

FEATURES

Extreme high temperature operation
Specified temperature range
 –55°C to +210°C (16-lead FLATPACK)
 –55°C to +175°C (16-lead TSSOP)
3.0 V to 5.5 V single supply
±2.5 V dual supply
10 Ω on resistance, maximum
2 Ω on-resistance flatness, maximum
12 ns switching times
Single 8:1 multiplexer
Low power consumption
TTL-/CMOS-compatible inputs

APPLICATIONS

Downhole drilling and instrumentation
Avionics
Heavy industrial
High temperature environments

GENERAL DESCRIPTION

The ADG798 is a low voltage, CMOS, analog multiplexer designed to operate at very high temperatures up to 210°C. The ADG798 switches one of eight inputs (S1 to S8) to a common output, D, as determined by the 3-bit binary address lines A0, A1, and A2. An EN input on the device enables or disables the device. When the device is disabled, all channels are switched off.

The ADG798 features low power consumption and a 3.3 V to 5.5 V operating supply range. All channels exhibit break-before-make switching action, preventing momentary shorting when switching channels. These switches are designed with an enhanced submicron process that provides low power dissipation, high switching speed, and very low on resistance.

The on resistance (R_{ON}) is a maximum of 10 Ω and is closely matched between switches and very flat over the full signal range. The ADG798 operates equally well as either a multiplexer or a demultiplexer and has an input signal range that extends to the supplies.

This mux is available in a 16-lead ceramic flat package (FLATPACK) and a 16-lead ceramic flat package with reverse formed gullwing leads (FLATPACK_RF). Both of the flat

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

packages have an operating temperature range of –55°C to +210°C. A 16-lead TSSOP package is also available that has an operating temperature range of –55°C to +175°C. All packages are designed for robustness at extreme temperatures, and are qualified for 1000 hours of continuous operation at the maximum temperature rating.

The ADG798 is a member of a growing series of high temperature qualified products offered by Analog Devices, Inc. For a complete selection table of available high temperature products, see the high temperature product list and qualification data available at <http://www.analog.com/hightemp>.

PRODUCT HIGHLIGHTS

- Single-Supply/Dual-Supply Operation.**
The ADG798 is fully specified and guaranteed with 3.3 V and 5 V single-supply rails and ± 2.5 V dual-supply rails.
- Low R_{ON} .**
The R_{ON} of the ADG798 is specified at 5 Ω , typical, at 210°C.
- Low Power Consumption.**
The power consumption of the ADG798 is specified at <0.01 μ W.
- Guaranteed Break-Before-Make Switching Action.**

Analog Inputs ¹	$V_{SS} - 0.3\text{ V}$ to $V_{DD} + 0.3\text{ V}$ or 30 mA, whichever occurs first
Digital Inputs ¹	−0.3 V to $V_{DD} + 0.3\text{ V}$ or 30 mA, whichever occurs first
Peak Current, Sx or D (Pulsed at 1 ms, 10% Duty Cycle Maximum)	94.9 mA
Continuous Current, Sx or D ²	Data + 5%
Operating Temperature Range	
TSSOP	−55°C to +175°C
FLATPACK	−55°C to +210°C
Junction Temperature	
TSSOP	180°C
FLATPACK	211°C

¹ Overvoltages at Ax, EN, Sx, or D are clamped by internal codes. Limit the current to the maximum ratings given.

² See Table 4.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Only one absolute maximum rating can be applied at any one time.

THERMAL RESISTANCE

Thermal performance is directly linked to PCB design and operating environment. Close attention to PCB thermal design is required.

Table 6. Thermal Resistance

Package Type ¹	θ_{JA}	θ_{JC}	Unit
F-16-1	70	22	°C/W
FR-16-1	70	10	°C/W
RU-16	109.6	36.5	°C/W

¹ Thermal impedance simulated values are based on a JEDEC 2s2p thermal test board. See JEDEC JESD51.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. TSSOP and FLATPACK Pin Configuration

Figure 3. Reversed Formed FLATPACK Pin Configuration

Table 7. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	A0	Digital Input. This pin controls the configuration of the switch, as shown in the truth table (see Table 8).
2	EN	Digital Input. This pin controls the configuration of the switch, as shown in the truth table (see Table 8).
3	V _{SS}	Most Negative Power Supply Pin in Dual-Supply Applications. For single-supply applications, tie this pin to GND.
4	S1	Source Terminal. This pin can be an input or output.
5	S2	Source Terminal. This pin can be an input or output.
6	S3	Source Terminal. This pin can be an input or output.
7	S4	Source Terminal. This pin can be an input or output.
8	D	Drain Terminal. This pin can be an input or output.
9	S8	Source Terminal. This pin can be an input or output.
10	S7	Source Terminal. This pin can be an input or output.
11	S6	Source Terminal. This pin can be an input or output.
12	S5	Source Terminal. This pin can be an input or output.
13	V _{DD}	Most Positive Power Supply Pin.
14	GND	Ground (0 V) Reference.
15	A2	Digital Input. This pin controls the configuration of the switch, as shown in the truth table (see Table 8).
16	A1	Digital Input. This pin controls the configuration of the switch, as shown in the truth table (see Table 8).

TERMINOLOGY

V_{DD}

V_{DD} is the most positive power supply potential.

V_{SS}

V_{SS} is the most negative power supply in a dual-supply application. In single-supply applications, tie V_{SS} to ground at the device.

GND

GND is the ground (0 V) reference.

S_x

S_x are the source terminals and can be inputs or outputs.

D

D is the drain terminal and can be an input or an output.

A_x

A_x is the logic control input.

EN

EN is the active high enable.

R_{ON}

R_{ON} is the ohmic resistance between D and S_x.

R_{FLAT} (ON)

R_{FLAT} (ON) flatness is the difference between the maximum and minimum value of on resistance as measured over the specified analog signal range.

I_s (Off)

I_s (Off) is the source leakage current with the switch off.

I_D (Off)

I_D (Off) is the drain leakage current with the switch off.

I_D, I_s (On)

I_D, I_s (On) is the channel leakage current with the switch on.

V_D (V_s)

V_D (V_s) is the analog voltage on Terminal D and Terminal S_x.

C_s (Off)

C_s (Off) is the off switch source capacitance and is measured with reference to ground.

C_D (Off)

C_D (Off) is the off switch drain capacitance and is measured with reference to ground.

C_D, C_s (On)

C_D, C_s (On) is the on switch capacitance and is measured with reference to ground.

C_{IN}

C_{IN} is the digital input capacitance.

t_{TRANSITION}

t_{TRANSITION} is the delay time measured between the 50% and 90% points of the digital inputs and the switch on condition when switching from one address state to another.

t_{ON} (EN)

t_{ON} (EN) is the delay time between the 50% and 90% points of the EN digital input and the switch on condition.

t_{OFF} (EN)

t_{OFF} (EN) is the delay time between the 50% and 90% points of the EN digital input and the switch off condition.

t_{OPEN}

t_{OPEN} is the off time measured between the 80% points of both switches when switching from one address state to another.

Off Isolation

Off isolation is a measure of unwanted signal coupling through an off switch.

Channel to Channel Crosstalk

Channel to channel crosstalk is a measure of unwanted signal that is coupled through from one channel to another as a result of parasitic capacitance.

Charge Injection

Charge injection is a measure of the glitch impulse transferred from injection of the digital input to the analog output during switching.

–3 dB Bandwidth

–3 dB bandwidth is the frequency at which the output is attenuated by 3 dB.

On Response

On response is the frequency response of the on switch.

On Loss

On loss is the loss due to the on resistance of the switch.

V_{INL}

V_{INL} is the maximum input voltage for Logic 0.

V_{INH}

V_{INH} is the minimum input voltage for Logic 1.

I_{INL} (I_{INH})

I_{INL} (I_{INH}) is the input current of the digital input.

I_{DD}

I_{DD} is the positive supply current.

I_{SS}

I_{SS} is the negative supply current.

THEORY OF OPERATION

The ADG798 is a bidirectional, 8:1 CMOS multiplexer designed for very high temperature operation. The device is controlled by four parallel digital inputs (EN, A0, A1, and A2). The EN input allows the ADG798 to be enabled or disabled. When the ADG798 is disabled, the source pins (S1 to S8) disconnect from the drain pin (D). When the ADG798 is enabled, the address lines (A0, A1, and A2) can determine which source pin (S1 to S8) is connected to the drain pin (D).

The low on resistance and on-resistance flatness of this device means that there is minimal signal distortion across the entire signal range of the device. This minimal signal distortion, combined with the close on-resistance match between channels,

makes this device ideal for applications where the error due to on resistance is key. The ADG798 also exhibits extremely fast switching times and extremely low power consumption, making the device useful in applications where there is a tight power budget. The ADG798 is compatible with single-supply systems that have a V_{DD} range from 5.5 V to 3.3 V and dual-supply systems at ± 2.5 V.

The ADG798 operates in a wide ambient temperature range from -55°C to $+210^{\circ}\text{C}$ (FLATPACK) or -55°C to $+175^{\circ}\text{C}$ (TSSOP), making the ADG798 perfect for use in harsh environments that subject the device to extreme temperature ranges, such as downhole drilling and avionics.

APPLICATIONS INFORMATION

POWER SUPPLY SEQUENCING

When using CMOS devices, take care to ensure correct power supply sequencing. Incorrect power supply sequencing may subject the device to stresses beyond the absolute maximum ratings listed in Table 5.

Always apply digital and analog inputs after power supplies and ground. For single-supply operation, tie V_{SS} to GND as close to the device as possible.
