

# Mobile I/O Expander and **QWERTY Keypad Controller**

**ADP5588 Data Sheet** 

#### **FEATURES**

18-GPIO port expander or 10 × 8 keypad matrix GPIOs configurable to GPIs, GPOs, and keypad rows or

Dual light sensor inputs (C8 and C9)

I<sup>2</sup>C interface

I<sup>2</sup>C register read autoincrement

1.8 V to 3.0 V operation

**Keypad lock capability** 

Open-drain interrupt output

Key press and key release interrupts

**GPI** interrupt with level programmability

Programmable pull-ups

Key event counter with overflow interrupt

50 µs debounce on the reset line and GPIs

1 μA typical idle current, 55 μA typical polling current drain for one key press

Small 4 mm × 4 mm LFCSP package

#### **APPLICATIONS**

Keypad and I/O expander designed for QWERTY type phones that require a large keypad matrix

#### **GENERAL DESCRIPTION**

The ADP5588 is an I/O port expander and keypad matrix designed for QWERTY type phones that require a large keypad matrix and expanded I/O lines. I/O expander ICs are used in mobile platforms as a solution to the limited number of GPIOs available in the main processor.

In its small 4 mm  $\times$  4 mm package, the ADP5588 contains enough power to handle all key scanning and decoding and flag the processor of key presses and releases via the I<sup>2</sup>C\* interface and interrupt. It frees the main microprocessor from having to monitor the keypad, thereby minimizing current drain and increasing processor bandwidth. It is also equipped with a buffer/FIFO and key event counter to handle and keep track of up to 10 unprocessed key or GPI events with overflow wrap and interrupt capability.

The ADP5588 has a keylock capability with an option to trigger or not trigger an interrupt at key presses and releases. All communication to the main processor is done using one interrupt line and two I<sup>2</sup>C-compatible interface lines. The ADP5588 can be configured to have a keypad matrix of up to 8 rows × 10 columns (a maximum of 80 keys).

#### FUNCTIONAL BLOCK DIAGRAM

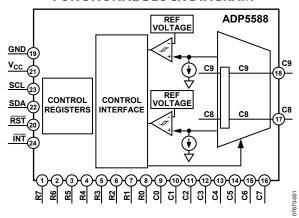

Figure 1.

When used for smaller keypad matrices, unused row and column pins can be reconfigured to act as general-purpose inputs, outputs, or light sensor inputs. R0, R1, R2, R3, R4, R5, R6, and R7 denote the row pins of the matrix, while C0, C1, C2, C3, C4, C5, C6, C7, C8, and C9 denote the column pins. At power-up, all rows and columns default as GPIs and must be programmed to function as part of the keypad matrix, GPOs, or light sensor inputs. In addition to keypad and GPIO functionalities, C8 and C9 can also be configured as light sensor inputs.

When configured as keypad lines, the function of the C8 and C9 lines is straightforward: the control interface disconnects these lines from the comparator inputs, disables the light sensor comparator, and connects them to the keypad columns of the keypad matrix. When used as light sensor comparator inputs, the control interface disconnects these pins from the keypad, enables the comparators, and connects these lines to the comparator inputs. Two external capacitors (0.1 µF) are required when these pins are configured as light sensor inputs. When used as GPIOs, these pins are removed from the keypad and the light sensor interface, and the light sensor comparators are disabled, along with the logic for the sensors.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

#### THERMAL RESISTANCE

 $\theta_{JA}$  is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

**Table 8. Thermal Resistance** 

| Package Type     | θ <sub>JA</sub> | θ <sub>JC</sub> | Unit |
|------------------|-----------------|-----------------|------|
| 24-Lead LFCSP_VQ | 57.8            | 9.4             | °C/W |
| Maximum Power    | 600             |                 | mW   |

## **ESD CAUTION**

**ESD** (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

# PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

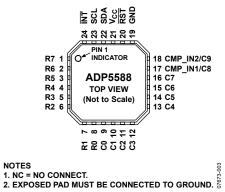

Figure 3. Pin Configuration

**Table 9. Pin Function Descriptions** 

| Pin No. | Mnemonic        | Description   |
|---------|-----------------|---|
| 1       | R7              | GPIO, Row 7 in the Keypad Matrix.   |
| 2       | R6              | GPIO, Row 6 in the Keypad Matrix.   |
| 3       | R5              | GPIO, Row 5 in the Keypad Matrix.   |
| 4       | R4              | GPIO, Row 4 in the Keypad Matrix.   |
| 5       | R3              | GPIO, Row 3 in the Keypad Matrix.   |
| 6       | R2              | GPIO, Row 2 in the Keypad Matrix.   |
| 7       | R1              | GPIO, Row 1 in the Keypad Matrix.   |
| 8       | R0              | GPIO, Row 0 in the Keypad Matrix.   |
| 9       | C0              | GPIO, Column 0 in the Keypad Matrix.  |
| 10      | C1              | GPIO, Column 1 in the Keypad Matrix.  |
| 11      | C2              | GPIO, Column 2 in the Keypad Matrix.  |
| 12      | C3              | GPIO, Column 3 in the Keypad Matrix.  |
| 13      | C4              | GPIO, Column 4 in the Keypad Matrix.  |
| 14      | C5              | GPIO, Column 5 in the Keypad Matrix.  |
| 15      | C6              | GPIO, Column 6 in the Keypad Matrix.  |
| 16      | C7              | GPIO, Column 7 in the Keypad Matrix.  |
| 17      | CMP_IN1/C8      | GPIO, Column 8 in the Keypad Matrix; Comparator Input for Photosensor 1.  |
| 18      | CMP_IN2/C9      | GPIO, Column 9 in the Keypad Matrix; Comparator Input for Photosensor 2.  |
| 19      | GND             | Ground.   |
| 20      | RST             | Hardware Reset (Active Low). This bit resets the device to the power default conditions. The reset pin must be driven for a minimum of 50 $\mu$ s to be valid and to prevent falsing due to ESD glitches or noise in the system. If not used, $\overline{\text{RST}}$ must be tied high with a pull-up. |
| 21      | V <sub>CC</sub> | $V_{CC} = 1.7 \text{ V to } 3.3 \text{ V}.$   |
| 22      | SDA             | I <sup>2</sup> C Serial Data (Open Drain Requires External Pull-up).  |
| 23      | SCL             | I <sup>2</sup> C Clock.   |
| 24      | ĪNT             | Processor Interrupt, Active Low, Open Drain. This pin can be pulled up to 2.7 V or 1.8 V for selection flexibility in the processor GPIO supply group.  |
| EP      | EPAD            | Exposed Pad. The exposed pad must be connected to ground.   |

# THEORY OF OPERATION

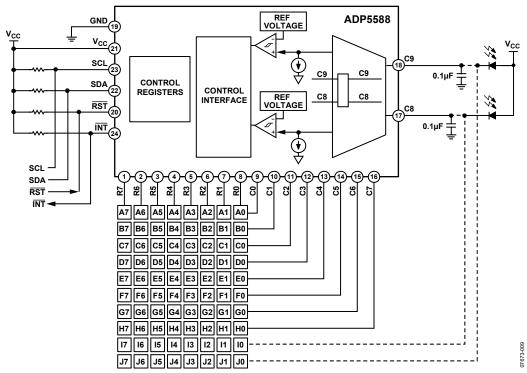

Figure 4. Typical Operating Circuit

The ADP5588 is a GPIO expander that can be configured either as an 18-I/O port expander or as a 10 column  $\times$  8 row keypad matrix (80 keys maximum). It is ideal for cellular phone designs and other portable devices that require a large extended keypad and/or expanded I/Os (see the Applications Information section for various configurations). When smaller size keypads are required, unused GPIOs in the keypad matrix can be used as I/Os (GPOs and GPIs). Two of the columns (C8 and C9) can also be configured as comparator inputs for single or dual light sensors. All GPIOs (rows and columns) default as GPIs at power-up with pull-ups and debounce enabled.

#### **KEYPAD OPERATION**

Any number of rows and columns, up to 10 columns  $\times$  8 rows, can be configured to be part of the keypad matrix. The rows and columns that make up the keypad matrix must be configured by setting the corresponding bits in Register 0x1D through Register 0x1F. Keys on the keypad matrix appear on the key event table with a decimal value of 1 (0x01 hexidecimal or 0000001 binary) and run through 80 decimals (0x50 hexidecimal or 1010000 binary). See Table 10 for key event number assignments. The keypad, in idle mode, is configured with columns being driven low and rows as inputs high with pull-ups.

Table 10. Key Event Number Assignment Table

| Row | CO | <b>C</b> 1 | C2 | С3 | C4 | C5 | C6 | <b>C7</b> | <b>C8</b> | C9 |
|-----|----|------------|----|----|----|----|----|-----------|-----------|----|
| R0  | 1  | 2          | 4  | 4  | 5  | 6  | 7  | 8         | 9         | 10 |
| R1  | 11 | 12         | 13 | 14 | 15 | 16 | 17 | 18        | 19        | 20 |
| R2  | 21 | 22         | 23 | 24 | 25 | 26 | 27 | 28        | 29        | 30 |
| R3  | 31 | 32         | 33 | 34 | 35 | 36 | 37 | 38        | 39        | 40 |
| R4  | 41 | 42         | 43 | 44 | 45 | 46 | 47 | 48        | 49        | 50 |
| R5  | 51 | 52         | 53 | 54 | 55 | 56 | 57 | 58        | 59        | 60 |
| R6  | 61 | 62         | 63 | 64 | 65 | 66 | 67 | 68        | 69        | 70 |
| R7  | 71 | 72         | 73 | 74 | 75 | 76 | 77 | 78        | 79        | 80 |

When one key press or multiple key presses (short between column and row) occur, the internal state machine checks the row pins to determine which one is driven low and then triggers an interrupt. The state machine then starts a key scan cycle to determine which keys are pressed. After a key has been pressed for 25 ms, the state machine sets the appropriate key(s) in the key event status register with the key-pressed bits set (the MSB in the key event register) in the order detected. If the KE\_IEN field in Register 0x01 is set, the state machine then sets the KE\_INT field in Register 0x01 and generates an interrupt to the host processor.

To prevent glitches or narrow press times registering as valid key presses, the key scanner requires the key to be pressed for two scan cycles. The key scanner has a sampling period of 25 ms, so the key must be pressed and held for at least 25 ms to register as pressed. If the key is continuously pressed, the key scanner continues to sample every 25 ms. If a key that was pressed is released for 25 ms or greater, the state machine sets the appropriate keys in the key event status register with the key pressed bits cleared in the order detected. Because the release of a key is not necessarily in sync with the key scan sampling period, it may take between 25 ms and 50 ms for a key to register as released. After the key is registered as released, the key scanner goes back to idle mode. Figure 5 shows the row and column pins connected to a typical  $10 \times 8$ , 80-switch keypad matrix.

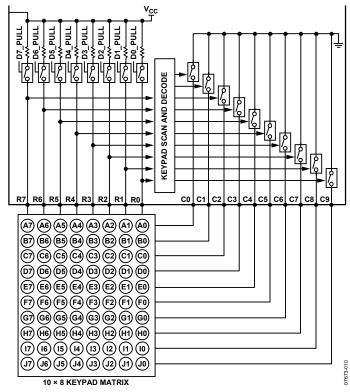

Figure 5. Keypad Decode Configuration

#### **Key Event Tracking**

The 10-key event registers are set to act as a FIFO, meaning that reading any of the 10-key event registers yields the key events in the order they were pressed and released.

Tracking of key events is done with the help of the key event counter (the KEC field in Register 0x03) and the FIFO/key event registers (Register 0x04 through Register 0x0D). The KEC count increases as keys are pressed and released; up to 10 events can be logged in the counter. The FIFO/key event registers, on the other hand, display the key events and their status (pressed or released) as they are read out of the FIFO. The FIFO registers are made of eight bits, with the MSB dedicated as the status bit (1 indicates a press and 0 indicates a release); the remaining seven bits are used to display binary representation of the keys that are pressed or released.

The first read of any of the FIFO registers displays the first event that happened and its status. Subsequent reads of the same register replace the register data with the next event that happens. If tracking of all the events is important, it is best to use a single register per event. After all the events in the FIFO are read, reading of any of the event registers yields a zero value.

Table 11 and Table 12 show the event sequences as they are logged in and read from the FIFO. The 10 FIFO registers are labeled A through J, and keys are labeled A0 through J7.

**Table 11. Example of Event Sequence** 

| Key Pressed/Released | Status   | Key Event Counter |
|----------------------|----------|-------------------|
| A0                   | Pressed  | 1                 |
| B1                   | Pressed  | 2                 |
| A0                   | Released | 3                 |
| C2                   | Pressed  | 4                 |
| B1                   | Released | 5                 |
| D3                   | Pressed  | 6                 |
| C2                   | Released | 7                 |
| E4                   | Pressed  | 8                 |
| E4                   | Released | 9                 |
| D3                   | Released | 10                |

Table 12. Interpretation of FIFO Event Reading

| Key Event<br>Counter | Key Event<br>Register<br>Read | Key Event Reg-<br>ister Content<br>(Binary) <sup>1</sup> | Key Event<br>Register<br>Interpretation |
|----------------------|-------------------------------|--|---|
| 10                   | N/A                           | N/A  | N/A                                     |
| 9                    | D                             | 1 0000001  | Key A0 pressed                          |
| 8                    | E                             | 1 0001100  | Key B1 pressed                          |
| 7                    | C                             | 0 0000001  | Key A0 released                         |
| 6                    | F                             | 1 0010111  | Key C2 pressed                          |
| 5                    | G                             | 0 0001100  | Key B1 released                         |
| 4                    | Α                             | 1 0100010  | Key D3 pressed                          |
| 3                    | В                             | 0 0010111  | Key C2 released                         |
| 2                    | Н                             | 1 0101101  | Key E4 pressed                          |
| 1                    | J                             | 0 0101101  | Key E4 released                         |
| 0                    | I                             | 0 0100010  | Key D3 released                         |

<sup>&</sup>lt;sup>1</sup> The first number indicates a key press or key release in Bit 7 of the key event register: 1 = key press; 0 = key release.

#### **Key Event Overflow**

The ADP5588 is equipped with an overflow feature to handle key events beyond the FIFO capacity. When all events are filled, any additional events set the OVR\_FLOW\_INT bit in Register 0x02; if the OVR\_FLOW\_IEN bit in Register 0x01 is set, the host processor is also interrupted when overflow occurs. When the FIFO is not full, new events are added as the last events.

The OVR\_FLOW\_M bit in Register 0x01 sets the mode of operation during overflows. Clearing the OVR\_FLOW\_M bit causes new incoming events to be discarded, and setting this bit rolls over and overwrites old data with new data starting at the first event.

#### **Autoincrement**

The ADP5588 features automatic increment during 1°C read access. This allows the user to increment the address pointer without having to send a read command for subsequent addresses. This minimizes processor intervention and, therefore, saves processor bandwidth and current drain. Bit 7 of Register 0x01 must be set to initiate autoincrement (see Figure 16 for the full write and read sequence).

#### Key Event Interrupt

On a key event (KE) interrupt, the processor reads the interrupt register to determine the cause of the interrupt. If the KE\_INT bit in Register 0x02 is the cause of the interrupt, the state machine sets the KE\_INT bit and reads the key event count from the KEC[3:0] field in Register 0x03 to determine the number of events. It then reads the INT\_STAT register (Register 0x02) to make sure that no new events have come in. After all the events are read, the KEC field is decremented to zero (KEC = 0) and the KE\_INT bit can be cleared by writing a 1 to it. Both key presses and key releases are capable of generating key event interrupts. The KE\_INT bit cannot be cleared, and the  $\overline{\rm INT}$  pin cannot be deasserted, until the FIFO is cleared of all events.

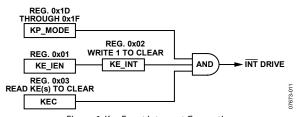

Figure 6. Key Event Interrupt Generation

# **Keypad Lock/Unlock Feature**

The ADP5588 has a locking feature that allows the user to lock the keypad or GPIs (configured to be part of the event table). Once enabled, the keypad lock can prevent generation of key event interrupts and key events to be recorded in the key event table. This feature comprises the Unlock Key 1 and Unlock Key 2 registers (Register 0x0F and Register 0x10), the keypad lock interrupt mask, the keypad unlock timers (Register 0x0E), and the LCK1 and LCK2 bits, and the keylock enable bit (Register 0x03).

The unlock keys can be programmed with any value of the keys in the keypad matrix or any GPI values that are part of the key event table. When the keypad lock interrupt mask timer is enabled, the user must press two specific keys before a keylock interrupt is generated or keypad events are recorded. After the keypad is locked (set Bit 6, Register 0x03 to enable the lock), the first time that the user presses any key, a key event interrupt is generated. No additional interrupt is generated unless both unlock key sequences are correct; then a keylock interrupt is generated.

If the correct unlock keys are not pressed before the mask timer expires, the state machine starts over. The first key event interrupt is generated to allow the software to see that the user has pressed a key so that the host can turn on the LCD and

display the unlock message. The host then reads the lock status register to see if the keypad is unlocked. After the first key event interrupt, the state machine does not interrupt the processor again unless the correct sequence is keyed. The state machine resets if the correct sequences are not keyed before the keypad lock interrupt mask timer expires.

The state of the keypad lock interrupt mask bit (Register 0x01, Bit 2) in the configuration register determines whether the interrupt pin is asserted when the keylock interrupt status bit (Register 0x02, Bit 2) is set. Setting the keylock interrupt mask bit causes the  $\overline{\rm INT}$  pin to be asserted when the keylock interrupt status bit is set in Register 0x02; clearing that bit masks the interrupt, causing the interrupt pin not to respond to the keylock interrupt status bit. The mask interrupt timer should be set for the time that it takes for the LCD to dim or turn off so that, if a key is pressed, the backlight is set to bright mode again or reset to turn on the LCD.

When the unlock mask interrupt timer equals 0, only the correct unlock sequence can generate an interrupt. Disabling the unlock mask interrupt timer allows the processor to remain undisturbed for situations in which the user has the phone in a pocket or purse and the keys are constantly pressed. The flow chart in Figure 6 shows the interaction of the interrupt mask timer and interrupt generation.

#### **GENERAL-PURPOSE INPUTS AND OUTPUTS**

The ADP5588 supports up to 18 programmable GPIOs that can be configured to address a variety of uses. Figure 7 shows the makeup of a typical GPIO block where GPIOx represents any of the 18 I/O lines.

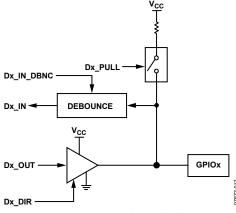

Figure 7. Typical GPIO Block

#### **General Purpose Inputs (GPI)**

The ADP5588 allows the user to configure all or some of its GPIOs into GPIs (general-purpose inputs). After the GPIOs are configured as GPIs, the user can opt to also turn on pull-up resistors and interrupt generation capability, thus reducing the amount of software monitoring and processor interaction and saving power.

The programmed level of the GPI interrupt determines the active level of the GPI pin. For example, if a GPI interrupt level

is programmed as high, a high on that pin is considered active and meets the interrupt requirement. If the interrupt is programmed as low, a low on that pin is considered active and meets the interrupt requirement.

GPI data and interrupt status are reflected in the GPIO interrupt and data status registers (Register 0x11 through Register 0x16). Caution must be taken during software implementation because an interrupt may be set immediately after register settings. To prevent this, correct logic levels must be present at the GPIs, and the GPIO interrupt level must be set before GPIO interrupt enable or GPI event FIFO enable registers are set. Figure 8 shows the interrupt generation scheme, where Dx represents any one of the 18 GPIOs.

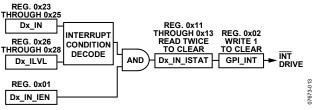

Figure 8. GPIO Interrupt Generation

#### **GPI Events**

A column or row configured as a GPI can be programmed to be part of the key event table and therefore also capable of generating a key event interrupt. A key event interrupt caused by a GPI follows the same process flow as a key event interrupt caused by a key press. GPIs configured as part of the key event table allow single key switches and other GPI interrupts to be monitored. As part of the event table, GPIs are represented by the decimal value 97 (0x61 or 1100001) through the decimal value 114 (0x72 or 1110010). See Table 13 and Table 14 for GPI event number assignments for rows and columns.

Table 13. GPI Event Number Assignments for Rows

| RO | R1 | R2 | R3  | R4  | R5  | R6  | R7  |
|----|----|----|-----|-----|-----|-----|-----|
| 97 | 98 | 99 | 100 | 101 | 102 | 103 | 104 |

Table 14. GPI Event Number Assignments for Columns

| CO  |     |     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 105 | 106 | 107 | 108 | 109 | 110 | 111 | 112 | 113 | 114 |

For a GPI that is set as active high, and is enabled in the key event table, the state machine adds an event to the event count and event table whenever that GPI goes high. If the GPI is set to active low, a transition from high to low is considered a press and is also added to the event count and event table. After the interrupt state is met, the state machine internally sets an interrupt for the opposite state programmed in the register to prevent polling for the released state, thereby saving current. After the released state is achieved, it is added to the event table. The press and release are still indicated by Bit 7 in the event register (Register 0x04 through Register 0x0D). The GPI events can also be used as unlocked sequences.

When the GPI\_EM\_REGx bit in Register 0x20 through Register 0x22 is set, GPI events are not tracked when the keypad is locked. The GPIEM\_CFG bit (Register 0x01, Bit 6) must be cleared for the GPI events to be tracked in the event counter and event table when the keypad is locked.

#### 50 Microsecond Interrupt Configuration

The ADP5588 gives the user the flexibility of deasserting the interrupt for 50  $\mu$ s while there is a pending event. When the INT\_CFG bit in Register 0x01 is set, any attempt to clear the interrupt bit while the interrupt pin is already asserted results in a 50  $\mu$ s deassertion. When the INT\_CFG bit is cleared, processor interrupt remains asserted if the host tries to clear the interrupt. This feature is particularly useful for software development and edge triggering applications.

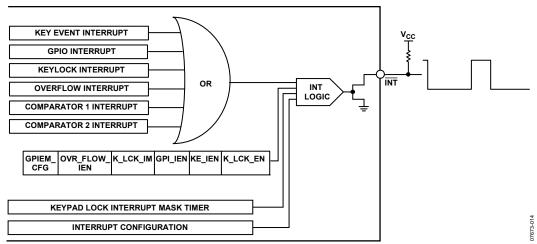

Figure 9. INT Pin Drive

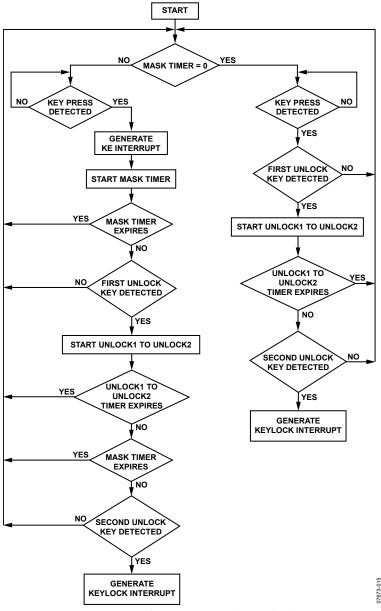

Figure 10. Keypad Lock Interrupt Mask Timer Flowchart

#### Debouncing

The ADP5588 has a 50  $\mu$ s debounce time for GPIOs configured as GPIs and rows in keypad scanning mode. The reset line always has a 50  $\mu$ s debounce time.

#### **General Purpose Outputs (GPOs)**

The ADP5588 allows the user to configure all or some of its GPIOs as GPOs. These GPOs can be used as extra enables for the host processor or simply as trigger outputs. When configured as an output (GPO), a digital buffer drives the pin to 0 V for a 0 and to  $V_{\rm CC}$  for a 1. To set any GPIO as a GPO, make sure that the corresponding bits in Register 0x1D through Register 0x1F are set for GPIO mode; then use Register 0x23 through Register 0x25 to set the corresponding bits for GPO mode.

#### **Power-On Reset**

For built-in power-up initialization for applications lacking a power-on reset signal, a reset pin,  $\overline{RST}$ , allows the user to reset the registers to default values in the event of a brownout or other reset conditions.

# **Ambient Light Sensing**

The ADP5588 has built in light sensor comparator inputs to detect ambient light conditions. An ADC samples the output of external photosensors connected to the comparator inputs, and the result is fed into programmable trip comparators. The ADC has an input range of 0  $\mu A$  to 1000  $\mu A$  (typical). The device can handle up to two photosensors (use Register 0x30 through Register 0x3A to configure the photosensor inputs).

#### **Light Sensor Inputs**

Each light sensor input has two built-in comparators (the L2 comparator and the L3 comparator) with two programmable trip points, L2 and L3. The trip points are used to select among three operation modes based on ambient lighting conditions: outdoor, office, and dark modes.

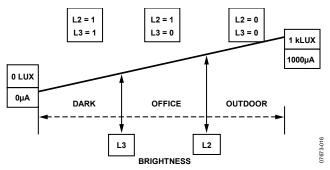

Figure 11. Light Sensor Comparator Modes and Trip Points

#### **L2** Comparator

The L2 comparator is used to detect when the photosensor output drops below the programmable L2\_TRIP point. When this event occurs, the L2\_OUT status signal is set. L2\_CMPR contains programmable hysteresis, meaning that the photosensor output must rise above L2\_TRIP + L2\_HYS before L2\_OUT is cleared.

L2\_CMPR is enabled via the L2\_EN bit (Bit 0, Register 0x31 for Sensor 1 and Bit 0, Register 0x32 for Sensor 2). The L2\_TRIP and L2\_HYS values of L2\_CMPR can be set between 0  $\mu$ A and 1000  $\mu$ A in steps of 4  $\mu$ A.

#### L3 Comparator

The L3 comparator is used to detect when the photosensor output drops below the programmable L3\_TRIP point. When this event occurs, the L3\_OUT status signal is set. L3\_CMPR contains programmable hysteresis, meaning that the photosensor output must rise above L3\_TRIP + L3\_HYS before L3\_OUT is cleared. L3\_CMPR is enabled via the L3\_EN bit. The L3\_TRIP and L3\_HYS values of L3\_CMPR can be set between 0  $\mu A$  and 127.5  $\mu A$  in steps of 0.5  $\mu A$ .

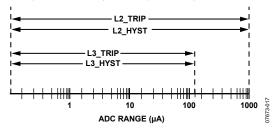

Figure 12. Comparator Ranges

The L2\_CMPR and L3\_CMPR comparators can be enabled independently of each other, and the ADC and comparator(s) run continuously when L2\_EN and/or L3\_EN is set.

#### **Photosensor Operation**

The comparator inputs remain idle until enabled, at which point they detect lighting conditions from the photosensor output. Depending on lighting conditions, and where the L2 and L3 trip points are set in the comparator level trip registers (Register 0x33 through Register 0x3A), the comparators set a value of 1 or 0 to L2\_OUT and L3\_OUT. The values of L2 and L3 determine what mode or setting adjustment is required for a particular lighting condition. Figure 11, Figure 12, and Table 15 summarize the mode settings and logical values of L2 and L3.

Table 15. L2\_OUT and L3\_OUT Comparator Mode Combination

| L3 | L2 | Mode    |
|----|----|---------|
| 0  | 0  | Outdoor |
| 0  | 1  | Office  |
| 1  | 1  | Dark    |

It is also possible to use the light sensor comparators in single-shot mode. A single-shot measurement is done when the FORCE\_RD bit in Register 0x31 is set. After the single-shot measurement is completed, the internal state machine clears the FORCE\_RD bit. It takes 80 ms for a complete conversion. To reduce the potential for flickering, the sensors can be programmed for a number of sequential readings. The filter settings in Register 0x31 and Register 0x32 determine the number of sequential readings needed by the user; these settings range from 80 ms to 10.24 sec.

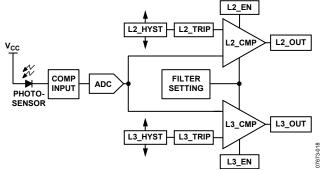

Figure 13. Light Sensor and Trip Points Block Diagram

# **Comparator Interrupt**

The ADP5588 allows the user to trigger an interrupt based on the light sensor comparator inputs. Changes in lighting condition that cause the settings of L2 and L3 to jump from one mode to another (dark, office, outdoor) set the comparator interrupt bits

in Register 0x02. If the comparator interrupt enable bits are set, the interrupt pin is asserted every time the comparator interrupt bits are set. The comparator interrupt flag can be cleared only by writing a 1 to it.

**Table 16. Device Configuration** 

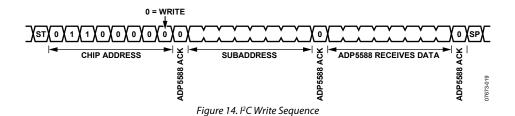

|              | Keypad             | Keypad         |                    | 210             |                             | Photosensor Inputs           |

# I<sup>2</sup>C Programming and Digital Control

The ADP5588 provides full software programmability to facilitate its adoption in various product architectures. All register programming is done via the I<sup>2</sup>C bus at Address 0x69 (01101001) for a read and Address 0x68 (01101000) for a write.

All communication to the ADP5588 is done via its I<sup>2</sup>C-compatible serial interface. Figure 14 shows a typical write sequence for programming an internal register. The cycle begins with a start condition followed by the chip write address (0x68). The ADP5588 acknowledges the chip write address byte by pulling the data line low. The address of the register to which data is to be written is sent next. The ADP5588 acknowledges the register address byte by pulling the data line low. The data byte to be written is sent next. The ADP5588 acknowledges the data byte by pulling the data line low. A stop condition completes the sequence.

Figure 15 shows a typical read sequence for reading back an internal register. The cycle begins with a start condition followed by the chip write address (0x68). The ADP5588 acknowledges the chip write address byte by pulling the data line low. The address of the register from which data is to be read is sent next. The ADP5588 acknowledges the register address byte by pulling the data line low. The cycle continues with a repeat start followed by the chip read address (0x69). The ADP5588 acknowledges the chip read address byte by pulling the data line low. The ADP5588 places the contents of the previously addressed register on the bus for readback. There is no acknowledge following the readback data byte, and the cycle is completed with a stop condition.

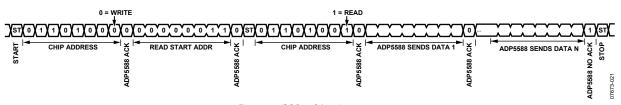

Figure 16. I<sup>2</sup>C Read Autoincrement

# **REGISTERS**

The general behavior of registers is as follows:

- All registers are 0 on reset.
- All registers are read/write unless otherwise specified.
- Unused bits are read as 0.

Table 17.

• Interrupt bits are cleared by writing 1 to the flag; writing 0 or reading the flag has no effect, with the exception of the key press, key release, and GPIO interrupt status registers, which are cleared on a read.

| Address | Register Name   | Description                              |
|---------|-----------------|--|
| 0x00    | DEV_ID          | Device ID                                |

| 0x3C    | CMP1_ADC_DAT_R2 | Comparator 1 ADC Data Register 2                                    |
| 0x3D    | CMP2_ADC_DAT_R1 | Comparator 2 ADC Data Register 1                                    |
| 0x3E    | CMP2_ADC_DAT_R2 | Comparator 2 ADC Data Register 2                                    |

# **REGISTER DESCRIPTIONS**

# Table 18. DEV\_ID—Register 0x00 (Device ID)

Default: 0000 XXXX (where X = don't care).

| Register Name | Register Description        | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|---------------|-----------------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| DEV_ID        | Device ID[3:0], MFG ID[7:4] | MFID3 | MFID2 | MFID1 | MFID0 | DID3  | DID2  | DID1  | DID0  |

Table 19. CFG—Register 0x01 (Configuration Register 1)

| Field        | Bit | Description   |
|--------------|-----|---|
| AUTO_INC     | 7   | I <sup>2</sup> C autoincrement. Burst read is supported; burst write is not supported.                            |
|              |     | 1: I <sup>2</sup> C autoincrement is on.  |
|              |     | 0: I <sup>2</sup> C autoincrement is off.   |
| GPIEM_CFG    | 6   | GPI event mode configuration.   |
|              |     | 1: GPI events are not tracked when the keypad is locked.  |
|              |     | 0: GPI events are tracked when the keypad is locked.  |
| OVR_FLOW_M   | 5   | Overflow mode.  |
|              |     | 1: Overflow mode is on; register overflow data shifts in, starting at the last event and losing first event data. |
|              |     | 0: Overflow mode is off; register overflow data is lost.  |
| INT_CFG      | 4   | Interrupt configuration.  |
|              |     | 1: Processor interrupt deasserts for 50 µs and reasserts with pending key events.                                 |
|              |     | 0: Processor interrupt remains asserted when host tries to clear interrupt while there is a pending key event.    |
| OVR_FLOW_IEN | 3   | Overflow interrupt enable.  |
|              |     | 1: Overflow interrupt is enabled.   |
|              |     | 0: Overflow interrupt is disabled.  |
| K_LCK_IM     | 2   | Keypad lock interrupt mask.   |
|              |     | 1: Keypad lock interrupt is enabled.  |
|              |     | 0: Keypad lock interrupt is disabled.   |
| GPI_IEN      | 1   | GPI interrupt enable.   |
|              |     | 1: GPI interrupt is enabled.  |
|              |     | 0: GPI interrupt is disabled.   |
| KE_IEN       | 0   | Key events interrupt enable.  |
|              |     | 1: Key events interrupt is enabled.   |
|              |     | 0: Key events interrupt is disabled.  |

Table 20. INT\_STAT—Register 0x02 (Interrupt Status Register)

| Field                     | Bit | Description  |  |
|---------------------------|-----|--|--|
| CMP2_INT                  | 5   | Comparator interrupt status. When set, write 1 to clear. |  |
|                           |     | 1: Comparator 2 interrupt is detected.                   |  |
|                           |     | 0: Comparator 2 interrupt is not detected.               |  |
| CMP1_INT                  | 4   | Comparator interrupt status. When set, write 1 to clear. |  |
|                           |     | 1: Comparator 1 interrupt is detected.                   |  |
|                           |     | 0: Comparator 1 interrupt is not detected.               |  |
| OVR_FLOW_INT <sup>1</sup> | 3   | Overflow interrupt status. When set, write 1 to clear.   |  |
|                           |     | 1: Overflow interrupt is detected.                       |  |
|                           |     | 0: Overflow interrupt is not detected.                   |  |
| K_LCK_INT <sup>2</sup>    | 2   | Keylock interrupt status. When set, write 1 to clear.    |  |
|                           |     | 1: Keylock interrupt is detected.                        |  |
|                           |     | 0: Keylock interrupt is not detected.                    |  |
| GPI_INT <sup>1, 3</sup>   | 1   | GPI interrupt status. When set, write 1 to clear.        |  |
|                           |     | 1: GPI interrupt is detected.                            |  |
|                           |     | 0: GPI interrupt is not detected.                        |  |
| KE_INT <sup>1, 3</sup>    | 0   | Key events interrupt status. When set, write 1 to clear. |  |
|                           |     | 1: Key events interrupt is detected.                     |  |
|                           |     | 0: Key events interrupt is not detected.                 |  |

<sup>&</sup>lt;sup>1</sup> The KE\_INT, GPI\_INT, and OVR\_FLOW\_INT bits reflect the status of the interrupts when the interrupt types are enabled even if the processor interrupt is masked.

Table 21. KEY\_LCK\_EC\_STAT—Register 0x03 (Keylock and Event Counter Register)

| Field            | Bit   | Description   |
|------------------|-------|---|
| K_LCK_EN         | [6]   | 0: Lock feature is disabled.  |
|                  |       | 1: Lock feature is enabled.   |
| LCK2, LCK1       | [5:4] | Keypad lock status[1:0] (00 = unlocked; 11 = locked; read only bits). |
| KEC <sup>1</sup> | [3:0] | Key event count of key event register.                                |

<sup>&</sup>lt;sup>1</sup> The KEC bit indicates the key event count of key event registers that have values in the bit (KEC(0000) = 0 events, KEC(0001) = 1 event, KEC(1010) = 10 events. As the key events are read and cleared, the state machine automatically reduces the event count on KEC.

Table 22. KEY\_EVENTx—Register 0x04 to Register 0x0D (Key Event Register A to Key Event Register J)<sup>1</sup>

| Register Name                              | Register Description   | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|--|--|-------|-------|-------|-------|-------|-------|-------|-------|
| KEY_EVENTA<br>(Register 0x04)              | Key Event Register A status (KE[6:0] = Key number),<br>KP[7] = 0: released, 1: pressed (cleared on read) | KA7   | KA6   | KA5   | KA4   | KA3   | KA2   | KA1   | KA0   |
| KEY_EVENTB<br>(Register 0x05)              | Key Event Register B status (KE[6:0] = Key number),<br>KP[7] = 0: released, 1: pressed (cleared on read) | KB7   | KB6   | KB5   | KB4   | KB3   | KB2   | KB1   | KB0   |
| KEY_EVENTC<br>(Register 0x06)              | Key Event Register C status (KE[6:0] = Key number),<br>KP[7] = 0: released, 1: pressed (cleared on read) | KC7   | KC6   | KC5   | KC4   | KC3   | KC2   | KC1   | KC0   |
| KEY_EVENTD<br>(Register 0x07)              | Key Event Register B status (KE[6:0] = Key number),<br>KP[7] = 0: released, 1: pressed (cleared on read) | KD7   | KD6   | KD5   | KD4   | KD3   | KD2   | Kd1   | KD0   |
| KEY_EVENTE <sup>2</sup><br>(Register 0x08) | Key Event Register B status (KE[6:0] = Key number),<br>KP[7]= 0: released, 1: pressed (cleared on read)  | KE7   | KE6   | KE5   | KE4   | KE3   | KE2   | KE1   | KE0   |
| KEY_EVENTF<br>(Register 0x09)              | Key Event Register B status (KE[6:0] = Key number),<br>KP[7] = 0: released, 1: pressed (cleared on read) | KF7   | KF6   | KF5   | KF4   | KF3   | KF2   | KF1   | KF0   |
| KEY_EVENTG<br>(Register 0x0A)              | Key Event Register B status (KE[6:0] = Key number),<br>KP[7] = 0: released, 1: pressed (cleared on read) | KG7   | KG6   | KG5   | KG4   | KG3   | KG2   | KG1   | KG0   |
| KEY_EVENTH<br>(Register 0x0B)              | Key Event Register B status (KE[6:0] = Key number),<br>KP[7] = 0: released, 1: pressed (cleared on read) | KH7   | KH6   | KH5   | KH4   | KH3   | KH2   | KH1   | KH0   |

 $<sup>^{\</sup>rm 2}$  The K\_LCK\_INT bit is the interrupt to the processor when the keypad lock sequence is triggered.

<sup>&</sup>lt;sup>3</sup> If there is a pending key event or GPI interrupt in their respective registers, KE\_INT does not clear until the FIFO is empty, and the GPI\_INT bit does not clear until the cause of the interrupt is resolved. The host must write a 1 to the INT bits to clear.

| Register Name                 | Register Description   | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------------------------|--|-------|-------|-------|-------|-------|-------|-------|-------|
| KEY_EVENTI<br>(Register 0x0C) | Key Event Register B status (KE[6:0] = Key number),<br>KP[7] = 0: released, 1: pressed (cleared on read) | KI7   | KI6   | KI5   | KI4   | KI3   | KI2   | KI1   | KI0   |
| KEY_EVENTJ<br>(Register 0x0D) | Key Event Register B status (KE[6:0] = Key number),<br>KP[7] = 0: released, 1: pressed (cleared on read) | KJ7   | KJ6   | KJ5   | KJ4   | КЈЗ   | KJ2   | KJ1   | KJ0   |

<sup>&</sup>lt;sup>1</sup> Data in key events is provided as a FIFO, where data is sequentially provided on each read, regardless of an event register read. The user can read register Event A only for an event count or can read registers sequentially.

Table 23. KP\_LCK\_TMR—Register 0x0E (Keypad Unlock 1 to Keypad Unlock 2 Timer)

| Register Name                 | Register Description   | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------------------------|--|-------|-------|-------|-------|-------|-------|-------|-------|
| KP_LCK_TMR<br>(Register 0x0E) | Keypad UnLock 1 to Keypad UnLock 2 timer[2:0] (0: disabled, 1 sec to 7 sec) Keypad Lock Interrupt Mask Timer[7:3] (0: disabled, 0 sec to 31 sec) <sup>1, 2</sup> | KIMT7 | KIMT6 | KIMT5 | KIMT4 | KIMT3 | KLLT2 | KLLT1 | KLLT0 |

<sup>&</sup>lt;sup>1</sup> When the keypad lock interrupt mask timer is enabled, the user must press two specific keys before a keylock interrupt is generated or keypad events are recorded. After the keypad is locked, the first time that the user presses any key, a key event interrupt is generated. No additional interrupt is generated unless both unlock key sequences are correct; then a keylock interrupt is generated. When the interrupt mask timer is disabled (0), an interrupt is generated only when the correct full unlock sequence is completed.

#### Table 24. UNLOCK1—Register 0x0F (Unlock Key 1)

| Register Name   | Register Description                   | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-----------------|--|-------|-------|-------|-------|-------|-------|-------|-------|
| UNLOCK1         | Unlock Key 1[6:0] (contains key number | N/A   | ULK6  | ULK5  | ULK4  | ULK3  | ULK2  | ULK1  | ULK0  |
| (Register 0x0F) | for Unlock Key 1; 0: disabled)         |       |       |       |       |       |       | ļ     |       |

#### Table 25. UNLOCK2—Register 0x10 (Unlock Key 2)

| Register Name   | Register Description                   | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-----------------|--|-------|-------|-------|-------|-------|-------|-------|-------|
| UNLOCK2         | Unlock Key 2[6:0] (contains key number | N/A   | ULK6  | ULK5  | ULK4  | ULK3  | ULK2  | ULK1  | ULK0  |
| (Register 0x10) | for Unlock Key 2; 0: disabled)         |       |       |       |       |       |       |       |       |

## Table 26. GPIO\_INT\_STATx—Register 0x11 to Register 0x13 (GPIO Interrupt Status)

| Register Name                     | Register Description  | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-----------------------------------|---|-------|-------|-------|-------|-------|-------|-------|-------|
| GPIO_INT_STAT1<br>(Register 0x11) | GPIO interrupt status (used to check<br>GPIO interrupt status, cleared on read) | R7IS  | R6IS  | R5IS  | R4IS  | R3IS  | R2IS  | R1IS  | ROIS  |
| GPIO_INT_STAT2<br>(Register 0x12) | GPIO interrupt status (used to check<br>GPIO interrupt status, cleared on read) | C7IS  | C6IS  | C5IS  | C4IS  | C3IS  | C2IS  | C1IS  | COIS  |
| GPIO_INT_STAT3<br>(Register 0x13) | GPIO interrupt status (used to check<br>GPIO interrupt status, cleared on read) | N/A   | N/A   | N/A   | N/A   | N/A   | N/A   | C9IS  | C8IS  |

#### Table 27. GPIO\_DAT\_STATx—Register 0x14 to Register 0x16 (GPIO Data Status)

| Register Name                     | Register Description                                     | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-----------------------------------|--|-------|-------|-------|-------|-------|-------|-------|-------|
| GPIO_DAT_STAT1<br>(Register 0x14) | GPIO data status (shows GPIO state when read for inputs) | R7DS  | R6DS  | R5DS  | R4DS  | R3DS  | R2DS  | R1DS  | RODS  |
| GPIO_DAT_STAT2<br>(Register 0x15) | GPIO data status (shows GPIO state when read for inputs) | C7DS  | C6DS  | C5DS  | C4DS  | C3DS  | C2DS  | C1DS  | CODS  |
| GPIO_DAT_STAT3<br>(Register 0x16) | GPIO data status (shows GPIO state when read for inputs) | N/A   | N/A   | N/A   | N/A   | N/A   | N/A   | C9DS  | C8DS  |

<sup>&</sup>lt;sup>2</sup> KE[6:0] reflects the value 1 to 80 for key press events and the value 97 to 114 for GPI events. For KE[7:0], 0 = key released event, 1 = key pressed event. For GPIEM\_CFG, 0 reflects a change in the GPI from GPI\_INT\_LVL = true to GPI\_INT\_LVL = false; 1 reflects a change in the GPI in which the GPI\_INT\_LVL condition becomes true.

<sup>&</sup>lt;sup>2</sup> The Unlock 1 and Unlock 2 timer keys can be either a key sequence or GPIEM\_CFG sequence. The unlock timer keys can be programmed with any value of the keys in the keypad matrix or any GPI values that are part of the key event table. The keylock enable bit (Bit 6, Register 0x03) must be set to lock the keypad.

Table 28. GPIO\_DAT\_OUTx—Register 0x17 to Register 0x19 (GPIO Data Out)

| Register Name                    | Register Description  | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|----------------------------------|---|-------|-------|-------|-------|-------|-------|-------|-------|
| GPIO_DAT_OUT1<br>(Register 0x17) | GPIO data out (GPIO data to be written to GPIO out driver, inputs are not affected). This is needed so that the value can be written prior to being set as an output. | R7DO  | R6DO  | R5DO  | R4DO  | R3DO  | R2DO  | R1DO  | RODO  |
| GPIO_DAT_OUT2<br>(Register 0x18) | GPIO data out (GPIO data to be written to GPIO out driver, inputs are not affected). This is needed so that the value can be written prior to being set as an output. | C7DO  | C6DO  | C5DO  | C4DO  | C3DO  | C2DO  | C1DO  | CODO  |
| GPIO_DAT_OUT3<br>(Register 0x19) | GPIO data out (GPIO data to be written to GPIO out driver, inputs are not affected). This is needed so that the value can be written prior to being set as an output. | N/A   | N/A   | N/A   | N/A   | N/A   | N/A   | C9DO  | C8DO  |

# Table 29. GPIO\_INT\_ENx—Register 0x1A to Register 0x1C (GPIO Interrupt Enable)

| Register Name                   | Register Description  | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|---------------------------------|---|-------|-------|-------|-------|-------|-------|-------|-------|
| GPIO_INT_EN1<br>(Register 0x1A) | GPIO interrupt enable (enables interrupts for GP inputs only) | R7IE  | R6IE  | R5IE  | R4IE  | R3IE  | R2IE  | R1IE  | ROIE  |
| GPIO_INT_EN2<br>(Register 0x1B) | GPIO interrupt enable (enables interrupts for GP inputs only) | C7IE  | C6IE  | C5IE  | C4IE  | C3IE  | C2IE  | C1IE  | COIE  |
| GPIO_INT_EN3<br>(Register 0x1C) | GPIO interrupt enable (enables interrupts for GP inputs only) | N/A   | N/A   | N/A   | N/A   | N/A   | N/A   | C9IE  | C8IE  |

# Table 30. KP\_GPIOx—Register 0x1D to Register 0x1F (Keypad or GPIO Selection)

| Register Name               | Register Description                                | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-----------------------------|---|-------|-------|-------|-------|-------|-------|-------|-------|
| KP_GPIO1<br>(Register 0x1D) | Keypad or GPIO selection<br>0: GPIO<br>1: KP matrix | R7    | R6    | R5    | R4    | R3    | R2    | R1    | R0    |
| KP_GPIO2<br>(Register 0x1E) | Keypad or GPIO selection<br>0: GPIO<br>1: KP matrix | C7    | C6    | C5    | C4    | C3    | C2    | C1    | C0    |
| KP_GPIO3<br>(Register 0x1F) | Keypad or GPIO selection<br>0: GPIO<br>1: KP matrix | N/A   | N/A   | N/A   | N/A   | N/A   | N/A   | C9    | C8    |

# Table 31. GPI\_EM\_REGx—Register 0x20 to Register 0x22 (GPI Event Mode 1 to GPI Event Mode 3)

| Register Name                  | Register Description   | Bit 7 | Bit 6 | Bit   | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|--------------------------------|--|-------|-------|-------|-------|-------|-------|-------|-------|

| Register Name | Register Description                    | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| CMP1_ADC_DAT  | Comparator ADC data register, Bits[7:0] | ADC7  | ADC6  | ADC5  | ADC   | ADC3  | ADC2  | ADC1  | ADC0  |

<sup>&</sup>lt;sup>1</sup> Read-only register; contains the most current 13-bit ADC data of the comparator for Sensor 2.

# APPLICATIONS INFORMATION

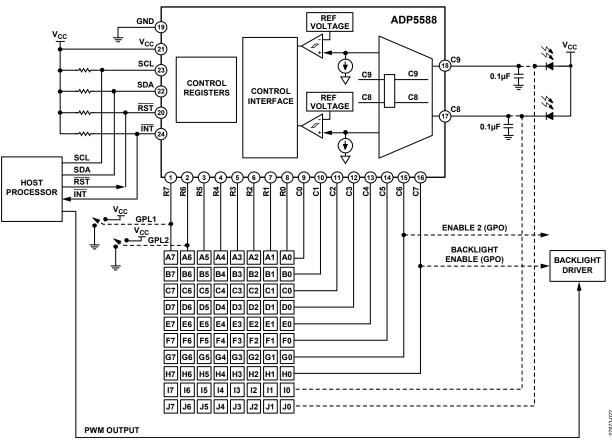

Figure 17. ADP5588 Detailed Application Block Diagram

## **APPLICATIONS OVERVIEW**

The ADP5588 is designed to complement host processors in a variety of ways. Its versatility makes it the ideal solution for mobile platforms that require extended keypads and GPIO expanders. The programmable registers give the designer the flexibility to configure any or all its GPIOs in a variety of ways. Figure 17 shows a detailed application diagram.

#### **KEYPAD CURRENT**

Keypad current drain varies based on how many keys and how many rows and columns are pressed during multiple key presses. Table 52 shows typical current drain for a single press and for two key presses.

Table 52. Typical Current Drain

| Key Presses Conditions <sup>1</sup> |  | Typical | Unit |  |  |
|-------------------------------------|--|---------|------|--|--|
| 1                                   | $V_{CC} = 1.8 \text{ V to } 3.0 \text{ V}$ | 55      | μΑ   |  |  |
| 2                                   | $V_{CC} = 1.8 \text{ V to } 3.0 \text{ V}$ | 100     | μΑ   |  |  |

 $<sup>{}^{1}</sup>T_{A} = T_{J} = -40^{\circ}\text{C to } +85^{\circ}\text{C}.$ 

## **BACKLIGHT CONTROL APPLICATION**

Although the ADP5588 is not designed with a backlight driver, the built-in light sensor comparator inputs, with programmable registers and trip points, give the backlight designer all the necessary tools to control the backlight based on lighting conditions or environment. With a few I<sup>2</sup>C commands, the designer can program the device to monitor lighting conditions and trigger an interrupt based on preset trip points. Once programmed, the state machine uses these trip points and hysteresis values to alert the microprocessor of any change in lighting conditions. In addition to the L2\_OUT and L3\_OUT bits, four additional registers (Register 0x3B through Register 0x3E, two registers per light sensor) provide detailed accounts of the internal ADC due to light condition changes. The ADC has a full-scale current of 1000 µA and a dynamic range of 8000, which translates to 0.125 µA or 0.3125 lux per step. These two corresponding registers per sensor form a 13-bit register that can be read to provide detailed translation of the light sensor input at any instant.
