

3A, Full Featured DC/DC Converter with Soft-Start and Inrush Current Protection

FEATURES

- **Wide Input Voltage Range: 2.5V to 24V**
- **3A, 42V Internal Switch**
- **High Efficiency Power Conversion: Up to 89%**
- **Soft-Start**
- Frequency Set by External Resistor: 200kHz to 3.5MHz
- Protection Against Input Short Circuits and Hot Plugging
- Low V_{CESAT} Switch: 0.3V at 2.5A (Typical)
- Capable of Positive and Negative Outputs
- Available in Thermally Enhanced 14-Lead (4mm × 3mm) DFN and 16-Lead TSSOP Packages

APPLICATIONS

- High Power LED Driver
- DSL Modems
- Distributed Power

DESCRIPTION

The LT[®]3479 is a current mode, fixed frequency step-up DC/DC converter with an internal 3A, 42V switch. Efficiencies of up to 89% can be achieved in typical applications. It features a programmable soft-start function to limit inductor current during start-up and inrush current protection to protect the LT3479 during shorts and line transients. Both inputs of the error amplifier are available to the user allowing positive and negative output voltages. Through an external resistor, the user can program the switching frequency from 200kHz to 3.5MHz. The low profile (0.75mm) 14-pin, 4mm × 3mm DFN package provides excellent thermal performance in a small footprint. The LT3479 is also available in a thermally enhanced 16-pin TSSOP package.

LT, LT, LTC, LTM, Linear Technology and the Linear logo are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners.

Switch Leakage Current	SW = 40V			0.2	5	μA

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: The LT3479 is guaranteed to meet performance specifications from 0°C to 70°C . Specifications over the -40°C to 85°C operating

temperature range are assured by design, characterization and correlation with statistical process controls.

Note 3: Inductor Current Limit, Switch Current Limit and Switch V_{CESAT} for DE package guaranteed by design and/or correlation to static test.

TYPICAL PERFORMANCE CHARACTERISTICS

PIN FUNCTIONS (DFN/TSSOP)

SW (Pins 1, 2/Pins 1, 2): Switch Pins. Collector of the internal NPN power switch. Connect the inductor and diode here and minimize the metal trace area connected to this pin to minimize electromagnetic interference.

L (Pin 3/Pin 3): Inductor Pin. Connect the inductor to this pin.

V_S (Pin 4/Pin 4): Inductor Supply. Must be locally bypassed. Powers the switch and the inductor. In case only one supply voltage is available, tie V_{IN} and V_S together.

V_{IN} (Pin 5/Pin 5): Input Supply. Must be locally bypassed. Powers the internal control circuitry.

R_T (Pin 6/Pin 6): Timing Resistor Pin. Adjusts the switching frequency. Do not leave this pin open. See Table 4 for R_T values and switching frequencies.

SHDN (Pin 7/Pin 7): Shutdown. Tie to 1.5V or greater to enable the device. Tie below 0.3V to turn off the device.

V_{REF} (Pin 8/Pin 9): Bandgap Voltage Reference. Internally set to 1.235V. Connect this pin to FBP if generating a positive output, or to an external resistor divider if generating a negative voltage. This pin can provide up to 100μA of current and can be locally bypassed with a 100pF capacitor.

FBP (Pin 9/Pin 10): The Noninverting Input to the Error Amplifier. Connect resistive divider tap here for negative output voltage.

FBN (Pin 10/Pin 11): The Inverting Input to the Error Amplifier. Connect resistive divider tap here for positive output voltage.

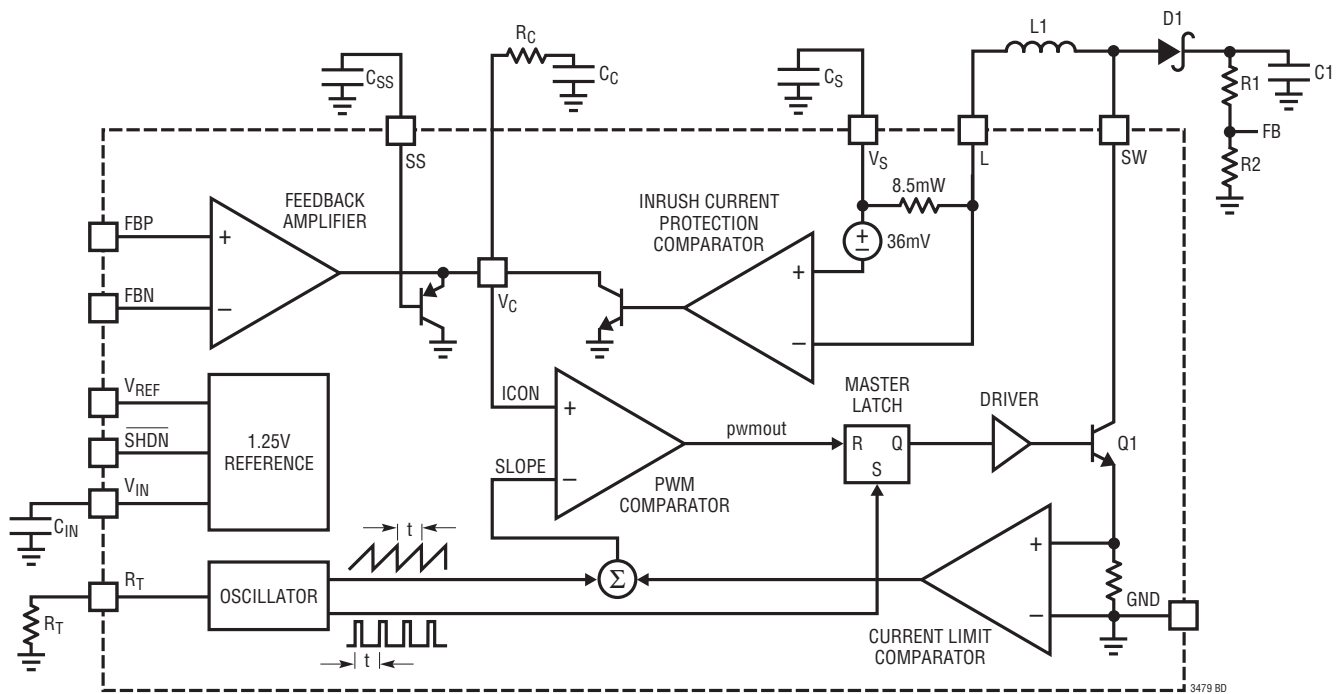

V_C (Pin 11/Pin 12): Compensation Pin for Error Amplifier. Connect a series RC from this pin to GND. Typical values are 10kΩ and 2.2nF.

SS (Pin 12/Pin 13): Soft-Start. Place a soft-start capacitor here. Leave floating if not in use.

GND (Pins 13, 14/Pins 8, 14, 15, 16): Ground. Tie directly to local ground plane.

Exposed Pad (Pin 15/Pin 17): Power Ground. Must be connected to electrical PCB ground.

BLOCK DIAGRAM

OPERATION

The LT3479 uses a fixed frequency, current mode control scheme to provide excellent line and load regulation. Operation can be best understood by referring to the Block Diagram. The start of each oscillator cycle sets the SR latch and turns on power switch Q1. The signal at the inverting input of the PWM comparator (SLOPE) is proportional to the sum of the switch current and oscillator ramp. When SLOPE exceeds V_C (the output of the feedback amplifier), the PWM comparator resets the latch and turns off the power switch. In this manner, the feedback amplifier and PWM comparators set the correct peak current level to keep the output in regulation.

The LT3479 also features a soft-start function. During start-up, 10 μ A of current charges the external soft-start capacitor. The SS pin directly limits the rate of voltage rise on the V_C pin, which in turn limits the peak switch current. The switch current is constantly monitored and not allowed to exceed the nominal value of 3A. If the switch

current reaches 3A, the SR latch is reset regardless of the output of the PWM comparator. Current limit protects the power switch and external components.

Soft-start plays an important role in applications where the switch will reach levels of 30V or higher. During startup, an overshoot in the switch current together with the presence of high switch voltage can overstress the switch. A properly used soft-start feature will greatly improve the robustness of such designs.

In addition to soft-start, inrush current protection protects the LT3479 against shorts and line transients. During such faults, the inductor current can momentarily exceed 3A and damage the switch. Through an internal 8.5m Ω resistor placed in series with the inductor, the inrush current protection comparator measures the inductor current. If it exceeds 5A, a soft-start cycle is initiated. The LT3479 will remain in the soft-start condition until the fault has passed.

APPLICATIONS INFORMATION

Capacitor Selection

Low ESR (equivalent series resistance) ceramic capacitors should be used at the output to minimize the output ripple voltage. Use only X5R or X7R dielectrics, as these materials retain their capacitance over wider voltage and temperature ranges better than other dielectrics. A 4.7 μ F to 10 μ F output capacitor is sufficient for most high output current designs. Converters with lower output currents may need only a 1 μ F or 2.2 μ F output capacitor.

Murata	(714) 852-2001	www.murata.com

Inductor Selection

Several inductors that work well with the LT3479 are listed in Table 2. However, there are many other manufacturers and devices that can be used. Consult each manufacturer for more detailed information and their entire range of parts. Ferrite core inductors should be used to obtain the best efficiency. Choose an inductor that can handle the necessary peak current without saturating, and ensure that the inductor has a low DCR (copper-wire resistance) to minimize I^2R power losses. A 4.7 μ H or 10 μ H inductor will suffice for most LT3479 applications.

Inductor manufacturers specify the maximum current rating as the current where the inductance falls to some percentage of its nominal value—typically 65%. An inductor

can pass a current larger than its rated value without damaging it. Aggressive designs where board space is precious will exceed the maximum current rating of the inductor to save board space. Consult each manufacturer to determine how the maximum inductor current is measured and how much more current the inductor can reliably conduct.

Physically larger inductors provide better efficiency than smaller ones. Figure 1 shows a 3% to 4% efficiency gain in using a larger inductor in a 1MHz, 5V to 12V application. The efficiency of the TOKO FDV0630-4R7M, which measures 7mm \times 7.7mm and 3 mm thick, peaks at 87%. The smaller Sumida CDRH4D28-4R7 which is 5mm \times 5mm and 3mm thick yields a peak efficiency of 85% in an identical application. Thus, if board space is abundant, then larger inductors should be used to maximize efficiency.

APPLICATIONS INFORMATION

Diode Selection

Schottky diodes, with their low forward voltage drop and fast switching speed, are ideal for LT3479 applications. Table 3 lists several Schottky diodes that work well with the LT3479. The diode's average current rating must exceed the average output current. The diode's maximum reverse voltage must exceed the output voltage. The diode conducts current only when the power switch is turned off (typically less than 50% duty cycle), so a 3A diode is sufficient for most designs. The companies below also offer Schottky diodes with high voltage and current ratings.

Table 3. Suggested Diodes

Setting Positive Output Voltages

To set a positive output voltage, select the values of R1 and R2 (see Figure 2) according to the following equation:

$$V_{OUT} = 1.235V \left(1 + \frac{R1}{R2} \right)$$

Figure 2. Positive Output Voltage Feedback Connections

Setting Negative Output Voltages

To set a negative output voltage, select the values of R3 and R4 (see Figure 3) according to the following equation:

$$V_{OUT} = -1.235V \left(\frac{R3}{R4} \right)$$

Figure 3. Negative Output Voltage Feedback Connections

Board Layout

As with all switching regulators, careful attention must be paid to the PCB board layout and component placement. To maximize efficiency, switch rise and fall times are made as short as possible. To prevent radiation and high frequency resonance problems, proper layout of the high frequency switching path is essential. Minimize the length and area of all traces connected to the SW pin and always use a ground plane under the switching regulator to minimize interplane coupling. The signal path including the switch, output diode D1 and output capacitor C_{OUT}, contains nanosecond rise and fall times and should be kept as short as possible. Recommended component placement is shown in Figure 4.

Soft-Start

For many applications, it is necessary to minimize the inrush current at start-up. The built-in soft-start circuit significantly reduces the start-up current spike and output voltage overshoot. A typical value is 10nF for 1.65ms. Figure 5 shows the start-up output voltage and inductor current waveforms in a typical application without a soft-start capacitor. Notice the output voltage overshoot and the large initial current. The addition of a 22nF capacitor eliminates the output overshoot and reduces the peak inductor current (Figure 6).

APPLICATIONS INFORMATION

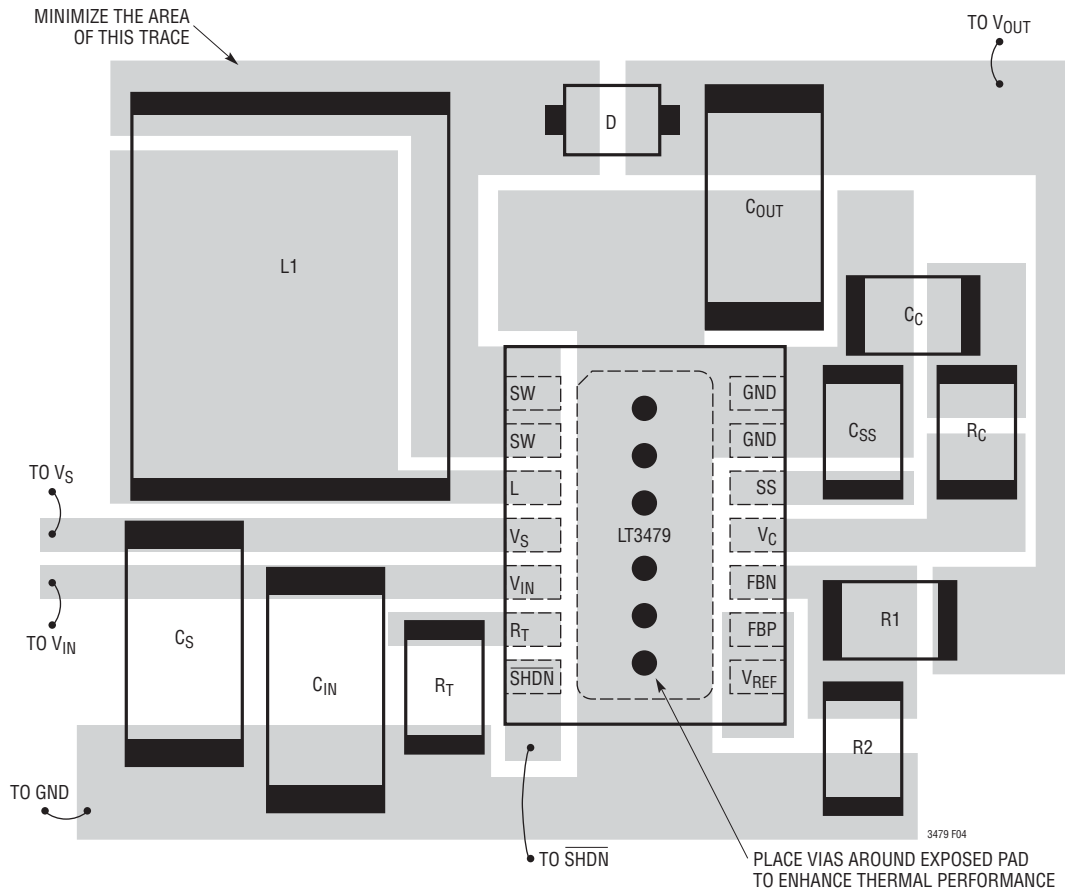

Figure 4. Suggested Board Layout

Figure 5. Start-Up with No Soft-Start Capacitor

Figure 6. Start-Up with $C_{SS} = 22\text{nF}$

Switching Frequency

The switching frequency of the LT3479 is set by an external resistor attached to the R_T pin. Do not leave this pin open. A resistor must always be connected for proper operation. See Table 4 and Figure 7 for resistor values and corresponding frequencies.

Table 4. Switching Frequency

SWITCHING FREQUENCY (MHz)	R_T (k Ω)
3.5	1.78
3	2.87
2.5	4.32
2	6.49
1.5	10.2
1	17.8
0.5	39.2
0.2	113

APPLICATIONS INFORMATION

Increasing switching frequency reduces output voltage ripple but also reduces efficiency. The user should set the frequency for the maximum tolerable output voltage ripple. Figure 8 shows a reduction in efficiency of about 4% between 1MHz and 2MHz operation in a typical application.

Inrush Current Protection

The LT3479 features a novel inductor current sensing circuit that protects the LT3479 during hot plugging and short circuits. An internal resistor in series with the external inductor senses the inductor current at all times. When it exceeds 5A, a soft-start cycle is initiated. Figure 9

shows an output overload with inrush current protection disabled. Notice that soft-start remains high, and that the inductor current does not return to zero. Figure 10 illustrates the benefits of inrush current protection. The output short initiates a new soft start cycle reducing the inductor current. After the fault has passed, the inductor current slowly returns to its equilibrium value. To ensure bond wire integrity, the inductor current should not exceed 8A for more than 10ms.

Bypassing the 8.5mΩ inductor current sense resistor disables inrush current protection. Connect the inductor supply trace and bypass capacitor to the L pin and leave the V_S pin open to disable this feature.

Figure 10 is a line graph showing the efficiency of the proposed converter as a function of the output current (I_{OUT}) in Amperes (A). The y-axis represents Efficiency in percent (%), ranging from 50 to 80. The x-axis represents I_{OUT} (A), ranging from 0 to 1.0. Three curves are plotted, corresponding to different input and output voltage conditions:

- The top curve is labeled $V_{IN} = 14V, V_{OUT} = \pm 10V$.
- The middle curve is labeled $V_{IN} = 10V, V_{OUT} = \pm 7V$.
- The bottom curve is labeled $V_{IN} = 14V, V_{OUT} = \pm 7V$.

All three curves show that efficiency increases with output current, reaching a peak around $I_{OUT} = 0.6A$ and then slightly decreasing. The efficiency is highest for the $V_{IN} = 14V, V_{OUT} = \pm 10V$ condition and lowest for the $V_{IN} = 14V, V_{OUT} = \pm 7V$ condition.

PACKAGE DESCRIPTION

DE Package 14-Lead Plastic DFN (4mm × 3mm) (Reference LTC DWG # 05-08-1708 Rev B)

RECOMMENDED SOLDER PAD PITCH AND DIMENSIONS
APPLY SOLDER MASK TO AREAS THAT ARE NOT SOLDERED

NOTE:

1. DRAWING PROPOSED TO BE MADE VARIATION OF VERSION (WGED-3) IN JEDEC PACKAGE OUTLINE MO-229
2. DRAWING NOT TO SCALE
3. ALL DIMENSIONS ARE IN MILLIMETERS
4. DIMENSIONS OF EXPOSED PAD ON BOTTOM OF PACKAGE DO NOT INCLUDE MOLD FLASH. MOLD FLASH, IF PRESENT, SHALL NOT EXCEED 0.15mm ON ANY SIDE
5. EXPOSED PAD SHALL BE SOLDER PLATED
6. SHADED AREA IS ONLY A REFERENCE FOR PIN 1 LOCATION ON THE TOP AND BOTTOM OF PACKAGE

PACKAGE DESCRIPTION

FE Package 16-Lead Plastic TSSOP (4.4mm) (Reference LTC DWG # 05-08-1663) Exposed Pad Variation BC

NOTE:

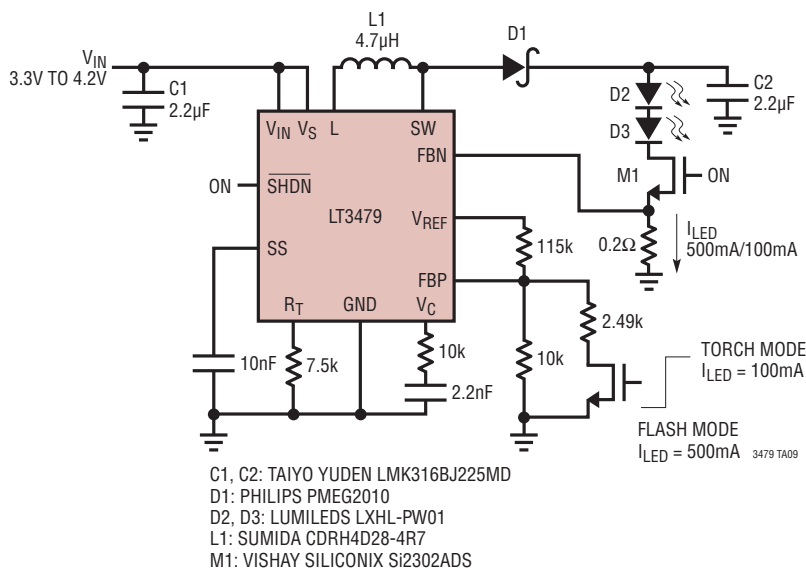

1. CONTROLLING DIMENSION: MILLIMETERS
2. DIMENSIONS ARE IN $\frac{\text{MILLIMETERS}}{(\text{INCHES})}$
3. DRAWING NOT TO SCALE

4. RECOMMENDED MINIMUM PCB METAL SIZE FOR EXPOSED PAD ATTACHMENT

*DIMENSIONS DO NOT INCLUDE MOLD FLASH. MOLD FLASH SHALL NOT EXCEED 0.150mm (.006") PER SIDE
