

FEATURES

Wideband switch: -3 dB @ 4 GHz
 ADG936 absorptive dual SPDT
 ADG936-R reflective dual SPDT
 High off isolation (36 dB @ 1 GHz)
 Low insertion loss (0.9 dB dc to 1 GHz)
 Single 1.65 V to 2.75 V power supply
 CMOS/LVTTL control logic
 20-lead TSSOP and 4 mm \times 4 mm LFCSP packages
 Low power consumption (1 μ A maximum)

APPLICATIONS

Wireless communications
 General-purpose RF switching
 Dual-band applications
 High speed filter selection
 Digital transceiver front end switch
 IF switching
 Tuner modules
 Antenna diversity switching

GENERAL DESCRIPTION

The ADG936/ADG936-R are wideband analog switches that comprise two independently selectable SPDT switches using a CMOS process to provide high isolation and low insertion loss to 1 GHz. The ADG936 is an absorptive/matched dual SPDT with 50 Ω terminated shunt legs; the ADG936-R is a reflective dual SPDT. These devices are designed such that the isolation is high over the dc to 1 GHz frequency range. They have on-board CMOS control logic, eliminating the need for external controlling circuitry. The control inputs are both CMOS and LVTTL

¹ Temperature range of B Version: -40°C to $+85^\circ\text{C}$.

² Typical values are at $V_{DD} = 2.5\text{ V}$ and 25°C , unless otherwise noted.

³ Operating frequency is the point at which insertion loss degrades by 1 dB.

⁴ Guaranteed by design, not subject to production test.

⁵ Video feedthrough is the dc transience at the output of any port of the switch when the control voltage is switched from high to low or from low to high in a $50\ \Omega$ test setup, measured with 1 ns rise time pulses and a 500 MHz bandwidth.

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 2.

Parameter	Rating
V_{DD} to GND	$-0.5\text{ V to }+4\text{ V}$
Inputs to GND	$-0.5\text{ V to }V_{DD} + 0.3\text{ V}^1$
Continuous Current	30 mA
Input Power	18 dBm
Operating Temperature Range	
Industrial (B Version)	$-40^\circ\text{C to }+85^\circ\text{C}$
Storage Temperature Range	$-65^\circ\text{C to }+150^\circ\text{C}$
Junction Temperature	150°C
TSSOP Package	
θ_{JA} Thermal Impedance	143°C/W
LFCSP Package	
θ_{JA} Thermal Impedance (4-Layer Board)	30.4°C/W
Lead Temperature, Soldering (10 sec)	300°C
IR Reflow, Peak Temperature (<20 sec)	235°C
ESD	1 kV

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Only one absolute maximum rating may be applied at any one time.

Table 3. Truth Table

INx	RF1x	RF2x
0	Off	On
1	On	Off

¹ RF1x/RF2x off port inputs to ground = $-0.5\text{ V to }V_{DD} - 0.5\text{ V}$.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

Table 4. Pin Function Descriptions

Pin No.		Mnemonic	Description
20-Lead TSSOP	20-Lead LFCSP		
1	18	RFCA	Common RF Port for Switch A.
2	19	V _{DD}	Power Supply Input. These parts can operate from 1.65 V to 2.75 V. V _{DD} should be decoupled to GND.
3, 5, 6, 8, 9, 11, 13, 15, 16, 18, 20	1, 3, 4, 6, 7, 9, 12, 13, 15, 17, 20	GND	Ground Reference Point for All Circuitry on the Part.
4	2	RF1A	RF1A Port.
7	5	RF1B	RF1B Port.
10	8	RFCB	Common RF Port for Switch B.
12	10	INB	Logic Control Input.
14	11	RF2B	RF2B Port.
17	14	RF2A	RF2A Port.
19	16	INA	Logic Control Input.
	EP	EP	Exposed Pad. The exposed pad must be tied to substrate, GND.

TERMINOLOGY

Table 5.

Parameter	Description
V_{DD}	Most Positive Power Supply Potential.
I_{DD}	Positive Supply Current.
GND	Ground (0 V) Reference.
INx	Logic Control Input.
V_{INL}	Maximum Input Voltage for Logic 0.
V_{INH}	Minimum Input Voltage for Logic 1.
I_{INL} (I_{INH})	Input Current of the Digital Input.
C_{IN}	Digital Input Capacitance.
t_{ON}	Delay Between Applying the Digital Control Input and the Output Switching On.
t_{OFF}	Delay Between Applying the Digital Control Input and the Output Switching Off.
t_{RISE}	Rise Time. Time for the RF signal to rise from 10% of the on level to 90% of the on level.
t_{FALL}	Fall Time. Time for the RF signal to fall from 90% of the on level to 10% of the on level.
Off Isolation	The Attenuation Between Input and Output Ports of the Switch When the Switch Control Voltage Is in the Off Condition.
Insertion Loss	The Attenuation Between Input and Output Ports of the Switch When the Switch Control Voltage Is in the On Condition.
Crosstalk	Measure of Unwanted Signal Coupled Through from One Channel to Another as a Result of Parasitic Capacitance.
$P_{-1\text{ dB}}$	1 dB Compression Point. The RF input power level at which the switch insertion loss increases by 1 dB over its low level value. $P_{-1\text{ dB}}$ is a measure of how much power the on switch can handle before the insertion loss increases by 1 dB.
IP_3	Third-Order Intermodulation Intercept. This is a measure of the power in false tones that occurs when closely spaced tones are passed through a switch, whereby the nonlinearity of the switch causes these false tones to be generated.
Return Loss	The Amount of Reflected Power Relative to the Incident Power at a Port. Large return loss indicates good matching. By measuring return loss, the voltage standing wave ratio (VSWR) can be calculated from conversion charts. VSWR indicates the degree of matching present at a switch RF port.
Video Feedthrough	Spurious Signals Present at the RF Ports of the Switch When the Control Voltage Is Switched from High to Low or from Low to High Without an RF Signal Present.

APPLICATIONS

The ADG936/ADG936-R are ideal solutions for low power, high frequency applications. The low insertion loss, high isolation between ports, low distortion, and low current consumption of these parts make them excellent solutions for many high frequency switching applications. They can be used in applications such as switchable filters, transmitters and receivers for radar systems, and communication systems from base stations to cell phones.

The ADG9xx family of wideband switches is designed to meet the demands of devices transmitting at ISM band frequencies to 1 GHz and higher. The low insertion loss, high isolation between ports, single pin control interface, no requirement for dc blocking capacitors, and TTL interface compatibility make them cost-effective and easy-to-integrate switching solutions for many high frequency switching and low power applications, because the parts can handle up to 16 dBm of power.

ABSORPTIVE VS. REFLECTIVE

The ADG936 is an absorptive (matched) switch with 50 Ω terminated shunt legs; the ADG936-R is a reflective switch with 0 Ω terminated shunts to ground. The ADG936 absorptive switch has a good VSWR on each port, regardless of the switch mode. An absorptive switch should be used when there is a need for a good VSWR that is looking into the port but not passing the through-signal to the common port. The ADG936 is, therefore, ideal for applications that require minimum reflections back to the RF source. It also ensures that the maximum power is transferred to the load.

The ADG936-R reflective switch is suitable for applications in which high off-port VSWR does not matter. The switch also has some other desired performance features. It can be used in many applications, including high speed filter selection. In most cases, an absorptive switch can be used instead of a reflective switch, but not vice versa.

FILTER SELECTION

The ADG936 and ADG936-R can be used to switch high frequency signals between different filters and to multiplex the signal to the output. These dual SPDT switches are also ideal for high speed signal routing and for switching high speed differential signals.

Figure 27. Filter Selection

Tx/Rx SWITCHING

The low insertion loss and high isolation between ports ensure that the ADG936/ADG936-R are suitable transmit/receive switches for all ISM band and wireless LAN applications, providing the required isolation between the transmit and receive signals.

Figure 28. Tx/Rx Switching

ANTENNA DIVERSITY SWITCH

The ADG936/ADG936-R are ideal for use as antenna diversity switches, switching in different antennas to the tuner. The low insertion loss, which ensures minimum signal loss and high isolation between channels, makes these dual SPDT switches suitable for switching applications in tuner modules and set-top boxes.

EVALUATION BOARD

The ADG936 and ADG936-R evaluation board allows designers to evaluate these high performance wideband switches with minimal effort.

To prove that these devices meet the user's requirements, only a power supply and a network analyzer, along with the evaluation board, are required. An application note available with the evaluation board gives complete information on operating the evaluation board.

The RFCA port is connected through a 50 Ω transmission line to SMA Connector J3. The RFCB port is connected through a 50 Ω transmission line to SMA Connector J4. RF1A, RF2A, RF1B, and RF2B are connected through 50 Ω transmission lines to SMA Connectors J5, J6, J7, and J8, respectively. A through transmission line connects J9 and J10; this transmission line is used to estimate the loss of the PCB over the environmental conditions being evaluated.

The board is constructed of a 4-layer FR4 material with a dielectric constant of 4.3 and an overall thickness of 0.062 in. Two ground layers with grounded planes provide ground for the RF transmission lines. The transmission lines were designed using a coplanar waveguide with a ground plane model using a trace width of 0.024 in, a clearance to ground plane of 0.008 in, a dielectric thickness of 0.02 in, and a metal thickness of 0.0021 in.
