

CMOS Static RAM 1 Meg (128K x 8-Bit) **Revolutionary Pinout**

Features

- 128K x 8 advanced high-speed CMOS static RAM
- JEDEC revolutionary pinout (center power/GND) for reduced noise.
- Equal access and cycle times
 - Commercial: 12/15/20ns
 - Industrial: 15/20ns
- One Chip Select plus one Output Enable pin
- Bidirectional inputs and outputs directly TTL-compatible
- Low power consumption via chip deselect
- Available in a 32-pin 400 mil Plastic SOJ.

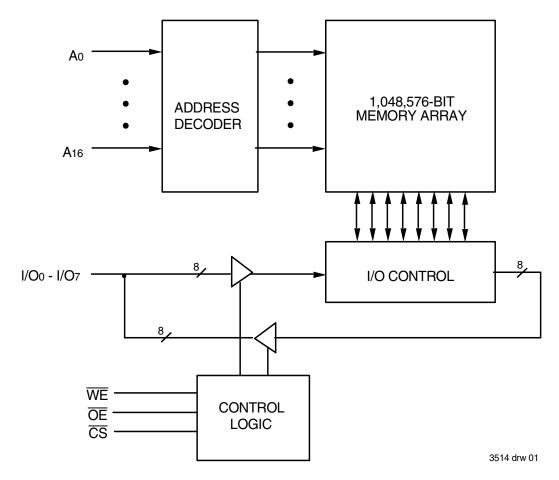

Description

The IDT71124 is a 1,048,576-bit high-speed static RAM organized as 128K x 8. It is fabricated using high-performance, high-reliability CMOS technology. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost-effective solution for high-speed memory needs. The JEDEC centerpower/GND pinout reduces noise generation and improves system performance.

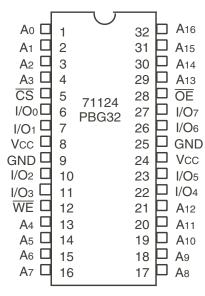

The IDT71124 has an output enable pin which operates as fast as 6ns, with address access times as fast as 12ns available. All bidirectional inputs and outputs of the IDT71124 are TTL-compatible and operation is from a single 5V supply. Fully static asynchronous circuitry is used; no clocks or refreshes are required for operation.

The IDT71124 is packaged in a 32-pin 400 mil Plastic SOJ.

NOTES:

- 1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the $operation alsections of this specification is not implied. Exposure to absolute \, maximum$ rating conditions for extended periods may affect reliability.
- 2. VTERM must not exceed Vcc + 0.5V.

NOTES:

- This parameter guaranteed with the AC load (Figure 2) by device characterization, but is not production tested.
 There is no industrial temperature offering for the 12ns speed grade.

Timing Waveform of Read Cycle No. 1⁽¹⁾

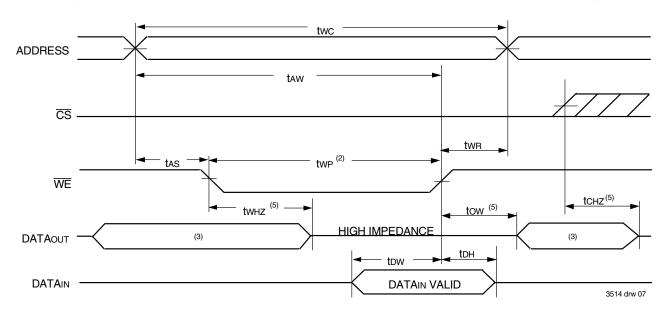

Timing Waveform of Read Cycle No. 2^(1,2,4)

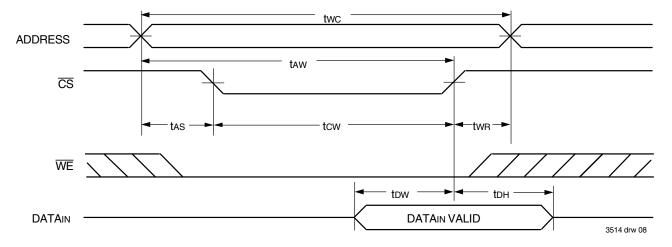

NOTES:

- 1. WE is HIGH for Read Cycle.
- 2. Device is continuously selected, \overline{CS} is LOW.
- 3. Address must be valid prior to or coincident with the later of $\overline{\text{CS}}$ transition LOW; otherwise tax is the limiting parameter.
- 4 OF ISLOW
- 5. Transition is measured ±200mV from steady state.

Timing Waveform of Write Cycle No. 1 (WE Controlled Timing)(1,2,4)

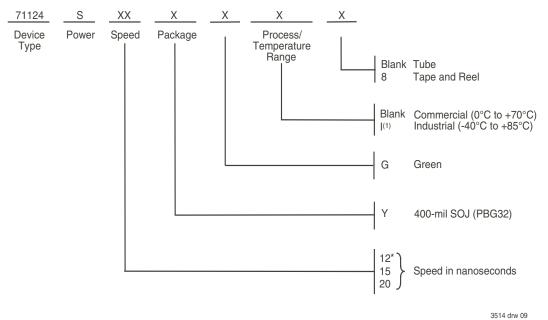

Timing Waveform of Write Cycle No. 2 (CS Controlled Timing)(1,4)

NOTES:

- 1. A write occurs during the overlap of a LOW $\overline{\text{CS}}$ and a LOW $\overline{\text{WE}}$.
- 2. \overline{OE} is continuously \overline{HIGH} . During a \overline{WE} controlled write cycle with \overline{OE} LOW, twp must be greater than or equal to twHz + tow to allow the I/O drivers to turn off and data to be placed on the bus for the required tow. If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the minimum write pulse is the specified twp.
- $3. \quad \text{During \underline{t} his period, I/O pins are in the output state, and input sign\underline{als} \ \text{must not be applied}.$
- 4. If the $\overline{\text{CS}}$ LOW transition occurs simultaneously with or after the $\overline{\text{WE}}$ LOW transition, the outputs remain in a high impedance state. $\overline{\text{CS}}$ must be active during the tcw write period.
- 5. Transition is measured ±200mV from steady state.
