MAX96700 Evaluation Kit

Evaluates: MAX96700 with Coax or STP Cable

General Description

The MAX96700 evaluation kit (EV kit) provides a proven design to evaluate the MAX96700 high-bandwidth gigabit multimedia serial link (GMSL) deserializers with spread spectrum and full-duplex control channel, through the use of a standard FAKRA coax or STP cable. The EV kit also includes Windows Vista®- and Windows 7-compatible software that provides a simple graphical user interface (GUI) for exercising features of the device.

For complete GMSL evaluation, using a standard FAKRA coaxial cable, order the MAX96700 EV kit and a companion serializer board (e.g., the MAX96701 EV kit, referenced in this document). For testing with STP cable, also order the MAXCOAX2STP-HSD adapter kit and refer to its data sheet. Only one adapter kit is required per link (connecting the serializer and deserializer boards).

Note: In the following sections, MAX96700 and the term "deserializer" refer to the MAX96700 IC and MAX96701 and the term "serializer" refer to the MAX96701 IC.

Note: This document applies to both coax and STP EV kits. This document covers coax cables, but the information provided applies equally to STP cables.

Features

- Accepts GMSL Serial Data through FAKRA Connectors as Inputs and Outputs 16-Bit Parallel Output Data
- Power Over Coax (POC) Capable
- Windows Vista- and Windows 7-Compatible Software
- USB-Controlled Interface (Cable Included)
- USB Powered
- Proven PCB Layout
- Fully Assembled and Tested

Items included in the Evaluation Kit Package

ITEM DESCRIPTION	QTY
MAX96700 coax EV kit board	1
2m FAKRA cable assembly	1
USB cable	1

maxim integrated™

Quick Start

Required Equipment

- MAX96700 EV kit
- MAX96701 EV kit
- 2m FAKRA cable assembly (included in the MAX96700 EV kit)
- > 20MHz function generator (optional)
- PC with Windows Vista or Windows 7 and a spare USB port (direct 500mA connection required; do not use a bus-powered hub)
- Ammeter
- 500mA, 5V DC power supply

Note: In the following sections, software-related items are identified by bolding. Text in **bold** refers to items from the EV kit software. Text in **bold and underlined** refers to items from the Windows operating system.

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

1) Visit **www.maximintegrated.com\EVKitsoftware** to download and install the latest version of the software, and then do the following:
   - Double-click on GMSL SerDes Evaluation Kit Software-Nuvoton µC.
   - Download the MAXSerDesEV-N_Vx_x_x_x_Install.ZIP file (8MB).
   - Extract and install the MAXSerDesEV-N_Vx_x_x_x_Install.EXE file. The installation application will install the USB driver. If the USB driver installation was not successful, install the appropriate USB driver for your computer by visiting www.ftdichip.com/Drivers/VCP.htm.
2) Verify that jumpers on the serializer board are in their default positions, as shown in Figure 15.
3) Verify that jumpers on the deserializer board are in their default positions, as shown in Figure 16.
4) Set up the system, as shown in Figure 1.
5) Connect the FAKRA cable from the OUT+ terminal on the serializer board to the IN0+ terminal on the deserializer board.
6) Connect the USB cable between the PC and USB port on the Nuvoton microcontroller daughter board on the deserializer board.
7) Connect the power supply to the +5VIN/GND terminals on the serializer board.
8) Turn on the power supply.
9) Verify that LED_PWR on the deserializer board lights up, indicating that the deserializer board has power.
10) Verify that LED_PWR on the serializer board lights up, indicating that the serializer board has power.
11) Verify that LOCK_LED on the deserializer EV board lights up, indicating that the link has been successfully established. If LOCK_LED is off, go to the *Troubleshooting* section at the end of this document and fix the problem before continuing..
12) Start the EV kit software by selecting **Start | Programs | Maxim Integrated | MAXSerDesEV-N | MAXSerDesEV-N**.
13) The **Configuration Settings** window opens (see Figure 2) and the GUI automatically searches for any active listener in both I^2C and UART mode and identifies a valid GMSL product. Once a valid device is identified, the corresponding configuration jumpers are displayed to help the user configure the serializer and deserializer.
14) In case an operating evaluation board with a Nuvoton microcontroller is not found, a window appears (Figure 3) warning as such. Press **OK** to continue and start the GUI anyway, or press **Cancel** to terminate the application. Go to the *Troubleshooting* section at the end of this document and fix the problem before continuing.
15) When an operating Nuvoton microcontroller is found, the GUI checks the firmware version in the microcontroller and prompts the user to update (Figure 4).
16) While the **Configuration Settings** window is open, press the **Identify Devices** button to search for the devices connected.

    Only **Link Type** and **Device Address** selections on the **Configuration Settings** window affect the EV kit operation. Other items are for user reference only.
17) Press the **Connect** button to open the **Evaluation Kit** window and devices under test (DUT) register maps (Figure 5). The GUI will read all internal registers of the serializer and deserializer and update the corresponding tabs.
18) Press the **Read All** button in the **Serializer** group box to read all the serializer registers.
19) Press the **MAX96700 Des** tab and then press the **Read All** button in the **Deserializer** group box to read all the deserializer registers.
20) Select any of the other tabs to evaluate other serializer/deserializer (SerDes) functions.

Table 1. Jumper Descriptions*

JUMPER	SIGNAL	DEFAULT POSITION	FUNCTION

		Open	External µC SCL signal must be pulled up externally

Jumper selections in the **Serializer/Deserializer group boxes on the **Configuration Settings** window are for reference only and do not affect software operation.*

***Default position.*

Detailed Description of Software

To start the serializer evaluation kit GUI, select **Start | All Programs | Maxim Integrated | MAXSerDesEV-N | MAXSerDesEV-N**.

Configuration Settings Window

The **Configuration Settings** window is the first window that opens after successful program launch. It allows the user to specify serializer and deserializer board setup and mode of operation (Figure 2).

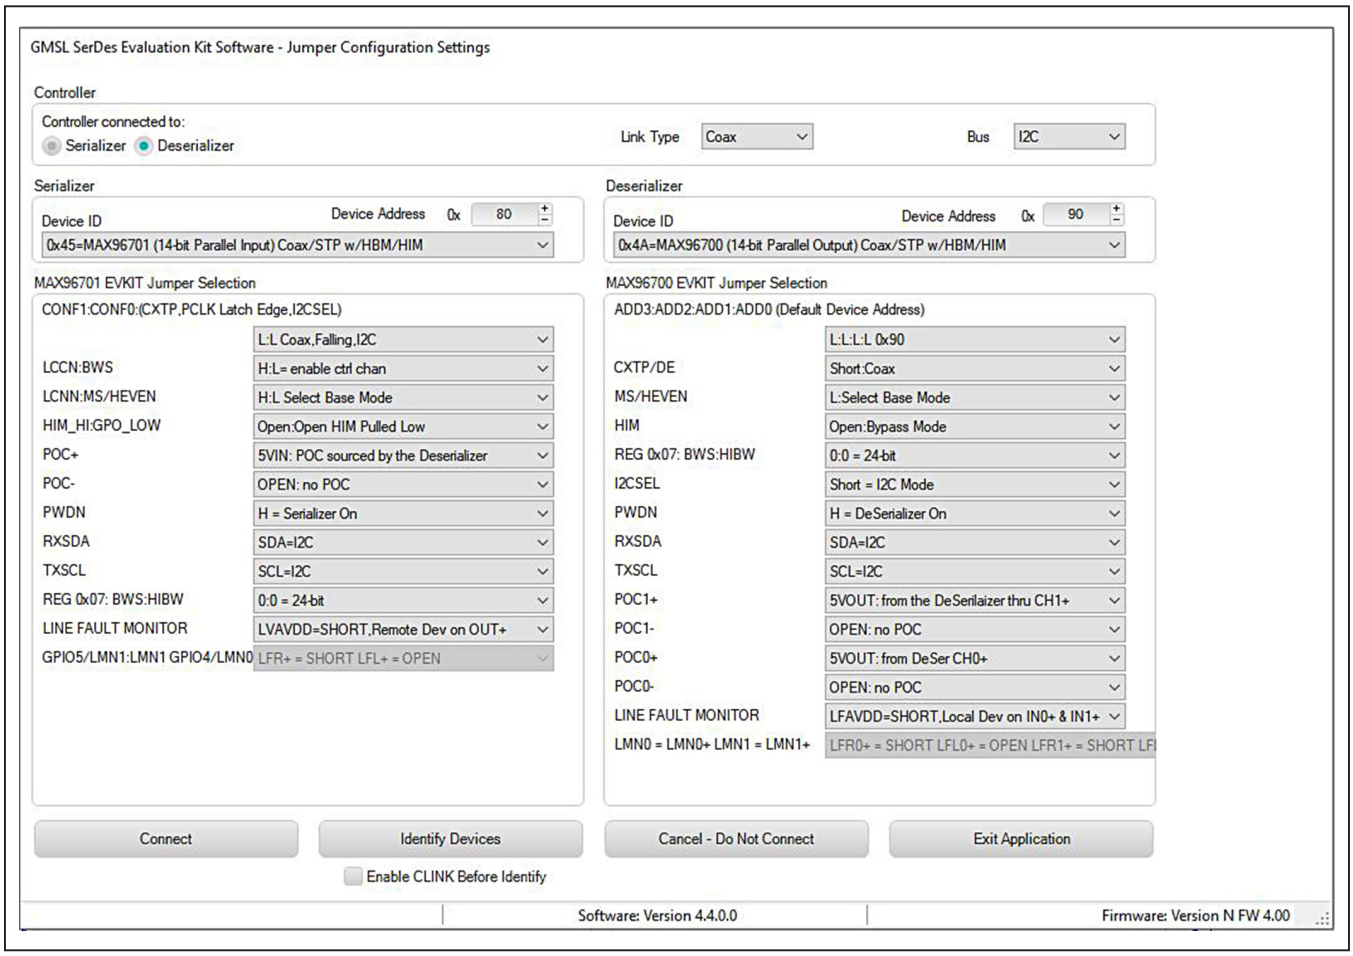

Figure 2. MAXSerDesEV-N EV Kit Software: Configuration Settings Window (shown with the MAX96701 and MAX96700 EV Kits Connected)

Controller Group Box

In the **Controller** group box, select **Coax** or **STP** from the **Link Type** drop-down list, **I2C** or **UART** from the **Bus** drop-down list, and whether the **Serializer** or **Deserializer** should be connected to the USB controller. Upon changing any of these parameters, conflicting jumper settings will be highlighted, guiding the user to check and make the corresponding changes on the evaluation boards. Only **Link Type** and **Device Address** selections on the **Configuration Settings** window affect EV kit operation. Other items, including jumper selections, are for user reference only.

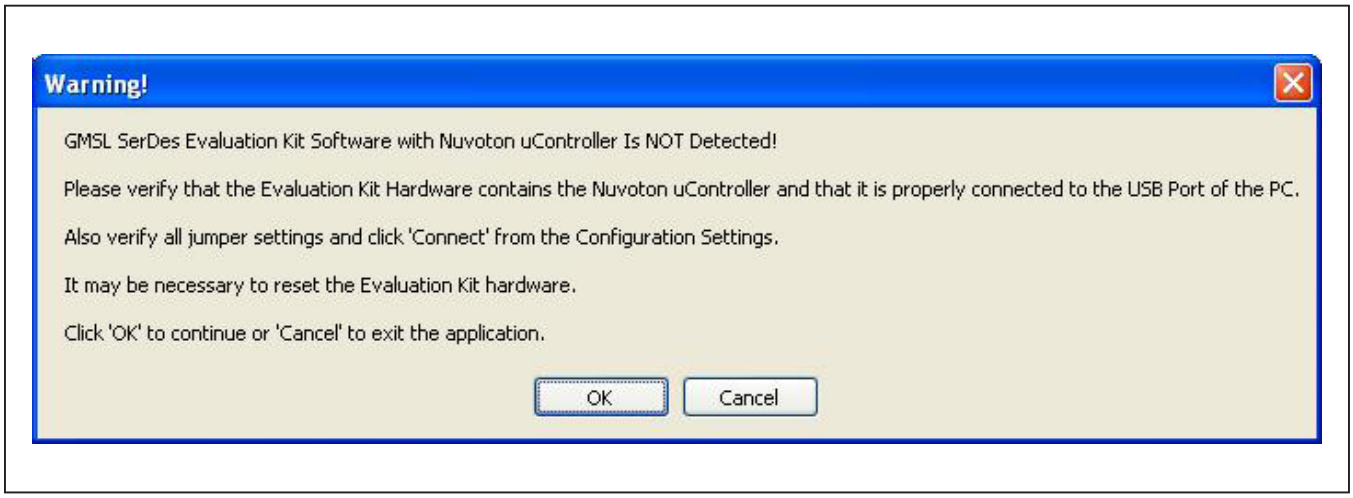

Figure 3. MAXSerDesEV-N EV Kit Software: Warning! Nuvoton µController is not Detected.

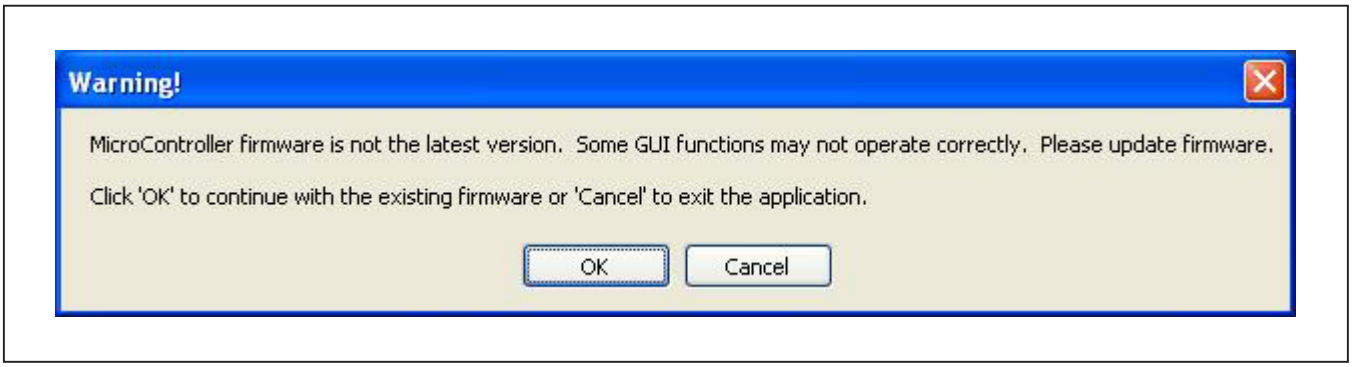

Figure 4. MAXSerDesEV-N EV Kit Software: Warning! Microcontroller Firmware is Not the Latest Version

Serializer and Deserializer Jumper Selection Blocks

The **Serializer** and **Deserializer Jumper Selection** blocks list jumpers on the evaluation boards of the selected **Device ID** and displays the correct shunt positions based on the conditions selected in the **Controller** blocks.

Identify Devices Button

The **Identify Devices** buttons causes the GUI to scan the system and hunt for slave addresses on the bus. Upon successful communication, it reads the **Device ID** register from the DUTs and displays the corresponding jumper lists on the **Serializer** and **Deserializer Jumper Selection** blocks. It is also possible to select a device from the **Device ID** drop-down list and manually change the slave address in the **Device Address** edit box. It is a good practice to utilize the **Identify Devices** button and verify communication with the DUTs before attempting to **Connect**.

Figure 15 and Figure 16 show jumper settings on the serializer and deserializer PCBs for coax cable and I^2C communication with the USB controller connected to the deserializer board. Refer to the respective IC data sheets for detailed configuration information. See Table 1 for PCB jumper descriptions.

Connect Button

The **Connect** button opens the **Evaluation Kit** window. The GUI reads the serializer and deserializer registers and updates the register maps for both. Successful register map updates are indicated by green LED indicators. In case of a communication problem, the LED indicators turn red.

Cancel - Do Not Connect Button

The **Cancel - Do not Connect** button opens the **Evaluation Kit** window without attempting to connect to the on-board microcontroller. Although there will be no communication with the microcontroller, all functions and tabs corresponding to the selected **Device ID**s become active once there.

Evaluation Kit Window

The **Evaluation Kit** window shown in Figure 5 provides access to all internal registers and functions of the DUTs by means of reading and writing registers through different tabs to allow the user to evaluate various functions of the serializer and deserializer.

The **Read All** button updates the serializer and deserializer register maps by reading the DUTs' internal registers.

The **Serializer** group box provides pushbuttons to update the serializer's register maps. The **Read All** button reads register contents from the serializer and updates the displayed register values. The **Load** button reads and updates registers from a previously saved register map. The **Save** button saves the existing register values into a new file.

The **Deserializer** group box provides pushbuttons to update the deserializer's registers. The **Read All** button reads register contents from the deserializer and updates the displayed register values. The **Load** button reads and updates registers from a previously saved register map. The **Save** button saves the existing register values into a new file.

The **Wake Up** button applies the register write sequence described in the IC data sheets to wake up the DUTs from sleep mode.

The **Open Configuration** button returns to the **Configuration Settings** window. Use **Open Configuration** and **Connect** buttons to go back and forth between **Configuration Settlings** window and **Evaluation Kit window**.

MAX96701 Ser Tab

The **MAX96701 Ser** tab (Figure 5) lists the serializer's registers bitmaps. The **Read** and **Write** buttons in each register group box allow read/write access for each bit or group of bits that specify a function or condition, as defined in the respective serializer IC data sheet. The color of the small LED indicator next to the **Read/ Write** buttons indicates the communication status. Green indicates successful communication and red indicates failed communication.

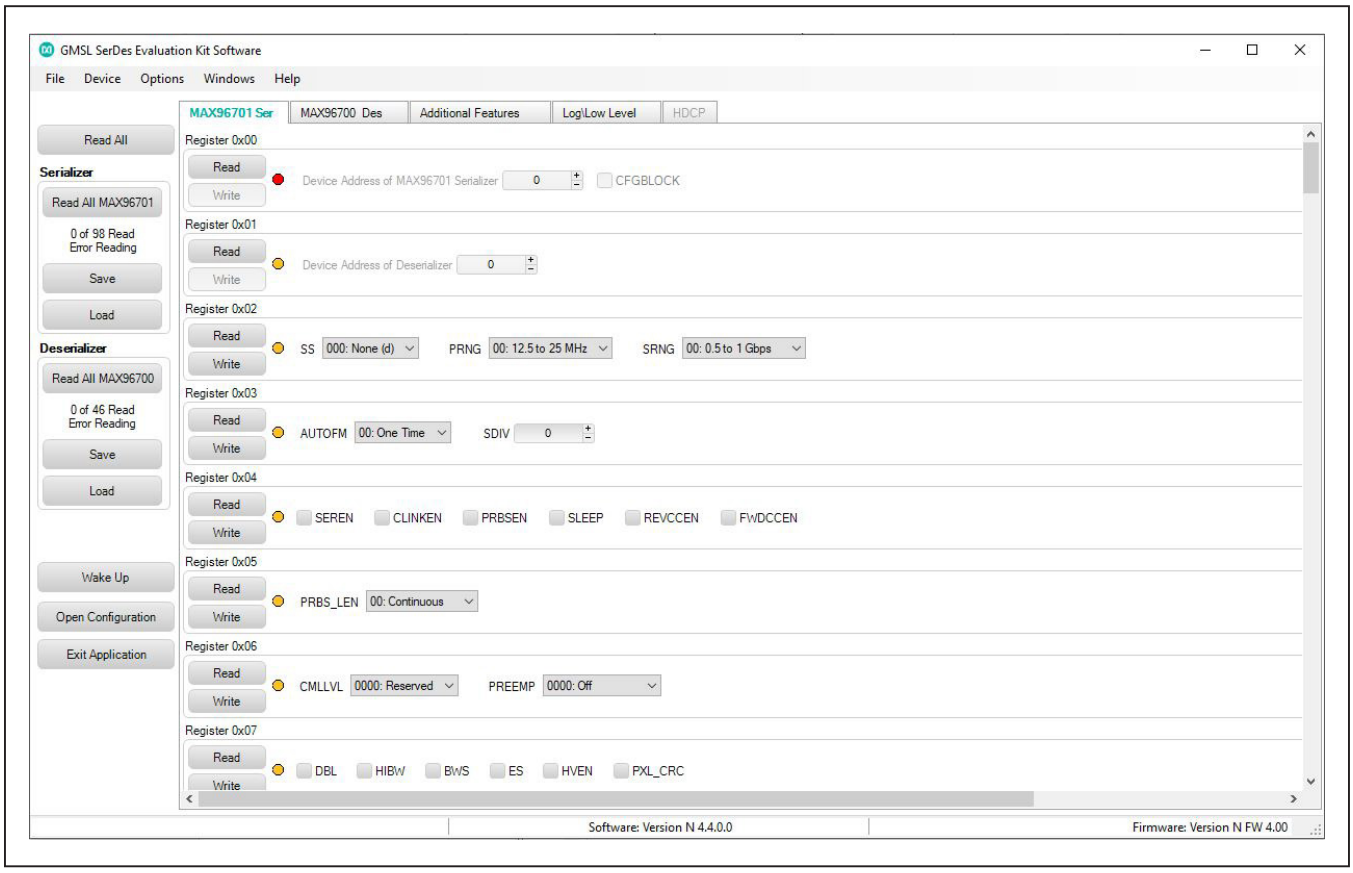

Figure 5. MAXSerDesEV-N EV Kit Software: Evaluation Kit Window (Shown with MAX96701 Ser Tab (Serializer))

MAX96700 Des Tab

The **MAX96700 Des** tab (Figure 6) lists the deserializer's registers bitmaps. The **Read** and **Write** buttons in each register group box allows read/write access for each bit or group of bits that specify a function or condition, as defined in the respective deserializer IC data sheet. The color of the small LED indicator next to the **Read/ Write** buttons indicates the communication status. Green indicates successful communication and red indicates failed communication.

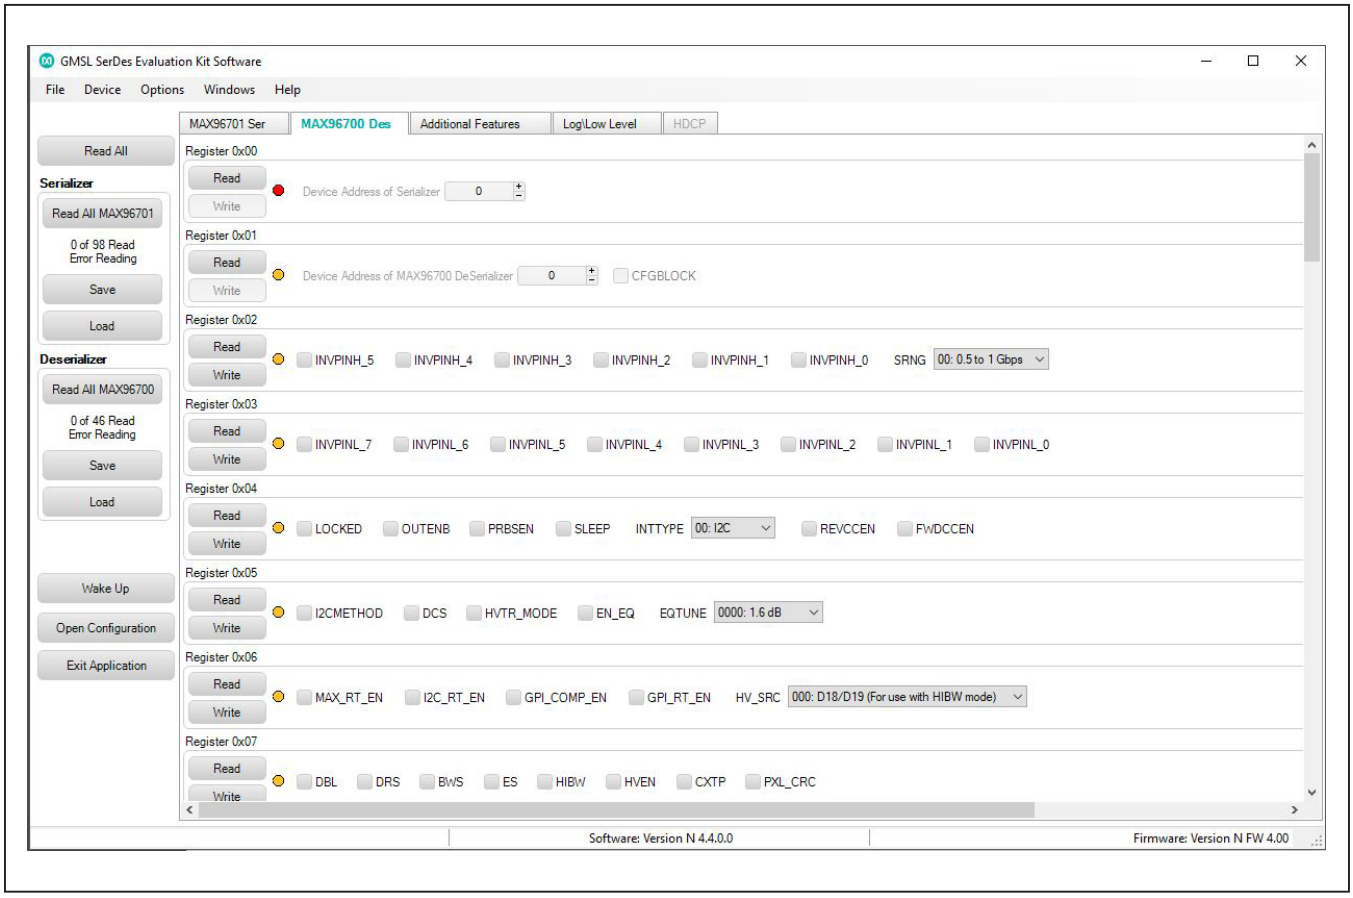

Figure 6. MAXSerDesEV-N EV Kit Software: Evaluation Kit Window (Shown with MAX96700 Des Tab (Deserializer))

Additional Features Tab

The **Additional Features** tab (Figure 7) provides push-buttons for specific functions that connected devices can perform. By pressing a button, a window pops up and launches the specific function selected. Function buttons not supported by the selected device are grayed out.

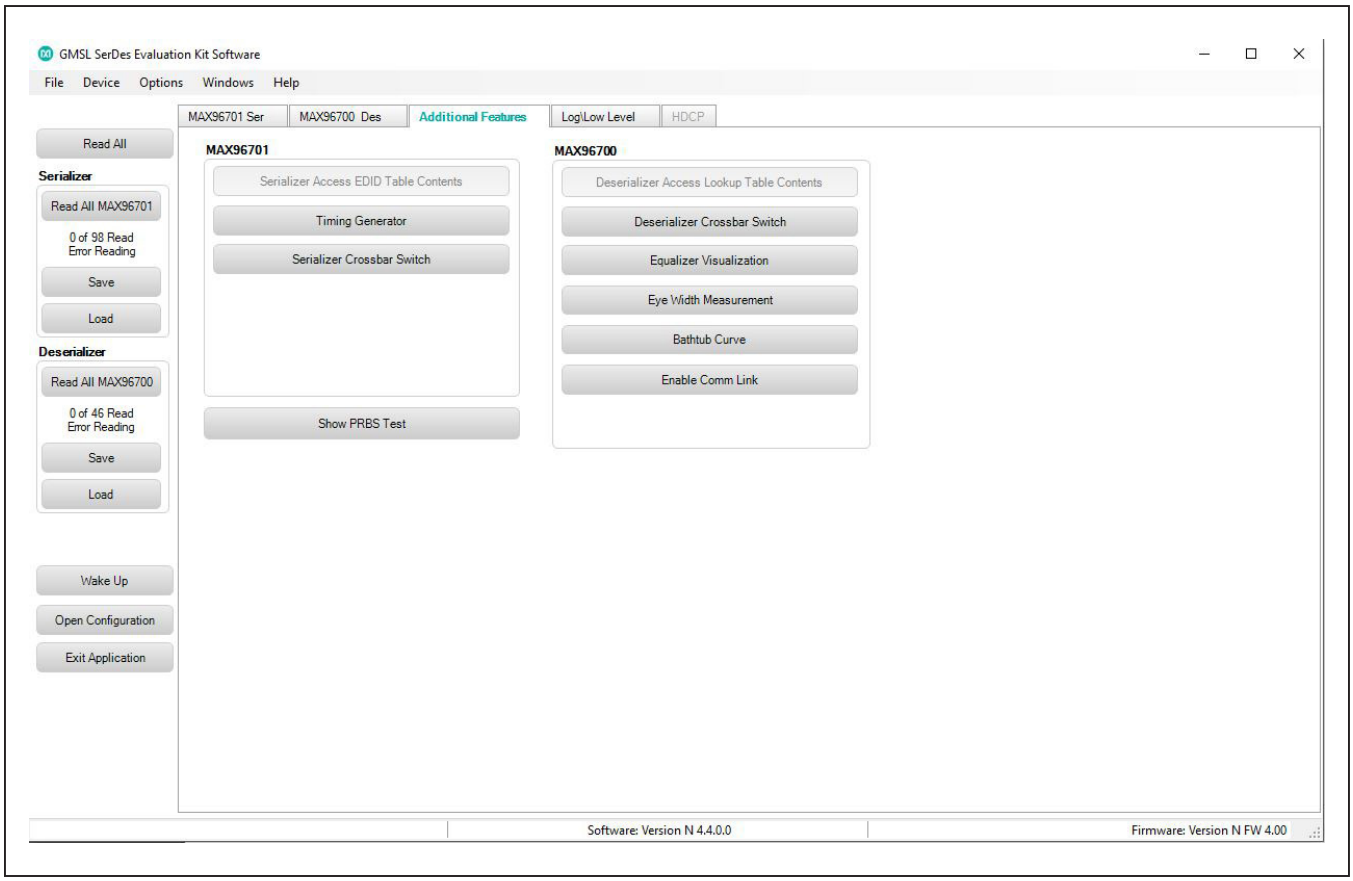

Figure 7. MAXSerDesEV-N EV Kit Software: Evaluation Kit Window (Additional Features Tab)

On the **Addtitional Features** tab, press the **Serializer Crossbar Switch** button to launch the **Serializer Crossbar Switch Configuration** window (Figure 8). This capability allows rearranging of data lines between the parallel input and output by the serializer. Refer to the respective IC data sheet for a detailed description and operation of the embedded crossbar switches.

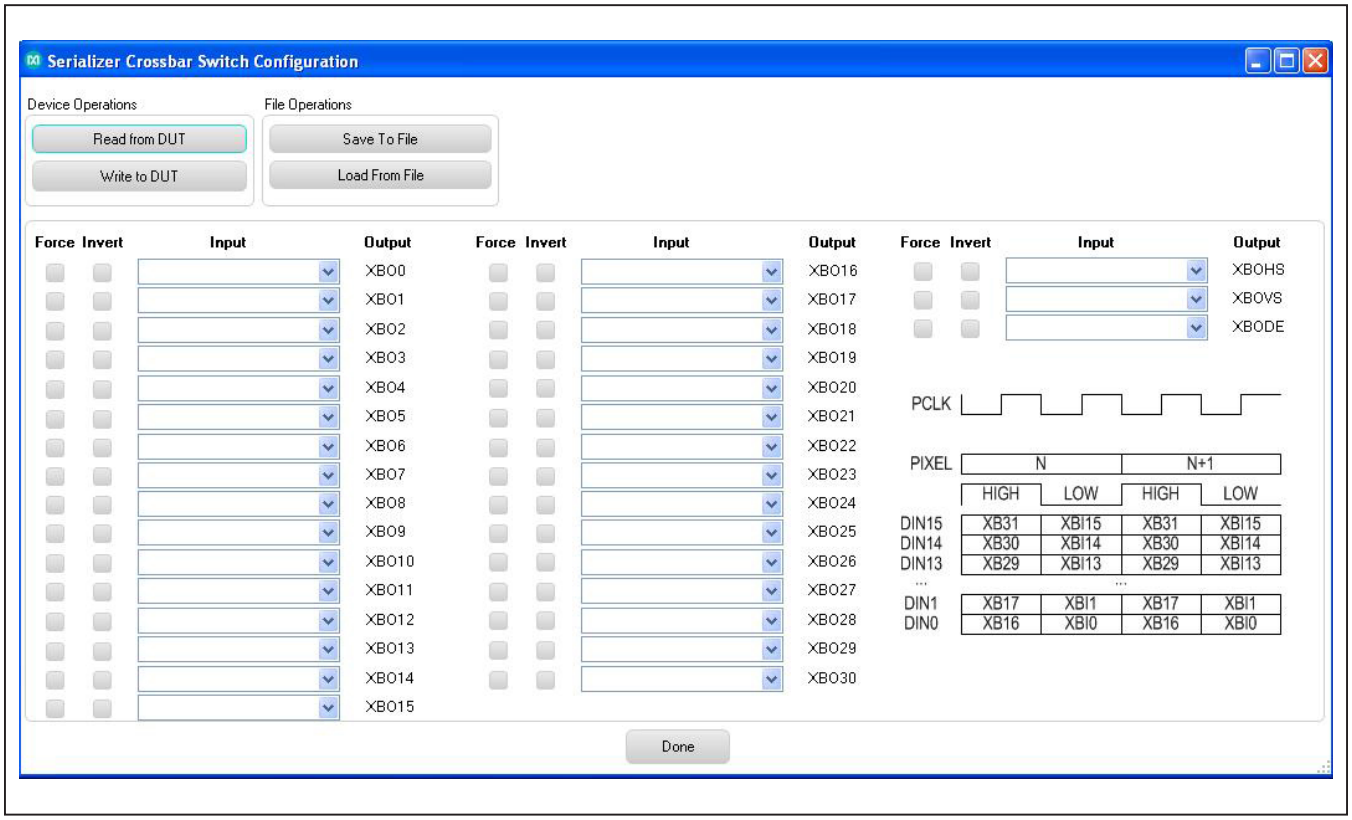

Figure 8. MAXSerDesEV-N EV Kit Software: Evaluation Kit Window (Serializer Crossbar Switch Configuration Window)

On the **Additional Features** tab, press the **Deserializer Crossbar Switch** button to launch the **Deserializer Crossbar Switch Configuration** window (Figure 9). This capability allows rearranging of data lines between the parallel input and output by the deserializer. Refer to the IC respective data sheet for a detailed description and operation of the embedded crossbar switches.

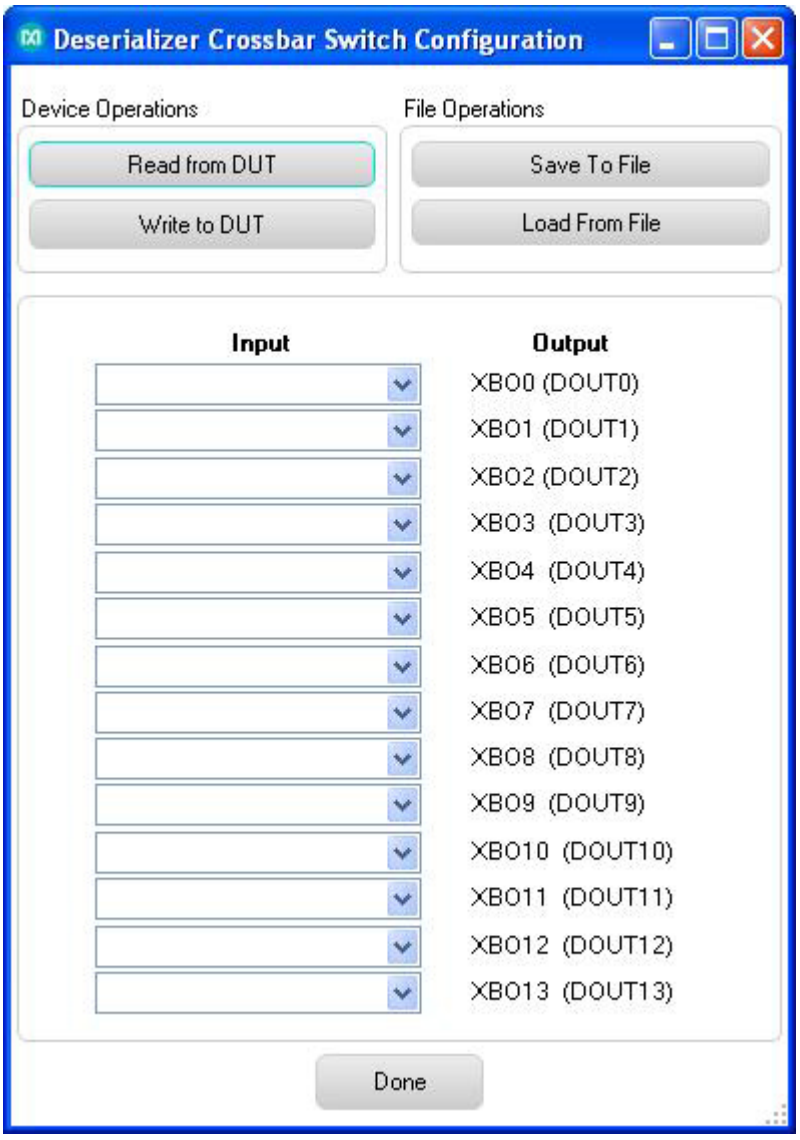

Figure 9. MAXSerDesEV-N EV Kit Software: Evaluation Kit Window (Deserializer Crossbar Switch Configuration Window)

On the **Additional Features** tab, press the **Timing Generator** button to launch this function (Figure 10), which allows the user to utilize the programmable video timing generator to generate/retime the input sync signals. Refer to the respective IC data sheet for a detailed description.

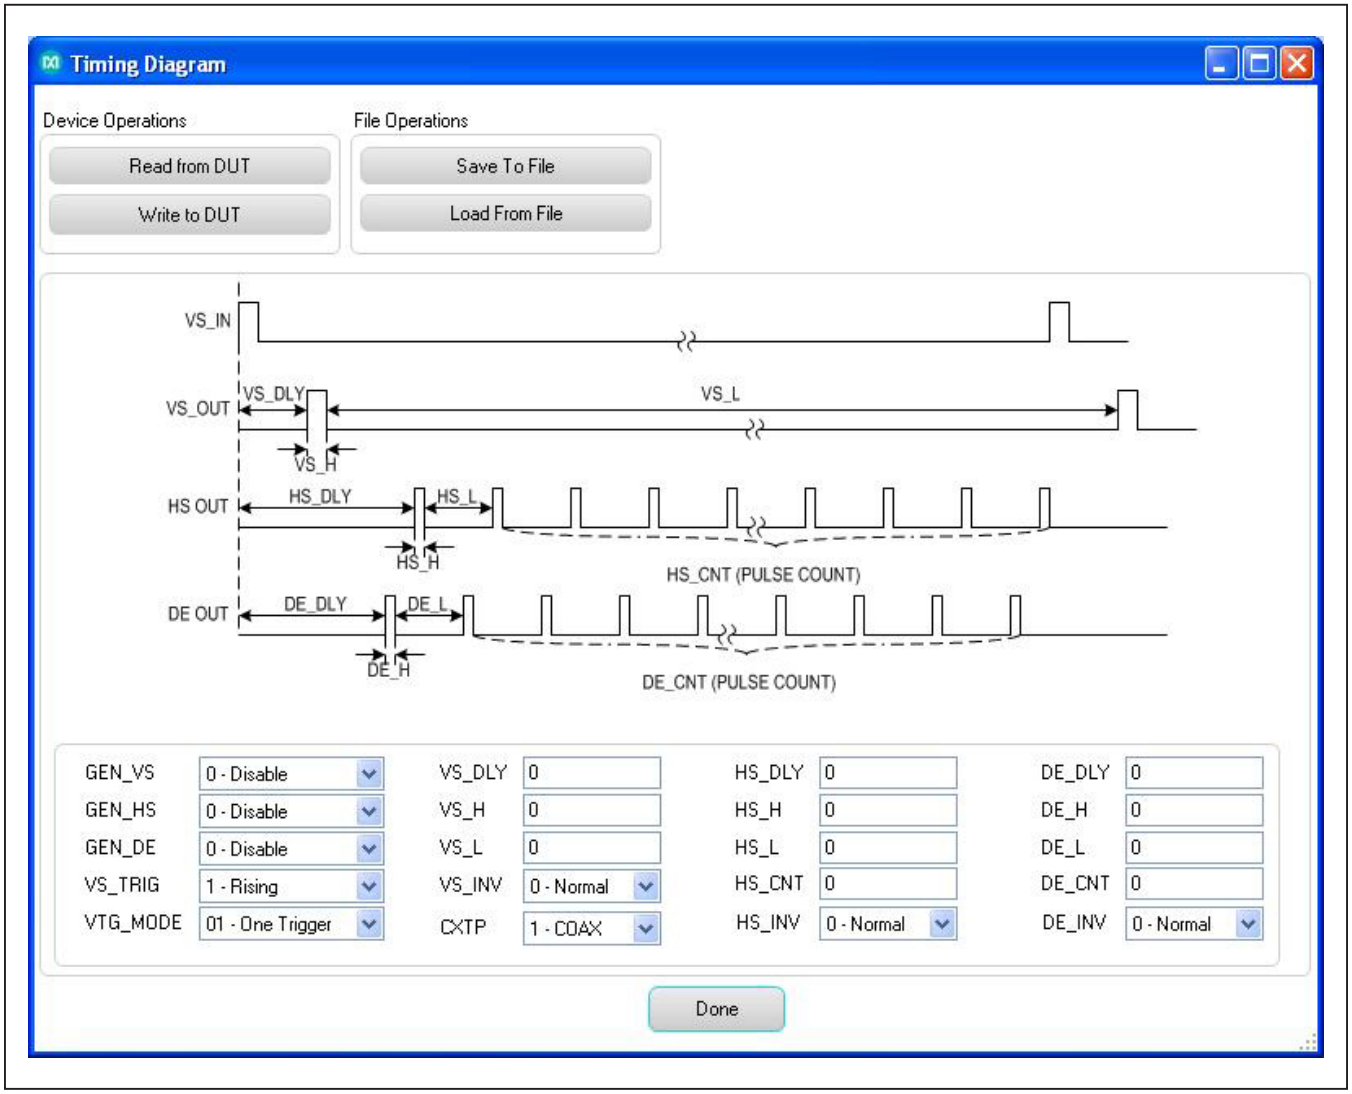

Figure 10. MAXSerDesEV-N EV Kit Software: Evaluation Kit Window (Timing Generator Window)

On the **Additional Features** tab, press the **Equalizer Visualization** button to launch this function (Figure 11), which allows compensating for higher cable attenuation at higher frequencies. Refer to the respective IC data sheet for detailed description. **Note:** This function is not available in the MAX96708 IC.

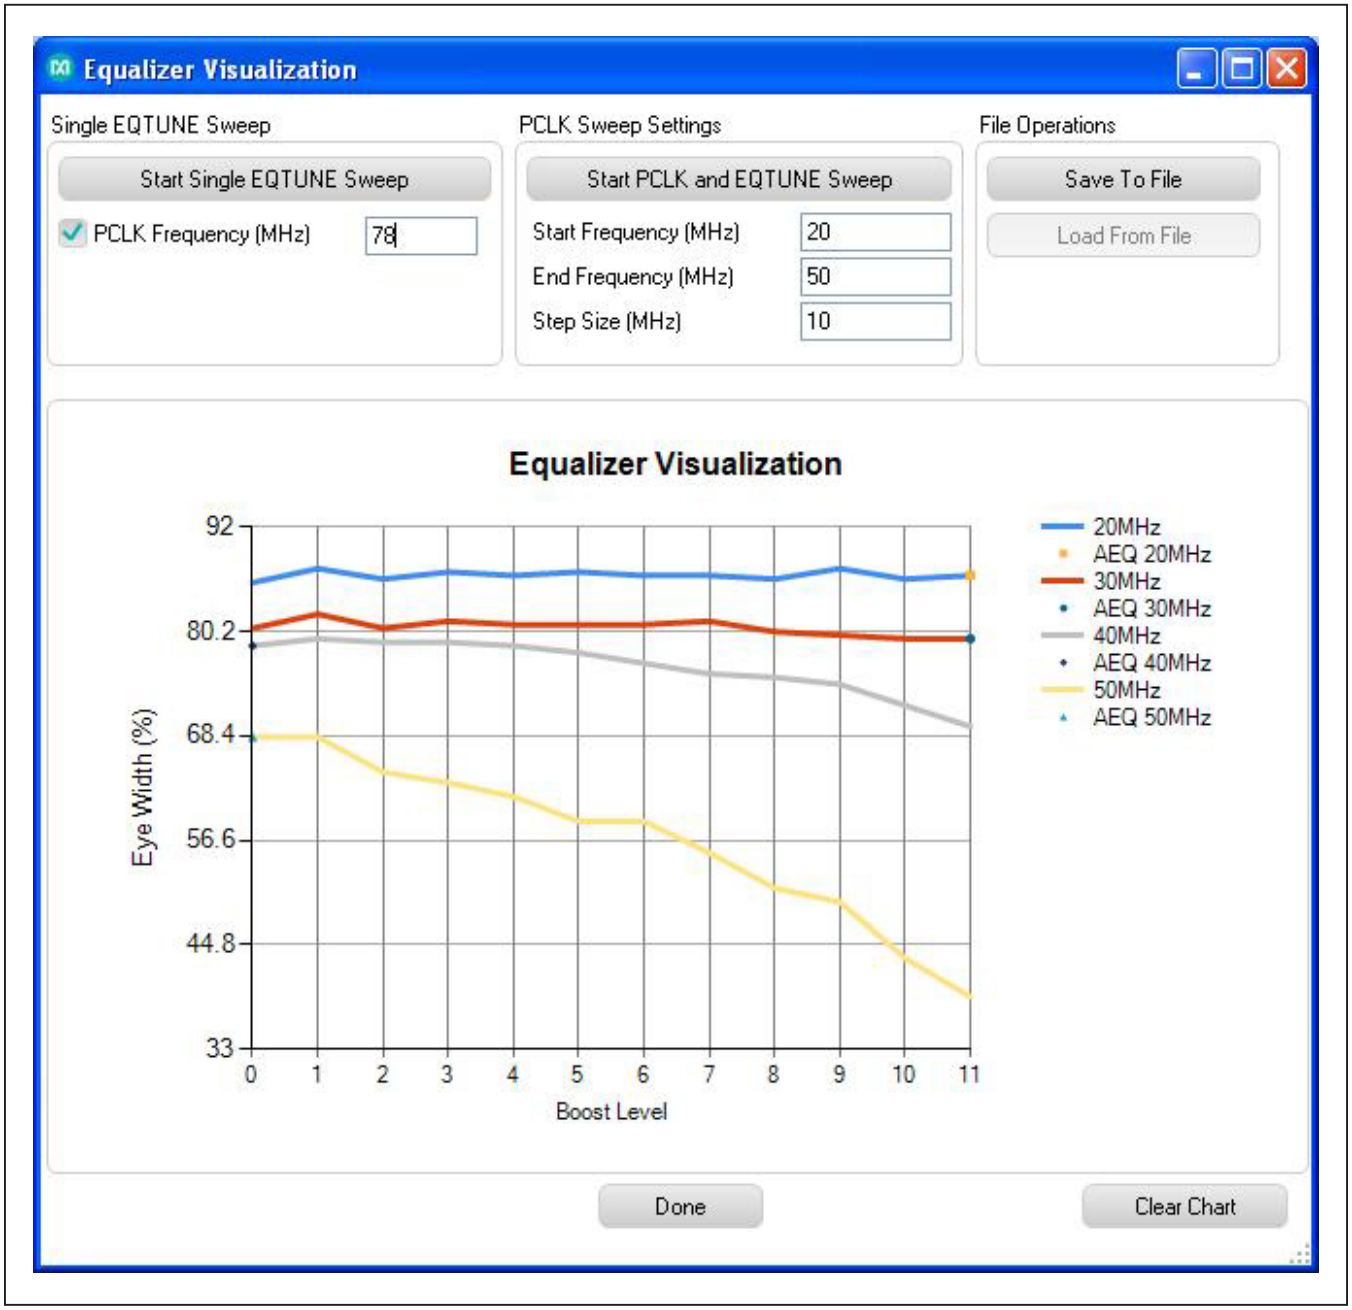

Figure 11. MAXSerDesEV-N EV Kit Software: Evaluation Kit Window (Equalizer Visualization Window)

On the **Additional Features** tab, press the **Eye Width Measurement** button to launch this function (Figure 12), which graphically displays eye width/opening of the high-speed data over the link. Refer to the respective IC data sheet for a detailed description. **Note:** This function is not available in the MAX96708 IC.

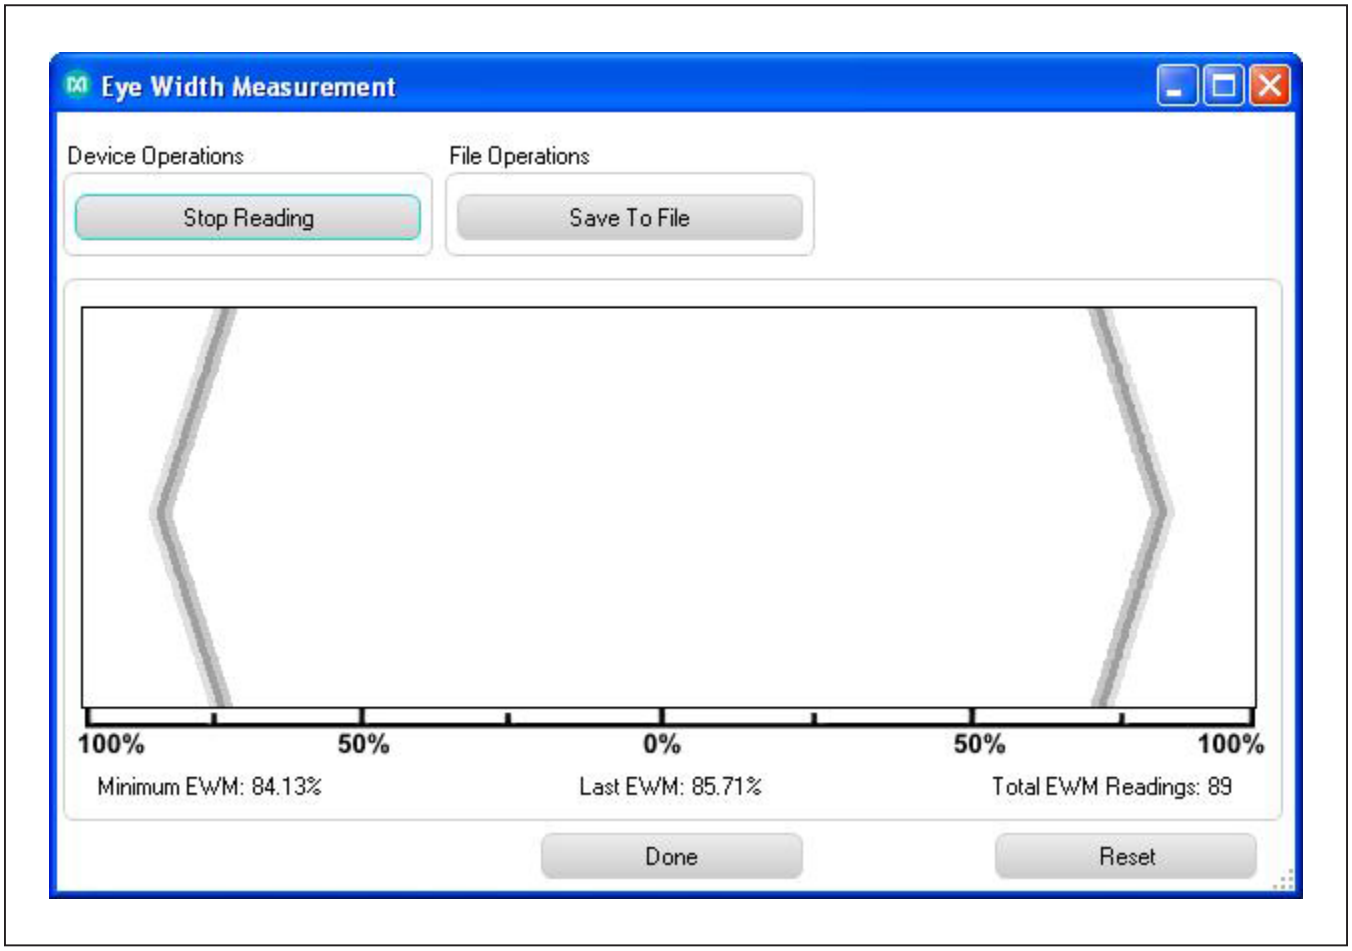

Figure 12. MAXSerDesEV-N EV Kit Software: Evaluation Kit Window (Eye Width Measurement Window)

On the **Additional Features** tab, press the **Show PRBS Test** button to perform a PRBS test (Figure 13). Enter test duration (maximum 32,767s = 9.1hrs) in the **Duration** edit box and press **Start** to start the test. At test completion, the number of bit errors are read from the PRBSERR register and displayed in the **PRBS Error Counter** box.

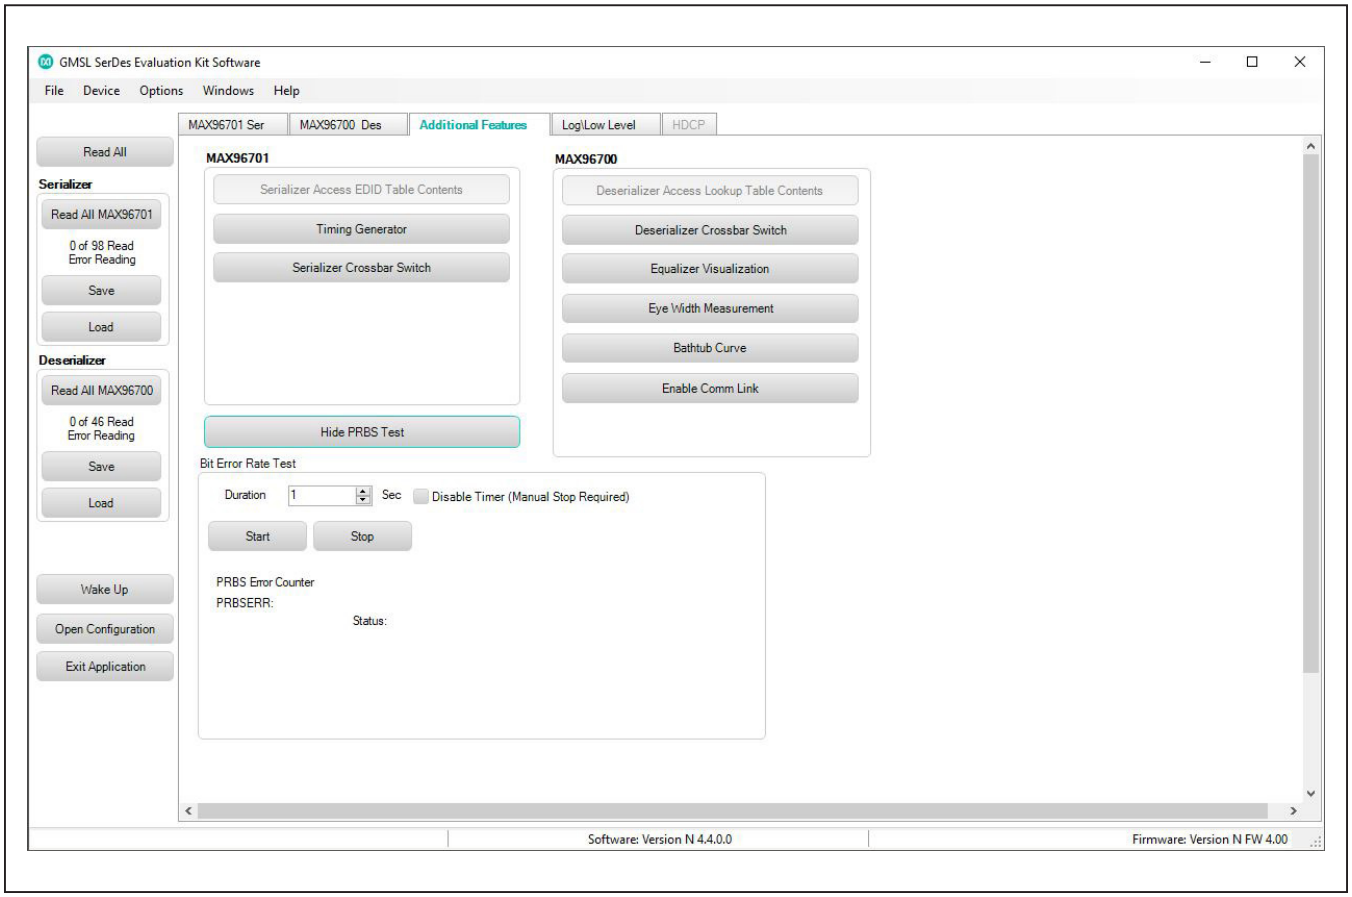

Figure 13. MAXSerDesEV-N EV Kit Software: Evaluation Kit Window (Expanded PRBS Test Window)

Log\Low Level Tab

The **Log\Low Level** tab (Figure 14) logs all activities between the GUIs and DUTs.

The **Register Access** group box allows reads or writes of the specified slave and register addresses. Use the **Send String to EVKIT** button to communicate with non-register-based devices (such as the MAX7324). The **SerDes Baud Rate** drop-down list sets the communications baud rate. Note that the baud rate should be changed in small increments/decrements (one step change is forced by the GUI).

On the **Log\Low Level** tab, the **16-Bit Register Address Read** block allows programming devices with any combination of 16-bit/8-bit register address/data.

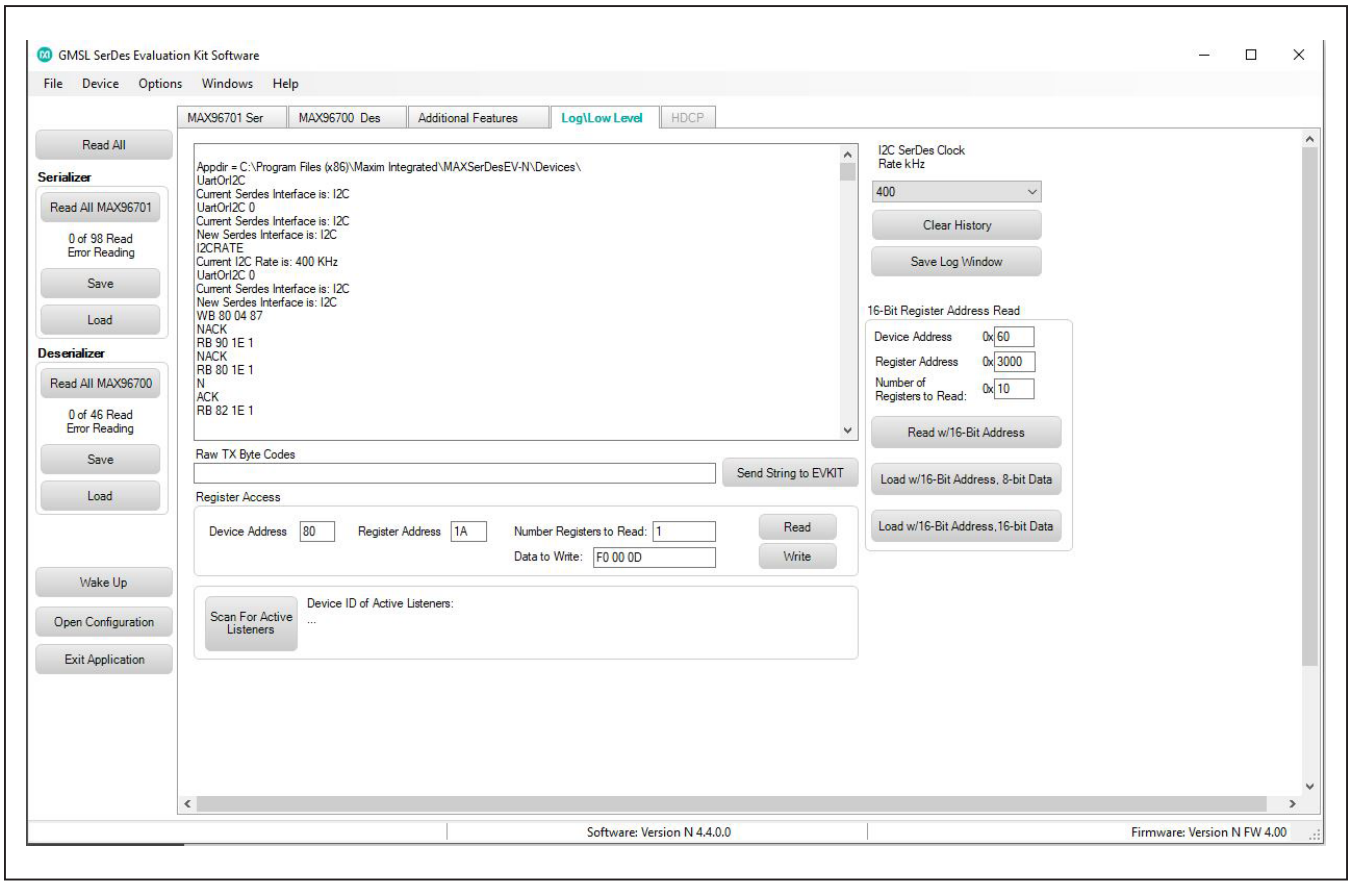

Figure 14. MAXSerDesEV-N EV Kit Software: Evaluation Kit Window (Log\Low Level Tab)

Detailed Description of Firmware

The Nuvoton microcontroller on the daughter board runs a custom firmware that ensures reliable communication between the PC and DUTs. The firmware records 9-bit even-parity data received from the USB interface while RTS is set, and plays back the 9-bit data with 1.5 stop bits timing when RTS is cleared. Data received from the DUTs is immediately relayed to the USB port.

Detailed Description of Hardware

The MAX96700 EV kit provides a proven design and layout for the MAX96700 GMSL deserializer, designed to be reliable with ease of use and flexibility. The evaluation board has FAKRA connectors to receive the GMSL serial-data input and outputs data in parallel format. On-board level translators and an easy-to-use USB-PC connection are included on the EV kit.

The MAX96700 EV kit board consists of three principal functional blocks:

1) Microcontroller daughter board
2) Application circuit block
3) Power-supply block

Microcontroller Daughter Board

The Nuvoton-based microcontroller daughter board provides UART and I^2C interfaces that communicate with both serializer and deserializer boards when they are powered on and properly configured. The Nuvoton microcontroller is programmed with the latest firmware available at the time of manufacturing.

To use the EV kit with an externally applied controller, remove the Nuvoton microcontroller daughter board from the EV kit board (DB1 position) and apply RX/SDA, TX/SCL, VDD, and GND signals from the user microcontroller to the corresponding signals on J22 of the deserializer board. Use 3.3V or 5V logic level from VDD_REF, J48 header, or apply externally.

Application Circuit Block

The application circuit block includes the deserializer and all other components and circuits suggested in the respective IC data sheet, test points, and provisions to provide access to internal functions of the deserializer for evaluation of the product.

Power Supplies

On-board LDO regulators U2, U3, and U12 generate various voltage levels required to operate the EV kit board. There are four options to power the board:

1) USB port (default)
2) 12V AC adapter
3) 5V power applied on +5VIN/GND terminals
4) Power over coax (POC), sourced by the serializer

Use header JU1 (5V0) to select the source powering the board. To operate the EV kit with voltage levels different from what are generated by on-board regulators, move the desired IOVDD (JU2), DVDD (JU3), and AVDD (JU4) shunts from the INT to EXT position and apply the desired external voltage to the corresponding wire-loop terminal

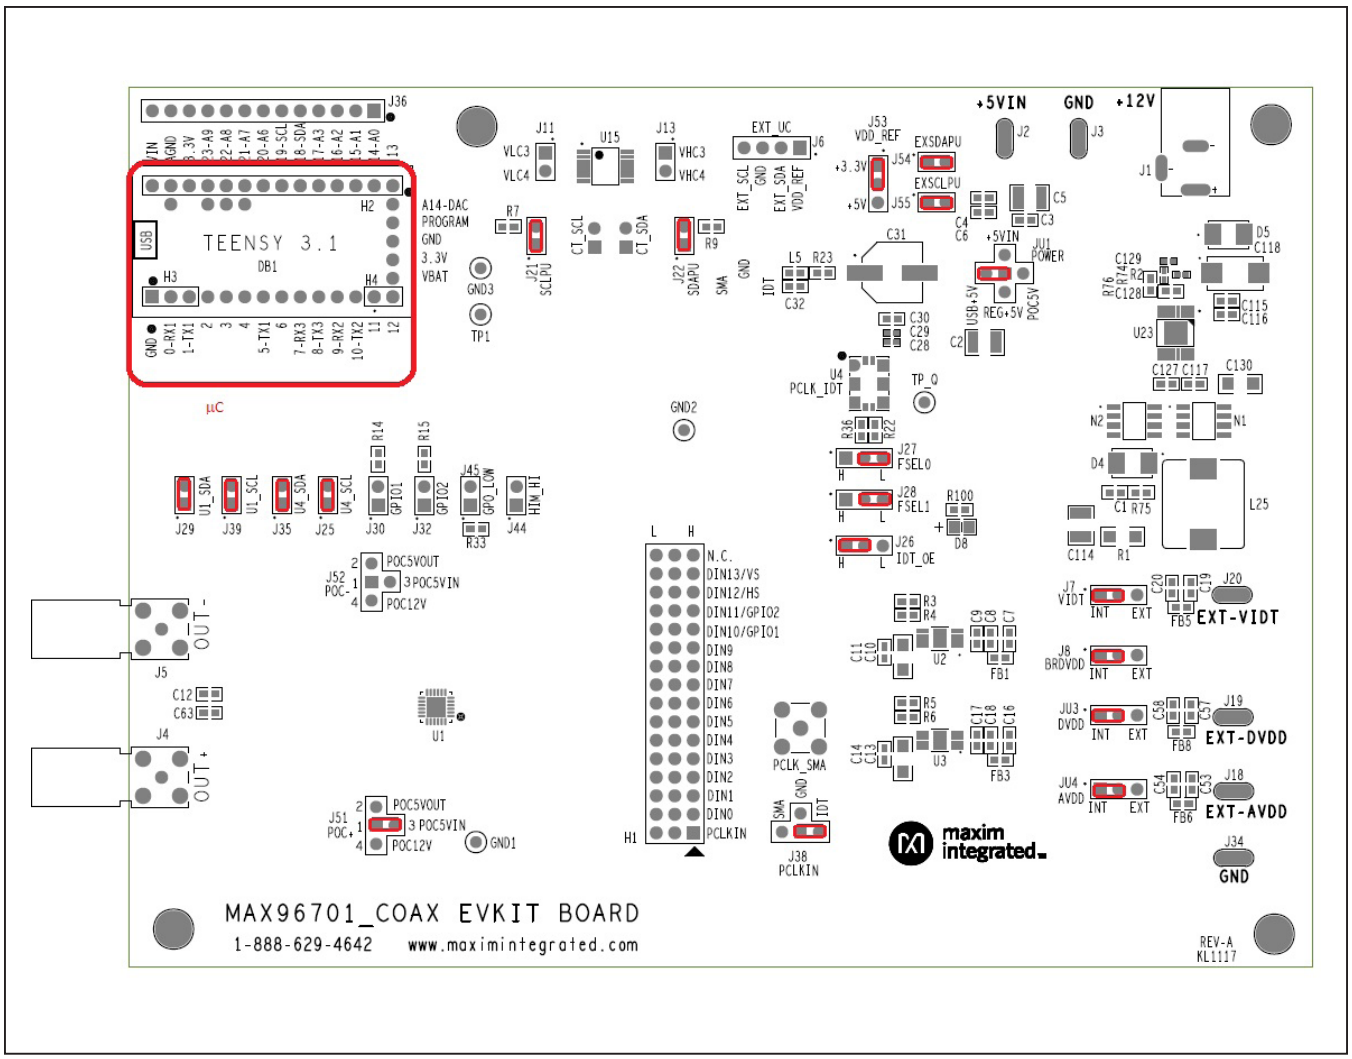

Figure 15. MAX96701 Coax EV Kit Jumper Settings for Coax Link and I²C Communication

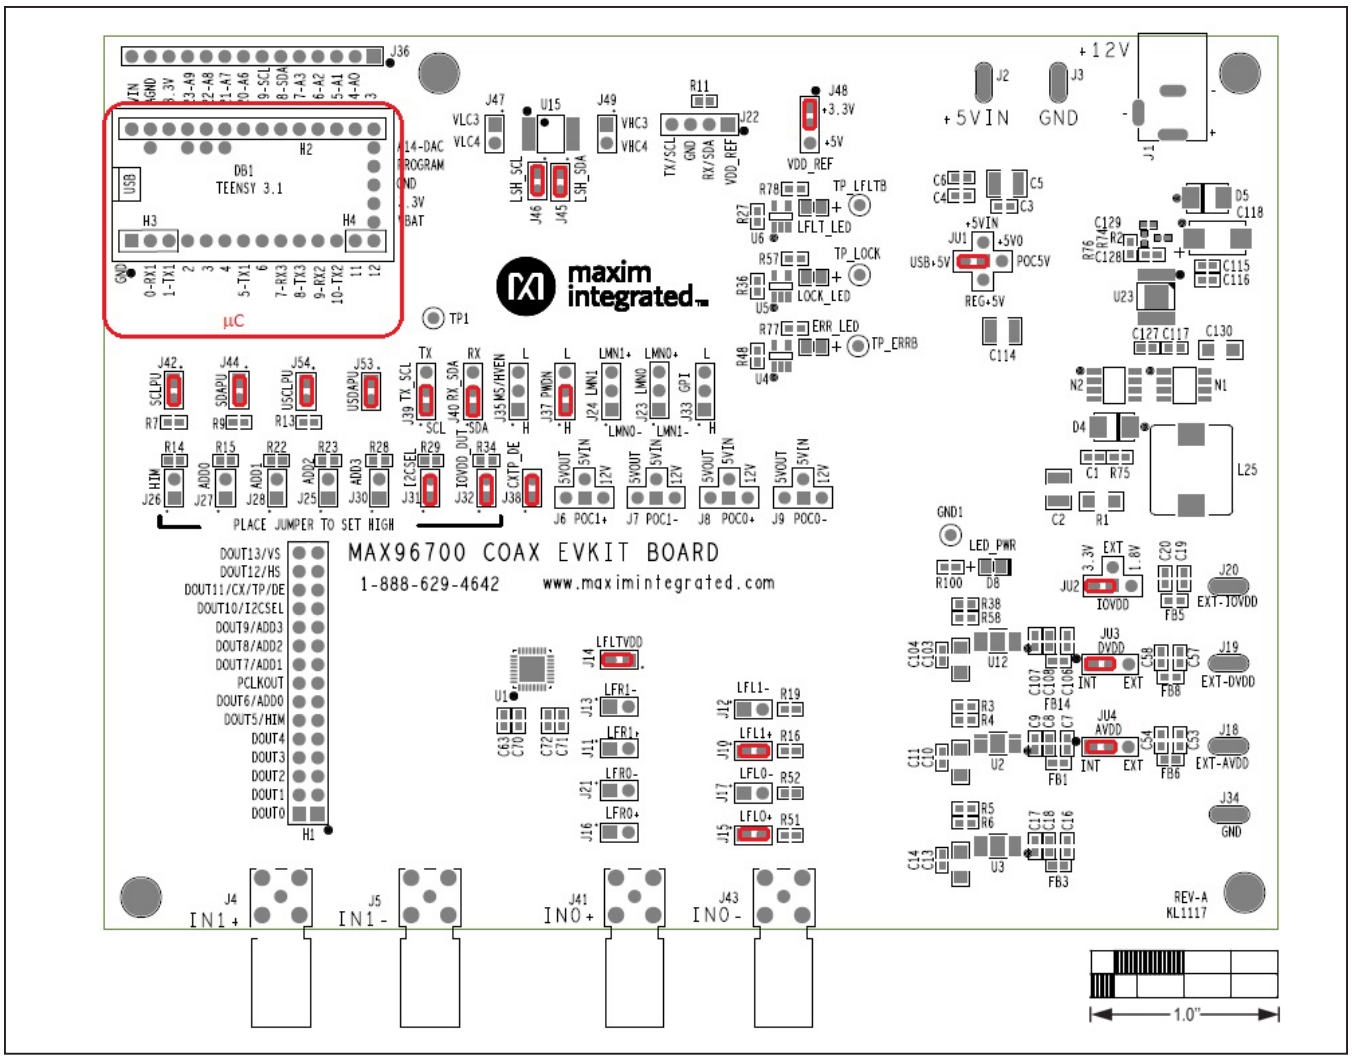

Figure 16. MAX96700 Coax EV Kit Jumper Settings for Coax Link and I²C Communication

Troubleshooting

Possible causes of board test failure include:

1) Coax cable not properly connected between the serializer OUT+ to the deserializer IN+.
2) PCLKIN not applied (e.g., FG output is disabled): Verify signal at the pins on the board.
3) PCLKIN and function generator output is not correct: Verify signal at the pins on the board.
4) Incorrect jumper setting on the deserializer board: Reverify.
5) Incorrect jumper setting on the serializer board: Reverify.
6) Bus selection on the GUI is not consistent with jumper position on the boards: Check and verify that the USB cable is properly connected.
7) USB port has locked: Exit application GUI, remove USB cable from the board, reinsert and relaunch the GUI.
8) Nuvoton µC is not communicating: Exit application GUI, remove USB cable from the board, reinsert and relaunch the GUI.
9) Deserializer board is faulty: Try a different board (if available).
10) Serializer board is faulty: Try a different board (if available).

Errata

On the MAX96700 COAX EVKIT BOARD REV-A silk-screen, the labels for headers J32 and J38 are swapped. The correct labels are listed below:

- Header J32 is CXTP_DE
- Header J38 is IOVDD_DUT
