

Restrictions:

IDT's ZSPM15xx-KIT01 Evaluation Kit hardware is designed only for evaluation of the ZSPM15xx True-Digital PWM Controller IC and the ZSPM9060 DrMOS power stage; laboratory setup; and module development. The kit hardware must not be used for module production and production test setups.

IDT shall not be liable for any damages arising out of defects resulting from (i) delivered hardware and software, (ii) non-observance of instructions contained in this manual, or (iii) misuse, abuse, use under abnormal conditions, or alteration by anyone other than IDT. To the extent permitted by law, IDT hereby expressly disclaims and User expressly waives any and all warranties, whether express, implied, or statutory, including, without limitation, implied warranties of merchantability and of fitness for a particular purpose, statutory warranty of non-infringement, and any other warranty that may arise by reason of usage of trade, custom, or course of dealing.

Important Safety Warning: These procedures can result in high currents, which can cause severe injury or death. Only trained professional staff should connect external equipment. Ensure that all staff have read and understood this document and the high voltage safety disclaimer that is included with the kit.

1 Introduction

This document describes the use of IDT's ZSPM15xx-KIT01 for evaluating DC/DC point-of-load (POL) applications and provides additional kit information, including the circuit diagram and board layout. The kit incorporates IDT's ZSPM15xx digital PWM controller IC and a ZSPM9060 DrMOS to form a "smart" buck converter (a.k.a. step-down DC-to-DC converter).

Note: The ZSPM15xx Family includes the ZSPM1501, ZSPM1502, ZSPM1503, ZSPM1504, ZSPM1505, ZSPM1506, ZSPM1507, ZSPM1508, ZSPM1509, ZSPM1511, ZSPM1512, and ZSPM1513. Unless otherwise noted, all references to the ZSPM15xx apply to all these products.

The ZSPM15xx-KIT01 Evaluation Kit hardware functions as a fixed-voltage self-starting autonomous DC/DC converter, which requires no software or subsequent programming.

Kit Contents:

- ZSPM15xx Evaluation Board
- *Startup Information* document
- *Safety Disclaimer* document

Figure 1.1 ZSPM15xx-KIT01 Evaluation Kit

2 ZSPM15xx Evaluation Board

2.1. Evaluation Board Overview

The ZSPM15xx Evaluation Kit provides all the necessary components for a first evaluation of IDT's ZSPM15xx digital PWM controller.

In addition to the ZSPM15xx controller, the Evaluation Board features the ZSPM9060 DrMOS power stage. The number of output capacitors can be selected with a jumper on the Evaluation Board. The electrical specifications can be found in Table 2.1, and the schematic is provided in Appendix B.

Table 2.1 Key Design Parameters for the Evaluation Kit Power Stage

Parameter	Value
Input voltage	10.8 to 13.2 V
Output voltage range	ZSPM1501: 0.85V
	ZSPM1502: 1.00V
	ZSPM1503: 1.20V
	ZSPM1504: 1.50V
	ZSPM1505: 1.80V
	ZSPM1506: 2.00V
	ZSPM1507: 2.50V
	ZSPM1508: 3.30V
	ZSPM1509: 5.00V
	ZSPM1511: 0.85V
	ZSPM1512: 1.00V
	ZSPM1513: 1.20V
Maximum output current	40A**
Switching frequency	500kHz
* Refer to Table 5.2 for BOM variations and the specific output voltages, which depend on the ZSPM15xx product number. ** The ZSPM9060 provided has an output power limitation of 50W. The maximum output current is therefore a function of the output voltage.	

An on-board transient load is also provided for generating load transients with high current slew rates.

Figure 2.1 shows the ZSPM15xx Evaluation Board and the board connections that will be completed in the subsequent setup steps. Do not make the connections at this point.

Figure 2.1 ZSPM15xx-KIT01 Evaluation Board (Top Side)

Notes:

- Jumper pins J1 and J2 are used to connect the onboard load transient found on the back of the board. The user can achieve transient load steps by placing a jumper across pins 2 and 3 on J1 and/or J2 (white arrows on the board indicate pin 1; see section 4.3). Power resistors in series with the power MOSFETs are used as loads for the load steps, and the current level is therefore output voltage dependent.
- The center pin on J1 or J2 can be used as a trigger for an oscilloscope.
- Jumper J7 can be used to select the amount of capacitance connected to the output of the ZSPM9060 (see section 4.2).
- The J5 DIP switch must be set to the proper compensation scheme. Further details are provided in section 4.2.
- The SMB connector on the right side of the board is intended for connection to an oscilloscope to provide a low noise measurement of the output voltage's transient response.

Figure 2.2 ZSPM15xx-KIT01 Evaluation Board (Bottom Side)

2.2. General Setup for the Evaluation System

The basic setup for using the ZSPM15xx Evaluation Kit is illustrated in Figure 2.3.

Figure 2.3 Pink Power Evaluation Kit Setup

2.2.1. User Instrumentation

The following user equipment is required or recommended for demonstrating the features of the ZSPM15xx Evaluation Kit:

- **DC power supply:** An external power supply is required for the ZSPM15xx Evaluation Board. Its output voltage should be at least 12V with a rated output current of approximately 1A to 8A depending on the test conditions.
- **Electronic load:** An external DC load is highly recommended as the Evaluation Board features only transient loads due to constraints on power dissipation. While an electronic load can be very advantageous, load resistors could also be sufficient for testing. Ensure that the electronic load has an adequate power rating.
- **Oscilloscope:** Connecting an oscilloscope to the Evaluation Kit is strongly recommended for measuring the performance of the Evaluation Board in the time domain. The Evaluation Board features an SMB connector connected to the output of the power stage for easy connection to an oscilloscope.

3 Evaluation Kit Setup

This section covers the steps for powering up the ZSPM15xx Evaluation Kit for the first time.

Important Safety Warning: The following procedures can result in high currents, which can cause severe injury or death. Only trained professional staff should connect external equipment. Do not enable the power supply connected to the input terminals until indicated in the following steps.

Follow this step-by-step instruction to power up the ZSPM15xx Evaluation Board:

- Step 1:** Connect the power supply to the connectors labeled CON1 (VINP in Figure 2.1) and CON2 (PGND). Connect the load to the CON3 (VOUT) and CON4 (PGND) connectors. The load can be either a resistor or an electronic load.
- Step 2:** Set the power supply voltage to 12V and enable the output of the power supply. If the power supply has no enable button, ensure that the output voltage is set to 12V before connecting it to the ZSPM15xx Evaluation Board.
- Step 3:** The power-good (PG) LED on the board should be on now (see Figure 2.1) and a voltage consistent with the preconfigured output voltage for ZSPM15xx product number (see section Table 5.2) should be present on the output terminals.

4 Evaluation Board Hardware and Software Setup

4.1. Introduction

The ZSPM15xx is a fixed-output voltage controller that is pre-configured with settings determined by the ZSPM15xx product number.

The output voltage is set as part of the configuration data. For output voltages up to 1.2V, the controller is configured to operate without a feedback divider. For output voltages above 1.2V, the controller is configured to operate with a feedback divider. Refer to the bill of materials (BOM) for the specific ZSPM15xx product number given in Table 5.2 for detailed information about the output voltage feedback divider.

The ZSPM15xx has four pre-configured compensators. The four compensators have been optimized for specific ranges of output capacitors. Section 4.2 describes how the Evaluation Board can be configured for any of the four options for output capacitor ranges, allowing simple comparisons of the dynamic performance of the complete solution. The output capacitor range can be selected on header J7 (see section 4.2). The *ZSPM15xx Data Sheet* provides further information about the compensation loop configuration of the ZSPM15xx controller and typical performance measurements.

4.2. Output Capacitor Range Selection

The ZSPM15xx controller can be configured with one of four sets of compensation loop parameters. Each set of compensation parameters has been designed to match a range of output capacitors (see the *ZSPM15xx Data Sheet* for more information on the output capacitor ranges and compensation loop settings). The ZSPM15xx Evaluation Board allows the user to test the performance of the controller for each of the four output capacitor ranges. In the final application, the set of compensation parameters would be selected via a pin-strapping resistor as described in the data sheet.

A minimum number of ceramic capacitors are always connected to the output of the ZSPM9060 (capacitor range #1, which is selected if there is no jumper on J7) and additional capacitor banks can be selected with a jumper on header J7 (see Table 4.1). On the Evaluation Board, one of the three LEDs adjacent to J7 will turn green to indicate if capacitor range #2, #3, or #4 has been selected (see Figure 2.1). If none of the LEDs are on, it means that capacitor range #1 has been selected.

Figure 4.1 J7 – Output Capacitor Range Hardware Selection

Important: Do not place more than one jumper on J7 at a time.

Important: For the output capacitor range selected by J7, a corresponding setting on the J5 DIP switch must be made as shown in Table 4.1 to select the ZSPM15xx compensation loop configuration (Comp0, Comp1, Comp2, or Comp3) optimized for the selected output capacitors.

Table 4.1 ZSPM15xx Evaluation Board – Output Capacitors

Capacitor Range Setting	Capacitance Range	J7 Header *	J5 DIP Switch Setting **
#1	200-500 μ F		Comp0 xxxx1000 
#2	500-1000 μ F		Comp1 xxxx0100 
#3	1200-2500 μ F		Comp2 xxxx0010 
#4	2500-4000 μ F		Comp3 xxxx0001 
* For both J7 and the J5 DIP switch, the settings must be made one-at-a-time. Do not place more than one jumper on J7 at a time. Do not set more than one position to ON in the group of four settings on the right of the DIP switch or in the group of four settings on the left. ** The first four settings of the J5 DIP switch (indicated with x) are for selecting the over-current protection threshold, for which the settings are given in section 4.4. For this step, this first set of switches can be considered “do not care,” except that no more than one switch in this group can be set to ON at a time.			

There is a provision on right side of the DIP switch for adding a jumper and a potentiometer or fixed resistor for selecting one of seven slew rate settings. For each set of compensation loop parameters, there is a choice of seven slew rates for the output voltage during power-up. The selection of the slew rate can be used to limit the input current of the DC/DC converter while it is ramping up the output voltage. The current needed to charge the output capacitors increases in direct proportion to the slew rate. See the *ZSPM15xx Data Sheet* for further details.

4.2.1. Output Capacitor Range Test Procedure

To test the performance of the four selectable compensators, follow these simple steps:

1. Make sure that the input voltage from the power supply to the ZSPM15xx Evaluation Board is OFF.
2. Select the ZSPM15xx output capacitor range via header J7 and set the corresponding position on the J5 DIP switch per Table 4.1.
3. Apply the input voltage to the ZSPM15xx Evaluation Board.
4. Measure the dynamic performance with an oscilloscope using either the on-board transient loads (see section 4.3) or an external electronic load.

4.3. On Board Transient Loads

The ZSPM15xx Evaluation Board has on-board transient loads that can be used to test the dynamic performance of the ZSPM15xx controller. The transient loads consist of a simple timer circuit driving a power MOSFET. The power MOSFET is connected in series with resistors connected across the output of the ZSPM9060. A schematic of the transient load circuitry is provided in Appendix B.

There are two transient loads that can be enabled via headers J1 and J2 respectively (see Figure 4.2). The two loads can be enabled simultaneously to achieve a larger current step. The timing signal for the transient loads has an ON time of approximately 1 millisecond with a time period of approximately 80 milliseconds (see Figure 4.3).

Figure 4.2 J1 and J2 – Transient Load Selection

Figure 4.3 Timing for the On-Board Transient Loads

4.4. Setting the Over Current Protection (OCP)

The ZSPM15xx-KIT01 can be configured to support a wide range of different over-current protection (OCP) thresholds based on the user's selection for the inductor. The voltage between the ISNSP and ISNSN pins triggers the OCP protection if the threshold is exceeded. This voltage represents the over-current threshold because faults are detected by measuring the voltage across the DCR of the selected inductor. Table 4.2 lists the different configuration options for selecting the OCP voltage threshold via the total resistance connected to the CONFIG0 pin on the ZSPM15xx.

The ZSPM15xx-KIT01 has the four preset current limit settings given in Table 4.3, which correspond to the index settings shaded pink in Table 4.2. If no preset is selected, the current limit is set to index 29 (70.0mV.) The presets can be selected with positions 1 through 4 on the J5 DIP switch (see Figure 4.4). There is provision on left side of the J5 DIP switch for the footprints for jumper J8 and potentiometer RP2 or fixed resistor R17 (on the back of the board) for achieving custom OCP settings. When RP2 or R17 is used, the J8 jumper must be shorted.

Figure 4.4 Footprint for Optional Additional Resistance on the CONFIG0 Pin for Custom OCP Settings

Selecting a custom OCP resistor is a simple calculation. For example, for a design with a maximum current of 20A and an inductor with 2mΩ resistance (DCR), the OCP can be calculated with the following equation:

$$20A \times 1.25 \text{ (25\% current limit buffer)} \times 0.002\Omega = 50mV$$

Next select the resistor from Table 4.2 that correlates with an over-current threshold voltage of 50mV, which is 15.8kΩ (index 25). For more details, see the *ZSPM15xx Data Sheet*.

Note: Due to the temperature compensation feature, the ZSPM15xx over-current threshold should be based on the current sense signal at 25°C. Temperature drift is automatically compensated within the ZSPM15xx.

Recommendation: For the selection of the over-current threshold voltage, include the tolerance of the inductor's DCR and take the parasitic effects of the circuit board layout into account.

Table 4.2 ZSPM15xx – OCP Pin Strap Resistor Selection

Index	Resistor Value Using the E96 Series	OCP Voltage Selection at 25°C	Index	Resistor Value Using the E96 Series	OCP Voltage Selection at 25°C
0	0Ω	3.0mV	15	5.360kΩ	20.0mV
1	392Ω	4.0mV	16	6.040kΩ	22.5mV
2	576Ω	5.0mV	17	6.810kΩ	25.0mV
3	787Ω	6.0mV	18	7.680kΩ	27.5mV
4	1.000kΩ	7.0mV	19	8.660kΩ	30.0mV
5	1.240kΩ	8.0mV	20	9.530kΩ	32.5mV
6	1.500kΩ	9.0mV	21	10.50kΩ	35.0mV
7	1.780kΩ	10.0mV	22	11.80kΩ	37.5mV
8	2.100kΩ	11.25mV	23	13.00kΩ	40.0mV
9	2.430kΩ	12.5mV	24	14.30kΩ	45.0mV
10	2.800kΩ	13.75mV	25	15.80kΩ	50.0mV
11	3.240kΩ	15.0mV	26	17.40kΩ	55.0mV
12	3.740kΩ	16.25mV	27	19.10kΩ	60.0mV
13	4.220kΩ	17.5mV	28	21.00kΩ	65.0mV
14	4.750kΩ	18.75mV	29	23.20kΩ	70.0mV

Table 4.3 Current Limiting Setting Options

OCP Index	Pin Strap Resistor Value	Inductor Voltage Threshold for OCP	DIP Switch Setting *
9	2.430k Ω	12.5mV	1000xxxx 
10	2.800k Ω	13.75mV	0100xxxx 
11	3.240k Ω	15.0mV	0010xxxx 
12	3.740k Ω	16.25mV	0001xxxx 
29	23.20k Ω	70mV	0000xxxx 
* The last four positions of the DIP switch (indicated with x) are for selecting the capacitor compensation, for which the settings are given in section 4.2. For this step, this last set of switches can be considered “do not care,” except that no more than one switch in this group can be set to ON at a time.			

5 Variations in Preconfigured Output Voltage and Bills of Materials (BOM) by ZSPM15xx Product Number

Table 5.1 lists the full bill of materials (BOM) for the ZSPM1502 Evaluation Board, for which the schematics and board layout are given in Appendix B and Appendix A respectively.

The prefigured nominal voltage output for each ZSPM15xx product number is given in Table 5.2, which also lists the differences in BOMs compared to Table 5.1 according to the product number for the different ZSPM15xx Evaluation Boards.

ZSPM1513-KIT01	ZSPM1513ZA1W0	1.20	680nH (7443310068)	1μF	1k	1k	DNP	6.3	0R1	DNP	0R2	DNP	*	*

1) For all kits, the C67 and C54 capacitors are rated for 10V.

2) For rows marked DNP for R27 and/or R29, the component is not placed; however, the footprint is available for adding custom load values.

3) Transient load current for rows marked with an asterisk (*) can be calculated by dividing the output voltage by the total load resistance.

6 Support

IDT provides additional support for the ZSPM15xx-KIT01. If further support is needed, contact IDT at www.IDT.com/go/support.

8 Definitions of Acronyms

Term	Description
PWM	Pulse Width Modulation
SMB	Sub-miniature Version B

9 Document Revision History

Revision	Date	Description
1.00	December 2, 2014	First release.
1.10	March 9, 2015	Edits to add ZSPM1507, ZSPM1508, and ZSPM1509. Updates for contact information.
1.20	April 27, 2015	Edits to add ZSPM1511, ZSPM1512, and ZSPM1513. Corrections for resistor value for Table 4.3. Minor edits for clarity.
	April 11, 2016	Changed to IDT branding.
