

# 1.5GHz to 7GHz Dual Programmable Gain Downconverting Mixer

## FEATURES

- 9dB Power Conversion Gain
- 32dBm Output IP3
- 15.5dB Range IF DVGA in 0.5dB Steps
- IF Frequency Range Up to 900MHz
- Reduced Power Mode
- 3.3V Single Supply
- Simple SPI for Fast Development
- -40°C to 105°C Operation ( $T_C$ )
- Very Small Solution Size
- 32-Lead (5mm × 5mm) QFN Package

## APPLICATIONS

- 4G and 5G MIMO Receivers
- 5.1GHz to 5.9GHz LTE-U
- Distributed Antenna Systems (DAS)
- Network Test/Monitoring Equipment
- Fixed Satellite Services

## DESCRIPTION

The **LTC<sup>®</sup>5556** dual programmable gain downconverting mixer is ideal for diversity and MIMO receivers that require precise gain setting. Each channel incorporates an active mixer and a digital IF VGA with 15.5dB gain control range. The IF gain of each channel is programmed in 0.5dB steps through the SPI.

Enable pins for each channel allow fast turn-on and shut-down. A reduced power mode is also available.

The device has the same functionality as the LTC5566, but the mixers are optimized for a higher 3GHz to 7GHz RF frequency range and the IF is optimized for use up to 900MHz. The mixers may be used down to 1.5GHz, or up to 8GHz with degraded performance.

### Dual Programmable Gain Downconverting Mixers

| PART NUMBER | OPTIMUM RF RANGE | IF RANGE       |
|-------------|------------------|----------------|
| LTC5556     | 3GHz to 7GHz     | 1MHz to 900MHz |
| LTC5566     | 300MHz to 4.5GHz | 1MHz to 500MHz |

## TYPICAL APPLICATION

### Dual Channel MIMO Receiver with Programmable 0.5dB Gain Steps

**LTC5556 Conversion Gain vs  
RF Frequency and IF Attenuation  
(0.5dB Gain Steps)**

## ABSOLUTE MAXIMUM RATINGS

(Notes 1, 2)

**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** The mixer output pins on this device are sensitive to ESD greater than 1kV (HBM). Proper ESD handling precautions must be observed. All other pins withstand 2kV.

**Note 3:** The LTC5556 is guaranteed functional over the  $-40^\circ\text{C}$  to  $105^\circ\text{C}$  case temperature range.

**Note 4:** SSB Noise Figure measured with a small-signal noise source, bandpass filter and 2dB matching pad on RF input, and bandpass filter on the LO input.

**Note 5:** Channel-to-channel isolation is defined as the relative IF output power of channel 2 to channel 1, with the RF input signal applied to RF1 while the RF2 input is  $50\Omega$  terminated. Both channels are enabled and programmed for 3dB IF attenuation.

**Note 6:** SPI timing guaranteed by design, not subject to test.

# TYPICAL PERFORMANCE CHARACTERISTICS

Test circuit shown in Figure 1.

$P_{RF} = -6\text{dBm/Tone}$ ,  $\Delta f = 2\text{MHz}$ ,  $P_{LO} = 0\text{dBm}$ ,  $V_{CC} = 3.3\text{V}$ ,  $V_{DD} = 3.3\text{V}$ ,  $T_C = 25^\circ\text{C}$ , full power mode, unless otherwise noted.

## PIN FUNCTIONS

**GND (Pins 1, 8, 9, 16, 25, 32, Exposed Pad Pin 33):** Ground. These pins must be soldered to the RF ground plane on the circuit board. The exposed pad provides both electrical ground contact and thermal contact to the printed circuit board.

**RF1, RF2 (Pins 2, 7):** Single-Ended RF Inputs for Channels 1 and 2, Respectively. These pins are internally biased to  $V_{CC}/2$  when  $V_{CC}$  is applied. Therefore, a series DC-blocking capacitor must be used.

**CSB (Pin 3):** Serial Port Chip Select. This CMOS input activates the SPI inputs when driven low. When driven high, the inputs are deactivated. See the Applications section for more details.

**CLK (Pin 4):** Serial Port Clock. This CMOS input clocks serial port input data on its rising edge. See the Applications section for more details.

**SDI (Pin 5):** Serial Port Data Input. This CMOS input is used to load serial data into the 16-bit register. See the Applications section for more details.

**SDO (Pin 6):** Serial Port Data Output. This CMOS three-state output presents data from the serial port during a communication burst. Optionally, attach a resistor of  $>200k$  to GND to prevent a floating output. See the Applications section for more details.

**MO2<sup>-</sup>, MO2<sup>+</sup>, MO1<sup>+</sup>, MO1<sup>-</sup> (Pins 10, 11, 30, 31):** Open-Collector Differential IF Outputs for Mixer 2 and Mixer 1, Respectively. These pins must be connected to  $V_{CC}$  through pull-up inductors. Typical DC current is 28mA into each pin.

**V<sub>CC2</sub>, V<sub>CC1</sub> (Pins 12, 29):** Power Supply Pins for Channels 2 and 1, Respectively. These pins must be connected to a regulated 3.3V supply, with a bypass capacitor located close to the pins. Typical DC current consumption is 40mA into each pin.

**EN2, EN1 (Pins 13, 28):** Enable Control Pins for Channels 2 and 1, Respectively. A CMOS logic high will enable each channel. These pins have internal 330k pull-down resistors, so if unconnected, both channels are shutdown.

**AI2<sup>+</sup>, AI2<sup>-</sup>, AI1<sup>-</sup>, AI1<sup>+</sup> (Pins 14, 15, 26, 27):** Differential IF Attenuator Inputs for Channel 2 and Channel 1, Respectively. These pins are internally biased to  $V_{CC}/2$  when  $V_{CC}$  is applied. Therefore, a series DC-blocking capacitor must be used.

**IF2<sup>+</sup>, IF2<sup>-</sup>, IF1<sup>-</sup>, IF1<sup>+</sup> (Pins 17, 18, 23, 24):** Open-Collector Differential IF Buffer Outputs for Channel 2 and Channel 1, Respectively. These pins must be connected to  $V_{CC}$  through pull-up inductors. Typical DC current is 47mA into each pin.

**RP (Pin 19):** Reduced Power Select Pin. A CMOS logic low on this pin commands both channels to full power mode, unless programmed to reduced power mode by the SPI. A CMOS logic high programs both channels to reduced power mode, independent of the SPI. This pin has an internal 330k pull-down resistor.

**LO<sup>-</sup>, LO<sup>+</sup> (Pins 20, 21):** Differential Local Oscillator Input. These pins are internally connected to ESD diodes to ground. Therefore, series DC-blocking capacitors must be used if the LO source has a DC voltage present. Single-ended or differential drive may be used. Each pin is internally matched to 50Ω, even when the mixers are disabled.

**V<sub>DD</sub> (Pin 22):** Power Supply Pin for Serial Interface Logic. This pin must be connected to a regulated 1.8V to 3.3V supply. Typical DC current consumption is less than 1mA with CSB low and the clock running at 10MHz. When idle, typical current consumption is less than 500μA. The supply voltage on this pin defines the logic levels for the SPI inputs (CSB, CLK and SDI), the SDO output, and the RP pin.

## APPLICATIONS INFORMATION

### Introduction

The LTC5556 incorporates two identical RF-to-IF down-conversion mixers driven by a common LO input. The symmetry of the IC assures that both mixers are driven with an amplitude- and phase-coherent LO. Each channel includes an IF DVGA (digital variable gain amplifier) consisting of a programmable 15.5dB range digital IF attenuator with 0.5dB steps, and a fixed-gain IF buffer amplifier. The cascaded RF-to-IF conversion gain ranges from 9.5dB at maximum IF gain, to -6dB at minimum IF gain. The IF frequency response is flat within 1dB from 30MHz to 450MHz, and may be modified by changing the IF output match.

Each channel can be programmed to a reduced power mode via the SPI or the RP pin, resulting in a 24% power savings, with reduced linearity performance. The test circuit schematic in Figure 1 shows the external components used to characterize the IC. The evaluation board is shown in Figure 2.

Figure 2. Evaluation Board

### RF Inputs

A simplified schematic of the channel 1 RF input is shown in Figure 3 (channel 2 is identical and not shown). Each RF input includes an integrated transformer and a differential RF buffer amplifier. The transformer's primary winding is biased at  $1.65V_{DC}$ , and therefore requires an external DC-blocking capacitor.

The RF inputs are  $50\Omega$  matched from 2.6GHz to 6.4GHz, requiring only a 1pF series capacitor (C1) for DC-blocking. Shunt reactance C17 is used to tune the inputs down to 1.5GHz, or up to 7GHz. Figure 1 summarizes the external matching component values for all bands. Measured RF input return loss for each band is shown in Figure 4.

Figure 3. RF Input Schematic

Figure 4. RF Input Return Loss for Each Band

## APPLICATIONS INFORMATION

### LO Input

A simplified schematic of the LO input is shown in Figure 5. As shown, each mixer has its own LO amplifier. A differential input is provided although the IC is characterized and production-tested with single-ended drive. Differential LO drive improves performance slightly, and is recommended if available. Each LO input is internally matched to  $50\Omega$  from 500MHz to 8GHz, requiring no external components. ESD protection diodes on each input limit the peak voltage swing to approximately  $\pm 700\text{mV}$  ( $+7\text{dBm}$ ), although higher LO drive, up to  $10\text{dBm}$  will not damage the input. An external DC-blocking capacitor is only needed if the LO source has DC voltage present. The measured LO input return loss is shown in Figure 6.

Figure 5. LO Input Schematic

Figure 6. LO Input Return Loss

### IF Outputs

A simplified IF output schematic for channel 1, with external matching components is shown in Figure 7 (channel 2 is identical, and not shown). The final output stage is differential, open-collector with integrated matching resistors, capacitors and ESD protection diodes. Each output pin must be biased at the supply voltage ( $V_{CC}$ ) using external chokes (L11 and L13). Each pin draws approximately  $47\text{mA}$  of DC supply current ( $94\text{mA}$  total). Therefore, inductors with low DC resistance ( $<1\Omega$ ), are required for the highest output IP3 and P1dB.

The integrated output resistors set the differential output resistance at  $206\Omega$ . C3, L15 and L17 form a 2:1 impedance transformer which transforms the output to  $100\Omega$  differential. If a  $200\Omega$  output is desired, C3 is not used and the values of L15 and L17 are reduced to the values shown in Table 1. C9 and C11 are DC-blocking capacitors, which may be omitted if the following stage is already DC-blocked.

Figure 7. IF Output Schematic

## APPLICATIONS INFORMATION

The standard evaluation board is built with 100Ω differential IF outputs, but also has pads which allow the use of IF transformers to provide 50Ω single-ended outputs. To implement this, it is recommended to use the 200Ω matching shown in Table 1 and 4:1 IF transformers. Figure 16 shows the circuit schematic and measured performance using this approach.

**Table 1. IF Output Matching Element Values**

| DIFFERENTIAL $Z_{OUT}$ | C3    | L15, L17 | 9dB RETURN LOSS BANDWIDTH |
|------------------------|-------|----------|---------------------------|
| 200Ω*                  | —     | 10nH     | 23MHz to 440MHz           |
| 100Ω                   | 3.9pF | 47nH     | 70MHz to 242MHz           |
|                        | 2.2pF | 33nH     | 87MHz to 352MHz           |
|                        | 1.2pF | 20nH     | 115MHz to 495MHz          |
|                        | 0.6pF | 16nH     | 155MHz to 610MHz          |
|                        | —     | 12nH     | 190MHz to 810MHz          |

\*200Ω differential output return loss measured with 4:1 transformer.

The differential IF output impedance vs frequency is listed in Table 2. The impedances are at the package pins with no external components. Measured IF output return loss vs frequency is shown in Figure 8.

**Figure 8. IF Output Return Loss (100Ω Differential)**

**Table 2. Differential IF Output Impedance vs Frequency**

| IF FREQUENCY (MHz) | DIFFERENTIAL IMPEDANCE ( $R_{IF} \parallel C_{IF}$ ) |
|--------------------|------------------------------------------------------|
| 10                 | 210 $\parallel$ 1.10pF                               |
| 50                 | 209 $\parallel$ 1.09pF                               |
| 100                | 209 $\parallel$ 1.04pF                               |

| 1000               | 172 $\parallel$ 0.89pF                               |

### Mixer Output to IF DVGA Interface

The mixer's 200Ω differential output impedance matches the IF DVGA's 200Ω differential input impedance, even over normal process variation due to the monolithic implementation. This assures minimal and repeatable DNL and INL over the full IF attenuation range. Furthermore, the mixer output and DVGA input include integrated matched capacitors, which simplify the realization of a lowpass filter between the mixer and DVGA. This filter attenuates undesired high frequency mixing products and LO leakage before entering the DVGA.

A simplified schematic of the interface for channel 1 is shown in Figure 9 (channel 2 is identical and not shown). L5 and L7 connect the mixer output to the DVGA input, while forming a 1GHz 3rd-order, 0.2dB ripple Chebyshev lowpass filter. L1 and L3 supply DC current to the mixer and C5 and C7 are DC-blocking capacitors.

APPLICATIONS INFORMATION

Figure 9. Mixer to IF DVGA Interface

Figure 10. Equivalent Lowpass Filter Schematic

An equivalent AC schematic of the lowpass filter is shown in Figure 10, where the mixer output and DVGA input are modeled as 200Ω in parallel with 1pF. The mixer supply chokes and series DC blocking capacitors are ignored in this schematic.

It's also possible to implement a bandpass filter between the mixer and DVGA. An example is shown in Figure 11, where a 3rd-order bandpass filter is realized by changing the values of the reactive components and adding C21, C23 and L19. Figure 19 shows measured conversion gain vs IF output frequency using this bandpass topology.

IF DVGA Phase vs IF Attenuation

Ideally, the phase of the IF output would be constant over the full IF attenuation range. Practically, there is some phase shift due to circuit parasitics in the attenuator. The LTC5556's IF DVGA is optimized for the lowest possible phase variation (or phase error) over the full IF attenuation range. Phase error vs IF attenuation for the complete IF section is listed in Table 3.

Table 3. IF Phase Error vs IF Attenuation

| ATT (dB) | 250MHz | 350MHz | 500MHz |
|----------|--------|--------|--------|
| 0        | REF    | REF    | REF    |
| 3        | -1.4°  | -2.3°  | -1.6°  |
| 6        | -2.5°  | -3.5°  | -3.3°  |
| 9        | -3.2°  | -4.4°  | -4.5°  |
| 12       | -3.7°  | -5.0°  | -5.1°  |
| 15       | -3.6°  | -4.7°  | -4.5°  |

Figure 11. 3rd-Order Bandpass Filter Realization

## APPLICATIONS INFORMATION

### Downconverter Performance vs IF Attenuation

RF-IF conversion gain, IIP3, OIP3 and noise figure over the full 15.5dB attenuation range is shown in Figure 12. The same data is listed in Table 4 with the INL and DNL at each attenuator setting.

**Table 4. Conversion Gain, IIP3, OIP3 and SSB NF vs IF Attenuation (RF = 3.6GHz, IF = 270MHz, Low Side LO)**

| A<br>(dB) | IF1[4:0]<br>IF2[4:0] | G <sub>C</sub><br>(dB) | IIP3<br>(dBm) | OIP3<br>(dBm) | NF<br>(dB) | DNL<br>(dB) | INL<br>(dB) |
|-----------|----------------------|------------------------|---------------|---------------|------------|-------------|-------------|

### Individual Stage Performance

The LTC5556 is characterized, specified and production-tested as a complete downconverter, from the RF inputs to the final IF outputs. For some applications, it may be preferred to insert a higher selectivity IF filter between the mixer and IF DVGA. To help with system performance calculations, the nominal performance of the mixer is shown in Table 5 and the IF DVGA performance is listed in Table 6. This information is provided for reference only as these blocks are not production-tested independently.

## APPLICATIONS INFORMATION

### Enable Inputs

Figure 13 shows a schematic of the Channel 1 enable interface. Channel 2 is identical and not shown. As shown, the positive ESD diodes for EN1 are connected to  $V_{CC1}$ . The positive ESD diodes for channel 2 are connected to  $V_{CC2}$  (not shown). To enable a channel, the applied voltage must be greater than 1.4V. An applied voltage less than 0.5V will disable the channel. If the enable function is not needed, the enable pin can be connected directly to the adjacent  $V_{CC}$  pin. If left floating, the internal 330k $\Omega$  pull-down resistor will disable the channel.

The voltage on the enable pins should never exceed  $V_{CC}$  by more than 0.3V, otherwise supply current may be sourced through the upper ESD diodes. Under no circumstances should voltage be applied to the enable pins before supply voltage is applied to the  $V_{CC}$  pins. If this occurs, damage to the IC may result.

Figure 13. Channel 1 Enable Pin Interface

### Supply Voltage Ramping

Fast ramping of the supply can cause a current glitch in the internal ESD protection circuits. Depending on the supply inductance, this could result in a supply voltage transient that exceeds the maximum rating. A supply voltage ramp time greater than 1ms is recommended.

Supply voltage for  $V_{CC1}$ ,  $V_{CC2}$  (Pins 29 and 21) and the IF amplifiers (Pins 17, 18, 23 and 24) are connected on the evaluation board, which assures that they all ramp up and down at the same rate. If they are powered independently in the final application circuit, care must be taken to assure that the IF amplifier supply pins go high before the  $V_{CC}$  pins, and go low after the  $V_{CC}$  pins.

### SPI DESCRIPTION

IF DVGA attenuator control and reduced power mode for each downconverter channel is programmed through the 3-wire SPI consisting of CSB, CLK and SDI. A fourth pin, SDO, is a serial output available to read out the contents of the registers. The SDO pin may also be used to daisy-chain multiple SPI interfaces on a single bus. For example, in an 8-channel MIMO receiver application, all four LTC5556 dual downconverters can be programmed with a single, 64-bit load, while sharing a common CSB line.

A block diagram of the SPI is shown in Figure 14. As shown, it is a 16-bit double-buffered FIFO slave architecture, with 8-bits for each channel. Logic levels for the digital inputs and SDO output are 1.8V to 3.3V CMOS compatible, determined by the supply voltage on the  $V_{DD}$  pin. An internal POR (power-on-reset) connected to the  $V_{DD}$  pin, resets all 16 bits to logic 0 at power-up, or when  $V_{DD}$  drops below 0.5V and then rises back above 1.2V. The POR requires approximately 100 $\mu$ s to reset the registers.

### SPI PROGRAMMING

Data transfers to the part are accomplished by first taking CSB low to enable the port. Then, serial input data on SDI is captured on the rising edge of CLK and shifted into a 16-bit shift register, MSB first. Serial data from the registers is driven out to SDO on the clock's falling edge. The communication burst is terminated by taking CSB high. The rising edge on CSB will then latch the shift-register's contents into a 16-bit buffer D-latch. The buffer latch prevents the downconverter's gain and power mode from changing while data is loaded. See Figure 15 for timing details.

When CSB is high, the clock and data inputs are internally gated off, minimizing current consumption when not selected, and the SDO output is high impedance. However, it is recommended that the serial interface signals should remain idle between data transfers to avoid digital noise coupling into the RF signal paths.

## APPLICATIONS INFORMATION

A memory map of the register contents is shown in Table 7, with detailed bit descriptions in Table 8. Each register's default power-up value is also shown in Table 8, which is:

- 0dB IF attenuation (maximum gain)
- Full power mode

When the logic level on RP (Pin 19) is low, each channel may be independently programmed to reduced power mode via the RP1 and RP2 bits in the SPI. When RP pin is driven high, both channels are commanded to reduced power mode and the RP1 and RP2 bits from the SPI are ignored.

**Table 7. Serial Port Register Contents**

| CHANNEL 2 (8 bits) |     |     |        |        |        |        |           |

### Spurious Output Levels

Spurious output levels vs harmonics of the RF and LO are tabulated in Table 9. The spur levels were measured using the test circuit shown in Figure 1, with an RF input power of -6dBm and 3dB of IF attenuation. Table 9a shows the relative spur levels in full power mode and Table 9b shows the relative spur levels in reduced power mode. The mixer spur levels are insensitive to the IF attenuation setting.

The spur frequencies can be calculated using the following equation:

$$f_{\text{SPUR}} = (M \cdot f_{\text{RF}}) - (N \cdot f_{\text{LO}})$$

**Table 9. IF Output Spur Levels (dBc).**  
(RF = 3.6GHz, P<sub>RF</sub> = -6dBm, IF = 270MHz, Low Side LO,  
P<sub>LO</sub> = 0dBm, 3dB IF Attenuation, T<sub>C</sub> = 25°C)  
**Table 9a. Full Power Mode**

|   |   | N   |     |     |     |     |     |

## APPLICATIONS INFORMATION

### Single-Ended IF Outputs Using a Balun

The LTC5556 evaluation board has differential IF outputs, but can be modified for single-ended operation by inserting a 4:1 balun, as shown in Figure 16. The 10nH series inductors at the differential IF output compensate for the IF amplifier's output capacitance, producing a 200 $\Omega$  differential output up to approximately 500MHz. The 4:1 balun then converts the 200 $\Omega$  differential output to 50 $\Omega$  single-ended. For applications with IF frequency less than 250MHz, the series 10nH inductors are not needed.

Figure 16 shows the measured conversion gain vs IF output frequency, using a Mini-Circuits TCM4-19+ balun. The RF input was swept from 3.35GHz to 3.85GHz using a fixed 3.33GHz LO, producing an IF output ranging from 20MHz to 520MHz. Measured conversion gain for the standard 100 $\Omega$  differential output matching is also shown on the same graph for comparison, highlighting the insertion loss of the balun.

**Figure 16. Test Circuit and Measured Conversion Gain Using 200 $\Omega$  Output Matching with a 4:1 IF Transformer to Realize a 50 $\Omega$  Single-Ended IF Output**

## APPLICATIONS INFORMATION

### 5.6GHz to 7.2GHz RF Application with Wideband IF

The LTC5556's RF inputs are optimized for operation up to 6GHz, but may be used up to 8GHz with degraded performance. Figure 17 shows an example where the RF input is matched from 5.6GHz to 7.2GHz and the IF output is matched for wideband operation up to 800MHz.

The measured performance is summarized in Figure 18, where the RF input is swept from 6.1GHz to 6.9GHz, with a fixed 6.03GHz LO, resulting in a wideband 70MHz to 870MHz IF output, centered at 470MHz.

Figure 17. 5.6GHz to 7.2GHz Input Matching with Wideband IF Output Match

| <a href="#">LTC5566</a>            | 300MHz to 6GHz Dual Programmable Gain Downconverting Mixer  | 12dB Gain, 35dBm OIP3 and 13.3dB NF at 2.6GHz                                                              |
| <a href="#">LTC5569</a>            | 300MHz to 4GHz Dual Active Downconverting Mixer             | 2dB Gain, 26.7dBm IIP3 and 11.7dB NF at 1950MHz, 3.3V/180mA Supply                                         |
| <a href="#">LTC6430</a>            | High Linearity Differential RF/IF Amplifier                 | 51dBm OIP3 at 240MHz, 100Ω Differential                                                                    |
| <a href="#">LTC5544</a>            | 4GHz to 6GHz Downconverting Mixer Family                    | 7.4dB Gain, >25dBm IIP3, 11.3dB NF, 3.3V/200mA Supply                                                      |
| <a href="#">LT5554</a>             | Ultralow Distortion IF Digital VGA                          | 48dBm OIP3 at 200MHz, 2dB to 18dB Gain Range, 0.125dB Gain Steps                                           |
| <a href="#">LTC5576</a>            | 3GHz to 8GHz Active Upconverting Mixer                      | 25dBm OIP3, −0.6dB Gain, −154dBm/Hz Output Noise Floor, −36dBm LO Leakage                                  |
| <a href="#">LTC5548</a>            | 2GHz to 14GHz Wideband Microwave Mixer                      | Up- or Down-Conversion, 21.4dBm IIP3 at 9GHz, 0dBm LO Drive, IF Bandwidth DC to 6GHz                       |
| <a href="#">LTC5549</a>            | 2GHz to 14GHz Wideband Microwave Mixer                      | Up- or Down-Conversion, 22.8dBm IIP3 at 12GHz, 0dBm LO Drive, Integrated Balun with IF BW = 500MHz to 6GHz |
| <a href="#">LTC5593</a>            | Dual 2.3GHz to 4.5GHz Downconverting Mixer                  | 8.5dB Gain, 27.7dBm IIP3, 9.5dB Noise Figure                                                               |
| <b>RF PLL/Synthesizer with VCO</b> |                                                             |                                                                                                            |
| <a href="#">LTC6946</a>            | Low Noise, Low Spurious Integer-N PLL with Integrated VCO   | 373MHz to 5.79GHz, −157dBc/Hz WB Phase Noise Floor, −100dBc/Hz Closed-Loop Phase Noise                     |
| <a href="#">LTC6948</a>            | Low Noise, Low Spurious Frac-N PLL with Integrated VCO      | 373MHz to 6.39GHz, −157dBc/Hz WB Phase Noise Floor, −274dBc/Hz Normalized In-Band 1/f Noise                |
| <b>ADCs</b>                        |                                                             |                                                                                                            |
| <a href="#">LTC2145-14</a>         | 14-Bit, 125Msps 1.8V Dual ADC                               | 73.1dB SNR, 90dB SFDR, 95mW/Ch Power Consumption                                                           |
| <a href="#">LTC2185</a>            | 16-Bit, 125Msps 1.8V Dual ADC                               | 76.8dB SNR, 90dB SFDR, 185mW/Channel Power Consumption                                                     |
| <a href="#">LTC2158-14</a>         | 14-Bit, 310Msps 1.8V Dual ADC, 1.25GHz Full-Power Bandwidth | 68.8dB SNR, 88dB SFDR, 362mW/Ch Power Consumption, 1.32V <sub>p-p</sub> Input Range                        |
