

FT Router 5000 Key Features

- 3.3V operation
- Higher-performance Neuron®
 Core; internal system clock
 scales up to 40 MHz; Larger
 buffer size to allow for extended NVs and improved throughput
- Serial interface for inexpensiveexternal non-volatile EEPROM and flash memories
- Compliant with TP/FT-10 Channels
- Low-cost surface mount FT-X3 Communications Transformer
- Compact 7mm x 7mm 48-pin QFN package
- Logical Isolation between two half routers improves system reliability by isolating failures between channels
- -40°C to +85°C operating temperature range

Proven, Safe Choice

The FT Router 5000 IC is an Echelon semiconductor product that is used to build half routers and full routers. The FT Router 5000 IC is based on the Echelon FT 5000 Smart Transceiver and can be used to build a FT-10 channel halfrouter with LONWORKS® communication channel to route LonTalk® messages. An Echelon router can support installation of networks with up to thousands of nodes.

The FT Router 5000 IC includes the Router firmware required to implement a half router. Its compact form factor minimizes the space required to develop a half router. Customers can develop two half routers to build a full router. Customers will need to use the FT-X3 communications transformer to connect to the network. The Router parameters are stored in an external EEPROM with a minimum size of 2 KB. For a full router design, customers can use the same crystal and the same power supply to implement the clock needed for the two half routers. This offers the flexibility for customers to incorporate the FT Router 5000 IC into their design for a higher level of integration.

The FT Router 5000 IC can use one of four routing algorithms: configured router, learning router, bridge or repeater. The ability to choose these options allows the customer to trade off system performance for ease of installation.

Configured and learning routers fall into a class of routers known as intelligent routers, which use routing tables to selectively forward messages based on the destination address.

A router configured as a bridge forwards all valid packets that match its domains, whereas a router functioning as a repeater forwards all valid packets. Configured routers are easily installed using an installation tool such as the OpenLNS Commissioning Tool and OpenLNS network operating system that calculates network topology and layer 4 timing parameters.

Usage

A FT Router 5000 based FT-10 channel half router consists of the FT Router 5000 chip. the FT-X3 communications transformer, a crystal to generate the clock and an external memory to hold the router table. Two such half routers are used to build a full router. A half router design that uses FT Router 5000 can be used with another half router to function as a repeater or interface with other twisted pair physical media such as RS-485, TP-78, TP-1250 or LPT-11. It can also be used to implement a FT-PL router using the PL 3150 Smart Transceiver. The two half routers of a full router are logically isolated so that a failure in one half router will not affect the other side's network.

Figure 1: Block Diagram of the LONWORKS Router based on the FT Router 5000

A FT Router 5000 IC based LONWORKS half router consists of the FT Router 5000 IC, the FT-X3 communications transformer, a crystal to generate the clock and an external serial memory to hold the router table. Two such half routers are used to build a full router. A half router design that uses FT Router 5000 can be used with a half router that uses the Router 5000 and an external transceiver such as RS-485, TP-1250, TP-78, FTT-10A or LPT-11 to implement a LONWORKS full router. The FT Router 5000 IC can also be used to implement the FT section of a FTPL router along with the PL 3150 Smart Transceiver to implement the PL section. Additionally, the FT Router 5000 IC offers higher reliability since two half routers of a full router are logically isolated and a failure in one half router will not affect the other side's network.

LONWORKS application programs do not have to be modified to work with routers. Only the network configuration of a device has to be modified when a device is moved to the far side of a router. The required modifications to the network configuration can be done automatically by an installation tool.

Routers are also independent of the network variables and message tags in a system, and can forward an unlimited number of them, which saves development cost because no code development is required to use routers in a system. It also saves installation and maintenance costs because router configuration is automatically managed by network server tools based on OpenLNS. Monitoring and control applications, such as those based on the LCA Object Server OCX, do not require modifications to work with multi-channel networks when routers are used. All network configuration is performed over the installed network, further minimizing installation and maintenance costs because routers do not have to be physically accessed to change their configuration.

Figure 2: FT Router 5000 Chip Pinout

Table 1: FT Router 5000 Chip Pin Assignments

Below is a table of the pin assignments for the FT Router 5000 chip. All digital inputs are low-voltage transistor-transistor logic (LVTTL) compatible, 5 V tolerant, with low leakage. All digital inputs are low-voltage transistortransistor logic (LVTTL) compatible, low leakage, 5V-tolerant. All digital outputs are slew-rate limited to reduce Electromagnetic Interference (EMI).

Name	Pin Number	Туре	Description		
SVC~	1	Digital I/O	Service (active low)		
100	2	Digital I/O	IO0 (side A to side B)		
IO1	3	Digital I/O	IO1 (side A to side B)		
IO2	4	Digital I/O	IO2 (side A to side B)		
IO3	5	Digital I/O	IO3 (side A to side B)		
VDD1V8	6	Power	1.8 V Power Input (from internal voltage regulator)		
104	7	Digital I/O	IO4 (side A to side B)		
VDD3V3	8	Power	3.3 V Power		
105	9	Digital I/O	IO5 (side A to side B)		
106	10	Digital I/O	IO6 (side A to side B)		
107	11	Digital I/O	IO7 (side A to side B)		
108	12	Digital I/O	IO8 (side A to side B)		
109	13	Digital I/O	IO9 (side A to side B)		
IO10	14	Digital I/O	IO10 (side A to side B)		
IO11	15	Digital I/O	IO11 (not used for routers)		
VDD1V8	16	Power	1.8 V Power Input (from internal voltage regulator)		
TRST~	17	Digital Input	JTAG Test Reset (active low)		
VDD3V3	18	Power	3.3 V Power		
TCK	19	Digital Input	JTAG Test Clock		
TMS	20	Digital Input	JTAG Test Mode Select		
TDI	21	Digital Input	JTAG Test Data In		
TDO	22	Digital Output	JTAG Test Data Out		
XIN	23	Oscillator In	Crystal oscillator input		
XOUT	24	Oscillator Out	Crystal oscillator output		
VDDPLL	25	Power	1.8 V Power Input (from internal voltage regulator)		
GNDPLL	26	Power	Ground		
VOUT1V8	27	Power	1.8 V Power Output (of internal voltage regulator)		
RST~	28	Digital I/O	Reset (active low)		

VIN3V3	-00	1.	Loove		
*******	29	Power	3.3 V Power Input

CP4	39	Comm	Connect to VDD33 through a 4.99 kΩ pullup resistor		
CS0~	40	Digital I/O for Memory	SPI slave select 0 (active low)		
VDD3V3	41	Power	3.3 V Power		
VDD3V3	42	Power	3.3 V Power		
SDA_CS1~	43	Digital I/O for	I ² C: serial data		
		Memory	SPI: slave select 1 (active low)		
VDD1V8	44	Power	1.8 V Power Input (from internal voltage regulator)		
SCL	45	Digital I/O for Memory	I ² C serial clock		
MISO	46	Digital I/O for Memory	SPI master input, slave output (MISO)		
SCK	47	Digital I/O for Memory	SPI serial clock		
MOSI	48	Digital I/O for Memory	SPI master output, slave input (MOSI)		
PAD	49	Ground Pad	Ground		

Param- eter ¹	Description	Minimum	Typical	Maximum
V _{DD3}	Supply voltage	3.00 V	3.3 V	3.60 V
V _{LVI}	Low-voltage indicator trip point			2.96 V
T _A	Ambient temperature	-40° C		+85° C
f _{XIN}	XIN clock frequency ²	-	10,0000 MHz	-
	Current consumption in receive mode ³			
I _{DD3-RX}	5MHz		9 mA	15 mA
	10MHz		9 mA	15 mA
	20MHz		15 mA	23 mA
	40MHz		23 mA	33 mA
	80MHz		38 mA	52 mA
I _{DD3-TX}	Current consumption in transmit mode ^{3,4}		I _{DD3-RX} + 15 mA	I _{DD3-RX} + 18mA

Table 2: Electrical Characteristics FT Router 5000 Operating Conditions

Notes

- All parameters assume nominal supply voltage (V_{DD3} = 3.3 V ± 0.3 V) and operating temperature (T_x between -40°C and +85°C), unless otherwise noted.
- See Clock Requirements in the Series 5000 Chip
 Data Book for more detailed information about
 the XIN clock frequency.
- Assumes no load on digital I/O pins, and that the I/O lines are not switching.
- Current consumption in Transmit mode represents a peak value rather than a continuous usage value because a Series 5000 device does not typically transmit data continuously.

Notes

- 1. All dimensions are in millimeters.
- 2. Dimensions and tolerances conform to ASME Y14.5M.-1994.
- 3. Package warpage max. 0.08 mm.
- 4. Package corners unless otherwise specified are R0.175±0.025 mm.

FT-X3 Communications Transformer Pin Descriptions

Figure 4: FT-X3 Communications Transformer Pinout Diagram

Figure 4: FT-X3 Communications Transformer Electrical Connection Schematic (winding connections are made on the PCB)

Recommended FT-X3 Communications Transformer Pad Layout

The FT-X3 Communications Transformer is rotationally symmetric. Hence, the transformer package does not have a marking for Pin 1.

Figure 5: FT-X3 Transformer SMT Layout Pad Pattern

Recommendation: Add vias to the ends of each pin pad connection (just outside of the SMT pad rectangles) to provide additional mechanical support for the transformer.

FT-X3 Communications Transformer Mechanical Specification

FT-X3 Packing Specifications

Figure 8 shows the placement of each device on the carrier tape.

Figure 8: FT-X3 Device Placement on the Carrier Tape

Specifications

Data Communications Type

Differential Manchester encoding

Network Polarity

Polarity insensitive

Isolation between Network and FT 5000 Router IC

0-60Hz, 60 seconds: 1,000Vrms; 0-60Hz, continuous: 277Vrms1

FMI

Designed to comply with FCC Part 15 Level B and EN55022 Level B

ESD

Designed to comply with EN 61000-4-2, Level 4

Radiated Electromagnetic Susceptibility

Designed to comply with EN 61000-4-3, Level 3

Fast Transient/Burst Immunity

Designed to comply with EN 61000-4-4, Level 4

Surge Immunity

Designed to comply with EN 61000-4-5, Level 3

Conducted RF Immunity

Designed to comply with EN 61000-4-6, Level 3

Transmission Speed

78 kilobits per second

Network Wiring

24 to 16AWG twisted pair; see Series 5000 Chip Data Book or Junction Box and Wiring Guidelines engineering bulletin for qualified cable types

Network Length in Free Topology

500m (1,640 feet) maximum total wire with no repeaters.500m (1,640 feet) maximum device-to-device distance.

Network Length in Doubly-terminated Bus Topology

22700m (8,850 feet) with no repeaters

Maximum Stub Length in Doubly-terminated Bus Topology 3m (9.8 feet)

Network Termination

One terminator in free topology; two terminators in bus topology (more details in Series 5000 Chip Data Book).

Power-down Network Protection

High impedance when unpowered.

Operating Temperature

-40 to 85 °C

Operating Humidity

25-90% RH @50 °C, non-condensing

Non-operating Humidity

95% RH @ 50 °C, non-condensing

Vibration

1.5g peak-to-peak, 8Hz-2kHz

Mechanical Shock

100g (peak)

(FT-X3 Communications Transformer)

Reflow Soldering Temperature Profile

Refer to Joint Industry Standard document IPC/JEDEC J-STD-020D.1 (March 2008).

Peak Reflow Soldering Temperature

260°C (FT 5000 Router)

245°C (FT-X3 Communications Transformer)

Co-planarity

0.12 mm (FT-X3 Communications Transformer)

Mass

6 g (FT-X3 Communications Transformer)

Notes

- 1. Safety agency hazardous voltage barrier requirements are not supported.
- Network segment length varies, depending on wire type. See Junction Box and Wiring Guidelines engineering bulletin for detailed specifications.
