Hermetically Sealed, Very High Speed, Logic Gate
Optocouplers

Data Sheet

Description

These units are single and dual channel, hermetically sealed optocouplers. The products are capable of operation and storage over the full military temperature range and can be purchased as either commercial product or with full MIL-PRF-38534 Class Level H or K testing or from the appropriate DLA Standard Microcircuit Drawing (SMD). All devices are manufactured and tested on a MIL-PRF-38534 certified line, and Class H and K devices are included in the DLA Qualified Manufacturers List, QML-38534 for Hybrid Microcircuits.

CAUTION It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

Features

- Dual marked with device part number and DLA Standard Microcircuit Drawing (SMD)
- Manufactured and tested on a MIL-PRF-38534 certified line
- QML-38534, Class H and K
- Two hermetically sealed package configurations
- Performance guaranteed over full military temperature range: -55°C to $+125^{\circ}\text{C}$
- High speed: 40 M bit/s
- High common mode rejection 500 V/ μs guaranteed
- 1500 Vdc withstand test voltage
- Active (totem pole) outputs
- Three stage output available
- High radiation immunity
- HCPL-2400/30 function compatibility
- Reliability data
- Compatible with TTL, STTL, LSTTL, and HCMOS logic families

Applications

- Military and space
- High reliability systems
- Transportation, medical, and life critical systems
- Isolation of high-speed logic systems
- Computer-peripheral interfaces
- Switching power supplies
- Isolated bus driver (networking applications) – (5400/1/K only)
- Pulse transformer replacement
- Ground loop elimination
- Harsh industrial environments
- High-speed disk drive I/O
- Digital isolation for A/D, D/A conversion

1. See [Selection Guide – Lead Configuration Options](#) for available extensions.

Functional Diagram

Multiple-channel devices available.

Truth Tables

(Positive Logic)

Multichannel Devices

Input	Output
On (H)	L
Off (L)	H

Single-Channel DIP

Input	Enable	Output
On (H)	L	L
Off (L)	L	H
On (H)	H	Z
Off (L)	H	Z

NOTE The connection of a 0.1-μF bypass capacitor between V_{CC} and GND is recommended.

Each channel contains an AlGaAs light emitting diode, which is optically coupled to an integrated high gain photon detector. This combination results in very high data rate capability. The detector has a threshold with hysteresis, which typically provides 0.25 mA of differential mode noise immunity and minimizes the potential for output signal chatter. The detector in the single-channel units has a three-state output stage that eliminates the need for a pull-up resistor and allows for direct drive of a data bus.

All units are compatible with TTL, STTL, LSTTL, and HCMOS logic families. The 35-ns pulse width distortion specification guarantees a 10 MBd signaling rate at +125°C with 35% pulse width distortion. [Figure 13](#) through [Figure 16](#) show recommended circuits for reducing pulse width distortion and optimizing the signal rate of the product. Package styles for these parts are 8-pin DIP through hole (case outlines P) and leadless ceramic chip carrier (case outline 2). Devices can be purchased with a variety of lead bend and plating options. See [Selection Guide – Lead Configuration Options](#) for details. Standard Microcircuit Drawing (SMD) parts are available for each package and lead style.

Because the same electrical die (emitters and detectors) are used for each channel of each device listed in this data sheet, absolute maximum ratings, recommended operating conditions, electrical specifications, and performance characteristics shown in the figures are similar for all parts. Occasional exceptions exist due to package variations and limitations and are as noted. Additionally, the same package assembly processes and materials are used in all devices. These similarities give justification for the use of data obtained from one part to represent other part's performance for die related reliability and certain limited radiation test results.

Selection Guide – Lead Configuration Options

Package	8-Pin DIP	8-Pin DIP	20-Pad LCCC

Input Reverse Breakdown Voltage		V _R	I _R = 10 μA	1, 2, 3	3.0	4.8	—	V		c
Input-Output Insulation Leakage Current		I _{I-O}	V _{I-O} = 1500 Vdc, RH ≤ 65%, t = 5s	1	—	—	1.0	μA		e, f
Propagation Delay Time Logic Low Output		t _{PHL}		9, 10, 11	—	33	60	ns	5, 6, 7	g, c
Propagation Delay Time Logic High Output		t _{PLH}		9, 10, 11	—	30	60	ns	5, 6, 7	g, c
Pulse Width Distortion		PWD		9, 10, 11	—	3	35	ns	5, 6, 7	g, c
Logic High Common-Mode Transient Immunity		CM _H	V _{CM} = 50 V _{P-P} , I _F = 0 mA	9, 10, 11	500	3000	—	V/μs	11	h, c, i
Logic Low Common-Mode Transient Immunity		CM _L	V _{CM} = 50 V _{P-P} , I _F = 6 mA	9, 10, 11	500	3000	—	V/μs	11	h, c, i

- Commercial parts receive 100% testing at 25°C (Subgroups 1 and 9). SMD, Class H and Class K parts receive 100% testing at 25°C , 125°C , and -55°C (Subgroups 1 and 9, 2 and 10, 3 and 11, respectively).
- All typical values are at $V_{CC} = 5\text{V}$, $T_A = 25^{\circ}\text{C}$, $I_F = 8\text{ mA}$ unless otherwise specified.
- Each channel.
- The HCPL-6430, HCPL-6431, and HCPL-643K dual-channel parts function as two independent single-channel units. Use the single-channel parameter limits.
- All devices are considered two-terminal devices: measured between all input leads or terminals shorted together and all output leads or terminals shorted together.
- This is a momentary withstand test, not an operating condition.
- t_{PHL} propagation delay is measured from the 50% point on the rising edge of the input current pulse to the 1.5V point on the falling edge of the output pulse. The t_{PLH} propagation delay is measured from the 50% point on the falling edge of the input current pulse to the 1.5V point on the rising edge of the output pulse. Pulse Width Distortion, $PWD = |t_{PHL} - t_{PLH}|$.
- CM_L is the maximum slew rate of the common-mode voltage that can be sustained with the output voltage in the logic low state ($V_{O(MIN)} < 0.8\text{V}$). CM_H is the maximum slew rate of the common-mode voltage that can be sustained with the output voltage in the logic high state ($V_{O(MIN)} > 2.0\text{V}$).
- Parameters are tested as part of device initial characterization and after design and process changes. Parameters are guaranteed to limits specified for all lots not specifically tested.

Single-Channel Product Only

Power Supply Noise Immunity	PSNI	0.5	V _{p-p}	48 Hz ≤ f _{ac} ≤ 50 MHz		e

- a. All devices are considered two-terminal devices: measured between all input leads or terminals shorted together and all output leads or terminals shorted together.
- b. Duration of output short circuit time not to exceed 10 ms.
- c. Each channel.
- d. Propagation delay skew is defined as the difference between the minimum and maximum propagation delays for any given group of optocouplers with the same part number that are all switching at the same time under the same operating conditions.
- e. Power Supply Noise Immunity is the peak-to-peak amplitude of the ac ripple voltage on the V_{CC} line that the device will withstand and still remain in the desired logic state. For desired logic high state, V_{OH(MIN)} > 2.0V, and for desired logic low state, V_{OL(MAX)} < 0.8V.

Single-Channel Product Only

Parameter	Symbol	Typ	Unit	Test Conditions	Fig	Notes
Input Capacitance	C_{IN}	15	pF	$f = 1 \text{ MHz}$, $V_F = 0V$, Pins 2 and 3		
Output Enable Time to Logic High	t_{PZH}	15	ns		8, 9	
Output Enable Time to Logic Low	t_{PZL}	30	ns		8, 9

Data Rate and Pulse-Width Distortion Definitions

Propagation delay is a figure of merit that describes the finite amount of time required for a system to translate information from input to output when shifting logic levels. Propagation delay from low to high (t_{PLH}) specifies the amount of time required for a system's output to change from a Logic 0 to a Logic 1, when given a stimulus at the input. Propagation delay from high to low (t_{PHL}) specifies the amount of time required for a system's output to change from a Logic 1 to a Logic 0, when given a stimulus at the input (see Figure 5).

When t_{PLH} and t_{PHL} differ in value, pulse width distortion results. Pulse width distortion is defined as $|t_{PHL} - t_{PLH}|$ and determines the maximum data rate capability of a distortion-limited system. Maximum pulse width distortion on the order of 25% to 35% is typically used when specifying the maximum data rate capabilities of systems. The exact figure depends on the particular application (RS-232, PCM, T-1, etc.).

These high-performance optocouplers offer the advantages of specified propagation delay (t_{PLH} , t_{PHL}), and pulse width distortion ($|t_{PLH} - t_{PHL}|$) over temperature and power supply voltage ranges.

Applications

Figure 13 Recommended HCPL-540x Interface Circuit

Figure 14 Alternative HCPL-540x Interface Circuit

The diagram illustrates a level shifter circuit. On the left, a 5V supply ($V_{CC1} = 5\text{ V}$) powers a Totem Pole Output Gate (e.g., 54AS1000). The gate's inputs are labeled 'DATA IN A' and 'GND 1'. Its outputs are labeled 'DATA OUT Y' and 'GND 2'. The output 'DATA OUT Y' is connected to the input of an HCPL-543x optocoupler. The optocoupler's input side includes a 274 Ω resistor and a 30 pF capacitor to ground. The optocoupler is powered by a 3.3V supply ($V_{CC} = +3.3\text{ V}$). Its output side includes a 274 Ω resistor and a 30 pF capacitor to ground. The output of the optocoupler is connected to the input of a 3.3V TTL-to-5V level shifter. This shifter has inputs labeled 'TTL', 'LSTTL', 'STTL', and 'HCMOS', and outputs labeled 'TTL', 'LSTTL', 'STTL', and 'HCMOS'. The output of the shifter is connected to the 'DATA OUT Y' output. The shifter is powered by a 5V supply ($V_{CC2} = +5\text{ V}$) and has a 0.1 μF capacitor to ground. The output of the shifter is labeled 'DATA OUT Y' and 'GND 2'.

The diagram illustrates a circuit for converting a TTL signal to an LSTTL signal using an HCPL-543x optocoupler. The input side features two inverters (labeled 'STTL OPEN COLLECTOR OUTPUT GATE (e.g. 54AS05)') connected to 'DATA IN A' and 'GND 1'. The output of the first inverter is connected to the input of the second inverter. The output of the second inverter is connected to the input of the HCPL-543x optocoupler. The optocoupler's output is connected to a 464 Ω resistor, which is then connected to the input of a third inverter. The third inverter's output is connected to the input of a fourth inverter, which produces the final 'DATA OUT Y' signal. The circuit is powered by two +5V supplies: VCC1 and VCC2. A 0.1 μF capacitor is connected between VCC1 and GND 1. The optocoupler's output is also connected to a 464 Ω resistor, which is then connected to the input of the third inverter. The output of the third inverter is connected to the input of the fourth inverter, which produces the final 'DATA OUT Y' signal. The circuit is powered by two +5V supplies: VCC1 and VCC2. A 0.1 μF capacitor is connected between VCC1 and GND 1. The optocoupler's output is also connected to a 464 Ω resistor, which is then connected to the input of the third inverter. The output of the third inverter is connected to the input of the fourth inverter, which produces the final 'DATA OUT Y' signal.
