

MCC 172

IEPE Measurement DAQ HAT for Raspberry Pi®

The MCC 172 is a 24-bit DAQ HAT for making sound and vibration measurements from IEPE sensors. The MCC 172 is shown connected to a Raspberry Pi (not included).

Features

- Two IEPE inputs
 - Two 24-bit, 51.2 kS/s A/D converters (one per channel)
 - AC coupled at ± 5 V
 - 10-32 and screw terminal connections for OEM support
- Synchronous ADC conversions between multiple boards
- Onboard sample buffers allow high-speed acquisition
- External digital trigger input
- Stack up to eight MCC HATs onto a single Raspberry Pi

Software

- MCC DAQ HAT Library; available on GitHub

Supported Operating Systems

- Linux®/Raspbian

Programming API

- C, C++, Python

Overview

The MCC 172 is a voltage HAT (Hardware Attached on Top) board designed for use with Raspberry Pi, the most popular single-board computer on the market today.

A HAT is an add-on board with a 40W GPIO (general purpose input/output) connector that conforms to the Raspberry Pi HAT specification.

The MCC 172 HAT provides two analog inputs for sound or vibration measurements. Up to eight MCC HATs can be stacked onto one Raspberry Pi.

Raspberry Pi Interface

The MCC 172 header plugs into the 40-pin general purpose I/O (GPIO) connector on a user-supplied Raspberry Pi. The MCC 172 was tested for use with all Raspberry Pi models with the 40-pin GPIO connector.

HAT Configuration

HAT configuration parameters are stored in an on-board EEPROM that allows the Raspberry Pi to automatically set up the GPIO pins when the HAT is connected.

Stackable HATs

Up to eight MCC HAT boards can be stacked onto a single Raspberry Pi.

Users can mix and match MCC HAT models in the stack.

Analog Input

The two 24-bit differential analog input channels simultaneously acquire data at rates up to 51.2 kS/s. Users can turn IEPE excitation current on or off.

Each channel has a dedicated A/D converter. Both ADCs share the same clock and are synchronized to start conversions at the same time for synchronous data.

Multiple HAT Synchronization

Multiple MCC 172 HATs can be synchronized to a single sampling clock. The clock is programmable for sampling rates between 51.2 kS/s to 200 S/s.

Sample Rates

- Single-board: max throughput is 102.4 kS/s ($51.2 \text{ kS} \times 2 \text{ channels}$)
- Stacked boards: max throughput is 307.2 kS/s aggregate¹.

Digital Trigger

The trigger input (terminal TRIG) is used to delay an input scan until a specified condition is met at the trigger input.

The trigger input signal may be a 3.3V or 5V TTL or CMOS logic signal. The input condition may be edge or level sensitive, rising or falling edge, or high or low level. This terminal may be used to trigger the start of an acquisition on multiple synchronized MCC 172 HATs.

Power

The MCC 172 is powered with 5 V provided by the Raspberry Pi through the GPIO header connector.

¹ Dependent on the load on the Raspberry Pi and the SPI interface.

OEM Support

Users can connect analog input signals to either the 10-32 coaxial inputs or to the screw terminals. Only one source may be connected to a channel at a time.

MCC DAQ HAT Library

The open-source MCC DAQ HAT Library of commands in C/C++ and Python allows users to develop applications on the Raspberry Pi using Linux.

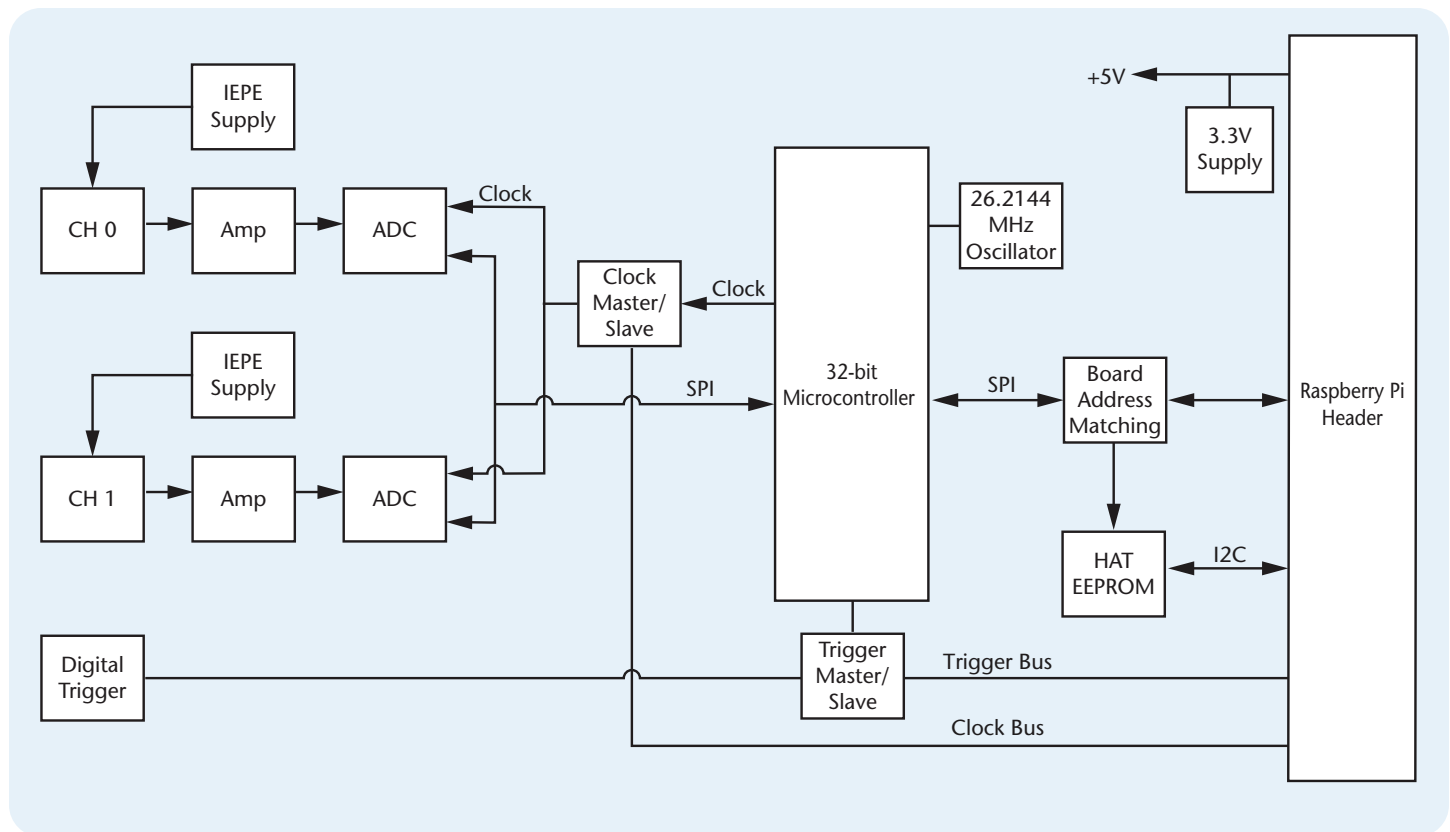

The library is available to download from [GitHub](#). Comprehensive API and hardware [documentation](#) is available.

The MCC DAQ HAT Library supports operation with multiple MCC DAQ HATs running concurrently.

Console-based and user interface (UI) example programs are available for each API.

MCC 172

Block Diagram

Stackable

Connect up to eight MCC DAQ HATs onto a single Raspberry Pi.

Onboard jumpers identify each board in the stack.

MCC DAQ HAT Examples

The MCC DAQ HAT Library includes example programs developed in C/C++ and Python that users can run to become familiar with the DAQ HAT library and boards; source code is included.

Console-Based (C/C++ and Python)

Console-based examples are provided that demonstrate how to perform FFT on a block of data, acquire synchronous data from multiple MCC 172 HATs using shared clock and trigger options, trigger a finite scan, and synchronously acquire data from multiple DAQ HATs. Source code is included.

The `fft_scan` example is shown here.

User Interface

Example programs featuring a user interface are provided in different formats. Examples of each are shown here.

Data Logger (C/C++)

The data logger example shows how to acquire data from the MCC 172, display the data on a strip chart, and log the data to a CSV file. This example can be run from the terminal.

Configure options, plot data on a strip chart, and log data to a file

Web Server (Python)

The web server example lets users configure acquisition options and view acquired data from a browser window. This example is written for Python (source included).

MCC 172 DAQ HAT Web Server Example

Configure options and view strip chart data from your browser

All specifications are subject to change without notice.
Typical for 25 °C unless otherwise specified.

Analog input

Number of channels: 2
ADC Resolution: 24 bits
A/D converter type: Delta sigma
Sampling mode: Simultaneous
Master timebase (f_M):
Frequency: 26.2144 MHz
Accuracy: ± 50 ppm max
Master timebase sources
Internal clock
Shared clock from another MCC 172

Data rates (fS)
($f_M / 512$) / n, n = 1, 2, ..., 256
51.2 kS/s max
200 S/s min

Input coupling: AC
AC cutoff frequency
-3 dB: 0.78 Hz
-0.1 dB: 5.2 Hz max

Input voltage range: ± 5 V
Common-mode voltage range
CHx to AGND: ± 2 V max

Overvoltage protection
CHx+ to CHx-: ± 35 V
CHx- to ground: ± 2.5 V

IEPE compliance voltage: 23 V max
IEPE excitation current: 4.0 mA min, 4.1 mA typ

Input delay
1 kHz to 23 kHz input frequency: $4.5 \mu\text{s} + 39 / f_s$

Channel-to-channel matching
Phase (200 Hz to 23 kHz): ($f_m \cdot 0.022^\circ$) max
Gain (20 Hz to 23 kHz): 0.19 dB typ

Passband
Frequency: $0.453 \cdot f_s$
Flatness (20 Hz to 23 kHz): 52 mdB (pk-to-pk max)

Phase nonlinearity
 $f_s = 51.2$ kS/s, 200 Hz to 23 kHz input frequency: $\pm 0.36^\circ$ max

Stopband
Frequency: $0.547 \cdot f_s$
Rejection: 99 dB min

Alias-free bandwidth: $0.453 \cdot f_s$
Alias rejection: 100 dB @ 51.2 kS/s
Oversample rate: $128 \cdot f_s$

Crosstalk
1 kHz: -122 dB

SFDR
 $f_m = 1$ kHz, -60 dBFS: 120 dB

Dynamic range
 $f_m = 1$ kHz, -1 dBFS: 100 dB

Input impedance
Differential: 202 k Ω
AI- (shield) to ground: 50 Ω

Throughput
Single board: 102.4 kS/s max ($51.2 \text{ kS/s} \times 2$ channels)
Multiple boards: Up to 307.2 kS/s aggregate[†]

[†] Depends on the load on the Raspberry Pi processor and the SPI interface.

Note: For best results, connect the signal source and the Raspberry Pi to a common ground. If a floating source is required, connect the MCC 172 to earth ground via the DGND screw terminal to minimize common mode noise.

Accuracy

Analog input AC voltage measurement accuracy (all values are \pm) and apply to calibrated readings)			
Gain error, max:	Offset error, max:	Gain temperature coefficient, max:	Gain temperature coefficient, max:
0.43%	5.10 mV	88 ppm/°C	184 $\mu\text{V}/^\circ\text{C}$

Noise performance

Idle Channel	51.2 kS/s
Noise	33 μV_{rms}
Noise density	207 nV/ $\sqrt{\text{Hz}}$

Total harmonic distortion (THD)

Input Amplitude	1 kHz	8 kHz
-1 dBFS	-93 dB	-91 dB
-10.96 dBFS	-87 dB	-87 dB

External digital trigger

Trigger source: TRIG input
Trigger mode: Software configurable for rising or falling edge, or high or low level
Trigger latency: 1 $\mu\text{s} + 1$ sample period (1/fS) max
Trigger pulse width: 100 ns min
Input type: Schmitt trigger, 100K pull-down to ground
Input high voltage threshold: 1.48 V min
Input low voltage threshold: 1.2 V max
Input hysteresis: 0.51 V min
Input voltage limits: 6.5 V absolute max, -0.5 V absolute min, 0 V recommended min

Memory

Data FIFO: 48 K (49,152) analog input samples
Non-volatile memory: 4 KB (ID and calibration storage, no user-modifiable memory)

Power

Supply current, 5 V supply
Typical: 100 mA
Maximum: 140 mA

Interface

Raspberry Pi GPIO pins used:
GPIO 8, GPIO 9, GPIO 10, GPIO 11 (SPI interface)
ID_SD, ID_SC (ID EEPROM)
GPIO 12, GPIO 13, GPIO 26 (Board address)
GPIO 5, 6, 19, 16, 20 (Clock / trigger sharing, Reset, IRQ)
Data interface type: SPI slave device, CEO chip select
SPI mode: 1
SPI clock rate: 18 MHz, max

Environment

Operating temperature: 0 °C to 55 °C
Storage temperature: -40 °C to 85 °C max
Relative humidity: 0% to 90% non-condensing

Mechanical

Dimensions (L \times W \times H): 65 \times 56.5 \times 12 mm (2.56 \times 2.22 \times 0.47 in.) max

Signal connectors

Connector types: 10-32 coaxial / screw terminal (in parallel; only one source may be connected to a channel at a time)

Coaxial input signals

CH0: channel 0 input

CH1: channel 1 input

Screw terminal wire gauge range: 16 AWG to 30 AWG

Analog input screw terminal pinout (Connector J2)		
Pin	Signal name	Pin description
1	CH0+	Channel 0 positive input
2	CH0-	Channel 0 negative input
3	CH1+	Channel 1 positive input
4	CH1-	Channel 1 negative input

Trigger input screw terminal pinout (Connector J5)		
Pin	Signal name	Pin description
1	TRIG	Digital trigger input
2	GND	Digital ground

Order Information

Hardware

Part No.	Description
MCC 172	24-bit, 2-channel IEPE measurement DAQ HAT. Raspberry Pi with the 40-pin GPIO connector required.

Accessories

Part No.	Description
ACC-172	Coaxial cable, 3 ft, with 10-32 plug to BNC jack (2 qty)

Software

Part No.	Description
MCC DAQ HAT Library	Open-source library for developing applications in C, C++, and Python on Linux for MCC DAQ HAT hardware. Available for download on GitHub at https://github.com/mccdaq/daqhats .
