## Si560 Data Sheet

### Ultra Low Jitter Any-Frequency XO (90 fs), 0.2 to 3000 MHz

The Si560 Ultra Series™ oscillator utilizes Skyworks Solutions' advanced 4<sup>th</sup> generation DSPLL® technology to provide an ultra-low jitter, low phase noise clock at any output frequency. The device is factory-programmed to any frequency from 0.2 to 3000 MHz with <1 ppb resolution and maintains exceptionally low jitter for both integer and fractional frequencies across its operating range. The Si560 offers excellent reliability and frequency stability as well as guaranteed aging performance. On-chip power supply filtering provides industry-leading power supply noise rejection, simplifying the task of generating low jitter clocks in noisy systems that use switched-mode power supplies. Offered in industry-standard footprints, the Si560 has a dramatically simplified supply chain that enables Skyworks to ship custom frequency samples 1-2 weeks after receipt of order. Unlike a traditional XO, where a different crystal is required for each output frequency, the Si560 uses one simple crystal and a DSPLL IC-based approach to provide the desired output frequency. This process also guarantees 100% electrical testing of every device. The Si560 is factory-configurable for a wide variety of user specifications, including frequency, output format, and OE pin location/polarity. Specific configurations are factory-programmed at time of shipment, eliminating the long lead times associated with custom oscillators.

## 1. Ordering Guide

The Si560 XO supports a variety of options including frequency, output format, and OE pin location/polarity, as shown in the chart below. Specific device configurations are programmed into the part at time of shipment, and samples are available in 1-2 weeks. Skyworks Solutions provides an online part number configuration utility to simplify this process. Refer to <https://www.skyworksinc.com/en/Products/Timing-Oscillators> to access this tool and for further ordering instructions.

### Notes:

- Contact Skyworks for non-standard configurations.
- Total stability includes temp stability, initial accuracy, load pulling, VDD variation, and 20 year aging at 70 °C.
- For example: 156.25 MHz = 156M250; 25 MHz = 25M0000. Create custom part numbers at <https://www.skyworksinc.com/en/Products/Timing-Oscillators>.

**Notes:**

1. Total Stability includes temperature stability, initial accuracy, load pulling, VDD variation, and aging for 20 yrs at 70 °C.
2. OE includes a 50 kΩ pull-up to VDD for OE active high, or includes a 50 kΩ pull-down to GND for OE active low.
3. R<sub>term</sub> = 50 Ω to V<sub>DD</sub> – 2.0 V (see Figure 4.1). Additional DC current from the output driver will flow through the 50 Ω resistors, resulting in a shift in common mode voltage. The measurements in this table have accounted for this.
4. R<sub>term</sub> = 100 Ω (differential) (see Figure 4.2).
5. R<sub>term</sub> = 50 Ω to GND (see Figure 4.2).
