#### **Universal Relays**

# RU Series

Full featured universal miniature relays. Designed with environment taken into consideration.

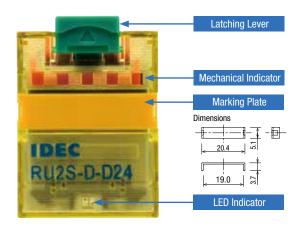

- See website for details on approvals and standards.
- Lloyd Register type approved.

#### Safety

The contact position can be confirmed through the five small windows.

Using the latching lever, operation can be checked without energizing the coil. The latching lever is color coded for AC and DC coils.(AC coil: Orange DC coil: Green)

Non-polarized LED indicator available on plug-in relays.

#### **Environment**

RoHS compliant models available. Complies with EU directive 2002/95/EC (Restricted substances: lead, Cadmium, Mercury, Hexavalent Chromium, PBB, PBDE)

#### Reliable

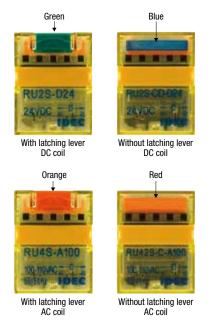

No internal wires. Simple construction.

#### Easy-to-Use

Marking plate for easy identification of relays (Optional marking plates available in four other colors) Applicable for small loads to maximum contact currents. (See table below)

	RU2	RU4	RU42
Max. continuous current	10A	6A	3A
Min. applicable load (Note)	24V DC 5mA	1V DC 1mA	1V DC 0.1mA

Note: Reference value.

					110 DC	0.6A	0.4A	100,000 min.			
					250 AC	6A	2.6A	50,000 min.			
					230 AU	3A	0.8A	200,000 min.			
	4PDT	6A	1500VA AC	600VA AC	30 DC	6A	2.7A	50,000 min.			
	(RU4)	UA	180W DC	90W DC	30 00	3A	1.5A	200,000 min.			
					110 DC	0.65A	0.33A	50,000 min.			
					110 00	0.33A	0.18A	200,000 min.			
	4PDT		750VA AC	200VA AC	250 AC	3A	0.8A	100,000 min.			
	(RU42)	(RU42) 3A GOW DC	90W DC	45W DC	30 DC	3A	1.5A	100,000 min.			
	bifurcated		30 W DO	30 W DO	SOW DO	SOM DC		110 DC	0.44A	0.22A	100,000 min.

On 4PDT relays, the maximum allowable total current of neighboring two poles is 6A. At
the rated load, make sure that the total current of neighboring two poles does not exceed
6A (3A + 3A = 6A).

#### **UL and c-UL Ratings**

<sup>\*1)</sup> Finger-safe cannot be used with ring terminal.

<sup>\*2)</sup> SU2S-11L and SU4S-11L are spring-clamp socket which does not require tightening screws. Stranded wire, solid wire, and ferrule can be attached using a

<sup>\*3)</sup> When using SU2S-11L and SU4S-11L at rated current 8A and above, maintain at least 10mm distance from the adjacent SU socket.

<sup>\*4)</sup> Front wiring socket can be mounted directly on DIN rail and mounting panel (some sockets need spacers for the ends).

### **Hold-down Springs**

Style	Shape	Material	Part No.	Ordering No.	Package Quantity	
Wire Spring			SY4S-51F1	SY4S-51F1PN10	10	
			SFA-101	SFA-101PN20		
		- Stainless Steel	SFA-202	SFA-202PN20		
			SFA-301	SFA-301PN20	- 10 pairs	
Leaf Spring			SFA-302	SFA-302PN20		
			SFA-502	SFA-502PN20		
			SFA-503	SFA-503PN20		
			SFA-504	SFA-504PN10	10	

- A relay needs a pair of leaf springs, except for SFA-504 (one spring per relay).
- When the wire spring SY4S-51F1 or leaf spring SFA-504 is used on a relay with latcing lever, lever cannot be opened or closed.
- Leaf springs (except for the leaf spring SFA-504) cannot be removed after being installed on a socket (except for SM2S-05D and SY4S-05D)

#### **Safety Precautions**

- Turn off the power to the relay before starting installation, removal, wiring, maintenance, and inspection of the relays. Failure to turn power off may cause electrical shock or fire hazard.
- Observe specifications and rated values, otherwise electrical shock or fire hazard may be caused.
- Use wires of the proper size to meet the voltage and current requirements. Tighten the terminal screws on the relay socket to the proper tightening torque.
- Before operating the latching lever, turn off the power to the RU relay.
   After checking the circuit, return the latching lever to the original position.
- Do not use the latching lever as a switch.

- The durability of the latching lever is a minimum of 100 operations.
- When using DC loads on 4PDT relays, apply a positive voltage to terminals of neighboring poles and a negative voltage to the other terminals of neighboring poles to prevent the possibility of short circuits.
- DC relays with a diode have a polarity in the coil terminals.
- The surge absorbing element on AC relays with RC or DC relays. with
  diode is provided to absorb the counter electromotive force generated
  by the coil. When the relay is subject to an excessive external surge
  voltage, the surge absorbing element may be damaged. Add another
  surge absorbing provision to the relay to prevent damage.

#### Instructions

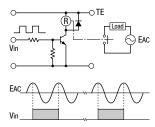

#### **Driving Circuit for Relays**

- 1. To make sure of correct relay operation, apply rated voltage to the relay coil.
- 2. Input voltage for the DC coil:

A complete DC voltage is best for the coil power to make sure of stable relay operation. When using a power supply containing a ripple voltage, suppress the ripple factor within 5%. When power is supplied through a rectification circuit, the relay operating characteristics, such as pickup voltage and dropout voltage, depend on the ripple factor. Connect a smoothing capacitor for better operating characteristics as shown below.

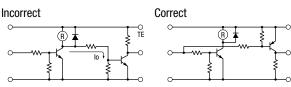

3. Operating the relay in synchronism with AC load: If the relay operates in synchronism with the AC power voltage of the load, the relay life may be reduced. If this is the case, select a relay in consideration of the required reliability for the load. Or, make the relay turn on and off irrespective of the AC power phase or near the point where the AC phase crosses zero voltage.

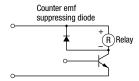

4. Leakage current while relay is off:

When driving an element at the same time as the relay operation, a special consideration is needed for the circuit design. As shown in the incorrect circuit below, Leakage current (lo) flows through the relay coil while the relay is off. Leakage current causes the coil release failure or adversely affects the vibration resistance and shock resistance. Design a circuit as shown in the correct example.

5. Surge suppression for transistor driving circuits: When the relay coil is turned off, a high-voltage pulse is generated, causing the transistor to deteriorate and sometimes to break. Be sure to connect a diode to suppress the counter electromotive force. Then, the coil release time becomes slightly longer. To shorten the coil release time, connect a Zener diode between the collector and emitter of the transistor. Select a Zener diode with a Zener voltage slightly higher than the power voltage.

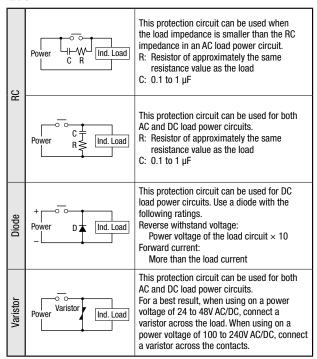

#### Instructions

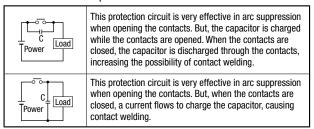

#### **Protection for Relay Contacts**

- 1. The contact ratings show maximum values. Make sure that these values are not exceeded. When an inrush current flows through the load, the contact may become welded. If this is the case, connect a contact protection circuit, such as a current limiting resistor.
- 2. Contact protection circuit:

When switching an inductive load, arcing causes carbides to form on the contacts, resulting in an increased contact resistance. In consideration of contact reliability, contact life, and noise suppression, use of a surge absorbing circuit is recommended. Note that the release time of the load becomes slightly longer. Check the operation using the actual load. Incorrect use of a contact protection circuit will adversely affect switching characteristics. Four typical examples of contact protection circuits are shown in the following table:

3. Do not use a contact protection circuit as shown below:

Generally, switching a DC inductive load is more difficult than switching a DC resistive load. Using an appropriate arc suppressor, however, will improve the switching characteristics of a DC inductive load.

#### Other Precautions

1. General notice:

To maintain the initial characteristics, do not drop the relay or shock the relay.

The relay cover cannot be removed from the base during normal operation. To maintain the initial characteristics, do not remove the

Use the relay in environments free from condensation of dust, sulfur dioxide (SO<sub>2</sub>), and hydrogen sulfide (H<sub>2</sub>S).

Make sure that the coil voltage does not exceed the applicable coil voltage range.

2. Connecting outputs to electronic circuits:

When the output is connected to a load which responds very quickly, such as an electronic circuit, contact bouncing causes incorrect operation of the load. Take the following measures into consideration

Connect an integral circuit.

Suppress the pulse voltage due to bouncing within the noise margin of the load.

- 3. UL- and CSA-approved ratings may differ from product rated values determined by IDEC.
- 4. Do not use relays in the vicinity of strong magnetic field as this may affect relay operation.

DC diode type has polarity.

The surge absorbing element on AC relays with RC or DC relays with diode is provided to absorb the counter electromotive force generated by the coil. When the relay is subject to an excessive external surge voltage, the surge absorbing element may be damaged. Add another surge absorbing provision to the relay to prevent damage.
