

### FEATURES

- Dual-channel, 1024-position resolution**
- 25 k $\Omega$  nominal resistance**
- Low temperature coefficient: 35 ppm/ $^{\circ}$ C**
- Nonvolatile memory stores wiper settings**
- Permanent memory write protection**
- Wiper setting readback**
- Resistance tolerance stored in EEMEM**
- Predefined linear increment/decrement instructions**
- Predefined  $\pm 6$  dB/step log taper increment/decrement instructions**
- SPI-compatible serial interface**
- +2.7 V to +5 V single supply or  $\pm 2.5$  V dual supply**
- 26 bytes extra nonvolatile memory for user-defined information**
- 100-year typical data retention,  $T_A = 55^{\circ}$ C**
- Power-on refreshed with EEMEM settings**
- Enhanced Features**
  - Supports defense and aerospace applications (AQEC)**
  - Temperature range:  $-40^{\circ}$ C to  $+125^{\circ}$ C**
  - Controlled manufacturing baseline**
  - 1 assembly/test site**
  - 1 fabrication site**
  - Product change notification**
  - Qualification data available on request**

### APPLICATIONS

- DWDM laser diode driver, optical supervisory systems**
- Mechanical potentiometer replacement**
- Instrumentation: gain, offset adjustment**
- Programmable voltage-to-current conversion**
- Programmable filters, delays, time constants**
- Programmable power supply**
- Low resolution DAC replacement**
- Sensor calibration**

### GENERAL DESCRIPTION

The AD5235-EP is a dual-channel, nonvolatile memory,<sup>1</sup> digitally controlled potentiometer<sup>2</sup> with 1024-step resolution. The device performs the same electronic adjustment function as a mechanical potentiometer with enhanced resolution, solid state reliability, and superior low temperature coefficient performance. The AD5235-EP's versatile programming via an SPI<sup>®</sup>-compatible serial interface allows 16 modes of operation and adjustment including scratchpad programming, memory storing and restoring, increment/decrement,  $\pm 6$  dB/step log taper adjustment, wiper setting readback, and extra EEMEM<sup>1</sup> for user-defined information such as memory data for other components, look-up tables, or system identification information.

### FUNCTIONAL BLOCK DIAGRAM

Figure 1.

In scratchpad programming mode, a specific setting can be programmed directly to the RDAC<sup>2</sup> register that sets the resistance between Terminal W and Terminal A, and Terminal W and Terminal B. This setting can be stored into the EEMEM and is restored automatically to the RDAC register during system power-on.

The EEMEM content can be restored dynamically or through external PR strobing, and a WP function protects EEMEM contents. To simplify the programming, the independent or simultaneous linear-step increment or decrement commands can be used to move the RDAC wiper up or down, one step at a time. For logarithmic  $\pm 6$  dB changes in the wiper setting, the left or right bit shift command can be used to double or halve the RDAC wiper setting.

The AD5235-EP patterned resistance tolerance is stored in the EEMEM. Therefore, in readback mode, the host processor can know the actual end-to-end resistance. The host can execute the appropriate resistance step through a software routine that simplifies open-loop applications as well as precision calibration and tolerance matching applications.

The AD5235-EP is available in a thin, 16-lead TSSOP package. The part is guaranteed to operate over the extended industrial temperature range of  $-40^{\circ}$ C to  $+125^{\circ}$ C.

Full details about this enhanced product, including theory of operation, register details, and applications information, are available in the [AD5235](#) data sheet, which should be consulted in conjunction with this data sheet.

<sup>1</sup> The terms nonvolatile memory and EEMEM are used interchangeably.

<sup>2</sup> The terms digital potentiometer and RDAC are used interchangeably.

Crosstalk ( $C_{W1}/C_{W2}$ )	$C_T$	$V_A = V_{DD}$ , $V_B = 0\text{ V}$ , measured $V_{W1}$ with $V_{W2}$ making full-scale change		30		nV-s
Analog Crosstalk	$C_{TA}$	$V_{DD} = V_{A1} = +2.5\text{ V}$ , $V_{SS} = V_{B1} = -2.5\text{ V}$ , measured $V_{W1}$ with $V_{W2} = 5\text{ V p-p}$ at $f = 1\text{ kHz}$ , Code 1 = 0x200, Code 2 = 0x3FF		-110		dB

<sup>1</sup> Typicals represent average readings at 25°C and  $V_{DD} = 5\text{ V}$ .

<sup>2</sup> Resistor position nonlinearity error (R-INL) is the deviation from an ideal value measured between the maximum resistance and the minimum resistance wiper positions. R-DNL measures the relative step change from ideal between successive tap positions.  $I_W \sim 50\text{ }\mu\text{A}$  for  $V_{DD} = 2.7\text{ V}$  and  $I_W \sim 400\text{ }\mu\text{A}$  for  $V_{DD} = 5\text{ V}$  (see Figure 25).

<sup>3</sup> INL and DNL are measured at  $V_W$  with the RDAC configured as a potentiometer divider similar to a voltage output DAC.  $V_A = V_{DD}$  and  $V_B = V_{SS}$ . DNL specification limits of  $\pm 1\text{ LSB}$  maximum are guaranteed monotonic operating conditions (see Figure 26).

<sup>4</sup> Resistor Terminal A, Resistor Terminal B, and Resistor Terminal W have no limitations on polarity with respect to each other. Dual-supply operation enables ground-referenced bipolar signal adjustment.

<sup>5</sup> Guaranteed by design and not subject to production test.

<sup>6</sup> Common-mode leakage current is a measure of the dc leakage from any Terminal A, Terminal B, or Terminal W to a common-mode bias level of  $V_{DD}/2$ .

<sup>7</sup> EEMEM restore mode current is not continuous. Current is consumed while EEMEM locations are read and transferred to the RDAC register (see Figure 22). To minimize power dissipation, a NOP, Instruction 0 (0x0) should be issued immediately after Instruction 1 (0x1).

<sup>8</sup>  $P_{DISS}$  is calculated from  $(I_{DD} \times V_{DD}) + (I_{SS} \times V_{SS})$ .

<sup>9</sup> All dynamic characteristics use  $V_{DD} = +2.5\text{ V}$  and  $V_{SS} = -2.5\text{ V}$ .

## INTERFACE TIMING AND EEMEM RELIABILITY CHARACTERISTICS

Guaranteed by design and not subject to production test. See the Timing Diagrams section for the location of measured values. All input control voltages are specified with  $t_R = t_F = 2.5$  ns (10% to 90% of 3 V) and timed from a voltage level of 1.5 V. Switching characteristics are measured using both  $V_{DD} = 2.7$  V and  $V_{DD} = 5$  V.

Table 2.

Parameter	Symbol	Conditions	Min	Typ <sup>1</sup>	Max	Unit
Clock Cycle Time ( $t_{CYC}$ )	$t_1$		20			ns
$\overline{CS}$ Setup Time	$t_2$		10			ns
CLK Shutdown Time to $\overline{CS}$ Rise	$t_3$		1			$t_{CYC}$
Input Clock Pulse Width	$t_4, t_5$	Clock level high or low	10			ns
Data Setup Time	$t_6$	From positive CLK transition	5			ns
Data Hold Time	$t_7$	From positive CLK transition	5			ns
$\overline{CS}$ to SDO-SPI Line Acquire	$t_8$				40	ns
$\overline{CS}$ to SDO-SPI Line Release	$t_9$				50	ns
CLK to SDO Propagation Delay <sup>2</sup>	$t_{10}$	$R_P = 2.2$ k $\Omega$ , $C_L < 20$ pF			50	ns
CLK to SDO Data Hold Time	$t_{11}$	$R_P = 2.2$ k $\Omega$ , $C_L < 20$ pF	0			ns
$\overline{CS}$ High Pulse Width <sup>3</sup>	$t_{12}$		10			ns
$\overline{CS}$ High to $\overline{CS}$ High <sup>3</sup>	$t_{13}$		4			$t_{CYC}$
RDY Rise to $\overline{CS}$ Fall	$t_{14}$		0			ns
$\overline{CS}$ Rise to RDY Fall Time	$t_{15}$			0.15	0.3	ms
Store EEMEM Time <sup>4, 5</sup>	$t_{16}$	Applies to Instructions 0x2, 0x3		15	50	ms
Read EEMEM Time <sup>4</sup>	$t_{16}$	Applies to Instructions 0x8, 0x9, 0x10		7	30	$\mu$ s
$\overline{CS}$ Rise to Clock Rise/Fall Setup	$t_{17}$		10			ns
Preset Pulse Width (Asynchronous) <sup>6</sup>	$t_{PRW}$		50			ns
Preset Response Time to Wiper Setting <sup>6</sup>	$t_{PRES}$	$\overline{PR}$ pulsed low to refresh wiper positions		30		$\mu$ s
Power-On EEMEM Restore Time <sup>6</sup>	$t_{EEMEM}$			30		$\mu$ s
FLASH/EE MEMORY RELIABILITY						
Endurance <sup>7</sup>		$T_A = 25^\circ\text{C}$		1		MCycles
			100			kCycles
Data Retention <sup>8</sup>				100		Years

<sup>1</sup> Typical values represent average readings at  $25^\circ\text{C}$  and  $V_{DD} = 5$  V.

<sup>2</sup> Propagation delay depends on the value of  $V_{DD}$ ,  $R_{PULL-UP}$ , and  $C_L$ .

<sup>3</sup> Valid for commands that do not activate the RDY pin.

<sup>4</sup> The RDY pin is low only for Instruction 2, Instruction 3, Instruction 8, Instruction 9, Instruction 10, and the  $\overline{PR}$  hardware pulse: CMD\_8 ~ 20  $\mu$ s; CMD\_9, CMD\_10 ~ 7  $\mu$ s; CMD\_2, CMD\_3 ~ 15 ms;  $\overline{PR}$  hardware pulse ~ 30  $\mu$ s.

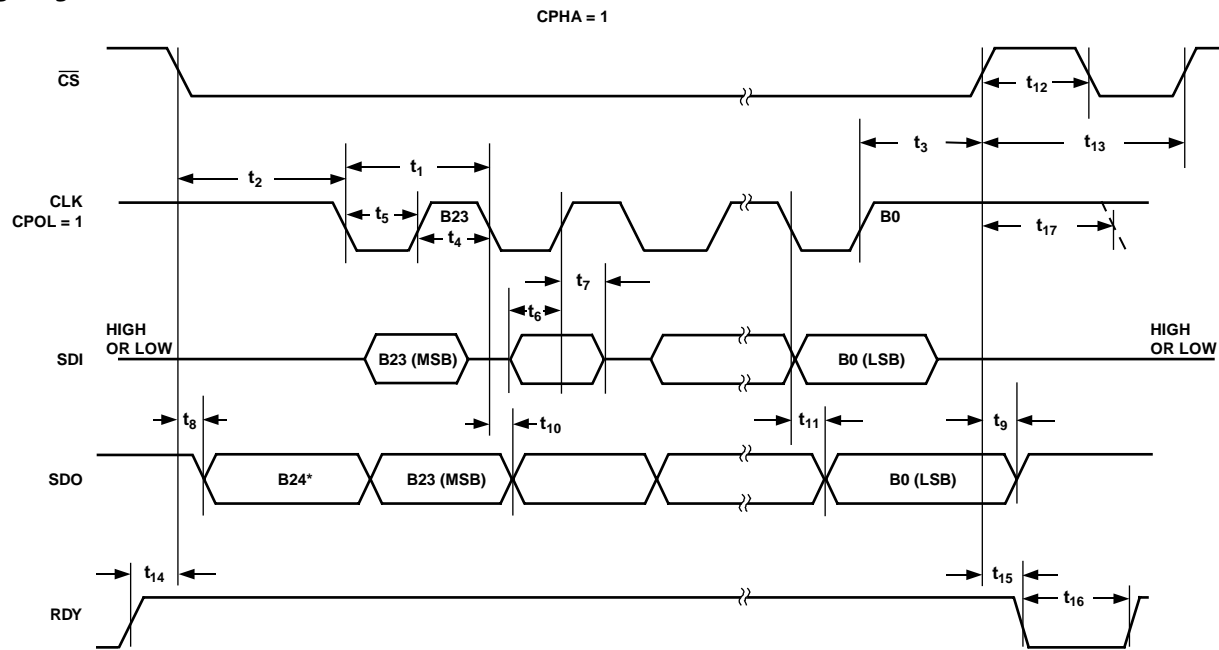

<sup>5</sup> Store EEMEM time depends on the temperature and EEMEM writes cycles. Higher timing is expected at a lower temperature and higher write cycles.

<sup>6</sup> Not shown in Figure 2 and Figure 3.

<sup>7</sup> Endurance is qualified to 100,000 cycles per JEDEC Standard 22, Method A117 and measured at  $-40^\circ\text{C}$ ,  $+25^\circ\text{C}$ , and  $+125^\circ\text{C}$ .

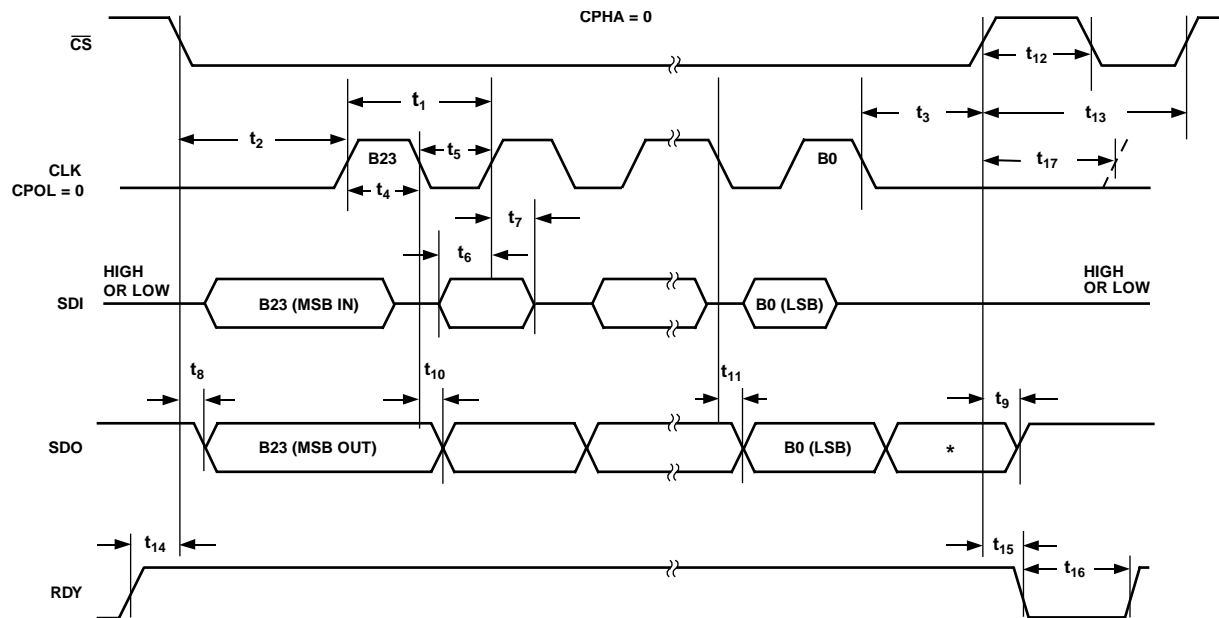

<sup>8</sup> Retention lifetime equivalent at junction temperature ( $T_J$ ) =  $85^\circ\text{C}$  per JEDEC Standard 22, Method A117. Retention lifetime based on an activation energy of 1 eV derates with junction temperature in the Flash/EE memory.

## Timing Diagrams

\*THE EXTRA BIT THAT IS NOT DEFINED IS NORMALLY THE LSB OF THE CHARACTER PREVIOUSLY TRANSMITTED.  
THE CPOL = 1 MICROCONTROLLER COMMAND ALIGNS THE INCOMING DATA TO THE POSITIVE EDGE OF THE CLOCK.

09185-002

\*THE EXTRA BIT THAT IS NOT DEFINED IS NORMALLY THE MSB OF THE CHARACTER JUST RECEIVED.  
THE CPOL = 0 MICROCONTROLLER COMMAND ALIGNS THE INCOMING DATA TO THE POSITIVE EDGE OF THE CLOCK.

09185-003

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.

Table 3.

Parameter	Rating
$V_{DD}$ to GND	$-0.3\text{ V to }+7\text{ V}$
$V_{SS}$ to GND	$+0.3\text{ V to }-7\text{ V}$
$V_{DD}$ to $V_{SS}$	$7\text{ V}$
$V_A, V_B, V_W$ to GND	$V_{SS} - 0.3\text{ V to }V_{DD} + 0.3\text{ V}$
$I_A, I_B, I_W$	
Pulsed <sup>1</sup>	$\pm 2.5\text{ mA}$
Continuous	$\pm 1.1\text{ mA}$
Digital Input and Output Voltage to GND	$-0.3\text{ V to }V_{DD} + 0.3\text{ V}$
Operating Temperature Range <sup>2</sup>	$-40^\circ\text{C to }+125^\circ\text{C}$
Maximum Junction Temperature ( $T_J$ max)	$150^\circ\text{C}$
Storage Temperature Range	$-65^\circ\text{C to }+150^\circ\text{C}$
Lead Temperature, Soldering	
Vapor Phase (60 sec)	$215^\circ\text{C}$
Infrared (15 sec)	$220^\circ\text{C}$
Thermal Resistance	
Junction-to-Ambient, $\theta_{JA}$	$150^\circ\text{C/W}$
Junction-to-Case, $\theta_{JC}$	$28^\circ\text{C/W}$
Package Power Dissipation	$(T_J \text{ max} - T_A)/\theta_{JA}$

<sup>1</sup> Maximum terminal current is bounded by the maximum current handling of the switches, maximum power dissipation of the package and the maximum applied voltage across any two of the A, B, and W terminals at a given resistance.

<sup>2</sup> Includes programming of nonvolatile memory.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

### ESD CAUTION

#### ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 4. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	CLK	Serial Input Register Clock. Shifts in one bit at a time on positive clock edges.
2	SDI	Serial Data Input. Shifts in one bit at a time on positive clock CLK edges. MSB loads first.
3	SDO	Serial Data Output. Serves readback and daisy-chain functions. Command 9 and Command 10 activate the SDO output for the readback function, delayed by 24 or 25 clock pulses, depending on the clock polarity before and after the data-word (see Figure 2 and Figure 3). In other commands, the SDO shifts out the previously loaded SDI bit pattern, delayed by 24 or 25 clock pulses depending on the clock polarity (see Figure 2 and Figure 3). This previously shifted out SDI can be used for daisy-chaining multiple devices. Whenever SDO is used, a pull-up resistor in the range of 1 kΩ to 10 kΩ is needed.
4	GND	Ground Pin, Logic Ground Reference.
5	V <sub>SS</sub>	Negative Supply. Connect to 0 V for single-supply applications. If V <sub>SS</sub> is used in dual supply, it must be able to sink 35 mA for 30 ms when storing data to EEMEM.
6	A1	Terminal A of RDAC1.
7	W1	Wiper terminal of RDAC1. ADDR (RDAC1) = 0x0.
8	B1	Terminal B of RDAC1.
9	B2	Terminal B of RDAC2.
10	W2	Wiper terminal of RDAC2. ADDR (RDAC2) = 0x1.
11	A2	Terminal A of RDAC2.
12	V <sub>DD</sub>	Positive Power Supply.
13	WP	Optional Write Protect. When active low, $\overline{WP}$ prevents any changes to the present contents, except $\overline{PR}$ strobe. CMD_1 and CMD_8 refresh the RDAC register from EEMEM. Execute a NOP instruction before returning to $\overline{WP}$ high. Tie $\overline{WP}$ to V <sub>DD</sub> , if not used.
14	PR	Optional Hardware Override Preset. Refreshes the scratchpad register with current contents of the EEMEM register. Factory default loads midscale 512 <sub>10</sub> until EEMEM is loaded with a new value by the user. PR is activated at the logic high transition. Tie PR to V <sub>DD</sub> , if not used.
15	CS	Serial Register Chip Select Active Low. Serial register operation takes place when $\overline{CS}$ returns to logic high.
16	RDY	Ready. Active high open-drain output. Identifies completion of Instruction 2, Instruction 3, Instruction 8, Instruction 9, Instruction 10, and PR.
