

## DS2781EVKIT+ Standalone Fuel Gauge IC Evaluation Kit

#### www.maxim-ic.com

#### **FEATURES**

- Demonstrates the capabilities of the DS2781 Standalone Fuel Gauge, including:
  - Estimation of available capacity for Li+ cells
  - Voltage measurement
  - Current measurement
  - Current accumulation
  - Temperature measurement
  - Information storage
  - Identification
- Interfaces to the USB port of a PC running Windows® XP or older operating system

#### INDEX

Evaluation Kit Contents Equipment Needed Introduction Setup and Installation Board Connections Software Installation Selecting the COM Port Program Menus Menu Windows Status Register Program Tabs Real Time Tab Parameters Tab Memory Tab Log Data Tab

### **EVALUATION KIT CONTENTS**

- 1 pc. Evaluation Board
- 1 pc. DS9123O USB Port Adapter
- 1 pc. RJ-11 Cable

#### **EQUIPMENT NEEDED**

- 1. A PC running Windows XP or older operating system and an available serial port.
- 2. Cables with mini-grabber style clips or the ability to solder directly to connection pads.
- 3. A Lithium-Ion battery and a power supply and/or load circuit.

Windows XP is a registered trademark of Microsoft Corp.

#### INTRODUCTION

The DS2781 evaluation kit (EV kit) makes performance evaluation, software development, and prototyping with the DS2781 Standalone Fuel Gauge easy. The evaluation board interfaces to a PC through a DS9123O USB Port Adapter and RJ-11 cable connection.

The DS2781 EV kit evaluation software gives the user complete control of all functions of the DS2781. Separate control tabs allow the user access to all EEPROM and RAM memory locations, all control registers, and real-time updates of all monitored parameters. The software also incorporates a data-logging feature to monitor a cell over time.

The evaluation board circuit is designed to provide the DS2781 with accurate parameter measurements. Kit demonstration boards will vary as they are improved upon over time.

#### SETUP AND INSTALLATION

#### **BOARD CONNECTIONS**

Connections to the TSSOP demonstration board are best made either by soldering directly to the pads or by using cables with mini-grabber clips. Communication to the TSSOP board can be accomplished either through the RJ-11 jack by connecting the provided standard six conductor RJ-11 cord or by wiring directly to the DQ and P- pads. In the latter case, the size of the board can be reduced by snapping off the RJ-11 jack along the break line, see Figure 1. To utilize the demonstration software, the DQ and PAC-lines must be connected to the DS9123 communication brick using either of the two methods described.

**Figure 1: Communication Connections** 

Figures 2a and 2b show the recommended circuits to simulate charging and discharging. The Lithium-Ion cell is connected between the B+ and B- pads. The battery charger/power supply or circuit load is connected between the B+ and P- pads. The evaluation software can be run in either configuration as long as a cell is connected between the B+ and B- terminals providing a minimum of 2.5 volts to power the DS2781. Leaving the PIO pin unconnected does not interfere with the operation of the demonstration board. Refer to the datasheet for the operation of this pin.

Figure 2a: Charging Circuit

Fig 2b: Discharging Circuit

#### SOFTWARE INSTALLATION

To install the DS2781 EV kit software, exit all programs currently running and download the latest version at www.maxim-ic.com. Unzip the compressed folder and double click the SETUP.EXE icon to begin the installation process. Follow the prompts to complete the installation. The DS2781 EV kit software can be uninstalled in the Add/Remove Programs tool in the Control Panel. After the installation is complete, open the DS2781K folder and run DS2781K.EXE or select DS2781K from the program menu. A splash screen containing information about the evaluation kit appears as the program is being loaded.

#### SELECTING THE COMMUNICATION PORT

The first time the software runs, the Select Preferences window appears. In this window, select either serial port or USB communication and the port number; then hit OK. The DS2781 EV kit software saves this port selection and automatically uses the selection each time the program starts. To change the port later, click the Preferences option on the menu bar, select Port Settings, and then select the appropriate port. To attempt to automatically locate the DS9123O, click the Poll Serial Ports button. Warning - automatically polling for the DS9123O can disrupt other devices connected to your computer's COM ports.

#### **PROGRAM MENUS**

Several pull down menu options have been provided to simplify use of the DS2781 EV kit software for the user. Their functions are individually detailed below.

#### FILE MENU

The File Menu allows the user to store and recall information to and from a file directly into the text boxes on the Parameters Tab. These functions do not directly write or read the DS2781. It is still necessary for the user to store or recall this information to or from the device by clicking on the Write & Copy or Recall & Read buttons on the Parameters Tab.

# REGISTERS MENU

The Registers Menu gives immediate access to all four status and function registers of the DS2781. Selecting any of the registers will open an individual control window giving the user a description of each register bit and the ability to read or write it. See the control register window example.

#### 🖶 Control Register Bit 7 NBEN. Negative Offset Blanking is : Enabled Ŧ UVEN. Bit 6 Under Voltage Enable is : Disabled • Bit 5 PMOD Sleep Mode is : Disabled • Bit 4 **RNAOP** Read Net Address Opcode Set to : 33h • Bit 3 UVTH Under Voltage Threshold is : 2.45V -Write Read Done

#### **CONTROL REGISTER**

The present state of all register bits are displayed immediately upon opening the register window. R/W locations contain a selection field or command button to allow the user to determine their state. Pressing the WRITE button will write the new value to the register and read the corresponding register inside the DS2781 to verify the correct value was written. The Control Register is stored in EEPROM, so when the WRITE command is issued, the value is written and copied to EEPROM without changing the values of the remainder of the Parameter EEPROM block.

#### **1 WIRE SPEED MENU**

The 1 Wire Speed Menu allows the user to select the appropriate 1 Wire timing. The speed the device uses is determined by the state of the OVD pin (pin 6).

#### 

The Preferences Menu allows the user to change COM port settings at any time. Edit Preferences opens the Select Preferences window. See Selecting the communication port above.

#### HELP MENU

DS2781K												×
Fil	e	Registers	1 Wire Speed	Preferences	Help							
					Ab	out						

Selecting the About topic from the Help Menu will open a window containing information about the current revision of this program and Dallas Semiconductor.

## **PROGRAM TABS**

All functions of the program are divided under four tabs in the main program window. Left click on the appropriate tab to move to the desired function page. Located on the Real Time tab is all of the information measured and calculated by the DS2781. That data is divided between the Parametric Data Tab and Fuel Gauging Tab. The Parameters Tab gives the user access to the entire Parameter EEPROM memory block in terms of Application Units and Device Units. The Memory tab displays the contents of every register and memory location inside the DS2781 and allows the user to alter the data. The Data Log tab allows the user to store all real time information to a file and view the data in a graphical form.

#### **REAL TIME TAB**

The Real Time data is divided into two tabs: Parametric Data and Fuel Gauge Data. The Parametric Data Tab contains all of the real time measurements taken by the DS2781. The Fuel Gauge Data contains all of the values calculated by the DS2781.

#### Parametric Data Tab DS2781K File Registers 1 Wire Speed Preferences Help **Real Time** Parameters Log Data Memory Parametric Data | Fuel Gauge Data | Voltage Current ACR Temperature F Charge Amps Degrees C Remaining 3.8845 Volts 0.0000 mA 988.7500 mAhr 22.5000 C Average Current 72.500 F 0.0000 mA SetACE Current Offset Bias Acc Bias RSense: 20.00 mOhms Set PIO bit PIO Pin is : Low

The Parametric Data Sub Tab displays the latest real-time measurements of cell voltage, temperature, current and accumulated charge with both analog meter readouts and digital values. The sense resistor value used to calculate the current reading is shown in the current section. Go to the sense resistor value on the Parameters Tab to change this value

The present states of PIO pin is shown at the bottom left of the window. There is also a button to toggle the state of the PIO pin.

#### Set Current Offset Bias Register

🖶 Set Current Offset Bias Register 💦 🔲 🗖 🔀								
Help								
New Current Offset Bias Value 0.00000 mA Average Current Reading : 0.0781 mA								
Read	Write	Done						

The user can bring up the Current Offset Bias Register window by left clicking the Current Offset Bias button. This window allows the user to enter a value for the Current Offset Bias Register in mA. The value entered here will be added to the Current Register during each current conversion. The bias value will affect the Current Register reading, as well as the Accumulated Current Register.

Set Accumulated Current Register

The user can bring up the Set Accumulated Current Register window by left clicking the Set ACR button. This window allows the user to enter a value for the Accumulated Current Register in mAH.

#### Set Accumulation Bias Register

🖶 Set Accumulation Bias Register 💦 🔲 🔀								
Help								
New Accumulation Bias Value 0.0000 mA Average Current Reading : 0.0781 mA								
Read	Write	Done						

The user can bring up the Set Accumulation Bias Register window by left clicking the Set Acc Bias button. This window allows the user to enter values for the Accumulation Bias Register in mA. The value entered here will be added to the Accumulated Current Register during each current conversion. The bias value will not affect the Current Register reading, but will be reflected in the Accumulated Current Register.

Fuel G	auge Data Tab									
	🖶 DS2781K									
	<u>File</u> <u>R</u> egisters 1 Wire <u>S</u> pee	e <u>R</u> egisters 1 Wire <u>Speed</u> <u>P</u> references <u>H</u> elp

	Real Time Parametric Data Fuel Ga	uge.D.ata	Evels Full Active Empty Stand-by Empty Capacities RAAC RARC RSAC RSRC Scalar Update	Memory 1112.58 mAhr 80.44 mAhr 9.50 mAhr 107.2 mAhr 10 % 179.2 mAhr 16 % 78.1250 %	Log Data Flags Full Charge Active Empty Stand-by Empty Learn Under Voltage Power-On-Reset					

The Fuel Gauge Data Sub Tab displays the latest fuel gauge calculations. The Full, Active Empty, and Standby Empty levels are calculated from the data input on the Parameters Tab. The Remaining Active Absolute Capacity (RAAC) and the Remaining Stand-by Absolute Capacity (RSAC) are displayed in terms of mAhrs. The Remaining Active Relative Capacity (RARC), Remaining Stand-by Relative Capacity (RSRC) are displayed in terms of percent of capacity remaining. The Analog Meter on the left displays the Remaining Active Absolute Capacity (RAAC).

The flags found in the Status Register are displayed on the right side of the window. When the Under Voltage Flag or the Power-on-Reset Flag is set, a button will appear that will allow the user to clear those bits.

#### **Scalar Register**

🖡 Set Age Scalar		
New Scalar Value	78.125000	) %
Read	Write	Done

The user can bring up the Set Age Scalar window by left clicking the Update button in the Scalar area. This window allows the user to read and write the Scalar value in terms of percent of the nominal capacity.

#### PARAMETERS TAB

The Parameters Tab gives the user access to the entire Parameter EEPROM memory block (block 1, addresses 60h-7Fh) in terms of Application Units and Device Units. The Application Units Tab displays the parameters in units like mA, mAhrs, and volts. The Device Units Tabs performs the calculations needed to get the application units into the units that are stored in the device like  $\mu V$ ,  $\mu V$ hrs, and ppm as well as show the hexadecimal values that get written to the device.

#### **Application Units Tab**

Save Set Up	.oad Set up		Load	Default Set (	qL	

The Application Units Sub Tab allows the user to read and write the Parameter EEPROM memory block. To change any of this information, simply click on the desired text field and enter the new value.

Clicking on the Load Default Set Up button will enter example data into the information fields of the Application Units Sub Tab. Once all data is in the desired format, click on the Write & Copy button to copy it to the EEPROM of the DS2781.

This information can also be stored to a file and recalled later using the Load/Save Set Up buttons or the Load/Save Parameters Set Up Menu Items. These functions do not directly write or read the DS2781. It is still necessary for the user to store or recall this information to or from the device by issuing a Write & Copy or Recall & Read buttons.

The Device Units Sub Tab is read-only. It displays the actual hexadecimal values read from the DS2781 and displays the units that are stored in the device.

#### **MEMORY TAB** DS2781K Preferences File Registers 1 Wire Speed Help Real Time Parameters Log Data Memory 00h-0Fh 10h-1Fh 20h-2Fh 60h-6Fh 70h-7Fh Net Address EEPROM Block 1 : 60h-7Fh Descripton Address **Descripton** Address AE 40 Control 60h 68h 80h 37h Acc Bias 61h RSNSP 69h 00h 32h Aging Cap MSB 62h Full 40 MSB 6Ah 16h 12h Aging Cap LSB 63h Full 40 LSB 6Bh 80h 06h Charge Voltage 64h Full 3040 Slope 6Ch D6h 01h Charge Current 65h 6Dh Full 2030 Slope 24h 18h AE Voltage 66h Full 1020 Slope 6Eh 9Ah 1Ch AE Current Full 0010 Slope 67h 6Fh 24h 3Eh Read Write Recall Сору Permanently Lock EEPROM Block 1

The Memory Tab gives the user access to all 32 bytes of SRAM and all 48 bytes of EEPROM inside the DS2781. They are separated into four sub-tabs for convenience. Any value can be modified by clicking in that address' text box and typing a new value in hexadecimal format. The Write button will copy the entire block of data to the corresponding location inside the DS2781 (Scratchpad RAM on the EEPROM blocks). The Read button will update the entire block's text boxes with data from the DS2781 (Scratchpad RAM on the EEPROM blocks). Sub-tabs displaying any EEPROM data will also have Copy and Recall buttons to allow the user to transfer the data between Scratchpad and EEPROM memory internal to the DS2781. The Permanently Lock Block 0/1 buttons will permanently store the data currently located in that block's EEPROM. Warning – this data can never be changed once locked. Verify your data first by issuing a Recall and a Read.

The Net Address Sub Tab allows the user to perform a Search Net Address to find all of the 1-Wire devices on the 1 Wire bus. All devices found on the bus will be listed in the Net Addresses field. To communicate to any device on the bus, click on its address inside the Net Addresses field to select it. The program will now use this Net Address for all operations until a different Net Address is chosen.

#### LOG DATA TAB DS2781K File Registers 1 Wire Speed Preferences Help Real Time Parameters Memory Log Data Voltage Current Temperature Accumulated Charge Log to File 30 30 25 25 20 20 Degrees C 15 15 10 10 5 5 0 Sampling Interval Clear Graphs 1 Second •

The Log Data tab allows the user to see the DS2781's real time measurements graphed over time. There are separate sub-tabs for voltage, current, temperature, and accumulated charge. Each graph displays the last 500 data points collected by the DS2781 EV kit software. The sampling interval can be adjusted from as fast as possible to 15 minutes and can be adjusted from the Sampling Interval Menu at the bottom of the window. The Clear Graphs button will clear all data from all four graphs, but does not reset the log to file function. When the Fastest sampling interval is selected, the graphs will not be updated, only the data logging is enabled.

The Log to File Sub Tab contains control information for storing all data to an ASCII file. The default filename is c:\DS2781K\_datalog.txt, but can be modified in the filename text field. The Log Data button toggles data logging off and on. Data will be stored at the same interval selected for updating the graphs in the tab-delimited format of

```
"Time<tab>Voltage<tab>Current<tab>AveCurrent<tab>Temperature<tab>ACR<tab>Full<tab>AE<tab>SE<tab>RAAC<tab>RAAC<tab>RSAC<tab>RSAC<tab>Status<tab>Scalar"
```

for easy import into a spreadsheet. The most recent 50 samples are displayed in the window for observation. Warning - The Log Data function overwrites previous file information. Data previously stored in the file will be lost.
