

QUICK START GUIDE FOR DC989B-B

TINY NO R_{SENSE} BOOST CONVERTER

LTC3872-1

DESCRIPTION

Demonstration circuit 989B-B is a single-output boost converter, it features tiny, boost controller LTC3872-1. The input voltage is from 3.0V to 4.5V without output de-rating. The supply has one output: 5V/2A_{MAX}. Minimum input voltage is 2.75V. When input voltage is lower than 3V, output current should be de-rated. The design employs the LTC3872-1, the small footprint NO R_{SENSE} boost regulator. The switching frequency is fixed at 550 kHz. With current mode control and OPTI-LOOP compensation, DC989B-B can be optimized to provide fast transient response. NO R_{SENSE} technique reduces both: size of the converter and power dissipation. However, care should be taken

to MOSFET selection, it's not only switching element, but also its $R_{DS(ON)}$ represents the current sensing element for the control loop, see LTC3872-1 datasheet for details. LTC3872-1 allows design small size and high efficiency step-up DC/DC solutions.

Design files for this circuit board are available. Call the LTC factory.

TM-NO R_{SENSE} is trademark of Linear Technology Corporation

Table 1. Performance Summary ($T_A = 25^\circ\text{C}$)

PARAMETER	CONDITION	VALUE
Minimum Input Voltage	If the input voltage must be lower than 3V, degrade output load current.	2.75V
Maximum Input Voltage		4.5V
Output Voltage V_{OUT}		5V +/- 2%
Maximum Continuous output Current	$V_{IN} = 3\text{V}$ to 4.5V	2A
Typical Operating Frequency	Fixed	550kHz
Typical Output Ripple (V_{OUT})	20MHz BW, 2A load, $V_{IN} = 3\text{V}$, frequency = 550kHz	30mV _{p-p}
Efficiency	$V_{IN}=3\text{V}$, $V_{OUT}=5\text{V}$ $I_{OUT}=2\text{A}$	90%

QUICK START PROCEDURE

Demonstration circuit 989B-B is easy to set up to evaluate the performance of the LTC3872-1. Please refer to Figure 1 for proper measurement equipment setup and follow the procedure below:

1. Place RUN in ON position for normal operation.

Connect the desired loads between 5V output terminal and the GND terminal on the board.

NOTE: The maximum load is 2A.

2. Connect the input power supply to the VIN and GND terminals on the right, center of the board.

NOTE: Do not increase V_{IN} over 5V.

3. Vary the input voltage from 3.0V to 4.5V and adjust the load current from 0 to 2A. Measure the output voltages. V_{OUT} should read between 5.0V \pm 0.1V within specified maximum load current.
4. Measure the output ripple voltage at maximum output current level and minimum in-
