

MAX12930/MAX12931 Evaluation Kit

Evaluates: MAX12930, MAX12931

General Description

The MAX12930/MAX12931 evaluation kit (EV kit) provides a proven design to evaluate the MAX12930 or MAX12931 two channel digital isolators. Two types of evaluation boards are available to support the narrow-body and wide-body package types.

The EV kit should be powered from two independent isolated power supplies with nominal output voltage in range from 1.71V to 5.5V. For evaluating the electrical parameters of the device without any isolation between the two sides, a single power supply can also be used.

The MAX1293XEVKIT# comes with U1 populated and supports the following digital isolators: MAX12930BASA+, MAX12930CASA+, MAX12930EASA+, MAX12930FASA+, MAX12931BASA+, MAX12931CASA+, MAX12931EASA+, MAX12931FASA+, MAX12931BAWE+

Features

- Broad Range of Data Transfer Rates (from DC to 150Mbps)
- Two Unidirectional Channels in the Same Direction (MAX12930) or Two Unidirectional Channels in the Opposite Direction (MAX12931)
- SMA Connectors for Easy Connection to External Equipment
- Wide Power Supply Voltage Range from 1.71V to 5.5V
- Guaranteed Up to 3kV_{RMS} Isolation (for the Narrow-Body SOIC Package) for 60s
- Guaranteed Up to 5kV_{RMS} Isolation (for the Wide-Body SOIC Package) for 60s

Ordering Information appears at end of data sheet.

Quick Start

Required Equipment

- MAX12930xS EV kit, MAX12931xS EV kit, or MAX12931BW EV kit
- Two adjustable +5V DC Power Supplies
- Signal/function generator
- Oscilloscope

Note: XS suffix stands for narrow-body EV kit; while BW suffix stands for wide-body EV kit.

Procedure

The MAX12930xS, MAX12931xS, and MAX12931BW EV kits are fully assembled and ready for evaluation. Follow the steps below to verify board functionality:

- 1) Connect the DC power supplies between the MAX1293x EV kit's V_{DDA}/V_{DDB} and $GNDA/GNDB$ test points.
- 2) Turn on the DC power supplies and set them between 1.71V and 5.5V, then enable the power supply output. **Note:** It is also possible to power the MAX1293X EV kit from a single power supply to test electrical parameters but this invalidates the digital isolation of the IC.
- 3) Connect the signal/function generator to the SMA connectors or test points of side A and observe the isolated signal on the other side, side B, using an oscilloscope.

Detailed Description of Hardware

The MAX12930xS, MAX12931xS, and MAX12931BW EV kit are powered from two external adjustable power supplies as described below.

External Power Supplies

Power to the MAX12930xS, MAX12931xS, and MAX12931BW EV kit are derived from two external sources which can both be between +1.71V and +5.5V. Connect one source between the V_{DDA} and GNDA test points, and another source between the V_{DDB} and GNDB test points. Each supply can be set independently and can be present over the entire range from 1.71V to 5.5V, regardless of the level or presence of the other supply. The MAX12930/MAX12931 level-shifts the data, transmitting them across the isolation barrier.

Two SMA connectors on each side of the board allow easy connections to signal generator(s) and oscilloscope. A typical application diagram is shown in [Figure 3](#).

Decoupling Capacitors

Each power supply is decoupled with a 10µF ceramic capacitor placed close to the power supply test point, and a 0.1µF ceramic capacitor placed close to U1.

Termination

Each input and output has an unpopulated 0805 SMT resistor (R1–R4) and a 0805 SMT capacitor (C1, C2, C6, C7) to GND_ to allow termination based on customer requirements.
