Features

Power Module

- High power density (L*W*H = 12.19*12.19*3.75)
- Wide operating temperature -40°C to +105°C at full load
- Efficiency up to 97%, no need for heatsinks
- 6-sided shielding
- Thermally and EMI enhanced 25 pad LGA package
- Compact DOSA-compatible footprint
- Low profile

Description

The RPM-3.0 series is a 3A non-isolated switching regulator power module with a full set of features including adjustable output, sequencing, soft-start control, on/off control, and power good signals. The ultra-compact module has a profile of only 3.75mm, but with an efficiency of up to 97%, the device can operate at full load in ambient temperatures as high as +105°C without forced air cooling. The package is complete with 6-sided shielding for optimal EMC performance and excellent heat management.

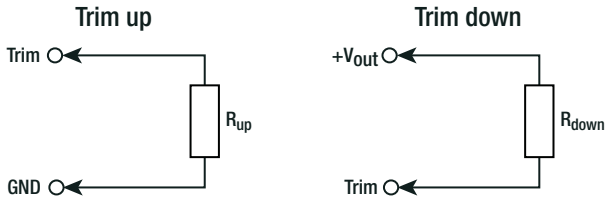
OUTPUT VOLTAGE TRIMMING

The RPM series offers the feature of trimming the output voltage over a range between 0.9V and 6V by using external trim resistors. The values for trim resistors shown in trim tables below are according to standard E96 values; therefore, the specified voltage may slightly vary.



$Vout_{nom}$	= nominal output voltage	[VDC]
$Vout_{set}$	= trimmed output voltage	[VDC]
V_{ref}	= reference voltage	[VDC]
R_{up}	= trim up resistor	[Ω]
R_{down}	= trim down resistor	[Ω]
R_1, R_2, R_3	= internal resistors	[Ω]

$Vout_{nom}$	R_1	R_2	R_3	V_{ref}
3.3VDC	376kΩ	1kΩ	471kΩ	0.81VDC
5VDC	344kΩ		431kΩ	

Calculation:

$$R_{up} = \left[\frac{R_1}{Vout_{set} - V_{nom}} \right] - R_2$$

$$R_{down} = \left[\frac{(Vout_{set} - V_{ref}) \times R_3}{Vout_{nom} - Vout_{set}} \right]$$

Practical Example RPM3.3-3.0:

$$R_{up} = \left[\frac{376k}{4.3 - 3.3} \right] - 1k = \underline{375k\Omega}$$

$$R_{down} = \left[\frac{(1.8 - 0.81) \times 471k}{3.3 - 1.8} \right] = \underline{311k\Omega}$$

R_{up} according to E96 ≈ **374kΩ**

R_{down} according to E96 ≈ **309kΩ**

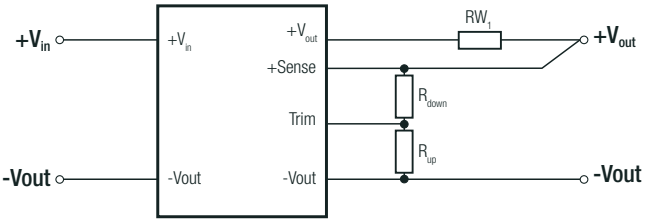
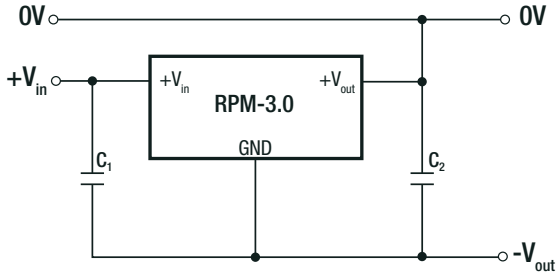
REMOTE SENSE



The output voltage can be adjusted via the trim and sense functions.
The maximum output voltage from Trim and Sense function combined is 5.5VDC. Derating may be required when using Trim and/or sense functions.

RW_1 ... wire losses +
R_{up} ... trim up resistor
R_{down} ... trim down resistor

POSITIVE TO NEGATIVE



C_1 and C_2 may be added to reduced ripple and should be fitted close to the converter pins.

Notes:

Note8: RECOM Power Modules can also be used to convert a positive voltag into a negative voltage. Parameters such as maximum Vin, efficiency and maximum operating temperature are reduced. Please contact RECOM for further details.

REGULATIONS

Parameter	Condition	Value
Output Accuracy		±3.0% max.
Line Regulation	low line to high line, full load	0.25% typ. / ±3.0% max.
Load Regulation	0% to 100% load	0.5% typ. / 3.0% max.

Transient Response	100% - 10% load step recovery time	200mV max. 6ms typ.
	25% load step change recovery time	150mV max. 500µs typ.

Sequencing Multiple Modules

The SEQ pin can be used to program the rising edge of the output voltage. An internal current source charges a soft-start capacitor which is connected from the sequencing pin to GND. The following equation is used to calculate the soft-start capacitor:

C_{ss}	= soft-start capacitor	[nF]
I_{ss}	= sum of all soft-start currents of all sequenced modules	[µs]
t_{ss}	= required soft-start time	[µs]
n	= number of RPMs	[ ]

$$C_{ss} = \frac{t_{ss} \times I_{ss}}{1.25V} - n \times 3.3nF$$

Note: there is a 3.3nF internal soft-start capacitor, and there are different constant current sources in the modules which leads to different preset soft-start times.

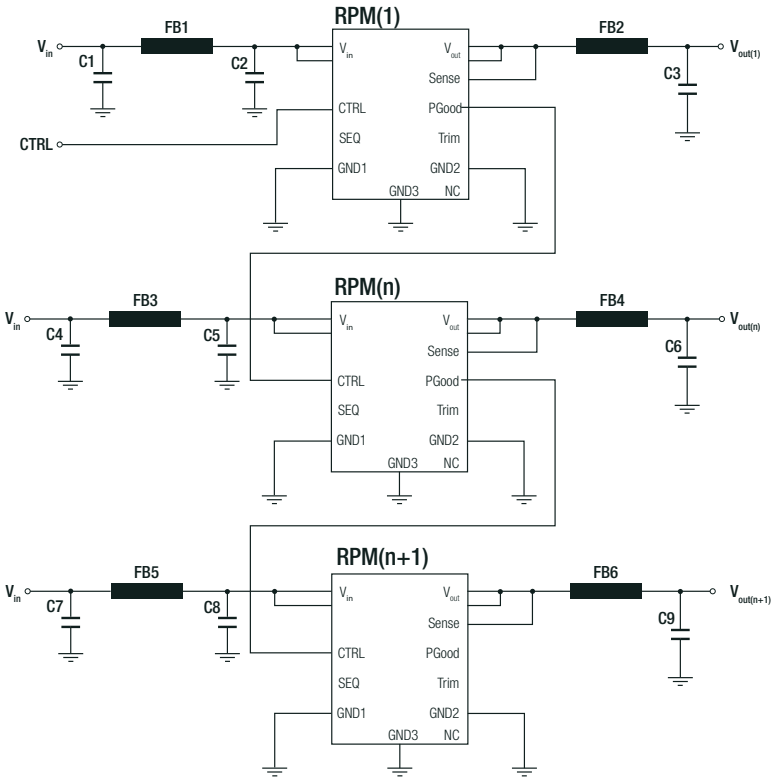
To sequence multiple power module start-up times the power good (PGood) pin and the CTRL pin may be used. In below schematic, the RPM(n) starts after RPM(1) reaches its set output voltage and the power good signal is set to high which then enables RPM(n). After RPM(n) reaches its set output voltage, it enables RPM(n+1).



To sequence multiple converters to start at the same time (set output voltage is reached at the same time), the following schematic may be used:
