Access This register can be read or written in 8-bit units.

Address <IEBBn_base> + 0018H

Initial value 00H

The read value is reset when the IEBBnBCR.IEBBnPW bit is overwritten.

Caution When issuing a master request, be sure to set up the IEBBnCDR register before starting communication (when the IEBBnBCR.IEBBnMSRQ bit = 0).

Note The IEBBnCDR register consists of a write register and a read register. Therefore, data written to this register cannot be read as is. The data received during IEBus communication can be read.

0	0	0	0	IEBBn SLCD3	IEBBn SLCD2	IEBBn SLCD1	IEBBn SLCD0
R	R	R	R	R/W	R/W	R/W	R/W

(8) IEBBnTCD - IEBBn transmission control data register

The IEBBnTCD register is used to specify the control data transmitted using the control field.

The value of the lower 4 bits of the value written to the IEBBnTCD register is transmitted as control data by using the control field during master transmission.

Access This register can be read or written in 8-bit units.

Address <IEBBn_base> + 001CH

Initial value 00H

Cautions
1. When issuing a master request, be sure to set up the IEBBnTCD register before starting communication (when the IEBBnBCR.IEBBnMSRQ bit = 0).
2. Do not specify undefined values.
3. During broadcast transmission, specifying slave transmission control data is prohibited.

1	1	0	1	Undefined
1	1	1	0	Write command
1	1	1	1	Write data

(9) IEBBnRCD - IEBBn reception control data register

The IEBBnRCD register is used to store the control data received using the control field.

The data received by using the control field is read to the lower 4 bits of the IEBBnRCD register. Data is stored in the IEBBnRCD register upon completion of the control field parity period if the parity value is normal.

- Storage in the single mode

  When a status transmission request is received, the user performs each process (settings for the transmission data of the IEBBnSSR register or the IEBBnPAR register) according to the value of the lower 4 bits of the IEBBnRCD register read value.

- Storage in the FIFO mode

  When a status transmission request is received, the hardware automatically performs the status transmission processing (settings for the transmission data of the IEBBnSSR register or the IEBBnPAR register).

Because it is necessary to judge whether the received data is a command or data, be sure to read the value of this register upon the completion of communication.

In the FIFO mode, if reading the data received during the previous communication has finished (if the IEBBnBSR.IEBBnRFLF bit = 0 and the IEBBnBSR.IEBBnSRFP4-SRFP0 bit = 00000), upon completion of the parity period for the control data field, storage is performed if the parity value is normal. Until reading the received data finishes, the IEBBnRCD register is not updated.

Access This register is read-only, in 8-bit units.

Address <IEBBn_base> + 0020H

Initial value 00H

This register is reset when the IEBBnBCR.IEBBnPW bit is overwritten.

1	1	0	1	Undefined
1	1	1	0	Write command
1	1	1	1	Write data

(10) IEBBnDLR - IEBBn message length register

The IEBBnDLR register is used to specify the message length data transmitted using the message length field.

After writing to the IEBBnDLR register, the IEBBnTDL register is written to.

After reading the IEBBnDLR register, the IEBBnRDL register value is read.

Access This register can be read or written in 8-bit units.

Address <IEBBn_base> + 0024H

Initial value 01H

The read value is reset when the IEBBnBCR.IEBBnPW bit is overwritten.

Caution When issuing a master request, be sure to set up the IEBBnDLR register before starting communication (when the IEBBnBCR.IEBBnMSRQ bit = 0).

Note The IEBBnDLR register consists of a write register and a read register. Therefore, data written to this register cannot be read as is. The data received during IEBus communication can be read.

7	6	5	4	3	2	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

(11) IEBBnTDL - IEBBn transmission message length register

The IEBBnTDL register is used to specify the message length data transmitted using the message length field.

The value written to the IEBBnTDL register is transmitted as message length data by using the message length field if the unit is the transmission unit (master transmission, slave transmission).

However, when a status transmission request is received, 0H is transmitted as the message length data regardless of the IEBBnTDL register setting.

Access This register can be read or written in 8-bit units.

Address <IEBBn_base> + 0028H

Initial value 01H

Cautions

1. Be sure to set up the IEBBnTDL register before starting communication (when the IEBBnBCR.IEBBnMSRQ bit = 0).
2. The maximum number of bytes that can be transferred per frame is determined according to the communication mode. For example, when transferring 48 bytes in communication mode 1, perform communication by dividing the data among multiple frames. In this case, when performing the second communication, use the IEBBnSCR register to check the number of data bytes transmitted during the first communication, subtract the number of bytes that were successfully transmitted from the number of bytes you want to transmit, and then specify the result for the IEBBnTDL register. Write the next data to the IEBBnDR register at the same time, and then issue a master request.

7	6	5	4	3	2	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.15 IEBBnTDL register contents

0	0	0	0	0	0	1	0	02H	2 bytes
...	...	...	...	...	...	...	...	...	...
0	0	0	1	0	1	0	0	20H	32 bytes
...	...	...	...	...	...	...	...	...	...
1	1	1	1	1	1	1	1	FFH	255 bytes
0	0	0	0	0	0	0	0	00H	256 bytes

(12) IEBBnRDL - IEBBn reception message length register

The IEBBnRDL register is used to specify the message length data received using the message length field.

The IEBBnRDL register read value is the data received using the message length field.

- Storage in the single mode

  Storage proceeds if the parity value is normal at the end of the parity period for the message length field.

- Storage in the FIFO mode

  If reading the data received during the previous communication has finished (IEBBnBSR.IEBBnRFLF bit = 0 and the IEBBnBSR.IEBBnSRFP4-SRFP0 bit = 00000), upon completion of the parity period for the message length field, storage is performed if the parity value is normal. Until reading the received data finishes, the IEBBnRDL register is not updated.

Access This register is read-only, in 8-bit units.

Address <IEBBn_base> + 002CH

Initial value 01H

This register is reset when the IEBBnBCR.IEBBnPW bit is overwritten.

7	6	5	4	3	2	1	0

0	0	0	0	0	0	0	0	00H	256 bytes

(13) IEBBnCKS - IEBBn clock selection register

The IEBBnCKS register is used to control the clock selection of the IEBus controller.

Access This register can be read or written in 8-bit units.

Address <IEBBn_base> + 0030H

Initial value 17H

Caution The IEBBnCKS register can only be set up when the IEBBnBCR.IEBBnPW bit = 0 and the IEBBnPSR.IEBBnCLKE bit = 0. Do not set up the register when this bit = 1. If an attempt is made to set up the register when the IEBBnPW bit = 1, the value is ignored.

1	0	0	PRSOUT/4
1	0	1	PRSOUT/5
1	1	0	PRSOUT/6
1	1	1	PRSOUT/7

Caution The conditions under which the baud rate generator is initialized are as follows:
- When the IEBBnBRS2 to IEBBnBRS0 bits are overwritten
- When the IEBBnBCR.IEBBnPW bit = 0 and the IEBBnPSR.IEBBnCLKE bit = 1

Table 22.18 Input clock specification example

P0φ	IEBBnPRS	IEBBnBRS2	IEBBnBRS1	IEBBnBRS0	Specified value
32 MHz	0	1	0	0	04H

Caution The IEBus controller is designed to operate at 8 MHz.

(14) IEBBnTMS - IEBBn transfer mode setting register

The IEBBnTMS register is used to control the IEBus controller communication operations.

Access This register can be read or written in 8-bit units.

Address <IEBBn_base> + 0034H

Initial value 01H

Caution The IEBBnTMS register can only be set up when the IEBBnBCR.IEBBnPW bit = 0. Do not set up the register when this bit = 1. If an attempt is made to set up the register when the IEBBnPW bit = 1, the value is ignored.

7	6	5	4	3	2	1	0
IEBBn FMDE	IEBBn SLRI1	IEBBn SLRI0	IEBBn SLTI1	IEBBn SLTI0	IEBBn ALC2	IEBBn ALC1	IEBBn ALC0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.19 IEBBnTMS register contents (1/2)

Bit position	Bit name	Function
7	IEBBnFMDE	Specify whether to enable or disable FIFO mode operation. 0: Disable FIFO mode operation (single mode). 1: Enable FIFO mode operation.
6, 5	IEBBnSLRI [1, 0]	Specify the IEBBTV occurrence timing during FIFO mode reception.

IEBBnSLRI1	IEBBnSLRI0	IEBBTV occurrence timing
0	0	When the reception data that has not been read from the reception FIFO buffer reaches 32 bytes
0	1	When the reception data that has not been read from the reception FIFO buffer reaches 24 bytes
1	0	When the reception data that has not been read from the reception FIFO buffer reaches 16 bytes
1	1	When the reception data that has not been read from the reception FIFO buffer reaches 8 bytes

Bit position	Bit name	Function
4, 3	IEBBnSLTI [1, 0]	Specify the IEBBTD occurrence timing during FIFO mode transmission.

IEBBnSLTI1	IEBBnSLTI0	IEBBTD occurrence timing
0	0	When the transmission FIFO buffer becomes empty
0	1	When the untransmitted data remaining in the transmission FIFO buffer reaches 2 bytes
1	0	When the untransmitted data remaining in the transmission FIFO buffer reaches 4 bytes
1	1	When the untransmitted data remaining in the transmission FIFO buffer reaches 8 bytes

Table 22.19 IEBBnTMS register contents (2/2)

Bit position	Bit name	Function
2 to 0	IEBBnALC [2-0]	Specify the arbitration loss number. This is only valid in the FIFO mode. The settings of these bits are invalid in the single mode. When arbitration is lost and the counter is set to 0H, the IEBBnBCR.IEBBnMSRQ bit is not retained. The settings of the IEBBnALC2 to IEBBnALC0 bits are always retained. The settings are not changed each time arbitration is lost. The arbitration loss counter is decremented separately from the IEBBnALC2 to IEBBnALC0 bits. Overwriting the IEBBnALC2 to IEBBnALC0 bits while the arbitration loss counter is counting does not affect the counter. (The values of the bits are specified for the arbitration loss counter when the IEBBnMSRQ bit = 1.)

IEBBnALC2	IEBBnALC1	IEBBnALC0	Maximum arbitration loss count
0	0	1	1
0	1	1	3
Other than the above			Setting prohibited

(a) FIFO operation enable bit (IEBBnFMDE): Bit 7

Differences between operation in the single mode and FIFO mode are shown below.

Table 22.20 Differences between operation in the single mode and FIFO mode

Transfer mode	Arbitration loss master request flag (IEBBnBCR.IEBBnMSRQ)	Arbitration loss error interrupt signal (IEBBTERR)	Support for slave status requests and lock address requests
Single mode	Clear	• The signal is not output. • The IEBBnESR.IEBBnABTE bit is fixed to 0.	During the slave status interrupt servicing, the value of the IEBBnSSR or IEBBnPAR register is written to the IEBBnDR register.
FIFO mode	The flag value is retained until arbitration is lost the number of times specified for the IEBBnALC2 to IEBBnALC0 bits. (The flag is cleared unless an error occurs during communication between third parties.)	• The signal is output if arbitration is lost the specified number of times. • The IEBBnESR.IEBBnABTE bit is simultaneously set (to 1).	The value of the IEBBnSSR or IEBBnPAR register is automatically sent by hardware by using the data field.

(b) FIFO mode reception IEBBTV occurrence timing specification bits (IEBBnSLRI1, IEBBnSLRI0): Bits 6, 5

In communication mode 1, the IEBBnSLRI1 and IEBBnSLRI0 bits are cleared to 00.

In communication mode 2, because data that exceeds 32 bytes is received, data must be read during reception. The occurrence timing of the data interrupt (IEBBTV) that requests that received data be read is specified by the IEBBnSLRI1 and IEBBnSLRI0 bits.

The IEBBTV interrupt occurs when received data is stored in the FIFO buffer and the number of unread bytes of data reaches the value specified for the IEBBnSLRI1 and IEBBnSLRI0 bits.

For the data no less than the number of bytes specified for the IEBBnSLRI1 and IEBBnSLRI0 bits, the data is read, and no interrupt occurs even if the number of unread bytes of received data exceeds the value specified for the IEBBnSLRI1 and IEBBnSLRI0 bits.

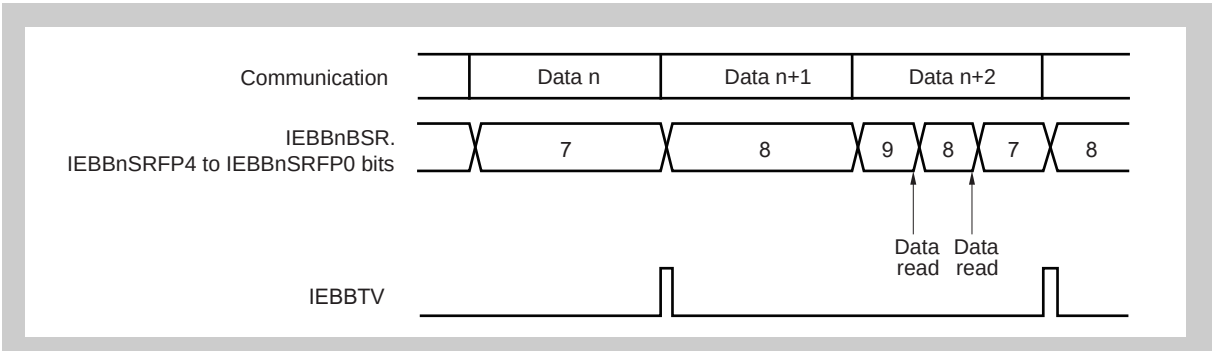

Figure 22.3 Example of operation in communication mode 2: When the IEBBnSLRI1 and IEBBnSLRI0 bits = 11

(c) FIFO mode transmission IEBBTB occurrence timing specification bits (IEBBnSLTI1, IEBBnSLTI0): Bits 4, 3

In communication mode 1, clear the IEBBnSLTI1 and IEBBnSLTI0 bits to 00.

In communication mode 2, because data that exceeds 32 bytes is transmitted, transmission data must be written during transmission. The occurrence timing of the data interrupt (IEBBTD) that requests that transmission data be written is specified by the IEBBnSLTI1 and IEBBnSLTI0 bits.

When less than 32 bytes of data are written to the FIFO buffer, IEBBTD occurs for the remaining number of bytes of data to be transmitted.

The IEBBTD interrupt occurs when transmission data is transferred from the FIFO buffer to the shift register and the number of bytes of data that have not been transmitted reaches the value specified for the IEBBnSLTI1 and IEBBnSLTI0 bits.

For data less than the number of bytes specified for the IEBBnSLTI1 and IEBBnSLTI0 bits, the data is written, and no interrupt occurs even if the number of bytes of data that have not been transmitted reaches the value specified for the IEBBnSLTI1 and IEBBnSLTI0 bits.

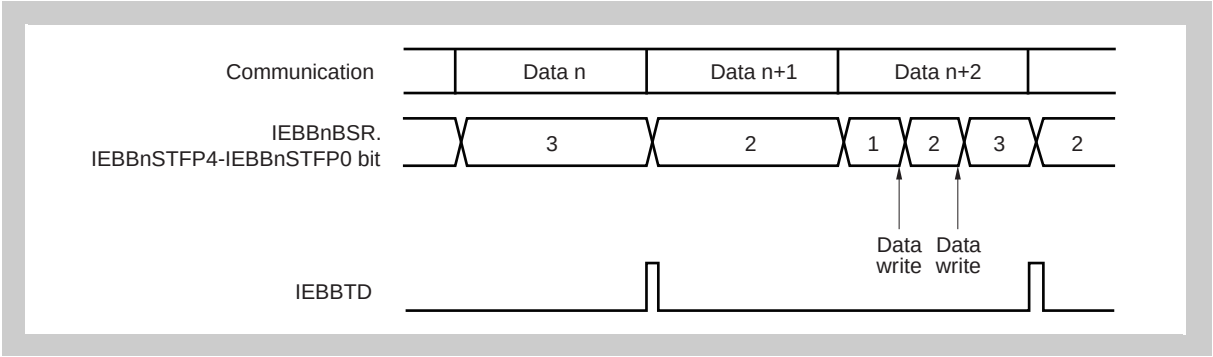

Figure 22.4 Example of operation in communication mode 2: When the IEBBnSLTI1 and IEBBnSLTI0 bits = 01

(d) Arbitration loss count specification bits (IEBBnALC2 to IEBBnALC0): Bits 2 to 0

This is only valid in the FIFO mode. The settings of these bits are invalid in the single mode.
When arbitration is lost and the counter is set to 0H, the IEBBnBCR.IEBBnMSRQ bit is not retained.

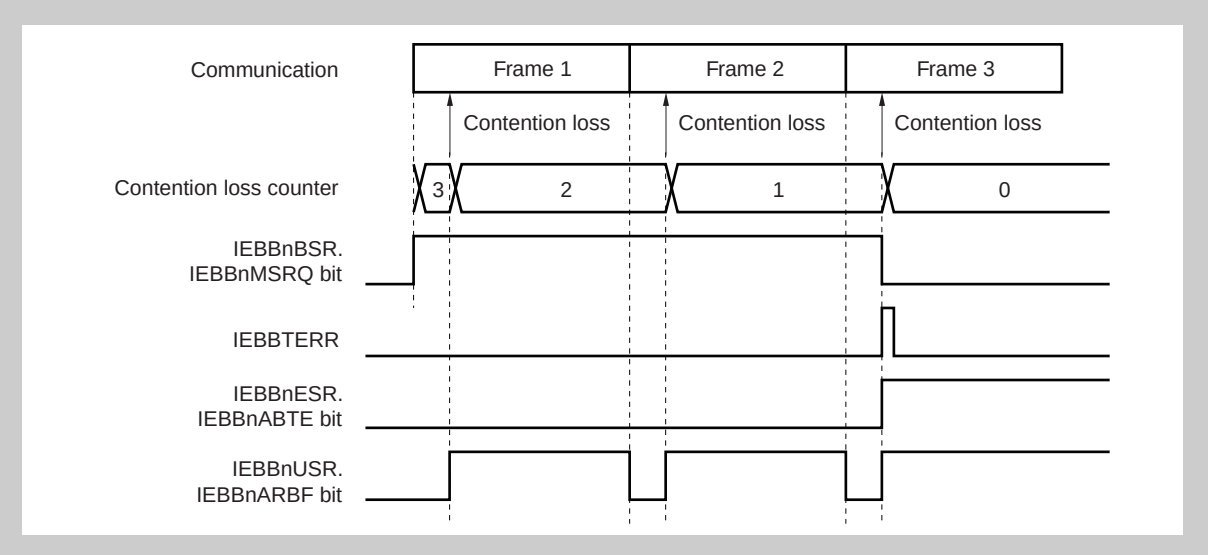

Figure 22.5 Example of operation in the FIFO mode: When the IEBBnALC2 to IEBBnALC0 bits = 011

(15) IEBBnPCR - IEBBn pointer clear register

The IEBBnPCR register is the trigger bit register for clearing the FIFO buffer pointer.

Access This register is write-only, in 8-bit units.

Address <IEBBn_base> + 0038H

Initial value 00H

7	6	5	4	3	2	1	0
IEBBn CRPT	IEBBn CTPT	0	0	0	0	0	0
W	W	R	R	R	R	R	R

Table 22.21 IEBBnPCR register contents

Bit position	Bit name	Function
7	IEBBnCRPT	Clear trigger bit for the store pointer and read pointer of the reception FIFO buffer 0: No operation 1: Clear the store pointer and read pointer of the reception FIFO buffer. The bit value can only be changed by setting the bit (to 1). Attempting to clear the bit (to 0) does not change the bit value. When the bit is read, 0 is always returned. **Caution** During reception or before reading received data, if the IEBBnCRPT bit is set to 1, the received data cannot be read. Except when discarding received data, only write 1 to the IEBBnCRPT bit after receiving and then reading data.
6	IEBBnCTPT	Clear the trigger bit for the write pointer and load pointer of the transmission FIFO buffer 0: No operation 1: Clear the write pointer and load pointer of the transmission FIFO buffer. The bit value can only be changed by setting the bit (to 1). Attempting to clear the bit (to 0) does not change the bit value. When the bit is read, 0 is always returned. **Cautions 1.** If the IEBBnCTPT bit = 1 while specifying data for the FIFO buffer or during transmission, the specified data cannot be transmitted. Except when discarding transmission data, only write 1 to the IEBBnCTPT bit after transmitting the data written to the FIFO buffer. **2.** To discard transmission data, set the IEBBnCTPT bit to 1 during transmission. Because the data is lost in this case, transmission is not performed and an underrun error occurs.

(16) IEBBnBSR - IEBBn buffer status register

The IEBBnBSR register indicates the FIFO buffer status.

Access This register is read only, in 16-bit units.

Address <IEBBn_base> + 003CH

Initial value 0000H

This register is reset when 0 is written to the IEBBnBCR.IEBBnPW bit.

15	14	13	12	11	10	9	8
IEBBn RFLF	IEBBn FOVR	0	IEBBn SRFP4	IEBBn SRFP3	IEBBn SRFP2	IEBBn SRFP1	IEBBn SRFP0
R	R	R	R	R	R	R	R
7	6	5	4	3	2	1	0
IEBBn TFLF	IEBBn FOVW	0	IEBBn STFP4	IEBBn STFP3	IEBBn STFP2	IEBBn STFP1	IEBBn STFP0
R	R	R	R	R	R	R	R

Table 22.22 IEBBnBSR register contents (1/2)

Bit position	Bit name	Function
15	IEBBnRFLF	Reception FIFO buffer full status flag 0: There are 31 bytes of data or less that have not been read in the reception FIFO buffer. 1: There are 32 bytes of data that have not been read in the reception FIFO buffer. This flag indicates that there are 32 bytes of data that have not been read in the reception FIFO buffer and that the buffer is full.
14	IEBBnFOVR	This flag indicates whether reception FIFO buffer over-reading has occurred. 0: Reception FIFO buffer over-reading has not occurred. 1: Reception FIFO buffer over-reading has occurred.
12 to 8	IEBBnSRFP [4-0]	This flag indicates the number of data bytes that have not been read remaining in the reception FIFO buffer. The (store pointer - read pointer) value can be read. However, the following values are used when IEBBnSRFP4 to IEBBnSRFP0 = 00000. • When the IEBBnRFLF bit = 0 and the IEBBnSRFP4 to IEBBnSRFP0 bits = 00000 Number of remaining data bytes that have not been read = 0 bytes • When the IEBBnRFLF bit = 1, and the IEBBnSRFP4 to IEBBnSRFP0 bits = 00000 Number of remaining data bytes that have not been read = 32 bytes
7	IEBBnTFLF	Transmission FIFO buffer full status flag 0: There are 31 bytes of data or less that have not been transferred in the transmission FIFO buffer. 1: There are 32 bytes of data that have not been transferred in the transmission FIFO buffer. This flag indicates that there are 32 bytes of data that have not been transferred in the transmission FIFO buffer and that the buffer is full.
6	IEBBnFOVW	Transmission FIFO buffer overwrite flag 0: No transmission FIFO buffer overwrite has occurred. 1: A transmission FIFO buffer overwrite has occurred.

Table 22.22 IEBBnBSR register contents (2/2)

Bit position	Bit name	Function
4 to 0	IEBBnSTFP [4-0]	This flag indicates the number of data bytes that have not been transferred remaining in the transmission FIFO buffer. The (write pointer - load pointer) value can be read. However, the following values are used when the IEBBnSTFP4 to STFPSTFP0 bits = 00000. • When the IEBBnTFLF bit = 0 and the IEBBnSTFP4 to IEBBnSTFP0 bits = 00000 Number of remaining data bytes that have not been transferred = 0 bytes • When the IEBBnTFLF bit = 1 and the IEBBnSTFP4 to IEBBnSTFP0 bits = 00000 Number of remaining data bytes that have not been transferred = 32 bytes

(a) Reception FIFO buffer over-read indicating flag (IEBBnFOVR): Bit 14

- Set/clear condition

  Set:

  – Single mode:

    The IEBBnFOVR bit is not set (to 1).

  – FIFO mode:

    When an over-read (a read of the IEBBnDR register while the store pointer = the read pointer) occurs for the reception FIFO buffer

  Clear:

  – Single mode or FIFO mode:

    By software (The flag is cleared when 1 is written to the IEBBnPCR.IEBBnCRPT bit.)

After reading the reception FIFO buffer, detect whether an over-read occurred by reading the IEBBnFOVR bit. (The data read during the over-read is the last bytes read during multiple operations.)

Even if an over-read is detected, because the data cannot be read again, perform software processing such as requesting retransmission. The IEBBnFOVR bit is cleared by writing 1 to the IEBBnPCR.IEBBnCRPT bit. (If an over-read occurred, the FIFO buffer pointers have already been cleared.)

(b) Transmission FIFO buffer overwrite flag (IEBBnFOVW): Bit 6

- Set/clear condition

  Set:

  – Single mode:

    The IEBBnFOVW bit is not set (to 1).

  – FIFO mode:

    When there are 32 bytes of that have not been transmitted in the transmission FIFO buffer and a 33rd byte of data is written

  Clear:

  – Single mode or FIFO mode:

    By software (The flag is cleared when 1 is written to the IEBBnPCR.IEBBnCTPT bit.)

After writing the required data to the transmission FIFO buffer, read the IEBBnFOVW bit before setting the master request flag. (IEBBnBCR.IEBBnMSRQ) (to 1) to detect whether an overwrite has occurred. If an overwrite is detected, clear the FIFO buffer pointers by writing 1 to the IEBBnPCR.IEBBnCTPT bit and then specify the data again.

(17) IEBBnSSR - IEBBn slave status register

The IEBBnSSR register indicates the communication status of the slave unit.

When a slave status transmission request interrupt is received form the master and the received control data is 0H or 6H, the IEBBnSSR register value is automatically written to the IEBBnDR register, and the slave status is transmitted.

In addition, when transmitting the slave status, because 01H is automatically transmitted as the message length, the IEBBnTDL register does not have to be set up.

Because bits 7 and 6 indicate the highest mode supported by the unit, they are fixed to 10 (which indicates communication mode 2).

Access This register is read-only, in 8-bit units.

Address <IEBBn_base> + 0040H

Initial value 81H

The IEBBnSSLF and IEBBnSTLF bits are reset by writing 0 to the IEBBnBCR.IEBBnPW bit.

The IEBBnSRXF and IEBBnSTXF bits are reset when the value of the IEBBnPW bit is overwritten with a different value.

7	6	5	4	3	2	1	0

R	R	R	R	R	R	R	R

Table 22.23 IEBBnSSR register contents (1/2)

Bit position	Bit name	Function
4	IEBBnSSLF	Slave transmission status flag 0: Slave transmission is stopped. 1: Slave transmission is enabled.
2	IEBBnSTLF	Lock status flag 0: Unlocked 1: Locked
1	IEBBnSRXF	IEBBnDR register or FIFO buffer reception status flag In the single mode 0: Received data has not been stored in the IEBBnDR register. 1: Received data has been stored in the IEBBnDR register. In the FIFO mode 0: Received data has not been stored in the FIFO buffer. 1: Received data has been stored in the FIFO buffer.

Table 22.23 IEBBnSSR register contents (2/2)

Bit position	Bit name	Function
0	IEBBnSTXF	IEBBnDR register or FIFO buffer transmission status flag • When communication is not being performed 1: The flag is always this value. • Master In the single mode (transmission) 0: The data specified for the IEBBnDR register has been transferred to the transmission shift register, and the next transmission data has not been written to the IEBBnDR register. 1: Transmission data remains in the IEBBnDR register. (This is the status up until the contents of the IEBBnDR register are transferred to the transmission shift register.) In the single mode (reception) 1: The flag is always this value. In the FIFO mode (transmission) 0: The number of bytes of data written to the FIFO buffer have been transferred from the FIFO buffer to the transmission shift register, and the next transfer data has not been written to the FIFO buffer. 1: This is the status from when communication starts until data is transferred to the transmission shift register and the number of bytes of data written to the FIFO buffer disappear. In the FIFO mode (reception) 1: The flag is always this value. • Slave In the single mode (transmission) 0: The data specified for the IEBBnDR register has been transferred to the transmission shift register, and the next transmission data has not been written to the IEBBnDR register. 1: This is the status from when communication starts until the first transmission data is transferred from the IEBBnDR register to the transmission shift register. This is also the status after writing data to the IEBBnDR register until the data is transferred to the transmission shift register. In the single mode (reception) 1: The flag is always this value. In the FIFO mode (transmission) 0: The number of bytes of data written to the FIFO buffer have been transferred from the FIFO buffer to the transmission shift register, and the next transfer data has not been written to the FIFO buffer. 1: This is the status from when communication starts until data is transferred to the transmission shift register and the number of bytes of data written to the FIFO buffer disappear. In the FIFO mode (reception) 1: The flag is always this value. • Third party 1: The flag is always this value.

(a) Slave transmission status flag (IEBBnSSLF): Bit 4

The value of the slave transmission enable flag (the IEBBnBCR.IEBBnSTXE bit) is applied as is.

(b) Lock status flag (IEBBnSTLF): Bit 2

The value of the lock status flag (the IEBBnUSR.IEBBnLCKF bit) is applied as is.

(c) IEBBnDR register or FIFO buffer reception status flag (IEBBnSRXF): Bit 1

- Set/clear condition

  Set:

  – Single mode:

    When received data is stored in the IEBBnDR register

  – FIFO mode:

    When received data is stored in the FIFO buffer

  Clear:

  – Single mode:

    When the IEBBnDR register contents are read

  – FIFO mode:

    When all the received data stored in the FIFO buffer has been read

In the single mode, when the IEBBnSRXF bit is set (to 1), the data interrupt IEBBTD occurs.

In the single mode, when IEBBTD occurs on data reception, the IEBBnDR register must be read before the next data is received. During broadcast communication, an overrun error occurs if the IEBBnDR register is not read regardless of whether IEBBTD has occurred. For details, see the description of the IEBBnOVRE bit in 22.3.2 (20), IEBBnESR - IEBBn error status register.

In the FIFO mode, even if the IEBBnSRXF bit is set (to 1), the interrupt signal IEBBTV is not generated. For details about the IEBBTV generation timing, see the description of the IEBBnSLRI1, IEBBnSLRI0 bits in 22.3.2 (14), IEBBnTMS - IEBBn transfer mode setting register.

(d) IEBBnDR register or FIFO buffer transmission status flag (IEBBnSTXF): Bit 0

- Set/clear condition

  Set:

  – When communication finishes

  – Single mode:

    When the IEBBnDR register is written to

  – FIFO mode:

    When transmission data is written to the FIFO buffer

  Clear:

  – Single mode:

    When the contents of the IEBBnDR register are written to the transmission shift register

  – FIFO mode:

    When the number of bytes of data written to the FIFO buffer are transferred from the FIFO buffer to the transmission shift register

In the single mode, when the IEBBnSTXF bit is cleared, the data interrupt IEBBTD occurs.

In the single mode, when IEBBTD occurs on data transmission, the next transmission data must be written to the IEBBnDR register.

Regardless of whether IEBBTD occurs, an underrun error occurs if IEBBnDR is not written to. For details, see the description of the IEBBnUNRE bit in 22.3.2 (20) IEBBnESR - IEBBn error status register.

In the FIFO mode, even if the IEBBnSRXF bit is set (to 1), the interrupt signal IEBBTD is not generated. For details about the IEBBTD generation timing, see the description of the IEBBnSLTI1, IEBBnSLTI0 bits in 22.3.2 (14) IEBBnTMS - IEBBn transfer mode setting register.

(18) IEBBnUSR - IEBBn unit status register

The IEBBnUSR register indicates the unit status.

Access This register is read-only, in 8-bit units.

Address <IEBBn_base> + 0044H

Initial value 00H

This register is reset when the value of the IEBBnPW bit is overwritten with a different value.

7	6	5	4	3	2	1	0
0	IEBBn SRQF	IEBBn ARBF	IEBBn ALTF	IEBBn ACKF	IEBBn LCKF	0	0
R	R	R	R	R	R	R	R

Table 22.24 IEBBnUSR register contents

Bit position	Bit name	Function
6	IEBBnSRQF	Slave request flag for the unit 0: There are no slave requests. 1: There is a slave request.
5	IEBBnARBF	Arbitration result flag 0: Arbitration loss did not occur. 1: Arbitration loss occurred.
4	IEBBnALTF	Broadcast communication flag 0: Individual communication status 1: Broadcast communication status
3	IEBBnACKF	Acknowledge transmission flag 0: A NACK signal is transmitted. 1: An $\overline{\text{ACK}}$ signal is transmitted.
2	IEBBnLCKF	Lock status flag 0: Unlocked 1: Locked

(a) Slave request flag for the unit (IEBBnSRQF): Bit 6

- Set/clear condition

  Set:

  When the unit is requested as a slave (if the condition in *Table 22.25 "Slave request conditions (conditions for setting the IEBBnSRQF bit)"* is satisfied), this flag is set (to 1) by hardware when the parity bit communication of the slave address field ends[a].

  Clear:

  This flag is cleared (to 0) by hardware when the unit is not requested as a slave (if the condition in *Table 22.25 "Slave request conditions (conditions for setting the IEBBnSRQF bit)"* is not satisfied). The timing[a] is the same as that for setting the flag.

a) The bit is updated when the communication of the slave address field parity bit finishes without an error such as a parity error occurring. For example, if the slave address reception parity is incorrect, the IEBBnSRQF bit is not updated and the previous value is retained.

Table 22.25 Slave request conditions (conditions for setting the IEBBnSRQF bit)

Status of unit	Received master address	Communication mode	Received slave address
Not locked	don't care	Individual	IEBBnUAR match
		Broadcast	Group matching
			FFFH match
Locked	Locked master matching	Individual	IEBBnUAR match
		Broadcast	Group matching
			FFFH match

Note IEBBnUAR match: When the reception slave address and unit IEBBnUAR register match

Group match: When the reception-slave-address group address and unit IEBBnUAR-register group address match

FFFH match: When the reception slave address is FFFH

Table 22.26 $\overline{\text{ACK}}$ signal response condition for the slave address field

Status of unit	Received master address	Communication mode	Received slave address
don't care	don't care	Individual	IEBBnUAR match

Note IEBBnUAR match: When the reception slave address and unit IEBBnUAR register match

Caution If a unit other than the locked master communicates with the unit while the unit is locked, the IEBBnSRQF bit is not set but the $\overline{\text{ACK}}$ signal is returned to the slave address field. This is because communication must be continued, even for communication of a unit other than the locked master, if the control data received using the control field is a slave status transmission request.

(b) Arbitration result flag (IEBBnARBF): Bit 5

- Set/clear condition

  Set:
  When the data output by the unit does not match the received data during the arbitration period[a]
  Clear: After each communication frame start bit is transmitted or received

a) In the FIFO mode, the arbitration loss flag is set (to 1) based on the same condition even while the master request flag (IEBBnBCR.IEBBnMSRQ) is retained.

Note that, if arbitration is lost in the FIFO mode, a NACK reception error is detected by returning the NACK signal after control data reception, and software processing by outputting IEBBTERR is required.

In the case of a status transmission request, the NACK signal is not returned because there is an automatic response.

The IEBBnARBF bit is set (to 1) if there is inter-unit-data contention during the arbitration period (the broadcast field and master address field period) and the unit loses arbitration.

Arbitration loss is judged to have occurred when the unit output data does not match the received data.

Because the IEBus controller uses AND logic, the unit that outputs 0 wins arbitration.

In other words, among units that output broadcast data (0) for the broadcast field, the unit that has the smallest master address wins arbitration.

Caution In the single mode, when the start interrupt occurs upon issuing a master request, use the IEBBnARBF bit to check for arbitration loss. To transfer data again in the case of arbitration loss, perform software processing to issue another master request.

In the FIFO mode, another master request is issued even if arbitration is lost the number of times specified by the IEBBnTMS.IEBBnALC0 to IEBBnALC2 bits. If the number of arbitration losses exceeds this setting, an interrupt occurs to indicate an arbitration loss error. To transfer data again, perform software processing to issue another master request.

(c) Broadcast communication flag (IEBBnALTF): Bit 4

Flag indicating whether the unit is performing broadcast communication. The contents of the flag are updated in the broadcast field of each frame.

- Set/clear condition

  Set: When “broadcast” is received by the broadcast field

  Clear: When individual is received by the broadcast field

Caution The broadcast flag is updated regardless of whether IEBus is the communication target.

In the FIFO mode, storage is performed upon header completion if reading the data received during the previous communication has finished (if the IEBBnBSR.IEBBnRFLF bit = 0 and the nBSR.IEBBnSRFP4 to IEBBnSRFP0 bits = 00000). Until reading the received data finishes, the IEBBnALTF register is not updated.

(d) Acknowledge transmission flag (IEBBnACKF): Bit 3

This flag indicates whether the $\overline{\text{ACK}}$ signal was transmitted during the acknowledge bit period of the acknowledge bit field when IEBus is the receiving unit.

- Set/clear condition

  Set:

  When $\overline{\text{ACK}}$ is transmitted upon the completion of the acknowledge bit period for each field

  Clear:

  When NACK is transmitted upon the completion of the acknowledge bit period for each field

Cautions
1. If a communication error occurs and the unit returns to the initial status, no update is performed at the end of the acknowledge bit period for the corresponding field. For example, if the reception parity for the control field is incorrect, because IEBBn changes to the initial status (the communication standby status) after parity reception due to the parity error, a NACK signal is returned by using the control field (more accurately, no $\overline{\text{ACK}}$ signal is returned), but this is not applied to the IEBBnACKF bit, and the previous value is retained.
2. In the single mode, because the occurrence timing (when IEBBTSTA or IEBBTV becomes active) for the start interrupt and status transmission interrupt is when parity bit reception ends, the reading of the IEBBnUSR register by the previously described interrupt in the slave mode during interrupt handler processing might overlap with the changing of the IEBBnACKF bit.

(e) Lock status flag (IEBBnLCKF): Bit 2

A flag that indicates whether the unit is locked.

- Set/clear condition

  Set:

  When an individual communication frame ends, lock-related data (3H, 6H, AH, and BH) is received by using the control field, the communication completion flag (the IEBBnISR.IEBBnETRF bit) is cleared (to 0), and the frame completion flag (the IEBBnISR.IEBBnEFMF bit) is set (to 1).

  Clear:

  When an individual communication frame ends, lock-related data (3H, 6H, AH, and BH) is received by using the control field, and the communication completion flag (the IEBBnISR.IEBBnETRF bit) is set (to 1)

Cautions

1. Locking and unlocking are performed only during individual communication, not during broadcast communication.
2. While the master is locked, communication from a unit other than the master is not generally acknowledged. However, as an exception, if the control data (0H, 4H, or 5H) of a slave status transmission request is received, the communication is acknowledged even if it is not from the locked master. Note that, at this time, only a status request interrupt occurs, not a start interrupt or completion interrupt.

(19) IEBBnISR - IEBBn interrupt status register

The IEBBnISR status register indicates the interrupt source when an IEBBTSTA, IEBBTERR, or IEBBTV interrupt occurs.

Each time the IEBBTSTA, IEBBTERR, and IEBBTV interrupts occur, the IEBBnISR register is read, and the specified interrupt servicing is performed.

Access Only bit 6 can be read or written in 8-bit units.

Bits other than bit 6 are read-only, in 8-bit units.

Address <IEBBn_base> + 0048H

Initial value 00H

The IEBBnIEBE bit is reset when 0 is written to the IEBBnBCR.IEBBnPW bit.

Bits other than IEBBnIEBE are reset when the value of the IEBBnPW bit is overwritten with a different value.

Caution Be sure to set bits 1, and 7 to 0.

7	6	5	4	3	2	1	0
0	IEBBn IEBE	IEBBn STRF	IEBBn STSF	IEBBn ETRF	IEBBn EFMF	0	IEBBn FOVE
R	R/W[a]	R	R	R	R	R	R

a) Only the IEBBnIEBE bit can be written. Note that, when writing to the IEBBnIEBE bit, the bit can only be cleared (to 0). Even if 1 is written, the IEBBnIEBE bit is not set (to 1).

Table 22.27 IEBBnISR register contents

Bit position	Bit name	Function
6	IEBBnIEBE	Communication error flag 0: No communication error has occurred. 1: A communication error has occurred.
5	IEBBnSTRF	Start interrupt flag 0: No start interrupt has occurred. 1: A start interrupt has occurred.
4	IEBBnSTSF	Status transmission flag (slave) 0: There is no status transmission request. 1: There is a status transmission request.
3	IEBBnETRF	Communication completion flag 0: Communication of the number of transmission bytes specified by the message length field has not finished. 1: Communication of the number of transmission bytes specified by the message length field has finished.
2	IEBBnEFMF	Frame completion flag 0: The frame (communication of the maximum number of transmission bytes[a]) has not finished. 1: The frame (communication of the maximum number of transmission bytes[a]) has finished.
0	IEBBnFOVE	Frame over error flag 0: No frame over error has occurred. 1: A frame over error has occurred.

a) Communication mode 1: 32 bits, communication mode 2: 128 bits

(a) Communication error flag (IEBBnIEBE): Bit 6

A flag that indicates a communication error has occurred.

- Set/clear condition

  Set:

  – Single mode:

    When a timing error, parity error (except in the data field during individual reception), NACK reception error, underrun error, or overrun error (during broadcast reception) occurs

  – FIFO mode:

    When a timing error, parity error (except in the data field during individual reception), NACK reception error, underrun error, overrun error (during broadcast reception), or arbitration loss error occurs

  Clear:

  – Single mode or FIFO mode:

    By software (The flag is cleared (to 0) when 0 is written to the IEBBnIEBE bit.)

When a communication error occurs, IEBBTERR IEBBTV occur in the single mode, and IEBBTERR occurs in the FIFO mode.

It is possible to determine what caused the error by reading the IEBBnESR and IEBBnISR registers.

(b) Start interrupt flag: (IEBBnSTRF): Bit 5

A flag that indicates the start interrupt.

- Set/clear condition

  Set:

  – Single mode:

    The flag is set (to 1) during master unit operation, regardless of whether arbitration is won or lost.

    The flag is set (to 1) during slave unit operation if there is a slave request (when the IEBBnUSR.IEBBnSRQF bit = 1) from the master (only the locked master when the unit is locked).

    The flag is set upon the completion of the slave address field parity period in all cases.

  – FIFO mode: The IEBBnSTRF bit is not set (to 1).

  Clear:

  – Single mode:

    If the unit is the communication target (during communication with the master unit or slave unit), the flag is cleared (to 0) by hardware when a status transmission interrupt, communication completion interrupt, frame completion interrupt, transmission data write request interrupt, reception data read interrupt, or communication error interrupt occurs.

  – FIFO mode: The IEBBnSTRF bit is normally cleared.

In the single mode, IEBBTSTA and IEBBTV occur when a start interrupt occurs. In the FIFO mode, the start interrupt, IEBBTSTA, and IEBBTV do not occur.

Cautions

1. When a start interrupt occurs, read the IEBBnUSR register to check the slave request flag (IEBBnSRQF) and arbitration result flag (IEBBnARBF) for the unit.
2. If the arbitration result flag (IEBBnARBF) is set (to 1) when a start interrupt occurs after the unit issues a master request, perform software processing to reissue the master request.

(c) Status transmission flag (slave) (IEBBnSTSF): Bit 4

This flag indicates that the master requested transmission of the slave status and lock address (higher 4 bits and lower 8 bits) when the controller was serving as a slave.

- Set/clear condition

  Set:

  – Single mode:

    When the unit is not locked, there is a slave request from any master, and 0H or 6H is received by using the control field

    When the unit is locked, there is a slave request from the locked master, and 0H, 4H, 5H, or 6H is received by using the control field, or when 0H, 4H, or 5H is received from a unit other than the locked master by using the control field

    The flag is set upon the completion of the control field parity period in all cases.

    For details, see Table 22.28, Conditions for setting the status transmission request flag (slave).

  – FIFO mode: The IEBBnSTSF bit is not set (to 1).

  Clear:

  – Single mode:

    If the unit is the communication target (during communication with the master unit or slave unit), the flag is cleared (to 0) by hardware when a start interrupt, communication completion interrupt, frame completion interrupt, transmission data write request interrupt, reception data read interrupt, or communication error interrupt occurs.

  – FIFO mode: The IEBBnSTSF bit is normally cleared.

In the single mode, IEBBTSTA and IEBBTV occur when there is a status transmission request. In the FIFO mode, no interrupt signal is generated even if there is a status transmission request.

Caution Even if the slave transmission enable flag (the IEBBnBCR.IEBBnSTXE bit) is set to the prohibited value (0), the IEBBnSTSF bit is set (to 1).

Table 22.28 Conditions for setting the status transmission request flag (slave)

Various statuses					Value received using the control field				
equa	lockf	eqpa	IEBBn STXE	IEBBn SRXE	0H	3H, 7H	4H, 5H	6H	AH, BH, EH, FH
1	0	0	Any	Any	Set	Not set	Not set	Set	Not set
1	0	1	Any	Any	Set	Not set	Not set	Set	Not set
1	1	0	Any	Any	Set	Not set	Set	Not set	Not set
1	1	1	Any	Any	Set	Not set	Set	Set	Not set

Note equa: Unit match (during individual communication, IEBBnUAR register match

lockf: Whether there is a lock

eqpa: Lock master match

IEBBnSTXE: Slave transmission enable flag (IEBBnBCR register bit 4)

IEBBnSRXE: Slave reception enable flag (IEBBnBCR register bit 3)

If a slave status transmission request interrupt occurs in the single mode, read the IEBBnCDR register to check the received control data contents, and then write the required slave status information to the IEBBnDR register.

The received control data and data written to the IEBBnDR register are shown below.

Table 22.29 Received control data and data written to the IEBBnDR register

Received control data	Function	Data written to the IEBBnDR register
0H, 6H	Slave status transmission	Value read from the IEBBnSSR register
4H	Transmission of the lower 8 bits of the lock address	Lower 8 bits of the IEBBnPAR register
5H	Transmission of the higher 4 bits of the lock address	Higher 8 bits of the IEBBnPAR register

Caution After a slave status transmission request interrupt occurs, be sure to write the appropriate data to the IEBBnDR register before the completion of the message length field.

(d) Communication completion flag (IEBBnETRF): Bit 3

A flag that indicates whether communication ends after the number of bytes set in the message length field have been transferred.

- Set/clear condition

  Set:

  – Single mode:

    When the unit is the communication target (during communication with the master unit or slave unit) and the value of the IEBBnSCR register becomes 0 at the end of the data field acknowledge period

  Clear:

  – Single mode:

    The flag is cleared (to 0) by hardware when a start interrupt, status transmission interrupt, frame completion interrupt (when a communication completion interrupt does not occur), transmission data write request interrupt, reception data read interrupt, or communication error interrupt occurs.

In the single mode, IEBBTSTA and IEBBTV occur when the communication completion flag is set (to 1).

In the FIFO mode, the IEBBTSTA interrupt occurs at the same timing as in the single mode.

In the FIFO mode, reading the IEBBnETRF bit is prohibited. If the bit is read, the returned value is undefined.

In the FIFO mode, after IEBBTSTA occurs, transmission and reception can be controlled by performing the software processing below.

- When reception ends

1. Detecting the completion of communication based on the occurrence of the IEBBTSTA interrupt
2. Checking whether communication or a frame has finished by using the IEBBnFSR.IEBBnRTRF bit
3. Checking the number of received data bytes by using the IEBBnBSR.IEBBnSRFP4 to IEBBnSRFP0 bits (the number of bytes that have not been read)
4. Reading the received data from the IEBBnDR register (the reception FIFO buffer)

- When transmission ends

1. Detecting the completion of communication based on the occurrence of the IEBBTSTA interrupt
2. Checking whether communication or a frame has finished by using the IEBBnFSR.IEBBnTTRF bit
3. Checking the number of transmission data bytes by using the IEBBnBSR.IEBBnSTFP4 to IEBBnSTFP0 bits (the number of bytes that have not been transmitted)
4. Proceeding to retransmission processing if there is data that has not been transmitted

(e) Frame completion flag (IEBBnEFMF): Bit 2

This flag indicates whether communication ends after the maximum number of bytes (communication mode 1: 32 bytes, communication mode 2: 128 bytes) have been transferred.

- Set/clear condition

  Set:

  – Single mode:

    When the unit is the communication target (during communication with the master unit or slave unit) and the value of the IEBBnCCR register becomes 0 at the end of the data field acknowledge period

  Clear:

  – Single mode:

    The flag is cleared (to 0) by hardware when a start interrupt, status transmission interrupt, communication completion interrupt (when a frame completion interrupt does not occur), transmission data write request interrupt, reception data read interrupt, or communication error interrupt occurs.

In the single mode, IEBBTSTA and IEBBTV occur when the frame completion flag is set (to 1).

Cautions

1. In the single mode, if the IEBBnSCR and IEBBnCCR registers are both cleared to 00H at the end of the data field acknowledge period, the IEBBnETRF and IEBBnEFMF bits are set (to 1) at the same time.
2. In the single mode, if the last data field is a NACK signal when the maximum number of bytes that can be transmitted is reached during retransmission, the IEBBnEFMF and IEBBnIEBE bits (NACK reception error) are set (to 1) at the same time.

In the FIFO mode, the IEBBTSTA interrupt occurs at the same timing as in the single mode.

In the FIFO mode, reading the IEBBnEFMF bit is prohibited. If the bit is read, the returned value is undefined.

After IEBBTSTA occurs, transmission and reception can be controlled by performing the software processing below.

- When reception ends

1. Detecting the completion of communication based on the occurrence of the IEBBTSTA interrupt
2. Checking whether communication or a frame has finished by using the IEBBnFSR.IEBBnRTRF bit
3. Checking the number of received data bytes by using the IEBBnBSR.IEBBnSRFP4 to IEBBnSRFP0 bits (the number of bytes that have not been read)
4. Reading the received data from the IEBBnDR register (the reception FIFO buffer)

- When transmission ends

1. Detecting the completion of communication based on the occurrence of the IEBBTSTA interrupt
2. Checking whether communication or a frame has finished by using the IEBBnFSR.IEBBnTTRF bit
3. Checking the number of transmission data bytes by using the IEBBnBSR.IEBBnSTFP4 to IEBBnSTFP0 bits (the number of bytes that have not been transmitted)
4. Proceeding to retransmission processing if there is data that has not been transmitted

(f) Frame over error flag (IEBBnFOVE): Bit 0

This flag indicates that a frame over error has occurred.

- Set/clear condition

  Set:

  – Single mode: The IEBBnFOVE bit is not set (to 1).

  – FIFO mode:

    If the next broadcast communication is received as a slave unit before reading the data received during the previous communication finishes, the flag is set (to 1) after the first data field parity period finishes.

  Clear:

  – Single mode or FIFO mode:

    By software

    (The flag is cleared (to 0) when 1 is written to the IEBBnSTC1.IEBBnCLFF bit.)

In the single mode, the IEBBnFOVE bit is not set (to 1), and no interrupt requests occur.

In the FIFO mode, IEBBTERR occurs when the IEBBnFOVE bit is set (to 1).

Even if a frame over error occurs for the current frame, the data received during the previous frame is valid.

(20) IEBBnESR - IEBBn error status register

The IEBBnESR register is used to indicate the cause when an IEBus controller communication error interrupt occurs. Each bit of the IEBBnESR register is set (to 1) as soon as the communication error flag of the IEBBnISR register (IEBBnIEBE) is set (to 1). The cause of a communication error, if any, can be identified by checking the contents of the IEBBnESR register. (If the IEBBnISR.IEBBnIEBE bit is already set to 1, only the bits of the IEBBnESR register are set (to 1).)

Note that the bits can only be set (to 1) by hardware and are cleared by writing 1 to the IEBBnSTC0 register.

When 1 is written to the IEBBnSTC0 register, if there is contention with the hardware trying to specify (1), the hardware is prioritized.

Note that writing to the IEBBnESR register is invalid.

Access This register is read-only, in 8-bit units.

Address <IEBBn_base> + 004CH

Initial value 00H

This register is reset when the value of the IEBBnBCR.IEBBnPW bit is overwritten with a different value.

Caution When a communication error occurs, IEBBn returns to the initial status and prepares for the next communication. Regardless of whether an error occurs, if the next communication is started without handling errors, any error flags that have been set remain set. (If the system returns to the initial status due to a timing error, and a parity error is received during the next communication, both the timing error and parity error bits of the IEBBnESR register are set to 1.)
Therefore, handle any errors that occur before the next communication starts.

7	6	5	4	3	2	1	0
IEBBn TIME	IEBBn PARE	IEBBn NACE	IEBBn UNRE	IEBBn OVRE	0	IEBBn ABTE	IEBBn TRDE
R	R	R	R	R	R	R	R

Table 22.30 IEBBnESR register contents (1/2)

Bit position	Bit name	Function
7	IEBBnTIME	Timing error occurrence flag 0: No timing error has occurred. 1: A timing error has occurred.
6	IEBBnPARE	Parity error occurrence flag 0: No parity error has occurred. 1: A parity error has occurred.
5	IEBBnNACE	NACK reception error flag 0: No NACK reception error has occurred. 1: A NACK reception error has occurred.
4	IEBBnUNRE	Underrun error occurrence flag 0: No underrun error has occurred. 1: An underrun error has occurred.

Table 22.30 IEBBnESR register contents (2/2)

Bit position	Bit name	Function
3	IEBBnOVRE	Overrun error occurrence flag 0: No overrun error has occurred. 1: An overrun error has occurred.
1	IEBBnABTE	Arbitration loss error occurrence flag 0: The number of arbitration losses specified for the arbitration loss count setting bits (IEBBnTMS.IEBBnALC2 to IEBBnALC0) have not occurred. 1: The number of arbitration losses specified for the arbitration loss count setting bits (IEBBnTMS.IEBBnALC2 to IEBBnALC0) have occurred.
0	IEBBnTRDE	Inter-third-party communication error occurrence flag 0: An error occurred during communication targeting the unit. 1: An error occurred during inter-third-party communication.

(a) Timing error occurrence flag (IEBBnTIME): Bit 7

- Set condition

  Set: This flag is set (to 1) if a timing error occurs.

A timing error occurs if the high-/low-level width of the communication bit is not the defined value.

The defined value of the high- and low-level width is set to the bit processing block and monitored by the internal timer.

(b) Parity error occurrence flag (IEBBnPARE): Bit 6

- Set condition

  Set: This flag is set (to 1) if a parity error occurs.

When the unit is the reception unit (including while communication between others is being monitored), a parity error occurs when the parity data generated by the data received using the master address field, slave address field, control data field, or message length field does not match the received parity data.

However, when there is a data field mismatch, a NACK signal is returned and a data retransmission request is issued during individual communication, but a parity error occurs during broadcast communication.

Note During the above parity period, if the parity data received on the transmission side is inverted for some reason, a timing error occurs and communication ends.

Table 22.31 Operation when the parity data does not match

Field	Communication mode	Operation when the parity data does not match
Master address field	Individual/broadcast	A parity error occurs.
Slave address field	Individual/broadcast	A parity error occurs.
Control data field	Individual/broadcast	A parity error occurs.
Message length field	Individual/broadcast	A parity error occurs.
Data field	Individual	A NACK signal is returned to request retransmission.
	Broadcast	A parity error occurs.

(c) NACK reception error flag (IEBBnNACE): Bit 5

- Set condition

  Set: This flag is set (to 1) if a NACK reception error occurs.

A NACK reception error occurs if a NACK signal is received during the acknowledge bit period of the slave address field, control data field, or message length field during individual communication, regardless of whether the controller is operating as the master or slave.

When a NACK signal is received for the data field, no NACK reception error generally occurs because this reception signals a data retransmission request. However, if the last data field is a NACK signal, a NACK reception error does occur.

During reception, a NACK reception error is judged to have occurred if an output NACK signal is received for the last data of the slave address field, control data field, message length field, or data field.

Note that, during broadcast communication, no NACK reception errors occur because $\overline{\text{ACK}}$/NACK signal judgment is not performed.

No NACK reception errors occur during inter-third-party communication because only timing/parity errors are detected as errors. However, for the slave address field, NACK reception error judgment is performed because communication is participated in as a slave.

Table 22.32 NACK reception error judgment period

Communication mode		Slave address field	Control data field Data field	Message length field	Data field (last)
Individual communication	Master transmission	Occurs	Occurs	Occurs	Occurs
	Master reception	—	—	Occurs	Occurs
	Slave transmission	—	—	Occurs	Occurs
	Slave reception	Occurs	Occurs	Occurs	Occurs
	Inter-third-party communication	Occurs	Does not occur	Does not occur	Does not occur
Broadcast communication	All	Does not occur	Does not occur	Does not occur	Does not occur

(d) Underrun error occurrence flag (IEBBnUNRE): Bit 4

- Set condition

  Set:

  – Single mode:

  During data transmission using the data field, an underrun error occurs if writing the next data to be transmitted to the IEBBnDR register does not finish before the end of the data-field acknowledge bit period following the occurrence of IEBBTD, and this flag is set (to 1). However, if the NACK signal is received during the acknowledge bit period, no underrun error occurs because retransmission is performed.

  During inter-third-party communication, underrun errors do not occur because only timing/parity errors are detected as errors.

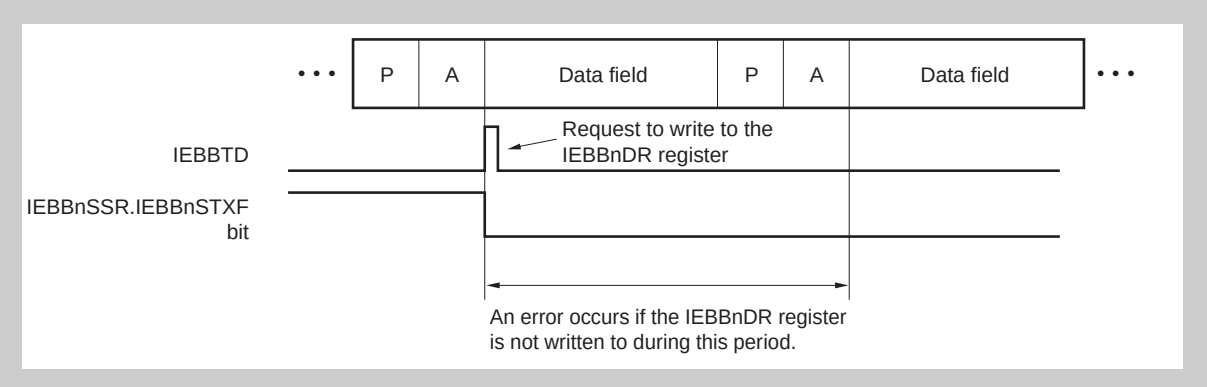

Figure 22.6 Underrun error occurrence timing

  – FIFO mode:

  Before data of the message length specified by the IEBBnTDL register is transmitted, if there are 0 data items to be transmitted remaining in the transmission FIFO buffer (if the IEBBnSSR.IEBBnSTXF bit = 0), an underrun error occurs if writing the next data to be transmitted to the IEBBnDR register does not finish before the end of the next data-field acknowledge bit period, and this flag is set (to 1). However, if the NACK signal is received during the acknowledge bit period, no underrun error occurs because retransmission is performed.

  During inter-third-party communication, underrun errors do not occur because only timing/parity errors are detected as errors.

(e) Overrun error occurrence flag (IEBBnOVRE): Bit 3

- Set condition

  Set:

  – Single mode:

  When the data field is used to receive data during broadcast communication, an overrun error occurs if reading the IEBBnDR register does not finish between when IEBBTD occurs and when the parity period of the data field finishes, and this flag is set (to 1).

  During individual communication, data retransmission is requested by returning a NACK signal without an error, and returning the NACK signal continues until the IEBBnDR register is read. (However, the frame ends when the maximum number of bytes that can be transferred is reached.)

  During inter-third-party communication, overrun errors do not occur because only timing/parity errors are detected as errors.

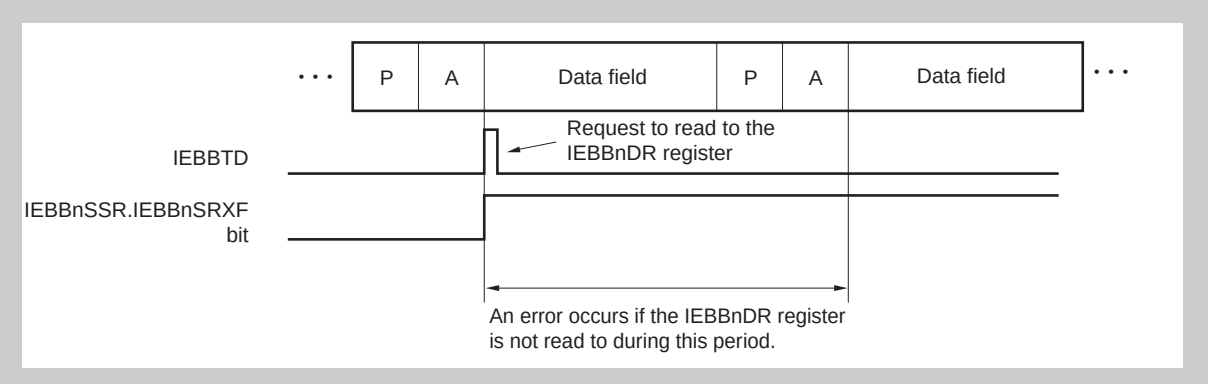

Figure 22.7 Overrun error occurrence timing

– FIFO mode:

During broadcast communication in communication mode 2, if there are 32 bytes of unread data in the reception FIFO buffer, an overrun error occurs if a 33rd byte of data is received, and this flag is set (to 1).

During individual communication, data retransmission is requested by returning a NACK signal without an error, and returning the NACK signal continues until the IEBBnDR register is read. (However, the frame ends when the maximum number of bytes that can be transferred is reached.)

If an overrun error occurs, do not read data by servicing interrupts.

If an interrupt occurs while reading data, it might no longer be possible to read the correct data.

(f) Arbitration loss error occurrence flag (IEBBnABTE): Bit 1

- Set condition

  Set:

  If arbitration losses occur the number of times specified for the IEBBnTMS.IEBBnALC2 to IEBBnALC0 bits, this flag is set (to 1) when the last arbitration loss error occurs.

  For details about arbitration loss, see the description of the IEBBnARBF bit in 22.3.2 (18), IEBBnUSR - IEBBn unit status register.

(g) Inter-third-party communication error occurrence flag (IEBBnTRDE): Bit 0

- Set condition

  Set:

  If an inter-third-party communication error occurs at the same time as a timing error or parity error that occurs during communication that is not related to the unit (inter-third-party communication), this flag is set (to 1) at the same time as the IEBBnTIME or IEBBnPARE bit.

Caution If an error occurs before the inter-third-party communication starts even when the slave address field does not match that of the unit (for example, if the NACK signal is received when the received address does not match that of the unit in the slave address field (if the IEBBnNACE bit is set (to 1))), the IEBBnTRDE bit is not set (to 1).

Note Communication between third parties may take place in the following two cases.

1. If the address received in the slave address field does not match that of the unit (during individual communication: matching with the IEBBnUAR register, during broadcast communication: matching with the group or FFFH) and communication continues after the ACK signal has been received, the unit monitors that communication.
2. If the unit cannot respond to the received control data in the control field during broadcast communication and if communication continues, the unit monitors that communication. For example, this happens when the unit receives the control data FH from the master during broadcast communication but the slave reception enable flag of the unit is disabled (IEBBnBCR.IEBBnSRXE bit = 0). (During individual communication, the NACK signal is returned and communication ends.)

(21) IEBBnFSR - IEBBn field status register

The IEBBnFSR register is used to store the field status state of the IEBus controller when various interrupts (IEBBTD, IEBBTSTA, IEBBTERR, and IEBBTV) occur.

Access This register is read-only, in 8-bit units.

Address <IEBBn_base> + 0050H

Initial value 00H

The IEBBnSSFS1 and IEBBnSSFS0 bits are reset when the IEBBnBCR.IEBBnPW bit is overwritten with a different value.

Cautions
1. If a different interrupt occurs before the IEBBnFSR register is read, the status information used at the time of the previous interrupt is overwritten with the status information used at the time of the new interrupt.
2. If an interrupt occurs during communication between third parties (during the reception of communication between other units), the IEBBnSSFS1 and IEBBnSSFS0 bits are cleared to 00. However, because the only interrupts that occur during communication between third parties are interrupts caused by errors, an inter-third-party communication error can be judged to have occurred by reading the inter-third-party communication error occurrence flag (the IEBBnTRDE bit) of the IEBBnESR register.
3. Even if the field status signal (an internal signal) changes, the IEBBnSSFS1 and IEBBnSSFS0 bits retain their previous values until an interrupt occurs.

		Master address field	
		Slave address field	
		Control data field	
		Message length field	
		Data field	

(a) Reception communication completion flag (IEBBnRTRF): Bit 7

This flag indicates that communication equivalent to the number of bytes specified by the message length has finished during reception.

- Set/clear condition

  Set:

  – Single mode: The IEBBnRTRF bit is not set (to 1).

  – FIFO mode:

    During reception, the flag is set (to 1) when the IEBBnISR.IEBBnETRF bit is set (to 1).

  Clear:

  – Single mode: The IEBBnRTRF bit always has the clear status.

  – FIFO mode:

    During reception, the flag is cleared (to 0) when the IEBBnISR.IEBBnEFMF bit is set (to 1).

Cautions
1. In the FIFO mode, if the set and clear conditions are both satisfied, setting the flag is prioritized.
2. The IEBBnRTRF bit is not cleared (to 0) by writing 1 to the IEBBnPCR.IEBBnCRPT bit.

(b) Transmission communication completion flag (IEBBnTTRF): Bit 6

This flag indicates that communication equivalent to the number of bytes specified by the message length has finished during transmission.

- Set/clear condition

  Set:

  – Single mode: The IEBBnTTRF bit is not set (to 1).

  – FIFO mode:

    During transmission, the flag is set (to 1) when the IEBBnISR.IEBBnETRF bit is set (to 1).

  Clear:

  – Single mode: The IEBBnTTRF bit always has the clear status.

  – FIFO mode:

    During transmission, the flag is cleared (to 0) when the IEBBnISR.IEBBnEFMF bit is set (to 1).

Cautions
1. In the FIFO mode, if the set and clear conditions are both satisfied, setting the flag is prioritized.
2. The IEBBnTTRF bit is not cleared (to 0) by writing 1 to the IEBBnPCR.IEBBnCTPT bit.

(c) Field status flags (IEBBnSSFS1 and IEBBnSSFS0): Bits 1 and 0

These flags store the state of the IEBus controller field status when various interrupts (IEBBTD, IEBBTSTA, IEBBTERR, and IEBBTV) occur.

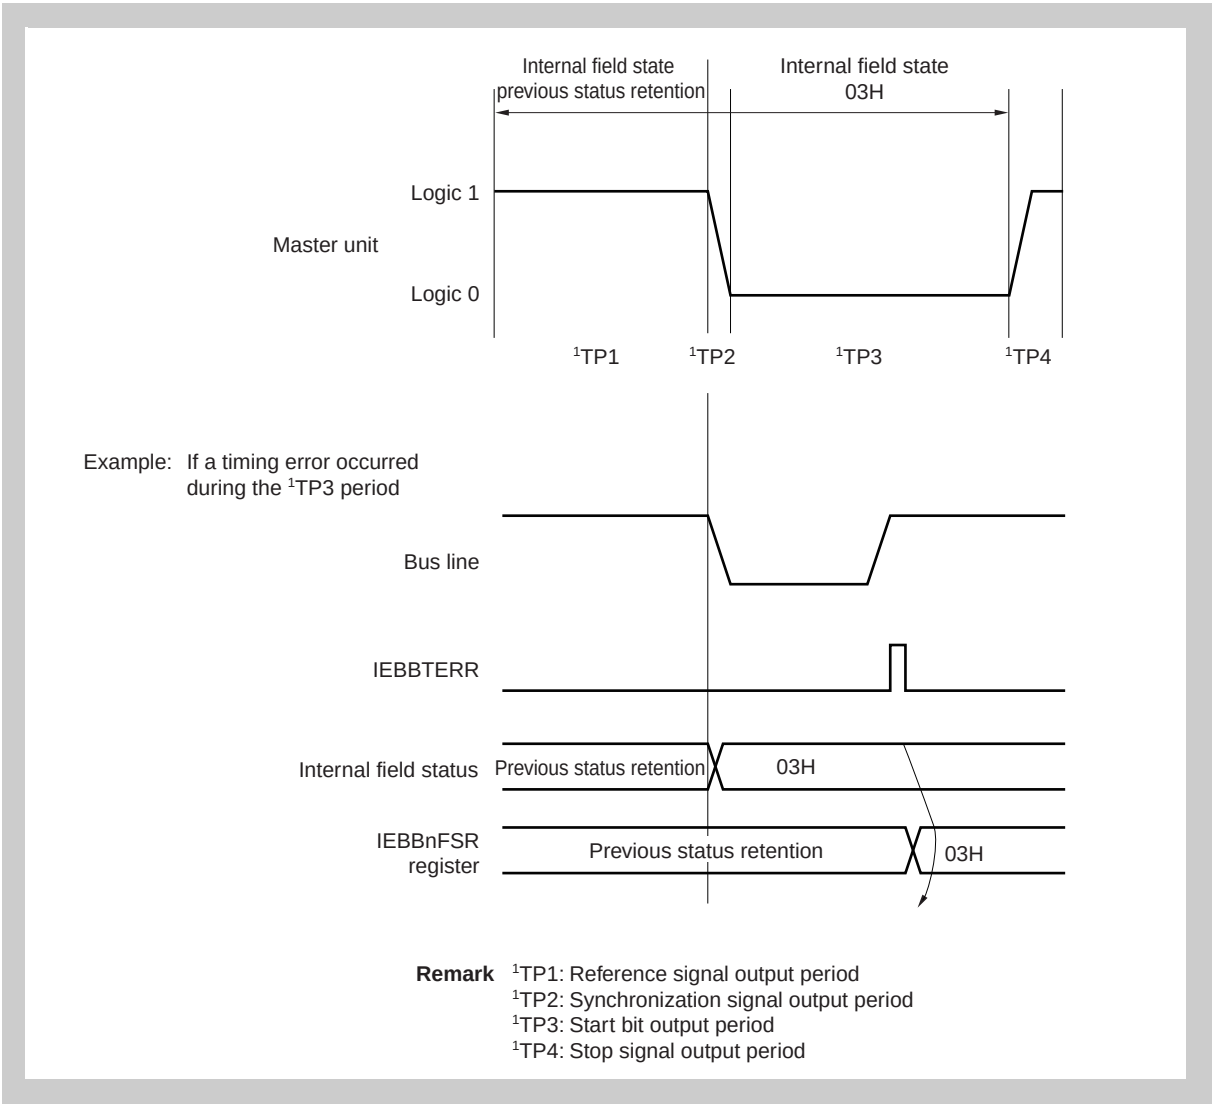

Figure 22.8 Start bit field status for the master (internal signal)

When the start bit shown in Figure 22.8 Start bit field status for the master (internal signal) is output for the master, the previous field status value is retained until ^{1}TP1. At point ^{1}TP2 and after, the field status value is 03H. If a timing error occurs at point ^{1}TP3 and IEBBTERR is output, 03H is stored in the IEBBnFSR register.

Because IEBBTERR does not occur if communication is performed normally, the field status value is not stored in the IEBBnFSR register, and the IEBBnFSR register retains the previous value at and after point ^{1}TP2.

(22) IEBBnSCR - IEBBn success count register

The IEBBnSCR register indicates the number of remaining communication bytes.

The value specified by the IEBBnDLR register is stored in the IEBBnSCR register after the message length field processing finishes, and the count value of the counter to be decremented according to the data field $\overline{ACK}$ signal is read.

In other words, because the number of successfully communicated bytes is subtracted from the number of data bytes to be communicated, the IEBBnSCR register indicates the remaining number of bytes to be communicated.

Note that the communication completion flag (the IEBBnISR.IEBBnETRF bit) is set (to 1) when the count value reaches 00H.

The data in the IEBBnSCR register is updated when the $\overline{ACK}$ signal is received at the end of the message length field parity period or data field acknowledge bit period.

Access This register is read-only, in 8-bit units.

Address <IEBBn_base> + 0054H

Initial value 01H

This register is reset when the value of the IEBBnBCR.IEBBnPW bit is overwritten with a different value.

Caution When 00H is read from the IEBBnSCR register, it is not possible to judge whether the remaining number of communication data bytes is 0 (indicating communication completion) or 256. Therefore, the communication completion flag (the IEBBnISR.IEBBnETRF bit) must also be used with this register to make this judgment.

7	6	5	4	3	2	1	0
R	R	R	R	R	R	R	R

Table 22.35 IEBBnSCR register contents

Bit								Setting	Number of remaining communication data bytes
7	6	5	4	3	2	1	0		
0	0	0	0	0	0	0	1	01H	1 byte
0	0	0	0	0	0	1	0	02H	2 bytes
...	...	...	...	...	...	...	...	...	...
0	0	0	1	0	1	0	0	20H	32 bytes
...	...	...	...	...	...	...	...	...	...
1	1	1	1	1	1	1	1	FFH	255 bytes
0	0	0	0	0	0	0	0	00H	0 bytes (communication completion) or 256 bytes

(23) IEBBnCCR - IEBBn communication count register

The IEBBnCCR register indicates the number of bytes remaining from the communication byte number specified by the communication mode.

This register indicates the number of transfer bytes.

The maximum number of transmitted bytes per frame defined in each mode (communication mode 1: 32 bytes, communication mode 2: 128 bytes) is preset to this register. The count value of the counter that is decremented during the acknowledge bit period of the data field regardless of the ACK/NACK signal is read from this register. In contrast with the IEBBnSCR register, which is decremented when there is normal communication (the ACK signal), the IEBBnCCR register is decremented when one byte is communicated, regardless of the ACK/NACK signal. Note that the frame completion flag (the IEBBnISR.IEBBnEFMF bit) is set (to 1) when the counter reaches 00H.

The preset value of the maximum number of transmitted bytes per frame is 20H (32 bytes) in communication mode 1 and 80H (128 bytes) in communication mode 2.

Updating of data proceeds independently of parity at the end of the ACK interval for the data field on completion of transmission (or reception) of the start bit for the preset maximum number of bytes.

Access This register is read-only, in 8-bit units.

Address <IEBBn_base> + 0058H

Initial value 20H

This register is reset when the value of the IEBBnBCR.IEBBnPW bit is overwritten with a different value.

Caution The value of the IEBBnCCR register is not updated by writing to the IEBBnPSR.IEBBnCMD bit.

7	6	5	4	3	2	1	0
R	R	R	R	R	R	R	R

(24) IEBBnSTC0 - IEBBn status clear register 0

The IEBBnSTC0 register is used to clear the IEBBnESR register.

Access This register is write-only, in 8-bit units.

Address <IEBBn_base> + 005CH

Initial value 00H

7	6	5	4	3	2	1	0
IEBBn CLTM	IEBBn CLPA	IEBBn CLNC	IEBBn CLUR	IEBBn CLOV	0	IEBBn CLAB	IEBBn CLTR
W	W	W	W	W	R	W	W

Table 22.36 IEBBnSTC0 register contents

Bit position	Bit name	Function
7	IEBBnCLTM	This bit is used to clear the timing error flag (IEBBnESR.IEBBnTIME). 0: No operation 1: Clear the IEBBnTIME bit. Writing 1 is valid, and writing 0 does not change the internal status. When the bit is read, 0 is always returned.
6	IEBBnCLPA	This bit is used to clear the parity error flag (IEBBnESR.IEBBnPARE). 0: No operation 1: Clear the IEBBnPARE bit. Writing 1 is valid, and writing 0 does not change the internal status. When the bit is read, 0 is always returned.
5	IEBBnCLNC	This bit is used to clear the NACK reception error flag (IEBBnESR.IEBBnNACE). 0: No operation 1: Clear the IEBBnNACE bit. Writing 1 is valid, and writing 0 does not change the internal status. When the bit is read, 0 is always returned.
4	IEBBnCLUR	This bit is used to clear the underrun error flag (IEBBnESR.IEBBnUNRE). 0: No operation 1: Clear the IEBBnUNRE bit. Writing 1 is valid, and writing 0 does not change the internal status. When the bit is read, 0 is always returned.
3	IEBBnCLOV	This bit is used to clear the overrun error flag (IEBBnESR.IEBBnOVRE). 0: No operation 1: Clear the IEBBnOVRE bit. Writing 1 is valid, and writing 0 does not change the internal status. When the bit is read, 0 is always returned.
1	IEBBnCLAB	This bit is used to clear the arbitration loss error flag (IEBBnESR.IEBBnABTE). 0: No operation 1: Clear the IEBBnABTE bit. Writing 1 is valid, and writing 0 does not change the internal status. When the bit is read, 0 is always returned.
0	IEBBnCLTR	This bit is used to clear the inter-third-party communication error flag (IEBBnESR.IEBBnTRDE). 0: No operation 1: Clear the IEBBnTRDE bit. Writing 1 is valid, and writing 0 does not change the internal status. When the bit is read, 0 is always returned.

(25) IEBBnSTC1 - IEBBn status clear register 1

The IEBBnSTC1 register is used to clear the IEBBnISR.IEBBnFOVE bit.

Access This register is write-only, in 8-bit units.

Address <IEBBn_base> + 0060H

Initial value 00H

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	IEBBn CLFF
R	R	R	R	R	R	R	W

Table 22.37 IEBBnSTC1 register contents

Bit position	Bit name	Function
0	IEBBnCLFF	This bit is used to clear the frame over error flag (IEBBnISR.IEBBnFOVE). 0: No operation 1: Clear the IEBBnFOVE bit. Writing 1 is valid, and writing 0 does not change the internal status. When the bit is read, 0 is always returned.

(26) IEBBnDR - IEBBn data register

The IEBBnDR register is used to set up the communication data. Specify the communication data (8 bits) for bits 7 to 0.

Notes
1. The IEBBnDR register consists of a write register and a read register. Therefore, data written to this register cannot be read as is. The data received during IEBus communication can be read.
2. In the FIFO mode, the data in the FIFO buffer can be transferred by continuously accessing the IEBBnDR register. (See 22.5.1 (1) "Transmission FIFO buffer" for details about using the transmission unit or 22.5.1 (2) "Reception FIFO buffer" for details about using the reception unit.)

(a) For the transmission unit

If the unit is the transmission unit (during master or slave transmission), the bits in the data field are transmitted as data bits starting with the highest bits when writing to the IEBBnDR register.

Specify the first byte of transmission data before starting communication (IEBBnBCR.IEBBnMSRQ bit = 0).

Even in the FIFO mode, write at least one byte of transmission data to the FIFO buffer before starting communication (IEBBnMSRQ bit = 0).

In the FIFO mode, the contents of the FIFO buffer are not reset in sync with the IEBBnBCR.IEBBnPW bit. Clearing the pointer value (to 0) eliminates the remaining data visible to the user. The stored data becomes undefined.

During transmission (master or slave transmission), if a data interrupt (IEBBTD) occurs, the next transmission data is written to the IEBBnDR register.

In the single mode, if a status transmission interrupt (IEBBTSTA or IEBBTV) occurs, the status data is written to the IEBBnDR register according to the control data.

(b) For the reception unit

The 1 byte of data received using the data field is read from the IEBBnDR register if the unit is the reception unit (master or slave reception). Storage is performed at the end of the data field parity period if the parity value is normal. The read value is reset by clearing the IEBBnPW bit to 0.

During reception (master or slave reception), if a data interrupt (IEBBTD) occurs, received data is read from the IEBBnDR register.

Access This register can be read or written in 8-bit units.

Address <IEBBn_base> + 0064H

Initial value 00H

The read value is reset when the IEBBnBCR.IEBBnPW bit is overwritten.

Cautions

1. If writing to the IEBBnDR register is not in time for transmission, an underrun error occurs and communication ends.
2. Write to the status data register IEBBnDR after a status transmission interrupt occurs and before the end of the message length field.
3. In the single mode, if the IEBBnDR register is not read before the next reception, the communication differs in the case of individual versus broadcast communication.
   - For individual communication, a NACK signal is returned for the field, and the master is requested to transmit the same data. Received data is not stored in the IEBBnDR register. If the NACK signal is returned again before the IEBBnDR register is read and the register has still not been read when the maximum number of transferable bytes is reached, frame completion (IEBBTSTA, IEBBTV) and a NACK reception error (IEBBTERR, IEBBTV) occur at the same time.
   - During broadcast communication, an overrun error occurs and communication ends. Received data is not stored in the IEBBnDR register. The overrun error flag (IEBBnOVRE) is set (to 1).
4. In the FIFO mode, if the next reception occurs before all the data received during the previous communication is read, the communication differs in the case of individual versus broadcast communication.
   - For individual communication, a NACK signal is returned for the data field, and the master is requested to transmit the same data. Received data is not stored in the FIFO buffer. If the NACK signal is returned again before all the data in the FIFO buffer is read and the FIFO buffer has still not been read when the maximum number of transferable bytes is reached, frame completion (IEBBTSTA) and a NACK reception error (IEBBTERR) occur at the same time.
   - During broadcast communication, an overrun error occurs and communication ends. Received data is not stored in the FIFO buffer. The frame over error flag (IEBBnISR.IEBBnFOVE) is set (to 1).
5. In the FIFO mode and communication mode 2, if there are 32 bytes of unread data and the next reception occurs, the communication differs in the case of individual versus broadcast communication.
   - For individual communication, a NACK signal is returned for the field, and the master is requested to transmit the same data. Received data is not stored in the FIFO buffer. If the NACK signal is returned again before the IEBBnDR register is read and reading the register has still not finished when the maximum number of transferable bytes is reached, frame completion (IEBBTSTA) and a NACK reception error (IEBBTERR) occur at the same time.
   - During broadcast communication, an overrun error occurs and communication ends. Received data is not stored in the FIFO buffer. The overrun error flag (IEBBnESR.IEBBnOVRE) is set (to 1).

22.4 Interrupt Operations

22.4.1 Interrupt request signals

Various interrupts occur in response to the eight interrupt requests below. The high level width of each interrupt signal is one P0ϕ clock cycle.

The interrupts that occur differ depending on whether the system is in the single or FIFO mode.

(1) Single mode

The causes of interrupts in the single mode are shown blow.

Table 22.38 Causes of interrupts in the single mode

Symbol	IEBBTD	IEBBTV	IEBBTERR	IEBBTSTA	Interrupt cause
IEBBnIEBE		Occurs	Occurs		Communication error (When the IEBBnISR.IEBBnIEBE bit = 1) Note that IEBBnIEBE occurs when the following bits of the IEBBnESR register = 1. • Timing error (IEBBnTIME) • Parity error (IEBBnPARE) • NACK reception error (IEBBnNACE)[a] • Underrun error (IEBBnUNRE) • Overrun error (IEBBnOVRE)
IEBBnSTRF		Occurs		Occurs	Start request (when the IEBBnISR.IEBBnSTRF bit = 1)
IEBBnSTSF		Occurs		Occurs	Status transmission request (when the IEBBnISR.IEBBnSTSF bit = 1)
IEBBnETRF		Occurs		Occurs	End of communication (When the IEBBnISR.IEBBnETRF bit = 1)
IEBBnEFMF		Occurs		Occurs	End of frame (When the IEBBnISR.IEBBnEFMF bit = 1)[a]
IEBBnFOVE					Frame over (When the IEBBnISR.IEBBnFOVE bit = 1)
WRREQ	Occurs				Transmission data write request (when the IEBBnSSR.IEBBnSTXF bit = 0)[b]
RDREQ	Occurs				Reception data read request (when the IEBBnSSR.IEBBnSRXF bit = 1) [c]

a) If the frame data ends with a NACK signal, IEBBTV and IEBBTSTA are triggered by setting the frame completion indicating bit IEBBnISR.IEBBnEFMF (to 1).
At this time, the IEBBTERR and IEBBTV interrupts are triggered by a NACK reception error.
Three interrupts (IEBBTV, IEBBTSTA, and IEBBTERR) occur at the same time.

b) During master transmission:

1. IEBBTD occurs after receiving the $\overline{\text{ACK}}$ signal, which follows message length field transmission. However, if the transfer size is one byte (the IEBBnTDL register = 01H), IEBBTD does not occur.

2. IEBBTD occurs after receiving the $\overline{\text{ACK}}$ signal, which follows data field transmission. However, IEBBTD does not occur before transmitting the final data, or after transmitting the final data and then receiving the ACK signal. More specifically, if the message length is five bytes, IEBBTD does not occur after transmitting the 4th or 5th byte. In addition, when transmitting the maximum number of transferable bytes for one frame, IEBBTD does not occur after transmitting byte number (maximum number of transferrable bytes – 1) or byte number (maximum number of transferable bytes).

During slave transmission:

1. IEBBTD occurs after receiving the $\overline{\text{ACK}}$ signal, which follows message length field transmission. However, if the transfer size is one byte or the received control bit is a status request (0H, 4H, 5H, or 6H), IEBBTD does not occur (and a status transmission interrupt occurs instead).

2. After data field transmission, the operation is the same as for *2* under During master transmission.

c) RDREQ occurs after receiving the parity bit by using the data field. However, if the self-transmitted parity bit differs from the received parity bit, there is a timing error and no interrupt occurs.

(2) FIFO mode

The causes of interrupts in the FIFO mode are shown below.

Table 22.39 Causes of interrupts in the FIFO mode

Symbol	IEBBTD	IEBBTV	IEBBTERR	IEBBTSTA	Interrupt cause
IEBBnIEBE			Occurs		Communication error (When the IEBBnISR.IEBBnIEBE bit = 1) Note that IEBBnIEBE occurs when the following bits of the IEBBnESR register = 1. • Timing error (IEBBnTIME) • Parity error (IEBBnPARE) • NACK reception error (IEBBnNACE)[a] • Underrun error (IEBBnUNRE) • Overrun error (IEBBnOVRE)[b] • Arbitration loss error (IEBBnABTE)
IEBBnSTRF					Start request (when the IEBBnISR.IEBBnSTRF bit = 1)
IEBBnSTSF					Status transmission request (when the IEBBnISR.IEBBnSTSF bit = 1)
IEBBnETRF		Occurs[c]		Occurs	End of communication (When the IEBBnISR.IEBBnETRF bit = 1)
IEBBnEFMF		Occurs[c]		Occurs	End of frame (When the IEBBnISR.IEBBnEFMF bit = 1)[a]
IEBBnFOVE			Occurs		Frame over (When the IEBBnISR.IEBBnFOVE bit = 1)[b]
WRREQ	Occurs[d]				Transmit data write request
RDREQ		Occurs[e]			Receive data write request Parity

a) If the frame data ends with a NACK signal, IEBBTV and IEBBTSTA are triggered by setting the frame completion indicating bit IEBBnISR.IEBBnEFMF (to 1).
Note that the IEBBTERR interrupt is triggered by a NACK reception error.
Three interrupts (IEBBTV, IEBBTSTA, and IEBBTERR) occur at the same time, regardless of transmission or reception.

b) If data is received during the broadcast communication for the next frame while the FIFO buffer is full due to the reception of the previous frame and the data has not been read, the IEBBnISR.IEBBnFOVE and IEBBnESR.IEBBnOVRE bits are set (to 1) at the same time.

c) IEBBTV occurs based on the same conditions and at the same timing as IEBBTSTA. (For details, see Table 22.40, ACK/NACK for IEBBnETRF and IEBBnEFMF)
For individual communication:
1. Transmission-side device

IEBBnETRF:
This is set (to 1) after receiving the $\overline{\text{ACK}}$ signal. If the NACK signal is received, communication does not end.

IEBBnEFMF: This is set (to 1) after reception regardless of the $\overline{\text{ACK}}$/NACK signal.

2. Reception-side device

IEBBnETRF:
This is set (to 1) after transmitting the $\overline{\text{ACK}}$ signal. If the NACK signal is transmitted, communication does not end.

IEBBnEFMF:
This is set (to 1) after transmission regardless of the $\overline{\text{ACK}}$/NACK signal.
The NACK signal is output when there is no room in the reception FIFO buffer or when there is a data retransmission request due to a parity mismatch. Not returning an ACK signal to the reception side as the bus status after exiting communications due to the detection of an error does not constitute a NACK signal. In this case, IEBBTSTA and IEBBTV do not occur because the system does not enter the frame completion status.

For broadcast communication:
For broadcast communication, no $\overline{\text{ACK}}$ signal is returned from the slave. Therefore, it is judged that the NACK signal was successfully returned regardless of master transmission or slave reception, and the IEBBnETRF or IEBBnEFMF interrupt occurs.

d) This occurs when the conditions specified by the IEBBnTMS.IEBBnSLTI1 and IEBBnSLTI0 bits are satisfied. The occurrence timing is after receiving the $\overline{\text{ACK}}$ signal, which follows data field transmission. However, if the transfer size is one byte or the received control bit is a status request (0H, 4H, 5H, or 6H), IEBBTD does not occur.

e) 1. Transmission-side device
RDREQ is not set under this condition.
2. Reception-side device
RDREQ is set (to 1) when the conditions specified by the IEBBnTMS.IEBBnSLRI1 and IEBBnSLRI0 bits are satisfied (after confirming that a normal parity bit value has been received).
If there is a parity bit mismatch, RDREQ is not set (to 1) because the conditions are not satisfied.
On normal completion or frame completion, RDREQ interrupt sources are masked.

Table 22.40 $\overline{\text{ACK}}$/NACK for IEBBnETRF and IEBBnEFMF

Field status	Individual communication				Broadcast communication			
	IEBBnETRF		IEBBnEFMF		IEBBnETRF		IEBBnEFMF	
	$\overline{\text{ACK}}$	NACK	$\overline{\text{ACK}}$	NACK	$\overline{\text{ACK}}$	NACK	$\overline{\text{ACK}}$	NACK
Master transmission	Occurs	Does not occur	Occurs	Occurs	–	Occurs	–	Occurs
Master reception	Occurs	Does not occur	Occurs	Occurs	–	–	–	–
Slave transmission	Occurs	Does not occur	Occurs	Occurs	–	–	–	–
Slave reception	Occurs	Does not occur	Occurs	Occurs	–	Occurs	–	Occurs

Note The IEBBTV usage method is shown below.

1. Generating IEBBTV before communication finishes (when the IEBBnTMS.IEBBnSLRI1 and IEBBnSLRI0 bit settings are 32 bytes or less)
   This operation is not generally performed in communication mode 1. (It can be performed but is not.) The operation is performed in communication mode 2.
   – Use IEBBTV to check the number of data bytes received by the FIFO buffer, and then perform a readout operation. (Be sure to check the number because the IEBBTV interrupt servicing is assumed to be late.)
   – For IEBBTSTA (communication completion/frame completion), check the status.
   – Because the status is changed after receiving data, the interrupt priority is IEBBTV followed by IEBBTSTA.
2. If not generating IEBBTV during communication (if the IEBBnSLRI1 and IEBBnSLRI0 bit settings are 32 bytes)

   Use communication mode 1. (Communication mode 2 can also be used.)
   – Communication mode 1

   Mask IEBBTV (so it is not used).
   Use IEBBTSTA (communication completion/frame completion) to check the number of data bytes in the FIFO buffer, and then check the readout and status changes.
   – Communication mode 2

   Perform the same operations as in 1.

22.4.2 Interrupt judgment examples

Interrupt judgment examples for the single mode are shown below.

(1) When using IEBBTD

IEBBn transmission/reception must be checked by issuing an IEBBTD interrupt.

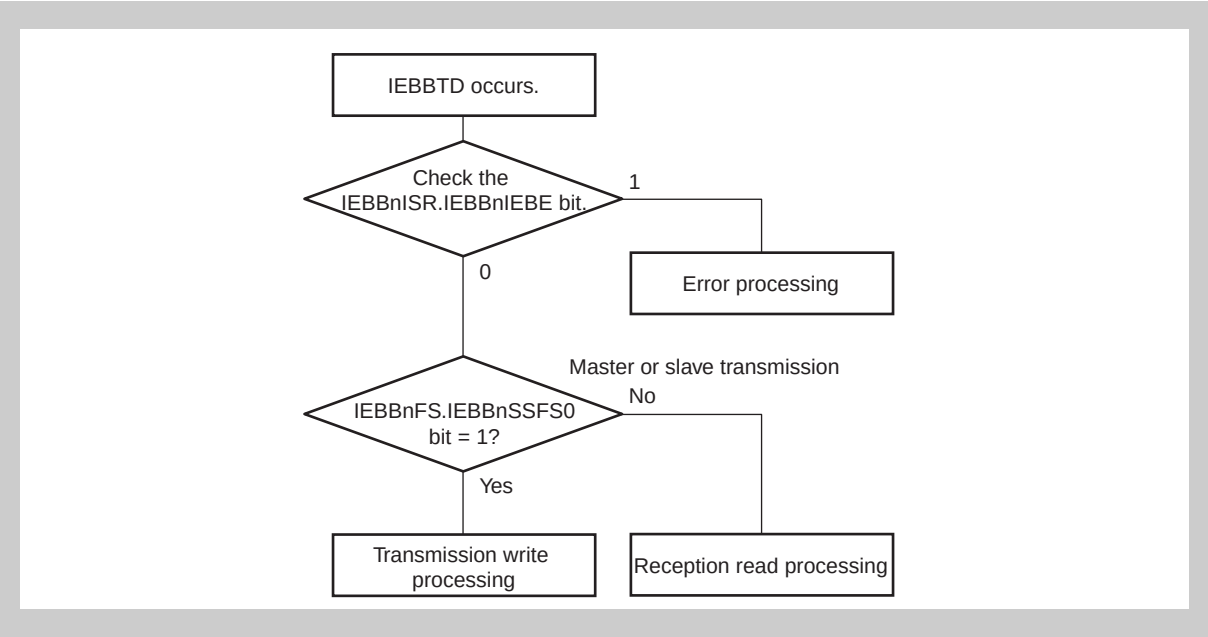

Figure 22.9 IEBBTD interrupt judgment example

Caution Even if IEBBTD occurs, an error might occur depending on when the interrupt is handled.

Such errors include timing errors after IEBBTD occurs. To increase data processing reliability, only handle data after using the IEBBnISR.IEBBnIEBE bit to make sure that no error has occurred.

(2) When using IEBBTERR

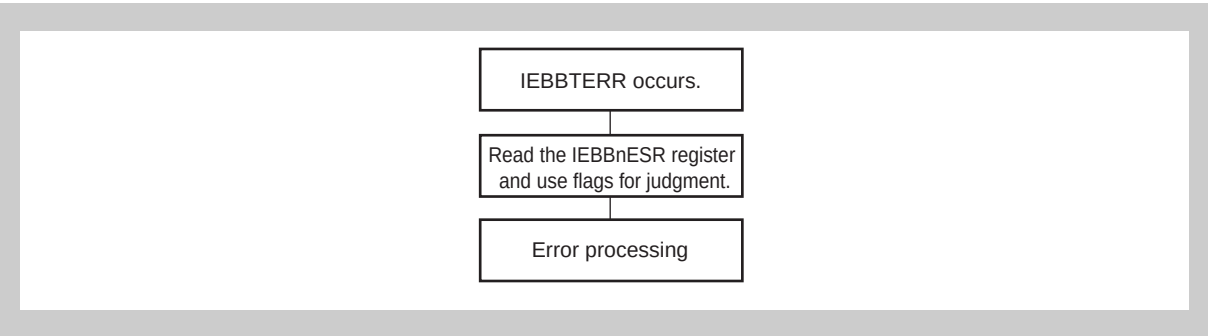

Figure 22.10 IEBBTERR interrupt judgment example

(3) When using IEBBTSTA or IEBBTV

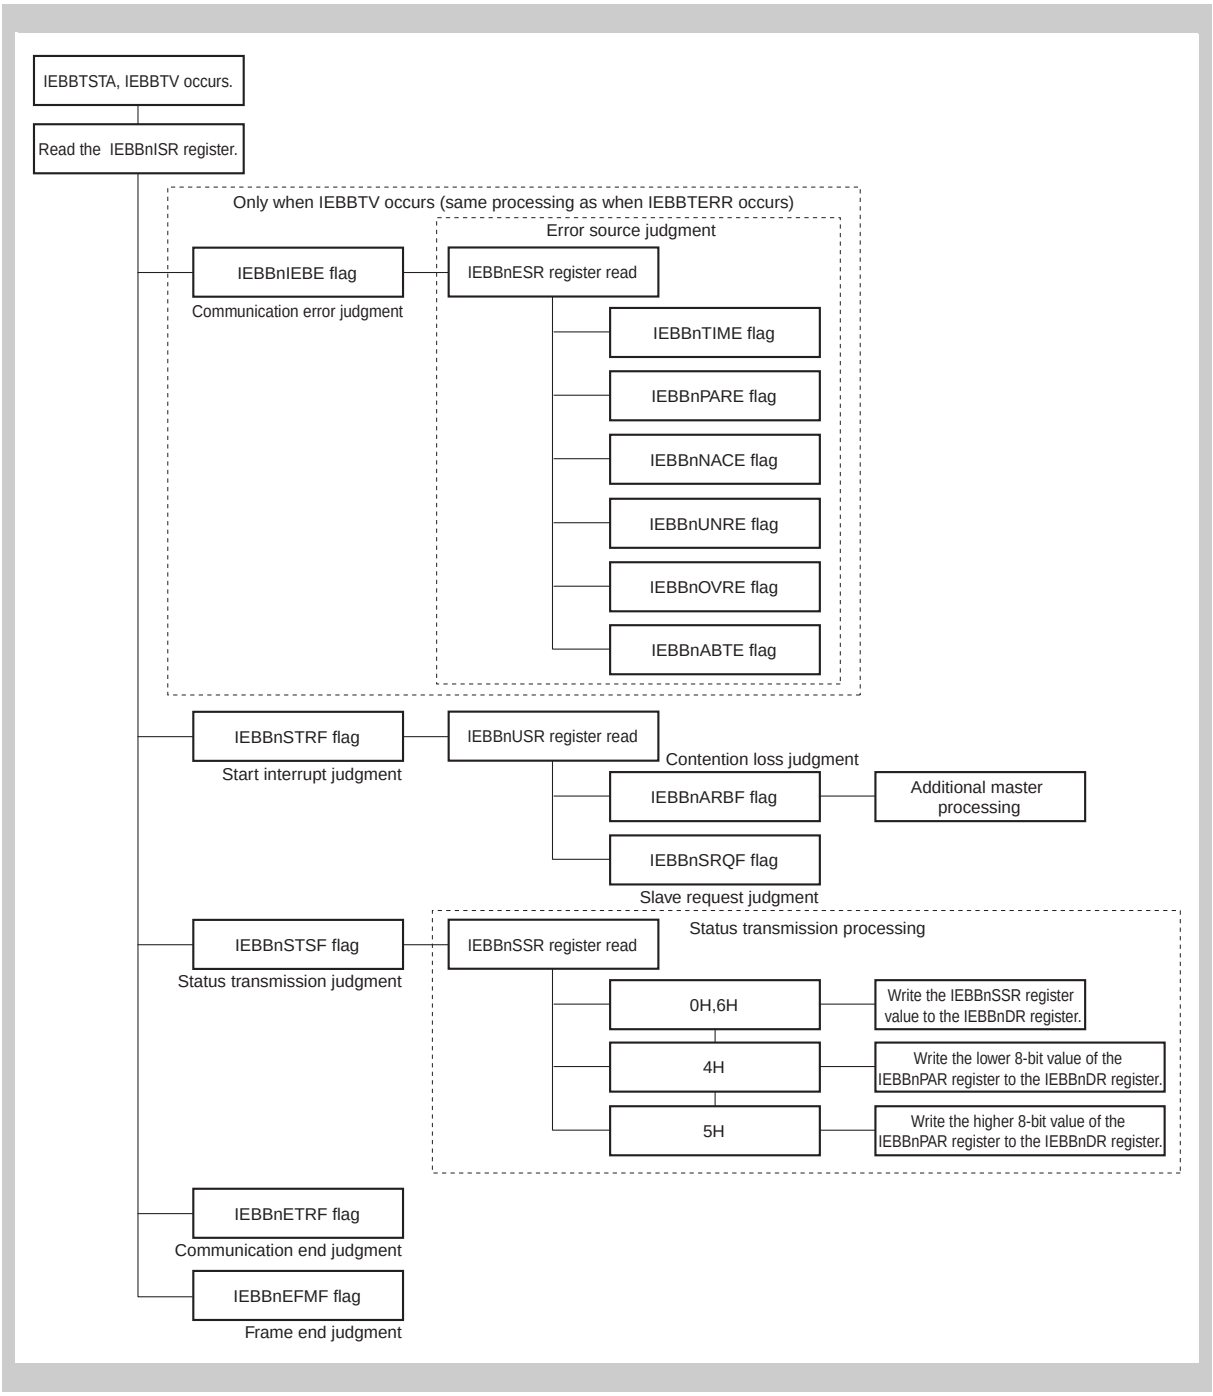

Figure 22.11 IEBBTSTA and IEBBTV interrupt judgment examples

22.5 Operation

22.5.1 FIFO

(1) Transmission FIFO buffer

When the IEBBnTMS.IEBBnFMDE bit = 1, data can be stored in the FIFO buffer while automatically incrementing the FIFO buffer pointer for writing by continuously writing transmission data to the IEBBnDR register. The FIFO buffer size is 8 bits x 32 stages.

When the transfer is started, the data indicated by the load pointer is transferred. After the transfer finishes, the load pointer is incremented. The initial value for the write pointer and load pointer is 0.

The IEBBnBSR.IEBBnTFLF bit is set (to 1) when there are 32 bytes of data in the FIFO buffer, and the transmission FIFO buffer overwrite flag (IEBBnBSR.IEBBnFOVW) is set (to 1) when a 33rd byte of data is written while the IEBBnTFLF bit = 1. At this time, the write data is ignored and the write pointer is not changed.

The data below can be written when one byte is transferred while the IEBBnTFLF bit = 1 and then the bit is cleared to 0.

If the write is not in time for data loading, an underrun error occurs.

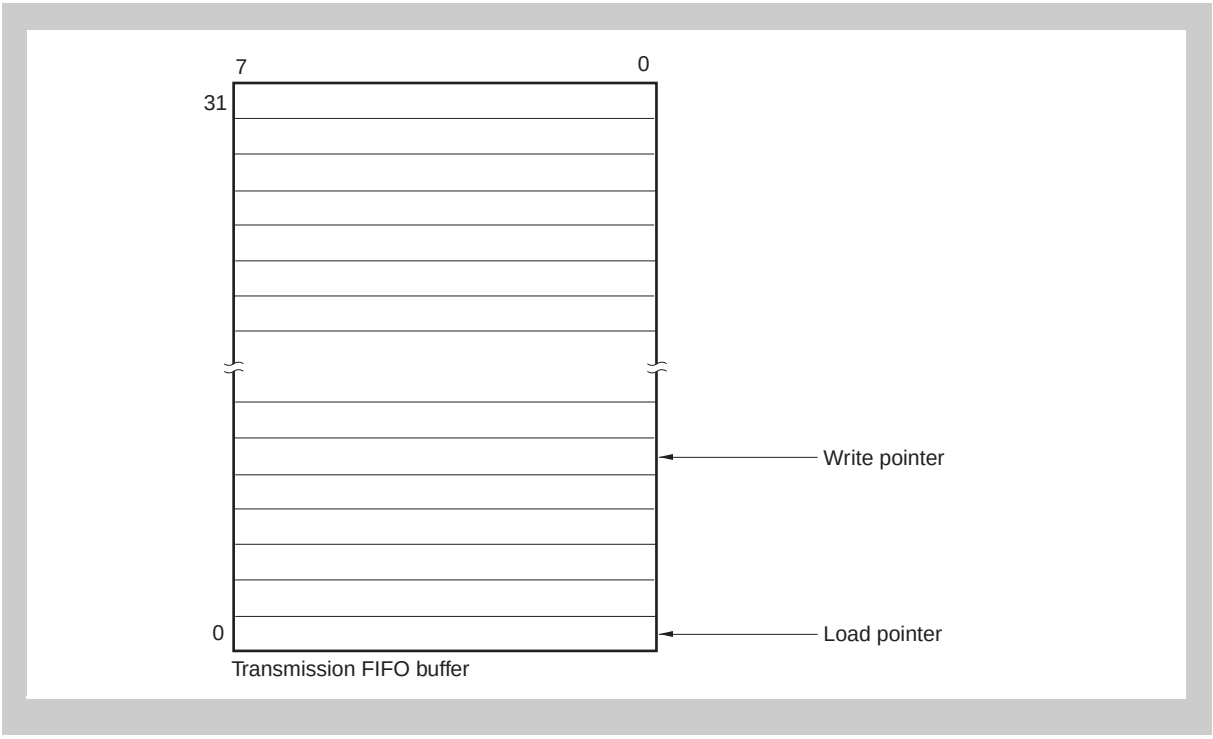

Figure 22.12 Transmission FIFO buffer

(2) Reception FIFO buffer

When the IEBBnTMS.IEBBnFMDE bit = 1, the received data is stored at the address indicated by the storage pointer. The storage pointer is incremented after storing the data. Data is stored in the FIFO buffer at the end of the data field parity period if the parity value is normal. The FIFO buffer size is 8 bits x 32 stages.

By reading the IEBBnDR register, the data in the FIFO buffer can be read while automatically incrementing the read pointer. The initial value for the read pointer and storage pointer is 0.

If there are 32 bytes of unread data in the FIFO buffer, the operation when the next data is received is as follows.

- During individual communication: No data is stored, a NACK signal is returned, and data retransmission is requested.
- During broadcast communication: No data is stored and an overrun error occurs.

  If the IEBBnDR register is read again after reading the received data that has been stored finishes (when the read pointer = the storage pointer), the read pointer is not changed, and the over-read flag (IEBBnBSR.IEBBnFOVR bit) is set (to 1).

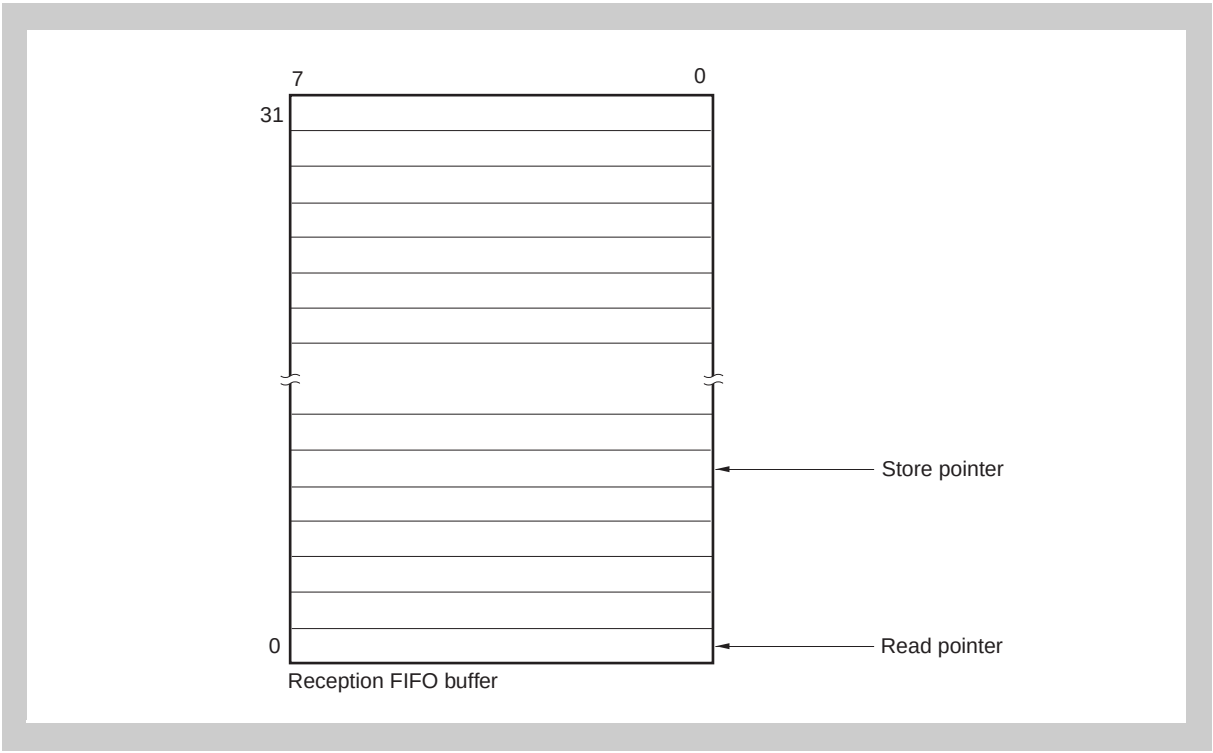

Figure 22.13 Reception FIFO buffer

22.5.2 Initial settings

After setting the IEBBnBCR.IEBBnPW bit to 1, set up the registers below, and then start communication processing.

Table 22.41 Initial setup

Register name	Function	Example
IEBBnPSR	Operation clock and communication mode settings	80H
IEBBnUAR	Set a unit address.	101H
IEBBnCKS	Clock Selection	15H
IEBBnTMS	Communication control	01H[a]

a) For use in the single mode, the initial values do no have to be changed.

22.5.3 Master transmission (single mode)

The unit transmits data and commands to the slave unit as the master.

Data interrupts are used to write transmission data to the IEBBnDR register for each one-byte transfer.

(1) Register settings

After specifying the initial settings in 22.5.2 Initial settings, set up the registers below before starting communication.

Table 22.42 Standard initial processing

Register name	Function	Example
IEBBnSAR	Communication partner unit address	102H
IEBBnCDR or IEBBnTCD	Control data (AH, BH, EH, FH)	FH
IEBBnDLR	Message length	02H
IEBBnDR	Data (1st byte of data)	11H

Table 22.43 Communication startup processing

Register name	Function	Example

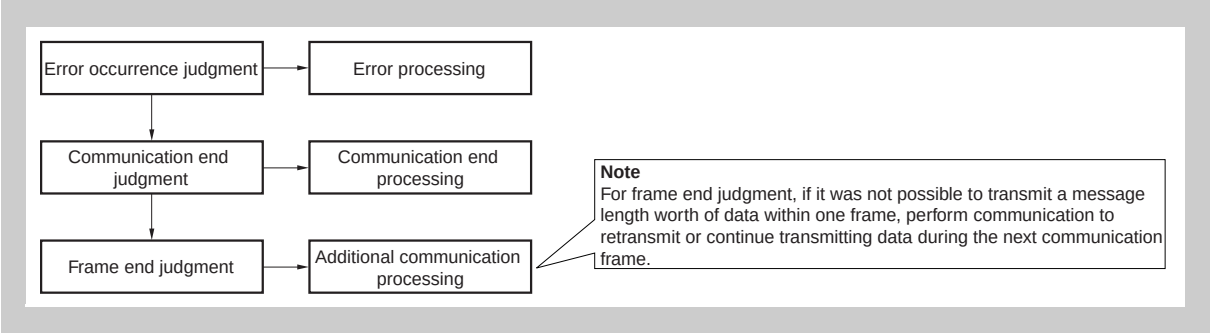

Figure 22.19 Transmission completion interrupt (IEBBTV, IEBBTSTA) CPU processing flow example

22.5.5 Master reception (single mode)

The unit receives data and commands from the slave unit as the master. Because the slave transfers the message length field in the case of master reception, indicate the message length of data to be transmitted to the slave, such as during other communication. Read the received data one byte at a time by using data interrupts.

(1) Register settings

After specifying the initial settings in 22.5.2 Initial settings, set up the registers below before starting communication.

Table 22.46 Standard initial processing

Register name	Function	Example
IEBBnSAR	Communication partner unit address	102H
IEBBnCDR or IEBBnTCD	Control data (0H, 3H, 4H, 5H, 6H, 7H)	7H

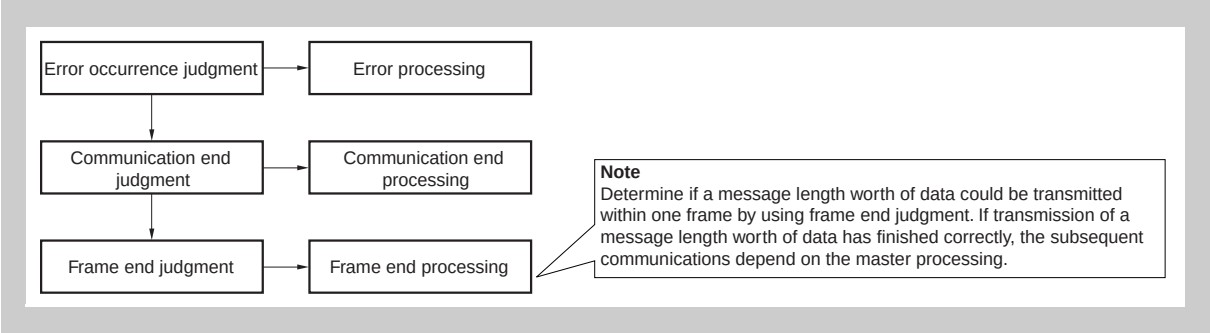

Figure 22.36 Transmission completion interrupt (IEBBTV, IEBBTSTA) CPU processing flow example

(b) Slave status transmission request processing flow example

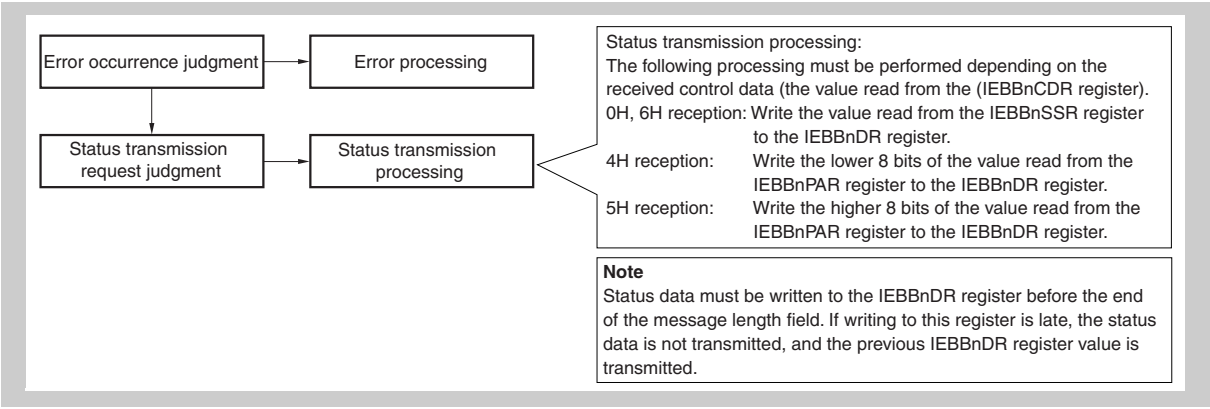

Figure 22.37 Slave status transmission request processing flow

In the FIFO mode, if the unit loses a conflict between a unit master transmission request and a slave transmission request addressed to the unit, because the slave transmission enable flag (IEBBnBCR.IEBBnSTXE) is not set (to 1) for the unit, a NACK signal is transmitted using the control data field and communication ends. Next, specify the slave transmission data for the FIFO buffer, set the slave transmission enable flag (to 1), and prepare to receive another slave transmission request from the master.

22.5.9 Slave reception (single mode)

The unit receives data and commands from the master unit as a slave.

Read the received data one byte at a time by using data interrupts.

(1) Register settings

After specifying the initial settings in 22.5.2 Initial settings, set up the registers below before starting communication.

22.7 Functions

22.7.1 IEBus communication protocol

The communication protocol of the IEBus is as follows.

(1) Multi-task mode

All the units connected to the IEBus can transfer data to the other units.

(2) Broadcast communication

Communication between one unit and multiple units can be performed as follows.

- Group broadcast communication: Broadcast communication to group units
- All-unit broadcast communication: Broadcast communication to all units

(3) Effective transmission speed

The effective transfer rate is in communication mode 1 or communication mode 2. (This product does not support mode 0 for the effective transfer rate.)

- Communication mode 1: Approx. 18 kbps
- Communication mode 2: Approx. 27 kbps

Caution Different modes (communication mode 1, communication mode 2) must not be mixed on one IEBus.

(4) Communication mode

Data transfer is executed in half-duplex asynchronous communication mode.

(5) Access control: CSMA/CD (Carrier Sense Multiple Access with Collision Detection)

The priority of the IEBus is as follows:

1. Broadcast communication takes precedence over individual communication (communication from one unit to another).
2. The lower master address takes precedence.

(6) Communication scale

The communication scale of IEBus is as follows:

- Number of units: 50 maximum
- Cable length: 150 m maximum (when twisted pair cable is used)

Caution The communication scale in an actual system differs depending on the characteristics of the cables, etc., constituting the IEBus driver/receiver and IEBus.

22.7.2 Determination of bus mastership (arbitration)

An operation to occupy the bus is performed when a unit connected to the IEBus controls the other units. This operation is called arbitration.

When multiple units simultaneously start transmission, arbitration is used to grant one of the units permission to occupy the bus.

Because only one unit is granted bus mastership as a result of arbitration, the priority conditions of the bus are predetermined as follows.

Caution Bus mastership is canceled if communication is aborted.

(1) Priority by communication type

Broadcast communication (communication from one unit to multiple units) takes precedence over normal communication (communication from one unit to another).

(2) Priority by master address

If the communication type is the same, communication with the lower master address takes precedence.

A master address consists of 12 bits, with unit 000H having the highest priority and unit FFFH having the lowest priority.

22.7.3 Communication mode

The IEBus has three communication modes, each of which has a different transfer rate. This module supports communication modes 1 and 2. The transfer rate and the maximum number of transfer bytes per communication frame in communication modes 1 and 2 are shown below.

Table 22.56 Transfer rate and maximum number of transfer bytes in each communication mode

Communication mode	Maximum number of transfer bytes (bytes/frame)	Effective transfer rate[a]
1	32 bytes/frame	Approx. 18 kbps
2	128 bytes/frame	Approx. 27 kbps

a) Effective transfer rate when the maximum number of transfer bytes is transmitted

Select the communication mode for each unit connected to the IEBus before starting communication. If the communication mode of the master unit and that of the partner unit (slave unit) are not the same, communication is not correctly executed.

22.7.4 Communication address

For the IEBus, each unit is assigned a specific 12-bit address. This communication address consists of the following identification numbers.

- Higher 4 bits: Group number (number to identify the group to which each unit belongs)
- Lower 8 bits: Unit number (number to identify each unit in a group)

22.7.5 Broadcast communication

Normally, transmission or reception is performed between the master unit and its partner slave unit on a one-to-one basis. During broadcast communication, however, multiple slave units exist and the master unit executes transmission to these slave units. Because multiple slave units exist, the NACK signal is returned by the communicating slave unit as an acknowledge bit.

Whether broadcast communication or normal communication is to be executed is selected by the broadcast bit. (For details about this bit, see 22.7.6 (2) Broadcast bit.)

Broadcast communication is classified into two types: group-unit broadcast communication and all-unit broadcast communication. Group-unit broadcast and all-unit broadcast are identified by the value of the slave address. (For the slave address, see 22.7.6 (4) Slave address field.)

(1) Group-unit broadcast communication

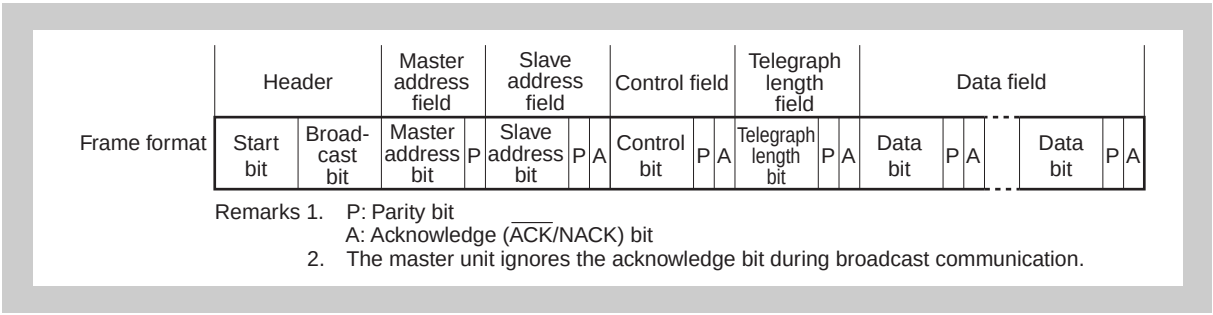
Broadcast communication is performed to the units in a group identified by the group number indicated by the higher 4 bits of the communication address.

(2) All-unit broadcast communication

Broadcast communication is performed to all the units, regardless of the value of the group number.

22.7.6 IEBus transfer format

The IEBus transfer signal format is shown in Figure 22.56.



Remarks 1. P: Parity bit
A: Acknowledge ($\overline{\text{ACK}}$/NACK) bit
2. The master unit ignores the acknowledge bit during broadcast communication.

Figure 22.56 IEBus transfer signal format

(1) Start bit

The start bit is a signal that informs the other units of the start of a data transfer.

The unit that is to start a data transfer outputs a low-level signal (start bit) for a specific time, and then starts outputting the broadcast bit.

If another unit has already output its start bit when one unit is to output the start bit, this unit does not output the start bit and instead waits for completion of output of the start bit by the other unit. When the output of the start bit by the other unit is complete, the unit starts outputting the broadcast bit in synchronization with the completion of the start bit output by the other unit.

The units other than the one that started communication detect this start bit, and enter the reception status.

(2) Broadcast bit

This bit indicates whether the master selects one slave (individual communication) or multiple slaves (broadcast communication) as the other party of communication.

When the broadcast bit is 0, it indicates broadcast communication. When it is 1, individual communication is indicated. Broadcast communication is classified into two types: group-unit communication and all-unit communication. These communication types are identified by the value of the slave address. (For the slave address, see 22.7.6 (4) Slave address field.)

Because multiple slave units exist as a partner slave unit of communication in the case of broadcast communication, the NACK signal is returned as an acknowledge bit in each field subsequent to the master address field.

If multiple units start transmitting a communication frame at the same time, broadcast communication takes precedence over individual communication, and wins in arbitration.

If one unit occupies the bus as the master, the value set to the broadcast request flag (the IEBBnBCR.IEBBnALRQ bit) is output.

(3) Master address field

The master address field is output by the master to inform a slave of the master's address.

The configuration of the master address field is shown in Figure 22.57.

If multiple units start transmitting the broadcast bit at the same time, the master address field makes a judgment of arbitration.

The master address field compares the data it outputs with the data on the bus each time it has output one bit. If the master address output by the master address field is found to differ from the data on the bus as a result of comparison, it is assumed that the master has lost arbitration.

As a result, the master stops transmission and enters the reception status. Because the IEBus is configured of wired AND, the unit having the smallest master address of the units participating in arbitration (arbitration masters) wins arbitration.

After a 12-bit master address has been output, only one unit remains in the transmission status as one master unit.

Next, this master unit outputs a parity bit, determines the master address of other unit, and starts outputting a slave address field.

If one unit occupies the bus as the master, the address specified by the IEBBnUAR register is output.

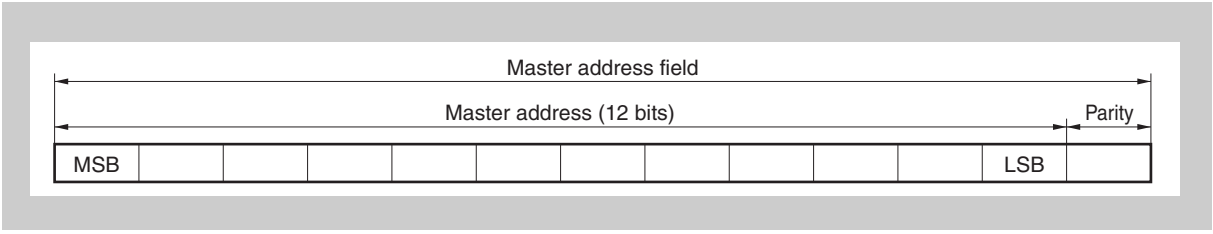


Figure 22.57 Master address field

(4) Slave address field

The master outputs the address of the unit with which it is to communicate.

The configuration of the slave address field is shown in Figure 22.58.

A parity bit is output after a 12-bit slave address has been transmitted to prevent the wrong slave address from being received by mistake. Next, the master unit detects an $\overline{\text{ACK}}$ signal from the slave unit to confirm that the slave unit exists on the bus. The master unit starts outputting the control field after detecting the $\overline{\text{ACK}}$ signal. During broadcast communication, however, the master does not confirm the acknowledge bit and instead starts outputting the control field.

The slave unit outputs the $\overline{\text{ACK}}$ signal if its slave address matches and if the slave detects that the parities of both the master address and slave address are even. The slave unit judges that the master address or slave address has not been correctly received and outputs the NACK signal if the parities are odd. At this time, the master unit is in the standby (monitor) status, and communication ends.

During broadcast communication, the slave address is used to identify group-unit broadcast or all-unit broadcast, as follows:

If the slave address is FFFH: All-unit broadcast communication

If the slave address is not FFFH: Group-unit broadcast communication

Note The group No. during group-unit broadcasting communication is the value of the higher 4 bits of the slave address.

If one unit occupies the bus as the master, the address specified by the IEBBnSAR register is output.

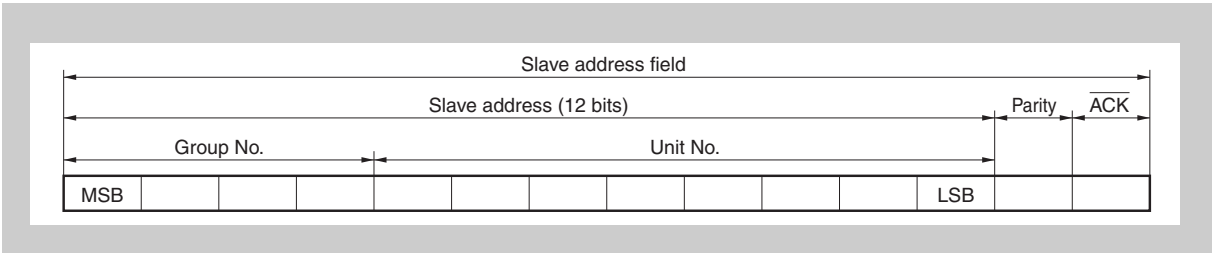

Figure 22.58 Slave address field

(5) Control data field

The master uses this field to output the operation it requires the slave to perform.

The configuration of the control field is shown in Figure 22.59.

If the parity following the control bit is even and the slave unit can execute the function required by the master unit, the slave unit outputs an $\overline{\text{ACK}}$ signal and starts outputting the message length field. If the slave unit cannot execute the function required by the master unit even if the parity is even, or if the parity is odd, the slave unit outputs the NACK signal, and returns to the standby (monitor) status.

The master unit starts outputting the message length field after detecting the $\overline{\text{ACK}}$ signal.

If the master detects the NACK signal, the master unit enters the standby status, and communication ends. During broadcast communication, however, the master unit does not confirm the acknowledge bit and starts outputting the message length field.

If one unit occupies the bus as the master, the value set to the IEBBnTCD register is output.

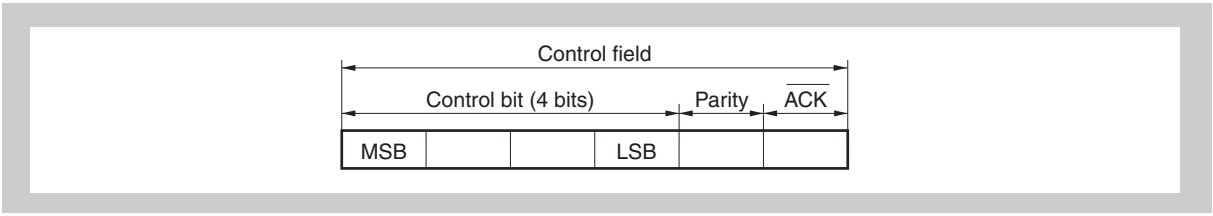

Figure 22.59 Control field

The contents of the control bits are shown below.

Table 22.57 Control bit contents

Bit 3[a]	Bit 2	Bit 1	Bit 0	Function
0	0	0	0	Read slave status
0	0	0	1	Undefined
0	0	1	0	Undefined
0	0	1	1	Read data and lock[b]
0	1	0	0	Read lock address (lower 8 bits)[c]
0	1	0	1	Lock address reading (higher 4 bits)[c]
0	1	1	0	Slave status reading and unlocking[b]
0	1	1	1	Read data
1	0	0	0	Undefined
1	0	0	1	Undefined
1	0	1	0	Command writing and locking[b]
1	0	1	1	Data writing and locking[b]
1	1	0	0	Undefined
1	1	0	1	Undefined

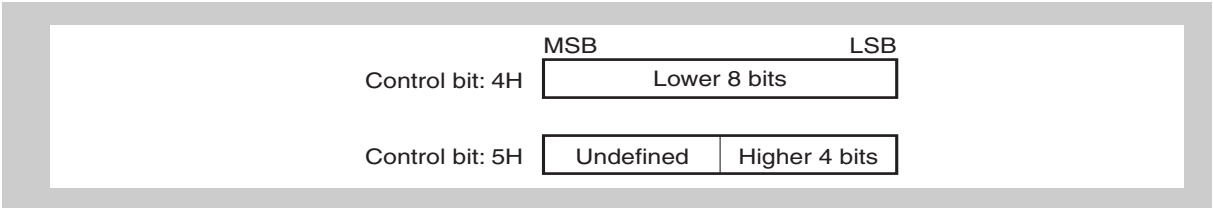
Table 22.57 Control bit contents

Bit 3[a]	Bit 2	Bit 1	Bit 0	Function
1	1	1	0	Write command
1	1	1	1	Write data

a) The message length bit of the message length field and data transfer direction of the data field change as follows depending on the value of bit 3 (MSB).
If bit 3 is 1: Transfer from master unit to slave unit
If bit 3 is 0: Transfer from slave unit to master unit

b) This is a control bit that specifies locking or unlocking. (For details, see 22.7.7 (4) Locking and unlocking.)

c) The lock address is transferred in 1-byte (8-bit) units and is configured as follows:



If the control bit received from the master unit is not as shown in *Table 22.58*, the unit locked by the master unit rejects acknowledging the control bit, and outputs the NACK signal.

Table 22.58 Control field for locked slave unit

Bit 3	Bit 2	Bit 1	Bit 0	Function
0	0	0	0	Read slave status
0	1	0	0	Lock address reading (lower 8 bits)
0	1	0	1	Lock address reading (higher 4 bits)

In addition, units for which locking is not set up by the master unit reject acknowledgment and output a NACK signal when the control data shown in Table 22.59 is acknowledged.

Table 22.59 Control field for unlocked slave unit

Bit 3	Bit 2	Bit 1	Bit 0	Function
0	1	0	0	Lock address reading (lower 8 bits)
0	1	0	1	Lock address reading (higher 4 bits)

Table 22.60 Control field $\overline{\text{ACK}}$ signal response conditions (when the received control data is 0H, 3H, 4H, 5H, 6H, or 7H)

Communication target (IEBBnUSR. IEBBnSRQF bit) Slave specification = 1 No specification = 0	Lock status (IEBBnUSR. IEBBnLCKF bit) Lock = 1 No lock = 0	Master unit judgment (IEBBnPAR register match) Lock request unit = 1 Other = 0	Slave transmission enabled (IEBBnBCR. IEBBnSTXE bit)	Slave reception enabled (IEBBnBCR. IEBBnSRXE bit)	Received control data 0H	3H	4H	5H	6H	7H

1	0	don't care	don't care	1	A			
	1	1						
Other than the above					N			

Note A: Slave transmission is performed. (The $\overline{\text{ACK}}$ signal is returned.)

N: Slave transmission is not performed. (The NACK signal is returned.)

Caution If the received control data is other than the data shown in the above table, N is unconditionally assumed. (Slave transmission is not performed (and the NACK signal is returned).)

(6) Message length field

This field is output by the transmission side to inform the reception side of the number of bytes of the transmit data.

The configuration of the message length field is shown in Figure 22.60.

Table 22.62 shows the relationship between the message length bit and the number of transmission data bytes.

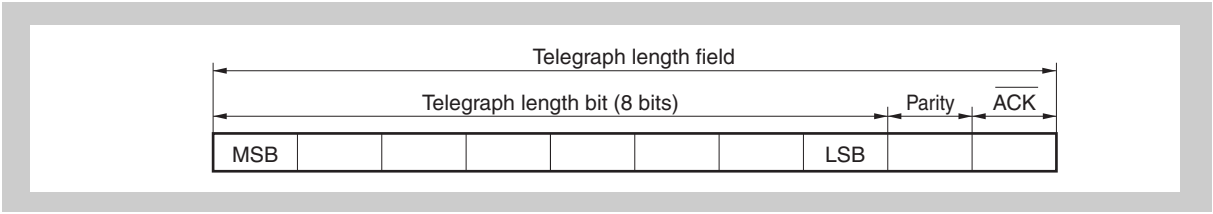

Figure 22.60 Message length field

Table 22.62 Contents of the message length bit

Message length bit (hexadecimal)	Number of transmission data bytes
01H	1 byte
02H	2 bytes
...	...
FFH	255 bytes
00H	256 bytes

The operation of the message length field differs depending on whether the master transmits data (when control bit 3 is 1) or receives data (when control bit 3 is 0).

(a) During master transmission

The message length bit and parity bit are output by the master unit and the synchronization signals of bits are output by the master unit. When the slave unit detects that the parity is even, it outputs the $\overline{\text{ACK}}$ signal, and starts outputting the data field. During broadcast communication, however, the slave unit outputs the NACK signal.

If the parity is odd, the slave unit judges that the message length bit has not been correctly received, outputs the NACK signal, and returns to the standby (monitor) status. At this time, the master unit also returns to the standby status, and communication ends.

(b) Master reception

The message length bit and parity bit are output by the slave unit and the synchronization signals of bits are output by the master unit. If the master unit detects that the parity bit is even, it outputs the $\overline{\text{ACK}}$ signal.

If the parity bit is odd, the master unit judges that the message length bit has not been correctly received, outputs the NACK signal, and returns to the standby status. At this time, the slave unit also returns to the standby status, and communication ends.

(7) Data field

This is data output by the transmission side.

The master unit transmits or receives data to or from a slave unit by using the data field.

The configuration of the data field is shown below.

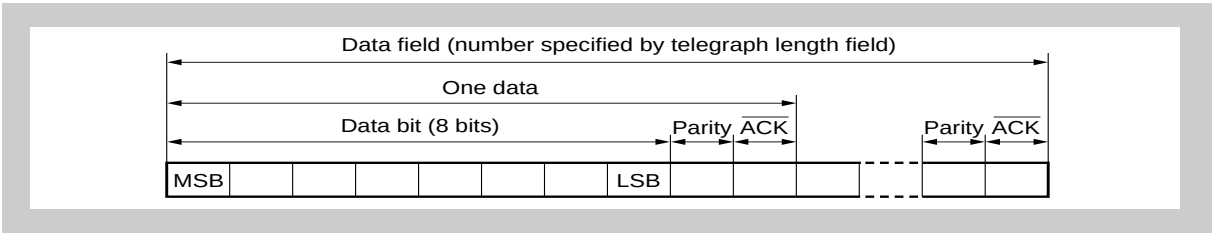

Figure 22.61 Data field

Following the data bit, the parity bit and acknowledge bit are output by the master unit and slave unit, respectively.

Use broadcast communication only when the master unit transmits data. At this time, the acknowledge bit is ignored.

The operation differs as follows depending on whether the master transmits or receives data.

(a) During master transmission

When the master units writes data to a slave unit, the master unit transmits the data bit and parity bit to the slave unit. If the parity is even and the received data is not stored in the IEBBnDR register when the slave unit has received the data bit and parity bit, the slave unit outputs an $\overline{\text{ACK}}$ signal. If the parity is odd or the received data is stored in the IEBBnDR register, the slave unit rejects receiving the data, and outputs the NACK signal.

If the slave unit outputs the NACK signal, the master unit transmits the same data again. This operation continues until the master detects the $\overline{\text{ACK}}$ signal from the slave unit, or the data exceeds the maximum number of transmit bytes.

If there is more data and the maximum number of transmission bytes is not exceeded when the parity is even and when the slave unit outputs the $\overline{\text{ACK}}$ signal, the master unit transmits the next data.

During broadcast communication, the slave unit outputs the NACK signal, and the master unit transfers 1 byte of data at a time. If the parity is odd or the IEBBnDR register is storing received data after the slave unit receives the data bit and parity bit during broadcast communication, the slave unit judges that reception has not been performed correctly, and stops reception.

(b) Master reception

When the master unit reads data from a slave unit, the master unit outputs a sync signal corresponding to all the read bits.

The slave unit outputs the contents of the data and parity bits to the bus in response to the sync signal from the master unit.

The master unit reads the data and parity bits output by the slave unit, and checks the parity.

If the parity is odd or the IEBBnDR register is storing received data, the master unit rejects accepting the data, and outputs the NACK signal. If the maximum number of transmission bytes is within the value that can be transmitted in one communication frame, the master unit rereads the same data.

If the parity is even and the IEBBnDR register is not storing received data, the master unit accepts the data and outputs the ACK signal. If the maximum number of transmission bytes is within the value that can be transmitted in one frame, the master unit reads the next data.

Caution During broadcast communication, do not perform master reception. If you do this, the slave unit cannot be defined and data transfers cannot be performed correctly.

Note that, due to the IEBBn specifications, overrun errors can occur. Therefore, even if reading the IEBBnDR register is late during individual communication and the system has reached the timing for receiving the next data (the overrun status), data can be retransmitted from the master unit by returning a NACK signal, which makes it possible to buy time for reading the IEBBnDR register. However, during broadcast communication, because no ACK signal is output from the slave unit and the master unit ignores ACK signals, even if reading the IEBBnDR register is late, no data is retransmitted from the master. Therefore, for IEBBn, if an overrun occurs during broadcast communication, normal reception is not possible, an overrun error occurs, and an interrupt request (for a communication error) is output.

(8) Parity bit

The parity bit is used to make sure that the transmission data has no error.

The parity bit is appended to each data of the master address, slave address, control, message length, and data bits.

The parity is an even parity. If the number of data bits that are ‘1’ is odd, the parity bit is ‘1’. If the number of data bits that are ‘1’ is even, the parity bit is ‘0’.

(9) Acknowledge bit

During normal communication (communication from one unit to another), an acknowledge bit is appended to the following locations to check whether the data has been correctly received.

- End of slave address field
- End of control field
- End of message length field
- End of data field

The definition of the acknowledge bit is as follows.

0: The transmission data is recognized. ($\overline{\text{ACK}}$ signal)

1: The transmission data is not recognized. (NACK signal)

During broadcast communication, however, the contents of the acknowledge bit are ignored.

(a) Last acknowledge bit of the slave address field

The last acknowledge bit of the slave address field serves as a NACK signal in any of the following cases, and transmission is stopped.

- If the parity of the master address bit or slave address bit is incorrect
- If a timing error (an error in the bit format) occurs
- If a slave unit does not exist

(b) Last acknowledge bit of the control field

The last acknowledge bit of the control field serves as a NACK signal in any of the following cases, and transmission is stopped.

- If the parity of the control bit is incorrect
- If control bit 3 is 1 (write operation) when the slave reception enable flag (the IEBBnBCR.IEBBnSRXE bit) is not set (to 1)

  (For details, see 22.3.2 (1) IEBBnBCR - IEBBn bus control register.)
- If control bit data is read (3H, 7H) when the slave transmission enable flag (the IEBBnBCR.IEBBnSTXE bit) is not set (to 1)

  (For details, see 22.3.2 (1) IEBBnBCR - IEBBn bus control register.)
- If a unit other than one that has set locking requests 3H, 6H, 7H, AH, BH, EH, or FH of the control bit when locking is set
- If the control bit indicates reading of lock addresses (4H, 5H) even when locking is not set
- If a timing error occurs
- If the control bit is undefined

Cautions
1. The $\overline{ACK}$ signal is always returned when the control data of the slave status request is received, if the IEBBnSTXE bit = 0.
2. The NACK signal is returned by the acknowledge bit in the control field when the control data for data/command writing is received, even if the IEBBnSRXE bit = 0.

   Slave reception can be disabled (communication stopped) by the IEBBnSRXE bit only in the case of individual communication. In the case of broadcast communication, communication is maintained and the data interrupt (IEBBTD) or completion interrupt (IEBBTSTA) is generated.

(c) Last acknowledge bit of message length field

The last acknowledge bit of the message length field serves as a NACK signal in any of the following cases, and transmission is stopped.

- If the parity of the message length bit is incorrect
- If a timing error occurs

(d) Last acknowledge bit of the data field

The last acknowledge bit of the data field serves as a NACK signal in any of the following cases, and transmission is stopped.

- If the parity of the data bit is incorrect[a]
- If a timing error occurs after the preceding acknowledge bit has been transmitted
- If the received data is stored in the IEBBnDR register and no more data can be received[a]

a) In this case, when the communication executed is individual communication, if the maximum number of transmit bytes is within the value that can be transmitted in one frame, the transmission side executes transmission of that data field again. For broadcast communication, the transmission side does not execute transmission again, a communication error occurs on the reception side and reception stops.

22.7.7 Transfer data

(1) Slave status

The master unit can learn why the slave unit did not return the $\overline{ACK}$ signal by reading the slave status.

The slave status is determined according to the result of the last communication the slave unit has executed.

All the slave units can supply information on the slave status.

The configuration of the slave status is shown below.

MSB LSB

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Bit 0[a]	Function
0	Transmit data is not written in IEBBnDR register
1	Transmit data is written in IEBBnDR register

Bit 1	Function
0	Receive data is not stored in IEBBnDR register
1	Receive data is stored in IEBBnDR register

Bit 2	Function
0	Unit is not locked
1	Unit is locked

Bit 3	Function
0	Fixed to 0

Bit 4[b]	Function
0	Slave transmission is stopped
1	Slave transmission is ready

Bit 5	Function
0	Fixed to 0

Bit 7	Bit 6	Function	
0	0	Communication mode 0	Indicates the highest communication mode supported by the unit[c].
0	1	Communication mode 1	
1	0	Communication mode 2	
1	1	Not used	

a) After reset: Bit 0 is set to 1.

b) When this module serves as a slave unit, this bit corresponds to the status indicated by IEBBnBCR.IEBBnSTXE bit.

c) Bits 7 and 6 are fixed to “10” because this module can support communication modes 1 and 2.

Figure 22.62 Slave status bit configuration

(2) Lock address

When the lock address is read (control bit: 4H or 5H), the address (12 bits) of the master unit that has issued the lock instruction is configured in 1-byte units as shown below and read.

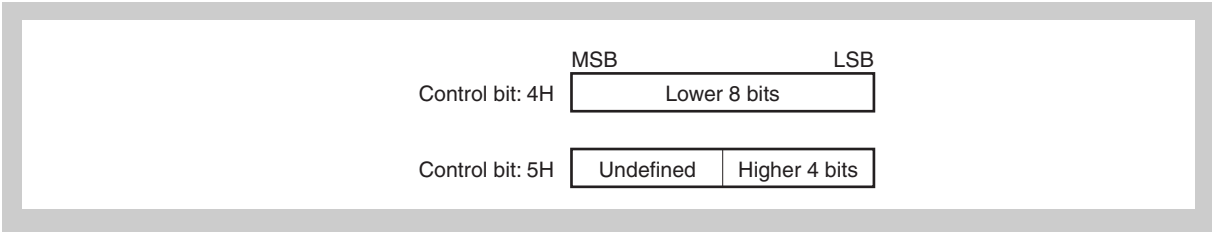

Figure 22.63 Lock address configuration

(3) Data

If the control bit indicates reading of data (3H or 7H), the data in the data buffer of the slave unit is read by the master unit.

If the control bit indicates writing of data (BH or FH), the data received by the slave unit is processed according to the operation rule of that slave unit.

(4) Locking and unlocking

The lock function is used when a message is transferred in two or more communication frames.

The unit that is locked does not receive data from units other than the one that has locked the unit (does not receive broadcast communication).

A unit is locked or unlocked as follows.

(a) Lock setting

If the communication frame is completed without succeeding to transmit or receive data of the number of bytes specified by the message length bit after the message length field has been transmitted or received ($\overline{\text{ACK}}$ = 0) by the control bit that specifies locking (3H, AH, or BH), the slave unit is locked by the master unit. At this time, the bit (bit 2) in the byte indicating the slave status is set to ‘1’.

(b) Unlocked

After transmitting or receiving data of the number of data bytes specified by the message length bit in one communication frame by the control bit that has specified locking (3H, AH, or BH), or the control bit that has specified unlocking (6H), the slave unit is unlocked by the master unit. At this time, the bit related to locking (bit 2) in the byte indicating the slave status is reset to ‘0’.

Locking or unlocking is not performed during broadcast communication.

Locking and unlocking conditions are shown below.

Table 22.63 Setting conditions:

Control data	Broadcast communication		Individual communication	
	End of communication	End of frame	End of communication	End of frame
3H, 6H[a]	–	–	Cannot be locked	Lock set
AH, BH	Cannot be locked	Cannot be locked	Cannot be locked	Lock set
0H, 4H, 5H, EH, FH	Cannot be locked	Cannot be locked	Cannot be locked	Cannot be locked

a) The frame end of control data 6H (slave status read/unlock) occurs when the parity in the data field is odd, and when the NACK signal from the IEBus unit is repeated with up to the maximum number of transfer bytes being output.

Table 22.64 Unlocking conditions (while locked)

Control data	Broadcast communication from the lock request unit		Individual communication from the lock request unit	
	End of communication	End of frame	End of communication	End of frame
3H, 6H[a]	–	–	Unlocked	Remains locked
AH, BH	Unlocked	Unlocked	Unlocked	Remains locked
0H, 4H, 5H, EH, FH	Remains locked	Remains locked	Remains locked	Remains locked

a) The frame end of control data 6H (slave status read/unlock) occurs when the parity in the data field is odd, and when the NACK signal from the IEBus unit is repeated with up to the maximum number of transfer bytes being output.

22.7.8 Bit format

The format of the bits constituting the communication frame of the IEBus is shown below.

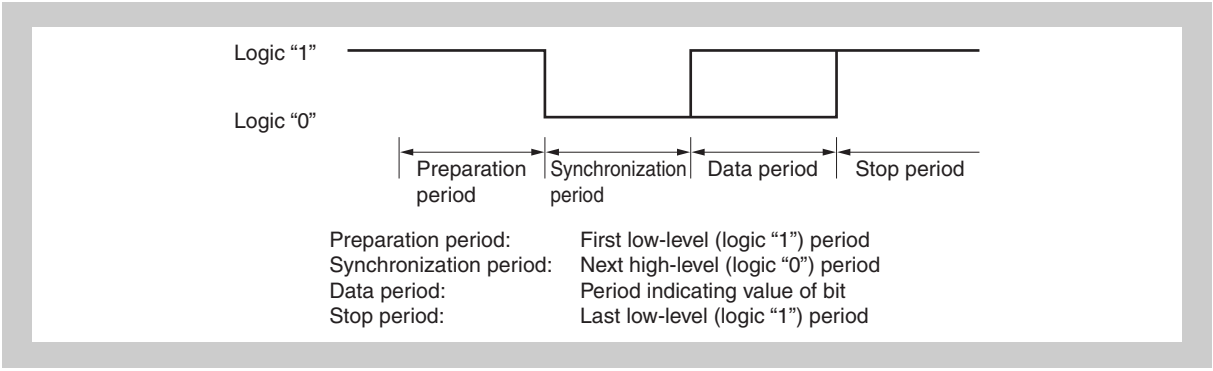

Figure 22.64 IEBus bit format

The synchronization period and data period are almost equal to each other in length.

The IEBus synchronizes each bit. The specifications on the time of the entire bit and the time related to the period allocated to that bit differ depending on the type of transmit bit, or whether the unit is the master unit or a slave unit. The master and slave units monitor whether each period (preparation period, synchronization period, data period, and stop period) is output for the specified time while they are in communication. If a period is not output for the specified time, the master and slave units report a timing error, immediately terminate communication, and enter the standby status.

23. Renesas SPDIF Interface

23.1 Overview

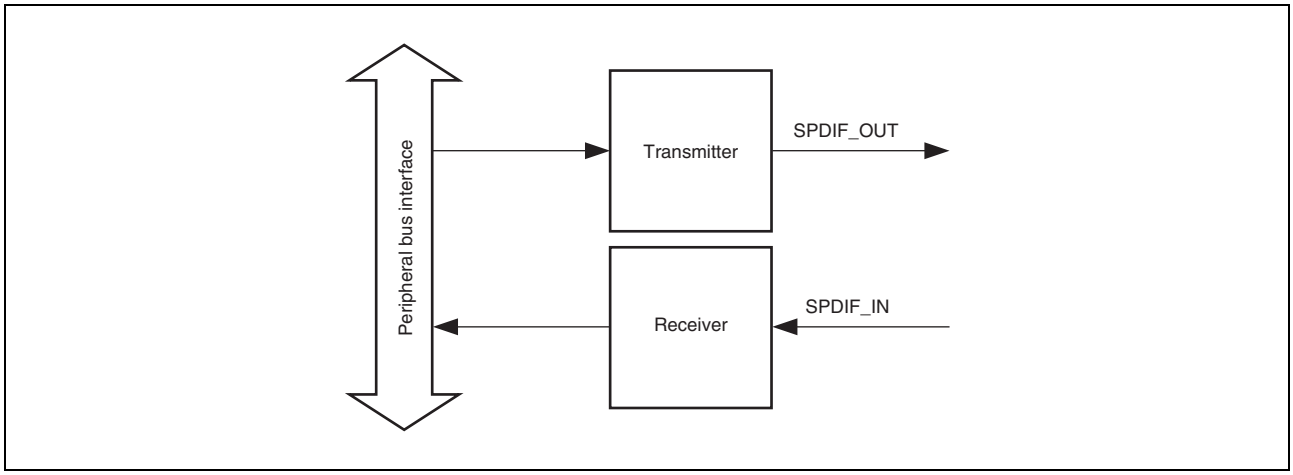

Figure 23.1 Overview Block Diagram

23.2 Features

- Supports the IEC 60958 standard (stereo and consumer use modes only).
- Supports sampling frequencies of 32 kHz, 44.1 kHz, and 48 kHz.
- Supports audio word sizes of 16 to 24 bits per sample.
- Biphase mark encoding.
- Double buffered data.
- Parity encoded serial data.
- Simultaneous transmit and receive
- Receiver autodetects IEC 61937 compressed mode data

23.3 Functional Block Diagram

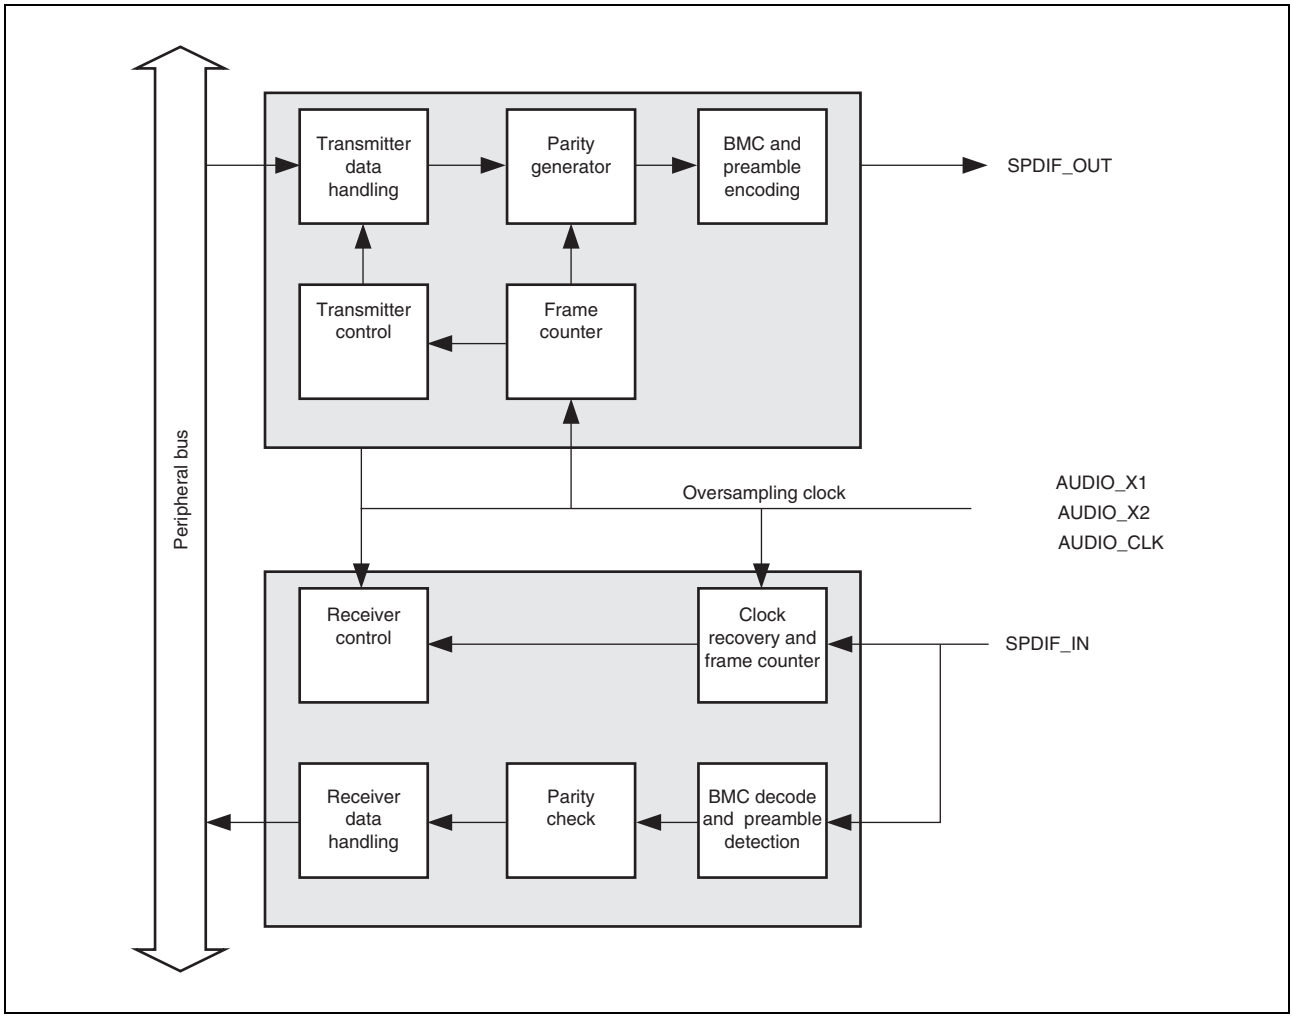

Figure 23.2 Functional Block Diagram

23.4 Input/Output Pins

Table 23.1 shows the pin configuration.

Table 23.1 Pin Configuration

Channel	Pin Name	I/O	Description
0	SPDIF_OUT	Output	Transmitter biphase-mark encoded SPDIF bitstream
1	SPDIF_IN	Input	Receiver biphase-mark encoded SPDIF bitstream
0, 1 (Common)	AUDIO_CLK	Input	External clock for audio
	AUDIO_X1	Input	Crystal resonator/external clock for audio
	AUDIO_X2	Output	

23.5 Renesas SPDIF (IEC60958) Frame Format

The Renesas SPDIF frame consists of two subframes (for channels 1 and 2), each of which contains a 4-bit preamble, audio data of up to 24 bits, a V flag, a user bit, a channel status bit, and an even parity bit. Figure 23.3 shows the subframe format. According to this format, the Renesas SPDIF performs biphase-mark modulation (channel coding) that will make the transmission line's DC component a minimum value.

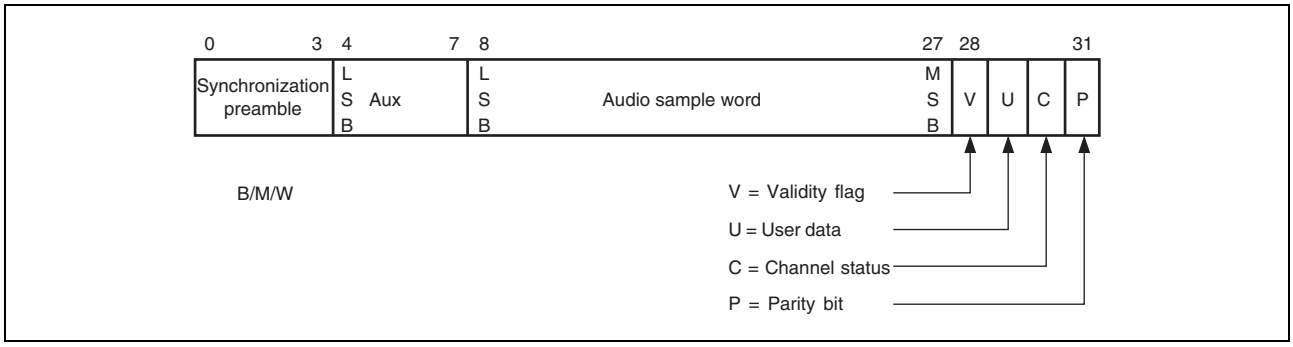

Figure 23.3 Subframe Format

Figure 23.4 shows the block format, which consists of 192 continuous frames. One block begins at the starting frame (preamble B) and ends at the 192nd frame (frame 191), and the preamble is used to identify all subframes. Each block has a total of 384 subframes, which are classified into three categories: subframe 0 indicating the beginning of a new block, subframe 1 (usually the channel 1), and subframe 2 (usually the channel 2). Usually, the music data sent and received by the SPDIF is continuous so that continuous blocks appear.

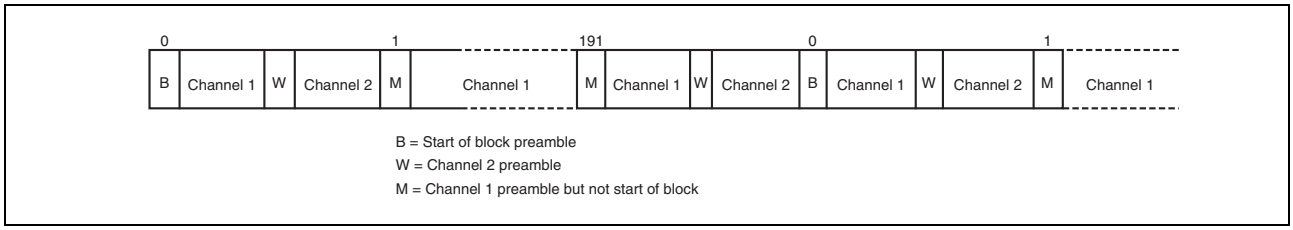

Figure 23.4 Block Format

Table 23.2 shows the binary values of the Renesas SPDIF preambles. The polarity of these preambles differs depending on the status of the preceding symbol (parity bit).

Table 23.2 Binary Preamble Values

Preamble	Preceding Symbol's Status = 0	Preceding Symbol's Status = 1
B	11101000	00010111
M	11100010	00011101
W	11100100	00011011

Note: As shown in Figure 23.3, the even parity bit at time slot 31 of a subframe determines the type of a preamble for one cycle of transmission. Usually, therefore, any one is selected from the set states that are sent through the Renesas SPDIF. However, IEC60958 requires decoding both types in view of connection with the preamble polarity reversed; the Renesas SPDIF has preambles decoded according to Table 23.2.

Channel status information is encoded at the rate of one bit per subframe, making the channel status information per block have a total of 192 bits for each of subframes 1 and 2. For the format of the channel status, refer to the IEC 60958 standard.

23.6 Register

Table 23.3 shows the register configuration.

Table 23.3 Register Configuration

Channel	Register Name	Abbreviation	Address	Access Size
0 (Transmit)	Transmitter channel 1 audio register	TLCA	H'FFFF D800	32
	Transmitter channel 2 audio register	TRCA	H'FFFF D804	32
	Transmitter channel 1 status register	TLCS	H'FFFF D808	32
	Transmitter channel 2 status register	TRCS	H'FFFF D80C	32
	Transmitter user data register	TUI	H'FFFF D810	32
1 (Receive)	Receiver channel 1 audio register	RLCA	H'FFFF D814	32
	Receiver channel 2 audio register	RRCA	H'FFFF D818	32
	Receiver channel 1 status register	RLCS	H'FFFF D81C	32
	Receiver channel 2 status register	RRCS	H'FFFF D820	32
	Receiver user data register	RUI	H'FFFF D824	32
0, 1 (Common)	Control register	CTRL	H'FFFF D828	32
	Status register	STAT	H'FFFF D82C	32
0, 1 (Common)	Transmitter DMA audio data register	TDAD	H'FFFF D830	32
	Receiver DMA audio data register	RDAD	H'FFFF D834	32

Note: All registers are longword registers and must be accessed as such.
A register diagram containing a 0 indicates that the write value should always be 0 (if the register is writeable) and that the read value should always be 0 (if readable).

23.7 Register Descriptions

Legend:

Initial Value: Register value after reset
—: Undefined value
R/W: Readable/writable register. The write value can be read.
R: Read only register. The write value should always be 0.
R/WC0: Readable/writable register. Writing 0 initializes the bit, but writing 1 is ignored.
R/WC1: Readable/writable register. Writing 1 initializes the bit, but writing 0 is ignored.
W: Write only register. Reading is prohibited. If this bit is reserved, the write value should always be 0.
—/W: Write only, Read value undefined

23.7.1 Control Register (CTRL)

Bit:	31	30	29	28	27	26	25	24
	-	-	-	CKS	-	PB	RASS

Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved
28	CKS	0	R/W	Oversampling clock select Selects oversampling clock supply source. 0: AUDIO_X1 1: AUDIO CLK
27	—	0	R	Reserved
26	PB	0	R/W	Pass Back Passes transmitter SPDIF output into SPDIF receiver in SPDIF module. 0: Pass Back disabled 1: Pass Back enabled
25, 24	RASS	All 0	R/W	Receiver Audio Sample Bit Size These bits Indicate the receiver audio sample bit size (16, 20, or 24 bits), for data alignment purposes. 00: 16-bit sample 01: 20-bit sample 10: 24-bit sample 11: Reserved

Bit	Bit Name	Initial Value	R/W	Description
23, 22	TASS	All 0	R/W	Transmitter Audio Sample Bit Size These bits Indicate the transmitter audio sample bit size (16, 20, or 24 bits), for data alignment purposes. 00: 16-bit sample 01: 20-bit sample 10: 24-bit sample 11: Reserved
21	RDE	0	R/W	Receiver DMA Enable Enables DMA requests for the receiver. 0: Receiver DMA disabled 1: Receiver DMA enabled
20	TDE	0	R/W	Transmitter DMA Enable Enables the DMA requests for the transmitter. 0: Transmitter DMA disabled 1: Transmitter DMA enabled
19	NCSI	0	R/W	New Channel Status Information Set this bit to 1 when new channel status information to be corrected is in the transmitter. 0: New channel status information has not been in transmitter 1: New channel status information has been in transmitter
18	AOS	0	R/W	Audio Only Samples Clear this bit to 0 when audio channel 1 and channel 2 registers contain user information. When this bit is set to 1, all user bits are cleared to 0. 0: User information present 1: User information not present
17	RME	0	R/W	Receiver Module Enable Enables the receiver module. 0: Receiver module disabled 1: Receiver module enabled
16	TME	0	R/W	Transmitter Module Enable Enables the transmitter module. 0: Transmitter module disabled 1: Transmitter module enabled
15	REIE	0	R/W	Receiver Error Interrupt Enable Enables the receiver error interrupts. 0: Receiver error interrupt disabled 1: Receiver error interrupt enabled
14	TEIE	0	R/W	Transmitter Error Interrupt Enable Enables the transmitter error interrupts. 0: Transmitter error interrupt disabled 1: Transmitter error interrupt enabled
13	UBOI	0	R/W	User Buffer Overrun Interrupt Enable Enables the user buffer overrun interrupts. 0: User buffer overrun interrupt disabled 1: User buffer overrun interrupt enabled
12	UBUI	0	R/W	User Buffer Underrun Interrupt Enable Enables the user buffer underrun interrupts. 0: User buffer underrun interrupt disabled 1: User buffer underrun interrupt enabled
11	CREI	0	R/W	Clock Recovery Error Interrupt Enable Enables the clock recovery error interrupts. 0: Clock recovery error interrupt disabled 1: Clock recovery error interrupt enabled
10	PAEI	0	R/W	Parity Error Interrupt Enable Enables the parity check error interrupts. 0: Parity check error interrupt disabled 1: Parity check error interrupt enabled

Bit	Bit Name	Initial Value	R/W	Description
9	PREI	0	R/W	Preamble Error Interrupt Enable Enables the preamble check error interrupts. 0: Preamble error interrupt disabled 1: Preamble error interrupt enabled
8	CSEI	0	R/W	Channel Status Error Interrupt Enable Enables the channel status error interrupts. 0: Channel status error interrupt disabled 1: Channel status error interrupt enabled
7	ABOI	0	R/W	Audio Buffer Overrun Interrupt Enable Enables the receiver audio buffer overrun interrupts. 0: Audio buffer overrun interrupt disabled 1: Audio buffer overrun interrupt enabled
6	ABUI	0	R/W	Audio Buffer Underrun Interrupt Enable Enables the transmitter audio buffer underrun interrupts. 0: Audio buffer underrun interrupt disabled 1: Audio buffer underrun interrupt enabled
5	RUII	0	R/W	Receiver User Information Interrupt Enable Enables the receiver user information register full interrupts. 0: Receiver user information interrupt disabled 1: Receiver user information interrupt enabled
4	TUII	0	R/W	Transmitter User Information Interrupt Enable Enables the transmitter user information register empty interrupts. 0: Transmitter user information interrupt disabled 1: Transmitter user information interrupt enabled
3	RCSI	0	R/W	Receiver Channel Status Interrupt Enable Enables the receiver channel status register full interrupts. 0: Receiver channel status interrupt disabled 1: Receiver channel status interrupt enabled
2	RCBI	0	R/W	Receiver Channel Buffer Interrupt Enable Enables the receiver audio channel buffer full interrupts. 0: Receiver audio channel interrupt disabled 1: Receiver audio channel interrupt enabled
1	TCSI	0	R/W	Transmitter Channel Status Interrupt Enable Enables the transmitter channel status register empty interrupts. 0: Transmitter channel status interrupt disabled 1: Transmitter channel status interrupt enabled
0	TCBI	0	R/W	Transmitter Channel Buffer Interrupt Enable Enables the transmitter audio channel buffer empty interrupts. 0: Transmitter audio channel interrupt disabled 1: Transmitter audio channel interrupt enabled

23.7.2 Status Register (STAT)

Bit:	31	30	29	28	27	26	25	24
	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit:	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	CMD
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8
	RIS	TIS	UBO	UBU	CE	PARE	PREE	CSE
Initial value:	1	1	0	0	0	0	0	0
R/W:	R	R	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0

Bit:	7	6	5	4	3	2	1	0
	ABO	ABU	RUIR	TUIR	CSRX	CBRX	CSTX	CBTX
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/WC0	R/WC0	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved
16	CMD	0	R	Compressed Mode Data Sets if the data being received is compressed mode data (When bit 1 = 1 in the V flag and channel status). 0: Data is not in compressed mode 1: Data is in compressed mode
15	RIS	1	R	Receiver Idle State Sets if the receiver is in the idle state. 0: Receiver is not in idle state 1: Receiver in idle state
14	TIS	1	R	Transmitter Idle State Sets if the transmitter is in the idle state. 0: Transmitter is not in idle state 1: Transmitter is in idle state
13	UBO	0	R/WC0	User Buffer Overrun* Sets if the receiver user buffer overruns. This bit is cleared by writing 0 to the register. If bit REIE and bit UBOI in the control register are set this causes an interrupt. 0: User buffer has not overrun 1: User buffer has overrun
12	UBU	0	R/WC0	User Buffer Underrun* Sets if the transmitter user buffer underrun. This bit is cleared by writing 0. If bits TEIE and UBUI in the control register are set this causes an interrupt. 0: User buffer has not underrun 1: User buffer has underrun
11	CE	0	R/WC0	Clock Error* Sets when the clock recovery falls out of synchronization. This bit is cleared by writing 0. If bits REIE and CREI in the control register are set this causes an interrupt. 0: Clock recovery stable 1: Clock recovery error
10	PARE	0	R/WC0	Parity Error* Sets when the parity checker produces a fail result. This bit is cleared by writing 0. If bits REIE and PAEI in the control register are set this causes an interrupt. 0: Parity check correct 1: Parity error

Bit	Bit Name	Initial Value	R/W	Description
9	PREE	0	R/WC0	Preamble Error* Sets when the start of word preamble fails to appear in the correct place. This bit is cleared by writing 0. If bits REIE and PREI in the control register are set this causes an interrupt. Note: Only set after a start of block preamble has occurred. 0: Preamble is in the correct place 1: Preamble error
8	CSE	0	R/WC0	Channel Status Error*1 Sets when the channel status information is written before the 32nd frame of the current block. This bit is cleared by writing 0. If bits TEIE and CSEI in the control register are set this causes an interrupt. 0: Channel status correct 1: Channel status error
7	ABO	0	R/WC0	Audio Buffer Overrun*1 Indicates that the receiver audio buffer is full in both the first and second stages and that data has been overwritten. This bit is cleared by writing 0. If bits REIE and ABOI in the control register are set then this causes an interrupt. 0: Receiver audio buffer has not overrun 1: Receiver audio buffer has overrun
6	ABU	0	R/WC0	Audio Buffer Underrun*1 Indicates that the transmitter audio buffer is empty in both the first and second stages and that the last data transmission has been repeated. This bit is cleared by writing 0. If bits TEIE and ABUI in the control register are set then this causes an interrupt. 0: Transmitter audio buffer has not underrun 1: Transmitter audio buffer has underrun
5	RUIR	0	R	Receiver User Information Register Status Indicates the status of the receiver user information register. This bit is cleared by reading from the receiver user register. If bit RUII in the control register is set then this causes an interrupt. 0: Receiver user information register is empty 1: Receiver user information register is full
4	TUIR	0	R	Transmitter User Information Register Status Indicates the status of the transmitter user information register. This bit is cleared by writing to the transmitter user register. If bit TUII in the control register is set then this causes an interrupt. 0: Transmitter user information register is full 1: Transmitter user information register is empty
3	CSRX	0	R	Channel 1 and Channel 2 Status for Receiver Indicates the status of the receiver channel status registers. This bit is cleared by reading from the receiver channel status registers. If bit RCSI in the control register is set this causes an interrupt. 0: Receiver channel status registers are empty 1: Receiver channel status registers are full
2	CBRX	0	R	Channel 1 and Channel 2 Buffers for Receiver Indicates the status of the receiver audio channel registers. This bit is cleared by reading from the receiver audio channel registers. If bit RCBI in the control register is set this causes an interrupt. 0: Receiver audio channel registers are empty 1: Receiver audio channel registers are full
1	CSTX	0	R	Channel 1 and Channel 2 Status for Transmitter Indicates the status of the transmitter channel status registers. This bit is cleared by writing to the transmitter channel status registers. If bit TCSI in the control register is set this causes an interrupt. 0: Transmitter channel status register is full 1: Transmitter channel status register is empty

Bit	Bit Name	Initial Value	R/W	Description
0	CBTX	0	R	Channel 1 and Channel 2 Buffers for Transmitter Indicates the status of the transmitter audio channel registers. This bit is cleared by writing to the transmitter audio channel registers. If bit TCBI in the control register is set this causes an interrupt. 0: Transmitter audio channel registers are full 1: Transmitter audio channel registers are empty

Note 1. When an error bit is detected during DMA transfer, DMA transfer settings must be made again. In this case, the Renesas SPDIF's module enable bit (either the RME or TME bit) and the DMA enable bit (either the RDE or TDE bit) must be disabled and the error status must be cleared before making DMA transfer settings again. Then the module enable bit should be set and DMA transfer can be started again.

23.7.3 Transmitter Channel 1 Audio Register (TLCA)

Bit:	31	30	29	28	27	26	25	24
	-	-	-	-	-	-	-	-
Initial value:	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W

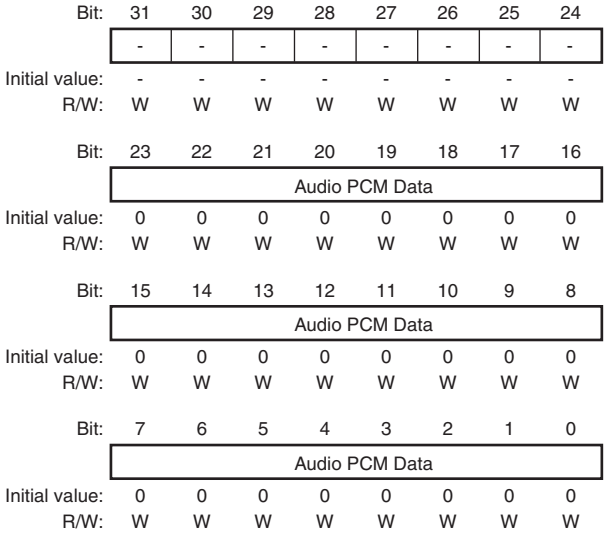
Bit:	23	22	21	20	19	18	17	16
	Audio PCM Data							
Initial value:	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8
	Audio PCM Data							
Initial value:	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W

Bit:	7	6	5	4	3	2	1	0
	Audio PCM Data							
Initial value:	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W

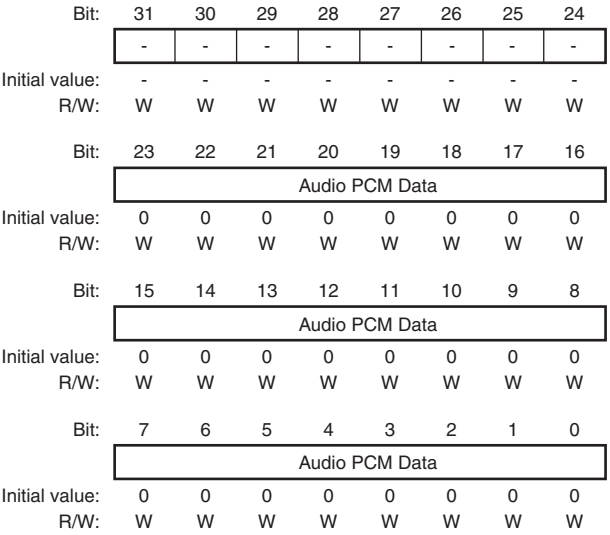
Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	W	Reserved
23 to 0	Audio PCM Data	All 0	W	Audio PCM Data LSB aligned PCM encoded audio data.

23.7.4 Transmitter Channel 2 Audio Register (TRCA)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	W	Reserved
23 to 0	Audio PCM Data	All 0	W	Audio PCM Data LSB aligned PCM encoded audio data.

23.7.5 Transmitter DMA Audio Data Register (TDAD)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	W	Reserved
23 to 0	Audio PCM Data	All 0	W	Audio PCM Data LSB aligned PCM encoded audio data.

23.7.6 Transmitter User Data Register (TUI)

U-bit data in subframes is written in to this register. Because U-bit data is transmitted in a sequence of subframes 1 and 2, you need to update the data on a 16-frame basis. For the contents of the user bytes refer to the appropriate standard for the device in use. The user bits to be transmitted are set in sequence starting at the LSB.

Bit:	31	30	29	28	27	26	25	24
	User Byte 4							
Initial value:	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W

	User Byte 1							
Initial value:	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	User Byte 4	All 0	W	U-bit information is stored here.
23 to 16	User Byte 3	All 0	W	
15 to 8	User Byte 2	All 0	W	
7 to 0	User Byte 1	All 0	W	

23.7.7 Transmitter Channel 1 Status Register (TLCS)

The 30-bit register stores the channel status information to be transmitted. For each channel, channel status information per frame consists of 192 bits. Because necessary data covers only the 30 bits that are set in the following register, zeros continue to be sent after the transmission of the first 30 bits.

Bit:	31	30	29	28	27	26	25	24
	-	-	CLAC[1:0]		FS[3:0]			
Initial value:	-	-	0	0	0	0	0	0

15 to 8	CATCD[7:0]	All 0	W	Category Code (Example) 00000000: 2-channel general format 00000001: 2-channel compact disc (IEC 908) 00000010: 2-channel PCM encoder/decoder 00000011: 2-channel digital audio tape recorder
7, 6	—	All 0	W	Reserved The write value should always be 0.
5 to 1	CTL[4:0]	All 0	W	Control The control bits are copied from the source (see IEC60958 standard).
0	—	0	W	Reserved The write value should always be 0.

23.7.8 Transmitter Channel 2 Status Register (TRCS)

The 30-bit register stores the channel status information to be transmitted. For each channel, channel status information per frame consists of 192 bits. Because necessary data covers only the 30 bits that are set in the following register, zeros continue to be sent after the transmission of the first 30 bits.

Bit:	31	30	29	28	27	26	25	24

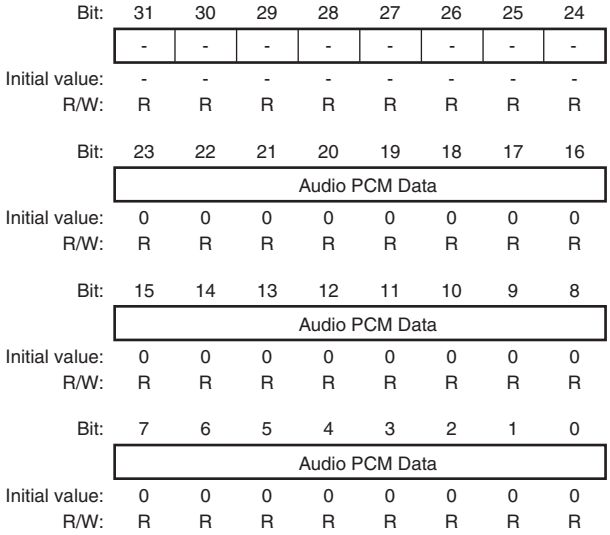
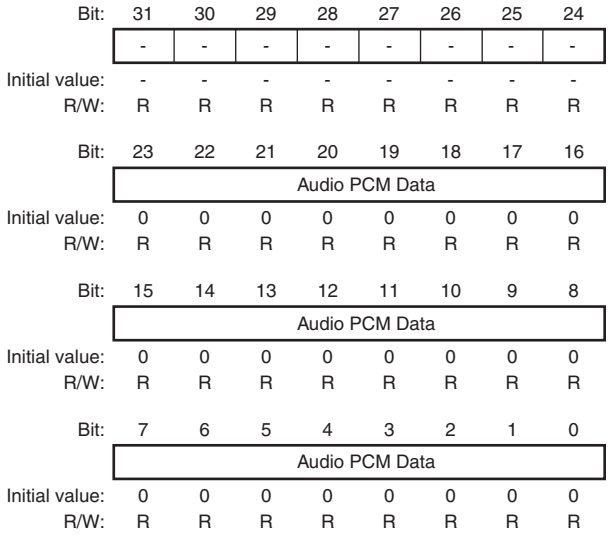
27 to 24	FS[3:0]	All 0	W	Sample Frequency (FS) 0000: 44.1 kHz 0010: 48 kHz 0011: 32 kHz
23 to 20	CHNO[3:0]	All 0	W	Channel Number 0000: Don't care 0001: A (left channel) 0010: B (right channel) 0011: C
19 to 16	SRCNO[3:0]	All 0	W	Source Number 0000: Don't care 0001: 1 0010: 2 0011: 3
15 to 8	CATCD[7:0]	All 0	W	Category Code (Example) 00000000: 2-channel general format 00000001: 2-channel compact disc (IEC 908) 00000010: 2-channel PCM encoder/decoder 00000011: 2-channel digital audio tape recorder
7, 6	—	All 0	W	Reserved The write value should always be 0.
5 to 1	CTL[4:0]	All 0	W	Control The control bits are copied from the source (see IEC60958 standard).
0	—	0	W	Reserved The write value should always be 0.

23.7.9 Receiver Channel 1 Audio Register (RLCA)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 0	Audio PCM Data	All 0	R	Audio PCM Data LSB aligned PCM encoded audio data.

23.7.10 Receiver Channel 2 Audio Register (RRCA)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 0	Audio PCM Data	All 0	R	Audio PCM Data LSB aligned PCM encoded audio data.

23.7.11 Receiver DMA Audio Data (RDAD)

Bit:	31	30	29	28	27	26	25	24
	-	-	-	-	-	-	-	-
Initial value:	-	-	-	-	-	-	-	-
R/W:	R	R	R	R	R	R	R	R

Bit:	23	22	21	20	19	18	17	16
	Audio PCM Data							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

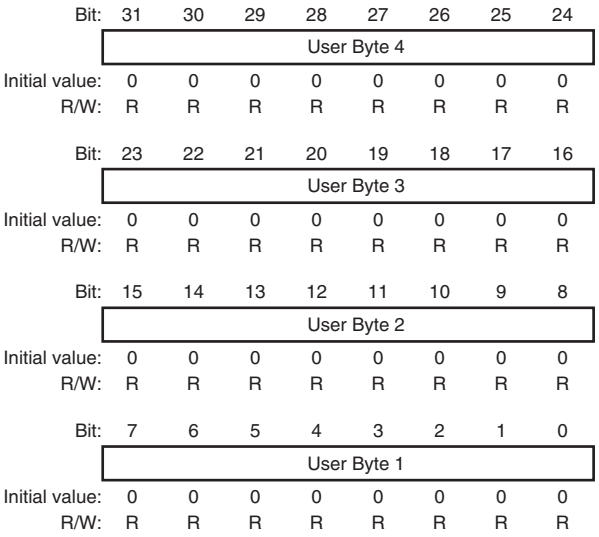
	Audio PCM Data							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit:	7	6	5	4	3	2	1	0
	Audio PCM Data							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	—	R	Reserved
23 to 0	Audio PCM Data	All 0	R	Audio PCM Data LSB aligned PCM encoded audio data.

23.7.12 Receiver User Data Register (RUI)

The register stores the U-bit data received through the Renesas SPDIF. Because U-bit data is stored in a sequence of subframes 1 and 2 starting at the LSB, you need to read the data on a 16-frame basis. For the contents of the user bytes refer to the appropriate standard for the device in use.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	User Byte 4	All 0	R	U-bit information is stored here.
23 to 16	User Byte 3	All 0	R	
15 to 8	User Byte 2	All 0	R	
7 to 0	User Byte 1	All 0	R	

23.7.13 Receiver Channel 1 Status Register (RLCS)

The channel status is stored starting at the register's LSB in a way that subframe 1 received from the beginning of the block is stored. For the contents of the channel status register, refer to the IEC-60958 standard.

Bit:	31	30	29	28	27	26	25	24

0	—	0	R	Reserved

23.8 Functional Description—Transmitter

23.8.1 Transmitter Module

The transmitter module transmits PCM data and auxiliary information after encoding it according to the method of biphase-mark modulation that complies with the IEC60958 standard (SPDIF).
The clock for the transmitter module is an oversampling clock supplied from the outside. This clock usually selects a value that serves as an oversample at a frequency eight times larger than the clock frequency required for biphase-mark encoding. In this case, the clock frequency required to transmit 32 time slots in a subframe is 512 times as large as the sample frequency for audio data.
Audio data and channel status information are first written into the module's channel 1 and then into channel 2.
Generally, the channel status need to be written only when the information changes. The SPDIF module requests that the channel status be written in 30 frames -- when all the current channel status data have been transmitted. You need to write somewhere between frame 31 and the beginning of the next block of 192 frames.
The audio data is stored in a double buffer arrangement. To make sure that the first stage buffer is empty, you can send an interrupt request or poll the status register. DMA transfers send channel 1 audio data on the first request and channel 2 data on the second.
The channel status information is stored in the 30-bit registers of channels 1 and 2. For each channel, the channel status information per frame consists of 192 bits. Because necessary data covers only 30 bits, zeros continue to be sent after the transmission of the first 30 bits until the block is completed.
User data forms a 32-bit double buffer arrangement. You can make sure that the first stage buffer is empty by either sending an interrupt request or polling the status register. Usually, information about the user data will become insufficient with the length of data between blocks. Transmission takes place in a sequence of channels 1 and 2. For the user data within a block, 384 bits are transmitted before the next block is continuously transmitted.
The audio data handled by the Renesas SPDIF module is a linear PCM, making it possible to set up to 24 bits. For this reason, the V flag indicating that audio data is a linear PCM remains to be 0. The V flag involves no register-based setting. An even parity is created for each 32 bits of serial output data (excluding the preamble).

Note: • When transmitter user buffer underrun occurs, the current data in the buffer data of SPDIF is transmitted until the next data is filled.

23.8.2 Transmitter Module Initialization

The device defaults to an idle state when it comes out of reset, or can be put into an idle state when 0 is written to the TME bit in the CTRL register. When the transmitter module is idle, it has the following settings:

- The transmitter idle status bit (TIS) is set to 1, all other status bits are cleared to 0.
- Preamble generation is invalid.
- Synchronization between channels 1 and 2 is set to 0 (0 for channel 1, 1 for channel 2).
- Both word_count and frame_count are set to 0.
- The output from the biphase-mark encoder is set to 0.

Channel status, user and audio data registers will retain its value prior to putting the module into idle. To exit the idle state the user must write 1 to the TME bit in the CTRL register.

23.8.3 Initial Settings for Transmitter Module

When the TME bit is set to 1, the TUIR and CSTX bits are set to 1. After that, if data is written in the order of 1) TUI and 2) TLCS and TRCS, a channel status error will occur. To avoid this, be sure to write data in the order of 1) TLCS and TRCS and 2) TUI.
Before writing the first audio data (write access to TLCA or TRCA by the CPU or write access to TDAD by the DMA transfer) after setting the TME bit to 1, be sure to check that the CSTX and TUIR bits are cleared by writing to TLCS, TRCS, and TUI.

23.8.4 Transmitter Module Data Transfer

Once the transmitter module has left the idle state, it is ready for data transfer. Data transfer timing can be achieved in three ways. Either the transfer is done by interrupts, DMA requests or by polling the status register. There is a shared interrupt line (for both transmit and receive) and a single transmitter DMA request line.
Figure 23.5 shows a data transfer with an interrupt for the transmitter.

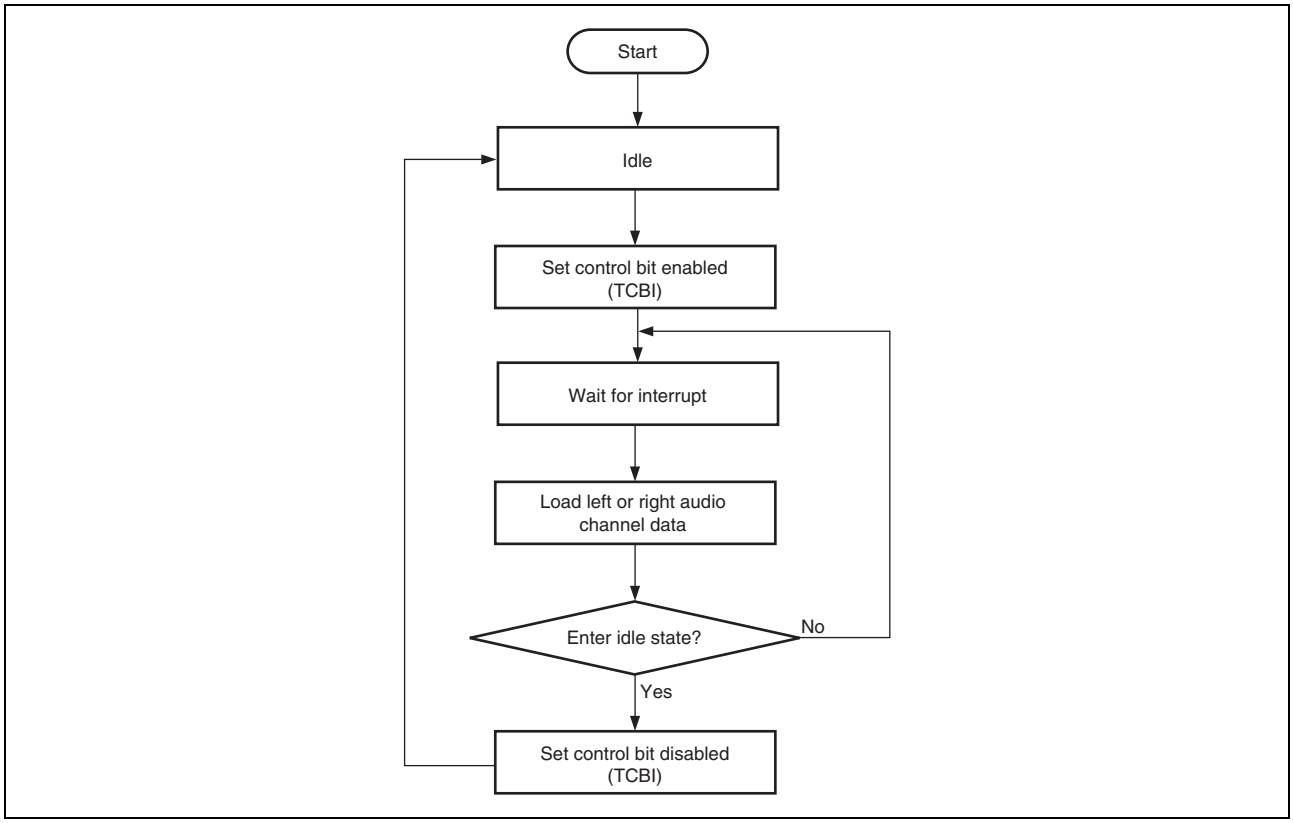

Figure 23.5 Transmitter Data Transfer Flow Diagram - Interrupt Driven

Figure 23.6 shows a data transfer with a DMA transfer for the transmitter.

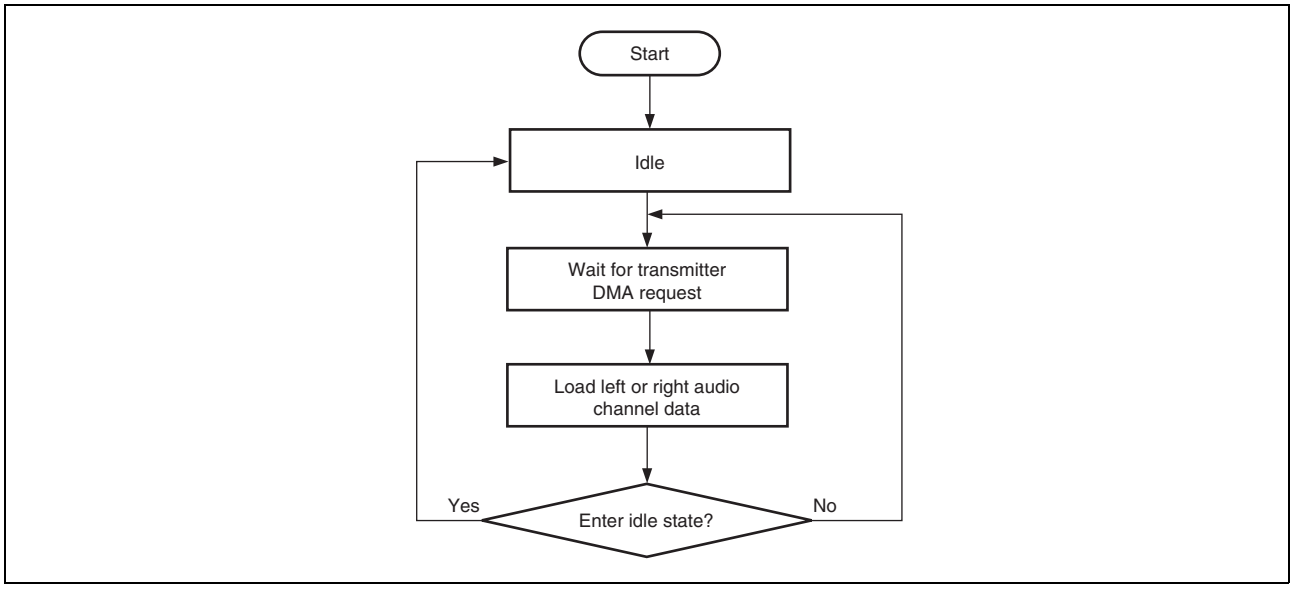

Figure 23.6 Transmitter Data Transfer Flow Diagram—DMA Request Driven

Channel status information is required to be updated when the information has changed. Because the updating needs to be done before the transmission of the next block, the channel status to be updated should be written after 30 frames have been sent; this is indicated either by an interrupt or by polling the status bit. If channel status is written before 30 frames have been sent (while current information is being sent) then an interrupt indicates that the channel status error bit (CSE) in the status register has been set.

Note: • 30 frames contains all the valid information in a single channel status block.

23.9 Functional Description—Receiver

23.9.1 Receiver Module

The receiver module demodulates data and clock signals from the input encoded according to the IEC60958 standard. The encoded data, shown in linear PCM format, is stored into the audio data register. The register also stores the channel status and user information being received simultaneously as auxiliary information.
The main clock for the receiver module is an oversampling clock supplied from the outside. The module operates at a frequency four times as large as the oversampling clock.

Note: • The oversampling clock is the same for the transmitter and receiver.

Clock recovery is performed using a pulse width counter and averaging filters to produce a sampling pulse in the middle of each bit in the datastream. A clock error status bit indicates clock synchronization loss. Synchronization is achieved when a preamble occurs on the data stream for the first time. Continuous adjustment prevents jitter and/or clock drift from affecting clock recovery, provided that they fall within the clock recovery specifications.
Once the clock recovery is successful the biphase-mark decoder initiates its preamble detection. The decoder searches for the start of block preamble (see Table 23.2). A preamble error status bit indicates that following preambles have not appeared at the correct time, such failures are most likely caused by transmission loss or interference.
Even parity checking is performed on the decoded data. A discrepancy will result in the parity error status bit being set.
The SPDIF module acquires user data and channel status information in addition to audio data. The audio is stored in a double buffer arrangement. Either an interrupt request because of a full buffer or polling of the status bit will indicate when the data is ready to be read. DMA transfers receive channel 1 audio data on the first request and channel 2 data on the second.
Channel status is stored in a 30-bit register. Channel status information is received at 1-bit per subframe. Therefore the registers will not be full until a total of 30 frames for each channel have been received. New channel status is compared with the current data to see if it has changed and is only read by the processor if it has. User data, which is also received at the same time, is stored into the register on a subframe basis, so that the reception is completed when 16 frames are reached.

Note 1. Channel status data requests do not support DMA.
Note 2. When receiver user buffer overrun occurs, the current data in the buffer data of SPDIF is overwritten by the next incoming data from SPDIF interface.

23.9.2 Receiver Module Initialization

The device defaults to an idle state when it comes out of reset, or can be put into an idle state by writing 0 to bit RME in the CTRL register. Whilst idle the module has the following settings:

- The receiver idle status bit is set to 1, all other status bits are cleared to 0.
- Synchronization between channels 1 and 2 is set to 0 (0 for channel 1, 1 for channel 2).
- Both Word_count and frame_count are set to 0.

Channel status registers, user data registers and audio data registers will retain its value prior to putting the module into idle. To exit the idle state the user must write 1 to the bit RME in the CTRL register.

23.9.3 Receiver Module Data Transfer

Once the module has left the idle state it is ready for data transfer. Data transfer timing can be achieved in three ways. The transfer can be done by interrupts, or by polling the status register, or by DMA. There is a shared interrupt line (transmit and receive) and a single receiver DMA request line. Data transfer for the receiver can be interrupted by error signals caused by:

1. Clock recovery failure.
2. Transmission loss or interference – indicated by a preamble error.
3. Parity check failure.

Transmission loss or interference can cause the start of subframe or start of block preamble to be misplaced or not present.
Parity check failure occurs when the parity bit is incorrect, this can be caused by any of the above.

- Clock Recovery Deviation
  The receive margin for clock recovery is based on the following equation:

$$M = \left| \left(0.5 - \frac{1}{2N} \right) - (L - 0.5)\, F - \frac{|D - 0.5|}{N} (1 + F) \right| \times 100\%$$

where M = receive margin
N = oversampling rate
L = frame length = 33
D = duty cycle = 0.6
F = oversampling clock deviation = Level II accuracy = 1000 in $10e^{-6}$

Figure 23.7 indicates what the receive margin M represents

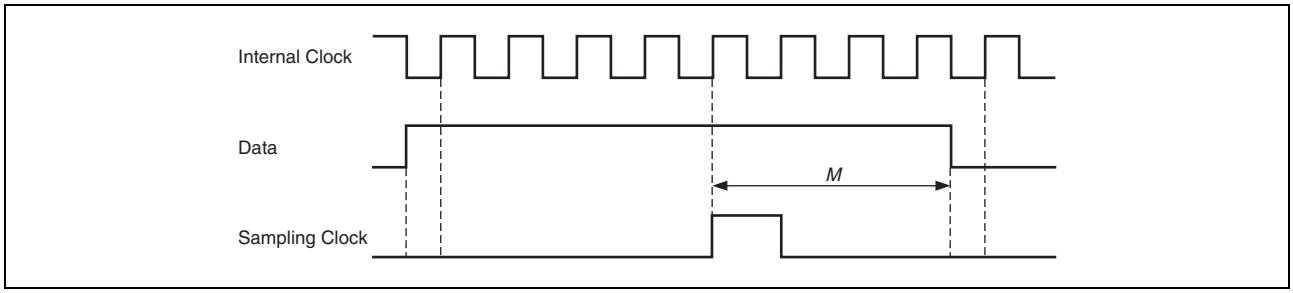

Figure 23.7 Receive Margin

Introducing jitter into the equation gives the following inequality.

$$j \leq \left| \left(0.5 - \frac{1}{2N} \right) - (L - 0.5)\, F - \frac{|D - 0.5|}{N} (1 + F) \right| \times 100\%$$

J = clock jitter
Eight times oversampling produces a receive margin = 39.25%
Four times oversampling produces a receive margin = 31.75%
Two times oversampling produces a receive margin = 16.75%

The fastest sample frequency is 48 kHz. This requires a clock speed of 128 × 48 kHz = 6.144 MHz. The worst case jitter in one cycle is specified at 40 ns = 24.5% of the period. This means that an oversampling rate of 4 or more will satisfy the inequality and therefore be sufficient for clock recovery.

Figure 23.8 illustrates the receiver data transfer using interrupts.

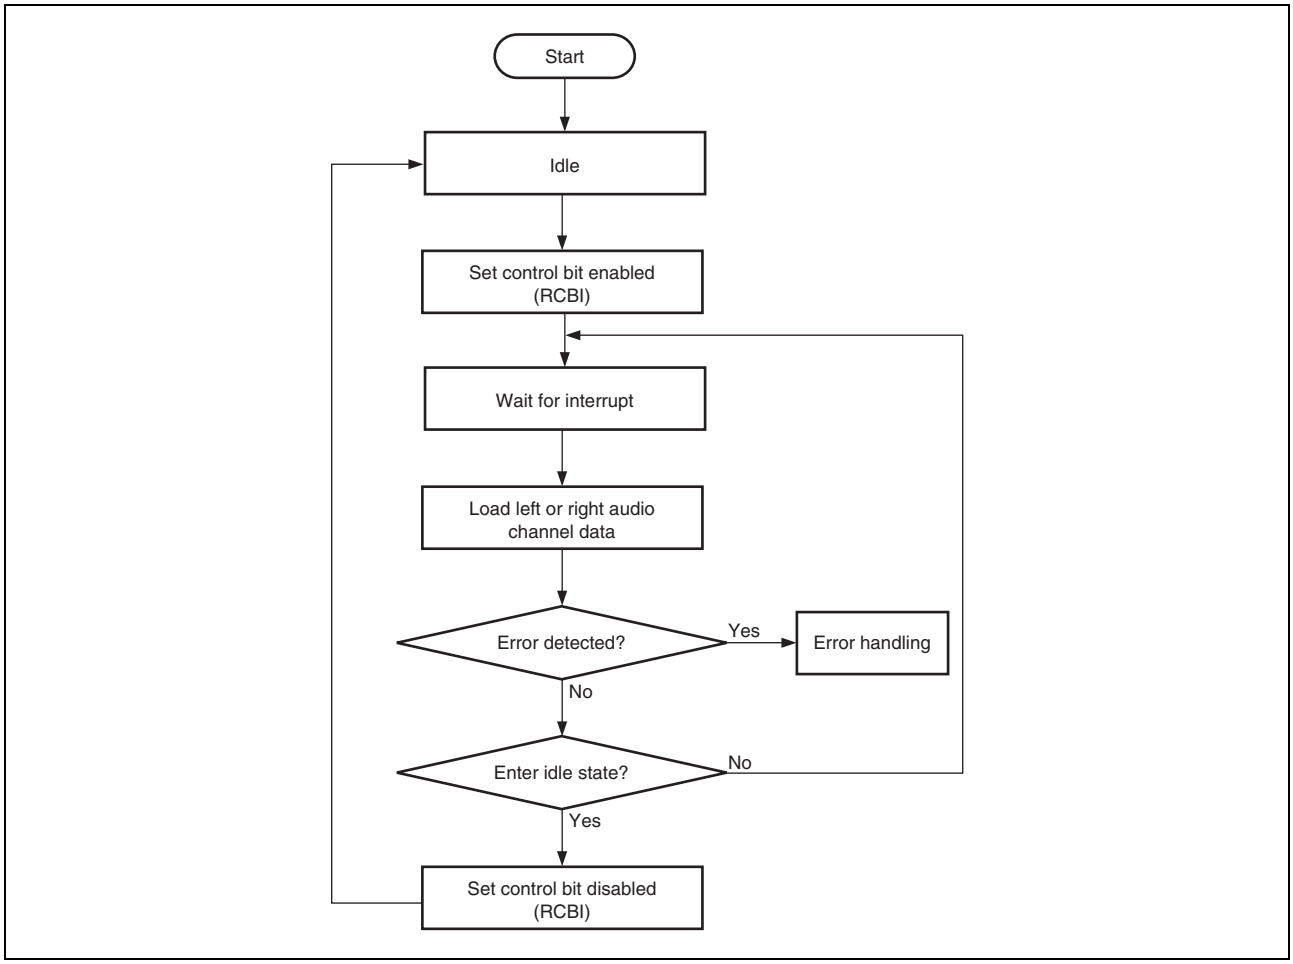

Figure 23.8 Receiver Data Transfer Flow Diagram - Interrupt Driven

Interrupts to indicate that the channel status information register is full occur after frame 30 has been received and only if the information has changed. When the first four bytes have been stored an interrupt occurs.

23.10 Disabling the Module

23.10.1 Transmitter and Receiver Idle

The transmitter or receiver modules can be disabled by writing 0 to the idle bit in the control register (TME for the transmitter and RME for the receiver). The idle state can be detected by polling the idle bit in the status register (TIS and RIS).

23.11 Compressed Mode Data

Compressed mode data is defined in the IEC 61937 specification. This module only detects compressed mode data. This is done by checking the parity flag (V flag) and bit 1 in the channel status data. If both are one then the data is in compressed mode. This is indicated by the setting of the CMD bit in the status register.

Note: • Only the receiver detects compressed mode data since the information is not relevant to the transmitter.

23.13 Usage Notes

23.13.1 Clearing TUIR

After TUI is written to, the TUIR bit is cleared only after transmission of a maximum of one frame is completed. When using a transmitter user information interrupt to write data to TUI, check that the TUIR bit is cleared before terminating the interrupt handling routine so that the interrupt is not unexpectedly accepted again.

23.13.2 Frequency of Clock Input for Audio

The frequency of the clock input to the AUDIO_X1 and AUDIO_X2 or AUDIO_CLK must be lower than the Bϕ frequency.

24. CD-ROM Decoder

The CD-ROM decoder decodes streams of data transferred from the CD-DSP. When the medium is CD-DA*1, the data stream is not input to the CD-ROM decoder because it consists of PCM data. In the case of CD-ROM*2, the stream of data is input and the CD-ROM decoder performs sync code detection and maintenance, descrambling, ECC correction, and EDC checking, and outputs the resulting stream of data.
However, since the stream received by the CD-ROM decoder is assumed to consist of data from a CD-ROM transferred via the serial sound interface, the decoder does not bother with the subcodes defined in the CD-DA standard.

Note 1. Compliant with JIS S 8605 (Red Book)
Note 2. Compliant with JIS X 6281 (Yellow Book)

24.1 Features

- Sync-code detection and maintenance
  Detects sync codes from the CD-ROM and is capable of providing sync-code maintenance (automatic interpolation of sync codes) when the sync code cannot be detected because of defects such as scratches on the disc.
  Five sector-synchronization modes are supported: automatic sync maintenance mode, external sync mode, interpolated sync mode, and interpolated sync plus external sync mode.
- Descrambling
- ECC correction
  P-parity-based correction, Q-parity-based correction, PQ correction, and QP correction are available.
  PQ correction and QP correction can be applied repeatedly up to three times. This, however, depends on the speed of the CD. For example, three iterations are possible when the CD-ROM decoder is operating at 60 MHz with a double-speed CD drive.
  Two buffers are provided due to the need for ECC correction. This allows parallel operation, where ECC correction is performed in one buffer while the data stream is being received in the other.
- EDC checking
  The EDC is checked before and after ECC correction. An operating mode is available in which, if the result of pre-ECC correction EDC checking indicates no errors, ECC correction is not performed regardless of the result of syndrome calculation.
- Data buffering control
  The CD-ROM decoder outputs data to the buffer area in a specific format where the sync code is at the head of the data for each sector.

24.1.1 Formats Supported by CD-ROM Decoder

This module supports the five formats shown in Figure 24.1.

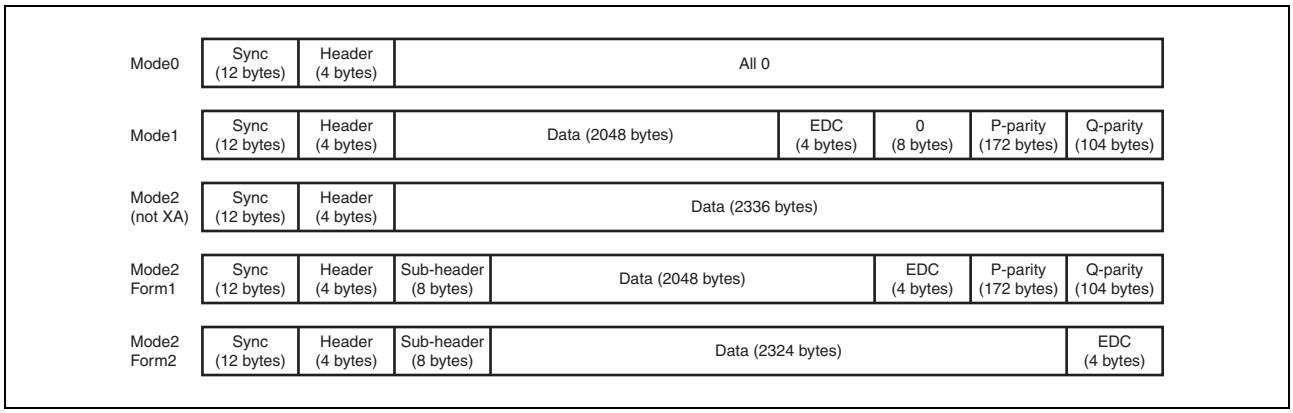

Figure 24.1 Formats Supported by CD-ROM Decoder

24.2 Block Diagrams

Figure 24.2 is a block diagram of the CD-ROM decoder functions of this LSI and the bus bridge for connection to the bus, that is, of the elements required to implement the CD-ROM decoder function.

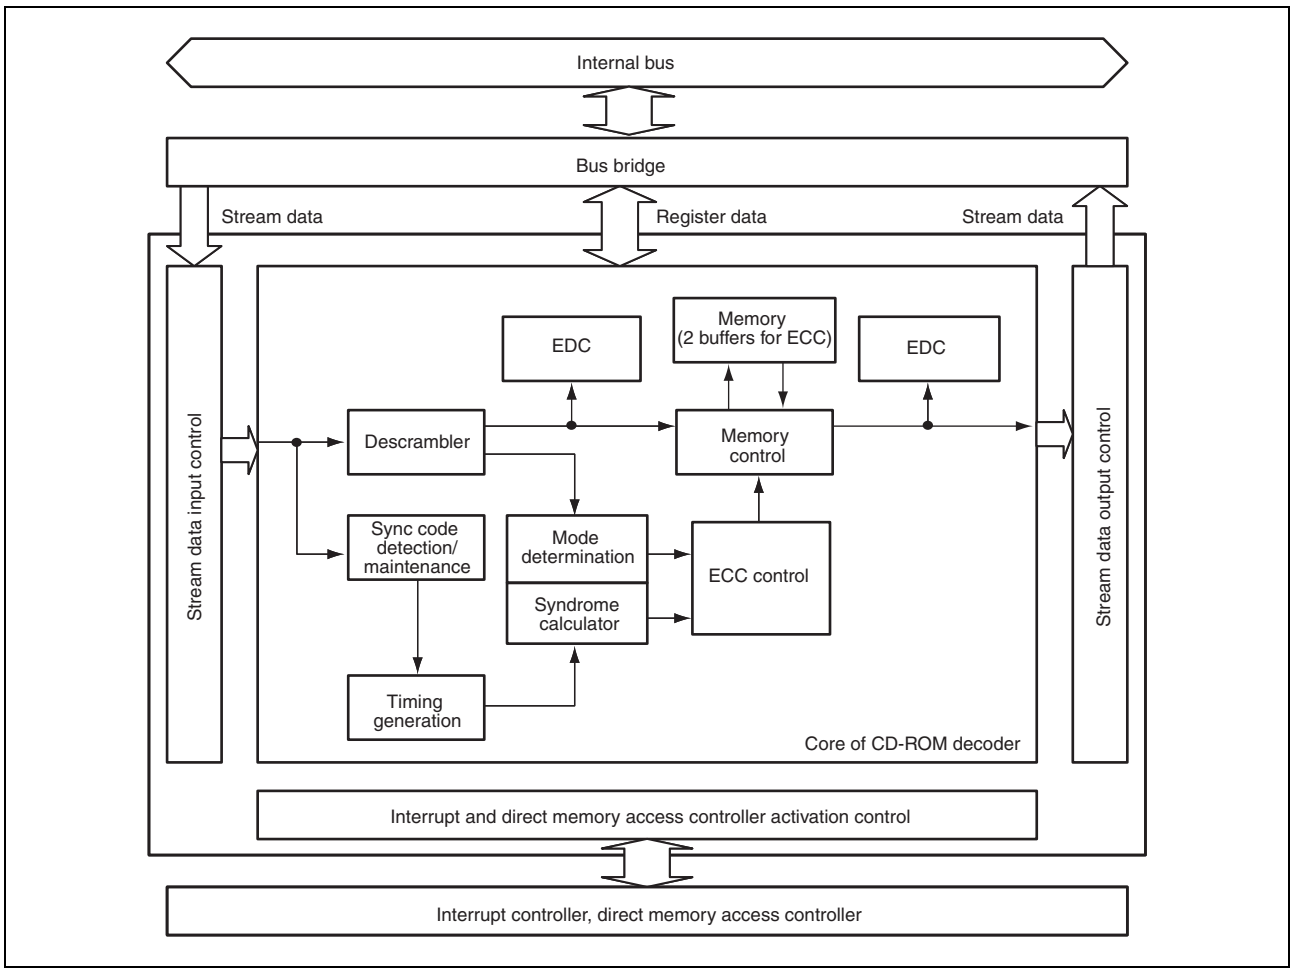

Figure 24.2 Block Diagram

The core of the CD-ROM decoder executes a series of processing required for CD-ROM decoding, including descrambling, sync code detection, ECC correction (P- and Q-parity-based correction), and EDC checking. The core includes sufficient memory to hold two sectors of data.
Input data come from the internal bus and output data go out via the internal bus along a single line each, but the bus bridge logic sets up branches for the register access port and stream data port.
The stream data from the CD-DSP are transferred via the serial sound interface to the stream data input control block. They are then subjected to descrambling, ECC correction, and EDC checking as they pass through the CD-ROM decoder. After these processes, data from one sector are obtained. The data are subsequently transferred to the stream-data buffer via the stream-data output control block. Stream data can be transferred by either the direct memory access controller or the CPU.
Figure 24.3 is a block diagram of the bus-bridge logic.
Since the input stream is transferred over the serial sound interface, transfer is relatively slow. On the other hand, data from the output stream can be transferred at high speeds because they are already in the core of the CD-ROM decoder. Since the data for output are buffered in SDRAM or other memory, they must be transferred at high speeds in order to reduce the busy rate of the SDRAM. For this reason, the data for the output stream are read out before the CD-ROM decoder receives an output stream data read request from the internal bus. This allows the accumulation of streaming data in the registers of the bus bridge, so that the data are ready for immediate output to the internal bus upon a request from the internal bus. Accordingly, the reception of a request to read from registers other than the stream-data registers after the stream data has already been read out and stored in the register of the bus bridge is possible. To cope with this, the CD-ROM decoder is provided with separate intermediary registers for the output stream-data register and the other registers.

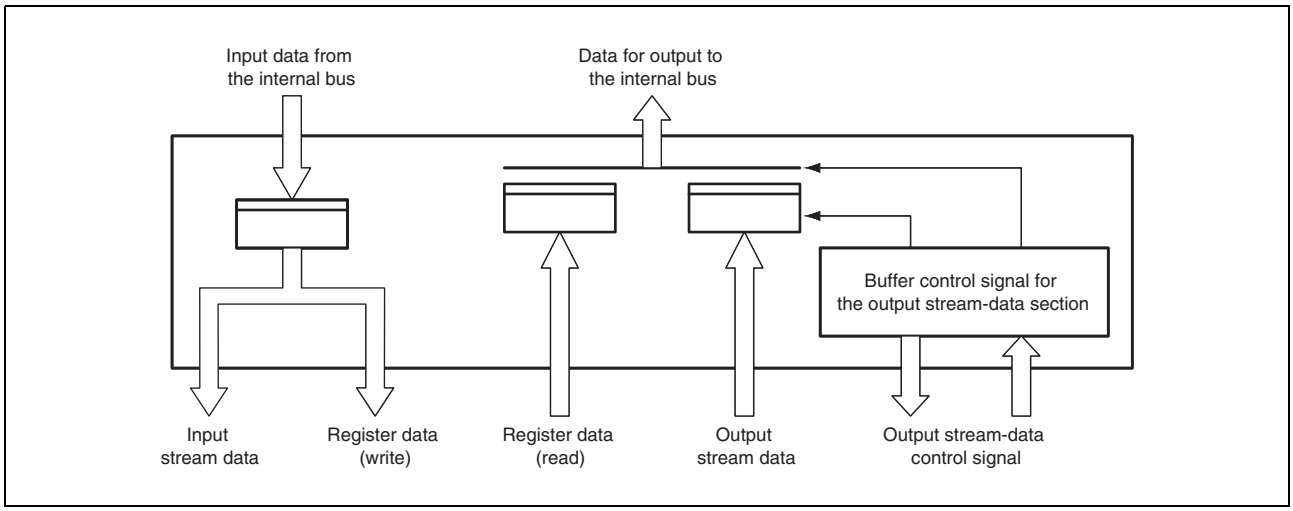

Figure 24.3 Schematic Diagram of the Bus Bridge

Figure 24.4 is a schematic diagram of the stream-data input control block. The stream-data input controller contains logic that controls the stream of input data and a register that is used to change the control mode of the CD-ROM decoder.
The serial sound interface mode used to transfer the stream data may affect the order (through the endian setting) or lead to padding before the data is transferred. To handle the different arrangements of data appropriately, the stream-data input control block includes a register for changing the operating mode and generates signals to control the core of the CD-ROM decoder.
The data holding registers for the input stream consists of two 16-bit registers. The data holding registers are controlled according to the mode set in the control register. For example, controlling the order in which 16-bit data is supplied to the core of the CD-ROM decoder (sending the second 16-bytes first or vice versa). It is also possible to stop the supply of padding data to the core of the CD-ROM decoder.

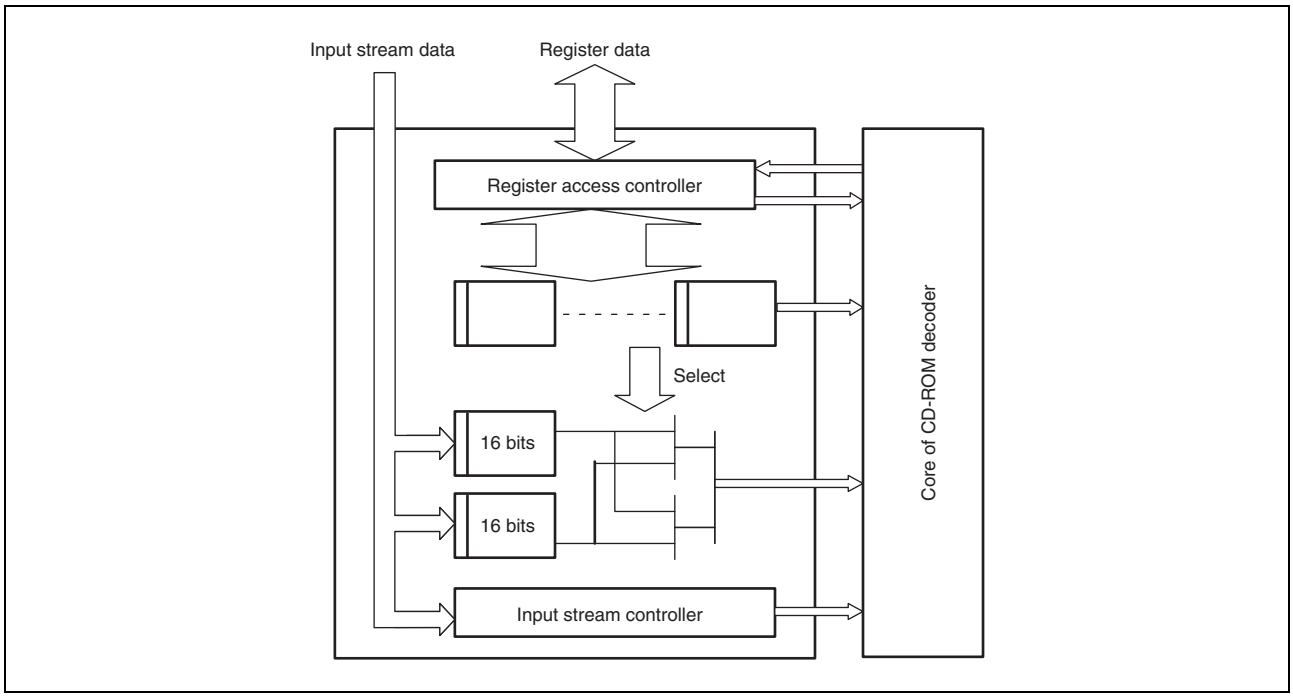

Figure 24.4 Schematic Diagram of the Stream-Data Input Control Block

Figure 24.5 is a schematic diagram of the stream-data output control block.
On recognizing that one sector of CD-ROM data is ready in the core of the CD-ROM decoder, this block ensures that the output stream-data register in the bus bridge section is empty and then starts to acquire the data for output from the core of the CD-ROM decoder.

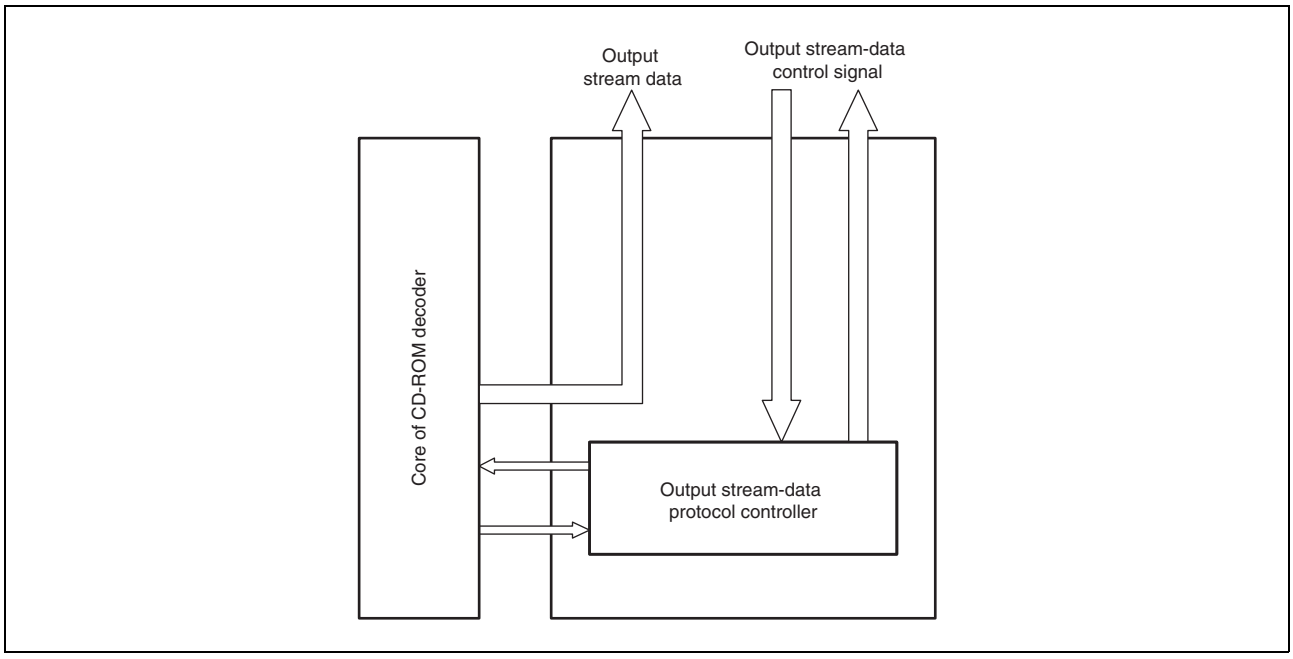

Figure 24.5 Schematic Diagram of the Stream-Data Output Control Block

This block has functions related to interrupts and direct memory access controller activation control such as suspending and masking of interrupts, turning interrupt flags off after they are read, asserting the activation signal to the direct

memory access controller, and negating the activation signal according to the detected amount of data that has been transferred.

24.3 Register Descriptions

This module has the following registers.

Table 24.1 Register Configuration

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Enable control register	CROMEN	R/W	H'00	0xE8005000	8
Sync code-based synchronization control register	CROMSY0	R/W	H'89	0xE8005001	8
Decoding mode control register	CROMCTL0	R/W	H'82	0xE8005002	8
EDC/ECC check control register	CROMCTL1	R/W	H'D1	0xE8005003	8
Automatic decoding stop control register	CROMCTL3	R/W	H'00	0xE8005005	8
Decoding option setting control register	CROMCTL4	R/W	H'00	0xE8005006	8
HEAD20 to HEAD22 representation control register	CROMCTL5	R/W	H'00	0xE8005007	8
Sync code status register	CROMST0	R	H'00	0xE8005008	8
Post-ECC header error status register	CROMST1	R	H'00	0xE8005009	8
Post-ECC subheader error status register	CROMST3	R	H'00	0xE800500B	8
Header/subheader validity check status register	CROMST4	R	H'00	0xE800500C	8
Mode determination and link sector detection status register	CROMST5	R	H'00	0xE800500D	8
ECC/EDC error status register	CROMST6	R	H'00	0xE800500E	8
Buffer status register	CBUFST0	R	H'00	0xE8005014	8
Decoding stoppage source status register	CBUFST1	R	H'00	0xE8005015	8
Buffer overflow status register	CBUFST2	R	H'00	0xE8005016	8
Pre-ECC correction header: minutes data register	HEAD00	R	H'00	0xE8005018	8
Pre-ECC correction header: seconds data register	HEAD01	R	H'00	0xE8005019	8
Pre-ECC correction header: frames (1/75 second) data register	HEAD02	R	H'00	0xE800501A	8
Pre-ECC correction header: mode data register	HEAD03	R	H'00	0xE800501B	8

24.3.1 Enable Control Register (CROMEN)

The enable control register (CROMEN) enables subcode processing and CD-ROM decoding, and stops CD-ROM decoding forcibly.

Bit:	7	6	5	4	3	2	1	0
	SUBC_EN	CROM_EN	CROM_STP	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	SUBC_EN	0	R/W	Subcode Processing Enable This bit should be set and cleared simultaneously with CROM_EN. It is automatically cleared when decoding is automatically stopped due to an abnormal condition or when CROM_STP = 1
6	CROM_EN	0	R/W	CD-ROM Decoding Enable When this bit is set to 1, CD-ROM decoding starts after detection of a valid sync code. When the bit is cleared to 0, decoding stops on completion of the processing for the sector currently being decoded. This bit is automatically cleared to 0 when the automatic decode-stopping function woks or when CROM_STP = 1.
5	CROM_STP	0	R/W	Forcible Stop of CD-ROM Decoding When this bit is set to 1, CD-ROM decoding is stopped immediately and the SUBC_EN and CROM_EN bits are automatically reset to 0. Before decoding can resume, this bit must be cleared to 0.
4 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.2 Sync Code-Based Synchronization Control Register (CROMSY0)

The sync code-based synchronization control register (CROMSY0) selects the sync code maintenance function.

Bit:	7	6	5	4	3	2	1	0
	SY_AUT	SY_IEN	SY_DEN	-	-	-	-	-
Initial value:	1	0	0	0	1	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	SY_AUT	1	R/W	Automatic CD-ROM Sync Code Maintenance Mode When this bit is set to 1, automatic sync maintenance (insertion of sync codes) is applied to obtain the CD-ROM sync codes. While this bit is set, the settings of the SY_IEN and SY_DEN bits are invalid.
6	SY_IEN	0	R/W	Internal Sync Signal Enable Enables the internal sync signal that is produced by the counter in the CD-ROM decoder. When this bit is set to 1 while SY_AUT = 0, synchronization of the CD-ROM data is in interpolated mode, i.e. driven by the internal counter.
5	SY_DEN	0	R/W	Synchronization with External Sync Code Selects constant monitoring for the sync code in the input data and bases synchronization solely on detection of the code, regardless of the value of the internal counter. The setting of this bit is valid when SY_AUT = 0.
4	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
3	—	1	R/W	Reserved This bit is always read as 1. The write value should always be 1.
2, 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	—	1	R/W	Reserved This bit is always read as 1. The write value should always be 1.

Table 24.2 Register Settings for Sync Code Maintenance Function

SY_AUT	SY_IEN	SY_DEN	Operating Mode
1	—	—	Automatic sync maintenance mode
0	0	1	External sync mode
0	1	0	Interpolated sync mode
0	1	1	Interpolated sync plus external sync mode
0	0	0	Setting prohibited

24.3.3 Decoding Mode Control Register (CROMCTL0)

The decoding mode control register (CROMCTL0) enables/disables the various functions, selects criteria for mode or form determination, and specifies the sector type. The setting of this register becomes valid at the sector-to-sector transition.

Bit:	7	6	5	4	3	2	1	0
	MD_DESC	-	MD_AUTO	MD_AUTOS1	MD_AUTOS2	MD_SEC[2:0]		
Initial value:	1	0	0	0	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MD_DESC	1	R/W	Descrambling Function ON/OFF 0: Disables descrambling function 1: Enables descrambling function
6	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
5	MD_AUTO	0	R/W	Automatic Mode/Form Detection ON/OFF 0: OFF 1: ON Detectable formats are Mode 0, Mode 1, Mode 2 (non-XA), Mode 2 Form 1, and Mode 2 Form 2. If the mode and form cannot be detected, the mode and form of the previous sector is used. If the mode and form of the first sector after decoding starts is undetectable, the setting of the MD_SEC[2:0] bits is used as the initial value.
4	MD_AUTOS1	0	R/W	Criteria for Mode Determination when MD_AUTO = 1 0: Mode determination is made only when the sync code is detected 1: Mode determination is always made The setting of this bit is valid only when the MD_AUTO bit is 1. If the mode cannot be determined, the mode of the previous sector is used. When this bit is cleared to 0, mode determination is made only when the sync code is detected for the sector.
3	MD_AUTOS2	0	R/W	Criteria for Mode 2 Form Determination when MD_AUTO = 1 0: The sector is assumed to be non-XA if the two form code bytes in the subheader do not match 1: No determination of XA or non-XA for the sector. The first form byte is regarded as valid. However, the two form bytes are compared, and the result is reflected in a status bit. The setting of this bit is valid only when the MD_AUTO bit is 1.
2 to 0	MD_SEC[2:0]	010	R/W	Sector Type 000: Setting prohibited 001: Mode 0 010: Mode 1 011: Long (Mode 0, Mode 1, or Mode 2 with no EDC/ECC data) 100: Setting prohibited 101: Mode 2 Form 1 110: Mode 2 Form 2 111: Mode 2 with automatic form detection If the form cannot be determined when set to B'111, it is processed as Mode 2 not XA.

24.3.4 EDC/ECC Check Control Register (CROMCTL1)

The EDC/ECC check control register (CROMCTL1) controls EDC/ECC checking. The setting of this register becomes valid at the sector-to-sector transition.

Bit:	7	6	5	4	3	2	1	0
	M2F2 EDC	MD_DEC[2:0]			-	-	MD_PQREP[1:0]	
Initial value:	1	1	0	1	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	M2F2EDC	1	R/W	For Mode 2 Form 2, disables the EDC function for sectors where all bits of the EDC are 0. When this bit set to 1 and all bits of the EDC for a Mode 2 Form 2 sector are 0, an IERR interrupt is not generated even if the result of EDC checking is 'fail'.
6 to 4	MD_DEC[2:0]	101	R/W	EDC/ECC Checking Mode Select 000: No checking 001: EDC only 010: Q correction + EDC 011: P correction + EDC 100: QP correction + EDC 101: PQ correction + EDC 110: Setting prohibited 111: Setting prohibited
3, 2	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	MD_PQREP[1:0]	01	R/W	Number of Iterations of PQ or QP Correction Number of correction iterations when PQ- or QP- correction is specified by MD_DEC[2:0]. 00: Setting prohibited 01: One iteration 10: Two iterations 11: Three iterations

24.3.5 Automatic Decoding Stop Control Register (CROMCTL3)

The automatic decoding stop control register (CROMCTL3) is used to select abnormal conditions on which decoding will be automatically stopped. When decoding is stopped in response to any of the selected conditions, an IBUF interrupt is generated and the condition is indicated in the CBUFST1 register. The setting of this register becomes valid at the sector-to-sector transition.

Bit:	7	6	5	4	3	2	1	0
	STP_ECC	STP_EDC	-	STP_MD	STP_MIN	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	STP_ECC	0	R/W	When this bit is set to 1, decoding is stopped if an error is found to be not correctable by ECC correction.
6	STP_EDC	0	R/W	When this bit is set to 1, decoding is stopped if post-ECC correction EDC checking indicates an error.
5	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
4	STP_MD	0	R/W	When this bit is set to 1, decoding is stopped if the sector has a mode or form setting that does not match those of the immediately preceding sector.
3	STP_MIN	0	R/W	When this bit is set to 1, decoding is stopped if a non-sequential minutes, seconds, or frames (1 frame = 1/75 second) value is encountered.
2 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.6 Decoding Option Setting Control Register (CROMCTL4)

The decoding option setting control register (CROMCTL4) enables/disables buffering control at link block detection, specifies the information indicated by the status register, and controls the ECC correction mode. The setting of this register becomes valid at the sector-to-sector transition.

Bit:	7	6	5	4	3	2	1	0
	-	LINK2	-	ER0SEL	NO_ECC	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R/W	Reserved Either 0 or 1 can be written to this bit. When it is read, the value written will be read.
6	LINK2	0	R/W	Link Block Detection Condition 0: The block is regarded as a link block when either run-out 1 or 2 and both run-in 3 and 4 have been detected. 1: The block is regarded as a link block when two out of run-out 1 and 2 and “link” have been detected. The condition for setting of the LINK_ON bit in CROMST5 is decoding of the link sector.
5	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
4	ER0SEL	0	R/W	CD-ROM Data-Related Status Register Setting Condition 0: Information is on the sector being decoded. 1: Information is on the latest sector that has been buffered. This condition affects the information given by bits 5 to 0 in the CROMST0 register, bits 7 to 1 in the CROMST4 and CROMST5 registers, and HEAD00 to HEAD02.
3	NO_ECC	0	R/W	ECC correction mode when the result of the EDC check before ECC correction was ‘pass’ When this bit is set to 1, ECC correction is not performed if the result of pre-ECC correction EDC checking is a ‘pass’, regardless of the results of syndrome calculation.
2 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.7 HEAD20 to HEAD22 Representation Control Register (CROMCTL5)

The HEAD20 to HEAD22 representation control register (CROMCTL5) specifies the representation mode for HEAD20 to HEAD22.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	MSF_LBA_SEL
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	MSF_LBA_SEL	0	R/W	HEAD20 to HEAD22 Representation Mode 0: Header MSF is represented in BCD (decimal) as is 1: Total sector number is represented in HEX (hexadecimal)

24.3.8 Sync Code Status Register (CROMST0)

The sync code status register (CROMST0) indicates various status information in sync code maintenance modes.

Bit:	7	6	5	4	3	2	1	0
	-	-	ST_SYIL	ST_SYNO	ST_BLKS	ST_BLKL	ST_SECS	ST_SECL
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
5	ST_SYIL	0	R	Indicates that a sync code was detected at a position where the value in the word counter (used to measure intervals between sync codes) was not correct, but the sync code was ignored and not taken into account in synchronization. This bit is only valid in automatic sync maintenance mode and interpolated sync mode.
4	ST_SYNO	0	R	Indicates that a sync code has not been detected despite the word counter having reached the final value, and synchronization has been continued with the aid of an interpolated sync code. This bit is only valid in automatic sync maintenance mode and interpolated sync mode.
3	ST_BLKS	0	R	Indicates that a sync code was detected at a position where the value in the word counter was not correct, and the sync code was used in synchronization. This bit is only valid in automatic sync maintenance mode and external sync mode.
2	ST_BLKL	0	R	Indicates that a sync code has not been detected despite the word counter having reached the final value, and the period of the sector has been prolonged. This bit is only valid in external sync mode.
1	ST_SECS	0	R	Indicates that a sector has been processed as a short sector with the aid of interpolated sync codes. If this bit is set to 1, stop decoding immediately and retry the procedure starting from the sector prior to the sector currently being decoded.
0	ST_SECL	0	R	Indicates that a sector has been processed as a long sector with the aid of interpolated sync codes. If this bit is set to 1, stop decoding immediately and retry the procedure starting from two sectors prior to the sector currently being decoded.

24.3.9 Post-ECC Header Error Status Register (CROMST1)

The post-ECC header error status register (CROMST1) indicates error status in the post-ECC header.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	ER2_HEAD0	ER2_HEAD1	ER2_HEAD2	ER2_HEAD3
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
3	ER2_HEAD0	0	R	Indicates an error in the minutes field of the header after ECC correction.
2	ER2_HEAD1	0	R	Indicates an error status in the seconds field of the header after ECC correction.
1	ER2_HEAD2	0	R	Indicates an error in the frames (1 frame = 1/75 second) field of the header after ECC correction.
0	ER2_HEAD3	0	R	Indicates an error in the mode field of the header after ECC correction.

24.3.10 Post-ECC Subheader Error Status Register (CROMST3)

The post-ECC subheader error status register (CROMST3) indicates error status in the post-ECC subheader.

Bit:	7	6	5	4	3	2	1	0
	ER2_SHEAD0	ER2_SHEAD1	ER2_SHEAD2	ER2_SHEAD3	ER2_SHEAD4	ER2_HEAD5	ER2_HEAD6	ER2_HEAD7
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	ER2_SHEAD0	0	R	Indicates that the subheader (file number) still has an error after ECC correction. Indicates the error of the SHEAD20 register.
6	ER2_SHEAD1	0	R	Indicates that the subheader (channel number) still has an error after ECC correction. Indicates the error of the SHEAD21 register.
5	ER2_SHEAD2	0	R	Indicates that the subheader (sub-mode) still has an error after ECC correction. Indicates the error of the SHEAD22 register.
4	ER2_SHEAD3	0	R	Indicates that the subheader (data type) still has an error after ECC correction. Indicates the error of the SHEAD23 register.
3	ER2_SHEAD4	0	R	Indicates that the subheader (file number) still has an error after ECC correction. Indicates the error of the SHEAD24 register.
2	ER2_SHEAD5	0	R	Indicates that the subheader (channel number) still has an error after ECC correction. Indicates the error of the SHEAD25 register.
1	ER2_SHEAD6	0	R	Indicates that the subheader (sub-mode) still has an error after ECC correction. Indicates the error of the SHEAD26 register.
0	ER2_SHEAD7	0	R	Indicates that the subheader (data type) still has an error after ECC correction. Indicates the error of the SHEAD27 register.

24.3.11 Header/Subheader Validity Check Status Register (CROMST4)

The header/subheader validity check status register (CROMST4) indicates errors relating to the automatic mode determination or form determination for Mode 2.

Bit:	7	6	5	4	3	2	1	0
	NG_MD	NG_MDCMP1	NG_MDCMP2	NG_MDCMP3	NG_MDCMP4	NG_MDDEF	NG_MDTIM1	NG_MDTIM2
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	NG_MD	0	R	Indicates that the sector mode could not be determined according to the automatic mode determination criteria.
6	NG_MDCMP1	0	R	Indicates a mismatch between the file number bytes (bytes 16 and 20) during the form determination for Mode 2.
5	NG_MDCMP2	0	R	Indicates a mismatch between the channel number bytes (bytes 17 and 21) during the form determination for Mode 2.
4	NG_MDCMP3	0	R	Indicates a mismatch between the sub-mode bytes (bytes 18 and 22) during the form determination for Mode 2.
3	NG_MDCMP4	0	R	Indicates a mismatch between the data-type bytes (bytes 19 and 23) during the form determination for Mode 2.
2	NG_MDDEF	0	R	Indicates that the mode and form differ from those of the previous sector.
1	NG_MDTIM1	0	R	Indicates that the minutes, seconds, or frames (1 frame = 1/75 second) value is out of sequence. In the continuity check for the next and subsequent sectors, the updated values will be used.
0	NG_MDTIM2	0	R	Indicates that the minutes, seconds, or frames (1 frame = 1/75 second) value was not a BCD value. Specifically, this bit means that any half-byte was beyond the range for BCD (i.e. was A to F), HEAD01 was greater than H'59, or HEAD02 was greater than H'74. In the continuity check for the next and subsequent sectors, interpolated values will be used.

24.3.12 Mode Determination and Link Sector Detection Status Register (CROMST5)

The mode determination and link sector detection status register (CROMST5) indicates the result of automatic mode determination and link block detection.

Bit:	7	6	5	4	3	2	1	0
	ST_AMD[2:0]			ST_MDX	LINK_ON	LINK_ DET	LINK_ SDET	LINK_ OUT1
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	ST_AMD[2:0]	000	R	Result of Automatic Mode Determination These bits indicate the result of mode determination when the automatic mode determination function is used. 000: Automatic mode determination function is not used 001: Mode 0 010: Mode 1 011: — 100: Mode 2 not XA 101: Mode 2 Form 1 110: Mode 2 Form 2 111: —
4	ST_MDX	0	R	Indicates that, when the mode has been manually set rather than automatically determined, the mode setting disagrees with the mode as recognized by the logic. In this case, the manually set value takes priority.
3	LINK_ON	0	R	This bit is set to 1 when a link block was recognized in link block determination. For the criteria for link block determination, refer to the LINK2 bit in the CROMCTL4 register.
2	LINK_DET	0	R	Indicates that a link block (run-out 1 to run-in 4) was detected. Since detection is based on the data before ECC correction, LINK_DET may also be set to 1 if data erroneously happens to contain the same code as a link block.
1	LINK_SDET	0	R	Indicates that a link block was detected within seven sectors after the start of decoding.
0	LINK_OUT1	0	R	Indicates that the sector after ECC correction has been identified as a run-out 1 sector. This bit is only valid when an IERR interrupt is not generated (i.e. when ECC correction was successful).

24.3.13 ECC/EDC Error Status Register (CROMST6)

The ECC/EDC error status register (CROMST6) indicates ECC processing error or EDC check error before/after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	ST_ERR	-	ST_ECCABT	ST_ECCNG	ST_ECCP	ST_ECCQ	ST_EDC1	ST_EDC2
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	ST_ERR	0	R	Indicates that the decoded block after ECC correction contains any error (even in a single byte).
6	—	0	R	Reserved This bit is always read as 0 and cannot be modified.
5	ST_ECCABT	0	R	Indicates that ECC processing was discontinued. This bit is set to 1 when a transition from sector to sector occurs while ECC correction is in progress. This does not indicate a problem for ECC correction if the BUF_NG bit in the CBUFST2 register is 0 at the same time. Whether or not this is so depends on the timing of the sector transition.
4	ST_ECCNG	0	R	Indicates that error correction was not possible. This bit is also set to 1 on detection of a short sector.
3	ST_ECCP	0	R	Indicates that P-parity errors were not corrected in ECC correction. This bit is only valid when synchronization is normal (the sector is neither short nor long). This bit is set to 1 when the result of syndrome calculation for P parity is other than all 0s.
2	ST_ECCQ	0	R	Indicates that Q-parity errors were not corrected in ECC correction. This bit is only valid when synchronization is normal (the sector is neither short nor long). This bit is set to 1 when the result of syndrome calculation for Q parity is other than all 0s.
1	ST_EDC1	0	R	Indicates that the result of the EDC check before ECC correction was ‘fail’. This bit is also set to 1 if a short sector is encountered while EDC is enabled.
0	ST_EDC2	0	R	Indicates that the result of the EDC check after ECC correction was ‘fail’.

24.3.14 Buffer Status Register (CBUFST0)

The buffer status register (CBUFST0) indicates that the system is searching for the first sector to be buffered, or that buffering is in progress.

Bit:	7	6	5	4	3	2	1	0
	BUF_REF	BUF_ACT	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BUF_REF	0	R	Indicates that the search for the first sector to be buffered is in progress. This bit is only valid when the automatic buffering function is used (CBUF_AUT = 1).
6	BUF_ACT	0	R	Indicates that buffering is in progress.
5 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.15 Decoding Stoppage Source Status Register (CBUFST1)

The decoding stoppage source status register (CBUFST1) indicates that decoding/buffering has been stopped due to some errors.

A bit in this register can only be set when the corresponding bit in the CROMCTL3 register is set to 1.

Bit:	7	6	5	4	3	2	1	0
	BUF_ECC	BUF_EDC	-	BUF_MD	BUF_MIN	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BUF_ECC	0	R	Indicates that decoding and buffering have been stopped because of an error that is not correctable by using the ECC.
6	BUF_EDC	0	R	Indicates that decoding and buffering have been stopped because the post-ECC correction EDC check indicated an error.
5	—	0	R	Reserved This bit is always read as 0 and cannot be modified.
4	BUF_MD	0	R	Indicates that decoding and buffering have been stopped because the current sector is in a mode or form differing from that of the previous sector.
3	BUF_MIN	0	R	Indicates that decoding and buffering have been stopped because a non-sequential minutes, seconds, or frames (1 frame = 1/75 second) value has been encountered.
2 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.16 Buffer Overflow Status Register (CBUFST2)

The buffer overflow status register (CBUFST2) indicates that a sector-to-sector transition occurred before data transfer to the buffer is completed.

Bit:	7	6	5	4	3	2	1	0
	BUF_NG	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BUF_NG	0	R	Indicates that a sector-to-sector transition has occurred before the data transfer to the buffer is completed. This bit is set to 1 when the data of a third sector are input while data for the output stream from the CD-ROM decoder remains unread. No interrupt is generated. Once this bit has been set to 1, its value will not recover unless it is reset by the LOGICRST bit in the ROMDECRST register.
6 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.17 Pre-ECC Correction Header: Minutes Data Register (HEAD00)

The pre-ECC correction header: minutes data register (HEAD00) indicates the minutes value in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD00[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD00[7:0]	All 0	R	Minutes Value in Header before ECC Correction

24.3.18 Pre-ECC Correction Header: Seconds Data Register (HEAD01)

The pre-ECC correction header: seconds data register (HEAD01) indicates the seconds value in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD01[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD01[7:0]	All 0	R	Seconds Value in Header before ECC Correction

24.3.19 Pre-ECC Correction Header: Frames (1/75 Second) Data Register (HEAD02)

The pre-ECC correction header: frames (1/75 second) data register (HEAD02) indicates the frames value (1 frame = 1/75 second) in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD02[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD02[7:0]	All 0	R	Frames Value (1 frame = 1/75 second) in Header before ECC Correction

24.3.20 Pre-ECC Correction Header: Mode Data Register (HEAD03)

The pre-ECC correction header: mode data register (HEAD03) indicates the mode value in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD03[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD03[7:0]	All 0	R	Mode Value in Header before ECC Correction

24.3.21 Pre-ECC Correction Subheader: File Number (Byte 16) Data Register (SHEAD00)

The pre-ECC correction subheader: file number (byte 16) data register (SHEAD00) indicates the file number value in the subheader before ECC correction (byte 16).

Bit:	7	6	5	4	3	2	1	0
	SHEAD00[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD00[7:0]	All 0	R	Indicates file number value in the subheader before ECC correction (byte 16). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.22 Pre-ECC Correction Subheader: Channel Number (Byte 17) Data Register (SHEAD01)

The pre-ECC correction subheader: channel number (byte 17) data register (SHEAD01) indicates the channel number value in the subheader before ECC correction (byte 17).

Bit:	7	6	5	4	3	2	1	0
	SHEAD01[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD01[7:0]	All 0	R	Indicates channel number value in the subheader before ECC correction (byte 17). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.23 Pre-ECC Correction Subheader: Sub-Mode (Byte 18) Data Register (SHEAD02)

The pre-ECC correction subheader: sub-mode (byte 18) data register (SHEAD02) indicates the sub-mode value in the subheader before ECC correction (byte 18).

Bit:	7	6	5	4	3	2	1	0
	SHEAD02[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD02[7:0]	All 0	R	Indicates sub-mode value in the subheader before ECC correction (byte 18). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.24 Pre-ECC Correction Subheader: Data Type (Byte 19) Data Register (SHEAD03)

The pre-ECC correction subheader: data type (byte 19) data register (SHEAD03) indicates the data type value in the subheader before ECC correction (byte 19).

Bit:	7	6	5	4	3	2	1	0
	SHEAD03[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD03[7:0]	All 0	R	Indicates data type value in the subheader before ECC correction (byte 19). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.25 Pre-ECC Correction Subheader: File Number (Byte 20) Data Register (SHEAD04)

The pre-ECC correction subheader: file number (byte 20) data register (SHEAD04) indicates the file number value in the subheader before ECC correction (byte 20).

Bit:	7	6	5	4	3	2	1	0
	SHEAD04[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD04[7:0]	All 0	R	Indicates file number value in the subheader before ECC correction (byte 20). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.26 Pre-ECC Correction Subheader: Channel Number (Byte 21) Data Register (SHEAD05)

The pre-ECC correction subheader: channel number (byte 21) data register (SHEAD05) indicates the channel number value in the subheader before ECC correction (byte 21).

Bit:	7	6	5	4	3	2	1	0
	SHEAD05[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD05[7:0]	All 0	R	Indicates channel number value in the subheader before ECC correction (byte 21). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.27 Pre-ECC Correction Subheader: Sub-Mode (Byte 22) Data Register (SHEAD06)

The pre-ECC correction subheader: sub-mode (byte 22) data register (SHEAD06) indicates the sub-mode value in the subheader before ECC correction (byte 22).

Bit:	7	6	5	4	3	2	1	0
	SHEAD06[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD06[7:0]	All 0	R	Indicates sub-mode value in the subheader before ECC correction (Byte 22). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.28 Pre-ECC Correction Subheader: Data Type (Byte 23) Data Register (SHEAD07)

The pre-ECC correction subheader: data type (byte 23) data register (SHEAD07) indicates the data type value in the subheader before ECC correction (byte 23).

Bit:	7	6	5	4	3	2	1	0
	SHEAD07[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD07[7:0]	All 0	R	Indicates data type value in the subheader before ECC correction (Byte 23). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.29 Post-ECC Correction Header: Minutes Data Register (HEAD20)

The post-ECC correction header: minutes data register (HEAD20) indicates the minutes value in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD20[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD20[7:0]	All 0	R	Indicates minutes value in the header after ECC correction. When MSF_LBA_SEL = 1, this register indicates the first byte (1/3) of the total number of sectors calculated from M, S, and F.

24.3.30 Post-ECC Correction Header: Seconds Data Register (HEAD21)

The post-ECC correction header: seconds data register (HEAD21) indicates the seconds value in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD21[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD21[7:0]	All 0	R	Indicates seconds value in the header after ECC correction. When MSF_LBA_SEL = 1, this register indicates the second byte (2/3) of the total number of sectors calculated from M, S, and F.

24.3.31 Post-ECC Correction Header: Frames (1/75 Second) Data Register (HEAD22)

The post-ECC correction header: frames (1/75 second) data register (HEAD22) indicates the frames value (1 frame = 1/75 seconds) in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD22[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD22[7:0]	All 0	R	Indicates frames value in the header after ECC correction. When MSF_LBA_SEL = 1, this register indicates the third byte (3/3) of the total number of sectors calculated from M, S, and F.

24.3.32 Post-ECC Correction Header: Mode Data Register (HEAD23)

The post-ECC correction header: mode data register (HEAD23) indicates the mode value in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD23[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD23[7:0]	All 0	R	Indicates mode value in the header after ECC correction.

24.3.33 Post-ECC Correction Subheader: File Number (Byte 16) Data Register (SHEAD20)

The post-ECC correction subheader: file number (byte 16) data register (SHEAD20) indicates the file number value in the subheader after ECC correction (byte 16).

Bit:	7	6	5	4	3	2	1	0
	SHEAD20[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD20[7:0]	All 0	R	Indicates file number value in the subheader after ECC correction (byte 16).

24.3.34 Post-ECC Correction Subheader: Channel Number (Byte 17) Data Register (SHEAD21)

The post-ECC correction subheader: channel number (byte 17) data register (SHEAD21) indicates the channel number value in the subheader after ECC correction (byte 17).

Bit:	7	6	5	4	3	2	1	0
	SHEAD21[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD21[7:0]	All 0	R	Indicates channel number value in the subheader after ECC correction (byte 17).

24.3.35 Post-ECC Correction Subheader: Sub-Mode (Byte 18) Data Register (SHEAD22)

The post-ECC correction subheader: sub-mode (byte 18) data register (SHEAD22) indicates the sub-mode value in the subheader after ECC correction (byte 18).

Bit:	7	6	5	4	3	2	1	0
	SHEAD22[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD22[7:0]	All 0	R	Indicates sub-mode value in the subheader after ECC correction (byte 18).

24.3.36 Post-ECC Correction Subheader: Data Type (Byte 19) Data Register (SHEAD23)

The post-ECC correction subheader: data type (byte 19) data register (SHEAD23) indicates the data type value in the subheader after ECC correction (byte 19).

Bit:	7	6	5	4	3	2	1	0
	SHEAD23[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD23[7:0]	All 0	R	Indicates data type value in the subheader after ECC correction (byte 19).

24.3.37 Post-ECC Correction Subheader: File Number (Byte 20) Data Register (SHEAD24)

The post-ECC correction subheader: file number (byte 20) data register (SHEAD24) indicates the file number value in the subheader after ECC correction (byte 20).

Bit:	7	6	5	4	3	2	1	0
	SHEAD24[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD24[7:0]	All 0	R	Indicates file number value in the subheader after ECC correction (byte 20).

24.3.38 Post-ECC Correction Subheader: Channel Number (Byte 21) Data Register (SHEAD25)

The post-ECC correction subheader: channel number (byte 21) data register (SHEAD25) indicates the channel number value in the subheader after ECC correction (byte 21).

Bit:	7	6	5	4	3	2	1	0
	SHEAD25[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD25[7:0]	All 0	R	Indicates channel number value in the subheader after ECC correction (byte 21).

24.3.39 Post-ECC Correction Subheader: Sub-Mode (Byte 22) Data Register (SHEAD26)

The post-ECC correction subheader: sub-mode (byte 22) data register (SHEAD26) indicates the sub-mode value in the subheader after ECC correction (byte 22).

Bit:	7	6	5	4	3	2	1	0
	SHEAD26[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD26[7:0]	All 0	R	Indicates sub-mode value in the subheader after ECC correction (byte 22).

24.3.40 Post-ECC Correction Subheader: Data Type (Byte 23) Data Register (SHEAD27)

The post-ECC correction subheader: data type (byte 23) data register (SHEAD27) indicates the data type value in the subheader after ECC correction (byte 23).

Bit:	7	6	5	4	3	2	1	0
	SHEAD27[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD27[7:0]	All 0	R	Indicates data type value in the subheader after ECC correction (byte 23).

24.3.41 Automatic Buffering Setting Control Register (CBUFCTL0)

Bit:	7	6	5	4	3	2	1	0
	CBUF_AUT	CBUF_EN	-	CBUF_MD[1:0]		CBUF_TS	CBUF_Q	-
Initial value:	0	0	0	0	0	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	CBUF_AUT	0	R/W	Automatic Buffering Function ON/OFF When this bit is to be set or cleared while CROM_EN = 1, CBUF_EN should also be set or cleared simultaneously. Otherwise, the validity of the status indications in CBUFST0, CBUFST1 and CBUFST2 cannot be guaranteed. 0: Automatic buffering is OFF. 1: Automatic buffering is ON.
6	CBUF_EN	0	R/W	Buffering to Buffer RAM Enable This bit turns on/off buffering in both automatic and manual buffering modes. In manual buffering mode, set this bit after generation of the ISEC interrupt. This bit is automatically reset when automatic buffering stops. 0: Buffering is OFF. 1: Buffering is ON.
5	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
4, 3	CBUF_MD[1:0]	00	R/W	Start-sector detection mode when the automatic buffering function is in use 00: The header values for the previous and current sectors must be in sequence. 01: The header value detected in the current sector must be in sequence with the interpolated value. 10: A current sector with any header value is OK. 11: Start-sector detection is based on the interpolated value even if the current sector is not detected.
2	CBUF_TS	1	R/W	CBUFCTL1 to CBUFCTL3 Setting Mode 0: CBUFCTL1 to CBUFCTL3: BCD (in decimal) 1: Total number of sectors (in hexadecimal)
1	CBUF_Q	0	R/W	Q-channel code buffering data specification in the case of a CRC error in the Q-channel code 0: The values for the last sector for which the CRC returned a correct result are buffered. 1: The erroneous data is buffered as is. Note: Since subcodes are not input with this LSI, always set this bit to 1.
0	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.

24.3.42 Automatic Buffering Start Sector Setting: Minutes Control Register (CBUFCTL1)

The automatic buffering start sector setting: minutes control register (CBUFCTL1) indicates the minutes value in the header for the first sector to be buffered.

Bit:	7	6	5	4	3	2	1	0
	M2F2 EDC	MD_DEC[2:0]			-	-	MD_PQREP[1:0]	
Initial value:	1	1	0	1	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BS_MIN[7:0]	All 0	R/W	Indicates setting of the minutes value in the header for the first sector to be buffered.

24.3.43 Automatic Buffering Start Sector Setting: Seconds Control Register (CBUFCTL2)

The automatic buffering start sector setting: seconds control register (CBUFCTL2) indicates the seconds value in the header for the first sector to be buffered.

Bit:	7	6	5	4	3	2	1	0
	BS_SEC[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BS_SEC[7:0]	All 0	R/W	Indicates setting of the seconds value in the header for the first sector to be buffered.

24.3.44 Automatic Buffering Start Sector Setting: Frames Control Register (CBUFCTL3)

The automatic buffering start sector setting: frames control register (CBUFCTL3) indicates the frames (1 frame = 1/75 second) value in the header for the first sector to be buffered.

Bit:	7	6	5	4	3	2	1	0
	BS_FRM[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BS_FRM[7:0]	All 0	R/W	Indicates setting of the frames (1 frame = 1/75 second) value in the header for the first sector to be buffered.

24.3.45 ISY Interrupt Source Mask Control Register (CROMST0M)

The ISY interrupt source mask control register (CROMST0M) masks the ISY interrupt sources specified by the bits in the sync code status register (CROMST0).

Bit:	7	6	5	4	3	2	1	0
	-	-	ST_SYILM	ST_SYNOM	ST_BLKSM	ST_BLKLM	ST_SECSM	ST_SECLM
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
5	ST_SYILM	0	R/W	ISY interrupt ST_SYIL (bit 5 in the CROMST0 register) source mask
4	ST_SYNOM	0	R/W	ISY interrupt ST_SYNO (bit 4 in the CROMST0 register) source mask
3	ST_BLKSM	0	R/W	ISY interrupt ST_BLKS (bit 3 in the CROMST0 register) source mask
2	ST_BLKLM	0	R/W	ISY interrupt ST_BLKL (bit 2 in the CROMST0 register) source mask
1	ST_SECSM	0	R/W	ISY interrupt ST_SECS (bit 1 in the CROMST0 register) source mask
0	ST_SECLM	0	R/W	ISY interrupt ST_SECL (bit 0 in the CROMST0 register) source mask

24.3.46 CD-ROM Decoder Reset Control Register (ROMDECRST)

The CD-ROM decoder reset control register (ROMDECRST) resets the random logic of the CD-ROM decoder and clears the RAM in the CD-ROM decoder.

Bit:	7	6	5	4	3	2	1	0
	LOGICRST	RAMRST	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	LOGICRST	0	R/W	CD-ROM Decoder Random Logic Reset Signal A reset signal is output while this bit is set to 1.
6	RAMRST	0	R/W	CD-ROM Decoder RAM Clearing Signal Refer to the RAMCLRST bit in the RSTSTAT register to confirm that RAM clearing is complete.
5 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

Note: • Before setting LOGICRST to 1, make sure that the RAMRST bit is cleared to 0 and then write B'10000000 to this register.

24.3.47 CD-ROM Decoder Reset Status Register (RSTSTAT)

The CD-ROM decoder reset status register (RSTSTAT) indicates that the RAM in the CD-ROM decoder has been cleared.

Bit:	7	6	5	4	3	2	1	0
	RAM CLRST	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	RAMCLRST	0	R	This bit is set to 1 on completion of RAM clearing after the RAMRST bit in ROMDECRST is set to 1. The bit is cleared by writing a 0 to the RAMRST bit.
6 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.48 Serial Sound Interface Data Control Register (SSI)

The serial sound interface data control register (SSI) provides various settings related to the data stream. For the operation corresponding to the setting of this register, refer to section 24.4.1, Endian Conversion for Data in the Input Stream.

Bit:	7	6	5	4	3	2	1	0
	BYTEND	BITEND	BUFEND0[1:0]		BUFEND1[1:0]		-	-
Initial value:	0	0	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	BYTEND	0	R/W	Specifies the endian of input data from the serial sound interface. When this bit is set to 1, byte 0 and byte 1 in STRMDIN0 are swapped. This is the same for STRMDIN2.
6	BITEND	0	R/W	Specifies treatment of the bit order of the input data from the serial sound interface. When this bit is set to 1, the bits within each byte are rearranged to place them in reverse order, bit 0 → bit 7 to bit 7 → bit 0.
5, 4	BUFEND0[1:0]	01	R/W	These bits select whether to change the order of 16-bit units of data transferred from the serial sound interface or suppress the stream data. In the serial sound interface, either “padding mode” or “non-padding mode” is selectable. In non-padding mode, each 32 bits of data transferred from the serial sound interface are transferred as CD-ROM data. Since the CD-ROM decoder has two 16-bit input data registers, the order of the 16-bit data can be swapped within the 32 bits. On the other hand, in padding mode each 32 bits of data transferred from the serial sound interface includes padding. Since the padding has no meaning, it should be kept out of the input stream to the decoder. This suppression can be specified by the setting of this register. The CD-ROM decoder handles data as a stream of 16-bit data, and this register controls which 16-bit portion of each 32 bits of data transferred from the serial sound interface should be input first. 00: The 16 bits of stream data that would otherwise be processed first is discarded. 01: The higher-order 16 bits of each 32 bits of data received from the serial sound interface are placed first in the stream to the decoder. 10: The lower-order 16 bits of each 32 bits of data received from the serial sound interface are placed first in the stream to the decoder. 11: Setting prohibited
3, 2	BUFEND1[1:0]	10	R/W	These bits select whether to change the order of 16-bit units of data transferred from the serial sound interface or suppress the stream data. In the serial sound interface, either “padding mode” or “non-padding mode” is selectable. In non-padding mode, each 32 bits of data transferred from the serial sound interface are transferred as CD-ROM data. Since the CD-ROM decoder has two 16-bit input data registers, the order of the 16-bit data can be swapped within the 32 bits. On the other hand, in padding mode each 32 bits of data transferred from the serial sound interface includes padding. Since the padding has no meaning, it should be kept out of the input stream to the decoder. This suppression can be specified by the setting of this register. The CD-ROM decoder handles data as a stream of 16-bit data, and this register controls which 16-bit portion of each 32 bits of data transferred from the serial sound interface should be input second. 00: The 16 bits of stream data that would otherwise be processed second is discarded. 01: The higher-order 16 bits of each 32 bits of data received from the serial sound interface are placed second in the stream to the decoder. 10: The higher-order 16 bits of each 32 bits of data received from the serial sound interface are placed second in the stream to the decoder. 11: Setting prohibited
1, 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.49 Interrupt Flag Register (INTHOLD)

The interrupt flag register (INTHOLD) consists of various interrupt flags.

Bit:	7	6	5	4	3	2	1	0
	ISEC	ITARG	ISY	IERR	IBUF	IREADY	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	ISEC	0	R/W	ISEC Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
6	ITARG	0	R/W	ITARG Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
5	ISY	0	R/W	ISY Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
4	IERR	0	R/W	IERR Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
3	IBUF	0	R/W	IBUF Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
2	IREADY	0	R/W	IREADY Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
1, 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.50 Interrupt Source Mask Control Register (INHINT)

The interrupt source mask control register (INHINT) controls masking of various interrupt requests in the CD-ROM decoder.

Bit:	7	6	5	4	3	2	1	0
	INH ISEC	INH ITARG	INH ISY	INH IERR	INH IBUF	INH IREADY	PREINH REQDM	PREINH IREADY
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	INHISEC	0	R/W	ISEC Interrupt Mask When set to 1, inhibits ISEC interrupt requests.
6	INHITARG	0	R/W	ITARG Interrupt Mask When set to 1, inhibits ITARG interrupt requests.
5	INHISY	0	R/W	ISY Interrupt Mask When set to 1, inhibits ISY interrupt requests.
4	INHIERR	0	R/W	IERR Interrupt Mask When set to 1, inhibits IERR interrupt requests.
3	INHIBUF	0	R/W	IBUF Interrupt Mask When set to 1, inhibits IBUF interrupt requests.
2	INHIREADY	0	R/W	IREADY Interrupt Mask When set to 1, inhibits IREADY interrupt requests.
1	PREINHREQDM	0	R/W	Inhibits setting of the DMA-transfer-request interrupt source flag for the output data stream. When this bit is set to 1, the DMA-transfer-request interrupt source is not retained.
0	PREINHIREADY	0	R/W	Inhibits setting of the IREADY interrupt flag. When this bit is set to 1, the IREADY interrupt source is not retained.

24.3.51 CD-ROM Decoder Stream Data Input Register (STRMDIN0)

The CD-ROM decoder stream data input register (STRMDIN0) holds the higher 2 bytes (from MSB) of the 4 bytes of data that is to be input to the CD-ROM decoder.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRMDIN[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDIN[31:16]	All 0	R/W	Indicates the higher 2 bytes (from MSB) of the 4-bytes of data that is to be input to the CD-ROM decoder. The CD-ROM decoder has a 4-byte wide data window as a data input register to handle the data input to this register as a stream data. The amount of data for one sector is 2352 bytes.

24.3.52 CD-ROM Decoder Stream Data Input Register (STRMDIN2)

The CD-ROM decoder stream data input register (STRMDIN2) holds the lower 2 bytes (from LSB) of the 4 bytes of data that is to be input to the CD-ROM decoder.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRMDIN[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDIN[15:0]	All 0	R/W	Indicates the lower 2 bytes (from LSB) of the 4-bytes of data that is to be input to the CD-ROM decoder. The CD-ROM decoder has a 4-byte wide data window as a data input register to handle the data input to this register as a stream data. The amount of data for one sector is 2352 bytes.

24.3.53 CD-ROM Decoder Stream Data Output Register (STRMDOUT0)

The CD-ROM decoder stream data output register (STRMDOUT0) holds 2 bytes that is to be output from the CD-ROM decoder.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRMDOUT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDOUT [15:0]	H'0000	R	Indicates 2 bytes that are to be output from the CD-ROM decoder. The CD-ROM decoder has a 2-byte wide data window or set of registers for the output of decoded data. Every time the relevant register is accessed, further data of access size are output sequentially in the output format that is separately defined. The amount of data for one sector is 2768 bytes. Always read 2768 bytes.

24.4 Operation

24.4.1 Endian Conversion for Data in the Input Stream

Stream data must be input to the core of the CD-ROM decoder in order according to the CD-ROM data format specifications. In some systems, however, the order of the data from the serial sound interface may have to be changed or the data will have been padded before transfer. To cope with this, the stream data input control section is capable of swapping the order of the data and preventing the input of padding data to the core of the CD-ROM decoder. These functions are controlled through the serial sound interface data control register (SSI).

Figure 24.6 shows a case where the upper and lower 16 bits of the data, consisting of padding data plus the first 2 bytes of sync code, that is, H'000000FF, are swapped (H'00FF0000) and input to the CD-ROM decoder as the stream data.

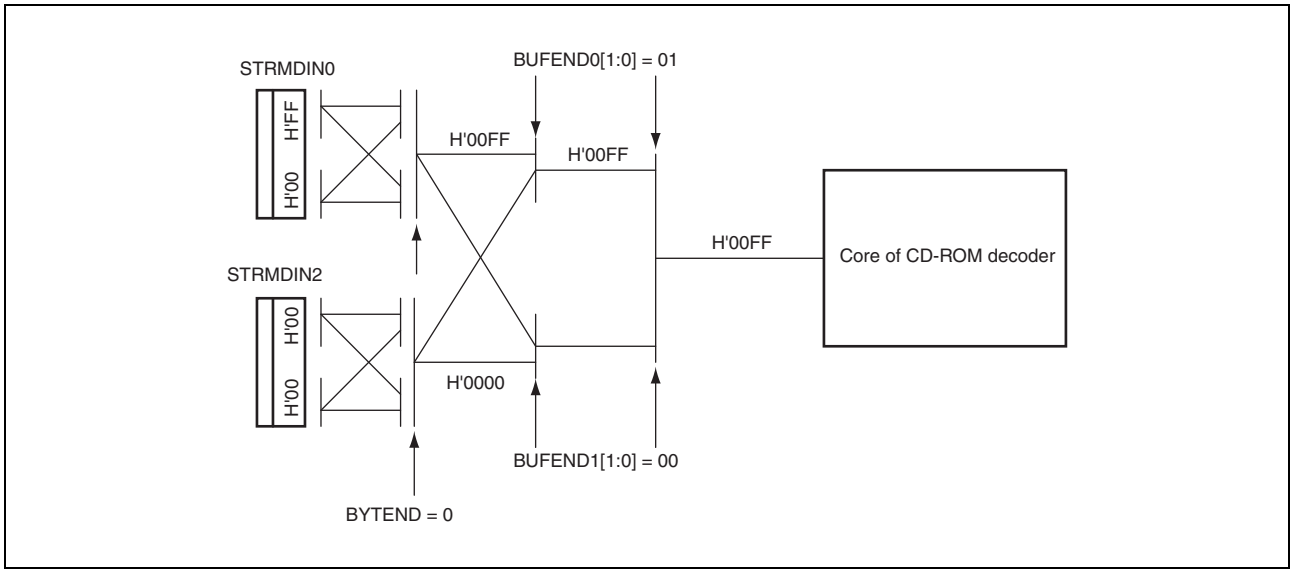

Figure 24.6 Example of Padded Stream Data Control by the SSI Register

Figure 24.7 shows a case of input stream data that has no padding (H'12345678). The upper and lower 16 bits of data are swapped (H'56781234) for input to the CD-ROM decoder.

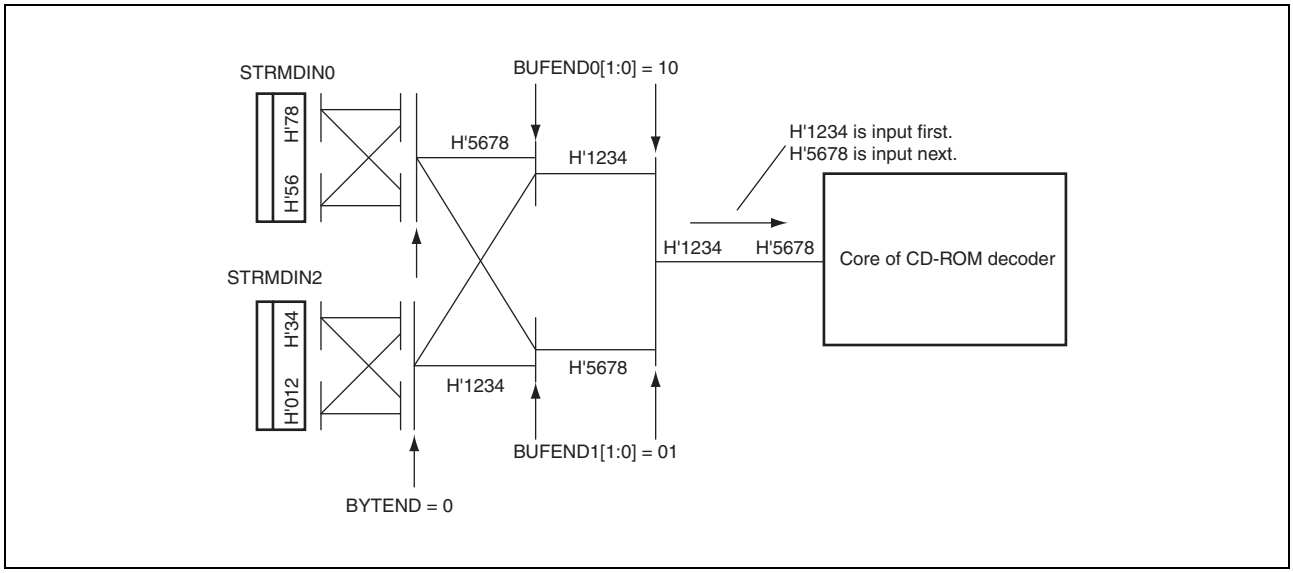

Figure 24.7 Example of Non-Padded Stream Data Control by the SSI Register

24.4.2 Sync Code Maintenance Function

Each sector of CD-ROM data consists of 2352 bytes starting with H'00FFFFFFFFFFFFFFFFFFFF00 (sync code). However, a scratch on the disc or some other factor might lead to erroneous recognition of the sync code sequence at the wrong time. Conversely, a sync code might not be detected at a point where it should be detected. As a solution to these problems, the CD-ROM decoder of this LSI has a sync-code maintenance function, which operates to ignore sync codes detected at abnormal times and maintain the appearance of the sync code at the expected times when it is not actually detected on the disc.

The operating modes of the sync-code maintenance function are listed below. For details on the settings, refer to section 24.3.2, Sync Code-Based Synchronization Control Register (CROMSY0), and Table 24.2.

- Automatic sync maintenance mode
- External sync mode
- Interpolated sync mode
- Interpolated sync plus external sync mode

(1) Automatic Sync Maintenance Mode

In automatic sync maintenance mode, the sync code is ignored if detected within the one-sector (2352-byte) period. Furthermore, if a sync code is not detected at the point where a next sector should start, sync code maintenance is applied. If synchronization timing has changed, re-synchronization is performed at the point where a sync code is detected within 2352 bytes after the change.

Therefore, this mode is effective in rejecting abnormal sync patterns and following changes in synchronization timing. Note, however, that this mode cannot achieve synchronization with the first sector after a change to the synchronization timing.

Figure 24.8 shows operation in the case of normal sync-code detection, Figure 24.9 shows a case where a sync code is detected before a current one-sector period has elapsed, and Figure 24.10 shows the case where the actual sync code is only detected some time after a full one-sector period has elapsed.

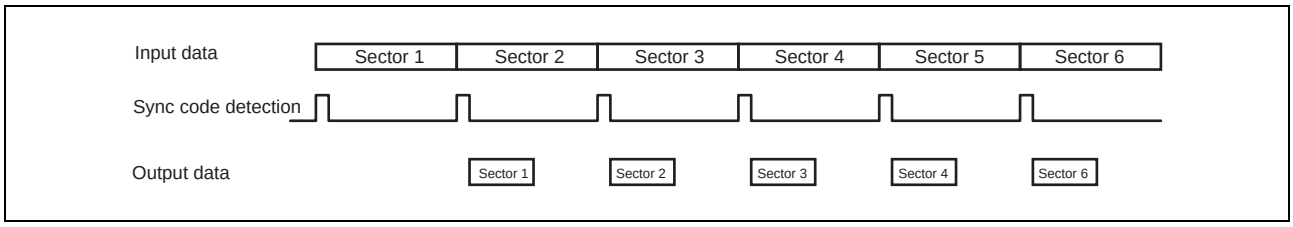

Figure 24.8 Operation in Automatic Sync Maintenance Mode (Normal Timing)

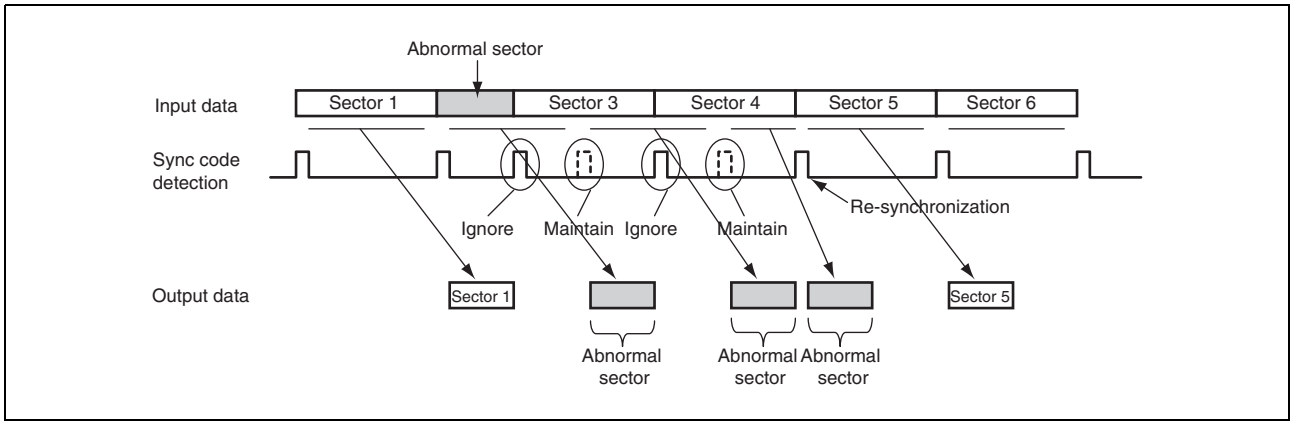

Figure 24.9 Operation in Automatic Sync Maintenance Mode (When an Abnormally Short Sector is Encountered)

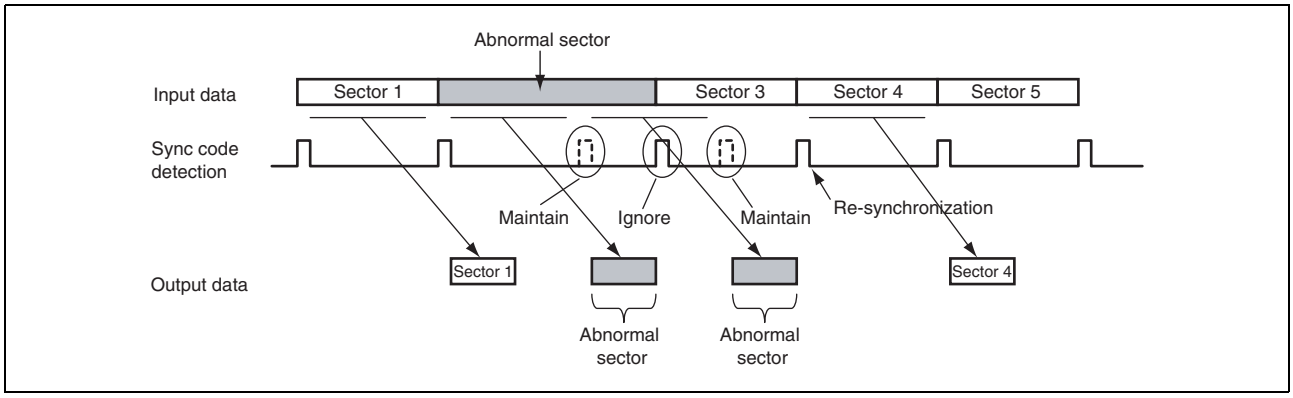

Figure 24.10 Operation in Automatic Sync Maintenance Mode (When an Abnormally Long Sector is Encountered)

(2) External Sync Mode

In external sync mode, synchronization is always based on the sync codes in the incoming data. Even if the next sync code is not detected at the 2352nd byte, decoding does not proceed until the next sync code is detected.
Accordingly, this mode is effective in that it strictly follows the external synchronization timing. Note, however, that decoding will not be performed normally when the sync-code pattern is input with abnormal timing.
Figure 24.11 shows the operation in external sync mode.

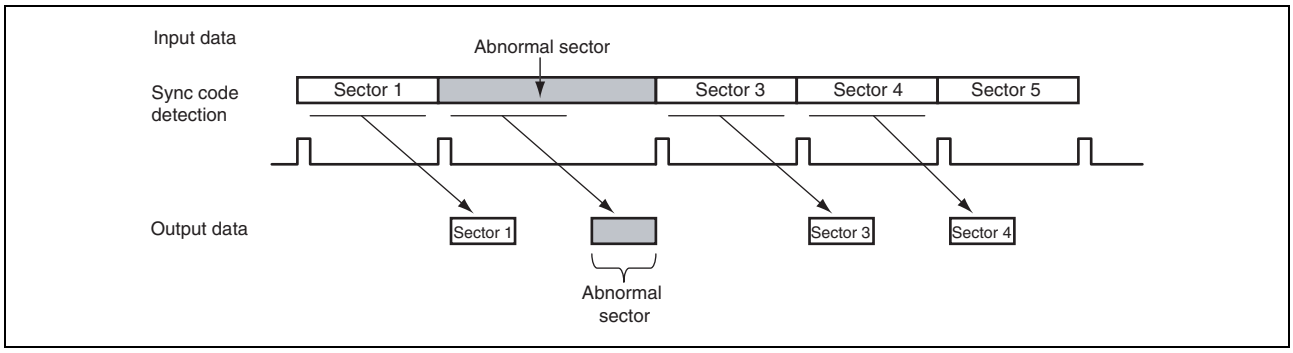

Figure 24.11 Operation in External Sync Mode

(3) Interpolated Sync Mode

In interpolated sync mode, synchronization is always driven by the internal counter after a sync code pattern has been detected at the start of decoding. Accordingly, this mode is effective when the sync patterns have been damaged. However, decoding becomes incorrect after a change to the synchronization timing, since the change in timing is not followed.
Figure 24.12 shows the operation in interpolated sync mode.

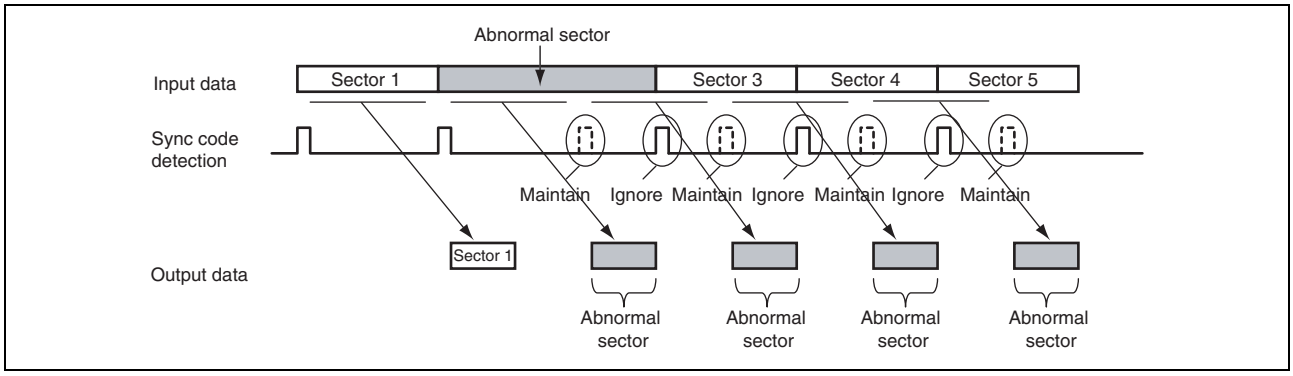

Figure 24.12 Operation in Interpolated Sync Mode

(4) Interpolated Sync Plus External Sync Mode

In interpolated sync plus external sync mode, synchronization is based on the detected sync code patterns as long as they are present, and if a sync pattern is not detected at the 2352nd byte, the sync code maintenance is applied.
Synchronization in this mode is more quickly responsive to changes in synchronization timing than synchronization in the automatic sync maintenance mode.
However, decoding still becomes incorrect when a sync pattern is input with abnormal timing.
Figure 24.13 and Figure 24.14 show the operation in interpolated sync plus external sync mode in the cases of abnormally short and long sectors, respectively.

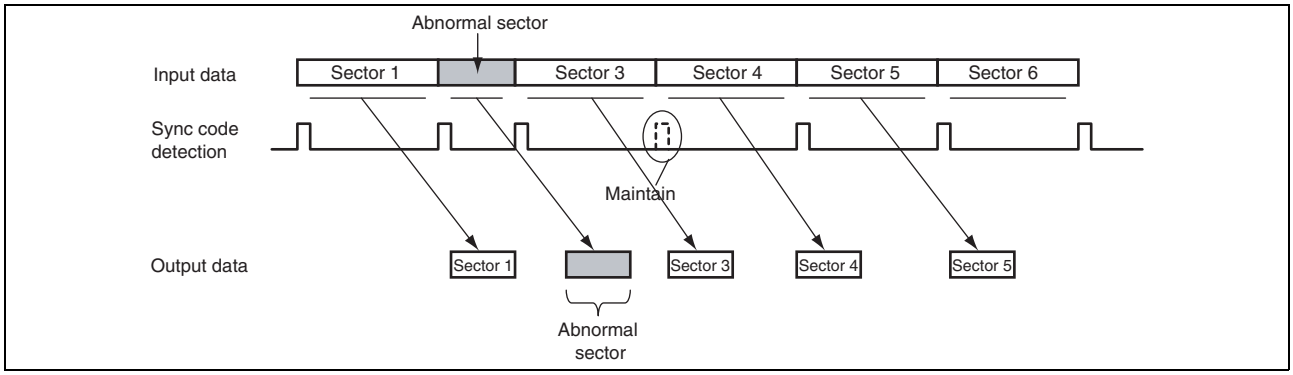

Figure 24.13 Operation in Interpolated Sync Plus External Sync Mode (When an Abnormally Short Sector is Encountered)

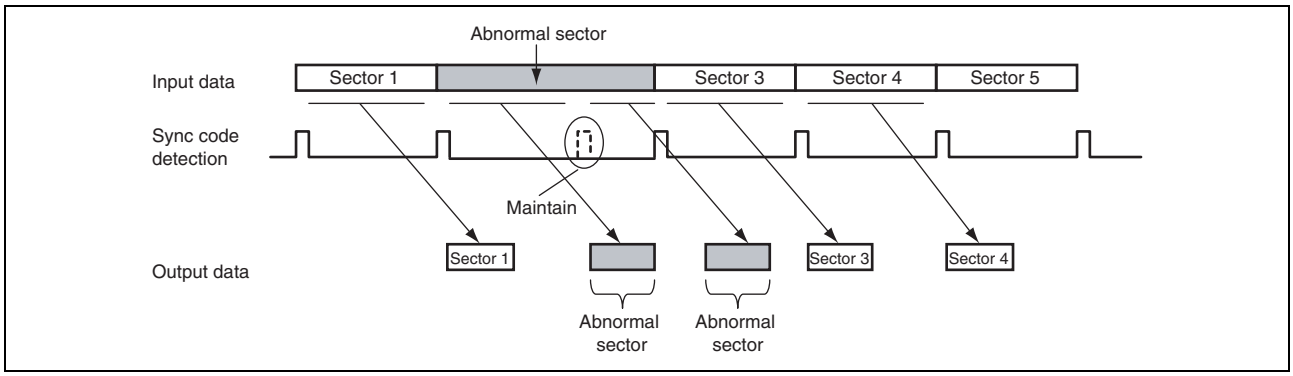

Figure 24.14 Operation in Interpolated Sync Plus External Sync Mode (When an Abnormally Long Sector is Encountered)

24.4.3 Error Correction

The CD-ROM decoder handles data in the formats containing information relevant to error correction, including the EDC, P parity, and Q parity. The CD-ROM decoder includes the following functions for use in error correction.

- Syndrome calculation
- ECC correction
- EDC checking

(1) Syndrome Calculation

After the data of a sector in Mode 1 or Form 1 of Mode 2 has been input, the ECC is used in correction if any error is detected (the result of syndrome calculation is non-zero). After correction, the results of syndrome operation for the corrected data are output to bits ST_ECCP (P parity) and ST_ECCQ (Q parity) in the CROMST6 register, respectively.

(2) ECC correction and EDC Checking

For CD-ROM format data that contains EDC, P-parity, and Q-parity fields, the CD-ROM decoder performs EDC checking and ECC correction. Supported correction modes are P correction, Q correction, PQ correction (P correction followed by Q correction), and QP correction (Q correction followed by P correction). In PQ and QP correction modes, up to three iterations of correction are possible (the number of iterations is limited by the playback speed).
The EDC check is performed twice, before and after correction.
The mode of ECC correction and EDC checking is specified by bits MD_DEC[2:0] in the CROMCTL1 register. When the PQ or QP correction mode is selected, the number of iterations of correction is specified by bits MD_PQREP[1:0] in the CROMCTL1 register.
When the automatic mode/form detection function is in use, the sector mode determines whether or not ECC correction and EDC checking can be performed. For sectors in Mode 0 and Mode 2 (non-XA), which include neither parity bits nor EDC, ECC correction and EDC checking are not performed. For sectors in Form 2 of Mode 2, ECC correction is not performed.

(a) ECC Correction

When ECC correction is in use and an error in a sector is identified as non-correctable, the CD-ROM decoder generates an IERR interrupt and sets the ST_ECCNG bit of the CROMST6 register to 1. The CD-ROM detector also sets this bit to 1 on detecting a short sector.
While the NO_ECC bit of the CROMCTL4 register is set to 1, a ‘pass’ result in pre-ECC correction EDC checking makes the CD-ROM decoder skip ECC correction, regardless of the results of the syndrome operation.

(b) EDC Checking

When EDC checking is in use, checking is in line with the specified or detected sector mode and form, depending on whether or not automatic sector mode and form detection is selected.
The results of EDC checking before and after correction are reflected in the ST_EDC1 and ST_EDC2 bits of the CROMST6 register, respectively. If EDC checking after ECC correction indicates that an error remains, an IERR interrupt is generated.

24.4.4 Automatic Decoding Stop Function

Decoding can be stopped automatically in response to an error during the decoding of CD-ROM data.
The possible conditions for automatically stopping the decoding process are listed below. The applicable conditions are specified in the CROMCTL3 register.

- An error is found to be not correctable by ECC correction.
- Post-ECC correction EDC checking indicates that an error remains.
- A change of the sector mode or form
- A non-sequential MSF (minutes, seconds, frames (1/75 second)) value

When automatic stopping is set up and any of the above conditions is encountered in a certain sector, the decoding is stopped after the results of decoding for that sector have been output.
After decoding has been stopped in response to a condition specified in the CROMCTL3 register, the condition can be identified by reading the CBUFST1 register.
The CD-ROM decoder has buffer space for two sectors. If input of the data stream continues and the output stream of data is not read, the CD-ROM decoder stops at the point where the data of a third sector starts to be input. At this time, the BUF_NG bit in the CBUFST2 register is set to 1, but no interrupt is generated. Once the BUF_NG bit in the CBUFST2 register has been set to 1, recovery can only be accomplished by using the LOGICRST bit in the ROMDECRST register to reset the CD-ROM decoder function. When the LOGICRST bit in the ROMDECRST register is set to 1, a reset signal is output and any registers in which settings have been made are cleared to their initial values.

24.4.5 Buffering Format

Figure 24.15 shows the format of the output data stream produced by CD-ROM decoding.
A 2-byte-wide window register STRMDOUT0 is provided for the output. When this window register is accessed after decoding of a CD-ROM sector has finished, the bytes of data are output in order from the sync code.

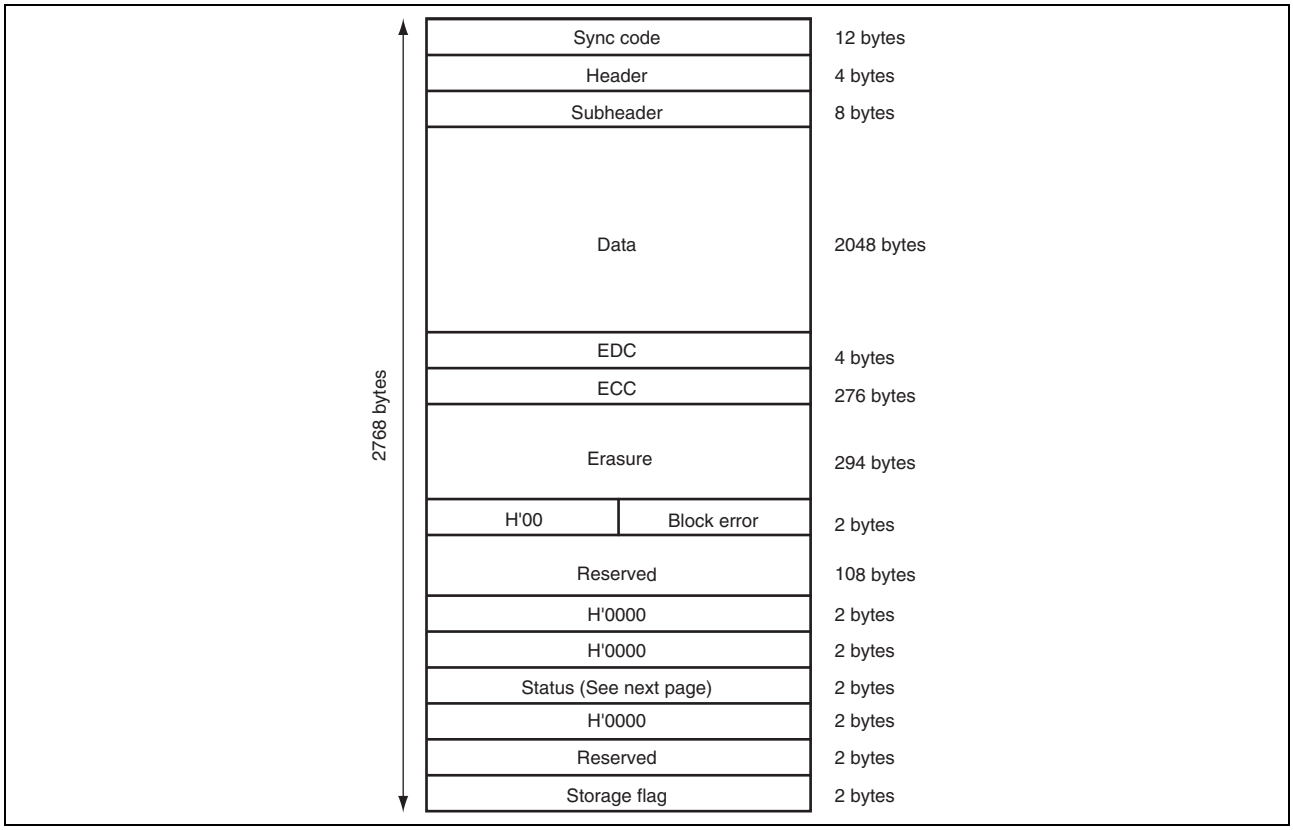

Figure 24.15 Output Data Stream Format

The meanings of bits in the two-byte status field shown in Figure 24.15 are given below. The values of the non-assigned bits are undefined.

Status

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PERR	QERR	EDCE	—	—	—	—	—	SD	SY		FM[2:0]		HD	—	—

[Legend]
PERR: Indicates that a P-parity error remains.
QERR: Indicates that a Q-parity error remains.
EDCE: Indicates that a remaining error was detected in post-ECC correction EDC checking.
SD: Indicates that a short sector was encountered.
SY: Indicates that a sync code was interpolated.
FM: Indicates the data format.
001: Mode 0
010: Mode 1
011: Long (format with no EDC and ECC)
100: Mode 2 (non-XA)
101: Mode 2 Form 1
110: Mode 2 Form 2
HD: Header continuity (minutes, seconds, and frames (1 frame = 1/75 second) are non-sequential)

The value of the storage flag field in Figure 24.15 is incremented every time the data for one sector are output. The value starts at H'0000 and wraps back around to H'0000 after it reaches H'FFFF. Note that the upper byte and lower byte in the storage flag are swapped.

24.4.6 Target-Sector Buffering Function

In the CD-ROM decoder, the sector for output can be designated in two ways: automatic buffering, where the CD-ROM decoder itself detects the presence of target sector that has been set beforehand, and manual buffering, where the target sector for output is designated by software and the software also recognizes the sectors buffered in the CD-ROM decoder.
The following describes the procedures for setting the registers in the CD-ROM decoder to set up automatic or manual buffering.

(1) Setting Up Automatic Buffering

Figure 24.16 shows an example of setting up the automatic buffering. Set the relevant CD-ROM decoder registers and start input of the data stream; the CD-ROM decoder then detects the target sector and starts the output of the stream data.

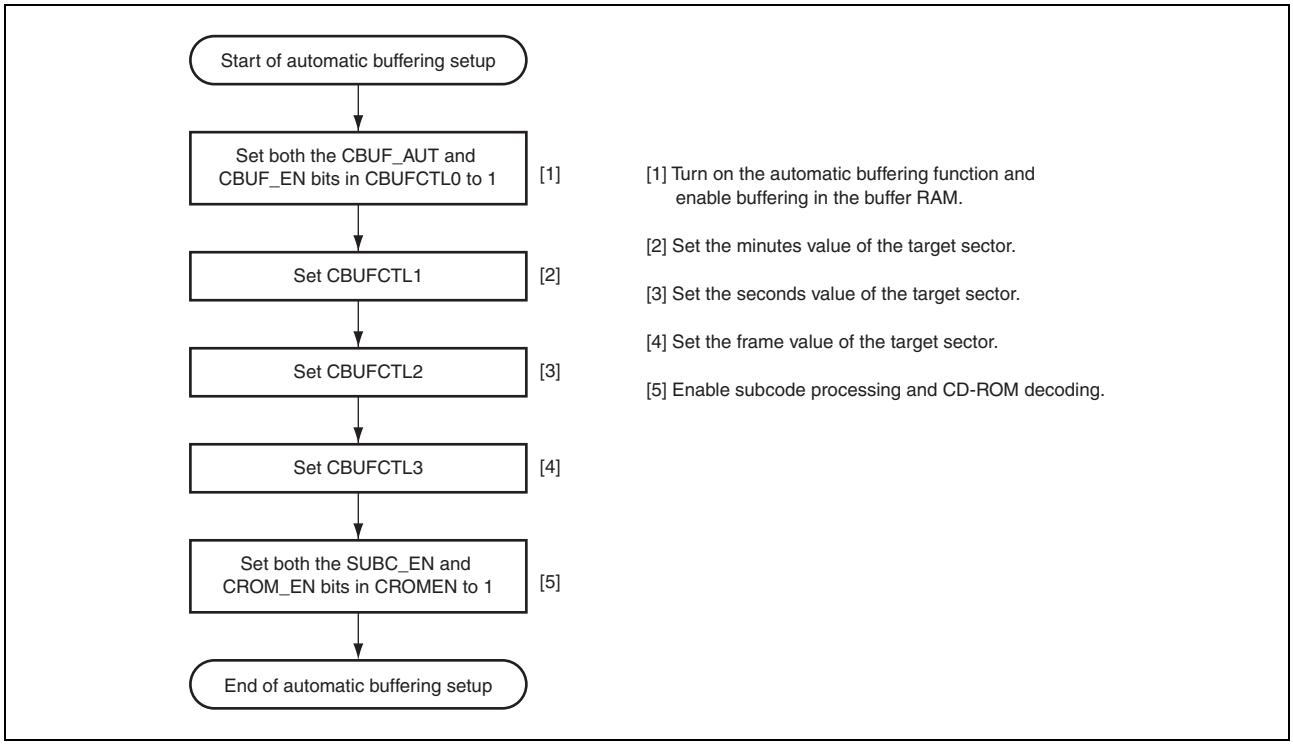

Figure 24.16 Example of Setting Up Automatic Buffering

(2) Setting Up Manual Buffering

Figure 24.17 shows an example of setting up manual buffering. Each time an ISEC interrupt is generated, the software checks whether or not the sector is the target sector and starts buffering when the target sector is found.

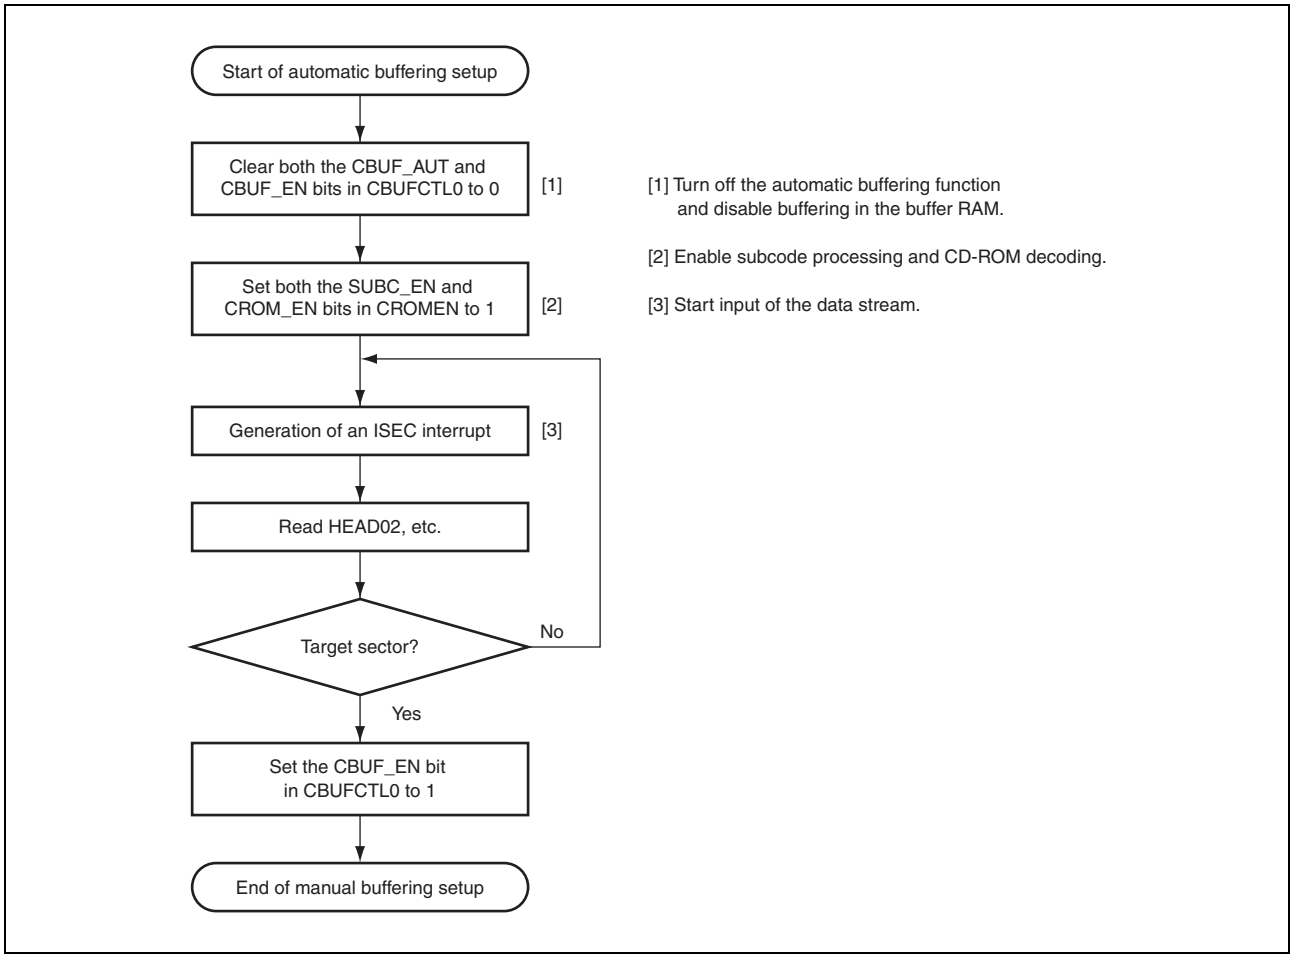

Figure 24.17 Example of Setting Up Manual Buffering

24.5 Interrupt Sources

24.5.1 Interrupt and DMA Transfer Request Signals

Table 24.3 lists the interrupt signals and DMA transfer request signal generated by the CD-ROM decoder, along with the meanings and the modules to which the signals are connected.

Table 24.3 Interrupt and DMA Transfer Request Signals

Name	Condition	Connected To
ISEC	Transition from sector to sector	Interrupt controller
ITARG	Access to a CD-ROM sector that is not the expected target sector	Interrupt controller
ISY	A sync code from the CD-ROM with abnormal timing	Interrupt controller
IERR	An error that was not correctable by ECC correction or an error indicated by EDC checking after ECC correction	Interrupt controller
IBUF	State changes in data transfer to the buffer	Interrupt controller
IREADY	Request for data transfer to the buffer for CD-ROM	Interrupt controller
DMA transfer request	Request for data transfer to the buffer for CD-ROM	Direct memory access controller

(1) ISEC Interrupt

This interrupt is generated when the sync code indicates a transition from sector to sector.

(2) ITARG Interrupt

This interrupt is generated when the stream data transferred from the CD-DSP is not the data of the target sector. The CD-ROM decoder checks the time data in the subcode. In correct operation, data transfer is expected to start slightly before the target sector. An ITARG interrupt is generated in the following cases.

- When data of a sector preceding the target sector by quite a few sectors have been transferred
- When data of a sector that comes after the target sector have been transferred

For the generation of this interrupt, ITARG is detected from the subcode. However, this interrupt has no meaning in this LSI because CD-ROM data are transferred from the serial sound interface.

(3) ISY Interrupt

This interrupt can be generated in the following cases.

- When a sync code was detected at a position where the value in the word counter (counter for checking sync code intervals) was not correct and the sync code was ignored
- When a sync code has not been detected although the word counter has reached the final value and a sync code has been interpolated (for sync maintenance)
- When a sync code was detected at a position where the value in the word counter (counter for checking sync code intervals) was not correct and the sync code was used in resynchronization
- When a sync code has not been detected although the word counter has reached the final value, so the period taken up by the sector has been prolonged
- When the sector has been processed as a short sector with the aid of interpolated sync codes
- When the sector has been processed as a long sector with the aid of interpolated sync codes

(4) IERR Interrupt

This interrupt is generated in the following cases.

- When ECC correction was incapable of correcting an error
- When ECC correction was OK but the subsequent EDC check indicated an error

(5) IBUF Interrupt

This interrupt is generated when the following transitions occur.

- Data transfer to the buffer → Data transfer complete (searching for data for the next transfer)
- Data for transfer to the buffer are being searched for → Data transfer started

(6) IREADY Interrupt

This interrupt is generated when decoding of data for one sector is completed. This interrupt should be used to start the CPU buffering stream data for output to SDRAM.

(7) DMA Transfer Request

The source of direct memory access controller activation is the same as that of IREADY. An interrupt request is generated when output stream data for one sector becomes ready, and after the 2768 bytes of data shown in figure 24.15 have been transferred, the request signal is negated. This is because a certain amount of time is required before the output data for the next sector is ready, so the transfer request from the direct memory access controller should be turned off between transfers.

24.5.2 Timing of Status Registers Updates

The status information registers of the CD-ROM decoder are updated on each ISEC interrupt. The sector for which information is reflected in the status registers is selected by the ER0SEL bit of the CROMCTL4 register.

24.6 Usage Notes

24.6.1 Stopping and Resuming Buffering Alone during Decoding

When the data of the output stream are not being read out but operation of the CD-ROM decoder has continued until the buffers are full, the BUF_NG bit in the CBUFST2 register is set to 1; after that, the CD-ROM decoder becomes incapable of operation.
To stop buffering alone, clear the CBUF_EN bit in the CBUFCTL0 register to 0. If the automatic buffering function is in use, clear the CBUF_AUT bit in the CBUFCTL0 register to 0 at the same time. In this case, the sectors currently in the buffers must be read out.
To resume automatic buffering, set the CBUF_AUT and CBUF_EN bits in the CBUFCTL0 register to 1 at the same time.

24.6.2 Setting Sync Code Status Register (CROMST0)

1. When the ST_SECS bit in the CROMST0 register becomes 1, stop decoding immediately and retry from one sector before the sector that was being decoded.
2. When the ST_SECL bit in the CROMST0 register becomes 1, stop decoding immediately and retry from two sectors before the sector that was being decoded.

24.6.3 Link Blocks

The CD-ROM decoder uses the header information before ECC correction to detect link blocks. Accordingly, an input data stream that contains an error may be erroneously detected as a link block. To prevent this, the following measures should be implemented in software.

- During buffering (BUF_ACT = 1 in the CBUFST0 register), check the LINK_OUT1 bit in the CROMST5 register on each ISEC interrupt. If it is set to 1, check to see if an IERR interrupt has also occurred; if an IERR interrupt has not occurred, save the MFS values from the HEAD20 to HEAD23 registers. If an IERR interrupt has occurred, do not save the MSF values.
- Perform the following processing for seven sectors (indicated by ISEC being generated seven times) after finding that the LINK_OUT1 bit has been set to 1.
- In either of cases 1 and 2 below,
  1. LINK_ON = 1 (in the CROMST5 register) is confirmed at each ISEC interrupt, and LINK_ON = 1 is detected again within the subsequent two-sector period
  2. LINK_ON = 1 was not detected at any ISEC interrupt

forcibly stop decoding, set the CROMSY0 register to place the decoder in external sync mode, and retry decoding by specifying the MSF value stored as described above + 7 (immediately after a link block) as the MSF value for the target sector.
The start sector address will be the address where RUN_OUT is stored + 7.

24.6.4 Stopping and Resuming CD-DSP Operation

When stopping and then resuming the stream data input to the CD-ROM decoder, if the input data stream does not stop immediately before a sync code and is then resumed, the CD-ROM decoder may recognize the data as incorrect. This happens because the system holds the data up to the point where input was stopped and the data that is input from the point of resumption at the same time. Take care on this point when stopping and then resuming input.

24.6.5 Note on Clearing the IREADY Flag

To clear the IREADY flag to 0 in interrupt processing etc., be sure to read one sector of data (2768 bytes) beforehand. If

the IREADY flag is cleared to 0 before reading of one sector of data is complete, decoding of the subsequent sectors will not be possible. For recovery from this situation, write 1 to the LOGICRST bit in the CD-ROM decoder reset control register (ROMDECRST), and then clear the bit to 0.

24.6.6 Note on Stream Data Transfer (1)

If reading of the output data stream is slower than writing of the input data stream, the buffer of the CD-ROM decoder will overflow. This causes the CD-ROM decoder to abnormally stop.

When DMA transfer is in use, ensure that reading of the output data stream is faster than writing of the input data stream by making settings as listed below.

- Set a larger transfer size for reading of the output data stream than for writing of the input data stream.
- Give reading of the output data stream higher priority than writing of the input data stream.
- Set a smaller interval count for reading of the output data stream than for writing of the input data stream.

When the CPU handles transfer, ensure that reading of the output data stream is faster than writing of the input data stream by taking similar measures to those in the case of DMA transfer.

24.6.7 Note on Stream Data Transfer (2)

When reading the stream data, be sure to use either the direct memory access controller or the CPU. If both the direct memory access controller and the CPU are used for reading, the stream data may not be recognized as being in the CD-ROM format.

24.6.8 Note on Software Reset

For transitions to the software reset state by the LOGICRST bit in the ROMDECRST register, see section 55.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the LOGICRST bit.

25. LIN Interface

This section contains a generic description of the LIN Interface (RLIN3). The first part of this section describes all specific properties of this product, such as the register base addresses, etc. The remainder of the section describes the functions and registers of RLIN3.

25.1 Features

25.1.1 Channels

This LSI has following number of channels of the LIN Interface.

Table 25.1 Channels of RLIN3n

LIN Interface	RZ/A1H and RZ/A1M
Channels	2
Name	RLIN30 and RLIN31

Index n

Throughout this section, the channel of the LIN Interface (RLIN3) is identified by the index “n” (n = 0 or 1), for example, RLN3nLMD for the LIN mode register.

25.1.2 Register Addresses

The register base address of the LIN interface is listed in the following table.

All LIN interface register addresses are given as address offsets to the individual base address.

Table 25.2 Register Base Addresses

Base Address Name	Base Address
<RLIN30_base>	FCFE 9000$_H$
<RLIN31_base>	FCFE 9800$_H$

25.1.3 Clock Supply

The following clock is provided for the LIN interface.

Table 25.3 RLIN3n Clock Supply

RLIN3n	Clock	Connected to
RLIN3n	LIN Communication Clock Source	P0φ

25.1.4 Interrupts and DMA

The LIN Interface can generate the following interrupt and DMA requests:

Table 25.4 RLIN3n Interrupt and DMA Requests

RLIN3n signal	Function
RLIN30	
LIN0_INT_M	LIN0 interrupt
LIN0_INT_T	LIN0 transmission interrupt
LIN0_INT_R	LIN0 successful reception interrupt
LIN0_INT_S	LIN0 status error interrupt
RLIN31	
LIN1_INT_M	LIN1 interrupt
LIN1_INT_T	LIN1 transmission interrupt
LIN1_INT_R	LIN1 successful reception interrupt
LIN1_INT_S	LIN1 status error interrupt

25.1.5 I/O Signals

The I/O signals of the LIN Interface are used for various purposes, as listed in Table 25.5.

Table 25.5 RLIN3n I/O Signals

Name	Function
RLIN30	
Port RLIN30RX	RLIN30 receive data input
Port RLIN30TX	RLIN30 transmit data output
RLIN31	
Port RLIN31RX	RLIN31 receive data input
Port RLIN31TX	RLIN31 transmit data output

25.2 Function

The LIN Interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602, and automatically performs frame communication and error determination.

The LIN master mode is only available.

LIN master

- LIN reset mode
- LIN mode (LIN master mode)
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

Table 25.6 gives the LIN Interface specifications and Figure 25.1 shows a block diagram of the LIN Interface.

Table 25.6 LIN Interface Specifications

Item		Specifications
	Channel count	2
LIN communication function	Protocol	LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602
	Variable frame structure	Master • Break transmission width: 13 to 28 Tbits • Break delimiter transmission width: 1 to 4 Tbits • Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*1 • Transmission response space width: 0 to 7 Tbits*1 • Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) • Transmit wake-up width: 1 to 16 Tbits
	Checksum	• Automatic operation for both transmission and reception • Classic or enhanced selectable (for each frame)
	Response field data byte count	Variable from 0 to 8 bytes Multi-byte (9 or more bytes) response transmission and reception also possible
	Frame communication modes	Master • Mode in which header transmission and response transmission/reception is started with a single transmission start request • Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode) (Setting of the frame separate mode is prohibited in this product.)
	Wake-up transmission and reception	LIN wake-up mode provided • Wake-up transmission (1 to 16 Tbits) • Wake-up reception Low-level width of input signals measured
	Status	Master • Successful frame/wake-up transmission • Successful header transmission • Successful frame/wake-up reception*2 • Successful data 1 reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)
	Error status	Master • Bit error • Checksum error • Frame timeout error/response timeout error • Physical bus error • Framing error • Response preparation error
	Baud rate selection	Baud rate conforming to the LIN specifications generated using baud rate generator
	Test mode	Self-test mode for user evaluation
	Interrupt function	Master • Successful header/frame/wake-up transmission • Successful frame/wake-up reception*2 • Error detection

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.
Note 2. For wake-up reception, the low level width of the input signal is indicated.

25.2.1 Block Diagram

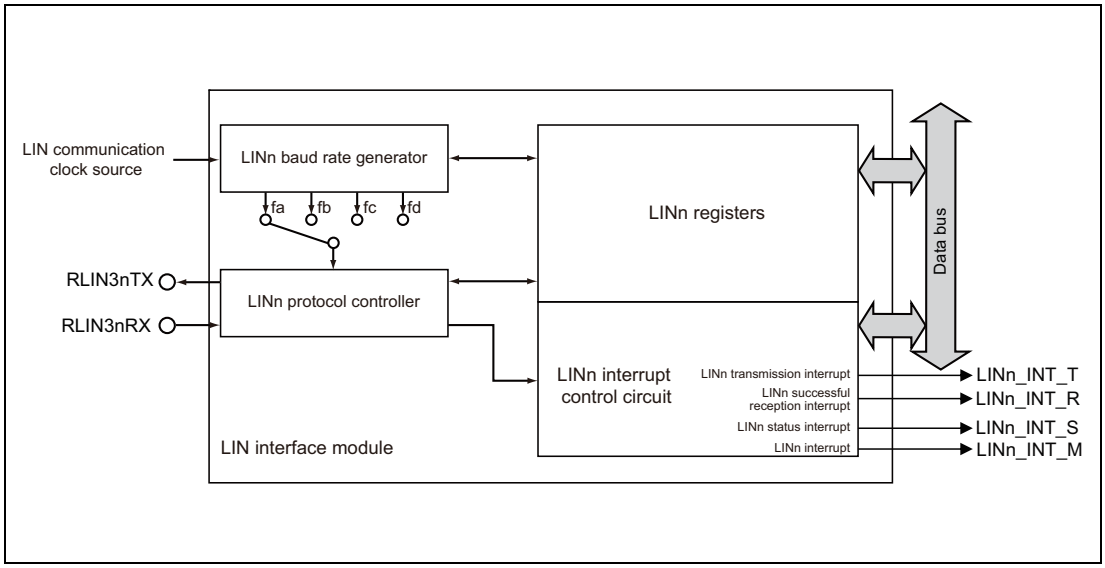

Figure 25.1 LIN Interface Block Diagram

25.2.2 Description of Blocks

- RLIN3nTX, RLIN3nRX: LIN Interface I/O pins
- LINn baud rate generator: Generates the LIN Interface communication clock signal.
- LINn registers: LIN Interface registers
- LINn interrupt controller: Controls interrupt requests generated by the LIN Interface

25.3 Registers

Table 25.7 lists the LIN Interface registers.

Table 25.7 List of LIN Interface Registers

Register Name	Symbol
LIN wake-up baud rate selector register	RLN3nLWBR
LIN baud rate prescaler 0 register	RLN3nLBRP0
LIN baud rate prescaler 1 register	RLN3nLBRP1
LIN self-test control register	RLN3nLSTC
LIN mode register	RLN3nLMD
LIN break field configuration register	RLN3nLBFC
LIN space configuration register	RLN3nLSC
LIN wake-up configuration register	RLN3nLWUP
LIN interrupt enable register	RLN3nLIE
LIN error detection enable register	RLN3nLEDE
LIN control register	RLN3nLCUC
LIN transmission control register	RLN3nLTRC
LIN mode status register	RLN3nLMST
LIN status register	RLN3nLST
LIN error status register	RLN3nLEST
LIN data field configuration register	RLN3nLDFC
LIN ID buffer register	RLN3nLIDB
LIN checksum buffer register	RLN3nLCBR
LIN data buffer 1 register	RLN3nLDBR1
LIN data buffer 2 register	RLN3nLDBR2
LIN data buffer 3 register	RLN3nLDBR3
LIN data buffer 4 register	RLN3nLDBR4
LIN data buffer 5 register	RLN3nLDBR5
LIN data buffer 6 register	RLN3nLDBR6
LIN data buffer 7 register	RLN3nLDBR7
LIN data buffer 8 register	RLN3nLDBR8

Note: When writing to a register not used, write 00_H.

25.3.1 LIN Master Related Registers

25.3.1.1 RLN3nLWBR — LIN Wake-up Baud Rate Select Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			LWBR0
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.8 RLN3nLWBR register contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 Other than above: Setting prohibited
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified by the LCKS bit setting in the RLN3nLMD register is used (when LIN1.3 is used). 1: In LIN wake-up mode, the clock fa is used regardless of the setting of the LCKS bit in the RLN3nLMD register (when LIN2.x is used).

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

NSPB[3:0] bits (bit sampling count select bits)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).

In LIN master mode, set these bits to 0000_B or 1111_B (16 sampling).

LPRS[2:0] bits (prescaler clock select bits)

These bits select the frequency division ratio for the prescaler.

LWBR0 bit (wake-up baud rate select bit)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows the 2.5-Tbit or longer low-level width of the input signal to be measured. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects fa as the LIN system clock (fLIN) during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.

Setting the baud rate to 19200 bps while fa is selected allows the 130 µs or longer low-level width of the input signal to be detected during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

25.3.1.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 02_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.9 RLN3nLBRP0 register contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (4 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1. Setting Range: 04_H to FF_H Note: Set the LPRS and LBRP0 bits so that the frequency of the prescaler clock becomes no more than that of the clock source for LIN communications divided by nine.

Set the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits by N + 1.

25.3.1.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 03_H

Initial value: 00H

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.10 RLN3nLBRP1 register contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (4 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1. Setting Range: 04_H to FF_H Note: Set the LPRS and LBRP1 bits so that the frequency of the prescaler clock becomes no more than that of the clock source for LIN communications divided by nine.

Set the RLN3nLBRP1 register when the OMM0 bit in the RLN2uunLcMST register is 0_B (in LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M + 1.

25.3.1.4 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 04_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—							LSTM
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.11 RLN3nLSTC register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed thus placing LIN self-test mode to be entered, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, refer to Section 25.8, LIN Self-Test Mode.

When read, bits 6 to 1 return 000000_B, and bit 7 returns an undefined value.

LSTM bit (LIN self test mode bit)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.

For leaving LIN self-test mode, refer to Section 25.8, LIN Self-Test Mode.

Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

25.3.1.5 RLN3nLMD — LIN Mode Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 08_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	LCKS[1:0]		LMD[1:0]	
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.12 RLN3nLMD register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, an initial value is returned. When written, write an initial value.
5	LRDNFS	LIN Reception Data Noise Filtering Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: LINn interrupt is used. 1: LINn transmission interrupt, LINn successful reception interrupt, and LINn status error interrupt are used.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	LMD[1:0]	LIN Mode Select b1 b0 0 0: LIN master mode

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LRDNFS bit (LIN reception data noise filtering disable bit)

The LRDNFS bit enables or disables the noise filter when receiving data.

With 0 set, the noise filter is enabled when receiving data.

With 1 set, the noise filter is disabled when receiving data.

LIOS bit (LIN interrupt output select bit)

The LIOS bit selects the number of interrupt outputs from the LIN Interface.

With 0 set, the LINn interrupt is generated from the LIN Interface.

With 1 set, the LINn transmission interrupt, LINn successful reception interrupt, and LINn status interrupt are generated from the LIN Interface.

For each interrupt source, refer to Section 25.4, Interrupt Sources.

LCKS[1:0] bits (LIN system clock select bits)

The LCKS bits select the clock to be input to the protocol controller.

With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).

With 01_B set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).

With 10_B set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).

With 11_B set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

With 1_B is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), and the RLN3nLMST register is 01_H (LIN wake-up mode), the protocol controller is provided with fa regardless of the setting of the bit (the LCKS bit is not changed).

LMD[1:0] bits (LIN mode select bits)

The LMD bits select the LIN Interface mode.

To use the LIN Interface as an LIN master, set these bits to 00_B.

25.3.1.6 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.13 RLN3nLBFC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, an initial value is returned. When written, write an initial value.
5, 4	BDT[1:0]	Break Delimiter (High level) width select bit b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmit Break (Low level) width select bit b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] bit (Transmission Break Delimiter high level width setting bit)

This bit is used to set the break high **level** width of transmission frame header.

1 Tbit to 4 Tbits can be set.

BLT[3:0] bit (Transmission Break Low level width setting bit)

This BLT bits set the break low **level** width of transmission frame header.

13 Tbits to 28 Tbits can be set.

25.3.1.7 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0A_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 25.14 RLN3nLSC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, an initial value is returned. When written, write an initial value.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, an initial value is returned. When written, write an initial value.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] bits (inter-byte space select bits)

The IBS bits set the width of the inter-byte space of the transmission frame response field.

0 Tbit to 3 Tbits can be set.

These bits are enabled only during response transmission; these are disabled during response reception.

IBHS[2:0] bits (inter-byte space (header)/response space select bits)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.

0 Tbit to 7 Tbits can be set.

The response space setting is enabled only during response transmission; setting is disabled during response reception.

The inter-byte space (header) is equal to the response space.

25.3.1.8 RLN3nLWUP — LIN Wake-up Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0B_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 25.15 RLN3nLWUP register contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, an initial value is returned. When written, write an initial value.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

WUTL[3:0] bits (wake-up transmission low level width select bits)

The WUTL bits set the low level width of the wake-up signal transmission.

1 Tbit to 16 Tbits can be set.

While 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), fa is selected as

the LIN system clock (fLIN) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

25.3.1.9 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0C_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.16 RLN3nLIE register contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	SHIE	Successful Header Transmission Interrupt Request Enable 0: Disables successful header transmission interrupt request. 1: Enables successful header transmission interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Request Enable 0: Disables successful frame/wake-up reception interrupt request. 1: Enables successful frame/wake-up reception interrupt request.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Request Enable 0: Disables successful frame/wake-up transmission interrupt request. 1: Enables successful frame/wake-up transmission interrupt request.

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

SHIE bit (successful header transmission interrupt enable bit)

The SHIE bit enables or disables interrupt request upon successful transmission of a header.

With 0 set, the interrupt request for LINn transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for LINn transmission is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE bit (error detection interrupt request enable bit)

The ERRIE bit enables or disables interrupt request upon detection of an error.

With 0 set, the interrupt request for LINn status is not generated when the ERR flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for LINn status is generated when the ERR flag in the RLN3nLST register is set to 1.

Interrupt sources can be the bit error, physical bus error, frame/response timeout error, framing error, checksum error, and response preparation error.

Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE bit (successful frame/wake-up reception interrupt request enable bit)

The FRCIE bit enables or disables interrupt request upon successful reception of a frame or a wake-up signal (counting of low level width of the input signal).

With 0 set, the interrupt request for successful LINn reception is not generated when the FRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for successful LINn reception is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE bit (successful frame/wake-up transmission interrupt request enable bit)

The FTCIE bit enables or disables interrupt request upon successful transmission of a frame or a wake-up signal.

With 0 set, the interrupt request for LINn transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for LINn transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

25.3.1.10 RLN3nLEDE —LIN Error Detection Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0D_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	—	—	—	FERE	FTERE	PBERE	BERE
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 25.17 RLN3nLEDE register contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6 to 4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LTES bit (timeout error select bit)

The LTES bit selects the specific timeout function to be used.

With 0 set, the timeout function applies to frame timeout.

With 1 set, the timeout function applies to response timeout.

For details of the timeout error, refer to Section 25.7.6, Error Status.

FERE bit (framing error detection enable bit)

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.

For details of the framing error, refer to Section 25.7.6, Error Status.

FTERE bit (timeout error detection enable bit)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.

With 0 set, the frame timeout error or response timeout error is not detected.

With 1 set, the frame timeout error or response timeout error is detected.

When this bit is set to 1, the detection result is indicated in the FTER flag in the RLN3nLEST register.

With the LTES bit, either the frame timeout error or response timeout error can be selected.

Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.

For details of the timeout error, refer to Section 25.7.6, Error Status.

PBERE bit (physical bus error detection enable bit)

The PBERE bit enables or disables detection of the physical bus error.

With 0 set, the physical bus error is not detected.

With 1 set, the physical bus error is detected.

When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN3nLEST register.

For details of the physical bus error, refer to Section 25.7.6, Error Status.

BERE bit (bit error detection enable bit)

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

When this bit is set to 1, the detection result is indicated in the BER flag in the RLN3nLEST register.

For details of the bit error, refer to Section 25.7.6, Error Status.

25.3.1.11 RLN3nLCUC — LIN Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0E_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.18 RLN3nLCUC register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	OM1	LIN Mode Select 0: LIN wake-up mode is caused. 1: LIN operation mode is caused.
0	OM0	LIN Reset 0: LIN reset mode is caused. 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to cause a transition to LIN wake-up mode after canceling LIN reset mode, and set the register to 03_H to cause a transition to LIN operation mode.

In LIN self-test mode, set the RLN3nLCUC register to 03h after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 bit (LIN mode select bit)

The OM1 bit selects the specific LIN operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.

With 0 set, LIN wake-up mode is caused.

With 1 set, LIN operation mode is caused.

This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.

Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 bit (LIN reset bit)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.

With 0 set, LIN reset mode is caused.

With 1 set, LIN reset mode is canceled.

25.3.1.12 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.19 RLN3nLTRC register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped in frame separate mode. 1: Response transmission/reception is started in frame separate mode. Note: Setting of the frame separate mode is prohibited in this product.
0	FTS	Frame Transmission/wake-up Transmission /Reception Start 0: Frame Transmission/wake-up transmission /reception is stopped. 1: Frame Transmission/wake-up transmission reception is started.

RTS bit (response transmission/reception start bit)

Set the RTS bit to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written. To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group communication or transition to LIN reset mode.

FTS bit (frame transmission/wake-up transmission/reception start bit)

Set the FTS bit to 1 to start frame transmission and reception.

Also set this bit to 1 to allow wake-up transmission and wake-up reception (counting of the low level width of the input signal).

Only 1 can be written to this bit; 0 cannot be written. Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication (including error detection) and transition to LIN reset mode.

25.3.1.13 RLN3nLMST — LIN Mode Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 11_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 25.20 RLN3nLMST register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	OMM1	LIN Mode Status Monitor 0: The module is in LIN wake-up mode. 1: The module is in LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: The module is in LIN reset mode. 1: The module is not in LIN reset mode.

OMM1 bit (LIN mode status monitor)

The OMM1 bit indicate the current operating mode.

OMM0 bit (LIN reset status monitor)

The OMM0 bit indicates the current operating mode.

25.3.1.14 RLN3nLST — LIN Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 25.21 RLN3nLST register contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag These bits are always read as 0. The write value should always be 0.
5, 4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H. To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC flag (successful header transmission flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt request for LINn transmission is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

D1RC flag (successful data 1 reception flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR flag (error detection flag)

The ERR flag is set to 1 upon detection of an error (when the value of any of the flags of the RLN3nLEST registers is 1). Here, an interrupt request for LINn status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC flag (successful frame/wake-up reception flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for successful LINn reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC flag (successful frame/wake-up transmission flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for LINn transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

25.3.1.15 RLN3nLEST — LIN Error Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Initial value: 00H

Bit	7	6	5	4	3	2	1	0
	RPER	—	CSER	—	FER	FTER	PBER	BER
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 25.22 RLN3nLEST register contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	Reserved	When read, an initial value is returned. When written, write an initial value.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: checksum error has been detected.
4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/ reception is started), do not write a value to this register. To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER flag (response preparation error flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

CSER flag (checksum error flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FER flag (framing error flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FER flag is set to 1 upon frame timeout detection when the FERE bit of the RLN3nLEDE register is 1 (frame timeout detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FTER flag (timeout error flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FTER flag is set to 1 upon frame timeout error or response timeout error detection when the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

PBER flag (physical bus error flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The PBER flag is set to 1 upon physical bus error detection when the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

BER flag (bit error flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The BER flag is set to 1 upon bit error detection when the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

25.3.1.16 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	FSM	CSM	RFT	RFDL[3:0]			
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.23 RLN3nLDFC register contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set. Note: Setting of the frame separate mode is prohibited in this product.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS bit (transmission/reception continuation select bit)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

FSM bit (frame separate mode select bit)

The FSM bit sets the response communication mode.

With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without the RTS bit in the RLN3nLTRC register being set.

With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception which is 8 bytes or less (the RFT bit is 0), set the FSM bit to 0.
When causing a transition to LIN self-test mode, set this bit to 0 before transition.
For details of frame separate mode, refer to Section 25.7.3.1, Transmission of LIN Frames.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

CSM bit (checksum select bit)

The CSM bit sets the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error is used (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details of the bit error, refer to Section 25.7.6, Error Status.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.

During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

RFT bit (response field communication direction select bit)

The RFT bits set the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low level width of the input signal is counted).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

RFDL[3:0] bits (response field length select bits)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the FTS bit in the RLN3nLTRC register is 0).
To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).

When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).

Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

25.3.1.17 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP[1:0]		ID[5:0]					
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.24 RLN3nLIDB register contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bit (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bit (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

In LIN self-test mode, this register operates as follows:

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

IIDP[1:0] bits (parity setting bits)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame (IDP0 for P0 and IDP1 for P1). Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

ID[5:0] bits (ID setting bits)

The ID bit sets the 6-bit ID value to be transmitted in the ID field of the LIN frame.

25.3.1.18 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register can only be read in 8-bit units. In LIN self-test mode, this register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.25 RLN3nLCBR register contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.
  For details about the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

25.3.1.19 RLN3nLDBRm — LIN Data Buffer m Register (m = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.26 RLN3nLDBRm (m = 1 to 8) register contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or allows the received data to be read. Setting Range: 00_H to FF_H

For response transmission:

The LDBRn registers set the data to be transmitted in the response field.
Use these registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 0 (not frame separate mode)
- FTS bit in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted)

or

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)

For response reception:

The LDBRn registers hold the data received in the response field.
The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.
Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started)

For transmission of response data of 9 bytes or more:

Use the LDBRn registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)

For reception of response data of 9 bytes or more:

Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as follows:

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

25.4 Interrupt Sources

The LIN Interface generates four types of interrupt requests.

- LINn transmission interrupt
- LINn successful reception interrupt
- LINn status interrupt
- LINn interrupt

Setting the LIOS bit in the RLN3nLMD register to 0 allows to perform logical OR operation on all of the interrupt sources, outputting the interrupt request from the LINn interrupt.

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the LINn transmission interrupt, LINn successful reception interrupt, or LINn status interrupt depending on the interrupt request.

Table 25.27 lists the sources for each interrupt.

Table 25.27 Interrupt Sources

		LIOS bit in RLN3nLMD register is 0	LIOS bit in RLN3nLMD register is 1		
		LINn Interrupt	**LINn Transmission Interrupt**	**LINn Successful Reception Interrupt**	**LINn Status Interrupt**
LIN mode	LIN master mode	• Successful frame transmission • Successful frame reception • Successful wake-up transmission • Successful wake-up reception • Successful header transmission • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error	• Successful frame transmission • Successful wake-up transmission • Successful header transmission	• Successful wake-up reception • Successful wake-up reception	• Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error

Each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is 1.

25.5 Modes

The LIN Interface provides the following three modes, depending upon the specific function to be performed:

- LIN reset mode
- LIN mode (LIN master mode)
- LIN self-test mode

The supply of clocks to the LIN Interface is stopped in LIN reset mode, which reduces power consumption.

Figure 25.2 shows mode transitions. Table 25.28 describes mode transition conditions. Table 25.29 lists operations available in each mode.

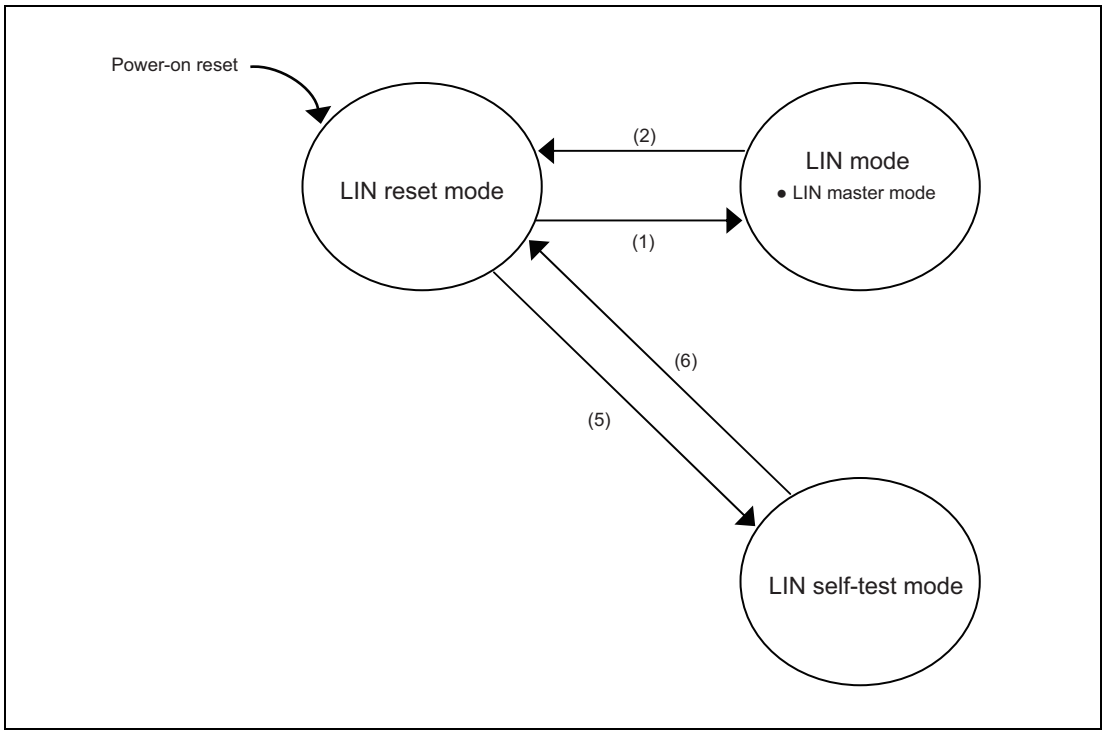

Figure 25.2 Mode Transitions

Table 25.28 Transition Condition of Each Mode

	Mode transition			Transition condition
1	LIN reset mode	→	LIN mode (LIN master mode)	RLN3nLMD.LMD = 00_B and RLN3nLCUC.OM1, OM0 = 01_B or 11_B
2	LIN mode	→	LIN reset mode	RLN3nLCUC.OM0 = 0_B
5	LIN reset mode	→	LIN self-test mode	See Section 25.8, LIN Self-Test Mode.
6	LIN self-test mode	→	LIN reset mode	See Section 25.8, LIN Self-Test Mode.

Table 25.29 Operations Available in Each Mode

LIN mode	
LIN master mode	**LIN self-test mode**
Header transmission Response transmission Response reception Wake-up transmission Wake-up reception Error detection	Self test

Whether a transition has been caused to LIN reset mode or LIN mode can be verified by reading the LMD bits in the RLN3nLMD register or the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

25.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The change to LIN reset mode can be verified by determining that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication function is halted.

When a DMA channel is activated by a LIN transfer request at the time of a transition to LIN reset mode, stop the channel.

For stopping a DMA channel, see section 9, Direct Memory Access Controller.

From LIN reset mode, transitions to LIN mode and LIN self-test mode can be made.

When the mode changes to LIN reset mode, the following registers are initialized to their reset values, and as long as LIN reset mode is in effect, they retain their initial values.

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLDBRm register (m = 1 to 8)

25.7 LIN Mode

LIN mode can operate in the LIN master mode.

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00_B (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01_B or 11_B sets LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01_B to 11_B.

The LIN mode provides the following two operation modes:

- LIN operation mode
- LIN wake-up mode

Figure 25.3 shows the transition of operation modes. Table 25.30 describes the transition conditions of operation modes.

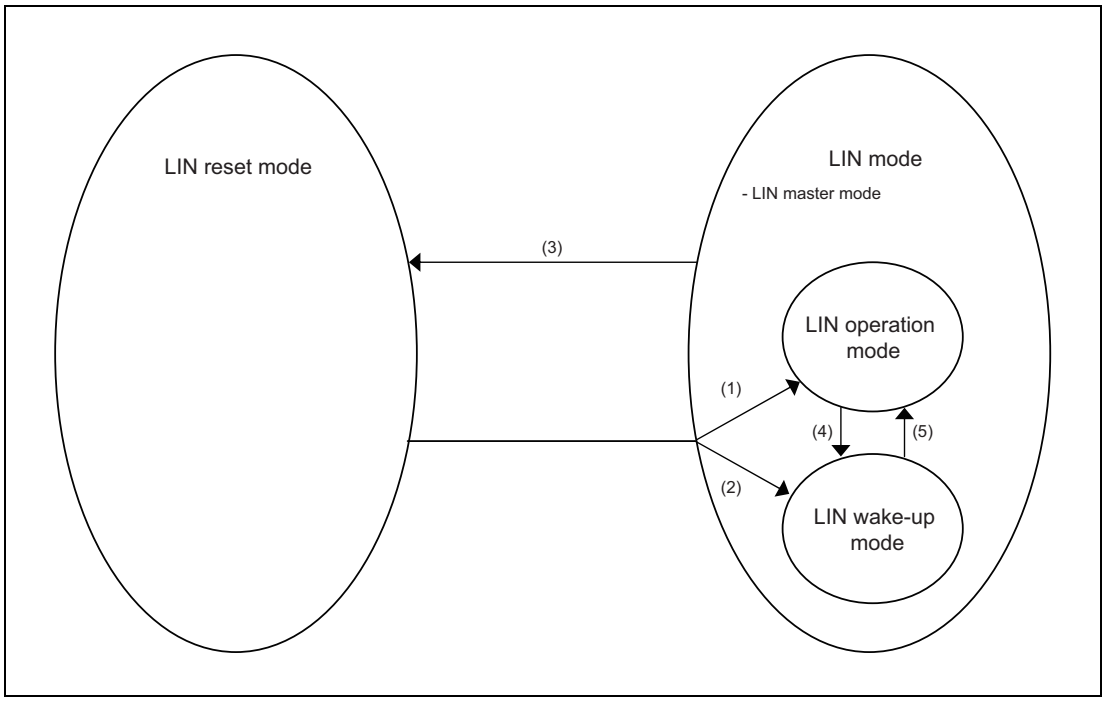

Figure 25.3 Transition of Operation Modes

Table 25.30 Transition Conditions of Operation Modes

	Operation mode transition			Transition condition
(1)	LIN reset mode	→	LIN mode - LIN operation mode	RLN3nLMD.LMD = 00_B and RLN3nLCUC.OM1, OM0 = 11_B
(2)	LIN reset mode	→	LIN mode - LIN wake-up mode	RLN3nLMD.LMD = 00_B and RLN3nLCUC.OM1, OM0 = 01_B
(3)	LIN mode -LIN operation mode -LIN wake-up mode	→	LIN reset mode	RLN3nLCUC.OM0 = 0_B
(4) *1	LIN mode -LIN operation mode	→	LIN mode - LIN wake-up mode	RLN3nLCUC.OM1, OM0 = 01_B
(5) *1	LIN mode -LIN wake-up mode	→	LIN mode - LIN operation mode	RLN3nLCUC.OM1, OM0 = 11_B

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is going on (when the FTS bit in the RLN3nLTRC register is 1).

(1) LIN Operation Mode

In LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11_B changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11_B. Communication settings should be performed after the RLN3nLMST register has become 11_B.

(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B. Communication settings should be performed after the RLN3nLMST register has become 01_B.

25.7.1 LIN Master Mode

25.7.1.1 Header Transmission

Figure 25.4 shows the operation of the LIN Interface (LIN master mode) in header transmission.
Table 25.31 provides processing in header transmission.

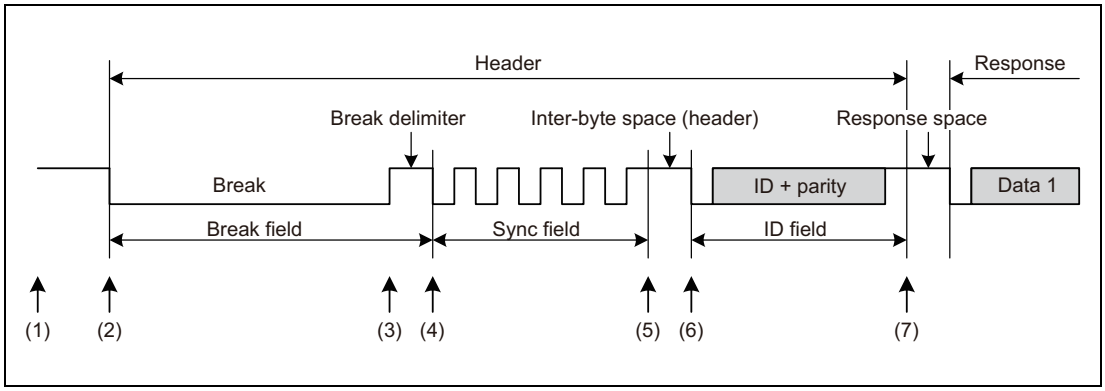

Figure 25.4 Operation in Header Transmission

Table 25.31 Processing in Header Transmission

	Software processing	LIN Interface processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Changes the LIN Interface to the LIN master mode: LIN operation mode • Sets information on the frame to be transmitted (ID, parity, data length, response direction, Checksum method, and transmission data)	Waits for the setting of the FTS bit in the RLN3nLTRC register by software (idle)
(2)	Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3)	Waits for an interrupt request	Transmits a break delimiter.
(4)		Transmits a sync field (55h).
(5)		Transmits an inter-byte space (header).
(6)		Transmits an ID field.
(7)		Sets a successful header transmission flag.

Note: For information about error detection, refer to Section 25.7.6, Error Status.

25.7.1.2 Response Transmission

Figure 25.5 shows the operation of the LIN Interface (LIN master mode) in response transmission. Table 25.32 provides processing in response transmission.

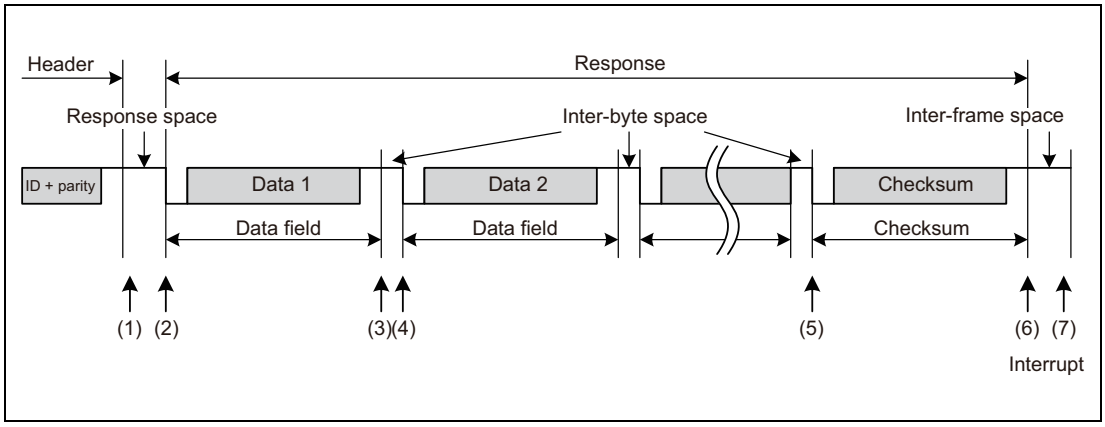

Figure 25.5 Operation in Response Transmission

Table 25.32 Processing in Response Transmission

	Software processing	LIN Interface processing
(1)	(When in frame separate mode) • Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started) (When not in frame separate mode) • Waits for an interrupt request	(When in frame separate mode) • Waits for the setting of the RTS bit in the RLN3nLTRC register to 1 by software. • When the bit is set to 1, sends a response space. (When not in frame separate mode) • Sends a response space.
(2)	Waits for an interrupt request	Transmits the data 1.
(3)		Transmits an inter-byte space.
(4)		• Transmits the data 2. • Transmits an inter-byte space • Transmits the data 3. • Transmits an inter-byte space (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RFC register.) : :
(5)		Transmits the checksum.
(6)		• Sets a successful frame/wake-up transmission flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped) (When in frame separate mode), and the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	Idle

Note: For information about error detection, refer to Section 25.7.6, Error Status.

25.7.1.3 Response Reception

Figure 25.6 shows the operation of the LIN Interface (LIN master mode) on response reception. Table 25.33 provides processing in response reception.

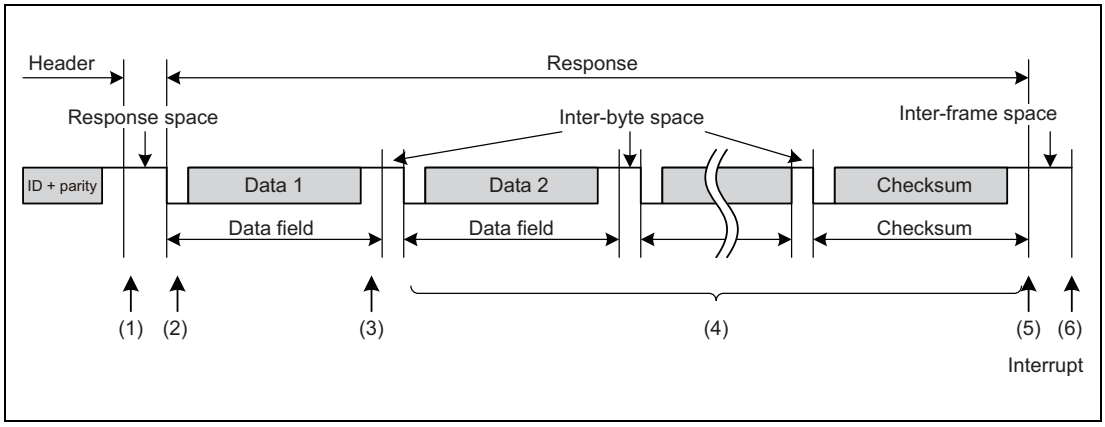

Figure 25.6 Operation in Response Reception

Table 25.33 Processing in Response Reception

	Software processing	LIN Interface processing
(1)	Waits for an interrupt request (no processing).	Waits for detection of a start bit.
(2)	Waits for an interrupt request.	Receives the data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		• Receives the data 2 when the start bit is detected. • Receives the data 3 when the start bit is detected. (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register.) : : • Receives the checksum when the start bit is detected.
(5)		• Determines the checksum. • Sets the successful frame/wake-up reception flag. • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	Idle

Note: For information about error detection, refer to Section 25.7.6, Error Status.

25.7.2 Data Transmission/Reception

25.7.2.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data is compared bit by bit, and the results are stored in the BER flag in the RLN3nLEST register (see Section 25.7.6, Error Status).

In LIN mater mode, 1 Tbit is generated to be 16 fLIN, and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

Figure 25.7 shows an example of data transmission timing.

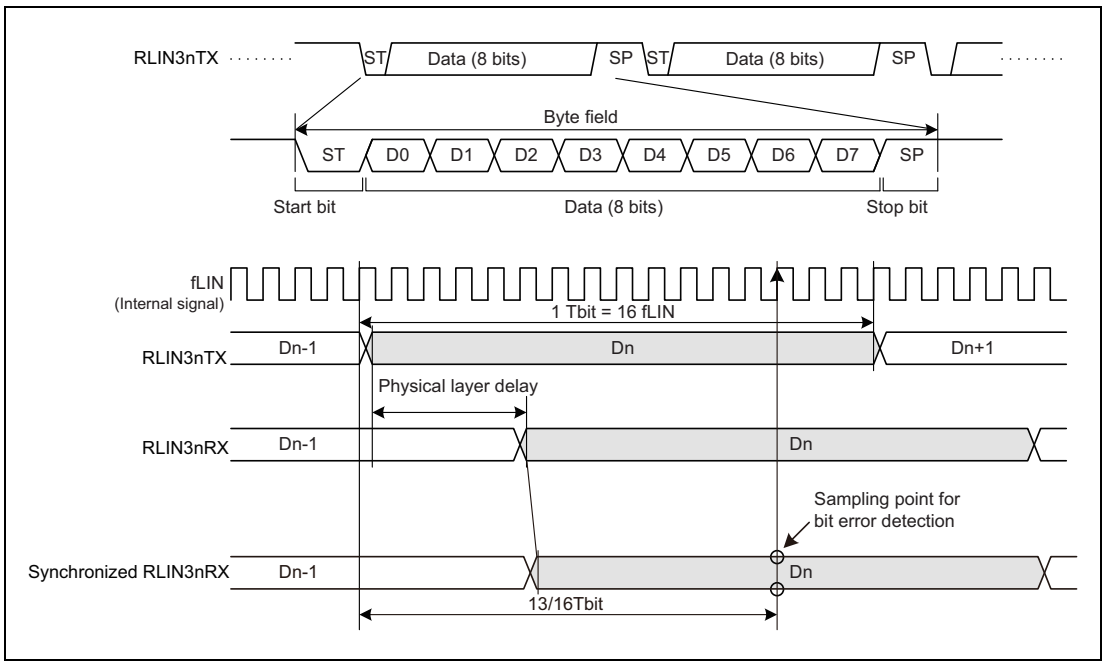

Figure 25.7 Example of Data Transmission Timing (LIN Master Mode)

25.7.2.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again a specified period of time later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the clearing of the resetting is low-level-fixed or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN Interface has a noise filter function with respect to reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN Interface uses a noise filter, and for a sampling value the value determined by a 3-sampling majority rule on prescaler clocks is used. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN Interface does not use a noise filter, and for a sampling value the value of the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 25.8 shows an example of data reception timing.

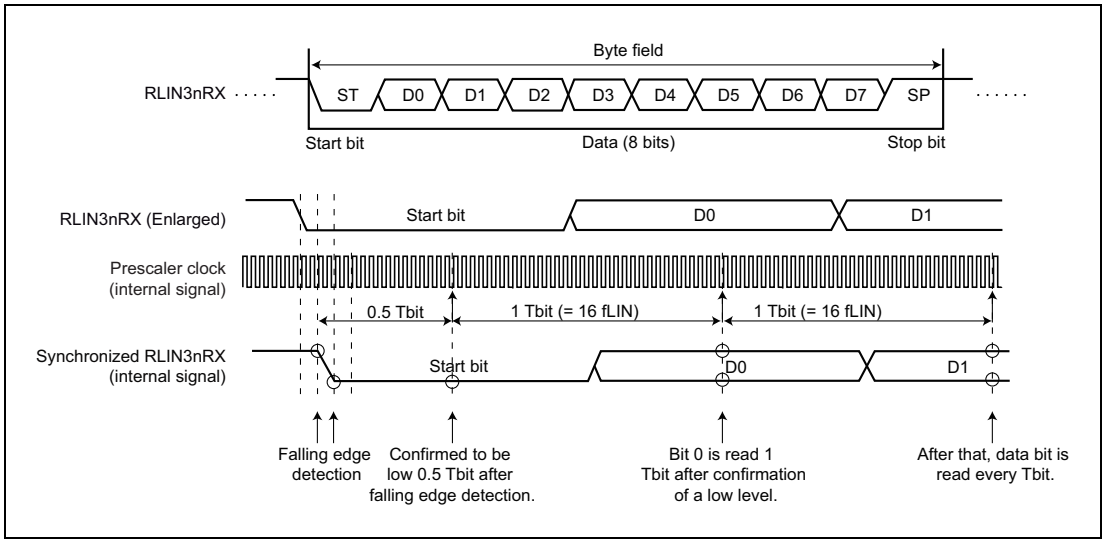

Figure 25.8 Example of Data Reception Timing

25.7.3 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN Interface sends or receives data continuously.

25.7.3.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

Figure 25.9 depicts the LIN transmission processing and the required buffer.

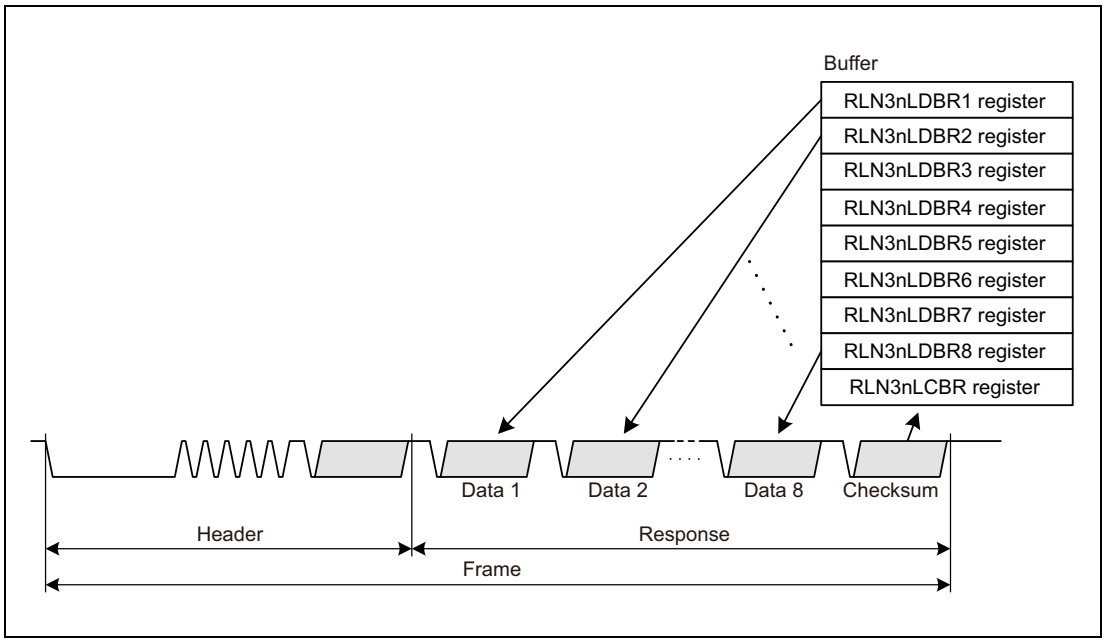

Figure 25.9 LIN Transmission Processing and Required Buffer

(1) Frame Separate Mode

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN3nLST register turns 1 (successful header transmission).

Use frame separate mode when sending or receiving response data of 9 bytes or greater in LIN master mode.

25.7.3.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame is stored in registers RLN3nRLN3nLDBR1 to RLN3nLDBR8, respectively, upon receipt of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; however, no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

Figure 25.10 depicts the LIN reception processing and the required buffer.

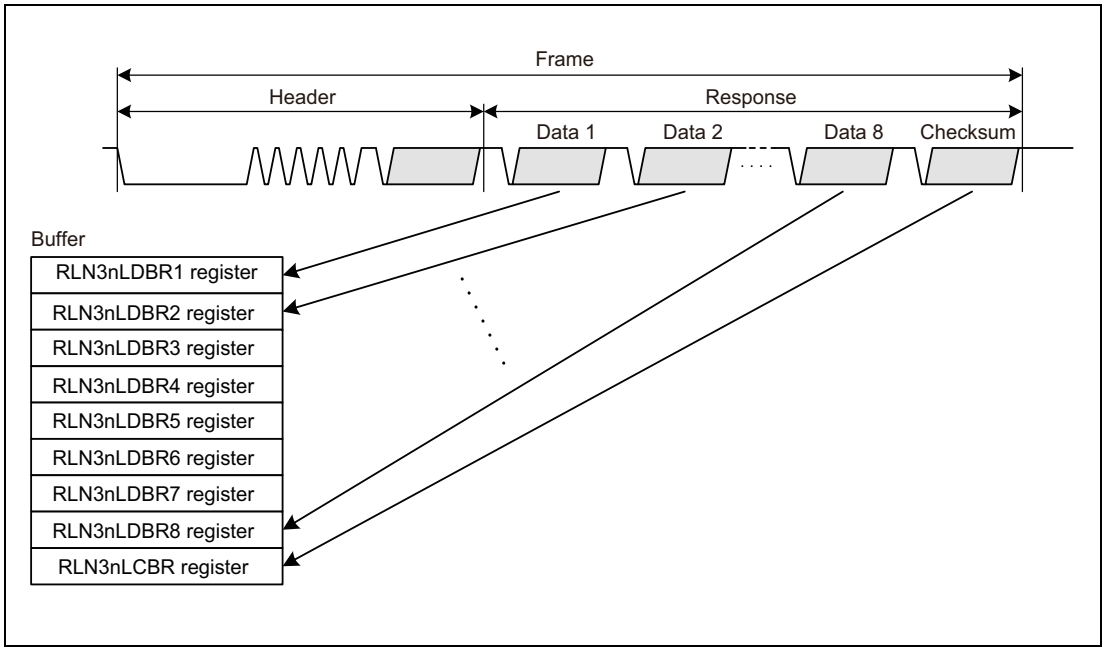

Figure 25.10 LIN Reception Processing and Required Buffer

(1) Reception of Data 1

When the reception of the first byte of data is finished, the D1RC flag in the RLN3nLST register turns 1 (successful data 1 reception).

25.7.3.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses in 10 bytes or greater can also be sent and received.

In such a case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is greater than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be sent or received is not the final data group) in the first data group (variable in 0 to 8 bytes) before sending or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the final data group. If it is the final data group, the LSS bit should be set to 0 (indicating that the next data group to be sent or received is the final data group, and a checksum should be appended to the final data group.

By changing the RFDL bit in RLN3nLDFC register settings when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register in the RLN3nLDFC register to 1 (frame separate mode).

25.7.4 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

25.7.4.1 Wake-up Transmission

In LIN wake-up mode, setting the RCDS bit in the RLN3nLDFC register to 1 (transmission) and the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal should be set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register is 1 (LIN2.x use), the LIN system clock (fLIN) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register.

By setting the baud rate to 19200 bps while fa is selected and the WUTL[3:0] bits of the RLN3nLWUP register to 0100_B (5 Tbits), 260 µs low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low is output without any bit error, the FTC flag in the RLN3nLST register turns 1 (successful frame response or wake-up transmission); when the FTCIE bit in the RLN3nLIE register is 1 (successful frame response/wakeup transmission interrupt enabled), an interrupt request is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is canceled and the BER flag in the RLN3nLEST register is set to 1 (bit error detection).

When RLN3nLEDE.PBERE is set, set RLN3nLEST.PBER flag to 1 (physical bus error detection) at the same time of a bit error.

Figure 25.11 shows the wake-up transmission timing.

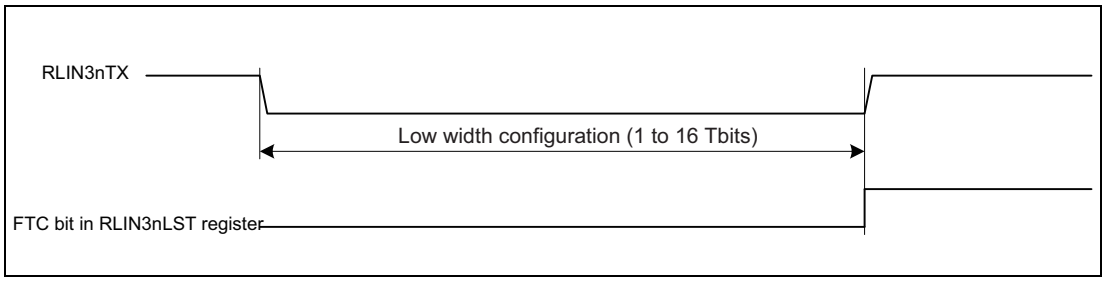

Figure 25.11 Wake-up Transmission Timing

25.7.4.2 Wake-up Reception

The detection of a wake-up involves the use of an input signal low level width count function.

The input signal low level width count function measures the low width of the input signal to the RLIN3nTX pin, using the same sampling point as data reception. The function can measure the input signal low level width of 2.5 Tbits of fLIN or greater.

By setting the LWBR0 bit in the RLN3nLWBR register, operation is executed without changing the baud rate generator setting at a transition between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects the LIN system clock (fLIN) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200 bps while fa is selected, the 130 µs or longer low-level width of the input signal to be measured regardless of the setting of the LCKS bit in the RLN3nLMD register.

When using the wake-up reception function, in LIN wake-up mode set the RFT bit in the RLN3nLDFC register to 0 (response reception), and then the FTS bit in the RLN3nLTRC register to 1 (frame transmission (header reception) or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register turns 1 (successful frame response/wake-up reception). If the FRCIE bit in the RLN3nLIE register is 1 (successful frame response or wake-up reception interrupt enabled), an interrupt request for successful LINn reception is generated.

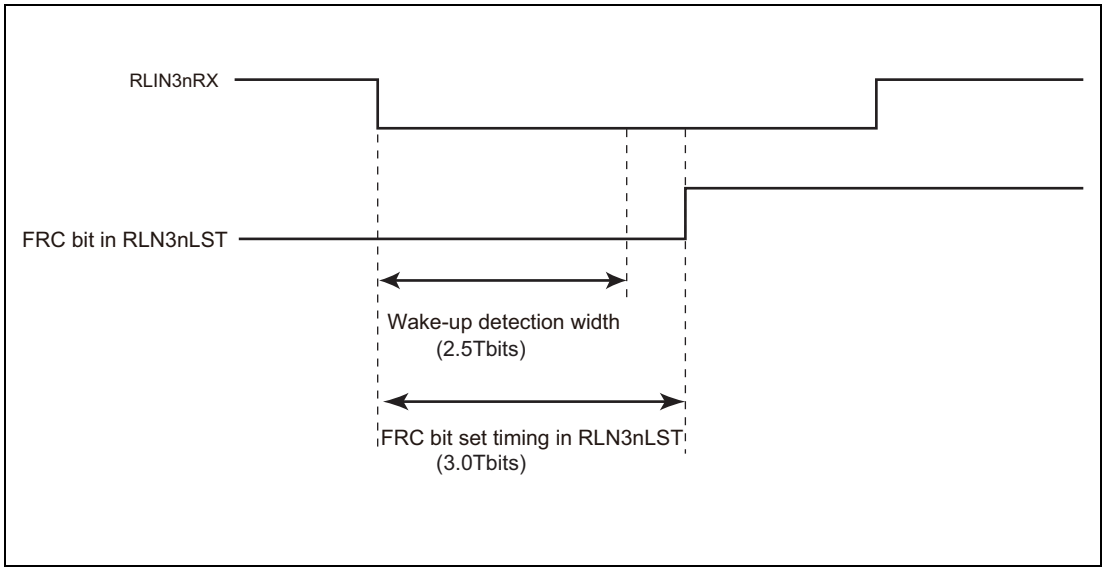

Figure 25.12 Input Signal Low level Count Function

25.7.4.3 Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, though a collision of wakeup signals is not detected in the LIN interface.

25.7.5 Status

During LIN mode operation, the LIN Interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, successful header transmission/header reception, can generate interrupt requests.

Table 25.34 shows the types of statuses available in LIN master mode.

Table 25.34 Types of Statuses in LIN Master Mode

Status	Status set condition	Status clear condition	Operation mode capable of status detection	Corresponding bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode (OM0 = 0), if the LIN Interface enters LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to 0 (LIN reset mode is canceled), if LIN reset mode is canceled.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN Interface enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN Interface enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Frame/wake-up transmission end	When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully.	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in RLN3nLST register	√
Frame/wake-up reception end	When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully.	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in RLN3nLST register	√
Error detection	If any of the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flags in the RLN3nLEST register turns 1 (error detected).	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software*1 • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in RLN3nLST register	√
Data 1 reception end	The RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte of each data group is received.*2	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Header transmission end	When a header field is transmitted successfully.	• When another communication is started • When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, CSER flag, FER flag, FER flag, FTER flag, PBER flag or BER flags in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

25.7.6 Error Status

25.7.6.1 LIN Master Mode

(1) Types of Error Statuses

The LIN Interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

All error statuses represent interrupt events.

Table 25.35 shows the types of error statuses.

Table 25.35 Types of Error Statuses in LIN Master Mode

Status	Error detection condition	Operation mode capable of error detection	Communication	Enable/ disable detection	Corresponding bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1*2	• LIN operation mode • LIN wake-up mode	Cancel	√	BER flag in RLN3nLEST register
Physical bus error	• LIN bus is detected to be high level when sending a break • LIN bus is detected to be low level when sending a break delimiter • LIN bus is detected to be high level when sending a wake-up	• LIN operation mode • LIN wake-up mode	Cancel	√	PBER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Cancel	√	FTER flag in RLN3nLEST register
Framing error	In response field reception, a stop bit of each data byte is low level	LIN operation mode	Cancel	√	FER flag in RLN3nLEST register
Checksum error	In response field reception, the result of checksum test gives an error	LIN operation mode	—	×	CSER flag in RLN3nLEST register
Response preparation error	One of the following conditions occurs in frame separate mode during a multi-byte response reception: • The first reception data byte is received after completion of header transmission but before a response transmission/reception request is set • The first reception data byte is received after the completion of previous data group reception before a transmission/reception request for another data group is sett	LIN operation mode	Cancel	×	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, the process is canceled after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is canceled immediately after that area. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.

Note 2. In a multi-byte response transmission, bit errors are detected also between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and this can be calculated according to the following formula.
When the setting of the FSM bit in the RLN3nLDFC register is 1 (i.e., frame separation mode), the timeout time is that for eight bytes until the RTS bit of the RLN3nLTRC register is set. Once the RTS bit is set, the timeout time is re-set to the time based on the response field data length (the RFDL[3:0] bits in the RLN3nLDFC register).
[Frame timeout]
On classic selection (when the CSM bit in RLN3nLDFC is 0):
Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

On enhanced selection (when the CSM bit in RLN3nLDFC is 1):
Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]
The aforementioned timeout time is a time greater than the TFRAME_MAX of LIN Specification Package Revision 1.3 on classic selection, or the TFRAME_MAX of LIN Specification Package Revision 2.x on enhanced selection.
[Response timeout]
Timeout time = (number of data bytes + 1) × 14 [Tbit]
When an error is detected, time-out error detection function stops.

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), by software, or at a transition to LIN reset mode.

(2) Target Time Area for LIN Error Detection

Figure 25.13 shows the time domain in which the LIN Interface in master mode performs monitoring for error detection.

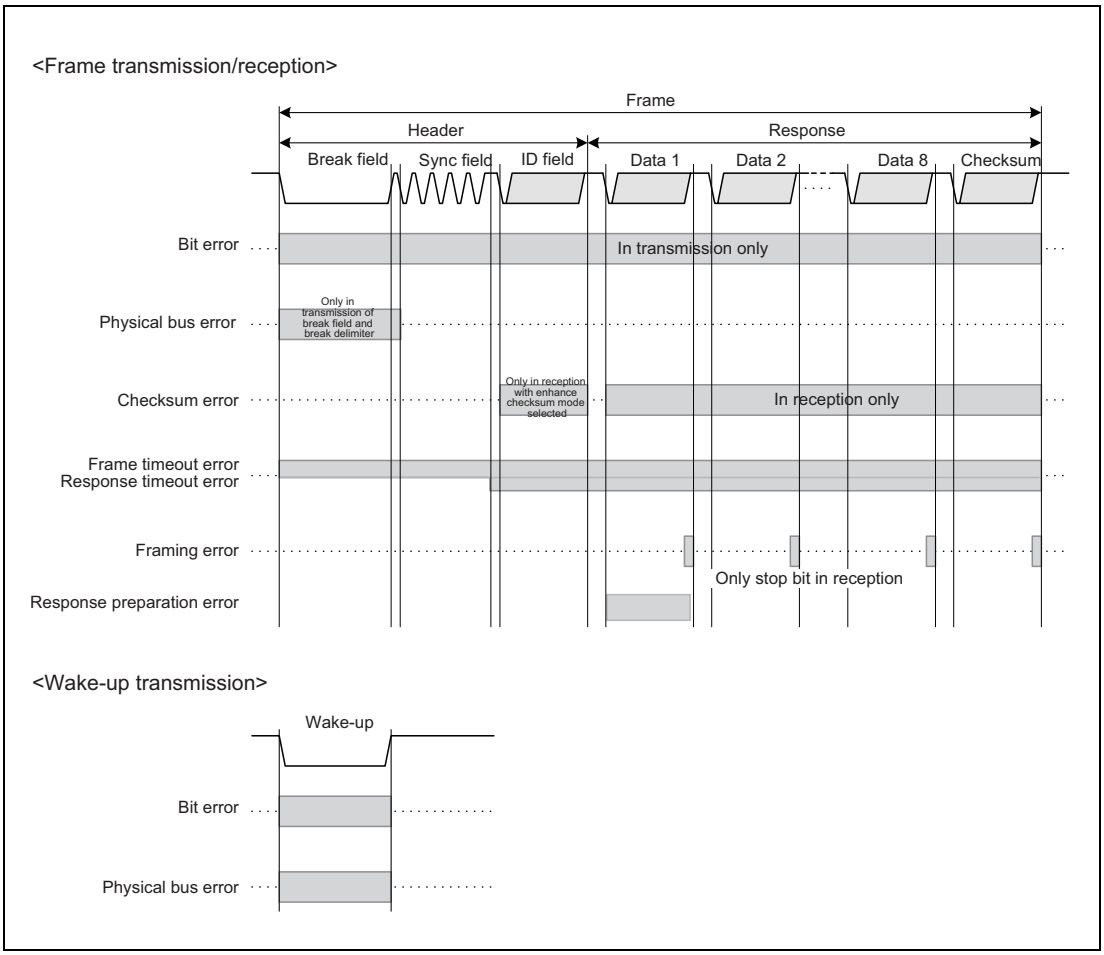

Figure 25.13 Target Time Area for LIN Error Detection (LIN Master Mode)

25.8 LIN Self-Test Mode

When the LIN interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and RLIN3nTX and RLIN3nRX are connected in the LIN interface. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX.

The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following two types.

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception

In LIN self-test mode, the operate is at the fastest baud rate, regardless of the setting of the baud rate generator,

Regardless of the setting of the baud rate related registers, the baud rate operates at the LIN communication clock source/16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to 0000_B or 1111_B.)

(The LPRS bits in the RLN3nLWBR register should be set to 000_B.)

In addition, in LIN self-mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- Frame/response timeout error

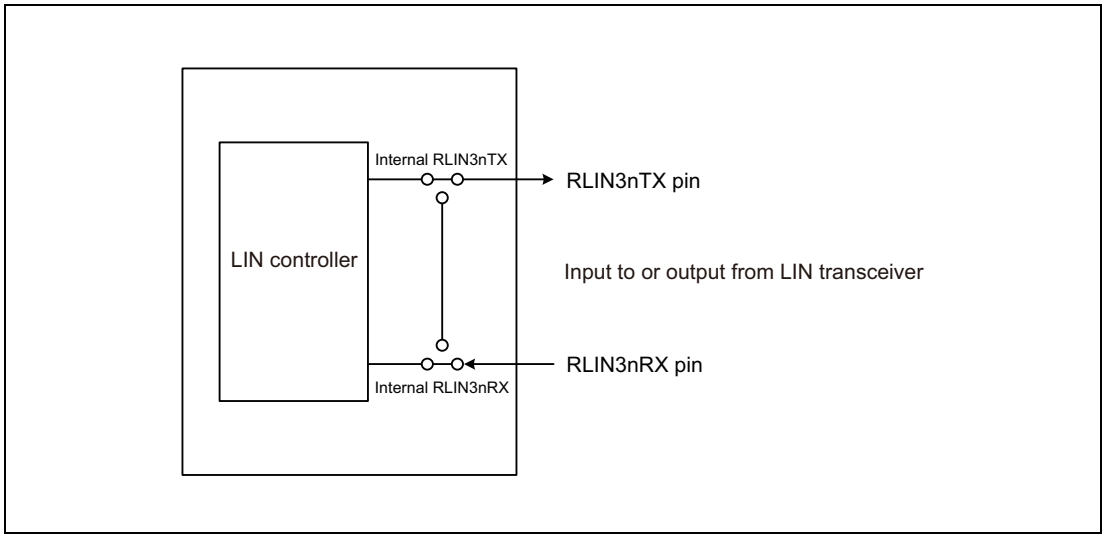

Figure 25.14 Connection in LIN Reset Mode and LIN Mode

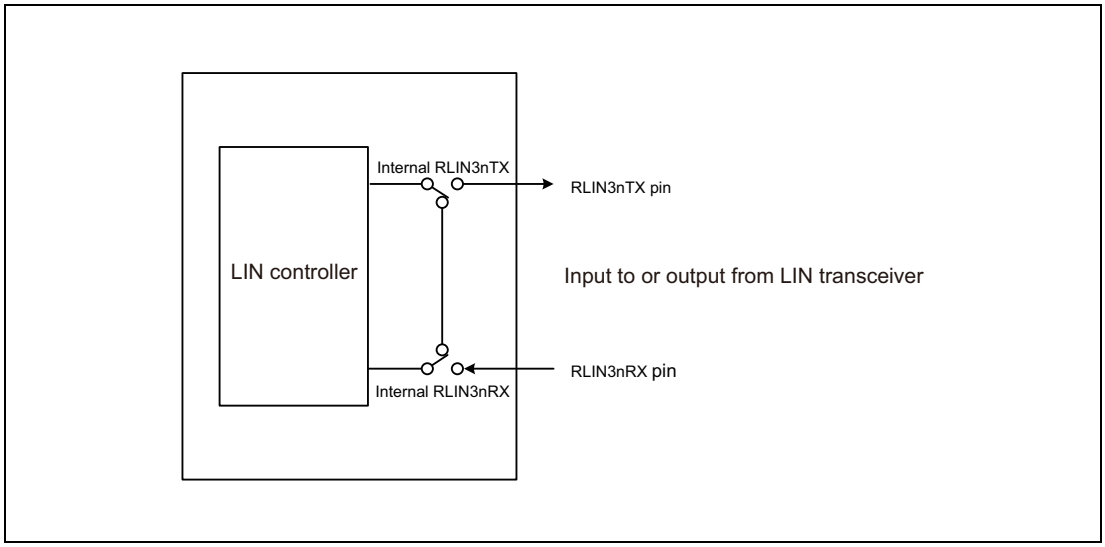

Figure 25.15 Connection in LIN Self-Test Mode

25.8.1 Change to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.
When the LSTM bit in the RLN3nLSTC register is set to 1, the shift to the LIN self-test mode is checked.

When changing to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be written three times consecutively to the LIN self-test control register, as follows:

- Change to LIN reset mode
  Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
  LMD bits in RLN3nLMD = 00_B (LIN master mode)
- 1st write: RLN3nLSTC register = $1010\ 0111_B$ ($A7_H$)
- 2nd write: RLN3nLSTC register = $0101\ 1000_B$ (58_H)
- 3rd write: RLN3nLSTC register = $0000\ 0001_B$ (01_H)
- Verify the transition to LIN self-test mode
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the step of first write. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also canceled.

25.8.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = $0000000x_B$
  RLN3nLBRP0 register = $xxxxxxxx_B$*1
  RLN3nLBRP1 register = $xxxxxxxx_B$*1
  RLN3nLMD register = $00xxxx00_B$*1
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = $0000xxxx_B$*2
  RLN3nLEDE register = $x000x0xx_B$
- Set the break field and space related registers.
  RLN3nLBFC register = $00xxxxxx_B$
  RLN3nLSC register = $00xx0xxx_B$
- Cancel the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the transmit frame related registers.
  RLN3nLDFC register = $00x1xxxx_B$
  RLN3nLIDB register = $xxxxxxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = $xxxxxxxx_B$
- Header transmission → response transmission started
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (transmission) is executed. In this mode, interrupts are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN interface. To suspend the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRm (m = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode: the RLN3nLBRP0 register, the RLN3nLBRP1 register, and the LCKS bit in the RLN3nLMD register. Therefore, those settings are not essential.

Note 2. When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled). The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up transmission flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]
1 Tbit = LIN communication clock source × 16

25.8.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = $0000000x_B$
  RLN3nLBRP0 register = $xxxxxxxx_B$*1
  RLN3nLBRP1 register = $xxxxxxxx_B$*1
  RLN3nLMD register = $00xxxx00_B$*1
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = $0000xxxx_B$*2
  RLN3nLEDE register = $x000x0xx_B$
- Set the break field and space related registers.
  RLN3nLBFC register = $00xxxxxx_B$
  RLN3nLSC register = $00xx0xxx_B$*1
- Cancel the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the reception frame related registers.
  RLN3nLDFC register = $00x0xxxx_B$*3
  RLN3nLIDB register = $xxxxxxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 registers = $xxxxxxxx_B$
  RLN3nCBR register = $xxxxxxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, set the calculation value to the RLN3nLCBR register. If an incorrect checksum is set at this time, the checksum error can be tested.
- Header transmission → response reception started
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (reception) is executed. In this mode, interrupts are generated, and status and error status are also updated. To suspend the LIN master self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRm (m = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode: the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not essential.

Note 2. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).
The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = LIN communication clock source × 16

Note 3. When the reception is in self-test mode, be sure to set the response field length (RFDL bits) to at least 1 byte.

25.8.4 Terminating LIN Self-Test Mode

To terminate LIN self-test mode, perform the procedure below:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
  If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11_B, write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register have turned 11_B, change to LIN reset mode.
- Verify the cancelation of LIN self-test mode.
  Read the LSTM bit in the RLN3nLSTC register; confirm that it is not 0 (not in LIN self-test)
- Verify the transition to LIN reset mode.
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).

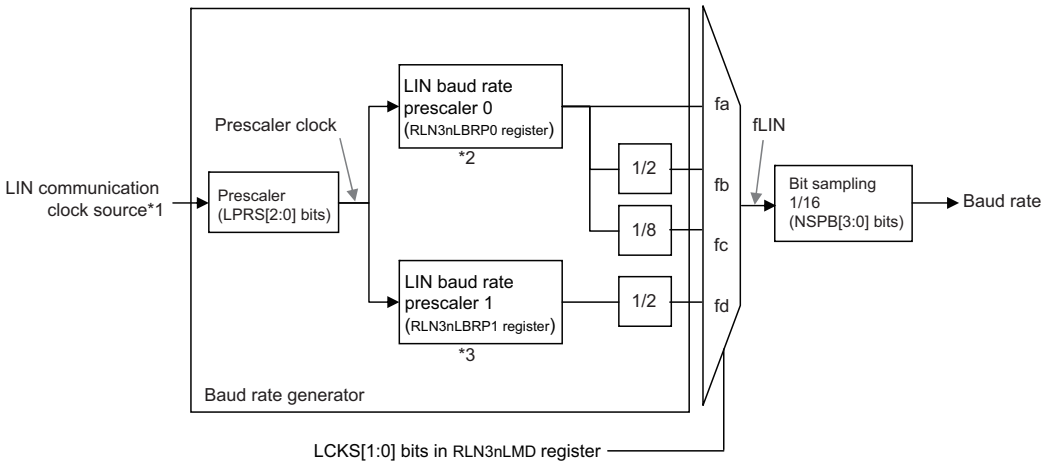
25.9 Baud Rate Generator

The prescaler clock is obtained by frequency-dividing the LIN communication clock source by the prescaler, and the LIN system clock (fLIN) is obtained by frequency-dividing the prescaler clock by the baud rate generator. The clock obtained by frequency-dividing the LIN system clock (fLIN) by the number of samples is the baud rate. The reciprocal of this baud rate is called the bit time (Tbit).

The LIN Interface has two kinds of baud rate generators. The baud rate generators switch over according to the mode used.

25.9.1 LIN Master Mode

Figure 25.16 shows a block diagram of baud rate generation in LIN master mode.



Note 1. For the LIN communication clock source, refer to **section 6, Clock Pulse Generator**.
Note 2. When the value in RLN3nLBRP0 register is N (N = 0 to 255), the clock frequency is divided by N + 1.
Note 3. When the value in RLN3nLBRP1 register is M (M = 0 to 255), the clock frequency is divided by M + 1.

Figure 25.16 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLN3nLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting bit rates are fa = 19200 × 16, fb = 9600 × 16 and fc = 2400 × 16. These bit rates are frequency-divided by 16 in the bit timing generator, enabling bit rates of 19200 bps, 9600 bps and 2400 bps to be generated. Also, by setting the RLN3nLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting bit rate is fd = 10417 × 16. This bit rate is frequency-divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

The equation for calculating the baud rate is given below.

Baud rate of LIN master

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock) ÷ (RLN3nLBRP0 + 1) ÷ 16 [bps] (When fa is selected for fLIN)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock) ÷ (RLN3nLBRP0 + 1) ÷ 2 ÷ 16 [bps] (When fb is selected for fLIN)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock) ÷ (RLN3nLBRP0 + 1) ÷ 8 ÷ 16 [bps] (When fc is selected for fLIN)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock)
÷ (RLN3nLBRP1 + 1) ÷ 2 ÷ 16 [bps] (When fd is selected for fLIN)

25.9.2 Noise Filter

The LIN Interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLN3nLMD register to 0 (to use the noise filter), the noise filter is activated. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

Figure 25.17 shows the configuration of the noise filter, Figure 25.18 an example of a noise filter circuit, and Figure 25.19 the determination of the received data when the noise filter is used.

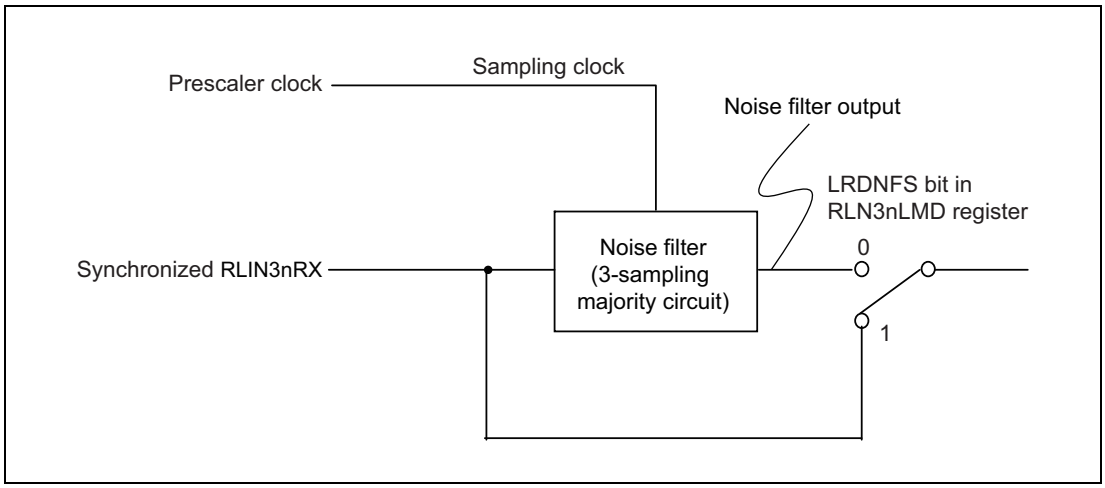


Figure 25.17 Configuration of Noise Filter

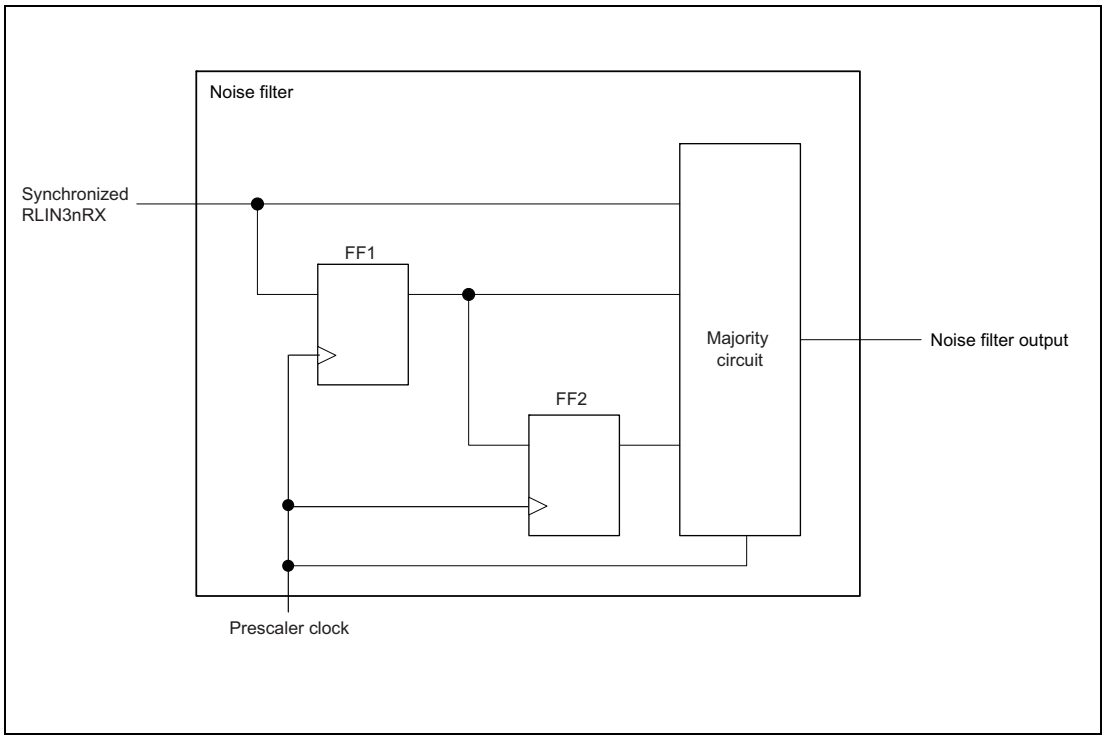

Figure 25.18 Example of Noise Filter Circuit

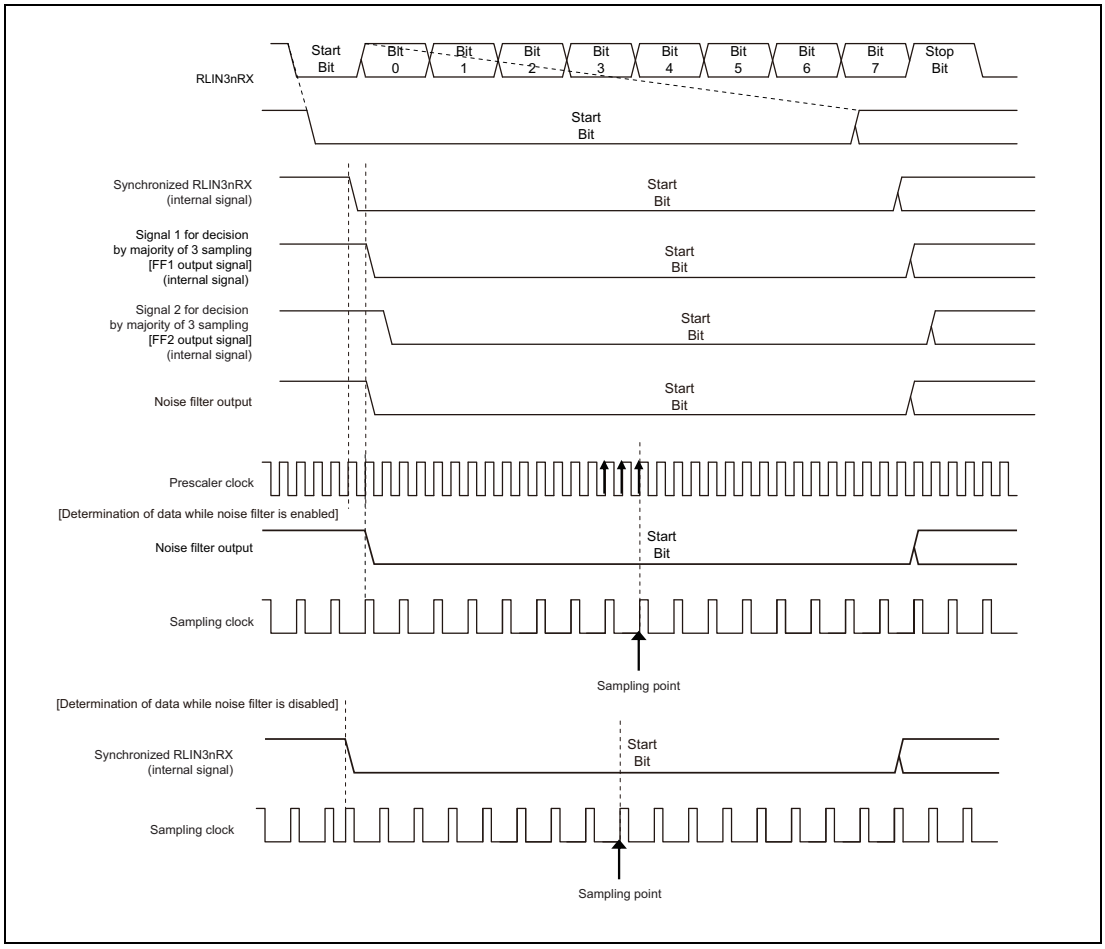

Figure 25.19 Determination of Received Data when Noise Filter is Used

26. Ethernet Controller

This LSI has an on-chip Ethernet controller (ETHER) conforming to the Ethernet or the IEEE802.3 MAC (Media Access Control) layer standard. Connecting a physical-layer LSI (PHY-LSI) complying with this standard enables the ETHER to perform transmission and reception of Ethernet/IEEE802.3 frames. The Ethernet controller in this LSI has one MAC layer interface port, which can be made to perform transmission and reception independently.
The ETHER can transfer the transmitted or received Ethernet frame data to and from the transmit/receive buffer in the memory at high speed using a dedicated direct memory access controller (E-DMAC).

26.1 Features

- MAC (Media Access Control) function
  Constructs/deconstructs data frames (frame format conforming to IEEE802.3, 2000 Edition)
  Supports transfer at 10 and 100 Mbps
  Supports full-duplex mode
  One channel (ETHER0)
  Flow control conforming to IEEE802.3x
  Supports one PHY interface conforming to IEEE802.3
  —MII (Media Independent Interface)
  Upward protocol support (checksum) function
- E-DMAC (Direct Memory Access Controller for Ethernet controller) function
  Data transfer between ETHER and external/internal memory
  One channel
  32-byte burst transfer
  Supports single-frame/single-descriptor operation and single-frame/multi-descriptor (multi-buffer) operation
  Transfer data width: 32 bits
  Transmit/receive FIFO (for transmission: 2 Kbytes, for reception: 4 Kbytes)
  Function for calculating the intelligent checksum value

Figure 26.1 shows the configuration of the ETHER.

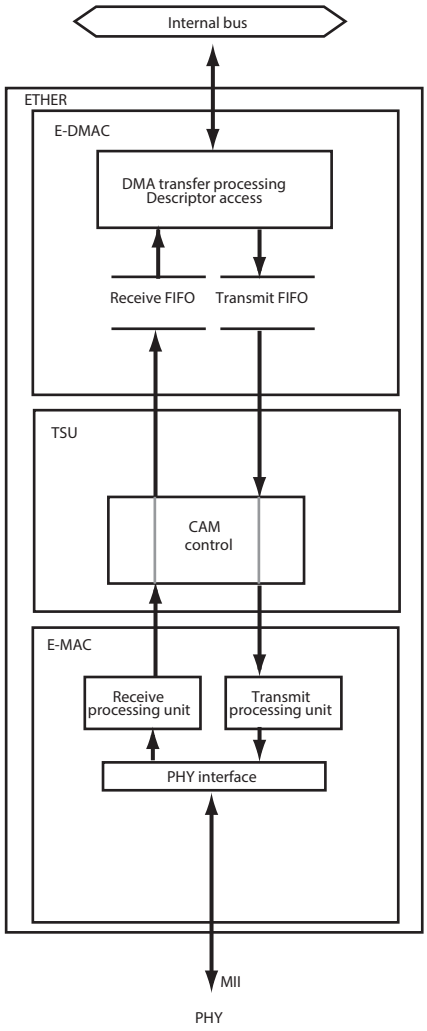

Figure 26.1 Configuration of ETHER

26.2 Input/Output Pins

Table 26.1 lists the pin configuration of the ETHER.

Table 26.1 Pin Configuration

Name	Abbreviation	I/O	Function
Transmit clock	ET_TXCLK*1	Input	ET_TXEN, ET_TXD[3:0] timing reference signal
Transmit enable	ET_TXEN*1	Output	Indicates that transmit data is ready on ET_TXD[3:0]
MII transmit data	ET_TXD[3:0]*1	Output	MII transmit data
Collision detection	ET_COL*1	Input	Collision detection signal
Transmit error	ET_TXER*1	Output	Not asserted in the ETHER
Receive clock	ET_RXCLK*1	Input	ET_RXDV, ET_RXD[3:0], ET_RXER timing reference signal
Receive data valid	ET_RXDV*1	Input	Indicates that valid receive data is on ET_RXD[3:0]
MII receive data	ET_RXD[3:0]*1	Input	MII receive data
Receive error	ET_RXER*1	Input	Identifies error state occurred during data reception
Carrier detection	ET_CRS*1	Input	Carrier detection signal
Management data clock	ET_MDC*1	Output	Reference clock signal for information transfer via ET_MDIO
Management data I/O	ET_MDIO*1	I/O	Bidirectional signal for exchange of management information between STA and PHY

Note 1. MII signal conforming to IEEE802.3u

26.3 Register Descriptions

Table 26.2 shows the configuration of registers of the ETHER.

Table 26.2 Register Configuration

Name	Abbreviation	R/W	Address	Access Size
Software reset register	ARSTR	R/W	H'E820 4800	32

26.3.1 Software Reset Register (ARSTR)

ARSTR resets all blocks (E-MAC, TSU, and E-DMAC) in the ETHER. By writing 1 to the ARST bit in this register, a software reset is issued to all blocks of the ETHER (for 256 cycles of internal bus clock Bφ). The ARST bit is always read as 0. While a software reset is issued, register access to all blocks of the ETHER is prohibited.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARST

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ARST	0	R/W	Software Reset When 1 is written to this bit, a software reset is issued to all blocks of the ETHER (for 256 cycles of internal bus clock Bϕ). Writing 0 does not affect this bit. This bit is always read as 0. While a software reset is issued, register access to all blocks of the ETHER is prohibited. The following registers are not initialized by a software reset. TSU_ADRH0 to TSU_ADRH31, TSU_ADRL0 to TSU_ADRL31, TXNLCR0, TXALCR0, RXNLCR0, RXALCR0

26.3.2 E-MAC Mode Register (ECMR)

ECMR is a 32-bit readable/writable register that specifies the operating mode of the ETHER. The settings in this register are normally made in the initialization process following a reset.

The operating mode setting must not be changed while the transmitting and receiving functions are enabled. To switch the operating mode, return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TRCCM	—	—	RCSC	—	DPAD	RZPF	ZPF	PFR	RXF	TXF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	MCT	—	—	—	—	—	—	RE	TE	—	—	—	DM	PRM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26	TRCCM	0	R/W	Counter Clear Mode Sets the method for clearing the counter register. Refer to the description of each register. 0: Cleared to 0 when the relevant register is written 1: Cleared to 0 when the relevant register is read
25, 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	RCSC	0	R/W	Checksum Calculation Specifies whether to perform automatic calculation (hardware calculation) of the checksum of the receive frame data unit. 0: Checksum is not automatically calculated 1: Checksum is automatically calculated Note that the checksum calculation of a frame with a VLAN tag is not supported. For details, see section 26.6.1, Checksum Calculation of Ethernet Frames.
22	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
21	DPAD	0	R/W	Data Padding 0: Padding is inserted to data less than 60 bytes so it is transmitted as 60-byte data 1: Padding is not inserted to data less than 60 bytes and it is transmitted without changes
20	RZPF	0	R/W	PAUSE Frame Reception with TIME = 0 0: Reception of a PAUSE frame whose TIME parameter value is 0 is disabled 1: Reception of a PAUSE frame whose TIME parameter value is 0 is enabled
19	ZPF	0	R/W	PAUSE Frame Usage with TIME = 0 Enable 0: Control of a PAUSE frame whose TIME parameter value is 0 is disabled. The next frame is not transmitted until the time specified by the Timer value has elapsed. If a PAUSE frame whose time specified by the Timer value is 0 is received, that PAUSE frame is discarded. 1: Control of a PAUSE frame whose TIME parameter value is 0 is enabled. When the data size in the receive FIFO becomes smaller than the FCFTR setting before the time specified by the Timer value elapses, an automatic PAUSE frame with a Timer value of 0 is transmitted. On receiving a PAUSE frame with a Timer value of 0, the transmission wait state is canceled.

Bit	Bit Name	Initial Value	R/W	Description
18	PFR	0	R/W	PAUSE Frame Receive Mode 0: PAUSE frame is not transferred to E-DMAC 1: PAUSE frame is transferred to E-DMAC
17	RXF	0	R/W	Operating Mode for Receiving Port Flow Control 0: PAUSE frame detection is disabled 1: Flow control for the receiving port is enabled
16	TXF	0	R/W	Operating Mode for Transmitting Port Flow Control 0: Flow control for the transmitting port is disabled (Automatic PAUSE frame is not transmitted) 1: Flow control for the transmitting port is enabled (Automatic PAUSE frame is transmitted as required)
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	MCT	0	R/W	Multicast Address Frame Receive Mode 0: Frames other than the multicast address set by the CAM entry table 0 to 31 (H/L) registers are received. However, if the on-chip CAM entry table reference is disabled, all multicast address frames are received. 1: Only the multicast address set by the CAM entry table 0 to 31 (H/L) registers is received.
12 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	RE	0	R/W	Reception Enable If a switch is made from receiving function enabled (RE = 1) to disabled (RE = 0) while a frame is being received, the receiving function will be enabled until reception of the corresponding frame is completed. 0: Receiving function is disabled 1: Receiving function is enabled
5	TE	0	R/W	Transmission Enable If a switch is made from transmitting function enabled (TE = 1) to disabled (TE = 0) while a frame is being transmitted, the transmitting function will be enabled until transmission of the corresponding frame is completed. 0: Transmitting function is disabled 1: Transmitting function is enabled
4 to 2	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	DM	0	R/W	Full-duplex Transfer Enable 0: Full-duplex transfer function is disabled. 1: Full-duplex transfer function is enabled.
0	PRM	0	R/W	Promiscuous Mode Setting this bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.). 0: ETHER performs normal operation 1: ETHER performs promiscuous mode operation

Note: • All bits, except for TE and RE, should be changed while the transmitting function is disabled (TE = 0) and the receiving function is disabled (RE = 0).

26.3.3 E-MAC Status Register (ECSR)

ECSR is a 32-bit readable/writable register that indicates the status in the E-MAC. This status can be notified to the CPU by interrupts. When 1 is written to the PFROI and ICD bits, the corresponding flags can be cleared. Writing 0 does not affect the flag. For bits that generate interrupts, the interrupt can be enabled or disabled by the corresponding bit in ECSIPR.

The interrupts generated due to this status register are indicated in the ECI bit in EESR of the E-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PFROI	—	—	—	ICD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PFROI	0	R/W	PAUSE Frame Retransmit Retry Over Indicates whether the retransmit count for retransmitting a PAUSE frame when flow control is enabled has exceeded the retransmit upper-limit set in the automatic PAUSE frame retransmit count register (TPAUSER). 0: PAUSE frame retransmit count has not exceeded the upper limit 1: PAUSE frame retransmit count has exceeded the upper limit
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ICD	0	R/W	Illegal Carrier Detection Indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used. 0: PHY-LSI has not detected an illegal carrier on the line 1: PHY-LSI has detected an illegal carrier on the line

26.3.4 E-MAC Interrupt Permission Register (ECSIPR)

ECSIPR is a 32-bit readable/writable register that enables or disables the interrupt sources indicated by ECSR. Each bit can disable or enable interrupts corresponding to the bits in ECSR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PFROIP	0	R/W	PAUSE Frame Retransmit Interrupt Enable 0: Interrupt notification by the PFROI bit is disabled 1: Interrupt notification by the PFROI bit is enabled
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ICDIP	0	R/W	Illegal Carrier Detect Interrupt Enable 0: Interrupt notification by the ICD bit is disabled 1: Interrupt notification by the ICD bit is enabled

26.3.5 PHY Interface Register (PIR)

PIR is a 32-bit readable/writable register that provides a means of accessing the PHY-LSI internal registers via the MII.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	MDI	Undefined	R	MII Management Data-In Indicates the level of the ET_MDIO pin.
2	MDO	0	R/W	MII Management Data-Out Outputs the value set in this bit from the ET_MDIO pin when the MMD bit is 1.
1	MMD	0	R/W	MII Management Mode Specifies the data read/write direction with respect to the MII. 0: Read direction is specified 1: Write direction is specified
0	MDC	0	R/W	MII Management Data Clock Outputs the value set in this bit from the MDC pin and supplies the MII with the management data clock. For the method of accessing the MII registers, see section 26.5.2, Accessing MII Registers.

26.3.6 MAC Address High Register (MAHR)

MAHR is a 32-bit readable/writable register that specifies the upper 32 bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset. The MAC address setting must not be changed while the transmitting and receiving functions are enabled. Return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.

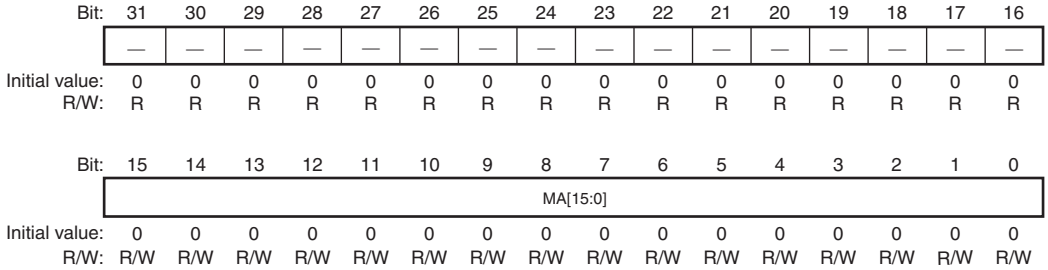
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MA[47:32]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MA[47:16]	All 0	R/W	MAC Address Bits 47 to 16 These bits are used to set the upper 32 bits of the MAC address. If the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'01234567 in this register.

26.3.7 MAC Address Low Register (MALR)

MALR is a 32-bit readable/writable register that specifies the lower 16 bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset. The MAC address setting must not be changed while the transmitting and receiving functions are enabled. Return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MA[15:0]	All 0	R/W	MAC Address Bits 15 to 0 These bits are used to set the lower 16 bits of the MAC address. If the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'000089AB in this register.

26.3.8 Receive Frame Length Register (RFLR)

RFLR is a 32-bit readable/writable register that specifies the maximum frame length (in bytes) that can be received by this LSI. The settings in this register must not be changed while the receiving function is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFL[17:16]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17 to 0	RFL[17:0]	All 0	R/W	Receive Frame Length The frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data is not included in the transfer. When data that exceeds the specified value is received, the part of data that exceeds the specified value is discarded. H'00000 to H'005EE: 1,518 bytes H'005EF: 1,519 bytes H'005F0: 1,520 bytes : : H'007FF: 2,047 bytes H'00800: 2,048 bytes : : H'01000: 4,096 bytes : : H'10000: 65,536 bytes : : H'20000 to H'3FFFF: 131,072 bytes

26.3.9 CRC Error Frame Receive Counter Register (CEFCR)

CEFCR is a 32-bit counter that indicates the number of times a frame with a CRC error was received. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CEFC[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CEFC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CEFC[31:0]	All 0	R/W	CRC Error Frame Count These bits indicate the number of CRC error frames received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.10 Frame Receive Error Counter Register (FRECR)

FRECR is a 32-bit counter that indicates the number of frames for which a receive error was generated by the RXER pin input from the PHY-LSI. FRECR is incremented each time the RXER pin becomes active. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FREC[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	FREC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FREC[31:0]	All 0	R/W	Frame Receive Error Count These bits indicate the number of errors during frame reception.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.11 Too-Short Frame Receive Counter Register (TSFRCR)

TSFRCR is a 32-bit counter that indicates the number of frames received with a length fewer than 64 bytes. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSFC[31:16]

	TSFC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSFC[31:0]	All 0	R/W	Too-Short Frame Receive Count These bits indicate the number of frames received with a length of less than 64 bytes.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.12 Too-Long Frame Receive Counter Register (TLFRCR)

TLFRCR is a 32-bit counter that indicates the number of frames received with a length exceeding the value specified by the receive frame length register (RFLR). When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is not incremented when a frame containing residual bits is received. In this case, the reception of the frame is indicated in the residual-bit frame receive counter register (RFCR). This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TLFC[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

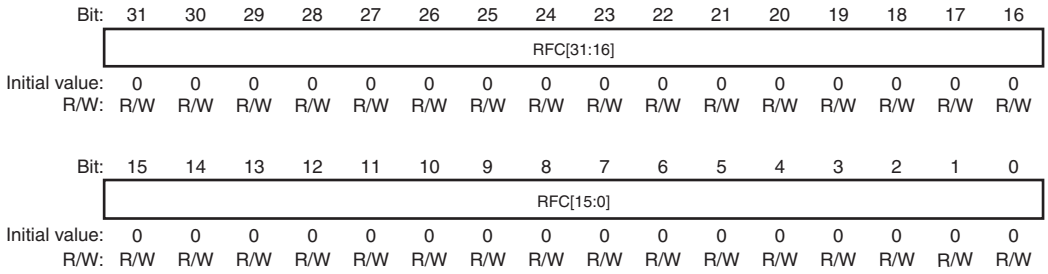
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TLFC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TLFC[31:0]	All 0	R/W	Too-Long Frame Receive Count These bits indicate the number of frames received with a length exceeding the value in RFLR.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.13 Residual-Bit Frame Receive Counter Register (RFCR)

RFCR is a 32-bit counter that indicates the number of frames received containing residual bits (less than an 8-bit unit). When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

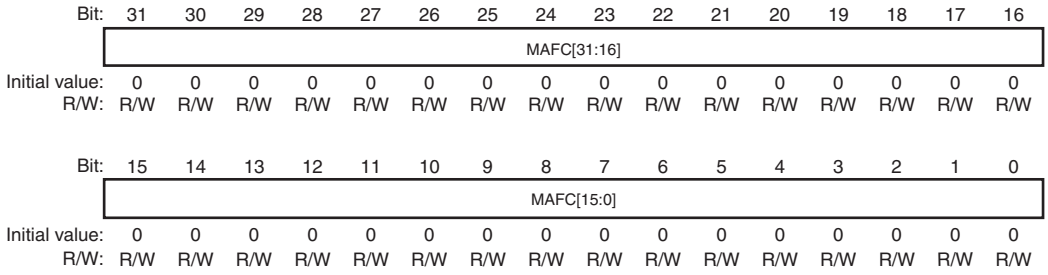


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RFC[31:0]	All 0	R/W	Residual-Bit Frame Receive Count These bits indicate the number of frames received containing residual bits.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.14 Multicast Address Frame Receive Counter Register (MAFCR)

MAFCR is a 32-bit counter that indicates the number of frames received with a specified multicast address. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MAFC[31:0]	All 0	R/W	Multicast Address Frame Count These bits indicate the number of multicast frames received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.15 Automatic PAUSE Frame Register (APR)

APR is used to set the TIME parameter value of an automatic PAUSE frame. When an automatic PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AP[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	AP[15:0]	All 0	R/W	Automatic PAUSE These bits set the TIME parameter value of an automatic PAUSE frame. One bit is equivalent to 512 bit-time. When flow control is enabled in transmission (PAUSE frame transmission) (TXF bit in ECMR = 1), set a value other than H'0000 in these bits. H'0000: — H'0001: 512 × 1 bit-time H'0002: 512 × 2 bit-time : : H'FFFF: 512 × 65,535 bit-time Note:The bit-time becomes as follows according to the transfer speed. 100 Mbps: 1 bit-time = 10 ns 10 Mbps: 1 bit-time = 100 ns

26.3.16 Manual PAUSE Frame Register (MPR)

MPR is used to set the TIME parameter value of a manual PAUSE frame. When a manual PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MP[15:0]	All 0	R/W	Manual PAUSE These bits set the TIME parameter value of a manual PAUSE frame. One bit is equivalent to 512 bit-time. H'0000: — H'0001: 512 × 1 bit-time H'0002: 512 × 2 bit-time : : H'FFFF: 512 × 65,535 bit-time Note:The bit-time becomes as follows according to the transfer speed. 100 Mbps: 1 bit-time = 10 ns 10 Mbps: 1 bit-time = 100 ns

26.3.17 Automatic PAUSE Frame Retransmit Count Register (TPAUSER)

TPAUSER is used to set the upper limit for the number of times to retransmit an automatic PAUSE frame. The settings in this register must not be changed while the transmitting function is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PFTXC[15:0]	All 0	R	PAUSE Frame Transmit Count These bits indicate the total number of automatic PAUSE frames and manual PAUSE frames transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.19 PAUSE Frame Receive Counter Register (PFRCR)

PFRCR is a 16-bit counter that indicates the number of times a PAUSE frame is received. This register is cleared to 0 when it is read.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFRXC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PFRXC[15:0]	All 0	R	PAUSE Frame Receive Count These bits indicate the number of PAUSE frames received when flow control is enabled in reception (RXF bit in ECMR = 1).

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.20 TSU Counter Reset Register (TSU_CTRST)

TSU_CTRST clears the transmit, receive, and relay frame counters to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CTRST	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CTRST	0	R/W	TSU Counter Reset When 1 is written to this bit, the values of registers TXNLCR0, TXALCR0, RXNLCR0, and RXALCR0 are cleared to 0. Writing 0 does not affect this bit. This bit is always read as 0.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.21 CAM Entry Table Specification Enable Register (Common) (TSU_FWSLC)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of among the CAM entry tables are for reference or reference to all tables. The TSU_FWSLC register enables or disables this action of the settings of the TSU_POST1 to TSU_POST4 registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	POSTENU	POSTENL	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	POSTENU	0	R/W	This bit enables the settings for CAM entry tables 0 to 15 in the POST bits of the TSU_POST1 and TSU_POST2 registers. 0: The settings of the POST bits are disabled (CAM entry tables 0 to 15 are referred to on reception of frames). 1: The settings of the POST bits are enabled (whether to refer to each of CAM entry tables is determined by the settings of the corresponding POST bit).
12	POSTENL	0	R/W	This bit enables the settings for CAM entry tables 16 to 31 in the POST bits of the TSU_POST3 and TSU_POST4 registers. 0: The settings of the POST bits are disabled (CAM entry tables 16 to 31 are not referred to on reception of frames). 1: The settings of the POST bits are enabled (whether to refer to each of CAM entry tables is determined by the settings of the corresponding POST bit).
11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.22 VLANtag Set Register (TSU_VTAG0)

TSU_VTAG0 enables or disables the frame receive/discard evaluation function based on the VLAN number, and also sets the VLAN number.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VTAG0	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	VID0[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	VTAG0	0	R/W	Port 0 VLANtag Evaluation Function 0: Disables receive/discard evaluation for frames based on the VLAN number 1: Enables receive/discard evaluation for frames based on the VLAN number
30 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	VID0[11:0]	All 0	R/W	V-LAN ID Setting (VID) These bits set the VLAN number received by receive frames.

26.3.23 CAM Entry Table Busy Register (TSU_ADSBSY)

When CAM entry table registers (TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31) are set by register writing, the ADSBSY bit in this register is set to 1 (when the process of reflecting the contents of the CAM entry table registers in the CAM controller is completed inside the TSU, the ADSBSY bit is automatically restored to 0). Access to TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 is prohibited, while the ADSBSY bit in this register is set to 1. This register is a read-only status register, which must not be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADSBSY	0	R	CAM Entry Table Setting Busy When TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 are set by register writing, this bit is set to 1. When the process of reflecting the contents of the CAM entry table registers in the CAM controller is completed inside the TSU, this bit is automatically restored to 0. Access to TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 is prohibited, while this bit is set to 1. Writing to this register is also prohibited.

26.3.24 CAM Entry Table Enable Register (TSU_TEN)

TSU_TEN enables or disables the settings of TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

26.3.25 CAM Entry Table POST 1 Register (TSU_POST1)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST1 register specifies the conditions for reference to TSU_ADRH0 to TSU_ADRH7 and TSU_ADRL0 to TSU_ADRL7. The setting of this register is effective when the POSTENU bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POST0	—	—	—	POST1	—	—	—	POST2	—	—	—	POST3	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	POST4	—	—	—	POST5	—	—	—	POST6	—	—	—	POST7	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	POST0	0	R/W	Specifies whether reference is or is not made to CAM entry table 0. Setting this bit to 1 selects the condition below. POST0: CAM entry table 0 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST1	0	R/W	Specifies whether reference is or is not made to CAM entry table 1. Setting this bit to 1 selects the condition below. POST1: CAM entry table 1 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST2	0	R/W	Specifies whether reference is or is not made to CAM entry table 2. Setting this bit to 1 selects the condition below. POST2: CAM entry table 2 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	POST3	0	R/W	Specifies whether reference is or is not made to CAM entry table 3. Setting this bit to 1 selects the condition below. POST3: CAM entry table 3 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST4	0	R/W	Specifies whether reference is or is not made to CAM entry table 4. Setting this bit to 1 selects the condition below. POST4: CAM entry table 4 is referred to on reception of frames.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST5	0	R/W	Specifies whether reference is or is not made to CAM entry table 5. Setting this bit to 1 selects the condition below. POST5: CAM entry table 5 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	POST6	0	R/W	Specifies whether reference is or is not made to CAM entry table 6. Setting this bit to 1 selects the condition below. POST6: CAM entry table 6 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST7	0	R/W	Specifies whether reference is or is not made to CAM entry table 7. Setting this bit to 1 selects the condition below. POST7: CAM entry table 7 is referred to on reception of frames.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.26 CAM Entry Table POST 2 Register (TSU_POST2)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST2 register specifies the conditions for reference to TSU_ADRH8 to TSU_ADRH15 and TSU_ADRL8 to TSU_ADRL15. The setting of this register is effective when the POSTENU bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POST8	—	—	—	POST9	—	—	—	POST10	—	—	—	POST11	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	POST8	0	R/W	Specifies whether reference is or is not made to CAM entry table 8. Setting this bit to 1 selects the condition below. POST8: CAM entry table 8 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST9	0	R/W	Specifies whether reference is or is not made to CAM entry table 9. Setting this bit to 1 selects the condition below. POST9: CAM entry table 9 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST10	0	R/W	Specifies whether reference is or is not made to CAM entry table 10. Setting this bit to 1 selects the condition below. POST10: CAM entry table 10 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	POST11	0	R/W	Specifies whether reference is or is not made to CAM entry table 11. Setting this bit to 1 selects the condition below. POST11: CAM entry table 11 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST12	0	R/W	Specifies whether reference is or is not made to CAM entry table 12. Setting this bit to 1 selects the condition below. POST12: CAM entry table 12 is referred to on reception of frames.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST13	0	R/W	Specifies whether reference is or is not made to CAM entry table 13. Setting this bit to 1 selects the condition below. POST13: CAM entry table 13 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7	POST14	0	R/W	Specifies whether reference is or is not made to CAM entry table 14. Setting this bit to 1 selects the condition below. POST14: CAM entry table 14 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST15	0	R/W	Specifies whether reference is or is not made to CAM entry table 15. Setting this bit to 1 selects the condition below. POST15: CAM entry table 15 is referred to on reception of frames.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.27 CAM Entry Table POST 3 Register (TSU_POST3)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST3 register specifies the conditions for reference to TSU_ADRH16 to TSU_ADRH23 and TSU_ADRL16 to TSU_ADRL23. The setting of this register is effective when the POSTENL bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	POST16	0	R/W	Specifies whether reference is or is not made to CAM entry table 16. Setting this bit to 1 selects the condition below. POST16: CAM entry table 16 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST17	0	R/W	Specifies whether reference is or is not made to CAM entry table 17. Setting this bit to 1 selects the condition below. POST17: CAM entry table 17 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST18	0	R/W	Specifies whether reference is or is not made to CAM entry table 18. Setting this bit to 1 selects the condition below. POST18: CAM entry table 18 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	POST19	0	R/W	Specifies whether reference is or is not made to CAM entry table 19. Setting this bit to 1 selects the condition below. POST19: CAM entry table 19 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST20	0	R/W	Specifies whether reference is or is not made to CAM entry table 20. Setting this bit to 1 selects the condition below. POST20: CAM entry table 20 is referred to on reception of frames.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST21	0	R/W	Specifies whether reference is or is not made to CAM entry table 21. Setting this bit to 1 selects the condition below. POST21: CAM entry table 21 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	POST22	0	R/W	Specifies whether reference is or is not made to CAM entry table 22. Setting this bit to 1 selects the condition below. POST22: CAM entry table 22 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST23	0	R/W	Specifies whether reference is or is not made to CAM entry table 23. Setting this bit to 1 selects the condition below. POST23: CAM entry table 23 is referred to on reception of frames.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.28 CAM Entry Table POST 4 Register (TSU_POST4)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST4 register specifies the conditions for reference to TSU_ADRH24 to TSU_ADRH31 and TSU_ADRL24 to TSU_ADRL31. The setting of this register is effective when the POSTENL bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

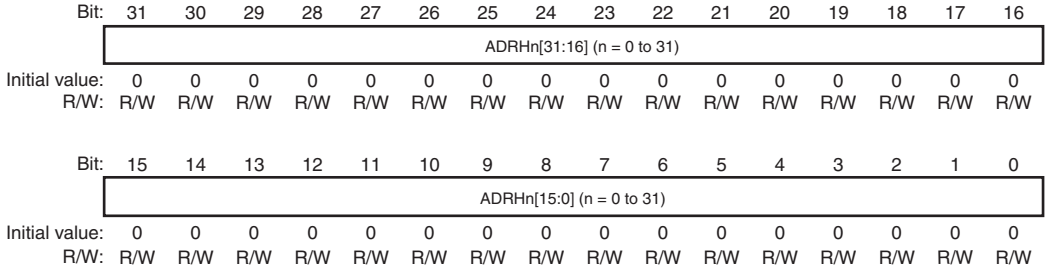
Bit	Bit Name	Initial Value	R/W	Description
31	POST24	0	R/W	Specifies whether reference is or is not made to CAM entry table 24. Setting this bit to 1 selects the condition below. POST24: CAM entry table 24 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST25	0	R/W	Specifies whether reference is or is not made to CAM entry table 25. Setting this bit to 1 selects the condition below. POST25: CAM entry table 25 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST26	0	R/W	Specifies whether reference is or is not made to CAM entry table 26. Setting this bit to 1 selects the condition below. POST26: CAM entry table 26 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
19	POST27	0	R/W	Specifies whether reference is or is not made to CAM entry table 27. Setting this bit to 1 selects the condition below. POST27: CAM entry table 27 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST28	0	R/W	Specifies whether reference is or is not made to CAM entry table 28. Setting this bit to 1 selects the condition below. POST28: CAM entry table 28 is referred to on reception of frames.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST29	0	R/W	Specifies whether reference is or is not made to CAM entry table 29. Setting this bit to 1 selects the condition below. POST29: CAM entry table 29 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	POST30	0	R/W	Specifies whether reference is or is not made to CAM entry table 30. Setting this bit to 1 selects the condition below. POST30: CAM entry table 30 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST31	0	R/W	Specifies whether reference is or is not made to CAM entry table 31. Setting this bit to 1 selects the condition below. POST31: CAM entry table 31 is referred to on reception of frames.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.29 CAM Entry Table 0H to 31H Registers (TSU_ADRH0 to TSU_ADRH31)

TSU_ADRH0 to TSU_ADRH31 are entry tables referred to by the CAM in reception and relay. Each of these registers sets the upper 32 bits of the 48-bit MAC address. Maximum 32 entries of MAC addresses can be registered.

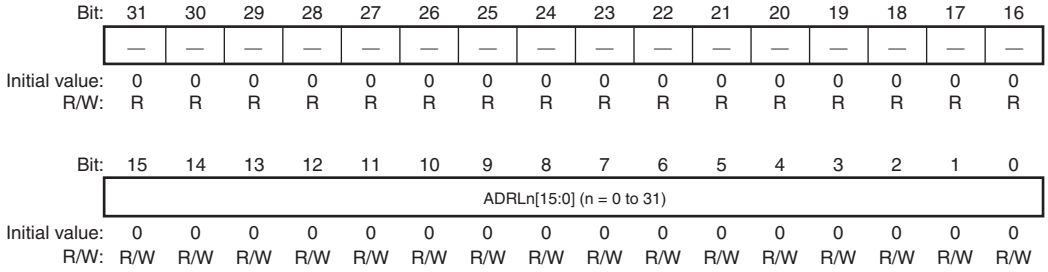


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADRHn[31:0] (n: 0 to 31)	All 0	R/W	MAC Address Bits These bits set the upper 32 bits of the MAC address. When the MAC address is 01-23-45-67-89-AB (displayed in hexadecimal), set H'01234567 in this register.

Note: • Set the CAM entry tables following the procedure below.
1. Check that the ADSBSY bit in TSU_ADSBSY is cleared to 0.
2. Set the upper 32 bits of the MAC addresses by TSU_ADRH0 to TSU_ADRH31.
3. Set the lower 16 bits of the MAC addresses by TSU_ADRL0 to TSU_ADRL31.

26.3.30 CAM Entry Table 0L to 31L Registers (TSU_ADRL0 to TSU_ADRL31)

TSU_ADRL0 to TSU_ADRL31 are entry tables referred to by the CAM in reception and relay. Each of these registers sets the lower 16 bits of the 48-bit MAC address. Maximum 32 entries of MAC addresses can be registered.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	ADRLn[15:0] (n: 0 to 31)	All 0	R/W	MAC Address Bits These bits set the lower 16 bits of the MAC address. When the MAC address is 01-23-45-67-89-AB (displayed in hexadecimal), set H'000089AB in this register.

Note: • Set the CAM entry tables following the procedure below.
1. Check that the ADSBSY bit in TSU_ADSBSY is cleared to 0.
2. Set the upper 32 bits of the MAC addresses by TSU_ADRH0 to TSU_ADRH31.
3. Set the lower 16 bits of the MAC addresses by TSU_ADRL0 to TSU_ADRL31.

26.3.31 Transmit Frame Counter Register (Normal Transmission Only) (TXNLCR0)

TXNLCR0 is a 32-bit counter indicating the number of frames successfully transmitted in the E-MAC. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NTC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NTC0[31:0]	All 0	R	Transmit Frame Counter Bits These bits indicate the number of frames successfully transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.32 Transmit Frame Counter Register (Normal and Erroneous Transmission) (TXALCR0)

TXALCR0 is a 32-bit counter indicating the number of frames transmitted in the E-MAC, including the number of frames erroneously transmitted. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TC0[31:16]

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TC0[31:0]	All 0	R	Transmit Frame Counter Bits These bits indicate the number of frames successfully transmitted and erroneously transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.33 Receive Frame Counter Register (Normal Reception Only) (RXNLCR0)

RXNLCR0 is a 32-bit counter indicating the number of frames successfully received in the E-MAC. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NRC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NRC0[31:0]	All 0	R	Receive Frame Counter Bits These bits indicate the number of frames successfully received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.34 Receive Frame Counter Register (Normal and Erroneous Reception) (RXALCR0)

RXALCR0 is a 32-bit counter indicating the number of frames received in the E-MAC, including the number of frames erroneously received. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RC0[31:0]	All 0	R	Receive Frame Counter Bits These bits indicate the number of frames successfully received and erroneously received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.35 E-DMAC Start Register (EDSR)

EDSR specifies activation of the transmitting unit and receiving unit of the E-DMAC. This register can only be written to, and the read values are invalid.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ENT	ENR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	ENT	0	W	E-DMAC Transmitting Unit Start 0: Stops the E-DMAC transmitting unit 1: Starts the E-DMAC transmitting unit
0	ENR	0	W	E-DMAC Receiving Unit Start 0: Stops the E-DMAC receiving unit 1: Starts the E-DMAC receiving unit

26.3.36 E-DMAC Mode Register (EDMR)

EDMR is a 32-bit readable/writable register that specifies E-DMAC resetting and the transmit/receive descriptor length. This register is to be set before the transmitting or receiving function is enabled (before the TR bit in EDTRR or the RR bit in EDRRR is set to 1). However, the SWRR and SWRT bits can be written to even after the transmitting or receiving function is enabled. If a software reset is executed with this register during data transmission, abnormal data may be transmitted on the line. Execute a software reset with this register before specifying the transmit/receive descriptor length or modifying the settings of TDLAR, RDLAR, and so forth, the setting of ECMR (E-MAC mode register), and the settings of registers related to the E-DMAC and E-MAC operation.

To execute a software reset with this register, 1 must be written to both the SWRT and SWRR bits simultaneously. Writing 1 to the SWRT and SWRR bits initializes the E-MAC registers and E-DMAC registers, except for TDLAR, RDLAR, and RMFCR of the E-DMAC. The TSU registers (registers whose names are prefixed with TSU_) are not initialized. The SWRT and SWRR bits in EDMR0 initializes the registers related to the E-DMAC and E-MAC. Note that during the period a software reset is issued (for 64 cycles of the internal bus clock Bck), accesses to all Ethernet-related registers are prohibited.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	DE	0	R/W	Transmit/Receive Frame Endian Sets the endian mode for DMA transfer of frame data between the transmit/receive FIFO and transmit/receive buffer. 0: Big endian (longword access) 1: Little endian (longword access)
5, 4	DL[1:0]	00	R/W	Transmit/Receive Descriptor Length These bits specify the descriptor length. (See section 26.4.1, Descriptors and Descriptor List.) 00: 16 bytes 01: 32 bytes 10: 64 bytes 11: Setting prohibited
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SWRT	0	R/W	Software Reset of Transmit FIFO Controller [Writing] 0: Disabled 1: Software reset started [Reading] 0: Software reset not executed (or completed) 1: Software reset being executed
0	SWRR	0	R/W	Software Reset of Receive FIFO Controller [Writing] 0: Disabled 1: Software reset started [Reading] 0: Software reset not executed (or completed) 1: Software reset being executed

26.3.37 E-DMAC Transmit Request Register (EDTRR)

EDTRR is a 32-bit readable/writable register that issues transmit directives to the E-DMAC. After writing 11 to bits TR[1:0] in this register, the E-DMAC reads the transmit descriptor at the address specified by TDLAR. If the TACT bit of this transmit descriptor is set to 1 (valid), transmit DMA transfer by the E-DMAC starts. When DMA transfer based on the first transmit descriptor is completed, the E-DMAC reads the next transmit descriptor. If the TACT bit of that transmit descriptor is set to 1 (valid), the E-DMAC continues transmit DMA operation. If the TACT bit of a transmit descriptor is cleared to 0 (invalid), the E-DMAC clears bits TR[1:0] and stops transmit DMA operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TR[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	TR[1:0]	00	R/W	Transmit Request 00, 01, 10: Transmission-halted state If 00, 01, or 10 is written to these bits, the E-DMAC stops DMA transfer of the currently processed transmit descriptor, reads the next transmit descriptor, and then clears these bits. (Write-back is completed for the valid transmit descriptors that have been detected up till then.) The E-DMAC clears these bits when transmit descriptor empty occurs, or transmission of a transmit descriptor has completed. (Write-back is completed for the valid transmit descriptors that have been detected up till then.) 11: Transmit DMA operation by E-DMAC After writing 11 to these bits, the E-DMAC starts reading a transmit descriptor.

26.3.38 E-DMAC Receive Request Register (EDRRR)

EDRRR is a 32-bit readable/writable register that issues receive directives to the E-DMAC. After writing 1 to the RR bit in this register, the E-DMAC reads the receive descriptor at the address specified by RDLAR. If the RACT bit of this receive descriptor is set to 1 (valid), and the receive FIFO holds a receive frame, the E-DMAC starts receive DMA transfer. When DMA transfer based on the first receive descriptor is completed, the E-DMAC reads the next receive descriptor. If the RACT bit of that receive descriptor is set to 1 (valid), the E-DMAC continues receive DMA operation. However, if the receive FIFO holds no receive data, the E-DMAC places receive DMA operation in the standby state. If the RACT bit of the receive descriptor is cleared to 0 (invalid), the E-DMAC clears the RR bit and stops receive DMAC operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

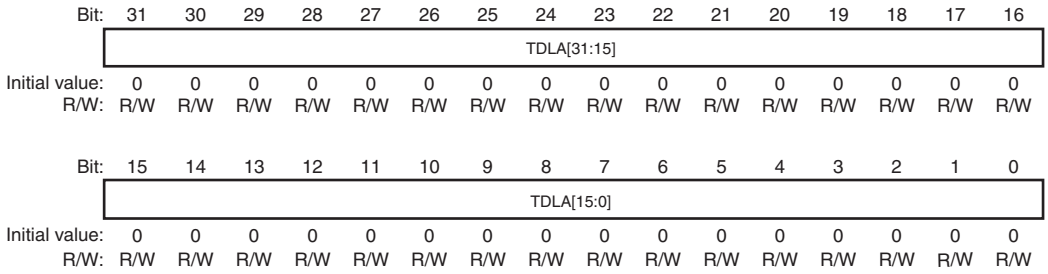
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RR	0	R/W	Receive Request 0: Receiving function is disabled*1 If 0 is written to this bit, the E-DMAC stops receive operation after DMA transfer of one frame has completed and then clears this bit. The E-DMAC clears this bit when receive descriptor empty occurs. 1: Receive descriptor is read, and the E-DMAC is ready to receive.

Note 1. If the receiving function is disabled during frame reception, write-back is not performed successfully to the receive descriptor. Following pointers to read a receive descriptor become abnormal and the E-DMAC cannot operate successfully. In this case, to make E-DMAC reception enabled again, execute a software reset by the SWRT and SWRR bits in EDMR0. To disable the E-DMAC receiving function without executing a software reset, specify the RE bit in ECMR0. Next, after the E-DMAC has completed the reception and write-back to the receive descriptor has been confirmed, disable the receiving function using this register.

26.3.39 Transmit Descriptor List Start Address Register (TDLAR)

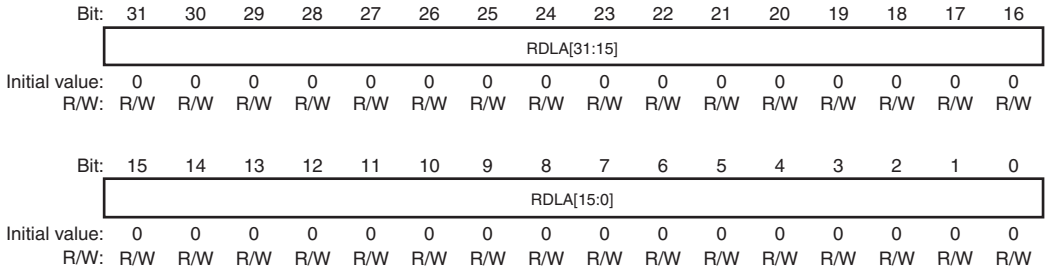
TDLAR is a 32-bit readable/writable register that specifies the start address of the transmit descriptor list. Descriptors have a boundary configuration in accordance with the descriptor length indicated by the DL bits in EDMR. This register must not be modified during transmission. Modifications to this register should only be made in the transmission-halted state specified by bits TR[1:0] (= 00) in the E-DMAC transmit request register (EDTRR).



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TDLA[31:0]	All 0	R/W	Transmit Descriptor Start Address The lower bits are set according to the specified descriptor length. 16-byte boundary: TDLA[3:0] = 0000 32-byte boundary: TDLA[4:0] = 00000 64-byte boundary: TDLA[5:0] = 000000

26.3.40 Receive Descriptor List Start Address Register (RDLAR)

RDLAR is a 32-bit readable/writable register that specifies the start address of the receive descriptor list. Descriptors have a boundary configuration in accordance with the descriptor length indicated by the DL bits in EDMR. This register must not be modified during reception. Modifications to this register should only be made while reception is disabled by the RR bit (= 0) in the E-DMAC receive request register (EDRRR).



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDLA[31:0]	All 0	R/W	Receive Descriptor Start Address The lower bits are set according to the specified descriptor length. 16-byte boundary: RDLA[3:0] = 0000 32-byte boundary: RDLA[4:0] = 00000 64-byte boundary: RDLA[5:0] = 000000

26.3.41 E-MAC/E-DMAC Status Register (EESR)

EESR is a 32-bit readable/writable register that shows communications status information on the E-DMAC in combination with the E-MAC. The information in this register is reported in the form of interrupt sources. Individual bits are cleared by writing 1 (however, bit 22 (ECI) is a read-only bit that is not cleared by writing 1) and are not affected by writing 0. Each interrupt source can also be masked by means of the corresponding bit in the E-MAC/E-DMAC status interrupt permission register (EESIPR).

The interrupt generated by this status register is ETHERI. For interrupt priorities, see section 7.4, Interrupt Sources.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	TWB[1:0]	00	R/W	Write-Back Complete Indicates that write-back from the E-DMAC to the corresponding descriptor after frame transmission has completed. This operation is enabled only when the TWBI bit in the transmit descriptor that includes the end of the transmit frame is set to 1. 00: Write-back has not completed, or no transmission directive 11: Write-back has completed Others: Setting disabled
29	TC[1]	0	R/W	Frame Transmission Complete Indicates, in combination with the TC[0] bit, that all the data specified by the transmit descriptor has been transmitted from the E-MAC. This bit is set to 1 on assuming the completion of transmission. This is when transmission of one frame is completed and the transmit descriptor valid bit (TACT) of the next transmit descriptor not being set in single-frame/single-descriptor operation or when the last data of a frame has been transmitted and the transmit descriptor valid bit (TACT) of the next descriptor not being set in multi-buffer frame processing based on single-frame/multi-descriptor operation. After frame transmission has completed, the E-DMAC writes the transmission status back to the relevant descriptor. TC[1:0] 00: Transmission has not completed, or no transmission directive 11: Transmission has completed Others: Setting disabled
28	TUC	0	R/W	Transmit Underflow Frame Write-Back Complete 0: Write-back has not completed for the frame causing transmit underflow 1: Write-back has completed for the frame causing transmit underflow
27	ROC	0	R/W	Receive Overflow Frame Write-Back Complete 0: Write-back has not completed for the frame causing receive overflow 1: Write-back has completed for the frame causing receive overflow
26	TABT	0	R/W	Transmit Abort Detect Indicates that the E-MAC aborts transmitting a frame because of failures during frame transmission. 0: Frame transmission has not been aborted or no transmission directive 1: Frame transmission has been aborted
25	RABT	0	R/W	Receive Abort Detect Indicates that the E-MAC aborts receiving a frame because of failures during frame reception. 0: Frame reception has not been aborted or no reception directive 1: Frame reception has been aborted

Bit	Bit Name	Initial Value	R/W	Description
24	RFCOF	0	R/W	Receive Frame Counter Overflow Indicates that the frame counter in the receive FIFO has overflowed. 0: Receive frame counter has not overflowed 1: Receive frame counter has overflowed
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	ECI	0	R	E-MAC Status Register Source This bit is a read-only bit. When the source of an ECSR interrupt is cleared, this bit is also cleared. 0: E-MAC status interrupt source has not been detected 1: E-MAC status interrupt source has been detected
21	TC[0]	0	R/W	Frame Transmission Complete Indicates, in combination with the TC[1] bit, that all the data specified by the transmit descriptor has been transmitted from the E-MAC. For details, see the description of the TC[1] bit.
20	TDE	0	R/W	Transmit Descriptor Empty Indicates that the transmit descriptor valid bit (TACT) of a transmit descriptor read by the E-DMAC is not set if the previous descriptor does not represent the end of a frame in multi-buffer frame processing based on single-frame/ multi-descriptor operation. As a result, an incomplete frame may be sent. 0: Transmit descriptor active bit TACT = 1 detected 1: Transmit descriptor active bit TACT = 0 detected When transmit descriptor empty (TDE = 1) occurs, execute a software reset and initiate transmission. In this case, transmission starts from the address that is stored in the transmit descriptor list start address register (TDLAR).
19	TFUF	0	R/W	Transmit FIFO Underflow Indicates that an underflow has occurred in the transmit FIFO during frame transmission. Incomplete data is sent onto the line. 0: Underflow has not occurred 1: Underflow has occurred
18	FR	0	R/W	Frame Reception Indicates that a frame has been received and the receive descriptor has been updated. This bit is set to 1 each time a frame is received. 0: Frame has not been received 1: Frame has been received
17	RDE	0	R/W	Receive Descriptor Empty Indicates that the RACT bit of a receive descriptor read by the E-DMAC for receive DMA operation is cleared to 0 (invalid). When receive descriptor empty (RDE = 1) occurs, reception can be resumed by setting the RACT bit (cleared to 0) of the receive descriptor to 1 and then writing 1 to the RR bit in EDRRR. 0: Receive descriptor active bit RACT = 1 detected 1: Receive descriptor active bit RACT = 0 detected
16	RFOF	0	R/W	Receive FIFO Overflow Indicates that the receive FIFO has overflowed during frame reception. 0: Overflow has not occurred 1: Overflow has occurred
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10, 9	—	Undefined	R	Reserved The write value should always be 0.
8	—	0	R	Reserved The write value should always be 0.
7	RMAF	0	R/W	Receive Multicast Address Frame 0: Multicast address frame has not been received 1: Multicast address frame has been received
6, 5	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	RRF	0	R/W	Receive Residual-Bit Frame 0: Residual-bit frame has not been received 1: Residual-bit frame has been received
3	RTLF	0	R/W	Receive Too-Long Frame Indicates that a frame whose byte size exceeds the upper limit for the receive frame length set by RFLR has been received. 0: Too-long frame has not been received 1: Too-long frame has been received
2	RTSF	0	R/W	Receive Too-Short Frame Indicates that a frame of fewer than 64 bytes has been received. 0: Too-short frame has not been received 1: Too-short frame has been received
1	PRE	0	R/W	PHY-LSI Receive Error 0: PHY-LSI receive error has not been detected 1: PHY-LSI receive error has been detected
0	CERF	0	R/W	CRC Error on Received Frame 0: CRC error has not been detected 1: CRC error has been detected

26.3.42 E-MAC/E-DMAC Status Interrupt Permission Register (EESIPR)

EESIPR is a 32-bit readable/writable register that enables interrupts corresponding to individual bits in the E-MAC/E-DMAC status register (EESR). An interrupt is enabled by writing 1 to the corresponding bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	CERFIP	0	R/W	CRC Error on Received Frame Interrupt Enable 0: CRC error interrupt is disabled 1: CRC error interrupt is enabled

26.3.43 Transmit/Receive Status Copy Enable Register (TRSCER)

TRSCER specifies whether the information for the transmit and receive state reported by bits 26, 25, and 10 to 0 in the E-MAC/E-DMAC status register (EESR) is to be reflected in the TFE or RFE bit of the corresponding descriptor. The bits in this register correspond to bits 26, 25, and 10 to 0 in EESR. When a bit is cleared to 0, the transmit status (bits 26 and 10 to 8 in EESR) is reflected in the TFE bit of the transmit descriptor, and the receive status (bits 25 and 7 to 0 in EESR) is reflected in the RFE bit of the receive descriptor. In this case, the state of a status bit set to 1 is reflected as the TFE or RFE bit set to 1. When a bit is set to 1, the occurrence of the corresponding source is not reflected in the descriptor. After this LSI is reset, all bits are cleared to 0.

1	PRECE	0	R/W	PRE Bit Copy Directive 0: Reflects the PRE bit status in the RFE bit of the receive descriptor 1: Occurrence of the corresponding source is not reflected in the RFE bit of the receive descriptor

Bit	Bit Name	Initial Value	R/W	Description
0	CERFCE	0	R/W	CERF Bit Copy Directive 0: Reflects the CERF bit status in the RFE bit of the receive descriptor 1: Occurrence of the corresponding source is not reflected in the RFE bit of the receive descriptor

26.3.44 Receive Missed-Frame Counter Register (RMFCR)

RMFCR is a 16-bit counter that indicates the number of frames that could not be saved in the receive buffer and so were discarded during reception. When the receive FIFO overflows, the receive frames in the FIFO are discarded. The number of frames discarded at this time is counted. When the value in this register reaches H'0000FFFF, count-up is halted. Clear the counter by writing H'00000000 in this register. Note that a value other than H'00000000 must not be written to this register.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MFC[15:0]	All 0	R/W	Missed-Frame Counter These bits indicate the number of frames that are discarded and not transferred to the receive buffer during reception.

26.3.45 Transmit FIFO Threshold Register (TFTR)

TFTR is a 32-bit readable/writable register that specifies the transmit FIFO threshold at which the first transmission is started. The actual threshold is 4 times the set value. The E-MAC starts transmission when the amount of data in the transmit FIFO exceeds the number of bytes specified by this register, when the transmit FIFO is full, or when one frame of data write is performed. This register must not be written to during transmission (bits TR[1:0] in EDTRR = 11).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TFT[10:0]	All 0	R/W	Transmit FIFO Threshold A value in 32-byte units and smaller than the FIFO size specified by FDR must be set as the transmit FIFO threshold. H'000: Store and forward modes H'008: 32 bytes H'010: 64 bytes H'018: 128 bytes : : H'07F: 508 bytes H'080: 512 bytes : : H'0FF: 1,020 bytes H'100: 1,024 bytes : : H'1FF: 2,044 bytes H'200: 2,048 bytes

Note: • When starting transmission before one frame of data write has completed, take care no underflow occurs.

26.3.46 FIFO Depth Register (FDR)

FDR is a 32-bit readable/writable register that specifies the sizes of the transmit and receive FIFOs.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	TFD[2:0]	All 1	R/W	Transmit FIFO Size Specifies 256 bytes to 2 Kbytes in 256-byte units as the size of the transmit FIFO whose maximum size is 2 Kbytes. The setting must not be changed after transmission/reception has started. H'00: 256 bytes H'01: 512 bytes : : H'07: 2048 bytes
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	RFD[4:0]	All 1	R/W	Receive FIFO Size Specifies 256 bytes to 4 Kbytes in 256-byte units as the size of the receive FIFO whose maximum size is 4 Kbytes. The setting must not be changed after transmission/reception has started. H'00: 256 bytes H'01: 512 bytes : : H'0F: 4096 bytes

26.3.47 Receiving Method Control Register (RMCR)

RMCR is a 32-bit readable/writable register that specifies the control method for the RE bit in ECMR while a frame is received. This register must be set during the receiving-halted state.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RNC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RNC	0	R/W	Receive Enable Control Sets whether to continue frame reception. 0: Upon completion of reception of one frame, the E-DMAC writes the receive status to the descriptor and clears the RR bit in EDRRR to 0. 1: Upon completion of reception of one frame, the E-DMAC writes (writes back) the receive status to the descriptor. In addition, the E-DMAC reads the next descriptor and prepares for reception of the next frame.

26.3.48 Receive Descriptor Fetch Address Register (RDFAR)

RDFAR stores the descriptor start address that is required when the E-DMAC fetches descriptor information from the receive descriptor. Which receive descriptor information is used for processing by the E-DMAC can be recognized by monitoring addresses displayed in this register. The address from which the E-DMAC is actually fetching a descriptor may be different from the value read from this register. In the initial setting, set the address of the receive descriptor at which receive processing is to be started.

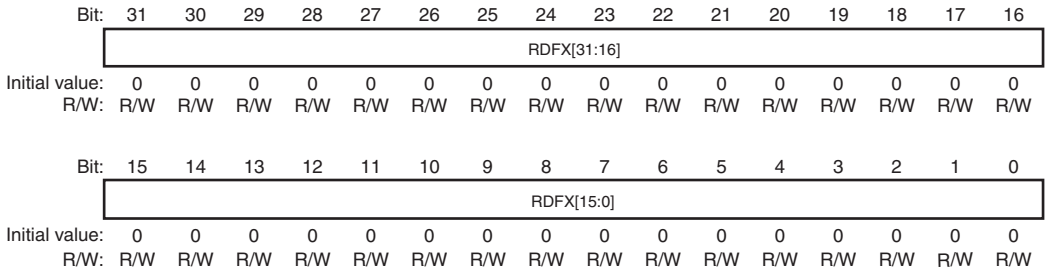
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDFA[31:0]	All 0	R/W	Receive Descriptor Fetch Address Writing to these bits during the reception is prohibited.

26.3.49 Receive Descriptor Finished Address Register (RDFXR)

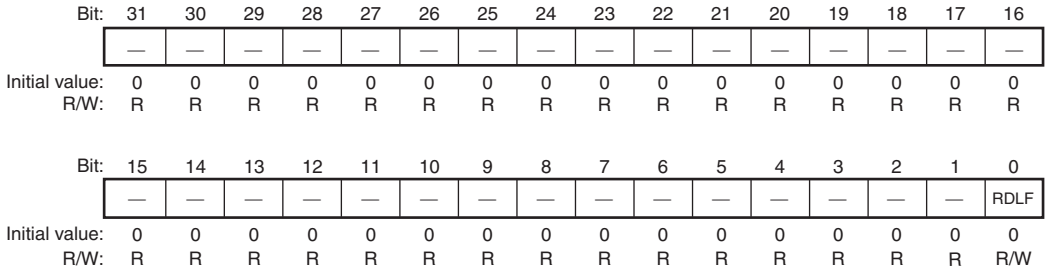
RDFXR stores the start address of the receive descriptor for which the E-DMAC has just completed the write-back processing. Up to which receive descriptor has been processed by the E-DMAC can be recognized by monitoring addresses displayed in this register. In the initial setting, set the address of the descriptor immediately before the descriptor that is pointed to by the address in RDFAR.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDFX[31:0]	All 0	R/W	Receive Descriptor Finished Address Writing to these bits during the reception is prohibited.

26.3.50 Receive Descriptor Final Flag Register (RDFFR)

RDFFR indicates whether the receive descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in RDFXR is at the end of the receive descriptor queue (descriptor list).



Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RDLF	0	R/W	Receive Descriptor Queue Last Flag Indicates whether the receive descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in RDFXR is at the end of the receive descriptor queue (descriptor list). 0: Not the last descriptor in the receive descriptor queue 1: Last descriptor in the receive descriptor queue

26.3.51 Transmit Descriptor Fetch Address Register (TDFAR)

TDFAR stores the descriptor start address that is required when the E-DMAC fetches descriptor information from the transmit descriptor. Which transmit descriptor information is used for processing by the E-DMAC can be recognized by monitoring addresses displayed in this register. The address from which the E-DMAC is actually fetching a descriptor may be different from the value read from this register. In the initial setting, set the address of the transmit descriptor at which transmit processing is to be started.

31 to 0	TDFA[31:0]	All 0	R/W	Transmit Descriptor Fetch Address Writing to these bits during transmission is prohibited.

26.3.52 Transmit Descriptor Finished Address Register (TDFXR)

TDFXR stores the start address of the transmit descriptor for which the E-DMAC has just completed the write-back processing. Up to which transmit descriptor has been processed by the E-DMAC can be recognized by monitoring addresses displayed in this register. In the initial setting, set the address of the transmit descriptor immediately before the descriptor that is pointed to by the address in TDFAR.

0	TDLF	0	R/W	Transmit Descriptor Queue Last Flag Indicates whether the transmit descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in TDFXR is at the end of the transmit descriptor queue (descriptor list). 0: Not the last descriptor in the transmit descriptor queue 1: Last descriptor in the transmit descriptor queue

26.3.54 Overflow Alert FIFO Threshold Register (FCFTR)

FCFTR is a 32-bit readable/writable register that sets the flow control of the E-MAC. The threshold can be set by the size of the receive FIFO data (bits RFD[7:0]) and the number of receive frames (bits RFF[4:0]).
If the same receive FIFO size as set by the FIFO depth register (FDR) is set when flow control is turned on according to the RFD setting condition, flow control is turned on with (FIFO data size – 64) bytes. For instance, when the RFD bits in FDR is 7 and the RFD bits in this register is 7, flow control is turned on when (2,048 – 64) bytes of data is stored in the receive FIFO. The value set in the RFD bits in this register should be equal to or less than that set in the RFD bits in FDR.

Flow control is turned on when either of the setting conditions of bits RFF[4:0] and bits RFD[7:0] is satisfied. Flow control is turned off when neither of the conditions is satisfied (release).

15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	RFD[7:0]	H'FF	R/W	Receive FIFO Overflow Alert Signal Output Threshold H'00: When (256 – 32) bytes of data is stored in the receive FIFO H'01: When (512 – 32) bytes of data is stored in the receive FIFO : : H'06: When (1,792 – 32) bytes of data is stored in the receive FIFO H'07: When (2,048 – 64) bytes of data is stored in the receive FIFO

26.3.55 Receive Data Padding Insert Register (RPADIR)

RPADIR is a 32-bit readable/writable register that inserts padding in receive data. To change the settings of this register, execute a software reset by means of the SWRT and SWRR bits in the E-DMAC mode register (EDMR) before making settings again.

26.3.56 Intelligent Checksum Mode Register (CSMR)

CSMR is a readable 32-bit register that specifies the intelligent checksum operation mode. This register must be set while reception is halted.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSEBL	CSMD	—	—	—	—	—	—	—	—	—	—	—	—	—	—

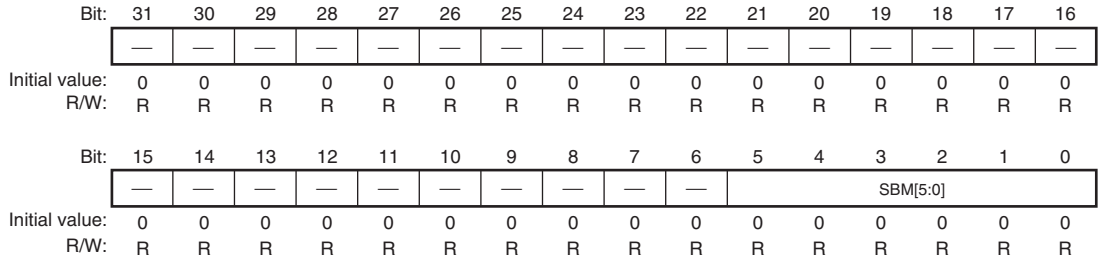
	—	—	—	—	—	—	—	—	—	—	SB[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CSELB	1	R	Intelligent Checksum Calculation Operation Setting 0: The result of checksum calculation is not written back to the receive descriptor. 1: The result of checksum calculation is written back to the receive descriptor.
30	CSMD	1	R/W	Intelligent Checksum Calculation Mode Setting 0: After having skipped the number of bytes specified in SB[5:0], counting from the beginning of the MAC-layer packet, the checksum is calculated for all subsequent data 1: MAC- or IP-layer packets are detected and checksums are calculated for upper-layer protocol packets such as TCP or UDP.
29 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	SB[5:0]*1	011010	R/W	Intelligent Checksum Calculation Skip Bytes These bits specify the number of bytes to be skipped for checksum calculation, counting from the beginning of the data received in the E-DMAC. When padding bytes are to be added, specify the checksum start position to cover the amount or extent of padding. H'00: 0 bytes (meaning checksum calculation is performed from the beginning of the packet.) H'02: 2 bytes : : H'1A: 26 bytes H'3E: 62 bytes

Note 1. These bits should only be set when CSEL is 1 and CSMD is 0; otherwise, set to H'00.

26.3.57 Intelligent Checksum Skipped Bytes Monitor Register (CSSBM)

CSSBM is a 32-bit readable register that holds the number of bytes that have been skipped in received packets being handled by the E-DMAC. The number of skipped bytes can be monitored through this register. The amount of data received in E-DMAC may not match the number of skipped bytes.

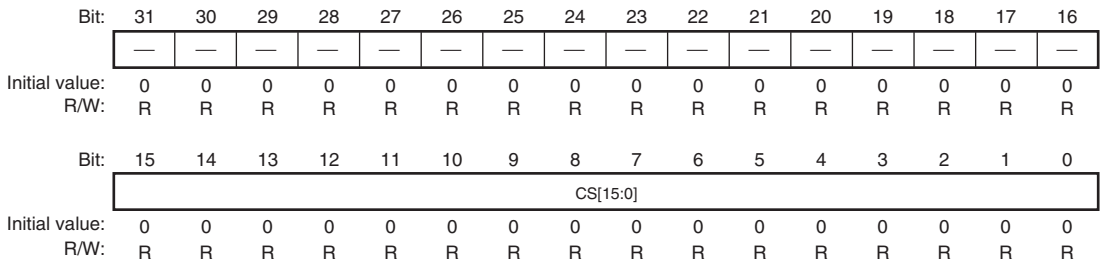


Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	SBM[5:0]	000000	R	Number of Skipped Bytes These bits are read-only. Writing is prohibited. These bits are initialized when the beginning of a packet for reception is detected.

Note: • This register is only valid when CSEL is 1 and CSMD is 0.

26.3.58 Intelligent Checksum Monitor Register (CSSMR)

CSSMR is a 32-bit register that holds the checksum value of received packets being handled by the E-DMAC. The checksum value can be monitored through this register. The amount of data received in E-DMAC may not match the number of skipped bytes.



Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	CS[15:0]	000000	R	Intelligent Checksum Value These bits are read-only. Writing is prohibited. These bits are initialized when the beginning of a packet for reception is detected.

Note: • This register is only valid when CSEL = 1 and CSMD = 0.

26.4 Operation

The ETHER consists of the following three function units:

- DMA transfer controller (E-DMAC): DMA transfer between the transmit/receive buffer in the memory and the transmit/receive FIFO
- MAC controller (E-MAC): Transmission/reception processing between the transmit/receive FIFO and the MII
- Transfer Switching Unit (TSU): CAM processing

Using its direct memory access (DMA) function, the E-DMAC performs DMA transfer of frame data between a user-specified Ethernet frame transmission/reception data storage destination (accessible memory space: transmit buffer/ receive buffer) and the transmit/receive FIFO in the E-DMAC. The user cannot read and write data from and to the transmit/receive FIFO directly via the CPU.
To enable the E-DMAC to perform DMA transfer, information (data) including a transmit/receive data storage address and so forth, referred to as a descriptor, is required. The E-DMAC reads transmit data from the transmit buffer or writes receive data to the receive buffer according to the descriptor information. By arranging multiple descriptors as a descriptor row (list) (to be placed in a readable/writable memory space), multiple Ethernet frames can be transmitted or received continuously.
The E-MAC constructs an Ethernet frame using the data written to the transmit FIFO and transmits the frame to the MII. It also performs a CRC check of an Ethernet frame received from the MII and deconstructs the frame to write to the receive FIFO. The E-MAC supports the MII format for interface to the PHI-LSI connected externally to this LSI.
The TSU, which is placed between the E-DMAC and E-MAC, references the CAM entry table to select one of the following tasks according to the Ethernet frame destination address (DA) input to the E-MAC.

- Receives data and writes to the receive FIFO.
- Discards data.

Figure 26.2 shows the frame data path and an overview of each setting.

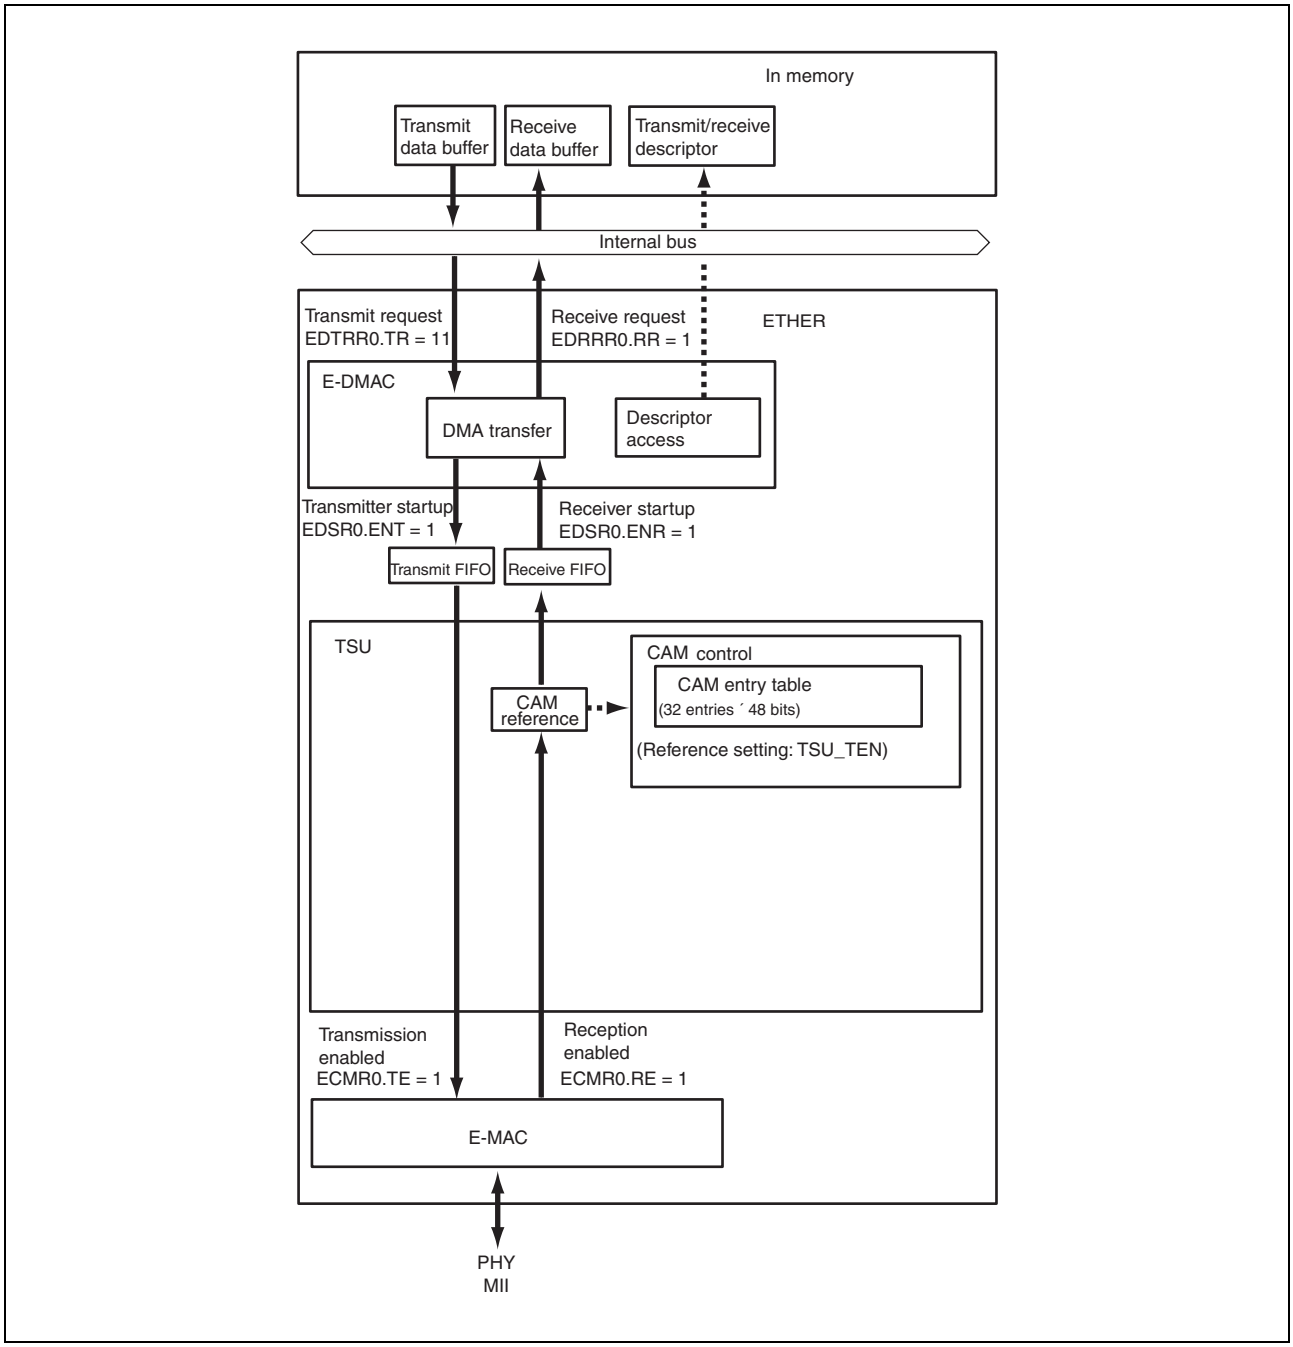


Figure 26.2 ETHER Data Path and Various Settings

26.4.1 Descriptors and Descriptor List

The E-DMAC performs DMA transfer according to the information (data), referred to as a descriptor, written in memory space. There are two types of descriptors: transmit descriptors and receive descriptors. Before a DMA transfer, DMA transfer information including a transmit/receive frame data storage address must be set by software.
The E-DMAC automatically starts reading a transmit/receive descriptor when the TR bits in EDTRR are set to 11 or the RR bit in EDRRR is set to 1, and performs DMA transfer of frame data between the transmit/receive buffer and transmit/receive FIFO according to the information stored in the descriptor. After completion of Ethernet frame transmission/reception, the E-DMAC disables the descriptor valid/invalid bit and reflects the result of transmission/reception in the status bits.
Descriptors are placed in a readable/writable memory space. The address of the start descriptor (descriptor to be read first by the E-DMAC) is set in TDLAR/RDLAR. When multiple descriptors are prepared as a descriptor row (descriptor list), the descriptors are placed in continuous addresses (memory) according to the descriptor length set in the DL0 and DL1 bits in EDMR.

(1) Transmit Descriptor

Figure 26.3 shows the configuration of a transmit descriptor and the relationship with a transmit buffer.
The data of a transmit descriptor consists of TD0, TD1, TD2, and padding data in groups of 32 bits from top to end. The length of padding data is determined according to the descriptor length specified by the DL0 and DL1 bits in EDMR.
TD0 indicates whether the transmit descriptor is valid or invalid, and information about the descriptor configuration and status. TD1 indicates the length of data in a transmit buffer to be transferred (TDL) as specified by the descriptor. TD2 indicates the start address of a transmit buffer that holds data to be transferred (TBA).
Depending on the descriptor specification, one transmit descriptor can specify all transmit data of one frame (single-frame/single-buffer) or multiple descriptors can specify the transmit data of one frame (single-frame/multi-buffer). As an example of single-frame/multi-buffer operation, the data portion that is used in a fixed manner in each Ethernet frame transmission can be referenced by multiple descriptors. For example, multiple descriptors can share the destination address and transmit source address in an Ethernet frame, and the remaining data can be stored in each separate buffer.

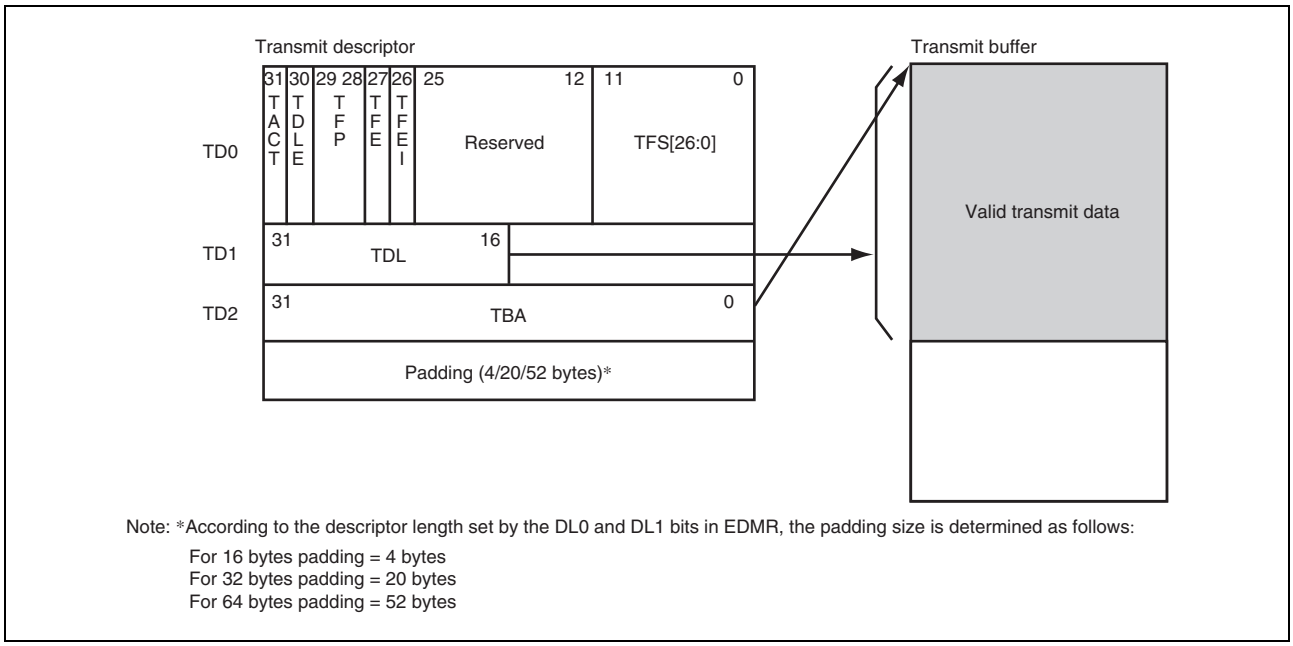

Figure 26.3 Relationship between Transmit Descriptor and Transmit Buffer

(a) Transmit Descriptor 0 (TD0)

Before the TR bits in EDTRR are set to 11, the user sets whether the bits of the descriptor are valid or invalid bit and sets other descriptor configuration. After Ethernet frame transmission, the E-DMAC disables the valid/invalid bits of the descriptor and writes status information. This operation is referred to as write-back.
When using TD0, the user should write desired values to bits 31 to 28 and 26 according to the descriptor configuration. Bits 27 and 25 to 0 should be cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
31	TACT	0	R/W	Transmit Descriptor Valid/Invalid Indicates whether the corresponding descriptor is valid or invalid. To make this bit valid, store transmit data in a transmit buffer (user-specified transmit data storage destination) beforehand, then write 1 to this bit. The E-DMAC clears this bit to 0 after data transfer. 0: Indicates that this transmit descriptor is invalid Indicates the initial setting state, the state after 0 is written, or (in case the user writes 1 to this bit) that this bit is cleared to 0 because the E-DMAC data transfer processing is completed. If this state is recognized when the E-DMAC reads a descriptor, the E-DMAC clears the TR bit in EDTRR to 0, and halts transfer operation related to transmission by the E-DMAC. 1: Indicates that this transmit descriptor is valid After the user writes 1 to this bit, this bit indicates that data is not transferred yet or data is being transferred. When there is a descriptor row (descriptor list) consisting of multiple continuous descriptors, the E-DMAC can continue operation when this bit of the next descriptor is valid.
30	TDLE	0	R/W	Transmit Descriptor List End Indicates whether the corresponding descriptor is the last descriptor of the descriptor row (descriptor list). 0: Not last descriptor After transfer of the corresponding descriptor, the E-DMAC reads the next one in the list of continuous descriptors. 1: Last descriptor After transfer of the corresponding descriptor, the E-DMAC reads the descriptor placed at the address indicated by TDLAR.
29, 28	TFP[1:0]	00	R/W	Transmit Frame Position These bits indicate whether information of this descriptor represents information about the start, middle, or end of the transmit frame. 00: The information of the descriptor represents information about the middle of the frame. 01: The information of the descriptor represents information about the end of the frame. 10: The information of the descriptor represents information about the start of the frame. 11: The information of the descriptor represents all information about the frame (single-frame/single-descriptor (single-buffer)). Reference When one frame is divided for use, the method of specifying this bit for a descriptor row according to the number of divisions is described below. • For single-frame/single-descriptor operation First descriptor: TFP[1:0] = 11 • For single-frame/two-descriptor operation First descriptor: TFP[1:0] = 10 Second descriptor: TFP[1:0] = 01 • For single-frame/three-descriptor operation First descriptor: TFP[1:0] = 10 Second descriptor: TFP[1:0] = 00 Third descriptor: TFP[1:0] = 01 When the number of divisions is large, a descriptor row is configured by adding intermediate descriptors with TFP[1:0] = 00.

Bit	Bit Name	Initial Value	R/W	Description
27	TFE	0	R/W	Transmit Frame Error Occurrence Indicates that an error occurred in the transmit frame. 0: The TFS11 to TFS0 bits are all 0 1: One of the TFS11 to TFS0 bits is 1 The TFS8 to TFS0 bits can be masked for each factor by using TRSCER. The TFS11 to TFS9 bits cannot be masked. This bit is set by the E-DMAC write-back operation.
26	TWBI	0	R/W	Write-Back Completion Interrupt Notification 0: Does not notify of a write-back completion interrupt 1: After a write-back operation to this descriptor is complete, this bit sets the TWB1 and TWB0 bits in EESR to 11 and notifies the CPU of a write-back completion interrupt. This bit is valid only for the descriptor including the end of transmit frame (TFP = 01 or 11). This bit is cleared to 0 by the E-DMAC write-back operation.
25 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	TFS [11:0]	All 0	R/W	Transmit Frame Status These bits indicate the status of the corresponding frame. A bit below, which is set by the E-DMAC write-back operation, indicates the occurrence of the corresponding event when set to 1. • TFS[11:10]: Reserved (The write value should always be 0.) • TFS[9]: Transmit FIFO underflow (Corresponding to the TUC bit in EESR) • TFS[8]: Detection of transmission abort (Corresponding to the TABT bit in EESR) • TFS[7:0]: Reserved (The write value should always be 0.)

(b) Transmit Descriptor 1 (TD1)

TD1 indicates the data length of the transmit buffer used by the corresponding descriptor.
The user should set TD1 before the start of a read by the E-DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TDL [15:0]	All 0	R/W	Transmit Buffer Data Length (in bytes) These bits set the data length of the corresponding transmit buffer in bytes. The specifiable data lengths are from a minimum of 1 (H'0001) byte to a maximum of 64 K – 32 (H'FFE0) bytes.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(c) Transmit Descriptor 2 (TD2)

TD2 indicates the start address of the corresponding 32-bit width transmit buffer. An address value should be specified in a 16-byte boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TBA [31:0]	All 0	R/W	Transmit Buffer Start Address These bits set the start address of the corresponding transmit buffer in a 16-byte boundary.

If descriptors are set below, the E-DMAC does not return to normal operation until a system reset is performed.

- TFP (transmit frame position) is not logically correct
  Example: The TFP bits are set to 11 in a descriptor (descriptor A) and the TFP bits are set to 01 in the next descriptor (descriptor B). This specification means that there is no descriptor indicating the start of the transmit

frame specified by descriptor B.

- TBL (transmit buffer length) is set to 0

When one transmit frame is divided into three parts or more with transmit descriptors, the E-DMAC performs the following write-back operation:

- A write-back operation is performed for a transmit descriptor including information for the start of the transmit frame (TFP = 10 or 11) and for a transmit descriptor including information for the end of the frame (TFP = 01 or 11).
- A write-back operation is not performed for a transmit descriptor for the middle of the frame (TFP = 00).

However, TFE (transmit frame error occurrence) or TFS (transmit frame status) is written only to a transmit descriptor including information for the end of the frame (TFP = 01 or 11) by a write-back operation.
Before changing a transmit descriptor with the software, make sure that a write-back operation has been performed (TACT = 0) for the transmit descriptor including information for the end of the frame (TFP = 01 or 11) to avoid overwriting (re-setting) an unprocessed transmit descriptor.

(2) Receive Descriptor

Figure 26.4 shows the relationship between a receive descriptor and receive buffer.
The data of a receive descriptor consists of RD0, RD1, RD2, and padding data in groups of 32 bits from top to end. The length of padding data is determined according to the descriptor length specified by the DL0 and DL1 bits in EDMR. RD0 indicates whether the receive descriptor is valid or invalid, and information about descriptor configuration and status. RD1 indicates the length of data that can be received in the receive buffer specified by the descriptor (RBL) and the length of the received frame data (RDL). RD2 indicates the start address of the receive buffer for storing receive data (RBA).
Depending on the descriptor specification, one receive descriptor can specify the storing of all receive data of one frame in a receive buffer (single-frame/single-buffer). All receive frames can be stored in a single buffer if RBL of each descriptor is set to more than 1514 bytes (maximum Ethernet frame length).

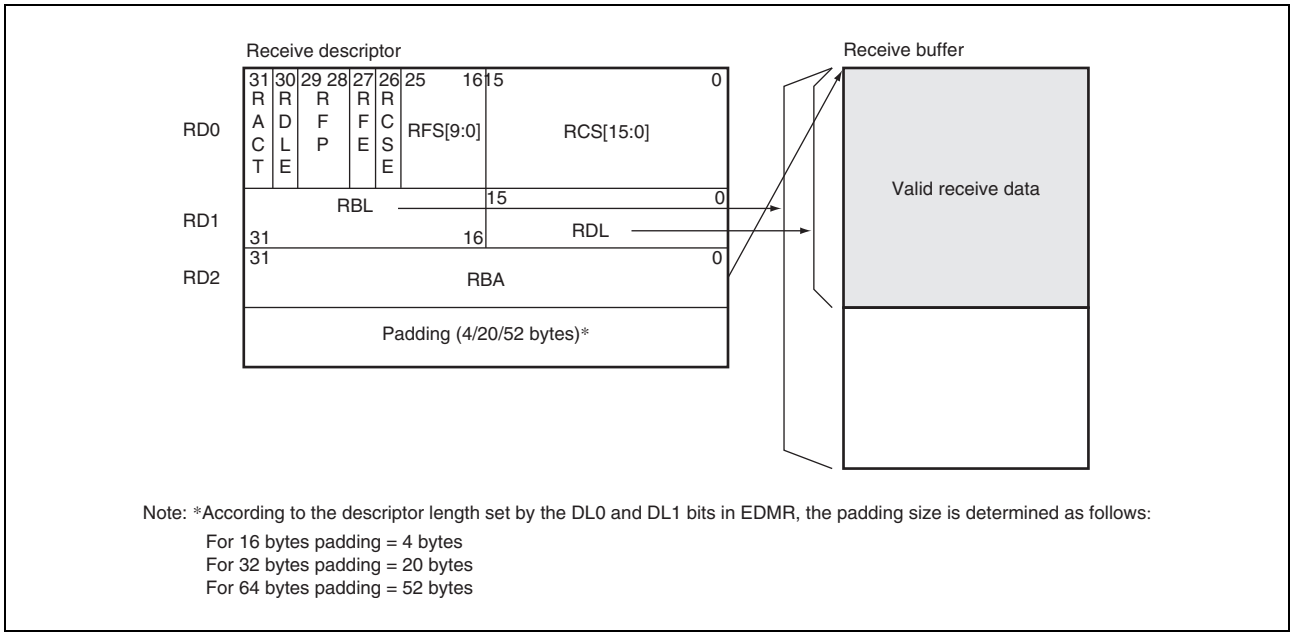

Figure 26.4 Relationship between Receive Descriptor and Receive Buffer

(a) Receive Descriptor 0 (RD0)

The user sets whether the bits of the descriptor are valid or invalid and whether the descriptor represents the end of the descriptor list in RD0 before the RR bit in EDRRR is set to 1 and the start of a read by the E-DMAC. After receive DMA transfer of an Ethernet frame by the E-DMAC, the E-DMAC disables the valid/invalid bits of the descriptor and writes status information. This operation is referred to as write-back.
When using RD0, the user should write desired values to bits 31 and 30 according to the descriptor configuration. Bits 29 to 0 should be cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
31	RACT	0	R/W	Receive Descriptor Valid/Invalid Indicates whether this descriptor is valid or invalid. To make this bit valid, prepare a receive buffer (user-specified receive data storage destination) beforehand, then write 1 to this bit. The E-DMAC clears this bit to 0 after data transfer. 0: Indicates that this receive descriptor is invalid Indicates the initial setting state, the state after 0 is written to, or (in case the user writes 1 to this bit) that this bit is cleared to 0 because the E-DMAC data transfer processing is completed If this state is recognized when the E-DMAC reads a descriptor, the E-DMAC clears the RR bit in EDRRR to 0, and halts transfer operation related to reception by the E-DMAC 1: Indicates that this receive descriptor is valid Indicates that data is not transferred yet after the user writes 1 to this bit, or that data is being transferred When there is a descriptor row (descriptor list) consisting of multiple continuous descriptors, the E-DMAC can continue operation when this bit of the next descriptor is valid
30	RDLE	0	R/W	Receive Descriptor List End Indicates whether this descriptor is the last descriptor of the descriptor row (descriptor list). 0: Not last descriptor After transfer of this descriptor, the E-DMAC reads the next one in the list of continuous descriptors 1: Last descriptor After transfer of this descriptor, the E-DMAC reads the descriptor placed at the address indicated by RDLAR
29, 28	RFP[1:0]	00	R/W	Receive Frame Position 1, 0 The E-DMAC indicates by write-back operation whether information of the corresponding descriptor represents information about the start, middle, or end of the receive frame. 00: The information of the descriptor represents information about the middle of the frame 01: The information of the descriptor represents information about the end of the frame 10: The information of the descriptor represents information about the start of the frame 11: The information of the descriptor represents all information about the frame (single-frame/single-descriptor (single-buffer)) Note: The relationship between a frame after reception of one frame and a descriptor is described below. When the receive buffer data length is less than the receive frame length, these bits are set to a value other than 11 after reception. When they are set so, reception processing should be started after a software reset.
27	RFE	0	R/W	Receive Frame Error Occurrence Indicates that an error occurred in the receive frame. 0: RFS9 to RFS0 are all 0 1: One of RFS9 to RFS0 is 1 Each of RFS8 to RFS0 can be masked by using TRSCER. RFS9 cannot be masked. This bit is set by the E-DMAC write-back operation.

Bit	Bit Name	Initial Value	R/W	Description
26	RCSE	0	R/W	Receive Packet Checksum Value Evaluation by Intelligent Checksum When CSEBL = 1 and CSMD = 1, the value of this bit is set as shown in Table 26.3, according to the receive packet and receive data. The information of this bit is invalid when operation is performed with a setting other than above.
25 to 16	RFS[9:0]	All 0	R/W	Receive Frame Status These bits indicate the error status during frame reception. RFS9: Receive FIFO overflow (corresponding to the RFOF bit in EESR) RFS8: Reserved (write value should be 0) RFS7: Multicast address frame received (corresponding to the RMAF bit in EESR) RFS[6:5]: Reserved (write value should be 0) RFS4: Residual-bit frame receive error (corresponding to the RRF bit in EESR) RFS3: Long frame receive error (corresponding to the RTLF bit in EESR) RFS2: Short frame receive error (corresponding to the RTSF bit in EESR) RFS1: PHY-LSI receive error (corresponding to the PRE bit in EESR) RFS0: CRC error on receive frame (corresponding to the CERF bit in EESR)
15 to 0	RCS[15:0]	All 0	R/W	Receive Packet Checksum Value in Intelligent Checksum

Table 26.3 RCSE State Determined by Receive Packet Type and Receive Data

Frame Type		Normal Data		Abnormal Data	
IP Version	Option and Extension Header	RCS[15:0]	RCSE	RCS[15:0]	RCSE

Other than IPv4 or IPv6		H'0000	0	H'0000	0

(b) Receive Descriptor 1 (RD1)

In RD1, the user specifies the data length of a receive buffer usable by the corresponding descriptor. After reception of a frame, RD1 indicates the length of a frame received by the E-DMAC.
The user should set RD1 before the start of a read by the E-DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	RBL [15:0]	All 0	R/W	Receive Buffer Data Length (in bytes, to be specified with a 32-byte boundary) These bits set the length of data that can be received by the corresponding receive buffer with an integral multiple of 32 bytes. The specifiable data lengths are from a minimum of 32 (H'0020) bytes to a maximum of 64 K - 32 (H'FFE0) bytes. Set the data length so that a receive frame can be stored in a single buffer. When the checksum function is disabled, any received frame can be stored in a single buffer if the setting is for 1514 bytes (the maximum length of an Ethernet frame) or more. When the checksum function is enabled, any received frame can be stored in a single buffer if the setting is for 1516 bytes (the maximum length of an Ethernet frame + checksum data) or more.
15 to 0	RDL [15:0]	All 0	R	Receive Data Length These bits indicate the data length of a receive frame stored in the receive buffer. Receive data transferred to the receive buffer does not include CRC data (4 bytes) placed at the end of a frame. Accordingly, these bits indicate the number of bytes (valid data bytes), excluding the CRC code, as the data length of the received frame. When the checksum function is enabled, they indicate the number of bytes including the checksum value (2 bytes) as the data length. In single-frame/multi-buffer (descriptor) operation, only the receive data length of the last descriptor is valid. The receive data length of an intermediate descriptor has no meaning. The maximum frame length that can be received is: When padding function is invalid: 64 Kbytes between 1 byte (H'FFFF) When padding function is valid: 64 Kbytes between 32 bytes (H'FFE0)

(c) Receive Descriptor 2 (RD2)

RD2 indicates the start address of the corresponding receive buffer. Set the start address of a receive buffer with a 32-byte boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RBA [31:0]	All 0	R/W	Receive Buffer Start Address These bits set the start address of the corresponding receive buffer with a 32-byte boundary.

The E-DMAC performs DMA transfer for a receive frame from the address specified by RBA (receive buffer address) to the receive buffer in 32-byte units. RBL (receive buffer length) must be set to be an integral multiple of 32 bytes.
If data to be transferred is less than 32 bytes, invalid data will be written to.
[Example]
When the receive frame length is 170 bytes and the required receive buffer capacity is 192 bytes (32 bytes × 6), the sixth DMA-transfer causes invalid data to be written to the receive buffer (In the 32-byte DMA data, the former 10 bytes are valid and the latter 22 bytes are invalid).
Padding of the value 0 can be inserted into only one position in the receive frame by setting RPADIR. The padding size can be selected from 1 byte to 31 bytes in byte units. When padding is inserted into a receive frame, a receive buffer area equal to the total of "receive frame length and padding size" is required. RPADIR setting is valid for all receive frames.
RFE (receive frame error occurrence), PV (padding insertion), RFS (receive frame status) and RFS (receive frame status) are only set in the receive descriptor including information for the end of the frame (TFP = 01 or 11) by a write-back

operation.
Before re-setting a receive descriptor with the software, completion of a write-back operation for the receive descriptor (RACT = 0) must be confirmed to avoid rewriting to (and re-setting) an unprocessed receive descriptor.

(3) Descriptor and Transmit/Receive Buffer

(a) Transmission

Each transmit descriptor specifies one transmit buffer. The E-DMAC transfers a transmit frame stored in a transmit buffer specified by a transmit descriptor to the transmit FIFO. Multiple transmit frames stored in transmit buffers specified by multiple descriptors can be connected into one transmit frame and transferred to the transmit FIFO.
Figure 26.5 shows the relationship between the transmit descriptors and transmit buffers.

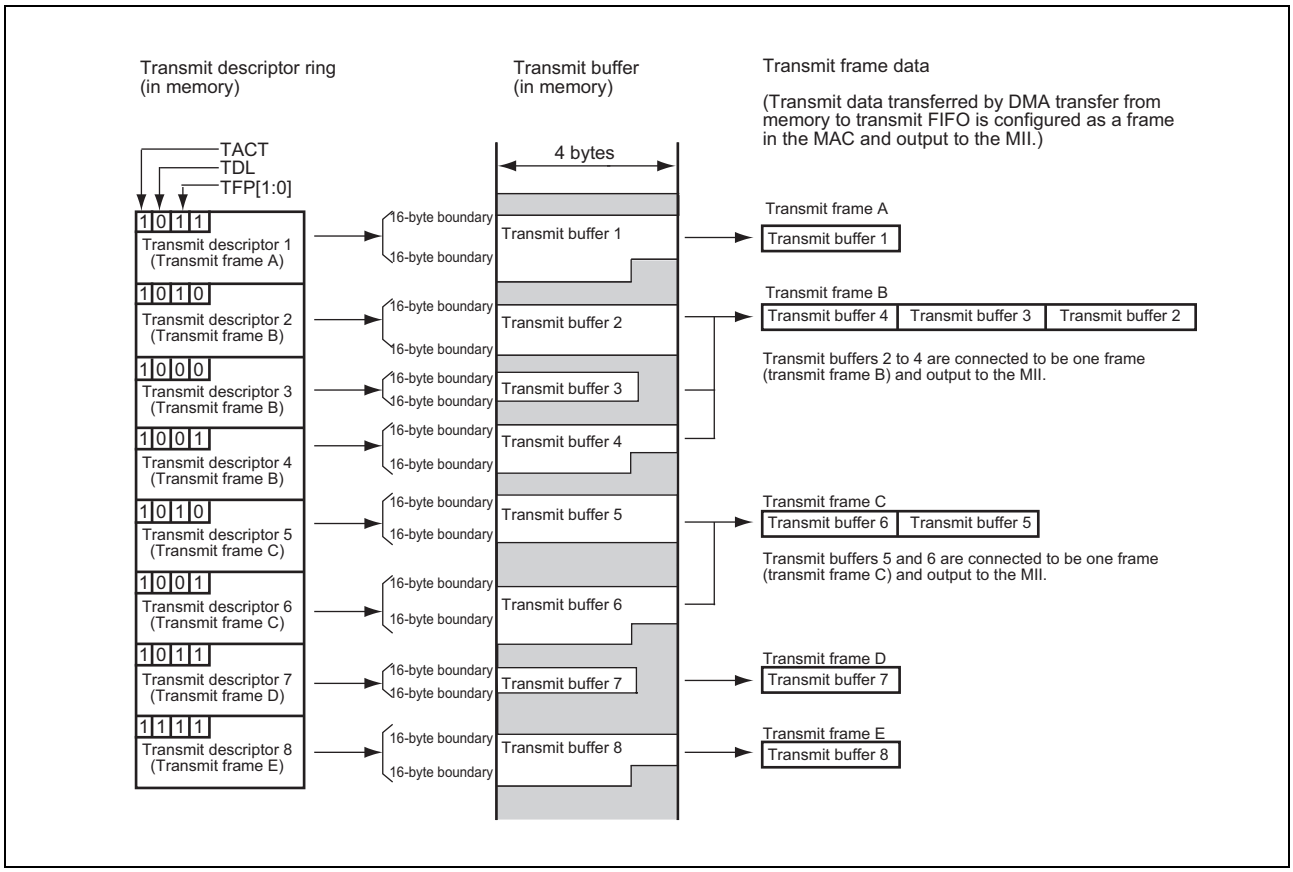

Figure 26.5 Relationship between Transmit Descriptor and Transmit Buffer

(b) Reception

Each receive descriptor specifies one receive buffer. The E-DMAC receives a receive frame from the receive FIFO and stores it in a receive buffer specified by a receive descriptor.

Figure 26.6 shows the relationship between the receive descriptors and receive buffers.

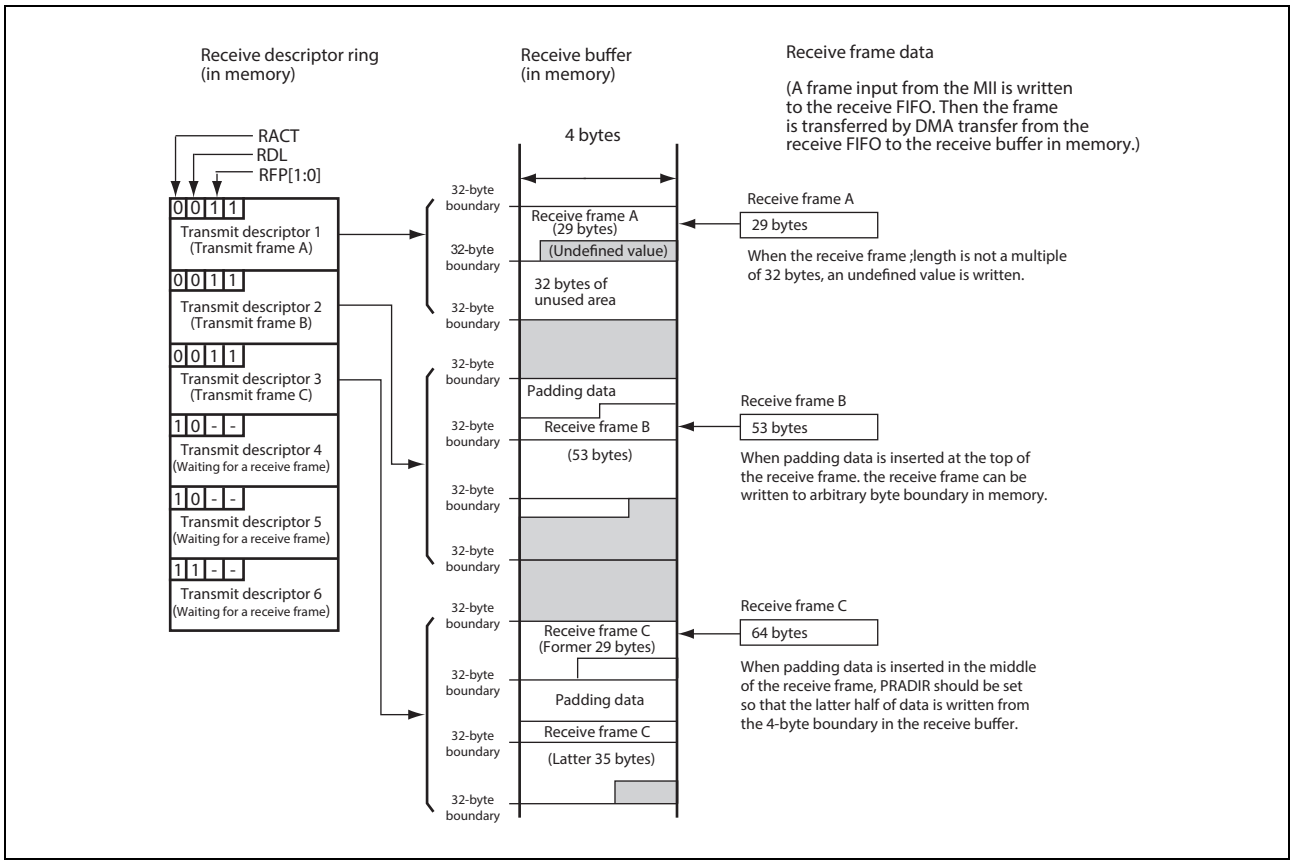

Figure 26.6 Relationship between Receive Descriptor and Receive Buffer

(4) Descriptor Pointer

The E-DMAC controls the transmit and receive descriptor addresses in memory and the processing priority by using the following registers.

1. Registers related to a transmit descriptor

- TDLAR: Address of the start descriptor in a list of transmit descriptors.
- TDFAR: Address of the transmit descriptor to be processed
- TDFXR: Address of the transmit descriptor that finished processing (set by a write-back operation) last
- TDFFR (DL bit): Indicates whether the TDLE value of the transmit descriptor specified by TDFXR is 1 or not.

2. Registers related to receive descriptor:

- RDLAR: Address of the start descriptor in a list of receive descriptors.
- RDFAR: Address of the receive descriptor to be processed
- RDFXR: Address of the receive descriptor that finished processing (set by a write-back operation) last
- RDFFR (DL bit): Indicates whether the RDLE value of the receive descriptor specified by RDFXR is 1 or not.

Transmit descriptors and receive descriptors have a ring structure. When the TDLE (RDLE) value of the processed transmit (receive) descriptor is 0, the next descriptor will be processed. The next descriptor is the transmit (receive) descriptor at the address obtained by adding the processed transmit (receive) descriptor address to the descriptor length specified by the DL bits in EDMR. When the TDLE (RDLE) value of the processed transmit (receive) descriptor is 1, the transmit descriptor indicated by TDLAR (RDLAR) will be processed next. Figure 26.7 shows the relationship between the transmit/receive descriptor ring and read pointer.

The transmit descriptor list must be large enough to point to five or more transmit frames. If four or less transmit frames are pointed to in a list, E-DMAC operation is not guaranteed. Accordingly, do not set that all the transmit descriptors in a ring are used by four or less descriptors. The receive descriptor list does not have this restriction. For example, one receive frame can use all receive descriptors in a list.

In the initial setting, the start address of a descriptor list must be set to TDLAR (RDLAR) and TDFAR (RDFAR), and the end descriptor address of the descriptor list to TDFXR (RDFXR) by the software.

The E-DMAC updates TDFAR (RDFAR), TDFXR (RDFXR), and the DL bit in TDFFR (DL bit in RDFFR) each time a descriptor is processed.

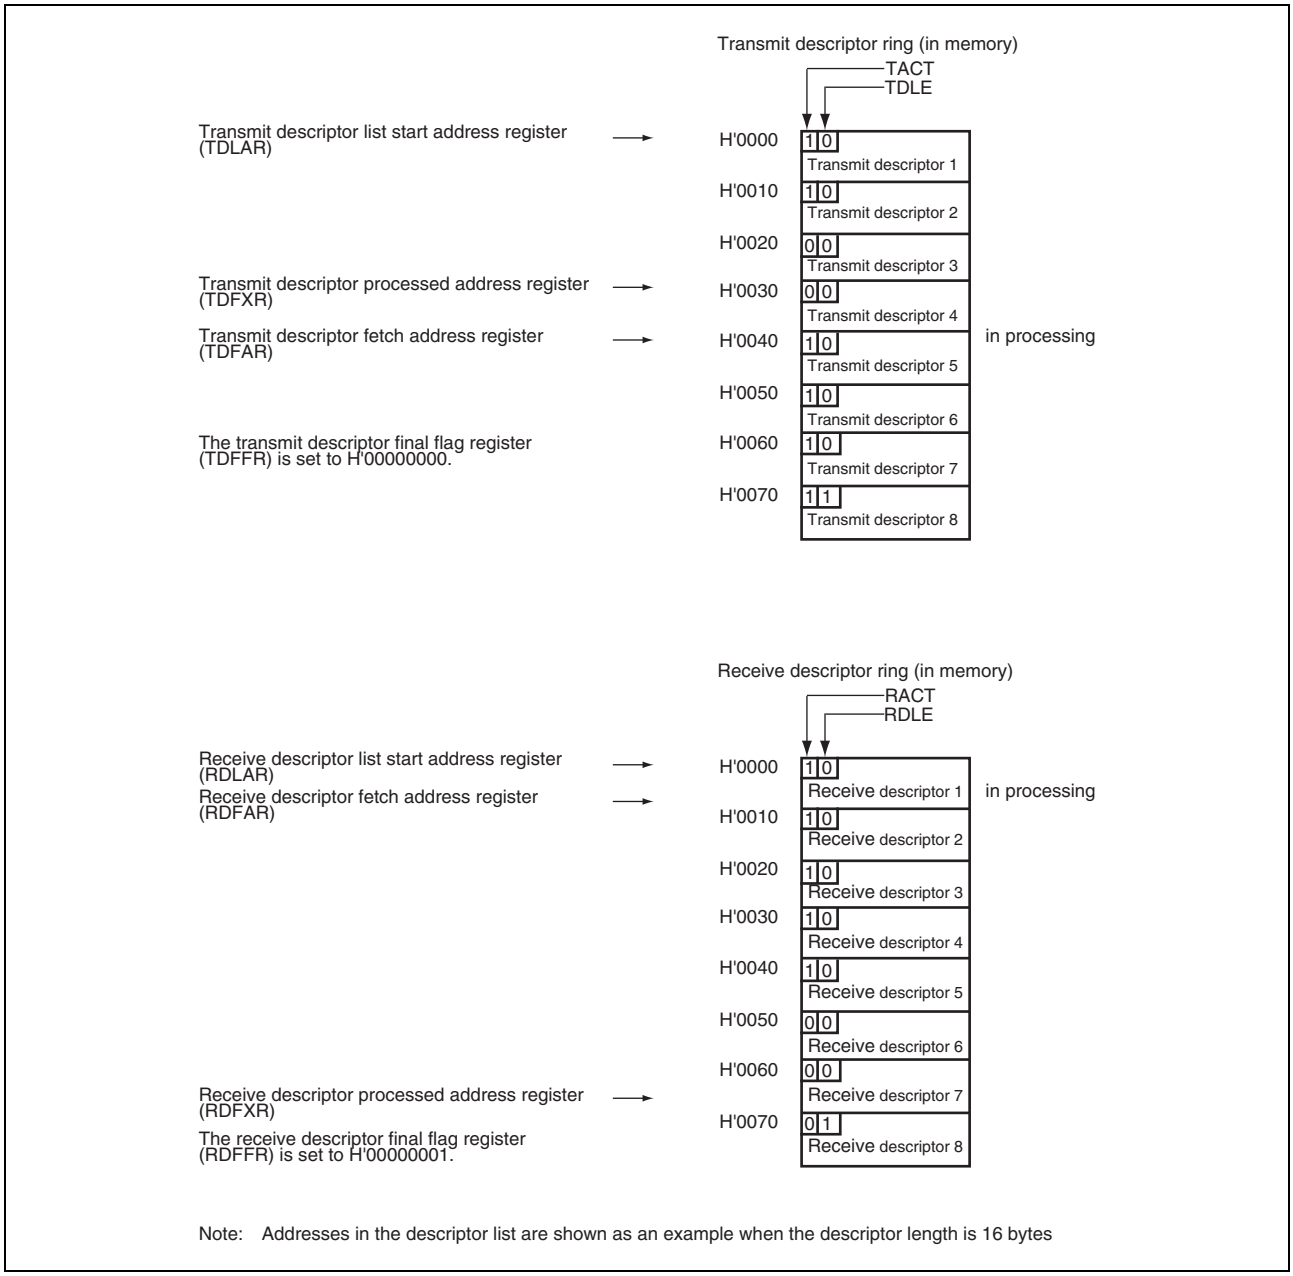

Figure 26.7 Relationship between Transmit/Receive Descriptor and Descriptor Pointing Registers

26.4.2 Transmission

(1) Transmission Procedure and Processing Flow

When 11 is written to the TR bits in EDTRR with the TE bit in ECMR set to 1 and there is empty space of 32 bytes or more in the transmit FIFO, the E-DMAC reads the descriptor following the previously used descriptor from the transmit descriptor list (or the descriptor indicated by TDLAR at the initial startup).
If the TACT bit of the read descriptor is set to 1 (valid), the E-DMAC sequentially reads transmit frame data from the transmit buffer start address specified by TD2 and transfers the data to the transmit FIFO. The E-DMAC configures a transmit frame and starts transmission to the MII. After DMA transfer of data equivalent to the buffer length specified in the descriptor, the following processing is carried out according to the TFP value.

- TFP = 10 (start of a frame)
  Descriptor write-back (writing 0 to the TACT bit) is performed after completion of DMA transfer.
- TFP = 01 or 11 (end of a frame)
  Descriptor write-back (writing 0 to the TACT bit and writing status) is performed after completion of frame transmission.
- TFP = 00 (frame continued)
  Descriptor write-back is not performed. The TACT bit retains the value 1.

As long as the TACT bit of a read descriptor is set to 1 (valid), the reading of E-DMAC descriptors and the transmission of frames continue.
When a descriptor with the TACT bit cleared to 0 (invalid) is read, the E-DMAC performs the following processing and completes transmit processing.

- Clears the TR bits in EDTRR to 00.
- Writes the TC bits in EESR to 11 and generates an interrupt to the CPU.

The E-DMAC can store up to four frames of data in the transmit FIFO.
When the following conditions are satisfied, the E-MAC transmit processing section reads transmit data from the transmit FIFO to configure a frame and transmits the frame to the MII

- The amount of data in the transmit FIFO exceeds the number of bytes specified by TFTR.
- One or more frame of data is stored in the transmit FIFO.
- The transmit FIFO has no space (full of transmit wait data for the MII).

Figure 26.8 shows an example of transmission flow.

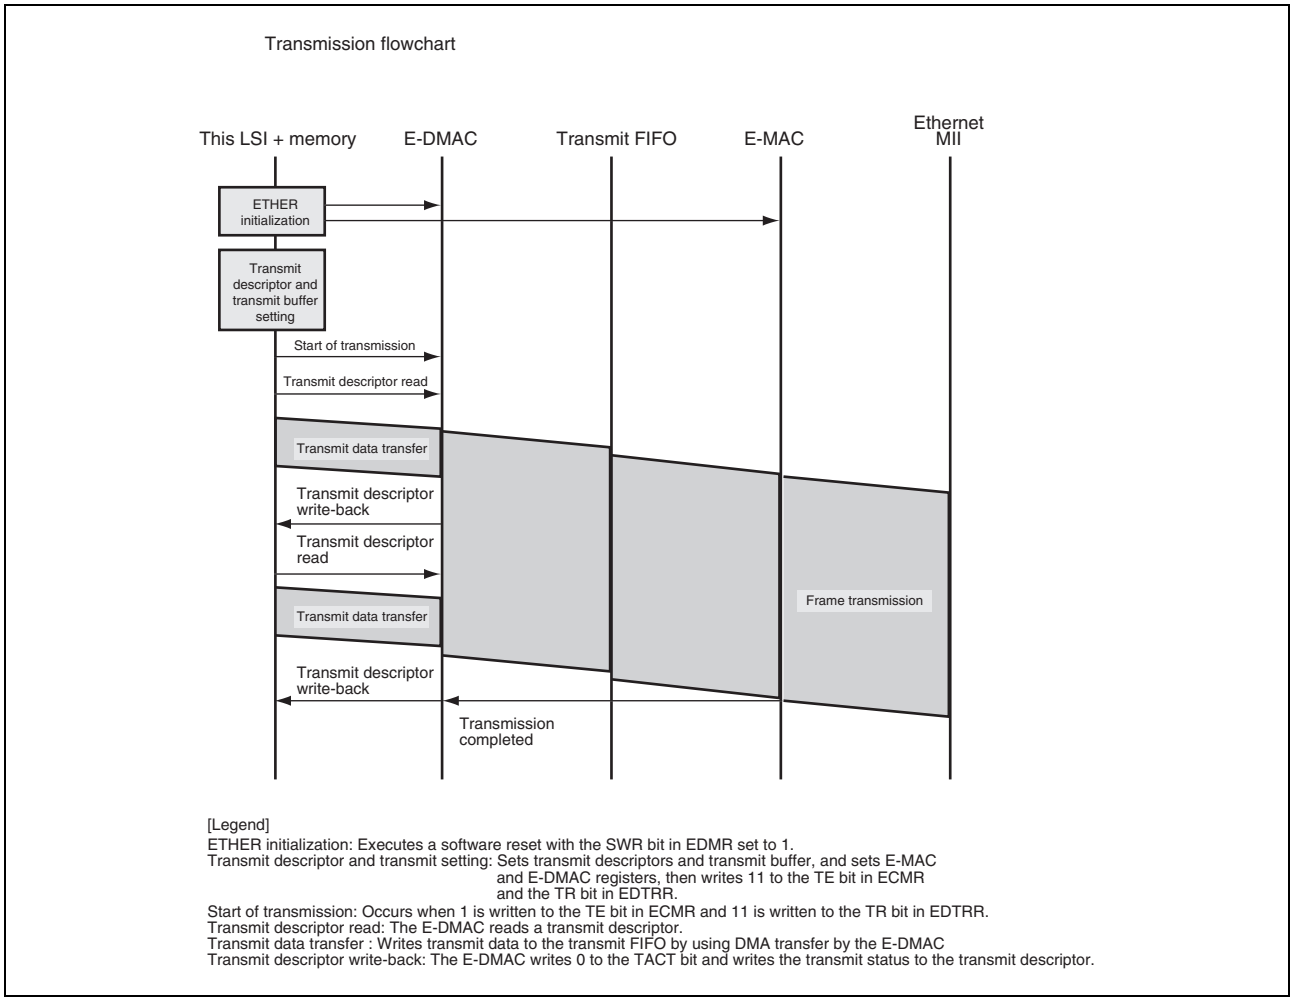

Figure 26.8 Sample Transmission Flowchart (Single-Frame/Two-Description)

Figure 26.9 shows the status change of the E-MAC transmitter.

1. When the TE bit in ECMR is set, the transmitter enters the transmit idle state.
2. The preamble is sent as soon as a transmit request is issued by the E-DMAC.
3. The transmitter sends the SFD, data, and CRC sequentially. At the end of transmission, the transmit E-DMAC generates a transmission complete interrupt (TC).
4. After waiting for the frame interval time, the transmitter enters the idle state, and if there is more transmit data, continues transmitting.

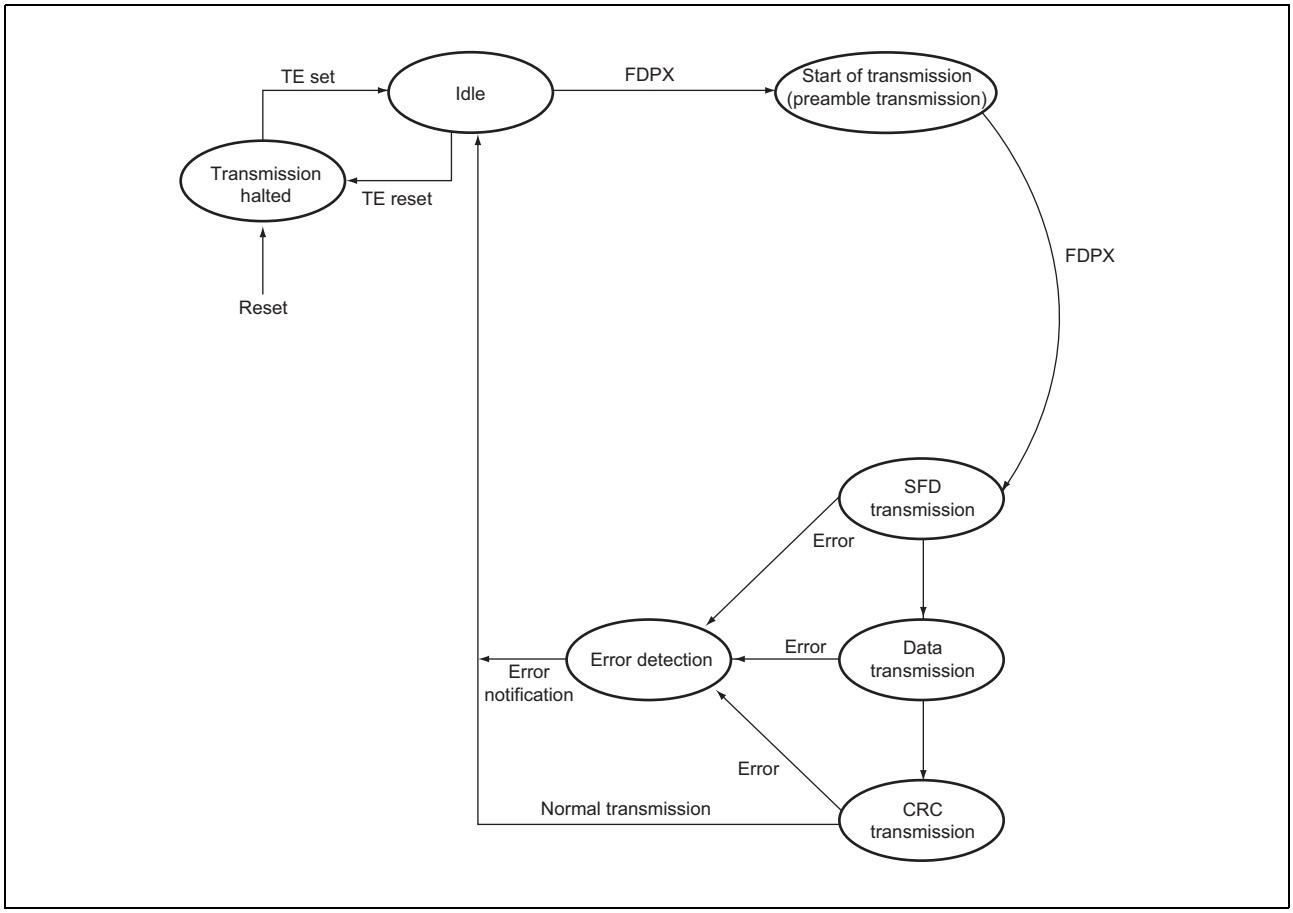

Figure 26.9 E-MAC Transmitter State Transitions

(2) Transmission Error Processing

(a) Transmission Abort

If a transmission error is detected during frame transmission from the transmit FIFO to the MII, transmission of the frame data is aborted. At this time, if DMA transfer of the appropriate frame from the transmit buffer to the transmit FIFO has not been completed, the DMA transfer is also aborted.
Following a write-back operation to the transmit descriptor related to the transmit frame aborted by a transmission error, 1 is written to the TABT bit in EESR and an interrupt is issued to the CPU. The subsequent transmit descriptors will be processed normally.

(b) Transmit FIFO Underflow

If the transmit FIFO is empty (transmit FIFO underflow) during frame transmission from the transmit FIFO to the MII, the E-MAC forcibly aborts transmission of the frame to the MII. At this time, the frame that the E-MAC receives from the E-DMAC is cut off halfway. Then, the E-MAC performs the following operation:

- Writes the TFUF bit in EESR to 1 and generates an interrupt to the CPU.
- Performs a write-back operation to the transmit descriptor corresponding to the transmit frame.
- Following the write-back operation, writes the TUC bit in EESR and generates an interrupt to the CPU.

The subsequent transmit descriptors operate normally.
The E-MAC waits to start frame transmission from the transmit FIFO to the MII until the data that was stored in the transmit FIFO exceeds the number of the bytes specified by TFTR. Through the effective use of TFTR, the transmit FIFO underflow counts can be controlled.

(c) Transmit Descriptor Empty

When the TFP bits of the descriptor previously processed are set to 00 or 10 and the TACT bit of the read transmit descriptor is set to 0 (invalid), a transmit descriptor empty state is determined and 1 is written to the TDE bit in EESR, and then an interrupt is issued to the CPU.
When a transmit descriptor state is empty, start transmission processing after a software reset.

26.4.3 Reception

(1) Reception Procedure and Processing Flow

The E-MAC receiver separates the frame from the MII into preamble, SFD, data and CRC, and transfers the fields from DA (destination address) to the data to the receive FIFO. Up to 24 frames can be written in the receive FIFO. Figure 26.10 shows the status change of the E-MAC receiver.

1. When the RE bit in ECMR is set to 1, the receiver enters the receive idle state.
2. When an SFD (start frame delimiter) is detected after a receive packet preamble, the receiver starts receive processing. A frame with an invalid pattern is discarded.
3. In normal mode, if the destination of the frame address is this LSI, the receiver starts data reception when broadcast or multicast transmission is specified. In promiscuous mode, data reception starts regardless of the frame type.
4. Following data reception from the MII, the receiver carries out a CRC check. The result is indicated as a status bit in the descriptor after the frame data has been written to the receive FIFO. Reports an error status in the case of an abnormality.

After one frame has been received, if the RE bit in ECMR is set to 1, the receiver prepares to receive the next frame.

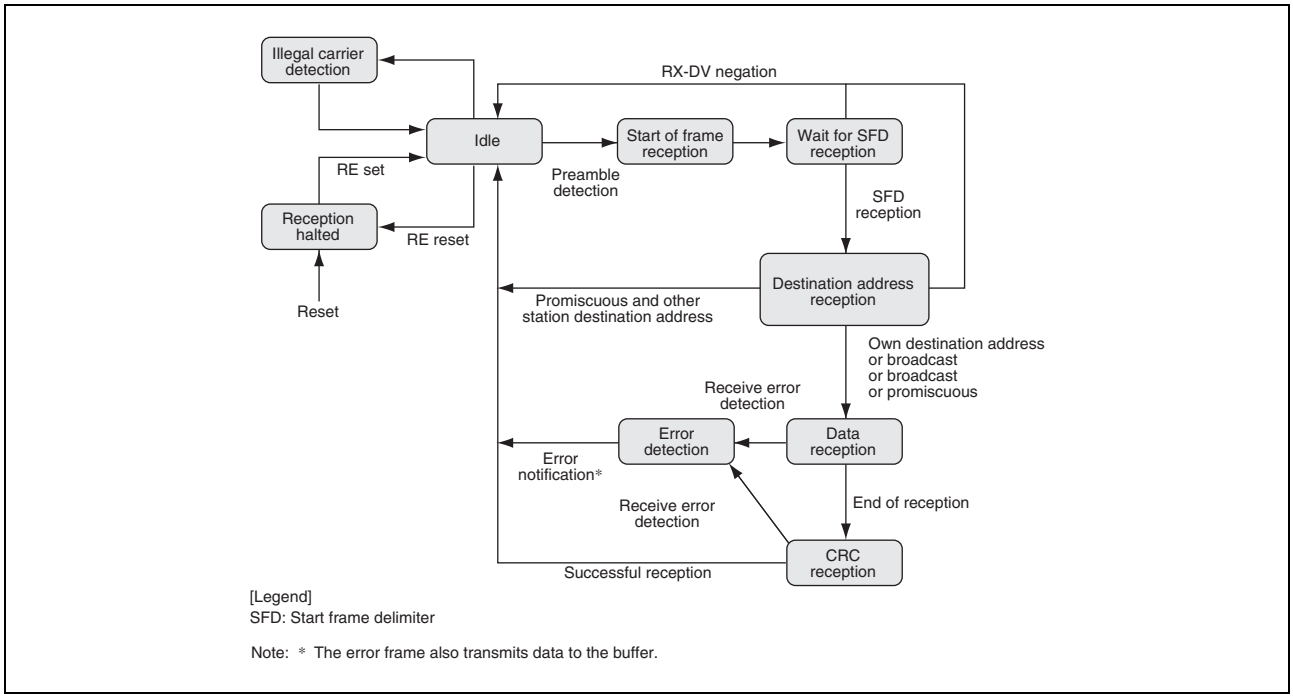

Figure 26.10 E-MAC Receiver State Transitions

CAM evaluation can be referenced during frame processing in reception (for details on the CAM function, refer to section 26.4.4, CAM Function).

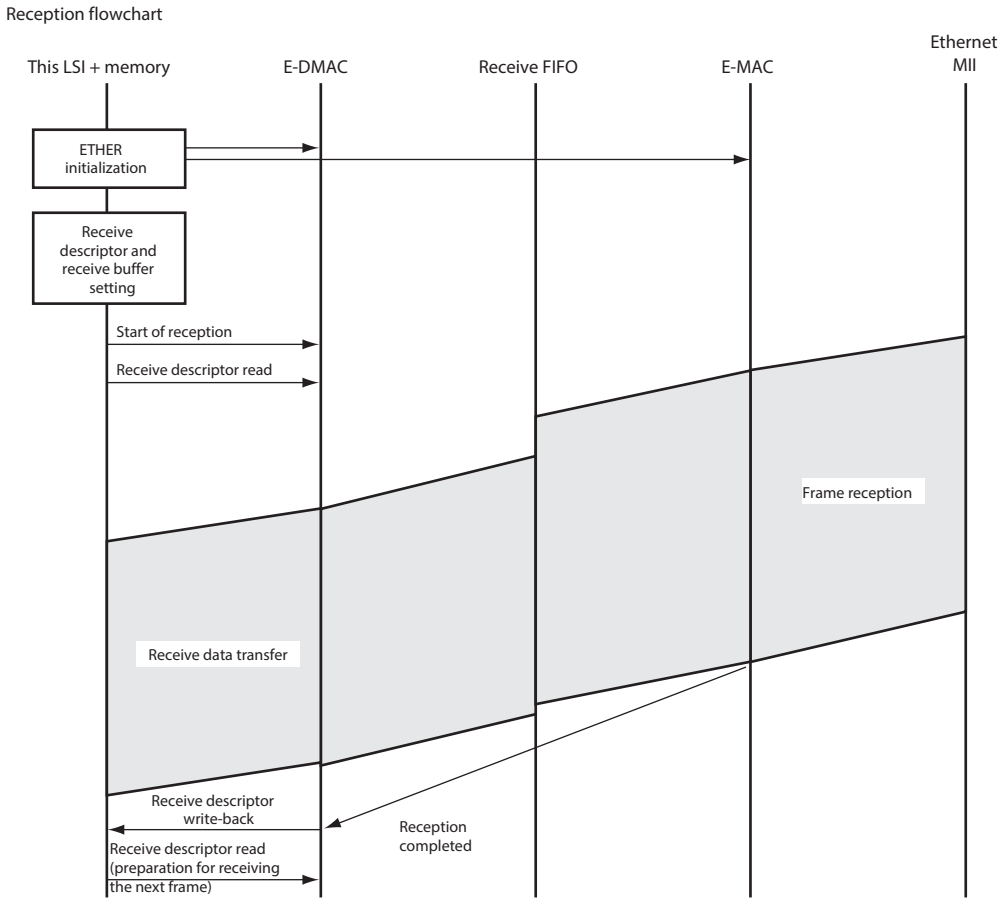
When 1 is written to the RR bit in EDRRR while the RE bit in ECMR is set to 1, the E-DMAC reads the descriptor following the previously used descriptor from the receive descriptor list (or the descriptor indicated by RDLAR at the initial startup) then enters the receive wait state. If 32 bytes or more of data or the last byte of the receive frame is stored in the receive FIFO, the E-DMAC transfers receive FIFO data to the receive buffer specified by RD2 according to the receive descriptor with the RACT bit set to 1 (valid).

If the data length of a received frame is longer than the buffer length specified by RD1, the E-DMAC performs a write-back operation to the descriptor (set RFP to 10 or 00) when the buffer is full, then reads the next descriptor. The E-DMAC then continues to transfer data to the receive buffer specified by the new RD2.

When the following conditions are satisfied, a write-back operation is performed for the descriptor (RFP = 11 or 01), 11 is written to the FR bits in EESR, and an interrupt is issued to the CPU.

- The receive buffer has been full during DMA transfer.
- DMA transfer to the receive buffer of the last byte of the receive frame has been completed.

After the reception processing of the frame, the next descriptor reading standby state begins. At this time, if 32 bytes or more of data or the last byte of the receive frame is stored in the receive FIFO, the next receive descriptor process is performed continuously.
When the TACT bit of the read receive descriptor is 0 (invalid), the receive descriptor empty state is determined and the RDE bit in EESR is written to 1, and then an interrupt is issued to the CPU.
To receive frames continuously, set the RNC bit in RMCR to 1. The initial value is 0.
Figure 26.11 shows an example of reception flow.



[Legend]

ETHER initialization:	Executes a software reset with the SWR bit in EDMR set to 1.
Receive descriptor and receive buffer setting:	Sets receive descriptors and receive buffers, and sets E-MAC and E-DMAC registers, then writes 1 to the RE bit in ECMR and the RR bit in EDRRR.
Start of Reception:	Occurs when 1 is written to the RE bit in ECMR and the RR bit in EDRRR.
Receive descriptor read:	The E-DMAC reads a receive descriptor.
Receive data transfer:	Writes receive data from the receive FIFO to the receive buffer by using DMA transfer by the E-DMAC.
Receive descriptor write-back:	The E-DMAC writes 0 to the RACT bit and writes the receive status to the receive descriptor

Figure 26.11 Sample Reception Flowchart (Single-Frame/Single-Descriptor)

(2) Reception Error Processing

(a) Reception Error

When a reception error occurs, the FR and RABT bits in EESR are set to 1 and an interrupt is issued to the CPU after a write-back operation for the receive descriptor related to the reception error frame.
If a reception error occurs when the length of the frame received from the MII is less than 32 bytes, DMA transfer to the receive buffer for the frame is not performed. At this time, the receive frame is discarded in the E-DMAC (flush function). However, if padding is inserted in the receive frame by RPADIR, the flush function is performed when the frame length including the padding bytes is less than 32 bytes.

(b) Receive FIFO Overflow

In any of the following cases, the E-MAC cannot receive frames from the MII because it has no space to store receive frames, and all the receive frames that have been transferred to the E-MAC will be discarded in the E-MAC (receive FIFO overflow).

- Receive FIFO is full of data waiting for DMA transfer (the receive FIFO has no space).
- The number of receive frames waiting for DMA transfer is 24 in total (the receive frame information managing area has no empty space; up to 24 frames can be managed).

If an overflow occurs due to the former case, the RFOF bit in EESR is set to 1 and an interrupt is generated to the CPU.
If an overflow occurs due to the latter case, the RFCOF bit in EESR is set to 1 and an interrupt is generated to the CPU.
Each time a receive frame is discarded due to an overflow, RMFCR is incremented. However, RMFCR is not incremented for a receive frame that is cut off due to insufficient receive FIFO space. If a receive frame is cut off due to insufficient receive FIFO space (the frame is partially stored in the receive FIFO), the E-DMAC performs the following operation:

- Performs DMA transfers for the cut-off frame stored in the receive FIFO to the receive buffer.
- After the DMA transfer, performs a write-back operation on the receive descriptor.
- After the write-back operation, sets the ROC bit in EESR to 1 and generates an interrupt to the CPU.

When the receive FIFO is full of data waiting for DMA transfer, frame reception from the MII can be resumed if DMA transfer is performed from the receive FIFO to the receive buffer and 32 bytes or more of empty space is generated in the receive FIFO. When the number of receive frames waiting for DMA transfer is 24 in total, frame reception from the MII can be resumed if one or more frame has been DMA transferred from the receive FIFO to the receive buffer. For restarting frame reception from the MII, when the E-DMAC resumes frame reception from the MII, it only accepts from the start of the frame.

(c) Flow Control

When the amount of receive data or the number of receive frames in the receive FIFO leads to one of the following conditions, the E-DMAC notifies the E-MAC to control E-MAC writing to the receive FIFO.

- When the space used in the receive FIFO exceeds the data amount specified by FCFTR
- When the number of receive frames in the receive FIFO exceeds the value specified by FCFTR

The threshold of the receive data amount can be set in a range from 256 to 65536 bytes in 256-byte units.
The threshold of receive frames can be set in a range from 1 to 24 frames (by the frame) in frame units.

(d) Receive Descriptor Empty

When the RACT bit of the read descriptor is 0 (invalid), the receive descriptor empty state is determined and DMA transfer is stopped. Then the following operation is performed.

- Writes the RR bit in EDRRR to 0
- Sets the RDE bit in EESR to 1 and generates an interrupt to the CPU.

To resume the DMA transfer to the receive buffer, the interrupt source needs to be cleared by software, the receive descriptor needs to be re-set and the RR bit in EDRRR should be set to 1.
Even if receive descriptor is empty, frame reception from the MII to the receive FIFO is continued if there is empty space left in the receive FIFO and receive frame information management area. Therefore, even if a receive descriptor empty state is determined, the DMA transfer can be performed without discarding the frames received from the MII if DMA transfer to the receive buffer can be resumed before an overflow occurs.

26.4.4 CAM Function

Frames input to the E-MAC are grouped into the following four types; unicast for this LSI, broadcast, multicast, and unicast to other destinations. The MAC addresses of unicast for this LSI and broadcast are fixed, and determined only by register settings. Consequently, only multicast and unicast to other destinations determine whether to receive or not by using the CAM (unicast frames whose destination MAC addresses match this LSI are called unicast frames to this LSI, and those that do not are called unicast frames to other destinations).
Furthermore, the evaluation of reception of unicast to other destinations and multicast frames by using CAM are performed by referencing the registered MAC addresses of the CAM entry table in the TSU. By using this function, receive FIFO overflow can be prevented caused by accumulation of frame data not required for reception, and CPU processing for determining reception can be reduced.
The on-chip CAM has entry tables which can register the MAC address of 32 entries, the details of which can be set by TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31. The setting to enable/disable referencing of the on-chip CAM entry table is performed by the CAM entry table enable setting register which sets whether to perform CAM evaluation or not. When on-chip CAM entry table referencing is enabled, the destination address in the frame and MAC address registered in the CAM entry table are compared, and it is determined whether to transfer the frames input to the E-MAC to E-DMAC (have E-DMAC receive the frames) or discard the frames. Table 26.4 shows the processing method of frames (receive or discard) in reception from E-MAC to E-DMAC.

Table 26.4 Receive Frame Processing

CAM Entry Table Referencing Results	Types of Frame	Normal Mode		Promiscuous Mode	
		MCT = 0	MCT = 1	MCT = 0	MCT = 1
CAM hit (when addresses match)	Frame to this LSI	Discarded		Discarded	
	Broadcast frame	Discarded		Discarded	
	Multicast frame	Discarded	Received	Discarded	Received
	Frames having destinations other than this LSI	Received		Discarded	
CAM mishit (when addresses do not match)	Frames to this LSI	Received		Received	
	Broadcast frame	Received		Received	
	Multicast frame	Received	Discarded	Received	Discarded
	Frames having destinations other than this LSI	Discarded		Received	

[Legend]
MCT (Bit 13 in ECMR): Multicast receive mode (0: Receive when CAM mishit/1: Receive when CAM hit)

26.4.5 Transmit Processing of Multi-Buffer Frame (Single-Frame/Multi-Descriptor)

(1) Multi-Buffer Frame Transmit Processing

If an error occurs during multi-buffer frame transmission, the processing shown in Figure 26.12 is carried out by the E-DMAC.

In the figure where the transmit descriptor is shown as inactive (TACT bit = 0), buffer data has already been transmitted successfully, and where the transmit descriptor is shown as active (TACT bit = 1), buffer data has not been transmitted. If a frame transmit error occurs in the first descriptor part where the transmit descriptor is active (TACT bit = 1), transmission is halted, and the TACT bit is cleared to 0, immediately. The next descriptor is then read, and the position within the transmit frame is determined on the basis of bits TFP1 and TFP0 (continuing [B′00] or end [B′01]). In the case of a continuing descriptor, the TACT bit is cleared to 0, and the next descriptor is read immediately. If the descriptor is the final descriptor, not only is the TACT bit cleared to 0, but write-back is also performed to the TFE and TFS bits at the same time. Data in the buffer is not transmitted between the occurrence of an error and write-back to the final descriptor. If error interrupts are enabled in EESIPR, an interrupt is generated immediately after the final descriptor write-back.

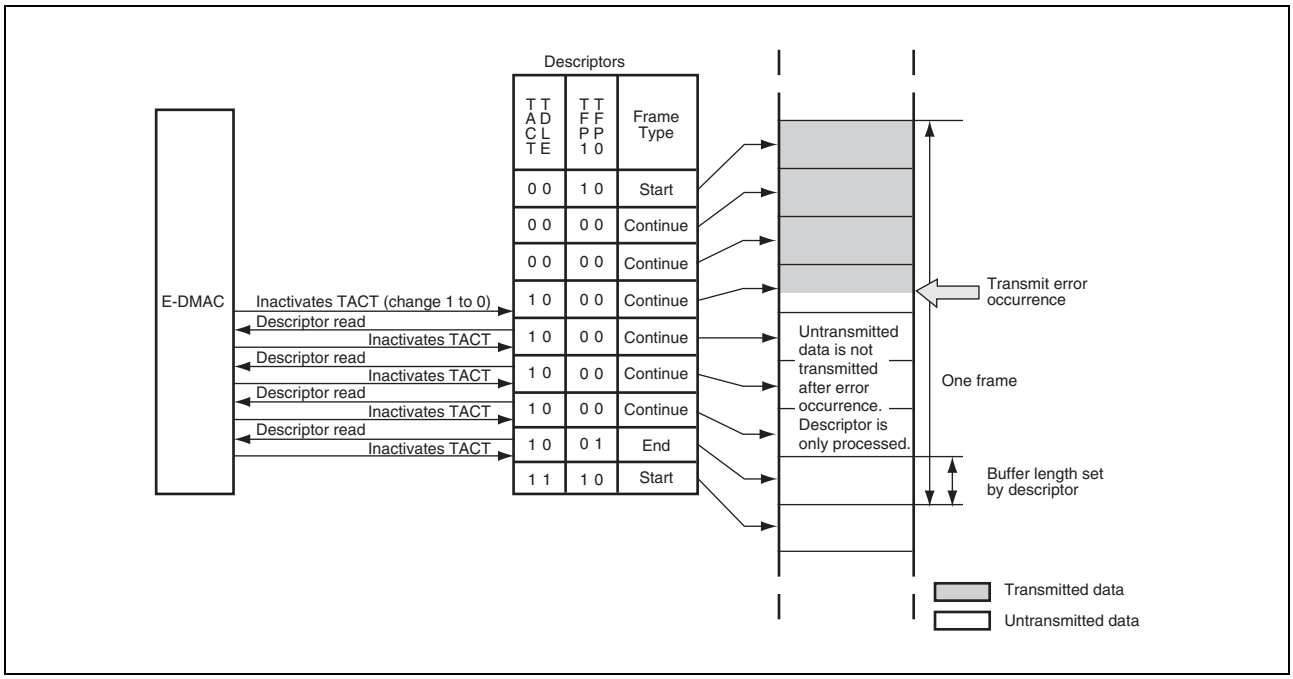


Figure 26.12 E-DMAC Operation after Transmit Error

26.4.6 Padding Insertion in Receive Data

In the E-DMAC, one to three bytes of padding can be inserted in any byte position of receive data to improve software handling capability. By using this function, for instance, inserting 2-byte padding after the MAC header (14 bytes) of Ethernet frame enables data following the MAC header to set in 4-byte boundary.

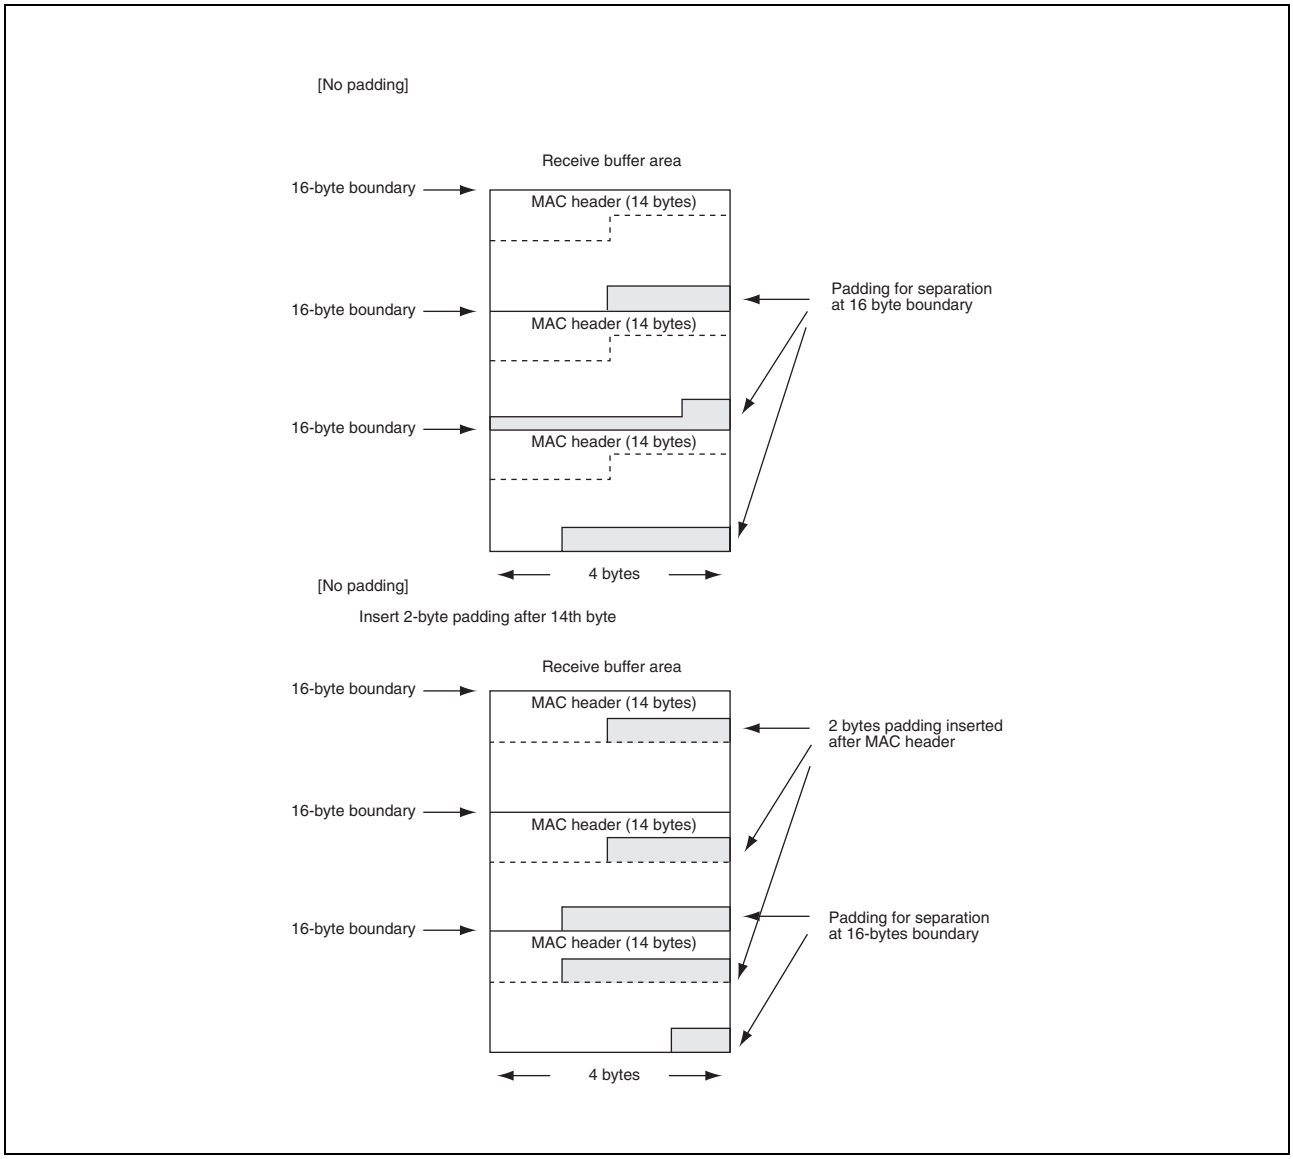

Figure 26.13 Padding Insertion in Receive Data

26.4.7 Interrupt Processing

(1) Interrupt Sources

The ETHER issues one type of interrupt to the CPU: receive/transmit interrupts (ETHERI).
ETHERI interrupts are generated in correspondence with the transmit/receive operation. When an interrupt source is generated, it is set in EESR0 and an interrupt is issued to the CPU. For some interrupt sources, the EESR0 setting and an interrupt to the CPU are performed after a write-back operation to a descriptor is completed, not immediately after the interrupt source is detected. Interrupt sources other than the E-MAC status register source (ECI bit) are cleared by writing a 1 to the corresponding source bit. The E-MAC status register source (ECI bit) is cleared by writing a 1 to the corresponding source bit in ECSR. Interrupt source bits retain the values until they are cleared. ETHERI interrupt source is allowed to issue interrupts by setting the corresponding bit in EESIPR0. Each E-MAC state register source (ECI bit) is allowed to issue an interrupt by setting the corresponding bit in ECSIPR. In the initial value, interrupts are disabled.
Table 26.5 shows these three interrupts, interrupt sources, interrupt status registers and bits set at interrupt occurrence and interrupt generation timing.

Table 26.5 List of ETHER Interrupts

Interrupt	Interrupt Source	Register and Bit	Interrupt Generation Timing
Transmit/ receive interrupt (ETHERI)	Write-back completed	EESR0.TWB	After write-back
	Transmit underflow frame write-back completed	EESR0.TUC	After write-back
	Receive underflow frame write-back completed	EESR0.ROC	After write-back
	Transmission abort detection	EESR0.TABT	After write-back
	Reception abort detection	EESR0.RABT	After write-back
	Receive frame counter overflow	EESR0.RFCOF	When the interrupt source is detected
	E-MAC status register source	EESR0.ECI	When the interrupt source is detected
	Frame transmission completed	EESR0.TC	After write-back
	Transmit descriptor empty	EESR0.TDE	When the interrupt source is detected
	Transmit FIFO underflow	EESR0.TFUF	When the interrupt source is detected
	Frame reception	EESR0.FR	After write-back
	Receive descriptor empty	EESR0.RDE	When the interrupt source is detected
	Receive FIFO overflow	EESR0.RFOF	When the interrupt source is detected
Transmit/ receive interrupt (ETHERI)	Receive Multicast Address Frame	EESR0.RMAF	After write-back
	Receive Residual-Bit Frame	EESR0.RRF	After write-back
	Receive Too-Long Frame	EESR0.RTLF	After write-back
	Receive Too-Short Frame	EESR0.RTSF	After write-back
	PHY-LSI Receive Error	EESR0.PRE	After write-back
	CRC Error on Received Frame	EESR0.CERF	After write-back

26.4.8 Activation Procedure

The ETHER should be activated by the following procedure:

(1) Reset

1. Perform a power-on reset.
2. Set the ET_TXCLK and ET_RXCLK pins and supply the clock signal (for details on pin function settings, see section 54, Ports).
3. Start the E-DMAC transmitter and receiver (activation of descriptor engine).
   —Set ENT to 1 and ENR to 1 in EDSR.
4. Perform a software reset.
   —Set SWRR to 1 and SWRT to 1 in EDMR simultaneously.
5. Initialize the descriptor entry table.
6. Confirm cancellation of the software reset.
   —Check that the SWRR and SWRT bits in EDMR are cleared to 0.

(2) Pin Settings

See section 54, Ports.

(3) Registration of Descriptor Ring

The address of a descriptor ring configured in memory is registered in the descriptor entry table.

1. Transmit descriptor setting
   —Set TDLAR.
   —Set TDFAR.
   —Set TDFXR.
   —Set TDFFR. When the descriptor indicated by TDFXR is the last descriptor in the descriptor list, set H'00000001.
2. Receive descriptor setting
   —Set RDLAR.
   —Set RDFAR.
   —Set RDFXR.
   —Set RDFFR. When the descriptor indicated by RDFXR is the last descriptor in the descriptor list, set H'00000001.

(4) Register Settings

The following registers should be set as necessary.

1. E-DMAC related registers
   —Set EDMR: Operating mode, etc.
   —Set EESIPR: Interrupt masks
   —Set TRSCER: Error masks
   —Set TFTR: Transmit FIFO threshold
   —Set FDR: External FIFO size
   —Set RMCR: Reset method for reception activation
   —Set RPADIR: Padding insertion into receive data
   —Set FCFTR: Receive BSY output threshold
2. E-MAC related registers
   —Set ECMR setting: Transmission/reception specifications
   —Set ECSIPR setting: Interrupt masks
   —Set MAHR: MAC address
   —Set MALR: MAC address

—Set RFLR: Maximum receive frame length
—Set APR: TIME parameter value of an automatic pause frame
—Set MPR: TIME parameter value of a manual PAUSE frame
—Set TPAUSER: Upper limit of automatic PAUSE frame retransmission

(5) Activation

1. Start the E-DMAC transmission/reception function
   —Set the TR bits in EDTRR to 11.
   —Set the RR bit in EDRRR to 1.
2. Start the E-MAC transmission/reception function
   —Set the TE and RE bits in ECMR to 1.

26.4.9 Flow Control

The ETHER supports flow control functions conforming to IEEE802.3x for full-duplex operation. The flow control can be applied to both receive and transmit operations. When transmitting PAUSE frames, flow control can be performed by the following two procedures:

(1) Automatic PAUSE Frame Transmission

For receive frames, PAUSE frames are automatically transmitted when the number of data written to the receive FIFO reaches the value set in FCFTR. The TIME parameter included in the PAUSE frame is set by APR. The automatic PAUSE frame transmission is repeated until the number of data in the receive FIFO becomes less than the value set in FCFTR as the receive data is read from the FIFO. Using TPAUSER, the upper limit of retransmission counts of the PAUSE frames can also be set in the range from 1 to 65535. In this case, PAUSE frame transmission is repeated until the number of receive FIFO data becomes less than the FCFTR value, or the number of transmits reaches the value set by TPAUSER. The transmission counter is cleared to 0 when the next PAUSE frame is transmitted after the number of data in the receive FIFO becomes less than the FCFTR value.
The automatic PAUSE frame transmission is enabled when the TXF bit in ECMR is 1.

(2) Manual PAUSE Frame Transmission

PAUSE frames are transmitted by directives from the software. When writing the Timer value to MPR, manual PAUSE frame transmission is started. With this method, PAUSE frame transmission is carried out only once.

(3) PAUSE Frame Reception

The next frame is not transmitted until the time indicated by the Timer value elapses after receiving a PAUSE frame. However, the transmission of the current frame is continued. A received PAUSE frame is valid only when the RXF bit in ECMR is set to 1. The number of times of PAUSE frame receptions is counted.

(4) 0-Time PAUSE Frame Control

Flow control is performed using a PAUSE frame with the TIME parameter value set to 0. The PAUSE frame with the TIME parameter set to 0 can be enabled or disabled by the ZPF bit in ECMR.

- When PAUSE frame control with the TIME parameter value set to 0 is enabled
  A PAUSE frame with the TIME parameter value set to 0 is transmitted when the number of data in the receive FIFO is less than the FCFTR value before the time indicated by the TIME parameter value has not elapsed. When a PAUSE frame with the time indicated by the TIME parameter value set to 0 is received, the transmit standby state is canceled.
- When PAUSE frame control with the TIME parameter value set to 0 is disabled
  A PAUSE frame with the TIME parameter value set to 0 is not transmitted. When a PAUSE frame with the TIME parameter value set to 0 is received, the PAUSE frame is discarded.

26.4.10 Intelligent Checksum Calculation Function

This function accelerates checksum calculation on received packets, and provides the following two modes.

- MAC/IP packet analyzing intelligent checksum calculation mode
- All-data intelligent checksum calculation mode with bytes to be skipped specified

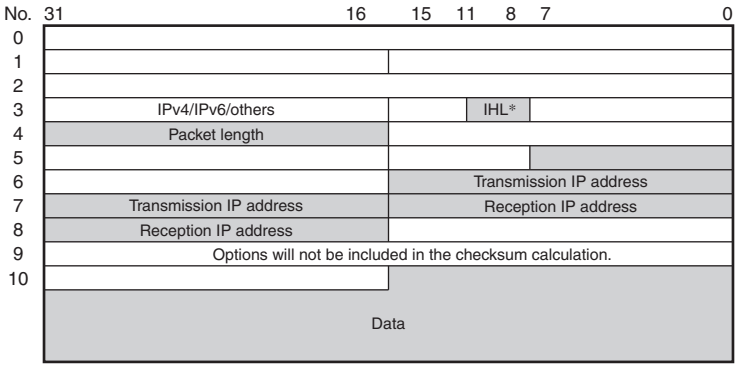
(1) MAC/IP Packet Analyzing Intelligent Checksum Calculation Mode (CSEBL = 1 and CSMD = 1 in CSMR)

In this mode, the checksum of received packets indicated in the table is calculated. However, if a MAC packet payload includes padding data in fields other than those for the IP packet itself because there is too little data for a full packet, it is not included in the checksum.

IPver	Items
IPv4	Option present
	Option not present
	Fragment*1
IPv6	Extension header not present
	Hop-by-hop options extension header length
	Routing extension header length
	Fragment extension header length*1
	Destination options header length
	AH extension header length
	ESP extension header length*2
	Extension header length for mobile IPv6*2

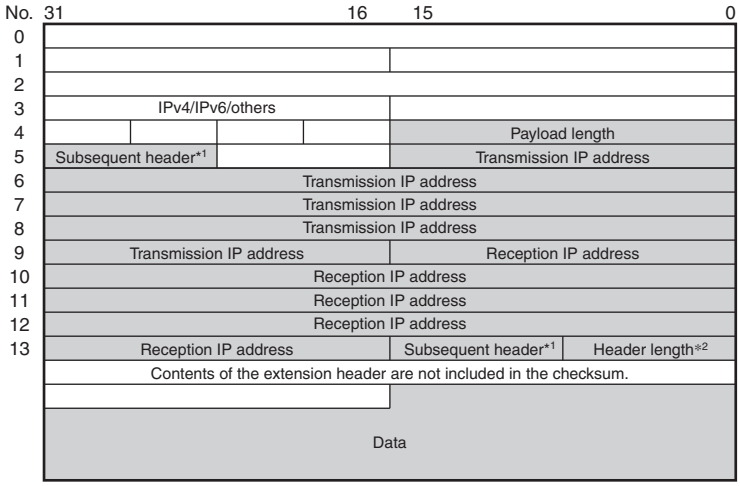
Note 1. This packet is to be checksumed, however, the RCS[15:0] bits and RCSE bit in RD0 are to be undefined even if the data is successfully received.
Note 2. The RD0.RCSE bit is set to 1 without calculating the value of the RD0.RCS[15:0] bits.

The shaded regions of the following figure indicate the parts of an IPv4 packet which are used to obtain the checksum.



Note: * After conversion to octet units, this is subtracted in the checksum calculation.
In the calculation: {8'h00, protocol no.[7:0]}

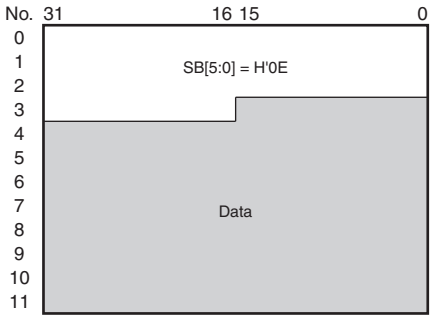
The shaded regions of the following figure indicate the parts of an IPv6 packet which are used to obtain the checksum.



Notes: *1 Only included in the checksum when the header is for the TCP or UDP. Calculation coverage is extended to {8'h00, protocol No.[7:0]} when the checksum is taken.
*2 After conversion to octet units, this is subtracted in the checksum calculation.

(2) All-Data Intelligent Checksum Calculation Mode with Bytes to be Skipped Specified (CSELB = 1 and CSMD = 0 in CSMR)

After having skipped the number of bytes specified in the SB[5:0] bits in CSMR, counting from the beginning of the packet, the checksum is calculated for all subsequent data (e.g. 14 bytes may be skipped).



26.5 Connection to PHY-LSI

26.5.1 MII Frame Transmission/Reception Timing

Each MII frame transmission/reception timing is shown in Figure 26.14 to Figure 26.17.

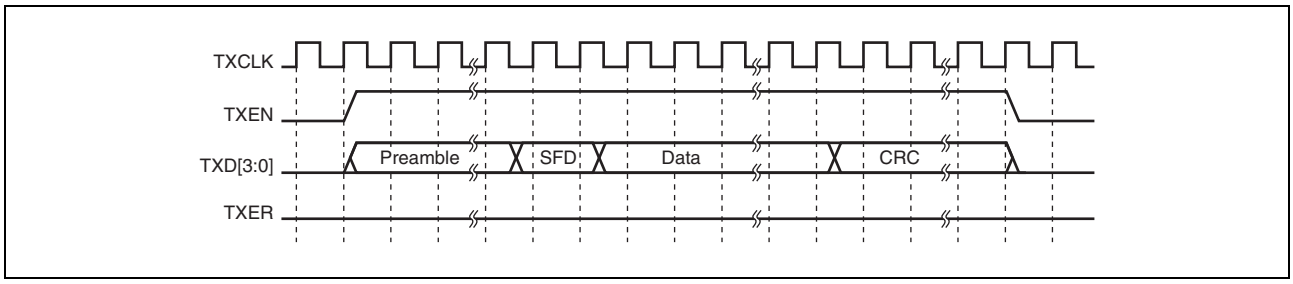


Figure 26.14 MII Frame Transmit Timing (Normal Transmission)

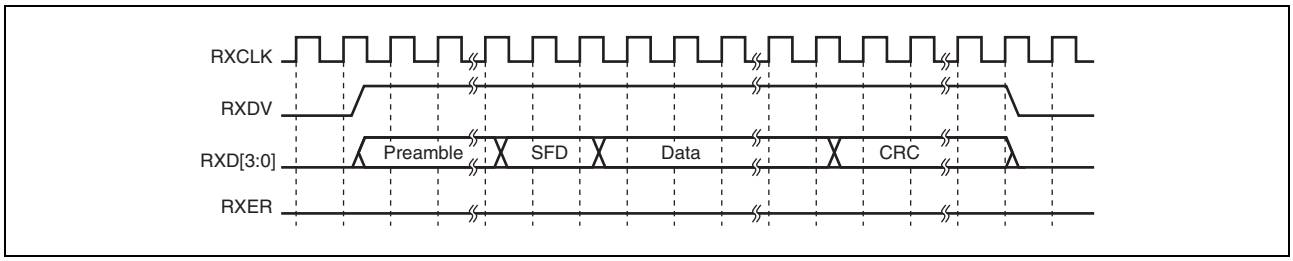

Figure 26.15 MII Frame Receive Timing (Normal Reception)

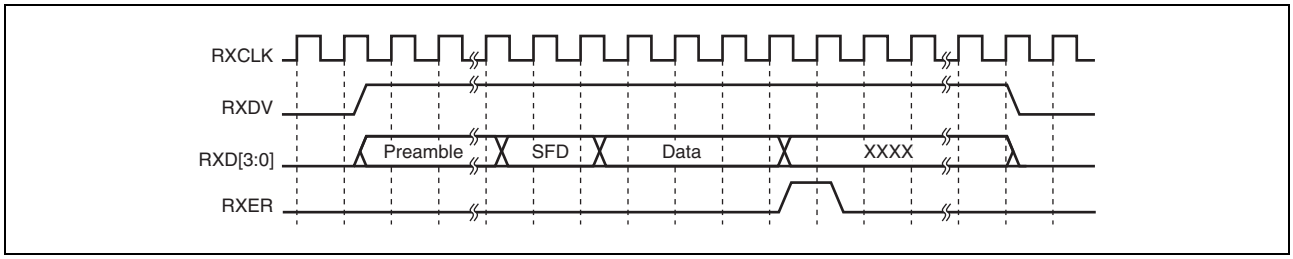

Figure 26.16 MII Frame Receive Timing (Reception Error (1))

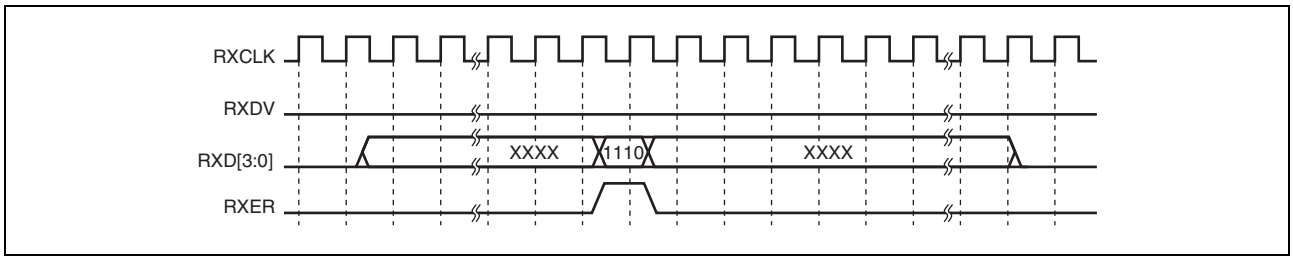

Figure 26.17 MII Frame Receive Timing (Reception Error (2))

26.5.2 Accessing MII Registers

MII registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

(1) MII Management Frame Format

Figure 26.18 shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in MII Register Access Procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0	D..D	
Write	1..1	01	01	00001	RRRRR	10	D..D	X

[Legend]

PRE: 32 consecutive 1s
ST: Write of 01 indicating start of frame
OP: Write of code indicating access type
PHYAD: Write of 0001 if the PHY-LSI address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI address.
REGAD: Write of 000q if the register address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI register address.
TA: Time for switching data transmission source on MII interface
(a) Write: 10 written
(b) Read: Bus release (notation: Z0) performed
DATA: 16-bit data. Sequential write or read from MSB
(a) Write: 16-bit data write
(b) Read: 16-bit data read
IDLE: Wait time until next MII management format input
(a) Write: Independent bus release (notation: X) performed
(d) Read: Bus already released in TA: control unnecessary

Figure 26.18 MII Management Frame Format

(2) MII Register Access Procedure

The program accesses MII registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. Figure 26.19 (1) to Figure 26.19 (4) show the MII register access timing. The timing will differ depending on the PHY-LSI type.

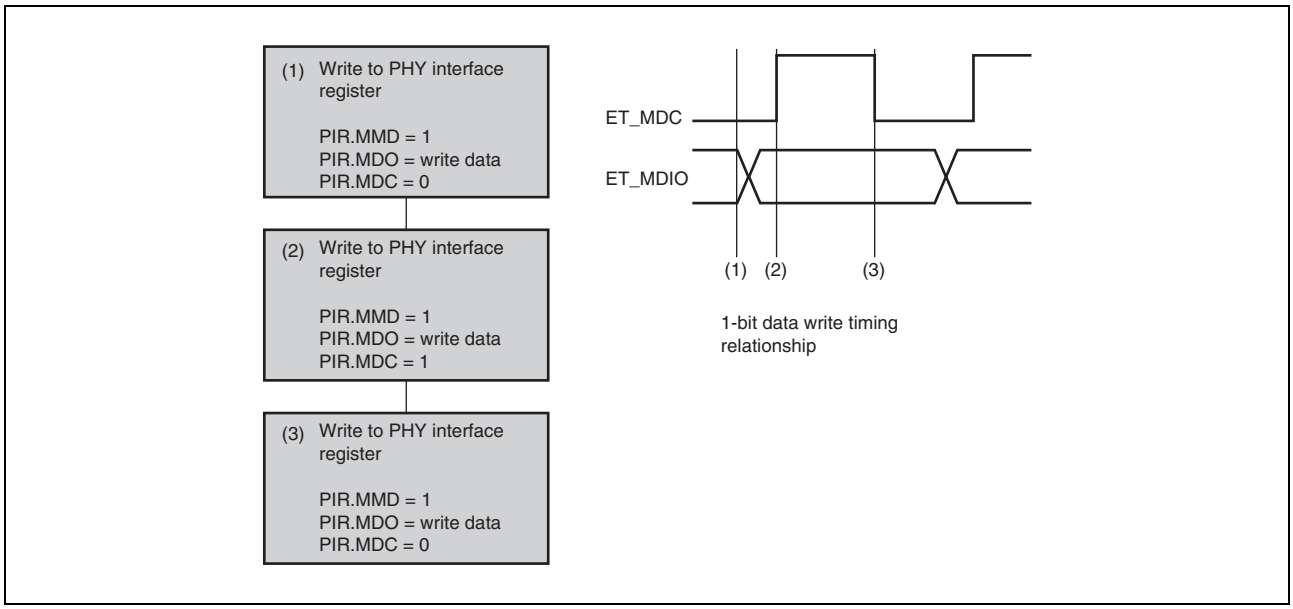

Figure 26.19 (1) 1-Bit Data Write Flowchart

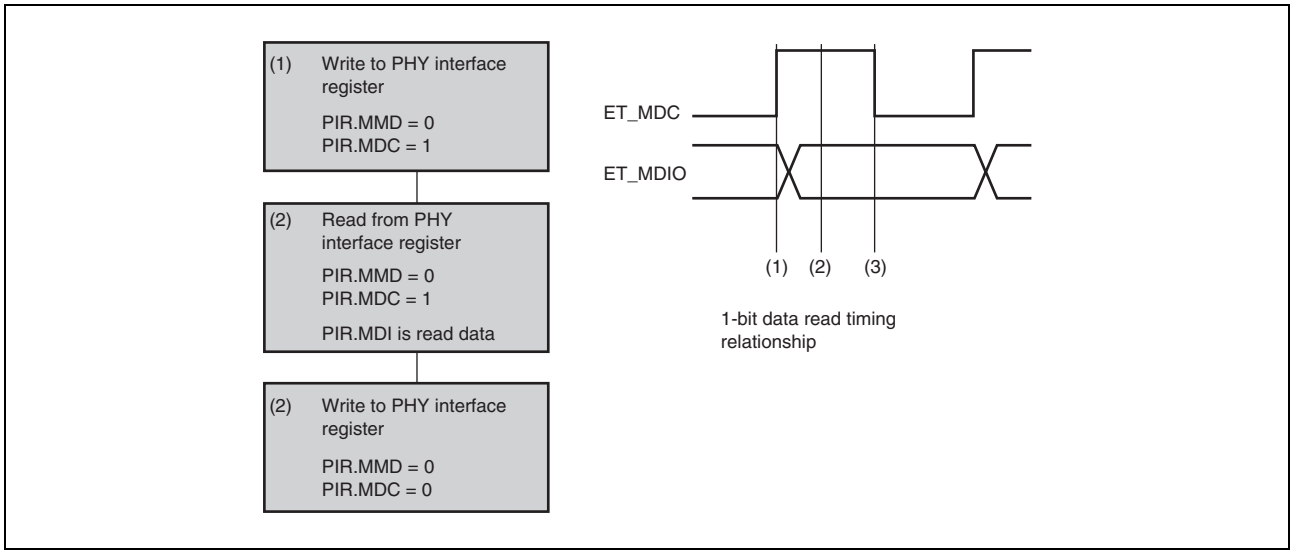

Figure 26.19 (3) 1-Bit Data Read Flowchart

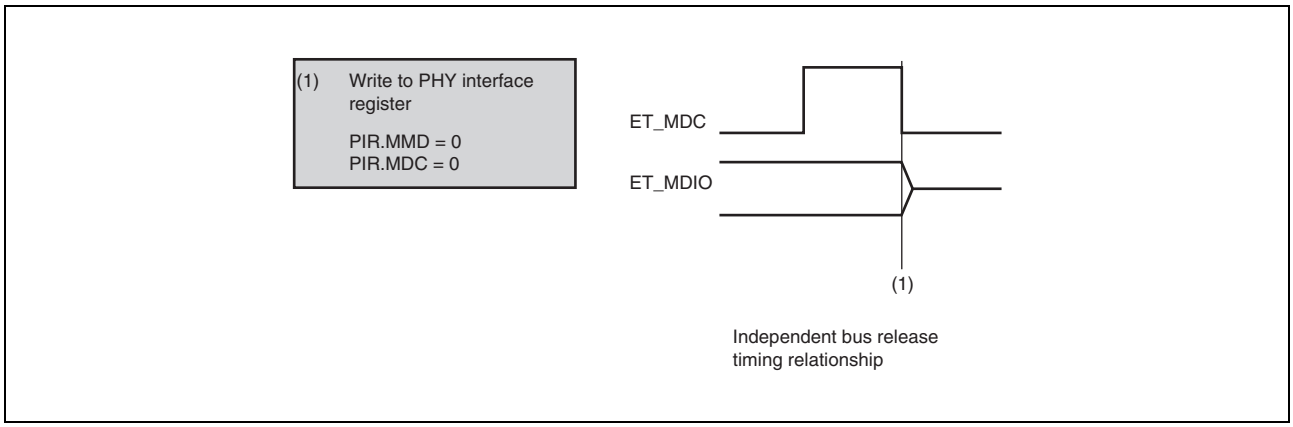

Figure 26.19 (4) Independent Bus Release Flowchart (IDLE in Write in Figure 26.18)

26.6 Usage Notes

26.6.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 26.20 shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 26.21 shows schematics of Ethernet frames to which the checksum data has been added.

Note: • Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

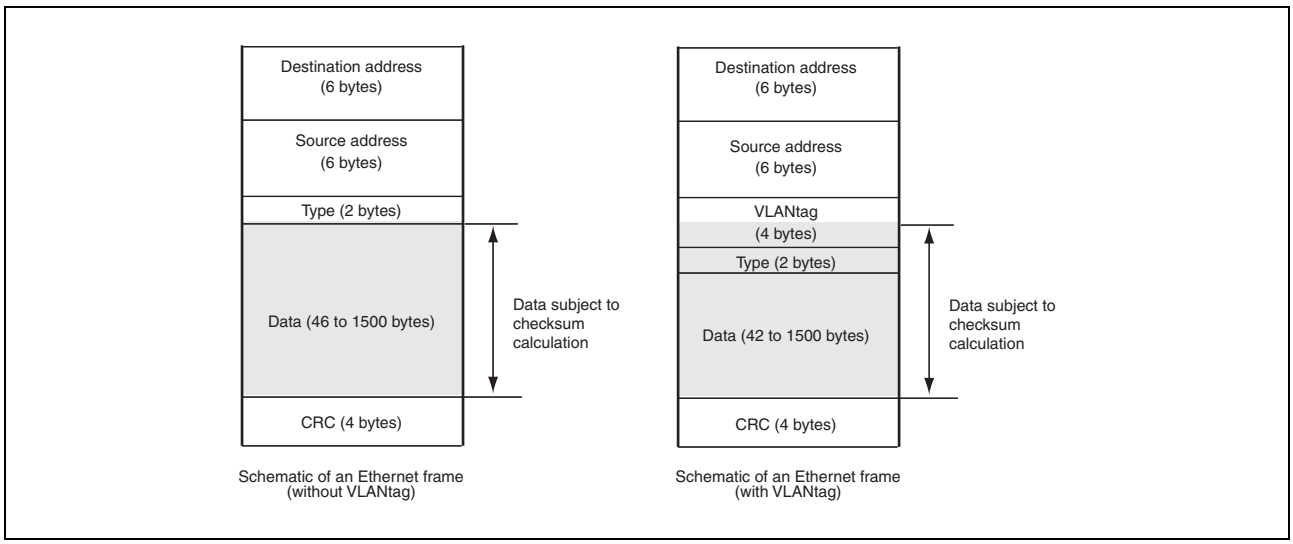

Figure 26.20 Data Subject to Checksum Calculation

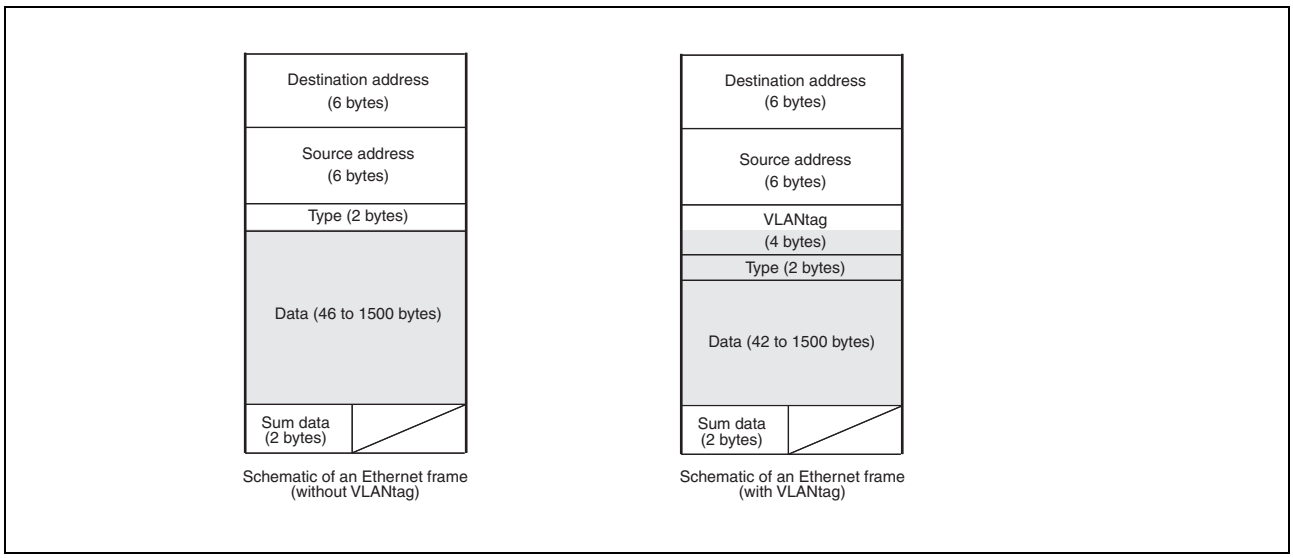

Figure 26.21 Data after Checksum Data Addition

26.6.2 Notes on Using the Intelligent Checksum Function

Checksum calculation using the intelligent checksum function is not affected by padding insertion specified by the receive data padding insert register (RPADIR). This is because checksum calculation is performed when transferring receive data from E-MAC to E-DMAC, while padding of receive data is performed when transferring receive data from E-DMAC to the receive buffer in memory.

26.6.3 Software Reset

For transitions to the software reset state by the ARST bit in the software reset register (ARSTR) or SWRT and SWRR bits in the E-DMAC mode register (EDMR), see section 55.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the ARST bit or SWRT and SWRR bits.

27. A/D Converter

This LSI includes a 12-bit successive-approximation A/D converter allowing selection of up to eight analog input channels.

27.1 Features

- Resolution: 12 bits
- Input channels: Eight channels
- Minimum conversion time: 5.0 µs per channel
- Absolute accuracy: ±11 LSB
- Operating modes: Three
  - Single mode: A/D conversion on one channel
  - Multi mode: A/D conversion on one to four channels or on one to eight channels
  - Scan mode: Continuous A/D conversion on one to four channels or on one to eight channels
- Data registers: Eight
  Conversion results are held in a 16-bit data register for each channel
- Sample-and-hold function
- A/D conversion start methods: Three methods
  - Software
  - Conversion start trigger from the multi-function timer pulse unit 2
  - External trigger signal
- Interrupt source: Two sources
  An A/D conversion end interrupt (ADI) request can be generated on completion of A/D conversion.
  An over-limit interrupt (LMTI) request can be generated when a conversion result exceeds the upper or lower limit value for each channel.*1
  Note 1.This is only available when 10-bit precision is in use.
- Module standby mode can be set

Figure 27.1 shows a block diagram of the A/D converter.

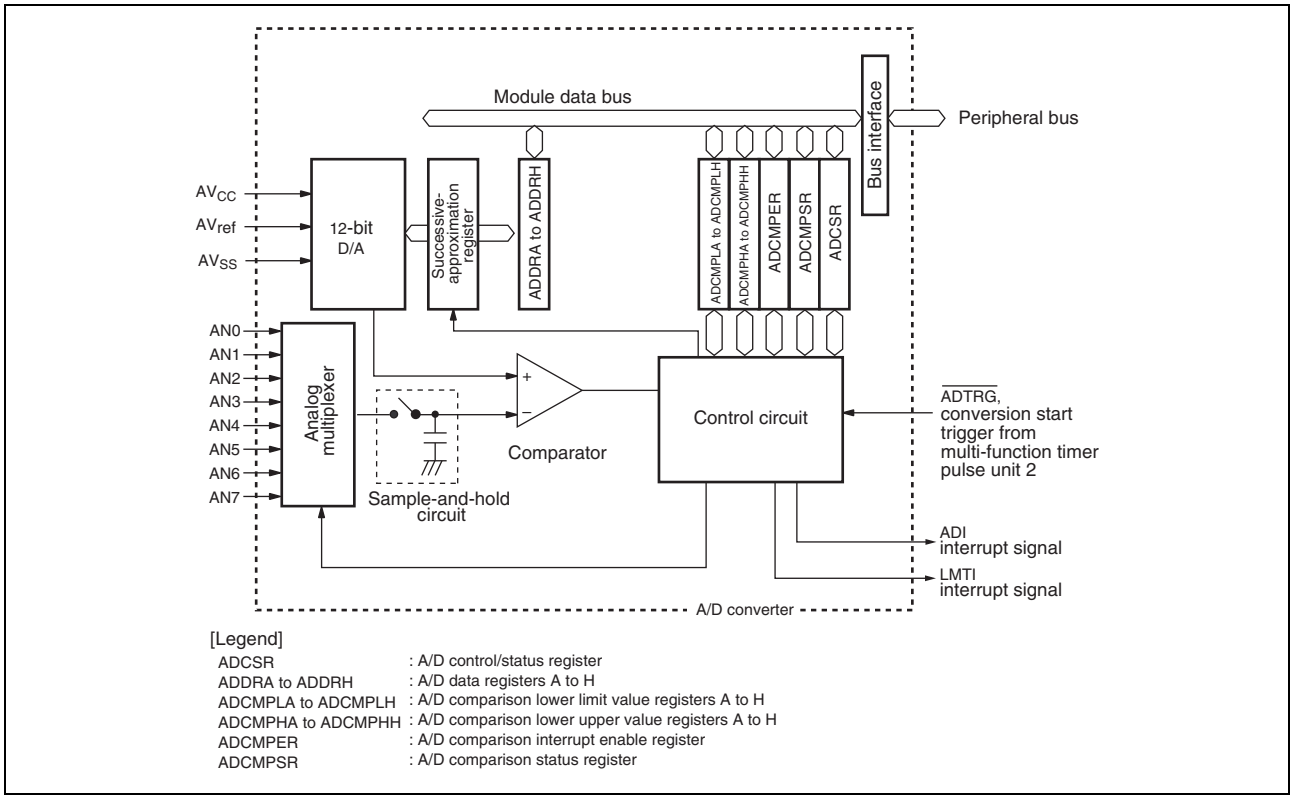

Figure 27.1 Block Diagram of A/D Converter

27.2 Input/Output Pins

Table 27.1 shows the A/D converter pins.

Table 27.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Analog power supply pin	AVcc	Input	Analog power supply pin
Analog ground pin	AVss	Input	Analog ground pin and A/D conversion reference ground
Analog reference voltage pin	AVref	Input	A/D converter reference voltage pin
Analog input pin 0	AN0	Input	Analog input
Analog input pin 1	AN1	Input	
Analog input pin 2	AN2	Input	
Analog input pin 3	AN3	Input	
Analog input pin 4	AN4	Input	
Analog input pin 5	AN5	Input	
Analog input pin 6	AN6	Input	
Analog input pin 7	AN7	Input	
A/D external trigger input pin	$\overline{\text{ADTRG}}$	Input	External trigger input to start A/D conversion

27.3 Register Descriptions

The A/D converter has the following registers.

Table 27.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
A/D data register A	ADDRA	R	H'0000	H'E8005800	16
A/D data register B	ADDRB	R	H'0000	H'E8005802	16
A/D data register C	ADDRC	R	H'0000	H'E8005804	16
A/D data register D	ADDRD	R	H'0000	H'E8005806	16
A/D data register E	ADDRE	R	H'0000	H'E8005808	16
A/D data register F	ADDRF	R	H'0000	H'E800580A	16
A/D data register G	ADDRG	R	H'0000	H'E800580C	16

27.3.1 A/D Data Registers A to H (ADDRA to ADDRH)

The eight A/D data registers, ADDRA to ADDRH, are 16-bit read-only registers that store the results of A/D conversion. An A/D conversion produces 12-bit data, which is transferred for storage into bits 15 to 4 of the ADDR corresponding to the selected channel. Bits 3 to 0 of ADDR are reserved bits that are always read as 0.

Access to ADDR in 8-bit units is prohibited. ADDR must always be accessed in 16-bit units.

Table 27.3 indicates the correspondence between analog input channels and ADDR.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
													-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 4		All 0	R	Bit Data (12bits)
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Table 27.3 Correspondence between Analog Input Channels and ADDR

Analog Input Channel	A/D Data Register where Conversion Result is Stored
AN0	ADDRA
AN1	ADDRB
AN2	ADDRC
AN3	ADDRD
AN4	ADDRE
AN5	ADDRF
AN6	ADDRG
AN7	ADDRH

27.3.2 A/D Comparison Upper Limit Value Registers A to H (ADCMPHA to ADCMPHH)

ADCMPH is a 16-bit readable/writable register that holds the upper limit value to be compared with an A/D conversion result. Eight registers, ADCMPHA to ADCMPHH, are provided.

On completion of A/D conversion on each channel, the A/D conversion result is compared with the data stored in the corresponding upper limit value register. When the result is greater than the upper limit value, the corresponding bit in the A/D comparison status register (ADCMPSR) is set. Comparison with the upper limit value is performed only when the corresponding bit in the A/D comparison interrupt enable register (ADCMPER) is set.

Access to ADCMPH in 8-bit units is prohibited. ADCMPH must always be accessed in 16-bit units.

Table 27.4 indicates the correspondence between the ADDR registers and the ADCMPH/ADCMPL registers.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6		All 0	R/W	Comparison Upper Limit Value (10 bits)
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

27.3.3 A/D Comparison Lower Limit Value Registers A to H (ADCMPLA to ADCMPLH)

ADCMPL is a 16-bit readable/writable register that holds the lower limit value to be compared with an A/D conversion result. Eight registers, ADCMPLA to ADCMPLH, are provided.

On completion of A/D conversion on each channel, the A/D conversion result is compared with the data stored in the corresponding lower limit value register. When the result is smaller than the lower limit value, the corresponding bit in the A/D comparison status register (ADCMPSR) is set. Comparison with the lower limit value is performed only when the corresponding bit in the A/D comparison interrupt enable register (ADCMPER) is set.

Access to ADCMPL in 8-bit units is prohibited. ADCMPL must always be accessed in 16-bit units.

Table 27.4 indicates the correspondence between the ADDR registers and the ADCMPH/ADCMPL registers.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6		All 0	R/W	Comparison Lower Limit Value (10 bits)
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Table 27.4 Correspondence between ADDR and ADCMPH/ADCMPL Registers

ADDR where Conversion Result is Stored	ADCMPH/ADCMPL (Target for Comparison)
ADDRA	ADCMPHA/ADCMPLA
ADDRB	ADCMPHB/ADCMPLB
ADDRC	ADCMPHC/ADCMPLC
ADDRD	ADCMPHD/ADCMPLD
ADDRE	ADCMPHE/ADCMPLE
ADDRF	ADCMPHF/ADCMPLF
ADDRG	ADCMPHG/ADCMPLG
ADDRH	ADCMPHH/ADCMPLH

27.3.4 A/D Control/Status Register (ADCSR)

ADCSR is a 16-bit readable/writable register that selects the operating mode, controls the A/D converter, and enables or disables starting of A/D conversion by external trigger input.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADF	ADIE	ADST	TRGS[3:0]				CKS[2:0]			MDS[2:0]			CH[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: *1 Only 0 can be written to clear the flag after 1 is read.

Bit	Bit Name	Initial Value	R/W	Description
15	ADF	0	R/(W)*1	A/D End Flag Status flag indicating the end of A/D conversion. [Clearing conditions] • Cleared by reading ADF while ADF = 1, then writing 0 to ADF • Cleared when the direct memory access controller is activated by ADI interrupt and ADDR is read [Setting conditions] • A/D conversion ends in single mode • A/D conversion ends for all the selected channels in multi mode • A/D conversion ends for all the selected channels in scan mode
14	ADIE	0	R/W	A/D Interrupt Enable Enables or disables the interrupt (ADI) requested at the end of A/D conversion. Set the ADIE bit while A/D conversion is not being performed. 0: A/D conversion end interrupt (ADI) request is disabled 1: A/D conversion end interrupt (ADI) request is enabled
13	ADST	0	R/W*2	A/D Start Starts or stops A/D conversion. This bit remains set to 1 during A/D conversion. 0: A/D conversion is stopped 1: Single mode: A/D conversion starts. This bit is automatically cleared to 0 when A/D conversion ends on the selected channel. Multi mode: A/D conversion starts. This bit is automatically cleared to 0 when A/D conversion is completed cycling through the selected channels. Scan mode: A/D conversion starts. A/D conversion is continuously performed until this bit is cleared to 0 by software, by a power-on reset as well as by a transition to deep standby mode.
12 to 9	TRGS[3:0]	0000	R/W	Timer Trigger Select These bits enable or disable starting of A/D conversion by a trigger signal. 0000: Start of A/D conversion by external trigger input is disabled 0001: A/D conversion is started by conversion trigger TRGAN from the multi-function timer pulse unit 2 0010: A/D conversion is started by conversion trigger TRG0N from the multi-function timer pulse unit 2 0011: A/D conversion is started by conversion trigger TRG4AN from the multi-function timer pulse unit 2 0100: A/D conversion is started by conversion trigger TRG4BN from the multi-function timer pulse unit 2 1001: A/D conversion is started by $\overline{\text{ADTRG}}$ Other than above: Setting prohibited
8 to 6	CKS[2:0]	000	R/W	Clock Select These bits select the A/D conversion time.*3 Set the A/D conversion time while A/D conversion is halted (ADST = 0). 000: Conversion time = 256 t_{cyc}*4 (maximum) 001: Conversion time = 298 t_{cyc}*4 (maximum) 010: Conversion time = 340 t_{cyc}*4 (maximum) 011: Conversion time = 382 t_{cyc}*4 (maximum) 100, 101, 110, 111: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
5 to 3	MDS[2:0]	000	R/W	Multi-scan Mode These bits select the operating mode for A/D conversion. 0xx: Single mode 100: Multi mode: A/D conversion on 1 to 4 channels 101: Multi mode: A/D conversion on 1 to 8 channels 110: Scan mode: A/D conversion on 1 to 4 channels 111: Scan mode: A/D conversion on 1 to 8 channels
2 to 0	CH[2:0]	000	R/W	Channel Select These bits and the MDS bits in ADCSR select the analog input channels.

MDS = 0xx	MDS = 100 or MDS = 110	MDS = 101 or MDS = 111
000: AN0	000: AN0	000: AN0
001: AN1	001: AN0, AN1	001: AN0, AN1
010: AN2	010: AN0 to AN2	010: AN0 to AN2
011: AN3	011: AN0 to AN3	011: AN0 to AN3
100: AN4	100: AN4	100: AN0 to AN4
101: AN5	101: AN4, AN5	101: AN0 to AN5
110: AN6	110: AN4 to AN6	110: AN0 to AN6
111: AN7	111: AN4 to AN7	111: AN0 to AN7

[Legend]
x: Don't care
Note 1. Only 0 can be written to clear the flag after 1 is read.
Note 2. Clear the ADST to stop A/D conversion before transition to software standby mode or module standby mode.
Note 3. Set the A/D conversion time to minimum or more values to meet the absolute accuracy of the A/D converter characteristics.
Note 4. t_{cyc} indicates a cycle time of the peripheral clock 1 (P1φ).

27.3.5 A/D Comparison Interrupt Enable Register (ADCMPER)

ADCMPER is a 16-bit readable/writable register that enables or disables comparison between the A/D data register (ADDR) that holds the A/D conversion result on each channel and the A/D comparison upper/lower limit value register (ADCMPH/ADCMPL), and enables or disables interrupt request.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HLMENH	HLMENG	HLMENF	HLMENE	HLMEND	HLMENC	HLMENB	HLMENA	LLMENH	LLMENG	LLMENF	LLMENE	LLMEND	LLMENC	LLMENB	LLMENA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	HLMENH to HLMENA	All 0	R/W	Comparison with Upper Limit Value and Interrupt Enable Enables or disables comparison between an A/D conversion result and the upper limit value as well as an LMTI interrupt request in the case of the result being greater than the upper limit value. 0: Disables comparison between an A/D conversion result and the upper limit value as well as an over-limit interrupt (LMTI) request. 1: Enables comparison between an A/D conversion result and the upper limit value as well as an over-limit interrupt (LMTI) request.
7 to 0	LLMENH to LLMENA	All 0	R/W	Comparison with Lower Limit Value and Interrupt Enable Enables or disables comparison between an A/D conversion result and the lower limit value as well as an LMTI interrupt request in the case of the result being smaller than the lower limit value. 0: Disables comparison between an A/D conversion result and the lower limit value as well as an over-limit interrupt (LMTI) request. 1: Enables comparison between an A/D conversion result and the lower limit value as well as an over-limit interrupt (LMTI) request.

27.3.6 A/D Comparison Status Register (ADCMPSR)

ADCMPSR is a 16-bit read-only register that indicates the results of comparison between the A/D data register (ADDR) that holds an A/D conversion result on each channel and the A/D comparison upper/lower limit value register (ADCMPH/ADCMPL).

The bits in this register are valid only when the comparison and an LMTI interrupt are enabled in the A/D comparison interrupt enable register (ADCMPER). When they are disabled, the bits are always in the cleared state.

When an A/D conversion result exceeds the upper or lower limit value, the corresponding bit is set to 1.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HOVRH	HOVRG	HOVRF	HOVRE	HOVRD	HOVRC	HOVRB	HOVRA	LUDRH	LUDRG	LUDRF	LUDRE	LUDRD	LUDRC	LUDRB	LUDRA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	HOVRH to HOVRA	All 0	R	Upper Limit Over Flag Status flag that indicates that an A/D conversion result on each channel has exceeded the upper limit value in ADCMPH. [Clearing condition] • Cleared by writing 0 to the HLMENn bit for the corresponding channel in ADCMPER register [Setting condition] • The HLMEN bit for the corresponding channel in ADCMPER is 1, and an A/D conversion result for the corresponding channel that is greater than the upper limit value in ADCMPH is stored in the ADDR register
7 to 0	LUDRH to LUDRA	All 0	R	Lower Limit Under Flag Status flag that indicates that an A/D conversion result on each channel has exceeded the lower limit value in ADCMPL. [Clearing condition] • Cleared by writing 0 to the LLMENn bit for the corresponding channel in ADCMPER register [Setting condition] The LLMEN bit for the corresponding channel in ADCMPER is 1, and an A/D conversion result for the corresponding channel that is smaller than the lower limit value in ADCMPL is stored in the ADDR register

27.4 Operation

The A/D converter uses the successive-approximation method, and the resolution is 12 bits. It has three operating modes: single mode, multi mode, and scan mode. Switching the operating mode or analog input channels must be done while the ADST bit in ADCSR is 0 to prevent incorrect operation. The ADST bit can be set at the same time as the operating mode or analog input channels are changed.

27.4.1 Single Mode

Single mode should be selected when only A/D conversion on one channel is required.
In single mode, A/D conversion is performed once for the specified one analog input channel, as follows:

1. A/D conversion for the selected channel starts when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed, the A/D conversion result is transferred to the A/D data register corresponding to the channel.
3. After A/D conversion has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit that remains 1 during A/D conversion is automatically cleared to 0 when A/D conversion is completed, and the A/D converter becomes idle.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1 to start A/D conversion again. The ADST bit can be set at the same time as the mode or channel selection is switched.

Typical operations when a single channel (AN1) is selected in single mode (MDS[2] = 0) are described next. Figure 27.2 shows a timing diagram for this example (the bits which are set in this example belong to ADCSR).

1. Single mode is selected, input channel AN1 is selected (CH[2:0] = 001), the A/D interrupt is enabled (ADIE = 1), and A/D conversion is started (ADST = 1).
2. When A/D conversion is completed, the A/D conversion result is transferred into ADDRB. At the same time the ADF flag is set to 1, the ADST bit is cleared to 0, and the A/D converter becomes idle.
3. Since ADF = 1 and ADIE = 1, an ADI interrupt is requested.
4. The A/D interrupt handling routine starts.
5. The routine reads ADF = 1, and then writes 0 to the ADF flag.
6. The routine reads and processes the A/D conversion result (ADDRB).
7. Execution of the A/D interrupts handling routine ends. Then, when the ADST bit is set to 1, A/D conversion starts and steps 2 to 7 are executed.

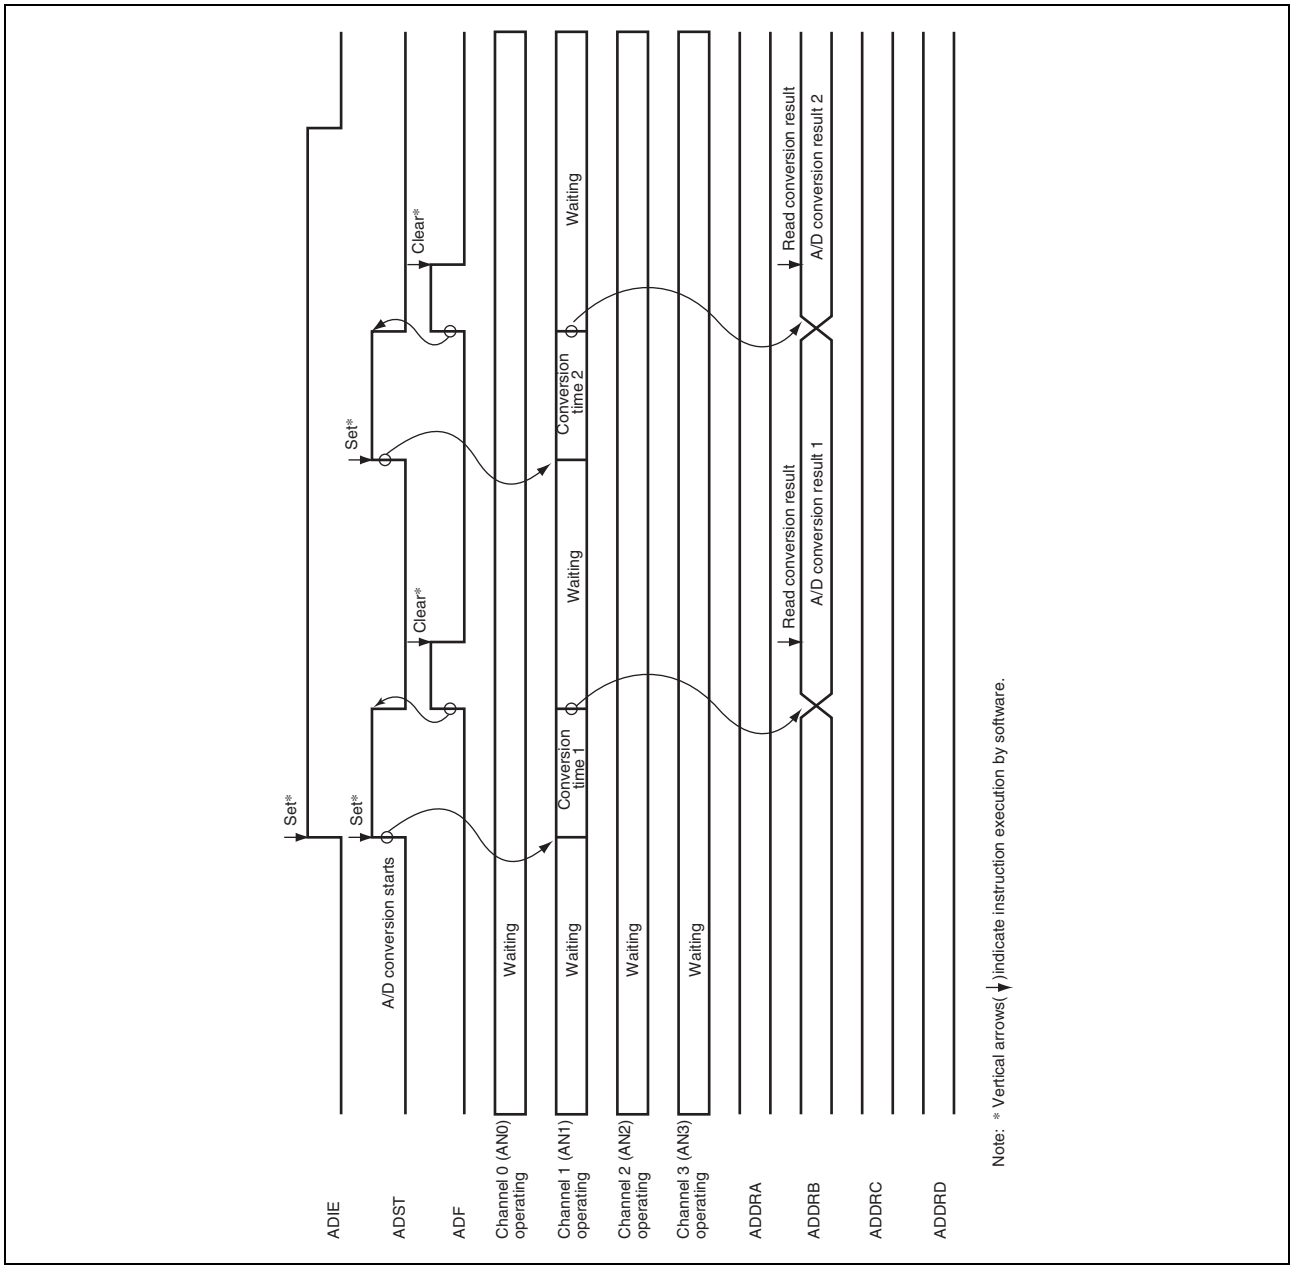

Figure 27.2 Example of A/D Converter Operation (Single Mode, One Channel (AN1) Selected)

27.4.2 Multi Mode

Multi mode should be selected when performing A/D conversion once on one or more channels.
In multi mode, A/D conversion is performed once for a maximum of eight specified analog input channels, as follows:

1. A/D conversion starts from the analog input channel with the lowest number (e.g. AN0, AN1, …, AN3) when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed on each channel, the A/D conversion result is sequentially transferred to the A/D data register corresponding to that channel.
3. After A/D conversion on all selected channels has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit that remains 1 during A/D conversion is automatically cleared to 0 when A/D conversion is completed, and the A/D converter becomes idle. If the ADST bit is cleared to 0 during A/D conversion, A/D conversion is halted and the A/D converter becomes idle. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

A/D conversion is to be performed once on all the specified channels. The conversion results are transferred for storage into the A/D data registers (ADDR) corresponding to the channels.
When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.
Typical operations when three channels (AN0 to AN2) are selected in multi mode are described next. Figure 27.3 shows a timing diagram for this example.

1. Multi mode is selected (MDS[2] = 1, MDS[1] = 0), analog input channels AN0 to AN2 are selected (CH[2:0] = 010), and A/D conversion is started (ADST = 1).
2. A/D conversion of the first channel (AN0) starts. When A/D conversion is completed, the A/D conversion result is transferred into ADDRA.
3. Next, the second channel (AN1) is selected automatically and A/D conversion starts.
4. Conversion proceeds in the same way through the third channel (AN2).
5. When conversion of all selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and the ADST bit is cleared to 0.
6. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested.

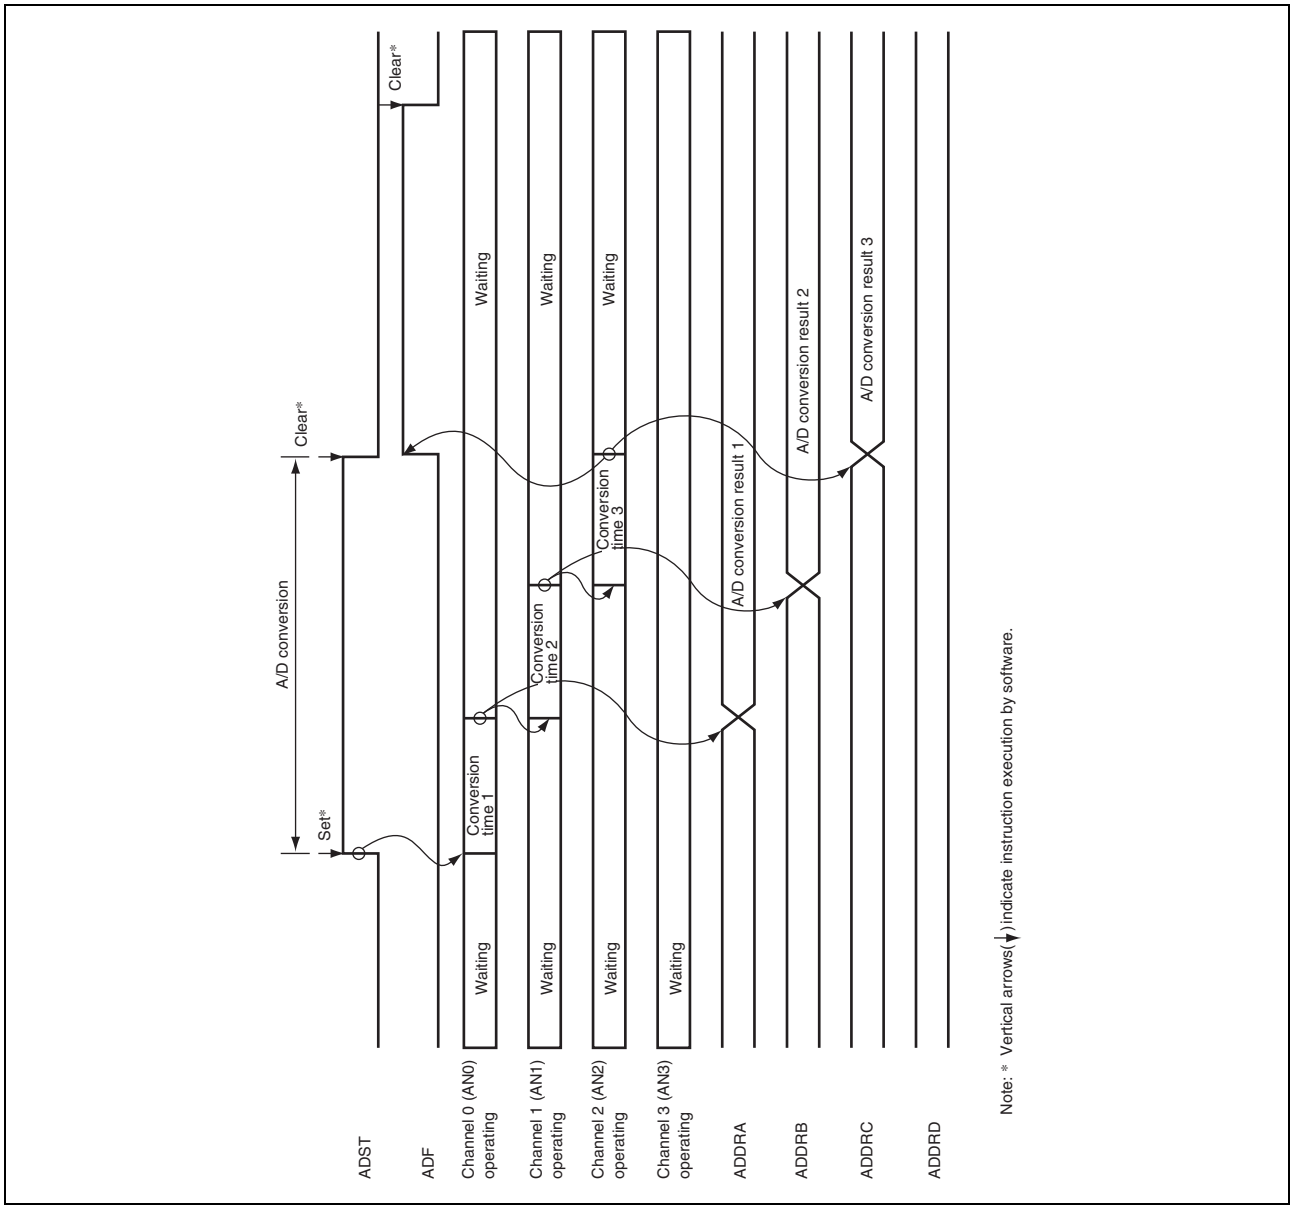

Figure 27.3 Example of A/D Converter Operation (Multi Mode, Three Channels (AN0 to AN2) Selected)

27.4.3 Scan Mode

Scan mode is useful for monitoring analog inputs in a group of one or more channels at all times. In scan mode, A/D conversion is performed sequentially for a maximum of eight specified analog input channels, as follows:

1. A/D conversion starts from the analog input channel with the lowest number (e.g. AN0, AN1, …, AN3) when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed on each channel, the A/D conversion result is sequentially transferred to the A/D data register corresponding to that channel.
3. After A/D conversion on all selected channels has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated. The A/D converter starts A/D conversion again from the channel with the lowest number.
4. The ADST bit is not cleared automatically, so steps 2. and 3. are repeated as long as the ADST bit remains set to 1. When the ADST bit is cleared to 0, A/D conversion halts and the A/D converter becomes idle.
   The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.
Typical operations when three channels (AN0 to AN2) are selected in scan mode are described as follows. Figure 27.4 shows a timing diagram for this example.

1. Scan mode is selected (MDS[2] = 1, MDS[1] = 1), analog input channels AN0 to AN2 are selected (CH[2:0] = 010), and A/D conversion is started (ADST = 1).
2. A/D conversion of the first channel (AN0) starts. When A/D conversion is completed, the A/D conversion result is transferred into ADDRA.
3. Next, the second channel (AN1) is selected automatically and A/D conversion starts.
4. Conversion proceeds in the same way through the third channel (AN2).
5. When conversion of all the selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and conversion of the first channel (AN0) starts again. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested after A/D conversion of the third channel.
6. The ADST bit is not cleared automatically, so steps 2. to 4. are repeated as long as the ADST bit remains set to 1. When steps 2. to 4. are repeated, the ADF flag is kept to 1. When the ADST bit is cleared to 0, A/D conversion stops. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

If both the ADF flag and ADIE bit are set to 1 while steps 2. to 4. are repeated, an ADI interrupt is requested at all times. To generate an interrupt on completing conversion of the third channel, clear the ADF bit to 0 after an interrupt is requested.

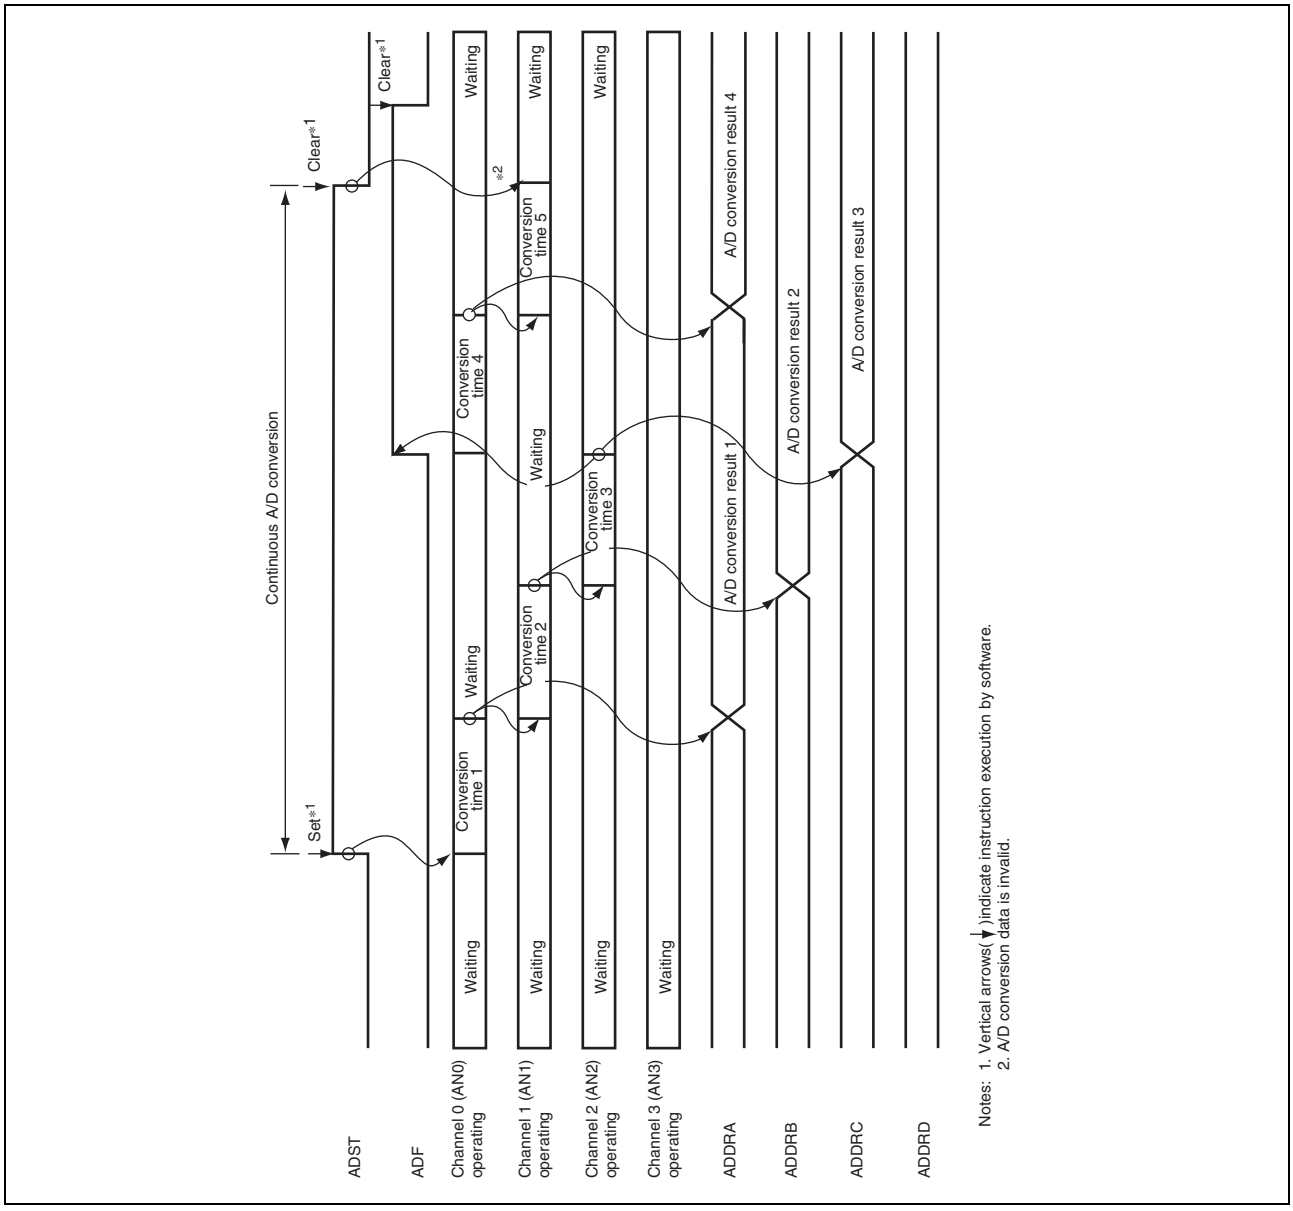

Figure 27.4 Example of A/D Converter Operation (Scan Mode, Three Channels (AN0 to AN2) Selected)

27.4.4 A/D Converter Activation by External Trigger or Multi-Function Timer Pulse Unit 2

The A/D converter can be independently activated by an external trigger or an A/D conversion request from the multi-function timer pulse unit 2. To activate the A/D converter by an external trigger or the multi-function timer pulse unit 2, set the A/D trigger enable bits (TRGS[3:0]). When an external trigger or an A/D conversion request from the multi-function timer pulse unit 2 is generated with this bit setting, the ADST bit is set to 1 to start A/D conversion. The channel combination is determined by bits CH2 to CH0 in ADCSR. The timing from setting of the ADST bit until the start of A/D conversion is the same as when 1 is written to the ADST bit by software.

27.4.5 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input at the A/D conversion start delay time (t_D) after the ADST bit in ADCSR is set to 1, then starts conversion. Figure 27.5 shows the A/D conversion timing. Table 27.5 indicates the A/D conversion time.
As indicated in Figure 27.5, the A/D conversion time (t_{CONV}) includes t_D and the input sampling time(t_{SPL}). The length of t_D varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in Table 27.5.
In multi mode and scan mode, the values given in Table 27.5 apply to the first conversion. In the second and subsequent conversions, time is the values given in Table 27.6.

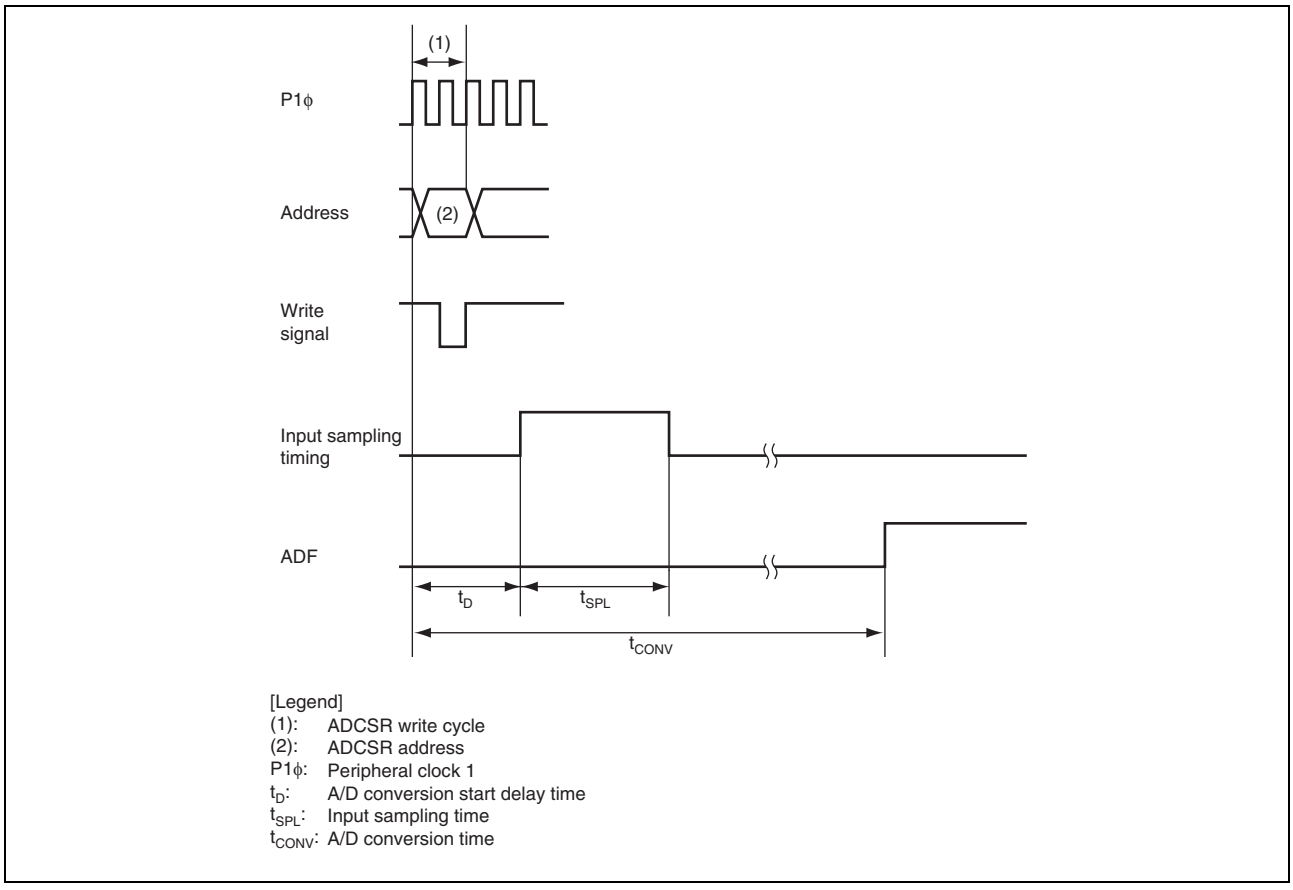

Figure 27.5 A/D Conversion Timing

Table 27.5 A/D Conversion Time (Single Mode)

		CKS1 = 0						CKS1 = 1					
		CKS0 = 0			CKS0 = 1			CKS0 = 0			CKS0 = 1		
Item	**Symbol**	**Min.**	**Typ.**	**Max.**	**Min.**	**Typ.**	**Max.**	**Min.**	**Typ.**	**Max.**	**Min.**	**Typ.**	**Max.**
A/D conversion start delay time	t_D	9	—	14	10	—	16	11	—	18	12	—	20
Input sampling time	t_{SPL}	—	78	—	—	91	—	—	104	—	—	117	—
A/D conversion time	t_{CONV}	251	—	256	292	—	298	333	—	340	374	—	382

Note: Values in the table are represented in terms of t_{cyc}. t_{cyc} indicates a cycle time of the peripheral clock 1 (P1φ).

Table 27.6 A/D Conversion Time (Multi Mode and Scan Mode)

CKS1	CKS0	Conversion Time (t_{cyc})
0	0	240 (constant)
	1	280 (constant)
1	0	320 (constant)
	1	360 (constant)

Note: Values in the table are represented in terms of t_{cyc}. t_{cyc} indicates a cycle time of the peripheral clock 1 (P1φ).

27.4.6 External Trigger Input Timing

A/D conversion can also be externally triggered. When the TRGS[3:0] bits in ADCSR are set to B'1001, an external trigger is input to the $\overline{\text{ADTRG}}$ pin. The ADST bit in ADCSR is set to 1 at the falling edge of the $\overline{\text{ADTRG}}$ pin, thus starting A/D conversion. Other operations, regardless of the operating mode, are the same as when the ADST bit has been set to 1 by software. Figure 27.6 shows the timing.

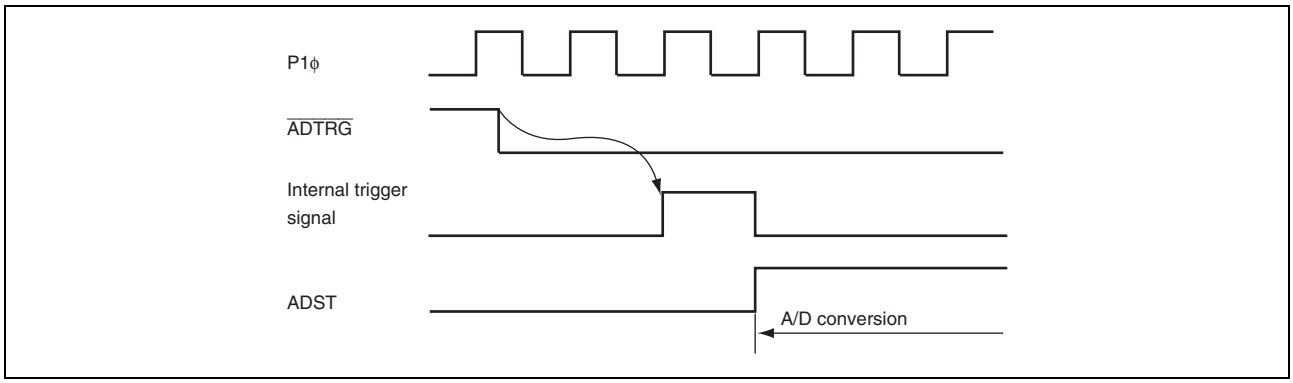

Figure 27.6 External Trigger Input Timing

27.5 Interrupt Sources and DMA Transfer Request

The A/D converter generates an A/D conversion end interrupt (ADI) and an over-limit interrupt (LMTI). The direct memory access controller can be activated by an ADI interrupt request depending on the setting of the direct memory access controller.

Table 27.6 shows the relationship between interrupt sources and the DMA transfer request.

Table 27.7 Relation between Interrupt Sources and DMA Transfer Request

Name	Interrupt Source	Interrupt Flag	Direct Memory Access Controller Activation
ADI	A/D conversion end	ADF in ADCSR	Possible
LMTI	Conversion result exceeding the limit value	HOVRA to HOVRH and LUDRA to LUDRH in ADCMPSR	Impossible

(a) ADI Interrupt

The A/D converter generates an A/D conversion end interrupt (ADI) at the end of A/D conversion. An ADI interrupt request is generated if the ADIE bit is set to 1 when the ADF bit in ADCSR is set to 1 on completion of A/D conversion. Note that the direct memory access controller can be activated by an ADI interrupt depending on the setting of the direct memory access controller. In this case, an interrupt is not issued to the CPU. If the setting to activate the direct memory access controller has not been made, an interrupt request is sent to the CPU. Having the converted data read by the direct memory access controller in response to an ADI interrupt enables continuous conversion to be achieved without imposing a load on software.

In single mode, set the direct memory access controller so that DMA transfer initiated by an ADI interrupt only proceeds once (single transfer mode). In the case of A/D conversion on multiple channels in scan mode or multi mode, setting the number of DMA transfers to one causes DMA transfer to finish after transferring only one channel of data. To make the direct memory access controller transfer all conversion data, set the ADDR where A/D conversion data is stored as the transfer source address, and the number of converted channels as the number of transfers (the number of DMA transactions in block transfer mode).

For details, see section 9, Direct Memory Access Controller.

When the direct memory access controller is activated by ADI, the ADF bit in ADCSR is automatically cleared to 0 when data is transferred by the direct memory access controller.

(b) LMTI Interrupt

An A/D conversion result is compared with the upper or lower limit value on each channel, and if the result exceeds the limit, the over-limit interrupt (LMTI) is generated. While the HLMEN bit in ADCMPER is 1, a conversion result is compared with the upper limit in ADCMPH the instant the conversion value is determined. When the value exceeds the upper limit, the corresponding bit in ADCMPSR is set to 1, which causes an LMTI interrupt to be generated. In the same way, while the LLMEN bit in ADCMPER is 1, a conversion result is compared with the lower limit. If it exceeds the limit, an LMTI interrupt request is generated.

The ADCMPSR register can be referenced in the LMTI interrupt handling to identify the channel causing over-limit value and to know whether the result has exceeded the upper limit value or the lower one.

27.6 Definitions of A/D Conversion Accuracy

The A/D converter compares an analog value input from an analog input channel with its analog reference value and converts it to 12-bit digital data. The absolute accuracy of this A/D conversion is the deviation between the input analog value and the output digital value. It includes the following errors:

- Offset error
- Full-scale error
- Quantization error
- Nonlinearity error

These four error quantities are explained below with reference to Figure 27.7. In the figure, the 12-bit A/D converter is illustrated as the 3-bit A/D converter for explanation. Offset error is the deviation between actual and ideal A/D conversion characteristics when the digital output value changes from the minimum (zero voltage) B'000000000000 (000 in the figure) to B'000000000001 (001 in the figure) (Figure 27.7, item (1)). Full-scale error is the deviation between actual and ideal A/D conversion characteristics when the digital output value changes from B'111111111110 (110 in the figure) to the maximum B'111111111111 (111 in the figure)(Figure 27.7, item (2)). Quantization error is the intrinsic error of the A/D converter and is expressed as 1/2 LSB (Figure 27.7, item (3)). Nonlinearity error is the deviation between actual and ideal A/D conversion characteristics between zero voltage and full-scale voltage (Figure 27.7, item (4)). Note that it does not include offset, full-scale, or quantization error.

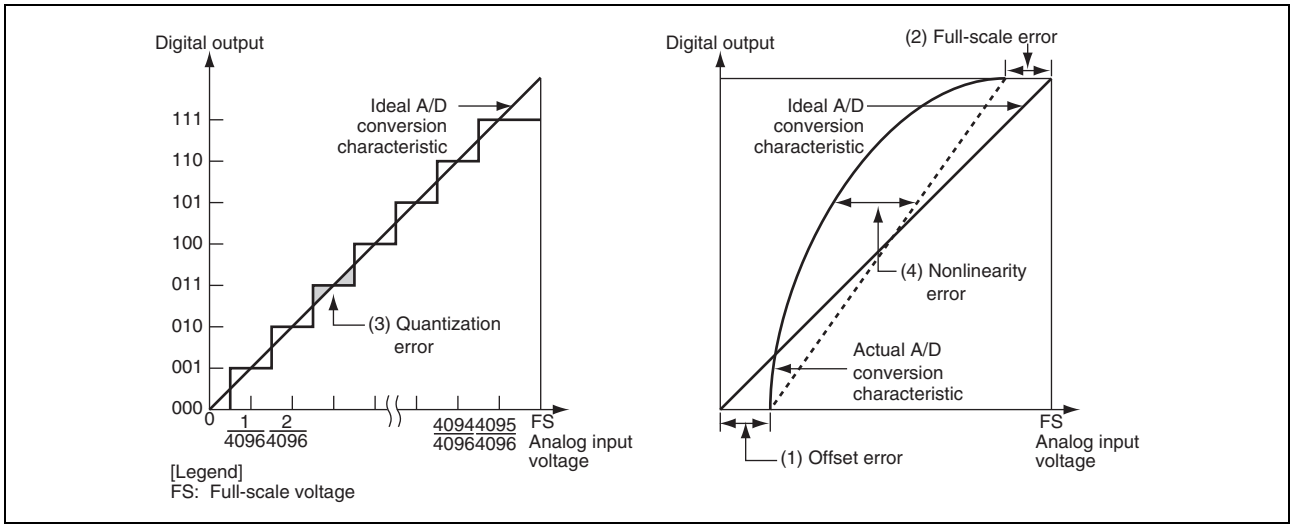

Figure 27.7 Definitions of A/D Conversion Accuracy

27.7 Usage Notes

When using the A/D converter, note the following points.

27.7.1 Module Standby Mode Setting

Operation of the A/D converter can be disabled or enabled using the standby control register. The initial setting is for operation of the A/D converter to be halted. Register access is enabled by clearing module standby mode. For details, see section 55, Power-Down Modes. The wait time (20 µs) is required after release from the module standby state. After the wait time has elapsed, perform conversion by the A/D converter.

27.7.2 Setting Analog Input Voltage

Using the LSI outside the following voltage ranges may impair the LSI reliability.

1. Analog input range
   During A/D conversion, voltages on the analog input pins ANn should not go beyond the following range: AVss ≤ ANn ≤ AVcc (n = 0 to 7).
2. AVcc and AVss input voltages
   Input voltages AVcc and AVss should be PVcc − 0.3 V ≤ AVcc ≤ PVcc and AVss = Vss. Do not leave the AVcc and AVss pins open even when the A/D converter is not in use and in software standby mode. When not in use, connect AVcc to the power supply (PVcc) and AVss to the ground (Vss).
3. Setting range of AVref input voltage
   Set the reference voltage range of the AVref pin as 3.0 V ≤ AVref ≤ AVcc.

27.7.3 Notes on Board Design

In board design, digital circuitry and analog circuitry should be as mutually isolated as possible, and layout in which digital circuit signal lines and analog circuit signal lines cross or are in close proximity should be avoided as far as possible. Failure to do so may result in incorrect operation of the analog circuitry due to inductance, adversely affecting A/D conversion values.
Digital circuitry must be isolated from the analog input signals (AN0 to AN7), analog reference voltage (AVref), and analog power supply (AVcc) by the analog ground (AVss). Also, the analog ground (AVss) should be connected at one point to a stable digital ground (Vss) on the board.

27.7.4 Processing of Analog Input Pins

To prevent damage from voltage surges at the analog input pins (AN0 to AN7), connect an input protection circuit like the one shown in Figure 27.8. The circuit shown also includes a CR filter to suppress noise. This circuit is shown as an example; the circuit constants should be selected according to actual application conditions.
Figure 27.9 shows an equivalent circuit diagram of the analog input ports and Table 27.8 lists the analog input pin specifications.

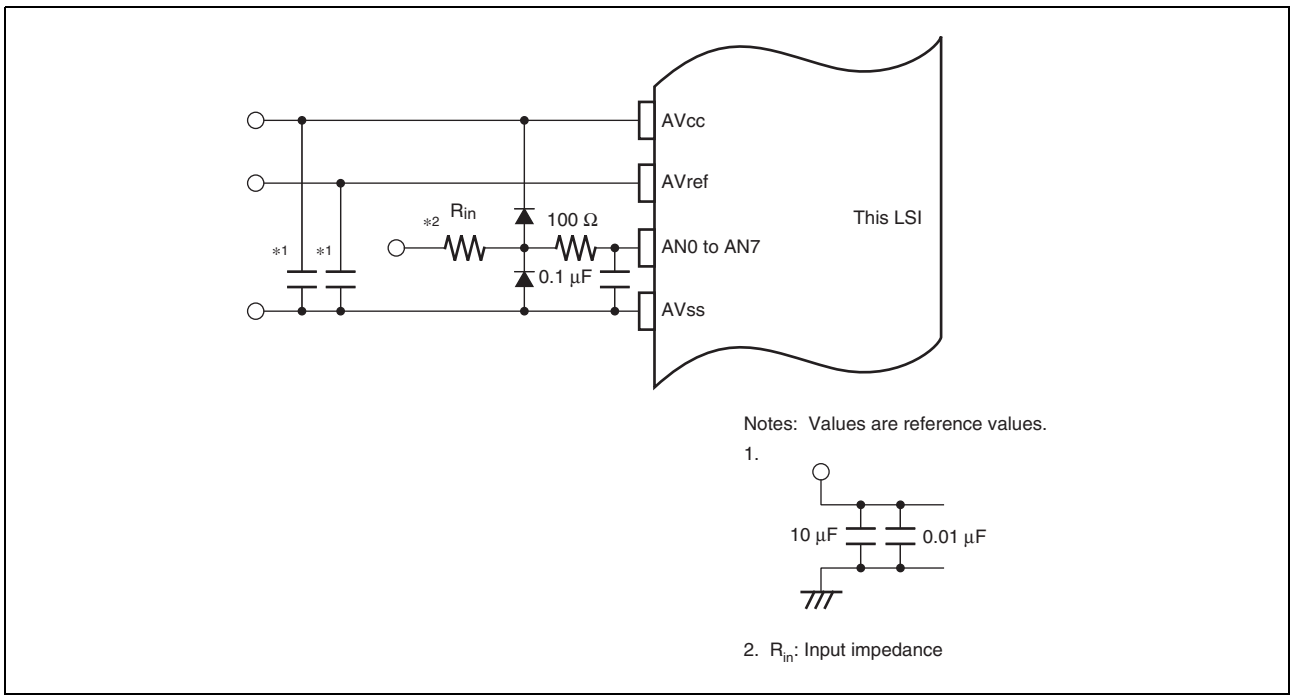

Figure 27.8 Example of Analog Input Protection Circuit

27.7.5 Permissible Signal Source Impedance

This LSI's analog input is designed such that conversion precision is guaranteed for an input signal for which the signal source impedance is 3 kΩ or less. This specification is provided to enable the A/D converter's sample-and-hold circuit input capacitance to be charged within the sampling time; if the sensor output impedance exceeds 3 kΩ, charging may be insufficient and it may not be possible to guarantee A/D conversion precision. However, for A/D conversion in single mode with a large capacitance provided externally for A/D conversion in single mode, the input load will essentially comprise only the internal input resistance of 1 kΩ, and the signal source impedance is ignored. However, as a low-pass filter effect is obtained in this case, it may not be possible to follow an analog signal with a large differential coefficient (e.g., 5 mV/µs or greater) (see Figure 27.9). When converting a high-speed analog signal or performing A/D conversion in scan mode, a low-impedance buffer should be inserted.

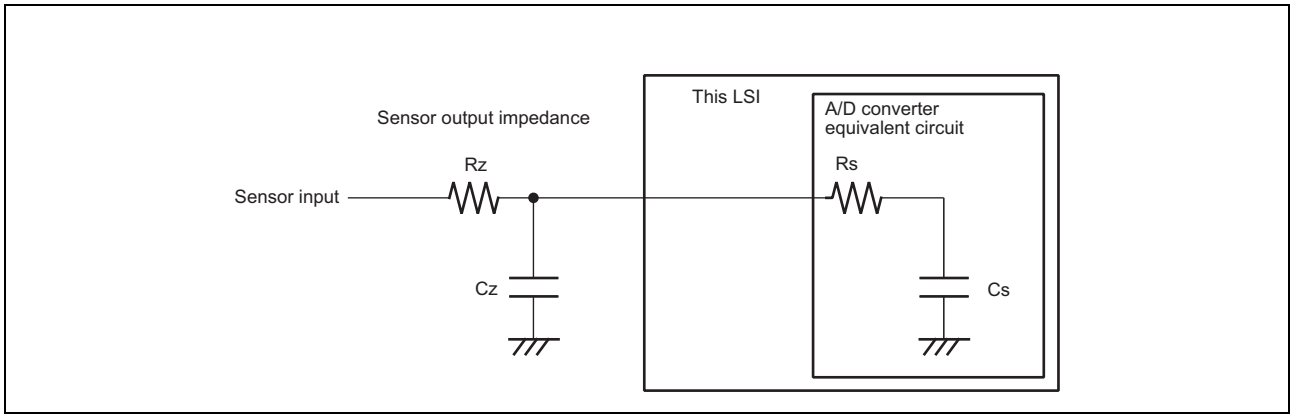

Figure 27.9 Example of Analog Input Circuit

Table 27.8 Analog Input Pin Ratings

Item	Symbol	Min.	Max.	Unit
Permissible Signal Source Impedance	Rz	—	3	kΩ
Low-Pass Filter	Cz	—	0.1	µF
Equivalent Circuit of A/D Converter	Rs	—	1	kΩ
	Cs	—	20	pF

Note: Values are reference values.

27.7.6 Influences on Absolute Precision

Adding capacitance results in coupling with GND, and therefore noise in GND may adversely affect absolute precision. Be sure to connect AVss, etc. to an electrically stable GND.
Care is also required to insure that filter circuits do not communicate with digital signals on the mounting board (i.e., acting as antennas).

27.7.7 Usage Note on Port Pins

The analog input pins (AN0 to AN7) are multiplexed with general-purpose I/O port pin functions (pins P1_8 to P1_15) and the latter can be used as digital inputs. Do not use these general-purpose I/O port pins as digital inputs while the A/D converter is in use with 12-bit precision.

28. NAND Flash Memory Controller

The NAND flash memory controller provides interfaces for an external NAND-type flash memory.

28.1 Features

(1) NAND-Type Flash Memory Interface

- Interface directly connectable to NAND-type flash memory
- Read or write in byte units
- Supports large-block (2048 + 64 bytes) flash memory*
- Supports addresses for 2 Gbits and more by extension to 5-byte addresses

(2) Access Mode

- Command access mode: Performs an access by specifying in a register a command to be issued from this module to flash memory, address, and data size to be input or output.

(3) Data Error

- When a program error or erase error occurs, the error is reflected on the error source flags. Interrupts for each source can be specified.

(4) Data Transfer FIFO and Data Register

- The 224-byte data FIFO register (FLDTFIFO) is incorporated for data transfer of flash memory.

(5) DMA Transfer

(6) Access Time

- The operating clock (FCLK) on the pins for the NAND-type flash memory is generated by dividing the peripheral clock 0 (P0ϕ). The division ratio can be specified by the QTSEL bit in the common control register (FLCMNCR).
- Before changing the clock pulse generator configuration, this module must be placed in a module stop state.
- In NAND-type flash memory, the $\overline{\text{FRE}}$ and $\overline{\text{FWE}}$ pins operate at the frequency of FCLK. The operating frequency must be specified within the maximum operating frequency of memory to be connected.

Figure 28.1 shows a block diagram.

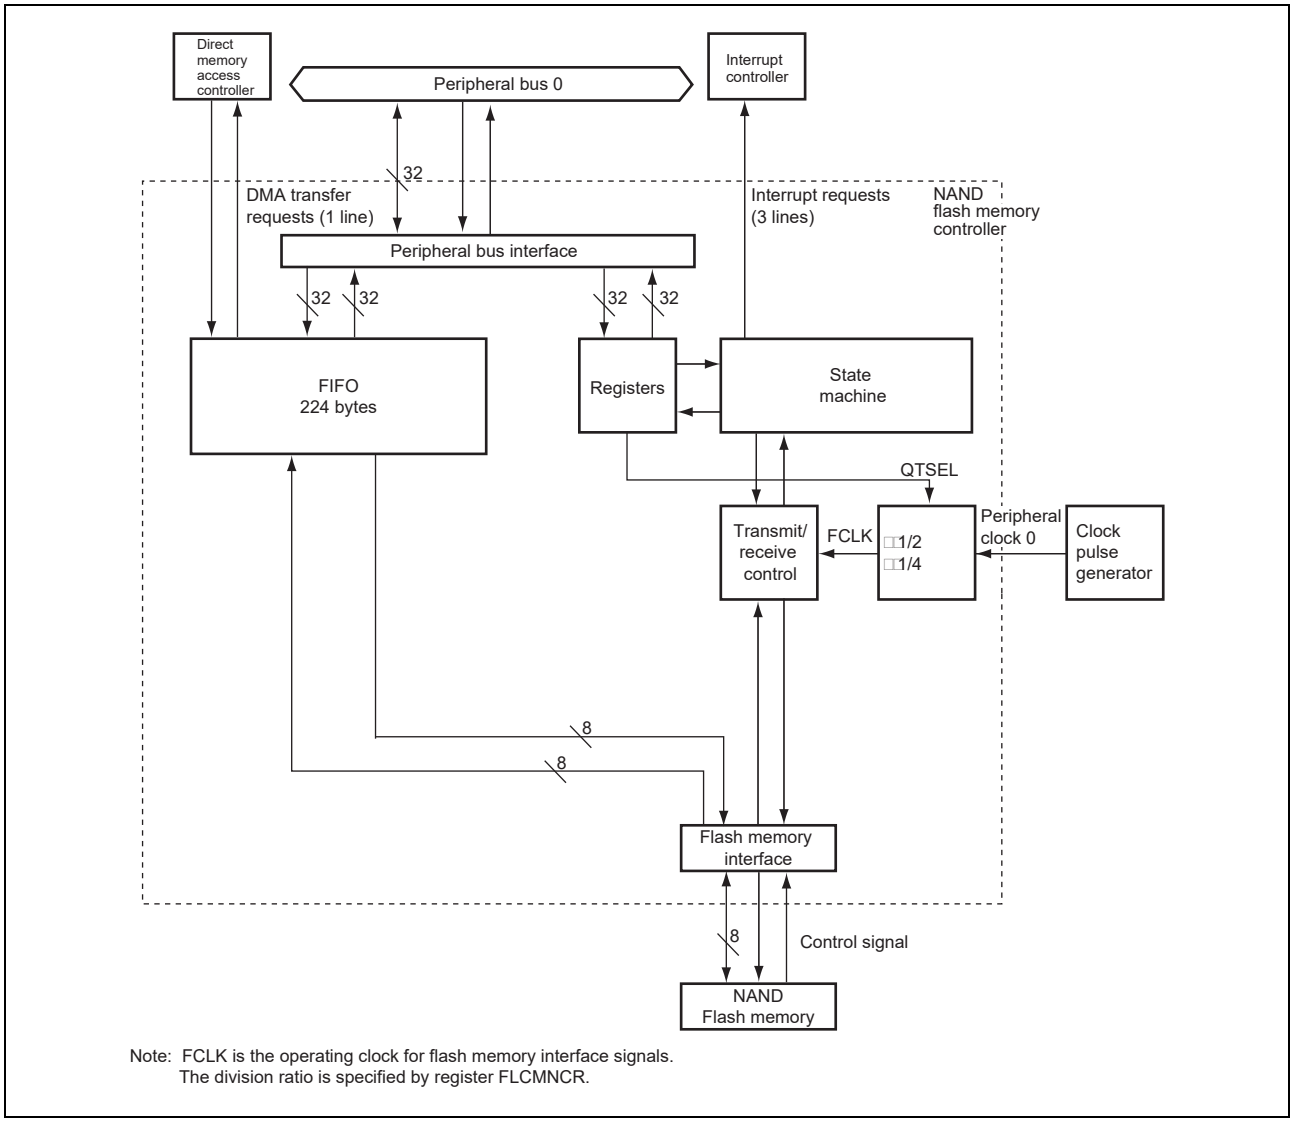

Figure 28.1 Block Diagram

28.2 Input/Output Pins

The pin configuration is listed in Table 28.1.

Table 28.1 Pin Configuration

Pin Name	I/O	Corresponding Flash Memory Pin: NAND Type	Function
$\overline{\text{FCE}}$	Output	$\overline{\text{CE}}$	Flash Memory Chip Enable Enables flash memory connected to this LSI.
NAF7 to NAF0	I/O	I/O7 to I/O0	Flash Memory Data I/O pins for command, address, and data.
FCLE	Output	CLE	Flash Memory Command Latch Enable Asserted when a command is output.
FALE	Output	ALE	Flash Memory Address Latch Enable Asserted when an address is output and negated when data is input or output.
$\overline{\text{FRE}}$	Output	$\overline{\text{RE}}$	Flash Memory Read Enable Reads data at the falling edge of $\overline{\text{RE}}$.
$\overline{\text{FWE}}$	Output	$\overline{\text{WE}}$	Flash Memory Write Enable Flash memory latches a command, address, and data at the rising edge of $\overline{\text{WE}}$.
FRB	Input	R/$\overline{\text{B}}$	Flash Memory Ready/Busy Indicates ready state at high level; indicates busy state at low level.
—*	—	$\overline{\text{WP}}$	Write Protect/Reset When this pin goes low, erroneous erasure or programming at power on or off can be prevented.
—*	—	$\overline{\text{SE}}$	Spare Area Enable Enables access to the spare area. This pin must be fixed at low in sector access mode.

Note: * Not supported in this LSI.

28.3 Register Descriptions

Table 28.2 shows the register configuration.

Table 28.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Common control register	FLCMNCR	R/W	H'00100001	H'FCFF4000	32
Command control register	FLCMDCR	R/W	H'00000000	H'FCFF4004	32

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	SNAND	0	R/W	Large-Capacity NAND Flash Memory Select This bit is used to specify 1-Gbit or larger NAND flash memory with the page configuration of 2048 + 64 bytes. 0: When flash memory with the page configuration of 512 + 16 bytes is used. 1: When NAND flash memory with the page configuration of 2048 + 64 is used.
17	QTSEL	0	R/W	Flash Clock Division Ratio Select Selects the division ratio of clock FCLK in the flash memory. 0: Divides a clock (P0ϕ) provided from the clock pulse generator by two and uses it as FCLK. 1: Divides a clock (P0ϕ) provided from the clock pulse generator by four and uses it as FCLK.
16 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11, 10	ACM[1:0]	00	R/W	Access Mode Specification 1 and 0 Specify access mode. 00: Command access mode 01: Setting prohibited 10: Setting prohibited 11: Setting prohibited
9	NANDWF	0	R/W	NAND Wait Insertion Operation 0: Performs address or data input/output in one FCLK cycle 1: Performs address or data input/output in two FCLK cycles
8 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	CE	0	R/W	Chip Enable 0: Disables the chip (Outputs high level to the $\overline{\text{FCE}}$ pin) 1: Enables the chip (Outputs low level to the $\overline{\text{FCE}}$ pin)
2, 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

28.3.2 Command Control Register (FLCMDCR)

FLCMDCR is a 32-bit readable/writable register that issues a command in command access mode, specifies address issue, and specifies source or destination of data transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADRCNT2	-	-	-	-	-	CDSRC	DOSR	-	-	SELRW	DOADR	ADRCNT[1:0]		DOCMD2	DOCMD1
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

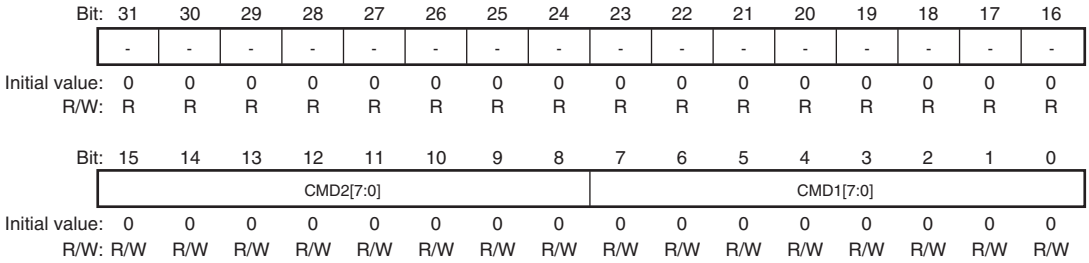
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	ADRCNT2	0	R	Address Issue Byte Count Specification 2 Specifies the number of bytes for the address data to be issued in address stage. This bit is used together with ADRCNT[1:0]. 0: Issues the address of byte count, specified by ADRCNT[1:0]. 1: Issues 5-byte address. ADRCNT[1:0] should be set to 00.
30 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	CDSRC	0	R/W	Data Buffer Specification Specifies the data buffer to be read from or written to in the data stage in command access mode. 0: Specifies FLDATAR as the data buffer. 1: Specifies FLDTFIFO as the data buffer.
24	DOSR	0	R/W	Status Read Check Specifies whether or not the status read is performed after the second command has been issued in command access mode. 0: Performs no status read 1: Performs status read
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	SELRW	0	R/W	Data Read/Write Specification Specifies the direction of read or write in data stage. 0: Read 1: Write
20	DOADR	0	R/W	Address Stage Execution Specification Specifies whether or not the address stage is executed in command access mode. 0: Performs no address stage 1: Performs address stage
19, 18	ADRCNT[1:0]	00	R/W	Address Issue Byte Count Specification [1:0] Specify the number of bytes for the address data to be issued in address stage. 00: Issue 1-byte address 01: Issue 2-byte address 10: Issue 3-byte address 11: Issue 4-byte address
17	DOCMD2	0	R/W	Second Command Stage Execution Specification Specifies whether or not the second command stage is executed in command access mode. 0: Does not execute the second command stage 1: Executes the second command stage
16	DOCMD1	0	R/W	First Command Stage Execution Specification Specifies whether or not the first command stage is executed in command access mode. 0: Does not execute the first command stage 1: Executes the first command stage

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

28.3.3 Command Code Register (FLCMCDR)

FLCMCDR is a 32-bit readable/writable register that specifies a command code to be issued in command access.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	CMD2[7:0]	H'00	R/W	Second Command Data Specify a command code to be issued in the second command stage.
7 to 0	CMD1[7:0]	H'00	R/W	First Command Data Specify a command code to be issued in the first command stage.

28.3.4 Address Register (FLADR)

FLADR is a 32-bit readable/writable register that specifies the value to be output as an address. The address of the size specified by ADRCNT[1:0] in the command control register is output sequentially from ADR1 in byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADR4[7:0]								ADR3[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADR2[7:0]								ADR1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ADR4[7:0]	H'00	R/W	Fourth Address Data Specify 4th data to be output to flash memory as an address.
23 to 16	ADR3[7:0]	H'00	R/W	Third Address Data Specify 3rd data to be output to flash memory as an address.
15 to 8	ADR2[7:0]	H'00	R/W	Second Address Data Specify 2nd data to be output to flash memory as an address.
7 to 0	ADR1[7:0]	H'00	R/W	First Address Data Specify 1st data to be output to flash memory as an address.

28.3.5 Address Register 2 (FLADR2)

FLADR2 is a 32-bit readable/writable register, and is valid when the ADRCNT2 bit in FLCMDCR is set to 1. FLADR2 specifies the value to be output as an address in command access mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ADR5[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	ADR5[7:0]	H'00	R/W	Fifth Address Data Specify the 5th data to be output to flash memory as an address.

28.3.6 Data Counter Register (FLDTCNTR)

FLDTCNTR is a 32-bit readable/writable register that specifies the number of bytes to be read or written in command access mode.

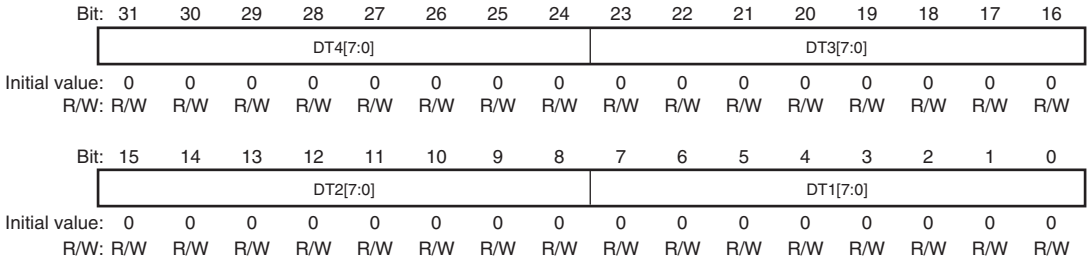
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	DTFLW[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	DTCNT[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	DTFLW[7:0]	H'00	R	FLDTFIFO Access Count Specify the number of longwords in FLDTFIFO to be read or written. These bit values are used when the CPU reads from or writes to FLDTFIFO. In FLDTFIFO read, these bits specify the number of longwords of the data that can be read from FLDTFIFO. In FLDTFIFO write, these bits specify the number of longwords of unoccupied area that can be written in FLDTFIFO.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	DTCNT[11:0]	H'000	R/W	Data Count Specification Specify the number of bytes of data to be read or written in command access mode. (Up to 2048 + 64 bytes for writing to and 128 bytes for reading from flash memory can be specified.)

28.3.7 Data Register (FLDATAR)

FLDATAR is a 32-bit readable/writable register. It stores input/output data used when 0 is written to the CDSRC bit in FLCMDCR in command access mode. FLDATAR cannot be used for reading or writing of five or more bytes of contiguous data.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DT4[7:0]	H'00	R/W	Fourth Data Specify the 4th data to be input or output via the NAF7 to NAF0 pins. In write: Specify write data In read: Store read data
23 to 16	DT3[7:0]	H'00	R/W	Third Data Specify the 3rd data to be input or output via the NAF7 to NAF0 pins. In write: Specify write data In read: Store read data
15 to 8	DT2[7:0]	H'00	R/W	Second Data Specify the 2nd data to be input or output via the NAF7 to NAF0 pins. In write: Specify write data In read: Store read data
7 to 0	DT1[7:0]	H'00	R/W	First Data Specify the 1st data to be input or output via the NAF7 to NAF0 pins. In write: Specify write data In read: Store read data

28.3.8 Interrupt DMA Control Register (FLINTDMACR)

FLINTDMACR is a 32-bit readable/writable register that enables or disables DMA transfer requests or interrupts. A transfer request from this module to the direct memory access controller is issued after each access mode has been started.

Bits 9 to 5 are the flag bits that indicate various errors occurred in flash memory access and whether there is a transfer request from the FIFO. Only 0 can be written to these bits. To clear a flag, write 0 to the target flag bit and 1 to the other flag bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	FIFOTRG [1:0]		-	AC0 CLR	-	DREQ0 EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	ST ERB	BTO ERB	-	TRR EQF0	STER INTE	RBER INTE	TE INTE	-	TR INTE0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/(W)*	R/(W)*	R	R/(W)*	R/W	R/W	R/W	R	R/W

Note: * Only 0 can be written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	FIFOTRG[1:0]	00	R/W	FIFO Trigger Setting Specify the condition (as a number of bytes) for generation of FLDTFIFO transfer requests. • In flash-memory read Issue an interrupt to the CPU or issue a DMA transfer request when FLDTFIFO stores the following number of bytes or more: 00: 4 01: 16 10: 128 11: 128 • In flash-memory programming Issue an interrupt to the CPU or issue a DMA transfer request when FLDTFIFO has the following empty area of bytes or more: 00: 4 01: 16 10: 128 11: 128 Note: For DMA transfer from/to FLDTFIFO, setting 10 and 11 are prohibited.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	AC0CLR	0	R/W	FLDTFIFO Clear Clears FLDTFIFO. 0: Retains the FLDTFIFO value. In flash-memory access, this bit should be cleared to 0. 1: Clears FLDTFIFO. After FLDTFIFO has been cleared, this bit should be cleared to 0. Note: When FLDTFIFO is to be used in reading data from flash memory, be sure to clear FLDTFIFO before the reading starts.
17	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
16	DREQ0EN	0	R/W	FLDTFIFODMA Request Enable Enables or disables the DMA transfer request issued from FLDTFIFO. 0: Disables the DMA transfer request issued from the FLDTFIFO 1: Enables the DMA transfer request issued from the FLDTFIFO
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	STERB	0	R/(W)*	Status Error Indicates the result of status read. This bit is set to 1 if the specific bit in the bits STAT[7:0] in FLBSYCNT is set to 1 in status read. This bit is a flag. 1 cannot be written to this bit. Only 0 can be written to clear the flag. 0: Indicates that no status error occurs (the specific bit in the bits STAT[7:0] in FLBSYCNT is 0.) 1: Indicates that a status error occurs For details on the specific bit in STAT7 to STAT0 bits, see section 28.4.4, Status Read.
7	BTOERB	0	R/(W)*	R/$\overline{B}$ Timeout Error This bit is set to 1 if an R/$\overline{B}$ timeout error occurs (the bits RBTIMCNT[19:0] in FLBSYCNT are decremented to 0). This bit is a flag. 1 cannot be written to this bit. Only 0 can be written to clear the flag. 0: Indicates that no R/$\overline{B}$ timeout error occurs 1: Indicates that an R/$\overline{B}$ timeout error occurs
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5	TRREQF0	0	R/(W)*	FLDTFIFO Transfer Request Flag Indicates that a transfer request is issued from FLDTFIFO. This bit is a flag. 1 cannot be written to this bit. Only 0 can be written to clear the flag. 0: Indicates that no transfer request is issued from FLDTFIFO 1: Indicates that a transfer request is issued from FLDTFIFO
4	STERINTE	0	R/W	Interrupt Enable at Status Error Enables or disables an interrupt request to the CPU when a status error has occurred. 0: Disables the interrupt request to the CPU by a status error 1: Enables the interrupt request to the CPU by a status error
3	RBERINTE	0	R/W	Interrupt Enable at R/$\overline{B}$ Timeout Error Enables or disables an interrupt request to the CPU when a timeout error has occurred. 0: Disables the interrupt request to the CPU by an R/$\overline{B}$ timeout error 1: Enables the interrupt request to the CPU by an R/$\overline{B}$ timeout error
2	TEINTE	0	R/W	Transfer End Interrupt Enable Enables or disables an interrupt request to the CPU when a transfer has been ended (TREND bit in FLTRCR). 0: Disables the transfer end interrupt request to the CPU 1: Enables the transfer end interrupt request to the CPU
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	TRINTE0	0	R/W	FLDTFIFO Transfer Request Enable to CPU Enables or disables an interrupt request to the CPU by a transfer request issued from FLDTFIFO. 0: Disables an interrupt request to the CPU by a transfer request from FLDTFIFO 1: Enables an interrupt request to the CPU by a transfer request from FLDTFIFO When the DMA transfer is enabled, this bit should be cleared to 0.

Note: * Only 0 can be written to these bits.

28.3.9 Ready Busy Timeout Setting Register (FLBSYTMR)

FLBSYTMR is a 32-bit readable/writable register that specifies the timeout time when the FRB pin is busy.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	RBTMOUT[19:16]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RBTMOUT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 0	RBTMOUT [19:0]	H'00000	R/W	Ready Busy Timeout Specify timeout time (the number of P0ϕ clocks) in busy state. When these bits are set to 0, timeout is not generated.

28.3.10 Ready Busy Timeout Counter (FLBSYCNT)

FLBSYCNT is a 32-bit read-only register.

The status of flash memory obtained by the status read is stored in the bits STAT[7:0].

The timeout time set in the bits RBTMOUT[19:0] in FLBSYTMR is copied to the bits RBTIMCNT[19:0] and counting down is started when the FRB pin is placed in a busy state. When values in the RBTIMCNT[19:0] become 0, 1 is set to the BTOERB bit in FLINTDMACR, thus notifying that a timeout error has occurred. In this case, an FLSTE interrupt request can be issued if an interrupt is enabled by the RBERINTE bit in FLINTDMACR.

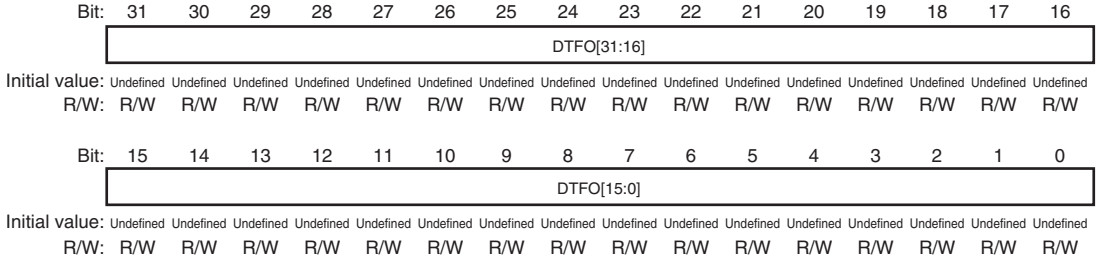
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STAT[7:0]								-	-	-	-	RBTIMCNT[19:16]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RBTIMCNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	STAT[7:0]	H'00	R	Indicate the flash memory status obtained by the status read.
23 to 20	—	All 0	R	Reserved These bits are always read as 0.
19 to 0	RBTIMCNT [19:0]	H'00000	R	Ready Busy Timeout Counter When the FRB pin is placed in a busy state, the values of the bits RBTMOUT[19:0] in FLBSYTMR are copied to these bits. These bits are counted down while the FRB pin is busy. A timeout error occurs when these bits are decremented to 0.

28.3.11 Data FIFO Register (FLDTFIFO)

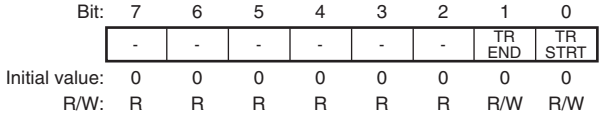
FLDTFIFO is used to read or write the data FIFO area.
In DMA transfer, this register must be specified as the destination or source.
Note that the direction of read or write specified by the SELRW bit in FLCMDCR must match that specified in this register. When changing the read/write direction, FLDTFIFO should be cleared by setting the AC0CLR bit in FLINTDMACR before use.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DTFO[31:0]	H'xxxxxxxx	R/W	Data FIFO Area Read/Write Data In write: Data in this register is written to the data FIFO area. In read: Data read from the data FIFO area is stored in this register.

28.3.12 Transfer Control Register (FLTRCR)

Setting the TRSTRT bit to 1 initiates access to flash memory. Access completion can be checked by the TREND bit. During the transfer (from when the TRSTRT bit is set to 1 until the TREND bit is set to 1), the processing should not be forcibly ended (by setting the TRSTRT bit to 0).
When reading from flash memory, TREND is set when reading from flash memory have been finished. However, if there is any read data remaining in the FIFO, the processing should not be forcibly ended until all data has been read from the FIFO.



Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	TREND	0	R/W	Processing End Flag Bit Indicates that the processing performed in the specified access mode has been completed. The write value should always be 0.
0	TRSTRT	0	R/W	Transfer Start By setting this bit from 0 to 1 when the TREND bit is 0, processing in the access mode specified by the access mode specification bits ACM[1:0] is initiated. 0: Stops transfer 1: Starts transfer

28.4 Operation

28.4.1 Access Sequence

This module performs accesses in several independent stages.
For example, NAND-type flash memory programming consists of the following five stages.

- First command issue stage (program setup command)
- Address issue stage (program address)
- Data stage (output)
- Second command issue stage (program start command)
- Status read stage

NAND-type flash memory programming access is achieved by executing these five stages sequentially. An access to flash memory is completed at the end of the final stage (status read stage).

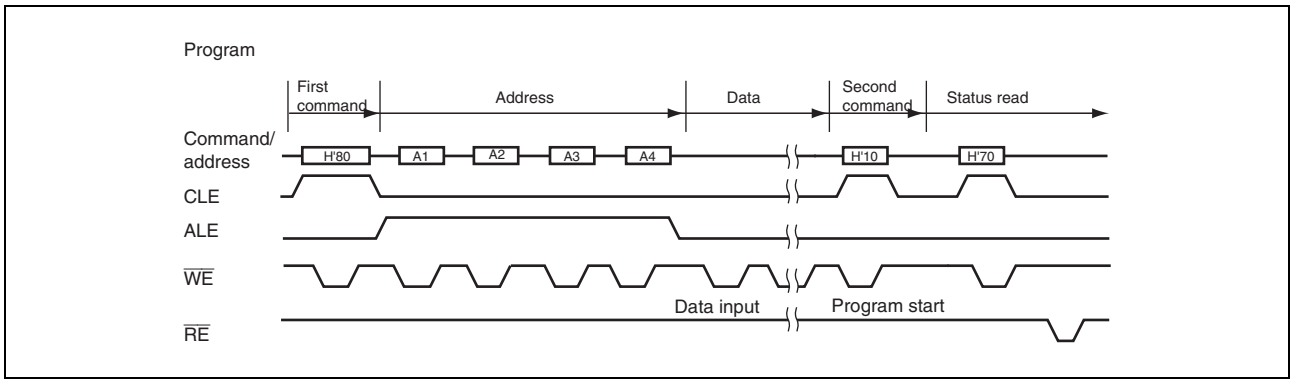


Figure 28.2 Programming Operation for NAND-Type Flash Memory and Stages

For details on NAND-type flash memory read operation, see section 28.4.3, Command Access Mode.

28.4.2 Register Setting Procedure

Figure 28.3 shows the register setting flow required for accessing the flash memory.

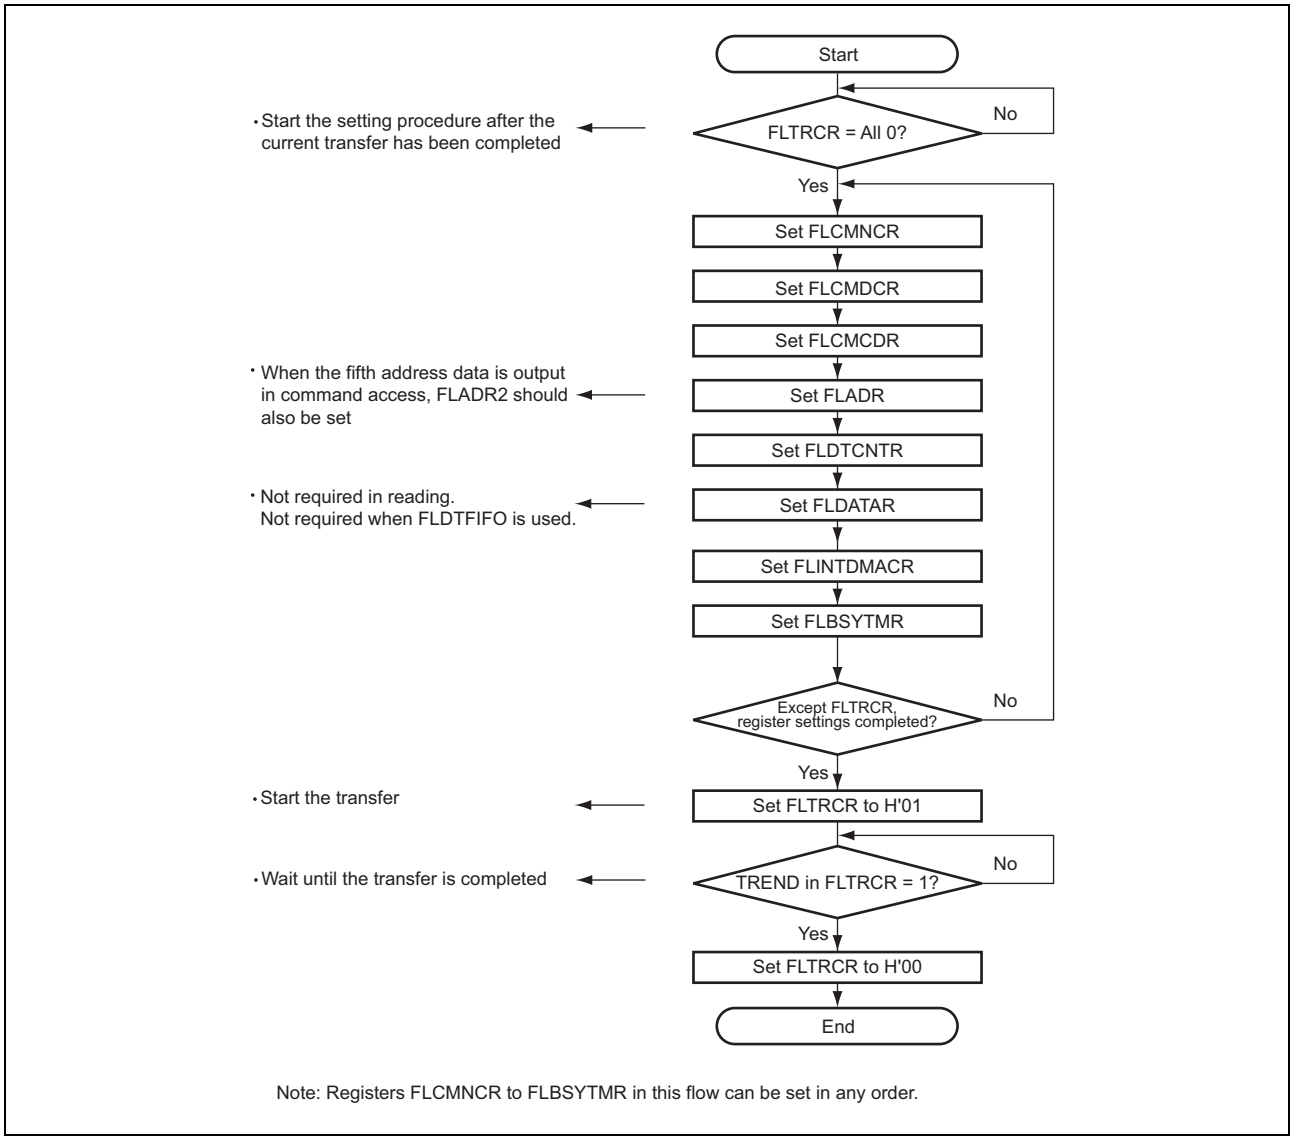

Figure 28.3 Register Setting Flow

28.4.3 Command Access Mode

Command access mode accesses flash memory by specifying a command to be issued to flash memory, address, data, read/write direction, and number of times to the registers. In this mode, I/O data can be transferred by the DMA via FLDTFIFO.

(1) NAND-Type Flash Memory Access

Figure 28.4 shows an example of read operation for NAND-type flash memory. In this example, the first command is specified as H'00, address data length is specified as 3 bytes, and the number of read bytes is specified as 8 bytes in the data counter.

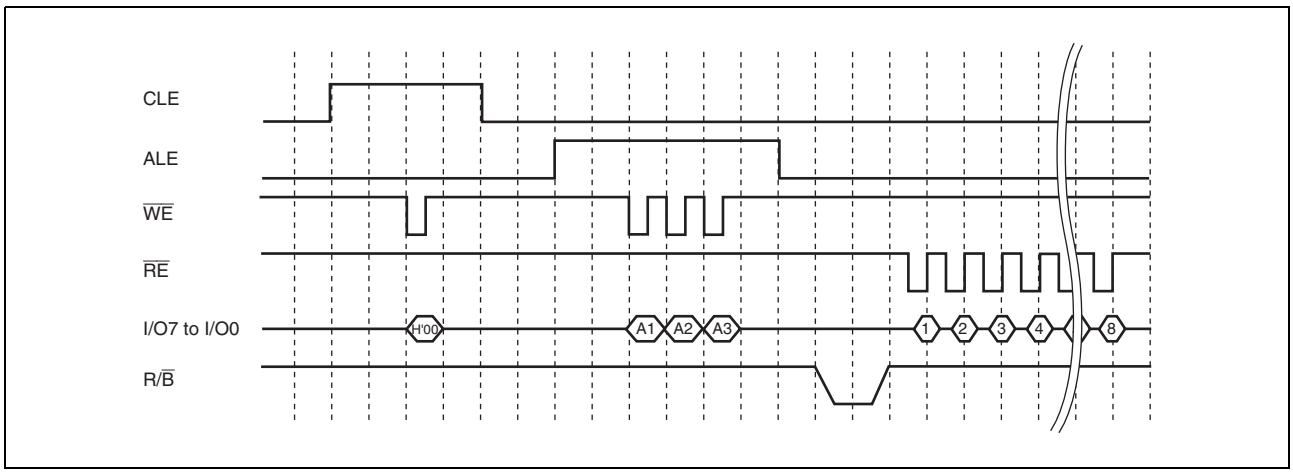

Figure 28.4 Read Operation Timing for NAND-Type Flash Memory

Figure 28.5 and Figure 28.6 show examples of programming operation for NAND-type flash memory.

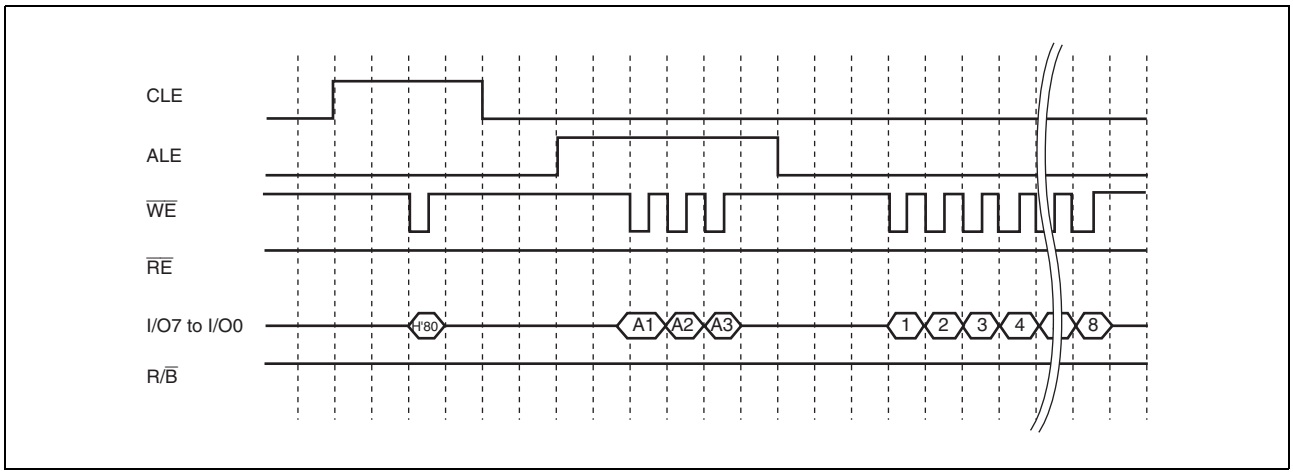

Figure 28.5 Programming Operation Timing for NAND-Type Flash Memory (1)

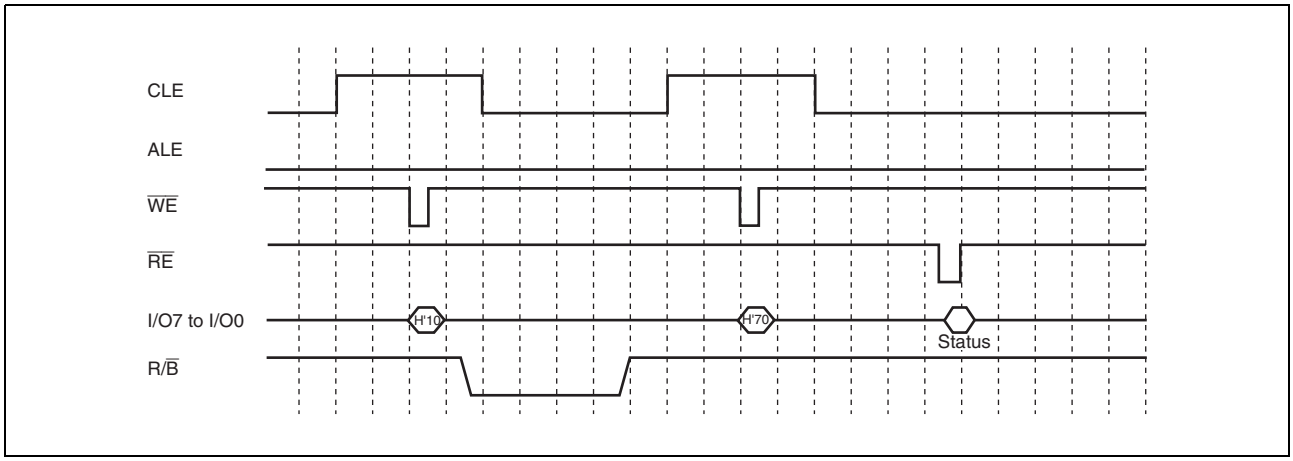

Figure 28.6 Programming Operation Timing for NAND-Type Flash Memory (2)

(2) NAND-Type Flash Memory (2048 + 64 Bytes) Access

Figure 28.7 shows an example of read operation for NAND-type flash memory (2048 + 64 bytes). In this example, the first command is specified as H'00, the second command is specified as H'30, and address data length is specified as 4 bytes. The number of read bytes is specified as 4 bytes in the data counter.

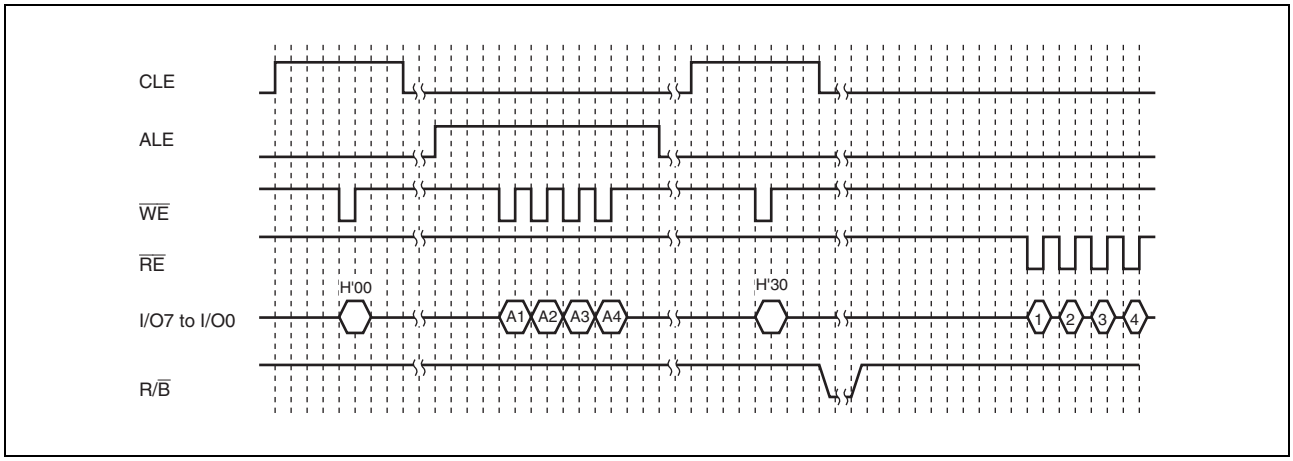

Figure 28.7 Read Operation Timing for NAND-Type Flash Memory

Figure 28.8 and Figure 28.9 show examples of programming operation for NAND-type flash memory (2048 + 64 bytes).

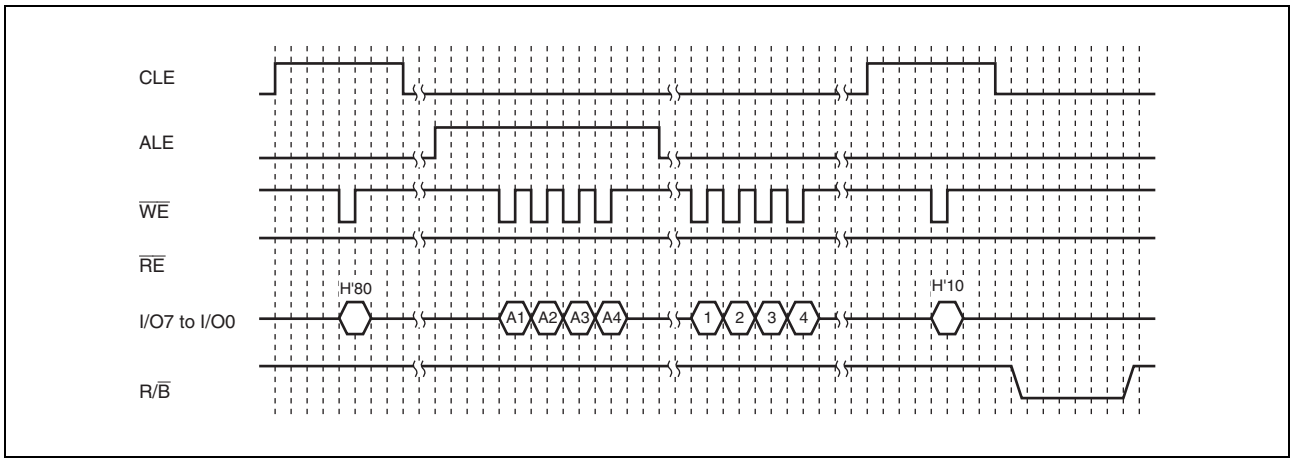

Figure 28.8 Programming Operation Timing for NAND-Type Flash Memory (1)

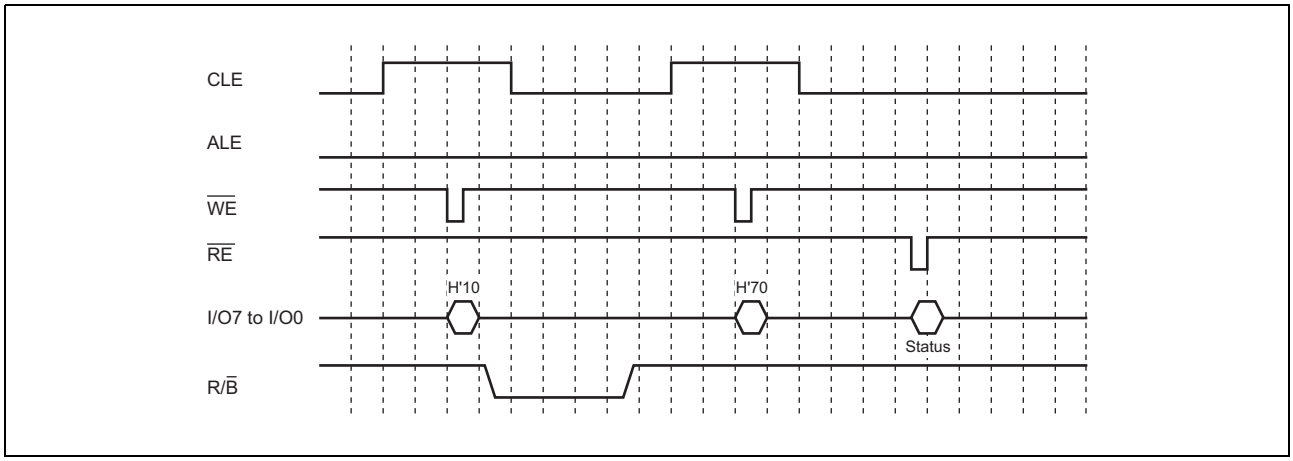

Figure 28.9 Programming Operation Timing for NAND-Type Flash Memory (2)

28.4.4 Status Read

This module can read the status register of a NAND-type flash memory. The data in the status register is input through the I/O7 to I/O0 pins and stored in the bits STAT[7:0] in FLBSYCNT, which can be read by the CPU. If a program error or erase error is detected when the status register value is stored in the bits STAT[7:0] in FLBSYCNT, the STERB bit in FLINTDMACR is set to 1 and generates an interrupt to the CPU if the STERINTE bit in FLINTDMACR is enabled. If a status error occurs during continuous sector access, the TREND bit in FLTRCR is set to 1 and the procedure stops.

(1) Status Read of NAND-Type Flash Memory

The status register of NAND-type flash memory can be read by inputting command H'70 to NAND-type flash memory. If programming is executed in command access mode or sector access mode while the DOSR bit in FLCMDCR is set to 1, this module automatically inputs command H'70 to NAND-type flash memory and reads the status register. When the status register of NAND-type flash memory is read, the I/O7 to I/O0 pins indicate the following information as described in Table 28.3.

Table 28.3 Status Read of NAND-Type Flash Memory

I/O	Status (definition)	Description
I/O7	Program protection	0: Cannot be programmed 1: Can be programmed
I/O6	Ready/busy	0: Busy state 1: Ready state
I/O5 to I/O1	Reserved	—
I/O0	Program/erase	0: Pass 1: Fail

28.5 Interrupt Processing

This module has four interrupt sources: Status error, ready/busy timeout error, transfer end, and FIFO0 transfer request. Each of the interrupt sources has its corresponding interrupt flag and the interrupt can be requested independently to the CPU if the interrupt is enabled by the interrupt enable bit. Note that the status error and ready/busy timeout error use the common FLSTE interrupt to the CPU.

Table 28.4 Interrupt Requests

Interrupt Source	Interrupt Flag	Enable Bit	Description	Priority
FLSTE interrupt	STERB	STERINTE	Status error	High
	BTOERB	RBERINTE	Ready/busy timeout error	
FLTEND interrupt	TREND	TEINTE	Transfer end	
FLTRQ0 interrupt	TRREQF0	TRINTE0	FIFO0 transfer request	Low

28.6 DMA Transfer Settings

For details on settings of the direct memory access controller, see section 9, Direct Memory Access Controller.

28.7 Usage Notes

28.7.1 Usage Note for the SNAND Bit

When the SNAND bit in FLCMNCR is 1, both the first and second commands are executed regardless of the settings of the DOCMD1 and DOCMD2 bits in FLCMDCR.
When no command or only the first command is issued, 0 should be written to the SNAND bit.

29. USB2.0 Host/Function Module

This LSI includes a two-channel USB 2.0 host/function module. This module is a USB controller which provides capabilities as a USB host controller and USB function controller.
This module supports high-speed transfer, full-speed transfer, and low-speed transfer defined by USB (Universal Serial Bus) Specification 2.0, when used as the host controller, and supports high-speed transfer and full-speed transfer defined by USB (Universal Serial Bus) Specification 2.0, when used as the function controller.
This module supports all of the transfer types defined by the USB Specification. This module has an 8-Kbyte buffer memory for data transfer, providing a maximum of 16 pipes. Any endpoint numbers can be assigned to PIPE1 to PIPE15, based on the peripheral devices or user system for communication.

29.1 Features

(1) Host Controller and Function Controller Supporting USB High-Speed Operation

- The USB host controller and USB function controller are incorporated.
- The USB host controller and USB function controller can be switched by register settings.
- On-chip USB transceiver

(2) All Types of USB Transfers Supported

All types of USB transfers including isochronous transfer are supported.

- Control transfer
- Bulk transfer
- Interrupt transfer (high bandwidth transfers not supported)
- Isochronous transfer (high bandwidth transfers not supported)

(3) Internal Bus Interfaces

- Two DMA interfaces available for each channel

(4) Pipe Configuration

- Up to 8 Kbytes of buffer memory for USB communications are supported for each channel
- Up to sixteen pipes can be selected per channel (including the default control pipe)
- Programmable pipe configuration
- Endpoint numbers can be assigned flexibly to PIPE1 to PIPE15.
- Transfer conditions that can be set for each pipe:

PIPE0:	Control transfer, 256-byte fixed single buffer
PIPE1 and PIPE2:	Bulk transfer or isochronous transfer can be selected, continuous transfer mode, programmable buffer size (up to 2 Kbytes: double buffer can be specified)
PIPE3 to PIPE5:	Bulk transfer, continuous transfer mode, programmable buffer size (up to 2 Kbytes: double buffer can be specified)
PIPE6 to PIPE8:	Interrupt transfer, 64-byte fixed single buffer
PIPE9:	Bulk transfer (only when the function controller mode is selected) Interrupt transfer (only when the host controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified only when bulk transfer has been selected)
PIPE10	Bulk transfer or interrupt transfer can be selected (only when the function controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified only when bulk transfer has been selected)

PIPE11 to PIPE15: Bulk transfer (only when the function controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified)

(5) Features of the USB Host Controller

- High-speed transfer (480 Mbps), full-speed transfer (12 Mbps), and low-speed transfer (1.5 Mbps) are supported.
- Communications with multiple peripheral devices connected via a single HUB
- Automatic response to the reset handshake
- Automatic scheduling for SOF and packet transmissions
- Programmable intervals for isochronous and interrupt transfers

(6) Features of the USB Function Controller

- High-speed transfer (480 Mbps) and full-speed transfer (12 Mbps) are supported.
- Automatic recognition of high-speed operation or full-speed operation based on automatic response to the reset handshake
- Control transfer stage monitoring function
- Device state monitoring function
- Auto response function for SET_ADDRESS request
- NAK response interrupt function (NRDY)
- SOF interpolation function

(7) Other Features

- Transfer ending function using transaction count
- BRDY interrupt event notification timing change function (BFRE)
- Function that automatically clears the buffer memory after the data for the pipe specified at the DnFIFO port has been read (DCLRM)
- NAK setting function for response PID generated by end of transfer (SHTNAK)

29.2 Input/Output Pins

Table 29.1 shows the pin configuration.

Table 29.1 Pin Configuration

Channel	Name	Abbreviation	I/O	Function
0	USB D+ data	DP0	Input/ Output	The D+ input/output pin of the on-chip USB transceiver Connect this pin to the D+ pin of the USB bus.
	USB D- data	DM0	Input/ Output	The D- input/output pin of the on-chip USB transceiver Connect this pin to the D- pin of the USB bus.
	VBUS input	VBUS0	Input	A pin for monitoring connection of the USB cable Connect this pin to the Vbus pin of the USB bus so that it can detect connection and disconnection of the Vbus pin. When it is not connected to the Vbus pin of the USB, It should be fixed to 5 V. Also supply 5 V to this pin when the host controller mode is selected. Note: This module is not capable of supplying Vbus power to connected peripheral devices.
1	USB D+ data	DP1	Input/ Output	The D+ input/output pin of the on-chip USB transceiver Connect this pin to the D+ pin of the USB bus.
	USB D- data	DM1	Input/ Output	The D- input/output pin of the on-chip USB transceiver Connect this pin to the D- pin of the USB bus.
	VBUS input	VBUS1	Input	A pin for monitoring connection of the USB cable Connect this pin to the Vbus pin of the USB bus so that it can detect connection and disconnection of the Vbus pin. When it is not connected to the Vbus pin of the USB, It should be fixed to 5 V. Also supply 5 V to this pin when the host controller mode is selected. Note: This module is not capable of supplying Vbus power to connected peripheral devices.
Common	Reference input	REFRIN	Input	A pin for connecting the reference resistor Connect this pin to the USBAPVss pin through a resistor with a value of 5.6 kΩ ± 1%. (QFP package) Connect this pin to the Vss pin through a resistor with a value of 5.6 kΩ ± 1%. (BGA package)
	USB crystal oscillator/external clock	USB_X1	Input	Connect this pin to the crystal oscillator for USB. An external clock can also be input to the USB_X1 pin.
		USB_X2	Output	
	Transceiver digital core power*	USBDVcc	Input	Power supply for the module's digital core
	Transceiver digital core ground*	USBDVss	Input	Ground for the module's digital core
	Transceiver digital pin power source*	USBDPVcc	Input	Power supply for pins
	Transceiver digital pin ground*	USBDPVss	Input	Ground for pins
	Transceiver analog pin power source	USBAPVcc	Input	Power supply for pins
	Transceiver analog pin ground*	USBAPVss	Input	Ground for pins
	Transceiver analog core power	USBAVcc	Input	Power supply for the module's analog core
	Transceiver analog core ground*	USBAVss	Input	Ground for the module's analog core
	Power source for the UTMI module*	USBUVcc	Input	Power supply for operation at 480 MHz
	Ground for the UTMI module*	USBUVss	Input	Power supply for operation at 480 MHz

Note: * These pins are not available in the BGA package products.

29.3 Register Descriptions

Table 29.2 shows the register configuration of this module.

Table 29.2 Register Configuration

Channel	Register Name	Abbreviation	R/W	Address	Access Size

29.3.1 System Configuration Control Register (SYSCFG0)

SYSCFG is a register that enables high-speed operation, selects the host controller mode or function controller mode, controls the DP and DM pins, and enables operation of this module.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	HSE	DCFM	DRPD	DPRPU	—	UCK SEL	UPLLE	USBE
Initial value:	—	—	—	—	—	—	—	0	0	0	1	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7	HSE	0	R/W	High-Speed Operation Enable 0: High-speed operation is disabled When the function controller mode is selected: Only full-speed operation is enabled. When the host controller mode is selected: Full-speed or low-speed operation is enabled. 1: High-speed operation is enabled (communication speed is detected by this module) (1) When the host controller mode is selected When HSE = 0, the USB port performs low-speed or full-speed operation. Set HSE to 0 when connection of a low-speed peripheral device to the USB port has been detected. When HSE = 1, this module executes the reset handshake protocol, and automatically allows the USB port to perform high-speed or full-speed operation according to the protocol execution result. This bit should be modified after detecting device connection (after detecting the ATTCH interrupt) and before executing a USB bus reset (before setting USBRST to 1). (2) When the function controller mode is selected When HSE = 0, this module performs full-speed operation. When HSE = 1, this module executes the reset handshake protocol, and automatically performs high-speed or full-speed operation according to the protocol execution result. This bit should be modified while DPRPU is 0.
6	DCFM	0	R/W	Controller Mode Select Selects the host controller mode or function controller mode. 0: Function controller mode is selected. 1: Host controller mode is selected. This bit should be modified while DPRPU and DRPD are 0.
5	DRPD	1	R/W	D+/D− Line Resistor Control Enables or disables pulling down D+ and D- lines when the host controller mode is selected. 0: Pulling down the lines is disabled. 1: Pulling down the lines is enabled. This bit should be set to 1 if the host controller mode is selected, and should be set to 0 if the function controller mode is selected.

Bit	Bit Name	Initial Value	R/W	Description
4	DPRPU	0	R/W	D+ Line Resistor Control Enables or disables pulling up D+ line when the function controller mode is selected. 0: Pulling up the line is disabled. 1: Pulling up the line is enabled. Setting this bit to 1 when the function controller mode is selected allows this module to pull up the D+ line, thus notifying the USB host of connection. Modifying this bit from 1 to 0 allows this module to cancel pulling up the D+ line, thus notifying the USB host of disconnection. This bit should be set to 1 if the function controller mode is selected, and should be set to 0 if the host controller mode is selected.
3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2	UCKSEL*1	0	R/W	Input Clock Selection Selects the clock to be supplied to this module from 48-MHz USB_X1 or 12-MHz EXTAL. 0: The 48-MHz USB_X1 clock is selected. 1: The 12-MHz EXTAL clock is selected. This bit should be modified while SUSPMODE.SUSPM for channel 0 and channel 1 is 0. Note that this bit is available only in channel 0 (SYSCFG0_0). Make the required setting for SYSCFG0_0 to use channel 1.
1	UPLLE*1	0	R/W	USB Internal PLL Operation Enable Enables or disables operation of the internal PLL of the USB block. 0: Disables operation of the internal PLL. 1: Enables operation of the internal PLL. This bit should be modified while SUSPMODE.SUSPM for channel 0 and channel 1 is 0. Set this bit to 0 when this module is to enter software standby or USB standby mode. Note that this bit is available only in channel 0 (SYSCFG0_0). Make the required setting for SYSCFG0_0 to use channel 1.
0	USBE	0	R/W	USB Module Operation Enable Enables or disables operation of this module. 0: USB module operation is disabled. 1: USB module operation is enabled. Modifying this bit from 1 to 0 initializes some register bits as listed in Table 29.3 and Table 29.4. This bit should be modified while SUSPMODE.SUSPM is 1. When the host controller mode is selected, this bit should be set to 1 after setting DPRD to 1, eliminating LNST bit chattering, and checking that the USB bus has been settled.

Note: • Writing to this register is possible even while the clock supply to this module is stopped (SUSPM = 0).
Note 1. UCKSEL and UPLLE are available only in channel 0 (SYSCFG0_0).

Table 29.3 Register Bits Initialized by Writing USBE = 0 (when Function Controller Mode is Selected)

Register Name	Bit Name	Remarks
SYSSTS0	LNST	The value is retained when the host controller mode is selected.
DVSTCTR0	RHST	
INTSTS0	DVSQ	The value is retained when the host controller mode is selected.
USBADDR	USBADDR	The value is retained when the host controller mode is selected.
USEREQ	BRequest, bmRequestType	The values are retained when the host controller mode is selected.
USBVAL	wValue	The value is retained when the host controller mode is selected.
USBINDX	wIndex	The value is retained when the host controller mode is selected.
USBLENG	wLength	The value is retained when the host controller mode is selected.

Table 29.4 Register Bits Initialized by Writing USBE = 0 (when Host Controller Mode is Selected)

Register Name	Bit Name	Remarks
DVSTCTR	RHST	
FRMNUM	FRNM	The value is retained when the function controller mode is selected.
UFRMNUM	UFRNM	The value is retained when the function controller mode is selected.

29.3.2 CPU Bus Wait Setting Register (BUSWAIT)

BUSWAIT is a register that specifies the number of wait cycles to be inserted during an access from the CPU to this module.
This register can be modified even when the SUSPM bit in SUSPMODE is 0.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BWAIT[5:0]					
Initial value:	—	—	0	0	1	1	1	1	—	—	0	0	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
13, 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 0.
7, 6	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
5 to 0	BWAIT[5:0]	001111	R/W	CPU Bus Wait Specifies the number of wait cycles to be inserted during an access to this module. 000000: 0 wait cycles (2 access cycles) : 000010: 2 wait cycles (4 access cycles) : 000100: 4 wait cycles (6 access cycles) : 001111: 15 wait cycles (17 access cycles) (initial value) : 111111: 63 wait cycles (65 access cycles) There is the following constraint imposed on the cycle period required to access SYSSTS0 and the subsequent registers of this module: Wait constraint: The cycle period required to consecutively access registers of this controller must be at least 67 ns. To satisfy this constraint, it is necessary to exercise wait control according to the frequency of peripheral clock 1 (P1ϕ). The initial value is 17 clock cycles. Select an appropriate value. This setting is also applied to the accesses to the FIFO port registers. The maximum access speeds for the FIFO ports are as follows: MBW = 10 (32-bit width): up to 60 MBytes/sec MBW = 01 (16-bit width): up to 30 MBytes/sec MBW = 00 (8-bit width): up to 15 MBytes/sec

29.3.3 System Configuration Status Register (SYSSTS0)

SYSSTS is a register that monitors the line status (D+ and D– lines) of the USB data bus.
This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	HTACT	SOFEA	—	—	—	LNST[1:0]	
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6	HTACT	Undefined	R	USB Host Sequencer Status Monitor Indicates the status of the host sequencer. 0: Stopped 1: Running This bit is set to 0 when the host sequencer in this controller is completely stopped. Make sure that the HTACT bit is set to 0 to put this controller in the USB suspended state by setting the UACT bit to 0 and stop the clock by setting the SUSPM bit to 0 in the host-mode communication state.
5	SOFEA	Undefined	R	SOF Active Monitor when the Host Controller Mode Is Selected Indicates the SOF output status. 0: SOF output stopped 1: SOF output in progress This bit allows checking if the last SOF has been output after setting the UACT bit to 0 when putting this controller in the USB suspended state with the host controller mode selected. To set the SUSPM bit to 0 (to stop the clock) after stopping this controller by setting the USBE bit to 0 in the host-mode communication state, make sure that both the HTACT bit and the SOFEA bit are set to 0.
4 to 2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
1, 0	LNST[1:0]	Undefined	R	USB Data Line Status Monitor Indicates the status of the USB data bus lines (D+ and D-) as shown in Table 29.5. These bits should be read after setting DPRPU to 1 to notify connection when the function controller mode is selected; whereas after setting DRPD to 1 to enable pulling down the lines when the host controller mode is selected.

Table 29.5 USB Data Bus Line States

LNST[1]	LNST[0]	During Low-Speed Operation (Only when Host Controller Mode is Selected)	During Full-Speed Operation	During High-Speed Operation	During Chirp Operation
0	0	SE0	SE0	Squelch	Squelch
0	1	K state	J state	UnSquelch	Chirp J
1	0	J state	K state	Invalid	Chirp K
1	1	SE1	SE1	Invalid	Invalid

[Legend]
Chirp: The reset handshake protocol (RHSP) is being executed in high-speed operation enabled state (the HSE bit in SYSCFG is set to 1).
Squelch: SE0 or idle state
UnSquelch: High-speed J state or high-speed K state
Chirp J: Chirp J state
Chirp K: Chirp K state

29.3.4 Device State Control Register 0 (DVSTCTR0)

DVSTCTR is a register that controls and confirms the state of the USB data bus.
This register is initialized by a power-on reset. After a USB bus reset, only the WKUP bit is initialized.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WKUP	RWUPE	USBRST	RESUME	UACT	—	RHST[2:0]		
Initial value:	—	—	—	—	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R/W*1	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	WKUP	0	R/W*1	Wakeup Output Enables or disables outputting the remote wakeup signal (resume signal) to the USB bus when the function controller mode is selected. 0: Remote wakeup signal is not output. 1: Remote wakeup signal is output. This module controls the output time of a remote wakeup signal. When this bit is set to 1, this module clears this bit to 0 after outputting the 10-ms K state. According to the USB Specification, the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is output. If this module writes 1 to this bit right after detection of suspended state, the K state will be output after 2 ms. Do not write 1 to this bit unless the device state is in the suspended state (the DVSQ bits in the INTSTS0 register are set to 1xx) and the USB host enables the remote wakeup signal. When this bit is set to 1, the internal clock must not be stopped even in the suspended state (write 1 to this bit while SUSPMODE.SUSPM is 1). This bit should be set to 0 if the host controller mode is selected.
7	RWUPE	0	R/W	Remote Wakeup Detection Enable Enables or disables the downstream port peripheral device to use the remote wakeup function (resume signal output) when the host controller mode is selected. 0: Downstream port remote wakeup is disabled. 1: Downstream port remote wakeup is enabled. With this bit set to 1, on detecting the resume signal (K-state for 2.5 μs) to the downstream port when the remote wakeup signal has been detected, this module performs the resume process (drives the port to the K-state). With this bit set to 0, this module ignores the detected remote wakeup signal (K-state) from the peripheral device connected to the downstream port. While this bit is 1, the internal clock should not be stopped even in the suspended state (SUSPMODE.SUSPM should be set to 1). Also note that the USB bus should not be reset from the suspended state (USBRST should not be set to 1); it is prohibited by USB Specification 2.0. This bit should be set to 0 if the function controller mode is selected.

Bit	Bit Name	Initial Value	R/W	Description
6	USBRST	0	R/W	Bus Reset Output Controls the USB bus reset signal output when the host controller mode is selected. 0: USB bus reset signal is not output. 1: USB bus reset signal is output. When the host controller mode is selected, setting this bit to 1 allows this module to drive the USB port to SE0 to reset the USB bus. Here, this module performs the reset handshake protocol if the HSE bit is 1. This module continues outputting SE0 while USBRST is 1 (until 0 is written to USBRST). Ensure the period over which USBRST being set to 1 (= USB bus reset period) conforms to the USB Specification 2.0. Even if 1 is written to this bit during communication (UACT = 1) or during the resume process (RESUME = 1), this module does not start the USB bus reset process until both UACT and RESUME become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset process (writing 0 to USBRST). This bit should be set to 0 if the function controller mode is selected.
5	RESUME	0	R/W	Resume Output Controls the resume signal output when the host controller mode is selected. 0: Resume signal is not output. 1: Resume signal is output. Setting this bit to 1 allows this module to drive the port to the K-state and output the resume signal. The controller sets this bit to 1 when detecting a remote wakeup signal while the RWUPE bit is set to 1 and the controller is in the USB suspended state. This module continues outputting K-state while RESUME is 1 (until 0 is written to RESUME). Ensure the period over which RESUME being set to 1 (= resume period) conforms to the USB Specification 2.0. This bit should only be set to 1 in the suspended state. Write 1 to the UACT bit simultaneously with the end of the resume process (writing 0 to RESUME). This bit should be set to 0 if the function controller mode is selected.
4	UACT	0	R/W	USB Bus Enable Enables operation of the USB bus (controls the SOF or µSOF packet transmission to the USB bus) when the host controller mode is selected. 0: Downstream port is disabled (SOF/µSOF transmission is disabled). 1: Downstream port is enabled (SOF/µSOF transmission is enabled). With this bit set to 1, this module puts the USB port to the USB-bus enabled state and performs SOF output and data transmission and reception. This module starts outputting SOF/µSOF within 1 (µ) frame after 1 is written to UACT. With this bit set to 0, this module enters the idle state after outputting SOF/µSOF. This module sets this bit to 0 on any of the following conditions. • A DTCH interrupt is detected during communication (while UACT = 1). • An EOFERR interrupt is detected during communication (while UACT = 1). Writing 1 to this bit should be done at the end of the USB bus reset process (writing 0 to USBRST) or at the end of the resume process from the suspended state (writing 0 to RESUME). This bit should be set to 0 if the function controller mode is selected.
3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	RHST[2:0]	000	R	Reset Handshake Indicates the status of the reset handshake. (1) When the host controller mode is selected 000: Communication speed not determined (powered state or no connection) 1xx: Reset handshake in progress 001: Low-speed connection 010: Full-speed connection 011: High-speed connection These bits indicate 100 after 1 is written to USBRST. If HSE has been set to 1, these bits indicate 111 as soon as this module detects Chirp-K from the peripheral device. This module fixes the value of the RHST bits when 0 is written to USBRST and this module completes SE0 driving. When 1xxx is written to UTST (parameters for the host test have been set), these bits indicate 011. (2) When the function controller mode is selected 000: Communication speed not determined (powered state or no connection) 100: Reset handshake in progress 010: Full-speed connection 011: High-speed connection If HSE has been set to 1, these bits indicate 100 as soon as this module detects the USB bus reset. Then, these bits indicate 011 as soon as this module outputs Chirp-K and detects Chirp-JK from the USB host three times. If the connection speed is not fixed to high speed within 2.5 ms after Chirp-K output, these bits indicate 010. If HSE has been set to 0, these bits indicate 010 as soon as this module detects the USB bus reset. A DVST interrupt is generated as soon as this module detects the USB bus reset and then the value of the RHST bits is fixed to 010 or 011.

Note 1. Only 1 can be written.

29.3.5 Test Mode Register (TESTMODE)

TESTMODE is a register that controls the USB test signal output during high-speed operation.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	UTST[3:0]			
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3 to 0	UTST[3:0]	0000	R/W	Test Mode This module outputs the USB test signals during the high-speed operation, when these bits are written appropriate value. (1) When the host controller mode is selected These bits can be set after writing 1 to DRPD. This module outputs waveforms when both DPRD and UACT have been set to 1. This module also performs high-speed termination for the USB port by writing the appropriate value to these bits. • Procedure for setting the UTST bits 1. Power-on reset. 2. Start the clock supply. 3. Set SUSPM to 1. 4. Set DCFM and DPRD to 1 (setting HSE to 1 is not required). 5. Set USBE to 1. 6. Set the UTST bits to the appropriate value according to the test specifications. 7. Set the UACT bit to 1. • Procedure for modifying the UTST bits 1. (In the state after executing step 7 above) Set UACT and USBE to 0. 2. Set USBE to 1. 3. Set the UTST bits to the appropriate value according to the test specifications. 4. Set the UACT bit to 1. When these bits are set to Test_SE0_NAK (1011), this module does not output the SOF packet even when 1 has been set to UACT for the port. When these bits are set to Test_Force_Enable (1101), this module outputs the SOF packet when 1 has been set to UACT. In this test mode, this module does not perform hardware control consequent to detection of high-speed disconnection (detection of the DTCH interrupt). When setting the UTST bits, the PID bits for all the pipes should be set to NAK. To return to normal USB communication after a test mode has been set, a power-on reset should be applied. (2) When the function controller mode is selected The appropriate value should be set to these bits according to the SetFeature request from the USB host during high-speed communication. This module does not make a transition to the suspended state while these bits are 0001 to 0100. Perform a power-on reset to carry out normal USB communication after configuring the test mode.

Table 29.6 Test Mode Operation

	UTST Bit Setting	
Test Mode	**When Function Controller Mode is Selected**	**When Host Controller Mode is Selected**
Normal operation	0000	0000
Test_J	0001	1001
Test_K	0010	1010
Test_SE0_NAK	0011	1011
Test_Packet	0100	1100
Test_Force_Enable	—	1101
Reserved	0101 to 0111	1110 to 1111

29.3.6 DMAn-FIFO Bus Configuration Registers (D0FBCFG, D1FBCFG)

D0FBCFG is a register that controls bus access to the DMA0-FIFO and D1FBCFG is a register that controls bus access to the DMA1-FIFO. Note that the setting of this register is invalid when the DMA0-FIFO bus or DMA1-FIFO bus is connected to the local bus.

These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	DFACC[1:0]		—	—	—	—	—	—	—	TENDE	—	—	—	—
Initial value:	—	—	0	0	—	—	—	—	—	—	—	0	—	—	—	—
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
13, 12	DFACC[1:0]	00	R/W	DMAx FIFO Access Mode Specifies the access mode of the FIFO port. 00: Cycle-stealing mode (initial value) 01: 16-byte continuous access mode 10: 32-byte continuous access mode 11: Setting prohibited These bits specify a DMA transfer mode. (a) In cycle-stealing mode, use the DnFIFO port to access the FIFO buffer. (b) In 16-byte/32-byte continuous access mode, use the DnFIFO continuous transfer port to access the FIFO buffer. The MBW bit in DnFIFOSEL can be set to 10 (32-bit width) only. Be sure to follow the procedure below when setting the DFACC bits for 16- or 32-byte continuous access. (1) Set the DREQE bit in the DnFIFOSEL register to 0. (2) Set the DFACC bits to 01 (16 bytes) or 10 (32 bytes). (3) In the DnFIFOSEL register, set the CURPIPE bits to 0000 (specifying no pipe) and the MBW bits to 10 (32-bit width) at the same time. After that, read the CURPIPE bits to confirm that they have been updated to the written value (0000). (4) Use the CPU to dummy-read the DnFIFO port register (DnFIFO) with 32-bit width (the value read data can be discarded). After that, specify the target pipe by using the CURPIPE bits in the DnFIFOSEL register and read the CURPIPE bits to confirm that they have been updated to written value. (5) Set the DREQE bit in the DnFIFOSEL to 1. Note that the above procedure is not required if these bits are to be set for the cycle-stealing mode (not following the procedure has no effect).

Bit	Bit Name	Initial Value	R/W	Description
11 to 5	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
4	TENDE	0	R/W	DMA Transfer End Sampling Enable Controls acceptance of DMA transfer end signal. 0: DMA transfer end signal is not sampled. 1: DMA transfer end signal is sampled. Controls acceptance of DMA transfer end signal output from the direct memory access controller on completion of a DMA transfer. This module can control input of the DMA transfer end signal to end the DMA transfer of data to the FIFO. Set this bit to 0 when the DFACC bits are set to 01 or 10.
3 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

29.3.7 FIFO Port Registers (CFIFO, D0FIFO, D1FIFO)

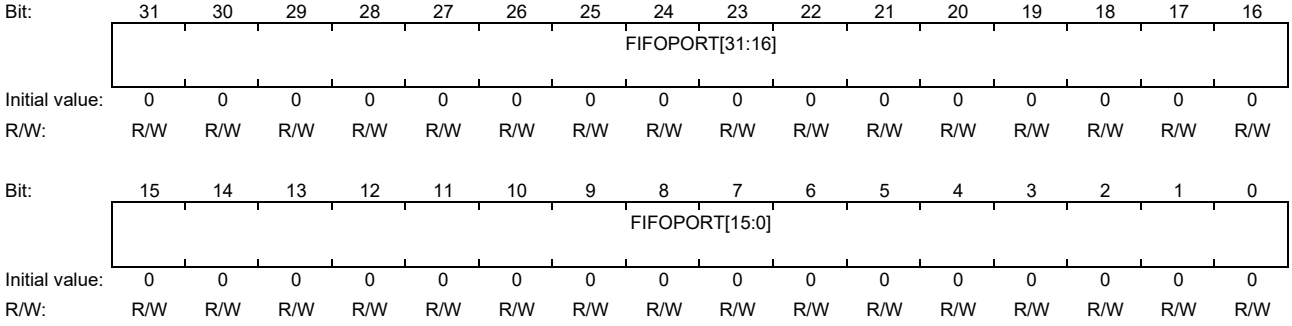
CFIFO, D0FIFO, and D1FIFO are port registers that are used to read data from the FIFO buffer memory and write data to the FIFO buffer memory.

There are three FIFO ports: the CFIFO, D0FIFO and D1FIFO ports. There are also DnFIFO continuous transfer ports for continuous transfer. Each FIFO port is configured of a port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer memory and writing of data to the FIFO buffer memory, a select register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that is used to select the pipe assigned to the FIFO port, and a control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR).

Each FIFO port has the following characteristics.

- Access to the FIFO buffer for the DCP should be performed through the CFIFO port.
- Access to the FIFO buffer by DMA transfer should be performed through the D0FIFO or D1FIFO port when the DFACC bits are set to 00 (cycle-stealing mode).
- Access to the FIFO buffer by DMA transfer should be performed through D0FIFO or D1FIFO continuous transfer ports when the DFACC bits are set to 01 (16-byte continuous access mode) or 10 (32-byte continuous access mode).
- The D1FIFO or D0FIFO port can be accessed by the CPU.
- When using functions specific to the FIFO port, the pipe number (selected pipe) specified by the CURPIPE bits cannot be changed (when the DMA transfer function is used, etc.).
- Registers configuring a FIFO port do not affect other FIFO ports.
- The same pipe should not be assigned to two or more FIFO ports.
- There are two FIFO buffer states: the access right is on the CPU side and it is on the SIE side. When the FIFO buffer access right is on the SIE side, the FIFO buffer cannot be accessed from the CPU.

These registers are initialized by a power-on reset.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT [31:0]	All 0	R/W	FIFO Port Accessing these bits allow reading the received data from the FIFO buffer or writing the transmit data to the FIFO buffer. These bits can be accessed only while the FRDY bit in each FIFO port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1 (or this module is issuing a DMA transfer request). The valid bits in this register depend on the settings of the MBW bits (access bit width setting) and BIGEND bit (endian setting) as shown in Table 29.7 to Table 29.9.

Table 29.7 Endian Operation in 32-Bit Access

BIGEND Bit	Bits 31 to 24	Bits 23 to 16	Bits 15 to 8	Bits 7 to 0
0	N+3 address	N+2 address	N+1 address	N+0 address
1	N+0 address	N+1 address	N+2 address	N+3 address

Table 29.8 Endian Operation in 16-Bit Access

BIGEND Bit	Bits 31 to 24	Bits 23 to 16	Bits 15 to 8	Bits 7 to 0
0	N+1 address	N+0 address	Writing: invalid, reading: prohibited*1	
1	Writing: invalid, reading: prohibited*1		N+0 address	N+1 address

Note 1. Reading data from the invalid bits in a word or byte unit is prohibited.

Table 29.9 Endian Operation in 8-Bit Access

BIGEND Bit	Bits 31 to 24	Bits 23 to 16	Bits 15 to 8	Bits 7 to 0
0	N+0 address	Writing: invalid, reading: prohibited*1		
1	Writing: invalid, reading: prohibited*1			N+0 address

Note 1. Reading data from the invalid bits in a word or byte unit is prohibited.

29.3.8 FIFO Port Select Registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL)

CFIFOSEL, D0FIFOSEL and D1FIFOSEL are registers that assign the pipe to the FIFO port, and control access to the corresponding port.

The same pipe should not be specified by the CURPIPE bits in CFIFOSEL, D0FIFOSEL and D1FIFOSEL. When the CURPIPE bits in D0FIFOSEL and D1FIFOSEL are cleared to B'0000, no pipe is selected.

The pipe number should not be changed while the DMA transfer is enabled.

These registers are initialized by a power-on reset.

(1) CFIFOSEL

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	—	—	MBW[1:0]		—	BIG END	—	—	ISEL	—	CURPIPE[3:0]			
Initial value:	0	0	—	—	0	0	—	0	—	—	0	—	0	0	0	0
R/W:	R/W	R/W*1	R	R	R/W	R/W	R	R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0	R/W	Read Count Mode Specifies the read mode for the value in the DTLN bits in CFIFOCTR. 0: The DTLN bits are cleared when all of the receive data has been read from the CFIFO. (In double buffer mode, the DTLN bit value is cleared when all the data has been read from a single plane.) 1: The DTLN bits are decremented when the receive data is read from the CFIFO. When this bit is cleared to 0, this module clears the DTLN bits in CFIFOCTR to 0 when all of the receive data has been read from the FIFO buffer that is assigned to the pipe specified in the CURPIPE bits (called the specified pipe) (in double buffer mode, the timing to clear is when finished reading data from one FIFO buffer plane). When this bit is set to 1, this module decrements the DTLN bits in CFIFOCTR every time receive data is read from the FIFO buffer that is assigned to the specified pipe.
14	REW	0	R/W*1	Buffer Pointer Rewind Specifies whether or not to rewind the buffer pointer. 0: The buffer pointer is not rewound. 1: The buffer pointer is rewound. When the selected pipe is in the receiving direction, setting this bit to 1 while the FIFO buffer is being read allows re-reading the FIFO buffer from the first data (in double buffer mode, re-reading the currently-read one FIFO buffer plane from the first data is allowed). Do not set REW to 1 simultaneously with modifying the CURPIPE bits. Before setting REW to 1, be sure to check that FRDY is 1. To re-write to the FIFO buffer again from the first data for the pipe in the transmitting direction, use the BCLR bit.
13, 12	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
11, 10	MBW[1:0]	00	R/W	FIFO Port Access Bit Width Specifies the bit width for accessing the CFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited When the pipe specified by the CURPIPE bits is in the receiving direction, once reading data is started after setting these bits, these bits should not be modified until all the data has been read. When the specified pipe is in the receiving direction, set the CURPIPE bits to a different value once, and then set the CURPIPE and MBW bits simultaneously. Regarding the procedure for changing the value of the CURPIPE bits, do so in accord with the description of the CURPIPE bits. When the specified pipe is in the transmitting direction, the bit width cannot be changed from the 8-bit width to the 16-/32-bit width or from the 16-bit width to the 32-bit width while data is being written to the buffer memory.
9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	BIGEND	0	R/W	FIFO Port Endian Control Specifies the byte endian for the CFIFO port. For details, refer to the description of the FIFO port bits in section 29.3.7, FIFO Port Registers (CFIFO, D0FIFO, D1FIFO). 0: Little endian 1: Big endian
7, 6	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
5	ISEL	0	R/W	FIFO Port Access Direction when DCP is Selected Specifies the direction of FIFO port access when the DCP is selected through the CURPIPE bits. 0: Reading from the buffer memory is selected 1: Writing to the buffer memory is selected After writing to this bit with the DCP being a selected pipe, read this bit to check that the written value agrees with the read value before proceeding to the next process. When this bit is modified during access to the FIFO buffer, the access results up to that point can be retained, and after the bit is restored to the previous value, access can be continued. Set this bit and the CURPIPE bits simultaneously.
4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3 to 0	CURPIPE[3:0]	0000	R/W	FIFO Port Access Pipe Specification Specifies the pipe number using which data is read or written through the CFIFO port. 0000: DCP 0001: PIPE 1 0010: PIPE 2 : 1110: PIPE 14 1111: PIPE 15 After writing to these bits, read these bits to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL. Even if the setting of these bits is modified during access to the FIFO buffer, the state of the FIFO buffer is retained, with continued access proceeding after these bits are re-set to the value before the modification.

Note 1. Only 0 can be read and 1 can be written to.

(2) D0FIFOSEL, D1FIFOSEL

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	DCLRM	DREQE	MBW[1:0]		—	BIGEND	—	—	—	—	CURPIPE[3:0]			
Initial value:	0	0	0	0	0	0	—	0	—	—	—	—	0	0	0	0
R/W:	R/W	R/W*	R/W	R/W	R/W	R/W	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0	R/W	Read Count Mode Specifies the read mode for the value in the DTLN bits in DnFIFOCTR. 0: The DTLN bits are cleared when all of the receive data has been read from the DnFIFO. (In double buffer mode, the DTLN bit value is cleared when all the data has been read from a single plane.) 1: The DTLN bits are decremented when the receive data is read from the DnFIFO. When this bit is cleared to 0, this module clears the DTLN bits in DnFIFOCTR to 0 when all of the receive data has been read from the FIFO buffer that is assigned to the pipe specified in the CURPIPE bits (called the specified pipe) (in double buffer mode, the timing to clear is when finished reading data from one FIFO buffer plane). When this bit is set to 1, this module decrements the DTLN bits in DnFIFOCTR every time receive data is read from the FIFO buffer that is assigned to the specified pipe.
14	REW	0	R/W*	Buffer Pointer Rewind Specifies whether or not to rewind the buffer pointer. 0: The buffer pointer is not rewound. 1: The buffer pointer is rewound. When the specified pipe is in the receiving direction, setting this bit to 1 while the FIFO buffer is being read allows re-reading the FIFO buffer from the first data (in double buffer mode, re-reading the currently-read FIFO buffer plane from the first data is allowed). Do not set REW to 1 simultaneously with modifying the CURPIPE bits. Before setting REW to 1, be sure to check that FRDY is 1. To re-write to the FIFO buffer again from the first data for the pipe in the transmitting direction, use the BCLR bit.
13	DCLRM	0	R/W	Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read Enables or disables the buffer memory to be cleared automatically after data has been read out using the selected pipe. 0: Auto buffer clear mode is disabled. 1: Auto buffer clear mode is enabled. With this bit set to 1, this module sets BCLR to 1 for the FIFO buffer of the selected pipe on receiving a zero-length packet while the FIFO buffer assigned to the selected pipe is empty, or on receiving a short packet and reading the data while BFRE is 1. When using this module with the BRDYM bit set to 1, set this bit to 0.
12	DREQE	0	R/W	DMA Transfer Request Enable Enables or disables the issuance of a DMA transfer request. 0: DMA transfer request is disabled. 1: DMA transfer request is enabled. To enable the issuance of a DMA transfer request, set this bit to 1 after setting the CURPIPE bits. When modifying the CURPIPE bits, first set this bit to 0.

Bit	Bit Name	Initial Value	R/W	Description
11, 10	MBW[1:0]	00	R/W	FIFO Port Access Bit Width Specifies the bit width for accessing the D0FIFO or D1FIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited Set 10 when the DFACC bits are set to 01 or 10. When the pipe specified by the CURPIPE bits is in the receiving direction, once reading data is started after setting these bits, these bits should not be modified until all the data has been read. When the specified pipe is in the receiving direction, set the CURPIPE bits to a different value once, and then set the CURPIPE and MBW bits simultaneously. Regarding the procedure for changing the value of the CURPIPE bits, do so in accord with the description of the CURPIPE bits. When the specified pipe is in the transmitting direction, the bit width cannot be changed from the 8-bit width to the 16-/32-bit width or from the 16-bit width to the 32-bit width while data is being written to the buffer memory. Set these bits to 10 (32-bit width) when the DFACC bits are set to 01 (16-byte continuous access mode) or 10 (32-byte continuous access mode).
9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	BIGEND	0	R/W	FIFO Port Endian Control Specifies the byte endian for the D0FIFO or D1FIFO port. For details, refer to the description of the FIFO port bits in section 29.3.7, FIFO Port Registers (CFIFO, D0FIFO, D1FIFO). 0: Little endian 1: Big endian
7 to 4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3 to 0	CURPIPE[3:0]	0000	R/W	FIFO Port Access Pipe Specification Specify a desired pipe number for which data is read or written through the D0FIFO or D1FIFO port. 0000: No pipe specified 0001: PIPE 1 0010: PIPE 2 : 1110: PIPE 14 1111: PIPE 15 After writing to these bits, read these bits to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL. Even if the setting of these bits is modified during access to the FIFO buffer, the state of the FIFO buffer is retained, with continued access proceeding after these bits are re-set to the value before the modification.

29.3.9 FIFO Port Control Registers (CFIFOCTR, D0FIFOCTR, D1FIFOCTR)

CFIFOCTR, D0FIFOCTR and D1FIFOCTR are registers that determine whether or not writing to the buffer memory has been finished, the buffer accessed from the CPU has been cleared, and the FIFO port is accessible. CFIFOCTR, D0FIFOCTR, and D1FIFOCTR are used for the corresponding FIFO ports.
These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BVAL	BCLR	FRDY	—	DTLN[11:0]											
Initial value:	0	0	0	—	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*2	R/W*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	BVAL	0	R/W*2	Buffer Memory Valid Flag Set this bit to 1 when writing has completed in the CPU-side FIFO buffer for the pipe specified in CURPIPE (called the selected pipe). 0: Invalid 1: Writing ended When the selected pipe is in the transmitting direction, set this bit to 1 in the following cases. Then, this module switches the FIFO buffer from the CPU side to the SIE side, enabling transmission. • To transmit a short packet, set this bit to 1 after data has been written. • To transmit a zero-length packet, set this bit to 1 before writing data to the FIFO buffer. • Set this bit to 1 after the number of data bytes has been written for the pipe in continuous transfer mode, where the number is a natural integral multiple of the maximum packet size and less than the buffer size. When the data of the maximum packet size has been written for the pipe in non-continuous transfer mode, this module sets this bit to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission. Writing 1 to this bit should be done while FRDY indicates 1. When checking the FRDY bit after setting this bit, allow an interval of at least 80 ns before referencing FRDY. When the selected pipe is in the receiving direction, do not write 1 to this bit.
14	BCLR	0	R/W*1	CPU Buffer Clear This bit should be set to 1 to clear the FIFO buffer on the CPU side for the selected pipe. 0: Invalid 1: Clears the buffer memory on the CPU side. When double buffer mode is set for the FIFO buffer assigned to the selected pipe, this module clears only one plane of the FIFO buffer even when both planes are read-enabled. When the selected pipe is the DCP, setting BCLR to 1 allows this module to clear the FIFO buffer regardless of whether the FIFO buffer is on the CPU side or SIE side. When clearing the buffer on the SIE side, set the PID bits for the DCP to NAK before setting BCLR to 1. When the selected pipe is not the DCP, writing 1 to this bit should be done while FRDY indicates 1. When checking the FRDY bit after setting this bit, allow an interval of at least 80 ns before referencing FRDY.

Bit	Bit Name	Initial Value	R/W	Description
13	FRDY	0	R	FIFO Port Ready Indicates whether the FIFO port can be accessed. 0: FIFO port access is disabled. 1: FIFO port access is enabled. In the following cases, this module sets FRDY to 1 but data cannot be read via the FIFO port because there is no data to be read. In these cases, set BCLR to 1 to clear the FIFO buffer, and enable transmission and reception of the next data. • A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty. • A short packet is received and the data is completely read while BFRE is 1.
12	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
11 to 0	DTLN[11:0]	H'000	R	Receive Data Length Indicates the length of the receive data. While the FIFO buffer is being read, these bits indicate the different values depending on the RCNT bit value as described below. • When RCNT = 0: The length of received data is set in these bits, and the value is retained until all received data has been read from a single FIFO buffer plane. While BFRE is 1, these bits retain the length of the receive data until BCLR is set to 1 even after all the data has been read. • When RCNT = 1: This module decrements the value indicated by these bits each time data is read from the FIFO buffer. (The value is decremented by one when MBW is 00, by two when MBW is 01, and by four when MBW is 10.) This module sets these bits to 0 when all the data has been read from one FIFO buffer plane. However, in double buffer mode, if data has been received in one FIFO buffer plane before all the data has been read from the other plane, this module sets these bits to indicate the length of the receive data in the latter plane when all the data has been read from the former plane. Note: When reading these bits during FIFO buffer reading while RCNT = 1, note that these bits are updated within ten bus cycles after a read cycle for the FIFO port.

Note 1. Only 0 can be read and 1 can be written to.
Note 2. Only 1 can be written to.

29.3.10 Interrupt Enable Register 0 (INTENB0)

INTENB0 is a register that enables various interrupts. On detecting the interrupt corresponding to the bit in this register which has been set to 1, this module generates the USB interrupt.
This module sets 1 to each status bit in INTSTS0 when a detection condition of the corresponding interrupt source has been satisfied regardless of the set value in INTENB0 (regardless of whether the interrupt output is enabled or disabled).
While the status bit in INTSTS0 corresponding to the interrupt source indicates 1, this module generates the USB interrupt when the corresponding interrupt enable bit in INTENB0 is changed from 0 to 1.
This register is initialized by a power-on reset.

13	SOFE	0	R/W	Frame Number Update Interrupt Enable Enables or disables the USB interrupt request when the SOFR interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
12	DVSE	0	R/W	Device State Transition Interrupt Enable*1 Enables or disables the USB interrupt request when the DVST interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
11	CTRE	0	R/W	Control Transfer Stage Transition Interrupt Enable*1 Enables or disables the USB interrupt request when the CTRT interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
10	BEMPE	0	R/W	Buffer Empty Interrupt Enable Enables or disables the USB interrupt request when the BEMP interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
9	NRDYE	0	R/W	Buffer Not Ready Response Interrupt Enable Enables or disables the USB interrupt request when the NRDY interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
8	BRDYE	0	R/W	Buffer Ready Interrupt Enable Enables or disables the USB interrupt request when the BRDY interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. The RSME, DVSE, and CTRE bits can be set to 1 only when the function controller mode is selected; do not set these bits to 1 to enable the corresponding interrupt output when the host controller mode is selected.

29.3.11 Interrupt Enable Register 1 (INTENB1)

INTENB1 is a register that enables various interrupts when the host controller mode is selected.
On detecting the interrupt corresponding to the bit in this register which has been set to 1, this module generates the USB interrupt.
This module sets 1 to each status bit in INTSTS1 when a detection condition of the corresponding interrupt source has been satisfied regardless of the set value in INTENB1 (regardless of whether the interrupt output is enabled or disabled).
While the status bit in INTSTS1 corresponding to the interrupt source indicates 1, this module generates the USB interrupt when the corresponding interrupt enable bit in INTENB1 is changed from 0 to 1.
When the function controller mode is selected, the interrupts should not be enabled.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	BCHGE	—	DTCHE	ATTCHE	—	—	—	—	EOFERRE	SIGNE	SACKE	—	—	—	—

R/W:	R	R/W	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	BCHGE	0	R/W	USB Bus Change Interrupt Enable Enables or disables the USB interrupt request when the BCHG interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	DTCHE	0	R/W	Disconnection Detection Interrupt Enable Enables or disables the USB interrupt request when the DTCH interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
11	ATTCHE	0	R/W	Connection Detection Interrupt Enable Enables or disables the USB interrupt request when the ATTCH interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
10	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6	EOFERRE	0	R/W	EOF Error Detection Interrupt Enable Enables or disables the USB interrupt request when the EOFERR interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
5	SIGNE	0	R/W	Setup Transaction Error Interrupt Enable Enables or disables the USB interrupt request when the SIGN interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
4	SACKE	0	R/W	Setup Transaction Normal Response Interrupt Enable Enables or disables the USB interrupt request when the SACK interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
3 to 1	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Note 1. The INTENB1 register bits can be set to 1 only when the host controller mode is selected; do not set these bits to 1 to enable the corresponding interrupt output when the function controller mode is selected.

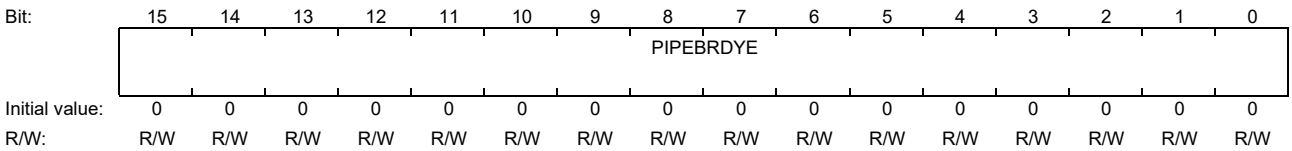
29.3.12 BRDY Interrupt Enable Register (BRDYENB)

BRDYENB is a register that enables or disables the BRDY bit in INTSTS0 to be set to 1 when the BRDY interrupt is detected for each pipe.

On detecting the BRDY interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPEBRDY bit in BRDYSTS and the BRDY bit in INTSTS0, and generates the BRDY interrupt.

While at least one PIPEBRDY bit in BRDYSTS indicates 1, this module generates the BRDY interrupt when the corresponding interrupt enable bit in BRDYENB is changed from 0 to 1.

This register is initialized by a power-on reset.

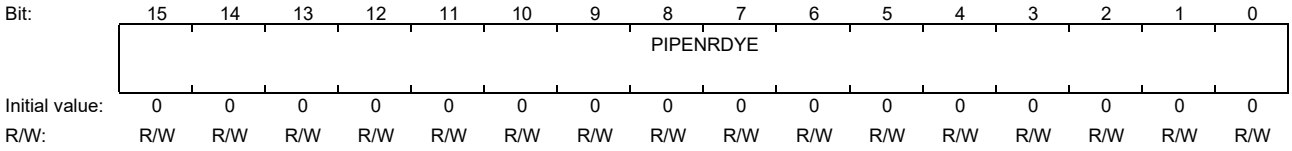


Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBRDYE	H'0000	R/W	BRDY Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

29.3.13 NRDY Interrupt Enable Register (NRDYENB)

NRDYENB is a register that enables or disables the NRDY bit in INTSTS0 to be set to 1 when the NRDY interrupt is detected for each pipe.
On detecting the NRDY interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPENRDY bit in NRDYSTS and the NRDY bit in INTSTS0, and generates the NRDY interrupt.
While at least one PIPENRDY bit in NRDYSTS indicates 1, this module generates the NRDY interrupt when the corresponding interrupt enable bit in NRDYENB is changed from 0 to 1.
This register is initialized by a power-on reset.

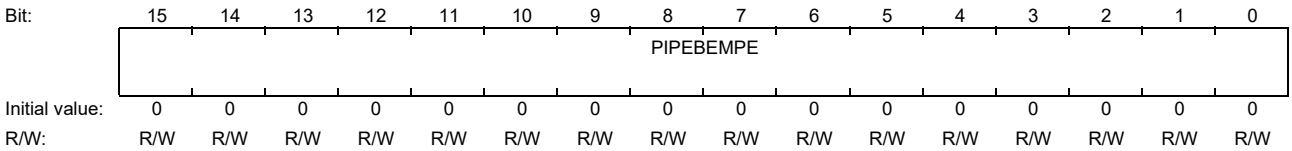


Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPENRDYE	H'0000	R/W	NRDY Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

29.3.14 BEMP Interrupt Enable Register (BEMPENB)

BEMPENB is a register that enables or disables the BEMP bit in INTSTS0 to be set to 1 when the BEMP interrupt is detected for each pipe.
On detecting the BEMP interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPEBEMP bit in BEMPSTS and the BEMP bit in INTSTS0, and generates the BEMP interrupt.
While at least one PIPEBEMP bit in BEMPSTS indicates 1, this module generates the BEMP interrupt when the corresponding interrupt enable bit in BEMPENB is changed from 0 to 1.
This register is initialized by a power-on reset.



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBEMPE	H'0000	R/W	BEMP Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

29.3.15 SOF Output Configuration Register (SOFCFG)

SOFCFG is a register that specifies the transaction-enabled time and BRDY interrupt status clear timing.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TRNENSEL	—	BRDYM	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	0	—	0	0	0	0	0	—	—
R/W:	R	R	R	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	TRNENSEL	0	R/W	Transaction-Enabled Time Select Selects the transaction-enabled time either for full-speed or low-speed communication, where is the time in which this module issues tokens in a frame. 0: For non-low-speed communication 1: For low-speed communication This bit is valid only when the host controller mode is selected. Even when the host controller mode is selected, the setting of this bit has no effect on the transaction-enabled time during high-speed communication. This bit should be set to 0 when the function controller mode is selected.
7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6	BRDYM	0	R/W	BRDY Interrupt Status Clear Timing for Each Pipe Specifies the timing for clearing the BRDY interrupt status for each pipe. 0: Clears the status by writing 0 to this bit. 1: This module automatically clears the status when data has been read from the FIFO buffer or data has been written to the FIFO buffer.
5 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

29.3.16 Interrupt Status Register 0 (INTSTS0)

INTSTS0 is a register that indicates the status of the various interrupts detected.
This register is initialized by a power-on reset. By a USB bus reset, the DVST and DVSQ[2:0] bits are initialized.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBINT	RESM	SOFR	DVST	CTRT	BEMP	NRDY	BRDY	VBSTS	DVSQ[2:0]			VALID	CTSQ[2:0]		
Initial value:	0	0	0	0/1*1	0	0	0	0	0/1*3	0*2	0*2	0/1*2	0	0	0	0
R/W:	R/W*7	R/W*7	R/W*7	R/W*7	R/W*7	R	R	R	R	R	R	R	R/W*7	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBINT	0	R/W*7	VBUS Interrupt Status*4*5 0: VBUS interrupts not generated 1: VBUS interrupts generated This module sets this bit to 1 when a change in the value input to the VBUS pin (high to low or low to high) is detected. The module indicates the VBUS pin input value in the VBSTS bit. When a VBINT interrupt is generated, the VBSTS bit is read several times to remove the chattering effect until the same value is read repeatedly from the bit.
14	RESM	0	R/W*7	Resume Interrupt Status*4*5*6 0: Resume interrupts not generated 1: Resume interrupts generated When the function controller mode is selected, this module sets this bit to 1 on detecting the falling edge of the signal on the DP pin in the suspended state (DVSQ = 1XX). When the host controller mode is selected, the read value is invalid.
13	SOFR	0	R/W*7	Frame Number Refresh Interrupt Status*4 0: SOF interrupts not generated 1: SOF interrupts generated (1) When the host controller mode is selected This module sets this bit to 1 on updating the frame number when the UACT bit is set to 1. (This interrupt is detected every 1 ms.) (2) When the function controller mode is selected This module sets this bit to 1 on updating the frame number. (This interrupt is detected every 1 ms.) This module can detect an SOFR interrupt through the internal interpolation function even when a damaged SOF packet is received from the USB host.
12	DVST	0/1*1	R/W*7	Device State Transition Interrupt Status*4*6 0: Device state transition interrupts not generated 1: Device state transition interrupts generated When the function controller mode is selected, this module updates the DVSQ value and sets this bit to 1 on detecting a change in the device state. When this interrupt is generated, clear the status before this module detects the next device state transition. When the host controller mode is selected, the read value is invalid.
11	CTRT	0	R/W*7	Control Transfer Stage Transition Interrupt Status*4*6 0: Control transfer stage transition interrupts not generated 1: Control transfer stage transition interrupts generated When the function controller mode is selected, this module updates the CTSQ value and sets this bit to 1 on detecting a change in the control transfer stage. When this interrupt is generated, clear the status before this module detects the next control transfer stage transition. When the host controller mode is selected, the read value is invalid.

Bit	Bit Name	Initial Value	R/W	Description
10	BEMP	0	R	Buffer Empty Interrupt Status 0: BEMP interrupts not generated 1: BEMP interrupts generated This module sets this bit to 1 when at least one PIPEBEMP bit in BEMPSTS is set to 1 among the PIPEBEMP bits corresponding to the PIPEBEMPE bits in BEMPENB to which 1 has been set (when this module detects the BEMP interrupt status in at least one pipe among the pipes for which the BEMP interrupt notification is enabled). For the conditions for PIPEBEMP status assertion, refer to section 29.4.2 (4) BEMP Interrupt. This module clears this bit to 0 when 0 is written to all the PIPEBEMP bits corresponding to the PIPEBEMPE bits to which 1 has been set. This bit cannot be cleared to 0 even if 0 is written to this bit.
9	NRDY	0	R	Buffer Not Ready Interrupt Status 0: NRDY interrupts not generated 1: NRDY interrupts generated This module sets this bit to 1 when at least one PIPENRDY bit in NRDYSTS is set to 1 among the PIPENRDY bits corresponding to the PIPENRDYE bits in NRDYENB to which 1 has been set (when this module detects the NRDY interrupt status in at least one pipe among the pipes for which the NRDY interrupt notification is enabled). For the conditions for PIPENRDY status assertion, refer to section 29.4.2 (3) NRDY Interrupt. This module clears this bit to 0 when 0 is written to all the PIPENRDY bits corresponding to the PIPENRDYE bits to which 1 has been set. This bit cannot be cleared to 0 even if 0 is written to this bit.
8	BRDY	0	R	Buffer Ready Interrupt Status 0: BRDY interrupts not generated 1: BRDY interrupts generated This module sets this bit to 1 when at least one PIPEBRDY bit in BRDYSTS is set to 1 among the PIPEBRDY bits corresponding to the PIPEBRDYE bits in BRDYENB to which 1 has been set (when this module detects the BRDY interrupt status in at least one pipe among the pipes for which the BRDY interrupt notification is enabled). For the conditions for PIPEBRDY status assertion, refer to section 29.4.2 (2) BRDY Interrupt. This module clears this bit to 0 when 0 is written to all the PIPEBRDY bits corresponding to the PIPEBRDYE bits to which 1 has been set. This bit cannot be cleared to 0 even if 0 is written to this bit.
7	VBSTS	0/1*3	R	VBUS Input Status 0: The VBUS pin is low level. 1: The VBUS pin is high level.
6 to 4	DVSQ[2:0]	000/001*2	R	Device State 000: Powered state 001: Default state 010: Address state 011: Configured state 1xx: Suspended state When the host controller mode is selected, the read value is invalid.
3	VALID	0	R/W*7	USB Request Reception 0: Not detected 1: Setup packet reception When the host controller mode is selected, the read value is invalid.
2 to 0	CTSQ[2:0]	000	R	Control Transfer Stage 000: Idle or setup stage 001: Control read data stage 010: Control read status stage 011: Control write data stage 100: Control write status stage 101: Control write (no data) status stage 110: Control transfer sequence error 111: Setting prohibited When the host controller mode is selected, the read value is invalid.

Note 1. This bit is initialized to B'0 by a power-on reset and B'1 by a USB bus reset.
Note 2. These bits are initialized to B'000 by a power-on reset and B'001 by a USB bus reset.
Note 3. This bit is 1 when the level of the VBUS pin input is high and 0 when low.
Note 4. To clear the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.
Note 5. A change in the status indicated by the VBINT and RESM bits can be detected by this module even while the clock supply is stopped, and the interrupts are output when the corresponding interrupt enable bits are enabled. Clearing the status should be done after enabling the clock supply.
Note 6. A change in the status of the RESM, DVST, and CTRT bits occurs only when the function controller mode is selected; disable the corresponding interrupt enable bits (set to 0) when the host controller mode is selected.
Note 7. Only 0 can be written to.

29.3.17 Interrupt Status Register 1 (INTSTS1)

INTSTS1 is a register that is used to confirm interrupt status.
The various interrupts indicated by the bits in this register should be enabled only when the host controller mode is selected.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	BCHG	—	DTCH	ATTCH	—	—	—	—	EOFERR	SIGN	SACK	—	—	—	—
Initial value:	0	0	—	0	0	—	0	0	—	0	0	0	—	—	—	0
R/W:	R	R/W*	R	R/W*	R/W*	R	R	R	R	R/W*	R/W*	R/W*	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	BCHG	0	R/W*	USB Bus Change Interrupt Status Indicates the status of the USB bus change interrupt. 0: BCHG interrupts not generated 1: BCHG interrupts generated This module detects the BCHG interrupt when a change in the full-speed or low-speed signal level occurs on the USB port (a change from J-state, K-state, or SE0 to J-state, K-state, or SE0), and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt. This module sets the LNST bits in SYSSTS to indicate the current input state of the USB port. When the BCHG interrupt is generated, the LNST bits are read several times to remove the chattering effect until the same value is read repeatedly from the bits. A change in the USB bus state can be detected even while the internal clock supply is stopped. When the function controller mode is selected, the read value is invalid.
13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	DTCH	0	R/W*	USB Disconnection Detection Interrupt Status Indicates the status of the USB disconnection detection interrupt when the host controller mode is selected. 0: DTCH interrupts not generated 1: DTCH interrupts generated This module detects the DTCH interrupt on detecting USB bus disconnection, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt. This module detects bus disconnection based on USB Specification 2.0. After detecting the DTCH interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Software should terminate all the pipes in which communications are currently carried out for the USB port and make a transition to the wait state for bus connection to the USB port (wait state for ATTCH interrupt generation). (1) Modifies the UACT bit to 0. (2) Puts the port into the idle state. When the function controller mode is selected, the read value is invalid.

Bit	Bit Name	Initial Value	R/W	Description
11	ATTCH	0	R/W*	ATTCH Interrupt Status Indicates the status of the ATTCH interrupt when the host controller mode is selected. 0: ATTCH interrupts not generated 1: ATTCH interrupts generated This module detects the ATTCH interrupt on detecting J-state or K-state of the full-speed or low-speed level signal for 2.5 µs, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt. Specifically, this module detects the ATTCH interrupt on any of the following conditions. • K-state, SE0, or SE1 changes to J-state, and J-state continues 2.5 µs. • J-state, SE0, or SE1 changes to K-state, and K-state continues 2.5 µs. When the function controller mode is selected, the read value is invalid.
10	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6	EOFERR	0	R/W*	EOF Error Detection Interrupt Status Indicates the status of the EOFERR interrupt when the host controller mode is selected. 0: EOFERR interrupt not generated 1: EOFERR interrupt generated This module detects the EOFERR interrupt on detecting that communication is not completed at the EOF2 timing prescribed by USB Specification 2.0, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the EOFERR interrupt. After detecting the EOFERR interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Software should terminate all the pipes in which communications are currently carried for the USB port and perform re-enumeration of the USB port. (1) Modifies the UACT bit to 0. (2) Puts the port into the idle state. When the function controller mode is selected, the read value is invalid.
5	SIGN	0	R/W*	Setup Transaction Error Interrupt Status Indicates the status of the setup transaction error interrupt when the host controller mode is selected. 0: SIGN interrupts not generated 1: SIGN interrupts generated This module detects the SIGN interrupt when ACK response is not returned from the peripheral device three consecutive times during the setup transactions issued by this module, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the SIGN interrupt. Specifically, this module detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions. Timeout is detected when the peripheral device has returned no response. • A damaged ACK packet is received. • A handshake other than ACK (NAK, NYET, or STALL) is received. When the function controller mode is selected, the read value is invalid.

Bit	Bit Name	Initial Value	R/W	Description
4	SACK	0	R/W*	Setup Transaction Normal Response Interrupt Status Indicates the status of the setup transaction normal response interrupt when the host controller mode is selected. 0: SACK interrupts not generated 1: SACK interrupts generated This module detects the SACK interrupt when ACK response is returned from the peripheral device during the setup transactions issued by this module, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the SACK interrupt. When the function controller mode is selected, the read value is invalid.
3 to 1	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Note 1. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

Note 2. A change in the status indicated by the BCHG bit can be detected by this module even while the clock supply is stopped, and the interrupt is output when the corresponding interrupt enable bit is enabled. Clearing the status should be done after enabling the clock supply.
No interrupts other than BCHG can be detected while the clock supply is stopped.

* Only 0 can be written to.

29.3.18 BRDY Interrupt Status Register (BRDYSTS)

BRDYSTS is a register that indicates the BRDY interrupt status for each pipe.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPEBRDY															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBRDY	H'0000	R/W*1	BRDY Interrupt Status for each Pipe*2 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.

Note 2. To clear the status indicated by the bits in this register when BRDYM is 0, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

* 1. Only 0 can be written to.

* 2. When BRDYM is 0, clearing this bit should be done before accessing the FIFO.

29.3.19 NRDY Interrupt Status Register (NRDYSTS)

NRDYSTS is a register that indicates the NRDY interrupt status for each pipe.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPENRDY															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPENRDY	H'0000	R/W*	NRDY Interrupt Status for each Pipe 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.
Note 2. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.
* Only 0 can be written to.

29.3.20 BEMP Interrupt Status Register (BEMPSTS)

BEMPSTS is a register that indicates the BEMP interrupt status for each pipe.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPEBEMP															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBEMP	H'0000	R/W*	BEMP Interrupt Status for each Pipe 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.
Note 2. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.
* Only 0 can be written to.

29.3.21 Frame Number Register (FRMNUM)

FRMNUM is a register that determines the source of isochronous error notification and indicates the frame number. This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVRN	CRCE	—	—	—	FRNM[10:0]										
Initial value:	0	0	—	—	—	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	OVRN	0	R/W*1	Overrun/Underrun Detection Status Indicates whether an overrun/underrun error has been detected in the pipe during isochronous transfer. On detecting either error, this module simultaneously generates the internal NRDY interrupt request. For details, refer to section 29.4.2, Interrupt Functions. 0: No error 1: An error occurred This bit can be cleared to 0 by writing 0 to the bit. Here, 1 should be written to the other bits in this register. (1) When the host controller mode is selected This module sets this bit to 1 on any of the following conditions. • For the isochronous transfer pipe in the transmitting direction, the time to issue an OUT token comes before all the transmit data has been written to the FIFO buffer. • For the isochronous transfer pipe in the receiving direction, the time to issue an IN token comes when no FIFO buffer planes are empty. (2) When the function controller mode is selected This module sets this bit to 1 on any of the following conditions. • For the isochronous transfer pipe in the transmitting direction, the IN token is received before all the transmit data has been written to the FIFO buffer. • For the isochronous transfer pipe in the receiving direction, the OUT token is received when no FIFO buffer planes are empty. Note: This bit should be used for debugging. When designing a system, control the timing so that neither overrun nor underrun occurs.
14	CRCE	0	R/W*1	Receive Data Error Indicates whether a CRC error or bit stuffing error has been detected in the pipe during isochronous transfer. On detecting either error, this module simultaneously generates the internal NRDY interrupt request. For details, refer to section 29.4.2, Interrupt Functions. 0: No error 1: An error occurred This bit can be cleared to 0 by writing 0 to the bit. Here, 1 should be written to the other bits in this register.
13 to 11	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
10 to 0	FRNM[10:0]	H'000	R	Frame Number This module sets these bits to indicate the latest frame number, which is updated every time an SOF packet is issued or received (every 1 ms). When reading these bits, repeat reading until the same value is read twice.

Note 1. Only 0 can be written to.

29.3.22 µFrame Number Register (UFRMNUM)

UFRMNUM is a register that indicates the µframe number.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UFRNM[2:0]		
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2 to 0	UFRNM[2:0]	000	R	µFrame The µframe number can be confirmed. This module sets these bits to indicate the µframe number during high-speed operation. During operation other than high-speed operation, this module sets these bits to B'000. When reading these bits, repeat reading until the same value is read twice.

29.3.23 USB Address Register (USBADDR)

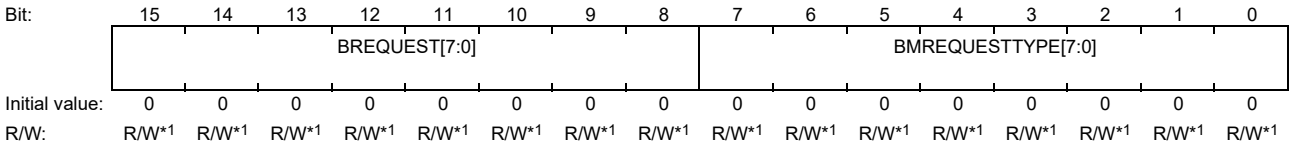
USBADDR is a register that indicates the USB address. This register is valid only when the function controller mode is selected. When the host controller mode is selected, peripheral device addresses should be set using the DEVSEL bits in PIPEMAXP.
This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	USBADDR[6:0]						
Initial value:	—	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6 to 0	USBADDR[6:0]	H'00	R	USB Address When the function controller mode is selected, these bits indicate the USB address assigned by the host when the SET_ADDRESS request is successfully processed. When the function controller mode is selected, these bits indicate H’00 upon detection of a USB bus reset signal. When the host controller mode is selected, the read value is invalid.

29.3.24 USB Request Type Register (USBREQ)

USBREQ is a register that stores setup requests for control transfers.
When the function controller mode is selected, the values of bRequest and bmRequestType that have been received are stored. When the host controller mode is selected, the values of bRequest and bmRequestType to be transmitted are set. This register is initialized by a power-on reset or a USB bus reset.



Bit	Bit Name	Initial Value	R/W	Description
15 to 8	BREQUEST[7:0]	H'00	R/W*1	Request These bits store the USB request bRequest value. (1) When the host controller mode is selected The USB request data value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request data value received during the setup transaction. Writing to these bits is invalid.
7 to 0	BMREQUEST TYPE[7:0]	H'00	R/W*1	Request Type These bits store the USB request bmRequestType value. (1) When the host controller mode is selected The USB request type value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request type value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

29.3.25 USB Request Value Register (USBVAL)

USBVAL is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wValue that has been received is stored. When the host controller mode is selected, the value of wValue to be transmitted is set.
This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WVALUE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WVALUE[15:0]	H'0000	R/W*1	Value These bits store the USB request wValue value. (1) When the host controller mode is selected The USB request wValue value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wValue value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

29.3.26 USB Request Index Register (USBINDX)

USBINDX is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wIndex that has been received is stored. When the host controller mode is selected, the value of wIndex to be transmitted is set.
This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WINDEX[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WINDEX[15:0]	H'0000	R/W*1	Index These bits store the USB request wIndex value. (1) When the host controller mode is selected The USB request wIndex value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wIndex value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

29.3.27 USB Request Length Register (USBLENG)

USBLENG is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wLength that has been received is stored. When the host controller mode is selected, the value of wLength to be transmitted is set.
This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WLENGTH[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WLENGTH[15:0]	H'0000	R/W*1	Length These bits store the USB request wLength value. (1) When the host controller mode is selected The USB request wLength value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wLength value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

29.3.28 DCP Configuration Register (DCPCFG)

DCPCFG is a register that specifies the data transfer direction for the default control pipe (DCP).
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CNTMD	SHTNAK	—	—	DIR	—	—	—	—
Initial value:	—	—	—	—	—	—	—	0	0	—	—	0	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	CNTMD	0	R/W	Continuous Transfer Mode Specifies whether to use the default control pipe in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode This module determines whether transmitting to/receiving from the FIFO buffer allocated for the DCP has completed or not using this bit setting, as shown in Table 29.10 . Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. To modify this bit after completing USB communication using the DCP, write 1 to BCLR to clear the FIFO buffer assigned to the DCP while the CSSTS, PID, and CURPIPE bits are in the above-described state. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
7	SHTNAK	0	R/W	Pipe Disabled at End of Transfer Specifies whether to modify PID to NAK upon the end of transfer when the default control pipe is in the receiving direction. 0: Pipe continued at the end of transfer 1: Pipe disabled at the end of transfer When this bit is set to 1, this module modifies the PID bits corresponding to the DCP to NAK on determining the end of the transfer. This module determines that the transfer has ended when a short packet (including a zero-length packet) is successfully received. Modify this bit while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. This bit should be cleared to 0 for the DCP in the transmitting direction.
6, 5	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
4	DIR	0	R/W	Transfer Direction When the host controller mode is selected, this bit sets the transfer direction of data stage and status stage for control transfers. 0: Data receiving direction 1: Data transmitting direction When the function controller mode is selected, this bit should be cleared to 0.
3 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Table 29.10 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled

Continuous or Non-Continuous Transfer Mode	When Reading Data or Transmitting Data is Enabled
Non-continuous transfer (CNTMD = 0)	In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in the following case. This module receives a single packet.
	In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in ether of the following cases. (1) Data of the maximum packet size is written to the FIFO buffer. (2) Data of the short packet size (including 0-byte data) is written to the FIFO buffer and then 1 is written to the BVAL bit
Continuous transfer (CNTMD = 1)	In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in any of the following cases. (1) The number of the data bytes received in the FIFO buffer assigned to the DCP becomes the same as the number of assigned data bytes (fixed to 256 bytes) (2) This module receives a short packet other than a zero-length packet (3) This module receives a zero-length packet when data is already stored in the FIFO buffer assigned to the DCP.
	In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in either of the following cases. (1) The number of the data bytes written to the FIFO buffer becomes the same as the number of data bytes in a single FIFO buffer plane assigned to the DCP. (2) A number of data bytes less than the size of a single FIFO buffer (including 0-byte data) assigned to the DCP being written to the FIFO buffer and then 1 being written to BVAL.

29.3.29 DCP Maximum Packet Size Register (DCPMAXP)

DCPMAXP is a register that specifies the maximum packet size for the DCP.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEVSEL[3:0]				—	—	—	—	—	MXPS[6:0]						
Initial value:	0	0	0	0	—	—	—	—	—	1	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DEVSEL[3:0]	0000	R/W	Device Select When the host controller mode is selected, these bits specify the communication target peripheral device address for control transfers. 0000: Address 0000 0001: Address 0001 : : 1001: Address 1001 1010: Address 1010 Others: Setting prohibited These bits should be set after setting the DEVADDn register corresponding to the value to be set in these bits. For example, before setting DEVSEL to 0010, the DEVADD2 register should be set first. These bits should be set while CSSTS is 0, PID is NAK, and SUREQ is 0. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. When the function controller mode is selected, these bits should be set to B'0000.
11 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6 to 0	MXPS[6:0]	H'40	R/W	Maximum Packet Size Specifies the maximum data payload (maximum packet size) for the DCP. These bits are initialized to H'40 (64 bytes). These bits should be set to the value based on the USB Specification. These bits should be set while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. While MXPS is 0, do not write to the FIFO buffer or do not set PID to BUF.

29.3.30 DCP Control Register (DCPCTR)

DCPCTR is a register that is used to confirm the buffer memory status, change and confirm the data PID sequence bit, and set the response PID for the DCP.

This register is initialized by a power-on reset. The CCPL and PID[1:0] bits are initialized by a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	SUREQ	CSCLR	CSSTS	SUREQCLR	—	—	SQCLR	SQSET	SQMON	PBUSY	PINGE	—	CCPL	PID[1:0]	
Initial value:	0	0	0	0	0	—	—	0	0	1	0	0	—	0	0	0
R/W:	R	R/W*2	R/W*1	R	R/W*1	R	R	R/W*1	R/W*1	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer Status Indicates whether DCP FIFO buffer access is enabled or disabled. 0: Buffer access is disabled. 1: Buffer access is enabled. The meaning of the BSTS bit depends on the ISEL bit setting as follows. • When ISEL = 0, BSTS indicates whether the received data can be read from the buffer. • When ISEL = 1, BSTS indicates whether the data to be transmitted can be written to the buffer.
14	SUREQ	0	R/W*2	Setup Token Transmission Transmits the setup packet by setting this bit to 1 when the host controller mode is selected. 0: Writing invalid 1: Transmits the setup packet. After completing the setup transaction process, this module generates either the SACK or SIGN interrupt and clears this bit to 0. This module also clears this bit to 0 when the SUREQCLR bit is set to 1. Before setting this bit to 1, set the DEVSEL bits, USBREQ register, USBVAL register, USBINDX register, and USBLENG register appropriately to transmit the desired USB request in the setup transaction. Before setting this bit to 1, check that the PID bits for the DCP are set to NAK. After setting this bit to 1, do not modify the DEVSEL bits, USBREQ register, USBVAL register, USBINDX register, or USBLENG register while the setup transaction is in progress (SUREQ = 1). Write 1 to this bit only when transmitting the setup token; for the other purposes, write 0. When the function controller mode is selected, be sure to write 0 to this bit.
13	CSCLR	0	R/W*1	C-SPLIT Status Clear for Split Transaction When the host controller mode is selected, setting this bit to 1 clears the CSSTS bit to 0 for the transfer using the split transaction. In this case, the next DCP transfer restarts with the S-SPLIT. 0: Writing invalid 1: Clears the CSSTS bit to 0. When this bit is set to 1, this module clears the CSSTS bit to 0. For the transfer using the split transaction, to restart the next transfer with the S-SPLIT forcibly, set this bit to 1. However, for the normal split transaction, this module automatically clears the CSSTS bit to 0 upon completion of the C-SPLIT; therefore, clearing the CSSTS bit is not necessary. Controlling the CSSTS bit through this bit must be done while UACT is 0 and thus communication is halted or while no transfer is being performed with bus disconnection detected. Setting this bit to 1 while CSSTS is 0 has no effect. When the function controller mode is selected, be sure to write 0 to this bit.

Bit	Bit Name	Initial Value	R/W	Description
12	CSSTS	0	R	COMPLETE SPLIT (C-SPLIT) Status of Split Transaction Indicates the C-SPLIT status of the split transaction when the host controller mode is selected. 0: START-SPLIT (S-SPLIT) transaction being processed or the device not using the split transaction being processed 1: C-SPLIT transaction being processed This module sets this bit to 1 upon start of the C-SPLIT and clears this bit to 0 upon detection of C-SPLIT completion. When the function controller mode is selected, the read value is invalid.
11	SUREQCLR	0	R/W*1	SUREQ Bit Clear When the host controller mode is selected, setting this bit to 1 clears the SUREQ bit to 0. 0: Writing invalid 1: Clears the SUREQ bit to 0. This bit always indicates 0. Set this bit to 1 when communication has stopped with SUREQ being 1 during the setup transaction. However, for normal setup transactions, this module automatically clears the SUREQ bit to 0 upon completion of the transaction; therefore, clearing the SUREQ bit is not necessary. Controlling the SUREQ bit through this bit must be done while UACT is 0 and thus communication is halted or while no transfer is being performed with bus disconnection detected. When the function controller mode is selected, be sure to write 0 to this bit.
10, 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	SQCLR	0	R/W*1	Toggle Bit Clear Specifies DATA0 as the expected value of the sequence toggle bit for the next transaction during the DCP transfer. 0: Writing invalid 1: Specifies DATA0. This bit always indicates 0. Do not set the SQCLR and SQSET bits to 1 simultaneously. Set this bit to 1 while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
7	SQSET	0	R/W*1	Toggle Bit Set Specifies DATA1 as the expected value of the sequence toggle bit for the next transaction during the DCP transfer. 0: Writing invalid 1: Specifies DATA1. Do not set the SQCLR and SQSET bits to 1 simultaneously. Set this bit to 1 while CSSTS is 0 and PID is NAK. Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
6	SQMON	1	R	Sequence Toggle Bit Monitor Indicates the expected value of the sequence toggle bit for the next transaction during the DCP transfer. 0: DATA0 1: DATA1 This module allows this bit to toggle upon normal completion of the transaction. However, this bit is not allowed to toggle when a DATA-PID disagreement occurs during the transfer in the receiving direction. When the function controller mode is selected, this module sets this bit to 1 (specifies DATA1 as the expected value) upon normal reception of the setup packet. When the function controller mode is selected, this module does not reference to this bit during the IN/OUT transaction of the status stage, and does not allow this bit to toggle upon normal completion.

Bit	Bit Name	Initial Value	R/W	Description
5	PBUSY	0	R	Pipe Busy Indicates whether or not the actual communication state of the DCP has entered the NAK state when the PID bits for the DCP are changed from BUF to NAK. 0: Has not finished the transition to NAK 1: Has finished the transition to NAK This module modifies this bit from 0 to 1 upon start of the USB transaction for the DCP, and modifies the bit from 1 to 0 upon completion of one transaction. Reading this bit after PID has been set to NAK allows checking whether modification of the pipe settings is possible. For details, refer to section 29.4.3 (1) Pipe Control Register Switching Procedures.
4	PINGE	0	R/W	PING Token Issue Enable When the host controller mode is selected, setting this bit to 1 allows this module to issue the PING token during transfers in the transmitting direction and start a transfer in the transmitting direction with the PING transaction. 0: Disables issuing PING token. 1: Enables normal PING operation. When having detected the ACK handshake during PING transactions, this module performs the OUT transaction as the next transaction. When having detected the NAK handshake or NYET handshake during OUT transactions, this module performs the PING transaction as the next transaction. When the host controller mode is selected, setting this bit to 0 prevents this module from issuing the PING token during transfers in the transmitting direction and only allows this module to perform OUT transactions for the transfers in the transmitting direction. This bit should be modified while CSSTS is 0 and PID is NAK. Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. When the function controller mode is selected, be sure to write 0 to this bit.
3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2	CCPL	0	R/W	Control Transfer End Enable When the function controller mode is selected, setting this bit to 1 enables the status stage of the control transfer to be completed. 0: Completion of control transfer is disabled. 1: Completion of control transfer is enabled. In function controller mode, when this bit is set to 1 while the corresponding PID bits are set to BUF, this module completes the control transfer status stage. Specifically, during control read transfer, this module transmits the ACK handshake in response to the OUT transaction from the USB host, and outputs the zero-length packet in response to the IN transaction from the USB host during control write or no-data control transfer. However, on detecting the SET_ADDRESS request, this module operates in auto response mode from the setup stage up to the status stage completion irrespective of the setting of this bit. This module modifies this bit from 1 to 0 on receiving the new setup packet. 1 cannot be written to this bit while VALID is 1. When the host controller mode is selected, be sure to write 0 to this bit.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	Response PID Controls the response type of this module during control transfer. 00: NAK response 01: BUF response (depending on the buffer state) 10: STALL response 11: STALL response (1) When the host controller mode is selected Modify the setting of these bits from NAK to BUF using the following procedure. • When the transmitting direction is set Write all the transmit data to the FIFO buffer while UACT is 1 and PID is NAK, and then set PID to BUF. After PID has been set to BUF, this module executes the OUT transaction (or PING transaction). • When the receiving direction is set Check that the FIFO buffer is empty (or empty the buffer) while UACT is 1 and PID is NAK, and then set PID to BUF. After PID has been set to BUF, this module executes the IN transaction. This module modifies the setting of these bits as follows. • This module sets PID to STALL (11) on receiving the data of the size exceeding the maximum packet size when PID has been set to BUF. • This module sets PID to NAK on detecting a reception error such as a CRC error three consecutive times. • This module also sets PID to STALL (11) on receiving the STALL handshake. Even if the PID bits are modified to NAK after this module has issued S-SPLIT of the split transaction for the selected pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes. This module sets PID to NAK upon completion of C-SPLIT. (2) When the function controller mode is selected This module modifies the setting of these bits as follows. • This module modifies PID to NAK on receiving the setup packet. Here, this module sets VALID to 1. The setting of PID cannot be modified until VALID is set to 0. • This module sets PID to STALL (11) on receiving the data of the size exceeding the maximum packet size when PID has been set to BUF. • This module sets PID to STALL (1x) on detecting the control transfer sequence error. • This module sets PID to NAK on detecting the USB bus reset. This module does not reference to the setting of the PID bits while the SET_ADDRESS request is processed (auto processing).

Note 1. Only 0 can be read and 1 can be written to.
Note 2. Only 1 can be written to.

29.3.31 Pipe Window Select Register (PIPESEL)

PIPE1 to PIPE9 should be set using PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN.

After selecting the pipe using PIPESEL, functions of the pipe should be set using PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI. PIPEnCTR, PIPEnTRE, and PIPEnTRN can be set regardless of the pipe selection in PIPESEL.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3 to 0	PIPESEL[3:0]	0000	R/W	Pipe Window Select When a value between 0001 and 1111 is set in these bits, the information and settings for the corresponding pipe can be read from the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. 0000: No pipe selected 0001: PIPE1 0010: PIPE2 0011: PIPE3 0100: PIPE4 0101: PIPE5 0110: PIPE6 0111: PIPE7 1000: PIPE8 1001: PIPE9 1010: PIPE10 1011: PIPE11 1100: PIPE12 1101: PIPE13 1110: PIPE14 1111: PIPE15 Others: Setting prohibited When 0000 is set in these bits, 0 is read from all of the bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Writing to the bits in these registers is invalid.

29.3.32 Pipe Configuration Register (PIPECFG)

PIPECFG is a register that specifies the transfer type, buffer memory access direction, and endpoint numbers for PIPE1 to PIPE15. It also selects continuous or non-continuous transfer mode, single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	TYPE[1:0]	00	R/W	Transfer Type Specifies the transfer type for the pipe selected by the PIPESEL bits (selected pipe). • PIPE1 and PIPE2 00: Pipe not used 01: Bulk transfer 10: Setting prohibited 11: Isochronous transfer • PIPE3 to PIPE5 00: Pipe not used 01: Bulk transfer 10: Setting prohibited 11: Setting prohibited • PIPE6 to PIPE8 00: Pipe not used 01: Pipe not used 10: Interrupt transfer 11: Setting prohibited • PIPE9 00: Pipe not used 01: Bulk transfer (when in function controller mode) 10: Interrupt transfer (when in host controller mode) 11: Setting prohibited • PIPE10 (available only in function controller mode) 01: Bulk transfer 10: Interrupt transfer • PIPE11 to PIPE15 (available only in function controller mode) 01: Bulk transfer Before setting PID to BUF for the selected pipe (before starting USB communication using the selected pipe), be sure to set these bits to the value other than 00. Modify these bits while the PID bits for the selected pipe are set to NAK. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
13 to 11	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10	BFRE	0	R/W	BRDY Interrupt Operation Specification Specifies the BRDY interrupt generation timing from this module to the CPU with respect to the selected pipe. 0: BRDY interrupt upon transmitting or receiving data 1: BRDY interrupt upon completion of reading data This bit is valid when PIPE1 to PIPE5 and PIPE9 to PIPE15 are selected. When this bit is set to 1 and the selected pipe is in the receiving direction, this module detects the transfer completion and generates the BRDY interrupt on having read the pertinent packet. When the BRDY interrupt is generated with the above conditions, 1 needs to be written to BCLR. The FIFO buffer assigned to the selected pipe is not enabled for reception until 1 is written to BCLR. When this bit is set to 1 and the selected pipe is in the transmitting direction, this module does not generate the BRDY interrupt. For details, refer to section 29.4.2 (2) BRDY Interrupt. Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. To modify this bit after completing USB communication using the selected pipe, write 1 and then 0 to ACLRM continuously to clear the FIFO buffer assigned to the selected pipe while the CSSTS, PID, and CURPIPE bits are in the above-described state. Before modifying this bit after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
9	DBLB	0	R/W	Double Buffer Mode Selects either single or double buffer mode for the FIFO buffer used by the selected pipe. 0: Single buffer 1: Double buffer This bit is valid when PIPE1 to PIPE5 and PIPE9 to PIPE15 are selected. For PIPE9 and PIPE10, this bit is only valid when the transfer type is set to bulk transfer. When this bit is set to 1, this module assigns two planes of the FIFO buffer size specified by the BUFSIZE bits in PIPEBUF to the selected pipe. Specifically, the following expression determines the FIFO buffer size assigned to the selected pipe by this module. (BUFSIZE + 1) × 64 × (DBLB + 1) [bytes] Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. To modify this bit after completing USB communication using the selected pipe, write 1 and then 0 to ACLRM continuously to clear the FIFO buffer assigned to the selected pipe while the CSSTS, PID, and CURPIPE bits are in the above-described state. Before modifying this bit after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

Bit	Bit Name	Initial Value	R/W	Description
8	CNTMD	0	R/W	Continuous Transfer Mode Specifies whether to use the selected pipe in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode This bit is valid when PIPE1 to PIPE5 and PIPE9 to PIPE15 are selected by the PIPESEL bits and bulk transfer is selected (TYPE = 01). This module determines whether transmitting to/receiving from the FIFO buffer allocated for the selected pipe has completed or not using this bit setting, as shown in Table 29.11. Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. To modify this bit after completing USB communication using the selected pipe, write 1 and then 0 to ACLRM continuously to clear the FIFO buffer assigned to the selected pipe while the CSSTS, PID, and CURPIPE bits are in the above-described state. Before modifying this bit after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
7	SHTNAK	0	R/W	Pipe Disabled at End of Transfer Specifies whether to modify PID to NAK upon the end of transfer when the selected pipe is in the receiving direction. 0: Pipe continued at the end of transfer 1: Pipe disabled at the end of transfer This bit is valid when the selected pipe is PIPE1 to PIPE5 and PIPE9 to PIPE15 in the receiving direction. When this bit is set to 1 for the selected pipe in the receiving direction, this module modifies the PID bits corresponding to the selected pipe to NAK on determining the end of the transfer. This module determines that the transfer has ended on any of the following conditions. • A short packet (including a zero-length packet) is successfully received. • The transaction counter is used and the number of packets specified by the counter is successfully received. Modify this bit while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. This bit should be cleared to 0 for the pipe in the transmitting direction.
6	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
4	DIR	0	R/W	Transfer Direction Specifies the transfer direction for the selected pipe. 0: Receiving direction 1: Transmitting direction When this bit is set to 0, this module uses the selected pipe in the receiving direction, and when this bit is set to 1, this module uses the selected pipe in the transmitting direction. Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. To modify this bit after completing USB communication using the selected pipe, write 1 and then 0 to ACLRM continuously to clear the FIFO buffer assigned to the selected pipe while the CSSTS, PID, and CURPIPE bits are in the above-described state. Before modifying this bit after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	EPNUM[3:0]	0000	R/W	Endpoint Number These bits specify the endpoint number for the selected pipe. Setting 0000 means unused pipe. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. Do not make the settings such that the combination of the set values in the DIR and EPNUM bits should be the same for two or more pipes (EPNUM = 0000 can be set for all the pipes).

Table 29.11 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled

Continuous or Non-Continuous Transfer Mode	When Reading Data or Transmitting Data is Enabled
Non-continuous transfer (CNTMD = 0)	In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in the following case. This module receives a single packet.
	In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in either of the following cases. (1) Data of the maximum packet size is written to the FIFO buffer. (2) Data of the short packet size (including 0-byte data) is written to the FIFO buffer and then 1 is written to BVAL.
Continuous transfer (CNTMD = 1)	In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in any of the following cases. (1) The number of the data bytes received in the FIFO buffer assigned to the selected pipe becomes the same as the number of assigned data bytes ((BUFSIZE + 1) × 64). (2) This module receives a short packet other than a zero-length packet. (3) This module receives a zero-length packet when data is already stored in the FIFO buffer assigned to the selected pipe. (4) This module receives the number of packets equal to the transaction counter value specified for the selected pipe.
	In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in any of the following cases. (1) The number of the data bytes written to the FIFO buffer becomes the same as the number of data bytes in a single FIFO buffer plane assigned to the selected pipe. (2) A number of data bytes less than the size of a single FIFO buffer (including 0 bytes of data) assigned to the selected pipe being written to the FIFO buffer and then 1 being written to BVAL (3) After setting the DMA transfer end sampling enable bit (TENDE) to 1, a number of data bytes less than the size of a single FIFO buffer (including 0 bytes of data) assigned to the selected pipe being written to the FIFO buffer by DMA transfer and the DMA transfer end signal is received when the last byte is written.

29.3.33 Pipe Buffer Setting Register (PIPEBUF)

PIPEBUF is a register that specifies the buffer size and buffer number for PIPE1 to PIPE9.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	BUFSIZE[4:0]					—	—	BUFNMB[7:0]							
Initial value:	—	0	0	0	0	0	—	—	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14 to 10	BUFSIZE[4:0]	H'00	R/W	Buffer Size Specifies the size of the buffer for the pipe selected by the PIPESEL bits (selected pipe) in terms of blocks, where one block comprises 64 bytes. 00000 (H'00): 64 bytes 00001 (H'01): 128 bytes : : 11111 (H'1F): 2 Kbytes When the DBLB bit is set to 1, this module assigns two planes of the FIFO buffer size specified by the BUFSIZE bits to the selected pipe. Specifically, the following expression determines the FIFO buffer size assigned to the selected pipe by this module. (BUFSIZE + 1) × 64 × (DBLB + 1) [bytes] The valid value for these bits depends on the selected pipe. • PIPE1 to PIPE5 and PIPE9 to PIPE15: Any value from H'00 to H'1F is valid. • PIPE6 to PIPE8: H'00 should be set. When used with CNTMD = 1, set an integral multiple of the maximum packet size to the BUFSIZE bits. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
9, 8	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BUFNMB[7:0]	H'00	R/W	Buffer Number The first block number in the FIFO buffer to be allocated for the selected pipe should be set in these bits. The FIFO buffer blocks allocated for the selected pipe by this module are determined as follows: Block number: BUFNMB to block number of (BUFNMB + (BUFSIZE + 1) × (DBLB + 1) – 1) These bits should be set to a value from H'04 to H'7F. BUFNMB = H'00 is used exclusively for DCP. BUFNMB = H'04 is used exclusively for PIPE6. When PIPE6 is not used, H'04 can be used for other pipes. When PIPE6 is selected, writing to these bits is invalid and H'04 is automatically assigned by this module. BUFNMB = H'05 is used exclusively for PIPE7. When PIPE7 is not used, H'05 can be used for other pipes. When PIPE7 is selected, writing to these bits is invalid and H'05 is automatically assigned by this module. BUFNMB = H'06 is used exclusively for PIPE8. When PIPE8 is not used, H'06 can be used for other pipes. When PIPE8 is selected, writing to these bits is invalid and H'06 is automatically assigned by this module. BUFNMB = H'07 is used exclusively for PIPE9. When PIPE9 is not used, H'07 can be used for other pipes. When PIPE9 is selected, writing to these bits is valid and H'07 is assigned as the initial value by this module. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

29.3.34 Pipe Maximum Packet Size Register (PIPEMAXP)

PIPEMAXP is a register that specifies the maximum packet size for PIPE1 to PIPE15.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEVSEL[3:0]				—	MXPS[10:0]										
Initial value:	0	0	0	0	—	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DEVSEL[3:0]	0000	R/W	Device Select When the host controller mode is selected, these bits specify the USB address of the communication target peripheral device. 0000: Address 0000 0001: Address 0001 0010: Address 0010 : : 1010: Address 1010 Others: Setting prohibited These bits should be set after setting the address to the DEVADDn (n = 0 to 9, and A) register corresponding to the value to be set in these bits. For example, before setting DEVSEL to 0010, the DEVADD2 address should be set first. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. When the function controller mode is selected, these bits should be set to B'0000.
11	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
10 to 0	MXPS[10:0]	*1	R/W	Maximum Packet Size Specifies the maximum data payload (maximum packet size) for the selected pipe. The valid value for these bits depends on the pipe as follows. PIPE1, PIPE2: 1 byte (H'001) to 1,024 bytes (H'400) PIPE3 to PIPE5: 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), and 512 bytes (H'200) (Bits [2:0] are not available.) PIPE6 to PIPE8: 1 byte (H'001) to 64 bytes (H'040) PIPE9 (when in host controller mode): 1 byte (H'001) to 64 bytes (H'040) PIPE9 (when in function controller mode): 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), 512 bytes (H'200) (Bits [2:0] are not available.) PIPE10 to PIPE15: 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), 512 bytes (H'200) (Bits [2:0] are not available.) These bits should be set to the approp3riate value for each transfer type based on the USB Specification. For split transactions using the isochronous pipe, these bits should be set to 188 bytes or less. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. While MXPS is 0, do not write to the FIFO buffer or set PID to BUF.

Note 1. The initial value of MXPS is H'000 when no pipe is selected with the PIPESEL bits in PIPESEL and H'040 when a pipe is selected with the PIPESEL bits in PIPESEL.

29.3.35 Pipe Timing Control Register (PIPEPERI)

PIPEPERI is a register that selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfer, and sets the interval error detection interval for PIPE1 to PIPE15.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV[2:0]		
Initial value:	—	—	—	0	—	—	—	—	—	—	—	—	—	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	IFIS	0	R/W	Isochronous IN Buffer Flush Specifies whether to flush the buffer when the pipe selected by the PIPESEL bits is used for isochronous IN transfers. 0: The buffer is not flushed. 1: The buffer is flushed. When the function controller mode is selected and the selected pipe is for isochronous IN transfers, this module automatically clears the FIFO buffer when this module fails to receive the IN token from the USB host within the interval set by the IITV bits in terms of (μ) frames. In double buffer mode (DBLB = 1), this module only clears the data in the plane used earlier. This module clears the FIFO buffer on receiving the SOF packet immediately after the (μ) frame in which this module has expected to receive the IN token. Even if the SOF packet is corrupted, this module also clears the FIFO buffer at the right timing to receive the SOF packet by using the internal interpolation. When the host controller mode is selected, set this bit to 0. When the selected pipe is not for the isochronous transfer, set this bit to 0.
11 to 3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2 to 0	IITV[2:0]	000	R/W	Interval Error Detection Interval Specifies the interval error detection timing for the selected pipe in terms of frames, which is expressed as n-th power of 2 (n is the value to be set). As described later, the detailed functions are different in host controller mode and in function controller mode. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. Before modifying these bits after USB communication has been completed with these bits set to a certain value, set PID to NAK and then set ACLRM to 1 to initialize the interval timer. The IITV bits are invalid for PIPE3 to PIPE5 and PIPE10 to PIPE15; set these bits to 000 for these pipes.

29.3.36 PIPEn Control Registers (PIPEnCTR) (n = 1 to F)

PIPEnCTR is a register that is used to confirm the buffer memory status for the corresponding pipe, change and confirm the data PID sequence bit, determine whether auto response mode is set, determine whether auto buffer clear mode is set, and set a response PID for PIPE1 to PIPE15. This register can be set regardless of the pipe selection in PIPESEL. These registers are initialized by a power-on reset. The PID[1:0] bits are initialized by a USB bus reset.

(1) PIPEnCTR (n = 1 to 5, 9, A to F)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	INBUFM	CSCLR	CSSTS	—	ATREPM	ACLRM	SQCLR	SQSET	SQMON	PBUSY	—	—	—	PID[1:0]	
Initial value:	0	0	0	0	—	0	0	0	0	0	0	—	—	—	0	0
R/W:	R	R	R/W*2	R	R	R/W	R/W	R/W*1	R/W*1	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer Status Indicates whether or not the FIFO buffer allocated for the pertinent pipe can be accessed by the CPU. 0: Buffer access by the CPU is disabled. 1: Buffer access by the CPU is enabled. The meaning of this bit depends on the settings of the DIR, BFRE, and DCLRM bits as shown in Table 29.12.
14	INBUFM	0	R	Transmission Buffer Monitor Indicates the pertinent FIFO buffer status when the pertinent pipe is in the transmitting direction. 0: There is no transmissible data in the buffer memory. 1: There is transmissible data in the buffer memory. When the pertinent pipe is in the transmitting direction (DIR = 1), this module sets this bit to 1 when writing data to at least one FIFO buffer plane is completed. This module sets this bit to 0 when this module completes transmitting the data from the FIFO buffer plane to which all the data has been written. In double buffer mode (DBLB = 1), this module sets this bit to 0 after this module has completed transmitting the data from both FIFO buffer planes but before it has completed writing data to a single FIFO buffer plane. This bit indicates the same value as the BSTS bit when the pertinent pipe is in the receiving direction (DIR = 0).
13	CSCLR	0	R/W*2	C-SPLIT Status Clear Bit When the host controller mode is selected, setting this bit to 1 allows this module to clear the CSSTS bit to 0. 0: Writing invalid 1: Clears the CSSTS bit to 0. For the transfer using the split transaction, to restart the next transfer with the S-SPLIT forcibly, set this bit to 1. However, for the normal split transaction, this module automatically clears the CSSTS bit to 0 upon completion of the C-SPLIT; therefore, clearing the CSSTS bit is not necessary. Controlling the CSSTS bit through this bit must be done while UACT is 0 and thus communication is halted or while no transfer is being performed with bus disconnection detected. Setting this bit to 1 while CSSTS is 0 has no effect. When the function controller mode is selected, be sure to write 0 to this bit.

Bit	Bit Name	Initial Value	R/W	Description
12	CSSTS	0	R	CSSTS Status Bit Indicates the C-SPLIT status of the split transaction when the host controller mode is selected. 0: START-SPLIT (S-SPLIT) transaction being processed or the transfer not using the split transaction in progress 1: C-SPLIT transaction being processed This module sets this bit to 1 upon start of the C-SPLIT and clears this bit to 0 upon detection of C-SPLIT completion. Indicates the valid value only when the host controller mode is selected.
11	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
10	ATREPM	0	R/W	Auto Response Mode Enables or disables auto response mode for the pertinent pipe. 0: Auto response disabled 1: Auto response enabled When the function controller mode is selected and the pertinent pipe is for bulk transfer, this bit can be set to 1. When this bit is set to 1, this module responds to the token from the USB host as described below. (1) When the pertinent pipe is for bulk IN transfer (TYPE = 01 and DIR = 1) When ATREPM = 1 and PID = BUF, this module transmits a zero-length packet in response to the IN token. This module updates (toggles) the sequence toggle bit (DATA-PID) each time this module receives the ACK from the USB host (in a single transaction, IN token is received, zero-length packet is transmitted, and then ACK is received.). In this case, this module does not generate the BRDY or BEMP interrupt. (2) When the pertinent pipe is for bulk OUT transfer (TYPE = 01 and DIR = 0) When ATREPM = 1 and PID = BUF, this module returns NAK in response to the OUT token (or PING token) and generates the NRDY interrupt. Modify this bit while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. For USB communication in auto response mode, set this bit to 1 while the FIFO buffer is empty. Do not write to the FIFO buffer during USB communication in auto response mode. When the pertinent pipe is for isochronous transfer, be sure to set this bit to 0. When the host controller mode is selected, set this bit to 0.
9	ACLRM	0	R/W	Auto Buffer Clear Mode Enables or disables automatic buffer clear mode for the pertinent pipe. 0: Disabled 1: Enabled (all buffers are initialized) To delete the contents in the FIFO buffer assigned to the pertinent pipe completely, write 1 and then 0 to this bit continuously. Table 29.13 shows the contents cleared by writing 1 and 0 to this bit continuously and the cases in which clearing the contents is necessary. Modify this bit while CSSTS is 0, PID is NAK, and the pertinent pipe is not selected by the CURPIPE bits. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

Bit	Bit Name	Initial Value	R/W	Description
8	SQCLR	0	R/W*1	Toggle Bit Clear This bit should be set to 1 to clear the expected value (to set DATA0 as the expected value) of the sequence toggle bit for the next transaction of the pertinent pipe. 0: Writing invalid 1: Specifies DATA0. Setting this bit to 1 allows this module to set DATA0 as the expected value of the sequence toggle bit of the pertinent pipe. This bit always indicates 0. When the host controller mode is selected, setting this bit to 1 for the pipe for bulk OUT transfer, this module starts the next transfer of the pertinent pipe with the PING token. Set the SQCLR bit to 1 while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
7	SQSET	0	R/W*1	Toggle Bit Set This bit should be set to 1 to set DATA1 as the expected value of the sequence toggle bit for the next transaction of the pertinent pipe. 0: Writing invalid 1: Specifies DATA1. Setting this bit to 1 allows this module to set DATA1 as the expected value of the sequence toggle bit of the pertinent pipe. This module always sets this bit to 0. Set the SQSET bit to 1 while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
6	SQMON	0	R	Toggle Bit Confirmation Indicates the expected value of the sequence toggle bit for the next transaction of the pertinent pipe. 0: DATA0 1: DATA1 When the pertinent pipe is not for the isochronous transfer, this bit is toggled upon normal completion of the transaction. However, this bit is not toggled when a DATA-PID disagreement occurs during the receiving transfer.
5	PBUSY	0	R	Pipe Busy This bit indicates whether or not the pertinent pipe is being currently used for the transaction. 0: The pertinent pipe is not being currently used for the transaction. 1: The pertinent pipe is being currently used for the transaction. This module modifies this bit from 0 to 1 upon start of the USB transaction for the pertinent pipe, and modifies the bit from 1 to 0 upon completion of one transaction. Reading this bit after PID has been set to NAK allows checking that modification of the pipe settings is possible.
4 to 2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	Response PID Specifies the response type for the next transaction of the pertinent pipe. 00: NAK response 01: BUF response (depending on the buffer state) 10: STALL response 11: STALL response The default setting of these bits is NAK. Modify the setting to BUF to use the pertinent pipe for USB transfer. Table 29.14 and Table 29.15 show the basic operation (operation when there are no errors in the transmitted and received packets) of this module depending on the PID bit setting. Some registers require these bits to be set to NAK before their settings can be changed by software. Set these bits to NAK by software when changing such kind of registers. To confirm which registers apply to this, reference the descriptions of bits. After modifying the setting of these bits from BUF to NAK during USB communication using the pertinent pipe, check that PBUSY is 0 to see if USB communication using the pertinent pipe has actually entered the NAK state. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. Even if the PID bits are modified to NAK after S-SPLIT of the split transaction has been issued for the pertinent pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes. • This module modifies the setting of these bits as follows. This module sets PID to NAK on recognizing the completion of the transfer when the pertinent pipe is in the receiving direction and the SHTNAK bit for the selected pipe has been set to 1. • This module sets PID to STALL (11) on receiving the data packet with the payload exceeding the maximum packet size of the pertinent pipe. • This module sets PID to NAK on detecting a USB bus reset when the function controller mode is selected. • This module sets PID to NAK on detecting a reception error such as a CRC error three consecutive times when the host controller mode is selected. • This module sets PID to STALL (11) on receiving the STALL handshake when the host controller mode is selected. To specify each response type, set these bits as follows. • To make a transition from NAK (00) to STALL, set 10. • To make a transition from BUF (01) to STALL, set 11. • To make a transition from STALL (11) to NAK, set 10 and then 00. • To make a transition from STALL to BUF, set 00 (NAK) and then 01 (BUF).

Note 1. Only 0 can be read and 1 can be written to.
Note 2. Only 1 can be written to.

Table 29.12 Meaning of BSTS Bit

DIR Bit	BFRE Bit	DCLRM Bit	Meaning of BSTS Bit
0	0	0	1: The received data can be read from the FIFO buffer. 0: The received data has been completely read from the FIFO buffer.
		1	Setting prohibited
	1	0	1: The received data can be read from the FIFO buffer. 0: The BCLR bit has been set to 1 after the received data has been completely read from the FIFO buffer.
		1	1: The received data can be read from the FIFO buffer. 0: The received data has been completely read from the FIFO buffer.
1	0	0	1: The transmit data can be written to the FIFO buffer. 0: The transmit data has been completely written to the FIFO buffer.
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

Table 29.13 Contents Cleared by This Module by Setting ACLRM = 1

No.	Contents Cleared by ACLRM Bit Manipulation	Cases in which Clearing the Contents is Necessary
1	All the contents in the FIFO buffer assigned to the pertinent pipe (all the information in two FIFO buffer planes in double buffer mode)	
2	The interval count value when the pertinent pipe is for isochronous transfer	When the interval count value is to be reset
3	Values of the internal flags related to the BFRE bit	When the BFRE setting is modified
4	FIFO buffer toggle control	When the DBLB setting is modified
5	Values of the internal flags related to the transaction count	When the transaction count function is forcibly terminated

Table 29.14 Operation of This Module Depending on PID Setting (when Host Controller Mode is Selected)

PID	Transfer Type (TYPE Bits)	Transfer Direction (DIR Bit)	Operation of This Module
00 (NAK)	Operation does not depend on the setting.	Operation does not depend on the setting.	Does not issue tokens.
01 (BUF)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Issues tokens while UACT is 1 and the FIFO buffer corresponding to the pertinent pipe is ready for transmission and reception. Does not issue tokens while UACT is 0 or the FIFO buffer corresponding to the pertinent pipe is not ready for transmission or reception.
	Isochronous (TYPE = 11)	Operation does not depend on the setting.	Issues tokens irrespective of the status of the FIFO buffer corresponding to the pertinent pipe when the UACT bit is set to 1. Does not issue tokens when the UACT bit is set to 0.
10 (STALL) or 11 (STALL)	Operation does not depend on the setting.	Operation does not depend on the setting.	Does not issue tokens.

Table 29.15 Operation of This Module Depending on PID Setting (when Function Controller Mode is Selected)

PID	Transfer Type (TYPE Bits)	Transfer Direction (DIR Bit)	Operation of This Module
00 (NAK)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Returns NAK in response to the token from the USB host.
	Isochronous (TYPE = 11)	Operation does not depend on the setting.	Returns nothing in response to the token from the USB host.
01 (BUF)	Bulk (TYPE = 01)	Receiving direction (DIR = 0)	Receives data and returns ACK or NYET in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready. Returns ACK in response to the PING token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready.
	Interrupt (TYPE = 10)	Receiving direction (DIR = 0)	Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready.
	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the corresponding FIFO buffer is ready for transmission. Returns NAK if not ready.
	Isochronous (TYPE = 11)	Receiving direction (DIR = 0)	Receives data in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Discards data if not ready.
		Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the corresponding FIFO buffer is ready for transmission. Transmits the zero-length packet if not ready.
10 (STALL) or 11 (STALL)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Returns STALL in response to the token from the USB host.
	Isochronous (TYPE = 11)	Operation does not depend on the setting	Returns nothing in response to the token from the USB host.

(2) PIPEnCTR (n = 6 to 8)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	—	CSCLR	CSSTS	—	—	ACLRM	SQCLR	SQSET	SQ MON	PBUSY	—	—	—	PID[1:0]	
Initial value:	0	—	0	0	—	—	0	0	0	0	0	—	—	—	0	0
R/W:	R	R	R/W*1	R/W	R	R	R/W	R/W*1	R/W*1	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer Status Indicates whether or not the FIFO buffer allocated for the pertinent pipe can be accessed by the CPU. 0: Buffer access is disabled. 1: Buffer access is enabled. The meaning of this bit depends on the settings of the DIR, BFRE, and DCLRM bits as shown in Table 29.12.
14	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
13	CSCLR	0	R/W*1	C-SPLIT Status Clear Bit Setting this bit to 1 allows this module to clear the CSSTS bit of the pertinent pipe to 0. 0: Writing invalid 1: Clears the CSSTS bit to 0. For the transfer using the split transaction, to restart the next transfer with the S-SPLIT forcibly, set this bit to 1. However, for the normal split transaction, this module automatically clears the CSSTS bit to 0 upon completion of the C-SPLIT; therefore, clearing the CSSTS bit is not necessary. Controlling the CSSTS bit through this bit must be done while UACT is 0 thus communication is halted or while no transfer is being performed with bus disconnection detected. Setting this bit to 1 while CSSTS is 0 has no effect. When the function controller mode is selected, be sure to write 0 to this bit.
12	CSSTS	0	R/W	CSSTS Status Bit Indicates the C-SPLIT status of the split transaction when the host controller mode is selected. 0: START-SPLIT (S-SPLIT) transaction being processed or the transfer not using the split transaction in progress 1: C-SPLIT transaction being processed This module sets this bit to 1 upon start of the C-SPLIT and clears this bit to 0 upon detection of C-SPLIT completion. Indicates the valid value only when the host controller mode is selected.
11, 10	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
9	ACLRM	0	R/W	Auto Buffer Clear Mode Enables or disables automatic buffer clear mode for the pertinent pipe. 0: Disabled 1: Enabled (all buffers are initialized) To delete the contents in the FIFO buffer assigned to the pertinent pipe completely, write 1 and then 0 to this bit continuously. Table 29.16 shows the contents cleared by writing 1 and 0 to this bit continuously and the cases in which clearing the contents is necessary. Modify this bit while CSSTS is 0, PID is NAK, and the pertinent pipe is not selected by the CURPIPE bits. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

Bit	Bit Name	Initial Value	R/W	Description
8	SQCLR	0	R/W*1	Toggle Bit Clear This bit should be set to 1 to clear the expected value (to set DATA0 as the expected value) of the sequence toggle bit for the next transaction of the pertinent pipe. 0: Writing invalid 1: Specifies DATA0. Setting this bit to 1 allows this module to set DATA0 as the expected value of the sequence toggle bit of the pertinent pipe. This bit always indicates 0. When the host controller mode is selected, setting this bit to 1 for the pipe for bulk OUT transfer, this module starts the next transfer of the pertinent pipe with the PING token. Set the SQCLR bit to 1 while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
7	SQSET	0	R/W*1	Toggle Bit Set This bit should be set to 1 to set DATA1 as the expected value of the sequence toggle bit for the next transaction of the pertinent pipe. 0: Writing invalid 1: Specifies DATA1. Setting this bit to 1 allows this module to set DATA1 as the expected value of the sequence toggle bit of the pertinent pipe. This module always sets this bit to 0. Set the SQSET bit to 1 while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
6	SQMON	0	R	Toggle Bit Confirmation Indicates the expected value of the sequence toggle bit for the next transaction of the pertinent pipe. 0: DATA0 1: DATA1 When the pertinent pipe is not for the isochronous transfer, this bit is toggled upon normal completion of the transaction. However, this bit is not toggled when a DATA-PID disagreement occurs during the receiving transfer.
5	PBUSY	0	R	Pipe Busy This bit indicates whether or not the pertinent pipe is being currently used for the transaction. 0: The pertinent pipe is not being currently used for the transaction. 1: The pertinent pipe is being currently used for the transaction. This module modifies this bit from 0 to 1 upon start of the USB transaction for the pertinent pipe, and modifies the bit from 1 to 0 upon completion of one transaction. Reading this bit after PID has been set to NAK allows checking that modification of the pipe settings is possible.
4 to 2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	Response PID Specifies the response type for the next transaction of the pertinent pipe. 00: NAK response 01: BUF response (depending on the buffer state) 10: STALL response 11: STALL response The default setting of these bits is NAK. Modify the setting to BUF to use the pertinent pipe for USB transfer. Table 29.14 and Table 29.15 show the basic operation (operation when there are no errors in the transmitted and received packets) of this module depending on the PID bit setting. Some registers require these bits to be set to NAK before their settings can be changed by software. Set these bits to NAK by software when changing such kind of registers. To confirm which registers apply to this, reference the descriptions of bits. After modifying the setting of these bits from BUF to NAK during USB communication using the pertinent pipe, check that PBUSY is 0 to see if USB communication using the pertinent pipe has actually entered the NAK state. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. Even if the PID bits are modified to NAK after S-SPLIT of the split transaction has been issued for the pertinent pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes. This module modifies the setting of these bits as follows. • This module sets PID to NAK on recognizing the completion of the transfer when the pertinent pipe is in the receiving direction and the SHTNAK bit for the selected pipe has been set to 1. • This module sets PID to STALL (11) on receiving the data packet with the payload exceeding the maximum packet size of the pertinent pipe. • This module sets PID to NAK on detecting a USB bus reset when the function controller mode is selected. • This module sets PID to NAK on detecting a reception error such as a CRC error three consecutive times when the host controller mode is selected. • This module sets PID to STALL (11) on receiving the STALL handshake when the host controller mode is selected. To specify each response type, set these bits as follows. • To make a transition from NAK (00) to STALL, set 10. • To make a transition from BUF (01) to STALL, set 11. • To make a transition from STALL (11) to NAK, set 10 and then 00. • To make a transition from STALL to BUF, set 00 (NAK) and then 01 (BUF).

Note 1. Only 0 can be read and 1 can be written to.

Table 29.16 Contents Cleared by This Module by Setting ACLRM = 1

No.	Contents Cleared by ACLRM Bit Manipulation	Cases in which Clearing the Contents is Necessary
1	All the contents in the FIFO buffer assigned to the selected pipe	
2	When the host controller mode is selected, the interval count value when the selected pipe is for interrupt transfer	When the interval count value is to be reset
3	Values of the internal flags related to the BFRE bit	When the BFRE setting is modified
4	Values of the internal flags related to the transaction count	When the transaction count function is forcibly terminated

29.3.37 PIPEn Transaction Counter Enable Registers (PIPEnTRE) (n = 1 to 5, 9, and A to F)

PIPEnTRE is a register that enables or disables the transaction counter corresponding to PIPE1 to PIPE5, and clears the transaction counter.

These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	0	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R/W	R/W*	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
9	TRENB	0	R/W	Transaction Counter Enable Enables or disables the transaction counter. 0: The transaction counter is disabled. 1: The transaction counter is enabled. For the pipe in the receiving direction, setting this bit to 1 after setting the total number of the packets to be received in the TRNCNT bits allows this module to control hardware as described below on having received the number of packets equal to the set value in the TRNCNT bits. • In continuous transmission/reception mode (CNTMD = 1), this module switches the FIFO buffer to the CPU side even if the FIFO buffer is not full on completion of reception. • While SHTNAK is 1, this module modifies the PID bits to NAK for the corresponding pipe on having received the number of packets equal to the set value in the TRNCNT bits. • While BFRE is 1, this module asserts the BRDY interrupt on having received the number of packets equal to the set value in the TRNCNT bits and then reading out the last received data. For the pipe in the transmitting direction, set this bit to 0. When the transaction counter is not used, set this bit to 0. When the transaction counter is used, set the TRNCNT bits before setting this bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.
8	TRCLR	0	R/W*	Transaction Counter Clear When this bit is set to 1, this module clears the current counter value of the transaction counter corresponding to the pertinent pipe and then sets this bit to 0. 0: Invalid 1: The current counter value is cleared.
7 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. Modify each bit in this register while CSSTS is 0 and PID is NAK. Before modifying each bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

* Only 0 can be read and 1 can be written to.

29.3.38 PIPEn Transaction Counter Registers (PIPEnTRN) (n = 1 to 5, 9, and A to F)

PIPEnTRN is a transaction counter corresponding to PIPE1 to PIPE5, 9, and A to F.
These registers are initialized by a power-on reset, but retain the set value by a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRNCNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TRNCNT[15:0]	H'0000	R/W	Transaction Counter When written to: Specifies the total number of packets to be received by the pertinent pipe (number of transactions). When read from: Indicates the specified number of transactions if TRENB is 0. Indicates the number of currently counted transaction if TRENB is 1. This module increments the value of these bits by one when all of the following conditions are satisfied on receiving the packet. • TRENB is 1. • (TRNCNT setting ≠ current counter value + 1) on receiving the packet. • The payload of the received packet agrees with the set value in the MXPS bits. This module clears the value of these bits to 0 when any of the following conditions are satisfied. • All the following conditions are satisfied. TRENB is 1. (TRNCNT setting = current counter value + 1) on receiving the packet. The payload of the received packet agrees with the set value in the MXPS bits. • All the following conditions are satisfied. TRENB is 1. This module has received a short packet. • The following condition is satisfied. TRCLR is 1. For the pipe in the transmitting direction, set these bits to 0. When the transaction counter is not used, set these bits to 0. Modify these bits while CSSTS is 0, PID is NAK, and TRENB is 0. Before modifying these bits after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. To modify the value of these bits, set TRCLR to 1 before setting TRENB to 1.

29.3.39 Device Address n Configuration Registers (DEVADDn) (n = 0 to 9, and A)

DEVADDn is a register that specifies the USB address and port number of the hub to which the communication target peripheral device is connected and also specifies the USB transfer speed of the communication target peripheral device. These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	UPPHUB[3:0]				HUBPORT[2:0]			USBSPD[1:0]		—	—	—	—	—	—
Initial value:	—	0	0	0	0	0	0	0	0	0	—	—	—	—	—	—
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14 to 11	UPPHUB[3:0]	0000	R/W	Address of Hub to which Communication Target is Connected Specifies the USB address of the hub to which the communication target peripheral device is connected. 0000: The peripheral device is directly connected to the port of this module. 0001 to 1010: USB address of the hub 1011 to 1111: Setting prohibited
10 to 8	HUBPORT[2:0]	000	R/W	Port Number of Hub to which Communication Target is Connected Specifies the port number of the hub to which the communication target peripheral device is connected. 000: The peripheral device is directly connected to the port of this module. 001 to 111: Port number of the hub
7, 6	USBSPD[1:0]	00	R/W	Transfer Speed of the Communication Target Device Specifies the USB transfer speed of the communication target peripheral device. 00: DEVADDn register is not used. 01: Low speed 10: Full speed 11: High speed
5 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. When the host controller mode is selected, the bits in this register should be set before starting communication using each pipe.
(1) When the host controller mode is selected, this module refers to the settings of the UPPHUB bits and HUBPORT bits to generate packets for split transactions.
(2) When the host controller mode is selected, this module refers to the setting of the USBSPD bits to generate packets.

Note 2. The bits in this register should be modified while no valid pipes are using the settings of this register. Valid pipes refer to the ones satisfying both of conditions (1) and (2) below.
(1) This register is selected by the DEVSEL bits as the communication target.
(2) The PID bits are set to BUF for the pertinent pipe or the pertinent pipe is the DCP with SUREQ being 1.

Note 3. When the function controller mode is selected, set all the bits in this register to 0.

29.3.40 UTMI Suspend Mode Register (SUSPMODE)

SUSPMODE is a register that specifies the SuspendM signal to be sent to the UTMI.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SUSPM	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	0	—	0	—	—	—	0	—	—	—	—	0	—	0	0
R/W:	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14	SUSPM	0	R/W	SuspendM Control Enables or disables the clock to be supplied to this module. 0: The clock supplied to this module is disabled. 1: The clock supplied to this module is enabled. This module controls clock output by using the SuspendM signal. The clock to the LINK is stopped, when the SuspendM signal is low. Writing to the registers of this module is impossible when the SUSPM bit is set to 0 (the clock to this module is stopped). Reading the registers is possible. Note that writing to the following registers is possible even when the SUSPM bit is set to 0. - SYSCFG0 - BUSWAIT - INTENB1* - SUSPMODE Note: * Writing to bit 0 in INTENB1 is only possible when the SUSPM bit is set to 0. When setting this bit to 1, wait for at least 1 ms after setting the UPLLE bit to 1. Set this bit to 0 when this module is to enter software standby or USB standby mode.
13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
11 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7 to 4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
1, 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

29.3.41 FIFO Continuous Transfer Port Registers (D0FIFOBn, D1FIFOBn) (n = 0 to 7)

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT [31:0]	H'0000 0000	R/W	FIFO Port Accessing these bits allows reading the received data from the FIFO buffer or writing the transmit data to the FIFO buffer. When the DFACC bits are set to 01 (16-byte continuous access mode) or 10 (32-byte continuous access mode), use the DnFIFO continuous transfer port registers to access the DnFIFO buffer.

29.4 Operation

29.4.1 System Control and Oscillation Control

This section describes the register operations that are necessary to the initial settings of this module, and the registers necessary for power consumption control.

(1) Resets

Table 29.17 lists the types of resets for this module. For the initialized states of the registers following the reset operations, see section 29.3, Register Descriptions.

Table 29.17 Types of Reset

Name	Operation
Power-on reset	Low level input from the $\overline{\text{RES}}$ pin
USB bus reset	Automatically detected by this module from the D+ and D– lines when the function controller mode is selected

(2) Controller Mode Selection

This module can select the host controller mode or function controller mode using the DCFM bit in SYSCFG0. Changing the DCFM bit should be done in the initial settings immediately after a power-on reset or in the D+ pull-up disabled (DPRPU = 0) and D+ /D– pull-down disabled (DRPD = 0) state.

(3) USB Data Bus Resistor Control

This module controls switching between a pull-up resistor for the D+ signal and a pull-down resistor for the D+ and D- signals for the Renesas USB 2.0 PHY port. The DPRPU and DRPD bits of the SYSCFG0 register are used to make the pull-up and pull-down resistor settings.
When the function controller mode is selected, set the DPRPU bit of the SYSCFG0 register to 1, which pulls up the D+ signal, after connection to a USB host is recognized.
When disconnection from the USB host is recognized, set the DPRPU and DCFM bits according to the procedure below.

1. Set the DPRPU bit to 0.
2. Wait for at least 1 µs (1000 ns).
3. Set the DCFM bit to 1.
4. Wait for at least 200 ns.
5. Set the DCFM bit to 0.

This module incorporates the terminating resistor for the D+ and D- signals during high-speed operation and the output resistor for the signals during full-speed operation. This module automatically switches the resistor after connection with the host controller or peripheral device upon the detection of a reset handshake, suspend, and resume event.
When the function controller mode is selected and the DPRPU bit in SYSCFG0 is cleared to 0 during communication with the host controller, the pull-up resistor (or the terminating resistor) of the USB data line is disabled, making it possible to notify the USB host of the device disconnection.

(4) Selecting the Input Clock

This module can select the signal on USB_X1 or EXTAL as an input clock. The UCKSEL bit of the SYSCFG0 register for channel 0 is used to select the input clock. The UCKSEL bit should be set while supply of the clock signal to the USB module is stopped (SUSPM = 0 for channel 0 and channel 1).

(5) Setting the Clock Supply for the USB Module

Set the UCKSEL bit of the SYSCFG0 register to the target input clock and then set clock supply by following the appropriate procedure below.

Example 1: When the clock supply is enabled by the initial setting immediately after a power-on reset,

1. set the UPLLE bit to 1,
2. wait for 1 ms, and
3. set the SUSPM bit to 1.

Example 2: When the clock supply is stopped in the suspended state,

1. set the SUSPM bit to 0 and
2. set the UPLLE bit to 0.

Example 3: When the clock supply is enabled after recovery from the suspended state,

1. set the UPLLE bit to 1,
2. wait for 1 ms, and
3. set the SUSPM bit to 1.

Note: • During high-speed operation when the function controller mode is selected, set the SUSPM bit to 1 within 2.5 ms of this module resuming operation from the suspended state due to a USB reset.

29.4.2 Interrupt Functions

(1) Overview of Interrupt Functions

Table 29.18 lists the interrupt generation conditions for this module.

Table 29.18 Interrupt Generation Conditions

Bit	Interrupt Name	Cause of Interrupt	Mode That Generates the Interrupt	Related Status
VBINT	VBUS interrupt	• When a change in the state of the VBUS input pin has been detected (low to high or high to low)	Host, function	VBSTS
RESM	Resume interrupt	• When a change in the state of the USB bus has been detected in the suspended state (J-state to K-state or J-state to SE0)	Function	—
SOFR	Frame number update interrupt	When the host controller mode is selected: • When an SOF packet with a different frame number has been transmitted When the function controller mode is selected: • If SOFRM = 0, reception of an SOF packet with a different frame number • If SOFRM = 1, reception of an SOF packet with the microframe number 0 was not possible because it was corrupted.	Host, function	—
DVST	Device state transition interrupt	• When a device state transition is detected A USB bus reset detected The suspended state detected SET_ADDRESS request received SET_CONFIGURATION request received	Function	DVSQ
CTRT	Control transfer stage transition interrupt	• When a stage transition is detected in control transfer Setup stage completed Control write transfer status stage transition Control read transfer status stage transition Control transfer completed A control transfer sequence error occurred	Function	CTSQ
BEMP	Buffer empty interrupt	• When transmission of all of the data in the buffer memory has been completed and the buffer has become empty • When an excessive maximum packet size error has been detected	Host, function	PIPEBEMP
NRDY	Buffer not ready interrupt	When the host controller mode is selected: • When STALL is received from the peripheral side for the issued token • When a response cannot be received correctly from the peripheral side for the issued token (No response is returned three consecutive times or a packet reception error occurred three consecutive times.) • When an overrun/underrun occurred during isochronous transfer When the function controller mode is selected: • Reception of a token while PID = BUF and the buffer memory is not ready for transmission or reception • When a CRC error or a bit stuffing error occurred during data reception in isochronous transfer • When an interval error occurred during data reception in isochronous transfer	Host, function	PIPENRDY
BRDY	Buffer ready interrupt	• When the buffer is ready (reading or writing is enabled)	Host, function	PIPEBRDY
BCHG	Bus change interrupt	• When a change of USB bus state is detected	Host	—
DTCH	Device disconnection detection	• When disconnection of a peripheral device connected to this LSI's USB port is detected.	Host	—
ATTCH	Device connection detection	• When J-state or K-state is detected on the USB port for 2.5 µs. Used for checking whether a peripheral device is connected.	Host	—

Table 29.18 Interrupt Generation Conditions

Bit	Interrupt Name	Cause of Interrupt	Mode That Generates the Interrupt	Related Status
EOFERR	EOF error detection	• When EOF error of a peripheral device is detected	Host	—
SACK	Normal setup operation	• When the normal response (ACK) for the setup transaction is received	Host	—
SIGN	Setup error	• When a setup transaction error (no response or ACK packet corruption) is detected three consecutive times.	Host	—

Figure 29.1 shows a diagram relating to interrupts of this module.

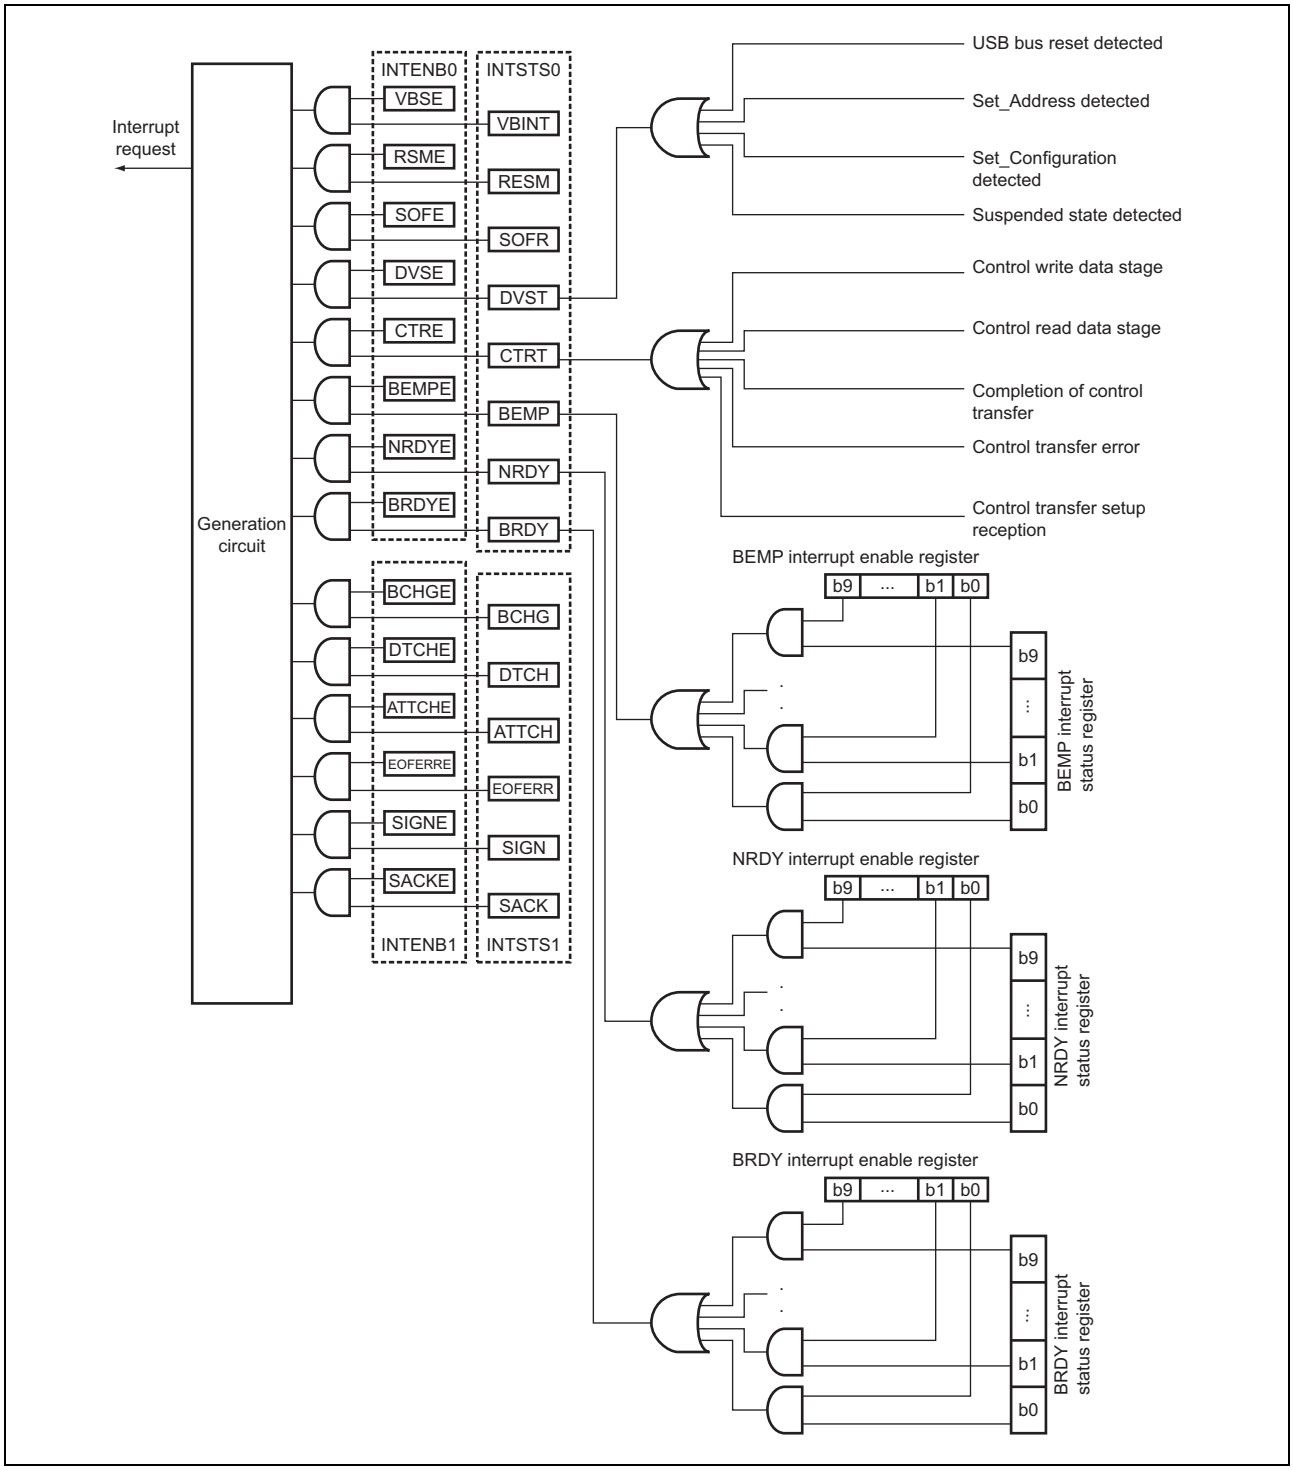

Figure 29.1 Items Relating to Interrupts

(2) BRDY Interrupt

The BRDY interrupt is generated when either of the host controller mode or function controller mode is selected. When each pipe satisfies the following conditions, this module sets 1 to a corresponding bit in BRDYSTS. Under this condition, if the PIPEBRDYE bit in BRDYENB that corresponds to the pipe is set to 1 and the BRDYE bit in INTENB0 is set to 1, this module sets the BRDY bit in INTSTS0 to 1, allowing the BRDY interrupt to be generated.
The conditions for generating and clearing the BRDY interrupt depend on the settings of the BRDYM bit and BFRE bit for the pertinent pipe as described below.

(a) When BRDYM Bit is 0 and BFRE Bit is 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.
On any of the following conditions, this module generates the internal BRDY interrupt request trigger and sets 1 to the PIPEBRDY bit corresponding to the pertinent pipe.

1. For the pipe in the transmitting direction
   - When the DIR bit is changed from 0 to 1.
   - When packet transmission is completed using the pertinent pipe when write-access from the CPU to the FIFO buffer for the pertinent pipe is disabled (when the BSTS bit is read as 0).
     In continuous transmission/reception mode, the request trigger is generated on completion of transmitting data of one plane of the FIFO buffer.
   - When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode.
     The request trigger is not generated until completion of writing data to the currently-written FIFO buffer plane even if transmission to the other FIFO buffer is completed.
   - When the hardware flushes the buffer of the pipe for isochronous transfers.
   - When 1 is written to the ACLRM bit, which causes the FIFO buffer to make transition from the write-disabled to write-enabled state.

The request trigger is not generated for the DCP (that is, during data transmission for control transfers).

2. For the pipe in the receiving direction
   - When packet reception is completed successfully thus enabling the FIFO buffer to be read when read-access from the CPU to the FIFO buffer for the pertinent pipe is disabled (when the BSTS bit is read as 0).
     The request trigger is not generated for the transaction in which DATA-PID disagreement occurs.
     In continuous transmission/reception mode, the request trigger is not generated when the data is of the specified maximum packet size and the buffer has available space.
     When a short packet is received, the request trigger is generated even if the FIFO buffer has available space.
   - When the transaction counter is used, the request trigger is generated on receiving the specified number of packets.
     In this case, the request trigger is generated even if the FIFO buffer has available space.
     When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode.
     The request trigger is not generated until completion of reading data from the currently-read FIFO buffer plane even if reception by the other FIFO buffer is completed.

When the function controller mode is selected, the BRDY interrupt is not generated in the status stage of control transfers.
The PIPEBRDY interrupt status of the pertinent pipe can be cleared to 0 by writing 0 to the corresponding PIPEBRDY interrupt status bit in the BRDYSTS register. In this case, 1s should be written to the PIPEBRDY interrupt status bits for the other pipes.
Be sure to clear the BRDY status before accessing the FIFO buffer.

(b) When BRDYM Bit is 0 and BFRE Bit is 1

With these settings, this module generates the BRDY interrupt on completion of reading all the data for a single transfer using the pipe in the receiving direction, and sets 1 to the PIPEBRDY bit corresponding to the pertinent pipe.
On any of the following conditions, this module determines that the last data for a single transfer has been received.

- When a short packet including a zero-length packet is received.
- When the transaction counter register (TRNCNT bits) is used and the number of packets specified by the TRNCNT bits is completely received.

When the pertinent data is completely read out after any of the above determination conditions has been satisfied, this module determines that all the data for a single transfer has been completely read out.
When a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data for a single transfer has been completely read out upon the FRDY and DTLN bits of the FIFO port control register being set to 1 and 0, respectively. In this case, to start the next transfer, write 1 to the BCLR bit in the corresponding FIFOCTR register.
With these settings, this module does not detect the BRDY interrupt for the pipe in the transmitting direction.
The PIPEBRDY interrupt status of the pertinent pipe can be cleared to 0 by writing 0 to the corresponding PIPEBRDY interrupt status bit. In this case, 1s should be written to the PIPEBRDY interrupt status bits for the other pipes.
In this mode, the BFRE bit setting should not be modified until all the data for a single transfer has been processed. When it is necessary to modify the BFRE bit before completion of processing, all the FIFO buffers for the pertinent pipe should be cleared using the ACLRM bit.

(c) When the BRDYM bit is 1 and the BFRE bit is 0

With these settings, the PIPEBRDY values are linked to the BSTS bit settings for each pipe. In other words, the BRDY interrupt status bits (PIPEBRDY) are set to 1 or 0 by this module depending on the FIFO buffer status.

1. For the pipe in the transmitting direction
   The BRDY interrupt status bits are set to 1 when the FIFO buffer is write-enabled and are set to 0 when write-disabled.
   However, the BRDY interrupt is not generated if the DCP in the transmitting direction is write-enabled.
2. For the pipe in the receiving direction
   The BRDY interrupt status bits are set to 1 when the FIFO buffer is read-enabled and are set to 0 when all the data have been read (read-disabled).
   When a zero-length packet is received when the FIFO buffer is empty, the pertinent bit is set to 1 and the BRDY interrupt continues to be effective until BCLR = 1 is written.

With this setting, the PIPEBRDY bit cannot be cleared to 0. When BRDYM is set to 1, all of the BFRE bits (for all pipes) should be cleared to 0.

(3) NRDY Interrupt

On generating the internal NRDY interrupt request for the pipe whose PID bits are set to BUF, this module sets the corresponding PIPENRDY bit in NRDYSTS to 1. If the corresponding bit in NRDYENB is set to 1, this module sets the NRDY bit in INTSTS0 to 1, allowing the NRDY interrupt to be generated.
The following describes the conditions on which this module generates the internal NRDY interrupt request for each pipe.
However, the internal NRDY interrupt request is not generated during setup transaction execution when the host controller mode is selected. During setup transactions when the host controller mode is selected, the SACK or SIGN interrupt is detected.
The internal NRDY interrupt request is not generated during status stage execution of the control transfer when the function controller mode is selected.

(a) If Host Controller Mode is Selected when Connection is Used in which No Split Transactions Occur

1. For the pipe in the transmitting direction
   On any of the following conditions, this module detects the NRDY interrupt.
   - For the pipe for isochronous transfers, when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer.
     In this case, this module transmits a zero-length packet following the OUT token, setting the corresponding PIPENRDY bit and the OVRN bit to 1.
   - During communications other than setup transactions using the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device) and 2) an error is detected in the packet from the peripheral device.
     In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.
   - During communications other than setup transactions, when the STALL handshake is received from the peripheral device (including the STALL handshake in response to PING in addition to the STALL handshake in response to OUT).
     In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to STALL (11).

2. For the pipe in the receiving direction
   - For the pipe for isochronous transfers, when the time to issue an IN token comes in a state in which there is no space available in the FIFO buffer.
     In this case, this module discards the received data for the IN token, setting the PIPENRDY bit of the corresponding pipe and the OVRN bit to 1.
     When a packet error is detected in the received data for the IN token, this module also sets the CRCE bit to 1.
   - For the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the peripheral device for the IN token issued by this module (when timeout is detected before detection of the DATA packet from the peripheral device) and 2) an error is detected in the packet from the peripheral device.
     In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.
   - For the pipe for isochronous transfers, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device.
     In this case, this module sets the corresponding PIPENRDY bit to 1. (The setting of the PID bits of the corresponding pipe is not modified.)

- For the pipe for isochronous transfers, when a CRC error or a bit stuffing error is detected in the received data packet.
  In this case, this module sets the corresponding PIPENRDY bit and CRCE bit to 1.
- When the STALL handshake is received.
  In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to STALL.

(b) If Host Controller Mode is Selected when Connection is Used in which Split Transactions Occur

1. For the pipe in the transmitting direction
   - For the pipe for isochronous transfers, when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer.
     In this case, this module transmits a zero-length packet following the OUT token, setting the corresponding PIPENRDY bit and the OVRN bit to 1 at the issuance of the start-split transaction (S-SPLIT).
   - For the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the S-SPLIT or complete-split transaction (C-SPLIT) (when timeout is detected before detection of the handshake packet from the HUB) and 2) an error is detected in the packet from the HUB.
     In this case, this module sets the PIPENRDY bit of the corresponding pipe to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.
     If the NRDY interrupt is detected when the C-SPLIT is issued, this module clears the CSSTS bit to 0.
   - When the STALL handshake is received in response to the C-SPLIT.
     In this case, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to STALL (11) and clears the CSSTS bit to 0.
     This interrupt is not detected for setup transactions.
   - For the pipe for interrupt transfers when the NYET is received in response to the C-SPLIT and the microframe number = 4.
     In this case, this module sets the corresponding PIPENRDY bit to 1 and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

2. For the pipe in the receiving direction
   - For the pipe for isochronous transfers, when the time to issue an IN token comes in a state in which there is no space available in the FIFO buffer.
     In this case, this module discards the received data for the IN token, setting the corresponding PIPENRDY bit and the OVRN bit to 1 at the issuance of the S-SPLIT.
   - For the pipes for bulk transfers, or the transfers other than setup transactions with the DCP, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the IN token issued by this module at the issuance of S-SPLIT or C-SPLIT (when timeout is detected before detection of the DATA packet from the HUB) and 2) an error is detected in the packet from the HUB.
     In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK. When the condition is generated during the C-SPLIT transaction, this module clears the CSSTS bit to 0.
   - During the C-SPLIT transaction for the pipe for isochronous transfers or interrupt transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the IN token issued by this module (when timeout is detected before detection of the DATA packet from the HUB) and 2) an error is detected in the packet from the HUB.
     On generating this condition for the pipe for interrupt transfers, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to NAK and clears the CSSTS bit to 0.
     On generating this condition for the pipe for isochronous transfers, this module sets the corresponding PIPENRDY

bit to 1 and CRCE bit to 1, and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

- During the C-SPLIT transaction, when the STALL handshake is received for the pipe for the transfers other than isochronous transfers.
  In this case, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to STALL (11) and clears the CSSTS bit to 0.
- During the C-SPLIT transaction, when the NYET handshake is received for the pipe for the isochronous transfers or interrupt transfers and the microframe number = 4.
  In this case, this module sets the corresponding PIPENRDY bit for the pipe to 1, sets the CRCE bit to 1, and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

(c) When Function Controller Mode is Selected

1. For the pipe in the transmitting direction
   - On receiving an IN token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no data to be transmitted in the FIFO buffer.
     In this case, this module generates an NRDY interrupt request at the reception of the IN token, setting the PIPENRDY bit to 1. For the pipe for the isochronous transfers in which an interrupt is generated, this module transmits a zero-length packet, setting the OVRN bit to 1.

2. For the pipe in the receiving direction
   - On receiving an OUT token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no space available in the FIFO buffer.
     For the pipe for the isochronous transfers in which an interrupt is generated, this module generates an NRDY interrupt request at the reception of the OUT token, setting the PIPENRDY bit to 1 and OVRN bit to 1.
     For the pipe for the transfers other than isochronous transfers in which an interrupt is generated, this module generates an NRDY interrupt request when an NAK handshake is transferred after the data following the OUT token was received, setting the PIPENRDY bit to 1.
     However, during re-transmission (due to DATA-PID disagreement), the NRDY interrupt request is not generated.
     In addition, if an error occurs in the DATA packet, the NRDY interrupt request is not generated.
   - On receiving a PING token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no space available in the FIFO buffer.
     In this case, this module generates an NRDY interrupt request at the reception of the PING token, setting the PIPENRDY bit to 1.
   - For the pipe for isochronous transfers, when the PID bits are set to 01 (BUF) for the pertinent pipe and a token is not received normally within an interval frame.
     In this case, this module generates an NRDY interrupt request at the reception of an SOF, and sets the PIPENRDY bit to 1.

(4) BEMP Interrupt

On detecting the BEMP interrupt for the pipe whose PID bits are set to BUF, this module sets the corresponding PIPEBEMP bit in BEMPSTS to 1. If the corresponding bit in BEMPENB is set to 1, this module sets the BEMP bit in INTSTS0 to 1, allowing the USB interrupt to be generated.

The following describes the conditions on which this module generates the internal BEMP interrupt request.

1. For the pipe in the transmitting direction, when the FIFO buffer of the corresponding pipe is empty on completion of transmission (including zero-length packet transmission). In single buffer mode, the internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for the pipe other than DCP. However, the internal BEMP interrupt request is not generated on any of the following conditions.
   - When writing data to the FIFO buffer on the CPU side is started on completion of transmitting data of one plane in double buffer mode.
   - When the buffer is cleared (emptied) by setting the ACLRM or BCLR bit to 1.
   - When IN transfer (zero-length packet transmission) is performed during the control transfer status stage in function controller mode.

2. For the pipe in the receiving direction
   When the successfully-received data packet size exceeds the specified maximum packet size. In this case, this module generates the BEMP interrupt request, setting the corresponding PIPEBEMP bit to 1, and discards the received data and modifies the setting of the PID bits of the corresponding pipe to STALL (11).
   Here, this module returns no response when used as the host controller, and returns STALL response when used as the function controller.
   However, the internal BEMP interrupt request is not generated on any of the following conditions.
   - When a CRC error or bit stuffing error is detected in the received data.
   - When a setup transaction is being performed.

Writing 0 to the PIPEBEMP bit clears the status; writing 1 to the PIPEBEMP bit has no effect.

(5) Device State Transition Interrupt (Function Controller Mode)

Figure 29.2 shows a diagram of how this module handles the device state transitions. This module monitors device states and generates device state transition interrupts. However, recovery from the suspended state (resume signal detection) is detected by means of the resume interrupt. The device state transition interrupts can be enabled or disabled individually by using INTENB0. The device state after a transition can be confirmed by using the DVSQ bits in INTSTS0.

When making a transition to the default state, the device state transition interrupt is generated after the reset handshake protocol has been completed.

Device state can be monitored only when the function controller mode is selected. Also, the device state transition interrupts can be generated only when the function controller mode is selected.

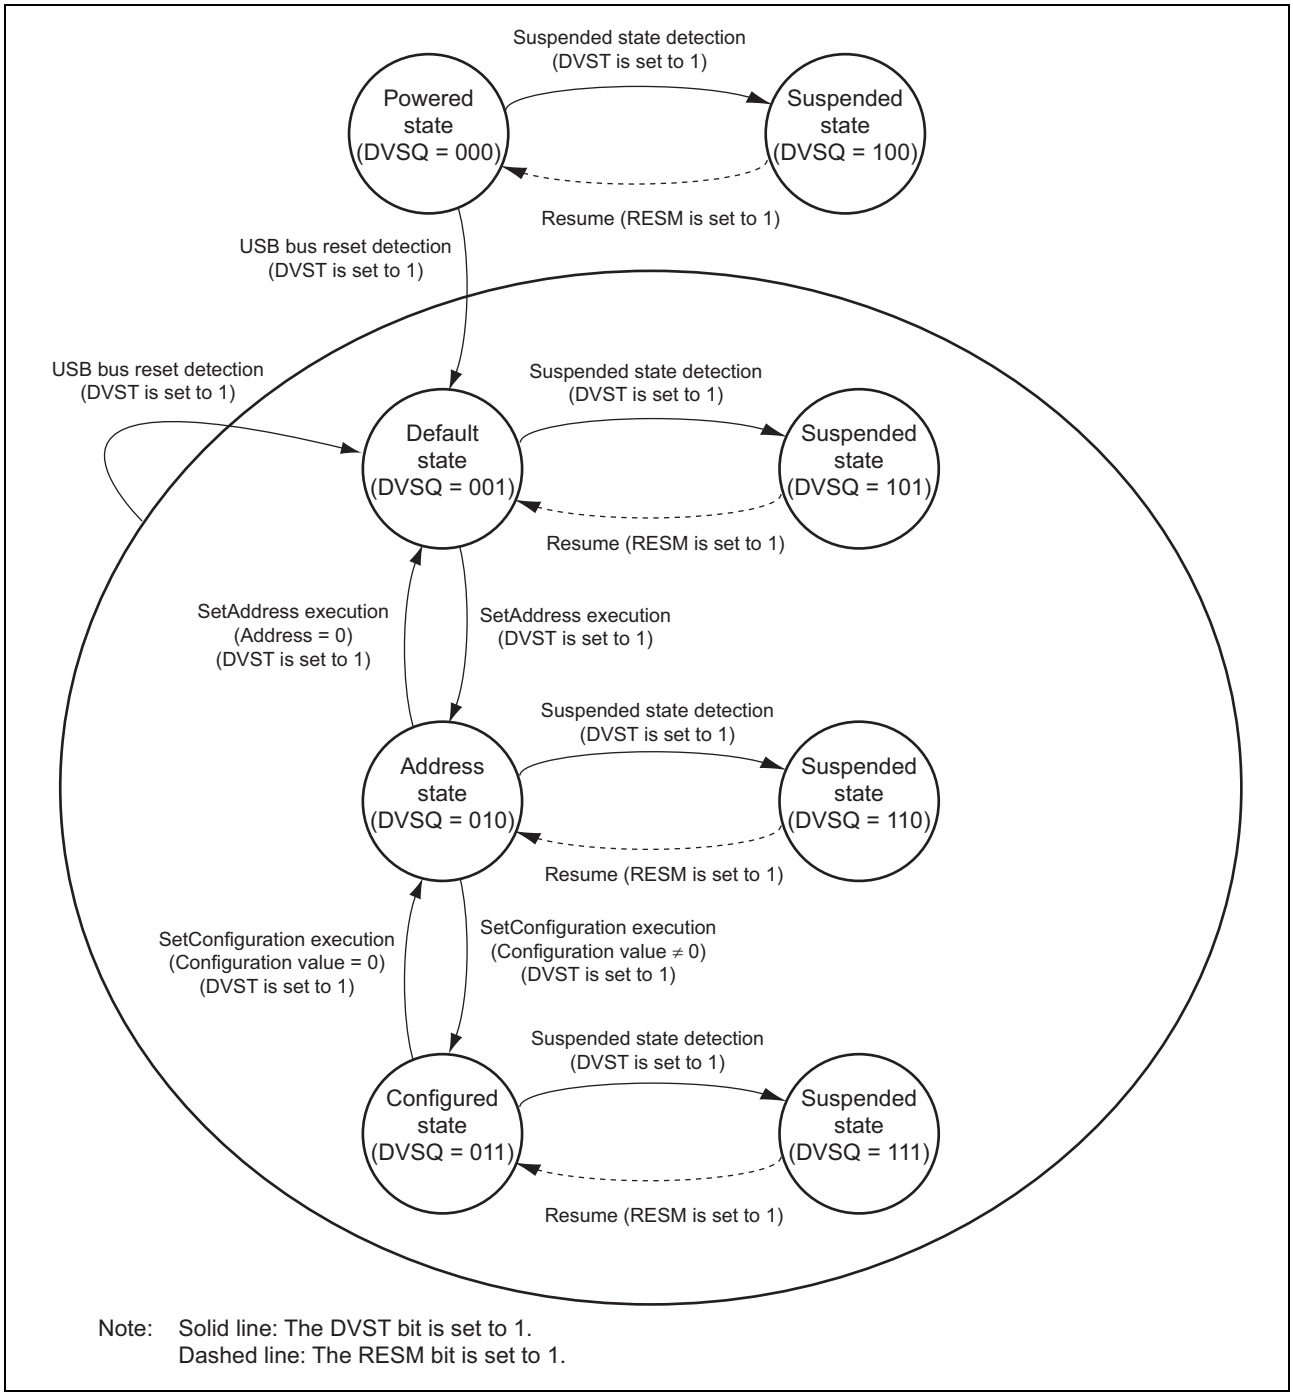

Figure 29.2 Device State Transitions

(6) Control Transfer Stage Transition Interrupt (Function Controller Mode)

Figure 29.3 shows a diagram of how this module handles the control transfer stage transition. This module monitors the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled individually using INTENB0. The control transfer stage after a transition can be confirmed using the CTSQ bits in INTSTS0.

The control transfer stage transition interrupts are generated only when the function controller mode is selected.

The control transfer sequence errors are described below. If an error occurs, the PID bits in DCPCTR are set to B'1x (STALL).

1. During control read transfers
   - At the IN token of the data stage, an OUT or PING token is received when there have been no data transfers at all.
   - An IN token is received at the status stage
   - A packet is received at the status stage for which the data packet is DATAPID = DATA0
2. During control write transfers
   - At the OUT token of the data stage, an IN token is received when there have been no ACK response at all
   - A packet is received at the data stage for which the first data packet is DATAPID = DATA0
   - At the status stage, an OUT or PING token is received
3. During control write no-data transfers
   - At the status stage, an OUT or PING token is received

At the control write transfer data stage, if the number of receive data exceeds the wLength value of the USB request, it cannot be recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (SERR = 1), the CTSQ = 110 value is retained until CTRT = 0 is written from the system (the interrupt status is cleared). Therefore, while CTSQ = 110 is being retained, the CTRT interrupt that indicates completion of the setup stage will not be generated even if a further USB request is received (this module retains the indication of completion of the setup stage, and after the interrupt status flag has been cleared, a CTRT interrupt is generated).

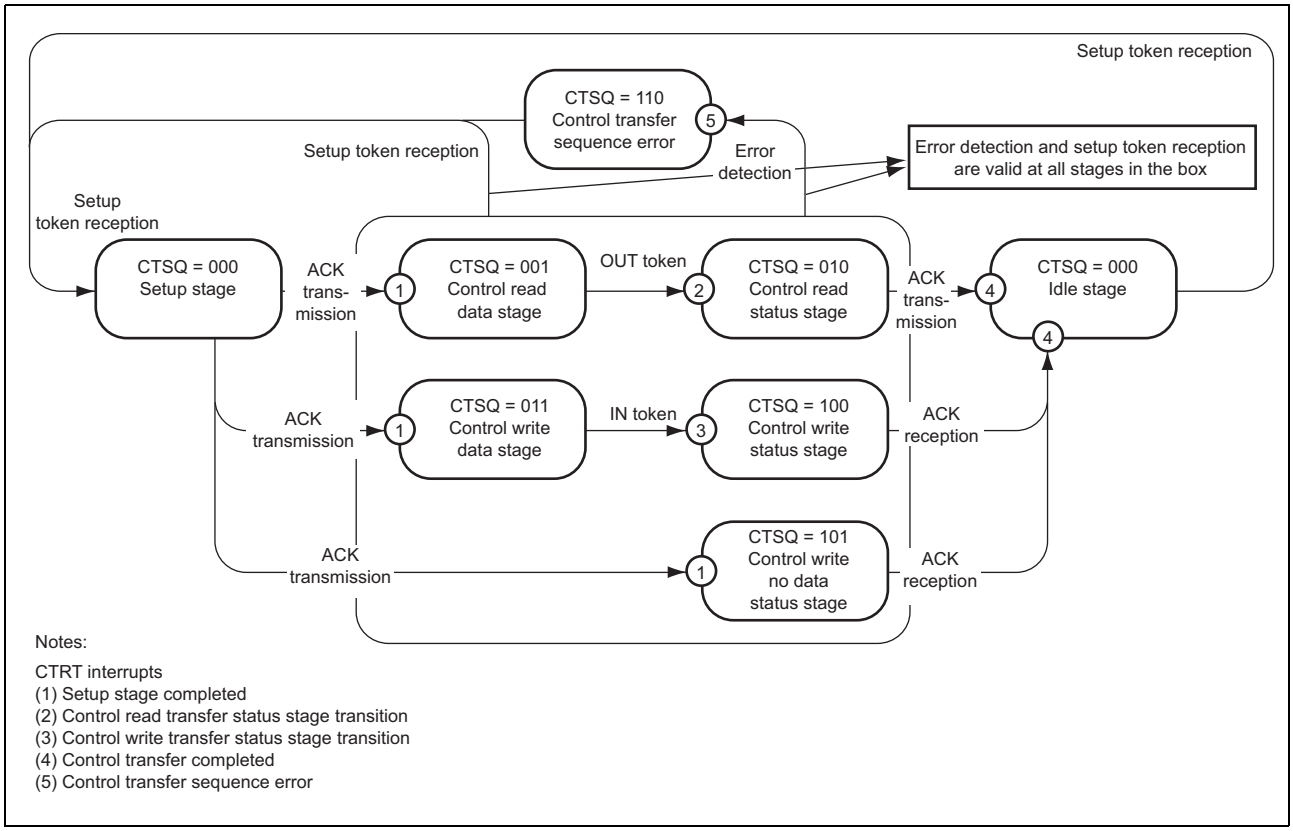

Figure 29.3 Control Transfer Stage Transitions

29.4.3 Pipe Control

Table 29.19 lists the pipe setting items of this module. With USB data transfer, data transmission has to be carried out using the logic pipe called the endpoint. This module has 16 pipes that are used for data transfer. Settings should be entered for each of the pipes in conjunction with the specifications of the system.

Table 29.19 Pipe Setting Items

Register Name	Bit Name	Setting Contents	Remarks
DCPCFG PIPECFG	TYPE	Specifies the transfer type	PIPE1 to PIPE15: Can be set
	BFRE	Selects the BRDY interrupt mode	PIPE1 to PIPE5, PIPE11 to PIPE15: Can be set
	DBLB	Selects a double buffer	PIPE1 to PIPE5, PIPE11 to PIPE15: Can be set PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected).
	CNTMD	Selects continuous transfer or non-continuous transfer	DCP: Can be set. PIPE1 and PIPE2, PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected). PIPE3 to PIPE5, PIPE11 to PIPE15: Can be set
	DIR	Selects transfer direction	IN or OUT can be set
	EPNUM	Endpoint number	PIPE1 to PIPE15: Can be set A value other than 0000 should be set when the pipe is used.
	SHTNAK	Selects disabled state for pipe when transfer ends	DCP: Can be set. PIPE1 and PIPE2, PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected) PIPE3 to PIPE5, PIPE11 to PIPE15: Can be set
PIPEBUF	BUFSIZE	Buffer memory size	DCP: Cannot be set (fixed at 256 bytes) PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set (a maximum of 2 Kbytes can be specified) PIPE6 to PIPE8: Cannot be set (fixed at 64 bytes)
	BUFNMB	Buffer memory number	DCP: Cannot be set (areas fixed at H'0 to H'3) PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set (can be specified in areas H'7 to H'7F) PIPE6 to PIPE8: Cannot be set (areas fixed at H'4 to H'6)
DCPMAXP PIPEMAXP	DEVSEL	Selects a device	Referenced only when the host controller mode is selected.
	MXPS	Maximum packet size	Compliant with the USB standard.
PIPEPERI	IFIS	Buffer flush	PIPE1 and PIPE2: Can be set (only when isochronous transfer has been selected) PIPE3 to PIPE15: Cannot be set
	IITV	Interval counter	PIPE1 and PIPE2: Can be set (only when isochronous transfer has been selected) PIPE3 to PIPE5: Cannot be set PIPE6 to PIPE9: Can be set (only when the host controller mode has been selected) PIPE10 to PIPE15: Can be set

Table 29.19 Pipe Setting Items

Register Name	Bit Name	Setting Contents	Remarks
DCPCTR PIPEnCTR	BSTS	Buffer status	For the DCP, receive buffer status and transmit buffer status are switched with the ISEL bit.
	INBUFM	IN buffer monitor	Mounted for only PIPE3 to PIPE5 and PIPE9 to PIPE15.
	SUREQ	Setup request	Can be set only for the DCP. Can be controlled only when the host controller mode has been selected.
	SUREQCLR	SUREQ clear	Can be set only for the DCP. Can be controlled only when the host controller mode has been selected.
	CSCLR	CSSTS clear	Can be controlled only when the host controller mode has been selected.
	CSSTS	SPLIT status indication	Can be referenced only when the host controller mode has been selected.
	ATREPM	Auto response mode	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set Can be set only when the function controller mode has been selected.
	ACLRM	Auto buffer clear	PIPE1 to PIPE15: Can be set
	SQCLR	Sequence clear	Clears the data toggle bit
	SQSET	Sequence set	Sets the data toggle bit
	SQMON	Sequence monitor	Monitors the data toggle bit
	PBUSY	Pipe busy confirmation	
	PID	Response PID	
PIPEnTRE	TRENB	Transaction counter enable	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set
	TRCLR	Current transaction counter clear	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set
PIPEnTRN	TRNCNT	Transaction counter	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set

(1) Pipe Control Register Switching Procedures

The following bits in the pipe control registers are only modifiable when USB communication is disabled (PID = NAK): Figure 29.4 shows the procedure for modifying the pipe control registers from the USB communication enabled (PID = BUF) state.

[Bits that should not be set in the USB communication enabled (PID = BUF) state]

- All bits in DCPCFG and DCPMAXP
- The SQCLR and SQSET bits in DCPCTR
- All bits in PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI
- The ATREPM, ACLRM, SQCLR, and SQSET bits in PIPEnCTR
- All bits in PIPEnTRE and PIPEnTRN
- All bits in DEVADDn

In addition to the settings described for the CSCLR bit and all bits in DEVADDn, the settings for each bit described in section 29.3, Register Descriptions must also be complied with.

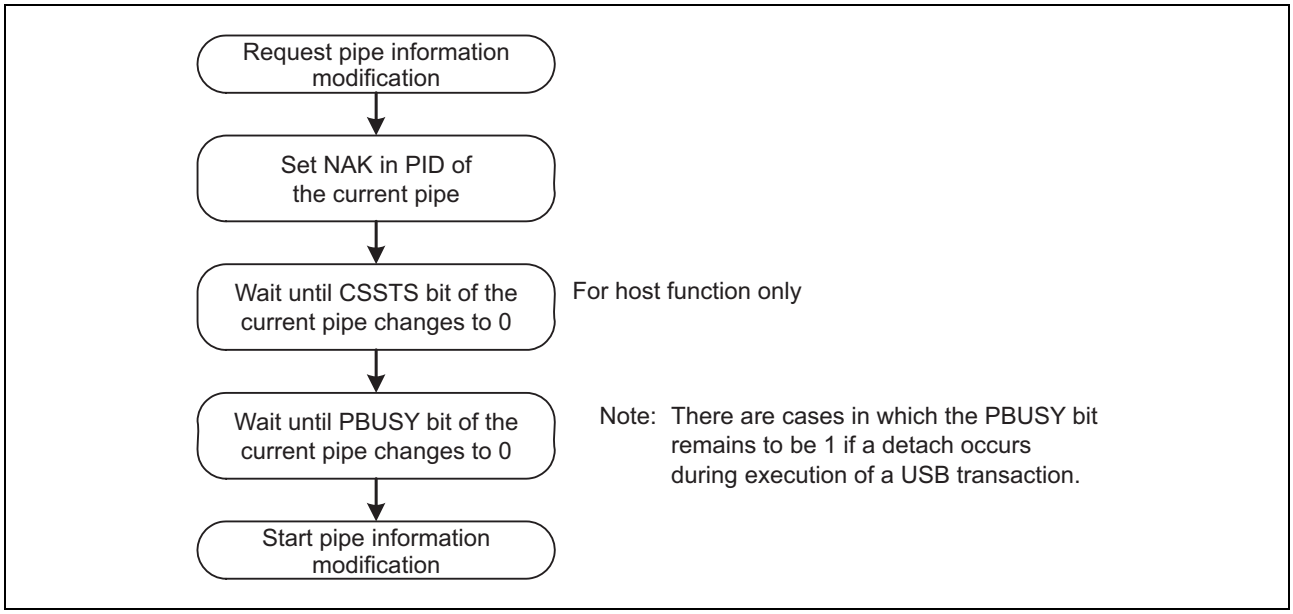

Figure 29.4 Procedure for Modifying Pipe Information from USB Communication Enabled (PID = BUF) State

The following bits in the pipe control registers are only modifiable when the pertinent pipe has not been specified by the CURPIPE bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

[Bits that should not be set when the pertinent pipe is specified by the CURPIPE bits in FIFO port select registers]

- All bits in DCPCFG and DCPMAXP
- All bits in PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI
- The ACLRM bit in PIPEnCTR

In order to modify pipe information, the CURPIPE bits should be set to the pipes other than the pipe to be modified. For the DCP, the buffer should be cleared using BCLR after the pipe information is modified.

(2) Maximum Packet Size Setting

The MXPS bits in DCPMAXP and PIPEMAXP are used to specify the maximum packet size for each pipe. DCP, PIPE1 to PIPE5, and PIPE11 to PIPE15 can be set to any of the maximum packet sizes defined by the USB Specification. For PIPE6 to PIPE10, 64 bytes are the upper limit of the maximum packet size. The maximum packet size should be set before beginning the transfer (PID = BUF).

- DCP: 64 should be set when using high-speed operation.
- DCP: Select and set 8, 16, 32, or 64 when using full-speed operation.
- PIPE1 to PIPE5: 512 should be set when using high-speed bulk transfer.
- PIPE1 to PIPE5: Select and set 8, 16, 32, or 64 when using full-speed bulk transfer.
- PIPE1 and PIPE2: Set a value between 1 and 1024 when using high-speed isochronous transfer.
- PIPE1 and PIPE2: Set a value between 1 and 1023 when using full-speed isochronous transfer.
  For details, see section 29.4.9, Isochronous Transfers (PIPE1 and PIPE2).
- PIPE6 to PIPE8: Set a value between 1 and 64.
- PIPE9: 64 should be set when using interrupt transfer (only when the host controller mode has been selected).
  512 should be set when using high-speed bulk transfer (only when the function controller mode has been selected).
  Select and set 8, 16, 32, or 64 when using full-speed bulk transfer (only when the function controller mode has been selected).
- PIPE10 to PIPE15: 512 should be set when using high-speed bulk transfer (only when the function controller mode has been selected).
- PIPE10 to PIPE15: Select and set 8, 16, 32, or 64 when using full-speed bulk transfer (only when the function controller mode has been selected).

The high bandwidth transfers used with interrupt transfers and isochronous transfers are not supported.

(3) Response PID

The PID bits in DCPCTR and PIPEnCTR are used to set the response PID for each pipe.
The following shows this module operation with various response PID settings:

1. Response PID settings when the host controller mode is selected
   The response PID is used to specify the execution of transactions.
   - NAK setting: Using pipes is disabled. No transaction is executed.
   - BUF setting: Transactions are executed based on the status of the buffer memory.
     For OUT direction: If there are transmit data in the buffer memory, an OUT token is issued.
     For IN direction: If there is an area to receive data in the buffer memory, an IN token is issued.
   - STALL setting: Using pipes is disabled. No transaction is executed.

Note: • Setup transactions for the DCP are set with the SUREQ bit.

2. Response PID settings when the function controller mode is selected
   The response PID is used to specify the response to transactions from the host.
   - NAK setting: The NAK response is always returned in response to the generated transaction.
   - BUF setting: Responses are made to transactions based on the status of the buffer memory.
   - STALL setting: The STALL response is always returned in response to the generated transaction.

Note: • For setup transactions, an ACK response is always returned, regardless of the PID setting, and the USB request is stored in registers USBREQ, USBVAL, USBINDX, and USBLENG.

This module may carry out writing to the PID bits, depending on the results of the transaction. Writing to the PID bits by this module is carried out in the following cases.

1. When the host controller mode has been selected and the response PID is set by this module
   - NAK setting: In the following cases, PID = NAK is set and issuing of tokens is automatically stopped:
     - For transfer that is not isochronous, any combination of the following two items occurring three consecutive times in response to transmitted tokens
       1) no response being returned or 2) a reception error such as a CRC error or a bit stuffing error
     - For isochronous transfer, a reception error such as a CRC error or a bit stuffing error occurring three consecutive times in response to transmitted tokens
     - Reception of a short packet at the stage of control read transfer data when the setting of the SHTNAK bit in PIPECFG is 1
     - If a short packet is received when the SHTNAK bit in PIPECFG has been set to 1 for bulk transfer.
     - If counting by the transaction counter ends while the SHTNAK bit in PIPECFG is set to 1 during bulk transfer.
   - BUF setting: There is no BUF writing by this module.
   - STALL setting: In the following cases, PID = STALL is set and issuing of tokens is automatically stopped:
     When STALL is received in response to the transmitted token.
     When the size of the receive data packet exceeds the maximum packet size.

2. When the function controller mode has been selected and the response PID is set by this module
   - NAK setting: When the setup token is received normally (DCP only).
     If counting by the transaction counter ends or a short packet is received while the SHTNAK bit in PIPECFG is set to 1 during bulk transfer.
   - BUF setting: There is no BUF writing by this module.
   - STALL setting: When a maximum packet size exceeded error has been detected in the receive data packet.
     When a control transfer sequence error has been detected.

(4) Data PID Sequence Bit

This module automatically toggles the sequence bit in the data PID when data is transferred normally in the control transfer data stage, bulk transfer and interrupt transfer. The sequence bit of the data PID that is to be transmitted for the next transaction can be confirmed with the SQMON bit in DCPCTR or PIPEnCTR. When data is transmitted, the sequence bit switches at the timing at which the ACK handshake is received. When data is received, the sequence bit switches at the timing at which the ACK handshake is transmitted. The SQCLR and SQSET bits in DCPCTR or PIPEnCTR can be used to change the data PID sequence bit.

When the function controller mode has been selected and control transfer is used, this module automatically sets the sequence bit when a stage transition is made. The data PID sequence bit becomes DATA1 when the setup stage ends and this module does not reference the sequence bit and responds with PID = DATA1 in the status stage. Therefore, settings are not required. However, when the host controller mode has been selected and control transfer is used, the sequence bit should be set at the stage transition.

For the ClearFeature request transmission or reception, the data PID sequence bit should be set, regardless of whether the host controller mode or function controller mode is selected.

With pipes for which isochronous transfer has been set, sequence bit operation cannot be carried out using the SQSET bit.

29.4.4 FIFO Buffer Memory

This section describes the operation of the FIFO buffers incorporated in this module. Unless specifically specified, the buffer operation is the same regardless of whether the host controller mode or function controller mode is selected.

(1) FIFO Buffer Memory Allocation

Figure 29.5 shows an example of a FIFO buffer memory map for this module. The FIFO buffer memory is an area shared by the CPU and this module. In the FIFO buffer memory status, there are times when the access right to the buffer memory is allocated to the user system (CPU side), and times when it is allocated to this module (SIE side).
Independent FIFO buffer memory areas should be set for each pipe. Each memory area can be set using the first block number and the number of blocks (specified using the BUFNMB and BUFSIZE bits in PIPEBUF), where one block comprises 64 bytes.
When continuous transfer mode has been selected using the CNTMD bit in PIPECFG, the BUFSIZE bits should be set so that the buffer memory size should be an integral multiple of the maximum packet size. When double buffer mode has been selected using the DBLB bit in PIPECFG, two planes of the memory area specified using the BUFSIZE bits in PIPEBUF can be assigned to a single pipe.
Moreover, three FIFO ports are used for access to the FIFO buffer memory (reading and writing data). A pipe is assigned to the FIFO port by specifying the pipe number using the CURPIPE bits in CFIFOSEL/DnFIFOSEL.
The FIFO buffer status of each pipe can be confirmed using the BSTS bit in DCPCTR or the BSTS and INBUFM bits in PIPEnCTR. Also, the access right of the FIFO port can be confirmed using the FRDY bit in CFIFOCTR or DnFIFOCTR.

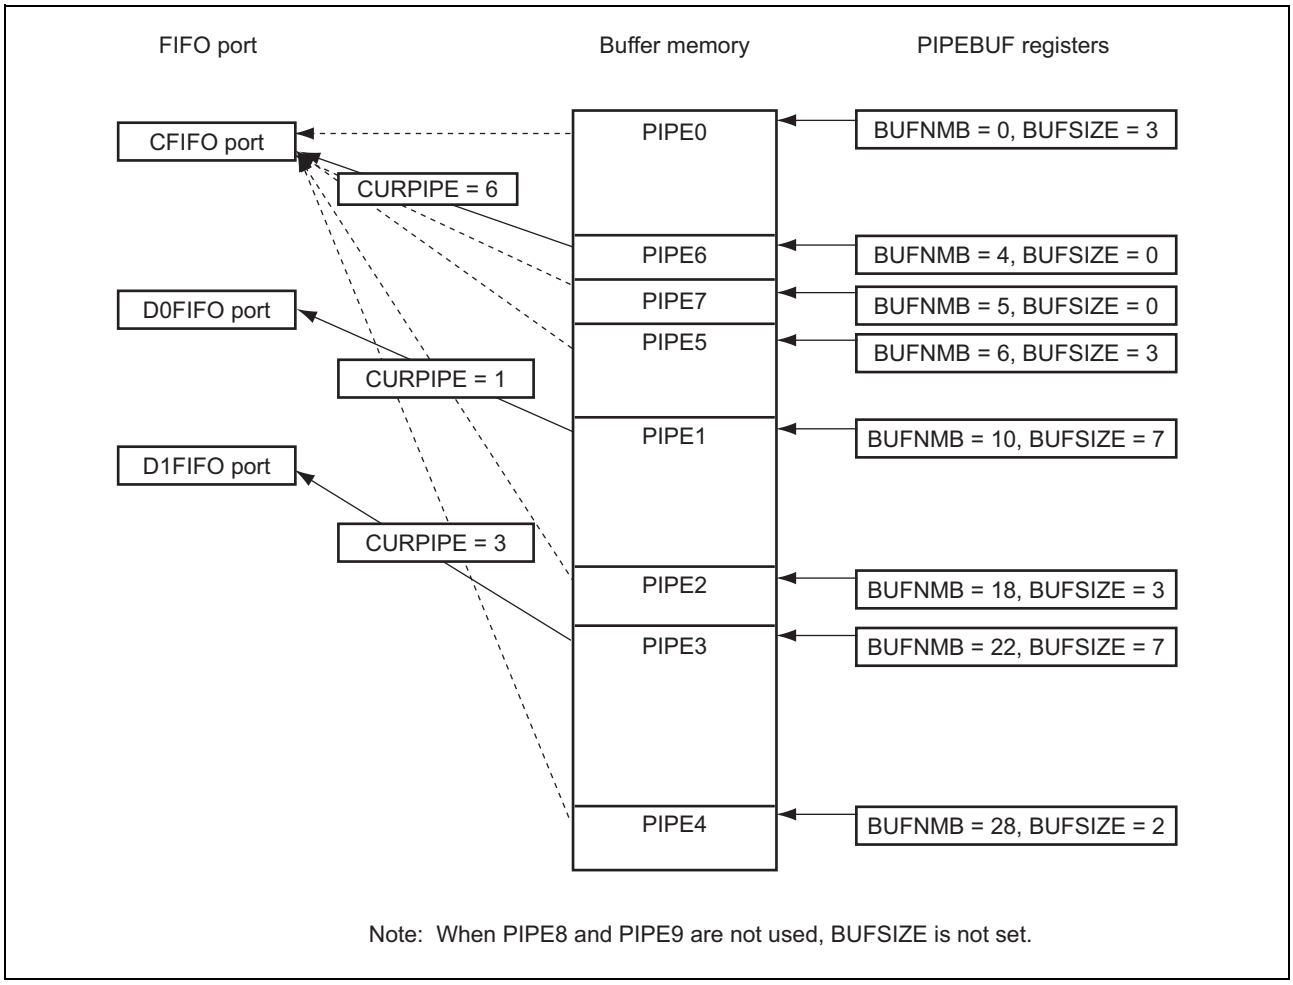

Figure 29.5 Example of a FIFO Buffer Memory Map

(a) FIFO Buffer Clearing

Table 29.20 shows the clearing of the FIFO buffer memory by this module. The FIFO buffer memory can be cleared using the BCLR, DCLRM, and ACLRM bits.

Table 29.20 List of FIFO Buffer Clearing Methods

Bit Name	BCLR	DCLRM	ACLRM
Register	CFIFOCTR DnFIFOCTR	DnFIFOSEL	PIPEnCTR
Function	Clears the FIFO buffer memory on the CPU side	In this mode, after the data of the specified pipe has been read, the FIFO buffer memory is cleared automatically.	This is the auto buffer clear mode, in which all of the received packets are discarded.
Clearing method	Cleared by writing 1	1: Mode valid 0: Mode invalid	1: Mode valid 0: Mode invalid

29.4.5 FIFO Port Functions

This section describes the FIFO port functions. Table 29.21 shows the settings for the FIFO port functions of this module. In write access, writing data until the buffer is full (or the maximum packet size for non-continuous transfers) automatically enables sending of the data to the USB bus. To enable sending of data before the buffer is full (or before the maximum packet size for non-continuous transfers), the BVAL bit in CFIFOCTR/DnFIFOCTR must be set to end the writing (TEND signal for DMA transfers). Also, to send a zero-length packet, the BCLR bit in the same register must be used to clear the buffer and then the BVAL bit is set in order to end the writing.
In read access, reception of new packets is automatically enabled if all of the data has been read. Data cannot be read when a zero-length packet has been received (DTLN = 0), so the BCLR bit in the same register must be used to clear the buffer. The length of the data being received can be confirmed using the DTLN bit in CFIFOCTR/DnFIFOCTR.

Table 29.21 FIFO Port Function Settings

Register Name	Bit Name	Function	Note
CFIFOSEL/ DnFIFOSEL	RCNT	Selects DTLN read mode	
	REW	Buffer memory rewind (re-read, rewrite)	
	DCLRM	Automatically clears data received for a specified pipe after the data has been read	For DnFIFO only
	DREQE	Enables a DMA transfer request	For DnFIFO only
	MBW	FIFO port access bit width	
	BIGEND	Selects FIFO port endian	
	ISEL	FIFO port access direction	For DCP only
	CURPIPE	Selects the current pipe	
CFIFOCTR/ DnFIFOCTR	BVAL	Ends writing to the buffer memory	
	BCLR	Clears the buffer memory on the CPU side	
	FRDY	Monitors whether the FIFO port is ready for access	
	DTLN	Checks the length of received data	

(a) FIFO Port Selection

Table 29.22 shows the pipes that can be selected with each FIFO port. The pipe to be accessed is selected using the CURPIPE bits in CFIFOSEL/DnFIFOSEL. After the pipe is selected, whether the CURPIPE value for the pipe which was written last can be correctly read should be checked. (If the previous pipe number is read, it indicates that the pipe switching is being executed by this module.) Then, the FIFO port can be accessed after FRDY = 1 is checked. Figure 29.6 shows the procedure for pipe switching during access to the FIFO port.
Also, the bus width to be accessed should be selected using the MBW bit. The buffer memory access direction conforms to the DIR bit in PIPECFG. The ISEL bit determines this only for the DCP.

Table 29.22 FIFO Port Access Categorized by Pipe

Pipe	Access Method	Port that can be Used
DCP	CPU access	CFIFO port register
PIPE1 to PIPE15	CPU access	CFIFO port register
	DMA access	D0FIFO/D1FIFO port register

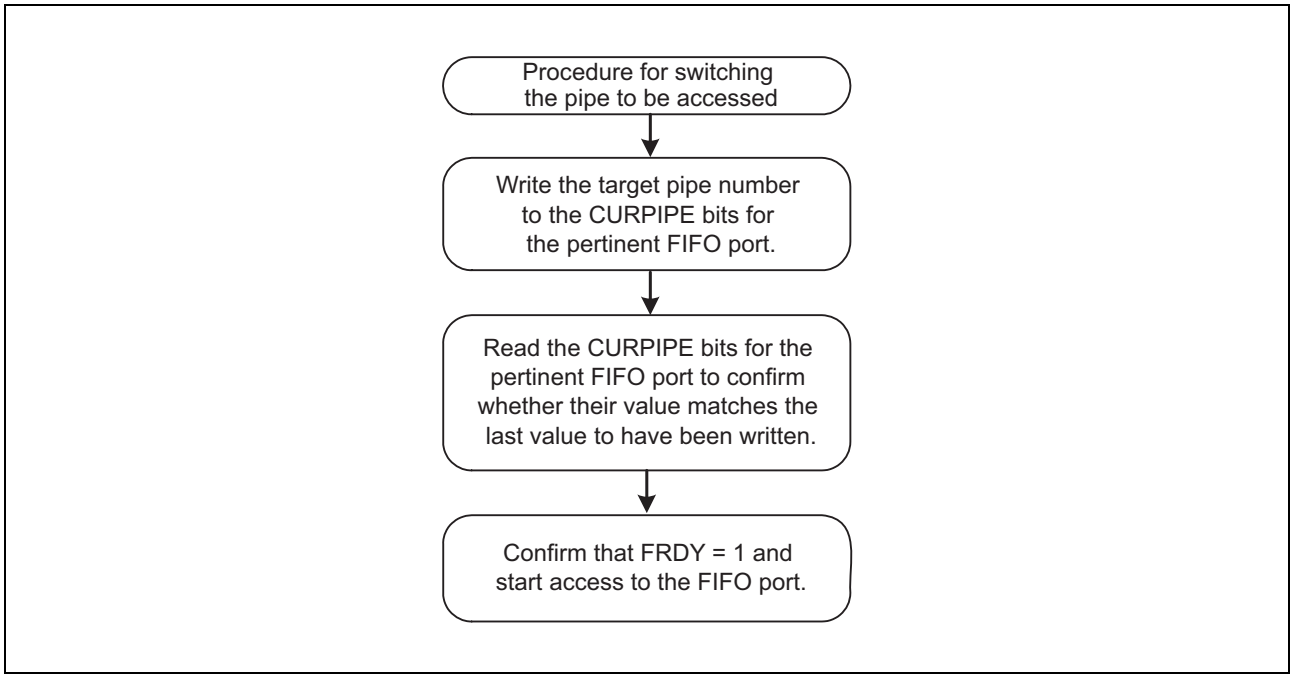

Figure 29.6 Procedure for Pipe Switching during Access to the FIFO Port

(b) DnFIFO Auto Clear Mode (D0FIFO/D1FIFO Port Reading Direction)

If 1 is set for the DCLRM bit in DnFIFOSEL, the module automatically clears the buffer memory of the selected pipe when reading of the data from the buffer memory has been completed.

Table 29.23 shows the packet reception and buffer memory clearing processing for each of the various settings. As shown in Table 29.23, the buffer clear conditions depend on the value set to the BFRE bit. Using the DCLRM bit eliminates the need for the buffer to be cleared even if a situation occurs that necessitates clearing of the buffer. This makes it possible to carry out DMA transfers without involving software.

This function can be set only in the buffer memory reading direction.

Table 29.23 Packet Reception and Buffer Memory Clearing Processing

Buffer Status when Packet is Received	Register Setting			
	DCLRM = 0		DCLRM = 1	
	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	Doesn't need to be cleared	Doesn't need to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Zero-length packet reception	Needs to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Normal short packet reception	Doesn't need to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Transaction count ended	Doesn't need to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared

(c) Timing Selection Function for BRDY Interrupts

The BFRE bit of the PIPECFG register can be used to select non-generation of the BRDY interrupt when a data packet with the maximum packet size has been received.
For DMA transfer, this function enables the generation of an interrupt only when the last of the data have been received. Reception of the last of the data indicates either that a short packet was received or completion of counting by the transaction counter. If BFRE = 1, a BRDY interrupt is generated after the received data have been read. The length of the data packet that was last to have been received before the BRDY interrupt was generated can be confirmed by reading the DTLN bits of the DnFIFOCTR register.
Table 29.24 shows the times at which a BRDY interrupt is generated by this module.

Table 29.24 Times BRDY Interrupts are Generated

Buffer Status when Packet is Received \ Register Setting	BFRE = 0	BFRE = 1
Buffer full (normal packet reception)	When a packet is received	No interrupt is generated.
Zero-length packet reception	When a packet is received	When a packet is received
Normal short packet reception	When a packet is received	When received data have been read from buffer memory
Transaction count ended	When a packet is received	When received data have been read from buffer memory

The BFRE bit function is only valid for the reading of buffer memory. In the case of writing, the value of the BFRE bit should always be 0.

29.4.6 Control Transfers (DCP)

Data transfers of the data stage of control transfers are done using the default control pipe (DCP). The DCP buffer memory is a 64-byte single buffer, and is a fixed area that is shared for both control reading and control writing. The buffer memory can be accessed through the CFIFO port.

(1) Control Transfers when the Host Controller Mode is Selected

(a) Setup Stage

USBREQ, USBVAL, USBINDX, and USBLENG are the registers that are used to transmit a USB request for setup transactions. Writing setup packet data to the registers and writing 1 to the SUREQ bit in DCPCTR transmits the specified data for setup transactions. Upon completion of transactions, the SUREQ bit is cleared to 0 by this module. The above USB request registers should not be modified while SUREQ = 1. The device address for setup transactions is specified using the DEVSEL bits in DCPMAXP.

When the data for setup transactions has been sent, a SIGN or SACK interrupt request is generated according to the response received from the peripheral device (SIGN or SACK bit in INTSTS1), by means of which the result of the setup transactions can be confirmed.

A data packet of DATA0 (USB request) is transmitted as the data packet for the setup transactions regardless of the setting of the SQMON bit in DCPCTR.

(b) Data Stage

Data transfers are done using the DCP buffer memory.

The access direction of the DCP buffer memory should be specified using the ISEL bit in CFIFOSEL. The transfer direction should be specified using the DIR bit in DCPCFG.

For the first data packet of the data stage, the data PID must be transferred as DATA1. Accordingly, transaction should be done by setting the data PID to DATA1 by using the SQSET bit in DCPCTR, and setting the response PID to BUF by using the PID bits in DCPCTR. Completion of data transfer is detected using the BRDY and BEMP interrupts.

The data in multiple packets can be transferred in continuous transfer mode. For continuous transfer in the receiving direction, however, note that a BRDY interrupt is only generated when the buffer memory is full or a short packet is received (when the number of bytes of data is an integer multiple of the maximum packet size and no greater than 256 bytes).

For control write transfers, when the number of data bytes to be sent is the integral multiple of the maximum packet size, a zero-length packet must be sent at the end.

(c) Status Stage

Zero-length packet data transfers are done in the direction opposite to that in the data stage. As with the data stage, data transfers are done using the DCP buffer memory. Transactions are done in the same manner as the data stage.

For the data packets of the status stage, the data PID must be transferred as DATA1. The data PID should be set to DATA1 using the SQSET bit in DCPCTR.

For reception of a zero-length packet, the received data length must be confirmed using the DTLN bits in CFIFOCTR after the BRDY interrupt is generated, and the buffer memory must then be cleared using the BCLR bit.

(2) Control Transfers when the Function Controller Mode is Selected

(a) Setup Stage

This module always sends an ACK response in response to a setup packet that is normal with respect to this module. The operation of this module in the setup stage is noted below.

(i) When a new setup packet is received, this module sets the following registers:

- Set the VALID bit in INTSTS0 to 1.
- Set the PID bits in DCPCTR to NAK.
- Set the CCPL bit in DCPCTR to 0.

(ii) When a data packet is received right after the setup packet, the USB request parameters are stored in USBREQ, USBVAL, USBINDX, and USBLENG.

Response processing with respect to the control transfer should always be carried out after first setting VALID = 0. In the VALID = 1 state, PID = BUF cannot be set, and the data stage cannot be terminated.

Using the function of the VALID bit, this module is able to interrupt the processing of a request currently being processed if a new USB request is received during a control transfer, and can send a response in response to the newest request.

Also, this module automatically judges the direction bit (bit 8 of the bmRequestType) and the request data length (wLength) of the USB request that was received, and then distinguishes between control read transfers, control write transfers, and control write no-data transfers, and monitors the stage transition. For a wrong sequence, the sequence error of the control transfer stage transition interrupt is generated. For information on the stage control of this module, see Figure 29.3.

(b) Data Stage

Data transfers corresponding to USB requests that have been received should be done using the DCP. Before accessing the DCP buffer memory, the access direction should be specified using the ISEL bit in CFIFOSEL.

Transaction should be done by setting the response PID to BUF by using the PID bits in DCPCTR.

Completion of data transfer is detected using the BRDY interrupt for control write transfers and BEMP interrupt for control read transfers, respectively.

With control write transfers during high-speed operation, the NYET handshake response is carried out based on the state of the buffer memory.

(c) Status Stage

Control transfers are terminated by setting the CCPL bit to 1 with the PID bits in DCPCTR set to BUF.

After the above settings have been entered, this module automatically executes the status stage in accordance with the data transfer direction determined at the setup stage. The specific procedure is as follows.

- For control read transfers
  This module receives a zero-length packet from the USB host controller and transmits an ACK response.
- For control write transfers and no-data control transfers
  This module transmits a zero-length packet and receives an ACK response from the USB host controller.

(d) Control Transfer Auto Response Function

This module automatically responds to a normal SET_ADDRESS request. If any of the following errors occur in the SET_ADDRESS request, a response is necessary.

- bmRequestType ≠ H'00
- wIndex ≠ H'00
- wLength ≠ H'00
- wValue > H'7F
- DVSQ = B'011 (Configured)

For all requests other than the SET_ADDRESS request, corresponding responses are required.

29.4.7 Bulk Transfers (PIPE1 to PIPE5, PIPE9 to PIPE15)

The buffer memory specifications for bulk transfers (single/double buffer setting, or continuous/non-continuous transfer mode setting) can be selected. The maximum size that can be set for the buffer memory is 2 Kbytes. The buffer memory state is controlled by this module, with a response sent automatically for a PING packet/NYET handshake.

(1) PING Packet Control when the Host Controller Mode is Selected

This module automatically sends a PING packet in the OUT direction at a specific timing.
On receiving an ACK handshake in the initial state in which PING packet sending mode is set, this module sends an OUT packet as noted below. Reception of an NAK or NYET handshake returns this module to PING packet sending mode. This control also applies to the control transfers in the data stage and status stage.
<Starts sending an OUT data>

1. Sets OUT data sending mode.
2. Sends a PING packet.
3. Receives an ACK handshake.
4. Sends an OUT data packet.
5. Receives an ACK handshake.
   (Repeats steps 4 and 5.)
6. Sends an OUT data packet.
7. Receives an NAK/NYET handshake.
8. Sends a PING packet.

This module is returned to PING packet sending mode by a power-on reset, receiving an NYET/NAK handshake, clearing the sequence toggle bit (SQCLR), and setting the buffer clear bit (ACLRM) in PIPEnCTR.

(2) NYET Handshake Control when the Function Controller Mode is Selected

Table 29.25 lists responses to tokens received in bulk or control transfer. The NYET response of this module is made when there is only enough space in the buffer memory for one packet when an OUT token for such transfer is received. When a short packet is received, an ACK response will be produced instead of an NYET response even if the above condition holds.

Table 29.25 NYET Handshake Responses

Value Set for PID Bits in DCPCTR	Buffer Memory State	Received Token	Response	Note
NAK/STALL	—	SETUP	ACK	—
	—	IN/OUT/ PING	NAK/STALL	—
BUF	—	SETUP	ACK	—
	RCV-BRDY	OUT/PING	ACK	If an OUT token is received, a data packet is received.*1
	RCV-BRDY	OUT	NYET	A data packet is received.*2
	RCV-BRDY	OUT (Short)	ACK	A data packet is received.*2
	RCV-BRDY	PING	ACK	*2
	RCV-NRDY	OUT/PING	NAK	
	TRN-BRDY	IN	DATA0/DATA1	A data packet is transmitted.
	TRN-NRDY	IN	NAK	

[Legend]
RCV-BRDY*1:When an OUT/PING token is received, there is space in the buffer memory for two or more packets.
RCV-BRDY*2:When an OUT token is received, there is only enough space in the buffer memory for one packet.
RCV-NRDY:When a PING token is received, there is no space in the buffer memory.
TRN-BRDY:When an IN token is received, there is data to be transmitted in the buffer memory.
TRN-NRDY:When an IN token is received, there is no data to be transmitted in the buffer memory.

29.4.8 Interrupt Transfers (PIPE6 to PIPE9, PIPE10)

When the function controller mode is selected, this module carries out interrupt transfers in accordance with the timing controlled by the host controller. For interrupt transfers, PING packets are ignored (no responses are sent), and the ACK, NAK, and STALL responses are carried out without an NYET handshake response being made.
When the host controller mode is selected, this module can set the timing of issuing a token using the interval counter. At this time, this module issues an OUT token even in the OUT direction, without issuing a PING token.
This module does not support high bandwidth transfers of interrupt transfers.

(1) Interval Counter during Interrupt Transfers when the Host Controller Mode is Selected

(a) Operation Outline

For interrupt transfers, intervals between transactions are set in the IITV bits in PIPEPERI. This module issues an interrupt transfer token based on the specified intervals.

(b) Counter Initialization

This module initializes the interval counter under the following conditions.

- Power-on reset:
  The IITV bits are initialized.
- Buffer memory initialization using the ACLRM bit:
  The IITV bits are not initialized but the count value is. Setting the ACLRM bit to 0 starts counting from the value set in the IITV bits.

Note that the interval counter is not initialized in the following case.

- USB bus reset, USB suspended:
  The IITV bits are not initialized. Setting 1 to the UACT bit starts counting from the value before entering the USB bus reset state or USB suspended state.

(c) Operation when Transmission/Reception is Impossible at Token Issuance Timing

This module cannot issue tokens even at token issuance timing in the following cases. In such a case, this module attempts transactions at the subsequent interval.

- When the PID is set to NAK or STALL.
- When the buffer memory is full at the token sending timing in the receiving (IN) direction.
- When there is no data to be sent in the buffer memory at the token sending timing in the sending (OUT) direction.

29.4.9 Isochronous Transfers (PIPE1 and PIPE2)

This module has the following functions pertaining to isochronous transfers.

- Notification of isochronous transfer error information
- Interval counter (specified by the IITV bits)
- Isochronous IN transfer data setup control (IDLY function)
- Isochronous IN transfer buffer flush function (specified by the IFIS bit)
- SOF pulse output function

This module does not support the high bandwidth transfers of isochronous transfers.

(1) Error Detection with Isochronous Transfers

This module has a function for detecting the error information in isochronous transfers noted below. Table 29.26 and Table 29.27 show the priority in which errors are confirmed and the interrupts that are generated.

1. PID errors
   - If the PID of the packet being received is illegal
2. CRC errors and bit stuffing errors
   - If an error occurs in the CRC of the packet being received, or the bit stuffing is illegal
3. Exceeded maximum packet size
   - The data size of the received packet exceeded the specified maximum packet size.
4. Overrun and underrun errors
   - When host controller mode is selected
     When using isochronous IN transfers (reception), the IN token was transmitted but there was not enough space in the buffer memory.
     When using isochronous OUT transfers (transmission), the OUT token was transmitted, but the data was not in the buffer memory.
   - When function controller mode is selected
     When using isochronous IN transfers (transmission), the IN token was received but the data was not in the buffer memory.
     When using isochronous OUT transfers (reception), the OUT token was received, but there was not enough space in the buffer memory.
5. Interval errors

When function controller mode is selected, interval errors occur in following cases.

- During an isochronous IN transfer, the IN token could not be received during the interval frame.
- During an isochronous OUT transfer, the OUT token could not be received during the interval frame.

Table 29.26 Error Detection when a Token is Received

Detection Priority Order	Error	Generated Interrupt and Status
1	PID errors	No interrupts are generated in both cases when the host controller mode is selected and the function controller mode is selected (ignored as a corrupted packet).
2	CRC error and bit stuffing errors	No interrupts are generated in both cases when the host controller mode is selected and the function controller mode is selected (ignored as a corrupted packet).
3	Overrun and underrun errors	An NRDY interrupt is generated and the OVRN bit is set in both host controller mode and function controller mode. When the function controller mode is selected, a zero-length packet is transmitted in response to IN token. However, no data packet is received in response to OUT token.
4	Interval errors	An NRDY interrupt is generated when the function controller mode is selected. It is not generated in the host controller mode.

Table 29.27 Error Detection when a Data Packet is Received

Detection Priority Order	Error	Generated Interrupt and Status
1	PID errors	No interrupts are generated (ignored as a corrupted packet)
2	CRC error and bit stuffing errors	An NRDY interrupt is generated and the CRCE bit is set in both host controller mode and function controller mode.
3	Maximum packet size exceeded error	A BEMP interrupt is generated to set the PID bits to STALL in both cases when the host controller mode is selected and the function controller mode is selected.

(2) DATA-PID

This module does not support high bandwidth transfers. When the function controller mode is selected, this module operates as follows in response to the received PID.

1. IN direction
   - DATA0: Sent as data packet PID
   - DATA1: Not sent
   - DATA2: Not sent
   - mDATA: Not sent

2. OUT direction (when using full-speed operation)
   - DATA0: Received normally as data packet PID
   - DATA1: Received normally as data packet PID
   - DATA2: Packets are ignored
   - mDATA: Packets are ignored

3. OUT direction (when using high-speed operation)
   - DATA0: Received normally as data packet PID
   - DATA1: Received normally as data packet PID
   - DATA2: Received normally as data packet PID
   - mDATA: Received normally as data packet PID

(3) Interval Counter

(a) Operation Outline

The isochronous interval can be set using the IITV bits in PIPEPERI. The interval counter enables the functions shown in Table 29.28 when the function controller mode is selected. When the host controller mode is selected, this module generates the token issuance timing. When the host controller mode is selected, the interval counter operation is the same as the interrupt transfer operation. Refer to section 29.4.8 (1) Interval Counter during Interrupt Transfers when the Host Controller Mode is Selected.

Table 29.28 Functions of the Interval Counter when the Function Controller Mode is Selected

Transfer Direction	Function	Conditions for Detection
IN	Transmission buffer flush function	When an IN token cannot be normally received in the interval frame during an isochronous IN transfer
OUT	Notifies that a token not being received	When an OUT token cannot be normally received in the interval frame during an isochronous OUT transfer

The interval count is carried out when an SOF is received or for interpolated SOFs, so the isochronism can be maintained even if an SOF is damaged. The frame interval that can be set is the 2^{IITV} frames or 2^{IITV} μ frames.

(b) Interval Counter Initialization when the Function Controller Mode is Selected

This module initializes the interval counter under the following conditions.

- Power-on reset
  The IITV bits are initialized.
- Buffer memory clearing using the ACLRM bit
  The IITV bits are not initialized but the count value is.
- USB bus reset

After the interval counter has been initialized, the counter is started under the following condition 1 or 2 when a packet has been transferred normally.

1. An SOF is received following transmission of data in response to an IN token, in the PID = BUF state.
2. An SOF is received after data following an OUT token is received in the PID = BUF state.

The interval counter is not initialized under the conditions below.

1. When the PID bits are set to NAK or STALL
   The interval timer does not stop. This module attempts the transactions at the subsequent interval.
2. The USB bus is reset or USB operations are suspended
   The IITV bits are not initialized. When the SOF has been received, the counter is restarted from the value prior to the reception of the SOF.

(c) Interval Counting and Transfer Control when the Host Controller Mode is Selected

The IITV bits can be set when the selected pipe is for isochronous or interrupt transfers. This module controls the interval between token issuance operations based on the IITV bit setting. Specifically, this module issues a token for the selected pipe once every 2^{IITV} (μ) frames.
This module counts the interval every 1-ms frame for the pipes used for communications with the full-speed or low-speed peripheral devices connected to a high-speed HUB.
This module starts counting the token issuance interval at the (μ) frame following the (μ) frame in which the PID bits are

set to BUF.

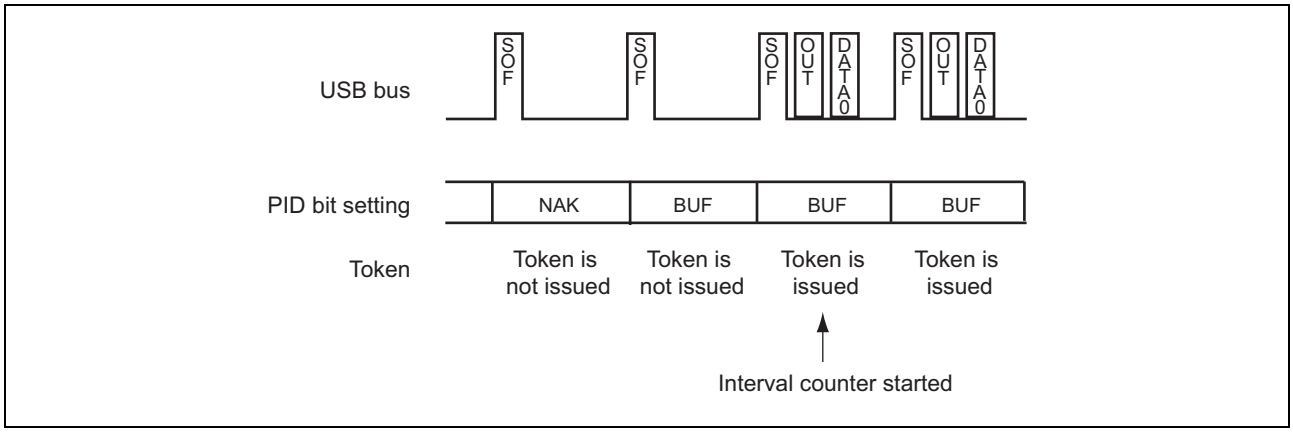

Figure 29.7 Token Issuance when IITV = 0

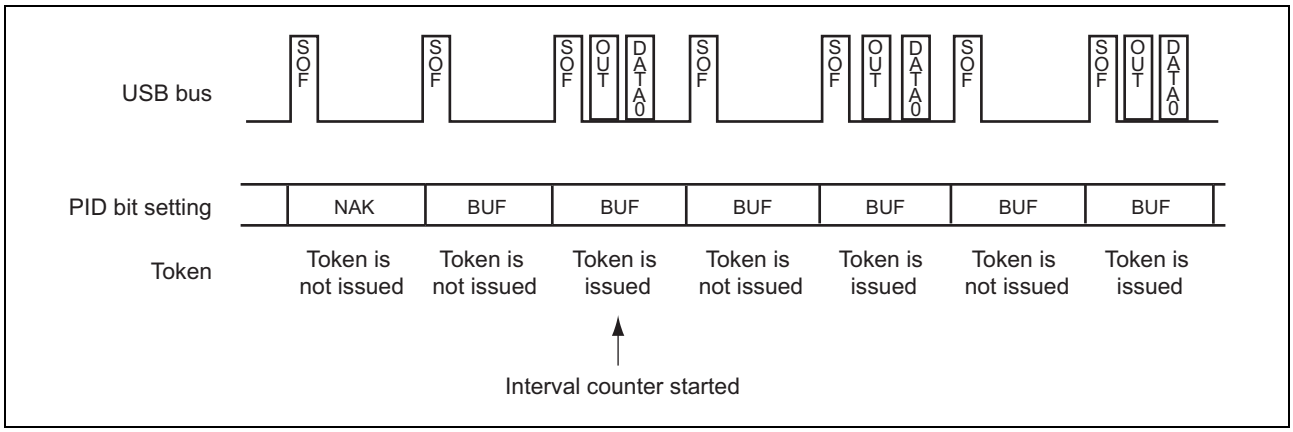

Figure 29.8 Token Issuance when IITV = 1

When the selected pipe is for isochronous transfers, this module carries out the operation below in addition to controlling token issuance interval. This module issues a token even when the NRDY interrupt generation condition is satisfied.

1. When the selected pipe is for isochronous IN transfers
   This module generates the NRDY interrupt when this module issues the IN token but does not receive a packet successfully from a peripheral device (no response or packet error).
   This module sets the OVRN bit to 1 generating the NRDY interrupt when the time to issue an IN token comes in a state in which this module cannot receive data because the FIFO buffer is full (because reading data from the FIFO buffer is slow).
2. When the selected pipe is for isochronous OUT transfers
   This module sets the OVRN bit to 1 generating the NRDY interrupt and transmitting a zero-length packet when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer (because writing data to the FIFO buffer is slow).
   The token issuance interval is reset by a power-on reset or when the ACLRM bit is set to 1.

(d) Interval Counting and Transfer Control when the Function Controller Mode is Selected

The IITV bits can be set when the selected pipe is for isochronous transfers.

1. When the selected pipe is for isochronous OUT transfers
   This module generates the NRDY interrupt when it fails to receive a data packet within the interval set for (μ) frames by the IITV bits.

This module generates the NRDY interrupt when this module fails to receive a data packet because of a CRC error or other errors contained in the packet, or because of the FIFO buffer being full (because reading data from the FIFO buffer is slow).
This module generates the NRDY interrupt on receiving an SOF packet. Even if the SOF packet is corrupted, the internal interpolation is used and allows the interrupt to be generated at the timing to receive the SOF packet. However, when the IITV bits are set to the value other than 0, this module generates the NRDY interrupt on receiving an SOF packet for every interval after starting interval counting operation. When the PID bits are set to NAK after starting the interval timer, this module does not generate the NRDY interrupt on receiving an SOF packet.

The interval counting starts at the different timing depending on the IITV bit setting as follows.
- When IITV = 0: The interval counting starts at the (μ) frame following the (μ) frame in which the PID bits for the selected pipe are set to BUF.

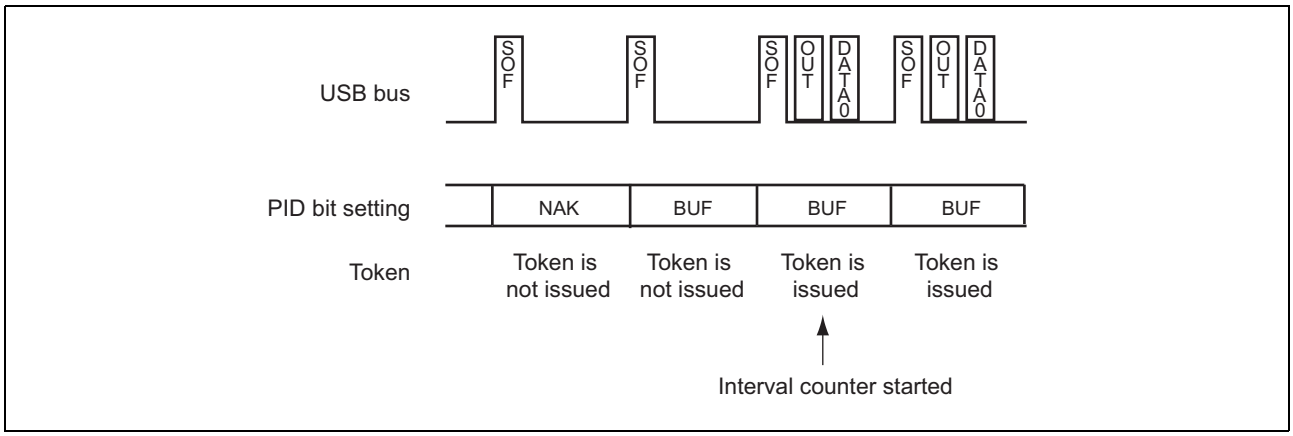

Figure 29.9 Relationship between (μ) Frames and Expected Token Reception when IITV = 0

- When IITV ≠ 0: The interval counting starts on completion of successful reception of the first data packet after the PID bits for the selected pipe have been modified to BUF.

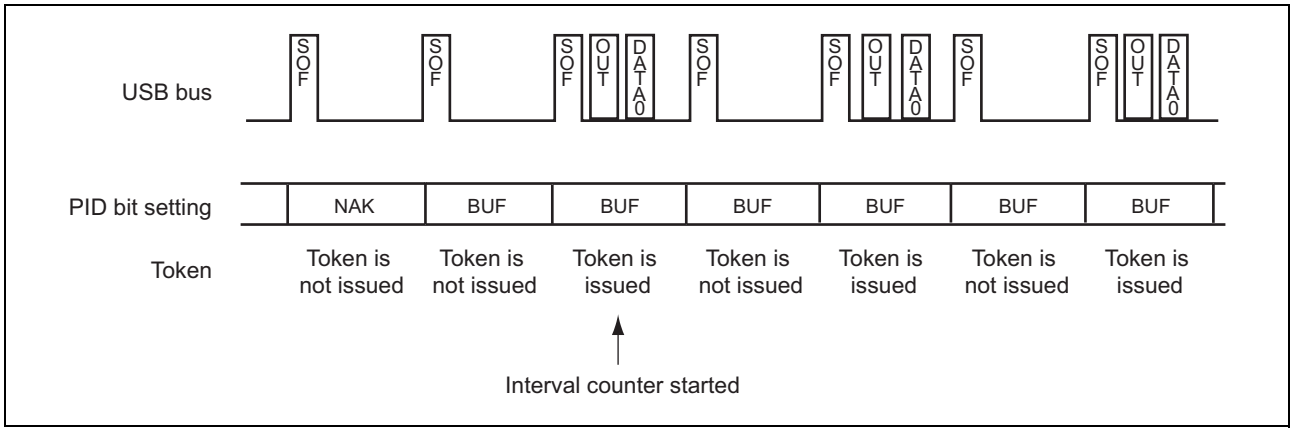

Figure 29.10 Relationship between (μ) Frames and Expected Token Reception when IITV = 1

2. When the selected pipe is for isochronous IN transfers
The IFIS bit should be 1 for this use. When IFIS = 0, this module transmits a data packet in response to the received IN token irrespective of the IITV bit setting.
When IFIS = 1, this module clears the FIFO buffer when this module fails to receive an IN token within the interval set for (μ) frames by the IITV bits in a state in which there is data to be transmitted in the FIFO buffer.
This module also clears the FIFO buffer when this module fails to receive an IN token successfully because of a bus error such as a CRC error contained in the token.

This module clears the FIFO buffer on receiving an SOF packet. Even if the SOF packet is corrupted, the internal interpolation is used and allows the FIFO buffer to be cleared at the timing to receive the SOF packet.
The interval counting starts at the different timing depending on the IITV bit setting (similar to the timing during OUT transfers).
The clearing conditions for the interval counter are any of the following in function controller mode.
- When a power-on-reset is applied to this module (the value set in the IITV bits is also cleared to 0).
- When the ACLRM bit is set to 1.
- When this module detects a USB bus reset.

(4) Setup of Data to be Transmitted using Isochronous Transfer when the Function Controller Mode is Selected

With isochronous data transmission using this module in function controller mode, after data has been written to the buffer memory, a data packet can be sent with the next frame in which an SOF packet is detected. This function is called the isochronous transfer transmission data setup function. This function enables identification of the frame that has started being transmitted.
When a double buffer is in use as the buffer memory, transmission from only one of the two buffers will be possible even after the writing of data to both buffers has been completed; the given buffer memory will be that to which the writing of data was completed first. For this reason, even if multiple IN tokens are received in a single frame, the only buffer memory that can be sent is one packet's worth of data.
When an IN token is received, if the buffer memory is in the transmission enabled state, this module transmits the data as a normal response. If the buffer memory is not in the transmission enabled state, however, a zero-length packet is sent and an underrun error occurs.
Figure 29.11 shows an example of transmission using the isochronous transfer transmission data setup function with this module, when IITV = 0 (every frame) has been set.

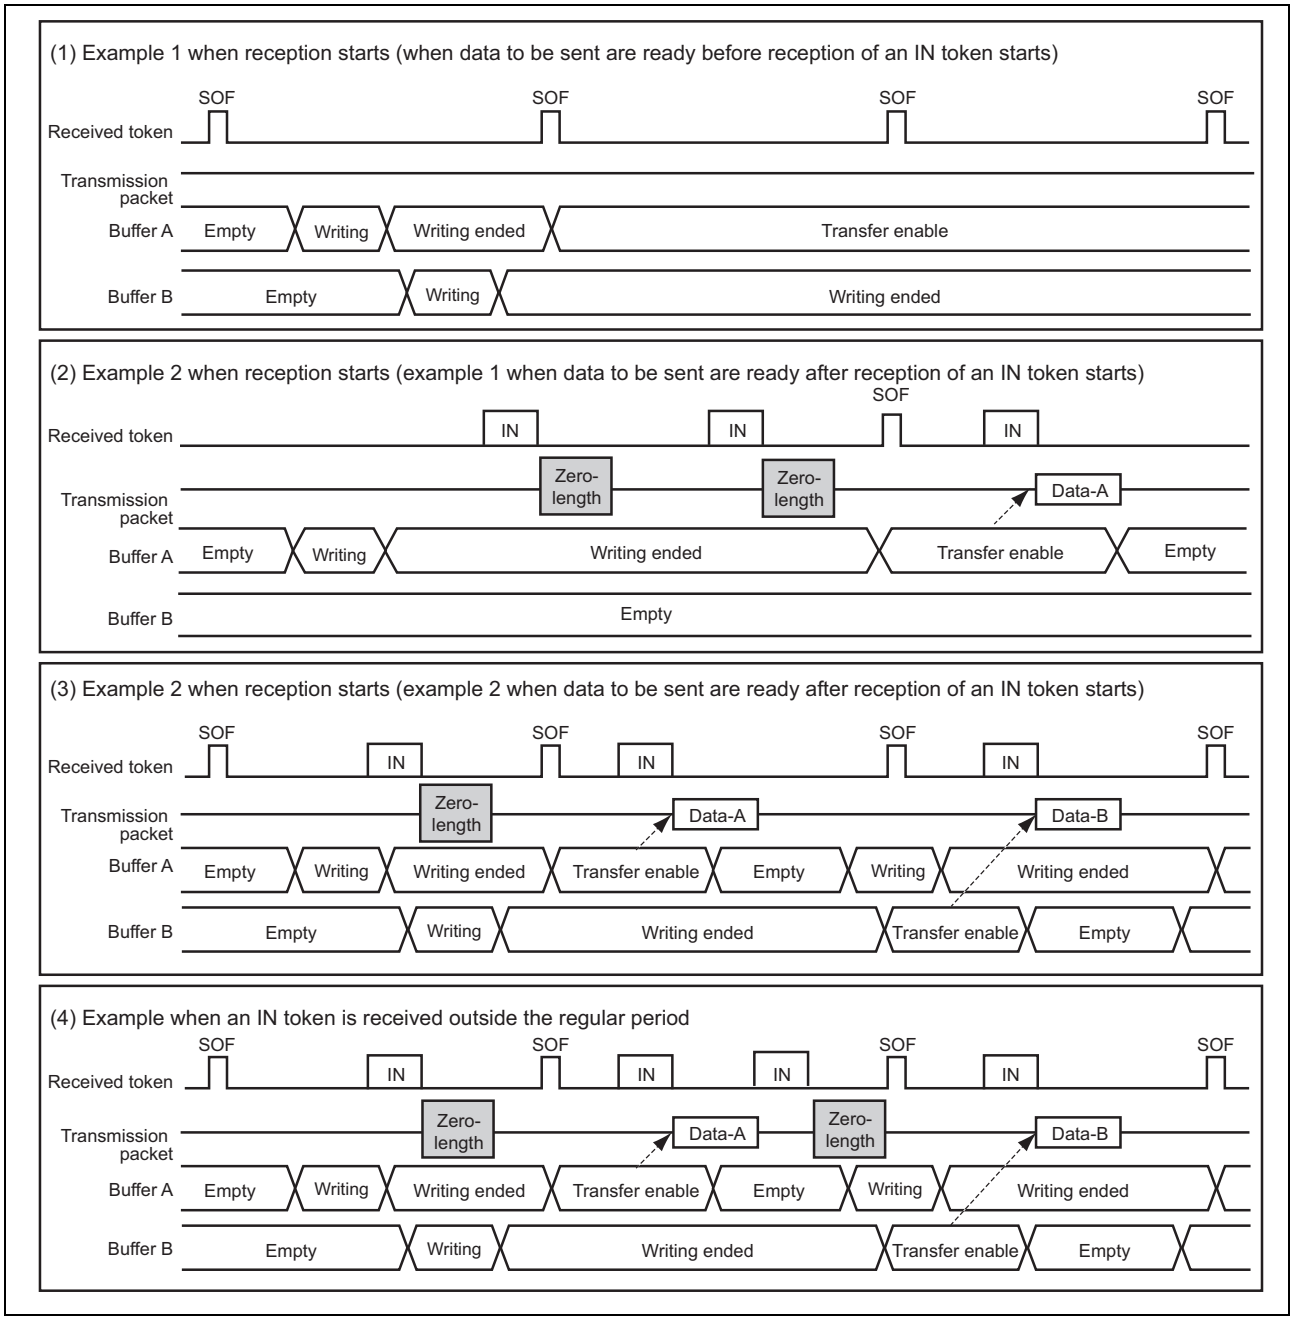

Figure 29.11 Example of Data Setup Function Operation

(5) Isochronous Transfer Transmission Buffer Flush when the Function Controller Mode is Selected

When the function controller mode is selected and an SOF packet or a µSOF packet of the next frame is received without receiving an IN token in the interval frame during isochronous data transmission, this module operates as if a corrupted IN token was received, and clears the buffer for which transmission is enabled, putting that buffer in the writing enabled state.

If a double buffer is being used and writing to both buffers has been completed, data are considered to have been sent from the buffer memory that was cleared in the same interval frame, and transmission is enabled for the buffer memory that is not discarded with SOF or µSOF packets reception.

The timing at which the buffer flush function is activated varies depending on the value set for the IITV bits.

- If IITV = 0
  The buffer flush operation starts from the next frame after the pipe becomes valid.
- In any cases other than IITV = 0
  The buffer flush operation is carried out subsequent to the first normal transaction.

Figure 29.12 shows an example of the buffer flush function of this module. When an unanticipated token is received prior to the interval frame, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

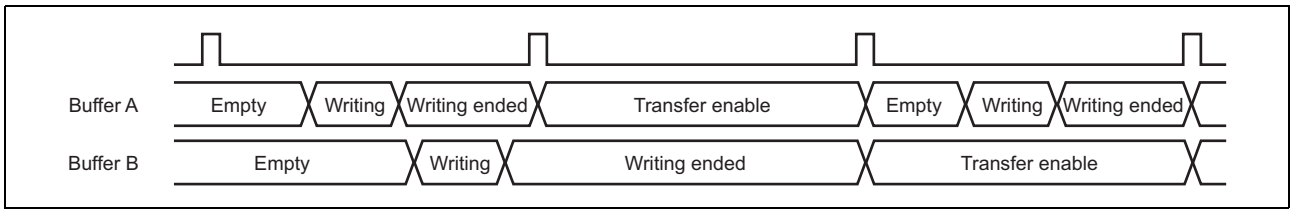

Figure 29.12 Example of Buffer Flush Function Operation

Figure 29.13 shows an example of this module generating an interval error. There are five types of interval errors, as shown below. The interval error is generated at the timing indicated by (1) in the figure, and the buffer flush function is activated.
If an interval error occurs during an IN transfer, the buffer flush function is activated; and if it occurs during an OUT transfer, an NRDY interrupt is generated.
The OVRN bit should be used to distinguish between NRDY interrupts such as received packet errors and overrun errors.
In response to tokens that are shaded in the figure, responses occur based on the buffer memory status.

1. IN direction
   - If the buffer is in the transmission enabled state, the data is transferred as a normal response.
   - If the buffer is in the transmission disabled state, a zero-length packet is sent and an underrun error occurs.
2. OUT direction
   - If the buffer is in the reception enabled state, the data is received as a normal response.
   - If the buffer is in the reception disabled state, the data is discarded and an overrun error occurs.

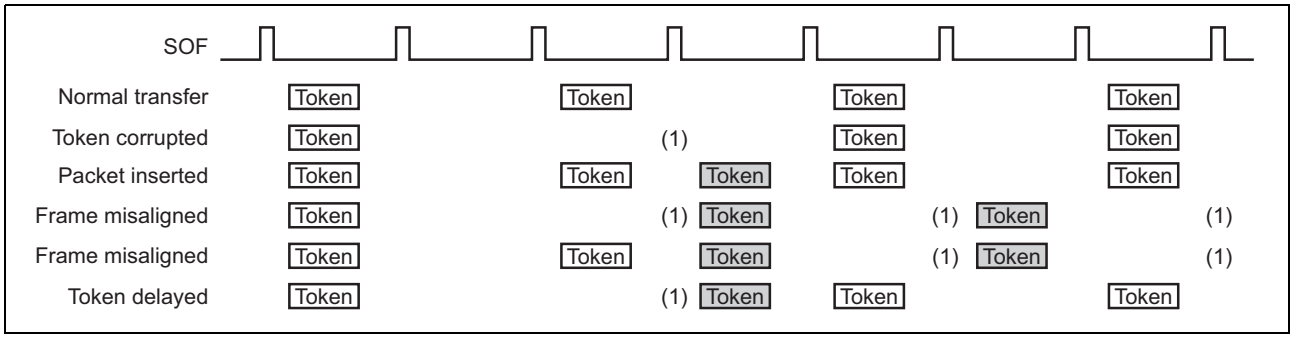

Figure 29.13 Example of an Interval Error being Generated when IITV = 1

29.4.10 SOF Interpolation Function

When the function controller mode is selected and if an SOF packet could not be received at intervals of 1 ms (when using full-speed operation) or 125 µs (when using high-speed operation) because of corruption or missing, this module interpolates the SOF. The SOF interpolation operation begins when both the USBE bit in SYSCFG and the SUSPM bit in SUSPMODE have been set to 1 and an SOF packet is received. The interpolation function is initialized under the following conditions.

- Power-on reset
- USB bus reset
- Suspended state detected

Also, the SOF interpolation operates under the following specifications.

- Frame interval (125 µs or 1 ms) conforms to the results of the reset handshake protocol.
- The interpolation function is not activated until an SOF packet is received.
- After the first SOF packet is received, either 125 µs or 1 ms is counted with an internal clock of 48 MHz, and interpolation is carried out.
- After the second and subsequent SOF packets are received, interpolation is carried out at the previous reception interval.
- Interpolation is not carried out in the suspended state or while a USB bus reset is being received. (With suspended transitions in high-speed operation, interpolation continues for 3 ms after the last packet is received.)

This module supports the following functions based on the SOF reception. These functions also operate normally with SOF interpolation, if the SOF packet was missing.

- Refreshing of the frame number and micro-frame number
- SOFR interrupt and µSOF lock
- SOF pulse output
- Isochronous transfer interval count

If an SOF packet is missing when full-speed operation is being used, the FRNM bits in FRMNUM are not refreshed. If a µSOF packet is missing during high-speed operation, the UFRNM bits in UFRMNUM are refreshed. However, if a µSOF packet for UFRNM = 000 is missing, the FRNM bits are not refreshed. In this case, the FRNM bits are not refreshed even if successive µSOF packets other than UFRNM = 000 are received normally.

30. Digital Video Decoder

30.1 Features

This LSI incorporates two channels of digital video decoders. This module consists of an A/D converter for video signal input, a sync separator circuit, a burst controlled oscillator (BCO), a 2D Y/C separator circuit, chroma decoding circuit, a digital clamp circuit, and an output gain adjustment circuit. Table 30.1 shows the digital video decoder functions.

Table 30.1 Digital Video Decoder Functions

Item	Function
Input signal	Video signal • Composite video signal (CVBS)
Functional outline	• A/D converter for video signal input — VIN1 and VIN2 pin input selection — Low-pass filter (LPF) — Sync tip clamp — Programmable gain amplifier (PGA) (0 to 6.021 dB) — 10-bit precision pipelined A/D converter • Sync separation — Noise reduction LPS, auto level control sync slicer, horizontal auto frequency control (AFC), vertical count-down, interlace detection, auto gain control (AGC)/peak limiter control • Burst controlled oscillator (BCO) — Color sub-carrier reproduction, color system detection (For details, see Table 30.3.) • Y/C separation (For details, see Table 30.2.) — Supporting NTSC 2D, PAL 2D, SECAM 1D • Chroma decoding — Supporting NTSC, PAL SECAM — Color killer, auto color control (ACC), TINT correction, R-Y axis correction • Digital clamp — Pedestal clamp (Y), center clamp (Cb/Cr), noise detection • Output gain adjustment — Contrast adjustment: 0 to approx. two times — Color adjustment (Cb/Cr independent): 0 to approx. two times

Table 30.2 Supported Y/C Separation Operation

Color System	Y/C Separation Operation
NTSC-3.58	Two dimensional
NTSC-4.43	Two dimensional
PAL-M	Two dimensional
PAL-N	Two dimensional
PAL-4.43	Two dimensional
SECAM	One dimensional

Table 30.3 Color System Detection

30.4.1 ADC Control Register 1 (ADCCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	AGC MODE	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	AGCMODE	0	R/W	A/D Converter AGC ON/OFF Control 0: AGC OFF 1: AGC ON
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) AGC Control

The AGCMODE bit controls the AGC ON/OFF. When AGCMODE is 1, the AGC operation is performed by detecting the sync amplitude and video peak amplitude and controlling the PGA gain of the ADC.
When PGACR.PGA_GAIN_SEL is 1, the PGA gain can be directly controlled with the PGACR.PGA_GAIN value. At this time, the AGCMODE setting is invalid.
Setting AGCMODE to 0 and PGACR.PGA_GAIN_SEL to 0 simultaneously is prohibited.

30.4.2 Timing Generation Control Register 1 (TGCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SRCLEFT[8:0]								
Initial value:	0	0	0	0	0	0	0	1	0	0	1	1	1	1	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	SRCLEFT[8:0]	H'13C	R/W	Left End of Input Video Signal Capturing Area Set the position from the horizontal sync reference in 27-MHz clock cycle units.

(1) Timing Generation (Horizontal Start Position) Control

SRCLEFT sets the start position of the horizontal enable signal of the output video signal from the horizontal sync reference in 27-MHz clock cycle units.

30.4.3 Timing Generation Control Register 2 (TGCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRCTOP[5:0]						SRCHEIGHT[9:0]									
Initial value:	0	1	0	1	0	0	0	0	1	1	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	SRCTOP[5:0]	H'14	R/W	Top End of Input Video Signal Capturing Area Set the position from the vertical sync reference in one-line units.
9 to 0	SRCHEIGHT [9:0]	H'0E8	R/W	Height of Input Video Signal Capturing Area Set the vertical active period in one-line units.

Note: • All the bits in this register are updated when the vertical sync signal is asserted with the NEWSETTING bit in RUPDCR being 1.

(1) Timing Generation (Vertical Start Position) Control

SRCTOP sets the start position of the vertical enable signal of the output video signal from the vertical sync reference in one-line units.

(2) Timing Generation (Vertical Width) Control

SRCHEIGHT sets the height of the vertical enable signal of the output video signal in one-line units.

30.4.4 Timing Generation Control Register 3 (TGCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SRCWIDTH[10:0]										
Initial value:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SRCWIDTH [10:0]	H'500	R/W	Width of Input Video Signal Capturing Area Set the horizontal active period in 27-MHz clock cycle units.

Note: • All the bits in this register are updated when the vertical sync signal is asserted with the NEWSETTING bit in RUPDCR being 1.

(1) Timing Generation (Horizontal Width) Control

SRCHEIGHT sets the width of horizontal enable signal of the output video signal in 27-MHz clock cycle units. Figure 30.3 to Figure 30.7 show the timings generated with the NTSC (59.94 Hz) and PAL/SECAM (50.00 Hz) formats.

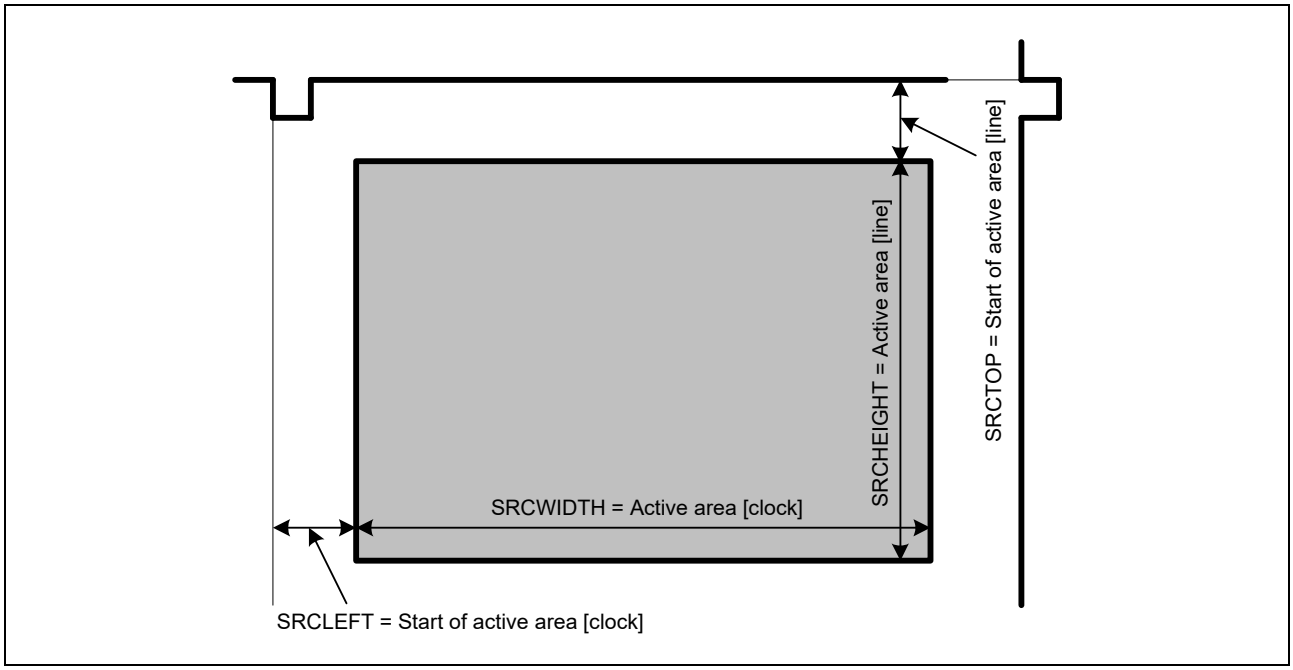

Figure 30.3 Active Image Area Setting

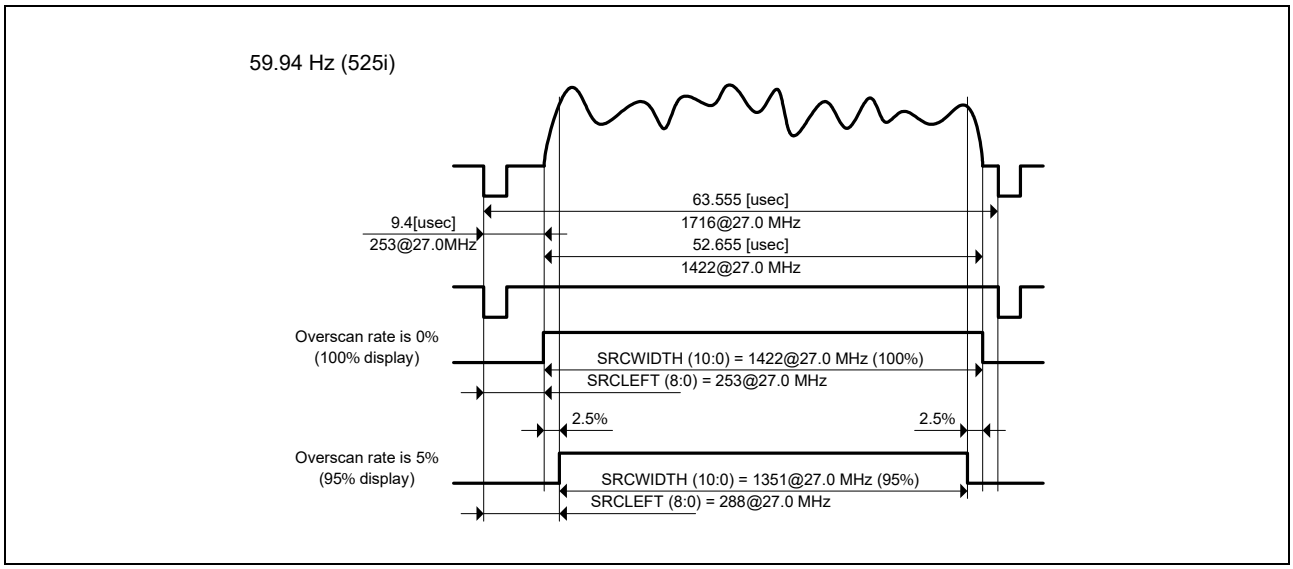

Figure 30.4 Example of Horizontal Active Image Period (59.94 Hz (525i))

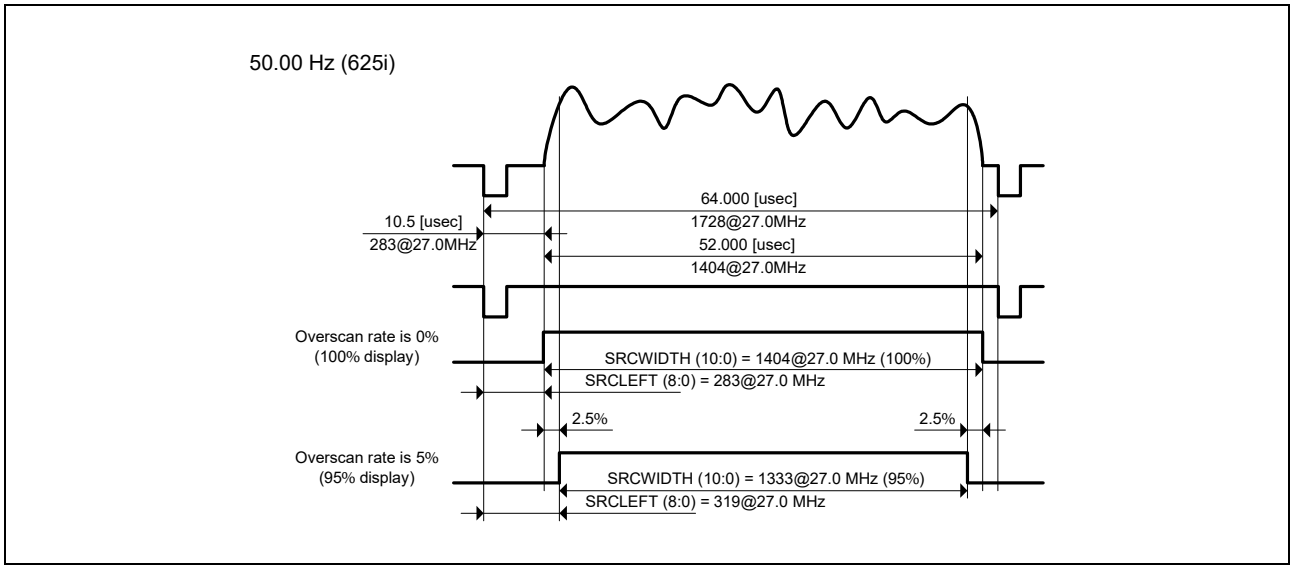

Figure 30.5 Example of Horizontal Active Image Period (50.00 Hz (625i))

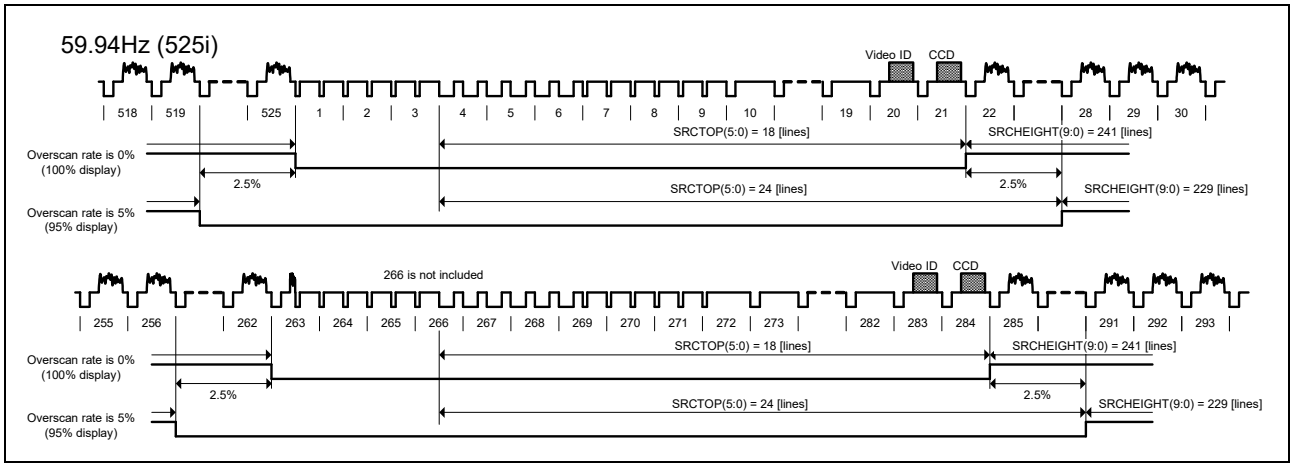

Figure 30.6 Example of Vertical Active Image Period (59.94 Hz (525i))

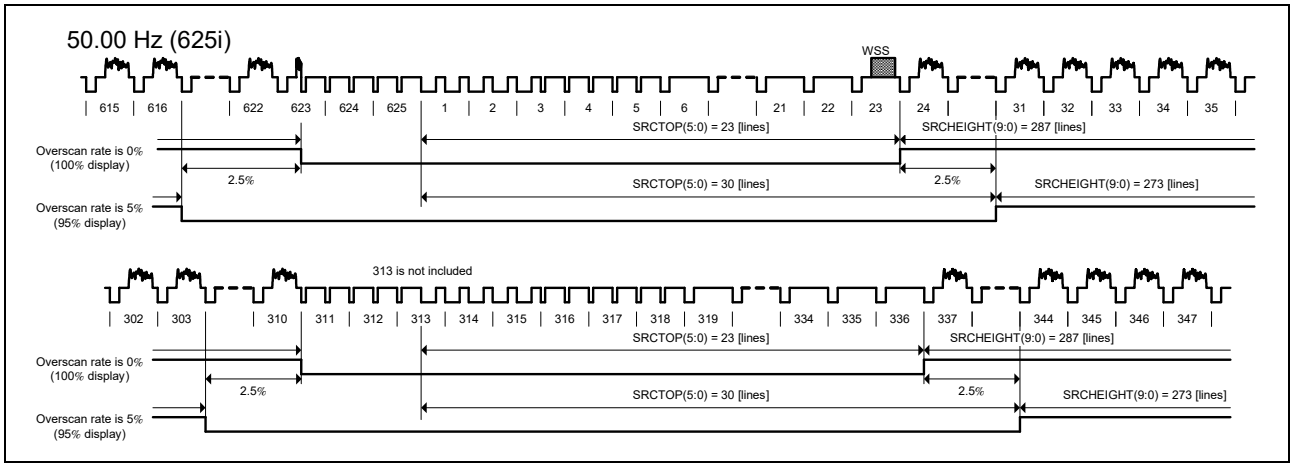

Figure 30.7 Example of Vertical Active Image Period (50.00 Hz (625i))

The active period width should not be larger than necessary.

The settings of TGCR1 to TGCR3 such as valid period setting for the peak limiter are applied only to this module. To set the display size of the input video, SCL0_DS2 and SCL0_DS3 of the video display controller 5 scaler should be used.

30.4.5 Sync Separation Control Register 1 (SYNSCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LPFVSYNC[2:0]			LPFHSYNC[2:0]			—	—	VELOCITYSHIFT_H[3:0]				SLICER MODE_H[1:0]		SLICER MODE_V[1:0]	
Initial value:	0	1	1	0	1	1	0	0	0	0	0	0	1	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	LPFVSYNC [2:0]	011	R/W	Low-Pass Filter Cutoff Frequency before Vertical Sync Separation 0: None 1: 0.94 MHz 2: 0.67 MHz 3: 0.54 MHz 4: 0.47 MHz 5: 0.34 MHz 6: 0.27 MHz 7: 0.23 MHz
12 to 10	LPFHSYNC [2:0]	011	R/W	Low-Pass Filter Cutoff Frequency before Horizontal Sync Separation 0: None 1: 2.15 MHz 2: 1.88 MHz 3: 1.34 MHz 4: 1.07 MHz 5: 0.94 MHz 6: 0.67 MHz 7: 0.54 MHz
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	VELOCITY SHIFT_H[3:0]	0000	R/W	Reference Level Operation Speed Control for Composite Sync Separation (for horizontal sync signal) 0: ×1 1: ×2 2: ×4 3: ×8 4: ×16 5: ×32 6: ×64 7: ×128 Others: ×256 Standard speed (×1) ⇔ High speed (×256)
3, 2	SLICERMODE _H[1:0]	10	R/W	Auto-Slice Level Setting for Composite Sync Separation Circuit (for horizontal sync signal) 0: Manual setting by CSYNCSLICE_H 1: 25% of sync depth (Auto) 2: 50% of sync depth (Auto) 3: 75% of sync depth (Auto)
1, 0	SLICERMODE _V[1:0]	10	R/W	Auto-Slice Level Setting for Composite Sync Separation Circuit (for vertical sync signal) 0: Manual setting by CSYNCSLICE_V 1: 25% of sync depth (Auto) 2: 50% of sync depth (Auto) 3: 75% of sync depth (Auto)

(1) Low-Pass Filter Control before Vertical Sync Separation

LPFVSYNC sets the noise reduction low-pass filter for the input video signal fed to a sync separator in order to avoid sync separation error caused by noise. A low-pass filter cutoff frequency should be set not to deteriorate (i.e. to enable to detect) the composite sync signal components.

Table 30.6 Low-Pass Filter Cutoff Frequency before Vertical Sync Separation

	For Vertical Sync Separation	
LPFVSYNC[2:0]	**t**	**fc (MHz)**
1	0.109375	0.939647766
2	0.078125	0.671176976
3	0.0625	0.536941581
4	0.0546875	0.469823883
5	0.0390625	0.335588488
6	0.003125	0.26847079
7	0.0273438	0.234911942

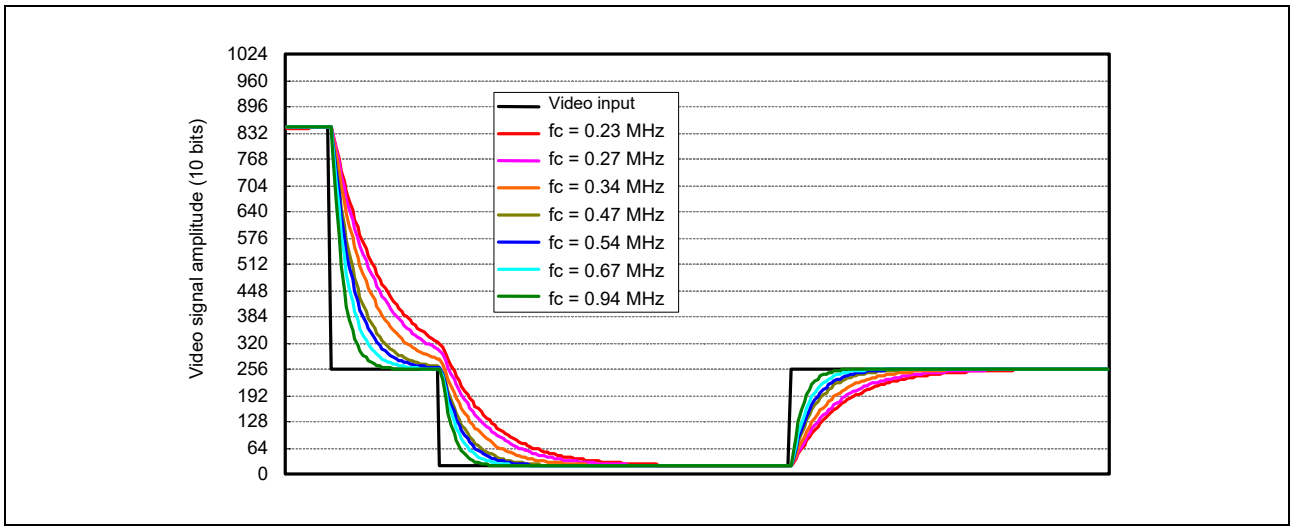

Figure 30.8 Low-Pass Filter Output Waveform near Vertical Sync Signal during 100% White Signal Input (Vertical: Pattern Diagram)

(2) Low-Pass Filter Control before Horizontal Sync Separation

LPFHSYNC sets the noise reduction low-pass filter for the input video signal fed to a sync separator in order to avoid sync separation error caused by noise. A low-pass filter cutoff frequency should be set not to deteriorate (i.e. to enable to detect) the composite sync signal components.

Table 30.7 Low-Pass Filter Cutoff Frequency before Horizontal Sync Separation

	For Horizontal Sync Separation	
LPFHSYNC[2:0]	**t**	**fc (MHz)**
1	0.25	2.147766323
2	0.21875	1.879295533
3	0.15625	1.342353952
4	0.125	1.073883162
5	0.10938	0.939647766
6	0.07813	0.671176976
7	0.0625	0.536941581

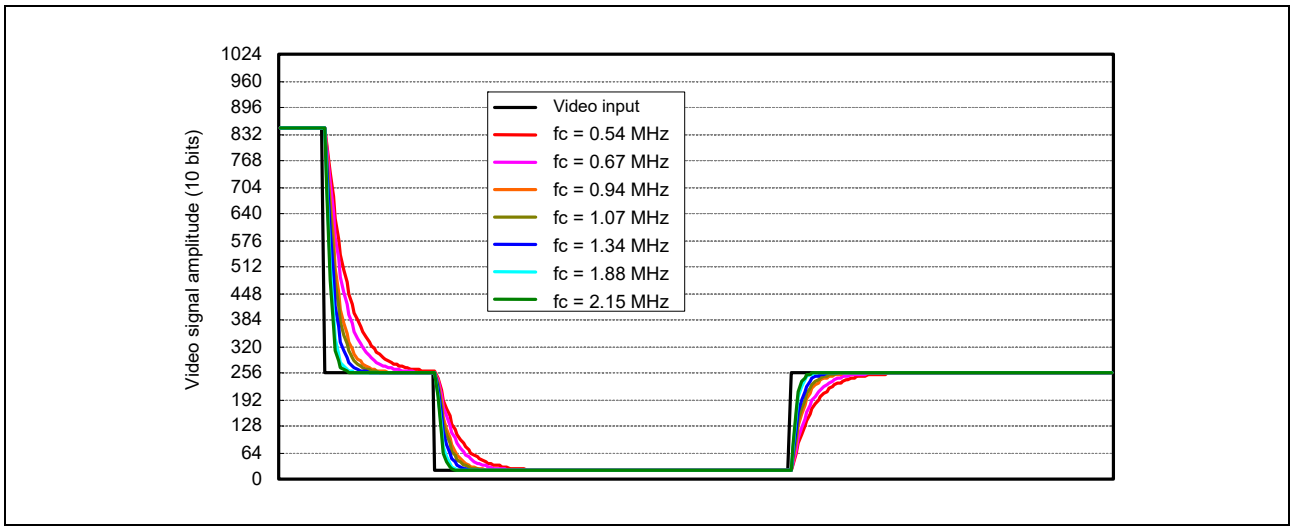

Figure 30.9 Low-Pass Filter Output Waveform near Horizontal Sync Signal during 100% White Signal Input (Horizontal: Pattern Diagram)

(3) Reference Level Operation Speed Control for Sync Separation

VELOCITYSHIFT_H controls the speed for automatically determining the slice level.
If sync skew is caused by sync sag, it can be improved by raising the determination speed using VELOCITYSHIFT_H.

(4) Horizontal Sync Slicer Control

SLICERMODE_H controls composite sync signal separation from the video signals.
The slice level for composite sync signal separation can be set either manually or automatically. When automatic setting is used, the level is automatically set using the sync signal amplitude detection result, which is described later. The sync slicer can be controlled separately for horizontal and vertical sync signals.

(5) Vertical Sync Slicer Control

SLICERMODE_V controls composite sync signal separation from the video signals.
The slice level for composite sync signal separation can be set either manually or automatically. When automatic setting is used, the level is automatically set using the sync signal amplitude detection result, which is described later. The sync slicer can be controlled separately for horizontal and vertical sync signals.

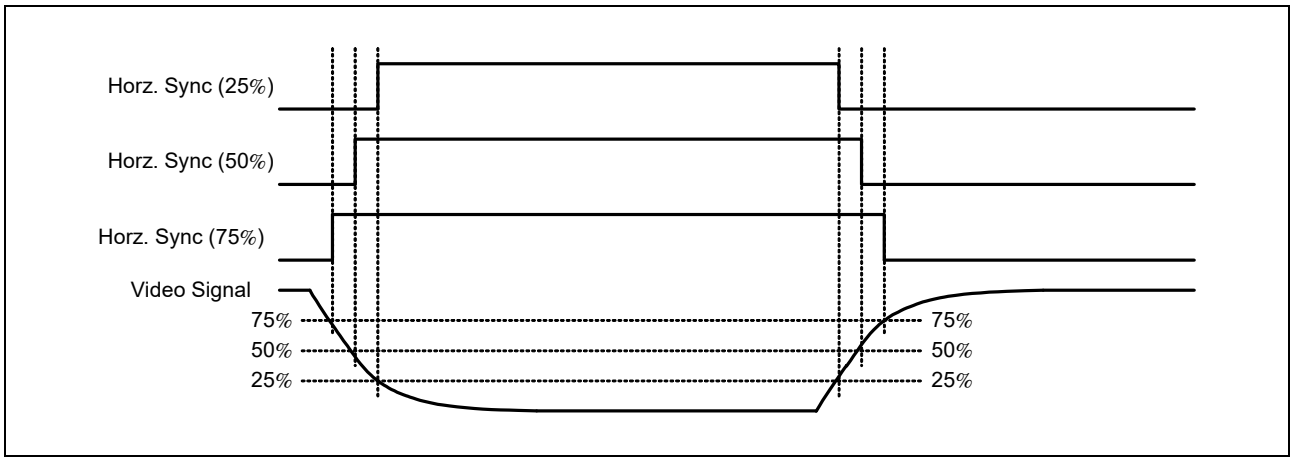

Figure 30.10 Auto Slice Level Setting

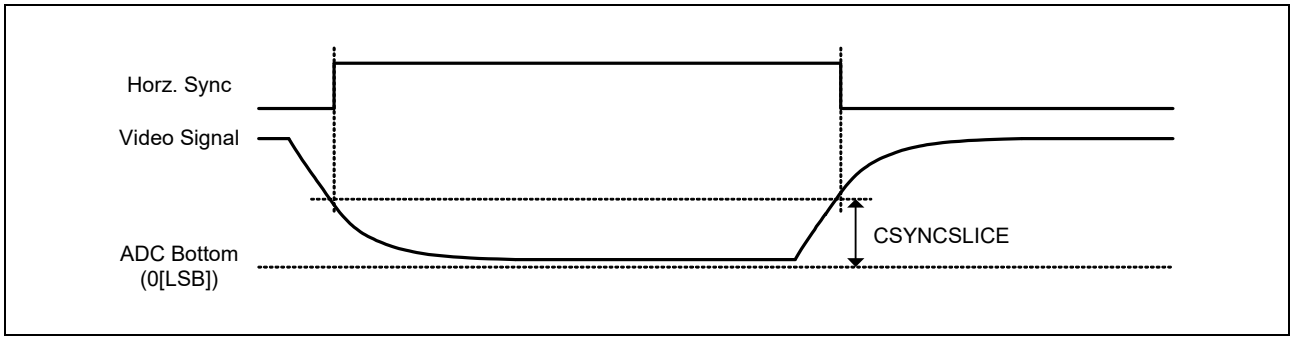

Figure 30.11 Manual Slice Level Setting

30.4.6 Sync Separation Control Register 2 (SYNSCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 6	SYNCMAX DUTY_H[5:0]	001111	R/W	Max Ratio of Horizontal Cycle to Horizontal Sync Signal Pulse Width Valid when auto slice level setting is active (SLICERMODE_H ≠ 0).
5 to 0	SYNCMIN DUTY_H[5:0]	001010	R/W	Min Ratio of Horizontal Cycle to Horizontal Sync Signal Pulse Width Valid when auto slice level setting is active (SLICERMODE_H ≠ 0).

(1) Sync Amplitude Detection Control for Horizontal Sync Separation

SYNCMAXDUTY_H and SYNCMINDUTY_H control the sync signal amplitude detection of composite sync signal included in the video signal.

Table 30.8 Auto Slice Level Register Settings for Composite Sync Separation

	Horizontal Period (µsec)	Horizontal Sync Width (µsec)	Video Active Period (µsec)	Horizontal Blanking Interval (µsec)	SYNCMAXDUTY_H [5:0] Recommended Value	SYNCMINDUTY_H [5:0] Recommended Value
525i/59.94 Hz	63.56	4.70	52.66	10.90	15	10
625i/50 Hz	64.00	4.70	52.00	12.00	15	10

30.4.7 Sync Separation Control Register 3 (SYNSCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SSCLIPSEL[3:0]				CSYNCSLICE_H[9:0]									
Initial value:	0	0	1	1	1	1	0	0	1	0	0	1	0	0	1	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 10	SSCLIPSEL [3:0]	1111	R/W	Clipping Level Clip the video signal supplied to the vertical/horizontal sync separation low-pass filter Bit value = Clipping level (amplitude 50% to no clipping) 0: 512 1: 546 2: 580 3: 614 4: 648 5: 682 6: 716 7: 750 8: 785 9: 819 10: 853 11: 887 12: 921 13: 955 14: 989 15: 1023
9 to 0	CSYNCSLICE_ H[9:0]	0010010010	R/W	Slice Level for Composite Sync Signal Separation (for horizontal sync signal) Valid when manual slice level setting is active (SLICERMODE_H = 0). Setting range: 0 to 1023

(1) Video Signal Clipping Setting for Sync Separation

For input video signals supplied to the sync separator circuit, the level to clip the high tone component of the video signal is specified to reduce amplitude-dependency of the video signal. The video clipping level should be set not to deteriorate (i.e. to enable to detect) the composite sync signal components.

(2) Slice Level Setting for Horizontal Sync Separation

CSYNCSLICE_H sets the slice level for sync separation. This bit is valid only when SLICERMODE_H = 0.

30.4.8 Sync Separation Control Register 4 (SYNSCR4)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SYNCMAXDUTY_V[5:0]						SYNCMINDUTY_V[5:0]

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 6	SYNCMAX DUTY_V[5:0]	001111	R/W	Max Ratio of Horizontal Cycle to Vertical Sync Signal Pulse Width Valid when auto slice level setting is active (SLICERMODE_V ≠ 0).
5 to 0	SYNCMIN DUTY_V[5:0]	001010	R/W	Min Ratio of Horizontal Cycle to Horizontal Sync Signal Pulse Width Valid when auto slice level setting is active (SLICERMODE_V ≠ 0).

(1) Sync Amplitude Detection Control for Vertical Sync Separation

SYNCMAXDUTY_V and SYNCMINDUTY_V control the sync signal amplitude detection of composite sync signal included in the video signal.

Table 30.9 Auto Slice Level Register Settings for Composite Sync Separation

	Horizontal Period (µsec)	Horizontal Sync Width (µsec)	Video Active Period (µsec)	Horizontal Blanking Interval (µsec)	SYNCMINDUTY_V [5:0] Recommended Value	SYNCMAXDUTY_V [5:0] Recommended Value
525i/59.94 Hz	63.56	4.70	52.66	10.90	15	9
625i/50 Hz	64.00	4.70	52.00	12.00	15	9

30.4.9 Sync Separation Control Register 5 (SYNSCR5)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VSYNC DELAY	VSYNCSLICE[4:0]					CSYNCSLICE_V[9:0]									
Initial value:	0	0	1	0	1	1	0	0	1	0	0	1	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	VSYNCDELAY	0	R/W	Delays the separated vertical sync signal for 1/4 horizontal cycle. 0: Disable 1/4fH delay 1: Enable 1/4fH delay Note: • Stability of the field determination result may be improved by changing VSYNCDELAY.
14 to 10	VSYNCSLICE [4:0]	01011	R/W	Threshold for Vertical Sync Separation The greater the value, the wider pulse width is needed.
9 to 0	CSYNCSLICE_ V[9:0]	0010010010	R/W	Slice Level for Composite Sync Signal Separation (for vertical sync signal) Valid when manual slice level setting is active (SLICERMODE_V = 0). Setting range: 0 to 1023

(1) Vertical Sync Separation Control

VSYNCDELAY controls the phases of vertical sync signal and horizontal sync signal. When VSYNCDELAY is 1, the stability of the field determination result may be improved by delaying the vertical sync signal for 1/4 fH.

(2) Vertical Sync Separation Control

VSYNCSLICE controls the threshold for separating vertical sync signal from composite sync signal. The value will be set depending on the serration pulse width of each video signal format. Table 30.10 shows the recommended set values.

Table 30.10 Recommended Threshold and Serration Pulse Width (for reference)

	Serration Pulse Width [µsec]	VSYNCSLICE[4:0]
525i/59.94Hz	27.08	10
625i/50Hz	27.30	10

(3) Slice Level Setting for Vertical Sync Separation

CSYNCSLICE_V sets the slice level for sync separation. This bit is valid only when SLICERMODE_V = 0.

30.4.10 Horizontal AFC Control Register 1 (HAFCCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HAFCGAIN[3:0]				—	HAFCFREERUN	HAFCTYP[9:0]									
Initial value:	0	1	1	0	0	0	1	0	1	0	1	1	0	1	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	HAFCGAIN[3:0]	0110	R/W	Horizontal AFC Loop Gain 0 to 5: A smaller value needs a longer time for synchronization. 6: Standard value 7 to 15: A larger value needs a shorter time for synchronization.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	HAFCFREE RUN	0	R/W	Horizontal AFC Free-Run Oscillation Mode ON/OFF 0: OFF 1: ON
9 to 0	HAFCTYP[9:0]	1010110100	R/W	Horizontal AFC Center Oscillation Frequency Set an offset from 1024th clock pulse in 27-MHz clock cycle units.

(1) Horizontal AFC Loop Gain Control

HAFCGAIN sets the loop gain (response speed) of the horizontal AFC. The larger the value is, the faster the response speed is. However, setting a larger value will result in higher susceptibility to noise.

(2) Horizontal AFC Free-Run Control

HAFCFREERUN controls the horizontal AFC free-run operation. When HAFCFREERUN is 1, the horizontal AFC operates independently of the inputs and performs free-run operation. HAFCFREERUN should usually be set to 0.

(3) Horizontal AFC Lock Range (Horizontal) Control

HAFCMIN, HAFCTYP, and HAFCMAX set the horizontal AFC center oscillation frequency and lock range. The horizontal AFC function is controlled to stabilize the horizontal sync signal when the signals are deteriorated by trick playback of VCR or a weak electric field.

HAFCMIN[9:0]	Min oscillation frequency of horizontal AFC
HAFCTYP[9:0]	Center oscillation frequency of horizontal AFC
HAFCMAX[9:0]	Max oscillation frequency of horizontal AFC

Horizontal AFC lock range can be indicated by the following formula.

HAFCMIN < HAFCTYP < HAFCMAX…(1)

where

HAFCMIN	= HAFCTYP – allowable deviation
HAFCTYP	= N × M – 1024
HAFCMAX	= HAFCTYP + allowable deviation
M:	Number of clock pulses per horizontal cycle (27-MHz sampling)
N:	Double speed setting 2 (double speed): M < 1024 1 (normal speed): M ≥ 1024

The horizontal AFC is locked if the formula indicated by (1) is satisfied.

When the horizontal AFC is locked, FHLOCK in VSYNCSR is set to 1. Otherwise, FHLOCK is 0.

Table 30.11 Horizontal AFC Lock Range Setting

Signal Format	fH Horizontal Cycle	M fH@ 27.0MHz	N-Times Speed Setting	HAFCMAX [9:0]	HAFCTYP [9:0]	HAFCMIN [9:0]	Deviation		Unit
525i	63.56 [µsec]	1716 [clk]	1	771	692	618	79	-74	[clk]
				15.034	15.734	16.434	-0.700	0.700	[kHz]
625i	64.00 [µsec]	1728 [clk]	1	785	704	629	81	-75	[clk]
				14.925	15.625	16.325	-0.700	0.700	[kHz]

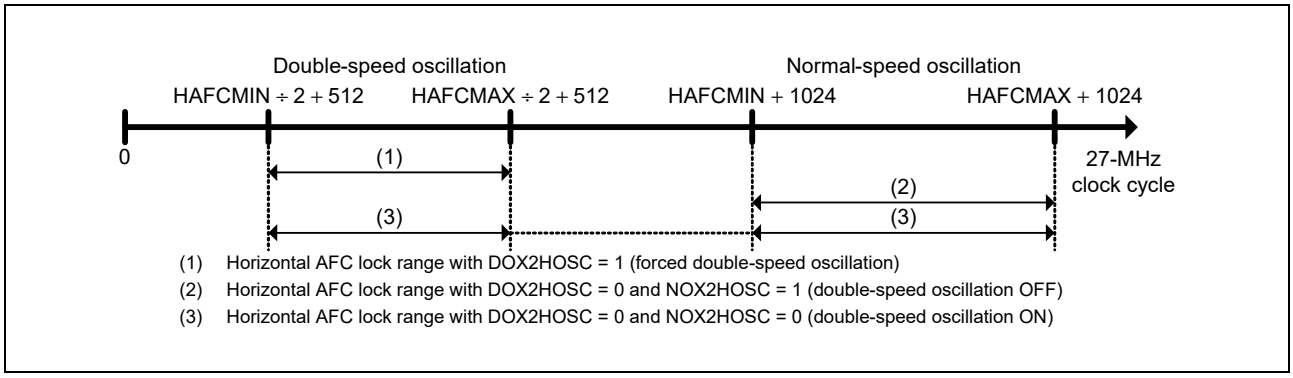

Figure 30.12 Horizontal AFC Lock Range (Horizontal)

30.4.11 Horizontal AFC Control Register 2 (HAFCCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HAFCSTART[3:0]				NOX2H OSC	DOX2H OSC	HAFCMAX[9:0]									
Initial value:	0	0	0	0	0	0	1	0	1	1	1	0	0	1	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	HAFCSTART [3:0]	0000	R/W	Start Line of Horizontal AFC Normal Operation (=VBI process end line) Start the phase comparison at the Nth line after the vertical sync signal.
11	NOX2HOSC	0	R/W	Disable of Horizontal AFC Double Speed Detection 0: Auto control 1: Double speed oscillation disabled
10	DOX2HOSC	0	R/W	Horizontal AFC Forced Double-Speed Oscillation 0: Auto control 1: Forced double-speed oscillation
9 to 0	HAFCMAX[9:0]	1011100110	R/W	Maximum Oscillation Frequency of Horizontal AFC Set an offset from 1024th clock pulse in 27-MHz clock cycle units.

(1) Horizontal AFC Lock Range (Vertical) Control

HAFCSTART and HAFCEND specify the horizontal AFC operation range. The horizontal AFC operation should be normally stopped from several lines before the vertical sync signal to the vertical sync signal to avoid a malfunction occurring in the VCR head switch part.

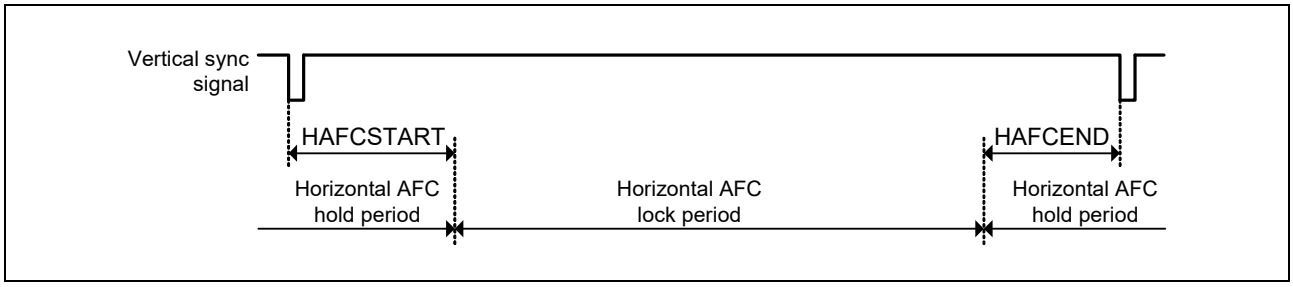

Figure 30.13 Horizontal AFC Lock Range (Vertical)

(2) Horizontal AFC Double-Speed Control

NOX2HOSC and DOX2HOSC control the horizontal AFC double speed detection. In the NTSC, PAL and SECAM formats, DOX2HOSC should always be 0.

30.4.12 Horizontal AFC Control Register 3 (HAFCCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HAFCEND[3:0]				HAFCMODE [1:0]		HAFCMIN[9:0]									
Initial value:	1	0	0	0	1	0	1	0	1	0	0	0	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	HAFCEND[3:0]	1000	R/W	End line of Horizontal AFC Normal Operation (=VBI process start line) Stop the phase comparison at the Nth line before the vertical sync signal.
11, 10	HAFCMODE [1:0]	10	R/W	Horizontal AFC VBI Period Operating Mode [1] Loop gain control for low S/N 0: Loop gain is fixed. 1: Loop gain is automatically controlled. [0] Horizontal AFC control during VBI period 0: Phase comparison is stopped during VBI period. 1: Loop gain is reduced during VBI period.
9 to 0	HAFCMIN[9:0]	1010000010	R/W	Min Oscillation Frequency of Horizontal AFC Set an offset from 1024th clock pulse in 27-MHz clock cycle units.

(1) Horizontal AFC Operation Control during VBI Period

The malfunction caused by noise can be avoided by setting HAFCMODE[1] to 1 to reduce the loop gain for low S/N (VSYNCSR.ISNOISY = 1). The recommended value for HAFCMODE[1] is 1.
HAFCMODE[0] controls the horizontal AFC operation during the VBI period. The recommended value for HAFCMODE[0] is 0.

30.4.13 Vertical Countdown Control Register 1 (VCDWCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VCDFREERUN	NOVCD50	NOVCD60	VCDDEFAULT[1:0]		VCDWINDOW[5:0]						VCDOFFSET[4:0]				
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	1	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	VCDFREERUN	0	R/W	Vertical Countdown Free-Run Oscillation Mode ON/OFF 0: OFF 1: ON
14	NOVCD50	0	R/W	Vertical Countdown 50-Hz Oscillation Mode OFF 0: 50-Hz oscillation ON 1: 50-Hz oscillation OFF
13	NOVCD60	0	R/W	Vertical Countdown 60-Hz (59.94-Hz) Oscillation Mode OFF 0: 60-Hz oscillation ON 1: 60-Hz oscillation OFF
12, 11	VCDDEFAULT [1:0]	00	R/W	Vertical Countdown Center Oscillation Frequency 0: Auto-detection 1: 50.00 Hz 2: 59.94 Hz 3: 60.00 Hz
10 to 5	VCDWINDOW [5:0]	010100	R/W	Vertical Countdown Sync Area Set a value in 0.1-ms units.
4 to 0	VCDOFFSET [4:0]	01010	R/W	Vertical Countdown Minimum Oscillation Frequency Set the shift from the center frequency in 0.1-ms units.

(1) Vertical Countdown Free-Run Operation Control

VCDFREERUN controls the vertical countdown free-run operation. When VCDFREERUN is 1, the vertical countdown free-run operation is performed independently of the inputs. VCDFREERUN should usually be set to 0.

(2) Vertical Countdown 50-Hz Oscillation Control

NOVD50 controls 50-Hz oscillation. When NOVCD50 is 1, the vertical countdown operation is not locked to 50 Hz.

(3) Vertical Countdown 60-Hz Oscillation Control

NOVD60 controls 60-Hz oscillation. When NOVCD60 is 1, the vertical countdown operation is not locked to 60 Hz.

(4) Vertical Countdown Center Oscillation Frequency Control

VCDDEFAULT sets the center frequency for the vertical countdown.

Table 30.12 Vertical Countdown Operating Modes

VCDDEFAULT[1:0]	Operating Mode
0	Auto-detection
1	50.00 Hz
2	59.94 Hz
3	60.00 Hz

(5) Vertical Countdown Lock Range Control

VCDWINDOW and VCDOFFSET control the vertical countdown lock range. Figure 30.14 shows the bit settings and lock ranges.

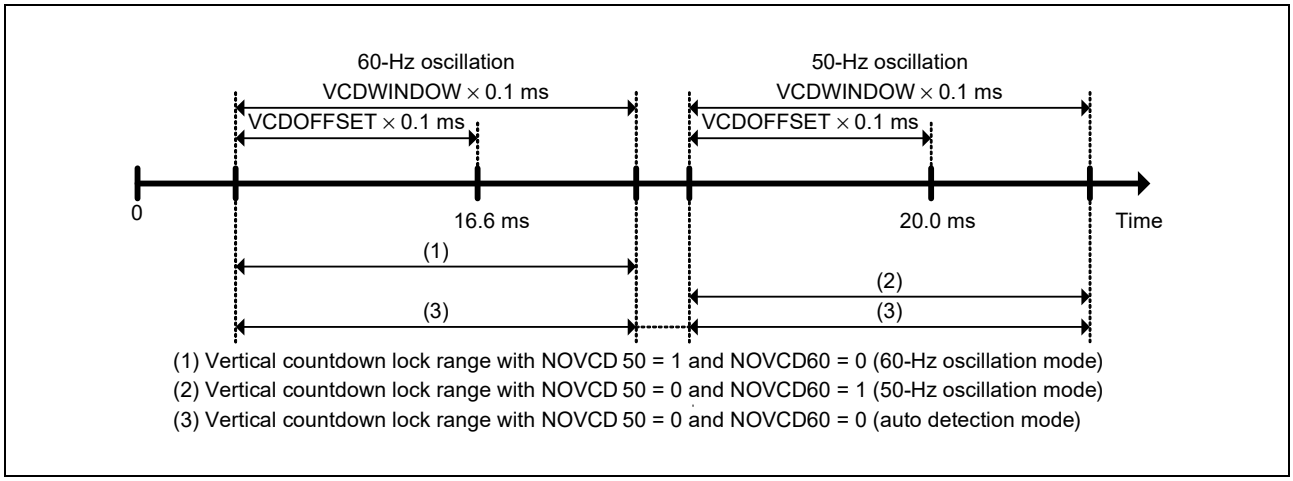

Figure 30.14 Vertical Countdown Lock Ranges

30.4.14 Digital Clamp Control Register 1 (DCPCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCPMODE_Y	—	—	—	DCPCHECK	—	BLANKLEVEL_Y[9:0]									
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	DCPMODE_Y	1	R/W	Clamp Level Setting Mode (Y signal) 0: Manual clamp level setting 1: Auto clamp level setting
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	DCPCHECK	0	R/W	Digital Clamp Pulse Position Check The offset given by BLANKLEVEL is added to the clamp position.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
9 to 0	BLANKLEVEL_Y[9:0]	0000000000	R/W	Clamp Offset Level (Y signal) Set the subtraction value. Set a value in 1-LSB units. 2s complement

(1) Y-Signal Clamp Operation Control

DCPMODE_Y controls the clamp level of Y signal.
When DCPMODE_Y = 0, the value set by BLANKLEVEL_Y is subtracted from the video signal.

Y signal output = Y signal input – BLANKLEVEL_Y

When DCPMODE_Y is 1, the video signal level at the digital clamp pulse position (pedestal level) and BLANKLEVEL_Y are added together and the resulting value is subtracted from the video signal.

Y signal output = Y signal input – (detected value + BLANKLEVEL_Y)

(2) Digital Clamp Pulse Position Check Control

DCPCHECK allows the digital clamp pulse position to be displayed and checked on the screen. The following shows the steps to check the position.

1. Set DCPCHECK (digital clamp pulse position check bit) to 1.
2. Set SRCLEFT (left end of input video signal capturing area bit) and RES_HS[10:0] in SCL0_DS3 of the video display controller 5 scaler to 0.
3. Set clamp offset level of the signal to be monitored to Min value (–512 for BLANKLEVEL_Y, –32 for BLANKLEVEL_CB/CR).
4. Adjust the pulse position and width using DCPPOS_Y (or DCPPOS_C) and DCPWIDTH.

30.4.15 Digital Clamp Control Register 2 (DCPCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCPMODE_C	—	—	—	BLANKLEVEL_CB[5:0]						BLANKLEVEL_CR[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	DCPMODE_C	0	R/W	Clamp Level Setting Mode (Cb/Cr signal) 0: Manual clamp level setting 1: Auto clamp level setting
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 6	BLANKLEVEL_CB[5:0]	000000	R/W	Clamp Offset Level (Cb signal) Set the subtraction value. Set a value in 1-LSB units. 2s complement
5 to 0	BLANKLEVEL_CR[5:0]	000000	R/W	Clamp Offset Level (Cr signal) Set the subtraction value. Set a value in 1-LSB units. 2s complement

(1) Cb/Cr-Signal Clamp Operation Control

DCPMODE_C controls the clamp level of Cb/Cr-signal.
When DCPMODE_C = 0, the value set by BLANKLEVEL_CB/BLANKLEVEL_CR is subtracted from the video signal.

Cb signal output = Cb signal input – BLANKLEVEL_CB
Cr signal output = Cr signal input – BLANKLEVEL_CR

When DCPMODE_C = 1, sum of the video signal level (center level) in the digital clamp pulse position and BLANKLEVEL_CB/CR is subtracted from the video signal.

Cb signal output = Cb signal input – (detected value + BLANKLEVEL_CB)
Cr signal output = Cr signal input – (detected value + BLANKLEVEL_CR)

30.4.16 Digital Clamp Control Register 3 (DCPCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DCPRESPONSE[2:0]			—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	1	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	DCP RESPONSE [2:0]	101	R/W	Digital Clamp Response Speed The larger the value is, the faster the response speed is. However, that will result in higher susceptibility to noise.
11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Digital Clamp Response Speed

DCPRESPONSE sets the digital clamp response speed.
Though the larger value makes the response faster, that will result in higher susceptibility to noise.
DCPRESPONSE is used in common to Y, Cb, and Cr signals.

30.4.17 Digital Clamp Control Register 4 (DCPCR4)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCPSTART[5:0]						—	—	—	—	—	—	—	—	—	—
Initial value:	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	DCPSTART [5:0]	010000	R/W	Digital Clamp Start Line (in 1-line units) Start clamp pulses at the Nth line after the vertical sync signal.
9 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

30.4.18 Digital Clamp Control Register 5 (DCPCR5)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCPEND[5:0]						—	—	—	—	—	—	—	—	—	—
Initial value:	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	DCPEND[5:0]	010000	R/W	Digital Clamp End Line (in 1-line units) Stop clamp pulses at the Nth line before the vertical sync signal.
9 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Digital Clamp Pulse Control (Vertical)

DCPSTART and DCPEND control the digital clamp pulses in the vertical direction. Figure 30.15 shows the bit settings and digital clamp timing.

DCPSTART and DCPEND are used in common to Y, Cb, and Cr signals.

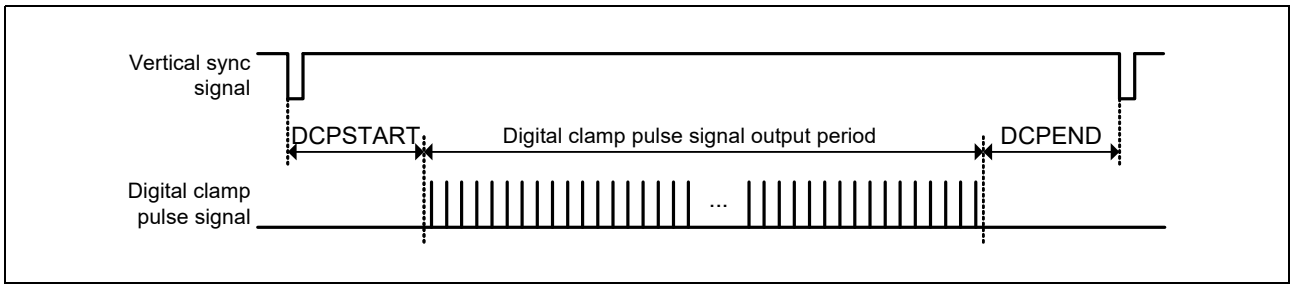

Figure 30.15 Digital Clamp Timing (Vertical)

30.4.19 Digital Clamp Control Register 6 (DCPCR6)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DCPWIDTH[6:0]							—	—	—	—	—	—	—	—

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	DCPPOS_C [7:0]	00011011	R/W	Digital Clamp Pulse Horizontal Start Position (Cb/Cr signal) Setting range: 0 to 255 Set a value in 27-MHz clock cycle units.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Digital Clamp Pulse Control (Horizontal)

DCPWIDTH, DCPPOS_Y, and DCPPOS_C control the digital clamp pulses in the horizontal direction. Figure 30.16 shows the bit settings and digital clamp timing.

DCPPOS_Y is used for Y signal and DCPPOS_C is for Cb/Cr signal. DCPWIDTH is used in common to Y, Cb, and Cr signals.

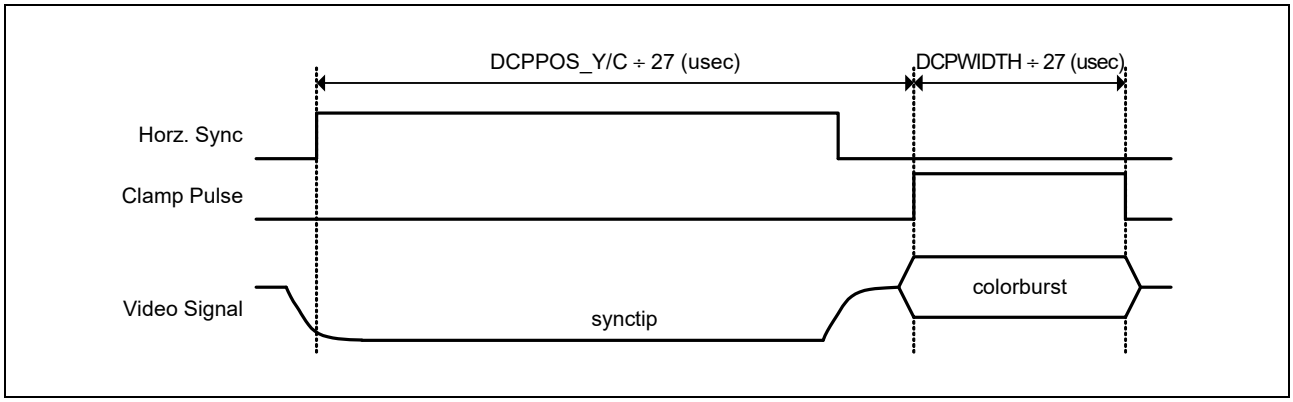

Figure 30.16 Digital Clamp Timing (Horizontal)

30.4.22 Noise Detection Control Register (NSDCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ACFINPUT[1:0]		—	—	—	ACFLAGTIME[4:0]					—	—	ACFFILTER[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	ACFINPUT[1:0]	00	R/W	Video Signal for Autocorrelation Function 0: Y signal 1: Cb signal 2, 3: Cr signal
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 4	ACFLAGTIME [4:0]	00000	R/W	Delay Time for Autocorrelation Function Calculation 0 to 31 clock pulses @ 27-MHz clock The NSDSR.AFCSTRENGTH value almost corresponds to noise power when the delay time is set to 0.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ACFFILTER [1:0]	00	R/W	Smoothing Parameter of Autocorrelation Function Data The smaller the ACFFILTER value is, the longer the time period is taken. The time period varies from 1 field to several seconds.

(1) Input for Noise Detection

ACFINPUT controls inputs for noise detection.

Table 30.13 Input Selection for Noise Detection

ACFINPUT	Input Signal
0	Y signal
1	Cb signal
2, 3	Cr signal

(2) Autocorrelation Function Control for Noise Detection

ACFLAGTIME controls autocorrelation function for noise detection.
The NSDSR.AFCSTRENGTH value almost corresponds to noise power when the delay time is set to 0.

(3) Smoothing Filter Control for Noise Detection

ACFFILTER controls smoothing function for noise detection inputs.
The smaller the ACFFILTER value is, the larger the field integration is (the longer time period is taken for noise detection).

30.4.23 Burst Lock/Chroma Decoding Control Register (BTLCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCKRANGE [1:0]		LOOPGAIN[1:0]		LOCKLIMIT[1:0]		BCOFREERUN	—	DEFAULTSYS [1:0]		NONTSC358	NONTSC443	NOPALM	NOPALN	NOPAL443	NOSECAM
Initial value:	0	1	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	LOCKRANGE [1:0]	01	R/W	Burst Lock PLL Lock Range 0: ±400 Hz 1: ±800 Hz 2: ±1200 Hz 3: ±1600 Hz
13, 12	LOOPGAIN [1:0]	01	R/W	Burst Lock PLL Loop Gain The larger value makes the response faster, but the noise is more easily picked up.
11, 10	LOCKLIMIT [1:0]	10	R/W	Level for Burst Lock PLL to Re-Search Free-Run Frequency The larger value more easily unlocks the PLL to start re-search.
9	BCOFREERUN	0	R/W	Burst Lock PLL Free-Run Oscillation Mode ON/OFF 0: OFF 1: ON
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7, 6	DEFAULTSYS[1:0]	00	R/W	Default Color System 0: NTSC 1: PAL 2: SECAM 3: Not specified
5	NONTSC358	0	R/W	NTSC-M Detection Control 0:NTSC-M detection ON 1:NTSC-M detection OFF
4	NONTSC443	0	R/W	NTSC-4.43 Detection Control 0:NTSC-4.43 detection ON 1:NTSC-4.43 detection OFF
3	NOPALM	0	R/W	PAL-M Detection Control 0:PAL-M detection ON 1:PAL-M detection OFF
2	NOPALN	0	R/W	PAL-N Detection Control 0:PAL-N detection ON 1:PAL-N detection OFF
1	NOPAL443	0	R/W	PAL-B, G, H, I, D Detection Control 0: PAL-B, G, H, I, D detection ON 1: PAL-B, G, H, I, D detection OFF
0	NOSECAM	00	R/W	SECAM Detection Control 0: SECAM detection ON 1: SECAM detection OFF

(1) Lock Range of Burst Lock PLL

LOCKRANGE controls the lock range of the burst lock PLL.

Table 30.14 Lock Range of Burst Lock PLL

LOCKRANGE	Lock Range of Burst Lock PLL
0	0: ±400 Hz
1	1: ±800 Hz
2	2: ±1200 Hz
3	3: ±1600 Hz

(2) Burst Lock PLL Loop Gain Control

LOOPGAIN controls the loop gain of the burst lock PLL.
The larger value makes the response faster, but the noise is more easily picked up.

(3) Burst Lock PLL Lock Limit Control

LOCKLIMIT controls the lock limit of the burst lock PLL.
The larger the LOCKLIMIT value is, the more easily the PLL free-run frequency is unlocked to start re-search.

(4) Burst Lock PLL Free-Run Operation Control

BCOFREERUN controls the free-run operation of burst lock PLL.
When BCOFREERUN is 1, the burst lock PLL performs free-run operation independently of the inputs. BCOFREERUN should usually be set to 0.

(5) Default Color System during Chroma Decoding

DEFAULTSYS sets the default color system when automatic judgement of the color system for use in chroma decoding is not possible.

Table 30.15 Default Color System

DEFAULTSYS	Default Color System
0	NTSC
1	PAL
2	SECAM
3	Not specified

(6) Color System Detection Control

NONTSC358, NONTSC443, NOPALM, NOPALN, NOPAL443, and NOSECAM control the color system detection. Color system detection can be fully automatic, manual, or semi-automatic (detecting the specified color system only). If the detection result does not apply to any color system type, a color system selected by DEFAULTSYS is used for the operation.

Color system detection can be controlled (ON or OFF) individually for each type. By enabling one particular color system to be detected, the color system can be fixed. Table 30.16 shows the color system detection control methods.

Table 30.16 Color System Detection Control

	NOSECAM	NOPAL443	NOPALN	NOPALM	NONTSC443	NONTSC358
Auto	0	0	0	0	0	0
NTSC-3.58(M)	1	1	1	1	1	0
NTSC-4.43	1	1	1	1	0	1
PAL-M	1	1	1	0	1	1
PAL-N	1	1	0	1	1	1
PAL-4.43	1	0	1	1	1	1
SECAM	0	1	1	1	1	1

In auto mode, the color system detection result is stored into the register. Table 30.17 and Table 30.18 show color system detection and detection result setting.

Table 30.17 Color System Detection Result (1)

COLORSYS[1:0]	FSCMODE	FVMODE	Detection Result
0: NTSC	0: 3.58 MHz	Don't care	NTSC-M
0: NTSC	1: 4.43 MHz	Don't care	NTSC-4.43
1: PAL	0: 3.58 MHz	0: 50 Hz	PAL-N
1: PAL	0: 3.58 MHz	1: 60 Hz	PAL-M
1: PAL	1: 4.43 MHz	0: 50 Hz	PAL-B, H, I, G, D
1: PAL	1: 4.43 MHz	1: 60 Hz	PAL-60
2: SECAM	—	—	SECAM
3: Unknown	—	—	Undetectable

Table 30.18 Color System Detection Result (2)

	ISNTSC	ISPAL	ISSECAM
Undetectable	0	0	0
NTSC	1	0	0
PAL	0	1	0
SECAM	0	0	1

30.4.24 Burst Gate Pulse Control Register (BTGPCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BGPCHECK	BGPWIDTH[6:0]							BGPSTART[7:0]							
Initial value:	0	0	1	0	0	1	0	0	1	0	0	0	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BGPCHECK	0	R/W	Burst Gate Pulse Position Check Displays the front and end edges of burst gate pulses by white lines.
14 to 8	BGPWIDTH [6:0]	0100100	R/W	Burst Gate Pulse Width Specify the offset from the 64th clock pulse width in 27-MHz clock cycle units.
7 to 0	BGPSTART [7:0]	10000010	R/W	Burst Gate Pulse Start Position Specify the position from the horizontal sync signal reference in 27-MHz clock cycle units.

(1) Burst Gate Pulse Control

BGPWIDTH and BGPSTART control the burst gate pulse timing.
The burst gate pulse position is specified to extract color burst from the video signal which is considered as a reference signal for the burst lock PLL. Usually, the burst gate pulse should be set so that it should start at the latter part of the horizontal sync signal and include the reference position in order to respond to an insert position shift of color burst caused by VCR.

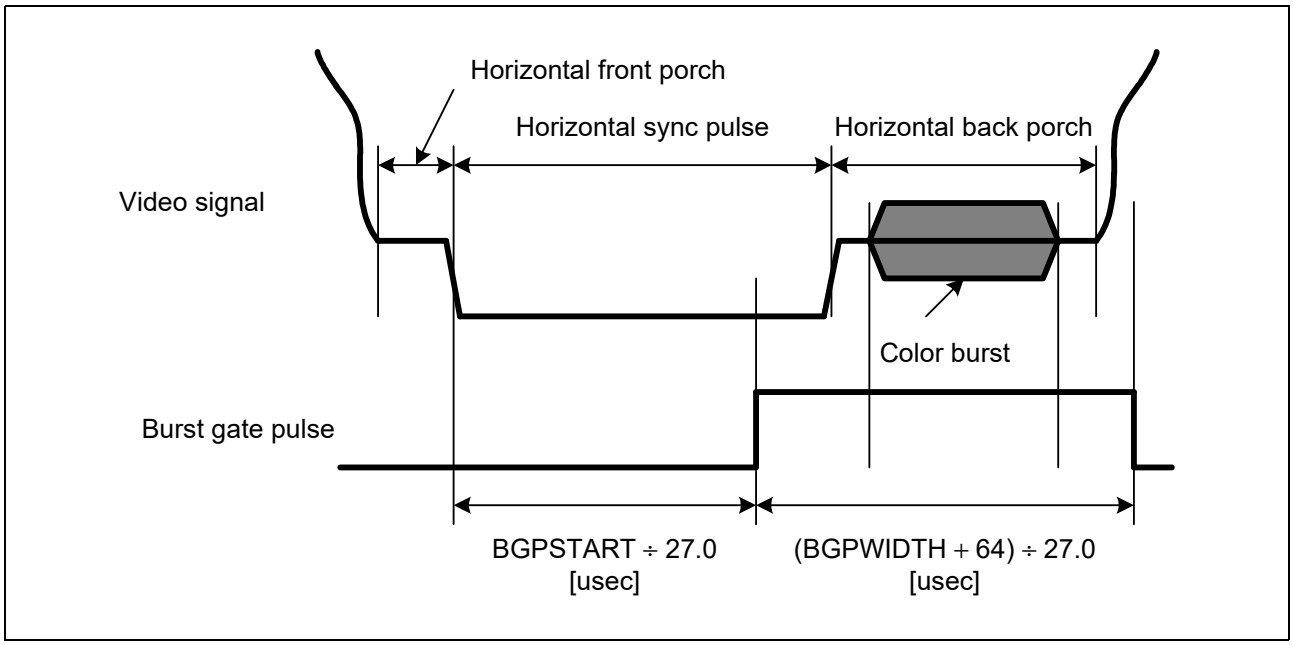

Figure 30.17 Burst Gate Pulse Generation Timing

(2) Burst Gate Pulse Position Check

BGPCHECK controls the burst gate pulse position check on screen. The following shows the steps to check the position:

- Burst gate position check: Set BGPCHECK to 1.
- Input video signal capturing left end setting: Set SRCLEFT to 0 and RES_HS[10:0] in SCL0_DS3 of the video display controller 5 scaler to 0.
- Adjust the pulse position and width with BGPSTART and BGPWIDTH.

30.4.25 ACC Control Register 1 (ACCCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KILLEROFFSET[3:0]				ACC MODE	ACCMAXGAIN [1:0]		ACCLEVEL[8:0]								
Initial value:	1	0	0	0	0	0	0	1	0	0	1	0	0	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	KILLER OFFSET[3:0]	1000	R/W	The levels of these bits and KILLERLEVEL are added together to be the level to turn off the color killer. This level corresponds to the Peak-to-Peak amplitude of the color burst signal.
11	ACCMODE	0	R/W	ACC Operating Mode 0: Auto gain 1: Manual gain
10, 9	ACCMAXGAIN [1:0]	00	R/W	Maximum ACC Gain Valid when ACCMODE = 0 (auto gain setting). 0: 6 times 1: 8 times 2: 12 times 3: 16 times
8 to 0	ACCLEVEL [8:0]	100100100	R/W	ACC Reference Color Burst Amplitude Valid when ACCMODE = 0 (auto gain setting). Set Peak-to-Peak amplitude in 1-LSB units.

(1) Color Killer Offset Control

KILLEROFFSET sets the hysteresis to make the color killer OFF.
If the KILLEROFFSET value is too large, the color killer cannot be turned off as long as the burst amplitude is not large enough. If the KILLEROFFSET value is too small, the color killer is turned on and off repeatedly due to noise.
The standard value is between 4 and 10.

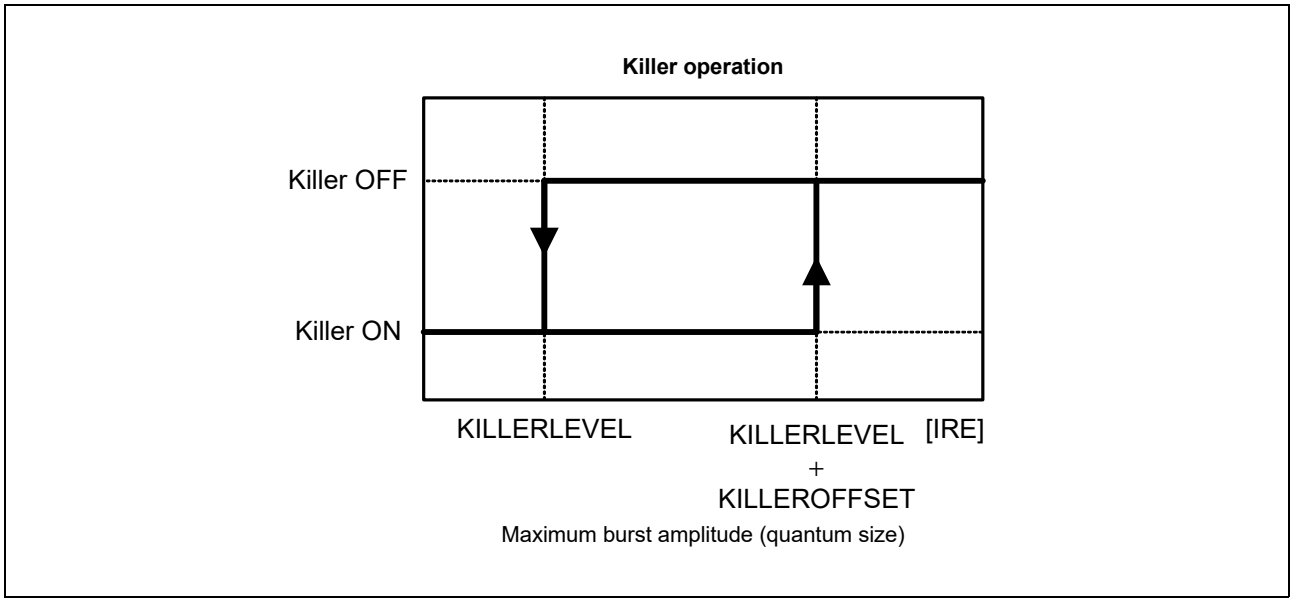

Figure 30.18 Color Killer Operation

(2) ACC Operation Control

ACCMODE controls the ACC operation.

Table 30.19 ACC Operating Modes

ACCMODE	Color Gain Adjustment
0	Auto gain
1	Manual gain

(3) Maximum ACC Gain Control

ACCMAXGAIN controls the maximum ACC gain. ACCMAXGAIN is valid only when ACCMODE = 0.

Table 30.20 Maximum ACC Gain

ACCMAXGAIN	Maximum Color Gain
0	6 times
1	8 times
2	12 times
3	16 times

(4) ACC Level Control

ACCLEVEL sets the burst amplitude of the chroma signal after gain correction. ACCLEVEL is valid only when ACCMODE = 0.

The ACC adjusts the gain so that the input chroma signal burst amplitude should be the same level as the ACCLEVEL value.

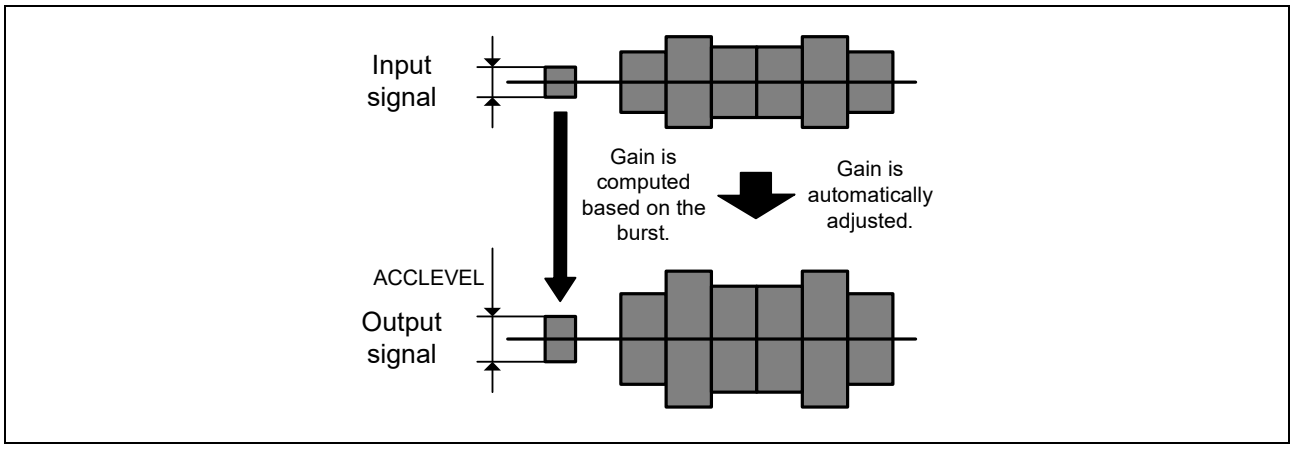

Figure 30.19 ACC Level Setting

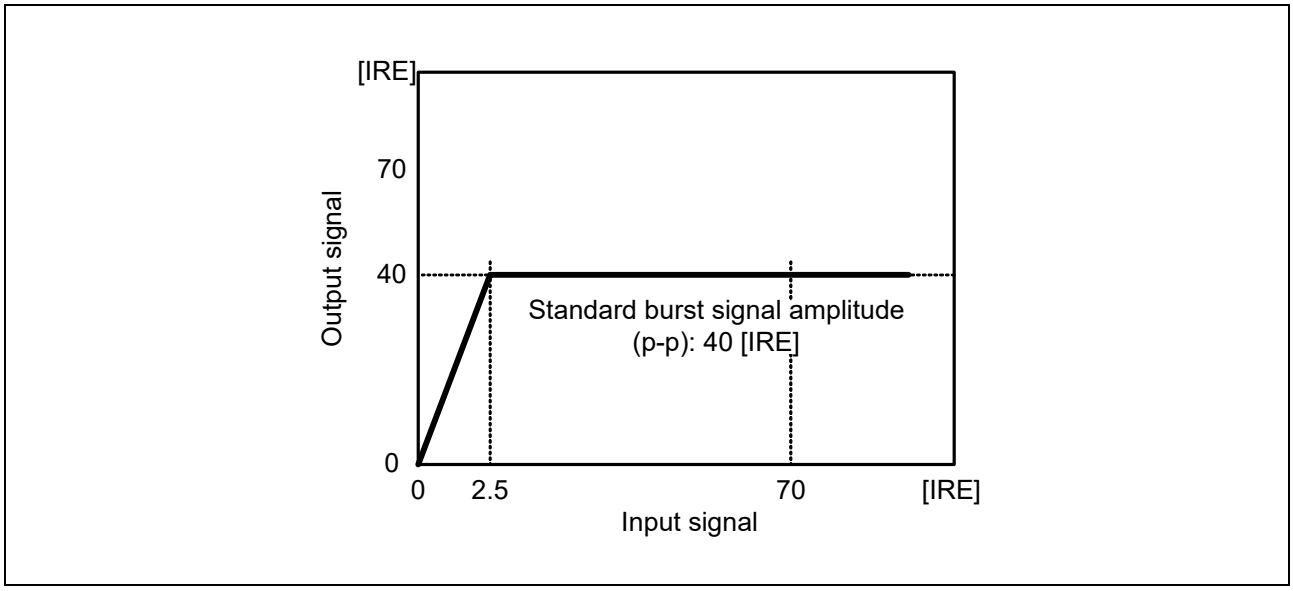

Figure 30.20 ACC Input/Output Characteristics

Table 30.21 ACC Characteristics

Input Burst Signal Level	Output Burst Signal Level
More than 24.1 [dB]	Reference amplitude (variable) ± acceptable error (variable)
24.1[dB] or less	Decreased in proportion to input level

30.4.26 ACC Control Register 2 (ACCCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	CHROMASUB GAIN[1:0]		CHROMAMAINGAIN[8:0]								
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10, 9	CHROMA SUBGAIN[1:0]	00	R/W	Chroma Manual Gain (sub) Valid when ACCMODE = 1 (manual gain setting) 0: 1 time 1: 2 times 2: 4 times 3: 8 times
8 to 0	CHROMA MAINGAIN[8:0]	100000000	R/W	Chroma Manual Gain (main) Valid when ACCMODE = 1 (manual gain setting) The value 256 corresponds to 1 time.

(1) Chroma Gain Adjustment (Manual) Control

CHROMASUBGAIN and CHROMAMAINGAIN control the chroma gain. CHROMASUBGAIN and CHROMAMAINGAIN are valid only when ACCMODE is 1.

C signal output = C signal input × (CHROMASUBGAIN + CHROMAMAINGAIN/256)

30.4.27 ACC Control Register 3 (ACCCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ACCRESPONSE [1:0]		ACCPRECIS[5:0]						KILLER MODE	KILLERLEVEL[5:0]						—
Initial value:	0	1	0	1	0	1	0	0	0	0	0	1	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	ACC RESPONSE [1:0]	01	R/W	ACC Response Speed The larger value makes the response faster, but the noise is more easily picked up. stment by 1 LSB of 10-bit accuracy.
13 to 8	ACCPRECIS [5:0]	010100	R/W	ACC Gain Adjustment Accuracy Set the acceptable error level of color burst signal amplitude after ACC adju
7	KILLERMODE	0	R/W	Forced Color Killer Mode ON/OFF 0: Auto-detection 1: Killer mode is forcedly ON.
6 to 1	KILLERLEVEL [5:0]	001001	R/W	Color Killer Operation Start Point Set the half value of Peak-to-Peak amplitude by 1 LSB of 10-bit accuracy.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

(1) ACC Response Speed Control

ACCRESPONSE controls the ACC response speed.
The larger value makes the response faster, and the smaller value makes it slower. However, the large value causes the noise to be more easily picked up.

(2) ACC Acceptable Error Range Control

ACCPRECIS controls the acceptable error range of the output burst signal amplitude based on ACCLEVEL (target value).
If ACCLEVEL = 236 and ACCPRECIS = 20, the ACC gain is fixed within the following range:

(236 – 20) < Output signal burst signal amplitude < (236 + 20)

(3) Killer Operating Mode Control

KILLERMODE controls the killer operating mode.
When KILLERMODE = 1, the killer is forcedly turned ON.

(4) Killer Level Control

KILLERLEVEL controls the level to make the killer ON.
For details, see section 30.4.25 (1), Color Killer Offset Control.

30.4.28 TINT Control Register (TINTCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TINTSUB[5:0]						TINTMAIN[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	TINTSUB[5:0]	000000	R/W	Fine Adjustment of R-Y Demodulation Axis (only valid for NTSC/PAL) Set a value by 360/1024 degrees. 2s complement
9 to 0	TINTMAIN[9:0]	0000000000	R/W	Hue Adjustment Level (only valid for NTSC/PAL) Set a value by 360/1024 degrees. 2s complement

(1) R-Y Axis Correction Control

TINTSUB controls the phase of R-Y axis by ±11.25 degrees.

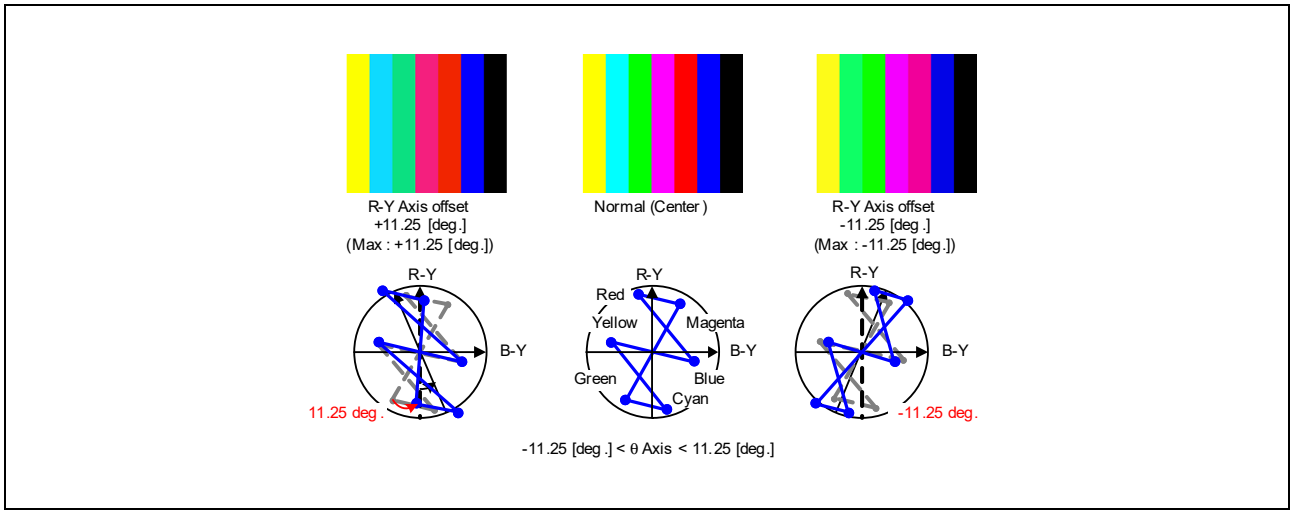

Figure 30.21 Example of R-Y Axis Correction

(2) Hue Adjustment (TINT) Correction Control

TINTMAIN controls the phase of demodulation axis by 0 to 360 degrees.

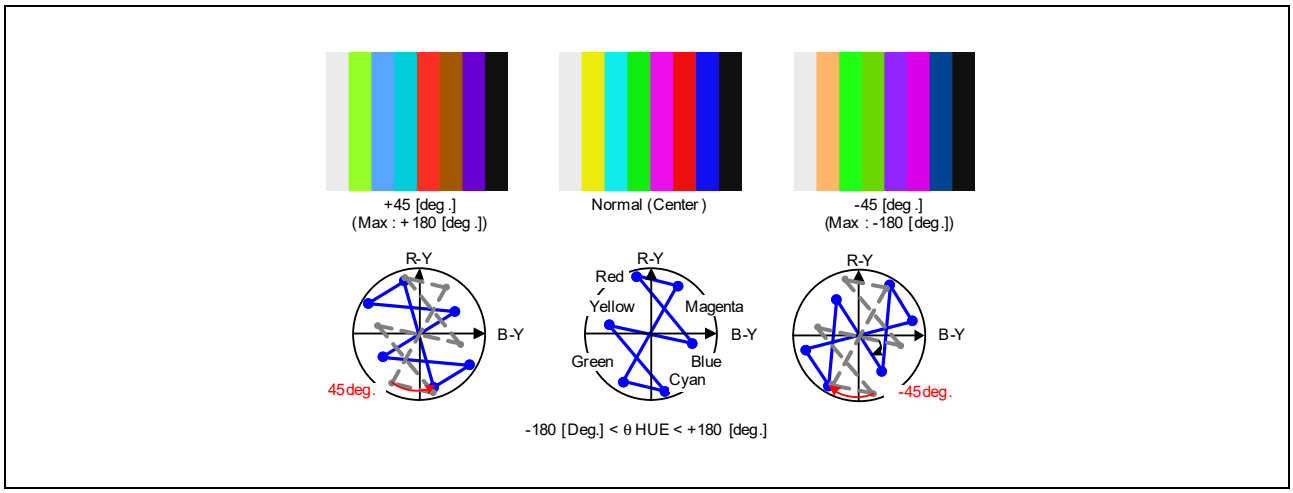

Figure 30.22 Example of Hue Adjustment (TINT) Correction

30.4.29 Y/C Delay/Chroma Decoding Control Register (YCDCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LUMADELAY[4:0]					—	CHROMALPF	DEMODMODE[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 4	LUMADELAY [4:0]	00000	R/W	Luminance Signal Delay Adjustment –16 to +15 clock pulses Set a value by the 2s complement.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	CHROMALPF	0	R/W	LPF for Demodulated Chroma 0: Not used 1: Used
1, 0	DEMODMODE [1:0]	10	R/W	Averaging Processing for Pre-Demodulated Line 0: No processing 1: Setting prohibited 2: For PAL 3: Setting prohibited

(1) Y/C Delay Adjustment Control

LUMADELAY controls the Y/C delay.

Table 30.22 Y/C Delay Adjustment

LUMADELAY	Operation
31	Advances Y signal by 1 [clk]
:	:
16	Advances Y signal by 16 [clk]
0	No delay
1	Delays Y signal by 1 [clk]
:	:
15	Delays Y signal by 15 [clk]

(2) Frequency Band Limiting after Demodulation

CHROMALPF turns on or off the frequency band limiting filter after demodulation.

Table 30.23 Frequency Band Limiting after Demodulation

CHROMALPF	Operation
0	Frequency band-limiting filter OFF
1	Frequency band-limiting filter ON

(3) Chroma Decoding Operation Control

DEMODMODE controls operating modes of chroma demodulation.

Table 30.24 Chroma Decoding Operation Modes

DEMODMODE	Operation
0	One-line demodulation
2	Two-line demodulation for PAL only
1 and 3	Setting prohibited

30.4.30 AGC Control Register 1 (AGCCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	DOREDUCE	NOREDUCE	AGCRESPONSE[2:0]			AGCLEVEL[8:0]								
Initial value:	0	0	0	0	1	0	1	0	1	1	1	0	1	1	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	DUREDUCE	0	R/W	Manual Control of Sync Signal Amplitude Detection during VBI Period 0: Sets sync amplitude to AGC standard value. 1: Sets AGC gain to 3/4 times the normal gain value.
12	NOREDUCE	0	R/W	Control of Sync Signal Amplitude Detection during VBI Period 0: Detects sync amplitude. 1: Does not detect sync amplitude.
11 to 9	AGC RESPONSE [2:0]	101	R/W	AGC Response Speed The larger register value makes the response faster However, the larger value causes the noise to be more easily picked up.
8 to 0	AGCLEVEL [8:0]	011101100	R/W	Sync Signal Reference Amplitude Setting range: 0 to 511 10-bit unsigned value

(1) Sync Signal Amplitude Detection during VBI Period

DOREDUCE and NOREDUCE control detection of the AGC sync signal amplitude fluctuation during VBI period.

Table 30.25 Sync Signal Amplitude Detection Operation during VBI Period

DOREDUCE	Sync Signal Amplitude Detection Operation during VBI Period
0	Sets sync amplitude to AGC standard
1	Sets AGC gain to 3/4 times the normal gain value

Table 30.26 Sync Signal Amplitude Detection during VBI Period

NOREDUCE	Sync Signal Amplitude Detection during VBI Period
0	Detects sync amplitude.
1	Does not detect sync amplitude.

(2) AGC Response Speed Control

AGCRESPONSE controls the AGC response speed.
The larger register value makes the response faster, and smaller value makes it slower. (The large value causes the noise to be more easily picked up.)
The recommended value is 4 to avoid a malfunction caused by trick playback of VCR (fast-forward play/rewind play) or a weak electric field.

(3) AGC Level Control

AGCLEVEL controls the AGC target level.
When NTSC signals are quantized by a 10-bit A/D converter, sync signal amplitude for full range of the A/D converter can be provided by:

1023[LSB] × (40[IRE] ÷ 173[IRE]) = 236.53179[LSB]

Table 30.27 shows the ideal AGC level for each input signal format.

Table 30.27 AGC Level Setting Values (Ideal Values)

Input Signal Format	AGCLEVEL[8:0]
NTSC	236
PAL/SECAM	248

Table 30.28 AGC Characteristics

Input Sync Signal Level	Output Sync Signal Level
0 or more [dB]	Increased in proportion to input level
–8.52 to 0 [dB]	Reference amplitude (variable) ± acceptable error (variable)
–8.52 or less [dB]	Decreased in proportion to input level

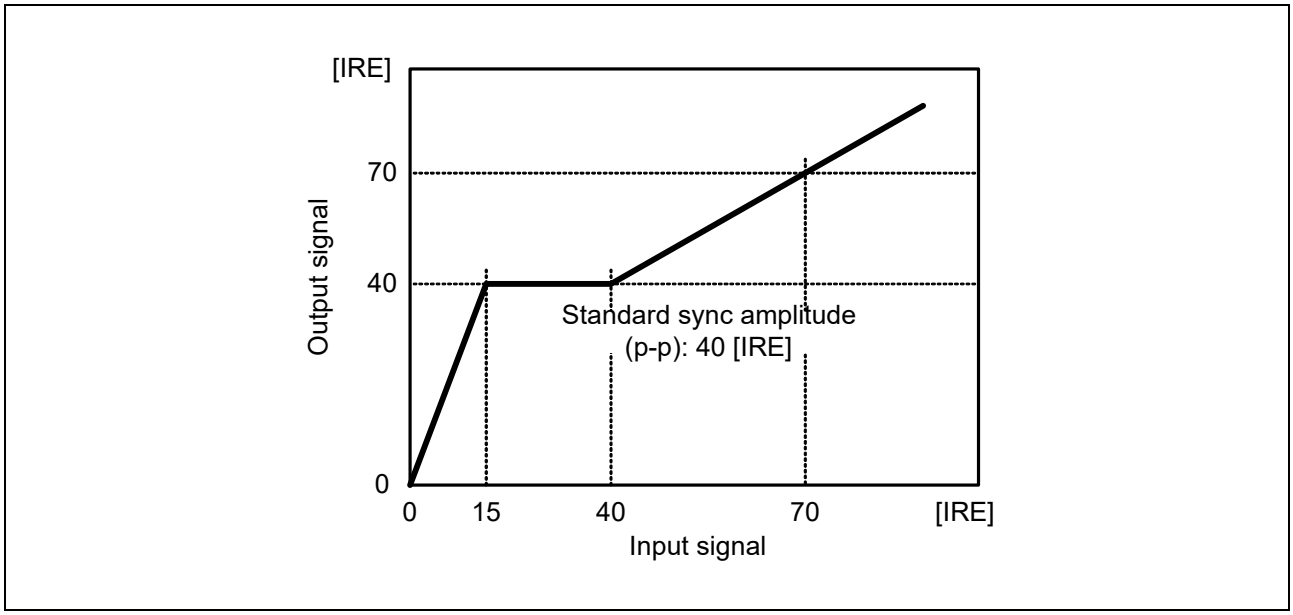

Figure 30.23 AGC Characteristics (Sync Signal Amplitude Reference)

30.4.31 AGC Control Register 2 (AGCCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15, 14	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
13 to 8	AGCPRECIS [5:0]	001010	R/W	AGC Gain Adjustment Accuracy Set acceptable error level for sync pulse amplitude after AGC adjustment by 1 LSB of 10-bit accuracy.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) AGC Acceptable Error Range Control

AGCPRECIS controls the acceptable error range of the output sync signal amplitude based on AGCLEVEL (target value).
If AGCLEVEL = 236 and AGCPRECIS = 10, AGC gain is fixed within the following range:

(236 – 10) < Output sync signal amplitude < (236 + 10)

In this case, the PGA gain can fall within a 2-step range. For video image with stabilized sync signal amplitude, AGCPRECIS = 4 is recommended, which enables the PGA gain to fall within a 1-step range, when the electric field is strong. For the above setting, the recommended value is 10 to avoid hunting in a weak electric field.

30.4.32 Peak Limiter Control Register (PKLIMITCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEAKLEVEL[1:0]		PEAKATTACK [1:0]		PEAKRELEASE [1:0]		PEAKRATIO [1:0]		MAXPEAKSAMPLES[7:0]							
Initial value:	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	PEAKLEVEL [1:0]	00	R/W	Peak Luminance Value Limited by Peak Limiter (video signal level) 0: Limiter OFF 1: 1008 LSB 2: 992 LSB 3: 960 LSB Peak limiter is not operated if AGC is OFF irrespective of PEAKLEVEL value.
13, 12	PEAKATTACK [1:0]	10	R/W	Response Speed with Peak Limiter Gain Decreased The larger value makes the response faster.
11, 10	PEAKRELEAS E[1:0]	00	R/W	Response Speed with Peak Limiter Gain Increased The larger value makes the response faster.
9, 8	PEAKRATIO [1:0]	00	R/W	Maximum Compression Rate of Peak Limiter 0: Compressed up to 50% 1: Compressed up to 25% 2: Compressed up to 12.5% 3: Compressed up to 0%
7 to 0	MAXPEAK SAMPLES[7:0]	00000000	R/W	Allowable Number of Overflowing Pixels Set a value by 1024 pixels. Exceeding this value will start peak limiter operation.

(1) Peak Limiter Level Control

PEAKLEVEL controls the peak luminance limited by the peak limiter.
If the number of pixels counted exceeds the value set in PEAKLEVEL and there exist pixels more than the value set in MAXPEAKSAMPLES, the peak limiter function is activated to reduce the gain.

Table 30.29 Peak Limiter Level Control

PEAKLEVEL	Output Sync Signal Level
0	Peak limiter OFF
1	Peak limiter is activated at 1008 LSB
2	Peak limiter is activated at 992 LSB
3	Peak limiter is activated at 960 LSB

(2) Peak Limiter Response Speed Control

PEAKATTACK controls the response speed when the peak limiter gain is reduced.
The larger value makes the response faster.

(3) Peak Limiter Response Speed Control

PEAKRELEASE controls the response speed when the peak limiter gain is increased.
The larger value makes the response faster.

(4) Peak Limiter Gain Down Control

PEAKRATIO sets the maximum compression rate of the peak limiter.
Specifically, PEAKRATIO controls the amount of gain reduction (compression ratio) using the peak limiter function.

Table 30.30 Peak Limiter Gain Down Control

PEAKRATIO	Output Sync Signal Level
0	Compressed up to 50%
1	Compressed up to 25%
2	Compressed up to 12.5%
3	Compressed up to 0%

(5) Peak Limiter Determination Control

MAXPEAKSAMPLES controls the number of overflowing pixels allowed.
If the number of pixels counted during the vertical active period exceeds the value set in PEAKLEVEL and there exist pixels more than the value set in MAXPEAKSAMPLES, the peak limiter function is activated to reduce the gain.
The maximum allowable value is obtained by MAXPEAKSAMPLES × 1024.

30.4.33 Over-Range Control Register 1 (RGORCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RADJ_O_LEVEL0[9:0]									
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	RADJ_O_ LEVEL0[9:0]	1111111111	R/W	A/D Over-Threshold Level (Between levels 0 and 1) Level 0 (normal) to level 3 (completely over the range) are available.

(1) A/D Over-Threshold Level (Between Levels 0 and 1) Control

RADJ_O_LEVEL0 controls the A/D over-threshold level (between levels 0 and 1).
Figure 30.24 shows the register values and threshold levels.

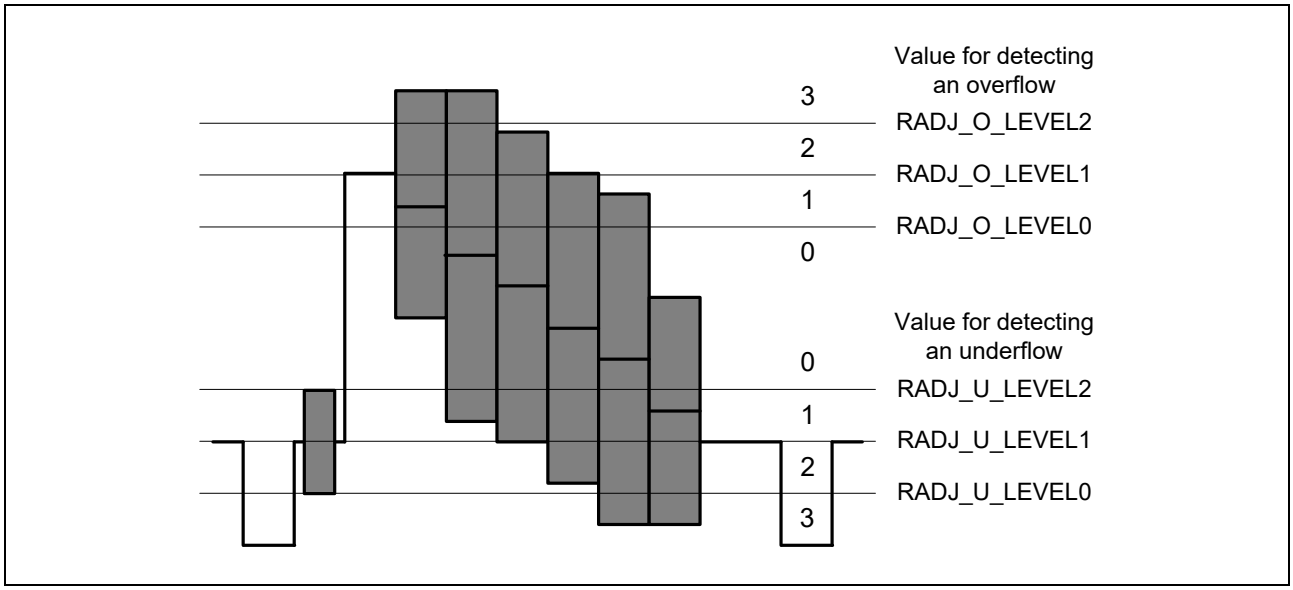

Figure 30.24 Over-Range Determination Areas

30.4.34 Over-Range Control Register 2 (RGORCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RADJ_U_LEVEL0[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	RADJ_U_ LEVEL0[9:0]	0000000000	R/W	A/D Under-Threshold Level (Between levels 2 and 3) Level 0 (normal) to level 3 (completely under the range) are available.

(1) A/D Under-Threshold Level (Between Levels 2 and 3) Control

RADJ_U_LEVEL0 controls the A/D under-threshold level (between levels 2 and 3).
For the register values and threshold levels, see section 30.4.33, Over-Range Control Register 1 (RGORCR1).

30.4.35 Over-Range Control Register 3 (RGORCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RADJ_O_LEVEL1[9:0]									
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	RADJ_O_ LEVEL1[9:0]	1111111111	R/W	A/D Over-Threshold Level (Between levels 1 and 2) Level 0 (normal) to level 3 (completely over the range) are available.

(1) A/D Over-Threshold Level (Between Levels 1 and 2) Control

RADJ_O_LEVEL1 controls the A/D over-threshold level (between levels 1 and 2).
For the register values and threshold levels, see section 30.4.33, Over-Range Control Register 1 (RGORCR1).

30.4.36 Over-Range Control Register 4 (RGORCR4)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RADJ_U_LEVEL1[9:0]

R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	RADJ_U_LEVEL1[9:0]	0000000000	R/W	A/D Under-Threshold Level (Between levels 1 and 2) Level 0 (normal) to level 3 (completely under the range) are available.

(1) A/D Under-Threshold Level (Between Levels 1 and 2) Control

RADJ_U_LEVEL1 controls the A/D under-threshold level (between levels 1 and 2).
For the register values and threshold levels, see section 30.4.33, Over-Range Control Register 1 (RGORCR1).

30.4.37 Over-Range Control Register 5 (RGORCR5)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RADJ_O_LEVEL2[9:0]									
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	RADJ_O_LEVEL2[9:0]	1111111111	R/W	A/D Over-Threshold Level (Between levels 2 and 3) Level 0 (normal) to level 3 (completely over the range) are available.

(1) A/D Over-Threshold Level (Between Levels 2 and 3) Control

RADJ_O_LEVEL2 controls the A/D over-threshold level (between levels 2 and 3).
For the register values and threshold levels, see section 30.4.33, Over-Range Control Register 1 (RGORCR1).

30.4.38 Over-Range Control Register 6 (RGORCR6)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RADJ_U_LEVEL2[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	RADJ_U_ LEVEL2[9:0]	0000000000	R/W	A/D Under-Threshold Level (Between levels 0 and 1) Level 0 (normal) to level 3 (completely under the range) are available.

(1) A/D Under-Threshold Level (Between Levels 0 and 1) Control

RADJ_U_LEVEL2 controls the A/D under-threshold level (between levels 0 and 1).
For the register values and threshold levels, see section 30.4.33, Over-Range Control Register 1 (RGORCR1).

30.4.39 Over-Range Control Register 7 (RGORCR7)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	TEST_MONI[2:0]			RADJ_MIX_K_FIX[2:0]			—	—	—	—	—	—	UCMP_SW	DCMP_SW	HWIDE_SW
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	TEST_MONI [2:0]	000	R/W	Test Mode 0 to 3: Normal operation 4: Level 0 part is output as black. 5: Level 1 part is output as black. 6: Level 2 part is output as black. 7: Level 3 part is output as black.
11 to 9	RADJ_MIX_K_ FIX[2:0]	000	R/W	Forced Range Over/Under Mode 0 to 3: Auto detection 4: Fixed to Level 0 (normal state) 5: Fixed to level 1 (almost normal) 6: Fixed to level 2 (almost over the range) 7: Fixed to level 3 (completely over the range)
8 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	UCMP_SW	0	R/W	Over-Range Detection Enable 0: Disables over-range detection 1: Enables over-range detection
1	DCMP_SW	0	R/W	Under-Range Detection Enable 0: Disables under-range detection 1: Enables under-range detection
0	HWIDE_SW	1	R/W	Horizontal Enlargement of Over/Under-Range Level 0: Does not provide horizontal enlargement 1: Provides horizontal enlargement

(1) Over-Range Test Control

TEST_MONI controls the over-range test.

(2) Forced Over/Under-Range Mode Control

RADJ_MIX_K_FIX controls the forced over-/under-range detection.

(3) Over-Range Detection Control

UCMP_SW enables the over-range detection.

(4) Under-Range Detection Control

DCMP_SW enables the under-range detection.

(5) Horizontal Enlargement at Over/Under-Range Level

HWIDE_SW controls the horizontal enlargement of the over/under-range level.

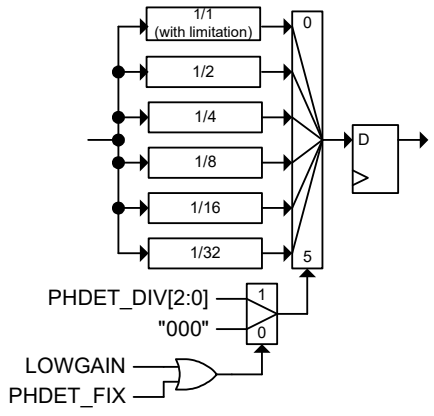
30.4.40 Feedback Control Register for Horizontal AFC Phase Comparator (AFCPFCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PHDET_FIX	—	PHDET_DIV[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PHDET_FIX	0	R/W	Forcible or LOWGAIN Control 0: LOWGAIN determination result used 1: Forcibly controlled (adjusted with PHDET_DIV)
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	PHDET_DIV [2:0]	101	R/W	Phase Comparator Feedback Adjust for Low Sync Signal Lock Stability 0: 1/1 1: 1/2 2: 1/4 3: 1/8 4: 1/16 5: 1/32 6 and 7: Setting prohibited

(1) Phase Comparator Feedback Adjust

PHDET_DEV adjusts the feedback amount as the phase comparison result when the lock stability is low. The greater the denominator is, the slower the reaction speed to the signal is.



LOWGAIN	PHDET_FIX	PHDET_DIV [2:0]	Output
-	1	0	1/1
		1	1/2
		2	1/4
		3	1/8
		4	1/16
		5	1/32
0	0	-	1/1
1	-	0	1/1
		1	1/2
		2	1/4
		3	1/8
		4	1/16
		5	1/32

Figure 30.25 Phase Comparator Feedback Adjust

30.4.41 Register Update Enable Register (RUPDCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NEWSETTING	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	NEWSETTING	0	R/W	V Update Enable for TGCR1 to TGCR3 1: Enables update. 0: Disables update.
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) V Update Enable for TGCR1 to TGCR3

NEWSETTING enables/disables TGCR1 to TGCR3 to execute V update.

30.4.42 Sync Separation Status/Vertical Cycle Read Register (VSYNCSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FHCOUNT[0]	FHLOCK	ISNOISY	FHMODE	NOSIGNAL	FVLOCK	FVMODE	INTERLACED	FVCOUNT[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	FHCOUNT[0]	0	R	Horizontal AFC Oscillation Cycle (bit 0) Set a value by 1/64 of 27-MHz clock.
14	FHLOCK	0	R	Horizontal AFC Lock Detection Result 0: Unlocked 1: Locked
13	ISNOISY	0	R	Detection Result of Low S/N Signal by Sync Separation 0: Not low S/N signal 1: Low S/N signal
12	FHMODE	0	R	Speed Detection Result 0: Normal speed (525i/625i, etc.) 1: Multiplied speed (525p/625p, etc.)
11	NOSIGNAL	0	R	No-Signal Detection Result 0: Vertical sync signal detected 1: No vertical sync signal detected
10	FVLOCK	0	R	Vertical Countdown Lock Detection Result 0: Unlocked 1: Locked
9	FVMODE	0	R	Vertical Countdown Oscillation Mode 0: 50Hz 1: 60Hz
8	INTERLACED	0	R	Interlace Detection Result 0: Progressive 1: Interlace
7 to 0	FVCOUNT[7:0]	00000000	R	Vertical Cycle Measurement Result (in 0.1-ms units)

(1) Horizontal AFC Oscillation Cycle Read

FHCOUNT indicates bit 0 of the horizontal AFC oscillation cycle.

(2) Horizontal AFC Lock Detection Result Read

FHLOCK indicates the horizontal AFC lock detection result.

(3) Sync Separation Low S/N Signal Detection Result Read

ISNOISY indicates the detection result of low S/N signal by sync separation.

(4) Speed Detection Result Read

FHMODE indicates the speed detection result.

(5) No-Signal Detection Result Read

NOSIGNAL indicates the no-signal detection result.

(6) Vertical Countdown Lock Detection Result Read

FVLOCK indicates the vertical countdown lock detection result.

(7) Interlace Detection Result Read

INTERFACED indicates the interlace detection result.

(8) Vertical Cycle Measurement Result Read

FVCOUNT indicates the vertical cycle measurement result.

30.4.43 Horizontal Cycle Read Register (HSYNCSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FHCOUNT[16:1]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	FHCOUNT [16:1]	H'0000	R	Horizontal AFC Oscillation Cycle (bit 16 to bit 1) Set a value by 1/64 of 27-MHz clock.

(1) Horizontal AFC Oscillation Cycle Read

FHCOUNT indicates the upper bits of the horizontal AFC oscillation cycle.

30.4.44 Digital Clamp Read Register 1 (DCPSR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLAMPLEVEL_CB[5:0]						CLAMPLEVEL_Y[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	CLAMPLEVEL_ CB[5:0]	000000	R	Digital Clamp Subtraction Value (Cb signal) Offset from the reference black level Set a value in 1-LSB units. 2s complement
9 to 0	CLAMPLEVEL_ Y[9:0]	0000000000	R	Digital Clamp Subtraction Value (Y signal) Offset from the reference black level Set a value in 1-LSB units. 2s complement

(1) Reading Digital Clamp Subtraction Value of Cb Signal

CLAMPLEVEL_CB indicates the digital clamp subtraction value of Cb signal.

(2) Reading Digital Clamp Subtraction Value of Y in Composite Signal

CLAMPLEVEL_Y indicates the digital clamp subtraction value of Y signal.

30.4.45 Digital Clamp Read Register 2 (DCPSR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLAMPLEVEL_CR[5:0]						—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	CLAMPLEVEL_ CR[5:0]	000000	R	Digital Clamp Subtraction Value (Cr signal) Offset from the reference black level Set a value in 1-LSB units. 2s complement
9 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Reading Digital Clamp Subtraction Value of Cr Signal

CLAMPLEVEL_CR indicates the digital clamp subtraction value of Cr signal.

30.4.46 Noise Detection Read Register (NSDSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ACFSTRENGTH[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	ACF STRENGTH [15:0]	H'0000	R	Noise Autocorrelation Strength at Digital Clamp Pulse Position (normally in the pedestal position) When ACFLAGTIME = 0, ACFSTRENGTH almost corresponds to the noise power in the pedestal position. Square root and logarithm of detection result almost correspond to noise amplitude and S/N (relative value), respectively.

(1) Reading Noise Autocorrelation Strength at Digital Clamp Pulse Position

ACFSTRENGTH indicates the noise correlation strength at the digital clamp pulse position (normal pedestal position).

30.4.47 Chroma Decoding Read Register 1 (CROMASR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COLORSYS[1:0]		FSC MODE	FSC LOCK	NO BURST	ACCSUBGAIN [1:0]		ACCMAINGAIN[8:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	COLORSYS [1:0]	00	R	Color System Detection Result 0: NTSC 1: PAL 2: SECAM 3: Undetectable
13	FSCMODE	0	R	Color Sub-Carrier Frequency Detection Result 0: 3.58 MHz 1: 4.43 MHz
12	FSCLOCK	0	R	Burst Lock PLL Lock State Detection Result 0: Unlocked 1: Locked
11	NOBURST	0	R	Color Burst Detection Result 0: Color burst present 1: No color burst present
10, 9	ACCSUBGAIN [1:0]	00	R	Current ACC Gain Value (Sub) 0: 1 time 1: 2 times 2: 4 times 3: 8 times
8 to 0	ACCMAINGAIN [8:0]	000000000	R	Current ACC gain value (Main) The value 256 corresponds to 1 time.

(1) Color System Detection Result Read

COLORSYS indicates the color system detection result.

(2) Color Sub-Carrier Frequency Detection Result Read

FSCMODE indicates the color sub-carrier frequency detection result.

(3) Burst Lock PLL Lock State Detection Result Read

FSCLOCK indicates the lock state detection result of the burst lock PLL.

(4) Color Burst Detection Result Read

NOBURST indicates the color burst detection result.

(5) Current ACC Gain (Sub) Value Read

ACCSUBGAIN indicates the current ACC gain (sub) value.

(6) Current ACC Gain (Main) Value Read

ACCMAINGAIN indicates the current ACC gain (main) value.

30.4.48 Chroma Decode Read Register 2 (CROMASR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	ISSECAM	ISPAL	ISNTSC	—	—	LOCKLEVEL[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	ISSECAM	0	R	SECAM Detection Result 0: Not SECAM signal 1: SECAM signal
11	ISPAL	0	R	PAL Detection Result 0: Not PAL signal 1: PAL signal
10	ISNTSC	0	R	NTSC Detection Result 0: Not NTSC signal 1: NTSC signal
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	LOCKLEVEL [7:0]	00000000	R	Low S/N Signal Detection Result by Burst Lock PLL The larger value corresponds to a higher S/N.

(1) SECAM Signal Detection Result Read

ISSECAM indicates the SECAM signal detection result.

(2) PAL Signal Detection Result Read

ISPAL indicates the PAL signal detection result.

(3) NTSC Signal Detection Result Read

ISNTSC indicates the NTSC signal detection result.

(4) Read of Low S/N Signal Detection Result by Burst Lock PLL

LOCKLEVEL indicates the low S/N signal detection result by the burst lock PLL.

30.4.49 Sync Separation Read Register (SYNCSSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	ISREDUCED	—	—	SYNCDEPTH[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	ISREDUCED	0	R	Sync Amplitude Detection Result during VBI Period 0: Amplitude is larger than that in image active period. 1: Amplitude is equal to that in image active period.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SYNCDEPTH [9:0]	0000000000	R	Sync Pulse Amplitude Detection Result

(1) Reading Sync Amplitude Detection Result during VBI Period

ISREDUCED indicates the sync amplitude detection result during VBI period.

(2) Reading Sync Pulse Level Amplitude Detection Result

SYNCDEPTH indicates the sync pulse amplitude detection result.

30.4.50 AGC Control Read Register 1 (AGCCSR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HIGHSAMPLES[7:0]								PEAKSAMPLES[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	HIGH SAMPLES[7:0]	00000000	R	Number of Pixels Which Have Larger Luminance Value Than Peak Luminance Limited by Peak Limiter Indicated by 1024 pixels
7 to 0	PEAK SAMPLES[7:0]	00000000	R	Number of Overflowing Pixels Indicated by 1024 pixels

(1) Reading Number of Pixels Which Have Larger Luminance Value Than Peak Luminance Limited by Peak Limiter

HIGHSAMPLES indicates the number of pixels which have larger luminance value than the peak luminance limited by the peak limiter.

(2) Number of Overflowing Pixels

PEAKSAMPLES indicates the number of overflowing pixels.

30.4.51 AGC Control Read Register 2 (AGCCSR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	AGCCONVERGE	AGCGAIN[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	AGC CONVERGE	0	R	AGC Convergence Detection Result 0: Not converged 1: Converged
7 to 0	AGCGAIN[7:0]	01000000	R	Current AGC Gain Value The value 64 corresponds to ×1.

(1) Reading AGC Convergence Detection Result

AGCCONVERGE indicates the AGC convergence detection result.

(2) Reading Current AGC Gain

AGCGAIN indicates the current AGC gain.

30.4.52 Y/C Separation Control Register 3 (YCSCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	K15[3:0]				K13[5:0]						K11[5:0]					
Initial value:	0	0	1	0	0	0	1	0	0	0	0	0	0	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	K15[3:0]	0010	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.
11 to 6	K13[5:0]	001000	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.
5 to 0	K11[5:0]	000100	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.

(1) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K15 controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

(2) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K13 controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

(3) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K11 controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

30.4.53 Y/C Separation Control Register 4 (YCSCR4)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	K16[3:0]				K14[5:0]						K12[5:0]					
Initial value:	0	0	1	1	0	1	0	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	K16[3:0]	0011	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.
11 to 6	K14[5:0]	010000	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.
5 to 0	K12[5:0]	000001	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.

(1) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K16 controls the two-dimensional Y/C separation filter select coefficient.
For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

(2) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K14 controls the two-dimensional Y/C separation filter select coefficient.
For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

(3) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K12 controls the two-dimensional Y/C separation filter select coefficient.
For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

30.4.54 Y/C Separation Control Register 5 (YCSCR5)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	K22A[7:0]								—	—	K21A[5:0]					
Initial value:	0	1	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	K22A[7:0]	01000000	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	K21A[5:0]	000110	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.

(1) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K22A controls the two-dimensional Y/C separation filter select coefficient.
For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

(2) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K21A controls the two-dimensional Y/C separation filter select coefficient.
For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

30.4.55 Y/C Separation Control Register 6 (YCSCR6)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	K22B[7:0]								—	—	K21B[5:0]					
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	K22B[7:0]	00010000	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	K21B[5:0]	000110	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.

(1) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K22B controls the two-dimensional Y/C separation filter select coefficient.
For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

(2) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K21B controls the two-dimensional Y/C separation filter select coefficient.
For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

30.4.56 Y/C Separation Control Register 7 (YCSCR7)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	K23B[3:0]				K23A[3:0]				—	—	—	K24[4:0]				
Initial value:	0	1	1	0	0	0	1	1	0	0	1	0	0	1	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	K23B[3:0]	0110	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.
11 to 8	K23A[3:0]	0011	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
4 to 0	K24[4:0]	00101	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the wider range.

(1) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K23B controls the two-dimensional Y/C separation filter select coefficient.
For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

(2) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K23A controls the two-dimensional Y/C separation filter select coefficient.
For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

(3) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K24 controls the two-dimensional Y/C separation filter select coefficient.
For details, refer to section 30.5.5 (3), Horizontal and Vertical Correlation Detection Block.

30.4.57 Y/C Separation Control Register 8 (YCSCR8)

In two-dimensional Y/C separation, horizontal BPF, vertical BPF, and horizontal/vertical BPF are adaptively switched. For the horizontal BPF and horizontal/vertical BPF, horizontal properties can be selected.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HBPF_NARROW	HVBPF_NARROW	HBPF1_9TAP_ON	HVBPF1_9TAP_ON	HFIL_TAP_SEL	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	HBPF_ NARROW	1	R/W	Latter-Stage Horizontal BPF Select 0: Bypass 1: 17 TAP
14	HVBPF_ NARROW	1	R/W	Latter-Stage Horizontal/Vertical BPF Select 0: Bypass 1: 17 TAP
13	HBPF1_ 9TAP_ON	0	R/W	Former-Stage Horizontal BPF Select 0: 17 TAP 1: 9 TAP
12	HVBPF1_ 9TAP_ON	0	R/W	Former-Stage Horizontal/Vertical BPF Select 0: 17 TAP 1: 9 TAP
11	HFIL_TAP_SEL	0	R/W	Horizontal Filter and Horizontal/Vertical Filter Bandwidth Switch Signal 0: 17 TAP 1: 9 TAP
10 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Horizontal BPF Select Control

HBPF_NARROW selects the latter-stage horizontal BPF.
For details, refer to section 30.5.5 (2), Horizontal and Vertical Filter Block.

(2) Horizontal/Vertical BPF Select Control

HVBPF_NARROW selects the latter-stage horizontal/vertical BPF.
For details, refer to section 30.5.5 (2), Horizontal and Vertical Filter Block.

(3) Horizontal BPF (Broadband) Select Control

HBPF1_9TAP_ON selects the former-stage horizontal BPF.
For details, refer to section 30.5.5 (2), Horizontal and Vertical Filter Block.

(4) Horizontal/Vertical BPF (Broadband) Select Control

HVBPF1_9TAP_ON selects the former-stage horizontal/vertical BPF.
For details, refer to section 30.5.5 (2), Horizontal and Vertical Filter Block.

(5) Horizontal BPF Bandwidth Switch Control

HFIL_TAP_SEL switches the horizontal BPF bandwidths used for mixing.
For details, refer to section 30.5.5 (5), Horizontal and Vertical Signal Mixing Block.

30.4.58 Y/C Separation Control Register 9 (YCSCR9)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DET2_ON	—	—	—	HSEL_MIX_Y[3:0]				VSEL_MIX_Y[3:0]				HVSEL_MIX_Y[3:0]			
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	DET2_ON	1	R/W	Two-Dimensional Filter Mixing Select 0: Signals are not mixed after passing the correlation detection filter. 1: Signals are mixed after passing the correlation detection filter.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	HSEL_MIX_Y [3:0]	0000	R/W	Mixing Ratio of Signal after Passing Horizontal Filter to Signal after Passing Former-Stage Horizontal Filter 0: Horizontal filter 100.0% 1: Horizontal filter 87.5% to former-stage horizontal filter 12.5% 2: Horizontal filter 75.0% to former-stage horizontal filter 25.0% 3: Horizontal filter 62.5% to former-stage horizontal filter 37.5% 4: Horizontal filter 50.0% to former-stage horizontal filter 50.0% 5: Horizontal filter 37.5% to former-stage horizontal filter 62.5% 6: Horizontal filter 25.0% to former-stage horizontal filter 75.0% 7: Horizontal filter 12.5% to former-stage horizontal filter 87.5% 8: Former-stage horizontal filter 100% 9 to 15: Setting prohibited
7 to 4	VSEL_MIX_Y [3:0]	0000	R/W	Mixing Ratio of Signal after Passing Vertical Filter to Signal after Passing Former-Stage Horizontal/Vertical Filter 0: Vertical filter 100.0% 1: Vertical filter 87.5% to former-stage horizontal/vertical filter 12.5% 2: Vertical filter 75.0% to former-stage horizontal/vertical filter 25.0% 3: Vertical filter 62.5% to former-stage horizontal/vertical filter 37.5% 4: Vertical filter 50.0% to former-stage horizontal/vertical filter 50.0% 5: Vertical filter 37.5% to former-stage horizontal/vertical filter 62.5% 6: Vertical filter 25.0% to former-stage horizontal/vertical filter 75.0% 7: Vertical filter 12.5% to former-stage horizontal/vertical filter 87.5% 8: Former-stage horizontal/vertical filter 100% 9 to 15: Setting prohibited
3 to 0	HVSEL_MIX_Y [3:0]	0000	R/W	Mixing Ratio of Signal after Passing Horizontal/Vertical Filter to Signal after Passing Former-Stage Horizontal/Vertical Filter 0: Horizontal/vertical filter 100.0% 1: Horizontal/vertical filter 87.5% to former-stage horizontal/vertical filter 12.5% 2: Horizontal/vertical filter 75.0% to former-stage horizontal/vertical filter 25.0% 3: Horizontal/vertical filter 62.5% to former-stage horizontal/vertical filter 37.5% 4: Horizontal/vertical filter 50.0% to former-stage horizontal/vertical filter 50.0% 5: Horizontal/vertical filter 37.5% to former-stage horizontal/vertical filter 62.5% 6: Horizontal/vertical filter 25.0% to former-stage horizontal/vertical filter 75.0% 7: Horizontal/vertical filter 12.5% to former-stage horizontal/vertical filter 87.5% 8: Former-stage horizontal/vertical filter 100% 9 to 15: Setting prohibited

(1) Two-Dimensional Filter Mixing Select Control

DET2_ON selects two-dimensional filter mixing.

For details, refer to section 30.5.5 (5), Horizontal and Vertical Signal Mixing Block.

(2) Control of Mixing Ratio of Signal after Passing Horizontal Filter to Signal after Passing Former-Stage Horizontal Filter

HSEL_MIX_Y controls the mixing ratio of the signal after passing a horizontal filter to the signal after passing the former-stage horizontal filter.
For details, refer to section 30.5.5 (5), Horizontal and Vertical Signal Mixing Block.

(3) Control of Mixing Ratio of Signal after Passing Vertical Filter to Signal after Passing Former-Stage Horizontal/Vertical Filter

VSEL_MIX_Y controls the mixing ratio of the signal after passing a vertical filter to the signal after passing the former-stage horizontal/vertical filter.
For details, refer to section 30.5.5 (5), Horizontal and Vertical Signal Mixing Block.

(4) Control of Mixing Ratio of Signal after Passing Horizontal/Vertical Filter to Signal after Passing Former-Stage Horizontal/Vertical Filter

HVSEL_MIX_Y controls the mixing ratio of the signal after passing a horizontal/vertical filter to the signal after passing the former-stage horizontal/vertical filter.
For details, refer to section 30.5.5 (5), Horizontal and Vertical Signal Mixing Block.

30.4.59 Y/C Separation Control Register 11 (YCSCR11)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	V_Y_LEVEL[8:0]								
Initial value:	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12, 11	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
10, 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	V_Y_LEVEL [8:0]	000000011	R/W	Vertical Luminance Detection Level for Correlation Detection Filter The luminance is detected when lower than the set value.

(1) Vertical Luminance Detection Level for Correlation Detection Filter

V_Y_LEVEL[8:0] select the vertical luminance detection level for correlation detection filter.
Be sure to set 0 to all the bits in this field when this module is in use.

30.4.60 Y/C Separation Control Register 12 (YCSCR12)

During two-dimensional Y/C separation, the horizontal bandwidth can be further narrowed using the cascade horizontal BPF after horizontal BPF, vertical BPF, and horizontal/vertical BPF are switched.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DET2_MIX_C[3:0]				DET2_MIX_Y[3:0]				—	—	—	—	FIL2_MODE_2D [1:0]		—	FIL2_NAR ROW_2D
Initial value:	0	0	0	0	0	1	1	0	0	0	0	0	0	1	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DET2_MIX_C [3:0]	0000	R/W	Mixing Ratio of C Signal after Passing Horizontal/Vertical Adaptive Filter to Signal after Passing Correlation Detection Filter (set 0 when DET2_ON = 0) 0: Horizontal/vertical adaptive filter 100.0% 1: Horizontal/vertical adaptive filter 87.5% to correlation detection filter 12.5% 2: Horizontal/vertical adaptive filter 75.0% to correlation detection filter 25.0% 3: Horizontal/vertical adaptive filter 62.5% to correlation detection filter 37.5% 4: Horizontal/vertical adaptive filter 50.0% to correlation detection filter 50.0% 5: Horizontal/vertical adaptive filter 37.5% to correlation detection filter 62.5% 6: Horizontal/vertical adaptive filter 25.0% to correlation detection filter 75.0% 7: Horizontal/vertical adaptive filter 12.5% to correlation detection filter 87.5% 8: Correlation detection filter 100% 9 to 15: Setting prohibited
11 to 8	DET2_MIX_Y [3:0]	0110	R/W	Mixing Ratio of C Signal for Y Generation after Passing Horizontal/Vertical Adaptive Filter to Signal after Passing Correlation Detection Filter (set 0 when DET2_ON = 0) 0: Horizontal/vertical adaptive filter 100.0% 1: Horizontal/vertical adaptive filter 87.5% to correlation detection filter 12.5% 2: Horizontal/vertical adaptive filter 75.0% to correlation detection filter 25.0% 3: Horizontal/vertical adaptive filter 62.5% to correlation detection filter 37.5% 4: Horizontal/vertical adaptive filter 50.0% to correlation detection filter 50.0% 5: Horizontal/vertical adaptive filter 37.5% to correlation detection filter 62.5% 6: Horizontal/vertical adaptive filter 25.0% to correlation detection filter 75.0% 7: Horizontal/vertical adaptive filter 12.5% to correlation detection filter 87.5% 8: Correlation detection filter 100% 9 to 15: Setting prohibited
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3, 2	FIL2_MODE_ 2D[1:0]	01	R/W	Two-Dimensional Cascade/TAKE-OFF Filter Mode Select 0: Bypass 1: Cascade filter 2: TAKE-OFF filter 3: Setting prohibited
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	FIL2_ NARROW_2D	1	R/W	Two-Dimensional Cascade Filter Select 0: Bypass 1: 17 TAP

(1) Mixing Ratio of C Signal after Passing Horizontal/Vertical Adaptive Filter to Signal after Passing Correlation Detection Filter

DET2_MIX_C controls the mixing ratio of the chroma signal (after adaptation) to the signal after passing the correlation detection filter.

For details, refer to section 30.5.5 (6), Correlation Detection Value Mixing Block.

(2) Mixing Ratio of C Signal for Y Generation after Passing Horizontal/Vertical Adaptive Filter to Signal after Passing Correlation Detection Filter

For details, refer to section 30.5.5 (6), Correlation Detection Value Mixing Block.

(3) Two-Dimensional Cascade/TAKE-OFF Filter Mode Select

FIL2_MODE_2D selects the two-dimensional cascade/TAKE-OFF filter mode.
For details, refer to section 30.5.5 (8), Cascade Filter Block.

(4) Two-Dimensional Cascade Filter Select

FIL2_NARROW_2D selects the two-dimensional cascade filter.
For details, refer to section 30.5.5 (8), Cascade Filter Block.

30.4.61 Digital Clamp Control Register 9 (DCPCR9)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CLP_HOLD_ON_Y	CLP_HOLD_ON_CB	CLP_HOLD_ON_CR	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	1	1	1	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
12	CLP_HOLD_ON_Y	1	R/W	Clamp Data Hold Processing ON/OFF (Y) 0: Hold processing ON 1: Hold processing OFF
11	CLP_HOLD_ON_CB	1	R/W	Clamp Data Hold Processing ON/OFF (Cb) 0: Hold processing ON 1: Hold processing OFF
10	CLP_HOLD_ON_CR	1	R/W	Clamp Data Hold Processing ON/OFF (Cr) 0: Hold processing ON 1: Hold processing OFF
9 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Clamp Data Hold Processing ON/OFF Control (Y)

CLP_HOLD_ON_Y selects ON/OFF of hold processing for Y signal clamp data.
Be sure to set 0 to this bit when this module is in use.

(2) Clamp Data Hold Processing ON/OFF Control (Cb)

CLP_HOLD_ON_CB selects ON/OFF of hold processing for Cb signal clamp data.
Be sure to set 0 to this bit when this module is in use.

(3) Clamp Data Hold Processing ON/OFF Control (Cr)

CLP_HOLD_ON_CR selects ON/OFF of hold processing for Cr signal clamp data.
Be sure to set 0 to this bit when this module is in use.

30.4.62 Chroma Filter TAP Coefficient (WA_F0 to WA_F8) Registers for Y/C Separation (YCTWA_F0 to YCTWA_F8)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIL2_2D_WA_F0 to FIL2_2D_WA_F8[12:0]												
Initial value:	0	0	0	*	*	*	*	*	*	*	*	*	*	*	*	*
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	FIL2_2D_WA_F0 to FIL2_2D_WA_F8[12:0]	*	R/W	Two-Dimensional Cascade Broadband (3.58/4.43/SECAM-DR)/TAKE-OFF Filter TAP Coefficients 0 to 8 [12]: Sign [11:0]: Absolute value * Initial values: FIL2_2D_WA_F0: H'0018 FIL2_2D_WA_F1: H'002C FIL2_2D_WA_F2: H'0014 FIL2_2D_WA_F3: H'1034 FIL2_2D_WA_F4: H'1080 FIL2_2D_WA_F5: H'1080 FIL2_2D_WA_F6: H'100C FIL2_2D_WA_F7: H'0084 FIL2_2D_WA_F8: H'00C8

(1) Two-Dimensional Cascade Broadband (3.58/4.43/SECAM-DR)/TAKE-OFF Filter TAP Coefficients 0 to 8 Control

FIL2_2D_WA_F0 to FIL2_2D_WA_F8[12:0] control two-dimensional cascade broadband (3.58/4.43/SECAM-DR)/TAKE-OFF filter TAP coefficients 0 to 8.
The transfer function is defined as follows:

$$H(z) = \{F0(z^{-8} + z^{+8}) + F1(z^{-7} + z^{+7}) + F2(z^{-6} + z^{+6}) + F3(z^{-5} + z^{+5}) + F4(z^{-4} + z^{+4}) + F5(z^{-3} + z^{+3}) + F6(z^{-2} + z^{+2}) + F7(z^{-1} + z^{+1}) + F8(z^{0})\} /1024$$

The coefficient value is represented using the MSB for a sign and the other bits for the effective value in the absolute value.

Table 30.31 TAP Coefficient Settings

Most Significant Bit	Other Than MSB	Setting Value
0	0 to 4095	+0 to +4095
1	0 to 4095	–0 to –4095

For the recommended setting value for each filter, see section 30.5.5 (8), Cascade Filter Block.

30.4.63 Chroma Filter TAP Coefficient (WB_F0 to WB_F8) Registers for Y/C Separation (YCTWB_F0 to YCTWB_F8)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	CB_GAIN2[9:0]	1000000000	R/W	Cb Signal Gain Coefficient (0 = 0 times, 512 = 1.0 times, 1023 ≈ 2.0 times)

(1) Cb Signal Output Gain Control

CB_GAIN2 controls the Cb signal output gain.

Cb signal output = Cb signal after decoding × (CB_GAIN2/512)

30.4.68 Color Difference (Cr) Signal Gain Control Register (CRGAINCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CR_GAIN2[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	CR_GAIN2[9:0]	1000000000	R/W	Cr Signal Gain Coefficient (0 = 0 times, 512 = 1.0 times, 1023 ≈ 2.0 times)

(1) Cr Signal Output Gain Control

CR_GAIN2 controls the Cr signal output gain.

Cr signal output = Cr signal after decoding × (CR_GAIN2/512)

30.4.69 PGA Register Update (PGA_UPDATE)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PGA_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PGA_VEN	1	R/W	PGACR Register V Update Enable 1: Enable 0: Disable

(1) PGACR Register V Update Enable

PGA_VEN enables or disables V update of PGACR register.

30.4.70 PGA Control Register (PGACR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	PGA_GAIN_SEL	PGA_GAIN[5:0]						—	—	—	—	—	—	—	—
Initial value:	0	0	0	1	0	1	0	1	0	0	0	0	1	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	PGA_GAIN_SEL	0	R/W	PGA Switch 0: Automatic (AGC) 1: Manual (Refer to the PGA_GAIN description below.)
13 to 8	PGA_GAIN[5:0]	010101	R/W	PGA Gain 0 (0.8 Vpp) to 63 (1.6 Vpp)
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: • All the bits in this register are updated when the vertical sync signal is asserted with PGA_VEN in PGA_UPDATE being 1.

(1) PGA Switch

When PGA_GAIN_SEL is 0 and ADCCR1.AGCMODE is 1, the AGC-controlled value is reflected on the PGA gain. When PGA_GAIN_SEL is 1, the PGA_GAIN value is directly reflected on the PGA gain. In this case, the ADCCR1.AGCMODE setting is invalid.
Setting ADCCR1.AGCMODE to 0 and PGA_GAIN_SEL to 0 simultaneously is prohibited.

(2) PGA Gain

When PGA_GAIN_SEL is 1, the PGA_GAIN value is reflected on the PGA gain. One of 64 levels of gain values can be set for the PGA of this LSI.

30.4.71 ADC Control Register 2 (ADCCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADC_VINSEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADC_VINSEL	0	R/W	Input Pin Control 0: VIN1 input 1: VIN2 input

(1) Input Pin Control

ADC_VINSEL selects the pin for inputting composite video signals.

30.5 Operation

30.5.1 Overview

This module decodes composite video signals (CVBS) and separates them into horizontal/vertical sync signals, luminance signals (Y), and color difference signals (Cb/Cr). Supported color systems are NTSC, PAL, and SECAM. This module consists of an A/D converter for video signal input, sync separator circuit, burst controlled oscillator (BCO), a Y/C separator circuit, a chroma decoding circuit, a digital clamp circuit, and an output gain adjustment circuit. Figure 30.26 shows an overall block diagram.

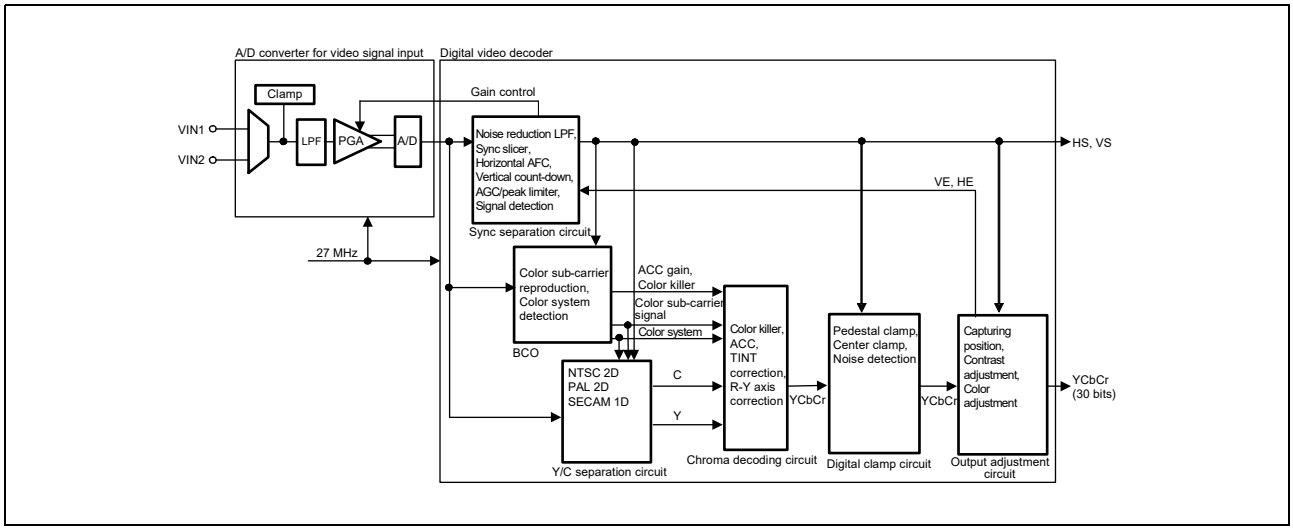

Figure 30.26 Overall Block Diagram

(1) A/D Converter for Video Signal Input

The A/D converter processes the composite video signal (CVBS) using the sync tip clamp block, the low-pass filter (LPF), and the programmable gain amplifier (PGA) and then A/D-converts the signal. The composite video signals from either VIN1 or VIN2 pin are selected.

(2) Sync Separator Circuit

The sync separator circuit extracts the horizontal and vertical sync signals from the composite video signal. This circuit also detects the amplitude of the sync signals and automatically adjusts the PGA gain (Automatic Gain Control = AGC).

(3) Burst Controlled Oscillator (BCO)

The BCO extracts the color burst signal from the composite video signal and reproduces the color sub-carrier signal required for color demodulation. The BCO also acquires phase and frequency information from the color burst signal and detects the color system used.

(4) Y/C Separator Circuit

The Y/C separator circuit separates the composite video signal of the NTSC, PAL, or SECAM format into the Y and C signals. Two-dimensional adaptive separation is used for NTSC and PAL and one-dimensional separation for SECAM.

(5) Chroma Decoding Circuit

The chroma decoding circuit demodulates the C signal extracted by the Y/C separator circuit into the Cb/Cr signal. This circuit has the automatic color control function (ACC), in which the amplitude of the color burst signal is detected to adjust the color gain automatically and also has the TINT/R-Y axis correction function, in which hue is adjusted at demodulation.

(6) Digital Clamp Circuit

The digital clamp circuit provides pedestal clamp for the Y signals and center clamp for the Cb/Cr signals at any position. This circuit also detects the amount of noise using the autocorrelation function.

(7) Output Adjustment Circuit

The output adjustment circuit sets the capturing position and adjusts the contrast and color.

30.5.2 A/D Converter for Video Signal Input

The A/D converter processes the composite video signal (CVBS) using the sync tip clamp block, the low-pass filter (LPF), and the programmable gain amplifier (PGA) and then A/D-converts the signal.
Figure 30.27 shows the block diagram of the A/D converter for video signal input.

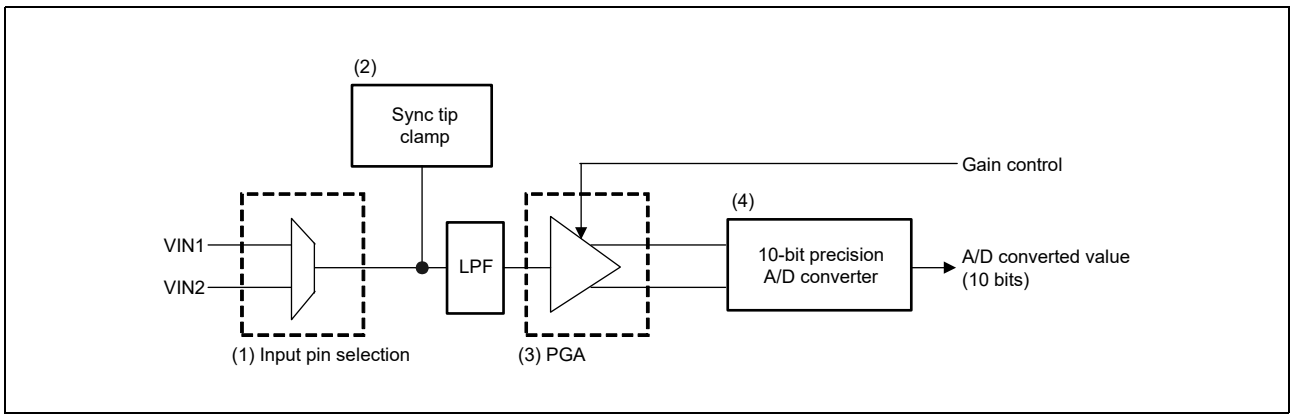

Figure 30.27 Block Diagram of A/D Converter for Video Signal Input

Figure 30.28 shows the waveforms when a video signal is A/D-converted.

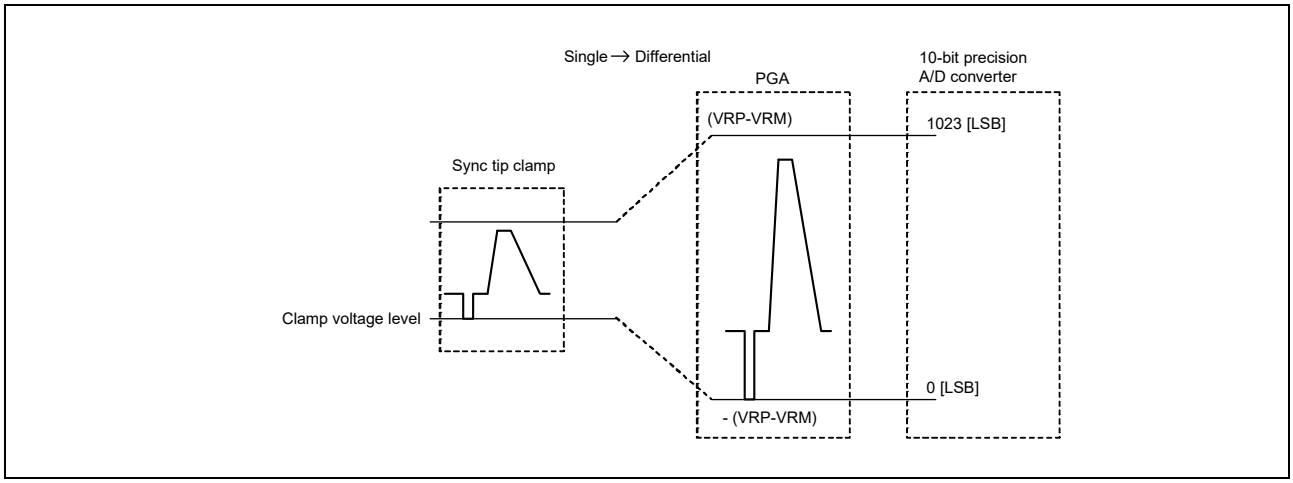

Figure 30.28 A/D Conversion Image

(1) Input Pin Selection Block

The input pin selection block selects either the VIN1 or VIN2 pin for inputting the signal according to the ADCCR2.ADC_VINSEL setting.

(2) Sync Tip Clamp Block

The sync tip clamp block clamps the sync tip level to about 0.6 V.

(3) Programmable Gain Amplifier (PGA)

The PGA adjusts the gain so that the input video signal voltage (≈ 0.8 Vpp to 1.6 Vpp) should be the level to be input to the A/D converter (≈ 1.6 Vpp). One of 64 levels of gain values can be set. One level corresponds to gain of 0.1 dB (typ.). The minimum gain is 0 dB (typ.) and maximum gain is 6.02 dB (typ.).
Table 30.35 shows the PGA gain setting and gain values.

Table 30.35 PGA Gain Setting and Gain Values (dB)

PGA Gain Setting	Input Range (Vpp)	Gain Value (dB)
0	1.600	0
1	1.587	0.069
2	1.575	0.138
3	1.562	0.209
4	1.549	0.280
5	1.537	0.351
6	1.524	0.423
7	1.511	0.496
8	1.498	0.569
9	1.486	0.643
:	:	:
59	0.851	5.48
60	0.838	5.61
61	0.825	5.74
62	0.813	5.88
63	0.800	6.02

The PGA gain can be set using PGACR.PGA_GAIN[5:0] with PGACR.PGA_GAIN_SEL = 1. When the AGC function is on (ADCCR1.AGCMODE = 1), the gain is automatically set.

(4) 10-Bit Precision A/D Converter

The 10-bit precision A/D converter receives the gain-adjusted video signal from the PGA and A/D-converts the signal. The converter has 10-bit resolution and performs sampling at 27 MHz, which is the frequency of the clock signal input via VIDEO_X1 or VIDEO_X2.

30.5.3 Sync Separator Circuit

The sync separator circuit extracts the horizontal and vertical sync signals from the composite video signal. This circuit also detects the amplitude of the sync signals and automatically adjusts the PGA gain (Automatic Gain Control = AGC). Figure 30.29 shows the block diagram of the sync separator circuit.

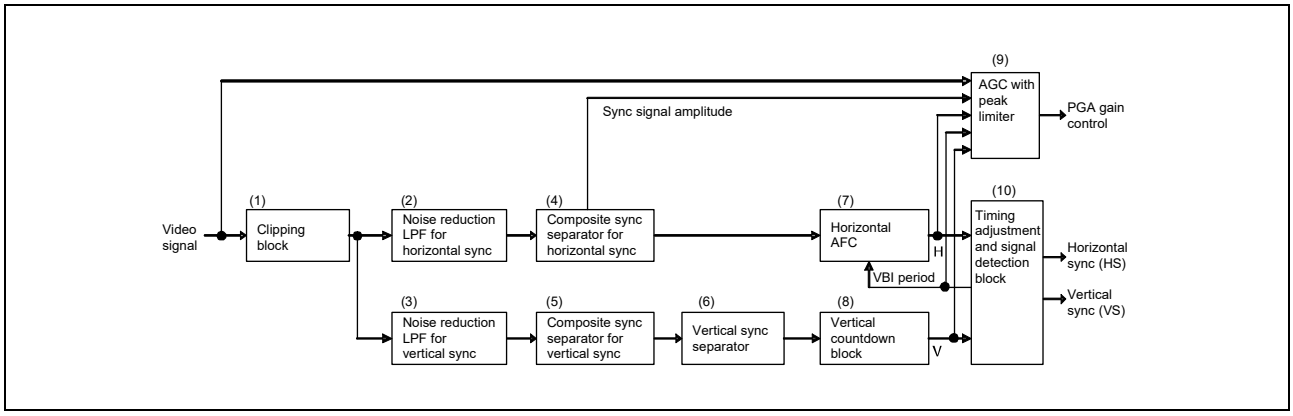

Figure 30.29 Block Diagram of Sync Separator Circuit

(1) Clipping Block

The clipping block clips the high tone component of the video signal to reduce amplitude-dependency of the video signal. The specific clipping level can be set using SYNSCR3.SSCLIPSEL[3:0].
The clipping level should be within the range so that the composite sync signal component should not be deteriorated (should be detectable).

(2) Noise Reduction Low-Pass Filter (LPF) for Horizontal Sync

The noise reduction LPF reduces the superimposed noise on the video signals before composite sync signal separation. The LPFs can be separately set for the horizontal sync and vertical sync. The cutoff frequency of the horizontal sync LPF can be set using SYNSCR1.LPFHSYNC[2:0]. The cutoff frequency should be within the range so that the composite sync signal component should not be deteriorated (should be detectable).

(3) Noise Reduction Low-Pass Filter (LPF) for Vertical Sync

The noise reduction LPF reduces the superimposed noise on the video signals before composite sync signal separation. The LPFs can be separately set for the horizontal sync and vertical sync. The cutoff frequency of the vertical sync LPF can be set using SYNSCR1.LPFVSYNC[2:0]. The cutoff frequency should be within the range so that the composite sync signal component should not be deteriorated (should be detectable).

(4) Composite Sync Separator for Horizontal Sync

The composite sync separator separates the composite sync signal from the video signal according to the slice level. The composite sync slice levels can be separately set for the horizontal and vertical sync signals. The slice level can be set either automatically or manually according to the SYNSCR1.SLICERMODE_H[1:0] setting.
When automatic setting is used, the slice level is automatically set according to the SYNSCR1.SLICERMODE_H[1:0], SYNSCR2.SYNCMAXDUTY_H[5:0], and SYNSCR2.SYNCMINDUTY_H[5:0] setting. The slice level detection speed can be set using SYNSCR1.VELOCITYSHIFT_H[3:0].
When manual setting is used, the slice level is determined by SYNSCR3.CSYNCSLICE_H[9:0].

(5) Composite Sync Separator for Vertical Sync

The composite sync separator separates the composite sync signal from the video signal according to the slice level. The composite sync slice levels can be separately set for the horizontal and vertical sync signals. The slice level can be set either automatically or manually according to the SYNSCR1.SLICERMODE_V[1:0] setting.

When automatic setting is used, the slice level is automatically set according to the SYNSCR1.SLICERMODE_V[1:0], SYNSCR4.SYNCMAXDUTY_V[5:0], and SYNSCR4.SYNCMINDUTY_V[5:0] setting.
When manual setting is used, the slice level is determined by SYNSCR5.CSYNCSLICE_V[9:0].

(6) Vertical Sync Separator

The vertical sync separator extracts the vertical sync signal from the composite video signal separated using (5) above. The threshold value for separating the vertical sync signal can be set using SYNSCR5.VSYNCSLICE[4:0]. The value should be set depending on the serration pulse width of each video signal format.

(7) Horizontal Automatic Frequency Control (AFC) Block

The horizontal AFC, which is a digital PLL, extracts the horizontal sync signal from the composite video signal separated using (4) above. The AFC removes the pseudo horizontal sync signal and interpolates the incomplete horizontal sync signal to generate a stable horizontal sync signal.
The center frequency and lock range of the horizontal AFC can be set using HAFCCR1.HAFCTYP[9:0], HAFCCR2.HAFCMAX[9:0], and HAFCCR3.HAFCMIN[9:0]. If the horizontal AFC is locked, VSYNCSR.FHLOCK becomes 1; and if the horizontal AFC is unlocked, VSYNCSR.FHLOCK becomes 0. The horizontal AFC oscillation cycle can be checked by reading HSYNCSR.FHCOUNT[16:1] and VSYNCSR.FHCOUNT[0].
The loop gain (response speed) of the horizontal AFC can be set using HAFCCR1.HAFCCGAIN[3:0]. As the speed is increased, the lockup time becomes shorter. However, the horizontal oscillation frequency will be more susceptible to noise. With HAFCCR3.HAFCMODE[1], AFCPFCR.PHDET_FIX, and AFCPFCR.PHDET_DIV[2:0], the loop gain can be reduced when S/N is low to prevent malfunction attributed to noise. Whether S/N is low or not can be checked with VSYNCSR.ISNOISY.
The loop gain during the vertical blanking period (VBI) can be set using HAFCCR2.HAFCSTART[3:0], HAFCCR3.HAFCEND[3:0], and HAFCCR3.HAFCMODE[0]. This is usually used to avoid malfunction in the VCR head switch.

(8) Vertical Countdown Block

The vertical countdown block removes the pseudo vertical sync signal from the vertical sync signal separated using (6) above and interpolates the incomplete vertical sync signal to generate a stable vertical sync signal.
The oscillation cycle of the vertical countdown block can be set using VCDWCR1.VCDDEFAULT[1:0]. When set to 0, the input vertical sync signal is detected and the oscillation cycle is automatically set appropriately. The detection result of the input vertical sync signal is indicated by VSYNCSR.FVMODE. When set to 1, 50.00-Hz oscillation mode is set. Here, it is recommended to set VCDWCR1.NOVCD60 to 1 (60-Hz oscillation off) to avoid unexpected malfunction. When set to 2 or 3, 59.94-/60.00-Hz oscillation mode is set. Here, it is recommended to set VCDWCR1.NOVCD50 to 1 (50-Hz oscillation off) to avoid unexpected malfunction.
The lock range of the vertical countdown block can be set using VCDWCR1.VCDWINDOW[5:0] and VCDWCR1.VCDOFFSET[4:0]. If the vertical countdown block is locked, VSYNCSR.FVLOCK becomes 1; and if the vertical countdown block is unlocked, VSYNCSR.FVLOCK becomes 0.
The cycle of the input vertical sync signal can be checked by reading VSYNCSR.FVCOUNT[7:0]. When the vertical sync signal input cannot be detected, VSYNCSR.NOSIGNAL is set to 1.

(9) Automatic Gain Control (AGC) Block with Peak Limiter

The AGC block detects the amplitude of the sync signal and automatically controls the PGA gain to the target value. The AGC function is activated with ADCCR1.AGCMODE = 1.

- Gain Control according to Sync Amplitude
  The target sync signal amplitude can be set using AGCCR1.AGCLEVEL[8:0] and AGCCR2.AGCPRECIS[5:0]. For example, when NTSC signals are quantized by the 10-bit A/D converter, the sync signal amplitude for the full range of the A/D converter can be provided by:
  1023[LSB] × (40[IRE] ÷ 173[IRE]) = 236.53179[LSB]
  Therefore, 236[LSB] should be set to AGCCR1.AGCLEVEL[8:0]. The gain is fixed when it falls within the

following range.

Target value (= AGCCR1.AGCLEVEL[8:0]) ± AGCCR2.AGCPRECIS[5:0]

Whether the gain is fixed or not can be checked by reading AGCCSR2.AGCCONVERGE. The detected sync signal amplitude can be checked using SYNCSSR.SYNCDEPTH[9:0]. The AGC response speed can be set using AGCCR1.AGCRESPONSE[2:0]. As the speed is increased, the input signal is tracked more quickly; however, it will result in higher susceptibility to noise.

The currently set gain value can be checked using AGCCSR2.AGCGAIN[7:0]. The actual PGA gain setting can be roughly calculated as follows:

PGA gain setting = 1.203008 × (AGCCSR2.AGCGAIN[7:0] – 48)

For example, when AGCCSR2.AGCGAIN[7:0] is 64 (corresponding to ×1),

PGA gain setting = 1.203008 × (64 – 48) ≈ 19.24

As a result, the PGA gain setting is 19 or 20. One of 0 to 63 can be set as the PGA gain value.

The gain during vertical blanking period (VBI) can be set using AGCCR1.DOREDUCE and AGCCR1.NOREDUCE. The sync amplitude detection result during VBI can be read from SYNCSSR.ISREDUCED.

- Peak Limiter

  The peak limiter works when the ratio of the video signal amplitude to the sync signal amplitude is inappropriate. If the ratio is smaller than expected, the PGA gain becomes smaller, and the video signal after gain adjustment becomes smaller than the full range of the A/D converter. Contrarily, if the ratio is larger than expected, the PGA gain becomes larger, and the video signal after gain adjustment becomes larger than the full range of the A/D converter.

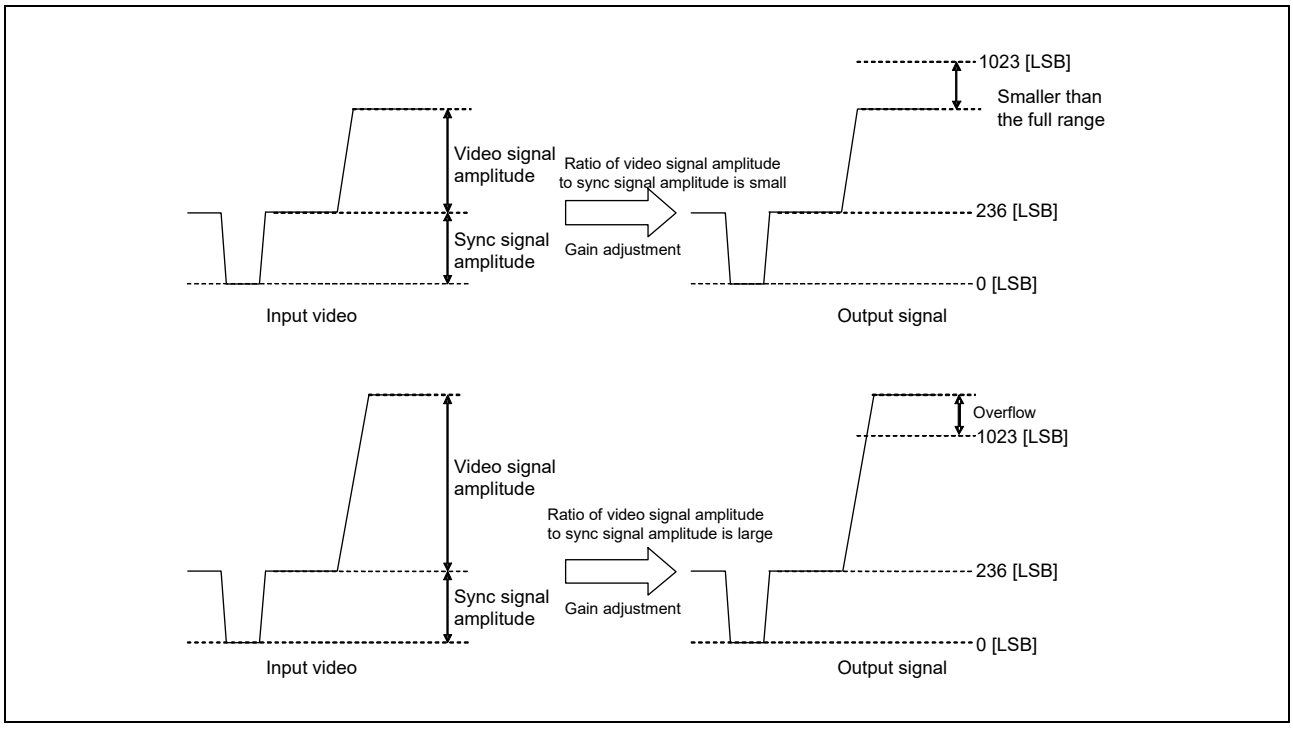

Figure 30.30 Cases in which Ratio of Video Signal Amplitude to Sync Signal Amplitude is Inappropriate

To deal with this problem, the peak limiter adjusts the PGA gain based on the sampled video signal peak value. The peak value used to control the gain can be set using PKLIMITCR.PEAKLEVEL[1:0]. When the peak value of the sampled video signal is smaller than the value set using PKLIMITCR.PEAKLEVEL[1:0], the gain is increased. Contrarily, when the peak value of the sampled video signal is larger than the value set using PKLIMITCR.PEAKLEVEL[1:0] exceeding the maximum allowable value set using

PKLIMITCR.MAXPEAKSAMPLES[7:0], the gain is decreased.
The gain increase/decrease response speed and maximum compression ratio can be set using PKLIMITCR.PEAKATTACK[1:0], PKLIMITCR.PEAKRELEASE[1:0], and PKLIMITCR.PEAKRATIO[1:0].
The number of pixels with the peak value larger than the value set using PKLIMITCR.PEAKLEVEL[1:0] can be checked with AGCCSR1.HIGHSAMPLES[7:0]; and the number of overflowing pixels (exceeding 1023[LSB]) can be checked with AGCCSR1.PEAKSAMPLES[7:0].

- Manual Setting
  Manual setting of the PGA gain can be enabled by setting PGACR.PGA_GAIN_SEL to 1. Here, the value set using PGACR.PGA_GAIN[5:0] is actually set as the PGA gain. When PGACR.PGA_GAIN_SEL is 1, ADCCR1.AGCMODE setting is invalid. Setting PGACR.PGA_GAIN_SEL to 0 (automatic setting) and ADCCR1.AGCMODE to 0 (AGC off) simultaneously is prohibited.

(10) Timing Adjustment and Signal Detection Block

The timing adjustment and signal detection block adjusts the output timing of the horizontal and vertical sync signals generated using (7) and (8) above. This block also detects the field; whether the interlaced or progressive system is used can be checked with VSYNCSR.INTERLACED. If the field detection function is unstable, setting SYNSCR5.VSYNCDELAY to 1 may improve the function.
The phases of the Hsync and Vsync signals are adjusted according to the result of detecting the field, and output of the Vsync signal from the sync separator circuit is delayed by one horizontal period. When having video display controller 5 capture the output signal from this module, take the above delay into consideration and set SC*_SCL*_DS2.SC*_RES_VS (vertical position setting for video signal capturing) as follows.
VSYNC + (V backporch - 2) lines

30.5.4 Burst Controlled Oscillator (BCO)

The BCO extracts the color burst signal from the composite video signal and reproduces the color sub-carrier signal required for color demodulation. It also acquires the phase and frequency information from the color burst signal and detects the color system used.
Figure 30.31 shows the block diagram of the BCO.

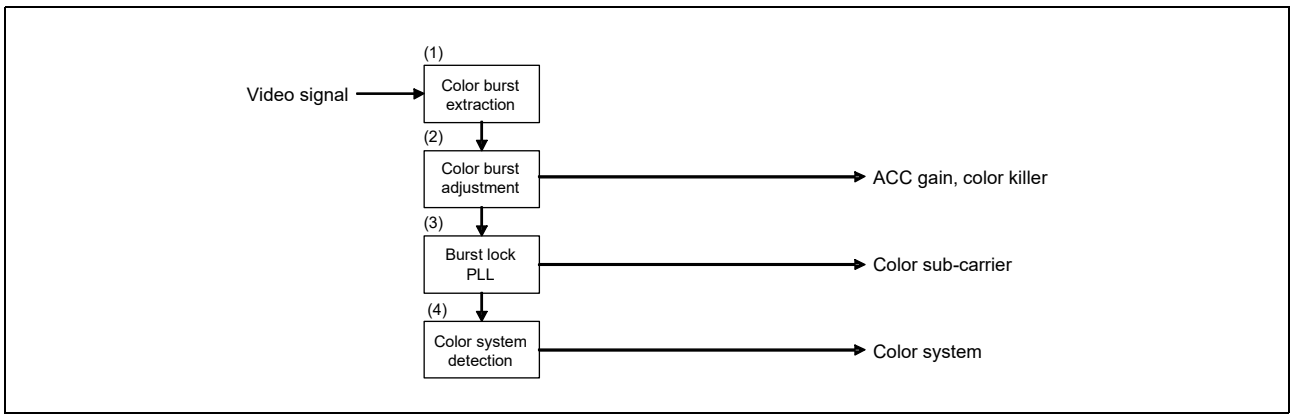

Figure 30.31 Block Diagram of Burst Controlled Oscillator

(1) Color Burst Extraction Block

The color burst extraction block extracts the color burst signal. The position of the color burst signal to be extracted can be adjusted using BTGPCR.BGPWIDTH[6:0] and BTGPCR.BGPSTART[7:0]. The extraction result of the color burst signal can be checked by reading CROMASR1.NOBURST.

(2) Color Burst Adjustment Block

The color burst adjustment block adjusts the amplitude of the extracted color burst signal. For details, refer to section 30.5.6 (1), Automatic Color Control (ACC) Block. This block also outputs the signal to turn on or off the color killer according to the amplitude of the input color burst signal. For details, refer to section 30.5.6 (2), Color Killer.

(3) Burst Lock PLL

The burst lock PLL is a digital PLL which reproduces the color sub-carrier signal from the adjusted color burst signal. The lock range of the burst lock PLL can be set using BTLCR.LOCKRANGE[1:0]. If the burst lock PLL is locked, CROMASR1.FSCLOCK becomes 1; and if unlocked, CROMASR1.FSCLOCK becomes 0.
The loop gain of the burst lock PLL can be set using BTLCR.LOOPGAIN[1:0] and BTLCR.LOCKLIMIT[1:0]. As the response speed is increased and the frequency search is started earlier, the lockup time becomes shorter. However, the PLL becomes unstable and unlocked more easily due to noise.
The S/N of the color burst signal can be checked using CROMASR2.LOCKLEVEL[7:0].

(4) Color System Detection Block

The color system detection block detects the color system of the input video signal based on the oscillation frequency of the burst lock PLL and phase information of the color burst signal. The color system can be detected using BTLCR.NONTSC358, BTLCR.NONTSC443, BTLCR.NOPALM, BTLCR.NOPALN, BTLCR.NOPAL443, and BTLCR.NOSECAM. Color system detection can be set to fully automatic, manual, or semi-automatic (detecting the specified color system only). If the detection result does not apply to any color system type, the color system selected with BTLCR.DEFAULTSYS[1:0] is assumed.
When an NTSC, PAL, or SECAM signal is detected, 1 is read from CROMASR2.ISNTSC, CROMASR2.ISPAL, or CROMASR2.ISSEAM, respectively. The currently used color system can be checked by reading CROMASR1.COLORSYS[1:0].
The color sub-carrier frequency can be checked by reading CROMASR1.FSCMODE.

30.5.5 Y/C Separator Circuit

The Y/C separator circuit separates the composite video signal of the NTSC, PAL, or SECAM format into the Y and C signals. Two-dimensional adaptive separation is used for NTSC and PAL and one-dimensional separation for SECAM. Figure 30.32 shows a block diagram of the Y/C separator circuit.

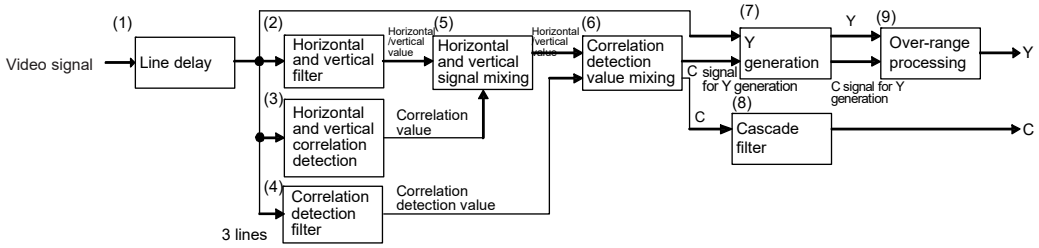

Figure 30.32 Block Diagram of Y/C Separator Circuit

Table 30.36 shows the operation of the Y/C separator circuit for each color format.

Table 30.36 Y/C Separation Operation for Each Color Format

Color Format	YC Separation Operation
NTSC-3.58	Two dimensional
NTSC-4.43	Two dimensional
PAL-M	Two dimensional
PAL-N	Two dimensional
PAL-4.43	Two dimensional
SECAM	One dimensional

(1) Line Delay Block

In two-dimensional Y/C separation, three lines of data is required (directly adjacent three lines for NTSC and adjacent three lines on every second line for PAL). This block delays video signals to hold three lines of data.

(2) Horizontal and Vertical Filter Block

In two-dimensional adaptive Y/C separation, the horizontal band pass filter (BPF), vertical band pass filter (BPF), and horizontal/vertical band pass filter (BPF) are adaptively switched according to the correlation between the horizontally-/vertically-adjacent pixels. This block processes the input signals using the horizontal BPF, vertical BPF, or horizontal/vertical BPF. In one-dimensional Y/C separation, only the horizontal BPF is used. Figure 30.33 shows the filter configuration.

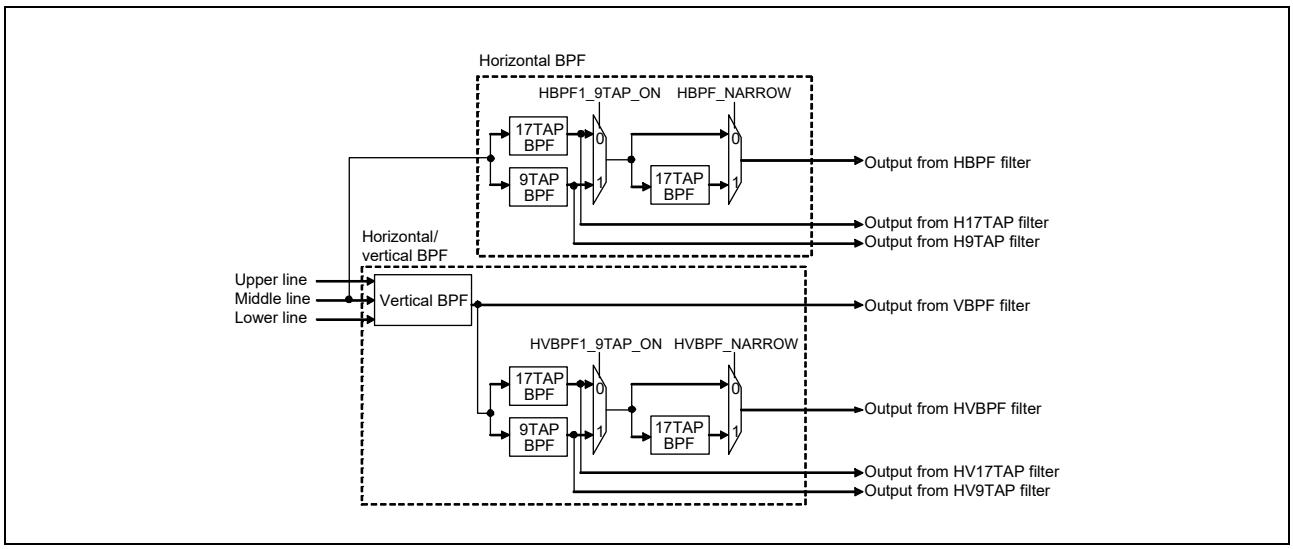

Figure 30.33 Horizontal and Vertical Filter Configuration

The horizontal BPF is composed of two stages. Either the 9-TAP or 17-TAP BPF is selected at the former stage. When YCSCR8.HBPF1_9TAP_ON/HVBPF1_9TAP_ON is 0, the 17-TAP BPF is selected; and when 1, the 9-TAP BPF is selected. Either bypass operation or the 17-TAP BPF is selected at the latter stage. When YCSCR8.HBPF_NARROW/HVBPF_ NARROW is 0, bypass operation is selected; and when 1, the 17-TAP BPF is selected.

(3) Horizontal and Vertical Correlation Detection Block

The horizontal and vertical correlation detection block detects the correlation value between the horizontal pixels, vertical pixels, and horizontal/vertical pixels. The value obtained by mixing the detected correlation value and the two-dimensional Y/C separation filter select coefficient is used for selecting the appropriate horizontal, vertical, or horizontal/vertical filter.
Table 30.37 shows the two-dimensional Y/C separation filter select coefficients.

Table 30.37 Two-Dimensional Y/C Separation Filter Select Coefficients

Category	Bit Name	Description	Bit Correlation
Vertical Y/C separation select coefficients	YCSCR5.K21A[5:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	There is correlation between these bits. When horizontal dot crawl is conspicuous, make the bit field value smaller (make the K24 value larger). However, when the value is too small (K24 is too large), vertical dot crawl is produced.
	YCSCR5.K22A[7:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	
	YCSCR7.K23A[3:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	
	YCSCR7.K24[4:0]	As the value becomes larger, the vertical BPF is applied to the wider range.	
	YCSCR6.K21B[5:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	There is correlation between these bits. When horizontal dot crawl is conspicuous, make the bit field value smaller. However, when the value is too small, vertical dot crawl is produced.
	YCSCR6.K22B[7:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	
	YCSCR7.K23B[3:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	
Horizontal Y/C separation select coefficients	YCSCR3.K11[5:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	There is correlation between these bits. When vertical dot crawl is conspicuous, make the bit field value smaller. However, when the value is too small, horizontal dot crawl is produced.
	YCSCR3.K13[5:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	
	YCSCR3.K15[3:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	
	YCSCR4.K12[5:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	There is correlation between these bits. When vertical dot crawl is conspicuous, make the bit field value smaller. However, when the value is too small, horizontal dot crawl is produced.
	YCSCR4.K14[5:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	
	YCSCR4.K16[3:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	

(4) Correlation Detection Filter Block

The correlation detection filter block, specific to this module, attaches greater importance to the correlation between lines to reduce dot crawl, especially at the intersection of a cross. By mixing the signals after correlation detection filter block, dot crawl can be reduced when dot crawl is not fully removed by the horizontal and vertical filter block.

(5) Horizontal and Vertical Signal Mixing Block

The horizontal and vertical signal mixing block mixes the signals output from the horizontal, vertical, and horizontal/vertical filter blocks with the signals output from the horizontal and horizontal/vertical filters of the former stage. After that, the appropriate signal is selected from among the signals output from the horizontal, vertical, and horizontal/vertical filters according to the correlation value obtained using (3). Figure 30.34 shows the configuration of the horizontal and vertical signal mixing block.

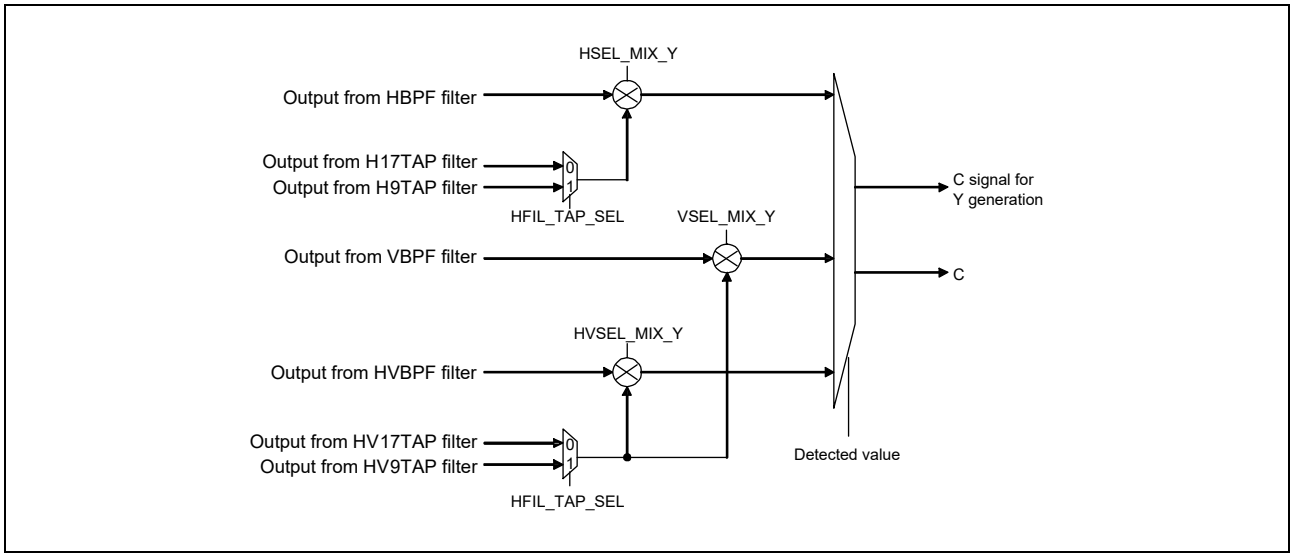

Figure 30.34 Configuration of Horizontal and Vertical Signal Mixing Block

The signal to be mixed, which is output from either the horizontal or horizontal/vertical filter of the former stage, can be selected with YCSCR8.HFIL_TAP_SEL. When YCSCR8. HFIL_TAP_SEL is 0, the signal output from the 17-TAP filter is selected; and when 1, the signal output from the 9-TAP filter is selected.
This block mixes the signals output from the horizontal filter with the signals output from the above described horizontal filter of the former stage. The mixing ratio can be set with YCSCR9.HSEL_MIX_Y[3:0]. Similarly, this block mixes the signals output from the vertical or horizontal/vertical filter with the signals output from the above described horizontal/vertical filter of the former stage. The mixing ratio can be set with YCSCR9.VSEL_MIX_Y[3:0] and YCSCR9.HVSEL_MIX_Y[3:0].
This block selects the appropriate signal from among the signals output from the horizontal, vertical, and horizontal/vertical filters according to the correlation value obtained using (3).

(6) Correlation Detection Value Mixing Block

The correlation detection value mixing block mixes the C signal for Y generation and the C signal generated using (5) with the signals after correlation detection filter block (4).
Figure 30.35 shows the configuration of the correlation detection value mixing block.

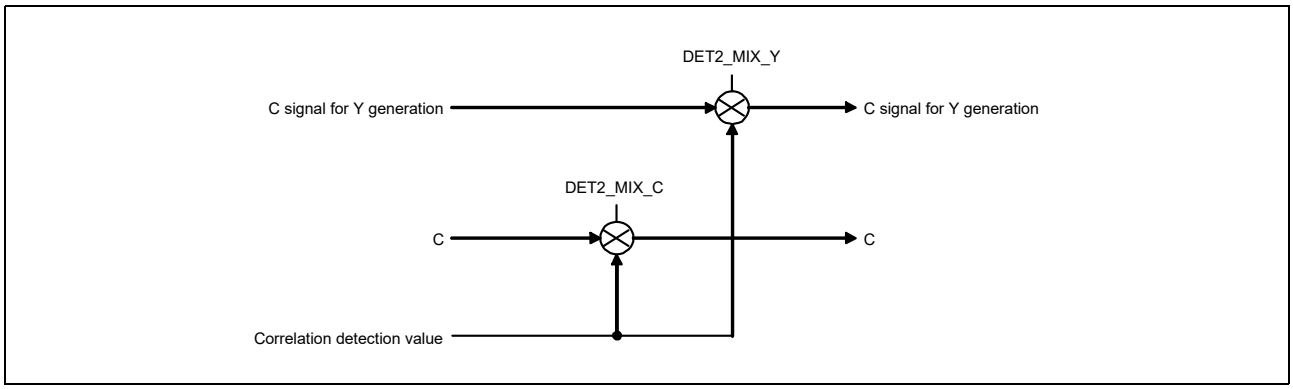

Figure 30.35 Configuration of Correlation Detection Value Mixing Block

When YCSCR9.DET2_ON is 1, this block mixes the signal after the correlation detection filter block. The mixing ratio of the C signal for Y generation to the signal after the correlation detection filter block can be set with YCSCR12.DET2_MIX_Y[3:0]. Similarly, the mixing ratio of the C signal to the signal after the correlation detection filter block can be set with YCSCR12.DET2_MIX_C[3:0].

When YCSCR9.DET2_ON is 0, this block outputs the signal after the horizontal and vertical filter block without mixing.

(7) Y Generation Block

The Y generation block generates the Y signal by subtracting the C signal for Y generation from the video signal.

(8) Cascade Filter Block

The cascade filter block allows the C signal to pass through the cascade filter or TAKE-OFF filter to further narrow the bandwidth.
Figure 30.36 shows the configuration of the cascade filter block.

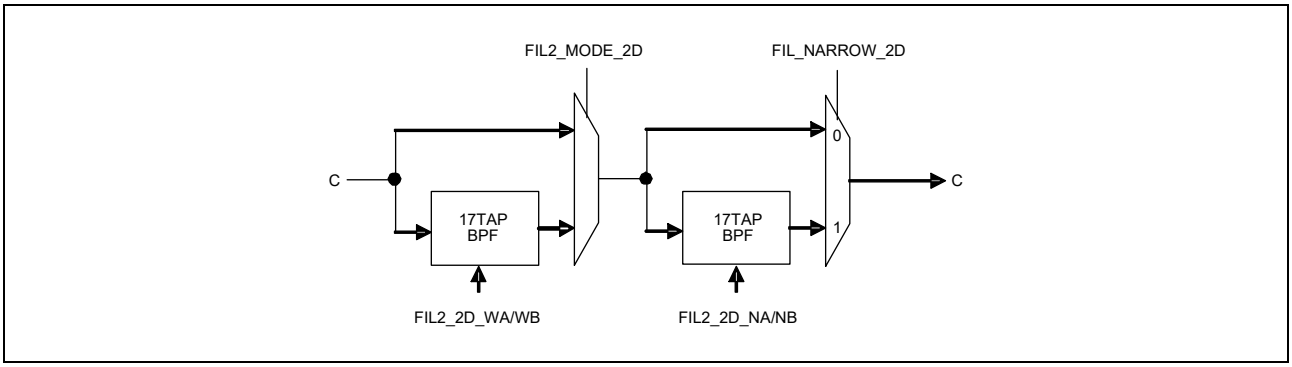

Figure 30.36 Configuration of Cascade Filter Block

The cascade filter block is composed of two stages. Either bypass operation or 17-TAP filter is selected at the former stage. Bypass operation, cascade, or TAKE-OFF filter can be selected at the former stage with YCSCR12.FIL2_MODE_2D[1:0].
Similarly, either bypass operation or 17-TAP filter can be selected at the latter stage with YCSCR12.FIL2_NARROW_2D.
Both of the former- and latter-stage filters are universal and can be set with YCTWA_F0 to YCTWA_F8, YCTWB_F0 to YCTWB_F8, YCTNA_F0 to YCTNA_F8, and YCTNB_F0 to YCTNB_F8.
Table 30.38 to Table 30.40 show the recommended setting for each filter.

(9) Over-Range Control Block

If overflow or underflow occurs at the top or bottom of the color amplitude of video signals, Y/C separation may not be correctly performed thus causing vertical lines to appear as dot crawl. To reduce this phenomenon, the over-range control block automatically inserts the low-pass filter for Y signals (cuts off the frequency components of the vertical lines)
Setting RGORCR7.UCMP_SW to 1 enables over-range control, and setting RGORCR7.DCMP_SW to 1 enables under-range control. One of four over-range levels can be set with RGORCR1.RADJ_O_LEVEL0[9:0], RGORCR3.RADJ_O_LEVEL1[9:0], and RGORCR5.RADJ_O_LEVEL2[9:0]. Similarly, one of four under-range levels can be set with RGORCR2.RADJ_U_LEVEL0[9:0], RGORCR4.RADJ_U_LEVEL1[9:0], and RGORCR6.RADJ_U_LEVEL2[9:0]. The filter to be inserted is appropriately selected according to the over-range and under-range levels.
Setting HWIDE_SW to 1 enables detection of the maximum (minimum) level of five pixels in the horizontal direction in addition to the currently processed pixel to detect over-range or under-range occurrence.

30.5.6 Chroma Decoding Circuit

The chroma decoding circuit demodulates the C signal extracted by the Y/C separator circuit into the Cb/Cr signal. This circuit has the automatic color control function (ACC), in which the amplitude of the color burst signal is detected to adjust the color gain automatically and also has the TINT/R-Y axis correction function, in which hue is adjusted at demodulation.

Figure 30.37 shows the block diagram of the chroma decoding circuit.

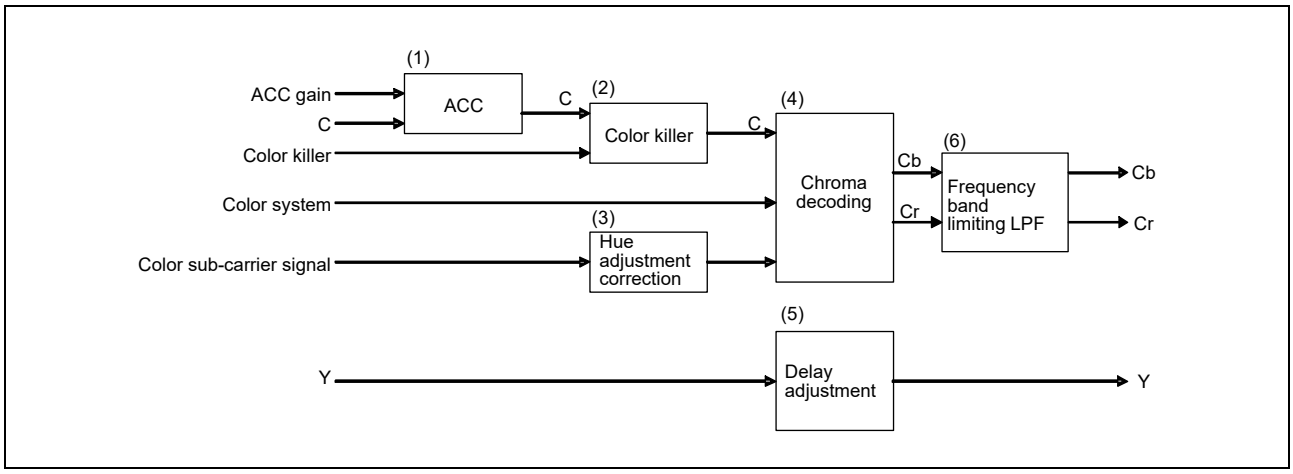

Figure 30.37 Block Diagram of Chroma Decoding Circuit

(1) Automatic Color Control (ACC) Block

The ACC block detects the amplitude of the color burst signal and automatically controls the C signal gain so that the amplitude should be controlled to the target value. The ACC function is activated with ACCCR1.ACCMODE = 0. The target amplitude of the color burst signal can be set with ACCCR1.ACCLEVEL[8:0]. The gain is fixed when the amplitude falls within ACCCR1.ACCLEVEL[8:0] ± ACCCR3.ACCPRECIS[5:0]. The maximum ACC gain can be controlled with ACCCR1.ACCMAXGAIN[1:0]. The currently set gain value can be checked by reading CROMASR1.ACCMAINGAIN[8:0] (main) and CROMASR1.ACCSUBGAIN[1:0] (sub).

The C signal gain can also be set manually by setting ACCCR1.ACCMODE to 1. The specific gain value can be set with ACCCR2.CHROMAMAINGAIN[8:0] (main) and ACCCR2.CHROMASUBGAIN[1:0] (sub).

(2) Color Killer

The color killer deletes color information when the color bust signal amplitude is small in a weak electric field. The color killer is turned on or off based on the hysteresis; specifically, it is turned on when the amplitude reaches the value set with ACCCR3.KILLERLEVEL[5:0] and turned off when the amplitude reaches the value determined by ACCCR3.KILLERLEVEL[5:0] + ACCCR1.KILLEROFFSET[3:0].

The color killer can also be turned on forcibly by so setting ACCCR3.KILLERMODE.

(3) Hue Adjustment Correction Block

The hue adjustment correction block adjusts the color sub-carrier signal phase to adjust the Cb/Cr hue after chroma decoding. This function can be used only for the NTSC and PAL systems. The phase of the demodulation axis is controlled with TINTCR.TINTMAIN[9:0] and the phase of the R-Y axis is controlled with TINTCR.TINTSUB[5:0].

(4) Chroma Decoding Block

The chroma decoding block demodulates the Cb/Cr signal from the C signal. Line averaging can be carried out before demodulation according to YCDCR.DEMODMODE[1:0] setting. YCDCR.DEMODMODE[1:0] should usually be set to 2 (two-line demodulation for PAL only; one-line demodulation for NTSC).

(5) Delay Adjustment Block

The delay adjustment block delays the Y signal to adjust the Y/C signal delay. The Y signal can be delayed by -16 to 15 clock pulses with YCDCR.LUMADELAY[4:0].

(6) Frequency Band Limiting LPF

The frequency band limiting LPF limits the frequency band of the Cb/Cr signal after chroma decoding. This LPF is turned on or off according to YCDCR.CHROMALPF setting.

30.5.7 Digital Clamp Circuit

The digital clamp circuit provides pedestal clamp for the Y signals and center clamp for the Cb/Cr signals at any position. This circuit also detects the amount of noise using the autocorrelation function.
Figure 30.38 shows the block diagram of the digital clamp circuit.

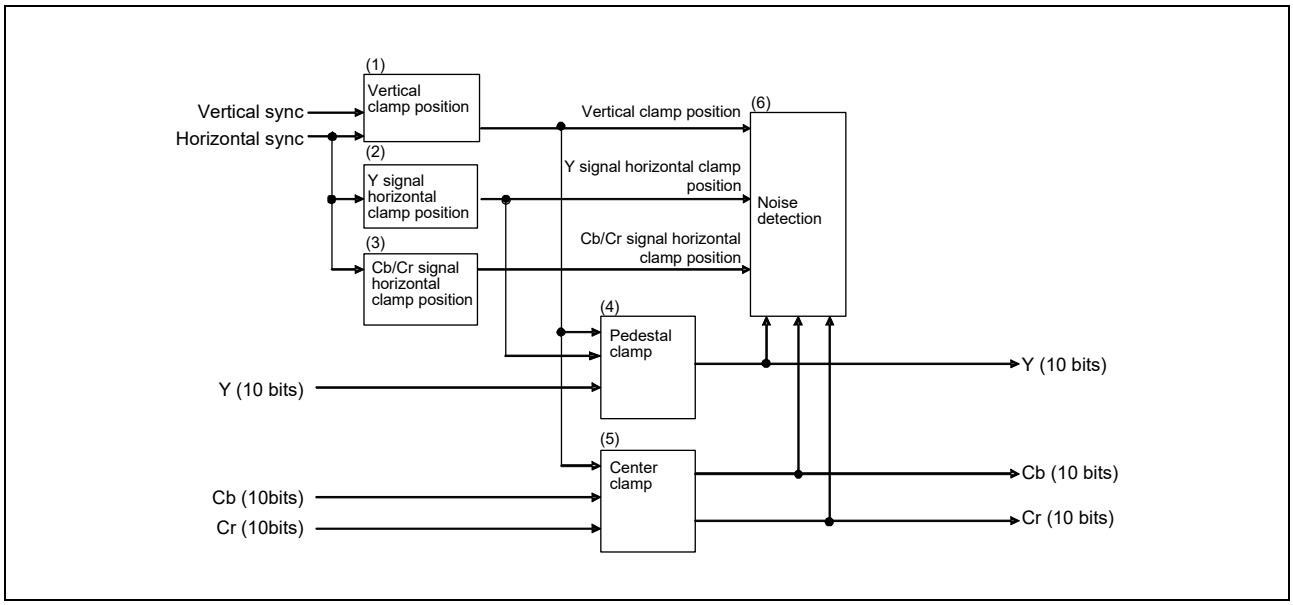

Figure 30.38 Block Diagram of Digital Clamp Circuit

(1) Vertical Clamp Position Control Block

The vertical clamp position can be set with DCPCR4.DCPSTART[5:0] and DCPCR5.DCPEND[5:0]. The setting is used in common to Y, Cb, and Cr signals.

(2) Y Signal Horizontal Clamp Position Control Block

The horizontal clamp start position of the Y signal can be set with DCPCR7.DCPPOS_Y[7:0]. The horizontal clamp width can be set with DCPCR6.DCPWIDTH[6:0].
The horizontal clamp width setting is used in common to Y, Cb, and Cr signals.

(3) Cb/Cr Signal Horizontal Clamp Position Control Block

The horizontal clamp start position of the Cb/Cr signal can be set with DCPCR8.DCPPOS_C[7:0]. The horizontal clamp width can be set with DCPCR6.DCPWIDTH[6:0].
The horizontal clamp width setting is used in common to Y, Cb, and Cr signals.

(4) Pedestal Clamp Control Block

The pedestal clamp control block stabilizes the Y signal pedestal level.
When DCPCR1.DCPMODE_Y is 0, the value set with DCPCR1.BLANKLEVEL_Y[9:0] is subtracted from the Y signal, which is expressed as:

Y signal output = Y signal input – DCPCR1.BLANKLEVEL_Y[9:0]

When DCPCR1.DCPMODE_Y is 1, the Y signal level detected at the set clamp position and DCPCR1.BLANKLEVEL_Y[9:0] are added together and the resulting value is subtracted from the Y signal, which is expressed as:

Y signal output = Y signal input – (detected value + DCPCR1.BLANKLEVEL_Y[9:0])

The detected value can be read from DCPSR1.CLAMPLEVEL_Y[9:0].
The clamp response speed can be set with DCPCR3.DCPRESPONSE[2:0]. The setting is used in common to Y, Cb, and Cr signals.

(5) Center Clamp Control Block

The center clamp control block stabilizes the Cb/Cr signal center level.
When DCPCR2.DCPMODE_C is 0, the value set with DCPCR2.BLANKLEVEL_CB/ DCPCR2.BLANKLEVEL_CR[5:0] is subtracted from the Cb/Cr signal, which is expressed as:

Cb signal output = Cb signal input – DCPCR2.BLANKLEVEL_CB[5:0]
Cr signal output = Cr signal input – DCPCR2.BLANKLEVEL_CR[5:0]

When DCPCR2.DCPMODE_C is 1, the Cb/Cr signal level detected at the set clamp position and DCPCR2.BLANKLEVEL_CB/DCPCR2.BLANKLEVEL_CR[5:0] are added together and the resulting value is subtracted from the Cb/Cr signal, which is expressed as:

Cb signal output = Cb signal input – (detected value + DCPCR2.BLANKLEVEL_CB[5:0])
Cr signal output = Cr signal input – (detected value + DCPCR2.BLANKLEVEL_CR[5:0])

The detected value can be read from DCPSR1.CLAMPLEVEL_CB[5:0] and DCPSR2.CLAMPLEVEL_CR[5:0].
The clamp response speed can be set with DCPCR3.DCPRESPONSE[2:0]. The setting is used in common to Y, Cb, and Cr signals.

(6) Noise Detection Block

Using the autocorrelation function, the noise amount at the set clamp position can be detected. With NSDCR.ACFINPUT[1:0], either Y, Cb, or Cr signal can be selected for which to calculate the autocorrelation function. The delay time for autocorrelation function calculation can be set with NSDCR.ACFLAGTIME[4:0] and accumulated field amount of autocorrelation function can be set with NSDCR.ACFFILTER[1:0]. The autocorrelation function (correlation coefficient) can be read from NSDSR.ACFSTRENGTH[15:0].

30.5.8 Output Control Circuit

The output control circuit sets the signal capturing position and adjusts the contrast and color.
Figure 30.39 shows the block diagram of the output control circuit

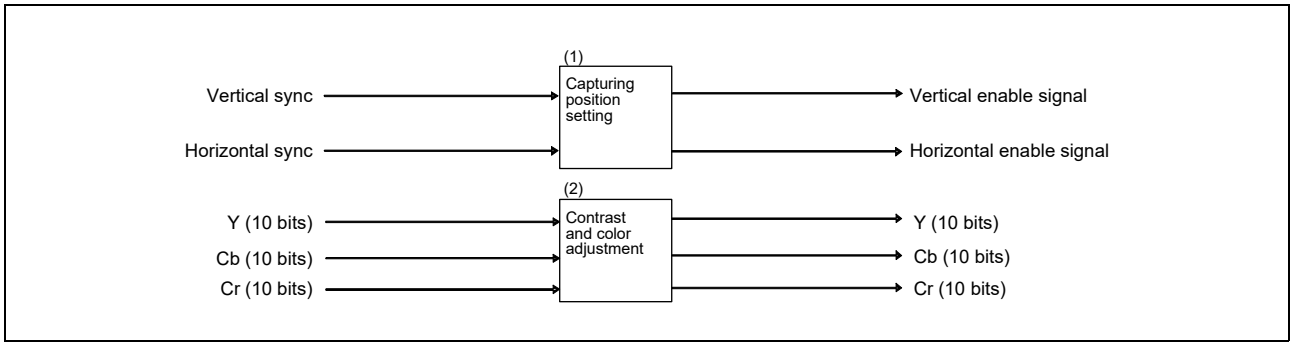

Figure 30.39 Block Diagram of Output Control Circuit

(1) Capturing Position Setting Block

The capturing position setting block sets the position to capture the input video signals. The position can be set with TGCR1.SRCLEFT[8:0], TGCR2.SRCTOP[5:0], TGCR2.SRCHEIGHT[9:0], and TGCR3.SRCWIDTH[10:0]. These settings are applied only to this module. To set the display size of the input video signals, the vertical capture size register (SCL0_DS2) and horizontal capture size register (SCL0_DS3) of the scaler of video display controller 5 should be used.

(2) Contrast and Color Adjustment Block

The contrast and color adjustment block adjusts the gain of the output Y/Cb/Cr signals. The contrast (Y signal gain) can be adjusted with YGAINCR.Y_GAIN2[9:0] and the color (Cb/Cr signal gain) can be adjusted with CBGAINCR.CB_GAIN2[9:0] and CRGAINCR.CR_GAIN2[9:0].

30.6 Recommended Setting

Table 30.41 and Table 30.42 show the recommended setting for this module.

30.7 Connection Example

Figure 30.40 shows a pin connection example of this module.

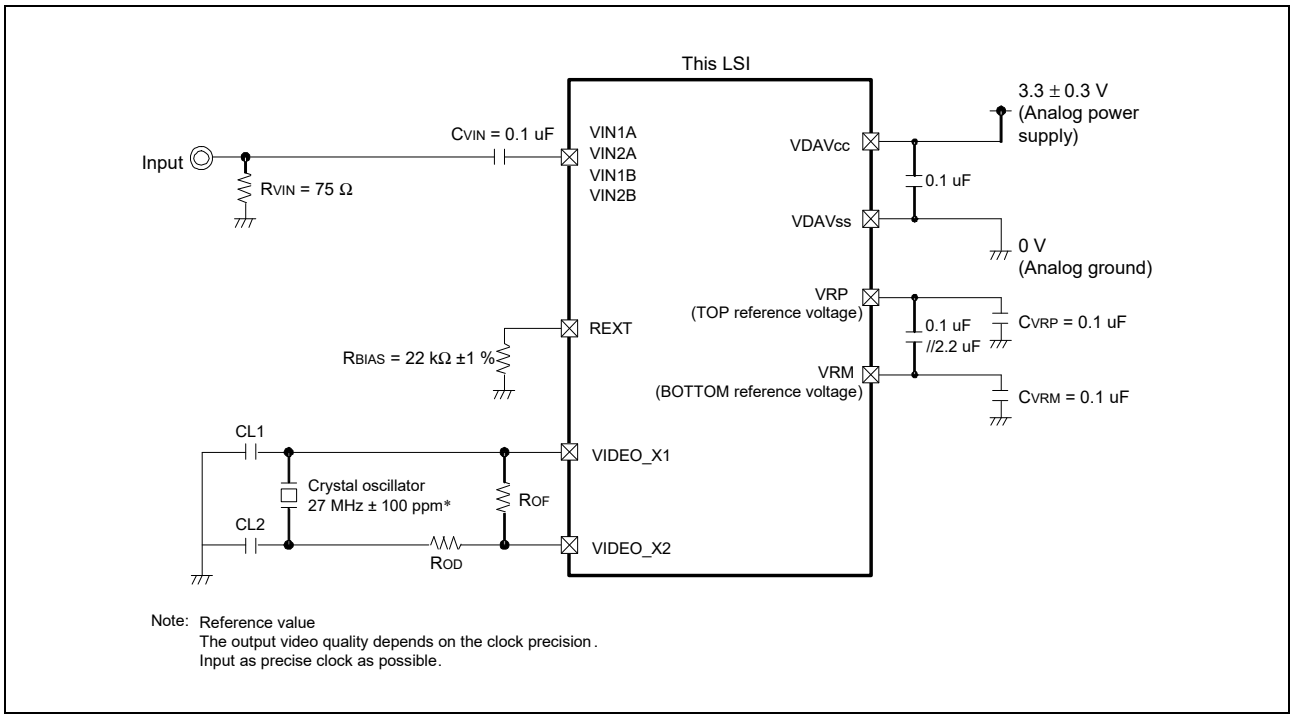

Figure 30.40 Pin Connection Example

31. Video Display Controller 5 (1): Overview

31.1 Features

The video display controller 5 consists of the following seven blocks. For the image synthesis, two planes of video image + two graphics planes, one plane of video image + three graphics planes, or four graphics planes can be selected.

1. Input controller: Input video image selection, sync signal adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix
2. Scaler: Scale up, scale down, and rotation of input video images using the frame buffer, and repeated recording of the specified number of fields in the frame buffer
3. Image quality improver: Black stretch, LTI/sharpness, and YCbCr ↔ GBR conversion using a color matrix
4. Image synthesizer: Synthesis of two planes of video image + two graphics planes, one plane of video image + three graphics planes, or four graphics planes
5. Output image generator: Writing and reading of image data to and from the frame buffer after the image synthesis
6. Output controller: Brightness/contrast adjustment, gamma correction, dither processing, output format conversion, control signal output for TFT-LCD panel
7. System controller: Interrupt control, panel clock control, CLUT table select signal status flag output

The functions of video display controller 5 are listed in Table 31.1.

Table 31.1 Features of Video Display Controller 5

Item	Function
Operating frequency	Video input clock: 27/54 MHz (for video image), 87 MHz or less (for RGB/YCbCr video image) Panel clock: 87 MHz or less (depends on the panel specifications)
Input video image specification	• 8-bit input conforming to ITU-R BT.656 standard (27 MHz, interlace signal) • 8-bit input conforming to ITU-R BT.656 extended standard (54 MHz, progressive signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (27 MHz, interlace signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (54 MHz, progressive signal) *1 • 16-bit input conforming to ITU-R BT.601 extended standard (13.5 MHz, interlace signal) *1 • Digital pin input: YCbCr422, YCbCr444, RGB888, RGB666, and RGB565 video image • Digital pin input size: Maximum input video image size to be set *2: 1440 pixels × 1024 lines (horizontal × vertical) Notes:1. The ITU-R BT.656 and 601 standards do not include the description regarding the progressive signal. The ITU-R BT.601 standard does not include the description regarding the connection interface. 2. Depends on the AC characteristics of the connected device. • Examples of input video image size: WXGA (1280 × 768), XGA (1024 × 768), SVGA (800 × 600), WVGA (800 × 480), VGA (640 × 480), WQVGA (480 × 240), QVGA in landscape (320 × 240), QVGA in portrait (240 × 320)
Video image recording function	• Storing the video image in the YCbCr422/YCbCr444/RGB565/RGB888 format at a rate of 1/1, 1/2, 1/4, or 1/8 field. • Maximum video image size to be stored: ×1 size of input video image
Video image quality adjustment function	Contrast adjustment, brightness adjustment, horizontal noise reduction, black stretch, LTI/sharpness
Video image scaling processing	Vertical: ×1/8 to ×8, linear/hold interpolation Horizontal: ×1/8 to ×8, linear/hold interpolation IP conversion can be performed by adjusting the initial phase.
Video image rotation function	• 0/90/180/270 degree rotation in the YCbCr422/RGB565 format • Horizontal mirroring in the YCbCr422/YCbCr444/RGB565/RGB888 format

Table 31.1 Features of Video Display Controller 5

Item	Function
Graphics	• Number of graphic planes: Four planes (graphics 0, graphics 1, graphics 2, and graphics 3) • Supported pixel formats: - RGB565 progressive format (α: none, R: 5 bits, G: 6 bits, B: 5 bits; 16 bits in total) - RGB888 progressive format (α: none, R: 8 bits, G: 8 bits, B: 8 bits; 24 bits in total) - α RGB1555 progressive format (α: 1 bit, R: 5 bits, G: 5 bits, B: 5 bits; 16 bits in total) - α RGB4444 progressive format (α: 4 bits, R: 4 bits, G: 4 bits, B: 4 bits; 16 bits in total) - α RGB8888 progressive format (α: 8 bits, R: 8 bits, G: 8 bits, B: 8 bits; 32 bits in total) - RGBα5551 progressive format (R: 5 bits, G: 5 bits, B: 5 bits, α: 1 bit; 16 bits in total) - RGBα8888 progressive format (R: 8 bits, G: 8 bits, B: 8 bits, α: 8 bits; 32 bits in total) - CLUT8 progressive format (CLUT: 8 bits) - CLUT4 progressive format (CLUT: 4 bits) - CLUT1 progressive format (CLUT: 1 bits) - YCbCr422 progressive format (Y: 8 bits, Cb/Cr: 8 bits; 16 bits in total) (only for graphics 0 and 1) - YCbCr444 progressive format (Y: 8 bits, Cb/Cr: 8 bits; 16 bits in total) (only for graphics 0 and 1) • Maximum image size to be read: 1440 pixels × 1440 lines (horizontal × vertical)
Graphics function	Alpha blending in rectangular area: Mixes images according to transparency rate α in the specified area (fade-in and fade-out functions are available.) Chroma-key: Mixes images using the specified RGB color and CLUT value according to transparency rate α. Alpha blending in one pixel units: Mixes images according to transparency rate α when the target graphics image is in the αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, or CLUT8/4/1 format.
	For each dot, the priority among the α values of the above functions is as follows: Alpha blending in rectangular area > Chroma-key > Alpha blending in one pixel units
Output video image size	Maximum output video image size to be set*: 1999 pixels × 2035 lines (horizontal × vertical) Note: * Depends on the AC characteristics of the display panel. Examples of output video image size: • WXGA (1280 × 768), XGA (1024 × 768) • SVGA (800 × 600), WVGA (800 × 480), • VGA (640 × 480), WQVGA (480 × 240), • QVGA size in landscape (320 × 240) • QVGA size in portrait (240 × 320)
Output video image format	• RGB888 progressive video output (24-bit parallel output) • RGB666 progressive video output (18-bit parallel output) • RGB565 progressive video output (16-bit parallel output) • RGB888 progressive video output (8-bit serial output)
Panel output adjustment	Panel brightness/contrast adjustment, RGB gamma correction, dither processing, output format conversion
Sync signal output	Control signal output for the TFT-LCD panel
Interrupt output	• Vsync signal for video image input/output • Line interrupt output (can be output on a desired line.) • Erroneous Vsync cycle detection signal for video input • Field write completion signal • Overflow/underflow signal for the internal buffer

31.2 Block Diagram

Figure 31.1 and Figure 31.2 show the entire block diagram of this module. This LSI incorporates two video display controllers (channels 0 and 1), to each of which the video signal is input from the corresponding video decoder. Each controller can also fetch output from the input control block of the other controller. For details, see the description of each block.

LCD0_TCON 6 to LCD0_TCON 0	Output	Control signal 0 for panel	Panel output 0 timing control pin
LCD0_EXTCLK	Input	Panel clock source 0	Panel clock source 0 input pin

Table 31.3 Input/Output Pins (Channel 1)

Symbol	I/O	Pin Name	Function
DV1_CLK	Input	External input clock 1	External input 1 clock pin
DV1_VSYNC	Input	External input Vsync 1	External input 1 Vsync signal pin
DV1_HSYNC	Input	External input Hsync 1	External input 1 Hsync signal pin
DV1_DATA 7 to DV1_DATA 0	Input	External input video image data 1	External input 1 video image data pin
LCD1_CLK	Output	Panel clock 1	Panel output 1 clock pin
LCD1_DATA 23 to LCD1_DATA 0	Output	Video image data 1 for panel	Panel output 1 video image data pin
LCD1_TCON 6 to LCD1_TCON 0	Output	Control signal 1 for panel	Panel output 1 timing control pin
LCD1_EXTCLK	Input	Panel clock source 1	Panel clock source 1 input pin

31.4 Clocks

There are two clocks to be mainly used by the video display controller 5: the video image clock and pixel clock.

The video image clock is used while the video image is processed in the input controller, passed to the scale-down control block in the scaler, and then written to the buffer (internal bus write control). When the INP_SEL bit is 0 (video decoder output selected) in INP_SEL_CNT of the input controller, the VIDEO_X1 clock (27 MHz) is used as the video image clock. When INP_SEL is 1 (external input pin selected), the DV_CLK clock is used as the video image clock.

The pixel clock is used in graphics read-out processing by the scaler (internal bus read controller) through output controller processing. When the parallel RGB output is selected in the output controller, the frequencies of the pixel clock and panel clock (LCD_CLK) are the same. The panel clock can be selected from the video clock, LCD_EXTCLK0, LCD_EXTCLK1, peripheral bus clock 1 (P1φ), and output clock from the LVDS PLL* with SYSCNT_PANEL_CLK.PANEL_ICKSEL[1:0] and SYSCNT_PANEL_CLK.PANEL_OCKSEL[1:0] of the system controller. When the serial RGB output (3/4 speed mode) is selected in the output controller, the pixel clock frequency is 1/3 or 1/4 the panel clock (LCD_CLK) frequency.

Note: * For details on the LVDS PLL, see section 40, LVDS Output Interface.

31.5 Hsync and Vsync Signals

Hsync and Vsync signals are generated by the synchronization control block of the scaler and output image generator. Since the Hsync and Vsync signals are used as the reference signals for the LCDTCON, which generates various panel driving timings, they are also the reference signals for the control signals (LCD_TCON6 to LCD_TCON0 pins) passed to the panel.

The output Hsync signal always operates at a free-running frequency. On the other hand, the output Vsync signal is selected from the external input and free-running Vsync signals.

31.5.1 External Input Vsync

(1) Operation Outline

In this mode, the output Vsync signal is generated according to an external input Vsync signal. The output Hsync signal is free running even in this mode. Figure 31.4 shows the timing of external input Vsync signal.

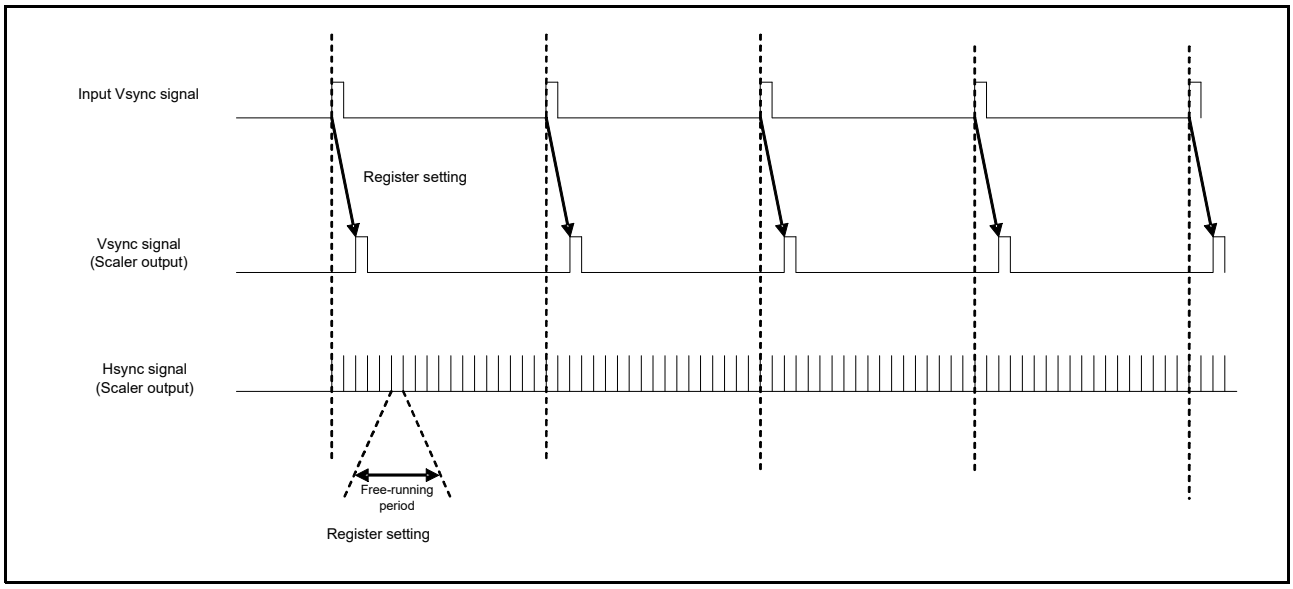

Figure 31.4 External Input Vsync Timing

(2) Notes

When Vsync is externally input, generation of the output Vsync signal is based on the external Vsync signal. That is, the output Vsync signal follows the input Vsync signal, so if an unstable Vsync signal is input, the output Vsync signal will also be unstable.

Since the output Hsync signal is generated according to the frequency generated by a free-running clock and the Vsync signal is generated from the video input as a base, the signals will not be in synchronization. This module adjusts the timing between these signals by adjusting the output Vsync signal so that it stays in time with the output Hsync signal. Therefore, even if the input Vsync signal is stable, the timing of the output Vsync signal may be increased or decreased by up to one line to stay in synchronization with the timing of the output Hsync signal.

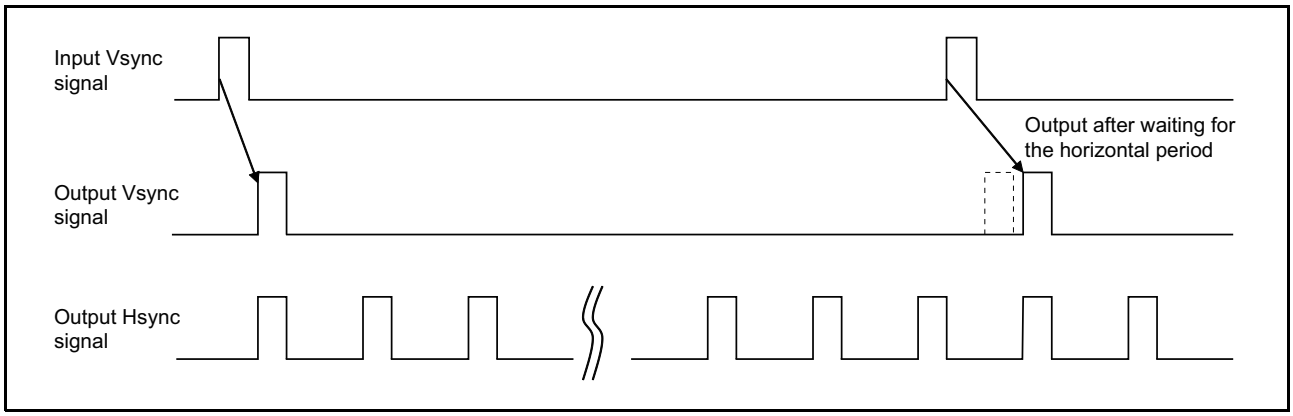

Figure 31.5 Detailed Timing Chart for Generation of the Output Vsync Signal

31.5.2 Free-Running Vsync

(1) Operation Outline

In this mode, the Vsync signal is generated according to the pixel clock (free running). The output Hsync signal is also free running. Figure 31.6 shows the timing.

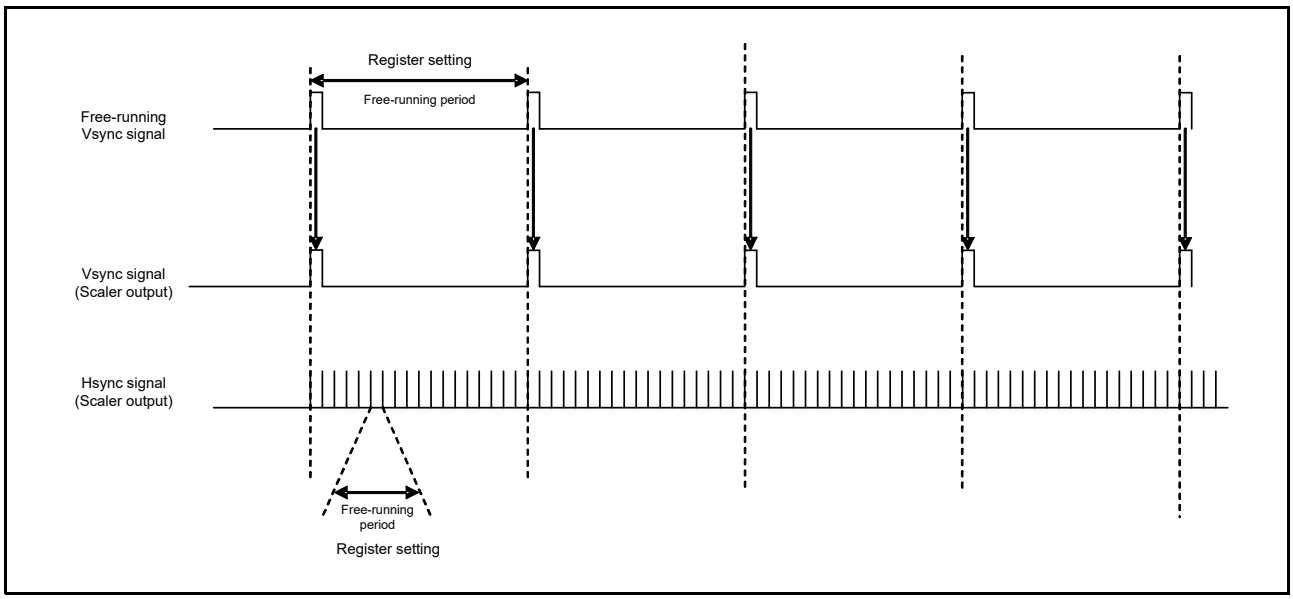

Figure 31.6 Free Running Vsync Timing

(2) Pointer Buffers

In free-running vertical synchronization mode, output of the input video image to a panel may lead to flicker in the output video image. This occurs when the input and output vertical sync signals are not in synchronization. To prevent this, use the pointer buffers to adjust the timing between the input and output video images in frame units. If the input Vsync signal is faster than the output Vsync signal, frames from the input video image are skipped in the output image for display. On the other hand, when the input Vsync signal is slower than the output Vsync signal, frames from the input video image are repeated. However, when the difference in timing between the input and output Vsync signals is too large, the pointer buffers cannot deal with the difference, so flicker may occur. As more buffers are used, the pointer buffers can deal with larger differences in frequency.

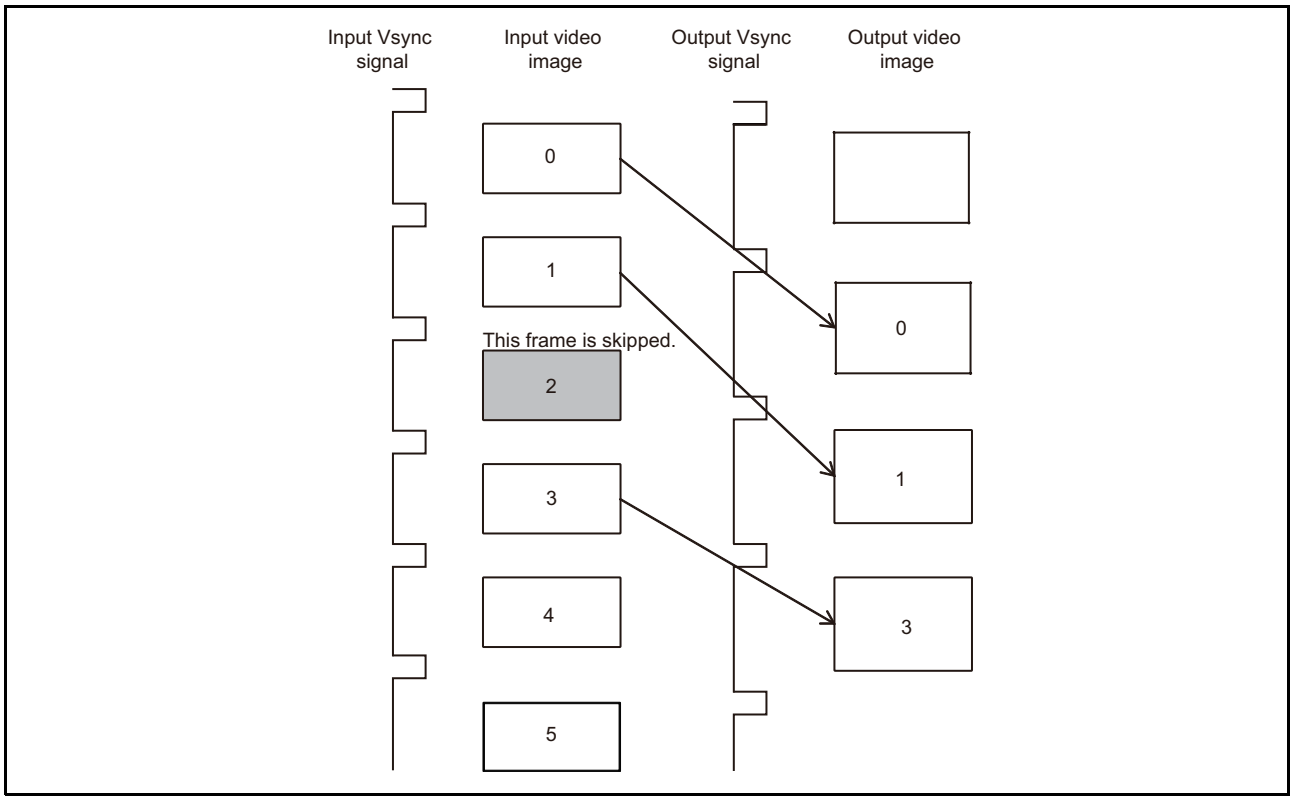

Figure 31.7 Timing when the Input Vsync Signal is Faster than the Output Vsync Signal

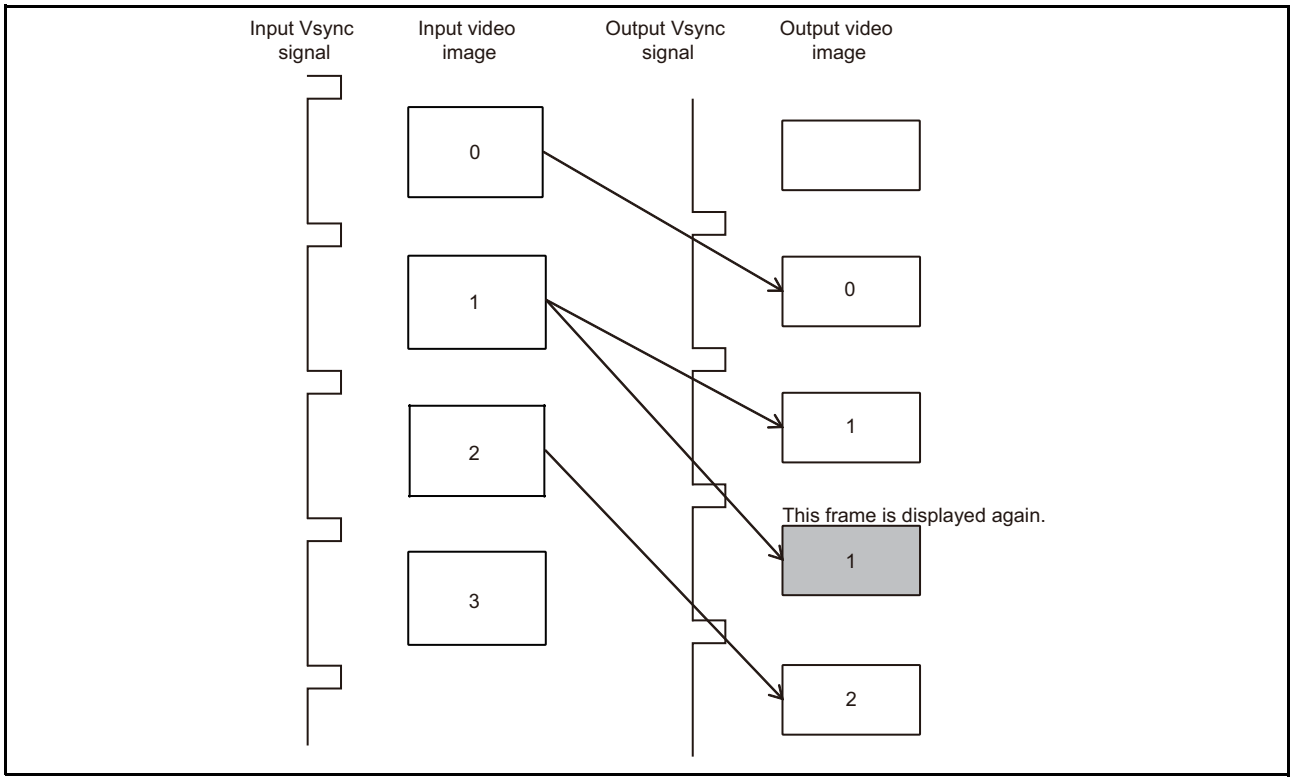

Figure 31.8 Timing when the Input Vsync Signal is Slower than the Output Vsync Signal

31.5.3 Blending Two Input Video Images

If images input from scalers 0 and 1 are to be combined, the output synchronization signals from the two scalers must be the same.

When the synchronization signals from scaler 0 are to serve as the standard, use the synchronization signals generated by scaler 0 as the output synchronization signals for scaler 1.

In this case, the timing of the vertical synchronization signal for the video input to scaler 1 will not be synchronized with that of the output vertical synchronization signal, which may lead to flickering of the output video.

Accordingly, use a pointer buffer to apply frame-buffer control in the same way as when scaler 1 is used with a free-running vertical synchronization signal.

Likewise, use a pointer buffer to apply frame-buffer control for scaler 0 when using the synchronization signals generated by scaler 1 as the standard.

Table 31.4 Vsync Signal When Blending Two Input Video Images

Standard output Sync signal	Scaler 0	Scaler 1
Scaler 0	Select from external or free-running Vsync signal	Sync signal generated by scaler 0 is selected and a pointer buffer handles frame buffer control.
Scaler 1	Sync signal generated by scaler 1 is selected and a pointer buffer handles frame buffer control.	Select from external or free-running Vsync signal

31.5.4 Usage Note on Changing Vsync Signal Selections

When the Vsync signal selection is changed, the output Vsync signal is discontinuous, resulting in disordered panel display. In this case, perform the mute processing according to the panel specification as necessary and change the Vsync signal selection.

32. Video Display Controller 5 (2): Input Controller

32.1 Input Controller Functions

32.1.1 Overview of Functions

The input controller selects either video decoder output signals or signals supplied via the external input pins, and subjects the signals to synchronization adjustment, horizontal noise reduction, contrast correction (dynamic range compression), and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix.

For contrast correction, refer to section 39, Dynamic Range Compression.

The functional block diagram of the input controller is shown below.

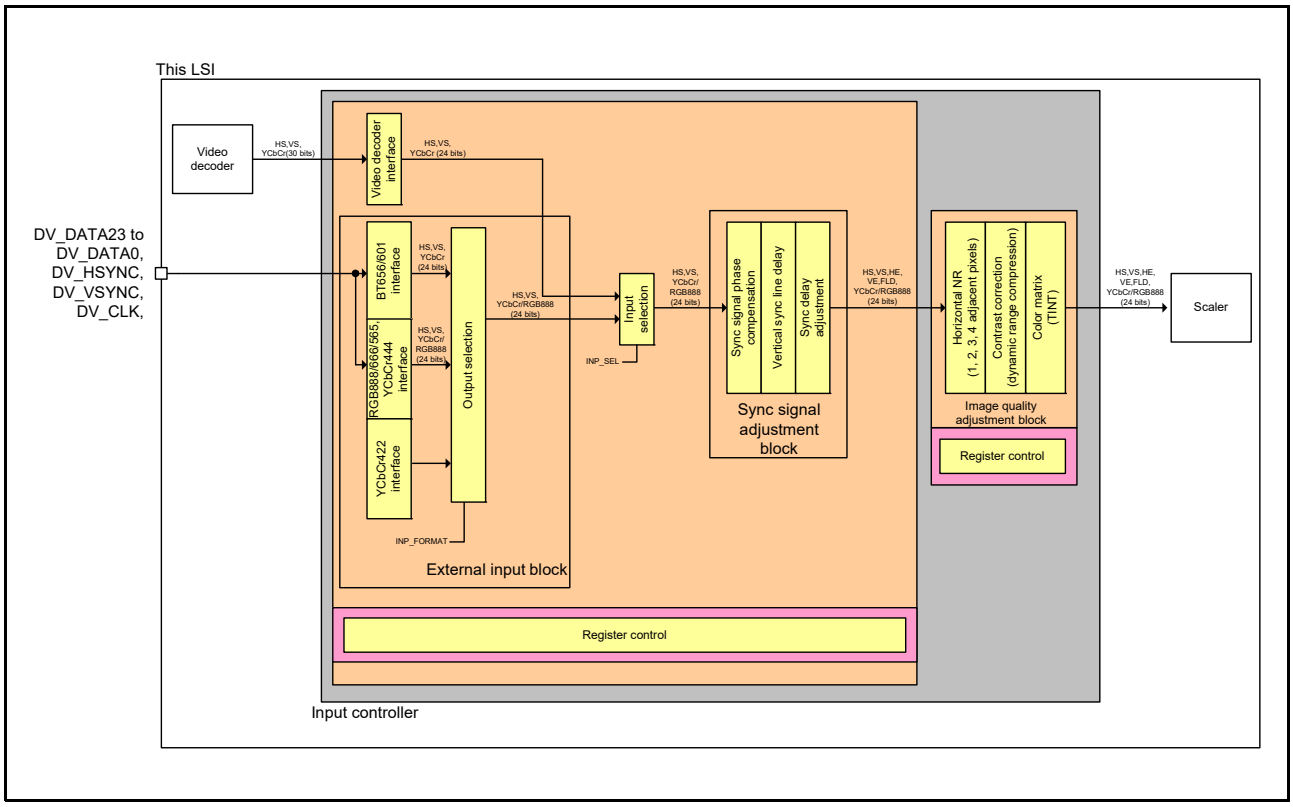

Figure 32.1 Functional Block Diagram of Input Controller

32.1.2 Updating Registers of External Signal Input Block and Sync Signal Adjustment Block

The control registers of the external input block and sync signal adjustment block are updated by setting the relevant update control bit to 1.

For the control registers other than the IMGCNT_DRC_REG register of the image quality adjustment block, the update timing is controlled using the Vsync signal.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 32.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
INP_UPDATE	INP_EXT_UPDATE	0	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
INP_UPDATE	INP_IMG_UPDATE	0	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.
IMGCNT_UPDATE	IMGCNT_VEN	0	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

32.1.3 Selecting Input Signals

The input controller selects either video decoder output signals or signals supplied via the external input pins.

Table 32.2 Input Signal Selection

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_SEL	0	Input Select 0: Video decoder output signals 1: Signals supplied via the external input pins

32.1.4 Controlling Externally Input Video Signals

The externally input video image signals in the YCbCr444, RGB888, RGB666, RGB565, BT656 (extended), BT601 (extended), YCbCr422 (the 16-bit data format of the BT601 standard) formats can be handled.

The BT656 signals can be used for the 525-line and 59.94-Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94-Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) BT656-extended progressive signals.

The BT601 signals can be used for the 8-bit data line 525-line and 59.94 Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94 Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) extended progressive signals.

The YCbCr422 signals can be used for the 16-bit data line 525-line and 59.94-Hz (13.5-MHz) or the 625-line and 50.00-Hz (13.5-MHz) BT601 interlace signals.

The above signals can be selected by the INP_FORMAT[2:0] bits. Bit endian change and B/R signal swap are controlled by setting the INP_ENDIAN_ON and INP_SWAP_ON bits.

Table 32.3 Externally Input Video Signal Control

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_FORMAT[2:0]	000	External Input Format Select 0: YCbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
INP_EXT_ SYNC_CNT	INP_ENDIAN_ON	0	External Input Bit Endian Change On/Off Control 0: Off 1: On
INP_EXT_ SYNC_CNT	INP_SWAP_ON	0	External Input B/R Signal Swap On/Off Control 0: Off 1: On

32.1.5 Selecting Clock Edge for Externally Input Signals

The clock edge for receiving the video image signals, Vsync signals, and Hsync signals is individually selected with the INP_PXD_EDGE, INP_VS_EDGE, INP_HS_EDGE bits.

Table 32.4 Externally Input Clock Edge Selection

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_PXD_EDGE	0	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_VS_EDGE	0	Clock Edge Select for Capturing External Input Vsync Signal DV_VSYNC 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_HS_EDGE	0	Clock Edge Select for Capturing External Input Hsync Signal DV_HSYNC 0: Rising edge 1: Falling edge

Figure 32.2 shows the typical input timing of externally input signals.

The input signals can be received at the rising edge of the clock signal DV_CLK when the INP_PXD_EDGE, INP_VS_EDGE, and INP_ES_EDGE bits are 0.

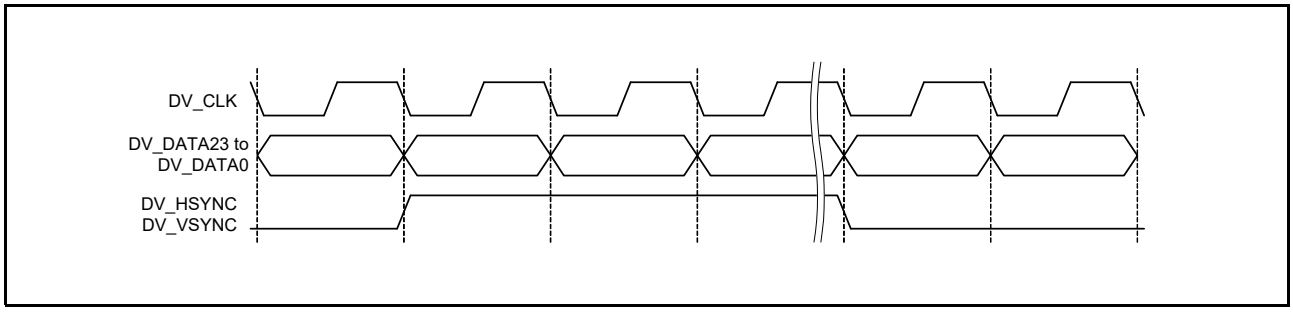

Figure 32.2 Typical Input Timing of Externally Input Signals (Clock Phase)

32.1.6 Externally Input Sync Signal Inversion Control

Inversion of polarity of the Vsync and Hsync signals can be controlled by the INP_VS_INV and INP_HS_INV bits.

Table 32.5 Sync Signal Inversion Control

Register Name	Bit Name	Initial Value	Description
INP_EXT_ SYNC_CNT	INP_VS_INV	0	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
INP_EXT_ SYNC_CNT	INP_HS_INV	0	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)

32.1.7 Bit Allocation of Externally Input Video Image Signals

Allocation of the externally input video image signal pins DV_DATA to the signals in each format is described below.

(1) YCbCr444/RGB888 Input

When the external input is of YCbCr444/RGB888 format, the video image signal pins DV_DATA are allocated to the internal signals Y/GOUT, Cb/BOUT, Cr/ROUT, as shown in Table 32.6.

Table 32.6 Bit Allocation of DV_DATA Pin Inputs when the External Input is of YCbCr444/RGB888

INP_FORMAT[2:0]	**0**	**0**	**0**	**0**
INP_ENDIAN_ON	**0**	**0**	**1**	**1**
INP_SWAP_ON	**0**	**1**	**0**	**1**
DV_DATA23	Cr/ROUT[7]	Cb/BOUT[7]	Cr/ROUT[0]	Cb/BOUT[0]
DV_DATA22	Cr/ROUT[6]	Cb/BOUT[6]	Cr/ROUT[1]	Cb/BOUT[1]
DV_DATA21	Cr/ROUT[5]	Cb/BOUT[5]	Cr/ROUT[2]	Cb/BOUT[2]
DV_DATA20	Cr/ROUT[4]	Cb/BOUT[4]	Cr/ROUT[3]	Cb/BOUT[3]
DV_DATA19	Cr/ROUT[3]	Cb/BOUT[3]	Cr/ROUT[4]	Cb/BOUT[4]
DV_DATA18	Cr/ROUT[2]	Cb/BOUT[2]	Cr/ROUT[5]	Cb/BOUT[5]
DV_DATA17	Cr/ROUT[1]	Cb/BOUT[1]	Cr/ROUT[6]	Cb/BOUT[6]
DV_DATA16	Cr/ROUT[0]	Cb/BOUT[0]	Cr/ROUT[7]	Cb/BOUT[7]
DV_DATA15	Y/GOUT[7]	Y/GOUT[7]	Y/GOUT[0]	Y/GOUT[0]
DV_DATA14	Y/GOUT[6]	Y/GOUT[6]	Y/GOUT[1]	Y/GOUT[1]
DV_DATA13	Y/GOUT[5]	Y/GOUT[5]	Y/GOUT[2]	Y/GOUT[2]
DV_DATA12	Y/GOUT[4]	Y/GOUT[4]	Y/GOUT[3]	Y/GOUT[3]
DV_DATA11	Y/GOUT[3]	Y/GOUT[3]	Y/GOUT[4]	Y/GOUT[4]
DV_DATA10	Y/GOUT[2]	Y/GOUT[2]	Y/GOUT[5]	Y/GOUT[5]
DV_DATA9	Y/GOUT[1]	Y/GOUT[1]	Y/GOUT[6]	Y/GOUT[6]
DV_DATA8	Y/GOUT[0]	Y/GOUT[0]	Y/GOUT[7]	Y/GOUT[7]
DV_DATA7	Cb/BOUT[7]	Cr/ROUT[7]	Cb/BOUT[0]	Cr/ROUT[0]
DV_DATA6	Cb/BOUT[6]	Cr/ROUT[6]	Cb/BOUT[1]	Cr/ROUT[1]
DV_DATA5	Cb/BOUT[5]	Cr/ROUT[5]	Cb/BOUT[2]	Cr/ROUT[2]
DV_DATA4	Cb/BOUT[4]	Cr/ROUT[4]	Cb/BOUT[3]	Cr/ROUT[3]
DV_DATA3	Cb/BOUT[3]	Cr/ROUT[3]	Cb/BOUT[4]	Cr/ROUT[4]
DV_DATA2	Cb/BOUT[2]	Cr/ROUT[2]	Cb/BOUT[5]	Cr/ROUT[5]
DV_DATA1	Cb/BOUT[1]	Cr/ROUT[1]	Cb/BOUT[6]	Cr/ROUT[6]
DV_DATA0	Cb/BOUT[0]	Cr/ROUT[0]	Cb/BOUT[7]	Cr/ROUT[7]

(2) RGB666 Input

When the external input is of RGB666 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 32.7.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB666 interface with the following formulae.

G[7:0] = GOUT[7:2] × 255 ÷ 63

B[7:0] = BOUT[7:2] × 255 ÷ 63

R[7:0] = ROUT[7:2] × 255 ÷ 63

Table 32.7 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB666

INP_FORMAT[2:0]	**1**	**1**	**1**	**1**
INP_ENDIAN_ON	**0**	**0**	**1**	**1**
INP_SWAP_ON	**0**	**1**	**0**	**1**
DV_DATA17	ROUT[7]	BOUT[7]	ROUT[2]	BOUT[2]
DV_DATA16	ROUT[6]	BOUT[6]	ROUT[3]	BOUT[3]
DV_DATA15	ROUT[5]	BOUT[5]	ROUT[4]	BOUT[4]
DV_DATA14	ROUT[4]	BOUT[4]	ROUT[5]	BOUT[5]
DV_DATA13	ROUT[3]	BOUT[3]	ROUT[6]	BOUT[6]
DV_DATA12	ROUT[2]	BOUT[2]	ROUT[7]	BOUT[7]
DV_DATA11	GOUT[7]	GOUT[7]	GOUT[2]	GOUT[2]

DV_DATA9	GOUT[5]	GOUT[5]	GOUT[4]	GOUT[4]
DV_DATA8	GOUT[4]	GOUT[4]	GOUT[5]	GOUT[5]
DV_DATA7	GOUT[3]	GOUT[3]	GOUT[6]	GOUT[6]
DV_DATA6	GOUT[2]	GOUT[2]	GOUT[7]	GOUT[7]
DV_DATA5	BOUT[7]	ROUT[7]	BOUT[2]	ROUT[2]
DV_DATA4	BOUT[6]	ROUT[6]	BOUT[3]	ROUT[3]
DV_DATA3	BOUT[5]	ROUT[5]	BOUT[4]	ROUT[4]
DV_DATA2	BOUT[4]	ROUT[4]	BOUT[5]	ROUT[5]
DV_DATA1	BOUT[3]	ROUT[3]	BOUT[6]	ROUT[6]
DV_DATA0	BOUT[2]	ROUT[2]	BOUT[7]	ROUT[7]

(3) RGB565 Input

When the external input is of RGB565 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 32.8.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB565 interface with the following formulae.

G[7:0] = GOUT[7:2] × 255 ÷ 63

B[7:0] = BOUT[7:3] × 255 ÷ 31

R[7:0] = ROUT[7:3] × 255 ÷ 31

Table 32.8 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB565

INP_FORMAT[2:0]	**2**	**2**	**2**	**2**
INP_ENDIAN_ON	**0**	**0**	**1**	**1**

DV_DATA3	BOUT[6]	ROUT[6]	BOUT[4]	ROUT[4]
DV_DATA2	BOUT[5]	ROUT[5]	BOUT[5]	ROUT[5]
DV_DATA1	BOUT[4]	ROUT[4]	BOUT[6]	ROUT[6]
DV_DATA0	BOUT[3]	ROUT[3]	BOUT[7]	ROUT[7]

(4) BT656/BT601 Input

When the external input is of BT656 or BT601 format, the video image signal pins DV_DATA are allocated to the internal signal BTOUT, as shown in Table 32.9.

The internal signal BTOUT to which the video image signal pins DV_DATA are allocated is expanded to the YCbCr signal.

For expansion to the YCbCr signal, see section 32.1.12, BT656/BT601/YCbCr422 Format Setting.

Table 32.9 Bit Allocation of DV_DATA Pin Inputs When the External Input is of BT656 or BT601

INP_FORMAT[2:0]	3 to 4	3 to 4
INP_ENDIAN_ON	0	1
INP_SWAP_ON	0	0
DV_DATA7	BTOUT[7]	BTOUT[0]
DV_DATA6	BTOUT[6]	BTOUT[1]
DV_DATA5	BTOUT[5]	BTOUT[2]
DV_DATA4	BTOUT[4]	BTOUT[3]
DV_DATA3	BTOUT[3]	BTOUT[4]
DV_DATA2	BTOUT[2]	BTOUT[5]
DV_DATA1	BTOUT[1]	BTOUT[6]
DV_DATA0	BTOUT[0]	BTOUT[7]

(5) YCbCr422 Input

When the external input is of YCbCr422 format, the video image signal pins DV_DATA are allocated to the internal signals Y and Cb/Cr, as shown in Table 32.10.

Table 32.10 Bit Allocation of DV_DATA Pin Inputs When the External Input is of YCbCr422

INP_FORMAT[2:0]	5	5	5	5
INP_ENDIAN_ON	0	0	1	1
INP_SWAP_ON	0	1	0	1
DV_DATA15	Y[7]	Cb/Cr[7]	Y[0]	Cb/Cr[0]
DV_DATA14	Y[6]	Cb/Cr[6]	Y[1]	Cb/Cr[1]
DV_DATA13	Y[5]	Cb/Cr[5]	Y[2]	Cb/Cr[2]

Figure 32.10 SAV/EAV Code in BT656 Format (525 Lines/59.94 Hz)

32.1.11 BT656 Progressive Format

This product can be connected with devices which output data in the BT656 progressive format. Because the standard for the BT656 format does not include description of output in the progressive format, there is no guarantee that this product is connected with devices which output data in the progressive format. The following description shows how to generate a vertical/horizontal synchronization signal by decoding the SAV/EAV code input via the BT656 interface of this module. Confirm the connection with devises which output data in the BT656 progressive format in accordance with this section.

(1) SAV/EAV Code

The SAV/EAV code consists of four words. When the first word is set to FF and the second and third words are set to 00, timing signals are generated by decoding the value of the fourth word (XY).

For bit information, see Table 32.12 in section 32.1.10, SAV/EAV Code in BT656 Format. This product does not refer to the parity bits (P3 to P0).

(2) Vertical/Horizontal Synchronization Signal

Based on the SAV/EAV code, the vertical/horizontal synchronization signal is generated.

(a) Vertical Synchronization Signal

The vertical synchronization signal is output when the value of the V bit is changed from 0 to 1 in the BT656 format. The timing of the output varies with the setting of INP_EXT_SYNC_CNT.INP_F525_625 setting and the value of the F bit in the BT656 format.

Table 32.14 lists the timing.

Table 32.14 Timing of Delay for Output of Vertical Synchronization Signal

INP_EXT_SYNC_CNT. INP_F525_625	F Bit in BT656 Format	Output Timing	Remark
0: 525 lines	0 (Field 1)	2.5 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 2
	1 (Field 2)	3 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 1
1: 625 lines	0 (Field 1)	2.5 lines after setting of V bit	625 lines, vertical synchronization signal for field 2
	1 (Field 2)	2 lines after setting of V bit to 1 is detected	625 lines, vertical synchronization signal for field 1

(b) Horizontal Synchronization Signal

Based on the setting of the INP_EXT_SYNC_CNT.INP_H_EDGE_SEL bit, the horizontal synchronization signal is output.

(c) Timing Example of 525-Line Interface Input in BT656 Format

Figure 32.11 and Figure 32.12 show examples of the timing of vertical/horizontal synchronization signal extracted from 525-line interlaced input in the BT656 format.

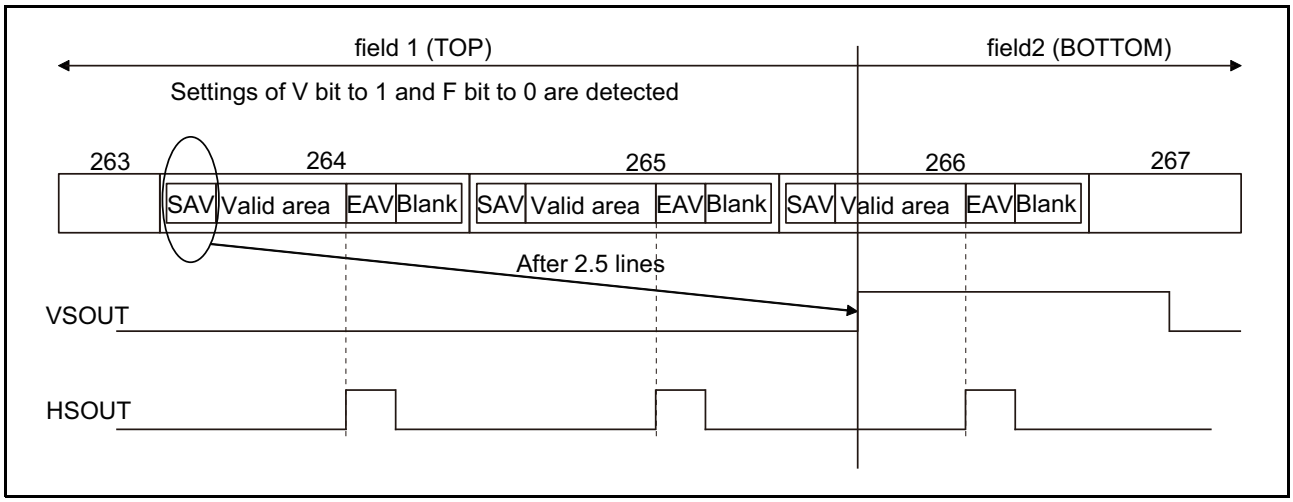

Figure 32.11 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Top to Bottom)

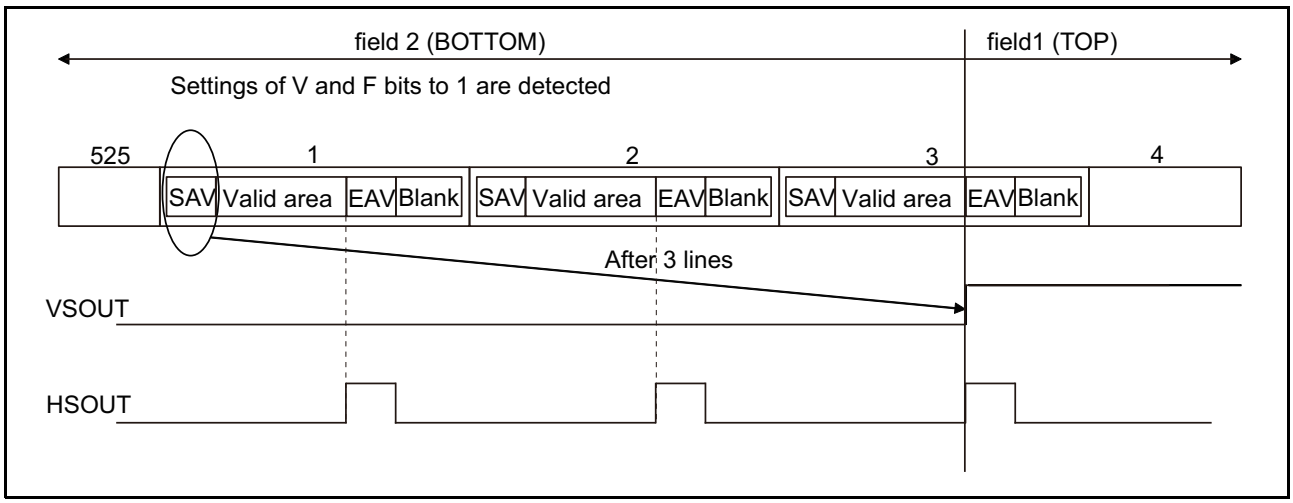

Figure 32.12 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Bottom to Top)

(3) Example of Timing for Progressive Input in BT656 Format

Figure 32.13 shows an example of the SAV/EAV code in 525-line progressive input in the BT656 format. Figure 32.14 shows the vertical/horizontal synchronization signal extracted from 525-line progressive input in the BT656 format. The field is detected as field 1 in this example, because the value of the F bit is set to 0 when that of the V bit is changed from 0 to 1. The filed is regarded as the bottom field. The vertical synchronization signal is output 2.5 lines after the detection of the SAV code.

Figure 32.13 SAV/EAV Code in BT656 Progressive Format (525 Lines, 59.94 Hz)

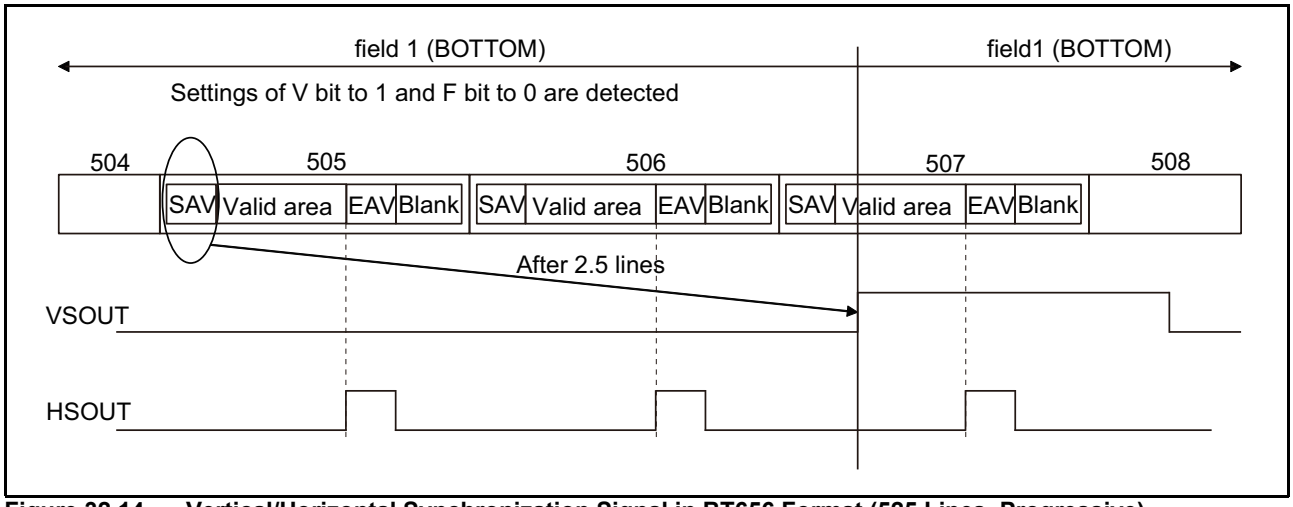

Figure 32.14 Vertical/Horizontal Synchronization Signal in BT656 Format (525 Lines, Progressive)

32.1.12 BT656/BT601/YCbCr422 Format Setting

The BT656 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The YCbCr422 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format in the 16-bit data-bus format of the BT601 standard.

The Vsync signal timing for the 525-line BT656 format and 625-line BT656 format are different.

The operating mode is set by the INP_F525_625 bit.

Table 32.15 Operating Mode Setting for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_F525_625	0	Number of Lines for BT656 Input of External Input System 0: 525 lines 1: 625 lines

When the interlace signals are to be input in BT656/BT601/YCbCr422 format, half of 2fH phase timings of the Vsync signal and the Hsync signal are set with the INP_FH50[9:0] bits.

The INP_FH50[9:0] bits are also used for the vertical synchronous phase adjustment block. Therefore, for bit description, see Table 32.20.

When the external input is of BT656 format, the reference point of the Hsync signal is set with the INP_H_EDGE_SEL bit.

Table 32.16 Hsync Signal Reference Selection for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	0	Hsync Signal Reference Select for BT656 Format of External Input System 0: EAV 1: SAV

When the external input is of BT656/BT601 format, the internal signal BTOUT[7:0], which is input from the DV_DATA pins and allocated, is expanded to the 24-bit YCbCr signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

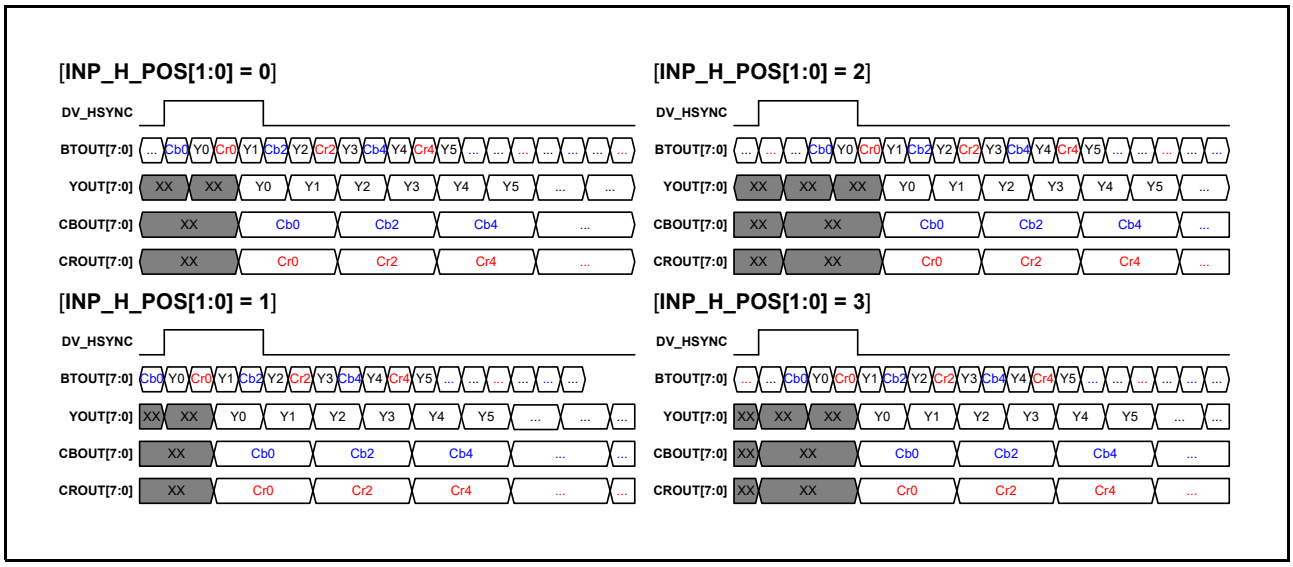

Figure 32.15 YCbCr Data Expansion for BT656/BT601 Input

Table 32.17 Data String Start Timing Selection for BT656/BT601 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Y/Cb/Y/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Y/Cr/Y 1: Y/Cr/Y/Cb 2: Cr/Y/Cb/Y 3: Y/Cb/Y/Cr

When the external input is in YCbCr422 format, the input from the DV_DATA pins is allocated to the internal Y[7:0] and CbCr[7:0] signals, and the CbCr[7:0] are expanded to a 16-bit signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

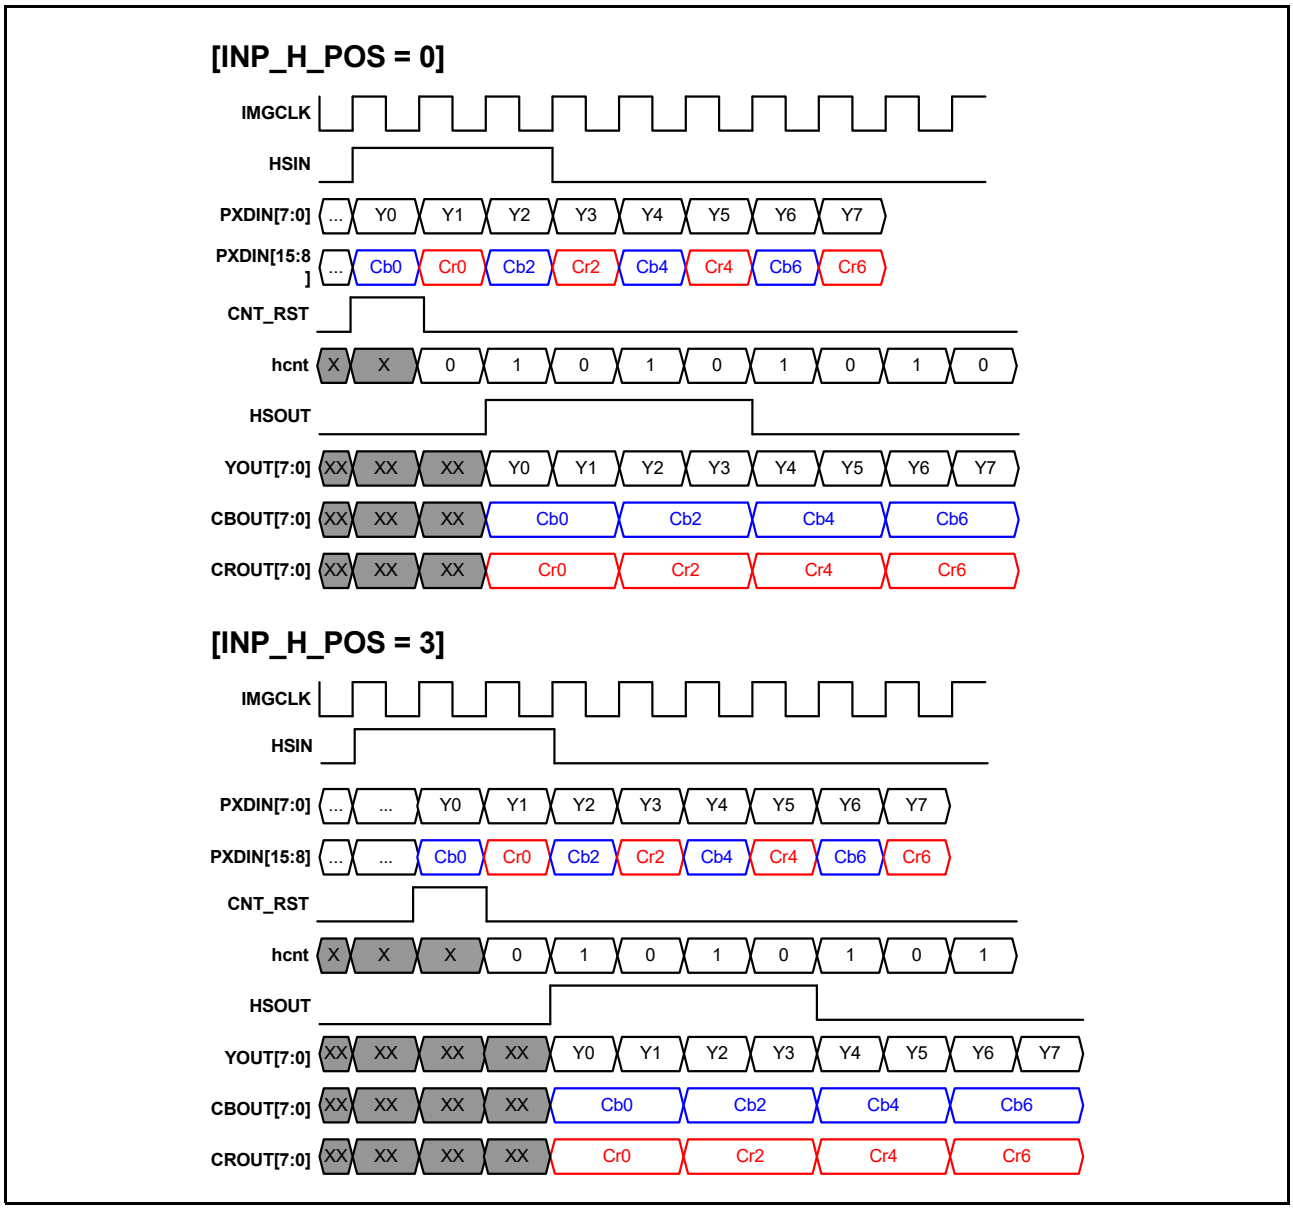

Figure 32.16 YCbCr Data Expansion for YCbCr422 Input

Table 32.18 Data String Start Timing Selection for YCbCr422 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Cb/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Cr 3: Cr/Cb 1, 2: Setting prohibited

32.1.13 YCbCr444/RBG888/666/565 Input Timing

The YCbCr444/RGB888/666/565 format can be used for the progressive YCbCr/RGB signal.

The sync signal width (H_SYNC, V_SYNC), sync signal polarity (H_POL, V_POL), valid period start position (H_BP, V_BP), valid period end position (H_FP, V_FP), and valid period video width (H_ACTIVE, V_ACTIVE) are shown in Table 32.19.

Table 32.19 YCbCr/RGB Signal Reception Timing

Item	Description
External input clock	Maximum external input clock frequency: 87.00 MHz
Vsync signal width (V_SYNC)	Minimum Vsync signal width: 1 CLK
Vsync signal polarity (V_POL)	Positive or negative polarity is selected by the relevant registers.
Vertical valid period start position (V_BP)	From Vsync reference to the head of the video image: 5 lines or more
Vertical valid period video width (V_ACTIVE)	Maximum vertical valid period: 1024 lines
Vertical valid period end position (V_FP)	From the end of the video image to the Vsync reference: 4 lines or more*1
Hsync signal width (H_SYNC)	Minimum Hsync signal width: 1 CLK
Hsync signal polarity (H_POL)	Positive or negative polarity is selected by the relevant registers.
Horizontal valid period start position (H_BP)	From Hsync reference to the head of the video image: 16 CLK or more
Horizontal valid period video width (H_ACTIVE)	Maximum horizontal valid period: 1440 pixels
Horizontal valid period end position (H_FP)	From the end of the video image to the Hsync reference: 16 CLK or more*2
Number of vertical lines (V_BP+V_ACTIVE+V_FP)	Between vertical synchronization signals: 2047 lines or less
Number of horizontal pixels (H_BP+H_ACTIVE+H_FP)	Between horizontal synchronization signals: 2047 CLK or less

Note 1. When V_FP is below 4 lines, the setting of INP_DLY_ADJ.INP_VS_DLY_L[2:0] should be adjusted so that V_FP is at least 4 lines.

Note 2. When H_FP is below 16 CLK, the settings of INP_DLY_ADJ.INP_VS_DLY[7:0], INP_HS_DLY[7:0], and INP_FLD_DLY[7:0] should be adjusted so that H_FP is at least 16 CLK.

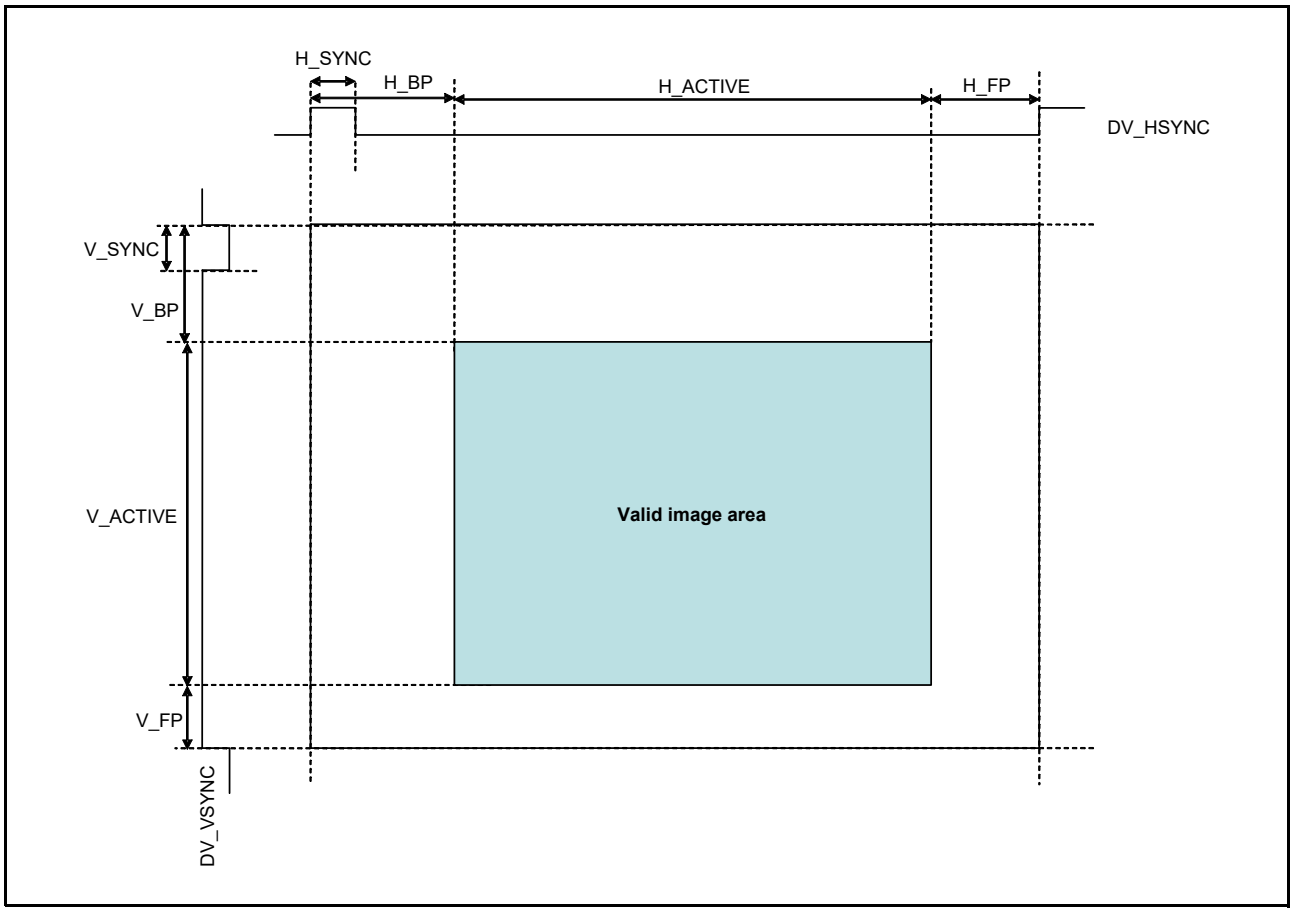

Figure 32.17 YCbCr/RGB Signal Reception Timing

32.1.14 Field Differentiation and Vsync Signal Phase Adjustment

The phase of the input Vsync signal and Hsync signal is detected and the field of the interlace signal is determined. When the reference point of the Vsync signal is detected within ±0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace top field. When the reference point of the Vsync signal is detected outside ±0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace bottom field.

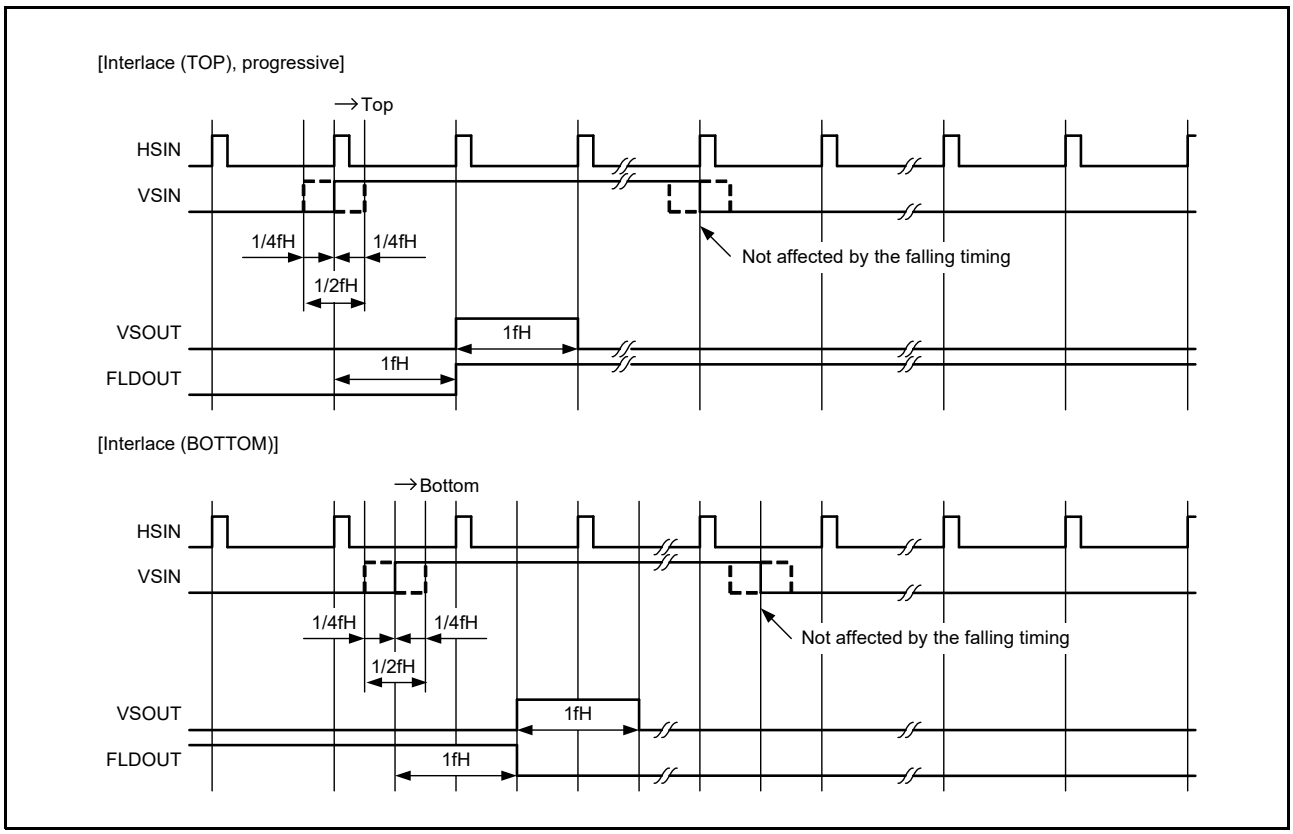

Figure 32.18 Vsync Signal Phase Adjustment

The timings of 1/2fH Vsync signal phase and 1/4fH Vsync signal phase are set with INP_FH50[9:0] and INP_FH25[9:0], respectively.

Table 32.20 Vsync Signal Phase Timing Setting

Register Name	Bit Name	Initial Value	Description
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	858	Vsync Signal 1/2fH Phase Timing Should be 1/2 the horizontal cycle.
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	429	Vsync Signal 1/4fH Phase Timing Should be 1/4 the horizontal cycle.

32.1.15 Vsync Signal Delay Adjustment in Line Units

The Vsync signal line delay adjust block can delay the Vsync signal and the field differentiation signal in line units.

When a video signal with a short vertical front porch is input, the vertical front porch is adjusted.

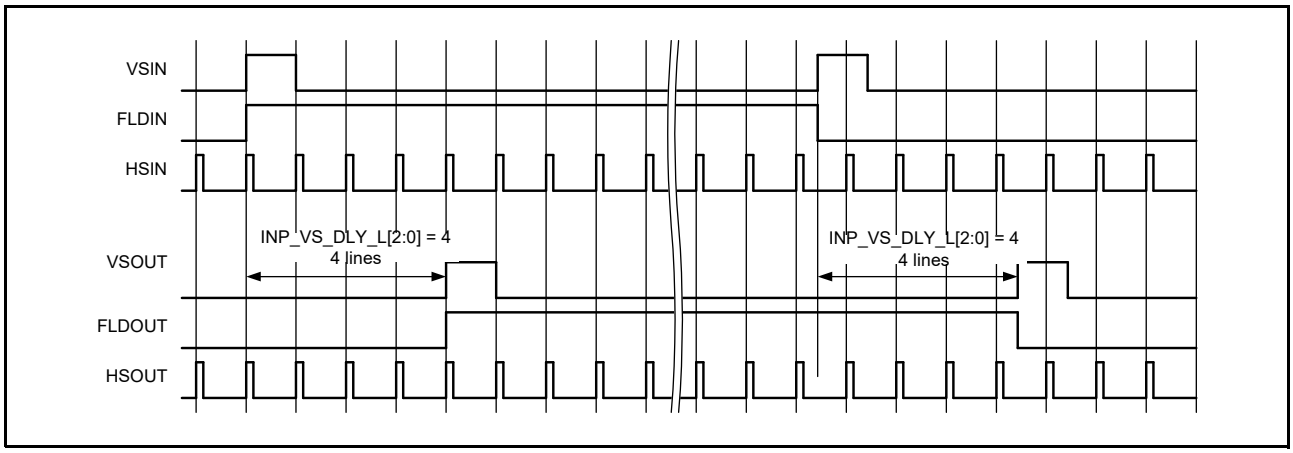

Figure 32.19 Timing of Vsync Signal Delay in Line Units

Table 32.21 Adjustment of Vsync Signal Delay in Line Units

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	0	Number of Lines for Delaying Vsync Signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)

32.1.16 Sync Signal Delay Adjustment

Delay can be adjusted independently for the Vsync signal, Hsync signal, and field differentiation signal in the units of clock.

Lacking margin of the horizontal front porch is adjusted according to the input synchronization disturbance.

Table 32.22 Sync Signal Delay Adjustment

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY[7:0]	0	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_HS_DLY[7:0]	0	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_FLD_DLY[7:0]	0	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

32.1.17 Horizontal Noise Reduction

Noise can be reduced according to horizontal pixel reference.

Noise reduction is controlled through noise component frequency band (TAP), noise level (threshold), and noise reduction intensity (gain).

(1) Frequency Band (TAP) Setting for Noise Component

The noise frequency band can be selected independently from the following four types by using the NR1D_Y_TAP[1:0], NR1D_CB_TAP[1:0], and NR1D_CR_TAP[1:0] bits.

When the number of adjacent pixels is one (noise reduction NR1D_Y/CB/CR_TAP is 0):

$$BPF_{(1)} = \frac{1}{4}\left(-1 \times Z_{(-1)},\ 2 \times Z_{(0)},\ -1 \times Z_{(+1)}\right)$$

When the number of adjacent pixels is two (noise reduction NR1D_Y/CB/CR_TAP is 1):

$$BPF_{(2)} = \frac{1}{4}\left(-1 \times Z_{(-2)},\ 2 \times Z_{(0)},\ -1 \times Z_{(+2)}\right)$$

When the number of adjacent pixels is three (noise reduction NR1D_Y/CB/CR_TAP is 2):

$$BPF_{(3)} = \frac{1}{4}\left(-1 \times Z_{(-3)},\ 2 \times Z_{(0)},\ -1 \times Z_{(+3)}\right)$$

When the number of adjacent pixels is four (noise reduction NR1D_Y/CB/CR_TAP is 3):

$$BPF_{(4)} = \frac{1}{4}\left(-1 \times Z_{(-4)},\ 2 \times Z_{(0)},\ -1 \times Z_{(+4)}\right)$$

Note: $Z_{(0)}$ indicates the target pixel for noise reduction and $Z_{(N)}$ indicates the pixel that is n pixels off from $Z_{(0)}$ In the horizontal direction.

(2) Setting Noise Level (Threshold)

The absolute value of the detected noise amount (BPF output value) is compared with the values of the NR1D_Y_TH[6:0], NR1D_CB_TH[6:0], and NR1D_CR_TH[6:0] bits. When the detected noise amount is greater than NR1D_Y/CB/CR_TH, the absolute value of the detected noise amount is considered as NR1D_Y/CB/CR_TH (fixed value).

ABS($BPF_{(n)}$) ≤ absolute value of detected noise amount when ABS($BPF_{(n)}$) ≤ NR1D_Y/CB/CR_TH: NOISE_ABS = ABS($BPF_{(n)}$)

ABS($BPF_{(n)}$) > absolute value of detected noise amount when ABS($BPF_{(n)}$) > NR1D_Y/CB/CR_TH: NOISE_ABS = NR1D_Y/CB/CR_TH

(3) Setting Noise Reduction Intensity (Gain)

The absolute value of the detected noise amount is multiplied by the value of gain specified by the NR1D_Y_GAIN[1:0], NR1D_CB_GAIN[1:0], and NR1D_CR_GAIN[1:0] bits, and the feedback is calculated for the original signal.

Computation when the amount of detected noise ($BPF_{(n)}$) is negative (−): DOUT = DIN + NOISE_ABS ÷ $2^{(NR1D_Y/CB/CR_GAIN+1)}$

Computation when the amount of detected noise ($BPF_{(n)}$ is positive (+): DOUT = DIN – NOISE_ABS ÷ $2^{(NR1D_Y/CB/CR_GAIN+1)}$

Table 32.23 Horizontal Noise Reduction

Register Name	Bit Name	Initial Value	Description
IMGCNT_NR_CNT0	NR1D_MD	1	Horizontal Noise Reduction Operating Mode 0: R/G/B mode 1: Y/Cb/Cr mode
IMGCNT_NR_CNT0	NR1D_ON	0	Noise Reduction On/Off Control 0: Noise Reduction Off 1: Noise Reduction On

IMGCNT_NR_CNT1	NR1D_CR_TH[6:0]	8	Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_C_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT1	NR1D_CR_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

32.1.18 Color Matrix

By using a color matrix, input signal offsets and nine-axis gain can be adjusted. This enables brightness adjustment, gain adjustment, and YCbCr and GBR mutual conversion.

(1) GBR to GBR Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128

CBBIN_A = CBBIN + IMGCNT_MTX_B – 128

CRRIN_A = CRRIN + IMGCNT_MTX_R – 128

YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256

CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256

CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256

(2) GBR to YCbCr Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128

CBBIN_A = CBBIN + IMGCNT_MTX_B – 128

CRRIN_A = CRRIN + IMGCNT_MTX_R – 128

YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256

CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256 + 128

CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256 + 128

Table 32.24 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	**Set Value**	**Coefficient**	**Set Value**	**Coefficient**	**Set Value**
YGOUT	0.587	IMGCNT_ MTX_GG = 150	0.114	IMGCNT_MTX_GB = 29	0.299	IMGCNT_MTX_GR = 77
CBBOUT	–0.331	IMGCNT_ MTX_BG = 1963	0.500	IMGCNT_MTX_BB = 128	–0.169	IMGCNT_MTX_BR = 2005
CRROUT	–0.419	IMGCNT_ MTX_RG = 1941	–0.081	IMGCNT_MTX_RB = 2027	0.500	IMGCNT_MTX_RR = 128

(3) YCbCr to GBR Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128

CBBIN_A = CBBIN – 128

CRRIN_A = CRRIN – 128

YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256

CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256

CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256

Table 32.25 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	**Set Value**	**Coefficient**	**Set Value**	**Coefficient**	**Set Value**
YGOUT	1.000	IMGCNT_ MTX_GG = 256	–0.344	IMGCNT_MTX_GB = 1960	–0.714	IMGCNT_MTX_GR = 1865
CBBOUT	1.000	IMGCNT_ MTX_BG = 256	1.772	IMGCNT_MTX_BB = 454	0.000	IMGCNT_MTX_BR = 0
CRROUT	1.000	IMGCNT_ MTX_RG = 256	0.000	IMGCNT_MTX_RB = 0	1.402	IMGCNT_MTX_RR = 359

(4) YCbCr to YCbCr Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128

CBBIN_A = CBBIN – 128

CRRIN_A = CRRIN – 128

YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256

CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256 + 128

CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256 + 128

Table 32.26 YCbCr to GBR Conversion

Register Name	Bit Name	Initial Value	Description
IMGCNT_MTX_MODE	IMGCNT_MTX_MD [1:0]	3	Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr
IMGCNT_MTX_YG_ ADJ0	IMGCNT_MTX_YG [7:0]	128	Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB], 512 [LSB])
IMGCNT_MTX_CBB_ ADJ0	IMGCNT_MTX_B [7:0]	128	Offset (DC) Adjustment of B Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
IMGCNT_MTX_CRR_ ADJ0	IMGCNT_MTX_R [7:0]	128	Offset (DC) Adjustment of R Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
IMGCNT_MTX_YG_ ADJ0	IMGCNT_MTX_GG [10:0]	256	Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_YG_ ADJ1	IMGCNT_MTX_GB [10:0]	0	Cb/B Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_YG_ ADJ1	IMGCNT_MTX_GR [10:0]	0	Cr/R Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CBB_ ADJ0	IMGCNT_MTX_BG [10:0]	0	Y/G Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CBB_ ADJ1	IMGCNT_MTX_BB [10:0]	256	Cb/B Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CBB_ ADJ1	IMGCNT_MTX_BR [10:0]	0	Cr/R Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CRR_ ADJ0	IMGCNT_MTX_RG [10:0]	0	Y/G Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CRR_ ADJ1	IMGCNT_MTX_RB [10:0]	0	Cb/B Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
IMGCNT_MTX_CRR_ ADJ1	IMGCNT_MTX_RR [10:0]	256	Cr/R Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

32.2 Register Descriptions

Table 32.27 to Table 32.30 show register Configuration.

- Symbols used in Register Description:

Initial value: Register value after a power-on reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R: Read-only. The write value should always be 0.
—/W: Write-only. The read value is undefined.

Table 32.27 Register Configuration of Input Controller (Channel 0)

Name	Abbreviation	R/W	Initial Value	Address	Access Size
External input block register update control register	INP_UPDATE	R/WC1	H'0000 0000	H'FCFF 7400	32
Input select control register	INP_SEL_CNT	R/W	H'0000 0000	H'FCFF 7404	32
External input sync signal control register	INP_EXT_SYNC_CNT	R/W	H'0000 0000	H'FCFF 7408	32
Vsync signal phase adjustment register	INP_VSYNC_PH_ADJ	R/W	H'035A 01AD	H'FCFF 740C	32
Sync signal delay adjustment register	INP_DLY_ADJ	R/W	H'0000 0000	H'FCFF 7410	32

Table 32.28 Register Configuration of Image Quality Adjustment Block (Channel 0)

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Image quality adjustment block register update control register	IMGCNT_UPDATE	R/WC1	H'0000 0000	H'FCFF 7480	32
NR control register 0	IMGCNT_NR_CNT0	R/W	H'0010 0803	H'FCFF 7484	32
NR control register 1	IMGCNT_NR_CNT1	R/W	H'0803 0803	H'FCFF 7488	32
Image quality adjustment block matrix mode register	IMGCNT_MTX_MODE	R/W	H'0000 0003	H'FCFF 74A0	32
Image quality adjustment block matrix YG adjustment register 0	IMGCNT_MTX_YG_ ADJ0	R/W	H'0080 0100	H'FCFF 74A4	32
Image quality adjustment block matrix YG adjustment register 1	IMGCNT_MTX_YG_ ADJ1	R/W	H'0000 0000	H'FCFF 74A8	32
Image quality adjustment block matrix CBB adjustment register 0	IMGCNT_MTX_CBB_ ADJ0	R/W	H'0080 0000	H'FCFF 74AC	32
Image quality adjustment block matrix CBB adjustment register 1	IMGCNT_MTX_CBB_ ADJ1	R/W	H'0100 0000	H'FCFF 74B0	32

Dynamic range compression register	IMGCNT_DRC_REG	R/W	H'0000 0000	H'FCFF 94C0	32

32.2.1 External Input Block Register Update Control Register (INP_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	INP_EXT_UPDATE	—	—	—	INP_IMG_UPDATE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_EXT_UPDATE	0	R/WC1	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INP_IMG_UPDATE	0	R/WC1	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.

32.2.2 Input Select Control Register (INP_SEL_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	INP_SEL	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	INP_FORMAT[2:0]			—	—	—	INP_PXD_EDGE	—	—	—	INP_VS_EDGE	—	—	—	INP_HS_EDGE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INP_SEL	0	R/W	Input Select 0: Video decoder output signals 1: Signals supplied via the external input pins
19 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	INP_FORMAT[2:0]	0	R/W	External Input Format Select 0: YcbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_PXD_EDGE	0	R/W	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_VS_EDGE	0	R/W	Clock Edge Select for Capturing External Input Vsync Signals DV_VSYNC 0: Rising edge 1: Falling edge
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INP_HS_EDGE	0	R/W	Clock Edge Select for Capturing External Input Hsync Signals DV_HSYNC 0: Rising edge 1: Falling edge

Note: INP_FORMAT, INP_PXD_EDGE, INP_VS_EDGE, and INP_HS_EDGE are updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1. INP_SEL is updated when set.

32.2.3 External Input Sync Signal Control Register (INP_EXT_SYNC_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INP_ENDIAN_ON	—	—	—	INP_SWAP_ON	—	—	—	INP_VS_INV	—	—	—	INP_HS_INV
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	INP_H_EDGE_SEL	—	—	—	INP_F525_625	—	—	INP_H_POS[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INP_ENDIAN_ON	0	R/W	External Input Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INP_SWAP_ON	0	R/W	External Input B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INP_VS_INV	0	R/W	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INP_HS_INV	0	R/W	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_H_EDGE_SEL	0	R/W	Reference Select for External Input BT656 Hsync Signal 0: EAV 1: SAV
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_F525_625	0	R/W	Number of Lines for BT656 External Input 0: 525 lines 1: 625 lines
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	INP_H_POS[1:0]	0	R/W	Y/Cb/Y/Cr Data String Start Timing to Hsync Reference for BT656/601 or YCbCr422 External Input 0: Cb/Y/Cr/Y(BT656/601), Cb/Cr (YCbCr422) 1: Y/Cr/Y/Cb(BT656/601), setting prohibited (YCbCr422) 2: Cr/Y/Cb/Y(BT656/601), setting prohibited (YCbCr422) 3: Y/Cb/Y/Cr(BT656/601), Cr/Cb (YCbCr422)

Note: This register is updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1.

32.2.4 Vsync Signal Phase Adjustment Register (INP_VSYNC_PH_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	INP_FH50[9:0]									
Initial Value:	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	INP_FH25[9:0]									
Initial Value:	0	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	INP_FH50 [9:0]	858	R/W	Vsync Signal 1/2fH Phase Timing 1/2 clock cycle of the horizontal cycle should be set.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	INP_FH25 [9:0]	429	R/W	Vsync Signal 1/4fH Phase Timing 1/4 clock cycle of the horizontal cycle should be set.

Note: The INP_FH50[9:0] bits are updated when the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE are 1. The IMP_FH25[9:0] bits are updated when the INP_IMG_UPDATE bit is 1.

32.2.5 Sync Signal Delay Adjustment Register (INP_DLY_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	INP_VS_DLY_L[2:0]			INP_FLD_DLY[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INP_VS_DLY[7:0]								INP_HS_DLY[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 24	INP_VS_ DLY_L[2:0]	0	R/W	Number of lines for Delaying Vsync signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)
23 to 16	INP_FLD_ DLY[7:0]	0	R/W	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
15 to 8	INP_VS_ DLY[7:0]	0	R/W	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
7 to 0	INP_HS_ DLY[7:0]	0	R/W	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

Note: This register is updated when the INP_IMG_UPDATE bit in INP_UPDATE is 1.

32.2.6 Image Quality Adjustment Block Register Update Control Register (IMGCNT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_VEN
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	IMGCNT_VEN	0	R/WC1	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

32.2.7 NR Control Register 0 (IMGCNT_NR_CNT0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	NR1D_MD	—	—	—	NR1D_ON
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	NR1D_Y_TH[6:0]							—	—	NR1D_Y_TAP[1:0]		—	—	NR1D_Y_GAIN[1:0]	
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	NR1D_MD	1	R/W	Horizontal Noise Reduction Operating Mode 0: G/B/R mode 1: Y/Cb/Cr mode
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	NR1D_ON	0	R/W	Noise Reduction On/Off Control 0: Noise reduction Off 1: Noise reduction On
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	NR1D_Y_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_Y_TH. Unsigned: 0 to 127 [LSB]
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	NR1D_Y_TAP[1:0]	0	R/W	Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	NR1D_Y_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

32.2.8 NR Control Register 1 (IMGCNT_NR_CNT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	NR1D_CB_TH[6:0]							—	—	NR1D_CB_TAP[1:0]		—	—	NR1D_CB_GAIN[1:0]	
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 24	NR1D_CB_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CB_TH. Unsigned: 0 to 127 [LSB]
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	NR1D_CB_TAP[1:0]	0	R/W	Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	NR1D_CB_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	NR1D_CR_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CR_TH. Unsigned: 0 to 127 [LSB]
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	NR1D_CR_TAP[1:0]	0	R/W	Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	NR1D_CR_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

32.2.9 Image Quality Adjustment Block Matrix Mode Register (IMGCNT_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_MTX_MD[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	IMGCNT_MTX_MD[1:0]	3	R/W	Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

32.2.10 Image Quality Adjustment Block Matrix YG Adjustment Register 0 (IMGCNT_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_YG[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_GG[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_MTX_YG[7:0]	128	R/W	Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_GG[10:0]	256	R/W	Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

32.2.11 Image Quality Adjustment Block Matrix YG Adjustment Register 1 (IMGCNT_MTX_YG_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IMGCNT_MTX_GB[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_GR[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_MTX_GB[10:0]	0	R/W	Cb/B Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_GR[10:0]	0	R/W	Cr/R Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

32.2.12 Image Quality Adjustment Block Matrix CBB Adjustment Register 0 (IMGCNT_MTX_CBB_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_B[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_BG[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_ MTX_B[7:0]	128	R/W	Offset (DC) Adjustment of Cb/B Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_ MTX_BG[10:0]	0	R/W	Y/G Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

32.2.13 Image Quality Adjustment Block Matrix CBB Adjustment Register 1 (IMGCNT_MTX_CBB_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IMGCNT_MTX_BB[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_BR[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_MTX_BB[10:0]	256	R/W	Cb/B Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_BR[10:0]	0	R/W	Cr/R Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

32.2.14 Image Quality Adjustment Block Matrix CRR Adjustment Register 0 (IMGCNT_MTX_CRR_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_R[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_RG[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_ MTX_R[7:0]	128	R/W	Offset (DC) Adjustment of Cr/R Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_ MTX_RG[10:0]	0	R/W	Y/G Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

32.2.15 Image Quality Adjustment Block Matrix CRR Adjustment Register 1 (IMGCNT_MTX_CRR_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IMGCNT_MTX_RB[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_RR[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_ MTX_RB[10:0]	0	R/W	Cb/B Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_ MTX_RR[10:0]	256	R/W	Cr/R Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

32.2.16 Dynamic Range Compression Register (IMGCNT_DRC_REG)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DRC_ EN
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DRC_EN	0	R/W	Use of Contrast Correction (Dynamic Range Compression) 0: Does not use contrast correction 1: Uses contrast correction

32.3 Usage Methods

32.3.1 Input Format Adjustment Method

Setting examples of each input format are shown below.

Table 32.31 Video Decoder (NTSC) Input Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Selects the input signal.	0
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	Control not necessary
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	Control not necessary
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	Control not necessary
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	Control not necessary
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	Control not necessary
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	Control not necessary
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	Control not necessary
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	Control not necessary
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	Control not necessary
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	Control not necessary
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	Control not necessary
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

Table 32.32 External Input (BT656, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Selects the input signal.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	3
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in IMP_UPDATE should be set to 1.

Table 32.33 External Input (BT601, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Selects the input signal.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	4
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INT_UPDATE should be set to 1.

32.3.2 Usage Method of Conversion Color Matrix

Typical data conversion setting examples are shown below.

Table 32.34 Conversion Color Matrix

Register Name	Bit Name	GBR to GBR	GBR to YCbCr	YCbCr to GBR	YCbCr to YCbCr
IMGCNT_MTX_MODE	IMGCNT_MTX_MD[1:0]	0	1	2	3
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_YG[7:0]	128	128	128	128
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_GG[10:0]	256	150	256	256
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GB[10:0]	0	29	1960	0
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GR[10:0]	0	77	1865	0
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_B[7:0]	128	128	128	128
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_BG[10:0]	0	1963	256	0
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BB[10:0]	256	128	454	256
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BR[10:0]	0	2005	0	0
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_R[7:0]	128	128	128	128
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_RG[10:0]	0	1941	256	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RB[10:0]	0	2027	0	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RR[10:0]	256	128	359	256

Note: The registers require, after they are set, that the IMGCNT_VEN bit in IMGCNT_UPDATE should be set to 1.

33. Video Display Controller 5 (3): Scaler

33.1 Scaler

33.1.1 Overview of Functions

The scaler subjects the YCbCr and RGB signals output from the input controller, to sync signal generation; and reduction, enlargement, and rotation of the images.

The scaler also records video image in the frame buffer.

Video display controller 5 has two scalers (scalers 0 and 1) in each channel. For image blending, either cascading the scalers or using the VIN synthesizer can be selected. When the scalers are cascaded for image blending, the image from scaler 0 is placed in the lower layer and that from scaler 1 is placed in the upper layer.

Scaler 0 receives a signal from the input controller in the channel where scaler 0 belongs, and scaler 1 receives a signal from the input controller in the other channel.

For the VIN synthesizer, refer to section 35, Video Display Controller 5 (5): Image Synthesizer.

In scalers 0 and 1, either enlargement process or graphics 0 or 1 process can be used at a time.

The functional block diagrams of scalers 0 and 1 are shown below.

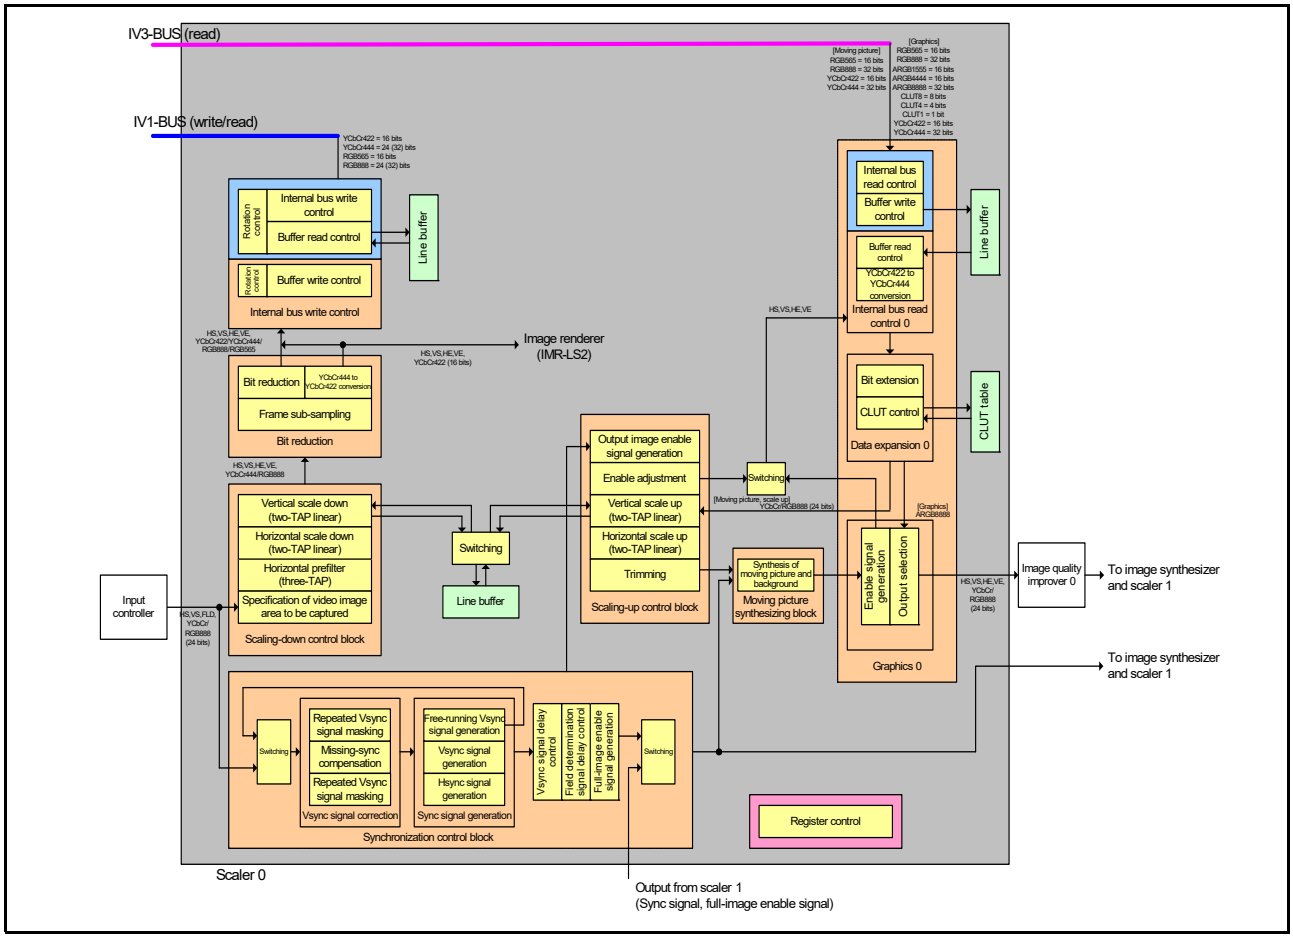

Figure 33.1 Functional Block Diagram of Scaler 0

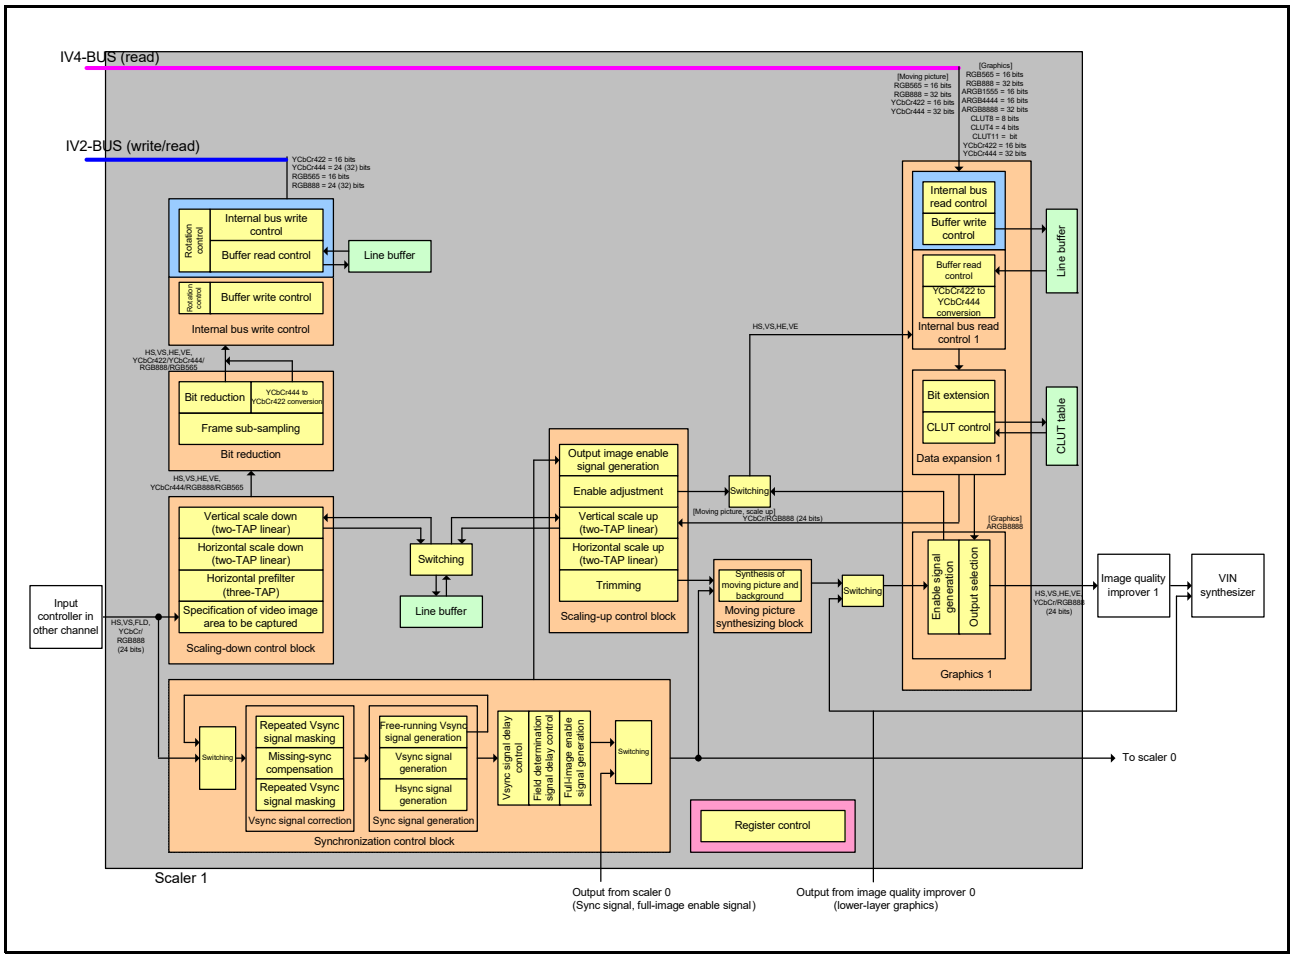

Figure 33.2 Functional Block Diagram of Scaler 1

The video display controller has two scalers and each scaler has a graphics block. The registers and bits in the scalers are named SC0_xxxx or SC1_xxxx and those in the graphics blocks are named GR0_xxxx or GR1_xxxx, but in this section, they are collectively called SC_xxxx or GR_xxxx.

33.1.2 Register Control

(1) Updating Registers

The Vsync signal is used to control the update timing of all the registers of the scaling and graphics blocks except some registers of the sync control block and some of the other blocks.

After 1 is set to the bits in the update control register, the contents of the relevant registers are modified at the rising edge of the Vsync signal. The update control register is automatically cleared to 0 after the modification.

Table 33.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_UPDATE	SC_SCL0_UPDATE	0	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL0_UPDATE	SC_SCL0_VEN_D	0	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_C	0	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_B	0	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_A	0	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_VEN_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_VEN_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

The registers controlled by SC_SCL0_VEN_A, SC_SCL0_VEN_C, SC_SCL1_VEN_A, and SC_SCL1_VEN_B are modified at the rising edge of the input Vsync signal.

The registers controlled by SC_SCL0_VEN_B, SC_SCL0_VEN_D, GR_P_VEN, and GR_IBUS_VEN are modified at the rising edge of the output Vsync signal.

33.1.3 Synchronization Control

(1) Selecting Vsync Signal

The Vsync signal to be output from the scaler can be selected.

When an external input signal is to be displayed, an external input Vsync signal should be selected to be output.

When an external input signal is not provided, a free-running Vsync signal should be selected to be output.

Table 33.2 Vsync Signal Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Vsync Signal Output Select 0: External input Vsync signal 1: Internally generated free-running Vsync signal

(2) Masking Repeated Vsync Signals

It is possible to prevent receiving the Vsync signal with a period shorter than the standard period. This is achieved by setting the start timing to receive the next Vsync signal after receiving an input Vsync signal.

The Vsync signal reception masking period is set with the SC_RES_VMASK[15:0] bits.

Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz]

This function is enabled or disabled by the SC_RES_VMASK_ON bit.

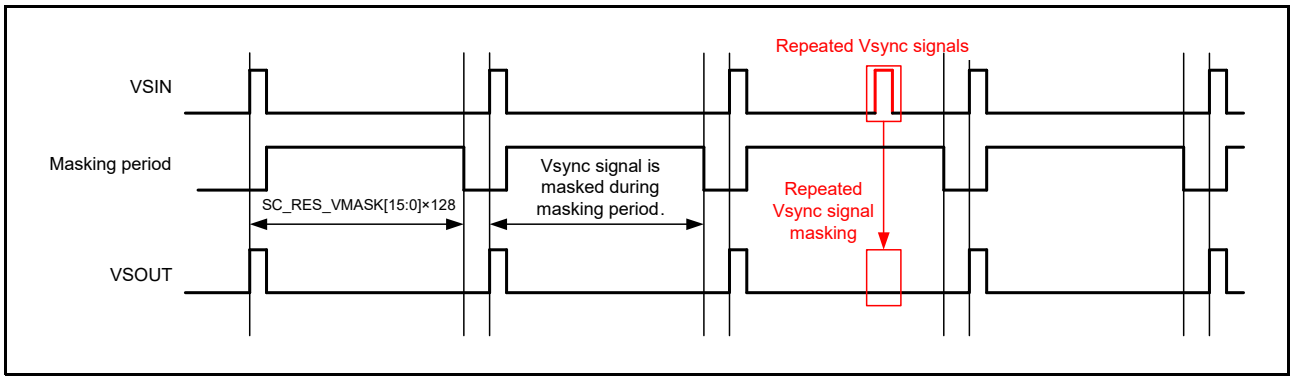

Figure 33.3 Timing for Masking Repeated Vsync Signals

Table 33.3 Repeated Vsync Signal Mask Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC1	SC_RES_VMASK_ON	1	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.
SC_SCL0_FRC1	SC_RES_VMASK[15:0]	2800	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz]

(3) Compensating for Missing Vsync Signals

It is possible to prevent output of the Vsync signal with a period longer than the standard period. This is achieved by setting the wait time after reception of an input Vsync signal until reception of the next Vsync signal.

If no Vsync signals are received during the wait time, an internally generated sync signal is inserted.

The wait time can be set using the SC_RES_VLACK[15:0] bits.

Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz]

This function is enabled or disabled by the SC_RES_VLACK_ON bit.

If no Vsync signals are input during the Vsync signal reception time, the SC_RES_QVLACK bit is set to the high level.

If Vsync signals are continuously detected four or more times during the Vsync signal reception time, the SC_RES_QVLOCK bit is set to the high level.

The SC_RES_QVLOCK bit is valid even when both the SC_RES_VMASK_ON and SC_RES_VLACK_ON bits are set to turn off the corresponding functions.

Note that, however, the SC_RES_VMASK and SC_RES_VLACK bits must be set correctly.

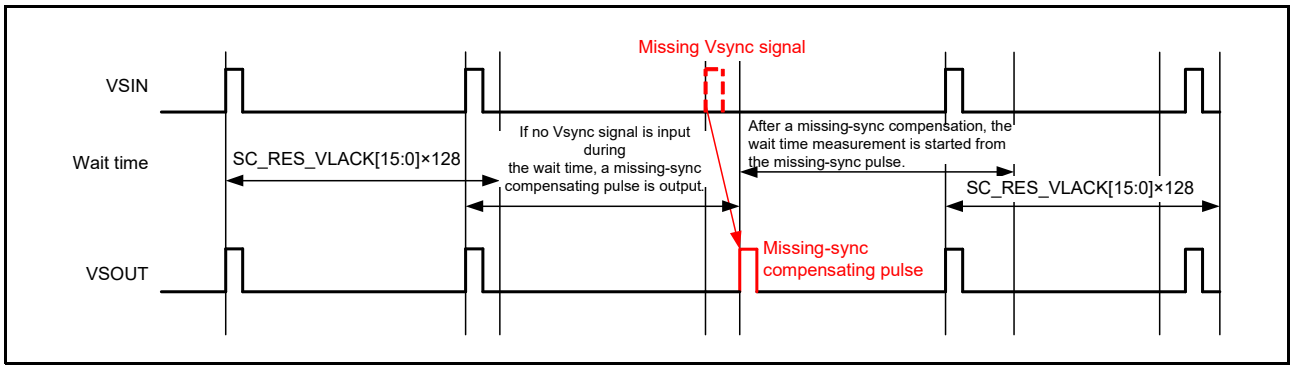

Figure 33.4 Compensation of Missing Vsync Signals

Table 33.4 Missing Vsync Compensation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC2	SC_RES_VLACK_ON	1	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.
SC_SCL0_FRC2	SC_RES_VLACK[15:0]	3600	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
SC_SCL0_FRC9	SC_RES_QVLACK	—	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.
SC_SCL0_FRC9	SC_RES_QVLOCK	—	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.

For the Vsync signal, repeated-signal masking is first carried out and then missing-signal compensation is carried out, followed by another repeated-signal masking.

Repetition masking is inserted after missing-Vsync compensation to prevent output of the Vsync signal even in cases such as the input of a Vsync signal immediately after the input of a pulse to compensate for a missing Vsync signal.

On/off control of the missing-Vsync compensation also applies to the second repeated-Vsync masking; and masking period setting of the first repeated-Vsync masking also applies to the second repeated-Vsync masking.

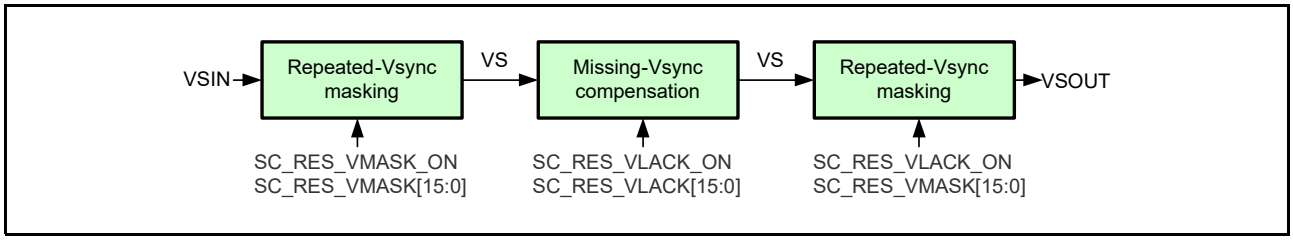

Figure 33.5 Repeated-Vsync Masking and Missing-Vsync Compensation

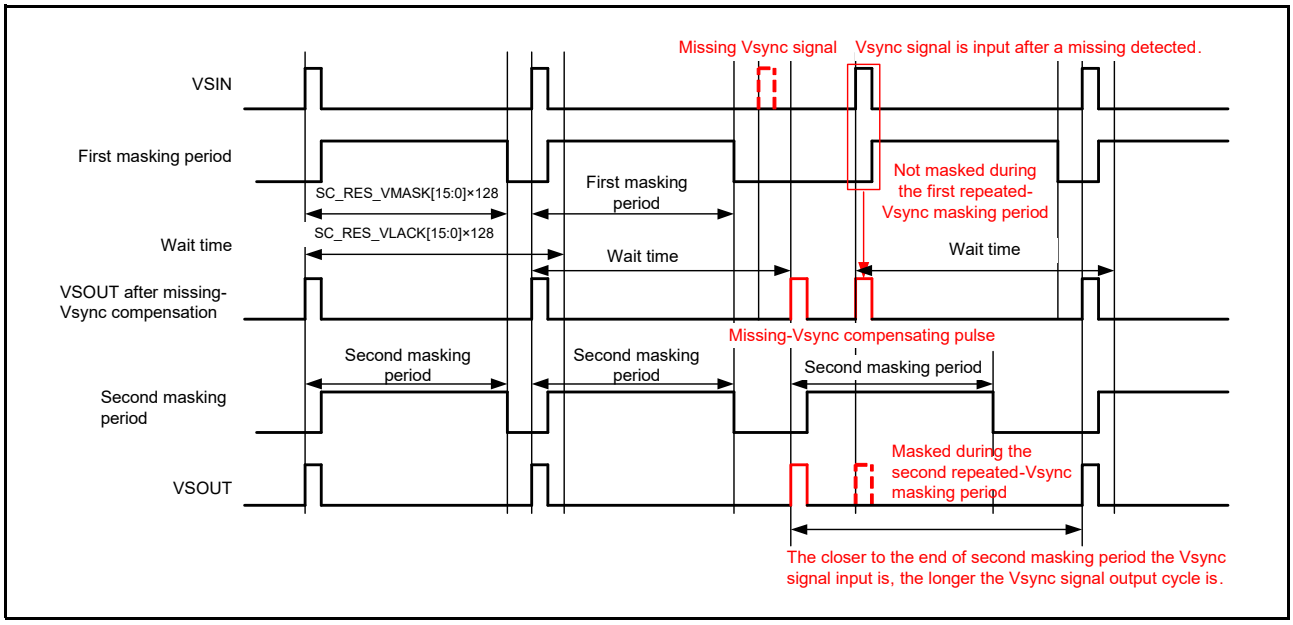

Figure 33.6 Timing for Masking Repeated Vsync Signals and Missing Vsync Signal Compensation

(4) Free-Running Period

Free-running Vsync and Hsync periods can be set.

Hsync period [usec] = (SC_RES_FH + 1) ÷ pixel clock frequency [MHz]

Vsync period [usec] = horizontal period [usec] × (SC_RES_FV + 1)

Table 33.5 Free-Running Period Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Free-Running Vsync Period Setting Free-running Vsync period = (SC_RES_FV + 1) × horizontal period [usec]
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Hsync Period Setting Hsync period [usec] = (SC_RES_FH +1) ÷ pixel clock frequency [MHz]

When selecting an external input Vsync signal, set the SC_RES_VS_SEL bit to 0. At this time, the internally generated free-running Vsync signal is not output.

In the meantime, the Hsync signal is always generated according to the free-running signal setting and output from the scaler.

(5) Vsync Signal Delay Control

Delay of Vsync signal output from the scaler can be controlled.

The delay is used to adjust the frame buffer read timing.

Table 33.6 Vsync Output Delay Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_VSDLY[7:0]	1	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC_RES_VSDLY × output Hsync period [usec]

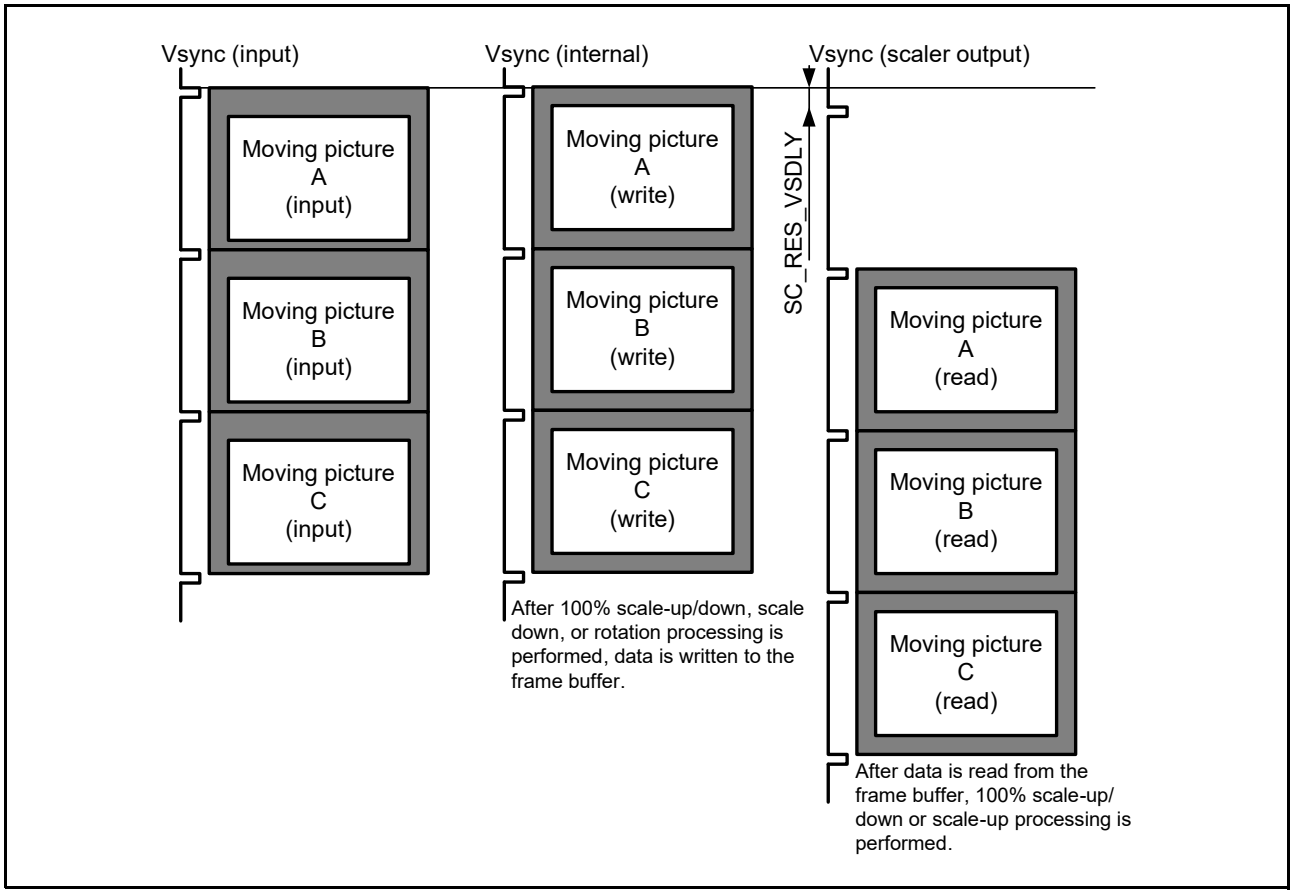

Figure 33.7 Vsync Signal Phases (Two Frame-Buffer Planes Used)

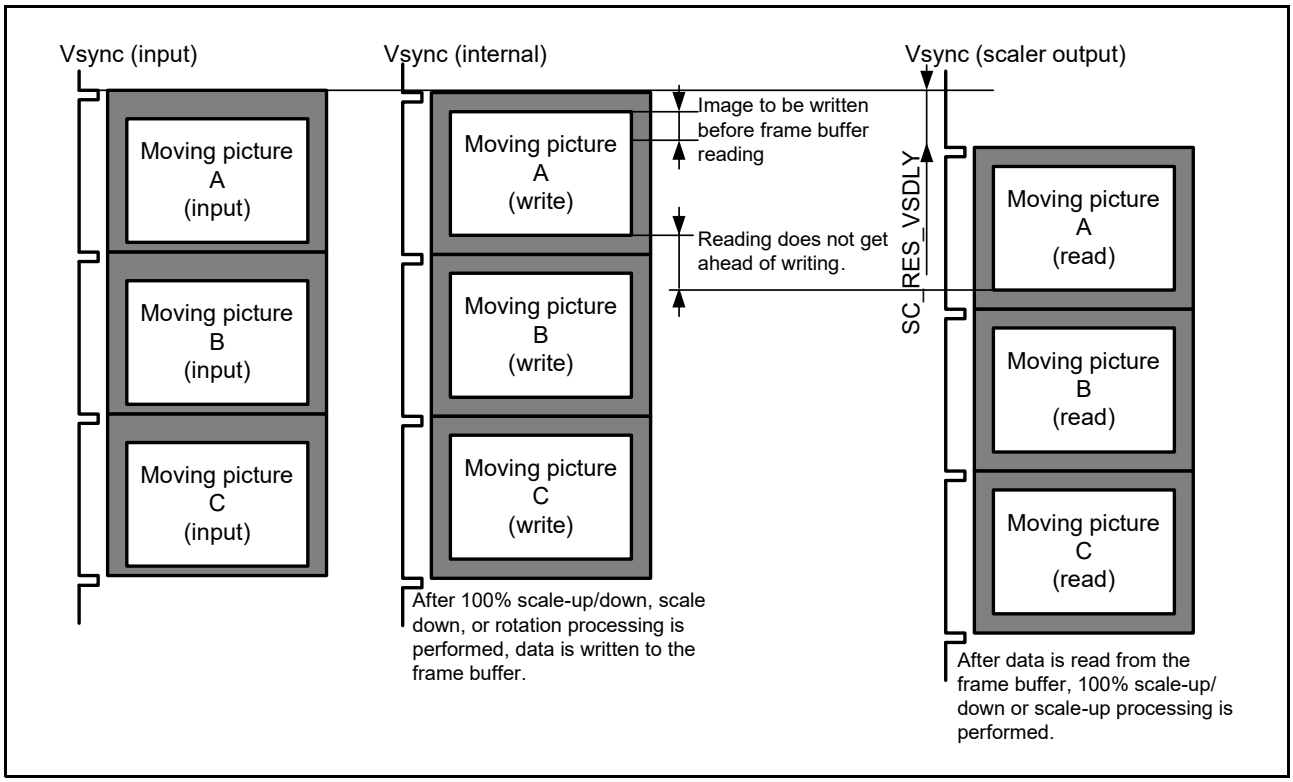

Figure 33.8 Vsync Signal Phases (One Frame-Buffer Plane Used)

33.1.4 Setting Angle of View

(1) Setting Image Area to be Captured

The image area to be captured can be set for reduction or enlargement.

The area is defined by specifying its start position and width based on the input Hsync and Vsync signals.

Table 33.7 Control of Image Area to be Captured

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS2	SC_RES_VS[10:0]	18	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS2	SC_RES_VW[10:0]	240	Vertical Width of Video Signal to be Captured (lines) Note: SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS3	SC_RES_HS[10:0]	244	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_HS + SC_RES_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_DS3	SC_RES_HW[10:0]	1440	Horizontal Width of Video Signal to be Captured (video-image clock cycles) Note: SC_RES_HS + SC_RES_HW should be equal to or less than 2015 (clock cycles).

(2) Generating a Full-Screen Enable Signal

The valid period of the full screen to be output from the scaler can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.
The vertical front porch should be set to four or more lines, and the horizontal front porch should be 16 or more clock cycles.

Table 33.8 Full-Screen Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical Enable Signal Width for Full Screen (lines) Note: SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal Enable Signal Start Position for Full Screen. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1: SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2: The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

(3) Generating an Image Output Enable Signal

The valid period of the image to be output can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

Table 33.9 Image Output Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US2	SC_RES_P_VS[10:0]	35	Vertical Enable Signal Start Position for Output Image. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US2	SC_RES_P_VW[10:0]	480	Vertical Enable Signal Width for Output Image (lines) Note: SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US3	SC_RES_P_HS[10:0]	144	Horizontal Enable Signal Start Position for Output Image. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_US3	SC_RES_P_HW[10:0]	640	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).

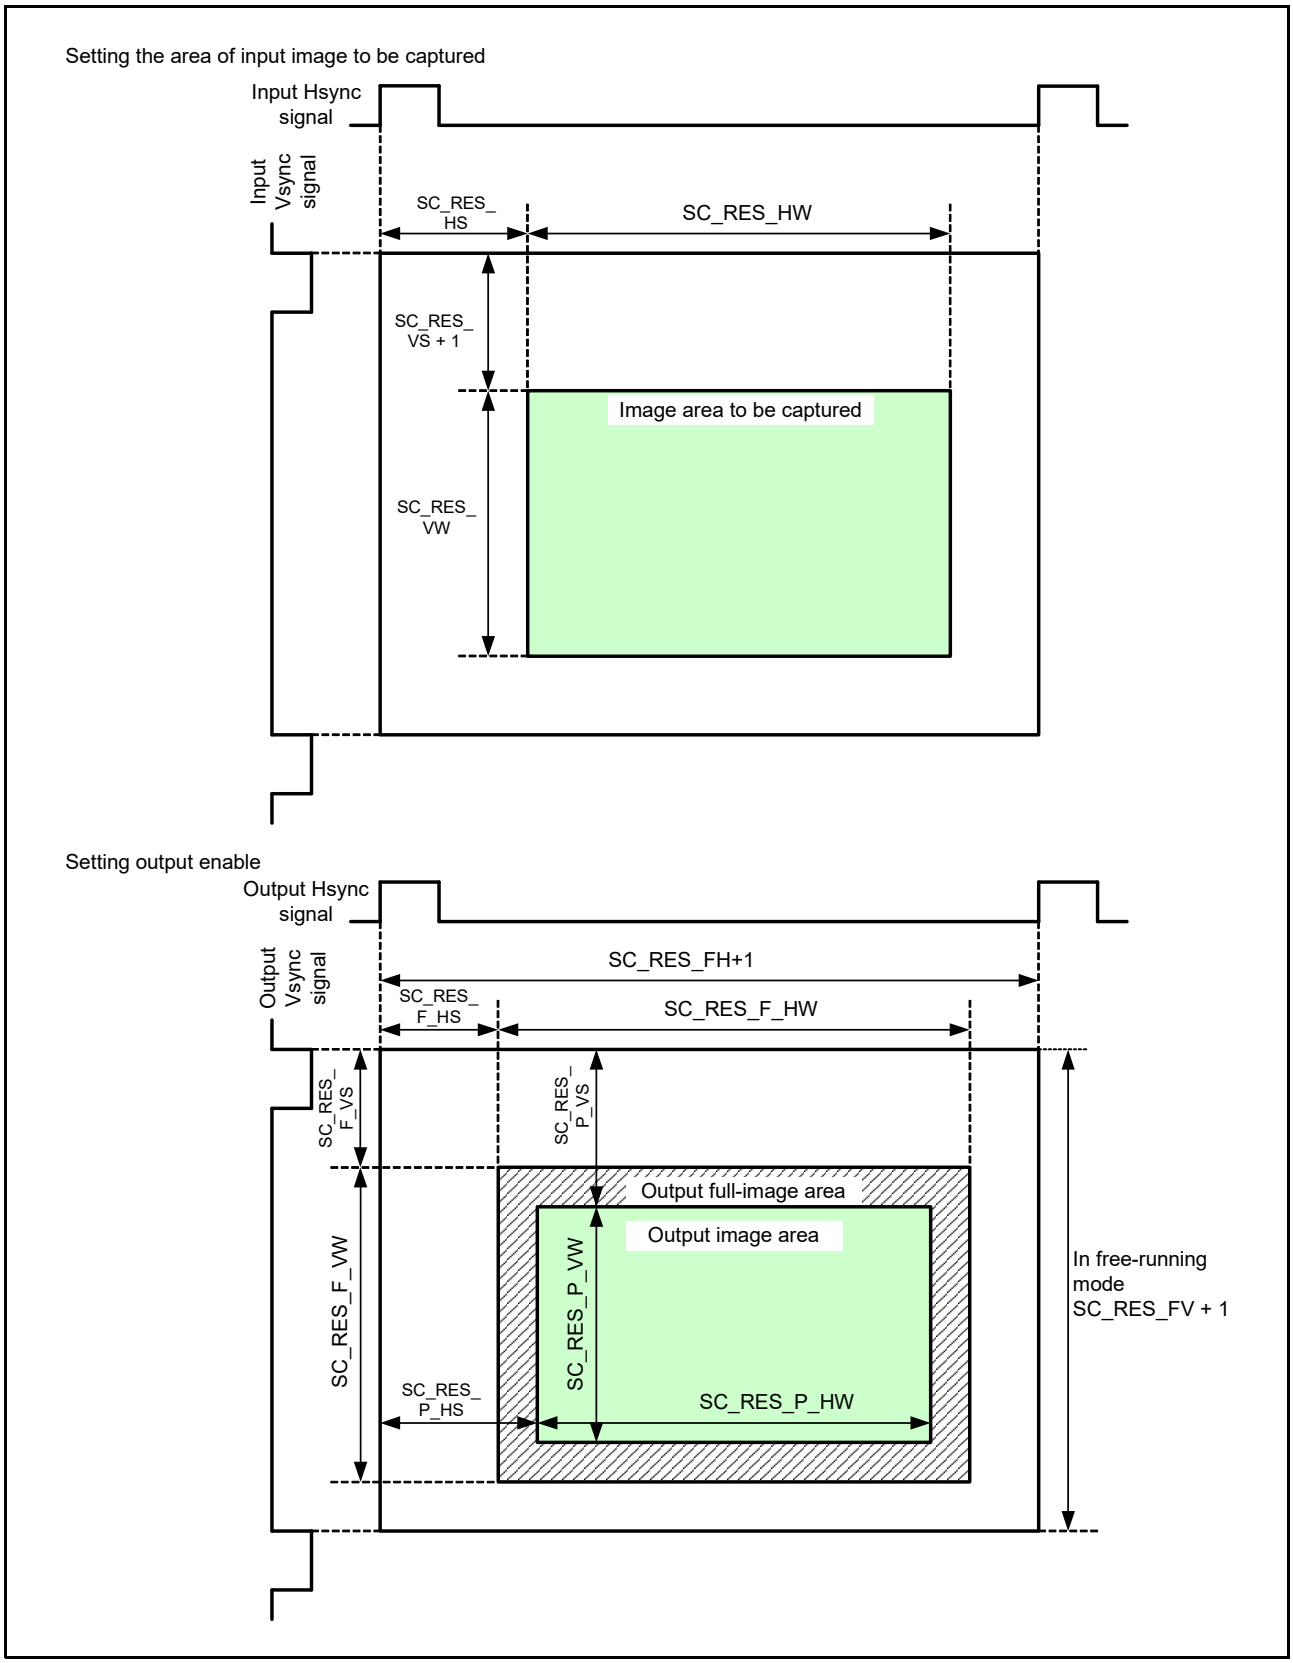

Figure 33.9 Enable Settings

33.1.5 Scaling Settings

(1) Scaling Processing Block

The scaling-down control block scales down the input image from the input controller.

When rotation is required, the scaling-down control block first scales down the image and then rotates it before writing it into the frame buffer.

The scaling-up control block reads the rotated image from the frame buffer and scales it up.

Table 33.10 Rotation and Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
Normal	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
Horizontal mirroring	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale-up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
90° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	Horizontal scale down/ vertical 100% scale up	Horizontal scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
180° rotation	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
270° rotation	(Horizontal input→vertical output) scale down	(Vertical input→horizontal output) scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	Horizontal scale down/ vertical 100% scale up	Horizontal scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up

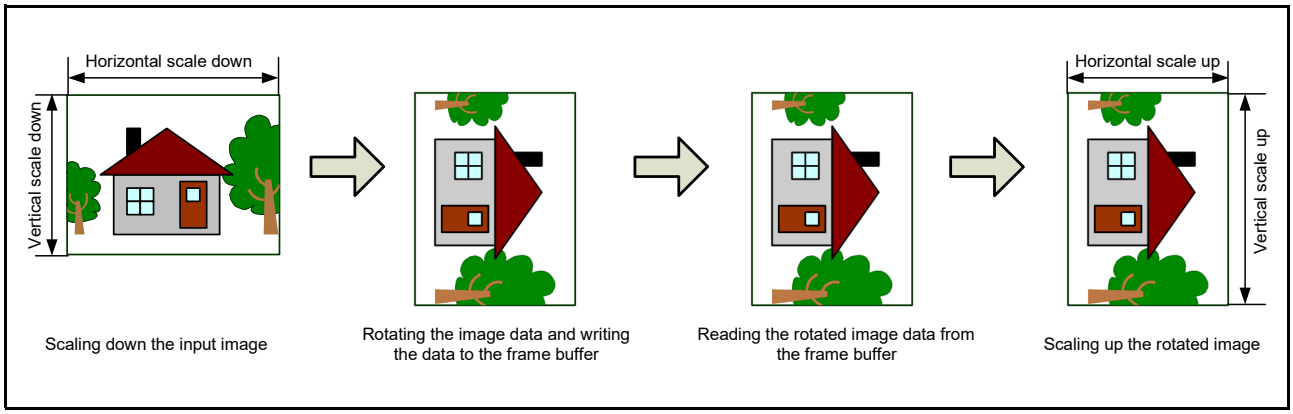

Figure 33.10 Rotation and Scaling Process

It is impossible to use vertical reduction by the scaling-down control block and vertical enlargement by the scaling-up control block simultaneously because they are mutually exclusive. Thus, the following scaling processes cannot be performed with 90° rotation or 270° rotation.

Table 33.11 Impossible Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
90° rotation 270° rotation	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale down	Horizontal 100% scale up/ vertical scale down	Horizontal 100% scale up/ vertical scale up

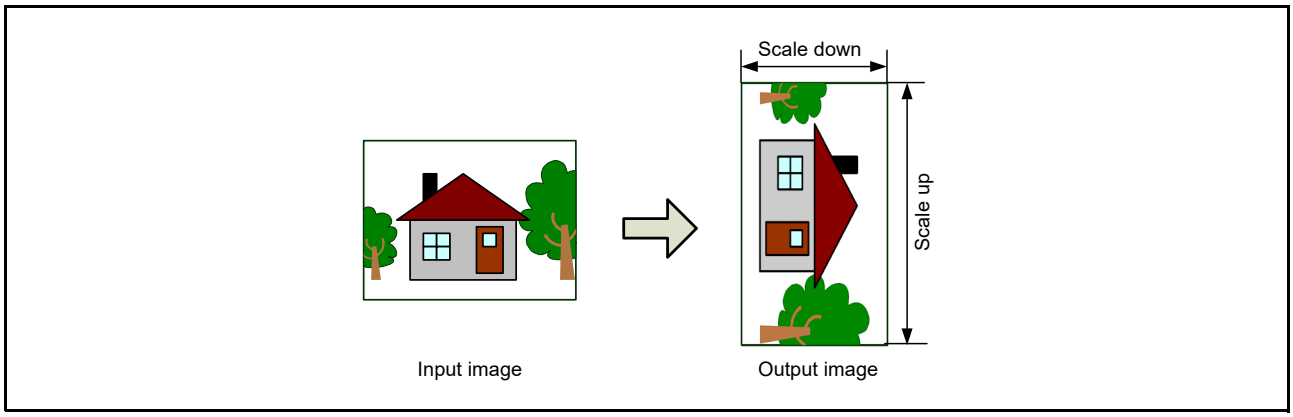

Figure 33.11 Impossible Scaling Process

33.1.6 Horizontal Prefilter

The horizontal prefilter can be turned on or off for brightness (Y) and RGB signals to suppress the frequency band of the signals during horizontal size reduction. The input format depends on the SC_RES_MD[1:0] bit setting in the writing mode register (SC_SCL1_WR1).

When the horizontal reduction ratio is high and there is too much folding frequency component to ignore, the horizontal prefilter should be turned on.

Table 33.12 Horizontal Prefilter Settings

Input Format	SC_RES_PFIL_SEL	Operation
YCbCr input	1	Turns on the horizontal prefilter for Y signal and turns off the horizontal prefilter for Cb/Cr signal.
	0	Turns off the horizontal prefilter.
RGB input	1	Turns on the horizontal prefilter for RGB signal.
	0	Turns off the horizontal prefilter.

Table 33.13 Horizontal Prefilter Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS4	SC_RES_PFIL_SEL	0	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)

33.1.7 Horizontal Scale-Down

The number of horizontally arranged pixels can be decreased at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Horizontal Scale Down Ratio

The value to be set to the horizontal scale-down ratio SC_RES_DS_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_HW and number of output pixels SC_RES_OUT_HW, where the decimals are rounded off.

SC_RES_DS_H_RATIO = round (SC_RES_HW ÷ SC_RES_OUT_HW × 4096)

Note that, for 100% horizontal scale-up, the SC_RES_HW and SC_RES_OUT_HW values should be identical and the SC_RES_DS_H_RATIO bits should be set to 4096.

(4) Handling for Lack of Last-Input Pixel

Interpolation is carried out between the second-last-input and last-input pixels to produce the last-output pixel at the right end of a screen. The interpolation position of the last-output pixel may be close to the second-last-input pixel depending on the horizontal scale-down ratio; in this case, it may appear that the last-input pixel is lacking.

The undesirable influence by lack of last-input pixel can be decreased by appropriately adjusting the horizontal scale-down ratio using the following equations.

Pre-adjustment horizontal scale-down ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-down ratio SC_RES_DS_H_RATIO should be determined.

RATIO_org = round (SC_RES_HW ÷ SC_RES_OUT_HW × 4096)

σ = (RATIO_org × (SC_RES_OUT_HW − 1) − (SC_RES_HW − 1) × 4096) ÷ (SC_RES_OUT_HW − 1)

SC_RES_DS_H_RATIO = roundup (RATIO_org − σ)

Table 33.14 Horizontal Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_H_ON	1	Horizontal Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_HW[10:0]	640	Number of Valid Horizontal Pixels Output by Scaling-down Control Block (Video-image clock cycles)
SC_SCL0_DS4	SC_RES_DS_H_INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS4	SC_RES_DS_H_RATIO[15:0]	9224	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC_RES_HW ÷ SC_RES_OUT_HW × 4096) SC_RES_DS_H_RATIO < 4096: Setting prohibited SC_RES_DS_H_RATIO = 4096: 100% scale up SC_RES_DS_H_RATIO > 4096: Scale down

Note: The SC_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC_RES_HW value.

33.1.8 Vertical Scale-Down

The number of lines can be decreased in the vertical direction at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Vertical Scale Down Ratio

The value to be set to the vertical scale-down ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_VW and number of output lines SC_RES_OUT_VW, where the decimals are rounded off.

$$SC_RES_V_RATIO = round\ (SC_RES_VW \div SC_RES_OUT_VW \times 4096)$$

Note that the SC_RES_VW and SC_RES_OUT_VW values should be identical for vertical enlargement or 100% vertical enlargement.

For 100% vertical enlargement, reduction is carried out assuming SC_RES_V_RATIO as 4096.

(4) Handling for Lack of Last-Input Line

Interpolation is carried out between the second-last-input and last-input lines to produce the last-output line at the lower end of a screen. The interpolation position of the last-output line may be close to the second-last-input line depending on the vertical scale-down ratio; in this case, it may appear that the last-input line is lacking.

The undesirable influence by the lack of last-input line can be decreased by appropriately adjusting the vertical scale-down ratio using the following equations.

Pre-adjustment vertical scale-down ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-down ratio SC_RES_V_RATIO should be determined.

$$RATIO_org = round\ (SC_RES_VW \div SC_RES_OUT_VW \times 4096)$$

$$\sigma = (RATIO_org \times (SC_RES_OUT_VW - 1) - (SC_RES_VW - 1) \times 4096) \div (SC_RES_OUT_VW - 1)$$

$$SC_RES_V_RATIO = round\ (RATIO_org - \sigma)$$

Table 33.15 Vertical Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_V_ON	1	Vertical Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_VW [10:0]	240	Number of Valid Lines in Vertical Direction Output by Scaling-Down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC_SCL1_WR1.SC_RES_LOOP is 0 (frame write mode), these bits specify the number of lines for one frame. When SC_SCL1_WR1.SC_RES_LOOP is 1 (line write mode), these bits specify the number of lines for writing in a ring configuration.
SC_SCL0_DS5	SC_RES_V_ INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO [15:0]	2044	Vertical Scale UP/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round(SC_RES_VW ÷ SC_RES_OUT_VW × 4096) For scale up: round(SC_RES_IN_VW ÷ SC_RES_P_VW × 4096) SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.
It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.
The SC_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC_RES_VW value.

33.1.9 Horizontal Scale Up

The number of horizontally arranged pixels can be increased at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Horizontal Scale Up Ratio

The value to be set to the horizontal scale-up ratio SC_RES_US_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_IN_HW and number of output pixels SC_RES_P_HW, where the decimals are rounded off.

SC_RES_US_H_RATIO = round (SC_RES_IN_HW ÷ SC_RES_P_HW × 4096)

Note that, for 100% horizontal scale-up, the SC_RES_IN_HW and SC_RES_P_HW values should be identical and the SC_RES_US_H_RATIO bits should be set to 4096.

(4) Folding Handling

Since interpolation is carried out between the last-input pixel and second-last-input folding pixel to produce the last-output pixel at the right end of a screen, folding may undesirably stand out depending on the horizontal scale up ratio.

The undesirable influence by folding pixels can be decreased by appropriately adjusting the horizontal scale-up ratio using the following equations.

Pre-adjustment horizontal scale-up ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-up ratio SC_RES_US_H_RATIO should be determined.

RATIO_org = round (SC_RES_IN_HW ÷ SC_RES_P_HW × 4096)

σ = (RATIO_org × (SC_RES_P_HW − 1) − (SC_RES_IN_HW − 1) × 4096 ÷ (SC_RES_P_HW − 1)

SC_RES_US_H_RATIO = round (RATIO_org − σ)

Table 33.16 Horizontal Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_H_ON	1	Horizontal Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Number of Valid Horizontal Pixels Input to Scaling-up Control Block (Pixel-clock cycles)
SC_SCL0_US6	SC_RES_US_H_ INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_US5	SC_RES_US_H_RATIO [15:0]	9224	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC_RES_IN_HW ÷ SC_RES_P_HW × 4096) SC_RES_US_H_RATIO < 4096: Scale up SC_RES_US_H_RATIO = 4096: 100% scale-up SC_RES_US_H_RATIO > 4096: Setting prohibited

33.1.10 Vertical Scale-Up

The number of lines can be increased in the vertical direction at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Vertical Scale Up Ratio

The value to be set to the vertical scale-up ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_IN_VW and number of output lines SC_RES_P_VW, where the decimals are rounded off.

SC_RES_V_RATIO = round (SC_RES_IN_VW ÷ SC_RES_P_VW × 4096)

Note that, for 100% vertical enlargement or vertical reduction, the SC_RES_IN_VW and SC_RES_P_VW values should be identical.

(4) Folding Handling

The last line to be output at the bottom of the screen is produced by interpolation between the last line and line for folding (second-last line to be input). According to the vertical scale-up rate, this may cause folding to stand out.

The undesirable influence by folding lines can be decreased by appropriately adjusting the vertical scale-up ratio using the following equations.

Pre-adjustment vertical scale-up ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-up ratio SC_RES_V_RATIO should be determined.

RATIO_org = round (SC_RES_IN_VW ÷ SC_RES_P_VW × 4096)

σ = (RATIO_org × (SC_RES_P_VW − 1) − (SC_RES_IN_VW − 1) × 4096) ÷ (SC_RES_P_VW − 1)

SC_RES_V_RATIO = round (RATIO_org − σ)

Table 33.17 Vertical Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_VW[10:0]	240	Number of Valid Lines in Vertical Direction Input to Scaling-up Control Block (Lines)
SC_SCL0_DS5	SC_RES_V_INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	2044	Vertical Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round(SC_RES_VW ÷ SC_RES_OUT_VW × 4096) For scale up: round(SC_RES_IN_VW ÷ SC_RES_P_VW × 4096) SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.
It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.

33.1.11 IP Conversion

(1) Initial Phase Control

When interlaced signals are input, line flickering caused by the line offset between the top and bottom fields can be decreased before being displayed by independently adjusting the initial scaling phases of the fields.

For various operations, appropriate settings should be made referring to the relevant registers as listed in Table 33.18.

Table 33.18 Initial Scaling Phase Settings (Standard Values) for IP Conversion

Rotation	Horizontal Scaling	Vertical Scaling	Reference Bit (Setting)
Normal	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
Horizontal mirroring	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
90° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	SC_RES_US_HB_INIPHASE = 2048
180° rotation	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_BTM_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_BTM_INIPHASE = 2048
270° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	SC_RES_US_HT_INIPHASE = 2048

Note: Set 0 to the initial phase control registers where the specific value is not shown in the table.
Set 0 to all the initial phase control registers when progressive signals are input.

Table 33.19 Initial Scaling Phase Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS5	SC_RES_BTM_INIPHASE [11:0]	0	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_DS5	SC_RES_TOP_INIPHASE [11:0]	2048	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HB_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HT_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)

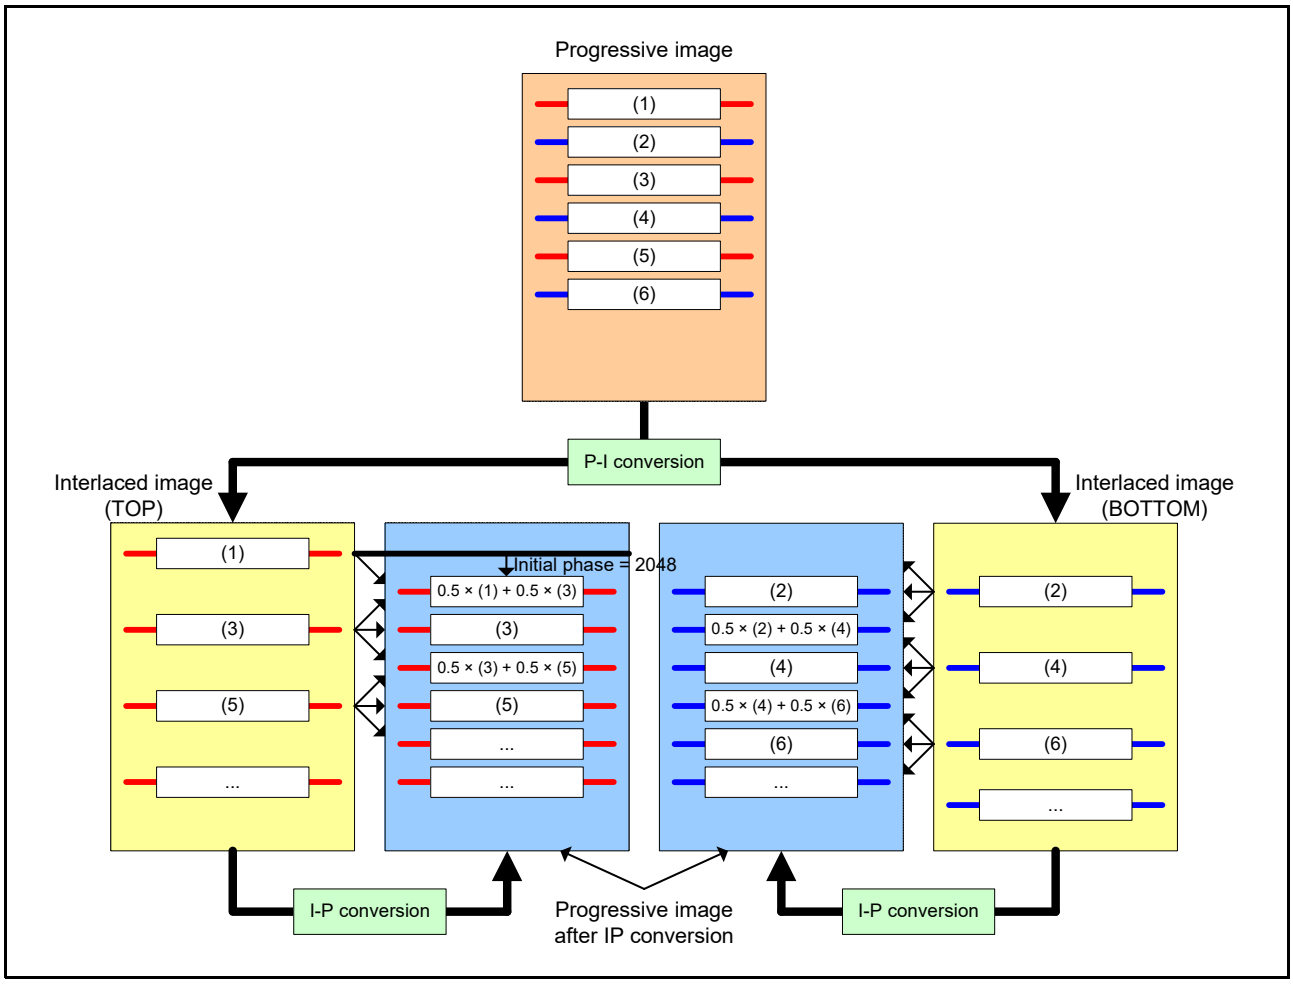

Figure 33.12 IP Conversion Processing Schematic Diagram

(2) Field Determination Signal Control

When interlaced signals are input, the field determination signal can be controlled, which is output to the scaling-up control block during vertical scaling.

When progressive signals are input or vertical scaling is carried out by the scaling-down control block, the field determination signal output to the scaling-up control block is fixed to the specific level, and thus either 0 or 1 can be set to the SC_RES_FLD_DLY_SEL bit.

Table 33.20 Settings for Field Determination Signal Control

Input Signal	Rotation	Vertical Processing	Frame Buffer	SC_RES_FLD_DLY_SEL
Progressive	—	—	—	—
Interlace	Normal Horizontal mirroring 180° rotation	Vertical scale down	—	—
		Vertical scale up	One plane or less	0
			Two planes or more	1
	90° rotation 270° rotation	(Horizontal input → vertical output) scale down	—	—
		(Horizontal input → vertical output) scale up	Two planes or more	1

Table 33.21 Field Determination Signal Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_FLD_DLY_SEL	1	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle

33.1.12 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image Line before Scaling-down

When the location of the image line input to the scaling-down control block matches the SC_SCL1_LINE setting, an interrupt processing is done. In addition, the current location of the line input to the scaling-down control block can be read from a register.

Table 33.22 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image line before Scaling-down

Register Name	Bit Name	Initial Value	Description
SC_SCL0_INT	SC_RES_LINE[10:0]	All 0	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC_SCL0_LINE setting, an interrupt signal is output. (Setting prohibited in this product)
SC_SCL0_MON0	SC_RES_LIN_STAT[10:0]	All 0	Current Location of Image Line Input to Scaling-down Control Block

33.1.13 Trimming

The upper, lower, right, and left parts of a post-scaling image can be trimmed off as specified by the SC_RES_VCUT and SC_RES_HCUT bits before being output.

The frame lines of the post-scaling image can also be displayed by setting the SC_RES_DISP_ON bit to 1.

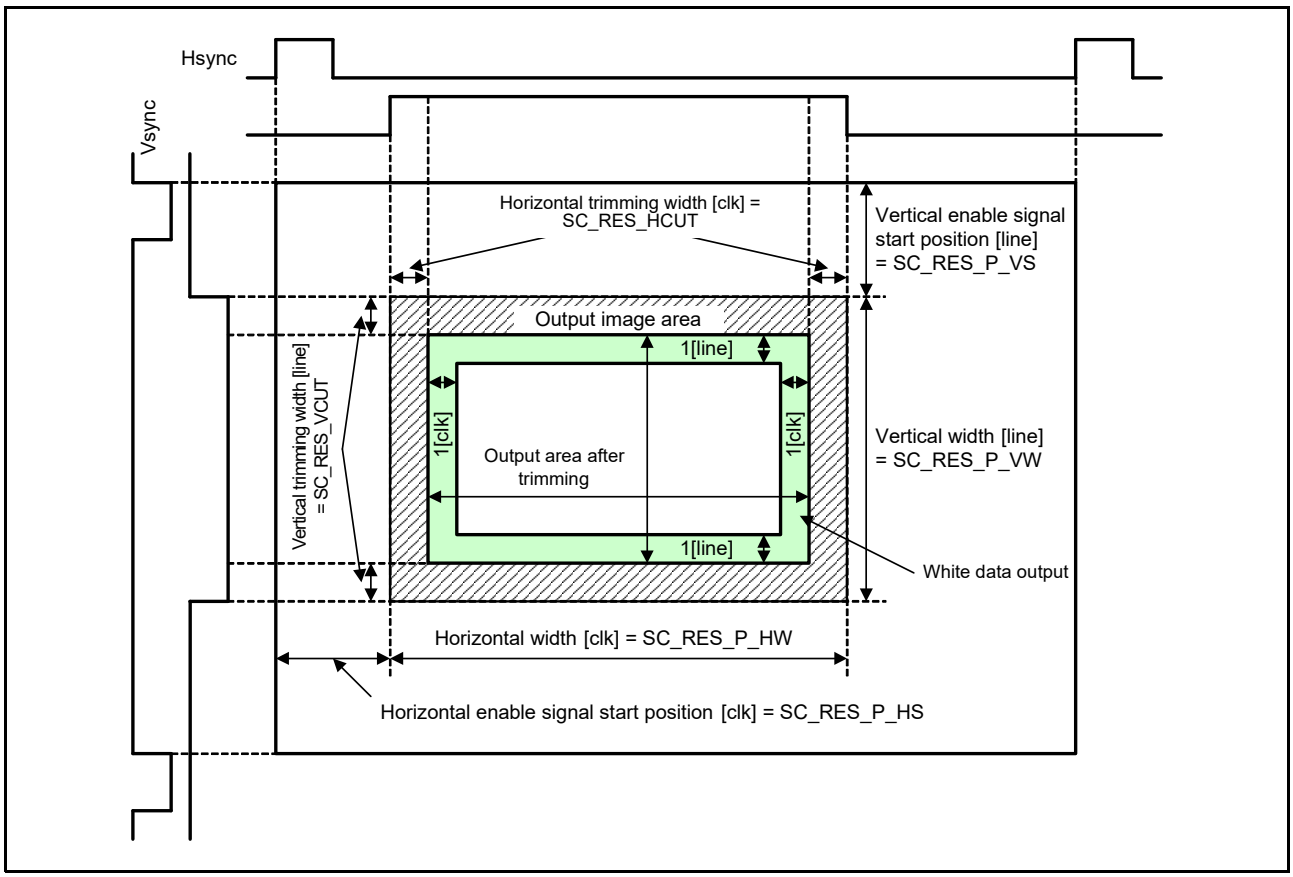

Figure 33.13 Area Relationship for Trimming (Frame Lines Displayed)

Table 33.23 Trimming Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US7	SC_RES_HCUT[7:0]	0	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
SC_SCL0_US7	SC_RES_VCUT[7:0]	0	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.
SC_SCL0_US8	SC_RES_DISP_ON	0	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

33.1.14 Screen Synthesis

During the valid full-screen period, the image area can be overlaid before being output. If the image area to be output is smaller than a full-screen, the background color specified by the SC_RES_BK_COL_R, SC_RES_BK_COL_G, and SC_RES_BK_COL_B bits are displayed to fill the background.

Table 33.24 Screen Synthesis Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_OVR1	SC_RES_BK_COL_R [7:0]	128	Background Color Setting R/Cr Signal R:8 bits; unsigned (0 to 255 [LSB]) Cr:8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_B [7:0]	128	Background Color Setting B/Cb Signal B:8 bits; unsigned (0 to 255 [LSB]) Cb:8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_G [7:0]	0	Background Color Setting G/Y Signal G/Y:8 bits; unsigned (0 to 255 [LSB])

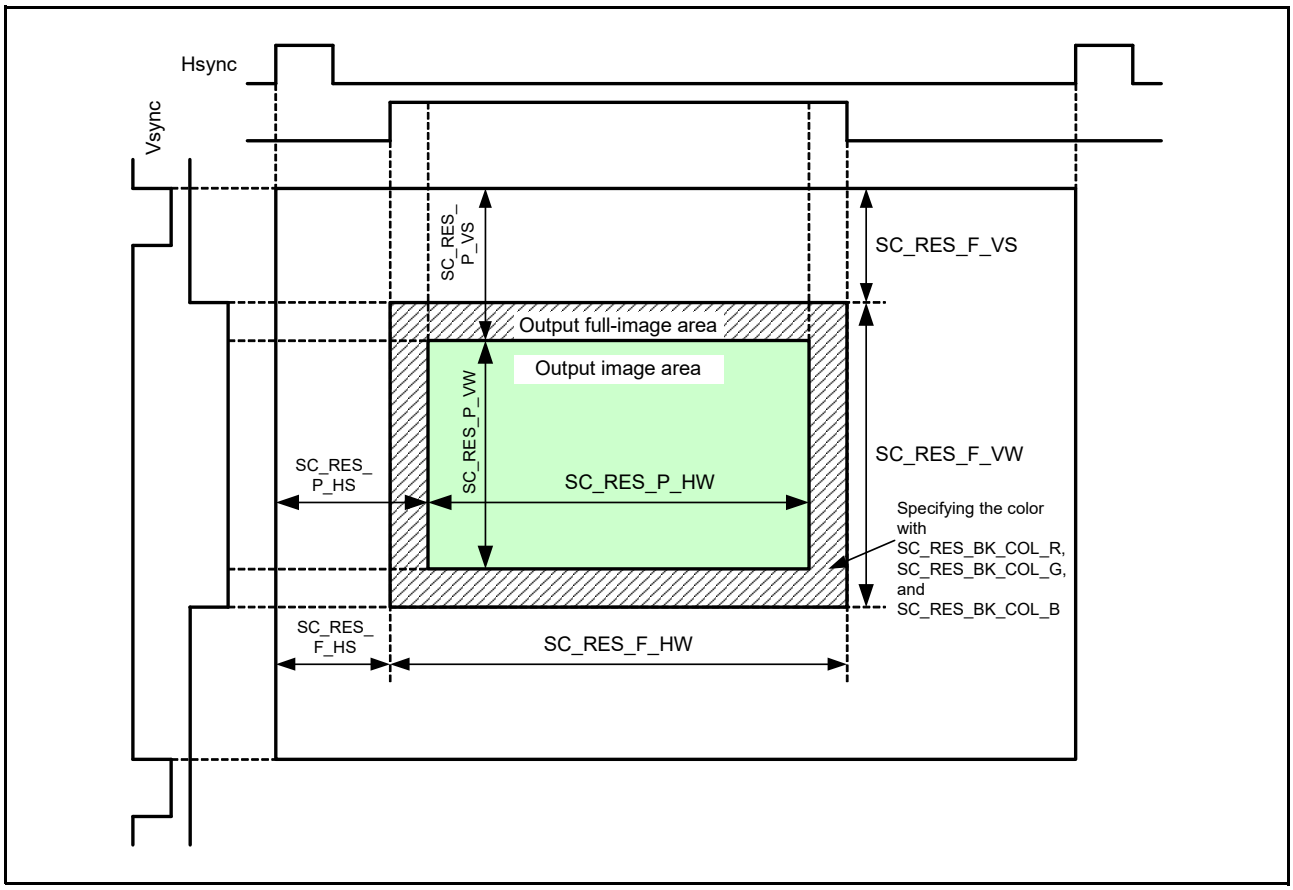

Figure 33.14 Area Relationship with Output Image Size Smaller than a Full Screen

33.1.15 Selecting Format for Writing Video Image Signals to Frame Buffer

A format can be selected for writing video image signals to the frame buffer.

Although 24-bit YCbCr signals or 24-bit RGB signals are input to the scaling control block, they are converted into 16-bit YCbCr422 signals, 16-bit RGB565 signals, 32-bit YCbCr444 signals, or 32-bit RGB888 signals before being written to the frame buffer.

As bit reduction processing of RGB565, rounding off or 2 × 2 pattern dither can be selected with the SC_RES_DTH_ON bit. For details on pattern dither, see section 37.1.7, Dither Process in section 37, Video Display Controller 5 (7): Output Controller.

Input YCbCr signals are converted into YCbCr422 signals and output to the image renderer. Note that only scaler 0 can output signals to the image renderer.

For distortion correction, refer to section 41, Image Renderer (IMR-LS2).

Table 33.25 Frame Buffer Writing Mode Setting

RES_BITDEC_ON	SC_RES_MD[1:0]	Writing Mode
0	3	YCbCr444 (normal, horizontal mirroring)
0	2	RGB888 (normal, horizontal mirroring)
1	1	RGB565 (normal, horizontal mirroring, rotation)
*	0	YCbCr422 (normal, horizontal mirroring, rotation), YCbCr422 (distortion correction)*1

Note 1. Only scaler 0 can output signals to the image renderer.

Table 33.26 Video Signal Writing Format Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_MD[1:0]	0	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
SC_SCL1_WR6	SC_RES_BITDEC_ON	0	Bit Reduction On/Off 0: Off 1: On
SC_SCL1_WR6	SC_RES_DTH_ON	0	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 pattern dither)

33.1.16 Horizontal Mirroring and Rotation

Horizontal mirroring and rotation can be carried out for scaled-down images before being written to the frame buffer.

Table 33.27 and Table 33.28 show the relationship between various writing modes for image processing and video signals.

Table 33.27 Relationship between Writing Modes and Video Signals

RES_DS_WR_MD[2:0]	Writing Modes	YCbCr444	YCbCr422	RGB565	RGB888
0	Normal writing	Enabled	Enabled	Enabled	Enabled
1	Horizontal mirroring	Enabled	Enabled	Enabled	Enabled
2	90° rotation	Disabled	Enabled	Enabled	Disabled
3	180° rotation	Disabled	Enabled	Enabled	Disabled
4	270° rotation	Disabled	Enabled	Enabled	Disabled
5 to 7	Setting prohibited	—	—	—	—

Table 33.28 Horizontal Mirroring and Rotation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_DS_WR_MD [2:0]	0	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited

33.1.17 Writing to Frame Buffer

(1) Frame Buffer Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video image data and graphics data are stored.

Table 33.29 Frame Buffer Transfer Mode

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_BST_MD	0	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

(2) Frame Buffer Write Control

Frame buffer writing is enabled or disabled.

Table 33.30 Frame Buffer Writing Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

(3) Frame Buffer Writing Rate Selection

A frame buffer writing rate can be selected from among 1/1, 1/2, 1/4, and 1/8 the vertical frequency of the input signal.

When 1/2, 1/4, or 1/8 is selected, either the top or bottom field can be selected for writing.

Table 33.31 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_FS_RATE [1:0]	0	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
SC_SCL1_WR5	SC_RES_FLD_SEL	0	Write Field Select 0: Top field 1: Bottom field
SC_SCL1_WR5	SC_RES_INTER	1	Field Operating Mode Select 0: Progressive 1: Interlace

(4) Frame Buffer Write Addresses

Frame buffer addresses are specified using the base address, line offset address, frame offset address, data size of a line, and the number of lines in a frame. When an interlaced video image is input, the top and bottom field data can be separately stored in the frame buffer.

The SC_RES_BASE[31:0], SC_RES_LN_OFF[14:0], and SC_RES_FLM_OFF[22:0] bits should be set in 32-byte units (the lower five bits should be fixed to 0).

For 128-byte transfer, bits [6:5] in the address control registers should be fixed to 0 since addresses should be specified in 128-byte units.

For the data size of a line and the number of lines in a frame, the relevant register values set for the scaling-down control block are used.

Table 33.32 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_TB_ADD_MOD	0	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
SC_SCL1_WR2	SC_RES_BASE [31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR8	SC_RES_BASE_B [31:0]	0	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR3	SC_RES_LN_OFF [14:0]	2048	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Line 0: SC_RES_BASE Line 1: SC_RES_BASE + SC_RES_LN_OFF × 1 : Line n: SC_RES_BASE + SC_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR9	SC_RES_LN_OFF_B [14:0]	2048	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC_RES_TB_ADD_MOD = 1. Line 0: SC_RES_BASE_B Line 1: SC_RES_BASE_B + SC_RES_LN_OFF_B × 1 : Line n: SC_RES_BASE_B+ SC_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR4	SC_RES_FLM_OFF [22:0]	524288	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Buffer 0: SC_RES_BASE Buffer 1: SC_RES_BASE + SC_RES_FLM_OFF × 1 : Buffer n: SC_RES_BASE + SC_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Table 33.32 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR10	SC_RES_FLM_OFF_B [22:0]	524288	Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC_RES_TB_ADD_MOD = 1. Buffer 0: SC_RES_BASE_B Buffer 1: SC_RES_BASE_B + SC_RES_FLM_OFF_B × 1 : Buffer n: SC_RES_BASE_B + SC_RES_FLM_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

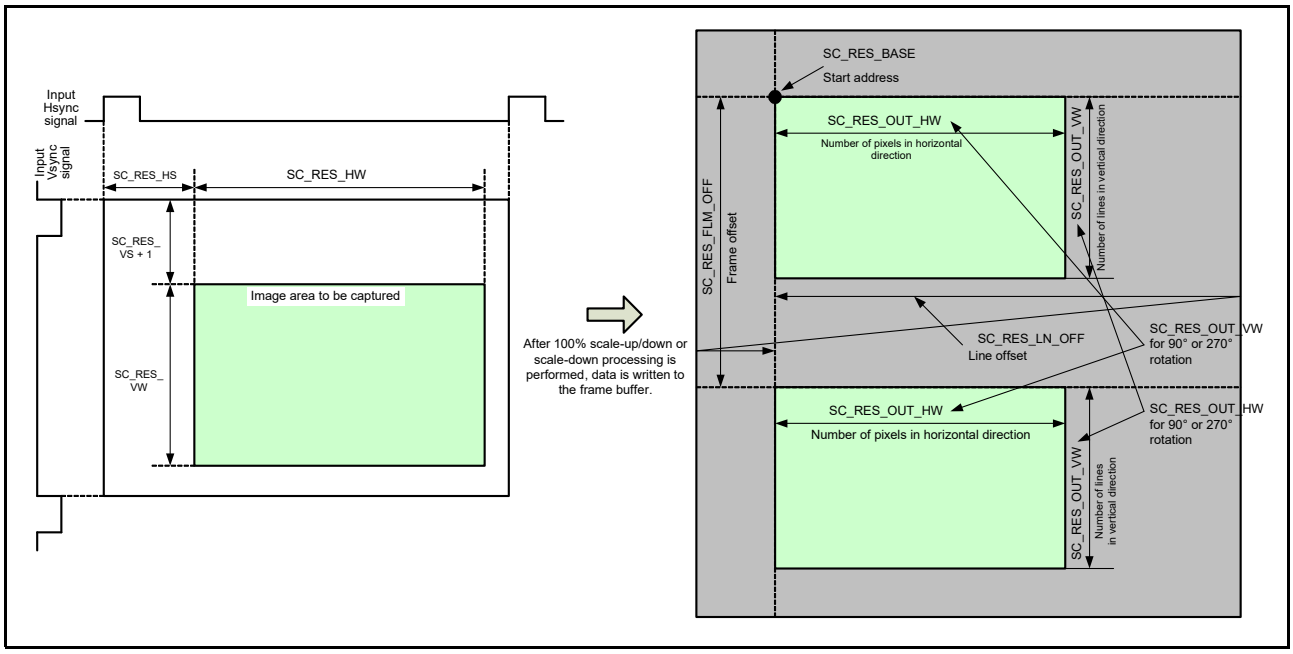

Figure 33.15 Data Arrangement in Frame Buffer

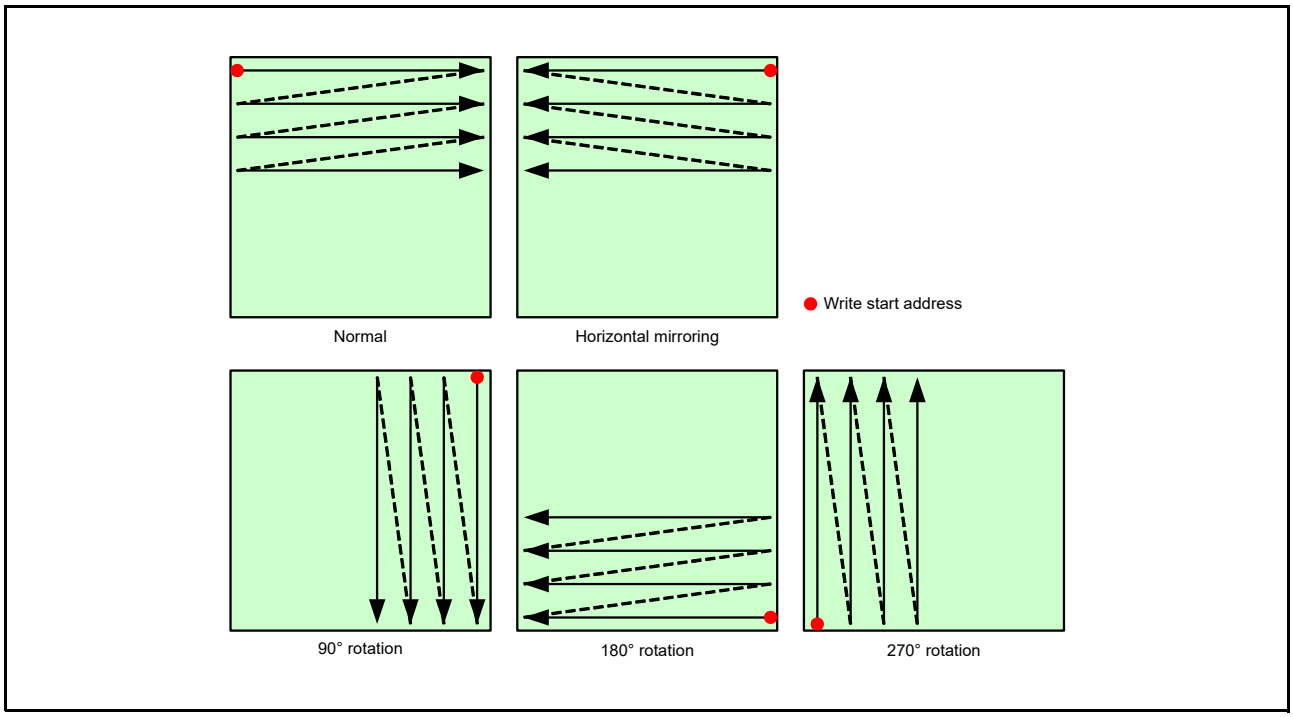

Figure 33.16 Data Arrangement in Frame Buffer in Various Writing Modes

(5) Frame Buffer Management

The scaling control block can handle multiple frames as the frame buffer.

Data is written to the buffer in cyclic mode according to the number of frames specified by the SC_RES_FLM_NUM bits.

For rotation, the SC_RES_FLM_NUM bits should be set to two or more frames.

To use the frame buffer as the ring buffer in line mode, the SC_RES_FLM_NUM bits should be set to 0 (1 frame) and the SC_RES_LOOP bit to 1.

Table 33.33 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR3	SC_RES_FLM_ NUM[9:0]	1	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0 Number of frames defined by SC_RES_FLM_NUM + 1 are used.
SC_SCL1_WR9	SC_RES_FLM_ NUM_B[9:0]	1	Number of Frames of Buffer to be Written to for Bottom Field when SC_RES_TB_ADD_MOD = 1 Number of frames defined by SC_RES_FLM_NUM_B + 1 are used.
SC_SCL1_WR1	SC_RES_LOOP	0	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
SC_SCL1_WR7	SC_RES_FLM_ CNT[9:0]	—	Frame Number Before Frame Being Accessed Frame number before the frame being accessed in the top field when SC_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC_RES_TB_ADD_MOD = 0.
SC_SCL1_WR11	SC_RES_FLM_ CNT_B[9:0]	—	Frame Number Before Frame Being Accessed in Bottom Field Frame number before the frame being accessed in the bottom field when SC_RES_TB_ADD_MOD = 1.

(6) Buffer Overflow Handling

If writing to the frame buffer cannot be completed due to bus-traffic related problems, an overflow interrupt can be output to the interrupt controller.

Table 33.34 Buffer Overflow Detection

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR7	SC_RES_OVERFLOW	—	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.

(7) Frame Buffer Write End Flag

When writing one frame of data to the frame buffer is completed, a frame buffer write end interrupt can be output to the interrupt controller.

33.1.18 Selecting a Scaling-up Process or Graphics 0 or 1 Process

Scaling-up process and graphics 0 or 1 process are mutually exclusive and thus frame buffer cannot be read out simultaneously for the processes.

When displaying input video image signals or displaying enlarged graphics, data is read from the frame buffer via the scaling-up control block.

However, graphics can be enlarged and displayed by the scaling-up control block only when the RGB565, RGB888, YCbCr422, or YCbCr444 format is used.

When displaying graphics without enlargement, the data is read from the frame buffer via the graphics 0 or 1 processing block.

With the SC_RES_IBUS_SYNC_SEL bit, sync signals for reading out the frame buffer and read size setting bits are selected.

Table 33.35 Selection of Scaling-Up Process and Graphics 0 or 1 Process

Type of Output Scaling Display	SC_RES_ IBUS_SYNC_SEL	Sync Signals for Frame Buffer Read	Frame Buffer Read Size Setting Bits	Display Enabling Bits
Input video signal display Enlarged graphics display	0	Output from scaling-up control block	SC_RES_IN_VW SC_RES_IN_HW	SC_RES_P_VS SC_RES_P_VW SC_RES_P_HS SC_RES_P_HW
Graphics display	1	Output from graphics 0 or 1 processing block	GR_FLM_LNUM* GR_HW*	GR_GRC_VS GR_GRC_VW GR_GRC_HS GR_GRC_HW

Note: * The value set to the register + 1 is the actual read size.

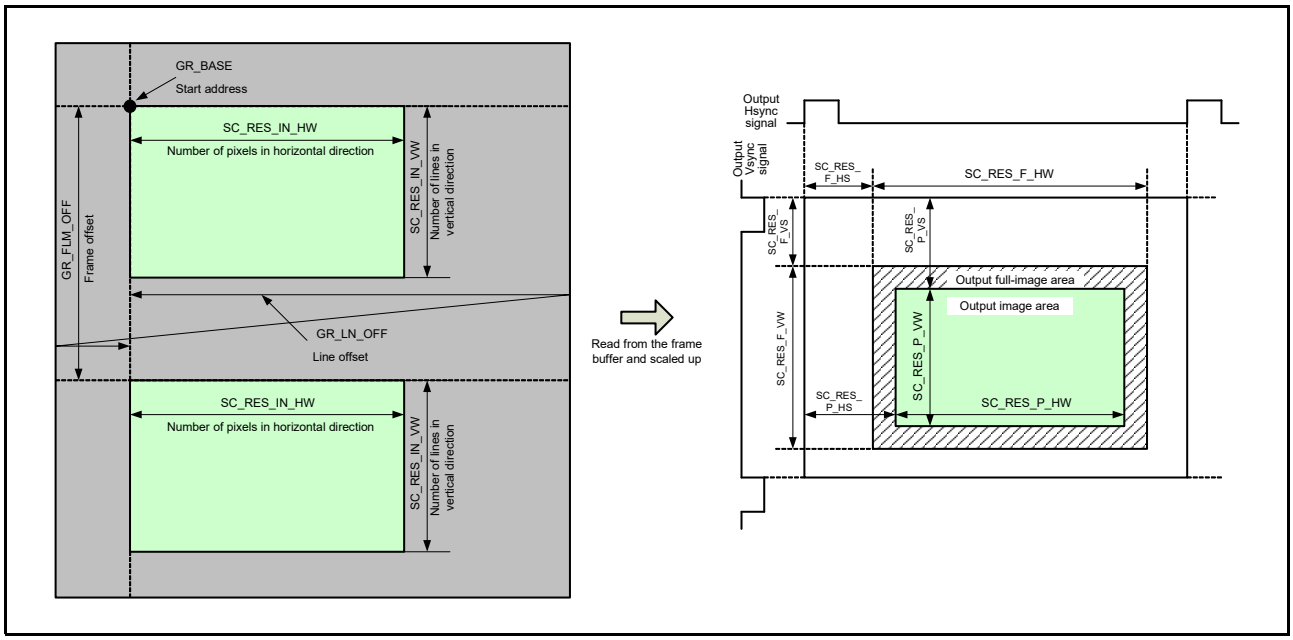

Figure 33.17 Area Setting for Input Video Image Signal Display and Enlarged Graphics Display

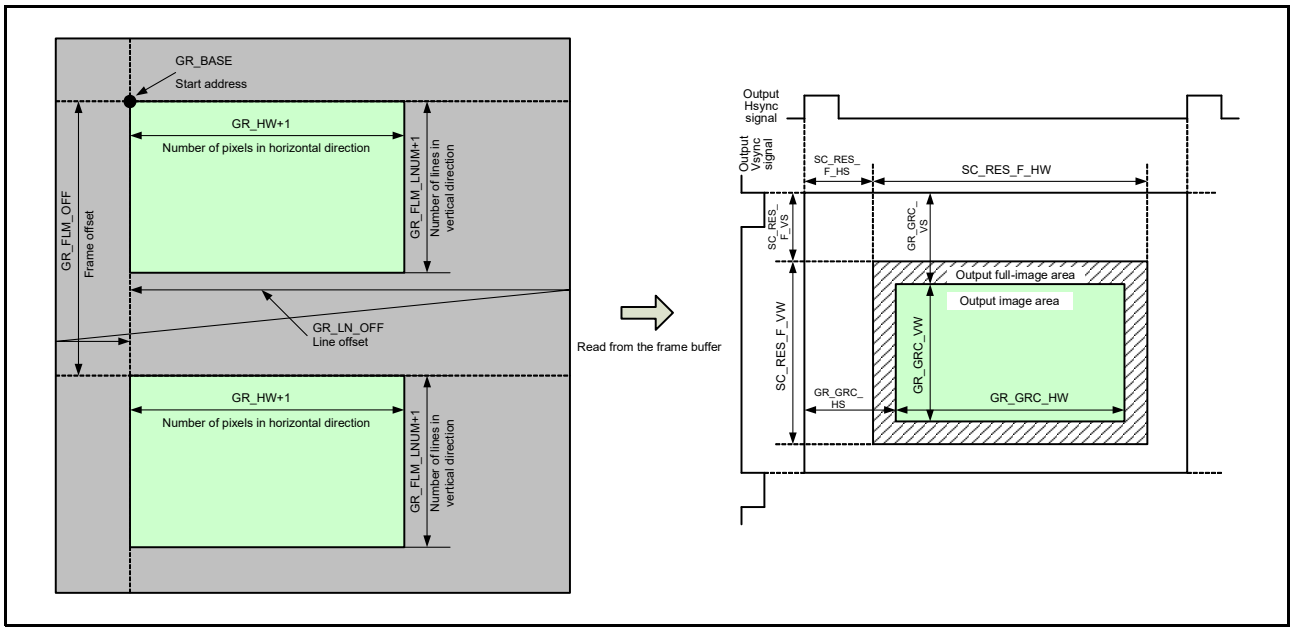

Figure 33.18 Area Setting for Graphics Display

Table 33.36 Scaling-Up Process or Graphics 0 or 1 Process Selection

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	0	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block

The GR_DISP_SEL bits are used to select a display by the scaling-up control block (video image display or enlarged graphics display) or graphics display.

For details on the graphics processing, refer to the section 35, Video Display Controller 5 (5): Image Synthesizer.

33.1.19 Selecting Field for Frame Buffer Reading

For the next frame buffer to be read, the top or bottom field can be selected. This field selection is used in the scaling-up control block.

Table 33.37 Field Specification for Frame Buffer Reading

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLD_SEL	0	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
GR_FLM3	GR_FLD_NXT	0	Selects the top or bottom field for the next frame buffer. 0: Bottom 1: Top

33.1.20 Pointer Buffer and Frame Buffer Reading Processing

(1) Pointer Buffers

The pointer buffers can be used to control the frame buffer for the input video image. They are mainly used to prevent flicker in the output video image, which occurs when the input and output vertical sync signals are asynchronous.

Four pointer buffers are provided and each pointer buffer has a start address register that shows the start location of the frame buffer and a field information register that shows the current field is the top or bottom field. The four pointer buffers are arranged in a ring structure and a write pointer is provided to indicate the pointer buffer corresponding to the location currently being written to. The location pointed to by the write pointer is being written to, and the corresponding pointer buffer value is undetermined. The value in the pointer buffer corresponding to the location being written to and the value in the write pointer are automatically updated when frame data writing is completed.

When the frame buffer address setting signal is linked with the pointer buffer (GR_FLM_SEL = 3), frame buffer reading can be controlled by using the read pointer that indicates the pointer buffer corresponding to the location being read; the start address and field information of the next frame buffer to be read should be read from the pointer buffer and they should be set in the frame buffer base address and field information. The read pointer value is automatically updated at the rising edge of the vertical sync signal on the reading side.

(2) Write Pointer Control

The write pointer is incremented by one every time frame data writing is completed.

(3) Read Pointer Control

The read pointer is updated at the rising edge of the vertical sync signal on the reading side according to the difference between the read and write pointer values as follows.

(A) When (write pointer value) – (read pointer value) ≤ 1

The read pointer value is not updated (the same frame is displayed continuously).

(B) When (write pointer value) – (read pointer value) = 2

The read pointer is incremented by one with the next updating timing.

(C) When (write pointer value) – (read pointer value) ≥ 3

The read pointer is incremented by two with the next updating timing.

(One frame is skipped.)

(4) Frame Buffer Read Control

(A) When SC_RES_WENB = 0

Frame data is not written to the frame buffer, and the frame buffer is not read.

(B) When frame data writing is terminated with SC_RES_WENB = 1

As the pointer buffer value is determined, the frame buffer is read.

Table 33.38 Frame Buffer Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_PBUF0	SC_BUF0_ADD	0	Start address of the write buffer pointed to by pointer buffer 0
SC_SCL1_PBUF1	SC_BUF1_ADD	0	Start address of the write buffer pointed to by pointer buffer 1
SC_SCL1_PBUF2	SC_BUF2_ADD	0	Start address of the write buffer pointed to by pointer buffer 2
SC_SCL1_PBUF3	SC_BUF3_ADD	0	Start address of the write buffer pointed to by pointer buffer 3
SC_SCL1_PBUF_FLD	SC_FLD_INF0	0	Top or bottom field information pointed to by pointer buffer 0 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF1	0	Top or bottom field information pointed to by pointer buffer 1 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF2	0	Top or bottom field information pointed to by pointer buffer 2 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF3	0	Top or bottom field information pointed to by pointer buffer 3 0: Bottom 1: Top
SC_SCL1_PBUF_CNT	SC_PBUF_RST	0	Reset Control for the Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
SC_SCL1_MON1	SC_PBUF_NUM	0	Write pointer indicating the pointer buffer number corresponding to the location currently being written to.
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Writing is disabled. 1: Writing is enabled.
GR_FLM1	GR_FLM_SEL	0	Frame Buffer Address Setting Signal Selection 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC_RES_TB_ADD_MOD = 1 in SC_SCL1_WR1.) 1: Selects GR0_FLM_NUM. 2: Links to distortion correction. (Channel 0 of VDC5 can be linked to channel 0 of IMR-LS2, and channel 1 of VDC5 can be linked to channel 1 of IMR-LS2.) 3: Links to pointer buffer.
GR_FLM2	GR_BASE	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

For other frame buffer read operation and graphics processing, refer to section 35, Video Display Controller 5 (5): Image Synthesizer.

33.1.21 Cascaded Connection

To display one video image plane + three graphics planes or to display four graphics planes, scaler 0 and graphics block 1 in scaler 1 are cascaded.

When cascaded connection is selected, the scaling-up processing in scaler 1 is not available.

Table 33.39 Cascaded Connection

Register Name	Bit Name	Initial Value	Description
GR1_AB1	GR1_CUS_CON_ON	0	Cascaded Connection Enable/Disable 0: Cascaded connection is disabled. 1: Cascaded connection is enabled.

33.1.22 Blending Two Input Video Images

To display two video image planes + two graphics planes, the video images input from scalers 0 and 1 are blended in the VIN synthesizer. To blend two input video images, the vertical and horizontal sync signal output and the full-screen enable signal output from scalers 0 and 1 should be synchronized. When the vertical sync signal output is synchronized with the vertical sync signal generated in the synchronization control block in scaler 0, the vertical sync signal input and output become asynchronous in scaler 1. This timing difference may cause flicker in the output video image; to avoid this, use the pointer buffers described before to control the frame buffer in scaler 1.

Likewise, when synchronizing with the output vertical sync signal generated in the synchronization control block in scaler 1, use the pointer buffers to control the frame buffer in scaler 0.

Table 33.40 Blending Two Input Video Images

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC3	SC_RES_VS_IN_SEL	0	Horizontal and Vertical Sync Signal Output and Full-Screen Enable Signal Select 0: Horizontal and vertical sync signal output and full-screen enable signal from the current scaler 1: Horizontal and vertical sync signal output and full-screen enable signal from the other scaler

33.2 Register Descriptions

Table 33.41 and Table 33.42 show the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R: Read-only. The write value should always be 0.
—/W: Write-only. The read value is undefined.

Table 33.41 Register Configuration of the Scaler (Channel 0)

Name	Abbreviation	R/W	Initial Value	Address	Access Size
SCL0 register update control register (SC0)	SC0_SCL0_UPDATE	R/WC1	H'0000 0000	H'FCFF 7500	32

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SC0_SCL0_VEN_D	SC0_SCL0_VEN_C	—	—	—	SC0_SCL0_UPDATE	—	—	—	SC0_SCL0_VEN_B	—	—	—	SC0_SCL0_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	SC0_SCL0_VEN_D	0	R/WC1	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
12	SC0_SCL0_VEN_C	0	R/WC1	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_SCL0_UPDATE	0	R/WC1	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL0_VEN_B	0	R/WC1	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL0_VEN_A	0	R/WC1	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.2 Mask Control Register (SC0_SCL0_FRC1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_VMASK[15:0]															
Initial value:	0	0	0	0	1	0	1	0	1	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VMASK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_VMASK [15:0]	2800	R/W	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC0_RES_VMASK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_ VMASK_ON	1	R/W	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.3 Missing Vsync Compensation Control Register (SC0_SCL0_FRC2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_VLACK[15:0]															
Initial value:	0	0	0	0	1	1	1	0	0	0	0	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VLACK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_ VLACK [15:0]	3600	R/W	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC0_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_ VLACK_ON	1	R/W	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.4 Output Sync Select Register (SC0_SCL0_FRC3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_RES_VS_IN_SEL	—	—	—	—	—	—	—	SC0_RES_VS_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_RES_VS_IN_SEL	0	R/W	Horizontal and Vertical Sync Signal Output and Full-Screen Enable Signal Select Be sure to clear this bit to 0 when cascaded connection is enabled (GR1_AB1.GR1_CUS_CON_ON = 1). 0: Horizontal and vertical sync signal output and full-screen enable signal from scaler 0 1: Horizontal and vertical sync signal output and full-screen enable signal from scaler 1
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_VS_SEL	1	R/W	Vsync Signal Output Select 0: Externally input Vsync signal 1: Internally generated free-running Vsync signal

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.5 Free-Running Period Control Register (SC0_SCL0_FRC4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_FV[10:0]										
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_FH[10:0]										
Initial value:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_FV [10:0]	524	R/W	Free-Running Vsync Period Setting Free-running Vsync period = (SC0_RES_FV + 1) × horizontal period [usec]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_FH [10:0]	799	R/W	Hsync Period Setting Hsync period [usec] = (SC0_RES_FH +1) ÷ pixel clock frequency [MHz]

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.6 Output Delay Control Register (SC0_SCL0_FRC5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_RES_FLD_DLY_SEL	SC0_RES_VSDLY[7:0]							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_RES_ FLD_DLY_SEL	1	R/W	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle
7 to 0	SC0_RES_ VSDLY[7:0]	1	R/W	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC0_RES_VSDLY × output Hsync period [usec]

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.7 Full-Screen Vertical Size Register (SC0_SCL0_FRC6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_VW[10:0]	480	R/W	Vertical Enable Signal Width for Full Screen (lines) Note: SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.8 Full-Screen Horizontal Size Register (SC0_SCL0_FRC7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1: SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2: The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.9 Vsync Detection Register (SC0_SCL0_FRC9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_QVLOCK	—	—	—	SC0_RES_QVLACK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_QVLOCK	0	R	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_QVLACK	0	R	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.

33.2.10 Status Monitor 0 Register (SC0_SCL0_MON0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LIN_STAT[10:0]	All 0	R	Current location of the image line input to the scaling-down control block.

33.2.11 Interrupt Control Register (SC0_SCL0_INT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LINE[10:0]	All 0	R/W	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC0_RES_LINE setting, an interrupt signal is output. (Setting prohibited in this product)

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.12 Scaling-Down Control Register (SC0_SCL0_DS1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DS_V_ON	—	—	—	SC0_RES_DS_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DS_V_ON	1	R/W	Vertical Scale Down On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DS_H_ON	1	R/W	Horizontal Scale Down On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.13 Vertical Capture Size Register (SC0_SCL0_DS2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_VS [10:0]	18	R/W	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC0_RES_VS + SC0_RES_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_VW [10:0]	240	R/W	Vertical Width of Video Signal to be Captured (Lines) Note: SC0_RES_VS + SC0_RES_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.14 Horizontal Capture Size Register (SC0_SCL0_DS3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_HW[10:0]										
Initial value:	0	0	0	0	0	1	0	1	1	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_HS [10:0]	244	R/W	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_HS + SC0_RES_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_HW [10:0]	1440	R/W	Horizontal Width of Video Signal to be Captured (Video-image clock cycles) Note: SC0_RES_HS + SC0_RES_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.15 Horizontal Scale Down Register (SC0_SCL0_DS4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SC0_RES_PFIL_SEL	SC0_RES_DS_H_INTERPOTYP	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_DS_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	SC0_RES_PFIL_SEL	0	R/W	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)
28	SC0_RES_DS_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_DS_H_RATIO[15:0]	9224	R/W	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC0_RES_HW ÷ SC0_RES_OUT_HW × 4096) SC0_RES_DS_H_RATIO < 4096: Setting prohibited SC0_RES_DS_H_RATIO = 4096: 100% scale up SC0_RES_DS_H_RATIO > 4096: Scale down

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.16 Initial Vertical Phase Register (SC0_SCL0_DS5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_V_INTERPOTYP	SC0_RES_TOP_INIPHASE[11:0]											
Initial value:	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_BTM_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_V_INTERPOTYP	1	R/W	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_TOP_INIPHASE[11:0]	2048	R/W	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_BTM_INIPHASE[11:0]	0	R/W	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

33.2.17 Vertical Scaling Register (SC0_SCL0_DS6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_V_RATIO[15:0]															
Initial value:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_V_RATIO [15:0]	2044	R/W	Vertical Scale Up/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round (SC0_RES_VW ÷ SC0_RES_OUT_VW × 4096) For scale up: round (SC0_RES_IN_VW ÷ SC0_RES_P_VW × 4096) SC0_RES_V_RATIO < 4096: Scale up SC0_RES_V_RATIO = 4096: 100% scale up SC0_RES_V_RATIO > 4096: Scale down

Note: These bits updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1. Accordingly, even a scaled-up graphics display requires both an input Vsync signal and output Vsync signal.

33.2.18 Scaling-Down Control Block Output Size Register (SC0_SCL0_DS7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_OUT_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_OUT_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_OUT_VW [10:0]	240	R/W	Number of Valid Lines in Vertical Direction Output by Scaling-down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC0_SCL1_WR1.SC0_RES_LOOP is 0 (frame write mode), specify the number of lines for one frame. When SC0_SCL1_WR1.SC0_RES_LOOP is 1 (line write mode), specify the number of lines for repeated write. Note: The SC0_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC0_RES_VW value.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_OUT_HW [10:0]	640	R/W	Number of Valid Horizontal Pixels Output by Scaling-Down Control Block (video-image clock cycles) Note: The SC0_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC0_RES_HW value.

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_C bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

33.2.19 Scaling-Up Control Register (SC0_SCL0_US1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_US_V_ON	—	—	—	SC0_RES_US_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_US_V_ON	1	R/W	Vertical Scale Up On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_US_H_ON	1	R/W	Horizontal Scale Up On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.20 Output Image Vertical Size Register (SC0_SCL0_US2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_VW[10:0]	480	R/W	Vertical Enable Signal Width for Output Image (lines) Note: SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.21 Output Image Horizontal Size Register (SC0_SCL0_US3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.22 Scaling-Up Control Block Input Size Register (SC0_SCL0_US4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_IN_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_IN_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_IN_VW[10:0]	240	R/W	Number of Valid Lines in Vertical Direction Input to Scaling-up Control Block (lines)
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_IN_HW[10:0]	640	R/W	Number of Valid Horizontal Pixels Input to Scaling-up Control Block (pixel-clock cycles)

Note: This register is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

33.2.23 Horizontal Scale Up Register (SC0_SCL0_US5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_US_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_US_H_RATIO [15:0]	9224	R/W	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round (SC0_RES_IN_HW ÷ SC0_RES_P_HW × 4096) SC0_RES_US_H_RATIO < 4096: Scale up SC0_RES_US_H_RATIO = 4096: 100% scale up SC0_RES_US_H_RATIO > 4096: Setting prohibited

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.24 Horizontal Scale Up Initial Phase Register (SC0_SCL0_US6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_US_H_INTERPOTYP	SC0_RES_US_HT_INIPHASE[11:0]											
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_US_HB_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_US_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_US_HT_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_US_HB_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.25 Trimming Register (SC0_SCL0_US7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_HCUT[7:0]								SC0_RES_VCUT[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	SC0_RES_HCUT[7:0]	0	R/W	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
7 to 0	SC0_RES_VCUT[7:0]	0	R/W	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.26 Frame Buffer Read Select Register (SC0_SCL0_US8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_IBUS_SYNC_SEL	—	—	—	SC0_RES_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_IBUS_SYNC_SEL	0	R/W	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DISP_ON	0	R/W	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

Note: SC0_RES_IBUS_SYNC_SEL is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.
SC0_RES_DISP_ON is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.27 Background Color Register (SC0_SCL0_OVR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SC0_RES_BK_COL_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BK_COL_G[7:0]								SC0_RES_BK_COL_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SC0_RES_BK_CLO_R[7:0]	128	R/W	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
15 to 8	SC0_RES_BK_COL_G[7:0]	0	R/W	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SC0_RES_BK_COL_B[7:0]	128	R/W	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

33.2.28 SCL1 Register Update Control Register (SC0_SCL1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_UPDATE_B	—	—	—	SC0_SCL1_UPDATE_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_VEN_B	—	—	—	SC0_SCL1_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	SC0_SCL1_UPDATE_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_SCL1_UPDATE_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL1_VEN_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL1_VEN_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.29 Writing Mode Register (SC0_SCL1_WR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_WRSWA [2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SC0_RES_TB_ADD_MOD	SC0_RES_DS_WR_MD[2:0]			SC0_RES_MD[1:0]		SC0_RES_LOOP	SC0_RES_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	SC0_RES_WRSWA[2:0]	All 0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units] Note: When YCbCr422 or RGB565 is selected as a frame buffer video-signal writing format, these bits should be set to 000 [Not swapped].
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	SC0_RES_TB_ADD_MOD	0	R/W	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
6 to 4	SC0_RES_DS_WR_MD[2:0]	0	R/W	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3, 2	SC0_RES_MD [1:0]	0	R/W	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
1	SC0_RES_ LOOP	0	R/W	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
0	SC0_RES_ BST_MD	0	R/W	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

Note: SC0_RES_LOOP and SC0_RES_BST_MD are updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.
SC0_RES_TB_ADD_MOD, SC0_RES_DS_WR_MD, and SC0_RES_MD are updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.
SC0_RES_WRSWA is updated when the SC0_SCL1_UPDATE_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

33.2.30 Write Address Register 1T (SC0_SCL1_WR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_ BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

33.2.31 Write Address Register 2T (SC0_SCL1_WR3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF [14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Line 0: SC0_RES_BASE Line 1: SC0_RES_BASE + SC0_RES_LN_OFF × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM [9:0]	1	R/W	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0 Number of frames defined by SC0_RES_FLM_NUM + 1 are used.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

33.2.32 Write Address Register 3T (SC0_SCL1_WR4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF [22:0]	524288	R/W	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Buffer 0: SC0_RES_BASE Buffer 1: SC0_RES_BASE + SC0_RES_FLM_OFF × 1 : Buffer n: SC0_RES_BASE + SC0_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

33.2.33 Frame Sub-Sampling Register (SC0_SCL1_WR5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SC0_RES_INTER	—	—	SC0_RES_FS_RATE[1:0]		—	—	—	SC0_RES_FLD_SEL	—	—	—	SC0_RES_WENB
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	SC0_RES_INTER	1	R/W	Field Operating Mode Select 0: Progressive 1: Interlace
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC0_RES_FS_RATE[1:0]	0	R/W	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC0_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_FLD_SEL	0	R/W	Write Field Select 0: Top field 1: Bottom field
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_WENB	0	R/W	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

Note: SC0_RES_INTER, SC0_RES_FS_RATE[1:0], and SC0_RES_FLD_SEL are updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.
SC0_RES_WENB is updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.

33.2.34 Bit Reduction Register (SC0_SCL1_WR6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DTH_ON	—	—	—	SC0_RES_BITDEC_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DTH_ON	0	R/W	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 dither pattern)
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_BITDEC_ON	0	R/W	Bit Reduction On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

33.2.35 Write Detection Register (SC0_SCL1_WR7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_OVER_FLOW
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_CNT[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_RES_OVERFLOW	0	R	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT[9:0]	0	R	Frame Number Before Frame Being Accessed Frame number before the frame being accessed in the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0.

33.2.36 Write Address Register 1B (SC0_SCL1_WR8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE_B[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_BASE_B [31:0]	0	R/W	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

33.2.37 Write Address Register 2B (SC0_SCL1_WR9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF_B[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF_B[14:0]	2048	R/W	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Line 0: SC0_RES_BASE_B Line 1: SC0_RES_BASE_B + SC0_RES_LN_OFF_B × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM_B[9:0]	1	R/W	Number of Frames of Buffer to be Written to for Bottom Field Number of frames defined by SC0_RES_FLM_NUM_B + 1 are used when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

33.2.38 Write Address Register 3B (SC0_SCL1_WR10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF_B[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF_B[22:0]	524288	R/W	Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Buffer 0: SC0_RES_BASE_B Buffer 1: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × 1 : Buffer n: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

33.2.39 Write Detection Register B (SC0_SCL1_WR11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	SC0_RES_FLM_CNT_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT_B[9:0]	0	R	Frame Number Before Frame Being Accessed in Bottom Field Frame number before the frame being accessed in the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

33.2.40 Status Monitor 1 Register (SC0_SCL1_MON1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_PBUF_NUM[1:0]		—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC0_PBUF_NUM[1:0]	All 0	R	Write pointer indicating the pointer buffer number corresponding to the location currently being written to.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

33.2.41 Pointer Buffer 0 Register (SC0_SCL1_PBUF0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF0_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF0_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF0_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 0.

33.2.42 Pointer Buffer 1 Register (SC0_SCL1_PBUF1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF1_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF1_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF1_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 1.

33.2.43 Pointer Buffer 2 Register (SC0_SCL1_PBUF2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF2_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF2_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF2_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 2.

33.2.44 Pointer Buffer 3 Register (SC0_SCL1_PBUF3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF3_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF3_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF3_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 3.

33.2.45 Pointer Buffer and Field Information Register (SC0_SCL1_PBUF_FLD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SC0_FLD_INF3	—	—	—	—	—	—	—	SC0_FLD_INF2
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_FLD_INF1	—	—	—	—	—	—	—	SC0_FLD_INF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	SC0_FLD_INF3	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 3. 0: Bottom 1: Top
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_FLD_INF2	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 2. 0: Bottom 1: Top
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_FLD_INF1	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 1. 0: Bottom 1: Top
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	SC0_FLD_INF0	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 0. 0: Bottom 1: Top

33.2.46 Pointer Buffer Control Register (SC0_SCL1_PBUF_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_PBUF_RST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_PBUF_RST	0	R/W	Reset Control for Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the SC0_SCL1_UPDATE_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

33.2.47 Graphics 0 Register Update Control Register (GR0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR0_UPDATE	—	—	—	GR0_P_VEN	—	—	—	GR0_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR0_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_IBUS_VEN	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.48 Frame Buffer Read Control Register (Graphics 0) (GR0_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_SEL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_SEL[1:0]		—	—	—	GR0_IMR_FLM_INV	—	—	—	GR0_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_SEL	0	R/W	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
30 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR0_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC0_RES_TB_ADD_MOD = 1 in SC0_SCL1_WR1.) 1: Selects GR0_FLM_NUM. 2: Links to distortion correction. (Channel 0 of VDC5 can be linked to channel 0 of IMR-LS2, and channel 1 of VDC5 can be linked to channel 1 of IMR-LS2.) 3: Links to pointer buffer.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_IMR_FLM_INV	0	R/W	Sets the frame buffer number for distortion correction. 0: Does not replace the numbers of the frames to be read. 1: Replaces the numbers of the frames to be read.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR0_FLD_SEL is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_LN_OFF_DIR and GR0_IMR_FLM_INV are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_FLM_SEL is updated when the GR0_P_VEN and GR0_IBUS_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

GR0_BST_MD is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

33.2.50 Frame Buffer Control Register 2 (Graphics 0) (GR0_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR0_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR0_BASE[4:3] and GR0_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

Note: This register is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

33.2.51 Frame Buffer Control Register 3 (Graphics 0) (GR0_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_NXT	GR0_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_NXT	0	R/W	Top or Bottom Field Selection for Next Frame Buffer 0: Bottom 1: Top
30 to 16	GR0_LN_OFF[14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR0_BASE Line 1: GR0_BASE + GR0_LN_OFF × 1 : Line n: GR0_BASE + GR0_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR0_FLM_NUM[9:0]	1	R/W	Frame Number of Frame Buffer Manually set the frame number when GR0_FLM_SEL = 1.

Note: GR0_FLD_NXT is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_LN_OFF[14:0] and GR0_FLM_NUM[9:0] are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.52 Frame Buffer Control Register 4 (Graphics 0) (GR0_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR0_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR0_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR0_BASE Buffer 1: GR0_BASE + GR0_FLM_OFF × 1 : Buffer n: GR0_BASE + GR0_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.53 Frame Buffer Control Register 5 (Graphics 0) (GR0_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame Number of lines is (GR0_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR0_FLM_LOOP + 1) lines are read.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.54 Frame Buffer Control Register 6 (Graphics 0) (GR0_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FORMAT[3:0]				—	GR0_HW[10:0]										
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_YCC_SWAP[2:0]			GR0_RDSWA[2:0]			—	GR0_CNV444_MD	—	—	GR0_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR0_FORMAT [3:0]	8	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 9: YCbCr444 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR0_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR0_HW + 1) pixels. Note: The set value should be equal to or more than two.
15 to 13	GR0_YCC_SWAP[2:0]	0	R/W	Controls swapping of data read from buffer in the YCbCr422 format. 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR0_ RDSWA [2:0]	0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer reading as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	GR0_ CNV444_ MD	0	R/W	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. 0: Hold interpolation 1: Average interpolation
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR0_STA_ POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR0_STA_POS is skipped from the start of the line.

Note: GR0_YCC_SWAP, GR0_CNV444, and GR0_STA_POS are updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_ RDSWA is updated when the GR0_UPDATE bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_FORMAT and GR0_HW are updated when GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

33.2.55 Alpha Blending Control Register 1 (Graphics 0) (GR0_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GR0_GRC_DISP_ON	—	—	GR0_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR0_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (GR0_BASE) 1: Lower-layer graphics display When displaying video image or enlarged graphics, select this setting. 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note: * Select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255.

Note: This register is updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.56 Alpha Blending Control Register 2 (Graphics 0) (GR0_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_GRC_VS[10:0]	0	R/W	Vertical Start Position of Graphics Image Area. Note: The set value should be four or more (lines). GR0_GRC_VS + GR0_GRC_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_GRC_VW[10:0]	0	R/W	Vertical Width of Graphics Image Area.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.57 Alpha Blending Control Register 3 (Graphics 0) (GR0_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_GRC_HS[10:0]	0	R/W	Horizontal Start Position of Graphics Image Area. Note: The set value should be 16 or more (clock cycles). GR0_GRC_HS + GR0_GRC_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_GRC_HW[10:0]	0	R/W	Horizontal Width of Graphics Image Area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR0_HW to 2 and GR0_GRC_HW to 1 (1 pixel) or 2 (2 pixels).

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.58 Alpha Blending Control Register 7 (Graphics 0) (GR0_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_CK_ON	0	R/W	CLUT-Index/RGB-Index Chroma-Key Processing On/Off 0: Off 1: On

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.59 Alpha Blending Control Register 8 (Graphics 0) (GR0_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_CK_KCLUT[7:0]								GR0_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_CK_KB[7:0]								GR0_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_CK_ KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR0_CK_ KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_CK_ KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR0_CK_ KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.60 Alpha Blending Control Register 9 (Graphics 0) (GR0_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_CK_A[7:0]								GR0_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_CK_B[7:0]								GR0_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB]) Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_CK_G [7:0]	0	R/W	Replaced G Signal after RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_CK_B [7:0]	0	R/W	Replaced B Signal after RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR0_CK_R [7:0]	0	R/W	Replaced R Signal after RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.61 Alpha Blending Control Register 10 (Graphics 0) (GR0_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_A0[7:0]								GR0_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_B0[7:0]								GR0_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_A0 [7:0]	0	R/W	CLUT1 α0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the αRGB1555/RGBα5551 format and α = 0. Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR0_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR0_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.62 Alpha Blending Control Register 11 (Graphics 0) (GR0_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_A1[7:0]								GR0_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_B1[7:0]								GR0_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555/RGBα5551 format and α = 1. Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR0_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR0_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.63 Background Color Control Register (Graphics 0) (GR0_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR0_BASE_ G[7:0]	0	R/W	Background Color G/Y Signal G/Y: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_BASE_ B[7:0]	128	R/W	Background Color B/Cb Signal B: Unsigned 8 bits (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	GR0_BASE_R[7:0]	128	R/W	Background Color R/Cr Signal R: Unsigned 8 bits (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.64 CLUT Table Control Register (Graphics 0) (GR0_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. Referring to the CLUT table 0 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 1. 1: Selects CLUT table 1. Referring to the CLUT table 1 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 0.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

33.2.65 SCL0 Register Update Control Register (SC1_SCL0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SC1_SCL0_VEN_D	SC1_SCL0_VEN_C	—	—	—	SC1_SCL0_UPDATE	—	—	—	SC1_SCL0_VEN_B	—	—	—	SC1_SCL0_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	SC1_SCL0_VEN_D	0	R/WC1	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
12	SC1_SCL0_VEN_C	0	R/WC1	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC1_SCL0_UPDATE	0	R/WC1	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_SCL0_VEN_B	0	R/WC1	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_SCL0_VEN_A	0	R/WC1	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.66 Mask Control Register (SC1_SCL0_FRC1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC1_RES_VMASK[15:0]															
Initial value:	0	0	0	0	1	0	1	0	1	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_VMASK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC1_RES_VMASK [15:0]	2800	R/W	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC1_RES_VMASK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_ VMASK_ON	1	R/W	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.

Note: This register is updated when the SC1_SCL0_UPDATE bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.67 Missing Vsync Compensation Control Register (SC1_SCL0_FRC2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC1_RES_VLACK[15:0]															
Initial value:	0	0	0	0	1	1	1	0	0	0	0	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_VLACK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC1_RES_ VLACK [15:0]	3600	R/W	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC1_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_ VLACK_ON	1	R/W	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

Note: This register is updated when the SC1_SCL0_UPDATE bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.68 Output Sync Select Register (SC1_SCL0_FRC3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC1_RES_VS_IN_SEL	—	—	—	—	—	—	—	SC1_RES_VS_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC1_RES_VS_IN_SEL	0	R/W	Horizontal and Vertical Sync Signal Output and Full-Screen Enable Signal Select This setting is ignored when cascaded connection is enabled (GR1_AB1.GR1_CUS_CON_ON = 1). 0: Horizontal and vertical sync signal output and full-screen enable signal from scaler 1 1: Horizontal and vertical sync signal output and full-screen enable signal from scaler 0
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_VS_SEL	1	R/W	Vsync Signal Output Select 0: Externally input Vsync signal 1: Internally generated free-running Vsync signal

Note: This register is updated when the SC1_SCL0_UPDATE bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.69 Free-Running Period Control Register (SC1_SCL0_FRC4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_FV[10:0]										
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_FH[10:0]										
Initial value:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_FV[10:0]	524	R/W	Free-Running Vsync Period Setting Free-running Vsync period = (SC1_RES_FV + 1) × horizontal period [usec]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_FH[10:0]	799	R/W	Hsync Period Setting Hsync period [usec] = (SC1_RES_FH +1) ÷ pixel clock frequency [MHz]

Note: This register is updated when the SC1_SCL0_UPDATE bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.70 Output Delay Control Register (SC1_SCL0_FRC5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC1_RES_FLD_DLY_SEL	SC1_RES_VSDLY[7:0]							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC1_RES_FLD_DLY_SEL	1	R/W	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle
7 to 0	SC1_RES_VSDLY[7:0]	1	R/W	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC1_RES_VSDLY × output Hsync period [usec]

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.71 Full-Screen Vertical Size Register (SC1_SCL0_FRC6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_F_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_F_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_F_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC1_RES_F_VS + SC1_RES_F_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_F_VW[10:0]	480	R/W	Vertical Enable Signal Width for Full Screen (lines) Note: SC1_RES_F_VS + SC1_RES_F_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.72 Full-Screen Horizontal Size Register (SC1_SCL0_FRC7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_F_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_F_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_F_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC1_RES_F_HS + SC1_RES_F_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	SC1_RES_F_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1: SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2: The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.73 Vsync Detection Register (SC1_SCL0_FRC9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_QVLOCK	—	—	—	SC1_RES_QVLACK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_RES_QVLOCK	0	R	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_QVLACK	0	R	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.

33.2.74 Status Monitor 0 Register (SC1_SCL0_MON0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_LIN_STAT[10:0]	All 0	R	Current location of the image line input to the scaling-down control block.

33.2.75 Interrupt Control Register (SC1_SCL0_INT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_LINE[10:0]	All 0	R/W	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC1_RES_LINE setting, an interrupt signal is output. (Setting prohibited in this product)

Note: This register is updated when the SC1_SCL0_VEN_A bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.76 Scaling-Down Control Register (SC1_SCL0_DS1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_DS_V_ON	—	—	—	SC1_RES_DS_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_RES_DS_V_ON	1	R/W	Vertical Scale Down On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_DS_H_ON	1	R/W	Horizontal Scale Down On/Off 0: Off 1: On

Note: This register is updated when the SC1_SCL0_VEN_A bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.77 Vertical Capture Size Register (SC1_SCL0_DS2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_HW[10:0]										
Initial value:	0	0	0	0	0	1	0	1	1	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_HS[10:0]	244	R/W	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC1_RES_HS + SC1_RES_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_HW[10:0]	1440	R/W	Horizontal Width of Video Signal to be Captured (Video-image clock cycles) Note: SC1_RES_HS + SC1_RES_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC1_SCL0_VEN_A bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.79 Horizontal Scale Down Register (SC1_SCL0_DS4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SC1_RES_PFIL_SEL	SC1_RES_DS_H_INTERPOTYP	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_DS_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	SC1_RES_PFIL_SEL	0	R/W	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)
28	SC1_RES_DS_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC1_RES_DS_H_RATIO[15:0]	9224	R/W	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC1_RES_HW ÷ SC1_RES_OUT_HW × 4096) SC1_RES_DS_H_RATIO < 4096: Setting prohibited SC1_RES_DS_H_RATIO = 4096: 100% scale up SC1_RES_DS_H_RATIO > 4096: Scale down

Note: This register is updated when the SC1_SCL0_VEN_A bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.80 Initial Vertical Phase Register (SC1_SCL0_DS5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC1_RES_V_INTERPOTYP	SC1_RES_TOP_INIPHASE[11:0]											
Initial value:	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC1_RES_BTM_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC1_RES_V_INTERPOTYP	1	R/W	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation

Bit	Bit Name	Initial Value	R/W	Description
27 to 16	SC1_RES_TOP_INIPHASE [11:0]	2048	R/W	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC1_RES_BTM_INIPHASE [11:0]	0	R/W	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC1_SCL0_VEN_A and SC1_SCL0_VEN_B bits in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) are 1.

33.2.81 Vertical Scaling Register (SC1_SCL0_DS6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_V_RATIO[15:0]															
Initial value:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC1_RES_V_RATIO [15:0]	2044	R/W	Vertical Scale Up/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round (SC1_RES_VW ÷ SC1_RES_OUT_VW × 4096) For scale up: round (SC1_RES_IN_VW ÷ SC1_RES_P_VW × 4096) SC1_RES_V_RATIO < 4096: Scale up SC1_RES_V_RATIO = 4096: 100% scale up SC1_RES_V_RATIO > 4096: Scale down

Note: These bits updated when the SC1_SCL0_VEN_A and SC1_SCL0_VEN_B bits in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) are 1. Accordingly, even a scaled-up graphics display requires both an input Vsync signal and output Vsync signal.

33.2.82 Scaling-Down Control Block Output Size Register (SC1_SCL0_DS7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_OUT_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_OUT_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_OUT_VW [10:0]	240	R/W	Number of Valid Lines in Vertical Direction Output by Scaling-down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC1_SCL1_WR1.SC1_RES_LOOP is 0 (frame write mode), specify the number of lines for one frame. When SC1_SCL1_WR1.SC1_RES_LOOP is 1 (line write mode), specify the number of lines for repeated write. Note: The SC1_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC1_RES_VW value.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_OUT_HW [10:0]	640	R/W	Number of Valid Horizontal Pixels Output by Scaling-Down Control Block (video-image clock cycles) Note: The SC1_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC1_RES_HW value.

Note: This register is updated when the SC1_SCL0_VEN_A and SC1_SCL0_VEN_C bits in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) are 1.

33.2.83 Scaling-Up Control Register (SC1_SCL0_US1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_US_V_ON	—	—	—	SC1_RES_US_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	SC1_RES_US_V_ON	1	R/W	Vertical Scale Up On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_US_H_ON	1	R/W	Horizontal Scale Up On/Off 0: Off 1: On

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.84 Output Image Vertical Size Register (SC1_SCL0_US2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_P_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_P_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_P_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC1_RES_P_VS + SC1_RES_P_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_P_VW[10:0]	480	R/W	Vertical Enable Signal Width for Output Image (lines) Note: SC1_RES_P_VS + SC1_RES_P_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.85 Output Image Horizontal Size Register (SC1_SCL0_US3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_P_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_P_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_P_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC1_RES_P_HS + SC1_RES_P_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_P_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC1_RES_P_HS + SC1_RES_P_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.86 Scaling-Up Control Block Input Size Register (SC1_SCL0_US4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC1_RES_IN_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC1_RES_IN_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC1_RES_IN_VW[10:0]	240	R/W	Number of Valid Lines in Vertical Direction Input to Scaling-up Control Block (lines)
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC1_RES_IN_HW[10:0]	640	R/W	Number of Valid Horizontal Pixels Input to Scaling-up Control Block (pixel-clock cycles)

Note: This register is updated when the SC1_SCL0_VEN_B and SC1_SCL0_VEN_D bits in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) are 1.

33.2.87 Horizontal Scale Up Register (SC1_SCL0_US5)

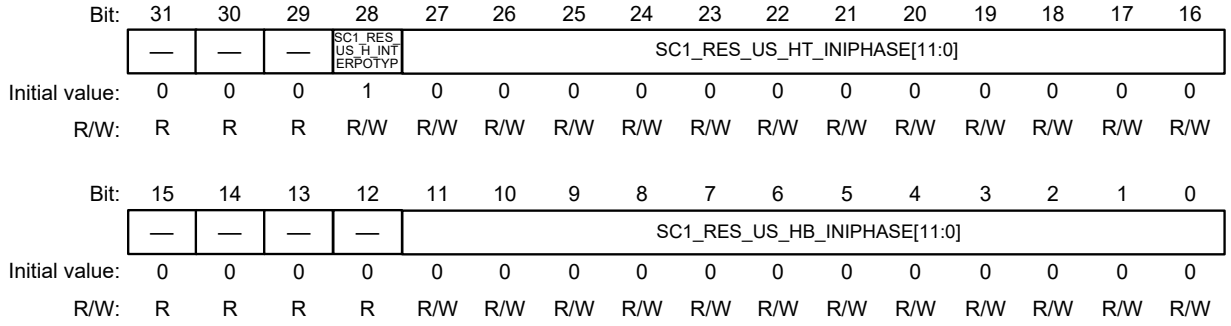
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_US_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC1_RES_US_H_RATIO [15:0]	9224	R/W	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round (SC1_RES_IN_HW ÷ SC1_RES_P_HW × 4096) SC1_RES_US_H_RATIO < 4096: Scale up SC1_RES_US_H_RATIO = 4096: 100% scale up SC1_RES_US_H_RATIO > 4096: Setting prohibited

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.88 Horizontal Scale Up Initial Phase Register (SC1_SCL0_US6)



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC1_RES_US_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC1_RES_US_HT_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC1_RES_US_HB_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.89 Trimming Register (SC1_SCL0_US7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_HCUT[7:0]								SC1_RES_VCUT[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	SC1_RES_HCUT[7:0]	0	R/W	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
7 to 0	SC1_RES_VCUT[7:0]	0	R/W	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.90 Frame Buffer Read Select Register (SC1_SCL0_US8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_IBUS_SYNC_SEL	—	—	—	SC1_RES_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_RES_IBUS_SYNC_SEL	0	R/W	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_DISP_ON	0	R/W	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

Note: SC1_RES_IBUS_SYNC_SEL is updated when the SC1_SCL0_VEN_B and SC1_SCL0_VEN_D bits in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) are 1. SC1_RES_DISP_ON is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.91 Background Color Register (SC1_SCL0_OVR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SC1_RES_BK_COL_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_BK_COL_G[7:0]								SC1_RES_BK_COL_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SC1_RES_BK_CLO_R[7:0]	128	R/W	Background Color Setting R/Cr Signal R:8 bits; unsigned (0 to 255 [LSB]) Cr:8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
15 to 8	SC1_RES_BK_COL_G[7:0]	0	R/W	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])
7 to 0	SC1_RES_BK_COL_B[7:0]	128	R/W	Background Color Setting B/Cb Signal B:8 bits; unsigned (0 to 255 [LSB]) Cb:8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the SC1_SCL0_VEN_B bit in the SC1_SCL0 register update control register (SC1_SCL0_UPDATE) is 1.

33.2.92 SCL1 Register Update Control Register (SC1_SCL1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SC1_SCL1_UPDATE_B	—	—	—	SC1_SCL1_UPDATE_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC1_SCL1_VEN_B	—	—	—	SC1_SCL1_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	SC1_SCL1_UPDATE_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC1_SCL1_UPDATE_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_SCL1_VEN_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_SCL1_VEN_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.93 Writing Mode Register (SC1_SCL1_WR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_WRSWA[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SC1_RES_TB_ADD_MOD	SC1_RES_DS_WR_MD[2:0]			SC1_RES_MD[1:0]		SC1_RES_LOOP	SC1_RES_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	SC1_RES_ WRSWA[2:0]	All 0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units] Note: When YCbCr422 or RGB565 is selected as a frame buffer video-signal writing format, these bits should be set to 000 [Not swapped].
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	SC1_RES_ TB_ADD_MOD	0	R/W	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
6 to 4	SC1_RES_ DS_WR_MD [2:0]	0	R/W	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited
3, 2	SC1_RES_MD [1:0]	0	R/W	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
1	SC1_RES_ LOOP	0	R/W	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
0	SC1_RES_ BST_MD	0	R/W	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

Note: SC1_RES_LOOP and SC1_RES_BST_MD are updated when the SC1_SCL1_VEN_B bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.

SC1_RES_TB_ADD_MOD, SC1_RES_DS_WR_MD, and SC1_RES_MD are updated when the SC1_SCL1_VEN_A and SC1_SCL1_VEN_B bits in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) are 1.

SC1_RES_WRSWA is updated when the SC1_SCL1_UPDATE_A bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.

33.2.94 Write Address Register 1T (SC1_SCL1_WR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC1_RES_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC1_RES_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC1_SCL1_VEN_B bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.

33.2.95 Write Address Register 2T (SC1_SCL1_WR3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC1_RES_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC1_RES_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC1_RES_LN_OFF [14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 0. Line 0: SC1_RES_BASE Line 1: SC1_RES_BASE + SC1_RES_LN_OFF × 1 : Line n: SC1_RES_BASE + SC1_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC1_RES_FLM_NUM [9:0]	1	R/W	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 0 Number of frames defined by SC1_RES_FLM_NUM + 1 are used.

Note: This register is updated when the SC1_SCL1_VEN_B bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.

33.2.96 Write Address Register 3T (SC1_SCL1_WR4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC1_RES_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC1_RES_FLM_OFF [22:0]	524288	R/W	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 0. Buffer 0: SC1_RES_BASE Buffer 1: SC1_RES_BASE + SC1_RES_FLM_OFF × 1 : Buffer n: SC1_RES_BASE + SC1_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC1_SCL1_VEN_B bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.

33.2.97 Frame Sub-Sampling Register (SC1_SCL1_WR5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SC1_RES_INTER	—	—	SC1_RES_FS_RATE[1:0]		—	—	—	SC1_RES_FLD_SEL	—	—	—	SC1_RES_WENB
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	SC1_RES_INTER	1	R/W	Field Operating Mode Select 0: Progressive 1: Interlace
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC1_RES_FS_RATE[1:0]	0	R/W	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC1_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_RES_FLD_SEL	0	R/W	Write Field Select 0: Top field 1: Bottom field
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_WENB	0	R/W	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

Note: SC1_RES_INTER, SC1_RES_FS_RATE[1:0], and SC1_RES_FLD_SEL are updated when the SC1_SCL1_VEN_A bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.
SC1_RES_WENB is updated when the SC1_SCL1_VEN_A and SC1_SCL1_VEN_B bits in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) are 1.

33.2.98 Bit Reduction Register (SC1_SCL1_WR6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_DTH_ON	—	—	—	SC1_RES_BITDEC_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC1_RES_DTH_ON	0	R/W	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 dither pattern)
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_RES_BITDEC_ON	0	R/W	Bit Reduction On/Off 0: Off 1: On

Note: This register is updated when the SC1_SCL1_VEN_A bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.

33.2.99 Write Detection Register (SC1_SCL1_WR7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC1_RES_OVERFLOW
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC1_RES_FLM_CNT[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC1_RES_OVERFLOW	0	R	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC1_RES_FLM_CNT[9:0]	0	R	Frame Number Before Frame Being Accessed Frame number before the frame being accessed in the top field when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 0.

33.2.100 Write Address Register 1B (SC1_SCL1_WR8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC1_RES_BASE_B[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_BASE_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC1_RES_ BASE_B[31:0]	0	R/W	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC1_SCL1_VEN_B bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.

33.2.101 Write Address Register 2B (SC1_SCL1_WR9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC1_RES_LN_OFF_B[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC1_RES_FLM_NUM_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC1_RES_LN_OFF_B[14:0]	2048	R/W	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 1. Line 0: SC1_RES_BASE_B Line 1: SC1_RES_BASE_B + SC1_RES_LN_OFF_B × 1 : Line n: SC1_RES_BASE + SC1_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC1_RES_FLM_NUM_B[9:0]	1	R/W	Number of Frames of Buffer to be Written to for Bottom Field Number of frames defined by SC1_RES_FLM_NUM_B + 1 are used when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 1.

Note: This register is updated when the SC1_SCL1_VEN_B bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.

33.2.102 Write Address Register 3B (SC1_SCL1_WR10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC1_RES_FLM_OFF_B[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_RES_FLM_OFF_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC1_RES_FLM_OFF_B[22:0]	524288	R/W	Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 1. Buffer 0: SC1_RES_BASE_B Buffer 1: SC1_RES_BASE_B + SC1_RES_FLM_OFF_B × 1 : Buffer n: SC1_RES_BASE_B + SC1_RES_FLM_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC1_SCL1_VEN_B bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.

33.2.103 Write Detection Register B (SC1_SCL1_WR11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC1_RES_FLM_CNT_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC1_RES_FLM_CNT_B[9:0]	0	R	Frame number before the frame being accessed in Bottom Field Frame number before the frame being accessed in the bottom field when SC1_SCL1_WR1.SC1_RES_TB_ADD_MOD = 1.

33.2.104 Status Monitor 1 Register (SC1_SCL1_MON1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC1_PBUF_NUM[1:0]		—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC1_PBUF_NUM[1:0]	All 0	R	Write pointer indicating the pointer buffer number corresponding to the location currently being written to.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

33.2.105 Pointer Buffer 0 Register (SC1_SCL1_PBUF0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC1_PBUF0_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_PBUF0_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC1_PBUF0_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 0.

33.2.106 Pointer Buffer 1 Register (SC1_SCL1_PBUF1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC1_PBUF1_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_PBUF1_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC1_PBUF1_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 1.

33.2.107 Pointer Buffer 2 Register (SC1_SCL1_PBUF2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC1_PBUF2_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_PBUF2_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC1_PBUF2_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 2.

33.2.108 Pointer Buffer 3 Register (SC1_SCL1_PBUF3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC1_PBUF3_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC1_PBUF3_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC1_PBUF3_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 3.

33.2.109 Pointer Buffer and Field Information Register (SC1_SCL1_PBUF_FLD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SC1_FLD_INF3	—	—	—	—	—	—	—	SC1_FLD_INF2
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC1_FLD_INF1	—	—	—	—	—	—	—	SC1_FLD_INF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	SC1_FLD_INF3	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 3. 0: Bottom 1: Top
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC1_FLD_INF2	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 2. 0: Bottom 1: Top
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC1_FLD_INF1	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 1. 0: Bottom 1: Top
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC1_FLD_INF0	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 0. 0: Bottom 1: Top

33.2.110 Pointer Buffer Control Register (SC1_SCL1_PBUF_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC1_PBUF_RST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC1_PBUF_RST	0	R/W	Reset Control for Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the SC1_SCL1_UPDATE_B bit in the SC1_SCL1 register update control register (SC1_SCL1_UPDATE) is 1.

33.2.111 Graphics 1 Register Update Control Register (GR1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR1_UPDATE	—	—	—	GR1_P_VEN	—	—	—	GR1_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR1_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR1_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	GR1_IBUS_VEN	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.112 Frame Buffer Read Control Register (Graphics 1) (GR1_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR1_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR1_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when the GR1_IBUS_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

33.2.113 Frame Buffer Control Register 1 (Graphics 1) (GR1_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_FLD_SEL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR1_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR1_FLM_SEL[1:0]		—	—	—	—	—	—	—	GR1_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR1_FLD_SEL	0	R/W	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
30 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR1_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR1_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC1_RES_TB_ADD_MOD = 1 in SC1_SCL1_WR1.) 1: Selects GR1_FLM_NUM. 2: Setting prohibited. 3: Links to pointer buffer.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR1_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR1_FLD_SEL is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

GR1_LN_OFF_DIR and GR1_IMR_FLM_INV are updated when the GR1_IBUS_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

GR1_FLM_SEL is updated when the GR1_P_VEN and GR1_IBUS_VEN bits in the graphics 1 register update control register (GR1_UPDATE) are 1.

GR1_BST_MD is updated when the GR1_IBUS_VEN and GR1_P_VEN bits in the graphics 1 register update control register (GR1_UPDATE) are 1.

33.2.114 Frame Buffer Control Register 2 (Graphics 1) (GR1_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR1_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR1_BASE[4:3] and GR1_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

Note: This register is updated when the GR1_IBUS_VEN and GR1_P_VEN bits in the graphics 1 register update control register (GR1_UPDATE) are 1.

33.2.115 Frame Buffer Control Register 3 (Graphics 1) (GR1_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_FLD_NXT	GR1_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR1_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR1_FLD_NXT	0	R/W	Top or Bottom Field Selection for Next Frame Buffer 0: Bottom 1: Top
30 to 16	GR1_LN_ OFF[14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR1_BASE Line 1: GR1_BASE + GR1_LN_OFF × 1 : Line n: GR1_BASE + GR1_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR1_FLM_ NUM[9:0]	1	R/W	Frame Number of Frame Buffer Manually set the frame number when GR1_FLM_SEL = 1.

Note: GR1_FLD_NXT is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.
GR1_LN_OFF[14:0] and GR1_FLM_NUM[9:0] are updated when the GR1_IBUS_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

33.2.116 Frame Buffer Control Register 4 (Graphics 1) (GR1_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR1_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR1_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR1_BASE Buffer 1: GR1_BASE + GR1_FLM_OFF × 1 : Buffer n: GR1_BASE + GR1_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the GR1_IBUS_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

33.2.117 Frame Buffer Control Register 5 (Graphics 1) (GR1_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR1_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR1_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR1_FLM_ LNUM[10:0]	0	R/W	Sets number of lines in a frame Number of lines is (GR1_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR1_FLM_ LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR1_FLM_LOOP + 1) lines are read.

Note: This register is updated when the GR1_IBUS_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

33.2.118 Frame Buffer Control Register 6 (Graphics 1) (GR1_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR1_FORMAT[3:0]				—	GR1_HW[10:0]										
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_YCC_SWAP[2:0]			GR1_RDSWA[2:0]			—	GR1_CNV444_MD	—	—	GR1_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR1_FORMAT [3:0]	8	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 9: YCbCr444 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR1_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR1_HW + 1) pixels. Note: The set value should be equal to or more than two.
15 to 13	GR1_YCC_SWAP[2:0]	0	R/W	Controls swapping of data read from buffer in the YCbCr422 format. 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR1_ RDSWA [2:0]	0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer reading as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	GR1_ CNV444_ MD	0	R/W	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. 0: Hold interpolation 1: Average interpolation
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR1_STA_ POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR1_STA_POS is skipped from the start of the line.

Note: GR1_YCC_SWAP, GR1_CNV444, and GR1_STA_POS are updated when GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

GR1_ RDSWA is updated when the GR1_UPDATE bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

GR1_FORMAT and GR1_HW are updated when GR1_IBUS_VEN and GR1_P_VEN bits in the graphics 1 register update control register (GR1_UPDATE) are 1.

33.2.119 Alpha Blending Control Register 1 (Graphics 1) (GR1_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	GR1_CUS_CON_ON	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR1_ARC_MUL	GR1_ACALC_MD	—	GR1_ARC_ON	—	—	—	GR1_ARC_DISP_ON	—	—	—	GR1_GRC_DISP_ON	—	—	GR1_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	GR1_CUS_CON_ON	0	R/W	Enables or disables cascaded connection. 0: Cascaded connection is disabled. 1: Cascaded connection is enabled.
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR1_ARC_MUL	0	R/W	Enables or disables multiplication with the current α for alpha blending in rectangular area. 0: Disabled 1: Enabled
14	GR1_ACALC_MD	0	R/W	Enables or disables pre-multiplication for alpha blending in pixel units. 0: Disabled 1: Enabled
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR1_ARC_ON	0	R/W	Enables or disables alpha blending in rectangular area. 0: Disabled 1: Enabled
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR1_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in rectangular area. 0: Frame-line display is turned off. 1: Frame-line display is turned on.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR1_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	GR1_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (GR1_BASE) 1: Lower-layer graphics display When displaying video image or enlarged graphics, select this setting. 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note: *When cascaded connection is disabled (GR1_CUS_CON_ON = 0), select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255.

Note: GR1_CUS_CON_ON is updated when GR1_UPDATE bit in the graphics 1 register update control register (GR1_UPDATE) is 1. The other bits are updated when GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

33.2.120 Alpha Blending Control Register 2 (Graphics 1) (GR1_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR1_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR1_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR1_GRC_VS[10:0]	0	R/W	Vertical Start Position of Graphics Image Area. Note: The set value should be four or more (lines). GR1_GRC_VS + GR1_GRC_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR1_GRC_VW[10:0]	0	R/W	Vertical Width of Graphics Image Area.

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

33.2.121 Alpha Blending Control Register 3 (Graphics 1) (GR1_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR1_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR1_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR1_GRC_HS[10:0]	0	R/W	Horizontal Start Position of Graphics Image Area. Note: The set value should be 16 or more (clock cycles). GR1_GRC_HS + GR1_GRC_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR1_GRC_HW[10:0]	0	R/W	Horizontal Width of Graphics Image Area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR1_HW to 2 and GR1_GRC_HW to 1 (1 pixel) or 2 (2 pixels).

Note: This register is updated when the GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

33.2.122 Alpha Blending Control Register 4 (Graphics 1) (GR1_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR1_ARC_VS[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR1_ARC_VW[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR1_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR1_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

33.2.123 Alpha Blending Control Register 5 (Graphics 1) (GR1_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR1_ARC_HS[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR1_ARC_HW[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR1_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR1_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

33.2.124 Alpha Blending Control Register 6 (Graphics 1) (GR1_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR1_ARC_MODE	GR1_ARC_COEF[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR1_ARC_RATE[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR1_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR1_ARC_COEF[7:0]	0	R/W	Alpha Coefficient for Alpha Blending in Rectangular Area (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR1_ARC_RATE[7:0]	0	R/W	Frame Rate for Alpha Blending in Rectangular Area

Note: This register is updated when GR1_P_VEN bit in the graphics 1 register update control register (GR1_UPDATE) is 1.

33.2.125 Alpha Blending Control Register 7 (Graphics 1) (GR1_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR1_ARC_DEF[7:0]

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR1_ ARC_ST
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR1_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

33.3 Usage Method

33.3.1 Scaling Setting Example for 525i Video Input and VGA-Size (640 x 480) Video Output

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 33.43.

Here, the over-scan rate is assumed to be 100%.

Table 33.43 Input and Output Angles for 525i Video Input and VGA-Size (640 x 480) Video Output

Input Signal	Output Signal	Signal Format	Rotation	Buffer Planes	Scaling Filter
1440 × 240	640 × 480	YCbCr	Normal	Two planes	2-tap linear

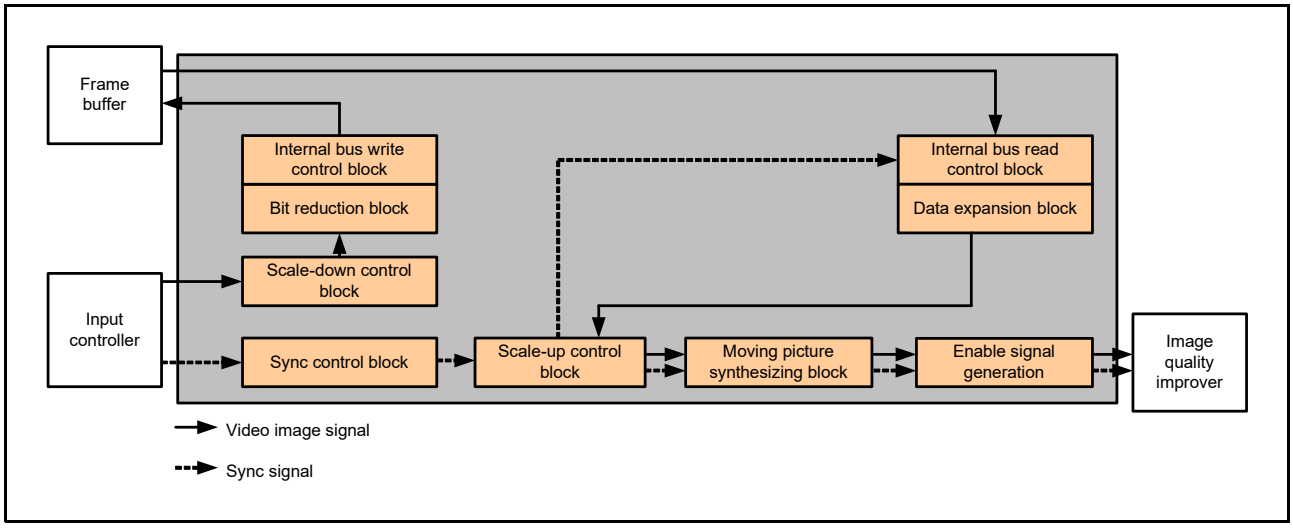

Figure 33.19 Signal Paths for Displaying Input Video Image

(2) Horizontal Scaling (Horizontal Scale Down, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (1440 ÷ 640 × 4096) = 9216

σ = (9216 × (640 − 1) − (1440 − 1) × 4096) ÷ (640 − 1) = −8.01

Horizontal scaling ratio = roundup (9216 − (−8.01)) = 9225

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (240 ÷ 480 × 4096) = 2048

σ = (2048 × (480 − 1) − (240 − 1) × 4096) ÷ (480 − 1) = 4.27

Vertical scaling ratio = round (2048 − (4.07)) = 2044

(4) Setting Frame Buffer Access Area

Since video data is written to the frame buffer after scaled down, the write size is 640 × 240 pixels.

The frame buffer area required is 640 pixels or more for line offset and line offset × 240 pixels or more for frame offset.

Here, the frame buffer work area is assumed to be 1024 × 256 pixels.

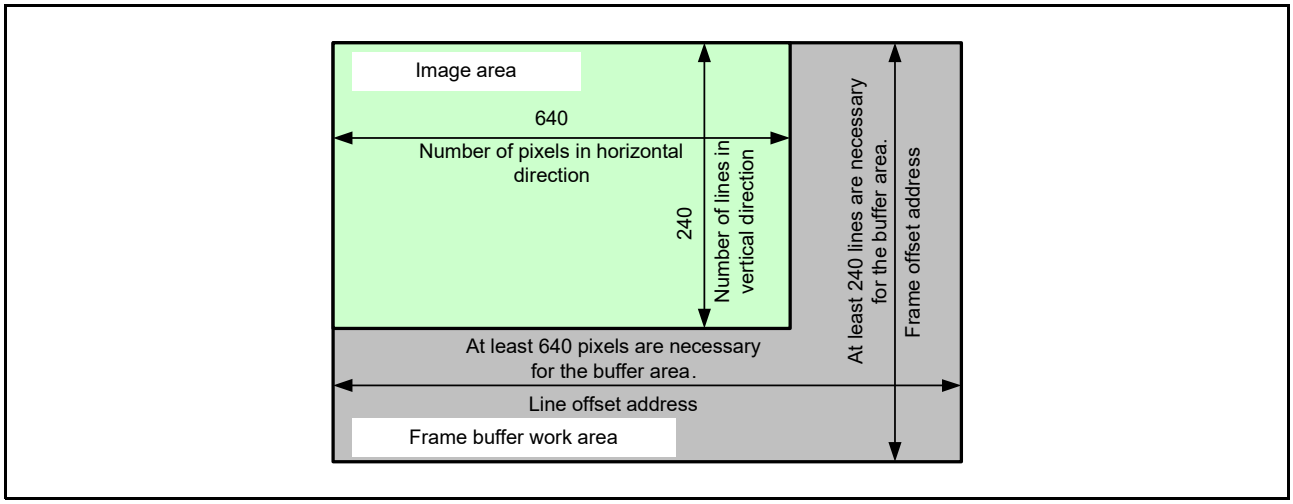

Figure 33.20 Frame Buffer Access Area Setting

Since the frame buffer is accessed in 64-bit units, YCbCr422 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

SC_RES_LN_OFF[14:0] = 1024 × 2 = 2048

GR_LN_OFF[14:0] = 1024 × 2 = 2048

The frame offset address values to be set are:

SC_RES_FLM_OFF[22:0] = SC_RES_LN_OFF[14:0] × 256 = 524288

GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 256 = 524288

(5) Register Setting Example

Table 33.44 Register Setting Example for 525i Video Input and VGA-Size Video Output

Register Name	Bit Name	Settings	Remarks
		Synchronization Control	
SC_SCL0_FRC3	SC_RES_VS_SEL	0	External Vsync selected
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Horizontal period width of output signal (period width = set value + 1)
		Size of Angle of View	
SC_SCL0_DS2	SC_RES_VS[10:0]	15	Vertical capture start position of input signal
SC_SCL0_DS2	SC_RES_VW[10:0]	240	Vertical capture width of input signal
SC_SCL0_DS3	SC_RES_HS[10:0]	244	Horizontal capture start position of input signal
SC_SCL0_DS3	SC_RES_HW[10:0]	1440	Horizontal capture width of input signal
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal valid width of full screen
SC_SCL0_US2	SC_RES_P_VS[10:0]	35	Vertical valid start position of output image
SC_SCL0_US2	SC_RES_P_VW[10:0]	480	Vertical valid width of output image
SC_SCL0_US3	SC_RES_P_HS[10:0]	144	Horizontal valid start position of output image
SC_SCL0_US3	SC_RES_P_HW[10:0]	640	Horizontal valid width of output image
		Scaling Setting	
SC_SCL0_DS4	SC_RES_DS_H_RATIO [15:0]	9224	Horizontal scaling-down because SC_RES_DS_H_RATIO is equal to or larger than 4096
SC_SCL0_DS1	SC_RES_DS_H_ON	1	Horizontal scaling-down on
SC_SCL0_US1	SC_RES_US_H_ON	0	Horizontal scaling-up off
SC_SCL0_US5	SC_RES_US_H_RATIO [15:0]	4096	Horizontal scaling-up off because SC_RES_US_H_RATIO is equal to or larger than 4096
SC_SCL0_DS1	SC_RES_DS_V_ON	0	Vertical scaling-down off
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical scaling-up on
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	2044	Vertical scaling-up because SC_RES_V_RATIO is smaller than 4096
SC_SCL0_DS7	SC_RES_OUT_VW[10:0]	240	Vertical valid input width because the vertical scaling-down function is off
SC_SCL0_DS7	SC_RES_OUT_HW[10:0]	640	Horizontal image size after horizontal scaling-down
SC_SCL0_US4	SC_RES_IN_VW[10:0]	240	Vertical width of frame buffer read
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Horizontal width of frame buffer read
		IP Conversion Setting	
SC_SCL0_DS5	SC_RES_TOP_ INIPHASE[11:0]	2048	Top field adjusted by 0.5-line phase
SC_SCL0_DS5	SC_RES_BTM_ INIPHASE[11:0]	0	No phase adjustment for bottom field
SC_SCL0_FRC5	SC_RES_FLD_DLY_SEL	1	IP conversion with two planes of frame buffer used for vertical scaling-up
		Frame Buffer Write Setting	
SC_SCL1_WR1	SC_RES_DS_WR_MD [2:0]	0	Normal write mode for rotation control
SC_SCL1_WR1	SC_RES_MD[1:0]	0	Frame buffer write format YCbCr422 (16 bits)
SC_SCL1_WR2	SC_RES_BASE[31:0]	0	Frame buffer write start address (0 in setting example)
SC_SCL1_WR3	SC_RES_LN_OFF[14:0]	2048	Frame buffer write line offset

Table 33.44 Register Setting Example for 525i Video Input and VGA-Size Video Output

Register Name	Bit Name	Settings	Remarks
SC_SCL1_WR3	SC_RES_FLM_NUM[9:0]	1	Two planes of frame buffer used
SC_SCL1_WR4	SC_RES_FLN_OFF[22:0]	524288	Frame buffer write frame offset
SC_SCL1_WR5	SC_RES_WENB	1	Frame buffer write enabled
Frame Buffer Read Setting			
GR_FLM1	GR_FLM_SEL[1:0]	0	Frame number for frame buffer write output
GR_FLM2	GR_BASE[31:0]	0	Conforming to frame buffer write setting
GR_FLM3	GR_LN_OFF[14:0]	2048	Conforming to frame buffer write setting
GR_FLM4	GR_FLM_OFF[22:0]	524288	Conforming to frame buffer write setting
GR_FLM6	GR_FORMAT[3:0]	8	Frame buffer read format YCbCr422
GR_FLM_RD	GR_R_ENB	1	Frame buffer read enabled
GR_FLM6	GR_CNV444_MD	1	Mean value interpolation in YCbCr422 → YCbCr444 conversion
Scaling-up Selection			
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	0	Scaled-up video signal displayed
GR_AB1	GR_DISP_SEL[1:0]	1	Scaling display selected

33.3.2 Scaling Setting Example for Graphics Display

(1) Angle of View for Graphics Display

This section describes an example of setting the signals of the input and output angles of view shown in Table 33.45.

Table 33.45 Input and Output Angles of View for Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	640 × 480	RGB888

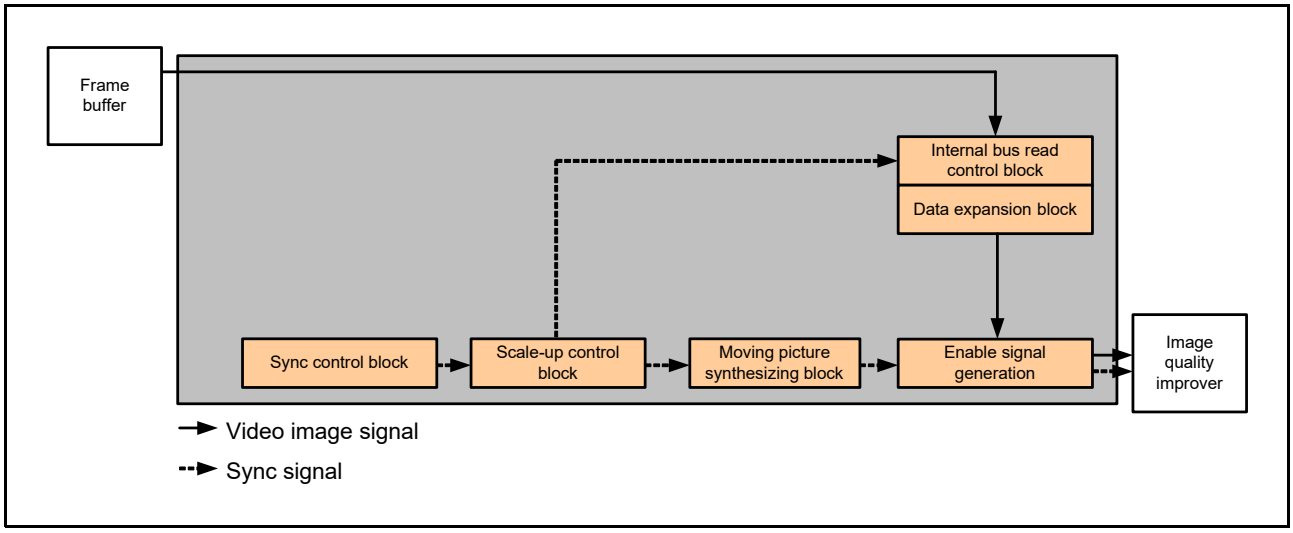

Figure 33.21 Signal Paths for Graphics Display

(2) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640 × 480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640 × 480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB888 (32 bits) is accessed in 2-pixel units.

The line offset address values to be set are:

GR_LN_OFF[14:0] = 640 × 4 = 2560

The frame offset address values to be set are:

GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 480 = 1228800

(3) Register Setting Example

Table 33.46 Register Setting Example for Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Vertical period width of output signal (period width = set value + 1)
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal valid width of full screen
GR_AB2	GR_GRC_VS[10:0]	35	Vertical valid start position of graphics output
GR_AB2	GR_GRC_VW[10:0]	480	Vertical valid width of graphics output
GR_AB3	GR_GRC_HS[10:0]	144	Horizontal valid start position of graphics output
GR_AB3	GR_GRC_HW[10:0]	640	Horizontal valid width of graphics output
Frame Buffer Read Setting			
GR_FLM1	GR_FLM_SEL[1:0]	1	Frame number setting with register
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame number of frame buffer (0 in setting example)
GR_FLM5	GR_FLM_LNUM[9:0]	479	Number of graphics lines (number of lines = set value + 1)
GR_FLM6	GR_HW[9:0]	639	Horizontal valid width of graphics (valid width = set value + 1)
GR_FLM2	GR_BASE[31:0]	0	Conforming to graphics expansion setting (0 in setting example)

33.3.3 Scaling Setting Example for Scaled-up Graphics Display

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 33.47.

Table 33.47 Input and Output Angles of View for Scaled-up Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	800 × 600	RGB565

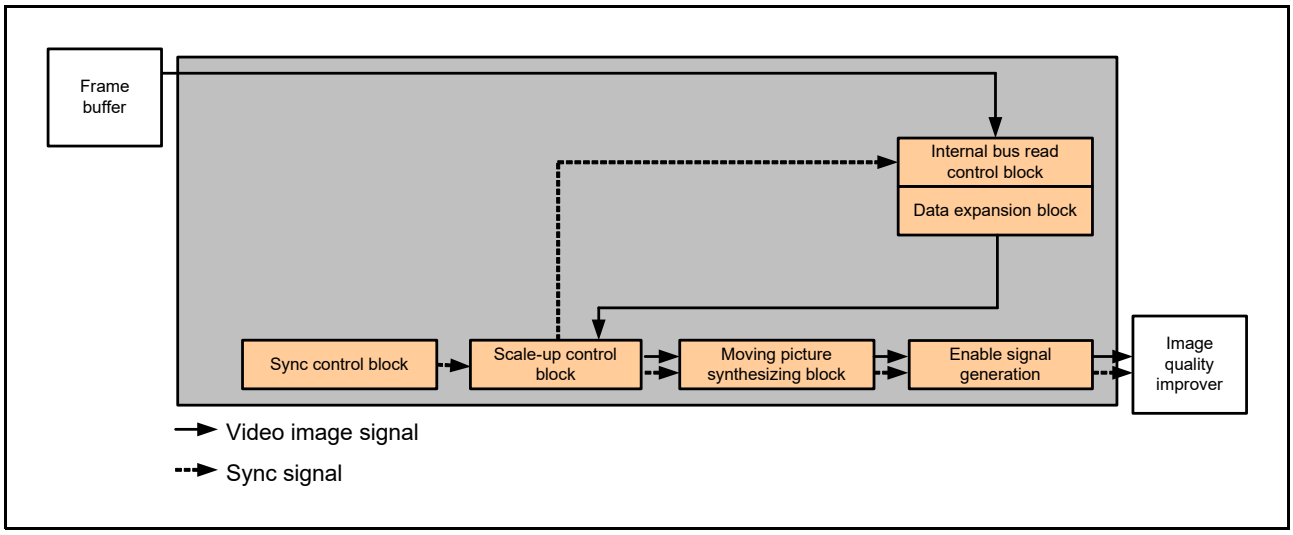

Figure 33.22 Signal Paths for Scaled-up Graphics Display

(2) Horizontal Scaling (Horizontal Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (640 ÷ 800 × 4096) = 3277

σ = (3277 × (800 − 1) − (640 − 1) × 4096) ÷ (800 − 1) = 1.23

Horizontal scaling ratio = round (3277 − (1.23)) = 3276

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (480 ÷ 600 × 4096) = 3277

σ = (3277 × (600 − 1) − (480 − 1) × 4096) ÷ (600 − 1) = 1.57

Vertical scaling ratio = round (3277 − (1.57)) = 3275

(4) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640 × 480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640 × 480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB565 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

GR_LN_OFF[14:0] = 640 × 2 = 1280

The frame offset address values to be set are:

GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 480 = 614400

(5) Register Setting Example

Table 33.48 Register Setting Example for Scaled-up Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)
SC_SCL0_FRC4	SC_RES_FV[10:0]	668	Vertical period width of output signal (period width = set value + 1)
SC_SCL0_FRC4	SC_RES_FH[10:0]	1040	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	27	Vertical valid start position of full screen

GR_AB1	GR_DISP_SEL[1:0]	1	Scaling display selected

34. Video Display Controller 5 (4): Image Quality Improver

34.1 Image Quality Improver

34.1.1 Overview of Functions

The image quality improver subjects scaled YCbCr signals to black stretching, LTI/sharpness processing, and GBR conversion by using a color matrix.

The image quality improver does not act on RGB signals.

Figure 34.1 is a functional block diagram of the image quality improver. Image quality improvers 0 and 1 are connected to scalers 0 and 1, respectively.

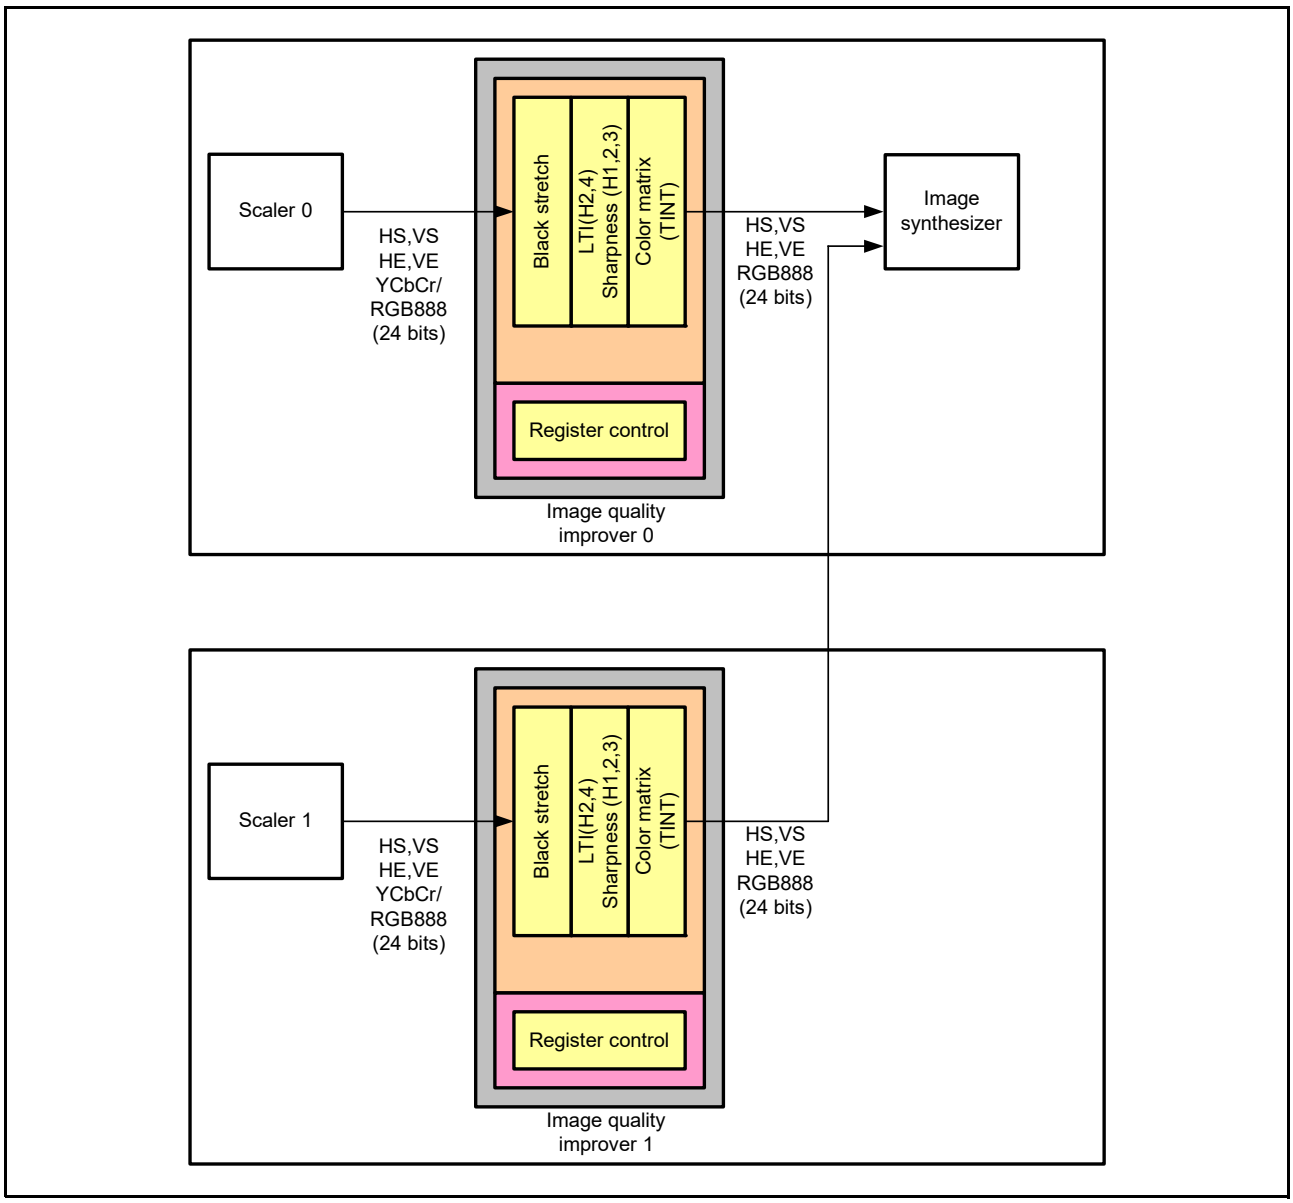

Figure 34.1 Functional Block Diagram of Image Quality Improver

34.1.2 Register Update Control

The control register for image quality improver controls the update timing entirely by vertical synchronous signals.

The vertical synchronous signal launched after the update control register is set to 1 is reflected in various registers, following which the update control register is automatically cleared to 0.

Note that there are two image quality improvers and registers for each improver can be identified by the number in the register name like ADJ0_xxxx and ADJ1_xxxx, respectively. In the sections except for Register Description, however, the number is omitted like ADJ_xxxx for convenience sake.

Table 34.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
ADJ_UPDATE	ADJ_VEN	0	Image Quality Improver Register Update 0: Register is not updated. 1: Register is updated by launch of vertical synchronous signal.

34.1.3 Black Stretch

Black stretch refers to the black stretch correction of the Y signal of the input video signal of YCbCr format.

Correction of the Y signal is done by adjusting the time constant, depth (gain), and start point.

Figure 34.2 is a drawing illustrating black stretch correction.

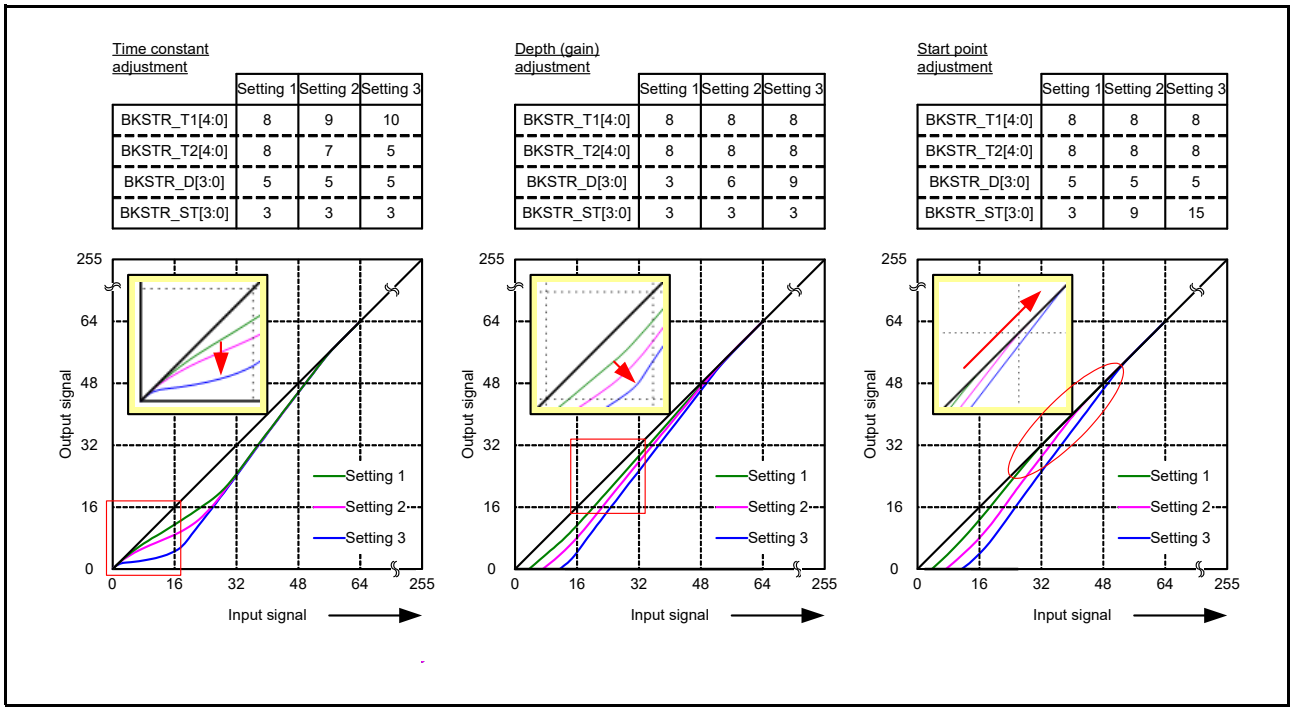

Figure 34.2 Black Stretch Correction (With Sample Settings)

Table 34.2 Black Stretch Control

Register Name	Bit Name	Initial Value	Description
ADJ_BKSTR_SET	BKSTR_ON	0	Black Stretch On/Off Control 0: Black Stretch Off 1: Black Stretch On
ADJ_BKSTR_SET	BKSTR_ST[3:0]	0	Black Stretch Start Point 0 (low) to 15 (high)
ADJ_BKSTR_SET	BKSTR_T1[4:0]	0	Black Stretch Time Constant (T1) 0 (small) to 31 (large)
ADJ_BKSTR_SET	BKSTR_T2[4:0]	0	Black Stretch Time Constant (T2) 0 (small) to 30 (large), 31: Setting prohibited
ADJ_BKSTR_SET	BKSTR_D[3:0]	0	Black Stretch Depth 0 (shallow) to 15 (deep)

34.1.4 Enhancer

The enhancer subjects the scaled Y signal input to transient improvement (LTI) and sharpness processing in the horizontal direction.

(1) Enhancer Area Specification

The operating area of the enhancer is specified with reference to the rising edges of the Hsync signal and Vsync signal. ENH_HS should be set to four or greater clocks, and ENH_VS should be set to two or greater lines. Figure 34.3 shows enhancer area setting.

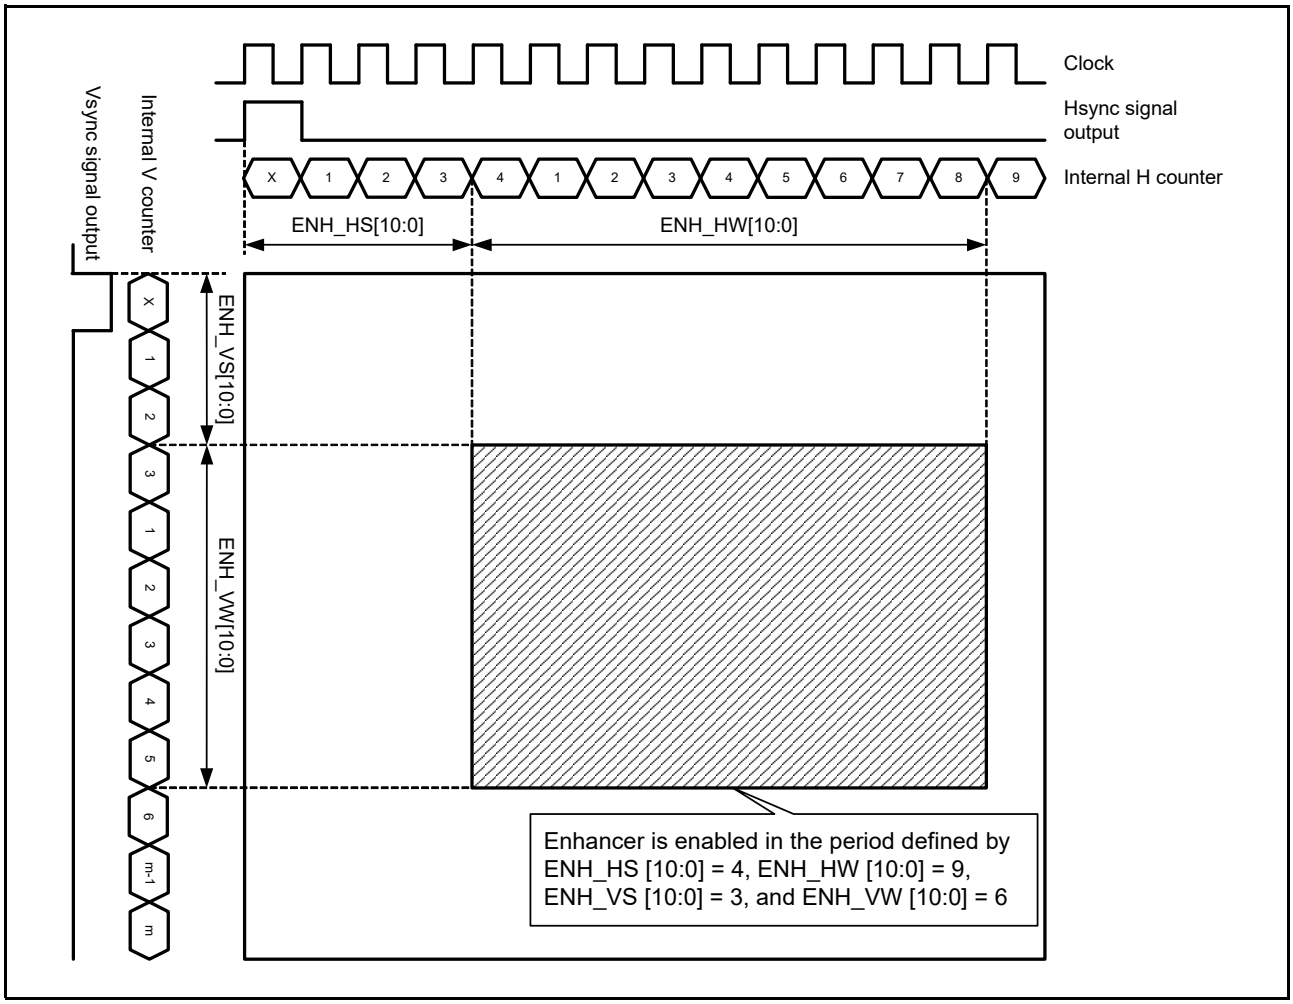

Figure 34.3 Period when Enhancer is Enabled

Setting ENH_DISP_ON to 1 displays the enhancer-enabled area with frame lines.

Table 34.3 Enhancer Area Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_TIM1	ENH_MD	1	Operating Mode 0: RGB mode 1: YCbCr mode
ADJ_ENH_TIM2	ENH_VS[10:0]	0	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
ADJ_ENH_TIM2	ENH_VW[10:0]	0	Width of Vertical Valid Image Area in Enhancer-Enabled Area
ADJ_ENH_TIM3	ENH_HS[10:0]	0	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
ADJ_ENH_TIM3	ENH_HW[10:0]	0	Width of Horizontal Valid Image Area in Enhancer-Enabled Area
ADJ_ENH_TIM1	ENH_DISP_ON	0	Frame Line Display in Enhancer-Enabled Area 0: Off 1: On

(2) LTI (Luminance Transient Improvement)

The enhancer subjects the Y signal input to transient improvement in the horizontal direction.

Transient improvement of the blanking signal is turned off.

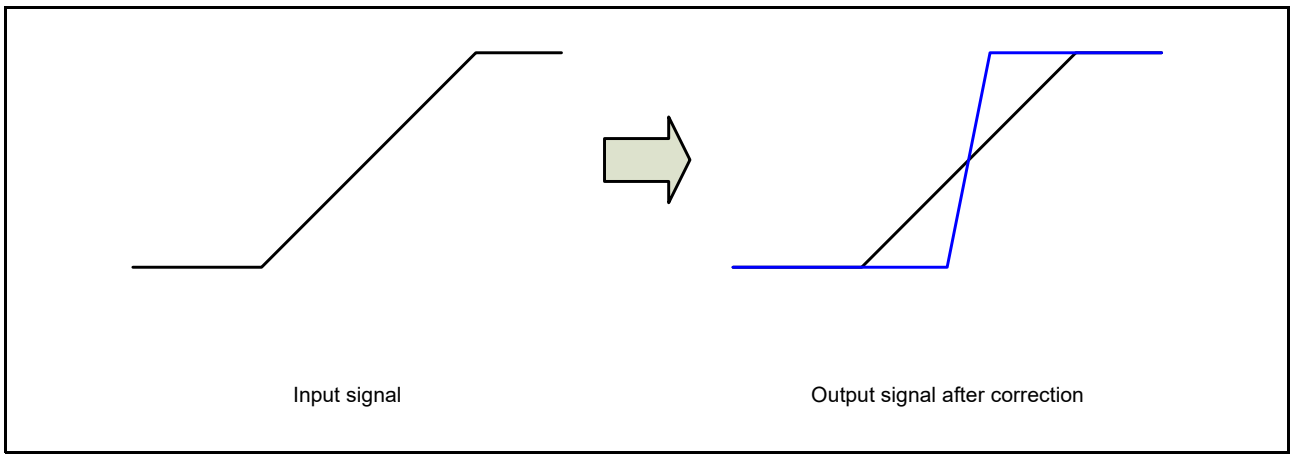

Figure 34.4 LTI Correction

After edge detection of the image, the LTI can be independently controlled in the two horizontal bands.

In LTI, the median filter is inserted after edge detection of the image.

In LTI (H4), the reference pixels of the median filter can be selected.

However, under normal operations, half the tap data (second adjacent pixel) at edge detection is used as reference.

Table 34.4 Reference Pixel Table for LTI

LTI Band	Reference Pixel for Edge Detection	LPF Application	Median Filter Reference Pixels
Horizontal LTI (H2)	Second adjacent pixel used as reference	LPF not applied or LPF (1,2,1)	Adjacent pixel used as reference
Horizontal LTI (H4)	Fourth adjacent pixel used as reference	LPF (1,2,1)	Adjacent pixel or second adjacent pixel used as reference

In LTI, the detection result can be subjected to a coring process.

The core value set in the register is subtracted from the edge detection result, and LTI correction is performed on the coring output after subtraction.

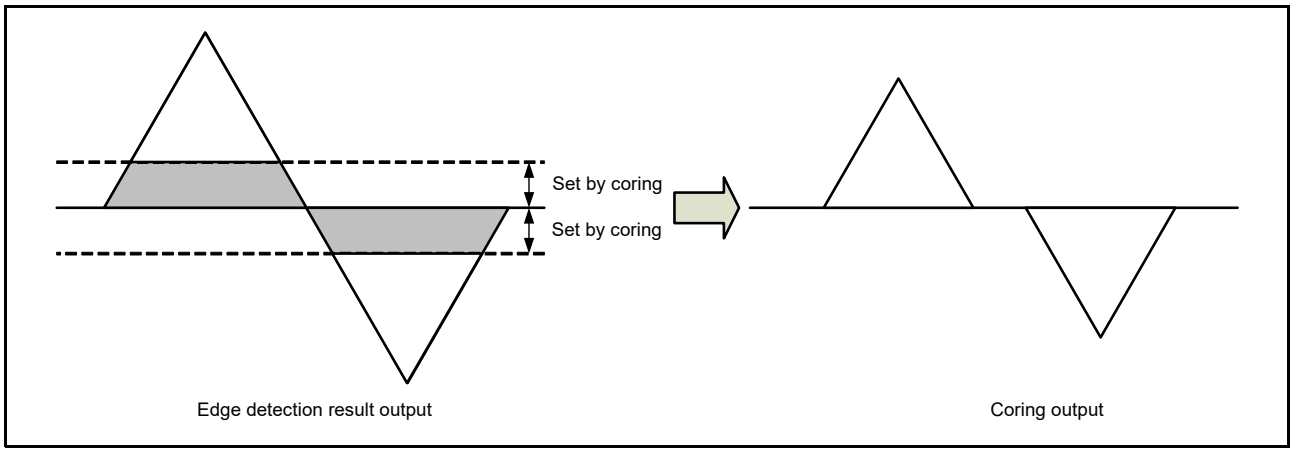

Figure 34.5 LTI Coring

Table 34.5 LTI Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_LTI1	LTI_H_ON	0	LTI On/Off Control 0: LTI off 1: LTI on
ADJ_ENH_LTI1	LTI_H2_INC_ZERO [7:0]	10	Median Filter LTI Correction Threshold LTI correction is disabled when: |right TAP value – center TAP value| < LTI1_H2_INC_ZERO or |left TAP value – center TAP value| < LTI1_H2_INC_ZERO.
ADJ_ENH_LTI1	LTI_H2_LPF_SEL	0	LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected
ADJ_ENH_LTI1	LTI_H2_GAIN[7:0]	0	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times)
ADJ_ENH_LTI1	LTI_H2_CORE[7:0]	0	LTI Coring (Maximum core value of 255) Amplitude smaller than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.)
ADJ_ENH_LTI2	LTI_H4_INC_ZERO[7:0]	10	Median Filter LTI Correction Threshold LTI correction is disabled when: |right TAP value – center TAP value| < LTI1_H4_INC_ZERO or |left TAP value – center TAP value| < LTI1_H4_INC_ZERO.
ADJ_ENH_LTI2	LTI_H4_MEDIAN_TAP_ SEL	0	Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference
ADJ_ENH_LTI2	LTI_H4_GAIN[7:0]	0	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times)
ADJ_ENH_LTI2	LTI_H4_CORE[7:0]	0	LTI Coring (Maximum core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.)

(3) Sharpness Process

The enhancer performs edge enhancement on the Y signal input by adding overshoot and undershoot to the original signal. Edge enhancement of the blanking signal is turned off.

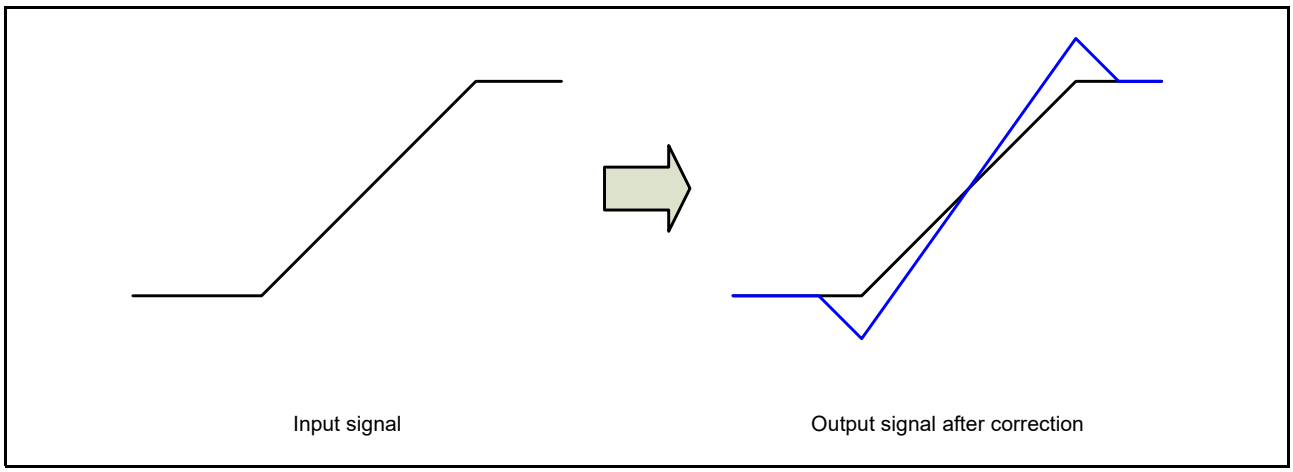

Figure 34.6 Sharpness Correction

After edge detection of the image, the sharpness can be independently controlled in the three horizontal bands.

In horizontal sharpness, a 3-tap low-pass filter (LPF) is inserted before edge detection to prevent folding. The LPF can be turned on or off by register setting.

Table 34.6 Reference Pixel Table for Sharpness

Sharpness Band	Reference Pixel for Edge Detection	LPF Application
Horizontal sharpness (H1)	Adjacent pixel used as reference	LPF not applied
Horizontal sharpness (H2)	Second adjacent pixel used as reference	LPF not applied or LPF (1,2,1)
Horizontal sharpness (H3)	Third adjacent pixel used as reference	LPF (1,2,1)

The edge amplitude of the edge to be enhanced is adjusted according to the value of SHP_CORE.

Edge enhancement is accomplished when the edge detection result of the image is greater than the value of SHP_CORE.

In edge enhancement, a correction value is output by multiplying (edge amplitude value - SHP_CORE) by sharpness gain.

Sharpness is turned off when the edge detection result of the image is smaller than the value of SHP_CORE.

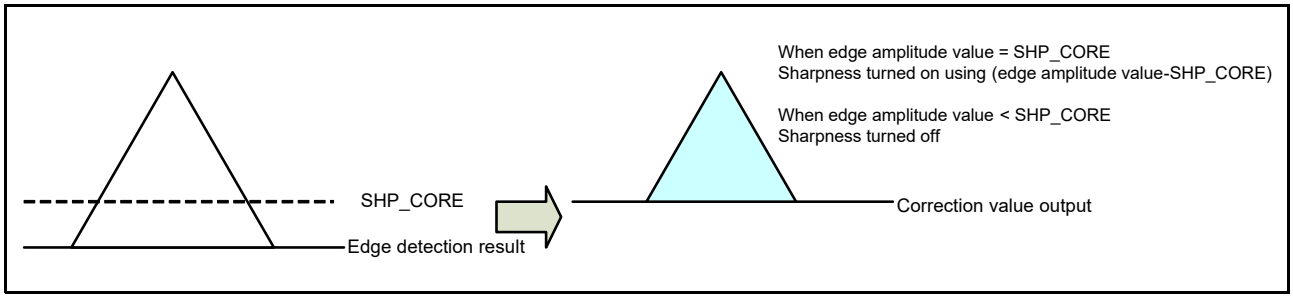

Figure 34.7 Sharpness Characteristics

Table 34.7 Sharpness Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_SHP1	SHP_H_ON	0	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
ADJ_ENH_SHP3	SHP_H2_LPF_SEL	0	LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected
ADJ_ENH_SHP2	SHP_H1_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O

ADJ_ENH_SHP2	SHP_H1_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
ADJ_ENH_SHP2	SHP_H1_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (edge amplitude value – SHP_H1_CORE)
ADJ_ENH_SHP1	SHP_H1_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H1_CORE: Sharpness processing on Edge amplitude value < SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.
ADJ_ENH_SHP4	SHP_H2_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O
ADJ_ENH_SHP4	SHP_H2_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U
ADJ_ENH_SHP4	SHP_H2_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE)
ADJ_ENH_SHP4	SHP_H2_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE)
ADJ_ENH_SHP3	SHP_H2_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H2_CORE: Sharpness processing on Edge amplitude value < SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.
ADJ_ENH_SHP6	SHP_H3_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
ADJ_ENH_SHP6	SHP_H3_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
ADJ_ENH_SHP6	SHP_H3_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (edge amplitude value – SHP_H3_CORE)
ADJ_ENH_SHP6	SHP_H3_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (edge amplitude value – SHP_H3_CORE)
ADJ_ENH_SHP5	SHP_H3_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

34.1.5 Color Matrix

Color matrix is performed by adjusting the offset of each input signal and nine-axis gain. This allows YCbCr to GBR conversion.

(1) GBR to GBR Conversion

YGIN_A = YGIN + ADJ_MTX_YG − 128

CBBIN_A = CBBIN + ADJ_MTX_B − 128

CRRIN_A = CRRIN + ADJ_MTX_R − 128

YGOUT = (ADJ_MTX_GG × YGIN_A + ADJ_MTX_GB × CBBIN_A + ADJ_MTX_GR × CRRIN_A) ÷ 256

CBBOUT = (ADJ_MTX_BG × YGIN_A + ADJ_MTX_BB × CBBIN_A + ADJ_MTX_BR × CRRIN_A) ÷ 256

CRROUT = (ADJ_MTX_RG × YGIN_A + ADJ_MTX_RB × CBBIN_A + ADJ_MTX_RR × CRRIN_A) ÷ 256

(2) YCbCr to GBR Conversion

YGIN_A = YGIN + ADJ_MTX_YG − 128

CBBIN_A = CBBIN − 128

CRRIN_A = CRRIN − 128

YGOUT = (ADJ_MTX_GG × YGIN_A + ADJ_MTX_GB × CBBIN_A + ADJ_MTX_GR × CRRIN_A) ÷ 256

CBBOUT = (ADJ_MTX_BG × YGIN_A + ADJ_MTX_BB × CBBIN_A + ADJ_MTX_BR × CRRIN_A) ÷ 256

CRROUT = (ADJ_MTX_RG × YGIN_A + ADJ_MTX_RB × CBBIN_A + ADJ_MTX_RR × CRRIN_A) ÷ 256

Table 34.8 Matrix Coefficients (Standard Values) of SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	**Bit Setting**	**Coefficient**	**Bit Setting**	**Coefficient**	**Bit Setting**
YGOUT	1.000	ADJ_MTX_GG = 256	–0.344	ADJ_MTX_GB = 1960	–0.714	ADJ_MTX_GR = 1865
CBBOUT	1.000	ADJ_MTX_BG = 256	1.772	ADJ_MTX_BB = 454	0.000	ADJ_MTX_BR = 0
CRROUT	1.000	ADJ_MTX_RG = 256	0.000	ADJ_MTX_RB = 0	1.402	ADJ_MTX_RR = 359

Table 34.9 Color Matrix Control

Register Name	Bit Name	Initial Value	Description

34.2 Register Description

Table 34.10 and Table 34.11 show the register configurations.

[Symbols used in Register Description]

Initial value : Register value after a reset
— : Undefined value
R/W : Readable/writable. The written value can be read.
R/WC0 : Read and write. Bit is initialized if 0 is written, and ignored if 1 is written.
R/WC1 : Read and write. Bit is initialized if 1 is written, and ignored if 0 is written.
R : Read-only. The write value should always be 0.
—/W : Write-only. Read value is undefined.

34.2.1 Register Update Control Register in Image Quality Improver (ADJ0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ0_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADJ0_VEN	0	R/WC1	Image Quality Improver Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.2 Black Stretch Register (ADJ0_BKSTR_SET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	BKSTR_ON	BKSTR_ST[3:0]				BKSTR_D[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	BKSTR_T1[4:0]					—	—	—	BKSTR_T2[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	BKSTR_ON	0	R/W	Black Stretch On/Off Control 0: Black stretch off 1: Black stretch on
23 to 20	BKSTR_ST [3:0]	0	R/W	Black Stretch Start Point Setting values: 0 (low) to 15 (high)
19 to 16	BKSTR_D [3:0]	0	R/W	Depth of Black Stretch Setting Values: 0 (shallow) to 15 (deep)
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	BKSTR_T1 [4:0]	0	R/W	Black Stretch Time Constant (T1) Setting Values: 0 (small) to 31 (large)
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	BKSTR_T2 [4:0]	0	R/W	Black Stretch Time Constant (T2) Setting Values: 0 (small) to 31 (large)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.3 Enhancer Timing Adjustment Register 1 (ADJ0_ENH_TIM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ENH_MD	—	—	—	ENH_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ENH_MD	1	R/W	Operating Mode 0: RGB mode 1: YCbCr mode
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ENH_DISP_ON	0	R/W	Frame Line Display On/Off of Enhancer-Enabled Area 0: Display off 1: Display on

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.4 Enhancer Timing Adjustment Register 2 (ADJ0_ENH_TIM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ENH_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENH_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_VS[10:0]	35	R/W	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_VW[10:0]	480	R/W	Width of Vertical Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.5 Enhancer Timing Adjustment Register 3 (ADJ0_ENH_TIM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ENH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENH_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_HS[10:0]	145	R/W	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_HW[10:0]	640	R/W	Width of Horizontal Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.6 Enhancer Sharpness Register 1 (ADJ0_ENH_SHP1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H1_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H_ON	0	R/W	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H1_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H1_CORE: Sharpness processing on Edge amplitude value < SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.7 Enhancer Sharpness Register 2 (ADJ0_ENH_SHP2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H1_CLIP_O[7:0]								SHP_H1_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H1_GAIN_O[7:0]								SHP_H1_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H1_CLIP_O [7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O
23 to 16	SHP_H1_CLIP_U [7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H1_CLIP_U
15 to 8	SHP_H1_GAIN_O [7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
7 to 0	SHP_H1_GAIN_U [7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (Edge amplitude value – SHP_H1_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.8 Enhancer Sharpness Register 3 (ADJ0_ENH_SHP3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H2_LPF_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H3_ CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
23 to 16	SHP_H3_ CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
15 to 8	SHP_H3_ GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (Edge amplitude value – SHP_H3_CORE)
7 to 0	SHP_H3_ GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (Edge amplitude value – SHP_H3_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.12 Enhancer LTI Register 1 (ADJ0_ENH_LTI1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LTI_H_ON	—	—	—	—	—	—	LTI_H2_LPF_SEL	LTI_H2_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H2_GAIN[7:0]								LTI_H2_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	LTI_H_ON	0	R/W	LTI On/Off Control 0: LTI off 1: LTI on
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H2_LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
23 to 16	LTI_H2_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when | right TAP value – center TAP value | < LTI_H2_INC_ZERO or | left TAP value – center TAP value | < LTI_H2_INC_ZERO
15 to 8	LTI_H2_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H2_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.13 Enhancer LTI Register 2 (ADJ0_ENH_LTI2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	LTI_H4_MEDIAN_TAP_SEL	LTI_H4_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H4_GAIN[7:0]								LTI_H4_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H4_MEDIAN_TAP_SEL	0	R/W	Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference
23 to 16	LTI_H4_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when | right TAP value – center TAP value | < LTI_H4_INC_ZERO or | left TAP value – center TAP value | < LTI_H4_INC_ZERO
15 to 8	LTI_H4_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H4_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.14 Matrix Mode Register in Image Quality Improver (ADJ0_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ0_MTX_MD[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ADJ0_MTX_MD[1:0]	2	R/W	Operating Mode 0: GBR → GBR 1: Setting prohibited 2: YCbCr → GBR 3: Setting prohibited

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.15 Matrix YG Control Register 0 in Image Quality Improver (ADJ0_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADJ0_MTX_YG[7:0]

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ0_MTX_RB [10:0]	0	R/W	Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_RR [10:0]	359	R/W	Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

34.2.21 Register Update Control Register in Image Quality Improver (ADJ1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ1_ VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADJ1_VEN	0	R/WC1	Image Quality Improver Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.22 Black Stretch Register (ADJ1_BKSTR_SET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	BKSTR_ON	BKSTR_ST[3:0]				BKSTR_D[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	BKSTR_T1[4:0]					—	—	—	BKSTR_T2[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	BKSTR_ON	0	R/W	Black Stretch On/Off Control 0: Black stretch off 1: Black stretch on
23 to 20	BKSTR_ST [3:0]	0	R/W	Black Stretch Start Point Setting values: 0 (low) to 15 (high)
19 to 16	BKSTR_D [3:0]	0	R/W	Depth of Black Stretch Setting Values: 0 (shallow) to 15 (deep)
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	BKSTR_T1 [4:0]	0	R/W	Black Stretch Time Constant (T1) Setting Values: 0 (small) to 31 (large)
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	BKSTR_T2 [4:0]	0	R/W	Black Stretch Time Constant (T2) Setting Values: 0 (small) to 31 (large)

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.23 Enhancer Timing Adjustment Register 1 (ADJ1_ENH_TIM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ENH_MD	—	—	—	ENH_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ENH_MD	1	R/W	Operating Mode 0: RGB mode 1: YCbCr mode
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ENH_DISP_ON	0	R/W	Frame Line Display On/Off of Enhancer-Enabled Area 0: Display off 1: Display on

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.24 Enhancer Timing Adjustment Register 2 (ADJ1_ENH_TIM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ENH_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENH_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_VS[10:0]	35	R/W	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_VW[10:0]	480	R/W	Width of Vertical Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.25 Enhancer Timing Adjustment Register 3 (ADJ1_ENH_TIM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ENH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENH_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_HS[10:0]	145	R/W	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_HW[10:0]	640	R/W	Width of Horizontal Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.26 Enhancer Sharpness Register 1 (ADJ1_ENH_SHP1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H1_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H_ON	0	R/W	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H1_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H1_CORE: Sharpness processing on Edge amplitude value < SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.27 Enhancer Sharpness Register 2 (ADJ1_ENH_SHP2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H1_CLIP_O[7:0]								SHP_H1_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H1_GAIN_O[7:0]								SHP_H1_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H1_ CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O
23 to 16	SHP_H1_ CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H1_CLIP_U
15 to 8	SHP_H1_ GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
7 to 0	SHP_H1_ GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (Edge amplitude value – SHP_H1_CORE)

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.28 Enhancer Sharpness Register 3 (ADJ1_ENH_SHP3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H2_LPF_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H2_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H2_LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H2_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H2_CORE: Sharpness processing on Edge amplitude value < SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.29 Enhancer Sharpness Register 4 (ADJ1_ENH_SHP4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H2_CLIP_O[7:0]								SHP_H2_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H2_GAIN_O[7:0]								SHP_H2_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H2_CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O
23 to 16	SHP_H2_CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U
15 to 8	SHP_H2_GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE)
7 to 0	SHP_H2_GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE)

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.30 Enhancer Sharpness Register 5 (ADJ1_ENH_SHP5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H3_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H3_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.31 Enhancer Sharpness Register 6 (ADJ1_ENH_SHP6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H3_CLIP_O[7:0]								SHP_H3_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H3_GAIN_O[7:0]								SHP_H3_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H3_ CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
23 to 16	SHP_H3_ CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
15 to 8	SHP_H3_ GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (Edge amplitude value – SHP_H3_CORE)
7 to 0	SHP_H3_ GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (Edge amplitude value – SHP_H3_CORE)

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.32 Enhancer LTI Register 1 (ADJ1_ENH_LTI1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LTI_H_ON	—	—	—	—	—	—	LTI_H2_LPF_SEL	LTI_H2_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H2_GAIN[7:0]								LTI_H2_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	LTI_H_ON	0	R/W	LTI On/Off Control 0: LTI off 1: LTI on
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H2_LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
23 to 16	LTI_H2_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when | right TAP value – center TAP value | < LTI_H2_INC_ZERO or | left TAP value – center TAP value | < LTI_H2_INC_ZERO
15 to 8	LTI_H2_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H2_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.2.33 Enhancer LTI Register 2 (ADJ1_ENH_LTI2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	LTI_H4_MEDIAN_TAP_SEL	LTI_H4_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ1_MTX_RB [10:0]	0	R/W	Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ1_MTX_RR [10:0]	359	R/W	Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ1_VEN in ADJ1_UPDATE is 1.

34.3 Usage Method

34.3.1 Black Stretch Usage Method

The degree of black stretch can be adjusted by setting the depth (BKSTR_D[3:0]) and the start point (BKSTR_ST[3:0]) of the black stretch. The variation in the black stretch time axis can be adjusted by setting the time constant (BKSTR_T1[4:0] and BKSTR_T2[4:0]). By setting the time constant, changes that occur abruptly due to swapping of the scene can be controlled.

Table 34.12 Black Stretch Setting Register

Register Name	Bit Name	Set Value
ADJ_BKSTR_SET	BKSTR_ON	When black stretch is on: 1
ADJ_BKSTR_SET	BKSTR_D[3:0]	Set the depth of black stretch. The depth increases as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_ST[3:0]	Set the start point of black stretch. The stretching area becomes larger as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_T1[4:0]	Set the time constant of black stretch in the positive direction. The changes are more delayed as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_T2[4:0]	Set the time constant of black stretch in the negative direction. The changes are more delayed as the value becomes larger.

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

34.3.2 LTI Processing of Enhancer

Figure 34.8 shows an example of LTI adjustment.

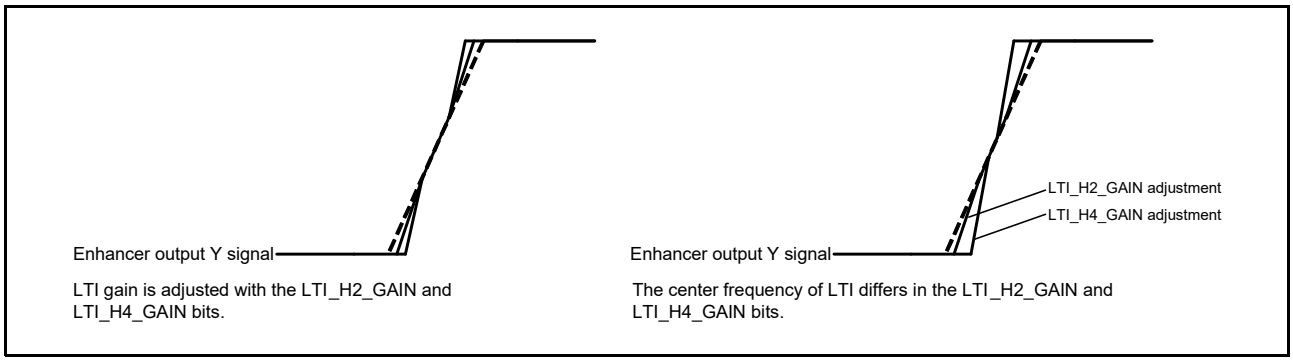

Figure 34.8 Example of LTI Adjustment

34.3.3 Sharpness Processing of Enhancer

Figure 34.9 shows an example of sharpness adjustment.

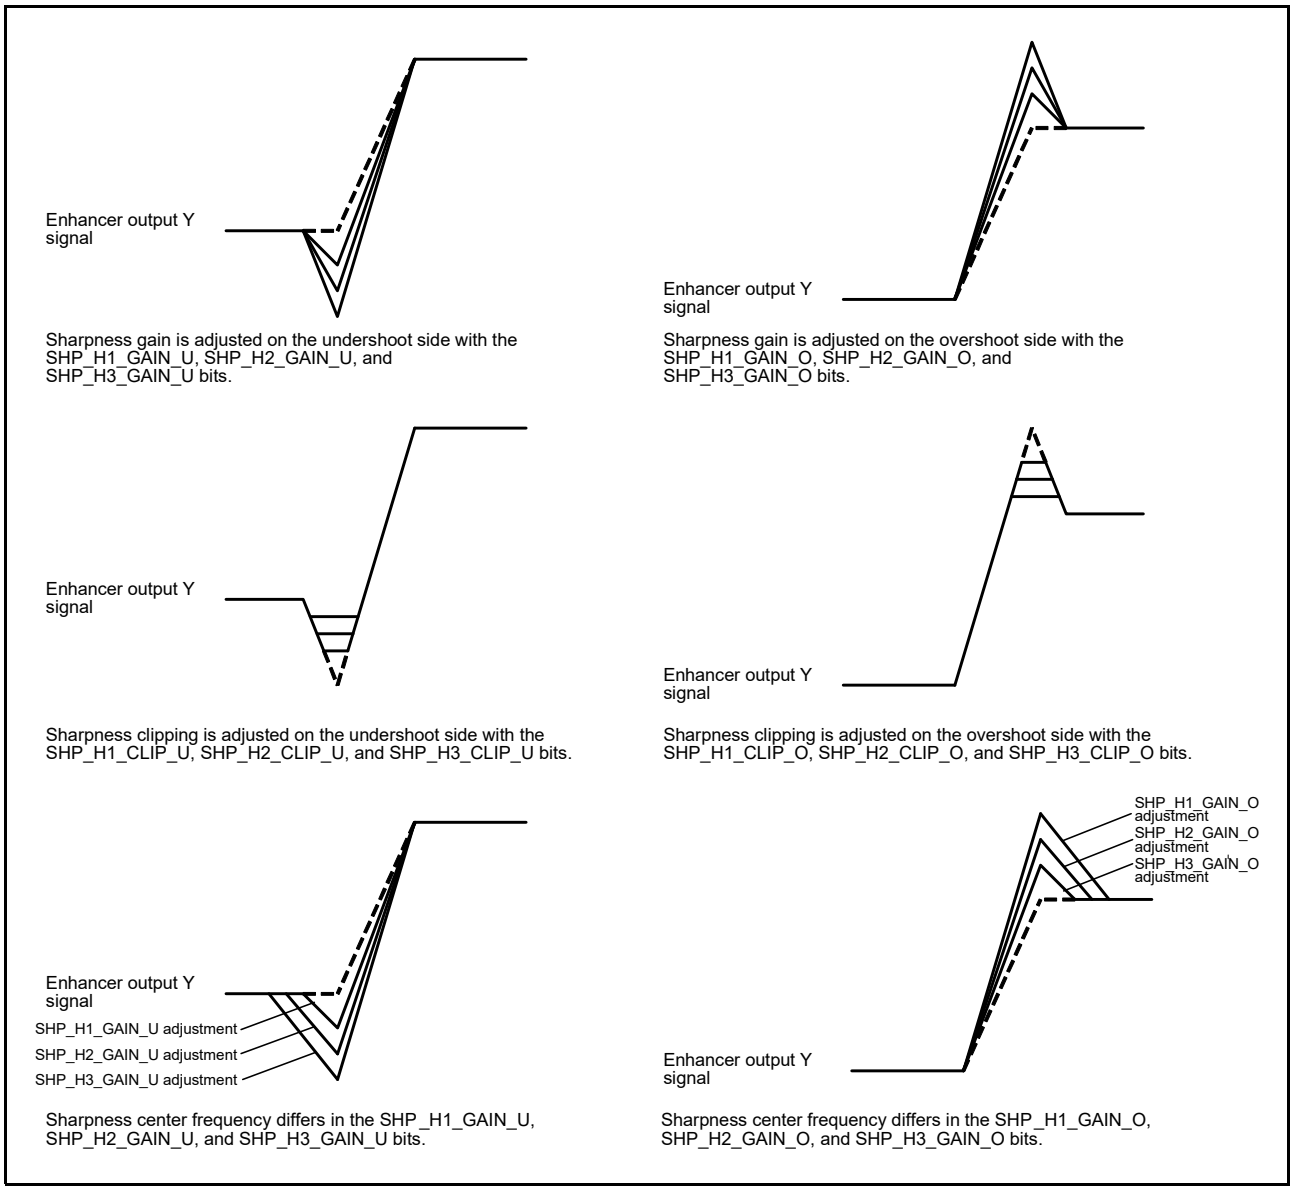

Figure 34.9 Example of Sharpness Adjustment

34.3.4 Setting Method for Color Matrix Data Conversion

GBR signals are assumed to be input to the circuit subsequent to the image quality improver; therefore, the output from the color matrix circuit should be in the GBR format.

Table 34.13 shows an example of GBR conversion setting.

Table 34.13 Recommended Setting Values for Matrix Conversion

		GBR to GBR Conversion	YCBCR to GBR Conversion
Register Name	**Bit Name**	**Recommended Values**	**Recommended Values**
ADJ_MTX_MODE	ADJ_MTX_MD[1:0]	0	2
ADJ_MTX_YG_ADJ0	ADJ_MTX_YG[7:0]	128	128
ADJ_MTX_CBB_ADJ0	ADJ_MTX_B[7:0]	128	128
ADJ_MTX_CRR_ADJ0	ADJ_MTX_R[7:0]	128	128
ADJ_MTX_YG_ADJ0	ADJ_MTX_GG[10:0]	256	256
ADJ_MTX_YG_ADJ1	ADJ_MTX_GB[10:0]	0	1960
ADJ_MTX_YG_ADJ1	ADJ_MTX_GR[10:0]	0	1865
ADJ_MTX_CBB_ADJ0	ADJ_MTX_BG[10:0]	0	256
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BB[10:0]	256	454
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BR[10:0]	0	0
ADJ_MTX_CRR_ADJ0	ADJ_MTX_RG[10:0]	0	256
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RB[10:0]	0	0
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RR[10:0]	256	359

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

35. Video Display Controller 5 (5): Image Synthesizer

35.1 Image Synthesizer

35.1.1 Overview of Functions

The image synthesizer reads graphics data from the frame buffer and displays the synthesized image on the screen.

Two video planes + two graphics planes, one video plane + three graphics planes, or four graphics planes can be selected for synthesis.

RGB565, RGB888, αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, CLUT8, CLUT4, CLUT1, YCbCr422 (for the graphics 0 and 1 processes), and YCbCr444 (for the graphics 0 and 1 processes) formats can be used for graphics data, and RGB565, RGB888, YCbCr422, and YCbCr444 formats for video data.

On each of the graphics planes, background color, lower-layer graphics, current graphics, or blended image (for the graphics 1, 2, and 3 processes and VIN synthesizer) of lower-layer graphics and current graphics can be displayed.

In the VIN synthesizer, graphics data is not read and images (for the graphics 0 and 1 processes) are blended.

The functional block diagram of the image synthesizer is shown below.

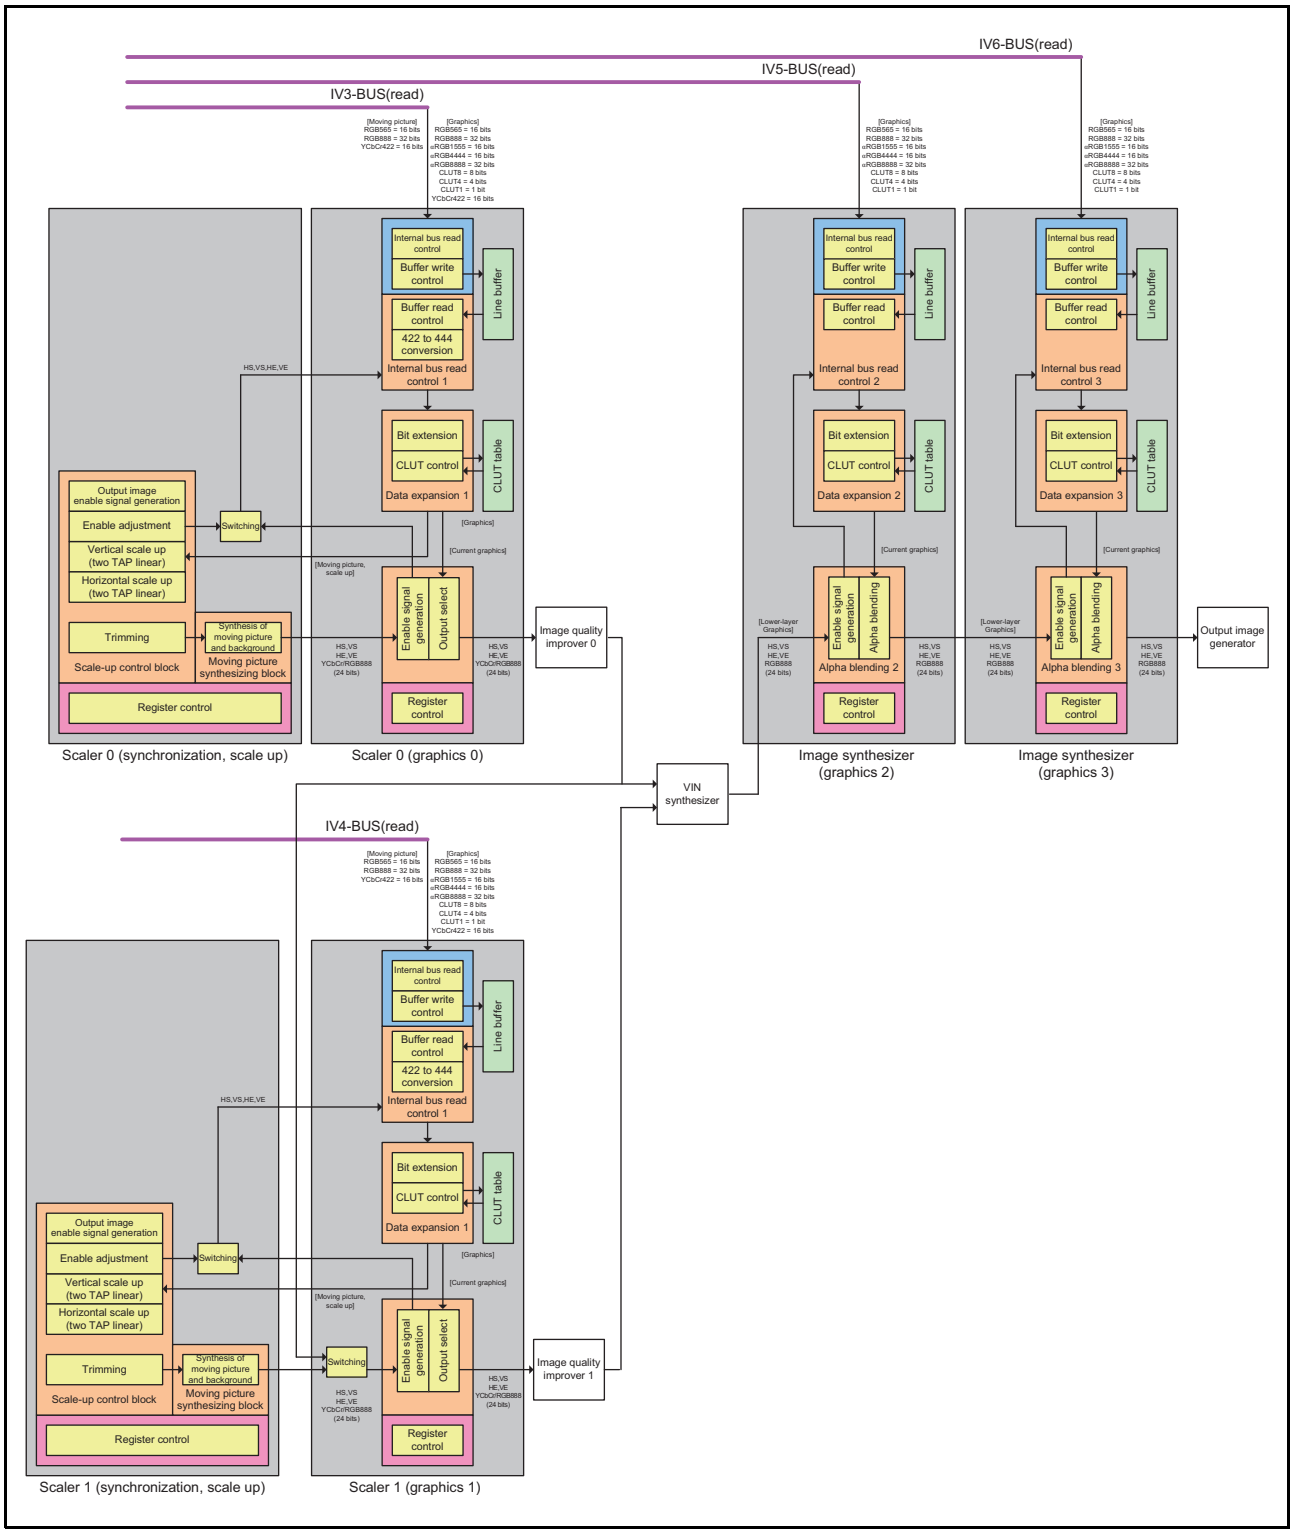

Figure 35.1 Functional Block Diagram of Image Synthesizer

35.1.2 Graphics Data Read Control

Graphics data read can be controlled for the five processes: the graphics 0 process in the scaler 0, the graphics 1 process in the scaler 1, the graphics 2 and 3 processes in the image synthesizer, and the graphics OIR process in the output image generator.

The register bits of each process can be identified by the number in the register name like GR0_xxxx, GR1_xxxx, GR2_xxxx, GR3_xxxx, and GR_OIR_xxxx, respectively. In the sections except for Register Descriptions, however, the number is omitted like GR_xxxx for convenience sake.

In the VIN synthesizer, graphics data read is not controlled and the blending register GR_VIN_xxxx is present. In this manual, the name is omitted like GR_xxxx for convenience sake. The synthesizer does not have the read control register (GR_FLM).

(1) Updating Registers

The Vsync signal is used to control the update timing of the registers for graphics display and frame buffer read control, except for some of the registers.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 35.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Register Update* 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

Note: * This bit is not supported for the VIN synthesizer.

(2) Frame Buffer Burst Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video data and graphics data are stored.

Table 35.2 Frame Buffer Burst Transfer Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_BST_MD	0	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

(3) Frame Buffer Control Mode

More than one frame of data is read from the frame buffer.

For graphics data, set the GR_FLM_SEL[1:0] bits to 1, and set the specific display frame number with the GR_FLM_NUM[9:0] bits. For video data, select a mode with the GR_FLM_SEL[1:0] bits depending on the writing process used; the quantity of the frames used for video data is set in the writing process block.

Table 35.3 Frame Buffer Control Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLM_SEL[1:0]	0	Frame Buffer Address Setting Signal Select 0: Control linked to scaling-down process, or frame 0 selected. *1 1: Register GR_FLM_NUM selected. 2: Control linked to distortion correction, or frame 0 selected. *2 3: Control linked to pointer buffer, or setting prohibited. *3
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame Number of Frame Buffer Manually set the frame number when GR_FLM_SEL = 1.

Notes: 1. For the graphics 0, 1, and OIR processes, frame buffer control links to the scaling-down process. For the graphics 2 and 3 processes, frame 0 is selected.
2. For the graphics 0 and OIR processes, frame buffer control links to distortion correction. For the graphics 1, 2 and 3 processes, frame 0 is selected.
3. For the graphics 0, 1, and OIR processes, frame buffer control links to the pointer buffer. For the graphics 2 and 3 processes, setting is prohibited.

(4) Frame Buffer Read Control

The following bit enables or disables read access to the frame buffer.

Table 35.4 Frame Buffer Read Control

Register Name	Bit Name	Initial Value	Description
GR_FLM_RD	GR_R_ENB	0	Frame Buffer Read Enable 0: Disables read access to the frame buffer. 1: Enables read access to the frame buffer.

(5) Distortion Correction Frame Buffer Control

Two frames (frames 0 and 1) are used for distortion correction, and the frame numbers to be read by the image renderer are set.

The frame numbers to be read (frames 0 and 1) can be switched by setting the GR_IMR_FLM_INV bit.

This bit is enabled only when the GR_FLM_SEL bits are set to 2.

Table 35.5 Distortion Correction Frame Buffer Control

Register Name	Bit Name	Initial Value	Description
GR1_FLM1	GR1_IMR_FLM_INV	0	Sets the frame buffer number for distortion correction.* 0:Does not switch the frame numbers to be read. 1:Switches the frame numbers to be read.

Note: * This function is supported for the graphics 0 and OIR processes only.

(6) Frame Buffer Size

The following bits set the size of the frame buffer to be read.

The numbers of horizontal pixels and of lines in the vertical direction are set with the GR_HW[10:0] and GR_FLM_LNUM[10:0] bits, respectively.

Table 35.6 Frame Buffer Size

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_HW[10:0]	0	Sets the width of the horizontal valid period. The width is (GR_HW + 1) pixels. Note: Set to 2 or greater.
GR_FLM5	GR_FLM_LNUM[10:0]	0	Sets the number of lines in a frame The number of lines is (GR_FLM_LNUM + 1).

(7) Calculating Addresses in Frame Buffer

The data area in the frame buffer is defined using the addresses specified by GR_BASE[31:0], GR_LN_OFF[14:0], and GR_FLM_OFF[22:0] bits and the display frame number.

The GR_LN_OFF[14:0] and GR_FLM_OFF[22:0] bits should be set in units of 32/128 bytes (the lower 5/7 bits should be fixed to 0).

The GR_BASE[31:0] bits should be set in units of 64 bits to set the display data start position (the lower three bits should be fixed).

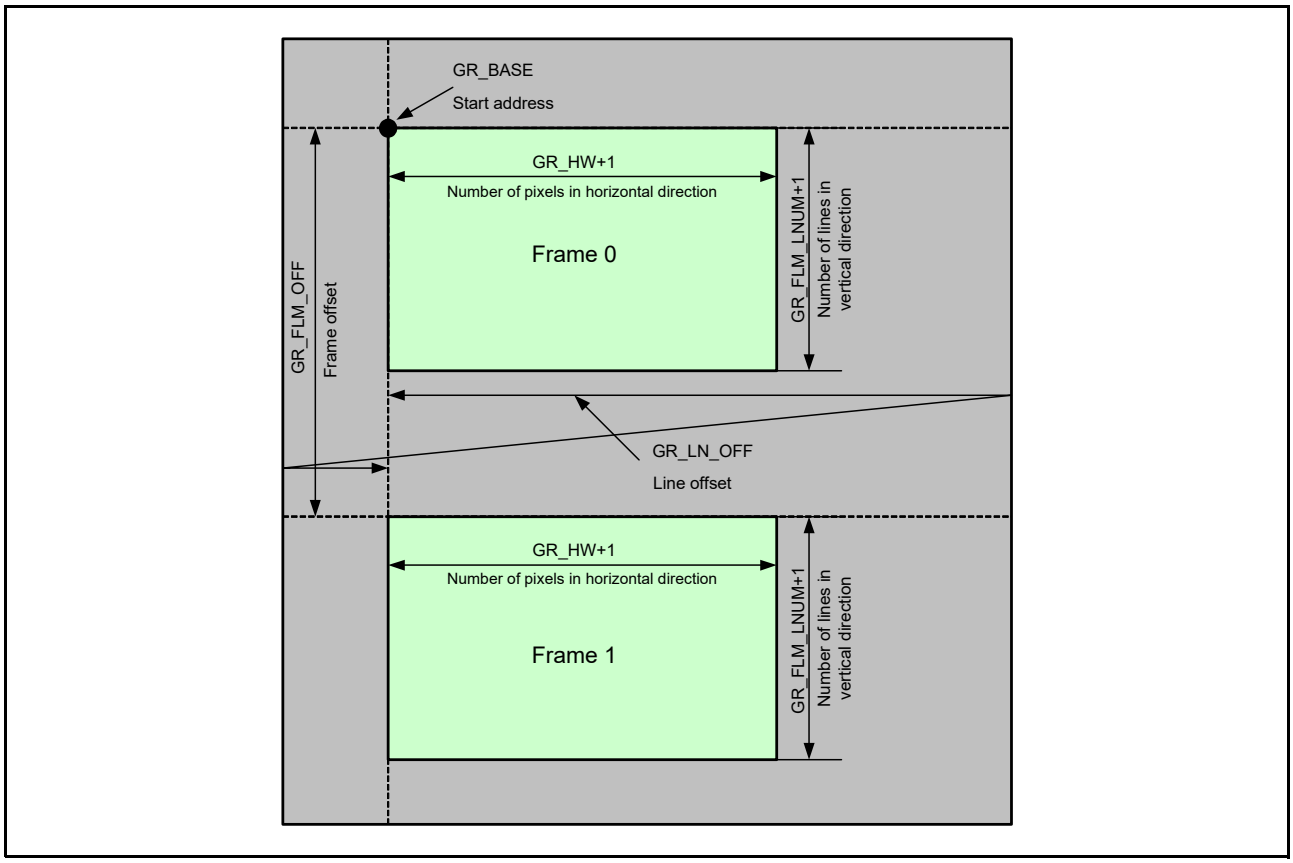

Figure 35.2 Data Arrangement in Frame Buffer

Table 35.7 Calculation of Addresses in Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM2	GR_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be set to 000.
GR_FLM3	GR_LN_OFF[14:0]	0	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0:GR_BASE Line 1:GR_BASE + GR_LN_OFF × 1 : Line n: GR_BASE + GR_LN_OFF × n For 32-byte transfer, the lower 5 bits should be fixed to 0_0000. For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.
GR_FLM4	GR_FLM_OFF[22:0]	0	Frame Buffer Frame Offset Address (lower) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR_BASE Buffer 1: GR_BASE + GR_FLM_OFF × 1 : Buffer n: GR_BASE + GR_FLM_OFF × n For 32-byte transfer, the lower 5 bits should be fixed to 0_0000. For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.

(8) Setting Frame Buffer Size Smaller than One Frame

Frame buffer size can be set in one-line units.

When the number of lines set with the GR_FLM_LOOP[10:0] bits is smaller than the value of the GR_FLM_LNUM[10:0] bits, data is again read from the start address of the frame buffer after the number of lines set with the (GR_FLM_LOOP[10:0] + 1) bits have been read.

Table 35.8 Setting of Frame Buffer Size Smaller than One Frame

Register Name	Bit Name	Initial Value	Description
GR_FLM5	GR_FLM_LOOP[10:0]	1023	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR_FLM_LOOP + 1).

(9) Line Offset Control for Frame Buffer

The following bit sets the line offset address direction of the frame buffer.

Table 35.9 Line Offset Address Direction Control for Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_LN_OFF_DIR	0	Selects the line offset address direction of the frame buffer. 0:Increments the address by the line offset address. 1:Decrements the address by the line offset address.

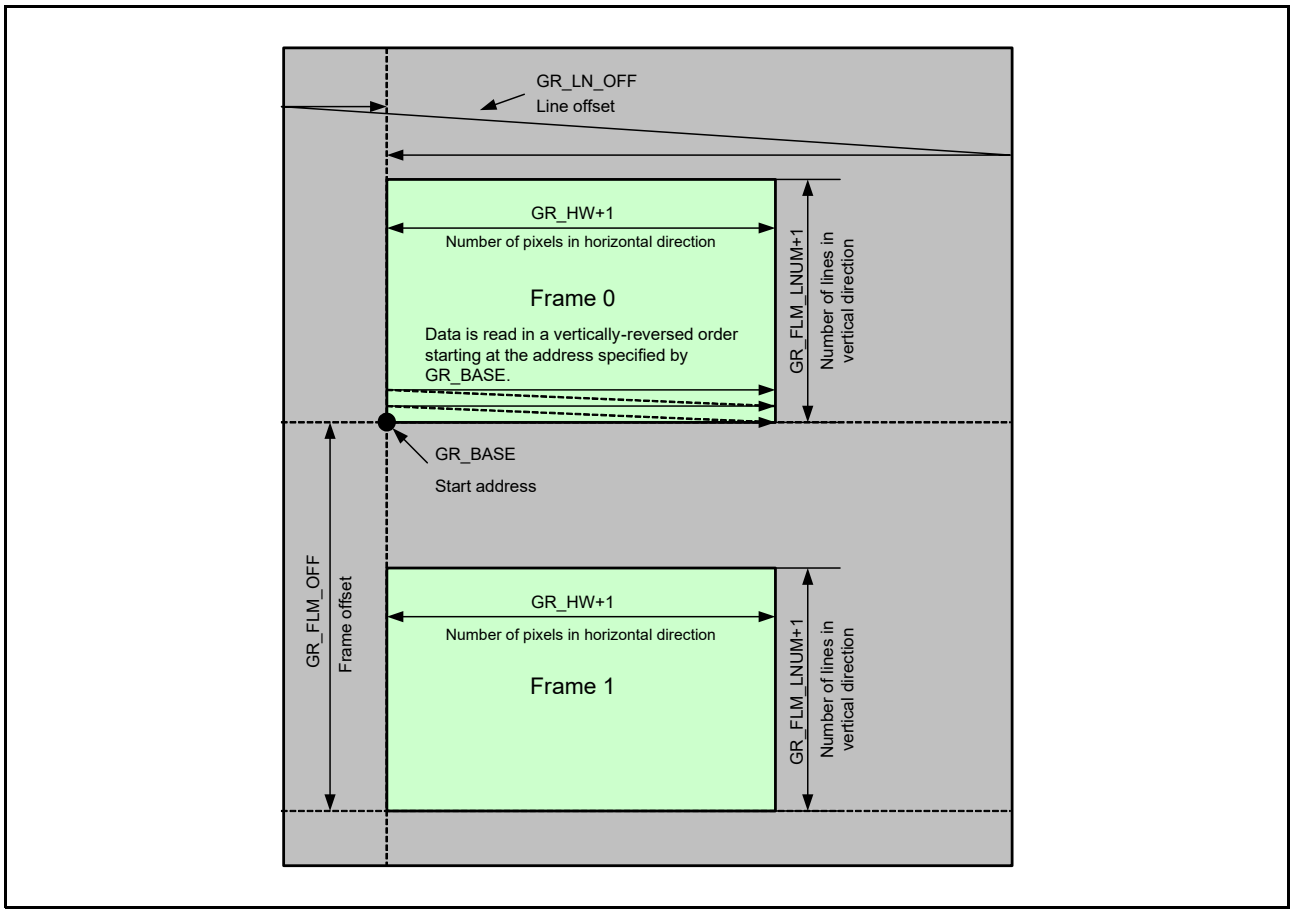

Figure 35.3 Data Arrangement with Line Offset and Decrement Control

(10) Selecting Format of Frame Buffer Read Signal

Signal formats RGB565, RGB888, αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, CLUT8, CLUT4 and CLUT1 are supported for the graphics 0, 1, 2, 3, and OIR processes. The YCbCr422 and YCbCr444 formats are also supported for the graphics 0 and 1 processes.

The GR_FORMAT[3:0] bits select a signal format.

Table 35.10 Format Selection for Frame Buffer Read Signal

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_FORMAT[3:0]	0	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 or setting prohibited * 9: YCbCr444 or setting prohibited * 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited

Note: * Setting this value selects YCbCr422 and YCbCr444 for the graphics 0 and 1 processes, and is prohibited for the graphics 2, 3, and OIR processes.

(11) Endian Control

In the frame buffer, data is handled in 64-bit units, and endian of the data to be read can be controlled by setting the GR_RDSWA[2:0] bits. Bit 0 of these bits indicates whether 8-bit data is swapped. Bit 1 indicates whether 16-bit data is swapped. Bit 2 indicates whether 32-bit data is swapped. In the YCbCr422 format, data can be arranged with the GR_YCC_SWAP[2:0] bits.

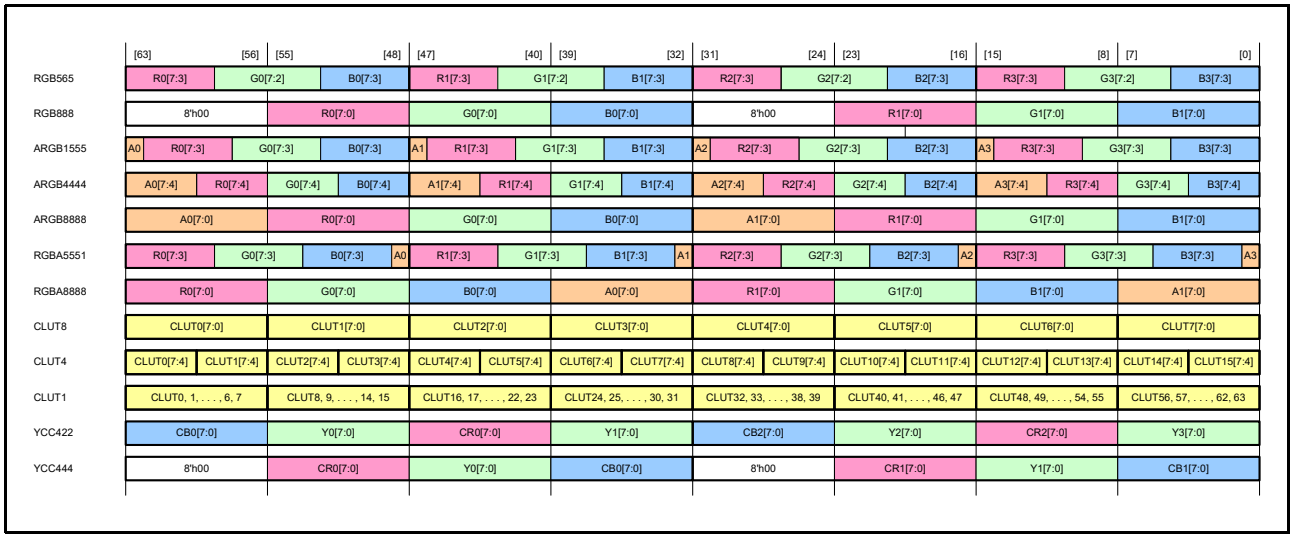

Figure 35.4 Data Arrangement with Endian Control Disabled (GR_RDSWA = 000)

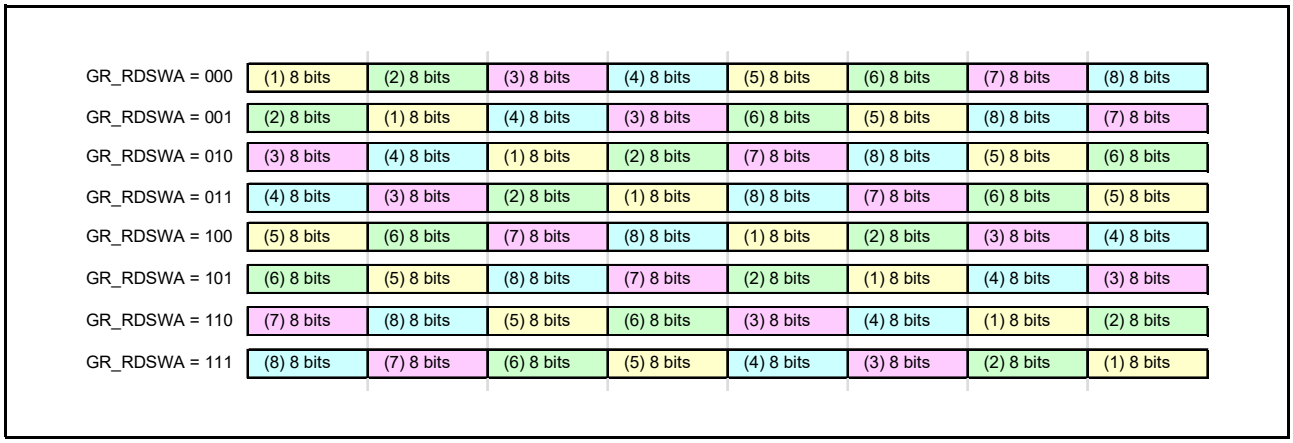

Figure 35.5 Data Arrangement with Endian Control Enabled

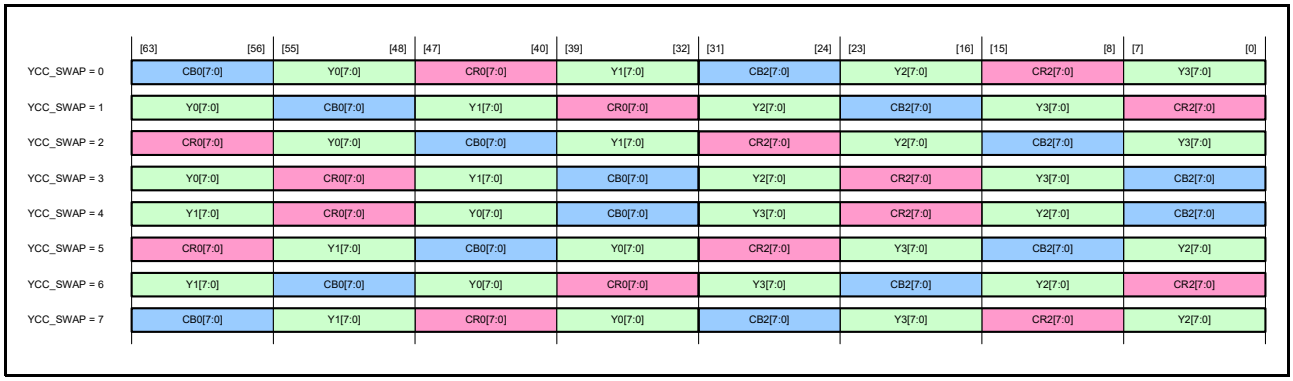

Figure 35.6 YCbCr422 Data Arrangement with Swapping Enabled

Table 35.11 Endian Control

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_RDSWA[2:0]	0	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]

Table 35.11 Endian Control

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_YCC_SWAP [2:0]	0	Controls swapping of data read from buffer in the YCbCr422 format. * 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Note: * These bits are supported for the graphics 0 and 1 processes only.

(12) Display Start Pixel Setting for Read Data

When a horizontal offset is applied to display the image data in the frame buffer, the display start pixel is set with the GR_BASE[31:0] and GR_STA_POS[5:0] bits. Calculation of the values for the GR_BASE[31:0] and GR_STA_POS[5:0] bits depends on the signal format. The display start pixel can be calculated with the formulas in the table below, where H_OFF is a horizontal offset from the display start pixel.

Table 35.12 Calculation of Display Start Position for Various Signal Formats

Signal Format of Video/Graphics	Number of Bits per Pixel	Calculation Formula *1
RGB888 αRGB8888, RGBα8888 YCbCr422*2 YCbCr444*3	32	GR_BASE[31:3] = t (H_OFF ÷ 2) GR_STA_POS[5:0] = mod (H_OFF ÷ 2)
RGB565 αRGB1555, RGBα5551 αRGB4444	16	GR_BASE[31:3] = int (H_OFF ÷ 4) GR_STA_POS[5:0] = mod (H_OFF ÷ 4)
CLUT8	8	GR_BASE[31:3] = int (H_OFF ÷ 8) GR_STA_POS[5:0] = mod (H_OFF ÷ 8)
CLUT4	4	GR_BASE[31:3] = int (H_OFF ÷ 16) GR_STA_POS[5:0] = mod (H_OFF ÷ 16)
CLUT1	1	GR_BASE[31:3] = int (H_OFF ÷ 64) GR_STA_POS[5:0] = mod (H_OFF ÷ 64)

Notes: 1. The functions int() and mod() output a quotient and a remainder, respectively.
2. The YCbCr422 format is not supported for the graphics 2, 3, and OIR processes.
In the YCbCr422 format, 32 bits are used for two pixels (Cb, Y0, Cr, and Y1 components). Therefore, the start position is controlled in units of 32 bits.
3. The YCbCr444 format is not supported for the graphics 2, 3, and OIR processes.

Table 35.13 Setting of Display Start Pixel of Read Data

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_STA_POS[5:0]	0	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR_STA_POS is skipped from the start of the line.
GR_FLM2	GR_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

(13) YCbCr422 to YCbCr444 Conversion

Data format for the graphics 0 and 1 processes are converted from YCbCr422 to YCbCr444.

This function is not supported for the graphics 2, 3, and OIR processes.

Table 35.14 YCbCr422 to YCbCr444 Conversion

Register Name	Bit Name	Initial Value	Description
GR1_FLM6	GR1_CNV444_MD	0	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. * 0: Hold interpolation 1: Average interpolation

Note: * This register is not provided for the graphics 2, 3, and OIR processes, for which the YCbCr422 format is not supported.

(14) Bit Extension

When the value of the GR_FORMAT[3:0] bits is 0 to 3, the RGB565, RGB888, αRGB1555, and αRGB4444 formats are converted to the αRGB8888 format. When the value of the GR_FORMAT[3:0] bits is 10, the RGBα5551 format is converted to the RGBα8888 format. The RGBα5551 to RGBα8888 format conversion is omitted because it differs from the αRGB5551 to αRGB8888 format conversion only in the position of α.

- RGB565 to αRGB8888 Format Conversion

  After conversion, α[7:0] is fixed to 255.

  After conversion, R[7:0] = R[4:0] × 263 ÷ 32 (round off to an integer), approximation of #R[4:0] × 255 ÷ 31

  After conversion G[7:0] = G[5:0] × 259 ÷ 64 (round off to an integer), approximation of #G[5:0] × 255 ÷ 63

  After conversion, B[7:0] = B[4:0] × 263 ÷ 32 (round off to an integer), approximation of #B[4:0] × 255 ÷ 31

- RGB888 to αRGB8888 Format Conversion

  After conversion, α[7:0] is fixed to 255.

- αRGB1555 to αRGB8888 Format Conversion

  After conversion, α[7:0] is GR_A1 when α input is 1, and GR_A0 when 0.

  After conversion, R[7:0] = R[4:0] × 263 ÷ 32 (round off to an integer), approximation of #R[4:0] × 255 ÷ 31

  After conversion, G[7:0] = G[4:0] × 263 ÷ 32 (round off to an integer), approximation of #G[4:0] × 255 ÷ 31

  After conversion, B[7:0] = B[4:0] × 263 ÷ 32 (round off to an integer), approximation of #B[4:0] × 255 ÷ 31

- αRGB4444 to αRGB8888 Format Conversion

  After conversion, α[7:0] = α[3:0] × 17

  After conversion, R[7:0] = R[3:0] × 17

  After conversion, G[7:0] = G[3:0] × 17

  After conversion, B[7:0] = B[3:0] × 17

(15) Buffer Underflow Processing

When data read from the frame buffer cannot be completed due to bus-traffic related problems, an underflow interrupt signal is output.

35.1.3 Setting Graphics Display Area

The graphics display area is set with the GR_GRC_HS[10:0], GR_GRC_HW[10:0], GR_GRC_VS[10:0], and GR_GRC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals.

Figure 35.7 shows the graphics display area.

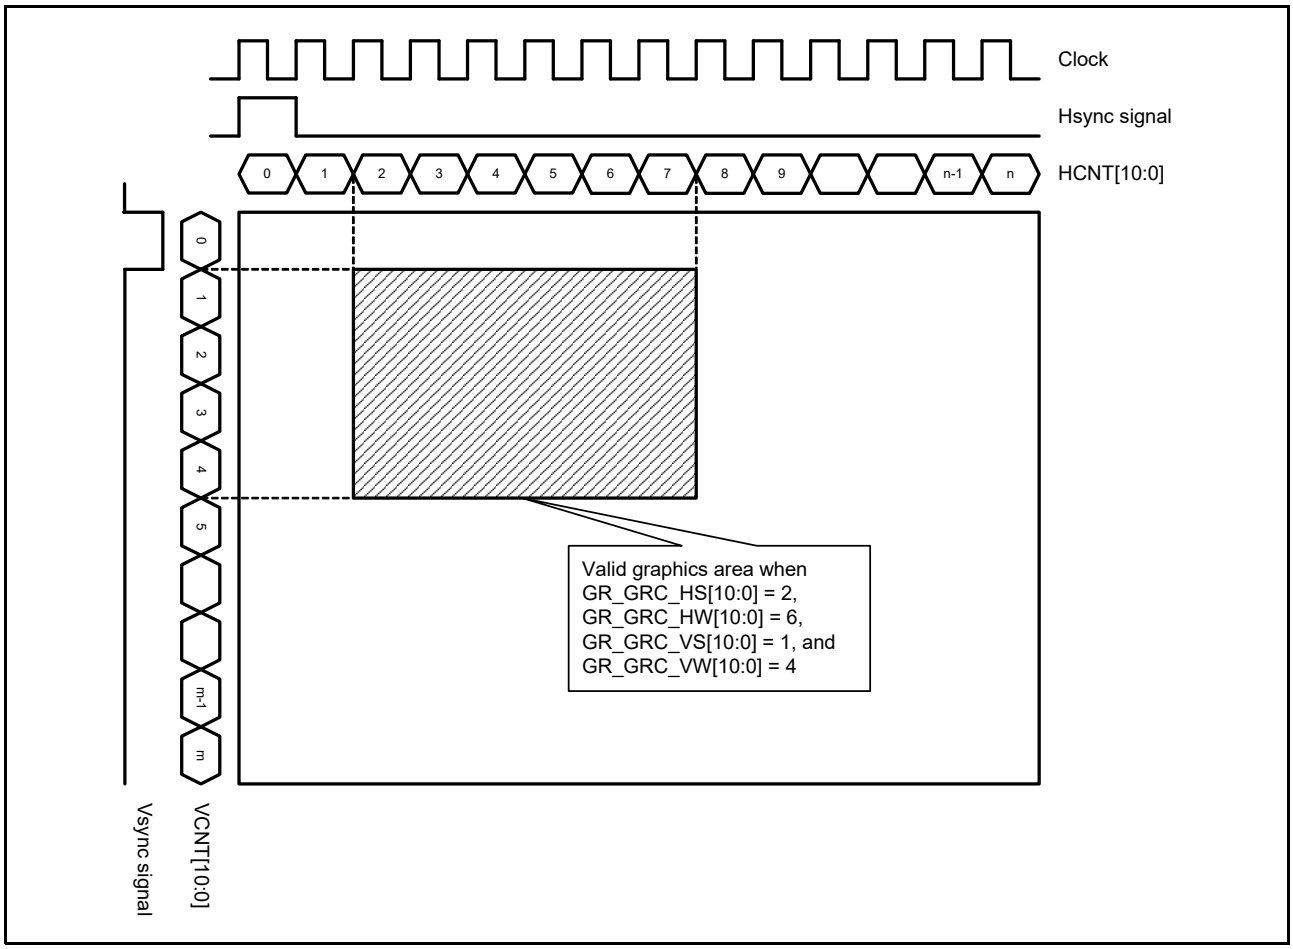

Figure 35.7 Graphics Display Area

The frame line of the graphics area can be displayed by setting the GR_GRC_DISP_ON bit to 1.

Table 35.15 Graphics Image Area Setting

Register Name	Bit Name	Initial Value	Description
GR_AB3	GR_GRC_HS[10:0]	0	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR_GRC_HS + GR_GRC_HW should be smaller than or equal to 2015 clocks.
GR_AB3	GR_GRC_HW[10:0]	0	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR_HW to 2 and GR_GRC_HW to 1 (1-pixel) or 2 (2-pixel).
GR_AB2	GR_GRC_VS[10:0]	0	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR_GRC_VS + GR_GRC_VW should be smaller than or equal to 2039 lines.
GR_AB2	GR_GRC_VW[10:0]	0	Sets the vertical width of the graphics image area.
GR_AB1	GR_GRC_DISP_ON	0	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on

35.1.4 Interrupt Generation at Specified Line

An interrupt signal can be generated at the line specified with the GR_LINE[10:0] bits.

Table 35.16 Interrupt Generation at Specified Line

Register Name	Bit Name	Initial Value	Description
GR_CLUT_INT	GR_LINE[10:0]	0	Line Interrupt Set * When the number of lines matches the value of the GR_LINE bits, an interrupt signal is output. This function is supported for the graphics 3 and OIR processes only. This function supported for the graphics 3 process is enabled even when the graphics 3 process is not used. This function supported for the graphics OIR process is enabled only when the output image generator is enabled.

Note: * This function is supported for the graphics 3 and OIR processes only; these bits are not supported for the graphics 0, 1, and 2 processes.

35.1.5 Formats of Frame Buffer Read Signals and Corresponding Alpha Blending Types

Setting the GR_FORMAT[3:0] bits selects the format of the signal read from the frame buffer.

Table 35.17 shows the signal formats and the corresponding alpha blending types. The priority of the alpha value is: alpha blending in rectangular area > chroma-key processing > alpha blending in pixel units.

Table 35.17 Formats of Frame Buffer Read Signal and Corresponding Alpha Blending Types

GR_FORMAT[3:0]	Signal Format	Alpha Blending in Rectangular Area	RGB-Index Chroma-Key Processing	CLUT-Index Chroma-Key Processing	Alpha Blending in Pixel Units
0	RGB565	Supported	Supported *1	Not supported	Not supported *2
1	RGB888	Supported	Supported	Not supported	Not supported *2
2	αRGB1555	Supported	Supported *1*3	Not supported	Supported *3
3	αRGB4444	Supported	Supported *1	Not supported	Supported
4	αRGB8888	Supported	Supported	Not supported	Supported
5	CLUT8	Supported	Not supported	Supported	Supported
6	CLUT4	Supported	Not supported	Supported	Supported
7	CLUT1	Supported *4	Not supported	Supported *4	Supported *4
8	YCbCr422	Not supported *5	Not supported *5	Not supported *5	Not supported *5
9	YCbCr444	Not supported *5	Not supported *5	Not supported *5	Not supported *5
10	RGBα5551	Supported	Supported *1*3	Not supported	Supported *3
11	RGBα8888	Supported	Supported	Not supported	Supported

Notes:
1. When each color component of the RGB signal read from the frame buffer is not 8 bits, it is converted to 8 bits by calculation in RGB-index chroma-key processing. (See section 35.1.2 (14) Bit Extension.)
2. Since α value is 255, the current graphics is always displayed.
3. α value for data read from the frame buffer is specified with one bit. This one-bit signal selects one of the two registers, each of which holds an 8-bit α value.
4. CLUT value for the frame buffer signal is specified with one bit. This one-bit signal selects one of the two registers, each of which holds the α, G, B, and R values (8 bits for each value). The CLUT table is not referenced.
5. YCbCr422 and YCbCr444 are supported for the graphics 0 and 1 processes, but any type of blending and chroma-key processing cannot be used.

35.1.6 Display Selection

The GR_DISP_SEL[1:0] bits select the graphics to be displayed from the background color, the lower-layer graphics, the current graphics, and the blended image of the lower-layer graphics and the current graphics. For blending, alpha blending in a rectangular area, multiplication with current alpha at alpha blending in a rectangular area, RGB-index chroma-key processing, CLUT-index chroma-key processing, alpha blending in one-pixel units, or premultiplication at alpha blending in one-pixel units can be selected. Only alpha blending in a rectangular area can be selected in the VIN synthesizer.

Table 35.18 shows the settings for various display types.

Table 35.18 Settings for Various Display Types

GR_DISP_SEL [1:0]	GR_ARC_ON	GR_CK_ON	GR_ARC_MUL	GR_ACALC_MD	Processing for Graphics Area	Processing for the Area outside the Graphics Area
0	—	—	—	—	Background color	Background color
1	—	—	—	—	Lower-layer graphics	Lower-layer graphics
2	—	—	—	—	Current graphics	Background color
3	1	—	0	0	Alpha blending in a rectangular area*1	Lower-layer graphics
3	1	—	0	1	Setting prohibited	
3	1	—	1	0	Multiplication with current alpha at alpha blending in a rectangular area*2	Lower-layer graphics
3	1	—	1	1	Multiplication with current alpha at alpha blending in a rectangular area with alpha premultiplied*2	Lower-layer graphics
3	0	1	—	—	RGB-index or CLUT-index chroma-key processing*3	Lower-layer graphics
3	0	0	—	0	Alpha blending in one-pixel units*2	Lower-layer graphics
3	0	0	—	1	Premultiplication at alpha blending in one-pixel units*2	Lower-layer graphics

Notes: 1. The alpha blending in a rectangular area is not supported for the graphics 0 process in the scaler and the graphics OIR process. When this processing is selected in the VIN synthesizer, cascaded connection cannot be selected in the scaler.
2. The multiplication with current alpha at alpha blending in a rectangular area and alpha blending function in one-pixel units are supported for the graphics 1, 2, and 3 processes only.
3. The RGB-index or CLUT-index chroma-key processing is not supported for the VIN synthesizer.

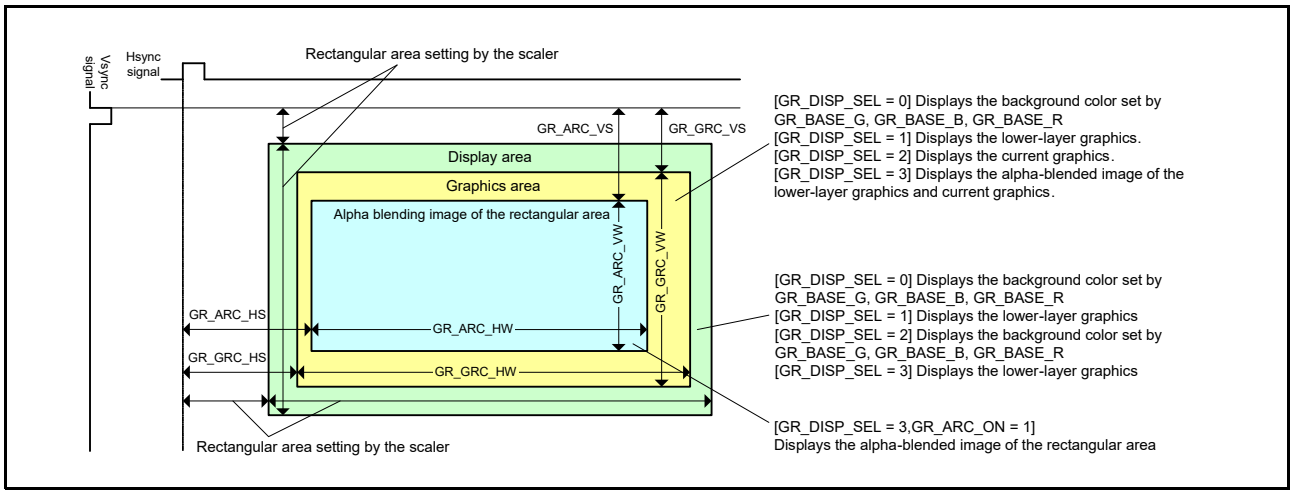

Figure 35.8 Graphic Display Types

Figure 35.9 shows the graphics planes displayed when the GR_DISP_SEL bits are set to 3.

For correspondence between the lower-layer graphics and the current graphics, see Figure 35.1.

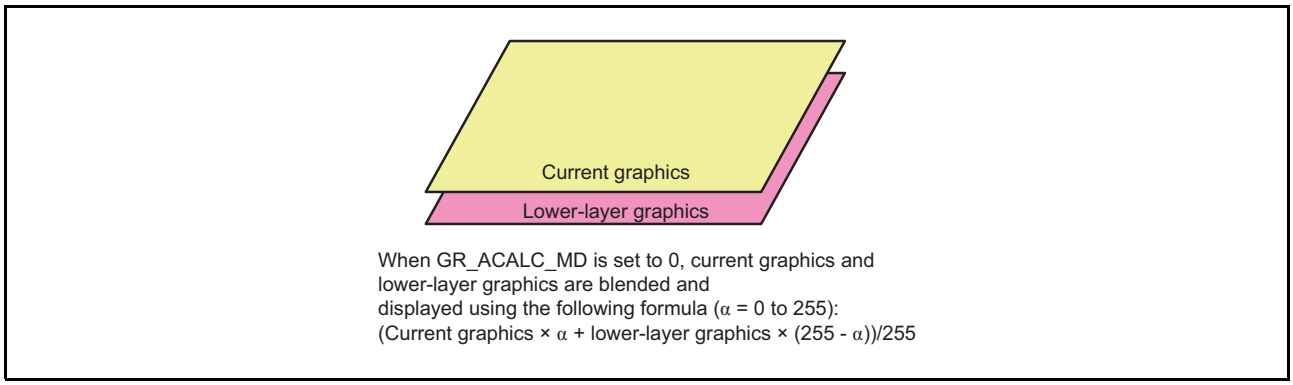

Figure 35.9 Graphics Planes with GR_DISP_SEL Set to 3

Table 35.19 Alpha Blending Setting

Register Name	Bit Name	Initial Value	Description
GR_AB1	GR_DISP_SEL [1:0]	0	Selects the graphics display mode. 0:Background color display 1:Lower-layer graphics display 2:Current graphics display 3:Blended display of lower-layer graphics and current graphics*1
GR_AB1	GR_ARC_ON	0	Turns on/off alpha blending in a rectangular area.*2 0: Off 1: On
GR_AB1	GR_ARC_MUL	0	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area *3 0: Off 1: On
GR_AB1	GR_ACALC_MD	0	Turns on/off premultiplication processing at alpha blending in one-pixel units *3 0: Off 1: On
GR_AB7	GR_CK_ON	0	Turns on/off CLUT-index/RGB-index chroma-key processing. *4 0: Off 1: On

Notes: 1. The graphics 0 and OIR processes support the chroma-key processing only. When performing chroma-key processing, set the α value for converting the pixels to be subjected to chroma-key processing, and the α value of the pixels not to be subjected to the chroma-key processing to 255 to display the current graphics only. The VIN synthesizer supports display processing with alpha blending in a rectangular area only.
2. This function is supported only for the graphics 1, 2, and 3 processes and the VIN synthesizer. This bit is not provided for the graphics 0 and OIR processes.
3. This function is supported only for the graphics 1, 2, and 3 processes. This bit is not provided for the graphics 0 and OIR processes and the VIN synthesizer.
4. This bit is not provided for the VIN synthesizer.

35.1.7 Background Color Display Processing

The color set with the GR_BASE_G[7:0], GR_BASE_B[7:0], and GR_BASE_R[7:0] bits is displayed.

G output = GR_BASE_G

B output = GR_BASE_B

R output = GR_BASE_R

Table 35.20 Background Color Setting

Register Name	Bit Name	Initial Value	Description
GR_BASE	GR_BASE_G[7:0]	0	Background color G signal G: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_B[7:0]	0	Background color B signal B: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_R[7:0]	0	Background color R signal R: 8 bits; unsigned (0 to 255 [LSB])

35.1.8 Lower-Layer Graphics Display Processing

The lower-layer graphics are displayed as follows:

G output = G input of lower-layer graphics

B output = B input of lower-layer graphics

R output = R input of lower-layer graphics

35.1.9 Current Graphics Display Processing

The current graphics are displayed as follows:

G output = G input of current graphics

B output = B input of current graphics

R output = R input of current graphics

35.1.10 Display with Alpha Blending in a Rectangular Area

The rectangular area subjected to alpha blending is set with the GR_ARC_HS[10:0], GR_ARC_HW[10:0], GR_ARC_VS[10:0], and GR_ARC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals. This function is not supported for the graphics 0 and OIR processes.

Figure 35.10 shows the rectangular area setting for alpha blending.

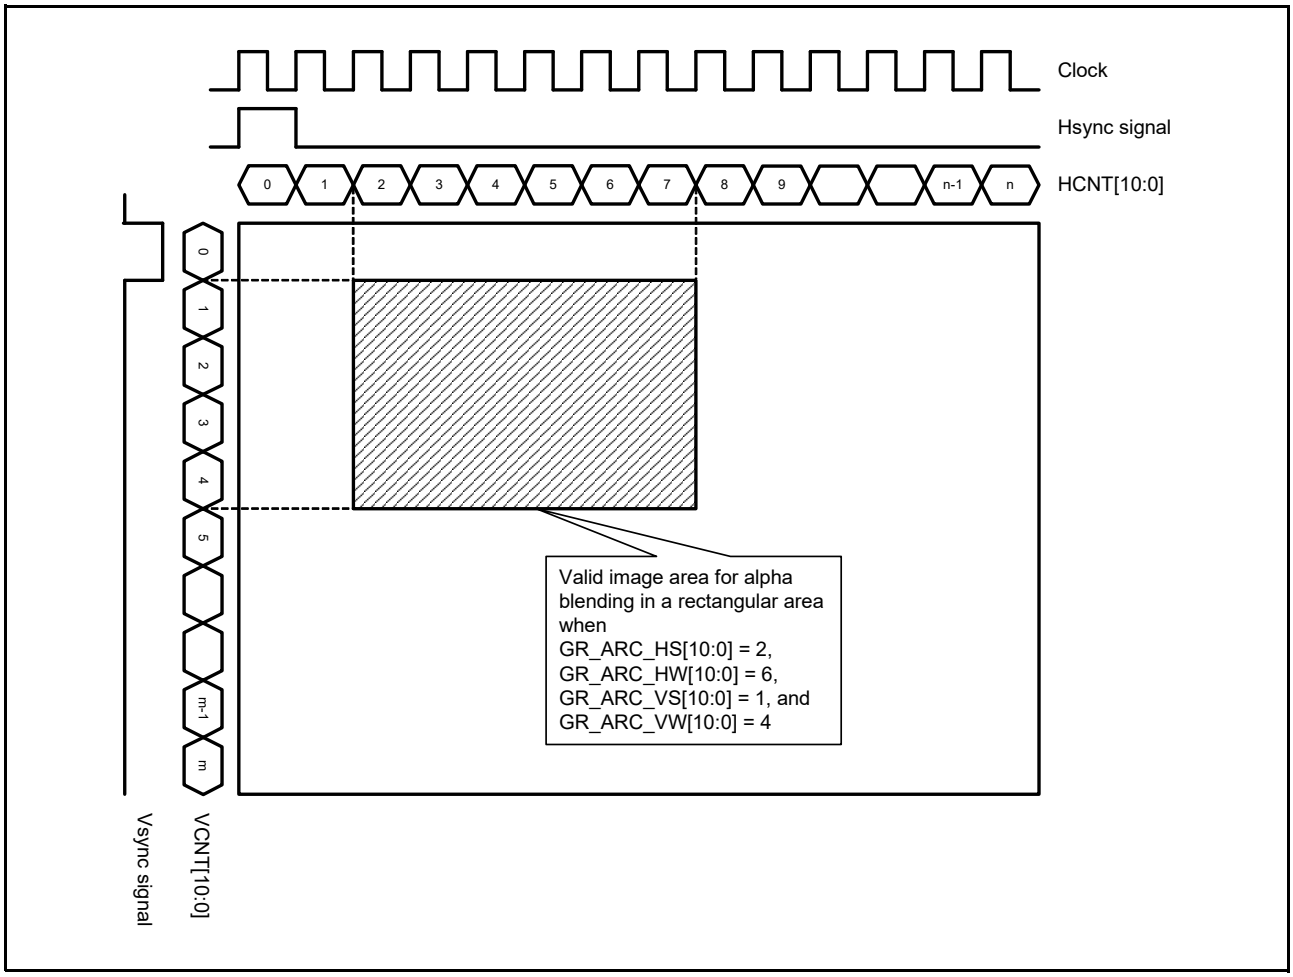

Figure 35.10 Rectangular Area Setting for Alpha Blending

The frame line of graphics area can be displayed by setting the GR_ARC_DISP_ON bit to 1.

Table 35.21 Setting of Rectangular Area for Alpha Blending

Register Name	Bit Name	Initial Value	Description
GR_AB5	GR_ARC_HS[10:0]	0	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
GR_AB5	GR_ARC_HW[10:0]	0	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VS[10:0]	0	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VW[10:0]	0	Sets the vertical width of the valid image area for alpha blending in a rectangular area.
GR_AB1	GR_ARC_DISP_ON	0	Turns on/off frame-line display of the valid image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on

In alpha blending in a rectangular area, the current graphics are faded in or out by setting the fade-in or fade-out coefficients with the GR_ARC_DEF[7:0], GR_ARC_MODE, GR_ARC_COEF[7:0], and GR_ARC_RATE[7:0] bits.

First, the value of the GR_ARC_DEF[7:0] bits is assigned to the α value.

Then, each time the Vsync signal rises for the number of times set with the GR_ARC_RATE[7:0] bits + 1, the value of the GR_ARC_COEF[7:0] bit is added to or subtracted from the α value.

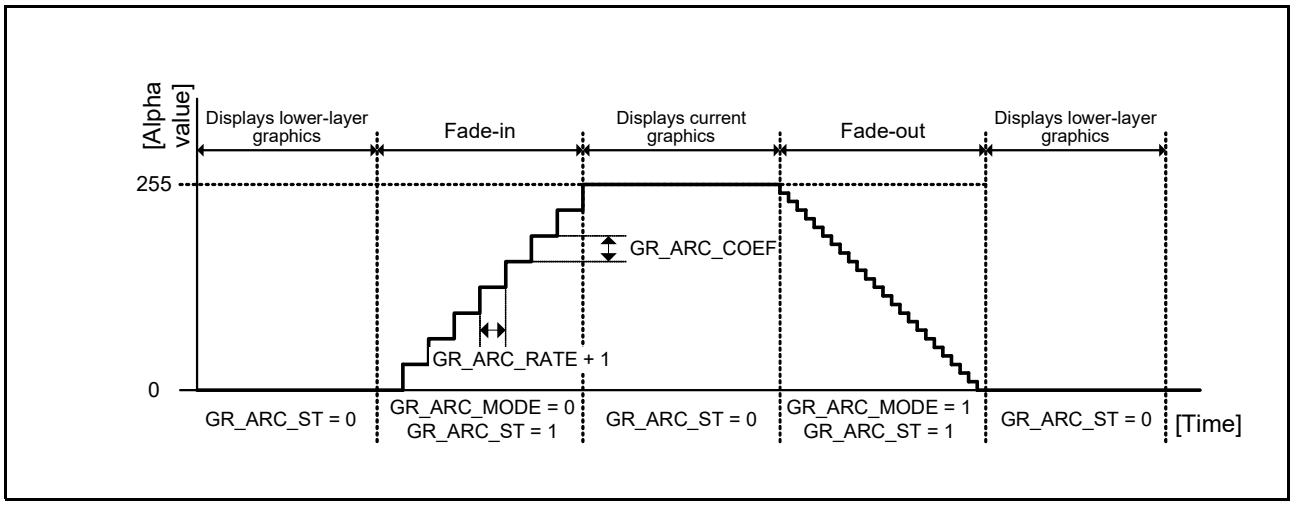

Figure 35.11 Fade In and Fade Out

Table 35.22 Setting for Alpha Blending in a Rectangular Area

Register Name	Bit Name	Initial Value	Description
GR_AB7	GR_ARC_DEF[7:0]	0	Sets the initial alpha value for alpha blending in a rectangular area.
GR_AB6	GR_ARC_MODE	0	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
GR_AB6	GR_ARC_COEF[7:0]	0	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
GR_AB6	GR_ARC_RATE[7:0]	0	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.
GR_MON	GR_ARC_ST	—	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

The values specified with the following expressions are used in the alpha blending calculation described in section 35.1.14, Alpha Blending Calculation.

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

35.1.11 RGB-Index Chroma-Key Processing

The pixels that satisfy all the expressions below are subjected to RGB-index chroma-key processing.

G input of the current graphics = GR_CK_KG

B input of the current graphics = GR_CK_KB

R input of the current graphics = GR_CK_KR

In RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 35.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 35.1.14, Alpha Blending Calculation.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 35.23 Setting for RGB-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_KG[7:0]	0	G Signal for RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KB[7:0]	0	B Signal for RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KR[7:0]	0	R Signal for RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_A[7:0]	0	Replaced Alpha Signal after RGB-Index Chroma-Key Processing* α: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_G[7:0]	0	Replaced G Signal after RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_B[7:0]	0	Replaced B Signal after RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_R[7:0]	0	Replaced R Signal after RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])

Note: * To use this function for the graphics 0 and OIR processes, the alpha value should be set to 255.

35.1.12 CLUT-Index Chroma-Key Processing

The pixels that satisfy the expression below are subjected to CLUT-index chroma-key processing.

CLUT input of the current graphics = GR_CK_KCLUT

In CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 35.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 35.1.14, Alpha Blending Calculation.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 35.24 Setting for CLUT-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_ KCLUT[7:0]	0	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: 8 bits; unsigned (0 to 255 [LSB])
GR_AB10	GR_A0[7:0]	0	CLUT1 α0 Signal* Replaced with α signal when in the CLUT1 format and CLUT1= 0. Replaced with α signal when in the αRGB1555 format and α = 0.
GR_AB10	GR_G0[7:0]	0	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
GR_AB10	GR_B0[7:0]	0	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
GR_AB10	GR_R0[7:0]	0	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.
GR_AB11	GR_A1[7:0]	0	CLUT1 α1 Signal* Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 format and α = 1.
GR_AB11	GR_G1[7:0]	0	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
GR_AB11	GR_B1[7:0]	0	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
GR_AB11	GR_R1[7:0]	0	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: * To use this function for the graphics 0 and OIR processes, the alpha value should be set to 255.

35.1.13 Display with Alpha Blending in One-Pixel Units

In the alpha blending in one-pixel units, the values specified with the following expressions are used in the alpha blending calculation described in section 35.1.14, Alpha Blending Calculation. This function is not supported in the graphics 0 and OIR processes and the VIN synthesizer.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

35.1.14 Alpha Blending Calculation

Alpha blending of two input signals is performed using the α value as described below (rounded up if the result includes a decimal fraction).

[GR_ACALC_MD = 0]

G output = (G value × α value + G input of the lower-layer graphics × (255 − α value)) ÷ 256

B output = (B value × α value + B input of the lower-layer graphics × (255 − α value)) ÷ 256

R output = (R value × α value + R input of the lower-layer graphics × (255 − α value)) ÷ 256

[GR_ACALC_MD = 1 (premultiplication)]

G output = (G value + G input of the lower-layer graphics × (255 − α value)) ÷ 256

B output = (B value + B input of the lower-layer graphics × (255 − α value)) ÷ 256

R output = (R value + R input of the lower-layer graphics × (255 − α value)) ÷ 256

35.1.15 CLUT Table

When the signal format is CLUT8 or CLUT4, the format is converted to αRGB8888 based on the CLUT table. When the format is CLUT1, it is converted to αRGB8888 based on the register value.

Figure 35.12 shows data arrangement in the CLUT table.

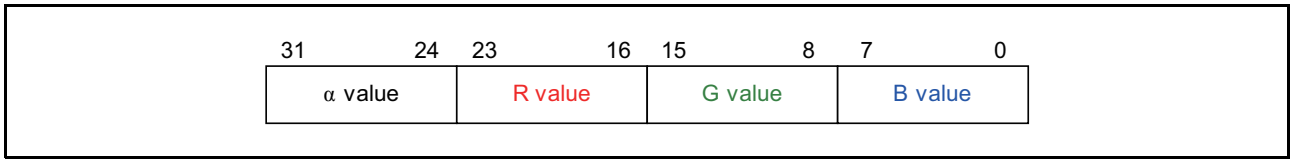

Figure 35.12 Data Arrangement in CLUT Table

The CLUT tables are arranged in the following addresses (channel 0). For the arrangement in channel 1, see the register configuration described in section 35.2, Register Descriptions.

Graphics 0 CLUT table: H'FCFF6000 to H'FCFF63FF
(For CLUT4, addresses H'FCFF6000 to H'FCFF603F are valid.)

Graphics 1 CLUT table: H'FCFF6400 to H'FCFF67FF
(For CLUT4, addresses H'FCFF6400 to H'FCFF643F are valid.)

Graphics 2 CLUT table: H'FCFF6800 to H'FCFF6BFF
(For CLUT4, addresses H'FCFF6800 to H'FCFF683F are valid.)

Graphics 3 CLUT table: H'FCFF6C00 to H'FCFF6FFF
(For CLUT4, addresses H'FCFF6C00 to H'FCFF6C3F are valid.)

Graphics OIR CLUT table: H'FCFF7000 to H'FCFF73FF
(For CLUT4, addresses H'FCFF7000 to H'FCFF703F are valid.)

Two CLUT tables (CLUT table 0, CLUT table 1) on the different planes are allocated to the same address and one of the

tables is selected with the GR_CLT_SEL bit. This allows rewriting one CLUT table when this module refers to the other CLUT table.
When switching the CLUT after overwriting the CLUT, please execute a dummy read of the CLUT table address. And switch the CLUT table by GR_CLT_SEL after dummy-read.

Table 35.25 CLUT Table Selection

Register Name	Bit Name	Initial Value	Description
GR_CLUT	GR_CLT_SEL	0	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.

35.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area

In multiplication processing with current alpha at alpha blending in a rectangular area, the values specified with the following expressions are used in the alpha blending calculation described in section 35.1.14, Alpha Blending Calculation.

[GR_ARC_MUL = 0]

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

[GR_ARC_MUL = 1 (multiplication)]

α value = Fade-in/out coefficient x α input of current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

35.1.17 Selection of Lower-Layer/Current Graphics in VIN Synthesizer

Graphics 0 and 1 are allocated to the lower-layer/current graphics in the VIN synthesizer, respectively.

Table 35.26 Selection of Lower-Layer Plane in Scaler

Register Name	Bit Name	Initial Value	Description
GR_VIN_AB1	GR_VIN_SCL_UND_SEL	0	Specifies lower-layer plane in the scaler. 0: Selects graphics 0 as lower-layer graphics and graphics 1 as current graphics. 1: Selects graphics 1 as lower-layer graphics and graphics 0 as current graphics.

35.2 Register Descriptions

Table 35.27 to Table 35.34 show the register configuration.

- Symbols used in Register Description:

Initial value:	Register value after a reset
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
R/WC0:	Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1:	Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R:	Read-only. The write value should always be 0.
—/W:	Write-only. The read value is undefined.

Table 35.27 shows the register configuration for the graphics 2 process of channel 0.

Table 35.28 shows the register configuration for the graphics 3 process of channel 0.

Table 35.29 shows the CLUT table configuration of channel 0.

Table 35.30 shows the register configuration for the VIN synthesizer of channel 0.

Table 35.31 shows the register configuration for the graphics 2 process of channel 1.

Table 35.32 shows the register configuration for the graphics 3 process of channel 1.

Table 35.33 shows the CLUT table configuration of channel 1.

Table 35.34 shows the register configuration for the VIN synthesizer of channel 1.

The register configuration for the graphics 0 and 1 processes is described in section 33, Video Display Controller 5 (3): Scaler.

Table 35.27 Register Configuration of the Image Synthesizer (Graphics 2 Process) (Channel 0)

Name	Abbreviation	R/W	Initial Value	Address	Access Size

Status monitor register (VIN synthesizer)	GR_VIN_MON	R	H'0000 0000	H'FCFF 9E54	32

35.2.1 Graphics 2 Register Update Control Register (GR2_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR2_UPDATE	—	—	—	GR2_P_VEN	—	—	—	GR2_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

35.2.2 Frame Buffer Read Control Register (Graphics 2) (GR2_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

35.2.3 Frame Buffer Control Register 1 (Graphics 2) (GR2_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_SEL[1:0]		—	—	—	—	—	—	—	GR2_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR2_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR2_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR2_LN_OFF_DIR and GR2_FLM_SEL are updated when GR2_IBUS_VEN in GR2_UPDATE is 1.
GR2_BST_MD is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

35.2.4 Frame Buffer Control Register 2 (Graphics 2) (GR2_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR2_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

Note: This register is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

35.2.5 Frame Buffer Control Register 3 (Graphics 2) (GR2_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR2_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR2_LN_ OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR2_BASE Line 1: GR2_BASE + GR2_LN_OFF × 1 : Line n: GR2_BASE + GR2_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR2_FLM_ NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR2_FLM_SEL = 1.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

35.2.6 Frame Buffer Control Register 4 (Graphics 2) (GR2_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR2_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR2_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR2_BASE Buffer 1: GR2_BASE + GR2_FLM_OFF × 1 : Buffer n: GR2_BASE + GR2_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

35.2.7 Frame Buffer Control Register 5 (Graphics 2) (GR2_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR2_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR2_FLM_LOOP + 1).

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

35.2.8 Frame Buffer Control Register 6 (Graphics 2) (GR2_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_FORMAT[3:0]				—	GR2_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR2_RDSWA[2:0]			—	—	—	—	GR2_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR2_ FORMAT [3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR2_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR2_HW + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 10	GR2_ RDSWA [2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	GR2_ STA_POS [5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR2_STA_POS is skipped from the start of the line.

Note: GR2_STA_POS is updated when GR2_P_VEN in GR2_UPDATE is 1. GR2_RDSWA is updated when GR2_UPDATE in GR2_UPDATE is 1.
GR2_FORMAT and GR2_HW are updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

35.2.9 Alpha Blending Control Register 1 (Graphics 2) (GR2_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_ARC _MUL	GR2_ACA LC_MD	—	GR2_ ARC_ON	—	—	—	GR2_ ARC_ DISP_ON	—	—	—	GR2_ GRC_ DISP_ON	—	—	GR2_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR2_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR2_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR2_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_ARC_ DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_GRC_ DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	GR2_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.10 Alpha Blending Control Register 2 (Graphics 2) (GR2_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR2_GRC_VS + GR2_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.11 Alpha Blending Control Register 3 (Graphics 2) (GR2_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR2_GRC_HS + GR2_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR2_HW to 2 and GR2_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.12 Alpha Blending Control Register 4 (Graphics 2) (GR2_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_VS[10:0]

	—	—	—	—	—	GR2_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.13 Alpha Blending Control Register 5 (Graphics 2) (GR2_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.14 Alpha Blending Control Register 6 (Graphics 2) (GR2_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR2_ARC_MODE	GR2_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR2_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR2_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR2_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR2_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This bit is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.15 Alpha Blending Control Register 7 (Graphics 2) (GR2_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.16 Alpha Blending Control Register 8 (Graphics 2) (GR2_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_KCLUT[7:0]								GR2_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_KB[7:0]								GR2_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.17 Alpha Blending Control Register 9 (Graphics 2) (GR2_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_A[7:0]								GR2_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_B[7:0]								GR2_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_G [7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_B [7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_R [7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.18 Alpha Blending Control Register 10 (Graphics 2) (GR2_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A0[7:0]								GR2_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B0[7:0]								GR2_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A0 [7:0]	0	R/W	CLUT1 α0 Signal Replaced with α signal when in the CLUT1 format and CLUT1= 0. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 0.
23 to 16	GR2_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR2_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR2_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.19 Alpha Blending Control Register 11 (Graphics 2) (GR2_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A1[7:0]								GR2_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B1[7:0]								GR2_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 1.
23 to 16	GR2_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR2_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR2_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.20 Background Color Control Register (Graphics 2) (GR2_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE_B[7:0]								GR2_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.21 CLUT Table Control Register (Graphics 2) (GR2_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

35.2.22 Status Monitor Register (Graphics 2) (GR2_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

35.2.23 Graphics 3 Register Update Control Register (GR3_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR3_UPDATE	—	—	—	GR3_P_VEN	—	—	—	GR3_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

35.2.24 Frame Buffer Read Control Register (Graphics 3) (GR3_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

35.2.25 Frame Buffer Control Register 1 (Graphics 3) (GR3_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_SEL[1:0]		—	—	—	—	—	—	—	GR3_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR3_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR3_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR3_LN_OFF_DIR and GR3_FLM_SEL are updated when GR3_IBUS_VEN in GR3_UPDATE is 1.
GR3_BST_MD is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

35.2.26 Frame Buffer Control Register 2 (Graphics 3) (GR3_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR3_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

Note: This register is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

35.2.27 Frame Buffer Control Register 3 (Graphics 3) (GR3_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR3_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR3_LN_ OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR3_BASE Line 1: GR3_BASE + GR3_LN_OFF × 1 : Line n: GR3_BASE + GR3_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR3_FLM_ NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR3_FLM_SEL = 1.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

35.2.28 Frame Buffer Control Register 4 (Graphics 3) (GR3_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR3_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR3_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR3_BASE Buffer 1: GR3_BASE + GR3_FLM_OFF × 1 : Buffer n: GR3_BASE + GR3_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

35.2.29 Frame Buffer Control Register 5 (Graphics 3) (GR3_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR3_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR3_FLM_LOOP + 1).

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

35.2.30 Frame Buffer Control Register 6 (Graphics 3) (GR3_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_FORMAT[3:0]				—	GR3_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR3_RDSWA[2:0]			—	—	—	—	GR3_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR3_FORMAT [3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR3_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR3_HW + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 10	GR3_RDSWA [2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	GR3_STA_POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR3_STA_POS is skipped from the start of the line.

Note: GR3_STA_POS is updated when GR3_P_VEN in GR3_UPDATE is 1. GR3_RDSWA is updated when GR3_UPDATE in GR3_UPDATE is 1.
GR3_FORMAT and GR3_HW are updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

35.2.31 Alpha Blending Control Register 1 (Graphics 3) (GR3_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_ARC_MUL	GR3_ACALC_MD	—	GR3_ARC_ON	—	—	—	GR3_ARC_DISP_ON	—	—	—	GR3_GRC_DISP_ON	—	—	GR3_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR3_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR3_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR3_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR3_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.32 Alpha Blending Control Register 2 (Graphics 3) (GR3_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR3_GRC_VS + GR3_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.33 Alpha Blending Control Register 3 (Graphics 3) (GR3_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR3_GRC_HS + GR3_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR3_HW to 2 and GR3_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: All the bits assigned to this address are updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.34 Alpha Blending Control Register 4 (Graphics 3) (GR3_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.35 Alpha Blending Control Register 5 (Graphics 3) (GR3_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.36 Alpha Blending Control Register 6 (Graphics 3) (GR3_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR3_ARC_MODE	GR3_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR3_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR3_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR3_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR3_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.37 Alpha Blending Control Register 7 (Graphics 3) (GR3_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.38 Alpha Blending Control Register 8 (Graphics 3) (GR3_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_KCLUT[7:0]								GR3_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_KB[7:0]								GR3_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.39 Alpha Blending Control Register 9 (Graphics 3) (GR3_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_A[7:0]								GR3_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_B[7:0]								GR3_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_A[7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_G[7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_B[7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_R[7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.40 Alpha Blending Control Register 10 (Graphics 3) (GR3_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_A0[7:0]								GR3_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_B0[7:0]								GR3_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A0 [7:0]	0	R/W	CLUT1 α0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 0.
23 to 16	GR3_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR3_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR3_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.41 Alpha Blending Control Register 11 (Graphics 3) (GR3_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_A1[7:0]								GR3_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_B1[7:0]								GR3_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 1.
23 to 16	GR3_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR3_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR3_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.42 Background Color Control Register (Graphics 3) (GR3_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_BASE_B[7:0]								GR3_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.43 CLUT Table and Interrupt Control Register (Graphics 3) (GR3_CLUT_INT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_CLT_ SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	GR3_LINE [10:0]	0	R/W	Line Interrupt Set When number of lines matches the value of the GR3_LINE bits, an interrupt signal is output. This function is enabled even when the graphics 3 process is not used.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

35.2.44 Status Monitor Register (Graphics 3) (GR3_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_ ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_LIN_ STAT[10:0]	0	R	Line Position of Image being Currently Read
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_ARC_ ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

35.2.45 VIN Synthesizer Register Update Control Register (GR_VIN_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR_VIN_UPDATE	—	—	—	GR_VIN_P_VEN	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR_VIN_UPDATE	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR_VIN_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

35.2.46 Alpha Blending Control Register 1 (VIN Synthesizer) (GR_VIN_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR_VIN_ARC_ON	—	—	—	GR_VIN_ARC_DISP_ON	—	—	—	GR_VIN_GRC_DISP_ON	—	GR_VIN_SCL_UND_SEL	GR_VIN_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	GR_VIN_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR_VIN_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR_VIN_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	GR_VIN_SCL_UND_SEL	0	R/W	Selection of Lower-Layer Plane in Scaler 0: Selects graphics 0 as lower-layer graphics and graphics 1 as current graphics 1: Selects graphics 1 as lower-layer graphics and graphics 0 as current graphics
1, 0	GR_VIN_DISP_SEL [1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics, or setting prohibited*

Notes: GR_VIN_SCL_UND_SEL is updated when GR_VIN_UPDATE in GR_VIN_UPDATE is 1. The other bits of this register are updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

* This setting is prohibited when the graphics block 0 in scaler 0 and graphics block 1 in scaler 1 are cascaded (GR1_AB1.GR1_CUS_CON_ON = 1).

35.2.47 Alpha Blending Control Register 2 (VIN Synthesizer) (GR_VIN_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_VIN_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_VIN_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_VIN_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR_VIN_GRC_VS + GR_VIN_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_VIN_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

35.2.48 Alpha Blending Control Register 3 (VIN Synthesizer) (GR_VIN_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_VIN_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_VIN_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_VIN_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR_VIN_GRC_HS + GR_VIN_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_VIN_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR_VIN_HW to 2 and GR_VIN_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

35.2.49 Alpha Blending Control Register 4 (VIN Synthesizer) (GR_VIN_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_VIN_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_VIN_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_VIN_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_VIN_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

35.2.50 Alpha Blending Control Register 5 (VIN Synthesizer) (GR_VIN_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_VIN_ARC_HS[10:0]

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR_VIN_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR_VIN_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR_VIN_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

35.2.54 Status Monitor Register (VIN Synthesizer) (GR_VIN_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR_VIN_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR_VIN_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

35.3 Usage Method

35.3.1 Mute Image

The initial values of the GR0_DISP_SEL[1:0], GR1_DISP_SEL[1:0], GR2_DISP_SEL[1:0], GR3_DISP_SEL[1:0], GR_VIN_DISP_SEL[1:0], and GR_OIR_DISP_SEL[1:0] bits are all 0. Accordingly, in the initial setting, a background color is displayed both inside and outside the graphics area for the graphics 0, 1, 2, 3, and OIR processes and the VIN synthesizer. Since the default background color is black, the black mute image is displayed in the initial state.

35.3.2 Alpha Blending in Rectangular Area

The alpha coefficient and the frame rate can be changed during fade in and fade out by modifying the GR_ARC_MODE, GR_ARC_COEF[7:0] and GR_ARC_RATE[7:0] bits, respectively.

36. Video Display Controller 5 (6): Output Image Generator

36.1 Output Image Generation Functions

36.1.1 Overview of Functions

The output image generator can be used to store the RGB output from the image synthesizer in the frame buffer. In addition to storing the RGB data, it can also read the graphics data and display them. In cooperation with the image renderer for display (channel 0 only), it can also distort the output image according to a display panel.

When the display functions described above (reading and displaying of graphics data and displaying of an image after distortion) are not in use, the signals from the image synthesizer can be output directly to the output control block, bypassing the output image generator.

The output image generator has the same circuit configuration as the scaler. However, note the following differences from the scaler.

(1) The scaling-up/-down function is not available.
(2) The rotation control function is not available.
(3) The pointer buffer function is not available.
(4) The field control function is not available because the inputs are always progressive signals.
(5) The I/O signals are always RGB signals.

The functional block diagram of the output image generator is shown below.

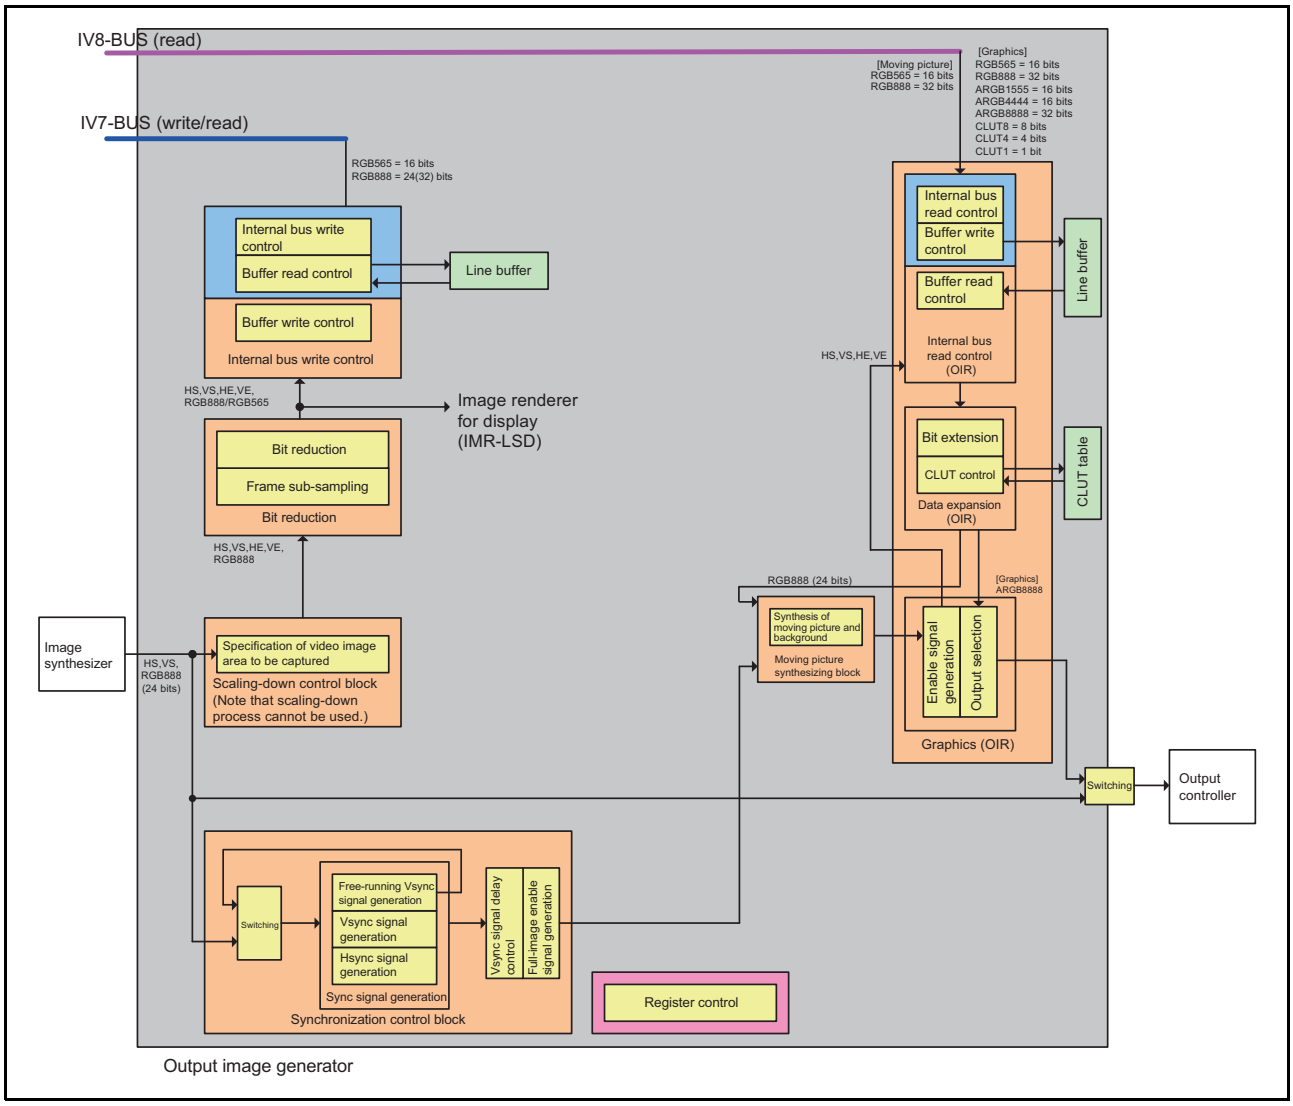

Figure 36.1 Functional Block Diagram of Output Image Generator

36.1.2 Register Control

(1) Updating Registers

The Vsync signal is used to control the update timing of all the registers of the output image generator and graphics block (OIR) except some registers of the sync control block.

After 1 is set to the bits in the update control register, the contents of the relevant registers are modified at the rising edge of the Vsync signal. The update control register is automatically cleared to 0 after the modification.

Table 36.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_ UPDATE	OIR_SCL0_ UPDATE	0	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
OIR_SCL0_ UPDATE	OIR_SCL0_ VEN_D	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
OIR_SCL0_ UPDATE	OIR_SCL0_ VEN_C	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
OIR_SCL0_ UPDATE	OIR_SCL0_ VEN_B	0	Synchronization Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
OIR_SCL0_ UPDATE	OIR_SCL0_ VEN_A	0	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
OIR_SCL1_ UPDATE	OIR_SCL1_ UPDATE_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
OIR_SCL1_ UPDATE	OIR_SCL1_ VEN_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
OIR_SCL1_ UPDATE	OIR_SCL1_ VEN_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_OIR_VEN	GR_OIR_P_ VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_OIR_VEN	GR_OIR_IBUS_ VEN	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

The registers controlled by OIR_SCL0_VEN_A, OIR_SCL_0_VEN_C, OIR_SCL1_VEN_A, and OIR_SCL1_VEN_B are modified at the rising edge of the input Vsync signal.

The registers controlled by OIR_SCL0_VEN_B, OIR_SCL0_VEN_D, GR_OIR_P_VEN, and GR_OIR_IBUS_VEN are modified at the rising edge of the output Vsync signal.

36.1.3 Enabling or Disabling Output Image Generator

The output signal from the image synthesizer can be selected.

Table 36.2 Output Image Generator Enable Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC3	OIR_RES_EN	0	Enabling or Disabling the Output Image Generator 0: The input data from the image synthesizer is directly output. 1: Signals from the graphics block (OIR) are output.

36.1.4 Synchronization Control

(1) Selecting Vsync Signal

The Vsync signal to be output from the output image generator can be selected.

Table 36.3 Vsync Signal Selection Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC3	OIR_RES_VS_SEL	1	Vsync Signal Output Select 0: Vsync signal input from the image synthesizer 1: Internally generated free-running Vsync signal

(2) Masking Repeated Vsync Signals

Take measures against the repeated Vsync signals by using the Vsync control block in the scaler. Accordingly, repeated Vsync signal masking control must be disabled in the output image generator when it is in use.

Table 36.4 Repeated Vsync Signal Mask Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC1	OIR_RES_VMASK_ON	1	Repeated Vsync Signal Masking Control This bit should always be set to 0 when the output image generator is in use. 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.

(3) Compensating for Missing Vsync Signals

Take measures against the missed Vsync signals by using the Vsync control block in the scaler. Accordingly, compensation of missing Vsync signals must be disabled in the output image generator when it is in use.

Table 36.5 Missing Vsync Compensation Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC2	OIR_RES_VLACK_ON	1	Missing Vsync Signal Compensation This bit should always be set to 0 when the output image generator is in use. 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

(4) Free-Running Period

Free-running Vsync and Hsync periods can be set.

Hsync period [usec] = (RES_FH + 1) ÷ pixel clock frequency [MHz]

Vsync period [usec] = horizontal period [usec] × (RES_FV + 1)

Table 36.6 Free-Running Period Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC4	OIR_RES_FV [10:0]	524	Free-Running Vsync Period Setting Free-running Vsync period = (OIR_RES_FV + 1) × horizontal period [usec]
OIR_SCL0_FRC4	OIR_RES_FH [10:0]	799	Hsync Period Setting Hsync period [usec] = (OIR_RES_FH +1) ÷ pixel clock frequency [MHz]

When selecting a Vsync signal input from the image synthesizer, set the OIR_RES_VS_SEL bit to 0. At this time, the internally generated free-running Vsync signal is not output.

In the meantime, the Hsync signal is always generated according to the free-running signal setting and output from the output image generator.

(5) Vsync Signal Delay Control

Delay of Vsync signal output from the output image generator can be controlled.

The delay is used to adjust the frame buffer read timing.

Table 36.7 Vsync Output Delay Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_ FRC5	OIR_RES_VSDLY [7:0]	1	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: OIR_RES_VSDLY × output Hsync period [usec]

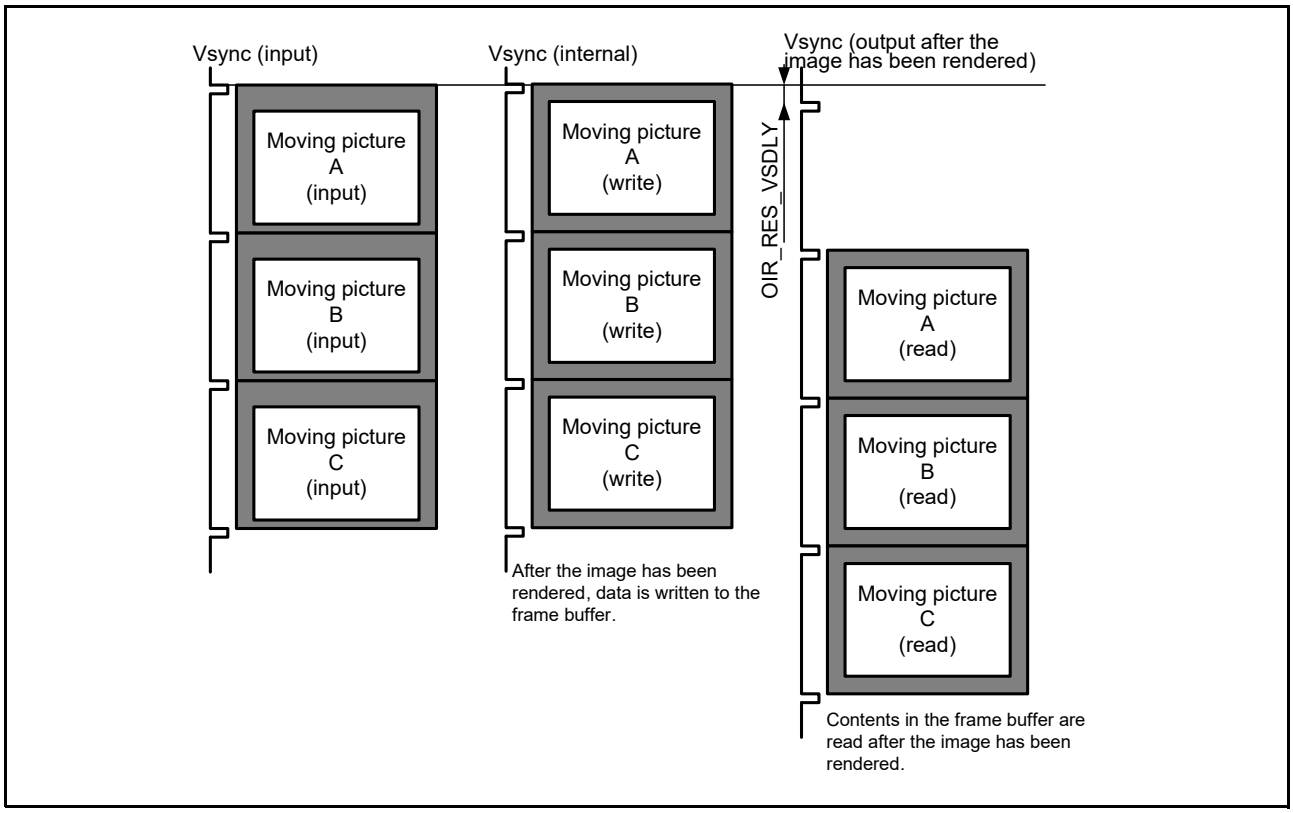

Figure 36.2 Vsync Signal Phases (Two Frame-Buffer Planes Used)

36.1.5 Setting Angle of View

(1) Setting Image Area to be Captured

The area to be captured for the input image can be set.

The area is defined by specifying its start position and width based on the input Hsync and Vsync signals.

Table 36.8 Control of Image Area to be Captured

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_DS2	OIR_RES_VS [10:0]	18	Vertical Position Setting for Video Signal Capturing (VSYNC + V backporch lines) Note: The set value should be four or more (lines). OIR_RES_VS + OIR_RES_VW should be equal to or less than 2039 (lines).
OIR_SCL0_DS2	OIR_RES_VW [10:0]	240	Vertical Width of Video Signal to be Captured (lines) Note: OIR_RES_VS + OIR_RES_VW should be equal to or less than 2039 (lines).
OIR_SCL0_DS3	OIR_RES_HS [10:0]	244	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_HS + OIR_RES_HW should be equal to or less than 2015 (clock cycles).
OIR_SCL0_DS3	OIR_RES_HW [10:0]	1440	Horizontal Width of Video Signal to be Captured (video-image clock cycles) Note: OIR_RES_HS + OIR_RES_HW should be equal to or less than 2015 (clock cycles).

(2) Generating a Full-Screen Enable Signal

The valid period of the full screen to be output from the output image generator can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the output image generator.
The vertical front porch should be set to four or more lines, and the horizontal front porch should be 16 or more clock cycles.

Table 36.9 Full-Screen Enable Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_FRC6	OIR_RES_F_VS [10:0]	35	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). OIR_RES_F_VS + OIR_RES_F_VW should be equal to or less than 2039 (lines).
OIR_SCL0_FRC6	OIR_RES_F_VW [10:0]	480	Vertical Enable Signal Width for Full Screen (lines) Note: OIR_RES_F_VS + OIR_RES_F_VW should be equal to or less than 2039 (lines).
OIR_SCL0_FRC7	OIR_RES_F_HS [10:0]	144	Horizontal Enable Signal Start Position for Full Screen. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_F_HS + OIR_RES_F_HW should be equal to or less than 2015 (clock cycles).
OIR_SCL0_FRC7	OIR_RES_F_HW [10:0]	640	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1: Note: OIR_RES_F_HS + OIR_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2: The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

(3) Generating an Image Output Enable Signal

The valid period of the image to be output can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the output image generator.

Table 36.10 Image Output Enable Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_US2	OIR_RES_P_VS [10:0]	35	Vertical Enable Signal Start Position for Output Image. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). OIR_RES_P_VS + OIR_RES_P_VW should be equal to or less than 2039 (lines).
OIR_SCL0_US2	OIR_RES_P_VW [10:0]	480	Vertical Enable Signal Width for Output Image (lines) Note: OIR_RES_P_VS + OIR_RES_P_VW should be equal to or less than 2039 (lines).
OIR_SCL0_US3	OIR_RES_P_HS [10:0]	144	Horizontal Enable Signal Start Position for Output Image. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_P_HS + OIR_RES_P_HW should be equal to or less than 2015 (clock cycles).
OIR_SCL0_US3	OIR_RES_P_HW [10:0]	640	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: OIR_RES_P_HS + OIR_RES_P_HW should be equal to or less than 2015 (clock cycles).

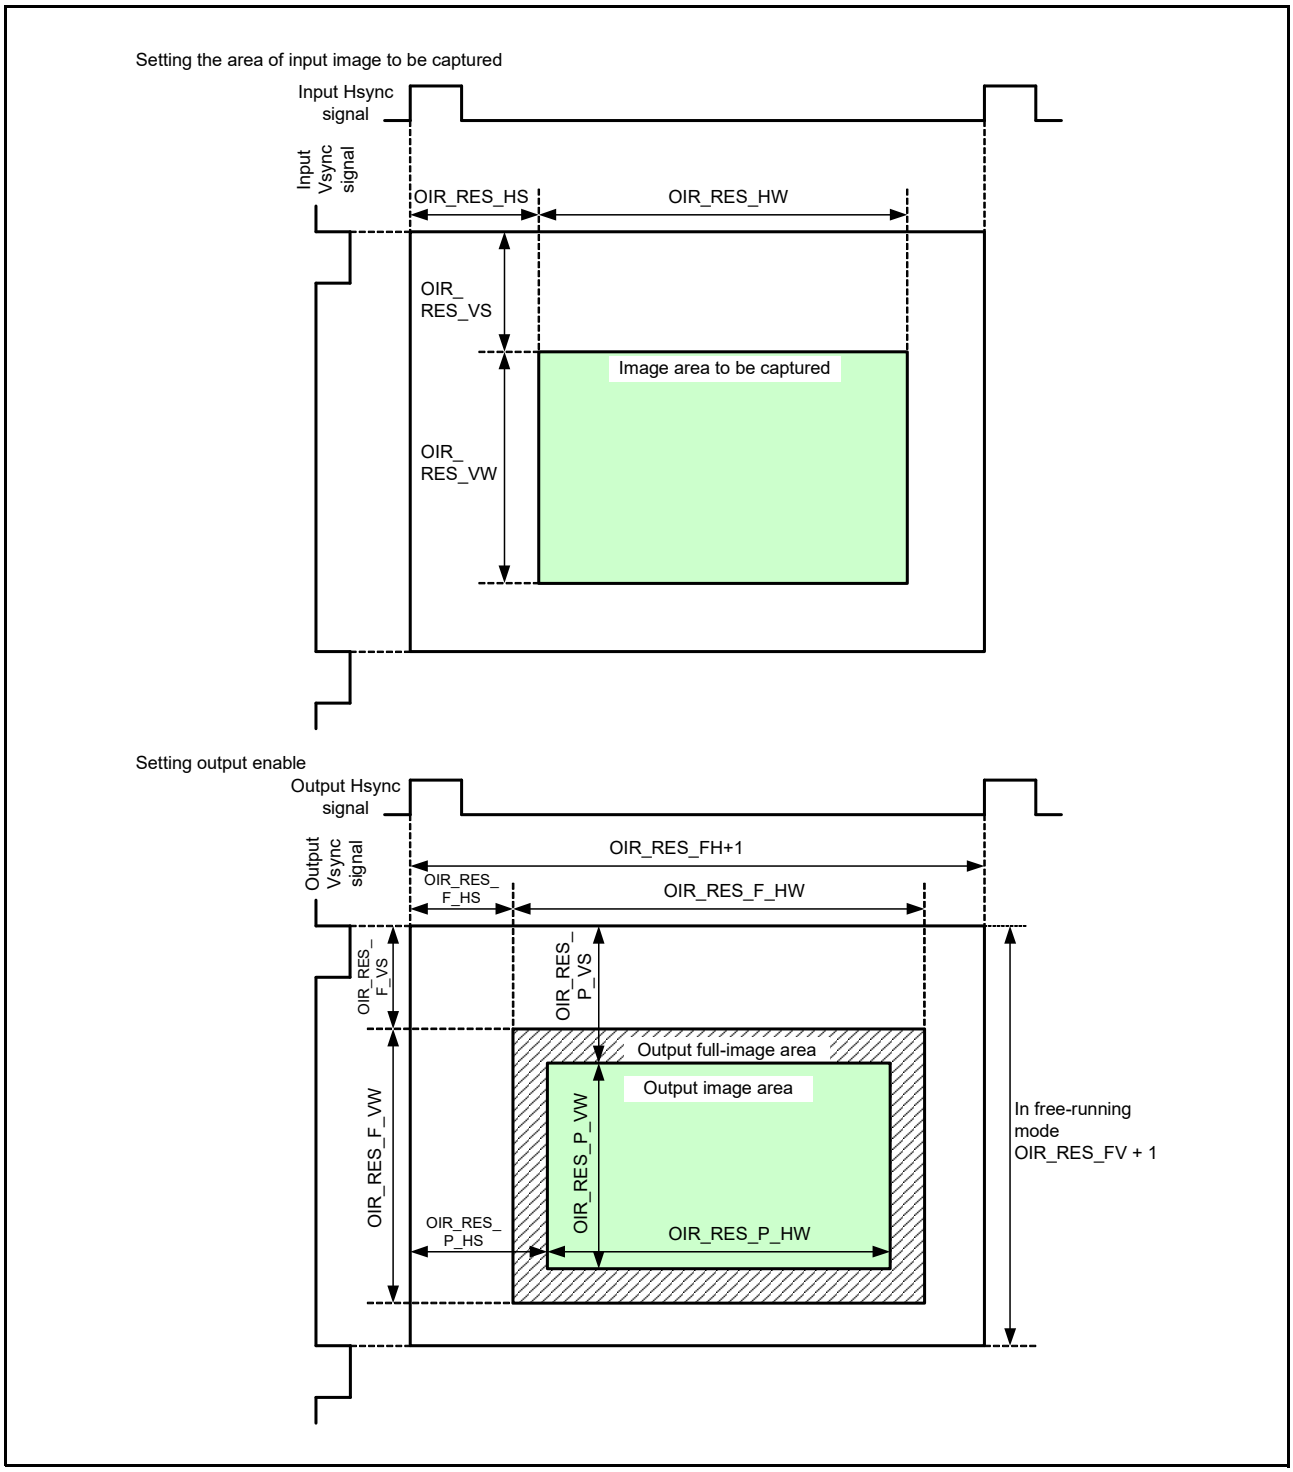

Figure 36.3 Enable Settings

36.1.6 Scaling Settings

Scaling up and down is not available in the output image generator. Accordingly, scaling up and down control must be off when the output image generator is in use.

Table 36.11 Scaling-Up/-Down Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_DS1	OIR_RES_DS_H_ON	1	Horizontal Scale Down On/Off This bit should always be set to 0 when the output image generator is in use. 0: Off 1: On
OIR_SCL0_DS1	OIR_RES_DS_V_ON	1	Vertical Scale Down On/Off This bit should always be set to 0 when the output image generator is in use. 0: Off 1: On
OIR_SCL0_US1	OIR_RES_US_H_ON	1	Horizontal Scale Up On/Off This bit should always be set to 0 when the output image generator is in use. 0: Off 1: On
OIR_SCL0_US1	OIR_RES_US_V_ON	1	Vertical Scale Up On/Off This bit should always be set to 0 when the output image generator is in use. 0: Off 1: On

36.1.7 Screen Synthesis

During the valid full-screen period, the image area can be overlayed before being output. If the image area to be output is smaller than a full-screen, the background color specified by the OIR_RES_BK_COL_R, OIR_RES_BK_COL_G, and OIR_RES_BK_COL_B bits are displayed to fill the background.

Table 36.12 Screen Synthesis Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL0_ OVR1	OIR_RES_BK_COL_R [7:0]	128	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
OIR_SCL0_ OVR1	OIR_RES_BK_COL_B [7:0]	128	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
OIR_SCL0_ OVR1	OIR_RES_BK_COL_G [7:0]	0	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])

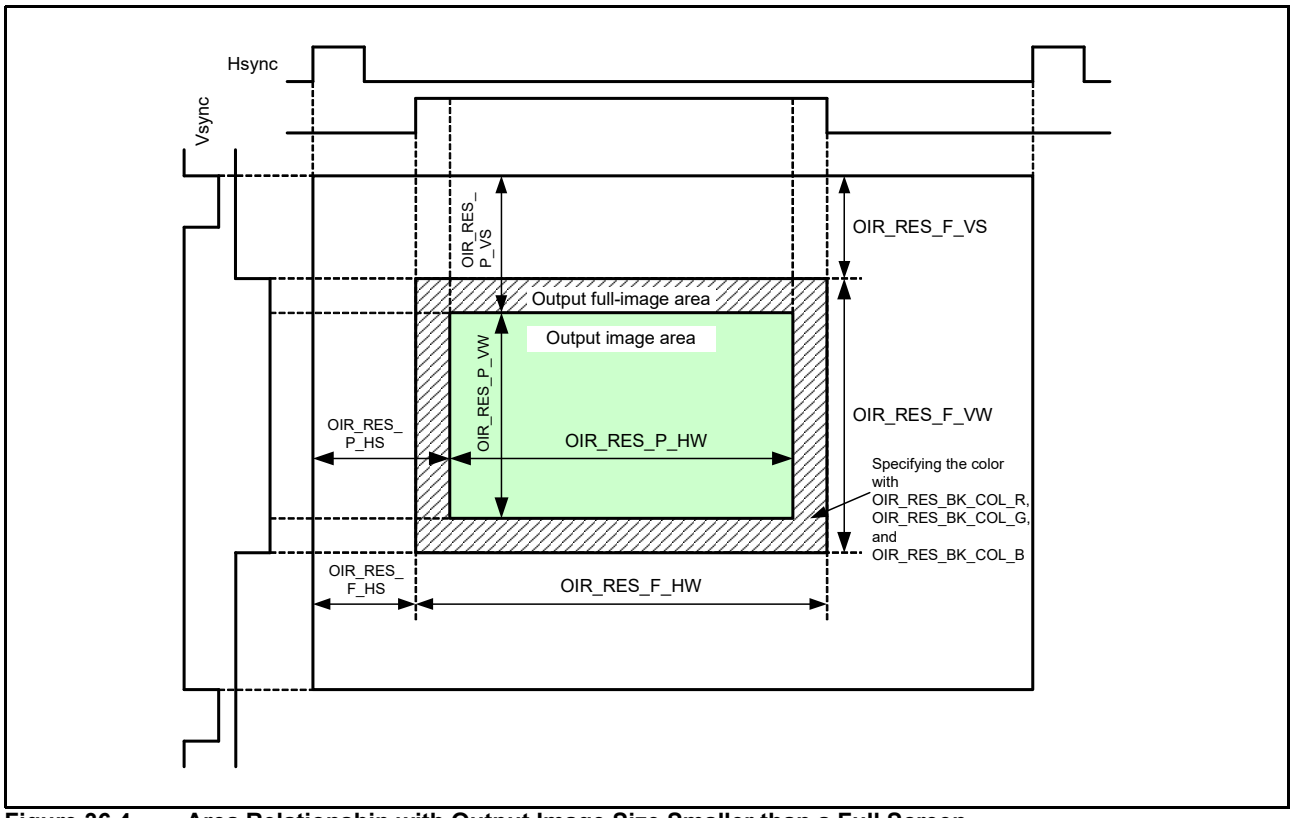

Figure 36.4 Area Relationship with Output Image Size Smaller than a Full Screen

36.1.8 Selecting Format for Writing Video Image Signals to Frame Buffer

A format can be selected for writing video image signals to the frame buffer.

Although 24-bit RGB signals are input to the output image generator, they are converted into 16-bit RGB565 signals or 32-bit RGB888 signals before being written to the frame buffer.

As bit reduction processing of RGB565, rounding off or 2 × 2 pattern dither can be selected with the OIR_RES_DTH_ON bit. For details on pattern dither, see Figure 37.1.7, Dither Process in section 37, Video Display Controller 5 (7): Output Controller.

RGB888 signals are output to the image renderer for display (this function is only available in channel 0).

For distortion correction for display, refer to section 42, Image Renderer for Display (IMR-LSD).

Table 36.13 Frame Buffer Writing Mode Setting

OIR_RES_BITDEC_ON	OIR_RES_MD[1:0]	Writing Mode
0	2	RGB888 (normal, distortion correction)
1	1	RGB565 (normal)

Table 36.14 Video Signal Writing Format Selection Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL1_WR1	OIR_RES_MD[1:0]	0	Frame Buffer Video-Signal Writing Format 0: Setting prohibited 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: Setting prohibited
OIR_SCL1_WR6	OIR_RES_BITDEC_ON	0	Bit Reduction On/Off 0: Off 1: On
OIR_SCL1_WR6	OIR_RES_DTH_ON	0	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 pattern dither)

36.1.9 Writing to Frame Buffer

(1) Frame Buffer Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video image data and graphics data are stored.

Table 36.15 Frame Buffer Transfer Mode

Register Name	Bit Name	Initial Value	Description
OIR_SCL1_ WR1	OIR_RES_ BST_MD	0	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

(2) Frame Buffer Write Control

Frame buffer writing is enabled or disabled.

Table 36.16 Frame Buffer Writing Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL1_ WR5	OIR_RES_ WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

(3) Frame Buffer Writing Rate Selection

A frame buffer writing rate can be selected from among 1/1, 1/2, 1/4, and 1/8 the vertical frequency of the input signal.

When 1/2, 1/4, or 1/8 is selected, either the top or bottom field can be selected for writing.

The field operating mode should always be progressive because the progressive signals are always input to the output image generator.

Table 36.17 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL1_WR5	OIR_RES_FS_RATE[1:0]	0	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The OIR_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
OIR_SCL1_WR5	OIR_RES_INTER	1	Field Operating Mode Select This bit should always be set to 0 when the output image generator is in use. 0: Progressive 1: Interlace

(4) Frame Buffer Write Addresses

Frame buffer addresses are specified using the base address, line offset address, frame offset address, data size of a line, and the number of lines in a frame.

The OIR_RES_BASE[31:0], OIR_RES_LN_OFF[14:0], and OIR_RES_FLM_OFF[22:0] bits should be set in 32-byte units (the lower five bits should be fixed to 0).

For 128-byte transfer, bits [6:5] in the address control registers should be fixed to 0 since addresses should be specified in 128-byte units.

For the data size of a line and the number of lines in a frame, the relevant register values set for the scaling-down control block are used.

Table 36.18 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL1_WR2	OIR_RES_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
OIR_SCL1_WR3	OIR_RES_LN_OFF [14:0]	2048	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: OIR_RES_BASE Line 1: OIR_RES_BASE + OIR_RES_LN_OFF × 1 : Line n: OIR_RES_BASE + OIR_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
OIR_SCL1_WR4	OIR_RES_FLM_OFF [22:0]	524288	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame. Buffer 0: OIR_RES_BASE Buffer 1: OIR_RES_BASE + OIR_RES_FLM_OFF × 1 : Buffer n: OIR_RES_BASE + OIR_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

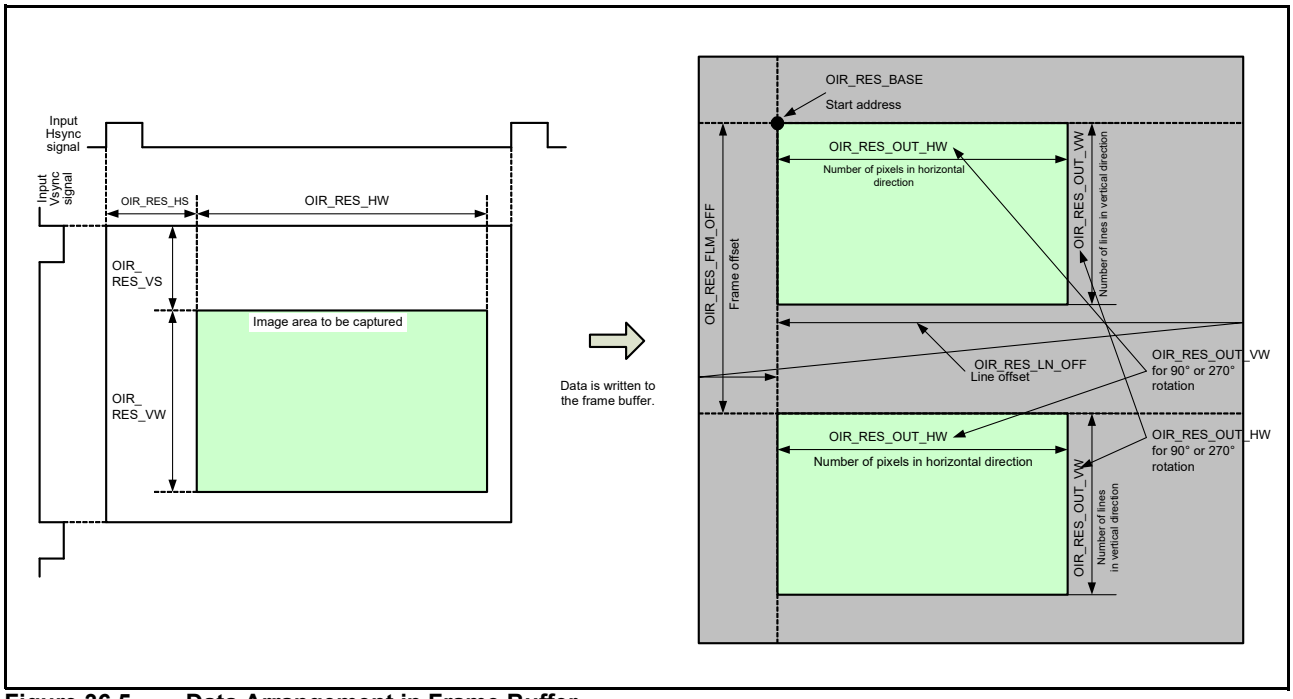

Figure 36.5 Data Arrangement in Frame Buffer

(5) Frame Buffer Management

The output image generator can handle multiple frames as the frame buffer.

Data is written to the buffer in cyclic mode according to the number of frames specified by the OIR_RES_FLM_NUM bits.

Table 36.19 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
OIR_SCL1_WR3	OIR_RES_FLM_ NUM[9:0]	1	Number of Frames of Buffer to be Written to Number of frames defined by OIR_RES_FLM_NUM + 1 are used. For video recording: the number of frames to be stored − 1
OIR_SCL1_WR7	OIR_RES_FLM_ CNT[9:0]	—	Frame Number Before Frame Being Accessed

(6) Buffer Overflow Handling

If writing to the frame buffer cannot be completed due to bus-traffic related problems, an overflow interrupt can be output to the interrupt controller.

Table 36.20 Buffer Overflow Detection

Register Name	Bit Name	Initial Value	Description
OIR_SCL1_WR7	OIR_RES_ OVERFLOW	—	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.

(7) Frame Buffer Write End Flag

When writing one frame of data to the frame buffer is completed, a frame buffer write end interrupt can be output to the interrupt controller.

36.1.10 Selecting an Input Video Image Signal Processing or Graphics (OIR) Processing

Scale-up processing is not possible in the generator. Accordingly, set the OIR_RES_IBUS_SYNC_SEL bit to 1 to select graphics display.

Table 36.21 Selection of Output Image Control Block or Graphics (OIR) Processing Block

Type of Output Image Generation Display	OIR_RES_ IBUS_ SYNC_SEL	Sync Signals for Frame Buffer Read	Frame Buffer Read Size Setting Bits	Display Enabling Bits
Graphics display	1	Output from graphics (OIR) processing block	GR_OIR_FLM_LNUM* GR_OIR_HW*	GR_OIR_GRC_VS GR_OIR_GRC_VW GR_OIR_GRC_HS GR_OIR_GRC_HW

Note: * The value set to the register + 1 is the actual read size.

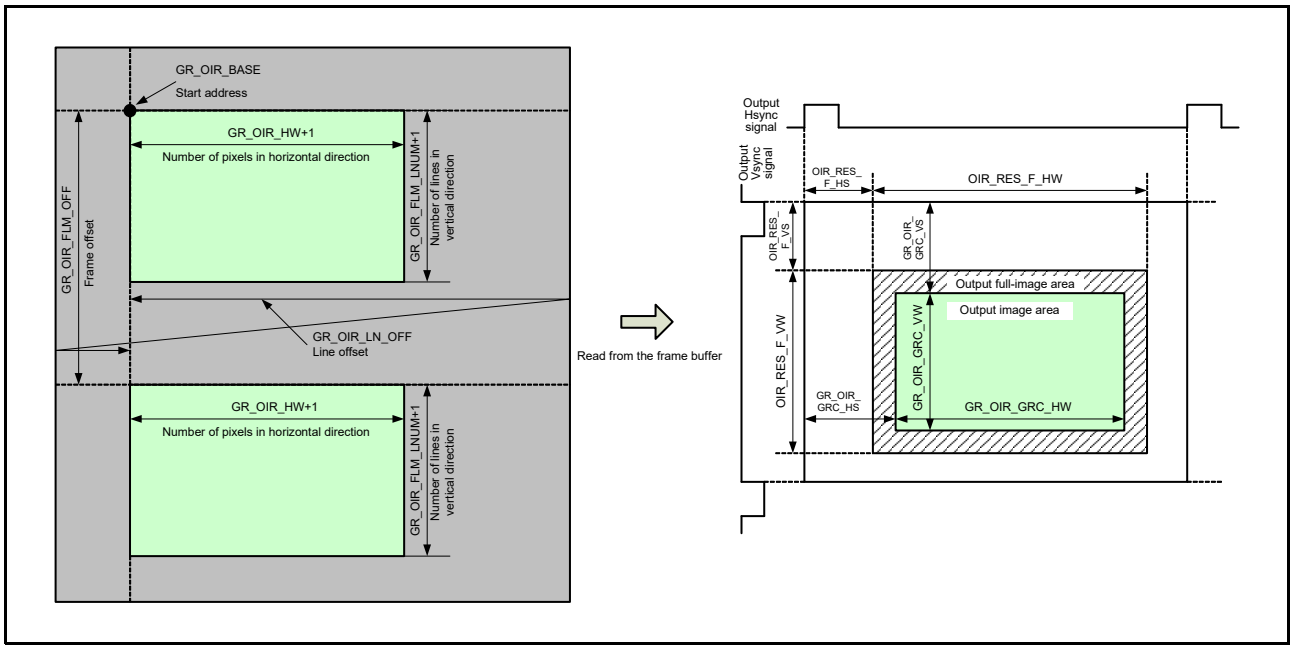

Figure 36.6 Area Setting for Graphics Display

Table 36.22 Output Image Control Block or Graphics (OIR) Processing Block Selection Control

Register Name	Bit Name	Initial Value	Description
OIR_ SCL0_US8	OIR_RES_IBUS_ SYNC_SEL	0	Sync Signal Select for Frame Buffer Read Block This bit should always be set to 1 when the output image generator is in use. 0: Sync signals from the output image control block 1: Sync signals from the graphics processing block

For details on the graphics processing, refer to the section 35, Video Display Controller 5 (5): Image Synthesizer.

36.2 Register Descriptions

Table 36.23 and Table 36.24 show the register configuration.

- Symbols used in Register Description:

  Initial value: Register value after a reset
  —: Undefined value
  R/W: Readable/writable. The written value can be read.
  R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
  R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
  R: Read-only. The write value should always be 0.
  —/W: Write-only. The read value is undefined.

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_FV[10:0]	524	R/W	Free-Running Vsync Period Setting Free-running Vsync period = (OIR_RES_FV + 1) × horizontal period [usec]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_FH[10:0]	799	R/W	Hsync Period Setting Hsync period [usec] = (OIR_RES_FH +1) ÷ pixel clock frequency [MHz]

Note: This register is updated when the OIR_SCL0_UPDATE bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.6 Output Delay Control Register (OIR_SCL0_FRC5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	OIR_RES_VSDLY[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	OIR_RES_ VSDLY[7:0]	1	R/W	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: OIR_RES_VSDLY × output Hsync period [usec]

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.7 Full-Screen Vertical Size Register (OIR_SCL0_FRC6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_F_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_F_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_F_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). OIR_RES_F_VS + OIR_RES_F_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_F_VW[10:0]	480	R/W	Vertical Enable Signal Width for Full Screen (lines) Note: OIR_RES_F_VS + OIR_RES_F_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.8 Full-Screen Horizontal Size Register (OIR_SCL0_FRC7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_F_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_F_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_F_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_F_HS + OIR_RES_F_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_F_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1: Note: OIR_RES_F_HS + OIR_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2: The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.9 Scaling-Down Control Register (OIR_SCL0_DS1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_DS_V_ON	—	—	—	OIR_RES_DS_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OIR_RES_DS_V_ON	1	R/W	Vertical Scale Down On/Off This bit should always be set to 0 when the output image generator is in use. 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OIR_RES_DS_H_ON	1	R/W	Horizontal Scale Down On/Off This bit should always be set to 0 when the output image generator is in use. 0: Off 1: On

Note: This register is updated when the OIR_SCL0_VEN_A bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.10 Vertical Capture Size Register (OIR_SCL0_DS2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_VS [10:0]	18	R/W	Vertical Position Setting for Video Signal Capturing (VSYNC + V backporch lines) Note: The set value should be four or more (lines). OIR_RES_VS + OIR_RES_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_VW [10:0]	240	R/W	Vertical Width of Video Signal to be Captured (Lines) Note: OIR_RES_VS + OIR_RES_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the OIR_SCL0_VEN_A bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.11 Horizontal Capture Size Register (OIR_SCL0_DS3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_HW[10:0]										
Initial value:	0	0	0	0	0	1	0	1	1	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_HS [10:0]	244	R/W	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_HS + OIR_RES_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_HW [10:0]	1440	R/W	Horizontal Width of Video Signal to be Captured (Video-image clock cycles) Note: OIR_RES_HS + OIR_RES_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the OIR_SCL0_VEN_A bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.12 Scaling-Down Control Block Output Size Register (OIR_SCL0_DS7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_OUT_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_OUT_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_OUT_VW [10:0]	240	R/W	Number of Valid Lines in Vertical Direction Output by Scaling-down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When OIR_SCL1_WR1.GR_OIR_FLM_LOOP is 0 (frame write mode), specify the number of lines for one frame. When GR_OIR_FLM5.GR_OIR_FLM_LOOP is 1 (line write mode), specify the number of lines for repeated write. Note: The OIR_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the OIR_RES_VW value.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_OUT_HW [10:0]	640	R/W	Number of Valid Horizontal Pixels Output by Scaling-Down Control Block (video-image clock cycles) Note: The OIR_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the OIR_RES_HW value.

Note: This register is updated when the OIR_SCL0_VEN_A or OIR_SCL0_VEN_C bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.13 Scaling-Up Control Register (OIR_SCL0_US1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_US_V_ON	—	—	—	OIR_RES_US_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OIR_RES_US_V_ON	1	R/W	Vertical Scale Up On/Off This bit should always be set to 0 when the output image generator is in use. 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OIR_RES_US_H_ON	1	R/W	Horizontal Scale Up On/Off This bit should always be set to 0 when the output image generator is in use. 0: Off 1: On

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.14 Output Image Vertical Size Register (OIR_SCL0_US2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_P_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_P_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_P_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). OIR_RES_P_VS + OIR_RES_P_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_P_VW[10:0]	480	R/W	Vertical Enable Signal Width for Output Image (lines) Note: OIR_RES_P_VS + OIR_RES_P_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.15 Output Image Horizontal Size Register (OIR_SCL0_US3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	OIR_RES_P_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OIR_RES_P_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_RES_P_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). OIR_RES_P_HS + OIR_RES_P_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	OIR_RES_P_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: OIR_RES_P_HS + OIR_RES_P_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.16 Frame Buffer Read Select Register (OIR_SCL0_US8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_IBUS_SYNC_SEL	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OIR_RES_IBUS_SYNC_SEL	0	R/W	Sync Signal Select for Frame Buffer Read Block This bit should always be set to 1 when the output image generator is in use. 0: Sync signals from the output image control block 1: Sync signals from the graphics processing block
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: OIR_RES_IBUS_SYNC_SEL is updated when the OIR_SCL0_VEN_D bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.17 Background Color Register (OIR_SCL0_OVR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	OIR_RES_BK_COL_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OIR_RES_BK_COL_G[7:0]								OIR_RES_BK_COL_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	OIR_RES_BK_CLO_R [7:0]	128	R/W	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
15 to 8	OIR_RES_BK_COL_G [7:0]	0	R/W	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])
7 to 0	OIR_RES_BK_COL_B [7:0]	128	R/W	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the OIR_SCL0_VEN_B bit in the OIR_SCL0 register update control register (OIR_SCL0_UPDATE) is 1.

36.2.18 SCL1 Register Update Control Register (OIR_SCL1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OIR_SCL1_UPDATE_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	OIR_SCL1_UPDATE_A	0	R/W	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OIR_SCL1_VEN_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OIR_SCL1_VEN_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

36.2.19 Writing Mode Register (OIR_SCL1_WR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_WRSWA[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_MD[1:0]		—	OIR_RES_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	OIR_RES_WRSWA[2:0]	All 0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3, 2	OIR_RES_MD[1:0]	0	R/W	Frame Buffer Video-Signal Writing Format 0: Setting prohibited 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: Setting prohibited
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	OIR_RES_BST_MD	0	R/W	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

Note: OIR_RES_BST_MD is updated when the OIR_SCL1_VEN_B bit in the OIR_SCL1 register update control register (OIR_SCL1_UPDATE) is 1.
OIR_RES_DS_WR_MD and OIR_RES_MD are updated when the OIR_SCL1_VEN_A or OIR_VEN_B bit in the OIR_SCL1 register update control register (OIR_SCL1_UPDATE) is 1.
OIR_RES_WRSWA is updated when the OIR_SCL1_UPDATE_A bit in the OIR_SCL1 register update control register (OIR_SCL1_UPDATE) is 1.

36.2.20 Write Address Register 1 (OIR_SCL1_WR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OIR_RES_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OIR_RES_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OIR_RES_BASE[31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the OIR_SCL1_VEN_B bit in the OIR_SCL1 register update control register (OIR_SCL1_UPDATE) is 1.

36.2.21 Write Address Register 2 (OIR_SCL1_WR3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	OIR_RES_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OIR_RES_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	OIR_RES_LN_OFF [14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: OIR_RES_BASE Line 1: OIR_RES_BASE + OIR_RES_LN_OFF × 1 : Line n: OIR_RES_BASE + OIR_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	OIR_RES_FLM_NUM [9:0]	1	R/W	Number of Frames of Buffer to be Written to Number of frames defined by OIR_RES_FLM_NUM + 1 are used. For video recording: the number of frames to be stored − 1

Note: This register is updated when the OIR_SCL1_VEN_B bit in the OIR_SCL1 register update control register (OIR_SCL1_UPDATE) is 1.

36.2.22 Write Address Register 3 (OIR_SCL1_WR4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	OIR_RES_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OIR_RES_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	OIR_RES_FLM_OFF [22:0]	524288	R/W	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame. Buffer 0: OIR_RES_BASE Buffer 1: OIR_RES_BASE + OIR_RES_FLM_OFF × 1 : Buffer n: OIR_RES_BASE + OIR_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the OIR_SCL1_VEN_B bit in the OIR_SCL1 register update control register (OIR_SCL1_UPDATE) is 1.

36.2.23 Frame Sub-Sampling Register (OIR_SCL1_WR5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	OIR_RES_INTER	—	—	OIR_RES_FS_RATE[1:0]		—	—	—	—	—	—	—	OIR_RES_WENB
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	OIR_RES_INTER	1	R/W	Field Operating Mode Select This bit should always be set to 0 when the output image generator is in use. 0: Progressive 1: Interlace
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	OIR_RES_FS_RATE [1:0]	0	R/W	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The OIR_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OIR_RES_WENB	0	R/W	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

Note: This register is updated when the OIR_SCL1_VEN_A bit in the OIR_SCL1 register update control register (OIR_SCL1_UPDATE) is 1.

36.2.24 Bit Reduction Register (OIR_SCL1_WR6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_DTH_ON	—	—	—	OIR_RES_BITDEC_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OIR_RES_DTH_ON	0	R/W	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 dither pattern)
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OIR_RES_BITDEC_ON	0	R/W	Bit Reduction On/Off 0: Off 1: On

Note: This register is updated when the OIR_SCL1_VEN_A bit in the OIR_SCL1 register update control register (OIR_SCL1_UPDATE) is 1.

36.2.25 Write Detection Register (OIR_SCL1_WR7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OIR_RES_OVERFLOW
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OIR_RES_FLM_CNT[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	OIR_RES_OVERFLOW	0	R	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	OIR_RES_FLM_CNT[9:0]	0	R	Frame Number Before Frame Being Accessed

36.2.26 Graphics (OIR) Register Update Control Register (GR_OIR_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR_OIR_UPDATE	—	—	—	GR_OIR_P_VEN	—	—	—	GR_OIR_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR_OIR_UPDATE	0	R/W	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR_OIR_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR_OIR_IBUS_VEN	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

36.2.27 Frame Buffer Read Control Register (Graphics (OIR)) (GR_OIR_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR_OIR_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR_OIR_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when the GR_OIR_IBUS_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

36.2.28 Frame Buffer Control Register 1 (Graphics (OIR)) (GR_OIR_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR_OIR_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR_OIR_FLM_SEL [1:0]		—	—	—	GR_OIR_IMR_FLM_INV	—	—	—	GR_OIR_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR_OIR_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR_OIR_FLM_SEL [1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Links to scaling-down process. 1: Selects GR_OIR_FLM_NUM. 2: Links to distortion correction.* 3: Setting prohibited Note: * It is only available in channel 0. This setting is prohibited in channel 1.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR_OIR_IMR_FLM_INV	0	R/W	Sets the frame buffer number for distortion correction for display. 0: Does not replace the numbers of the frames to be read. 1: Replaces the numbers of the frames to be read.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR_OIR_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR_OIR_LN_OFF_DIR, GR_OIR_FLM_SEL, and GR_OIR_IMR_FLM_INV are updated when the GR_OIR_IBUS_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1. GR_OIR_BST_MD is updated when the GR_OIR_IBUS_VEN and GR_OIR_P_VEN bits in the graphics (OIR) register update control register (GR_OIR_UPDATE) are 1.

36.2.29 Frame Buffer Control Register 2 (Graphics (OIR)) (GR_OIR_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR_OIR_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR_OIR_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR_OIR_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

Note: This register is updated when the GR_OIR_IBUS_VEN or GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

36.2.30 Frame Buffer Control Register 3 (Graphics (OIR)) (GR_OIR_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR_OIR_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR_OIR_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR_OIR_LN_OFF [14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR_OIR_BASE Line 1: GR_OIR_BASE + GR_OIR_LN_OFF × 1 : Line n: GR_OIR_BASE + GR_OIR_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR_OIR_FLM_NUM [9:0]	1	R/W	Frame Number of Frame Buffer Manually set the frame number when GR_OIR_FLM_SEL = 1.

Note: This register is updated when the GR_OIR_IBUS_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

36.2.31 Frame Buffer Control Register 4 (Graphics (OIR)) (GR_OIR_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR_OIR_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR_OIR_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR_OIR_FLM_OFF [22:0]	524288	R/W	Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR_OIR_BASE Buffer 1: GR_OIR_BASE + GR_OIR_FLM_OFF × 1 : Buffer n: GR_OIR_BASE + GR_OIR_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the GR_OIR_IBUS_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

36.2.32 Frame Buffer Control Register 5 (Graphics (OIR)) (GR_OIR_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_OIR_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_OIR_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_OIR_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame Number of lines is (GR_OIR_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_OIR_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR_OIR_FLM_LOOP + 1) lines are read.

Note: This register is updated when the GR_OIR_IBUS_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

36.2.33 Frame Buffer Control Register 6 (Graphics (OIR)) (GR_OIR_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR_OIR_FORMAT[3:0]				—	GR_OIR_HW[10:0]										
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR0_RDSWA[2:0]			—	—	—	—	GR_OIR_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR_OIR_ FORMAT [3:0]	8	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR_OIR_ HW[10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR_OIR_HW + 1) pixels. Note: The set value should be equal to or more than two.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR_OIR_RDSWA [2:0]	0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR_OIR_STA_POS [5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR_OIR_STA_POS is skipped from the start of the line.

Note: GR_OIR_STA_POS is updated when GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.
GR_OIR_RDSWA is updated when GR_OIR_UPDATE bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.
GR_OIR_FORMAT and GR_OIR_HW are updated when GR_OIR_IBUS_VEN or GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

36.2.34 Alpha Blending Control Register 1 (Graphics (OIR)) (GR_OIR_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GR_OIR_GRC_DISP_ON	—	—	GR_OIR_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR_OIR_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR_OIR_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (GR_OIR_BASE) 1: Setting prohibited 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note: * Select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255.

Note: This register is updated when GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

36.2.35 Alpha Blending Control Register 2 (Graphics (OIR)) (GR_OIR_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_OIR_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_OIR_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_OIR_GRC_VS[10:0]	0	R/W	Vertical Start Position of Graphics Image Area. Note: The set value should be four or more (lines). GR_OIR_GRC_VS + GR_OIR_GRC_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_OIR_GRC_VW[10:0]	0	R/W	Vertical Width of Graphics Image Area.

Note: This register is updated when the GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

36.2.36 Alpha Blending Control Register 3 (Graphics (OIR)) (GR_OIR_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR_OIR_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR_OIR_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR_OIR_GRC_HS[10:0]	0	R/W	Horizontal Start Position of Graphics Image Area. Note: The set value should be 16 or more (clock cycles). GR_OIR_GRC_HS + GR_OIR_GRC_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR_OIR_GRC_HW[10:0]	0	R/W	Horizontal Width of Graphics Image Area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR_OIR_HW to 2 and GR_OIR_GRC_HW to 1 (1 pixel) or 2 (2 pixels).

Note: This register is updated when the GR_OIR_P_VEN bit in the graphics (OIR) register update control register (GR_OIR_UPDATE) is 1.

36.2.37 Alpha Blending Control Register 7 (Graphics (OIR)) (GR_OIR_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	OIR_LIN_ STAT[10:0]	All 0	R	Line Position of Image Currently Being Read
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

37. Video Display Controller 5 (7): Output Controller

37.1 Output Controller

37.1.1 Overview of Functions

The output controller subjects RGB signals output from the output image generator to brightness adjustment, contrast adjustment, gamma correction of individual RGB, dither process, and output format conversion. The output controller also generates various timing signals for LCD panel drive.

Output from the LVDS is also possible. For the LVDS output, see section 40, LVDS Output Interface.

Figure 37.1 shows the function block diagram of the output controller.

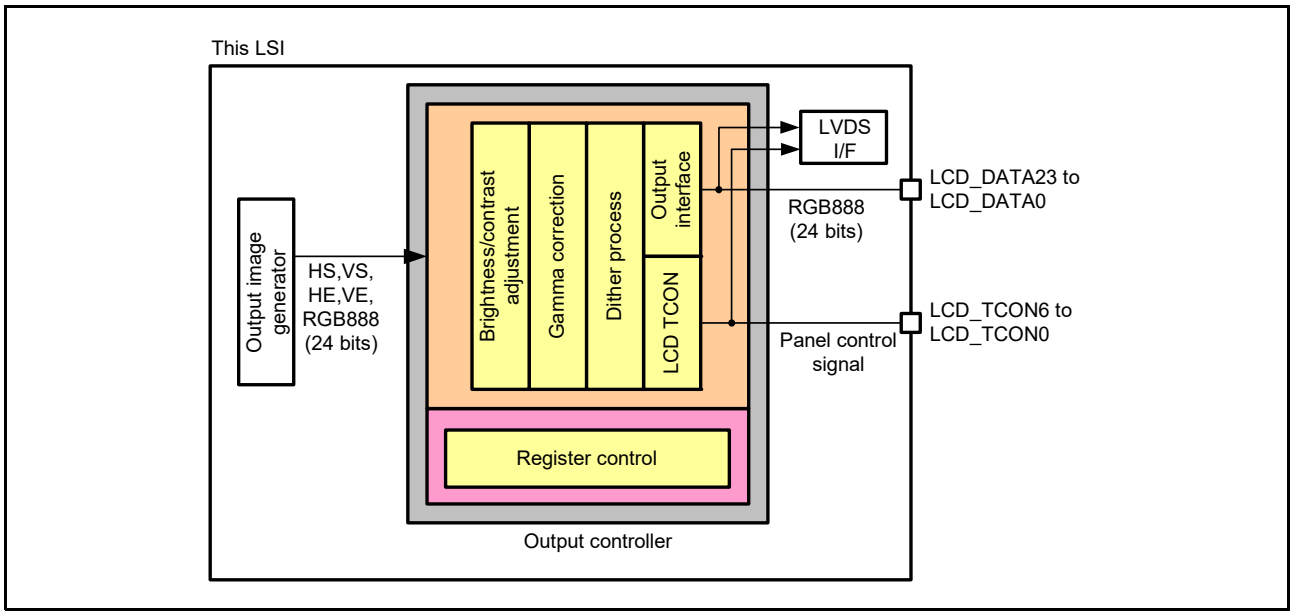

Figure 37.1 Functional Block Diagram of Output Controller

37.1.2 Register Update Control

The Vsync signal is used to control the update timing of all the registers of the output controller.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 37.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
OUT_UPDATE	OUTCNT_VEN	0	Brightness/Contrast Control, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_G_UPDATE	GAM_G_VEN	0	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_B_UPDATE	GAM_B_VEN	0	Gamma Correction (B) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_R_UPDATE	GAM_R_VEN	0	Gamma Correction (R) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
TCON_UPDATE	TCON_VEN	0	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

37.1.3 Route Selection

The processing sequence of the brightness/contrast control and gamma correction control can be swapped according to the settings of the register.

Table 37.2 Route Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_ FRONT_GAM	0	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast

37.1.4 Panel Brightness Adjustment

Brightness (DC) adjustment is individually performed for RGB signals from output image generator.

(BRT_R/G/BOUT after brightness adjustment has many bits to prevent overflow or underflow. The overflow or underflow process is performed at contrast calculation.)

(1) Calculation formulas for brightness (DC) adjustment

BRT_GOUT = GIN + PBRT_G − 512

BRT_BOUT = BIN + PBRT_B − 512

BRT_ROUT = RIN + PBRT_R − 512

Table 37.3 Brightness (DC) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_BRIGHT1	PBRT_G[9:0]	512	Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_B[9:0]	512	Brightness (DC) Adjustment of B Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_R[9:0]	512	Brightness (DC) Adjustment of R Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

37.1.5 Contrast Adjustment

Contrast is calculated for RGB signals obtained after brightness calculation.

(If an overflow or underflow occurs, contrast is clipped to the maximum or minimum value.)

(1) Calculation formulas for contrast (gain) adjustment

GOUT = BRT_GOUT × CONT_G/128

BOUT = BRT_BOUT × CONT_B/128

ROUT = BRT_ROUT × CONT_R/128

Table 37.4 Contrast (Gain) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_CONTRAST	CONT_G [7:0]	128	Contrast (Gain) Adjustment of G Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_B [7:0]	128	Contrast (Gain) Adjustment of B Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_R [7:0]	128	Contrast (Gain) Adjustment of R Signal 0/128 to 255/128 (approx.2 times)

37.1.6 Gamma Correction

Gamma correction is carried out by dividing an input signal having 256 gradation levels into 32 and controlling the gain of each area. Gain coefficient of each area can be set as 0 to approx. 2.0 [times]

(1) Gamma correction formula for each area

$$DOUT = ((DIN - TH_{(n)}) \times GAIN_{(n)} + OFFSET_{(n)})/256$$

DIN: Input signal (8-bit)

DOUT: Output signal (10-bit)

TH(n): Threshold (8-bit)

OFFSET(n): Offset value (19-bit)

GAIN(n): Gain coefficient (11-bit)

(2) Offset calculation formulas for each area

$$OFFSET_{(n)} = OFFSET_{(n-1)} + DEF_O_{(n)} \text{ (When n = 0, } OFFSET_{(0)} = 0.)$$

$$DEF_O_{(n)} = (TH_{(n)} - TH_{(n-1)}) \times GAIN_{(n-1)} \text{ (When n = 0, } OFFSET_{(0)} = 0.)$$

OFFSET(n): Offset value of current area (19-bit)

OFFSET(n-1): Offset value of previous area (19-bit)

DEF_O(n): Difference in offset value of Current and previous area (19-bit)

TH(n): Threshold of current area (8-bit)

TH(n-1): Threshold of previous area (8-bit)

GAIN(n-1): Gain coefficient of previous area (11-bit)

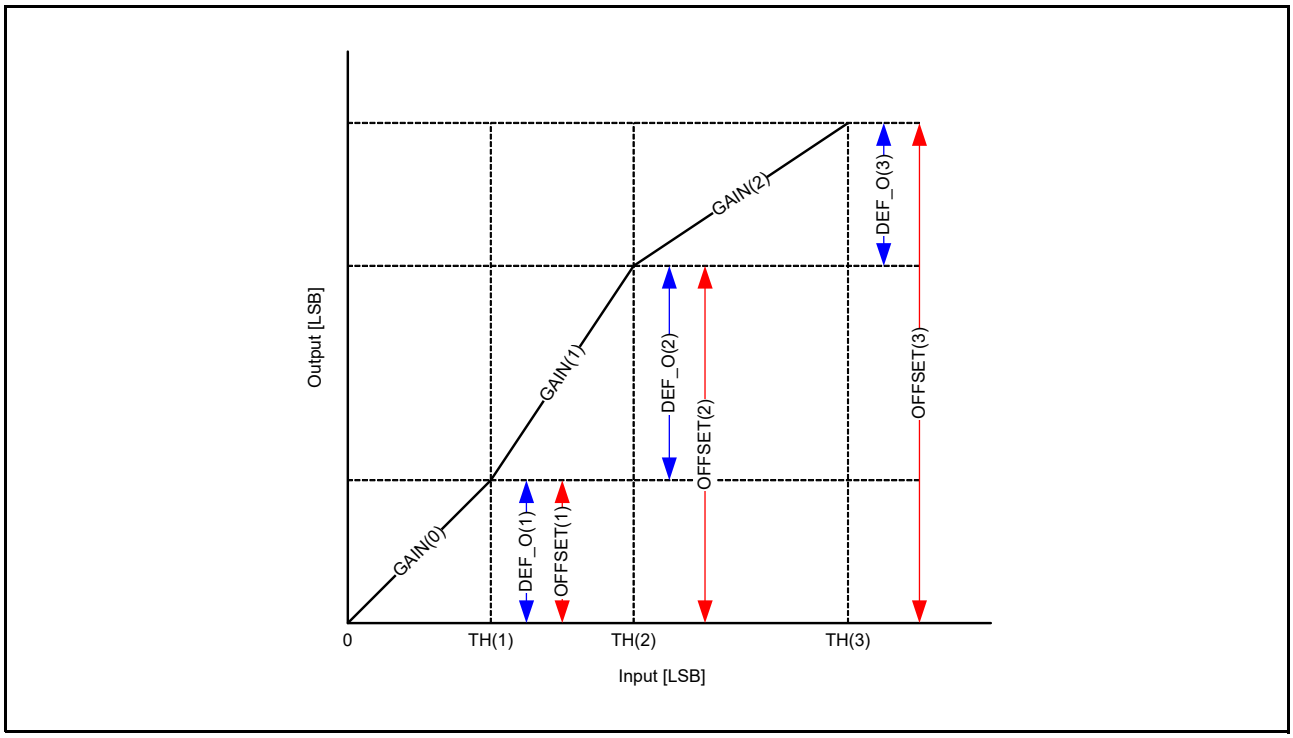

Figure 37.2 Corresponding Chart of Offset Calculation Formulas

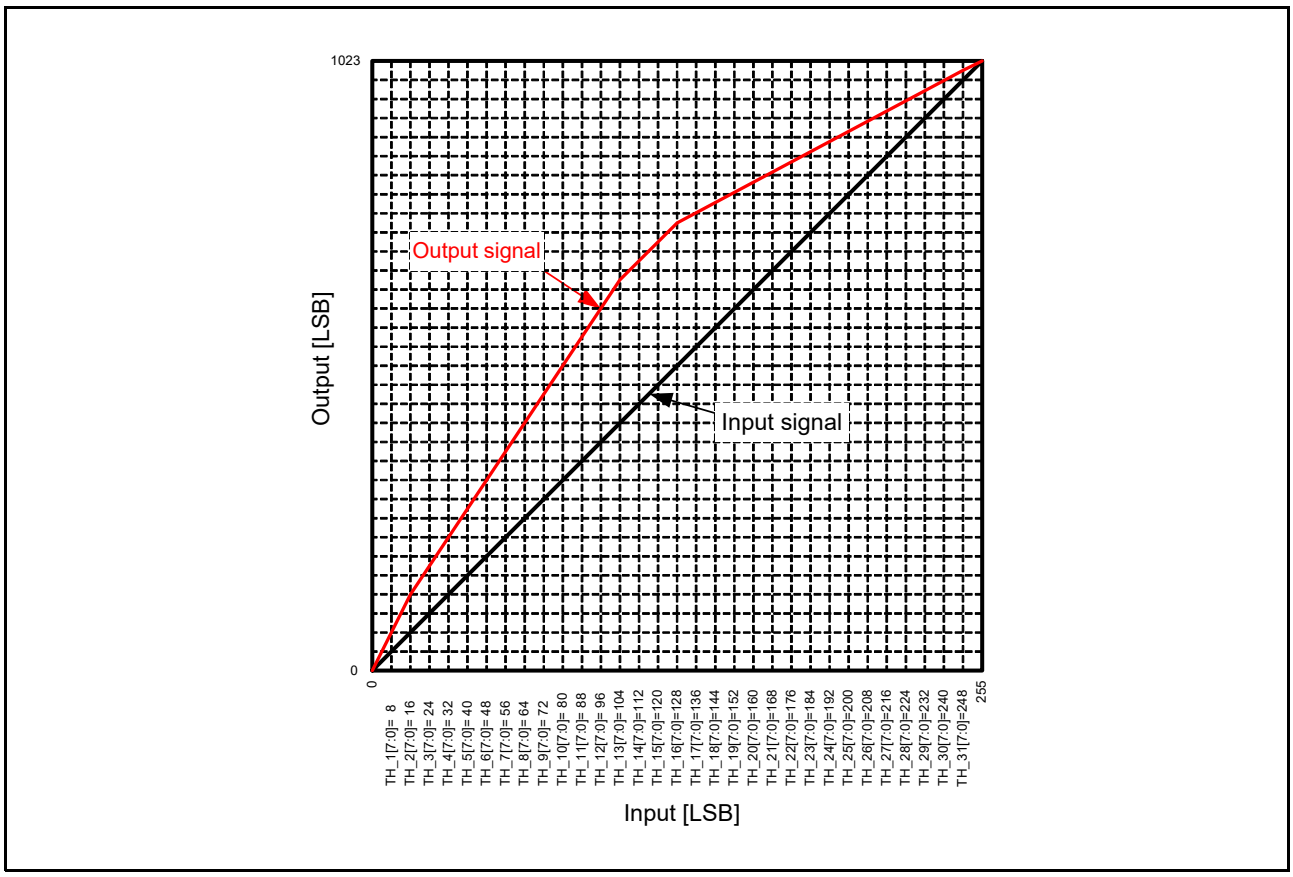

Figure 37.3 Example of Input-Output Characteristics of Gamma Correction

Table 37.5 Gamma Correction

37.1.7 Dither Process

Dither process is carried out by adjusting brightness/contrast or reducing 10-bit RGB signals output from the gamma correction block to 8-bit, 6-bit, or 5-bit RGB signals. The operation mode of dither process can be selected from truncate mode, round-off mode, 2 × 2 pattern dither mode and random pattern dither mode.

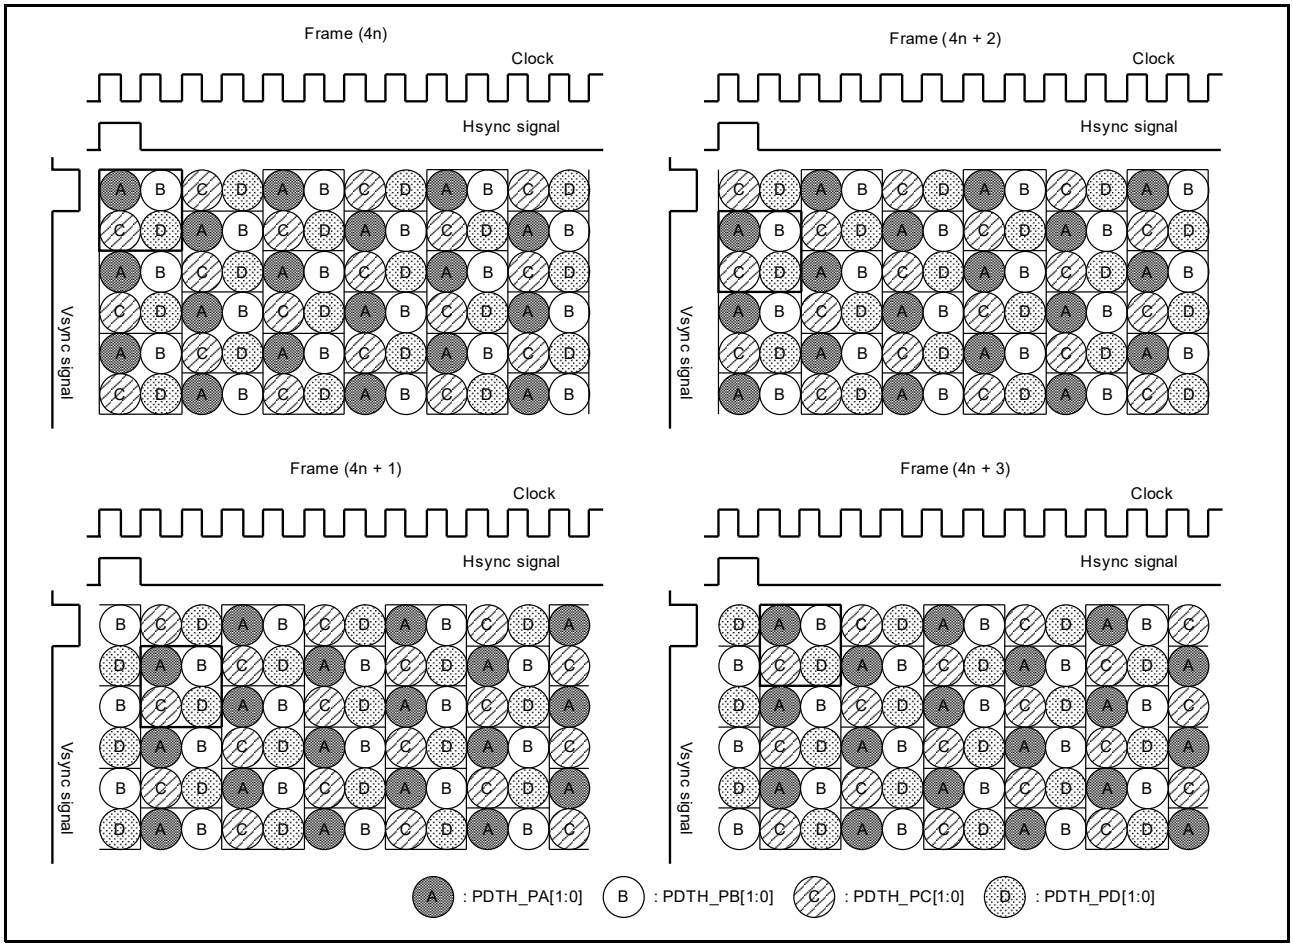

Figure 37.4 Operation Specification of 2 × 2 Pattern Dither

The conversion equations are as follows.

[Truncate mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (truncate the number below the decimal point)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (truncate the number below the decimal point)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (truncate the number below the decimal point)

[Round-off mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (round off to an integer)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (round off to an integer)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (round off to an integer)

[2 × 2 pattern dither mode, random pattern dither mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

Table 37.6 Panel Dither Correction

Register Name	Bit Name	Initial Value	Description

OUT_PDTHA	PDTH_PB[1:0]	0	Pattern Value (B) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
OUT_PDTHA	PDTH_PC[1:0]	2	Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
OUT_PDTHA	PDTH_PD[1:0]	1	Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])

37.1.8 Output Format Conversion

In output format conversion, the RGB signal after dither process is converted to LCD output signal having any of the following formats, namely, parallel RGB888, parallel RGB666, parallel RGB565, and serial RGB.

Further, converted data can be allocated to LCD output pins as selected.

(1) Bit Allocation of LCD Signals for RGB888 Output

Table 37.7 shows the RGB signal input allocated to the LCD signal output for RGB888 output.

R/G/BIN[7:0] are the RGB internal signals after dither process.

Table 37.7 Bit Allocation of RGB Signal Input for RGB888 Output

(4) Bit Allocation of LCD Signal for Serial RGB Output

For serial RGB output, RGB signal input shown Table 37.10 is allocated to rgb internal signals and the signals are converted from parallel to serial format and output as LCD signals. R/G/BIN[7:0] are the RGB internal signals after dither process.

The internal signals r[7:0], g[7:0], and b[7:0] are serially output to LCD_DATA7 to LCD_DATA0.

(5) Parallel to Serial Conversion

As shown in Table 37.11, four types of parallel to serial conversions are possible by controlling clock speed mode and selecting the scan direction ('n' in the table are natural numbers).

Table 37.11 Specifications of Serial RGB Output

OUT_FRQ_SEL	**1**	**1**	**2**	**2**
OUT_DIR_SEL	**0**	**1**	**0**	**1**
Line (2n-1)	Repeated (r → g → b)	Repeated (b → g → r)	Repeated (r → g → b → X)	Repeated (X → b → g → r)
Line 2n	Repeated (g → b → r)	Repeated (r → b → g)	Repeated (r → g → b → X)	Repeated (X → b → g → r)

Figure 37.5 and Figure 37.6 show the timing of parallel to serial conversion in triple speed and quadruple speed modes, respectively.

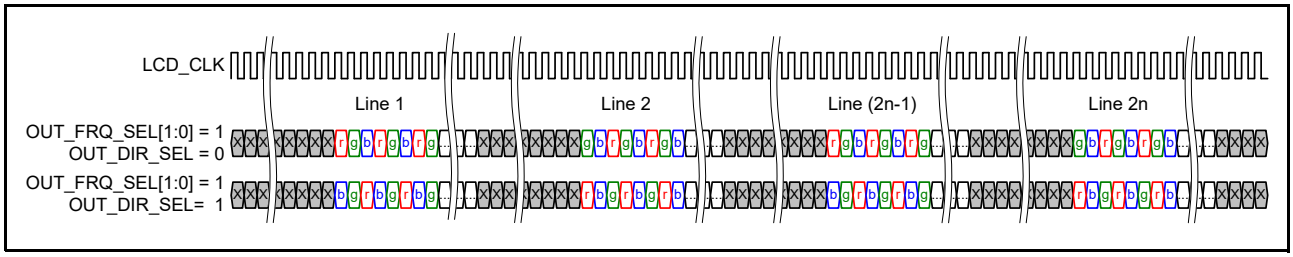

Figure 37.5 Timing of Parallel to Serial Conversion in Triple Speed Mode

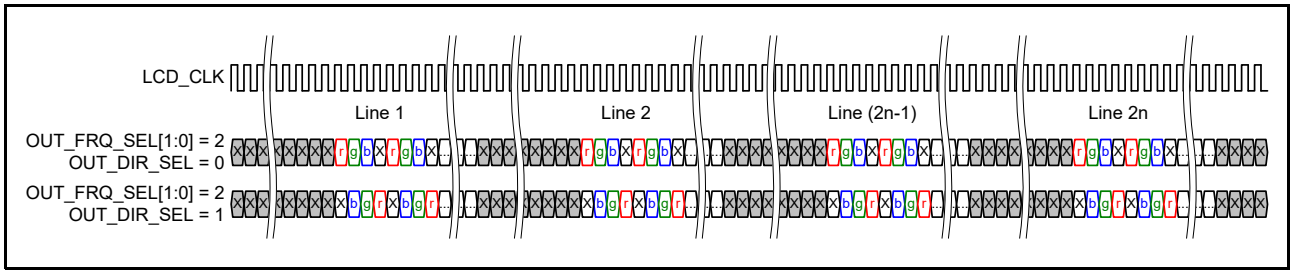

Figure 37.6 Timing of Parallel to Serial Conversion in Quadruple Speed Mode

During serial output, the phase timing with the HE signal can be adjusted by OUT_PHASE[0:1].

Figure 37.7 shows the timing of the clock phases of the serial RGB output (triple speed mode).

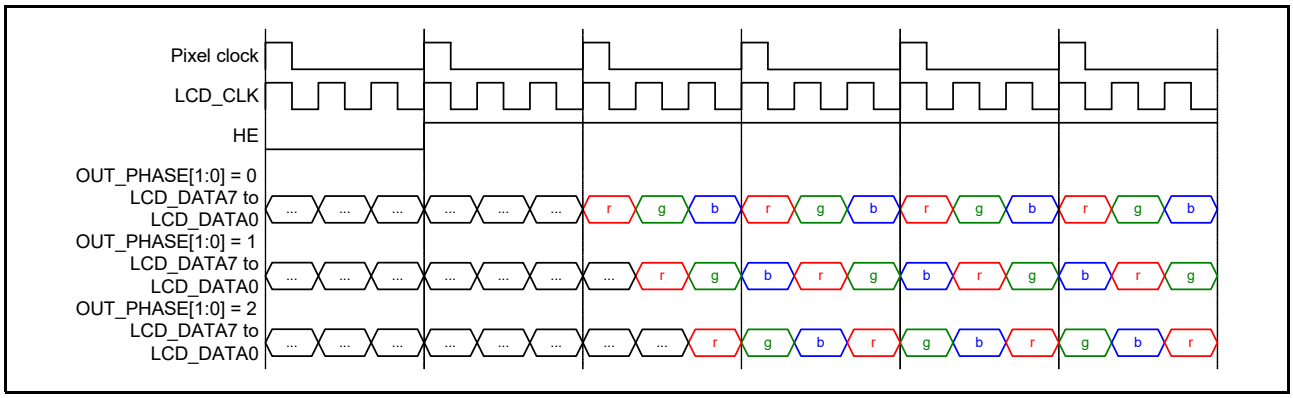

Figure 37.7 Timing of Clock Phases of Serial RGB Output (Triple Speed Mode)

Figure 37.8 shows the timing of the clock phases of the serial RGB output (quadruple speed mode).

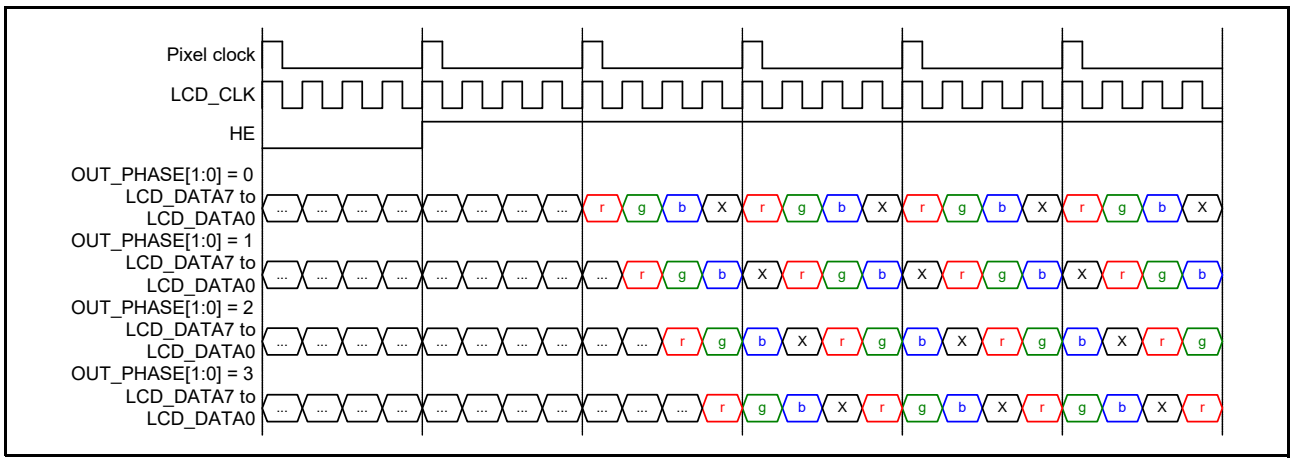

Figure 37.8 Timing of Clock Phases of Serial RGB Output (Quadruple Speed Mode)

Table 37.12 Output Format Conversion

37.1.9 LCD TCON

The LCD TCON generates various timing signals for driving the LCD panel.

Specifically, the timing include two vertical panel driver signals, five horizontal panel driver signals, and one composite signal of the vertical and horizontal panel driver signals. Table 37.13 lists the timing signals that are generated by LCD TCON

Table 37.13 Signals Generated by LCD TCON

Signal Name	Type	Description
STVA/VS	Vertical	• Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Vsync signal The width, position, and polarity of the sync signal can be controlled.
STVB/VE	Vertical	• Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Vertical enable signal The width, position, and polarity of the sync signal can be controlled.
STH/SP/HS	Horizontal	• Source start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Hsync signal The width, position, and polarity of the sync signal can be controlled.
STB/LP/HE	Horizontal	• Source strobe signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Horizontal enable signal The width, position, and polarity of the enable signal can be controlled.
CPV/GCK	Horizontal	• Gate clock signal The pulse width, pulse position, and pulse polarity of the signal can be controlled.
POLA	Horizontal	• VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
POLB	Horizontal	• VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
DE	Horizontal/Vertical	• Data enable signal The width, position, and polarity of the enable signal can be controlled.

(1) Horizontal Reference Offset Control

The horizontal reference offset control enables generation of a reference signal with a clock delay equivalent to the value of TCON_OFFSET[10:0] from the rising edge of the Hsync signal. If a signal that spans across the Hsync signal needs to be generated, such a signal is generated with reference to the offset reference signal.

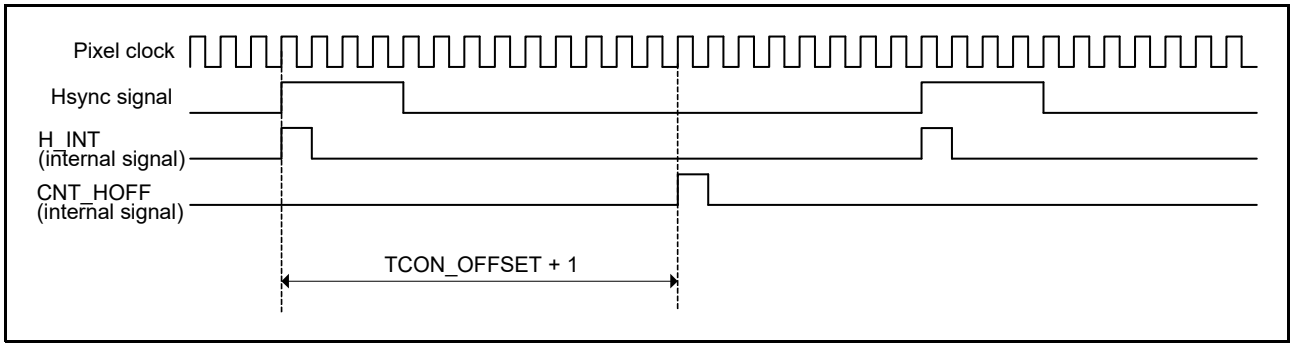

Figure 37.9 Generation of Offset Horizontal Reference (H_OFF) Signal

Table 37.14 Horizontal Reference Signal Selection

Signal Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_OFFSET[10:0]	0	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.
TCON_TIM_STH2	TCON_STH_HS_SEL	0	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_STB2	TCON_STB_HS_SEL	0	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_CPV2	TCON_CPV_HS_SEL	0	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLA2	TCON_POLA_HS_SEL	0	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLB2	TCON_POLB_HS_SEL	0	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference

Note: When generating the POLA and POLB signals in reverse mode, the bits TCON_POLA_HS_SEL and TCON_POLB_HS_SEL should be set to 0.

(2) Horizontal Panel Driver Signal Generation (A)

Horizontal synchronous panel driver signal generation (A) involves generation of a timing signal that changes twice in a horizontal period according to the values of TCON_xxxx_HS[10:0] and TCON_xxxx_HW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter performs the following operations.

1. Resets the counter value at the rising edge of the Hsync signal as the reference.
2. Increments the counter value at the rising edge of the panel clock.

A fixed output value of 0 can be obtained by setting 0 in TCON_xxxx_HW[10:0], which set the second changing timing.

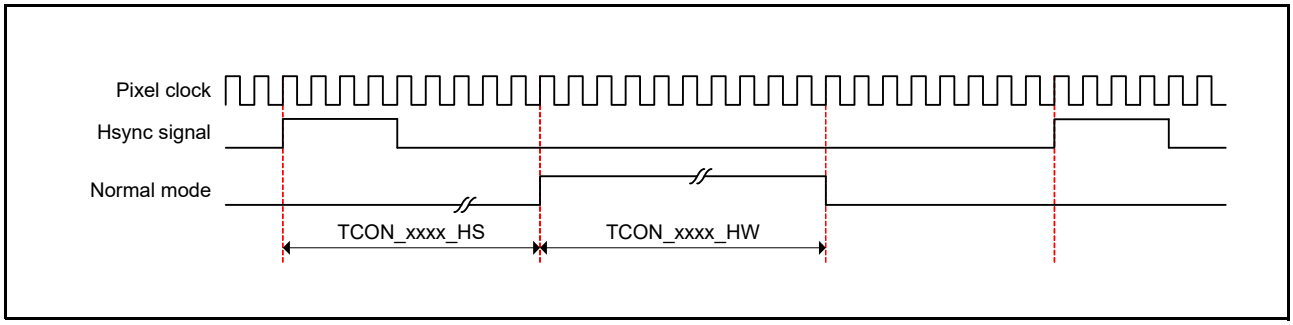

Figure 37.10 Horizontal Panel Driver Signal (in Normal Mode)

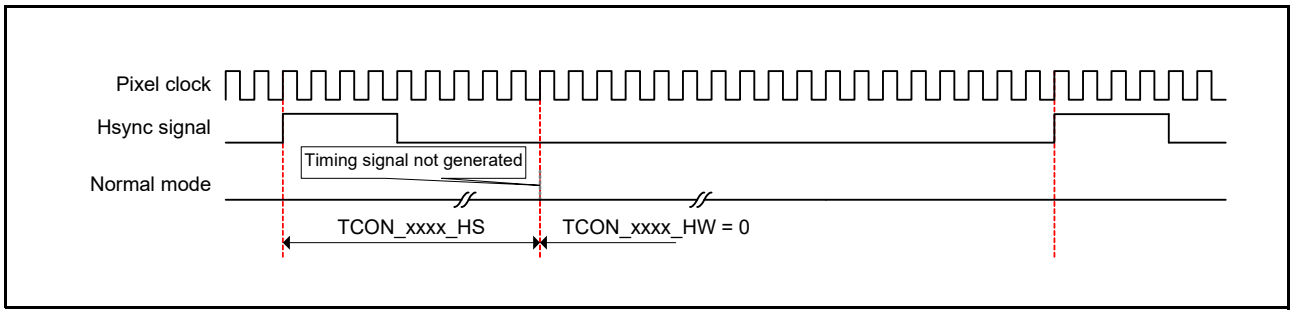

Figure 37.11 Horizontal Panel Driver Signal (in Normal Mode and When TCON_xxxx_HW_ = 0)

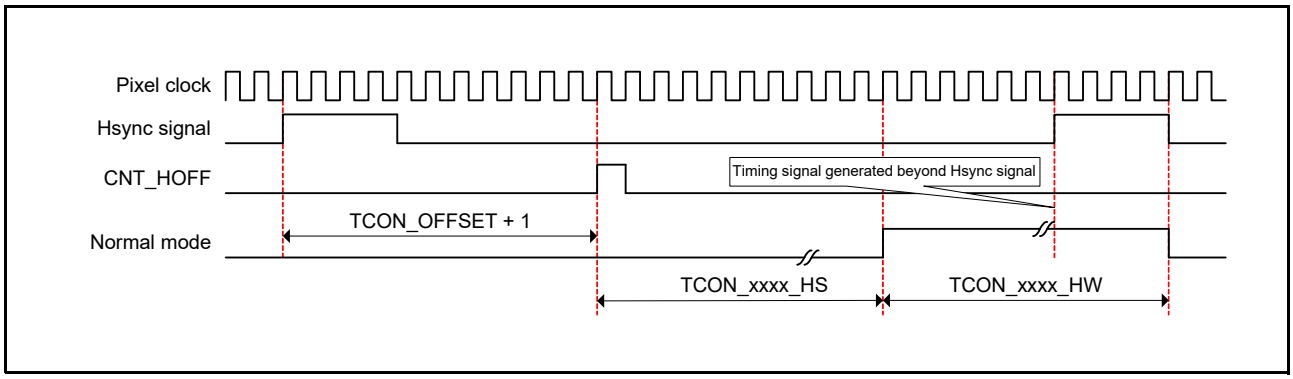

Figure 37.12 Horizontal Panel Driver Signal (in Normal Mode and When Offset Horizontal Reference is Used)

Table 37.15 Settings for Horizontal Panel Driver Signal Generation (A)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles)
TCON_TIM_STB1	TCON_STB_HS[10:0]	144	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HS[10:0]	0	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HW[10:0]	0	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles)

(3) Horizontal Panel Driver Signal Generation (B)

In addition to the normal mode operation described in (2), reverse mode operation, that is, horizontal panel driver signal generation (B) is provided. In reverse mode, operation starts at the rising edge of the Vsync signal as the reference and a signal is generated such that its polarity is inverted every horizontal period in the timing set by the TCON_xxxx_HS[10:0] bits, which set the first changing timing.

In reverse mode, regardless of whether the number of lines in the vertical direction is odd or even, the polarity of the signals generated is inverted every horizontal period. The following three reverse modes are selectable for polarity inversion operation.

Table 37.16 Horizontal Panel Driver Signal Generation Modes

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA2	TCON_POLA_MD [1:0]	1	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
TCON_TIM_POLB2	TCON_POLB_MD [1:0]	1	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.

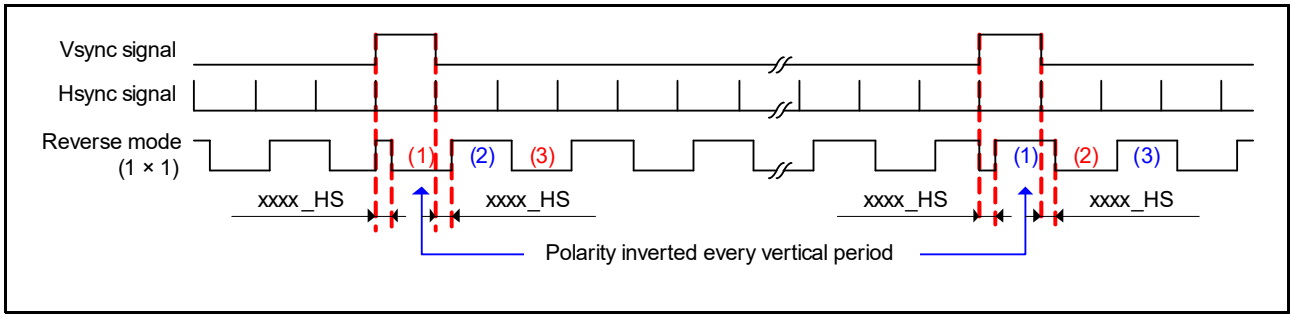

Figure 37.13 Horizontal Panel Driver Signal (in 1 × 1 Reverse Mode)

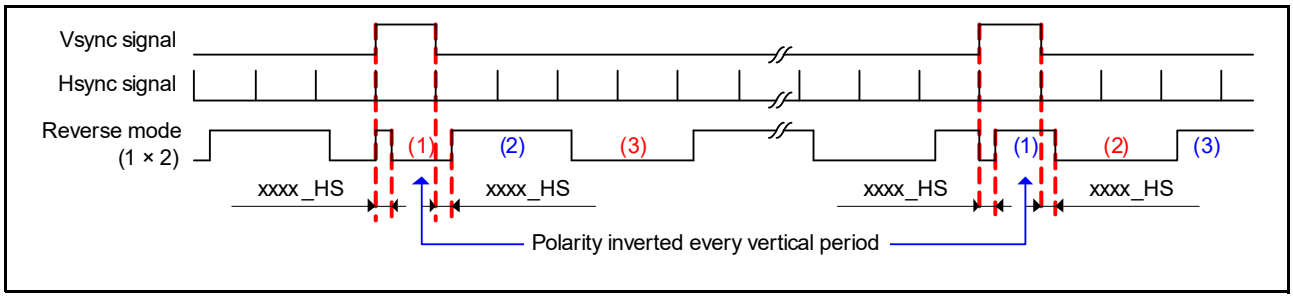

Figure 37.14 Horizontal Panel Driver Signal (in 1 × 2 Reverse Mode)

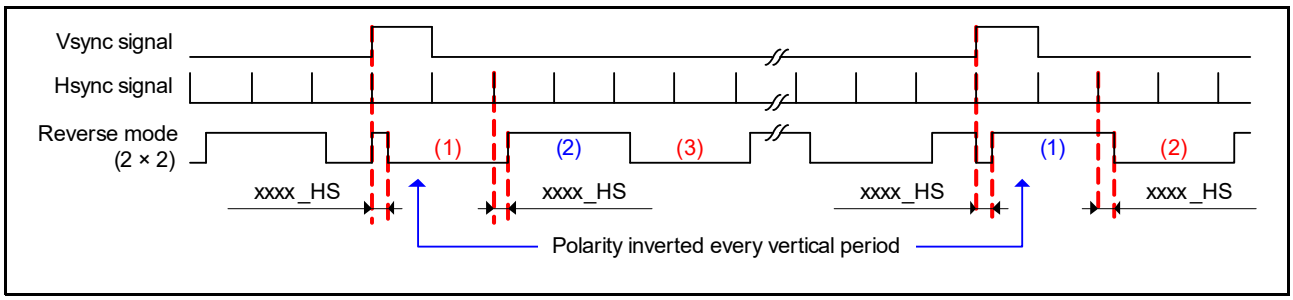

Figure 37.15 Horizontal Panel Driver Signal (in 2 × 2 Reverse Mode)

Table 37.17 Settings of Horizontal Panel Driver Signal Generation (B)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA1	TCON_POLA_HS [10:0]	0	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
TCON_TIM_POLA1	TCON_POLA_HW [10:0]	0	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles)
TCON_TIM_POLB1	TCON_POLB_HS [10:0]	0	POLBA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to1 or greater.
TCON_TIM_POLB1	TCON_POLB_HW [10:0]	0	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles)

(4) Vertical Panel Driver Signal Generation

The vertical synchronous panel driver signal generation involves the following operations.

1. Initialization at the rising edge of the Vsync signal
2. Generation of a timing signal that changes twice in a vertical period according to the values of the internal counter, and TCON_xxxx_VS[10:0] and TCON_xxxx_VW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter increments the counter value in the following two cases.

1. At the rising edge of the Hsync signal
2. At the point reached after a clock delay specified by the value of TCON_HALF[10:0] from the rising edge of the Hsync signal (normally, 1/2fH is set).

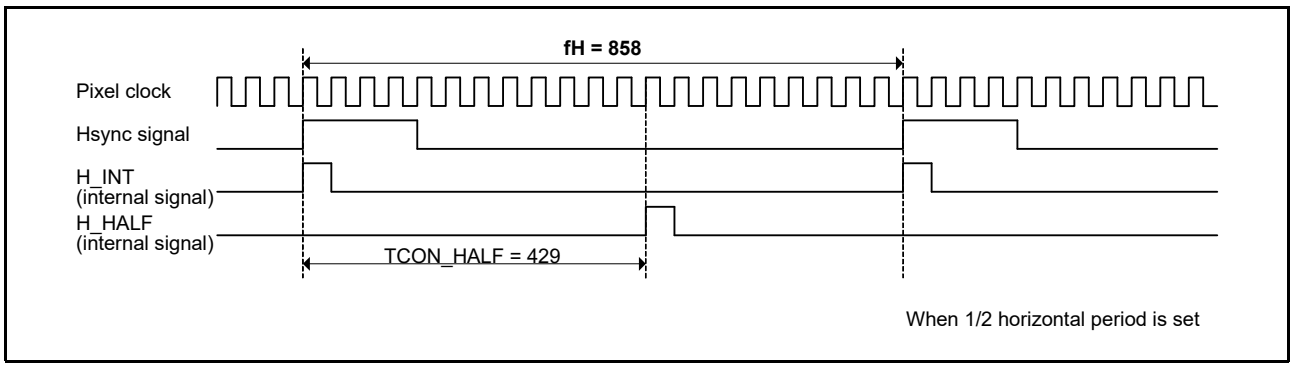

Figure 37.16 1/2 Pulse (H_HALF) Signal Generation

Table 37.18 Settings of 1/2 Pulse (H_HALF) Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_HALF[10:0]	400	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter

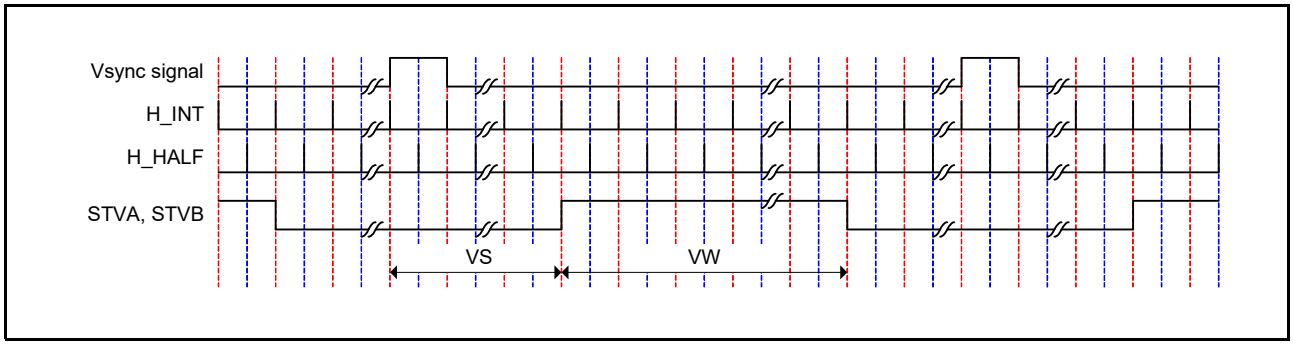

Figure 37.17 Vertical Panel Driver Signal (H_INT Reference Operation)

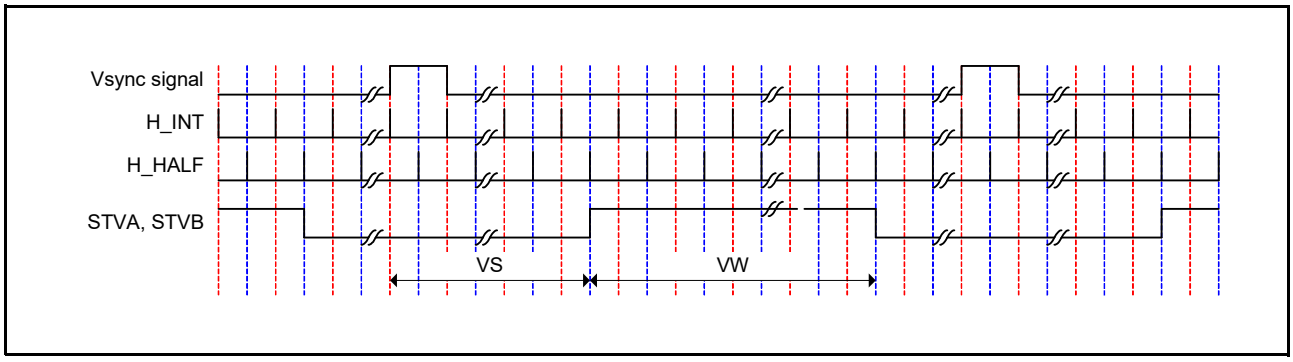

Figure 37.18 Vertical Panel Driver Signal (H_HALF Reference Operation)

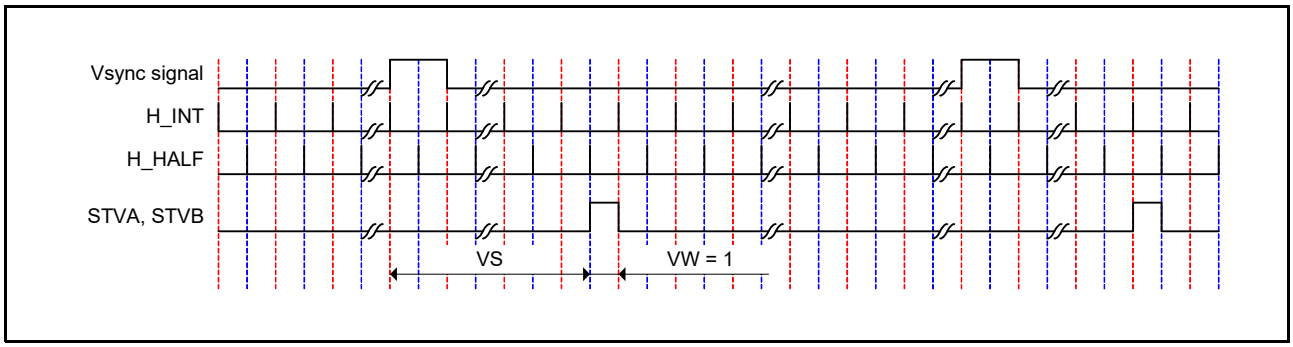

Figure 37.19 Vertical Panel Driver Signal (H_INT and H_HALF Reference Operation)

Table 37.19 Vertical Panel Driver Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_HS from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_HW (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	70	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_HS from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_HW (1/2fH cycles)

(5) DE Timing Signal Generation

DE timing signal generation involves generation of data enable signal (DE) that indicates the valid period of the video signal by synthesizing the horizontal panel driver (HE) signal and the vertical panel driver (VE) signal (AND).

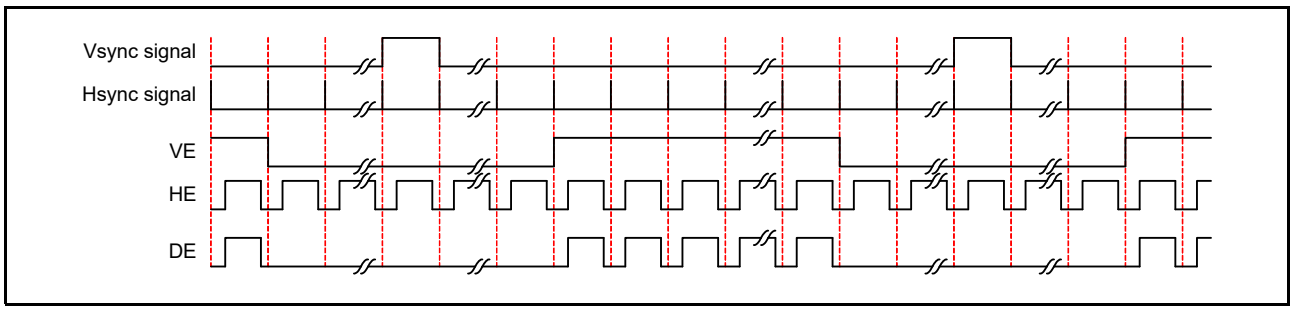

Figure 37.20 Data Enable Signal Generation

(6) Polarity Inversion

Polarity inversion enables inversion of polarity of each signal generated by the signal generating circuit.

Table 37.20 Panel Driver Signal Polarity Inversion Control

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_INV	1	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
TCON_TIM_STVB2	TCON_STVB_INV	0	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
TCON_TIM_STH2	TCON_STH_INV	1	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
TCON_TIM_STB2	TCON_STB_INV	0	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
TCON_TIM_CPV2	TCON_CPV_INV	0	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
TCON_TIM_POLA2	TCON_POLA_INV	0	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
TCON_TIM_POLB2	TCON_POLB_INV	0	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
TCON_TIM_DE	TCON_DE_INV	0	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

(7) Output Selection

An output pin is selected for every signal subjected to polarity inversion control.

Table 37.21 Panel Driver Signal Output Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_SEL [2:0]	0	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_STVB2	TCON_STVB_SEL [2:0]	1	Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_STH2	TCON_STH_SEL [2:0]	2	Output Signal Select for LCD_TCON2 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_STB2	TCON_STB_SEL [2:0]	7	Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

TCON_TIM_POLA2	TCON_POLA_SEL [2:0]	5	Output Signal Select for LCD_TCON5 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Table 37.21 Panel Driver Signal Output Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLB2	TCON_POLB_SEL [2:0]	6	Output Signal Select for LCD_TCON6 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

(8) Output Phase Selection

The output phase can be individually selected for the video output signal and the various timing output signals based on the LCD_CLK (panel clock).

Table 37.22 Panel Output Signal Phase Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_LCD_EDGE	0	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVA_EDGE	0	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVB_EDGE	0	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STH_EDGE	0	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STB_EDGE	0	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_CPV_EDGE	0	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLA_EDGE	0	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLB_EDGE	0	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

37.2 Register Descriptions

Table 37.23 to Table 37.28 shows the register configuration.

- Symbols used in Register Description:

  Initial value: Register value after a reset
  —: Undefined value
  R/W: Readable/writable. The written value can be read.
  R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
  R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
  R: Read-only. The write value should always be 0.
  —/W: Write-only. The read value is undefined.

Table 37.23 Gamma Correction Block Register Configuration (Channel 0)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Register update control register G in gamma correction block	GAM_G_UPDATE	R/WC1	H'0000 0000	H'FCFF 7800	32

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_B_TH_26[7:0]								GAM_B_TH_27[7:0]							
Initial value:	1	1	0	1	0	0	0	0	1	1	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_B_TH_24[7:0]	192	R/W	Start Threshold of Area 24 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_B_TH_25[7:0]	200	R/W	Start Threshold of Area 25 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_B_TH_26[7:0]	208	R/W	Start Threshold of Area 26 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_B_TH_27[7:0]	216	R/W	Start Threshold of Area 27 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

37.2.21 Area Setting Register B8 in Gamma Correction Block (GAM_B_AREA8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_B_TH_28[7:0]								GAM_B_TH_29[7:0]							
Initial value:	1	1	1	0	0	0	0	0	1	1	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_B_TH_30[7:0]								GAM_B_TH_31[7:0]							
Initial value:	1	1	1	1	0	0	0	0	1	1	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_B_TH_28[7:0]	224	R/W	Start Threshold of Area 28 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_B_TH_29[7:0]	232	R/W	Start Threshold of Area 29 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_B_TH_30[7:0]	240	R/W	Start Threshold of Area 30 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_B_TH_31[7:0]	248	R/W	Start Threshold of Area 31 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area ≤ 255

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

37.2.22 Register Update Control Register R in Gamma Correction Block (GAM_R_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_R_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_R_VEN	0	R/WC1	Gamma Correction (R) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

37.2.23 Table Setting Register R1 to R16 in Gamma Correction Block (GAM_R_LUT1 to GAM_R_LUT16)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GAM_G_GAIN_xx[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GAM_G_GAIN_yy[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	*	1024	R/W	GAM_R_LUT1: Gain Adjustment of Area 0 of R Signal GAM_R_LUT2: Gain Adjustment of Area 2 of R Signal GAM_R_LUT3: Gain Adjustment of Area 4 of R Signal GAM_R_LUT4: Gain Adjustment of Area 6 of R Signal GAM_R_LUT5: Gain Adjustment of Area 8 of R Signal GAM_R_LUT6: Gain Adjustment of Area 10 of R Signal GAM_R_LUT7: Gain Adjustment of Area 12 of R Signal GAM_R_LUT8: Gain Adjustment of Area 14 of R Signal GAM_R_LUT9: Gain Adjustment of Area 16 of R Signal GAM_R_LUT10: Gain Adjustment of Area 18 of R Signal GAM_R_LUT11: Gain Adjustment of Area 20 of R Signal GAM_R_LUT12: Gain Adjustment of Area 22 of R Signal GAM_R_LUT13: Gain Adjustment of Area 24 of R Signal GAM_R_LUT14: Gain Adjustment of Area 26 of R Signal GAM_R_LUT15: Gain Adjustment of Area 28 of R Signal GAM_R_LUT16: Gain Adjustment of Area 30 of R Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times]) *: Bit Name GAM_R_LUT1: GAM_R_GAIN_00[10:0] GAM_R_LUT2: GAM_R_GAIN_02[10:0] GAM_R_LUT3: GAM_R_GAIN_04[10:0] GAM_R_LUT4: GAM_R_GAIN_06[10:0] GAM_R_LUT5: GAM_R_GAIN_08[10:0] GAM_R_LUT6: GAM_R_GAIN_10[10:0] GAM_R_LUT7: GAM_R_GAIN_12[10:0] GAM_R_LUT8: GAM_R_GAIN_14[10:0] GAM_R_LUT9: GAM_R_GAIN_16[10:0] GAM_R_LUT10: GAM_R_GAIN_18[10:0] GAM_R_LUT11: GAM_R_GAIN_20[10:0] GAM_R_LUT12: GAM_R_GAIN_22[10:0] GAM_R_LUT13: GAM_R_GAIN_24[10:0] GAM_R_LUT14: GAM_R_GAIN_26[10:0] GAM_R_LUT15: GAM_R_GAIN_28[10:0] GAM_R_LUT16: GAM_R_GAIN_30[10:0]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	*	1024	R/W	GAM_R_LUT1: Gain Adjustment of Area 1 of R Signal GAM_R_LUT2: Gain Adjustment of Area 3 of R Signal GAM_R_LUT3: Gain Adjustment of Area 5 of R Signal GAM_R_LUT4: Gain Adjustment of Area 7 of R Signal GAM_R_LUT5: Gain Adjustment of Area 9 of R Signal GAM_R_LUT6: Gain Adjustment of Area 11 of R Signal GAM_R_LUT7: Gain Adjustment of Area 13 of R Signal GAM_R_LUT8: Gain Adjustment of Area 15 of R Signal GAM_R_LUT9: Gain Adjustment of Area 17 of R Signal GAM_R_LUT10: Gain Adjustment of Area 19 of R Signal GAM_R_LUT11: Gain Adjustment of Area 21 of R Signal GAM_R_LUT12: Gain Adjustment of Area 23 of R Signal GAM_R_LUT13: Gain Adjustment of Area 25 of R Signal GAM_R_LUT14: Gain Adjustment of Area 27 of R Signal GAM_R_LUT15: Gain Adjustment of Area 29 of R Signal GAM_R_LUT16: Gain Adjustment of Area 31 of R Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times]) *: Bit Name GAM_R_LUT1: GAM_R_GAIN_01[10:0] GAM_R_LUT2: GAM_R_GAIN_03[10:0] GAM_R_LUT3: GAM_R_GAIN_05[10:0] GAM_R_LUT4: GAM_R_GAIN_07[10:0] GAM_R_LUT5: GAM_R_GAIN_09[10:0] GAM_R_LUT6: GAM_R_GAIN_11[10:0] GAM_R_LUT7: GAM_R_GAIN_13[10:0] GAM_R_LUT8: GAM_R_GAIN_15[10:0] GAM_R_LUT9: GAM_R_GAIN_17[10:0] GAM_R_LUT10: GAM_R_GAIN_19[10:0] GAM_R_LUT11: GAM_R_GAIN_21[10:0] GAM_R_LUT12: GAM_R_GAIN_23[10:0] GAM_R_LUT13: GAM_R_GAIN_25[10:0] GAM_R_LUT14: GAM_R_GAIN_27[10:0] GAM_R_LUT15: GAM_R_GAIN_29[10:0] GAM_R_LUT16: GAM_R_GAIN_31[10:0]

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

37.2.24 Area Setting Register R1 in Gamma Correction Block (GAM_R_AREA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GAM_R_TH_01[7:0]

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_28[7:0]	224	R/W	Start Threshold of Area 28 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_29[7:0]	232	R/W	Start Threshold of Area 29 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_30[7:0]	240	R/W	Start Threshold of Area 30 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_31[7:0]	248	R/W	Start Threshold of Area 31 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area ≤ 255

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

37.2.32 TCON Register Update Control Register (TCON_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_VEN	0	R/WC1	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

37.2.33 TCON Reference Timing Setting Register (TCON_TIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_HALF[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_OFFSET[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_HALF[10:0]	400	R/W	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_OFFSET[10:0]	0	R/W	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.34 TCON Vertical Timing Setting Register A1 (TCON_TIM_STVA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STVA_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STVA_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVA_VS [10:0]	0	R/W	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_VS from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVA_VW [10:0]	4	R/W	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_VW (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.35 TCON Vertical Timing Setting Register A2 (TCON_TIM_STVA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVA_INV	—	TCON_STVA_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVA_INV	1	R/W	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVA_SEL [2:0]	0	R/W	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.36 TCON Vertical Timing Setting Register B1 (TCON_TIM_STVB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STVB_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STVB_VW[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVB_VS [10:0]	70	R/W	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_VS from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVB_VW [10:0]	960	R/W	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_VW (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.37 TCON Vertical Timing Setting Register B2 (TCON_TIM_STVB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVB_INV	—	TCON_STVB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVB_INV	0	R/W	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVB_SEL [2:0]	1	R/W	Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.38 TCON Horizontal Timing Setting Register STH1 (TCON_TIM_STH1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STH_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STH_HS [10:0]	0	R/W	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STH_HW [10:0]	96	R/W	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.39 TCON Horizontal Timing Setting Register STH2 (TCON_TIM_STH2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_STH_HS_SEL	—	—	—	TCON_STH_INV	—	TCON_STH_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_STH_HS_SEL	0	R/W	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STH_INV	1	R/W	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STH_SEL [2:0]	2	R/W	Output Signal Select for LCD_TCON2 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.40 TCON Horizontal Timing Setting Register STB1 (TCON_TIM_STB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STB_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STB_HS [10:0]	144	R/W	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STB_HW [10:0]	640	R/W	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.41 TCON Horizontal Timing Setting Register STB2 (TCON_TIM_STB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_STB_HS_SEL	—	—	—	TCON_STB_INV	—	TCON_STB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_STB_HS_SEL	0	R/W	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STB_INV	0	R/W	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STB_SEL [2:0]	7	R/W	Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.42 TCON Horizontal Timing Setting Register CPV1 (TCON_TIM_CPV1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_CPV_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_CPV_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_CPV_HS [10:0]	0	R/W	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_CPV_HW [10:0]	0	R/W	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.43 TCON Horizontal Timing Setting Register CPV2 (TCON_TIM_CPV2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_CPV_HS_SEL	—	—	—	TCON_CPV_INV	—	TCON_CPV_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_CPV_HS_SEL	0	R/W	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_CPV_INV	0	R/W	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_CPV_SEL[2:0]	4	R/W	Output Signal Select for LCD_TCON4 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.44 TCON Horizontal Timing Setting Register POLA1 (TCON_TIM_POLA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLA_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLA_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLA_HS [10:0]	0	R/W	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLA_HW [10:0]	0	R/W	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.45 TCON Horizontal Timing Setting Register POLA2 (TCON_TIM_POLA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLA_MD[1:0]		—	—	—	TCON_POLA_HS_SEL	—	—	—	TCON_POLA_INV	—	TCON_POLA_SEL[2:0]		
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	0	1
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLA_MD [1:0]	1	R/W	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLA_HS _SEL	0	R/W	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLA_INV	0	R/W	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLA_SEL [2:0]	5	R/W	Output Signal Select for LCD_TCON5 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.46 TCON Horizontal Timing Setting Register POLB1 (TCON_TIM_POLB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLB_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLB_HS [10:0]	0	R/W	POLB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLB_HW [10:0]	0	R/W	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.47 TCON Horizontal Timing Setting Register POLB2 (TCON_TIM_POLB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLB_MD[1:0]		—	—	—	TCON_POLB_HS_SEL	—	—	—	TCON_POLB_INV	—	TCON_POLB_SEL[2:0]		
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLB_MD [1:0]	1	R/W	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLB_HS _SEL	0	R/W	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLB_INV	0	R/W	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLB_SEL [2:0]	6	R/W	Output Signal Select for LCD_TCON6 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.48 TCON Data Enable Polarity Setting Register (TCON_TIM_DE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_DE_INV
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_DE_INV	0	R/W	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

37.2.49 Register Update Control Register in Output Controller (OUT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OUTCNT_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OUTCNT_VEN	0	R/WC1	Brightness/Contrast, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

37.2.50 Output Interface Register (OUT_SET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	OUT_ENDIAN_ON	—	—	—	OUT_SWAP_ON	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	OUT_FORMAT[1:0]		—	—	OUT_FRQ_SEL[1:0]		—	—	—	OUT_DIR_SEL	—	—	OUT_PHASE[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	OUT_ENDIAN_ON	0	R/W	Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	OUT_SWAP_ON	0	R/W	B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	OUT_FORMAT[1:0]	0	R/W	Output Format Select 0: RBG888 1: RGB666 2: RGB565 3: Serial RGB
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	OUT_FRQ_SEL[1:0]	0	R/W	Clock Frequency Control 0: 100% speed — (parallel RGB) 1: Triple speed — (serial RGB) 2: Quadruple speed — (serial RGB) 3: Setting prohibited
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OUT_DIR_SEL	0	R/W	Scan Direction Select 0: Forward scan 1: Reverse scan
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	OUT_PHASE[1:0]	0	R/W	Clock Phase Adjustment During Serial RGB Output Triple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: Setting prohibited Quadruple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: 3 (clk)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

37.2.51 Brightness (DC) Correction Register 1 (OUT_BRIGHT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PBRT_G[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	PBRT_G[9:0]	512	R/W	Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

37.2.52 Brightness (DC) Correction Register 2 (OUT_BRIGHT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PBRT_B[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PBRT_R[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	PBRT_B[9:0]	512	R/W	Brightness (DC) Adjustment of B Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	PBRT_R[9:0]	512	R/W	Brightness (DC) Adjustment of R Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

37.2.53 Contrast (Gain) Correction Register (OUT_CONTRAST)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CONT_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CONT_B[7:0]								CONT_R[7:0]							
Initial value:	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	CONT_G[7:0]	128	R/W	Contrast (Gain) Adjustment of G Signal 0/128 to 255/128 (approx.2 times)
15 to 8	CONT_B[7:0]	128	R/W	Contrast (Gain) Adjustment of B Signal 0/128 to 255/128 (approx.2 times)
7 to 0	CONT_R[7:0]	128	R/W	Contrast (Gain) Adjustment of R Signal 0/128 to 255/128 (approx.2 times)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

37.2.54 Panel Dither Register (OUT_PDTHA)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	PDTH_SEL[1:0]		—	—	PDTH_FORMAT[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	PDTH_PA[1:0]		—	—	PDTH_PB[1:0]		—	—	PDTH_PC[1:0]		—	—	PDTH_PD[1:0]	
Initial value:	0	0	1	1	0	0	0	0	0	0	1	0	0	0	0	1
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	PDTH_SEL[1:0]	0	R/W	Panel Dither Operation Mode 0: Truncate 1: Round-off 2: 2 × 2 pattern dither 3: Random pattern dither
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

0	OUTCNT_POLB_EDGE	0	R/W	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

37.3 Usage Methods

37.3.1 Gamma Correction Adjustment Method

The characteristics of G, B, R of each panel to be connected should be measured and gamma correction should be made to suit the panel.

Since the gamma correction adjustment depends on to the characteristics of the panel, there are no recommended setting values.

37.3.2 Dither Usage Method

Dither is used when pseudo contour is appeared on the display screen.

Table 37.29 Dither Settings

Bit Name	Setting Value
PDTH_FORMAT[1:0]	Selects the format. For RGB888: 0 For RGB666: 1 For RGB565: 2
PDTH_SEL[1:0]	When 2 × 2 pattern dither is to be used: 2
PDTH_PA[1:0]	Normally 3 (initial value)
PDTH_PB[1:0]	Normally 0 (initial value)
PDTH_PC[1:0]	Normally 2 (initial value)
PDTH_PD[1:0]	Normally 1 (initial value)

37.3.3 Output Format Adjustment Method

The setting example of the typical output format is shown in Table 37.30 and Table 37.31.

It is necessary to carry out the setting of synchronization system signals of each output format similarly as the setting of output after scaling.

Table 37.30 Setting Example of Synchronizing Signal

Register Name	Bit Name	VGA	SVGA	Description
TCON_TIM	TCON_HALF[10:0]	400	528	Sets the half value of 1H time period in clock units.
Vsync signal				
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	8	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVA2	TCON_STVA_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVA2	TCON_STVA_SEL[2:0]	0	0	For STVA output selection: 0
Vertical enable signal				
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	68	44	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	1200	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVB2	TCON_STVB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVB2	TCON_STVB_SEL[2:0]	1	1	For STVB output selection: 1

Register Name	Bit Name	VGA	SVGA	Description
Hsync signal				
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	128	Sets the changing point from the above pulse generation start position.
TCON_TIM_STH2	TCON_STH_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STH2	TCON_STH_SEL[2:0]	2	2	For STH output selection: 2
Horizontal enable signal				
TCON_TIM_STB1	TCON_STB_HS[10:0]	128	192	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	800	Sets the changing point from the above pulse generation start position.
TCON_TIM_STB2	TCON_STB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STB2	TCON_STB_SEL[2:0]	3	3	For STB output selection: 3

Table 37.31 Setting Example of Data System

Register Name	Bit Name	RGB888	RGB ()	Description
OUT_SET	OUT_ENDIAN_ON	0	0	When bit endian is changed: 1
OUT_SET	OUT_SWAP_ON	0	0	When B/R is to be swapped: 1
OUT_SET	OUT_PIXEL_INV_ON	0	0	When the function of reducing number of simultaneous changes is to be used: 1
OUT_SET	OUT_SUM_MOVE[4:0]	31	31	When OUT_PIXEL_INV_ON = 1, this register becomes valid. Sets the simultaneous changing threshold.
OUT_SET	OUT_FORMAT[1:0]	0	3	Sets the output format. For RGB888: 0 For RGB666: 1 For RGB565: 2 For serial RGB: 3
OUT_SET	OUT_FRQ_SEL[1:0]	0	1	Sets the output clock. For RGB888, RGB666, RGB565: 0 For triple speed serial RGB output: 1 For quadruple serial RGB output: 2
OUT_SET	OUT_DIR_SEL	0	0	When data arrangement of the serial RGB output is to be reversed: 1
OUT_SET	OUT_PHASE[1:0]	0	0	Sets when output phase of the serial RGB is shifted. Not delayed Delayed by one clock cycle: 1 Delayed by two clock cycles: 2 Delayed by three clock cycles: 3 (applicable only for quadruple speed mode)

38. Video Display Controller 5 (8):System Controller

38.1 System Controller

38.1.1 Overview of Functions

The system controller provides interrupt control, panel clock control, CLUT table read select signal status flag output functions.

38.1.2 Interrupt Control

Twenty three interrupt signals are output from the scaler and image synthesizer. The system controller controls whether to output these interrupt signals.

One is written to the corresponding INT_STA* bit when an interrupt signal is to be accepted. After 1 has been written to the bit, however, its value is still read out as 0 until the interrupt signal is accepted. Once the interrupt signal has been accepted, the INT_STA* bit is read out as 1.

The bit for an accepted interrupt signal is cleared by writing 0 to the INT_STA* bit. If further interrupt signals are to be accepted after the INT_STA* bit has been cleared, 1 is again written to the bit.

Table 38.1 Interrupt Signals

Request Source Name	Bit Name	Function
S0_VI_VSYNC	INT_STA 0	Vsync signal input to scaler 0
S0_LO_VSYNC	INT_STA 1	Vsync signal output from scaler 0
S0_VSYNCERR	INT_STA 2	Missing Vsync signal for scaler 0
GR3_VLINE	INT_STA 3	Specified line signal for panel output in graphics 3
S0_VFIELD	INT_STA 4	Field end signal for recording function in scaler 0
IV1_VBUFERR	INT_STA 5	Frame buffer write overflow signal for scaler 0
IV3_VBUFERR	INT_STA 6	Frame buffer read underflow signal for graphics 0
IV5_VBUFERR	INT_STA 7	Frame buffer read underflow signal for graphics 2
IV6_VBUFERR	INT_STA 8	Frame buffer read underflow signal for graphics 3
S0_WLINE	INT_STA 9	Write specification line signal input to scaling-down control block in scaler 0 (This signal is not present in this product.)
S1_VI_VSYNC	INT_STA 10	Vsync signal input to scaler 1
S1_LO_VSYNC	INT_STA 11	Vsync signal output from scaler 1
S1_VSYNCERR	INT_STA 12	Missing Vsync signal for scaler 1
S1_VFIELD	INT_STA 13	Field end signal for recording function in scaler 1
IV2_VBUFERR	INT_STA 14	Frame buffer write overflow signal for scaler 1
IV4_VBUFERR	INT_STA 15	Frame buffer read underflow signal for graphics 1
S1_WLINE	INT_STA 16	Write specification line signal input to scaling-down control block in scaler 1 (This signal is not present in this product.)
OIR_VI_VSYNC	INT_STA 17	Vsync signal input to output image generator
OIR_LO_VSYNC	INT_STA 18	Vsync signal output from output image generator
OIR_VLINE	INT_STA 19	Specified line signal for panel output in output image generator
OIR_VFIELD	INT_STA 20	Field end signal for recording function in output image generator
IV7_VBUFERR	INT_STA 21	Frame buffer write overflow signal for output image generator
IV8_VBUFERR	INT_STA 22	Frame buffer read underflow signal for graphics (OIR)

Table 38.2 Interrupt Clear/Hold Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT1	INT_STA0	0	S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA1	0	S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA2	0	S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA3	0	GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA4	0	S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA5	0	IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA6	0	IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA7	0	IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA8	0	IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA9	0	S0_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (Setting prohibited in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA10	0	S1_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Table 38.2 Interrupt Clear/Hold Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT2	INT_STA11	0	S1_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA12	0	S1_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA13	0	S1_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA14	0	IV2_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA15	0	IV4_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT3	INT_STA16	0	S1_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (Setting prohibited in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT3	INT_STA17	0	OIR_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT3	INT_STA18	0	OIR_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT3	INT_STA19	0	OIR_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT3	INT_STA20	0	OIR_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT3	INT_STA21	0	IV7_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT3	INT_STA22	0	IV8_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Table 38.3 Interrupt Output On/Off Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT4	INT_OUT0_ON	0	S0_VI_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT1_ON	0	S0_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT2_ON	0	S0_VSYNCERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT3_ON	0	GR3_VLINE Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT4_ON	0	S0_VFIELD Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT5_ON	0	IV1_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT6_ON	0	IV3_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT7_ON	0	IV5_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT8_ON	0	IV6_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT9_ON	0	S0_WLINE Interrupt Output On/Off 0: Off 1: On (Setting prohibited in this product)

SYSCNT_INT6	INT_OUT17_ON	0	OIR_VI_VSYNC Interrupt Output On/Off 0: Off 1: On

Table 38.3 Interrupt Output On/Off Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT6	INT_OUT18_ON	0	OIR_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT6	INT_OUT19_ON	0	OIR_VLINE Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT6	INT_OUT20_ON	0	OIR_VFIELD Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT6	INT_OUT21_ON	0	IV7_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT6	INT_OUT22_ON	0	IV8_VBUFERR Interrupt Output On/Off 0: Off 1: On

38.1.3 Panel Clock Control

The video image clock, external clock, or peripheral clock 1 is selectable as the source of the panel clock for supply to this module. The module is also equipped with a divider for scaling the frequency by factors from 1/1 to 1/32. The bits listed in Table 38.4 control the panel clock.

Table 38.4 Panel Clock Control

Register Name	Bit Name	Initial Value	Description
SYSCNT_PANEL_CLK	PANEL_ICKSEL [1:0]	0	Divided Clock Source Select 0: Video image clock (this is VIDEO_X1 if INP_SEL = 0 and DV_CLK if INP_SEL = 1) 1: External clock (LCD0_EXTCLK) 2: External clock (LCD1_EXTCLK) 3: Peripheral clock 1 (P1φ)
SYSCNT_PANEL_CLK	PANEL_OCKSEL[1:0]	0	Panel Clock Output Select 0: Divided clock generated from clock source selected by PANEL_CLK[1:0] 1: LVDS PLL clock 2: LVDS PLL clock divided by 7 3: Setting prohibited
SYSCNT_PANEL_CLK	PANEL_ICKEN	0	Panel Clock Operation Enable 0: Disables operation of the panel clock operation block. 1: Enables operation of the panel clock operation block. Note: Set this bit to 0 before changing the value of the PANEL_ICKSEL, PANEL_OCKSEL, or PANEL_DCDR bits.*
SYSCNT_PANEL_CLK	PANEL_DCDR [5:0]	1	Clock Frequency Division Ratio Refer to Table 38.5 for details on the settings. Note: Settings other than those in Table 38.5 are prohibited.

Note: * Set this bit to 0 before changing the value of the LVDS_CLK_EN bit in LVDS_CLKSELR.

Table 38.5 I/O Clock Frequency and Divisors

		I/O Clock Frequency (MHz)		
DCDR[5:0]	**Clock Ratio**	**27.00**	**54.00**	**66.67**
000001	1/1	27.00	54.00	66.67
000010	1/2	13.50	27.00	33.33
000011	1/3	9.00	18.00	22.22
000100	1/4	6.75	13.50	16.67
000101	1/5	5.40	10.80	13.33
000110	1/6	4.50	9.00	11.11
000111	1/7	3.86	7.71	9.52
001000	1/8	3.38	6.75	8.33
001001	1/9	3.00	6.00	7.41
001100	1/12	2.25	4.50	5.56
010000	1/16	1.69	3.38	4.17
011000	1/24	1.13	2.25	2.78
100000	1/32	0.84	1.69	2.08

38.1.4 CLUT Table Read Select Signal Status Flag

The CLUT read select signal status can be read using the flags shown in Table 38.6.

Table 38.6 CLUT Table Read Select Signal Status Flags

Register Name	Bit Name	Initial Value	Description
SYSCNT_CLUT	GR0_CLT_SEL_ST	—	Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR1_CLT_SEL_ST	—	Graphics 1 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR2_CLT_SEL_ST	—	Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR3_CLT_SEL_ST	—	Graphics 3 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR_OIR_CLT_SEL_ST	—	Graphics OIR CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.

38.2 Register Descriptions

The following register sets are allocated in the SH register map area.

- Symbols used in Register Descriptions

  Initial value: Register value after a reset
  —: Undefined value
  R/W: Readable/writable. The written value can be read.
  R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
  R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
  R: Read-only. The write value should always be 0.
  —/W: Write-only. The read value is undefined.

Table 38.7 Register Configuration of System Controller (CH0)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Interrupt control register 1	SYSCNT_INT1	R/W	H'0000 0000	H'FCFF 7A80	32
Interrupt control register 2	SYSCNT_INT2	R/W	H'0000 0000	H'FCFF 7A84	32
Interrupt control register 3	SYSCNT_INT3	R/W	H'0000 0000	H'FCFF 7A88	32
Interrupt control register 4	SYSCNT_INT4	R/W	H'0000 0000	H'FCFF 7A8C	32
Interrupt control register 5	SYSCNT_INT5	R/W	H'0000 0000	H'FCFF 7A90	32
Interrupt control register 6	SYSCNT_INT6	R/W	H'0000 0000	H'FCFF 7A94	32

CLUT table read select signal status register	SYSCNT_CLUT	R	H'0000	H'FCFF 7A9A	16

Table 38.8 Register Configuration of System Controller (CH1)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Interrupt control register 1	SYSCNT_INT1	R/W	H'0000 0000	H'FCFF 9A80	32
Interrupt control register 2	SYSCNT_INT2	R/W	H'0000 0000	H'FCFF 9A84	32
Interrupt control register 3	SYSCNT_INT3	R/W	H'0000 0000	H'FCFF 9A88	32
Interrupt control register 4	SYSCNT_INT4	R/W	H'0000 0000	H'FCFF 9A8C	32
Interrupt control register 5	SYSCNT_INT5	R/W	H'0000 0000	H'FCFF 9A90	32
Interrupt control register 6	SYSCNT_INT6	R/W	H'0000 0000	H'FCFF 9A94	32
Panel clock control register	SYSCNT_PANEL_CLK	R/W	H'0001	H'FCFF 9A98	16
CLUT table read select signal status register	SYSCNT_CLUT	R	H'0000	H'FCFF 9A9A	16

38.2.1 Interrupt Control Register 1 (SYSCNT_INT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_STA7	—	—	—	INT_STA6	—	—	—	INT_STA5	—	—	—	INT_STA4
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_STA3	—	—	—	INT_STA2	—	—	—	INT_STA1	—	—	—	INT_STA0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_STA7	0	R/W	IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_STA6	0	R/W	IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_STA5	0	R/W	IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_STA4	0	R/W	S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_STA3	0	R/W	GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INT_STA2	0	R/W	S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_STA1	0	R/W	S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_STA0	0	R/W	S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

38.2.2 Interrupt Control Register 2 (SYSCNT_INT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_STA15	—	—	—	INT_STA14	—	—	—	INT_STA13	—	—	—	INT_STA12
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_STA11	—	—	—	INT_STA10	—	—	—	INT_STA9	—	—	—	INT_STA8
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_STA15	0	R/W	IV4_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_STA14	0	R/W	IV2_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_STA13	0	R/W	S1_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_STA12	0	R/W	S1_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_STA11	0	R/W	S1_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INT_STA10	0	R/W	S1_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_STA9	0	R/W	S0_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (Setting prohibited in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_STA8	0	R/W	IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

38.2.3 Interrupt Control Register 3 (SYSCNT_INT3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	INT_STA22	—	—	—	INT_STA21	—	—	—	INT_STA20
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_STA19	—	—	—	INT_STA18	—	—	—	INT_STA17	—	—	—	INT_STA16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_STA22	0	R/W	IV8_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_STA21	0	R/W	IV7_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_STA20	0	R/W	OIR_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_STA19	0	R/W	OIR_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INT_STA18	0	R/W	OIR_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_STA17	0	R/W	OIR_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	INT_STA16	0	R/W	S1_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (Setting prohibited in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

38.2.4 Interrupt Control Register 4 (SYSCNT_INT4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_OUT7_ON	—	—	—	INT_OUT6_ON	—	—	—	INT_OUT5_ON	—	—	—	INT_OUT4_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_OUT3_ON	—	—	—	INT_OUT2_ON	—	—	—	INT_OUT1_ON	—	—	—	INT_OUT0_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_OUT7_ON	0	R/W	IV5_VBUFERR Interrupt Output On/Off 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_OUT6_ON	0	R/W	IV3_VBUFERR Interrupt Output On/Off 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_OUT5_ON	0	R/W	IV1_VBUFERR Interrupt Output On/Off 0: Off 1: On
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_OUT4_ON	0	R/W	S0_VFIELD Interrupt Output On/Off 0: Off 1: On
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_OUT3_ON	0	R/W	GR3_VLINE Interrupt Output On/Off 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INT_OUT2_ON	0	R/W	S0_VSYNCERR Interrupt Output On/Off 0: Off 1: On
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_OUT1_ON	0	R/W	S0_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_OUT0_ON	0	R/W	S0_VI_VSYNC Interrupt Output On/Off 0: Off 1: On

38.2.5 Interrupt Control Register 5 (SYSCNT_INT5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_OUT15_ON	—	—	—	INT_OUT14_ON	—	—	—	INT_OUT13_ON	—	—	—	INT_OUT12_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_OUT11_ON	—	—	—	INT_OUT10_ON	—	—	—	INT_OUT9_ON	—	—	—	INT_OUT8_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_OUT15_ON	0	R/W	IV4_VBUFERR Interrupt Output On/Off 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_OUT14_ON	0	R/W	IV2_VBUFERR Interrupt Output On/Off 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_OUT13_ON	0	R/W	S1_VFIELD Interrupt Output On/Off 0: Off 1: On
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_OUT12_ON	0	R/W	S1_VSYNCERR Interrupt Output On/Off 0: Off 1: On
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_OUT11_ON	0	R/W	S1_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INT_OUT10_ON	0	R/W	S1_VI_VSYNC Interrupt Output On/Off 0: Off 1: On
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_OUT9_ON	0	R/W	S0_WLINE Interrupt Output On/Off 0: Off 1: On (Setting prohibited in this product)
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_OUT8_ON	0	R/W	IV6_VBUFERR Interrupt Output On/Off 0: Off 1: On

38.2.6 Interrupt Control Register 6 (SYSCNT_INT6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	INT_OUT22_ON	—	—	—	INT_OUT21_ON	—	—	—	INT_OUT20_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_OUT19_ON	—	—	—	INT_OUT18_ON	—	—	—	INT_OUT17_ON	—	—	—	INT_OUT16_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_OUT22_ON	0	R/W	IV8_VBUFERR Interrupt Output On/Off 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_OUT21_ON	0	R/W	IV7_VBUFERR Interrupt Output On/Off 0: Off 1: On
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_OUT20_ON	0	R/W	OIR_VFIELD Interrupt Output On/Off 0: Off 1: On
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_OUT19_ON	0	R/W	OIR_VLINE Interrupt Output On/Off 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INT_OUT18_ON	0	R/W	OIR_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_OUT17_ON	0	R/W	OIR_VI_VSYNC Interrupt Output On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_OUT16_ON	0	R/W	S1_WLINE Interrupt Output On/Off 0: Off 1: On (Setting prohibited in this product)

38.2.7 Panel Clock Control Register (SYSCNT_PANEL_CLK)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	PANEL_ICKSEL [1:0]		PANEL_OCKSEL [1:0]		—	PANEL_ ICKEN	—	—	PANEL_DCDR[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R/W	R/W	R/W	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	PANEL_ICKSEL [1:0]	All 0	R/W	Divided Clock Source Select 0: Video image clock (this is VIDEO_X1 if INP_SEL = 0 and DV_CLK if INP_SEL = 1) 1: External clock (LCD0_EXTCLK) 2: External clock (LCD1_EXTCLK) 3: Peripheral clock 1 (P1φ)
11, 10	PANEL_OCKSEL [1:0]	All 0	R/W	Panel Clock Output Select 0: Divided clock generated from clock source selected by PANEL_CLK[1:0] 1: LVDS PLL clock 2: LVDS PLL clock divided by 7 3: Setting prohibited
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	PANEL_ ICKEN	0	R/W	Panel Clock Operation Enable 0: Disables operation of the panel clock operation block. 1: Enables operation of the panel clock operation block. Note: Set this bit to 0 before changing the value of the PANEL_ICKSEL, PANEL_OCKSEL, or PANEL_DCDR bits.*
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	PANEL_ DCDR[5:0]	1	R/W	Clock Frequency Division Ratio Refer to Table 38.5 for details on the settings. Note: Settings other than those in Table 38.5 are prohibited.

Note: * Set this bit to 0 before changing the value of the LVDS_CLK_EN bit in LVDS_CLKSELR.

38.2.8 CLUT Table Read Select Signal Status Register (SYSCNT_CLUT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	GR_OIR_CLT_SEL_ST	—	GR3_CLT_SEL_ST	—	—	—	GR2_CLT_SEL_ST	—	—	—	GR1_CLT_SEL_ST	—	—	—	GR0_CLT_SEL_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	GR_OIR_CLT_SEL_ST	—	R	Graphics OIR CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR3_CLT_SEL_ST	—	R	Graphics 3 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_CLT_SEL_ST	—	R	Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR1_CLT_SEL_ST	—	R	Graphics 1 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_CLT_SEL_ST	—	R	Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.

40. LVDS Output Interface

This LSI has a module for providing a low voltage differential signaling (LVDS) output interface. This module converts the RGB signals output from video display controller 5 to the LVDS format that has six bits each for R, G, and B signals, and outputs the converted signals. It has a dedicated phase-locked loop (PLL) circuit, which can generate a clock with a desired frequency by dividing or multiplying the input clock frequency.

The clock output from this PLL can be used as the panel clock for video display controller 5 even when LVDS output is not used. This PLL is called LVDS PLL in this section.

40.1 Features

- Four pairs of differential output conforming to the TIA/EIA-644 standard (three pairs for data and one pair for the clock)
- When LVDS output is not used, the LVDS pins can be used as CMOS input/output pins.
- LVDS PLL for generating a clock with a desired frequency
- LVDS PLL power-down function

40.2 Block Diagram

Figure 40.1 shows a block diagram of the LVDS output interface configuration.

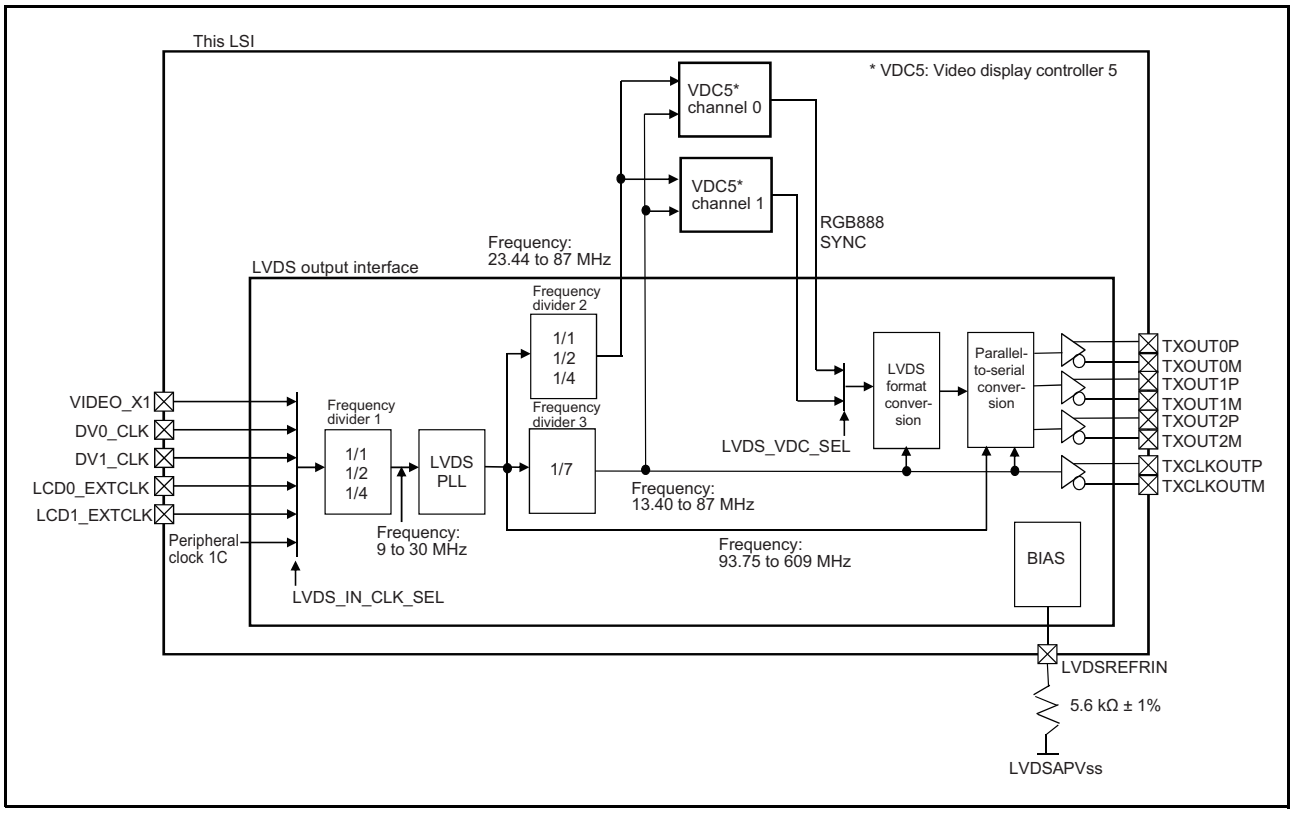

Figure 40.1 Block Diagram of LVDS Output Interface Configuration

Figure 40.2 shows a block diagram of the LVDS PLL circuit.

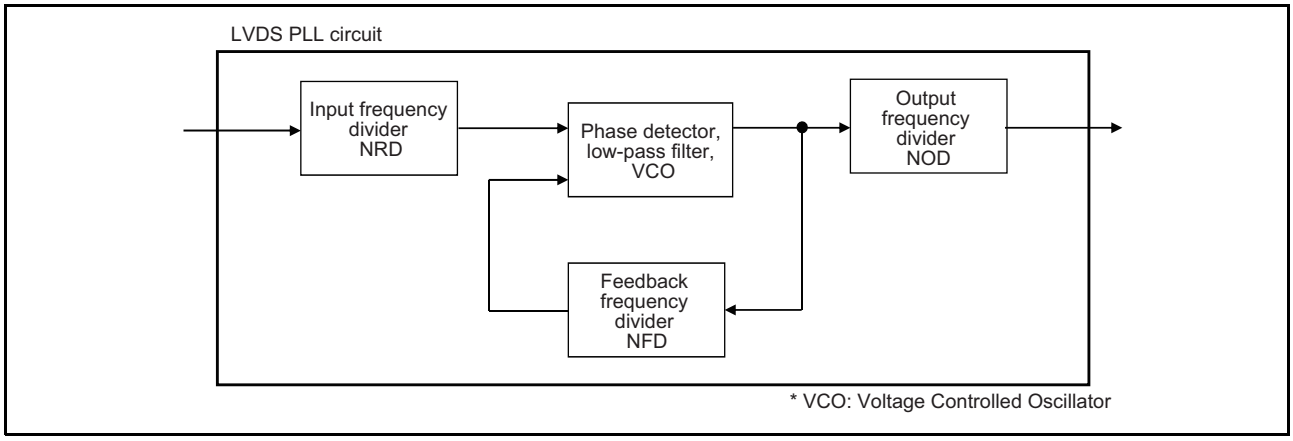

Figure 40.2 Block Diagram of LVDS PLL Circuit

40.3 Input/Output Pins

Table 40.1 shows the pin configuration.

Table 40.1 Pin Configuration

Pin Name	Symbol	I/O	Function
LVDS analog power supply pin	LVDSAPVcc	Input	Power supply pin for LVDS output
LVDS analog ground pin*	LVDSAPVss	Input	Ground pin for LVDS output
LVDS PLL power supply pin	LVDSPLLVcc	Input	Power supply pin for LVDS PLL
LVDS resistor connection pin	LVDSREFRIN	Input	Reference resistor connection pin Connect to LVDSAPVss via a resistor with a value of 5.6 kΩ ± 1%. (QFP package) Connect to Vss via a resistor with a value of 5.6 kΩ ± 1%. (BGA package)
LVDS data output pin 0P	TXOUT0P	Output	LVDS data output pins
LVDS data output pin 0M	TXOUT0M	Output	
LVDS data output pin 1P	TXOUT1P	Output	
LVDS data output pin 1M	TXOUT1M	Output	
LVDS data output pin 2P	TXOUT2P	Output	
LVDS data output pin 2M	TXOUT2M	Output	
LVDS clock output pin CP	TXCLKOUTP	Output	LVDS clock output pins
LVDS clock output pin CM	TXCLKOUTM	Output	

Note: * This pin is not present on products in the BGA package.

40.4 Register Descriptions

Table 40.2 shows the register configuration.

Table 40.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
LVDS register update control register	LVDS_UPDATE	R/W	H'00000000	H'FCFF7A30	32
LVDS format conversion register L	LVDSFCL	R/W	H'00000321	H'FCFF7A34	32
LVDS clock select register	LCLKSELR	R/W	H'00000000	H'FCFF7A50	32
LVDSPLL setting register	LPLLSETR	R/W	H'00000001	H'FCFF7A54	32
LVDS PHY characteristics switching register	LPHYACC	R/W	H'00000000	H'FCFF7A5C	32

40.4.1 LVDS Register Update Control Register (LVDS_UPDATE)

LVDS_UPDATE controls the timing for updating LVDS registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LVDS_UPDATE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	LVDS_ UPDATE	0	R/W	LVDS Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

40.4.2 LVDS Format Conversion Register L (LVDSFCL)

LVDSFCL is used to make necessary settings for conversion of the RGB signals output from video display controller 5 to the LVDS format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SYNC_MODE	—	—	—	—	SYNC_POL[1:0]		—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R/W	R/W	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LVDS_SEL2[3:0]				LVDS_SEL1[3:0]				LVDS_SEL0[3:0]			
Initial value:	0	0	0	0	0	0	1	1	0	0	1	0	0	0	0	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SYNC_MODE	0	R/W	SYNC Mode Switch Switches the SYNC mode. 0: LVDS_TCON0 and LVDS_TCON2 are transmitted through LVDS signals. 1: Fixed values are transmitted as LVDS_TCON0 and LVDS_TCON2 through LVDS signals. The fixed values are specified in the SYNC_POL bits.
27 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23, 22	SYNC_POL [1:0]	00	R/W	LVDS_TCON0 and LVDS_TCON2 Value The values specified in these bits are output as the LVDS_TCON0 and LVDS_TCON2 values through LVDS signals when the SYNC_MODE bit is set to 1. SYNC_POL[1]: Specifies the LVDS_TCON0 output value. SYNC_POL[0]: Specifies the LVDS_TCON2 output value.
21 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	LVDS_SEL2 [3:0]	0011	R/W	TXOUT2P/M Data Format Setting These bits specify the format of the data to be output through the TXOUT2P and TXOUT2M pins. Be sure to set these bits to 3 in this LSI.
7 to 4	LVDS_SEL1 [3:0]	0010	R/W	TXOUT1P/M Data Format Setting These bits specify the format of the data to be output through the TXOUT1P and TXOUT1M pins. Be sure to set these bits to 2 in this LSI.
3 to 0	LVDS_SEL0 [3:0]	0001	R/W	TXOUT0P/M Data Format Setting These bits specify the format of the data to be output through the TXOUT0P and TXOUT0M pins. Be sure to set these bits to 1 in this LSI.

Note: This register is updated by setting the LVDS_UPDATE bit in the LVDS register update control register (LVDS_UPDATE) to 1.

40.4.3 LVDS Clock Select Register (LCLKSELR)

LCLKSELR specifies the input clock, the frequency dividing values for frequency dividers 1 and 2, and the channel used in video display controller 5.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	LVDS_IN_CLK_SEL [2:0]			—	—	—	—	—	—	LVDS_IDIV_ SET[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LVDSPLL_TST[5:0]						LVDS_ODIV_ SET[1:0]		—	—	—	LVDS_ CLK_EN	—	—	LVDS_V DC_SEL	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 24	LVDS_IN_ CLK_SEL [2:0]	All 0	R/W	These bits select the clock input to frequency divider 1. 0: VIDEO_X1 1: DV0_CLK 2: DV1_CLK 3: LCD0_EXTCLK 4: LCD1_EXTCLK 5: Peripheral clock 1C (P1φ) 6 and 7: Setting prohibited
23 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	LVDS_IDIV_ SET[1:0]	All 0	R/W	These bits specify the frequency dividing value (NIDIV) for frequency divider 1. NIDIV = 1, 2, or 4 0: NIDIV = 1 1: NIDIV = 2 2: NIDIV = 4 3: Setting prohibited
15 to 10	LVDSPLL_ TST[5:0]	All 0	R/W	Internal Parameter Setting for LVDS PLL These bits specify the internal parameters for the LVDS PLL (the resistance of the LPF circuit and the current through the charge pump circuit). Note: Be sure to set these bits to 010000 in this LSI.
9, 8	LVDS_ODIV_ SET[1:0]	All 0	R/W	These bits specify the frequency dividing value (NODIV) for frequency divider 2. NODIV = 1, 2, or 4 0: NODIV = 1 1: NODIV = 2 2: NODIV = 4 3: Setting prohibited
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	LVDS_CLK_ EN	0	R/W	Enables the LVDS PLL output. 0: Output from the PLL is disabled. 1: Output from the PLL is enabled. Note: Be sure to clear this bit to 0 before making settings in any other register described in this section. In addition, before modifying this bit, be sure to clear the PANEL_ICKEN bits in SYSCNT_PANEL_CLK in video display controller 5 to 0.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	LVDS_VDC_ SEL	0	R/W	Selects a channel in video display controller 5 whose data is to be output through the LVDS interface. 0: Channel 0 is selected. 1: Channel 1 is selected.

Bit	Bit Name	Initial Value	R/W	Description
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

40.4.4 LVDS PLL Setting Register (LPLLSETR)

LPLLSETR specifies the frequency dividing value and controls power-down in the LVDS PLL.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	LVDSPLL_FD[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	LVDSPLL_RD[4:0]					—	—	LVDSPLL_OD[1:0]		—	—	—	LVDSPLL_PD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	LVDSPLL_FD[10:0]	All 0	R/W	These bits specify the frequency dividing value (NFD) for the feedback frequency in the LVDS PLL. NFD = 24 to 2047*2 24 to 2047*2: NFD = LVDSPLL_FD value 0 to 23: Setting prohibited
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	LVDSPLL_RD[4:0]	All 0	R/W	These bits specify the frequency dividing value (NRD) for the input frequency in the LVDS PLL. NRD = 1 to 32 0 to 31: NRD = LVDSPLL_RD value + 1
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	LVDSPLL_OD[1:0]	All 0	R/W	These bits specify the frequency dividing value (NOD) for the output frequency in the LVDS PLL. NOD = 1, 2, 4, or 8 0 to 3: NOD = 2 ^ LVDSPLL_OD value
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LVDSPLL_PD	1	R/W	Controls power-down for the LVDS PLL. 0: Normal operation 1: Power-down state

Notes: 1. When selecting the bypass output, set LVDSPLL_OD to 0.
2. The following values are also prohibited: 28 to 31, 37 to 39, 46, 47, and 55.

40.4.5 LVDS PHY Characteristics Switching Register (LPHYACC)

LPHYACC specifies the characteristics of the LVDS output buffers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SKEWC [1]	SKEWC [0]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	SKEWC [1:0]	00	R/W	Skew Adjustment of TXCLKOUTP and TXCLKOUTM Pins These bits adjust the skew between the signals on the TXCLKOUTP and TXCLKOUTM pins. Note: For LVDS output, be sure to set these bits to 01.

40.5 Operation

This module receives the RGB888 signals output from video display controller 5 and the SYNC signal, converts the video signals to the LVDS format, and outputs them. The precision of the RGB signals is reduced to six bits each. The operating clock is generated in the LVDS PLL.

40.5.1 LVDS PLL Settings

The input clock select circuit, frequency dividers 1 to 3, and LVDS PLL circuit are used to generate operating clocks. For input and output of each circuit, allowable frequency ranges are determined; be sure to make appropriate settings to generate input and output frequencies within the ranges.

Before modifying various setting registers, check that the panel clock operation in video display controller 5 is disabled (SYSCNT_PANEL_CLK.PANEL_ICKEN = 0) and the LVDS PLL output is disabled (LPLLSETR.LVDS_CLK_EN = 0).

Figure 40.3 shows a block diagram of the LVDS PLL and its peripheral circuits.

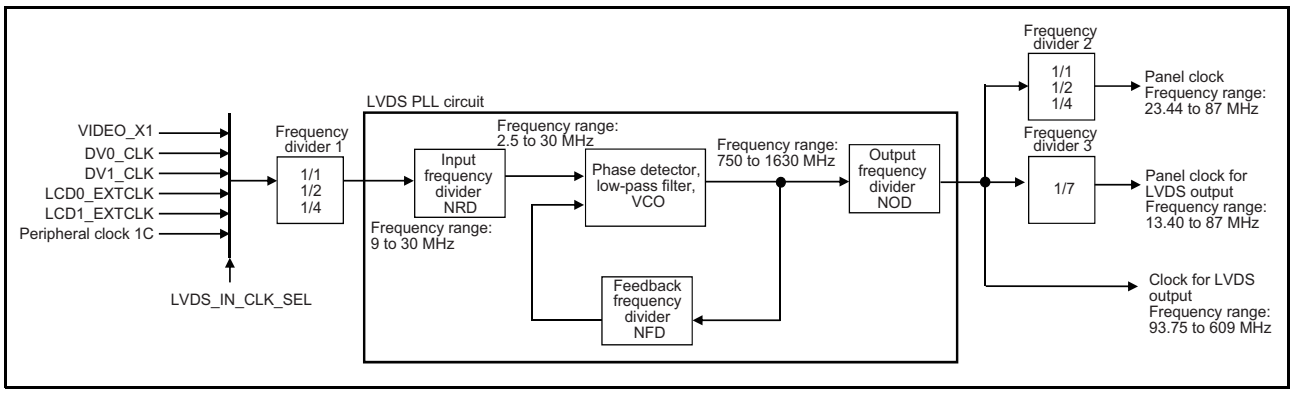

Figure 40.3 Block Diagram of LVDS PLL and Peripheral Circuits

(1) Clock Input to LVDS PLL

The clock input to the LVDS PLL can be selected from among VIDEO_X1, DV0_CLK, DV1_CLK, LCD0_EXTCLK, LCD1_EXTCLK, and peripheral clock 1C (P1φ) clocks through the LVDS_IN_CLK_SEL bit setting in LVDS_CLKSELR.

The frequency of this input clock should be within the range from 9 to 30 MHz. When the input clock frequency is higher than the upper limit of this range, use frequency divider 1 placed before the LVDS PLL and reduce the frequency so that it is within the allowed range.

(2) LVDS PLL Frequency Setting

The LVDS PLL has three internal frequency dividers: input frequency divider NRD, feedback frequency divider NFD, and output frequency divider NOD.

The frequency of the clock output from the LVDS PLL is calculated by the following equations. Note that the reference frequency, VCO output frequency, LVDS PLL input frequency, and LVDS PLL output frequency should be within the respective ranges shown below the equations.

FREF = FIN / NRD (Reference frequency)
FVCO = FIN × NFD / NRD (VCO output frequency)
FOUT = FIN × NFD / (NRD × NOD) (LVDS PLL output frequency)

Note:
FREF: Reference frequency. Frequency range = 2.5 MHz to 30 MHz
FVCO: VCO output frequency. Frequency range = 750 MHz to 1630 MHz
FIN: LVDS PLL input frequency. Frequency range = 9 MHz to 30 MHz
FOUT: LVDS PLL output frequency. Frequency range = 609 MHz max.

(3) LVDS PLL Frequency Setting Timing

Before making settings for each frequency divider in the PLL circuit described in (2), place the PLL in the power-down state (PD = 1) and wait for at least 0.5 µs. After making frequency divider settings, wait for a retention period of at least 0.5 µs and release the power-down state (PD = 0).

Figure 40.4 shows this timing.

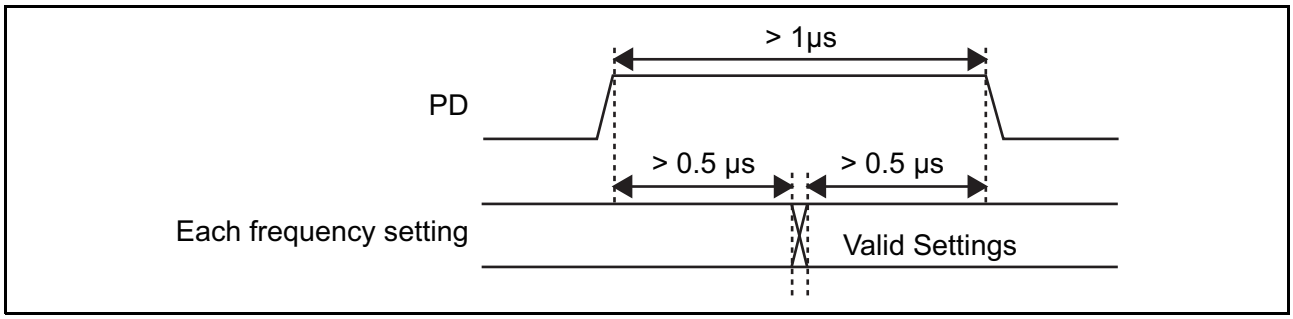

Figure 40.4 PLL Setting Timing

(4) LVDS PLL Output Enable Timing

Output of the clock from the LVDS PLL can be enabled or disabled through the LVDS_CLK_EN bit setting in LCLKSELR.

To allow time for stabilization of oscillation by the PLL, wait for at least 200 us after release from the power-down state before enabling the LVDS PLL output. The LVDS_CLK_EN bit in LCLKSELR should be modified only while the panel clock operation in video display controller 5 is disabled (SYSCNT_PANEL_CLK.PANEL_ICKEN = 0).

(5) LVDS PLL Output Clock Frequency Setting

When using the clock output from the LVDS PLL as the clock for the LVDS output interface, select the clock from frequency divider 3 (divided by 7) as the panel clock for video display controller 5.

When using the clock output from the LVDS PLL as the clock for digital RGB output, select the clock from frequency divider 2 as the panel clock for video display controller 5. In addition, make appropriate settings so that the clock frequency after frequency division is 87 MHz or lower. This limitation on the frequency is not applied when the clock is used for the LVDS output interface.

The panel clock can be selected through the PANEL_OCKSEL bits in SYSCNT_PANEL_CLK in video display controller 5.

40.5.2 LVDS Output Format

This module converts and then outputs the LCD data output from video display controller 5 and the timing signals generated by the LCD TCON.

(1) LVDS Output Format

(a) LCD data

After converted into the LVDS format, LCD data is output from LCD_DATA23 to LCD_DATA18, LCD_DATA15 to LCD_DATA10, and LCD_DATA7 to LCD_DATA2 pins.

(b) Timing signals generated by LCD TCON

After converted into the LVDS format, the timing signals are output from the LCD_TCON0, LCD_TCON2, and LCD_TCON3 pins.

Figure 40.5 shows the bit alignment in the LVDS output format.

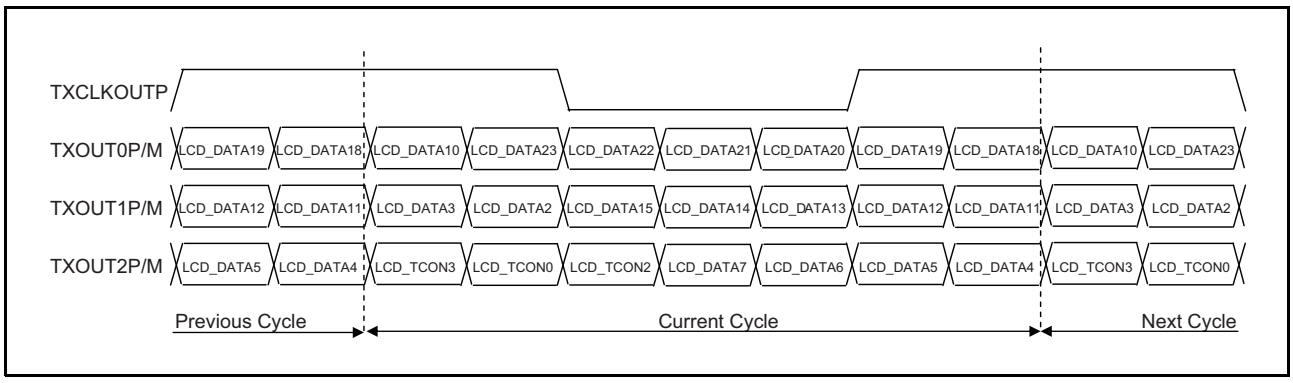

Figure 40.5 Data Map of LVDS Output Format

(2) Setting Example

The following is the setting example of the LVDS output format. The register the setting is applied is register in video display controller 5. For the details of the register, see section 37, Video Display Controller 5 (7): Output Controller.

Table 40.3 Setting Example of LVDS Output Format

Register	Bit	Value	Remark
OUT_SET	OUT_ENDIAN_ON	0	Bit endian change is off.
	OUT_SWAP_ON	0	B/R signal swap is off.
	OUT_FORMAT[1:0]	0	RGB888 is selected as an output format (the upper six-bit data is output in the LVDS format).
TCON_TIM_STVA2	TCON_TIM_STVA2	0	The VS signal is selected for the LCD_TCON0 pin.
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	Arbitrary	The VS signal timing is set.
	TCON_STVA_VW[10:0]	Arbitrary	The VS signal timing is set.
TCON_TIM_STH2	TCON_STH_SEL[2:0]	2	The HS signal is selected for the LCD_TCON2 pin.
TCON_TIM_STH1	TCON_STH_HS[10:0]	Arbitrary	The HS signal timing is set.
	TCON_STH_VS[10:0]	Arbitrary	The HS signal timing is set.
TCON_TIM_STB2	TCON_STB_SEL[2:0]	7	The DE signal is selected for the LCD_TCON3 pin.
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	Arbitrary	The DE signal timing is set.
	TCON_STVB_VW[10:0]	Arbitrary	The DE signal timing is set.
TCON_TIM_STB1	TCON_STB_HS[10:0]	Arbitrary	The DE signal timing is set.
	TCON_STB_HW[10:0]	Arbitrary	The DE signal timing is set.

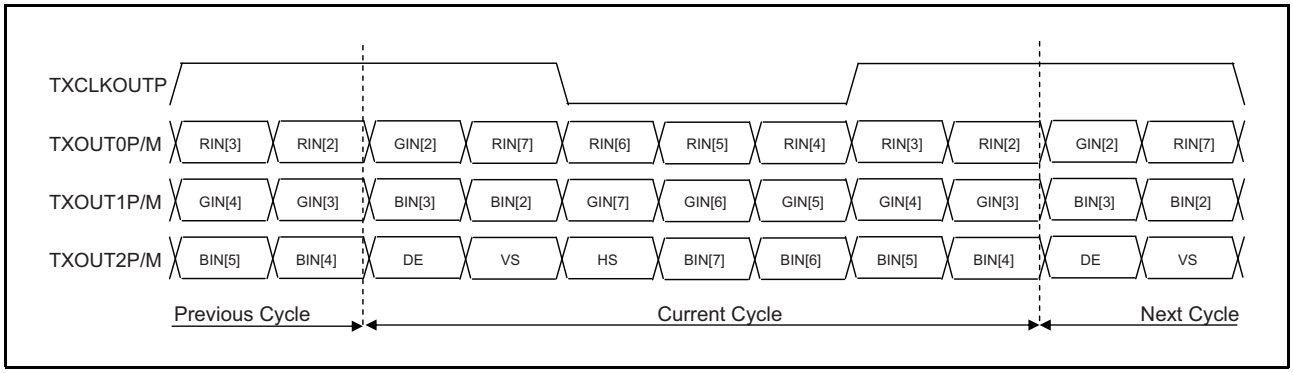

Figure 40.6 Data Map of Setting Example of LVDS Output Format

40.5.3 Procedures for Register Settings

(1) Initial Settings after Power-on Reset

The following shows an example of initial settings after a power-on reset.

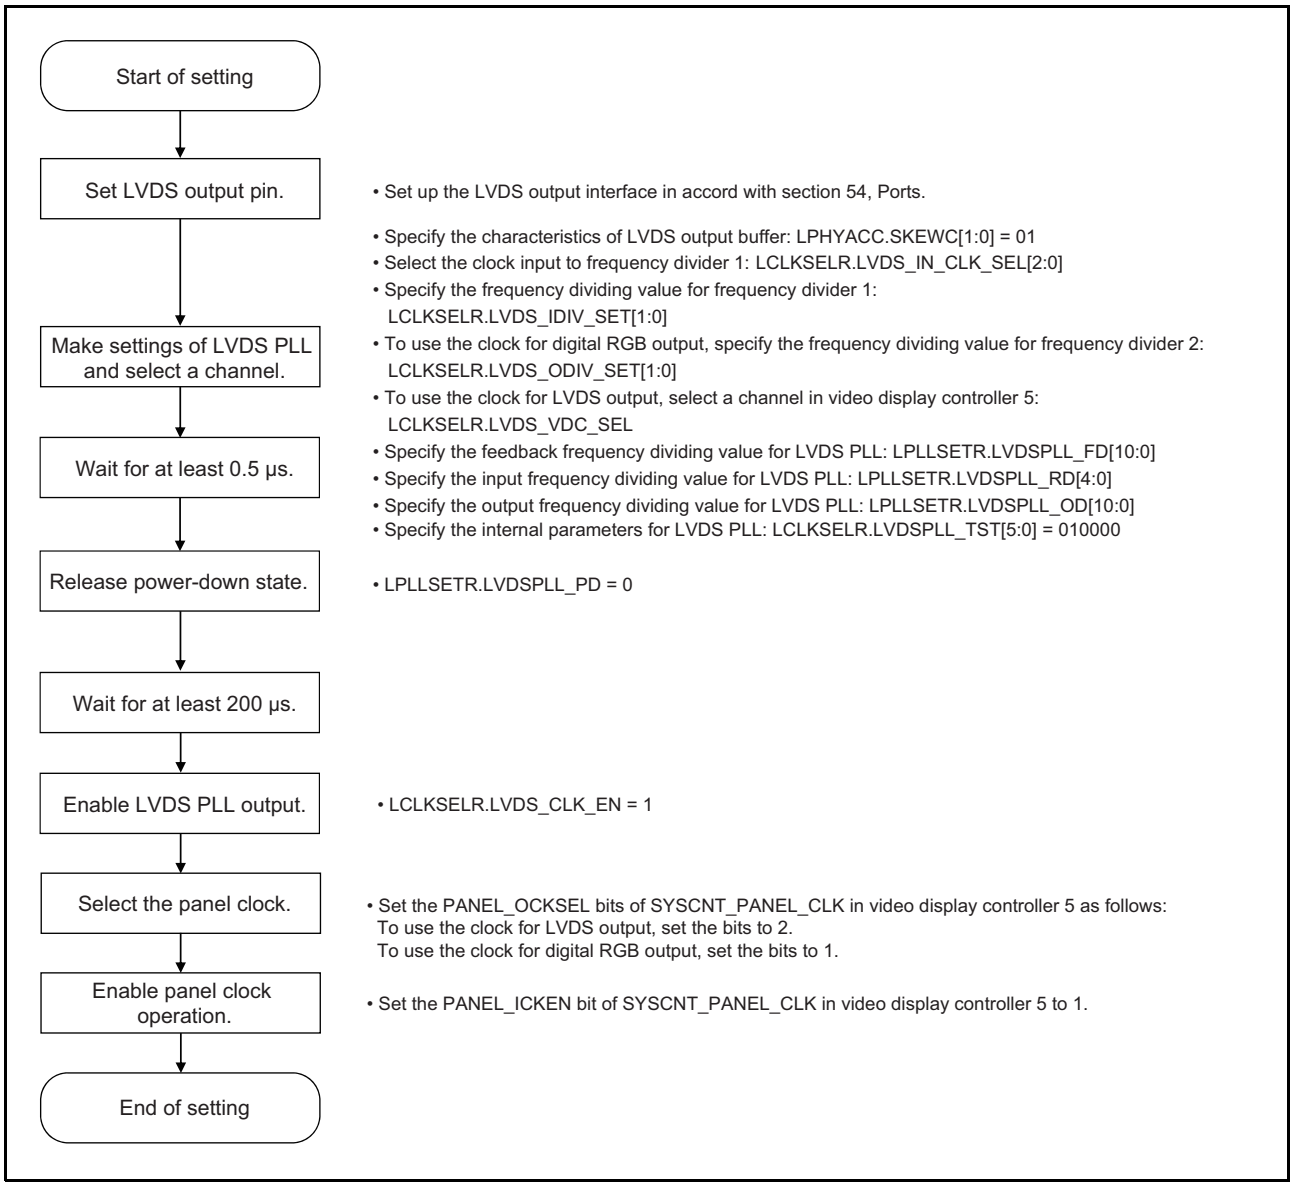

Figure 40.7 Example of Initial Settings after Power-On Reset

(2) Frequency Modification Settings

The following shows an example of modifying frequencies.

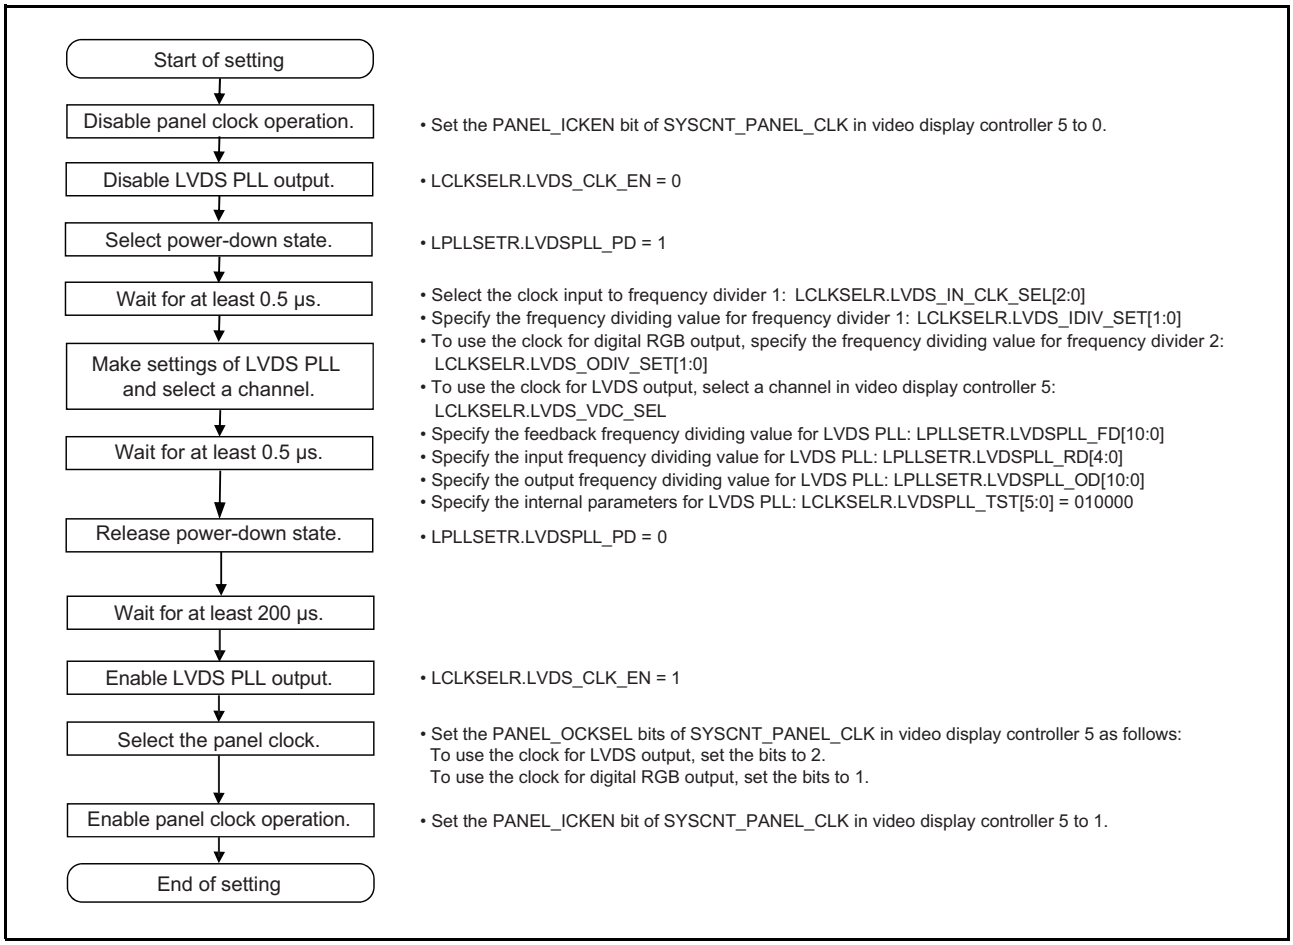

Figure 40.8 Example of Modifying Frequencies for LVDS Output

40.6 Notes

40.6.1 LVDS Output Pin Settings

The LVDS output buffers enter a low power consumption state when pins are set up other than for an LVDS output interface in accord with section 54, Ports. Although the LVDS output buffers return from the low power consumption state after pins are set to operate as an LVDS output interface, this requires up to 0.5 µs. Accordingly, at least 0.5 µs are required before actual LVDS output starts after pins have been set to operate as an LVDS output interface.

41. Image Renderer (IMR-LS2)

The contents of this section are available upon non-disclosure agreement.
For details, contact your local sales representatives.

42. Image Renderer for Display (IMR-LSD)

The contents of this section are available upon non-disclosure agreement.
For details, contact your local sales representatives.

43. Display Out Comparison Unit

The display out comparison unit (DISCOM) checks whether the data output from the graphics display module* agrees with the expected graphics data. This checking is accomplished by comparing the CRC code of the data output from the graphics display module with the pre-calculated CRC code of the expected graphics data. Since this LSI incorporates two channels of graphics display modules, it also incorporates two channels of the DISCOM units corresponding to them.

Note: * This indicates video display controller 5 in this LSI.

43.1 Features

This module has the following features.

- Comparison of Graphics Planes of Graphics Display Module
  One of the graphics planes of the graphics display module can be selected and its CRC code can be compared with the expected CRC code.
- Comparison of Data after α Blending
  The CRC code of the graphics data obtained after α blending in the graphics display module can be compared with the expected CRC code.
- Rectangular Area Specification
  The rectangular area can be specified based on the graphics data output from the graphics display module (graphics plane or graphics data obtained after α blending) and its CRC code can be compared with the expected CRC code.
- Pixel Format
  A pixel format for 32 bits/pixel or 16 bits/pixel can be selected.
  ARGB8888/RGB888 are available for 32 bits/pixel, and only RGB565 is available for 16 bits/pixel.

43.2 Block Diagram

An overall block diagram of this module is shown in Figure 43.1.

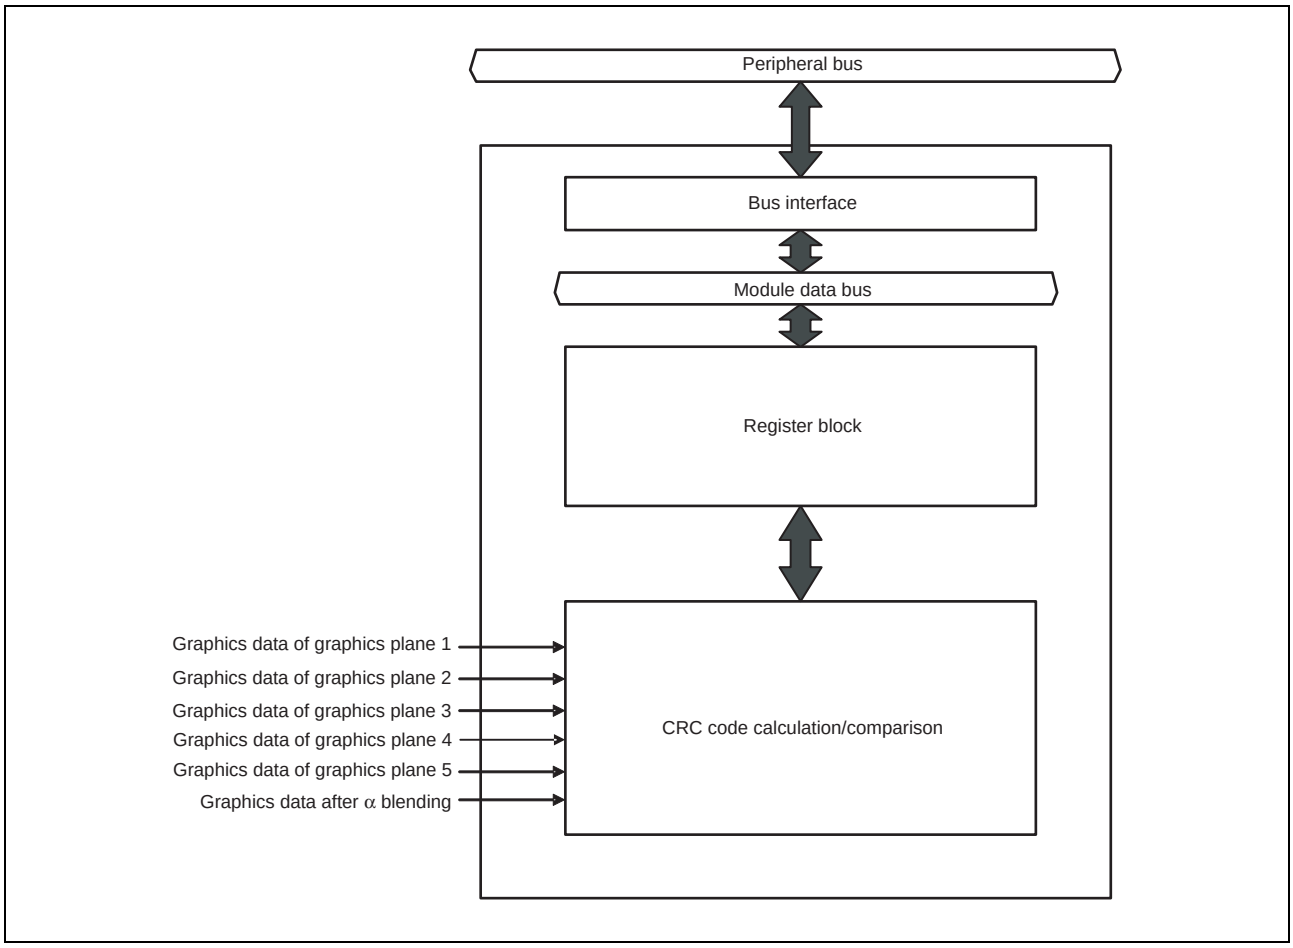

Figure 43.1 Block Diagram

43.3.1 Control Register (DOCMCR)

DOCMCR turns CRC code comparison on or off.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMPRU
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMPR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CMPRU	0	R	Display Out Comparison Update Value Reflects the internal update of the CMPR bit. It should be checked that this bit is 0 before updating the registers other than the CMPR bit in DOCMCR, DOCMCLSTR, and DOCMIENR. For details, see section 43.4.8, Register Update Timing.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CMPR	0	R/W	Display Out Comparison Execution Executes display out comparison. This bit is loaded inside when the start of the valid period of the graphics data is detected. For details, see section 43.4.8, Register Update Timing. 0: Stops display out comparison. 1: Executes display out comparison.

43.3.2 Status Register (DOCMSTR)

DOCMSTR returns the comparison result of the CRC code. The result is reflected in this register when the end of the valid period of the graphics data is detected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMPST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved Values read from these bits are undefined. The write value should always be 0.
29 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CMPST	0	R	Display Out Comparison Status 0: Compared CRC codes match. 1: Compared CRC codes do not match.

43.3.3 Status Clear Register (DOCMCLSTR)

Writing 1 to the CMPCLST bit causes clearing of the CMPST bit in DOCMSTR to 0. However, clearing of the CMPST bit in DOCMSTR after 1 is written to the CMPCLST bit takes a fixed amount of time. Confirm that the CMPST bit in DOCMSTR is actually cleared after writing 1 to the CMPCLST bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMP CLST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CMPCLST	0	R/W	Display Out Comparison Status Clear Setting this bit to 1 clears the CMPST bit in DOCMSTR to 0. This bit is always read as 0.

43.3.4 Interrupt Enable Register (DOCMIENR)

DOCMIENR enables interrupt of the corresponding status bits in DOCMSTR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMPIEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CMPIEN	0	R/W	Display Out Comparison Mismatch Detection Interrupt Enable Enables/disables the display out comparison mismatch detection interrupt (CMPI) when the CMPST bit in DOCMSTR is set to 1. 0: Disables the display out comparison mismatch detection interrupt (CMPI). 1: Enables the display out comparison mismatch detection interrupt (CMPI).

43.3.5 Operation Parameter Setting Register (DOCMPMR)

DOCMPMR selects the graphics data and sets the pixel format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CMPBT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPDFA[7:0]								CMP DAUF	-	-	-	CMPSELP[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CMPBT	0	R/W	Pixel Format Data Width Specifies the data width of the pixel format. 0: 32 bits/pixel (ARGB8888/RGB888 format) 1: 16 bits/pixel (RGB565 format)
15 to 8	CMPDFA[7:0]	H'00	R/W	Display Out Comparison Default α Value Set the default α value. These bits are enabled when the CMPDAUF bit is 1.
7	CMPDAUF	0	R/W	Display Out Comparison Default α Value Use Enables the use of default α value. 0: Disables use of default α value. 1: Enables use of default α value. Note: This bit is enabled only if RGB888 format is selected. For ARGB8888/RGB565 format, this bit should always be set to 0. When this bit is set to 0 when RGB888/ARGB8888/RGB565 pixel format is selected, the data output from the graphics display module is used as the α value.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CMPSELP[3:0]	0000	R/W	Display Out Comparison Selection Plane Select the graphics data for CRC code comparison. 0: Selects no data. 1 to 5: Select graphics data of graphics plane 1 to graphics plane 5. 9: Selects graphics data after α blending. Other than above: Setting prohibited

43.3.6 Expected CRC Code Register (DOCMECRCR)

DOCMECRCR specifies the CRC code of the expected graphics data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMPECRC[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPECRC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMPECRC [31:0]	H'00000000	R/W	Expected Display Out Comparison CRC Code The expected CRC code value for the rectangular area of the selected graphics data

43.3.7 Calculated CRC Code Value Register (DOCMCCRCR)

The CRC code calculation result of the selected graphics plane or rectangular area can be read from this register. The calculation result is reflected in this register when the end of the valid period of the graphics data is detected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMPCCRC[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPCCRC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMPCCRC [31:0]	H'00000000	R	Calculated Display Out Comparison CRC Code Value The calculated CRC code value for the rectangular area of the selected graphics data

43.3.8 Horizontal Start Position Setting Register (DOCMSPXR)

DOCMSPXR specifies the horizontal start position of the rectangular area for which the CRC code is calculated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	CMPSPX[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	CMPSPX[10:0]	H'000	R/W	Display Out Comparison Horizontal Start Position Specify the horizontal start position of the rectangular area for which the CRC code is calculated. The set value should be smaller than or equal to the horizontal size of the graphics data.

43.3.9 Vertical Start Position Setting Register (DOCMSPYR)

DOCMSPYR specifies the vertical start position of the rectangular area for which the CRC code is calculated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	CMPSPY[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	CMPSPY[10:0]	H'000	R/W	Display Out Comparison Vertical Start Position Specify the vertical start position of the rectangular area for which the CRC code is calculated. The set value should be smaller than or equal to the vertical size of the graphics data.

43.3.10 Horizontal Size Setting Register (DOCMSZXR)

DOCMSZXR specifies the horizontal size of the rectangular area for which the CRC code is calculated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	CMPSZX[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	CMPSZX [10:0]	H'000	R/W	Display Out Comparison Horizontal Size Specify the horizontal size of the rectangular area for which the CRC code is calculated. The value should be set as follows: Horizontal size of the graphics data ≥ Horizontal start position (CMPSPX) + Horizontal size (CMPSZX).

43.3.11 Vertical Size Setting Register (DOCMSZYR)

DOCMSZYR specifies the vertical size of the rectangular area for which the CRC code is calculated.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	CMPSZY[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	CMPSZY [10:0]	H'000	R/W	Display Out Comparison Vertical Size Specify the vertical size of the rectangular area for which the CRC code is calculated. The value should be set as follows: Vertical size of the graphics data ≥ Vertical start position (CMPSPY) + Vertical size (CMPSZY).

43.3.12 CRC Code Initialization Register (DOCMCRCIR)

DOCMCRCIR is used to specify the initial value of the CRC code.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRCINI[31:16]															
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRCINI[15:0]															
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRCINI[31:0]	H'FFFFFFFF	R/W	Display Out CRC Comparison Initial Value These bits specify the initial value of the CRC for the rectangular area of the selected graphics data.

43.4 Operation

43.4.1 Overview of Operations

This module is capable of calculating the CRC code of the arbitrary rectangular area of graphics data. By comparing the CRC code with the pre-calculated expected CRC code value, this module can detect whether the display output is obtained as expected.
Main features of this module are as follows.

- Graphics data can be selected from graphics plane 1 to graphics plane 5
- Graphics data after α blending can be selected
- Arbitrary rectangular area of the selected graphics data can be specified
- Pixel format can be selected from ARGB8888 and RGB888 for 32 bits/pixel or RGB565 for 16 bits/pixel
- Interrupt is generated when the compared CRC codes do not match.

43.4.2 System Configuration

This module is configured as shown in Figure 43.2.
The CRC code is calculated after receiving the graphics data output from the graphics display module. The calculated CRC code is then compared with the pre-calculated expected CRC code value. The graphics data can be selected from graphics plane 1 to graphics plane 5, and the data after α blending. Note that the graphics planes 1 to 4 correspond respectively to graphics (0) to (3) in the image synthesizer of video display controller 5, and the graphics plane 5 corresponds to graphics (OIR) of the output video image generation block.

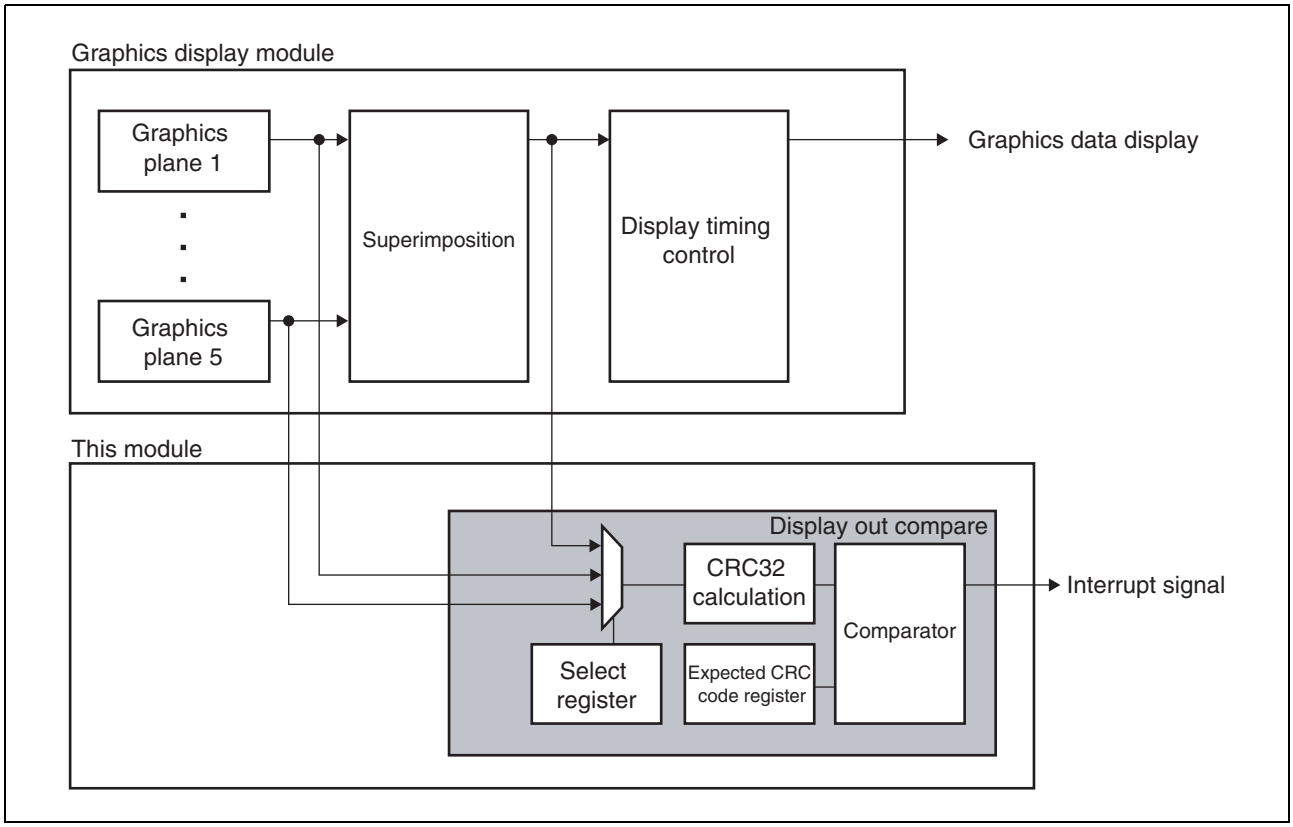

Figure 43.2 System Configuration

43.4.3 CRC Calculation Method

The display out comparison unit generates a 32-bit CRC code by using the following CRC polynomial (IEEE802.3).

$x^{32}+ x^{26}+ x^{23}+ x^{22}+ x^{16}+ x^{12}+ x^{11}+ x^{10}+ x^{8}+ x^{7}+ x^{5}+ x^{4}+ x^{2}+ x+1$

CRC is sequentially calculated beginning with LSB in pixel units.
In other words, for 32 bits/pixel, it is calculated in units of 32 bits and for 16 bits/pixel, it is calculated in units of 16 bits.
During CRC calculation of data, pixel data is input when the graphics data is output (top left to bottom right).

43.4.4 Graphics Data Selection for CRC Code Generation

The graphics data for which the CRC code is calculated can be selected from the graphics plane 1 to graphics plane 5 or the graphics data after α blending by setting the CMPSELP[3:0] bits in DOCMPMR.

43.4.5 Pixel Format

(1) Pixel Format Specification

DOCMPMR specifies the pixel format. The pixel formats are given in Table 43.3.

Table 43.3 Pixel Format

Bits in DOCMPMR		CMPBT	CMPDFA[7:0]	CMPDAUF
32 bits/pixel	ARGB8888	0	—	—
	RGB888		Arbitrary	Arbitrary
16 bits/pixel	RGB565	1	—	—

(2) Data Arrangement for Available Pixel Formats

Data arrangement for each pixel format is given below.

- ARGB8888 (32 bits/pixel)

b31 – b24	b23 – b16	b15 – b8	b7 – b0
α 8 bits	Red 8 bits	Green 8 bits	Blue 8 bits

- RGB888 (32 bits/pixel)

b31 – b24	b23 – b16	b15 – b8	b7 – b0
*	Red 8 bits	Green 8 bits	Blue 8 bits

Note: * When CMPDAUF = 0, α value is the value output from the graphics display module.
When CMPDAUF = 1, α value is the value specified by CMPDFA[7:0].

- RGB565 (16 bits/pixel)

b15 – b11	b10 – b5	b4 – b0
Red 5 bits	Green 6 bits	Blue 5 bits

43.4.6 Rectangular Area Settings

Based on the selected graphics data, the start position and size of the rectangular area for which the CRC code is calculated can be set with the registers. Figure 43.3 shows such a rectangular area and Table 43.4 shows the register settings for the area.

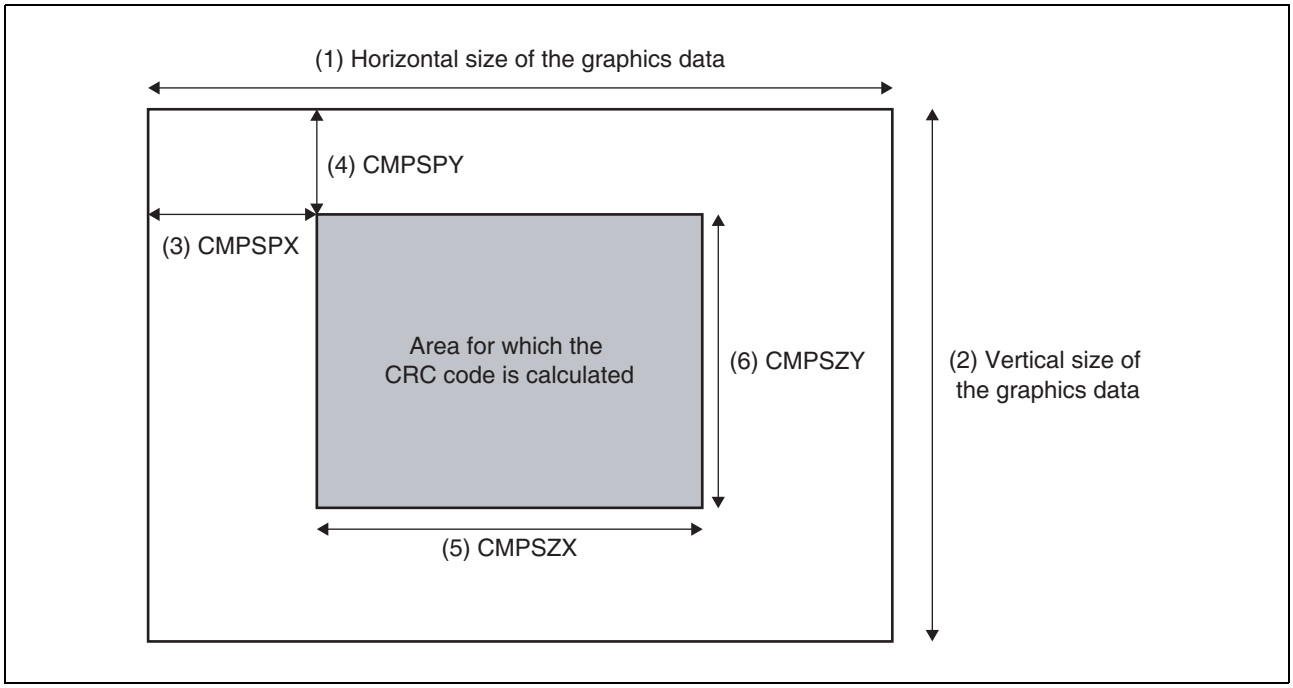

Figure 43.3 Rectangular Area for which the CRC Code is Calculated

Table 43.4 Register Settings for the Rectangular Area for which the CRC Code is Calculated

No.	Symbol in the Figure	Register Used for Setting	Description
(1)	Horizontal size of the graphics data		Horizontal size of the graphics data. Set the size using the graphics display module.
(2)	Vertical size of the graphics data		Vertical size of the graphics data. Set the size using the graphics display module.
(3)	CMPSPX (horizontal start position)	DOCMSPXR	Set the horizontal distance from the upper left origin of the graphics data to the rectangular area for which the CRC code is calculated in pixel units.
(4)	CMPSPY (vertical start position)	DOCMSPYR	Set the vertical distance from the upper left origin of the graphics data to the rectangular area for which the CRC code is calculated in line units.
(5)	CMPSZX (horizontal size)	DOCMSZXR	Set the horizontal size of the rectangular area for which the CRC code is calculated in pixel units. The value should be set as follows: Horizontal size of the graphics data ≥ CMPSPX + CMPSZX.
(6)	CMPSZY (vertical size)	DOCMSZYR	Set the vertical size of the rectangular area for which the CRC code is calculated in line units. The value should be set as follows: Vertical size of the graphics data ≥ CMPSPY + CMPSZY.

43.4.7 CRC Calculation Time Period and Comparison Timing

Figure 43.4 shows the CRC calculation time period and timing of comparing the calculated result with the expected value.

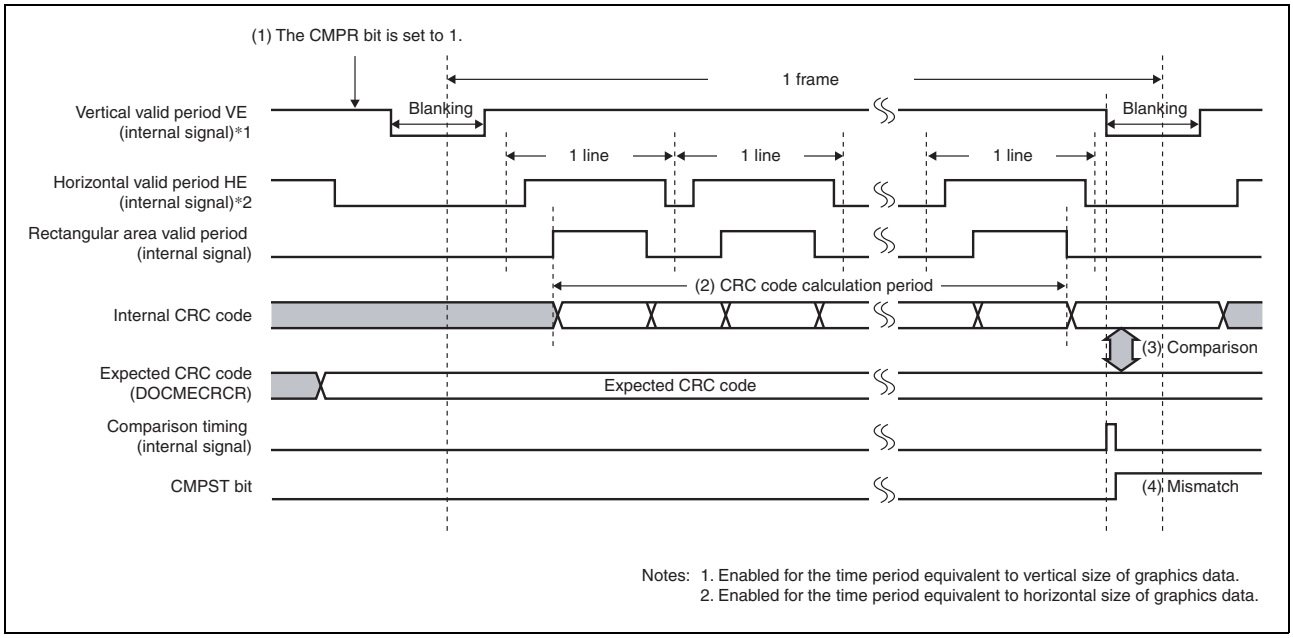

Figure 43.4 CRC Calculation Time Period and Timing of Comparing the Calculated Result with the Expected Value

[Operation]

(1) The operation starts at the next frame after the CMPR bit in DOCMCR is set to 1. For the register update timing, see section 43.4.8, Register Update Timing.

(2) CRC code is calculated in the set rectangular area.

(3) The CRC code calculation result is compared with the expected CRC code value (DOCMECRCR) at the end of the valid period of the graphics data.

(4) If the compared CRC codes do not match, the CMPST bit in DOCMSTR is set.

43.4.8 Register Update Timing

(1) Timing when Register Values are Loaded Inside

All the register bits except the CMPR bit in DOCMCR are loaded inside immediately after the registers are written to. Thus, if the register is updated with the CMPRU bit in DOCMCR as 1, an unexpected result is likely to be obtained in the CRC code calculation. The registers that affect the CRC code calculation (i.e., registers other than DOCMCLSTR and DOCMIENR) should be updated after confirming that the CMPRU bit in DOCMCR is 0.
The CMPR bit in DOCMCR is loaded inside upon detection of the start of the valid period of the graphics data. Thus, even if the register is rewritten to in the middle of a frame, the CRC code calculation of the frame does not get affected.

(2) Timing when Internal State is Reflected in Registers

The internal state is reflected in DOCMSTR and DOCMCCRCR at the end of the valid period of the graphics data. The internal state of the CMPR bit is reflected in the CMPRU bit in DOCMCR at the start of the valid period of the graphics data.
Figure 43.5 shows the register update timing.

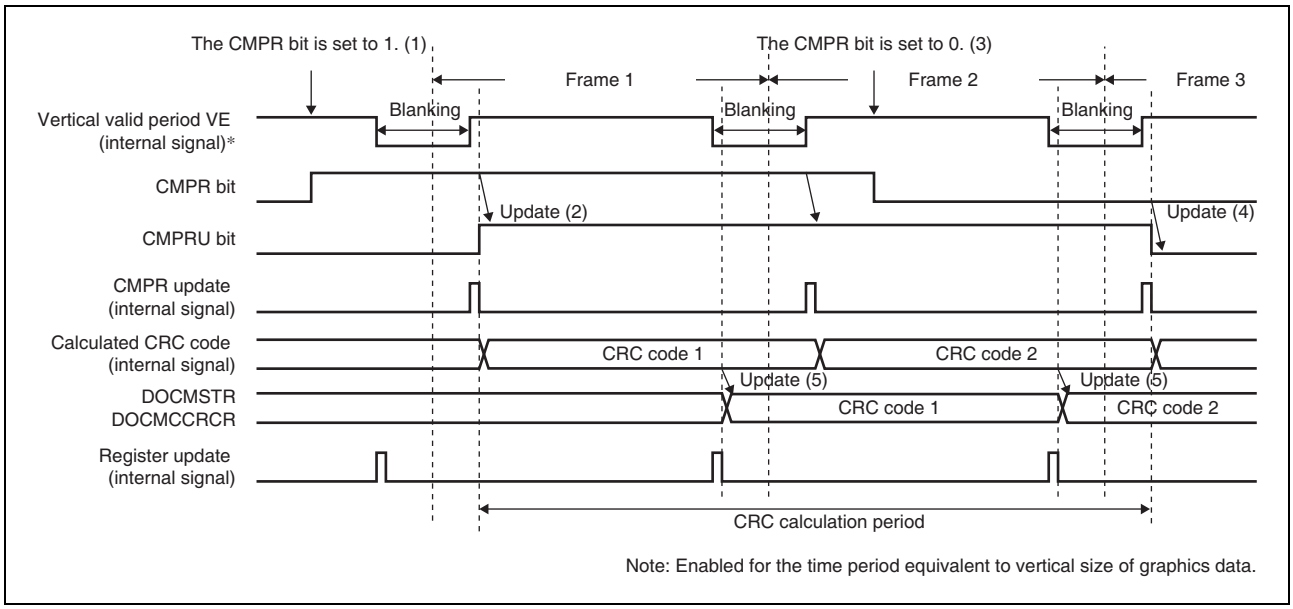

Figure 43.5 Register Update Timing

[Operation]

(1) The CMPR bit is set to 1. This bit is not immediately loaded inside.
(2) CRC calculation is carried out after the CMPR bit value is loaded inside upon detection of the start of the valid period of the graphics data.
(3) To suspend the CRC comparison, the CMPR bit is set to 0. Similarly to (1), this bit is not immediately loaded inside.
(4) The CRC calculation is suspended after the CMPR bit value is loaded inside upon detection of the start of the valid period of the graphics data.
(5) The internal state is reflected in the register at the end of the valid period of the graphics data.

43.4.9 Operation Flow

(1) Procedure for Starting Display Out Comparison

Figure 43.6 shows a sample procedure for starting the display out comparison.

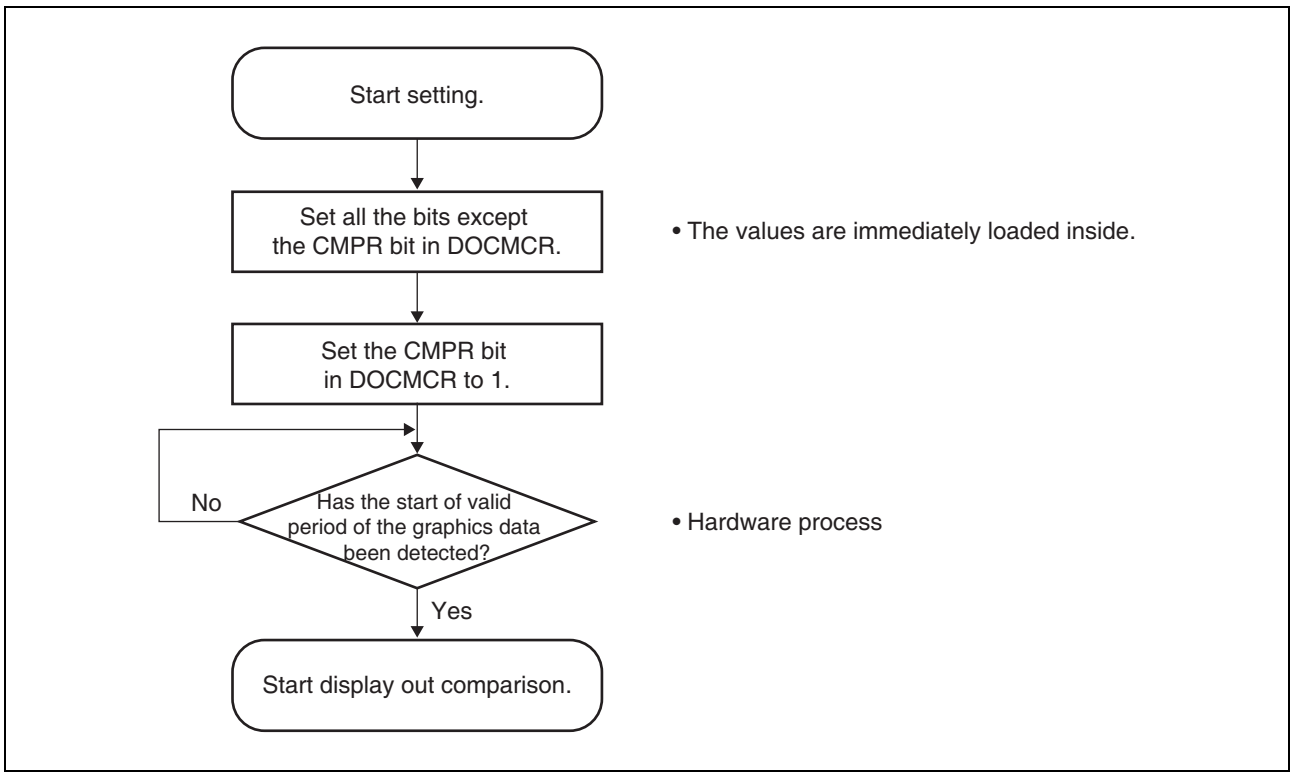

Figure 43.6 Sample Procedure for Starting the Display Out Comparison

(2) Procedure for Changing Register Setting

Figure 43.7 shows a sample procedure for changing the register setting during display out comparison.

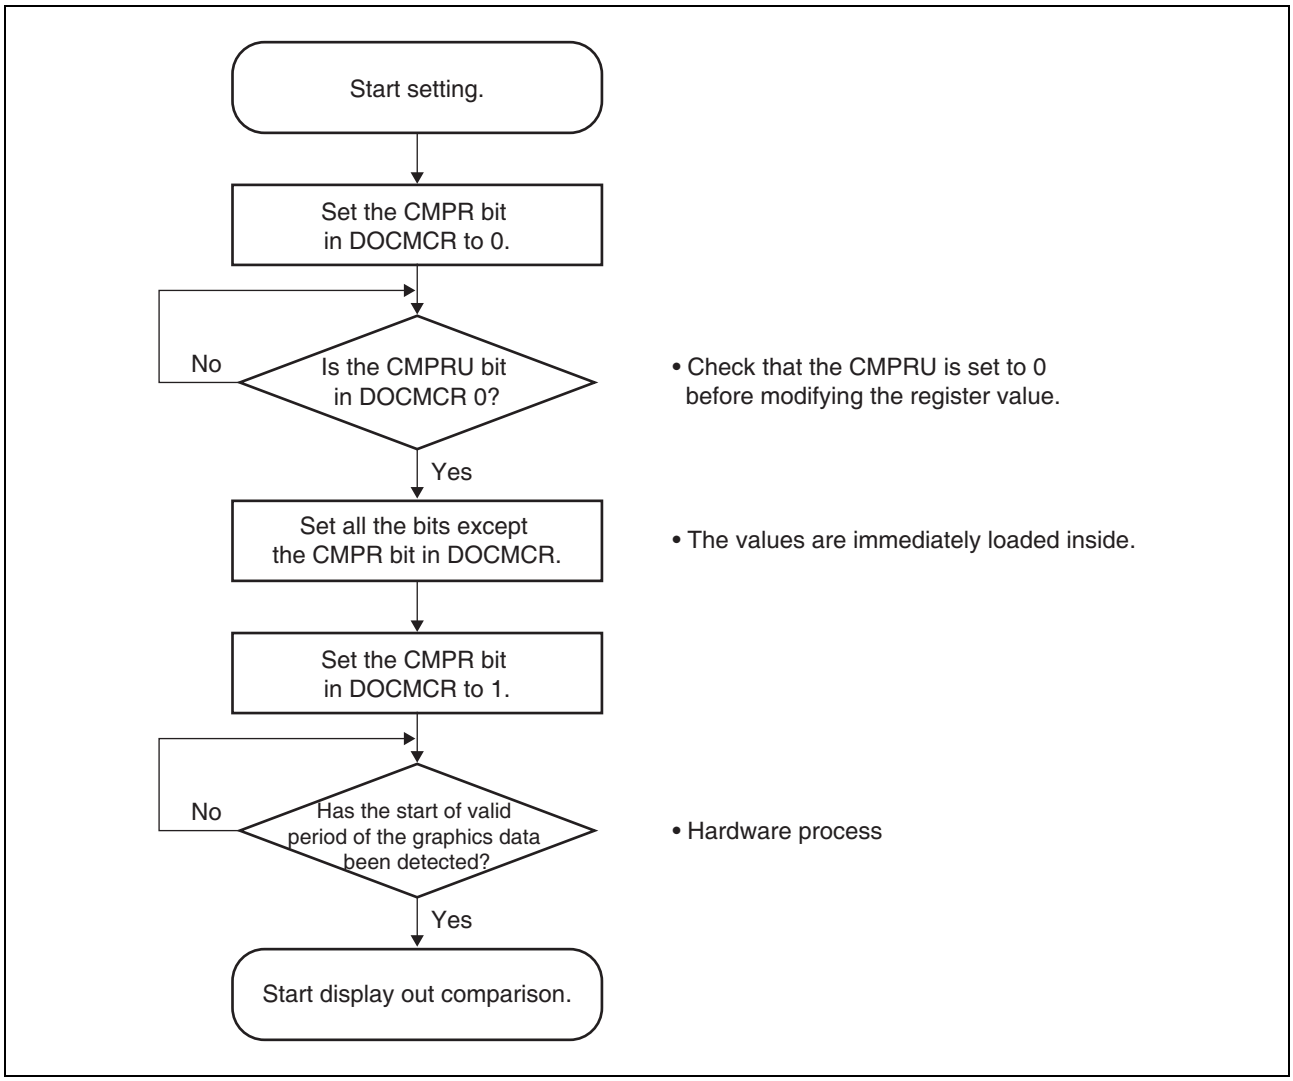

Figure 43.7 Sample Procedure for Changing the Register Setting during Display Out Comparison

43.5 Interrupt

The display out comparison mismatch detection interrupt is provided as an interrupt source.
The interrupt request is generated when the CMPIEN bit in DOCMIENR and the CMPST bit in DOCMSTR are both set to 1.

43.6 Usage Note

43.6.1 Expected CRC Value

When graphics plane 1 to graphics plane 5 are selected, the expected CRC code value (DOCMECRCR) should be calculated from the graphics data to be used by using the software. When the graphics data after α blending is selected, the graphics data after α blending should be selected at the time of debugging and the calculated CRC code value read from DOCMCCRCR should be used as the expected CRC code value. This is because there is a possibility of mismatching of the result of superimposition of the graphics data by the software and the result of superimposition by the graphics display module due to an error in calculation when the graphics data after α blending is selected.

43.6.2 Expansion Control Functionality

When scaling settings are applied for expansion processing by video display controller 5, this module becomes incapable of generating CRC codes. Stop this module while expansion processing is being applied.

44. Renesas Graphics Processor for OpenVG™

44.1 Specification

This processor supports OpenVG™1.1, an open source 2D vector graphics API. Dedicated hardware and a programmable shader are used to accelerate OpenVG™ Stage 2 to Stage 8 processing.
Please refer to the Khronos Group Web site for the specifications of OpenVG™1.1.

45. JPEG Codec Unit

The JPEG codec unit (JCU) incorporates a JPEG codec conforming to the JPEG baseline compression and decompression standard to provide high-speed compression of image data and high-speed decoding of JPEG data.

45.1 Features

The JPEG codec unit has the following features:

- Conforms to the JPEG baseline standard within the range described in this document.
  This module does not support the following basic features:
  Scanning with two elements
  Non-interleave scanning with multiple elements
- Operational precision: Conforming to JPEG Part 2, ISO-IEC10918-2
- Image input/output system: Block interleave method
- Pixel format:
  Compression: YCbCr422 (H = 2:1:1, V = 1:1:1)
  Decompression: YCbCr444 (H = 1:1:1, V = 1:1:1), YCbCr422 (H = 2:1:1, V = 1:1:1), YCbCr411 (H = 4:1:1, V = 1:1:1), YCbCr420 (H = 2:1:1, V = 2:1:1)
  Output pixel format to the buffer: YCbCr422, ARGB8888, RGB565
- Four quantization tables provided
- Four Huffman tables provided (two tables for AC coefficients and two tables for DC coefficients)
- Markers supported: SOI (start of image), SOF0 (start of frame type 0), SOS (start of scan), DQT (define quantization tables), DHT (define Huffman tables), DRI (define restart interval), RSTm (restart marks), and EOI (end of image)
- Image data rate: Max. 133.34 Mbytes/s (at 66.67-MHz operation)
- The buffer size can be reduced by using the mode in which data transfer is temporarily stopped each time the specified number of lines or the specified amount of data is transferred during image data or coded data input/output.
- Processing unit: 8-byte address boundary units can be set
- Image sizes that can be processed: Sizes divisible by the minimum coded unit (MCU): 8 lines by 8 pixels in YCbCr444; 8 lines by 16 pixels in YCbCr422; 8 lines by 32 pixels in YCbCr411; 16 lines by 16 pixels in YCbCr420

Note: • Compression and decompression processing of images in unsupported pixel formats or unsupported image sizes should be avoided.

Figure 45.1 shows a block diagram.

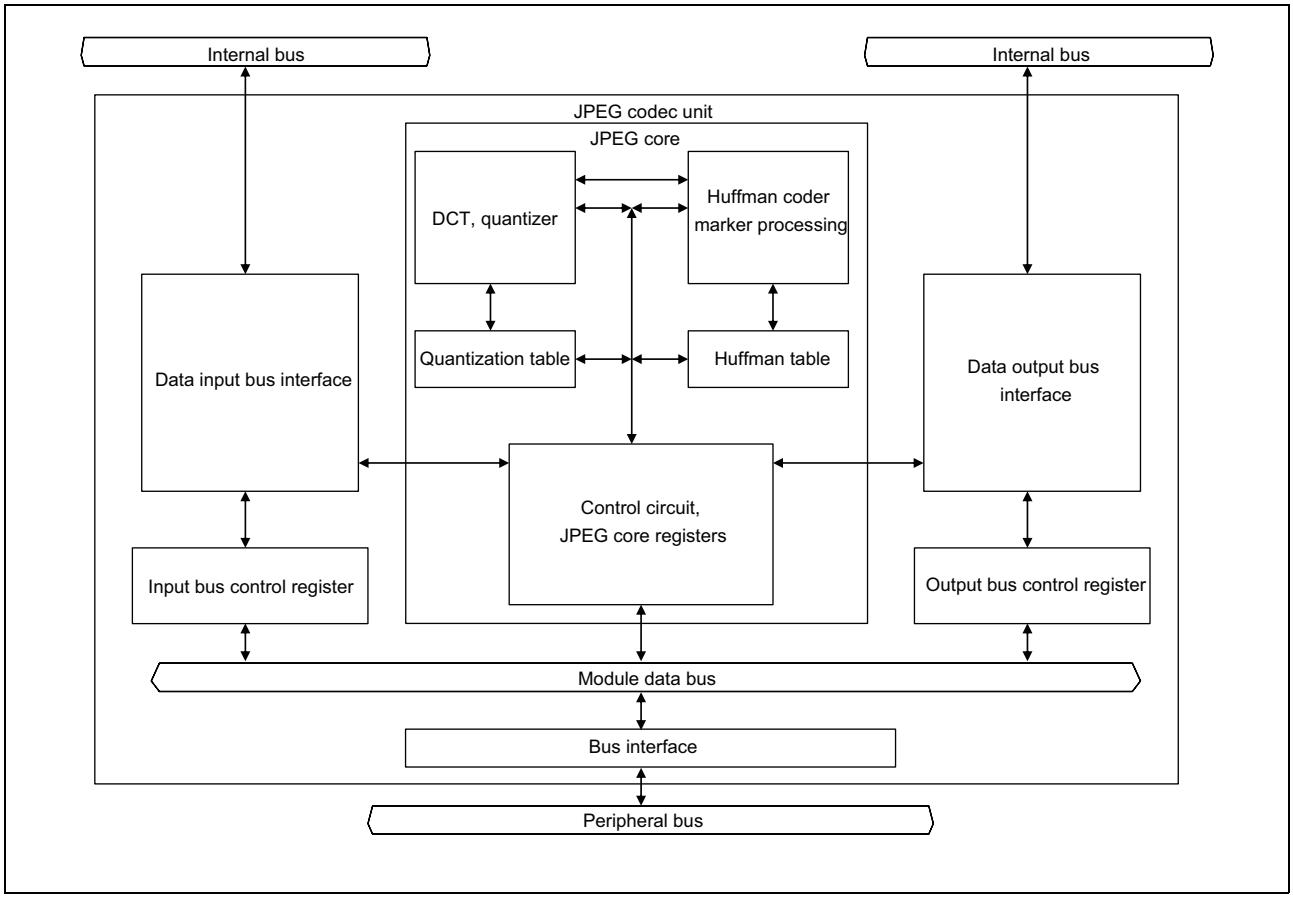

Figure 45.1 Block Diagram

45.2 Register Descriptions

Table 45.1 shows the JCU registers.

Table 45.1 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
JPEG code mode register	JCMOD	R/W	H'E801 7000	8
JPEG code command register	JCCMD	R/W	H'E801 7001	8
JPEG code quantization table number register	JCQTN	R/W	H'E801 7003	8
JPEG code Huffman table number register	JCHTN	R/W	H'E801 7004	8
JPEG code DRI upper register	JCDRIU	R/W	H'E801 7005	8
JPEG code DRI lower register	JCDRID	R/W	H'E801 7006	8
JPEG code vertical size upper register	JCVSZU	R/W	H'E801 7007	8
JPEG code vertical size lower register	JCVSZD	R/W	H'E801 7008	8
JPEG code horizontal size upper register	JCHSZU	R/W	H'E801 7009	8
JPEG code horizontal size lower register	JCHSZD	R/W	H'E801 700A	8
JPEG code data count upper register	JCDTCU	R	H'E801 700B	8
JPEG code data count middle register	JCDTCM	R	H'E801 700C	8
JPEG code data count lower register	JCDTCD	R	H'E801 700D	8
JPEG interrupt enable register 0	JINTE0	R/W	H'E801 700E	8
JPEG interrupt status register 0	JINTS0	R/W	H'E801 700F	8
JPEG code decode error register	JCDERR	R/W	H'E801 7010	8
JPEG code reset register	JCRST	R	H'E801 7011	8
JPEG interface compression control register	JIFECNT	R/W	H'E801 7040	32
JPEG interface compression source address register	JIFESA	R/W	H'E801 7044	32
JPEG interface compression line offset register	JIFESOFST	R/W	H'E801 7048	32
JPEG interface compression destination address register	JIFEDA	R/W	H'E801 704C	32
JPEG interface compression source line count register	JIFESLC	R/W	H'E801 7050	32
JPEG interface compression destination register	JIFEDDC	R/W	H'E801 7054	32
JPEG interface decompression control register	JIFDCNT	R/W	H'E801 7058	32
JPEG interface decompression source address register	JIFDSA	R/W	H'E801 705C	32
JPEG interface decompression destination offset register	JIFDDOFST	R/W	H'E801 7060	32
JPEG interface decompression destination address register	JIFDDA	R/W	H'E801 7064	32
JPEG interface decompression source count register	JIFDSDC	R/W	H'E801 7068	32
JPEG interface decompression destination line count register	JIFDDLC	R/W	H'E801 706C	32
JPEG interface decompression α setting register	JIFDADT	R/W	H'E801 7070	32
JPEG interrupt enable register 1	JINTE1	R/W	H'E801 708C	32
JPEG interrupt status register 1	JINTS1	R/W	H'E801 7090	32
JPEG input image data CbCr range setting register	JIFESVSZ	R/W	H'E801 7094	32
JPEG output image data CbCr range setting register	JIFESHSZ	R/W	H'E801 7098	32
JPEG code quantization table 0 register	JCQTBL0	R/W	H'E801 7100 to H'E801 713F	8
JPEG code quantization table 1 register	JCQTBL1	R/W	H'E801 7140 to H'E801 717F	8
JPEG code quantization table 2 register	JCQTBL2	R/W	H'E801 7180 to H'E801 71BF	8
JPEG code quantization table 3 register	JCQTBL3	R/W	H'E801 71C0 to H'E801 71FF	8

Table 45.1 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
JPEG code Huffman table DC0 register	JCHTBD0	W	H'E801 7200 to H'E801 721B	8
JPEG code Huffman table AC0 register	JCHTBA0	W	H'E801 7220 to H'E801 72D1	8
JPEG code Huffman table DC1 register	JCHTBD1	W	H'E801 7300 to H'E801 731B	8
JPEG code Huffman table AC1 register	JCHTBA1	W	H'E801 7320 to H'E801 73D1	8

Note: • For the settings of the JPEG code quantization table and JPEG code Huffman table, see section 45.3.1 (4), Table Setting.

45.2.1 JPEG Code Mode Register (JCMOD)

JCMOD sets the operating mode before the JCU starts operation.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	DSP	REDU[2:0]		
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 4	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
3	DSP	0	R/W		Compression/Decompression Set 0: Compression process 1: Decompression process Note: • When changing between processing for compression and for decompression, be sure to reset this module in advance by setting the SRST21 bit in the software reset control register 2 (SWRSTCR2) of the power-down modes.
2 to 0	REDU[2:0]	000	R/W	R	Pixel Format [Compression] 001: YCbCr422 Other than above: Setting prohibited. [Decompression] 000: YCbCr444 001: YCbCr422 110: YCbCr411 010: YCbCr420 Other than above: Error (JCU cannot process normally.)

45.2.2 JPEG Code Command Register (JCCMD)

JCCMD sets commands. Bits of this register need not be cleared to 0 after setting a command.
Multiple commands must not be set simultaneously.

Bit:	7	6	5	4	3	2	1	0
	BRST	—	—	—	—	JEND	JRST	JSRT
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R*/W	R	R	R	R	R*/W	Undefined	R*/W
R/W(decompress):	R*/W	R	R	R	R	R*/W	R*/W	R*/W

Note: * Values read from these bits are undefined.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7	BRST	0	R*/W		Bus Reset Setting this bit to 1 resets the internal circuits. While the JCU is in operation (from setting the JPEG core process start command to writing the last output coded/image data), do not set this bit to 1. For the bus reset processing, see section 45.5, Bus Reset Processing.
6 to 3	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
2	JEND	0	R*/W		Interrupt Request Clear Command This bit is valid only for the interrupt sources corresponding to bits INS6, INS5, and INS3 in JINTS0. To clear an interrupt request, set this bit to 1.
1	JRST	0	Invalid	R*/W	JPEG Core Process Stop Clear Command To clear the process-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0), set this bit to 1.
0	JSRT	0	R*/W		JPEG Core Process Start Command To start JPEG core processing, set this bit to 1. Do not write this bit to 1 again while the JCU is in operation.

Note: * Values read from these bits are undefined.

45.2.3 JPEG Code Quantization Table Number Register (JCQTN)

JCQTN sets the quantization table number before compression process is started.

- To use quantization table No. 0 (JCQTBL0) as the first color component, set QT1 to B'00
- To use quantization table No. 1 (JCQTBL1) as the first color component, set QT1 to B'01
- To use quantization table No. 2 (JCQTBL2) as the first color component, set QT1 to B'10
- To use quantization table No. 3 (JCQTBL3) as the first color component, set QT1 to B'11

Bit:	7	6	5	4	3	2	1	0
	—	—	QT3[1:0]		QT2[1:0]		QT1[1:0]	
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7, 6	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
5, 4	QT3[1:0]	00	R/W	R	Quantization table number for the third color component
3, 2	QT2[1:0]	00	R/W	R	Quantization table number for the second color component
1, 0	QT1[1:0]	00	R/W	R	Quantization table number for the first color component

45.2.4 JPEG Code Huffman Table Number Register (JCHTN)

JCHTN sets the Huffman table number (AC/DC) before compression process is started.

- To use DC/AC Huffman table No. 0 (JCHTBD0 and JCHTBA0) as the first color component, set bits HTA1 and HTD1 to B'0
- To use DC/AC Huffman table No. 1 (JCHTBD1 and JCHTBA1) as the first color component, set bits HTA1 and HTD1 to B'1

Bit:	7	6	5	4	3	2	1	0
	—	—	HTA3	HTD3	HTA2	HTD2	HTA1	HTD1
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7, 6	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
5	HTA3	0	R/W	R	Huffman table number (AC) for the third color component
4	HTD3	0	R/W	R	Huffman table number (DC) for the third color component
3	HTA2	0	R/W	R	Huffman table number (AC) for the second color component
2	HTD2	0	R/W	R	Huffman table number (DC) for the second color component
1	HTA1	0	R/W	R	Huffman table number (AC) for the first color component
0	HTD1	0	R/W	R	Huffman table number (DC) for the first color component

45.2.5 JPEG Code DRI Upper Register (JCDRIU)

JCDRIU sets the upper bytes of the minimum coded units (MCUs) preceding an RST marker.

Bit:	7	6	5	4	3	2	1	0
	DRIU[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DRIU[7:0]	H'00	R/W	Invalid	Upper Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed.

45.2.6 JPEG Code DRI Lower Register (JCDRID)

JCDRID sets the lower bytes of MCUs preceding an RST marker.

Bit:	7	6	5	4	3	2	1	0
	DRID[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DRID[7:0]	H'00	R/W	Invalid	Lower Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed.

45.2.7 JPEG Code Vertical Size Upper Register (JCVSZU)

JCVSZU sets the upper bytes of the vertical image size.

Bit:	7	6	5	4	3	2	1	0
	VSZU[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	VSZU[7:0]	H'00	R/W	R	Upper Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set.

45.2.8 JPEG Code Vertical Size Lower Register (JCVSZD)

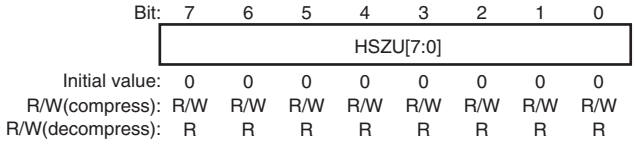
JCVSZD sets the lower bytes of the vertical image size.

Bit:	7	6	5	4	3	2	1	0
	VSZD[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	VSZD[7:0]	H'00	R/W	R	Lower Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set.

45.2.9 JPEG Code Horizontal Size Upper Register (JCHSZU)

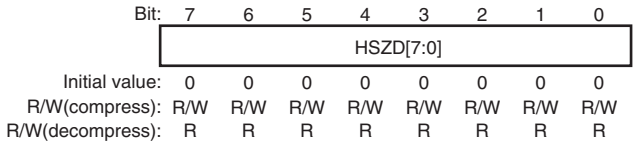
JCHSZU sets the upper bytes of the horizontal image size.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	HSZU[7:0]	H'00	R/W	R	Upper Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set.

45.2.10 JPEG Coded Horizontal Size Lower Register (JCHSZD)

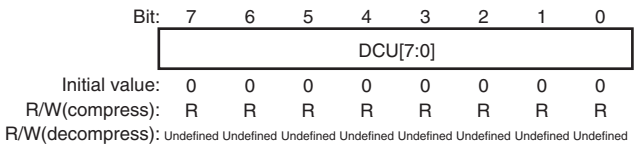
JCHSZD sets the lower bytes of the horizontal image size.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	HSZD[7:0]	H'00	R/W	R	Lower Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set.

45.2.11 JPEG Code Data Count Upper Register (JCDTCU)

The upper bytes for the counted amount of data to be compressed are set to JCDTCU. The values of this register are reset before compression starts.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCU[7:0]	H'00	R	Invalid	Upper bytes of the counted amount of data to be compressed

45.2.12 JPEG Code Data Count Middle Register (JCDTCM)

The middle bytes for the counted amount of data to be compressed are set to JCDTCM. The values of this register are reset before compression starts.

Bit:	7	6	5	4	3	2	1	0
	DCM[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R
R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCM[7:0]	H'00	R	Invalid	Middle bytes of the counted amount of data to be compressed

45.2.13 JPEG Code Data Count Lower Register (JCDTCD)

The lower bytes for the counted amount of data to be compressed are set to JCDTCD. The values of this register are reset before compression starts.

Bit:	7	6	5	4	3	2	1	0
	DCD[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R
R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCD[7:0]	H'00	R	Invalid	Lower bytes of the counted amount of data to be compressed

45.2.14 JPEG Interrupt Enable Register 0 (JINTE0)

JINTE0 enables interrupts.

When any of bits INT7 to INT5 is set to B'1, the INS5 bit in JINTS0 indicates B'1 as the error status upon occurrence of the compression data error, and the ERR bit in JCDERR indicates the particular error code.

Bit:	7	6	5	4	3	2	1	0
	INT7	INT6	INT5	—	INT3	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	Undefined	Undefined	Undefined	R	Undefined	R	R	R
R/W(decompress):	R/W	R/W	R/W	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7	INT7	0	Invalid	R/W	This bit enables an interrupt to be generated when the number of data in the restart interval of the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
6	INT6	0	Invalid	R/W	This bit enables an interrupt to be generated when the total number of data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
5	INT5	0	Invalid	R/W	This bit enables an interrupt to be generated when the final number of MCU data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
4	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
3	INT3	0	Invalid	R/W	This bit enables an interrupt to be generated when it has been determined that the image size and the subsampling setting of the compressed data can be read through analyzing the data.
2 to 0	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.

45.2.15 JPEG Interrupt Status Register 0 (JINTS0)

JINTS0 identifies the interrupt sources.
The interrupt sources of this register should be cleared by clearing the corresponding interrupt status bits to 0 and setting the relevant bit in JCCMD appropriately.

Bit:	7	6	5	4	3	2	1	0
	—	INS6	INS5	—	INS3	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R/W*	Undefined	R	Undefined	R	R	R
R/W(decompress):	R	R/W*	R/W*	R	R/W*	R	R	R

Note: * Clear this bit by writing 0 to it.
Do not write 1 to this bit.

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
7	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
6	INS6	0	R/W*		This bit is set to 1 when the JCU completes compression process normally.
5	INS5	0	Invalid	R/W*	This bit is set to 1 when a compressed data error occurs.
4	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
3	INS3	0	Invalid	R/W*	This bit is set to 1 when the image size and pixel format can be read. When an interrupt occurs, this module stops processing and the state is indicated by the JCRST register. To make the JCU resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.
2 to 0	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.

Note: * Clear this bit by writing 0 to it. Do not write 1 to this bit.

45.2.16 JPEG Code Decode Error Register (JCDERR)

JCDERR indicates the error code to identify the type of the error which has occurred in the compressed data analysis for decompression. The values of this register are reset before the JCU starts decompression.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	ERR[3:0]			
Initial value:	0	0	0	0	1	0	1	0
R/W(compress):	R	R	R	R	Undefined	Undefined	Undefined	Undefined
R/W(decompress):	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
7 to 4	—	All 0	R		Reserved These bits are always read as 0.
3 to 0	ERR[3:0]	1010	Invalid	R/W	Error Code (See Table 45.3 and Table 45.4)

45.2.17 JPEG Code Reset Register (JCRST)

JCRST indicates a processing-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0). To resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	RST
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	Undefined
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 1	—	All 0	R		Reserved These bits are always read as 0.
0	RST	0	Invalid	R/W	Operating State 0: State other than below 1: Suspended state caused by interrupt sources of JINTE0

45.2.18 JPEG Interface Compression Control Register (JIFECNT)

JIFECNT controls the compression process.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 15	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
14	JOUTRINI	0	R/W	Invalid	Address Initialization when Output Coded Data is Resumed This bit is only valid when the count mode for stopping the output of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the output of coded data is restarted. 1: The transfer address is initialized when the output of coded data is restarted.
13	JOUTR CMD	0	R/W	Invalid	Output Coded Data Resume Command This bit is only valid when the count mode for stopping the output of coded data is on. Setting this bit to 1 resumes writing output coded data. This bit is always read as 0.
12	JOUTC	0	R/W	Invalid	Count Mode Setting for Stopping Output Coded Data 0: Count mode for stopping the output of coded data is off. 1: Count mode for stopping the output of coded data is on.
11	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	JOUT SWAP[2:0]	000	R/W	Invalid	Byte/Word/Longword Swap Output coded data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]
7	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
6	DINRINI	0	R/W	Invalid	Address Initialization when Resuming Input of Image Data Lines This bit is only valid when the count mode for stopping the input of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: The transfer address is not initialized when the input of image data lines is restarted. 1: The transfer address is initialized when the input of image data lines is restarted.
5	DINRCMD	0	R/W	Invalid	Input Image Data Lines Resume Command This bit is valid only when the count mode for stopping the input of image data lines is on. Setting this bit to 1 resumes reading input image data. This bit is always read as 0.
4	DINLC	0	R/W	Invalid	Count Mode Setting for Stopping Input Image Data Lines 0: Count mode for stopping the input of image data lines is off. 1: Count mode for stopping the input of image data lines is on.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DINSWAP [2:0]	000	R/W	Invalid	Byte/Word Swap Input image data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]

45.2.19 JPEG Interface Compression Source Address Register (JIFESA)

JIFESA sets the source address of the input image data. This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ESA[31:16]

31 to 3	ESA[31:3]	H'0000	R/W	Invalid	Input Image Data Source Address (in 8-byte units)
2 to 0	ESA[2:0]	0000	R		The lower three bits should be set to 0.

45.2.20 JPEG Interface Compression Line Offset Register (JIFESOFST)

JIFESOFST sets the line offset of the input image data (refer to section 45.3.4, Storing Image Data). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

14 to 3	ESMW [14:3]	H'0000	R/W	Invalid	Input Image Data Lines Offset (in 8-byte units) The lower three bits should be set to 0.
2 to 0	ESMW[2:0]		R		

45.2.21 JPEG Interface Compression Destination Address Register (JIFEDA)

JIFEDA sets the destination address of the output coded data. This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EDA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
31 to 3	EDA[31:3]	H'0000	R/W	Invalid	Output Coded Data Destination Address (in 8-byte units)
2 to 0	EDA[2:0]	0000	R		The lower three bits should be set to 0.

45.2.22 JPEG Interface Compression Source Line Count Register (JIFESLC)

JIFESLC sets the number of input image data lines when the count mode for stopping the input of image data lines is on (the DINLC bit in JIFECNT is set to 1). This register should be set in 8-line units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8	R		Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	LINES[15:3]	H'FFF8	R/W	Invalid	Number of Input Image Data Lines to be Read (in 8-line units)
2 to 0	LINES[2:0]		R		The lower three bits should be set to 0.

45.2.23 JPEG Interface Compression Destination Count Register (JIFEDDC)

JIFEDDC sets the amount of output coded data when the count mode for stopping the output of coded data is on (the JOUTC bit in JIFECNT is set to 1). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8	R	Invalid	Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	JDATAS[15:3]	H'FFF8	R/W	Invalid	Amount of Output Coded Data to be Written (in 8-byte units)
2 to 0	JDATAS[2:0]		R		The lower three bits should be set to 0.

45.2.24 JPEG Interface Decompression Control Register (JIFDCNT)

JIFDCNT controls the decompression process.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	VINTER[1:0]		HINTER[1:0]		OPF[1:0]		—	—	—	—	—	—	—	—

R/W(compress):	R	Undefined			R	Undefined			R	Undefined			R	Undefined		
R/W(decompress):	R	R/W			R	R/W			R	R/W			R	R/W		

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
31, 30	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
29, 28	VINTER[1:0]	00	Invalid	R/W	Vertical Subsampling Subsamples vertical output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8.
27, 26	HINTER[1:0]	00	Invalid	R/W	Horizontal Subsampling Subsamples horizontal output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8.
25, 24	OPF[1:0]	00	Invalid	R/W	Specifies output image data pixel format. 00: YCbCr422 01: ARGB8888 10: RGB565 11: Setting prohibited
23 to 15	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
14	JINRINI	0	Invalid	R/W	Address Initialization when Input Coded Data is Resumed This bit is only valid when the count mode for stopping the input of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the input of coded data is restarted. 1: The transfer address is initialized when the input of coded data is restarted.
13	JINRCMD	0	Invalid	R/W	Input Coded Data Resume Command This bit is valid only when the count mode for stopping the input of coded data is on. Setting this bit to 1 resumes reading input coded data. This bit is always read as 0.
12	JINC	0	Invalid	R/W	Count Mode Setting for Stopping Input Coded Data 0: Count mode for stopping the input of coded data is off. 1: Count mode for stopping the input of coded data is on.
11	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
10 to 8	JINSWAP [2:0]	000	Invalid	R/W	Byte/Word/Longword Swap Input coded data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]
7	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
6	DOUTRINI	0	Invalid	R/W	Address Initialization when Resuming Output of Image Data Lines This bit is only valid when the count mode for stopping the output of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: The transfer address is not initialized when the output of lines of image data is restarted. 1: The transfer address is initialized when the output of lines of image data is restarted.
5	DOUTRCMD	0	Invalid	R/W	Output Image Data Lines Resume Command This bit is valid only when the count mode for stopping the output of image data lines is on. Setting this bit to 1 resumes writing image data. This bit is always read as 0.
4	DOUTLC	0	Invalid	R/W	Count Mode for Stopping Output Image Data Lines 0: Count mode for stopping the output of image data lines is off. 1: Count mode for stopping the output of image data lines is on.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DOUTSWAP [2:0]	000	Invalid	R/W	Byte/Word Swap Output image data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]

45.2.25 JPEG Interface Decompression Source Address Register (JIFDSA)

JIFDSA sets the source address of the input coded data. This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
31 to 3	DSA[31:3]	H'0000 0000	Invalid	R/W	Input Coded Data Source Address (in 8-byte units)
2 to 0	DSA[2:0]			R	The lower three bits should be set to 0.

45.2.26 JPEG Interface Decompression Line Offset Register (JIFDDOFST)

JIFDDOFST sets the line offset of the output image data to be transferred to the external buffer (refer to section 45.3.4, Storing Image Data). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W(decompress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 3	DDA[31:3]	H'0000	Invalid	R/W	Output Image Data Destination Address (in 8-byte units)
2 to 0	DDA[2:0]	0000		R	The lower three bits should be set to 0.

45.2.28 JPEG Interface Decompression Source Data Count Register (JIFDSDC)

JIFDSDC sets the amount of input coded data when the count mode for stopping the input of coded data is on (the JINC bit in JIFDCNT is set to 1). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
31 to 16	—	H'FFF8	R		Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	JDATAS[15:3]	H'FFF8	Invalid	R/W	Amount of Input Coded Data to be Read (in 8-byte units)The lower three bits should be set to 0.
2 to 0	JDATAS[2:0]			R	

45.2.29 JPEG Interface Decompression Destination Line Count Register (JIFDDLC)

JIFDDLC sets the number of lines of output image data when the count mode for stopping the output of image data lines is on (the DOUTLC bit in JIFECNT is set to 1). This register is used to set the number of lines of output image data in MCU units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W(decompress):	R	R	R	R	R	R	R	R	R	Undefined	Undefined	Undefined	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 7	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
6	CBTEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the CBTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
5	DINLEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the DINLF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
4	JOUTEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the JOUTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2	DBTEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the DBTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
1	JINEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the JINF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
0	DOUTLEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the DOUTLF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.

45.2.32 JPEG Interrupt Status Register 1 (JINTS1)

JINTS1 indicates the interrupt sources.

The interrupt sources of this register should be cleared by writing 0 to this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CBTF	DINLF	JOUTF	—	DBTF	JINF	DOU TLF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R/W*	R/W*	R/W*	R	Undefined	Undefined	Undefined
R/W(decompress):	R	R	R	R	R	R	R	R	R	Undefined	Undefined	Undefined	R	R/W*	R/W*	R/W*

Note: * When the bit is read as 1, write 0 to clear it.
When the bit is read as 0, write 1 to it.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 7	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
6	CBTF	0	R/W*	Invalid	This bit is set to 1 when the last output coded data is written in compression.
5	DINLF	0	R/W*	Invalid	This bit is set to 1 when the number of input image data lines indicated by JIFESLC is read in compression. This bit is valid only when the DINLC bit in JIFECNT is set to 1.
4	JOUTF	0	R/W*	Invalid	This bit is set to 1 when the amount of output coded data indicated by JIFEDDC is written in compression. This bit is valid only when the JOUTC bit in JIFECNT is set to 1.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2	DBTF	0	Invalid	R/W*	This bit is set to 1 when the last output image data is written in decompression.
1	JINF	0	Invalid	R/W*	This bit is set to 1 when the amount of input coded data indicated by JIFDSDC is read in decompression. This bit is valid only when the JINC bit in JIFDCNT is set to 1.
0	DOUTLF	0	Invalid	R/W*	In decompression, this bit is set to 1 when the number of lines of output image data indicated by JIFDDLC have been written. This bit is only valid when the DOUTLC bit in JIFDCNT is set to 1.

Note: * When the bit is read as 1, write 0 to clear it.
When the bit is read as 0, write 1 to it.

45.2.33 JPEG Input Image Data CbCr Range Setting Register (JIFESVSZ)

JIFESVSZ sets the CbCr range of input image data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W(decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DOUTYCHG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(decompress):	Undefined	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
15	DOUTYCHG	0	Invalid	R/W	Output Image Data CbCr Range Setting 0: Range from -128 to 127 1: Range from 0 to 255
14 to 0	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.

45.3 Operation

45.3.1 Compression

(1) Overview of Processing

The compression process flows are described below.

1. The JPEG core is activated.
   A marker is output. (After a marker is output, image data can be input.)
   Approximately 30,000 cycles (necessary for making SOI to SOS markers)
2. Image data is transferred in MCUs from the external buffer to the JCU.
   If the count mode for stopping the input of image data lines is on, reading is stopped each time the number of lines set in JIFESLC is read. Reading is resumed by setting the DINRCMD bit in JIFECNT to 1.
   When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   When the DINRINI bit is one, the address set in JIFESA is used on resumption.
   Reading is also stopped when one frame of image data is completely transferred.
   If the count mode for stopping the input of image data lines is off, reading is continued until one frame of image data is completely transferred.
3. Image data is input to the JPEG core.
   The input data is processed in MCUs at any time in the JPEG core.
4. Coded data is transferred from the JCU to the external buffer.
   When the count mode for stopping the output of coded data is on, writing is stopped each time the amount of coded data set in JIFEDDC is written. Writing is resumed by setting the JOUTRCMD bit in JIFECNT to 1.
   When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
   When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.
   Writing is also stopped when one frame of coded data is completely transferred.
   If the count mode for stopping the output of coded data is off, writing is continued until one frame of coded data is completely transferred.
5. Compression is completed after one frame of data is processed completely.

(2) Flowchart (Compression)

(a) Initial Settings

After completing the JPEG core settings and input/output buffer settings and transferring image data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1. After the JCU has been activated, the JPEG markers (SOI to SOS) are generated and output. It takes approximately 30,000 cycles to generate the markers.

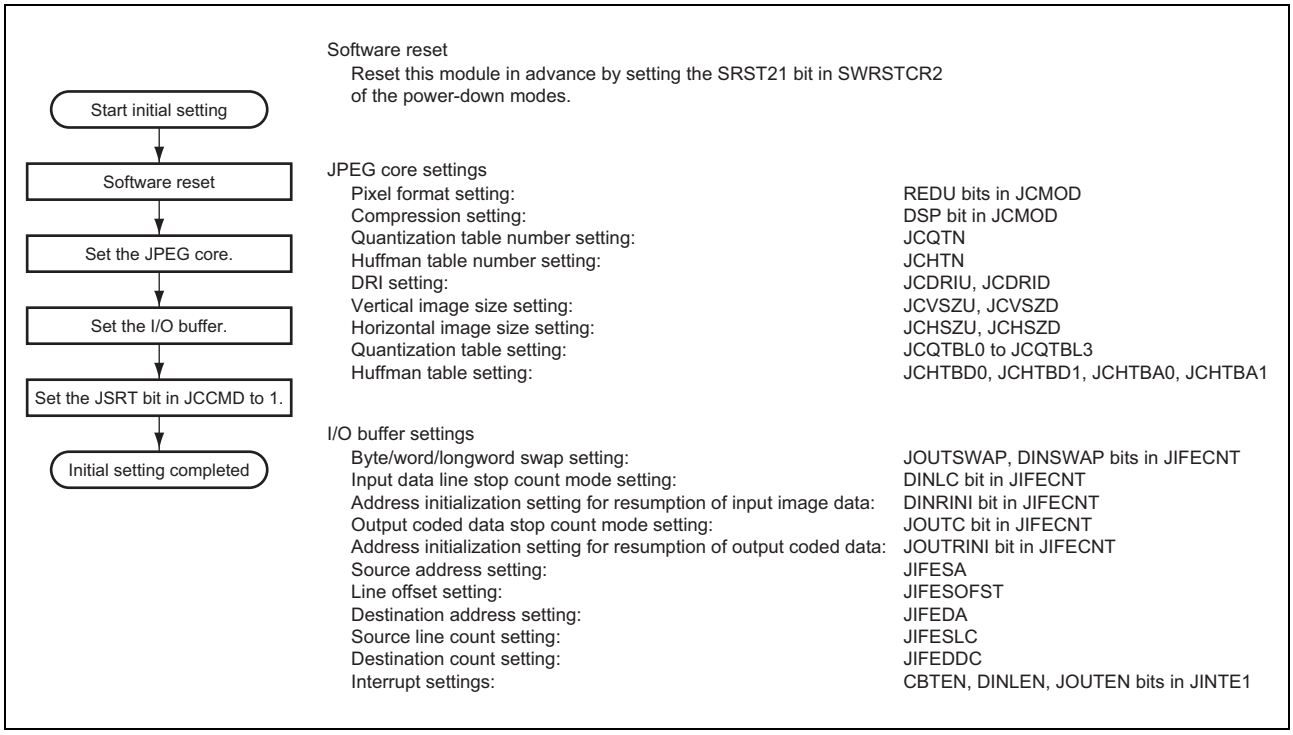

Figure 45.2 Compression Initial Setting Flow

(b) Compression Process

The compression process flows are described below.

- When JPEG compression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCU continues processing since the coded data remains to be transferred. The CBTF bit in JINTS1 is set to 1 when the last coded data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCU has completed compression and all coded data has been transferred, the CBTF flag in JINTS1 is set to 1. When the CBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the CBTF flag.
- If the count mode for stopping image data lines is on, when the specified number of image data lines set in JIFESLC has been read, the DINLF flag in JINTS1 is set to 1, and reading is stopped. When the DINLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DINLEN bit. Setting the DINRCMD bit in JIFECNT to 1 resumes reading.
  When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
  When the DINRINI bit is one, the address set in JIFESA is used on resumption.
- If the count mode for stopping the output of coded data is on, when the specified amount of coded data set in JIFEDDC has been written, the JOUTF flag in JINTS1 is set to 1, and writing is stopped. When the JOUTEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JOUTF bit. Setting the JOUTRCMD bit in JIFECNT to 1 resumes writing.

When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.

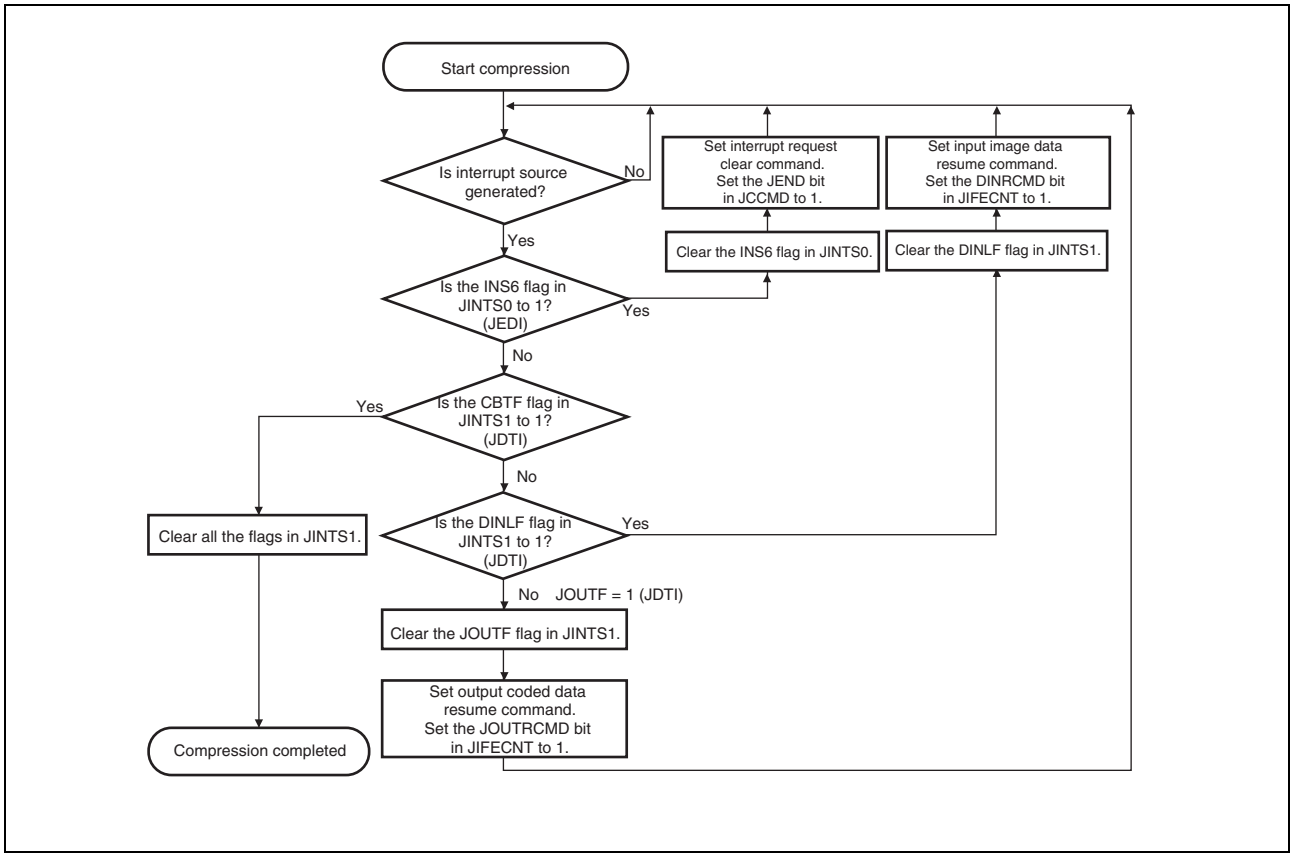

Figure 45.3 Compression Process Flow

(3) JPEG Coded Data Format

Figure 45.4 shows the data output stream in compression. The amount of coded data from SOI to EOI is indicated by JCDTCU, JCDTCM, and JCDTCD. When both JCDRIU and JCDRID are set to H'0000 0000, the following markers are not output.

- DRI marker
- RST marker (in compressed image data)

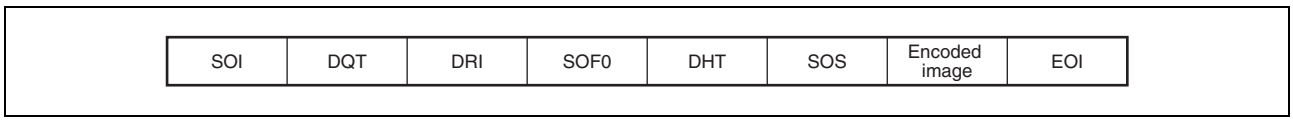

Figure 45.4 JPEG Coded Data Format

DQT: Not output for unused table.
DHT: Output in order DC0, AC0, DC1, and AC1. Not output for unused table.
SOF0: Component identifiers are C1 = first color component, C2 = second color component, and C3 = third color component.
SOS: Scan component selectors are CS1 = first color component, CS2 = second color component, and CS3 = third color component.

Header Volume (Reference):

- SOI: 2 bytes (FFD8)
- DQT: 134 bytes when two quantization tables are used, 199 bytes when three quantization tables are used (±65 bytes/table increase or decrease)
- DRI: 6 bytes
- SOF0: 19 bytes (4:2:2)
- DHT: 420 bytes (two tables are used)
- SOS: 14 bytes (4:2:2)
- EOI: 2 bytes (FFD9)

(4) Table Setting

(a) Quantization Table Specification

The order of addresses shown in 8 × 8 blocks corresponds to that of the register addresses. Do not access this table while the JCU is in processing.

Table 45.2 Quantization Table

00	01	02	03	04	05	06	07
08	09	0A	0B	0C	0D	0E	0F
10	11	12	13	14	15	16	17
18	19	1A	1B	1C	1D	1E	1F
20	21	22	23	24	25	26	27
28	29	2A	2B	2C	2D	2E	2F
30	31	32	33	34	35	36	37
38	39	3A	3B	3C	3D	3E	3F

JCQTBL0 (H'E801 7100) = H'00
JCQTBL0 (H'E801 7101) = H'01
JCQTBL0 (H'E801 7102) = H'02
JCQTBL0 (H'E801 7103) = H'03
:
JCQTBL0 (H'E801 713F) = H'3F

(b) Huffman Table Specification

Examples of the Huffman table specification given in the ITU-T T81 Annex K.3.3 recommended by JPEG are shown below. In compression, the following settings must be specified for all the codes so that Huffman codes can be generated for all the group numbers.

- DC Huffman table: The number of codes for each code length is 12.
  The group numbers in order of frequency of occurrence are 12.
- AC Huffman table: The number of codes for each code length is 162.
  The zero run length/the group numbers in order of frequency of occurrence are 162.

Do not access the following tables while the JCU is in processing. In particular, read access is prohibited.

- able K.3/T81
  JCHTBD0 (H'E801 7200) = H'00
  JCHTBD0 (H'E801 7201) = H'01
  JCHTBD0 (H'E801 7202) = H'05
  JCHTBD0 (H'E801 7203) = H'01
  :
  JCHTBD0 (H'E801 721B) = H'0B

- Table K.4/T81
  JCHTBD1 (H'E801 7300) = H'00
  JCHTBD1 (H'E801 7301) = H'03
  JCHTBD1 (H'E801 7302) = H'01
  JCHTBD1 (H'E801 7303) = H'01
  :
  JCHTBD1 (H'E801 731B) = H'0B

- Table K.5/T81
  JCHTBA0 (H'E801 7220) = H'00
  JCHTBA0 (H'E801 7221) = H'02

  JCHTBA0 (H'E801 7223) = H'03
  :
  JCHTBA0 (H'E801 72D1) = H'FA

- Table K.6/T81
  JCHTBA1 (H'E801 7320) = H'00
  JCHTBA1 (H'E801 7321) = H'02
  JCHTBA1 (H'E801 7322) = H'01
  JCHTBA1 (H'E801 7323) = H'02
  :
  JCHTBA1 (H'E801 73D1) = H'FA

(5) Input Pixel Format

Image data in the YCbCr422 format can be input to this module. Allocation of data in the YCbCr422 format can be changed by the DINSWAP bits in JIFECNT as shown below.

- When the DINSWAP bits = 000

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits	Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits

- When the DINSWAP bits = 001

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits	Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits

- When the DINSWAP bits = 010

Cr1 8 bits	Y3 8 bits	Cb1 8 bits	Y2 8 bits	Cr0 8 bits	Y1 8 bits	Cb0 8 bits	Y0 8 bits

(6) Output Coded Data

In the case of compression, coded data are output. This module handles the output of coded data in 16-bit units. For this reason, if the coded data have an odd code length (are fractional), the final code for output will be H'D9FF.
The JOUTSWAP bits in JIFECNT can be used to alter the arrangement of coded data in the output.

45.3.2 Decompression

(1) Overview of Processing

The decompression process flows are described below.

1. The JPEG core is activated.
2. Coded data is transferred from the external buffer to the JCU.
   If the count mode for stopping the input of coded data is on, reading is stopped each time the amount of coded data set in JIFDSLC is read. Reading is resumed by setting the JINRCMD bit in JIFDCNT to 1. When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   When the JINRINI bit is one, the address set in JIFDSA is used on resumption. Reading is stopped when the end of the coded data is detected.
   If the count mode for stopping the input of coded data is off, reading is continued until the end of code is detected. With this module, more coded data may be read than the coded data size since coded data reading is continued until the end of code is detected.
3. Coded data is input to the JPEG core.
   The input data is processed in MCUs at any time in the JPEG core.
4. Image data is transferred in MCUs from the JCU to the external buffer.
   When the count mode for stopping the output of image data lines is on, writing is stopped each time the number of image data lines set in JIFDDLC is written. Writing is resumed by setting the DOUTRCMD bit in JIFECNT to 1. When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
   When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption. Writing is stopped when one frame of image data is completely transferred.
   If the count mode for stopping the output of image data lines is off, writing is continued until one frame of image data is completely transferred.
5. Decompression is completed after one frame of data is processed completely.

(a) Initial Settings

- When the INT3 bit in JINTE0 is set to 0:
  After completing the JPEG core settings and input/output buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
- When the INT3 bit in JINTE0 is set to 1:
  After completing the JPEG core settings and input buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
  When the image size and pixel format become readable after the coded data has been decompressed, the INS3 bit in JINTS0 is set. At this time, decompression is temporarily stopped.
  After the image size and pixel format have been read, set the output buffer.
  Setting the JRST bit in JCCMD to 1 after interrupt handling resumes decompression.

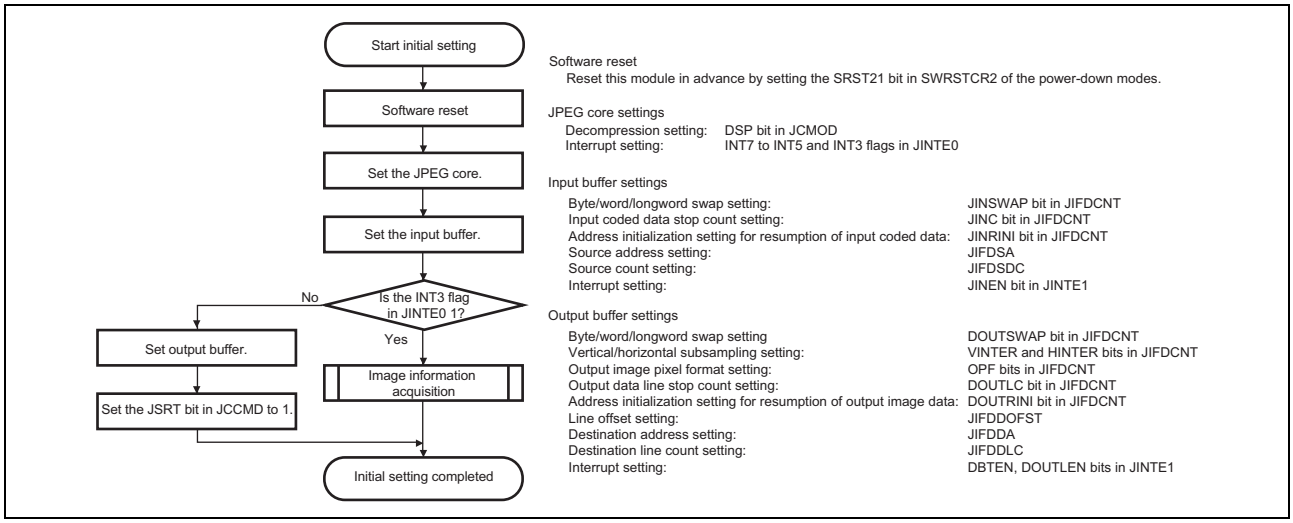

Figure 45.5 Decompression Initial Setting Flow

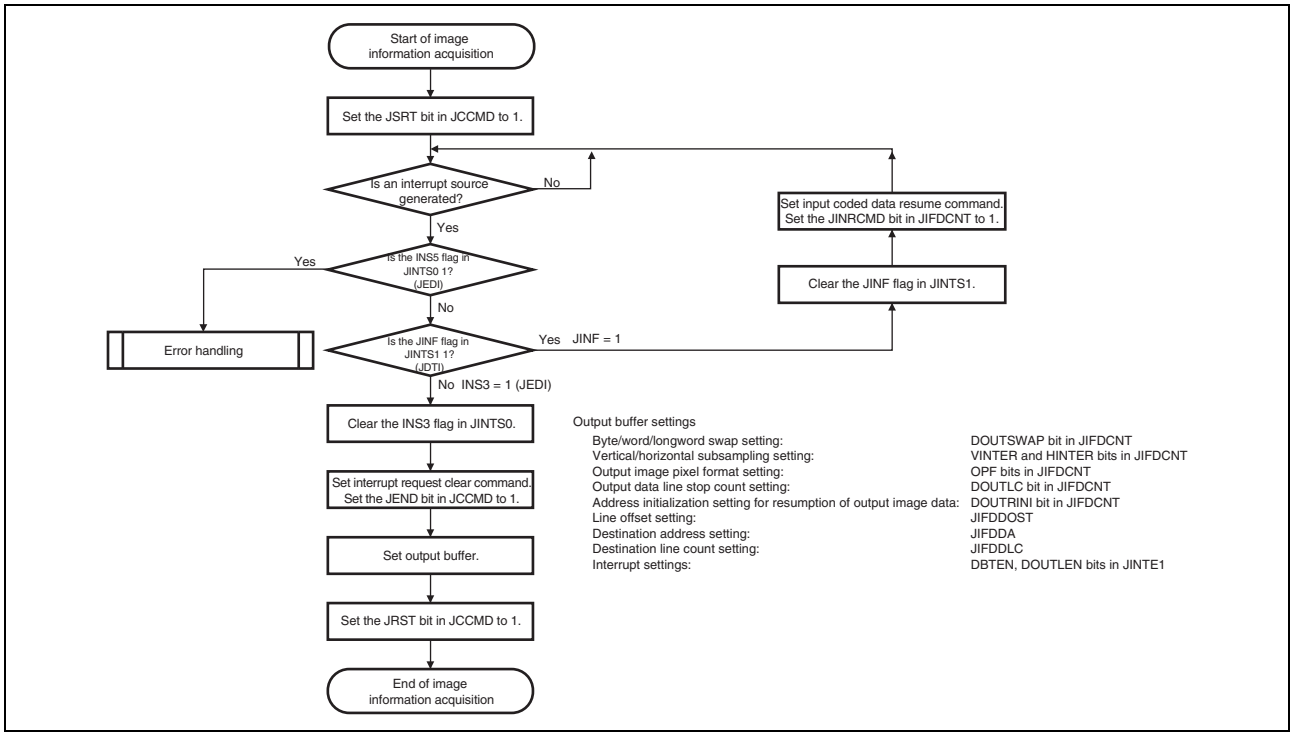

Figure 45.6 Image Information Acquisition Flow

(b) Decompression Process

The decompression process flows are described below.

- When JPEG decompression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCU continues processing since the image data remains to be transferred. The DBTF bit in JINTS1 is set to 1 when the last image data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCU has completed decompression process and all image data has been transferred, the DBTF flag in JINTS1 is set to 1. When the DBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the DBTF flag.
- If the count mode for stopping input coded data is on, when the specified amount of coded data set in JIFDSDC have been read, the JINF flag in JINTS1 is set to 1, and reading is stopped. When the JINEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JINF bit. Setting the JINRCMD bit in JIFDCNT to 1 resumes reading.
  When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
  When the JINRINI bit is one, the address set in JIFDSA is used on resumption.
- If the count mode for stopping the output image data is on, when the specified number of image data lines set in JIFDDLC have been written, the DOUTLF flag in JINT1 is set to 1, and writing is stopped. When the DOUTLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DOUTLF bit. Setting the DOUTRCMD bit in JIFDCNT to 1 resumes writing.
  When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
  When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption.

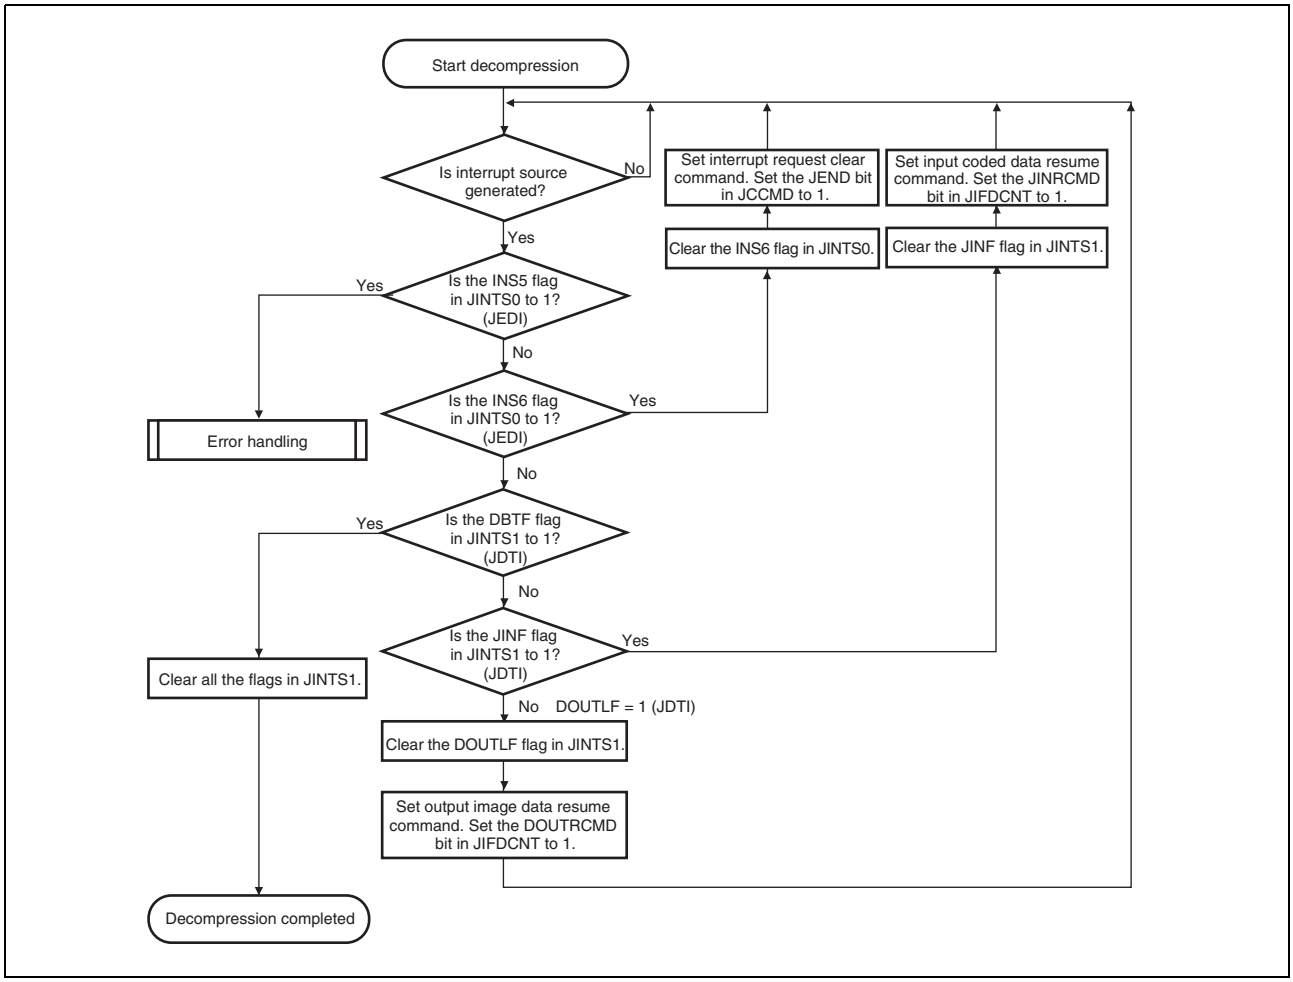

Figure 45.7 Decompression Process Flow

(c) Error Handling

If the INS5 bit in JINTS0 is 1, it indicates that there is an error in the input JPEG coded data and that the decompression process by this module has been ended. Read the ERR bits in JCDERR to determine the cause of the error. The interrupt signal asserted due to the interrupt source indicated by the INS5 bit cannot be negated by clearing the interrupt status through 0-writing. To clear the interrupt request, set the interrupt request clear command (by setting the JEND bit in JCCMD to 1).
If decompression or compression is to proceed after error handling is completed, start by making the initial settings.

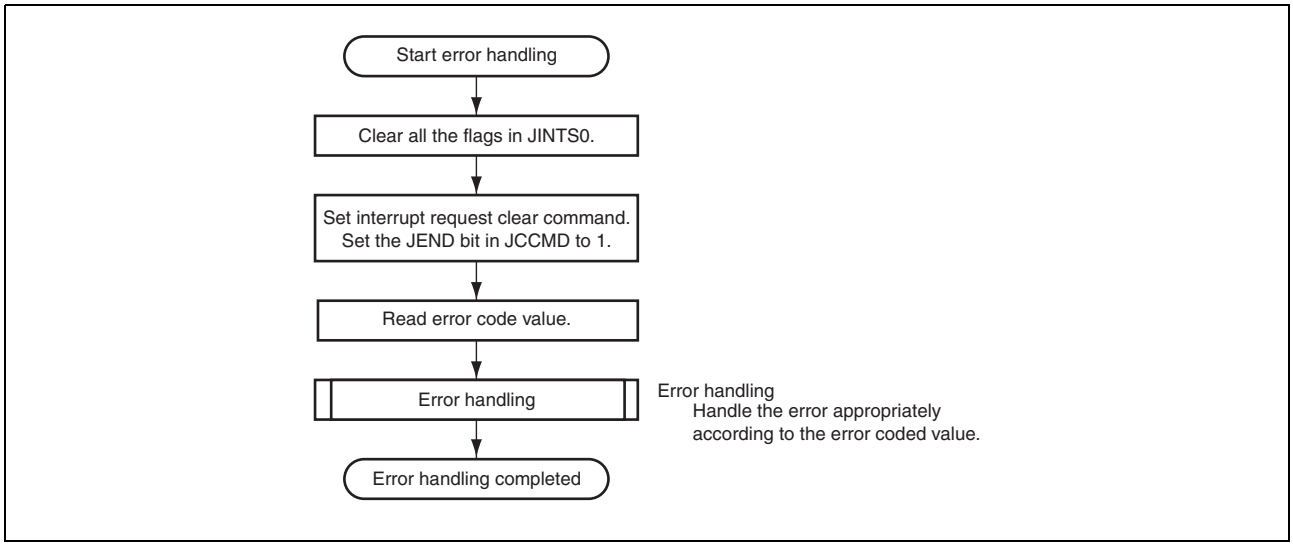

Figure 45.8 Error Handling Flow

(2) Input JPEG Coded Data

Markers to be processed in decompression are SOI, SOF0, SOS, DQT, DHT, DRI, RSTm, and EOI. Other markers except for the error markers shown below are ignored even if they are read.
The JINSWAP bits in JIFDCNT can be used to alter the arrangement for the input of coded data.

(3) JPEG Decompression Errors

(a) Error Marker

If a marker error is found while analyzing compressed data for decompression, the code to identify the error type (shown in Table 45.3) is set to ERR bits in JCDERR. When an error is detected, the JCU generates an interrupt signal and terminates decoding. The stored code value will be set to B'1010 (default value) at the start of processing of the next frame or after a bus reset.

Table 45.3 Decompression Error Codes

Code	Description
B'0000	Normal
B'0001	SOI not detected: SOI not detected until EOI detected
B'0010	SOF1 to SOFF detected
B'0011	Unprovided pixel format detected
B'0100	SOF accuracy error: Other than 8 detected
B'0101	DQT accuracy error: Other than 0 detected
B'0110	Component error 1: The number of SOF0 header components detected is other than 1, 3, or 4
B'0111	Component error 2: The number of components differs between SOF0 header and SOS
B'1000	SOF0, DQT, and DHT not detected when SOS detected
B'1001	SOS not detected: SOS not detected until EOI detected
B'1010	EOI not detected (default)
B'1011	Restart interval data number error detected
B'1100	Image size error detected
B'1101	Last MCU data number error detected
B'1110	Block data number error detected

(b) Huffman Coded Segment Error

During the compressed data analysis in decompression operation, if there is an increase or decrease in the decoded data count due to an error resulting from bit reversal or missing data in the Huffman-coded segment, determine the error type, and set the error code in the ERR bit in JCDERR. Table 45.4 lists the segment error codes. The error code is set, interrupt signal is issued, and the process is ended only if the bits INT7 to INT5 in JINTE0 corresponding to the detected error is set to 1. The set code value will turn to the default value (B'1010) at the start of processing of the next frame or after a bus reset.

However, in this error detection, if an error in the Huffman-coded segment does not result in an alteration in the decoded data count, the error will go undetected.

[Example]

The number of data in a Huffman coded segment with pixel format setting YCbCr422, DRI = 2, X = 80 pixels, and Y = 8 pixels

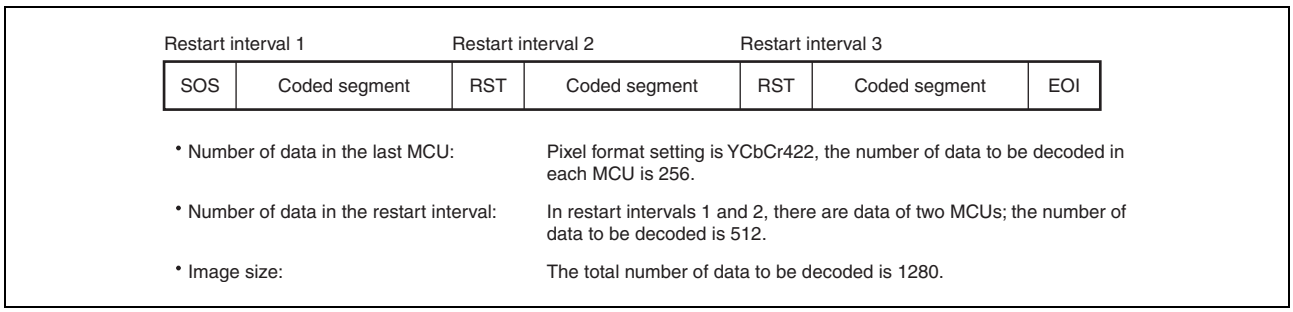

Figure 45.9 Huffman Coded Segment

Table 45.4 Segment Error Codes

Code	Description
B'0000	Normal
B'1011	Restart interval data number error: The number of data in each interval is compared with the number of data specified by the DRI marker. If an interval has more or less data that is specified by the DRI marker, the decompression error code (1011) is set. The last interval which is shorter than the restart interval is not compared. If the DRI marker segment is not placed or the specified number is 00, an error is not detected even if the RSTm marker is placed. Also an m which indicates the order of RSTm marker modulo 8 (m = 0 to 7) is exempt from the error detection analysis. When the INT7 bit in JINTE0 is set to 0, this error is not detected.
B'1100	Image size error: The data number of an image which is calculated from the number of lines specified by the frame parameter and the number of samples per line is compared with the total number of data from SOS to EOI (in pixel units). If the numbers of data do not match, the decompression error code (1100) is set. When the INT6 bit in JINTE0 is set to 0, this error is not detected. The data number of an image is shown in MCU units. Thus the number of lines and the number of samples per line for calculation need to be shown in MCU units.
B'1101	Last MCU data number error: Whether the number of data in the MCUs at the EOI detection is shown in MCU units is checked and fractions are detected. If error (1100) occurs simultaneously, error (1100) has priority. When the INT5 bit in JINTE0 is set to 0, this error is not detected.
B'1110	Block data number error: Whether a block is an 8 × 8 array is checked; the check is performed for fractions. When bits INT7 to INT5 in JINTE0 are all set to 0, this error is not detected.

45.3.3 Output Pixel Format in Decompression

This module is capable of decompressing JPEG encoded data created in the YCbCr444, YCbCr422, YCbCr411 and YCbCr420 formats. The pixel format of the output image will be YCbCr422, ARGB8888, or RGB565. The flow of conversion of decompressed data to the given output pixel format is shown below.

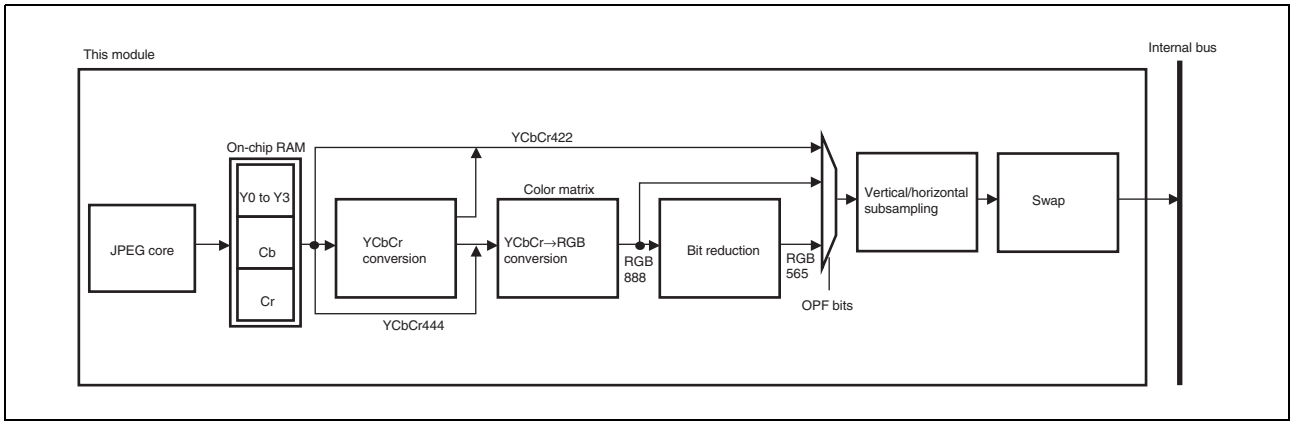

Figure 45.10 Block Diagram of Output Pixel Format Conversion in Decompression

(1) On-chip RAM

Data decoded by the JPEG core are stored in MCUs on RAM in this module.

(2) YCbCr Conversion

When data are to be output in the ARGB8888 or RGB565 format, data in the YCbCr422, YCbCr411 or YCbCr420 format are first converted to the YCbCr444 format.

When data are to be output in the YCbCr422 format, data in the YCbCr444, YCbCr411 or YCbCr420 format are converted to the YCbCr422 format.

Conversion is performed using simple interpolation.

(3) YCbCr → RGB Conversion

Data in the YCbCr444 format are converted to the RGB888 format. The following formulae are used.
R = 1.000Y + 1.402Cr
G = 1.000Y - 0.344Cb - 0.714Cr
B = 1.000Y + 1.772Cb

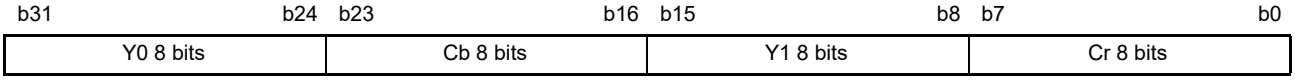
(4) Bit Reduction

RGB888 data is reduced to RGB565 data. The lower three bits of red and blue, and lower two bits of green are removed.

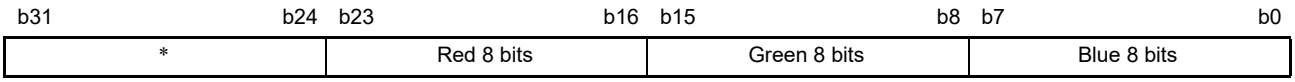
(5) Output Pixel Format Selection

The pixel format to be output is selected by the OPF bit in JIFDCNT.
Allocation of data (while the DOUTSWAP bits in JIFDCNT = 000) in the pixel format is shown below.

- YCbCr422 (32 bits/pixel)

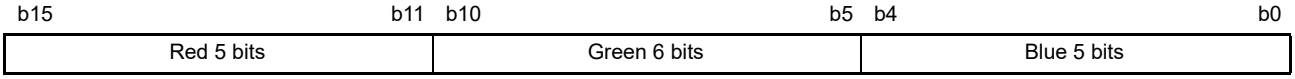


- ARGB8888 (32 bits/pixel)



Note: * This value is determined by the ALPHA[7:0] bits in JIFDADT.

- RGB565 (16 bits/pixel)



(6) Vertical/Horizontal Subsampling

The output data can be horizontally and vertically subsampled according to the VINTER and HINTER bit setting in JIFDCNT.
Figure 45.11 to Figure 45.13 show line subsampling modes.
For the output formats ARGB8888 and RGB565, one cell represents one pixel in the figures.
For the output format YCbCr422, one cell represents one set of Y0Cb0Y1Cr0 in the figures.
As subsampling is carried out by minimum coded units (MCU), the numbers of the horizontal and vertical block units will vary according to the decompressed pixel format.
Table 45.5 and Table 45.6 show the values of n and m in the figures.
Horizontal:

Table 45.5 Number of Horizontal Blocks

Compression Format	Output Format	n
YCbCr444	YCbCr422	1/2
YCbCr444	ARGB8888, RGB565	1
YCbCr422	YCbCr422	1
YCbCr422	ARGB8888, RGB565	2
YCbCr411	YCbCr422	2
YCbCr411	ARGB8888, RGB565	4
YCbCr420	YCbCr422	1
YCbCr420	ARGB8888, RGB565	2

Vertical:

Table 45.6 Number of Vertical Blocks

Compression Format	Output Format	m
YCbCr444	YCbCr422	1
YCbCr444	ARGB8888, RGB565	1
YCbCr422	YCbCr422	1
YCbCr422	ARGB8888, RGB565	1
YCbCr411	YCbCr422	1
YCbCr411	ARGB8888, RGB565	1
YCbCr420	YCbCr422	2
YCbCr420	ARGB8888, RGB565	2

- Subsampling into 1/2
  Even lines are skipped by subsampling.

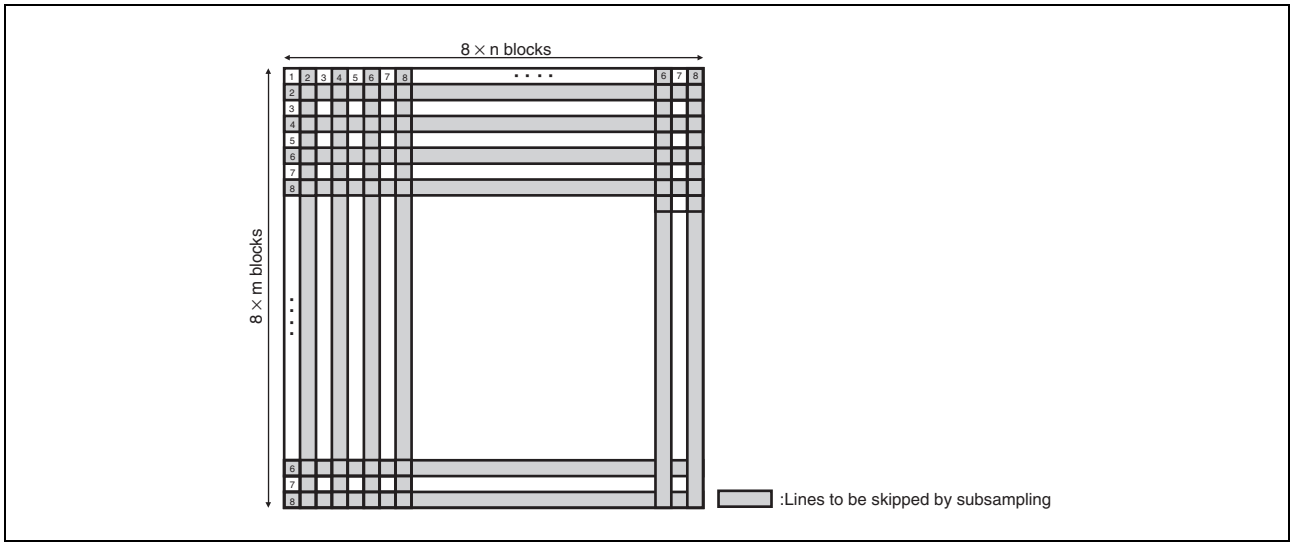


Figure 45.11 MCU when subsampling into 1/2 is selected

- Subsampling into 1/4

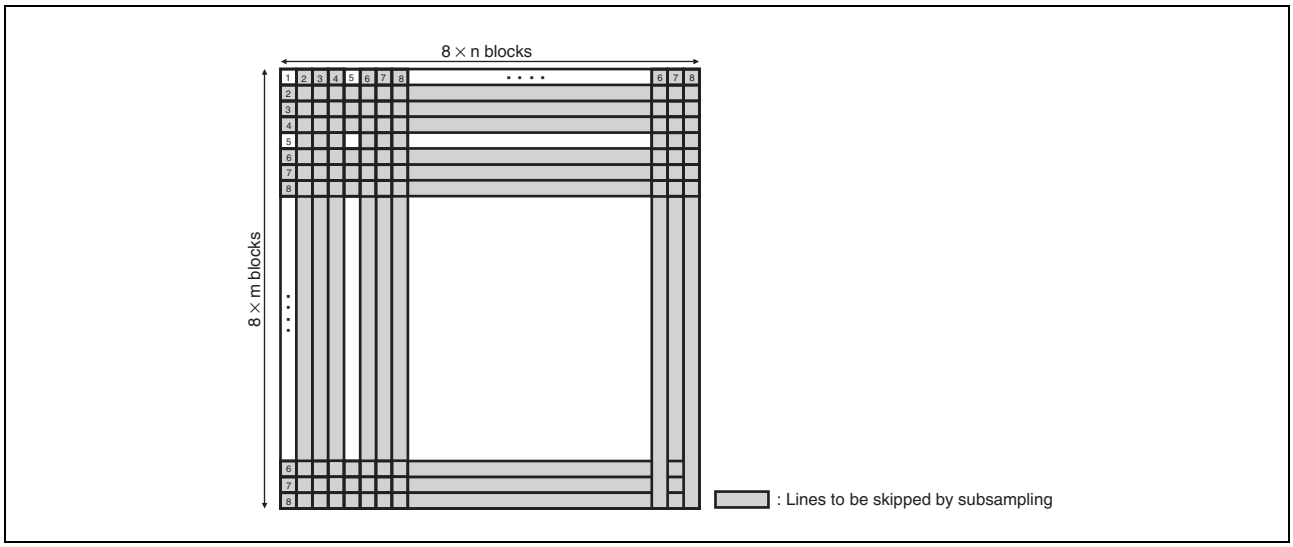

Figure 45.12 MCU when subsampling into 1/4 is selected

- Subsampling into 1/8
  The second, third, fourth, fifth, sixth, seventh, and eighth lines are skipped by subsampling.

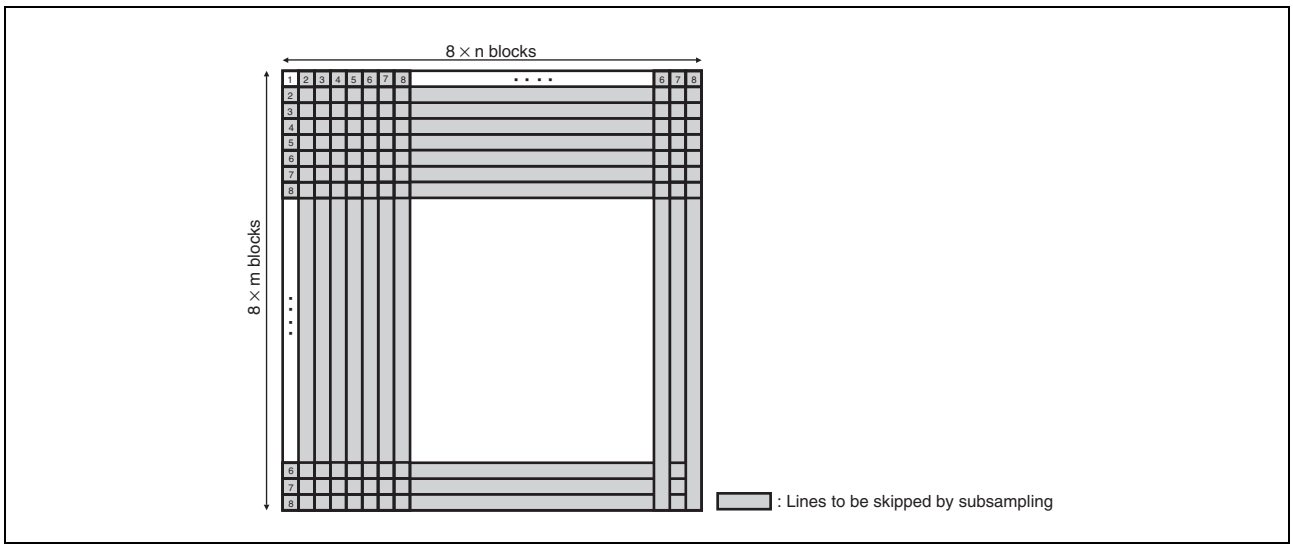

Figure 45.13 MCU when subsampling into 1/8 is selected

(7) Swap

Allocation of data can be changed by the DOUTSWAP bits in JIFECNT.

45.3.4 Storing Image Data

Figure 45.14 shows the buffer area for storing the image data.

- Start address
  Compression: JIFESA
  Decompression: JIFDDA
- Horizontal size
  Compression, decompression: JCHSZU, JCHSZD
- Vertical size
  Compression, decompression: JCVSAU, JCVSZD
- Offset
  Compression: JIFESOFST
  Decompression: JIFDDOFST

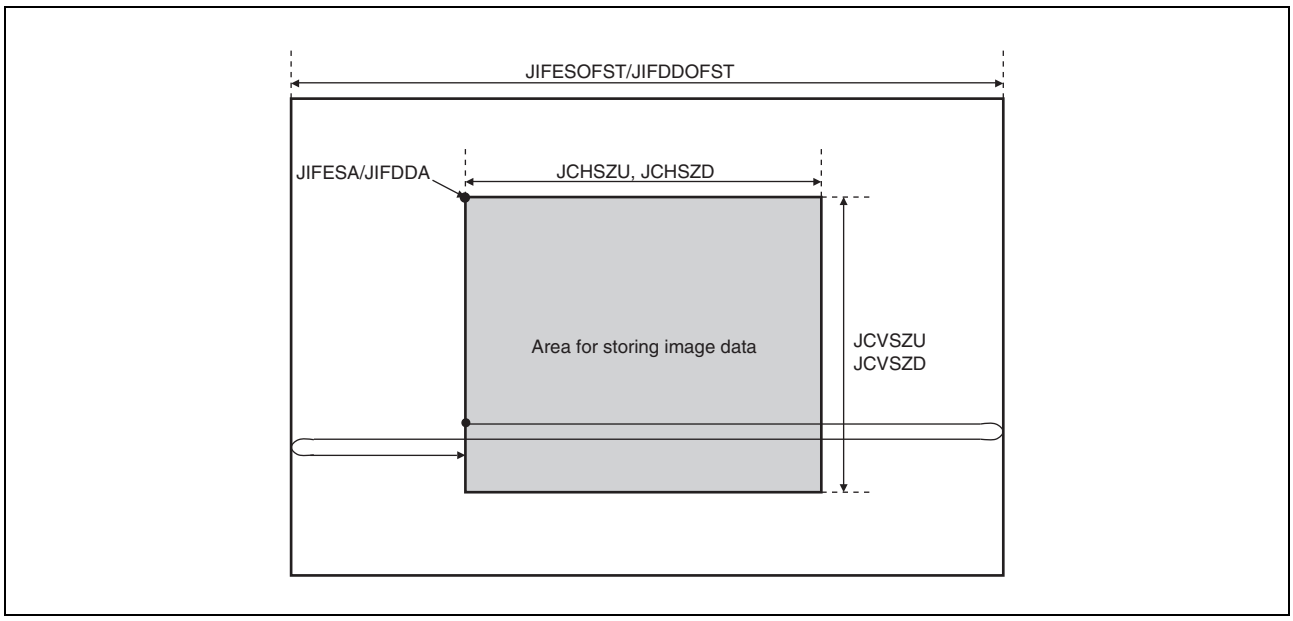

Figure 45.14 Image of Storing Image Data

45.4 Interrupts

Two types of interrupt requests, namely compression/decompression process interrupt request (JEDI) and data transfer interrupt request (JDTI), are available in this module. The two types of interrupt requests are each related to multiple sources. The interrupt request cancellation methods differ depending on the source of the interrupt request.

45.4.1 Compression/Decompression Process Interrupt Request (JEDI)

The flags in JINTS0 indicate compression/decompression-related sources. The interrupt requests asserted by these interrupt sources cannot be negated by clearing the corresponding interrupt status bits to 0. Issue an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request. When a flag in JINTS0 is set to 1, a compression/decompression process interrupt request is sent to the interrupt controller.

(1) Compression

- JPEG compression process end
  When the INS6 bit in JINTS0 is 1, the JPEG compression process has been successfully completed. After all of the coded data is transferred, the JCU completes compression.

(2) Decompression

- JPEG decompression process end
  When the INS6 bit in JINTS0 is 1, the JPEG decompression process has been successfully completed. After all of the image data is transferred, JCU completes decompression.
- JPEG decompression error occurrence
  When the INS5 bit in JINTS0 is 1, the input JPEG coded data has an error and the JCU has stopped the decompression process. Read the error code (ERR bits in JCDERR) and identify the error source. This interrupt occurs when any of the INT7 to INT5 bits in JINTE0 is 1.
- Request for reading the image size and pixel format
  When the INS3 bit in JINTS0 is 1, JPEG coded data has been input and information regarding the image size and pixel format can be read. Since the JPEG decompression process is suspended, resume the JPEG decompression process by setting the process stop clear command after accessing the necessary registers. This interrupt occurs when the INT3 bit in JINTE0 is 1.

45.4.2 Data Transfer Interrupt Request (JDTI)

The flags in JINTS1 are the interrupt sources for transferring the image data and coded data. The interrupt requests asserted by these interrupt sources can be negated by clearing the corresponding interrupt status bits to 0.

(1) Compression

- Interrupt request generated after the specified number of input image data lines has been read
  When the DINLF bit in JINTS1 is 1, the number of image data lines specified by JIFESLC has been transferred; transfer the rest of the image data to the external buffer and resume transferring the data from the external buffer. A data transfer interrupt request is sent when the DINLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of output coded data have been written to
  When the JOUTF bit in JINTS1 is 1, the amount of coded data specified by JIFEDDC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. The data transfer interrupt request is sent when the JOUTEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
  When the CBTF bit in JINTS1 is 1, the JCU has completed compression and transferred all of the coded data. The data transfer interrupt request is sent when the CBTEN bit in JINTE1 is set to 1.

(2) Decompression

- Interrupt request generated after the specified number of output image data lines has been written to
  When the DOUTLF bit in the JINTS1 is 1, the number of image data lines specified by JIFDDLC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. A data transfer interrupt request is sent when the DOUTLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of input coded data has been read
  The JINF bit in JINTS1 becomes 1 when the amount of coded data specified by JIFDSDC has been transferred. Secure the next coded data in the external buffer, and resume transfer process. A data transfer interrupt is also sent at this time if the JINEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
  The DBTF bit in JINTS1 becomes 1 when the JCU has completed decompression and transferred all of the coded data. A data transfer interrupt request is also sent at this time if the DBTEN bit in JINTE1 is set to 1.

45.5 Bus Reset Processing

Issuing the bus reset command (setting the BRST bit in JCCMD to 1) causes a bus reset.
When the JCU is in operation, the bus reset command should not be issued. Registers below are initialized by a bus reset.

- JPEG code data count upper register (JCDTCU)
- JPEG code data count middle register (JCDTCM)
- JPEG code data count lower register (JCDTCD)
- JPEG interrupt status register 0 (JINTS0)
- JPEG code decode error register (JCDERR)
- JPEG code reset register (JCRST)

46. Capture Engine Unit

The capture engine unit (CEU) is a capture module that fetches image data externally input and transfers it to the memory. The CEU is connected to the system bus via bus bridge modules.

46.1 Features of CEU

Lists the features of CEU as follows.

(1) Image data fetch

- Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data.
- Fetches image data other than YCbCr data, e.g. JPEG data, RGB565, from an externally connected module, such as a camera, and sequentially writes the image data to the memory.
- Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.

(2) Filter processing

- Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.

(3) Format conversion

- Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory. Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.

46.2 Functional Overview of CEU

The functional overview of the CEU is shown in Table 46.1, and the main functions and their details are shown in Table 46.1.

Table 46.1 Functional Overview of CEU

Classification	Item	Function	Description	Note
Connectable camera	Size	5 megapixels	2,560 pixels × 1,920 lines	Horizontal: 4-pixel units Vertical: 4-line units The range of the image size that can be input is as follows. Horizontal: 2,560 pixels to 128 pixels Vertical: 1,920 lines to 96 lines [Note] This depends on the AC characteristics of the device to be connected, frame rate of the connected device, and transfer speed to the destination RAM.
		3 megapixels	2,048 pixels × 1,536 lines	
		2 megapixels	1,632 pixels × 1,224 lines	
		UXGA	1,600 pixels × 1,200 lines	
		SXGA (1)	1,280 pixels × 1,024 lines	
		SXGA (2)	1,280 pixels × 960 lines	
		WXGA	1,280 pixels × 768 lines	
		XGA	1,024 pixels × 768 lines	
		SVGA	800 pixels × 600 lines	
		WVGA	800 pixels × 480 lines	
		VGA	640 pixels × 480 lines	
		CIF	352 pixels × 288 lines	
		WQVGA	480 pixels × 240 lines	
		QVGA	320 pixels × 240 lines, 240 pixels × 320 lines	
		QCIF	176 pixels × 144 lines	
		QQVGA	160 pixels × 120 lines	
		Sub-QCIF	128 pixels × 96 lines	
	Input format	YCbCr422 8 bits	Cb_0, Y_0, Cr_0, $Y_{1...}$	Supports clock ratio of 1:1
			Cr_0, Y_0, Cb_0, $Y_{1...}$	
			Y_0, Cb_0, Y_1, $Cr_{0...}$	
			Y_0, Cr_0, Y_1, $Cb_{0...}$	
		YCbCr422 16 bits	{Y0, Cb0}, {Y1, Cr0}, …	
			{Y0, Cr0}, {Y1, Cb0}, …	
		Binary data	Specified amount to be fetched on edges of the sync signal	Written sequentially
			Data is fetched with the horizontal sync signal as an enable signal. (Setting is prohibited in this product.)	
	Horizontal and vertical sync signal polarities	Arbitrary	High-active and low-active	
	Capture start location	Arbitrary	Can be specified in camera input clock units	Horizontal: 1-cycle units Vertical: 1-HD (horizontal sync signal) units
	Number of captured pixels	Arbitrary	Can be specified in 4-pixel units horizontally and in 4-line units vertically	
	Interlace	Both-field capture	Stored as a field image	Capture: 2-VD (vertical sync signal) units
			Stored as a frame image	
		One-field capture	Top field or bottom field can be specified	Capture: 1-VD units
Memory write	Output format	YCbCr422 YCbCr420	YCbCr420 is realized by simple skipping	
Filter function	No scaling or scale-down	Scale-down of captured display	Desired scaling factor from 1/16 to 1 (scaled-down display must not exceed VGA)	
	Low-pass filter		Removal of high-frequency components	Only in the horizontal direction

Table 46.2 Main Functions of CEU and Their Details

Main Function	Detailed Description
Image data fetch	• Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data. • Fetches image data other than YCbCr data, e.g. JPEG data, from an externally connected module, such as a camera, and sequentially writes the image data to the memory. • Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.
Filter processing	Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.
Format conversion	Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory. Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.

Figure 46.1 shows a block diagram of the CEU.

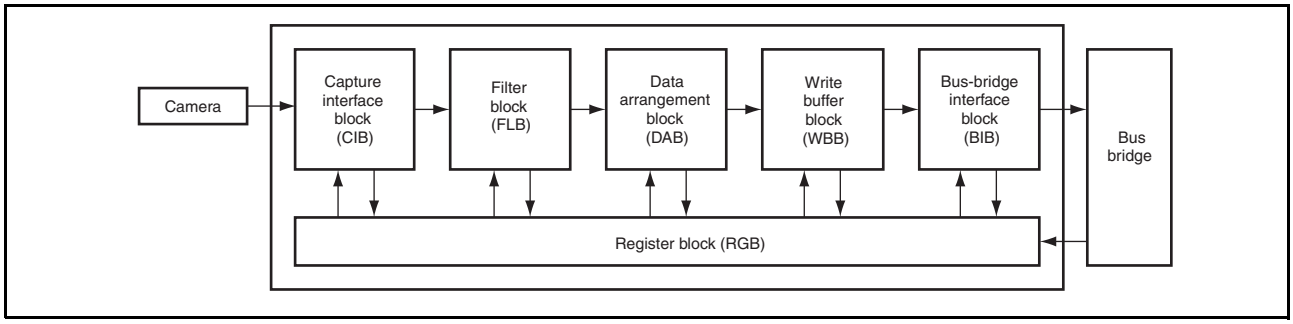

Figure 46.1 Block Diagram of CEU

46.3 Pin Configuration of CEU

The pin configuration of the CEU is shown in Table 46.3.

Table 46.3 Pin Configuration of CEU

Pin Name	Function	I/O	Description
VIO_D15 to VIO_D0*	CEU data bus	Input	Camera image data input to the CEU
VIO_CLK	CEU clock	Input	Camera clock input to the CEU
VIO_VD	CEU vertical sync	Input	Camera vertical sync signal input to the CEU
VIO_HD	CEU horizontal sync	Input	Camera horizontal sync signal input to the CEU
VIO_FLD	Field signal	Input	Field identification signal to the CEU

Note: * When the distinction according to the bus width for the data bus is not needed, VIO_D is used in this manual. Otherwise, VIO_D15 to VIO_D0 are used.

46.4 Register Descriptions of CEU

The register configuration of the CEU is shown in Table 46.4.

Most CEU registers have a 2-plane configuration (plane A and plane B). The CEU switches the planes when using these 2-plane registers. A mirror address, which is an address that can always access the register on the unused plane, is provided for each 2-plane register. Figure 46.2 shows the timing to switch the register planes. The CEU switches the register planes at the same time a VD interrupt is asserted.

In the following register descriptions, "during operation" indicates the period that begins when the CEU is activated by the CE bit in the capture start register (CAPSR) and ends when a capture end interrupt (CPE) of the capture event flag clear register (CETCR) occurs. In the read-only bits in each register, the write value should always be 0. If a value other than 0 is written to any of these bits, correct operation cannot be guaranteed.

Table 46.4 Register Configuration of CEU

			Addresses			
Register Name	**Abbr.**	**R/W**	**Address (Plane A)**	**Address (Plane B)**	**Mirror Address**	**Access Size**
CEU Capture start register	CAPSR	R/W	H'E821 0000	—	—	32
CEU Capture control register	CAPCR	R/W	H'E821 0004	—	—	32
CEU Capture interface control register*	CAMCR	R/W	H'E821 0008	—	—	32
CEU Capture interface cycle register*	CMCYR	R/W	H'E821 000C	—	—	32

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CPKIL	0	R/W	Write 1 to this bit to perform a software reset of capturing. At a software reset, capturing ends immediately without completing capture operation until the end of a frame. Clear the CE bit to 0 when writing 1 to this bit. Processing of the capture software reset is indicated by this bit being set to 1. When this bit is 1, do not start capturing since reset processing is in progress. When restarting capture operations, after referring to the CPTON bit in CSTSR to ensure that the CEU is halted (in the idle state), wait until this bit is cleared to 0. The timing of restarting capture operations is shown in Figure 46.6. When a software reset is generated by this bit, a capture end interrupt (CPE bit in CETCR) may be output immediately after the software reset. However, such kind of interrupt should be ignored. Also, even if the capture end interrupt is not output, the interrupt source (CPE bit) must be cleared before capturing of the next frame. 0: Normal state 1: Software reset of capturing
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	CE	0	R/W	• Single-capture This bit reserves capturing of the next frame. When 1 is written to this bit, the capture of one frame starts from the next VD input, and stops when the one-frame capture end interrupt (CPE bit in CETCR) is asserted (Figure 46.7). To perform capture again, write 1 to this bit. After the VD or HD polarity is changed, do not write 1 to this bit until the next VD interrupt is asserted. As this bit indicates the capture reserve state, this bit is read as 1 after it is set to 1 and until VD is input. When VD is input, this bit returns to 0 and so is read as 0. The capture end is determined by the one-frame capture end interrupt (CPE bit). This is similar in data fetch mode. Registers should be set before the VD interrupt of the frame where capture starts next. The new register settings take effect at the next VD input. When registers are modified during capturing, the register settings take effect from the capture operations of the next VD input. If a setting register to which writing during capturing is prohibited is modified during capturing, an interrupt source (IGRW bit in CETCR) is generated. For details on the interrupt source, see the description on CETCR. • Continuous capture When this bit is set to 1 while the CTNCP bit in CAPCR is set to 1, continuous capture starts from the next frame (Figure 46.8). Note that this bit is not cleared to 0 but remains as 1. To stop capturing, clear this bit to 0; capturing stops after the current frame is completed. Continuous capture operations are possible in only image capture mode. The start address of the memory to which the captured data is written to must be set for each frame. 0: Stops capturing 1: Starts capturing

When both the VD (vertical sync signal) and HD (horizontal sync signal) polarities are high-active, one frame is defined as a period from a VD rising edge to the next VD rising edge, and one line as a period from an HD rising edge to the next HD rising edge. Figure 46.3 shows the timing of one frame (when both the VD and HD polarities are high-active).

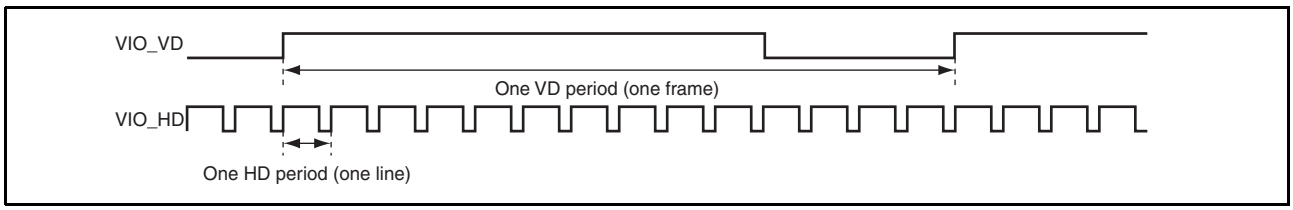

Figure 46.3 Frame Timing

When both the VD and HD polarities are high-active, similar to one frame, one field is defined as follows:

- Period from a VD rising edge to the next VD rising edge
- One line is a period from an HD rising edge to the next HD rising edge

The field identification signal FLD should be fixed for at least 1-HD period from a VD input. Figure 46.4 shows the timing of one field (when both the VD and HD polarities are high-active).

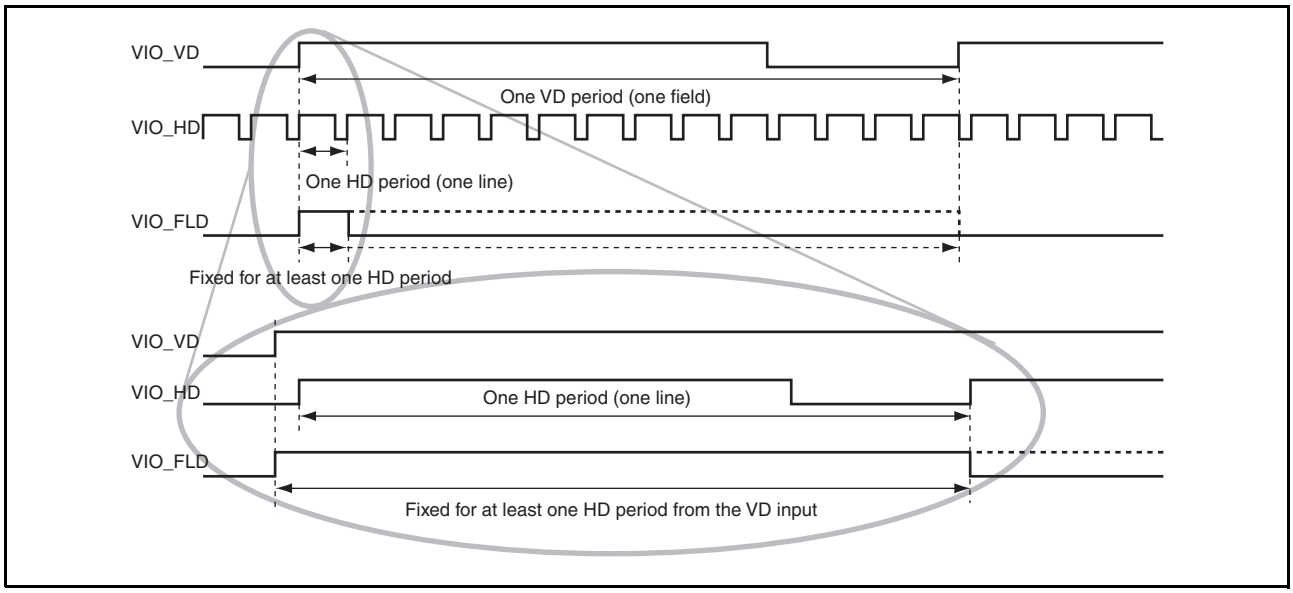

Figure 46.4 One Field Timing

In data enable fetch*, one frame is defined as a period from a VD rising edge to the VD falling edge. With the HD as an enable signal (positive polarity), data of a cycle in which the HD is asserted is fetched while the VD is high. Figure 46.5 shows the timing of one frame for data enable fetch.

Note: * Data enable fetch mode cannot be set in this product.

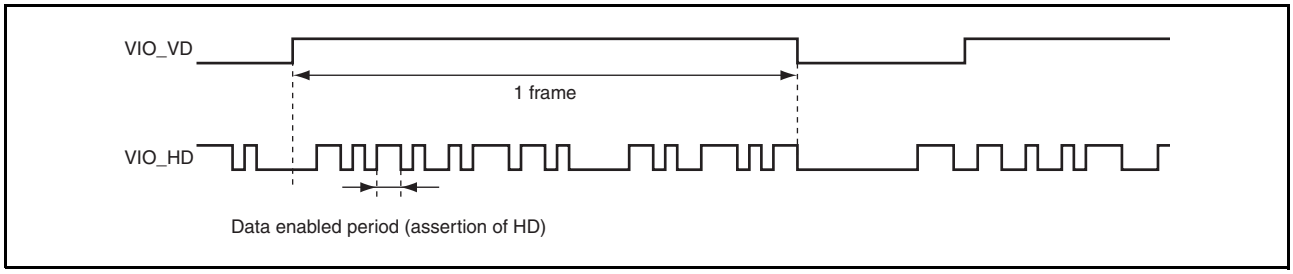

Figure 46.5 Frame Timing (Data Enable Fetch)

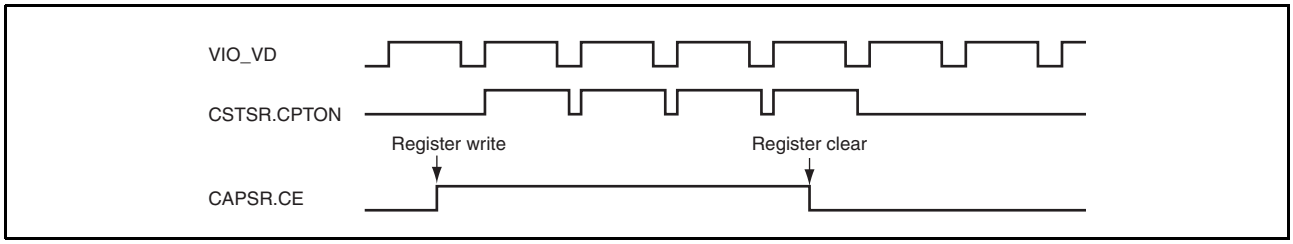

Figure 46.8 Continuous-Frame Capture

46.4.2 Capture Control Register (CAPCR)

CAPCR sets continuous-frame capture and the frame drop intervals.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	FDRP[7:0]	H'00	R/W	These bits set the frame drop interval in continuous-frame capture. When these bits are cleared to 0, frame drop is not performed, and all frames are captured. Figure 46.9 shows the value set in these bits and the timing of captured frames. The frame drop interval unit differs according to the capture setting. Table 46.5 shows the relationship between the capture setting and frame drop interval unit. The image of the frame drop timing for each capture setting when these bits are set to 2 is shown in Figure 46.10. In both-field capture, capturing is performed continuously for 2-VD periods, regardless of whether the second field is the top field or bottom field. In addition, in both-field capture, the frame drop counter is incremented when the first field has been identified as the top field or bottom field, regardless of whether the second field is the top field or bottom field. When 0 is written to the CE bit in CAPSR, capturing terminates after the current frame has been captured for a capture frame. However, for a drop frame, capturing is forcibly terminated in the CEU so no capture end interrupt (CPE bit in CETCR) is output. While CE bit is 1, do not change the setting of these bits. Note: Do not change the setting of these bits during continuous capture operations. To change the setting of these bits, stop continuous capture (CE bit = 0), clear the CTNCP bit (continuous capture) in CAPCR to 0, and then restart continuous capture. Continuous capture is performed during the period of CAPSR.CE = 1 shown in Figure 46.9.
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
21, 20	MTCM[1:0]	00	R/W	These bits specify the unit for transferring data to a bus bridge module. The efficiency of writing image data can be improved by continuously accessing the addresses. To improve the write efficiency, set these bits to 11. The setting of these bits appear to be unchanged from the outside. 00: Transferred to the bus in 32-byte units 01: Transferred to the bus in 64-byte units 10: Transferred to the bus in 128-byte units 11: Transferred to the bus in 256-byte units (1) Image capture 00: Y data and C data are transferred in 32-byte units 01: Y data and C data are transferred in 64-byte units 10: Y data and C data are transferred in 128-byte units 11: Y data and C data are transferred in 256-byte units (2) Data fetch 00: Data is transferred in 32-byte units 01: Data is transferred in 64-byte units 10: Data is transferred in 128-byte units 11: Data is transferred in 256-byte units
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CTNCP	0	R/W	When capturing is started with this bit set to 1, capturing continues until the CE bit in CAPSR is cleared to 0 or a software reset is initiated by the CPKIL bit in CAPSR (see Figure 46.8). Continuous capture must be set before capturing is started. This bit is modified only after 0 is written to the CE bit to stop capturing. If this bit is modified during capturing, correct operation cannot be guaranteed. In data fetch mode, clear this bit to 0. 0: One-frame capture when the CE bit is 1 1: Continuous capture until the CE bit is cleared to 0
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

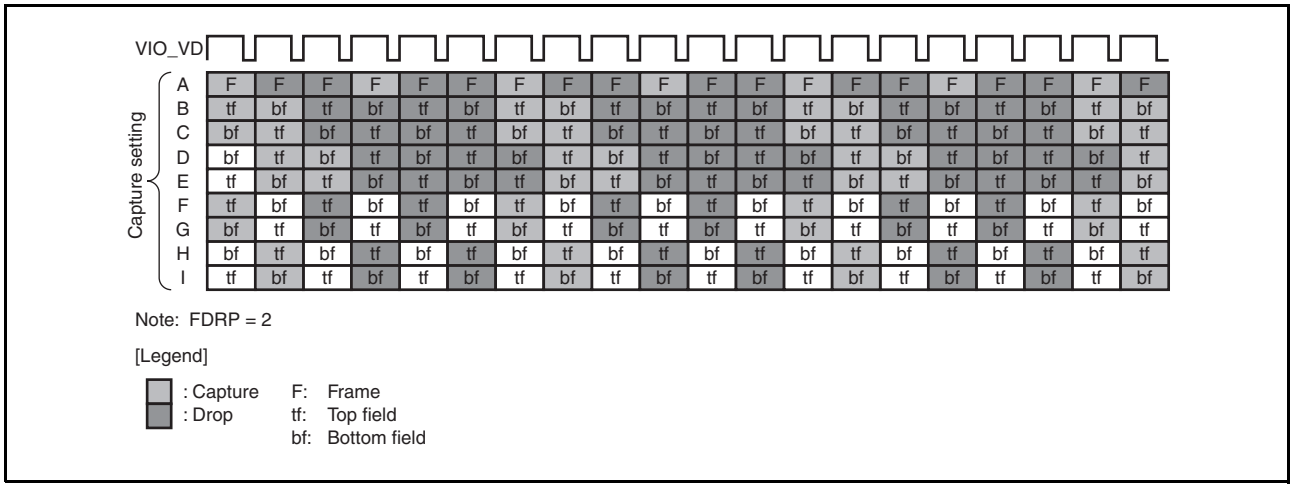

Figure 46.10 Image of Frame Drop Timing for Capture Settings (FDRP Bits = 2)

46.4.3 Capture Interface Control Register (CAMCR)

CAMCR sets the capture interface.

The following items are set by CAMCR.

- Selection between image capture operation or data fetch operation
- Polarities of the vertical and horizontal sync signals
- Input order of image data components (Y, Cb, and Cr) (only for image capture mode)
- Selection of digital image input pins (8 bits or 16 bits)
- Polarity of the field identification signal

CAMCR must be set according to the module connected. In data fetch mode, set the DTARY bits to B'0. Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	FLDPOL	0	R/W	Sets the polarity of the field identification signal (FLD) from an external module. 0: When the FLD signal is high-active, the field is detected as the top field and when low-active, the field is detected as the bottom field. 1: When the FLD signal is low-active, the field is detected as the top field and when high-active, the field is detected as the bottom field.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DTIF	0	R/W	Sets the digital image input pins from which data is to be captured. 0: Data input to 8-bit digital image input pins is captured 1: Data input to 16-bit digital image input pins is captured
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9, 8	DTARY[1:0]	00	R/W	These bits set the input order of the luminance component and chrominance component. The order in which the luminance component (Y) and chrominance component (Cb and Cr) are input from an external module differs among modules. The CEU supports the input orders shown in Figure 46.12. Set the corresponding value in these bits. In data fetch mode, set these bits to 00. (1) 8-bit interface 00: Image input data is fetched in the order of Cb_0, Y_0, Cr_0, and Y_1 01: Image input data is fetched in the order of Cr_0, Y_0, Cb_0, and Y_1 10: Image input data is fetched in the order of Y_0, Cb_0, Y_1, and Cr_0 11: Image input data is fetched in the order of Y_0, Cr_0, Y_1, and Cb_0 (2) 16-bit interface 00: Image input data is fetched in the order of {Cb0, Y0} and {Cr0, Y1} 01: Image input data is fetched in the order of {Cr0, Y0} and {Cb0, Y1} 10: Image input data is fetched in the order of {Y0, Cb0} and {Y1, Cr0} 11: Image input data is fetched in the order of {Y0, Cr0} and {Y1, Cb0}
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	JPG[1:0]	00	R/W	These bits select the fetched data type. 00: Image capture mode (input data are separated into Y data and CbCr data for output to the memory) 01: Data synchronous fetch mode (specified size of input data are output to the specified memory addresses in order of input and in synchronization with the sync signal) 10: Data enable fetch mode (Setting is prohibited in this product.) (input data are fetched with HD as an enable signal and output to the specified addresses in memory in order of input)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	VDPOL	0	R/W	Sets the polarity for detection of the vertical sync signal input from an external module. Figure 46.14 and Figure 46.15 show the relationship between the VIO_VD and VIO_HD signals and VD interrupt when high-active is selected. Since a VD interrupt may occur when this bit value is modified, the VD bit in CETCR must always be cleared to 0 when this bit value is changed. In data enable fetch mode, this bit is not used and the sense for detection is always active high. 0: Vertical sync signal (VD) from an external module is detected as high-active 1: Vertical sync signal (VD) from an external module is detected as low-active
0	HDPOL	0	R/W	Sets the polarity for detection of the horizontal sync signal input from an external module. Figure 46.16 shows the relationship between the HD and HD interrupt when high-active is selected. Since an HD interrupt may occur when this bit value is modified, the HD bit in CETCR must always be cleared to 0 when this bit value is changed. 0: Horizontal sync signal (HD) from an external module is detected as high-active 1: Horizontal sync signal (HD) from an external module is detected as low-active

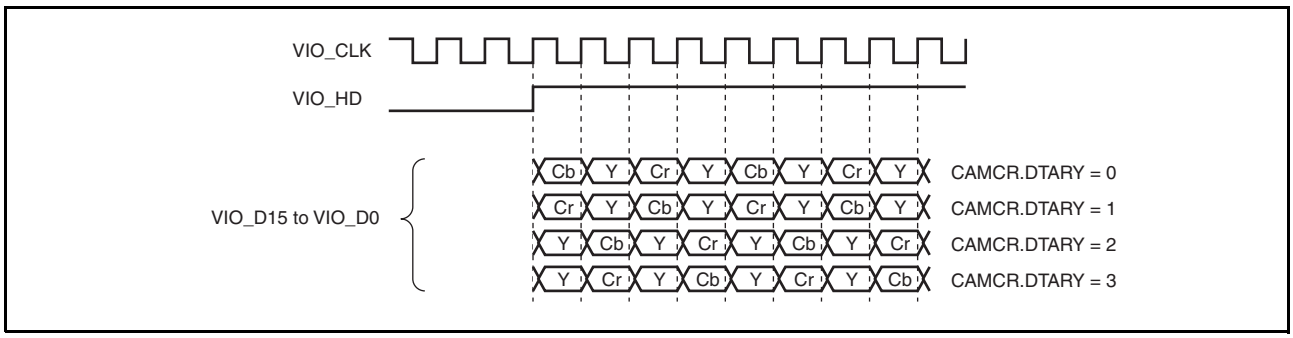

Figure 46.11 Input Order of Image Data

The JPG bit in CAMCR selects whether digital image data is fetched or data such as JPEG is fetched. In addition, when data such as JPEG is fetched, select whether the specified amount of data is continuously fetched in synchronization with the sync signal or data is fetched while the horizontal sync signal is enabled*.

Note: * Data enable fetch mode cannot be set in this product.

In data enable fetch mode, one frame is defined as a period from the rising edge to the falling edge of the vertical sync signal (VD) for data fetching. The horizontal sync signal (HD) is enabled only when the VD is high and treated as an enable signal. Data input in the cycle in which the HD is asserted (high) is fetched and output to the memory continuously.

This module starts fetching data at the rising edge of the VD and stops fetching data at the falling edge of the VD in data enable fetch mode. Thus, if the VD remains high and does not go low, end processing does not start. In addition, if the VD remains high and the HD also remains asserted, data continues to be fetched.

Figure 46.12 and Figure 46.13 show the interface timing in data enable fetch mode.

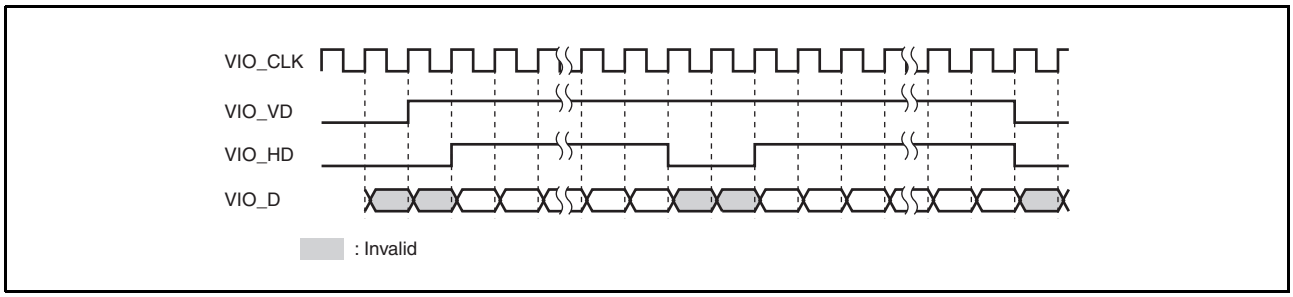

Figure 46.12 Data Enable Fetch Timing (HD Asserted (High) While VD is High)

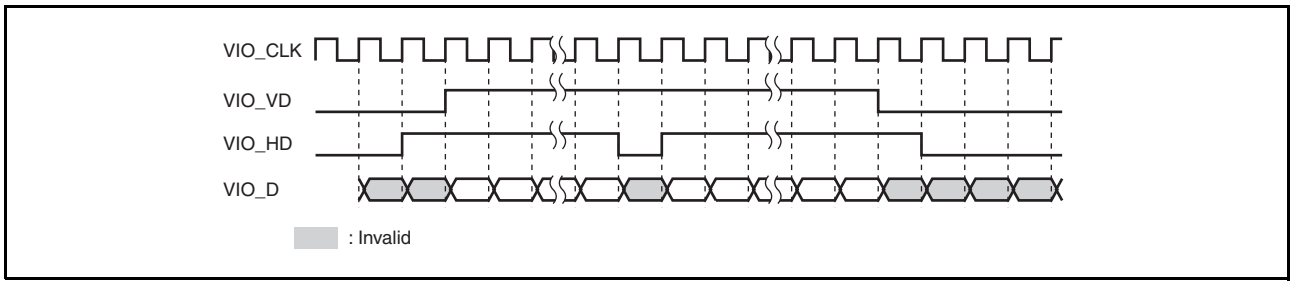

Figure 46.13 Data Enable Fetch Timing (HD Asserted (High) When VD is Not High)

In data enable fetch mode, this module generates a VD interrupt in response to detection of the active level of VD. In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time.
Figure 46.14 to Figure 46.16 show the relationships between the VIO_VD signal and the VD interrupt, the VIO_VD and VIO_HD signals and the VD interrupt, and the VIO_HD signal and the HD interrupt.

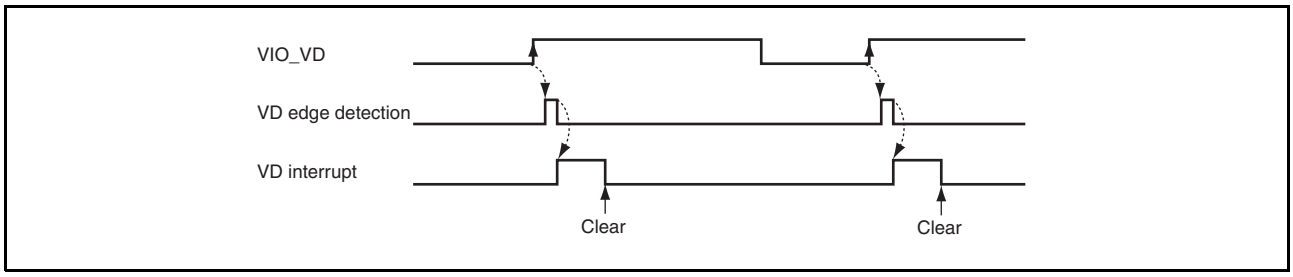

Figure 46.14 Relationship between VIO_VD and VD Interrupt when VD is High-Active (In Data Enable Fetch Mode)

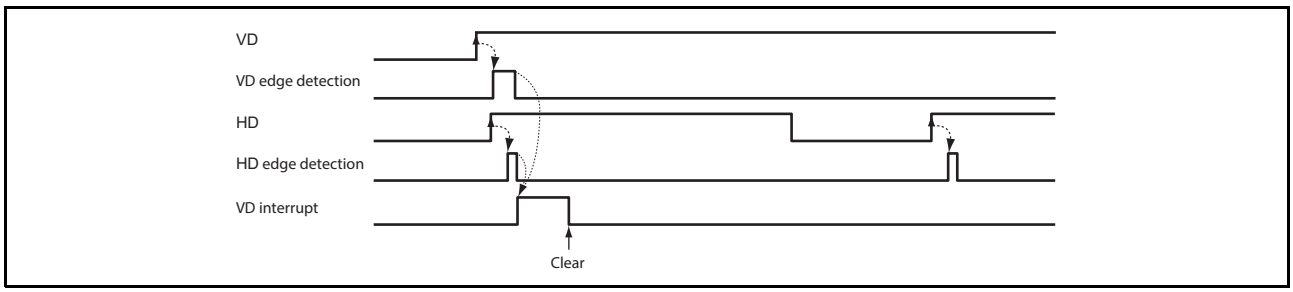

Figure 46.15 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are High-Active (in Image Capture Mode or Data Synchronous Fetch Mode)

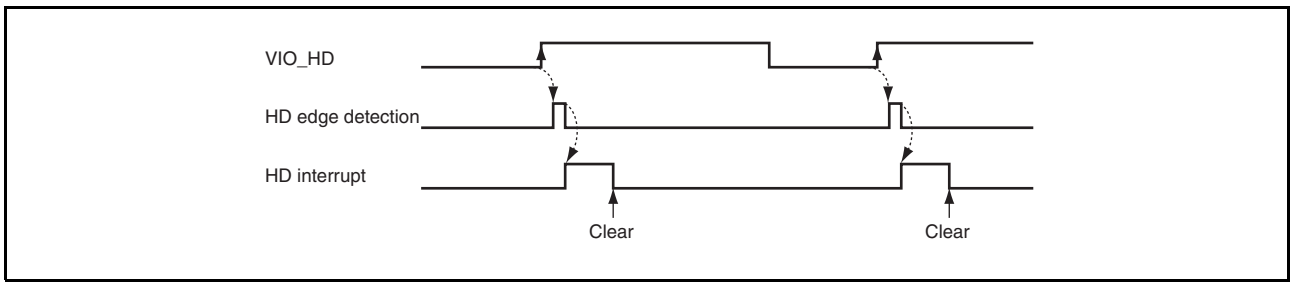

Figure 46.16 Relationship between VIO_HD and HD Interrupt when HD is High-Active

46.4.4 Capture Interface Cycle Register (CMCYR)
