

# Low Noise, 8th Order, Clock Sweepable Elliptic Lowpass Filter

## FEATURES

- 8th Order Filter in a 14-Pin Package
- No External Components
- 100:1 Clock to Center Ratio
- $150\mu\text{V}_{\text{RMS}}$  Total Wideband Noise
- 0.03% THD or Better
- 50kHz Maximum Corner Frequency
- Operates from  $\pm 2.37\text{V}$  to  $\pm 8\text{V}$  Power Supplies
- Passband Ripple Guaranteed Over Full Military Temperature Range

## APPLICATIONS

- Antialiasing Filters
- Telecom PCM Filters

## DESCRIPTION

The LTC<sup>®</sup>1064-1 is an 8th order, clock sweepable elliptic (Cauer) lowpass switched capacitor filter. The passband ripple is typically  $\pm 0.15\text{dB}$ , and the stopband attenuation at 1.5 times the cutoff frequency is 68dB or more.

An external TTL or CMOS clock programs the value of the filter's cutoff frequency. The clock to cutoff frequency ratio is 100:1.

No external components are needed for cutoff frequencies up to 20kHz. For cutoff frequencies over 20kHz two low value capacitors are required to maintain passband flatness. The LTC1064-1 features low wideband noise and low harmonic distortion even for input voltages up to  $3\text{V}_{\text{RMS}}$ . In fact the LTC1064-1 overall performance compares with equivalent multiple op amp RC active realizations.

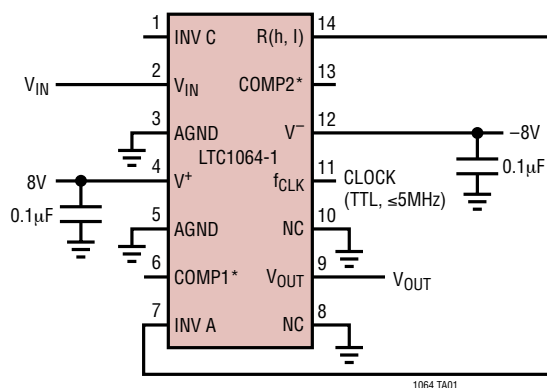

The LTC1064-1 is available in a 14-pin DIP or 16-pin surface mounted SW package.

The LTC1064-1 is pin compatible with the LTC1064-2.

 LTC and LT are registered trademarks of Linear Technology Corporation.

## TYPICAL APPLICATION

8th Order Clock Sweepable Lowpass Elliptic Antialiasing Filter

NOTE: THE POWER SUPPLIES SHOULD BE BYPASSED BY A  $0.1\mu\text{F}$  CAPACITOR CLOSE TO THE PACKAGE.

FOR SERVO OFFSET NULLING APPLICATIONS, PIN 1 IS THE 2ND STAGE SUMMING JUNCTION.

\*FOR CUTOFF FREQUENCY ABOVE 20kHz, USE COMPENSATION CAPACITORS ( $5\text{pF}$  TO  $56\text{pF}$ ) BETWEEN PIN 13 AND PIN 1 AND PIN 6 AND PIN 7.

Frequency Response

1064 TA02

8th ORDER CLOCK SWEEPABLE LOWPASS ELLIPTIC ANTIALIASING FILTER MAINTAINS, FOR  $0.1\text{Hz} \leq f_{\text{CUTOFF}} \leq 10\text{kHz}$ , A  $\pm 0.15\text{dB}$  PASSBAND RIPPLE AND 72dB STOPBAND ATTENUATION AT  $1.5 \times f_{\text{CUTOFF}}$ . TOTAL WIDEBAND NOISE =  $150\mu\text{V}_{\text{RMS}}$ . THD = 0.03% FOR  $V_{\text{IN}} = 1\text{V}_{\text{RMS}}$

## PIN FUNCTIONS (Pin Numbers Refer to the 14-Pin Package)

**COMP1, INV A, COMP2, INV C (Pins 1,6,7, and 13):** For filter cutoff frequencies higher than 20kHz, in order to minimize the passband ripple, compensation capacitors should be added between Pin 6 and Pin 7 (COMP1) and Pin 1 and Pin 13 (COMP2). For COMP1 (COMP2), add 1pF (1.5pF) mica capacitor for each kHz increase in cutoff frequency above 20kHz. For more detail refer to Gain vs Frequency graphs.

**V<sub>IN</sub>, V<sub>OUT</sub> (Pins 2, 9):** The input Pin 2 is connected to an 18k resistor tied to the inverting input of an op amp. Pin 2

is protected against static discharge. The device's output, Pin 9, is the output of an op amp which can typically source/sink 3mA/1mA. Although the internal op amps are unity gain stable, driving long coax cables is not recommended.

When testing the device for noise and distortion, the output, Pin 9, should be buffered (Figure 4). *The op amp power supply wire (or trace) should be connected directly to the power source.*

**AGND (Pins 3, 5):** For dual supply operation these pins should be connected to a ground plane. For single supply

10641fa

## PIN FUNCTIONS (Pin Numbers Refer to the 14-Pin Package)

operation both pins should be tied to one half supply (Figure 2). Also Pin 8 and Pin 10, although they are not internally connected should be tied to analog ground or system ground. This improves the clock feedthrough performance.

**V<sup>+</sup>, V<sup>-</sup> (Pins 4, 12):** The V<sup>+</sup> and V<sup>-</sup> pins should be bypassed with a 0.1μF capacitor to an adequate analog ground. Low noise, nonswitching power supplies are recommended. To avoid latchup when the power supplies exhibit high turn-on transients, a 1N5817 Schottky diode should be added from the V<sup>+</sup> and V<sup>-</sup> pins to ground (Figure 1).

**INV A, R(h, I) (Pins 7, 14):** A very short connection between Pin 14 and Pin 7 is recommended. This connection should be preferably done under the IC package. In a

breadboard, use a one inch, or less, shielded coaxial cable; the shield should be grounded. In a PC board, use a one inch trace or less; surround the trace by a ground plane.

**NC (Pins 8, 10):** The “no connection” pins preferably should be grounded.

**f<sub>CLK</sub> (Pin 11):** For ±5V supplies the logic threshold level is 1.4V. For ±8V and 0V to 5V supplies the logic threshold levels are 2.2V and 3V respectively. The logic threshold levels vary ±100mV over the full military temperature range. The recommended duty cycle of the input clock is 50% although for clock frequencies below 500kHz the clock “on” time can be as low as 200ns. The maximum clock frequency for ±5V supplies is 4MHz. For ±7V supplies and above, the maximum clock frequency is 5MHz. Do not allow the clock levels to exceed the power supplies. For clock level shifting (see Figure 3).

## TYPICAL APPLICATIONS
