

FT 5000 Smart Transceiver FT-X3 Communications Transformer

The Next-generation
Free Topology Smart
Transceiver

The FT 5000 Smart Transceiver is our next-generation chip for smart networks. It is the key product in the LONWORKS® 2.0 platform – the next generation of LONWORKS products designed to greatly increase the power and capability of LONWORKS enabled devices, while lowering development and node costs.

The FT 5000 Smart Transceiver integrates a high-performance Neuron® Core with a free topology twisted-pair transceiver. Combined with the new low-cost FT-X3 Communications Transformer and inexpensive serial memory, the FT 5000 Smart Transceiver provides a lower-cost, higher-performance LONWORKS solution than previous-generation FT Smart Transceivers.

FEATURES

- 3.3V operation.
- Higher-performance Neuron® Core – internal system clock scales up to 80MHz.
- Substantial device price reduction.
- Serial memory interface for inexpensive external EEPROM and flash non-volatile memories.
- Supports up to 254 Network Variables (NVs) and 127 aliases.
- Low-cost surface mount FT-X3 Communications Transformer.
- User-programmable interrupts provide faster response time to external events.
- Includes hardware UART with 16-byte receive and transmit FIFOs.
- 7 mm x 7 mm 48-pin QFN package.
- Supports polarity-insensitive free topology star, daisy chain, bus, loop, or mixed topology wiring.
- Compliant with TP/FT-10 channels using FT 3120®/FT 3150® Smart Transceivers and FTT-10/FTT-10A/LPT-10/LPT-11 Transceivers.
- 12 I/O pins with 35 programmable standard I/O models.
- Supports up to 42KB of application code space.
- 64KB RAM (44KB user-accessible) and 16KB ROM on-chip memories.

- Unique 48-bit Neuron ID in every device for network installation and management.
- Very high common-mode noise immunity.
- -40°C to +85°C operating temperature range.

DESCRIPTION

The FT 5000 Smart Transceiver includes three independent 8-bit logical processors to manage the physical MAC layer, the network, and the user application. These are called the Media-Access Control (MAC) processor, the network (NET) processor, and the application (APP) processor, respectively (see Figure 1). At higher system clock rates, there is also a fourth processor to handle interrupts.

Figure 1: FT 5000 Smart Transceiver Chip

The FT 5000 Smart Transceiver supports polarity-insensitive cabling using a star, bus, daisy-chain, loop, or combination topology (see Figure 2). Thus, installers don't have to follow a strict set of wiring rules imposed by other networking technologies. Instead, they can install wiring in the fastest and most cost-effective manner, thereby saving time and money. Free topology wiring also simplifies network expansion by eliminating restrictions on wire routing, splicing, and device placement.

Figure 2: Free Topology Network Configurations

The FT-X3 Communications Transformer is a surface mount communications transformer that's compatible with both the FT 5000 Smart Transceiver and the previous-

generation FT 3120/FT 3150 Smart Transceivers. The FT-X3 Communications Transformer provides equivalent noise immunity to both the FT-X1 and FT-X2 Communication Transformers, the previous-generation communication transformers. However, the FT-X3 Communications Transformer is not pin-compatible with the FT-X2 Communication Transformer (which is also a surface mount transformer). The FT 5000 Smart Transceiver can also be used with the FT-X1 and FT-X2 Communication Transformers.

Backward Compatibility

The FT 5000 Smart Transceiver is fully compliant with the TP/FT-10 channel and can communicate with devices that use Echelon's FTT-10/FTT-10A Transceivers, FT 3120/FT 3150 Smart Transceivers, or LPT-10/LPT-11 Link Power Transceivers.

The Neuron Core in the FT 5000 Smart Transceiver uses the same instruction set and architecture as the previous-generation Neuron Core, with two new additional instructions for hardware multiplication and division. The Series 5000 Neuron Core is source code compatible with applications written for the Series 3100 Neuron Core. Applications written for the Series 3100 Neuron Core must be recompiled with the NodeBuilder® FX Development Tool or the Mini FX Evaluation Kit before they can be used with the FT 5000 Smart Transceiver.

The FT 5000 Smart Transceiver uses Neuron firmware version 19. Firmware versions prior to version 19 are not compatible with the FT 5000 Smart Transceiver. The Neuron firmware is pre-programmed into the on-chip ROM. The FT 5000 Smart Transceiver can also be configured to read newer firmware from external memories, allowing the firmware to be upgraded over time.

Enhanced Performance

Faster system clock. The internal system clock for the FT 5000 Smart Transceiver can be user-configured to run from 5MHz to 80MHz. The required external crystal provides a 10MHz clock frequency, and an internal PLL boosts the frequency to a maximum of 80MHz as the internal system clock speed. The previous-generation Neuron 3120/3150 Core divided the external oscillator frequency by two to create the internal system clock. An FT 5000 Smart Transceiver

running with an 80MHz internal system clock is thus 16 times faster than a 10MHz Neuron 3120/3150 Core running.

The 5MHz internal system clock mode in the FT 5000 Smart Transceiver provides backward compatibility to support timing-critical applications designed for the 10MHz FT 3150 or FT 3120 Smart Transceiver.

The Neuron Core inside the FT 5000 Smart Transceiver includes a built-in hardware multiplier and divider to increase the performance of arithmetic operations.

Support for more network variables.

Because it uses Neuron firmware version 19, the FT 5000 Smart Transceiver supports applications with up to 254 network variables and 127 aliases for Neuron hosted devices (devices without a host microprocessor). A Series 3100 Neuron Chip or Smart Transceiver with Neuron firmware version 15 or earlier supports up to 62 network variables and 62 aliases for Neuron hosted devices. Series 3100 chips with Neuron firmware version 16 or later support up to 254 network variables. You must use the NodeBuilder FX Development Tool to take advantage of 254 network variables.

Interrupts. The FT 5000 Smart Transceiver lets developers define application interrupts to handle asynchronous events triggered by selected state changes on any of the 12 I/O pins, by on-chip hardware timer-counter units, or by an on-chip high-performance hardware system timer. An application uses the **Neuron C interrupt()** clause to define the interrupt condition and the interrupt task that handles the condition. The Neuron C program runs the interrupt task whenever the interrupt condition is met. See the *Neuron C Programmer's Guide* for more information about writing interrupt tasks and handling interrupts.

JTAG. The FT 5000 Smart Transceiver provides an interface for the Institute of Electrical and Electronics Engineers (IEEE) Standard Test Access Port and Boundary-Scan Architecture (IEEE 1149.1-1990) of the Joint Test Action Group (JTAG) to allow a Series 5000 chip to be included in the boundary-scan chain for device production tests. A Boundary Scan Description Language (BSDL) file for the FT 5000 Smart Transceiver can be downloaded from Echelon's Web site.

I/O Pins and Counters

The FT 5000 Smart Transceiver provides 12 bidirectional I/O pins that are 5V-tolerant and can be configured to operate in one or more of 35 predefined standard input/output models. The chip also has two 16-bit timer/counters that reduce the need for external logic and software development.

Memory Architecture

The FT 5000 Smart Transceiver uses inexpensive external serial EEPROM and flash memories for non-volatile application and data storage, and optionally for future Neuron firmware upgrades. It has 16KB of ROM and 64KB (44KB user-accessible) of RAM on the chip. It has no on-chip non-volatile memory (EEPROM or flash) for application use. Each chip, however, contains its unique Neuron identifier (Neuron ID) in an on-chip, non-volatile, read-only memory.

The application code and configuration data are stored in the external non-volatile memory (NVM) and copied into the internal RAM during device reset; the instructions then execute from internal RAM. Writes to NVM are shadowed in the internal RAM and pushed out to external NVM by the Neuron firmware (see Figure 2). The application does not manage NVM directly.

External memories supported. The FT 5000 Smart Transceiver supports two serial interfaces for accessing off-chip, non-volatile memories: serial Inter-Integrated Circuit (I2C) and serial peripheral interface (SPI). EEPROM and flash memory devices can use either the I2C interface or the SPI interface. However, at the time of publication, there are no serial flash parts that use the I2C protocol and meet the required specifications for the Series 5000 external memory interface.

External serial EEPROMs and flash devices, which are inexpensive and come in very small form factors, are available from multiple vendors.

The FT 5000 Smart Transceiver requires at least 2KB of off-chip memory available in an EEPROM device to store the configuration data. The application code can be stored either in the EEPROM (by using a larger-capacity EEPROM device) or in a flash memory device used in addition to the 2KB (minimum) EEPROM. Thus, the external memory for the FT 5000 Smart Transceiver has one of the configurations listed in Table 1:

Configuration	EEPROM		Flash	Comments
	I ² C	SPI	SPI	
1	☑			A single I ² C EEPROM memory device, from 2KB to 64KB in size.
2	☑		☑	One I ² C EEPROM (at least 2KB in size, up to 64KB in size, but the system uses only the first 2KB of the EEPROM memory). One SPI flash memory device.
3		☑		A single SPI EEPROM memory device, from 2KB to 64KB in size.
4		☑	☑	One SPI EEPROM (at least 2KB in size, up to 64KB in size, but the system uses only the first 2KB of the EEPROM memory). One SPI flash memory device.

Table 1: Allowed External Memory Device Configurations

As Table 1 shows, the FT 5000 Smart Transceiver supports using a single EEPROM memory device, or a single EEPROM memory device plus a single flash memory device.

If the FT 5000 Smart Transceiver detects an external flash memory device, the flash memory represents the entire user non-volatile memory for the device. That is, any additional EEPROM memory beyond the mandatory 2KB is not used.

Using the I²C interface. When using the I²C interface for external EEPROM, the FT 5000 Smart Transceiver is always the master I²C device (see Figure 3). The clock speed supported for the I²C serial memory interface is 400kHz (fast I²C mode). The I²C memory device must specify I²C address 0. Both 1-byte and 2-byte address modes are supported, but 3-byte addressing mode is not.

Figure 3: Using the I²C Interface for External NVM EEPROM Memory

Using the SPI interface. The FT 5000 Smart Transceiver is always the master SPI device; any external NVM devices are always slave devices. The FT 5000 Smart Transceiver can support up to two SPI slave devices from the serial memory interface: one EEPROM device at CS0~ and one flash device at CS1~ (see Figure 4). The FT 5000 Smart Transceiver supports 2-byte addressing mode for SPI EEPROM devices, but does not support 3-byte addressing. The FT 5000 Smart Transceiver runs the SPI protocol from the serial memory interface at 2.5 MHz and supports SPI Mode 0. In Mode 0, the base value of the clock is zero; the data is read on the clock's rising edge and changed on the clock's falling edge. Most external NVMs support SPI Mode 0 and 3.

Figure 4: Using the SPI Interface for External NVM Memories

Using both I²C and SPI interfaces. Figure 5 shows an FT 5000 Smart Transceiver that includes both an I²C memory device (a 2KB EEPROM device) and a SPI memory device (a flash memory device). Although both EEPROM and flash memory share the SDA_CS1~ pin, there is no conflict because only one of them can be active at a time. SDA is an active high signal and CS1~ is an active low signal. While small applications could use EEPROM both for application code and configuration data, larger applications might find it economical to use a small EEPROM for configuration data and a flash device for application code. The choice between EEPROM and flash can be affected by multiple factors, including:

- Use of a single external memory versus two memories.
- Cost comparison between a large EEPROM device and a combination of a small EEPROM and large flash devices.
- Use of non-volatile variables by the application, which can require a large number of writes to the device.

Figure 5: Using both I²C and SPI Interfaces for External NVM Memories

Memory devices supported. The FT 5000 Smart Transceiver supports any EEPROM device that uses the SPI or I²C protocol, and meets the clock speed and addressing requirements described above. While all EEPROM devices have a uniform write procedure, flash devices from various manufacturers differ slightly in their write procedure. Thus, a small library routine is stored in the external EEPROM device that helps the system write successfully to the external flash device. Echelon has qualified the following SPI flash memory devices for use with the FT 5000 Smart Transceiver:

- Atmel® AT25F512B 512-Kilobit 2.7-volt Minimum SPI Serial Flash Memory.
- Numonyx™ M25P05-A 512-Kbit, serial flash memory, 50MHz SPI bus interface.
- Silicon Storage Technology SST25VF512A 512 Kbit SPI Serial Flash.

Additional devices may be qualified in the future.

Memory map. An FT 5000 Smart Transceiver has a memory map of 64KB. A Neuron C application program uses this memory map to organize its memory and data access. The memory map is a logical view of device memory, rather than a physical view, because the chip's processors only directly access RAM. The memory map divides the FT 5000 Smart Transceiver's physical 64KB RAM into the following types of logical memory, as shown in Figure 6:

- Neuron firmware image (stored in on-chip ROM or external NVM).
- On-chip RAM or NVM. Memory ranges for each are configurable within the device hardware template. The non-volatile memory represents the area shadowed from external NVM into the RAM.
- On-chip RAM for stack segments and RAMNEAR data.

- Mandatory external EEPROM that holds configuration data and non-volatile application variables.
- Reserved space for system use.

If a 64KB external serial EEPROM or flash device is used, the maximum allowed size of application code is 42KB as defined by extended NVM area in the memory map. An additional 16KB of the remaining space can hold an external system firmware image, in case a future firmware upgrade is required.

Figure 6: FT 5000 Smart Transceiver Memory Map

Programming memory devices. Because the FT 5000 Smart Transceiver does not have any on-chip user-accessible NVM, only the external serial EEPROM or flash devices need to be programmed with the application and configuration data. The memory devices can be programmed in any of the following ways:

- In-circuit programming on the board.
- Over the network.
- Pre-programming before soldering on the board.

Noise Immunity

A LONWORKS device based on the FT 5000 Smart Transceiver is composed of two components: the FT 5000 Smart Transceiver and an external communications transformer (the FT-X3). The transformer enables operation in the presence of high frequency common-mode noise on unshielded twisted-pair networks. Properly designed devices can meet the rigorous Level 3 requirements of EN 61000-4-6 without the need for a network

isolation choke. The transformer also offers outstanding immunity from magnetic noise, eliminating the need for protective magnetic shields in most applications.

The FT 5000 Smart Transceiver and the FT-X3 Communications Transformer are designed to be used as a pair, and therefore must be implemented together in all designs. No transformer other than the FT-X3 (or FT-X1 or FT-X2) communications transformer may be used with the FT 5000 Smart Transceiver or the smart transceiver warranty will be void.

Migration Considerations

Most device designs that use the previous-generation FT 3120/3150 Smart Transceiver can transition to the FT 5000 Smart Transceiver. However, because the two generations have different supply voltage and memory architecture, hardware redesign of the boards is required to transition to the FT 5000 Smart Transceiver.

See the *Series 5000 Chip Data Book* for more information about migrating device designs for FT 3120/3150 Smart Transceivers to the FT 5000 Smart Transceiver.

End-to-End Solutions

A typical FT 5000 Smart Transceiver-based device requires a power source, crystal, external memory, and an I/O interface to the device being controlled (see Figure 7 for a typical FT 5000 Smart Transceiver-based device).

Figure 7: Typical LONWORKS based Device

Echelon provides all of the building blocks required to successfully design and field cost-effective, robust products based on the FT 5000 Smart Transceivers. Our end-to-end solutions include a comprehensive set of development tools, network interfaces, routers, and network tools. In addition, pre-production design review services, training, and worldwide technical support (including onsite support) are available through Echelon's Support technical assistance program.

FT 5000 Smart Transceiver IC Pin Configuration

Figure 8: FT 5000 Smart Transceiver Pinout

FT 5000 Smart Transceiver IC Pin Descriptions

All digital inputs are low-voltage transistor-transistor logic (LVTTTL) compatible, low leakage, 5V-tolerant. All digital outputs are slew-rate limited to reduce Electromagnetic Interference (EMI).

Pin Name	Pin Number	Type	Description
SVC~	1	Digital I/O	Service (active low)
I00	2	Digital I/O	I00 for I/O Objects
I01	3	Digital I/O	I01 for I/O Objects
I02	4	Digital I/O	I02 for I/O Objects
I03	5	Digital I/O	I03 for I/O Objects
VDD1V8	6	Power	1.8 V Power Input (from internal voltage regulator)
I04	7	Digital I/O	I04 for I/O Objects

Figure 12: FT-X3 Communications Transformer Electrical Connection Schematic (winding connections are made on the PCB)

Recommended FT-X3 Communications Transformer Pad Layout

The FT-X3 Communications Transformer is rotationally symmetric. Hence, the transformer package does not have a marking for Pin 1.

Figure 13: FT-X3 Transformer SMT Layout Pad Pattern

Recommendation: Add vias to the ends of each pin pad connection (just outside of the SMT pad rectangles) to provide additional mechanical support for the transformer.

FT-X3 Communications Transformer Mechanical Specification

FT 5000 Tape and Reel Information

Devices are uniformly loaded in the carrier tape such that the device pin one is oriented in quadrant 1 toward the side of the tape having round sprocket holes. Figure 15 illustrates the pin-one location.

Figure 15: FT 5000 Pin One Orientation

Figure 16 shows the outline dimensions of the carrier tape.

Figure 16: Carrier Tape Outline Drawing

SPECIFICATIONS

Data Communications Type

Differential Manchester encoding.

Network Polarity

Polarity insensitive.

Isolation between Network and FT 5000 IC

0-60Hz, 60 seconds: 1,000Vrms; 0-60Hz, continuous: 277Vrms¹.

EMI

Designed to comply with FCC Part 15 Subpart B and EN55022 Level B.

ESD

Designed to comply with EN 61000-4-2, Level 4.

Radiated Electromagnetic Susceptibility

Designed to comply with EN 61000-4-3, Level 3.

Fast Transient/Burst Immunity

Designed to comply with EN 61000-4-4, Level 4.

Surge Immunity

Designed to comply with EN 61000-4-5, Level 3.

Conducted RF Immunity

Designed to comply with EN 61000-4-6, Level 3.

Transmission Speed

78 kilobits per second.

Number of Transceivers per Segment

Up to 64.

Network Wiring

24 to 16AWG twisted pair; see *Series 5000 Chip Data Book* or *Junction Box and Wiring Guidelines* engineering bulletin for qualified cable types.

Network Length in Free Topology²

500m (1,640 feet) maximum total wire with no repeaters.

500m (1,640 feet) maximum device-to-device distance.

Network Length in Doubly-terminated Bus Topology²

2700m (8,850 feet) with no repeaters.

Maximum Stub Length in Doubly-terminated Bus Topology

3m (9.8 feet).

Network Termination

One terminator in free topology; two terminators in bus topology (more details in *Series 5000 Chip Data Book*).

Power-down Network Protection

High impedance when unpowered.

Operating Temperature

-40 to 85 °C

Operating Humidity

25-90% RH @50 °C, non-condensing
(FT-X3 Communications Transformer).

Non-operating Humidity

95% RH @ 50 °C, non-condensing
(FT-X3 Communications Transformer).

Vibration

1.5g peak-to-peak, 8Hz-2kHz
(FT-X3 Communications Transformer).

Mechanical Shock

100g (peak)
(FT-X3 Communications Transformer).

Reflow Soldering Temperature Profile

Refer to Joint Industry Standard document *IPC/JEDEC J-STD-020D.1* (March 2008).

Peak Reflow Soldering Temperature

260°C (FT 5000 Smart Transceiver).
245°C (FT-X3 Communications Transformer).

Co-planarity

0.12 mm (FT-X3 Communications Transformer).

Mass

6g (FT-X3 Communications Transformer).

Notes

1. Safety agency hazardous voltage barrier requirements are not supported.
2. Network segment length varies, depending on wire type. See Junction Box and Wiring Guidelines engineering bulletin for detailed specifications.
