

DESCRIPTION

This document describes the specification for the F1953 Digital Step Attenuator. The F1953 is part of a family of *Glitch-Free™* DSAs optimized for the demanding requirements of communications Infrastructure. These devices are offered in a compact 4 x 4 mm QFN package with 50Ω impedances for ease of integration.

COMPETITIVE ADVANTAGE

Digital step attenuators are used in Receivers and Transmitters to provide gain control. The F1953 is a 6-bit step attenuator optimized for these demanding applications. The silicon design has very low insertion loss and low distortion (> +60dBm IP3i.) The device has pinpoint accuracy and settles to final attenuation value within 400ns. Most importantly, the F1953 includes Renesas' *Glitch-Free™* technology which results in less than 0.5dB of overshoot ringing during MSB transitions. This is in stark contrast to competing DSAs that *glitch* as much as 10dB.

- ✓ Lowest insertion loss for best SNR
- ✓ Glitch-Free™ when transitioning – won't damage PA or ADC
- ✓ Extremely accurate with low distortion

APPLICATIONS

- Base Station 2G, 3G, 4G, TDD radio-cards
- Repeaters and E911 systems
- Digital Pre-Distortion
- Point to Point Infrastructure
- Public Safety Infrastructure
- WIMAX Receivers and Transmitters
- Military Systems, JTRS radios
- RFID handheld and portable readers
- Cable Infrastructure

PART# MATRIX

| Part# | Freq range | Resolution / Range | Control | IL | Pinout |
|--------------|-------------------|--------------------|------------------------------|-------------|----------------------------------|
| F1950 | 150 - 4000 | 0.25 / 31.75 | Parallel & Serial | -1.3 | PE43702 PE43701 |
| F1951 | 100 - 4000 | 0.50 / 31.5 | Serial Only | -1.2 | HMC305 |
| F1952 | 100 - 4000 | 0.50 / 15.5 | Serial Only | -0.9 | HMC305 |
| F1953 | 400 - 4000 | 0.50 / 31.5 | Parallel & Serial | -1.3 | PE4302 DAT-31R5 |

FEATURES

- *Glitch-Free™*, < 0.6dB transient overshoot
- Spurious Free Design
- 2.7 to 3.6 V supply
- Attenuation Error < 0.5dB at 2GHz
- Low Insertion Loss < 1.4dB at 2GHz
- Excellent Linearity >+60dBm IP3i
- Fast settling time, < 400ns
- Serial or Parallel Interface 31.5dB Range
- Stable Integral Non-Linearity over temperature
- Low Power Consumption < 200μA
- Integrated DC blocking capacitors
- Drop-In replacement
- 4 x 4 mm thin 20-VFQFPN package

DEVICE BLOCK DIAGRAM

ORDERING INFORMATION

ABSOLUTE MAXIMUM RATINGS

| | |
|---|---|
| V_{DD} to GND | -0.3V to +4.0V |
| D[5:0], DATA, CLK, LE, V_{MODE} | -0.3V to 3.6V |
| RF Input Power (RF1, RF2) calibration and testing | +29dBm |
| RF Input Power (RF1, RF2) continuous RF operation | +23dBm |
| θ_{JA} (Junction – Ambient) | +50°C/W |
| θ_{JC} (Junction – Case) The Case is defined as the exposed paddle | +3°C/W |
| Operating Temperature Range (Case Temperature) | $T_C = -40^{\circ}\text{C}$ to $+100^{\circ}\text{C}$ |
| Maximum Junction Temperature | 140 °C |
| Storage Temperature Range | -65°C to +150°C |
| Lead Temperature (soldering, 10s) | +260°C |

Stresses above those listed above may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD Caution

This product features proprietary protection circuitry. However, it may be damaged if subjected to high energy ESD. Please use proper ESD precautions when handling to avoid damage or loss of performance.

F1953 RECOMMENDED OPERATING CONDITIONS

| Parameter | Comment | Sym | Min | Typ | Max | Units |
|-------------------|------------------------|-----------|-----|-----|------|----------|
| Supply Voltage | Main Supply | V_{DD} | 2.7 | 3.0 | 3.6 | V |
| Temperature Range | Operating Range (Case) | T_C | -40 | | +100 | °C |
| Frequency Range | Operating Range | F_{RF} | 400 | | 4000 | MHz |
| RF1 Impedance | Single-Ended | Z_{RF1} | | 50 | | Ω |
| RF2 Impedance | Single-Ended | Z_{RF2} | | 50 | | Ω |

F1953 SPECIFICATION (31.5 dB Range)

Specifications apply at $V_{DD} = +3.0\text{ V}$, $f_{RF} = 2000\text{ MHz}$, $T_C = +25^\circ\text{C}$, $V_{MODE} > V_{IH}$ (Serial Mode) EVkit losses are de-embedded.

| Parameter | Comment | Sym | Min | Typ | Max | Units |
|--|--|------------------|---------------------|------|---------------------|---------------|
| Logic Input High | CLK, DATA, LE, V_{MODE} , D[5:0] | V_{IH} | $0.7 \times V_{DD}$ | | V_{DD} | V |

| LE pulse | LE minimum pulse width | D | 30 | | | ns |

SPECIFICATION NOTES:

- Items in min/max columns in **bold italics** are confirmed by Test.
- All other Items in min/max columns are confirmed by Design Characterization.

SERIAL CONTROL

Serial mode is selected when V_{MODE} is pulled high ($> V_{IH}$). In serial mode the F1953 attenuation setting is programmed via the 3 wire bus (LE, CLK, DATA). In serial mode data is clocked in MSB first. Note the timing diagram below.

Note – The F1953 includes a CLK inhibit feature designed to minimize sensitivity to CLK bus noise when the device is not being programmed. When Latch enable is high ($> V_{IH}$), the CLK input is disabled and DATA will not be clocked into the shift register. It is recommended that LE be pulled high ($> V_{IH}$) when the device is not being programmed.

SERIAL REGISTER DEFAULT CONDITION

If the device is powered up in Serial Mode, the device will default to whatever attenuation state is defined by the six parallel data input pins D5,D4,D3,D2,D1,D0 thus allowing *any attenuation setting* to be specified as the power up state.

SERIAL REGISTER TIMING DIAGRAM: (Note the Timing Spec Intervals in Blue)

SERIAL REGISTER TIMING TABLE

| Interval Symbol | Description | Min Spec | Max Spec | Units |
|-----------------|--|----------|----------|-------|
| A | From rising edge of V _{mode} to rising edge of CLK for D5 | 20 | | ns |
| B | Clock high pulse width | 10 | | ns |
| C | From rising edge of CLK pulse for D0 to LE rising edge | 10 | | ns |
| D | LE minimum pulse width | 30 | | ns |
| E | Serial data set-up time before clock rising edge | 10 | | ns |
| F | Serial data hold time after clock rising edge | 10 | | ns |

PARALLEL CONTROL MODE

The user has the option of running in one of two parallel modes: *Direct Parallel Mode* or *Latched Parallel Mode*.

DIRECT-PARALLEL MODE:

Direct-parallel mode is selected when V_{MODE} (pin 13) is $< V_{IL}$ and LE (pin 5) is $> V_{IH}$. In this mode the device will immediately react to any voltage changes to the parallel control pins [pins 1, 15, 16, 17, 19, 20]. Use direct-parallel mode for the fastest settling time.

LATCHED-PARALLEL MODE:

Latched-parallel mode is selected when V_{MODE} (pin 13) is $< V_{IL}$ and LE (pin 5) is toggled from $< V_{IL}$ to $> V_{IH}$.

To utilize latched-parallel mode:

- Set LE $< V_{IL}$
- Adjust pins [1, 15, 16, 17, 19, 20] to the desired attenuation setting. (Note the device will not react to these pins while LE $< V_{IL}$.)
- Pull LE $> V_{IH}$. The device will then transition to the attenuation settings reflected by these pins.

When the device is powered up In Latched Parallel Mode [$V_{MODE} < V_{IL}$ and LE $> V_{IH}$] the attenuation setting defaults to the state defined by the six parallel data pins [pins 1, 15, 16, 17, 19, 20]

LATCHED PARALLEL MODE TIMING DIAGRAM: (Note the Timing Spec Intervals in Blue)

LATCHED PARALLEL MODE TIMING TABLE:

| Interval Symbol | Description | Min Spec | Max Spec | Units |
|-----------------|------------------------------------|----------|----------|-------|
| A | Serial to Parallel Mode Setup Time | 100 | | ns |
| B | Parallel Data Hold Time | 10 | | ns |
| C | LE minimum pulse width | 10 | | ns |
| D | Parallel Data Setup Time | 10 | | ns |

Transient [15.5 to 16.0 (MSB+) 3.3V F1953]

The graphs **ABOVE** show the transient overshoot and settling time performance for both the MSB+ and MSB- cases for the F1953. The device settles very quickly (~ 400) ns with benign (~ 0.5) dB overshoot.

Transient [16.0 to 15.5 (MSB-) 5.0V F1953]

The graphs **BELOW** show the transient overshoot and settling time performance for a popular competing DSA. *Note the overshoot/undershoot excursion of almost 10 dB and the very long settling time.* For the MSB- case, the settling time is off the scale, $\sim 3 \mu\text{sec}$.

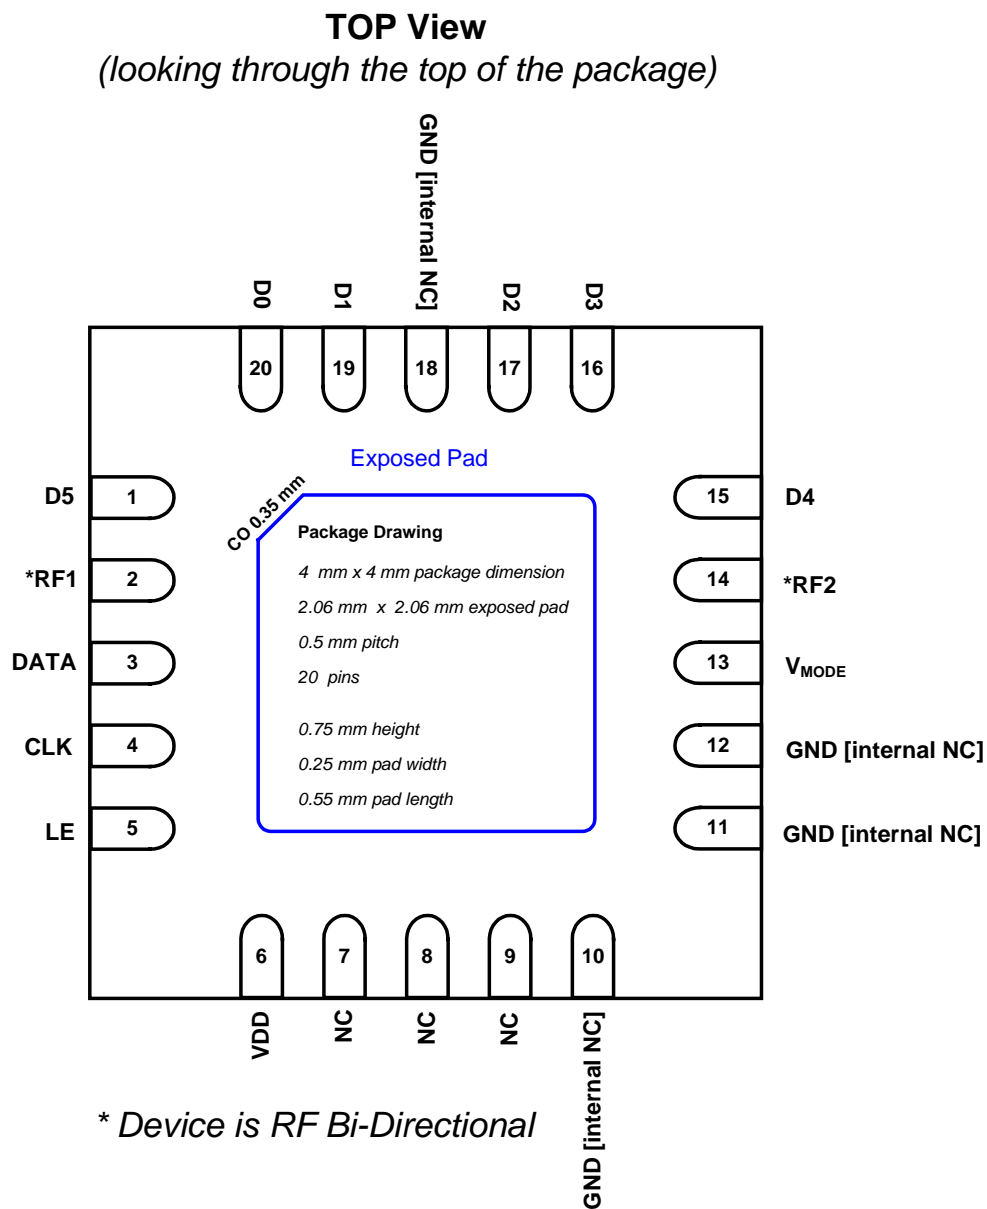

Transient [15.75 to 16.00 (MSB+) Standard DSA]

Transient [16.00 to 15.75 (MSB-) Standard DSA]

PACKAGE OUTLINE DRAWINGS

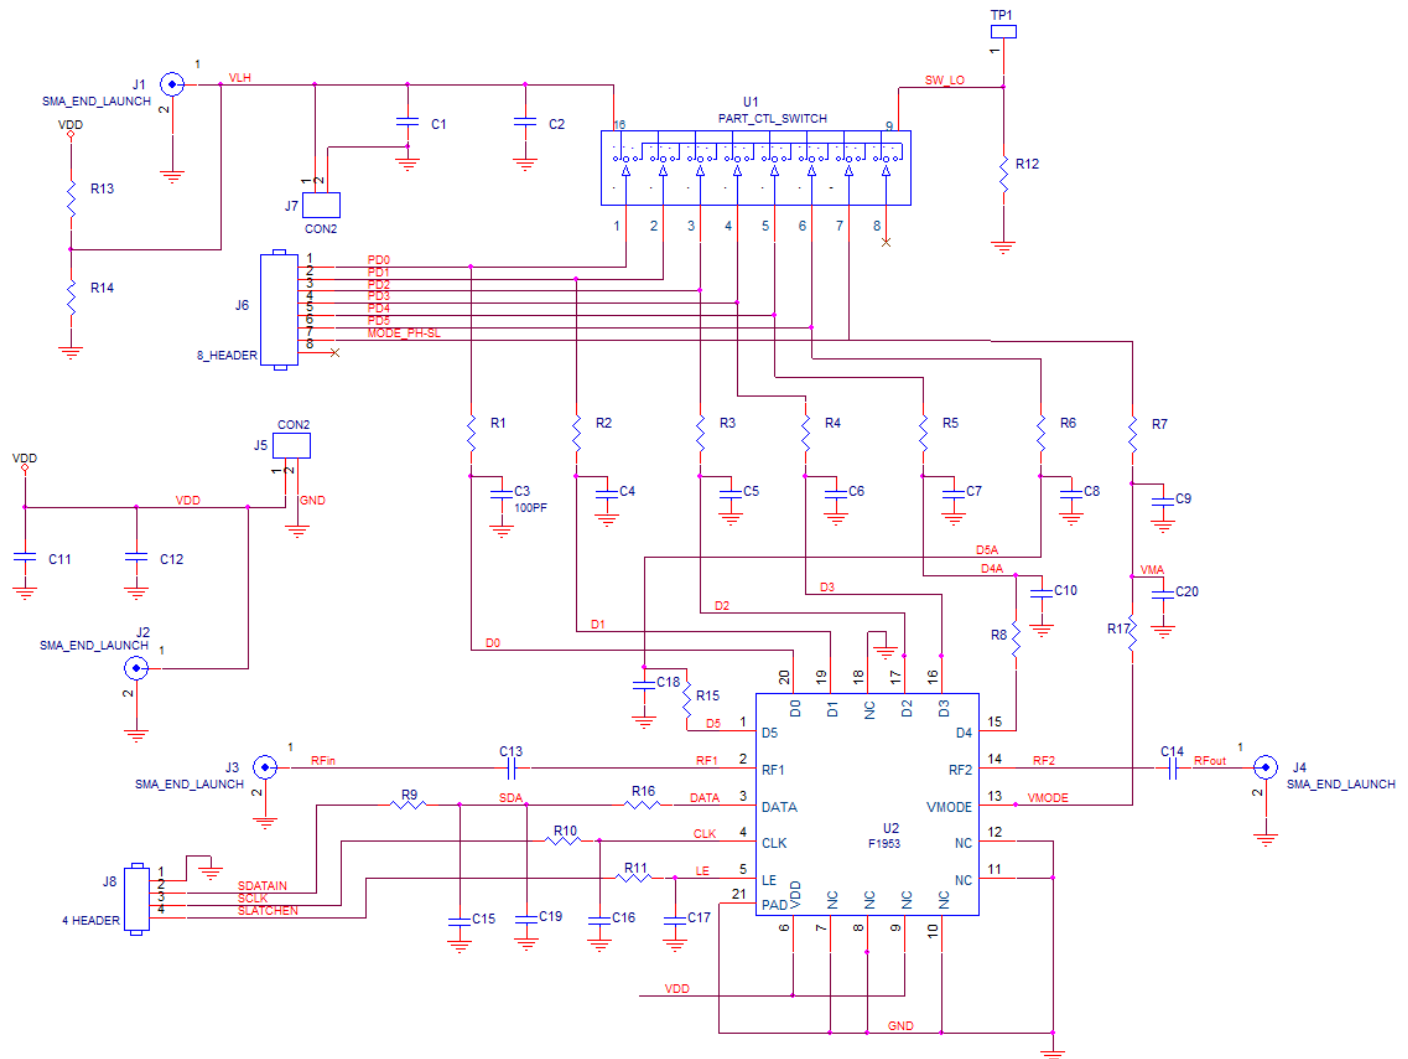

The package outline drawings for the [20-VFQFPN](#) are located at the end of this document and are accessible from the Renesas website. The package information is the most current data available and is subject to change without revision of this document.

PIN DESCRIPTIONS

| Pin # | Pin Name | Pin Function |
|-------|----------------|--|
| 1 | D5 | 16dB Attenuation Control Bit. Pull high for 16dB ATTN. |
| 2 | RF1 | Device RF input or output (bi-directional). Internally DC blocked. |
| 3 | DATA | Serial interface Data Input. |
| 4 | CLK | Serial interface Clock Input. |
| 5 | LE | Serial interface Latch Enable Input. Internal pull-up (100K ohm). |
| 6 | VDD | Power supply pin. |
| 7 | NC | No internal connection. These pins can be left unconnected, voltage applied, or connected to ground (recommended). |
| 8 | NC | No internal connection. These pins can be left unconnected, voltage applied, or connected to ground (recommended). |
| 9 | NC | No internal connection. These pins can be left unconnected, voltage applied, or connected to ground (recommended). |
| 10 | NC | No internal connection. These pins can be left unconnected, voltage applied, or connected to ground (recommended). |
| 11 | NC | No internal connection. These pins can be left unconnected, voltage applied, or connected to ground (recommended). |
| 12 | NC | No internal connection. These pins can be left unconnected, voltage applied, or connected to ground (recommended). |
| 13 | VMODE | Pull high for serial mode. Ground for Parallel control mode. |
| 14 | RF2 | Device RF input or output (bi-directional). Internally DC blocked. |
| 15 | D4 | 8dB Attenuation Control Bit. Pull high for 8dB ATTN. |
| 16 | D3 | 4dB Attenuation Control Bit. Pull high for 4dB ATTN. |
| 17 | D2 | 2dB Attenuation Control Bit. Pull high for 2dB ATTN. |
| 18 | NC | No internal connection. These pins can be left unconnected, voltage applied, or connected to ground (recommended). |
| 19 | D1 | 1dB Attenuation Control Bit. Pull high for 1dB ATTN. |
| 20 | D0 | 0.5dB Attenuation Control Bit. Pull high for 0.5dB ATTN. |
| EP | Exposed Paddle | Connect to Ground with multiple vias for good thermal relief. |

EVKit THROUGH-REFLECT-LINE (TRL) CALIBRATION

The “Through-Reflect-Line” (TRL) method [1] is used to de-embed the evaluation board losses from the S-parameter measurements of the F1953. This method requires the use of three standards: a through, a reflection, and a line. The TRL method has the advantage over other calibration methods in that it requires only one of these three standards to be well defined.

The TRL through which is used for the F1953 TRL calibration was constructed identically to the evaluation board, minus the DUT and its corresponding length. Therefore, the through corresponds to a precise zero length connection between the input and output reference planes of the DUT. This through satisfies the requirement of the TRL method that one of the three standards be precisely specified.

The TRL reflection standard used is constructed identically to the input and output lines of the evaluation board, with a short placed at the reference plane of the DUT. In accordance with the TRL method's requirements, the actual magnitude and phase were not accurately specified, but the phase was known to within 90 degrees and the TRL reflection standard has a magnitude close to one.

The TRL line standard is identical to the TRL through, but with an additional length of 0.8 inches (2cm). This satisfies the TRL method's requirement that the TRL be a different length than the TRL through, that it have the same impedance and propagation constant as the through, and that the phase difference between the through and the line be between 20 degrees and 160 degrees. The difference in length yields a phase difference of approximately 20 degrees at 500MHz, and a phase difference of 160 degrees at 4GHz.

Standards used for F195x TRL calibration
