

Ultrahigh Speed Operational Amplifier

FEATURES

- Gain Bandwidth Product, $A_V = 5$: 350MHz
- Slew Rate: 450V/ μ s
- Low Cost
- Output Current: ± 50 mA
- Settling Time: 90ns to 0.1%
- Differential Gain Error: 0.1% ($R_L = 1$ k)
- Differential Phase Error: 0.01° ($R_L = 1$ k)
- High Open-Loop Gain: 100V/mV Min
- Single Supply 5V Operation
- Output Shutdown

APPLICATIONS

- Video Cable Drivers
- Video Signal Processing
- Photo Diode Amplifier
- Pulse Amplifiers
- D/A Current to Voltage Conversion

DESCRIPTION

The LT1192 is a video operational amplifier optimized for operation on ± 5 V and a single 5V supply. Unlike many high speed amplifiers, this amplifier features high open-loop gain, over 100dB, and the ability to drive heavy loads to a full-power bandwidth of 20MHz at 7V_{P-P}. In addition to its very fast slew rate, the LT1192 has a high gain bandwidth of 350MHz and is compensated for a closed-loop gain of 5 or greater.

Because the LT1192 is a true operational amplifier, it is an ideal choice for wideband signal conditioning, active filters, and applications requiring speed, accuracy and low cost.

The LT1192 is available in 8-pin PDIP and SO packages with standard pinouts. The normally unused Pin 5 is used for a shutdown feature that shuts off the output and reduces power dissipation to a mere 15mW.

 LTC and LT are registered trademarks of Linear Technology Corporation.

Note 1: Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

Note 2: A heat sink is required to keep the junction temperature below absolute maximum when the output is shorted.

Note 3: Exceeding the input common mode range may cause the output to invert.

Note 4: Slew rate is measured between $\pm 1\text{V}$ on the output, with a $\pm 0.3\text{V}$ input step.

Note 5: Full-power bandwidth is calculated from the slew rate measurement:

$$\text{FPBW} = \text{SR}/2\pi V_P$$

Note 6: Settling time measurement techniques are shown in "Take the Guesswork Out of Settling Time Measurements," EDN, September 19, 1985. $A_V = -5$, $R_L = 1\text{k}$.

Note 7: NTSC (3.58MHz). For $R_L = 1\text{k}$, Diff $A_V = 0.1\%$, Diff Ph = 0.01° . Diff A_V and Diff Ph can be reduced for $A_V < 10$.

Note 8: See Applications section for shutdown at elevated temperatures. Do not operate the shutdown above $T_J > 125^{\circ}\text{C}$.

Note 9: AC parameters are 100% tested on the ceramic and plastic DIP packaged parts (J and N suffix) and are sample tested on every lot of the SO packaged parts (S suffix).

APPLICATIONS INFORMATION

Power Supply Bypassing

The LT1192 is quite tolerant of power supply bypassing. In some applications a $0.1\mu F$ ceramic disc capacitor placed 1/2 inch from the amplifier is all that is required. A scope photo of the amplifier output with no supply bypassing is used to demonstrate this bypassing tolerance, $R_L = 1k$.

In most applications, and those requiring good settling time, it is important to use multiple bypass capacitors. A $0.1\mu F$ ceramic disc in parallel with a $4.7\mu F$ tantalum is recommended. Two oscilloscope photos with different bypass conditions are used to illustrate the settling time characteristics of the amplifier. Note that although the output waveform looks acceptable at $1V/DIV$, when

No Supply Bypass Capacitors

LT1192 • TA04

 $A_V = -5$, IN DEMO BOARD, $R_L = 1k$

APPLICATIONS INFORMATION

amplified to 1mV/DIV the settling time to 1mV is 4.132 μ s for the 0.1 μ F bypass; the time drops to 140ns with multiple bypass capacitors.

Settling Time Poor Bypass

SETTLING TIME TO 1mV, $A_V = -1$
SUPPLY BYPASS CAPACITORS = 0.1 μ F

Settling Time Good Bypass

SETTLING TIME TO 1mV, $A_V = -1$
SUPPLY BYPASS CAPACITORS = 0.1 μ F + 4.7 μ F TANTALUM

Cable Terminations

The LT1192 operational amplifier has been optimized as a low cost video cable driver. The ± 50 mA guaranteed output current enables the LT1192 to easily deliver 7.5V_{P-P} into 100 Ω , while operating on ± 5 V supplies or 2.6V_{P-P} on a single 5V supply.

When driving a cable it is important to terminate the cable to avoid unwanted reflections. This can be done in one of two ways: single termination or double termination. With single termination, the cable must be terminated at the receiving end (75 Ω to ground) to absorb unwanted

Double Terminated Cable Driver

Cable Driver Voltage Gain vs Frequency

LT1192 • TA07

energy. The best performance can be obtained by double termination (75 Ω in series with the output of the amplifier, and 75 Ω to ground at the other end of the cable). This termination is preferred because reflected energy is absorbed at each end of the cable. When using the double termination technique it is important to note that the signal is attenuated by a factor of 2, or 6dB. For a cable driver with a gain of 5 (op amp gain of 10) the -3dB bandwidth is 56MHz with only 0.25dB of peaking.

Using the Shutdown Feature

The LT1192 has a unique feature that allows the amplifier to be shut down for conserving power or for multiplexing several amplifiers onto a common cable. The amplifier will shut down by taking Pin 5 to V^- . In shutdown, the amplifier dissipates 15mW while maintaining a true high impedance output state of 15k Ω in parallel with the feedback resistors. The amplifiers must be used in a noninverting configuration for MUX applications. In inverting configurations the input signal is fed to the output through the feedback components. When the output is loaded with as little as 1k Ω from the amplifier's feedback resistors, the amplifier shuts off in 400ns. This shutoff can be under the control of HC CMOS operating between 0V and -5V.

APPLICATIONS INFORMATION

Output Shutdown

1MHz SINE WAVE GATED OFF WITH SHUTDOWN PIN, $A_V = 10$, $R_L = 1k$

The ability to maintain shutoff is shown on the curve Shutdown Supply Current vs Temperature in the Typical Performance Characteristics section. At very high elevated temperatures it is important to hold the SHDN pin close to the negative supply to keep the supply current from increasing.

Operating with Low Closed-Loop Gains

When using uncompensated amplifiers it should be realized that peaking in the frequency domain, and overshoot and ringing in the time domain occur as closed-loop gain is lowered. The LT1192 is stable to a closed-loop gain of 5, however, peaking and ringing can be minimized by increasing the closed-loop gain. For instance, the LT1192 peaks 5dB when used in a gain of 5, but peaks by less than 0.5dB for a closed-loop gain of 10. Likewise, the overshoot drops from 50% to 4% for gains of 10.

Murphy Circuits

There are several precautions the user should take when using the LT1192 in order to realize its full capability. Although the LT1192 can drive a 50pF load, isolating the capacitance with 20Ω can be helpful. Precautions primarily have to do with driving large capacitive loads.

Small-Signal Transient Response

$A_V = 10$, SMALL-SIGNAL RISE TIME, WITH FET PROBES

Closed-Loop Voltage Gain vs Frequency

LT1192 • TA10

Other precautions include:

1. Use a ground plane (see Design Note 50, High Frequency Amplifier Evaluation Board).
2. Do not use high source impedances. The input capacitance of 2pF, and $R_S = 10k$ for instance, will give an 8MHz –3dB bandwidth.
3. PC board socket may reduce stability.
4. A feedback resistor of 1k or lower reduces the effects of stray capacitance at the inverting input.
