# MAX77787 Evaluation Kit

# Evaluates: MAX77787

### **General Description**

The MAX77787 evaluation kit (EV kit) is a fully assembled and tested printed circuit board (PCB) that demonstrates the MAX77787, standalone 3.15A USB Type-C<sup>®</sup> autonomous charger with JEITA.

The MAX77787 can operate from 4.5V to 13.7V input, with a fast charge current up to 3.15A and a maximum input current limit of 3A. The MAX77787 is offered to support Liion batteries with JEITA compliance. It also has another option that supports LiFePO4 batteries with non-JEITA compliance.

The EV kit features USB Type-C CC detection, battery charging compliant with the USB Battery Charging Specification Revision 1.2 (BC1.2), proprietary adapter detection upon input insertion, and automatic configuration of the charger input current limit to the maximum allowable current from the input source.

The MAX77787 has the reverse-boost capability, which is enabled by the ENBST pin to allow the 5.1V/1.5A output to CHGIN. The EV kit includes the variable resistor and thermistor to demonstrate the JEITA compliance.

### **EV Kit Photo**

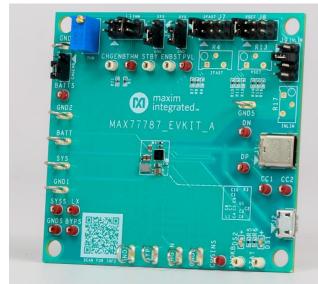

Figure 1. MAX77787 EV Kit

### **Benefits and Features**

- Up to 16V Protection
- 13.7V Maximum Input Operating Voltage
- 3.15A Maximum Charging Current
- 6A Discharge Current Protection
- No Firmware or Communication Required
- Integrated USB Detection
  - Integrated CC Detection for USB Type-C
  - Integrated BC1.2 Detection for Legacy SDP, DCP, and CDP
  - Automatic Input Current Limit Configuration
- Input Voltage Regulation with Adaptive Input Current Limit (AICL)
- 5.1V, 1.5A OTG Mode and BYP Reverse Boost
- Termination Voltage
  - 4.1V to 4.55V for Li-ion and Li-poly Batteries
  - 3.6V/3.7V for LiFePO4 Battery
- Safety
  - Charge Safety Timer
  - JEITA Compliance with NTC Thermistor (MAX77787J)
  - HOT/COLD Stop Charging with NTC Thermistor (MAX77787H)
  - Thermal Shutdown
- Pin Control of all Functions
  - Resistor-Configurable Fast-Charge Current, Termination Voltage, and Input Current Limit
  - · ENBST Pin to Enable and Disable Reverse Boost
  - STAT Pin to Indicate Charging Status
  - INOKB Pin to Indicate Input Power-OK (POK)
  - · CHGENB Pin to Enable and Disable Charging
  - · STBY Pin to Support Suspend Mode
  - THM Pin to Monitor Thermistor
- Fixed Resistor Options to Easily set Fast-Charge Current, Termination Voltage, and Input Current Limit
- Integrated Power Path
- Integrated Battery True-Disconnect FET
- Proven PCB Layout
- Fully Assembled and Tested

Ordering Information appears at end of data sheet.

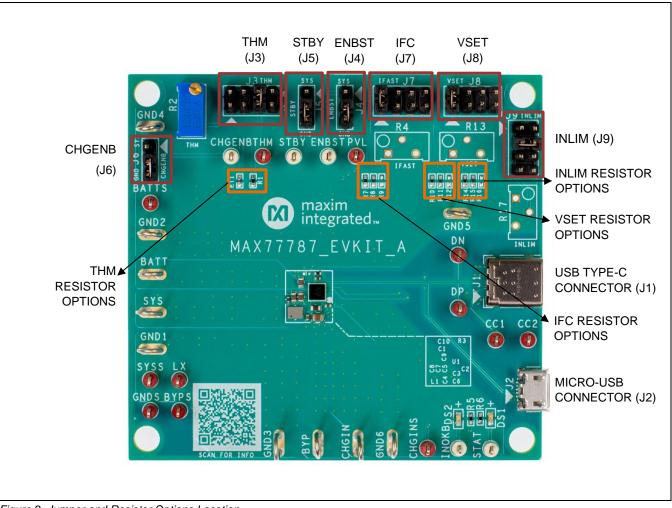

Figure 2. Jumper and Resistor Options Location

### **Quick Start**

### EV Kit Default Setting

| INPUT CURRENT<br>LIMIT | FAST-CHARGE<br>CURRENT | TERMINATION<br>VOLTAGE | CHARGER | REVERSE BOOST<br>MODE | SUSPEND MODE |
|------------------------|------------------------|------------------------|---------|-----------------------|--------------|
| ЗA                     | 500mA                  | 3.6V                   | ON      | OFF                   | OFF          |

*Note:* To change the setting, see <u>Table 1</u> for jumper positions.

#### **Required Equipment**

- MAX77787 evaluation kit
- USB Type-C travel adapter and cable
- Power supply
- Battery, battery simulator, or power supply with electronic load
- Oscilloscope
- Multimeters

## MAX77787 Evaluation Kit

#### **Initial Test Setup**

The EV kit is fully assembled and tested. Follow the steps to verify board operation:

- 1. Do not turn on the DC power supply until all connections are made.
- 2. Confirm that all jumpers are at their default positions as indicated in Table 1.
- 3. Connect the battery, battery simulator, or power supply to the loop labeled BATT and GND.
- 4. Connect the power supply to the loop labeled CHGIN. Note that CHGIN can come from three sources (Micro-USB connector, USB TYPE-C Connector, or CHGIN loop), only one of these sources should be connected at any time.
- 5. The EV kit is now ready for use.

### **Detailed Description of Hardware**

Follow the initial test setup procedure.

#### **Battery Charger Test Setup**

The battery charger can be tested in three different ways; with a battery, battery simulator, or power supply with an electronic load. Typical bench setups for MAX77787 the EV kit with different configurations are shown in <u>Figure 3</u>, <u>Figure 4</u> and <u>Figure 5</u>.

#### Battery

1) Connect the 1 cell battery pack and current meter between BATT and GND. **Note:** Only use a battery with a charge termination voltage that matches that of the jumper setting on the board.

2) Connect the 5.0V/5.0A current-limited DC power supply between CHGIN and GND and turn it on.

3) Observe the current reading from the current meter. If the battery is discharged, the fast-charging current should match the setting with the external IFAST resistor (R7/R8/R9). If the battery is not discharged, it could be in a top-off state or done state. The current reading could be top-off current (match the jumper setting on the board) or done state (~0A).

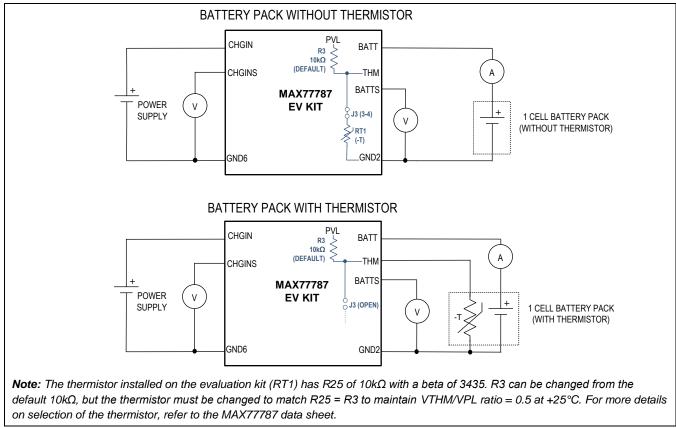

Figure 3. Battery Charger Test with Real Battery Pack

www.analog.com

# MAX77787 Evaluation Kit

#### **Battery Simulator**

1) Connect the battery simulator between BATT and GND, adjust the voltage to 3.8V with 3.5A current limit, and turn it on.

2) Connect the 5.0V/5.0A current-limited DC power supply between CHGIN and GND and turn it on.

3) Observe the current reading from the battery simulator and see if the fast-charging current matches with the external IFAST resistor.

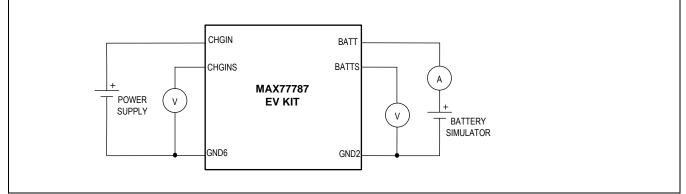

Figure 4. Battery Charger Test with Battery Simulator

#### **Power Supply with Electronic Load**

1) Connect the power supply between BATT and GND and adjust the voltage to 3.8V with 3.5A current limit.

2) Connect the electronic load between BATT and GND and set the load current to 3.5A.

3) Turn on the power supply and electronic load.

4) Connect the 5.0V/5.0A current-limited DC power supply between CHGIN and GND and turn it on.

5) Observe the current reading from the current meter 1 and 2 (the fast-charging current equals  $I_2$ - $I_1$ ) and see if this value matches with the external IFAST resistor.

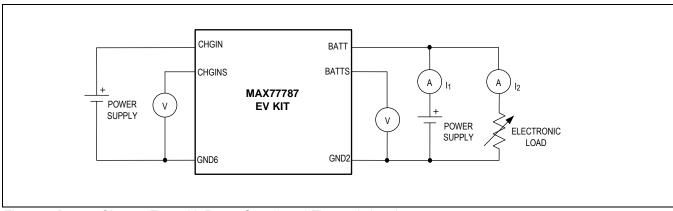

Figure 5. Battery Charger Test with Power Supply and Electronic Load

### **MAX77787 Evaluation Kit**

#### BC1.2 and CC Detection Test Setup

1) Connect the battery/battery simulator/power supply with an electronic load between BATT and GND. See the <u>Battery</u> <u>Charger Test Setup</u> section for details.

2) Plug in the USB Type-C cable from the PC or AC adaptor.

3) MAX77787 automatically sets the CHGIN input current limit based on the charger type detection results. If the input source is not a standard power source described by BC1.2, USB Type-C or proprietary charger type that the MAX77787 can detect, the MAX77787 sets the input current limit according to RINLIM. In the case of floating RINLIM, the MAX77787 input current limit is set to 0.5A when an unknown proprietary charger is detected.

#### **OTG Reverse Boost Test Setup**

1) Connect the power supply between BATT and GND, adjust the voltage to 3.8V with 3.5A current limit, and turn it on.

2) Apply the Jumper 4 to enable the OTG reverse-boost mode.

3) Monitor the voltage of CHGIN at CHGINS test point and see whether it equals 5.1V. Note that VCHGIN must be lower than 0.7V before ENBST is enabled. Otherwise, CHGIN does not supply current when ENBST is enabled.

#### **BYP Reverse Boost Test Setup**

1) Connect the power supply between BATT and GND, adjust the voltage to 3.8V with 3.5A current limit, and turn it on.

2) Apply the Jumper 4 and Jumper 5 to enable the BYP reverse-boost mode.

3) Monitor the voltage of BYP at BYPS test point and see whether it equals 5.1V.

#### **LED Indicator**

1) Two LED indicators are installed on the EV kit: DS1 (green) is for the STAT pin and DS2 (red) is for INOKB.

2) The STAT pin is an open-drain and active-low output that indicates charge status. See <u>Table 3</u> for details.

3) INOKB is an open-drain and active-low output that indicates the input status. If a valid input source is inserted and the buck converter starts switching, INOKB pulls low. When the reverse boost is enabled, INOKB pulls low to indicate the 5V output from CHGIN.

### **Table 3. STAT Output with Charging Status**

| CHARGING STATUS                     | STAT   | LOGIC STATE   | CHARGE STATUS LED                    |
|-------------------------------------|--|---|--------------------------------------|
| No Input                            | High Impedance   | High  | Off                                  |
| Trickle, Pre-charge, Fast<br>Charge | Repeat Low and High<br>Impedance with 1Hz,<br>50% duty cycle | After an external diode and a capacitor rectifier, High | Blinking with 1Hz,<br>50% duty cycle |
| Top-Off and Done                    | Low  | Low   | Solid On                             |
| Faults                              | High Impedance   | High  | Off                                  |
