

General Description

The MAX4366 evaluation kit (EV kit) is a fully assembled and tested circuit board that uses the MAX4366 bridged amplifier to drive speakers or headsets in portable audio applications. The MAX4366 EV kit operates from a 2.3V to 5.5V DC power supply and is capable of delivering 330mW into a 32 Ω load or 200mW into a 16 Ω load. The closed-loop gain of the MAX4366 is set to 2V/V with external resistors. The MAX4367/MAX4368 bridged amplifiers with internal fixed gains can be evaluated on the MAX4366 EV kit. Contact Maxim to obtain samples. The *Selector Guide* provides the complete part numbers for the amplifiers that can be evaluated on the MAX4366 EV kit.

Features

- Small 8-Pin SOT23 Package
- No DC-Blocking Capacitor On Output
- ♦ 2.3V to 5.5V Single-Supply Operation
- Drives 330mW into 32Ω Speakers or 200mW into 16Ω Speakers
- Externally Adjustable Gain
- Clickless/Popless Power-Up and Shutdown
- Fully Assembled and Tested

Ordering Information

PART	TEMP RANGE	IC PACKAGE
MAX4366EVKIT	0°C to +70°C	8 SOT23

Selector Guide

PART	GAIN
MAX4366	External
MAX4367	2V/V
MAX4368	3V/V

_Component List

DESIGNATION	QTY	DESCRIPTION
C5	0	Not installed (0603)
R1, R2	2	$20k\Omega \pm 1\%$ resistors (0603)
R3	1	100k Ω ±5% resistor (0603)
J1	1	Right-angle PC-mount phono jack (white)
J2	1	2-position terminal block
JU1	1	3-pin header
U1	1	MAX4366, 8-pin SOT23
None	1	Shunt (JU1)
None	1	MAX4366 PC board
None	1	MAX4366 data sheet
None	1	MAX4366 EV kit data sheet

Quick Start

The MAX4366 EV kit is fully assembled and tested. Follow the steps listed below to verify board operation. **Do not turn on the power supply until all connections are completed.**

Recommended Equipment:

- 5V, 1A power supply
- 32Ω or 16Ω speaker
- Audio source (e.g., CD player, tape player)
- Verify that a shunt is across pins 2 and 3 of jumper JU1 (SHDN).
- 2) Connect an audio source to phono jack J1.
- Connect the speaker across the + and outputs of terminal block J2.
- Connect the 5V terminal of the power supply to the VCC pad and the ground terminal of the power supply to the GND pad.
- 5) Turn on the 5V power supply.
- 6) Turn on the audio source.

Detailed Description

The MAX4366 EV kit contains the MAX4366 bridged amplifier designed to differentially drive speakers or headsets in portable audio applications. The advantage of driving speakers in a bridge-tied load (BTL) configuration is that no large output capacitor is required and the output voltage doubles compared to a single-ended amplifier under similar conditions. Thus, the differential gain of the device is twice the closed-loop gain of the input amplifier. The MAX4366's input amplifier closedloop gain of 1V/V creates an effective gain of 2V/V across the speaker.

The MAX4366 EV kit is capable of delivering the following power when using the 5V power supply:

330mW to a 32 Ω speaker and an input of 1.62VRMS

200mW to a 16 Ω speaker and an input of 0.894V_{RMS}

The MAX4366 EV kit operates from a 2.3V to 5.5V DC power supply.

Output Signal

The MAX4366 EV kit produces a differential output signal that is used to drive 16Ω or 32Ω speakers. The positive and negative signals of the differential output are 180° out of phase and are both biased with a DC offset of V_{CC}/2. This bias voltage allows the voltage at the load to swing between 0 and V_{CC}. The MAX4366 EV kit is configured for a gain of 2V/V. A feedback capacitor (C5) may be added to limit the bandwidth or to compensate for the parasitic capacitance at pin 4, especially at higher values of R2.

Shutdown

Jumper JU1 controls the shutdown pin (SHDN) on the MAX4366. The shutdown function can also be controlled by removing the shunt from JU1 and connecting an external source to the SHDN pad. The SHDN pin is an active-high pin that requires a low signal to enable and a high signal to disable the MAX4366 EV kit (see Table 1 for JU1 configuration).

Table 1. Jumper JU1 Configuration

SHUNT POSITION	SHDN PIN	FUNCTION
1 and 2	Connected to VCC	Shutdown mode
2 and 3	Connected to GND	EV kit enabled
None*	Connect an external source to SHDN pad	SHDN driven by external source. (SHDN pin is active high)

*Remove the shunt.

Level Shifting

Jumper JU2 provides an option to use an external $D\bar{C}$ source to level shift the output of the MAX4366 EV kit. To use an external source for the DC component of the output, connect the DC source to JU2.

MAX4366 Evaluation Kit

Figure 1. MAX4366 EV Kit Schematic

Setting the Gain

The signal gain of the MAX4366 input amplifier is set to 1V/V (BTL gain of 2V/V) with resistors R1 and R2. R1 and R2 set the gain of the amplifier as follows:

$$A_{VBTL} = 2\left(\frac{R2}{R1}\right)$$

The gain of the device in a BTL configuration is twice the gain of the single-ended case. Choose R1 and R2 between $10k\Omega$ and $50k\Omega$. The gains of the MAX4367/MAX4368 are set internally.

Evaluating Other Amplifiers

The MAX4366 EV kit can be used to evaluate the MAX4367/MAX4368 bridge amplifiers with fixed internal gains. The MAX4367 has an internal gain of 2V/V and the MAX4368 has an internal gain of 3V/V. Order samples of these amplifiers and replace the MAX4366 (U1) on the board with the desired IC.

Note: Replace resistor R1 with a 0 resistor and remove R2 to evaluate the amplifiers with internal gains.
