

# 16 Channel Buck Mode LED Driver

## FEATURES

- 4.5V to 45V Input Supply Range
- Up to 50mA LED Current per Channel
- 100mA, 45V Internal Switches
- 8% Relative LED Current Match at 20mA
- 16 Independent LED Channels
- 5000:1 True Color PWM™ Dimming Range
- LEDs Disconnected in Shutdown
- Internal Schottky Diodes
- Low Quiescent Current
- 2MHz Switching Frequency
- $R_{SET}$  Pin Sets Master LED Current
- Typical Efficiency: 92%
- Open LED Detection and Thermal Protection
- 56-Pin 5mm × 9mm × 0.75mm QFN Package

## APPLICATIONS

- LED Video Billboards
- LCD Televisions
- Stadium and Advertising Displays

## DESCRIPTION

The LT®3595 is a high performance LED Driver designed to drive sixteen independent channels of up to 10 LEDs at currents up to 50mA. Series connection of the LEDs provides identical LED currents resulting in uniform brightness. Power switches, Schottky diodes, and compensation components are all internal, providing a small converter footprint and lower component cost. The high 2MHz switching frequency permits the use of tiny, low profile inductors and capacitors. A fixed frequency, current mode architecture results in stable operation over a wide range of supply and output voltage.

A single external resistor sets the LED current for all sixteen channels, and dimming is then controlled for each channel by pulse width modulating the individual PWM pins. Relative current matching among the sixteen drivers is 8% and the PWM dimming range is 5000:1. The part is available in a 5mm × 9mm × 0.75mm 56-pin QFN package.

LT, LT, LTC and LTM are registered trademarks of Linear Technology Corporation. True Color PWM is a trademark of Linear Technology Corporation. All other trademarks are the property of their respective owners.

## TYPICAL APPLICATION

### 5000:1 PWM Dimming at 100Hz

## ABSOLUTE MAXIMUM RATINGS

(Note 1)

Input Voltage ( $V_{IN}$ )	45V
L1-16 Voltage	45V
Supply Voltage ( $V_{CC}$ )	6V
$R_{SET}$ , $\overline{OPENLED}$ , PWM1-16, $\overline{SHDN}$ Voltage	6V
Operating Junction Temperature Range	
(Note 2)	–40°C to 85°C
Maximum Junction Temperature	125°C
Storage Temperature Range	–65°C to 125°C

## PIN CONFIGURATION

## ORDER INFORMATION

LEAD FREE FINISH	TAPE AND REEL	PART MARKING	PACKAGE DESCRIPTION	TEMPERATURE RANGE

**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** The LT3595 is guaranteed to meet performance specifications from  $0^\circ\text{C}$  to  $85^\circ\text{C}$  junction temperature. Specifications over the  $-40^\circ\text{C}$  to  $85^\circ\text{C}$  operating junction temperature range are assured by design, characterization and correlation with statistical process controls.

## PIN FUNCTIONS

**L1-16 (Pins 1, 3, 7, 9, 10, 12, 16, 18, 29, 31, 35, 37, 38, 40, 44, 46):** LED Pins. Connection point for the anode of the highest LED in each string.

**SW1-16 (Pins 2, 4, 6, 8, 11, 13, 15, 17, 30, 32, 34, 36, 39, 41, 43, 45):** Switch Pins. Minimize trace area at these pins to minimize EMI. Connect the inductors to these pins.

**V<sub>IN</sub> (Pins 5, 14):** 4.5V to 45V Input Supply Pin. Must be locally bypassed. Both V<sub>IN</sub> pins must be tied together.

**PWM1-16 (Pins 19-22, 25-28, 47-50, 53-56):** Input Pin for LED Dimming Function. The rising edge of each channel must be synchronized.

**OPENLED (Pin 23):** Open Collector Output for Reporting Faults. If any channel experiences an open LED connection, the OPENLED pin is pulled low.

**SHDN (Pin 24):** Shutdown. Tie to 1.6V or greater to enable the device. Tie below 0.4V to turn off the device.

**NC (Pins 33, 42):** No Connect. Connect these pins to ground.

**R<sub>SET</sub> (Pin 51):** External Resistor to Set the Master LED Current. The LED current is equal to:

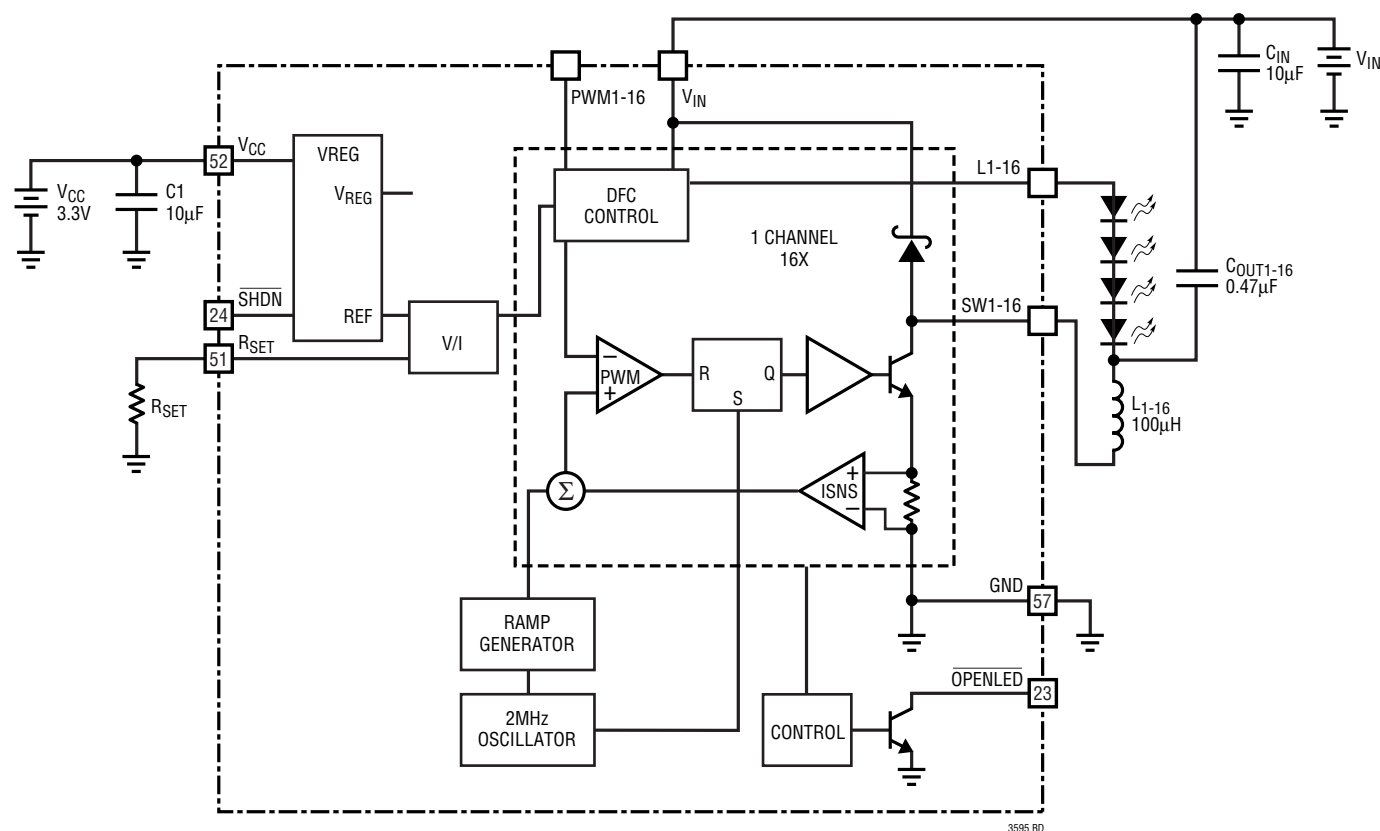

$$I_{LED} = \frac{1.21V}{R_{SET}} \cdot 1240$$

where R<sub>SET</sub> is the value of the external resistor. Use a kelvin for ground metal.

**V<sub>CC</sub> (Pin 52):** 3.3V Input Supply. Must be locally bypassed.

**Exposed Pad (Pin 57):** Ground. The Exposed Pad must be soldered to PCB. Use wide metal from backtab to the grounds of the input capacitors on V<sub>CC</sub> and V<sub>IN</sub>.

BLOCK DIAGRAM

## OPERATION

The LT3595 uses a constant-frequency, current mode control scheme to provide excellent line and load regulation. Operation is best understood by referring to the Block Diagram. The oscillator, V-I converter and internal regulator are shared by the sixteen converters. The control circuitry, power switches, PWM comparators and dimming control (DFC) are identical for all converters.

The LT3595 enters shutdown mode when the  $\overline{\text{SHDN}}$  pin is lower than 400mV. If the  $\overline{\text{SHDN}}$  pin is above 1.6V, then the LT3595 turns on. At the start of each oscillator cycle, the power switch is turned on. Current ramps up through the output capacitor, the inductor, and the switch to ground. When the voltage across the output capacitor is larger than the LEDs' forward voltage, current flows through the LEDs.

When the switch is on, a voltage proportional to the switch current is added to a stabilizing ramp and the resulting sum is fed into the positive terminal of the PWM comparator. When this voltage exceeds the level at the negative input of the PWM comparator, the PWM logic turns off the power switch. The level at the negative input of the PWM comparator is set by the error amplifier output. This voltage is set by the LED current and the bandgap reference. In this manner, the error amplifier sets the correct peak current level in the inductor to keep the LED output current in regulation. The external  $R_{\text{SET}}$  resistor is used to program the LED current from 10mA to 50mA.

### Input Voltage Range

The minimum input voltage required to generate a specific output voltage in an LT3595 application is limited by its 4.5V input voltage or by its maximum duty cycle. The duty cycle is the fraction of time that the internal switch is on divided by the total period. It is determined by the input voltage and the voltage across the LEDs:

$$\text{DC} = \frac{V_{\text{LED}} + V_{\text{D}}}{V_{\text{VIN}} - V_{\text{CESAT}} + V_{\text{D}}}$$

where  $V_{\text{LED}}$  is the voltage drop across the LEDs,  $V_{\text{D}}$  is the Schottky forward drop, and  $V_{\text{CESAT}}$  is the saturation voltage of the internal switch. This leads to a minimum input voltage of:

$$V_{\text{IN(MIN)}} = \frac{V_{\text{LED}} + V_{\text{D}}}{\text{DC}_{\text{MAX}}} + V_{\text{CESAT}} - V_{\text{D}}$$

where  $\text{DC}_{\text{MAX}}$  is the minimum rating of maximum duty cycle.

The maximum input voltage is limited by the absolute maximum rating of 45V.

### Pulse-Skipping

At low duty cycles, the LT3595 may enter pulse-skipping mode. Low duty cycle occurs at higher input voltages and lower LED count. The LT3595 can drive currents without pulse-skipping provided the voltage across the LED string is greater than 15% of the input supply voltage. If the current decreases to the point that the LED voltage is less than 15% of the input supply, the device may begin skipping pulses. This will result in some low frequency ripple, although the LED current remains regulated on an average basis down to 10mA.

## OPERATION

### Discontinuous Current Mode

The LT3595 can drive a 10-LED string at 15mA LED current operating in continuous conduction mode using the recommended external components shown in the application circuit on page 1 of this data sheet. As current is further reduced, the regulator enters discontinuous conduction mode. The photo in Figure 1 details circuit operation driving ten LEDs at 10mA load. The inductor current reaches zero during the discharge phase and the SW pin exhibits ringing. The ringing is due to the LC tank circuit formed by the inductor in combination with the switch and diode capacitance. This ringing is not harmful; far less spectral energy is contained in the ringing than in the switch transitions.

Figure 1. Switching Waveforms

## TYPICAL APPLICATIONS

### Inductor Selection

A 100 $\mu$ H inductor is recommended for most LT3595 applications. Although small size and high efficiency are major concerns, the inductor should have low core losses at 2MHz and low DCR (copper wire resistance). Some inductors that meet these criteria are listed in Table 1. An efficiency comparison of different inductors is shown in Figure 2.

Figure 2. Efficiency Comparison of Different Inductors

### Capacitor Selection

The small size of ceramic capacitors make them ideal for LT3595 applications. Only X5R and X7R types should be used because they retain their capacitance over wider voltage and temperature ranges than other types such as Y5V or Z5U. Typically, 10 $\mu$ F capacitors on  $V_{IN}$  and  $V_{CC}$  are sufficient. The output capacitor used across the

## APPLICATIONS INFORMATION

LED string depends on the number of LEDs and can vary from 0.47 $\mu$ F to 1 $\mu$ F. Refer to Table 2 for proper output capacitor selection.

**Table 2. Recommended Output Capacitor Values ( $V_{LED} = 3.5V$ )**

# LEDs	$C_{OUT}$ ( $\mu$ F)
3-10	0.47
1-2	1

Kemet	(408)-986-0424 www.kemet.com

Table 3 shows a list of several ceramic capacitor manufacturers. Consult the manufacturers for detailed information on their entire selection of ceramic parts.

### Open LED Detection

The LT3595 detects an open LED on any channel and reports it to the  $\overline{OPENLED}$  pin. The fault also reports during startup until the output voltage and LED current are in regulation. Therefore, it can also be used as a “power ok” signal.

### Programming LED Current

The set resistor ( $R_{SET}$  in the Block Diagram) controls the LED current in all sixteen channels. LED current as a function of the  $R_{SET}$  resistance is shown in the Typical Performance Characteristics. Common values for LED current and their required resistor values are listed in Table 4. Since resistor error directly translates to LED current error, precision resistors are preferred (1% is recommended). The maximum allowed resistor value is 150k.

**Table 4. LED Current vs  $R_{SET}$  Resistance**

$R_{SET}$ ( $k\Omega$ )	$I_{LED}$ (mA)
150	10
75.0	20
49.9	30
37.4	40
30.1	50

## APPLICATIONS INFORMATION

### Dimming Control

The sixteen PWM1-16 inputs control the dimming function. Each channel is modulated by its corresponding PWM1-16 input. On a rising edge of any PWM1-16, the IC's internal support circuitry is enabled and the specific channel turns on. LED current flows in the channel until the falling edge of the PWM1-16 input. In this way, the average LED current is modulated. The minimum on time

of a channel is  $2\mu\text{s}$  and the maximum period is  $10\text{ms}$  (at  $100\text{Hz}$ ). Therefore, the maximum dimming ratio is  $5000:1$ . Since the maximum  $R_{\text{SET}}$  produces  $10\text{mA}$ , the minimum modulated LED current is  $2\mu\text{A}$ .

When multiple channels are modulated, the rising edges of PWM1-16 must be synchronized. The falling edges may be asynchronous. A sample timing diagram is shown in Figure 3.

Figure 3. Timing Diagram for Multi-Channel Modulation

## APPLICATIONS INFORMATION

### Board Layout Considerations

As with all switching regulators, careful attention must be paid to the PCB board layout and component placement. To prevent electromagnetic interference (EMI) problems, proper layout of high frequency switching paths is essential. Minimize the length and area of all traces connected to

the SW1-16 and PWM1-16 pins. Keep the sense voltage pins ( $V_{IN}$  and L1-16) away from the switching nodes. Place  $C_{OUT1-16}$  and  $C_{IN}$  close to the  $V_{IN}$  pins. Always use a ground plane under the switching regulator to minimize interplane coupling. Recommended component placement is shown in Figures 4-7.
