## High-Performance Dual-Channel DC-DC Converter

---

### General Description

DA9220 is a power management unit (PMU) suitable for supplying CPUs, GPUs, DDR memory rails in single in-line pin package (SIPP) modules, smartphones, tablets, and other handheld applications.

DA9220 integrates two single-phase buck converters, each phase requiring a small external 0.10  $\mu$ H inductor. Each buck is capable of delivering up to 3 A output current at a 0.3 V to 1.9 V output voltage range. The 2.5 V to 5.5 V input voltage range is suitable for a wide variety of low-voltage systems, including, but not limited to, all Li-Ion battery supplied applications.

With remote sensing, the DA9220 guarantees the highest accuracy and supports multiple PCB routing scenarios without loss of performance.

The pass devices are fully integrated, so no external FETs or Schottky diodes are needed.

A programmable soft start-up can be enabled, which limits the inrush current from the input node and secures a slope-controlled rail activation.

The dynamic voltage control (DVC) supports adaptive adjustment of the supply voltage dependent on the processor load, via either a direct register write using the communication interface (I<sup>2</sup>C-compatible) or with a programmable input pin.

A configurable GPI allows multiple I<sup>2</sup>C address selection for multiple instances of DA9220 in the same application.

DA9220 has integrated over-temperature and over-current protection for increased system reliability, without the need for external sensing components.

### Key Features

- 2.5 V to 5.5 V input voltage
- 0.3 V to 1.9 V output voltage
- 4 MHz nominal switching frequency
- $\pm 1$  % accuracy (static)
- $\pm 5$  % accuracy (dynamic)
- I<sup>2</sup>C-compatible interface (FM+)
- Programmable GPIOs
- Programmable soft-start
- Voltage, current, and temperature supervision
- -40 °C to +85 °C ambient temperature range
- Package:  
24WLCSP 2.5 mm x 1.7 mm (0.4 mm pitch)

### Applications

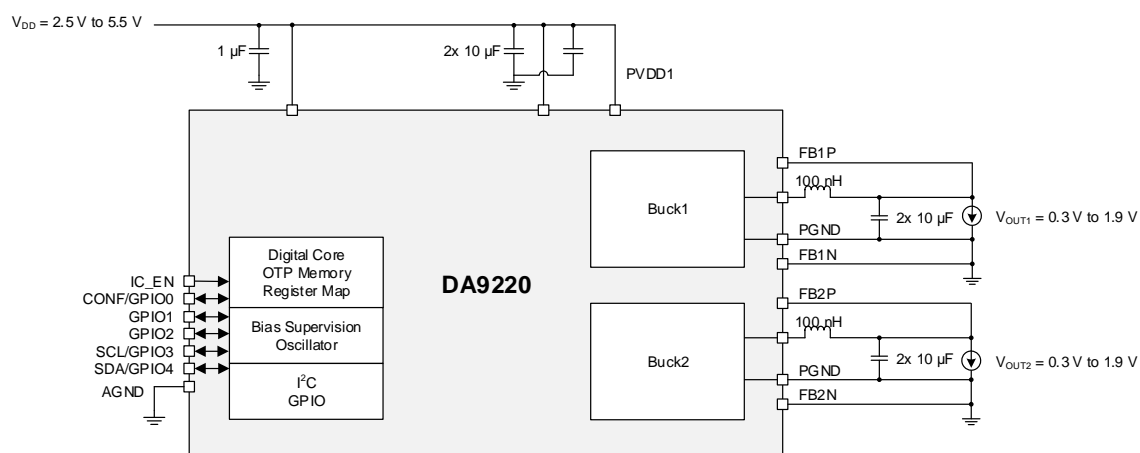

- SIPP modules (SoC, DRAM)
- Smartphones
- Tablet PCs
- Infotainment
- Ultrabooks™
- Wi-Fi Modules
- Game Consoles

### 3 Characteristics

#### 3.1 Absolute Maximum Ratings

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, so functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification are not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

**Table 3: Absolute Maximum Ratings**

Parameter	Description	Conditions	Min	Max	Unit
T <sub>STG</sub>	Storage temperature		-65	150	°C
T <sub>J</sub>	Junction temperature		-40	150	°C
V <sub>SYS</sub>	System supply voltage		-0.3	6.0	V
V <sub>PIN</sub>	Voltage on pins		-0.3	6.0	V

#### 3.2 Recommended Operating Conditions

**Table 4: Recommended Operating Conditions**

Parameter	Description	Conditions (Note 1)	Min	Typ	Max	Unit
V <sub>SYS</sub>	System supply voltage		2.5		5.5	V
V <sub>PIN</sub>	Voltage on pins		-0.3		V <sub>SYS</sub> + 0.3	V
T <sub>J</sub>	Junction temperature		-40		125	°C
T <sub>A</sub>	Ambient temperature		-40		85	°C

**Note 1** Within the specified limits, a lifetime of 10 years is guaranteed. If operating outside of these recommended conditions, please consult with Dialog Semiconductor.

## 4 Functional Description

### 4.1 DC-DC Buck Converter

DA9220 contains two buck converters, Buck1 and Buck2, each capable of delivering up to 3 A output current at a 0.3 V to 1.9 V output voltage range.

Buck1 and Buck2 have two voltage registers each. One defines the normal output voltage, while the other offers an alternative retention voltage. In this way, different application power modes can easily be supported. The voltage selection can be operated either via GPI or via control interface to guarantee the maximum flexibility according to the specific host processor status in the application.

When a buck is enabled, its output voltage is monitored and a power good signal indicates that the buck output voltage has reached a level higher than the  $V_{THR\_PG\_RISE}$  threshold. The power good status is lost when the voltage drops below  $V_{THR\_PG\_DWN}$  or increases above  $V_{THR\_HV}$ . For each of the buck converters the status of the power good indicator can be read back via I<sup>2</sup>C from the PG1 and PG2 status bits. It can be also individually assigned to any of the GPIOs by setting the GPIO mode registers to either PG1 or PG2 output.

The buck converters are capable of supporting DVC transitions that occur:

- When the active and selected A- or B-voltage is updated to a new target value.
- When the voltage selection is changed from the A- to B-voltage (or B- to A-voltage) using CH<x>\_VSEL.

The DVC controller operates in pulse width modulation (PWM) mode with synchronous rectification.

The slew rate of the DVC transition is individually programmed for each buck converter at 10 mV per 8  $\mu$ s, 4  $\mu$ s, 2  $\mu$ s, 1  $\mu$ s, or 0.5  $\mu$ s in register bits CH1\_SR\_DVC and CH2\_SR\_DVC.

A pull-down resistor (typically 150  $\Omega$ ) for each phase is always activated unless it is disabled by setting register bits CH<x>\_PD\_DIS to 1.

#### 4.1.1 Switching Frequency

The buck switching frequency can be tuned using register bit OSC\_TUNE. The internal 8 MHz oscillator frequency is tuned in  $\pm 160$  kHz steps. This impacts the buck converter frequency in steps of 80 kHz and helps to mitigate possible disturbances to other high frequency systems in the application.

#### 4.1.2 Operation Modes and Phase Selection

The buck converters can operate in PWM and PFM modes. The operating mode is selected using register bits CH1\_<A or B>\_MODE and CH2\_<A or B>\_MODE.

If the automatic operation mode is selected on CH1\_<A or B>\_MODE or CH2\_<A or B>\_MODE, the buck converters automatically change between synchronous PWM mode and PFM depending on the load current. This improves the efficiency across the whole range of output load currents.

## High-Performance Dual-Channel DC-DC Converter

### 4.1.3 Output Voltage Selection

The switching converter can be configured using the I<sup>2</sup>C interface.

For each buck converter two output voltages can be pre-configured in registers CH<x>\_A or B>\_VOUT. The output voltage can be selected by either toggling register bit CH<x>\_VSEL or by re-programming the selected voltage control register. Both changes will result in ramped voltage transitions. After being enabled, the buck converter will, by default, use the register settings in CH<x>\_A\_VOUT unless the output voltage selection is configured via the GPI port.

Registers CH<1 and 2>\_VMAX limit the output voltage that can be set for each of the respective buck converters.

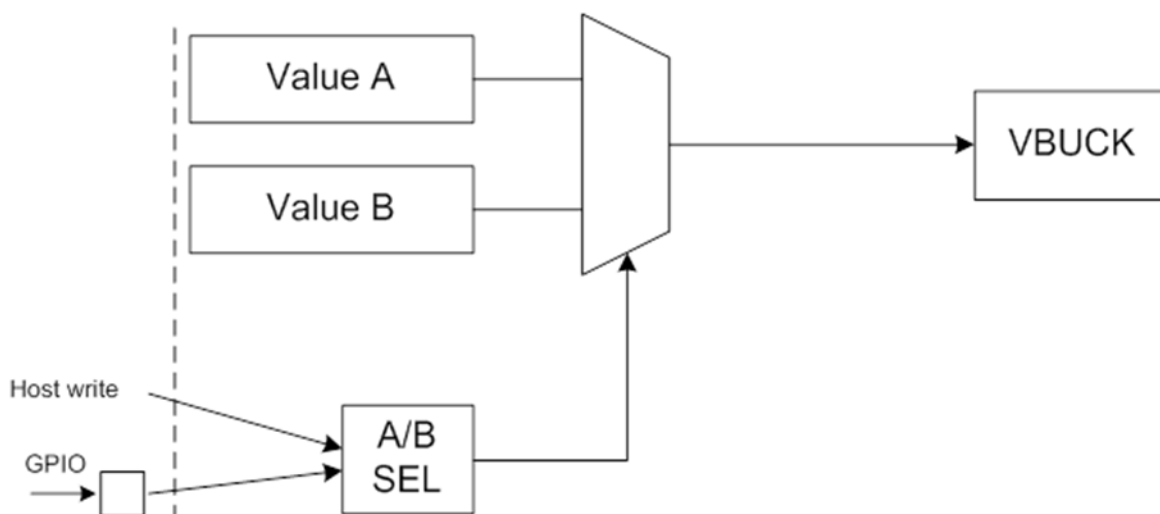

Figure 14: Buck Output Voltage Control Concept

### 4.1.4 Soft Start-Up and Shutdown

To limit in-rush current from V<sub>SY</sub>, the buck converters can perform a soft-start after being enabled. The start-up behavior is a compromise between acceptable inrush current from the battery and turn-on time. Individual ramp times can be configured for each buck converter in registers CH<1 and 2>\_SR\_STARTUP respectively. Rates higher than 20 mV/μs may produce overshoot during the start-up phase, so they should be considered carefully.

A ramped power down can be selected in register bits CH<1 and 2>\_SR\_SHDN. When no ramp is selected (immediate power down), the output node will be discharged only by the pull-down resistor, if enabled in registers CH<1 and 2>\_PD\_DIS.

### 4.1.5 Current Limit

The integrated current limit protects the power stages and external coil from excessive current. The buck current limit should be configured to at least 40 % higher than the required maximum output current.

When the current limit is reached, each buck converter generates an event and an interrupt to the host processor unless the interrupt has been masked using register M\_OC<x> in SYS\_MASK\_1. Register bits OC\_DVC\_MASK is used to mask over-current events during DVC transitions.

## High-Performance Dual-Channel DC-DC Converter

### 4.1.6 Thermal Protection

DA9220 is protected from internal overheating by thermal shutdown.

There are two kinds of flags concerning thermal protection, thermal warning and thermal critical. The warning flag is asserted when  $T_J > T_{WARN}$  and the critical flag is asserted when  $T_J > T_{CRIT}$ . When the critical flag is asserted, Buck1 and 2 are shut down immediately.

**Table 12: Thermal Protection Control Registers**

Category	Register name	Description
Status	TEMP_WARN	Asserted as long as the thermal warning threshold is reached
	TEMP_CRIT	Asserted as long as the thermal shutdown threshold is reached
IRQ event	E_TEMP_WARN	TEMP_WARN caused event
	E_TEMP_CRIT	TEMP_CRIT caused event
IRQ mask	M_TEMP_WARN	TEMP_WARN event IRQ mask
	M_TEMP_CRIT	TEMP_CRIT event IRQ mask
	M_VR_HOT	TEMP_WARN status IRQ mask

**Figure 15: Thermal Protection Operation**

## High-Performance Dual-Channel DC-DC Converter

### 4.2 Internal Circuits

#### 4.2.1 IC\_EN/Chip Enable/Disable

IC\_EN is chip enable/disable control input. When IC\_EN = 0, all blocks except for low I<sub>Q</sub> POR are powered-down and buck output is pulled-down.

#### 4.2.2 nIRQ/Interrupt

The interrupt triggers events. Trigger conditions and control registers for each interrupt event are listed in Table 13.

Some of these events are categorized as fault events and affect device operation (for example, buck disable), see Section 4.1.6.

**Table 13: Interrupt List**

Name	Polarity (Note 1)	Trigger	IRQ Status Register	IRQ Mask Register	Deglintch Period
Thermal warning (event)	N	T <sub>J</sub> rising above T <sub>WARN</sub>	E_TEMP_WARN	M_TEMP_WARN	0 s
Thermal critical (event)	N	T <sub>J</sub> rising above T <sub>CRIT</sub>	E_TEMP_CRIT	M_TEMP_CRIT	0 s
System good (event)	P		E_SG	M_SG	0 s
Buck1 power-good (event)	P	Buck1 V <sub>OUT</sub> is in power-good voltage range (not under- or over-voltage)	E_PG1	M_PG1	0 s
Buck2 power-good (event)	P	Buck2 V <sub>OUT</sub> is in power-good voltage range (not under- or over-voltage)	E_PG2	M_PG2	0 s
Buck1 over-voltage (event)	N	Buck1 V <sub>OUT</sub> rising above over-voltage threshold (target voltage + 150 mV)	E_OV1	M_OV1	Rise:8 μs Fall:8 μs
Buck2 over-voltage (event)	N	Buck2 V <sub>OUT</sub> rising above over-voltage threshold (target voltage + 150 mV)	E_OV2	M_OV2	Rise:8 μs Fall:8 μs
Buck1 under-voltage (event)	N	Buck1 V <sub>OUT</sub> falling below under-voltage threshold (target voltage - V <sub>TH_PG</sub> )	E_UV1	M_UV1	0 s
Buck2 under-voltage (event)	N	Buck2 V <sub>OUT</sub> falling below under-voltage threshold (target voltage - V <sub>TH_PG</sub> )	E_UV2	M_UV2	0 s
Buck1 over-current (event)	N	Buck1 current rising above over-current threshold	E_OC1	M_OC1	0 s

## High-Performance Dual-Channel DC-DC Converter

Name	Polarity (Note 1)	Trigger	IRQ Status Register	IRQ Mask Register	Deglitch Period
Buck2 over-current (event)	N	Buck2 current rising above over-current threshold	E_OC2	M_OC2	0 s
Buck1 power-good (status) (Note 2)	P	Buck1 V <sub>OUT</sub> is in power-good voltage range (not under- or over-voltage)	PG1	M_PG1_STAT (Note 3)	0 s
Buck2 power-good (status) (Note 2)	P	Buck2 V <sub>OUT</sub> is in power-good voltage range (not under- or over-voltage)	PG2	M_PG2_STAT (Note 3)	0 s
System good (status) (Note 2)	P		SG	M_SG_STAT (Note 3)	0 s
Thermal warning (status) (Note 2)	N	T <sub>J</sub> rising above T <sub>WARN</sub>	TEMP_WARN	M_VR_HOT (Note 3)	0 s
GPIO0 change (event)	N	Detect GPIO0 change for active trigger selected GPIO0_TRIG register	E_GPIO0	M_GPIO0	100 μs/ 1 ms/ 10 ms/ 100 ms
GPIO1 change (event)	N	Detect GPIO1 change for active trigger selected GPIO1_TRIG register	E_GPIO1	M_GPIO1	
GPIO2 change (event)	N	Detect GPIO2 change for active trigger selected GPIO2_TRIG register	E_GPIO2	M_GPIO2	

**Note 1** Polarity at the source of the flag: P = active-high, N = active-low.

General rule is: normal system state is high, and abnormal system state is low (for example, PG = high means power-good, TEMP\_CRIT = low when TEMP critical state).

**Note 2** Interrupt outputs the status as is. I<sup>2</sup>C write is not required for interrupt clear.

**Note 3** OTP load value defined by CONF pin setting if CONF\_EN = 1.

## High-Performance Dual-Channel DC-DC Converter

**Table 14: Interrupt Registers Except for Power Good Status**

Register	Description
E_<name>	Read-only interrupt event register 0: No interrupt 1: Interrupt occurred <b>Cleared after being written to I<sup>2</sup>C. Set until IRQ is removed.</b>
M_<name>	Interrupt mask register 0: Not masked 1: Masked. No IRQ signal sent. Event register (E_<name>) is updated.

**Table 15: Interrupt Registers for Power Good, System Good, and Temp Warning Status**

Register	Description
PG<x>	Buck<x> power good status. Asserted as long as the buck<x> output voltage is in range (under-voltage threshold < buck output voltage < over-voltage threshold) 0: Not power good 1: Power good
M_PG<x>_STAT	Power good status interrupt mask register 0: Not masked 1: Masked. No IRQ signal sent. Power good status register (PG<x>) is updated
SG	System good status 0: Not system good 1: System good
M_SG_STAT	System good status (SG) interrupt mask register 0: Not masked 1: Masked. No IRQ signal sent. System good status register (SG) is updated
TEMP_WARN	Asserted as long as the thermal warning threshold (T <sub>WARN</sub> ) is reached 0: Junction temperature is below T <sub>WARN</sub> 1: Junction temperature is above T <sub>WARN</sub>
M_VR_HOT	Temperature warning status (TEMP_WARN) interrupt mask register 0: Not masked 1: Masked. No IRQ signal sent. Temperature warning status register (TEMP_WARN) is updated

### 4.2.3 GPIO

#### 4.2.3.1 GPIO Pin Assignment

The DA9220 provides up to five GPIO pins, three if the I<sup>2</sup>C is enabled, see Table 16. These registers are OTP programmable. When CONF\_EN = 1 GPIO0 can be used for chip configuration.

Any register settings for GPIO3 and GPIO4 are ignored and GPIO3 and GPIO4 function as SCL and SDA respectively if I2C\_EN = 1.

**Table 16: GPIO Pin Assignment**

OTP Option		GPIO Pin					Available GPIOs
I2C_EN	CONF_EN	CONF/GPIO0	GPIO1	GPIO2	SCL/GPIO3	SDA/GPIO4	
1'b0	1'b0	GPIO0	GPIO1	GPIO2	GPIO3	GPIO4	5
	1'b1	CONF	GPIO1	GPIO2	GPIO3	GPIO4	4
1'b1	1'b0	GPIO0	GPIO1	GPIO2	SCL	SDA	3
	1'b1	CONF	GPIO1	GPIO2	SCL	SDA	2

#### 4.2.3.2 GPIO Function

The GPIOs pins are configurable as the following functions in register GPIO<x>\_MODE (x = 0 to 4):

- Buck1 enable input (EN1)
- Buck2 enable input (EN2)
- Buck1 and Buck2 enable input (EN1 & EN2)
- Buck1 DVC control input (DVC1)
- Buck2 DVC control input (DVC2)
- Buck1 and Buck2 DVC control input (DVC1 & DVC2)
- Buck1 and Buck2 OTP setting reload input (RELOAD)
- Buck1 power good output (PG1)
- Buck2 power good output (PG2)
- Buck1 power good and Buck2 power good output (PG1 & PG2)
- System good output (SG)
- Interrupt output (nIRQ)

**Table 17: GPIO Function Configuration**

GPIO<x>_MODE[3:0]	Function	IO Condition
4'h0	GPIO disable	HiZ
4'h1	EN1	In
4'h2	EN2	In
4'h3	EN1 & EN2	In
4'h4	DVC1	In
4'h5	DVC2	In
4'h6	DVC1 & DVC2	In
4'h7	RELOAD	In
4'h8	PG1	Out

## High-Performance Dual-Channel DC-DC Converter

GPIO<x>_MODE[3:0]	Function	IO Condition
4'h9	PG2	Out
4'hA	PG1 & PG2	Out
4'hB	SG	Out
4'hC	nIRQ	Out
4'hD	Reserved	HiZ
4'hE	Low level	Out
4'hF	High level	Out

**Figure 20: Power Good (PG) and System Good (SG)**

## High-Performance Dual-Channel DC-DC Converter

### 4.2.3.3 Chip Configuration Select (CONF)

GPIO0 functions as chip configuration select (CONF) input when CONF\_EN = 1.

Three different chip configurations can be selected according to the CONF pin level, whether it is HIGH, LOW, or Hi-Z.

**Table 18: GPIO0-Configurable Registers when CONF\_EN = 1**

Register Name	Description
IF_SLAVE_ADDR[6:0]	I2C slave address
CH1_A_MODE[1:0]	CH1_A Operation mode select
CH1_B_MODE[1:0]	CH1_B Operation mode select
CH1_VSEL	CH1 output voltage and operation selection
CH1_EN	CH1 enable
CH1_A_VOUT[7:0]	CH1 output voltage setting A
CH1_B_VOUT[7:0]	CH1 output voltage setting B
CH2_A_MODE[1:0]	CH2_A Operation mode select
CH2_B_MODE[1:0]	CH2_B Operation mode select
CH2_VSEL	CH2 output voltage and operation selection
CH2_EN	CH2 enable
CH2_A_VOUT[7:0]	CH2 output voltage setting A
CH2_B_VOUT[7:0]	CH2 output voltage setting B
M_PG1_STAT	IRQ mask setting for CH1 power good status
M_PG2_STAT	IRQ mask setting for CH2 power good status
M_SG_STAT	IRQ mask setting for system good status
M_VR_HOT	IRQ mask setting for temp warning status
CH1_EN_DLY[3:0]	Delay setting for CH1 enable
CH1_DIS_DLY[3:0]	Delay setting for CH1 disable
CH2_EN_DLY[3:0]	Delay setting for CH2 enable
CH2_DIS_DLY[3:0]	Delay setting for CH2 disable
GPIO1_MODE[3:0]	GPIO1 mode setting
GPIO2_MODE[3:0]	GPIO2 mode setting
GPIO1_OBUF	GPIO1 output buffer select
GPIO2_OBUF	GPIO2 output buffer select
GPIO1_TRIG[1:0]	GPIO1 input trigger select
GPIO1_POL	GPIO1 polarity select
GPIO1_PUPD	GPIO1 pull-up/pull-down enable
GPIO1_DEB[1:0]	GPIO1 input debounce time setting
GPIO1_DEB_RISE	GPIO1 input debounce rising edge enable
GPIO1_DEB_FALL	GPIO1 input debounce falling edge enable
GPIO2_TRIG[1:0]	GPIO2 input trigger select
GPIO2_POL	GPIO2 polarity select

## High-Performance Dual-Channel DC-DC Converter

Register Name	Description
GPIO2_PUPD	GPIO2 pull-up/pull-down enable
GPIO2_DEB[1:0]	GPIO2 input debounce time setting
GPIO2_DEB_RISE	GPIO2 input debounce rising edge enable
GPIO2_DEB_FALL	GPIO2 input debounce falling edge enable

### 4.2.3.4 OTP Reload (RELOAD)

Buck settings listed in [Error! Reference source not found.](#) are reloaded from CONF registers by triggering GPIO configured as RELOAD input.

The OTP reload happens at the same time for Buck1 and Buck2 settings. During reloading, Buck1/2 keep operating as configured without shut-down.

**Table 19: OTP Reload Registers**

Register Name	Description
CH#_VSEL	CH# output voltage and operation selection. 0: A, 1: B
CH#_A_VOUT[7:0]	CH# output voltage setting A : CH#_A_VOUT * 10 mV Setting under 0.3V is clamped to 0.3V, and setting over 1.9V is clamped to 1.9 V
CH#_B_VOUT[7:0]	CH# output voltage setting B : CH#_A_VOUT * 10 mV Setting under 0.3 V is clamped to 0.3 V, and setting over 1.9V is clamped to 1.9 V
CH#_A_MODE[1:0]	Operation mode selection 0: Force PFM 1: Force PWM. full phase 2: Force PWM with phase shedding 3: Auto mode
CH#_B_MODE[1:0]	Operation mode selection 0: Force PFM 1: Force PWM. full phase 2: Force PWM with phase shedding 3: Auto mode

## 4.3 Operating Modes

### 4.3.1 ON

DA9220 is ON when the IC\_EN port is higher than  $V_{IH\_EN}$  and the supply voltage is higher than  $V_{THR\_POR}$ . Once enabled, the host processor can start communicating with DA9220 using the control interface, after the  $t_{IC\_EN}$  delay.

### 4.3.2 OFF

DA9220 is OFF when the IC\_EN port is lower than  $V_{IL\_EN}$ . In OFF, the bucks are always disabled and LX nodes are pulled down by (typically 150  $\Omega$ ) internal pull-down resistors.

## 4.4 I<sup>2</sup>C Communication

All features of DA9220 can be controlled with the I<sup>2</sup>C interface which is enabled or disabled in register I2C\_EN.

## High-Performance Dual-Channel DC-DC Converter

I2C_EN	Description
0	I <sup>2</sup> C disable: SCL/GPIO3 and SDA/GPIO4 pins can be used as GPIO
1	I <sup>2</sup> C enable: SCL/GPIO3 and SDA/GPIO4 pins are used as I <sup>2</sup> C clock input and I <sup>2</sup> C data input/output.

GPIO3 functions as the I<sup>2</sup>C clock and GPIO4 carries all the power manager bidirectional I<sup>2</sup>C data. The I<sup>2</sup>C interface is open-drain supporting multiple devices on a single line. The bus lines have to be pulled high by external pull-up resistors (2 kΩ to 20 kΩ). The standard frequency of the I<sup>2</sup>C bus is 1 MHz in fast-mode plus (FM+), 400 kHz in fast-mode, or 100 kHz in standard mode.

### 4.4.1 I<sup>2</sup>C Protocol

All data is transmitted across the I<sup>2</sup>C bus in eight-bit groups. To send a bit, the SDA line is driven towards the intended state while the SCL is low (a low SDA indicates a zero bit). Once the SDA has settled, the SCL line is brought high and then low. This pulse on SCL clocks the SDA bit into the receiver's shift register.

A two-byte serial protocol is used containing one byte for address and one byte data. Data and address transfer are transmitted MSB first for both read and write operations. All transmissions begin with the START condition from the master while the bus is in idle state (the bus is free). It is initiated by a high to low transition on the SDA line while the SCL is in the high state (a STOP condition is indicated by a low to high transition on the SDA line while the SCL is in the high state).

Figure 21: I<sup>2</sup>C START and STOP Condition Timing

The I<sup>2</sup>C bus is monitored for a valid slave address whenever the interface is enabled. It responds immediately when it receives its own slave address. The acknowledge is done by pulling the SDA line low during the following clock cycle (white blocks marked with A in Figure 22 and Figure 23).

The protocol for a register write from master to slave consists of a START condition, a slave address with read/write bit, and the eight-bit register address followed by eight bits of data, terminated by a STOP condition. DA9220 responds to all bytes with acknowledge (A), see Figure 22.

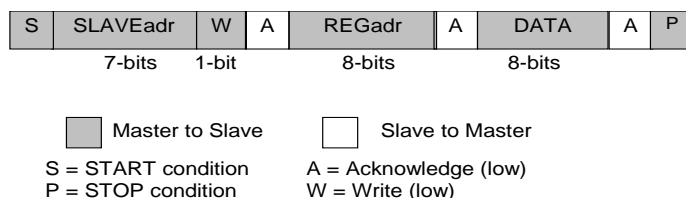

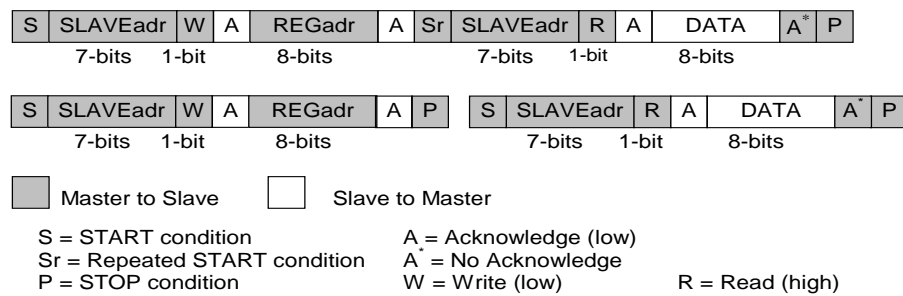

Figure 22: I<sup>2</sup>C Byte Write (SDA Line)

When the host reads data from a register it first has to write to DA9220 with the target register address and then read from DA9220 with a repeated START, or alternatively a second START, condition. After receiving the data, the host sends no acknowledge (A\*) and terminates the transmission with a STOP condition, see Figure 23.

## 6 Package Information

### 6.1 Package Outlines

High-Performance Dual-Channel DC-DC Converter

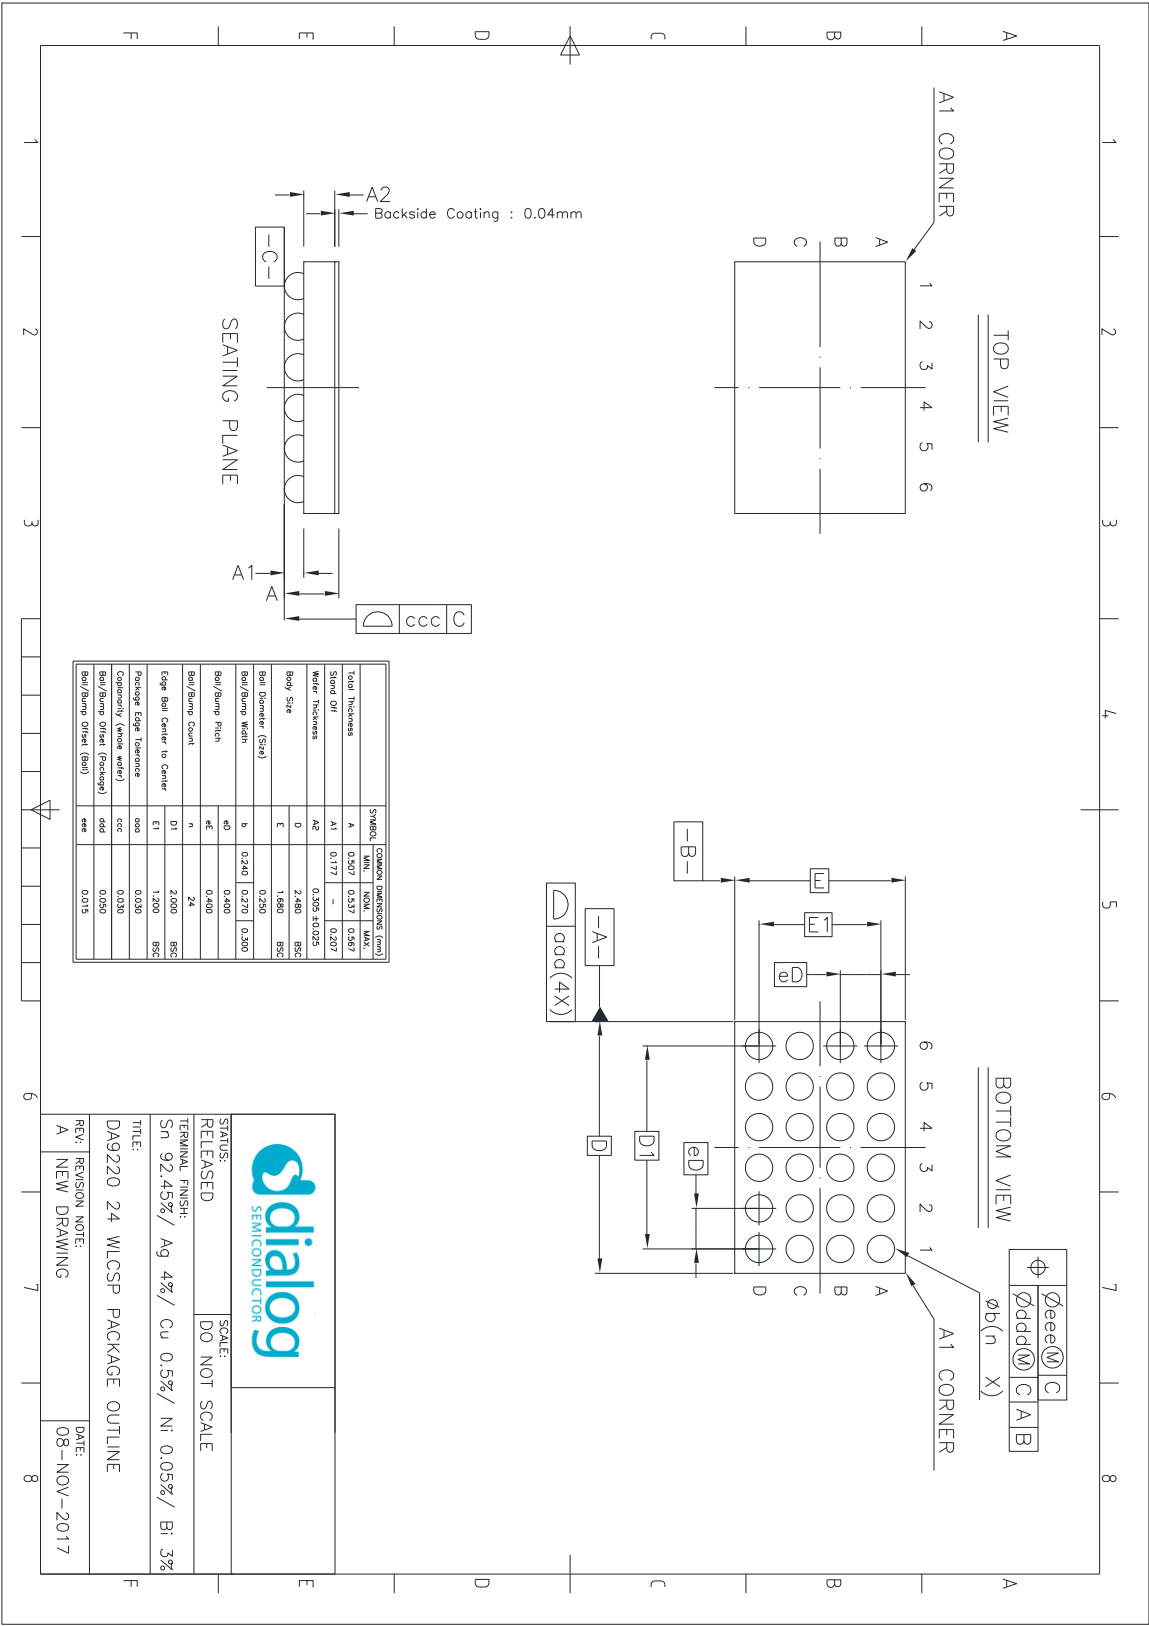

Figure 24: Package Outline Drawing

## High-Performance Dual-Channel DC-DC Converter

### 6.2 Moisture Sensitivity Level

The moisture sensitivity level (MSL) is an indicator for the maximum allowable time period (floor lifetime) in which a moisture sensitive plastic device, once removed from the dry bag, can be exposed to an environment with a specified maximum temperature and a maximum relative humidity before the solder reflow process. The MSL classification is defined in Table 61.

For detailed information on MSL levels refer to the IPC/JEDEC standard J-STD-020, which can be downloaded from <http://www.jedec.org>.

The DA9220 package is qualified for MSL1.

**Table 61: MSL Classification**

MSL Level	Floor Lifetime	Conditions
MSL 1	Unlimited	≤30 °C / 85 % RH

### 6.3 WLCSP Handling

Manual handling of WLCSP packages should be reduced to the absolute minimum. In cases where it is still necessary, a vacuum pick-up tool should be used. In extreme cases plastic tweezers could be used, but metal tweezers are not acceptable, since contact may easily damage the silicon chip.

Removal of a WLCSP package will cause damage to the solder balls. Therefore a removed sample cannot be reused.

WLCSP packages are sensitive to visible and infrared light. Precautions should be taken to properly shield the chip in the final product.

### 6.4 Soldering Information

Refer to the IPC/JEDEC standard J-STD-020 for relevant soldering information. This document can be downloaded from <http://www.jedec.org>.

## High-Performance Dual-Channel DC-DC Converter

### 7 Ordering Information

The ordering number consists of the part number followed by a suffix indicating the packing method. For details and availability, please consult Dialog Semiconductor's [customer support portal](#) or your local sales representative.

**Table 62: Ordering Information**

Part Number	Package	Size (mm)	Shipment Form	Pack Quantity
DA9220-xxV72	24 WLCSP	2.5 x 1.7	T&R	4500
DA9220-xxV76	24 WLCSP	2.5 x 1.7	Waffle Tray	140
DA9220-70V72 Standard OTP Variant $V_{OUT1} = 1.2\text{ V}$ , $V_{OUT2} = 1.8\text{ V}$	24 WLCSP	2.5 x 1.7	T&R	4500
DA9220-70V76 Standard OTP Variant $V_{OUT1} = 1.2\text{ V}$ , $V_{OUT2} = 1.8\text{ V}$	24 WLCSP	2.5 x 1.7	Waffle Tray	140
DA9220-71V72 Standard OTP Variant $V_{OUT1} = 1.0\text{ V}$ , $V_{OUT2} = 1.0\text{ V}$	24 WLCSP	2.5 x 1.7	T&R	4500
DA9220-71V76 Standard OTP Variant $V_{OUT1} = 1.0\text{ V}$ , $V_{OUT2} = 1.0\text{ V}$	24 WLCSP	2.5 x 1.7	Waffle Tray	140

### 8 Application Information

The following recommended components are examples selected from requirements of a typical application.

#### 8.1 Capacitor Selection

Ceramic capacitors are used as bypass capacitors at all VDD and output rails. When selecting a capacitor, especially for types with high capacitance at smallest physical dimension, the DC bias characteristic has to be taken into account.

**Table 63: Recommended Capacitor Types**

Application	Value	Size	Temp. Char.	Tol. (%)	V-Rate	Type
VOUT output bypass	10 $\mu\text{F}$	0402	X5R $\pm 15\%$	$\pm 20$	6.3 V	Murata GRM155R60J106ME15
PVDDx bypass	10 $\mu\text{F}$	0603	X5R $\pm 15\%$	$\pm 20$	25 V	Murata GRM188R61E106MA73
AVDD bypass	1 $\mu\text{F}$	0402	X5R $\pm 15\%$	$\pm 10$	10 V	Murata GRM155R61A105KE15

## High-Performance Dual-Channel DC-DC Converter

### 8.2 Inductor Selection

Inductors should be selected based on the following parameters:

- Rated maximum current  
Usually a coil provides two current limits: ISAT specifies the maximum current at which the inductance drops by 30 % of the nominal value, and IMAX is defined by the maximum power dissipation and is applied to the effective current.
- DC resistance  
Critical for the converter efficiency and should therefore be minimized.

**Table 64: Recommended Inductor Types**

Value (μH)	Size (mm)	IMAX (DC) (A)	ISAT (A)	Tol. (%)	DC Resistance (mΩ)	Type
0.1	2.0 x 1.6 x 1.0	6.5	9.0	±20	11.5	Cyntec HTEN20161T-R10MDR
0.1	1.6 x 0.8 x 1.0	5.2	6.5	±20	17	Taiyo Yuden MEKK1608TR10M
0.1	1.6 x 0.8 x 0.8	4.1	9.4	±20	19	Taiyo Yuden MCHK1608TR10MJN
0.11	2.0 x 1.25 x 0.8	5.8	6.9	±20	9.1	Taiyo Yuden MCHK2012TR11MKG

### Status Definitions

Revision	Datasheet Status	Product Status	Definition
1.<n>	Target	Development	This datasheet contains the design specifications for product development. Specifications may be changed in any manner without notice.
2.<n>	Preliminary	Qualification	This datasheet contains the specifications and preliminary characterization data for products in pre-production. Specifications may be changed at any time without notice in order to improve the design.
3.<n>	Final	Production	This datasheet contains the final specifications for products in volume production. The specifications may be changed at any time in order to improve the design, manufacturing and supply. Major specification changes are communicated via Customer Product Notifications. Datasheet changes are communicated via <a href="http://www.dialog-semiconductor.com">www.dialog-semiconductor.com</a> .
4.<n>	Obsolete	Archived	This datasheet contains the specifications for discontinued products. The information is provided for reference only.

### RoHS Compliance

Dialog Semiconductor's suppliers certify that its products are in compliance with the requirements of Directive 2011/65/EU of the European Parliament on the restriction of the use of certain hazardous substances in electrical and electronic equipment. RoHS certificates from our suppliers are available on request.
