Table 21.121 RSCFDnCFDGAFLP1_j Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25 to 8	GAFLFDP[25:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCFDnCFDGAFLP1_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[25:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) can be selected.

21.5.6 Details of Receive Buffer-related Registers

21.5.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register

Access: RSCFDnCFDRMNB register can be read or written in 32-bit units
RSCFDnCFDRMNBL register can be read or written in 16-bit units
RSCFDnCFDRMNBLL, RSCFDnCFDRMNBLH registers can be read or written in 8-bit units

Address: RSCFDnCFDRMNB: <RSCANn_base> + $00A4_H$

RSCFDnCFDRMNBL: <RSCANn_base> + $00A4_H$

RSCFDnCFDRMNBLL: <RSCANn_base> + $00A4_H$,
RSCFDnCFDRMNBLH: <RSCANn_base> + $00A5_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 21.122 RSCFDnCFDRMNB Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	RMPLS[1:0]	Receive Buffer Payload Storage Size Select b9 b8 0 0: 8 bytes 0 1: 12 bytes 1 0: 16 bytes 1 1: 20 bytes
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 96.

Modify the RSCFDnCFDRMNB register only in global reset mode.

RMPLS[1:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

21.5.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0 to 2)

Access: RSCFDnCFDRMNDy register can be read or written in 32-bit units
RSCFDnCFDRMNDyL, RSCFDnCFDRMNDyH registers can be read or written in 16-bit units
RSCFDnCFDRMNDyLL, RSCFDnCFDRMNDyLH, RSCFDnCFDRMNDyHL, RSCFDnCFDRMNDyHH registers can be read or written in 8-bit units

Address: RSCFDnCFDRMNDy: <RSCANn_base> + $00A8_H$ + (04_H × y)

RSCFDnCFDRMNDyL: <RSCANn_base> + $00A8_H$ + (04_H × y),
RSCFDnCFDRMNDyH: <RSCANn_base> + $00AA_H$ + (04_H × y)

RSCFDnCFDRMNDyLL: <RSCANn_base> + $00A8_H$ + (04_H × y),
RSCFDnCFDRMNDyLH: <RSCANn_base> + $00A9_H$ + (04_H × y),
RSCFDnCFDRMNDyHL: <RSCANn_base> + $00AA_H$ + (04_H × y),
RSCFDnCFDRMNDyHH: <RSCANn_base> + $00AB_H$ + (04_H × y)

Table 21.123 RSCFDnCFDRMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 95)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[1:0] value in the RSCFDnCFDRMNB register is 00_B (8 bytes), the message storing time is 12 pclk clock cycles. When the RMPLS[1:0] value is 11_B (20 bytes), the message storing time is 18 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size).

These flags are cleared to 0 in global reset mode.

21.5.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 95)

Access: RSCFDnCFDRMIDq register is a read-only register that can be read in 32-bit units
RSCFDnCFDRMIDqL, RSCFDnCFDRMIDqH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRMIDqLL, RSCFDnCFDRMIDqLH, RSCFDnCFDRMIDqHL, RSCFDnCFDRMIDqHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDRMIDq: <RSCANn_base> + 2000_H + (20_H × q)

RSCFDnCFDRMIDqL: <RSCANn_base> + 2000_H + (20_H × q),
RSCFDnCFDRMIDqH: <RSCANn_base> + 2002_H + (20_H × q)

RSCFDnCFDRMIDqLL: <RSCANn_base> + 2000_H + (20_H × q),
RSCFDnCFDRMIDqLH: <RSCANn_base> + 2001_H + (20_H × q),
RSCFDnCFDRMIDqHL: <RSCANn_base> + 2002_H + (20_H × q),
RSCFDnCFDRMIDqHH: <RSCANn_base> + 2003_H + (20_H × q)

Value after reset: $0000\ 0000_H$

Table 21.124 RSCFDnCFDRMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR/RRS • When the received message is a classical CAN frame 0: Data frame 1: Remote frame • When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	Reserved	When read, the value after reset is returned.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

21.5.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 95)

Access: RSCFDnCFDRMPTRq register is a read-only register that can be read in 32-bit units
RSCFDnCFDRMPTRqL, RSCFDnCFDRMPTRqH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRMPTRqLL, RSCFDnCFDRMPTRqLH, RSCFDnCFDRMPTRqHL, RSCFDnCFDRMPTRqHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDRMPTRq: <RSCANn_base> + 2004_H + (20_H × q)

RSCFDnCFDRMPTRqL: <RSCANn_base> + 2004_H + (20_H × q),
RSCFDnCFDRMPTRqH: <RSCANn_base> + 2006_H + (20_H × q)

RSCFDnCFDRMPTRqLL: <RSCANn_base> + 2004_H + (20_H × q),

0	1	0	0	4 data bytes	
0	1	0	1	5 data bytes	
0	1	1	0	6 data bytes	
0	1	1	1	7 data bytes	
1	0	0	0	8 data bytes	
1	0	0	1	8 data bytes	12 data bytes
1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

21.5.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 95)

Access: RSCFDnCFDRMFDSTSq register is a read-only register that can be read in 32-bit units
RSCFDnCFDRMFDSTSqL register is a read-only register that can be read in 16-bit units
RSCFDnCFDRMFDSTSqLL register is a read-only register that can be read in 8-bit units

Address: RSCFDnCFDRMFDSTSq: <RSCANn_base> + 2008_H + (20_H × q)

RSCFDnCFDRMFDSTSqL: <RSCANn_base> + 2008_H + (20_H × q)

RSCFDnCFDRMFDSTSqLL: <RSCANn_base> + 2008_H + (20_H × q)

Value after reset: $0000\ 0000_H$

Table 21.126 RSCFDnCFDRMFDSTSq Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	RMFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	RMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RMESI	ESI 0: Error active node 1: Error passive node

RMFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive buffer.

RMBRS Bit

When the RMFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

RMESI Bit

When the RMFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

21.5.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 95)

Access: RSCFDnCFDRMDFb_q register is a read-only register that can be read in 32-bit units
RSCFDnCFDRMDFb_qL, RSCFDnCFDRMDFb_qH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRMDFb_qLL, RSCFDnCFDRMDFb_qLH, RSCFDnCFDRMDFb_qHL, RSCFDnCFDRMDFb_qHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDRMDFb_q: <RSCANn_base> + $200C_H$ + (04_H × b) + (20_H × q)

RSCFDnCFDRMDFb_qL: <RSCANn_base> + $200C_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qH: <RSCANn_base> + $200E_H$ + (04_H × b) + (20_H × q)

RSCFDnCFDRMDFb_qLL: <RSCANn_base> + $200C_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qLH: <RSCANn_base> + $200D_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qHL: <RSCANn_base> + $200E_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qHH: <RSCANn_base> + $200F_H$ + (04_H × b) + (20_H × q)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RMDB4 × b + 3 [7:0]								RMDB4 × b + 2 [7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RMDB4 × b + 1 [7:0]								RMDB4 × b + 0 [7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.127 RSCFDnCFDRMDFb_q Register Contents

Bit Position	Bit Name	Function
31 to 24	RMDB4 × b + 3 [7:0]	Receive Buffer Data Byte 4 × b + 3 Receive Buffer Data Byte 4 × b + 2 Receive Buffer Data Byte 4 × b + 1 Receive Buffer Data Byte 4 × b + 0
23 to 16	RMDB4 × b + 2 [7:0]	
15 to 8	RMDB4 × b + 1 [7:0]	Data for a message stored in the receive buffer can be read.
7 to 0	RMDB4 × b + 0 [7:0]	

When the RMDLC[3:0] value in the RSCFDnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the receive buffer by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. Do not read the RSCFDnCFDRMDFb_q register corresponding to an area larger than the specified size.

21.5.7 Details of Receive FIFO Buffer-related Registers

21.5.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access: RSCFDnCFDRFCCx register can be read or written in 32-bit units
RSCFDnCFDRFCCxL register can be read or written in 16-bit units
RSCFDnCFDRFCCxLL, RSCFDnCFDRFCCxLH registers can be read or written in 8-bit units

Address: RSCFDnCFDRFCCx: <RSCANn_base> + $00B8_H$ + (04_H × x)

RSCFDnCFDRFCCxL: <RSCANn_base> + $00B8_H$ + (04_H × x)

RSCFDnCFDRFCCxLL: <RSCANn_base> + $00B8_H$ + (04_H × x),

Table 21.128 RSCFDnCFDRFCCx Register Contents (2/2)

Bit Position	Bit Name	Function
6 to 4	RFPLS[2:0]	Receive FIFO Buffer Payload Storage Size Select b6 b5 b4 0 0 0: 8 bytes 0 0 1: 12 bytes 0 1 0: 16 bytes 0 1 1: 20 bytes 1 0 0: 24 bytes 1 0 1: 32 bytes 1 1 0: 48 bytes 1 1 1: 64 bytes
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit is set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RSCFDnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

21.5.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RSCFDnCFDRFSTSx register can be read or written in 32-bit units
RSCFDnCFDRFSTSxL register can be read or written in 16-bit units
RSCFDnCFDRFSTSxLL register can be read or written in 8-bit units
RSCFDnCFDRFSTSxLH register is a read-only register that can be read in 8-bit units

Address: RSCFDnCFDRFSTSx: <RSCANn_base> + $00D8_H$ + (04_H × x)

RSCFDnCFDRFSTSxL: <RSCANn_base> + $00D8_H$ + (04_H × x)

RSCFDnCFDRFSTSxLL: <RSCANn_base> + $00D8_H$ + (04_H × x),
RSCFDnCFDRFSTSxLH: <RSCANn_base> + $00D9_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.129 RSCFDnCFDRFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCFDnCFDRFCCx register is set to 0.

This flag is 00H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to other flags.

21.5.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RSCFDnCFDRFPCTRx register is a write-only register that can be written in 32-bit units
RSCFDnCFDRFPCTRxL register is a write-only register that can be written in 16-bit units
RSCFDnCFDRFPCTRxLL register is a write-only register that can be written in 8-bit units

Address: RSCFDnCFDRFPCTRx: <RSCANn_base> + $00F8_H$ + (04_H × x)

RSCFDnCFDRFPCTRxL: <RSCANn_base> + $00F8_H$ + (04_H × x)

RSCFDnCFDRFPCTRxLL: <RSCANn_base> + $00F8_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RFPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 21.130 RSCFDnCFDRFPCTRx Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

When the RFDMAEx value in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCFDnCFDRFSTSx register is decremented. Read the RSCFDnCFDRFIDx, RSCFDnCFDRFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCFDnCFDRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCFDnCFDRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

21.5.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RSCFDnCFDRFIDx register is a read-only register that can be read in 32-bit units
RSCFDnCFDRFIDxL, RSCFDnCFDRFIDxH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRFIDxLL, RSCFDnCFDRFIDxLH, RSCFDnCFDRFIDxHL, RSCFDnCFDRFIDxHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDRFIDx: <RSCANn_base> + 3000_H + (80_H × x)

RSCFDnCFDRFIDxL: <RSCANn_base> + 3000_H + (80_H × x),
RSCFDnCFDRFIDxH: <RSCANn_base> + 3002_H + (80_H × x)

RSCFDnCFDRFIDxLL: <RSCANn_base> + 3000_H + (80_H × x),
RSCFDnCFDRFIDxLH: <RSCANn_base> + 3001_H + (80_H × x),
RSCFDnCFDRFIDxHL: <RSCANn_base> + 3002_H + (80_H × x),
RSCFDnCFDRFIDxHH: <RSCANn_base> + 3003_H + (80_H × x)

Value after reset: $0000\ 0000_H$

Table 21.131 RSCFDnCFDRFIDx Register Contents

Bit Position	Bit Name	Function
31	RFIDE	Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	RFRTR	Receive FIFO Buffer RTR/RRS • When the received message is a classical CAN frame 0: Data frame 1: Remote frame • When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	Reserved	When read, the value after reset is returned.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

21.5.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RSCFDnCFDRFPTRx register is a read-only register that can be read in 32-bit units
RSCFDnCFDRFPTRxL, RSCFDnCFDRFPTRxH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRFPTRxLL, RSCFDnCFDRFPTRxLH, RSCFDnCFDRFPTRxHL, RSCFDnCFDRFPTRxHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDRFPTRx: <RSCANn_base> + 3004_H + (80_H × x)

RSCFDnCFDRFPTRxL: <RSCANn_base> + 3004_H + (80_H × x),
RSCFDnCFDRFPTRxH: <RSCANn_base> + 3006_H + (80_H × x)

RSCFDnCFDRFPTRxLL: <RSCANn_base> + 3004_H + (80_H × x),
RSCFDnCFDRFPTRxLH: <RSCANn_base> + 3005_H + (80_H × x),
RSCFDnCFDRFPTRxHL: <RSCANn_base> + 3006_H + (80_H × x),

1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

27 to 16	RFPTR[11:0]	Receive FIFO Buffer Label Data Label information of the received message can be read.
15 to 0	RFTS[15:0]	Receive FIFO Buffer Timestamp Data Timestamp value of the received message can be read.

RFDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive FIFO buffer.

RFPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive FIFO buffer.

RFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive FIFO buffer.

21.5.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register (x = 0 to 7)

Access: RSCFDnCFDRFFDSTSx register is a read-only register that can be read in 32-bit units
RSCFDnCFDRFFDSTSxL register is a read-only register that can be read in 16-bit units
RSCFDnCFDRFFDSTSxLL register is a read-only register that can be read in 8-bit units

Address: RSCFDnCFDRFFDSTSx: <RSCANn_base> + 3008_H + (80_H × x)

RSCFDnCFDRFFDSTSxL: <RSCANn_base> + 3008_H + (80_H × x)

Table 21.133 RSCFDnCFDRFFDSTSx Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	RFFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	RFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RFESI	ESI 0: Error active node 1: Error passive node

RFFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive FIFO buffer.

RFBRS Bit

When the RFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

RFESI Bit

When the RFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

21.5.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x = 0 to 7)

Access: RSCFDnCFDRFDFd_x register is a read-only register that can be read in 32-bit units
RSCFDnCFDRFDFd_xL, RSCFDnCFDRFDFd_xH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDRFDFd_xLL, RSCFDnCFDRFDFd_xLH, RSCFDnCFDRFDFd_xHL, RSCFDnCFDRFDFd_xHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDRFDFd_x: <RSCANn_base> + $300C_H$ + (04_H × d) + (80_H × x)

RSCFDnCFDRFDFd_xL: <RSCANn_base> + $300C_H$ + (04_H × d) + (80_H × x),
RSCFDnCFDRFDFd_xH: <RSCANn_base> + $300E_H$ + (04_H × d) + (80_H × x)

RSCFDnCFDRFDFd_xLL: <RSCANn_base> + $300C_H$ + (04_H × d) + (80_H × x),

Table 21.134 RSCFDnCFDRFDFd_x Register Contents

Bit Position	Bit Name	Function
31 to 24	RFDB4 × d + 3 [7:0]	Receive Buffer Data Byte 4 × d + 3 Receive Buffer Data Byte 4 × d + 2 Receive Buffer Data Byte 4 × d + 1 Receive Buffer Data Byte 4 × d + 0 Data for a message stored in the receive buffer can be read.
23 to 16	RFDB4 × d + 2 [7:0]	
15 to 8	RFDB4 × d + 1 [7:0]	
7 to 0	RFDB4 × d + 0 [7:0]	

When the RFDLC[3:0] value in the RSCFDnCFDRFPTRx register is smaller than the payload storage size of the receive FIFO buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the receive FIFO buffer by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register. Do not read or write the RSCFDnCFDRFDFd_x register corresponding to an area larger than the specified size.

21.5.8 Transmit/Receive FIFO Buffer Related Registers

21.5.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 17)

Access: RSCFDnCFDCFCCk register can be read or written in 32-bit units
RSCFDnCFDCFCCkL, RSCFDnCFDCFCCkH registers can be read or written in 16-bit units
RSCFDnCFDCFCCkLL, RSCFDnCFDCFCCkLH, RSCFDnCFDCFCCkHL, RSCFDnCFDCFCCkHH registers can be read or written in 8-bit units

Address: RSCFDnCFDCFCCk: <RSCANn_base> + 0118_H + (04_H × k)

RSCFDnCFDCFCCkL: <RSCANn_base> + 0118_H + (04_H × k),

Bit Position	Bit Name	Function
31 to 24	CFITT[7:0]	Set a message transmission interval. Set Value: 00_H to FF_H
23 to 20	CFTML[3:0]	Transmit Buffer Link Configuration Set the transmit buffer number to be linked to the transmit/receive FIFO buffer.
19	CFITR	Transmit/Receive FIFO Interval Timer Resolution 0: Clock dividing pclk/2 by (ITRCP[15:0] bits) 1: Clock dividing pclk/2 by (ITRCP[15:0] bits × 10)
18	CFITSS	Transmit/Receive FIFO Interval Timer Clock Source Select 0: Interval timer clock source selected by the CFITR bit 1: Interval timer clock source is the nominal bit time clock for the channel to which the FIFO is linked.
17, 16	CFM[1:0]	Transmit/Receive FIFO Mode Select b17 b16 0 0: Receive mode 0 1: Transmit mode 1 0: Gateway mode 1 1: Setting prohibited
15 to 13	CFIGCV[2:0]	Transmit/Receive FIFO Receive Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.

Table 21.135 RSCFDnCFDCFCCk Register Contents (2/2)

Bit Position	Bit Name	Function
12	CFIM	Transmit/Receive FIFO Interrupt Source Select 0: • Receive mode/gateway mode When the number of received messages has met the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. • Transmit mode/gateway mode When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. 1: • Receive mode/gateway mode A FIFO receive interrupt request is generated each time a message has been received. • Transmit mode/gateway mode A FIFO transmit interrupt request is generated each time a message has been transmitted.
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	CFDC[2:0]	Transmit/Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 4	CFPLS[2:0]	Transmit/Receive FIFO Buffer Payload Storage Size Select b6 b5 b4 0 0 0: 8 bytes 0 0 1: 12 bytes 0 1 0: 16 bytes 0 1 1: 20 bytes 1 0 0: 24 bytes 1 0 1: 32 bytes 1 1 0: 48 bytes 1 1 1: 64 bytes
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 21.91** and **Table 21.92**, for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register × 10.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel does not handle the CAN FD frames.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCFDnCFDCFCCk register have been set, set this bit to 1 by using other instructions.

21.5.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 17)

Access: RSCFDnCFDCFSTSk register can be read or written in 32-bit units
RSCFDnCFDCFSTSkL register can be read or written in 16-bit units
RSCFDnCFDCFSTSkLL register can be read or written in 8-bit units
RSCFDnCFDCFSTSkLH register is a read-only register that can be read in 8-bit units

Address: RSCFDnCFDCFSTSk: <RSCANn_base> + 0178_H + (04_H × k)

RSCFDnCFDCFSTSkL: <RSCANn_base> + 0178_H + (04_H × k)

RSCFDnCFDCFSTSkLL: <RSCANn_base> + 0178_H + (04_H × k),
RSCFDnCFDCFSTSkLH: <RSCANn_base> + 0179_H + (04_H × k)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFMC[7:0]								—	—	—	CFTXIF	CFRXIF	CFMLT	CFFLL	CFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.136 RSCFDnCFDCFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCFDnCFDCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCFDnCFDCFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCFDnCFDCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not performing transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): When not performing transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: When at least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: When a value of FF_H has been written to the RSCFDnCFDCFPCTRk register after data was written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction, write “0” to the given flag and “1” to other flags.

21.5.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 17)

Access: RSCFDnCFDCFPCTRk register is a write-only register that can be written in 32-bit units
RSCFDnCFDCFPCTRkL register is a write-only register that can be written in 16-bit units
RSCFDnCFDCFPCTRkLL register is a write-only register that can be written in 8-bit units

Address: RSCFDnCFDCFPCTRk: <RSCANn_base> + $01D8_H$ + (04_H × k)

RSCFDnCFDCFPCTRkL: <RSCANn_base> + $01D8_H$ + (04_H × k)

RSCFDnCFDCFPCTRkLL: <RSCANn_base> + $01D8_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 21.137 RSCFDnCFDCFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

When the corresponding transmit/receive FIFO buffer is the first transmit/receive FIFO buffer (k = 3 × m) allocated to channel m and when the CFDMAEm bit in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 00_B):
  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCFDnCFDCFSTSk register is decremented. Read the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B):
  Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers before writing FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 and the CFFLL flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 10_B):
  Setting prohibited

21.5.8.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 17)

Access: RSCFDnCFDCFIDk register can be read or written in 32-bit units
RSCFDnCFDCFIDkL, RSCFDnCFDCFIDkH registers can be read or written in 16-bit units
RSCFDnCFDCFIDkLL, RSCFDnCFDCFIDkLH, RSCFDnCFDCFIDkHL, RSCFDnCFDCFIDkHH registers can be read or written in 8-bit units

Address: RSCFDnCFDCFIDk: <RSCANn_base> + 3400_H + (80_H × k)

RSCFDnCFDCFIDkL: <RSCANn_base> + 3400_H + (80_H × k),
RSCFDnCFDCFIDkH: <RSCANn_base> + 3402_H + (80_H × k)

RSCFDnCFDCFIDkLL: <RSCANn_base> + 3400_H + (80_H × k),
RSCFDnCFDCFIDkLH: <RSCANn_base> + 3401_H + (80_H × k),
RSCFDnCFDCFIDkHL: <RSCANn_base> + 3402_H + (80_H × k),
RSCFDnCFDCFIDkHH: <RSCANn_base> + 3403_H + (80_H × k)

Table 21.138 RSCFDnCFDCFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR/RRS • When the CFM[1:0] value is 01_B (transmit mode) – When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame – When the transmit message is a CAN FD frame Write 0 to this bit. • When the CFM[1:0] value is 00_B (receive mode) – When the received message is a classical CAN frame 0: Data frame 1: Remote frame – When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This RSCFDnCFDCFIDk register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. If the received message is a CAN FD frame, this bit indicates the RRS bit value of the received message.

When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 1 (CAN FD frame), set this bit to 0.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, these bits are used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

21.5.8.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 17)

Access: RSCFDnCFDCFPTRk register can be read or written in 32-bit units
RSCFDnCFDCFPTRkL, RSCFDnCFDCFPTRkH registers can be read or written in 16-bit units
RSCFDnCFDCFPTRkLL, RSCFDnCFDCFPTRkLH, RSCFDnCFDCFPTRkHL, RSCFDnCFDCFPTRkHH registers can be read or written in 8-bit units

Address: RSCFDnCFDCFPTRk: <RSCANn_base> + 3404_H + (80_H × k)

RSCFDnCFDCFPTRkL: <RSCANn_base> + 3404_H + (80_H × k),
RSCFDnCFDCFPTRkH: <RSCANn_base> + 3406_H + (80_H × k)

RSCFDnCFDCFPTRkLL: <RSCANn_base> + 3404_H + (80_H × k),
RSCFDnCFDCFPTRkLH: <RSCANn_base> + 3405_H + (80_H × k),
RSCFDnCFDCFPTRkHL: <RSCANn_base> + 3406_H + (80_H × k),
RSCFDnCFDCFPTRkHH: <RSCANn_base> + 3407_H + (80_H × k)

Value after reset: $0000\ 0000_H$

Table 21.139 RSCFDnCFDCFPTRk Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 28	CFDLC[3:0]	Transmit/Receive FIFO Buffer DLC Data

b31	b30	b29	b28	Classical CAN Frame	CAN FD Frame
0	0	0	0		0 data bytes
0	0	0	1		1 data byte
0	0	1	0		2 data bytes
0	0	1	1		3 data bytes
0	1	0	0		4 data bytes
0	1	0	1		5 data bytes
0	1	1	0		6 data bytes
0	1	1	1		7 data bytes
1	0	0	0		8 data bytes
1	0	0	1	8 data bytes	12 data bytes
1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.

Table 21.139 RSCFDnCFDCFPTRk Register Contents (2/2)

Bit Position	Bit Name	Function
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFDLC[3:0] bits are set to 1001_B or more while the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 0 (CAN frame), 8-byte data is transmitted actually. When the CFFDF bit is 1 (CAN FD frame), the settable value range varies depending on the settings of the TMME bit in the RSCFDnCFDCmFDCFG register and the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

- When TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000_B to 1111_B is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by CCH.
- When TMME bit = 1 (transmit buffer merge mode enabled):
  Set the data length within the payload storage size specified by the CFPLS[2:0] bits.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

21.5.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CAN FD Configuration/Status Register (k = 0 to 17)

Access: RSCFDnCFDCFFDCSTSk register can be read or written in 32-bit units
RSCFDnCFDCFFDCSTSkL register can be read or written in 16-bit units
RSCFDnCFDCFFDCSTSkLL register can be read or written in 8-bit units

Address: RSCFDnCFDCFFDCSTSk: <RSCANn_base> + 3408_H + (80_H × k)

RSCFDnCFDCFFDCSTSkL: <RSCANn_base> + 3408_H + (80_H × k)

RSCFDnCFDCFFDCSTSkLL: <RSCANn_base> + 3408_H + (80_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 21.140 RSCFDnCFDCFFDCSTSk Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	CFFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	CFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	CFESI	ESI 0: Error active node 1: Error passive node

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). Do not read or write this register when the CFM[1:0] value is 10_B (gateway mode).

CFFDF Bit

When the CFM[1:0] value is 00_B, this bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] value is 01_B, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.

CFBRS Bit

When the CFM[1:0] value is 00_B, if the CFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is 01_B, if the CFFDF bit is 1, this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is 0, write 0 to this bit.

CFESI Bit

When the CFM[1:0] value is 00_B, if the CFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is 01_B, if the CFFDF bit is 1, this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is 0, write 0 to this bit.

21.5.8.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 17)

Access: RSCFDnCFDCFDFd_k register can be read or written in 32-bit units
RSCFDnCFDCFDFd_kL, RSCFDnCFDCFDFd_kH registers can be read or written in 16-bit units
RSCFDnCFDCFDFd_kLL, RSCFDnCFDCFDFd_kLH, RSCFDnCFDCFDFd_kHL, RSCFDnCFDCFDFd_kHH registers can be read or written in 8-bit units

Address: RSCFDnCFDCFDFd_k: <RSCANn_base> + $340C_H$ + (04_H × d) + (80_H × k)

RSCFDnCFDCFDFd_kL: <RSCANn_base> + $340C_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kH: <RSCANn_base> + $340E_H$ + (04_H × d) + (80_H × k)

RSCFDnCFDCFDFd_kLL: <RSCANn_base> + $340C_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kLH: <RSCANn_base> + $340D_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kHL: <RSCANn_base> + $340E_H$ + (04_H × d) + (80_H × k),
RSCFDnCFDCFDFd_kHH: <RSCANn_base> + $340F_H$ + (04_H × d) + (80_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CFDB4 × d + 3 [7:0]								CFDB4 × d + 2 [7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.141 RSCFDnCFDCFDFd_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB4 × d + 3 [7:0]	Transmit/Receive FIFO Buffer Data Byte 4 × d + 3 Transmit/Receive FIFO Buffer Data Byte 4 × d + 2 Transmit/Receive FIFO Buffer Data Byte 4 × d + 1 Transmit/Receive FIFO Buffer Data Byte 4 × d + 0 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.
23 to 16	CFDB4 × d + 2 [7:0]	
15 to 8	CFDB4 × d + 1 [7:0]	
7 to 0	CFDB4 × d + 0 [7:0]	

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode).

This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCFDnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register. Do not read or write the RSCFDnCFDCFDFd_k register corresponding to an area larger than the specified size.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

21.5.9 Details of FIFO Status-related Registers

21.5.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register

Access: RSCFDnCFDFESTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDFESTSL, RSCFDnCFDFESTSH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDFESTSLL, RSCFDnCFDFESTSLH, RSCFDnCFDFESTSHL, RSCFDnCFDFESTSHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDFESTS: <RSCANn_base> + 0238_H

RSCFDnCFDFESTSL: <RSCANn_base> + 0238_H,
RSCFDnCFDFESTSH: <RSCANn_base> + $023A_H$

RSCFDnCFDFESTSLL: <RSCANn_base> + 0238_H,
RSCFDnCFDFESTSLH: <RSCANn_base> + 0239_H,
RSCFDnCFDFESTSHL: <RSCANn_base> + $023A_H$,
RSCFDnCFDFESTSHH: <RSCANn_base> + $023B_H$

Value after reset: $03FF\ FFFF_H$

9	CF1EMP	
8	CF0EMP	

Table 21.142 RSCFDnCFDFESTS Register Contents (2/2)

Bit Position	Bit Name	Function
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCFDnCFDFESTS register is set to 03FF $FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 17)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains message), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread message), the RFxEMP flag is cleared to 0.

21.5.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register

Access: RSCFDnCFDFFSTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDFFSTSL, RSCFDnCFDFFSTSH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDFFSTSLL, RSCFDnCFDFFSTSLH, RSCFDnCFDFFSTSHL, RSCFDnCFDFFSTSHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDFFSTS: <RSCANn_base> + $023C_H$

RSCFDnCFDFFSTSL: <RSCANn_base> + $023C_H$,
RSCFDnCFDFFSTSH: <RSCANn_base> + $023E_H$

RSCFDnCFDFFSTSLL: <RSCANn_base> + $023C_H$,
RSCFDnCFDFFSTSLH: <RSCANn_base> + $023D_H$,

5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCFDnCFDFFSTS register is cleared to 0000 0000_H in global reset mode.

CFkFLL Flag (k = 0 to 17)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).
When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

21.5.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register

Access: RSCFDnCFDFMSTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDFMSTSL, RSCFDnCFDFMSTSH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDFMSTSLL, RSCFDnCFDFMSTSLH, RSCFDnCFDFMSTSHL, RSCFDnCFDFMSTSHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDFMSTS: <RSCANn_base> + 0240_H

RSCFDnCFDFMSTSL: <RSCANn_base> + 0240_H,
RSCFDnCFDFMSTSH: <RSCANn_base> + 0242_H

RSCFDnCFDFMSTSLL: <RSCANn_base> + 0240_H,

1	RF1MLT	
0	RF0MLT	

The RSCFDnCFDFMSTS register is cleared to 0000 0000_H in global reset mode.

CFkMLT Flag (k = 0 to 17)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

21.5.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCFDnCFDRFISTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDRFISTSL register is a read-only register that can be read in 16-bit units
RSCFDnCFDRFISTSLL register is a read-only register that can be read in 8-bit units

Address: RSCFDnCFDRFISTS: <RSCANn_base> + 0244_H

RSCFDnCFDRFISTSL: <RSCANn_base> + 0244_H

RSCFDnCFDRFISTSLL: <RSCANn_base> + 0244_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 21.145 RSCFDnCFDRFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCFDnCFDRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

21.5.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCFDnCFDCFRISTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDCFRISTSL, RSCFDnCFDCFRISTSH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDCFRISTSLL, RSCFDnCFDCFRISTSLH, RSCFDnCFDCFRISTSHL registers are read-only registers that can be ready in 8-bit units

Address: RSCFDnCFDCFRISTS: <RSCANn_base> + 0248_H

RSCFDnCFDCFRISTSL: <RSCANn_base> + 0248_H,
RSCFDnCFDCFRISTSH: <RSCANn_base> + $024A_H$

RSCFDnCFDCFRISTSLL: <RSCANn_base> + 0248_H,
RSCFDnCFDCFRISTSLH: <RSCANn_base> + 0249_H,
RSCFDnCFDCFRISTSHL: <RSCANn_base> + $024A_H$

Value after reset: $0000\ 0000_H$

5	CF5RXIF	
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCFDnCFDCFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkRXIF Flag (k = 0 to 17)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

21.5.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCFDnCFDCFTISTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDCFTISTSL, RSCFDnCFDCFTISTSH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDCFTISTSLL, RSCFDnCFDCFTISTSLH, RSCFDnCFDCFTISTSHL registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDCFTISTS: <RSCANn_base> + $024C_H$

RSCFDnCFDCFTISTSL: <RSCANn_base> + $024C_H$,
RSCFDnCFDCFTISTSH: <RSCANn_base> + $024E_H$

2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCFDnCFDCFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkTXIF Flag (k = 0 to 17)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

21.5.10 Details of FIFO DMA-Related Registers

21.5.10.1 RSCFDnCFDCDTCT — DMA Enable Register

Access: RSCFDnCFDCDTCT register can be read or written in 32-bit units
RSCFDnCFDCDTCTL register can be read or written in 16-bit units
RSCFDnCFDCDTCTLL, RSCFDnCFDCDTCTLH registers can be read or written in 8-bit units

Address: RSCFDnCFDCDTCT: <RSCANn_base> + 0490_H

RSCFDnCFDCDTCTL: <RSCANn_base> + 0490_H

RSCFDnCFDCDTCTLL: <RSCANn_base> + 0490_H,
RSCFDnCFDCDTCTLH: <RSCANn_base> + 0491_H

Value after reset: 0000 0000_H

5	RFDMAE5	
4	RFDMAE4	
3	RFDMAE3	
2	RFDMAE2	
1	RFDMAE1	
0	RFDMAE0	

Modify the RSCFDnCFDCDTCT register in global operating mode or global test mode.

CFDMAEm Bit

This bit is used to enable DMA transfer for transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m). DMA transfer is enabled only for transmit/receive FIFO buffers for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register is set to 00_B (receive mode). Set this bit to 0 when the CFM[1:0] value is 01_B (transmit mode) or 10_B (gateway mode).

RFDMAEx Bit

This bit is used to enable DMA transfer for receive FIFO buffer x.

21.5.10.2 RSCFDnCFDCDTSTS — DMA Status Register

Access: RSCFDnCFDCDTSTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDCDTSTSL register is a read-only register that can be read in 16-bit units
RSCFDnCFDCDTSTSLL, RSCFDnCFDCDTSTSLH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDCDTSTS: <RSCANn_base> + 0494_H

RSCFDnCFDCDTSTSL: <RSCANn_base> + 0494_H

RSCFDnCFDCDTSTSLL: <RSCANn_base> + 0494_H,
RSCFDnCFDCDTSTSLH: <RSCANn_base> + 0495_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.149 RSCFDnCFDCDTSTS Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	CFDMASTS5	Transmit/Receive FIFO Buffer 15 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 15 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 15 is in progress.
12	CFDMASTS4	Transmit/Receive FIFO Buffer 12 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 12 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 12 is in progress.
11	CFDMASTS3	Transmit/Receive FIFO Buffer 9 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 9 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 9 is in progress.
10	CFDMASTS2	Transmit/Receive FIFO Buffer 6 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 6 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 6 is in progress.
9	CFDMASTS1	Transmit/Receive FIFO Buffer 3 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 3 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 3 is in progress.
8	CFDMASTS0	Transmit/Receive FIFO Buffer 0 DMA Status 0: DMA transfer of transmit/receive FIFO buffer 0 is not in progress. 1: DMA transfer of transmit/receive FIFO buffer 0 is in progress.
7	RFDMASTS7	Receive FIFO Buffer x DMA Status 0: DMA transfer of receive FIFO buffer x is not in progress. 1: DMA transfer of receive FIFO buffer x is in progress. (x = 0 to 7)
6	RFDMASTS6	
5	RFDMASTS5	
4	RFDMASTS4	
3	RFDMASTS3	
2	RFDMASTS2	
1	RFDMASTS1	
0	RFDMASTS0	

CFDMASTSm Bit

When DMA transfer is enabled (CFDMAEm bit in the RSCFDnCFDCDTCT register is 1) for the transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m) while the transmit/receive FIFO buffer contains one of more messages, the CFDMASTSm bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the transmit/receive FIFO buffer have been transferred or DMA transfer is disabled (CFDMAEm bit is 0), the CFDMASTSm bit is cleared to 0 indicating that DMA transfer has been completed. If the CFDMAEm bit is set to 0 during DMA transfer, the CFDMASTSm bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

RFDMASTSx Bit

When DMA transfer is enabled (corresponding RFDMAEx bit in the RSCFDnCFDCDTCT register is 1) for the receive FIFO buffer x and the receive FIFO buffer contains one of more messages, the RFDMAEx bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the receive FIFO buffer x have been transferred or DMA transfer is disabled (RFDMAEx bit = 0), the RFDMASTSx bit is cleared to 0 indicating that DMA transfer has been completed. If the RFDMAEx bit is set to 0 during DMA transfer, the RFDMASTSx bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

21.5.11 Details of Transmit Buffer-related Registers

21.5.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 95)

Access: RSCFDnCFDTMCp register can be read or written in 8-bit units

Address: RSCFDnCFDTMCp: <RSCANn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 21.150 RSCFDnCFDTMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCFDnCFDTMCp register meets any of the following conditions, set it to 00_H.

- The RSCFDnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFDCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm (m = 0 to 5) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).
- RSCFDnCFDTMCp register (p = (m × 16) + 1, (m × 16) + 2, (m × 16) + 4, or (m × 16) + 5) corresponding to the transmit buffer allocated as a payload storage area when the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode)

Bits in the RSCFDnCFDTMCp register are all cleared to 0 in channel reset mode. Modify the RSCFDnCFDTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCFDnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or the one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnCFDTMSTSp register is 00_B.

21.5.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 95)

Access: RSCFDnCFDTMSTSp register can be read or written in 8-bit units

Address: RSCFDnCFDTMSTSp: <RSCANn_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 21.151 RSCFDnCFDTMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCFDnCFDTMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

21.5.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 95)

Access: RSCFDnCFDTMIDp register can be read or written in 32-bit units
RSCFDnCFDTMIDpL, RSCFDnCFDTMIDpH registers can be read or written in 16-bit units
RSCFDnCFDTMIDpLL, RSCFDnCFDTMIDpLH, RSCFDnCFDTMIDpHL, RSCFDnCFDTMIDpHH registers can be read or written in 8-bit units

Address: RSCFDnCFDTMIDp: <RSCANn_base> + 4000_H + (20_H × p)

RSCFDnCFDTMIDpL: <RSCANn_base> + 4000_H + (20_H × p),

Table 21.152 RSCFDnCFDTMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR/RRS • When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame • When the transmit message is a CAN FD frame Write 0 to this bit.
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

Set this bit to 0 when the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 1 (CAN FD frame).

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

21.5.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 95)

Access: RSCFDnCFDTMPTRp register can be read or written in 32-bit units
RSCFDnCFDTMPTRpH register can be read or written in 16-bit units
RSCFDnCFDTMPTRpHL, RSCFDnCFDTMPTRpHH registers can be read or written in 8-bit units

Address: RSCFDnCFDTMPTRp: <RSCANn_base> + 4004_H + (20_H × p)

RSCFDnCFDTMPTRpH: <RSCANn_base> + 4006_H + (20_H × p)

RSCFDnCFDTMPTRpHL: <RSCANn_base> + 4006_H + (20_H × p),
RSCFDnCFDTMPTRpHH: <RSCANn_base> + 4007_H + (20_H × p)

Value after reset: $0000\ 0000_H$

Table 21.153 RSCFDnCFDTMPTRp Register Contents

Bit Position	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data
27 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

b31	b30	b29	b28	Classical CAN Frame	CAN FD Frame
0	0	0	0	0 data bytes	
0	0	0	1	1 data byte	
0	0	1	0	2 data bytes	
0	0	1	1	3 data bytes	
0	1	0	0	4 data bytes	
0	1	0	1	5 data bytes	
0	1	1	0	6 data bytes	
0	1	1	1	7 data bytes	
1	0	0	0	8 data bytes	
1	0	0	1	8 data bytes	12 data bytes
1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCFDnCFDTMIDp register is set to 0 (data frame).

When the TMDLC[3:0] bits are set to 1001_B or more while the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the TMFDF bit is 1 (CAN FD frame), the settable value range varies depending on the setting of the TMME bit in the RSCFDnCFDCmFDCFG register.

- When the TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000_B to 1111_B is settable. If a value larger than 1100_B is set, payloads exceeding 20 bytes are padded by CCH.
- When the TMME bit = 1 (transmit buffer merge mode enabled):
  When the corresponding transmit buffer number p = (m × 16) + 0 or (m × 16) + 3, a value of 0000_B to 1111_B is settable. In other cases, set a value of 0000_B to 1011_B (20 data bytes).

When the TMRTR bit is 1 (remote frame), set the data length of a message to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

21.5.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register (p = 0 to 95)

Access: RSCFDnCFDTMFDCTRp register can be read or written in 32-bit units
RSCFDnCFDTMFDCTRpL register can be read or written in 16-bit units
RSCFDnCFDTMFDCTRpLL register can be read or written in 8-bit units

Address: RSCFDnCFDTMFDCTRp: <RSCANn_base> + 4008_H + (20_H × p)

RSCFDnCFDTMFDCTRpL: <RSCANn_base> + 4008_H + (20_H × p)

RSCFDnCFDTMFDCTRpLL: <RSCANn_base> + 4008_H + (20_H × p)

Value after reset: 0000 0000_H

Table 21.154 RSCFDnCFDTMFDCTRp Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TMFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	TMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	TMESI	ESI 0: Error active node 1: Error passive node

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer p (p = m × 16 + 15) of the corresponding channel.

TMFDF Bit

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.

TMBRS Bit

When this bit is set to 1 while the TMFDF bit is 1, the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is 0, write 0 to this bit.

TMESI Bit

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is 1. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is 0, write 0 to this bit.

21.5.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 95)

Access: RSCFDnCFDTMDFb_p register can be read or written in 32-bit units
RSCFDnCFDTMDFb_pL, RSCFDnCFDTMDFb_pH registers can be read or written in 16-bit units
RSCFDnCFDTMDFb_pLL, RSCFDnCFDTMDFb_pLH, RSCFDnCFDTMDFb_pHL, RSCFDnCFDTMDFb_pHH registers can be read or written in 8-bit units

Address: RSCFDnCFDTMDFb_p: <RSCANn_base> + $400C_H$ + (04_H × b) + (20_H × p)

RSCFDnCFDTMDFb_pL: <RSCANn_base> + $400C_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pH: <RSCANn_base> + $400E_H$ + (04_H × b) + (20_H × p)

Table 21.156 RSCFDnCFDTMIECy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 95)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode enable), set the bit corresponding to the transmit buffer allocated as a payload storage area to 0.

Table 21.157 shows the bit assignment.

Table 21.158 RSCFDnCFDTMTRSTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 95)

These flags indicate the status of the TMTR bit in the RSCFDnCFDTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 21.159 shows the bit assignment.

Table 21.160 RSCFDnCFDTMTARSTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTARSTSp	Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit abort request is present. 1: A transmit abort request is present.
15 to 0	TMTARSTSp	Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit abort request is present. 1: A transmit abort request is present.

TMTARSTSp Flags (p = 0 to 95)

These flags indicate the status of the TMTAR bit in the RSCFDnCFDTMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

Table 21.161 shows the bit assignment.

Table 21.166 RSCFDnCFDTXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited. For transmit buffer merge mode, set g to 2 to 9.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 21.9**.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode), transmit buffers (m × 16 + 5) to (m × 16 + 0) are merged and cannot be allocated to the transmit queue. Therefore, do not set TXQDC[3:0] bits to 10 to 15.

Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

21.5.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0 to 5)

Access: RSCFDnCFDTXQSTSm register can be read or written in 32-bit units
RSCFDnCFDTXQSTSmL register can be read or written in 16-bit units
RSCFDnCFDTXQSTSmLL register can be read or written in 8-bit units

Address: RSCFDnCFDTXQSTSm: <RSCANn_base> + $03C0_H$ + (04_H × m)

RSCFDnCFDTXQSTSmL: <RSCANn_base> + $03C0_H$ + (04_H × m)

RSCFDnCFDTXQSTSmLL: <RSCANn_base> + $03C0_H$ + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.167 RSCFDnCFDTXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	Reserved	When read, the undefined value is returned. When writing, write the value after reset.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCFDnCFDTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCFDnCFDTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

21.5.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 5)

Access: RSCFDnCFDTXQPCTRm register is a write-only register that can be written in 32-bit units
RSCFDnCFDTXQPCTRmL register is a write-only register that can be written in 16-bit units
RSCFDnCFDTXQPCTRmLL register is a write-only register that can be written in 8-bit units

Address: RSCFDnCFDTXQPCTRm: <RSCANn_base> + $03E0_H$ + (04_H × m)

RSCFDnCFDTXQPCTRmL: <RSCANn_base> + $03E0_H$ + (04_H × m)

RSCFDnCFDTXQPCTRmLL: <RSCANn_base> + $03E0_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 21.168 RSCFDnCFDTXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDnCFDTMDFb_p registers (p = 15, 31, 47, 63, 79, and 95) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCFDnCFDTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCFDnCFDTXQSTSm register is 0 (the transmit queue is not full).

21.5.14 Details of Transmit History-related Registers

21.5.14.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 to 5)

Access: RSCFDnCFDTHLCCm register can be read or written in 32-bit units
RSCFDnCFDTHLCCmL register can be read or written in 16-bit units
RSCFDnCFDTHLCCmLL, RSCFDnCFDTHLCCmLH registers can be read or written in 8-bit units

Address: RSCFDnCFDTHLCCm: <RSCANn_base> + 0400_H + (04_H × m)

RSCFDnCFDTHLCCmL: <RSCANn_base> + 0400_H + (04_H × m)

RSCFDnCFDTHLCCmLL: <RSCANn_base> + 0400_H + (04_H × m),
RSCFDnCFDTHLCCmLH: <RSCANn_base> + 0401_H + (04_H × m)

Table 21.169 RSCFDnCFDTHLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

21.5.14.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0 to 5)

Access: RSCFDnCFDTHLSTSm register can be read or written in 32-bit units
RSCFDnCFDTHLSTSmL register can be read or written in 16-bit units
RSCFDnCFDTHLSTSmLL register can be read or written in 8-bit units
RSCFDnCFDTHLSTSmLH register is a read-only register that can be read in 8-bit units

Address: RSCFDnCFDTHLSTSm: <RSCANn_base> + 0420_H + (04_H × m)

RSCFDnCFDTHLSTSmL: <RSCANn_base> + 0420_H + (04_H × m)

RSCFDnCFDTHLSTSmLL: <RSCANn_base> + 0420_H + (04_H × m),
RSCFDnCFDTHLSTSmLH: <RSCANn_base> + 0421_H + (04_H × m)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THLEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.170 RSCFDnCFDTHLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnCFDTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

21.5.14.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 5)

Access: RSCFDnCFDTHLPCTRm register is a write-only register that can be written in 32-bit units
RSCFDnCFDTHLPCTRmL register is a write-only register that can be written in 16-bit units
RSCFDnCFDTHLPCTRmLL register is a write-only register that can be written in 8-bit units

Address: RSCFDnCFDTHLPCTRm: <RSCANn_base> + 0440_H + (04_H × m)

RSCFDnCFDTHLPCTRmL: <RSCANn_base> + 0440_H + (04_H × m)

RSCFDnCFDTHLPCTRmLL: <RSCANn_base> + 0440_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	THLPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 21.171 RSCFDnCFDTHLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCFDnCFDTHLSTSm register is decremented. Write FF_H to the THLPC[7:0] bits after reading from the RSCFDnCFDTHLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCFDnCFDTHLSTSm register is 0.

21.5.14.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0 to 5)

Access: RSCFDnCFDTHLACCm register is a read-only register that can be read in 32-bit units
RSCFDnCFDTHLACCmL, RSCFDnCFDTHLACCmH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDTHLACCmLL, RSCFDnCFDTHLACCmLH, RSCFDnCFDTHLACCmHL, RSCFDnCFDTHLACCmHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDTHLACCm: <RSCANn_base> + 6000_H + (04_H × m)

RSCFDnCFDTHLACCmL: <RSCANn_base> + 6000_H + (04_H × m),
RSCFDnCFDTHLACCmH: <RSCANn_base> + 6002_H + (04_H × m)

RSCFDnCFDTHLACCmLL: <RSCANn_base> + 6000_H + (04_H × m),
RSCFDnCFDTHLACCmLH: <RSCANn_base> + 6001_H + (04_H × m),
RSCFDnCFDTHLACCmHL: <RSCANn_base> + 6002_H + (04_H × m),
RSCFDnCFDTHLACCmHH: <RSCANn_base> + 6003_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Table 21.172 RSCFDnCFDTHLACCm Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTS[15:0]	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	When read, the value after reset is returned.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

Timestamp values in transmit history data stored in the transmit history buffer are displayed.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

21.5.15 Details of Test-related Registers

21.5.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register

Access: RSCFDnCFDGTSTCFG register can be read or written in 32-bit units
RSCFDnCFDGTSTCFGL, RSCFDnCFDGTSTCFGH registers can be read or written in 16-bit units
RSCFDnCFDGTSTCFGLL, RSCFDnCFDGTSTCFGHL registers can be read or written in 8-bit units

Address: RSCFDnCFDGTSTCFG: <RSCANn_base> + 0468_H

RSCFDnCFDGTSTCFGL: <RSCANn_base> + 0468_H,
RSCFDnCFDGTSTCFGH: <RSCANn_base> + $046A_H$

RSCFDnCFDGTSTCFGLL: <RSCANn_base> + 0468_H,
RSCFDnCFDGTSTCFGHL: <RSCANn_base> + $046A_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.173 RSCFDnCFDGTSTCFG Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within the range of page 0 (00_H) to page 83 (53_H).
15 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	C5ICBCE	CAN5 Inter-channel Communication Test Enable 0: CAN5 inter-channel communication test is disabled 1: CAN5 inter-channel communication test is enabled.
4	C4ICBCE	CAN4 Inter-channel Communication Test Enable 0: CAN4 inter-channel communication test is disabled 1: CAN4 inter-channel communication test is enabled.
3	C3ICBCE	CAN3 Inter-channel Communication Test Enable 0: CAN3 inter-channel communication test is disabled 1: CAN3 inter-channel communication test is enabled.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled 1: CAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCFDnCFDGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to 53_H, inclusive.

In CAN FD mode, do not access more than 64 bytes in the last page (RTMPS = 53_H) during RAM test.

C5ICBCE Bit

Setting this bit to 1 enables the channel 5 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C4ICBCE Bit

Setting this bit to 1 enables the channel 4 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C3ICBCE Bit

Setting this bit to 1 enables the channel 3 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

21.5.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register

Access: RSCFDnCFDGTSTCTR register can be read or written in 32-bit units
RSCFDnCFDGTSTCTRL register can be read or written in 16-bit units
RSCFDnCFDGTSTCTRLL register can be read or written in 8-bit units

Address: RSCFDnCFDGTSTCTR: <RSCANn_base> + $046C_H$

RSCFDnCFDGTSTCTRL: <RSCANn_base> + $046C_H$

RSCFDnCFDGTSTCTRLL: <RSCANn_base> + $046C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RTME	—	ICBCTME
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 21.174 RSCFDnCFDGTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ICBCTME	Communication Test between Channels Enable 0: Communication test between channels disabled 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCFDnCFDGCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 5) in the RSCFDnCFDGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

21.5.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register

Access: RSCFDnCFDGLOCKK register is a write-only register that can be written in 32-bit units.
RSCFDnCFDGLOCKKL register is a write-only register that can be written in 16-bit units.

Address: RSCFDnCFDGLOCKK: <RSCANn_base> + $047C_H$

RSCFDnCFDGLOCKKL: <RSCANn_base> + $047C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCK[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 21.175 RSCFDnCFDGLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCFDnCFDGLOCKK register is used to release the protection of special test bits and is write only.

For the protection release data, see **Section 21.11.4.2, Procedure for Releasing the Protection**.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCFDnCFDGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCANn_base> + 0000_H to <RSCANn_base> + $0FFF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

21.5.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access: RSCFDnCFDRPGACCr register can be read or written in 32-bit units
RSCFDnCFDRPGACCrL, RSCFDnCFDRPGACCrH registers can be read or written in 16-bit units
RSCFDnCFDRPGACCrLL, RSCFDnCFDRPGACCrLH, RSCFDnCFDRPGACCrHL,
RSCFDnCFDRPGACCrHH registers can be read or written in 8-bit units

Address: RSCFDnCFDRPGACCr: <RSCANn_base> + 6400_H + (04_H × r)

RSCFDnCFDRPGACCrL: <RSCANn_base> + 6400_H + (04_H × r),
RSCFDnCFDRPGACCrH: <RSCANn_base> + 6402_H + (04_H × r)

RSCFDnCFDRPGACCrLL: <RSCANn_base> + 6400_H + (04_H × r),
RSCFDnCFDRPGACCrLH: <RSCANn_base> + 6401_H + (04_H × r),
RSCFDnCFDRPGACCrHL: <RSCANn_base> + 6402_H + (04_H × r),
RSCFDnCFDRPGACCrHH: <RSCANn_base> + 6403_H + (04_H × r)

Value after reset: $0000\ 0000_H$

Table 21.176 RSCFDnCFDRPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA[31:0]	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCFDnCFDRPGACCr register in global test mode with the RTME bit in the RSCFDnCFDGTSTCTR register set to 1 (RAM test is enabled).

The RSCFDnCFDRPGACCr register is readable and writable when the RTME bit is set to 1.

21.6 Interrupt Sources and DMA Trigger

21.6.1 Interrupt Sources

The RS-CANFD module has 20 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources):
  Receive FIFO interrupt
  Global error interrupt
- Channel interrupts (3 sources/channel):
  CANm transmit interrupt (m = 0 to 5)
  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

  CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)
  CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

Table 21.177 lists the CAN interrupt sources. **Figure 21.2** shows the CAN global interrupt block diagram. **Figure 21.3** shows the CAN channel interrupt block diagram.

Table 21.177 List of CAN Interrupt Sources

Interrupt Source			Corresponding Interrupt Request Flag	Corresponding Interrupt Enable Bit
Global interrupts	Receive FIFO	Receive FIFO 0	RFIF in the RSCANn(CFD)RFSTS0 register	RFIE in the RSCANn(CFD)RFCC0 register
		Receive FIFO 1	RFIF in the RSCANn(CFD)RFSTS1 register	RFIE in the RSCANn(CFD)RFCC1 register
		Receive FIFO 2	RFIF in the RSCANn(CFD)RFSTS2 register	RFIE in the RSCANn(CFD)RFCC2 register
		Receive FIFO 3	RFIF in the RSCANn(CFD)RFSTS3 register	RFIE in the RSCANn(CFD)RFCC3 register
		Receive FIFO 4	RFIF in the RSCANn(CFD)RFSTS4 register	RFIE in the RSCANn(CFD)RFCC4 register
		Receive FIFO 5	RFIF in the RSCANn(CFD)RFSTS5 register	RFIE in the RSCANn(CFD)RFCC5 register
		Receive FIFO 6	RFIF in the RSCANn(CFD)RFSTS6 register	RFIE in the RSCANn(CFD)RFCC6 register
		Receive FIFO 7	RFIF in the RSCANn(CFD)RFSTS7 register	RFIE in the RSCANn(CFD)RFCC7 register
	Global error		• DEF in the RSCANn(CFD)GERFL register • MES in the RSCANn(CFD)GERFL register • THLES in the RSCANn(CFD)GERFL register • CMPOF in the RSCFDnCFDGERFL register	• DEIE in the RSCANn(CFD)GCTR register • MEIE in the RSCANn(CFD)GCTR register • THLEIE in the RSCANn(CFD)GCTR register • CMPOFIE in the RSCFDnCFDGCTR register
Channel interrupts (m = 0 to 5)	CANm transmit	CANm transmit complete	TMTRF[1:0] in the RSCANn(CFD)TMSTSp register	TMIEp in the RSCANn(CFD)TMIECy register
		CANm transmit abort	TMTRF[1:0] in the RSCANn(CFD)TMSTSp register	TAIE in the RSCANn(CFD)CmCTR register
		CANm transmit/ receive FIFO transmit complete	CFTXIF in the RSCANn(CFD)CFSTSk register	CFTXIE in the RSCANn(CFD)CFCCk register
		CANm transmit queue	TXQIF in the RSCANn(CFD)TXQSTSm register	TXQIE in the RSCANn(CFD)TXQCCm register

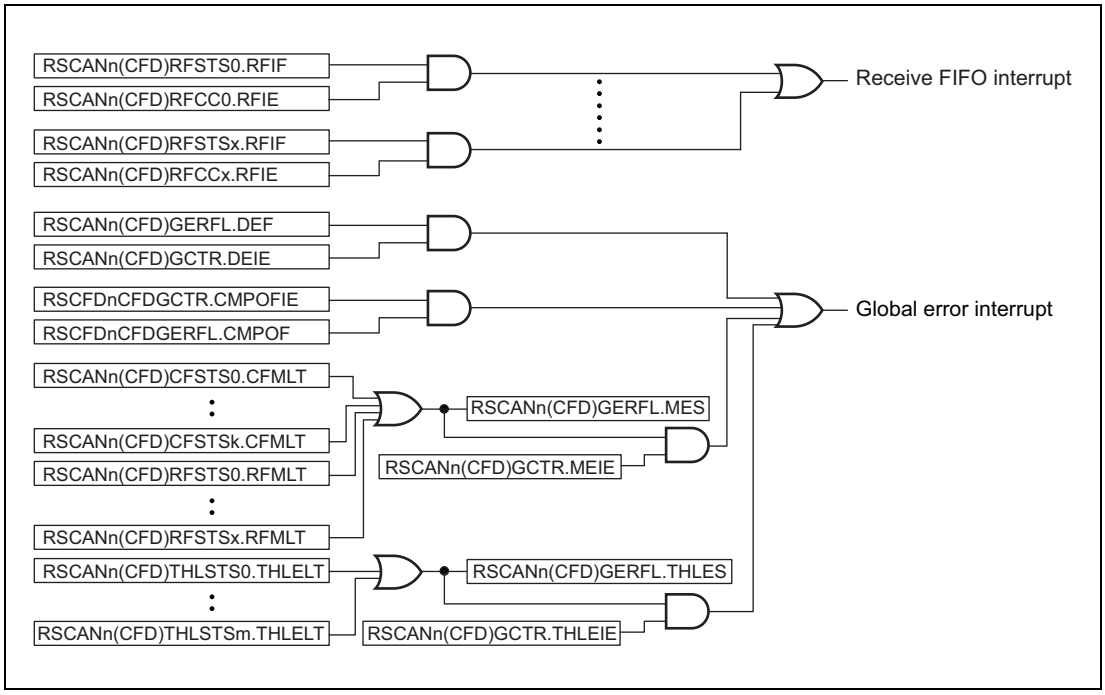

Figure 21.2 CAN Global Interrupt Block Diagram

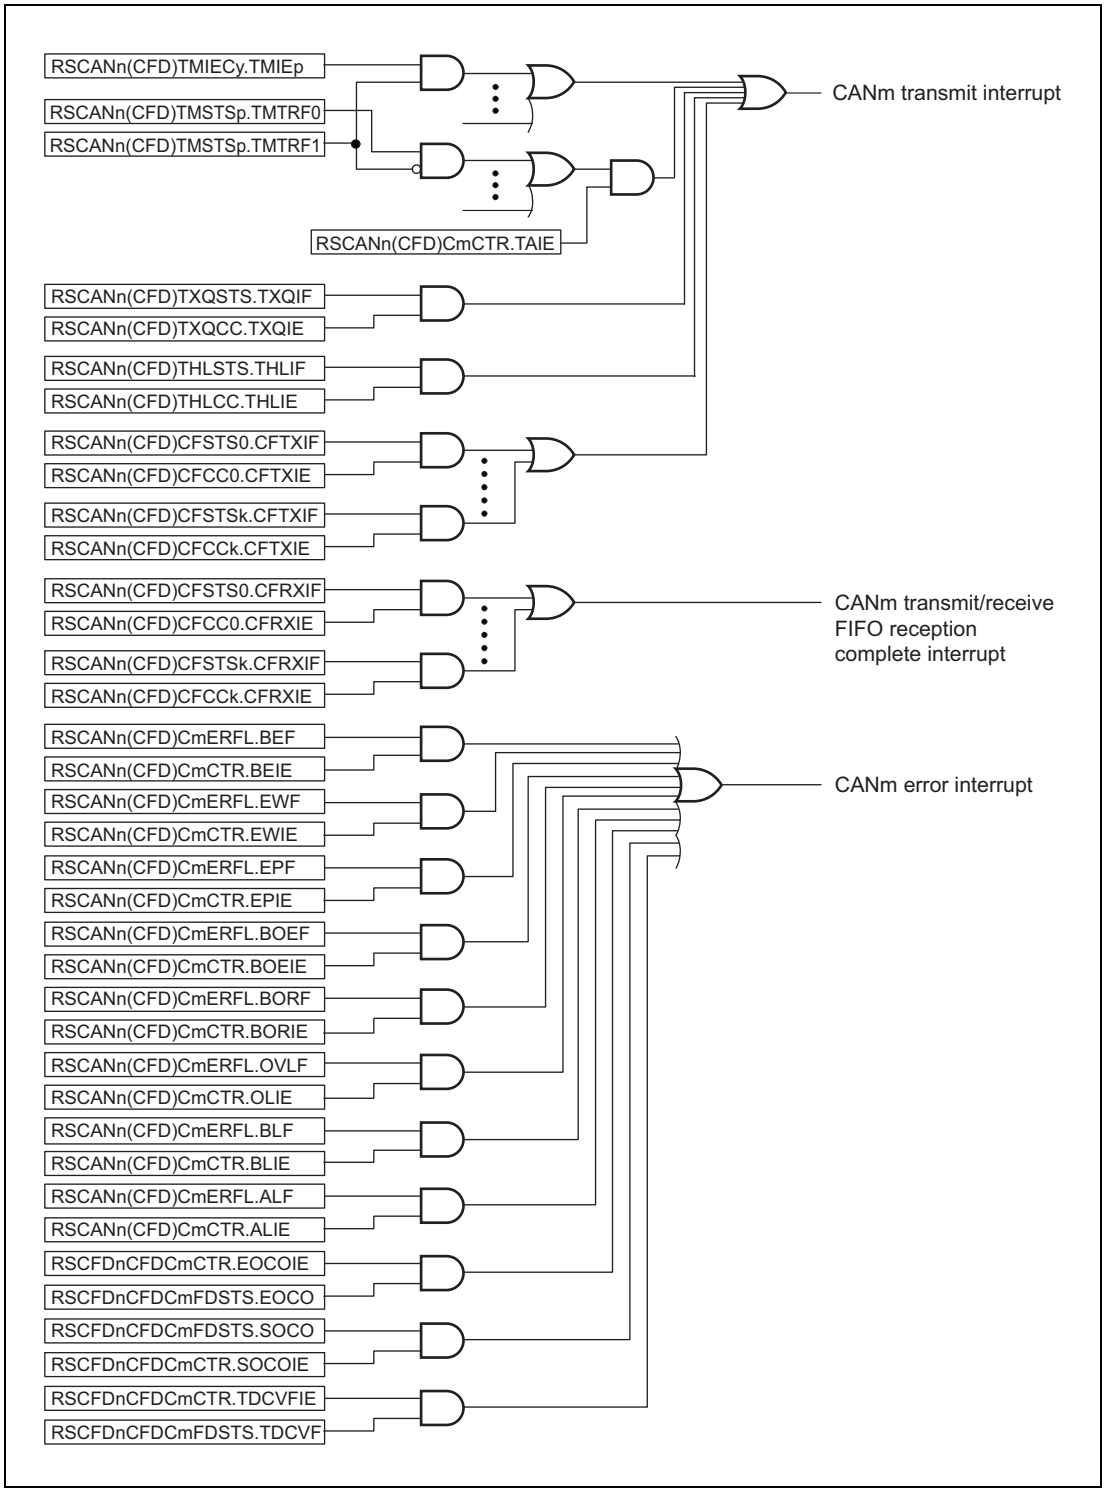

Figure 21.3 CAN Channel Interrupt Block Diagram

21.6.2 DMA Trigger (Only in CAN FD Mode)

In CAN FD mode, receive FIFO buffers can be related to DMA channels. The following 14 FIFO buffers can be related.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k (k = 3 × m, m = 0 to 5) allocated to channel m

When the DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) is set to 1 and an unread message is remaining in the related FIFO, a DMA transfer request trigger is generated.

21.7 CAN Modes

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in **Section 21.7.1, Global Modes**, and details of channel modes are described in **Section 21.7.2, Channel Modes**.

- Global stop mode: Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs the RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channels.
- Channel halt mode: Stops CAN communication and allows channel testing.
- Channel communication mode: Performs CAN communication.

21.7.1 Global Modes

Figure 21.4 shows the transitions of global modes.

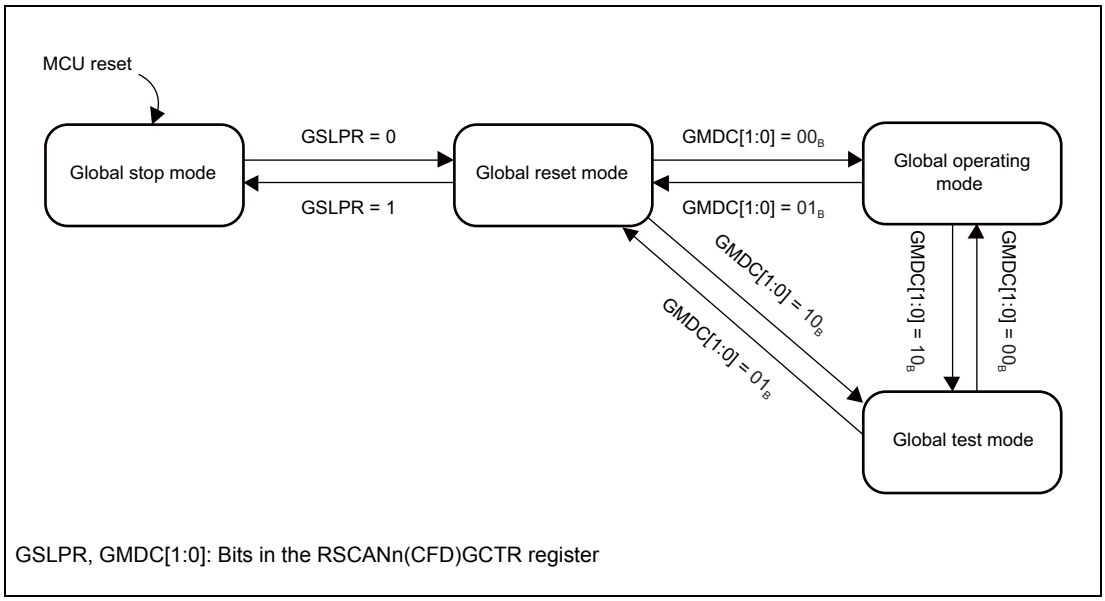

Figure 21.4 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. **Table 21.178** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 21.178 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

Channel Mode before Setting	Channel Mode after Setting			
	GMDC[1:0] = 00_B GSLPR = 0 (Global Operation)	**GMDC[1:0] = 10_B GSLPR = 0 (Global Test)**	**GMDC[1:0] = 01_B GSLPR = 0 (Global Reset)**	**GMDC[1:0] = 01_B GSLPR = 1 (Global Stop)**
Channel communication	Channel communication	Channel halt	Channel reset	Transition prohibited
Channel halt	Channel halt	Channel halt	Channel reset	Transition prohibited
Channel reset	Channel reset	Channel reset	Channel reset	Channel stop
Channel stop	Channel stop	Channel stop	Channel stop	Channel stop

Note: GMDC[1:0], GSLPR: Bits in the RSCANn(CFD)GCTR register

Table 21.179 shows the global mode transition time.

Table 21.179 Global Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Global stop	Global reset	Three pclk cycles
Global reset	Global stop	Three pclk cycles
Global reset	Global test	Ten pclk cycles
Global reset	Global operating	Ten pclk cycles
Global test	Global reset	Two CAN bit times*1,*2
Global test	Global operating	Three pclk cycles
Global operating	Global reset	Two CAN bit times*1,*2
Global operating	Global test	Two CAN frames*1

Note 1. CAN frame time and CAN bit time of the lowest communication speed of the channels in use

Note 2. In CAN FD mode, this time value is the CAN bit time of the nominal bit rate.

21.7.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the RS-CANFD module transitions to global stop mode. Setting the GSLPR bit in the RSCANn(CFD)GCTR register to 1 (global stop mode) in global reset mode sets the CSLPR bit in each of the RSCANn(CFD)CmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the RS-CANFD module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

21.7.1.2 Global Reset Mode

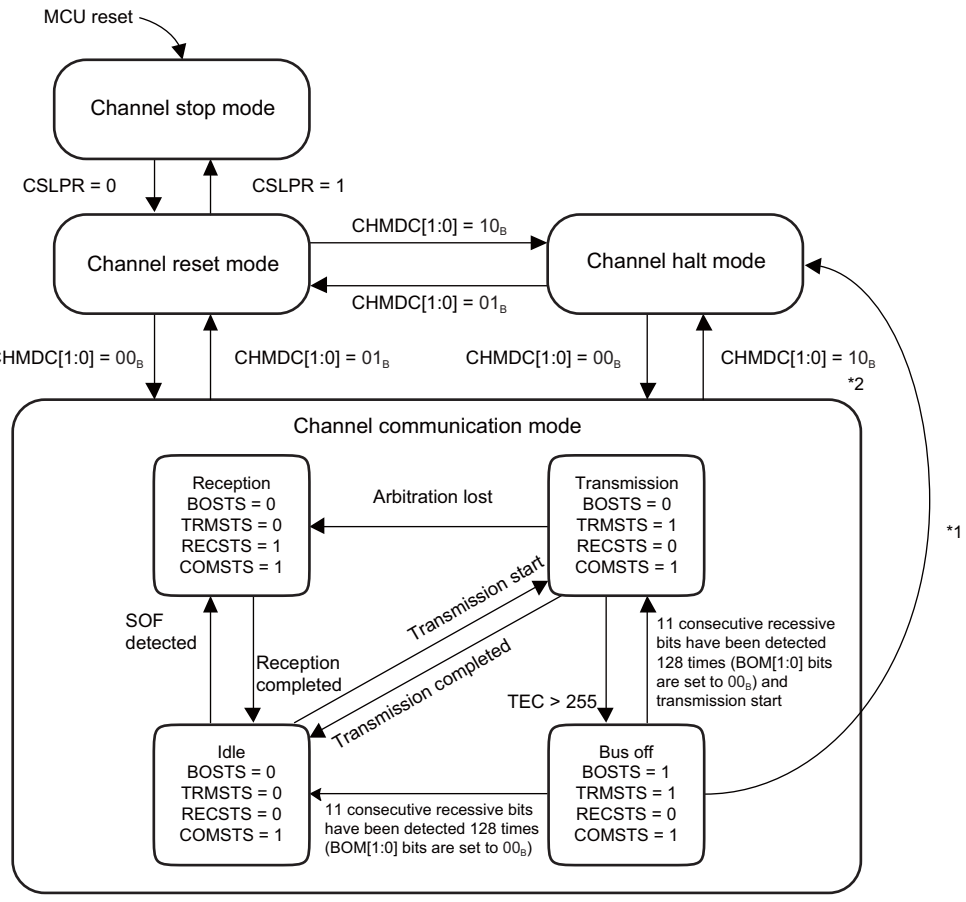
In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. For registers to be initialized, see **Table 21.182, Registers Initialized in Global Reset Mode and Channel Reset Mode** and **Table 21.183, Registers Initialized Only in Global Reset Mode**.

Setting the GMDC[1:0] bits in the RSCANn(CFD)GCTR register to 01_B sets the CHMDC[1:0] bits in each of the RSCANn(CFD)CmCTR registers (m = 0 to 5) to 01_B (channel reset mode). If all channels are forced to transition to channel reset mode, the RS-CANFD module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01_B).

21.7.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the RS-CANFD module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCANn(CFD)GCTR register to 10_B sets the CHMDC[1:0] bits in each of the RSCANn(CFD)CmCTR register to 10_B (channel halt mode). If all channels are forced to transition to channel halt mode, the RS-CANFDmodule transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.



21.7.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.

When the GMDC[1:0] bits in the RSCANn(CFD)GCTR register are set to 00_B, the RS-CANFD module transitions to global operating mode.

21.7.2 Channel Modes

Figure 21.5 shows a channel mode state transition chart. **Table 21.180** shows the channel mode transition time.

Note: CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCANn(CFD)CmCTR register (m = 0 to 5)
BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCANn(CFD)CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = 01_B: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = 10_B: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = 11_B: Transition to channel halt mode when the CHMDC[1:0] bits are set to 10_B

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Figure 21.5 Channel Mode State Transition Chart

Table 21.180 Channel Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel stop	Channel reset	Three pclk cycles
Channel reset	Channel stop	Three pclk cycles
Channel reset	Channel halt	Three CANm bit times*1
Channel reset	Channel communication	Four CANm bit times*1
Channel halt	Channel reset	Two CANm bit times*1
Channel halt	Channel communication	Four CANm bit times*1
Channel communication	Channel reset	Two CANm bit times*1
Channel communication	Channel halt	Two CANm frames

Note 1. In CAN FD mode, this time value is the CANm bit time of the nominal bit rate.

21.7.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RSCANn(CFD)CmCTR register (m = 0 to 5) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

21.7.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. For registers to be initialized, see **Table 21.182, Registers Initialized in Global Reset Mode and Channel Reset Mode**.

When the CHMDC[1:0] bits in the RSCANn(CFD)CmCTR register are set to 01_B (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 21.181** shows the operation when the CHMDC[1:0] bits are set to 01_B (channel reset mode) during CAN communication.

21.7.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

Table 21.181 shows operation when the CHMDC[1:0] bits are set to 10_B (channel halt mode) during CAN communication.

Table 21.181 Operation when a Channel Transitions to Channel Reset Mode/Channel Halt Mode

Mode	During Reception	During Transmission	Bus Off State
Channel reset (CHMDC[1:0] = 01_B)	Transitions to channel reset mode before reception is completed.*1	Transitions to channel reset mode before transmission is completed.*1	Transitions to channel reset mode before bus off recovery.
Channel halt*3 (CHMDC[1:0] = 10_B)	Transitions to channel halt mode after reception is completed.*2	Transitions to channel halt mode after transmission is completed.	[When BOM[1:0] = 00_B] Transitions to channel halt mode (CHMDC[1:0] = 10_B) only after bus off recovery. [When BOM[1:0] = 01_B] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = 10_B] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = 11_B] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10_B before bus off recovery.

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10_B and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01_B.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCANn(CFD)CmERFL register that becomes 1 when bus dominant lock is detected.

Note 3. In classical CAN mode, when the transition from channel reset mode to channel halt mode is to be made, set the RSCANnCmCFG register in channel reset mode and then shift to channel halt mode. In CAN FD mode, set the RSCFDnCFDCmNCFG register and the RSCFDnCFDCmDCFG register, and then make a transition.

21.7.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCANn(CFD)CmCTR register are set to 00_B, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCANn(CFD)CmSTS register (m = 0 to 5) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

21.7.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/ decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCANn(CFD)CmCTR register.

- When BOM[1:0] = 00_B:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCANn(CFD)CmSTS register are initialized to 00_H, the BORF flag in the RSCANn(CFD)CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCANn(CFD)CmCTR register are set to 10_B (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = 01_B:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10_B and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.
- When BOM[1:0] = 10_B:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10_B. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.
- When BOM[1:0] = 11_B:
  When the CHMDC[1:0] bits are set to 10_B in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a RS-CANFD module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to 10_B.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01_B or 10_B is made only when the CHMDC[1:0] bits are 00_B (channel communication mode).

Furthermore, setting the RTBO bit in the RSCANn(CFD)CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the RS-CANFD module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to 00_H. Write 1 to the RTBO bit only when the BOM[1:0] value is 00_B. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

21.7.3 Initializing Registers by Transition to CAN Mode

Table 21.182 lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, **Table 21.183** lists bits and flags to be initialized only by a transition to global reset mode.

Table 21.182 Registers Initialized in Global Reset Mode and Channel Reset Mode

Register	Bit / Flag
RSCANn(CFD)CmCTR register	(ROM), CRCT, CTMS[1:0], CTME, CHMDC[1:0]
RSCANn(CFD)CmSTS register	CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, (ESIF), REC[7:0], TEC[7:0]
RSCANn(CFD)CmERFL register	CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF
RSCFDnCFDCmFDCTR register	EOCCLR, SOCCLR
RSCFDnCFDCmFDSTS register	SOC[7:0], EOC[7:0], SOCO, EOCO, TDCVF, TDCR[6:0]
RSCFDnCFDCmFDCRC register	CRCREG[20:0]
RSCANn(CFD)CFCCk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE
RSCANn(CFD)CFSTSk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF
RSCANn(CFD)CFTISTS register	CFkTXIF
RSCANn(CFD)TMCp register	TMOM, TMTAR, TMTR
RSCANn(CFD)TMSTSp register	TMTARM, TMTRM, TMTRF[1:0], TMTSTS
RSCANn(CFD)TMTRSTSy register	TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCANn(CFD)TMTARSTSy register	TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCANn(CFD)TMTCSTSy register	TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCANn(CFD)TMTASTSy register	TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCANn(CFD)TXQCCm register	TXQE
RSCANn(CFD)TXQSTSm register	TXQIF, TXQFLL, TXQEMP
RSCANn(CFD)THLCCm register	THLE
RSCANn(CFD)THLSTSm register	THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP
RSCANn(CFD)GTINTSTS0 register	TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 0 to 3)
RSCANn(CFD)GTINTSTS1 register	TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 4, 5)

Note: Bits and flags in parentheses exist only in registers in CAN FD mode.

Table 21.183 Registers Initialized Only in Global Reset Mode

Register	Bit / Flag
RSCANn(CFD)GSTS register	GHLTSTS
RSCANn(CFD)GERFL register	EEF0, EEF1, EEF2, EEF3, EEF4, EEF5, (CMPOF), THLES, MES, DEF
RSCANn(CFD)GTSC register	TS[15:0]
RSCANn(CFD)RMNDy register	RMNSq
RSCANn(CFD)RFCCx register	RFE
RSCANn(CFD)RFSTSx register	RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP
RSCANn(CFD)CFCCk register	When transmit/receive FIFO buffer is in receive mode: CFE
RSCANn(CFD)CFSTSk register	When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT
RSCANn(CFD)FESTS register	CFkEMP, RFxEMP
RSCANn(CFD)FFSTS register	CFkFLL, RFxFLL
RSCANn(CFD)FMSTS register	CFkMLT, RFxMLT
RSCANn(CFD)RFISTS register	RFxIF
RSCANn(CFD)CFRISTS register	CFkRXIF
RSCFDnCFDCDTCT register	CFDMAEm, RFDMAEx
RSCFDnCFDCDTSTS register	CFDMASTSm, RFDMASTSx
RSCANn(CFD)GTSTCFG register	RTMPS[6:0], C0ICBCE, C1ICBCE, C2ICBCE, C3ICBCE, C4ICBCE, C5ICBCE
RSCANn(CFD)GTSTCTR register	RTME, ICBCTME

Note: Bits and flags in parentheses exist only in registers in CAN FD mode.

21.8 Reception Function

There are two reception types.

- Reception by receive buffers:
  Zero to 96 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

21.8.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module. (Up to 384 receive rules can be registered in this module that has six channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 21.6** illustrates how receive rules are registered.

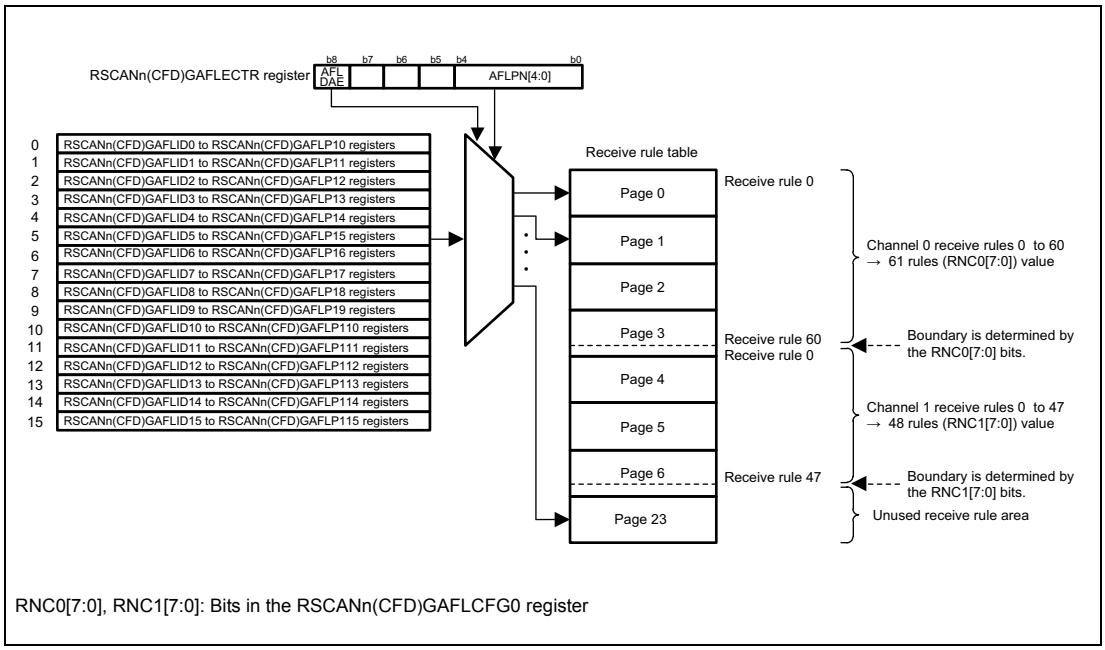


Figure 21.6 Entry of Receive Rules (for Setting Channel 0 and 1)

CAUTION

Receive rules for each channel must be set in contiguous blocks.
Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCANn(CFD)GAFLIDj, RSCANn(CFD)GAFLMj, RSCANn(CFD)GAFLP0j, and RSCANn(CFD)GAFLP1j registers (j = 0 to 15). The RSCANn(CFD)GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCANn(CFD)GAFLMj register is used to set mask, the RSCANn(CFD)GAFLP0j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCANn(CFD)GAFLP1j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

21.8.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCANn(CFD)GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

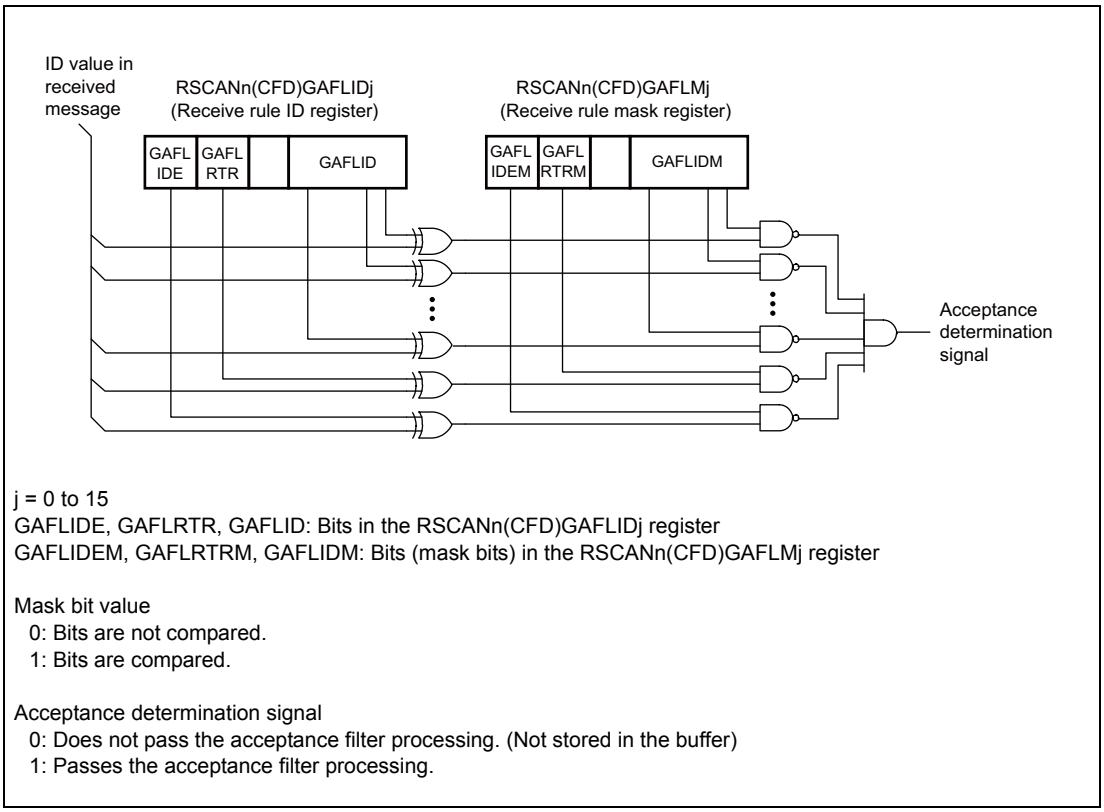

Figure 21.7 Acceptance Filter Function

21.8.1.2 DLC Filter Processing

When the DCE bit in the RSCANn(CFD)GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCANn(CFD)GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCANn(CFD)GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of 00_H is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCANn(CFD)GERFL register is set to 1 (a DLC error is present).

21.8.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCANn(CFD)GAFLP0j register (j = 0 to 15) and by the RSCANn(CFD)GAFLP1j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

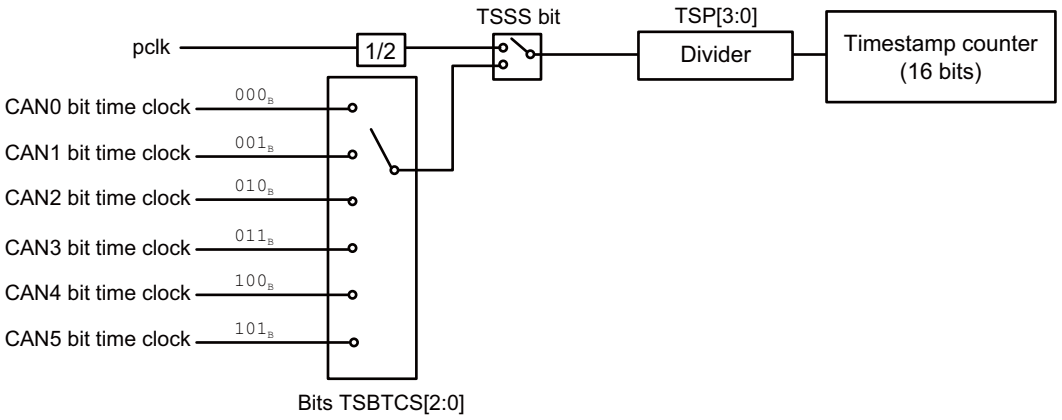
In CAN FD mode, if the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 (payload overflow) and the processing is handled according to the CMPOC bit in the RSCFDnCFDGCFG register. When the CMPOC bit is 0, the received message which exceeds the payload storage size is not stored in the buffer. When the CMPOC bit is 1, the received message is stored in the buffer with payloads exceeding the storage size being discarded.

21.8.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCANn(CFD)GAFLP0j register.

21.8.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCANn(CFD)GCFG register to 1 (mirror function is enabled).



When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCANn(CFD)GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

21.8.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time and transmission time. The timestamp counter value is fetched at the start-of-frame (SOF) timing of a message and is then stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RSCANn(CFD)GCFG register. In classical CAN mode, either pclk/2 or the CANm bit time clock (m = 0 to 5). In CAN FD mode, the clock source is selectable from pclk/2 or nominal CANm bit time clock. However, do not select the nominal CANm bit time clock of channels that handle CAN FD frames. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCANn(CFD)GCFG register.

When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to 0000_H by setting the TSRST bit in the RSCANn(CFD)GCTR register to 1.

TSBTCS[2:0], TSSS, TSP[3:0]: Bits in the RSCANn(CFD)GCFG register

Note: When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Figure 21.8 Timestamp Function Block Diagram

21.9 Transmission Functions

There are three types of transmission. In classical CAN mode, transmittable payload length is 8 bytes in every transmission type. In CAN FD mode, transmittable payload length varies with transmission types.

- Transmission using transmit buffers:
  Each channel has 16 buffers. Transmittable payload length in CAN FD mode is 20 bytes. However, when transmit buffer merge mode is used, four buffers out of 16 buffers are allocated as a payload-only storage area and two buffers are able to transmit payloads with a length of more than 20 bytes.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Transmittable payload length in CAN FD mode is 64 bytes. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmittable payload length in CAN FD mode is 20 bytes. Transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

Figure 21.9 shows the allocation of transmit queues and transmit/receive FIFO buffer links.

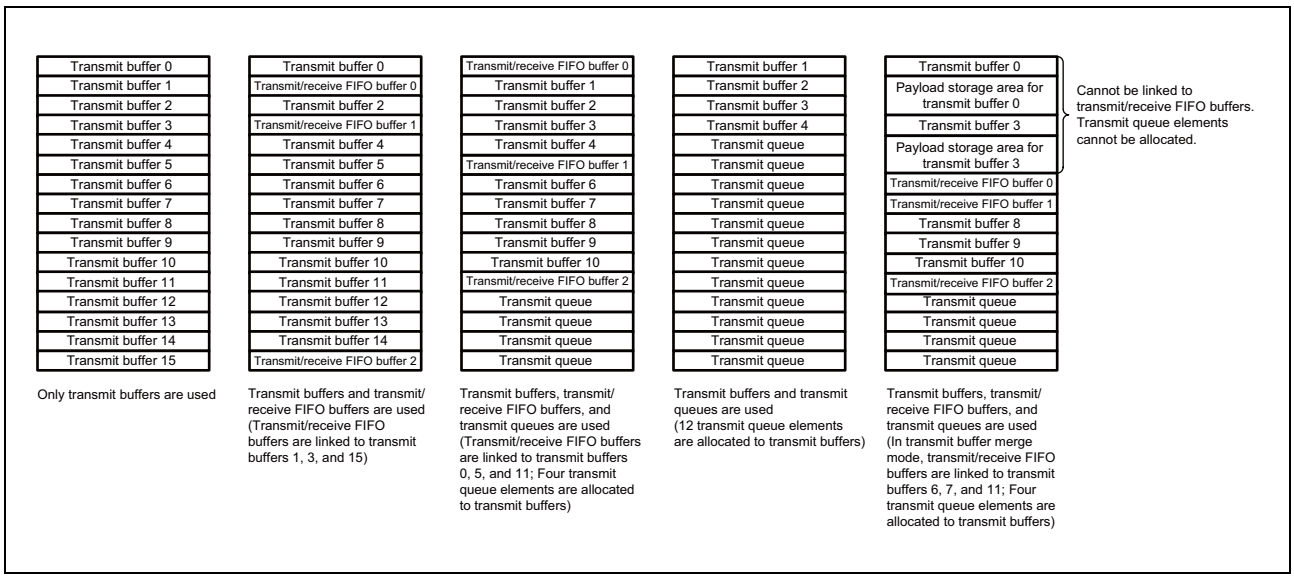


Figure 21.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

21.9.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

The priority is determined by using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCANn(CFD)GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit. When a 2-bit ECC error is detected in the priority determination processing, no message is transmitted (only when the EEFE bit in the RSCANnGCFG register is 1 in classical CAN mode).

21.9.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCANn(CFD)TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCANn(CFD)TMSTSp register (p = 0 to 95). When transmit completes successfully, the TMTRF[1:0] flag is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)).

21.9.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCANn(CFD)TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCANn(CFD)TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCANn(CFD)TMSTSp register is set to 01_B (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

21.9.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCANn(CFD)TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCANn(CFD)TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10_B or 11_B. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to 01_B (transmit abort has been completed).

21.9.2.3 Transmit Buffer Merge Mode (Only in CAN FD Mode)

Transmit buffers can transmit messages with a payload length of 20 bytes, but can transmit messages with a payload length of up to 64 bytes by merging three transmit buffers in transmit buffer merge mode.

Setting the TMME bit to 1 in the RSCFDnCFDCmFDCFG register enables transmit buffer merge mode. In this mode, six buffers per channel become a merge area and two sets of transmit buffers (16 × m) + 0 to (16 × m) + 2 and transmit buffers (16 × m) + 3 to (16 × m) + 5 are merged. A transmission request is made by the first transmit buffer, and subsequent two buffers are used as a payload storage area. Do not set the transmission request bit (TMTR bit in the RSCFDnCFDTMCp register) and the transmission abort request bit (TMTAR bit in the RSCFDnCFDTMCp register) to 1 for transmit buffers except for the first buffer.

While transmit buffer merge mode is enabled, do not link the transmit/receive FIFO buffer to six merged buffers or allocate it to the transmit queue.

21.9.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCANn(CFD)CFCCk register (k = 0 to 17). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCANn(CFD)CFCCk register. When the CFE bit in the RSCANn(CFD)CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

21.9.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCANn(CFD)CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RSCANn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to 00_H.

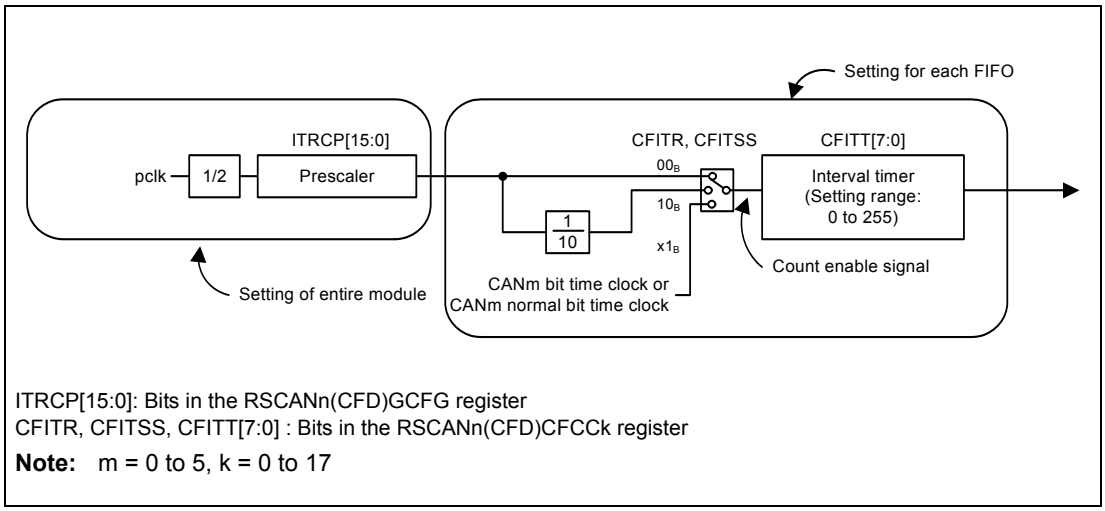
Select an interval timer count source using the CFITR and CFITSS bits in the RSCANn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to 00_H. Select an interval timer count source using the CFITR bit in the RSCANn(CFD)CFCCk register and the CFITSS bit in the RSCANnCFCCk register. When the CFITR and CFITSS bits are set to 00_B, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to 10_B, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits × 10). When the CFITR and CFITSS bits are set to $x1_B$, the CANm bit time clock becomes a count source in classical CAN mode and the nominal CANm bit time clock becomes a count source in CAN FD mode.

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00_B:

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times N$$

- When CFITR and CFITSS = 10_B:



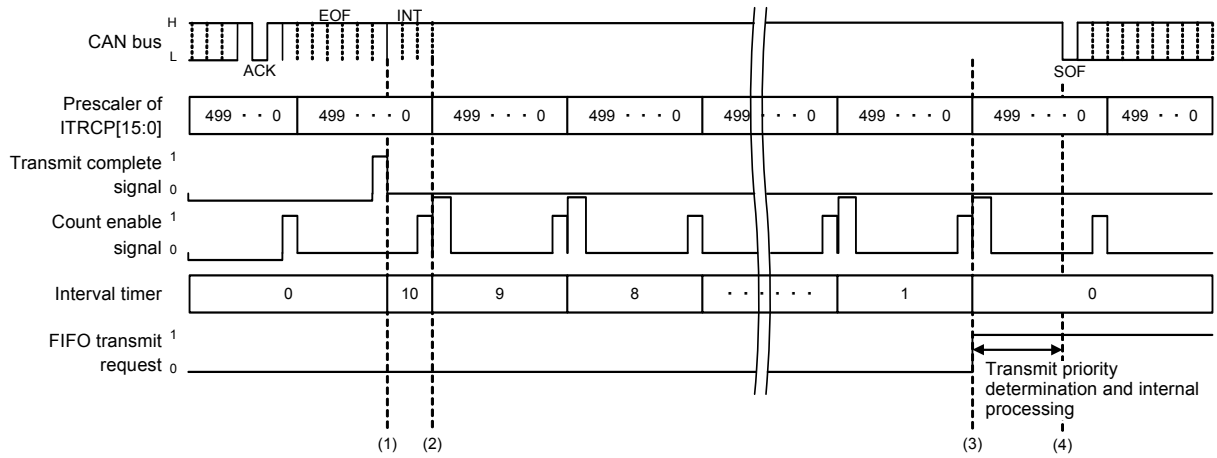
$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = $x1_B$:

Classical CAN mode: $\dfrac{1}{\text{CANm bit time clock frequency}} \times N$

CAN FD mode: $\dfrac{1}{\text{Nominal CANm bit time clock frequency}} \times N$

Figure 21.10 shows the interval timer block diagram.



ITRCP[15:0]: Bits in the RSCANn(CFD)GCFG register
CFITR, CFITSS, CFITT[7:0] : Bits in the RSCANn(CFD)CFCCk register

Note: m = 0 to 5, k = 0 to 17

Figure 21.10 Interval Timer Block Diagram

Figure 21.11 shows the interval timer timing chart.

$$\text{Interval time (logical value)} = \frac{2}{\text{pclk frequency}} \times (\text{ITRCP[15:0] setting value}) \times \text{CFITT[7:0] setting value}$$

- ITRCP[15:0]: Bits in the RSCANn(CFD)GCFG register (The set value is 500 in this figure.)
- CFITT[7:0]: Bits in the RSCANn(CFD)CFCCk register (The set value is 10 in this figure.)

Figure 21.11 Interval Timer Timing Chart

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 1164 cycles of the pclk may be generated.

21.9.4 Transmission Using Transmit Queues

Three to sixteen buffers (up to 10 buffers in transmit buffer merge mode) are allocated to a transmit queue for each channel, and transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RSCANn(CFD)TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCANn(CFD)TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

21.9.5 Transmit Data Padding (Only in CAN FD Mode)

When the payload length indicated by the DLC setting value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by CC_H.

This processing is performed in the following cases when the transmit buffer merge mode is disabled (TMME bit in the RSCFDnCFDCmFDCFG register is 0).

- Transmit/receive FIFO set to transmission or gateway mode:
  When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register
- Transmit buffer (including transmit queue):
  When the payload length of the transmit DLC exceeds 20 bytes

When the transmit buffer merge mode is enabled, no transmit data is padded in any transmission using a transmit buffer, transmit/receive FIFO buffer, or transmit queue. At this time, do not set a payload length more than the payload storage size of the buffer for transmitting as the DLC value in the transmit message.

21.9.6 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCANn(CFD)THLCCm register. The THLEN bit in the RSCANn(CFD)CFIDk register (k = 0 to 17) determines whether transmit history data is stored for each message.

In classical CAN mode, the TMTSCE bit in the RSCANnGCFG register can be used to set whether to include a timestamp value in the transmit history data. In CAN FD mode, a timestamp value is always included.

The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.

Storage of the transmit history data after the successful completion of transmission may take up to 152 cycles of pclk in classical CAN mode or 420 cycles of pclk in CAN FD mode.

- Buffer type — 001_B: Transmit buffer
010_B: Transmit/receive FIFO buffer
100_B: Transmit queue
- Buffer number — Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See **Table 21.184**.
- Label data — Label information of the transmit message
- Timestamp — Timestamp value of the transmit message
(When the TMTSCE bit is 1 in classical CAN mode)

Table 21.184 Transmit History Data Buffer Numbers

Buffer No. / Buffer type	001_B	010_B	100_B
0000_B	Transmit buffer 16 × m + 0	Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCANn(CFD)CFCCk register (k = 0 to 17)	Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission
0001_B	Transmit buffer 16 × m + 1		
0010_B	Transmit buffer 16 × m + 2		
0011_B	Transmit buffer 16 × m + 3		
0100_B	Transmit buffer 16 × m + 4		
0101_B	Transmit buffer 16 × m + 5		
0110_B	Transmit buffer 16 × m + 6		
0111_B	Transmit buffer 16 × m + 7		
1000_B	Transmit buffer 16 × m + 8		
1001_B	Transmit buffer 16 × m + 9		
1010_B	Transmit buffer 16 × m + 10		
1011_B	Transmit buffer 16 × m + 11		
1100_B	Transmit buffer 16 × m + 12		
1101_B	Transmit buffer 16 × m + 13		
1110_B	Transmit buffer 16 × m + 14		
1111_B	Transmit buffer 16 × m + 15		

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see **Section 21.8.1.6, Timestamp**.

Transmit history data can be read from the RSCANn(CFD)THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

21.10 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
  - Restricted operation mode (only in CAN FD mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test [CRC error test enabled]

21.10.1 Standard Test Mode

CRC tests are enabled in standard test mode. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RSCANn(CFD)CmERFL register when the message is a classical CAN frame (CRC length = 15 bits) or in the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register when the message is a CAN FD frame (CRC length = 17 or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see **Section 21.10.6.1, CRC Error Test**.

21.10.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

Figure 21.12 shows the connection when listen-only mode is selected.

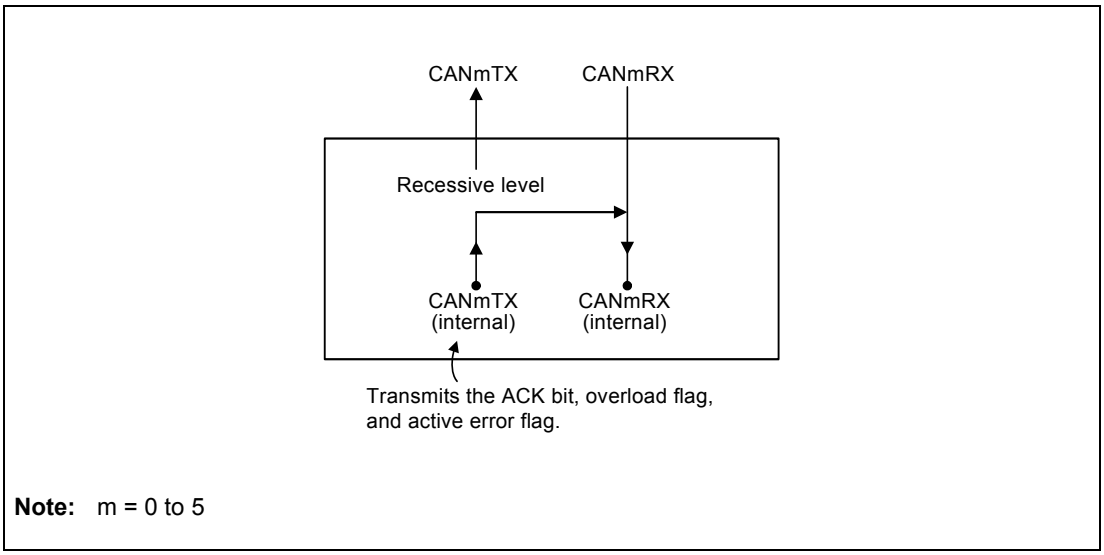


Figure 21.12 Connection when Listen-Only Mode is Selected

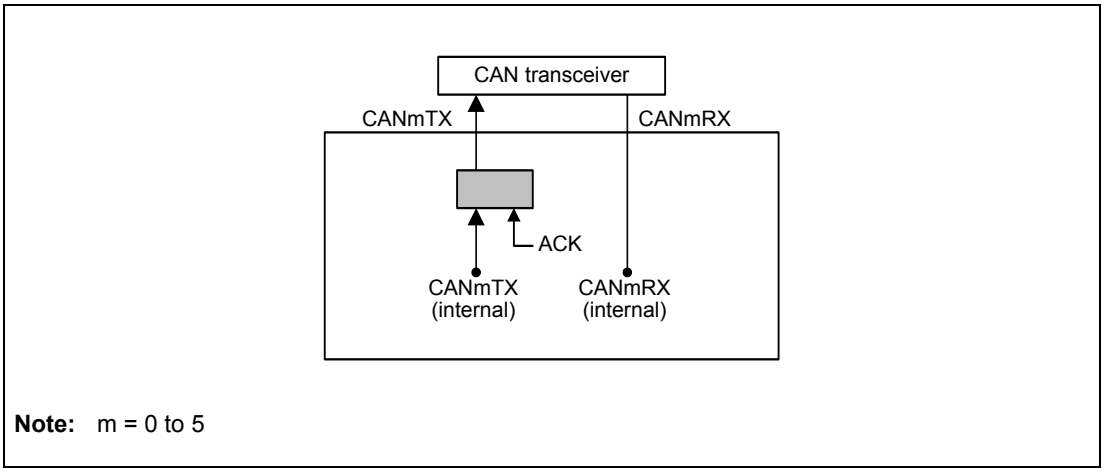
21.10.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCANn(CFD)GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).



If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

21.10.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

Figure 21.13 shows the connection when self-test mode 0 is selected.

Note: m = 0 to 5

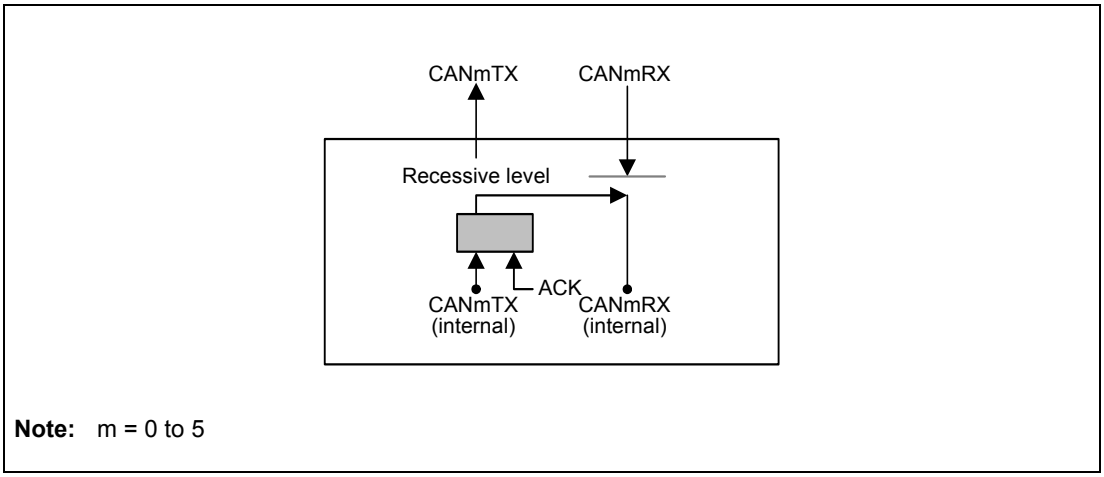


Figure 21.13 Connection when Self-Test Mode 0 is Selected

21.10.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin (m = 0 to 5) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

Figure 21.14 shows the connection when self-test mode 1 is selected.

Note: m = 0 to 5

Figure 21.14 Connection when Self-Test Mode 1 is Selected

21.10.4 Restricted Operation Mode (Only in CAN FD Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the state becomes bus idle for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error.

A desired transmission request can be made for transmission without restrictions.

21.10.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCANn(CFD)GTSTCFG register. Data in the set page can be read from and written to the RSCANn(CFD)RPGACCr register (r = 0 to 63). The available total RAM size is 15360 bytes ($3C00_H$) in classical CAN mode or 21312 bytes (5340_H) in CAN FD mode.

In CAN FD mode, RAM addresses after the first 64 bytes of the last page (the page specified by RTMPS = 53_H) cannot be accessed.

21.10.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.

Figure 21.15 shows the connection for inter-channel communication test.

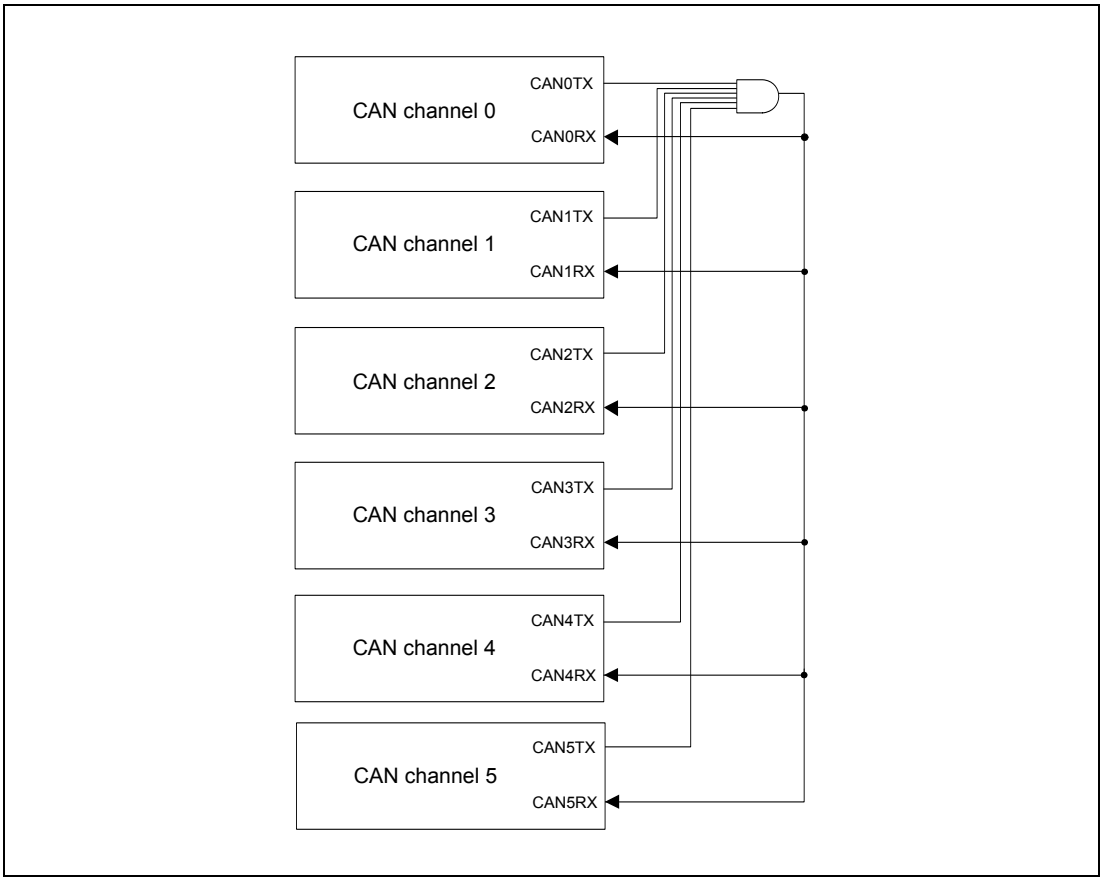

Figure 21.15 Connection for Inter-Channel Communication Test

21.10.6.1 CRC Error Test

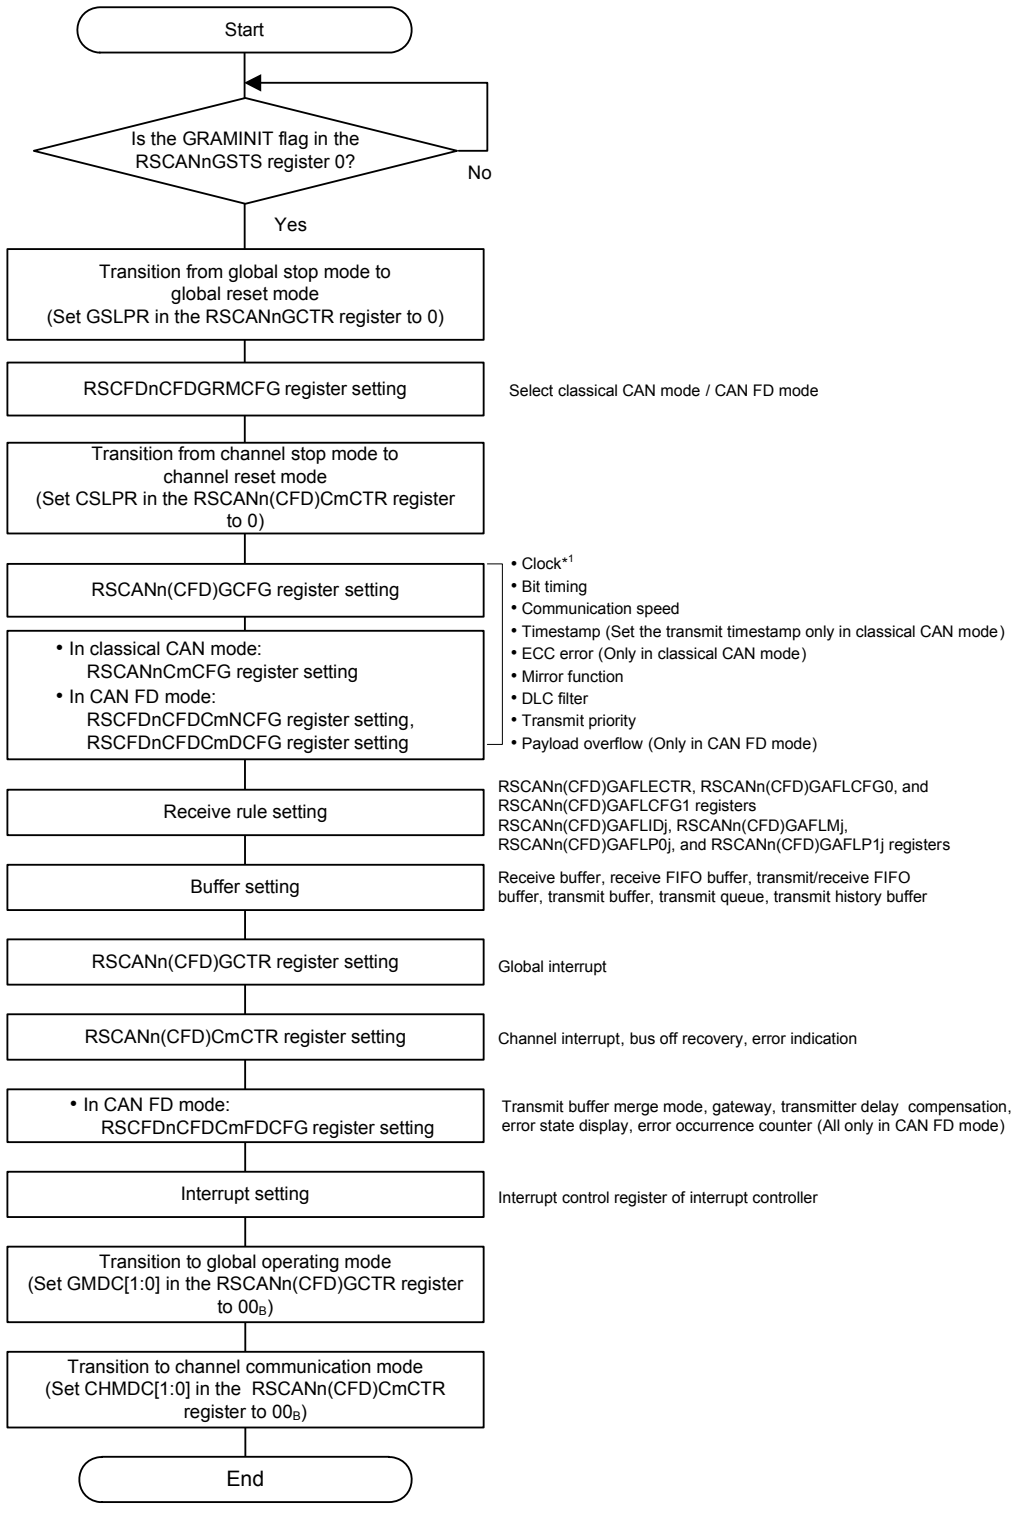
A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

Preconditions

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

Procedure

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RSCANn(CFD)C0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RSCANn(CFD)TMCp register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RSCANn(CFD)CmERFL register or the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RSCANm(CFD)C0ERFL register is 1 (CRC error detected).



The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID's upper 5-bit value is 10000_B or ID's upper 6-bit value is 011111_B is received.

The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

21.11 RS-CANFD Setting Procedure

21.11.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 7586 cycles of the pclk. The GRAMINIT flag in the RSCANn(CFD)GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 21.16** shows the CAN setting procedure after the MCU is reset.

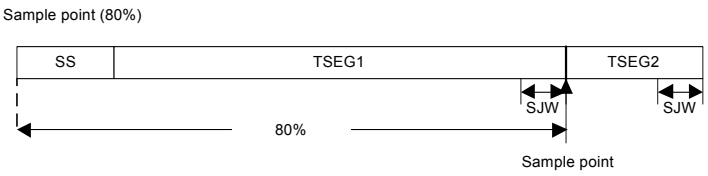
Note 1. For the setting of CAN clock frequency, see **Table 21.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

Note: m = 0 to 5, j = 0 to 15

Figure 21.16 CAN Setting Procedure after the MCU is Reset

21.11.1.1 Clock Setting

Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk_xincan or clkc using the DCS bit in the RSCANn(CFD)GCFG register.



21.11.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding registers for each channel. In classical CAN mode, set these two segments in the RSCANnCmCFG register. Two bit rates (nominal bit rate and data bit rate) are provided for CAN FD mode. Set the nominal bit rate in the RSCFDnCFDCmNCFG register and set the data bit rate in the RSCFDnCFDCmDCFG register. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RSCANnGCFG register. Set a division ratio by the BRP[9:0] bits in the RSCANnCmCFG register in classical CAN mode (CANmTq clock), and by the NBRP[9:0] bits in the RSCFDnCFDCmNCFG register and the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register in CAN FD mode (CANmTq(N) clock and CANmTq(D) clock).

The NBRP[9:0] value and the DBRP[7:0] value should be equal and the two bit rate values be different according to the respective segment values.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0]

Figure 21.17 shows the bit timing chart. **Table 21.185** shows an example of bit timing setting.

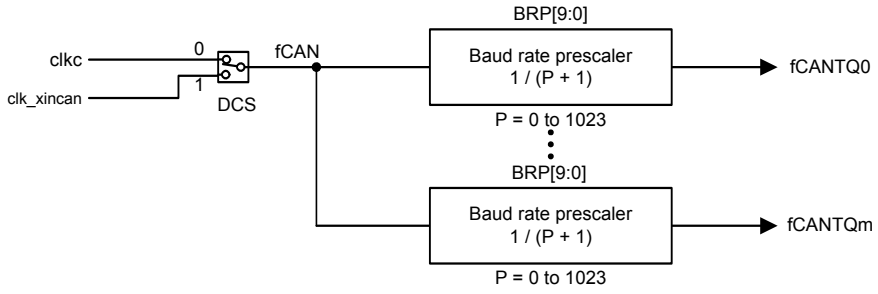
Classical CAN mode:	SS = 1 Tq fixed Set TSEG1 to the range of 4 Tq to 16 Tq Set TSEG2 to the range of 2 Tq to 8 Tq Set SJW to the range of 1 Tq to 4 Tq Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq TSEG1 > TSEG2 ≥ SJW	
CAN FD mode:	<Nominal bit rate> SS = 1 Tq fixed Set TSEG1 to the range of 4 Tq to 128 Tq Set TSEG2 to the range of 2 Tq to 32 Tq Set SJW to the range of 1 Tq to 32 Tq Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 161 Tq TSEG1 > TSEG2 ≥ SJW	<Data bit rate> SS = 1 Tq fixed Set TSEG1 to the range of 2 Tq to 16 Tq Set TSEG2 to the range of 2 Tq to 8 Tq Set SJW to the range of 1 Tq to 8 Tq Set SS + TSEG1 + TSEG2 to a range of 5 Tq to 25 Tq TSEG1 ≥ TSEG2 ≥ SJW

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space. Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (Time segment 1):
  TSEG1 is a segment that absorbs physical delays on the CAN network. The physical delay on the network is the doubled value of the total of a CAN bus delay, input converter delay, and output driver delay on the CAN bus.
- TSEG2 (Time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (Resynchronization jump width):
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

Figure 21.17 Bit Timing Chart

Table 21.185 Example of Bit Timing Setting

1 Bit	Set Value (Tq)				Sample Point (%) Note: See Figure 21.17.
	SS	TSEG1	TSEG2	SJW	
5 Tq*1	1	2	2	1	60.00
8 Tq	1	4	3	1	62.50
	1	5	2	1	75.00
10 Tq	1	6	3	1	70.00
	1	7	2	1	80.00
16 Tq	1	10	5	1	68.75
	1	11	4	1	75.00
20 Tq	1	12	7	1	65.00
	1	13	6	1	70.00
50 Tq*1	1	39	10	4	80.00



Note 1. Only in CAN FD mode

21.11.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. For CAN FD mode, set two types of transmission rate (arbitration phase and data phase) for each channel.

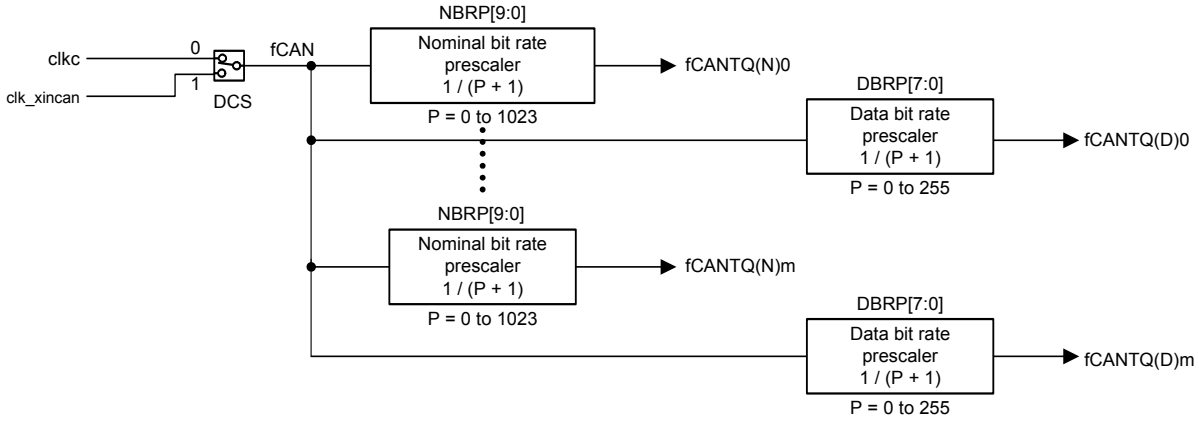


Figure 21.18 shows the CAN clock control block diagram, and **Table 21.186** and **Table 21.187** show examples of the communication speed setting.

- Classical CAN mode

$$\text{Communication speed} = \frac{\text{fCAN}}{\text{Baud rate prescaler division value} \times (\text{Tq count of 1 bit time})}$$

- CAN FD mode

$$\text{Nominal bit rate} = \frac{\text{fCAN}}{\text{Nominal bit rate prescaler division value} \times (\text{Tq count of 1 nominal bit time})}$$

$$\text{Data bit rate} = \frac{\text{fCAN}}{\text{Data bit rate prescaler division value} \times (\text{Tq count of 1 data bit time})}$$

Note: m = 0 to 5
DCS: Bit in the RSCANn(CFD)GCFG register

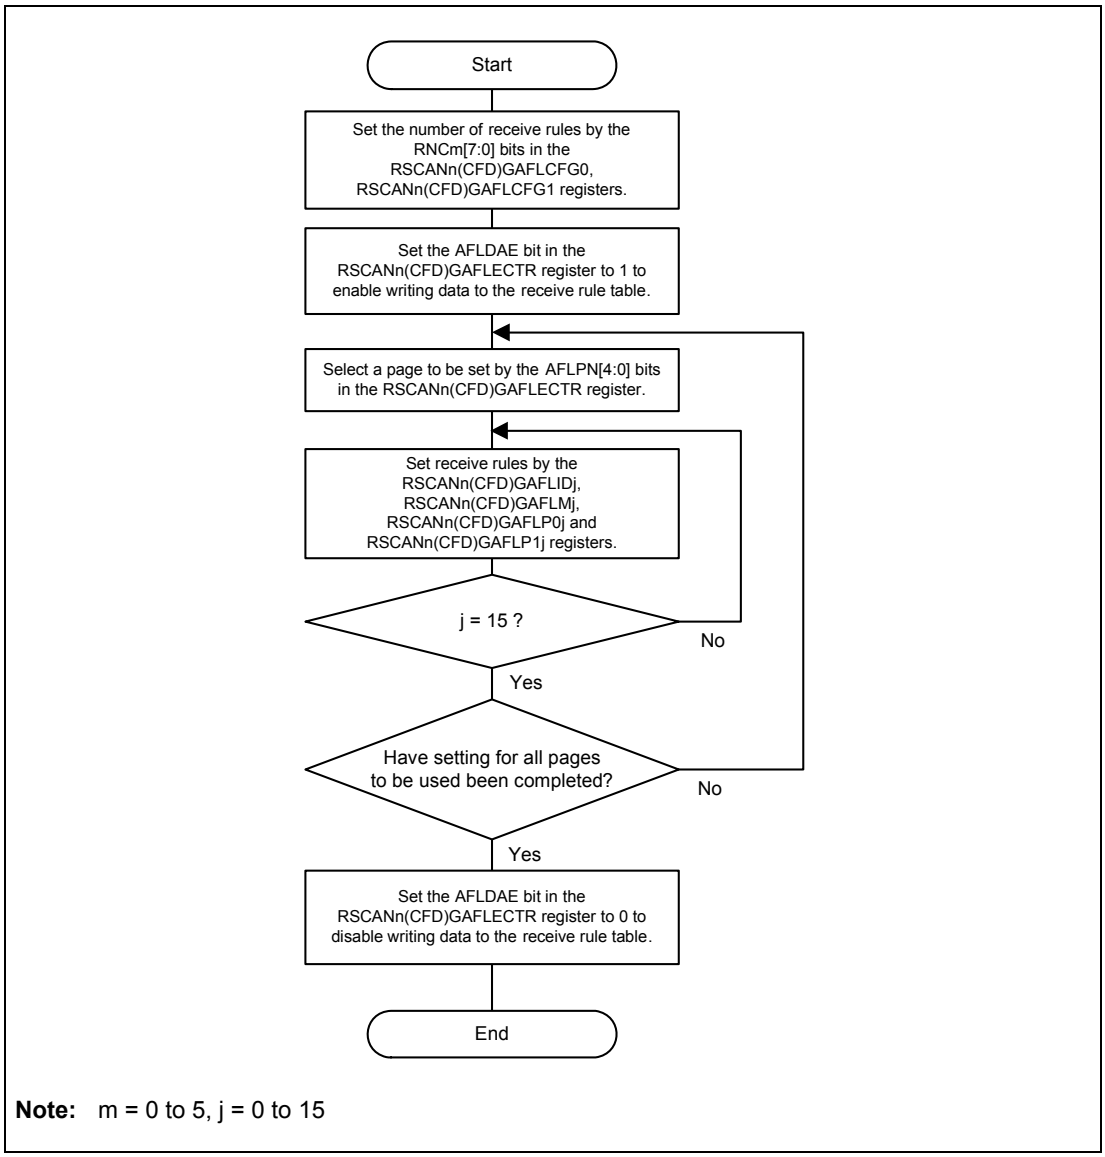
Table 21.187 Example of Communication Speed Setting (Nominal Bit Rate and Data Bit Rate in CAN FD Mode)

fCAN / Communication Speed	40 MHz	20 MHz
Nominal bit rate 1 Mbps Data bit rate 5 Mbps	Nominal bit rate 40 Tq (1) Data bit rate 8 Tq (1)	None
Nominal bit rate 500 kbps Data bit rate 2 Mbps	Nominal bit rate 80 Tq (1) Data bit rate 20 Tq (1)	Nominal bit rate 40 Tq (1) Data bit rate 10 Tq (1)



Note: Values in ( ) are baud rate prescaler division values.

21.11.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 23 (for 6-channel unit) by the AFLPN[4:0] bits in the RSCANn(CFD)GAFLECTR register. Set receive rule table write enable/ disable using the AFLDAE bit.

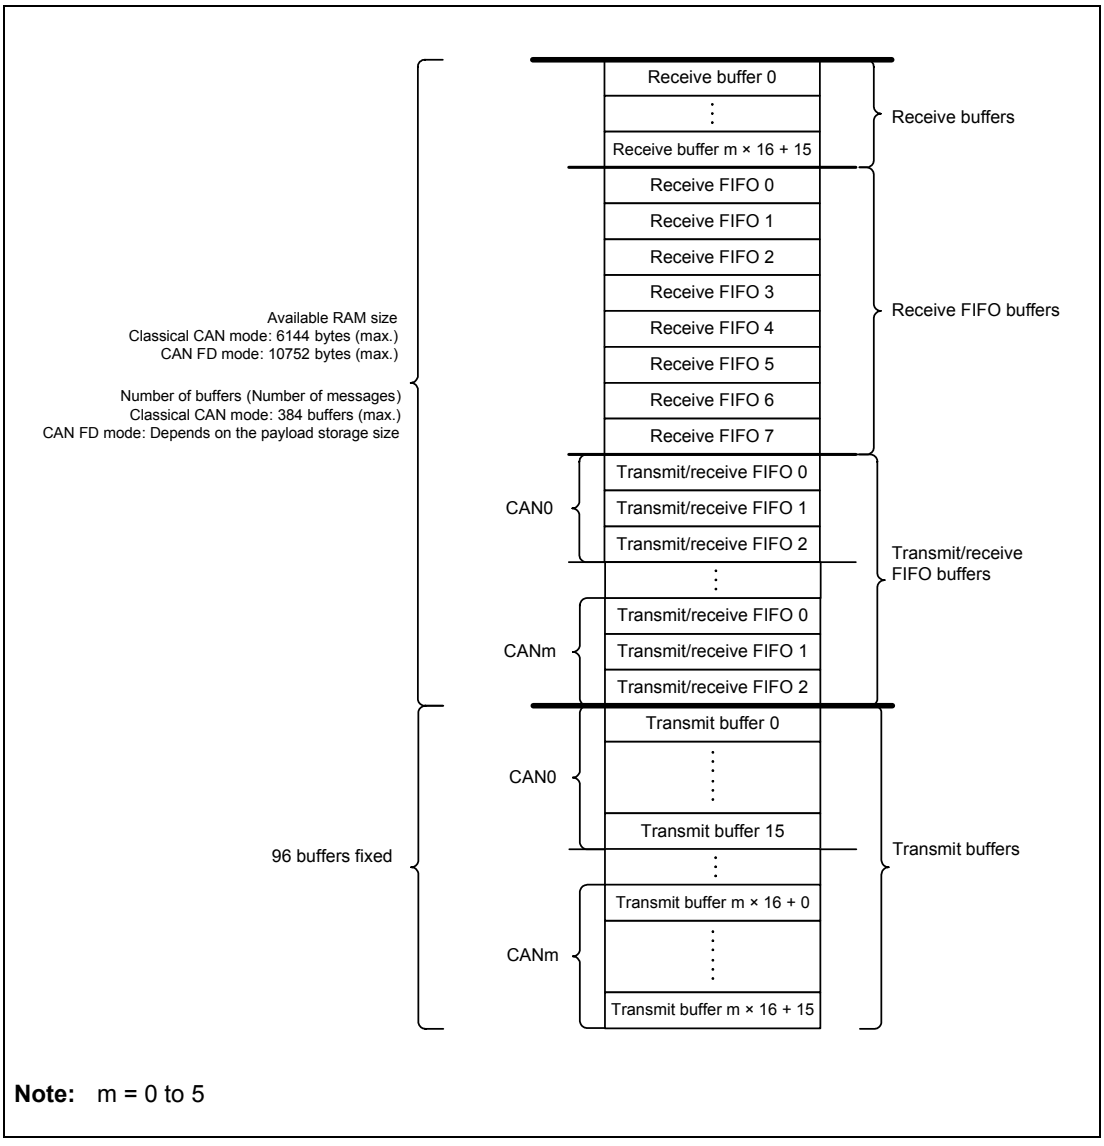
Figure 21.19 shows the receive rule setting procedure.

Note: m = 0 to 5, j = 0 to 15

Figure 21.19 Receive Rule Setting Procedure

21.11.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. Also set the payload storage size for CAN FD mode. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.



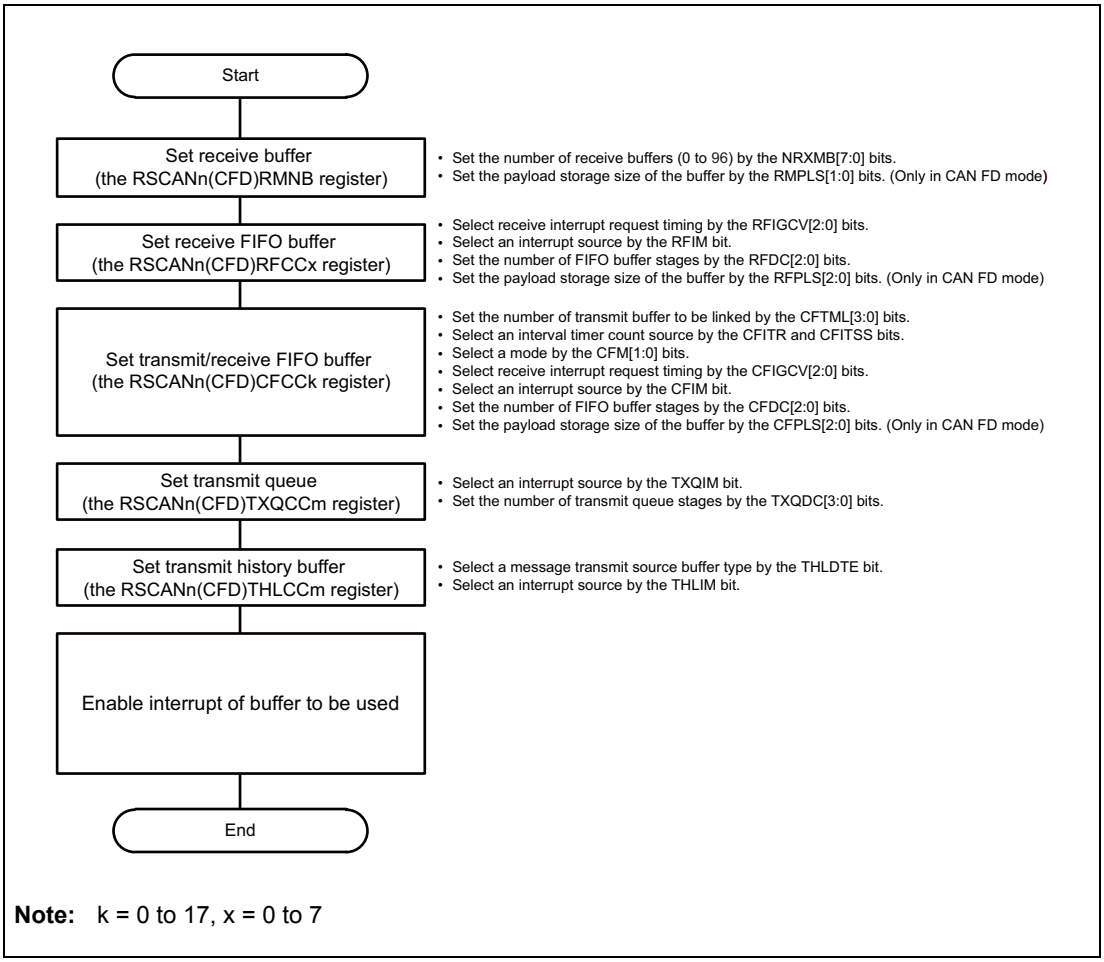
In classical CAN mode, up to 6144 bytes of the RAM can be used in receive buffers and FIFO buffers. Up to 384 buffers are available, and 16 bytes are used per buffer. Configure the buffers so that the following conditions are met.

Number of receive buffers + total number of depth of receive FIFO buffers x + total number of depth of transmit/receive FIFO buffers k ≤ 384 buffers

In CAN FD mode, up to 10752 bytes of the RAM can be used in receive buffers and FIFO buffers. Configure the buffers so that the following conditions are met.

Number of receive buffers × (12 + payload storage size) + total of (number of depth × (12 + payload storage size)) of receive FIFO buffers x + total of (number of depth × (12 + payload storage size)) of transmit/receive FIFO buffers k ≤ 10752 bytes

Figure 21.20 shows the buffer configuration. **Figure 21.21** shows the buffer setting procedure.



Note: m = 0 to 5

Figure 21.20 Buffer Configuration

CAUTION

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.

Note: k = 0 to 17, x = 0 to 7

Figure 21.21 Buffer Setting Procedure

21.11.1.6 Transmitter Delay Compensation (Only in CAN FD Mode)

A high baud rate is used in CAN FD mode. Transmitter delay compensation is provided as a function to accept propagation delay in this case.

To use this function, set the TDCE bit in the RSCFDnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the SSP timing equals the total value of the delay measured by the RS-CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of Tq.) Usually, the TDCO[6:0] value must be equal to SS + TSEG1, the sample point timing.

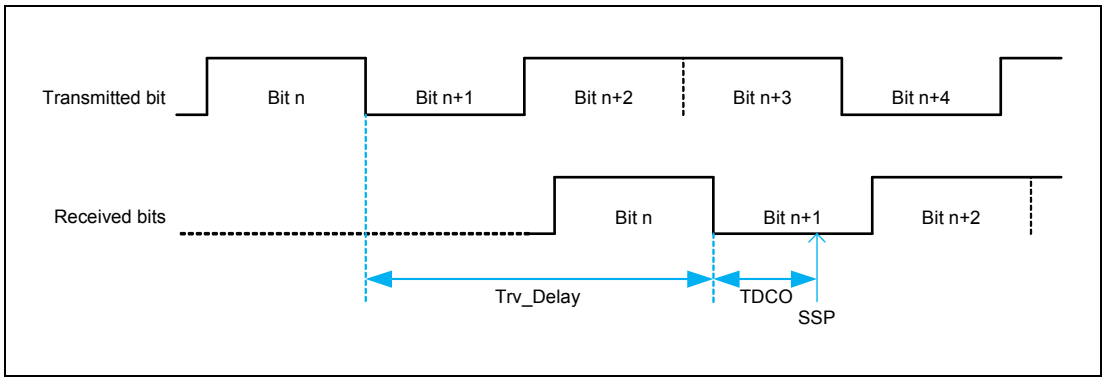


Figure 21.22 SSP timing

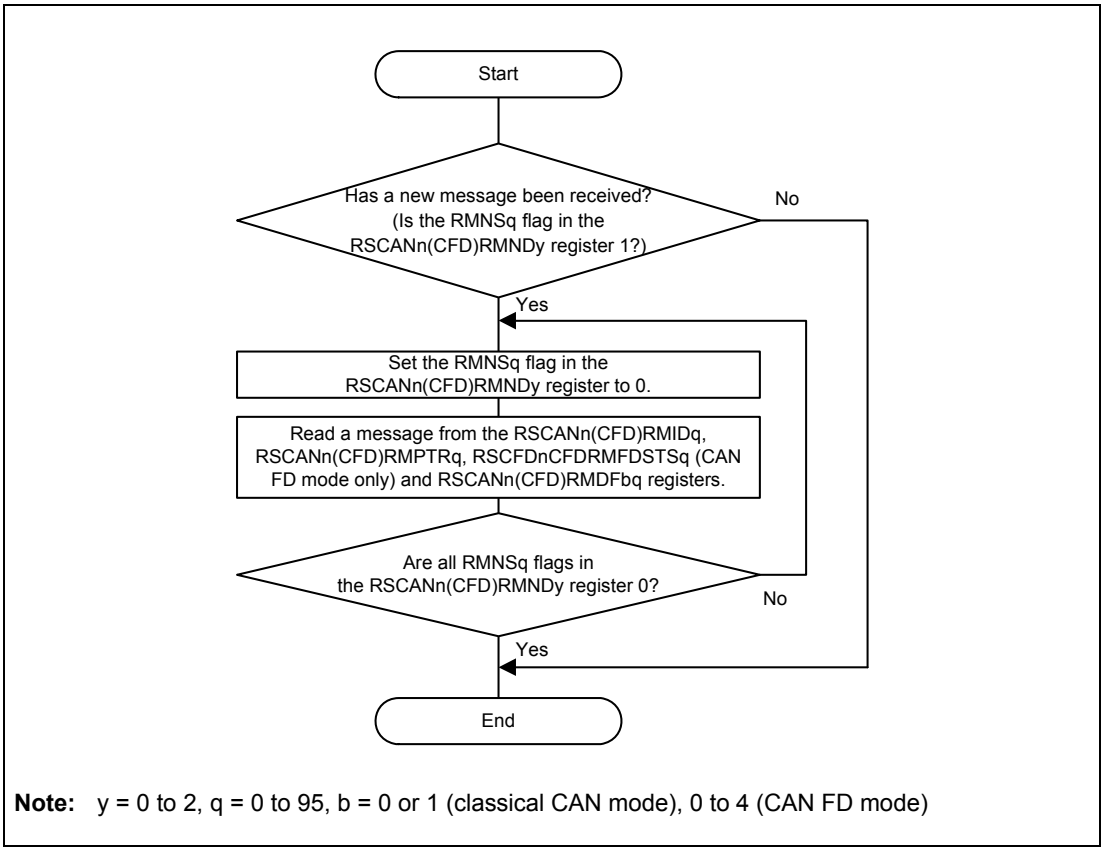
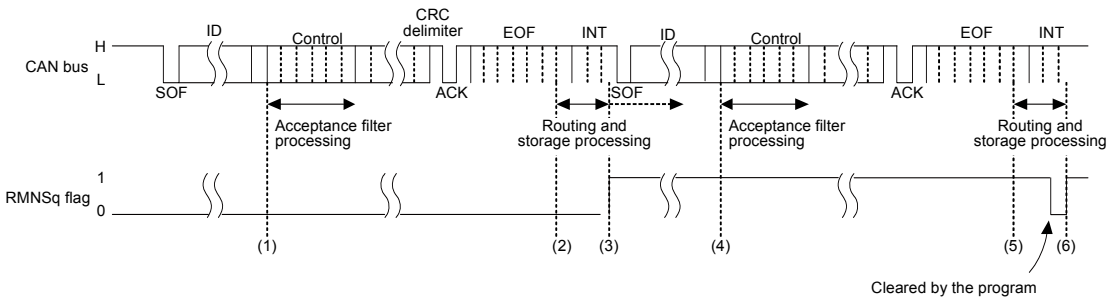
When the TDCOC bit is 1, the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RSCFDnCFDCmDCFG register is larger than 0, the TDCO[6:0] value is also rounded off to the nearest integer of Tq.)



The RS-CANFD module compensates a delay up to (3 CANm bit time - 2 Tq). (CANm bit time is data bit rate values.)

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

21.11.2 Reception Procedure



21.11.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCANn(CFD)RMNDy register (y = 0 to 2, q = 0 to 95) is set to 1 (receive buffer q contains a new message). Messages can be read from registers RSCANn(CFD)RMIDq, RSCANn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq (only in CAN FD mode), and RSCANn(CFD)RMDFbq (b = 0 or 1 in classical CAN mode, b = 0 to 4 in CAN FD mode). **Figure 21.23** shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RSCANn(CFD)RMIDq, RSCANn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCANn(CFD)RMDFbq.

Note: y = 0 to 2, q = 0 to 95, b = 0 or 1 (classical CAN mode), 0 to 4 (CAN FD mode)

Figure 21.23 Receive Buffer Reading Procedure

Note: y = 0 to 2, q = 0 to 95
RMNSq: Flag in the RSCANn(CFD)RMNDy register

Figure 21.24 Receive Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

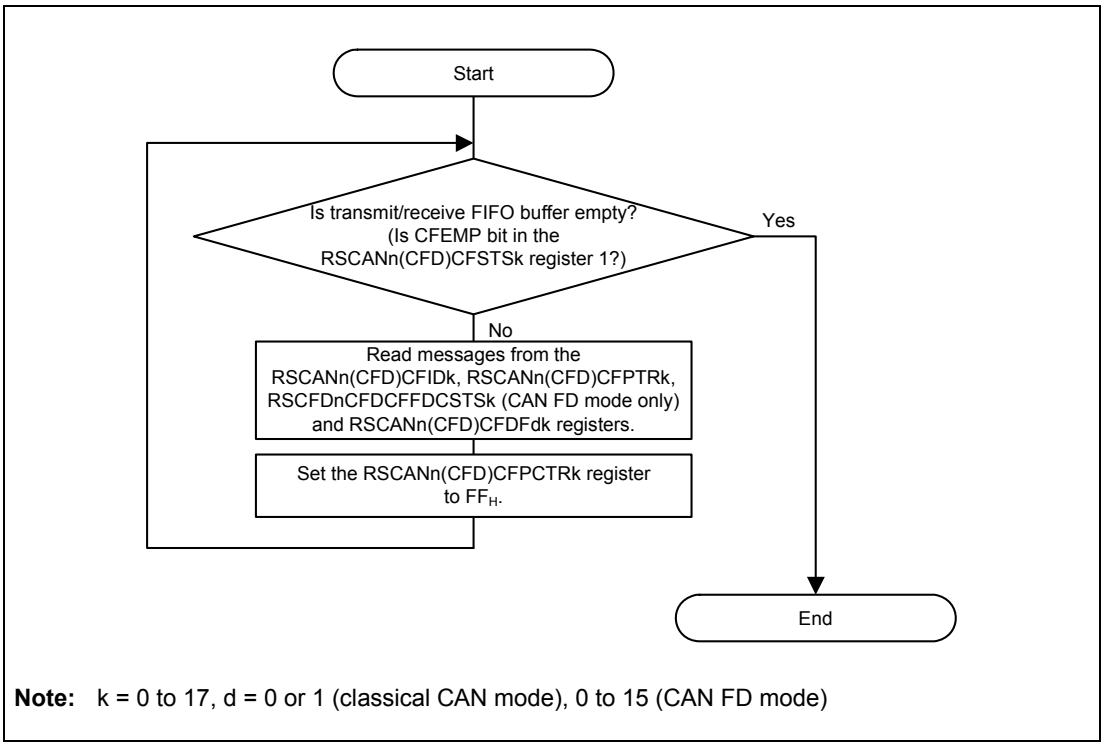
(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCANn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCANn(CFD)RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCANn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.



21.11.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCANn(CFD)RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCANn(CFD)CFSTSk register (k = 0 to 17)) is incremented. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCANn(CFD)RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCANn(CFD)CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCANn(CFD)RFIDx, RSCANn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx (only in CAN FD mode), and RSCANn(CFD)RFDFdx (d = 0 or 1 in classical CAN mode, d = 0 to 15 in CAN FD mode) registers for receive FIFO buffers, or from the RSCANn(CFD)CFIDk, RSCANn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk (only in CAN FD mode), and RSCANn(CFD)CFDFdk registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

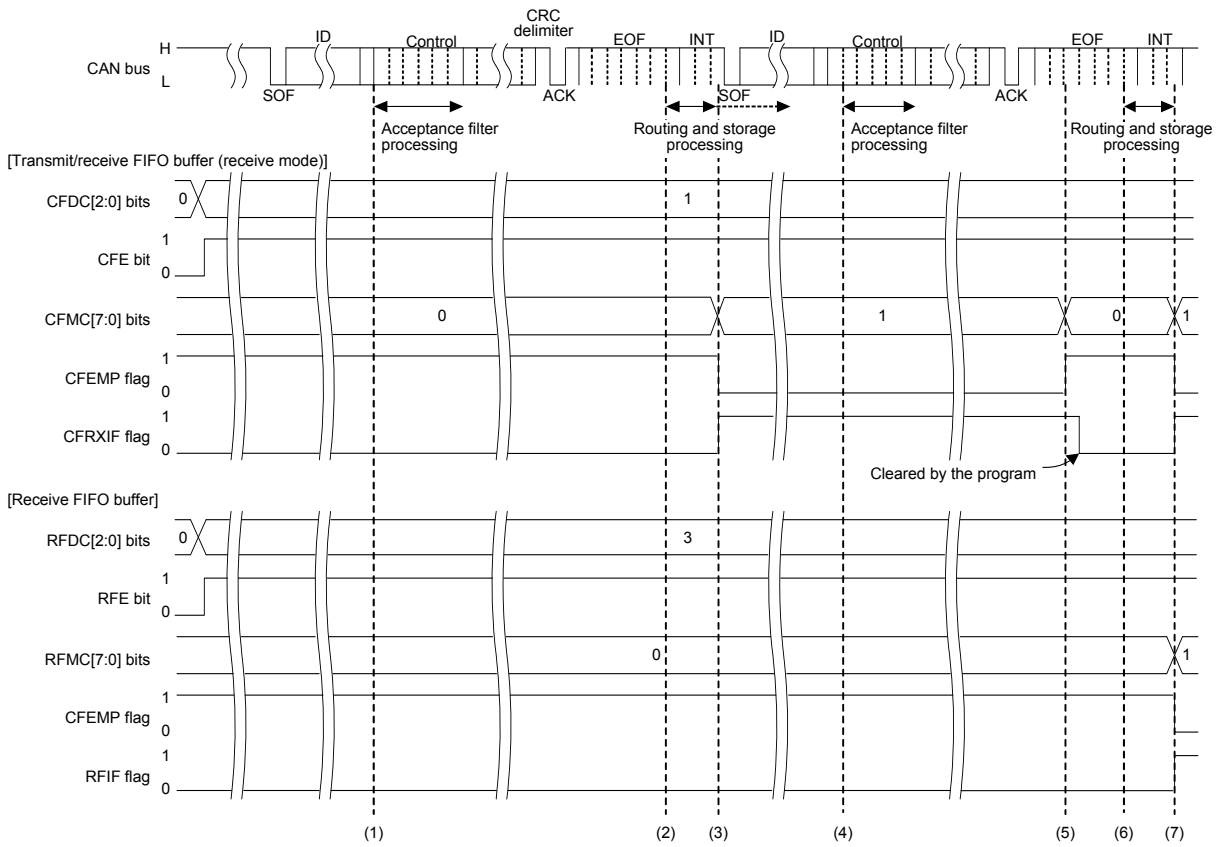
When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCANn(CFD)RFCCx register or the CFDC[2:0] bits in the RSCANn(CFD)CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCANn(CFD)RFSTSx register or the CFEMP flag in the RSCANn(CFD)CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCANn(CFD)RFSTSx register or CFRXIF flag in the RSCANn(CFD)CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.

Note: k = 0 to 17, d = 0 or 1 (classical CAN mode), 0 to 15 (CAN FD mode)

Figure 21.25 Transmit/Receive FIFO Buffer Reading Procedure



When reading a message in CAN FD mode, do not read the RSCFDnCFDRFDFd_x or RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 21.188 Payload Storage Area of Receive FIFO Buffer

RFPLS[2:0] Setting Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF1_x
001_B	12 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF2_x
010_B	16 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF3_x
011_B	20 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF4_x
100_B	24 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF5_x
101_B	32 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF7_x
110_B	48 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF11_x
111_B	64 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF15_x

Table 21.189 Payload Storage Area of Transmit/Receive FIFO Buffer

CFPLS[2:0] Setting Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001_B	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010_B	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011_B	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100_B	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101_B	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110_B	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k

CFDC[2:0], CFE: Bits in the RSCANn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFRXIF: Flags in the RSCANn(CFD)CFSTSk register
RFDC[2:0], RFE: Bits in the RSCANn(CFD)RFCCx register
RFMC[7:0], CFEMP, RFIF: Flags in the RSCANn(CFD)RFSTSx register

Note: k = 0 to 17, x = 0 to 7

Figure 21.26 FIFO Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCANn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCANn(CFD)CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCANn(CFD)CFCCk register is 001_B or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCANn(CFD)CFSTSk register is incremented and becomes 01_H. When the CFIM bit in the RSCANn(CFD)CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCANn(CFD)CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCANn(CFD)CFIDk, RSCANn(CFD)CFPTRk, and RSCANn(CFD)CFDFdk registers and write FF_H to the RSCANn(CFD)CFPCTRk register. This causes the CFMC[7:0] bits in the RSCANn(CFD)CFSTSk register to be decremented. When CFMC[7:0] becomes 00_H, the CFEMP flag in the RSCANn(CFD)CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCANn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001_B or more. The CFMC[7:0] bit value is incremented by 1 to be 01_H. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCANn(CFD)RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCANn(CFD)RFCCx register are set to 001_B or more. The RFMC[7:0] bits in the RSCANn(CFD)RFSTSx register are set to 01_H by being incremented by 1. When the RFIM bit in the RSCANn(CFD)RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCANn(CFD)RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

21.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer

In CAN FD mode, the following FIFO buffers can be read by DMA transfer.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k allocated to channel m (k = 3 × m, m = 0 to 5)

The DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTC register) can be set at any time. However, before setting the DMA enable bit to 1 (to enable DMA transfer requests), set the receive interrupt enable bit (RFIE bit in the RSCFDnCFDRFCCx register or CFRXIE bit in the RSCFDnCFDCFCCk register) of related FIFO buffers to 0 (to disable interrupts). When DMA transfer requests are enabled, do not write a value to the FIFO control register (RSCFDnCFDRFCCx register or RSCFDnCFDCFCCk register).

When an unread message is remaining in a DMA transfer-enabled FIFO buffer, a DMA transfer request trigger is generated. Specify the FIFO access register address for the transfer source address, and adjust the transfer size so that data can be read to the end of the payload storage area with a single trigger. The end of the payload storage area depends on the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

After the end of the payload stored in the FIFO buffer has been read, the RFMC[7:0] value in the RSCFDnCFDRFSTSx register or the CFMC[7:0] value in the RSCFDnCFDCFSTSk register is automatically decremented. After that, if an unread message is remaining in the FIFO buffer, a trigger is generated again.

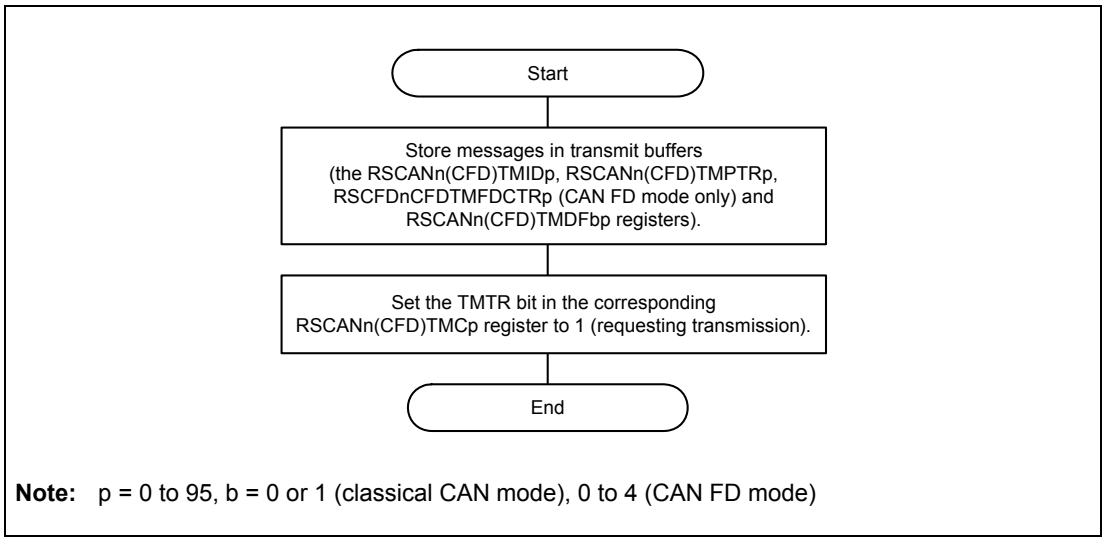
When the RFDMAEx or CFDMAEm bit is set to 0 (to disable DMA transfer requests) during DMA transfer, wait until the DMA transfer status (RFDMASTSx or CFDMASTSm bit in the RSCFDnCFDCDTSTS register) is cleared to 0 (not in DMA transfer processing), and then start the next processing (enabling DMA transfer again etc.). When disabling DMA transfer, examine how to process a message remaining in the FIFO buffer and a newly arriving message. When the FIFO buffer is enabled, it continues to receive messages.

21.11.3 Transmission Procedure

21.11.3.1 Procedure for Transmission from Transmit Buffers

Figure 21.27 shows the procedure for transmission from transmit buffers.

Figure 21.28 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 21.29** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.



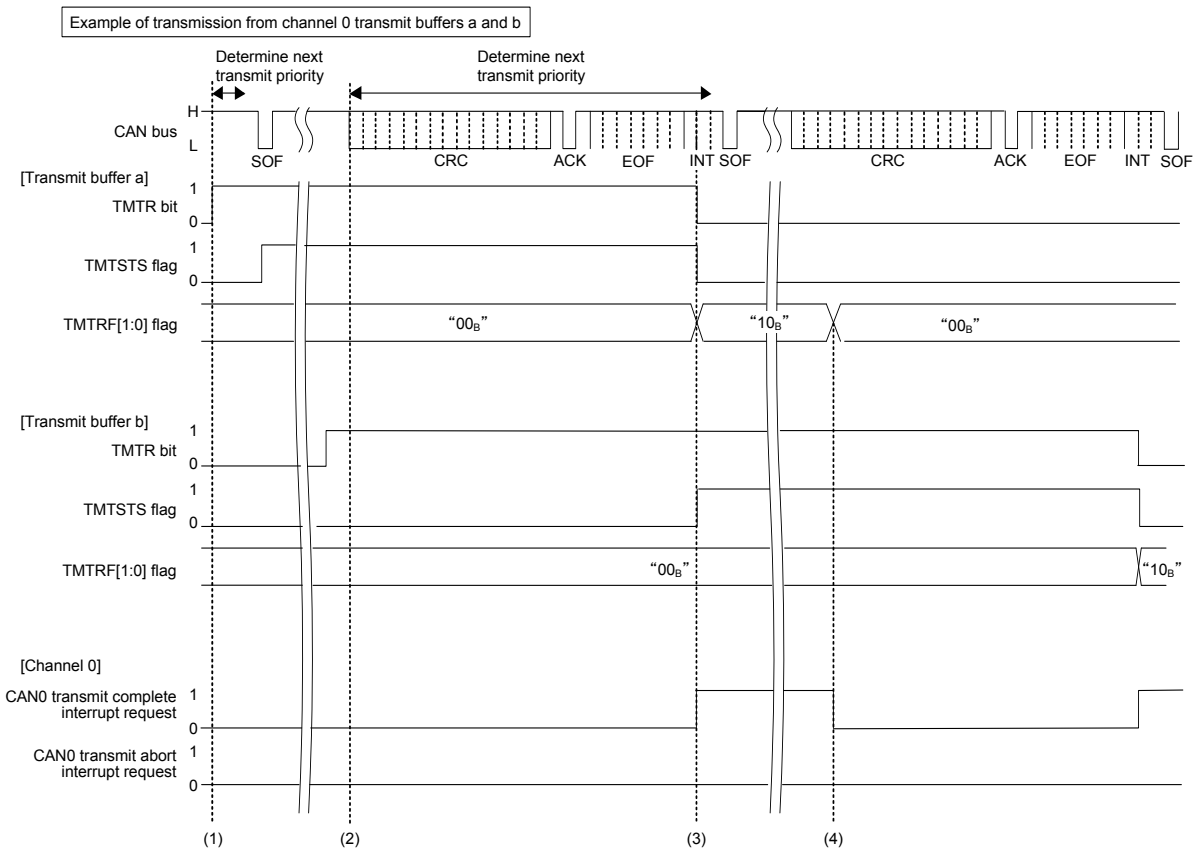


Figure 21.27 Procedure for Transmission from Transmit Buffers

In CAN FD mode and transmit buffer merge mode, messages with a payload size of more than 20 bytes can be transmitted from transmit buffers (16 × m) + 0 and transmit buffers (16 × m) + 3. At this time, transmit buffers (16 × m) + 1 to (16 × m) + 2 and transmit buffers (16 × m) + 4 to (16 × m) + 5 are allocated as a payload storage area. Registers RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, and RSCFDnCFDTMFDCTRp corresponding to these buffers can be used as data field registers that can store 4-byte data bytes (payload) like the RSCFDnCFDTMDFb_p register. **Table 21.190** shows message storage registers when transmitting a message with a payload size of more than 20 bytes from transmit buffer 0.

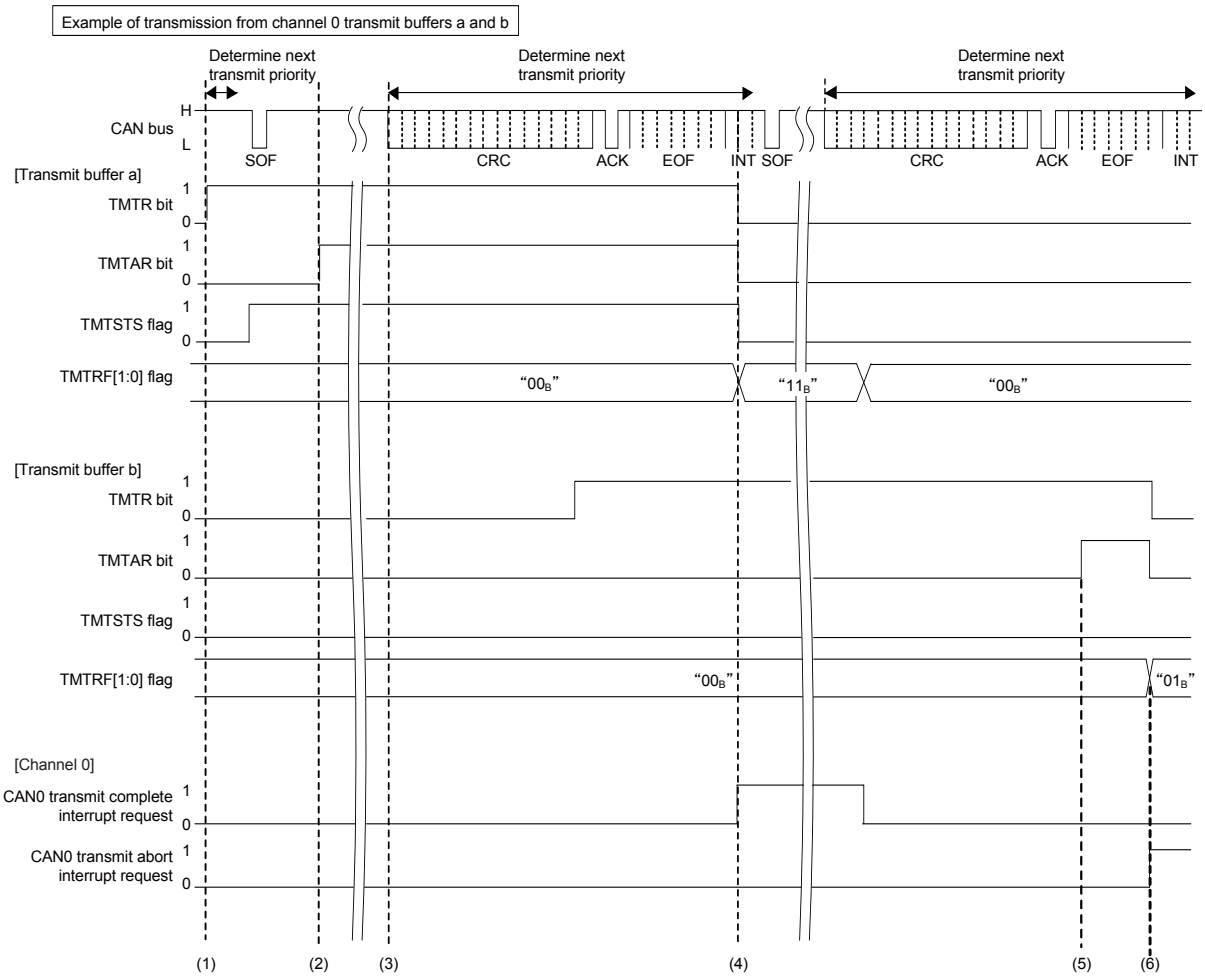
Table 21.190 Message Storage Registers in Transmit Buffer Merge Mode (Example of Transmit Buffer 0)

Transmit Buffer	Offset from Base Address	Symbol	Register Function in Transmit Buffer Merge Mode
Transmit buffer 0	4000_H	RSCFDnCFDTMID0	Transmit buffer 0 ID data, transmit history data store enable bit, RTR bit,and IDE bit
	4004_H	RSCFDnCFDTMPTR0	Transmit buffer 0 label data and DLC data
	4008_H	RSCFDnCFDTMFDCTR0	Transmit buffer 0 ESI bit, BRS bit, and FDF bit
	$400C_H$ to $401C_H$	RSCFDnCFDTMDF0_0 to RSCFDnCFDTMDF4_0	Transmit buffer 0 data bytes 0, 1, 2, and 3 to transmit buffer 0 data bytes 16, 17, 18, and 19
Transmit buffer 1	4020_H	RSCFDnCFDTMID1	Transmit buffer 0 data bytes 20, 21, 22, and 23
	4024_H	RSCFDnCFDTMPTR1	Transmit buffer 0 data bytes 24, 25, 26, and 27
	4028_H	RSCFDnCFDTMFDCTR1	Transmit buffer 0 data bytes 28, 29, 30, and 31
	$402C_H$ to $403C_H$	RSCFDnCFDTMDF0_1 to RSCFDnCFDTMDF4_1	Transmit buffer 0 data bytes 32, 33, 34, and 35 to transmit buffer 0 data bytes 48, 49, 50, and 51
Transmit buffer 2	4040_H	RSCFDnCFDTMID2	Transmit buffer 0 data bytes 52, 53, 54, and 55
	4044_H	RSCFDnCFDTMPTR2	Transmit buffer 0 data bytes 56, 57, 58, and 59
	4048_H	RSCFDnCFDTMFDCTR2	Transmit buffer 0 data bytes 60, 61, 62, and 63
	$404C_H$ to $405C_H$	RSCFDnCFDTMDF0_2 to RSCFDnCFDTMDF4_2	Not used

Note: a = 0 to 15, b = 0 to 15
TMTR: Bit in the RSCANn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCANn(CFD)TMSTSp registers

Figure 21.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) When the TMTR bit in the RSCANn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCANn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.



(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCANn(CFD)TMSTSa register is set to 10_B (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCANn(CFD)TMCa register are cleared to 0. When the TMIEa bit in the RSCANn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to 00_B. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00_B.

If an arbitration-lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (in classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1).

Note: a = 0 to 15, b = 0 to 15
TMTR, TMTAR: Bits in the RSCANn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCANn(CFD)TMSTSp register

Figure 21.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) When the TMTR bit in the RSCANn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCANn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

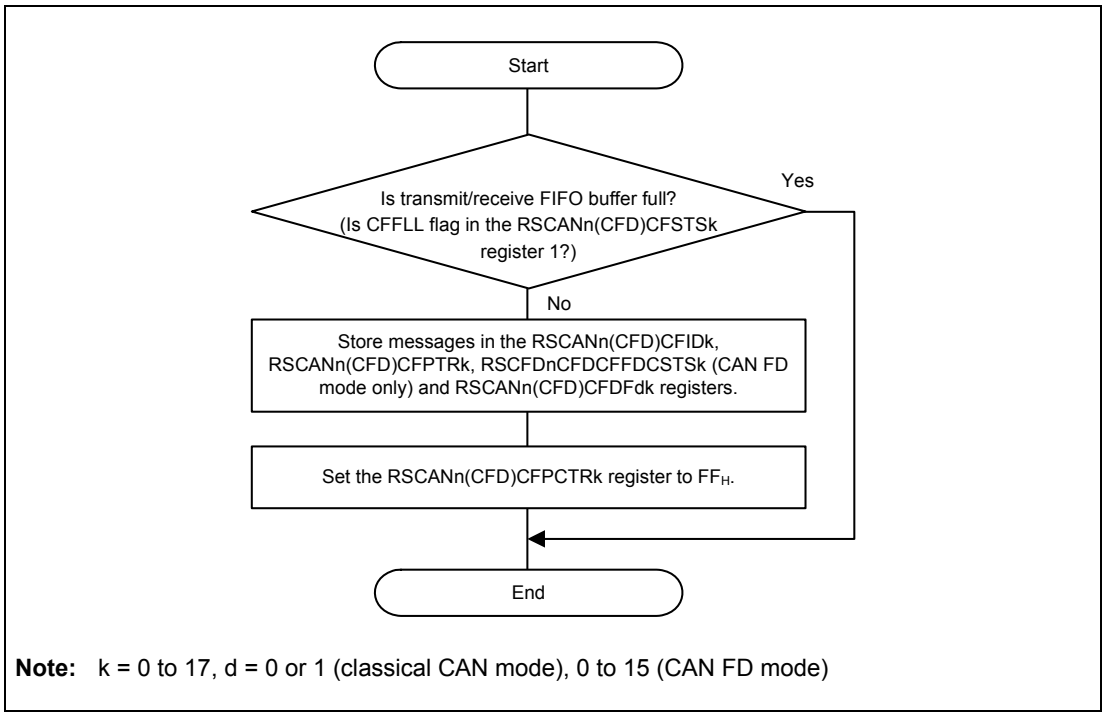
(2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts at the first bit of the CRC field for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCANn(CFD)TMSTSa register is set to 11_B (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCANn(CFD)TMCa register are cleared to 0. When the TMIEa value in the RSCANn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01_B. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01_B. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCANn(CFD)CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B.



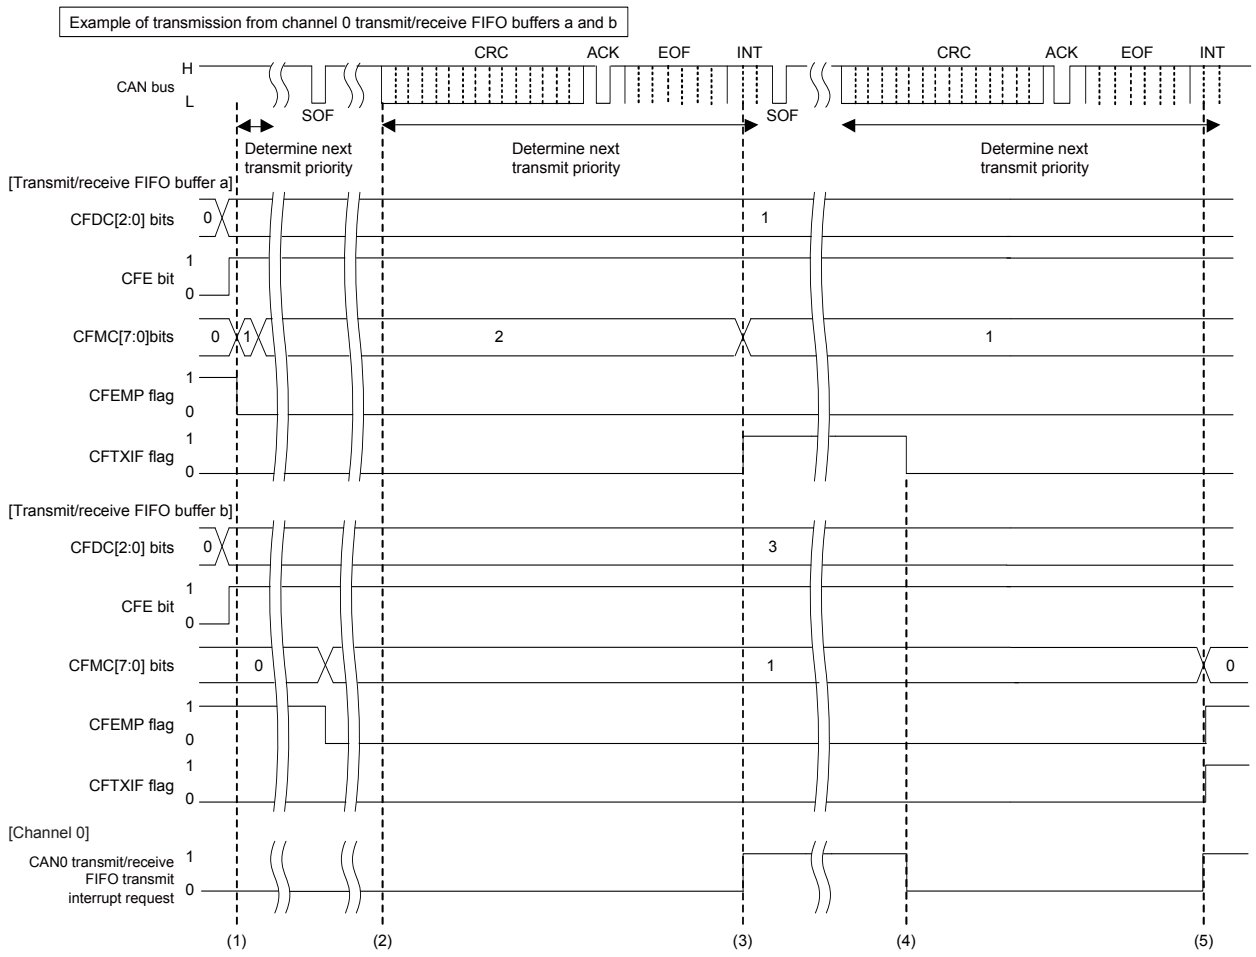
If an arbitration loss has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (in classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1).

21.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure 21.30 shows the procedure for transmission from transmit/receive FIFO buffers.

Figure 21.31 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 21.32** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.



Note: k = 0 to 17, d = 0 or 1 (classical CAN mode), 0 to 15 (CAN FD mode)

Figure 21.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

When storing a message, do not write a value to the RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 21.191 Payload Storage Area of Transmit/Receive FIFO Buffer

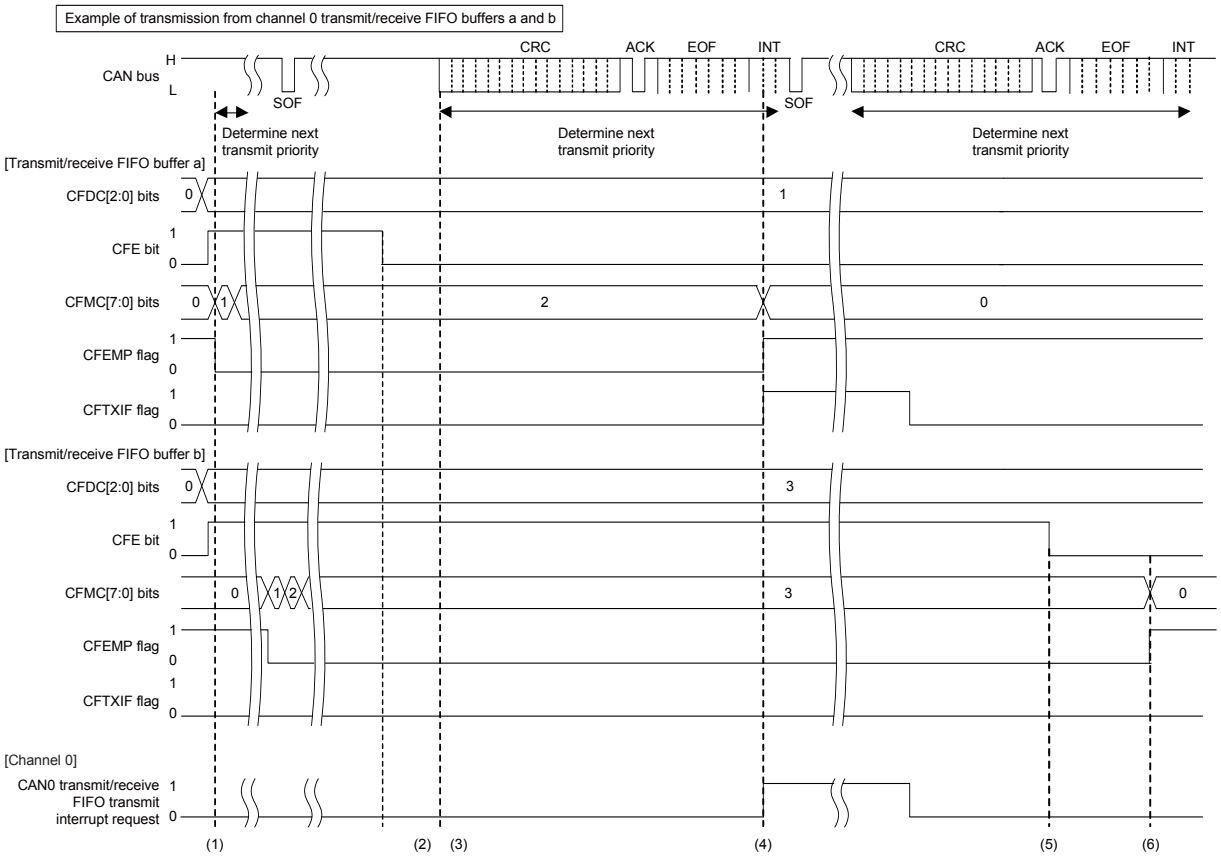
CFPLS[2:0] Setting Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001_B	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010_B	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011_B	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100_B	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101_B	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110_B	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111_B	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k

Note: a = 0 to 2, b = 0 to 2
CFDC[2:0],CFE: Bits in the RSCANn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCANn(CFD)CFSTSk register

Figure 21.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RSCANn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCANn(CFD)CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCANn(CFD)CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.



(3) When transmission completes successfully, the CFMC[7:0] value in the RSCANn(CFD)CFSTSa register is decremented. Setting the CFIM bit in the RSCANn(CFD)CFCCa register to 1 (a FIFO

transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCANn(CFD)CFSTSk register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCANn(CFD)CFSTSb register is decremented. The CFMC[7:0] bits are cleared to 00_H and therefore the CFEMP flag in the RSCANn(CFD)CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCANn(CFD)CFSTSa and RSCANn(CFD)CFSTSb register is set to 1 (the transmit/receive FIFO buffer is full).

Note: a = 0 to 2, b = 0 to 2
CFDC[2:0], CFE: Bits in the RSCANn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCANn(CFD)CFSTSk register

Figure 21.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) While the CAN bus is idle, when the CFE bit in the RSCANn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCANn(CFD)CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCANn(CFD)CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

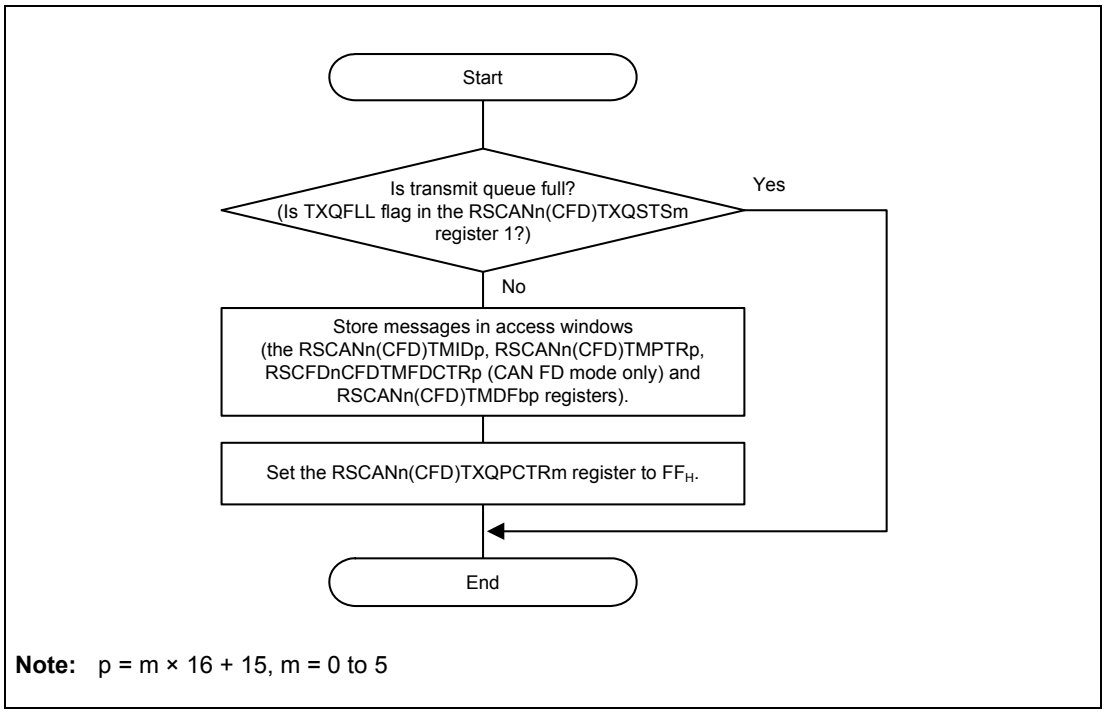
(4) When transmit completes successfully, the CFMC[7:0] value is cleared to 00_H. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCANn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffers cannot be disabled immediately even if the CFE bit in the RSCANn(CFD)CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCANn(CFD)CFSTSb register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffers are disabled and the CFMC[7:0] bits in the RSCANn(CFD)CFSTSb register are cleared to 00_H and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer is immediately disabled. (The CFMC[7:0] bits are cleared to 00_H and the CFEMP flag is set to 1.)

21.11.3.3 Procedure for Transmission from the Transmit Queue

Figure 21.33 shows the procedure for transmission from the transmit queue.



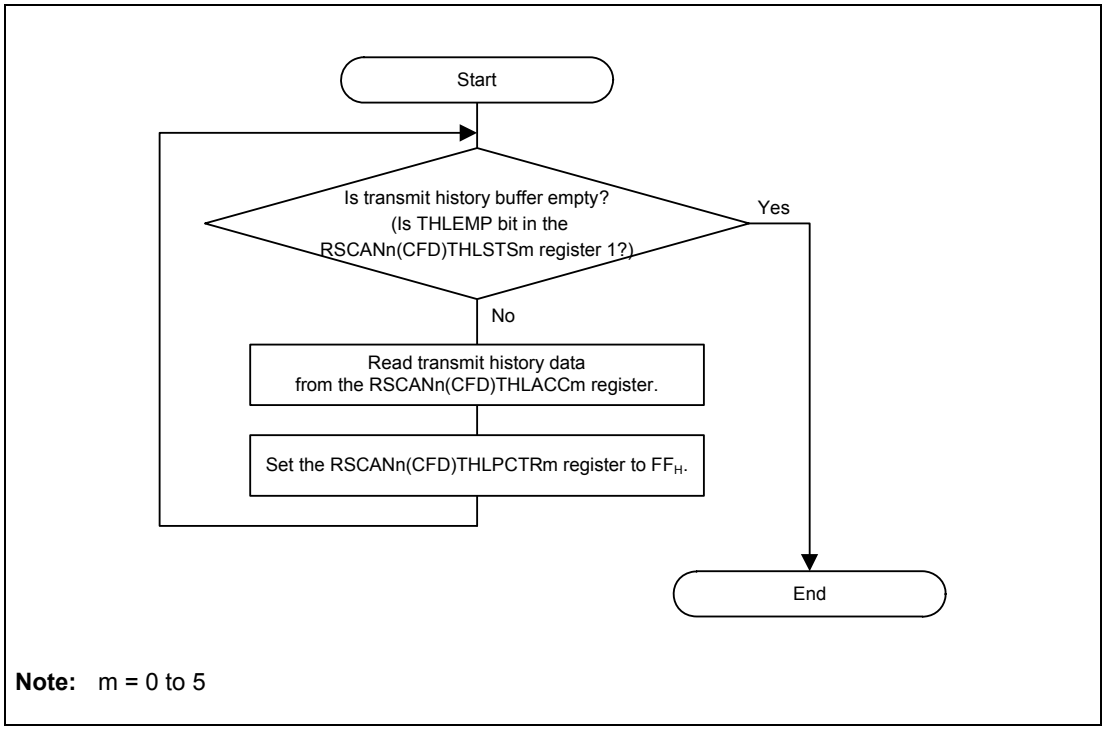


Figure 21.33 Procedure for Transmission from the Transmit Queue

21.11.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCANn(CFD)THLACCm register. The next data can be accessed by writing FF_H to the corresponding RSCANn(CFD)THLPCTRm register (m = 0 to 5) after reading a set of data. **Figure 21.34** shows the transmit history buffer reading procedure.

Note: m = 0 to 5

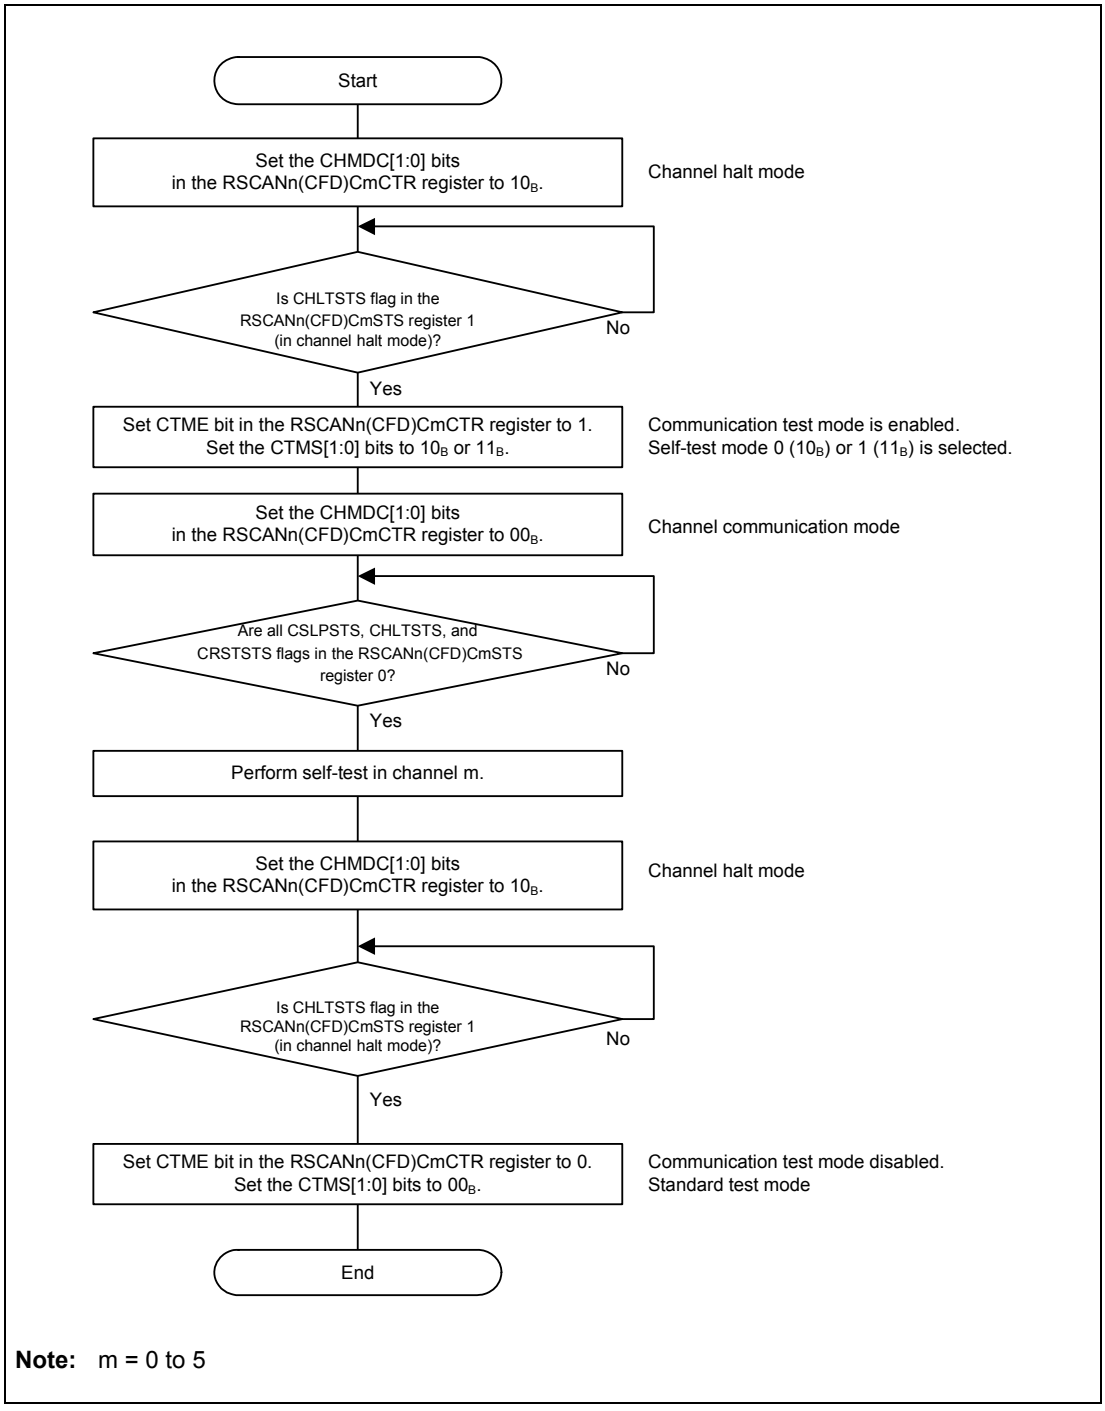

Figure 21.34 Transmit History Buffer Reading Procedure

21.11.4 Test Settings

21.11.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

Figure 21.35 shows the self-test mode setting procedure.

Note: m = 0 to 5

Figure 21.35 Self-Test Mode Setting Procedure

21.11.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 21.192** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCANn(CFD)GLOCKK register, then set the target test function bit to 1.

Table 21.192 Protection Release Data for Test Function

Test Function	Protection Release Data 1	Protection Release Data 2	Target Bit
RAM test	7575_H	$8A8A_H$	RTME bit in the RSCANn(CFD)GTSTCTR register

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. **Figure 21.36** shows the procedure for releasing the protection.

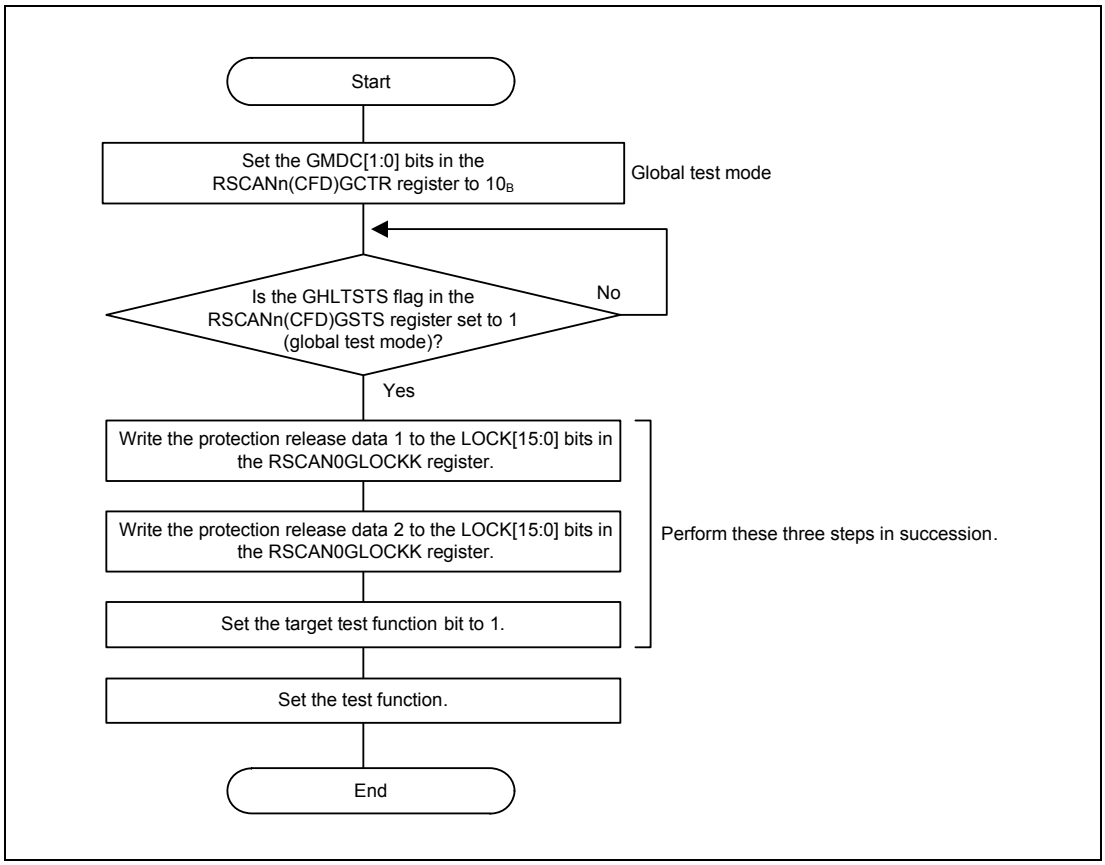

Figure 21.36 Protection Release Procedure

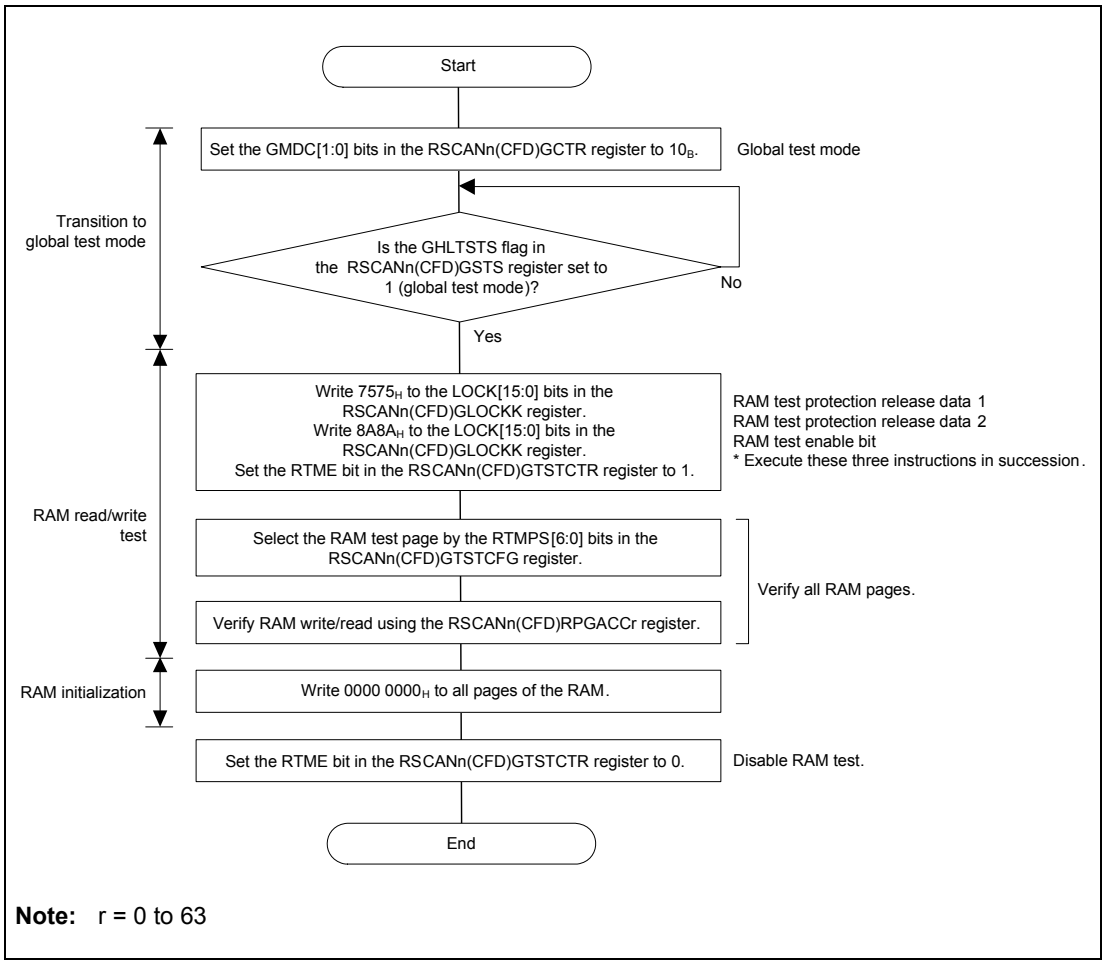
21.11.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write 0000 0000_H to all pages of the CAN RAM.

Figure 21.37 shows the RAM test setting procedure.



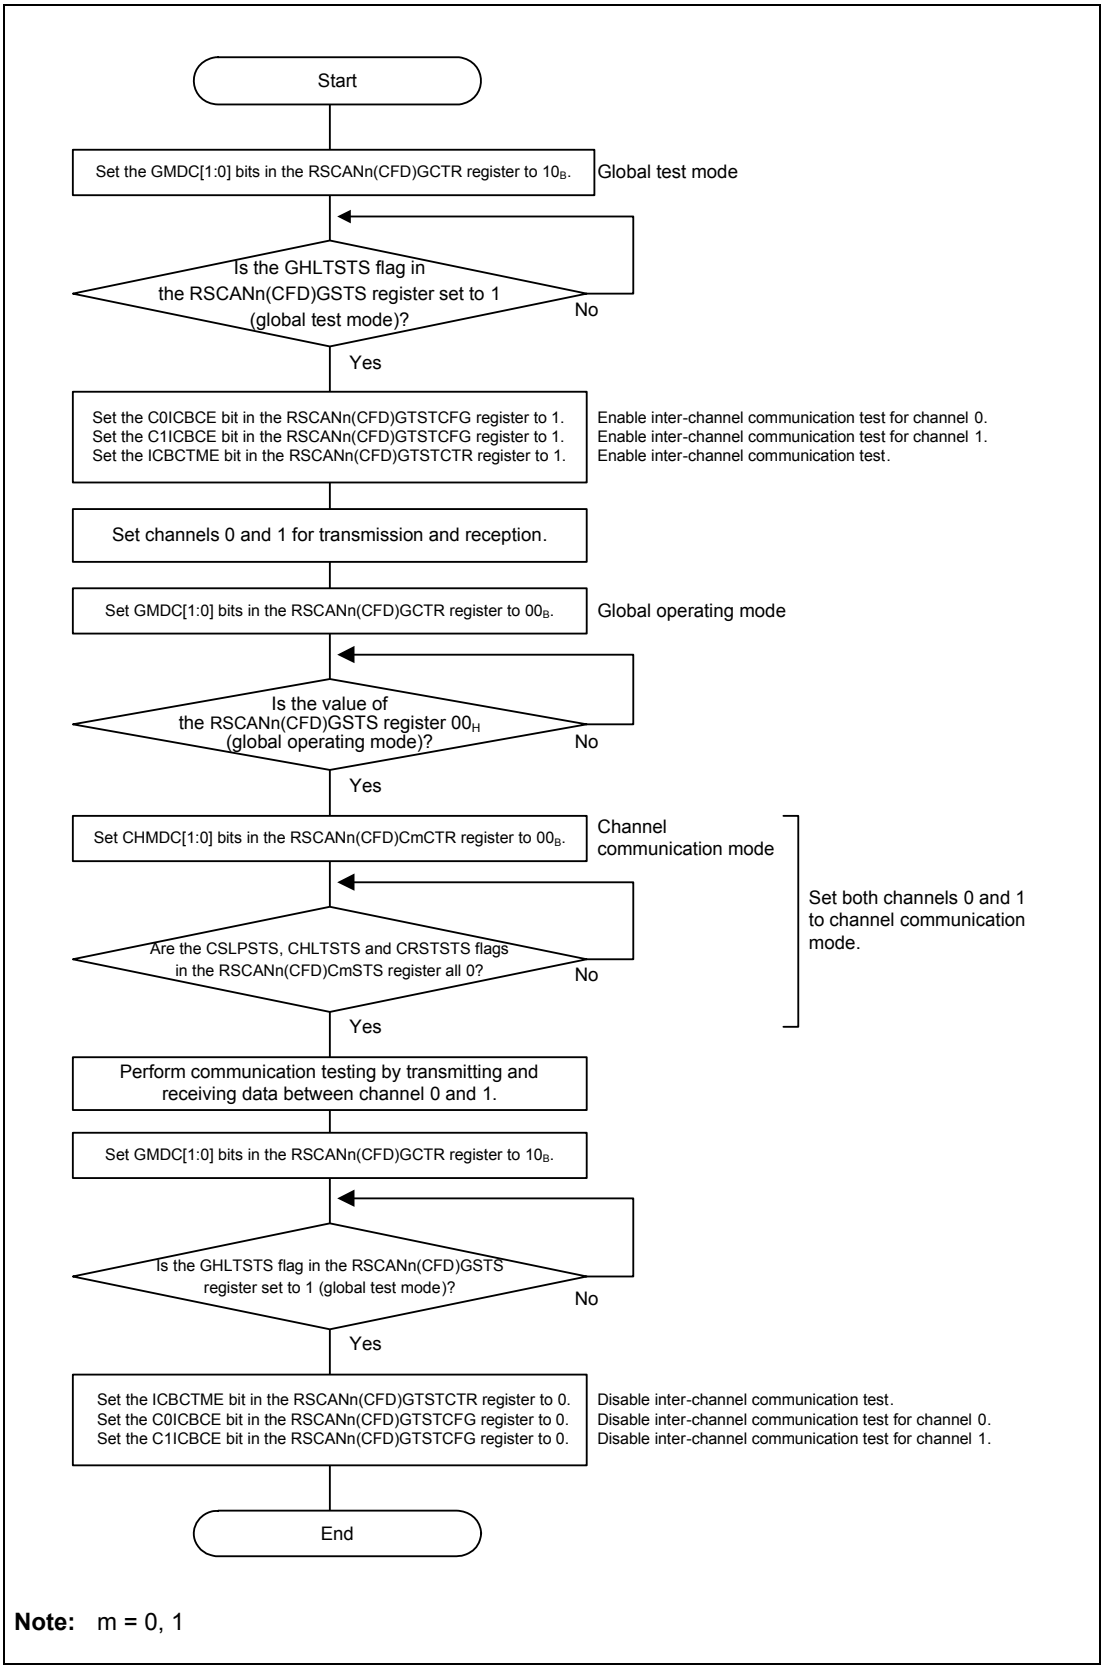


Figure 21.37 RAM Test Setting Procedure

21.11.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

Figure 21.38 shows the inter-channel communication test setting procedure.

Note: m = 0, 1

Figure 21.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

21.12 Detection and Correction of Errors in RS-CAN0 RAM

21.12.1 ECC for the RSCAN0 RAM

Table 21.193 gives an outline of the ECC functions for the RSCAN0 RAM.

Table 21.193 List of the ECC Functions for the RSCAN0 RAM

Item	Outline of Functions
ECC error detection/correction	The RAM is checked for ECC errors. The following options can be selected. • 2-bit error detection and 1-bit error detection/correction • 2-bit error detection and 1-bit error detection The ECC error detection/correction can be disabled by using through mode. With the initial settings, error detection/correction is enabled.
Error notification	When an ECC error has occurred, the error is notified. • Error notification can be enabled or disabled when an ECC 2-bit error is detected. • Error notification can be enabled or disabled when an ECC 1-bit error is detected. In the initial setting, 2-bit error notification is enabled and 1-bit error notification is disabled. However, when the interrupt is masked by the FEINTFMSK register, interrupt processing is not performed.
Error status	Monitoring for the detection of two-bit ECC errors and for the detection of one-bit ECC errors is available. A register for clearing the error status is provided.
Address capture	Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error , and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).

CAUTION

When ECC error detection/correction is performed, confirm initialization of the RSCAN0 RAM (RSCAN0(CFD)GSTS.GRAMINIT = 0) before it is used.

21.12.2 Interrupt Request

Table 21.194 lists the ECC interrupt request of RSCANn RAM.

Table 21.194 RS-CAN0 ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Bit Name	Outline	Name	DMA Trigger Number
ECCDCNRAM0FEIF	RS-CAN0 ECC error interrupt	INTECCDCNRAM0	—

21.12.3 List of ECC Registers

Table 21.195 ECC Registers

Module	Register	Symbol	Address	Guard Group
RS-CAN0 ECC Register (for MB RAM)				
ECCCAN00	ECC Control Register	ECCRCAN0CTL_PHY1	<ECCCAN0_base > + 00_H	ECCCAN0 PHY1
	ECC Test Mode Control Register	ECCRCAN0TMC_PHY1	<ECCCAN0_base > + 04_H	ECCCAN0 PHY1
	ECC Encode/Decode Input/Output Replacement Test Register	ECCRCAN0TED_PHY1	<ECCCAN0_base > + $0C_H$	ECCCAN0 PHY1
	ECC Redundant Bit Data Control Test Register	ECCRCAN0TRC_PHY1	<ECCCAN0_base > + 08_H	ECCCAN0 PHY1
	ECC Decode Syndrome Data Register in ECCRCAN0TRC	ECCRCAN0SYND_PHY1	<ECCCAN0_base > + $0B_H$	ECCCAN0 PHY1
	ECC 7-Bit Redundant Bit Data Hold Test Register in ECCRCAN0TRC	ECCRCAN0HORD_PHY1	<ECCCAN0_base > + $0A_H$	ECCCAN0 PHY1
	ECC Encode Test Register in ECCRCAN0TRC	ECCRCAN0ECRD_PHY1	<ECCCAN0_base > + 09_H	ECCCAN0 PHY1
	ECC Redundant Bit Input/Output Replacement Register in ECCRCAN0TRC	ECCRCAN0ERDB_PHY1	<ECCCAN0_base > + 08_H	ECCCAN0 PHY1
	ECC Error Address Register 0	ECCRCAN0AD0_PHY1	<ECCCAN0_base> + 10_H	ECCCAN0 PHY1
RS-CAN0 ECC Register (for AFL RAM)				
ECCCAN01	ECC Control Register	ECCRCANFD0CTL_PHY2	<ECCCANFD0_base > + 00_H	ECCCAN0 PHY2
	ECC Test Mode Control Register	ECCRCANFD0TMC_PHY2	<ECCCANFD0_base > + 04_H	ECCCAN0 PHY2
	ECC Encode/Decode Input/Output Replacement Test Register	ECCRCANFD0TED_PHY2	<ECCCANFD0_base > + $0C_H$	ECCCAN0 PHY2
	ECC Redundant Bit Data Control Test Register	ECCRCANFD0TRC_PHY2	<ECCCANFD0_base > + 08_H	ECCCAN0 PHY2
	ECC Decode Syndrome Data Register in ECCRCANFD0TRC	ECCRCANFD0SYND_PHY2	<ECCCANFD0_base > + $0B_H$	ECCCAN0 PHY2
	ECC 7-Bit Redundant Bit Data Hold Test Register in ECCRCANFD0TRC	ECCRCANFD0HORD_PHY2	<ECCCANFD0_base > + $0A_H$	ECCCAN0 PHY2
	ECC Encode Test Register in ECCRCANFD0TRC	ECCRCANFD0ECRD_PHY2	<ECCCANFD0_base > + 09_H	ECCCAN0 PHY2
	ECC Redundant Bit Input/Output Replacement Register in ECCRCANFD0TRC	ECCRCANFD0ERDB_PHY2	<ECCCANFD0_base > + 08_H	ECCCAN0 PHY2
	ECC Error Address Register 0	ECCRCANFD0AD0_PHY2	<ECCCANFD0_base> + 10_H	ECCCAN0 PHY2

Note: For details about Guard Group, see **Section 33, Functional Safety**.

21.12.4 ECCRCAN0CTL_PHY1/ECCRCANFD0CTL_PHY2 — RSCANn ECC Control Register

The ECCRCAN0CTL_PHY1/ECCRCANFD0CTL_PHY2 register controls the mode of the ECC and the status for RSCAN0.

Bits 7, 5 and 4 should be set (written) while the RSCAN0 operation is stopped. In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01_B.

Access: This register can be read or written in 16-bit units.

Address: <ECCCAN0_base > + 00_H
<ECCCANFD0_base > + 00_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	ECCOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	—
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R	R

Note 1. These bits are always read as 0.

Table 21.196 ECCRCAN0CTL_PHY1/ECCRCANFD0CTL_PHY2 Register Contents (1/2)

Bit Position	Bit Name	Function
15	EMCA1	Access control bits 1 and 0 to ECC mode selection bit These bits specify whether modifying the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 01_B, writing to bit 7 is enabled.
14	EMCA0	
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	ECCOVFF	By detecting an error while the error status is set and the new error has an address different from the one that already latched (not cleared or reset is not issued), this bit is set and error notification is generated.

ECCOVFF	Operation description
0	Overflow has not occurred after reset of clearing ECER2F and ECER1F. Clearing at (1) Reset (2) Writing ECER2C = 1 or ECER1C = 1 (3) Selecting through mode enable (ECTHM = 1)
1	Error address register overflowed.

10	ECER2C	2-bit ECC error detection flag clear bit This bit is used to clear the 2 bit error detection flag of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority.
9	ECER1C	1-bit ECC error correction accumulation flag clear bit This bit is used to clear the 1 bit error detection/correction flag of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority.
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 21.196 ECCRCAN0CTL_PHY1/ECCRCANFD0CTL_PHY2 Register Contents (2/2)

Bit Position	Bit Name	Function
7	ECTHM	ECC function through mode selection bit This bit is used to set enabling and disabling of ECC. Setting this bit to 1 disables ECC function. When writing to this bit, (0, 1) must be written to (EMCA1, EMCA0) at the same time. 0: Through mode is disabled (normal operation mode). 1: Through mode is enabled. (ECC function disable)
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	EC1ECP	1-bit error correction enable bit This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. 0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.
4	EC2EDIC	2-bit error detection interrupt control bit This bit controls whether to generate an interrupt when 2-bit error is detected. 0: When 2-bit error is detected, a INTECCDCNRAMn interrupt will not be generated. 1: When 2-bit error is detected, a INTECCDCNRAMn interrupt will be generated.
3	EC1EDIC	1-bit error detection interrupt control bit This bit controls whether to generate an interrupt when 1-bit error is detected. 0: When 1-bit error is detected, a INTECCDCNRAMn interrupt will not be generated. 1: When 1-bit error is detected, a INTECCDCNRAMn interrupt will be generated.
2	ECER2F	2-bit error detection flag bit This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (INTECCDCNRAMn) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). If 2-bit error is detected again while this bit is set, an interrupt signal will not be generated. 0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred.
1	ECER1F	1-bit error detection/correction flag bit This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). 0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred.
0	ECEMF	ECC error message flag This flag indicates whether an error exists in the current read data. This bit is updated whenever the RAM reads data. This bit might be set if it is read before initialization of the RAM. This bit is cleared at the time of through mode enable selection (ECTHM = 1) and when there is no 1 bit error in the decode circuit input data. 0: The currently-read RAM data does not have bit errors. 1: The currently-read RAM data have bit errors.

CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

We recommend initializing the RAM before clearing bits 2 and 1.

21.12.5 ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2 — RSCANn ECC Test Mode Control Register

The ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2 register switches to and controls the test mode.

This register can be used when RS-CAN is not accessed to RAM.

Access: This register can be read or written in 16-bit units.

Address: <ECCCAN0_base > + 04_H
<ECCCANFD0_base > + 04_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA1	ETMA0	—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. These bits are always read as 0.

Table 21.197 ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2 Register Contents (1/2)

Bit Position	Bit Name	Function
15	ETMA1	Access control bits 1 and 0 to ECC test mode bit These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 10_B, writing to bit 7 is enabled.
14	ETMA0	
13 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTMCE	ECC test mode enable bit This bit specifies whether to enable access to the test registers and test control bits. When writing to this bit, (1, 0) should be written to (ETMA1, ETMA0) at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2, ECCRCAN0TRC_PHY1/ECCRCANFD0TRC_PHY2, ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2, ECCRCAN0HORD_PHY1/ECCRCANFD0HORD_PHY2, ECCRCAN0ECRD_PHY1/ECCRCANFD0ECRD_PHY2, ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 Test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECTRRS	ECC RAM read test mode selection bit Select reading destination when reading ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register and reading destination when reading ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0:The read value of the ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 register is the write value of the ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register. The read value of the ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register is the write value of the ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register. 1: The read value of the ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 register can read RAM data. The read value of the ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register is the ECC data to be written to RAM.

Table 21.197 ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2 Register Contents (2/2)

Bit Position	Bit Name	Function
3	ECREOS	ECC redundant bit output data selection bit This bit is used to identify and select the ECC data to be stored in RAM as ECC data generated for write data or the value of the ECCRCAN0ERDB_PHY1/ ECCRCANFD0ERDB_PHY2 register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Store ECC data generated for write data to RAM. 1: Store the value of ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register to RAM.
2	ECENS	ECC encoder input selection bit This bit is used to identify the targeted data for ECC data generation as write data to RAM or the value of the ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate ECC data from the write data to RAM. 1: Generate ECC data from the value of the ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register.
1	ECDCS	ECC decoder input selection bit This bit is used to indetifyand select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from RAM data and detect errors. 1: Generate syndrome code from the value of the ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register and detect errors.
0	ECREIS	ECC redundant bit input data selection bit This bit is used to indetifyand select the targeted data for sy nd rom code generation and error detection as RAM data or the value of the ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from ECC data stored in RAM and detect errors. 1: Generate syndrome code from the value of the ECCRCAN0ERDB_PHY1/ ECCRCANFD0ERDB_PHY2 register and detect errors.

21.12.6 ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 — RSCAN0 ECC Encode/ Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

The value of the register can be used to generate ECC data or syndrome code.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), it is accesible. When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read. This register can be used when RS-CAN is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: <ECCCAN0_base > + $0C_H$
<ECCCANFD0_base > + $0C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEDB[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEDB[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.198 ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 Register Contents

Bit Position	Bit Name	Function
31 to 0	ECEDB[31:0]	When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM. When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECDCS = 1, the value of this register is used to generate syndrome code and the value of this register is stored in ECC decode syndrome data register (ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2). In addition, when ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2. ECTRRS = 1, RAM data [31:0], instead of written data, is read for the value of this register.

21.12.7 ECCRCAN0TRC_PHY1/ECCRCANFD0TRC_PHY2 — RSCAN0 ECC Redundant Bit Data Control Test Register

In ECC test mode, this test register, for ECC data, consists of four 8-bit registers, ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2, ECCRCAN0HORD_PHY1/ ECCRCANFD0HORD_PHY2, ECCRCAN0ECRD_PHY1/ECCRCANFD0ECRD_PHY2, and ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), this register can be accessed. When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2. ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read. This register can be used when RS-CAN is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: <ECCCAN0_base > + 08_H
<ECCCANFD0_base > + 08_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2 (See **Section 21.12.9**)								ECCRCAN0HORD_PHY1/ECCRCANFD0HORD_PHY2 (See **Section 21.12.10**)

21.12.8 ECCRCAN0AD0_PHY1/ECCRCANFD0AD0_PHY2 — RSCAN0 ECC Error Address Register 0

This is a read-only register to hold the ECC error occurring address.

When ECC error is detected while ECC error judgment is enabled, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ECCCAN0_base > + 10_H
<ECCCANFD0_base > + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	ECEAD[30:16]

Table 21.199 ECCRCAN0AD0_PHY1/ECCRCANFD0AD0_PHY2 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned.
30 to 0	ECEAD[30:0]	ECEAD0 is a read-only register to hold the address at which an ECC error has occurred. If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECEAD0 as the address at which the ECC error has occurred. The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. Only one address can be held in ECEAD0

21.12.9 ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2 — RSCAN0 ECC Decode Syndrome Data Register

In ECC test mode, this is a read-only register for storing generated syndrome code.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCRCAN0TMC_PHY1/ ECCRCANFD0TMC_PHY2.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ECCCAN0_base > + $0B_H$
<ECCCANFD0_base > + $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SYND6	SYND5	SYND4	SYND3	SYND2	SYND1	SYND0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 21.200 ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	SYND[6:0]	The generated syndrome code is stored as needed.

21.12.10 ECCRCAN0HORD_PHY1/ECCRCANFD0HORD_PHY2 — RSCAN0 ECC 7-Bit Redundant Bit Data Hold Test Register

In ECC test mode, this register is used to store ECC data for read RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCRCAN0TMC_PHY1/ ECCRCANFD0TMC_PHY2.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ECCCAN0_base > + $0A_H$
<ECCCANFD0_base > + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	HORD6	HORD5	HORD4	HORD3	HORD2	HORD1	HORD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 21.201 ECCRCAN0HORD_PHY1/ECCRCANFD0HORD_PHY2 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	HORD[6:0]	ECC code for read RAM data is stored as needed. When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTRRS = 1 and ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 register is read, ECC code is stored.

21.12.11 ECCRCAN0ECRD_PHY1/ECCRCANFD0ECRD_PHY2 — RSCAN0 ECC Encode Test Register

In ECC test mode, this is a read-only register for storing ECC data generated for write RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCAN0TMC_PHY1/ ECCRCANFD0TMC_PHY2.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ECCCAN0_base > + 09_H
<ECCCANFD0_base > + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ECRD6	ECRD5	ECRD4	ECRD3	ECRD2	ECRD1	ECRD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 21.202 ECCRCAN0ECRD_PHY1/ECCRCANFD0ECRD_PHY2 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing, and can read ECC data for the data written to the ECCRCAN0TED_PHY1/ ECCRCANFD0TED_PHY2 register when ECCRCAN0TMC_PHY1/ ECCRCANFD0TMC_PHY2.ECENS = 1.

21.12.12 ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 — RSCAN0 ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles ECC data.

The value of this register can be used as ECC data generated at the time of RAM writing or ECC data read at the time of RAM data reading.

When ECC test mode is enabled (ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCAN0TMC_PHY1/ ECCRCANFD0TMC_PHY2.ECTMCE = 0), 00_H is read.

Access: This register can be read or written in 8-bit units.

Address: <ECCCAN0_base > + 08_H
<ECCCANFD0_base > + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ERDB6	ERDB5	ERDB4	ERDB3	ERDB2	ERDB1	ERDB0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.203 ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ERDB[6:0]	When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECREOS = 1, these bits store the value of this register as ECC data to RAM. When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECREIS = 1, the value of this register is read as ECC data read from RAM. When ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2.ECTRRS = 1, ECC data to be stored in RAM is read instead of the write data for the read value of this register.

21.12.13 SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the CSIHn ECC registers and the RSCAN0 and the RSCAN1 ECC registers. For details, see **Section 17.7.14, SELB_READTEST — ECCREAD Test Select Register**.

21.13 Notes on the RS-CANFD Module

- When changing interface mode without resetting the RS-CANFD, write the value after reset to all registers and bits that are not allocated to the register map after change and then modify the RSCFDnCFDGRMCFG register.
- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCANn(CFD)GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCANn(CFD)CmSTS register (m = 0 to 5) for transitions.
- When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the RSCFDnCFDCmNCFG register setting value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCANn(CFD)TMCp) of the corresponding transmit buffer to 00_H. The status register (RSCANn(CFD)TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCANn(CFD)TMTRSTS0 to RSCANn(CFD)TMTRSTS2, RSCANn(CFD)TMTARSTS0 to RSCANn(CFD)TMTARSTS2, RSCANn(CFD)TMTCSTS0 to RSCANn(CFD)TMTCSTS2, and RSCANn(CFD)TMTASTS0 to RSCANn(CFD)TMTASTS2), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RSCANn(CFD)TMIEC0 to RSCANn(CFD)TMIEC2) to 0 (transmit buffer interrupt is disabled).
- When using transmit buffer merge mode (in CAN FD mode), write 00H to the control register (RSCANn(CFD)TMCp) of the transmit buffer corresponding to the transmit buffer allocated as a payload storage area. Set the enable bit of corresponding interrupt enable registers (RSCANn(CFD)TMIEC0 to RSCANn(CFD)TMIEC2) to 0 (to disable interrupts).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not be allocated to transmit queues. Do not allocate a transmit buffer allocated as a payload storage area in transmit buffer merge mode (in CAN FD mode) to the transmit queue either.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- In the case of registers that access the RAM, the value after reset shown in **Section 21.4, Registers (Classical CAN Mode)** and **Section 21.5, Registers (CAN FD Mode)** indicate the values cleared by initialization of the CAN RAM. Values before clear are undefined. The following registers apply.

  - Receive rule (RSCANn(CFD)GAFLIDj, RSCANn(CFD)GAFLMj, RSCANn(CFD)GAFLP0j, RSCANn(CFD)GAFLP1j registers)
  - Receive buffers (RSCANn(CFD)RMIDq, RSCANn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, RSCANn(CFD)RMDFbq registers)
  - Receive FIFO buffer access registers (RSCANn(CFD)RFIDx, RSCANn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCANn(CFD)RFDFdx registers)
  - Transmit/receive FIFO buffer access registers (RSCANn(CFD)CFIDk, RSCANn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCANn(CFD)CFDFdk registers)
  - Transmit buffers (RSCANn(CFD)TMIDp, RSCANn(CFD)TMPTRp, RSCFDnCFDTMFDCTRp, and RSCANn(CFD)TMDFbp registers)
  - Transmit history access register (RSCANn(CFD)THLACCm registers)
  - RAM test page access register (RSCANn(CFD)RPGACCr registers)

- The values of unused receive buffers (RSCANn(CFD)RMIDq, RSCANn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCANn(CFD)RMDFbq registers), receive FIFO buffer access registers (RSCANn(CFD)RFIDx, RSCANn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCANn(CFD)RFDFdx registers) and transmit/receive FIFO buffer access registers (RSCANn(CFD)CFIDk, RSCANn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCANn(CFD)CFDFdk registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

21.14 RS-CAN

This section describes the functions and registers of RS-CAN.

Table 21.204 Indices

Index	Description
n	Throughout this section, the individual RS-CAN units are generically indicated by the index “n” (n = 1); for example, RSCANnGCTR is the global control register of the RSCANn unit.
m	Throughout this section, the individual channels of RS-CAN units are generically indicated by the index “m” (m = 6); for example, RSCAN1CmSTS is the channel m status register.
i	The individual channels of RSCAN1 module are generically indicated by the index “i” (i = 0); for example, THIFi bit is the transmit history interrupt status flag of the global TX interrupt status register 0 (RSCAN1GTINTSTS0).
j	The individual registers associated with receive rule table are generically indicated by the index “j” (j = 0 to 15); for example, RSCAN1GAFLIDj is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index “k” (k = 0 to [channel i × 3 + 2]); for example, RSCAN1CFCCk is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers in the RS-CAN units are identified by the index “x” (x = 0 to 7): for example, RSCAN1RFSTSx is the receive FIFO buffer status register.
q	The individual receive buffers are generically indicated by the index “q” (q = 0 to [channel i × 16 + 15]); for example, RSCAN1RMIDq is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index “p” (q = 0 to [channel i × 16 + 15]; for example, RSCAN1TMCp is the transmit buffer control register.
r	The individual RAM tests for CAN are generically indicated by the index “r” (r = 0 to 63); for example, RSCAN1RPGACCr is the RAM test page access register.
y	The registers not covered above are indicated by the letter “y” (y = 0); for example, RSCAN1RMNDy is a receive buffer new data register.

Note: The descriptions of functions and registers in this section are for the RS-CANs that has one channel (m = 6). When referring to information with indices, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

The following table lists the values of indices for individual products.

Table 21.205 Indices for Individual Products

Indices for Individual Products
176 pins
i = 0
j = 0 to 15
k = 0 to 2
x = 0 to 7
q = 0 to 15
p = 0 to 15
r = 0 to 63
y = 0

21.14.1 Register Base Address

RSCAN1 base addresses are listed in the following table.

RSCAN1 register addresses are given as offsets from the base addresses.

Table 21.206 Register Base Addresses

Base Address Name	Base Address
<RSCAN1_base>	FFD0 8000_H
<ECCCAN1_base>	FFC7 1020_H

21.14.2 Clock Supply

The RSCAN1 clock supply is shown in the following table.

Table 21.207 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
RSCAN1	clk_xincan	CKSCLK_ICANOSC	Communicatiaon clock from osc clock
	clkc	CKSCLK_IPERI2	Communication clock
	pclk	CKSCLK_ICAN	Module clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_ICAN	

The operating frequency of the RSCAN1 depends on the transfer rate and the number of channels in use. Use the RSCAN1 within the frequency range shown in **Table 21.208**.

Table 21.208 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K

Condition		Range of Operating Frequency		
Transfer Rate	No. of Channels in Use	pclk	clk_xincan*1, *3	clkc*1, *2
1 Mbps	1ch	pclk ≥ 18MHz	8 MHz ≤ clk_xincan ≤ pclk/2	12.5 MHz ≤ clkc ≤ pclk/2
500 kbps	1ch	pclk ≥ 8MHz	4 MHz ≤ clk_xincan ≤ pclk/2	12.5 MHz ≤ clkc ≤ pclk/2
125 kbps	1ch	pclk ≥ 8MHz	4 MHz ≤ clk_xincan ≤ pclk/2	12.5 MHz ≤ clkc ≤ pclk/2

Note 1. Setting the DCS bit in RSCAN1GCFG enables to select either clk_xincan or clkc. Set clocks less than or equal to pclk/2 (up to 40 MHz).

Note 2. Select clk_xincan when pclk < 25 MHz.

Note 3. The maximum frequency of clk_xincan is 24 MHz.

CAUTION

When the RS-CAN module is used in stop mode, set the MainOSC as the clock source of the RS-CAN module. For details about how to set the clock source, see Section 12.4.3.10, RS-CAN Clock Domains C_ISO_CAN and C_ISO_CANOSC.

21.14.3 Interrupt Request

RSCAN1 interrupt requests are listed in the following table.

Table 21.209 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RSCAN1			
INTRCANGERR1	CAN global error interrupt	319	—
INTRCANGRECC1	CAN receive FIFO interrupt	320	—
CAN6			
INTRCANmERR (m = 6)	CAN6 error interrupt	321	—
INTRCANmREC (m = 6)	CAN6 transmit/receive FIFO receive completion interrupt	322	—
INTRCANmTRX (m = 6)	CAN6 transmit interrupt	323	—

NOTE

For the wake-up factors from standby mode, see **Section 14.1.2.1, Wake-Up Factors for Stand-By Modes**.

21.14.4 Reset Sources

RSCAN1 reset sources are listed in the following table. RSCAN1 is initialized by these reset sources.

Table 21.210 Reset Sources

Unit Name	Reset Source
RSCAN1	All reset sources (ISORES)

21.14.5 External Input/Output Signals

External input/output signals of RSCAN1 are listed below.

Table 21.211 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
CAN6		
CANmRX (m = 6)	CAN6 receive data input	CAN6RX
CANmTX (m = 6)	CAN6 transmit data output	CAN6TX

21.15 Overview

21.15.1 Functional Overview

The RH850/F1K incorporates one CAN interface unit (RSCAN1) which consists of one channel (CAN6). **Table 21.212** shows the RS-CAN module specifications. **Figure 21.39** shows the RS-CAN module block diagram.

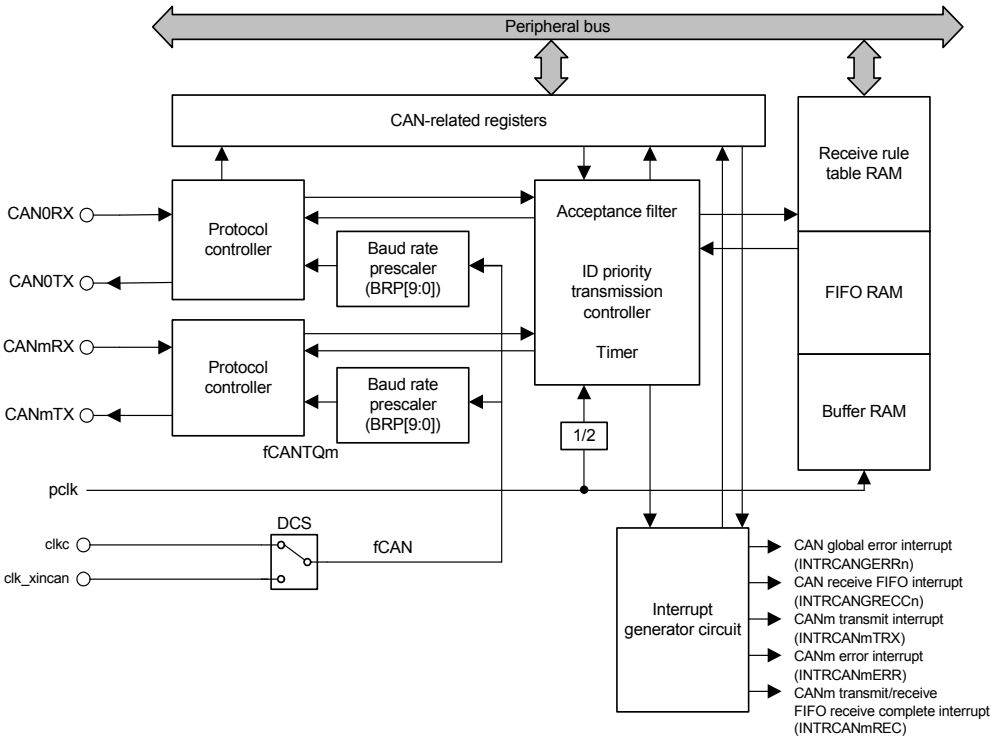

Table 21.212 RS-CAN Module Specifications (1/2)

Item	Specification
Number of channels	1
Protocol	ISO11898-1 compliant
Communication speed	• Maximum 1 Mbps Communication speed (CANm bit time clock) = $\frac{1}{\text{CANm bit time}}$ CANm bit time = CANmTq × Tq count per bit CANmTq = $\frac{\text{(BRP[9:0] bits in the RSCAN1CmCFG register + 1)}}{\text{fCAN}}$ m = 6 (n = 1) Tq: Time quantum fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCAN1GCFG register)
Buffer	80 buffers (n = 1) in total • Channel-dedicated: 16 buffers (16 buffers × 1 channel) (n = 1) Transmit buffer: 16 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable) • Shared between channels: 64 buffers (n = 1) Receive buffer: 16 buffers (n = 1) Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) • ECC included
Reception function	• Receives data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be received. • Sets interrupt enable/disable for each FIFO. • Mirror function (reception of messages transmitted from the own CAN node) • Timestamp function (to record message reception time as a 16-bit timer value)
Reception filter function	• Selects receive messages according to 64 (n = 1) receive rules. • Sets the number of receive rules (0 to 128) for each channel. • Acceptance filter processing: Sets ID and mask for each receive rule. • DLC filter processing: Enables DLC filter check for each acceptance rule.
Receive message transfer function	• Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer • Labeling function Stores label information together with a message in a receive buffer and FIFO buffer.
Transmission function	• Transmits data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be transmitted. • Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer. • Selects ID priority transmission or transmit buffer number priority transmission. • Transmission can be aborted (possible to confirm with a flag) • One-shot transmission function
Interval transmission function	Transmits messages at configurable intervals (transmit mode of transmit/receive FIFO buffers)

Table 21.212 RS-CAN Module Specifications (2/2)

Item	Specification
Transmit queue function	Transmits all stored messages according to the ID priority.
Transmit history function	Stores the history information of transmission-completed messages
Gateway function	Not supported.
Bus off recovery mode selection	Selects the method for returning from bus off state. • ISO11898-1 compliant • Automatic entry to channel halt mode at bus-off entry • Automatic entry to channel halt mode at bus-off end • Transition to channel halt mode by program request • Transition to the error-active state by program request (forcible return from the bus off state)
Error status monitoring	• Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock). • Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery) • Reads the error counter. • Monitors DLC errors.
Interrupt source	5 sources • Global interrupts (2 sources/unit) Receive FIFO interrupt (1 source/unit) Global error interrupt (1 source/unit) • Channel interrupts (3 sources/channel) CANm transmit interrupt (m = 6) – CANm transmit complete interrupt – CANm transmit abort interrupt – CANm transmit/receive FIFO transmit complete interrupt (in transmit mode) – CANm transmit history interrupt – CANm transmit queue interrupt CANm transmit/receive FIFO receive complete interrupt (in receive mode) CANm error interrupt
CAN stop mode	Reduces power consumption by stopping clock supply to the RS-CAN module.
CAN clock source	Selects the clkc or the clk_xincan. For the operating frequency range, see **Table 21.208**.
Test function	Test function for user evaluation • Listen-only mode • Self-test mode 0 (external loopback) • Self-test mode 1 (internal loopback) • RAM test (read/write test)

21.15.2 Block Diagram

Note: n = 1, m = 6
BRP[9:0]: Bits in the RSCAN1CmCFG register
DCS: Bits in the RSCAN1GCFG register
fCANTQm: CANmTq clock
fCAN: CAN clock

Figure 21.39 RS-CAN Module Block Diagram

21.16 Registers

21.16.1 List of Registers

RS-CAN registers are listed in the following table.

For details about <RSCAN1_base>, see **Section 21.14.1, Register Base Address**.

Table 21.213 Registers (1/9)

Module	Register	Symbol	Address	Guard Group
RSCAN1	Channel m configuration register	RSCAN1CmCFG	<RSCAN1_base> + 0000_H	RSCAN1 Ch0
	Channel m control register	RSCAN1CmCTR	<RSCAN1_base> + 0004_H	RSCAN1 Ch0
	Channel m status register	RSCAN1CmSTS	<RSCAN1_base> + 0008_H	RSCAN1 Ch0
	Channel m error flag register	RSCAN1CmERFL	<RSCAN1_base> + $000C_H$	RSCAN1 Ch0
	Global configuration register	RSCAN1GCFG	<RSCAN1_base> + 0084_H	RSCAN1 Global
	Global control register	RSCAN1GCTR	<RSCAN1_base> + 0088_H	RSCAN1 Global
	Global status register	RSCAN1GSTS	<RSCAN1_base> + $008C_H$	RSCAN1 Global
	Global error flag register	RSCAN1GERFL	<RSCAN1_base> + 0090_H	RSCAN1 Global
	Global timestamp counter register	RSCAN1GTSC	<RSCAN1_base> + 0094_H	RSCAN1 Global
	Receive rule entry control register	RSCAN1GAFLECTR	<RSCAN1_base> + 0098_H	RSCAN1 Global

Table 21.213 Registers (2/9)

Module	Register	Symbol	Address	Guard Group
RSCAN1	Transmit/receive FIFO buffer status register 0	RSCAN1CFSTS0	<RSCAN1_base> + 0178_H	RSCAN1 Global
	Transmit/receive FIFO buffer status register 1	RSCAN1CFSTS1	<RSCAN1_base> + $017C_H$	RSCAN1 Global
	Transmit/receive FIFO buffer status register 2	RSCAN1CFSTS2	<RSCAN1_base> + 0180_H	RSCAN1 Global
	Transmit/receive FIFO buffer pointer control register 0	RSCAN1CFPCTR0	<RSCAN1_base> + $01D8_H$	RSCAN1 Global
	Transmit/receive FIFO buffer pointer control register 1	RSCAN1CFPCTR1	<RSCAN1_base> + $01DC_H$	RSCAN1 Global
	Transmit/receive FIFO buffer pointer control register 2	RSCAN1CFPCTR2	<RSCAN1_base> + $01E0_H$	RSCAN1 Global
	FIFO empty status register	RSCAN1FESTS	<RSCAN1_base> + 0238_H	RSCAN1 Global
	FIFO full status register	RSCAN1FFSTS	<RSCAN1_base> + $023C_H$	RSCAN1 Global
	FIFO Msg lost status register	RSCAN1FMSTS	<RSCAN1_base> + 0240_H	RSCAN1 Global
	Receive FIFO buffer interrupt flag status register	RSCAN1RFISTS	<RSCAN1_base> + 0244_H	RSCAN1 Global
	Transmit/receive FIFO buffer RX interrupt flag status register	RSCAN1CFRISTS	<RSCAN1_base> + 0248_H	RSCAN1 Global
	Transmit/receive FIFO buffer TX interrupt flag status register	RSCAN1CFTISTS	<RSCAN1_base> + $024C_H$	RSCAN1 Global
	Transmit buffer control register 0	RSCAN1TMC0	<RSCAN1_base> + 0250_H	RSCAN1 Global
	Transmit buffer control register 1	RSCAN1TMC1	<RSCAN1_base> + 0251_H	RSCAN1 Global
	Transmit buffer control register 2	RSCAN1TMC2	<RSCAN1_base> + 0252_H	RSCAN1 Global
	Transmit buffer control register 3	RSCAN1TMC3	<RSCAN1_base> + 0253_H	RSCAN1 Global
	Transmit buffer control register 4	RSCAN1TMC4	<RSCAN1_base> + 0254_H	RSCAN1 Global
	Transmit buffer control register 5	RSCAN1TMC5	<RSCAN1_base> + 0255_H	RSCAN1 Global
	Transmit buffer control register 6	RSCAN1TMC6	<RSCAN1_base> + 0256_H	RSCAN1 Global
	Transmit buffer control register 7	RSCAN1TMC7	<RSCAN1_base> + 0257_H	RSCAN1 Global
	Transmit buffer control register 8	RSCAN1TMC8	<RSCAN1_base> + 0258_H	RSCAN1 Global
	Transmit buffer control register 9	RSCAN1TMC9	<RSCAN1_base> + 0259_H	RSCAN1 Global
	Transmit buffer control register 10	RSCAN1TMC10	<RSCAN1_base> + $025A_H$	RSCAN1 Global
	Transmit buffer control register 11	RSCAN1TMC11	<RSCAN1_base> + $025B_H$	RSCAN1 Global
	Transmit buffer control register 12	RSCAN1TMC12	<RSCAN1_base> + $025C_H$	RSCAN1 Global
	Transmit buffer control register 13	RSCAN1TMC13	<RSCAN1_base> + $025D_H$	RSCAN1 Global
	Transmit buffer control register 14	RSCAN1TMC14	<RSCAN1_base> + $025E_H$	RSCAN1 Global
	Transmit buffer control register 15	RSCAN1TMC15	<RSCAN1_base> + $025F_H$	RSCAN1 Global
	Transmit buffer status register 0	RSCAN1TMSTS0	<RSCAN1_base> + $02D0_H$	RSCAN1 Global
	Transmit buffer status register 1	RSCAN1TMSTS1	<RSCAN1_base> + $02D1_H$	RSCAN1 Global
	Transmit buffer status register 2	RSCAN1TMSTS2	<RSCAN1_base> + $02D2_H$	RSCAN1 Global
	Transmit buffer status register 3	RSCAN1TMSTS3	<RSCAN1_base> + $02D3_H$	RSCAN1 Global
	Transmit buffer status register 4	RSCAN1TMSTS4	<RSCAN1_base> + $02D4_H$	RSCAN1 Global
	Transmit buffer status register 5	RSCAN1TMSTS5	<RSCAN1_base> + $02D5_H$	RSCAN1 Global
	Transmit buffer status register 6	RSCAN1TMSTS6	<RSCAN1_base> + $02D6_H$	RSCAN1 Global
	Transmit buffer status register 7	RSCAN1TMSTS7	<RSCAN1_base> + $02D7_H$	RSCAN1 Global
	Transmit buffer status register 8	RSCAN1TMSTS8	<RSCAN1_base> + $02D8_H$	RSCAN1 Global
	Transmit buffer status register 9	RSCAN1TMSTS9	<RSCAN1_base> + $02D9_H$	RSCAN1 Global
	Transmit buffer status register 10	RSCAN1TMSTS10	<RSCAN1_base> + $02DA_H$	RSCAN1 Global
	Transmit buffer status register 11	RSCAN1TMSTS11	<RSCAN1_base> + $02DB_H$	RSCAN1 Global
	Transmit buffer status register 12	RSCAN1TMSTS12	<RSCAN1_base> + $02DC_H$	RSCAN1 Global
	Transmit buffer status register 13	RSCAN1TMSTS13	<RSCAN1_base> + $02DD_H$	RSCAN1 Global
	Transmit buffer status register 14	RSCAN1TMSTS14	<RSCAN1_base> + $02DE_H$	RSCAN1 Global
	Transmit buffer status register 15	RSCAN1TMSTS15	<RSCAN1_base> + $02DF_H$	RSCAN1 Global
	Transmit buffer transmit request status register 0	RSCAN1TMTRSTS0	<RSCAN1_base> + 0350_H	RSCAN1 Global
	Transmit buffer transmit abort request status register 0	RSCAN1TMTARSTS0	<RSCAN1_base> + 0360_H	RSCAN1 Global
	Transmit buffer transmit complete status register 0	RSCAN1TMTCSTS0	<RSCAN1_base> + 0370_H	RSCAN1 Global

Table 21.213 Registers (3/9)

Module	Register	Symbol	Address	Guard Group
RSCAN1	Transmit buffer transmit abort status register 0	RSCAN1TMTASTS0	<RSCAN1_base> + 0380_H	RSCAN1 Global
	Transmit buffer interrupt enable configuration register 0	RSCAN1TMIEC0	<RSCAN1_base> + 0390_H	RSCAN1 Global
	Transmit queue configuration and control register m	RSCAN1TXQCCm	<RSCAN1_base> + $03A0_H$	RSCAN1 Ch0
	Transmit queue status register m	RSCAN1TXQSTSm	<RSCAN1_base> + $03C0_H$	RSCAN1 Ch0
	Transmit queue pointer control register m	RSCAN1TXQPCTRm	<RSCAN1_base> + $03E0_H$	RSCAN1 Ch0
	Transmit history configuration and control register m	RSCAN1THLCCm	<RSCAN1_base> + 0400_H	RSCAN1 Ch0
	Transmit history status register m	RSCAN1THLSTSm	<RSCAN1_base> + 0420_H	RSCAN1 Ch0
	Transmit history pointer control register m	RSCAN1THLPCTRm	<RSCAN1_base> + 0440_H	RSCAN1 Ch0
	Global TX interrupt status register 0	RSCAN1GTINTSTS0	<RSCAN1_base> + 0460_H	RSCAN1 Global
	Global test configuration register	RSCAN1GTSTCFG	<RSCAN1_base> + 0468_H	RSCAN1 Global
	Global test control register	RSCAN1GTSTCTR	<RSCAN1_base> + $046C_H$	RSCAN1 Global
	Global lock key register	RSCAN1GLOCKK	<RSCAN1_base> + $047C_H$	RSCAN1 Global

15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 0	BRP[9:0]	Prescaler Division Ratio Setting When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.

Modify the RSCAN1CmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before transitioning to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see **Section 21.22.1, Initial Settings**.

SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width.Values from 1Tq to 4Tq can be specified.
Set a value less than or equal to the value of the TSEG2 bits.

TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).
Values from 2Tq to 8Tq can be specified.
Set a value smaller than the value of the TSEG1 bits.

TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).
Values from 4Tq to 16Tq can be specified.

BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

21.16.3 RSCAN1CmCTR — Channel Control Register (m = 6)

Access: RSCAN1CmCTR register can be read or written in 32-bit units.
RSCAN1CmCTRL, RSCAN1CmCTRH registers can be read or written in 16-bit units.
RSCAN1CmCTRLL, RSCAN1CmCTRLH, RSCAN1CmCTRHL, RSCAN1CmCTRHH registers can be read or written in 8-bit units.

Address: RSCAN1CmCTR: <RSCAN1_base> + 0004_H + (10_H × i)

RSCAN1CmCTRL: <RSCAN1_base> + 0004_H + (10_H × i),
RSCAN1CmCTRH: <RSCAN1_base> + 0006_H + (10_H × i)

RSCAN1CmCTRLL: <RSCAN1_base> + 0004_H + (10_H × i),
RSCAN1CmCTRLH: <RSCAN1_base> + 0005_H + (10_H × i),
RSCAN1CmCTRHL: <RSCAN1_base> + 0006_H + (10_H × i),
RSCAN1CmCTRHH: <RSCAN1_base> + 0007_H + (10_H × i)

Value after reset: $0000\ 0005_H$

8	BEIE	Bus Error Interrupt Enable 0: Bus error interrupt is disabled. 1: Bus error interrupt is enabled.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	RTBO	Forcible Return from Bus-off When this bit is set to 1, forcible return from the bus off state is made. This bit is always read as 0.
2	CSLPR	Channel Stop Mode 0: Other than channel stop mode 1: Channel stop mode
1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCAN1CmERFL register.
When this bit is cleared to 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CAN module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CAN module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CAN module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CAN module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCAN1CmCTR register (m = 6) are set to 10_B and the RS-CAN module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits in the RSCAN1CmSTS register are cleared to 00_H.

When the RS-CAN module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CAN module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CAN module is in the bus off state, the RS-CAN module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CAN module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CAN module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01_B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCAN1CmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCAN1CmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCAN1CmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCAN1CmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCAN1CmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCAN1CmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCAN1CmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCAN1CmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel halt mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCAN1CmSTS register to 00_H and also clears the BOSTS flag in the RSCAN1CmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCAN1CmCTR register are 00_B (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 21.18.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10_B.

21.16.4 RSCAN1CmSTS — Channel Status Register (m = 6)

Access: RSCAN1CmSTS register is a read-only register that can be read in 32-bit units.
RSCAN1CmSTSL, RSCAN1CmSTSH registers are read-only registers that can be read in 16-bit units.
RSCAN1CmSTSLL, RSCAN1CmSTSHL, RSCAN1CmSTSHH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1CmSTS: <RSCAN1_base> + 0008_H + (10_H × i)

RSCAN1CmSTSL: <RSCAN1_base> + 0008_H + (10_H × i),
RSCAN1CmSTSH: <RSCAN1_base> + $000A_H$ + (10_H × i)

RSCAN1CmSTSLL: <RSCAN1_base> + 0008_H + (10_H × i),
RSCAN1CmSTSHL: <RSCAN1_base> + $000A_H$ + (10_H × i),
RSCAN1CmSTSHH: <RSCAN1_base> + $000B_H$ + (10_H × i)

Value after reset: $0000\ 0005_H$

Table 21.220 RSCAN1CmSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 8	Reserved	When read, the value after reset is returned.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CAN module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])). It is cleared to 0 when the RS-CAN module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

21.16.5 RSCAN1CmERFL — Channel Error Flag Register (m = 6)

Access: RSCAN1CmERFL register can be read or written in 32-bit units.
RSCAN1CmERFLL register can be read or written in 16-bit units.
RSCAN1CmERFLH register is a read-only register that can be read in 16-bit units.
RSCAN1CmERFLLL, RSCAN1CmERFLLH registers can be read or written in 8-bit units.
RSCAN1CmERFLHL, RSCAN1CmERFLHH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1CmERFL: <RSCAN1_base> + $000C_H$ + (10_H × i)

RSCAN1CmERFLL: <RSCAN1_base> + $000C_H$ + (10_H × i),
RSCAN1CmERFLH: <RSCAN1_base> + $000E_H$ + (10_H × i)

RSCAN1CmERFLLL: <RSCAN1_base> + $000C_H$ + (10_H × i),
RSCAN1CmERFLLH: <RSCAN1_base> + $000D_H$ + (10_H × i),
RSCAN1CmERFLHL: <RSCAN1_base> + $000E_H$ + (10_H × i),
RSCAN1CmERFLHH: <RSCAN1_base> + $000F_H$ + (10_H × i)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	CRCREG[14:0]

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.221 RSCAN1CmERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.

Table 21.221 RSCAN1CmERFL Register Contents (2/2)

Bit Position	Bit Name	Function
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus is detected. 1: Channel bus is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCAN1CmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCAN1CmERFL is detected, the flag bits are only set by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

CRCREG[14:0] Flags

When the CTME bit in the RSCAN1CmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCAN1CmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCAN1CmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCAN1CmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCAN1CmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCAN1CmCTR register (m = 6) set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127). This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCAN1CmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

21.16.6 RSCAN1GCFG — Global Configuration Register

Access: RSCAN1GCFG register can be read or written in 32-bit units.
RSCAN1GCFGL, RSCAN1GCFGH registers can be read or written in 16-bit units.
RSCAN1GCFGLL, RSCAN1GCFGLH, RSCAN1GCFGHL, RSCAN1GCFGHH registers can be read or written in 8-bit units.

Address: RSCAN1GCFG: <RSCAN1_base> + 0084_H

RSCAN1GCFGL: <RSCAN1_base> + 0084_H,
RSCAN1GCFGH: <RSCAN1_base> + 0086_H

RSCAN1GCFGLL: <RSCAN1_base> + 0084_H,
RSCAN1GCFGLH: <RSCAN1_base> + 0085_H,
RSCAN1GCFGHL: <RSCAN1_base> + 0086_H,
RSCAN1GCFGHH: <RSCAN1_base> + 0087_H

Value after reset: $0000\ 0000_H$

4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Note 2. For the CAN clock frequency settings, see **Table 21.208, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

Modify the RSCAN1GCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 21.20.3.1, Interval Transmission Function**.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

TSSS Bit

This bit is used to select a clock source of the timestamp counter.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 21.208, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCAN1GAFLP0j register to 0000_B before clearing the DCE bit in the RSCAN1GCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

21.16.7 RSCAN1GCTR — Global Control Register

Access: RSCAN1GCTR register can be read or written in 32-bit units.
RSCAN1GCTRL, RSCAN1GCTRH registers can be read or written in 16-bit units.
RSCAN1GCTRLL, RSCAN1GCTRLH, RSCAN1GCTRHL registers can be read or written in 8-bit units.

Address: RSCAN1GCTR: <RSCAN1_base> + 0088_H

RSCAN1GCTRL: <RSCAN1_base> + 0088_H,
RSCAN1GCTRH: <RSCAN1_base> + $008A_H$

RSCAN1GCTRLL: <RSCAN1_base> + 0088_H,
RSCAN1GCTRLH: <RSCAN1_base> + 0089_H,
RSCAN1GCTRHL: <RSCAN1_base> + $008A_H$

Value after reset: $0000\ 0005_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.223 RSCAN1GCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCAN1GTSC register is cleared to 0000_H.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCAN1GERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCAN1GERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCAN1GERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.
Clearing this bit to 0 makes the RSCAN module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CAN module (global operating mode, global reset mode, or global test mode). For details, see **Section 21.18.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CAN module into global stop mode.

21.16.8 RSCAN1GSTS — Global Status Register

Access: RSCAN1GSTS register is a read-only register that can be read in 32-bit units.
RSCAN1GSTSL register is a read-only register that can be read in 16-bit units.
RSCAN1GSTSLL register is a read-only register that can be read in 8-bit units.

Address: RSCAN1GSTS: <RSCAN1_base> + $008C_H$

RSCAN1GSTSL: <RSCAN1_base> + $008C_H$

RSCAN1GSTSLL: <RSCAN1_base> + $008C_H$

Value after reset: $0000\ 000D_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	GRAMINIT	GSLPSTS	GHLTSTS	GRSTSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.224 RSCAN1GSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialisation is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

21.16.9 RSCAN1GERFL — Global Error Flag Register

Access: RSCAN1GERFL register can be read or written in 32-bit units.
RSCAN1GERFLL register can be read or written in 16-bit units.
RSCAN1GERFLLL register can be read or written in 8-bit units.

Address: RSCAN1GERFL: <RSCAN1_base> + 0090_H

RSCAN1GERFLL: <RSCAN1_base> + 0090_H

RSCAN1GERFLLL: <RSCAN1_base> + 0090_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.225 RSCAN1GERFL Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	Reserved	When read, the undefined value is returned. When writing, write the value after reset.
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	Reserved	When read, the undefined value is returned. When writing, write the value after reset.
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCAN1GERFL register are cleared to 0 in global reset mode.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCAN1THLSTSm register (m = 6) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCAN1RFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCAN1CFSTSk register (k = 0 to 2) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

21.16.10 RSCAN1GTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCAN1GTINTSTS0 register is a read-only register that can be read in 32-bit units.
RSCAN1GTINTSTS0L register is a read-only register that can be read in 16-bit units.
RSCAN1GTINTSTS0LL register is a read-only register that can be read in 8-bit units.

Address: RSCAN1GTINTSTS0: <RSCAN1_base> + 0460_H

RSCAN1GTINTSTS0L: <RSCAN1_base> + 0460_H

RSCAN1GTINTSTS0LL: <RSCAN1_base> + 0460_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 21.226 RSCAN1GTINTSTS0 Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned.
4	THIF0	Unit Channel Number 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Unit Channel Number 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Unit Channel Number 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Unit Channel Number 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Unit Channel Number 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFi Bits

The TSIFi bit is set to 1 when the TMIEp bit in the RSCAN1TMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCAN1TMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFi bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFi Bits

The TAIFi bit is set to 1 when the TAIE bit in the RSCAN1CmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCAN1TMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFi Bits

When the TXQIE bit in the RSCAN1TXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCAN1TXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFi bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCAN1TXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFi Bits

When the CFTXIE bit in the RSCAN1CFCCk register is set to 1 (transmit/receive FIFO buffer transmit interrupt enabled) and the CFTXIF bit in the RSCAN1CFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFi bit is set to 1.

When the CFTIFi bit is cleared to 0 under the conditions that the CFTIFi bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFi Bits

When the THLIE bit in the RSCAN1THLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCAN1THLSTSm register is set to 1 (transmit history interrupt request), the THIFi bit is set to 1.

When the THLIF bit in the RSCAN1THLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

21.16.11 RSCAN1GTSC — Global Timestamp Counter Register

Access: RSCAN1GTSC register is a read-only register that can be read in 32-bit units.
RSCAN1GTSCL register is a read-only register that can be read in 16-bit units.

Address: RSCAN1GTSC: <RSCAN1_base> + 0094_H

RSCAN1GTSCL: <RSCAN1_base> + 0094_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.227 RSCAN1GTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCAN1GCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

21.16.12 RSCAN1GAFLECTR — Receive Rule Entry Control Register

Access: RSCAN1GAFLECTR register can be read or written in 32-bit units.
RSCAN1GAFLECTRL register can be read or written in 16-bit units.
RSCAN1GAFLECTRLL, RSCAN1GAFLECTRLH registers can be read or written in 8-bit units.

Address: RSCAN1GAFLECTR: <RSCAN1_base> + 0098_H

RSCAN1GAFLECTRL: <RSCAN1_base> + 0098_H

RSCAN1GAFLECTRLL: <RSCAN1_base> + 0098_H,
RSCAN1GAFLECTRLH: <RSCAN1_base> + 0099_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.228 RSCAN1GAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected from a range of page 0 (00000_B) to page 23 (10111_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 10111_B.

21.16.13 RSCAN1GAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCAN1GAFLCFG0 register can be read or written in 32-bit units.
RSCAN1GAFLCFG0H register can be read or written in 16-bit units.
RSCAN1GAFLCFG0HH register can be read or written in 8-bit units.

Address: RSCAN1GAFLCFG0: <RSCAN1_base> + $009C_H$

RSCAN1GAFLCFG0H: <RSCAN1_base> + $009E_H$

RSCAN1GAFLCFG0HH: <RSCAN1_base> + $009F_H$

Value after reset: $0000\ 0000_H$

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.229 RSCAN1GAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Unit Channel Number 0 Set the number of receive rules exclusively used for Unit Channel Number 0.
23 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Modify the RSCAN1GAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules for each channel of the units should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the receive rule table for unit channel number 0.

Set these bits to a value within the range of 00_H to 80_H.

21.16.14 RSCAN1GAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access: RSCAN1GAFLIDj register can be read or written in 32-bit units.
RSCAN1GAFLIDjL, RSCAN1GAFLIDjH registers can be read or written in 16-bit units.
RSCAN1GAFLIDjLL, RSCAN1GAFLIDjLH, RSCAN1GAFLIDjHL, RSCAN1GAFLIDjHH registers can be read or written in 8-bit units.

Address: RSCAN1GAFLIDj: <RSCAN1_base> + 0500_H + (10_H × j)

RSCAN1GAFLIDjL: <RSCAN1_base> + 0500_H + (10_H × j),
RSCAN1GAFLIDjH: <RSCAN1_base> + 0502_H + (10_H × j)

RSCAN1GAFLIDjLL: <RSCAN1_base> + 0500_H + (10_H × j),
RSCAN1GAFLIDjLH: <RSCAN1_base> + 0501_H + (10_H × j),
RSCAN1GAFLIDjHL: <RSCAN1_base> + 0502_H + (10_H × j),
RSCAN1GAFLIDjHH: <RSCAN1_base> + 0503_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Table 21.230 RSCAN1GAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCAN1GAFLIDj register when the AFLDAE bit in the RSCAN1GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

21.16.15 RSCAN1GAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access: RSCAN1GAFLMj register can be read or written in 32-bit units.
RSCAN1GAFLMjL, RSCAN1GAFLMjH registers can be read or written in 16-bit units.
RSCAN1GAFLMjLL, RSCAN1GAFLMjLH, RSCAN1GAFLMjHL, RSCAN1GAFLMjHH registers can be read or written in 8-bit units.

Address: RSCAN1GAFLMj: <RSCAN1_base> + 0504_H + (10_H × j)

RSCAN1GAFLMjL: <RSCAN1_base> + 0504_H + (10_H × j),
RSCAN1GAFLMjH: <RSCAN1_base> + 0506_H + (10_H × j)

RSCAN1GAFLMjLL: <RSCAN1_base> + 0504_H + (10_H × j),
RSCAN1GAFLMjLH: <RSCAN1_base> + 0505_H + (10_H × j),
RSCAN1GAFLMjHL: <RSCAN1_base> + 0506_H + (10_H × j),
RSCAN1GAFLMjHH: <RSCAN1_base> + 0507_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDEM	GAFLRTRM	—	GAFLIDM[28:16]

Table 21.231 RSCAN1GAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared
29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCAN1GAFLMj register when the AFLDAE bit in the RSCAN1GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCAN1GAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

21.16.16 RSCAN1GAFLP0j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCAN1GAFLP0j register can be read or written in 32-bit units.
RSCAN1GAFLP0jL, RSCAN1GAFLP0jH registers can be read or written in 16-bit units.
RSCAN1GAFLP0jLH, RSCAN1GAFLP0jHL, RSCAN1GAFLP0jHH registers can be read or written in 8-bit units.

Address: RSCAN1GAFLP0j: <RSCAN1_base> + 0508_H + (10_H × j)

RSCAN1GAFLP0jL: <RSCAN1_base> + 0508_H + (10_H × j),
RSCAN1GAFLP0jH: <RSCAN1_base> + $050A_H$ + (10_H × j)

RSCAN1GAFLP0jLH: <RSCAN1_base> + 0509_H + (10_H × j),
RSCAN1GAFLP0jHL: <RSCAN1_base> + $050A_H$ + (10_H × j),
RSCAN1GAFLP0jHH: <RSCAN1_base> + $050B_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Table 21.232 RSCAN1GAFLP0j Register Contents

Bit Position	Bit Name	Function
31 to 28	GAFLDLC[3:0]	Receive Rule DLC b31 b30 b29 b28 0 0 0 0: DLC check is disabled. 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	GAFLPTR[11:0]	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Modify the RSCAN1GAFLP0j register when the AFLDAE bit in the RSCAN1GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCAN1RMNB register.

21.16.17 RSCAN1GAFLP1j — Receive Rule Pointer 1 Register (j = 0 to 15)

Access: RSCAN1GAFLP1j register can be read or written in 32-bit units.
RSCAN1GAFLP1jL register can be read or written in 16-bit units.
RSCAN1GAFLP1jLL, RSCAN1GAFLP1jLH registers can be read or written in 8-bit units.

Address: RSCAN1GAFLP1j: <RSCAN1_base> + $050C_H$ + (10_H × j)

RSCAN1GAFLP1jL: <RSCAN1_base> + $050C_H$ + (10_H × j)

RSCAN1GAFLP1jLL: <RSCAN1_base> + $050C_H$ + (10_H × j),
RSCAN1GAFLP1jLH: <RSCAN1_base> + $050D_H$ + (10_H × j)

Table 21.233 RSCAN1GAFLP1j Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	GAFLFDP[10:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCAN1GAFLP1j register when the AFLDAE bit in the RSCAN1GAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP [10:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCAN1GAFLP0j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCAN1CFCCk register are set to 00_B (receive mode) can be selected.

21.16.18 RSCAN1RMNB — Receive Buffer Number Register

Access: RSCAN1RMNB register can be read or written in 32-bit units.
RSCAN1RMNBL register can be read or written in 16-bit units.
RSCAN1RMNBLL register can be read or written in 8-bit units.

Address: RSCAN1RMNB: <RSCAN1_base> + $00A4_H$

RSCAN1RMNBL: <RSCAN1_base> + $00A4_H$

RSCAN1RMNBLL: <RSCAN1_base> + $00A4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.234 RSCAN1RMNB Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 16.

Modify the RSCAN1RMNB register only in global reset mode.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CAN module. The maximum value is 16 × (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

21.16.19 RSCAN1RMNDy — Receive Buffer New Data Register (y = 0)

Access: RSCAN1RMNDy register can be read or written in 32-bit units.
RSCAN1RMNDyL register can be read or written in 16-bit units.
RSCAN1RMNDyLL, RSCAN1RMNDyLH registers can be read or written in 8-bit units.

Address: RSCAN1RMNDy: <RSCAN1_base> + $00A8_H$ + (04_H × y)

RSCAN1RMNDyL: <RSCAN1_base> + $00A8_H$ + (04_H × y)

RSCAN1RMNDyLL: <RSCAN1_base> + $00A8_H$ + (04_H × y),
RSCAN1RMNDyLH: <RSCAN1_base> + $00A9_H$ + (04_H × y)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.235 RSCAN1RMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCAN1RMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to i × 16 + 15)

Each RMNS flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message.

These flags are cleared to 0 in global reset mode.

21.16.20 RSCAN1RMIDq — Receive Buffer ID Register (q = 0 to 15)

Access: RSCAN1RMIDq register is a read-only register that can be read in 32-bit units.
RSCAN1RMIDqL, RSCAN1RMIDqH registers are read-only registers that can be read in 16-bit units.
RSCAN1RMIDqLL, RSCAN1RMIDqLH, RSCAN1RMIDqHL, RSCAN1RMIDqHH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1RMIDq: <RSCAN1_base> + 0600_H + (10_H × q)

RSCAN1RMIDqL: <RSCAN1_base> + 0600_H + (10_H × q),
RSCAN1RMIDqH: <RSCAN1_base> + 0602_H + (10_H × q)

RSCAN1RMIDqLL: <RSCAN1_base> + 0600_H + (10_H × q),
RSCAN1RMIDqLH: <RSCAN1_base> + 0601_H + (10_H × q),
RSCAN1RMIDqHL: <RSCAN1_base> + 0602_H + (10_H × q),
RSCAN1RMIDqHH: <RSCAN1_base> + 0603_H + (10_H × q)

Value after reset: $0000\ 0000_H$

Table 21.236 RSCAN1RMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	When read, the value after reset is returned.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

21.16.21 RSCAN1RMPTRq — Receive Buffer Pointer Register (q = 0 to 15)

Access: RSCAN1RMPTRq register is a read-only register that can be read in 32-bit units.
RSCAN1RMPTRqL, RSCAN1RMPTRqH registers are read-only registers that can be read in 16-bit units.
RSCAN1RMPTRqLL, RSCAN1RMPTRqLH, RSCAN1RMPTRqHL, RSCAN1RMPTRqHH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1RMPTRq: <RSCAN1_base> + 0604_H + (10_H × q)

RSCAN1RMPTRqL: <RSCAN1_base> + 0604_H + (10_H × q),

27 to 16	RMPTR[11:0]	Receive Buffer Label Data Label information of the received message.
15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

21.16.22 RSCAN1RMDF0q — Receive Buffer Data Field 0 Register (q = 0 to 15)

Access: RSCAN1RMDF0q register is a read-only register that can be read in 32-bit units.
RSCAN1RMDF0qL, RSCAN1RMDF0qH registers are read-only registers that can be read in 16-bit units.
RSCAN1RMDF0qLL, RSCAN1RMDF0qLH, RSCAN1RMDF0qHL, RSCAN1RMDF0qHH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1RMDF0q: <RSCAN1_base> + 0608_H + (10_H × q)

RSCAN1RMDF0qL: <RSCAN1_base> + 0608_H + (10_H × q),
RSCAN1RMDF0qH: <RSCAN1_base> + $060A_H$ + (10_H × q)

RSCAN1RMDF0qLL: <RSCAN1_base> + 0608_H + (10_H × q),

Table 21.238 RSCAN1RMDF0q Register Contents

Bit Position	Bit Name	Function
31 to 24	RMDB3[7:0]	Receive Buffer Data Byte 3
23 to 16	RMDB2[7:0]	Receive Buffer Data Byte 2
15 to 8	RMDB1[7:0]	Receive Buffer Data Byte 1
7 to 0	RMDB0[7:0]	Receive Buffer Data Byte 0 Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCAN1RMPTRq register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

21.16.23 RSCAN1RMDF1q — Receive Buffer Data Field 1 Register (q = 0 to 15)

Access: RSCAN1RMDF1q register is a read-only register that can be read in 32-bit units.
RSCAN1RMDF1qL, RSCAN1RMDF1qH registers are read-only registers that can be read in 16-bit units.
RSCAN1RMDF1qLL, RSCAN1RMDF1qLH, RSCAN1RMDF1qHL, RSCAN1RMDF1qHH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1RMDF1q: <RSCAN1_base> + $060C_H$ + (10_H × q)

RSCAN1RMDF1qL: <RSCAN1_base> + $060C_H$ + (10_H × q),
RSCAN1RMDF1qH: <RSCAN1_base> + $060E_H$ + (10_H × q)

RSCAN1RMDF1qLL: <RSCAN1_base> + $060C_H$ + (10_H × q),

Table 21.239 RSCAN1RMDF1q Register Contents

Bit Position	Bit Name	Function
31 to 24	RMDB7[7:0]	Receive Buffer Data Byte 7
23 to 16	RMDB6[7:0]	Receive Buffer Data Byte 6
15 to 8	RMDB5[7:0]	Receive Buffer Data Byte 5
7 to 0	RMDB4[7:0]	Receive Buffer Data Byte 4 Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCAN1RMPTRq register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

21.16.24 RSCAN1RFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access: RSCAN1RFCCx register can be read or written in 32-bit units.
RSCAN1RFCCxL register can be read or written in 16-bit units.
RSCAN1RFCCxLL, RSCAN1RFCCxLH registers can be read or written in 8-bit units.

Address: RSCAN1RFCCx: <RSCAN1_base> + $00B8_H$ + (04_H × x)

RSCAN1RFCCxL: <RSCAN1_base> + $00B8_H$ + (04_H × x)

RSCAN1RFCCxLL: <RSCAN1_base> + $00B8_H$ + (04_H × x),

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.

Table 21.240 RSCAN1RFCCx Register Contents (2/2)

Bit Position	Bit Name	Function
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCAN1RFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

21.16.25 RSCAN1RFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RSCAN1RFSTSx register can be read or written in 32-bit units.
RSCAN1RFSTSxL register can be read or written in 16-bit units.
RSCAN1RFSTSxLL register can be read or written in 8-bit units.
RSCAN1RFSTSxLH register is a read-only register that can be read in 8-bit units.

Address: RSCAN1RFSTSx: <RSCAN1_base> + $00D8_H$ + (04_H × x)

RSCAN1RFSTSxL: <RSCAN1_base> + $00D8_H$ + (04_H × x)

RSCAN1RFSTSxLL: <RSCAN1_base> + $00D8_H$ + (04_H × x),
RSCAN1RFSTSxLH: <RSCAN1_base> + $00D9_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.241 RSCAN1RFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flags

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCAN1RFCCx register is set to 0.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCAN1RFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCAN1RFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCAN1RFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCAN1RFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

21.16.26 RSCAN1RFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RSCAN1RFPCTRx register is a write-only register that can be written in 32-bit units.
RSCAN1RFPCTRxL register is a write-only register that can be written in 16-bit units.
RSCAN1RFPCTRxLL register is a write-only register that can be written in 8-bit units.

Address: RSCAN1RFPCTRx: <RSCAN1_base> + $00F8_H$ + (04_H × x)

RSCAN1RFPCTRxL: <RSCAN1_base> + $00F8_H$ + (04_H × x)

RSCAN1RFPCTRxLL: <RSCAN1_base> + $00F8_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Table 21.242 RSCAN1RFPCTRx Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCAN1RFSTSx register is decremented. Read the RSCAN1RFIDx, RSCAN1RFPTRx, RSCAN1RFDF0x, and RSCAN1RFDF1x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCAN1RFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCAN1RFSTSx register is 0 (the receive FIFO buffer contains unread messages).

21.16.27 RSCAN1RFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RSCAN1RFIDx register is a read-only register that can be read in 32-bit units.
RSCAN1RFIDxL, RSCAN1RFIDxH registers are read-only registers that can be read in 16-bit units.
RSCAN1RFIDxLL, RSCAN1RFIDxLH, RSCAN1RFIDxHL, RSCAN1RFIDxHH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1RFIDx: <RSCAN1_base> + $0E00_H$ + (10_H × x)

RSCAN1RFIDxL: <RSCAN1_base> + $0E00_H$ + (10_H × x),
RSCAN1RFIDxH: <RSCAN1_base> + $0E02_H$ + (10_H × x)

29	Reserved	When read, the value after reset is returned.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

21.16.28 RSCAN1RFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RSCAN1RFPTRx register is a read-only register that can be read in 32-bit units.
RSCAN1RFPTRxL, RSCAN1RFPTRxH registers are read-only registers that can be read in 16-bit units.
RSCAN1RFPTRxLL, RSCAN1RFPTRxLH, RSCAN1RFPTRxHL, RSCAN1RFPTRxHH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1RFPTRx: <RSCAN1_base> + $0E04_H$ + (10_H × x)

RSCAN1RFPTRxL: <RSCAN1_base> + $0E04_H$ + (10_H × x),

15 to 0	RFTS[15:0]	Receive FIFO Buffer Timestamp Data Timestamp value of the received message can be read.

RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

21.16.29 RSCAN1RFDF0x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7)

Access: RSCAN1RFDF0x register is a read-only register that can be read in 32-bit units.
RSCAN1RFDF0xL, RSCAN1RFDF0xH registers are read-only registers that can be read in 16-bit units.
RSCAN1RFDF0xLL, RSCAN1RFDF0xLH, RSCAN1RFDF0xHL, RSCAN1RFDF0xHH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1RFDF0x: <RSCAN1_base> + $0E08_H$ + (10_H × x)

RSCAN1RFDF0xL: <RSCAN1_base> + $0E08_H$ + (10_H × x),

Table 21.247 RSCAN1CFCCk Register Contents (2/2)

Bit Position	Bit Name	Function
12	CFIM	Transmit/Receive FIFO Interrupt Source Select 0: • Receive mode When the number of received messages has met the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. • Transmit mode When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. 1: • Receive mode A FIFO receive interrupt request is generated each time a message has been received. • Transmit mode A FIFO transmit interrupt request is generated each time a message has been transmitted.
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	CFDC[2:0]	Transmit/Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode). There are three transmit/receive FIFO buffers per channel, so channel number i of FIFO buffer k is calculated as i = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer p will be ((16 × i) + CFTML[3:0]).

See **Table 21.214** and **Table 21.215**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCAN1GCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCAN1GCFG register × 10.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCAN1CFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCAN1CFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode: Channel communication mode or channel halt mode

21.16.32 RSCAN1CFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 2)

Access: RSCAN1CFSTSk register can be read or written in 32-bit units.
RSCAN1CFSTSkL register can be read or written in 16-bit units.
RSCAN1CFSTSkLL register can be read or written in 8-bit units.
RSCAN1CFSTSkLH register is a read-only register that can be read in 8-bit units.

Address: RSCAN1CFSTSk: <RSCAN1_base> + 0178_H + (04_H × k)

RSCAN1CFSTSkL: <RSCAN1_base> + 0178_H + (04_H × k)

RSCAN1CFSTSkLL: <RSCAN1_base> + 0178_H + (04_H × k),
RSCAN1CFSTSkLH: <RSCAN1_base> + 0179_H + (04_H × k)

Value after reset: $0000\ 0001_H$

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.248 RSCAN1CFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCAN1CFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer

- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B: In channel reset mode

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the factor selected by the CFIM bit in the RSCAN1CFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RSCAN1CFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCAN1CFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCAN1CFCCk register is 0 (no transmit/receive FIFO buffer is used): When not performing transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): When not performing transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCAN1CFPCTRk register after data was written to the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

21.16.33 RSCAN1CFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 2)

Access: RSCAN1CFPCTRk register is a write-only register that can be written in 32-bit units.
RSCAN1CFPCTRkL register is a write-only register that can be written in 16-bit units.
RSCAN1CFPCTRkLL register is a write-only register that can be written in 8-bit units.

Address: RSCAN1CFPCTRk: <RSCAN1_base> + $01D8_H$ + (04_H × k)

RSCAN1CFPCTRkL: <RSCAN1_base> + $01D8_H$ + (04_H × k)

RSCAN1CFPCTRkLL: <RSCAN1_base> + $01D8_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 21.249 RSCAN1CFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer.

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCAN1CFCCk register is 00_B):
  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCAN1CFSTSk register is decremented. Read the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCAN1CFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCAN1CFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCAN1CFCCk register is 01_B):
  Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers before writing FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCAN1CFCCk register is set to 1 and the CFFLL flag in the RSCAN1CFSTSk register is 0 (the transmit/receive FIFO buffer is not full).

21.16.34 RSCAN1CFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 2)

Access: RSCAN1CFIDk register can be read or written in 32-bit units.
RSCAN1CFIDkL, RSCAN1CFIDkH registers can be read or written in 16-bit units.
RSCAN1CFIDkLL, RSCAN1CFIDkLH, RSCAN1CFIDkHL, RSCAN1CFIDkHH registers can be read or written in 8-bit units.

Address: RSCAN1CFIDk: <RSCAN1_base> + $0E80_H$ + (10_H × k)

RSCAN1CFIDkL: <RSCAN1_base> + $0E80_H$ + (10_H × k),
RSCAN1CFIDkH: <RSCAN1_base> + $0E82_H$ + (10_H × k)

RSCAN1CFIDkLL: <RSCAN1_base> + $0E80_H$ + (10_H × k),
RSCAN1CFIDkLH: <RSCAN1_base> + $0E81_H$ + (10_H × k),
RSCAN1CFIDkHL: <RSCAN1_base> + $0E82_H$ + (10_H × k),

Table 21.250 RSCAN1CFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCAN1CFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, these bits are used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

21.16.35 RSCAN1CFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 2)

Access: RSCAN1CFPTRk register can be read or written in 32-bit units.
RSCAN1CFPTRkL, RSCAN1CFPTRkH registers can be read or written in 16-bit units.
RSCAN1CFPTRkLL, RSCAN1CFPTRkLH, RSCAN1CFPTRkHL, RSCAN1CFPTRkHH registers can be read or written in 8-bit units.

Address: RSCAN1CFPTRk: <RSCAN1_base> + $0E84_H$ + (10_H × k)

RSCAN1CFPTRkL: <RSCAN1_base> + $0E84_H$ + (10_H × k),
RSCAN1CFPTRkH: <RSCAN1_base> + $0E86_H$ + (10_H × k)

RSCAN1CFPTRkLL: <RSCAN1_base> + $0E84_H$ + (10_H × k),
RSCAN1CFPTRkLH: <RSCAN1_base> + $0E85_H$ + (10_H × k),
RSCAN1CFPTRkHL: <RSCAN1_base> + $0E86_H$ + (10_H × k),
RSCAN1CFPTRkHH: <RSCAN1_base> + $0E87_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Table 21.251 RSCAN1CFPTRk Register Contents

Bit Position	Bit Name	Function
31 to 28	CFDLC[3:0]	Transmit/Receive FIFO Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCAN1CFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 9 bytes or more, the actual transmit data defaults to 8 bytes.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

21.16.36 RSCAN1CFDF0k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 2)

Access: RSCAN1CFDF0k register can be read or written in 32-bit units.
RSCAN1CFDF0kL, RSCAN1CFDF0kH registers can be read or written in 16-bit units.
RSCAN1CFDF0kLL, RSCAN1CFDF0kLH, RSCAN1CFDF0kHL, RSCAN1CFDF0kHH registers can be read or written in 8-bit units.

Address: RSCAN1CFDF0k: <RSCAN1_base> + $0E88_H$ + (10_H × k)

RSCAN1CFDF0kL: <RSCAN1_base> + $0E88_H$ + (10_H × k),
RSCAN1CFDF0kH: <RSCAN1_base> + $0E8A_H$ + (10_H × k)

RSCAN1CFDF0kLL: <RSCAN1_base> + $0E88_H$ + (10_H × k),
RSCAN1CFDF0kLH: <RSCAN1_base> + $0E89_H$ + (10_H × k),

Bit Position	Bit Name	Function
31 to 24	CFDB7[7:0]	Transmit/Receive FIFO Buffer Data Byte 7 Transmit/Receive FIFO Buffer Data Byte 6 Transmit/Receive FIFO Buffer Data Byte 5 Transmit/Receive FIFO Buffer Data Byte 4 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.
23 to 16	CFDB6[7:0]	
15 to 8	CFDB5[7:0]	
7 to 0	CFDB4[7:0]	

This register is writable only when the CFM[1:0] value in the RSCAN1CFCCk register is 01_B (transmit mode).

This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCAN1CFPTRk register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

21.16.38 RSCAN1FESTS — FIFO Empty Status Register

Access: RSCAN1FESTS register is a read-only register that can be read in 32-bit units.
RSCAN1FESTSL register is a read-only register that can be read in 16-bit units.
RSCAN1FESTSLL, RSCAN1FESTSLH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1FESTS: <RSCAN1_base> + 0238_H

RSCAN1FESTSL: <RSCAN1_base> + 0238_H

RSCAN1FESTSLL: <RSCAN1_base> + 0238_H,
RSCAN1FESTSLH: <RSCAN1_base> + 0239_H

Value after reset: $0001\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.254 RSCAN1FESTS Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned.
10	CF2EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 2)
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCAN1FESTS register is set to $0001\ FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 2)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCAN1CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCAN1RFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

21.16.39 RSCAN1FFSTS — FIFO Full Status Register

Access: RSCAN1FFSTS register is a read-only register that can be read in 32-bit units.
RSCAN1FFSTSL register is a read-only register that can be read in 16-bit units.
RSCAN1FFSTSLL, RSCAN1FFSTSLH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1FFSTS: <RSCAN1_base> + $023C_H$

RSCAN1FFSTSL: <RSCAN1_base> + $023C_H$

RSCAN1FFSTSLL: <RSCAN1_base> + $023C_H$,
RSCAN1FFSTSLH: <RSCAN1_base> + $023D_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.255 RSCAN1FFSTS Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned.
10	CF2FLL	Transmit/Receive FIFO Buffer Full Status Flag 0: Transmit/receive buffer k is not full. 1: Transmit/receive buffer k is full. (k = 0 to 2)
9	CF1FLL	
8	CF0FLL	
7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCAN1FFSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkFLL Flag (k = 0 to 2)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCAN1CFSTSk register is set to 1 (the transmit/receive FIFO buffer is full). When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCAN1RFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

21.16.40 RSCAN1FMSTS — FIFO Message Lost Status Register

Access: RSCAN1FMSTS register is a read-only register that can be read in 32-bit units.
RSCAN1FMSTSL register is a read-only register that can be read in 16-bit units.
RSCAN1FMSTSLL, RSCAN1FMSTSLH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1FMSTS: <RSCAN1_base> + 0240_H

RSCAN1FMSTSL: <RSCAN1_base> + 0240_H

RSCAN1FMSTSLL: <RSCAN1_base> + 0240_H,
RSCAN1FMSTSLH: <RSCAN1_base> + 0241_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.256 RSCAN1FMSTS Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned.
10	CF2MLT	Transmit/Receive FIFO Buffer Message Lost Status Flag 0: No transmit/receive FIFO buffer k message is lost. 1: A transmit/receive FIFO buffer k message is lost. (k = 0 to 2)
9	CF1MLT	
8	CF0MLT	
7	RF7MLT	Receive FIFO Buffer Message Lost Status Flag 0: No receive FIFO buffer x message is lost. 1: A receive FIFO buffer x message is lost. (x = 0 to 7)
6	RF6MLT	
5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCAN1FMSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkMLT Flag (k = 0 to 2)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCAN1CFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCAN1RFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

21.16.41 RSCAN1RFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCAN1RFISTS register is a read-only register that can be read in 32-bit units.
RSCAN1RFISTSL register is a read-only register that can be read in 16-bit units.
RSCAN1RFISTSLL register is a read-only register that can be read in 8-bit units.

Address: RSCAN1RFISTS: <RSCAN1_base> + 0244_H

RSCAN1RFISTSL: <RSCAN1_base> + 0244_H

RSCAN1RFISTSLL: <RSCAN1_base> + 0244_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.257 RSCAN1RFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCAN1RFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCAN1RFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

21.16.42 RSCAN1CFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCAN1CFRISTS register is a read-only register that can be read in 32-bit units.
RSCAN1CFRISTSL register is a read-only register that can be read in 16-bit units.
RSCAN1CFRISTSLL register is a read-only register that can be read in 8-bit units.

Address: RSCAN1CFRISTS: <RSCAN1_base> + 0248_H

RSCAN1CFRISTSL: <RSCAN1_base> + 0248_H

RSCAN1CFRISTSLL: <RSCAN1_base> + 0248_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.258 RSCAN1CFRISTS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	CF2RXIF	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 2)
1	CF1RXIF	
0	CF0RXIF	

The RSCAN1CFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkRXIF Flag (k = 0 to 2)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCAN1CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

21.16.43 RSCAN1CFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCAN1CFTISTS register is a read-only register that can be read in 32-bit units.
RSCAN1CFTISTSL register is a read-only register that can be read in 16-bit units.
RSCAN1CFTISTSLL register is a read-only register that can be read in 8-bit units.

Address: RSCAN1CFTISTS: <RSCAN1_base> + $024C_H$

RSCAN1CFTISTSL: <RSCAN1_base> + $024C_H$

RSCAN1CFTISTSLL: <RSCAN1_base> + $024C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CF2TXIF	CF1TXIF	CF0TXIF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.259 RSCAN1CFTISTS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	CF2TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 2)
1	CF1TXIF	
0	CF0TXIF	

The RSCAN1CFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkTXIF Flag (k = 0 to 2)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCAN1CFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

21.16.44 RSCAN1TMCp — Transmit Buffer Control Register (p = 0 to i × 16 + 15)

Access: RSCAN1TMCp register can be read or written in 8-bit units.

Address: RSCAN1TMCp: <RSCAN1_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 21.260 RSCAN1TMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCAN1TMCp register meets any of the following conditions, set it to 00_H.

- The RSCAN1TMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCAN1CFCCk register (p = i × 16 + the value of CFTML[3:0] bits).
- The RSCAN1TMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCAN1TXQCCm (m = 6) register. (p = (i × 16 + 15) to (i × 16 + 15 – the value of TXQDC[3:0] bits)).

Bits in the RSCAN1TMCp register are all cleared to 0 in channel reset mode. Modify the RSCAN1TMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCAN1TMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCAN1TMSTSp register is 00_B.

21.16.45 RSCAN1TMSTSp — Transmit Buffer Status Register (p = 0 to 15)

Access: RSCAN1TMSTSp register can be read or written in 8-bit units.

Address: RSCAN1TMSTSp: <RSCAN1_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 21.261 RSCAN1TMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCAN1TMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCAN1TMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCAN1TMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCAN1TMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCAN1TMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCAN1TMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCAN1TMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

21.16.46 RSCAN1TMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0)

Access: RSCAN1TMTRSTSy register is a read-only register that can be read in 32-bit units.
RSCAN1TMTRSTSyL register is a read-only register that can be read in 16-bit units.
RSCAN1TMTRSTSyLL, RSCAN1TMTRSTSyLH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1TMTRSTSy: <RSCAN1_base> + 0350_H + (04_H × y)

RSCAN1TMTRSTSyL: <RSCAN1_base> + 0350_H + (04_H × y)

RSCAN1TMTRSTSyLL: <RSCAN1_base> + 0350_H + (04_H × y),

31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 15)

These flags indicate the status of the TMTR bit in the RSCAN1TMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 21.263 shows the bit assignment.

Table 21.263 TMTRSTSp Bit Assignment

Table 21.272 RSCAN1TMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCAN1TMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = i × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

THLEN Bit

With this bit set to 1, the transmit history data of the message transmitted (label information and the number and type) are stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

21.16.52 RSCAN1TMPTRp — Transmit Buffer Pointer Register (p = 0 to 15)

Access: RSCAN1TMPTRp register can be read or written in 32-bit units.
RSCAN1TMPTRpH register can be read or written in 16-bit units.
RSCAN1TMPTRpHL, RSCAN1TMPTRpHH registers can be read or written in 8-bit units.

Address: RSCAN1TMPTRp: <RSCAN1_base> + 1004_H + (10_H × p)

RSCAN1TMPTRpH: <RSCAN1_base> + 1006_H + (10_H × p)

RSCAN1TMPTRpHL: <RSCAN1_base> + 1006_H + (10_H × p),
RSCAN1TMPTRpHH: <RSCAN1_base> + 1007_H + (10_H × p)

Value after reset: 0000 0000_H

Table 21.273 RSCAN1TMPTRp Register Contents

Bit Position	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCAN1TMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = i × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCAN1TMIDp register is set to 0 (data frame). If the data length is set to 9 bytes or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), set the data length of messages to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

21.16.53 RSCAN1TMDF0p — Transmit Buffer Data Field 0 Register (p = 0 to 15)

Access: RSCAN1TMDF0p register can be read or written in 32-bit units.
RSCAN1TMDF0pL, RSCAN1TMDF0pH registers can be read or written in 16-bit units.
RSCAN1TMDF0pLL, RSCAN1TMDF0pLH, RSCAN1TMDF0pHL, RSCAN1TMDF0pHH registers can be read or written in 8-bit units.

Address: RSCAN1TMDF0p: <RSCAN1_base> + 1008_H + (10_H × p)

RSCAN1TMDF0pL: <RSCAN1_base> + 1008_H + (10_H × p),

Table 21.275 RSCAN1TMDF1p Register Contents

Bit Position	Bit Name	Function
31 to 24	TMDB7[7:0]	Transmit Buffer Data Byte 7
23 to 16	TMDB6[7:0]	Transmit Buffer Data Byte 6
15 to 8	TMDB5[7:0]	Transmit Buffer Data Byte 5
7 to 0	TMDB4[7:0]	Transmit Buffer Data Byte 4 Set the transmit buffer data.

Modify this register when the TMTRM bit in the corresponding RSCAN1TMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = i × 16 + 15) for the corresponding channel.

21.16.55 RSCAN1TXQCCm — Transmit Queue Configuration and Control Register (m = 6)

Access: RSCAN1TXQCCm register can be read or written in 32-bit units.
RSCAN1TXQCCmL register can be read or written in 16-bit units.
RSCAN1TXQCCmLL, RSCAN1TXQCCmLH registers can be read or written in 8-bit units.

Address: RSCAN1TXQCCm: <RSCAN1_base> + $03A0_H$ + (04_H × i)

RSCAN1TXQCCmL: <RSCAN1_base> + $03A0_H$ + (04_H × i)

RSCAN1TXQCCmLL: <RSCAN1_base> + $03A0_H$ + (04_H × i),
RSCAN1TXQCCmLH: <RSCAN1_base> + $03A1_H$ + (04_H × i)

Value after reset: $0000\ 0000_H$

Table 21.276 RSCAN1TXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (i × 16 + 15) to (i × 16 + 0). For examples of how buffer allocation is done, see **Figure 21.47**. Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

21.16.56 RSCAN1TXQSTSm — Transmit Queue Status Register (m = 6)

Access: RSCAN1TXQSTSm register can be read or written in 32-bit units.
RSCAN1TXQSTSmL register can be read or written in 16-bit units.
RSCAN1TXQSTSmLL register can be read or written in 8-bit units.

Address: RSCAN1TXQSTSm: <RSCAN1_base> + $03C0_H$ + (04_H × i)

RSCAN1TXQSTSmL: <RSCAN1_base> + $03C0_H$ + (04_H × i)

RSCAN1TXQSTSmLL: <RSCAN1_base> + $03C0_H$ + (04_H × i)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.277 RSCAN1TXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	Reserved	When read, the undefined value is returned. When writing, write “0”.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCAN1TXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCAN1TXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCAN1TXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

21.16.57 RSCAN1TXQPCTRm — Transmit Queue Pointer Control Register (m = 6)

Access: RSCAN1TXQPCTRm register is a write-only register that can be written in 32-bit units.
RSCAN1TXQPCTRmL register is a write-only register that can be written in 16-bit units.
RSCAN1TXQPCTRmLL register is a write-only register that can be written in 8-bit units.

Address: RSCAN1TXQPCTRm: <RSCAN1_base> + $03E0_H$ + (04_H × i)

RSCAN1TXQPCTRmL: <RSCAN1_base> + $03E0_H$ + (04_H × i)

RSCAN1TXQPCTRmLL: <RSCAN1_base> + $03E0_H$ + (04_H × i)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 21.278 RSCAN1TXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCAN1TMIDp, RSCAN1TMPTRp, RSCAN1TMDF0p, and RSCAN1TMDF1p registers (p = 15, 31, 47, 63, 79, and 95) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCAN1TXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCAN1TXQSTSm register is 0 (the transmit queue is not full).

21.16.58 RSCAN1THLCCm — Transmit History Configuration and Control Register (m = 6)

Access: RSCAN1THLCCm register can be read or written in 32-bit units.
RSCAN1THLCCmL register can be read or written in 16-bit units.
RSCAN1THLCCmLL, RSCAN1THLCCmLH registers can be read or written in 8-bit units.

Address: RSCAN1THLCCm: <RSCAN1_base> + 0400_H + (04_H × i)

RSCAN1THLCCmL: <RSCAN1_base> + 0400_H + (04_H × i)

RSCAN1THLCCmLL: <RSCAN1_base> + 0400_H + (04_H × i),
RSCAN1THLCCmLH: <RSCAN1_base> + 0401_H + (04_H × i)

Value after reset: $0000\ 0000_H$

R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Table 21.279 RSCAN1THLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

21.16.59 RSCAN1THLSTSm — Transmit History Status Register (m = 6)

Access: RSCAN1THLSTSm register can be read or written in 32-bit units.
RSCAN1THLSTSmL register can be read or written in 16-bit units.
RSCAN1THLSTSmLL register can be read or written in 8-bit units.
RSCAN1THLSTSmLH register is a read-only register that can be read in 8-bit units.

Address: RSCAN1THLSTSm: <RSCAN1_base> + 0420_H + (04_H × i)

RSCAN1THLSTSmL: <RSCAN1_base> + 0420_H + (04_H × i)

RSCAN1THLSTSmLL: <RSCAN1_base> + 0420_H + (04_H × i),
RSCAN1THLSTSmLH: <RSCAN1_base> + 0421_H + (04_H × i)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THLEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.280 RSCAN1THLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCAN1THLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCAN1THLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCAN1THLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

21.16.60 RSCAN1THLACCm — Transmit History Access Register (m = 6)

Access: RSCAN1THLACCm register is a read-only register that can be read in 32-bit units.
RSCAN1THLACCmL register is a read-only register that can be read in 16-bit units.
RSCAN1THLACCmLL, RSCAN1THLACCmLH registers are read-only registers that can be read in 8-bit units.

Address: RSCAN1THLACCm: <RSCAN1_base> + 1800_H + (04_H × i)

RSCAN1THLACCmL: <RSCAN1_base> + 1800_H + (04_H × i)

RSCAN1THLACCmLL: <RSCAN1_base> + 1800_H + (04_H × i),
RSCAN1THLACCmLH: <RSCAN1_base> + 1801_H + (04_H × i)

Value after reset: $0000\ 0000_H$

Table 21.281 RSCAN1THLACCm Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	When read, the value after reset is returned.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

21.16.61 RSCAN1THLPCTRm — Transmit History Pointer Control Register (m = 6)

Access: RSCAN1THLPCTRm register is a write-only register that can be written in 32-bit units.
RSCAN1THLPCTRmL register is a write-only register that can be written in 16-bit units.
RSCAN1THLPCTRmLL register is a write-only register that can be written in 8-bit units.

Address: RSCAN1THLPCTRm: <RSCAN1_base> + 0440_H + (04_H × i)

RSCAN1THLPCTRmL: <RSCAN1_base> + 0440_H + (04_H × i)

RSCAN1THLPCTRmLL: <RSCAN1_base> + 0440_H + (04_H × i)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 21.282 RSCAN1THLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCAN1THLSTSm register is decremented. Write FF_H to the THLPC[7:0] bits after reading from the RSCAN1THLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCAN1THLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCAN1THLSTSm register is 0.

21.16.62 RSCAN1GTSTCFG — Global Test Configuration Register

Access: RSCAN1GTSTCFG register can be read or written in 32-bit units.
RSCAN1GTSTCFGH register can be read or written in 16-bit units.
RSCAN1GTSTCFGHL register can be read or written in 8-bit units.

Address: RSCAN1GTSTCFG: <RSCAN1_base> + 0468_H

RSCAN1GTSTCFGH: <RSCAN1_base> + $046A_H$

RSCAN1GTSTCFGHL: <RSCAN1_base> + $046A_H$

Table 21.284 RSCAN1GTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

1. Set the GMDC[1:0] bits in the RSCAN1GCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

21.16.64 RSCAN1GLOCKK — Global Lock Key Register

Access: RSCAN1GLOCKK register is a write-only register that can be written in 32-bit units.
RSCAN1GLOCKKL register is a write-only register that can be written in 16-bit units.

Address: RSCAN1GLOCKK: <RSCAN1_base> + $047C_H$

RSCAN1GLOCKKL: <RSCAN1_base> + $047C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. Writing to these bits is effective only when the RS-CAN module is in global test mode.

Table 21.285 RSCAN1GLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCAN1GLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 21.22.4.2, Procedure for Releasing the Protection**.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCAN1GTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCAN1_base> + 0000_H to <RSCAN1_base> + $04FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/wring to other areas does not enable the protection.

21.16.65 RSCAN1RPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access: RSCAN1RPGACCr register can be read or written in 32-bit units.
RSCAN1RPGACCrL, RSCAN1RPGACCrH registers can be read or written in 16-bit units.
RSCAN1RPGACCrLL, RSCAN1RPGACCrLH, RSCAN1RPGACCrHL, RSCAN1RPGACCrHH registers can be read or written in 8-bit units.

Address: RSCAN1RPGACCr: <RSCAN1_base> + 1900_H + (04_H × r)

RSCAN1RPGACCrL: <RSCAN1_base> + 1900_H + (04_H × r),
RSCAN1RPGACCrH: <RSCAN1_base> + 1902_H + (04_H × r)

RSCAN1RPGACCrLL: <RSCAN1_base> + 1900_H + (04_H × r),
RSCAN1RPGACCrLH: <RSCAN1_base> + 1901_H + (04_H × r),
RSCAN1RPGACCrHL: <RSCAN1_base> + 1902_H + (04_H × r),
RSCAN1RPGACCrHH: <RSCAN1_base> + 1903_H + (04_H × r)

Value after reset: $0000\ 0000_H$

Table 21.286 RSCAN1RPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA [31:0]	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCAN1RPGACCr register in global test mode with the RTME bit in the RSCAN1GTSTCTR register set to 1 (RAM test is enabled).

The RSCAN1RPGACCr register is readable and writable when the RTME bit is set to 1.

21.17 Interrupt Sources

The RS-CAN module has 5 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources/unit)
  Receive FIFO interrupt (1 source/unit)
  Global error interrupt (1 source/unit)
- Channel interrupts (3 sources/channel):
  CANm transmit interrupt (m = 6)
  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

  CANm transmit/receive FIFO receive complete interrupt (in receive mode)
  CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CAN module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

Table 21.287 lists the CAN interrupt sources. **Figure 21.40** shows the CAN global interrupt block diagram. **Figure 21.41** shows the CAN channel interrupt block diagram.

Table 21.287 List of CAN Interrupt Sources

Interrupt Source			Corresponding Interrupt Request Flag	Corresponding Interrupt Enable Bit
Global interrupts	Receive FIFO	Receive FIFO 0	RFIF in the RSCAN1RFSTS0 register	RFIE in the RSCAN1RFCC0 register
		Receive FIFO 1	RFIF in the RSCAN1RFSTS1 register	RFIE in the RSCAN1RFCC1 register
		Receive FIFO 2	RFIF in the RSCAN1RFSTS2 register	RFIE in the RSCAN1RFCC2 register
		Receive FIFO 3	RFIF in the RSCAN1RFSTS3 register	RFIE in the RSCAN1RFCC3 register
		Receive FIFO 4	RFIF in the RSCAN1RFSTS4 register	RFIE in the RSCAN1RFCC4 register
		Receive FIFO 5	RFIF in the RSCAN1RFSTS5 register	RFIE in the RSCAN1RFCC5 register
		Receive FIFO 6	RFIF in the RSCAN1RFSTS6 register	RFIE in the RSCAN1RFCC6 register
		Receive FIFO 7	RFIF in the RSCAN1RFSTS7 register	RFIE in the RSCAN1RFCC7 register
	Global error		• DEF in the RSCAN1GERFL register • MES in the RSCAN1GERFL register • THLES in the RSCAN1GERFL register	• DEIE in the RSCAN1GCTR register • MEIE in the RSCAN1GCTR register • THLEIE in the RSCAN1GCTR register
Channel interrupts (m = 6)	CANm transmit	CANm transmit complete	TMTRF[1:0] in the RSCAN1TMSTSp register	TMIEp in the RSCAN1TMIECy register
		CANm transmit abort	TMTRF[1:0] in the RSCAN1TMSTSp register	TAIE in the RSCAN1CmCTR register
		CANm transmit/receive FIFO transmit complete	CFTXIF in the RSCAN1CFSTSk register	CFTXIE in the RSCAN1CFCCk register
		CANm transmit queue	TXQIF in the RSCAN1TXQSTSm register	TXQIE in the RSCAN1TXQCCm register
		CANm transmit history	THLIF in the RSCAN1THLSTSm register	THLIE in the RSCAN1THLCCm register
	CANm transmit/receive FIFO receive complete		CFRXIF in the RSCAN1CFSTSk register	CFRXIE in the RSCAN1CFCCk register
	CANm error		• BEF in the RSCAN1CmERFL register • ALF in the RSCAN1CmERFL register • BLF in the RSCAN1CmERFL register • OVLF in the RSCAN1CmERFL register • BORF in the RSCAN1CmERFL register • BOEF in the RSCAN1CmERFL register • EPF in the RSCAN1CmERFL register • EWF in the RSCAN1CmERFL register	• BEIE in the RSCAN1CmCTR register • ALIE in the RSCAN1CmCTR register • BLIE in the RSCAN1CmCTR register • OLIE in the RSCAN1CmCTR register • BORIE in the RSCAN1CmCTR register • BOEIE in the RSCAN1CmCTR register • EPIE in the RSCAN1CmCTR register • EWIE in the RSCAN1CmCTR register

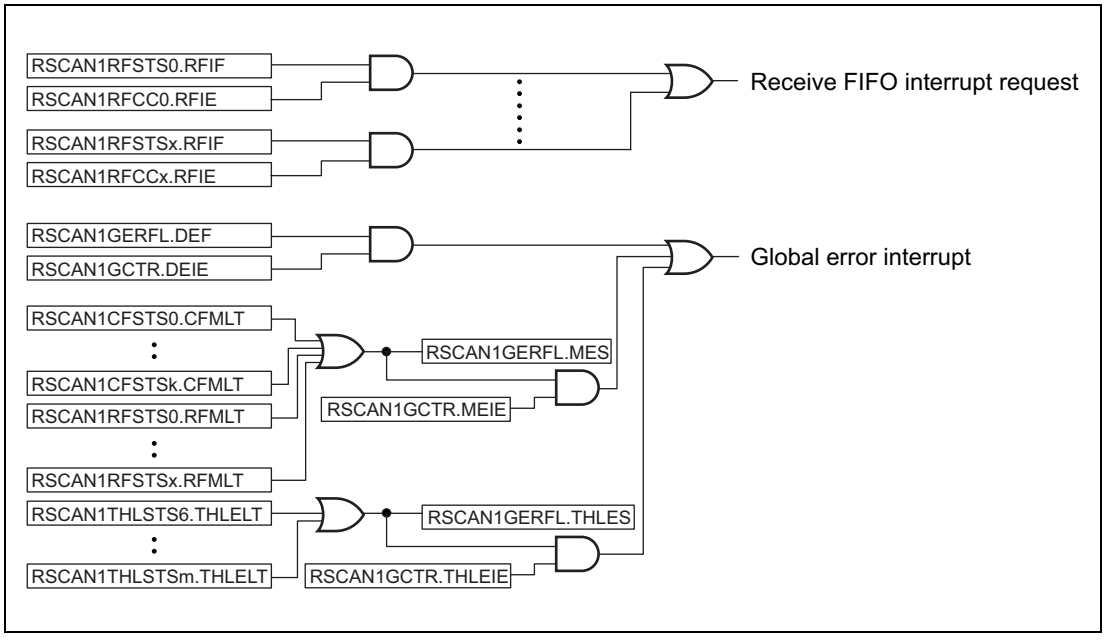

Figure 21.40 CAN Global Interrupt Block Diagram

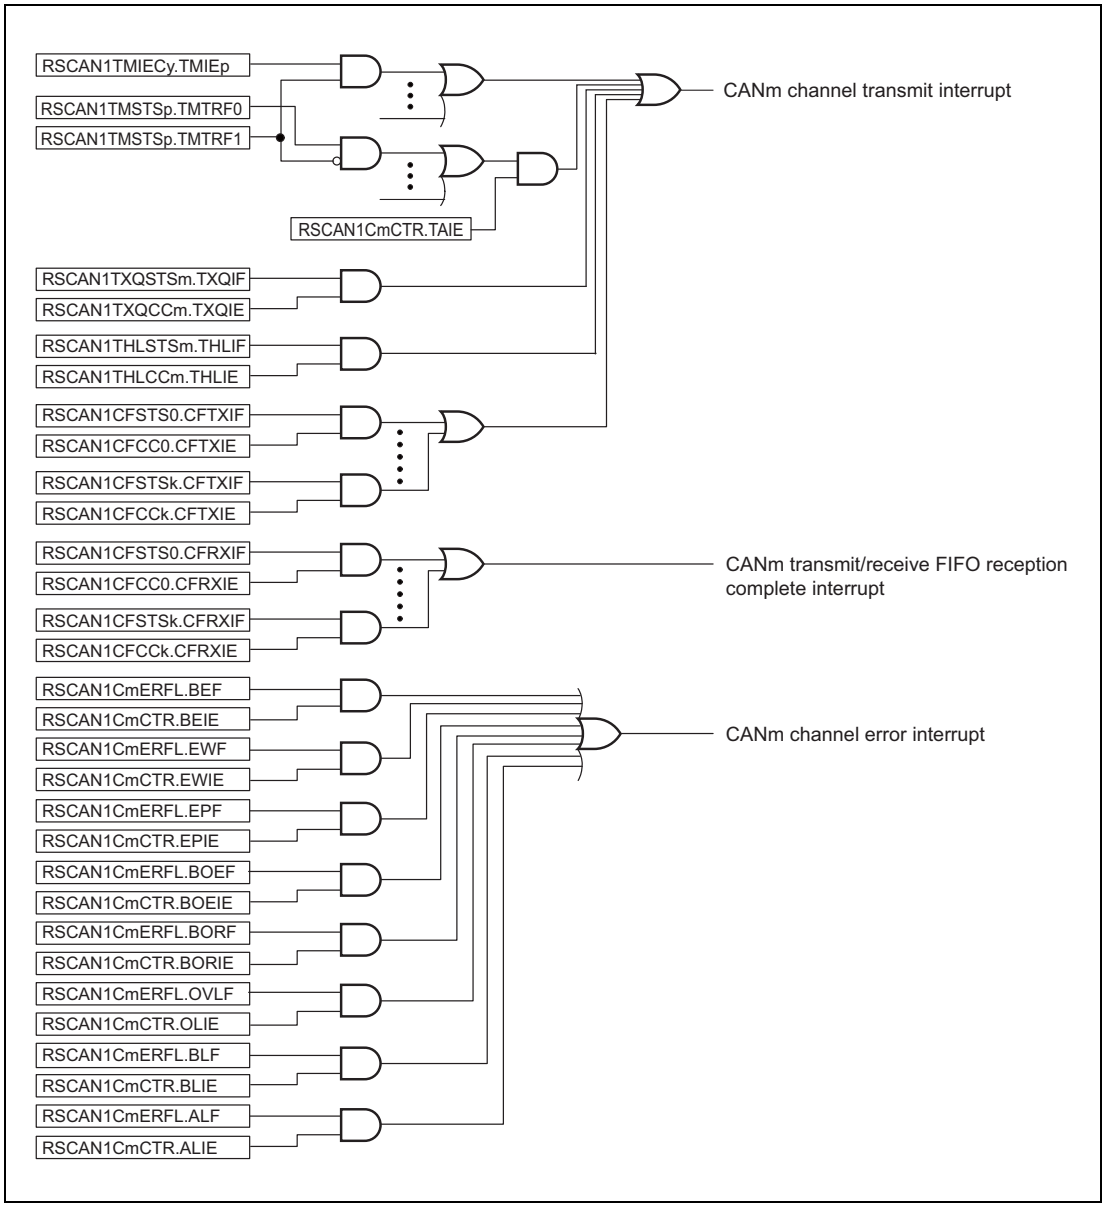

Figure 21.41 CAN Channel Interrupt Block Diagram

21.18 CAN Modes

The RS-CAN module has four global modes to control the entire RS-CAN module status and four channel modes to control individual channel status. Details of global modes are described in **Section 21.18.1, Global Modes**, and details of channel modes are described in **Section 21.18.2, Channel Modes**.

- Global stop mode: Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs the RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channels.
- Channel halt mode: Stops CAN communication and allows channel testing.
- Channel communication mode: Performs CAN communication.

21.18.1 Global Modes

Figure 21.42 shows the transitions of global modes.

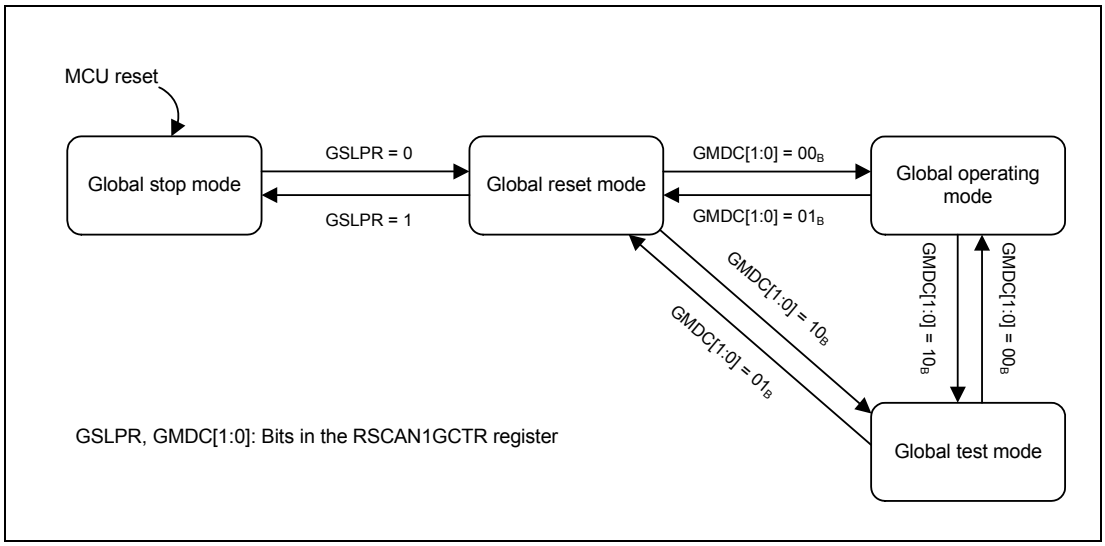

Figure 21.42 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. **Table 21.288** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 21.288 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

Channel Mode before Setting	Channel Mode after Setting			
	GMDC[1:0] = 00_B GSLPR = 0 (Global Operation)	GMDC[1:0] = 10_B GSLPR = 0 (Global Test)	GMDC[1:0] = 01_B GSLPR = 0 (Global Reset)	GMDC[1:0] = 01_B GSLPR = 1 (Global Stop)
Channel communication	Channel communication	Channel halt	Channel reset	Transition prohibited
Channel halt	Channel halt	Channel halt	Channel reset	Transition prohibited
Channel reset	Channel reset	Channel reset	Channel reset	Channel stop
Channel stop	Channel stop	Channel stop	Channel stop	Channel stop

Note: GMDC[1:0], GSLPR: Bits in the RSCAN1GCTR register

Table 21.289 shows the global mode transition time.

Table 21.289 Global Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Global stop	Global reset	Three pclk cycles
Global reset	Global stop	Three pclk cycles
Global reset	Global test	Ten pclk cycles
Global reset	Global operating	Ten pclk cycles
Global test	Global reset	Three pclk cycles
Global test	Global operating	Three pclk cycles
Global operating	Global reset	Three pclk cycles
Global operating	Global test	Two CAN frames*1

Note 1. CAN frame time of the lowest communication speed of the channels in use

21.18.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the CAN module transitions to global stop mode. Setting the GSLPR bit in the RSCAN1GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each of the RSCAN1CmCTR register to 1 (channel stop mode). If all channels are forced to transition to channel stop mode, the CAN module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

21.18.1.2 Global Reset Mode

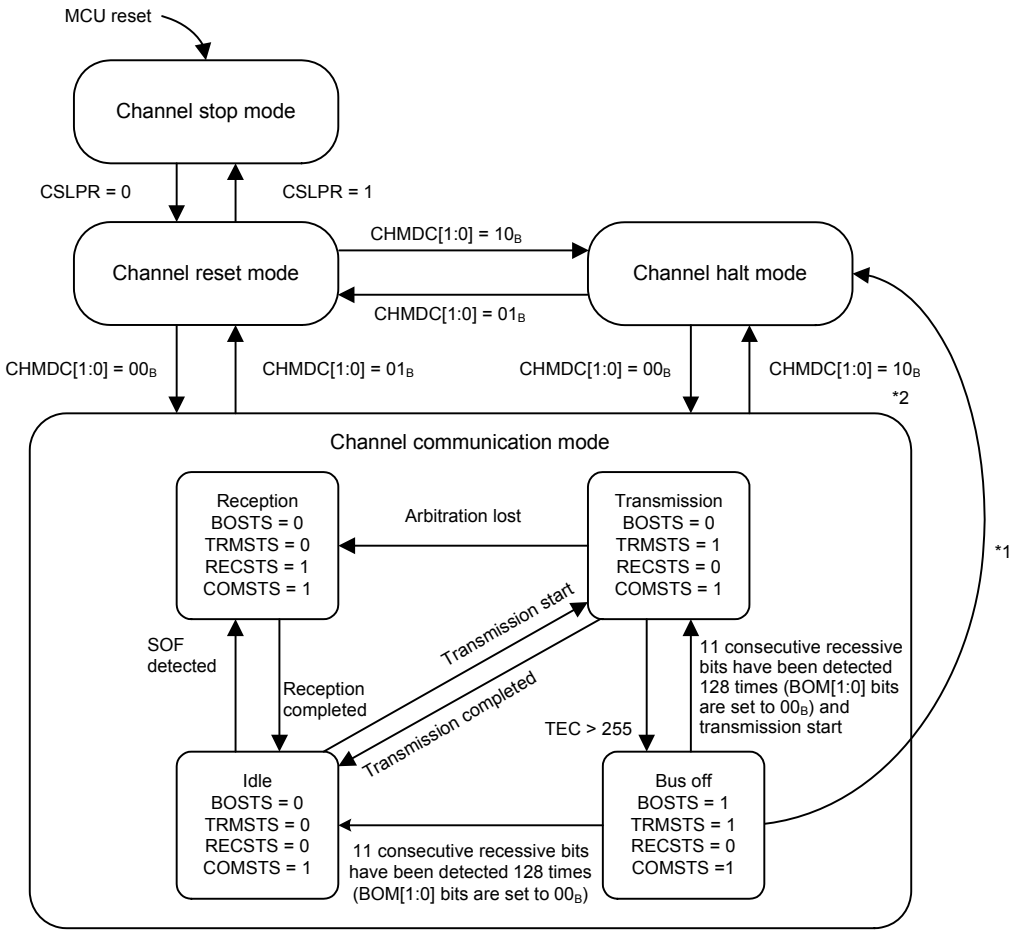
In global reset mode, RS-CAN module settings are performed. When the RS-CAN module transitions to global reset mode, some registers are initialized. **Table 21.292** and **Table 21.293** list the registers to be initialized.

Setting the GMDC[1:0] bits in the RSCAN1GCTR register to 01_B sets the CHMDC[1:0] bits in each of the RSCAN1CmCTR registers (m = 6) to 01_B (channel reset mode). If all channels are forced to transition to channel reset mode, the CAN module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01_B).

21.18.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCAN1GCTR register to 10_B sets the CHMDC[1:0] bits in each of the RSCAN1CmCTR register to 10_B (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.



21.18.1.4 Global Operating Mode

The RS-CAN module operates in global operating mode.

When the GMDC[1:0] bits in the RSCAN1GCTR register are set to 00_B, the RS-CAN module transitions to global operating mode.

21.18.2 Channel Modes

Figure 21.43 shows a channel mode state transition chart. **Table 21.290** shows the channel mode transition time.

Note: CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCAN1CmCTR register (m = 6)
BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCAN1CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = 01_B: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = 10_B: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = 11_B: Transition to channel halt mode when the CHMDC[1:0] bits are set to 10_B

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Figure 21.43 Channel Mode State Transition Chart

Table 21.290 Channel Mode Transition Time (1/2)

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel stop	Channel reset	Three pclk cycles
Channel reset	Channel stop	Three pclk cycles
Channel reset	Channel halt	Three CANm bit times
Channel reset	Channel communication	Two CANm bit times

Table 21.290 Channel Mode Transition Time (2/2)

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel halt	Channel reset	Three pclk cycles
Channel halt	Channel communication	Three CANm bit times
Channel communication	Channel reset	Three pclk cycles
Channel communication	Channel halt	Two CANm frames

21.18.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RSCAN1CmCTR register (m = 6) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

21.18.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. **Table 21.292** lists the registers to be initialized.

When the CHMDC[1:0] bits in the RSCAN1CmCTR register are set to 01_B (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 21.291** shows the operation when the CHMDC[1:0] bits are set to 01_B (channel reset mode) during CAN communication.

21.18.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

Table 21.291 shows operation when the CHMDC[1:0] bits are set to 10_B (channel halt mode) during CAN communication.

Table 21.291 Operation a Channel Transitions to Channel Reset Mode/Channel Halt Mode

Mode	During Reception	During Transmission	Bus Off State
Channel reset (CHMDC[1:0] = 01_B)	Transitions to channel reset mode before reception is completed.*1	Transitions to channel reset mode before transmission is completed.*1	Transitions to channel reset mode before bus off recovery.
Channel halt*3 (CHMDC[1:0] = 10_B)	Transitions to channel halt mode after reception is completed.*2	Transitions to channel halt mode after transmission is completed.	[When BOM[1:0] = 00_B] Transitions to channel halt mode (CHMDC[1:0] = 10_B) only after bus off recovery. [When BOM[1:0] = 01_B] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = 10_B] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = 11_B] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10_B before bus off recovery.

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10_B and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01_B.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCAN1CmERFL register that becomes 1 when dominant lock is detected.

Note 3. When the transition from channel reset mode to channel halt mode is to be made, set the RSCAN1CmCFG register in channel reset mode and then shift to channel halt mode.

21.18.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCAN1CmCTR register are set to 00_B, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCAN1CmSTS register (m = 6) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

21.18.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/ decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCAN1CmCTR register.

- When BOM[1:0] = 00_B:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCAN1CmSTS register are initialized to 00_H, the BORF flag in the RSCAN1CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCAN1CmCTR register are set to 10_B (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = 01_B:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10_B and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, but the BORF flag is not set to 1. Also, a bus off recovery interrupt request is not generated.
- When BOM[1:0] = 10_B:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10_B. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.

- When BOM[1:0] = 11_B:
  When the CHMDC[1:0] bits are set to 10_B in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to 10_B.

If the RS-CAN module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01_B or 10_B is made only when the CHMDC[1:0] bits are 00_B (channel communication mode).

Furthermore, setting the RTBO bit in the RSCAN1CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to 00_H. Write 1 to the RTBO bit only when the BOM[1:0] value is 00_B. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

Table 21.292 Registers Initialized in Global Reset Mode or Channel Reset Mode

Register	Bit / Flag
RSCAN1CmCTR register	CTMS[1:0], CTME, CHMDC[1:0]
RSCAN1CmSTS register	CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, REC[7:0], TEC[7:0]
RSCAN1CmERFL register	CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF
RSCAN1CFCCk register	When transmit/receive FIFO buffer is in transmit mode: CFE
RSCAN1CFSTSk register	When transmit/receive FIFO buffer is in transmit mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF
RSCAN1CFTISTS register	CFkTXIF
RSCAN1TMCp register	TMOM, TMTAR, TMTR
RSCAN1TMSTSp register	TMTARM, TMTRM, TMTRF[1:0], TMTSTS
RSCAN1TMTRSTSy register	TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCAN1TMTARSTSy register	TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCAN1TMTCSTSy register	TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCAN1TMTASTSy register	TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCAN1TXQCCm register	TXQE
RSCAN1TXQSTSm register	TXQIF, TXQFLL, TXQEMP
RSCAN1THLCCm register	THLE
RSCAN1THLSTSm register	THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP
RSCAN1GTINTSTS0 register	TSIFi, TAIFi, TQIFi, CFTIFi, THIFi (i = 0)

Table 21.293 Registers Initialized Only in Global Reset Mode

Register	Bit / Flag
RSCAN1GSTS register	GHLTSTS
RSCAN1GERFL register	THLES, MES, DEF
RSCAN1GTSC register	TS[15:0]
RSCAN1RMNDy register	RMNSq
RSCAN1RFCCx register	RFE
RSCAN1RFSTSx register	RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP
RSCAN1CFCCk register	When transmit/receive FIFO buffer is in receive mode: CFE
RSCAN1CFSTSk register	When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT
RSCAN1FESTS register	CFkEMP, RFxEMP
RSCAN1FFSTS register	CFkFLL, RFxFLL
RSCAN1FMSTS register	CFkMLT, RFxMLT
RSCAN1RFISTS register	RFxIF
RSCAN1CFRISTS register	CFkRXIF
RSCAN1GTSTCFG register	RTMPS[6:0], C0ICBCE, C1ICBCE, C2ICBCE, C3ICBCE, C4ICBCE, C5ICBCE
RSCAN1GTSTCTR register	RTME, ICBCTME

21.19 Reception Function

There are two reception types.

- Reception by receive buffers:
  Zero to 16 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

21.19.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module (up to 64 receive rules can be registered in this module that has one channel.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 21.44** illustrates how receive rules are registered.

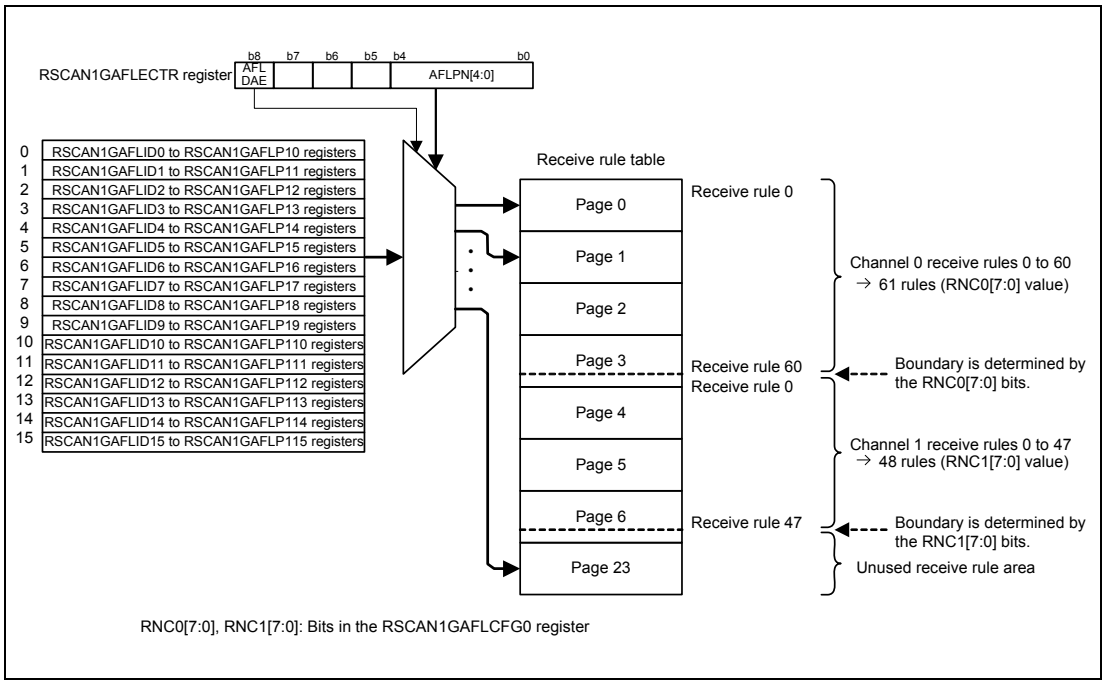


Figure 21.44 Entry of Receive Rules (for Setting Channel 0 and 1)

CAUTION

Receive rules for each channel must be set in contiguous blocks.
Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCAN1GAFLIDj, RSCAN1GAFLMj, RSCAN1GAFLP0j, and RSCAN1GAFLP1j registers (j = 0 to 15). The RSCAN1GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCAN1GAFLMj register is used to set mask, the RSCAN1GAFLP0j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCAN1GAFLP1j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

21.19.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCAN1GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

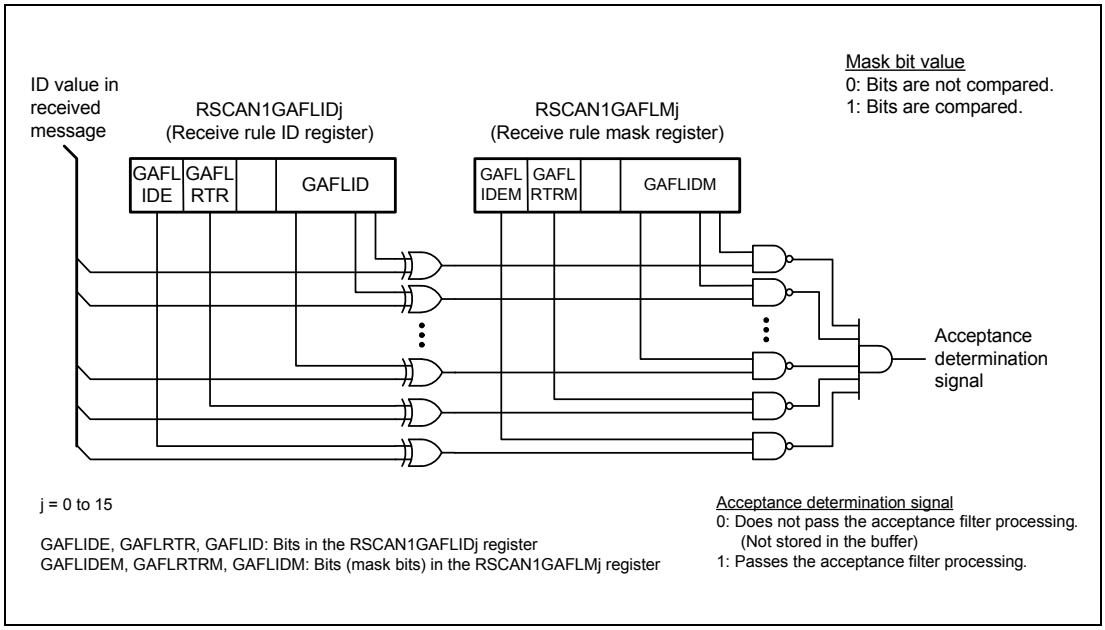

Figure 21.45 Acceptance Filter Function

21.19.1.2 DLC Filter Processing

When the DCE bit in the RSCAN1GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCAN1GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCAN1GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of 00_H is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCAN1GERFL register is set to 1 (a DLC error is present).

21.19.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCAN1GAFLP0j register (j = 0 to 15) and by the RSCAN1GAFLP1j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

21.19.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCAN1GAFLP0j register.

21.19.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCAN1GCFG register to 1 (mirror function is enabled).

When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCAN1GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

21.19.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time. The timestamp counter value is fetched at the start-of-frame (SOF) timing of a message and is then stored in a receive buffer or a FIFO buffer together with the message ID and data. Either pclk/2 or the CANm bit time clock (m = 6) may be selected as a timestamp counter clock source using the TSBTCS[2:0] and TSSS bits in the RSCAN1GCFG register. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCAN1GCFG register.

When the CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to 0000_H by setting the TSRST bit in the RSCAN1GCTR register to 1.

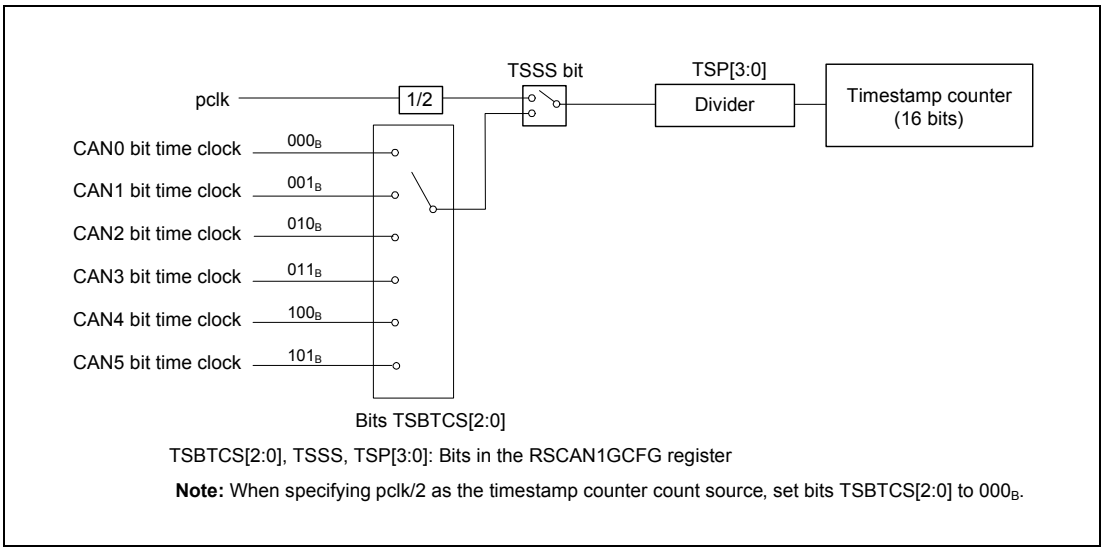

Figure 21.46 Timestamp Function Block Diagram

21.20 Transmission Functions

There are three types of transmission.

- Transmission using transmit buffers:
  Each channel has 16 buffers.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmit buffer ((16 × i) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

Figure 21.47 shows the allocation of transmit queues and transmit/receive FIFO buffer link.

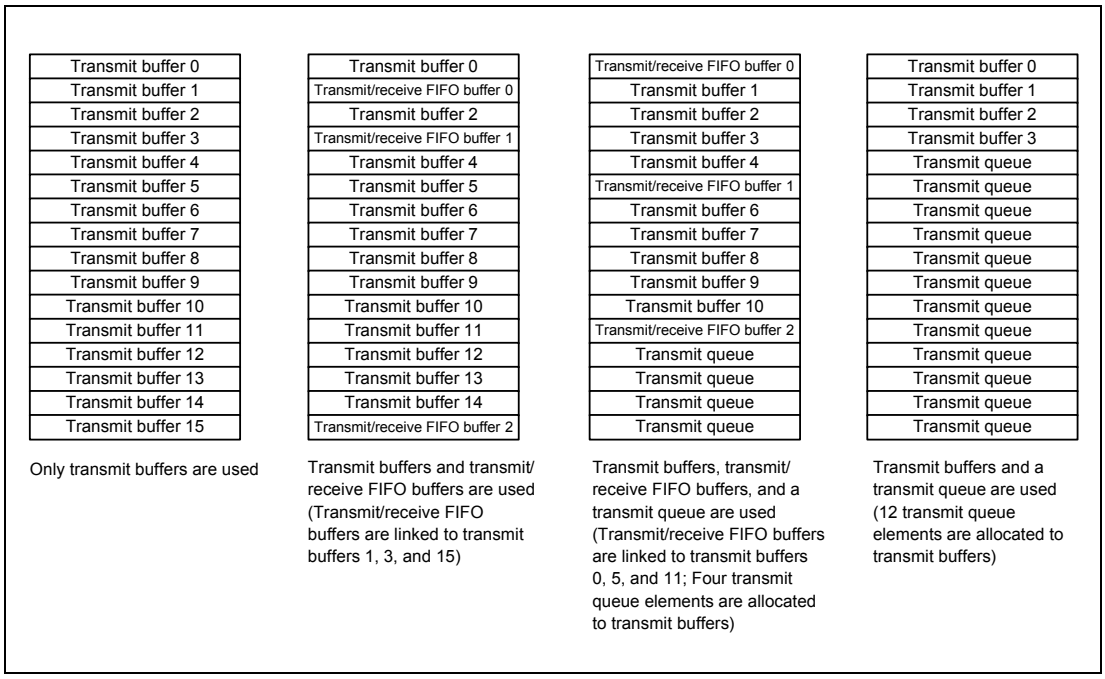

Figure 21.47 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

21.20.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

The priority is determined by using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCAN1GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again according to the TPRI bit.

21.20.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCAN1TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCAN1TMSTSp register (p = 0 to i × 16 + 15). When transmit completes successfully, the TMTRF[1:0] flag is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)).

21.20.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCAN1TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCAN1TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCAN1TMSTSp register is set to 01_B (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

21.20.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCAN1TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCAN1TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10_B or 11_B. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to 01_B (transmit abort has been completed).

21.20.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCAN1CFCCk register (k = 0 to i × 3 + 2). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCAN1CFCCk register. When the CFE bit in the RSCAN1CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

21.20.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCAN1CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

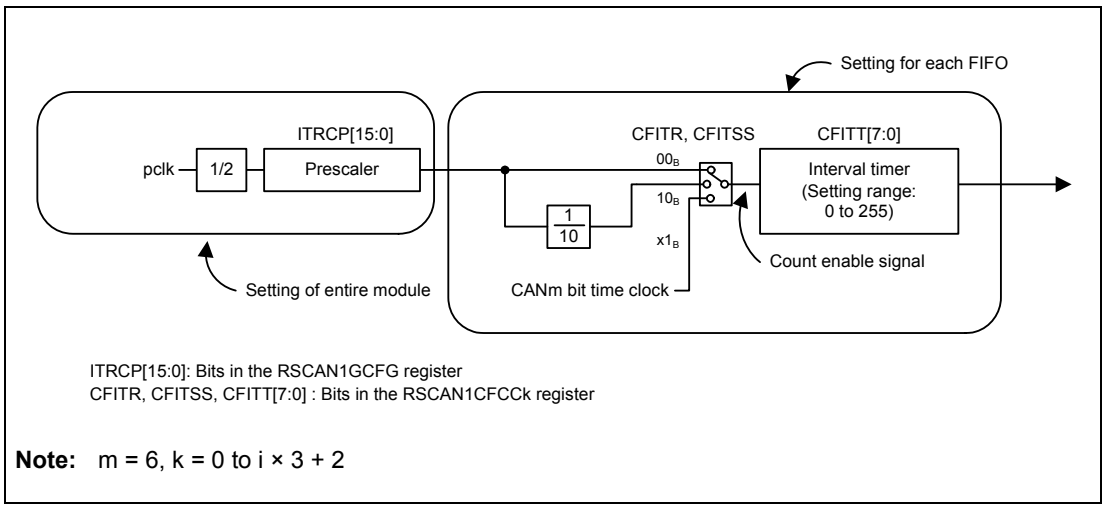
The interval time is set by the CFITT[7:0] bits in the RSCAN1CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to 00_H.

Select an interval timer count source using the CFITR and CFITSS bits in the RSCAN1CFCCk register. When the CFITR and CFITSS bits are set to 00_B, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits in the RSCAN1GCFG register. When the CFITR and CFITSS bits are set to 10_B, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits × 10). When the CFITR and CFITSS bits are set to $x1_B$, the CANm bit time clock is used as a count source.

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00_B (fPBA is the frequency of pclk):

$$\frac{1}{f_{PBA}} \times 2 \times M \times N$$



- When CFITR and CFITSS = 10_B:

$$\frac{1}{f_{PBA}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = $x1_B$ (fCANBIT is the frequency of CANm bit time clock):

$$\frac{1}{f_{CANBIT}} \times N$$

Figure 21.48 shows the interval timer block diagram.

Note: m = 6, k = 0 to i × 3 + 2

Figure 21.48 Interval Timer Block Diagram

Figure 21.49 shows the interval timer timing diagram.

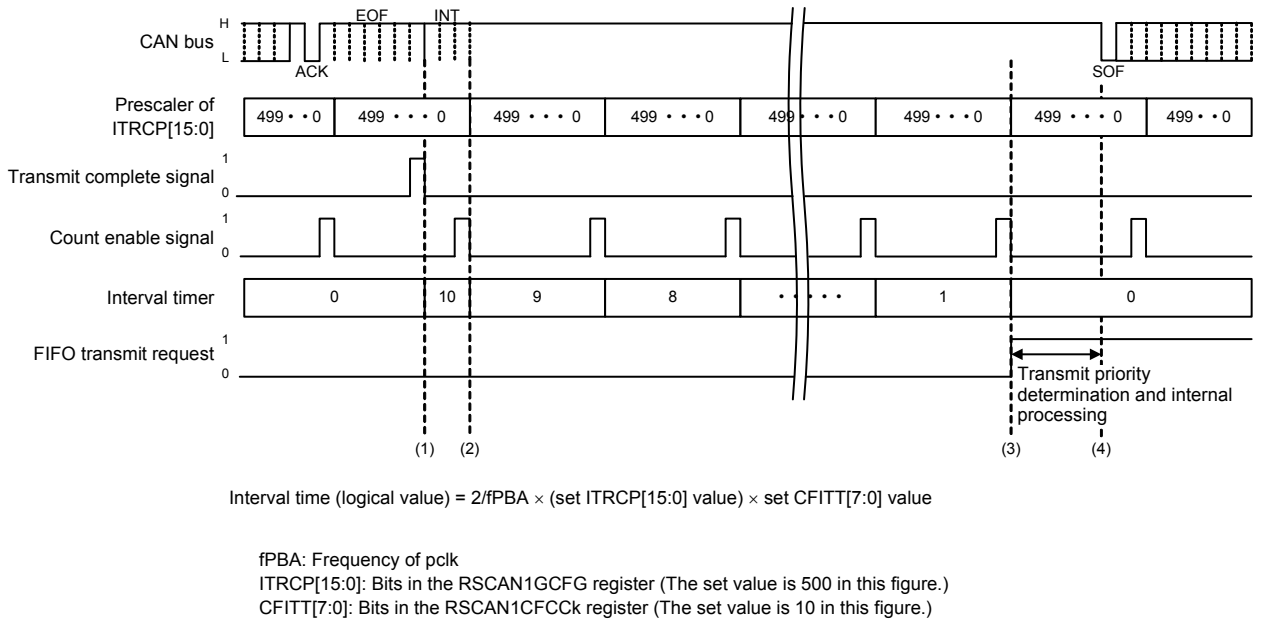


Figure 21.49 Interval Timer Timing Chart

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 348 cycles of the pclk may be generated.

21.20.4 Transmission Using Transmit Queues

Three to sixteen buffers are allocated to a transmit queue for each channel, and transmit buffer ((16 × i) + 15) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RSCAN1TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCAN1TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

21.20.5 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCAN1THLCCm register. The THLEN bit in the RSCAN1CFIDk register (k = 0 to i × 3 + 2) determines whether transmit history data is stored for each message.

The following information on a transmitted message will be stored in the transmission history buffer after the successful completion of transmission.

Storage of the transmission history data after the successful completion of transmission may take up to 123 cycles of pclk.

- Buffer type — 001_B: Transmit buffer
010_B: Transmit/receive FIFO buffer
100_B: Transmit queue
- Buffer number — Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See **Table 21.294**.
- Label data — Label information of the transmit message

Table 21.294 Transmit History Data Buffer Numbers

Buffer No. / Buffer type	001_B	010_B	100_B
0000_B	Transmit buffer 16 × i + 0	Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCAN1CFCCk register (k = 0 to i × 3 + 2)	Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission
0001_B	Transmit buffer 16 × i + 1		
0010_B	Transmit buffer 16 × i + 2		
0011_B	Transmit buffer 16 × i + 3		
0100_B	Transmit buffer 16 × i + 4		
0101_B	Transmit buffer 16 × i + 5		
0110_B	Transmit buffer 16 × i + 6		
0111_B	Transmit buffer 16 × i + 7		
1000_B	Transmit buffer 16 × i + 8		
1001_B	Transmit buffer 16 × i + 9		
1010_B	Transmit buffer 16 × i + 10		
1011_B	Transmit buffer 16 × i + 11		
1100_B	Transmit buffer 16 × i + 12		
1101_B	Transmit buffer 16 × i + 13		
1110_B	Transmit buffer 16 × i + 14		
1111_B	Transmit buffer 16 × i + 15		

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

Transmit history data can be read from the RSCAN1THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

21.21 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)

21.21.1 Standard Test Mode

Standard test mode allows CRC test.

21.21.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

Figure 21.50 shows the connection when listen-only mode is selected.

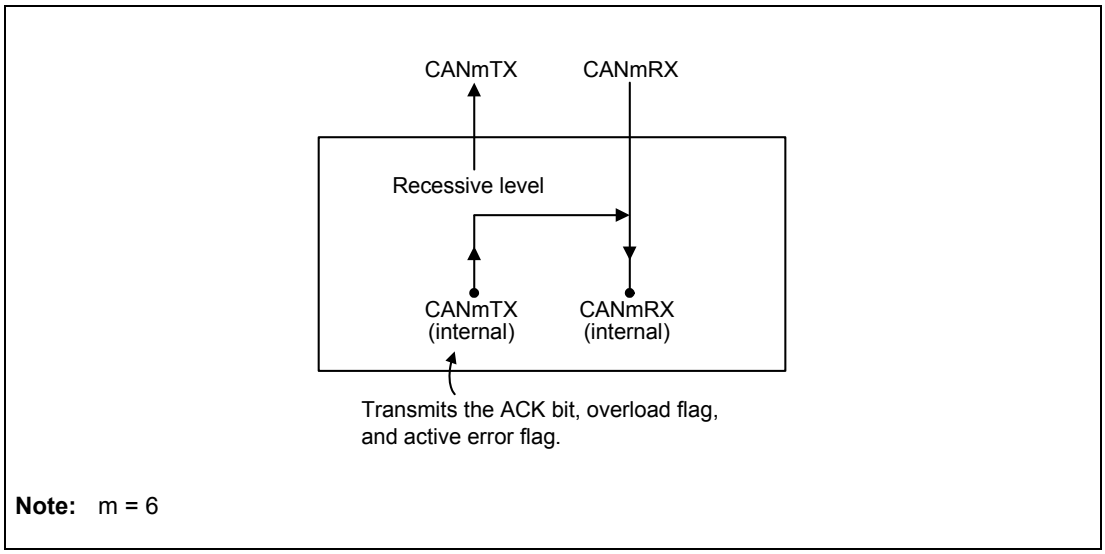

Figure 21.50 Connection when Listen-Only Mode is Selected

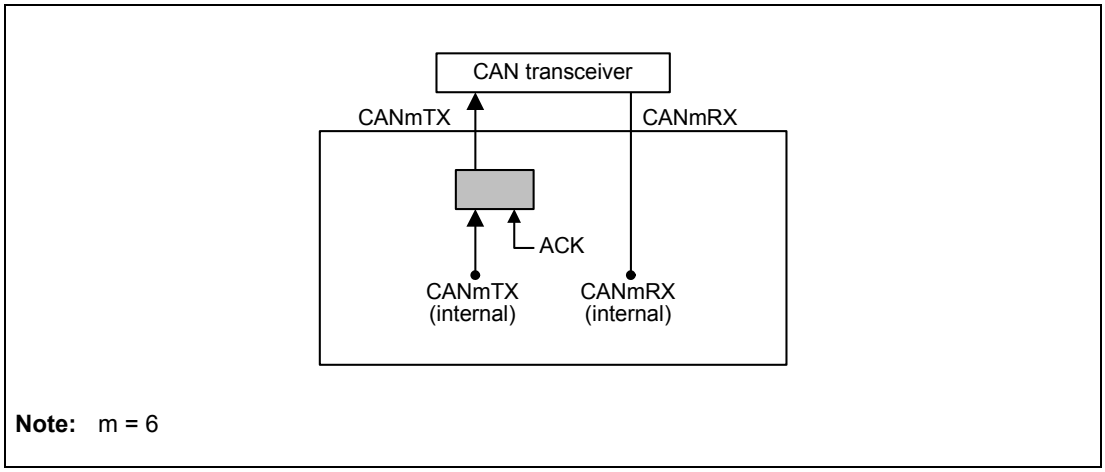
21.21.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCAN1GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).



If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

21.21.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

Figure 21.51 shows the connection when self-test mode 0 is selected.

Note: m = 6

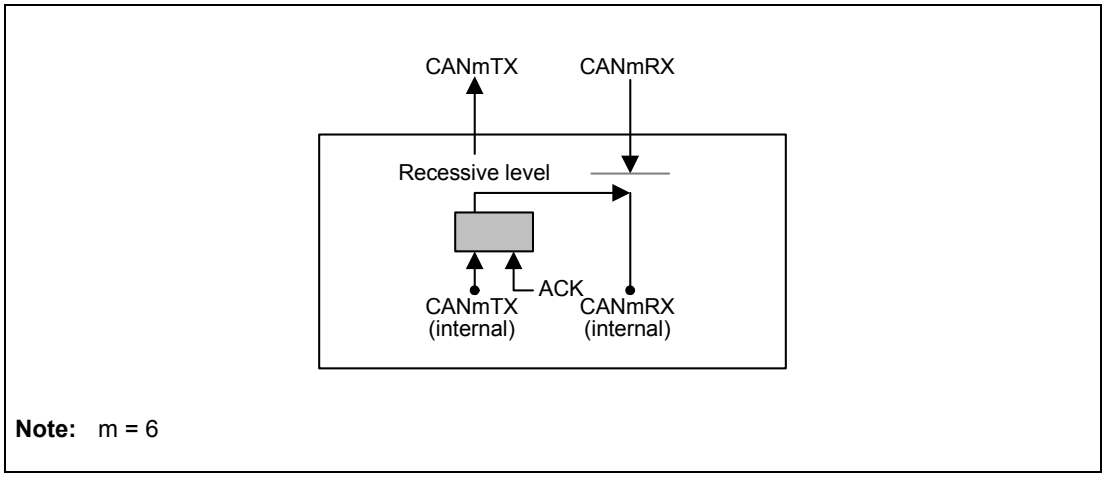


Figure 21.51 Connection when Self-Test Mode 0 is Selected

21.21.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

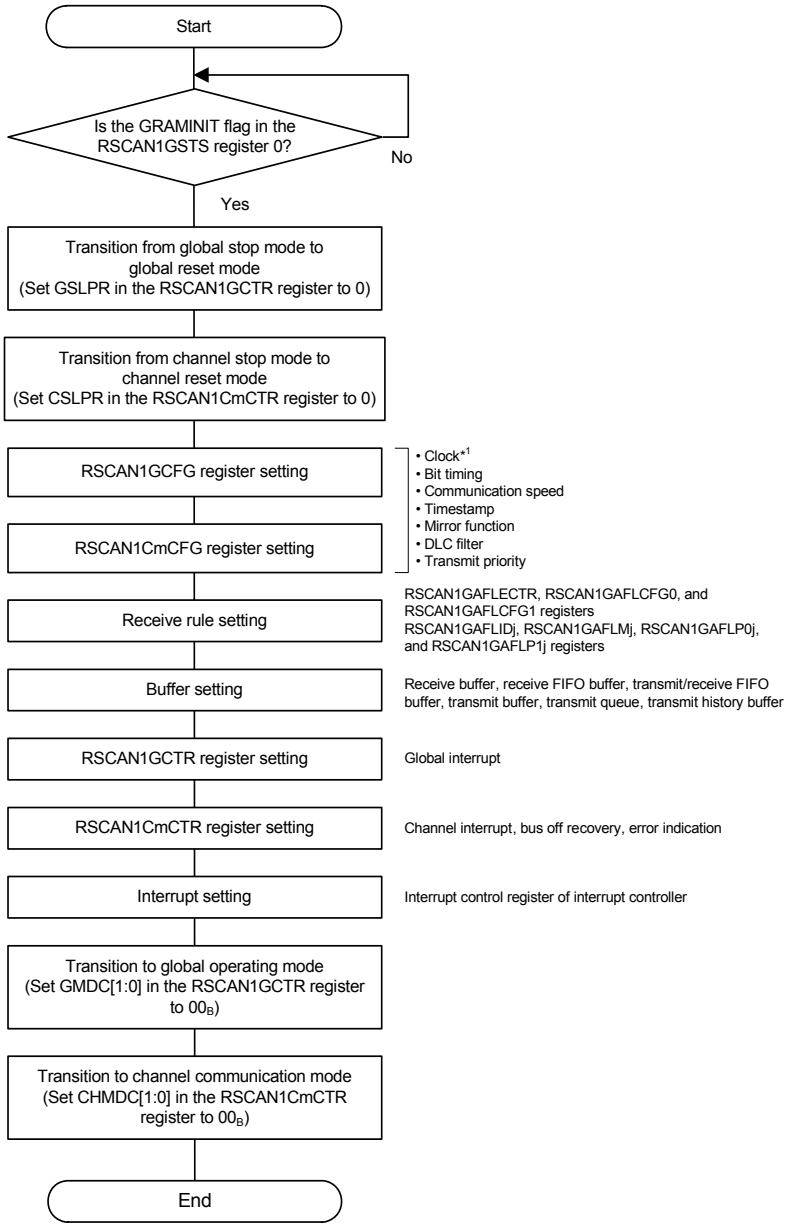
In self-test mode 1, internal feedback from the internal CANmTX pin (m = 6) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

Figure 21.52 shows the connection when self-test mode 1 is selected.

Note: m = 6

Figure 21.52 Connection when Self-Test Mode 1 is Selected

21.21.4 RAM Test



The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCAN1GTSTCFG register. Data in the set page can be read from and written to the RSCAN1RPGACCr register (r = 0 to 63). The available total RAM size is 7296 bytes ($1C80_H$).

21.22 RS-CAN Setting Procedure

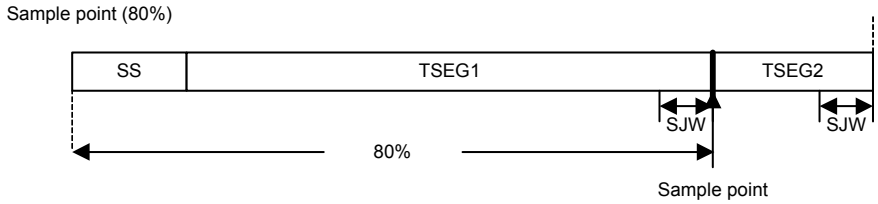
21.22.1 Initial Settings

The RS-CAN module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 3650 cycles of the pclk. The GRAMINIT flag in the RSCAN1GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 21.53** shows the CAN setting procedure after the MCU is reset.

Note 1. For the setting of CAN clock frequency, see the **Table 21.208, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

Note: m = 6, j = 0 to 15

Figure 21.53 CAN Setting Procedure after the MCU is Reset



21.22.1.1 Clock Setting

Set the CAN clock (fCAN) as a clock source of the RS-CAN module. Select the clk_xincan or clkc using the DCS bit in the RSCAN1GCFG register.

21.22.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the RSCAN1CmCFG register for each channel. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). 1 Tq is equal to one CANmTq clock cycle. The CANmTq clock is obtained by selecting the clock source with the DCS bit in the RSCAN1GCFG register and selecting the clock division ratio with the BRP[9:0] bits in the RSCAN1CmCFG register.

Figure 21.54 shows the bit timing chart. **Table 21.295** shows an example of bit timing setting.

SS = 1 Tq fixed
Set TSEG1 to a range of 4 Tq to 16 Tq
Set TSEG2 to a range of 2 Tq to 8 Tq
Set SJW to a range of 1 Tq to 4 Tq
Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
TSEG1 > TSEG2 ≥ SJW

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space.
  Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (Time segment 1):
  TSEG1 is a segment that absorbs physical delay on the CAN network. The physical delay on the CAN network is twice the total of the delay on the CAN bus, the delay in the input comparator, and the delay in the output driver.
- TSEG2 (Time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (Resynchronization jump width)
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

Figure 21.54 Bit Timing Chart

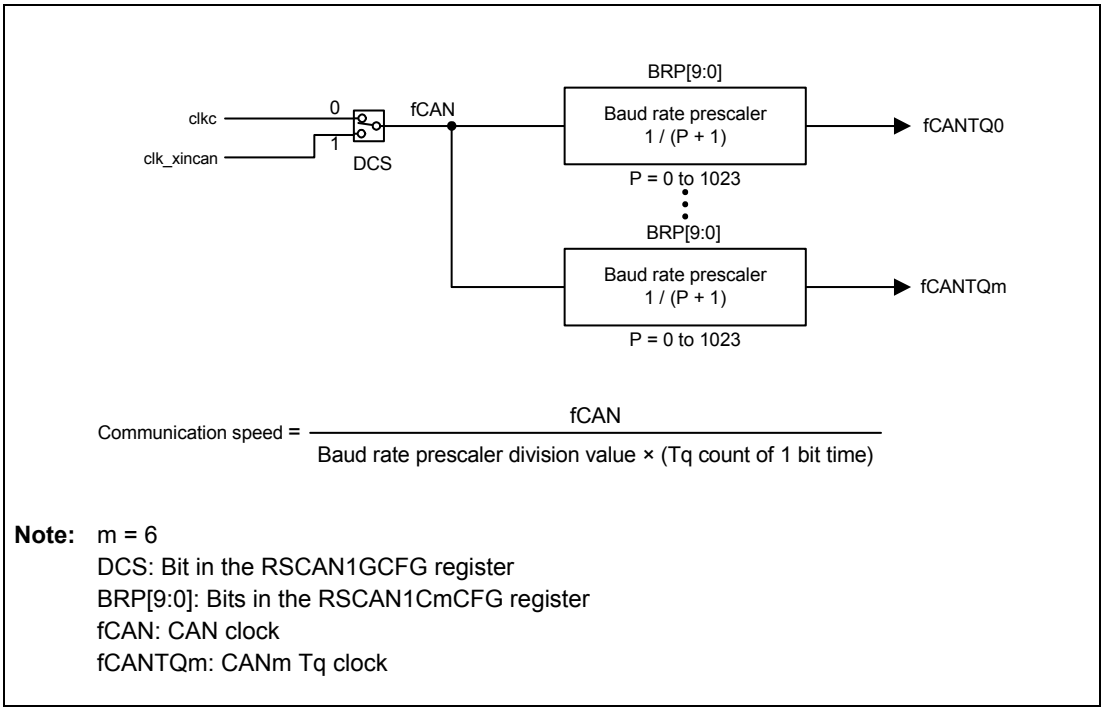


Table 21.295 Example of Bit Timing Setting

1 Bit	Set Value (Tq)				Sample Point (%) Note: See Figure 21.54.
	SS	TSEG1	TSEG2	SJW	
8 Tq	1	4	3	1	62.50
	1	5	2	1	75.00
10 Tq	1	6	3	1	70.00
	1	7	2	1	80.00
16 Tq	1	10	5	1	68.75
	1	11	4	1	75.00
20 Tq	1	12	7	1	65.00
	1	13	6	1	70.00

21.22.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value (BRP[9:0] bits in the RSCAN1CmCFG register), and Tq count per bit time.

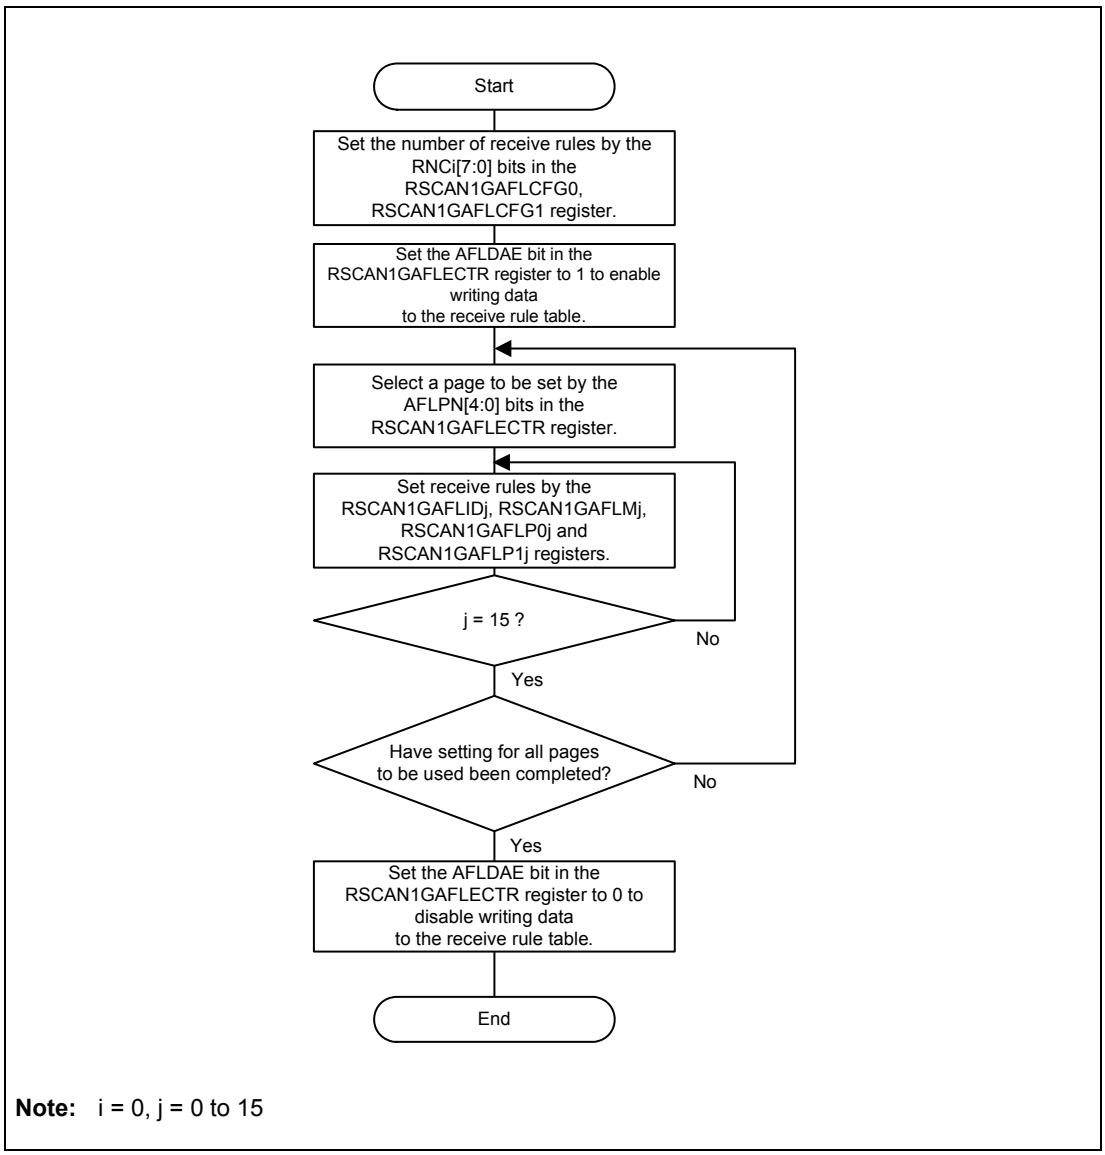
Figure 21.55 shows the CAN clock control block diagram, and **Table 21.296** shows an example of the communication speed setting.

Note: m = 6
DCS: Bit in the RSCAN1GCFG register
BRP[9:0]: Bits in the RSCAN1CmCFG register
fCAN: CAN clock
fCANTQm: CANm Tq clock

Figure 21.55 CAN Clock Control Block Diagram

Table 21.296 Example of Communication Speed Setting

fCAN / Communication speed	40 MHz	32 MHz	24 MHz	16 MHz	8 MHz
1 Mbps	8 Tq (5) 20 Tq (2)	8 Tq (4) 16 Tq (2)	8 Tq (3) 12 Tq (2) 24 Tq (1)	8 Tq (2) 16 Tq (1)	8 Tq (1)
500 Kbps	8 Tq (10) 20 Tq (4)	8 Tq (8) 16 Tq (4)	8 Tq (6) 12 Tq (4) 24 Tq (2)	8 Tq (4) 16 Tq (2)	8 Tq (2) 16 Tq (1)
250 Kbps	8 Tq (20) 20 Tq (8)	8 Tq (16) 16 Tq (8)	8 Tq (12) 12 Tq (8) 24 Tq (4)	8 Tq (8) 16 Tq (4)	8 Tq (4) 16 Tq (2)
125 Kbps	8 Tq (40) 20 Tq (16)	8 Tq (32) 16 Tq (16)	8 Tq (24) 12 Tq (16) 24 Tq (8)	8 Tq (16) 16 Tq (8)	8 Tq (8) 16 Tq (4)



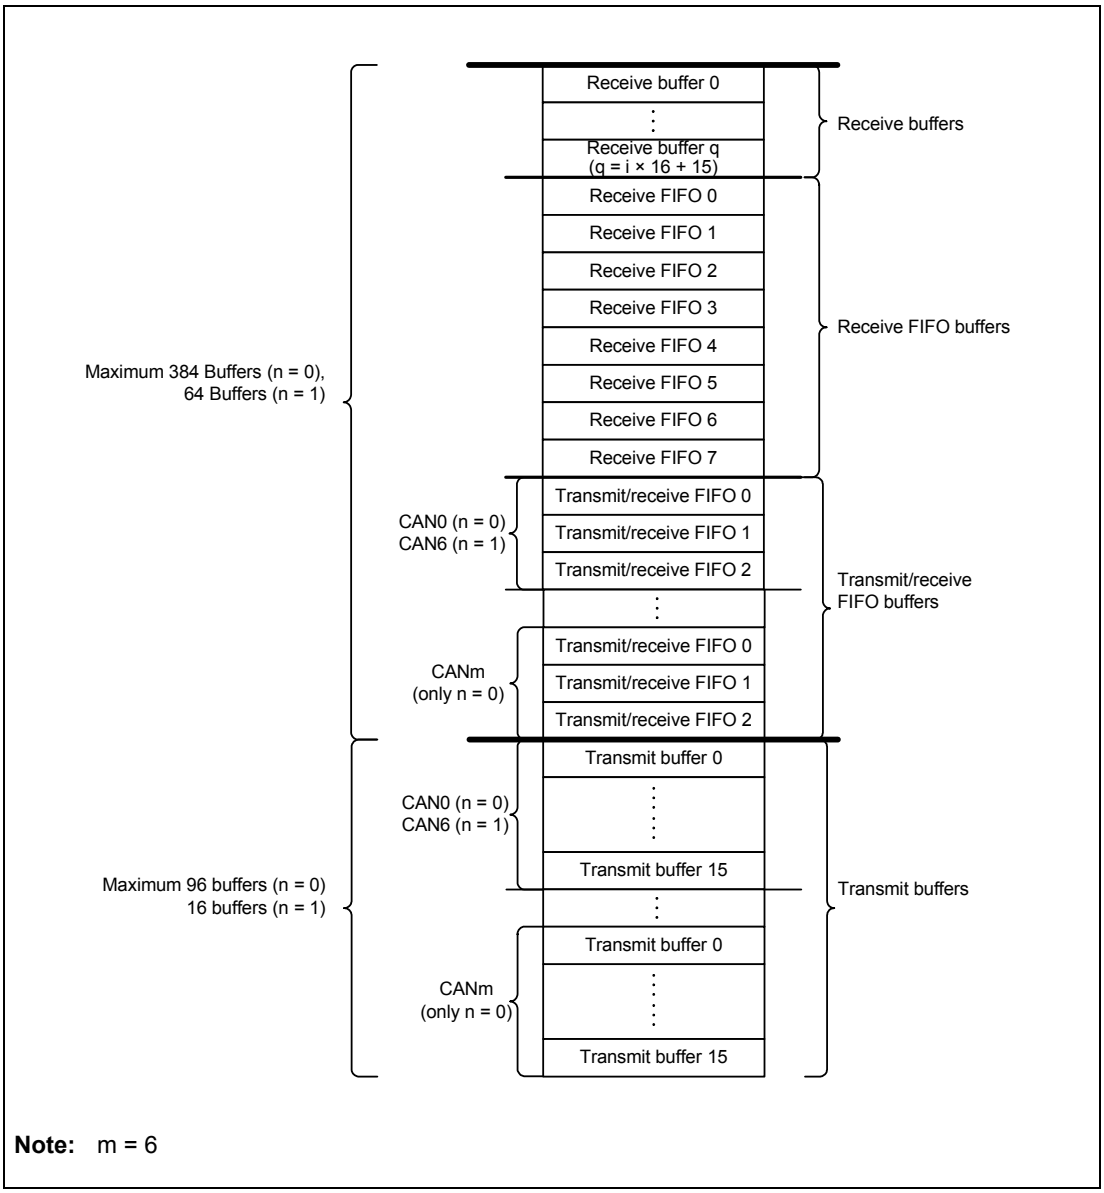
Note: Values in ( ) are baud rate prescaler division values.

21.22.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 23 by the AFLPN[4:0] bits in the RSCAN1GAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.

Figure 21.56 shows the receive rule setting procedure.



Note: i = 0, j = 0 to 15

Figure 21.56 Receive Rule Setting Procedure

21.22.1.5 Buffer Setting

Set sizes and interrupt sources of buffers. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

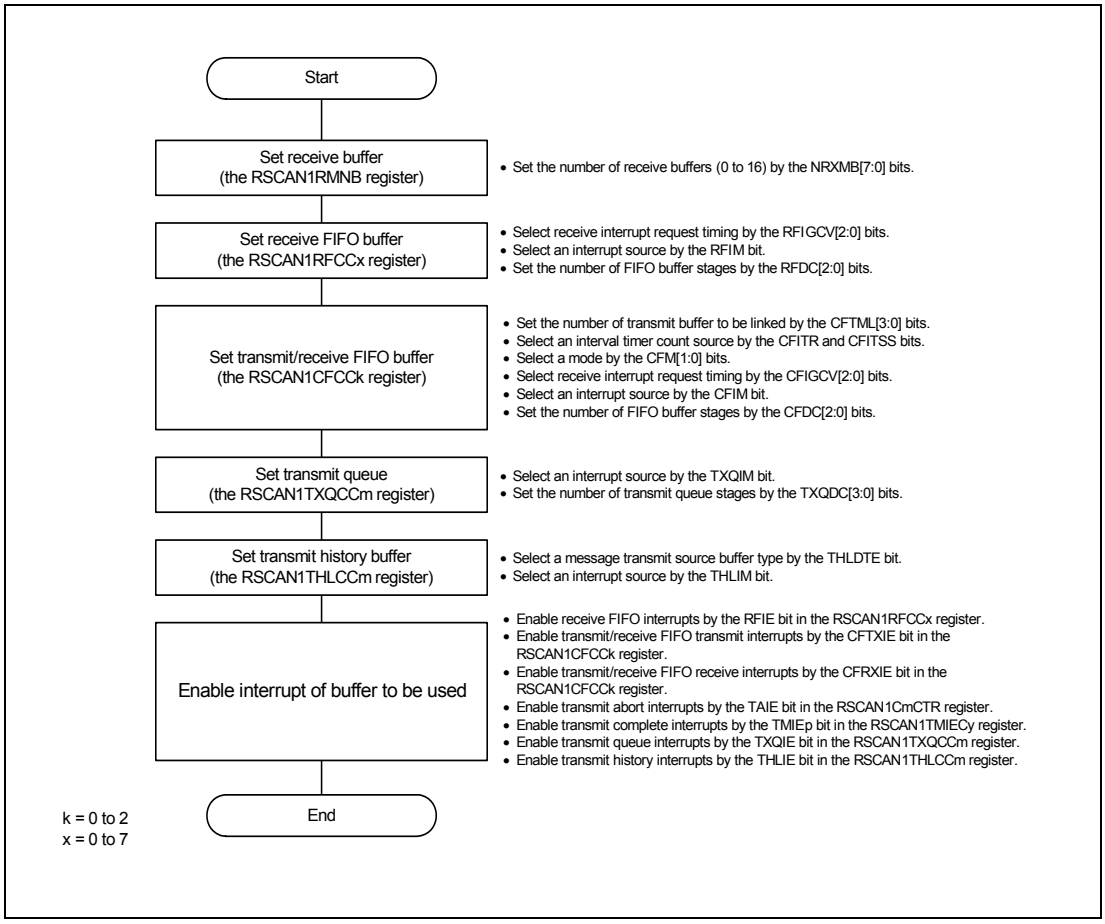
Figure 21.57 shows the buffer configuration. **Figure 21.58** shows the buffer setting procedure.

Note: m = 6

Figure 21.57 Buffer Configuration

CAUTION

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.



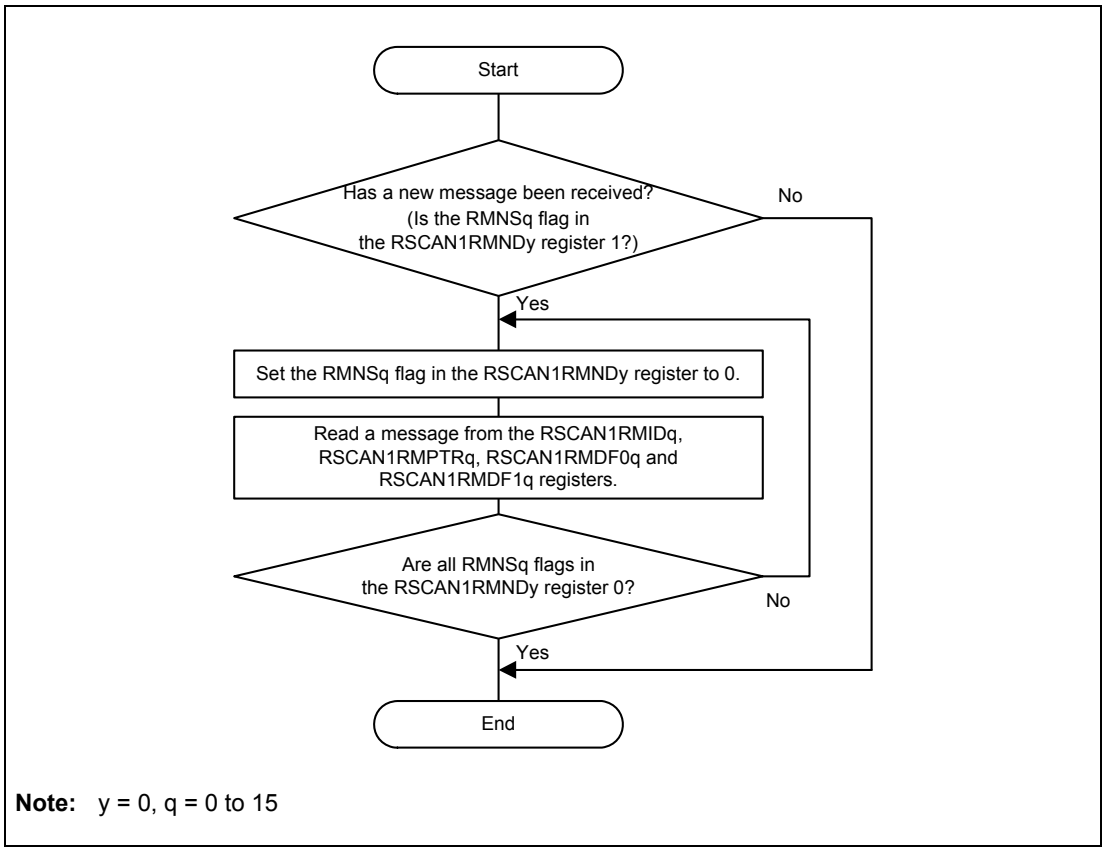


Figure 21.58 Buffer Setting Procedure

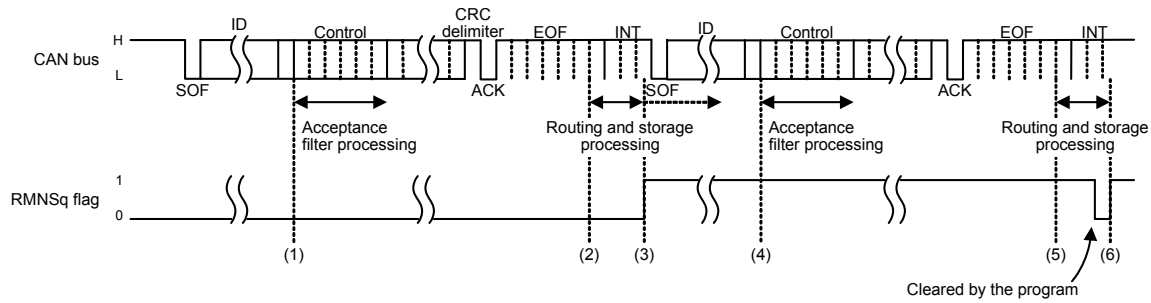
21.22.2 Reception Procedure



21.22.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCAN1RMNDy register ((y = 0, q = 0 to 15) is set to 1 (receive buffer q contains a new message). Messages can be read from the RSCAN1RMIDq, RSCAN1RMPTRq, RSCAN1RMDF0q, and RSCAN1RMDF1q registers. If the next message has been received before the current message is read from the receive buffer, the message is overwritten. **Figure 21.59** shows the receive buffer reading procedure.

Note: y = 0, q = 0 to 15

Figure 21.59 Receive Buffer Reading Procedure

Note: y = 0, q = 0 to 15
RMNSq: Flag in the RSCAN1RMNDy register

Figure 21.60 Receive Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN1GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCAN1RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN1GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.

21.22.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCAN1RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCAN1CFSTSk register (k = 0 to 2)) is incremented. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCAN1RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCAN1CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCAN1RFIDx, RSCAN1RFPTRx, RSCAN1RFDF0x, and RSCAN1RFDF1x registers for receive FIFO buffers, or from the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCAN1RFCCx register or the CFDC[2:0] bits in the RSCAN1CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCAN1RFSTSx register or the CFEMP flag in the RSCAN1CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCAN1RFSTSx register or CFRXIF flag in the RSCAN1CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.

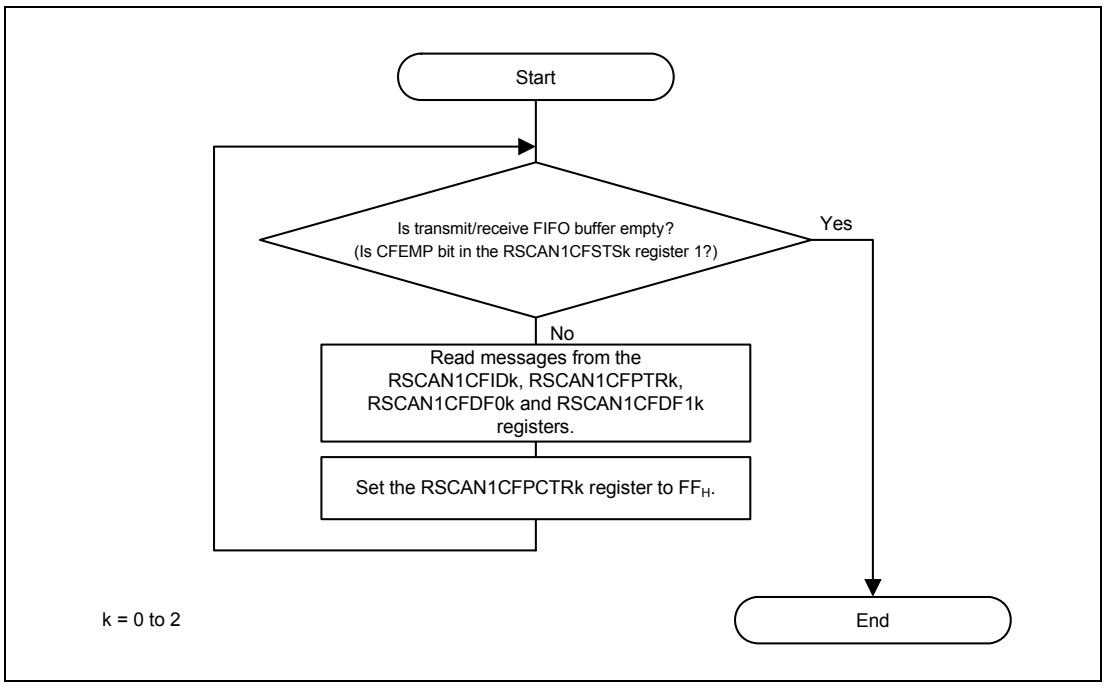


Figure 21.61 Transmit/Receive FIFO Buffer Reading Procedure

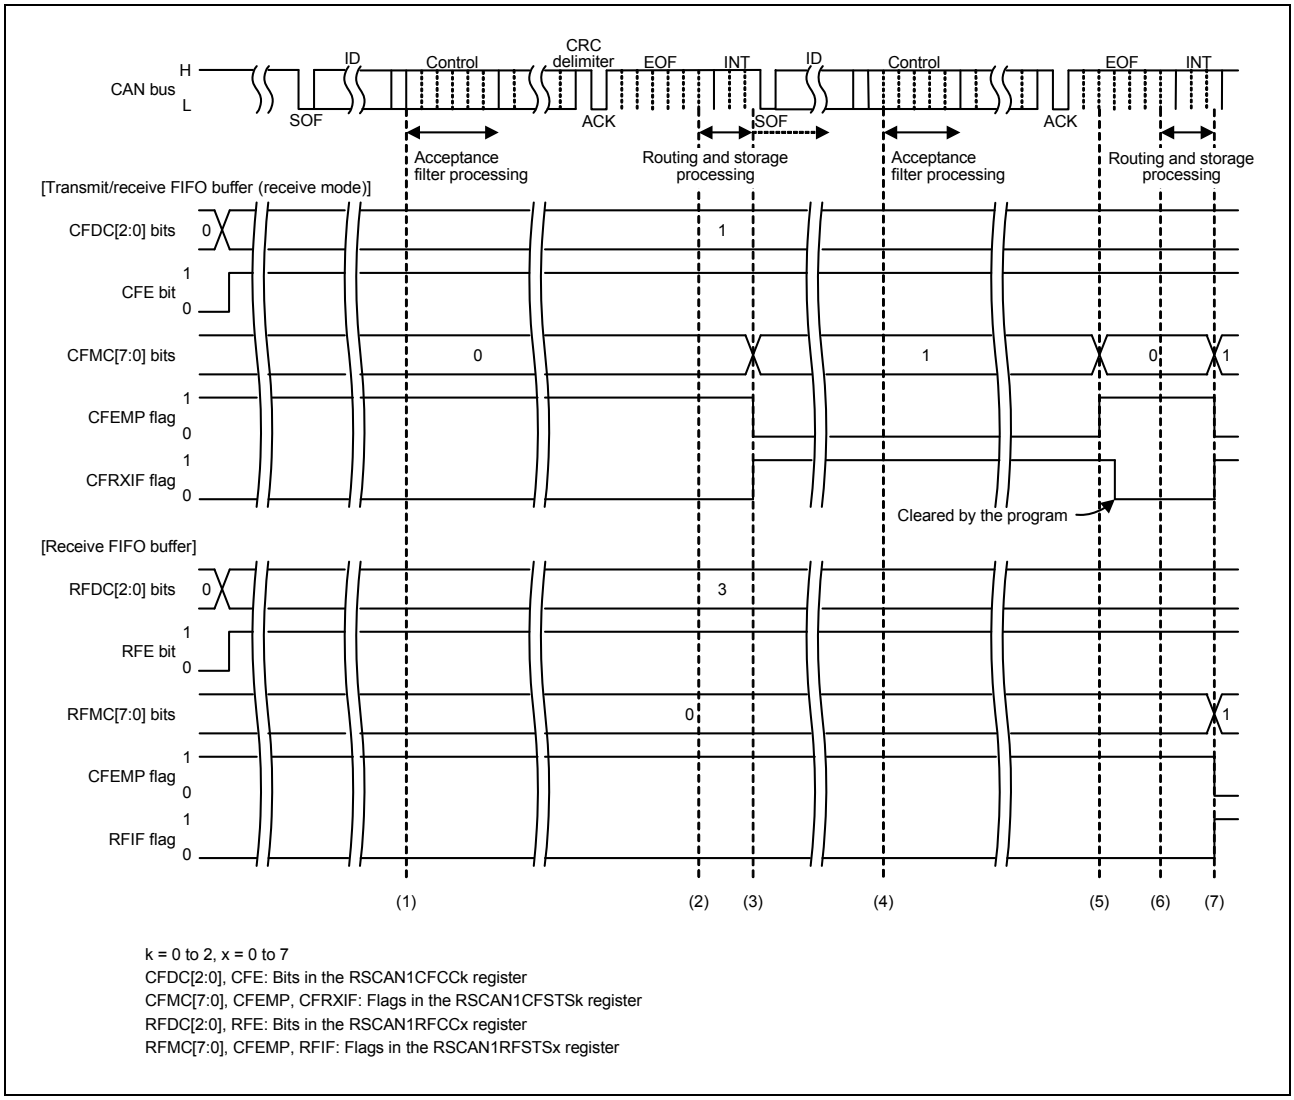

Figure 21.62 FIFO Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN1GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCAN1CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCAN1CFCCk register is 001_B or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCAN1CFSTSk register is incremented and becomes 01_H. When the CFIM bit in the RSCAN1CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCAN1CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers and write FF_H to the RSCAN1CFPCTRk register. This causes the

CFMC[7:0] bits in the RSCAN1CFSTSk register to be decremented. When CFMC[7:0] becomes 00_H, the CFEMP flag in the RSCAN1CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCAN1GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

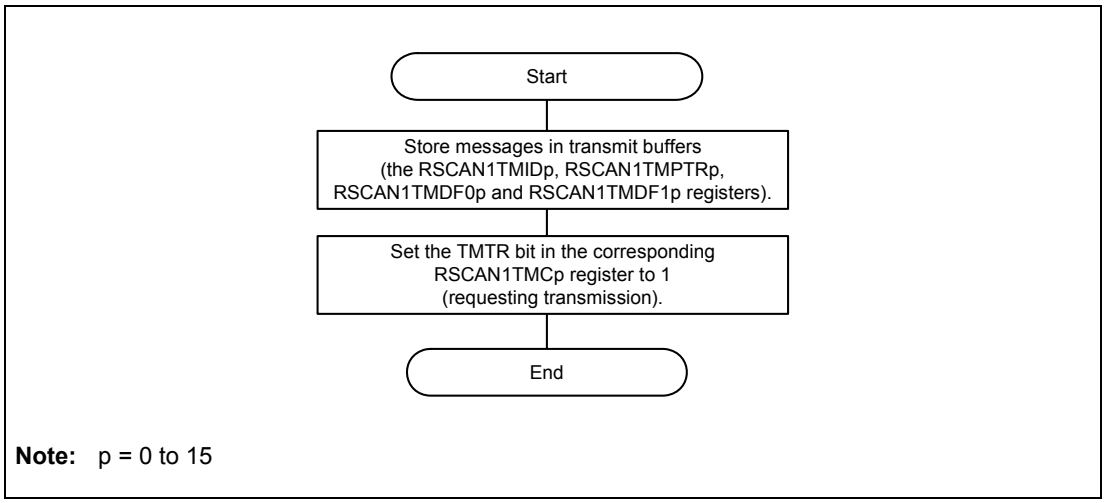
(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001_B or more. The CFMC[7:0] bit value is incremented by 1 to be 01_H. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCAN1RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCAN1RFCCx register are set to 001_B or more. The RFMC[7:0] bits in the RSCAN1RFSTSx register are set to 01_H by being incremented by 1. When the RFIM bit in the RSCAN1RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCAN1RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

21.22.3 Transmission Procedure

21.22.3.1 Procedure for Transmission from Transmit Buffers

Figure 21.63 shows the procedure for transmission from transmit buffers.

Figure 21.64 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 21.65** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.



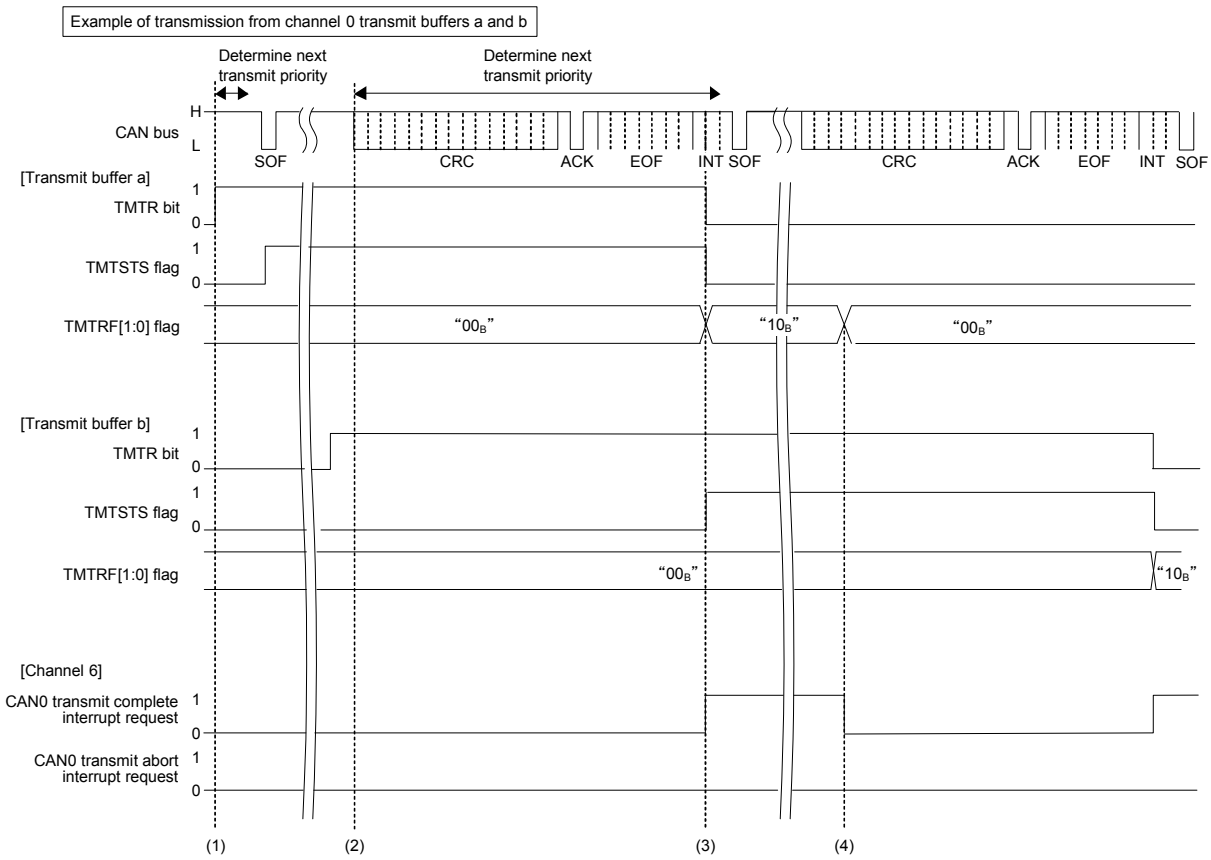


Figure 21.63 Procedure for Transmission from Transmit Buffers

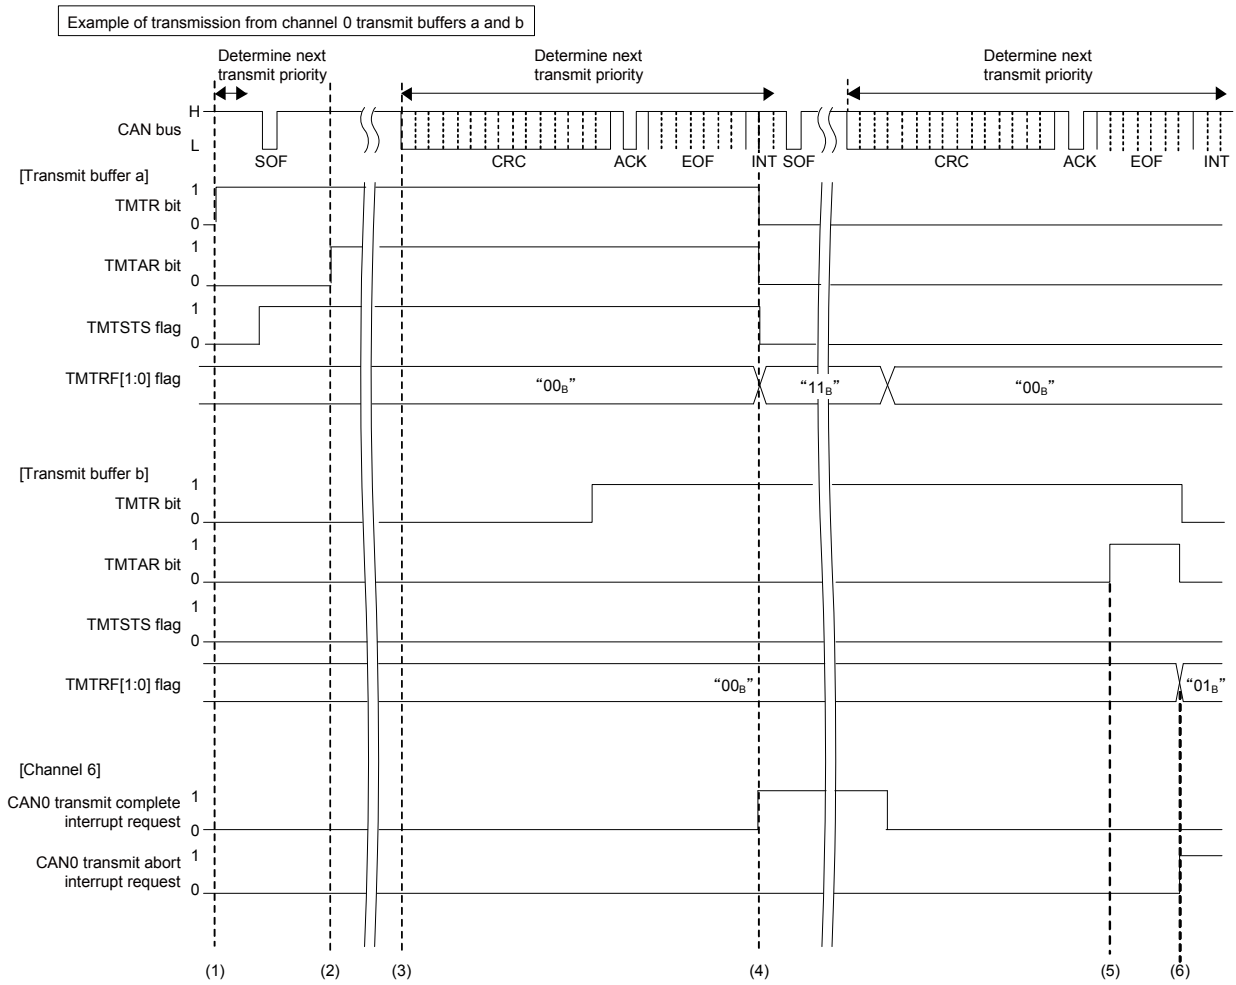
Note: a = 0 to 15, b = 0 to 15
TMTR: Bit in the RSCAN1TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCAN1TMSTSp registers

Figure 21.64 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)



(1) When the TMTR bit in the RSCAN1TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCAN1TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCAN1TMSTSa register is set to 10_B (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCAN1TMCa register are cleared to 0. When the TMIEa bit in the RSCAN1TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to 00_B. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00_B.

If an arbitration-lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC delimiter to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

Note: a = 0 to 15, b = 0 to 15
TMTR, TMTAR: Bits in the RSCAN1TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCAN1TMSTSp register

Figure 21.65 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) When the TMTR bit in the RSCAN1TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCAN1TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2)When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts with the CRC delimiter for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCAN1TMSTSa register is set to 11_B (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCAN1TMCa register are cleared to 0. When the TMIEa value in the RSCAN1TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01_B. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01_B. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCAN1CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B.

If an arbitration loss has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC delimiter to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

21.22.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure 21.66 shows the procedure for transmission from transmit/receive FIFO buffers.

Figure 21.67 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 21.68** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.

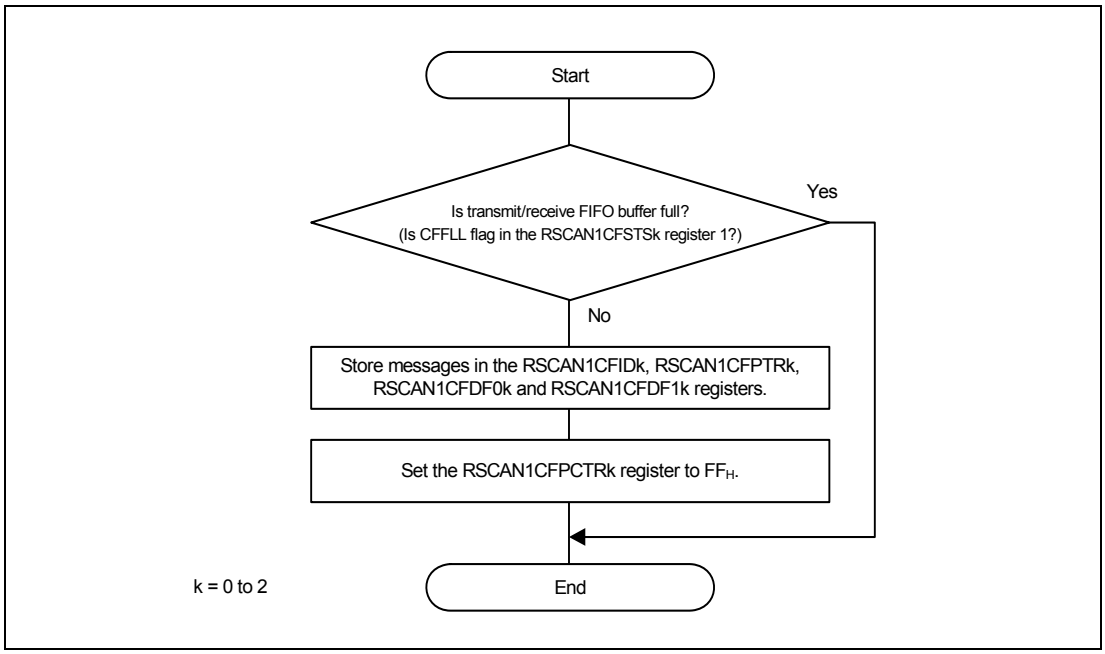


Figure 21.66 Procedure for Transmission from Transmit/Receive FIFO Buffers

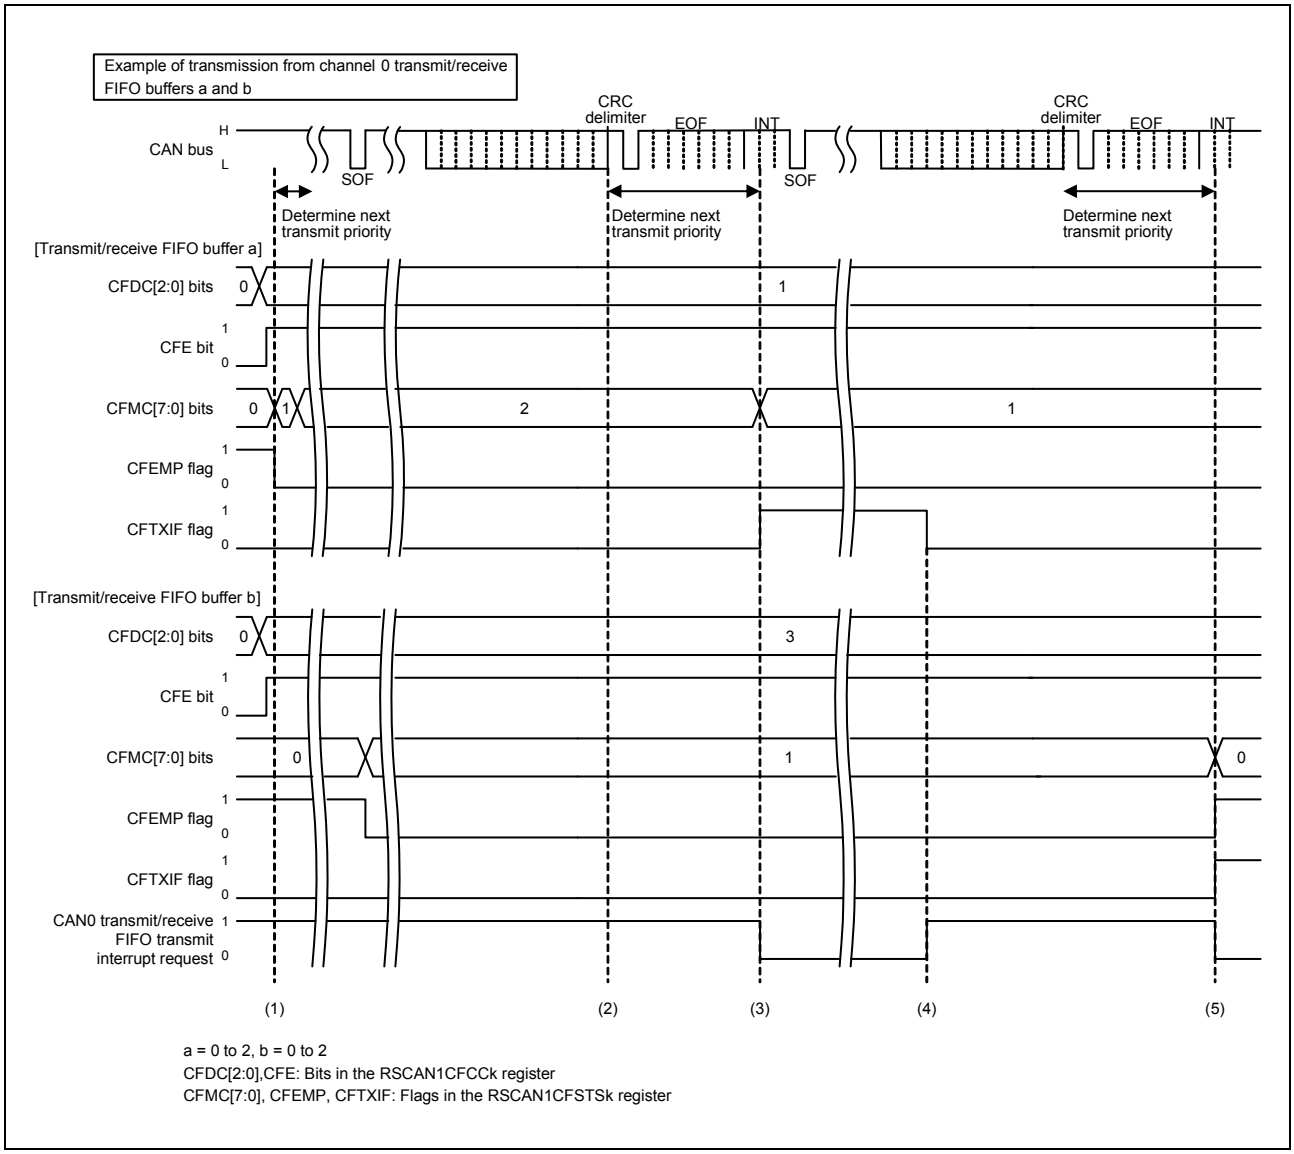

Figure 21.67 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RSCA0CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCAN1CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCAN1CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the CFMC[7:0] value in the RSCAN1CFSTSa register is decremented. Setting the CFIM bit in the RSCAN1CFCCa register to 1 (a FIFO transmit

interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCAN1CFSTSk register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCAN1CFSTSb register is decremented. The CFMC[7:0] bits are cleared to 00_H and therefore the CFEMP flag in the RSCAN1CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCAN1CFSTSa and RSCAN1CFSTSb register is set to 1 (the transmit/receive FIFO buffer is full).

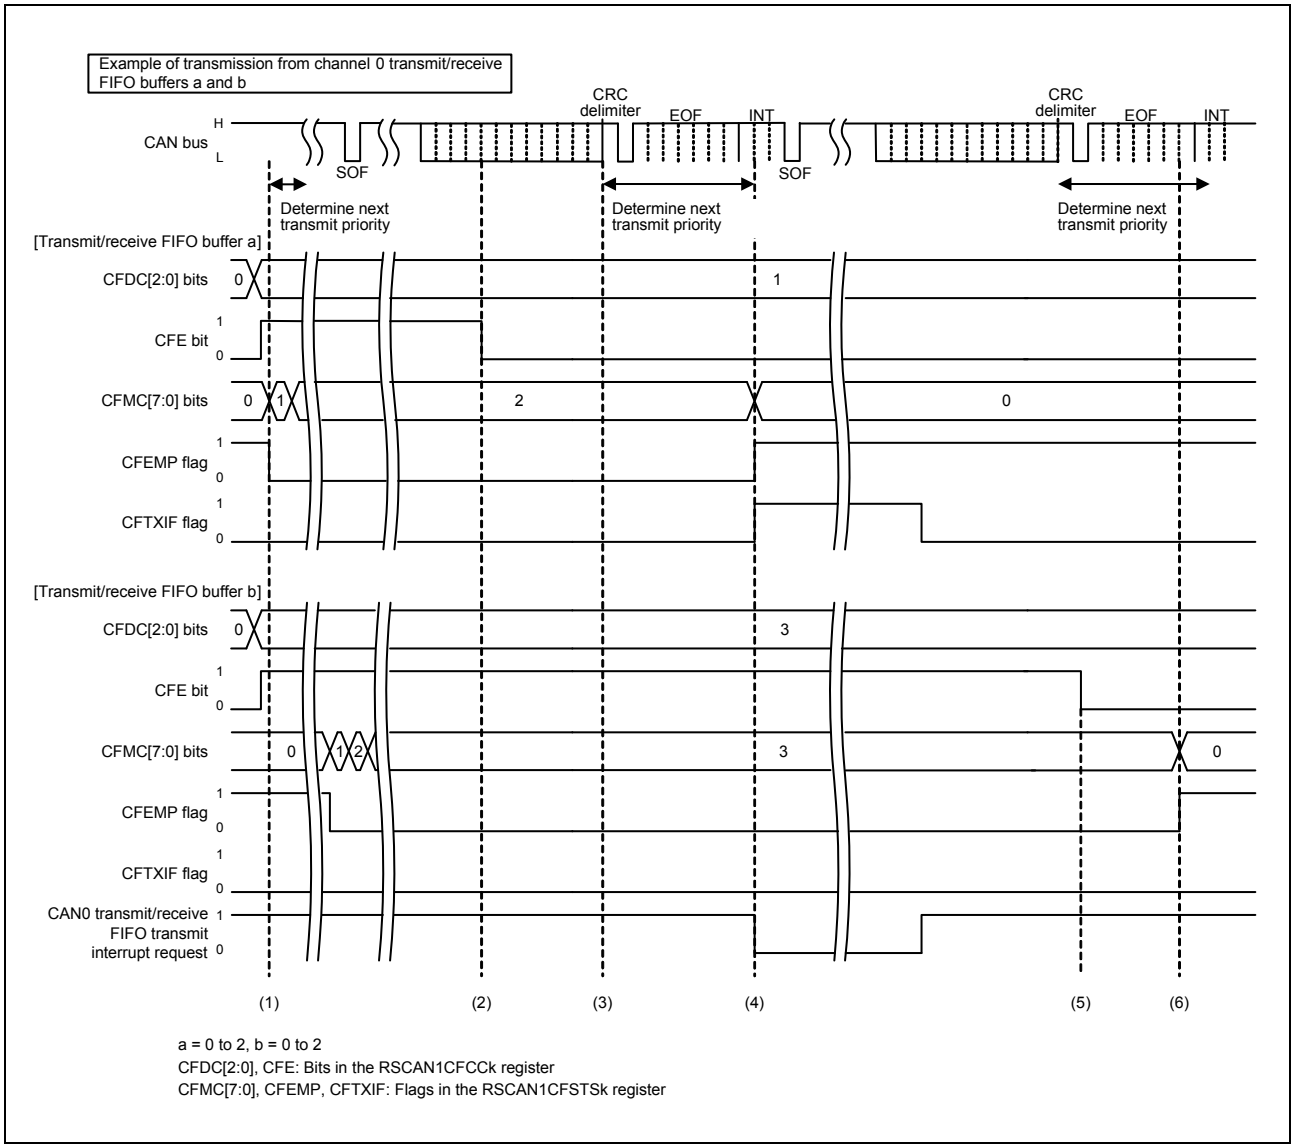

Figure 21.68 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) While the CAN bus is idle, when the CFE bit in the RSCAN1CFCCa register (a = 0 to 17) is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCAN1CFCCa register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCAN1CFSTSa register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit

message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

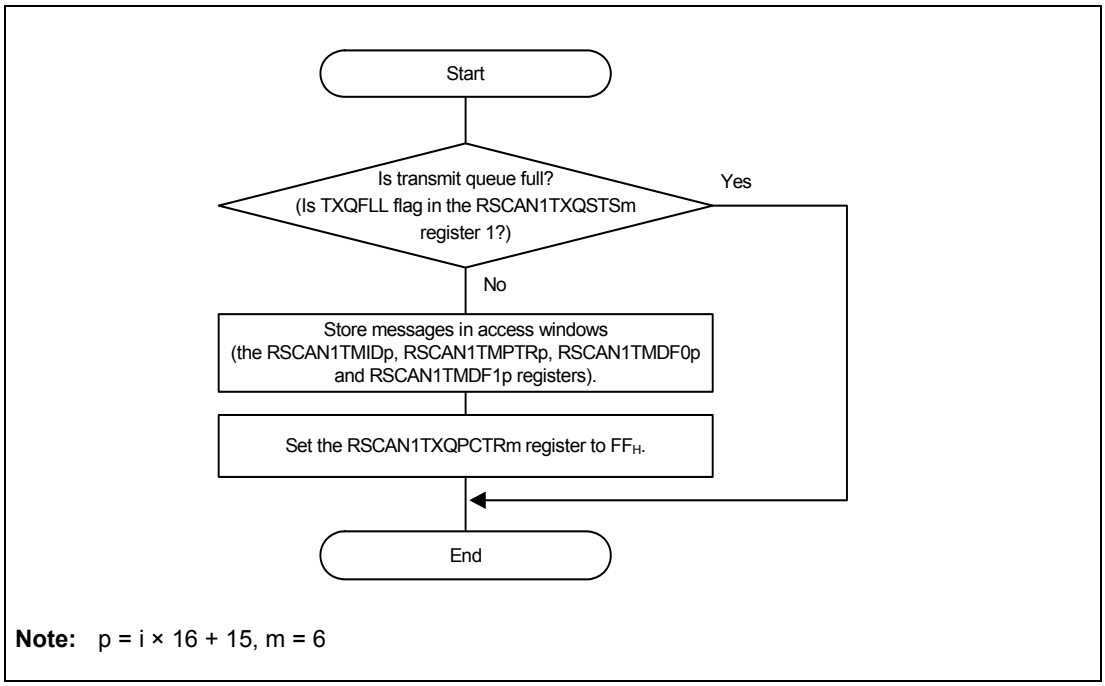
(4) When transmit completes successfully, the CFMC[7:0] value is cleared to 00_H. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCAN1CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffers cannot be disabled immediately even if the CFE bit in the RSCAN1CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCAN1CFSTSb register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffers are disabled and the CFMC[7:0] bits in the RSCAN1CFSTSb register are cleared to 00_H and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer is immediately disabled. (The CFMC[7:0] bits are cleared to 00_H and the CFEMP flag is set to 1.)

21.22.3.3 Procedure for Transmission from the Transmit Queue

Figure 21.69 shows the procedure for transmission from the transmit queue.



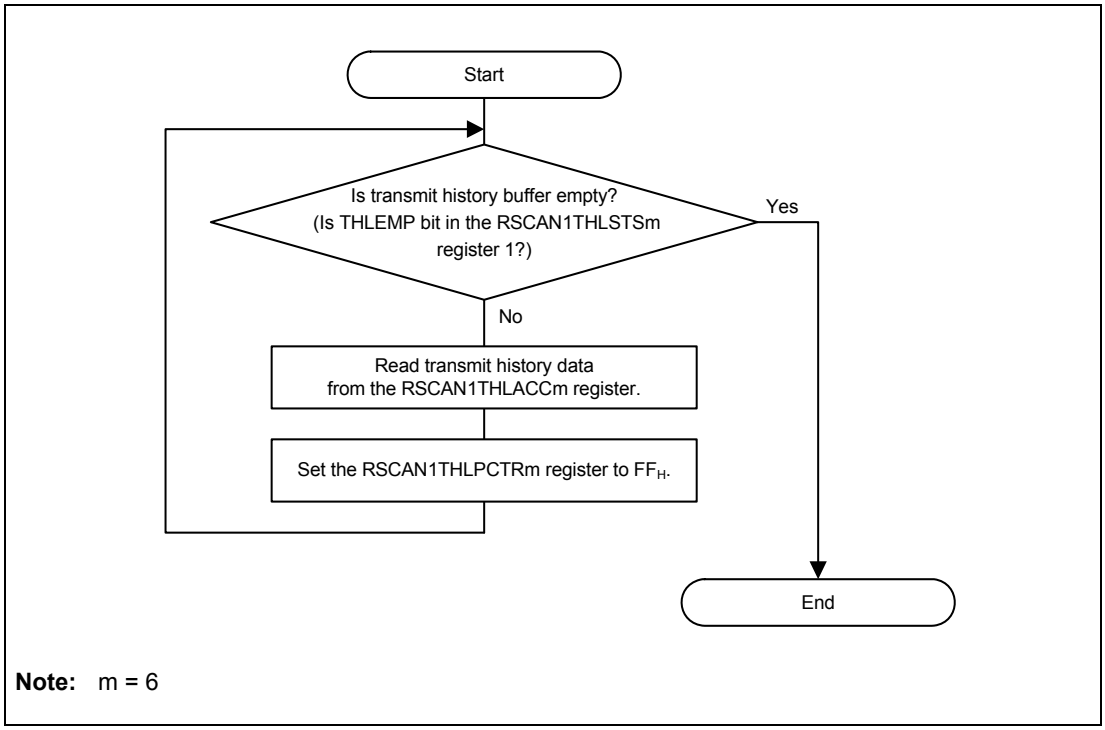


Figure 21.69 Procedure for Transmission from the Transmit Queue

21.22.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCAN1THLACCm register. The next data can be accessed by writing FF_H to the corresponding RSCAN1THLPCTRm register (m = 6) after reading a set of data. **Figure 21.70** shows the transmit history buffer reading procedure.

Note: m = 6

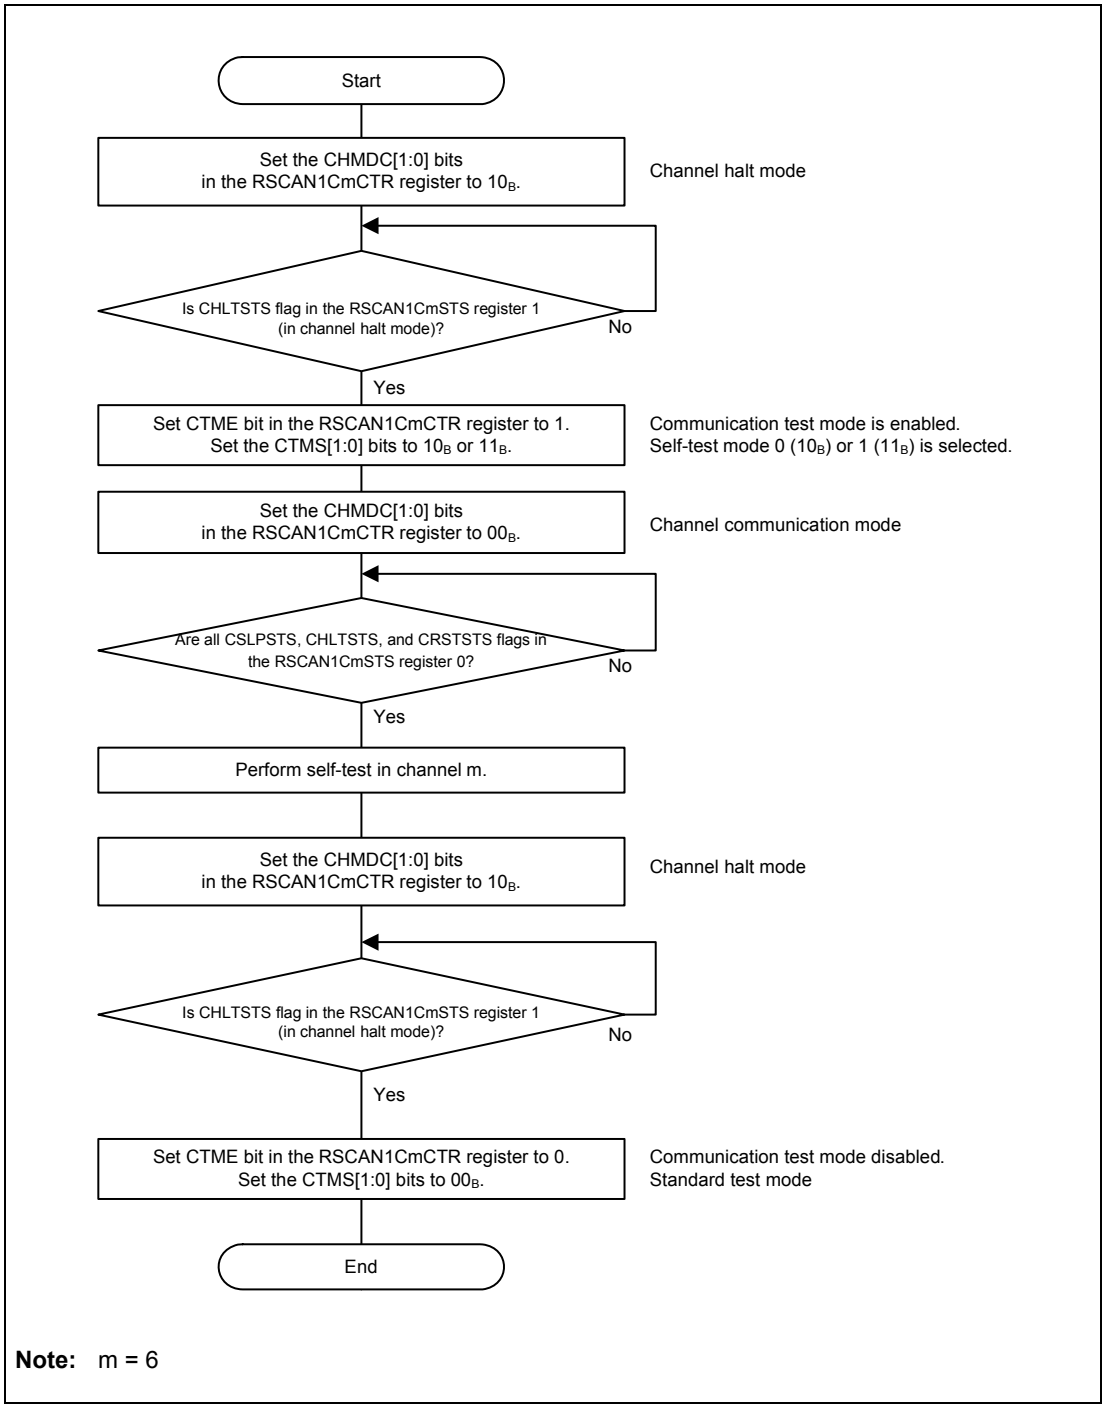

Figure 21.70 Transmit History Buffer Reading Procedure

21.22.4 Test Settings

21.22.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

Figure 21.71 shows the self-test mode setting procedure.

Note: m = 6

Figure 21.71 Self-Test Mode Setting Procedure

21.22.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 21.297** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCAN1GLOCKK register, then set the target test bit to 1.

Table 21.297 Protection Release Data for Test Function

Test Function	Protection Release Data 1	Protection Release Data 2	Target Bit
RAM test	7575_H	$8A8A_H$	RTME bit in the RSCAN1GTSTCTR register

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. **Figure 21.72** shows the procedure for releasing the protection.

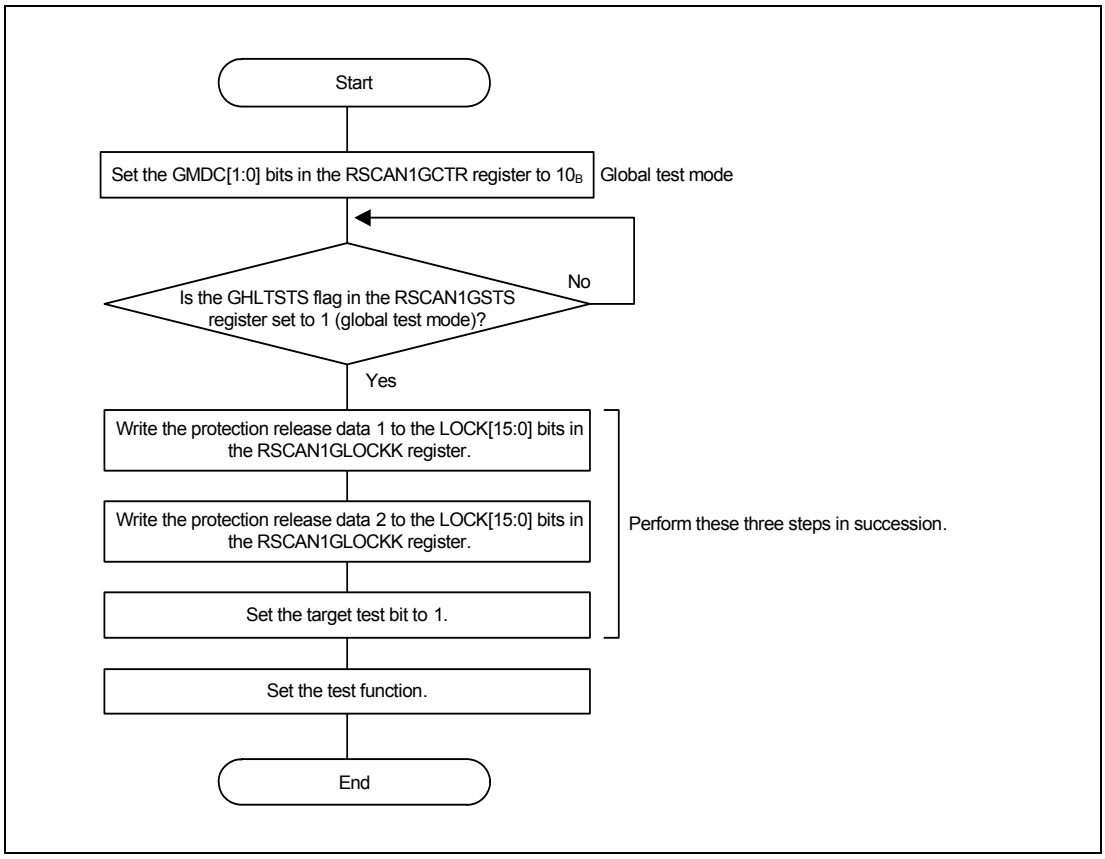

Figure 21.72 Protection Release Procedure

21.22.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write 0000 0000_H to all pages of the CAN RAM.

Figure 21.73 shows the RAM test setting procedure.

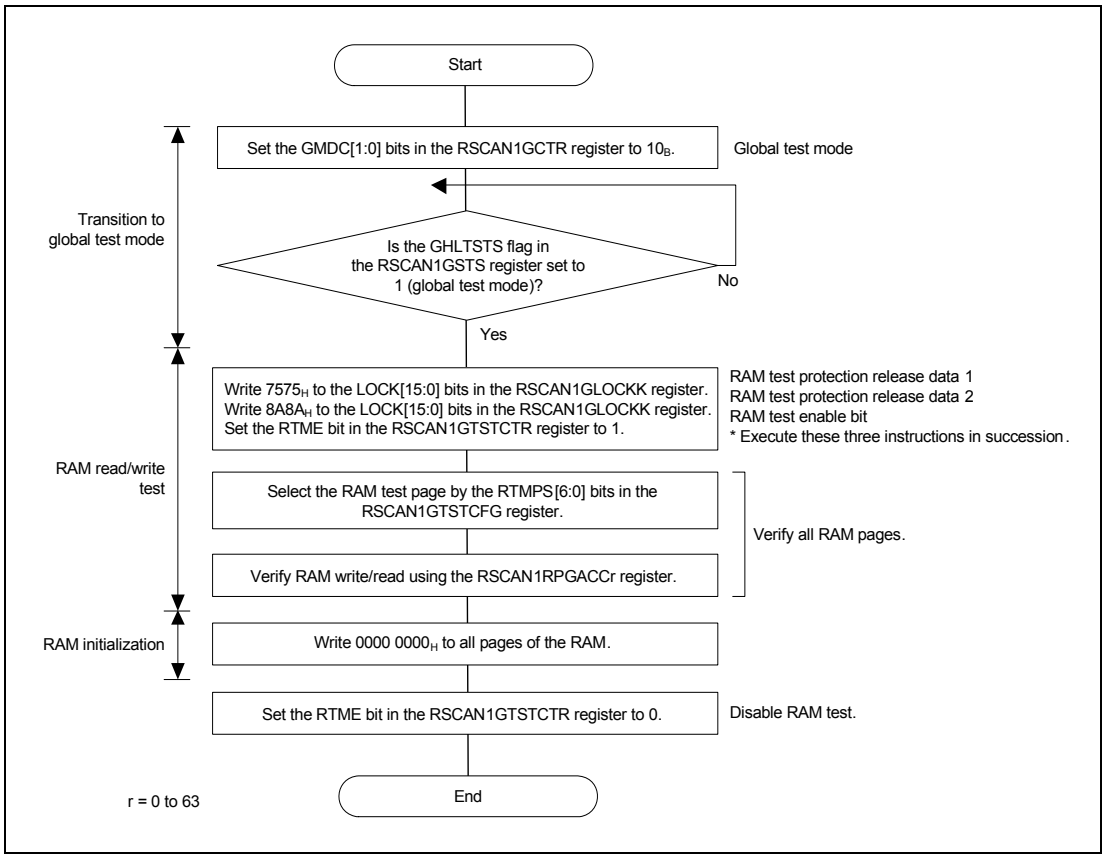

Figure 21.73 RAM Test Setting Procedure

21.23 Detection and Correction of Errors in RS-CAN RAM

21.23.1 ECC for the RSCAN1 RAM

Table 21.298 gives an outline of the ECC functions for the RSCAN1 RAM.

Table 21.298 List of the ECC Functions for the RSCAN1 RAM

Item	Outline of Functions
ECC error detection/ correction	The RAM is checked for ECC errors. The following options can be selected. • 2-bit error detection and 1-bit error detection/correction • 2-bit error detection and 1-bit error detection The ECC error detection/correction can be disabled by using through mode. With the initial settings, error detection/correction is enabled.
Error notification	When an ECC error has occurred, the error is notified. • Error notification can be enabled or disabled when an ECC 2-bit error is detected. • Error notification can be enabled or disabled when an ECC 1-bit error is detected. In the initial setting, 2-bit error notification is enabled and 1-bit error notification is disabled. However, when the interrupt is masked by the FEINTFMSK register, interrupt processing is not performed.
Error status	Monitoring for the detection of ECC 2-bit errors and for the detection of ECC 1-bit errors is available. A register for clearing the error status is provided.
Address capture	Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error , and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).

CAUTION

When ECC error detection/correction is performed, confirm initialization of the RSCAN1 RAM (RSCAN1GSTS.GRAMINIT = 0) before it is used.

21.23.2 Interrupt Request

Table 21.299 lists the ECC interrupt request of RSCAN1 RAM.

Table 21.299 RS-CAN ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit Interrupt Signal Name	Outline	Name	DMA Trigger Number
ECCDCNRAM1FEIF	RSCAN ECC bit error interrupt	INTECCDCNRAM1	—

21.23.3 List of Registers

The registers for RSCAN1 are listed in the following table.

Table 21.300 Registers

Module	Register	Abbreviation	Address
ECCCAN1	RSCAN1 ECC Control Register	ECCRCAN1CTL	FFC7 1020_H
ECCCAN1	RSCAN1 ECC Test Mode Control Register	ECCRCAN1TMC	FFC7 1024_H
ECCCAN1	RSCAN1 ECC Encode/Decode Input/Output Replacement Register	ECCRCAN1TED	FFC7 $102C_H$
ECCCAN1	RSCAN1 ECC Redundant Bit Data Control Test Register	ECCRCAN1TRC	FFC7 1028_H
ECCCAN1	RSCAN1 ECC Redundant Bit Input/Output Replacement Buffer Register	ECCRCAN1ERDB	FFC7 1028_H
ECCCAN1	RSCAN1 ECC Encode Test Register	ECCRCAN1ECRD	FFC7 1029_H
ECCCAN1	RSCAN1 ECC 7-Bit Redundant Bit Data Hold Test Register	ECCRCAN1HORD	FFC7 $102A_H$
ECCCAN1	RSCAN1 ECC Decode Syndrome Data Register	ECCRCAN1SYND	FFC7 $102B_H$
ECCCAN1	RSCAN1 ECC Error Address Register 0	ECCRCAN1AD0	FFC7 1030_H

21.23.4 ECCRCANnCTL — RSCAN1 ECC Control Register

The ECCRCANnCTL register controls the mode of the ECC and the status for RSCAN1.

Bits 7, 5 and 4 should be set (written) while the RSCAN1 operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01_B.

Access: This register can be read or written in 16-bit units.

Address: See **Table 21.300, Registers**.

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	ECCOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	Undefined
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R	R

Note 1. These bits are always read as 0.

Table 21.301 ECCRCANnCTL Register Contents (1/2)

Bit position	Bit Name	Function
15	EMCA1	Access control bits 1 and 0 to ECC mode selection bit These bits specify whether modifying the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 01_B, writing to bit 7 is enabled.
14	EMCA0	
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	ECCOVFF	By detecting an error while the error status is set and the new error has anotheraddress than the already latched (not cleared or reset is not issued), this bit is set and error notification is generated.

ECCOVFF	Operation explanation
0	Overflow has not occurred after reset of clearing ECER2F and ECER1F. Clearing at (1) Reset (2) Writing ECER2C = 1 or ECER1C = 1 (3) Selecting through mode enable (ECTHM = 1)
1	Error address register overflowed.

10	ECER2C	2-bit ECC error detection flag clear bit This bit is used to clear the 2 bit error detection flag of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority.
9	ECER1C	1-bit ECC error correction accumulation flag clear bit This bit is used to clear the 1 bit error detection/correction flag of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority.
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTHM	ECC function through mode selection bit This bit is used to set enabling and disabling of ECC. Setting this bit to 1 disables ECC function. When writing to this bit, (0, 1) must be written to (EMCA1, EMCA0) at the same time. 0: Through mode is disabled (normal operation mode). 1: Through mode is enabled. (ECC function disable)

Table 21.301 ECCRCANnCTL Register Contents (2/2)

Bit position	Bit Name	Function
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	EC1ECP	1-bit error correction enable bit This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. 0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.
4	EC2EDIC	2-bit error detection interrupt control bit This bit controls whether to generate an interrupt when 2-bit error is detected. 0: When 2-bit error is detected, a INTECCDCNRAMn interrupt will not be generated. 1: When 2-bit error is detected, a INTECCDCNRAMn interrupt will be generated.
3	EC1EDIC	1-bit error detection interrupt control bit This bit controls whether to generate an interrupt when 1-bit error is detected. 0: When 1-bit error is detected, a INTECCDCNRAMn interrupt will not be generated. 1: When 1-bit error is detected, a INTECCDCNRAMn interrupt will be generated.
2	ECER2F	2-bit error detection flag bit This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (INTECCDCNRAMn) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). If 2-bit error is detected again while this bit is set, an interrupt signal will not be generated. 0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred.
1	ECER1F	1-bit error detection/correction flag bit This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. This bit is cleared at the time of through mode enable selection (ECTHM = 1). 0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred.
0	ECEMF	ECC error message flag This flag indicates whether an error exists in the current read data. This bit is updated whenever the RAM reads data. This bit might be set if it is read before initialization of the RAM. This bit is cleared at the time of through mode enable selection (ECTHM = 1) and when there is no 1 bit error in the decode circuit input data. 0: The currently-read RAM data does not have bit errors. 1: The currently-read RAM data have bit errors.

CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

We recommend initializing the RAM before clearing bits 2 and 1.

21.23.5 ECCRCANnTMC — RSCAN1 ECC Test Mode Control Register

The ECCRCANnTMC register switches to and controls the test mode.

This register can be used when RS-CAN is not accessed to RAM.

Access: This register can be read or written in 16-bit units.

Address: See **Table 21.300, Registers**.

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA1	ETMA0	—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. These bits are always read as 0.

Table 21.302 ECCRCANnTMC Register Contents (1/2)

Bit position	Bit Name	Function
15	ETMA1	Access control bits 1 and 0 to ECC test mode bit These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 10_B, writing to bit 7 is enabled.
14	ETMA0	
13 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTMCE	ECC test mode enable bit This bit specifies whether to enable access to the test registers and test control bits. When writing to this bit, (1, 0) should be written to (ETMA1, ETMA0) at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: ECCRCANnTED, ECCRCANnTRC, ECCRCANnSYND, ECCRCANnHORD, ECCRCANnECRD, ECCRCANnERDB Register test control bit: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECTRRS	ECC RAM read test mode selection bit Select reading destination when reading ECCRCANnTED register and reading destination when reading ECCRCANnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0:The read value of the ECCRCANnTED register is the write value of the ECCRCANnTED register. The read value of the ECCRCANnERDB register is the write value of the ECCRCANnERDB register. 1: The read value of the ECCRCANnTED register can read RAM data. The read value of the ECCRCANnERDB register is the ECC data to be written to RAM.
3	ECREOS	ECC redundant bit output data selection bit This bit is used to identifyand select the ECC data to be stored in RAM as ECC data generated for write data or the value of the ECCRCANnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Store ECC data generated for write data to RAM. 1: Store the value of ECCRCANnERDB register to RAM.

Table 21.302 ECCRCANnTMC Register Contents (2/2)

Bit position	Bit Name	Function
2	ECENS	ECC encoder input selection bit This bit is used to identify the targeted data for ECC data generation as write data to RAM or the value of the ECCRCANnTED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate ECC data from the write data to RAM. 1: Generate ECC data from the value of the ECCRCANnTED register.
1	ECDCS	ECC decoder input selection bit This bit is used to indetifyand select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCRCANnTED register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from RAM data and detect errors. 1: Generate syndrome code from the value of the ECCRCANnTED register and detect errors.
0	ECREIS	ECC redundant bit input data selection bit This bit is used to indetify and select the targeted data for syndrome code generation and error detection as RAM data or the value of the ECCRCANnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Generate syndrome code from ECC data stored in RAM and detect errors. 1: Generate syndrome code from the value of the ECCRCANnERDB register and detect errors.

21.23.6 ECCRCANnTED — RSCAN1 ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

The value of the register can be used to generate ECC data or syndrome code.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), it is accessible. When ECCRCANnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when RS-CAN is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See **Table 21.300, Registers**.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.303 ECCRCANnTED Register Contents

Bit position	Bit Name	Function
31 to 0	ECEDB[31:0]	When ECCRCANnTMC.ECENS = 1, the value of this register is used to generate ECC data and the value this register to RAM is stored to RAM. When ECCRCANnTMC.ECDCS = 1, the value of this register is used to generate syndrome code and the value of this register is stored in ECC decode syndrome data register (ECCRCANnSYND). In addition, when ECCRCANnTMC.ECTRRS = 1, RAM data [31:0], instead of written data, is read for the value of this register.

21.23.7 ECCRCANnTRC — RSCAN1 ECC Redundant Bit Data Control Test Register

In ECC test mode, this test register, for ECC data, consists of four 8-bit registers, ECCRCANnSYND, ECCRCANnHORD, ECCRCANnECRD, and ECCRSCAN1ERDB.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), this register can be accessed. When ECCRCANnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when RS-CAN is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: See **Table 21.300, Registers**.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECCRCANnSYND (See **Section 21.23.8**)								ECCRCANnHORD (See **Section 21.23.9**)

21.23.8 ECCRCANnSYND — RSCAN1 ECC Decode Syndrome Data Register

In ECC test mode, this is a read-only register for storing generated syndrome code.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCRCANnTMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 21.300, Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SYND6	SYND5	SYND4	SYND3	SYND2	SYND1	SYND0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 21.304 ECCRCANnSYND Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	SYND[6:0]	The generated syndrome code is stored as needed.

21.23.9 ECCRCANnHORD — RSCAN1 ECC 7-Bit Redundant Bit Data Hold Test Register

In ECC test mode, this register is used to store ECC data for read RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), this register can be accessed. When ECC test mode is disabled (ECCRCANnTMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 21.300, Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	HORD6	HORD5	HORD4	HORD3	HORD2	HORD1	HORD0
Value after reset	0	0	0	0	0	0	0	0

Table 21.305 ECCRCANnHORD Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	HORD[6:0]	ECC code for read RAM data is stored as needed. When ECCRCANnTMC.ECTRRS = 1 and ECCRCANnTED register is read, ECC code is stored.

21.23.10 ECCRCANnECRD — RSCAN1 ECC Encode Test Register

In ECC test mode, this is a read-only register for storing ECC data generated for write RAM data.

Writing to this register is ignored.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCANnTMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 21.300, Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ECRD6	ECRD5	ECRD4	ECRD3	ECRD2	ECRD1	ECRD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 21.306 ECCRCANnECRD Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing, and can read ECC data for the data written to the ECCRCANnTED register when ECCRCANnTMC.ECENS = 1.

21.23.11 ECCRCANnERDB — RSCAN1 ECC Redundant Bit Input/Output Replacement Buffer Register

In ECC test mode, this register handles ECC data.

The value of this register can be used as ECC data generated at the time of RAM writing or ECC data read at the time of RAM data reading.

When ECC test mode is enabled (ECCRCANnTMC.ECTMCE = 1), this register is accessible. When ECC test mode is disabled (ECCRCANnTMC.ECTMCE = 0), 00_H is read.

Access: This register can be read or written in 8-bit units.

Address: See **Table 21.300, Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ERDB6	ERDB5	ERDB4	ERDB3	ERDB2	ERDB1	ERDB0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.307 ECCRCANnERDB Register Contents

Bit position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ERDB[6:0]	When ECCRCANnTMC.ECREOS = 1, these bits store the value of this register as ECC data to RAM. When ECCRCANnTMC.ECREIS = 1, the value of this register is read as ECC data read from RAM. When ECCRCANnTMC.ECTRRS = 1, ECC data to be stored in RAM is read instead of the write data for the read value of this register.

21.23.12 ECCRCAN1AD0 — RSCAN1 ECC Error Address Register 0

This is read only register to hold the ECC error occurred address.

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ECCCAN1_base > + 10_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	ECEAD[30:16]														
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.308 ECCRCAN1AD0 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned.
30 to 0	ECEAD[30:0]	ECEAD0 is a read-only register to hold the address at which an ECC error has occurred. If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECEAD0 as the address at which the ECC error has occurred. The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. Only one address can be held in ECEAD0

21.23.13 SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the CSIHn ECC registers and the RSCAN1 ECC registers. For detail, see **Section 17.7.14, SELB_READTEST — ECCREAD Test Select Register**.

21.24 Notes on the RS-CAN Module

- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCAN1GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCAN1CmSTS register (m = 6) for transitions.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCAN1TMCp) of the corresponding transmit buffer to 00_H. The status register (RSCAN1TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCAN1TMTRSTSy, RSCAN1TMTARSTSy, RSCAN1TMTCSTSy, and RSCAN1TMTASTSy), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (register RSCAN1TMIECy) to 0 (transmit buffer interrupt is disabled).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not be allocated to transmit queues.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- The values of unused receive buffers (RSCAN1RMIDq, RSCAN1RMPTRq, RSCAN1RMDF0q, and RSCAN1RMDF1q registers), receive FIFO buffer access registers (RSCAN1RFIDx, RSCAN1RFPTRx, RSCAN1RFDF0x, and RSCAN1RFDF1x registers), and transmit/receive FIFO buffer access registers (RSCAN1CFIDk, RSCAN1CFPTRk, RSCAN1CFDF0k, and RSCAN1CFDF1k registers) are undefined when the RS-CAN module transitions to global operation mode or global test mode after exiting from global reset mode.

Section 22 Window Watchdog Timer (WDTA)

This section contains a generic description of the Window Watchdog Timer (WDTA).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of WDTA.

22.1 Features of RH850/F1K WDTA

22.1.1 Number of Units and Channels

This microcontroller has the following number of WDTA units.

Table 22.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	2		
Name	WDTAn (n = 0, 1)		

Table 22.2 Index

Index	Description
n	Throughout this section, the individual window watchdog timer units are identified by the index “n”: for example, WDTAnWDTE (n = 0, 1) is the WDTAn enable register.

22.1.2 Register Base Address

WDTAn base addresses are listed in the following table.

WDTAn register addresses are given as offsets from the base addresses.

Table 22.3 Register Base Addresses

Base Address Name	Base Address
<WDTA0_base>	FFED 0000_H
<WDTA1_base>	FFED 1000_H

22.1.3 Clock Supply

The WDTAn clock supply is shown in the following table.

Table 22.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
WDTA0	WDTATCKI	CKSCLK_AWDTA	Timer count clock
	Register access clock	CPUCLK2	Bus clock
WDTA1	WDTATCKI	LS IntOSC	Timer count clock
	Register access clock	CPUCLK2	Bus clock

22.1.4 Interrupt Request

WDTAn interrupt requests are listed in the following table.

Table 22.5 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
WDTA0			
INTWDTAn	WDTA0 75% interrupt	40	—
WDTA1			
INTWDTAn	WDTA1 75% interrupt	41	—

Table 22.6 Interrupt Request (FE Level Non-Maskable Interrupt)

Unit Interrupt Signal	Description	Interrupt Name	DMA Trigger Number
WDTA0			
WDTAnTNMI	WDTA0 FENMI interrupt (in WDTA error detection mode with an NMI request)	WDTA0NMI	—
WDTA1			
WDTAnTNMI	WDTA1 FENMI interrupt (in the WDTA error detection mode with an NMI request)	WDTA1NMI	—

22.1.5 Reset Sources

WDTAn reset sources are listed in the following table. WDTAn is initialized by these reset sources.

Table 22.7 Reset Sources

Unit Name	Reset Source
WDTA0	Reset sources (AWORES)
WDTA1	All reset sources (ISORES)

Note: WDTA1 is stopped in STOP mode.

22.2 Overview

22.2.1 Functional Overview

WDTA has the following functions:

- Selection of the operation mode after reset, by using the option bytes

Enabling/disabling of WDTA, starting/stopping of the counter after reset, setting of the counter overflow time, and enabling/disabling of the VAC function can be selected. WDTA startup options to be set by the option bytes are described in **Table 22.8**.

- WDTA trigger function

Writing an activation code to the WDTA trigger register starts WDTA and restarts the counter. Activation codes include fixed activation codes and variable activation codes (VAC function). In a variable activation code, a different value from the previous time (variable value) is written to the WDTA trigger register, which causes the counter to be restarted.

- 75% interrupt request signal

An interrupt request signal can be generated when the WDTA counter reaches 75% of the overflow interval time (this function can be enabled or disabled by the setting of WDTAnMD.WDTAnWIE).

- Window function

The period during which writing to the WDTA trigger register is valid (window-open period) can be set. Writing to the WDTA trigger register during a period other than the window-open period causes an error.

- WDTA error detection function

When an error is detected, a non-maskable interrupt request or an internal reset is generated.

For details about the error sources, see **Section 22.5.3, WDTA Error Detection**.

Table 22.8 WDTA Start-Up Options

Start-Up Option	Function	Description	Option Byte
OPWDEN	WDTA setting	Enables/disables the WDTA. 0: WDTA is disabled 1: WDTA is enabled	• WDTA0: OPBT0.WDT0_0 • WDTA1: OPBT0.WDT1_0
OPWDOVF[2:0]	Overflow interval time reset value setting	Specifies the reset value of the overflow interval time control bits WDTAnMD.WDTAnOVF[2:0].	• WDTA0/WDTA1: OPBT0.WDT_[2:0]
OPWDRUN	Start mode setting	Specifies the start mode. 0: Software trigger start mode 1: Default start mode For details, see **Section 22.5.1, WDTA after Reset Release**.	• WDTA0: OPBT0.WDT0_1 • WDTA1: OPBT0.WDT1_1
OPWDVAC	Variable activation code selection	Specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing. 0: WDTAnWDTE (fixed) 1: WDTAnEVAC (variable) When WDTAnWDTE is selected, the value to be written to the register (activation code) is fixed (ACH). When WDTAnEVAC is selected, the activation code to be written to the register is variable. For details, see **Section 22.5.2, WDTA Trigger** and **22.5.2.1, Calculating an Activation Code when the VAC Function is Used**.	• WDTA0: OPBT0.WDT0_3 • WDTA1: OPBT0.WDT1_3

NOTE

For the option byte settings, see **Section 37.9, Option Bytes**.

22.2.2 Block Diagram

Figure 22.1 shows the main components of the WDTA.

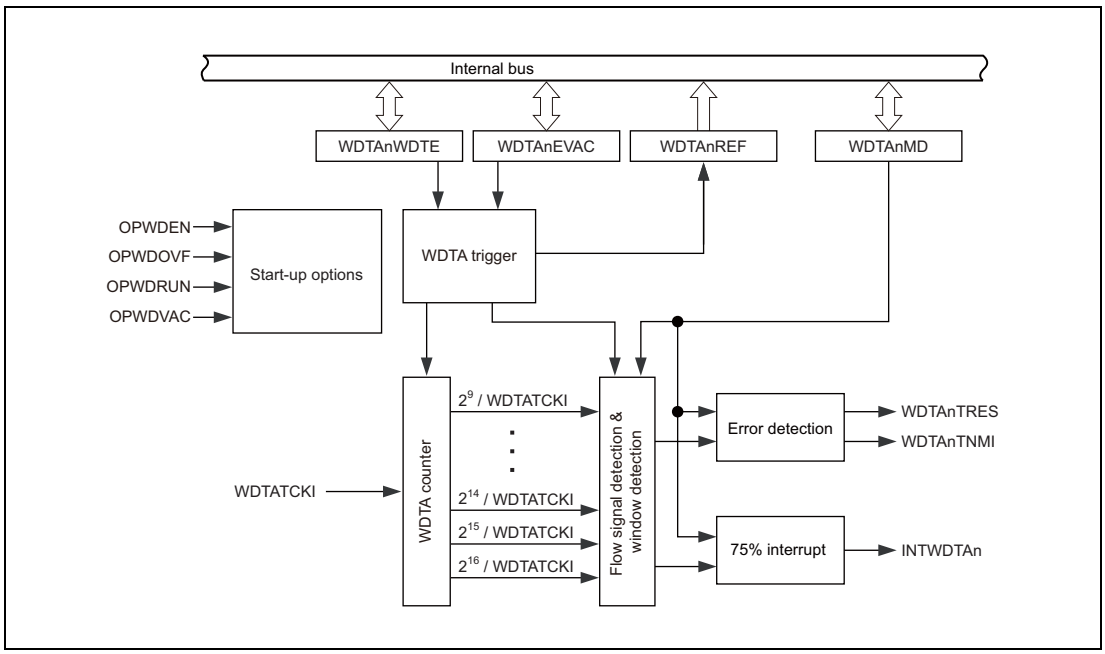

Figure 22.1 Block Diagram of the Window Watchdog Timer A

22.3 Registers

22.3.1 List of Registers

WDTA registers are listed in the following table.

For details about <WDTAn_base>, see **Section 22.1.2, Register Base Address**.

Table 22.9 List of Registers

Module	Register	Symbol	Address
WDTAn	WDTA enable register	WDTAnWDTE	<WDTAn_base> + 0000_H
	WDTA enable VAC register	WDTAnEVAC	<WDTAn_base> + 0004_H
	WDTA reference value register	WDTAnREF	<WDTAn_base> + 0008_H
	WDTA mode register	WDTAnMD	<WDTAn_base> + $000C_H$

22.3.2 WDTAnWDTE — WDTA Enable Register

This register is the WDTA trigger register when the VAC function is not used (start-up option OPWDVAC = 0).

Writing AC_H to this register generates a WDTA trigger and starts or restarts the WDTA counter. See **Section 22.5.2, WDTA Trigger**, for details.

The behavior of this register depends on the setting of the start-up option (OPWDVAC), see **Table 22.12, WDTAnWDTE Behavior**.

WDTA0 is initialized by AWORES.

WDTA1 is initialized by a reset of any type.

Access: This register can be read or written in 8-bit units.

Address: <WDTAn_base> + 0000_H

Value after reset: The initial value depends on the start-up options (OPWDEN, OPWDRUN and OPWDVAC). See **Table 22.11, Values of WDTAnRUN7 after Reset**.

Bit	7	6	5	4	3	2	1	0
	WDTAnRUN[7:0]							
Value after reset	0/1	0	1	0	1	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.10 WDTAnWDTE Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnRUN [7:0]	Writing the fixed activation code (AC_H) generates the WDTA trigger and starts/ restarts the WDTAn counter. Writing a value other than AC_H generates an error. The WDTAn cannot be stopped once it is started. See **Table 22.12, WDTAnWDTE Behavior**, when reading from or writing to these bits.

The WDTAnRUN7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is disabled (OPWDVAC = 0). **Table 22.11** lists the values of the WDTAnRUN7 bit after reset according to the start-up options.

Table 22.11 Values of WDTAnRUN7 after Reset

Start-Up Options			Start Mode	Value of WDTAnRUN7 after Reset
OPWDEN	OPWDVAC	OPWDRUN		
1	0	1	Default start	1
		0	Software trigger start	0

The behavior of WDTAnWDTE during read/write accesses depends on the OPWDVAC setting, as shown in **Table 22.12, WDTAnWDTE Behavior**.

Table 22.12 WDTAnWDTE Behavior

OPWDVAC	Description	WDTAnWDTE	
		Read	Write
0	The VAC function is disabled. WDTAnWDTE is enabled.	$2C_H$ is returned (in software trigger start mode, before the activation of WDTAn). AC_H is returned (after the activation of WDTAn).	WDTA trigger Write AC_H *1.
1	The VAC function is enabled. WDTAnWDTE is disabled.	$2C_H$ is returned.	Writing is ignored.

Note 1. Any other write value will cause an error.

22.3.3 WDTAnEVAC — WDTA Enable VAC Register

This register is the WDTA trigger register when the VAC function is used (start-up option OPWDVAC = 1).

Writing a correct activation code to this register generates a WDTA trigger and starts or restarts the WDTA counter. For details, see **Section 22.5.2, WDTA Trigger**. For details about the activation codes when the VAC function is used, see **Section 22.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

The behavior of this register depends on the setting of the start-up option (OPWDVAC). See **Table 22.15, WDTAnEVAC Behavior**.

WDTA0 is initialized by AWORES.

WDTA1 is initialized by a reset of any type.

Access: This register can be read or written in 8-bit units.

Address: <WDTAn_base> + 0004_H

Value after reset: The initial value depends on the start-up options (OPWDEN, OPWDRUN and OPWDVAC). See **Table 22.14, Values of WDTAnEVAC7 after Reset**.

Bit	7	6	5	4	3	2	1	0
	WDTAnEVAC[7:0]							
Value after reset	0/1	0	1	0	1	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 22.13 WDTAnEVAC Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnEVAC [7:0]	Writing a variable activation code generates the WDTA trigger and starts/ restarts the WDTAn counter. Writing an incorrect activation code generates an error. The WDTAn cannot be stopped once it is started. See **Table 22.15, WDTAnEVAC Behavior**, when reading from or writing to these bits.

The WDTAnEVAC7 bit is only valid if WDTA is enabled (OPWDEN = 1) and the VAC function is enabled (OPWDVAC = 1). **Table 22.14** lists the values of the WDTAnEVAC7 bit after reset according to the start-up options.

Table 22.14 Values of WDTAnEVAC7 after Reset

Start-Up Options			Start Mode	Value of WDTAnEVAC7 after Reset
OPWDEN	OPWDVAC	OPWDRUN		
1	1	1	Default start	1
		0	Software trigger start	0

The behavior of WDTAnEVAC during read/write accesses depends on the OPWDVAC setting, as shown in **Table 22.15**.

Table 22.15 WDTAnEVAC Behavior

OPWDVAC	Description	WDTAnEVAC	
		Read	Write
0	The VAC function is disabled. WDTAnEVAC is disabled.	$2C_H$ is returned.	Writing is ignored.
1	The VAC function is enabled. WDTAnEVAC is enabled.	$2C_H$ is returned (in software trigger start mode, before the activation of WDTAn). The variable activation code written last is read (after the activation of WDTAn).	Write the variable activation code*1 For details, see **Section 22.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

Note 1. Any other write value will cause an error.

22.3.4 WDTAnREF — WDTA Reference Value Register

This register contains the reference value for calculating the activation code of the VAC function. It is automatically updated after every trigger operation. See **Section 22.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

If the VAC function is disabled (OPWDVAC = 0), reading this register returns 00_H.

WDTA0 is initialized by AWORES.

WDTA1 is initialized by a reset of any type.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <WDTAn_base> + 0008_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WDTAnREF[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 22.16 WDTAnREF Register Contents

Bit Position	Bit Name	Function
7 to 0	WDTAnREF[7:0]	Reference value for activation code calculation for the VAC function

22.3.5 WDTAnMD — WDTA Mode Register

This register specifies the overflow interval time, 75% interrupt enable/disable, the error mode, and the window-open period.

The value of this register can be updated only once after reset release and before the first trigger is generated. The updated value will be effective after the WDTA trigger register is written to next.

Updating this register after the first WDTA trigger is generated generates an error, but an error does not occur if the same value has been written to it.

WDTA0 is initialized by AWORES.

WDTA1 is initialized by a reset of any type.

Access: This register can be read or written in 8-bit units.

Address: <WDTAn_base> + $000C_H$

Value after reset: The initial value depends on the start-up options (OPWDOVF[2:0]). See **Table 22.8, WDTA Start-Up Options**.

Bit	7	6	5	4	3	2	1	0
	—	WDTAnOVF[2:0]			WDTAnWIE	WDTAnERM	WDTAnWS[1:0]	
Value after reset	0	*1	*1	*1	0	1	1	1
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The WDTAnOVF[2:0] value after reset can be set by the start-up options OPWDOVF[2:0].

Table 22.17 WDTAnMD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 4	WDTAnOVF[2:0]	Selects the overflow interval time
3	WDTAnWIE	Enables/disables the 75% interrupt request INTWDTAn. 0: INTWDTAn is disabled. 1: INTWDTAn is enabled.
2	WDTAnERM	Specifies the error mode. 0: NMI request mode 1: Reset mode
1, 0	WDTAnWS[1:0]	Selects the window-open period.

WDTAn OVF2	WDTAn OVF1	WDTAn OVF0	Overflow Interval Time
0	0	0	2^9 / WDTATCKI
0	0	1	2^{10} / WDTATCKI
0	1	0	2^{11} / WDTATCKI
0	1	1	2^{12} / WDTATCKI
1	0	0	2^{13} / WDTATCKI
1	0	1	2^{14} / WDTATCKI
1	1	0	2^{15} / WDTATCKI
1	1	1	2^{16} / WDTATCKI

WDTAn WS1	WDTAn WS0	Window-Open Period
0	0	25%
0	1	50%
1	0	75%
1	1	100%

22.4 Interrupt Sources

WDTA checks the status of the WDTA counter value, detects illegal accesses to the WDTA-related registers, and generates an interrupt request. The following are WDTA interrupt requests:

(1) INTWDTAn (WDTA timer count 75% interrupt request)
An interrupt request signal is generated at 75% of the counter overflow time of the WDTA timer. An interrupt request signal can be enabled or disabled by using the WDTA mode register (WDTAnMD).

(2) WDTAnTNMI (WDTA error detection interrupt)
Detection of a WDTA error to generation of an NMI interrupt request. The WDTA mode register (WDTAnMD) can be used to switch between an NMI interrupt and a reset. For details about WDTA errors, see **Section 22.5.3, WDTA Error Detection**.

22.5 Functions

22.5.1 WDTA after Reset Release

22.5.1.1 Start Modes

There are two start modes (software start mode and default start mode) when WDTAn starts after reset release. The start mode can be selected by the start-up option.

The start mode selection is listed in **Table 22.18**.

Table 22.18 Start Modes

Start-Up Option OPWDRUN	Start Mode	Description
0	Software trigger	• The WDTA counter stops (0000_H) after reset release. • Writing an activation code to the WDTA trigger register starts WDTA.
1	Default	The WDTA counter starts after reset release.

22.5.1.2 WDTA Settings after Reset Release

(1) **Table 22.19** shows the WDTA settings after reset release.

Table 22.19 WDTA Settings after Reset Release

Function	Setting	Remark
WDTA enable/disable	Specified by start-up options	
Start mode		
VAC function		
WDTA overflow interval time	Specified by start-up options	Modification is possible only once by the setting of the WDTA mode register (WDTAnMD).
75% interrupt mode	75% interrupt disabled	
Behavior on error detection	Reset generation	
Window-open period	100%	

The setting of the WDTA mode register (WDTAnMD) is enabled when the first WDTA trigger is generated (writing an activation code to WDTAnWDTE and WDTAnEVAC). Perform the WDTAnMD register setting before a WDTA trigger is generated.

Setting of WDTA by using WDTAnMD is possible only once. If the value set to WDTAnMD is changed after a WDTA trigger is generated, an error occurs. However, an error does not occur if the same value is set.

22.5.1.3 Default Start Mode Timing

The default start mode timing and the changes to the WDTA settings are illustrated in **Figure 22.2**.

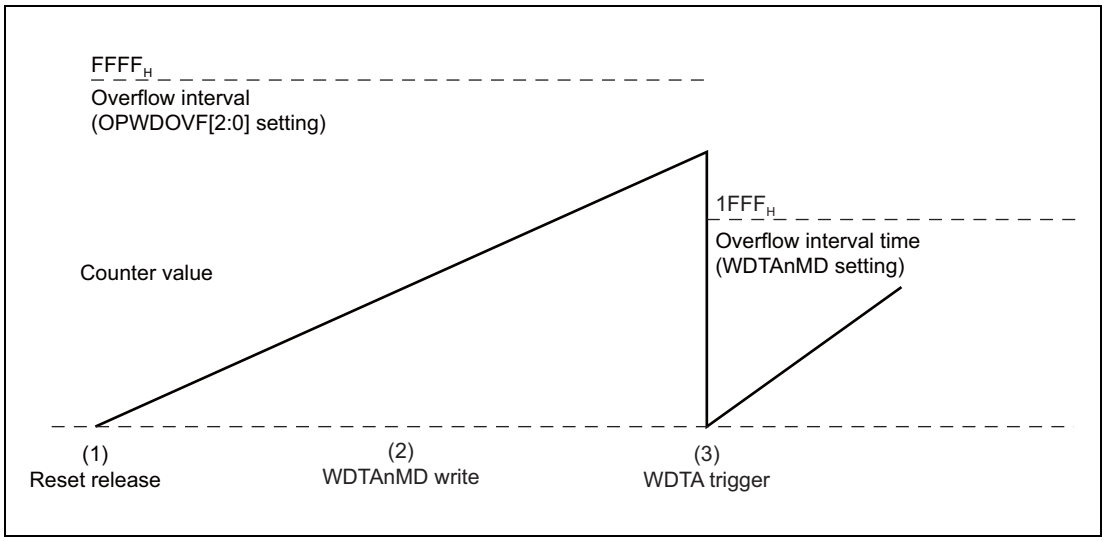

Figure 22.2 Timing Diagram of WDTA Start in Default Start Mode

The timing diagram shown in **Figure 22.2** shows the following behaviors:

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

Example: Overflow interval time after reset release
$= 2^{16}$/WDTATCKI (OPWDOVF[2:0] = 111_B)

(2) WDTAnMD is set before a WDTA trigger is generated. Note that the setting is not applied immediately.

(3) Write to the WDTA trigger register before the WDTA counter overflows.
The WDTAnMD setting is applied by the generation of a WDTA trigger.

Example: Overflow interval time after a WDTA trigger is generated
$= 2^{13}$/WDTATCKI

22.5.1.4 Software Trigger Start Mode Timing

The software trigger start mode timing and the changes to the WDTA settings are illustrated in **Figure 22.3**.

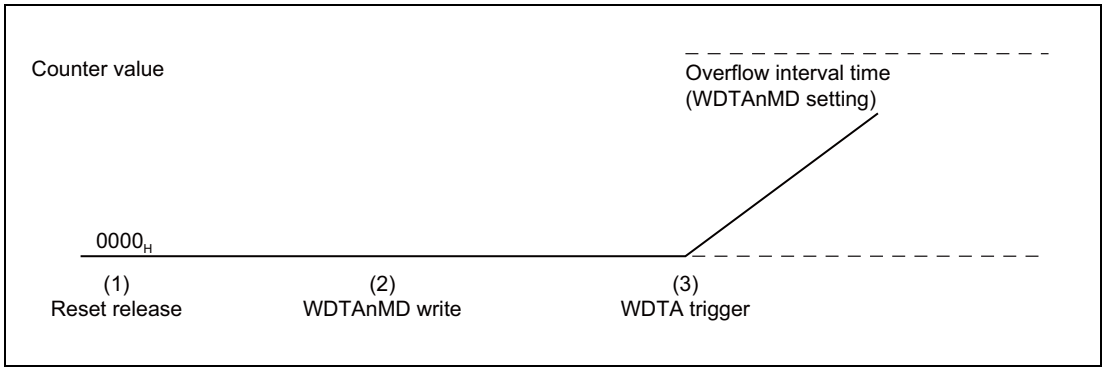

Figure 22.3 Timing Diagram of WDTA Start in Software Trigger Start Mode

The timing diagram shown in **Figure 22.3** shows the following behaviors:

(1) The WDTA counter value remains 0000_H until the first trigger is generated after reset release. The overflow interval time is set by start-up options, but this setting has no effect because the counter is not operating.

(2) WDTAnMD is set before a WDTA trigger is generated. Note that the setting is not applied immediately.

(3) The WDTA counter starts by the generation of a WDTA trigger.
The overflow interval time specified in WDTAnMD and other settings are applied.

22.5.2 WDTA Trigger

Writing a special value called an activation code to the WDTA enable register (WDTAnWDTE) and the WDTA enable VAC register (WDTAnEVAC) leads to generation of a WDTA trigger.

The WDTA trigger has the following functions:

- Starting the WDTA counter in software trigger start mode
- Restarting the WDTA counter
- Setting the WDTA mode specified by the WDTAnMD register (only for the first WDTA trigger after reset release)

The WDTA trigger register, which generates a WDTA trigger, is specified by the start-up option OPWDVAC.

Table 22.20 lists the WDTA trigger registers and activation codes.

Table 22.20 WDTA Trigger Registers and Activation Codes

Type of Activation Code	Trigger Register	Activation Code
Fixed (OPWDVAC = 0)	WDTAnWDTE	AC_H
Variable (OPWDVAC = 1)	WDTAnEVAC	For details, see **22.5.2.1, Calculating an Activation Code when the VAC Function is Used**.

CAUTION

- **When writing the processing to clear WDTA successively, the clear processing below is not acknowledged for the following period:**
  "12 × CPU clock*1 cycles + 6 × WDT clock*2 cycles"
- **After writing the processing to clear WDTA and then changing to standby mode, the clear processing below is not acknowledged for the following period after return from stand-by mode:**
  "6 × CPU clock*1 cycles + 3 × WDT clock*2 cycles"

Note 1. CPU clock: Clock selected by CKSC_CPUCLKS_CTL and CKSC_CPUCLKD_CTL
Note 2. WDT clock: Clock selected by CKSC_AWDTAD_CTL in WDTA0.
LS IntOSC in WDTA1.

22.5.2.1 Calculating an Activation Code when the VAC Function is Used

Use the following expression to calculate the variable activation code (ExpectWDTE) to be set in the WDTA trigger register (WDTAnEVAC) when the VAC function is used, by using the WDTA reference value register (WDTAnREF):

$$\text{ExpectWDTE} = AC_H - \text{WDTAnREF (previous)}$$

Note that the value in the WDTAnREF register is updated every time a start-code is written to the trigger register WDTAnEVAC. Use the following expression to calculate the updated value of the WDTAnREF register:

WDTAnREF (following) = (rotate the value of ExpectWDTE to the left by 1 bit)

Table 22.21 lists the variable activation codes according to the number of WDTA triggers.

Table 22.21 Expected Variable Activation Code Development

No*1	WDTAnREF (Previous)		ExpectWDTE (AC_H - WDTAnREF)		WDTAnREF (Following)	
0	0000 0000	00_H	1010 1100	AC_H	0101 1001	59_H
1	0101 1001	59_H	0101 0011	53_H	1010 0110	$A6_H$
2	1010 0110	$A6_H$	0000 0110	06_H	0000 1100	$0C_H$
…	…	…	…	…	…	…

Note 1. Number of triggers after reset

NOTE

Writing an incorrect activation code generates an error.

22.5.3 WDTA Error Detection

WDTA detects an error, including generation of the WDTA count overflow or illegal operations.

The following events are detected as errors:

- WDTA counter overflow
- Incorrect activation code is written to the WDTA trigger register
- Writing to the trigger register at a time outside the window-open period
- When the setting value in the WDTA mode register (WDTAnMD) is changed after the first WDTA trigger is generated
- When the value of the WDTA mode register (WDTAnMD) is changed twice before the first WDTA trigger is generated

22.5.3.1 WDTA Error Mode

When a WDTA error is detected, either an NMI interrupt or a reset is generated according to the setting of the WDTA error mode bit (WDTAnMD.WDTAnERM). The error mode bit after reset release is set to the reset mode.

- WDTAnMD.WDTAnERM = 0: NMI mode
- WDTAnMD.WDTAnERM = 1: Reset mode

Figure 22.4 shows the reset or NMI request generation when the counter overflows and default start mode is selected.

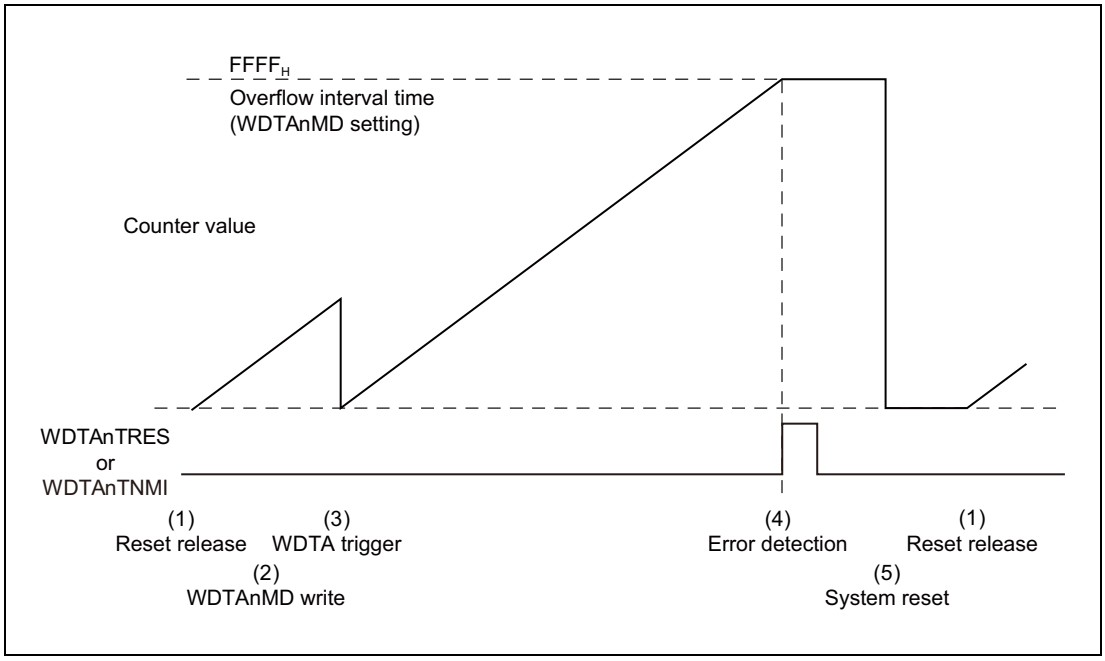

Figure 22.4 Timing Diagram of WDTA NMI Request or Reset Generation

The timing diagram shown in **Figure 22.4** shows the following behaviors:

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated.
In this case, 2^{16}/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated.
The counter value remains until a system reset is performed.

(5) When the system is reset, the counter is cleared and stops until reset release.

22.5.4 75% Interrupt Request Signals

When the WDTA counter reaches 75% of the time set for the overflow interval, the interrupt request INTWDTAn is generated.

This function can be enabled or disabled by the WDTAnMD.WDTAnWIE register.

Figure 22.5 shows the 75% interrupt request generated under following conditions:

- Default start mode is selected.
- 75% interrupt request is enabled after the first WDTA trigger is generated
- WDTA overflow interval time is 2^{16}/WDTATCKI

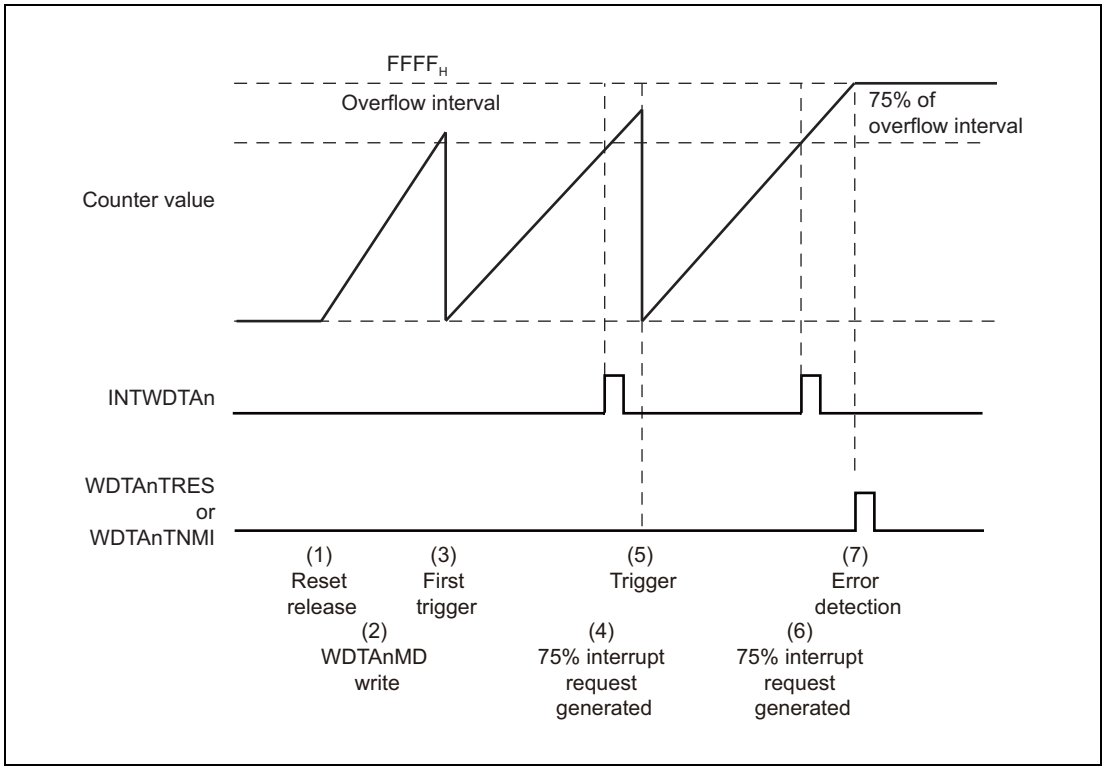

Figure 22.5 Timing Diagram of WDTA 75% Interrupt Request Signals

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated. In this case, 2^{16}/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) When the WDTA counter reaches 75% of the overflow interval timer, interrupt request INTWDTAn is generated.

(5) The WDTA trigger restarts counting.

(6) When the WDTA counter reaches 75% of the overflow interval timer, interrupt request INTWDTAn is generated.

(7) When the counter overflows, an error is detected. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.

22.5.5 Window Function

The period when a WDTA trigger is valid (window-open period) can be set. If the window-open period is set to the value less than 100%, the generation of a WDTA trigger not in the window-open period causes an error. The window-open period after reset release is 100%. The period is set to the value by the WDTAnMD.WDTAnWS[1:0] setting after the first WDTA trigger is generated.

Figure 22.6 shows the behavior of the window function under the following conditions.

- Default start mode is selected.
- 25% window-open period is enabled after the first WDTA trigger is generated (WDTAnWS[1:0] = 00_B)
- WDTA overflow interval time is 2^{16}/WDTATCKI

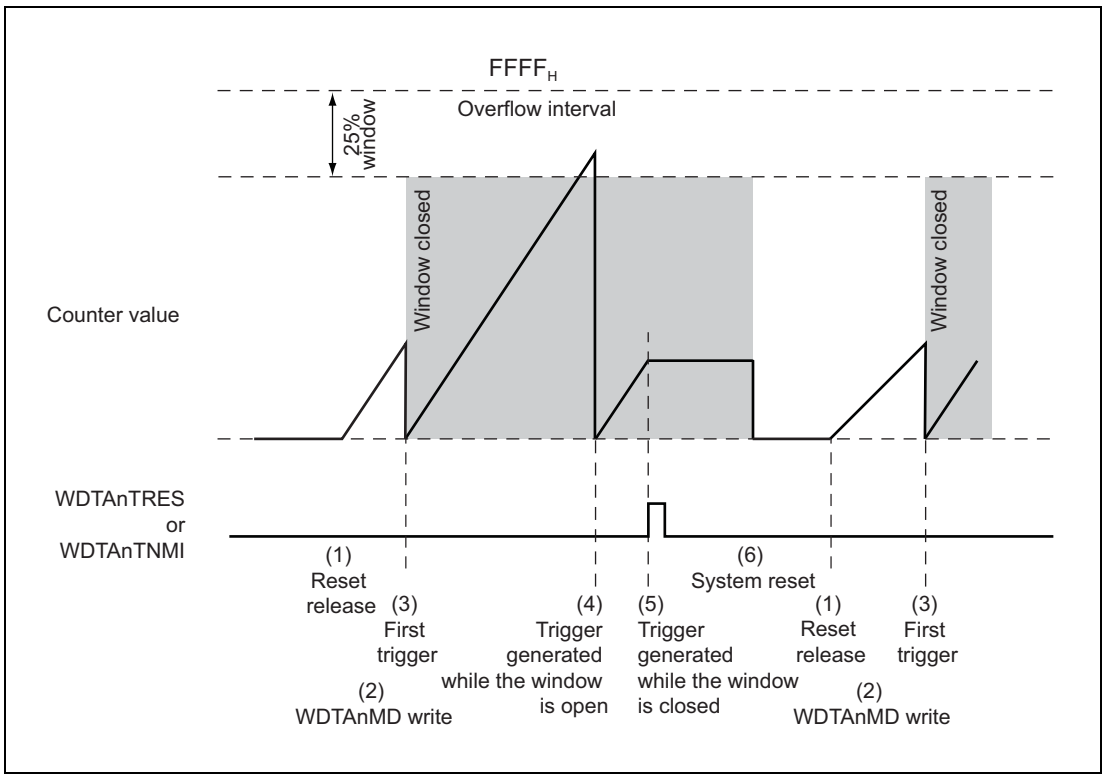

Figure 22.6 Timing Diagram of WDTA Window Function

(1) In default start mode, the WDTA counter starts after reset release. The overflow interval time after reset release is set by start-up options.

(2) WDTAnMD is set before a WDTA trigger is generated. In this case, 2^{16}/WDTATCKI is set for the overflow interval time.

(3) A WDTA trigger is generated, and the WDTAnMD setting is applied.

(4) During the window-open period, the WDTA trigger restarts counting.

(5) During the window-closed period, an error is detected by the WDTA trigger. Depending on the error mode, either interrupt request WDTAnTNMI or reset WDTAnTRES is generated. The counter value remains until a system reset is performed.

(6) When the system is reset, the counter is cleared and stops until reset release.

Section 23 OS Timer (OSTM)

This section contains a generic description of the OS Timer (OSTM).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the OSTM.

23.1 Features of RH850/F1K OSTM

23.1.1 Number of Units

This microcontroller has the following number of units of the OSTM.

Table 23.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	5		
Name	OSTMn (n = 0 to 4)		

Table 23.2 Index

Index	Description
n	Throughout this section, the individual OSTM units are identified by the index “n”; for example, OSTMnCNT is the OSTM counter register.

23.1.2 Register Base Address

OSTM base addresses are listed in the following table.

OSTM register addresses are given as offsets from the base addresses.

Table 23.3 Register Base Addresses

Base Address Name	Base Address
<OSTM0_base>	FFD7 0000_H
<OSTM1_base>	FFD7 0100_H
<OSTM2_base>	FFD7 0200_H
<OSTM3_base>	FFD7 0300_H
<OSTM4_base>	FFD7 0400_H

23.1.3 Clock Supply

The OSTM clock supply is shown in the following table.

Table 23.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
OSTMn (n = 0 to 4)	PCLK	CPUCLK2	Timer count clock
	Register access clock	CPUCLK2	Bus clock

23.1.4 Interrupt Request

OSTM interrupt requests are listed in the following table.

Table 23.5 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
OSTM0			
OSTMTINT	OSTM0 interrupt	84 (INTOSTM0)	—

Table 23.6 Interrupt Request (FE Level Maskable Interrupt Request)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
OSTM0			
OSTMTINT	OSTM0 interrupt	INTOSTM0_FE	—
OSTM1			
OSTMTINT	OSTM1 interrupt	INTOSTM1_FE	—
OSTM2			
OSTMTINT	OSTM2 interrupt	INTOSTM2_FE	—
OSTM3			
OSTMTINT	OSTM3 interrupt	INTOSTM3_FE	—
OSTM4			
OSTMTINT	OSTM4 interrupt	INTOSTM4_FE	—

23.1.5 Reset Sources

OSTM reset sources are listed in the following table. OSTM is initialized by these reset sources.

Table 23.7 Reset Sources

Unit Name	Reset Source
OSTMn (n = 0 to 4)	All reset sources (ISORES)

23.2 Overview

OSTM is a 32-bit timer/counter.

It can be used in interval timer mode or in free-run compare mode. The settings for operating mode specify the direction of counting (up or down) to control the generation of interrupt requests.

23.2.1 Functional Overview

OSTM has the following features.

- Two operating modes
  - Interval timer mode
  - Free-run compare mode
- OSTMTINT interrupt

23.2.2 Block Diagram

The following block diagram shows the main components of OSTM.

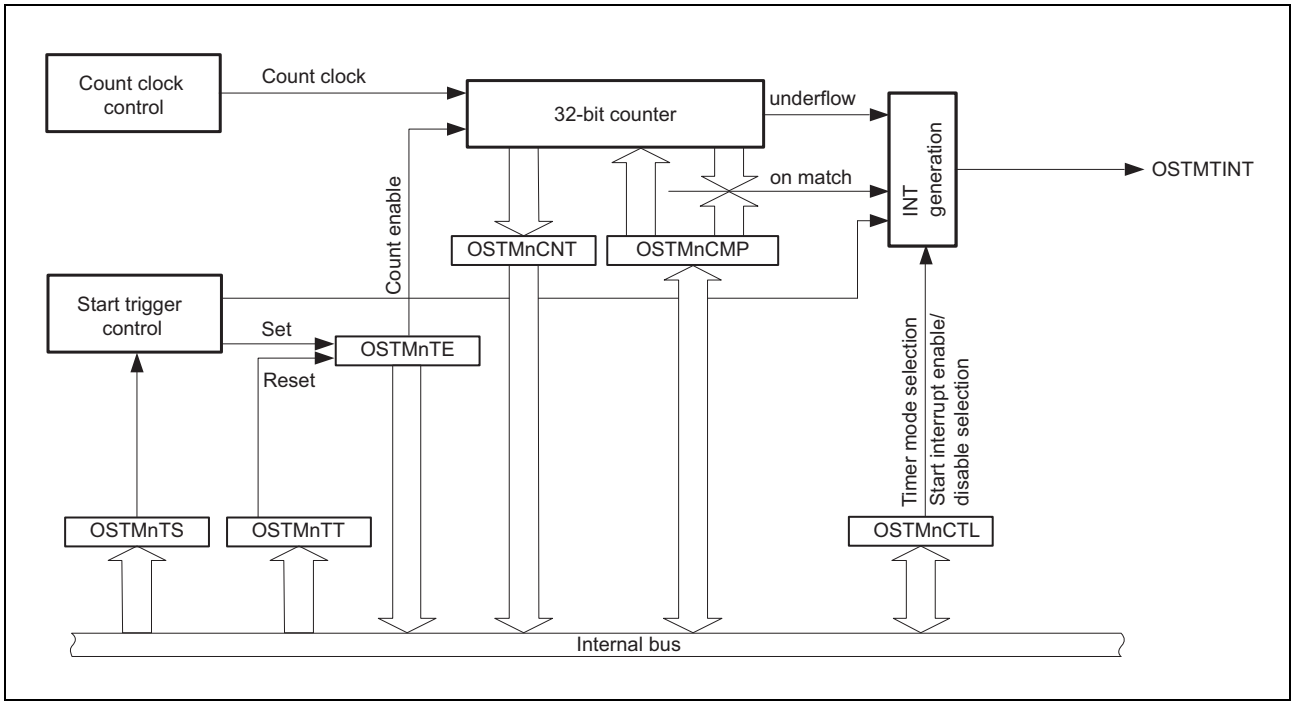

Figure 23.1 Block Diagram of OSTM

23.2.3 Count Clock

The count clock used by OSTM is PCLK.

23.2.4 Interrupt Sources (OSTMTINT)

An OSTMTINT interrupt request is generated on counter underflow (interval timer mode) or when the counter matches the compare value (free-run compare mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

This is illustrated in the following figure.

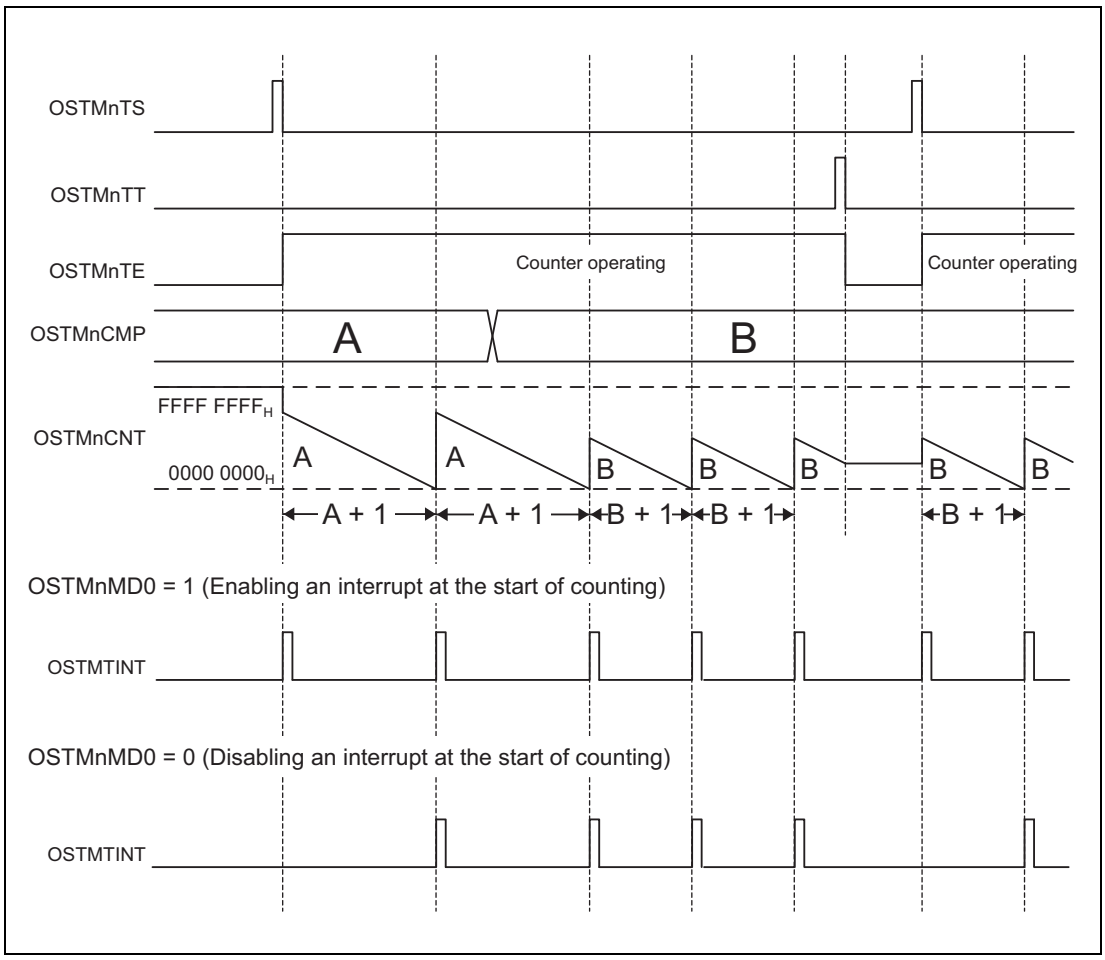

Figure 23.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode)

23.3 Registers

23.3.1 List of Registers

OSTM registers are listed in the following table.

For details about <OSTMn_base>, see **Section 23.1.2, Register Base Address**.

Table 23.8 Registers

Module	Register	Symbol	Address
OSTMn	OSTMn compare register	OSTMnCMP	<OSTMn_base> + 00_H
	OSTMn counter register	OSTMnCNT	<OSTMn_base> + 04_H
	OSTMn count enable status register	OSTMnTE	<OSTMn_base> + 10_H
	OSTMn count start trigger register	OSTMnTS	<OSTMn_base> + 14_H
	OSTMn count stop trigger register	OSTMnTT	<OSTMn_base> + 18_H
	OSTMn control register	OSTMnCTL	<OSTMn_base> + 20_H
	OSTMn emulation register	OSTMnEMU	<OSTMn_base> + 24_H

23.3.2 OSTMnCMP — OSTMn Compare Register

This register stores the start value of the down-counter or the value with which the counter is compared, depending on the operation mode.

Access: This register can be read or written in 32-bit units.

Address: <OSTMn_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCMP[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 23.9 OSTMnCMP Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCMP [31:0]	• In interval timer mode: start value of the down-counter • In free-run compare mode: compare value

23.3.3 OSTMnCNT — OSTMn Counter Register

This register indicates the counter value of the timer.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <OSTMn_base> + 04_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OSTMnCNT[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTMnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 23.10 OSTMnCNT Register Contents

Bit Position	Bit Name	Function
31 to 0	OSTMnCNT [31:0]	Timer counter value

Table 23.11 lists the correspondence among the OSTM operating mode, counting direction, and start value. The start value indicates the value to be read after the operating mode is changed.

Table 23.11 Correspondence among Operating Mode, Counting Direction, and Start Value

Timer Operating Mode	OSTMnCTL.OSTMnMD1	Counting Direction	Start Value
Interval timer mode	0*1	Down	FFFF $FFFF_H$
Free-run compare mode	1	Up	0000 0000_H

Note 1. Value after reset.

23.3.4 OSTMnTE — OSTMn Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <OSTMn_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 23.12 OSTMnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	OSTMnTE	Indicates whether the counter is enabled or disabled: 0: Counter disabled 1: Counter enabled This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1. Setting OSTMnTT.OSTMnTT to 1 resets this bit to 0.

NOTE

If the counter is disabled, the counter value retains its value.

If the counter is restarted, it

- restarts counting down from the value in the OSTMnCMP register if it is in interval timer mode or
- restarts counting up from the counter value 0000 0000_H if it is in free-run compare mode.

23.3.5 OSTMnTS — OSTMn Count Start Trigger Register

This register starts the counter.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <OSTMn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 23.13 OSTMnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OSTMnTS	Starts the counter: 0: This setting is invalid. 1: Starts the counter and sets OSTMnTE.OSTMnTE = 1. • In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE = 1. • In free-run compare mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE = 1.

23.3.6 OSTMnTT — OSTMn Count Stop Trigger Register

This register stops the counter.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <OSTMn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OSTMnTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 23.14 OSTMnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OSTMnTT	Stops the counter: 0: This setting is invalid. 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit.

23.3.7 OSTMnCTL — OSTMn Control Register

This register specifies the operating mode for the counter and controls the generation of OSTMTINT interrupt requests when counting starts.

Although this register is readable and writable, writing to it is only possible when OSTMnTE.OSTMnTE = 0; that is, the register becomes read only when OSTMnTE.OSTMnTE = 1.

Access: This register can be read or written in 8-bit units.

Address: <OSTMn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OSTMnMD1	OSTMnMD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 23.15 OSTMnCTL Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OSTMnMD1	Specifies the operating mode for the counter: 0: Interval timer mode 1: Free-run compare mode
0	OSTMnMD0	Controls the generation of OSTMTINT interrupt requests at the start of counting: 0: Interrupts when counting starts are disabled. 1: Interrupts when counting starts are enabled.

23.3.8 OSTMnEMU — OSTMn Emulation Register

This register controls operation in combination with SVSTOP.

Access: This register can be read or written in 8-bit units.
Only proceed with writing while the counter is stopped (OSTMnTE.OSTMnTE = 0 and EPC.SVSTOP = 0).

Address: <OSTMn_base> + 24_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	OSTMnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 23.16 OSTMnEMU Register Contents

Bit Position	Bit Name	Function
7	OSTMnSVSDIS	When EPC.SVSTOP = 0 Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on) regardless of the value of this bit (0/1). When EPC.SVSTOP = 1 0: The count clock is stopped when the debugger acquires control of the microcontroller (at breakpoints and so on). 1: Supply of the count clock is continued when the debugger acquires control of the microcontroller (at breakpoints and so on).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

23.4 Operation

23.4.1 Starting and Stopping OSTM

OSTM is started and stopped as follows:

Starting the timer

OSTM is started by the following setting.

- Setting the OSTMnTS.OSTMnTS bit to 1

The OSTMnTE.OSTMnTE status bit is set to 1.

The counter starts to count up or down in accordance with the settings for operating mode. For details, see **Section 23.4.2, Interval Timer Mode** and **Section 23.4.3, Free-Run Compare Mode**.

Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops OSTM.

This also clears the OSTMnTE.OSTMnTE status bit.

23.4.2 Interval Timer Mode

In interval timer mode, OSTM can be used as a reference timer generating interrupt requests at fixed intervals.

23.4.2.1 Basic Operation in Interval Timer Mode

In interval timer mode, the timer counts down from the value specified in the OSTMnCMP register. An OSTMTINT interrupt request is generated when the counter underflows (reaches 0000 0000_H).

To select interval timer mode, set OSTMnCTL.OSTMnMD1 = 0.

New values can be written to the OSTMnCMP register at any time. If it is rewritten during count operation, the counter loads the new OSTMnCMP value when the next 0000 0000_H is reached. Then the counter continues with the new value.

OSTMTINT period

The periods of OSTMTINT is:

- OSTMTINT generation period = count clock period × (OSTMnCMP + 1)

The following figure shows the basic operation of OSTM when counter-start interrupts is enabled in interval timer mode.

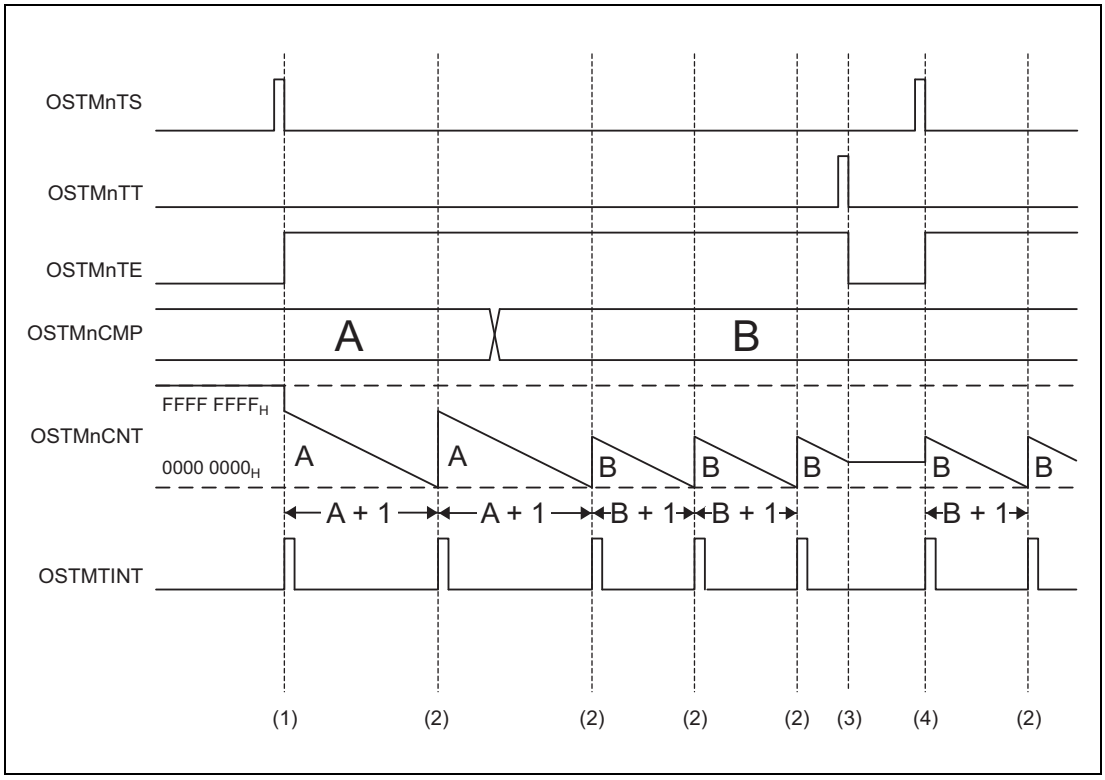

Figure 23.3 Timing Diagram of OSTM in Interval Timer Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting down from the value of OSTMnCMP.
If OSTMnCTL.OSTMnMD0 is 1, OSTMTINT interrupt requests are generated at the start of counting. The OSTMnCNT register indicates the counter value.

(2) When the counter reaches 0000 0000$_H$, an OSTMTINT interrupt request is generated. The counter loads the new start value from OSTMnCMP and continues counting down.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.

(4) When counting is restarted (OSTMnTS.OSTMnTS = 1), the counter loads the new start value from OSTMnCMP and starts counting down.

Forced restart

The counter is forcibly restarted by setting OSTMnTS.OSTMnTS = 1 during counting.

The counter loads the start value from the OSTMnCMP register and continues to count down.

The following figure shows the timing in interval timer mode, with counter-start interrupts enabled (OSTMnCTL.OSTMnMD0 = 1).

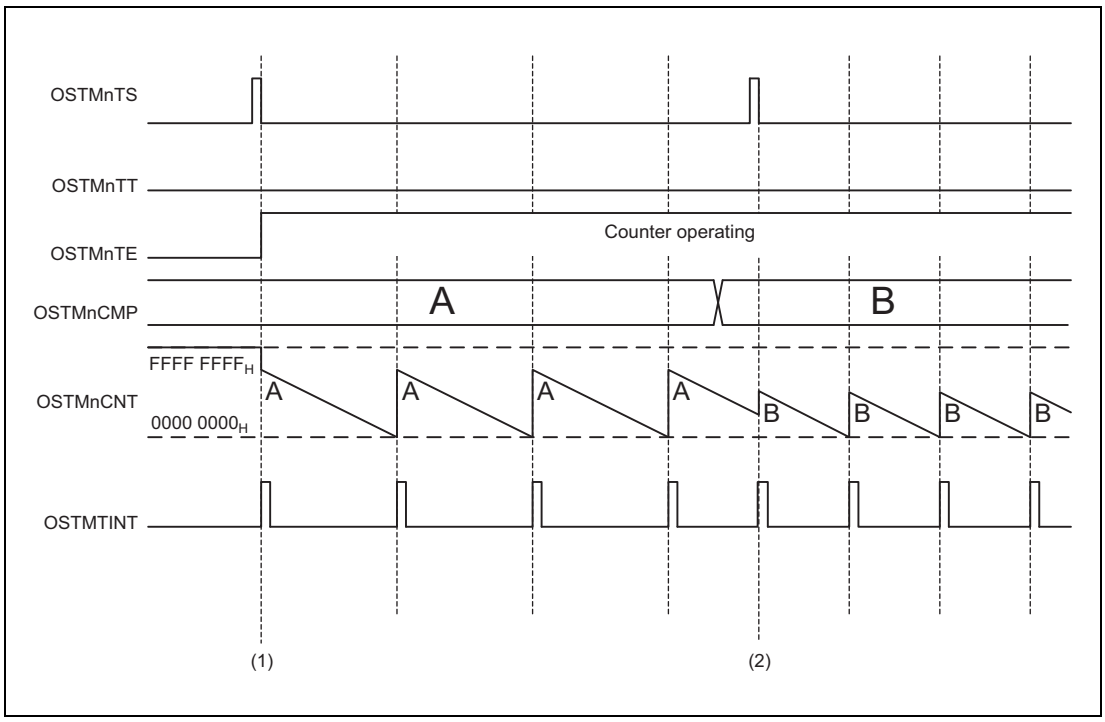

Figure 23.4 Timing Diagram of Forced Restart in Interval Timer Mode

The timing diagram above shows the following operations:

(1) The counter is started and stopped as described under **Figure 23.3, Timing Diagram of OSTM in Interval Timer Mode**.

(2) Setting OSTMnTS.OSTMnTS = 1 restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated when counting starts.

23.4.2.2 Operation when OSTMnCMP = 0000 0000$_H$

When OSTMnCMP = 0000 0000$_H$, OSTM behaves as follows.

- When the counter is enabled, the OSTMTINT interrupt request is always set to 1.

The following figure shows operations of OSTM when OSTMnCMP = 0000 0000$_H$, and counter-start interrupts are enabled.

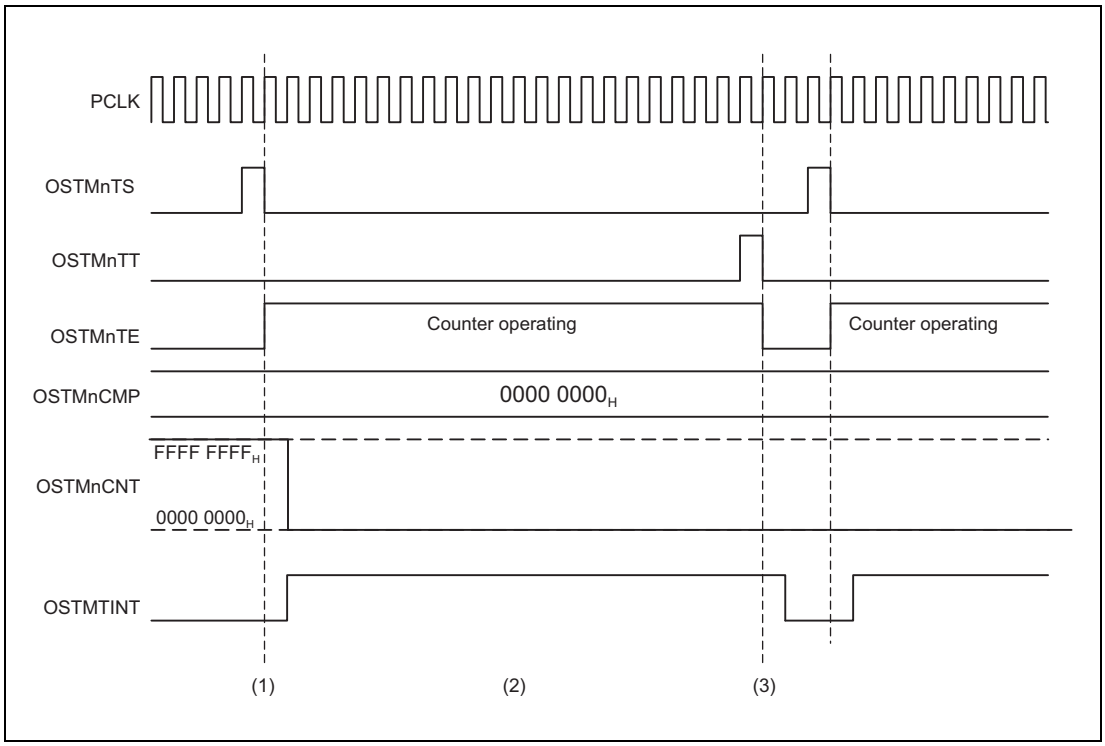

Figure 23.5 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Interval Timer Mode

The timing diagram above shows the following operations:

(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value 0000 0000$_H$ is retained in OSTMnCMP.

(2) The OSTMTINT interrupt request is continuously asserted.

(3) After the counter stops, the OSTMTINT interrupt request signal is deasserted.

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

23.4.2.3 Setting Procedure for Interval Timer Mode

The setting procedure in interval timer mode after reset release is described below:

Setting procedure

(1) Set the start value of the counter in the OSTMnCMP register.

(2) Select interval timer mode by setting the OSTMnCTL.OSTMnMD1 bit to 0.

(3) Enable or disable interrupts when counting starts (OSTMnCTL.OSTMnMD0).

23.4.3 Free-Run Compare Mode

23.4.3.1 Basic Operation in Free-Run Compare Mode

In free-run compare mode, the counter counts up from 0000 0000_H to FFFF $FFFF_H$. When the value of the OSTMnCMP register matches the current counter value, an OSTMTINT interrupt request is output.

In free-run compare mode, set OSTMnCTL.OSTMnMD1 = 1.

New values can be written to the OSTMnCMP register at any time.

The following figure shows the basic operation of OSTM in free-run compare mode with the start of counting enabled (OSTMnCTL.OSTMnMD0 = 1).

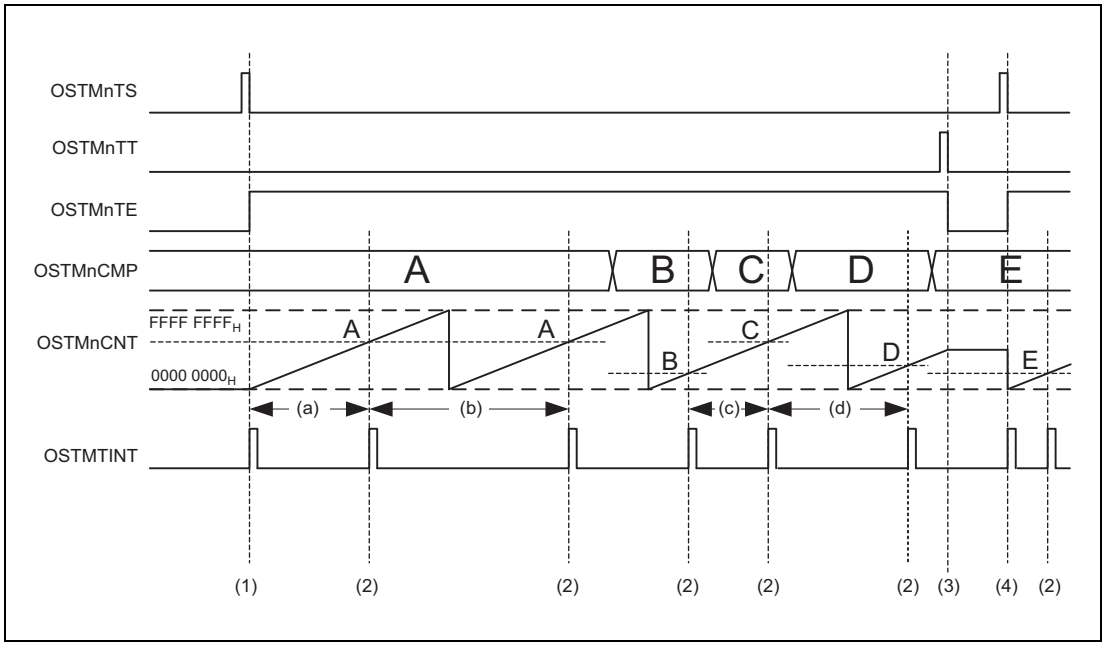

Figure 23.6 Timing Diagram of OSTM in Free-Run Compare Mode

The timing diagram above shows the following:

(1) The counter starts counting when OSTMnTS.OSTMnTS = 1.
The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from 0000 0000_H to FFFF $FFFF_H$. The OSTMnCNT register indicates the counter value.
When OSTMnCTL.OSTMnMD0 = 1, an OSTMTINT interrupt request is generated at the start of counting.

(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMTINT interrupt request is generated.

(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter.
The counter retains its current value until it is restarted.

(4) Counting by the counter restarts from 0000 0000_H when OSTMnTS.OSTMnTS = 1.

OSTMTINT period

The OSTMTINT generation period is different depending on the starting time. If OSTMnCMP is rewritten during operation, the period is changed according to the size of the new and old compare values.

Table 23.17 OSTMTINT Generation Timing

Old Value for Comparison	New Value for Comparison	Counter Value at Time of Rewriting	Period of OSTMTINT Generation	Label in Timing Diagram
Counter starts			(A + 1) × count clock period	(a)
A	A	No rewriting	(FFFF FFFF$_H$ + 1) × count clock period	(b)
B	C > B	B < counter value < C	(C – B) × count clock period	(c)
C	D < C	Counter value > D,C	(FFFF FFFF$_H$ – C + D + 1) × count clock period	(d)

Forced restart

Forced restarting of the counter does not proceed if the OSTMnTS.OSTMnTS bit is set during counting. The counter ignores the attempted setting and continues counting.

23.4.3.2 Operation when OSTMnCMP = 0000 0000$_H$

The following figure shows the operation of OSTM when OSTMnCMP = 0000 0000$_H$, and counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 = 1).

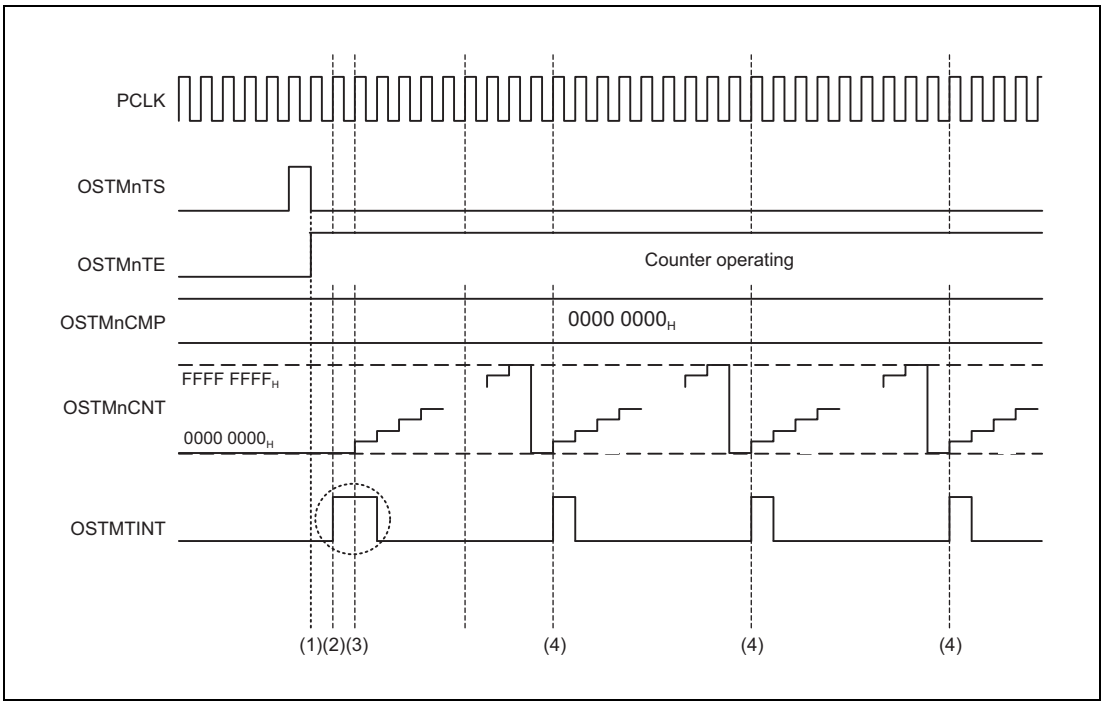

Figure 23.7 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Free-Run Compare Mode

The timing diagram above shows the following operations.

(1) Once the counter starts, it counts up from 0000 0000$_H$ to FFFF FFFF$_H$.

(2) An OSTMTINT interrupt request is generated when counting starts.

(3) If the current counter value matches OSTMnCMP, an OSTMTINT interrupt request is generated. If OSTMnCMP = 0000 0000_H as shown above, OSTMTINT is generated over two clock cycles.

(4) An OSTMTINT interrupt request is generated for each clock cycle (FFFF $FFFF_H$ +1).

When interrupts on starting of the counter are disabled, no interrupt is generated when counting starts.

23.4.3.3 Setting Procedure for Free-Run Compare Mode

The setting procedure in free-run compare mode after reset release is described below:

Setting procedure

(1) Set the compare value in the OSTMnCMP register.

(2) Select free-run compare mode by setting the OSTMnCTL.OSTMnMD1 bit to 1.

(3) Enable or disable interrupts when counting starts by the OSTMnCTL.OSTMnMD0 bit.

Section 24 Timer Array Unit B (TAUB)

This section contains a generic description of the timer array unit B (TAUB).

The first part in this section describes the RH850/F1K specific features, such as the number of units and the register base addresses. The remainder of the section describes the functions and registers of the TAUB.

24.1 Features of RH850/F1K TAUB

24.1.1 Number of Units and Channels

This microcontroller has the following number of TAUB units.

Table 24.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	1	1	2
Name	TAUBn (n = 0)	TAUBn (n = 0)	TAUBn (n = 0, 1)

TAUBn has the following number of channels of timers.

Table 24.2 TAUBn Unit Configurations and Channels

Unit Name (Channel Name) TAUBn	Channels per Unit	RH850/F1K 100 pins (16 ch)	RH850/F1K 144 pins (16 ch)	RH850/F1K 176 pins (32 ch)
TAUB0	16	√	√	√
TAUB1	16	-	-	√

Table 24.3 Indices

Index	Description
n	Throughout this section, the individual TAUB units are identified by the index “n”; for example, TAUBnTOM is the TAUBn channel output mode register.
m	The TAUB has 16 channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 15), thus a certain channel is denoted as CHm. The even numbered channels (m = 0, 2, 4, 6, 8, 10, 12, 14) are denoted as CHm_even. The odd numbered channels (m = 1, 3, 5, 7, 9, 11, 13, 15) are denoted as CHm_odd.

24.1.2 Register Base Addresses

TAUBn base addresses are listed in the following table.

TAUBn register addresses are given as offsets from the base addresses.

Table 24.4 Register Base Addresses

Name	Base Address
<TAUB0_base>	FFE3 0000_H
<TAUB1_base>	FFE3 1000_H

24.1.3 Clock Supply

The TAUBn clock supply is shown in the following table.

Table 24.5 TAUBn Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAUBn	PCLK	CKSCLK_IPERI2	Timer count clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_IPERI2	

24.1.4 Interrupt Requests

TAUBn interrupt requests are listed in the following table.

Table 24.6 Interrupt Requests (1/2)

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
TAUB0			
INTTAUB0I0	Channel 0 interrupt	142	33
INTTAUB0I1	Channel 1 interrupt	143	92
INTTAUB0I2	Channel 2 interrupt	144	34
INTTAUB0I3	Channel 3 interrupt	145	93
INTTAUB0I4	Channel 4 interrupt	146	35
INTTAUB0I5	Channel 5 interrupt	147	94
INTTAUB0I6	Channel 6 interrupt	148	36
INTTAUB0I7	Channel 7 interrupt	149	95
INTTAUB0I8	Channel 8 interrupt	150	96
INTTAUB0I9	Channel 9 interrupt	151	37
INTTAUB0I10	Channel 10 interrupt	152	97
INTTAUB0I11	Channel 11 interrupt	153	38
INTTAUB0I12	Channel 12 interrupt	154	98
INTTAUB0I13	Channel 13 interrupt	155	39
INTTAUB0I14	Channel 14 interrupt	156	99
INTTAUB0I15	Channel 15 interrupt	157	40
TAUB1			
INTTAUB1I0	Channel 0 interrupt	256	52
INTTAUB1I1	Channel 1 interrupt	257	115
INTTAUB1I2	Channel 2 interrupt	258	53
INTTAUB1I3	Channel 3 interrupt	259	116
INTTAUB1I4	Channel 4 interrupt	260	54
INTTAUB1I5	Channel 5 interrupt	261	117
INTTAUB1I6	Channel 6 interrupt	262	55
INTTAUB1I7	Channel 7 interrupt	263	118
INTTAUB1I8	Channel 8 interrupt	264	119
INTTAUB1I9	Channel 9 interrupt	265	56
INTTAUB1I10	Channel 10 interrupt	266	120
INTTAUB1I11	Channel 11 interrupt	267	57

Table 24.6 Interrupt Requests (2/2)

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
INTTAUB1I12	Channel 12 interrupt	268	121
INTTAUB1I13	Channel 13 interrupt	269	58
INTTAUB1I14	Channel 14 interrupt	270	122
INTTAUB1I15	Channel 15 interrupt	271	59

24.1.5 Reset Sources

TAUBn reset sources are listed in the following table. TAUBn is initialized by these reset sources.

Table 24.7 Reset Sources

Unit Name	Reset Source
TAUBn	All reset sources (ISORES)

24.1.6 External input/output Signals

External input/output signals of TAUBn are listed below.

Table 24.8 External Input/Output Signals (1/2)

Unit Signal Name	Description	Alternative Port Pin Signal
TAUB0		
TAUBTTIN0	Channel 0 input*1	TAUB0I0
TAUBTTIN1	Channel 1 input*1	TAUB0I1
TAUBTTIN2	Channel 2 input*1	TAUB0I2
TAUBTTIN3	Channel 3 input*1	TAUB0I3
TAUBTTIN4	Channel 4 input*1	TAUB0I4
TAUBTTIN5	Channel 5 input*1	TAUB0I5
TAUBTTIN6	Channel 6 input*1	TAUB0I6
TAUBTTIN7	Channel 7 input*1	TAUB0I7
TAUBTTIN8	Channel 8 input*1	TAUB0I8
TAUBTTIN9	Channel 9 input*1	TAUB0I9

TAUBTTIN15	Channel 15 input*1	TAUB1I15
TAUBTTOUT0	Channel 0 output	TAUB1O0
TAUBTTOUT1	Channel 1 output	TAUB1O1
TAUBTTOUT2	Channel 2 output	TAUB1O2
TAUBTTOUT3	Channel 3 output	TAUB1O3
TAUBTTOUT4	Channel 4 output	TAUB1O4
TAUBTTOUT5	Channel 5 output	TAUB1O5
TAUBTTOUT6	Channel 6 output	TAUB1O6
TAUBTTOUT7	Channel 7 output	TAUB1O7
TAUBTTOUT8	Channel 8 output	TAUB1O8
TAUBTTOUT9	Channel 9 output	TAUB1O9
TAUBTTOUT10	Channel 10 output	TAUB1O10
TAUBTTOUT11	Channel 11 output	TAUB1O11
TAUBTTOUT12	Channel 12 output	TAUB1O12
TAUBTTOUT13	Channel 13 output	TAUB1O13
TAUBTTOUT14	Channel 14 output	TAUB1O14
TAUBTTOUT15	Channel 15 output	TAUB1O15

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**.

24.2 Overview

24.2.1 Functional Overview

The TAUB has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUB is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUBnCNTm and a 16-bit data register TAUBnCDRm to hold the count start value and compare value.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels. The synchronous operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

24.2.2 Terms

In this section, the following terms are used:

Independent channel operation function/synchronous channel operation function

TAUB has 16 channels, and provides an independent channel operation function whereby individual channels operate independently and a synchronous channel operation function whereby multiple channels operate in combination.

- The independent channel operation function can be used by any channel independently of all other channels.
- The synchronous channel operation function is implemented using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”.
A channel group has one master channel and one or more slave channels.

Upper/lower channel

Depending on the channel number m, a channel with a smaller number or with a larger number is referred to as “upper” or “lower” channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

Example:
For channel 5, channel 3 is an upper channel and channel 9 is a lower channel. Channel 0 is the highest channel and channel 15 is the lowest channel.

24.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 24.9 Functional List of TAUB Operations

Operation Function	Setting Example
Independent Channel Operation Functions	**Section 24.12**
Interval Timer Function	**Section 24.12.1**
TAUBTTINm Input Interval Timer Function	**Section 24.12.2**
Clock Divide Function	**Section 24.12.3**

24.2.4 Input/Output Interrupt Request Signals

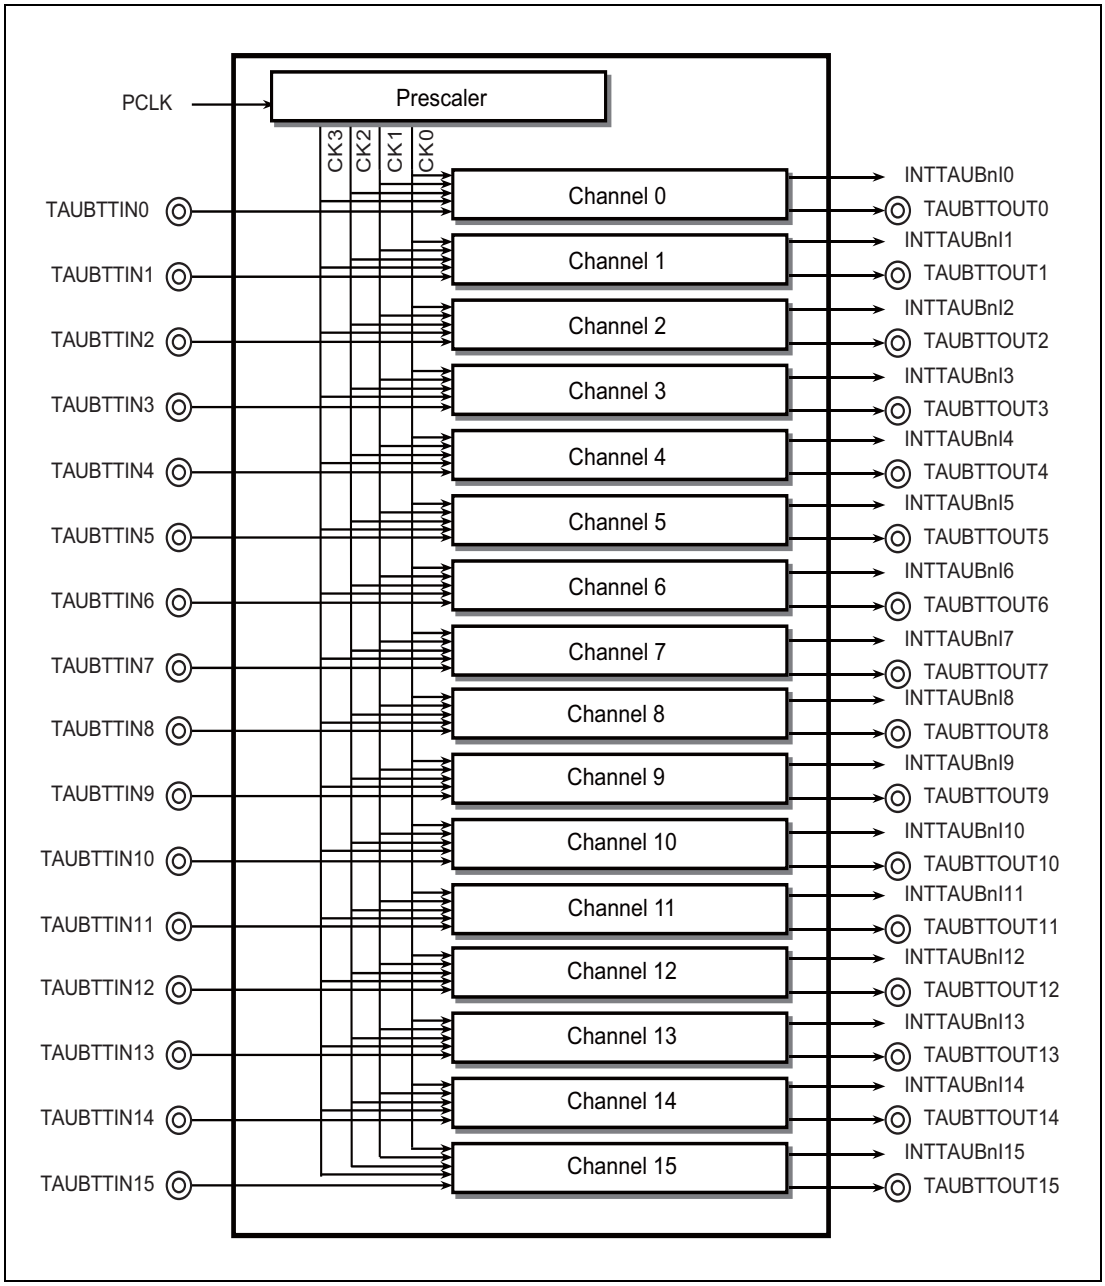

Figure 24.1 TAUB Input/Output and Interrupt Request Signals

24.2.5 Block Diagram

The following figure shows the main components of the TAUB.

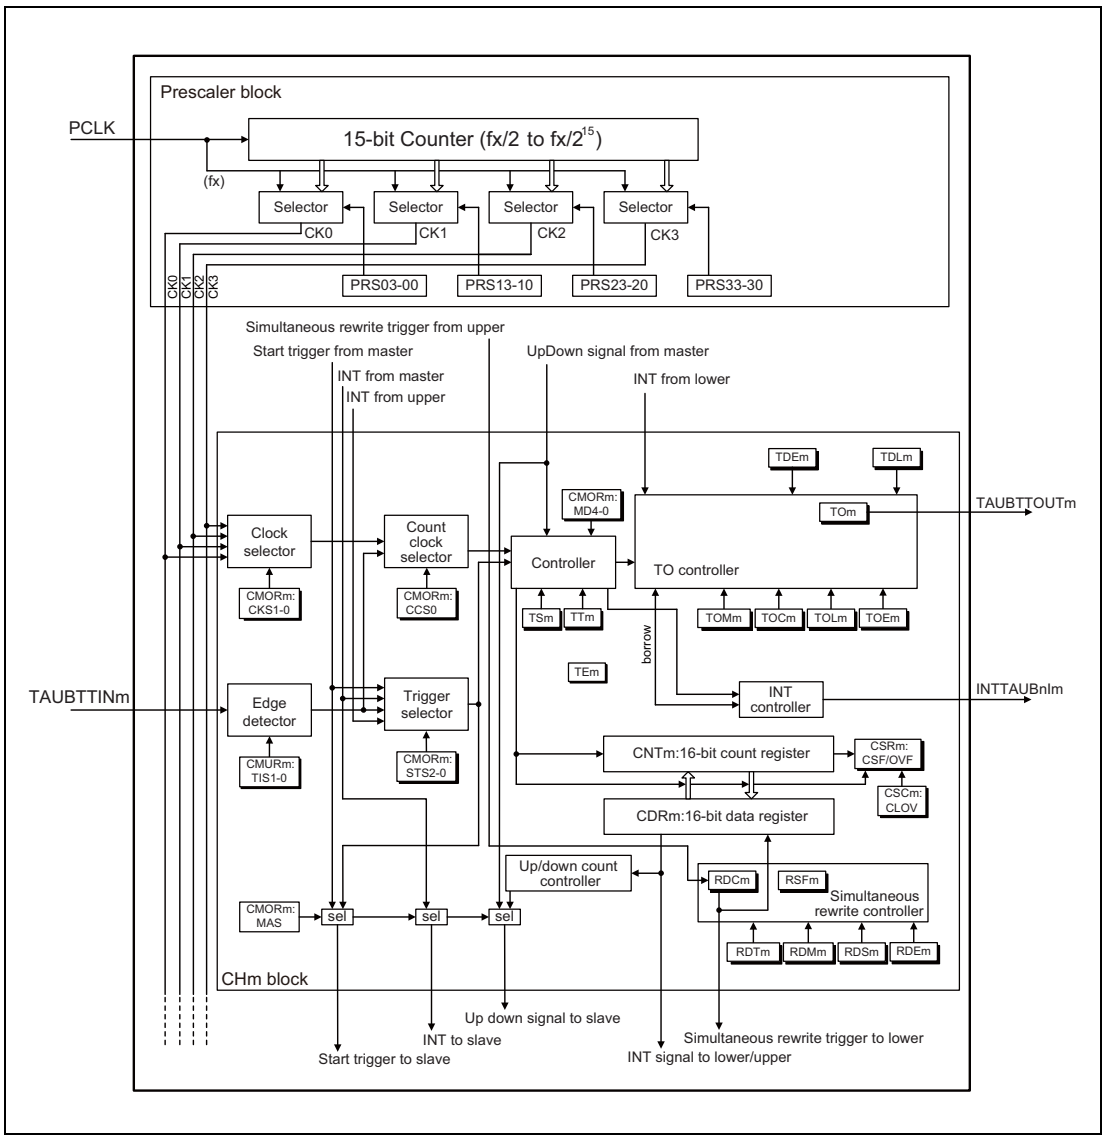

Figure 24.2 Block Diagram of the TAUB

The prefix “TAUBn” has been omitted from the register names for the sake of clarity in the above figure.

24.2.6 Description of Blocks

The following describes the functional blocks:

Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK3 are derived from PCLK by a configurable prescaler division factor of 2^0 to 2^{15}.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- TAUBTTINm input signal valid edge

Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUBnCMORm.TAUBnMD[4:0])
- Counter start enable (TAUBnTS.TAUBnTSm) and counter stop (TAUBnTT.TAUBnTTm)
  When counter start is enabled, status flag TAUBnTE.TAUBnTEm is set.
- Count direction (up/down) (can be controlled by the master channel)

Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUBnTE.TAUBnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger:

- Input of TAUBTTINm valid edge
- INTTAUBnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUBTTOUTm generation unit

Simultaneous rewrite controller

Simultaneous rewrite control is a special function that can be used if multiple cahnnels like synchronous operation functions are used. The data registers (TAUBnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

TAUBnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

24.3 Registers

24.3.1 List of Registers

TAUB registers are listed in the following table.

For details about <TAUBn_base>, see **Section 24.1.2, Register Base Addresses**.

Table 24.10 List of Registers

Module Name	Register Name	Symbol	Address
TAUBn prescaler registers			
TAUBn	TAUBn prescaler clock select register	TAUBnTPS	<TAUBn_base> + 240_H
TAUBn control registers			
TAUBn	TAUBn channel data register m	TAUBnCDRm	<TAUBn_base> + 0_H + m × 4_H
	TAUBn channel counter register m	TAUBnCNTm	<TAUBn_base> + 80_H + m × 4_H
	TAUBn channel mode OS register m	TAUBnCMORm	<TAUBn_base> + 200_H + m × 4_H
	TAUBn channel mode user register m	TAUBnCMURm	<TAUBn_base> + $C0_H$ + m × 4_H
	TAUBn channel status register m	TAUBnCSRm	<TAUBn_base> + 140_H + m × 4_H
	TAUBn channel status clear trigger register m	TAUBnCSCm	<TAUBn_base> + 180_H + m × 4_H
	TAUBn channel start trigger register	TAUBnTS	<TAUBn_base> + $1C4_H$
	TAUBn channel enable status register	TAUBnTE	<TAUBn_base> + $1C0_H$
	TAUBn channel stop trigger register	TAUBnTT	<TAUBn_base> + $1C8_H$
TAUBn output registers			
TAUBn	TAUBn channel output enable register	TAUBnTOE	<TAUBn_base> + $5C_H$
	TAUBn channel output register	TAUBnTO	<TAUBn_base> + 58_H
	TAUBn channel output mode register	TAUBnTOM	<TAUBn_base> + 248_H
	TAUBn channel output configuration register	TAUBnTOC	<TAUBn_base> + $24C_H$
	TAUBn channel output active level register	TAUBnTOL	<TAUBn_base> + 040_H
	TAUBn channel dead time output enable register	TAUBnTDE	<TAUBn_base> + 250_H
	TAUBn channel dead time output level register	TAUBnTDL	<TAUBn_base> + 54_H
TAUBn reload data registers			
TAUBn	TAUBn channel reload data enable register	TAUBnRDE	<TAUBn_base> + 260_H
	TAUBn channel reload data mode register	TAUBnRDM	<TAUBn_base> + 264_H
	TAUBn channel reload data control CH select register	TAUBnRDS	<TAUBn_base> + 268_H
	TAUBn channel reload data control register	TAUBnRDC	<TAUBn_base> + $26C_H$

24.3.2 Details of TAUBn Prescaler Registers

24.3.2.1 TAUBnTPS — TAUBn Prescaler Clock Select Register

This register specifies the clocks CK0, CK1, CK2, and CK3 for all channels of the PCLK prescaler.

Access: This register can be read or written in 16-bit units.

Address: <TAUBn_base> + 240_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnPRS3[3:0]				TAUBnPRS2[3:0]				TAUBnPRS1[3:0]				TAUBnPRS0[3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.11 TAUBnTPS Register Contents (1/3)

Bit Position	Bit Name	Function
15 to 12	TAUBnPRS3 [3:0]	Specifies the CK3 clock.

TAUBnPRS3[3:0]	CK3 clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

These bits can only be rewritten when all counters using CK3 are stopped (TAUBnTE.TAUBnTEm = 0).

Table 24.11 TAUBnTPS Register Contents (2/3)

Bit Position	Bit Name	Function
11 to 8	TAUBnPRS2 [3:0]	Specifies the CK2 clock.

TAUBnPRS2[3:0]	CK2 Clock
0000_B	$PCLK/2^0$
0001_B	$PCLK/2^1$
0010_B	$PCLK/2^2$
0011_B	$PCLK/2^3$
0100_B	$PCLK/2^4$
0101_B	$PCLK/2^5$
0110_B	$PCLK/2^6$
0111_B	$PCLK/2^7$
1000_B	$PCLK/2^8$
1001_B	$PCLK/2^9$
1010_B	$PCLK/2^{10}$
1011_B	$PCLK/2^{11}$
1100_B	$PCLK/2^{12}$
1101_B	$PCLK/2^{13}$
1110_B	$PCLK/2^{14}$
1111_B	$PCLK/2^{15}$

These bits can only be rewritten when all counters using CK2 are stopped (TAUBnTE.TAUBnTEm = 0).

7 to 4	TAUBnPRS1 [3:0]	Specifies the CK1 clock.

TAUBnPRS1[3:0]	CK1 Clock
0000_B	$PCLK/2^0$
0001_B	$PCLK/2^1$
0010_B	$PCLK/2^2$
0011_B	$PCLK/2^3$
0100_B	$PCLK/2^4$
0101_B	$PCLK/2^5$
0110_B	$PCLK/2^6$
0111_B	$PCLK/2^7$
1000_B	$PCLK/2^8$
1001_B	$PCLK/2^9$
1010_B	$PCLK/2^{10}$
1011_B	$PCLK/2^{11}$
1100_B	$PCLK/2^{12}$
1101_B	$PCLK/2^{13}$
1110_B	$PCLK/2^{14}$
1111_B	$PCLK/2^{15}$

These bits can only be rewritten when all counters using CK1 are stopped (TAUBnTE.TAUBnTEm = 0).

Table 24.11 TAUBnTPS Register Contents (3/3)

Bit Position	Bit Name	Function
3 to 0	TAUBnPRS0 [3:0]	Specifies the CK0 clock.

TAUBnPRS0[3:0]	CK0 Clock
0000_B	$PCLK/2^0$
0001_B	$PCLK/2^1$
0010_B	$PCLK/2^2$
0011_B	$PCLK/2^3$
0100_B	$PCLK/2^4$
0101_B	$PCLK/2^5$
0110_B	$PCLK/2^6$
0111_B	$PCLK/2^7$
1000_B	$PCLK/2^8$
1001_B	$PCLK/2^9$
1010_B	$PCLK/2^{10}$
1011_B	$PCLK/2^{11}$
1100_B	$PCLK/2^{12}$
1101_B	$PCLK/2^{13}$
1110_B	$PCLK/2^{14}$
1111_B	$PCLK/2^{15}$

These bits can only be rewritten when all counters using CK0 are stopped (TAUBnTE.TAUBnTEm = 0).

NOTE

The TAUBn clock input PCLK is specified in the first part of this section, **Section 24.1.3, Clock Supply**.

24.3.3 Details of TAUBn Control Registers

24.3.3.1 TAUBnCDRm — TAUBn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operation mode specified in TAUBnCMORm.TAUBnMD[4:1].

Access: This register can be read or written in 16-bit units.
- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

Address: <TAUBn_base> + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 24.12 TAUBnCDRm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnCDR [15:0]	Data register for the capture/compare value.

24.3.3.2 TAUBnCNTm — TAUBn Channel Counter Register

This register is the channel m counter register.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUBn_base> + 80_H + m × 4_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.13 TAUBnCNTm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnCNT [15:0]	16-bit counter value.

The read value depends on the counter, the operation mode change, and the values of the TAUBnTS.TAUBnTSm and TAUBnTT.TAUBnTTm bits.

The initial counter read value depends on the operation mode and how the counter was stopped:

- by a reset
- by a counter stop trigger (TAUBnTT.TAUBnTTm = 1)

The following table lists the initial counter read values after the counter has stopped (TAUBnTE.TAUBnTEm = 0) and re-enabled (TAUBnTS.TAUBnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUBnTS.TAUBnTSm = 1) for modes where the counter waits for a start trigger.

Table 24.14 TAUBnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUBnCNTm		
		Start Value*1	After Stop Trigger	After One Count
Interval timer mode	Count down	$FFFF_H$	Stop value	—
Judge mode	Count down	$FFFF_H$	Stop value	—
Capture mode	Count up	0000_H	Stop value	—
Event count mode	Count down	$FFFF_H$	Stop value	—
One-count mode	Count down	$FFFF_H$	Stop value	Stop value
Capture and one-count mode	Count up	0000_H	Stop value	Capture value + 1 (TAUBnCDRm)
Judge and one-count mode	Count down	$FFFF_H$	Stop value	TAUBnCNTm value – 1
Count-up/-down mode	Count up/down	$FFFF_H$	Stop value	—
Pulse one-count mode	Count down	$FFFF_H$	Stop value	0000_H
Count capture mode	Count up	0000_H	Stop value	—
Gate count mode	Count down	$FFFF_H$	Stop value	Stop value
Capture and gate count mode	Count up	0000_H	Stop value	Stop value

Note 1. The value set for TAUBnCNTm when operation mode is changed after reset release

24.3.3.3 TAUBnCMORm — TAUBn Channel Mode OS Register

This register controls channel m operation.

Access: This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

Address: <TAUBn_base> + 200_H + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS [1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS [1:0]		—	TAUBnMD[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 24.15 TAUBnCMORm Register Contents (1/3)

Bit Position	Bit Name	Function
15, 14	TAUBnCKS [1:0]	Selects the operation clock. The operation clock is used for the TAUBTTINm input edge detection circuit. TAUBnCNTm can also be used as the count clock depending on the setting of the TAUBnCMORm.TAUBnCCS0 bit
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Selects the count clock for the TAUBnCNTm counter
11	TAUBnMAS	Specifies the channel as master or slave channel during synchronous channel operation: 0: Slave 1: Master This bit is only valid for even channels (CHm_even). For odd channels (CHm_odd), it is fixed to 0.

TAUBn CKS1	TAUBn CKS0	Selection of Count Clock
0	0	CK0
0	1	CK1
1	0	CK2
1	1	CK3

TAUBnCCS0	Selected Count Clock
0	Operation clock as specified by TAUBnCMORm.TAUBnCKS[1:0].
1	Valid edge of TAUBTTINm input signal

</table>

Table 24.15 TAUBnCMORm Register Contents (3/3)

Bit Position	Bit Name	Function
4 to 0	TAUBnMD [4:0]	Specifies the operation mode. For details, refer to the settings for individual functions.

TAUBn MD4	TAUBn MD3	TAUBn MD2	TAUBn MD1	TAUBn MD0	Description
0	0	0	0	1/0	Interval timer mode
0	0	0	1	1/0	Judge mode
0	0	1	0	1/0	Capture mode
0	0	1	1	0	Event count mode
0	1	0	0	1/0	One-count mode
0	1	0	1	1/0	Setting prohibited
0	1	1	0	0	Capture and one-count mode
0	1	1	1	1/0	Judge and one-count mode
1	0	0	0	0	Setting prohibited
1	0	0	1	0	Count-up/-down mode
1	0	1	0	1/0	Pulse one-count mode
1	0	1	1	1/0	Count capture mode
1	1	0	0	0	Gate count mode
1	1	0	1	0	Capture and gate count mode

Mode	Role of TAUBnMD0 Bit
Interval timer mode Capture mode Count capture mode	Specifies whether INTTAUBnIm is output at the beginning of count operation (when a start trigger is entered) or not. 0: INTTAUBnIm is not output. 1: INTTAUBnIm is output.
Event count mode Count-up/-down mode	This bit should be set to 0 (INTTAUBnIm signal is not output at the beginning of count operation).
One-count mode Pulse one-count mode	Enables/disables start trigger detection during counting. 0: Disables detection. 1: Enables detection. **CAUTION** • In one-count mode, INTTAUBnIm signal is not output at the beginning of count operation. • In pulse one-count mode, INTTAUBnIm signal is output at the beginning of count operation.
Gate count mode	This bit should be set to 0 (start trigger detection during counting is disabled).
Capture and one-count mode Capture and gate count mode	This bit should be set to 0. **CAUTION** INTTAUBnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled.
Judge mode Judge and one-count mode	Specifies INTTAUBnIm output timing. 0: When TAUBnCNTm ≤ TAUBnCDRm 1: When TAUBnCNTm > TAUBnCDRm

24.3.3.4 TAUBnCMURm — TAUBn Channel Mode User Register

This register specifies the type of valid edge detection used for the TAUBTTINm input.

Access: This register can be read or written in 8-bit units.

Address: <TAUBn_base> + $C0_H$ + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 24.16 TAUBnCMURm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS [1:0]	Specifies the valid edge of the TAUBTTINm input signal:

TAUBn TIS1	TAUBn TIS0	Description
0	0	Falling edge
0	1	Rising edge
1	0	Rising and falling edges (low-width measurement selection). Start trigger: falling edge Stop trigger (capture): rising edge
1	1	Rising and falling edges (high-width measurement selection). Start trigger: rising edge Stop trigger (capture): falling edge

- Edge detection for TAUBTTINm input signals is performed based on the operation clock selected by TAUBnCMORm.TAUBnCKS[1:0].

24.3.3.5 TAUBnCSRm — TAUBn Channel Status Register

This register indicates the count direction and the overflow status of the counter for channel m.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <TAUBn_base> + 140_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnCSF	TAUBnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 24.17 TAUBnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	TAUBnCSF	Indicates the count direction: 0: Counts up 1: Counts down The read value of this bit is only valid in the following mode: • Up/Down Count mode
0	TAUBnOVF	Indicates the counter overflow status: 0: No overflow occurred 1: Overflow occurred This bit is used only in the following modes: • Capture mode • Capture and one-count mode The function of this bit depends on the setting of control bits TAUBnCMORm.TAUBnCOS[1:0].

24.3.3.6 TAUBnCSCm — TAUBn Channel Status Clear Register

This register is a trigger register for clearing the overflow flag TAUBnCSRm.TAUBnOVF of channel m.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H

Address: <TAUBn_base> + 180_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUBnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 24.18 TAUBnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUBnCLOV	0: No function 1: Clears the overflow flag TAUBnCSRm.TAUBnOVF

24.3.3.7 TAUBnTS — TAUBn Channel Start Trigger Register

This register enables the counter for each channel.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000_H

Address: <TAUBn_base> + $1C4_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTS15	TAUBnTS14	TAUBnTS13	TAUBnTS12	TAUBnTS11	TAUBnTS10	TAUBnTS09	TAUBnTS08	TAUBnTS07	TAUBnTS06	TAUBnTS05	TAUBnTS04	TAUBnTS03	TAUBnTS02	TAUBnTS01	TAUBnTS00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 24.19 TAUBnTS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTSm	Enables the counter for channel m: 0: No function 1: Enables the counter and sets TAUBnTE.TAUBnTEm = 1. TAUBnTE.TAUBnTEm = 1 only enables the counter. Whether the counter starts depends on the selected operation mode.

24.3.3.8 TAUBnTE — TAUBn Channel Enable Status Register

This register indicates whether counter is enabled or disabled.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUBn_base> + $1C0_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTE15	TAUBnTE14	TAUBnTE13	TAUBnTE12	TAUBnTE11	TAUBnTE10	TAUBnTE09	TAUBnTE08	TAUBnTE07	TAUBnTE06	TAUBnTE05	TAUBnTE04	TAUBnTE03	TAUBnTE02	TAUBnTE01	TAUBnTE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 24.20 TAUBnTE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTEm	Indicates whether counter for channel m is enabled or disabled: 0: Counter disabled 1: Counter enabled Setting TAUBnTS.TAUBnTSm to 1 sets this bit to 1. Setting TAUBnTT.TAUBnTTm to 1 resets this bit to 0.

24.3.3.9 TAUBnTT — TAUBn Channel Stop Trigger Register

This register stops the counter for each channel.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000_H.

Address: <TAUBn_base> + $1C8_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnTT15	TAUBnTT14	TAUBnTT13	TAUBnTT12	TAUBnTT11	TAUBnTT10	TAUBnTT09	TAUBnTT08	TAUBnTT07	TAUBnTT06	TAUBnTT05	TAUBnTT04	TAUBnTT03	TAUBnTT02	TAUBnTT01	TAUBnTT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 24.21 TAUBnTT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTTm	Stops the counter of channel m: 0: No function 1: Stops the counter and resets TAUBnTE.TAUBnTEm. TAUBnCNTm, TAUBnTO.TAUBnTOm, and TAUBTTOUTm all retain the values they had before the counter was stopped.

24.3.4 Details of TAUBn Simultaneous Rewrite Registers

24.3.4.1 TAUBnRDE — TAUBn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUBnCDRm/ TAUBnTOLm.

Access: This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

Address: <TAUBn_base> + 260_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 24.22 TAUBnRDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDEm	Enables/disables simultaneous rewrite of the data register of channel m: 0: Disables simultaneous rewrite 1: Enabled simultaneous rewrite

24.3.4.2 TAUBnRDS — TAUBn Channel Reload Data Control Channel Select Register

This register selects the control channel for simultaneous rewrite.

Access: This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

Address: <TAUBn_base> + 268_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 24.23 TAUBnRDS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDSm	Specifies which channel is controlled for the simultaneous rewrite trigger: 0: Master channel 1: Another upper channel

24.3.4.3 TAUBnRDM — TAUBn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

Access: This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0.

Address: <TAUBn_base> + 264_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 24.24 TAUBnRDM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDMm	Selects when the signal that triggers simultaneous rewrite is generated: 0: When the master channel counter starts counting 1: At the top of a triangle wave cycle These bits only apply when TAUBnRDE.TAUBnRDEm = 1 and TAUBnRDS.TAUBnRDSm = 0.

24.3.4.4 TAUBnRDC — TAUBn Channel Reload Data Control Register

This register specifies the channel that generates the INTTAUBnIm signal that triggers simultaneous rewrite.

Access: This register can be read or written in 16-bit units. It can only be written when TAUBnTE.TAUBnTEm = 0

Address: <TAUBn_base> + $26C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 24.25 TAUBnRDC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDCm	Specifies whether the channel generates a simultaneous rewrite trigger signal or not. 0: Does not operate as a simultaneous rewrite trigger channel. 1: Operates as a simultaneous rewrite trigger channel. These bits only apply when TAUBnRDE.TAUBnRDEm = 1 and TAUBnRDS.TAUBnRDSm = 1.

24.3.4.5 TAUBnRDT — TAUBn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000_H.

Address: <TAUBn_base> + 044_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 24.26 TAUBnRDT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRDTm	Triggers the simultaneous rewrite enabling state: 0: No function. Writing 0 is ignored (the operation is not affected). 1: The simultaneous rewrite enabling flag (TAUBnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger. These bits only apply when: • TAUBnRDE.TAUBnRDEm = 1

24.3.4.6 TAUBnRSF — TAUBn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUBn_base> + 048_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 24.27 TAUBnRSF Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnRSFm	Indicates the simultaneous rewrite status: 0: Indicates simultaneous rewrite is completed due to the generation of the simultaneous rewrite trigger. 1: Indicates the simultaneous rewrite trigger waiting state when simultaneous rewrite is enabled (TAUBnRDTm = 1).

24.3.5 Details of TAUBn Output Registers

24.3.5.1 TAUBnTOE — TAUBn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

Access: This register can be read or written in 16-bit units.

Address: <TAUBn_base> + $5C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBn TOE15	TAUBn TOE14	TAUBn TOE13	TAUBn TOE12	TAUBn TOE11	TAUBn TOE10	TAUBn TOE09	TAUBn TOE08	TAUBn TOE07	TAUBn TOE06	TAUBn TOE05	TAUBn TOE04	TAUBn TOE03	TAUBn TOE02	TAUBn TOE01	TAUBn TOE00

Bit Position	Bit Name	Function
15 to 0	TAUBnTOEm	Enables/disables independent channel output mode: 0: Disables independent channel output mode (controlled by software) 1: Enables independent channel output mode

24.3.5.2 TAUBnTO — TAUBn Channel Output Register

This register specifies and reads the level of TAUBTTOUTm.

Access: This register can be read or written in 16-bit units.

Address: <TAUBn_base> + 58_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 24.31 TAUBnTOC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOCm	Specifies the output mode: 0: Operation mode 1 1: Operation mode 2 The output mode also depends on TAUBnTOM.TAUBnTOMm, as can be seen in the following table.

TOMm	TOCm	Description
0	0	Toggle mode: Toggles when INTTAUBnIm occurs.
	1	Set/reset mode: Set when INTTAUBnIm occurs upon count start and reset when INTTAUBnIm occurs due to detection of a match between TAUBnCNTm and TAUBnCDRm.
1	0	Synchronous channel operation mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel.
	1	Synchronous channel operation mode 2: Set when INTTAUBnIm occurs while the slave channel is counting down and reset when INTTAUBnIm occurs while the slave channel is counting up.

24.3.5.5 TAUBnTOL — TAUBn Channel Output Active Level Register

This register specifies the output logic of the channel output bit (TAUBnTO.TAUBnTOm).

Access: This register can be read or written in 16-bit units.

Address: <TAUBn_base> + 040_H

Value after reset: 0000_H

Table 24.32 TAUBnTOL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTOLm	Specifies the output logic of the channel m output bit (TAUBnTO.TAUBnTOm): 0: Positive logic (active high) 1: Negative logic (active low) The setting of these bits applies to all channel output modes other than independent channel output mode controlled by software.

24.3.6 Details of TAUBn Dead Time Output Registers

24.3.6.1 TAUBnTDE — TAUBn Channel Dead Time Output Enable Register

This register enables/disables dead time operation for each channel.

Access: This register can be read or written in 16-bit units. It can only be written when the counter is stopped (TAUBnTE.TAUBnTEm = 0).

Address: <TAUBn_base> + 250_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 24.34 TAUBnTDL Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUBnTDLm	Selects the phase period to which dead time is added: 0: Positive phase period 1: Negative phase period These bits only apply when: • TAUBnTOE.TAUBnTOEm, TAUBnTOM.TAUBnTOMm, TAUBnTOC.TAUBnTOCm, TAUBnTDE.TAUBnTDEm = 1

24.3.7 TAUBn Emulation Register

24.3.7.1 TAUBnEMU — TAUBn Emulation Register

This register controls SVSTOP operations.

Access: This register can be read or written in 8-bit units.
Write to this register only when the counter is stopped (TAUBnTE.TAUBnTEm = 0) and when EPC.SVSTOP = 0.

Address: <TAUBn_base> + 290_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TAUBnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 24.35 TAUBnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUBnSVSDIS	(When EPC.SVSTOP = 0) Regardless of the value of this bit (1/0), the count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint). (When EPC.SVSTOP = 1) 0: The count clock stops when the debugger obtains the control of the microcontroller (e.g., at a breakpoint). 1: The count clock is continuously supplied when the debugger obtains the control of the microcontroller (e.g., at a breakpoint).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

24.4 General Operating Procedure

The following describes the general operation procedure for the TAUBn:

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUBTTOUTm is also initialized and outputs a low level.

1. Set the TAUBnTPS register to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUBn function:
   - Set the operation mode
   - Set the channel output mode
   - Set any other control bits
3. Enable the counter by setting the TAUBnTS.TAUBnTSm bit to 1.
   The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUBnTT.TAUBnTTm bit to 1. The counter can be forcibly restarted by setting the TAUBnTS.TAUBnTSm bit to 1.
5. Stop the function by setting the TAUBnTT.TAUBnTTm bit to 1.

NOTE

- A detailed description of the required control bits and the operation of the individual functions is given below.
  - **Section 24.12, Independent Channel Operation Functions**
  - **Section 24.14, Synchronous Channel Operation Functions**
- The function can be changed while the counter is stopped (TAUBnTE.TAUBnTEm=0).

24.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in **Section 24.5.1, Rules of Synchronous Channel Operation Function**.

Two special features for synchronous channel operation are detailed in the following:

- **Section 24.5.2, Simultaneous Start and Stop of Synchronous Channel Counters**
- **Section 24.6, Simultaneous Rewrite**

24.5.1 Rules of Synchronous Channel Operation Function

Number of master and slave channels

- Only even channels (CH0, CH2, CH4, …) can be set as master channels.
  Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 and the lower channels (CH3, CH4, CH5, …) can be set as slave channels.
- If multiple master channels are used, a range of slave channels that includes another master channel cannot be set for a given master channel.
  Example: If CH0 and CH4 are master channels, CH1 to CH3 can be set as slave channels for CH0, but CH5 to CH15 cannot.

Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the same value to the TAUBnCMORm.TAUBnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave channel usage and operation clocks are illustrated in **Figure 24.3**.

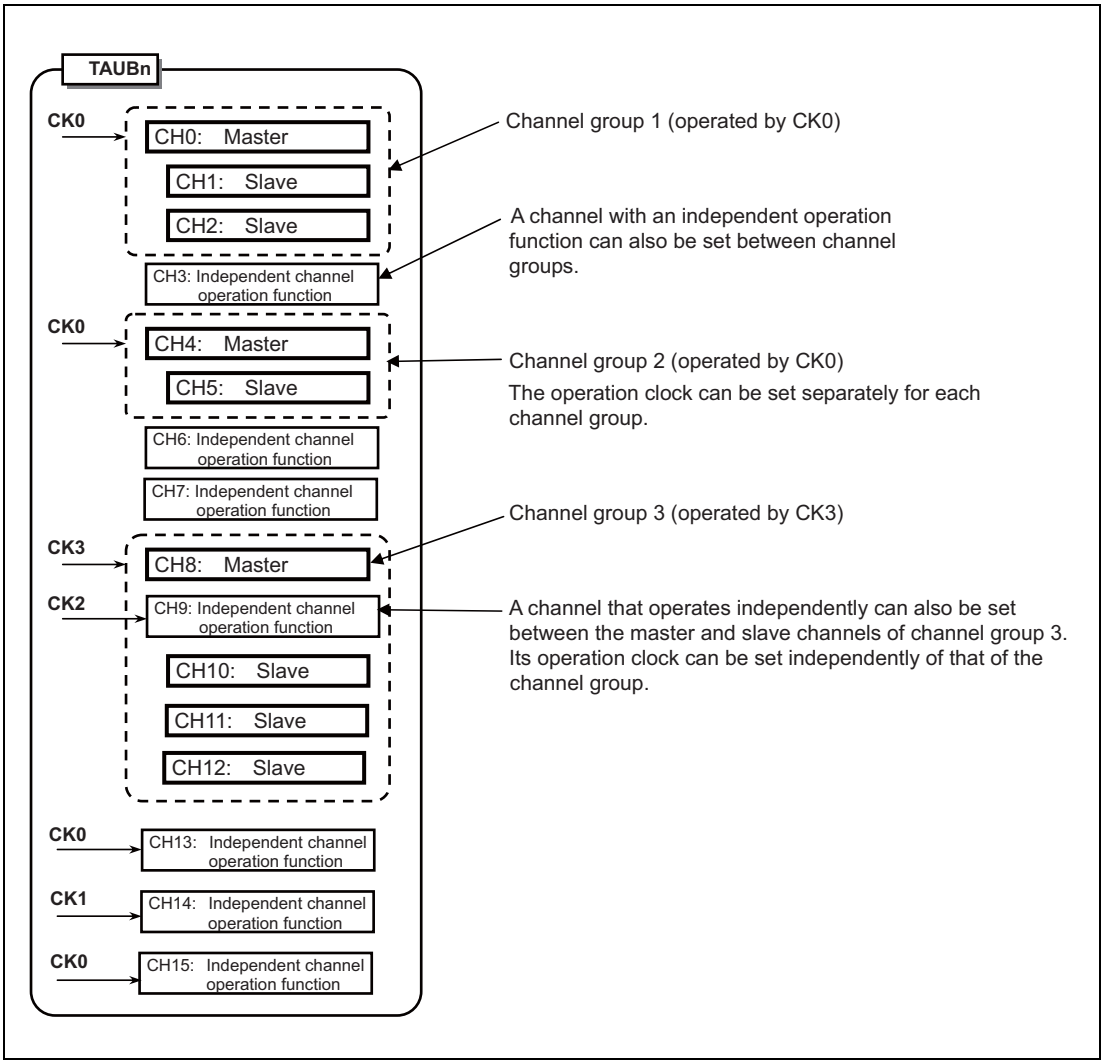

Figure 24.3 Grouping of the Channels and Assignment of Operation Clocks

24.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit.

24.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUBnTS.TAUBnTSm bits of the channels must be set at the same time.
- To simultaneously stop synchronized channels, the TAUBnTT.TAUBnTTm bits of the channels must be set at the same time.

Setting the TAUBnTS.TAUBnTSm bits to 1 sets the corresponding TAUBnTE.TAUBnTEm bits to 1, enabling counting. The exact time that it starts depends on the operation mode.

24.6 Simultaneous Rewrite

24.6.1 Introduction

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUBnCDRm and TAUBnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUBnIm being issued on the upper channel specified by TAUBnRDC.TAUBnRDCm

There are three methods for simultaneous rewrite. These are listed in the following table, along with how to specify them and when they cause simultaneous rewrite to be triggered.

Table 24.36 Simultaneous Rewrite Methods and when They are Triggered

Method	Trigger	TAUBnRDE.TAUBnRDEm	TAUBnRDS.TAUBnRDSm	TAUBnRDM.TAUBnRDMm
—	No simultaneous rewrite	0	0	0
A	The master channel (re)starts counting	1	0	0
B	Counting is started in the master channel. The master channel starts counting down at the peak of triangular wave of the corresponding slave channel.	1	0	1
C1	INTTAUBnIm is generated on an upper channel specified by TAUBnRDC.TAUBnRDCm	1	1	0/1

The following table lists which of these three methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in **Section 24.13, Independent Channel Simultaneous Rewrite Functions** and **Section 24.14, Synchronous Channel Operation Functions**.

Table 24.37 Channel Functions and the Methods They Use for Simultaneous Rewrite

Descriptions	A	B	C1	TAUBnTOL.TAUBnTOLm
Simultaneous Rewrite Trigger Output Function Type 1			√	
PWM Output Function	√		√	√
One-Shot Pulse Output Function	√			
Delay Pulse Output Function	√			
Triangle PWM Output Function		√	√	√
Triangle PWM Output Function with Dead Time		√	√	
A/D Conversion Trigger Output Function Type 1	√		√	
A/D Conversion Trigger Output Function Type 2		√	√	

Note: √: Available, (Blank): Unavailable

24.6.2 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite.
The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

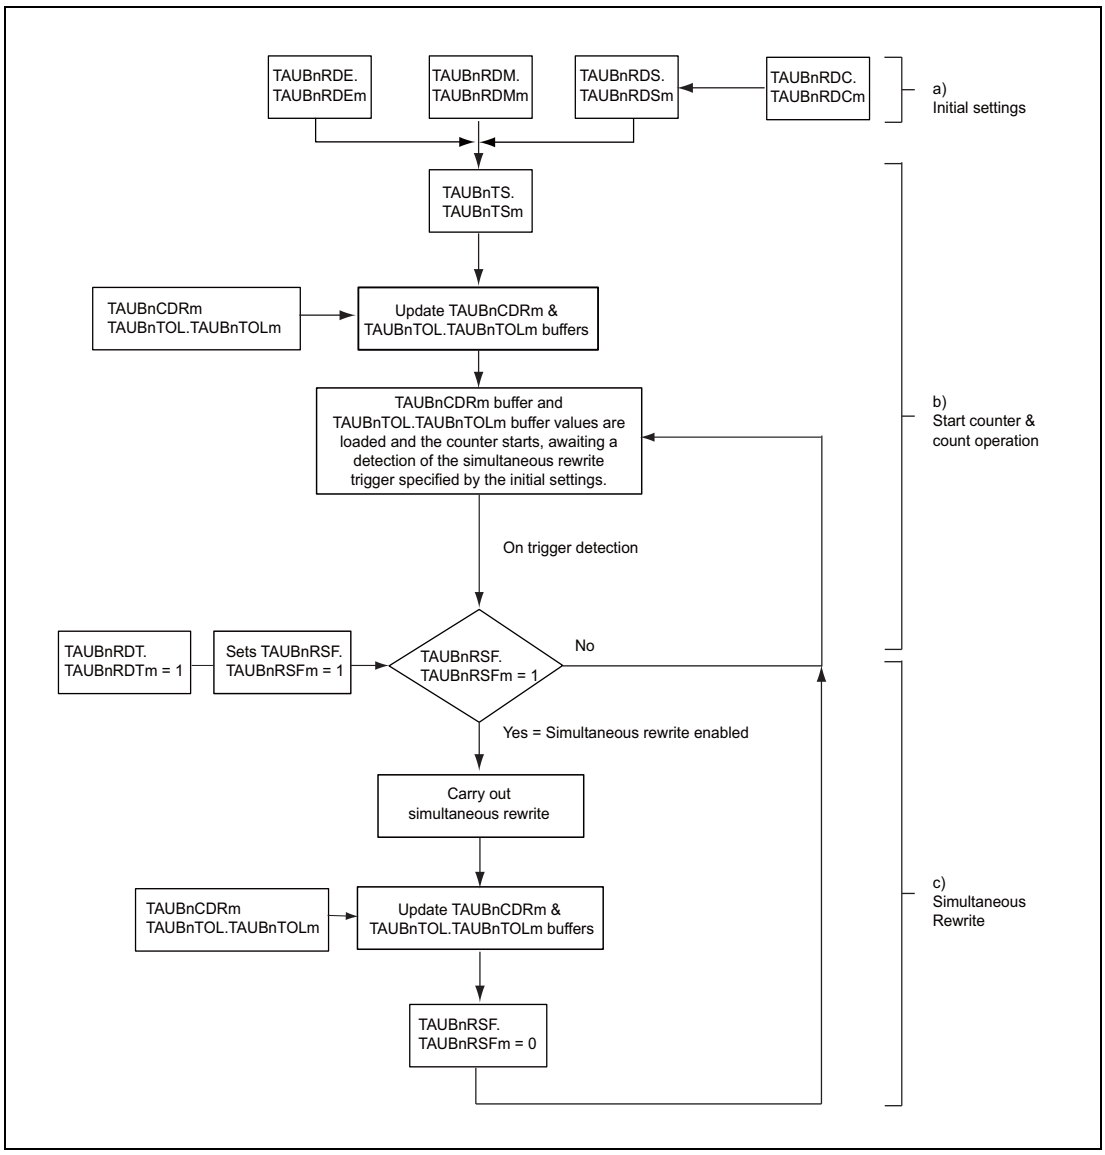

Figure 24.4 General Procedure for Simultaneous Rewrite

24.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUBnRDE.TAUBnRDEm = 1.
- To select the type of simultaneous rewrite, set TAUBnRDM.TAUBnRDMm and TAUBnRDS.TAUBnRDSm according to the values in **Table 24.36, Simultaneous Rewrite Methods and when They are Triggered**.
- Specify a simultaneous rewrite trigger channel by using TAUBnRDC.TAUBnRDCm. (Prerequisite: TAUBnRDS.TAUBnRDSm has been set to the upper channel.)

24.6.2.2 Start Counter and Count Operation

- To start all the TAUBnCNTm counters in the channel group, set the corresponding TAUBnTS.TAUBnTSm bits to 1. TAUBnTOL.TAUBnTOLm and the values in the data registers (TAUBnCDRm) are written to the corresponding TAUBnTOL.TAUBnTOLm buffer (TAUBnTOL.TAUBnTOLm buf) and data buffer registers (TAUBnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1 sets the reload flag (TAUBnRSF.TAUBnRSFm) to 1, enabling simultaneous rewrite. TAUBnRSF.TAUBnRSFm remains at 1 until simultaneous rewrite has taken place.
- When the specified trigger for simultaneous rewrite is detected, the TAUBnRSF.TAUBnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUBnRSF.TAUBnRSFm = 1). If it is, simultaneous rewrite is carried out.
  Otherwise, simultaneous rewrite is not carried out, and the system awaits the next simultaneous rewrite trigger detection.

24.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled (TAUBnRSF.TAUBnRSFm = 1) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then written to the corresponding counters and the values are applied the next time the counter starts or restarts.
- When simultaneous rewrite is finished, the TAUBnRSF.TAUBnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

24.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUBnRDE.TAUBnRDEm, TAUBnRDS.TAUBnRDSm, TAUBnRDM.TAUBnRDMm, and TAUBnRDC.TAUBnRDCm cannot be changed while the counter is in operation (TAUBnTE.TAUBnTEm = 1).
- TAUBnTOL.TAUBnTOLm can only be rewritten during operation in PWM output function or triangle PWM output function. For all other output functions, TAUBnTOL.TAUBnTOLm must be written before the counter starts. If it is rewritten in another function mode, TAUBTTOUTm outputs an invalid wave.
- When a simultaneous rewrite trigger is issued on an upper channel (TAUBnRDS.TAUBnRDSm = 1), the TAUBnRDC.TAUBnRDCm bit controls all the lower channels. This means that if the TAUBnRDC.TAUBnRDCm bits of CH2 and CH7 are set to 1 and the TAUBnRDC.TAUBnRDCm bits of other channels are set to 0, CH2 and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger generation channel (TAUBnRDE.TAUBnRDEm and TAUBnRDS.TAUBnRDSm = 1) but no upper channel is set (TAUBnRDC.TAUBnRDC[15:0] = 0), simultaneous rewrite cannot take place.

24.6.4 Types of Simultaneous Rewrite

In the following section, the three simultaneous rewrite methods are explained using timing diagrams.

24.6.4.1 Simultaneous Rewrite when the Master Channel (Re)Starts Counting (Method A)

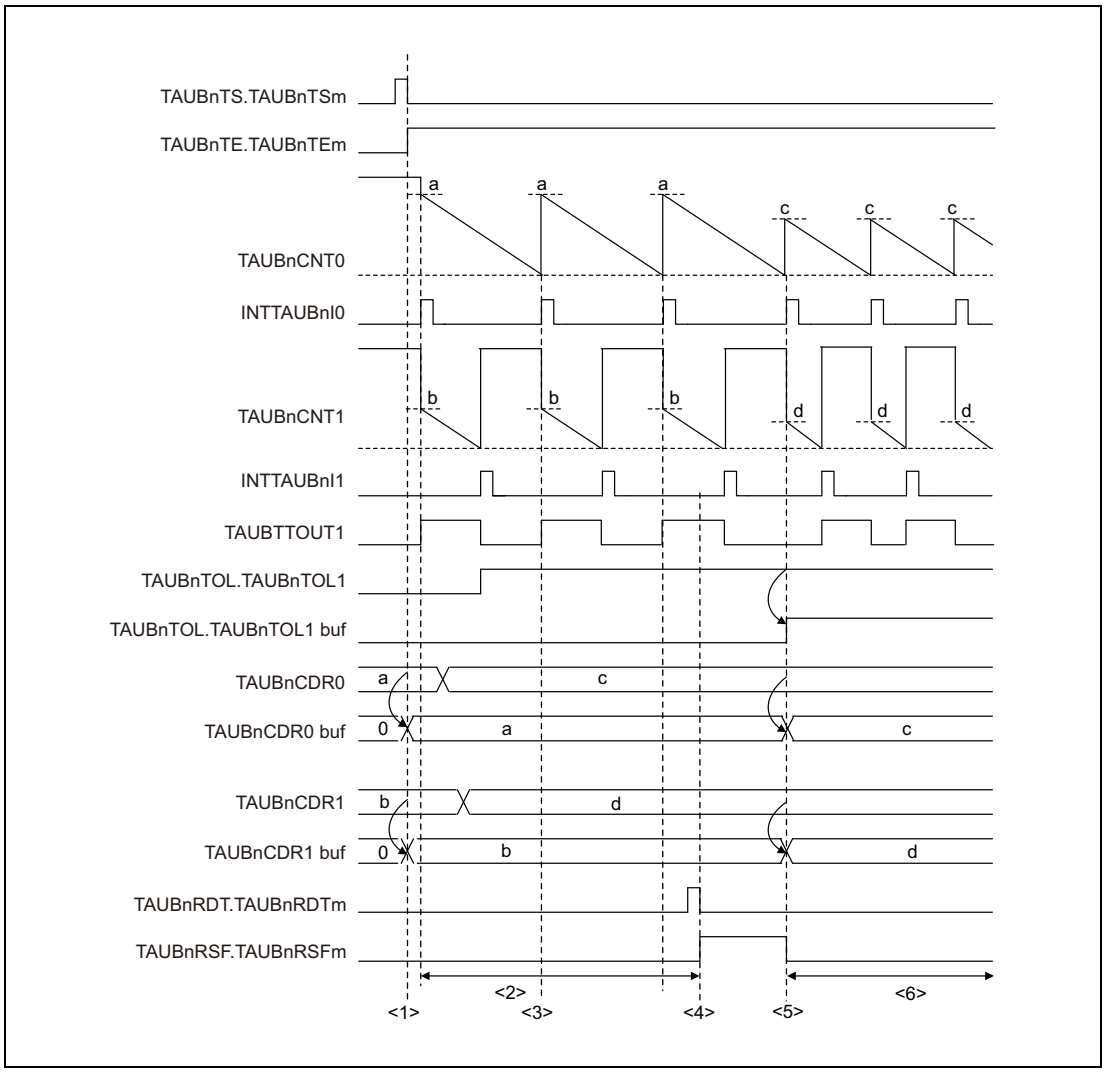

Figure 24.5 Simultaneous Rewrite when the Master Channel (Re)Starts Counting

Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

Description:

(1) When TAUBnTS.TAUBnTSm = 1 is set, the value of TAUBnCDRm is copied to the TAUBnCDRm buffer and the value of TAUBnTOL.TAUBnTOLm is copied to the TAUBnTOL.TAUBnTOLm buffer.

(2) The TAUBnCDRm and TAUBnTOL.TAUBnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUBnRSF.TAUBnRSFm = 0)

(4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.

(5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

24.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel (Method B)

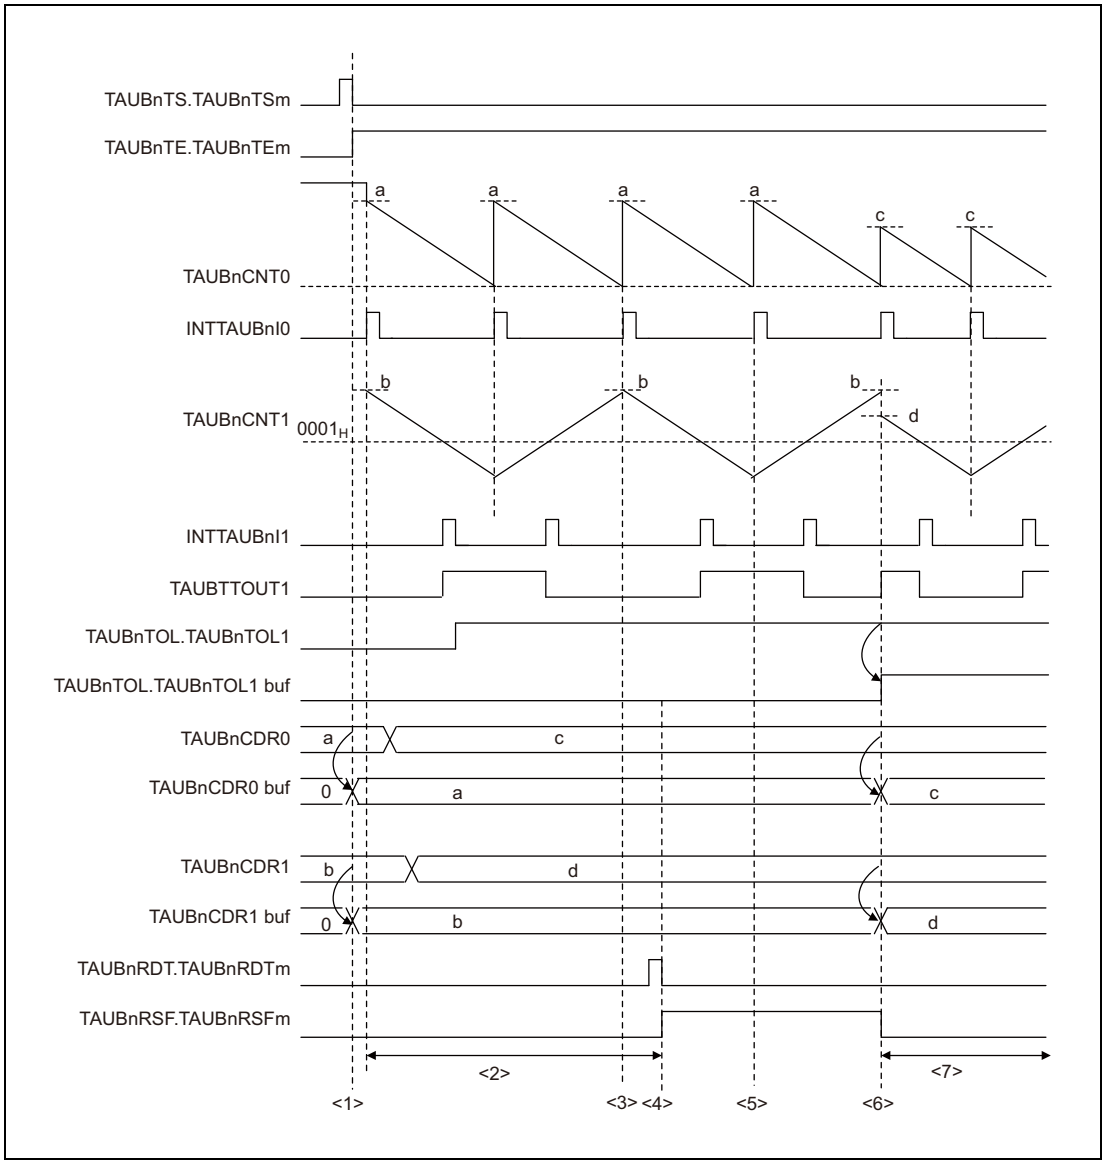

Figure 24.6 Simultaneous Rewrite at the Peak of a Triangular Wave of the Slave Channel

Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

Description:

(1) When TAUBnTS.TAUBnTSm = 1 is set, the value of TAUBnCDRm is copied to the TAUBnCDRm buffer.

(2) The TAUBnCDRm and TAUBnTOL registers can be written at any time.

(3) Simultaneous rewrite does not occur because it is disabled (TAUBnRSF.TAUBnRSFm = 0).

(4) The reload data trigger bit (TAUBnRDT.TAUBnRDTm) is set to 1 which sets the status flag (TAUBnRSF.TAUBnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.

(6) Simultaneous rewrite takes place at the start timing of the top of the triangular cycle. The TAUBnCDRm value is loaded into the TAUBnCDRm buffer, and the TAUBnTOL.TAUBnTOLm value is loaded into the TAUBnTOL.TAUBnTOLm buffer.

(7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUBnCDRm and TAUBnTOL.TAUBnTOLm can be changed again.

24.6.4.3 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm (Method C1)

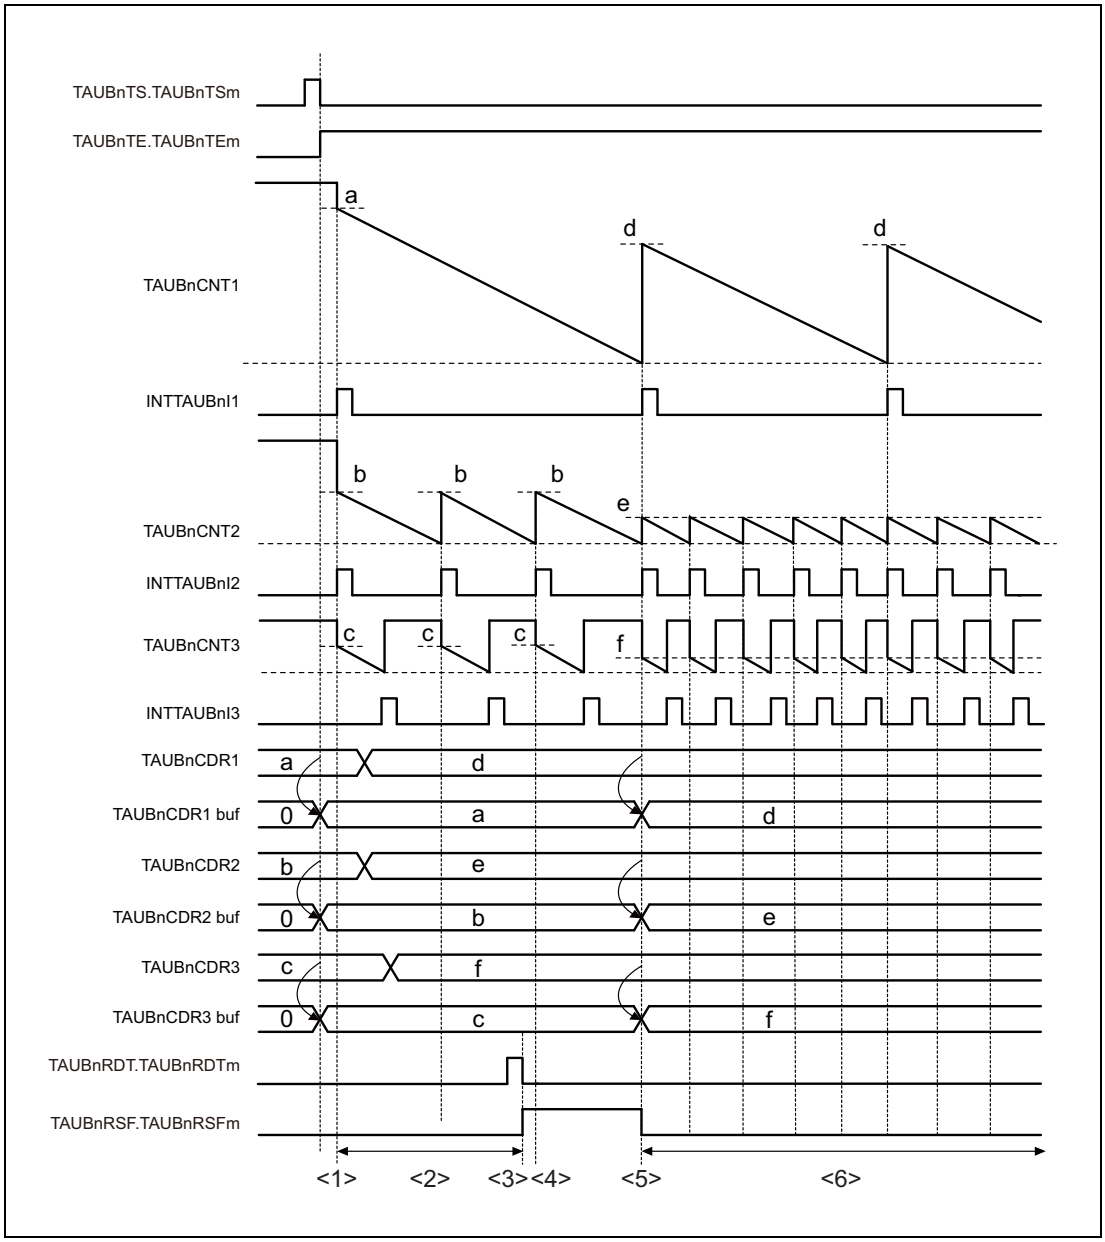

Figure 24.7 Simultaneous Rewrite when INTTAUBnIm is Generated on an Upper Channel Specified by TAUBnRDC.TAUBnRDCm

Setting:

CH1 is an upper channel used counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C1 is applied. The TAUBnRDC register specifies a channel which generates simultaneous rewrite triggers.

Description:

(1) When TAUBnTS.TAUBnTSm is set to 1, the TAUBnCDRm value is copied to the TAUBnCDRm buffer.

(2) The TAUBnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUBnRDT.TAUBnRDTm) to 1, the status flag is set (TAUBnRSF.TAUBnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches 0000_H. The TAUBnCDRm values are loaded into the corresponding TAUBnCDRm buffers.

(6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUBnCDRm register can be rechanged.

24.7 Channel Output Modes

The output of the TAUBTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUBnTOE.TAUBnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUBnTO.TAUBnTOm) is sent to the output pin (TAUBTTOUTm).
- By TAUB signals (TAUBnTOE.TAUBnTOEm = 1)
  When controlled by TAUB signals, the output level of TAUBTTOUTm is set or reset or toggled by internal signals. The value of TAUBnTO.TAUBnTOm is updated accordingly to reflect the value of TAUBTTOUTm.
  - Independently (TAUBnTOM.TAUBnTOMm = 0)
    In case of independent operation, the output of the TAUBTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUBnTOM.TAUBnTOMm = 0).
  - Synchronously (TAUBnTOM.TAUBnTOMm = 1)
    In case of synchronous operation, the output of the TAUBTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUBnTOM.TAUBnTOMm = 1).

The TAUBnTO.TAUBnTOm bit can always be read to determine the current value of TAUBTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 24.38, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 24.7.2, Channel Output Modes Controlled Independently by TAUBn Signals**
- **Section 24.7.3, Channel Output Modes Controlled Synchronously by TAUBn Signals**

Batch operation of TAUBnTOm bit

Whether a set value is reflected to the TAUBnTOm bit or not is controlled by the TAUBnTOE.TAUBnTOEm bit.

The TAUBnTOm setting is written only to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit = 0 when a write to the TAUBnTO register is attempted. No TAUBnTOm setting is reflected to the bit (channel) set with TAUBnTOE.TAUBnTOEm bit = 1.

NOTE

The TAUBnTO.TAUBnTOm bit is placed so that its bit number corresponds to a channel number.

Output logic

Positive logic or negative logic of the output is specified by control bit TAUBnTOL.TAUBnTOLm.

The value of TAUBnTOL.TAUBnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. If TAUBnTOL.TAUBnTOLm is changed after the counter starts, the output of TAUBTTOUTm is undefined.

See **Section 24.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 24.38**.

Table 24.38 Channel Output Modes

Channel Output Mode	TAUBnTOE. TAUBnTOEm	TAUBnTOM. TAUBnTOMm	TAUBnTOC. TAUBnTOCm	TAUBnTDE. TAUBnTDEm
By software				
Independent channel output mode controlled by software	0	x		
By TAUB signals, independently				
Independent channel output mode 1	1	0	0	0
Independent channel output mode 2			1	
By TAUB signals, synchronously				
Synchronous channel output mode 1	1	1	0	0
Synchronous channel output mode 2			1	0
Synchronous channel output mode 2 with dead time output				1

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

NOTE

The following bits cannot be changed during count operation (TAUBnTE.TAUBnTEm = 1):

- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

24.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUBTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUBnTOE.TAUBnTOEm = 0).

(1) Set TAUBnTO.TAUBnTOm to specify the initial level of the TAUBTTOUTm output.

(2) Set channel output mode according to **Table 24.38, Channel Output Modes**, and the output logic using the TAUBnTOL.TAUBnTOLm bit.

(3) Start the counter (TAUBnTS.TAUBnTSm = 1).

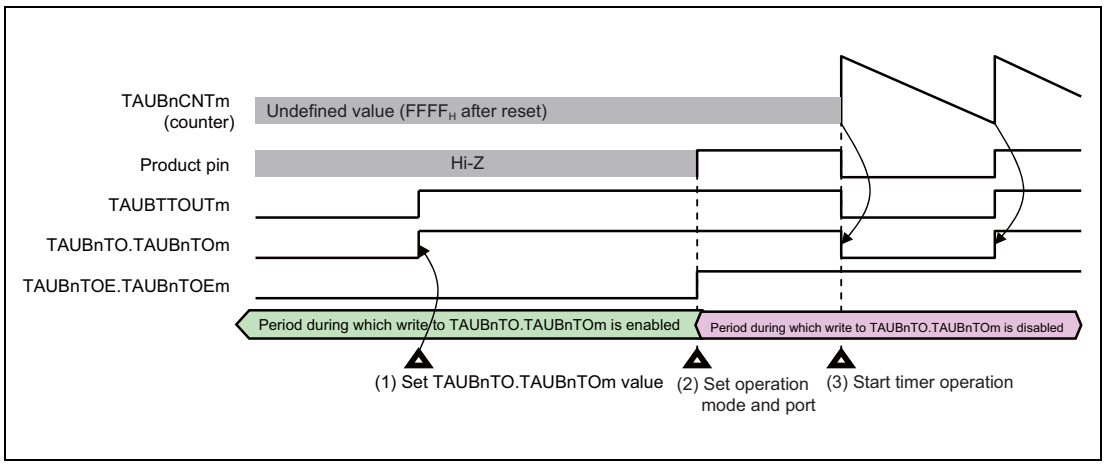

Figure 24.8 General Procedure for Specifying a TAUBTTOUTm Channel Output Mode

24.7.2 Channel Output Modes Controlled Independently by TAUBn Signals

This section lists the channel output modes that are controlled independently by TAUBn signals. The control bits used to specify a mode are listed in **Table 24.38, Channel Output Modes**.

24.7.2.1 Independent Channel Output Mode 1

Set/reset conditions

In this output mode, TAUBTTOUTm toggles when INTTAUBnIm is detected. The value of TAUBnTOL.TAUBnTOLm is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 24.38, Channel Output Modes**.

24.7.2.2 Independent Channel Output Mode 2

Set/reset conditions

In this output mode, TAUBTTOUTm is set when INTTAUBnIm occurs at the time of count start, and reset when INTTAUBnIm occurs due to a match between TAUBnCNTm and TAUBnCDRm.

Prerequisites

There are no prerequisites other than those shown in **Table 24.38, Channel Output Modes**.

24.7.3 Channel Output Modes Controlled Synchronously by TAUBn Signals

This section lists the channel output modes that are controlled synchronously by TAUBn signals. The control bits used to specify a mode are listed in **Table 24.38, Channel Output Modes**.

24.7.3.1 Synchronous Channel Output Mode 1

Set/reset conditions

In this output mode, INTTAUBnIm of master channel serves as a set signal and INTTAUBnIm of the slave channel as a reset signal. If INTTAUBnIm of the master channel and INTTAUBnIm of the slave channel are generated at the same time, INTTAUBnIm of the slave channel (reset signal) has priority over INTTAUBnIm (set signal) of the master channel, i.e., the master channel is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 24.38, Channel Output Modes**.

24.7.3.2 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is trianglular wave PWM output at TAUBTTOUTm. For details, see **Section 24.14.5, Triangle PWM Output Function**.

Set/reset conditions

TAUBnCNTm of the slave channel counts down and up alternatively. When it passes 0001_H it generates an interrupt, causing TAUBTTOUTm to toggle.

Prerequisites

A set of two channels is required to generate the triangle PWM output. TAUBTTOUTm should be set to 0 before the function starts.

24.7.3.3 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUBTTOUTm. The set/reset conditions are shown in **Figure 24.9**.

Set/reset conditions

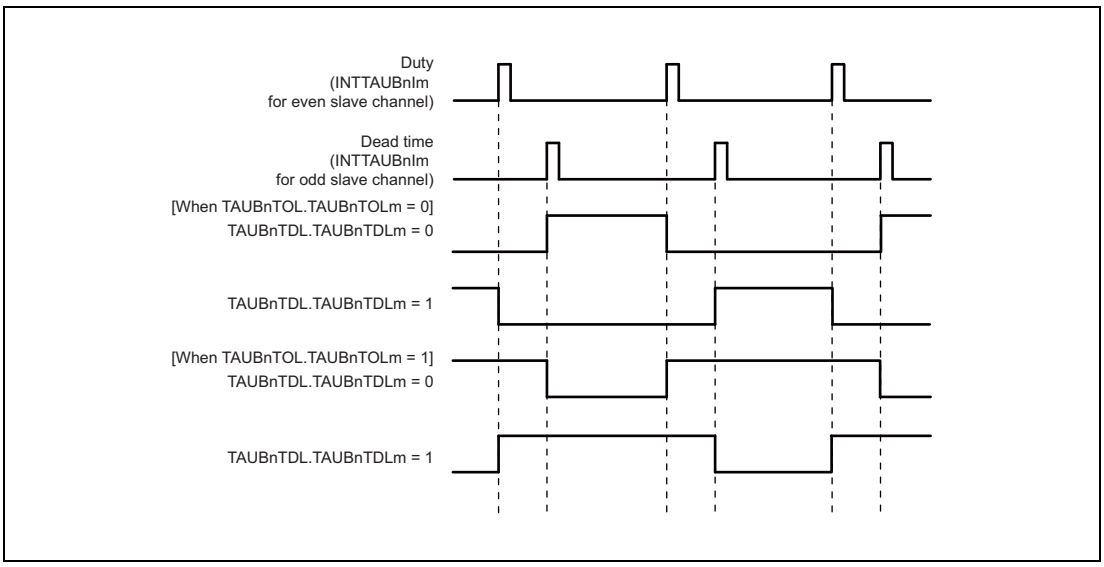

Figure 24.9 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output

With regard to the edge to which dead time is added, set TAUBnTDL.TAUBnTDLm = 0 for rising edges and TAUBnTDL.TAUBnTDLm = 1 for falling edges.

Prerequisites

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel
  The master channel should be set to interval timer mode.
- One even slave channel
  The even slave channel should be set to count-up/-down mode.
- One odd slave channel (even channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUBnTOE.TAUBnTOEm
- TAUBnTOM.TAUBnTOMm
- TAUBnTOC.TAUBnTOCm
- TAUBnTDE.TAUBnTDEm

24.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUBnTS.TAUBnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

24.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-Up/-Down Mode, and Count Capture Mode

The counter starts operating at the next count clock after TAUBnTS.TAUBnTSm is set to 1. The value of data register is also loaded when the counter starts.

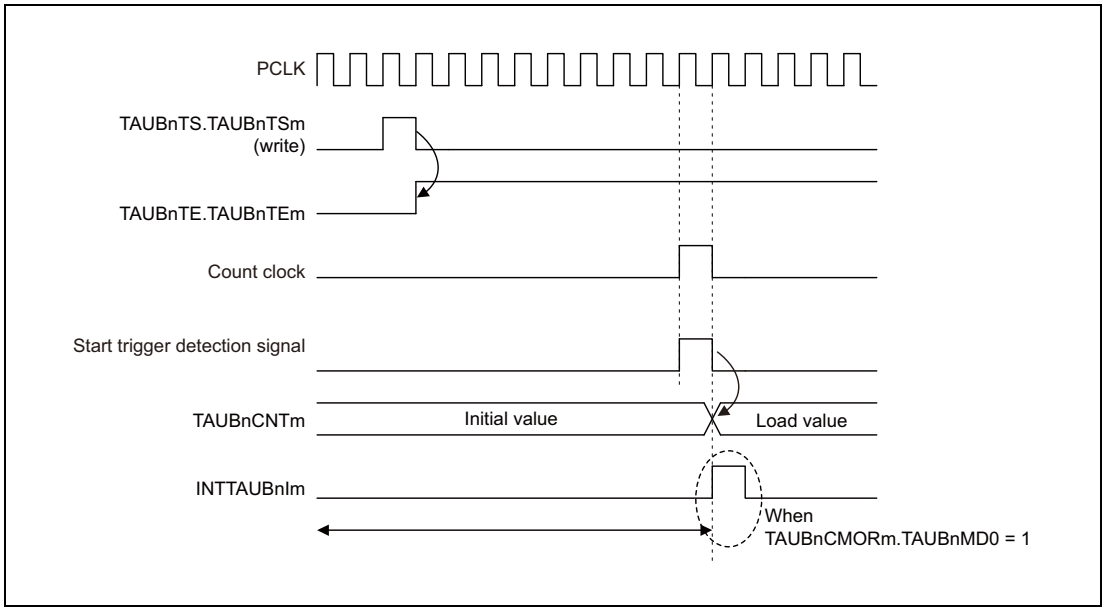

Figure 24.10 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Up/Down Count Mode, and Count Capture Mode

NOTE

Make sure to set TAUBnCMORm.TAUBnMD0 to 0 when using the count-up/-down mode.

24.8.2 Event Count Mode

The value of data register is loaded as soon as TAUBnTS.TAUBnTSm is set to 1. The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

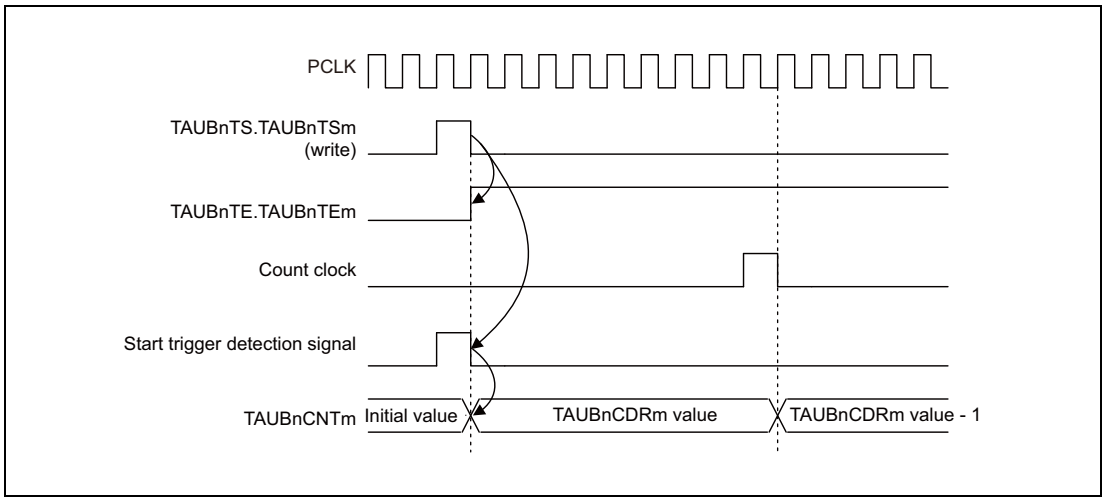

Figure 24.11 Start Timing in Event Count Mode

24.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUBTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which are irrelevant to start of counter operation, determine the frequency with which all operations take place.

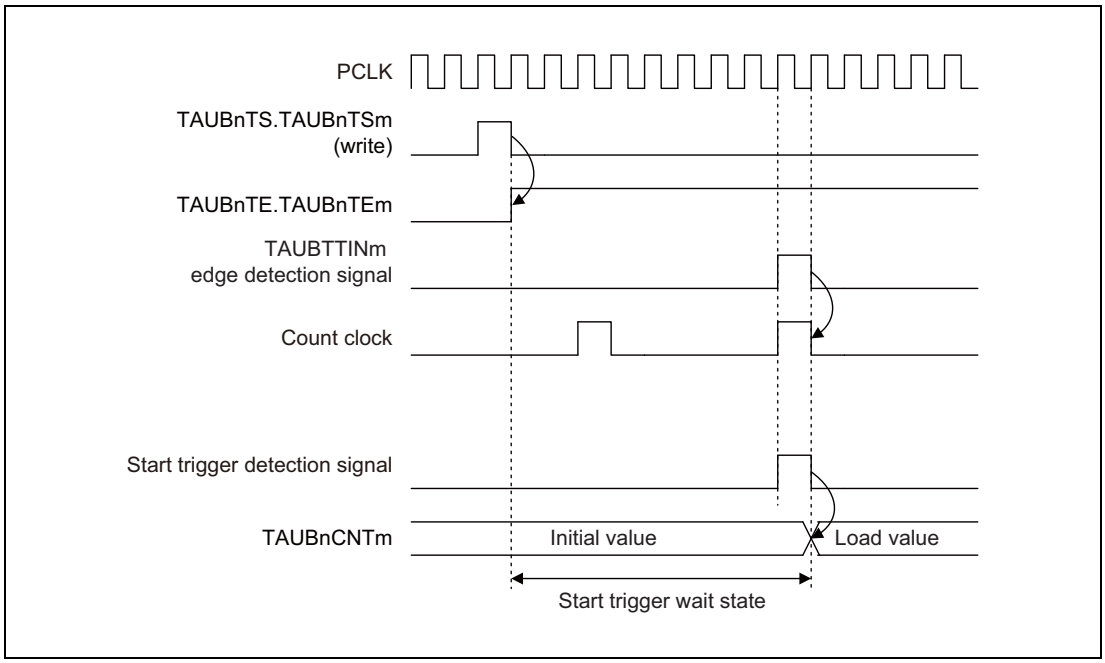

Figure 24.12 Count Start Timing in Other Operating Modes

24.9 TAUBTTOUTm Output and INTTAUBnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUBnIm is generated using the TAUBnCMORm.TAUBnMD0 bit. The generation of INTTAUBnIm when the TAUBnCMORm.TAUBnMD0 bit starts counting and the effect to TAUBTTOUTm depend on the selected function. For details, refer to the description of TAUBnCMORm.TAUBnMD0 of each function.

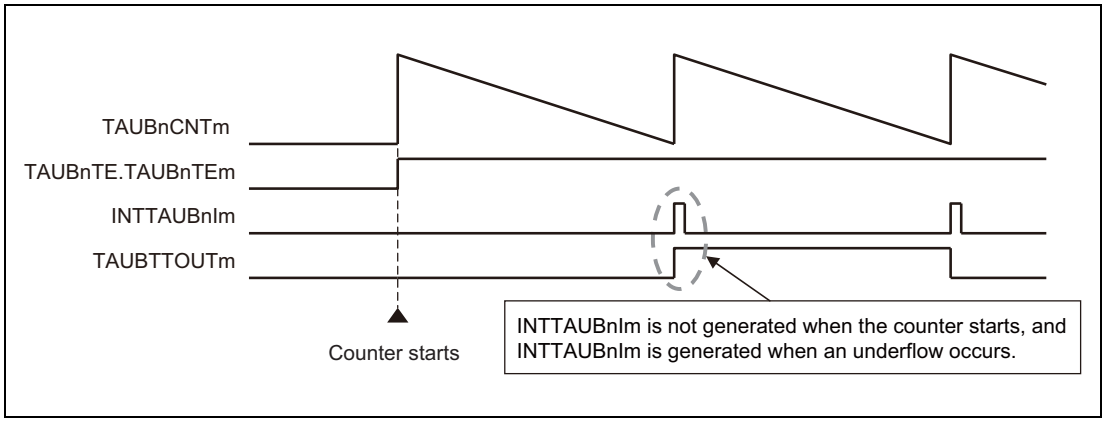

Figure 24.13 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMD0=0)

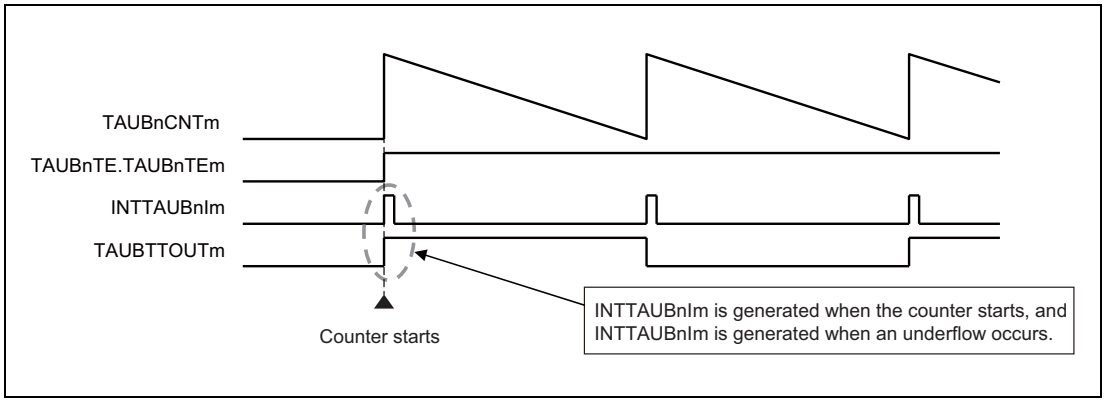

Figure 24.14 INTTAUBnIm Generation Timing (TAUBnCMORm.TAUBnMD0=1)

24.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches $FFFF_H$ and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operation in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches 0000_H at the same time as the first channel overflows (TAUBnCNTm = $FFFF_H$).
- Set TAUBnCDRm of the second channel to $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUBTTINm input.
- The trigger detection settings (TAUBnCMORm.TAUBnSTS[2:0] and TAUBnCMURm.TAUBnTIS[1:0]) must be identical for both channels.

Result:

The down-counter of the second channel reaches 0000_H at exactly the same time as the up-counter of the first channel overflows (TAUBnCNTm = $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

24.10.1 Example of Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the TAUBTTINm input interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input pulse interval measurement function exceeds $FFFF_H$.

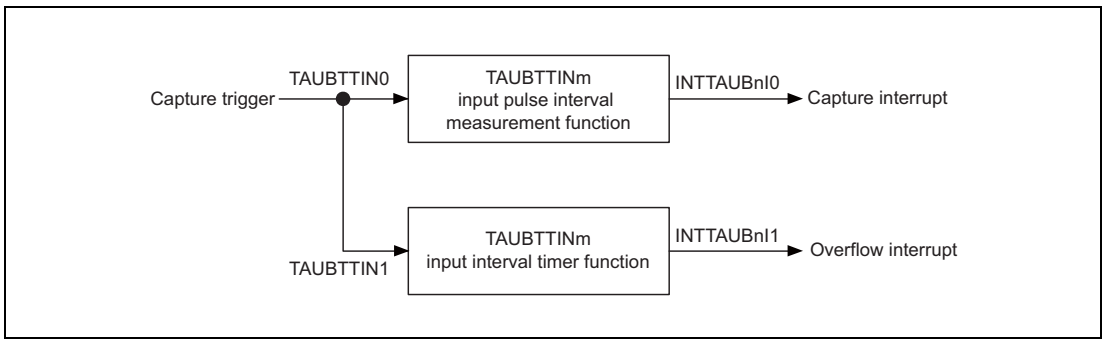

Figure 24.15 Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

Timing diagram

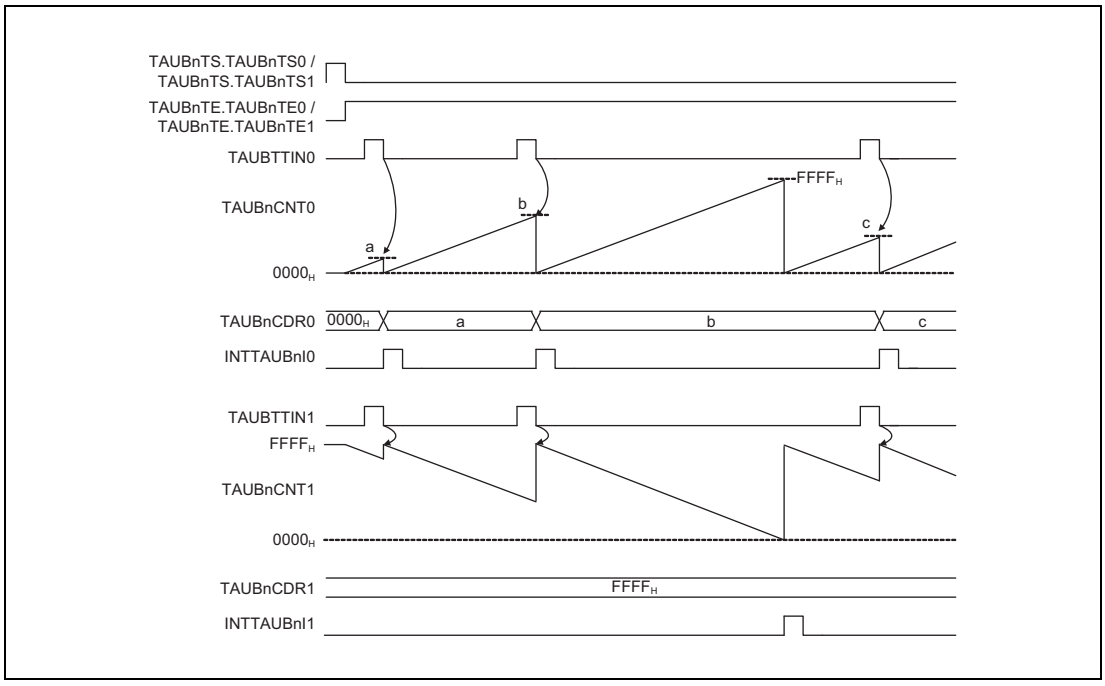

Figure 24.16 Interrupt Generation by Combination of TAUBTTINm Input Pulse Interval Measurement Function and TAUBTTINm Input Interval Timer Function

24.10.2 Example of Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm width measurement) can detect the overflow when TAUBnCNTm of the TAUBTTINm input signal width measurement function exceeds $FFFF_H$.

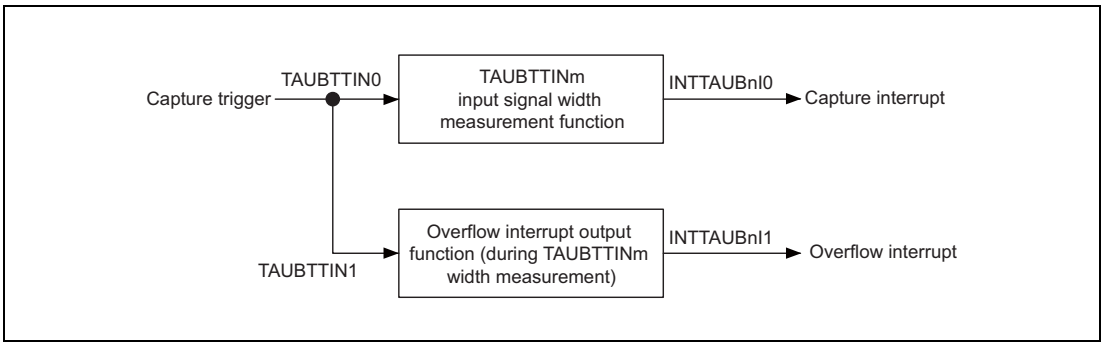

Figure 24.17 Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

Timing diagram

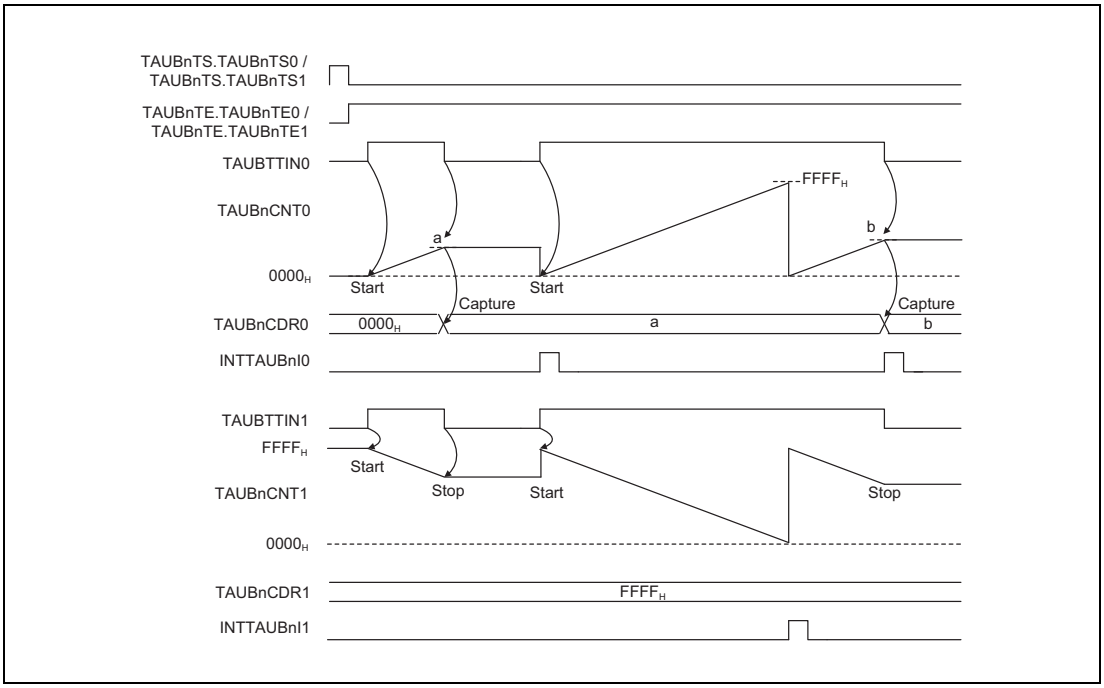

Figure 24.18 Interrupt Generation by Combination of TAUBTTINm Input Signal Width Measurement Function and Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

24.10.3 Example of Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

When the counters of both channels are enabled simultaneously, INTTAUBnIm of the interval timer function can detect the overflow when TAUBnCNTm of the TAUBTTINm input position detection function exceeds $FFFF_H$.

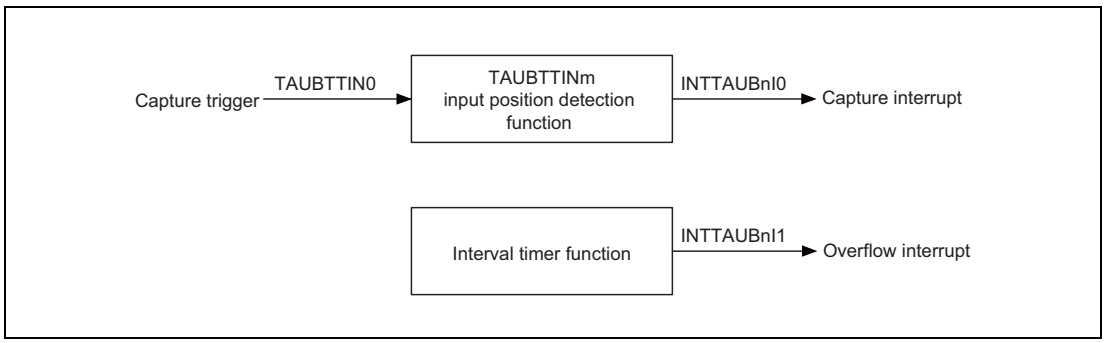

Figure 24.19 Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

Timing diagram

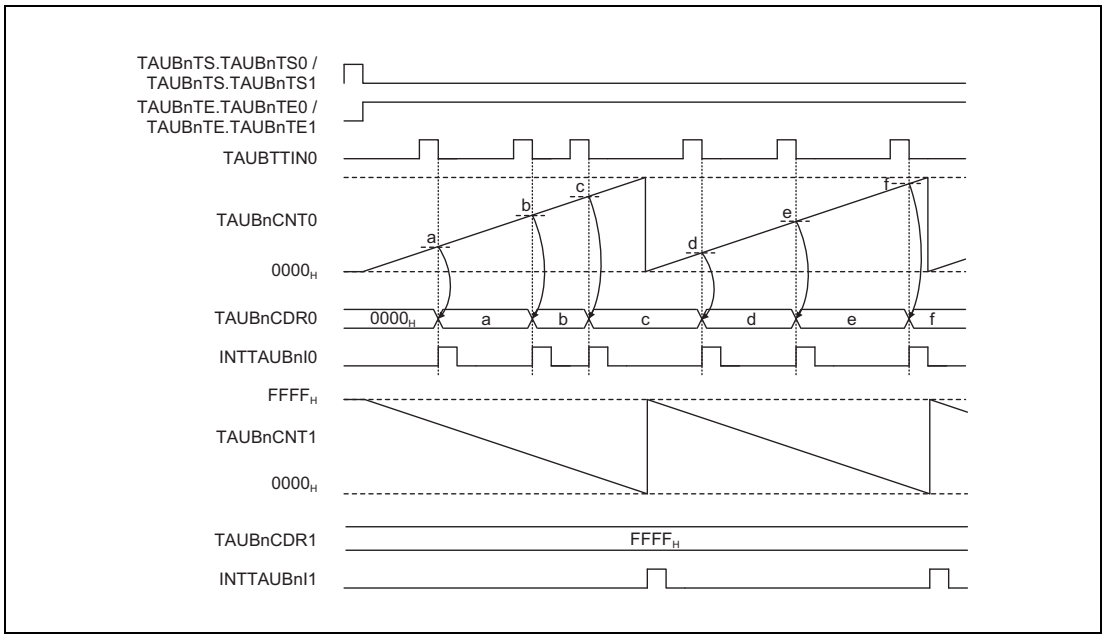

Figure 24.20 Interrupt Generation by Combination of TAUBTTINm Input Position Detection Function and Interval Timer Function

24.10.4 Example of Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

When the capture trigger is input simultaneously to TAUBTTINm of both channels, INTTAUBnIm of the overflow interrupt output function (during TAUBTTINm input period count detection) can detect the overflow when TAUBnCNTm of the TAUBTTINm input period count detection function exceeds $FFFF_H$.

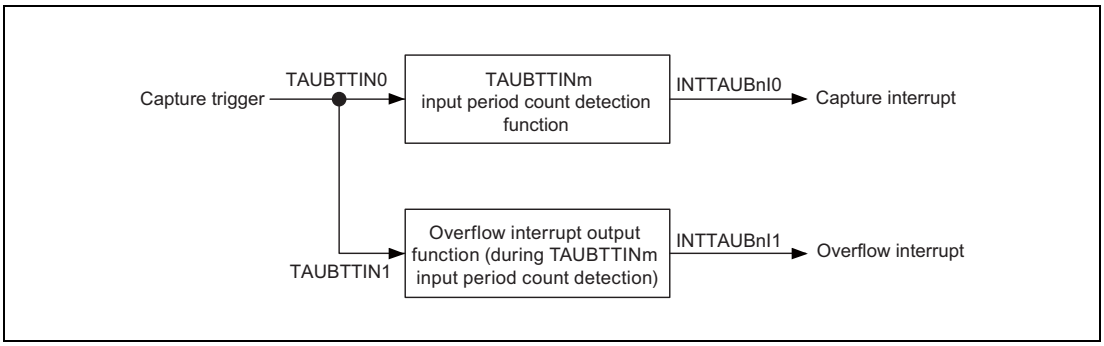

Figure 24.21 Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (TAUBTTINm Input Period Count Detection)

Timing diagram

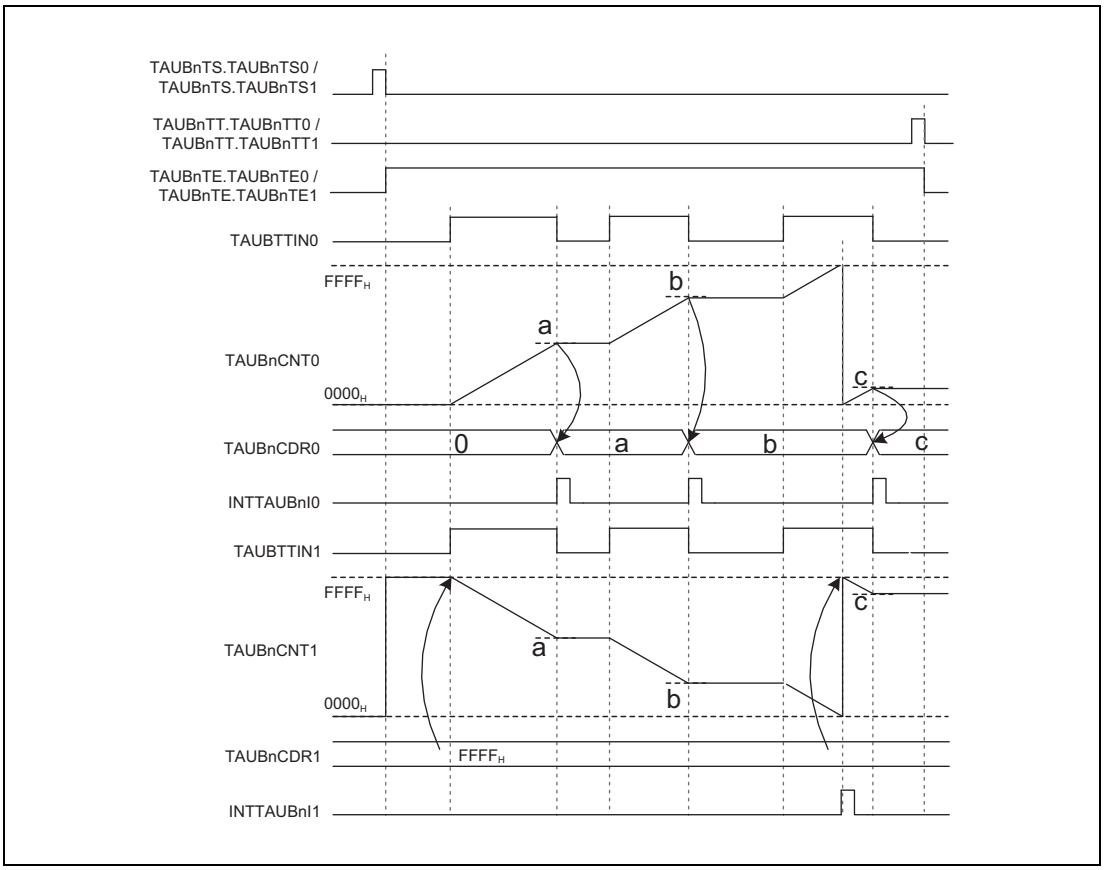

Figure 24.22 Interrupt Generation by Combination of TAUBTTINm Input Period Count Detection Function and Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

24.11 TAUBTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

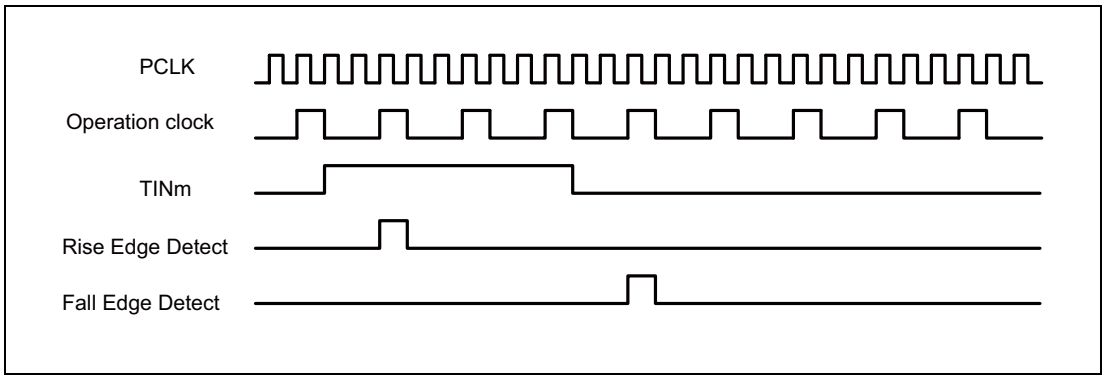

Figure 24.23 Basic Edge Detection Timing

Figure 24.23 is an image of the operation timing. Actually, the delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn will be generated.

24.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUB. For a general overview of independent channel operation functions, see **Section 24.2, Overview**.

24.12.1 Interval Timer Function

24.12.1.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals. When an interrupt is generated, the TAUBTTOUTm signal toggles, resulting in a square wave.

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

When the counter reaches 0000_H, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle. This results in an inverted TAUBTTOUTm signal output when TAUBnCMORm.TAUBnMD0 is set to 1.

24.12.1.2 Equations

INTTAUBnIm cycle = count clock cycle × (TAUBnCDRm + 1)

TAUBTTOUTm square wave cycle = count clock cycle × (TAUBnCDRm + 1) × 2

24.12.1.3 Block Diagram and General Timing Diagram

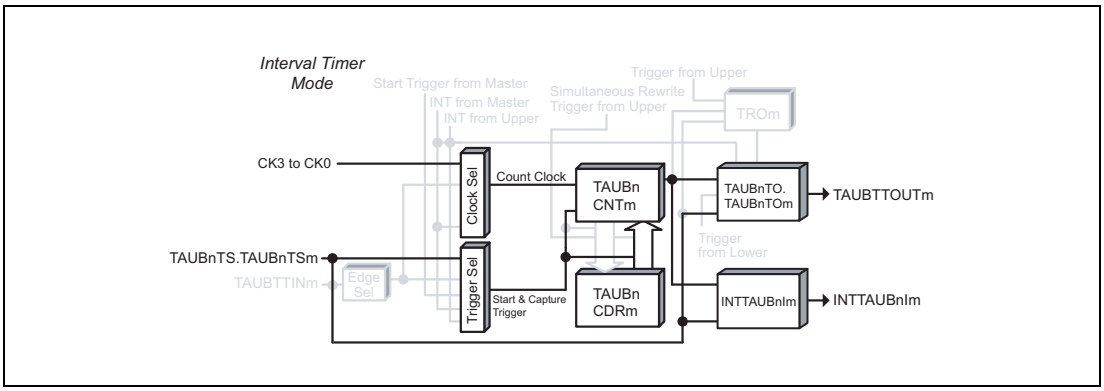

Figure 24.24 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

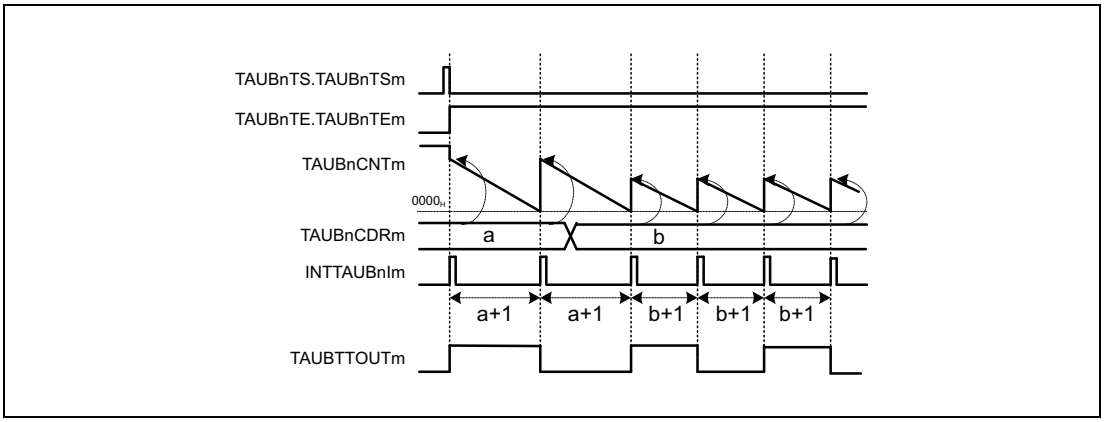

Figure 24.25 General Timing Diagram for Interval Timer Function

24.12.1.4 Register Settings

(1) TAUBnCMORm

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 24.39 Contents of the TAUBnCMORm Register for Interval Timer Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 000_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000_B.
0	TAUBnMD0	0: INTTAUBnIm is not generated and TAUBTTOUTm does not toggle at operation start. 1: INTTAUBnIm is generated and TAUBTTOUTm toggles at operation start or restart.

(2) TAUBnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 24.40 Contents of the TAUBnCMURm Register for Interval Timer Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode

Table 24.41 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	Write 0_B.
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUBnTOE.TAUBnTOEm = 0. TAUBTTOUTm can then be controlled independently of the interrupts.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Interval Timer Function. Therefore, these registers must be set to 0.

Table 24.42 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

24.12.1.5 Operating Procedure for Interval Timer Function

Table 24.43 Operating Procedure for Interval Timer Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.39, Contents of the TAUBnCMORm Register for Interval Timer Function** and **Table 24.40, Contents of the TAUBnCMURm Register for Interval Timer Function** Set the value of the TAUBnCDRm register Set the channel output mode by setting the control bits as described in **Table 24.41, Control Bit Settings for Independent Channel Output Mode 1**	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated and TAUBTTOUTm toggles.
During operation	The TAUBnCDRm register value can be changed at any time. The TAUBnCNTm register can be read at all times.	TAUBnCNTm counts down. When the counter reaches 0000_H: • TAUBnCNTm reloads the TAUBnCDRm value and continues count operation • INTTAUBnIm is generated and TAUBTTOUTm toggles.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

24.12.1.6 Specific Timing Diagrams

(1) TAUBnCDRm = 0000_H, count clock = PCLK/2

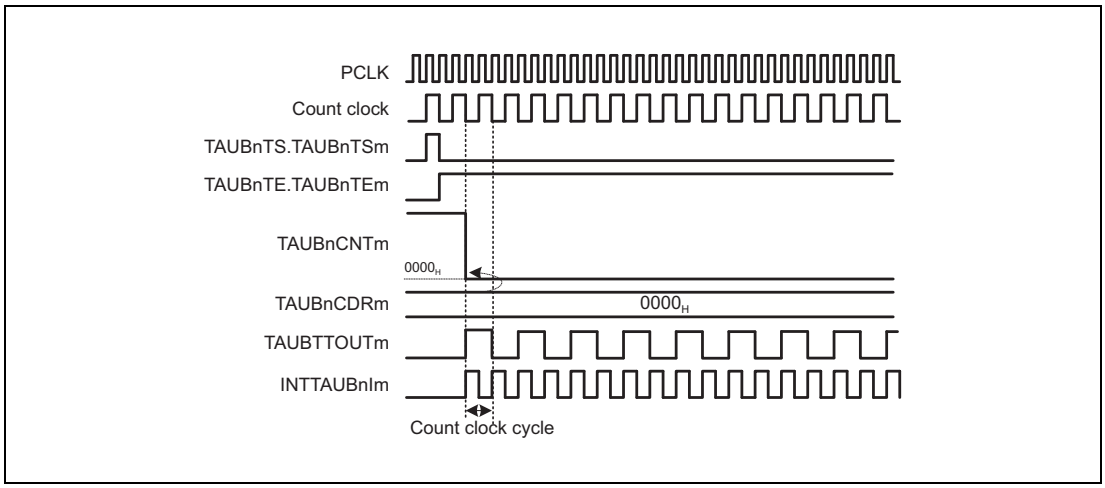

Figure 24.26 TAUBnCDRm = 0000_H, Count Clock = PCLK/2

- TAUBnCDRm = 0000_H, and the count clock = PCLK/2, the TAUBnCDRm value is written to TAUBnCNTm every count clock, meaning that TAUBnCNTm is always 0000_H.
- INTTAUBnIm is generated every count clock, resulting in TAUBTTOUTm toggling every count clock.

(2) TAUBnCDRm = 0000_H, count clock = PCLK

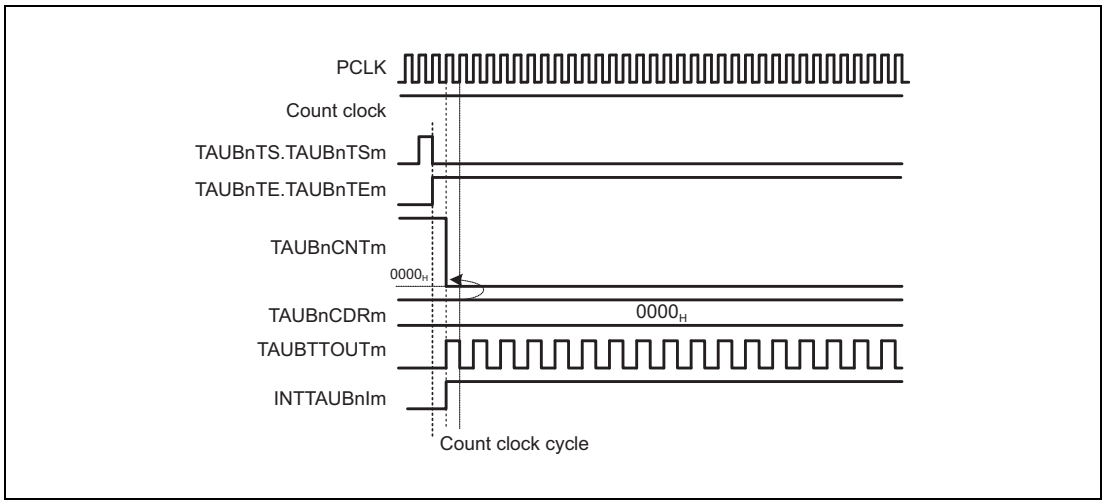

Figure 24.27 TAUBnCDRm = 0000_H, Count Clock = PCLK

- TAUBnCDRm = 0000_H, and the count clock = PCLK, the TAUBnCDRm value is written to TAUBnCNTm every PCLK clock, meaning that TAUBnCNTm is always 0000_H.
- INTTAUBnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
  TAUBTTOUTm is toggled every PCLK clock.

(3) Operation stop and restart (TAUBnCMORm TAUBnMDO = 1)

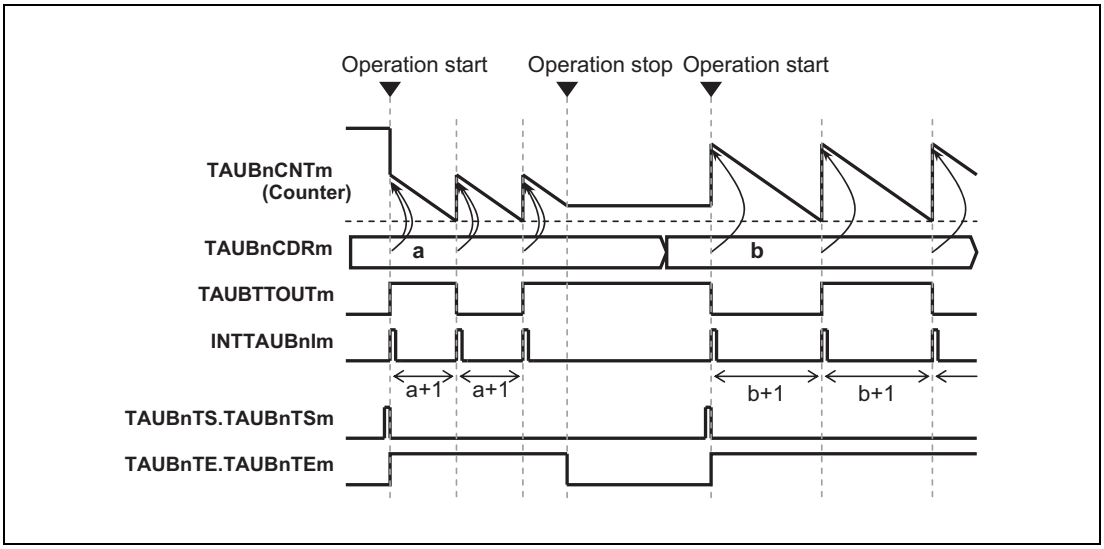

Figure 24.28 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 = 1

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm and TAUBTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1.

(4) Operation stop and restart (TAUBnCMORm.TAUBnMD0 = 0)

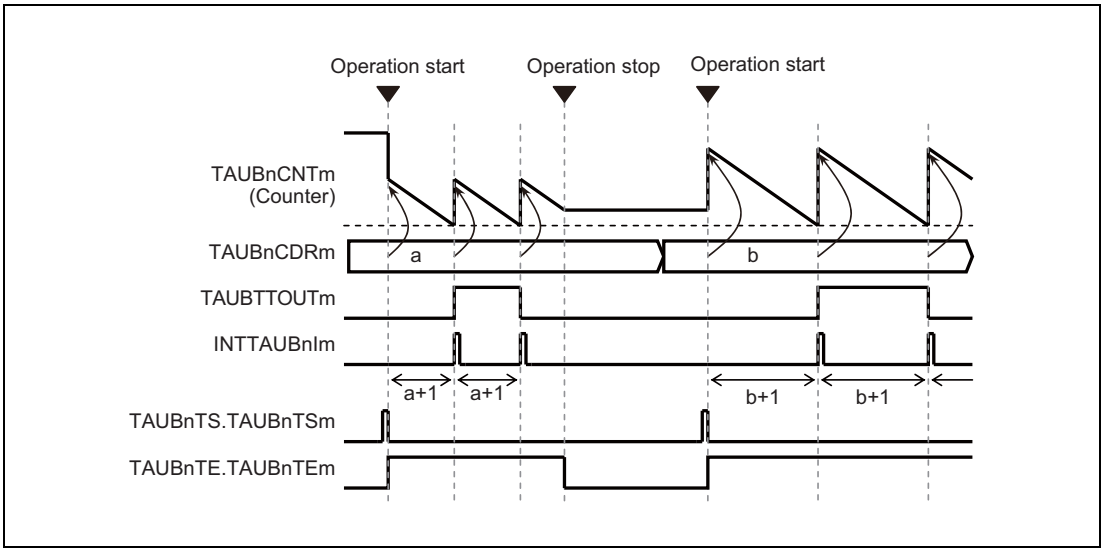

Figure 24.29 Operation Stop and Restart, TAUBnCMORm.TAUBnMD0 = 0

(5) Forced restart (TAUBnCMORm.TAUBnMD0 = 1)

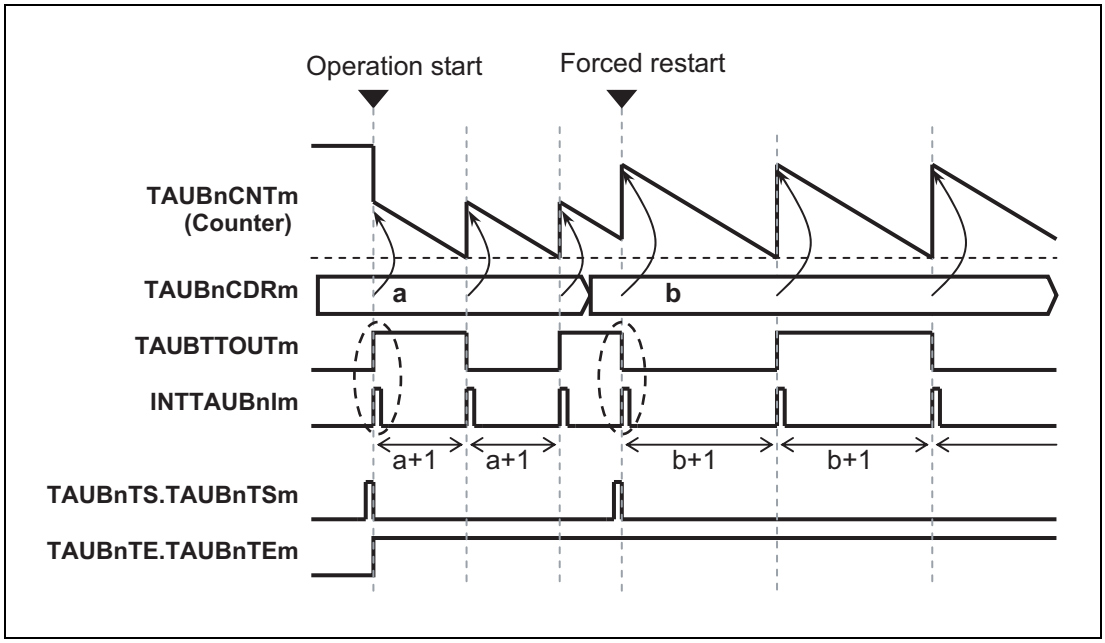

Figure 24.30 Forced Restart Operation, TAUBnCMORm.TAUBnMD0 = 1

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt at start or restart is generated and the output TAUBTTOUTm toggles.

(6) Forced restart (TAUBnCMORm.TAUBnMD0 = 0)

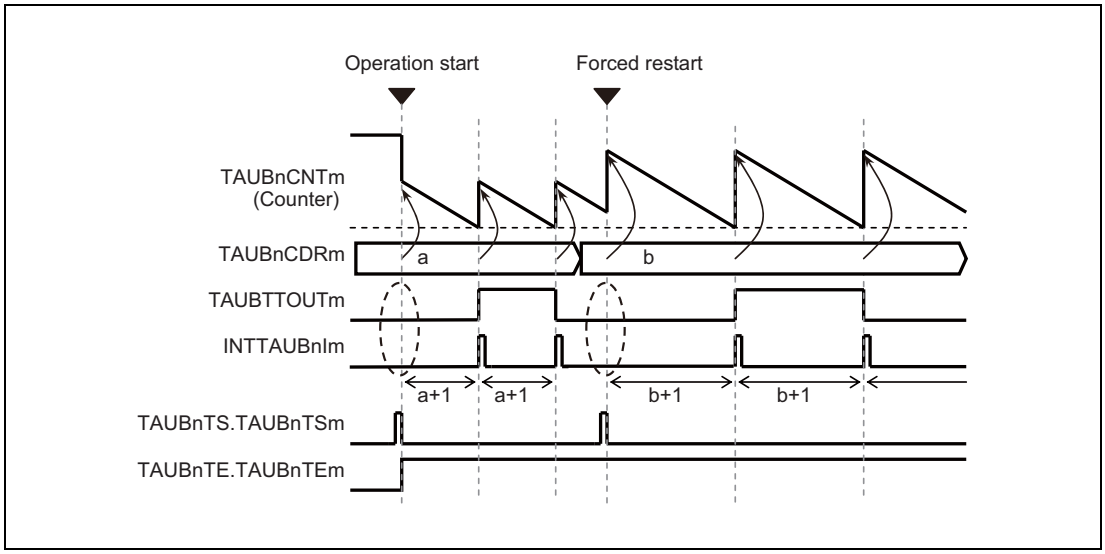

Figure 24.31 Forced Restart Operation (TAUBnCMORm.TAUBnMD0 = 0)

- The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUBTTOUTm does not toggle.

24.12.2 TAUBTTINm Input Interval Timer Function

24.12.2.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUBnIm) at regular intervals or when a valid TAUBTTINm input edge is detected.

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The current value of TAUBnCDRm is loaded to TAUBnCNTm and the counter starts to count down from this value.

INTTAUBnIm is generated when the counter reaches 0000_H or by an effective TAUBTTINm input edge. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm stop but retain their values. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The type of edge used as the trigger is specified using the TAUBnCMURm.TAUBnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

24.12.2.2 Block Diagram and General Timing Diagram

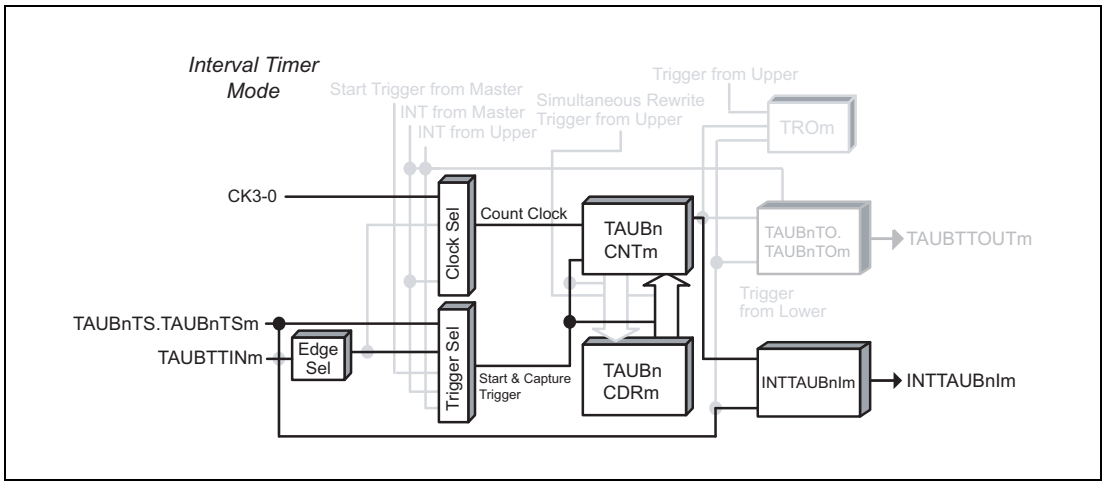

Figure 24.32 Block Diagram for TAUBTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1).
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

(3) Channel output mode

This function does not use channel output mode.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Interval Timer Function. Therefore, these registers must be set to 0.

Table 24.46 Simultaneous Rewrite Settings for TAUBTTINm Input Interval Timer Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

24.12.2.4 Operating Procedure for TAUBTTINm Input Interval Timer Function

Table 24.47 Operating Procedure for TAUBTTINm Input Interval Timer Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.44, Contents of the TAUBnCMORm Register for TAUBTTINm Input Interval Timer Function** and **Table 24.45, Contents of the TAUBnCMURm Register for TAUBTTINm Input Interval Timer Function** Set the value of the TAUBnCDRm register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated.
During operation	The values of the TAUBnCMURm.TAUBnTIS[1:0] and the TAUBnCDRm register can be changed at any time. The TAUBnCNTm register can be read at all times. Detection of TAUBTTINm edge	TAUBnCNTm counts down. When the counter reaches 0000_H: • TAUBnCNTm reloads the TAUBnCDRm value and continues count operation • INTTAUBnIm is generated When a TAUBTTINm input valid edge is detected during count operation, TAUBnCNTm reloads the TAUBnCDRm value and continues count operation. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1 TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stop and retain their current values.

Restart operation

24.12.2.5 Specific Timing Diagrams

The timing diagrams in **Section 24.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by an effective TAUBTTINm input edge.

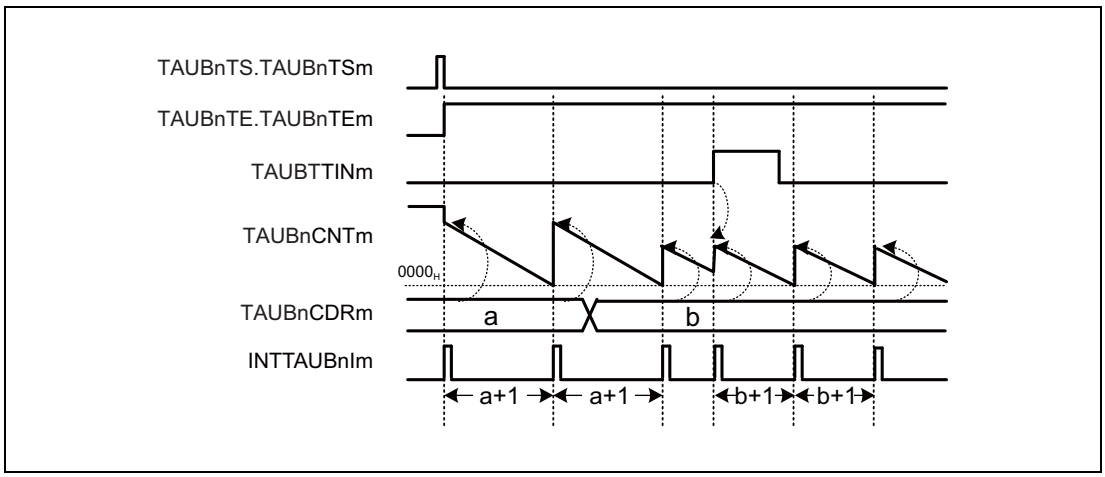

Figure 24.34 Counter Triggered by Rising TAUBTTINm Input Edge (TAUBnCMURm.TAUBnTIS[1:0] = 01_B), TAUBnCMORm.TAUBnMD0 = 1

- If an effective TAUBTTINm input edge is detected, an interrupt INTTAUBnIm is generated. In this example, the effective edge is a rising edge (TAUBnCMURm.TAUBnTIS[1:0] = 01_B).

24.12.3 Clock Divide Function

24.12.3.1 Overview

Summary

This function is used as a frequency divider. The frequency of the input signal TAUBTTINm is divided by a factor related to TAUBnCDRm, and an interrupt INTTAUBnIm is generated.

Prerequisites

- TAUBTTINm must have a fixed frequency
- The operation mode must be set to interval timer mode, see **Table 24.48, Contents of the TAUBnCMORm Register for Clock Divide Function**

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value, using TAUBTTINm as the count clock.

When the counter value reaches 0000_H, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

The counter can be stopped by setting TAUBnTT.TAUBnTTm = 1, which in turn sets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm stops but retain their values. The function can be restarted by setting TAUBnTS.TAUBnTSm = 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.

Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the first interrupt after a start or restart is not generated.

NOTE

The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits.

24.12.3.2 Block Diagram and General Timing Diagram

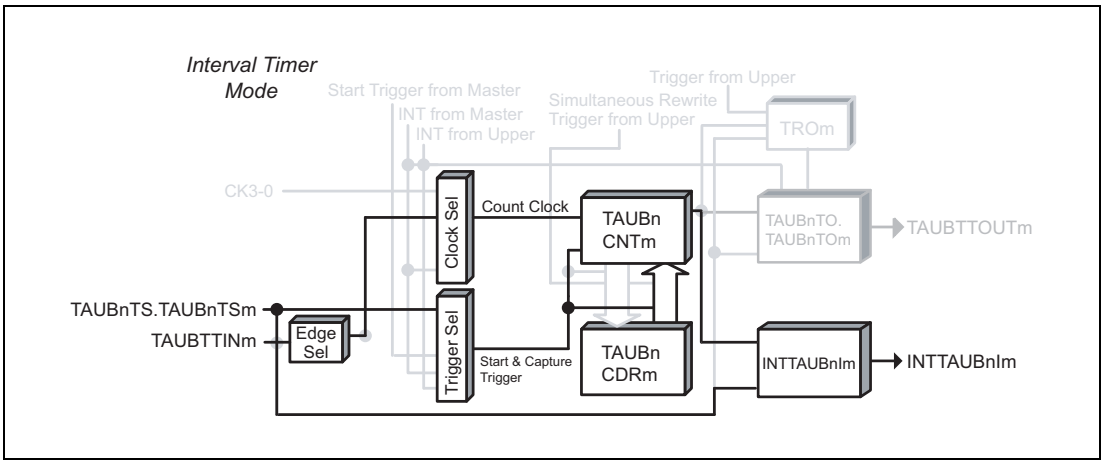

Figure 24.35 Block Diagram for Clock Divide Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

(3) Channel output mode

This function does not use channel output mode.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the Clock Divide Function. Therefore, these registers must be set to 0.

Table 24.50 Simultaneous Rewrite Settings for Clock Divide Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

24.12.3.4 Operating Procedure for Clock Divide Function

Table 24.51 Operating Procedure for Clock Divide Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.48, Contents of the TAUBnCMORm Register for Clock Divide Function** and **Table 24.49, Contents of the TAUBnCMURm Register for Clock Divide Function** Set the value of the TAUBnCDRm register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 is set to 1, INTTAUBnIm is generated.
During operation	The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at all times.	When a TAUBTTINm input edge is detected, TAUBnCNTm counts down. When the counter reaches 0000_H: • TAUBnCNTm loads the TAUBnCDRm value and continues count operation • INTTAUBnIm is generated
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

24.12.3.5 Specific Timing Diagrams

(1) TAUBnCDRm = 0000_H

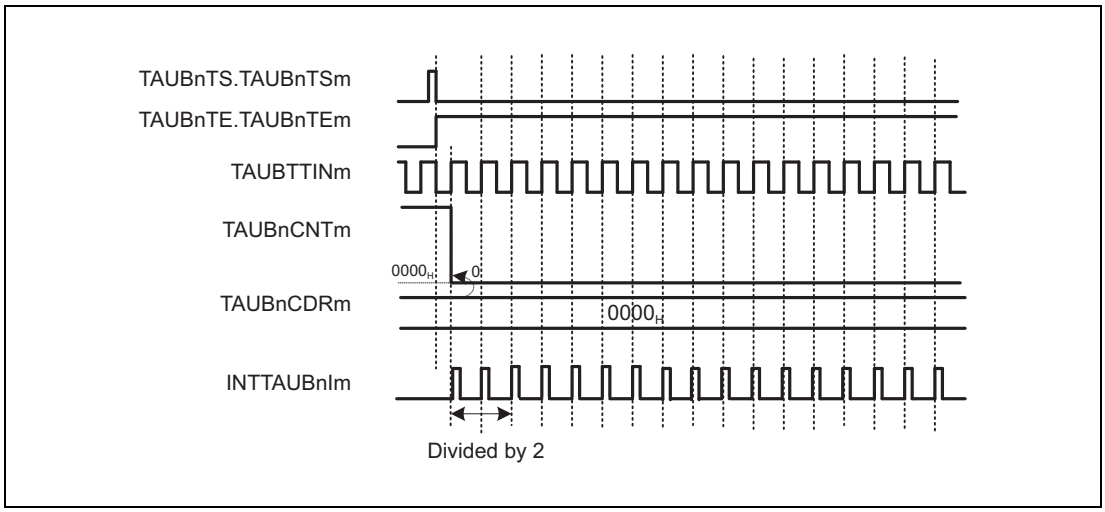

Figure 24.37 TAUBnCDRm = 0000_H, TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01_B

- If TAUBnCDRm is 0000_H, TAUBnCNTm is also always 0000_H.
- INTTAUBnIm is generated every count clock.

Figure 24.37 is an image of the operation timing. Actually, there is a delay time caused by the noise filter and the synchronization circuit between the TAUBnIm terminal and TAUBn.

(2) Operation restart

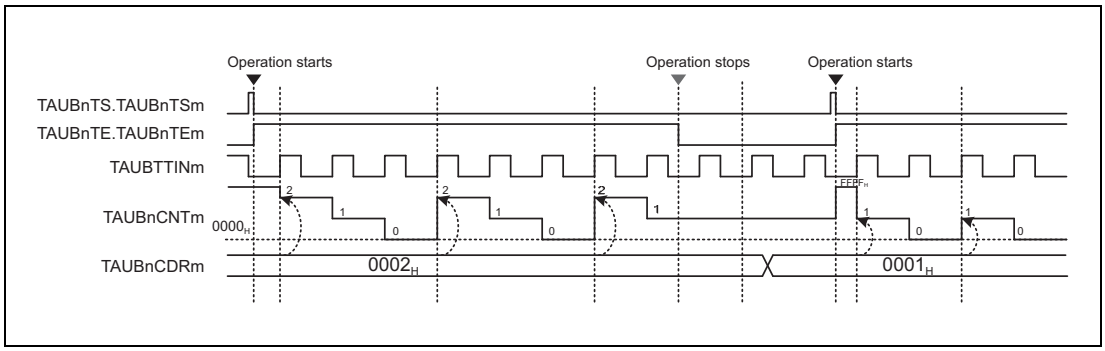

Figure 24.38 Operation Restart (TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

(3) Forced restart

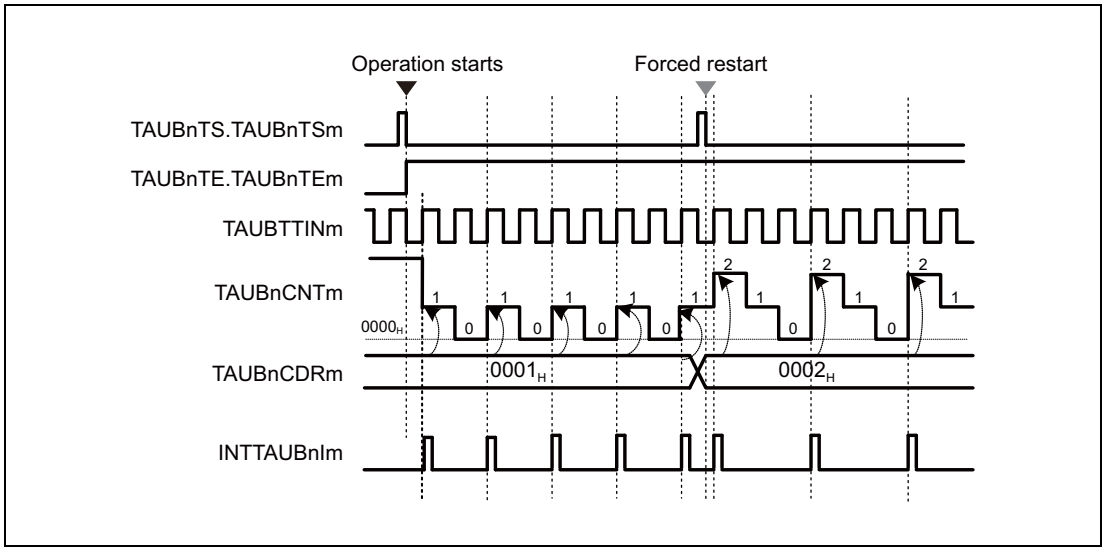

Figure 24.39 Forced Restart (TAUBnCMORm.TAUBnMD0 = 1, TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

To forcibly restart the counter.

- The counter can be forcibly restarted (without stopping it first) by setting TAUBnTS.TAUBnTSm = 1 during operation.
- The value of TAUBnCDRm is written to TAUBnCNTm and the count operation restarts.

24.12.4 External Event Count Function

24.12.4.1 Overview

Summary

This function is used as an event timer. It generates an interrupt (INTTAUBnIm) when a specific number of valid edges of TAUBTTINm input are detected.

Prerequisites

- The operation mode must be set to event count mode, see **Table 24.52, Contents of the TAUBnCMORm Register for External Event Count Function**
- TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When the counter starts, the current value of TAUBnCDRm is written to TAUBnCNTm.

When an effective TAUBTTINm input edge is detected, the value of TAUBnCNTm reduces by 1. TAUBnCNTm retains this value until a valid TAUBTTINm input edge is detected or the counter is restarted.

When effective edges are detected (TAUBnCDRm + 1) times, INTTAUBnIm is generated. TAUBnCNTm then loads the TAUBnCDRm value and subsequently continues to operate.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0. The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. The counter can also be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

24.12.4.2 Equations

Number of valid edges,
detected before INTTAUBnIm is generated = TAUBnCDRm + 1

24.12.4.3 Block Diagram and General Timing Diagram

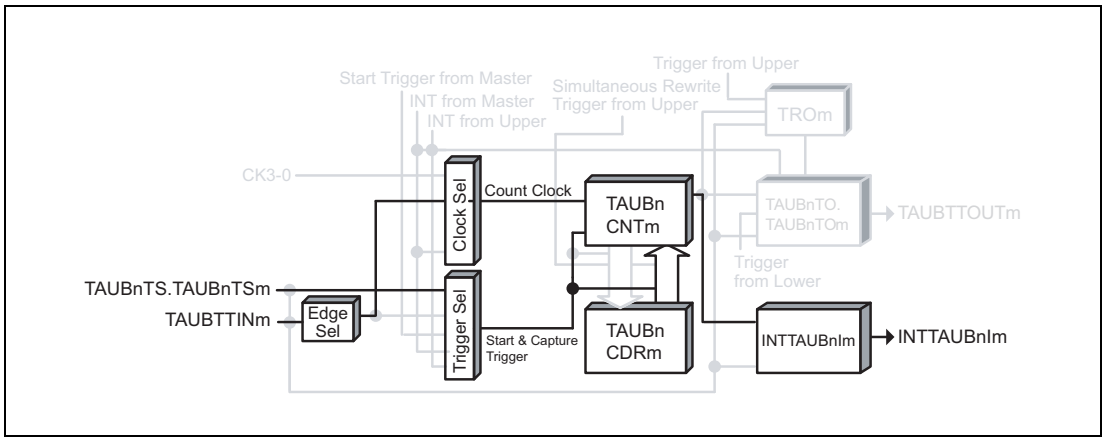

Figure 24.40 Block Diagram for External Event Count Function

The following settings apply to the general timing diagram.

- Rising edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

(3) Channel output mode

The channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the External Event Count Function.

Therefore, these registers must be set to 0.

Table 24.54 Simultaneous Rewrite Settings for External Event Count Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0

24.12.4.5 Operating Procedure for External Event Count Function

Table 24.55 Operating Procedure for External Event Count Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.52, Contents of the TAUBnCMORm Register for External Event Count Function** and **Table 24.53, Contents of the TAUBnCMURm Register for External Event Count Function** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value and waits for detection of the TAUBTTINm input edge.
During operation	Detection of TAUBTTINm edges. The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at any time.	TAUBnCNTm performs count-down operation each time a TAUBTTINm input edge is detected. When effective edges are detected (TAUBnCDRm + 1) times: • TAUBnCNTm loads the TAUBnCDRm value and continues count operation • INTTAUBnIm is generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

24.12.4.6 Specific Timing Diagrams

(1) TAUBnCDRm = 0000_H

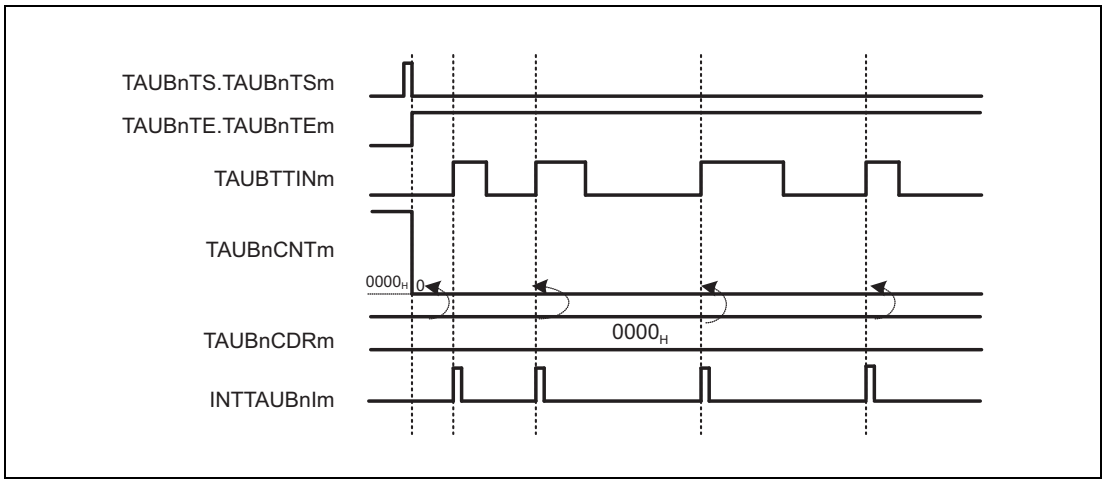

Figure 24.42 TAUBnCDRm = 0000_H, TAUBnCMURm.TAUBnTIS[1:0] = 01_B

- If 0000_H = TAUBnCDRm, 0000_H is loaded to TAUBnCNTm every time a valid TAUBTTINm input edge is detected.

  This means, INTTAUBnIm is generated every time a valid TAUBTTINm input edge is detected.

(2) Operation stop and restart

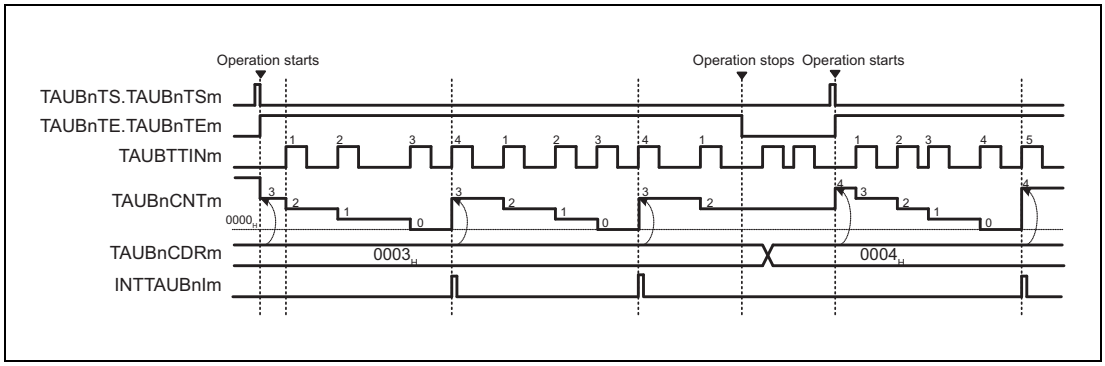

Figure 24.43 Operation Stop and Restart (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm stops and the current value is retained. TAUBTTINm continues and TAUBnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm loads the TAUBnCDRm value and restarts count operation.

(3) Forced restart

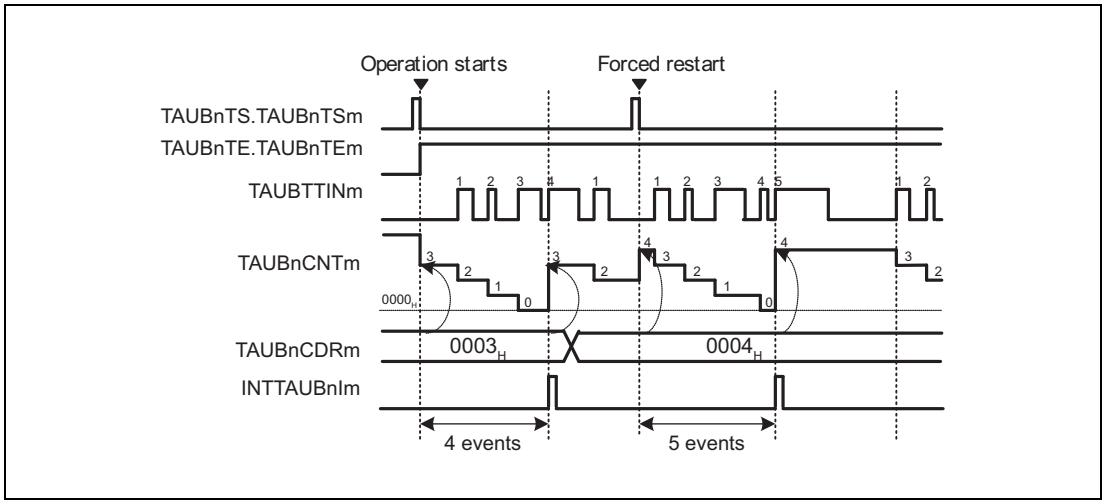

Figure 24.44 Forced Restart (TAUBnCMURm.TAUBnTIS[1:0] = 01_B)

A forced restart applies the new TAUBnCDRm value to TAUBnCNTm immediately.

- The counter can be restarted (without stopping it first), by setting TAUBnTS.TAUBnTSm to 1 during operation.
- The value of TAUBnCDRm is loaded to TAUBnCNTm and the counter awaits the next valid TAUBTTINm input edge.

24.12.5 One-Pulse Output Function

24.12.5.1 Overview

Summary

This function generates an interrupt (INTTAUBnIm) when a valid TAUBTTINm input edge is detected and subsequently, in a specific interval. TAUBTTINm input signal pulses that occur within the defined interval are ignored.

Prerequisites

- The operation mode must be set to pulse one-count mode. (See **Table 24.56, Contents of the TAUBnCMORm Register for One-Pulse Output Function**).
- Trigger detection must be disabled during counting (TAUBnCMORm.TAUBnMD0 = 0).

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input edge is detected. The value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from the TAUBnCDRm value, and an interrupt is generated.

When the counter reaches 0001_H an interrupt is generated. The counter stops at 0000_H and awaits the next effective TAUBTTINm input edge.

When the counter is counting down, further TAUBTTINm input signals are ignored, i.e. the counter does not reset.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as the trigger is specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

(3) Channel output mode

This function does not use channel output mode.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the One-Pulse Output Function.
Therefore, these registers must be set to 0.

Table 24.58 Simultaneous Rewrite Settings for One-Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

24.12.5.5 Operating Procedure for One-Pulse Output Function

Table 24.59 Operating Procedure for One-Pulse Output Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in**Table 24.56, Contents of the TAUBnCMORm Register for One-Pulse Output Function** and **Table 24.57, Contents of the TAUBnCMURm Register for One-Pulse Output Function** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value.
During operation	The value of TAUBnCDRm can be changed at any time. The TAUBnCNTm register can be read at all times.	INTTAUBnIm is generated when TAUBnCNTm starts. TAUBnCNTm counts down. When the counter reaches 0001_H, INTTAUBnIm is generated. TAUBnCNTm stops counting and waits for a trigger. If a trigger occurs while TAUBnCNTm is counting, the trigger is ignored. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

24.12.6 TAUBTTINm Input Pulse Interval Measurement Function

24.12.6.1 Overview

Summary

This function captures the count value and uses this value and the overflow bit TAUBnCSRm.TAUBnOVF to measure the interval of the TAUBTTINm input signal.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter TAUBnCNTm starts counting up from 0000_H. When a valid TAUBTTINm edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter resets to 0000_H and subsequently continues operation.

If the counter reaches $FFFF_H$ before a valid TAUBTTINm edge is detected, it overflows to 0000_H. The counter is reset to 0000_H and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

Table 24.60 Effects of an Overflow

TAUBnCMORm. TAUBnCOS[1:0]	When Overflow Occurs		When a Valid TAUBTTINm Input is then Detected	
	TAUBnCDRm	TAUBnCSRm. TAUBnOVF	TAUBnCDRm, TAUBnCNTm	TAUBnCSRm. TAUBnOVF
00	Unchanged	0	TAUBnCNTm loaded to TAUBnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUBnCNTm set to 0, TAUBnCDRm unchanged	Unchanged
11		1		

If TAUBnCMORm.TAUBnCOS[0] is 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the interval of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

The function can be stopped by setting TAUBnTT.TAUBnTTm = 1, which in turn sets TAUBnTE.TAUBnTEm = 0. TAUBnCNTm stops but retains its value. While the function is stopped, TAUBTTINm input valid edge detection and TAUBnCNTm capture are not performed.

The counter is reset to 0000_H and subsequently continues operation.

Conditions

If the TAUBnCMORm.TAUBnMD0 bit is set to 0, the interrupt at start or restart is not generated.

NOTE

When TAUBnCMORm.TAUBnCOS[1:0] = 10_B or 11_B, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

24.12.6.2 Equations

TAUBTTINm input pulse interval = count clock cycle ×

[(TAUBnCSRm.TAUBnOVF × ($FFFF_H$ + 1)) + TAUBnCDRm capture value + 1]

24.12.6.3 Block Diagram and General Timing Diagram

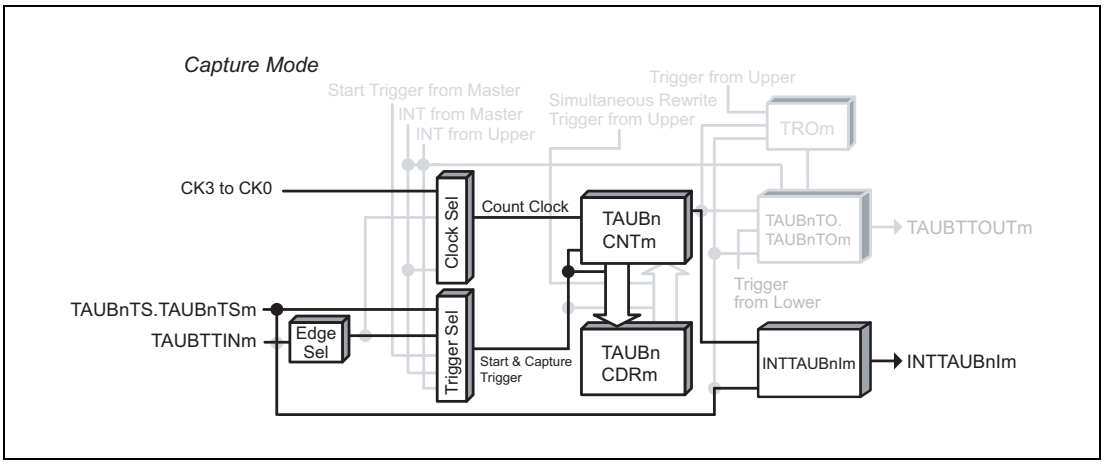

Figure 24.47 Block Diagram for TAUBTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)
- When a valid TAUBTTINm input is detected after an overflow TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] = 00_B)

1, 0	TAUBnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

(3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Pulse Interval Measurement Function. Therefore, these registers must be set to 0.

Table 24.63 Simultaneous Rewrite Settings for TAUBTTINm Input Pulse Interval Measurement Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

24.12.6.5 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

Table 24.64 Operating Procedure for TAUBTTINm Input Pulse Interval Measurement Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.61, Contents of the TAUBnCMORm Register for TAUBTTINm Input Pulse Interval Measurement Function** and **Table 24.62, Contents of the TAUBnCMURm Register for TAUBTTINm Input Pulse Interval Measurement Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm is cleared to 0000_H. INTTAUBnIm is generated when TAUBnCMORm.TAUBnMD0 is set to 1.
During operation	Detection of TAUBTTINm edges. The values of TAUBnCMURm.TAUBnTIS[1:0] bits can be changed at any time. The TAUBnCDRm and TAUBnCSRm registers can be read at any time. The TAUBnCSCm.TAUBnCLOV bit can be set to 1. (The TAUBnCSRm.TAUBnOVF bit can be cleared to 0.)	TAUBnCNTm starts to count up from 0000_H. When a TAUBTTINm valid edge is detected: • TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and returns to 0000_H • INTTAUBnIm is then generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values.

Restart operation

24.12.6.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUBnCMORm.TAUBnCOS[1:0] = 00_B

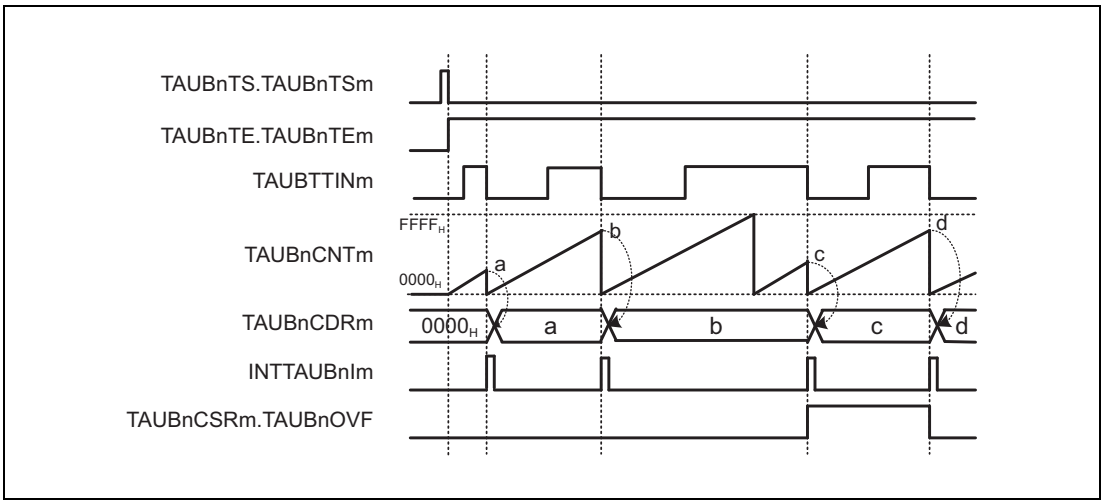

Figure 24.49 TAUBnCMORm.TAUBnCOS[1:0] = 00_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is loaded to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.

(2) TAUBnCMORm.TAUBnCOS[1:0] = 01_B

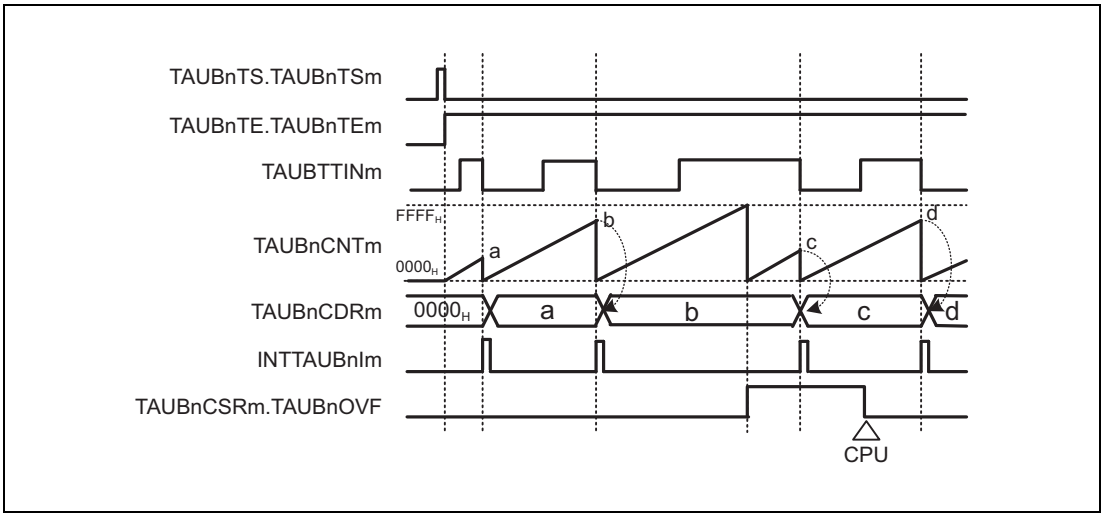

Figure 24.50 TAUBnCMORm.TAUBnCOS[1:0] = 01_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command. (TAUBnCSCm.TAUBnCLOV bit = 1)

(3) TAUBnCMORm.TAUBnCOS[1:0] = 10_B

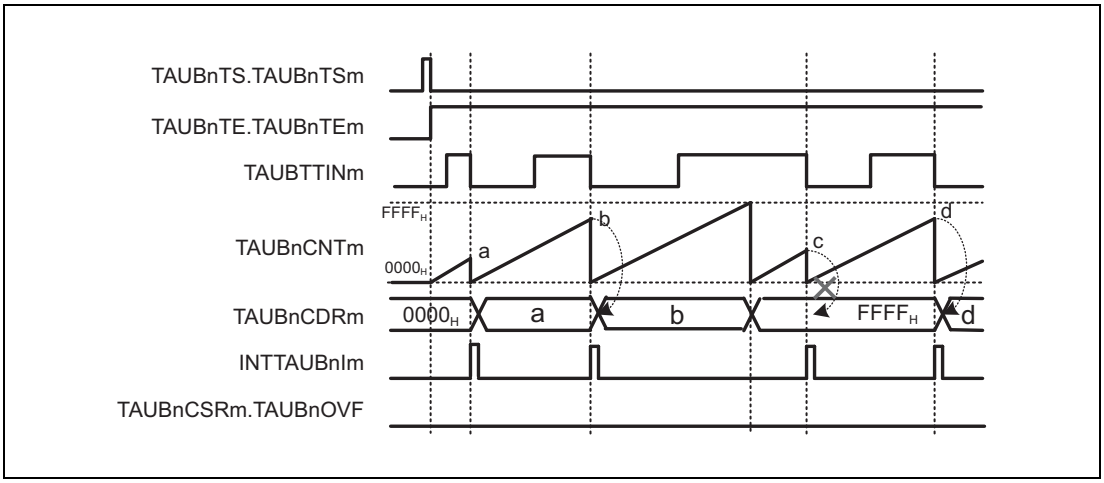

Figure 24.51 TAUBnCMORm.TAUBnCOS[1:0] = 10_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$ and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.

(4) TAUBnCMORm.TAUBnCOS[1:0] = 11_B

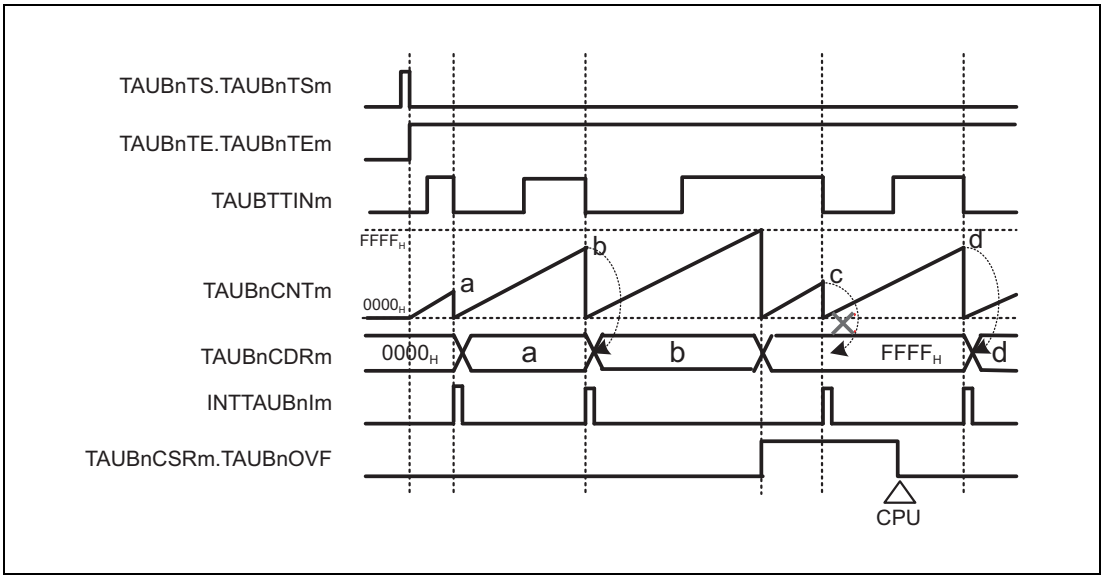

Figure 24.52 TAUBnCMORm.TAUBnCOS[1:0] = 11_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$, and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm is reset to 0, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

(5) When rising and falling edge detection are selected (TAUBnCMORm.TAUBnMD0 = 1)

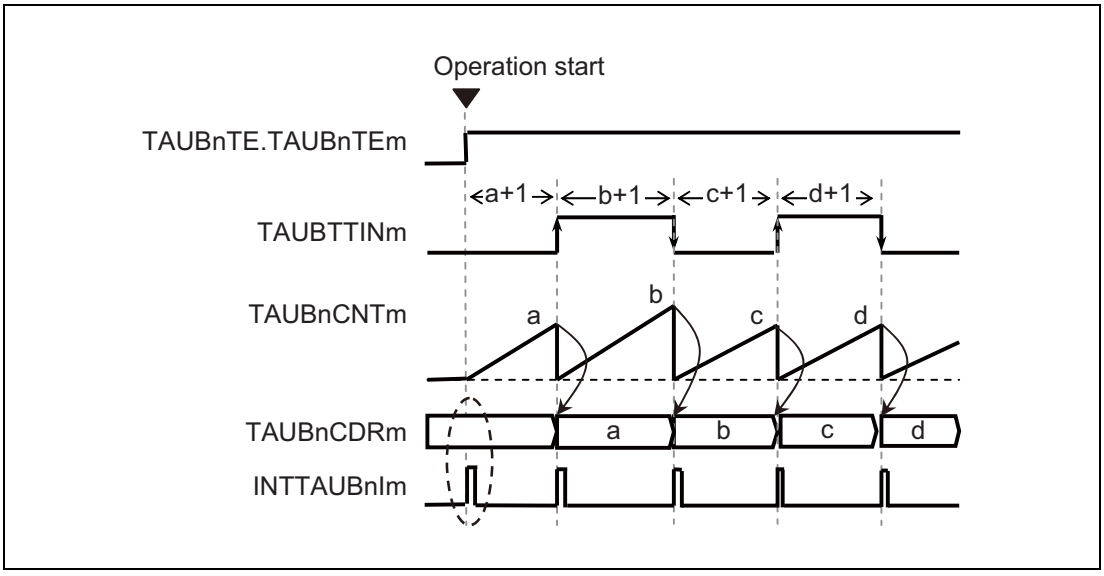

Figure 24.53 TAUBnCMORm.TAUBnMD0 = 1

Setting TAUBnCMURm.TAUBnTIS[1:0] to 10_B (detection of both edges selected) measures the TAUBTTINm rising and falling edge intervals.

(6) Operation stop and operation restart (TAUBnCMORm.TAUBnMD0 = 0)

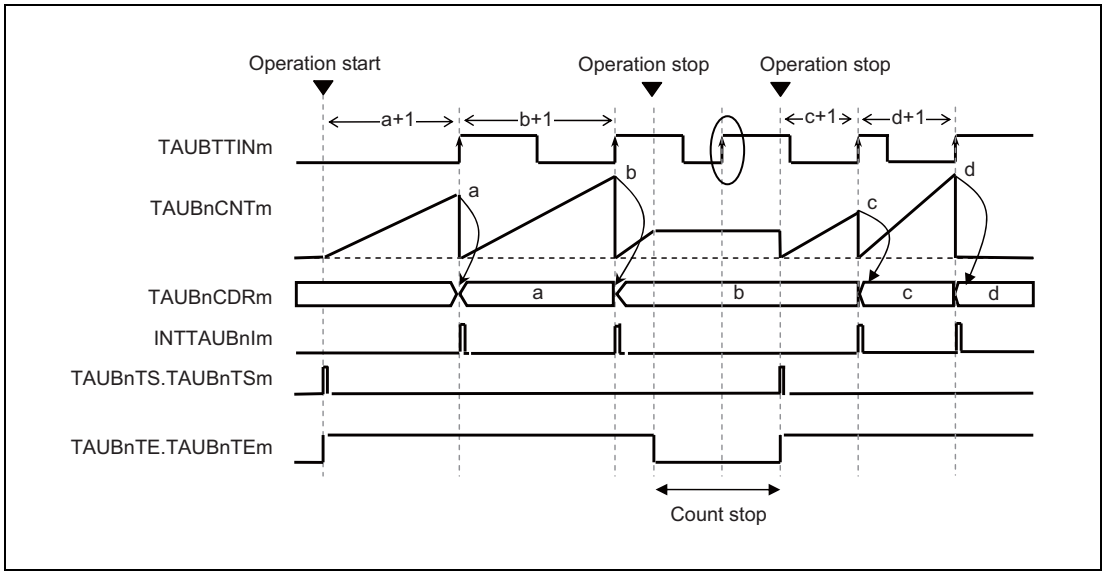

Figure 24.54 Operation Stop and Operation Restart (TAUBnCMORm.TAUBnMD0 = 0)

Setting TAUBnTT.TAUBnTTm to 1 clears TAUBnTE.TAUBnTEm to 0, which stops the count operation. At this time, TAUBnCNTm retains the status and stops.

When TAUBnTE.TAUBnTEm retains 0 (operation stopped), TAUBTTINm input is ignored (edge detection is ignored and capture operation is not performed).

Setting TAUBnTS.TAUBnTSm to 1 clears the counter to 0000_H and restarts count-up operation.

24.12.7 TAUBTTINm Input Signal Width Measurement Function

24.12.7.1 Overview

Summary

This function measures the width of a TAUBTTINm signal by starting counting on one edge of the TAUBTTINm signal and capturing the counter value on the opposite edge.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm start edge is detected, the counter TAUBnCNTm starts counting up from 0000_H. When a valid TAUBTTINm stop edge is detected, the value of TAUBnCNTm is captured, transferred to TAUBnCDRm, and an interrupt INTTAUBnIm is generated. The counter retains its value (TAUBnCDRm + 1) and awaits the next valid TAUBTTINm input start edge.

If the counter reaches $FFFF_H$ before a valid TAUBTTINm stop edge is detected, it overflows. The counter is reset to 0000_H and subsequently continues operation. The values transferred to TAUBnCDRm and TAUBnCSRm.TAUBnOVF respectively depend on the values of bits TAUBnCMORm.TAUBnCOS[1:0].

Table 24.65 Effects of an Overflow

TAUBnCMORm.TAUBnCOS[1:0]	When Overflow Occurs		When a Valid TAUBTTINm Input Stop Edge is Detected	
	TAUBnCDRm	TAUBnCSRm.TAUBnOVF	TAUBnCDRm, TAUBnCNTm	TAUBnCSRm.TAUBnOVF
00	Unchanged	0	TAUBnCNTm written to TAUBnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUBnCNTm stops counting TAUBnCDRm unchanged	Unchanged
11		1		

If TAUBnCMORm.TAUBnCOS[0] = 1, the overflow bit TAUBnCSRm.TAUBnOVF can only be cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

The combination of the value of TAUBnCDRm and TAUBnCSRm.TAUBnOVF can be used to deduce the width of the TAUBTTINm signal. However, if an overflow occurs multiple times before a valid TAUBTTINm input is detected, the overflow bit TAUBnCSRm.TAUBnOVF cannot indicate this.

This function cannot be forcibly restarted.

NOTE

When TAUBnCMORm.TAUBnCOS[1] = 1, the value of TAUBnCNTm is not written to TAUBnCDRm when the first valid TAUBTTINm input edge occurs after an overflow. However, an interrupt is generated.

24.12.7.2 Equations

TAUBTTINm input signal width = count clock cycle ×

[(TAUBnCSRm.OVF × ($FFFF_H$ + 1)) + TAUBnCDRm capture value + 1]

24.12.7.3 Block Diagram and General Timing Diagram

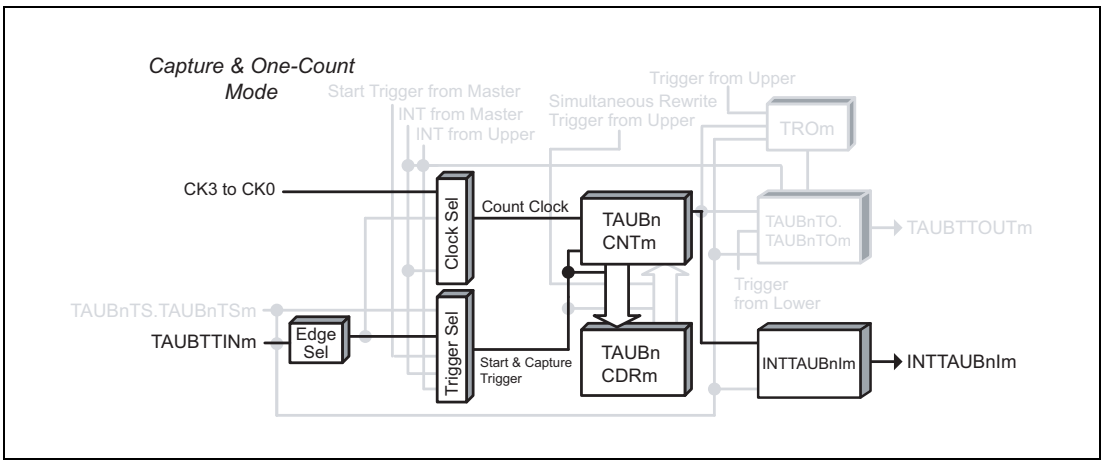

Figure 24.55 Block Diagram for TAUBTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)
- When a valid TAUBTTINm input is detected after an overflow, TAUBnCDRm is changed and TAUBnCSRm.TAUBnOVF is set to 1 (TAUBnCMORm.TAUBnCOS[1:0] = 00_B)

(3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, and TAUBnRDC) cannot be used with the TAUBTTINm Input Signal Width Measurement Function. Therefore, these registers must be set to 0.

Table 24.68 Simultaneous Rewrite Settings for TAUBTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

24.12.7.5 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

Table 24.69 Operating Procedure for TAUBTTINm Input Signal Width Measurement Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.66, Contents of the TAUBnCMORm Register for TAUBTTINm Input Signal Width Measurement Function** and **Table 24.67, Contents of the TAUBnCMURm Register for TAUBTTINm Input Signal Width Measurement Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When a TAUBTTINm start edge is detected, TAUBnCNTm start edge to count up.
During operation	The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time. TAUBnCSCm.TAUBnCLOV bit can be set to 1.	TAUBnCNTm starts to count up from 0000_H. When a TAUBTTINm valid edge is detected: • TAUBnCNTm transfers (captures) its value to TAUBnCDRm, and retains its value • INTTAUBnIm is then generated. • The count stops at the value transferred to TAUBnCDRm + 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TEm is cleared to 0 and the counter stops. TAUBnCNTm stops and both it and TAUBnCSRm.TAUBnOVF retain their current values.

Restart operation

24.12.7.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUBnCMORm.TAUBnCOS[1:0] = 00_B

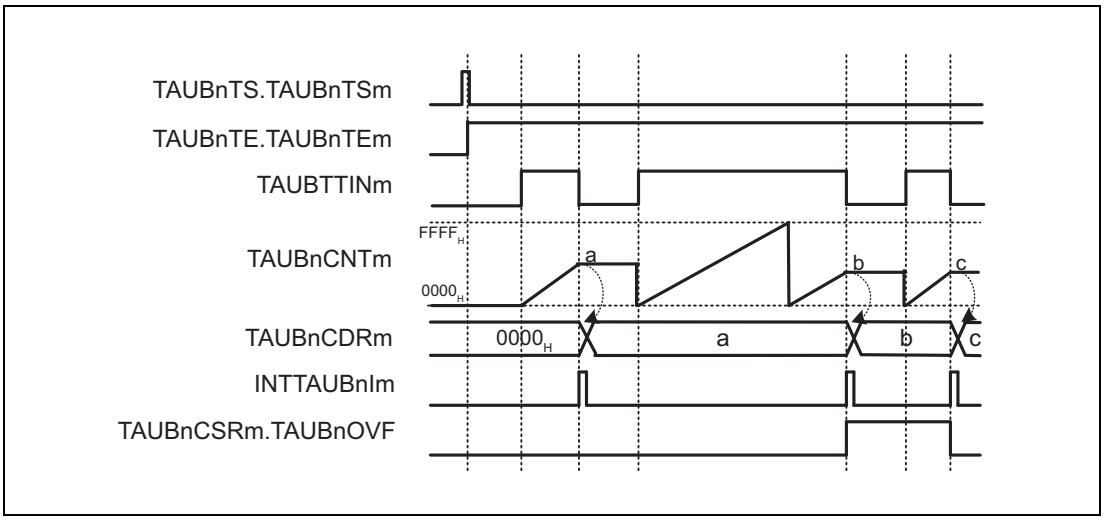

Figure 24.57 TAUBnCMORm.TAUBnCOS[1:0] = 00_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, while any overflow has not occurred, TAUBnCSRm.TAUBnOVF is cleared to 0.

(2) TAUBnCMORm.TAUBnCOS[1:0] = 01_B

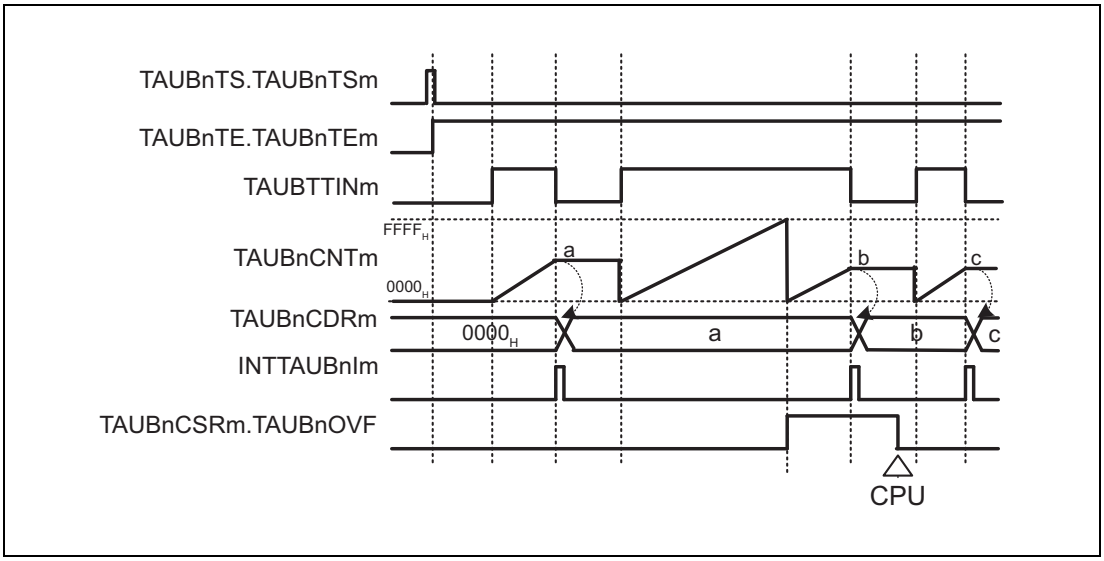

Figure 24.58 TAUBnCMORm.TAUBnCOS[1:0] = 01_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUBnCDRm remains unchanged and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, the value of TAUBnCNTm is written to TAUBnCDRm.
- TAUBnCSRm.TAUBnOVF is only cleared by a CPU command (The TAUBnCSCm.TAUBnCLOV bit = 1).

(3) TAUBnCMORm.TAUBnCOS[1:0] = 10_B

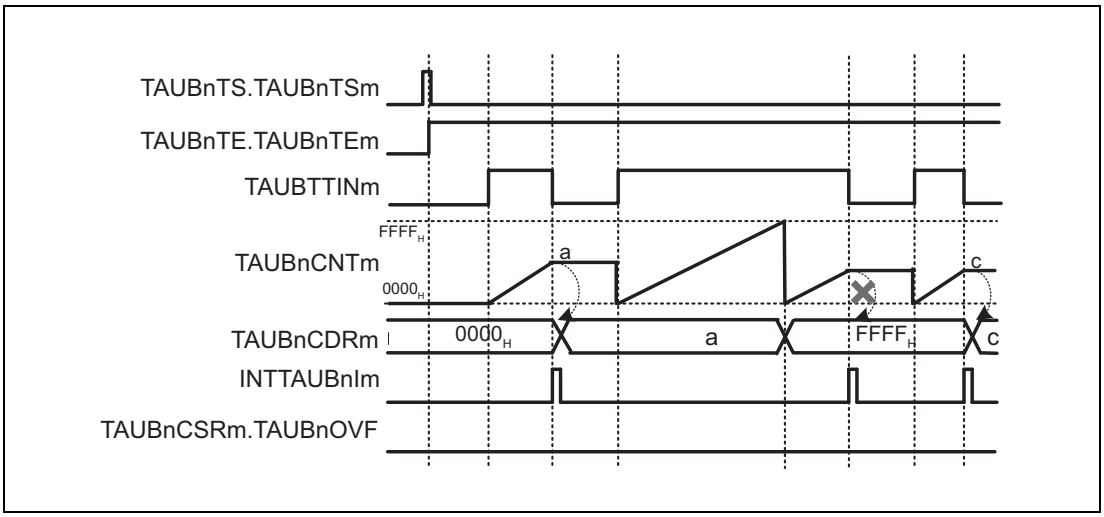

Figure 24.59 TAUBnCMORm.TAUBnCOS[1:0] = 10_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$ and TAUBnCSRm.TAUBnOVF remains 0.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.

(4) TAUBnCMORm.TAUBnCOS[1:0] = 11_B

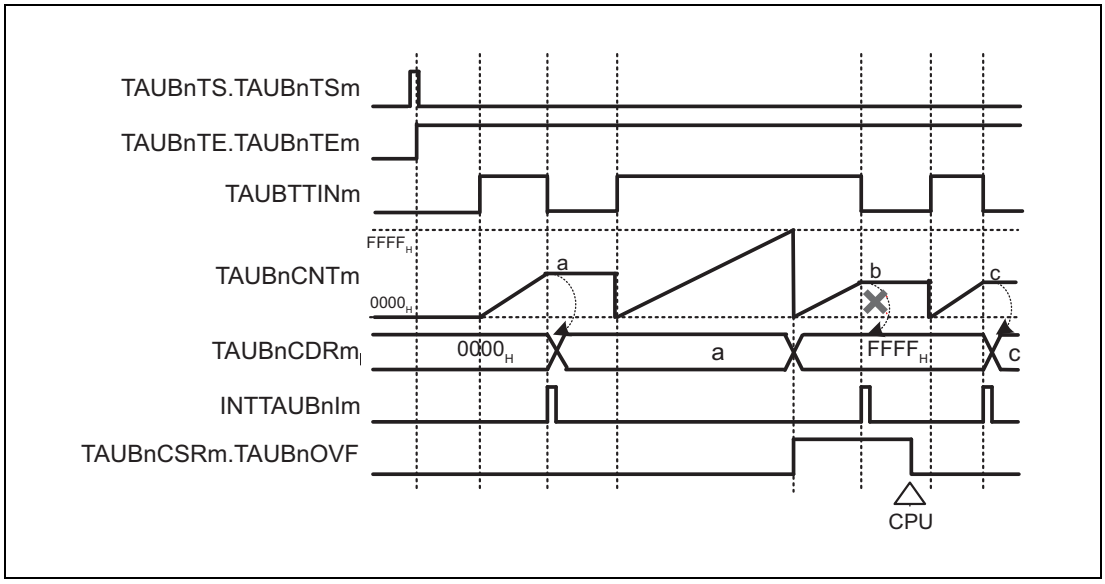

Figure 24.60 TAUBnCMORm.TAUBnCOS[1:0] = 11_B, TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 11_B

- When an overflow occurs, TAUBnCDRm is set to $FFFF_H$, and TAUBnCSRm.TAUBnOVF is set to 1.
- Upon detection of the next valid TAUBTTINm input edge, TAUBnCNTm stops counting, but TAUBnCDRm and TAUBnCSRm.TAUBnOVF remain unchanged.
- Thus, the next TAUBTTINm input valid edge after the overflow is ignored.
- TAUBnCSRm.TAUBnOVF is cleared by setting TAUBnCSCm.TAUBnCLOV = 1.

(5) When an overflow occurs (high width measurement)

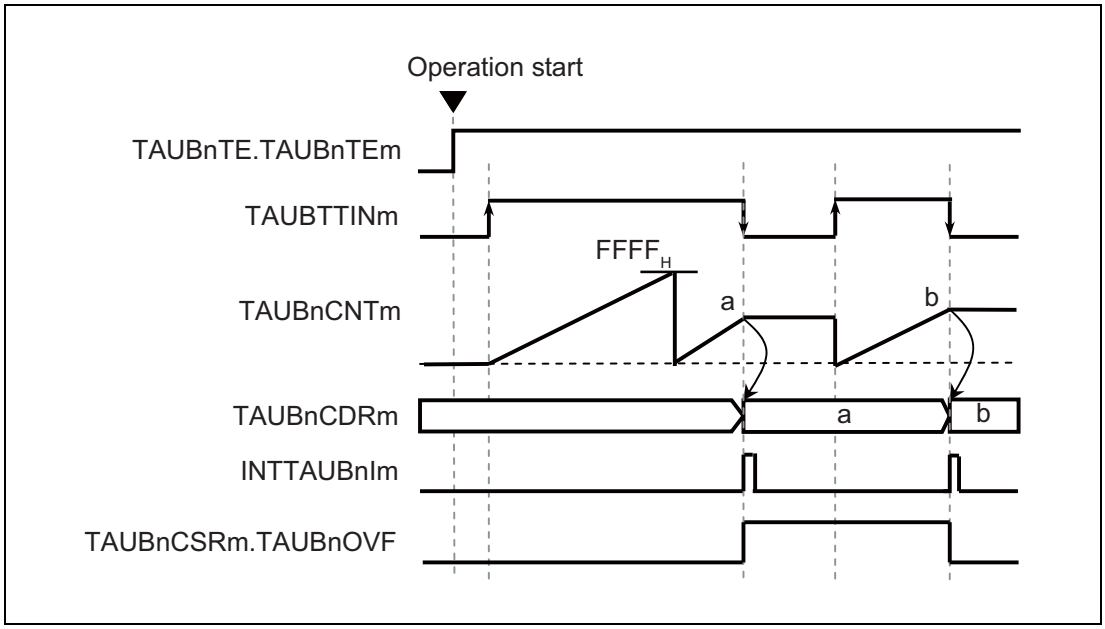

Figure 24.61 When an Overflow Occurs

When a capture trigger is input after the counter value has overflowed, the counter value is transferred to TAUBnCDRm and at the same time TAUBnCSRm.TAUBnOVF is set to 1.

TAUBnCSRm.TAUBnOVF is kept at 1 until the next capture trigger occurs.

If the next capture trigger is not accompanied by an overflow, TAUBnCSRm.TAUBnOVF is cleared to 0.

TAUBTTINm input signal width (example when TAUBnCSRm.TAUBnOVF is 1 and TAUBnCDRm is a)
= count clock cycle × ((10000_H × TAUBnCSRm.TAUBnOVF) + (TAUBnCDRm capture value + 1))
= count clock cycle × ((10000_H × 1) + (a+1))
= count clock cycle × (10000_H + a+1)

24.12.8 TAUBTTINm Input Position Detection Function

24.12.8.1 Overview

Summary

This function measures the interval of input signals by capturing the counter value on a valid edge of the TAUBTTINm signal.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter starts to count from 0000_H. When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The count operation continues.

When the counter reaches $FFFF_H$, the counter restarts from 0000_H.

NOTE

The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits. As a result, the output cycle of TAUBTTOUTm has an error of ± 1 operation clock cycle.

Conditions

If the TAUBnCMORm.MD0 bit is set to 0, the first interrupt after a start or restart is not generated.

24.12.8.2 Equations

Function duration at a TAUBTTINm input pulse =

count clock cycle × (TAUBnCDRm capture value + 1)

24.12.8.3 Block Diagram and General Timing Diagram

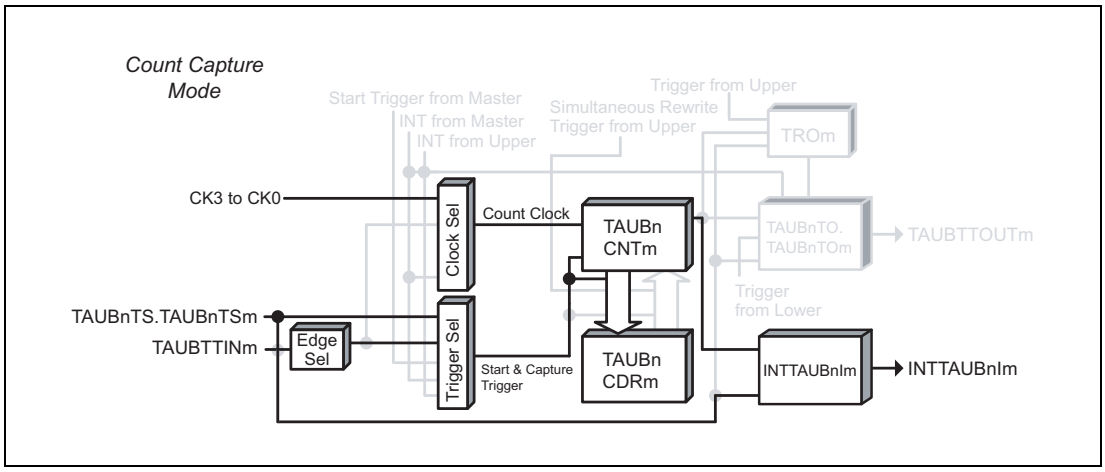

Figure 24.62 Block Diagram for TAUBTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

(3) Channel output mode

The channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Position Detection Function. Therefore, these registers must be set to 0.

Table 24.72 Simultaneous Rewrite Settings for TAUBTTINm Input Position Detection Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0

TAUBnRDC.TAUBnRDCm	

24.12.8.5 Operating Procedure for TAUBTTINm Input Position Detection Function

Table 24.73 Operating Procedure for TAUBTTINm Input Position Detection Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.70, Contents of the TAUBnCMORm Register for TAUBTTINm Input Position Detection Function** and **Table 24.71, Contents of the TAUBnCMURm Register for TAUBTTINm Input Position Detection Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. INTTAUBnIm is generated when TAUBnCMORm.TAUBnMD0 is set to 1.
During operation	The values of TAUBnCMURm.TAUBnTIS[1:0] bits can be changed at any time. The TAUBnCDRm and TAUBnCSRm registers can be read at any time.	TAUBnCNTm starts to count up from 0000_H. When a TAUBTTINm valid edge is detected: • TAUBnCNTm transfers (captures) its value to TAUBnCDRm • INTTAUBnIm is output. • The counter value is not cleared to 0000_H and TAUBnCNTm continues count operation. Afterwards, this procedure is repeated. If TAUBnCNTm reaches $FFFF_H$, the counter restarts from 0000_H.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

24.12.8.6 Specific Timing Diagrams

(1) Operation stop and restart

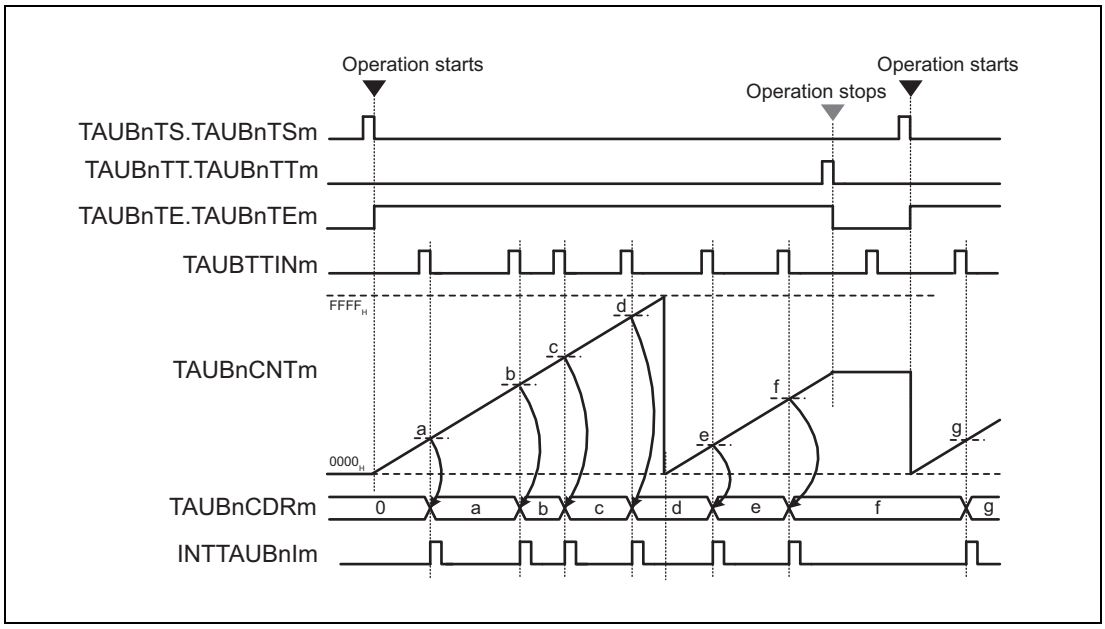

Figure 24.64 Operation Stop and Restart (TAUBnCMORm.TAUBnMD0 = 0, TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TEm to 0.
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from 0000_H.

24.12.9 TAUBTTINm Input Period Count Detection Function

24.12.9.1 Overview

Summary

This function measures the cumulative width of a TAUBTTINm input signal.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.

This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The counter awaits a valid TAUBTTINm input edge.

When a valid TAUBTTINm input start edge is detected, the counter starts to count from 0000_H.

When a valid TAUBTTINm input stop edge is detected, the current TAUBnCNTm value is written to TAUBnCDRm and an interrupt (INTTAUBnIm) is generated. The counter stops and retains its value (TAUBnCDRm + 1) until the next valid TAUBTTINm input start edge is detected.

When a next valid TAUBTTINm input start edge is detected, the counter restarts from the value retained while stopping.

If the counter reaches $FFFF_H$, the counter restarts from 0000_H.

NOTES

1. The TAUBTTINm input signal is sampled at the frequency of the operation clock, specified by the TAUBnCMORm.TAUBnCKS[1:0] bits.
2. As this function is to measure the TAUBTTINm input signal width, setting TAUBnTS.TAUBnTSm to 1 is disabled while TAUBnTE.TAUBnTEm = 1.

Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11_B, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

24.12.9.2 Equations

Cumulative TAUBTTINm input width =

count clock cycle × (TAUBnCDRm capture value + 1)

24.12.9.3 Block Diagram and General Timing Diagram

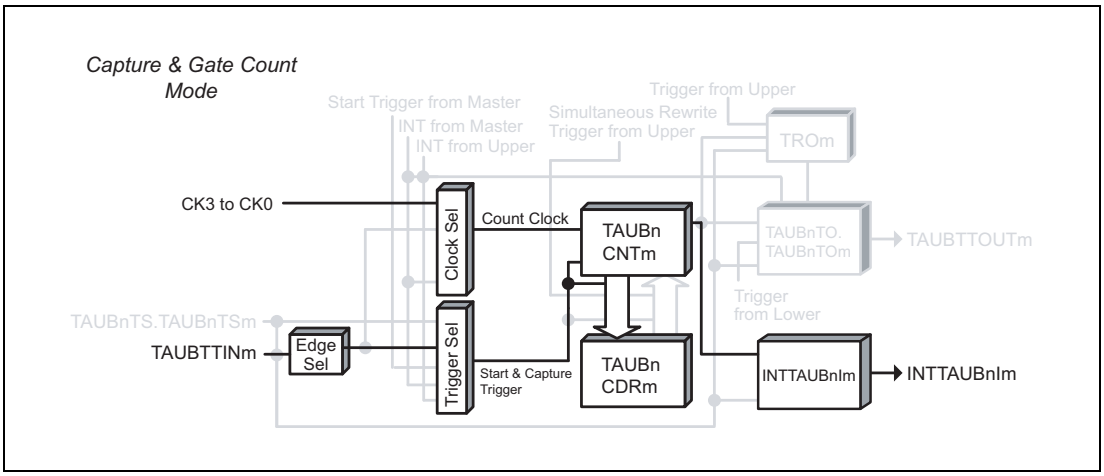

Figure 24.65 Block Diagram for TAUBTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

1, 0	TAUBnTIS[1:0]	10: Rising and falling edge detection (Low width measurement) 11: Rising and falling edge detection (High width measurement)

(3) Channel output mode

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUBnRDE, TAUBnRDS, TAUBnRDM, TAUBnRDC) cannot be used with the TAUBTTINm Input Period Count Detection Function. Therefore, these registers must be set to 0.

Table 24.76 Simultaneous Rewrite Settings for TAUBTTINm Input Period Count Detection Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	0: Disables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: When simultaneous rewrite is disabled (TAUBnRDE.TAUBnRDEm = 0), set these bits to 0
TAUBnRDM.TAUBnRDMm	
TAUBnRDC.TAUBnRDCm	

24.12.9.5 Operating Procedure for TAUBTTINm Input Period Count Detection Function

Table 24.77 Operating Procedure for TAUBTTINm Input Period Count Detection Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.74, Contents of the TAUBnCMORm Register for TAUBTTINm Input Period Count Detection Function** and **Table 24.75, Contents of the TAUBnCMURm Register for the TAUBTTINm Input Period Count Detection Function** The TAUBnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.
During operation	Detection of TAUBTTINm edges. The TAUBnCDRm, TAUBnCNTm, and TAUBnCSRm registers can be read at any time.	When a TAUBTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUBnCNTm starts to count up from the stop value. When TAUBnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUBnCDRm and INTTAUBnIm is generated. Counting stops at the “value transferred to TAUBnCDRm + 1” value and TAUBnCNTm waits for detection of the TAUBTTINm start edge. When TAUBnCNTm reaches $FFFF_H$, the counter restarts from 0000_H. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

24.12.9.6 Specific Timing Diagrams

(1) Operation stop and restart

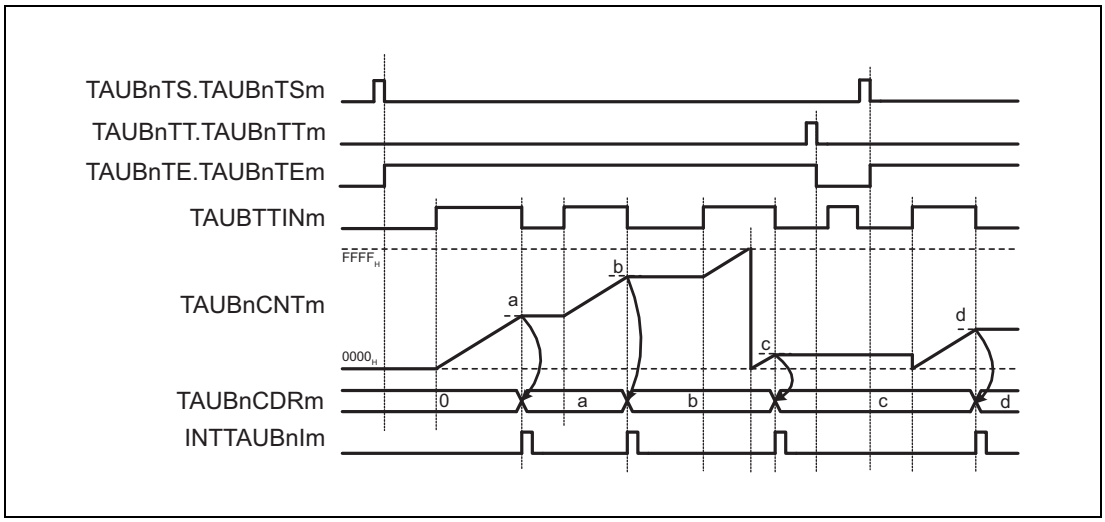

Figure 24.67 Operation Stop and Restart (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUBTTINm input edges are ignored.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm to 1. TAUBnCNTm restarts to count from 0000_H.

24.12.10 TAUBTTINm Input Pulse Interval Judgment Function

24.12.10.1 Overview

Summary

This function outputs the result of a comparison between the count value (TAUBnCNTm) and the value in the channel data register (TAUBnCDRm) when a TAUBTTINm input pulse occurs. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1.
This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid edge is detected or TAUBnTS.TAUBnTSm is set to 1, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. TAUBnCNTm reloads the value of TAUBnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches 0000_H before a TAUBTTINm valid edge is detected, TAUBnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

Conditions

The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:

- If TAUBnCMORm.TAUBnMD0 = 0, INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm.
- If TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated when TAUBnCNTm > TAUBnCDRm.

24.12.10.4 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function

Table 24.81 Operating Procedure for TAUBTTINm Input Pulse Interval Judgment Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.78, Contents of the TAUBnCMORm Register for TAUBTTINm Input Pulse Interval Judgment Function** and **Table 24.79, Contents of the TAUBnCMURm Register for TAUBTTINm Input Pulse Interval Judgment Function** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value.
During operation	The following register can be changed at any time: • TAUBnCDRm register	When TAUBnCMORm.TAUBnMD0 = 0 If TAUBnCNTm ≤ TAUBnCDRm when a TAUBTTINm input edge is detected, INTTAUBnIm is generated. When TAUBnCMORm.TAUBnMD0 = 1 If TAUBnCNTm > TAUBnCDRm when a TAUBTTINm input edge is detected, INTTAUBnIm is generated. If a TAUBTTINm input edge is detected, then TAUBnCNTm starts to count down from the value of TAUBnCDRm. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

24.12.11 TAUBTTINm Input Signal Width Judgment Function

24.12.11.1 Overview

Summary

This function compares the count value (TAUBnCNTm) for the high or low level width of a TAUBTTINm input signal and the TAUBnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUBnIm.

Prerequisites

TAUBTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. When a valid TAUBTTINm input start edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value.

When a TAUBTTINm valid stop edge is detected, the function compares the current values of TAUBnCNTm and TAUBnCDRm. An interrupt request signal INTTAUBnIm is generated if the result of the comparison is true. The counter TAUBnCNTm retains its value until the next TAUBTTINm valid start edge is detected, regardless of the result of the comparison.

If the counter reaches 0000_H before a valid TAUBTTINm stop edge is detected, TAUBnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUBnCDRm can be rewritten at any time, and the changed value of TAUBnCDRm is applied the next time the function starts to count down.

Conditions

- The TAUBnCMORm.TAUBnMD0 bit specifies the type of comparison:
  - If TAUBnCMORm.TAUBnMD0 = 0, INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm.
  - If TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated when TAUBnCNTm > TAUBnCDRm.
- The TAUBnCMURm.TAUBnTIS[1:0] bits specify the type of width measurement:
  - For high width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = 11_B) the start edge is a rising TAUBTTINm edge and the stop edge is a falling TAUBTTINm edge.
  - For low width measurement, (TAUBnCMURm.TAUBnTIS[1:0] = 10_B) the start edge is a falling TAUBTTINm edge and the stop edge is a rising TAUBTTINm edge.
- Forced restart is not possible for this function.

24.12.11.2 Block Diagram and General Timing Diagram

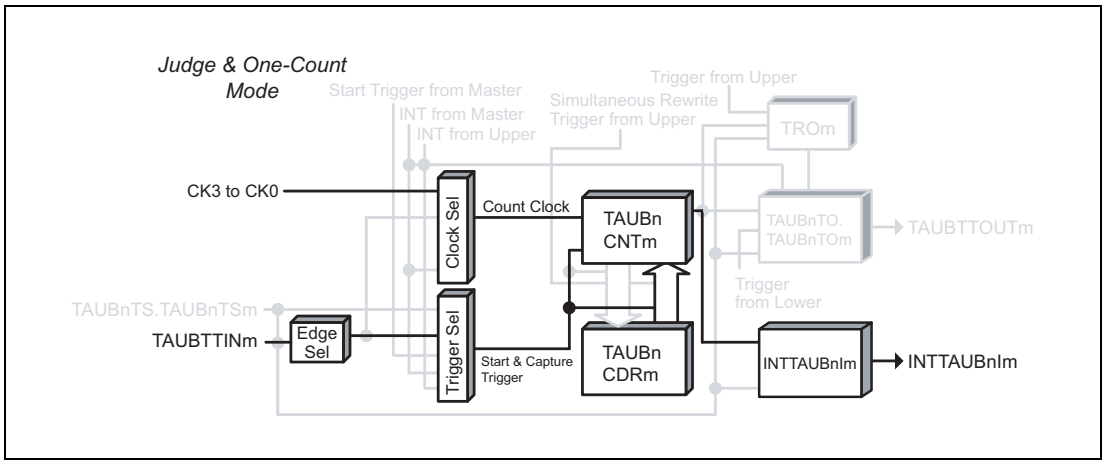

Figure 24.70 Block Diagram for TAUBTTINm Input Signal Width Judgment Function

The following settings apply to the general timing diagram.

- INTTAUBnIm is generated when TAUBnCNTm ≤ TAUBnCDRm (TAUBnCMORm.TAUBnMD0 = 0)
- TAUBTTINm valid start edge = rising edge, TAUBTTINm valid stop edge = falling edge (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

24.12.11.4 Operating Procedure for TAUBTTINm Input Signal Width Judgment Function

Table 24.85 Operating Procedure for TAUBTTINm Input Signal Width Judgment Function

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.82, Contents of the TAUBnCMORm Register for TAUBTTINm Input Signal Width Judgment Function** and **Table 24.83, Contents of the TAUBnCMURm Register for TAUBTTINm Input Signal Width Judgment Function** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the TAUBTTINm start edge.
During operation	The following register can be changed at any time: • TAUBnCDRm register	If a TAUBTTINm start edge is detected, then TAUBnCNTm starts to count down from the value of TAUBnCDRm. When TAUBnCMORm.TAUBnMD0 = 0 If TAUBnCNTm ≤ TAUBnCDRm when a TAUBTTINm input stop edge is detected, INTTAUBnIm is generated. When TAUBnCMORm.TAUBnMD0 = 1 If TAUBnCNTm > TAUBnCDRm when a TAUBTTINm input stop edge is detected, INTTAUBnIm is generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

24.12.12 Overflow Interrupt Output Function (during TAUBTINm Width Measurement)

24.12.12.1 Overview

Summary

This function measures the width of an individual TAUBTTINm input signal. An interrupt is generated if the TAUBTTINm input width is longer than $FFFF_H + 1$.

Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to $FFFF_H$.

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. $FFFF_H$ is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUBTTINm input start edge is detected, TAUBnCNTm loads $FFFF_H$ and starts to count down.

If the counter reaches 0000_H before a stop edge is detected, an interrupt is generated.

Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, the TAUBTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11_B, the TAUBTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

24.12.12.2 Block Diagram and General Timing Diagram

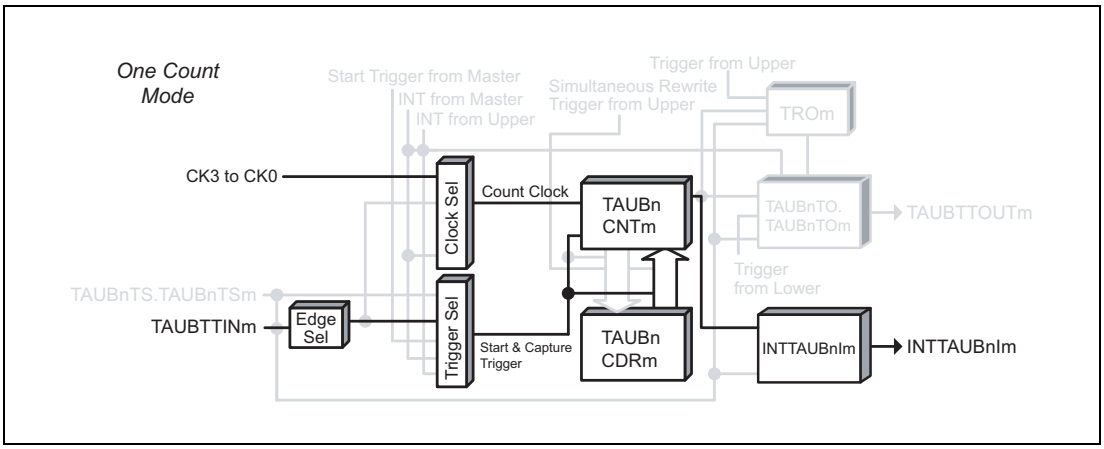

Figure 24.72 Block Diagram for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUBnCMURm.TAUBnTIS[1:0] = 11_B)

Table 24.89 Operating Procedure for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers as described in **Table 24.86, Contents of the TAUBnCMORm Register for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)** and **Table 24.87, Contents of the TAUBnCMURm Register for Overflow Interrupt Output Function (during TAUBTTINm Width Measurement)** Set the value of the TAUBnCDRm register to $FFFF_H$.	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1 and TAUBnCNTm waits for detection of the start edge. When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value ($FFFF_H$).
During operation	The TAUBnCNTm register can be read at any time.	TAUBnCNTm counts down. When the counter reaches 0000_H: • INTTAUBnIm is generated When a TAUBTTINm input stop edge is detected during count operation: • TAUBnCNTm stops and retains its current value. When a TAUBTTINm input start edge is detected while the counter is stopped: • The TAUBnCDRm value ($FFFF_H$) is loaded to TAUBnCNTm again and the counter starts to count down. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

24.12.13 Overflow Interrupt Output Function (during TAUBTTINm Input Period Count Detection)

24.12.13.1 Overview

Summary

This function measures the cumulative width of a TAUBTTINm input signal. An interrupt is generated and an overflow interrupt can be output if the cumulative TAUBTTINm input width is longer than $FFFF_H$.

Prerequisites

- TAUBTTOUTm is not used for this function
- The value of TAUBnCDRm must be set to $FFFF_H$

Description

The counter is enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

The counter starts when a valid TAUBTTINm input start edge is detected. $FFFF_H$ is written to TAUBnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUBTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000_H an interrupt is generated. $FFFF_H$ is written to TAUBnCNTm and the counter continues to count down until a TAUBTTINm input stop edge is detected.

Conditions

The valid start and stop edges are specified by the TAUBnCMURm.TAUBnTIS[1:0] bits.

- If TAUBnCMURm.TAUBnTIS[1:0] = 10_B, the TAUBTTINm input low width is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUBnCMURm.TAUBnTIS[1:0] = 11_B, the TAUBTTINm input high width is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1 TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUBTTINm start edge	TAUBnTE.TAUBnTEm is set to 1. TAUBnCNTm waits for detection of the start edge. When a start edge is detected, TAUBnCNTm loads the TAUBnCDRm value ($FFFF_H$).
During operation	The TAUBnCNTm register can be read at all times.	TAUBnCNTm counts down. When the counter reaches 0000_H: • INTTAUBnIm is generated • TAUBnCNTm reloads the TAUBnCDRm value ($FFFF_H$) and continues count operation When a TAUBTTINm input stop edge is detected during count operation: • TAUBnCNTm stops and retains its current value. When a TAUBTTINm input start edge is detected while the counter is stopped: • TAUBnCNTm starts to count down from the stop value. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

24.13 Independent Channel Simultaneous Rewrite Functions

The following describes functions that carry out simultaneous rewrite:

24.13.1 Simultaneous Rewrite Trigger Generation Function Type 1

24.13.1.1 Overview

Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals. The upper channel is for generating the simultaneous rewrite trigger (TAUBnRDC.TAUBnRDCm = 1), and the lower channels are for conducting simultaneous rewrite when triggered from the upper channel (TAUBnRDC.TAUBnRDCm = 0).

Prerequisites

- Two (or more) channels that are lower than the channel used as the upper channel, each with simultaneous rewrite enabled (TAUBnRDE.TAUBnRDEm = 1)
- The operation mode of the upper channel must be set to interval timer mode, see **Table 24.94, Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1.**
- For the operation modes that can be set to the lower channels, see **Table 24.37, Channel Functions and the Methods They Use for Simultaneous Rewrite.**
- In this function, TAUBTTOUTm is not used for all the channels.

Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) of the upper and lower channel(s) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of the data register buffer of the upper channel (TAUBnCDRm buf) is written to the counter (TAUBnCNTm) and the counter starts to count down from this value.
The counter(s) of the lower channel(s) start to count as specified by their selected operating modes.

When a counter reaches 0000_H, an interrupt is generated from the channel.
The corresponding TAUBnCNTm then reloads the current TAUBnCDRm buffer value and subsequently continues operation.

If the channel where the interrupt occurs is specified as the trigger channel for simultaneous rewrite (TAUBnRDC.TAUBnRDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUBnRSF.TAUBnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

Condition

- The channel which is monitored for INTTAUBnIm is specified by setting TAUBnRDC.TAUBnRDCm = 1 for the corresponding channel. The TAUBnRDC.TAUBnRDCm bit must be 0 for all other channels in which simultaneous rewrite should take place.

24.13.1.2 Equations

Simultaneous rewrite trigger generation cycle = count clock cycle × (TAUBnCDRm + 1)

To control simultaneous rewrite, the following condition must be satisfied:

[For PWM]

TAUBnCDRm = [(value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1) × number of interrupts] – 1

[For triangle PWM]

TAUBnCDRm = [(value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1) × 2 × number of interrupts] – 1

That is, the ratio of TAUBnCDRm + 1 and value of TAUBnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

Note that the cycle for the triangle PWM is twice the cycle for the PWM

1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the upper channel

Set TAUBnTOE.TAUBnTOEm to 0 because the channel output mode is not used by this function. However, it can be used in independent channel output mode controlled by software.

(4) Simultaneous rewrite for the upper channel

Table 24.96 Simultaneous Rewrite Settings for the Upper Channel in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	1: Selects an upper channel as the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The signal that controls simultaneous rewrite is loaded when the master channel starts counting
TAUBnRDC.TAUBnRDCm	1: Channel is monitored for an INTTAUBnIm signal that is used as the simultaneous rewrite trigger

24.13.1.5 Register Settings for the Lower Channel(s)

(1) TAUBnCMORm for the lower channel(s)

For the TAUBnCMORm register of the lower channels, follow the TAUBnCMORm register settings for the operation mode that can be set. (See **Table 24.37, Channel Functions and the Methods They Use for Simultaneous Rewrite**)

(2) TAUBnCMURm for the lower channel(s)

For the TAUBnCMURm register of the lower channels, follow the TAUBnCMURm register settings for the operation mode that can be set. (See **Table 24.37, Channel Functions and the Methods They Use for Simultaneous Rewrite**)

(3) Channel output mode for the lower channel(s)

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see **Table 24.37, Channel Functions and the Methods They Use for Simultaneous Rewrite**.

(4) Simultaneous rewrite for the lower channel(s)

Table 24.97 Simultaneous Rewrite Settings for the Lower Channel in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	1: Selects an upper channel as the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The signal that controls simultaneous rewrite is loaded when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

24.13.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Table 24.98 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

	Operation	Status of TAUBn
Initial channel setting	Set the TAUBnCMORm and TAUBnCMURm registers for the upper channel as described in **Table 24.94, Contents of the TAUBnCMORm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1** and **Table 24.95, Contents of the TAUBnCMURm Register for the Upper Channel of the Simultaneous Rewrite Trigger Generation Function Type 1** Set the TAUBnCMORm and TAUBnCMURm registers for the lower channel as described in **Section 24.13.1.5, Register Settings for the Lower Channel(s)** Set the value of the TAUBnCDRm register	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm to 1. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is set to 1 and the counter starts. TAUBnCNTm loads the TAUBnCDRm value. When TAUBnCMORm.TAUBnMD0 = 1, INTTAUBnIm is generated.
During operation	TAUBnRDT.TAUBnRDTm, TAUBnCDRm can be changed. TAUBnRSF.TAUBnRSFm can be read at all times.	TAUBnCNTm counts down. When the counter reaches 0000_H: • TAUBnCNTm reloads the TAUBnCDRm value and continues count operation • INTTAUBnIm is generated Simultaneous rewrite is controlled when INTTAUBnIm is generated from the channel where TAUBnRDC.TAUBnRDCm is set to 1. Afterwards, this procedure is repeated.
Stop operation	Set TAUBnTT.TAUBnTTm to 1. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm stops and retains its current value.

Restart operation

24.14 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the Timer Array Unit B. For a general overview of synchronous channel operation, see **Section 24.2, Overview**.

24.14.1 PWM Output Function

24.14.1.1 Overview

Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the pulse width (duration) of the TAUBTTOUTm to be set. The pulse cycle is set in the master channel. The pulse width is set in the slave channel.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 24.99, Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function**
- The operation mode of the slave channel(s) must be set to one-count mode, see **Table 24.102, Contents of the TAUBnCMORm Register for the Slave Channel of the PWM Output Function**
- TAUBTTOUTm is not used for the master channel of this function
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 1.

Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current value of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave) toggles, which realizes a PWM output.

- Master channel:

  When the counter of the master channel reaches 0000_H, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter loads the TAUBnCDRm value and counts down.

- Slave channel:

  INTTAUBnIm generated on the master channel triggers the counter of the slave channel(s). The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value. The TAUBTTOUTm signal is set to the active level.

  When the counter reaches 0000_H, i.e. duty time has elapsed, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset to the inactive level. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. Please see **Section 24.6, Simultaneous Rewrite**.

24.14.1.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUBnCDRm (slave) / (TAUBnCDRm (master) + 1)) × 100

– Duty cycle = 0%
  TAUBnCDRm (slave) = 0000_H
– Duty cycle = 100%
  TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

24.14.1.3 Block Diagram and General Timing Diagram

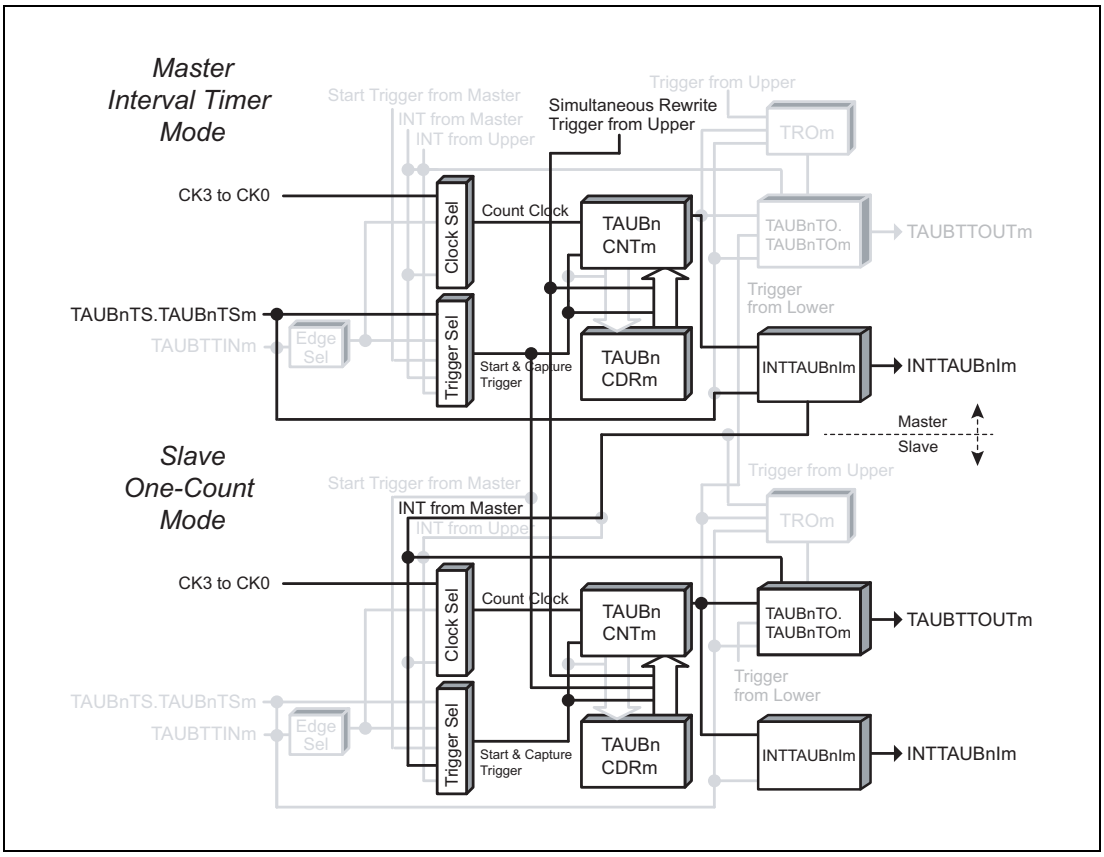

Figure 24.78 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

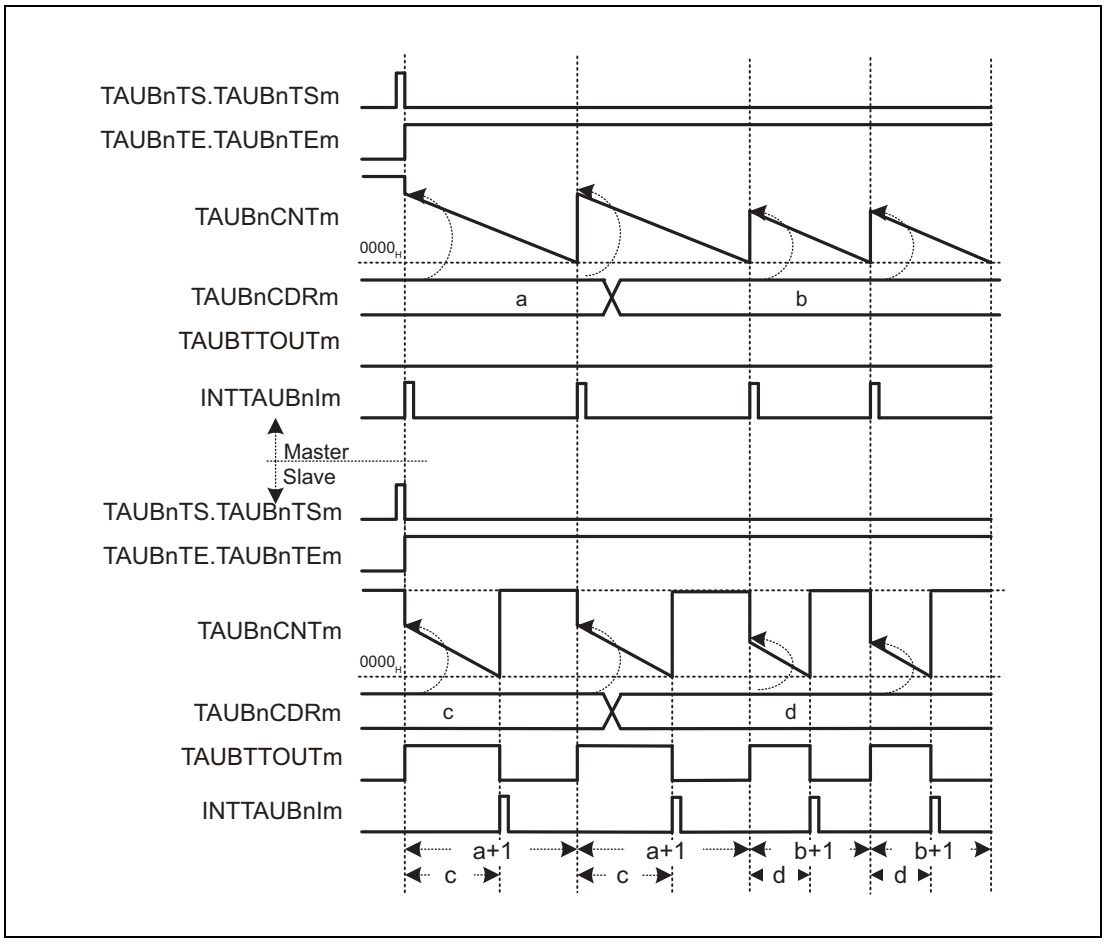

Figure 24.79 General Timing Diagram for PWM Output Function

NOTE

The interval between the starting to count and an interrupt being generated is the value of corresponding TAUBnCDRm + 1.

24.14.1.4 Register Settings for the Master Channel

(1) TAUBnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS [1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS [1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 24.99 Contents of the TAUBnCMORm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 1_B.
10 to 8	TAUBnSTS[2:0]	Write 000_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000_B.
0	TAUBnMD0	Write 1_B.

(2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 24.100 Contents of the TAUBnCMURm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the master channel

The channel output mode is not used by this function.

(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.101 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

When used in TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel operating in **Section 24.13.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Configure the operation following the conditions below.

- The channel set to Simultaneous Rewrite Trigger Output Function Type 1: TAUBnRDCm = 1, TAUBnRDSm = 1
  The setting value of TAUBnCDRm to this channel is as follows.
  = ((setting value of TAUBnCDRm of the master channel subject to simultaneous rewrite + 1) × number of interrupts) – 1
- Master channel: TAUBnRDCm = 0, TAUBnRDSm = 1
- Slave channel: TAUBnRDCm = 0, TAUBnRDSm = 1

Although the value of duty exceeds 100% when the setting value of TAUBnCDRm (slave) > the setting value of TAUBnCDRm (master) + 1, the output will be aggregated to 100%.

24.14.1.5 Register Settings for the Slave Channel(s)

(1) TAUBnCMORm for the slave channel(s)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS [1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS [1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 24.102 Contents of the TAUBnCMORm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 100_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0100_B.
0	TAUBnMD0	Write 1_B.

(2) TAUBnCMURm for the slave channel(s)

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 24.103 Contents of the TAUBnCMURm Register for the Slave Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the slave channel(s)

Table 24.104 Control Bit Settings for Synchronous Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.105 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

24.14.1.6 Operating Procedure for PWM Output Function

Table 24.106 Operating Procedure for PWM Output Function

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.1.4, Register Settings for the Master Channel**. Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.1.5, Register Settings for the Slave Channel(s)**. Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave) is set.
During operation	TAUBnCDRm can be changed at any time. TAUBnTOL.TAUBnTOLm can be changed. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel loads TAUBnCDRm and counts down. When the counter reaches 0000_H: • INTTAUBnIm (master) is generated • TAUBnCNTm (master) loads the TAUBnCDRm value and continues count operation • TAUBnCNTm (slave) loads the TAUBnCDRm value and counts down • TAUBTTOUTm (slave) is set to the active level When TAUBnCNTm (slave) reaches 0000_H: • The counter of TAUBnCNTm (slave) stops. • INTTAUBnIm (slave) is generated • TAUBTTOUTm (slave) is set to the inactive level
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

24.14.1.7 Specific Timing Diagrams

(1) Duty cycle = 0%

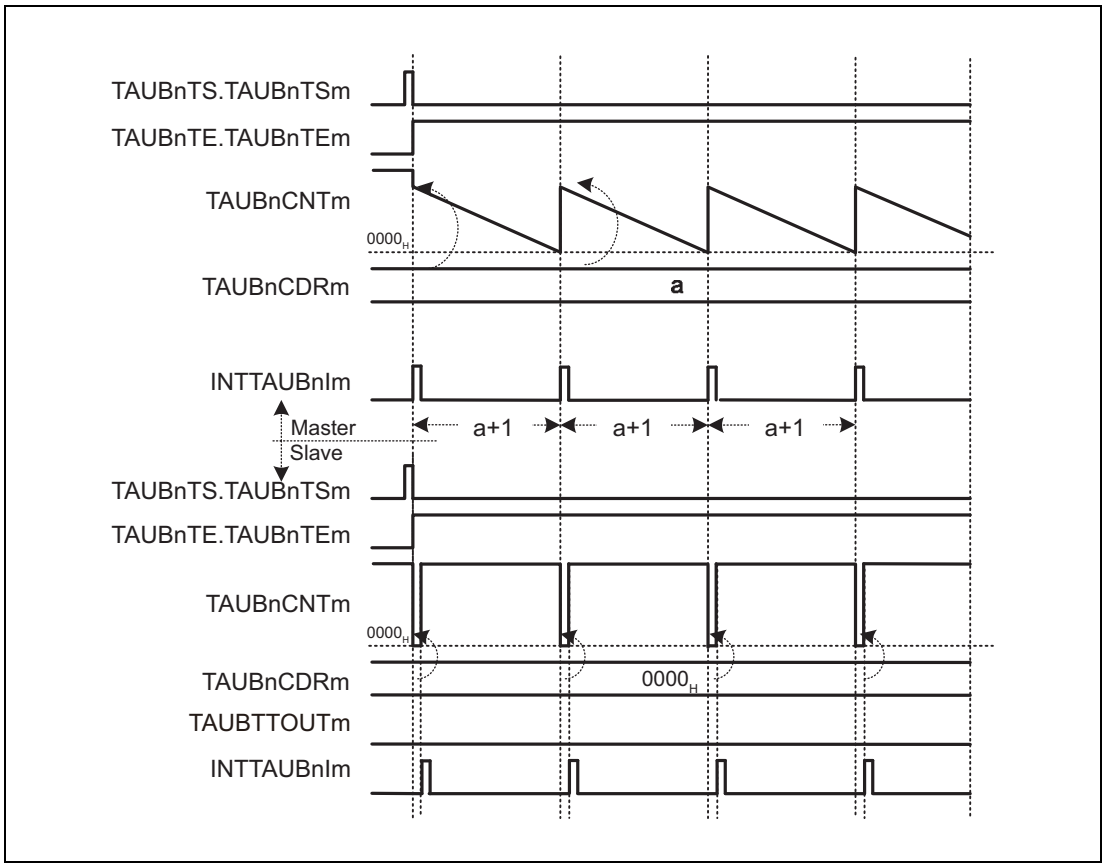

Figure 24.80 TAUBnCDRm (slave) = 0000_H, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

- Every time the master channel generates an interrupt (INTTAUBnIm), 0000_H is written to TAUBnCNTm (slave). As a result, a slave channel interrupt (INTTAUBnIm) is generated at the same time and TAUBTTOUTm remains inactive.
- TAUBnCNTm (slave) generates an interrupt every time the value of TAUBnCDRm is loaded.

(2) Duty cycle = 100%

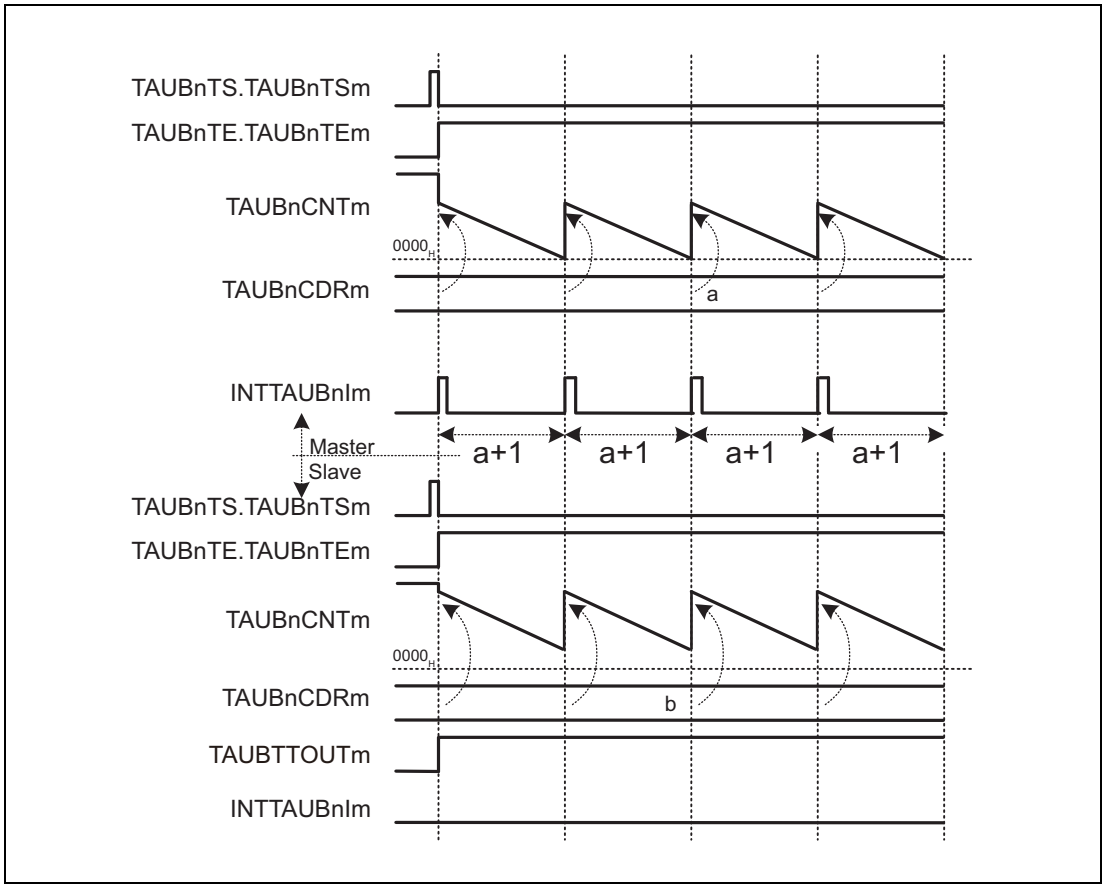

Figure 24.81 TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

If the value TAUBnCDRm (slave) is higher than the value TAUBnCDRm (master), the counter of the slave channel cannot reach 0000_H and cannot generate interrupts. The TAUBTTOUTm remains at active state.

(3) Operation stop and restart

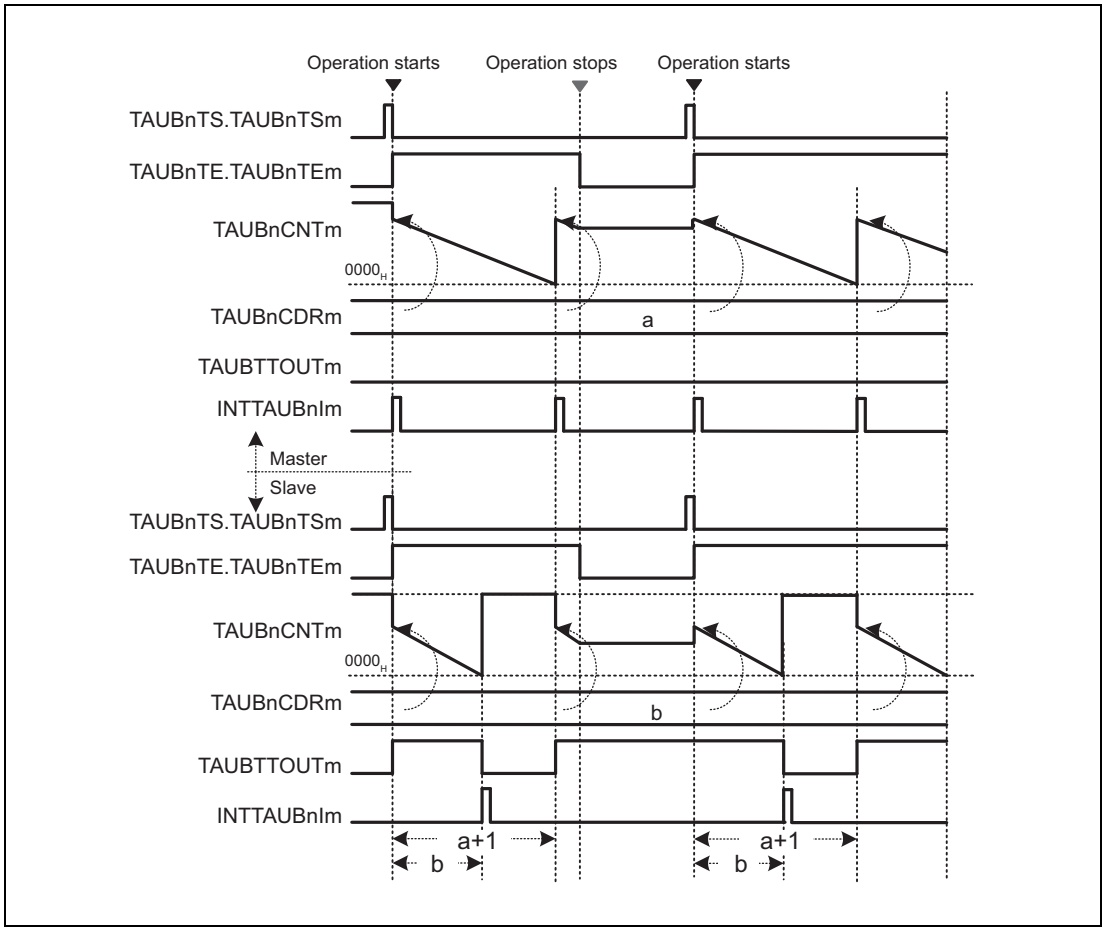

Figure 24.82 Operation Stop and Restart, Positive Logic (TAUBnTOL.TAUBnTOLm (slave) = 0)

- The counter can be stopped by setting TAUBnTT.TAUBnTTm of the master and slave channel(s) to 1, which in turn sets TAUBnTE.TAUBnTEm to 0.
- TAUBnCNTm and TAUBTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUBnTS.TAUBnTSm of master and slave channel(s) to 1. TAUBnCNTm of master and slave channel reload the current values of TAUBnCDRm and start to count down from these values.

(4) Operation stop and restart (Slave output, Initialization)

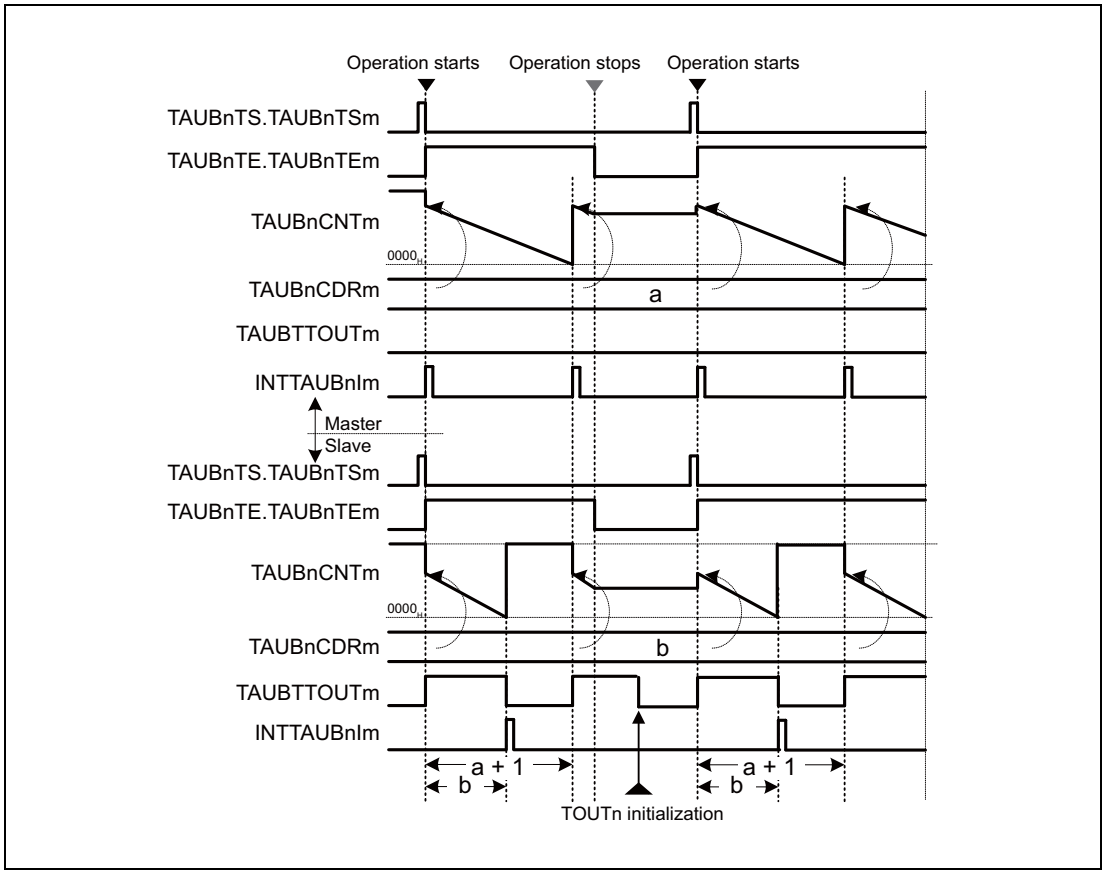

Figure 24.83 Operation Stop and Restart (Slave Output, Initialization)

When TAUBnTOE.TAUBnTOEm of the slave channel is set to 0 while TAUBnTE.TAUBnTEm = 0 and the inactive level of TAUBTTOUTm is written in the TAUBnTO.TAUBnTOm, the output level of TAUBTTOUTm (slave channel) becomes active when INTTAUBnIm is issued when the count operation is started after restart.

24.14.2 One-Shot Pulse Output Function

24.14.2.1 Overview

Summary

This function outputs a signal pulse with a defined pulse width and a specific delay time compared to an external input signal pulse by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to one-count mode, see **Table 24.107, Contents of the TAUBnCMORm Register for the Master Channel of the One-Shot Pulse Output Function**
- The operation mode of the slave channel must be set to pulse one-count mode, see **Table 24.110, Contents of the TAUBnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function**
- TAUBTTOUTm is not used for the master channel of this function
- The channel output mode of the slave channel must be set to independent channel output mode 2.
- TAUBTTINm (master) has to be detected while TAUBnCNTm (master) and TAUBnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUBTTINm (slave).

Description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) for master and slave channels to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation.

- Master channel:
  When the next valid TAUBTTINm input edge is detected, the current value of TAUBnCDRm is written to TAUBnCNTm. The counter starts to count down from this value. If TAUBnCMORm.TAUBnMD0 = 0, a trigger (TAUBTTINm) which is detected within the delay time is ignored.
  When the counter of the master channel reaches 0000_H, INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next valid TAUBTTINm input edge.
- Slave channel:
  INTTAUBnIm generated on the master channel triggers the counter of the slave channel. The current value of TAUBnCDRm (slave) is written to TAUBnCNTm (slave) and the counter starts to count down from this value.
  An interrupt is generated and the TAUBTTOUTm signal is set.
  When the counter reaches 0001_H, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter remains at 0000_H and awaits the next INTTAUBnIm of the master channel.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

The counter of the master channel can be restarted without stopping it first (forced restart) by setting TAUBnTS.TAUBnTSm to 1 during operation.

NOTES

1. If a forced restart of the counter is executed during operation, the width of the output signal does not correspond to the value of TAUBnCDRm (slave).
2. The TAUBTTINm input signal is sampled at the frequency of the operating clock, specified by TAUBnCMORm.TAUBnCKS[1:0] bits. As a result, the output cycle of TAUBTTOUTm has an error of ± 1 operation clock cycle.

Conditions

- If TAUBnCMORm.TAUBnMD0 of the master channel is set to 0, during counting detected TAUBTTINm input edges are ignored.
- Simultaneous rewrite can be used with this function. Please see **Section 24.6, Simultaneous Rewrite**.

24.14.2.2 Equations

Delay from trigger input to pulse output
= (TAUBnCDRm (master) + 1) × count clock cycle

Pulse width = (TAUBnCDRm (slave)) × count clock cycle

24.14.2.3 Block Diagram and General Timing Diagram

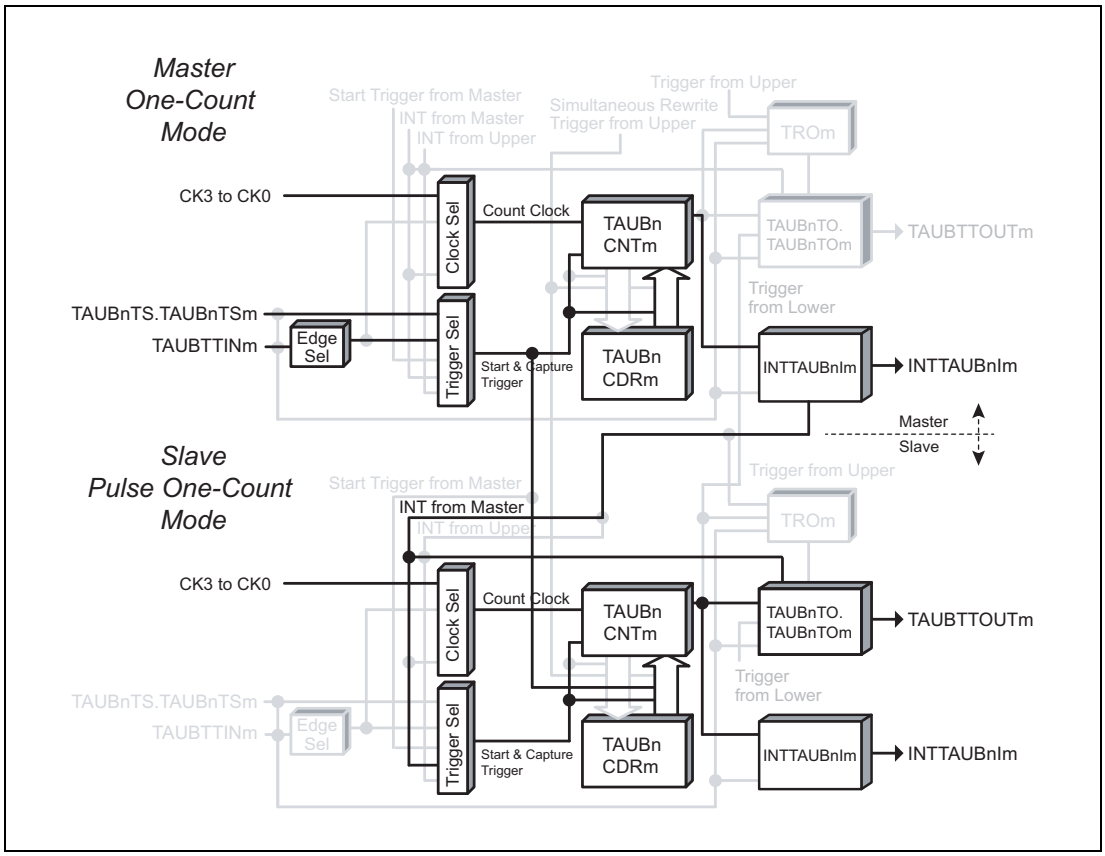

Figure 24.84 Block Diagram for One-Shot Pulse Output Function

The following settings apply to the general basic diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

(3) Channel output mode for the slave channel

Table 24.112 Control Bit Settings for Independent Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	1: Enables independent channel output mode
TAUBnTOM.TAUBnTOMm	0: Independent channel output
TAUBnTOC.TAUBnTOCm	1: Operating mode 2
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	0: Disables dead time operation
TAUBnTDL.TAUBnTDLm	0: When dead time operation is disabled (TAUBnTDE.TAUBnTDEm = 0), set these bits to 0

(4) Simultaneous rewrite for the slave channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.113 Simultaneous Rewrite Settings for the Slave Channel of the One-Shot Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

24.14.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 24.114 Operating Procedure for One-Shot Pulse Output Function

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.2.4, Register Settings for the Master Channel**. Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.2.5, Register Settings for the Slave Channel**. Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the master channel awaits a TAUBTTINm input.
During operation	TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	When a valid TAUBTTINm input edge is detected, TAUBnCNTm of the master channel loads the TAUBnCDRm value and counts down. When the counter reaches 0000_H: • INTTAUBnIm (master) is generated • TAUBnCNTm (master) is reset to $FFFF_H$ and waits for the next valid TAUBTTINm input edge. • TAUBnCNTm (slave) reloads the TAUBnCDRm value and starts to count down • INTTAUBnIm (slave) is generated • TAUBTTOUTm (slave) is set to the active level. When TAUBnCNTm (slave) reaches 0001_H: • The counter of TAUBnCNTm (slave) stops. • INTTAUBnIm (slave) is generated • TAUBTTOUTm (slave) is set to an inactive level.
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

24.14.2.7 Specific Timing Diagrams

(1) TAUBnCDRm (master) = 0000_H

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

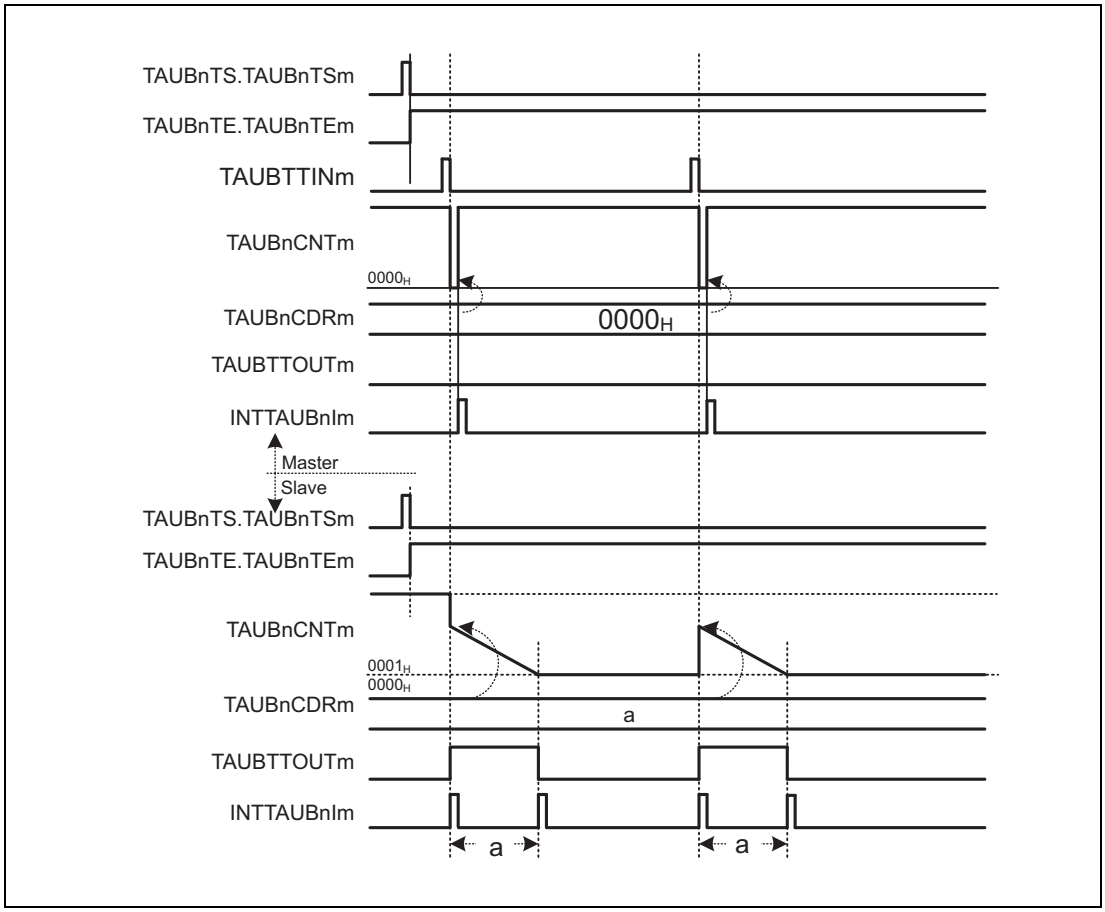

Figure 24.86 TAUBnCDRm (master) = 0000_H

- When a valid TAUBTTINm input edge is detected, the value 0000_H is written to TAUBnCNTm (master). The counter is set to 0000_H for one count and returns to $FFFF_H$.
  Thus, the slave channel starts to count down one count clock later to TAUBTTINm (master).

(2) TAUBnCDRm (slave) = 0000_H

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

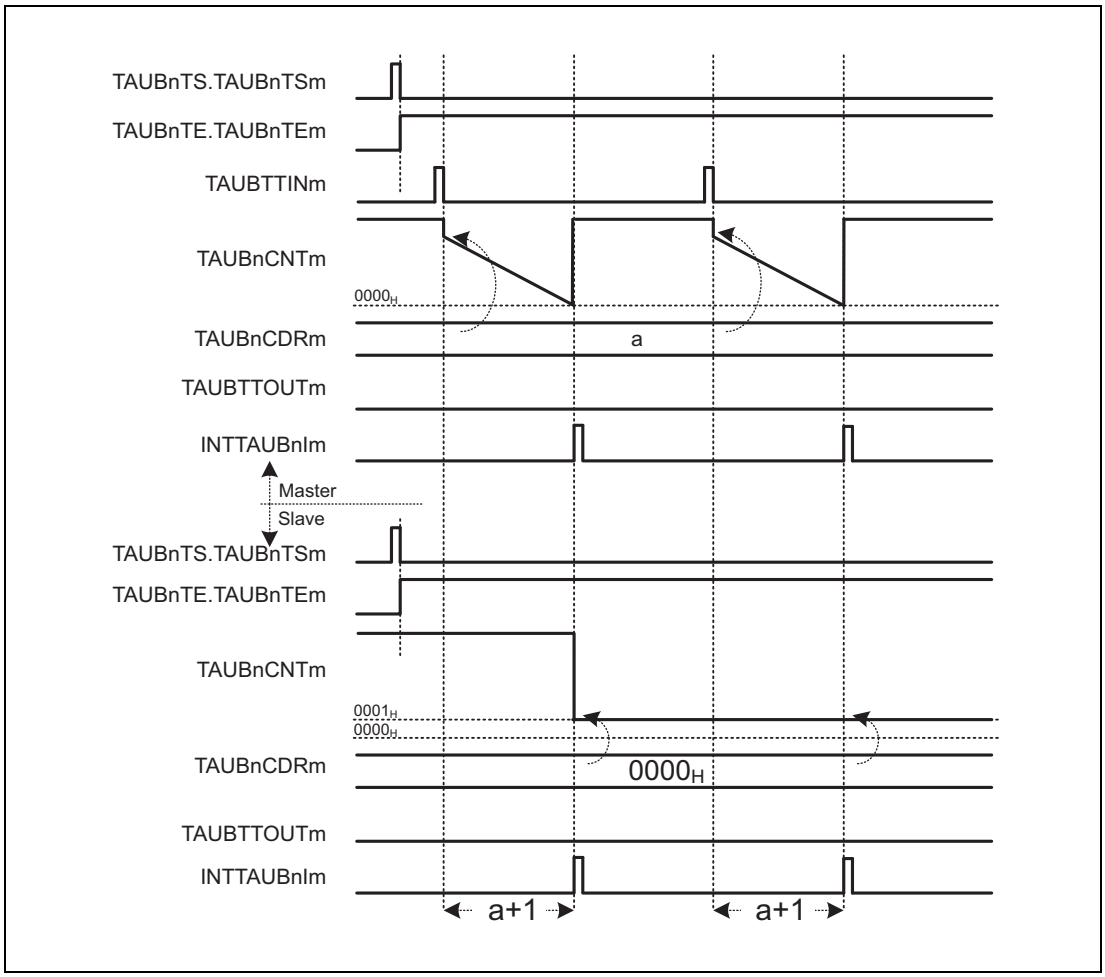

Figure 24.87 TAUBnCDRm (slave) = 0000_H

- TAUBTTOUTm remains at inactive state, because the pulse width is zero.

(3) TAUBnCMORm.TAUBnMD0 = 0

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

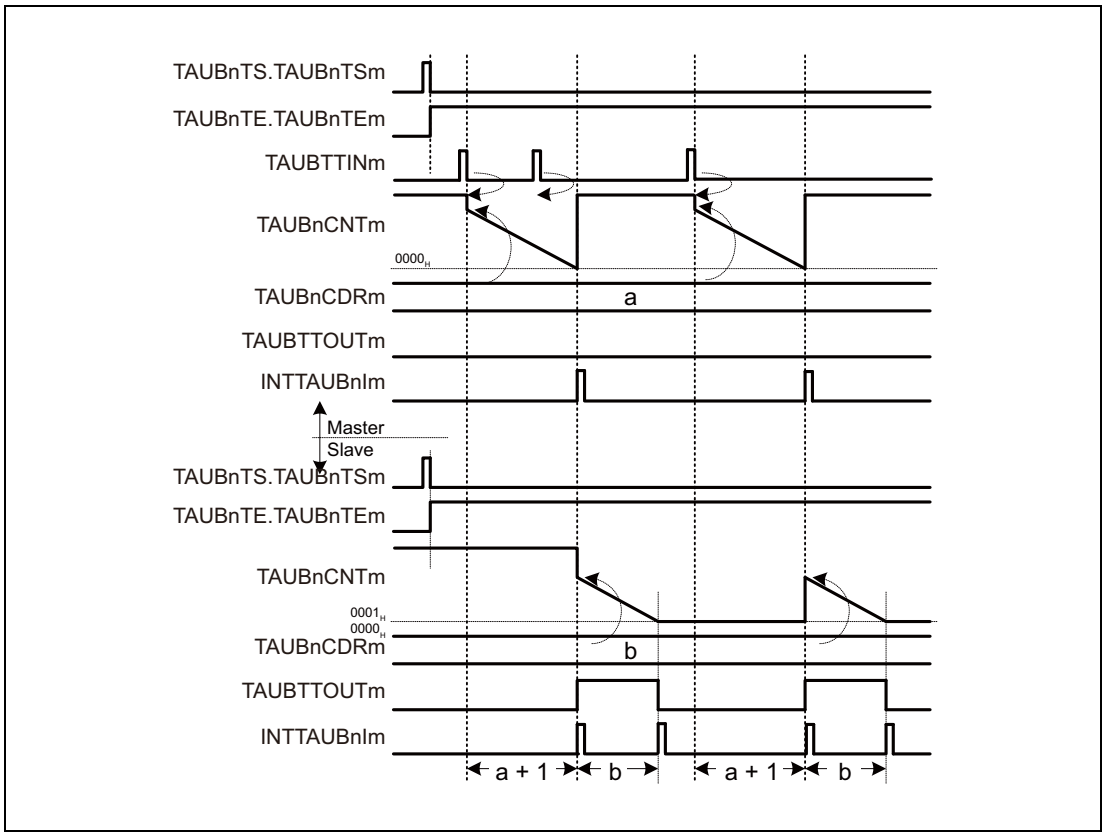

Figure 24.88 TAUBnCMORm.TAUBnMD0 = 0

- Even when an effective edge is input to TAUBTTINm while the counter of the master channel counts down, the counter continues counting down.

(4) TAUBnCMORm.TAUBnMD0 = 1

The following settings apply to this diagram.

- Start trigger detection enabled during counting (TAUBnCMORm.TAUBnMD0 = 1)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

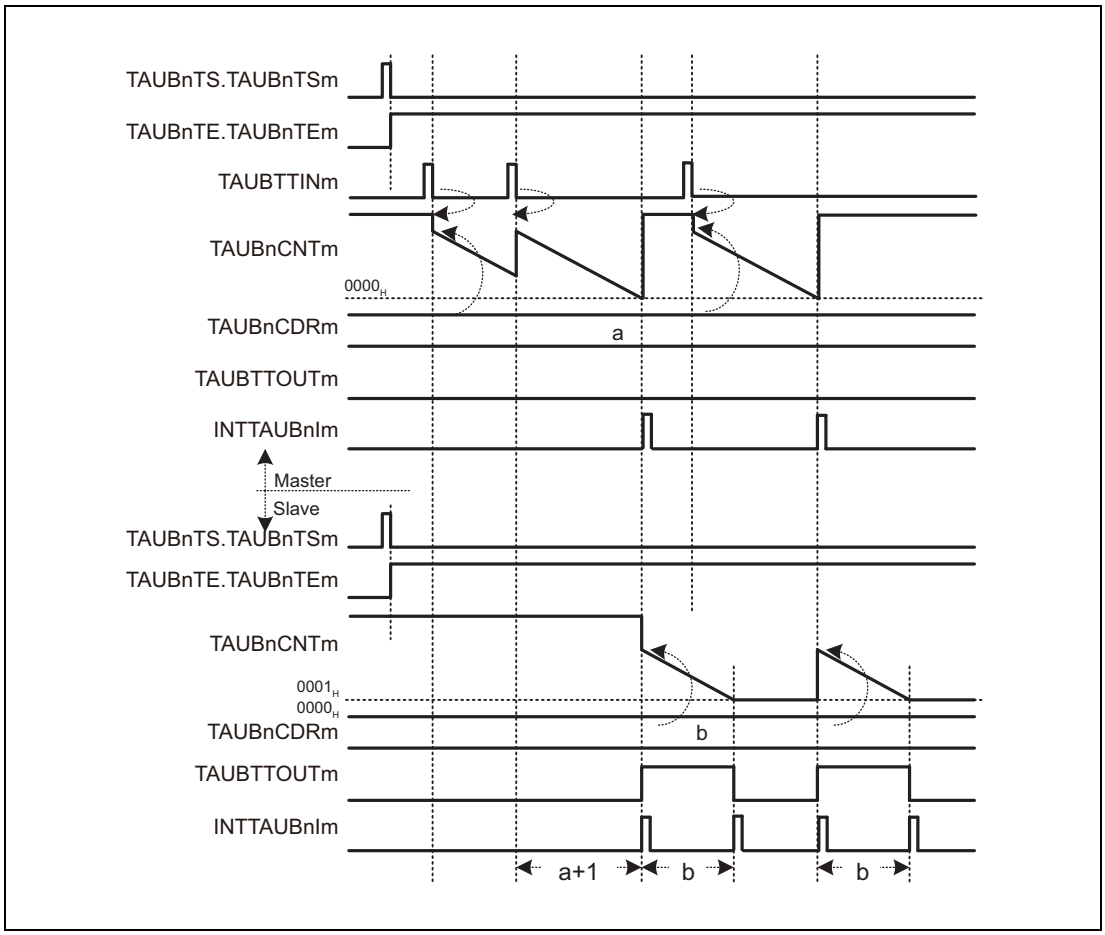

Figure 24.89 TAUBnCMORm.TAUBnMD0 = 1

- If a valid TAUBTTINm input edge is detected while the counter of the master channel counts down, TAUBnCNTm reloads the value of TAUBnCDRm. The counter restarts to count down.

This means the delay for INTTAUBnIm generation interval is extended by the value of TAUBnCNTm at the time when a valid TAUBTTINm input edge is detected.

(5) Operation stop and restart

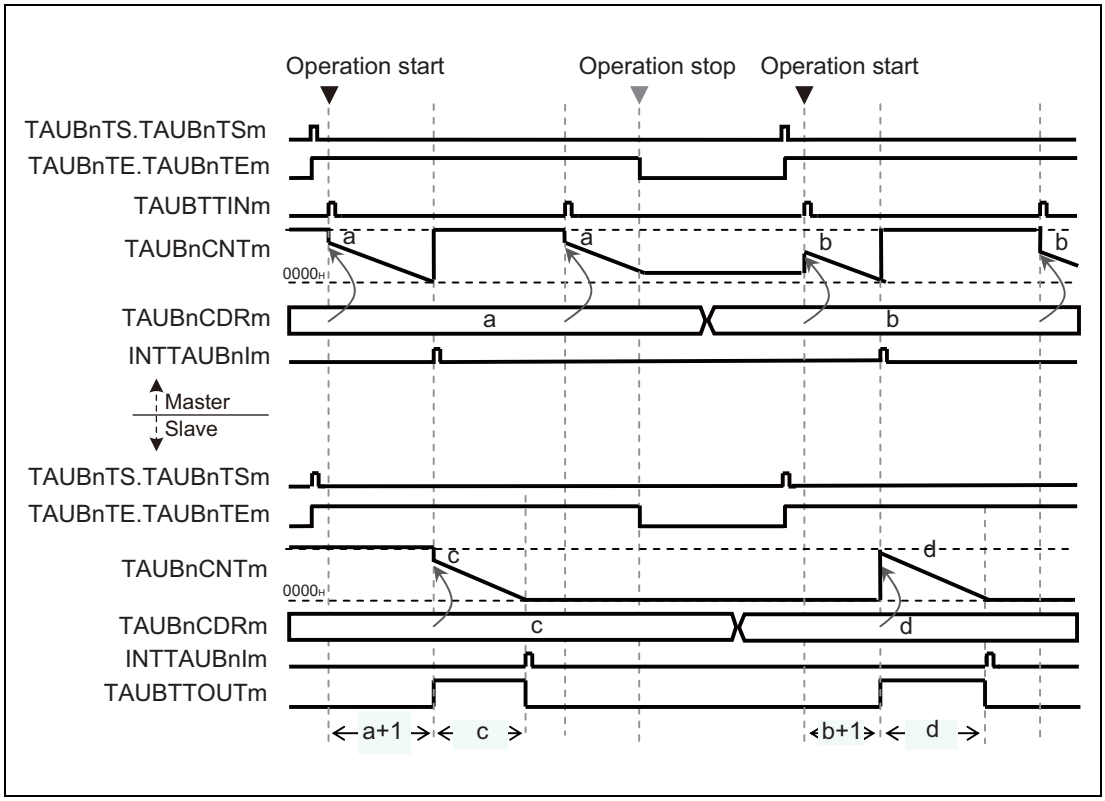

Figure 24.90 Stopping and Restarting the Operation

Setting TTm of the master and slave channels to 1 clears TAUBnTE.TAUBnTEm to 0, thereby stopping the count operation. If this happens, TAUBnCNTm and TAUBTTOUTm stop operation with the values retained.

Setting TAUBnTS.TAUBnTSm of the master and slave channels to 1 concurrently sets TAUBnTE.TAUBnTEm to 1.

When the start trigger is detected while the TAUBnTE.TAUBnTEm is set to 1, the TAUBnCDRm value is transferred to TAUBnCNTm and the operation restarts.

(6) Restarting the master channel while the slave channel is counting

The following settings apply to this diagram.

- Start trigger detection disabled during counting (TAUBnCMORm.TAUBnMD0 = 0)
- Falling edge detection (TAUBnCMURm.TAUBnTIS[1:0] = 00_B)

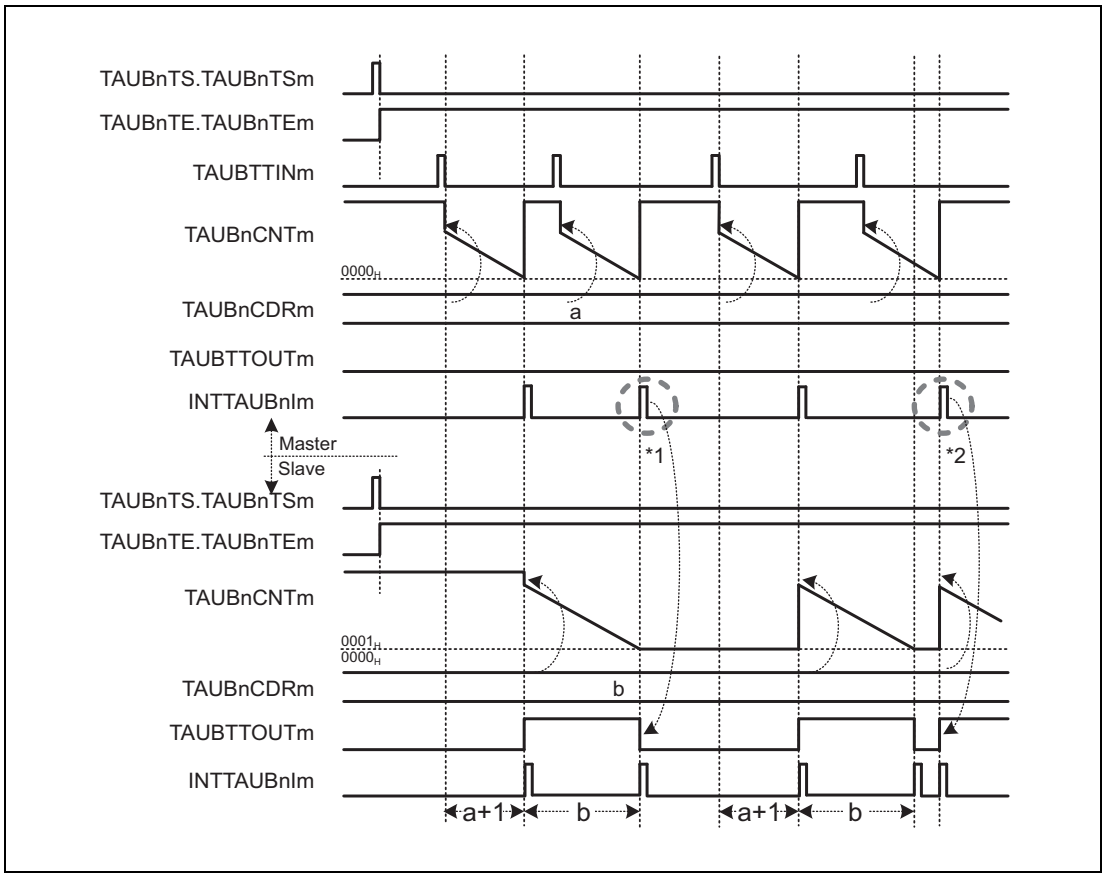

Figure 24.91 Input Interval of TAUBTTINm ≤ Delay Time + Pulse Width + 1

- If the master channel generates an interrupt before the counter of the slave channel has reached 0001_H or exactly when 0001_H is reached (*1), the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUBnCDRm (slave) is reloaded. An interrupt is generated and TAUBTTOUTm toggles. If TAUBnCNTm (master) has started to count down while the TAUBnCNTm (slave) is still counting (*2), TAUBTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

24.14.3 Delay Pulse Output Function

24.14.3.1 Overview

Summary

This function outputs two signals. The reference signal has a defined pulse width and pulse cycle specified using the master channel and slave channel 1.
Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by amount specified in slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1.
  The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified in slave channel 2.

Prerequisites

- Four channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 24.115, Contents of the TAUBnCMORm Register for the Master Channel of the Delay Pulse Output Function**.
- The operation mode of slave channels 1 and 2 must be set to one-count mode, see **Table 24.118, Contents of the TAUBnCMORm Register for the Slave Channel 1 of the Delay Pulse Output Function** and **Table 24.122, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Delay Pulse Output Function**.
- The operation mode of slave channel 3 must be set to pulse one-count mode, see **Table 24.125, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Delay Pulse Output Function**
- TAUBTTOUTm is not used for the master channel and slave channel 2
- The channel output mode of slave channel 1 must be set to synchronous channel output mode 1.
- The channel output mode of slave channel 3 must be set to independent channel output mode 1.

Description

The counters of the channel group are enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm to 1, enabling count operation.

- Master channel:

  The current value of TAUBnCDRm is written to TAUBnCNTm and the counter starts to count down from this value. INTTAUBnIm is generated on the master channel.
  When the counter of the master channel reaches 0000_H, pulse cycle time has elapsed and INTTAUBnIm is generated. The counter reloads the TAUBnCDRm value and counts down.

- Slave channels 1 and 2:

  When the slave channels 1 and 2 detect an interrupt from the master channel, they start to count down from the current value of TAUBnCDRm. The TAUBTTOUTm signal (slave 1) is set.

  – Slave channel 1:
  When the counter of slave channel 1 reaches 0000_H (duty time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel.

  – Slave channel 2:
  When the counter of slave channel 2 reaches 0000_H, delay time has elapsed and INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of the master channel.
  INTTAUBnIm (slave channel 2) triggers the counter of slave channel 3

- Slave channel 3:
  When slave channel 3 detects an interrupt from slave channel 2, it starts to count down from the current value of TAUBnCDRm. INTTAUBnIm is generated and the TAUBTTOUTm signal (slave 3) is set.
  When the counter of slave channel 3 reaches 0001_H, INTTAUBnIm is generated and the TAUBTTOUTm signal is reset.
  The output from slave channel 3 is the delayed PWM pulse.

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channels, which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUBnTS.TAUBnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. Please see **Section 24.6, Simultaneous Rewrite**.

24.14.3.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

Duty width 1 = (TAUBnCDRm (slave 1)) × count clock cycle

Delay = (TAUBnCDRm (slave 2) + 1) × count clock cycle

Duty width 2 = (TAUBnCDRm (slave 3)) × count clock cycle

Where the setting of the delay is within the following range:

$0000_H \leq$ TAUBnCDRm (slave 2) < TAUBnCDRm (master)

NOTES

1. The output waveform of TAUBTTOUTm (slave 3) is the output waveform of TAUBTTOUTm (slave 1) delayed for the delay generated by slave 2. It cannot be delayed for more than the pulse cycle.
2. When INTTAUBnIm of slave 2 occurs while slave 3 is counting, slave 3 restarts the operation. Therefore, the output waveform of TAUBTTOUTm (slave 3) retains the active level. (In this case, TAUBTTOUTm (Slave-CH-3) cannot output the waveform of the delayed basic pulse of TAUBTTOUTm (Slave-CH-1).)

24.14.3.3 Block Diagram and General Timing Diagram

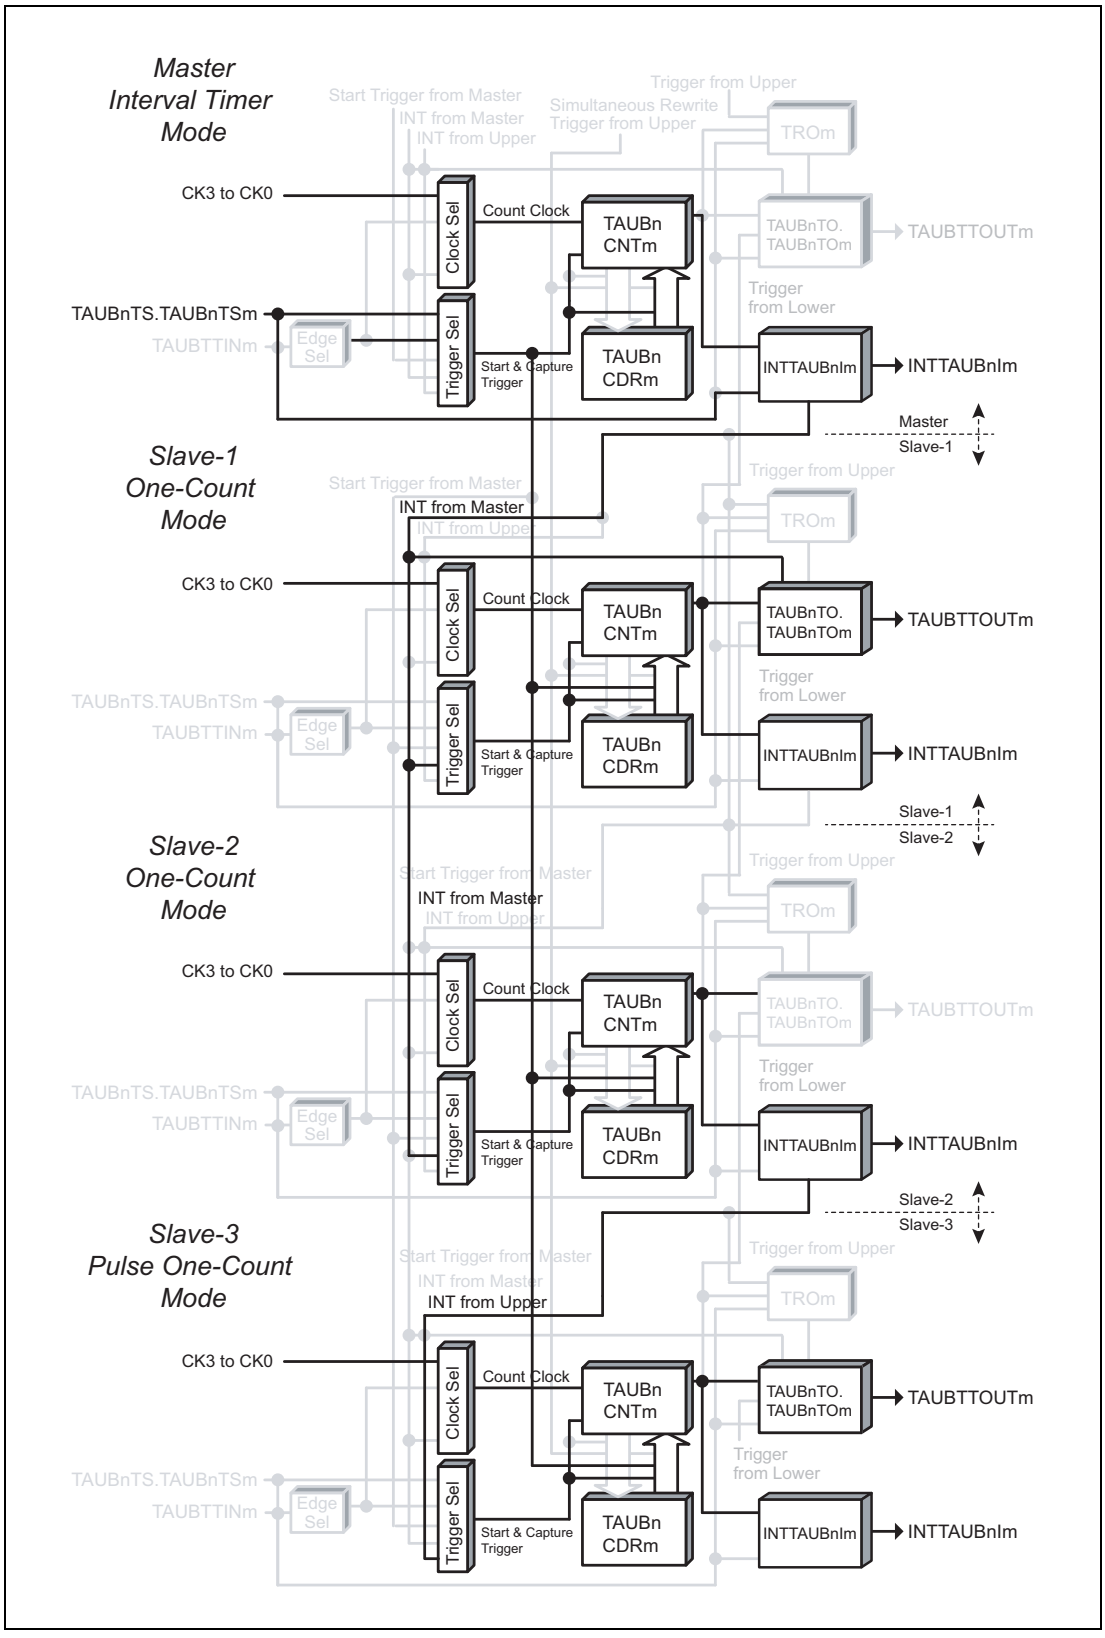

Figure 24.92 Block Diagram for Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3: Positive logic (TAUBnTOL.TAUBnTOLm = 0)

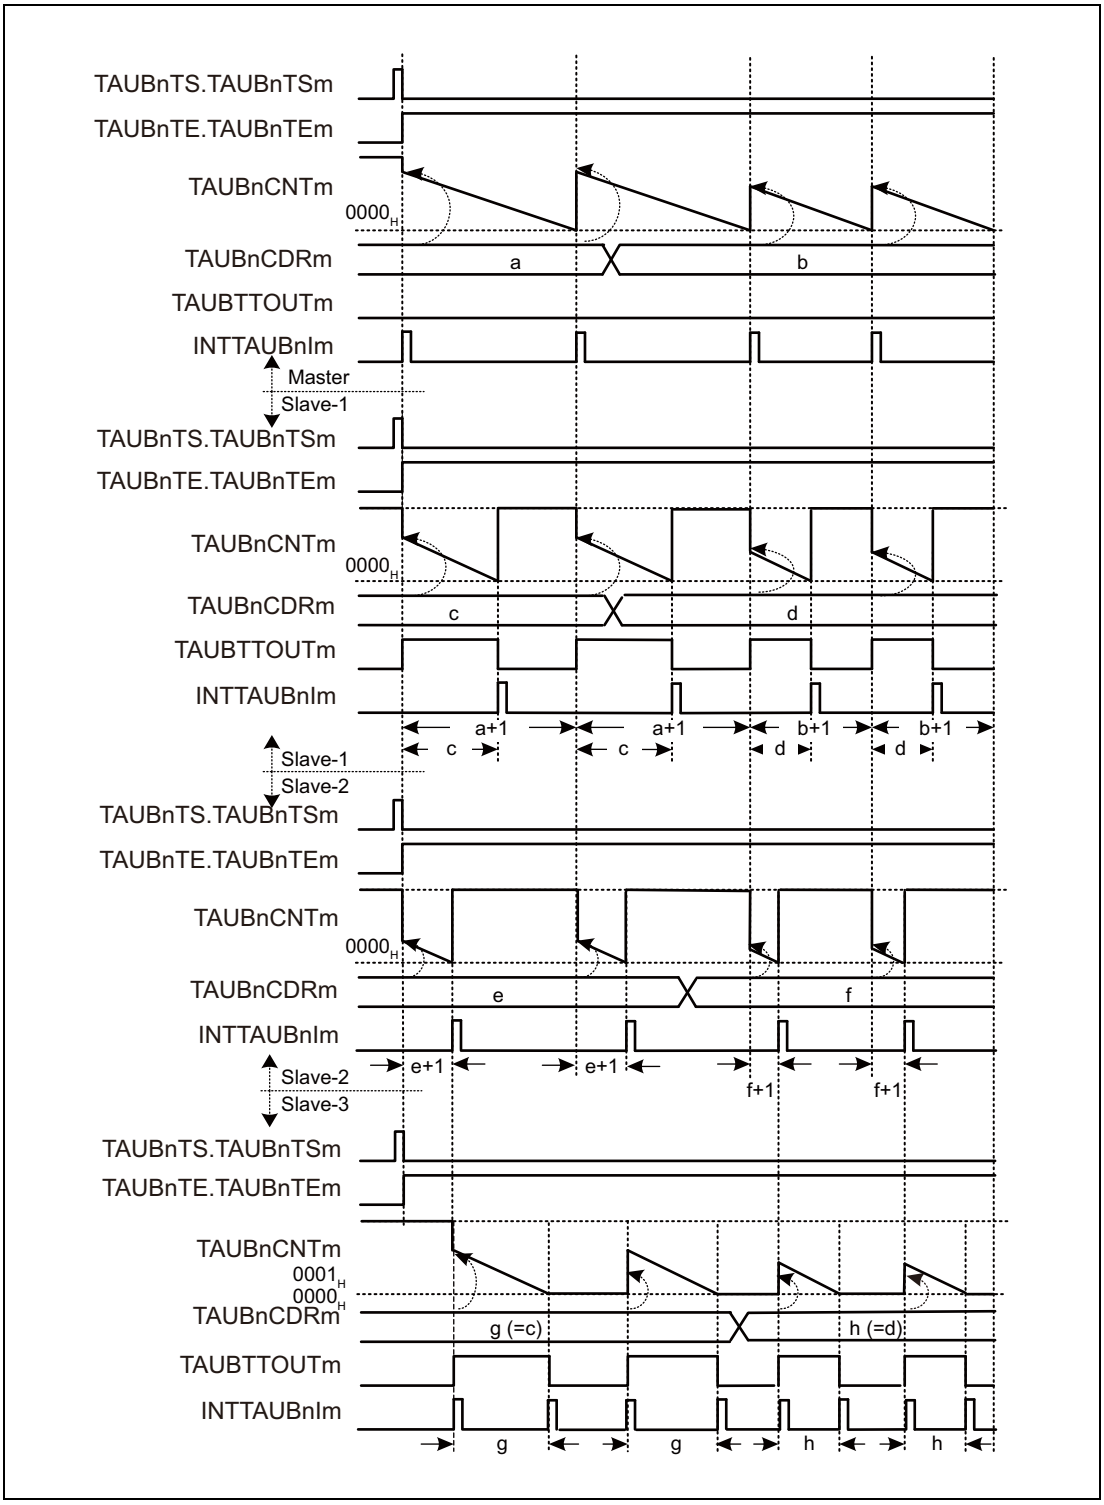

Figure 24.93 General Timing Diagram for Delay Pulse Output Function

24.14.3.4 Register Settings for the Master Channel

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 3

Table 24.127 Control Bit Settings for Independent Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for slave channel 3

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.128 Simultaneous Rewrite Settings for Slave Channel 3 of the Delay Pulse Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: The master channel is the control channel for simultaneous rewrite
TAUBnRDM.TAUBnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

24.14.3.8 Operating Procedure for Delay Pulse Output Function

Table 24.129 Operating Procedure for Delay Pulse Output Function (1/2)

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.3.4, Register Settings for the Master Channel**. Slave channel 1: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.3.5, Register Settings for Slave Channel 1**. Slave channel 2: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.3.6, Register Settings For Slave Channel 2**. Slave channel 3: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.3.7, Register Settings for Slave Channel 3**. Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.

Table 24.129 Operating Procedure for Delay Pulse Output Function (2/2)

Restart operation

	Operation	Status of TAUBn
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master channel and slave channels 1 and 2 start. INTTAUBnIm is generated on the master channel and TAUBTTOUTm (slave 1) is set.
During operation	TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel and slave channels 1 and 2 load TAUBnCDRm and count down. When the counter of the master channel reaches 0000_H: • INTTAUBnIm (master) is generated • TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation • TAUBnCNTm (slave 1 and slave 2) reload the TAUBnCDRm value and start counting down • TAUBTTOUTm (slave 1) is set When TAUBnCNTm (slave 1) reaches 0000_H: • INTTAUBnIm (slave 1) is generated • TAUBTTOUTm (slave 1) is reset When TAUBnCNTm (slave 2) reaches 0000_H: • INTTAUBnIm (slave 2) is generated • INTTAUBnIm (slave 3) is generated • TAUBTTOUTm (slave 3) is set • TAUBnCNTm (slave 3) reloads the TAUBnCDRm value and starts counting down When TAUBnCNTm (slave 3) reaches 0001_H: • INTTAUBnIm (slave 3) is generated • TAUBTTOUTm (slave 3) is reset
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

24.14.3.9 Specific Timing Diagrams

(1) Duty cycle (slave 3) = 100%

The following values apply to the figure below.

- TAUBnCDRm (master) = $000A_H$
- TAUBnCDRm (slave 1) = $000B_H$
- TAUBnCDRm (slave 2) = 0000_H
- TAUBnCDRm (slave 3) = $000B_H$

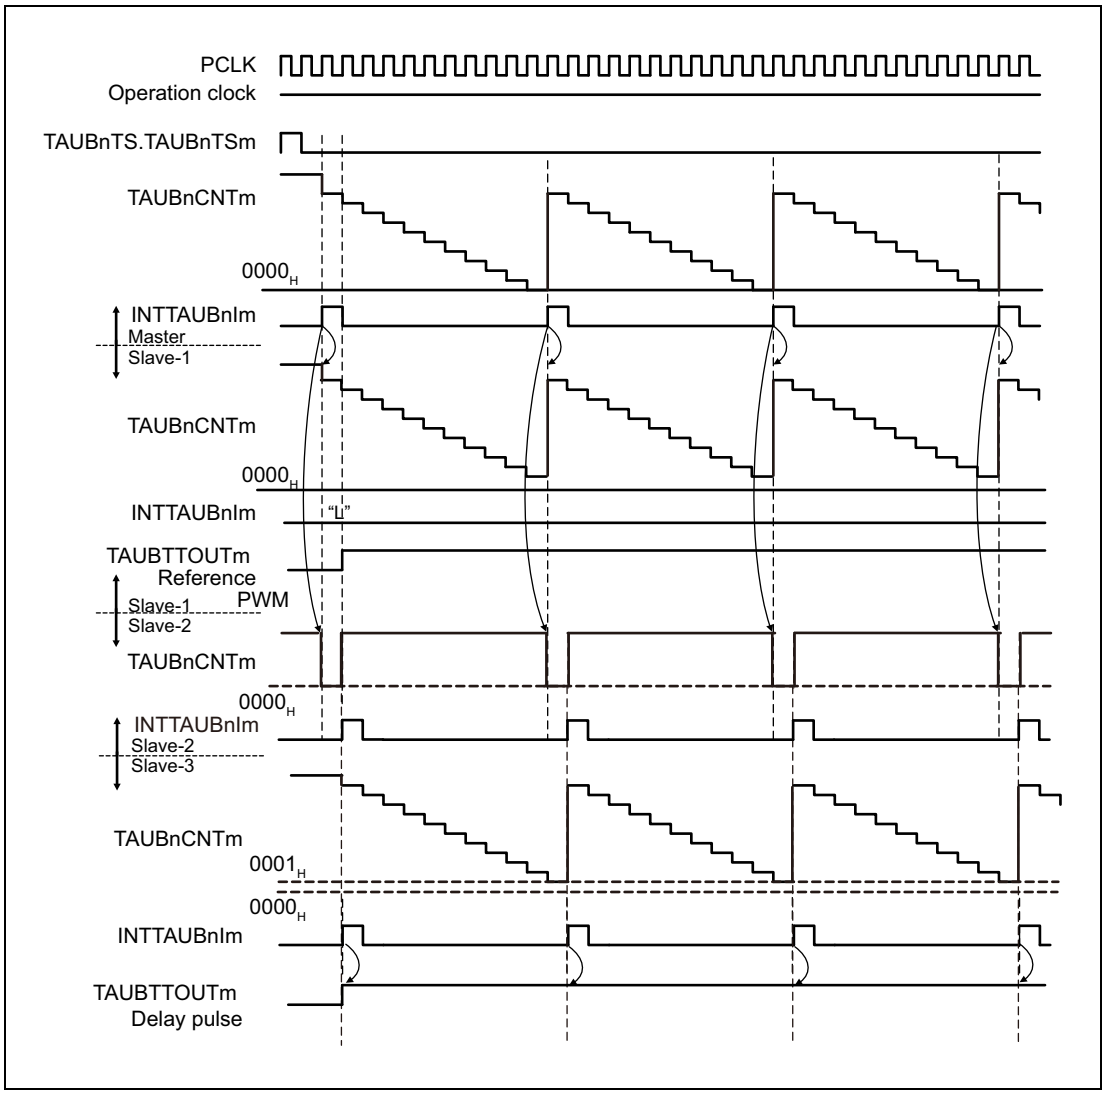

Figure 24.94 Duty Cycle (slave 3) = 100%

- If the value of TAUBnCDRm (slave 1 and 3) is higher than the value of TAUBnCDRm (master), the counter of slave channel 1 cannot reach 0000H and cannot generate interrupt request signals. TAUBTTOUTm of channels 1 and 3 remain in the active state.

(2) TAUBTTOUTm (slave 1) = TAUBTTOUTm (slave 3)

The following values apply to the figure below.

- TAUBnCDRm (master) = $000A_H$
- TAUBnCDRm (slave 1) = 0005_H
- TAUBnCDRm (slave 2) = 0000_H
- TAUBnCDRm (slave 3) = 0005_H

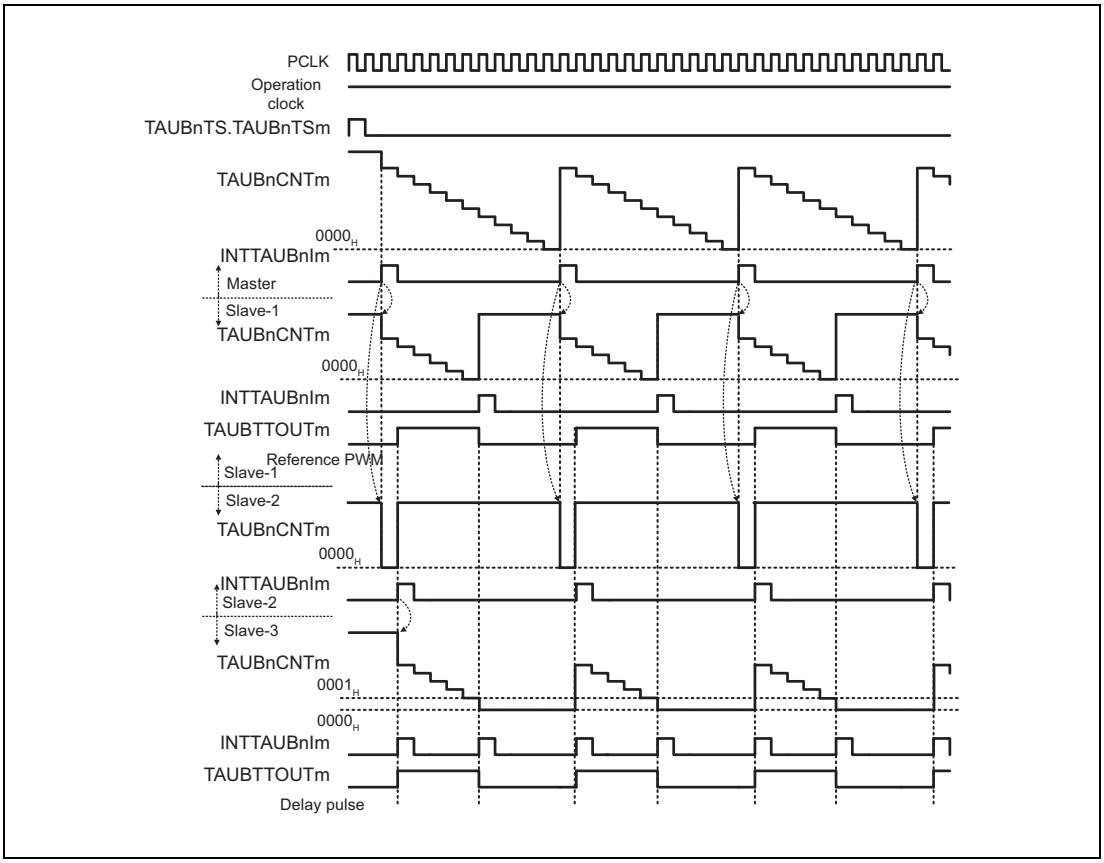

Figure 24.95 TAUBTTOUTm (slave 1) = TAUBTTOUTm (slave 3)

- If TAUBnCDRm (slave 2) = 0000_H, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1. The reference pulse and the delay pulse are output with a delay of one clock count.

24.14.4 AD Conversion Trigger Output Function Type 1

24.14.4.1 Overview

Summary

This function is identical to **Section 24.14.1, PWM Output Function** except that TAUBTTOUTm is not output.

This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

24.14.4.2 Block Diagram and General Timing Diagram

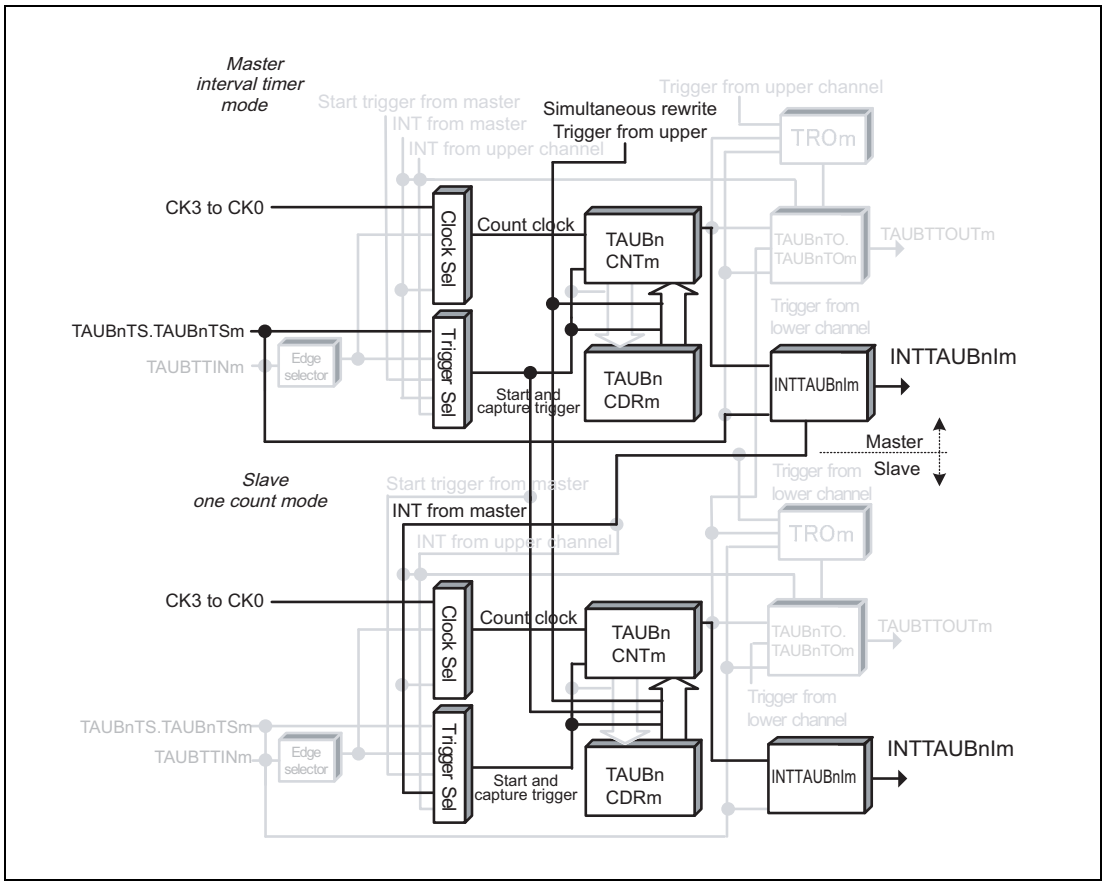

Figure 24.96 Block Diagram for AD Conversion Trigger Output Function Type 1

The following settings apply to the general timing diagram.

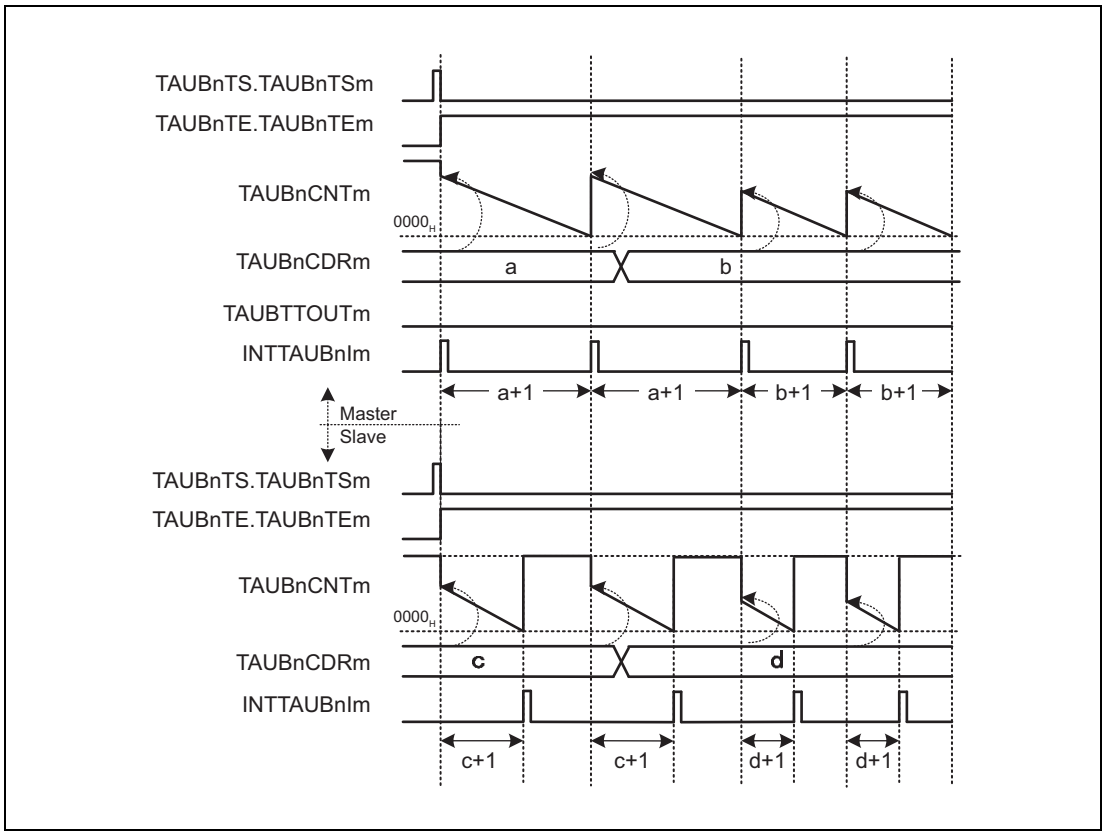

Figure 24.97 General Timing Diagram for AD Conversion Trigger Output Function Type 1

24.14.5 Triangle PWM Output Function

24.14.5.1 Overview

Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUTm to be set using the master and slave channel(s) respectively.

The master channel generates a carrier cycle from two pulse cycles. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slaves counter.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode, see **Table 24.130, Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function**.
- The operation mode of the slave channel(s) must be set to up down count mode, see **Table 24.134, Contents of the TAUBnCMORm Register for the Slave Channel of the Triangle PWM Output Function**.
- The channel output mode of the master channel must be set to independent channel output mode 1.
- The channel output mode of the slave channel(s) must be set to synchronous channel output mode 2.
- The following settings establish TAUBTTOUTm at high level for the down status of the carrier cycle.
  - If the TAUBnCMORm.TAUBnMD0 (master) bit is set to 0,TAUBnTO.TAUBnTOm must be set to 1 while TAUBnTOE.TAUBnTOEm is 0. (recommended)
  - If the TAUBnCMORm.TAUBnMD0 (master) bit is set to 1, TAUBnTO.TAUBnTOm must be set to 0 while TAUBnTOE.TAUBnOEm is 0.

Functional description

The counters are enabled by setting the channel trigger bit (TAUBnTS.TAUBnTSm) to 1 for every channel. This in turn sets TAUBnTE.TAUBnTEm, enabling count operation. The current values of TAUBnCDRm (master and slave) are written to TAUBnCNTm (master and slave) and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:
  When the counter of the master channel reaches 0000_H (pulse cycle time has elapsed) INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. TAUBnCNTm then reloads the TAUBnCDRm value and counts down.

- Slave channel:
  INTTAUBnIm generated on the master channel triggers the counter of the slave channel:
  - If the slave counter currently counts down, it changes count direction.
  - If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

  When the counter of the slave channel reaches 0001_H while counting up or down, INTTAUBnIm is generated and the TAUBTTOUTm (slave) signal is set or reset.

  The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.

  TAUBTTOUTm can be switched between positive and negative phase setting TAUBnTOL.TAUBnTOLm during operation.

The counters can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

Conditions

Simultaneous rewrite can be used with this function. Please see **Section 24.6, Simultaneous Rewrite**.

24.14.5.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUBnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUBnCDRm (master) + 1) × 2 × count clock cycle

Duty cycle =

[(TAUBnCDRm (master) + 1 - TAUBnCDRm (slave))/ (TAUBnCDRm (master) + 1)] × 100

- Duty cycle = 100%
  TAUBnCDRm (slave) = 0000_H
- Duty cycle = 0%
  TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

24.14.5.3 Block Diagram and General Timing Diagram

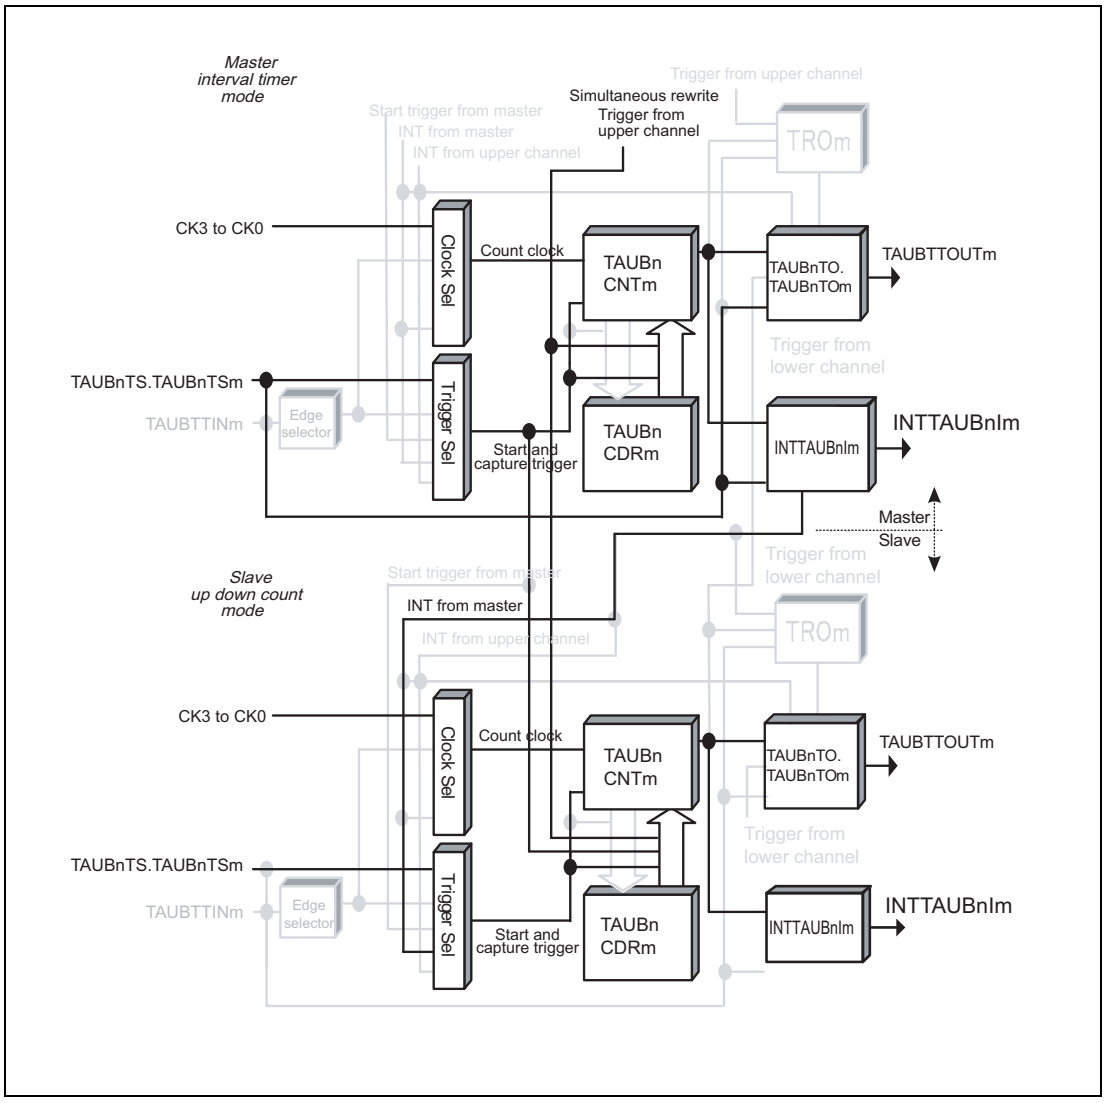

Figure 24.98 Block Diagram for Triangle PWM Output Function

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

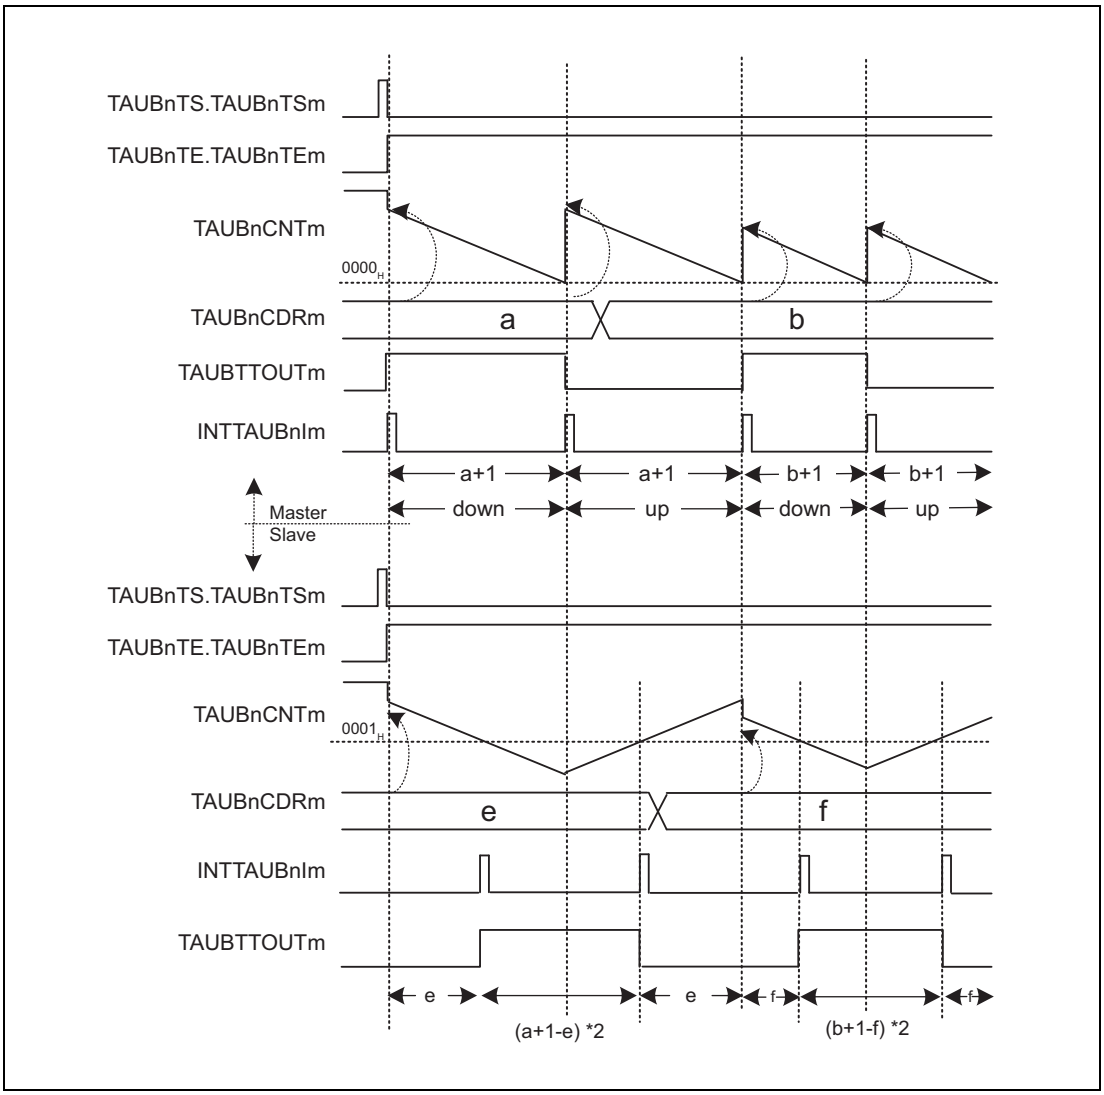

Figure 24.99 General Timing Diagram for Triangle PWM Output Function

Table 24.135 Contents of the TAUBnCMURm Register for the Slave Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the slave channel(s)

Table 24.136 Control Bit Settings for Synchronous Channel Output Mode 2

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.137 Simultaneous Rewrite Settings for the Slave Channel of the Triangle PWM Output Function

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

24.14.5.6 Operating Procedure for Triangle PWM Output Function

Table 24.138 Operating Procedure for Triangle PWM Output Function

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.5.4, Register Settings for the Master Channel** Slave channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.5.5, Register Settings for the Slave Channel(s)** Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUBnIm (master) is generated on the master channel when TAUBnCMORm.TAUBnMD0 set to 1.
During operation	TAUBnCDRm can be changed at any time. TAUBnTOL.TAUBnTOLm can be changed. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master and slave channels loads TAUBnCDRm and counts down. When the counter of the master channel reaches 0000_H: • INTTAUBnIm (master) is generated • TAUBTTOUTm (master) toggles • TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation. • TAUBnCNTm (slave) reloads the TAUBnCDRm value or counts in the reverse direction. When TAUBnCNTm of the slave = 0001_H: • INTTAUBnIm (slave) is generated • TAUBTTOUTm (slave) is set (in count-down status) or reset (in count-up status)
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

24.14.5.7 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnCDRm = a = 5_H
- Slave channel:
  - TAUBnCDRm = 6_H

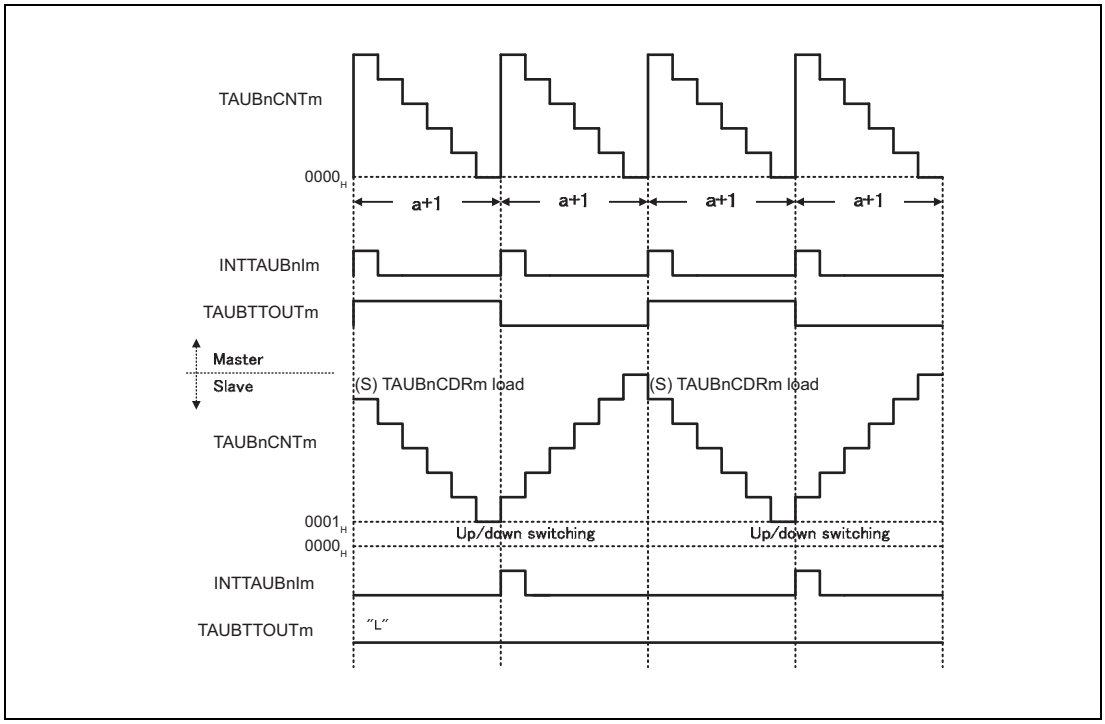

Figure 24.100 TAUBnCDRm (slave) ≥ TAUBnCDRm (master) + 1

- If TAUBnCDRm (slave) ≥ TAUBnCDRm (master) +1, INTTAUBnIm of slave channel is not generated during counting down. The set signal is never detected, so TAUBTTOUTm remains at low state.

(2) Duty cycle = 100%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnCDRm = a = 5_H
- Slave channel:
  - TAUBnCDRm = 0_B

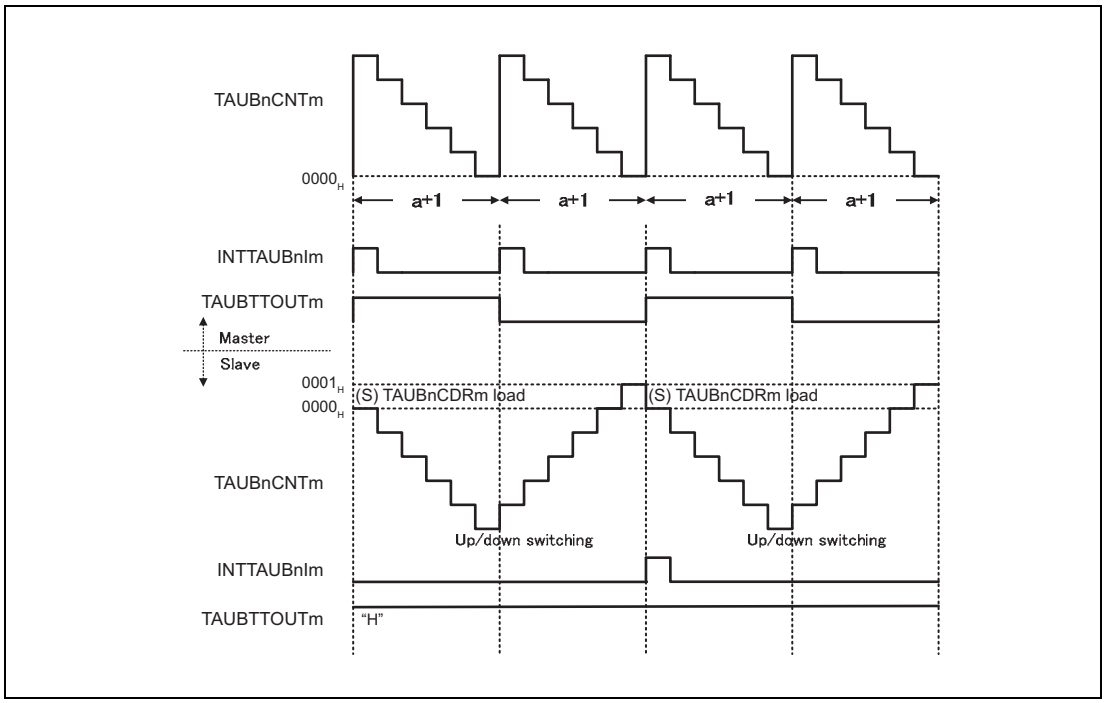

Figure 24.101 TAUBnCDRm (slave) = 0000_H

- If TAUBnCDRm (slave) = 0000_H, INTTAUBnIm of slave channel is not generated during counting up. The reset signal is never detected, so TAUBTTOUTm remains at high state.

24.14.6 Triangle PWM Output Function with Dead Time

24.14.6.1 Overview

Summary

This function generates multiple triangle PWM outputs with a defined dead time by using a master and two or more slave channels. The resulting PWM signals with the dead time are output via TAUBTTOUTm of the slave channels 2 and 3. It enables the pulse cycle (frequency) and the duty cycle of TAUBTTOUTm to be set using the master and slave channel(s) respectively.

The master generates a carrier cycle. The first pulse controls the down status and the second pulse controls the up status of the slaves counter.

An interrupt on slave 2 causes TAUBTTOUTm of the slave channels to be set or reset.
Depending on the settings of TAUBnTDL.TAUBnTDLm, delay time is added to positive or negative logic side of the signal (i.e. whether TAUBTTOUTm is set or reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

Prerequisites

- Three channels. Select an even channel CH (a) and an odd channel CH (a + 1) for slave channel 2 and 3 respectively.
- The operation mode of the master channel must be set to interval timer mode, see **Table 24.140, Contents of the TAUBnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time**
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even-numbered channel (a), and slave channel 3 is an odd-numbered channel (a + 1). Slave channel 1 can be used as a separate timer (independent function).
- The operation mode of slave channel 2 must be set to up down mode, see **Table 24.144, Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time**
  Furthermore, slave channel 2 must be an even channel
- The operation mode of slave channel 3 must be set to one-count mode, see **Table 24.148, Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time**
  Furthermore, slave channel 3 must be an odd channel
- The channel output mode of the master channel must be set to independent channel output mode 1
- The channel output mode of the slave channels 2 and 3 must be set to synchronous channel output mode 2.
- The following settings establish TAUBTTOUTm at high level for the down status of the carrier cycle.
  - If the TAUBnCMORm.MD0 (master) bit is set to 0,TAUBnTO.TAUBnTOm must be set to 1 while TAUBnTOE.TAUBnTOEm is 0. (recommended)
  - If the TAUBnCMORm.MD0 (master) bit is set to 1, TAUBnTO.TAUBnTOm must be set to 0 while TAUBnTOE.TAUBnTOEm is 0.

NOTE

Slave channel 1 is not used for Triangle PWM Output Function with Dead Time. Slave channel 1 can be used as a separate timer (independent function).

Functional description

The counters are enabled by setting the channel trigger bits (TAUBnTS.TAUBnTSm) to 1. This in turn sets TAUBnTE.TAUBnTEm = 1, enabling count operation. The current values of TAUBnCDRm is written to TAUBnCNTm and the counters start to count down from these values. If the master channel TAUBnCMORm.TAUBnMD0 bit is set to 1, an interrupt is generated and TAUBTTOUTm signal of the master toggles.

- Master channel:
  When the counter of the master channel reaches 0000_H, INTTAUBnIm is generated and the TAUBTTOUTm signal toggles. The counter reloads the TAUBnCDRm value and counts down.
- Slave channel 2:
  INTTAUBnIm generated on the master channel triggers the counter of the slave channel 2:
  - If the slave counter currently counts down, it changes count direction.
  - If the slave counter currently counts up, the value of TAUBnCDRm is reloaded and the counter counts down.

  The counter continues to count down or up and awaits the next INTTAUBnIm of the master channel.
  When the counter value of slave channel 2 reaches 0001_H, INTTAUBnIm is generated.
- Slave channel 3:
  INTTAUBnIm of slave channel 2 triggers the counter of slave channel 3. The current value of TAUBnCDRm (slave 3) is written to TAUBnCNTm (slave 3) and the counter starts to count down from this TAUBnCDRm value.
  When the counter reaches 0000_H, INTTAUBnIm is generated. The counter returns to $FFFF_H$ and awaits the next INTTAUBnIm of slave channel 2.

The TAUBnTDL.TAUBnTDLm settings of the corresponding channel specify whether it is set/reset immediately, or after dead time has elapsed, as shown in **Table 24.139, Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2**.

The TAUBnTOL.TOLm settings specify whether set corresponds to a high signal (TAUBnTOL.TAUBnTOLm = 0) or a low signal (TAUBnTOL.TAUBnTOLm = 1).

The counter can be stopped by setting TAUBnTT.TAUBnTTm to 1 for the master and slave channel(s), which in turn sets TAUBnTE.TAUBnTEm to 0. TAUBnCNTm and TAUBTTOUTm of master and slave channel(s) stop but retain their values.

TAUBnCDRm value of slave channel 2 can be set to 0000_H to output 100% TAUBTTOUTm.

NOTE

If a forced restart is executed during operation, TAUBTTOUTm is not output as a triangle PWM signal.

Conditions

Simultaneous rewrite can be used with this function. Please see **Section 24.6, Simultaneous Rewrite**.

TAUBnTOL.TAUBnTOLm and TAUBnTDL.TAUBnTDLm bits should be set before the counter starts, and slave channels 2 and 3 should have opposite TAUBnTOL.TAUBnTOLm settings or opposite TAUBnTDL.TAUBnTDLm settings.

Table 24.139 Behavior of TAUBTTOUTm when an Interrupt Occurs on Slave Channel 2

TAUBnTDL.TAUBnTDLm	Count Direction of Slave Channel 2 when Interrupt is Generated	TAUBTTOUTm Set/Reset Timing
0	Down	Set after dead time has elapsed
	Up	Reset immediately
1	Down	Set immediately
	Up	Reset after dead time has elapsed

24.14.6.2 Equations

Pulse cycle = (TAUBnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUBnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUBnCDRm (master) + 1) × 2 × count clock cycle

PWM signal width (positive phase) = [(TAUBnCDRm (master) + 1 – TAUBnCDRm (slave 2)) × 2 – (TAUBnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (negative phase) = [(TAUBnCDRm (master) + 1 – TAUBnCDRm (slave 2)) × 2 + (TAUBnCDRm (slave 3) + 1)] × count clock cycle

24.14.6.3 Block Diagram and General Timing Diagram

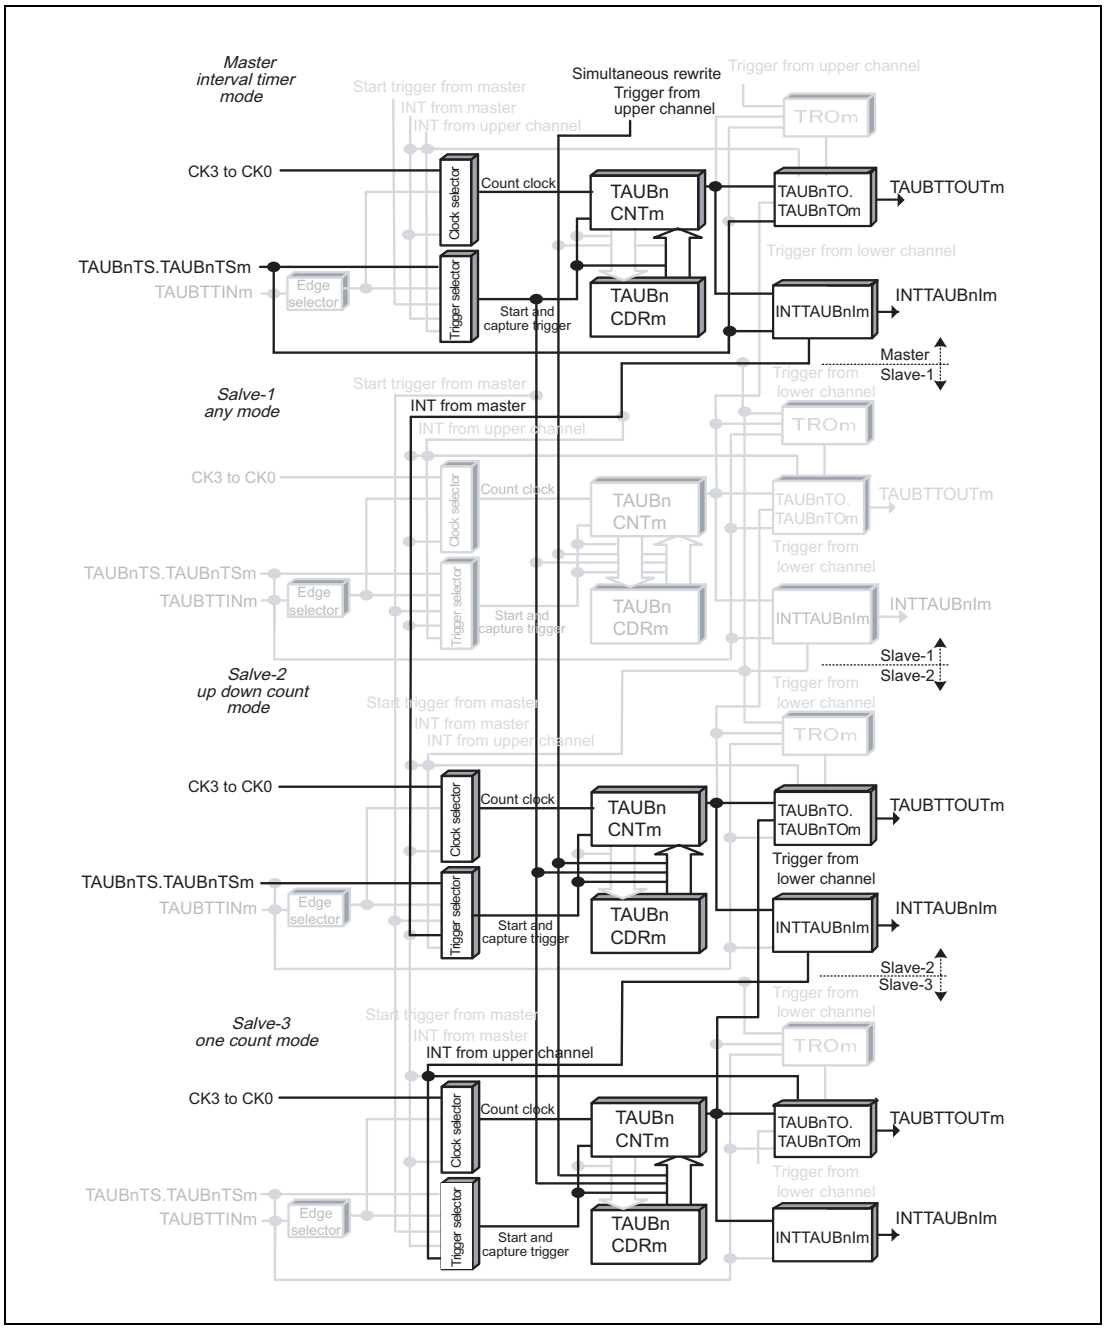

Figure 24.102 Block Diagram for Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)
- Slave channel 2:
  - INTTAUBnIm is not generated at operation start (TAUBnCMORm.TAUBnMD0 = 0)
  - TAUBnTDL.TAUBnTDLm = 0
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Enables start trigger detection during counting (TAUBnCMORm.TAUBnMD0 = 1)
  - TAUBnTDL.TAUBnTDLm = 1
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)

10 to 8	TAUBnSTS[2:0]	Write 000_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0000_B.
0	TAUBnMD0	0: INTTAUBnIm not generated and TAUBTTOUTm does not toggle at operation start 1: Generates INTTAUBnIm and toggles TAUBTTOUTm at operation start

(2) TAUBnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 24.141 Contents of the TAUBnCMURm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for the master channel

Table 24.142 Control Bit Settings for Independent Channel Output Mode 1

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 0_B.
TAUBnTOC.TAUBnTOCm	Write 0_B.
TAUBnTOL.TAUBnTOLm	Write 0_B.
TAUBnTDE.TAUBnTDEm	Write 0_B.
TAUBnTDL.TAUBnTDLm	Write 0_B.

(4) Simultaneous rewrite for the master channel

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.143 Simultaneous Rewrite Settings for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

NOTE

If TAUBnRDS.TAUBnRDSm = 1, the master channel requires an upper channel that generates the simultaneous rewrite trigger signal.

24.14.6.5 Register Settings for Slave Channel 2

(1) TAUBnCMORm for slave channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS [1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS [1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 24.144 Contents of the TAUBnCMORm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 111_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 1001_B.
0	TAUBnMD0	Write 0_B.

(2) TAUBnCMURm for slave channel 2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 24.145 Contents of the TAUBnCMURm Register for the Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 2

Table 24.146 Control Bit Settings for Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 1_B.
TAUBnTDL.TAUBnTDLm	0: Dead time is added to the positive phase 1: Dead time is added to the negative phase

CAUTION

Set TAUBnTDL.TAUBnTDLm exclusively to the odd channel.

(4) Simultaneous rewrite for slave channel 2

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.147 Simultaneous Rewrite Settings for Slave Channel 2 of the Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

24.14.6.6 Register Settings for Slave Channel 3

(1) TAUBnCMORm for slave channel 3

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUBnCKS [1:0]		—	TAUBn CCS0	TAUBn MAS	TAUBnSTS[2:0]			TAUBnCOS [1:0]		—	TAUBnMD[4:1]				TAUBn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 24.148 Contents of the TAUBnCMORm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUBnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUBnCKS[1:0] bits of the master and slave channel(s) must be identical.
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TAUBnCCS0	Write 0_B.
11	TAUBnMAS	Write 0_B.
10 to 8	TAUBnSTS[2:0]	Write 110_B.
7, 6	TAUBnCOS[1:0]	Write 00_B.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUBnMD[4:1]	Write 0100_B.
0	TAUBnMD0	Write 1_B.

(2) TAUBnCMURm for slave channel 3

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUBnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 24.149 Contents of the TAUBnCMURm Register for the Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUBnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode for slave channel 3

Table 24.150 Control Bit Settings for Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUBnTOE.TAUBnTOEm	Write 1_B.
TAUBnTOM.TAUBnTOMm	Write 1_B.
TAUBnTOC.TAUBnTOCm	Write 1_B.
TAUBnTOL.TAUBnTOLm	0: Positive logic 1: Negative logic
TAUBnTDE.TAUBnTDEm	Write 1_B.
TAUBnTDL.TAUBnTDLm	0: Dead time is added to the positive phase 1: Dead time is added to the negative phase

CAUTION

Set TAUBnTDL.TAUBnTDLm exclusively to the even channel.

(4) Simultaneous rewrite for slave channel 3

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 24.151 Simultaneous Rewrite Settings for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUBnRDE.TAUBnRDEm	1: Enables simultaneous rewrite
TAUBnRDS.TAUBnRDSm	0: Selects master channel for simultaneous rewrite triggers. 1: Selects upper channel outside the channel group for simultaneous rewrite triggers.
TAUBnRDM.TAUBnRDMm	1: The simultaneous rewrite trigger signal is generated when the master channel starts counting and the corresponding slave channel is at the peak of a triangular wave
TAUBnRDC.TAUBnRDCm	0: Does not use the channel to generate the simultaneous rewrite trigger.

24.14.6.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 24.152 Operating Procedure for Triangle PWM Output with Dead Time

	Operation	Status of TAUBn
Initial channel setting	Master channel: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.6.4, Register Settings for the Master Channel** Slave channel 2: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.6.5, Register Settings for Slave Channel 2** Slave channel 3: set the TAUBnCMORm and TAUBnCMURm registers and the channel output mode as described in **Section 24.14.6.6, Register Settings for Slave Channel 3** Set the values of the TAUBnCDRm registers of all channels	Channel operation is stopped.
Start operation	Set TAUBnTS.TAUBnTSm of the master and slave channels to 1 simultaneously. TAUBnTS.TAUBnTSm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUBnIm (master) is generated when TAUBnCMORm.TAUBnMD0 is set to 1 on the master channel.
During operation	TAUBnCDRm can be changed at any time. TAUBnCNTm and TAUBnRSF.TAUBnRSFm can be read at any time. TAUBnRDT.TAUBnRDTm can be changed during operation.	TAUBnCNTm of the master channel and slave channel 2 load TAUBnCDRm and count down. When the counter of the master channel reaches 0000_H: • INTTAUBnIm (master) is generated • TAUBnCNTm (master) reloads the TAUBnCDRm value and continues count operation • TAUBnCNTm (slave 2) reloads the TAUBnCDRm value or counts in the reverse direction When TAUBnCNTm (slave 2) reaches 0001_H: • INTTAUBnIm (slave 2) is generated • TAUBnCNTm of slave channel 3 loads the TAUBnCDRm value and counts down When TAUBnCNTm of slave channel 3 = 0000_H: • INTTAUBnIm is generated
Stop operation	Set TAUBnTT.TAUBnTTm of the master and slave channels to 1 simultaneously. TAUBnTT.TAUBnTTm is a trigger bit, so it is automatically cleared to 0.	TAUBnTE.TAUBnTEm is cleared to 0 and the counter stops. TAUBnCNTm and TAUBTTOUTm stop and retain their current values.

Restart operation

24.14.6.8 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

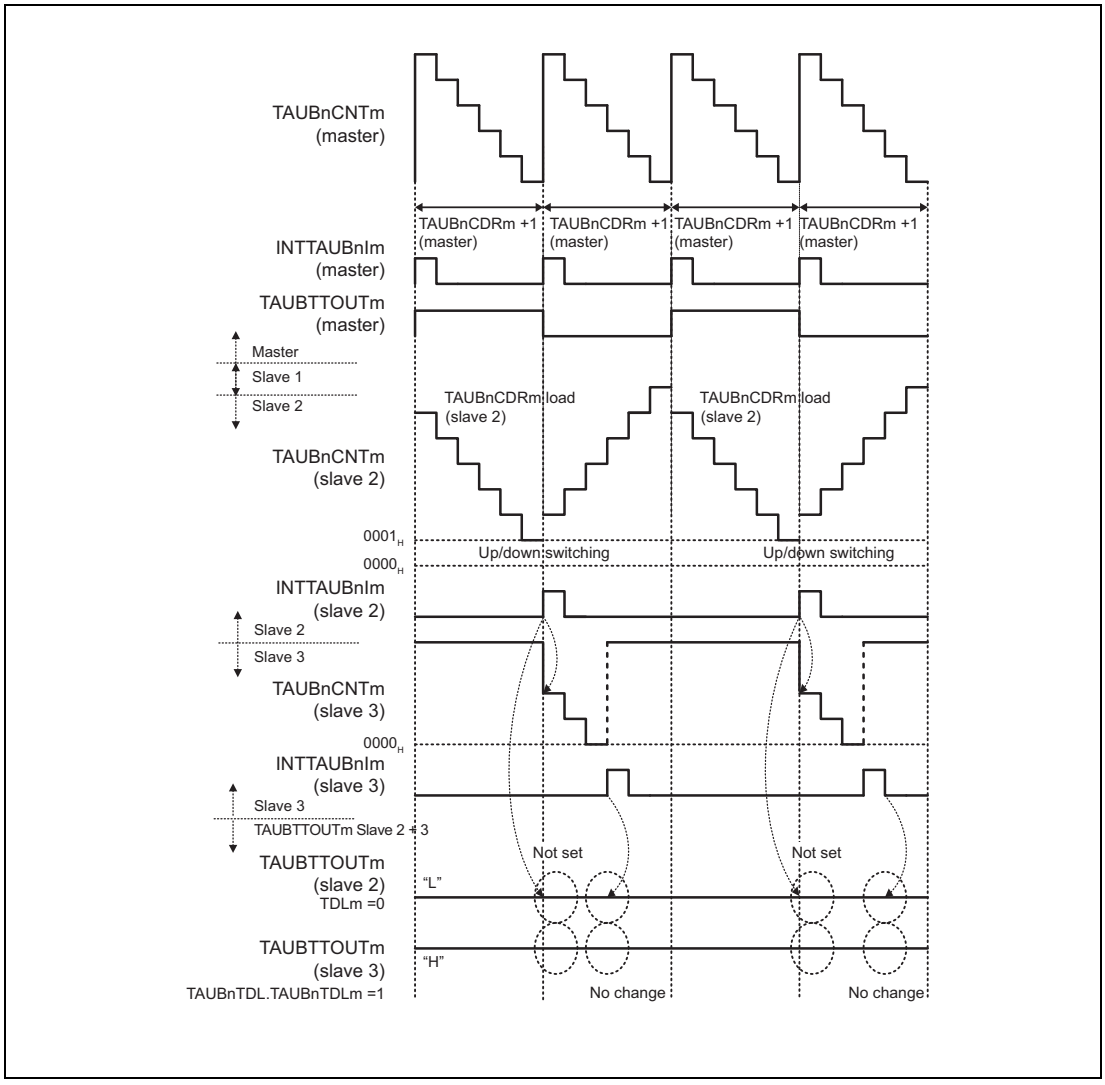

Figure 24.104 TAUBnCDRm (slave 2) ≥ TAUBnCDRm (master) + 1

- If TAUBnCDRm (slave 2) ≥ TAUBnCDRm (master), the counter of slave channel cannot reach 0000_H during counting down. Therefore TAUBTTOUTm cannot toggle, i.e. it remains at its initial state. The interrupt from slave channel 2 occurs during count up, therefore it is a reset signal.

(2) Duty cycle = 100%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

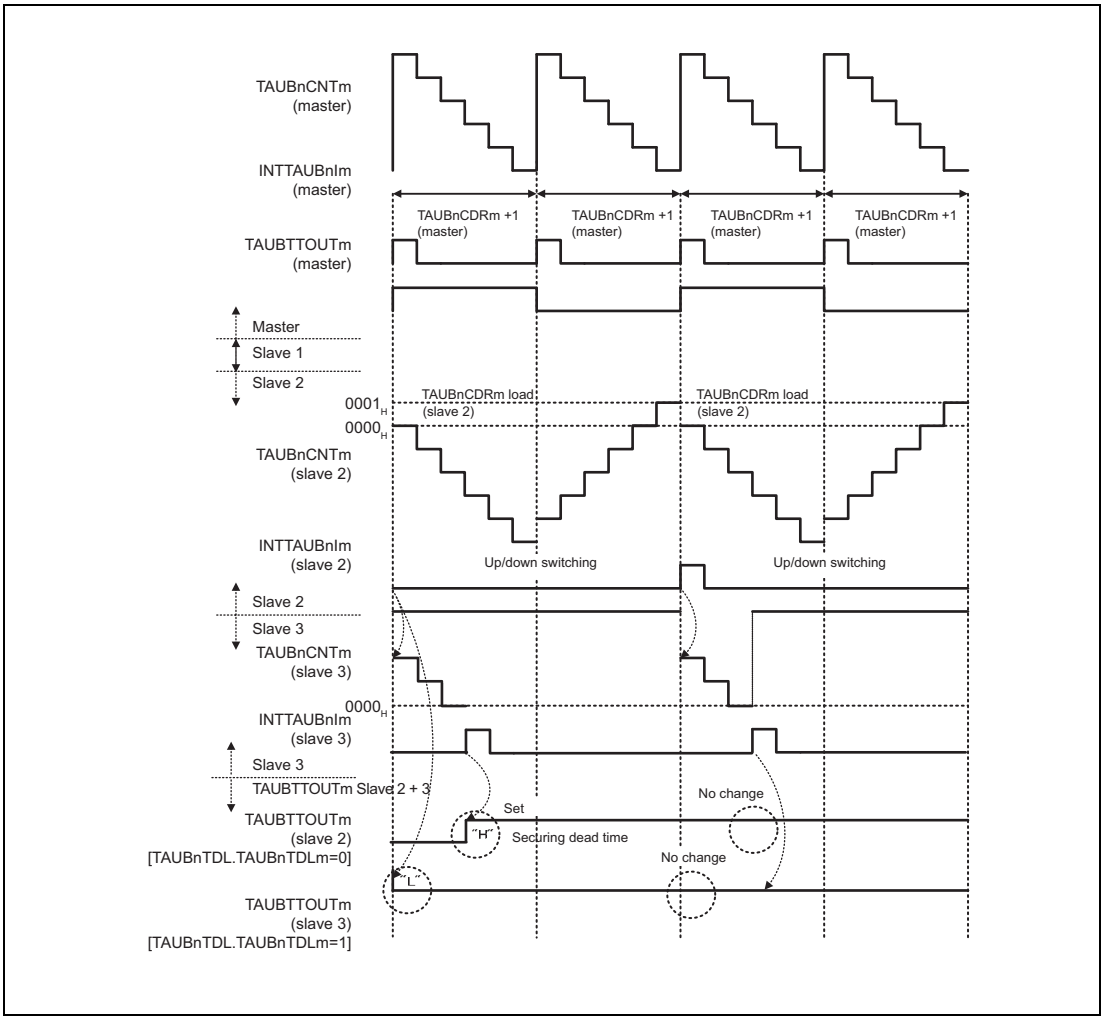

Figure 24.105 TAUBnCDRm (slave 2) = 0000_H

- If TAUBnCDRm (slave 2) = 0000_H the counter of slave channel cannot reach 0001_H while counting up and therefore cannot generate an INTTAUBnIm while counting up.
  - The set conditions for a channel in which TAUBnTDL.TAUBnTDLm = 0 are met after dead time has elapsed. TAUBTTOUTm toggles but remains in the new state because the reset conditions are never satisfied for such a channel.
  - Slave channel 3 in the above diagram is set when the counter starts.
    However, the reset conditions for a channel in which TAUBnTDL.TAUBnTDLm = 1 are never satisfied so TAUBTTOUTm remains in its initial state for such a slave channel.

(3) TAUBTTOUTm (slave 2) = 0% and TAUBTTOUTm (slave 3) ≥ 0%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

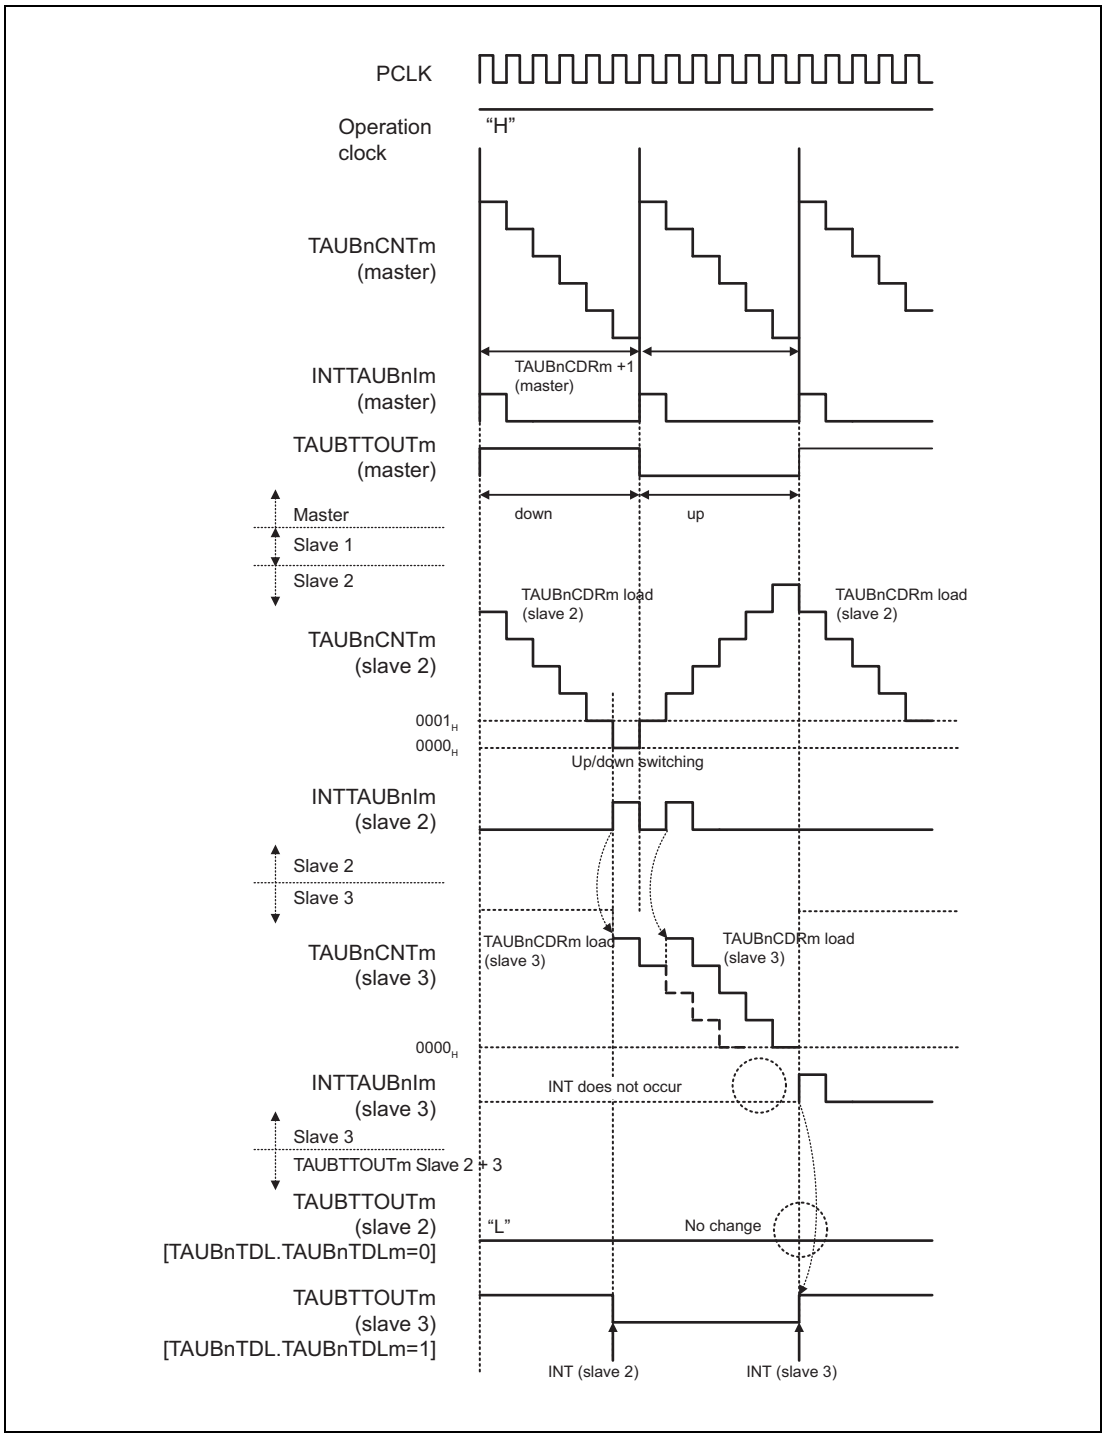

Figure 24.106 TAUBnCDRm (master) = 0005_H, TAUBnCDRm (slave 2) = 0005_H TAUBnCDRm (slave 3) = 0004_H

- When the counter of slave channel 2 reaches 0000_H after detecting that the counter reached 0001_H, INTTAUBnIm (slave 2) is generated. The counter of slave channel 3 starts to count down.
- If another INTTAUBnIm (slave 2) is generated while the counter of slave channel 3 is still counting down, the value of TAUBnCDRm (slave 3) is reloaded and the counter restarts counting down from this value.
- In the diagram above, the first interrupt on channel 2 occurs while the counter is counting down, and the second while it is counting up.
- After the first interrupt, a slave for which TAUBnTDL.TAUBnTDLm = 0 waits for dead time to elapse before setting. However, if another interrupt occurs on slave 2, before the dead time has elapsed, the counter is counting up, so the signal acts as a reset signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm = 0 always remains inactive.
- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 is set and reset as normal when the corresponding INTTAUBnIm is generated.

(4) TAUBTTOUTm (slave 2) > 0% and TAUBTTOUTm (slave 3) = 100%

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

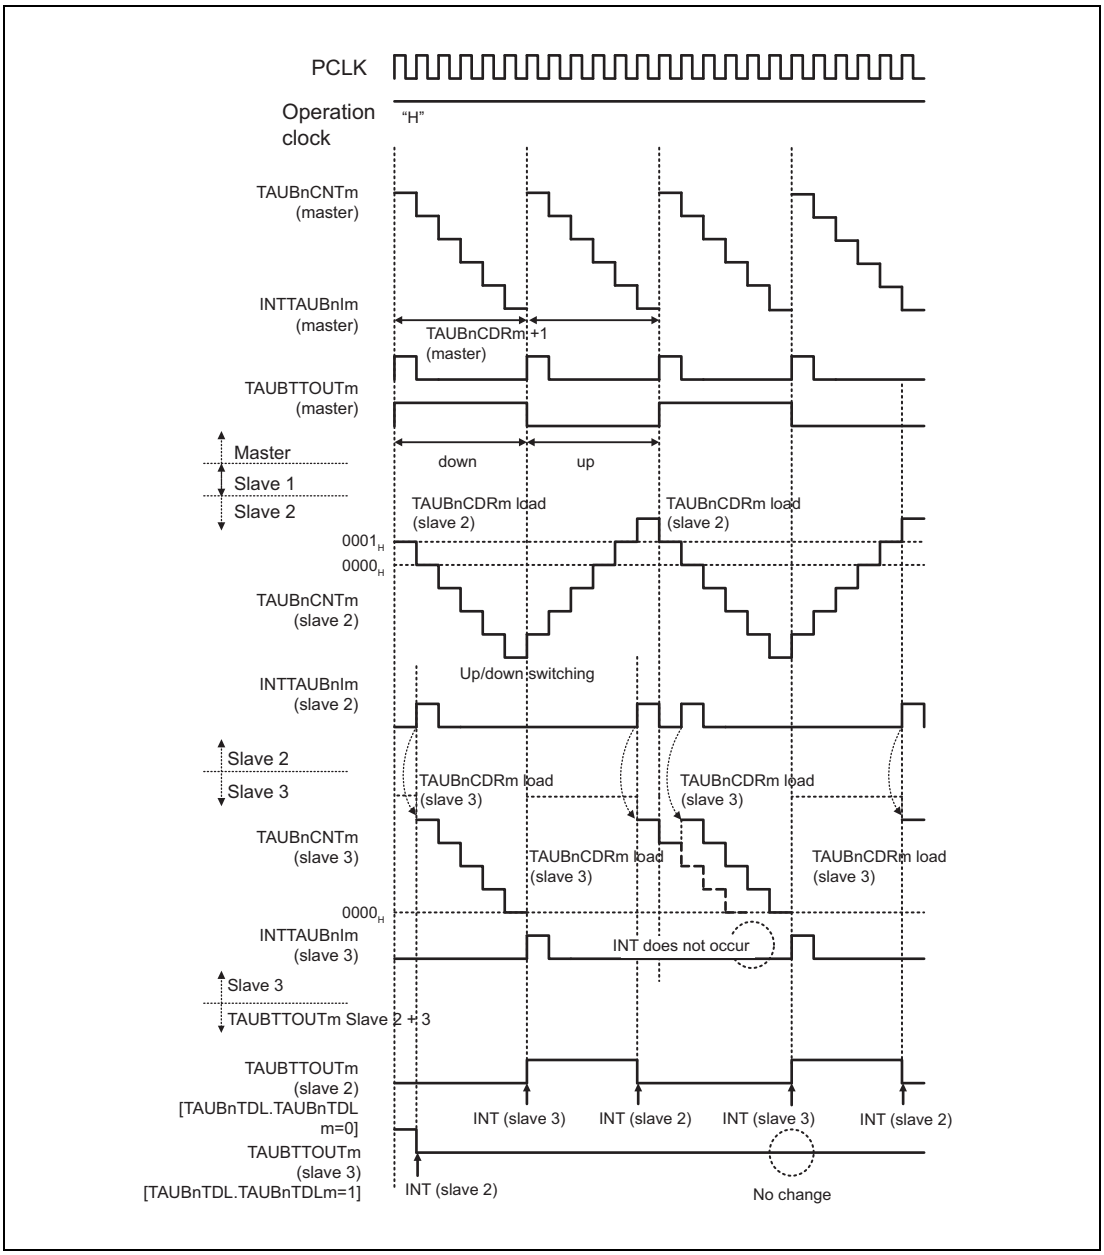

Figure 24.107 TAUBnCDRm (master) = 0005_H, TAUBnCDRm (slave 2) = 0001_H TAUBnCDRm (slave 3) = 0004_H PWM Signal Width (negative phase) ≥ Carrier Cycle

- After the second interrupt on slave channel 2, a slave for which TAUBnTDL.TAUBnTDLm = 1 is reset after the dead time has elapsed. However if another interrupt occurs on slave 2 before the dead time has elapsed, slave channel 3 is restarted, and then if an interrupt on slave channel 3 is generated, the counter is counting up, so the signal acts as a setting signal, meaning that a channel for which TAUBnTDL.TAUBnTDLm = 1 always remains active.
- TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 0 is set and reset as normal when the corresponding INTTAUBnIm is generated.

(5) Inhibited INTTAUBnIm to set TAUBTTOUTm positive phase period

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

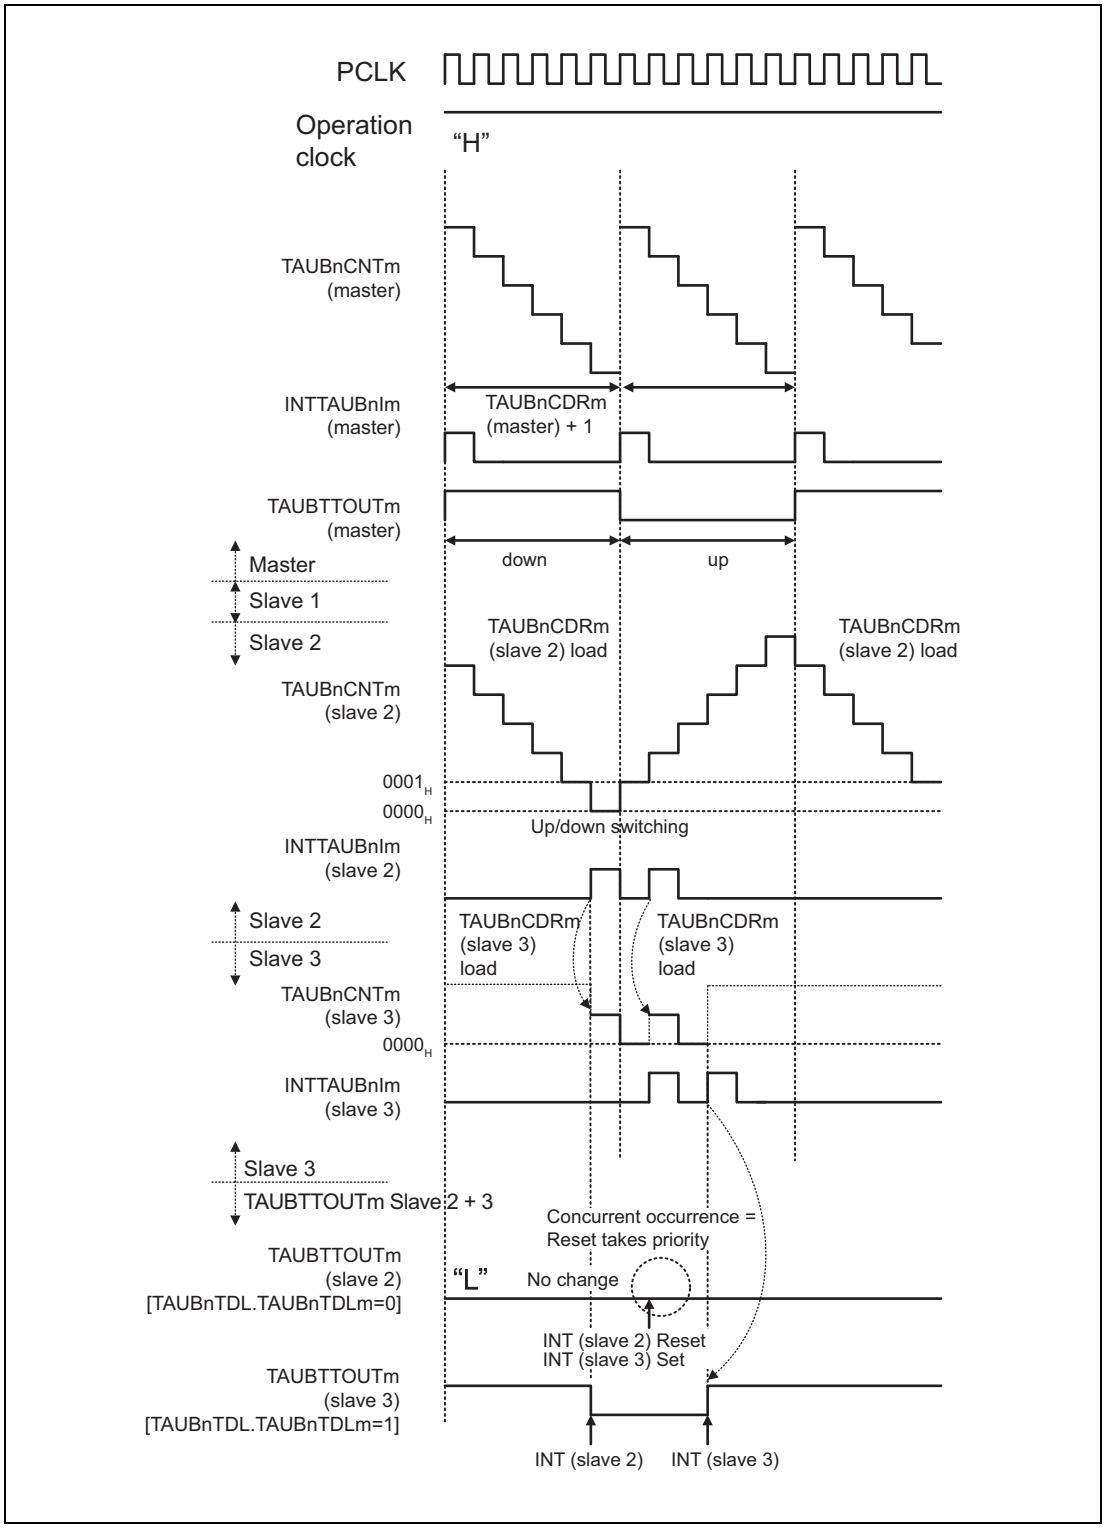

Figure 24.108 TAUBnCDRm (master) = 0005_H, TAUBnCDRm (slave 2) = 0005_H, TAUBnCDRm (slave 3) = 0001_H PWM Signal Width (positive phase) = 0

- The counter of slave channel 3 reaches 0000_H and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm = 0 (slave channel 2 in this example).
- If slave channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, this reset signal is given priority if TAUBnTOL.TAUBnTOLm = 0 (if TAUBnTOL.TAUBnTOLm = 1, the set signal is given priority).
- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 0 remains in the value after reset.

(6) Inhibited INTTAUBnIm to set TAUBTTOUTm negative phase period

The following settings apply to the diagram below.

- Slave channel 2:
  - Positive logic (TAUBnTOL.TAUBnTOLm = 0)
- Slave channel 3:
  - Negative logic (TAUBnTOL.TAUBnTOLm = 1)

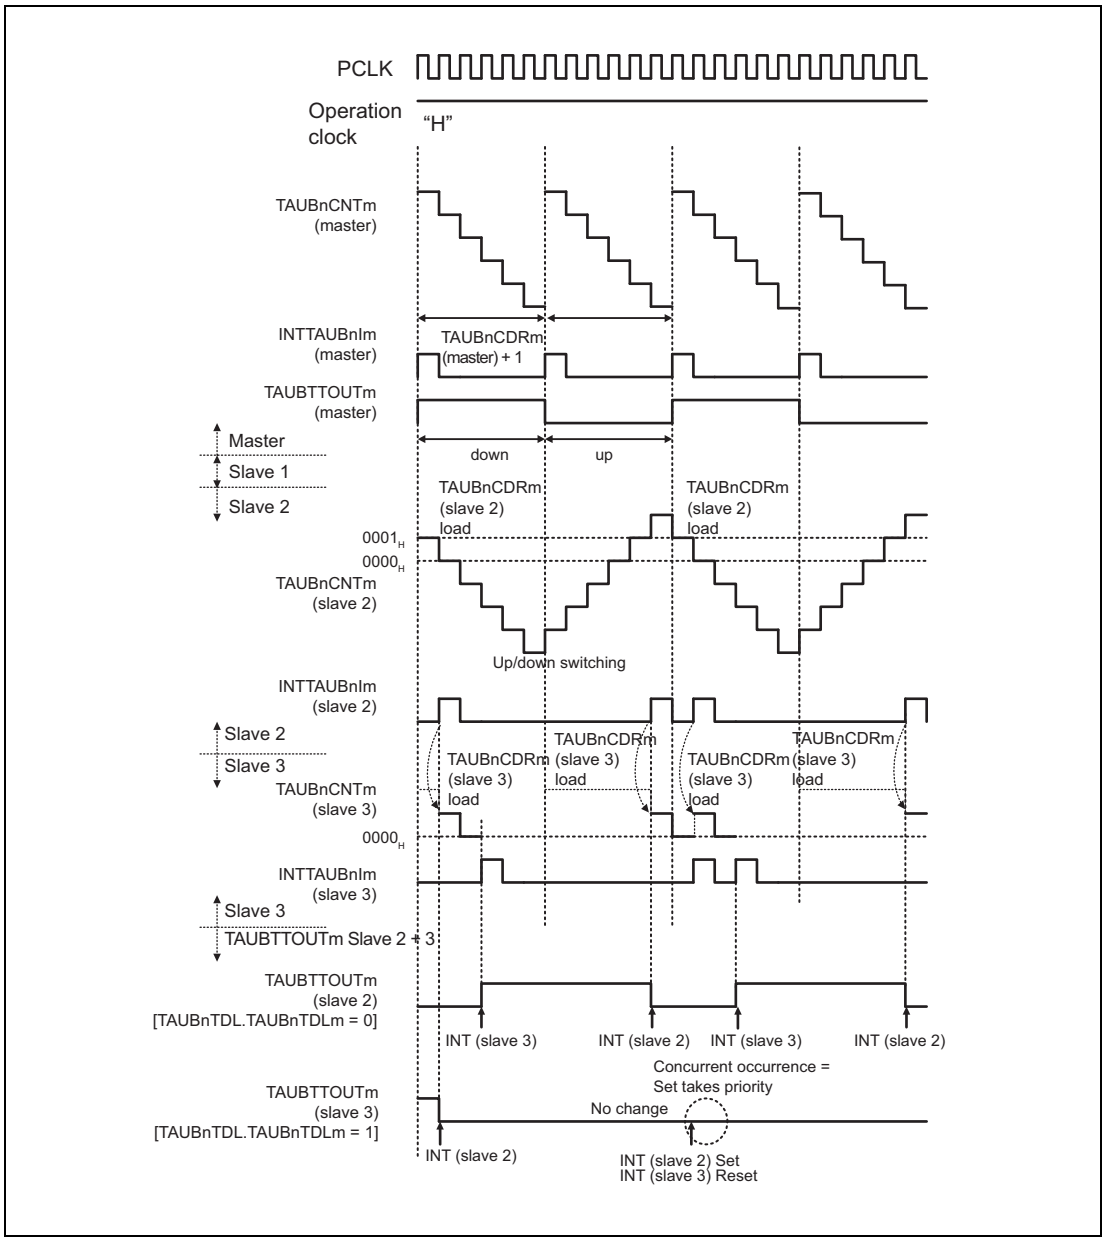

Figure 24.109 TAUBnCDRm (master) = 0005_H, TAUBnCDRm (slave 2) = 0001_H, TAUBnCDRm (slave 3) = 0001_H PWM Signal Width (negative phase) = Carrier Cycle

- The counter of slave channel 3 reaches 0000_H and generates an INTTAUBnIm to set the TAUBTTOUTm of slave channel for which TAUBnTDL.TAUBnTDLm = 1 (slave 3 in this example).

- If slave channel 2 generates an INTTAUBnIm and resets TAUBTTOUTm simultaneously, the set signal is given priority if TAUBnTOL.TAUBnTOLm = 1 (if TAUBnTOL.TAUBnTOLm = 0, the reset signal is given priority).
- Therefore, TAUBTTOUTm of a slave channel for which TAUBnTDL.TAUBnTDLm = 1 remains in the value after reset.

(7) Slave 2 TAUBnCDRm = 0000_H (Duty cycle = 100%)

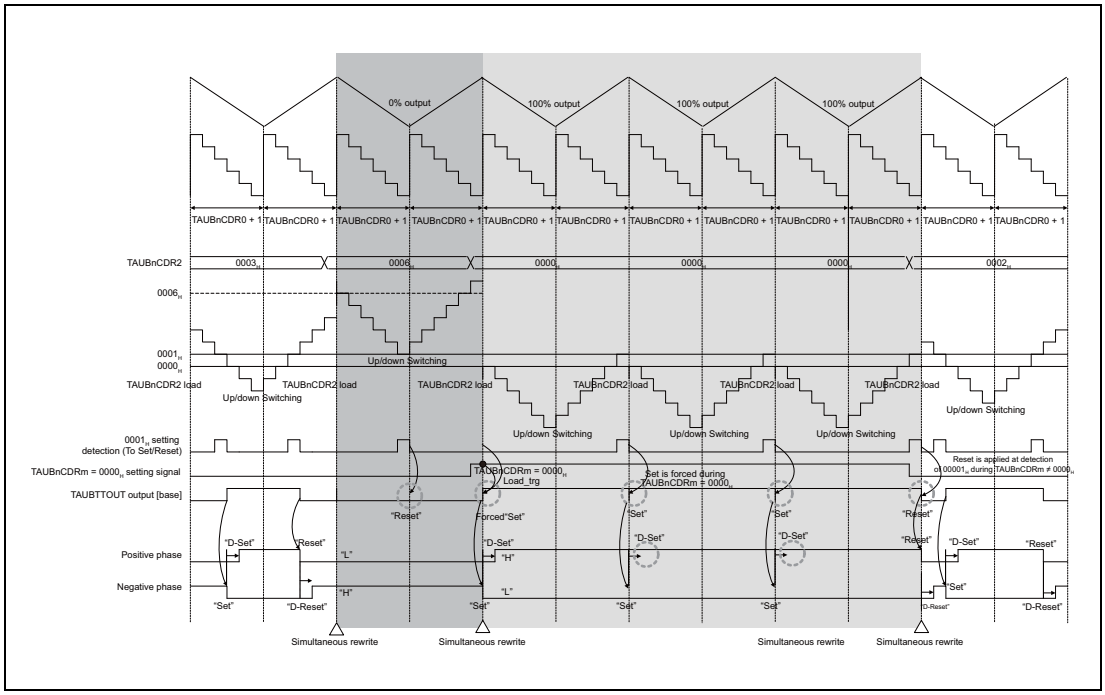

Figure 24.110 Slave 2 TAUBnCDRm = 0000_H (Duty cycle = 100%)

When rewriting (slave channel 2) TAUBnCDRm ≠ 0000_H to (slave channel 2) TAUBnCDRm = 0000_H (100% output), set the negative phase side at the start of the carrier cycle, and set the positive phase side after dead time is secured.

When rewriting (slave channel 2) TAUBnCDRm = 0000_H (100% output) to (slave channel 2) TAUBnCDRm ≠ 0000_H, reset the positive phase side at the end of the carrier cycle, and reset the negative phase side after dead time is secured.

24.14.7 A/D Conversion Trigger Output Function Type 2

24.14.7.1 Overview

Summary

This function is identical to **Section 24.14.5, Triangle PWM Output Function**, except that TAUBTTOUTm is not output.

This is achieved by setting the channel output mode of the slave to independent channel output mode controlled by software.

24.14.7.2 Block Diagram and General Timing Diagram

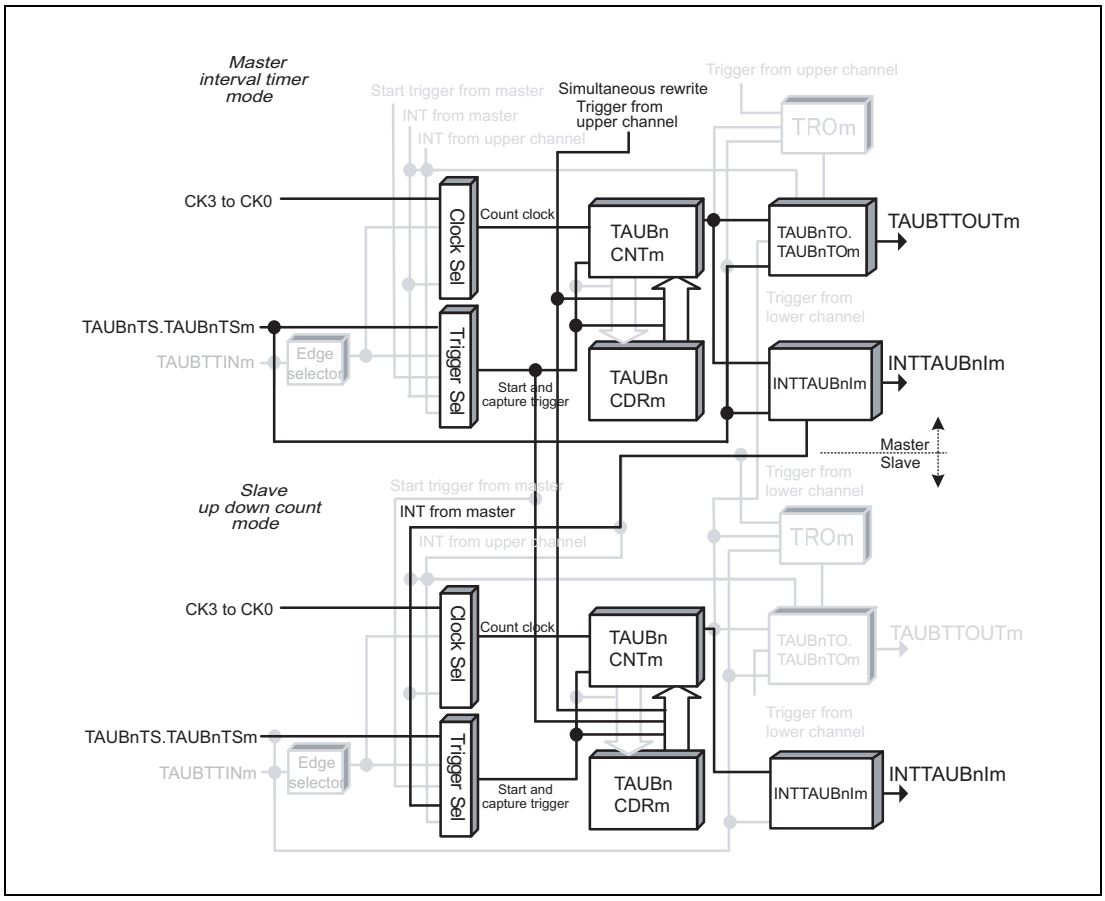

Figure 24.111 Block Diagram for A/D Conversion Trigger Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUBnIm is generated at operation start (TAUBnCMORm.TAUBnMD0 = 1)

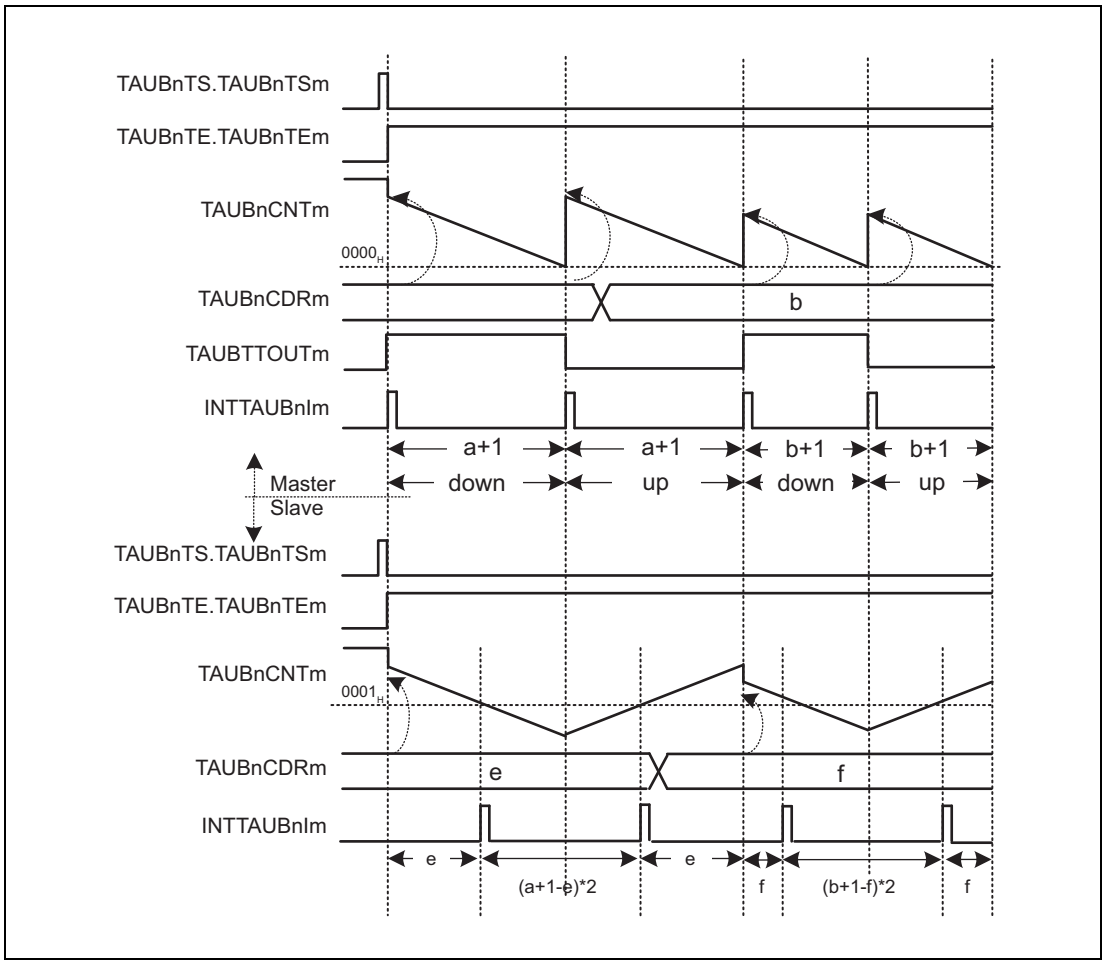

Figure 24.112 General Timing Diagram for A/D Conversion Trigger Output Function Type 2

Section 25 Timer Array Unit D (TAUD)

This section contains a generic description of the timer array unit D (TAUD).

The first part in this section describes the RH850/F1K specific features, such as the number of units and the register base addresses. The remainder of the section describes the functions and registers of the TAUD.

25.1 Features of RH850/F1K TAUD

25.1.1 Number of Units and Channels

This microcontroller has the following number of TAUD units.

Table 25.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	1		
Name	TAUDn (n = 0)		

TAUDn has the following number of channels of timers.

Table 25.2 TAUDn Unit Configurations and Channels

Unit Name (Channel Name) TAUDn	Channels per Unit	RH850/F1K 100 pins (16 ch)	RH850/F1K 144 pins (16 ch)	RH850/F1K 176 pins (16 ch)
TAUD0	16	√	√	√

Table 25.3 Indices

Index	Description
n	Throughout this section, the individual TAUD units are identified by the index “n”; for example, TAUDnTOM is the TAUDn channel output mode register.
m	The TAUD has 16 channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 15), thus a certain channel is denoted as CHm. The even numbered channels (m = 0, 2, 4, 6, 8, 10, 12, 14) are denoted as CHm_even. The odd numbered channels (m = 1, 3, 5, 7, 9, 11, 13, 15) are denoted as CHm_odd.

25.1.2 Register Base Address

TAUDn base addresses are listed in the following table.

TAUDn register addresses are given as offsets from the base addresses.

Table 25.4 Register Base Address

Base Address Name	Base Address
<TAUD0_base>	FFE2 0000_H

25.1.3 Clock Supply

The TAUDn clock supply is shown in the following table.

Table 25.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAUDn	PCLK	CKSCLK_IPERI1	Module clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_IPERI1	

25.1.4 Interrupt Requests

TAUDn interrupt requests are listed in the following table.

Table 25.6 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
TAUD0			
INTTAUD0I0	Channel 0 interrupt	8, 132	0
INTTAUD0I1	Channel 1 interrupt	48	15
INTTAUD0I2	Channel 2 interrupt	9, 158	64
INTTAUD0I3	Channel 3 interrupt	49	76
INTTAUD0I4	Channel 4 interrupt	10, 133	1
INTTAUD0I5	Channel 5 interrupt	50	16
INTTAUD0I6	Channel 6 interrupt	11, 134	65
INTTAUD0I7	Channel 7 interrupt	51	77
INTTAUD0I8	Channel 8 interrupt	12, 135	2
INTTAUD0I9	Channel 9 interrupt	52	17
INTTAUD0I10	Channel 10 interrupt	13, 159	66
INTTAUD0I11	Channel 11 interrupt	53	78
INTTAUD0I12	Channel 12 interrupt	14, 160	3
INTTAUD0I13	Channel 13 interrupt	54	18
INTTAUD0I14	Channel 14 interrupt	15, 161	67
INTTAUD0I15	Channel 15 interrupt	55	79

25.1.5 Reset Sources

TAUDn reset sources are listed in the following table. TAUDn is initialized by these reset sources.

Table 25.7 Reset Sources

Unit Name	Reset Source
TAUDn	All reset sources (ISORES)

25.1.6 External Input/Output Signals

External input/output signals of TAUDn are listed below. .

Table 25.8 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
TAUD0		
TAUDTTIN0	Channel 0 input*1	TAUD0I0
TAUDTTIN1	Channel 1 input*1	TAUD0I1
TAUDTTIN2	Channel 2 input*1	TAUD0I2
TAUDTTIN3	Channel 3 input*1	TAUD0I3
TAUDTTIN4	Channel 4 input*1	TAUD0I4
TAUDTTIN5	Channel 5 input*1	TAUD0I5
TAUDTTIN6	Channel 6 input*1	TAUD0I6
TAUDTTIN7	Channel 7 input*1	TAUD0I7
TAUDTTIN8	Channel 8 input*1	TAUD0I8
TAUDTTIN9	Channel 9 input*1	TAUD0I9
TAUDTTIN10	Channel 10 input*1	TAUD0I10
TAUDTTIN11	Channel 11 input*1	TAUD0I11
TAUDTTIN12	Channel 12 input*1	TAUD0I12
TAUDTTIN13	Channel 13 input*1	TAUD0I13
TAUDTTIN14	Channel 14 input*1	TAUD0I14
TAUDTTIN15	Channel 15 input*1	TAUD0I15
TAUDTTOUT0	Channel 0 output	TAUD0O0
TAUDTTOUT1	Channel 1 output	TAUD0O1
TAUDTTOUT2	Channel 2 output	TAUD0O2
TAUDTTOUT3	Channel 3 output	TAUD0O3
TAUDTTOUT4	Channel 4 output	TAUD0O4
TAUDTTOUT5	Channel 5 output	TAUD0O5
TAUDTTOUT6	Channel 6 output	TAUD0O6
TAUDTTOUT7	Channel 7 output	TAUD0O7
TAUDTTOUT8	Channel 8 output	TAUD0O8
TAUDTTOUT9	Channel 9 output	TAUD0O9
TAUDTTOUT10	Channel 10 output	TAUD0O10
TAUDTTOUT11	Channel 11 output	TAUD0O11
TAUDTTOUT12	Channel 12 output	TAUD0O12
TAUDTTOUT13	Channel 13 output	TAUD0O13
TAUDTTOUT14	Channel 14 output	TAUD0O14
TAUDTTOUT15	Channel 15 output	TAUD0O15

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**.

25.1.7 Internal Input/Output Signals

The internal input/output signals of TAUDn are listed below.

Table 25.9 Internal Input/Output Signals

Unit Signal Name	Description	Connected to
TAUDnTSSTm	Simultaneous channel start trigger input	PIC
TAUDnTUDCm (m = 0, 2, 8)	TAUD master up/down signal output	PIC

25.1.8 TAUD0 Input Selection

The output from port TAUD0Im (m = 0 to 15) can be input to TAUDTTINm (m = 0 to 15) as shown in the following figure.

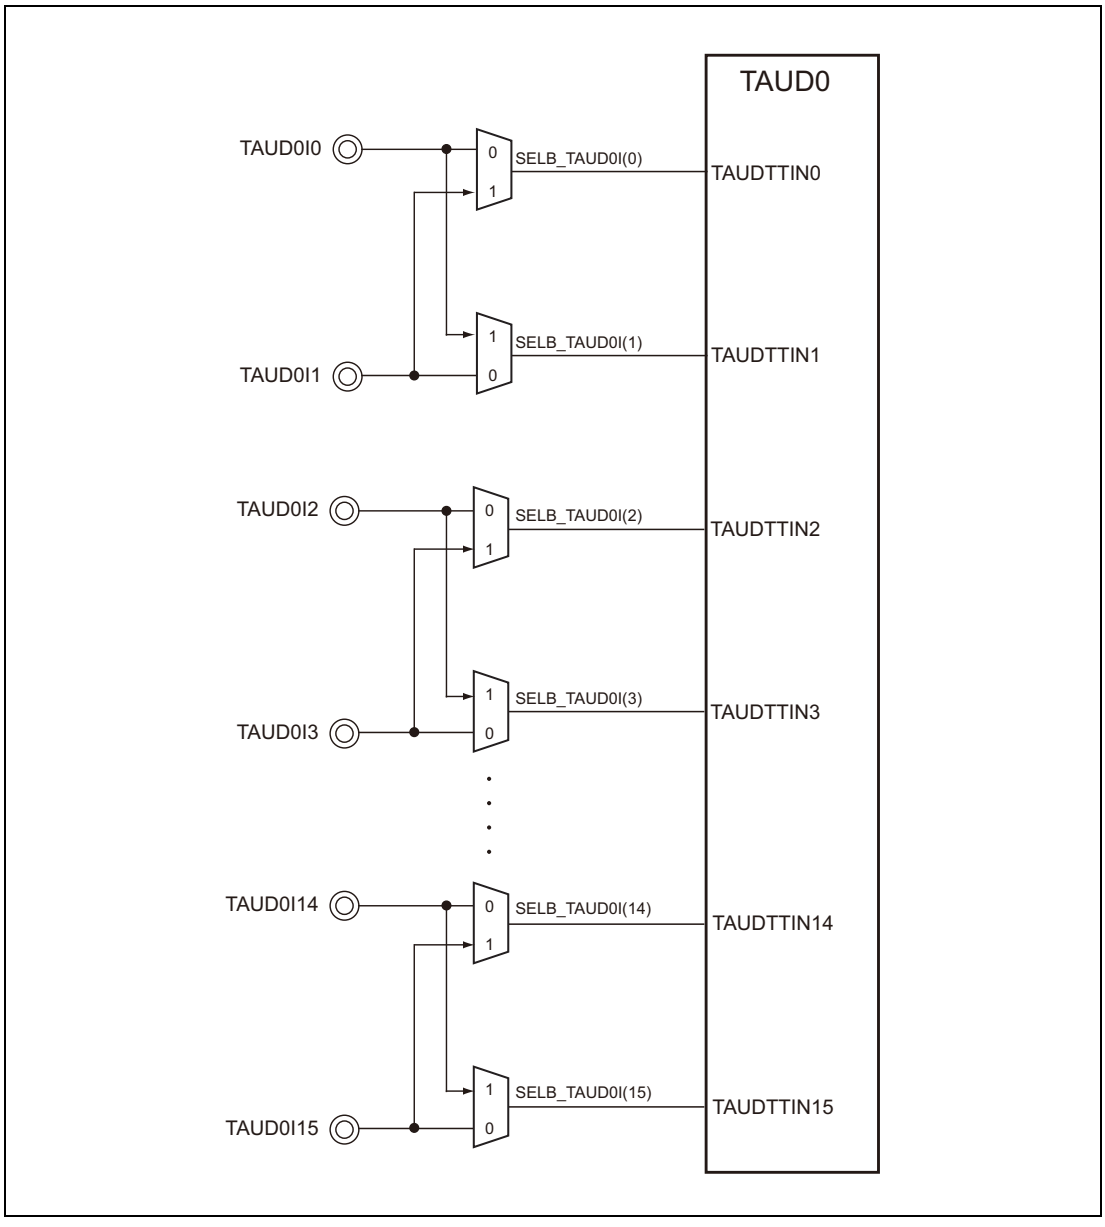

Figure 25.1 Selection of Signals Input to TAUD0

The following table shows the method of selecting input signals to several TAUD0 inputs.

Table 25.10 TAUD0 Input Selection

Input Signal	Function	Settings
TAUDTTIN [m]	Port TAUD0I[m]	SELB_TAUD0I [m] = 0
	Port TAUD0I[m + 1]	SELB_TAUD0I [m] = 1
TAUDTTIN [m + 1]	Port TAUD0I[m + 1]	SELB_TAUD0I [m + 1] = 0
	Port TAUD0I[m]	SELB_TAUD0I [m + 1] = 1

25.1.8.1 List of Registers

Input signal selection register is listed in the following table.

Table 25.11 List of Registers

Module Name	Register Name	Symbol	Address
SL_TAUD0	TAUDTTINm Input Signal Selection Register	SELB_TAUD0I	FFE2 4000_H

25.1.8.2 SELB_TAUD0I — TAUDTTINm Input Signal Selection Register

This register selects the TAUDTTINm input signals.

Access: This register can be read or written in 16-bit units.

Address: FFE2 4000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SELB_TAUD0I 15	SELB_TAUD0I 14	SELB_TAUD0I 13	SELB_TAUD0I 12	SELB_TAUD0I 11	SELB_TAUD0I 10	SELB_TAUD0I 9	SELB_TAUD0I 8	SELB_TAUD0I 7	SELB_TAUD0I 6	SELB_TAUD0I 5	SELB_TAUD0I 4	SELB_TAUD0I 3	SELB_TAUD0I 2	SELB_TAUD0I 1	SELB_TAUD0I 0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.12 SELB_TAUD0I Register Contents

Bit Position	Bit Name	Function
15 to 0	SELB_TAUD0Im	Selection of TAUDTTINm input signal

TAUD Input	Bit [m+1]	Bit [m]	Input signal
TAUDTTIN[m]	x	0	Selection of port TAUD0I[m]
	x	1	Selection of port TAUD0I[m + 1]
TAUDTTIN[m+1]	0	x	Selection of port TAUD0I[m + 1]
	1	x	Selection of port TAUD0I[m]

(m = 0, 2, 4, 6, 8, 10, 12, 14)

CAUTION

Do not change the input signal of each channel during the timer counting.

25.2 Overview

25.2.1 Functional Overview

The TAUD has the following functions:

- 16 channels
- 16-bit counter and 16-bit data register per channel
- Independent channel operation
- Synchronous channel operation (master and slave operation)
- Generation of different types of output signal
- Real-time output
- Counter can be triggered by external signal
- Interrupt generation

The Timer Array Unit D is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 16 channels, each equipped with a 16-bit counter TAUDnCNTm and a 16-bit data register TAUDnCDRm to hold the start or compare value of the counter.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate in different operation modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, its operation mode and functions are not affected by those of other channels. When a channel is operated synchronously it is either a master or a slave. A master channel can have multiple slaves, and the state of one channel affects that of the other channels. For example, this means that one channel can control when another starts to count, is reset, etc.

25.2.2 Terms

In this section, the following terms are used.

Independent / synchronous channel operation

Independent or synchronous channel operation describes the dependency of channels on each other:

- If a channel operates independently of all other channels, this is called independent channel operation.
- If a channel operates depending on other channels, this is called synchronous channel operation.

Channel group

In synchronous channel operation, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

Operation mode

An operation mode can be selected for every channel m. The operation mode defines the basic operation and features of a channel.

In synchronous channel operation, every channel in the channel group can operate in a different operation mode.

Examples are “Capture Mode”, “Event Count Mode”, and “Interval Timer Mode”.

Channel output mode

The channel output mode defines the operation of TAUDTTOUTm

- of a single channel (independent output operation) or
- of all channels in a channel group (synchronous output operation).

Examples are “Independent Channel Output Mode 1” and “Synchronous Channel Output Mode 2 with Dead Time Output”.

Channel operation function

The channel operation function defines the complete function and all features

- of a single channel (independent channel operation) or
- of all channels in a channel group (synchronous channel operation).

Upper / lower channel

Depending on the channel number m, a channel with a smaller number or with a larger number is referred to as “upper” or “lower” channel, respectively.

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

Example:

For channel 5, channel 3 is an upper channel and channel 9 is a lower channel.

25.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 25.13 Functional List of TAUD Operations

Operation Function	Example
Independent Channel Operation Functions	**Section 25.12**
Interval Timer Function	**Section 25.12.1**

25.2.4 TAUD I/O and Interrupt Request Signals

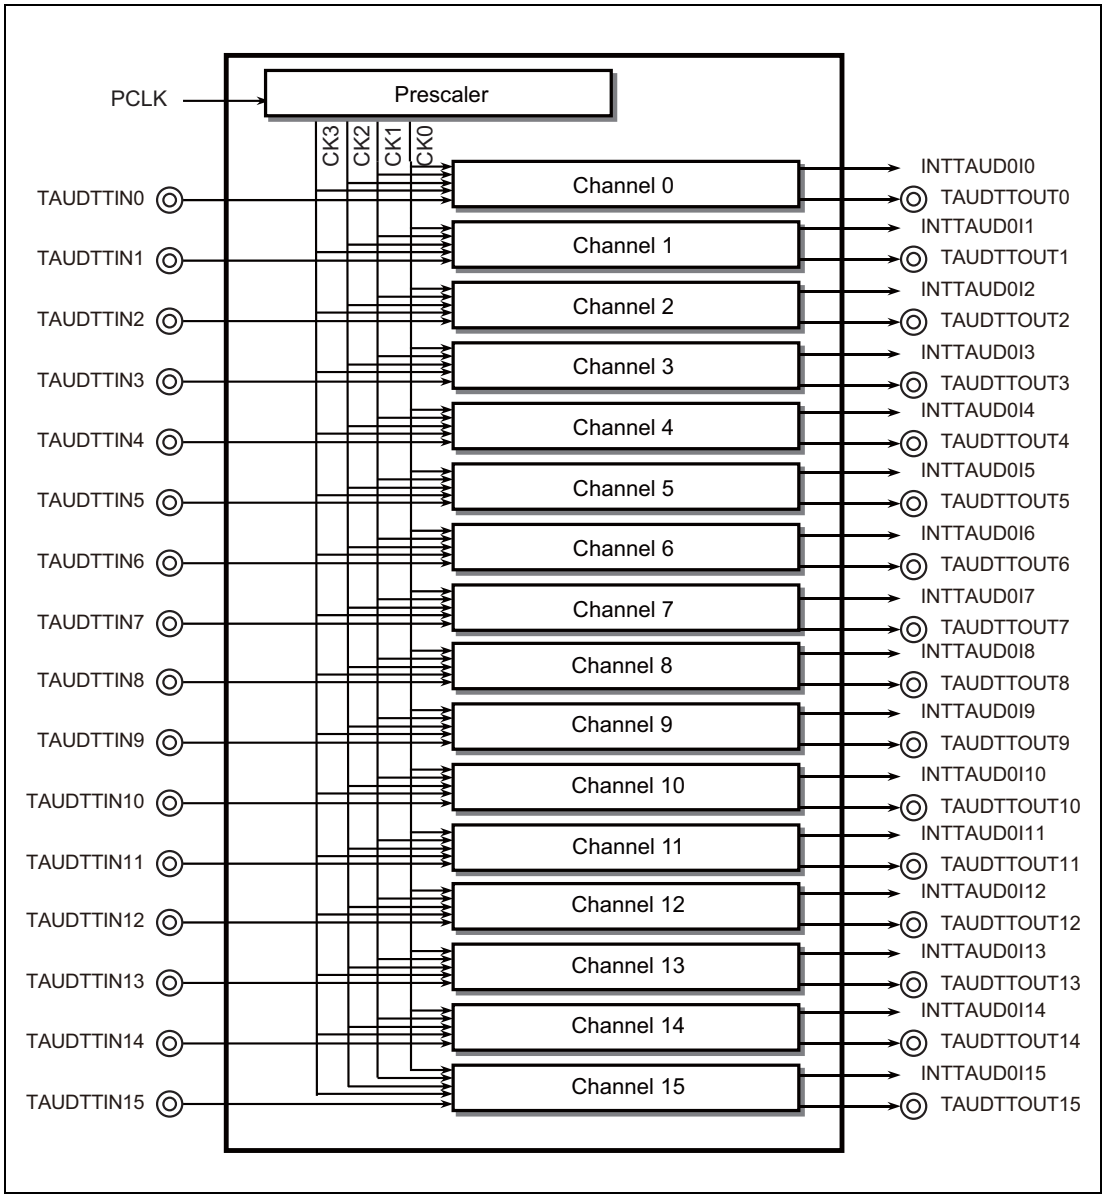

Figure 25.2 TAUD I/O and Interrupt Request Signals

25.2.5 Block Diagram

Figure 25.3 shows the main components of the TAUD.

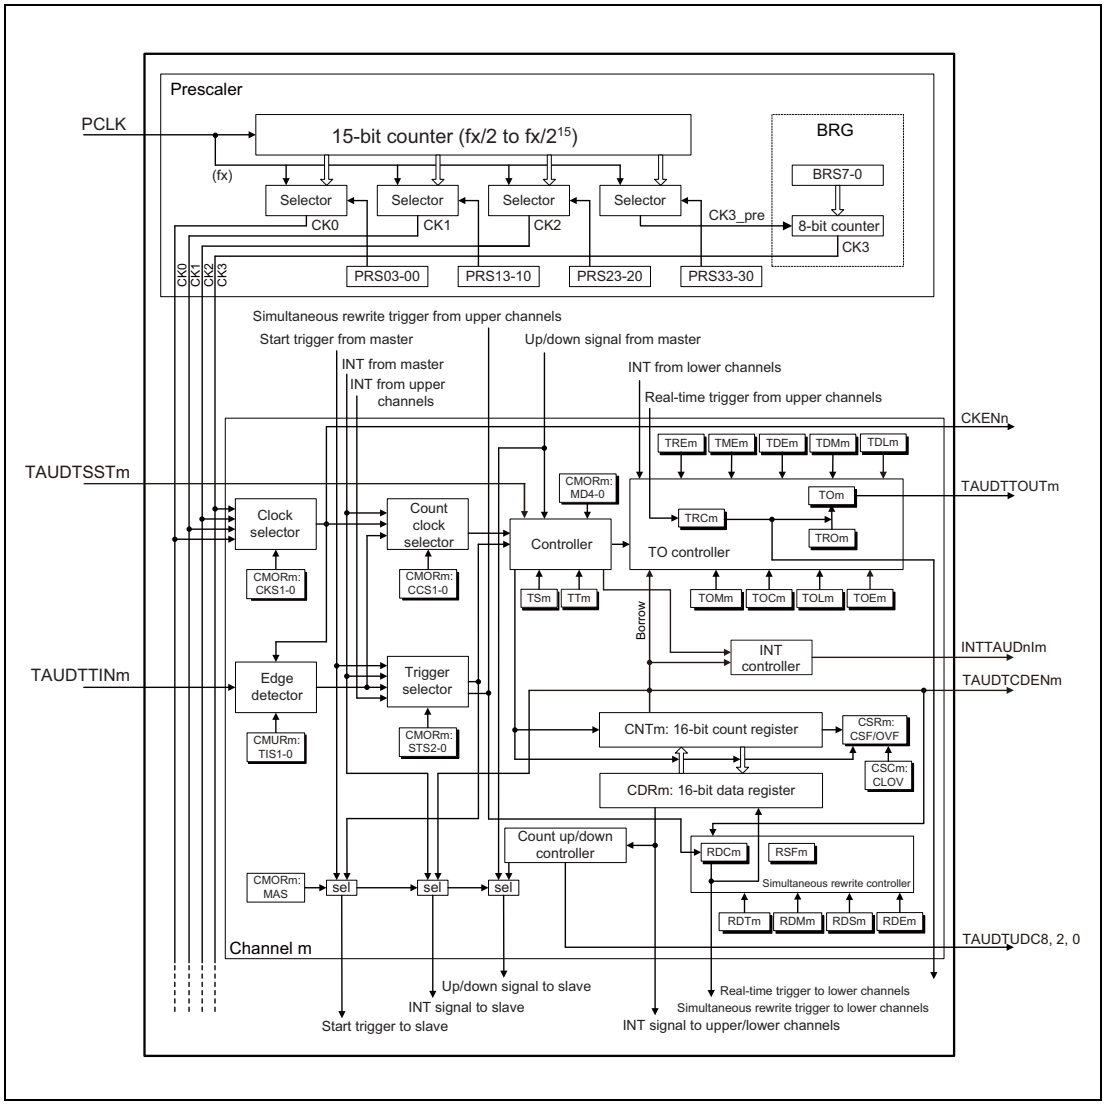

Figure 25.3 Block Diagram of the TAUD

The module name “TAUDn” has been omitted from the register names for the sake of clarity in the above figure.

25.2.6 Description of Blocks

The following describes the functional blocks:

Prescaler block

The prescaler block provides up to four clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived from PCLK by a configurable prescaler division factor of 2^0 to 2^{15}. The fourth count clock CK3 can be adjusted more precisely by using BRG to set an additional division factor that is not a power of 2.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source:

- One of the clocks CK0 to CK3 (selected by the clock selector)
- INTTAUDnIm from master channel
- TAUDTTINm input signal valid edge

Controller

The controller controls the main operations of the counter:

- Operation mode (selected by bits TAUDnCMORm.TAUDnMD[4:0])
- Counter start enable (TAUDnTS.TAUDnTSm) and counter stop (TAUDnTT.TAUDnTTm)
  When counter start is enabled, status flag TAUDnTE.TAUDnTEm is set.
- Count direction (up/down) (can be controlled by master channel)

Trigger selector

Depending on the selected operation mode, the counter starts automatically when it is enabled (TAUDnTE.TAUDnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

- Synchronous channel start trigger input TAUDnTSSTm
- TAUDTTINm input signal valid edge
- INTTAUDnIm from the master or any upper channel
- Up/down output trigger signal of the master channel
- Dead-time output signal of the TAUDTTOUTm generation unit.

Simultaneous rewrite controller

Simultaneous rewrite control is a function that can be used in synchronous operating modes. The data registers (TAUDnCDRm) of all channels in a channel group can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

TAUDnTO controller

The output control of every channel enables the generation of various output signal forms such as PWM signals or triangular waves.

25.3 Registers

25.3.1 List of Registers

TAUD registers are listed in the following table.

For details about <TAUDn_base>, see **Section 25.1.2, Register Base Address**.

Table 25.14 List of Registers

Module	Register	Symbol	Address
TAUDn prescaler registers			
TAUDn	TAUDn prescaler clock select register	TAUDnTPS	<TAUDn_base> + 240_H
	TAUDn prescaler baud rate setting register	TAUDnBRS	<TAUDn_base> + 244_H
TAUDn control registers			
TAUDn	TAUDn channel data register m	TAUDnCDRm	<TAUDn_base> + m × 4_H
	TAUDn channel counter register m	TAUDnCNTm	<TAUDn_base> + 80_H + m × 4_H
	TAUDn channel mode OS register m	TAUDnCMORm	<TAUDn_base> + 200_H + m × 4_H
	TAUDn channel mode user register m	TAUDnCMURm	<TAUDn_base> + $C0_H$ + m × 4_H
	TAUDn channel status register m	TAUDnCSRm	<TAUDn_base> + 140_H + m × 4_H
	TAUDn channel status clear trigger register m	TAUDnCSCm	<TAUDn_base> + 180_H + m × 4_H
	TAUDn channel start trigger register	TAUDnTS	<TAUDn_base> + $1C4_H$
	TAUDn channel enable status register	TAUDnTE	<TAUDn_base> + $1C0_H$
	TAUDn channel stop trigger register	TAUDnTT	<TAUDn_base> + $1C8_H$
TAUDn output registers			
TAUDn	TAUDn channel output enable register	TAUDnTOE	<TAUDn_base> + $5C_H$
	TAUDn channel output register	TAUDnTO	<TAUDn_base> + 58_H
	TAUDn channel output mode register	TAUDnTOM	<TAUDn_base> + 248_H
	TAUDn channel output configuration register	TAUDnTOC	<TAUDn_base> + $24C_H$
	TAUDn channel output active level register	TAUDnTOL	<TAUDn_base> + 040_H
	TAUDn channel dead time output enable register	TAUDnTDE	<TAUDn_base> + 250_H
	TAUDn channel dead time output mode register	TAUDnTDM	<TAUDn_base> + 254_H
	TAUDn channel dead time output level register	TAUDnTDL	<TAUDn_base> + 54_H
	TAUDn channel real-time output register	TAUDnTRO	<TAUDn_base> + $4C_H$
	TAUDn channel real-time output enable register	TAUDnTRE	<TAUDn_base> + 258_H
	TAUDn channel real-time output control register	TAUDnTRC	<TAUDn_base> + $25C_H$
	TAUDn channel modulation output enable register	TAUDnTME	<TAUDn_base> + 50_H
TAUDn reload data registers			
TAUDn	TAUDn channel reload data enable register	TAUDnRDE	<TAUDn_base> + 260_H
	TAUDn channel reload data mode register	TAUDnRDM	<TAUDn_base> + 264_H
	TAUDn channel reload data control CH select register	TAUDnRDS	<TAUDn_base> + 268_H
	TAUDn channel reload data control register	TAUDnRDC	<TAUDn_base> + $26C_H$
	TAUDn channel reload data trigger register	TAUDnRDT	<TAUDn_base> + 44_H
	TAUDn channel reload status register	TAUDnRSF	<TAUDn_base> + 48_H
TAUDn Emulation Register			
TAUDn	TAUDn emulation register	TAUDnEMU	<TAUDn_base> + 290_H

25.3.2 Details of TAUDn Prescaler Registers

25.3.2.1 TAUDnTPS — TAUDn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescaler. CK3 is generated by dividing CK3_PRE by the factor specified in TAUDnBRS.

Access: This register can be read or written in 16-bit units.

Address: <TAUDn_base> + 240_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnPRS3 [3:0]				TAUDnPRS2 [3:0]				TAUDnPRS1 [3:0]				TAUDnPRS0 [3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.15 TAUDnTPS Register Contents (1/3)

Bit Position	Bit Name	Function
15 to 12	TAUDnPRS3 [3:0]	Specifies CK3_PRE clock. CK3_PRE clock is an input clock to BRG unit which supplies the CK3 operation clock to all channels.

TAUDnPRS3[3:0]	CK3_PRE Clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK3 are stopped (TAUDnTE.TAUDnTEm = 0).

Table 25.15 TAUDnTPS Register Contents (2/3)

Bit Position	Bit Name	Function
11 to 8	TAUDnPRS2 [3:0]	Specifies the CK2 clock.

TAUDnPRS2[3:0]	CK2 Clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK2 are stopped (TAUDnTE.TAUDnTEm = 0).

7 to 4	TAUDnPRS1 [3:0]	Specifies the CK1 clock.

TAUDnPRS1[3:0]	CK1 Clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK1 are stopped (TAUDnTE.TAUDnTEm = 0).

Table 25.15 TAUDnTPS Register Contents (3/3)

Bit Position	Bit Name	Function
3 to 0	TAUDnPRS0 [3:0]	Specifies the CK0 clock.

TAUDnPRS0[3:0]	CK0 Clock
0000_B	$PCLK/2^0$
0001_B	$PCLK/2^1$
0010_B	$PCLK/2^2$
0011_B	$PCLK/2^3$
0100_B	$PCLK/2^4$
0101_B	$PCLK/2^5$
0110_B	$PCLK/2^6$
0111_B	$PCLK/2^7$
1000_B	$PCLK/2^8$
1001_B	$PCLK/2^9$
1010_B	$PCLK/2^{10}$
1011_B	$PCLK/2^{11}$
1100_B	$PCLK/2^{12}$
1101_B	$PCLK/2^{13}$
1110_B	$PCLK/2^{14}$
1111_B	$PCLK/2^{15}$

The above bits are rewritable only when all the counters using CK0 are stopped (TAUDnTE.TAUDnTEm = 0).

NOTE

The TAUDn clock input PCLK is specified in the first part of this section, **Section 25.1.3, Clock Supply**.

25.3.2.2 TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUDnTPS.TAUDnPRS3[3:0].

Access: This register can be read or written in 8-bit units.

Address: <TAUDn_base> + 244_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TAUDnBRS[7:0]							
Value after reset	0	0	0	0	0	0	0	0

Table 25.16 TAUDnBRS Register Contents

Bit Position	Bit Name	Function
7 to 0	TAUDnBRS[7:0]	Specifies a CK3_PRE clock division factor for generating CK3.

TAUDnBRS[7:0]	CK3 Clock
$0000\ 0000_B$	CK3_PRE / 1
$0000\ 0001_B$	CK3_PRE / 2
$0000\ 0010_B$	CK3_PRE / 3
$0000\ 0011_B$	CK3_PRE / 4
...	...
$1111\ 1110_B$	CK3_PRE / 255
$1111\ 1111_B$	CK3_PRE / 256

25.3.3 Details of TAUDn Control Registers

25.3.3.1 TAUDnCDRm — TAUDn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUDnCMORm.TAUDnMD[4:1].

Access: This register can be read or written in 16-bit units.
- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

Address: <TAUDn_base> + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.17 TAUDnCDRm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnCDR [15:0]	Data register for capture/compare values

25.3.3.2 TAUDnCNTm — TAUDn Channel Counter Register

This is a channel m counter register.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUDn_base> + 80_H + m × 4_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCNT[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.18 TAUDnCNTm Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnCNT [15:0]	16-bit counter value

A read value depends on a counter value, a changed operating mode, TAUDnTS.TAUDnTSm or TAUDnTT.TAUDnTTm bit value.

The initial read value of the counter depends on an operating mode and how the counter is stopped.

- Stop by a reset
- Stop by a counter stop trigger (TAUDnTT.TAUDnTTm = 1)

Table 25.19 lists the initial counter read values after the counter is stopped (TAUDnTE.TAUDnTEm = 0) and re-enabled (TAUDnTS.TAUDnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUDnTS.TAUDnTSm = 1) with the counter waiting for a start trigger.

Table 25.19 TAUDnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUDnCNTm Value		
		Start Value*1	After Stop Trigger	After One Count
Interval timer mode	Count down	$FFFF_H$	Stop value	—
Judge mode	Count down	$FFFF_H$	Stop value	—
Capture mode	Count up	0000_H	Stop value	—
Event count mode	Count down	$FFFF_H$	Stop value	—
One-count mode	Count down	$FFFF_H$	Stop value	Stop value
Capture and one-count mode	Count up	0000_H	Stop value	Capture value + 1 (TAUDnCDRm)
Judge and one-count mode	Count down	$FFFF_H$	Stop value	TAUDnCNTm value – 1
Count-up/-down mode	Count down/up	$FFFF_H$	Stop value	—
Pulse one-count mode	Count down	$FFFF_H$	Stop value	0000_H
Count capture mode	Count up	0000_H	Stop value	—
Gate count mode	Count down	$FFFF_H$	Stop value	Stop value
Capture and gate count mode	Count up	0000_H	Stop value	Stop value

Note 1. The value set for TAUDnCNTm when the operating mode is changed after a reset is deasserted.

25.3.3.3 TAUDnCMORm — TAUDn Channel Mode OS Register

This register controls channel m operation.

Access: This register can be read or written in 16-bit units. Writable only when the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 200_H + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS [1:0]		TAUDnCCS [1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS [1:0]		—	TAUDnMD[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 25.20 TAUDnCMORm Register Contents (1/3)

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Selects an operation clock. An operation clock is used for the TAUDTTINm input edge detection circuit. Setting of TAUDnCMORm.TAUDnCCS[1:0] bits also allows the operation clock to serve as the TAUDnCNTm counter clock.

TAUDn CKS1	TAUDn CKS0	Selection of Operation Clock
0	0	CK0
0	1	CK1
1	0	CK2
1	1	CK3

Bit Position	Bit Name	Function
13, 12	TAUDnCCS[1:0]	Selects a count clock for TAUDnCNTm counter.

TAUDn CCS1	TAUDn CCS0	Selection of Count Clock
0	0	Operation clock specified by TAUDnCMORm.TAUDnCKS[1:0]
0	1	Valid edge of TAUDTTINm input signal
1	0	Setting prohibited
1	1	INTTAUDnIm signal of master channel

Bit Position	Bit Name	Function
11	TAUDnMAS	Specifies whether the channel is a master channel or slave channel during synchronous channel operation. 0: Slave 1: Master This bit setting is valid only for even channels (CHm_even). Odd channels (CHm_odd) are fixed to 0.

Table 25.20 TAUDnCMORm Register Contents (3/3)

Bit Position	Bit Name	Function
4 to 0	TAUDnMD[4:0]	Specifies an operating mode.

TAUDnMD4	TAUDnMD3	TAUDnMD2	TAUDnMD1	TAUDnMD0	Functional Description
0	0	0	0	1/0	Interval timer mode
0	0	0	1	1/0	Judge mode
0	0	1	0	1/0	Capture mode
0	0	1	1	0	Event count mode
0	1	0	0	1/0	One-count mode
0	1	0	1	1/0	Setting prohibited
0	1	1	0	0	Capture and one-count mode
0	1	1	1	1/0	Judge and one-count mode
1	0	0	0	0	Setting prohibited
1	0	0	1	0	Count-up/-down mode
1	0	1	0	1/0	Pulse one-count mode
1	0	1	1	1/0	Count capture mode
1	1	0	0	0	Gate count mode
1	1	0	1	0	Capture and gate count mode

Mode	Role of TAUDnMD0 Bit
Interval timer mode Capture mode Count capture mode	Specifies whether INTTAUDnIm is generated at the beginning of count operation (when a start trigger is entered) or not. 0: INTTAUDnIm is not generated. 1: INTTAUDnIm is generated.
Event count mode Count-up/-down mode	This bit should be set to 0 (the INTTAUDnIm signal is not output at the beginning of count operation).
One-count mode Pulse one-count mode	Enables/disables start trigger detection during counting. 0: Disables detection. 1: Enables detection. **CAUTION** • INTTAUDnIm signal is not output at the beginning of count operation in one-count mode. • INTTAUDnIm signal is output at the beginning of count operation in pulse one-count mode.
Gate count mode	This bit should be set to 0 (disables start trigger detection during counting).
Capture and one-count mode Capture and gate count mode	This bit should be set to 0. **CAUTION** INTTAUDnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled.
Judge mode Judge and one-count mode	Specifies INTTAUDnIm output timing. 0: When TAUDnCNTm ≤ TAUDnCDRm 1: When TAUDnCNTm > TAUDnCDRm

25.3.3.4 TAUDnCMURm — TAUDn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUDTTINm input.

Access: This register can be read or written in 8-bit units.

Address: <TAUDn_base> + $C0_H$ + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.21 TAUDnCMURm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	Specifies a valid edge of TAUDTTINm input signal.

TAUDn TIS1	TAUDn TIS0	Functional Description
0	0	Falling edge
0	1	Rising edge
1	0	Detection of rising and falling edges (selects low width measurement) Start trigger: Falling edge Stop trigger (capture): Rising edge
1	1	Detection of rising and falling edges (selects high width measurement) Start trigger: Rising edge Stop trigger (capture): Falling edge

- Edge detection of TAUDTTINm input signal is based on the operation clock selected by TAUDnCMORm.TAUDnCKS[1:0].

25.3.3.5 TAUDnCSRm — TAUDn Channel Status Register

This register indicates the count direction and overflow status of channel m counter.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <TAUDn_base> + 140_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnCSF	TAUDnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 25.22 TAUDnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	TAUDnCSF	Indicates a count direction. 0: Count-up 1: Count-down The read value of this bit is valid only in the following mode: • Count-up/-down mode
0	TAUDnOVF	Indicates counter overflow status. 0: No overflow occurs. 1: Overflow occurs. This bit is used only in the following modes: • Capture mode • Capture and one-count mode The function of this bit depends on the setting of control bit TAUDnCMORm.TAUDnCOS[1:0].

25.3.3.6 TAUDnCSCm — TAUDn Channel Status Clear Register

This is a trigger register for clearing the overflow flag TAUDnCSRm.TAUDnOVF of channel m.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H.

Address: <TAUDn_base> + 180_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUDnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 25.23 TAUDnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUDnCLOV	0: No function 1: Clears overflow flag TAUDnCSRm.TAUDnOVF.

25.3.3.7 TAUDnTS — TAUDn Channel Start Trigger Register

This register enables the counter operation of each channel.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000_H.

Address: <TAUDn_base> + $1C4_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTS15	TAUDnTS14	TAUDnTS13	TAUDnTS12	TAUDnTS11	TAUDnTS10	TAUDnTS09	TAUDnTS08	TAUDnTS07	TAUDnTS06	TAUDnTS05	TAUDnTS04	TAUDnTS03	TAUDnTS02	TAUDnTS01	TAUDnTS00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 25.24 TAUDnTS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTSm	Enables the counter operation of channel m. 0: No function 1: Enables the counter operation and sets TAUDnTE.TAUDnTEm to 1. The counter operation is only enabled when TAUDnTE.TAUDnTEm is set to 1. Whether counting is started or not depends on a selected operating mode.

25.3.3.8 TAUDnTE — TAUDn Channel Enable Status Register

This register enables/disables a counter operation.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUDn_base> + $1C0_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTE15	TAUDnTE14	TAUDnTE13	TAUDnTE12	TAUDnTE11	TAUDnTE10	TAUDnTE09	TAUDnTE08	TAUDnTE07	TAUDnTE06	TAUDnTE05	TAUDnTE04	TAUDnTE03	TAUDnTE02	TAUDnTE01	TAUDnTE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.25 TAUDnTE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTEm	Enables/disables the counter operation of channel m. 0: Disables counter operation. 1: Enables counter operation. This bit is set to 1 when trigger input of TAUDnTSSTm (synchronous channel start trigger signal) is detected or when TAUDnTS.TAUDnTSm is set to 1. This bit is set to 0 when TAUDnTT.TAUDnTTm is set to 1.

25.3.3.9 TAUDnTT — TAUDn Channel Stop Trigger Register

This register stops the counter operation of each channel.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000_H.

Address: <TAUDn_base> + $1C8_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnTT15	TAUDnTT14	TAUDnTT13	TAUDnTT12	TAUDnTT11	TAUDnTT10	TAUDnTT09	TAUDnTT08	TAUDnTT07	TAUDnTT06	TAUDnTT05	TAUDnTT04	TAUDnTT03	TAUDnTT02	TAUDnTT01	TAUDnTT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 25.26 TAUDnTT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTTm	Stops the counter operation of channel m. 0: No function 1: Stops the counter operation and resets TAUDnTE.TAUDnTEm. TAUDnCNTm, TAUDnTO.TAUDnTOm, and TAUDTTOUTm retain the values provided before the counter is stopped.

25.3.4 Details of TAUDn Simultaneous Rewrite Registers

25.3.4.1 TAUDnRDE — TAUDn Channel Reload Data Enable Register

This register enables/disables simultaneous rewrite of TAUDnCDRm/TAUDnTOLm data register.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 260_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RDE15	TAUDn RDE14	TAUDn RDE13	TAUDn RDE12	TAUDn RDE11	TAUDn RDE10	TAUDn RDE09	TAUDn RDE08	TAUDn RDE07	TAUDn RDE06	TAUDn RDE05	TAUDn RDE04	TAUDn RDE03	TAUDn RDE02	TAUDn RDE01	TAUDn RDE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.27 TAUDnRDE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDEm	Enables/disables simultaneous rewrite of the data register of channel m. 0: Disables simultaneous rewrite 1: Enables simultaneous rewrite

25.3.4.2 TAUDnRDS — TAUDn Channel Reload Data Control Channel Select Register

This register selects a channel that controls simultaneous rewrite.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 268_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RDS15	TAUDn RDS14	TAUDn RDS13	TAUDn RDS12	TAUDn RDS11	TAUDn RDS10	TAUDn RDS09	TAUDn RDS08	TAUDn RDS07	TAUDn RDS06	TAUDn RDS05	TAUDn RDS04	TAUDn RDS03	TAUDn RDS02	TAUDn RDS01	TAUDn RDS00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.28 TAUDnRDS Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDSm	Selects a channel that controls a simultaneous rewrite trigger. 0: Master channel 1: Another upper channel

25.3.4.3 TAUDnRDM — TAUDn Channel Reload Data Mode Register

This register selects the timing for generating a simultaneous rewrite control signal.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + 264_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RDM15	TAUDn RDM14	TAUDn RDM13	TAUDn RDM12	TAUDn RDM11	TAUDn RDM10	TAUDn RDM09	TAUDn RDM08	TAUDn RDM07	TAUDn RDM06	TAUDn RDM05	TAUDn RDM04	TAUDn RDM03	TAUDn RDM02	TAUDn RDM01	TAUDn RDM00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 25.29 TAUDnRDM Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDMm	Selects the timing for generating a simultaneous rewrite trigger signal. 0: When the master channel counter starts to count 1: At the peak of cycle of triangular wave These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and TAUDnRDS.TAUDnRDSm = 0.

25.3.4.4 TAUDnRDC — TAUDn Channel Reload Data Control Register

This register specifies a channel which generates an INTTAUDnIm signal to trigger simultaneous rewrite.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + $26C_H$

Value after reset: 0000_H

Table 25.30 TAUDnRDC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDCm	Specifies whether the channel generates a simultaneous rewrite trigger signal or not. 0: Does not operate as a simultaneous rewrite trigger channel. 1: Operates as a simultaneous rewrite trigger channel. These bit settings are applied only when TAUDnRDE.TAUDnRDEm = 1 and TAUDnRDS.TAUDnRDSm = 1.

25.3.4.5 TAUDnRDT — TAUDn Channel Reload Data Trigger Register

This register triggers a simultaneous rewrite enabling state.

Access: This register is a write-only register that can be written in 16-bit units. It is always read as 0000_H.

Address: <TAUDn_base> + 044_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 25.31 TAUDnRDT Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRDTm	Triggers a simultaneous rewrite enabling state. 0: No function 1: The simultaneous rewrite enabling flag (TAUDnRSFm) is set to 1. The system waits for a simultaneous rewrite trigger. These bits only apply when: • TAUDnRDE.TAUDnRDEm = 1

25.3.4.6 TAUDnRSF — TAUDn Channel Reload Status Register

This flag register indicates simultaneous rewrite status.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAUDn_base> + 048_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn RSF15	TAUDn RSF14	TAUDn RSF13	TAUDn RSF12	TAUDn RSF11	TAUDn RSF10	TAUDn RSF09	TAUDn RSF08	TAUDn RSF07	TAUDn RSF06	TAUDn RSF05	TAUDn RSF04	TAUDn RSF03	TAUDn RSF02	TAUDn RSF01	TAUDn RSF00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 25.32 TAUDnRSF Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnRSFm	Indicates simultaneous rewrite status. 0: Indicates that simultaneous rewrite has been completed due to the generation of simultaneous rewrite trigger. 1: Indicates that the system waits for a simultaneous rewrite trigger in the simultaneous rewrite enabling state (TAUDnRDTm = 1).

25.3.5 Details of TAUDn Output Registers

25.3.5.1 TAUDnTOE — TAUDn Channel Output Enable Register

This register enables/disables the independent channel output mode controlled by software.

Access: This register can be read or written in 16-bit units.

Address: <TAUDn_base> + $5C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TOE15	TAUDn TOE14	TAUDn TOE13	TAUDn TOE12	TAUDn TOE11	TAUDn TOE10	TAUDn TOE09	TAUDn TOE08	TAUDn TOE07	TAUDn TOE06	TAUDn TOE05	TAUDn TOE04	TAUDn TOE03	TAUDn TOE02	TAUDn TOE01	TAUDn TOE00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.33 TAUDnTOE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOEm	Enables/disables the independent channel output function. 0: Disables the independent timer output function (controlled by software). 1: Enables the independent timer output function.

25.3.5.2 TAUDnTO — TAUDn Channel Output Register

This register specifies and reads a TAUDTTOUTm level.

Access: This register can be read or written in 16-bit units.

Address: <TAUDn_base> + 58_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDn TO15	TAUDn TO14	TAUDn TO13	TAUDn TO12	TAUDn TO11	TAUDn TO10	TAUDn TO09	TAUDn TO08	TAUDn TO07	TAUDn TO06	TAUDn TO05	TAUDn TO04	TAUDn TO03	TAUDn TO02	TAUDn TO01	TAUDn TO00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.34 TAUDnTO Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOm	Specifies and reads a TAUDTTOUTm level. 0: Low level 1: High level Only TAUDnTOm bits for which Independent Channel Output function is disabled (TAUDnTOEm = 0) can be written.

25.3.5.3 TAUDnTOM — TAUDn Channel Output Mode Register

This register specifies the output mode of each channel.

Access: This register can be read or written in 16-bit units. Writable only while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

Address: <TAUDn_base> + 248_H

Table 25.36 TAUDnTOC Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTOCm	Specifies an output mode. 0: Operating mode 1 1: Operating mode 2 As listed below, the output mode depends on the setting of TAUDnTOM.TAUDnTOMm.

TAUDn TOMm	TAUDn TOCm	Functional Description
0	0	Toggle mode: Toggle operation is conducted when INTTAUDnIm occurs.
0	1	Set/reset mode: Set when INTTAUDnIm occurs at the beginning of count operation, and reset when INTTAUDnIm is caused by detection of a match between TAUDnCNTm and TAUDnCDRm.
1	0	Synchronous channel operating mode 1: Set when INT occurs on master channels, and reset when INT occurs on slave channels.
1	1	Synchronous channel operating mode 2: Set when INTTAUDnIm occurs in count-down status, and reset when INTTAUDnIm occurs in count-up status.

25.3.5.5 TAUDnTOL — TAUDn Channel Output Active Level Register

This register specifies the output logic of channel output bit (TAUDnTO.TAUDnTOm).

Access: This register can be read or written in 16-bit units.

Address: <TAUDn_base> + 040_H

Value after reset: 0000_H

Table 25.41 TAUDnTRE Register Contents

Bit Position	Bit Name	Function
15 to 0	TAUDnTREm	Enables or disables real-time output of channel m. 0: Disables real-time output 1: Enables real-time output. These bit settings are applied only when TAUDnTOE.TAUDnTOEm = 1. When TAUDnTRE.TAUDnTREm = 0, TAUDTTOUTm is not affected by real-time output. When TAUDnTRE.TAUDnTREm = 1, TAUDTTOUTm outputs the value of real-time output bit TAUDnTRO.TAUDnTROm in response to a timer operation.

25.3.7.2 TAUDnTRC — TAUDn Channel Real-time Output Control Register

This register controls the real-time output trigger of each channel.

Access: This register can be read or written in 16-bit units. Writable only while TAUDnTE.TAUDnTEm = 0.

Address: <TAUDn_base> + $25C_H$

Value after reset: 0000_H

Bit Position	Bit Name	Function
15 to 0	TAUDnTMEm	Enables/disables modulation output for timer output and real-time output of channel m. 0: Disables modulation 1: Enables modulation These bit settings are applied only when TAUDnTOE.TAUDnTOEm and TAUDnTRE.TAUDnTREm = 1.

25.3.8 TAUDn Emulation Register

25.3.8.1 TAUDnEMU — TAUDn Emulation Register

This register controls SVSTOP operations.

Access: This register can be read or written in 8-bit units.
Perform write operations when the counter is stopped (TAUDnTE.TAUDnTEm = 0) and (EPC.SVSTOP = 0).

Address: <TAUDn_base> + 290_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TAUDnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 25.45 TAUDnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUDnSVSDIS	When EPC.SVSTOP bit = 0: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0). When EPC.SVSTOP bit = 1: 0: The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint). 1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

25.4 Operating Procedure

The following lists the general operation procedure for the TAUDn.

After reset release, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUDTTOUTm is also initialized and outputs a low level.

(1) Set the TAUDnTPS and TAUDnBRS registers to specify the clock frequency of CK0 to CK3.

(2) Configure the desired TAUDn function:
- Set the operation mode
- Set the channel output mode
- Set any other control bits

(3) Enable the counter by setting the TAUDnTS.TAUDnTSm bit to 1.
The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.

(4) If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUDnTT.TAUDnTTm bit to 1. The counter can be forcibly restarted by setting the TAUDnTS.TAUDnTSm bit to 1.

(5) Stop the function by setting the TAUDnTT.TAUDnTTm bit to 1.

NOTES

1. A detailed description of the required control bits and the operation of the individual functions are given in **Section 25.12, Independent Channel Operation Functions** and **Section 25.15, Synchronous Channel Operation Functions**.
2. The function can be changed while the counter is stopped (TAUDnTE.TAUDnTEm = 0).

25.5 Concepts of Synchronous Channel Operation

The synchronous channel operation function is implemented using a combination of channel groups (consisted of master and slave channels). Several rules apply to the settings of channels. These rules are detailed in **Section 25.5.1, Rules of Synchronous Channel Operation**.

Two special features for synchronous channel operation are detailed in the following:

- **Section 25.5.2, Simultaneous Start and Stop of Synchronous Channel Counters**
- **Section 25.6, Simultaneous Rewrite**

25.5.1 Rules of Synchronous Channel Operation

Number of master and slave channels

- Only even channels (CH0, CH2, CH4, …) can be set as master channels. Any channel apart from CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 and the lower channels (CH3, CH4, CH5, …) can be set as slave channels.
- If multiple master channels are used, slave channels cannot cross the master channels.
  Example: If CH0 and CH4 are master channels, CH1 to CH3 can be set as slave channels for CH0, but CH5 to CH15 cannot.

Operation clock

- The same operation clock must be set for the master channel and the synchronized slave channel. This is achieved by setting the TAUDnCMORm.TAUDnCKS[1:0] bits of the slave and master channel.

The basic concepts of master/slave usage and operation clocks are illustrated in **Figure 25.4**.

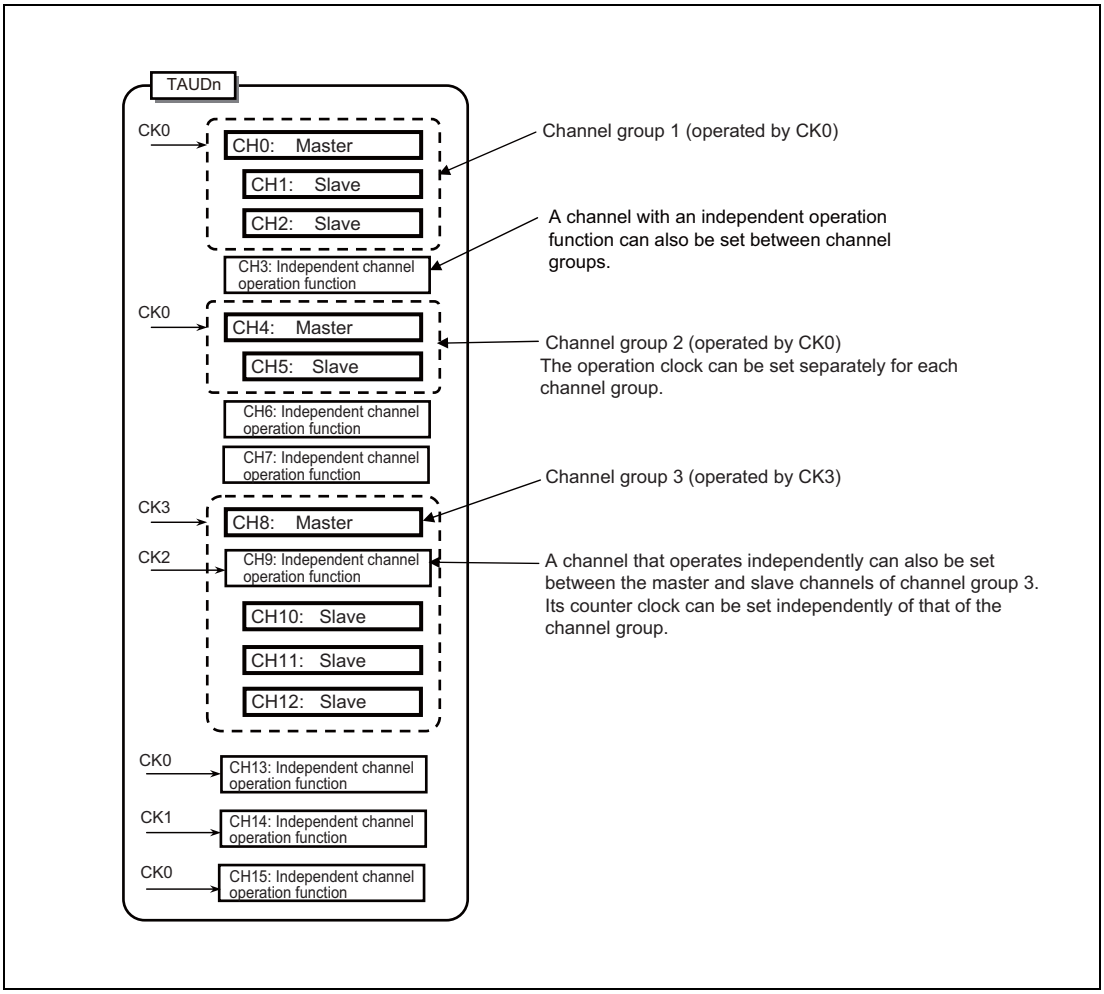

Figure 25.4 Grouping of Channels and Assignment of Count Clocks

Control trigger signal for master/slave channels

- Master channels can output control trigger signals to slave channels.
- Slave channels can use control trigger signals from master channels but cannot output control trigger signals for their own to lower channels.
- Master channels cannot use control trigger signals from upper master channels.

25.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously within the same unit and between the units.

25.5.2.1 Simultaneous Start and Stop within the Same Unit

- To simultaneously start synchronized channels, the TAUDnTS.TAUDnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUDnTT.TAUDnTTm bits of the channels should be set at the same time.

Setting to the TAUDnTS.TAUDnTSm bits to 1 also sets the corresponding TAUDnTE.TAUDnTEm bits to 1, enabling counting. The count start timing depends on operating mode.

25.5.2.2 Simultaneous Start between the Units

Counters in different units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

For details about how to perform simultaneous start between the units, see **Section 29.8, Simultaneous Start Trigger Function**.

25.6 Simultaneous Rewrite

25.6.1 Overview of Operations

Simultaneous rewrite describes the ability to change the compare/start value and the output logic of multiple channels at the same time.

The corresponding data and control registers (TAUDnCDRm and TAUDnTOLm) can nevertheless be written at any time. The new value does not affect the counter operation or the output signal until simultaneous rewrite is triggered.

Simultaneous rewrite can be triggered by:

- The counter on the master channel or upper channel (depending on the selected operation mode) reaching a certain value
- INTTAUDnIm being issued on the upper channel specified by TAUDnRDC.TAUDnRDCm

There are four methods for simultaneous rewrite. These are listed in **Table 25.46**, along with how to specify them and when they cause simultaneous rewrite to be triggered.

Table 25.46 Simultaneous Rewrite Methods and when They are Triggered

Method	Simultaneous Rewrite Triggered when	TAUDnRDE. TAUDnRDEm	TAUDnRDS. TAUDnRDSm	TAUDnRDM. TAUDnRDMm
—	No simultaneous rewrite	0	0	0
A	The master channel (re)starts counting	1	0	0
B	Counting is started in the master channel. The master channel starts counting down at the peak of triangular cycle of the corresponding slave channel.	1	0	1
C1	INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm	1	1	0/1
C2	INTTAUDnIm is generated on an upper channel specified by TAUDnRDC.TAUDnRDCm that in turn is triggered by an external signal	1	1	0/1

Table 25.47 lists which of these four methods is available for each channel operation function. For more information about the individual channel operation functions, see the corresponding sections in **Section 25.14, Independent Channel Simultaneous Rewrite Functions**, **Section 25.15, Synchronous Channel Operation Functions**, and **Section 25.16, Synchronous Non-Complementary and Complementary Modulation Output Functions**.

Table 25.47 Channel Functions and the Methods They Use for Simultaneous Rewrite

Non-Complementary Modulation Output Function Type 2		√	√		
Complementary Modulation Output Function		√	√		

Note: √: Available, (Blank): Unavailable

25.6.2 How to Control Simultaneous Rewrite

Figure 25.5 shows the general procedure for simultaneous rewrite. The three main blocks (initial settings, start and counter count operation, and simultaneous rewrite) are explained afterwards.

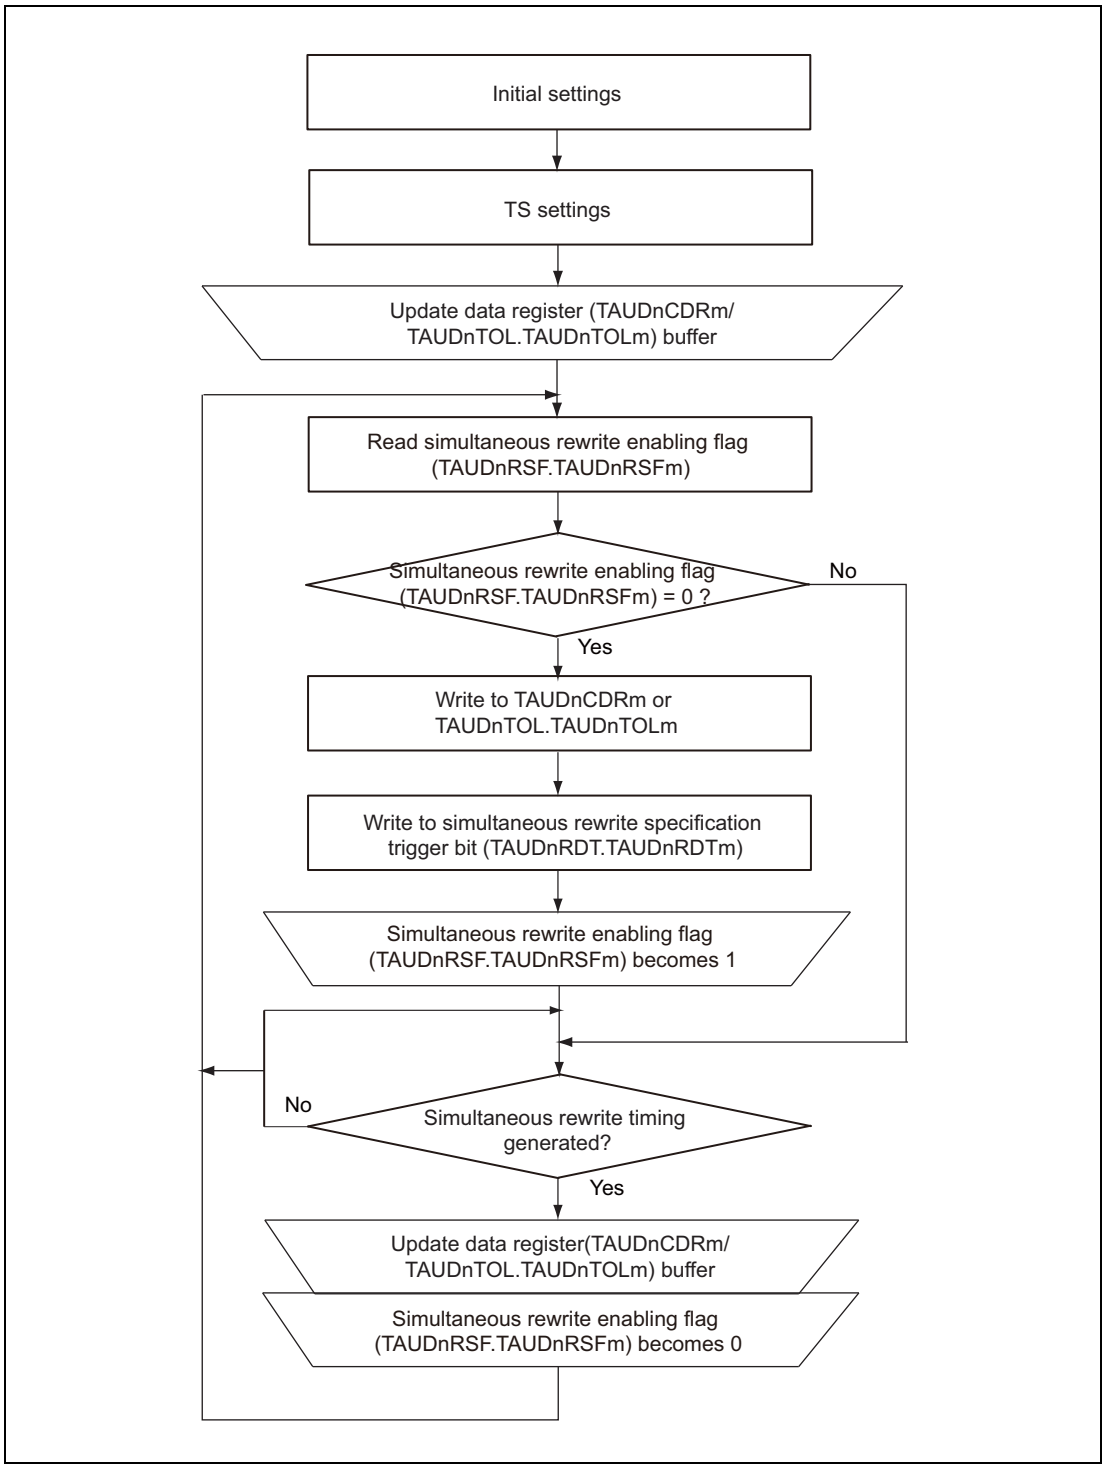

Figure 25.5 General Procedure for Simultaneous Rewrite

25.6.2.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUDnRDE.TAUDnRDEm = 1
- To select the type of simultaneous rewrite, set TAUDnRDM.TAUDnRDMm and TAUDnRDS.TAUDnRDSm according to the values listed in **Table 25.46, Simultaneous Rewrite Methods and when They are Triggered**.
- Specify a simultaneous rewrite trigger channel by using TAUDnRDC.TAUDnRDCm. (Prerequisite: TAUDnRDS.TAUDnRDSm has been set to the upper channel.)

25.6.2.2 Start Counter and Count Operation

- To start all the TAUDnCNTm counters of the channel group, set the corresponding TAUDnTS.TAUDnTSm bits to 1. The values of TAUDnTOL.TAUDnTOLm and the data registers (TAUDnCDRm) are loaded into the corresponding TAUDnTOL.TAUDnTOLm buffer (TAUDnTOL.TAUDnTOLm buf) and data buffer registers (TAUDnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1 sets the reload flag (TAUDnRSF.TAUDnRSFm) to 1, enabling simultaneous rewrite. TAUDnRSF.TAUDnRSFm remains set to 1 until simultaneous rewrite is completed.
- When the specified trigger for simultaneous rewrite is detected, the TAUDnRSF.TAUDnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUDnRSF.TAUDnRSFm = 1). If it is, simultaneous rewrite is carried out. Otherwise the simultaneous rewrite is not carried out and waits for the next trigger detection.

25.6.2.3 Simultaneous Rewrite

- When simultaneous rewrite is enabled (TAUDnRSF.TAUDnRSFm = 1) and the simultaneous rewrite trigger is detected, the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and are applied the next time the counter starts or restarts.
- When simultaneous rewrite is complete, the TAUDnRSF.TAUDnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

25.6.3 Other General Rules of Simultaneous Rewrite

The following rules also apply:

- TAUDnRDE.TAUDnRDEm, TAUDnRDS.TAUDnRDSm, TAUDnRDM.TAUDnRDMm, and TAUDnRDC.TAUDnRDCm cannot be changed while the counter is in operation (TAUDnTE.TAUDnTEm = 1).
- TAUDnTOL.TAUDnTOLm can only be rewritten during operation with PWM output function or triangle PWM output function. For all other output functions, TAUDnTOL.TAUDnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUDTTOUTm outputs an invalid wave.
- When an upper channel is used as a channel issuing the simultaneous rewrite trigger (TAUDnRDS.TAUDnRDSm = 1), the TAUDnRDC.TAUDnRDCm bit controls all the lower channels. This means that if the TAUDnRDC.TAUDnRDCm bits of CH2 and CH7 are set to 1 and the TAUDnRDC.TAUDnRDCm bits of other channels are set to 0, CH2 and CH7 serve as simultaneous rewrite trigger generation channels. CH2 controls the lower channels CH3 to CH6, and CH7 controls the lower channels CH8 to CH15.
- If simultaneous rewrite is enabled and an upper channel is selected for the simultaneous rewrite trigger (TAUDnRDE.TAUDnRDEm and TAUDnRDS.TAUDnRDSm = 1) but no upper channel is set (TAUDnRDC.TAUDnRDC[15:0] = 0), simultaneous rewrite cannot take place.

25.6.4 Types of Simultaneous Rewrite

In the following section, the four simultaneous rewrite methods are explained using timing diagrams.

25.6.4.1 Simultaneous Rewrite when the Master Channel (Re)starts Counting (Method A)

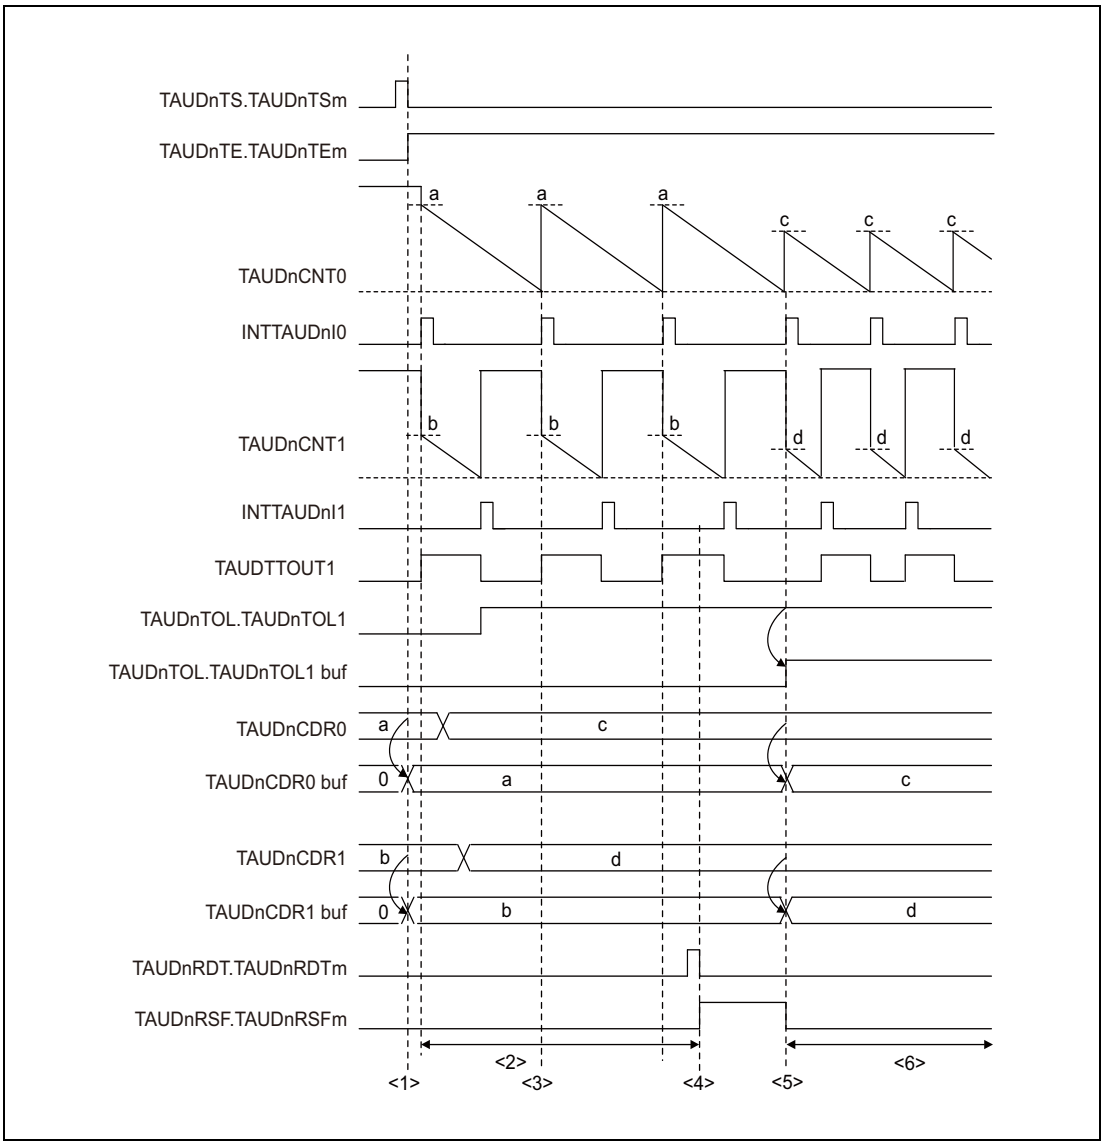

Figure 25.6 Simultaneous Rewrite when the Master Channel (Re)starts Counting

Setting:

CH0 is the master channel, which starts counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method A is applied.

Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer and TAUDnTOL.TAUDnTOLm value is copied to the TAUDnTOL.TAUDnTOLm buffer.

(2) The TAUDnCDRm and TAUDnTOL.TAUDnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm = 0)

(4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.

(5) Because simultaneous rewrite is enabled, it is triggered when CH0 restarts counting. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer and the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

25.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel (Method B)

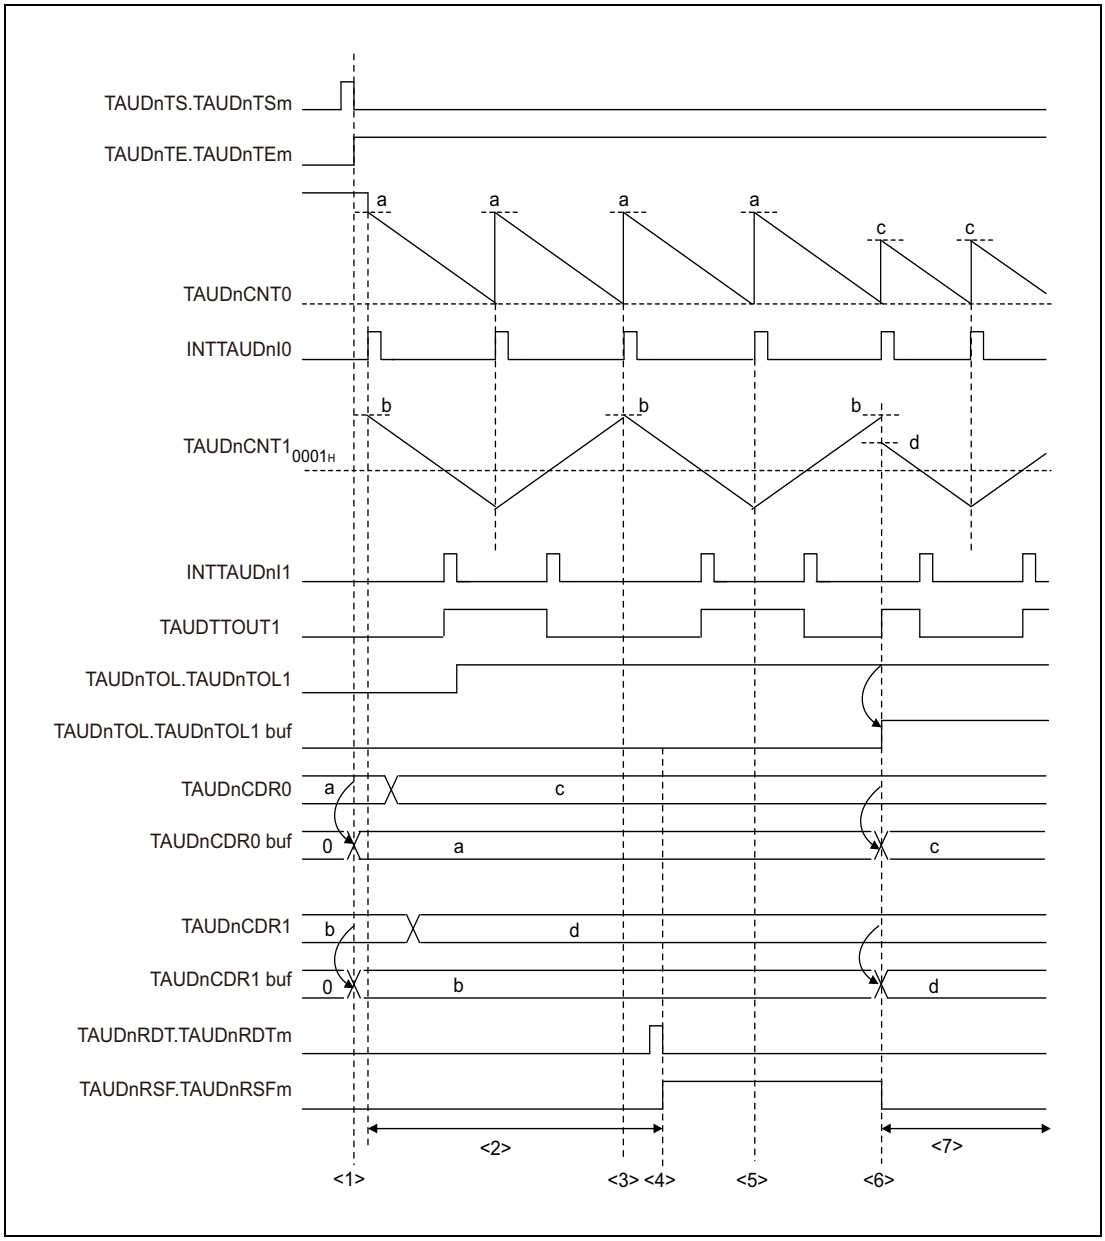

Figure 25.7 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel

Setting:

CH0 is the master channel which performs counting down, and CH1 represents an arbitrary slave channel. The simultaneous rewrite method B is applied.

Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer.

(2) The TAUDnCDRm and TAUDnTOL registers can be written at any time.

(3) Simultaneous rewrite does not occur because it is disabled (TAUDnRSF.TAUDnRSFm = 0).

(4) The reload data trigger bit (TAUDnRDT.TAUDnRDTm) is set to 1 which sets the status flag (TAUDnRSF.TAUDnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite does not take place at the bottom of the triangular cycle.

(6) Simultaneous rewrite takes place at the top of the triangular cycle. The TAUDnCDRm value is loaded into the TAUDnCDRm buffer, the TAUDnTOL.TAUDnTOLm value is loaded into the TAUDnTOL.TAUDnTOLm buffer.

(7) The counters count down and await the next simultaneous rewrite trigger. The values of TAUDnCDRm and TAUDnTOL.TAUDnTOLm can be changed again.

25.6.4.3 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm (Method C1)

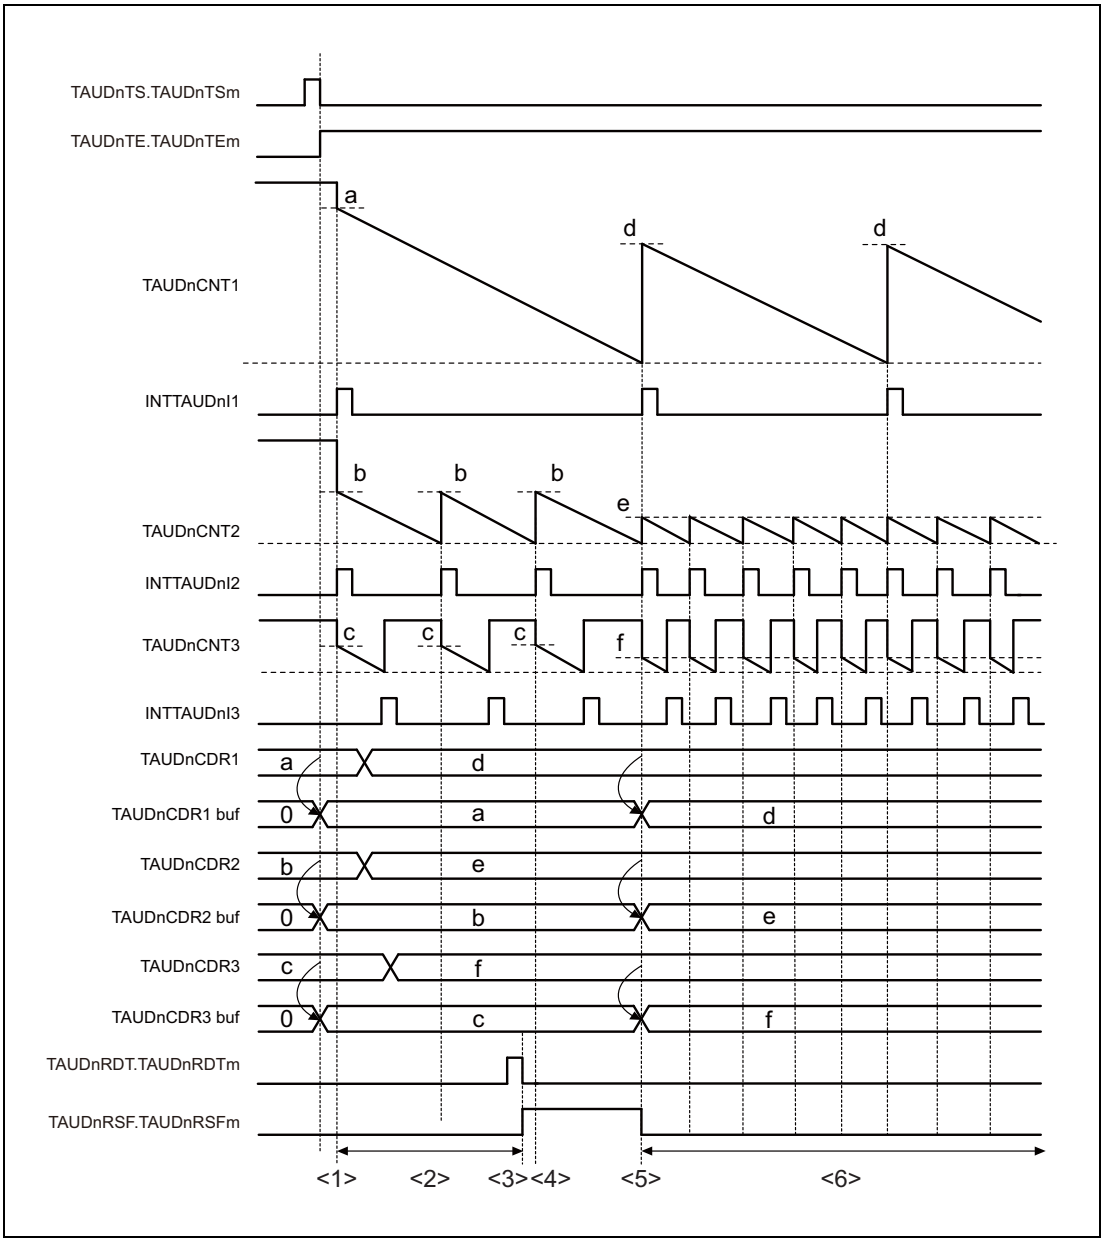

Figure 25.8 Simultaneous Rewrite When INTTAUDnIm Is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm

Setting:

CH1 is an upper channel which performs counting down, CH2 is a master channel, and CH3 is the slave channel. The simultaneous rewrite method C1 is applied. The TAUDnRDC register specifies a channel which generates simultaneous rewrite triggers.

Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer.

(2) The TAUDnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1, the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is generated when counter 1 reaches 0000_H. The TAUDnCDRm values are loaded into the corresponding TAUDnCDRm buffers.

(6) The counter counts down and awaits the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be rechanged.

25.6.4.4 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal (Method C2)

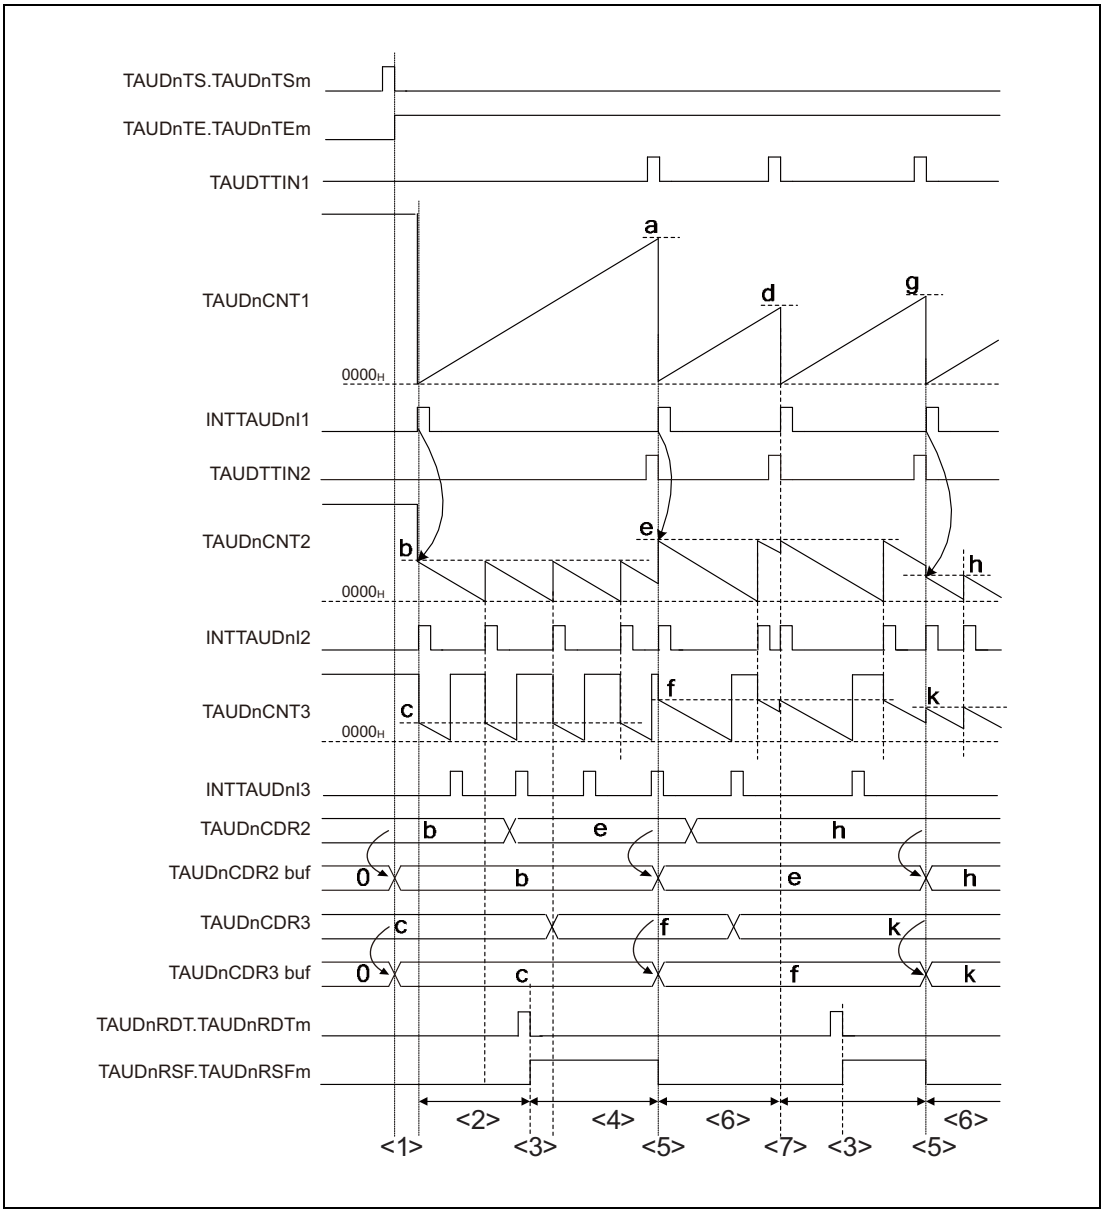

Figure 25.9 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal

Setting:

CH1 is an upper channel which performs counting up, CH2 is a master channel, and CH3 is the slave channel. The synchronous channel operation method C2 is applied. The TAUDnRDC register specifies which upper channel is monitored for an INTTAUDnIm trigger.

Description:

(1) When TAUDnTS.TAUDnTSm is set to 1, TAUDnCDRm value is copied to the TAUDnCDRm buffer. However, as TAUDnCDR1 operates in capture mode, TAUDnCDR1 value is not copied to the TAUDnCDR1 buffer.

(2) The TAUDnCDRm register is always ready to write.

(3) By setting the reload data trigger bit (TAUDnRDT.TAUDnRDTm) to 1, the status flag is set (TAUDnRSF.TAUDnRSFm = 1) to enable simultaneous rewrite.

(4) Simultaneous rewrite is triggered only by a CH1 interrupt. Therefore, simultaneous rewrite is not conducted even if enabled.

(5) Simultaneous rewrite is triggered by INT1 which is caused by external signal TIN1. The TAUDnCDRm values are written to the corresponding TAUDnCDRm buffers.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of the TAUDnCDRm registers can be changed again.

(7) An external signal occurs at TIN2 but simultaneous rewrite does not take place because it is disabled (TAUDnRSF.TAUDnRSFm = 0).

25.7 Channel Output Modes

The output of the TAUDTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUDnTOE.TAUDnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUDnTO.TAUDnTOm) is sent to the output pin (TAUDTTOUTm).
- By TAUD signals (TAUDnTOE.TAUDnTOEm = 1)
  When controlled by TAUD signals, the output level of TAUDTTOUTm is set or reset or toggled by internal signals. The value of TAUDnTO.TAUDnTOm is updated accordingly to reflect the value of TAUDTTOUTm.
  - Independently (TAUDnTOM.TAUDnTOMm = 0)
    In case of independent operation, the output of the TAUDTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUDnTOM.TAUDnTOMm = 0).
  - Synchronously (TAUDnTOM.TAUDnTOMm = 1)
    In case of synchronous operation, the output of the TAUDTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUDnTOM.TAUDnTOMm = 1).

The TAUDnTO.TAUDnTOm bit can always be read to determine the current value of TAUDTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 25.48, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 25.7.2, Channel Output Modes Controlled Independently by TAUDn Signals**
- **Section 25.7.3, Channel Output Modes Controlled Synchronously by TAUDn Signals**

Batch operation of TAUDnTOm bit

Whether a set value is reflected to the TAUDnTOm bit or not is controlled by the TAUDnTOE.TAUDnTOEm bit.

The TAUDnTOm setting is written only to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit = 0 when a write to the TAUDnTO register is attempted. No TAUDnTOm setting is reflected to the bit (channel) set with TAUDnTOE.TAUDnTOEm bit = 1.

NOTE

TAUDnTO.TAUDnTOm bit is placed so that its bit number corresponds to a channel number.

Output logic

Positive logic or negative logic of the output is specified by control bit TAUDnTOL.TAUDnTOLm.

The value of TAUDnTOL.TAUDnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function or triangle PWM output function. Otherwise, changes to TAUDnTOL.TAUDnTOLm result in an undefined TAUDTTOUTm signal output.

See **Section 25.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 25.48**.

Table 25.48 Channel Output Modes

Channel Output Mode	TAUDn TOE. TAUDn TOEm	TAUDn TOM. TAUDn TOMm	TAUDn TOC. TAUDn TOCm	TAUDn TDE. TAUDn TDEm	TAUDn TRE. TAUDn TREm	TAUDn TME. TAUDn TMEm	TAUDn TDM. TAUDn TDMm
By software							
Independent channel output mode controlled by software	0	X					
By TAUD signals, independently							
Independent channel output mode 1	1	0	0	0	0	0	0
with real-time output					1		
Independent channel output mode 2			1		0		
By TAUD signals, synchronously							
Synchronous channel output mode 1	1	1	0	0	0	0	0
with non-complementary modulation output					1	X	
Synchronous channel output mode 2			1	0	0	0	0
with dead time output				1			
with one-phase PWM output							1
with complementary modulation output					1	1	0
with non-complementary modulation output			1	0			

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

NOTES

1. The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm = 1):
   - TAUDnTOM.TAUDnTOMm
   - TAUDnTOC.TAUDnTOCm
   - TAUDnTDE.TAUDnTDEm
   - TAUDnTRE.TAUDnTREm
   - TAUDnTDM.TAUDnTDMm
2. The following bits cannot be changed during count operation (TAUDnTE.TAUDnTEm = 1) except in channel output modes with modulation output:
   - TAUDnTME.TAUDnTMEm
   - TAUDnTDL.TAUDnTDLm

25.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUDTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUDnTOE.TAUDnTOEm = 0).

(1) Set TAUDnTO.TAUDnTOm to specify the initial level of the TAUDTTOUTm output.

(2) Set channel output mode according to **Table 25.48, Channel Output Modes**, and the output logic using the TAUDnTOL.TAUDnTOLm bit.

(3) Start the counter (TAUDnTS.TAUDnTSm = 1).

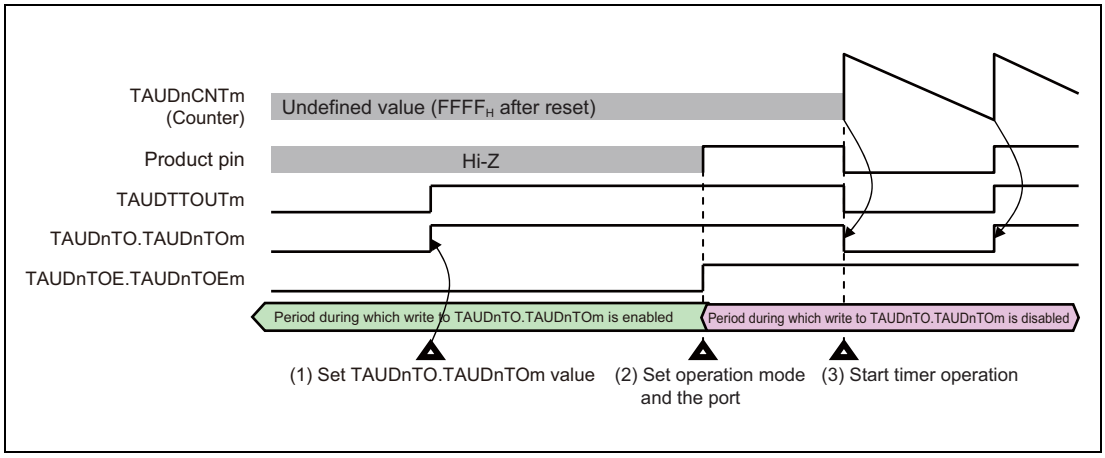

Figure 25.10 General Procedure for Specifying a TAUDTTOUTm Channel Output Mode

25.7.2 Channel Output Modes Controlled Independently by TAUDn Signals

This section lists the channel output modes that are controlled independently by TAUDn signals. The control bits used to specify a mode are listed in **Table 25.48, Channel Output Modes**.

25.7.2.1 Independent Channel Output Mode 1

Set/reset conditions

In this output mode, TAUDTTOUTm toggles when INTTAUDnIm is detected. The value of TAUDnTOL.TAUDnTOLm is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 25.48, Channel Output Modes**.

25.7.2.2 Independent Channel Output Mode 1 with Real-Time Output

In this output mode, the value of TAUDnTRO.TAUDnTROm bit of the trigger channel is output to TAUDTTOUTm. The trigger channel is specified by setting the corresponding TAUDnTRC.TAUDnTRCm bit to 1. It controls all lower channels for which TAUDnTRC.TAUDnTRCm = 0.

Set/reset conditions

The value of TAUDnTRO.TAUDnTROm bit is sent to TAUDTTOUTm only when an INTTAUDnIm interrupt occurs on the trigger channel. The interrupt is generated either:

- at certain specified intervals or
- on detection of a valid TAUDTTINm input edge/counter start

The type of trigger is set using the TAUDnCMORm.TAUDnMD[4:1] bits.

Prerequisites

Both the master and slave channels can be set as a trigger generation channel. A channel for which TAUDnTRC.TAUDnTRCm is set to 1 serves as a trigger generation channel regardless of the value of TAUDnTRE.TAUDnTREm.

If there is no channel for which TAUDnTRC.TAUDnTRCm is set to 1 or if TAUDnTRC.TAUDnTRC0 = 0, real-time output cannot take place.

This can be seen in **Figure 25.11**.

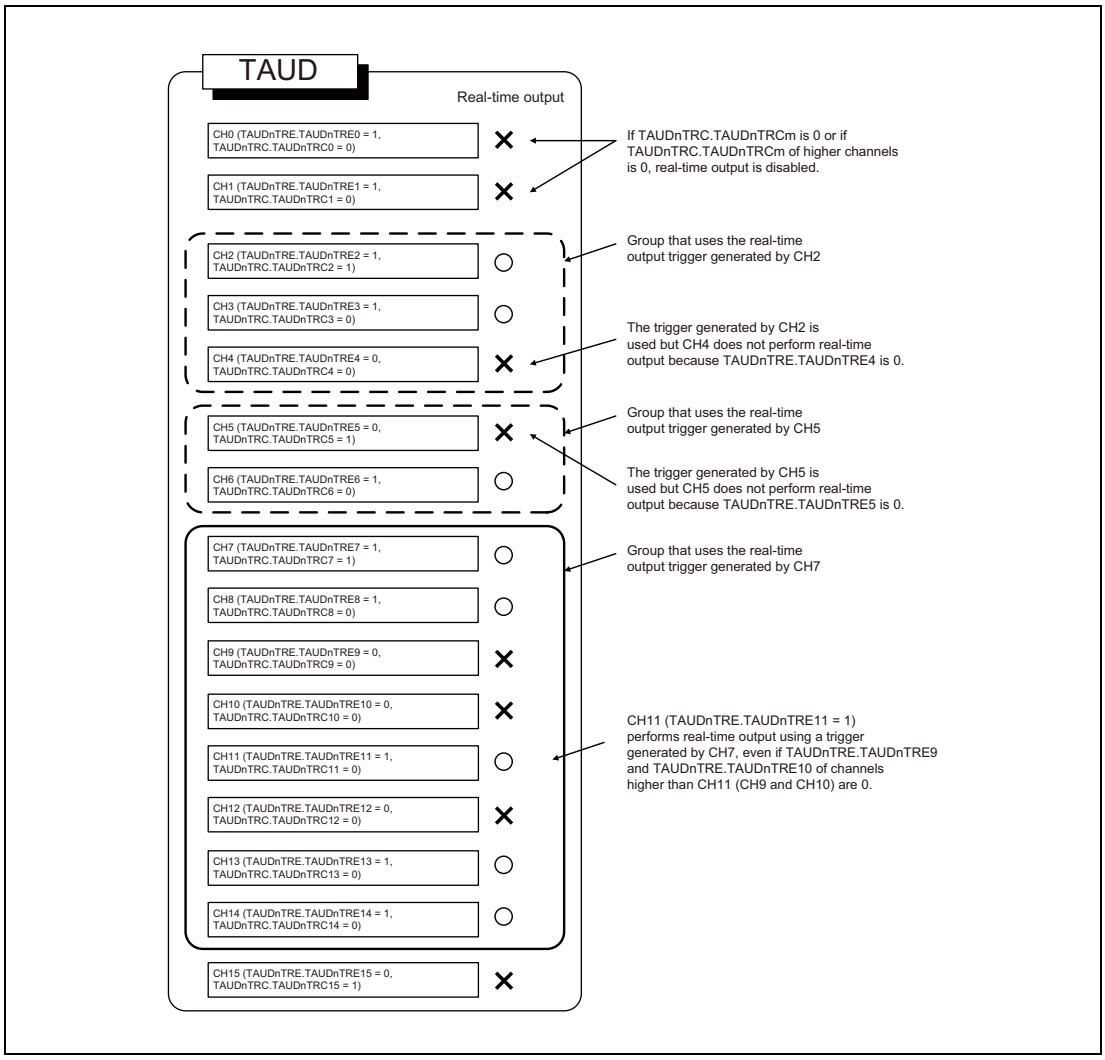

Figure 25.11 Real-Time Output

25.7.2.3 Independent Channel Output Mode 2

Set/reset conditions

In this output mode, TAUDTTOUTm is set when INTTAUDnIm occurs at the time of count start, and reset when INTTAUDnIm occurs due to a match between TAUDnCNTm and TAUDnCDRm.

Prerequisites

There are no prerequisites other than those shown in **Table 25.48, Channel Output Modes**.

25.7.3 Channel Output Modes Controlled Synchronously by TAUDn Signals

This section lists the channel output modes that are controlled synchronously by TAUDn signals. The control bits used to specify a mode are listed in **Table 25.48, Channel Output Modes**.

25.7.3.1 Synchronous Channel Output Mode 1

Set/reset conditions

In this output mode, INTTAUDnIm of master channel serves as a set signal and INTTAUDnIm of the slave channel as a reset signal. If INTTAUDnIm of master channel and INTTAUDnIm of the slave channel are generated at the same time, INTTAUDnIm of the slave channel (reset signal) has priority over INTTAUDnIm (set signal) of master channel, i.e., the master channel is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 25.48, Channel Output Modes**.

25.7.3.2 Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

Set/reset conditions

In this output mode, TAUDTTOUTm outputs the result of an AND operation between the PWM output and the real-time output bit (TAUDnTRO.TAUDnTROm) of a channel.

The phase period to which the dead time is added is specified using the TAUDnTDL.TAUDnTDLm bit; for positive phase set TAUDnTDL.TAUDnTDLm = 0 and for negative phase set TAUDnTDL.TAUDnTDLm = 1.

Prerequisites

A set of at least three channels is required to generate the PWM output. The master channel and slave channel 1 generate a period, and slave channel 2 generates the duty cycle. In typical applications, five more slave channels are also used that operate in the same manner as slave channel 2.

Only the PWM output and the real-time output bit of the same channel can be combined.

TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed, its new value is applied upon detection of INTTAUDnIm on the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on the master channel.

25.7.3.3 Synchronous Channel Output Mode 2

In this output mode, the operating mode should be set to count-up/-down mode. The result is a triangle PWM output at TAUDTTOUTm. For details, see **Section 25.15.7, Triangle PWM Output Function**.

Set/reset conditions

TAUDnCNTm of the slave channel counts down and up alternatively. When it passes 0001_H it generates an interrupt, causing TAUDTTOUTm to toggle.

Prerequisites

A set of two channels is required to generate the triangle PWM output. TAUDTTOUTm should be set to 0 before the function starts.

25.7.3.4 Synchronous Channel Output Mode 2 with Dead Time Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in **Figure 25.12**.

Set/reset conditions

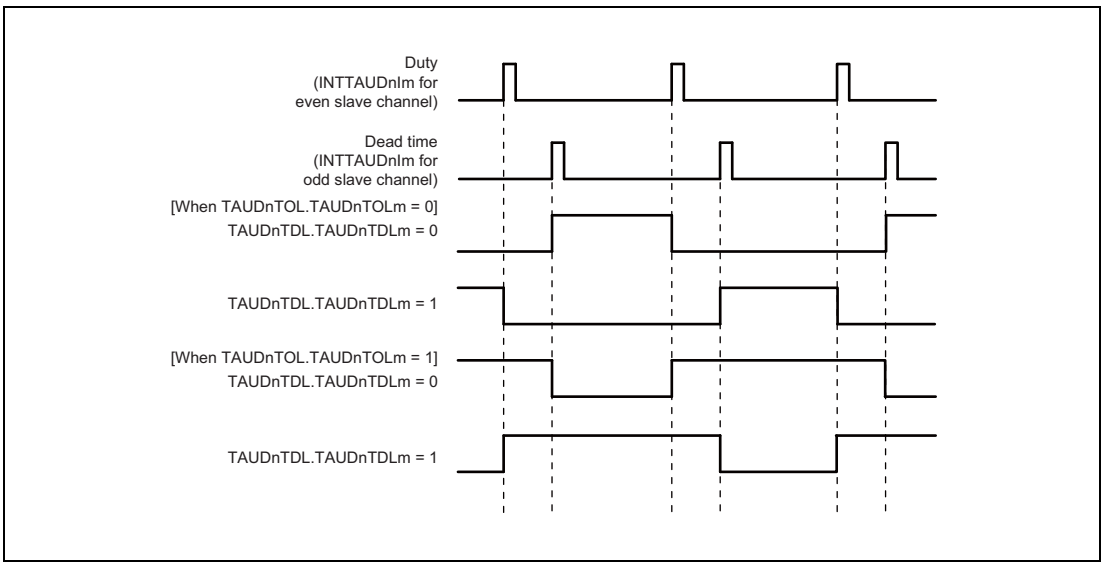

Figure 25.12 Set/Reset Conditions for Synchronous Channel Output Mode 2 with Dead Time Output

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm = 0 for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges.

Prerequisites

Dead time control requires a set of three channels, each operating in the following modes:

- One master channel
  The master channel should be set to interval timer mode.
- One even slave channel
  The even slave channel should be set to count-up/-down mode.
- One odd slave channel (even channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm

- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

25.7.3.5 Synchronous Channel Output Mode 2 with One-Phase PWM Output

In this output mode, a dead time delay is added to TAUDTTOUTm. The set/reset conditions are shown in **Figure 25.13**.

Set/reset conditions

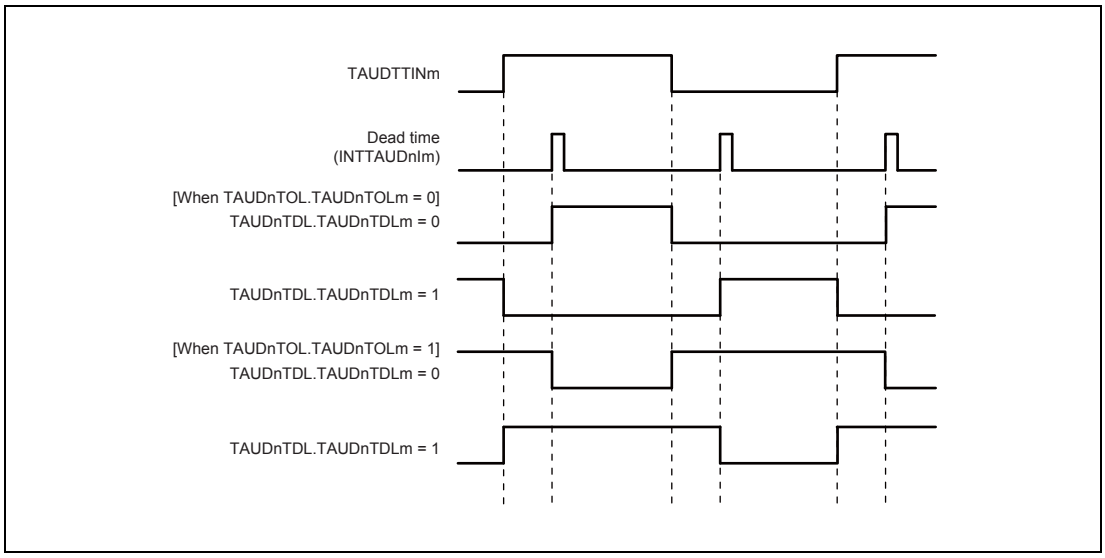

Figure 25.13 Set/Reset Conditions for Synchronous Channel Output Mode 2 with One-Phase PWM Output

With regard to the edge to which dead time is added, set TAUDnTDL.TAUDnTDLm = 0 for rising edges and TAUDnTDL.TAUDnTDLm = 1 for falling edges.

Prerequisites

One-phase PWM output control requires a set of two channels:

- One even slave channel
- One odd slave channel (even channel + 1)
  The odd slave channel should be set to one-count mode.

The values of the following bits should be the same for the odd channel and the even channel:

- TAUDnTOE.TAUDnTOEm
- TAUDnTME.TAUDnTMEm
- TAUDnTRE.TAUDnTREm
- TAUDnTOM.TAUDnTOMm
- TAUDnTOC.TAUDnTOCm
- TAUDnTDE.TAUDnTDEm
- TAUDnTDM.TAUDnTDMm

25.7.3.6 Synchronous Channel Output Mode 2 with Complementary Modulation Output

Set/reset conditions

In this output mode, TAUDTTOUTm outputs a PWM signal, a high signal, or a low signal depending on the value of real-time output bit (TAUDnTRO.TAUDnTROm), the modulation output bit (TAUDnTME.TAUDnTMEm), and the output level bit (TAUDnTOL.TAUDnTOLm) of a pair of slave channels.

For details, see **Section 25.16.3, Complementary Modulation Output Function**.

Prerequisites

A set of at least four channels is required for this mode. The master channel and slave channel 1 generate a period, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time. Slave channels 2 and 3 are a pair. In typical applications, four more channels are also used, which operates in the same manner as slave channels 2 and 3 respectively.

TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can only be changed during count operation.

- If TAUDnTME.TAUDnTMEm is changed during operation, its new value is applied upon detection of INTTAUDnIm at the specified channel.
- If TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm are changed, their new values are applied upon detection of INTTAUDnIm on an even slave channel.

25.7.3.7 Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

The difference from synchronous channel output mode 1 with non-complementary modulation output is the PWM wave shape.

Mode 1 has a square wave while mode 2 has a triangular wave.

25.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUDnTS.TAUDnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

25.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUDnTS.TAUDnTSm is set to 1. The value of data register is also loaded when the counter starts.

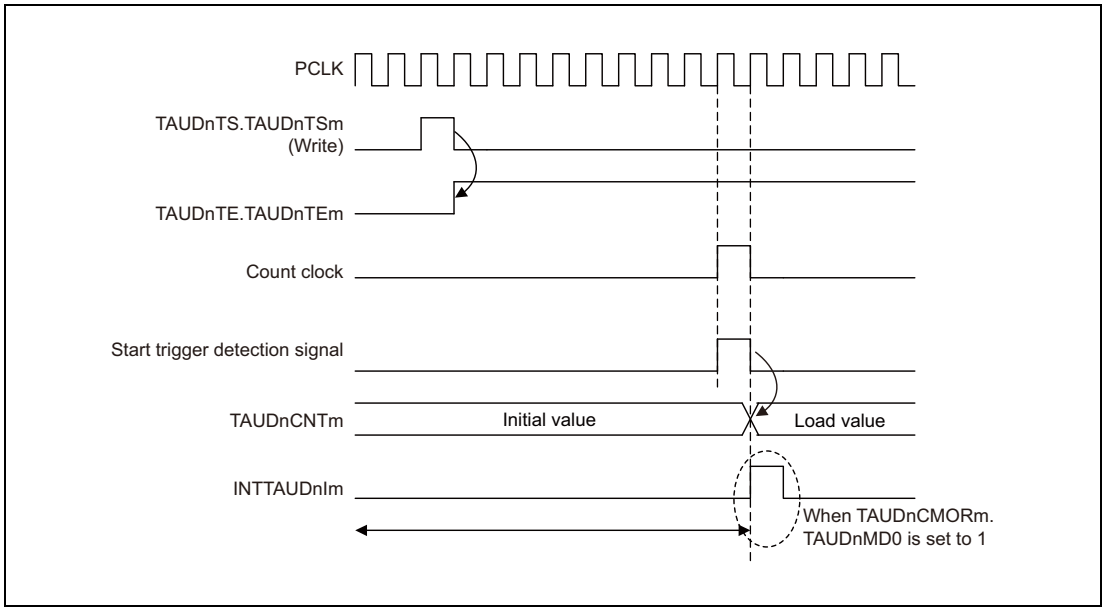

Figure 25.14 Start Timing in Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode

NOTE

Make sure to set TAUDnCMORm.TAUDnMD0 to 0 when using the count-up/-down mode.

25.8.2 Event Count Mode

The value of data register is loaded as soon as TAUDnTS.TAUDnTSm is set to 1. The counter also starts immediately. The value of data register decrements when the subsequent count clock cycle starts.

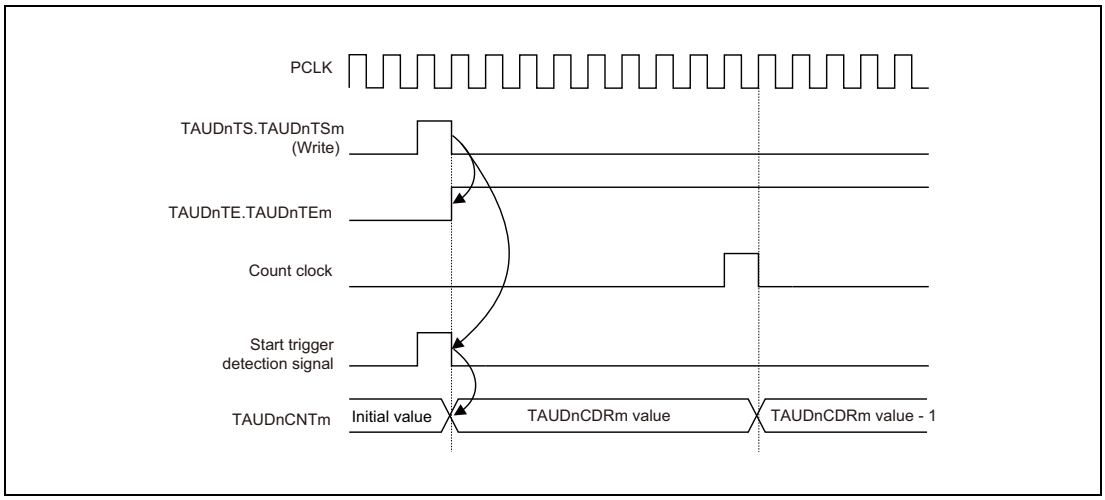

Figure 25.15 Start Timing in Event Count Mode

25.8.3 Other Operating Modes

In other operating modes, the counter operation start timing is triggered only upon detection of a valid edge of TAUDTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which are irrelevant to start of counter operation, determine the frequency with which all operations take place.

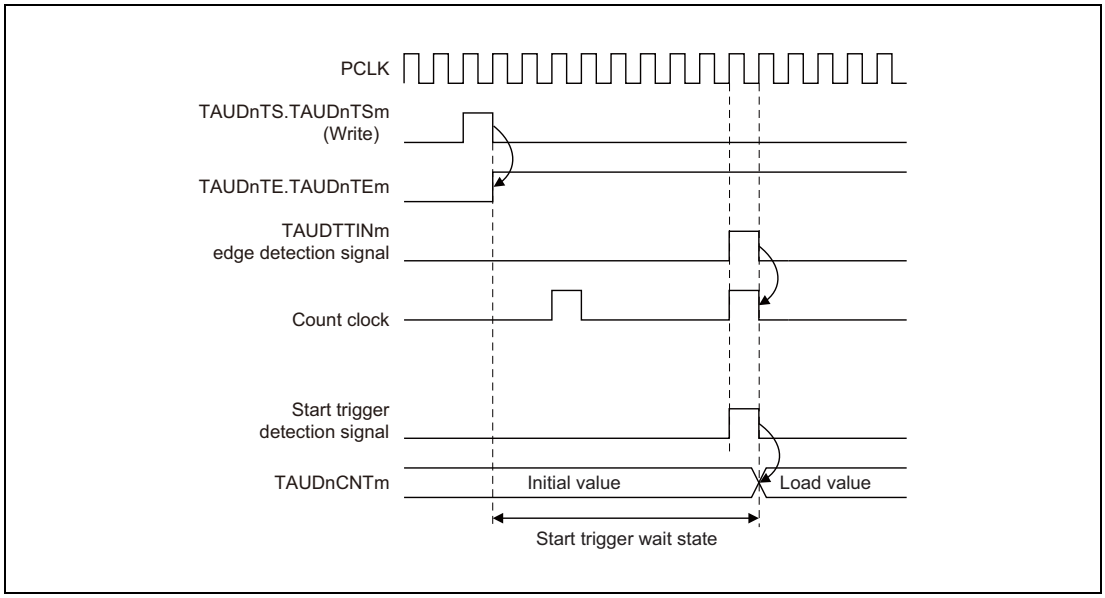

Figure 25.16 Count Start Timing in Other Operating Modes

25.9 TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUDnIm is generated using the TAUDnCMORm.TAUDnMD0 bit. The generation of INTTAUDnIm when the TAUDnCMORm.TAUDnMD0 bit starts counting and the effect to TAUDTTOUTm depend on the selected function. For details, refer to the description of TAUDnCMORm.TAUDnMD0 of each function.

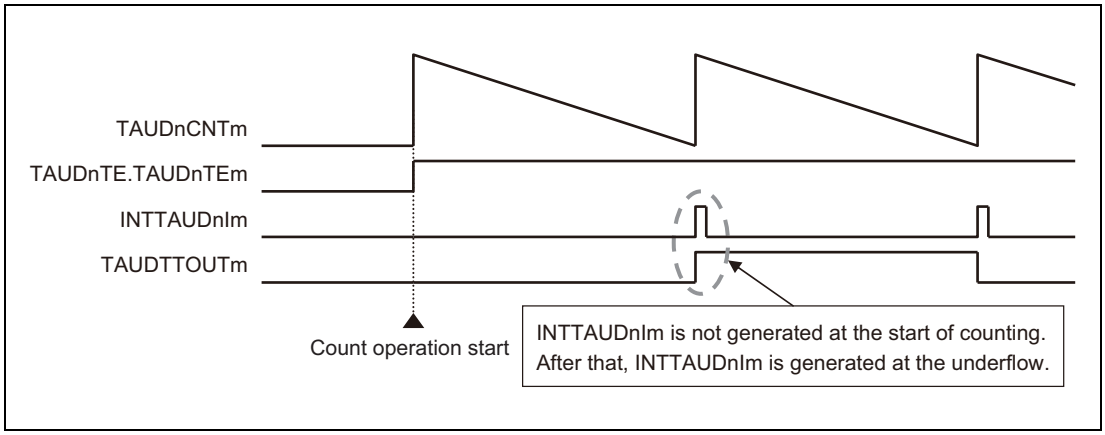

Figure 25.17 INTTAUDnIm Generation Timing (when TAUDnCMORm.TAUDnMD0 = 0)

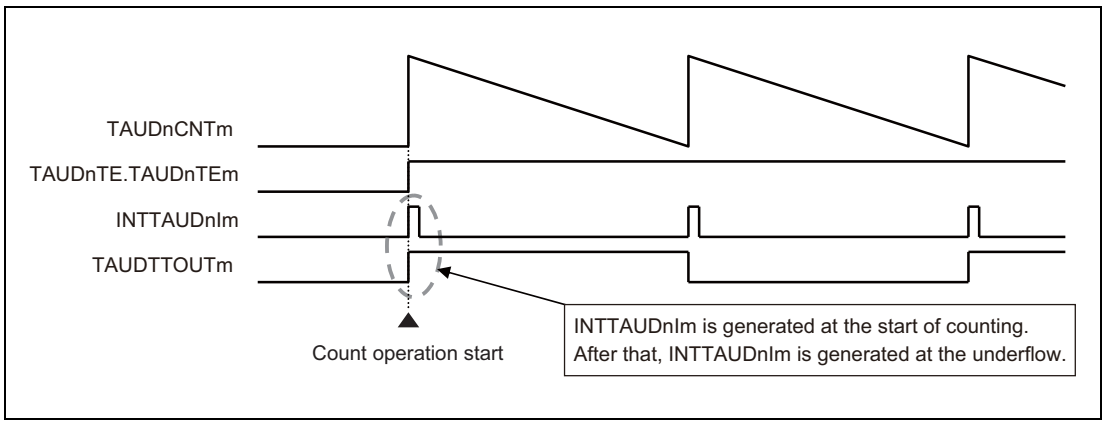

Figure 25.18 INTTAUDnIm Generation Timing (when TAUDnCMORm.TAUDnMD0 = 1)

25.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches $FFFF_H$ and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operation in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches 0000_H at the same time as the first channel overflows (TAUDnCNTm = $FFFF_H$).
- Set TAUDnCDRm of the second channel to $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUDTTINm input.
- The trigger detection settings (TAUDnCMORm.TAUDnSTS[2:0] and TAUDnCMURm.TAUDnTIS[1:0]) must be identical for both channels.

Result:

The down-counter of the second channel reaches 0000_H at exactly the same time as the up-counter of the first channel overflows (TAUDnCNTm = $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

25.10.1 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the TAUDTTINm input interval timer function can detect the overflow when TAUDnCNTm of the TAUDTTINm input pulse interval measurement function exceeds $FFFF_H$.

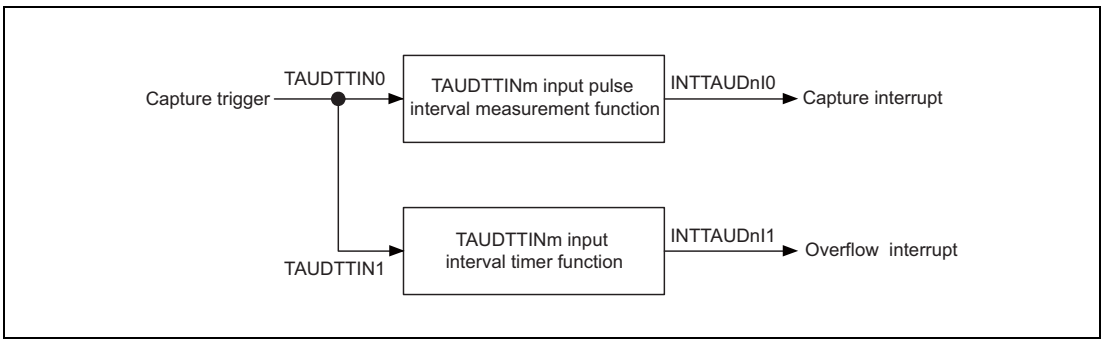

Figure 25.19 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

Timing diagram

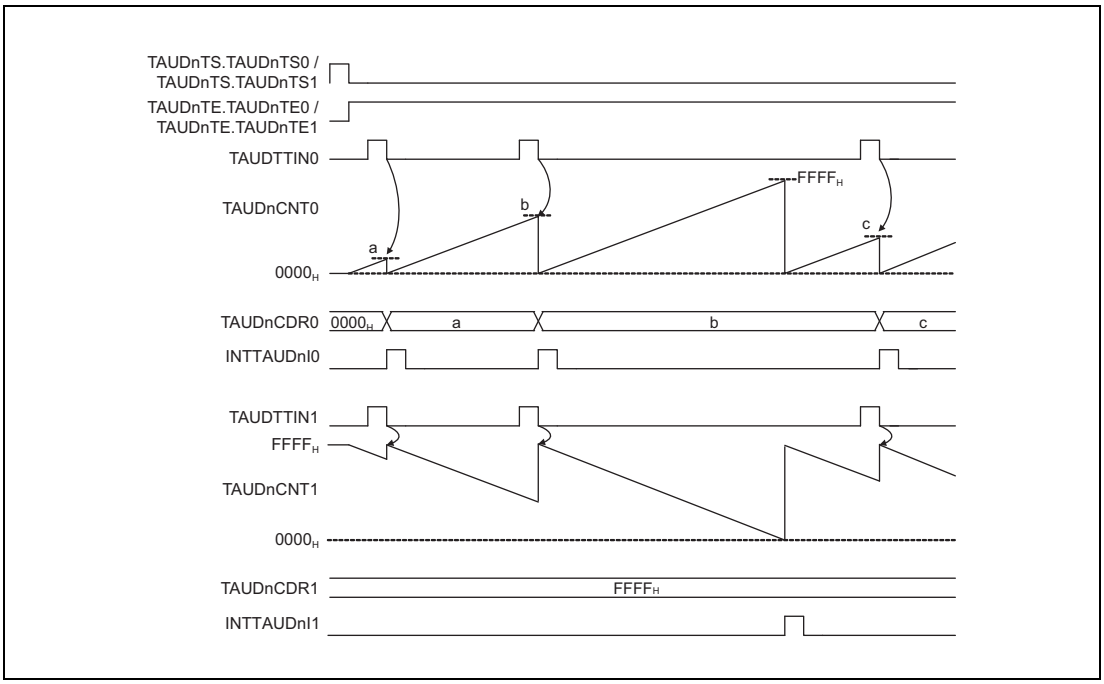

Figure 25.20 Interrupt Generation via Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function

25.10.2 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the overflow interrupt output function (at measuring the TAUDTTINm width) can detect the overflow when TAUDnCNTm of the TAUDTTINm input signal width measurement function exceeds $FFFF_H$.

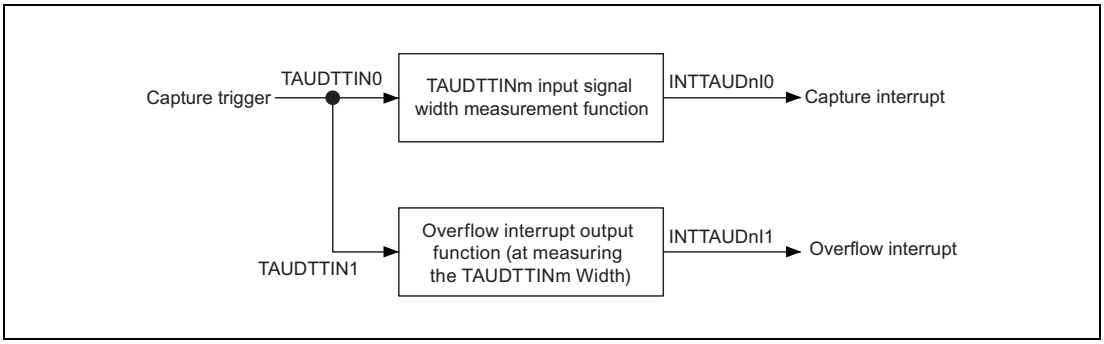

Figure 25.21 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

Timing diagram

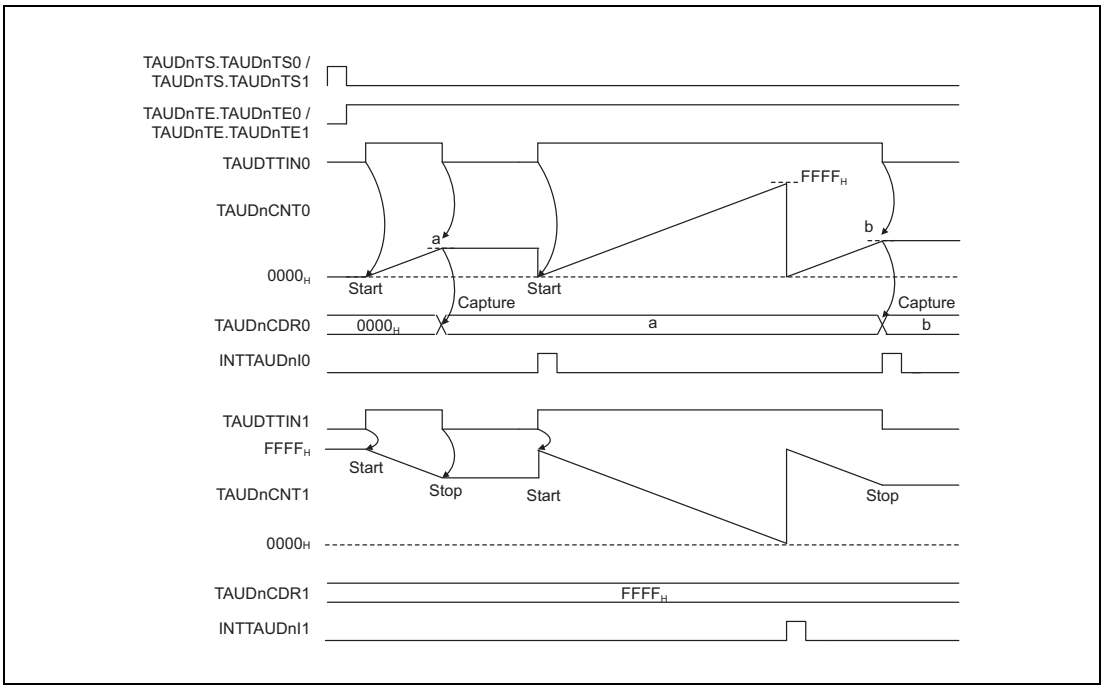

Figure 25.22 Interrupt Generation via Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width)

25.10.3 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

When the counters of both channels are enabled simultaneously, INTTAUDnIm of the interval timer function can detect the overflow when TAUDnCNTm of the TAUDTTINm input position detection function exceeds $FFFF_H$.

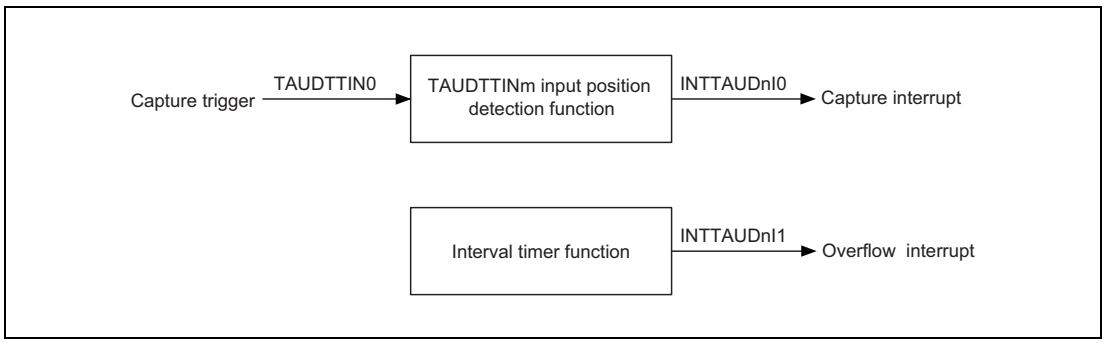

Figure 25.23 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

Timing diagram

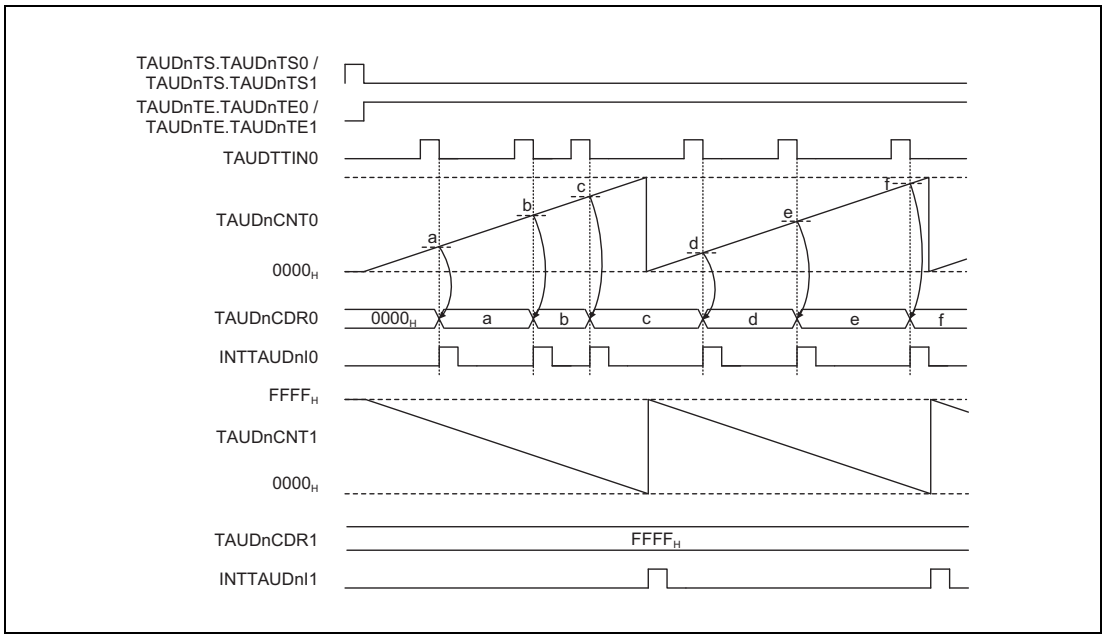

Figure 25.24 Interrupt Generation via Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function

25.10.4 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

When the capture trigger is input simultaneously to TAUDTTINm of both channels, INTTAUDnIm of the overflow interrupt output function (at detecting the TAUDTTINm input period count) can detect the overflow when TAUDnCNTm of the TAUDTTINm input period count detection function exceeds $FFFF_H$.

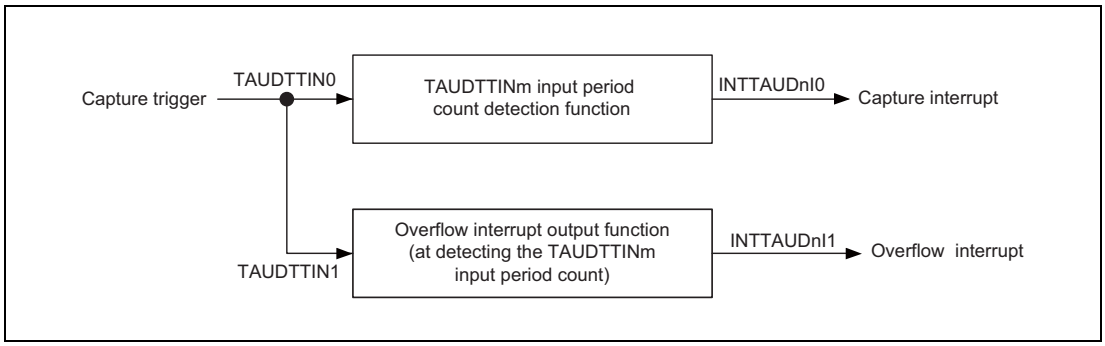

Figure 25.25 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

Timing diagram

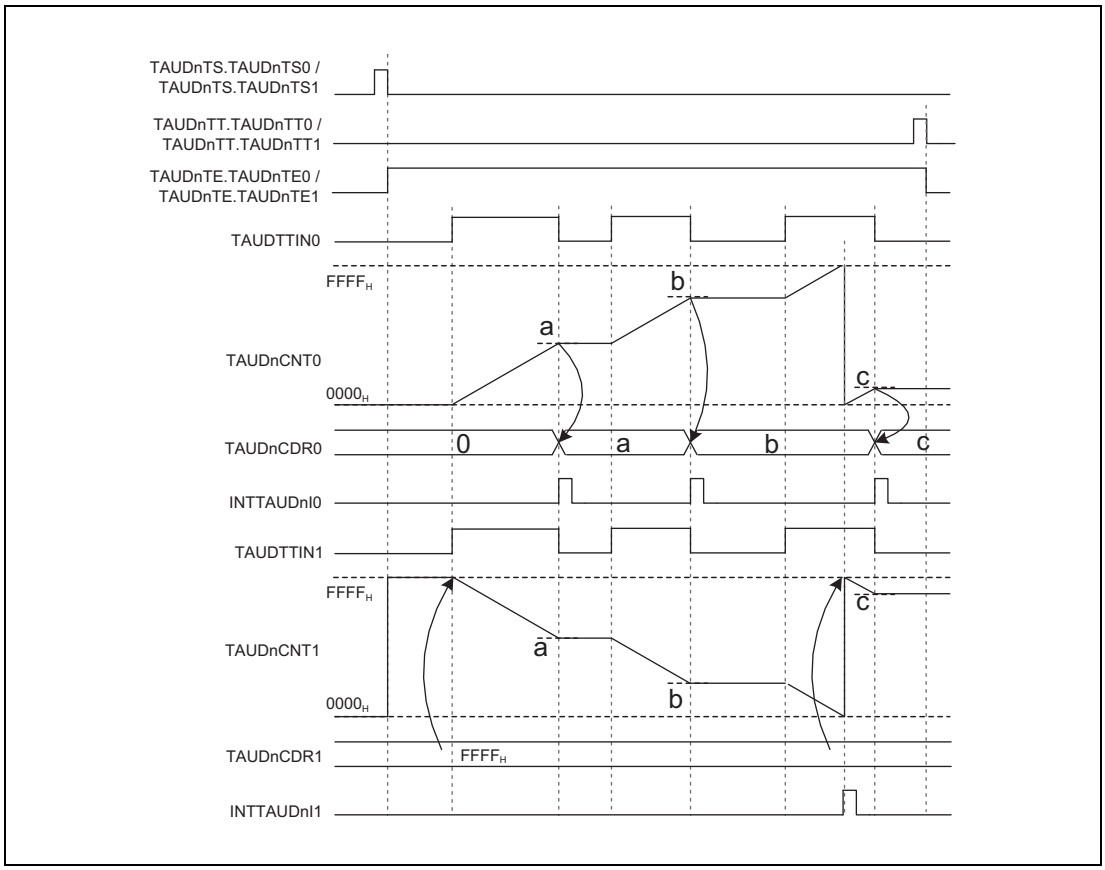

Figure 25.26 Interrupt Generation via Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count)

25.11 TAUDTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

Figure 25.27 shows when edge detection takes place.

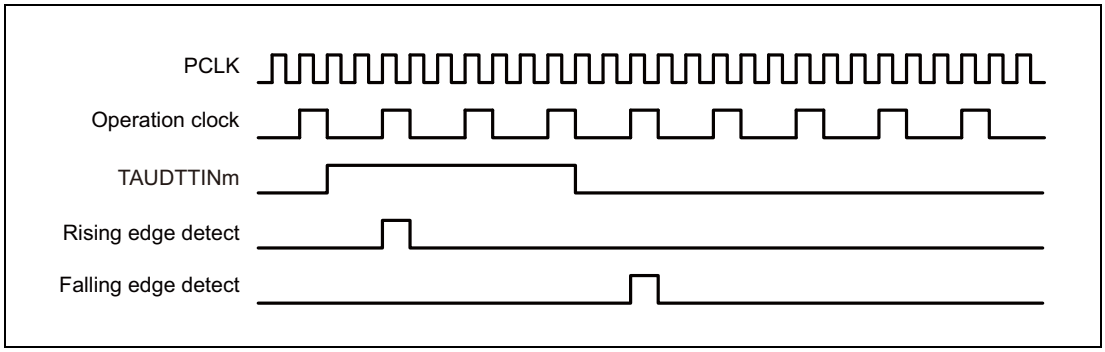

Figure 25.27 Basic Edge Detection Timing

Figure 25.27 shows an operation timing image. Actually, a noise filter or synchronization circuit which is located between the TAUDnIm pin and TAUDn causes a delay time.

25.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the Timer Array Unit D. For a general overview of independent channel operation, see **Section 25.2, Overview**.

This section describes functions that generate interrupts at regular intervals or with a specified delay.

25.12.1 Interval Timer Function

25.12.1.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operation mode must be set to Interval Timer Mode, see **Table 25.49, Contents of the TAUDnCMORm Register for Interval Timer Function**.
- The channel output mode must be set to Independent Channel Output Mode 1, see **Section 25.7, Channel Output Modes**.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is written to TAUDnCNTm and the counter starts to count down from this value.

When the counter reaches 0000_H, INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and subsequently continues operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm stop but retain their values. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in a negative TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

25.12.1.2 Equations

INTTAUDnIm cycle = count clock cycle × (TAUDnCDRm + 1)

TAUDTTOUTm square wave cycle = count clock cycle × (TAUDnCDRm + 1) × 2

25.12.1.3 Block Diagram and General Timing Diagram

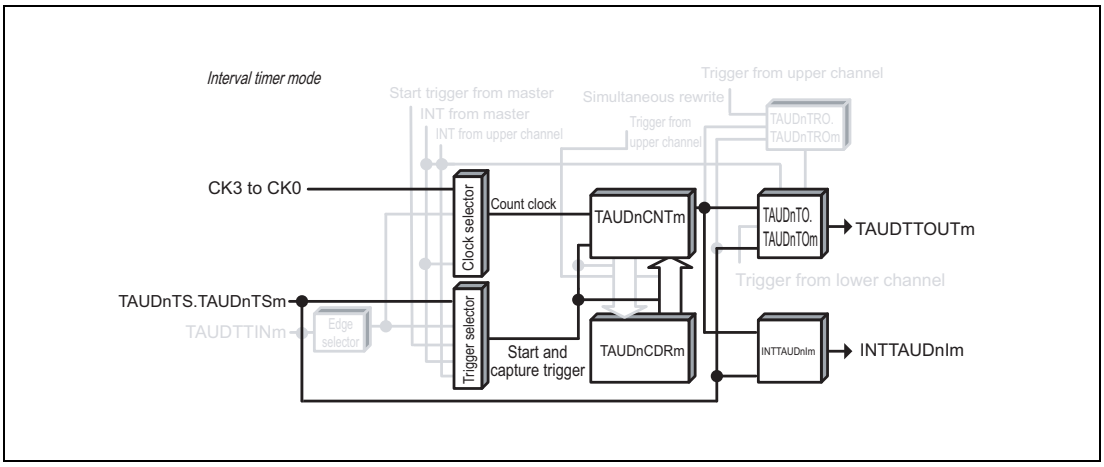

Figure 25.28 Block Diagram of Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 1).

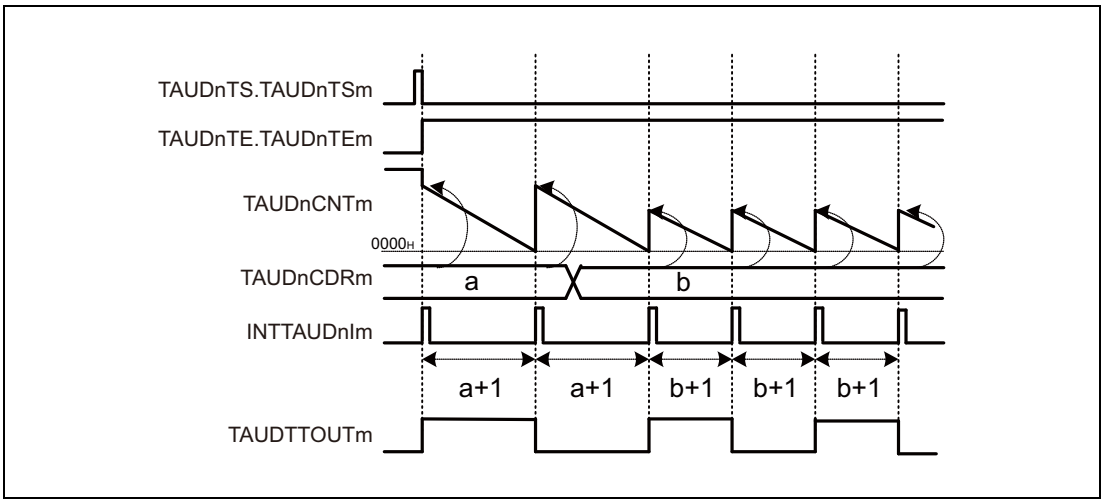

Figure 25.29 General Timing Diagram of Interval Timer Function

25.12.1.4 Register Settings

Table 25.49 Contents of the TAUDnCMORm Register for Interval Timer Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS [1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Independent operation, set to 0.
10 to 8	TAUDnSTS[2:0]	000: Triggers the counter by software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated to toggle TAUDTTOUTm at the beginning of an operation. 1: INTTAUDnIm is generated to toggle TAUDTTOUTm at the beginning of an operation.

(2) TAUDnCMURm

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.50 Contents of the TAUDnCMURm Register for Interval Timer Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode

Table 25.51 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Section 25.7, Channel Output Modes**.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the interval timer function. Therefore, these registers should be set to 0.

Table 25.52 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

25.12.1.5 Operating Procedure for Interval Timer Function

Table 25.53 Operating Procedure for Interval Timer Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.49, Contents of the TAUDnCMORm Register for Interval Timer Function**, and **Table 25.50, Contents of the TAUDnCMURm Register for Interval Timer Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 25.51, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. When TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated and TAUDTTOUTm toggles.
During Operation	The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000_H: • The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. • INTTAUDnIm is generated and TAUDTTOUTm toggles.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart operation

25.12.1.6 Specific Timing Diagrams

(1) TAUDnCDRm = 0000_H, count clock = PCLK/2

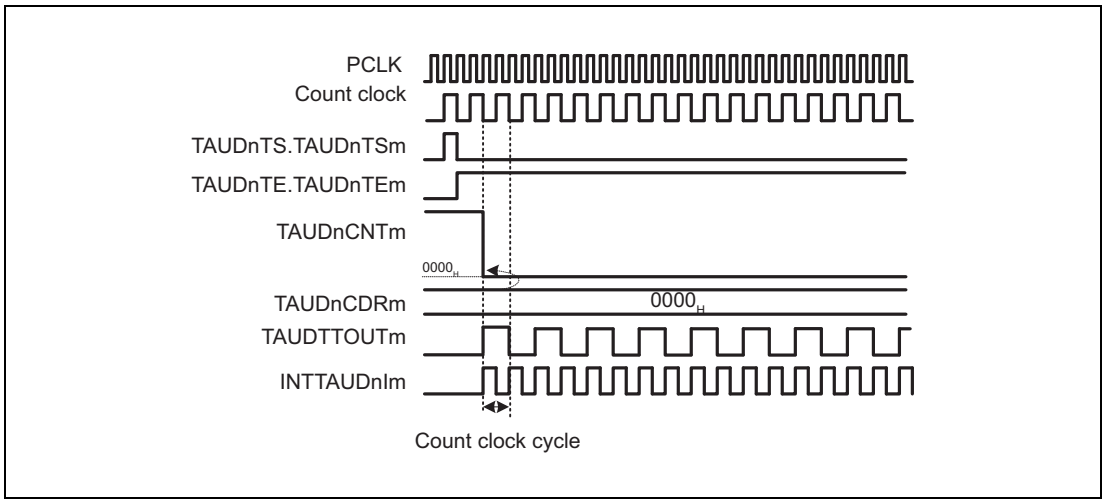

Figure 25.30 TAUDnCDRm = 0000_H, Count Clock = PCLK/2

- If TAUDnCDRm = 0000_H and the count clock = PCLK/2, the TAUDnCDRm value is loaded into TAUDnCNTm every count clock, meaning that TAUDnCNTm is always 0000_H.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

(2) TAUDnCDRm = 0000_H, count clock = PCLK

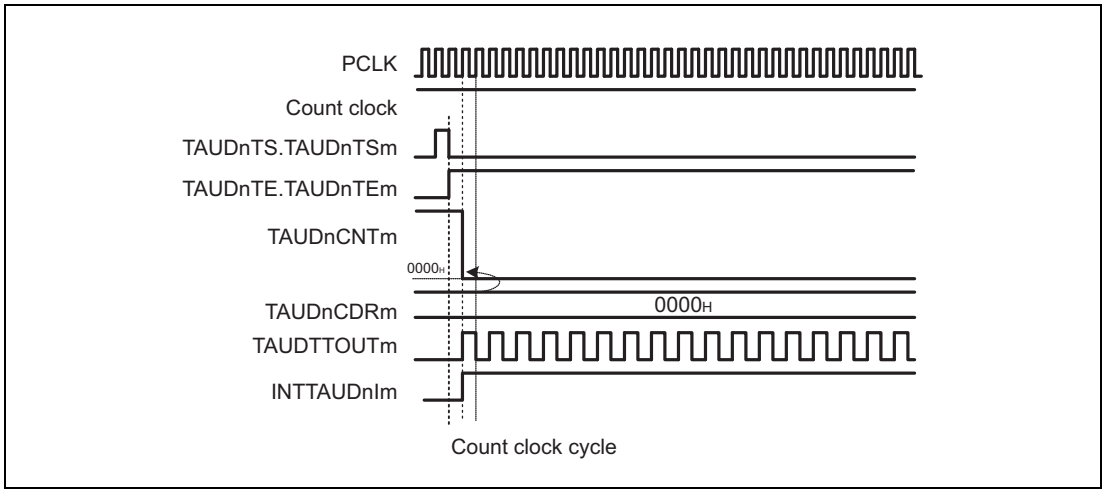

Figure 25.31 TAUDnCDRm = 0000_H, Count Clock = PCLK

- If TAUDnCDRm = 0000_H and the count clock = PCLK, the TAUDnCDRm value is loaded into TAUDnCNTm every PCLK clock, meaning that TAUDnCNTm is always 0000_H.
- INTTAUDnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
  TAUDTTOUTm is toggled every PCLK clock.

(3) Operation stop and restart

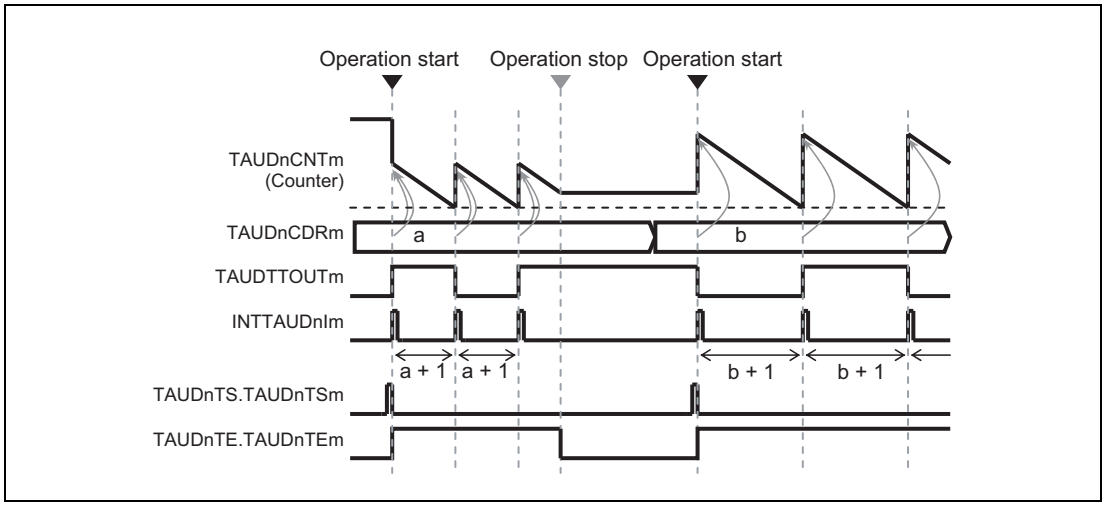

Figure 25.32 Operation Stop and Restart (TAUDnCMORm.TAUDnMD0 = 1)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm and TAUDTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

(4) Forced restart (TAUDnCMORm.TAUDnMD0 = 1)

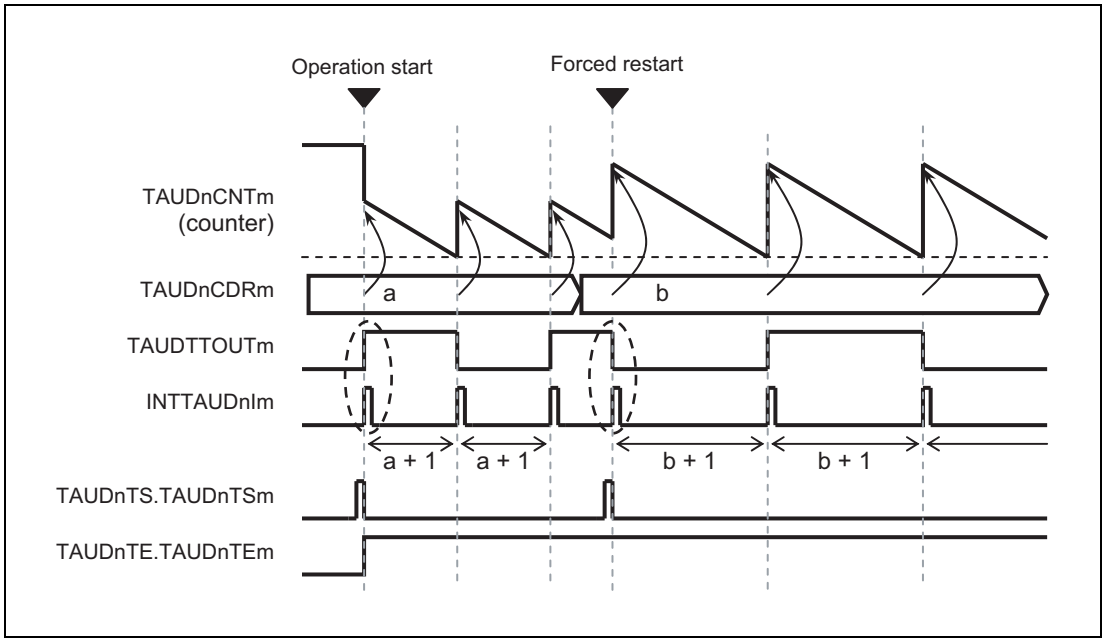

Figure 25.33 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 1)

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm to 1 during operation.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 1, the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUDnCDRm value is reflected to TAUDnCNTm and counting starts. Execute a forced restart to reflect the changed TAUDnCDRm value immediately.
- When a forced restart is made, an interrupt (INTTAUDnIm) is generated and TAUDTTOUTm is inverted.

(5) Forced restart (TAUDnCMORm.TAUDnMD0 = 0)

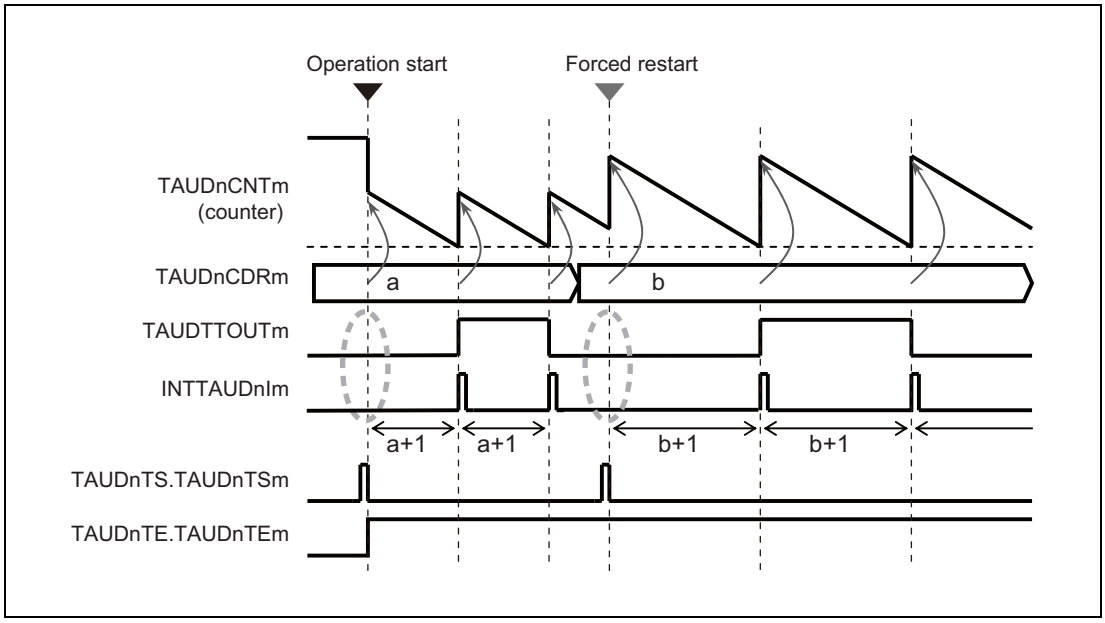

Figure 25.34 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 0)

- When a forced restart is made, an interrupt (INTTAUDnIm) is not generated and TAUDTTOUTm is not inverted.

25.12.2 TAUDTTINm Input Interval Timer Function

25.12.2.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUDnIm) at regular intervals or when a valid TAUDTTINm input edge is detected. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operating mode should be set to interval timer mode. See **Table 25.54, Contents of the TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function**.
- The channel output mode should be set to independent channel output mode 1. See **Section 25.7, Channel Output Modes**.

Functional description

This function operates in an identical manner to the interval timer function (see **Section 25.12.1, Interval Timer Function**) except that this function is restarted by a valid TAUDTTINm input edge. The type of edge used as a trigger is specified using the TAUDnCMURm.TAUDnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

25.12.2.2 Equations

INTTAUDnIm cycle = count clock cycle × (TAUDnCDRm + 1)

TAUDTTOUTm square wave cycle = count clock cycle × (TAUDnCDRm + 1) × 2

25.12.2.3 Block Diagram and General Timing Diagram

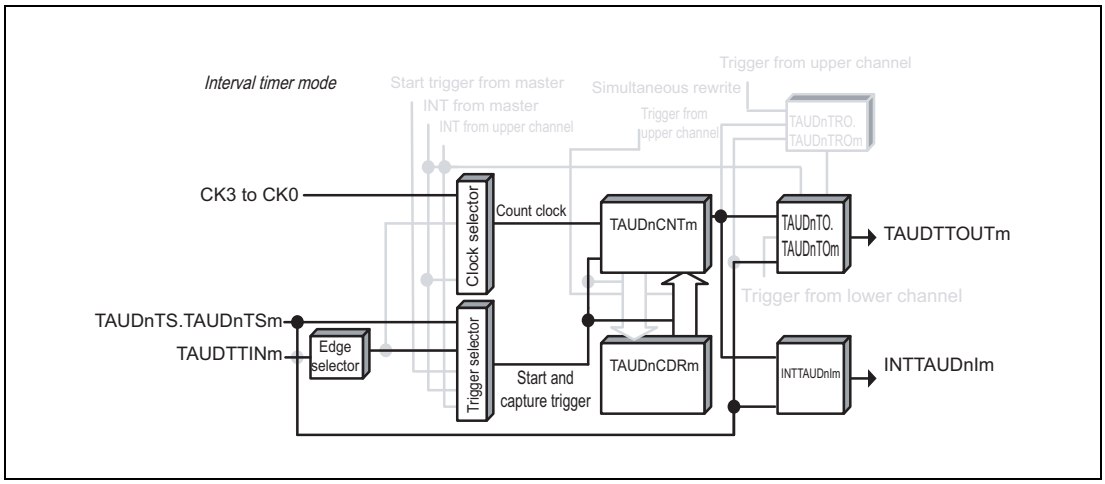

Figure 25.35 Block Diagram of TAUDTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 1).
- Rising edge detection (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

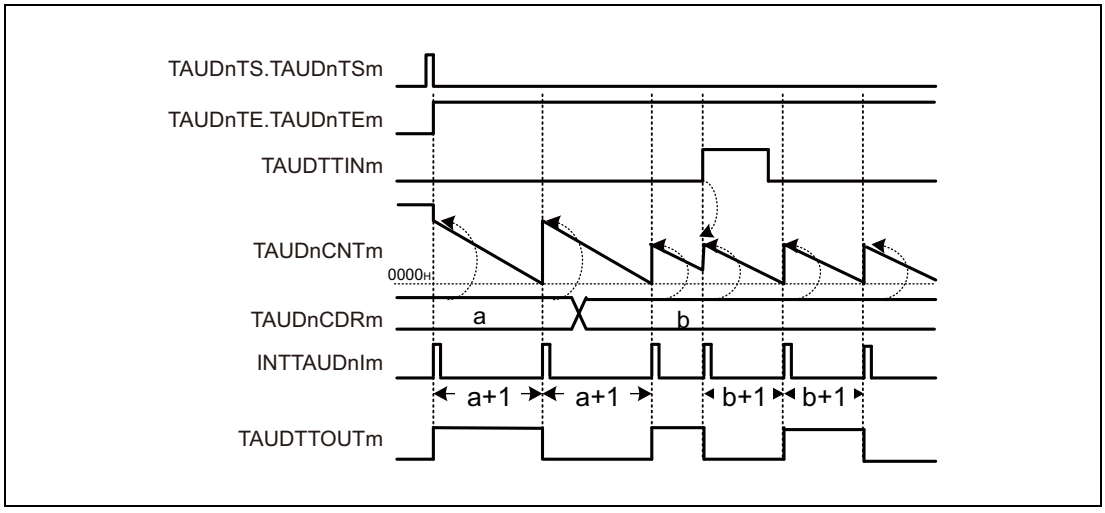

Figure 25.36 General Timing Diagram of TAUDTTINm Input Interval Timer Function

TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Section 25.7, Channel Output Modes**.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm Input Interval Timer Function. Therefore, these registers should be set to 0.

Table 25.57 Simultaneous Rewrite Settings for TAUDTTINm Input Interval Timer Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

25.12.2.5 Operating Procedure for TAUDTTINm Input Interval Timer Function

Table 25.58 Operating Procedure for TAUDTTINm Input Interval Timer Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.54, Contents of the TAUDnCMORm Register for TAUDTTINm Input Interval Timer Function**, and **Table 25.55, Contents of the TAUDnCMURm Register for TAUDTTINm Input Interval Timer Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 25.56, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. When TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated and TAUDTTOUTm toggles.
During Operation	The values of the TAUDnCMURm.TAUDnTIS[1:0] and the TAUDnCDRm register are changeable at any time. The TAUDnCNTm register can be read at all times. Detection of TAUDTTINm edge	TAUDnCNTm counts down. When the counter reaches 0000_H: • The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. • INTTAUDnIm is generated and TAUDTTOUTm toggles. When a TAUDTTINm input valid edge is detected during count operation, the TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

25.12.2.6 Specific Timing Diagrams

The timing diagrams in **Section 25.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by a valid TAUDTTINm input edge.

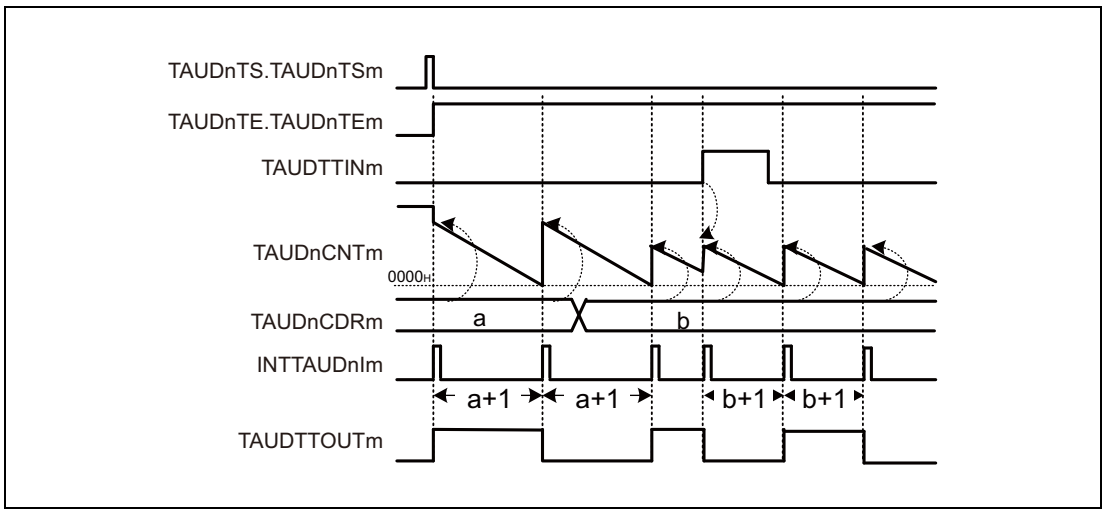

Figure 25.37 Counter Triggered by Rising TAUDTTINm Input Edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B), TAUDnCMORm.TAUDnMD0 = 1

- If a valid TAUDTTINm input edge is detected, an interrupt is generated which causes TAUDTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

25.12.3 Clock Divide Function

25.12.3.1 Overview

Summary

This function is used as a frequency divider. The frequency of the input signal TAUDTTINm is divided by a factor related to TAUDnCDRm, and the resulting signal is output to TAUDTTOUTm.

Prerequisites

- TAUDTTINm should have a fixed frequency.
- The operating mode should be set to interval timer mode. (See **Table 25.59, Contents of the TAUDnCMORm Register for Clock Divide Function**.)
- The channel output mode should be set to independent channel output mode 1. (See **Section 25.7, Channel Output Modes**.)

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value, using TAUDTTINm as a count clock.

When the counter value reaches 0000_H, INTTAUDnIm occurs and TAUDTTOUTm signal is toggled. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The value of TAUDnCDRm can be rewritten at any time. The changed value of TAUDnCDRm is applied when the counter starts to count down next time.

The counter can be stopped by setting TAUDnTT.TAUDnTTm = 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm and TAUDTTOUTm stop but retain their values. The function can be restarted by setting TAUDnTS.TAUDnTSm = 1. The counter can also be forcibly restarted without making a stop by setting TAUDnTS.TAUDnTSm = 1 during operation (forced restart).

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUDTTOUTm does not toggle. This results in a negative TAUDTTOUTm signal compared to when TAUDnCMORm.TAUDnMD0 is set to 1. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

NOTE

TAUDTTINm input signals are sampled at the frequency of the operation clock set by TAUDnCMORm.TAUDnCKS[1:0] bits. Therefore, the TAUDTTOUTm output clock cycle has an error of ± 1 operation clock cycle.

25.12.3.2 Equations

- When rising edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/[(TAUDnCDRm + 1) × 2]
- When falling edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/[(TAUDnCDRm + 1) × 2]
- When falling and rising edge detection is selected:
  TAUDTTOUTm frequency = TAUDTTINm frequency/(TAUDnCDRm + 1)

25.12.3.3 Block Diagram and General Timing Diagram

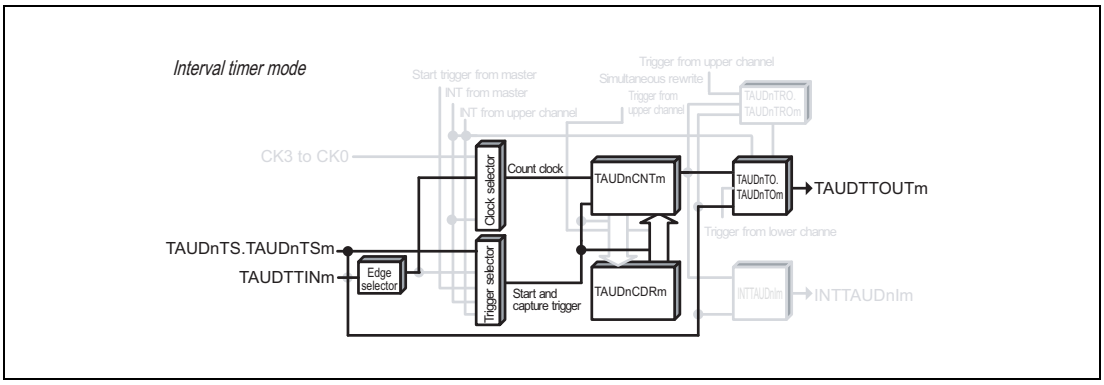

Figure 25.38 Block Diagram of Clock Divide Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the clock divide function. Therefore, these registers should be set to 0.

Table 25.62 Simultaneous Rewrite Settings for Clock Divide Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

25.12.3.5 Operating Procedure for Clock Divide Function

Table 25.63 Operating Procedure for Clock Divide Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.59, Contents of the TAUDnCMORm Register for Clock Divide Function**, and **Table 25.60, Contents of the TAUDnCMURm Register for Clock Divide Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 25.61, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm loads TAUDnCDRm value. If TAUDnCMORm.TAUDnMD0 is set to 1, INTTAUDnIm is generated and TAUDTTOUTm is toggled.
During Operation	The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When the counter reaches 0000_H: • TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. • INTTAUDnIm is generated. • TAUDTTOUTm is toggled. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm and TAUDTTOUTm retain their current values.

Restart Operation

25.12.3.6 Specific Timing Diagrams

(1) TAUDnCDRm = 0000_H

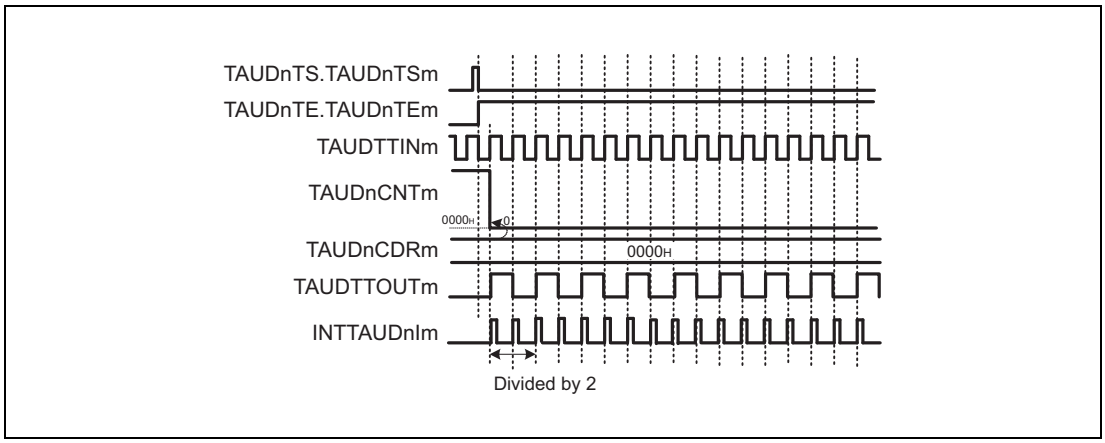

Figure 25.40 TAUDnCDRm = 0000_H, TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01_B

- If TAUDnCDRm is 0000_H, TAUDnCNTm is always 0000_H.
- INTTAUDnIm is generated every count clock, resulting in TAUDTTOUTm toggling every count clock.

Figure 25.40 shows an operation timing example. Actually, there is a delay from TINm detection until TOUTm output because of the delay time of a noise filter or synchronization circuit placed between the TAUDnIm pin and TAUDn.

(2) Operation restart

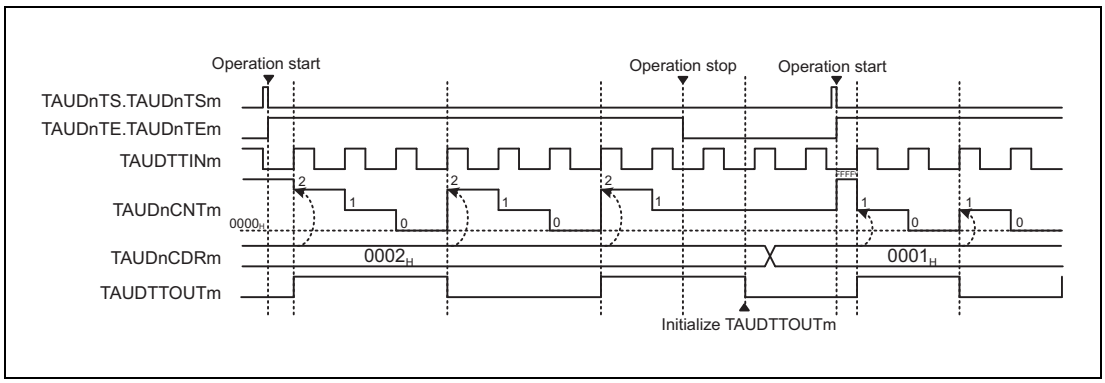

Figure 25.41 Operation Restart (TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

To reset the value of TAUDTTOUTm:

- Set TAUDnTOE.TAUDnTOEm = 0 when the counter is stopped (TAUDnTE.TAUDnTEm = 0).
- Then, write either 0 or 1 to TAUDnTO.TAUDnTOm to set the new start value of TAUDTTOUTm.

(3) Forced restart

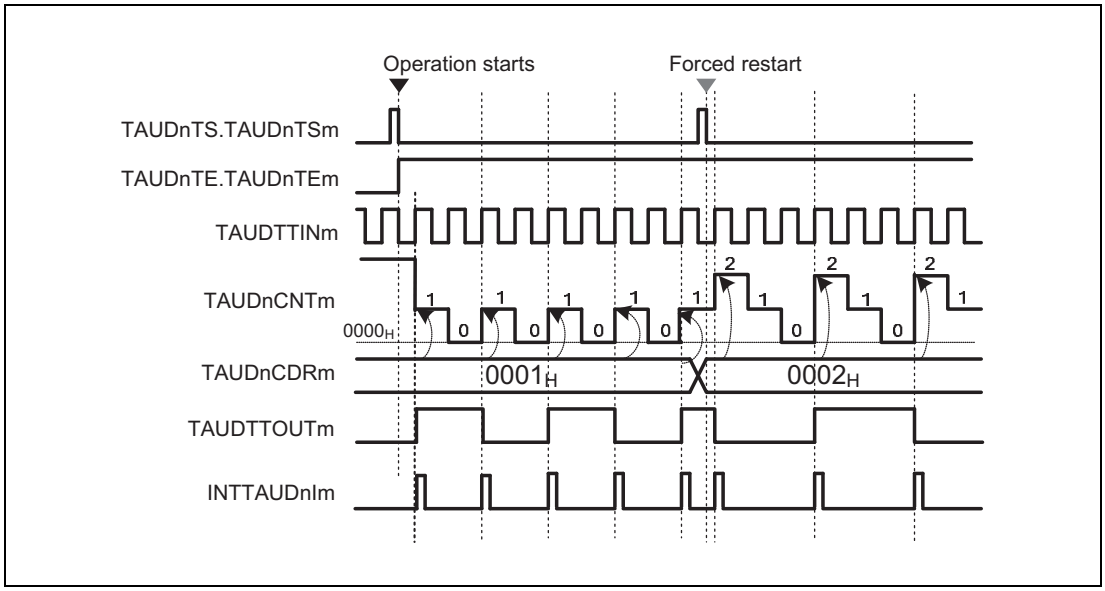

Figure 25.42 Forced Restart Operation (TAUDnCMORm.TAUDnMD0 = 1, TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

- The counter can be forcibly restarted (without stopping it first) by setting TAUDnTS.TAUDnTSm = 1 during operation.
- The value of TAUDnCDRm is written to TAUDnCNTm and the count operation restarts.
- TAUDTTOUTm restarts at the same level as before the forced restart.

25.12.4 External Event Count Function

25.12.4.1 Overview

Summary

This function is used as an event timer, which generates an interrupt (INTTAUDnIm) when a specific number of valid TAUDTTINm input edges are detected.

Prerequisites

- The operating mode should be set to the event count mode. (See **Table 25.64, Contents of the TAUDnCMORm Register for External Event Count Function**.)
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When the counter starts, the current value of TAUDnCDRm is loaded into TAUDnCNTm.

When a valid TAUDTTINm input edge is detected, the value of TAUDnCNTm decrements by 1. TAUDnCNTm retains this value until a valid TAUDTTINm input edge is detected or the counter is restarted.

When the valid edge is detected for the (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. The counter can also be restarted without stopping it first (forced restart) by setting TAUDnTS.TAUDnTSm to 1 during operation.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

An edge type used as a trigger is specified by TAUDnCMURm.TAUDnTIS[1:0] bits.

- When TAUDnCMURm.TAUDnTIS[1:0] = 00_B, falling edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = 01_B, rising edges are counted.
- When TAUDnCMURm.TAUDnTIS[1:0] = 10_B, both edges are counted.

25.12.4.2 Equations

Number of valid edges detected before INTTAUDnIm generation = TAUDnCDRm + 1

(3) Channel output mode

The channel output mode is not used by this function.

(4) Simultaneous rewrite

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the external event count function. Therefore, these registers should be set to 0.

Table 25.66 Simultaneous Rewrite Settings for External Event Count Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

25.12.4.5 Operating Procedure for External Event Count Function

Table 25.67 Operating Procedure for External Event Count Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.64, Contents of the TAUDnCMORm Register for External Event Count Function**, and **Table 25.65, Contents of the TAUDnCMURm Register for External Event Count Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm loads TAUDnCDRm value and waits for TAUDTTINm input edge detection.
During Operation	Detection of TAUDTTINm edge The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down each time TAUDTTINm input edge is detected. When effective edges are detected (TAUDnCDRm + 1) times: • TAUDnCDRm value is loaded in TAUDnCNTm and count operation continues. • INTTAUDnIm is generated. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

25.12.4.6 Specific Timing Diagrams

(1) TAUDnCDRm = 0000_H

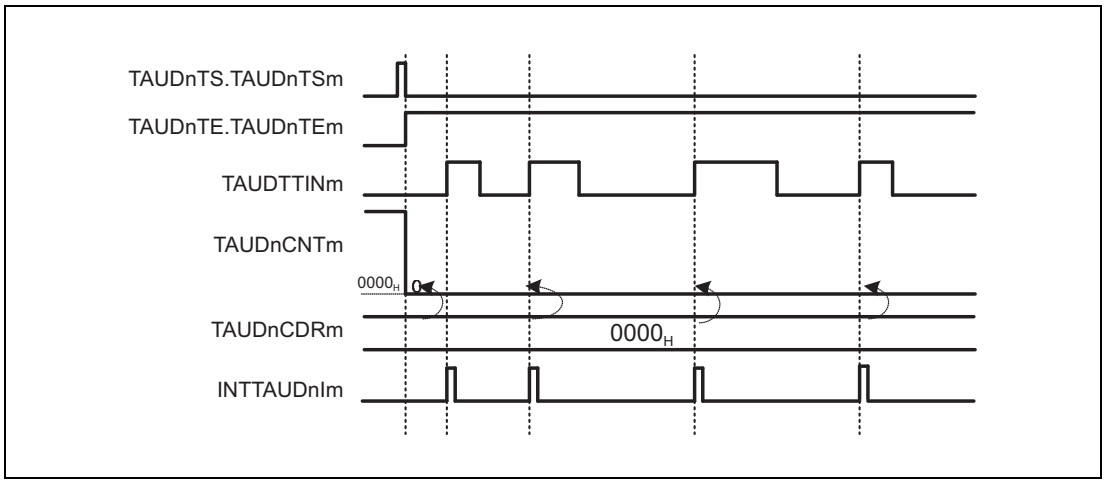

Figure 25.45 TAUDnCDRm = 0000_H, TAUDnCMURm.TAUDnTIS[1:0] = 01_B

- If 0000_H = TAUDnCDRm, 0000_H is loaded into TAUDnCNTm each time a valid TAUDTTINm input edge is detected.
  In other words, INTTAUDnIm is generated each time a valid TAUDTTINm input edge is detected.

(2) Operation stop and restart

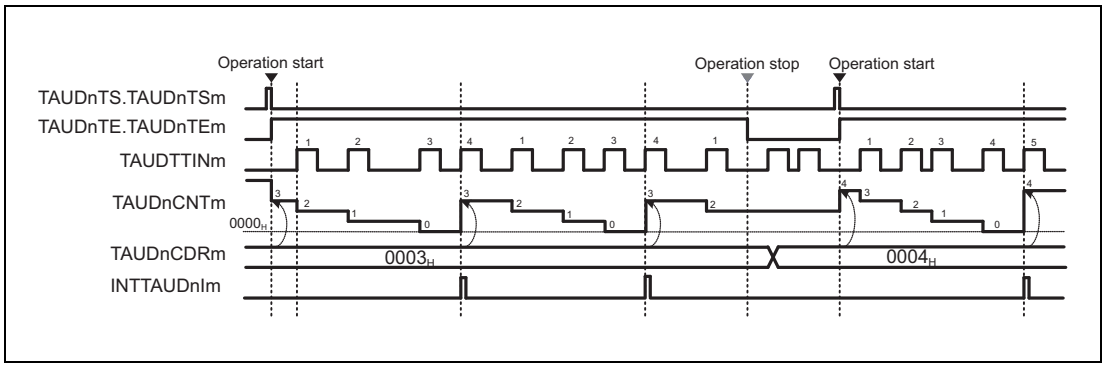

Figure 25.46 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value. TAUDTTINm continues and TAUDnCNTm ignores the valid edge.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm loads the TAUDnCDRm value and restarts count operation.

(3) Forced restart

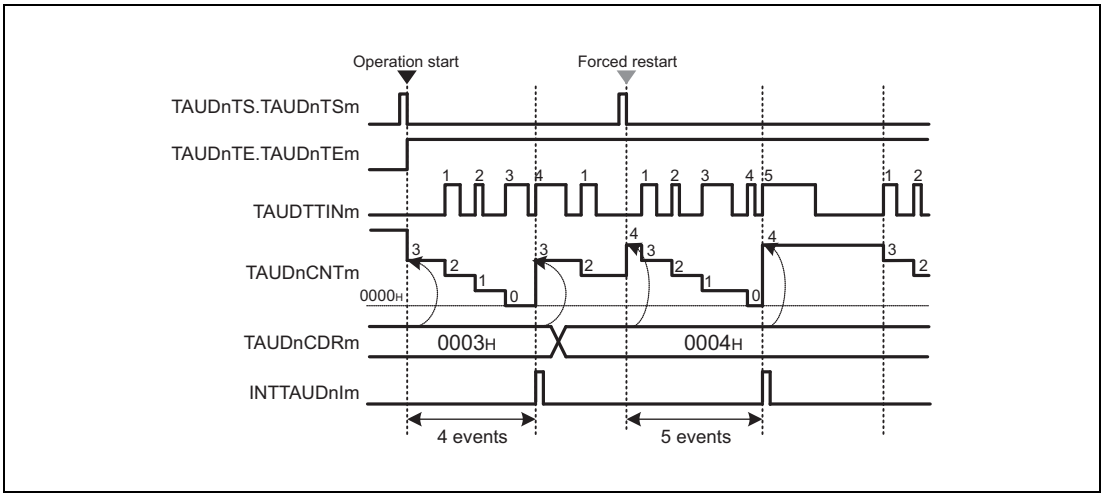

Figure 25.47 Forced Restart Operation (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)

Once a forced restart is made, the changed TAUDnCDRm value is applied to TAUDnCNTm immediately.

- The counter can be restarted without making a stop by setting TAUDnTS.TAUDnTSm to 1 during operation.
- The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter awaits the next valid TAUDTTINm input edge.

25.12.5 Delay Count Function

25.12.5.1 Overview

Summary

This function generates interrupts (INTTAUDnIm), which have a defined delay to the TAUDTTINm input signal. TAUDTTINm input signal pulses that occur within the delay period are ignored.

Prerequisites

- The operating mode should be set to one-count mode. See **Table 25.68, Contents of the TAUDnCMORm Register for Delay Count Function**.
- TAUDTTOUTm is not used with this function.
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches 0000_H, an interrupt is generated. The counter returns to $FFFF_H$ and awaits the next valid TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

25.12.5.2 Equations

Delay between TAUDTTINm and INTTAUDnIm = count clock cycle × (TAUDnCDRm + 1)

25.12.5.5 Operating Procedure for Delay Count Function

Table 25.71 Operating Procedure for Delay Count Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.68, Contents of the TAUDnCMORm Register for Delay Count Function**, and **Table 25.69, Contents of the TAUDnCMURm Register for Delay Count Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a start edge is detected, the TAUDnCDRm value is loaded in TAUDnCNTm.
During Operation	The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000_H. INTTAUDnIm is generated. TAUDnCNTm stops counting, returns $FFFF_H$, and waits for a trigger. If a trigger occurs while TAUDnCNTm is counting, the trigger is ignored. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its value.

Restart Operation

25.12.6 One-Pulse Output Function

25.12.6.1 Overview

Summary

This function generates an interrupt (INTTAUDnIm) when a valid TAUDTTINm input edge is detected and at a defined interval afterward. TAUDTTINm input signal pulses that occur within the defined interval are ignored. When an interrupt is generated, the TAUDTTOUTm signal toggles, resulting in a square wave.

Prerequisites

- The operation mode should be set to pulse one-count mode. (See **Table 25.72, Contents of the TAUDnCMORm Register for One-Pulse Output Function**.)
- The channel output mode should be set to independent channel output mode 2. (See **Section 25.7, Channel Output Modes**.)
- Trigger detection should be disabled during counting (TAUDnCMORn.TAUDnMD0 = 0).

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. An interrupt is generated and TAUDTTOUTm is set to active level.

When the counter reaches 0001_H, an interrupt is generated and TAUDTTOUTm is set to the inactive level. The counter stops at 0000_H and awaits the next valid TAUDTTINm input edge.

When the counter is counting down, further TAUDTTINm input signals are ignored, i.e., the counter does not reset.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

The type of edge used as a trigger is specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 00_B, falling edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 01_B, rising edges trigger the counter.
- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, rising and falling edges trigger the counter.

25.12.6.2 Equations

Interval between TAUDTTINm and INTTAUDnIm = TAUDTTOUTm (timer output) width = count clock cycle × TAUDnCDRm

TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUDnTOE.TAUDnTOEm = 0. TAUDTTOUTm can then be controlled independently of the interrupts. For details, see **Table 25.48, Channel Output Modes**.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the One-Pulse Output Function. Therefore, these registers should be set to 0.

Table 25.75 Simultaneous Rewrite Settings for One-Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0

25.12.6.5 Operating Procedure for One-Pulse Output Function

Table 25.76 Operating Procedure for One-Pulse Output Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.72, Contents of the TAUDnCMORm Register for One-Pulse Output Function**, and **Table 25.73, Contents of the TAUDnCMURm Register for One-Pulse Output Function**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 25.74, Control Bit Settings in Independent Channel Output Mode 2**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a start edge is detected, TAUDnCNTm loads the TAUDnCDRm value.
During Operation	The value of TAUDnCDRm is changeable at any time. The TAUDnCNTm register can be read at all times.	INTTAUDnIm is generated when TAUDnCNTm starts and TAUDTTOUTm is set to its active level. TAUDnCNTm counts down. When the counter reaches 0001_H: • INTTAUDnIm is generated. • TAUDTTOUTm is set to its inactive level. TAUDnCNTm stops counting and waits for a trigger. If a trigger occurs while TAUDnCNTm is counting, the trigger is ignored.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

25.12.7 TAUDTTINm Input Pulse Interval Measurement Function

25.12.7.1 Overview

Summary

This function captures the count value and uses this value and the overflow bit TAUDnCSRm.TAUDnOVF to measure the interval of the TAUDTTINm input signals.

Prerequisites

- The operating mode should be set to capture mode. See **Table 25.78, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function**.
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter TAUDnCNTm starts to count up from 0000_H. When a valid TAUDTTINm edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter resets to 0000_H and subsequently continues operation.

If the counter reaches $FFFF_H$ before a valid TAUDTTINm edge is detected, it overflows to 0000_H. The counter is reset to 0000_H and subsequently continues operation. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

Table 25.77 Effects of Overflow

TAUDnCMORm. TAUDnCOS[1:0]	When Overflow Occurs		When a Valid TAUDTTINm Input is Detected	
	TAUDnCDRm	TAUDnCSRm. TAUDnOVF	TAUDnCDRm, TAUDnCNTm	TAUDnCSRm. TAUDnOVF
00	Unchanged	0	TAUDnCNTm loaded into TAUDnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUDnCNTm set to 0, TAUDnCDRm unchanged	Unchanged
11		1		

When TAUDnCMORm.TAUDnCOS[0] = 1, the overflow bit (TAUDnCSRm.TAUDnOVF) can be cleared only by setting TAUDnCSCm.TAUDnCLOV = 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the interval of the TAUDTTINm signal. However, if an overflow occurs multiple times before a valid TAUDTTINm input is detected, the overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

The function can be stopped by setting TAUDnTT.TAUDnTTm = 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm stops but retains its value. While the function is stopped, valid TAUDTTINm input edge detection and TAUDnCNTm capture are not performed.

The counter is reset to 0000_H and subsequently continues operation.

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

NOTE

When TAUDnCMORm.TAUDnCOS[1:0] = 10_B or 11_B, the value of TAUDnCNTm is not loaded into TAUDnCDRm when the first valid TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

25.12.7.2 Equations

TAUDTTINm input pulse interval = count clock cycle × [(TAUDnCSRm.TAUDnOVF × ($FFFF_H$ + 1)) + TAUDnCDRm capture value + 1]

25.12.7.3 Block Diagram and General Timing Diagram

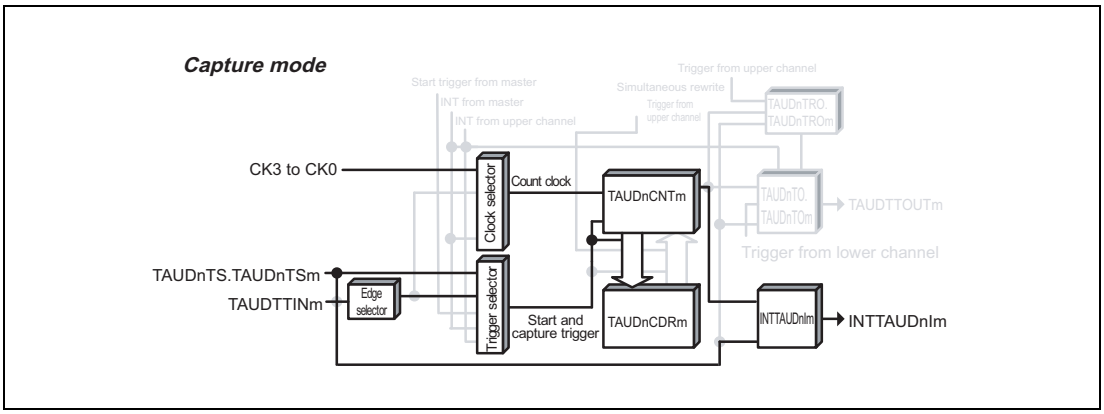

Figure 25.52 Block Diagram of TAUDTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation (TAUDnCMORm.TAUDnMD0 = 0).
- Falling edge detection (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)
- When a valid TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1 (TAUDnCMORm.TAUDnCOS[1:0] = 00_B).

(3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input pulse interval measurement function. Therefore, these registers should be set to 0.

Table 25.80 Simultaneous Rewrite Settings for TAUDTTINm Input Pulse Interval Measurement Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

25.12.7.5 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

Table 25.81 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.78, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Measurement Function**, and **Table 25.79, Contents of the TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Measurement Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000_H. INTTAUDnIm is generated when TAUDnCMORm.TAUDnMD0 is set to 1.
During Operation	Detection of TAUDTTINm edge The values of TAUDnCMURm.TAUDnTIS[1:0] bits can be changed at any time. The TAUDnCDRm and TAUDnCSRm registers can be read at any time. TAUDnCSCm.TAUDnCLOV can be written to 1. (TAUDnCSRm.TAUDnOVF bit is cleared to 0.)	TAUDnCNTm starts to count up from 0000_H. When a TAUDTTINm valid edge is detected: • TAUDnCNTm transfers (captures) its value to TAUDnCDRm, and returns to 0000_H. • INTTAUDnIm is then generated. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values.

Restart Operation

25.12.7.6 Specific Timing Diagrams: Overflow Operation

(1) TAUDnCMORm.TAUDnCOS[1:0] = 00_B

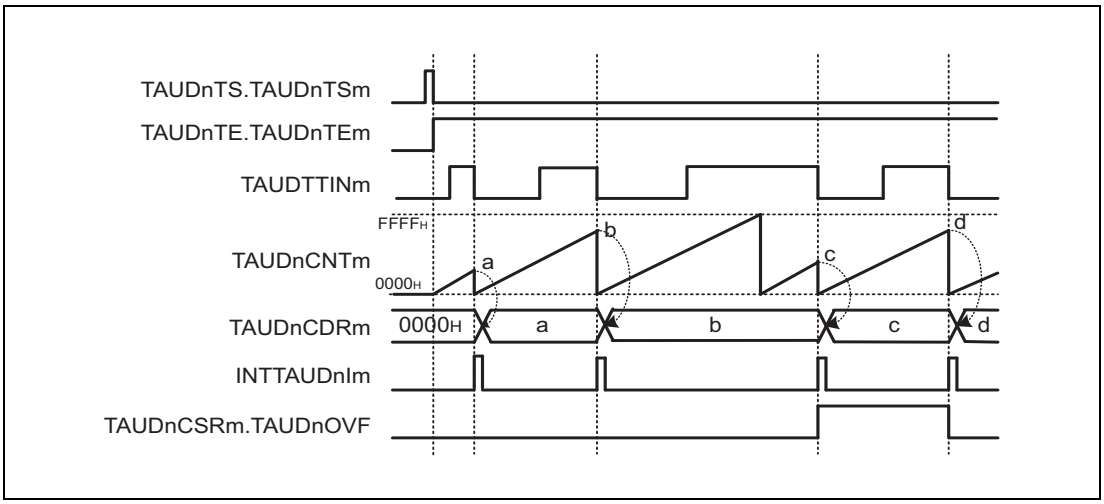

Figure 25.54 TAUDnCMORm.TAUDnCOS[1:0] = 00_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0.

(2) TAUDnCMORm.TAUDnCOS[1:0] = 01_B

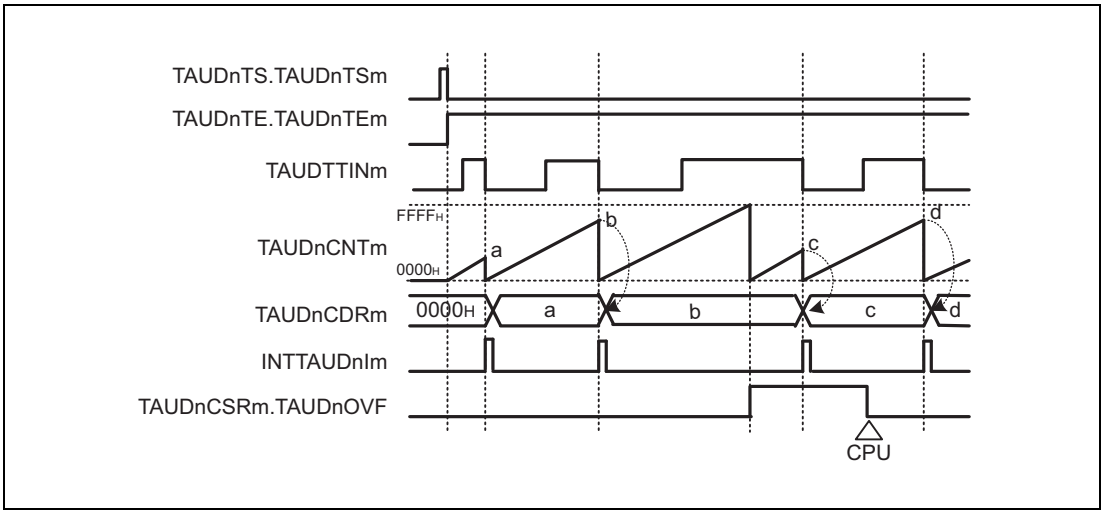

Figure 25.55 TAUDnCMORm.TAUDnCOS[1:0] = 01_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to1.

- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).

(3) TAUDnCMORm.TAUDnCOS[1:0] = 10_B

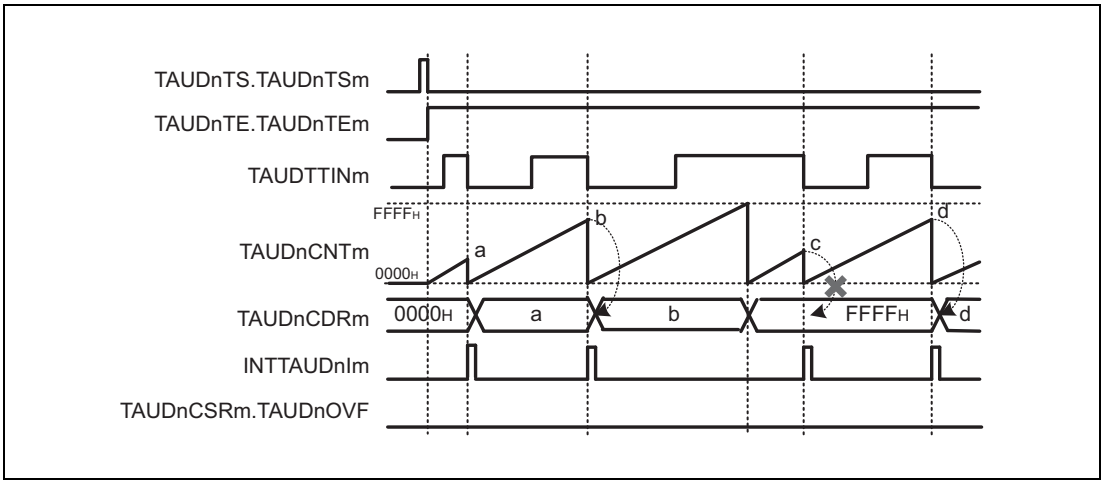

Figure 25.56 TAUDnCMORm.TAUDnCOS[1:0] = 10_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm is reset to 0, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.

(4) TAUDnCMORm.TAUDnCOS[1:0] = 11_B

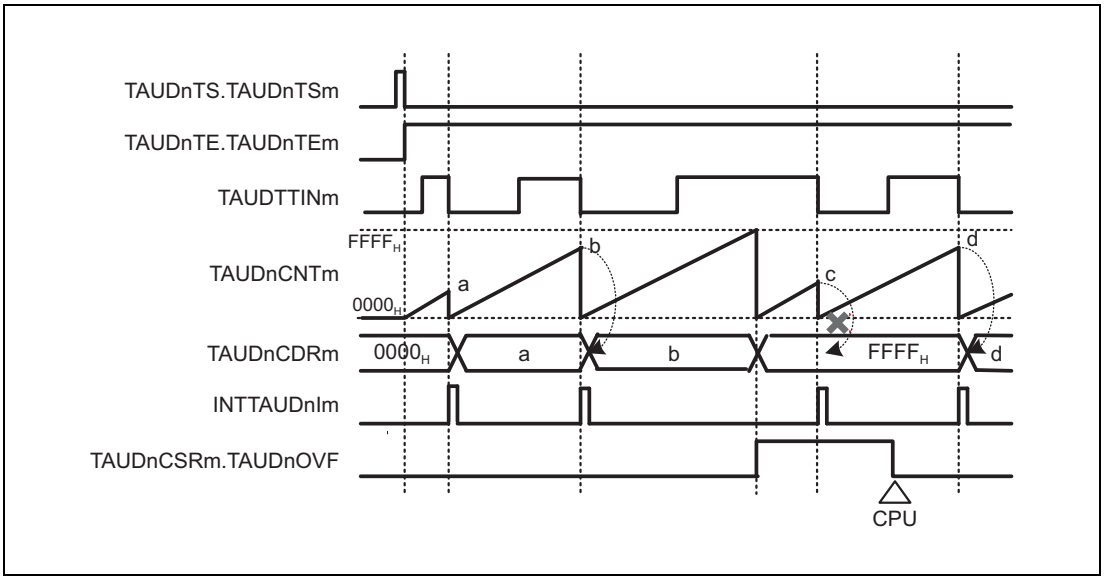

Figure 25.57 TAUDnCMORm.TAUDnCOS[1:0] = 11_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm is reset to 0, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

25.12.8 TAUDTTINm Input Signal Width Measurement Function

25.12.8.1 Overview

Summary

This function measures the width of a TAUDTTINm signal, by starting the count at one edge of TAUDTTINm and capturing the count value at the other edge.

Prerequisites

- The operating mode should be set to capture and one-count mode. See **Table 25.83, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function**.
- TAUDTTOUTm is not used with this function.
- TAUDnCMORm.TAUDnMD0 should be set to 0.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When a valid TAUDTTINm start edge is detected, the counter TAUDnCNTm starts to count up from 0000_H. When a valid TAUDTTINm stop edge is detected, the value of TAUDnCNTm is captured, transferred to TAUDnCDRm, and an interrupt INTTAUDnIm is generated. The counter retains its value (TAUDnCDRm +1) and awaits the next valid TAUDTTINm input start edge.

If the counter reaches $FFFF_H$ before a valid TAUDTTINm stop edge is detected, it overflows. The counter is reset to 0000_H and subsequently continues operation. The values transferred to TAUDnCDRm and TAUDnCSRm.TAUDnOVF respectively depend on the values of bits TAUDnCMORm.TAUDnCOS[1:0].

Table 25.82 Effects of Overflow

TAUDnCMORm.TAUDnCOS[1:0]	When Overflow Occurs		When a Valid TAUDTTINm Input Stop Edge is Detected	
	TAUDnCDRm	TAUDnCSRm.TAUDnOVF	TAUDnCDRm, TAUDnCNTm	TAUDnCSRm.TAUDnOVF
00	Unchanged	0	TAUDnCNTm loaded into TAUDnCDRm	1
01		1		
10	Set to $FFFF_H$	0	TAUDnCNTm stops counting TAUDnCDRm unchanged	Unchanged
11		1		

When TAUDnCMORm.TAUDnCOS[0] = 1, overflow bit TAUDnCSRm.TAUDnOVF can be cleared only by setting TAUDnCSCm.TAUDnCLOV to 1.

The combination of the value of TAUDnCDRm and TAUDnCSRm.TAUDnOVF can be used to deduce the width of the TAUDTTINm signal. However, if an overflow occurs multiple times before a valid TAUDTTINm input is detected, overflow bit TAUDnCSRm.TAUDnOVF cannot indicate the occurrence of multiple overflows.

This function cannot be forcibly restarted.

NOTE

When TAUDnCMORm.TAUDnCOS[1] = 1, the value of TAUDnCNTm is not loaded to TAUDnCDRm when the first valid TAUDTTINm input edge occurs after an overflow. However, an interrupt is generated.

25.12.8.2 Equations

TAUDTTINm input signal width = count clock cycle × [(TAUDnCSRm.TAUDnOVF × ($FFFF_H$ + 1)) + TAUDnCDRm capture value + 1]

25.12.8.3 Block Diagram and General Timing Diagram

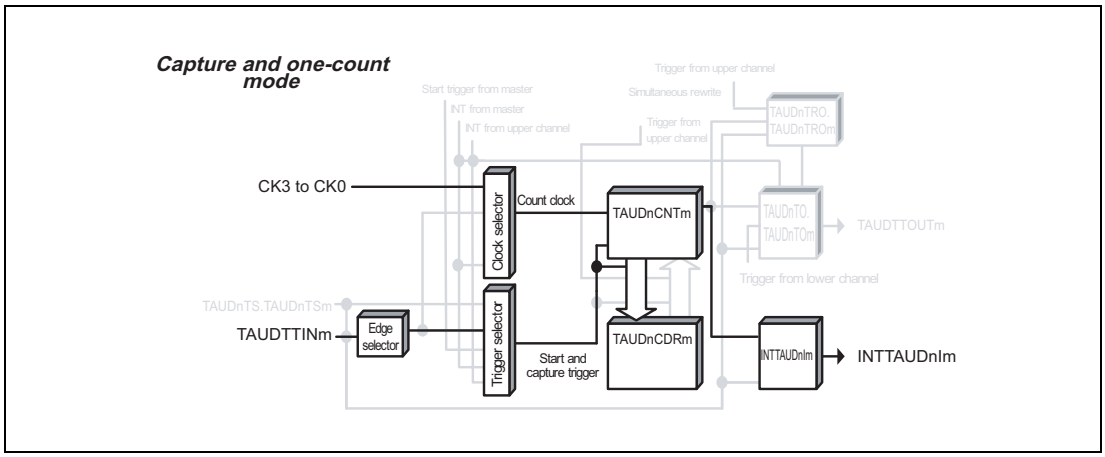

Figure 25.58 Block Diagram of TAUDTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)
- When a valid TAUDTTINm input is detected after an overflow, TAUDnCDRm is changed and TAUDnCSRm.TAUDnOVF is set to 1. (TAUDnCMORm.TAUDnCOS[1:0] = 00_B)

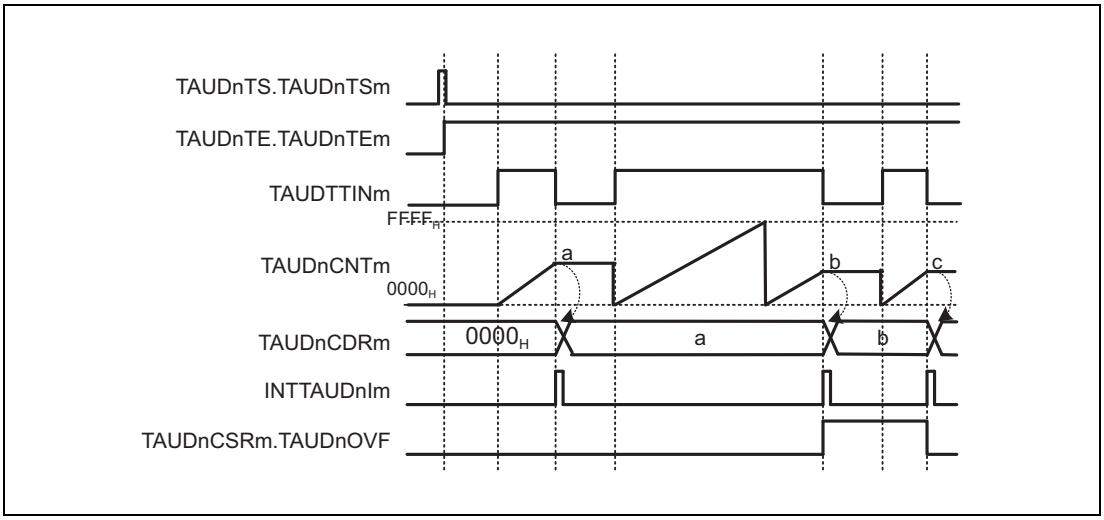

Figure 25.59 General Timing Diagram of TAUDTTINm Input Signal Width Measurement Function

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	10: Detection of rising and falling edges (low width measurement) 11: Detection of rising and falling edges (high width measurement)

(3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the TAUDTTINm input signal width measurement function. Therefore, these registers should be set to 0.

Table 25.85 Simultaneous Rewrite Settings for TAUDTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

25.12.8.5 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

Table 25.86 Operating Procedure for TAUDTTINm Input Signal Width Measurement Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.83, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Measurement Function**, and **Table 25.84, Contents of the TAUDnCMURm Register For TAUDTTINm Input Signal Width Measurement Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When a TAUDTTINm start edge is detected, TAUDnCNTm starts to count up.
During Operation	TAUDnCDRm, TAUDnCNTm, and TAUDnCSRm registers can be read at any time. TAUDnCSCm.TAUDnCLOV bit can be set to 1.	TAUDnCNTm starts to count up from 0000_H. When TAUDTTINm valid edge is detected: • TAUDnCNTm transfers (captures) its value to TAUDnCDRm, and retains its value. INTTAUDnIm is then generated. Counting stops at the “value that transferred to TAUDnCDRm + 1” and TAUDnCNTm waits for detection of the TAUDTTINm start edge. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and both it and TAUDnCSRm.TAUDnOVF retain their current values.

Restart Operation

25.12.8.6 Specific Timing Diagrams: Overflow Operation

(1) TAUDnCMORm.TAUDnCOS[1:0] = 00_B

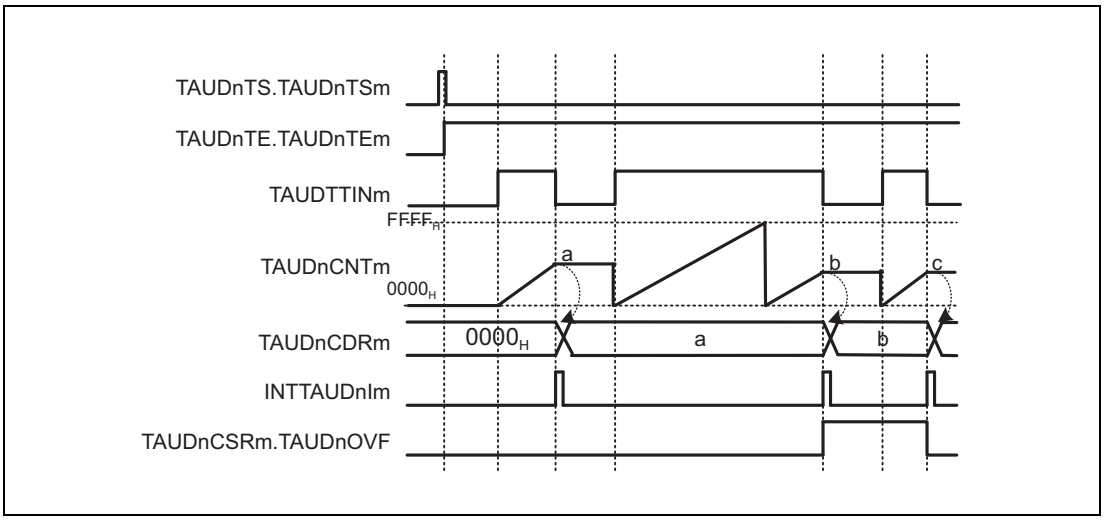

Figure 25.60 TAUDnCMORm.TAUDnCOS[1:0] = 00_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge with no overflow occurring, TAUDnCSRm.TAUDnOVF is cleared to 0.

(2) TAUDnCMORm.TAUDnCOS[1:0] = 01_B

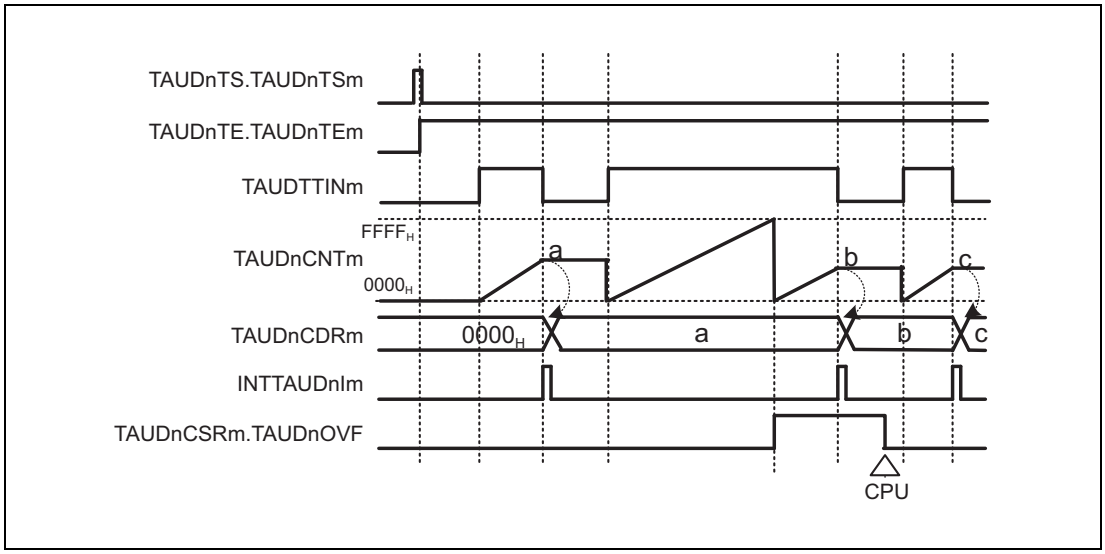

Figure 25.61 TAUDnCMORm.TAUDnCOS[1:0] = 01_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUDnCDRm remains unchanged and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, the value of TAUDnCNTm is loaded into TAUDnCDRm.
- TAUDnCSRm.TAUDnOVF is only cleared by a CPU command (by setting TAUDnCSCm.TAUDnCLOV bit to 1).

(3) TAUDnCMORm.TAUDnCOS[1:0] = 10_B

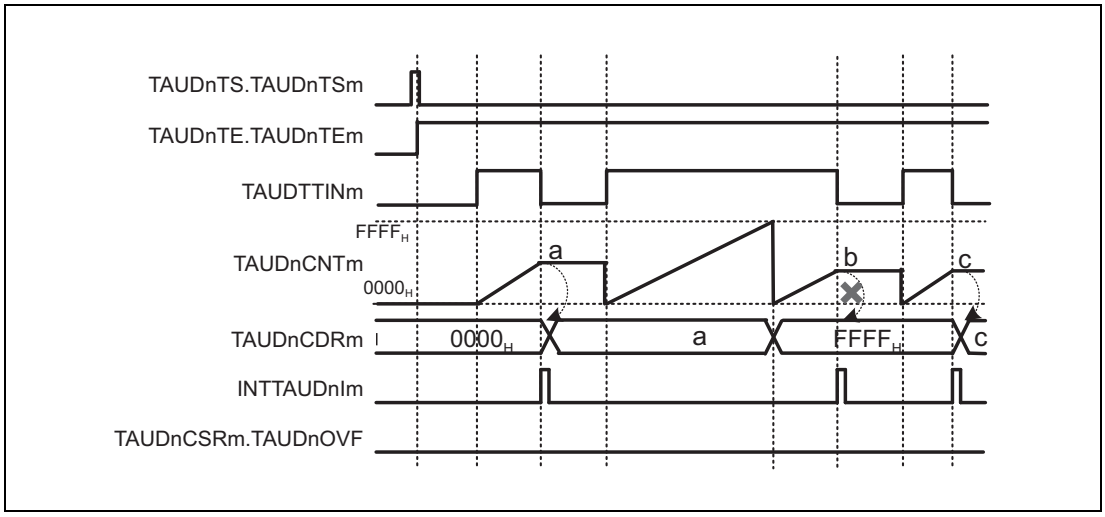

Figure 25.62 TAUDnCMORm.TAUDnCOS[1:0] = 10_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF remains 0.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm stops counting, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.

(4) TAUDnCMORm.TAUDnCOS[1:0] = 11_B

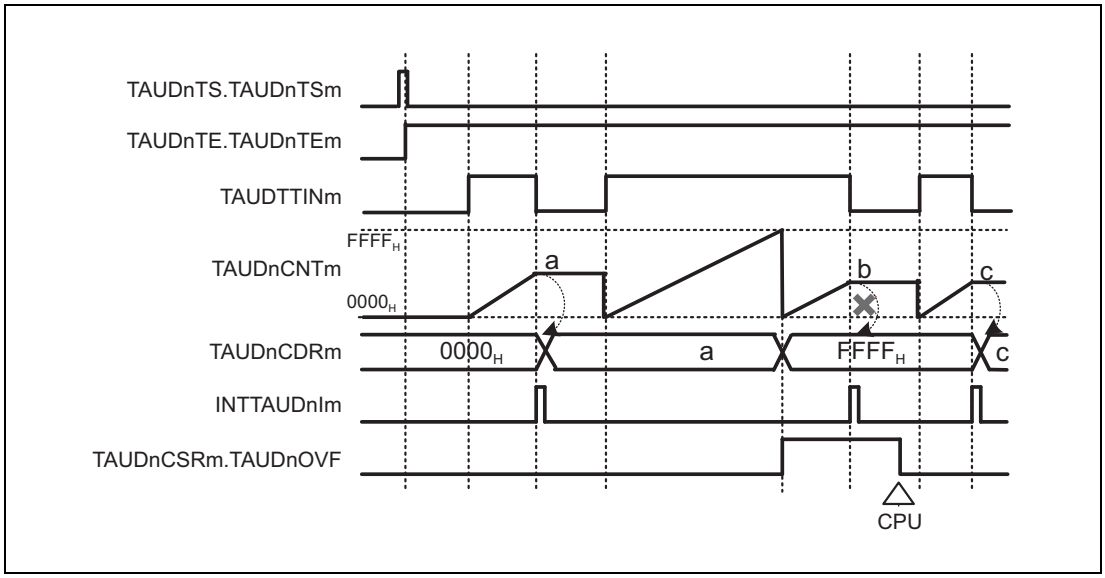

Figure 25.63 TAUDnCMORm.TAUDnCOS[1:0] = 11_B, TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 11_B

- When an overflow occurs, TAUDnCDRm is set to $FFFF_H$ and TAUDnCSRm.TAUDnOVF is set to 1.
- Upon detection of the next valid TAUDTTINm input edge, TAUDnCNTm stops counting, but TAUDnCDRm and TAUDnCSRm.TAUDnOVF remain unchanged.
- Thus, the next valid TAUDTTINm input edge after the overflow is ignored.
- TAUDnCSRm.TAUDnOVF is cleared by setting TAUDnCSCm.TAUDnCLOV to 1.

25.12.9 TAUDTTINm Input Position Detection Function

25.12.9.1 Overview

Summary

This function measures the input signal duration by capturing the count value at the valid edge of TAUDTTINm.

Prerequisites

- The operating mode should be set to count capture mode. (See **Table 25.87, Contents of the TAUDnCMORm Register for TAUDTTINm Input Position Detection Function**.)
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter starts counting from 0000_H. When a valid TAUDTTINm input edge is detected, the current value of TAUDnCNTm is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The count operation continues.

When the counter reaches $FFFF_H$, the counter restarts from 0000_H.

NOTE

The TAUDTTINm input signal is sampled at the frequency of the operation clock, specified by TAUDnCMORm.TAUDnCKS[1:0] bits. As a result, the output cycle of TAUDTTOUTm has an error of ± 1 operation clock cycle.

Conditions

If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt does not occur at the beginning of operation or after restart. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

25.12.9.2 Equations

Functional duration at a TAUDTTINm input pulse =

count clock cycle × (TAUDnCDRm capture value + 1)

25.12.9.3 Block Diagram and General Timing Diagram

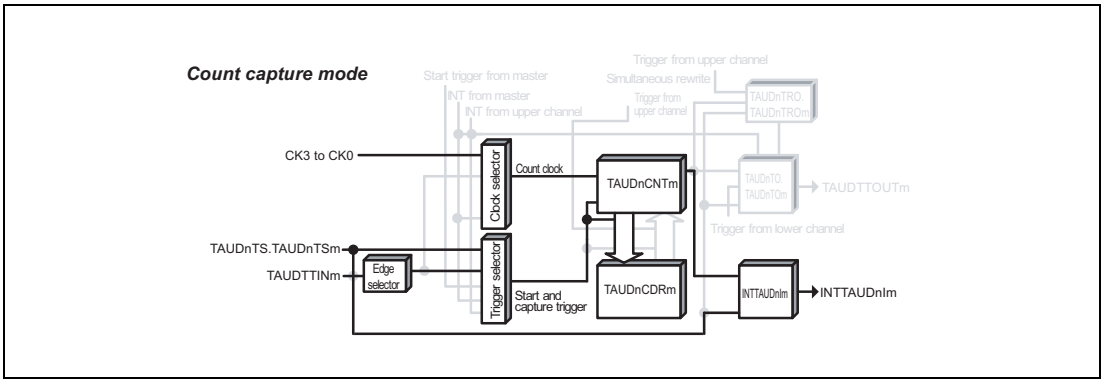

Figure 25.64 Block Diagram of TAUDTTINm Input Position Detection Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

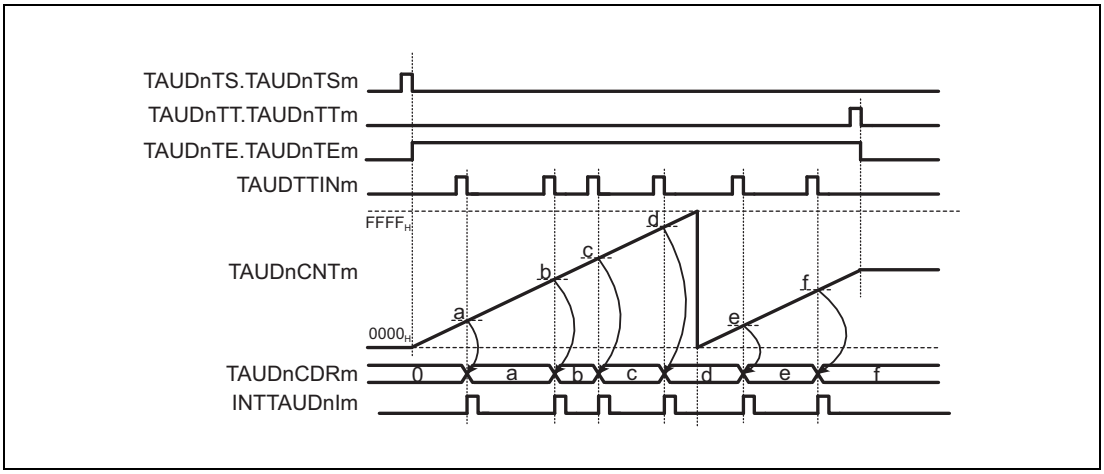

Figure 25.65 General Timing Diagram of TAUDTTINm Input Position Detection Function

25.12.9.5 Operating Procedure for TAUDTTINm Input Position Detection Function

Table 25.90 Operating Procedure for TAUDTTINm Input Position Detection Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.87, Contents of the TAUDnCMORm Register for TAUDTTINm Input Position Detection Function**, and **Table 25.88, Contents of the TAUDnCMURm Register for TAUDTTINm Input Position Detection Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm occurs.
During Operation	The values of TAUDnCMURm.TAUDnTIS[1:0] bits can be changed at any time. The TAUDnCDRm and TAUDnCSRm registers can be read at any time.	TAUDnCNTm starts to count up from 0000_H. When a valid TAUDTTINm edge is detected: • TAUDnCNTm transfers (captures) its own value to TAUDnCDRm. • Outputs INTTAUDnIm. • The counter is not cleared to 0000_H and TAUDnCNTm continues counting. Afterwards, this procedure is repeated. When TAUDnCNTm reaches $FFFF_H$, the counter restarts from 0000_H.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart

25.12.9.6 Specific Timing Diagrams

(1) Operation stop and restart

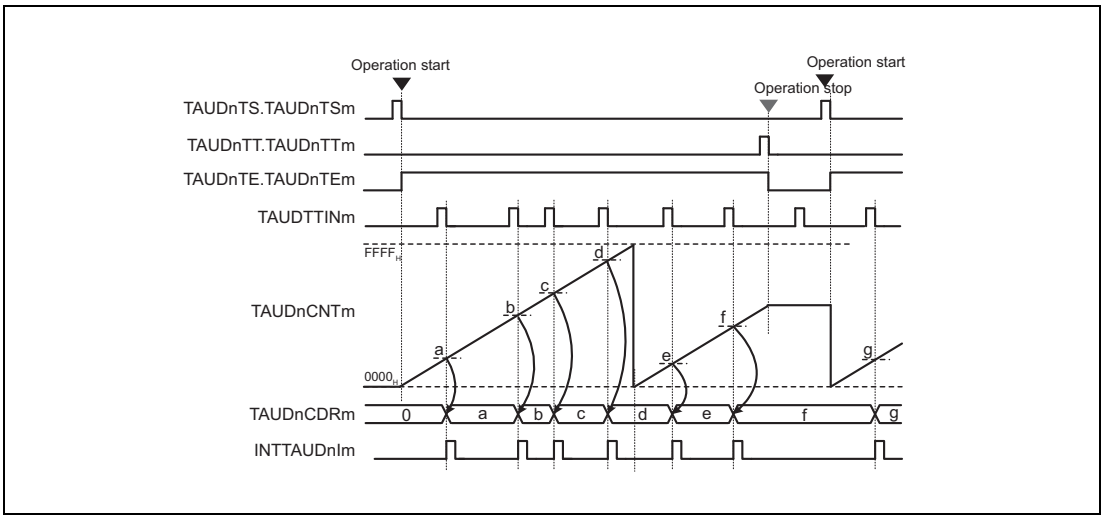

Figure 25.66 Operation Stop and Restart (TAUDnCMORm.TAUDnMD0 = 0, TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

- The counter can stop operating by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value.
- If the counter stops operating, valid TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm restarts to count from 0000_H.

25.12.10 TAUDTTINm Input Period Count Detection Function

25.12.10.1 Overview

Summary

This function measures the cumulative width of a TAUDTTINm input signal.

Prerequisites

- The operating mode should be set to capture and gate count mode. (See **Table 25.91, Contents of the TAUDnCMORm Register for TAUDTTINm Input Period Count Detection Function**.)
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter awaits a valid TAUDTTINm input edge.

When a valid TAUDTTINm input start edge is detected, the counter starts to count from 0000_H.

When a valid TAUDTTINm input stop edge is detected, the current TAUDnCNTm value is loaded into TAUDnCDRm and an interrupt (INTTAUDnIm) is generated. The counter stops and retains its value (TAUDnCDRm + 1) until the next valid TAUDTTINm input start edge is detected.

When the next valid TAUDTTINm input start edge is detected, the counter restarts to count from the value retained when stopped.

If the counter reaches $FFFF_H$, the counter restarts from 0000_H.

NOTES

1. TAUDTTINm input signal is sampled at the frequency of an operation clock set by the TAUDnCMORm.TAUDnCKS[1:0] bits.
2. As this function is to measure the TAUDTTINm input signal width, setting TAUDnTS.TAUDnTSm to 1 is disabled while TAUDnTE.TAUDnTEm = 1.

Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, the TAUDTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11_B, the TAUDTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

25.12.10.2 Equations

Cumulative TAUDTTINm input width =
count clock cycle × (TAUDnCDRm capture value + 1)

25.12.10.3 Block Diagram and General Timing Diagram

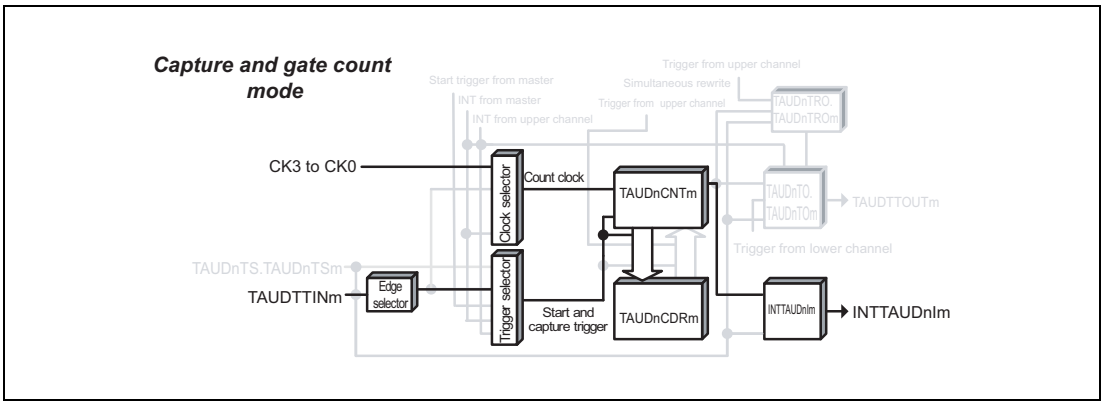

Figure 25.67 Block Diagram of TAUDTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

25.12.10.5 Operating Procedure for TAUDTTINm Input Period Count Detection Function

Table 25.94 Operating Procedure for TAUDTTINm Input Period Count Detection Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.91, Contents of the TAUDnCMORm Register for TAUDTTINm Input Period Count Detection Function**, and **Table 25.92, Contents of the TAUDnCMURm Register for TAUDTTINm Input Period Count Detection Function**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge.
During Operation	Detection of TAUDTTINm edge The TAUDnCDRm, TAUDnCNTm, and TAUDnCSRm registers can be read at any time.	When a TAUDTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUDnCNTm starts counting up from the stop value. When TAUDnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUDnCDRm and INTTAUDnIm is generated. Counting stops at the “value transferred to TAUDnCDRm + 1” and TAUDnCNTm waits for detection of the TAUDTTINm start edge. When TAUDnCNTm reaches $FFFF_H$, the counter restarts from 0000_H. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

25.12.10.6 Specific Timing Diagrams

(1) Operation stop and restart

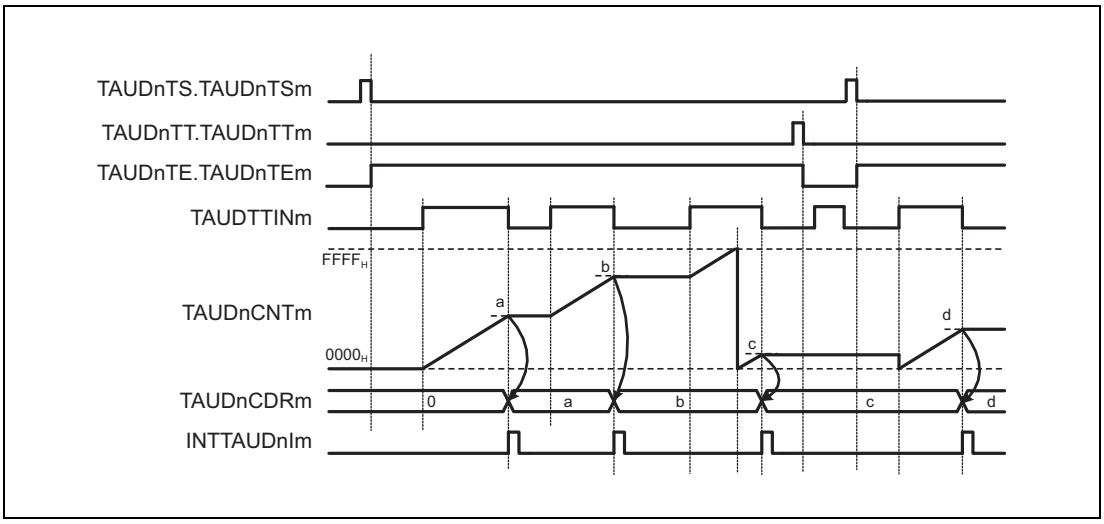

Figure 25.69 Operation Stop and Restart (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm stops and retains its current value.
- If the counter is stopped, valid TAUDTTINm input edges are ignored.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1. TAUDnCNTm restarts to count from 0000_H.

25.12.11 TAUDTTINm Input Pulse Interval Judgment Function

25.12.11.1 Overview

Summary

This function outputs the result of a comparison between the count value (TAUDnCNTm) and the value in the channel data register (TAUDnCDRm) when a TAUDTTINm input pulse occurs. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true.

Prerequisites

- The operating mode should be set to judge mode. See **Table 25.95, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Judgment Function**.
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When a TAUDTTINm valid edge is detected or TAUDnTS.TAUDnTSm is set to 1, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. TAUDnCNTm reloads the value of TAUDnCDRm and subsequently continues operation, regardless of the result of the comparison.

If the counter reaches 0000_H before a TAUDTTINm valid edge is detected, TAUDnCNTm overflows and is set to $FFFF_H$. It then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:

- If TAUDnCMORm.TAUDnMD0 = 0, INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm.
- If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm.

25.12.11.4 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

Table 25.98 Operating Procedure for TAUDTTINm Input Pulse Interval Judgment Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.95, Contents of the TAUDnCMORm Register for TAUDTTINm Input Pulse Interval Judgment Function**, and **Table 25.96, Contents of the TAUDnCMURm Register for TAUDTTINm Input Pulse Interval Judgment Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCDRm value is loaded into TAUDnCNTm.
During Operation	The following register can be changed at any time: • TAUDnCDRm register	When TAUDnCMORm.TAUDnMD0 = 0 If TAUDnCNTm ≤ TAUDnCDRm when a TAUDTTINm input edge is detected, INTTAUDnIm is generated. When TAUDnCMORm.TAUDnMD0 = 1 If TAUDnCNTm > TAUDnCDRm when a TAUDTTINm input edge is detected, INTTAUDnIm is generated. If a TAUDTTINm input edge is detected, then TAUDnCNTm starts to count down from the value of TAUDnCDRm. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

25.12.12 TAUDTTINm Input Signal Width Judgment Function

25.12.12.1 Overview

Summary

This function compares the count value (TAUDnCNTm) for the high or low level width of a TAUDTTINm input signal and the TAUDnCDRm value, and outputs the judgment result from the interrupt request signal INTTAUDnIm.

Prerequisites

- The operating mode should be set to judge and one-count mode. (See **Table 25.99, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Judgment Function**.)
- TAUDTTOUTm is not used with this function.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation. When a valid TAUDTTINm input start edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value.

When a TAUDTTINm valid stop edge is detected, the function compares the current values of TAUDnCNTm and TAUDnCDRm. An interrupt request signal INTTAUDnIm is generated if the result of the comparison is true. The counter TAUDnCNTm retains its value until the next valid TAUDTTINm start edge is detected, regardless of the result of the comparison.

If the counter reaches 0000_H before a valid TAUDTTINm stop edge is detected, TAUDnCNTm overflows and is set to $FFFF_H$. The counter then continues to count down.

The value of TAUDnCDRm can be rewritten at any time, and the changed value of TAUDnCDRm is applied the next time the counter starts to count down.

Conditions

- The TAUDnCMORm.TAUDnMD0 bit specifies the type of comparison:
  - If TAUDnCMORm.TAUDnMD0 = 0, INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm.
  - If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated when TAUDnCNTm > TAUDnCDRm.
- The TAUDnCMURm.TAUDnTIS[1:0] bits specify a type of width measurement:
  - For high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B), TAUDTTINm rising edge is used as a start edge and TAUDTTINm falling edge as a stop edge.
  - For low width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 10_B), TAUDTTINm falling edge is used as a start edge and TAUDTTINm rising edge as a stop edge.
- This function cannot make a forced restart.

25.12.12.2 Block Diagram and General Timing Diagram

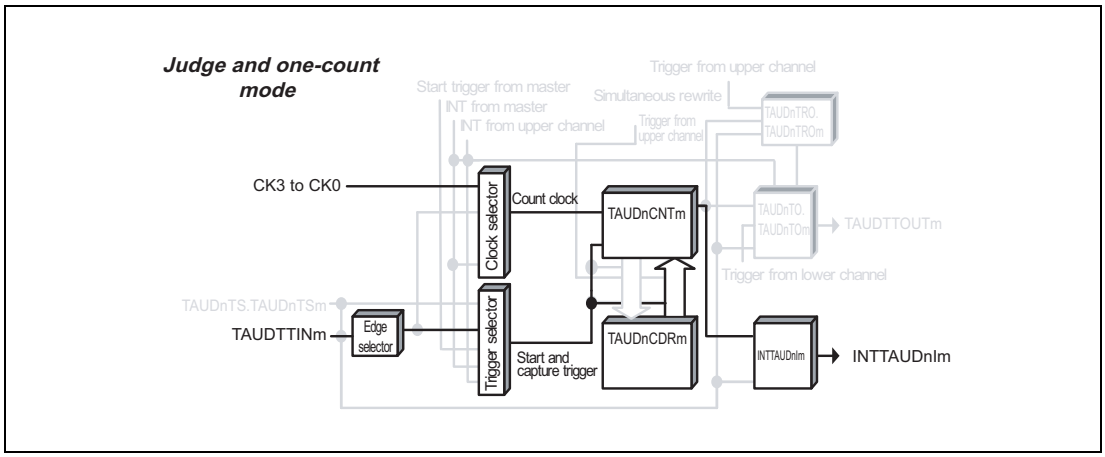

Figure 25.72 Block Diagram of TAUDTTINm Input Signal Width Judgment Function

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated when TAUDnCNTm ≤ TAUDnCDRm (TAUDnCMORm.TAUDnMD0 = 0).
- TAUDTTINm valid start edge = rising edge, TAUDTTINm valid stop edge = falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

25.12.12.4 Operating Procedure for TAUDTTINm Input Signal Width Judgment Function

Table 25.102 Operating Procedure for TAUDTTINm Input Signal Width Judgment Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.99, Contents of the TAUDnCMORm Register for TAUDTTINm Input Signal Width Judgment Function**, and **Table 25.100, Contents of the TAUDnCMURm Register for TAUDTTINm Input Signal Width Judgment Function**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the TAUDTTINm start edge.
During Operation	The following register can be changed at any time: • TAUDnCDRm register	Upon detection of a TAUDTTINm start edge, TAUDnCNTm starts count down from the value of TAUDnCDRm. When TAUDnCMORm.TAUDnMD0 = 0 If TAUDnCNTm ≤ TAUDnCDRm when a TAUDTTINm input stop edge is detected, INTTAUDnIm is generated. When TAUDnCMORm.TAUDnMD0 = 1 If TAUDnCNTm > TAUDnCDRm when a TAUDTTINm input stop edge is detected, INTTAUDnIm is generated. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

25.12.13 Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

25.12.13.1 Overview

Summary

This function measures the width of an individual TAUDTTINm input signal. An interrupt is generated if the TAUDTTINm input width is longer than $FFFF_H + 1$.

Prerequisites

- The operation mode must be set to One-Count Mode (see **Table 25.103, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**).
- TAUDTTOUTm is not used for this function.
- The value of TAUDnCDRm must be set to $FFFF_H$.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. $FFFF_H$ is loaded to TAUDnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUDTTINm input start edge is detected, TAUDnCNTm loads $FFFF_H$ and starts to count down.

If the counter reaches 0000_H before a stop edge is detected, an interrupt is generated.

Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TAUDnTIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, the TAUDTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11_B, the TAUDTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

25.12.13.2 Block Diagram and General Timing Diagram

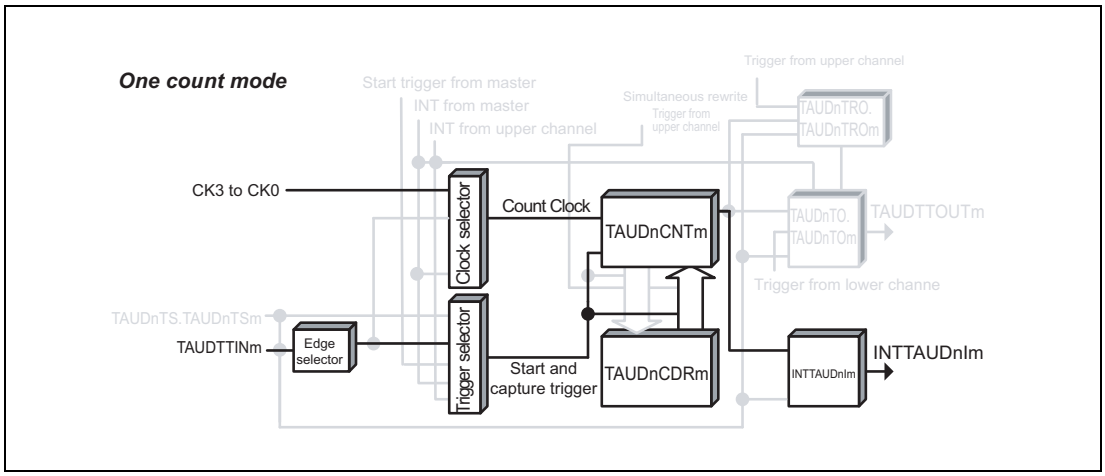

Figure 25.74 Block Diagram for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

(3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the Overflow Interrupt Output Function (during TAUDTTINm Width Measurement). Therefore, these registers must be set to 0.

Table 25.105 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0

25.12.13.4 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

Table 25.106 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.103, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**, and **Table 25.104, Contents of the TAUDnCMURm Register for Overflow Interrupt Output Function (during TAUDTTINm Width Measurement)**. Set the value of TAUDnCDRm register to $FFFF_H$.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the start edge. When a start edge is detected, TAUDnCNTm loads the TAUDnCDRm value ($FFFF_H$).
During Operation	The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down. When the counter reaches 0000_H: • INTTAUDnIm is generated. When TAUDTTINm input stop edge is detected during count operation: • TAUDnCNTm stops and retains its current value. When TAUDTTINm input start edge is detected while the counter is stopped: • TAUDnCNTm loads the TAUDnCDRm value ($FFFF_H$) again, and continues to count down. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

25.12.14 Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

25.12.14.1 Overview

Summary

This function measures the cumulative width of a TAUDTTINm input signal. If the cumulative TAUDTTINm input width is longer than $FFFF_H$, an interrupt is generated and an overflow interrupt can be output.

Prerequisites

- The operation mode must be set to Gate Count Mode, (see **Table 25.107, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)**).
- TAUDTTOUTm is not used with this function.
- The value of TAUDnCDRm must be set to $FFFF_H$.

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. $FFFF_H$ is loaded to TAUDnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUDTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000_H an interrupt is generated. $FFFF_H$ is loaded to TAUDnCNTm and the counter continues to count down until a TAUDTTINm input stop edge is detected.

Conditions

The valid start and stop edges are specified by the TAUDnCMURm.TIS[1:0] bits.

- If TAUDnCMURm.TAUDnTIS[1:0] = 10_B, the TAUDTTINm input low width is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUDnCMURm.TAUDnTIS[1:0] = 11_B, the TAUDTTINm input high width is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

25.12.14.2 Block Diagram and General Timing Diagram

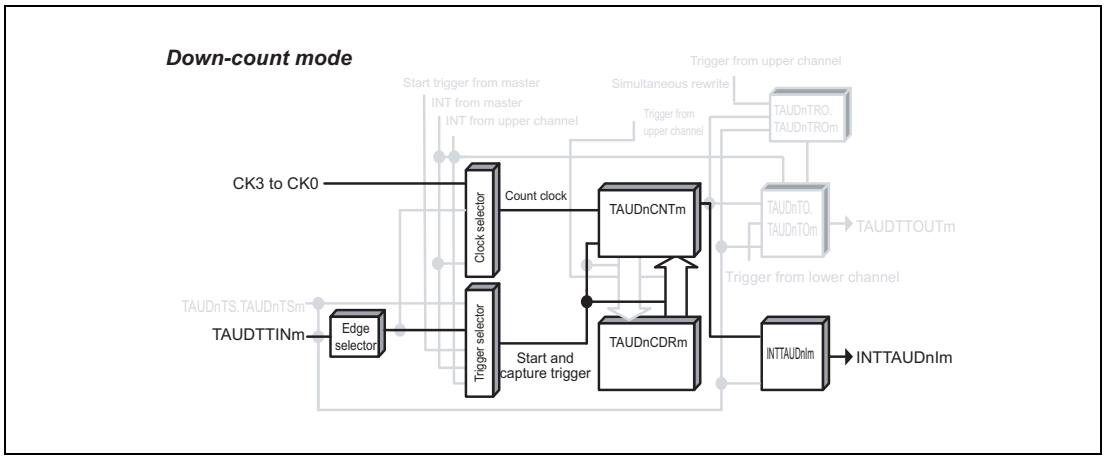

Figure 25.76 Block Diagram for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

Table 25.110 Operating Procedure for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers as described in **Table 25.107, Contents of the TAUDnCMORm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)**, and **Table 25.108, Contents of the TAUDnCMURm Register for Overflow Interrupt Output Function (during TAUDTTINm Input Period Count Detection)**. Set the value of TAUDnCDRm register to $FFFF_H$.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 and TAUDnCNTm waits for detection of the start edge. When a start edge is detected, TAUDnCNTm loads the TAUDnCDRm value ($FFFF_H$).
During Operation	The TAUDnCNTm register can be read at all times.	TAUDnCNTm counts down. When the counter reaches 0000_H: • INTTAUDnIm is generated. • TAUDnCNTm loads the TAUDnCDRm value ($FFFF_H$) and continues to count down. When TAUDTTINm input stop edge is detected during count operation: • TAUDnCNTm stops and retains the current value. When TAUDTTINm input start edge is detected while the counter is stopped: • TAUDnCNTm counts down from the stop value. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

25.12.15 One-Phase PWM Output Function

25.12.15.1 Overview

Summary

This function adds dead time to a TAUDTTINm input signal. The resulting PWM signal is output via TAUDTTOUTm of the channel and TAUDTTOUTm of upper channels.

Prerequisites

- Each of two (or more) channels is enabled for dead time control (TAUDnTDE.TAUDnTDEm = 1).
- The operating mode for the lower channel should be set to one-count mode. (See **Table 25.112, Contents of the TAUDnCMORm Register for the Lower Channel of the One-Phase PWM Output Function**.)
- Any operating mode can be set to upper channels.
- Channel output mode for upper and lower channels should be set to synchronous channel output mode 2 with one-phase PWM output. (See **Section 25.7, Channel Output Modes**.)

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation.

The counter starts when a valid TAUDTTINm input start edge is detected. The value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value.

When the counter reaches 0000_H, an interrupt occurs. The counter is reset to $FFFF_H$ and waits for the next valid TAUDTTINm input start edge.

Table 25.111 TAUDTTOUTm to which Dead Time is Added and State of TAUDTTINm

TAUDnCMURm. TAUDnTIS[1:0]	TAUDnTOL. TAUDnTOLm	TAUDTTOUTm to which Dead Time is Added	TAUDnTDL. TAUDnTDLm	TAUDTTINm State when Added
10	0	TAUDTTOUTm low	0	High
			1	Low
	1	TAUDTTOUTm high	0	High
			1	Low
11	0	TAUDTTOUTm low	0	Low
			1	High
	1	TAUDTTOUTm high	0	Low
			1	High

Conditions

- TAUDnCMURm.TAUDnTIS[1:0] bits specify the type of width measurement:
  - TAUDnCMURm.TAUDnTIS[1:0] = 10_B: Uses both edges as valid edges for detection (Low width measurement).
  - TAUDnCMURm.TAUDnTIS[1:0] = 11_B: Uses both edges as valid edges for detection (High width measurement).
- The TAUDnTDL.TAUDnTDLm bit specifies the operation of TAUDTTOUTm for each channel when an interrupt or valid TAUDTTINm edge is detected on the lower channel:
  - If TAUDnTDL.TAUDnTDLm = 0, an interrupt is used as a TAUDTTOUTm set trigger and a valid TAUDTTINm edge as a TAUDTTOUTm reset trigger.
  - If TAUDnTDL.TAUDnTDLm = 1, a valid TAUDTTINm edge is used as a TAUDTTOUTm set trigger and an interrupt as a TAUDTTOUTm reset trigger.
- This function cannot make a forced restart.

25.12.15.2 Block Diagram and General Timing Diagram

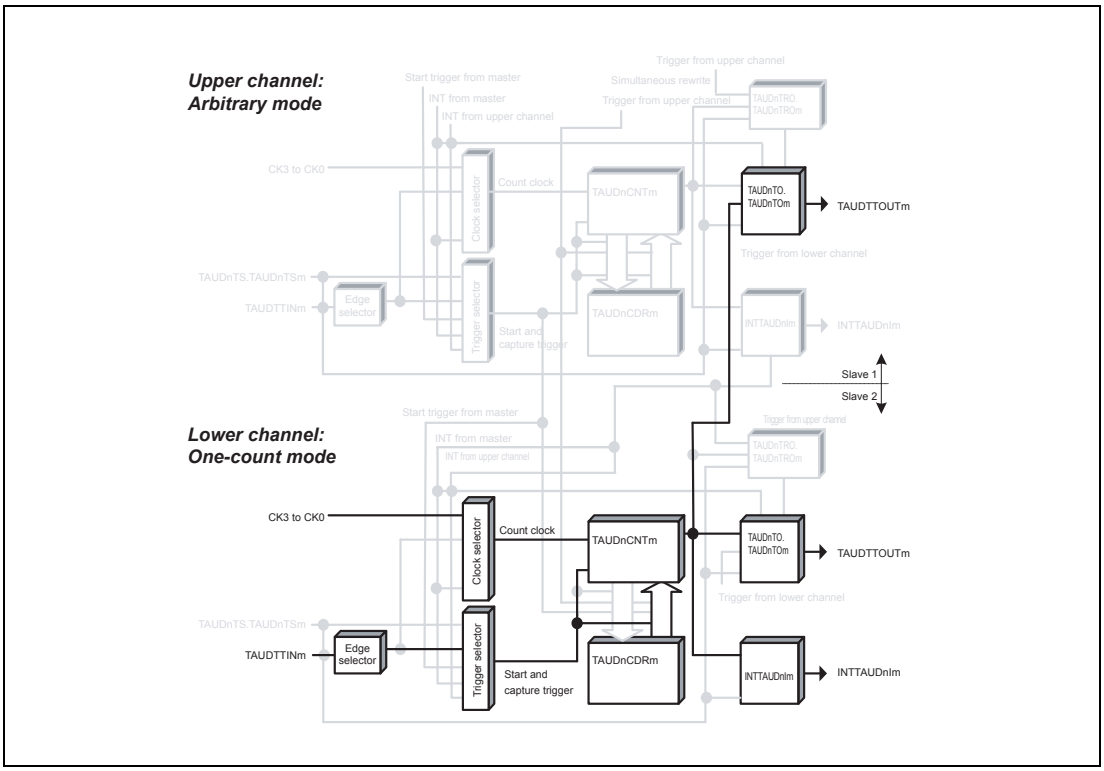

Figure 25.78 Block Diagram of One-Phase PWM Output Function

The following settings apply to the general timing diagram.

- Detection of rising and falling edges = high width measurement (TAUDnCMURm.TAUDnTIS[1:0] = 11_B)

This setting considers a duty as an active high.

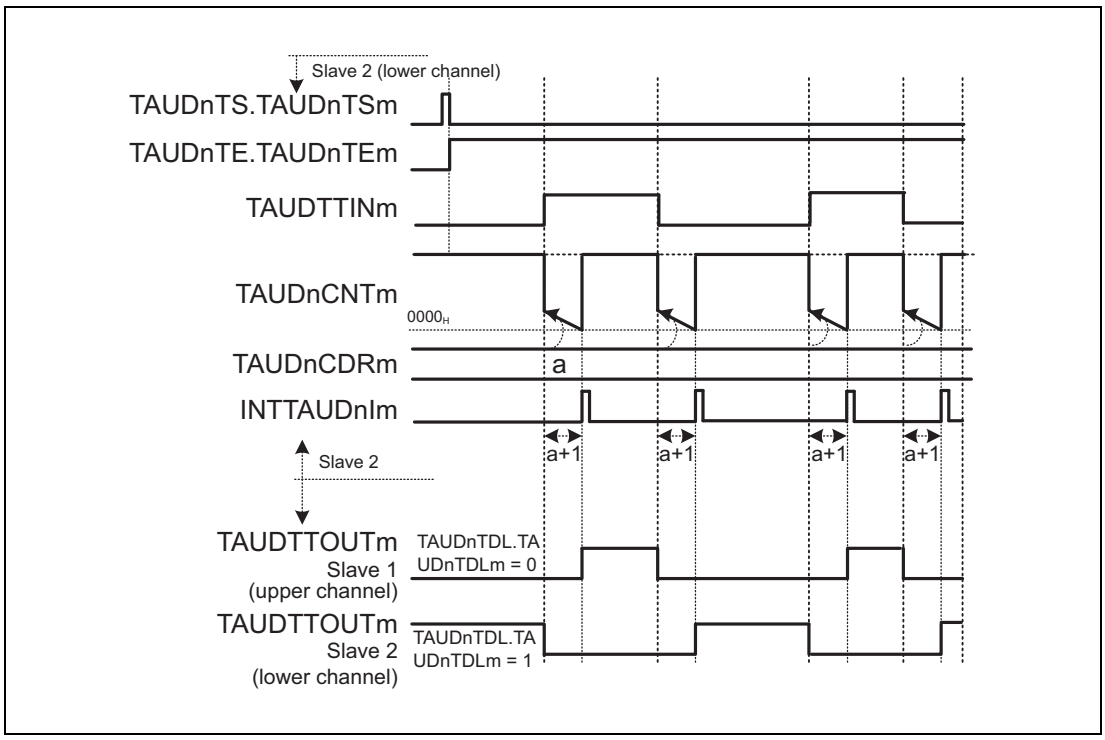

Figure 25.79 General Timing Diagram of One-Phase PWM Output Function

TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	1: Adds dead time upon detection of a TAUDTTINm input edge on a lower odd channel.
TAUDnTDL.TAUDnTDLm	0: Adds dead time of the positive-phase width 1: Adds dead time of the negative-phase width
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from lower channels.

(4) Simultaneous rewrite for upper channels

Simultaneous rewrite register for upper channels can be set arbitrarily.

25.12.15.5 Operating Procedure for One-phase PWM Output Function

Table 25.117 Operating Procedure for One-phase PWM Output Function

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for the lower channel as described in **Table 25.112, Contents of the TAUDnCMORm Register for the Lower Channel of the One-Phase PWM Output Function**, and **Table 25.113, Contents of the TAUDnCMURm Register for the Lower Channel of the One-Phase PWM Output Function**. Set TAUDnCMORm and TAUDnCMURm registers for the upper channel as described in **Section 25.12.15.4, Register Settings for Upper Channels**. Set the value of TAUDnCDRm register. Set channel output mode by setting the control bits as described in **Table 25.114, Control Bit Settings in Synchronous Channel Output Mode 2 with One-Phase PWM Output**.	Channel operation is stopped.
Start Operation	Set TAUDnTOE.TAUDnTOEm (slave channels 1 and 2) to 1 (at restart time only). Set TAUDnTS.TAUDnTSm = 1 for slave channel 2. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0. Detection of TAUDTTINm start edge	TAUDnTE.TAUDnTEm is set to 1 (slave channel 2) and TAUDnCNTm waits for detection of TAUDTTINm start edge. TAUDnCNTm loads TAUDnCDRm value.
During Operation	The TAUDnCDRm register value can be changed at any time. The TAUDnCNTm register can be read at any time.	TAUDnCNTm of slave channel 2 counts down. When the counter reaches 0000_H: • INTTAUDnIm is generated. • TAUDnCNTm stops counting. TAUDTTOUTm is changed by a TAUDTTINm edge detection signal and slave channel 2 INTTAUDnIm signal to output one-phase PWM waveform with dead time. Afterwards, this operation is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm = 1 for slave channel 2. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm and TAUDTTOUTm retain their current values.

Restart Operation

25.13 Independent Channel Real-Time Functions

This section describes functions that output the value of the TAUDnTRO.TAUDnTROm bit in real time.

25.13.1 Real-Time Output Function Type 1

25.13.1.1 Overview

Summary

This function outputs a value of the TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated at certain specified intervals.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm = 1), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger (TAUDnTRC.TAUDnTRCm = 0).

Prerequisites

- Channels should use the TAUDTTOUTm control of other channels.
- The operating mode for the upper channel should be set to interval timer mode. (See **Table 25.118, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 1**.)
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output. (See **Section 25.7, Channel Output Modes**.)
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREm = 1).

Functional description

The counter of the upper channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The current value of the data register of the upper channel (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.

When the counter of the upper channel reaches 0000_H, INTTAUDnIm is generated and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1). TAUDnCNTm then reloads the TAUDnCDRm value to continue operation subsequently.

The TAUDTTOUTm signal changes only when an interrupt is generated, and when its value is different from the current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.

Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels that do not generate a real-time output trigger.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm = 0) or if the

channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.

- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1) and TAUDnTRC.TAUDnTRCm = 0, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not output. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

25.13.1.2 Equations

INTTAUDnIm generation cycle = count clock cycle × (TAUDnCDRm value + 1)

Table 25.119 Contents of the TAUDnCMURm Register for the Upper Channel of Real-Time Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for upper channels

Table 25.120 Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output
TAUDnTRO.TAUDnTROm	0: Real-time output is low 1: Real-time output is high
TAUDnTRC.TAUDnTRCm	1: Channel m generates a unique real-time output trigger
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for upper channels

The simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the real-time output function type 1. Therefore, these registers should be set to 0.

Table 25.121 Simultaneous Rewrite Settings for Real-Time Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

25.13.1.5 Register Settings for Lower Channels

(1) TAUDnCMORm for lower channels

The TAUDnCMORm register for lower channels can be set arbitrarily.

(2) TAUDnCMURm for lower channels

The TAUDnCMURm register for lower channels can be set arbitrarily.

(3) Channel output mode for lower channels

Table 25.122 Control Bit Settings for the Lower Channels in Independent Channel Output Mode 1 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTDL.TAUDnTDLm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTRE.TAUDnTREm	1: Enables real-time output
TAUDnTRO.TAUDnTROm	0: Real-time output is low 1: Real-time output is high
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for lower channels

Simultaneous rewrite registers for lower channels are available for any setting.

25.13.1.6 Operating Procedure for Real-Time Output Function Type 1

Table 25.123 Operating Procedure for Real-Time Output Function Type 1

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for upper channels as described in **Table 25.118, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 1**, and **Table 25.119, Contents of the TAUDnCMURm Register for the Upper Channel of Real-Time Output Function Type 1**. Set TAUDnCMORm and TAUDnCMURm registers for lower channels as described in **Section 25.13.1.5, Register Settings for Lower Channels**. Set the value of TAUDnCDRm register (only channels with TAUDnTRC.TAUDnTRCm = 1) Set channel output mode by setting the control bits as described in **Table 25.120, Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output**. Set channel output mode by setting the control bits as described in **Table 25.122, Control Bit Settings for the Lower Channels in Independent Channel Output Mode 1 with Real-Time Output**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm = 1 on the channel with TAUDnTRC.TAUDnTRCm set to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	[Channel with TAUDnTRC.TAUDnTRCm set to 1] TAUDnTE.TAUDnTEm is set to 1 and the counter starts. The TAUDnCDRm value is loaded in TAUDnCNTm. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm is generated.
During Operation	TAUDnCDRm and TAUDnTRO.TAUDnTROm can be changed at any time. The TAUDnCNTm register can be read at any time.	TAUDnCNTm counts down. When the counter reaches 0000_H: • The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. • INTTAUDnIm is generated. • TAUDTTOUTm outputs the current value of the real-time output bit TAUDnTRO.TAUDnTROm. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. Both TAUDnCNTm and TAUDTTOUTm retain their current values.

Restart Operation

25.13.1.7 Specific Timing Diagrams

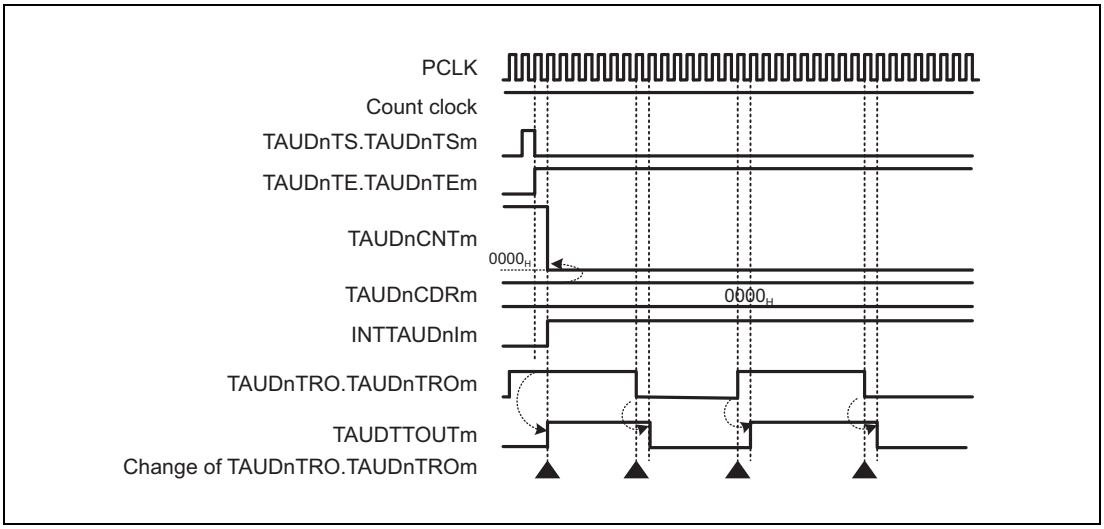

Figure 25.82 TAUDnCDRm = 0000_H, TAUDnCMORm.TAUDnMD0 = 1

- The value of TAUDTTOUTm changes according to the setting of TAUDnTRO.TAUDnTROm with a delay of one PCLK cycle.

25.13.2 Real-Time Output Function Type 2

25.13.2.1 Overview

Summary

This function outputs the value of TAUDnTRO.TAUDnTROm bit from TAUDTTOUTm when a specified channel generates an interrupt (INTTAUDnIm). In this function, the interrupt is generated when a valid TAUDTTINm input edge is detected or the function starts.

The upper channel is a channel which generates a real-time output trigger (TAUDnTRC.TAUDnTRCm = 1), and the lower channel is a channel which makes a real-time output in response to the upper channel trigger (TAUDnTRC.TAUDnTRCm = 0).

Prerequisites

- Channels should use the TAUDTTOUTm control of the other channels.
- The operating mode for the upper channel should be set to capture mode. (See **Table 25.124, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 2**.)
- Any operating mode can be set for lower channels.
- The channel output mode for all the channels should be set to independent channel output mode 1 with real-time output. (See **Section 25.7, Channel Output Modes**.)
- Real-time output should be enabled for the upper channel (TAUDnTRE.TAUDnTREm = 1).

Functional description

The counter for upper channels is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The counter starts to count up.

When a valid TAUDTTINm input edge is generated on one of upper channels, an interrupt occurs and TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) of every channel (only channels with TAUDnTRE.TAUDnTREm = 1).

The TAUDTTOUTm signal changes only when an interrupt is generated, and when TAUDTTOUTm value is different from the current value of TAUDnTRO.TAUDnTROm during the occurrence of the interrupt.

Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnTRC.TAUDnTRCm to 1 for the corresponding channel. The TAUDnTRC.TAUDnTRCm bit should be 0 for all other channels that do not generate a real-time output trigger.
- If real-time output of a lower channel is disabled (TAUDnTRE.TAUDnTREm = 0) or if the channel itself is used as a rewrite trigger (TAUDnTRC.TAUDnTRCm = 1), the value of that channel’s TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in that channel.
- If real-time output of a lower channel is enabled (TAUDnTRE.TAUDnTREm = 1) and TAUDnTRC.TAUDnTRCm = 0, the value of that channel's TAUDnTRO.TAUDnTROm bit is output when INTTAUDnIm is generated in the upper channel.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not

output. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

Table 25.128 Control Bit Settings for Lower Channels in Independent Channel Output Mode 1 with Real-Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode. (The value after reset.)
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low 1: Real-time output is high
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for lower channels

Simultaneous rewrite registers for lower channels can be set arbitrarily.

25.13.2.5 Operating Procedure for Real-Time Output Function Type 2

Table 25.129 Operating Procedure for Real-Time Output Function Type 2

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for upper channels as described in **Table 25.124, Contents of the TAUDnCMORm Register for the Upper Channel of Real-Time Output Function Type 2**, and **Table 25.125, Contents of the TAUDnCMURm Register for the Upper Channel of Real-Time Output Function Type 2**. Set TAUDnCMORm and TAUDnCMURm registers for the lower channel as described in **Section 25.13.2.4, Register Settings for Lower Channels**. The TAUDnCDRm register functions as a capture register (only channels with TAUDnTRC.TAUnTRCm = 1). Set channel output mode by setting the control bits as described in **Table 25.126, Control Bit Settings in Independent Channel Output Mode 1 with Real-Time Output**. Set channel output mode by setting the control bits as described in **Table 25.128, Control Bit Settings for Lower Channels in Independent Channel Output Mode 1 with Real-Time Output**.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm = 1 on the channel with TAUDnTRC.TAUDnTRCm set to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	[Channel with TAUDnTRC.TAUDnTRCm set to 1] TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000_H. If TAUDnCMORm.TAUDnMD0 is 1, INTTAUDnIm is generated.
During Operation	TAUDnTRO.TAUDnTROm can be changed at any time.	TAUDnCNTm starts to count up from 0000_H. When a valid TAUDTTINm input edge is detected: • TAUDnCNTm captures the TAUDnCDRm value, and the counter is cleared to 0000_H. • INTTAUDnIm is generated. • When the TAUDTTINm input valid edge is detected immediately after the generation of an overflow, the TAUDnCSRm.TAUDnOVF bit is set to 1. When detected before the generation of an overflow, the TAUDnCSRm.TAUDnOVF bit is cleared to 0. TAUDTTOUTm outputs the current value of real-time output bit TAUDnTRO.TAUDnTROm. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops. TAUDnCNTm, TAUDnCSRm.TAUDnOVF, and TAUDTTOUTm retain their current values.

Restart Operation

25.13.2.6 Specific Timing Diagrams

(1) Operation start and stop

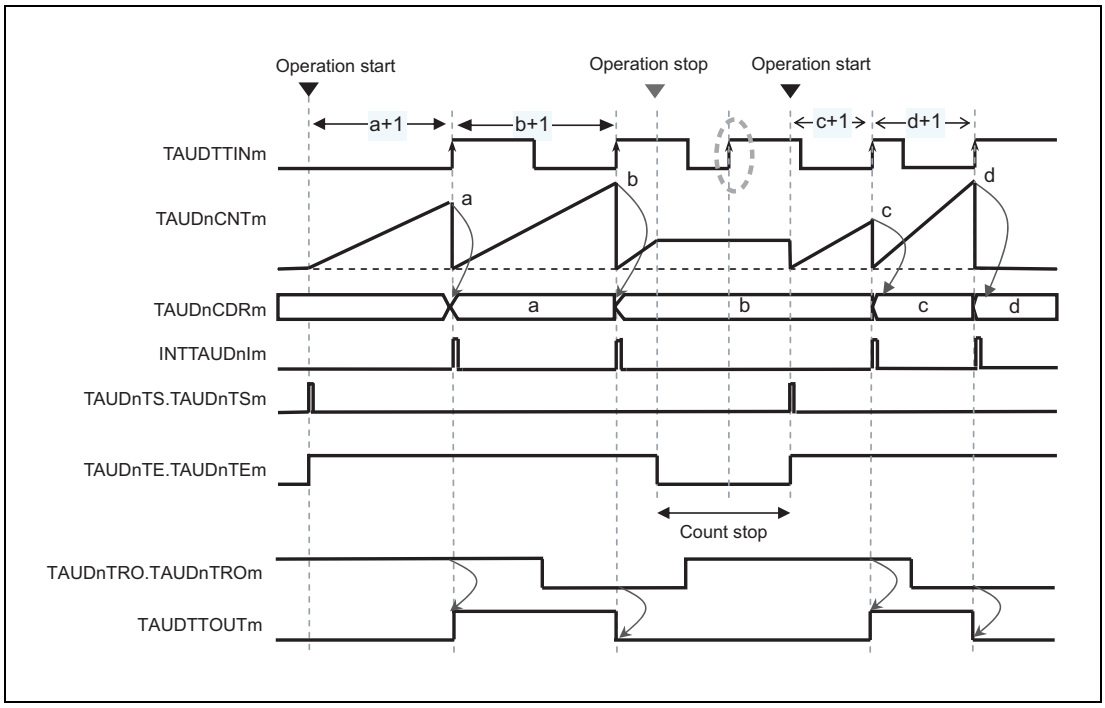

Figure 25.85 Operation Start and Stop (TAUDnCMORm.TAUDnMD0 = 0)

- When TAUDnTS.TAUDnTSm is set to 1, the counter starts counting up.
- When a valid input edge is detected, the current value of the counter is written to the data register (TAUDnCDRm) and an interrupt is generated.
- TAUDTTOUTm outputs the current value of the real-time output bit (TAUDnTRO.TAUDnTROm) and the counter resets and starts to count up again.
- The TAUDTTOUTm signal only changes when an interrupt is generated, and then only when its value is different from the current value of TAUDnTRO.TAUDnTROm at the moment that the interrupt is generated.
- If the counter is stopped (TAUDnTE.TAUDnTEm = 0), valid input edges are ignored and no interrupt is generated.

25.14 Independent Channel Simultaneous Rewrite Functions

This section describes functions that carry out simultaneous rewrite.

25.14.1 Simultaneous Rewrite Trigger Generation Function Type 1

25.14.1.1 Overview

Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. The interrupt is generated at regular intervals.

The upper channel is a channel which generates a simultaneous rewrite trigger (TAUDnRDC.TAUDnRDCm = 1), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger (TAUDnRDC.TAUDnRDCm = 0).

Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite (TAUDnRDE.TAUDnRDEm = 1).
- The operating mode for the upper channel should be set to interval timer mode. (See **Table 25.130, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**.)
- For the operating mode that can be set for lower channels, see **Table 25.47, Channel Functions and the Methods They Use for Simultaneous Rewrite**.
- TAUDTTOUTm is not used for any channel in this function.

Functional description

The counter operation is enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) for upper and lower channels to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of the data register buffer for upper channels (TAUDnCDRm buf) is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value. The counter for lower channels start to count according to the selected operating mode.

Once the counter reaches 0000_H, an interrupt occurs on the channel. The current value of the corresponding TAUDnCDRm buffer is loaded into TAUDnCNTm to continue operation subsequently.

If the channel where an interrupt occurs is specified as a trigger channel for simultaneous rewrite (TAUDnRDC.TAUDnRDCm = 1) and is an upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUDnRSF.TAUDnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers. Each time a counter starts to count down, it reads the value in the data register buffer and counts down from this value.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

Conditions

- The channel which is monitored for INTTAUDnIm occurrence is specified by setting TAUDnRDC.TAUDnRDCm = 1 for the corresponding channel. The TAUDnRDC.TAUDnRDCm

bit should be set to 0 for all other channels in which simultaneous rewrite should take place.

- If the TAUDnCMORm.TAUDnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

25.14.1.2 Equations

Simultaneous rewrite trigger generation cycle = count clock cycle × (TAUDnCDRm + 1)

To control simultaneous rewrite, the following condition should be satisfied:

[PWM]

TAUDnCDRm = [(value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1) × number of interrupts] – 1

[Triangle PWM]

TAUDnCDRm = [(value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1) × 2 × number of interrupts] – 1

That is, the ratio of TAUDnCDRm + 1 and value of TAUDnCDRm of master channel subject to simultaneous rewrite + 1 must be an integer. This integer corresponds to the number of interrupts.

For triangle PWM, remember that the cycle doubles.

25.14.1.3 Block Diagram and General Timing Diagram

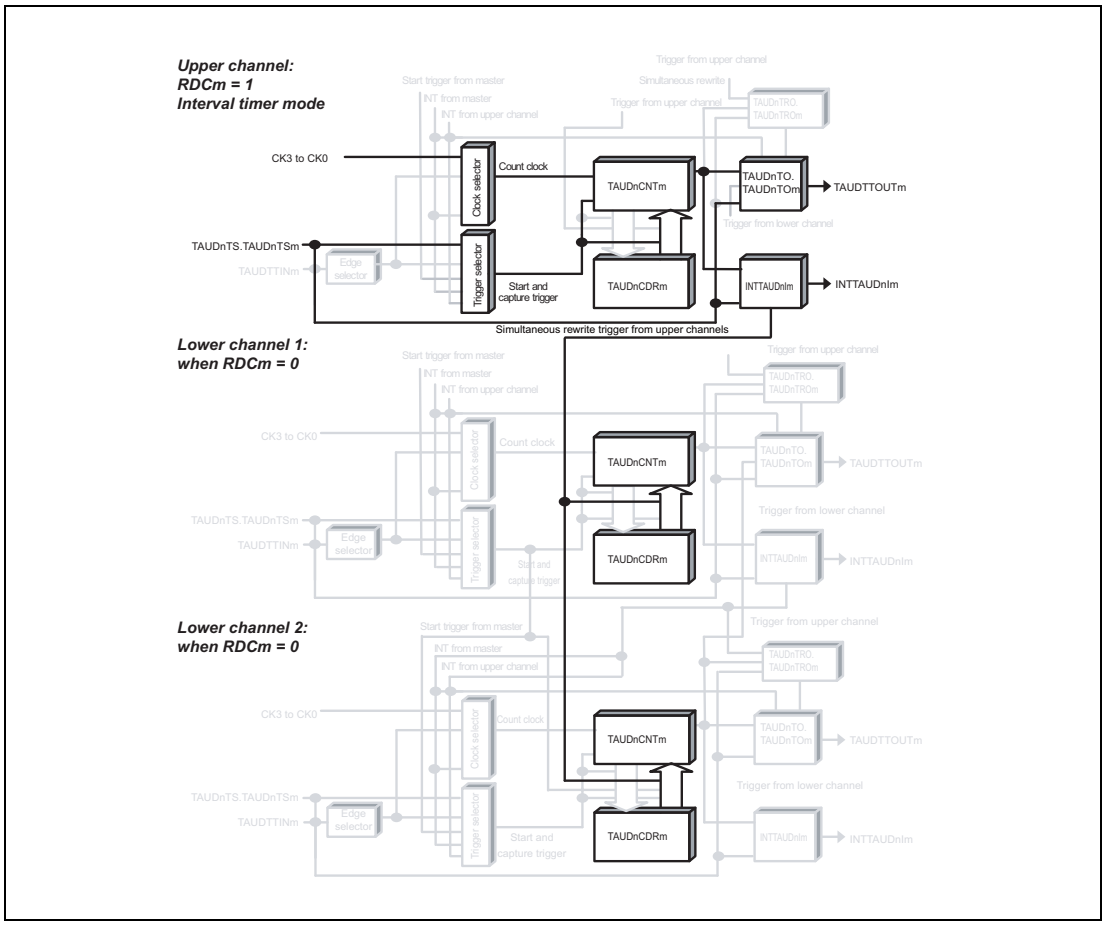

Figure 25.86 Block Diagram of Simultaneous Rewrite Trigger Generation Function Type 1

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

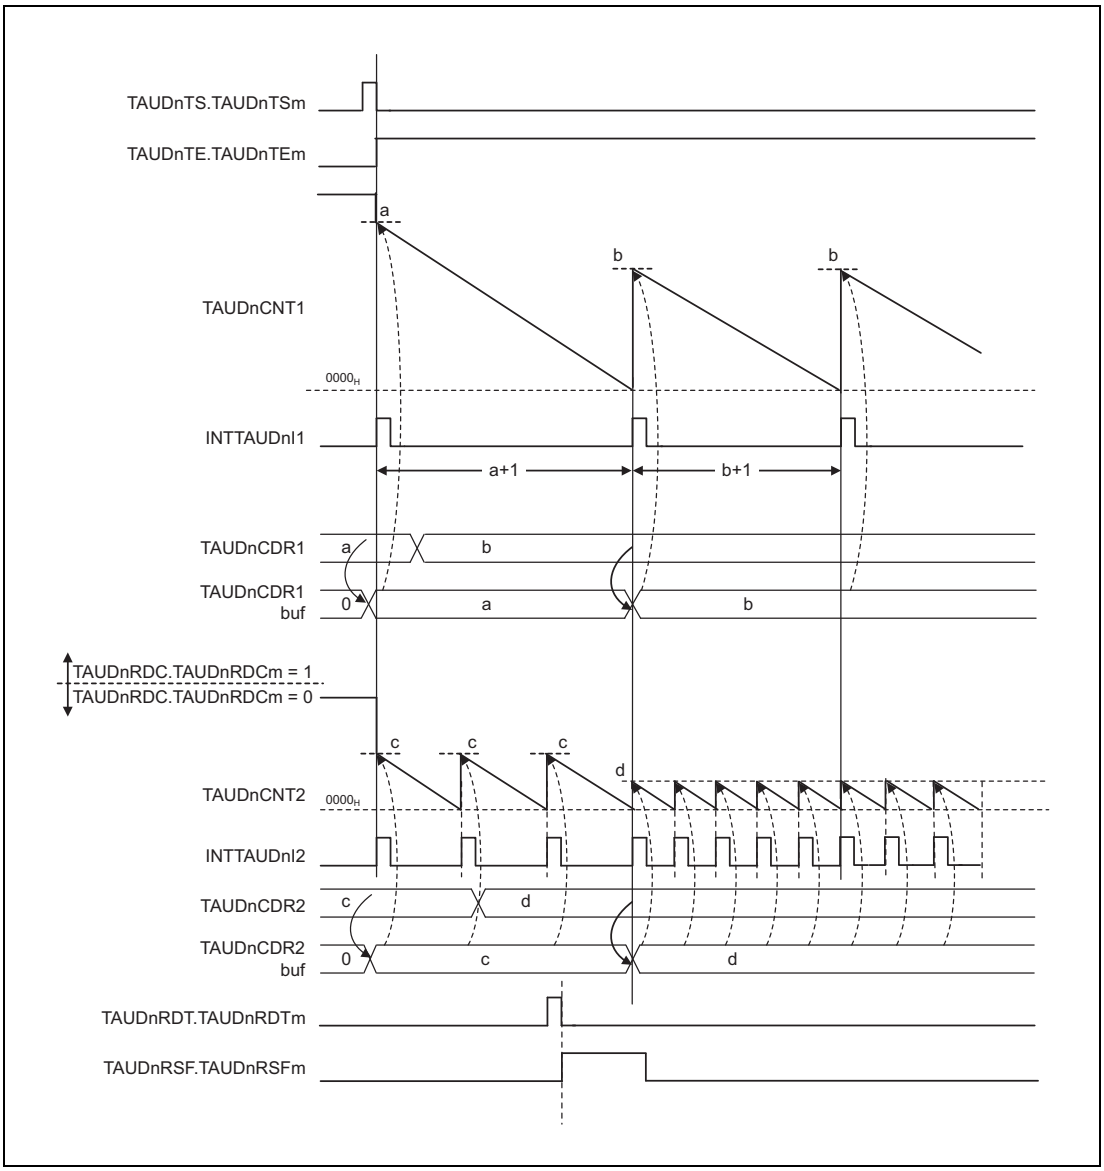

Figure 25.87 General Timing Diagram of Simultaneous Rewrite Trigger Generation Function Type 1

1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for upper channels

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function. However, this mode can be used in independent channel output mode controlled by software.

(4) Simultaneous rewrite for upper channels

Table 25.132 Simultaneous Rewrite Settings for Upper Channels in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts counting.
TAUDnRDC.TAUDnRDCm	1: Monitors INTTAUDnIm signal which triggers a simultaneous rewrite on the channel.

25.14.1.5 Register Settings for Lower Channels

(1) TAUDnCMORm for lower channels

TAUDnCMORm register for lower channels must follow the TAUDnCMORm register settings in the operating mode which can be set. (See **Table 25.47, Channel Functions and the Methods They Use for Simultaneous Rewrite**.)

(2) TAUDnCMURm for lower channels

TAUDnCMURm register for lower channels must follow the TAUDnCMURm register settings in the operating mode which can be set. (See **Table 25.47, Channel Functions and the Methods They Use for Simultaneous Rewrite**.)

(3) Channel output mode for lower channels

Output can be made according to the setting for lower channels (master/slave). As for the available function for simultaneous rewrite trigger generation function type 1, see **Table 25.46, Simultaneous Rewrite Methods and when They are Triggered**.

(4) Simultaneous rewrite for lower channels

Table 25.133 Simultaneous Rewrite Settings for Lower Channels in Simultaneous Rewrite Trigger Generation Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts counting.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.14.1.6 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

Table 25.134 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 1

	Operation	TAUDn Status
Initial Channel Setting	Set TAUDnCMORm and TAUDnCMURm registers for the upper channel as described in **Table 25.130, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**, and **Table 25.131, Contents of the TAUDnCMURm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 1**. Set TAUDnCMORm and TAUDnCMURm registers for lower channels as described in **Section 25.14.1.5, Register Settings for Lower Channels**. Set the value of TAUDnCDRm register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCDRm value is loaded into TAUDnCNTm. If TAUDnCMORm.TAUDnMD0 = 1, INTTAUDnIm is generated.
During Operation	TAUDnRDT.TAUDnRDTm and TAUDnCDRm.TAUDnCDR are changeable. TAUDnRSF.TAUDnRSFm can be always read.	TAUDnCNTm counts down. When the counter reaches 0000_H: • The TAUDnCDRm value is loaded in TAUDnCNTm again and count operation continues. • INTTAUDnIm is generated. If INTTAUDnIm is generated on the channel where TAUDnRDC.TAUDnRDCm is set to 1, simultaneous rewrite is controlled. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

25.14.2 Simultaneous Rewrite Trigger Generation Function Type 2

25.14.2.1 Overview

Summary

This function generates an interrupt on a specific channel that can be used by lower channels as a simultaneous rewrite trigger. In this function, the interrupt is generated when a valid TAUDTTINm input edge is detected or the function starts.

The upper channel is a channel which generates a simultaneous rewrite trigger (TAUDnRDC.TAUDnRDCm = 1), and the lower channel is a channel which makes a simultaneous rewrite in response to the upper channel trigger (TAUDnRDC.TAUDnRDCm = 0).

Prerequisites

- Two or more channels lower than the channel used as upper channel are enabled for simultaneous rewrite (TAUDnRDE.TAUDnRDEm = 1).
- The operation mode of the upper channel must be set to Capture Mode (see **Table 25.135, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 2**).
- For the operation mode that can be set for a lower channel, see **Table 25.47, Channel Functions and the Methods They Use for Simultaneous Rewrite**.

Functional description

The counter operation is enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) for upper and lower channels to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The counter for the upper channel starts to count up, and then the counter for lower channels start to count according to the selected operating mode.

When a TAUDTTINm input edge occurs on the upper channel, an interrupt is generated. The trigger is detected by the lower channel(s), which then also generate an interrupt.

When TAUDnRDC.TAUDnRDCm = 1 on the upper channel, simultaneous rewrite takes place on all lower channels in which simultaneous rewrite is currently possible (TAUDnRSF.TAUDnRSFm = 1).

The values of the data registers are copied to the corresponding data register buffers.

The value of a data register can be changed at any time, but it is only transferred to the corresponding data register buffer when simultaneous rewrite occurs.

Conditions

- The channel which is monitored for INTTAUDnIm is specified by setting TAUDnRDC.TAUDnRDCm = 1 for the corresponding channel. The TAUDnRDC.TAUDnRDCm bit must be 0 for all other channels in which simultaneous rewrite should take place.
- If the TAUDnCMORm.TAUDnMD0 bit is set to 1, an interrupt is generated when the function starts. For details see **Section 25.9, TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts**.

25.14.2.2 Block Diagram and General Timing Diagram

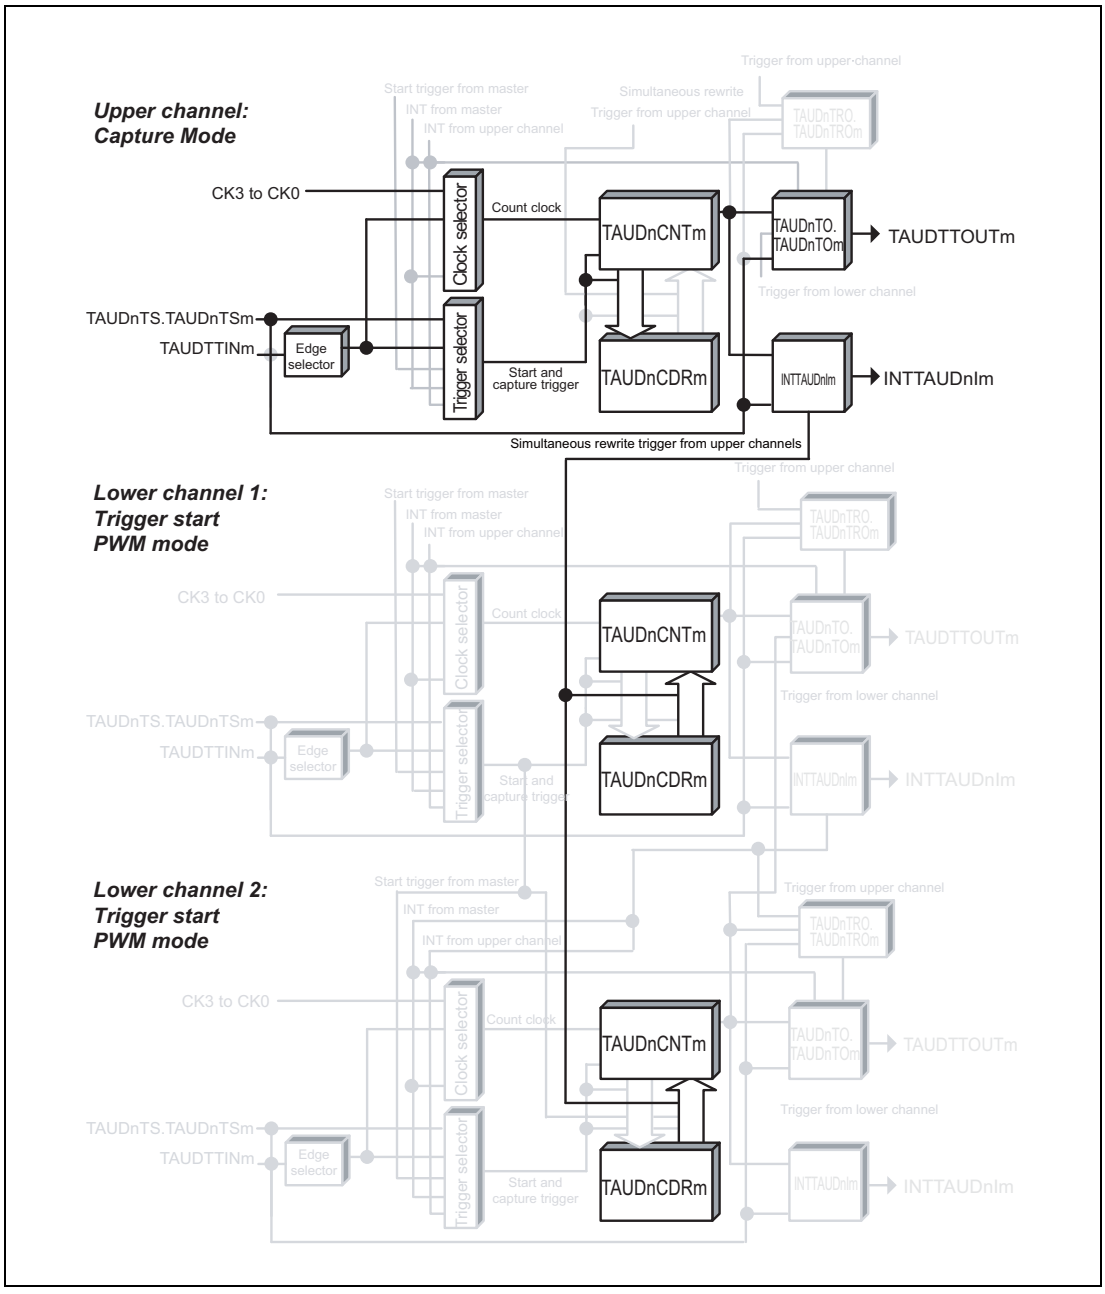

Figure 25.88 Block Diagram for Simultaneous Rewrite Trigger Generation Function Type 2

The following settings apply to the general timing diagram.

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)
- Upper channel (CH1) generates simultaneous rewrite trigger.

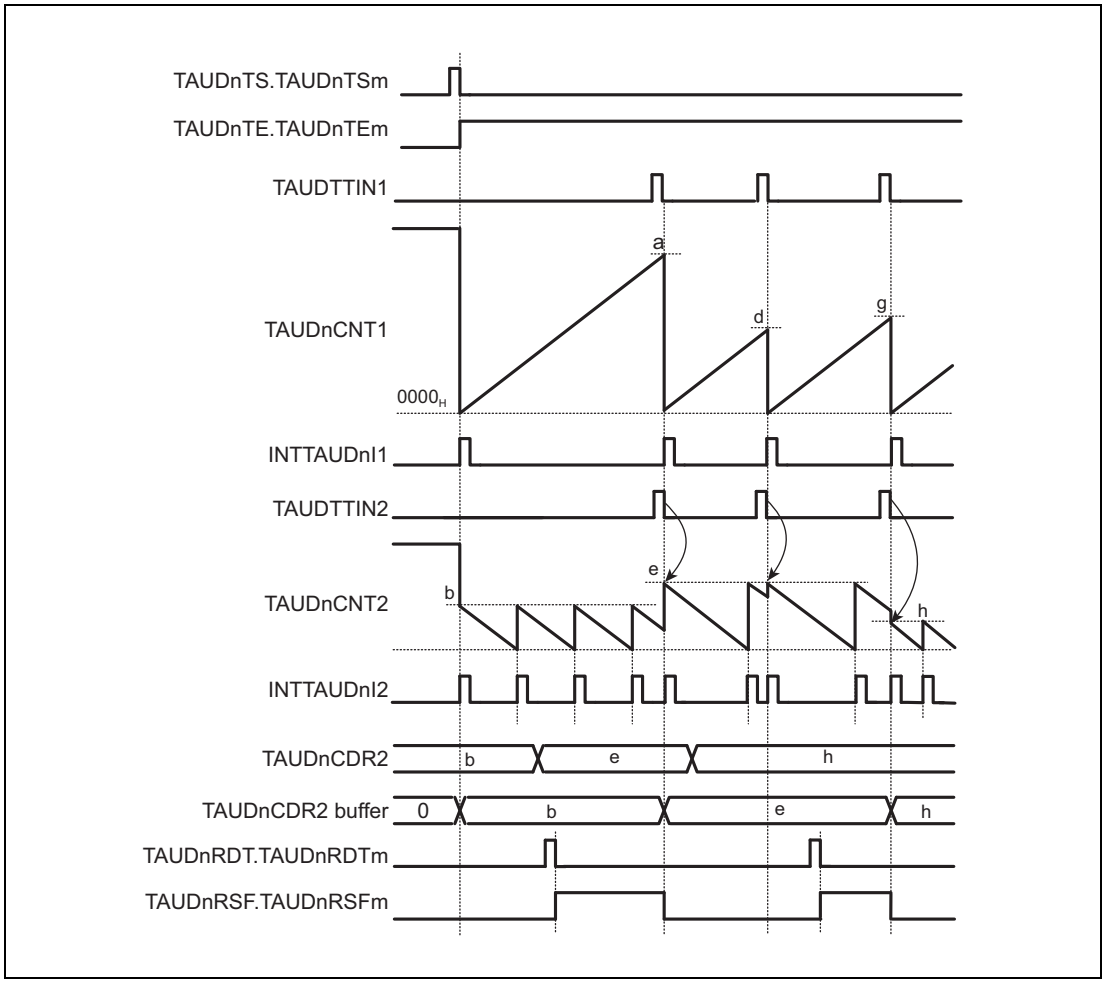

Figure 25.89 General Timing Diagram for Simultaneous Rewrite Trigger Generation Function Type 2

1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges 11: Setting prohibited

(3) Channel output mode for lower channels

Output can be made according to the trigger start PWM mode setting.

(4) Simultaneous rewrite for lower channels

Table 25.140 Simultaneous Rewrite Settings for the Lower Channel in Simultaneous Rewrite Trigger Generation Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	1: Selects one of upper channels as simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Loads a simultaneous rewrite control signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.14.2.5 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 2

Table 25.141 Operating Procedure for Simultaneous Rewrite Trigger Generation Function Type 2

	Operation	TAUDn Status
Initial Channel Setting	Set the TAUDnCMORm and TAUDnCMURm registers for the upper channel as described in **Table 25.135, Contents of the TAUDnCMORm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 2** and **Table 25.136, Contents of the TAUDnCMURm Register for the Upper Channel of Simultaneous Rewrite Trigger Generation Function Type 2**. Set the TAUDnCMORm and TAUDnCMURm registers for the lower channel as described in **Table 25.138, Contents of the TAUDnCMORm Register for the Lower channel of Simultaneous Rewrite Trigger Generation Function Type 2** and **Table 25.139, Contents of the TAUDnCMURm Register for the Lower Channel of Simultaneous Rewrite Trigger Generation Function Type 2**. The TAUDnCDRm register functions as a capture register.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm to 1. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is set to 1 and the counter starts. TAUDnCNTm is cleared to 0000_H. INTTAUDnIm is generated when TAUDnCMORm.TAUDnMD0 is set to 1.
During Operation	TAUDnRDT.TAUDnRDTm can be set at any time. TAUDnRSF.TAUDnRSFm can be read at any time.	TAUDnCNTm counts up from 0000_H. When a TAUDTTINm valid edge is detected: • TAUDnCNTm transfers (captures) its value to TAUDnCDRm and returns to 0000_H. • INTTAUDnIm is generated. Simultaneous rewrite is controlled when INTTAUDnIm is generated from the channel where TAUDnRDC.TAUDnRDCm is set to 1. Afterwards, this procedure is repeated.
Stop Operation	Set TAUDnTT.TAUDnTTm to 1. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and it retains its current value.

Restart Operation

25.15 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the timer array unit D. For a general overview of synchronous channel operation, see **Section 25.2, Overview**

This section describes functions that generate PWM signals at regular intervals.

25.15.1 PWM Output Function

25.15.1.1 Overview

Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty cycle of the TAUDTTOUTm to be set. The pulse cycle is set in the master channel. The duty cycle is set in the slave channel.

Prerequisites

- Two channels
- The operating mode for the master channel should be set to interval timer mode. (See **Table 25.142, Contents of the TAUDnCMORm Register for the Master Channel of the PWM Output Function**.)
- The operating mode for the slave channels should be set to one-count mode. (See **Table 25.145, Contents of the TAUDnCMORm Register for the Slave Channel of the PWM Output Function**.)
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channels should be set to Synchronous Channel Output Mode 1. (See **Section 25.7, Channel Output Modes**.)

Functional description

The counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm, and the counter starts counting down from the TAUDnCDRm value. If an INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set/reset, PWM output is made.

- Master channel:
  When the master channel counter reaches 0000_H and the pulse cycle time has passed, INTTAUDnIm is generated. The counter loads TAUDnCDRm value into TAUDnCNTm and counts down.
- Slave channel:
  When INTTAUDnIm is generated on the master channel, the counter operation of the slave channel is triggered. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave) and the counter starts counting down from the TAUDnCDRm value. TAUDTTOUTm signal is set to the active level.
  When the counter reaches to 0000_H (duty time has elapsed), INTTAUDnIm is generated and a TAUDTTOUTm signal is set to an inactive level. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnIm (start of the next pulse cycle) of the master channel.

The counter can stop operating by setting the TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. See **Section 25.6, Simultaneous Rewrite**.

25.15.1.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUDnCDRm (slave)/(TAUDnCDRm (master) + 1)) × 100

– Duty cycle = 0%
  TAUDnCDRm (slave) = 0000_H
– Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

25.15.1.3 Block Diagram and General Timing Diagram

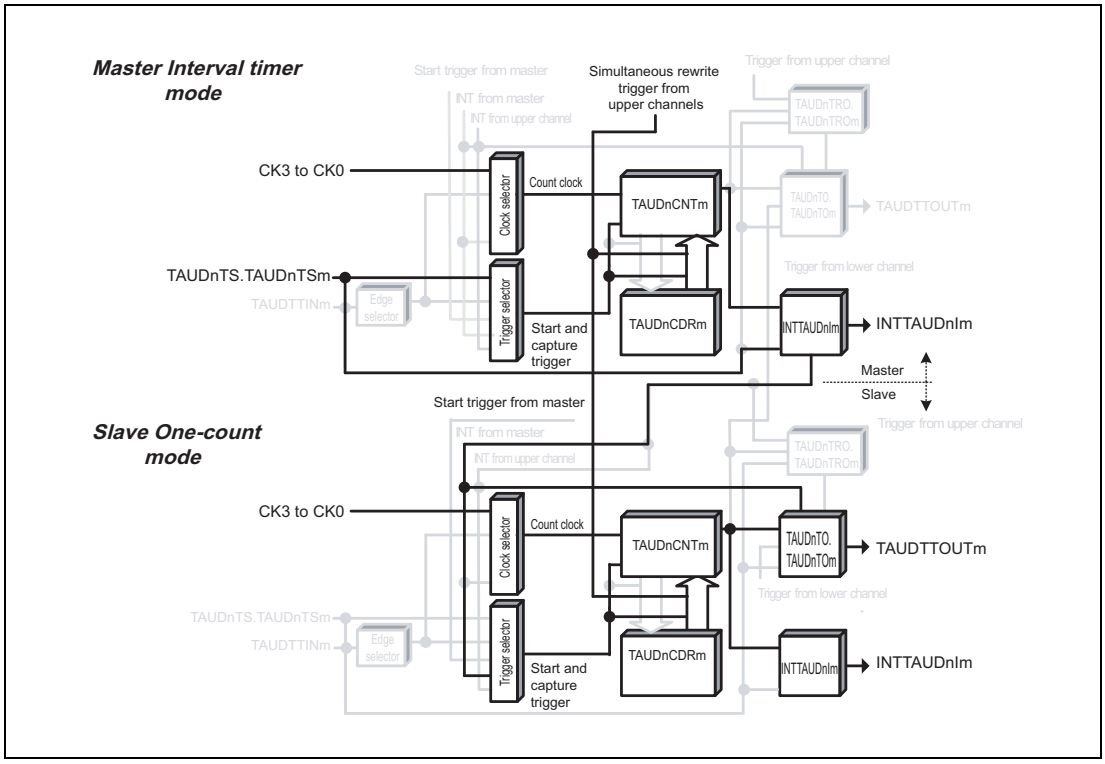

Figure 25.90 Block Diagram of PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

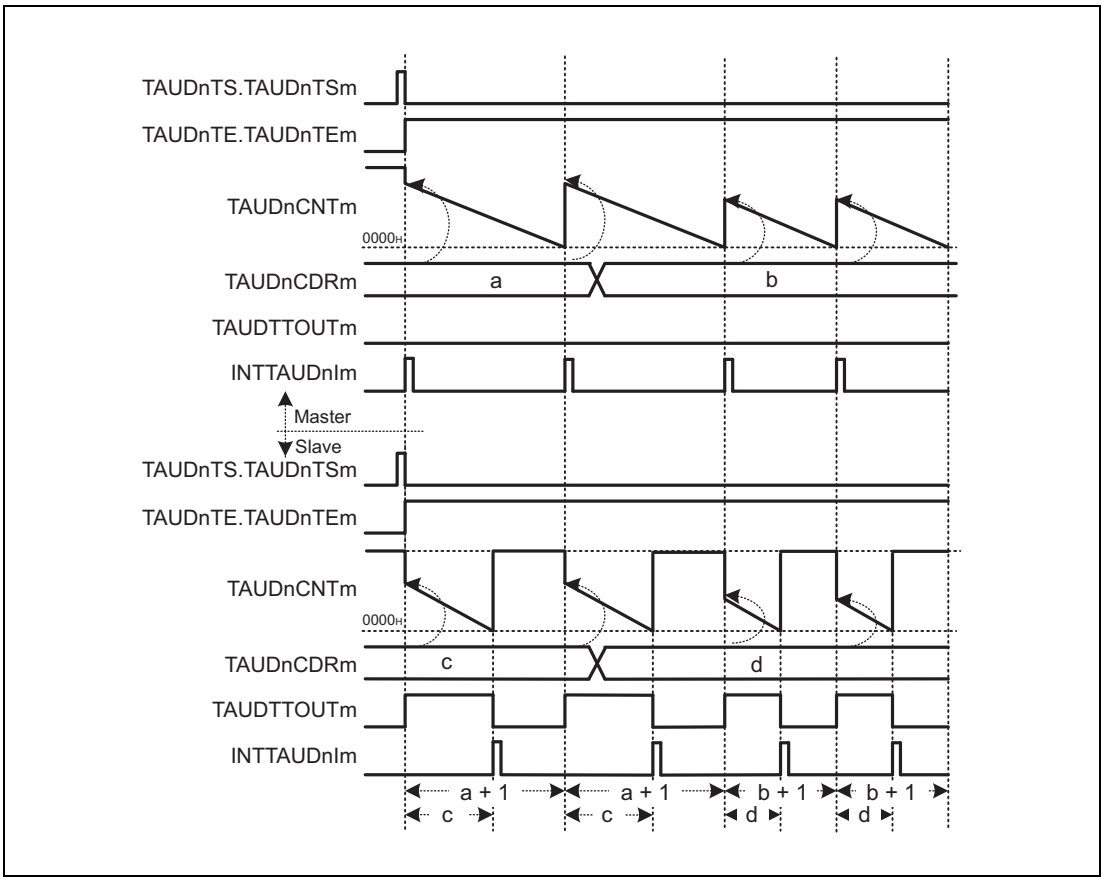

Figure 25.91 General Timing Diagram of PWM Output Function

NOTES

1. The interval between the starting to count and an interrupt being generated is the value of corresponding TAUDnCDRm + 1.
2. TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

25.15.1.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 25.142 Contents of the TAUDnCMORm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	1: INTTAUDnIm generated at the beginning of operation.

(2) TAUDnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.143 Contents of the TAUDnCMURm Register for the Master Channel of the PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for the master channel

The channel output mode is not used with this function.

(4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.144 Simultaneous Rewrite Settings for the Master Channel of the PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

NOTE

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires a channel higher than the master channel that operates with **Section 25.14.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Conduct operation settings under the following conditions:

- Simultaneous rewrite trigger output function type 1 setting channel: TAUDnRDCm = 1, TAUDnRDSm = 1
  TAUDnCDRm settings for this channel are as follows:
  = ((TAUDnCDR setting for the master channel targeted for simultaneous rewrite + 1) × interrupt count) – 1
- Master channel: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channel: TAUDnRDCm = 0, TAUDnRDSm = 1

If TAUDnCDRm (slave) setting > TAUDnCDRm (master) setting + 1, the duty value (which exceeds 100%) is aggregated to be 100% output.

25.15.1.5 Register Settings for Slave Channels

(1) TAUDnCMORm for slave channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for slave channels

Table 25.147 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for slave channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.148 Simultaneous Rewrite Settings for Slave Channels of PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.15.1.6 Operating Procedure for PWM Output Function

Table 25.149 Operating Procedure for PWM Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.1.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.1.5, Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set.
During operation	TAUDnCDRm can be changed at any time. TAUDnTOL.TAUDnTOLm can be changed. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000_H: • INTTAUDnIm (master) is generated. • TAUDnCDRm value is loaded into TAUDnCNTm (master) to continue count operation. • TAUDnCDRm value is loaded into TAUDnCNTm (slave) to perform counting down. • TAUDTTOUTm (slave) is set to the active level. If TAUDnCNTm (slave) reaches 0000_H: • INTTAUDnIm (slave) is generated. • TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

25.15.1.7 Specific Timing Diagrams

(1) Duty cycle = 0%

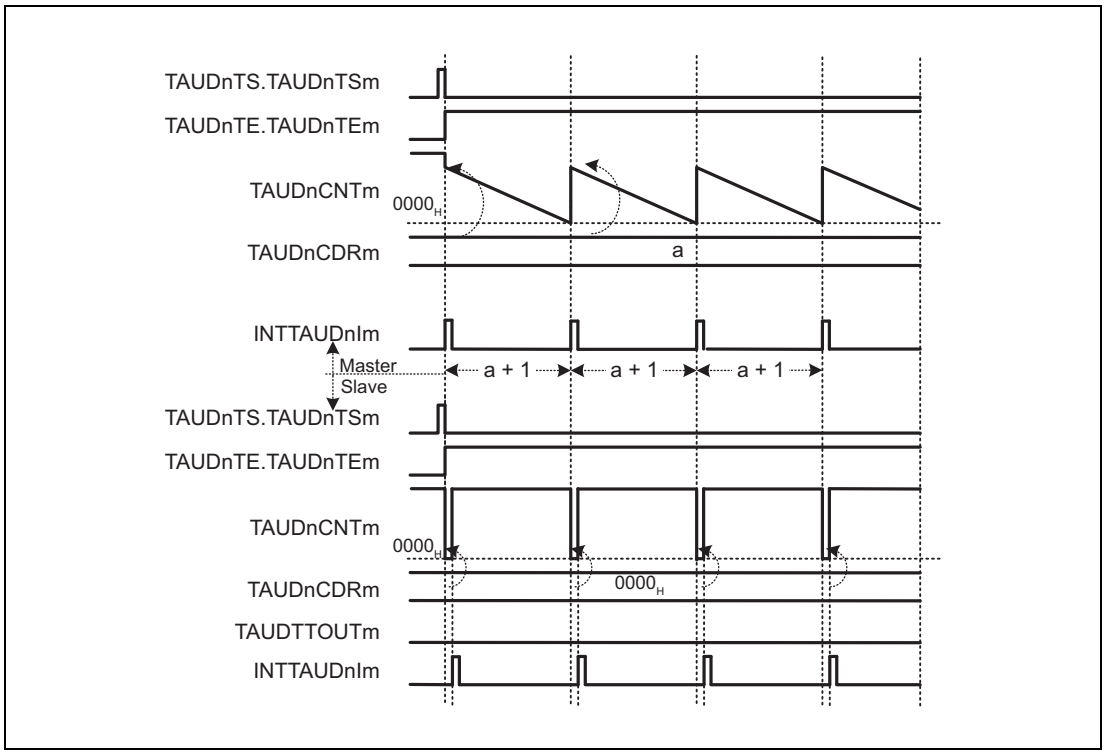

Figure 25.92 TAUDnCDRm (Slave) = 0000_H, Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- Every time the master channel generates an interrupt (INTTAUDnIm), 0000_H is loaded into TAUDnCNTm (slave). As a result, a slave channel interrupt (INTTAUDnIm) is generated at the same time and TAUDTTOUTm remains inactive.
- TAUDnCDRm value is loaded into TAUDnCNTm (slave) to generate an interrupt.

(2) Duty cycle = 100%

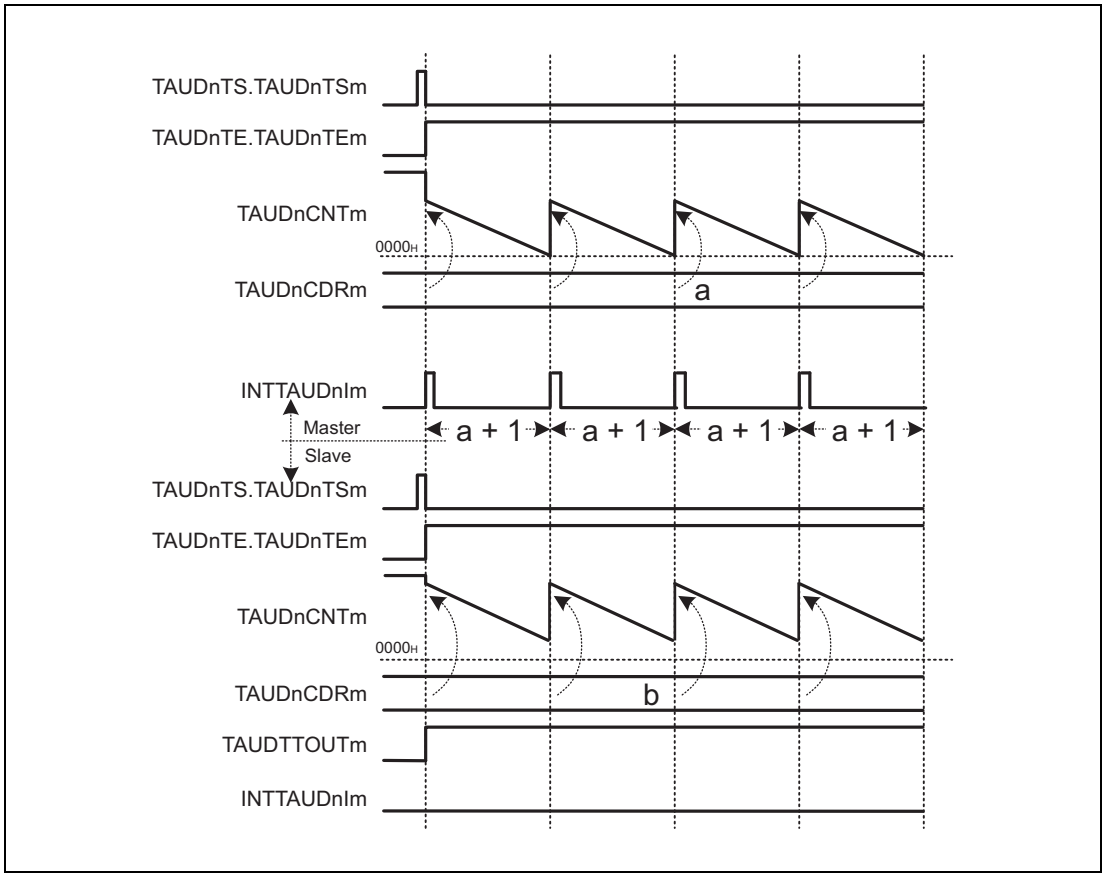

Figure 25.93 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- If TAUDnCDRm (slave) value is greater than TAUDnCDRm (master) value, the slave channel counter does not reach 0000_H and consequently, no interrupt occurs. TAUDTTOUTm remains active.

(3) Operation stop and restart

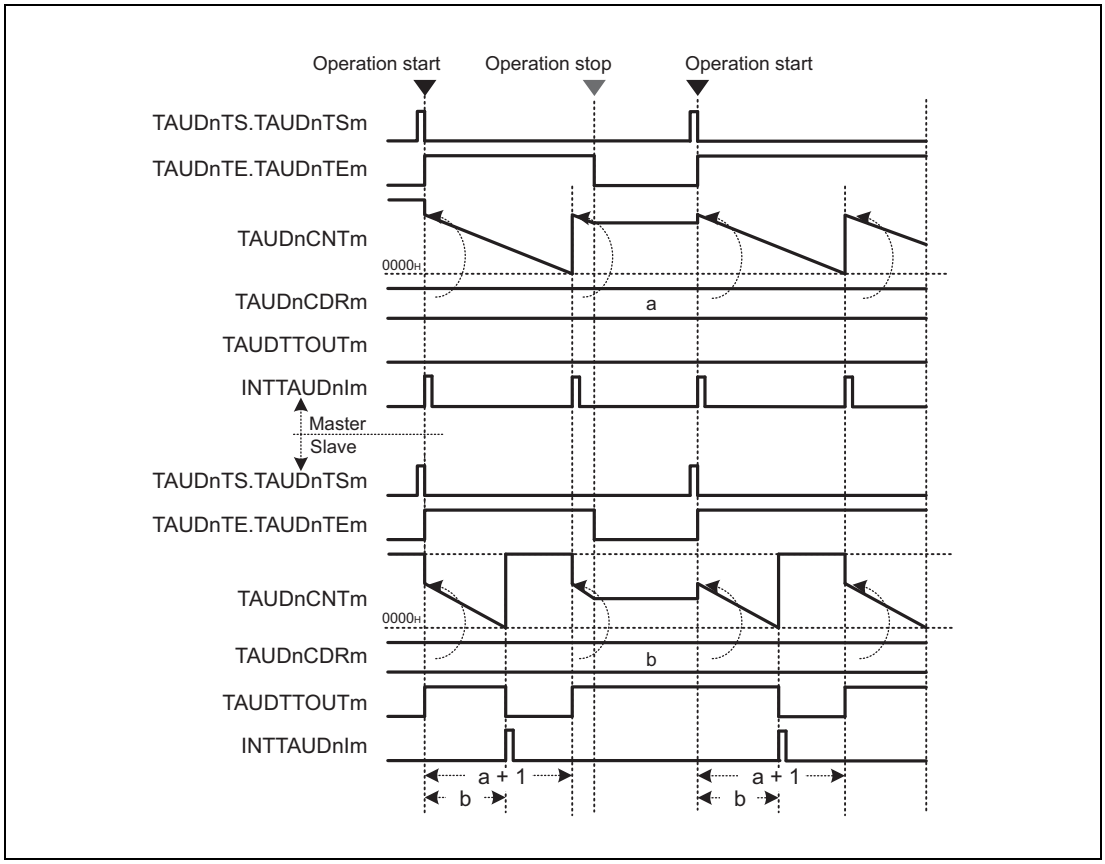

Figure 25.94 Operation Stop and Restart
Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)

- The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0.
- TAUDnCNTm and TAUDTTOUTm of all channels stop and the current values are retained. No interrupts are generated.
- The counter can be restarted by setting TAUDnTS.TAUDnTSm of master and slave channels to 1. TAUDnCDRm values of the master and slave channels are loaded to TAUDnCNTm and start to count down from these values.

25.15.2 One-Shot Pulse Output Function

25.15.2.1 Overview

Summary

This function outputs a signal pulse with a specific pulse width and delay time (both defined relative to an external input signal pulse) by using a master and a slave channel. The delay time is specified using the master channel. The pulse width is specified using the slave channel.

Prerequisites

- Two channels
- The operating mode for the master channel should be set to one-count mode. (See **Table 25.150, Contents of the TAUDnCMORm Register for the Master Channel of the One-Shot Pulse Output Function**.)
- The operating mode for slave channels should be set to pulse one-count mode. (See **Table 25.153, Contents of the TAUDnCMORm Register for the Slave Channel of the One-Shot Pulse Output Function**.)
- TAUDTTOUTm is not used with the master channel of this function.
- The channel output mode for the slave channel should be set to independent channel output mode 2. (See **Section 25.7, Channel Output Modes**.)
- TAUDTTINm (master) has to be detected while TAUDnCNTm (master) and TAUDnCNTm (slave) await a trigger. Furthermore, the slave is only triggered by an interrupt from the master channel and not by TAUDTTINm (slave).

Functional description

The counters are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) to 1 for the master and slave channels. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation.

- Master channel:
  When the next valid TAUDTTINm input edge is detected, the current value of TAUDnCDRm is loaded into TAUDnCNTm. The counter starts to count down from this value. If TAUDnCMORm.TAUDnMD0 = 0, a trigger (TAUDTTINm) which is detected within the delay time is ignored.
  When the counter of master channel reaches 0000_H, INTTAUDnIm is generated. The counter is reset to $FFFF_H$ and waits for the next valid TAUDTTINm input edge.
- Slave channel:
  INTTAUDnIm generated on master channel triggers the counter operation of slave channel. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave). The counter starts counting down from this value. An interrupt occurs and the TAUDTTOUTm signal is set.
  When the counter reaches 0001_H, INTTAUDnIm is generated and TAUDTTOUTm signal is reset.
  The counter stops at 0000_H and waits for the next INTTAUDnIm of master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Setting TAUDnTS.TAUDnTSm to 1 while counting allows the counter to restart counting of master channel without making a stop (forced restart).

Conditions

- If TAUDnCMORn.TAUDnMD0 of master channel is set to 0, TAUDTTINm input edges detected during counting are ignored.
- Simultaneous rewrite can be used with this function. See **Section 25.6, Simultaneous Rewrite**.

25.15.2.2 Equations

Delay from trigger input to pulse output
= (TAUDnCDRm (master) + 1) × count clock cycle

Pulse width = (TAUDnCDRm (slave)) × count clock cycle

25.15.2.3 Block Diagram and General Timing Diagram

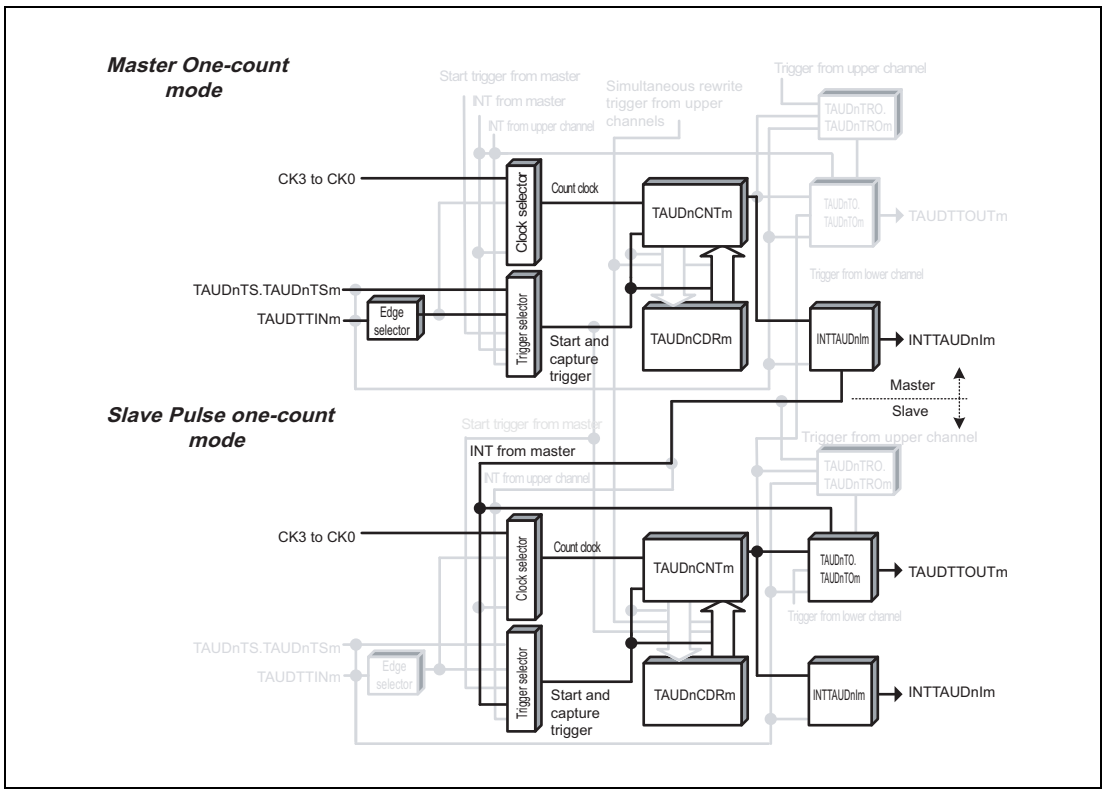

Figure 25.95 Block Diagram of One-Shot Pulse Output Function

The following settings apply to the general timing diagram.

- Start trigger detection is disabled during counting (TAUDnCMORm.TAUDnMD0 = 0).
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

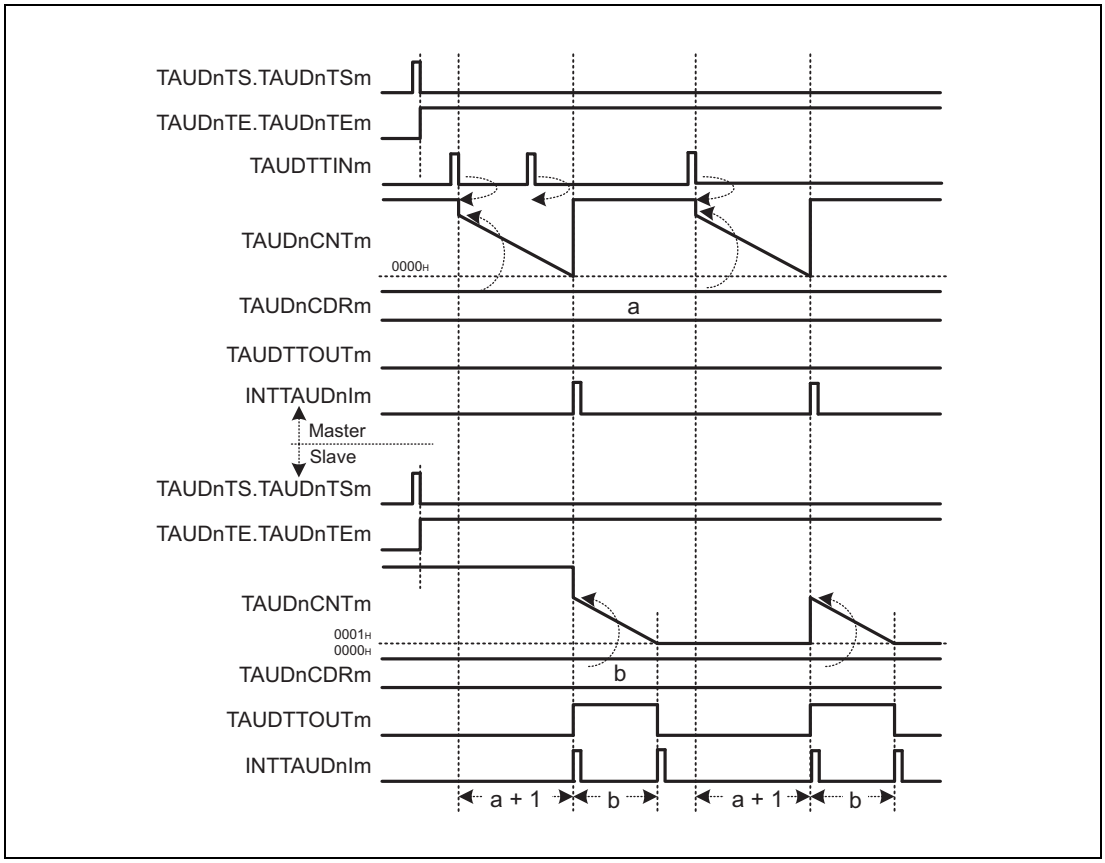

Figure 25.96 General Timing Diagram of One-Shot Pulse Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1010: Pulse one-count mode
0	TAUDnMD0	0: Disables detection of start trigger during count operation. 1: Enables start trigger detection while counting. The MD0 bits of the master and slave channels must be indentical.

(2) TAUDnCMURm for slave channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.154 Contents of the TAUDnCMURm Register for the Slave Channel of the One-Shot Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for the slave channel

Table 25.155 Control Bit Settings in Independent Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTDL.TAUDnTDLm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set this bit to 0
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for slave channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.156 Simultaneous Rewrite Settings for Slave Channels of One-Shot Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.15.2.6 Operating Procedure for One-Shot Pulse Output Function

Table 25.157 Operating Procedure for One-Shot Pulse Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.2.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and channel output mode as described in **Section 25.15.2.5, Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the master channel awaits a TAUDTTINm input.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	When valid TAUDTTINm input edge is detected, TAUDnCDRm value of master channel is loaded into TAUDnCNTm to perform counting down. When the counter reaches 0000_H: • INTTAUDnIm (master) is generated. • TAUDnCNTm (master) is reset to $FFFF_H$ and waits for the next valid TAUDTTINm input edge. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to perform counting down. • INTTAUDnIm (slave) is generated. • TAUDTTOUTm (slave) is set to the active level. When TAUDnCNTm (slave) reaches 0001_H: • INTTAUDnIm (slave) is generated. • TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

25.15.2.7 Specific Timing Diagrams

(1) TAUDnCDRm (master) = 0000_H

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

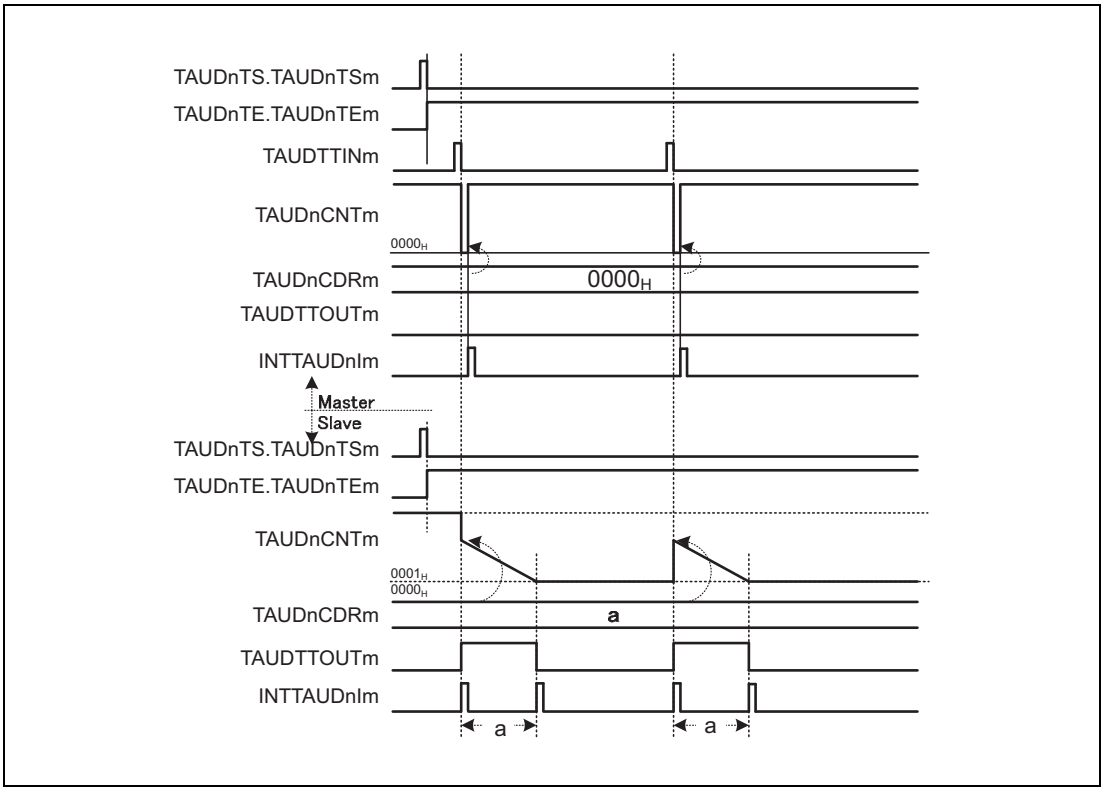

Figure 25.97 TAUDnCDRm (Master) = 0000_H

- When a valid TAUDTTINm input edge is detected, the value 0000_H is written to TAUDnCNTm (master). The counter is set to 0000_H for one count and returns to $FFFF_H$.
  Thus the slave channel starts to count down one count clock later than TAUDTTINm (master).

(2) TAUDnCDRm (slave) = 0000_H

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

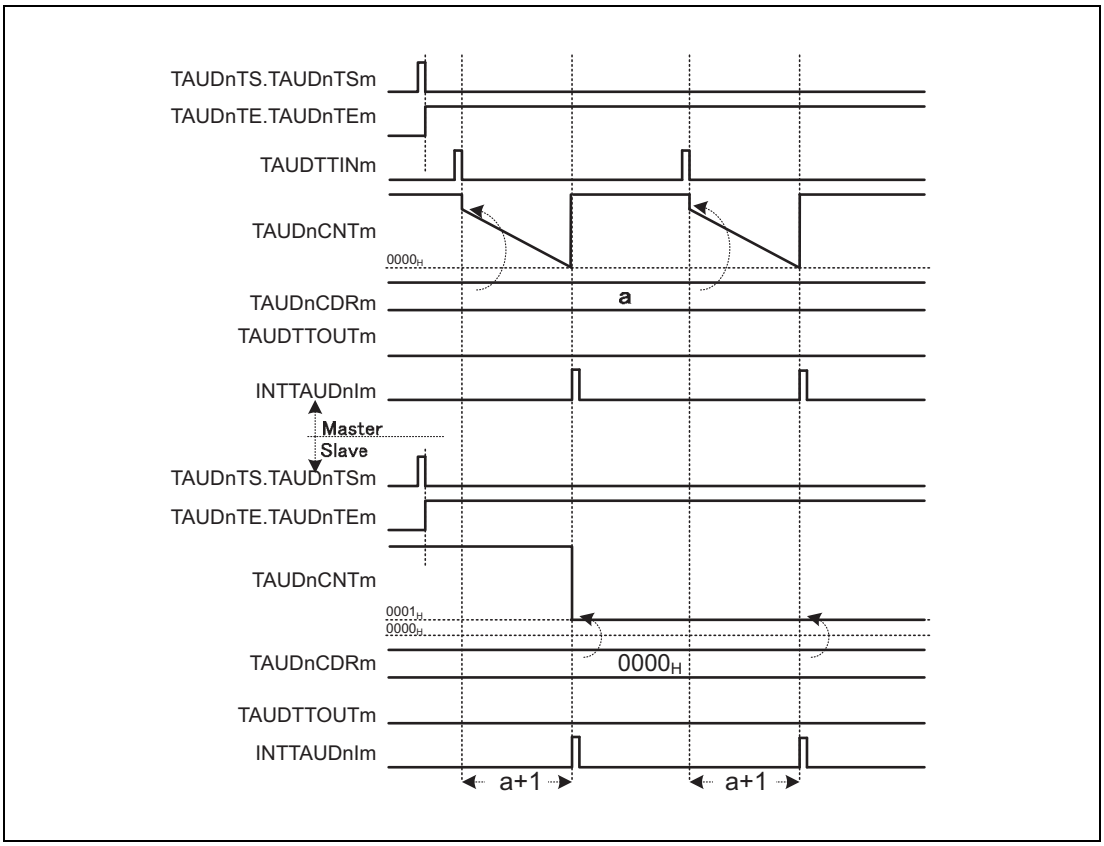

Figure 25.98 TAUDnCDRm (Slave) = 0000_H

- TAUDTTOUTm remains inactive, because the pulse width is zero.

(3) TAUDnCMORm.TAUDnMD0 = 1

The following settings apply to this diagram.

- Enables start trigger detection while counting. (TAUDnCMORm.TAUDnMD0 = 1)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

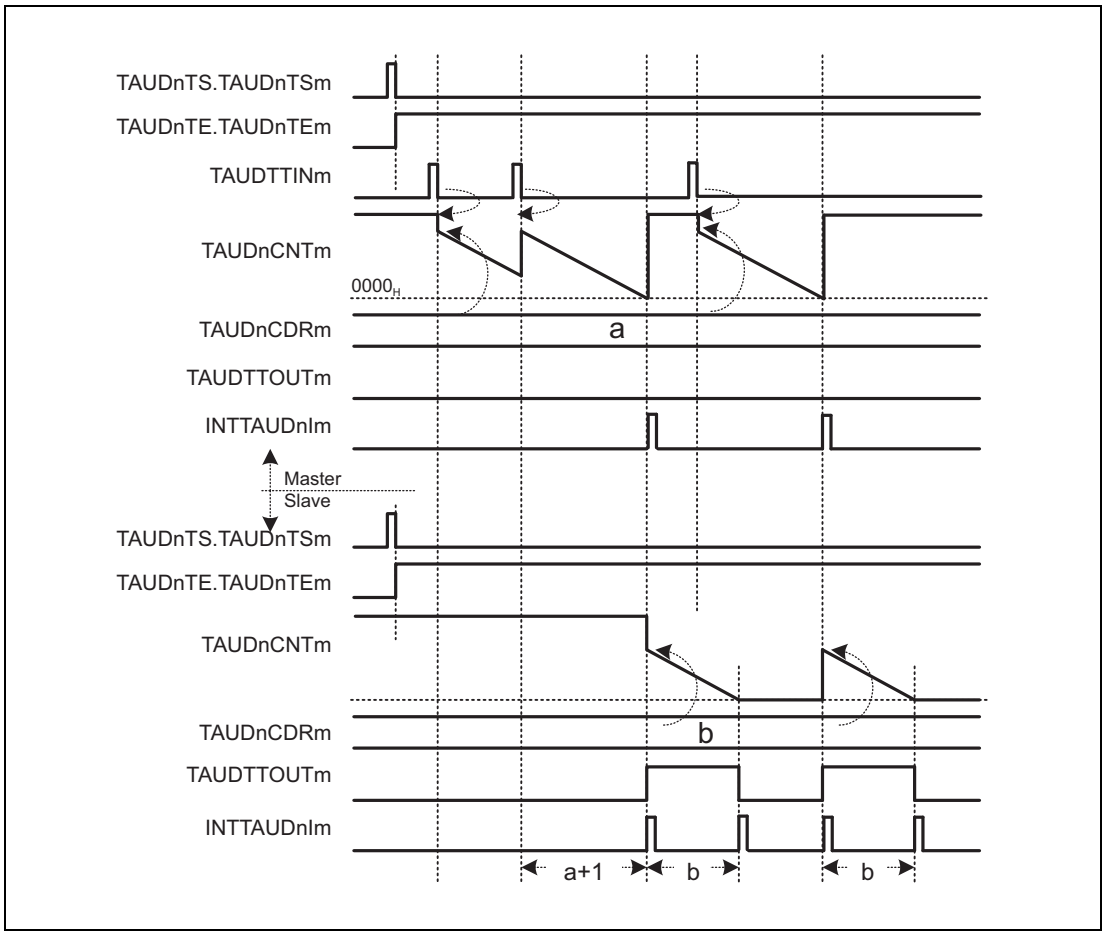

Figure 25.99 TAUDnCMORm.TAUDnMD0 = 1

- If a valid TAUDTTINm input edge is detected while the counter of the master channel counts down, TAUDnCNTm reloads the value of TAUDnCDRm. The counter restarts to count down. This means the delay is extended by the value of TAUDnCNTm at the time when a valid TAUDTTINm input edge is detected.

(4) Restarting the master channel while the slave channel is counting

The following settings apply to this diagram.

- Disables detection of start trigger during count operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

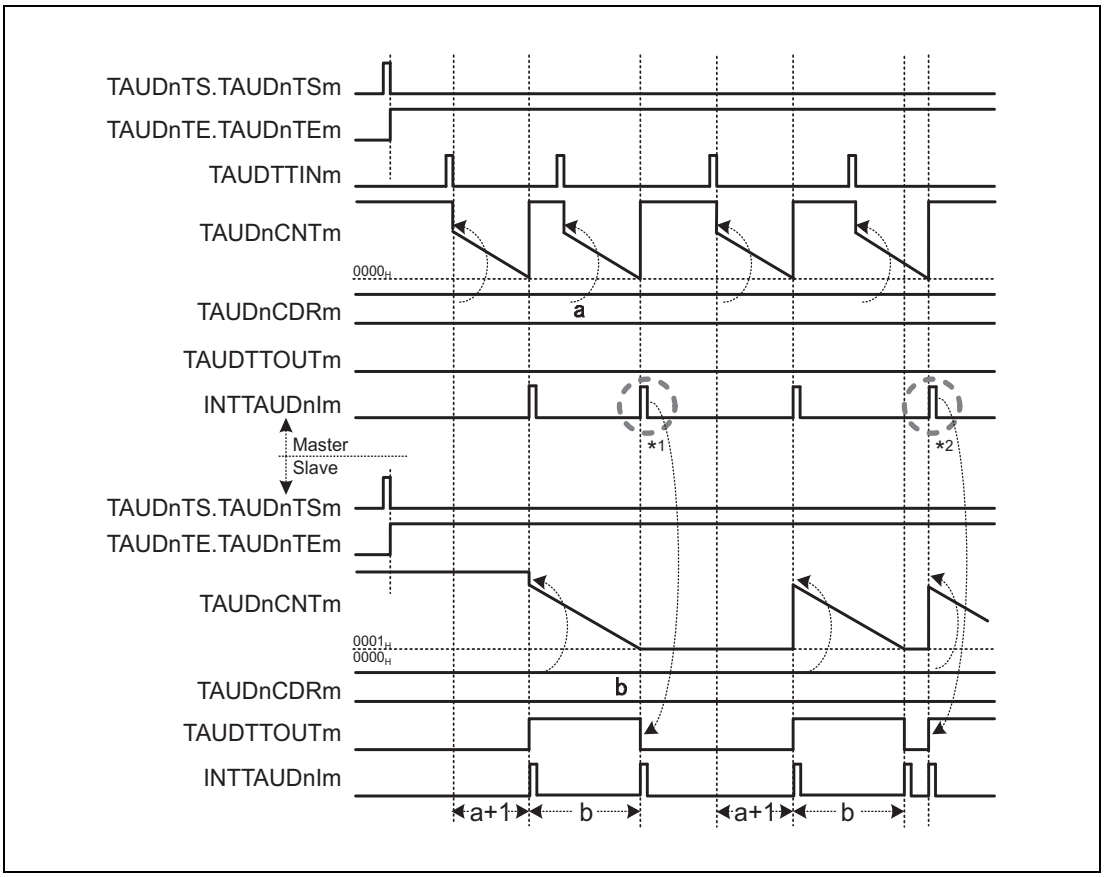

Figure 25.100 TAUDTTINm input interval ≤ Delay Time + Pulse Width +1

- If the master channel generates an interrupt before the counter of the slave channel has reached 0001_H or exactly when 0001_H is reached[*1], the interrupt (master) is ignored.
- If an interrupt of the master channel occurs when the counter of the slave channel awaits the next trigger, the value of TAUDnCDRm (slave) is reloaded. An interrupt is generated and TAUDTTOUTm toggles. If TAUDnCNTm (master) has started to count down while the TAUDnCNTm (slave) is still counting[*2], TAUDTTOUTm is not output with the expected delay time.
- To generate the correct one-shot pulse, the start trigger for the master channel must be detected while the master and slave channels are waiting for the start trigger, and not while they are counting.

25.15.3 Trigger Start PWM Output Function

25.15.3.1 Overview

Summary

This function generates a PWM output using a master and a slave channel. It enables the pulse cycle (frequency) and the duty of the TAUDTTOUTm to be set. The pulse cycle is specified using the master channel. The duty is specified using the slave channel. The Trigger Start PWM Output Function is identical to PWM Output Function except that the master channel of this function can be reset by a valid TAUDTTINm input edge.

Prerequisites

- Two channels
- The operation mode of the master channel must be set to Interval Timer Mode (see **Table 25.158, Contents of the TAUDnCMORm Register for the Master Channel of the Trigger Start PWM Output Function**).
- The operation mode of the slave channel must be set to One-Count Mode (see **Table 25.161, Contents of the TAUDnCMORm Register for the Slave Channel of the Trigger Start PWM Output Function**).
- The channel output mode of the slave channel must be set to Synchronous Channel Output Mode 1 (see **Section 25.7, Channel Output Modes**).
- TAUDTTOUTm is not used with the master channel of this function.

Functional description

The counters (master and slave) are enabled by setting the channel trigger bits (TAUDnTS.TAUDnTSm) to 1. This in turn sets TAUDnTE.TAUDnTEm to 1, enabling count operation. The current value of TAUDnCDRm is loaded to TAUDnCNTm, and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel, and a PWM output is realized by setting and resetting TAUDTTOUTm (slave).

- Master channel:
  The current value of TAUDnCDRm is loaded to the counter (TAUDnCNTm), INTTAUDnIm is generated and the counter starts to count down from this value.
  When the counter reaches 0000_H and the pulse cycle time has elapsed, INTTAUDnIm is generated and the counters (master and slave) load the current TAUDnCDRm values.
  If a valid TAUDTTINm input edge is detected, the counter of the master channel loads the current TAUDnCDRm value, restarts counting down and generates an interrupt.
- Slave channel:
  When the slave detects an interrupt from the master channel, it starts to count down from the current value of TAUDnCDRm. The TAUDTTOUTm signal is set to the active level.
  When the counter reaches 0000_H (duty time has elapsed), INTTAUDnIm is generated and the TAUDTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channels, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. See **Section 25.6, Simultaneous Rewrite**.

25.15.3.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = [TAUDnCDRm (slave) / (TAUDnCDRm (master) + 1)] × 100

– Duty cycle = 0%
  TAUDnCDRm (slave) = 0000_H
– Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

25.15.3.3 Block Diagram and General Timing Diagram

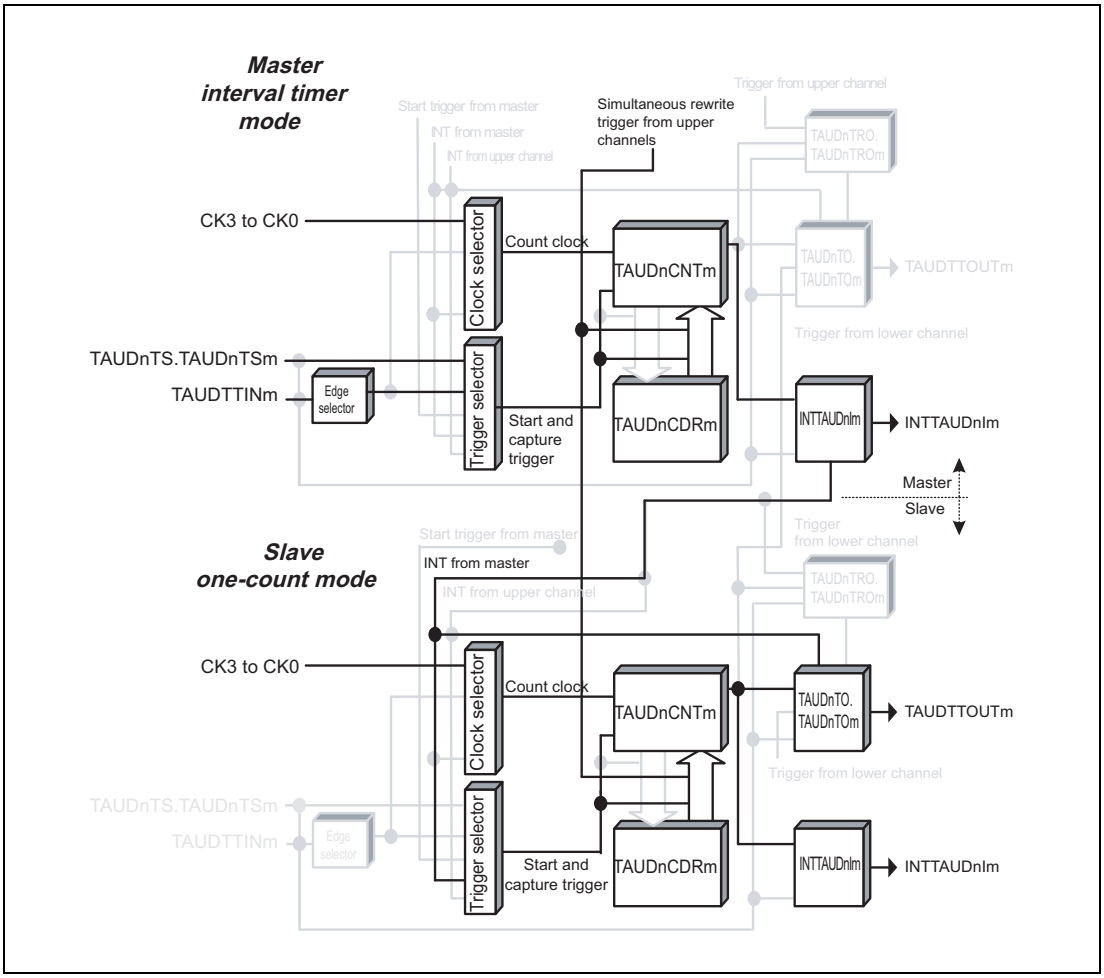

Figure 25.101 Block Diagram for Trigger Start PWM Output Function

The following settings apply to the general timing diagram.

- Detection of rising edge (TAUDnCMURm.TAUDnTIS[1:0] = 01_B)
- Positive logic (TAUDnTOL.TAUDnTOLm (slave) = 0)

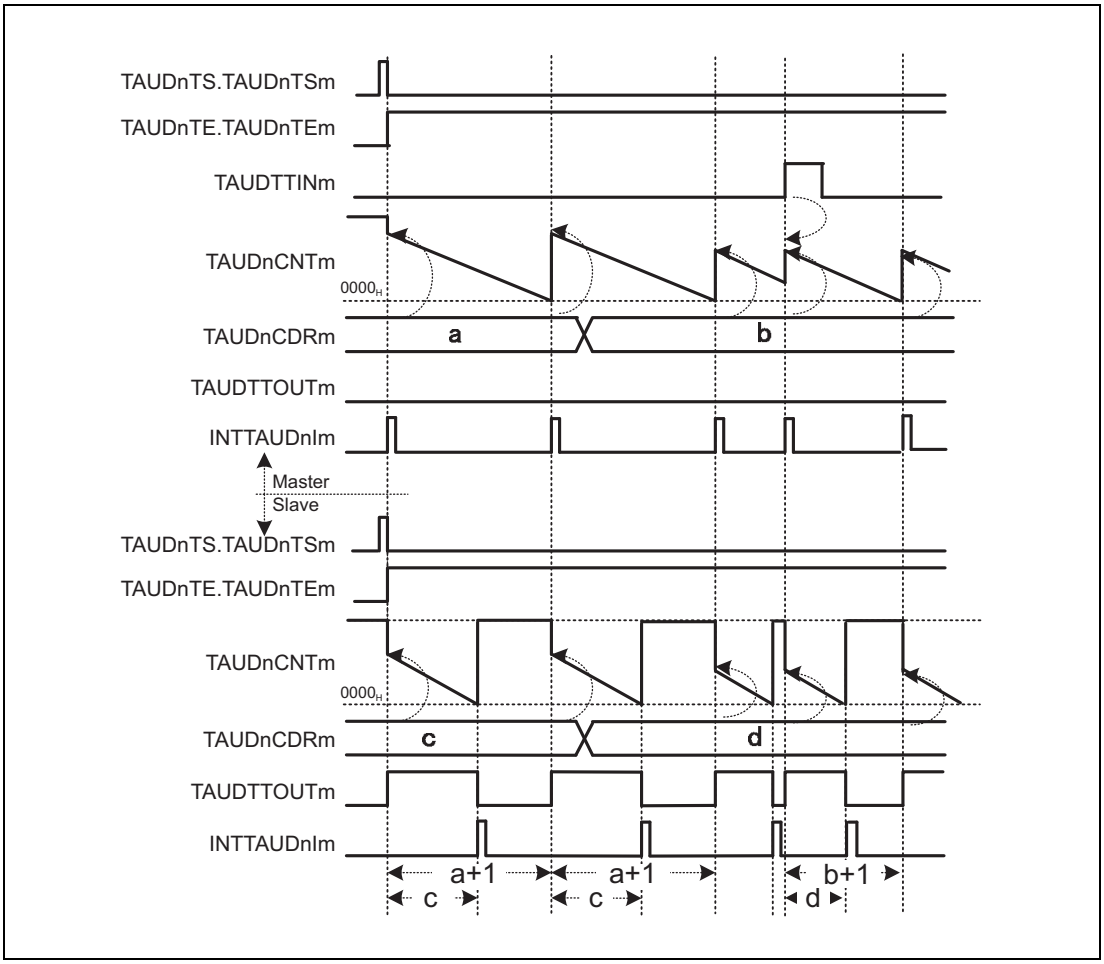

Figure 25.102 General Timing Diagram for Trigger Start PWM Output Function

NOTE

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

25.15.3.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is valid. The value of the TAUDnMD[0] bit of the master and slave channels must be identical.

(2) TAUDnCMURm for slave channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.162 Contents of the TAUDnCMURm Register for the Slave Channel of the Trigger Start PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for the slave channel

Table 25.163 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for slave channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.164 Simultaneous Rewrite Settings for the Slave Channel of the Trigger Start PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.15.3.6 Operating Procedure for Trigger Start PWM Output Function

Table 25.165 Operating Procedure for Trigger Start PWM Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.3.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.3.5, Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000_H: • INTTAUDnIm (master) is generated. • TAUDnCDRm value is loaded into TAUDnCNTm (master) to continue count operation. • TAUDnCNTm (slave) loads the TAUDnCDRm value and starts to count down • TAUDTTOUTm (slave) is set When TAUDnCNTm of the slave = 0000_H: • INTTAUDnIm (slave) is generated. • TAUDTTOUTm (slave) is set to an inactive level. In addition, the counter of slave channel stops. If a TAUDTTINm input is detected on the master channel while TAUDnCNTm of the master channel is counting down: • TAUDnCNTm (master and slave) loads the TAUDnCDRm value and counts down • INTTAUDnIm (master) is generated. • TAUDTTOUTm (slave) is set to the active level.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

25.15.3.7 Specific Timing Diagrams

(1) Duty cycle = 0%

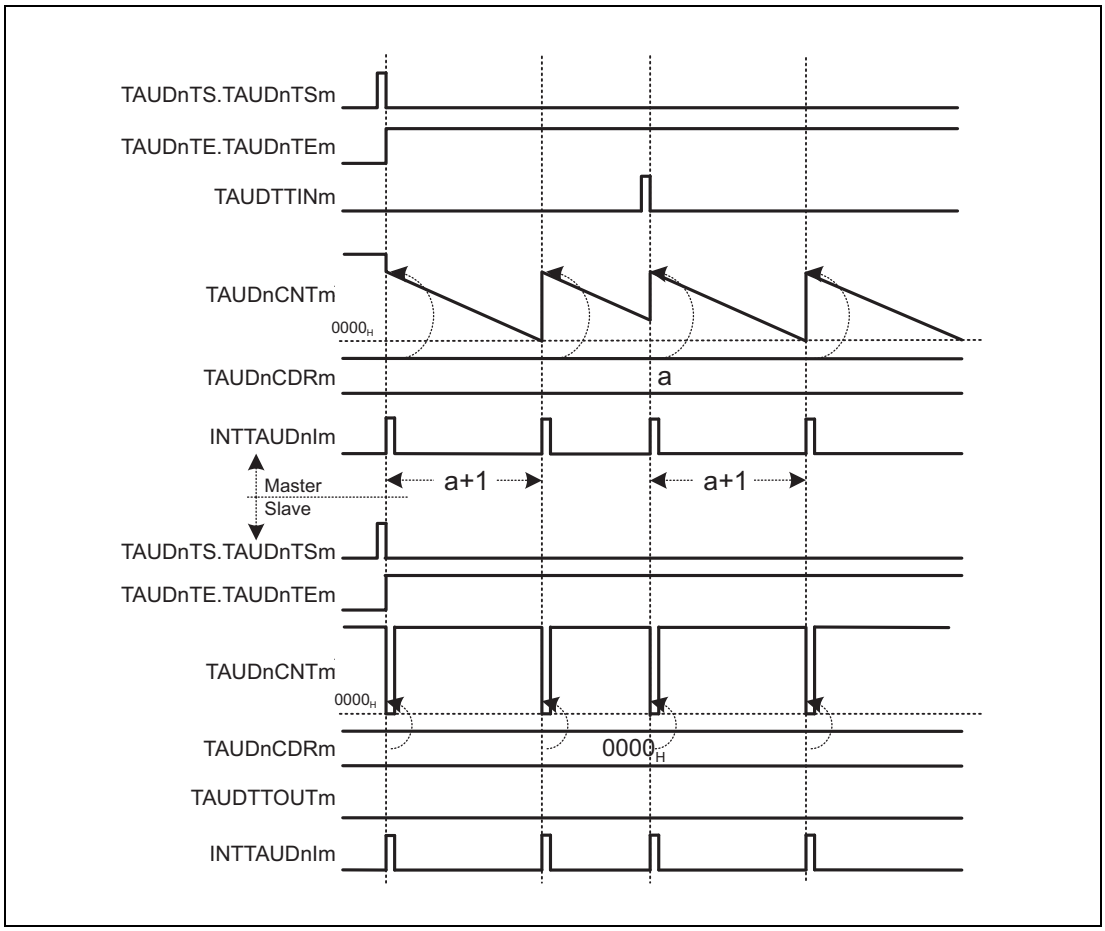

Figure 25.103 TAUDnCDRm (Slave) = 0000_H, Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0) Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

- Every time the master channel generates an interrupt (INTTAUDnIm), 0000_H is written to TAUDnCNTm (slave). Therefore, TAUDnCNTm (slave) cannot start to count and TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The detection of a valid TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).

(2) Duty cycle = 100%

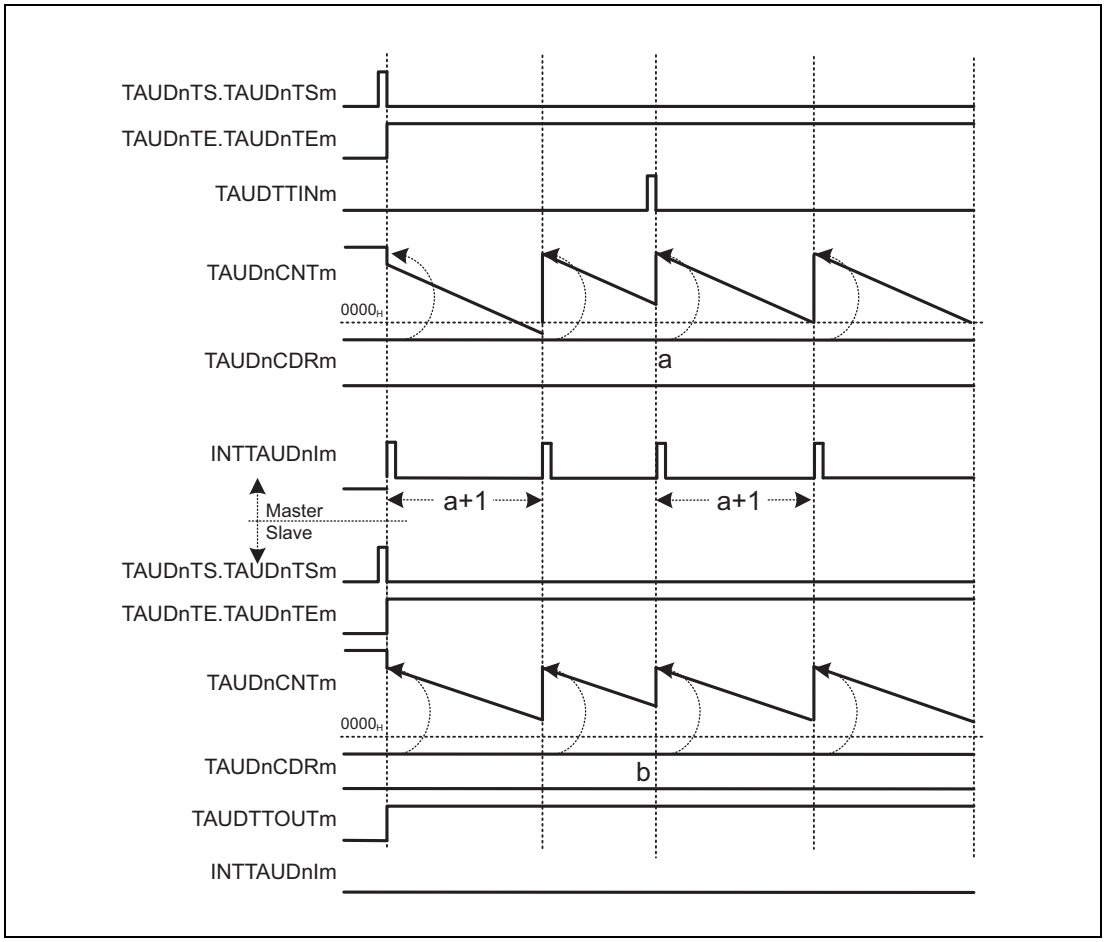

Figure 25.104 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1, Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0) Falling Edge Detection (TAUDnCMURm.TIS[1:0] = 00_B)

- If the value TAUDnCDRm (slave) is higher than the value TAUDnCDRm (master), the counter of the slave channel cannot reach 0000_H and cannot generate interrupts.
  The TAUDTTOUTm remains at active state.
  The detection of a valid TAUDTTINm input edge has no effect on TAUDTTOUTm (slave).

(3) TAUDTTINm detection and active slave counter

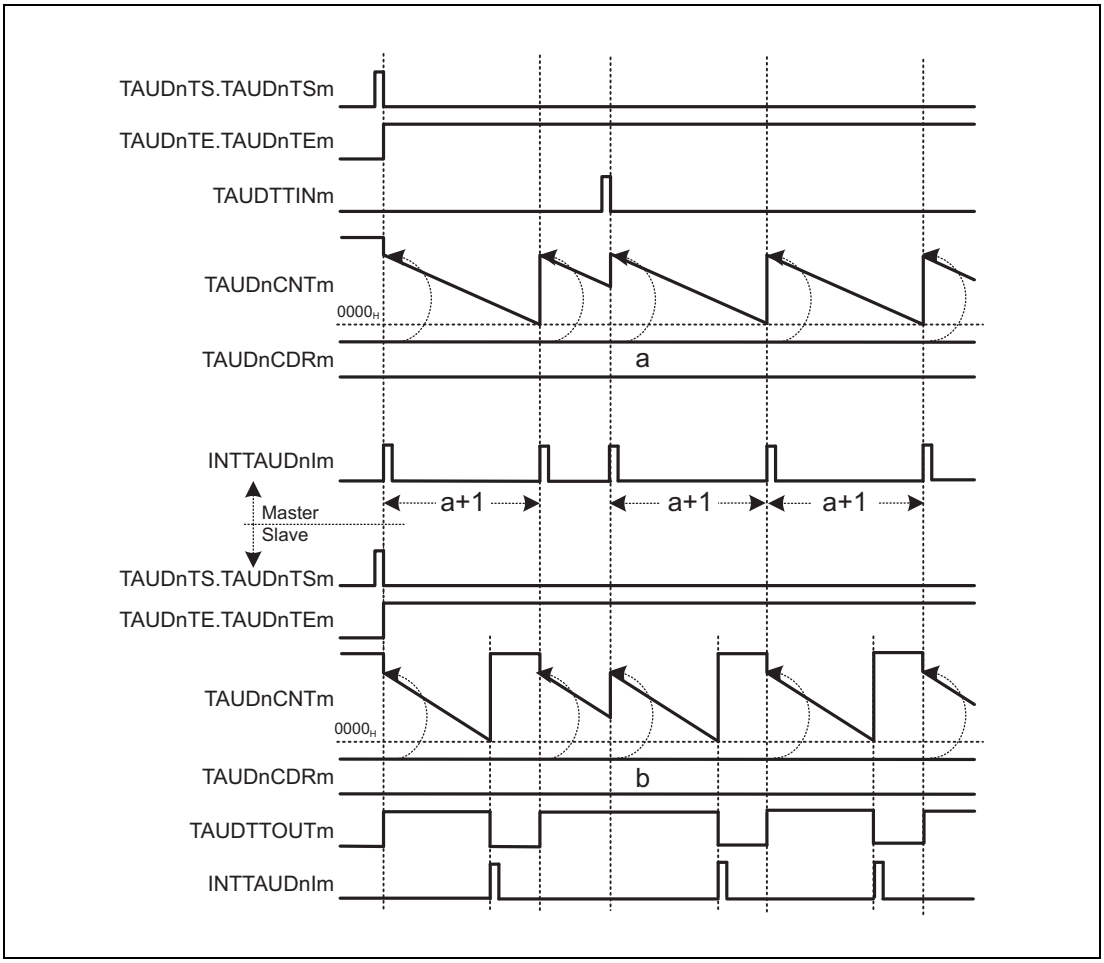

Figure 25.105 Positive Logic (TAUDnTOL.TAUDnTOLm (Slave) = 0)
Detection of Falling Edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

- If TAUDnCNTm (slave) reloads the value TAUDnCDRm (slave) while it is still counting down, TAUDTTOUTm remains unchanged and extends the duty.
  The duty does not correspond to the value of the slave's data register.

25.15.4 Delay Pulse Output Function

25.15.4.1 Overview

Summary

This function outputs two signals. The pulse width and pulse cycle of the reference signal are defined using the master channel and slave channel 1. Slave channels 2 and 3 output the reference signal with a specified delay. The delay signal is identical to the reference signal, but delayed by the amount specified on slave channel 2.

The signal values are specified in the following way:

- The pulse cycle is specified using the master channel.
- The duty cycle of the reference signal is specified using slave channel 1. The duty cycle of the delay signal is specified using slave channel 3.
- The delay is specified on slave channel 2.

Prerequisites

- Four channels
- The operating mode for the master channel should be set to interval timer mode. (See **Table 25.166, Contents of the TAUDnCMORm Register for the Master Channel of the Delay Pulse Output Function**.)
- The operating mode for slave channels 1 and 2 should be set to one-count mode. (See **Table 25.169, Contents of the TAUDnCMORm Register for Slave Channel 1 of the Delay Pulse Output Function** and **Table 25.173, Contents of the TAUDnCMORm Register for Slave Channel 2 of the Delay Pulse Output Function**.)
- The operating mode for slave channel 3 should be set to pulse one-count mode. (See **Table 25.176, Contents of the TAUDnCMORm Register for Slave Channel 3 of the Delay Pulse Output Function**.)
- TAUDTTOUTm is not used with the master channel and slave channel 2.
- The channel output mode for slave channel 1 should be set to synchronous channel output mode 1. (See **Section 25.7, Channel Output Modes**.)
- The channel output mode for slave channel 3 should be set to independent channel output mode 2. (See **Section 25.7, Channel Output Modes**.)

Functional description

The counters of the channel group are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm to 1, enabling count operation.

- Master channel:
  The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from this value. INTTAUDnIm is generated on the master channel.
  When the counter value of master channel reaches 0000_H and pulse cycle time has elapsed, INTTAUDnIm is generated. The TAUDnCDRm value is reloaded into the counter to perform counting down.
- Slave channels 1 and 2:
  Slave channels 1 and 2 start to count down from the current TAUDnCDRm value when detecting

an interrupt from the master channel. TAUDTTOUTm signal (slave 1) is set.

– Slave channel 1:
When the counter of slave channel 1 reaches 0000_H (duty time has elapsed), INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnIm of master channel.

– Slave channel 2:
When the counter of slave channel 2 reaches 0000_H and delay time has elapsed, INTTAUDnIm is generated. The counter is reset to $FFFF_H$ and waits for the next INTTAUDnIm of master channel.
Generating INTTAUDnIm (slave channel 2) triggers the counter of slave channel 3.

- Slave channel 3:
When slave channel 3 detects an interrupt from slave channel 2, its counter starts counting down from the current value of TAUDnCDRm. INTTAUDnIm is generated and the TAUDTTOUTm signal (slave channel 3) is set.
When the counter of slave channel 3 reaches 0001_H, INTTAUDnIm is generated and the TAUDTTOUTm signal is reset.
The delayed PWM pulse is output from slave channel 3.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but their values are retained. The counter can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. See **Section 25.6, Simultaneous Rewrite**.

25.15.4.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

Duty width 1 = (TAUDnCDRm (slave 1)) × count clock cycle

Delay width = (TAUDnCDRm (slave 2) + 1) × count clock cycle

Duty width 2 = (TAUDnCDRm (slave 3)) × count clock cycle

However, the delay width shall be set within the following range:
$0000_H \leq$ TAUDnCDRm (slave 2) < TAUDnCDRm (master)

NOTES

1. The waveform of TAUDTTOUTm (slave 3) becomes the waveform made by delaying the waveform of TAUDTTOUTm (slave 1) by the quantity generated by slave 2. It is impossible to make a delay longer than the pulse cycle.
2. If INTTAUD0Im of slave 2 is generated while slave 3 is counting, slave 3 restarts operation. Therefore, the waveform of TAUDTTOUTm (slave 3) is retained on the active level. In this case, TAUDTTOUTm (Slave-CH-3) cannot output the waveform generated by delaying the basic pulse of TAUDTTOUTm (Slave-CH-1).

25.15.4.3 Block Diagram and General Timing Diagram

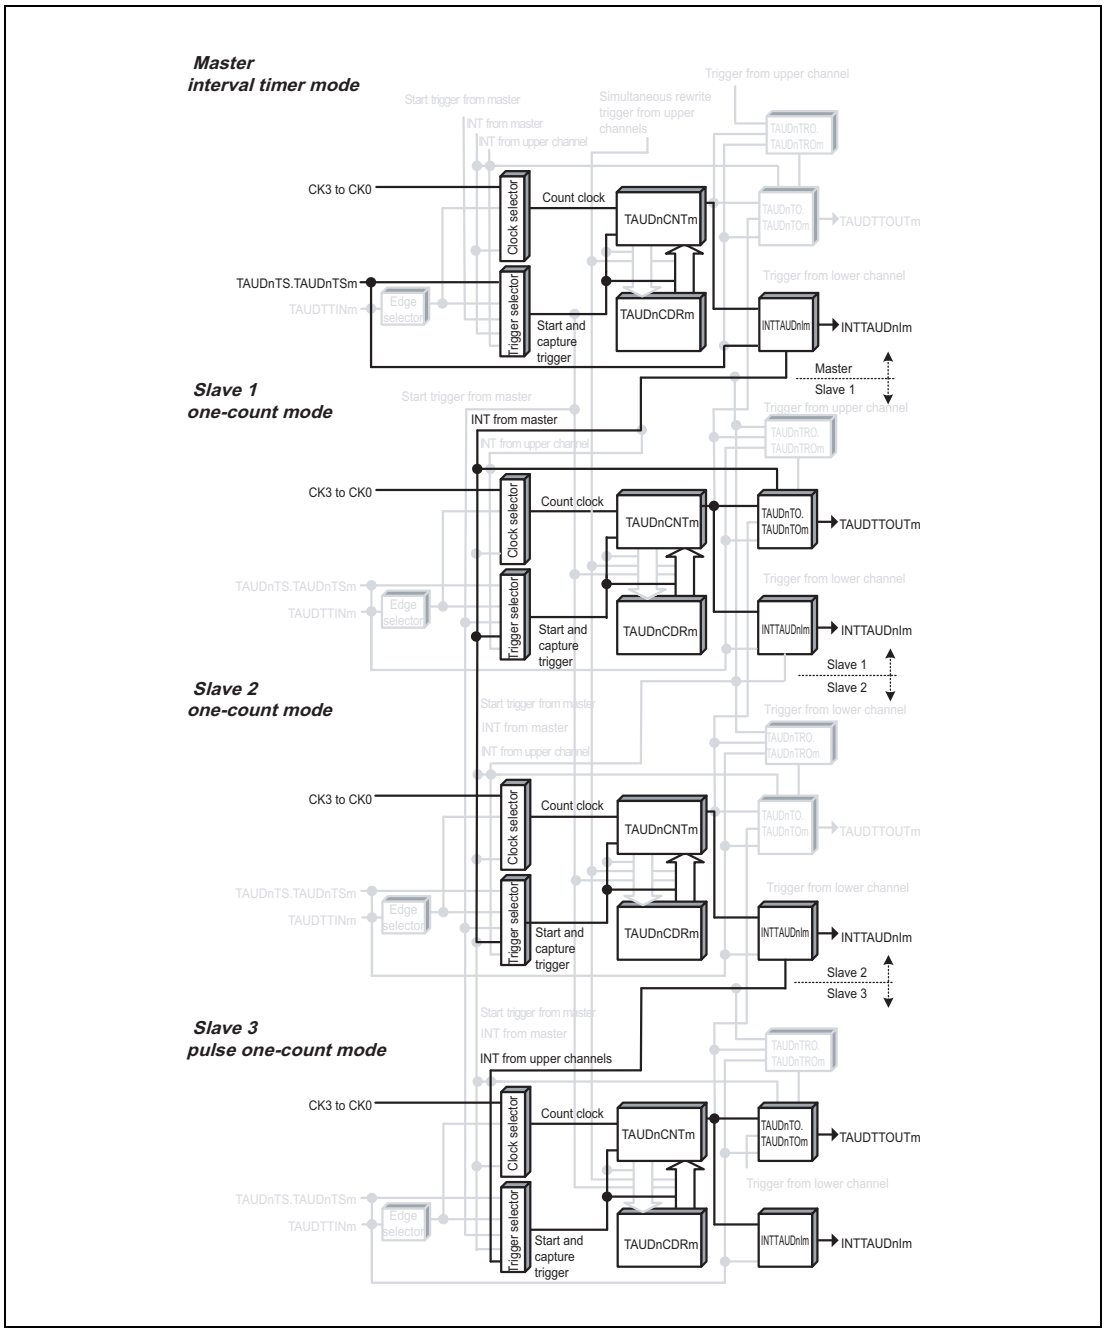

Figure 25.106 Block Diagram of Delay Pulse Output Function

The following settings apply to the general timing diagram.

- Slave channel 1: Positive logic (TAUDnTOL.TAUDnTOLm = 0)
- Slave channel 3: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

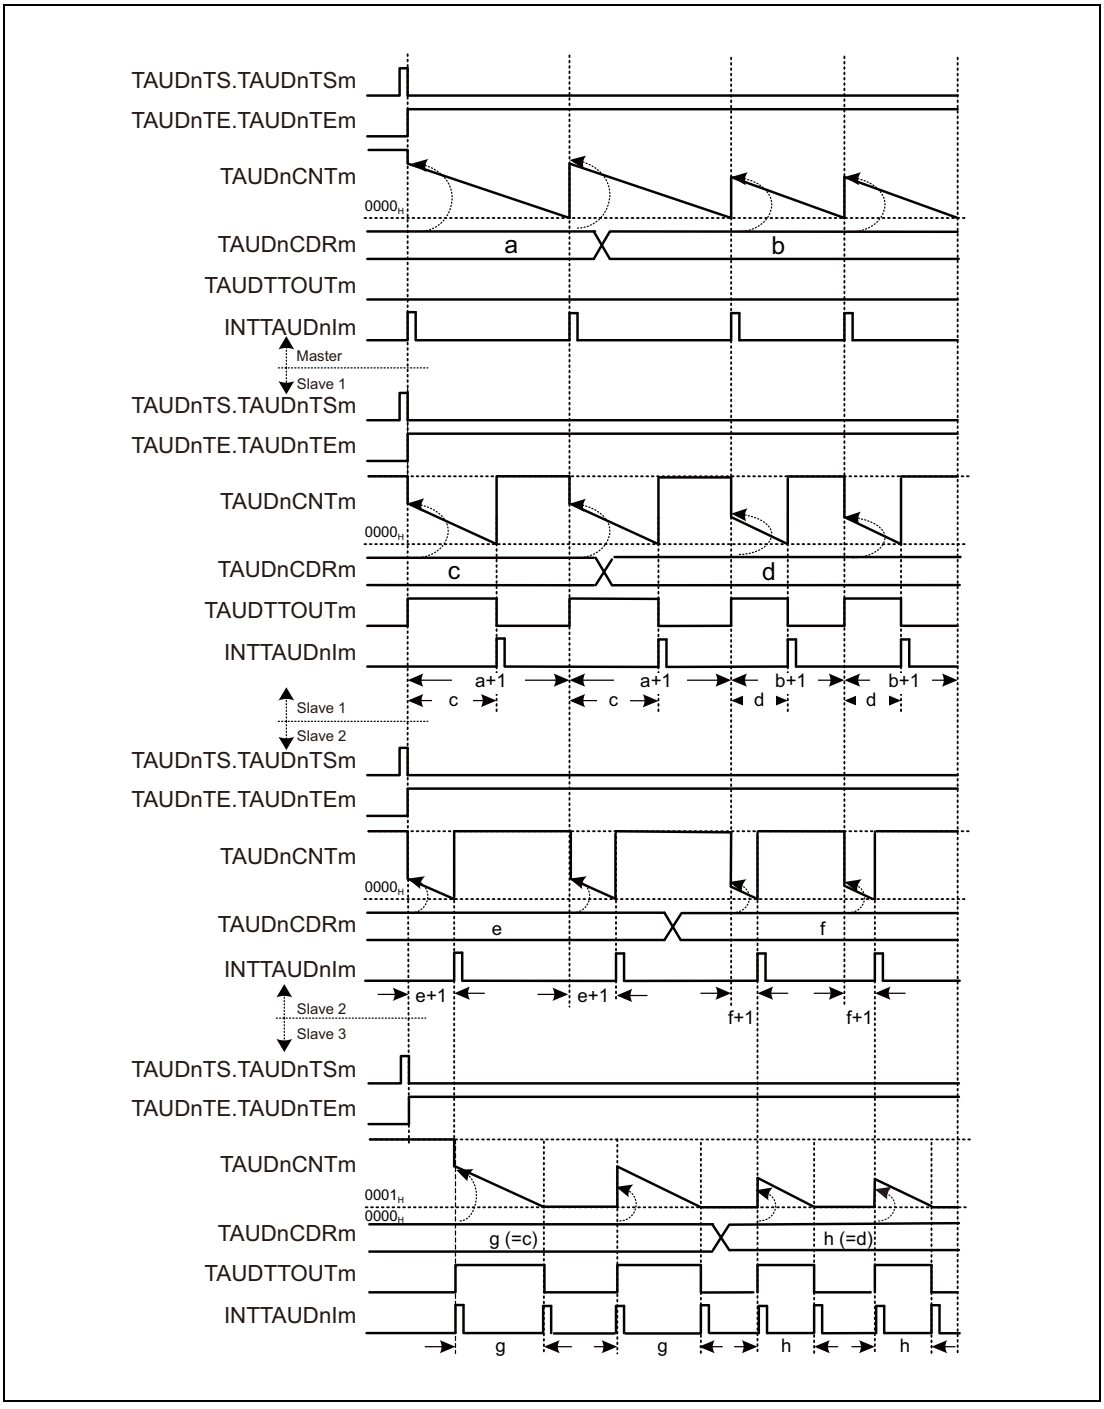

Figure 25.107 General Timing Diagram of Delay Pulse Output Function

NOTE

TAUDTTOUTm of slave channel 1 rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

25.15.4.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 25.166 Contents of the TAUDnCMORm Register for the Master Channel of the Delay Pulse Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	1: INTTAUDnIm generated at the beginning of operation.

(2) TAUDnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.167 Contents of the TAUDnCMURm Register for the Master Channel of the Delay Pulse Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for the master channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used for the master channel with this function.

(4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.168 Simultaneous Rewrite Settings for the Master Channel of Delay Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.15.4.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for slave channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for slave channel 1

Table 25.171 Control Bit Settings for Slave Channel 1 in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for slave channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.172 Simultaneous Rewrite Settings for Slave Channel 1 of Delay Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.15.4.6 Register Settings for Slave Channel 2

(1) TAUDnCMORm for slave channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for slave channel 3

Table 25.178 Control Bit Settings in Independent Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for slave channel 3

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.179 Simultaneous Rewrite Settings for Slave Channel 3 of Delay Pulse Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Master channel is simultaneous rewrite control channel.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.15.4.8 Operating Procedure for Delay Pulse Output Function

Table 25.180 Operating Procedure for Delay Pulse Output Function (1/2)

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.4.4, Register Settings for the Master Channel**. Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.4.5, Register Settings for Slave Channel 1**. Slave channel 2: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.4.6, Register Settings for Slave Channel 2**. Slave channel 3: Set the TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.4.7, Register Settings for Slave Channel 3**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.

Table 25.180 Operating Procedure for Delay Pulse Output Function (2/2)

	Operation	TAUDn Status
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master channel and slave channels 1 and 2 start. INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave channel 1) is set.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel and slave channels 1 and 2 is loaded to TAUDnCNTm and count down. When the counter of master channel reaches 0000_H: • INTTAUDnIm (master) is generated. • TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave 1/2) to count down. • TAUDTTOUTm (slave 1) is set. When TAUDnCNTm (slave 1) reaches 0000_H: • INTTAUDnIm (slave 1) is generated. • TAUDTTOUTm (slave 1) is reset. When TAUDnCNTm (slave 2) reaches 0000_H: • INTTAUDnIm (slave 2) is generated. • INTTAUDnIm (slave 3) is generated. • TAUDTTOUTm (slave 3) is set. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave 3) to count down operation. When TAUDnCNTm (slave 3) reaches 0001_H: • INTTAUDnIm (slave 3) is generated. • TAUDTTOUTm (slave 3) is reset.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

25.15.4.9 Specific Timing Diagrams

(1) Duty cycle (slave 3) = 100%

The following values apply to **Figure 25.108**:

- TAUDnCDRm (master) = $000A_H$
- TAUDnCDRm (slave 1) = $000B_H$
- TAUDnCDRm (slave 2) = 0000_H
- TAUDnCDRm (slave 3) = $000B_H$

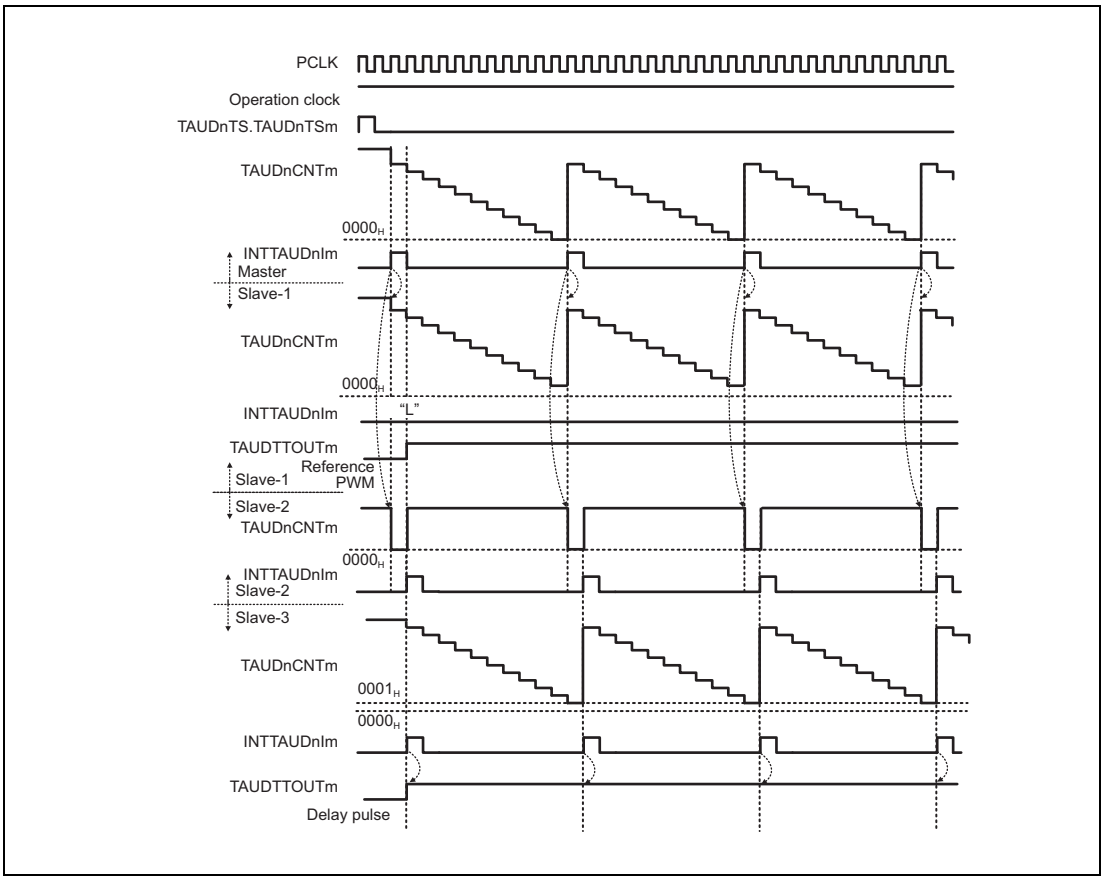

Figure 25.108 Duty Cycle (Slave 3) = 100%

- If the value of TAUDnCDRm (slaves 1 and 3) is higher than the value of TAUDnCDRm (master), the counter of the slave channel 1 cannot reach 0000_H and cannot generate interrupts. TAUDTTOUTm of channels 1 and 3 remain in the active state.

(2) TAUDTTOUTm (slave 1) = TAUDTTOUTm (slave 3)

The following values apply to **Figure 25.109**.

- TAUDnCDRm (master) = $000A_H$
- TAUDnCDRm (slave 1) = 0005_H
- TAUDnCDRm (slave 2) = 0000_H
- TAUDnCDRm (slave 3) = 0005_H

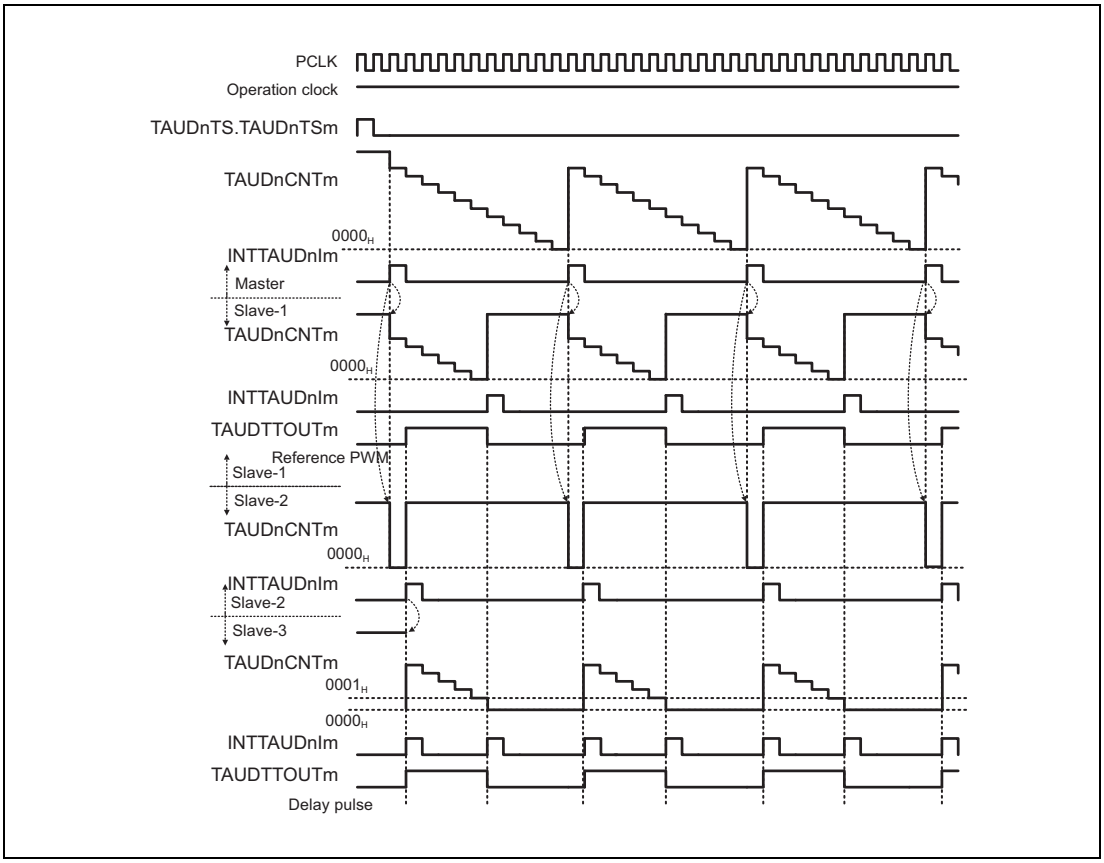

Figure 25.109 TAUDTTOUTm (Slave 1) = TAUDTTOUTm (Slave 3)

- If TAUDnCDRm (slave 2) = 0000_H, the counter of slave channel 3 starts counting one count clock later than the counter of slave channel 1. The reference pulse and the delay pulse are output with a delay of one clock count.

25.15.5 Offset Trigger Output Function

25.15.5.1 Overview

Summary

This function generates a PWM output using a master channel and a slave channel, enabling the pulse width (duration) of the TAUDTTOUTm to be set. The pulse cycle is set by detecting a valid input edge of master channel. The pulse width is specified on the slave channel.

Prerequisites

- Two channels
- The operating mode for the master channel should be set to capture mode. (See **Table 25.181, Contents of the TAUDnCMORm Register for the Master Channel of the Offset Trigger Output Function**.)
- The operating mode for slave channels should be set to one-count mode. (See **Table 25.184, Contents of the TAUDnCMORm Register for the Slave Channel of the Offset Trigger Output Function**.)
- The output mode for slave channels should be set to synchronous channel output mode 1. (See **Section 25.7, Channel Output Modes**.)
- TAUDTTOUTm is not used with the master channel of this function.

Functional description

The counter can be enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This makes TAUDnTE.TAUDnTEm = 1, enabling count operation. The master channel counter (TAUDnCNTm) starts to count up from 0000_H.

- Master channel:
  When a valid TAUDTTINm input edge is detected, the current value of the counter (TAUDnCNTm) is loaded into the data register of master channel (TAUDnCDRm). INTTAUDnIm is generated and the counter restarts to count up from 0000_H.
- Slave channel:
  If INTTAUDnIm is generated on the master channel, the TAUDTTOUTm (slave) signal is set and the counter of the slave channel is triggered. The current value of TAUDnCDRm (slave) is loaded into TAUDnCNTm (slave) and the counter starts to count down from this value.
  When the counter reaches 0000_H (duty time has elapsed), INTTAUDnIm is generated and TAUDTTOUTm signal is reset. The counter returns to $FFFF_H$ and awaits the next INTTAUDnIm of the master channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

25.15.5.2 Equations

Pulse width = (TAUDnCDRm (slave)) × count clock cycle

Duty cycle [%] = [TAUDnCDRm (slave)/(TAUDnCDRm (master) + 1)] × 100

– Duty cycle = 0%
  TAUDnCDRm (slave) = 0000_H
– Duty cycle = 100%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

25.15.5.3 Block Diagram and General Timing Diagram

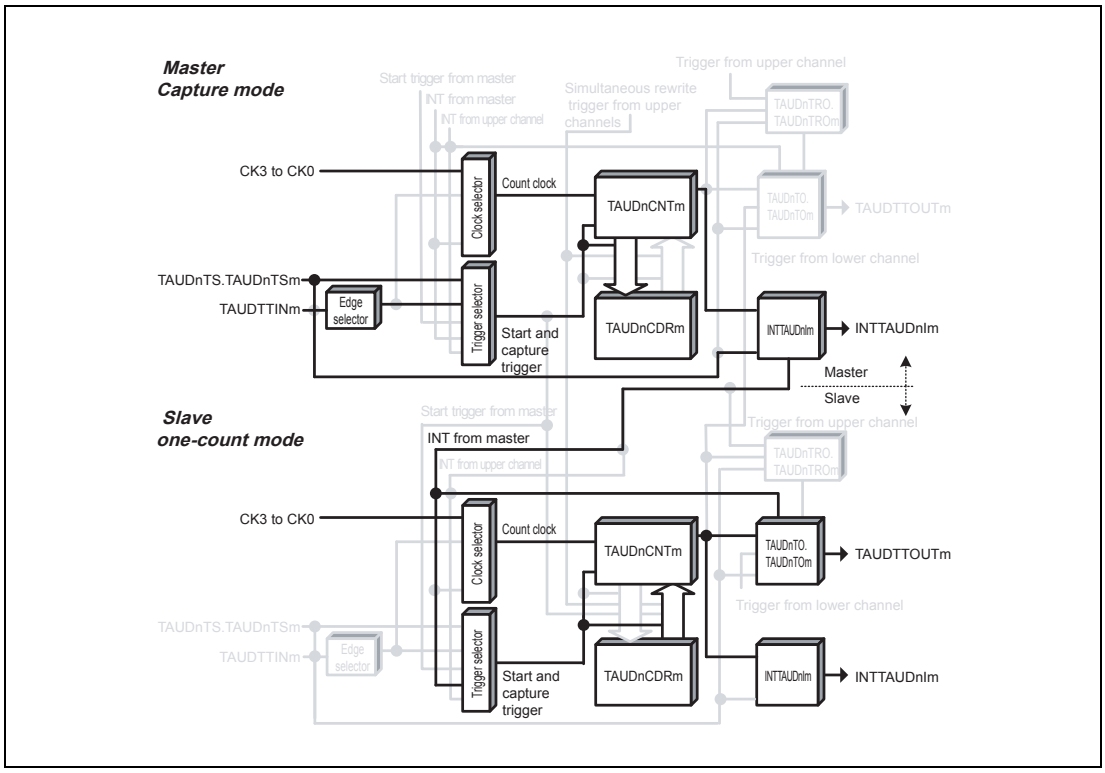

Figure 25.110 Block Diagram of Offset Trigger Output Function

The following settings apply to the general timing diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

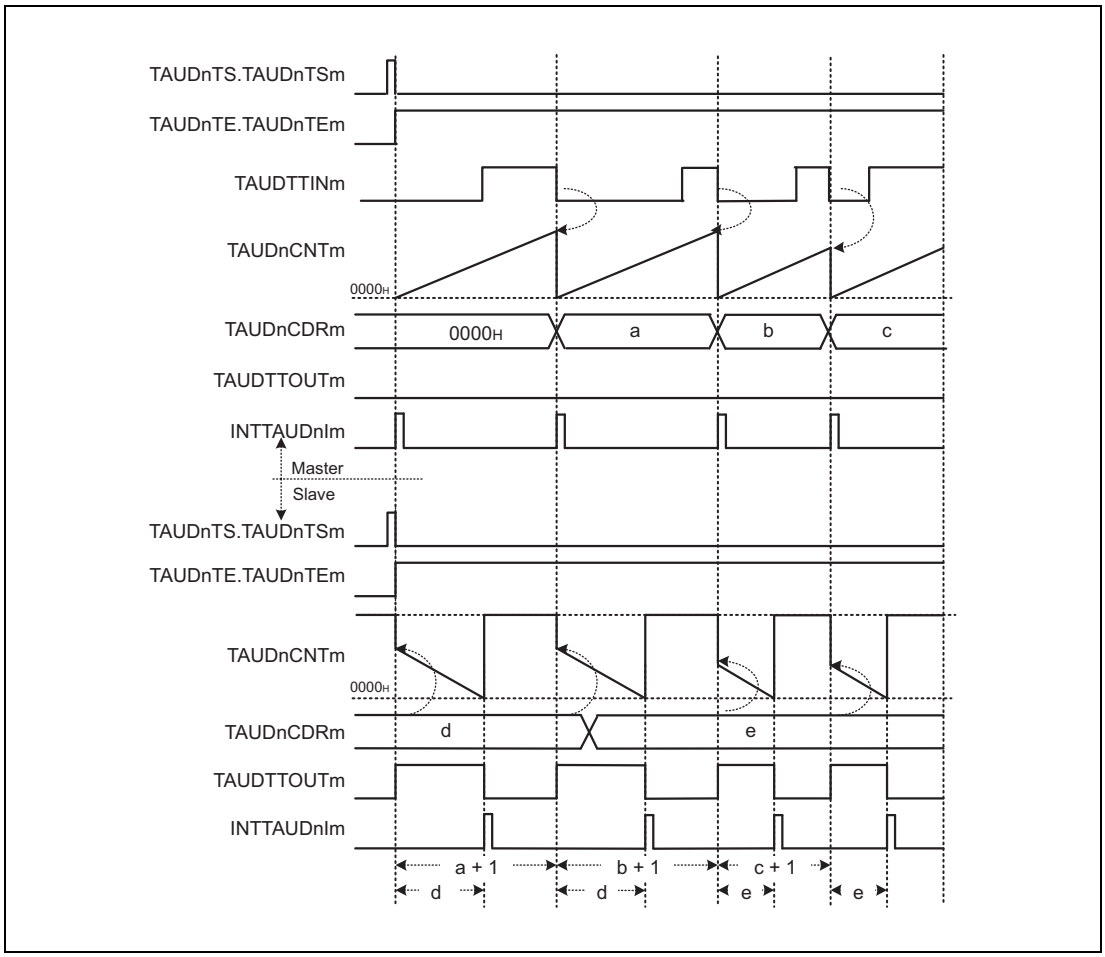

Figure 25.111 General Timing Diagram of Offset Trigger Output Function

NOTE

TAUDTTOUTm of the slave channel rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

25.15.5.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDnMAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDnMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 25.181 Contents of the TAUDnCMORm Register for the Master Channel of the Offset Trigger Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	001: Valid TAUDTTINm input edge signal is used as the start trigger
7, 6	TAUDnCOS[1:0]	11: Updated upon detection of a valid TAUDTTINm input edge or when a counter overflow occurs: – Detection of valid TAUDTTINm input edge: The counter value is written into TAUDnCDRm. – Occurrence of overflow: $FFFF_H$ is written into TAUDnCDRm. A valid TAUDTTINm input edge to be detected next is ignored. TAUDnCSRm.TAUDnOVF is set when a counter overflow occurs, and cleared by setting TAUDnCSCm.TAUDnCLOV = 1.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0010: Capture mode
0	TAUDnMD0	1: INTTAUDnIm generated at the beginning of operation.

(2) TAUDnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.182 Contents of the TAUDnCMURm Register for the Master Channel of the Offset Trigger Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Detection of falling edge 01: Detection of rising edge 10: Detection of rising and falling edges 11: Setting prohibited

(3) Channel output mode for the master channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

(4) Simultaneous rewrite for the master channel

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the offset trigger output function. Therefore, these registers should be set to 0.

Table 25.183 Simultaneous Rewrite Settings for the Master Channel of Offset Trigger Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

25.15.5.5 Register Settings for Slave Channels

(1) TAUDnCMORm for slave channels

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

(2) TAUDnCMURm for slave channels

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.185 Contents of the TAUDnCMURm Register for the Slave Channel of the Offset Trigger Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for slave channels

Table 25.186 Control Bit Settings in Synchronous Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for slave channels

Simultaneous rewrite registers (TAUDnRDE, TAUDnRDS, TAUDnRDM, and TAUDnRDC) cannot be used with the offset trigger output function. Therefore, these registers should be set to 0.

Table 25.187 Simultaneous Rewrite Settings for Slave Channels of Offset Trigger Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	0: Disables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	When simultaneous rewrite is disabled (TAUDnRDE.TAUDnRDEm = 0), set these bits to 0
TAUDnRDM.TAUDnRDMm	
TAUDnRDC.TAUDnRDCm	

25.15.5.6 Operating Procedure for Offset Trigger Output Function

Table 25.188 Operating Procedure for Offset Trigger Output Function

		Operation	TAUDn Status
Restart Operation	Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.5.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and channel output mode as described in **Section 25.15.5.5, Register Settings for Slave Channels**. The TAUDnCDRm register of master channel functions as a capture register. Set the value of TAUDnCDRm register of slave channel.	Channel operation is stopped.
	Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start: • TAUDnCNTm (master) counts up. • TAUDnCDRm value is loaded into TAUDnCNTm (slave) to perform counting down. INTTAUDnIm is generated on the master channel and TAUDTTOUTm (slave) is set.
	During Operation	TAUDnCDRm can be changed at any time. TAUDnCSCm.TAUDnCLOV can be set to 1. TAUDnCDRm of slave channel can be changed after the generation of INTTAUDnIm (master). TAUDnCNTm and TAUDnCSRm can be read at any time.	When TAUDnCNTm of the slave = 0000_H: • INTTAUDnIm (slave) is generated. • TAUDTTOUTm (slave) is reset, and the counter of slave channel stops. When TAUDTTINm input edge is detected on the master channel: • INTTAUDnIm (master) is generated. • TAUDnCNTm (master) is reset to 0000_H and then continues count operation subsequently. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave) to perform counting down. • TAUDTTOUTm (slave) is set.
	Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

25.15.5.7 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to this diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

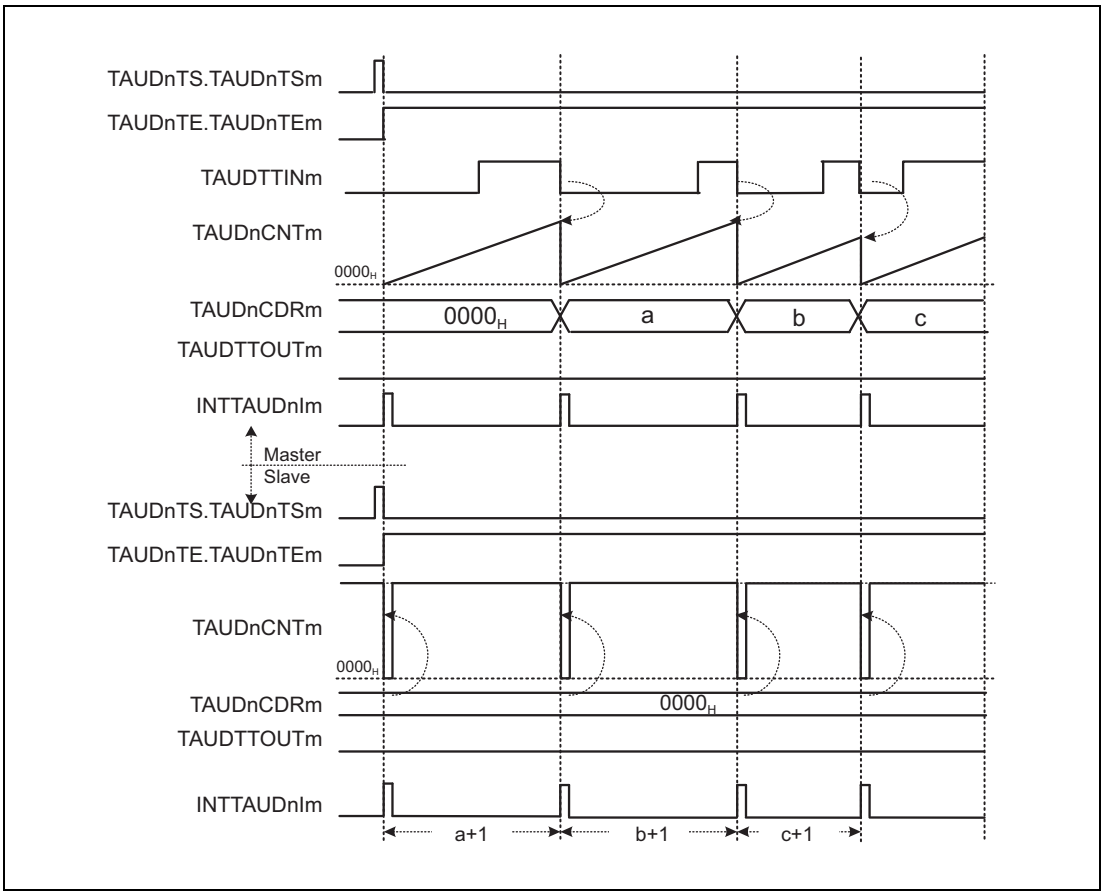

Figure 25.112 TAUDnCDRm (Slave) = 0000_H

- When TAUDnCDRm (slave) = 0000_H, 0000_H is written to TAUDnCNTm every time the master channel generates an interrupt (INTTAUDnIm), and TAUDnCNTm cannot start to count. The TAUDTTOUTm remains inactive.
- TAUDnCNTm (slave) generates an interrupt every time the value of TAUDnCDRm is reloaded. The slave and the master channels generate interrupts in the same cycle.

(2) Duty cycle = 100%

The following settings apply to this diagram.

- Detection of falling edge (TAUDnCMURm.TAUDnTIS[1:0] = 00_B)

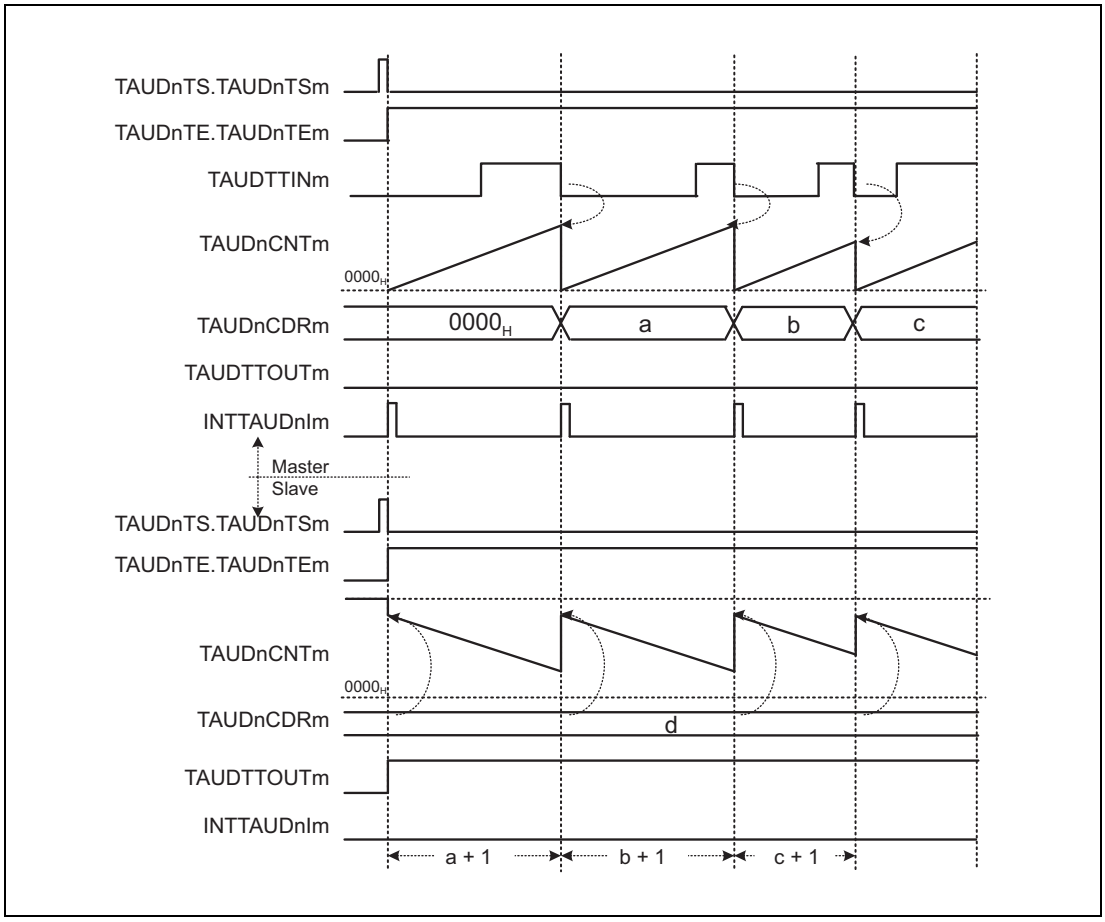

Figure 25.113 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1

- If the value TAUDnCDRm (slave) is higher than the interval of valid input edges, the counter of the slave channel cannot reach 0000_H and cannot generate interrupts. The TAUDTTOUTm remains at active state.

25.15.6 A/D Conversion Trigger Output Function Type 1

25.15.6.1 Overview

Summary

This function is identical to **Section 25.15.1, PWM Output Function**, except that TAUDTTOUTm is not output.

This is achieved by setting the channel output mode for the slave to independent channel output mode controlled by software.

25.15.6.2 Block Diagram and General Timing Diagram

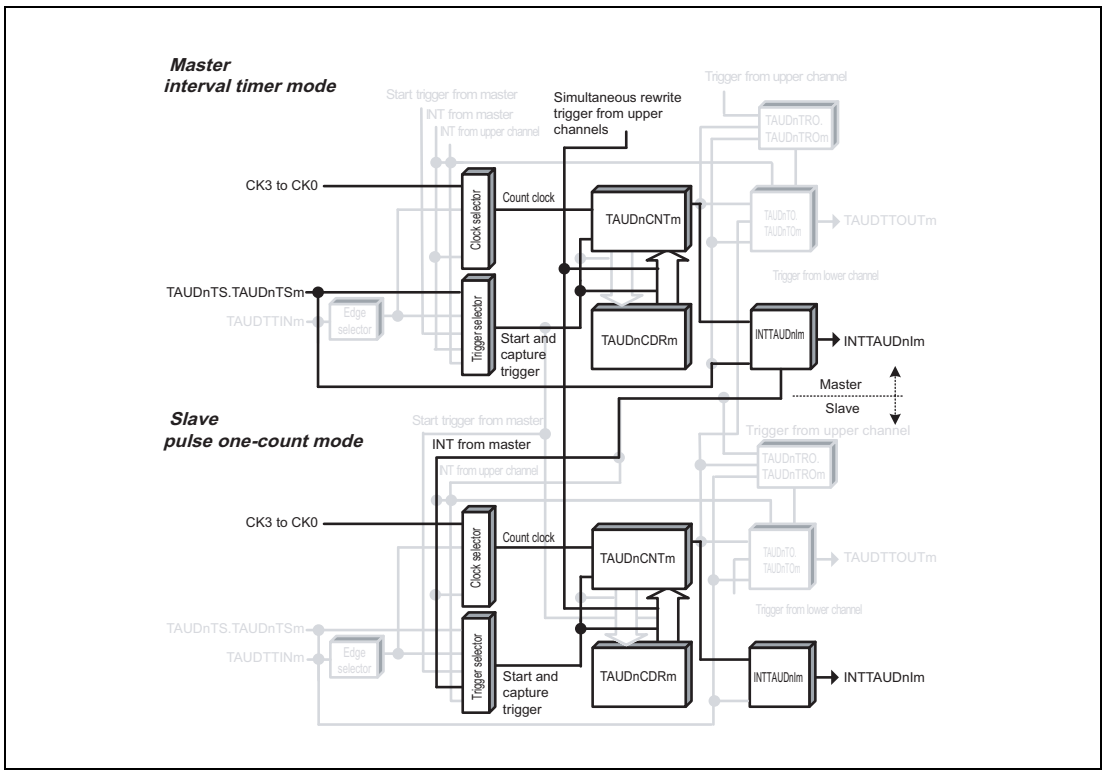

Figure 25.114 Block Diagram of A/D Conversion Trigger Output Function Type 1

The following settings apply to the general timing diagram.

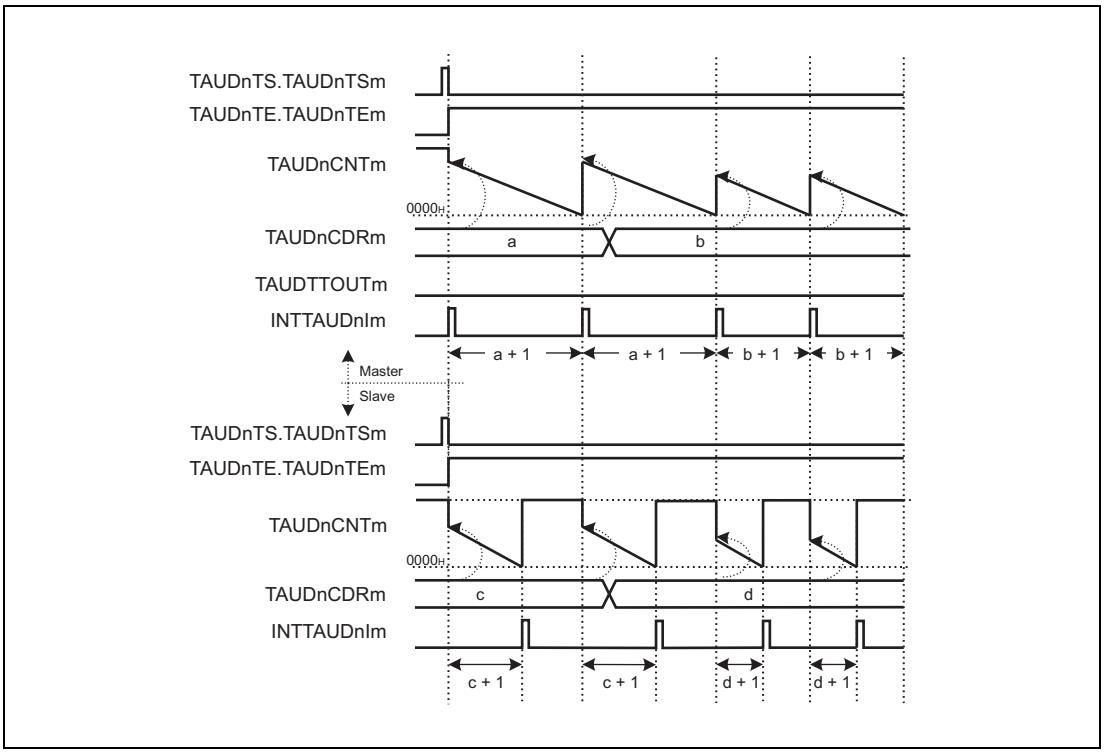

Figure 25.115 General Timing Diagram of A/D Conversion Trigger Output Function Type 1

25.15.7 Triangle PWM Output Function

25.15.7.1 Overview

Summary

This function generates multiple triangle PWM outputs by using a master and one or more slave channels. It enables the pulse cycle (frequency) and the duty cycle of TAUDTTOUTm to be set using the master and slave channels respectively.

The master channel generates a carrier cycle. The first cycle of the master channel controls the down status and the second cycle controls the up status of the slave counter.

Prerequisites

- Two channels
- The operating mode for the master channels should be set to interval timer mode. (See **Table 25.189, Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function**.)
- The operating mode for slave channels should be set to count-up/-down mode. (See **Table 25.193, Contents of the TAUDnCMORm Register for the Slave Channel of the Triangle PWM Output Function**.)
- The channel output mode for the master channel should be set to independent channel output mode 1. (See **Section 25.7, Channel Output Modes**.)
- The channel output mode for slave channels should be set to synchronous channel output mode 2. (See **Section 25.7, Channel Output Modes**.)
- The following settings allow the TAUDTTOUTm signal to be at high level during the down status of a carrier cycle.
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTOm should be set to 1 while TAUDnTOE.TAUDnTOEm is set to 0 (recommended setting).
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTOm should be set to 0 while TAUDnTOE.TAUDnTOEm is set to 0.

Functional description

The counters are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for every channel. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current values of TAUDnCDRm (master and slave) are loaded into TAUDnCNTm (master and slave) and the counters start counting down from these values. When the TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1, an interrupt is generated and TAUDTTOUTm signal of master toggles.

- Master channel:
  When the counter of master channel reaches 0000_H (pulse cycle time has elapsed), INTTAUDnIm is generated and the TAUDTTOUTm signal toggles. TAUDnCNTm then reloads the TAUDnCDRm value and counts down.

- Slave channel:
  If INTTAUDnIm is generated on the master channel, the counter of the slave channel is triggered.
  - If the slave counter is counting down, the count direction changes.
  - If the slave counter is counting up, the TAUDnCDRm value is reloaded and the counter starts to count down.

  When the counter of the slave channel reaches 0001_H while counting up or down, INTTAUDnIm is generated and the TAUDTTOUTm (slave) signal is set/reset.
  The counter continues count-up/-down and waits for the next INTTAUDnIm of the master channel.
  Setting TAUDnTOL.TAUDnTOLm allows TAUDTTOUTm signal switching between normal phase and reverse phase during operation.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm = 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

Conditions

This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.

25.15.7.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

Duty cycle 100 [%] =
[(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave))/(TAUDnCDRm (master) + 1)] × 100

- Duty cycle = [%]
  TAUDnCDRm (slave) = 0000_H
- Duty cycle = 0%
  TAUDnCDRm (slave) ≥ TAUDnCDRm (master) + 1

25.15.7.3 Block Diagram and General Timing Diagram

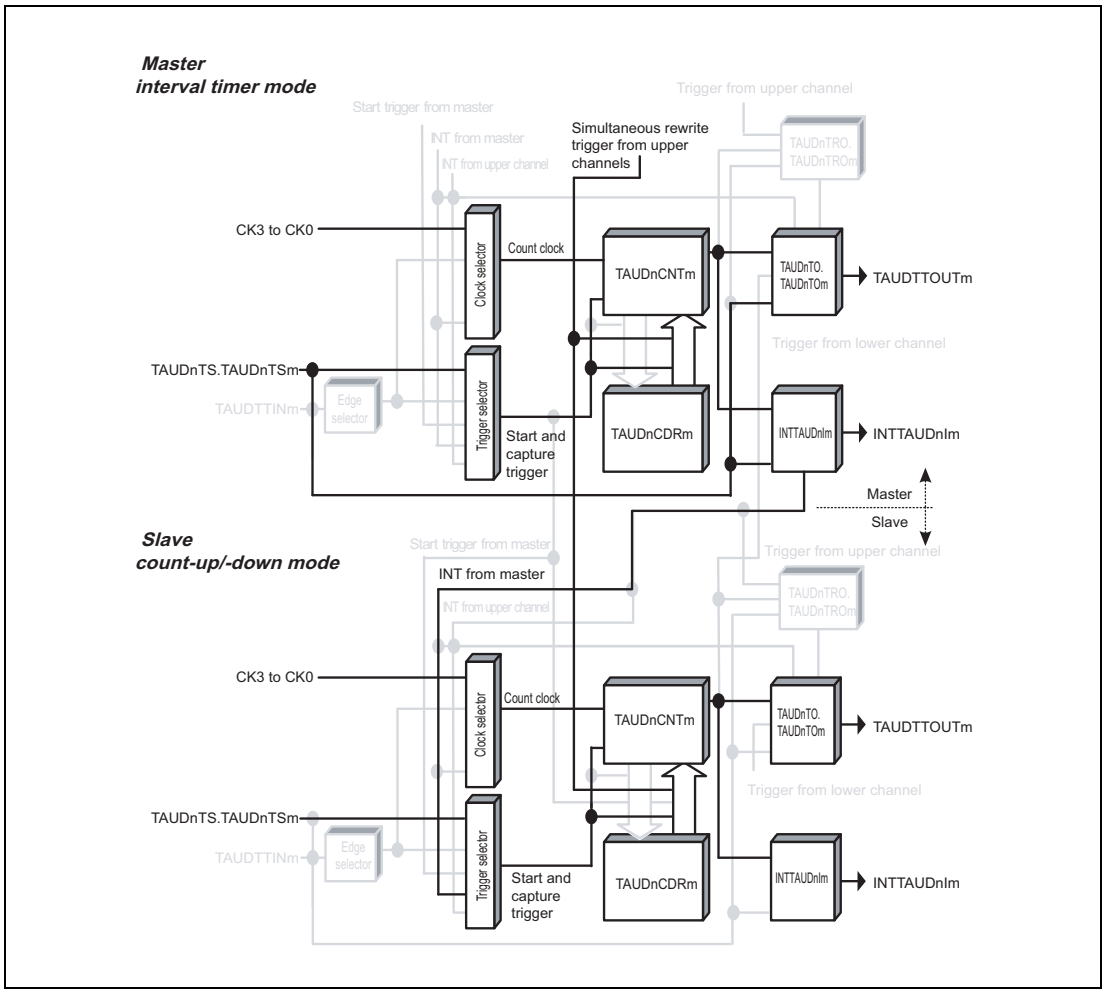

Figure 25.116 Block Diagram of Triangle PWM Output Function

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUDnIm is generated at the beginning of operation.
    (TAUDnCMORm.TAUDnMD0 = 1)

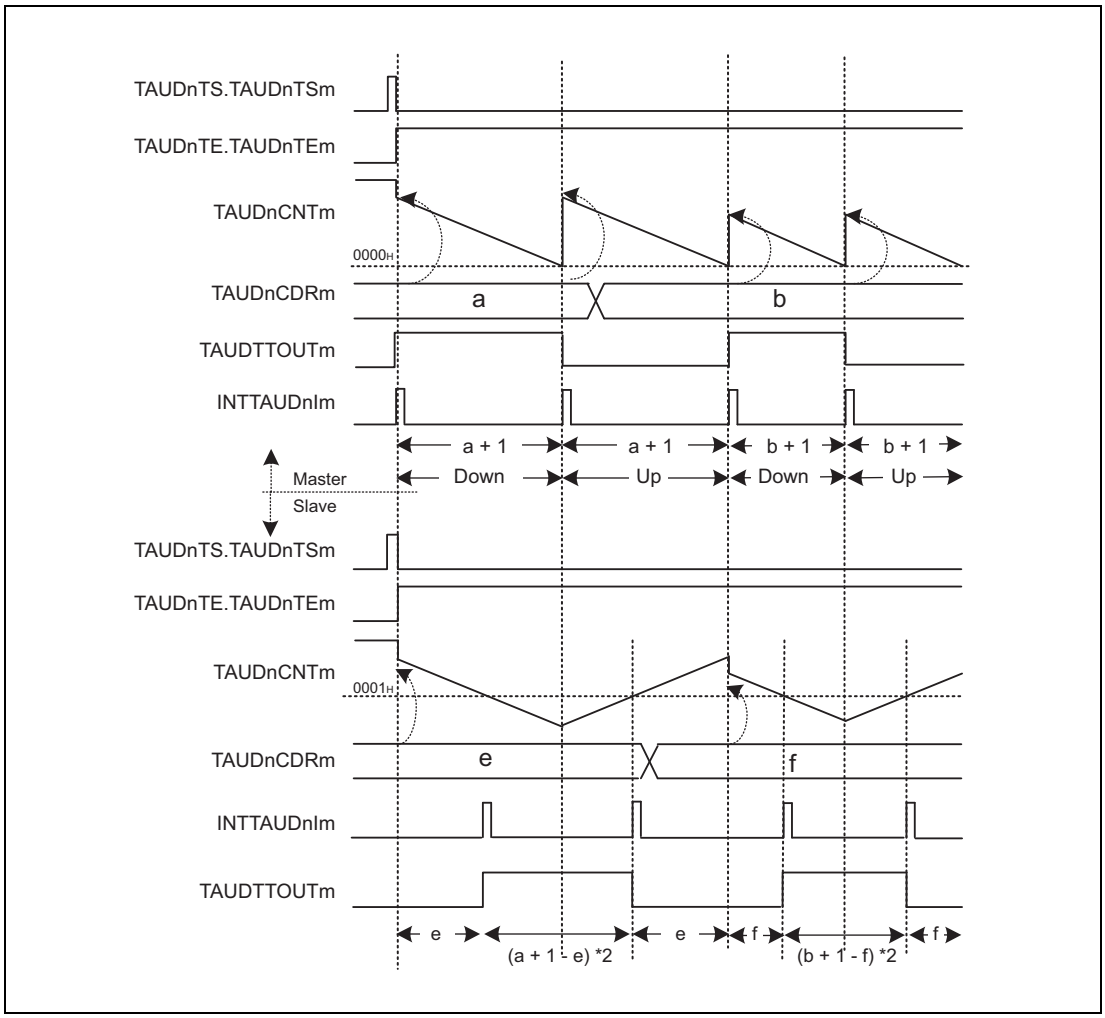

Figure 25.117 General Timing Diagram of Triangle PWM Output Function

25.15.7.4 Register Settings for the Master Channel

Table 25.190 Contents of the TAUDnCMURm Register for the Master Channel of the Triangle PWM Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for the master channel

Table 25.191 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.192 Simultaneous Rewrite Settings for the Master Channel of Triangle PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

25.15.7.5 Register Settings for Slave Channels

(1) TAUDnCMORm for slave channels

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for slave channels

Table 25.195 Control Bit Settings in Synchronous Channel Output Mode 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for slave channels

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.196 Simultaneous Rewrite Settings for Slave Channels of Triangle PWM Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when the master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.15.7.6 Operating Procedure for Triangle PWM Output Function

Table 25.197 Operating Procedure for Triangle PWM Output Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.7.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.7.5, Register Settings for Slave Channels**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm (master) is generated on the master channel if TAUDnCMORm.TAUDnMD0 is set to 1.
During Operation	TAUDnCDRm can be changed at any time. TAUDnTOL.TAUDnTOLm can be changed. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master and slave channels is loaded into TAUDnCNTm to count down. When the counter of master channel reaches 0000_H: • INTTAUDnIm (master) is generated. • TAUDTTOUTm (master) is toggled. • TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave) or counting is started in opposite direction. When TAUDnCNTm of slave channel reaches 0001_H: • INTTAUDnIm (slave) is generated. • TAUDTTOUTm (slave) is set in the count-down status or reset in count-up status.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

25.15.7.7 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnCDRm = a = 5_H
- Slave channel:
  - TAUDnCDRm = 6_H

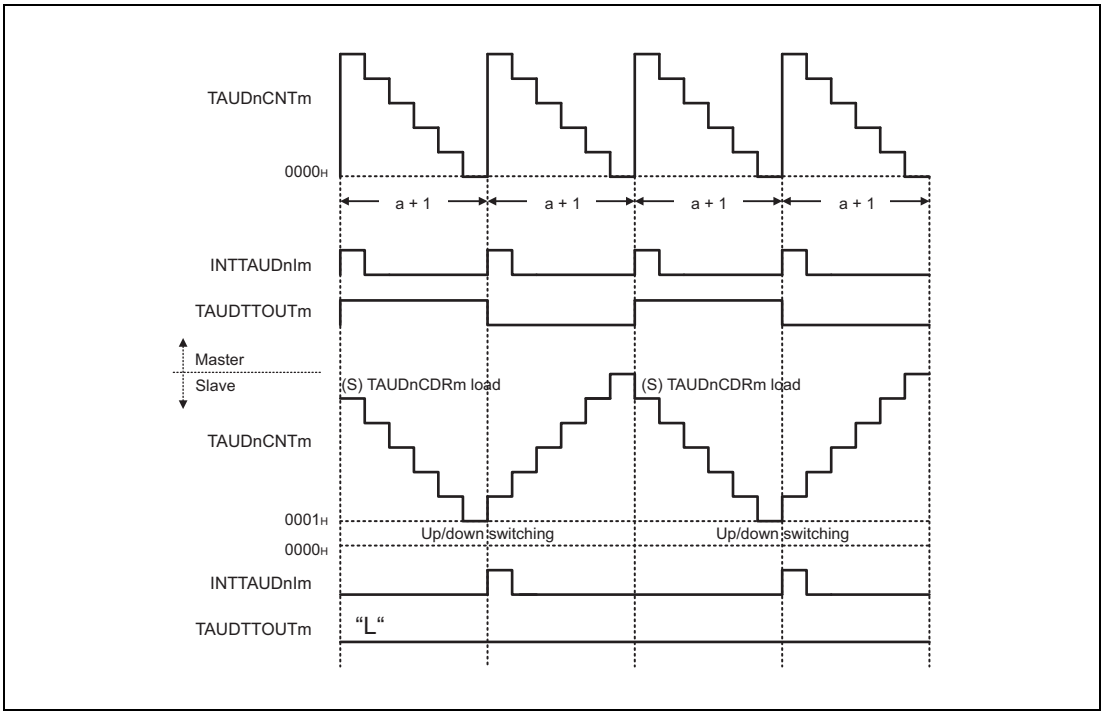

Figure 25.118 TAUDnCDRm (Slave) ≥ TAUDnCDRm (Master) + 1

- If TAUDnCDRm (slave) value ≥ TAUDnCDRm (master) value +1, INTTAUDnIm of the slave channel is not generated while counting down. TAUDTTOUTm remains low because there is no set signal to be detected.

(2) Duty cycle = 100%

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnCDRm = a = 5_H
- Slave channel:
  - TAUDnCDRm = 0_H

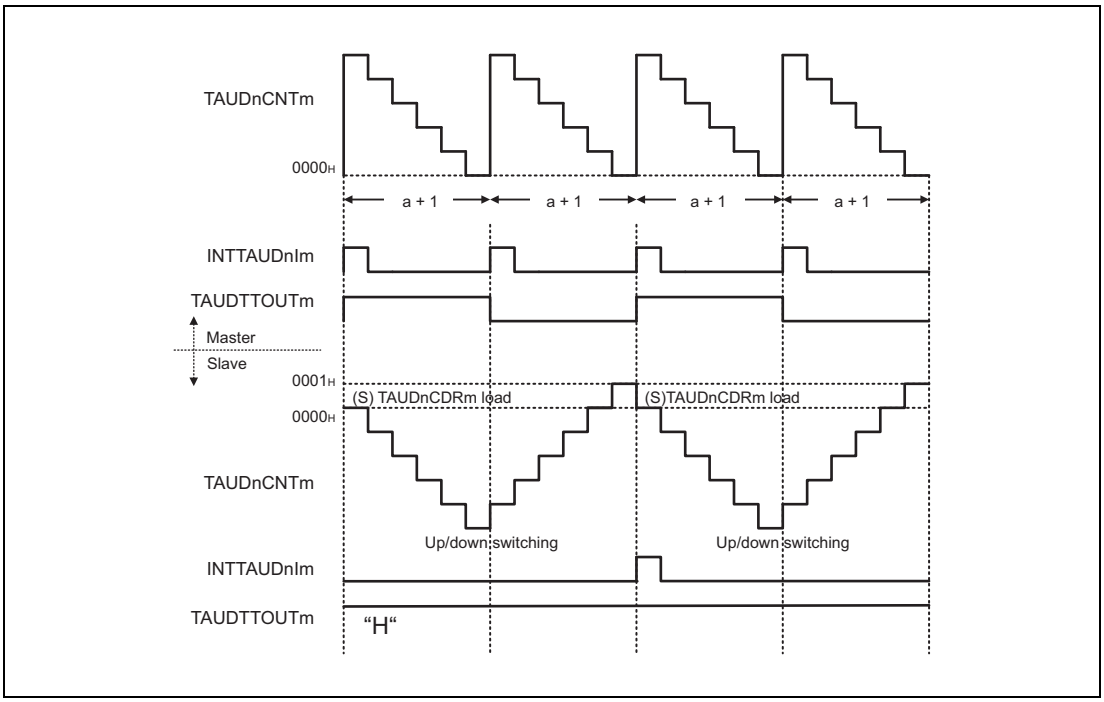

Figure 25.119 TAUDnCDRm (Slave) = 0000_H

- If TAUDnCDRm (slave) = 0000_H, INTTAUDnIm of the slave channel is not generated while counting up. TAUDTTOUTm remains high because there is no reset signal to be detected.

25.15.8 Triangle PWM Output Function with Dead Time

25.15.8.1 Overview

Summary

This function generates multiple triangle PWM outputs with a predefined dead time added by using a master and two or more slave channels. The resulting PWM signals with dead time are output via TAUDTTOUTm of the slave channels 2 and 3, enabling the pulse cycle (frequency) and the duty cycle of TAUDTTOUTm to be set using the master and slave channels.

Carrier cycles are generated on the master channel. The first pulse controls the down status of the slave counter and the second one controls the up status.

An interrupt on slave 2 causes TAUDTTOUTm of slave channels to be set/reset. Depending on the settings of TAUDnTDL.TAUDnTDLm, delay time is added to positive or negative logic side of the signal (i.e., whether TAUDTTOUTm is set/reset immediately or after dead time has elapsed). The duration of the dead time is specified by slave channel 3.

Prerequisites

- Three channels. For slave channels 2 and 3, select even channel CH (a) and odd channel CH (a + 1).
- The operating mode for the master channel should be set to interval timer mode. (See **Table 25.199, Contents of the TAUDnCMORm Register for the Master Channel of the Triangle PWM Output Function with Dead Time**)
- Slave channel 1 is not used for this function. This ensures that slave channel 2 is an even channel (a), and slave channel 3 is an odd channel (a + 1). Slave channel 1 can be used as a separate timer (independent function).
- The operating mode for slave channel 2 should be set to count-up/-down mode (See **Table 25.203, Contents of the TAUDnCMORm Register for Slave Channel 2 of the Triangle PWM Output Function with Dead Time**). Slave channel 2 should be an even channel.
- The operating mode for slave channel 3 should be set to one-count mode (See **Table 25.207, Contents of the TAUDnCMORm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time**). Slave channel 3 should be an odd channel.
- The channel output mode for the master channel should be set to independent channel output mode 1. (See **Section 25.7, Channel Output Modes**)
- The output mode for slave channels 2 and 3 should be set to synchronous channel output mode 2 with dead time output. (See **Section 25.7, Channel Output Modes**)
- The following settings make a TAUDTTOUTm signal at high level during the down status of the carrier cycle:
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 0, TAUDnTO.TAUDnTOm should be set to 1 while TAUDnTOE.TAUDnTOEm is set to 0 (recommended setting).
  - If TAUDnCMORm.TAUDnMD0 (master) bit is set to 1, TAUDnTO.TAUDnTOm should be set to 0 while TAUDnTOE.TAUDnTOEm is set to 0.

NOTE

The triangle PWM output function with dead time does not use slave channel 1. Slave channel 1 can be used as a separate timer (independent function).

Functional description

The counter starts by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This makes TAUDnTE.TAUDnTEm = 1, enabling count operation. The current value of TAUDnCDRm is loaded into TAUDnCNTm and the counter starts to count down from the TAUDnCDRm value. If TAUDnCMORm.TAUDnMD0 bit of master channel is set to 1, an interrupt is generated and the master's TAUDTTOUTm signal is toggled.

- Master channel:
  When the counter of the master channel reaches 0000_H, an INTTAUDnIm is generated and the TAUDTTOUTm signal is toggled. The TAUDnCDRm value is reloaded to continue counting down.
- Slave channel 2:
  If INTTAUDnIm is generated on the master channel, the counter of slave channel 2 is triggered.
  - If the slave counter is counting down, the counting direction changes.
  - If the slave counter is counting up, the TAUDnCDRm value is reloaded and the counter starts counting down.

  The counter continues to count down/up and waits for the next INTTAUDnIm of the master channel.
  When the counter value of slave channel 2 reaches 0001_H, INTTAUDnIm is generated
- Slave channel 3:
  If INTTAUDnIm is generated on slave channel 2, the counter of slave channel 3 is triggered. The current value of TAUDnCDRm (slave 3) is loaded into TAUDnCNTm (slave 3) and the counter starts to count down from the TAUDnCDRm value.
  When the counter reaches 0000_H, INTTAUDnIm occurs. The counter returns to $FFFF_H$ and waits for the next INTTAUDnIm of slave channel 2.

As described in **Table 25.198, Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2**, the set/reset timing (right after occurrence of an interrupt or after dead time has elapsed) depends on the TAUDnTDL.TAUDnTDLm setting of the corresponding channel.

The setting of TAUDnTOL.TAUDnTOLm also determines whether a high level signal (TAUDnTOL.TAUDnTOLm = 0) or a low level signal (TAUDnTOL.TAUDnTOLm = 1) is output from the corresponding channel.

The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values.

TAUDTTOUTm can be 100% output by setting the TAUDnCDRm value of slave channel 2 to 0000_H.

Conditions

This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.

TAUDnTOL.TAUDnTOLm and TAUDnTDL.TAUDnTDLm should be set before start of count operation. Slave channels 2 and 3 should have the opposite settings of TAUDnTDL.TAUDnTDLm.

Table 25.198 Operation of TAUDTTOUTm upon Occurrence of an Interrupt on Slave Channel 2

TAUDnTDL. TAUDnTDLm	Count Direction of Slave Channel 2 upon Occurrence of Interrupt	TAUDTTOUTm Set/Reset Timing
0	Down	Set after elapse of dead time
	Up	Reset right after interrupt occurs
1	Down	Set right after interrupt occurs
	Up	Reset after elapse of dead time

25.15.8.2 Equations

Pulse cycle = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

PWM signal width (normal phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2))× 2 – (TAUDnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (reverse phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2)) × 2 + (TAUDnCDRm (slave 3) + 1)] × count clock cycle

25.15.8.3 Block Diagram and General Timing Diagram

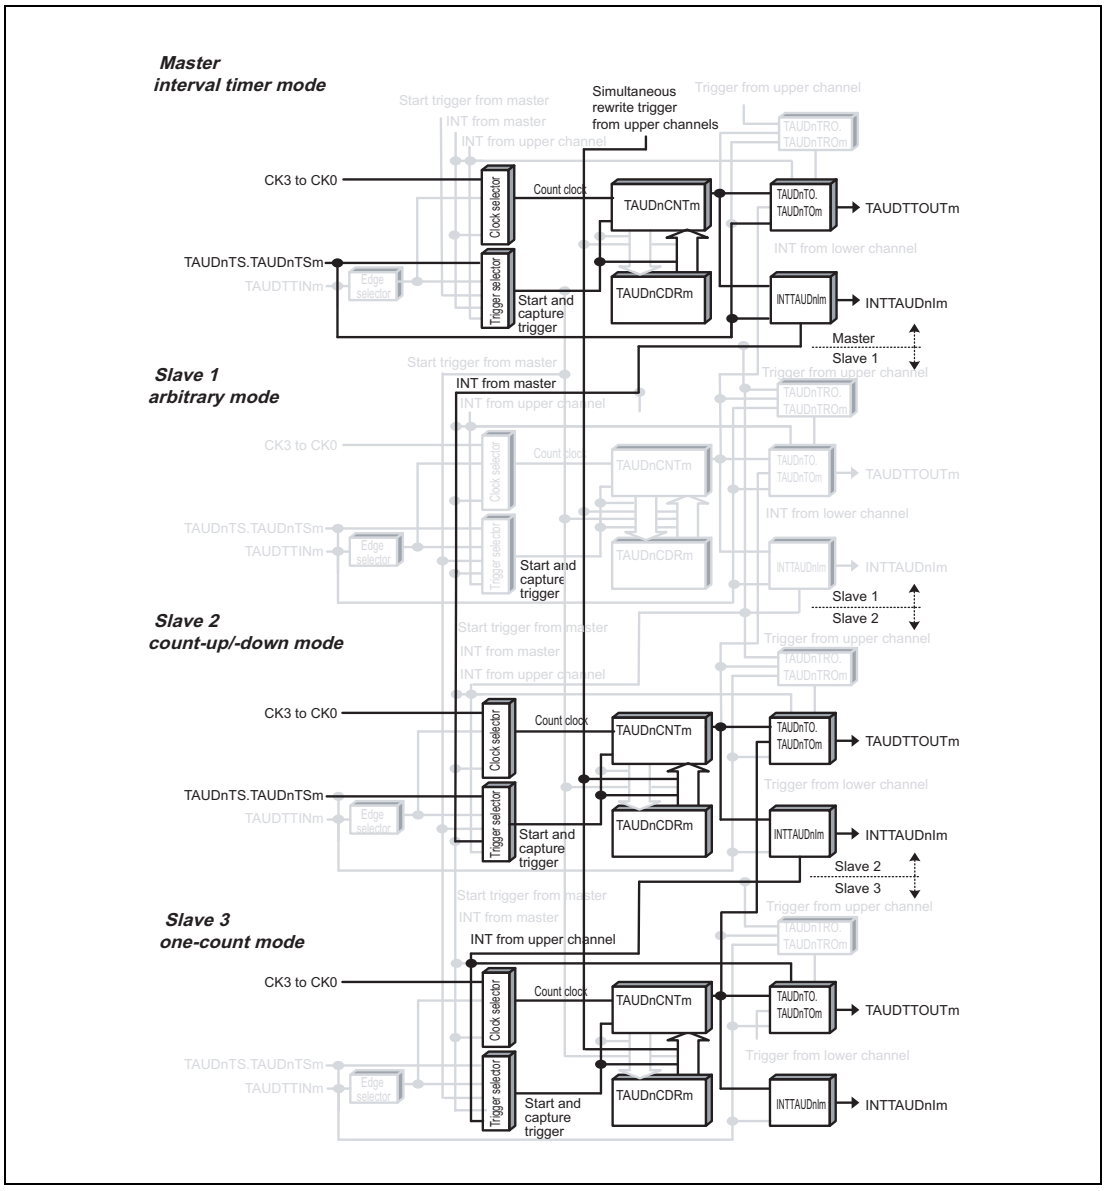

Figure 25.120 Block Diagram of Triangle PWM Output Function with Dead Time

The following settings apply to the general timing diagram.

- Master channel:
  - INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)
- Slave channel 2:
  - INTTAUDnIm not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
  - TAUDnTDL.TAUDnTDLm = 0
  - Positive logic (TAUDnTOL.TAUDnTOLm = 0)

- Slave channel 3:
  - Enables start trigger detection during counting (TAUDnCMORm.TAUDnMD0 = 1)
  - TAUDnTDL.TAUDnTDLm = 1
  - Positive logic (TAUDnTOL.TAUDnTOLm = 0)

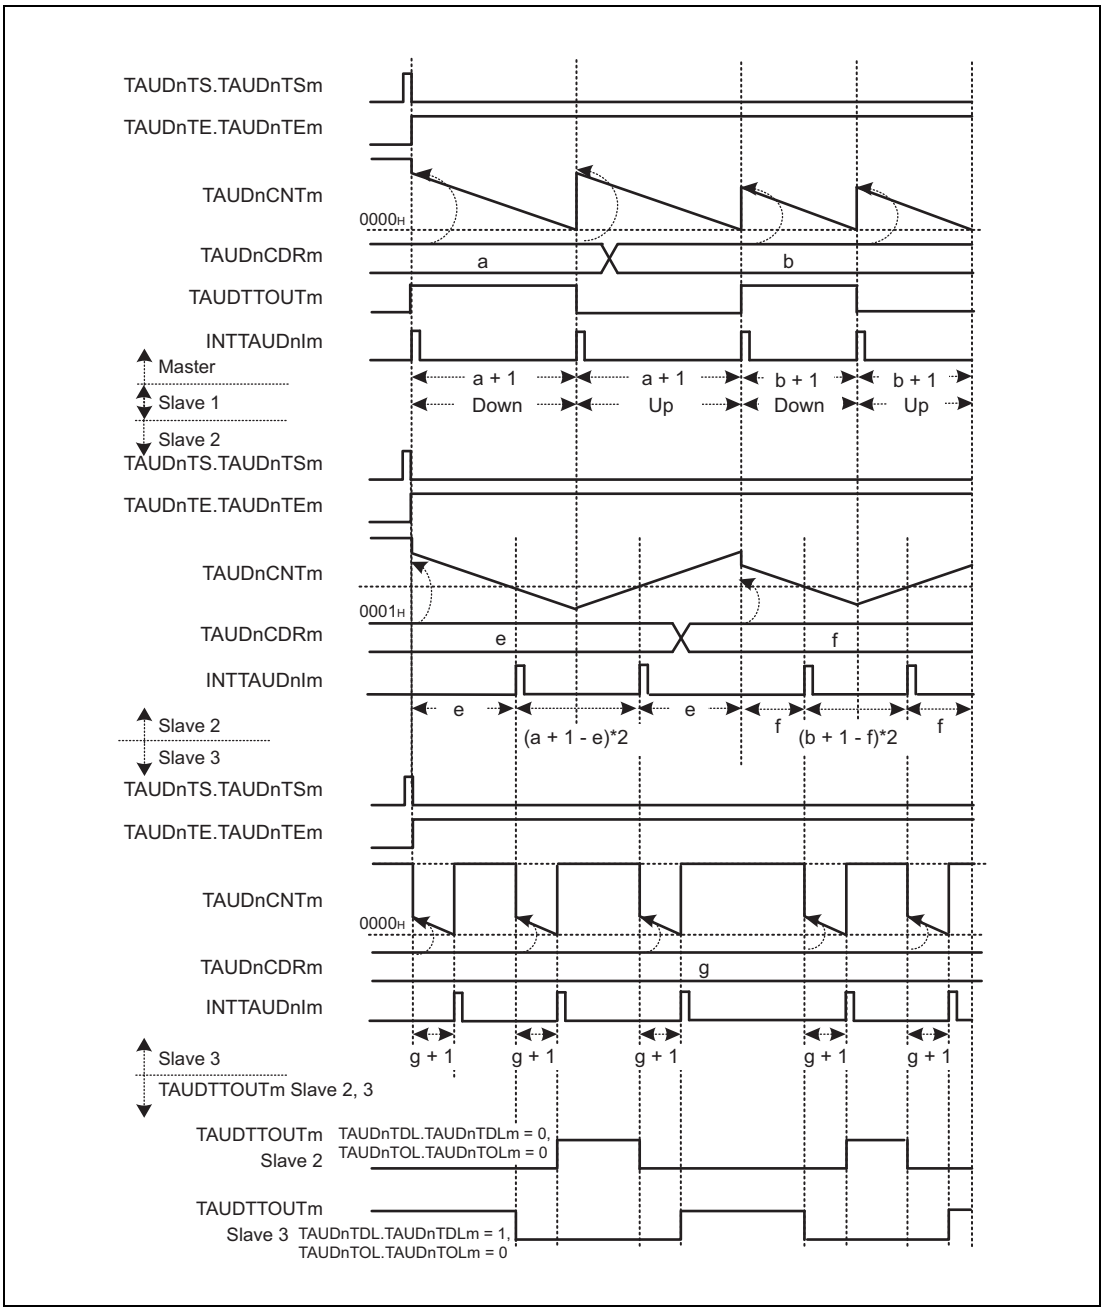

Figure 25.121 General Timing Diagram of Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated and TAUDTTOUTm is not toggled at the beginning of operation. 1: INTTAUDnIm is generated and TAUDTTOUTm is toggled at the beginning of operation.

(2) TAUDnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.200 Contents of the TAUDnCMURm Register for the Master Channel of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for the master channel

Table 25.201 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.202 Simultaneous Rewrite Setting for the Master Channel of Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

25.15.8.5 Register Settings for Slave Channel 2

(1) TAUDnCMORm for slave channel 2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for slave channel 2

Table 25.205 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from odd channels.

(4) Simultaneous rewrite for slave channel 2

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.206 Simultaneous Rewrite Settings for Slave Channel 2 of Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.15.8.6 Register Settings for Slave Channel 3

(1) TAUDnCMORm for slave channel 3

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0

15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	110: Dead time output signal of the TAUDTTOUTm generation unit
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

(2) TAUDnCMURm for slave channel 3

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.208 Contents of the TAUDnCMURm Register for Slave Channel 3 of the Triangle PWM Output Function with Dead Time

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for slave channel 3

Table 25.209 Control Bit Settings in Synchronous Channel Output Mode 2 with Dead Time Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel operation
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set this bit to 0
TAUDnTRC.TAUDnTRCm	0: Disables the operation as a real-time output trigger channel
TAUDnTME.TAUDnTMEm	0: Disables modulation

CAUTION

Set TAUDnTDL.TAUDnTDLm exclusively from even channels.

(4) Simultaneous rewrite for slave channel 3

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.210 Simultaneous Rewrite Settings for Slave Channel 3 of Triangle PWM Output Function with Dead Time

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave cycle.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.15.8.7 Operating Procedure for Triangle PWM Output Function with Dead Time

Table 25.211 Operating Procedure for Triangle PWM Output Function with Dead Time

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.8.4, Register Settings for the Master Channel**. Slave channel 2: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.8.5, Register Settings for Slave Channel 2**. Slave channel 3: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.8.6, Register Settings for Slave Channel 3**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm (master) is generated on the master channel if TAUDnCMORm.TAUDnMD0 is set to 1.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel and slave channel 2 is loaded into TAUDnCNTm to perform counting down. When the counter of master channel reaches 0000_H: • INTTAUDnIm (master) is generated. • TAUDnCDRm value is reloaded into TAUDnCNTm (master) to continue count operation. • TAUDnCDRm value is reloaded into TAUDnCNTm (slave 2) or counting is started in opposite direction. When TAUDnCNTm of slave channel 2 reaches 0001_H: • INTTAUDnIm (slave 2) is generated. • TAUDnCDRm value of slave channel 3 is loaded into TAUDnCNTm perform counting down. When TAUDnCNTm of slave channel 3 reaches 0000_H: • INTTAUDnIm is generated.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

25.15.8.8 Specific Timing Diagrams

(1) Duty cycle = 0%

The following settings apply to the general timing diagram in **Figure 25.122**.

- Slave channel 2:
  - Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
  - Negative logic (TAUDnTDL.TAUDnTDLm = 1)

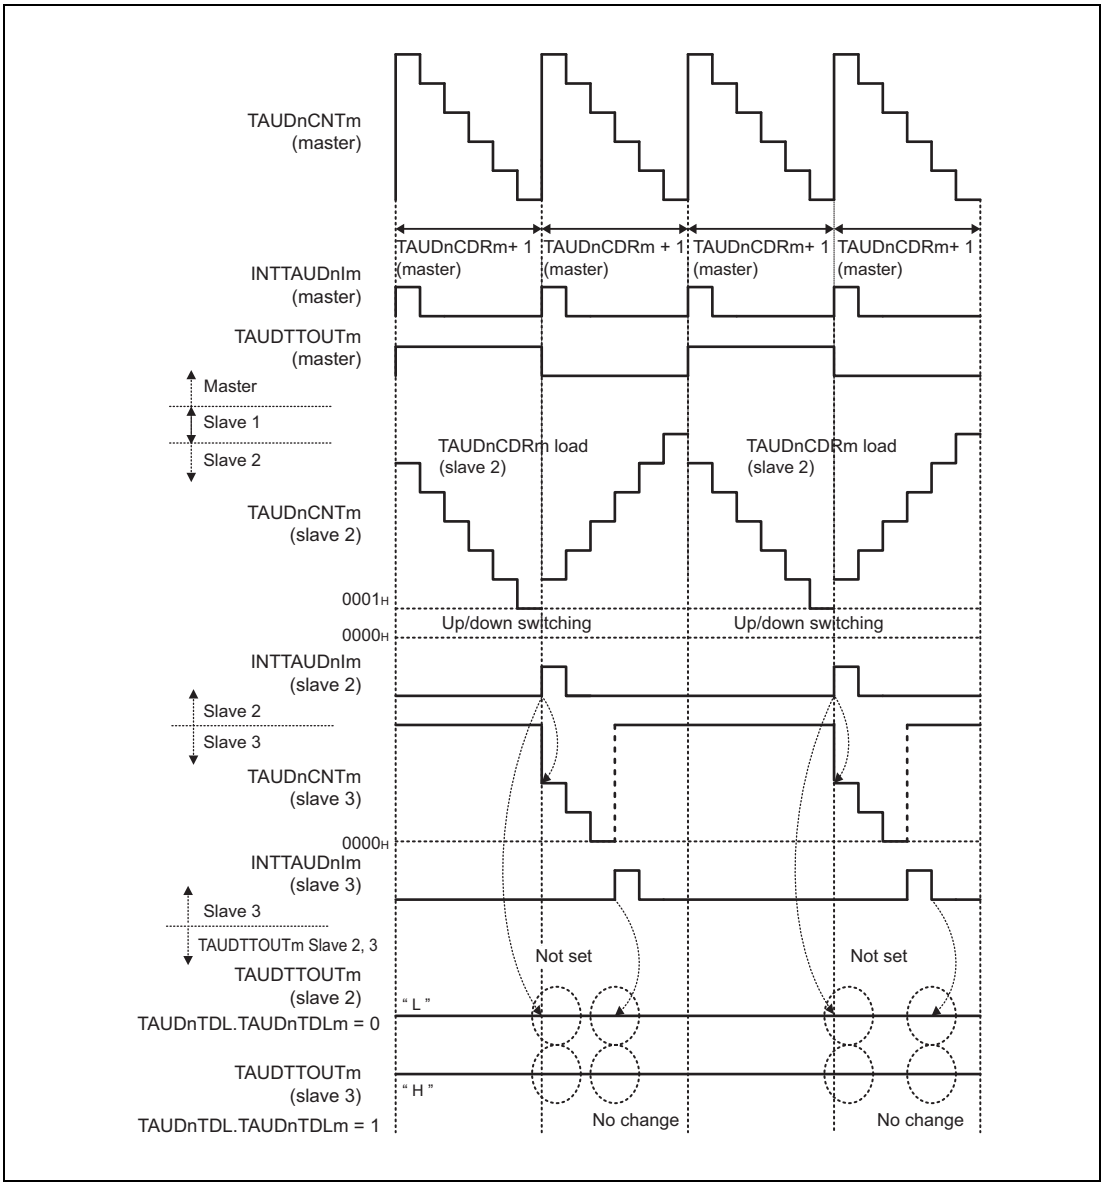

Figure 25.122 TAUDnCDRm (Slave 2) ≥ TAUDnCDRm (Master) + 1

- If TAUDnCDRm (slave 2) is greater than TAUDnCDRm (master), the counter of slave channel does not reach 0000_H while counting down. Therefore, TAUDTTOUTm signal is not set/reset and remains in the initial state. This signal becomes a reset signal because an interrupt occurs on slave channel 2 during count-up operation.

(2) Duty cycle = 100%

The following settings apply to the general timing diagram in **Figure 25.123**.

- Slave channel 2:
  - Positive logic (TAUDnTDL.TAUDnTDLm = 0)
- Slave channel 3:
  - Negative logic (TAUDnTDL.TAUDnTDLm = 1)

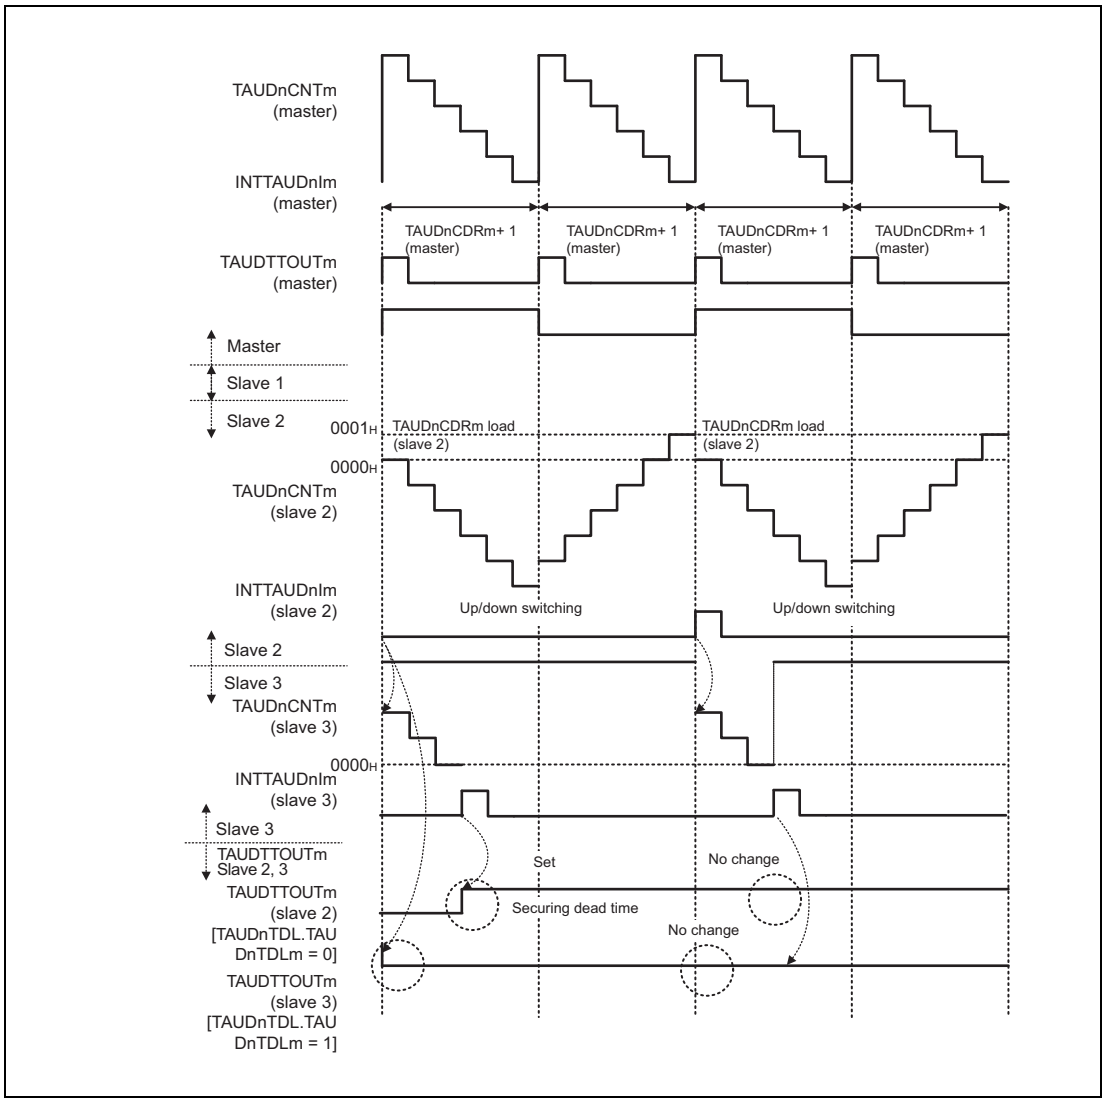

Figure 25.123 TAUDnCDRm (Slave) = 0000_H

- If TAUDnCDRm (slave 2) = 0000_H, the slave channel counter does not reach 0001_H while counting up. Therefore, no INTTAUDnIm is generated during count-up operation.
  - The set conditions for a channel with TAUDnTDL.TAUDnTDLm = 0 are met after elapse of dead time. TAUDTTOUTm is left in a newly set state even if a set/reset is made because no reset conditions are satisfied on such a channel.
  - Slave channel 3 in the above diagram is set when the counter starts. However, TAUDTTOUTm is left in an initial state on the slave channel with TAUDnTDL.TAUDnTDLm = 1 because no reset conditions are satisfied on that channel.

25.15.9 A/D Conversion Trigger Output Function Type 2

25.15.9.1 Overview

Summary

This function is identical to **Section 25.15.7, Triangle PWM Output Function**, except that TAUDTTOUTm is not output.

This function is enabled by setting channel output mode for the slave to independent channel output mode controlled by software.

25.15.9.2 Block Diagram and General Timing Diagram

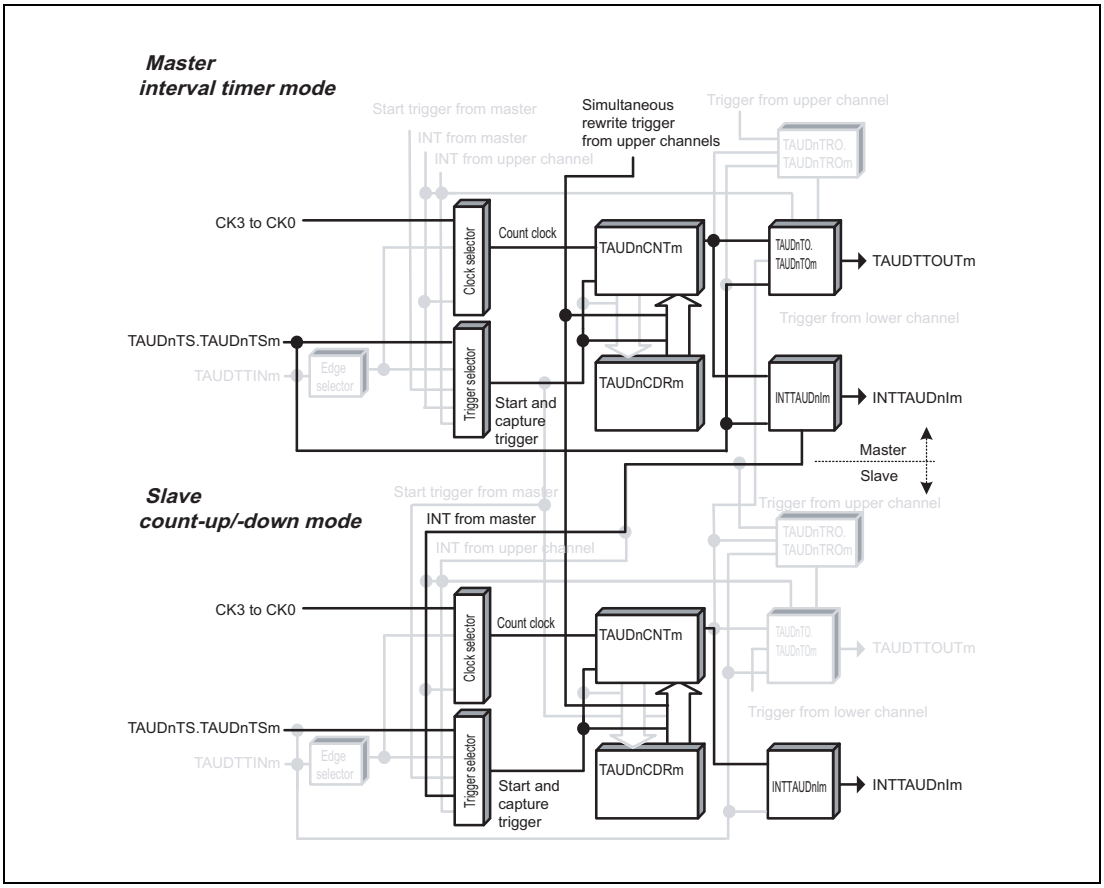

Figure 25.124 Block Diagram of A/D Conversion Trigger Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel
  - INTTAUDnIm is generated at the beginning of operation.
    (TAUDnCMORm.TAUDnMD0 = 1)

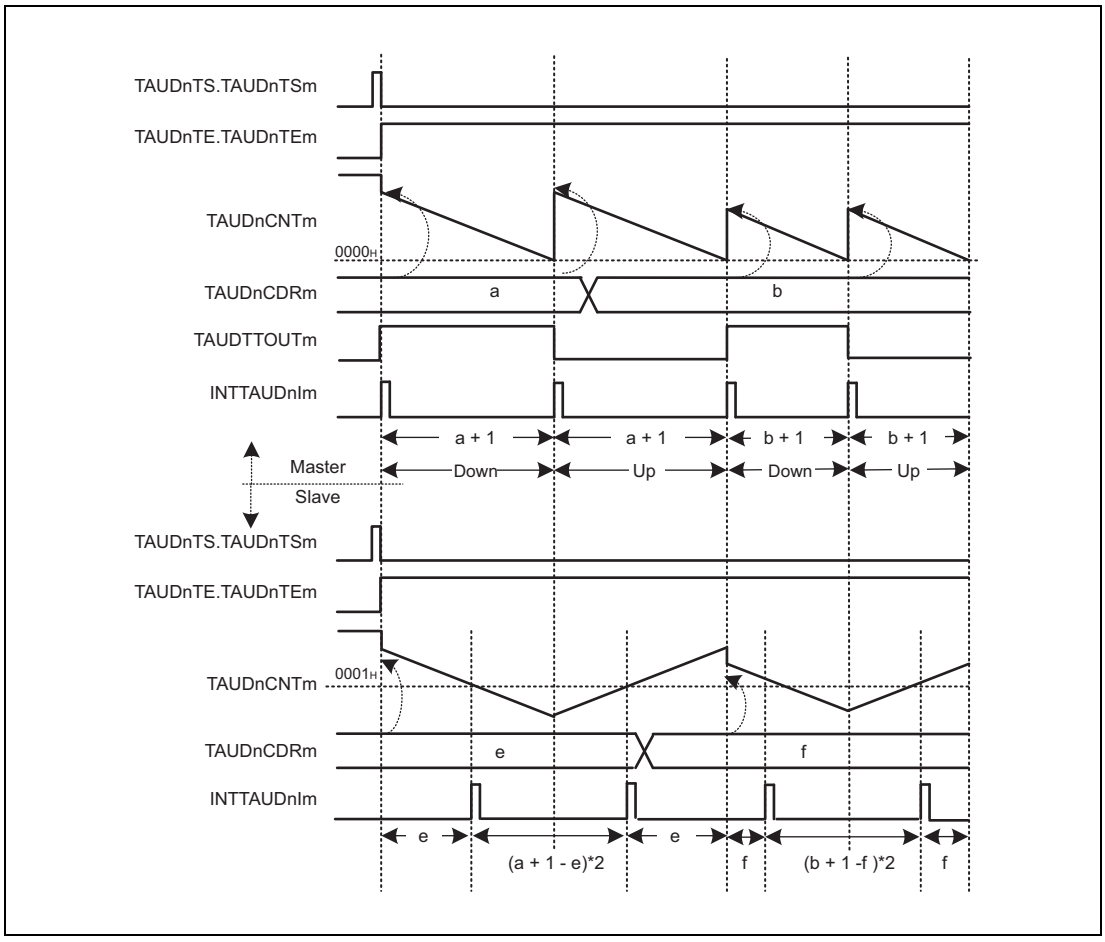

Figure 25.125 General Timing Diagram of A/D Conversion Trigger Output Function Type 2

25.15.10 Interrupt Request Signals Culling Function

25.15.10.1 Overview

Summary

This function divides the number of interrupts of the master channel by a specified value using a slave channel.

The interrupt request signals culling function is a sub function of the following functions:

- PWM Output Function (See **Section 25.15.1, PWM Output Function**)
- Triangle PWM Output Function (See **Section 25.15.7, Triangle PWM Output Function**
- Triangle PWM Output Function with Dead Time
  (See **Section 25.15.8, Triangle PWM Output Function with Dead Time**)

Prerequisites

- Two channels
- The operation mode of the master channel must be set to interval timer mode. (See **Table 25.212, Contents of the TAUDnCMORm Register for the Master Channel of the Interrupt Request Signals Culling Function**)
- The operation mode of the slave channel must be set to Event Count Mode. (See **Table 25.215, Contents of the TAUDnCMORm Register for the Slave Channel of the Interrupt Request Signals Culling Function**)
- This function does not use TAUDTTOUTm.

Functional description

The counters (master and slave) are enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1 for both channels. This in turn sets TAUDnTE.TAUDnTEm, enabling count operation. The current value of the data register of the master channel and slave channel (TAUDnCDRm) are written to the counter (TAUDnCNTm).

- Master channel:
  When the counter of the master channel reaches 0000_H, INTTAUDnIm is generated and TAUDnCDRm value is reloaded to TAUDnCNTm.
- Slave channel:
  Every time the master channel generates an INTTAUDnIm, the counter of the slave channel decrements by one. When the counter reaches 0000_H, it awaits the next interrupt from the master channel. This causes TAUDnCNTm (slave) to reload the value of TAUDnCDRm, and an INTTAUDnIm is generated.

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm to 1 for the master and slave channels, which in turn sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm of master and slave channels stops but retains its value.

Conditions

This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.

25.15.10.2 Equations

Interrupt division operator = TAUDnCDRm (slave channel)

– One INTTAUDnIm is generated for the INTTAUDnIm count of the master channel defined by TAUDnCDRm (slave channel) + 1.

25.15.10.3 Block Diagram and General Timing Diagram

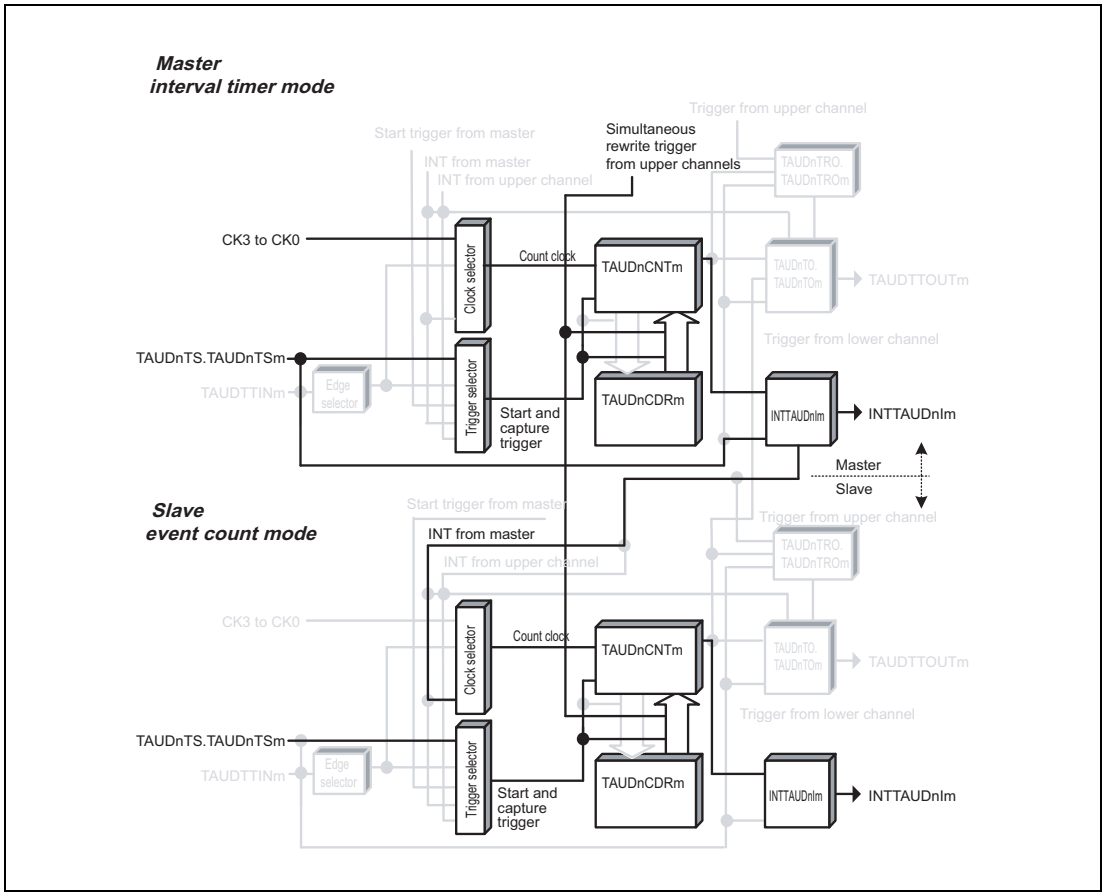

Figure 25.126 Block Diagram of Interrupt Request Signals Culling Function

The following settings apply to the general timing diagram.

Master channel:

- INTTAUDnIm is generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 1)

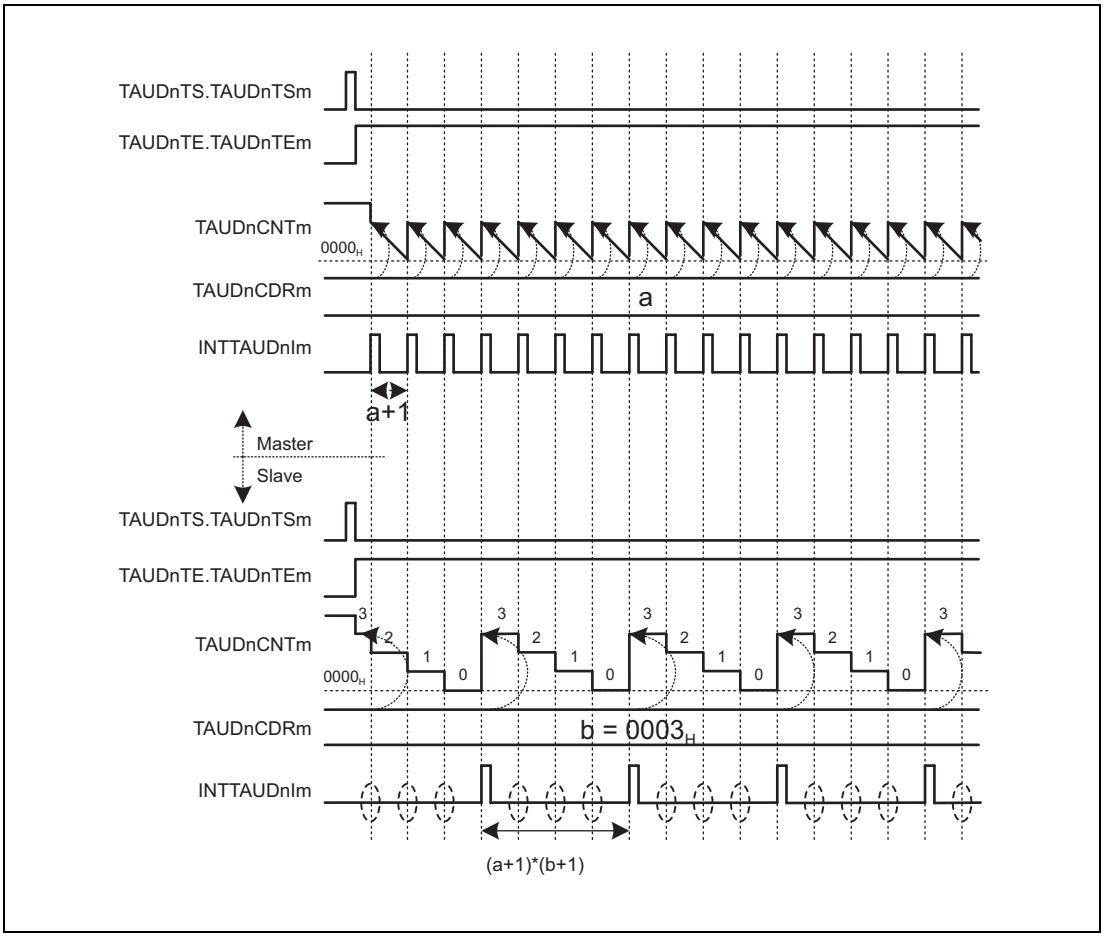

Figure 25.127 General Timing Diagram of Interrupt Request Signals Culling Function

7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for the slave channel

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite for the slave channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.217 Simultaneous Rewrite Settings for the Slave Channel of Interrupt Request Signals Culling Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Selects a master channel for simultaneous rewrite triggers. 1: Selects an upper channel outside the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count. 1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

25.15.10.6 Operating Procedure for Interrupt Request Signals Culling Function

Table 25.218 Operating Procedure for Interrupt Request Signals Culling Function

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.10.4, Register Settings for the Master Channel**. Slave channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.15.10.5, Register Settings for the Slave Channel**. Set the value of TAUDnCDRm register of every channel.	Channel operation is stopped.
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm (master and slave channels) is set to 1 and the counters of master and slave channels start. INTTAUDnIm is generated on the master channel.
During Operation	TAUDnCDRm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCNTm of master channel loads TAUDnCDRm value and counts down. When the counter reaches 0000_H: • INTTAUDnIm (master) is generated. • TAUDnCNTm (master) loads TAUDnCDRm value and continues count operation. • TAUDnCNTm of slave channels counts down each time INTTAUDnIm of master channel is detected. When TAUDnCNTm of the slave = 0000_H: • INTTAUDnIm (slave) is generated. • The TAUDnCDRm value is loaded in TAUDnCNTm (slave) and count operation continues.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm stops and retains its current value.

Restart Operation

25.15.10.7 Specific Timing Diagrams

(1) Interrupt count (master) = interrupt count (slave)

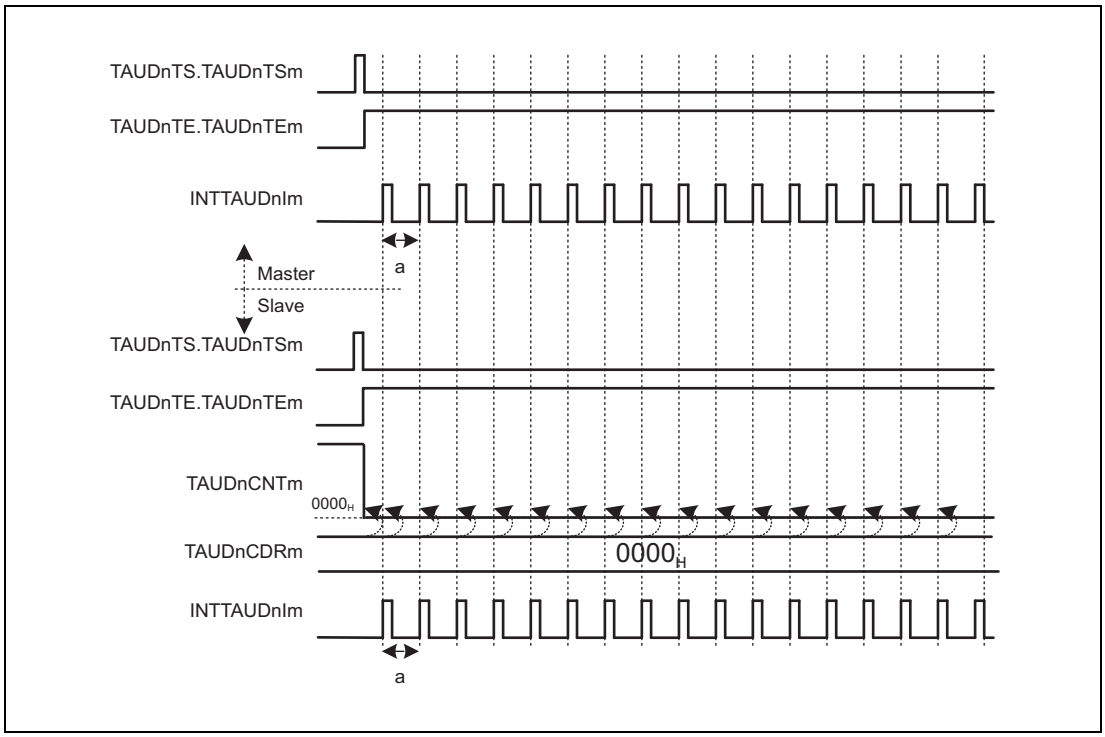

Figure 25.128 TAUDnCDRm (Slave) = 0000_H

- If TAUDnCDRm = 0000_H, the TAUDnCDRm value of the slave channel is loaded into TAUDnCNTm each time INTTAUDnIm of master channel is detected. In other words, TAUDnCNTm is always 0000_H.
- Therefore, an interrupt occurs on the master channel and simultaneously an interrupt occurs on slave channels.

25.16 Synchronous Non-Complementary and Complementary Modulation Output Functions

This section describes functions that generate 6-phase PWM output or triangle PWM output using a master channel and seven slave channels.

25.16.1 Non-Complementary Modulation Output Function Type 1

25.16.1.1 Overview

Summary

This function outputs a PWM signal, a high-level signal, or a low-level signal from TAUDTTOUTm depending on the values of the real-time output bits (TAUDnTRO.TAUDnTROm) and the modulation output enable bits (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See **Table 25.220, Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1**).
- The operating mode for slave channels 1 to 7 should be set to one-count mode (See **Table 25.223, Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1**, and **Table 25.226, Contents of the TAUDnCMORm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1**).
- TAUDTTOUTm is not used with the master channel of this function.
- TAUDTTOUTm of slave channel 1 is not used with this function, but TAUDnTRC.TAUDnTRCm should be set to 1 (See **Section 25.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 1 with non-complementary modulation output (See **Section 25.7, Channel Output Modes**).
- TAUDnCDRm of slave channel 1 should be set to 0000_H.

Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm) and the counter starts to count down. When the counter reaches 0000_H, INTTAUDnIm is generated.

- Slave channel 1:
  Slave channel 1 is set as a channel that triggers real-time output (TAUDnTRC.TAUDnTRCm = 1). If an interrupt occurs on slave channel 1 (TAUDnCDRm is fixed to 0000_H), the value of real-time output bit (TAUDnTRO.TAUDnTROm) of the channel that monitors the interrupt on slave channel 1 is reflected to the TAUDTTOUTm output. After that, the counter returns to $FFFF_H$ and waits for the next interrupt of master channel.

- Slave channel 2:
  Slave channel 2 generates a PWM output. The master channel specifies a PWM output cycle and slave channel 2 specifies a duty cycle. After generating an interrupt, the counter returns to $FFFF_H$ and awaits the next interrupt from the master channel.

Slave channels 3 to 7 operate like slave channel 2.

As described in **Table 25.219, TAUDTTOUTm Output of Slave Channels for Non-Complementary Modulation Output Function Type 1 (TAUDnTOL.TAUDnTOLm = 0)**, a signal output from TAUDTTOUTm depends on the value of the real-time output bit (TAUDnTRO.TAUDnTROm) and modulation output bit (TAUDnTME.TAUDnTMEm) of slave channel.

This function cannot use a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

- If TAUDnTME.TAUDnTMEm = 0 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm = 1 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM (positive logic) corresponding to the channel.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

Table 25.219 TAUDTTOUTm Output of Slave Channels for Non-Complementary Modulation Output Function Type 1 (TAUDnTOL.TAUDnTOLm = 0)

TAUDnTME.TAUDnTMEm	TAUDnTRO.TAUDnTROm	TAUDTTOUTm Output
0	0	Low level
	1	High level
1	0	Low level
	1	PWM (positive logic)

- This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.
- TAUDnCDRm value of slave channel 1 should be set to 0000_H so that a real-time output is triggered at the same time with PWM generation on slave channels 2 to 7.
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.

25.16.1.2 Equations

Slave channels 2 to 7:

Pulse period = [TAUDnCDRm (master) + 1] × count clock cycle

Duty time = [TAUDnCDRm (slave)] × count clock cycle

25.16.1.3 Block Diagram and General Timing Diagram

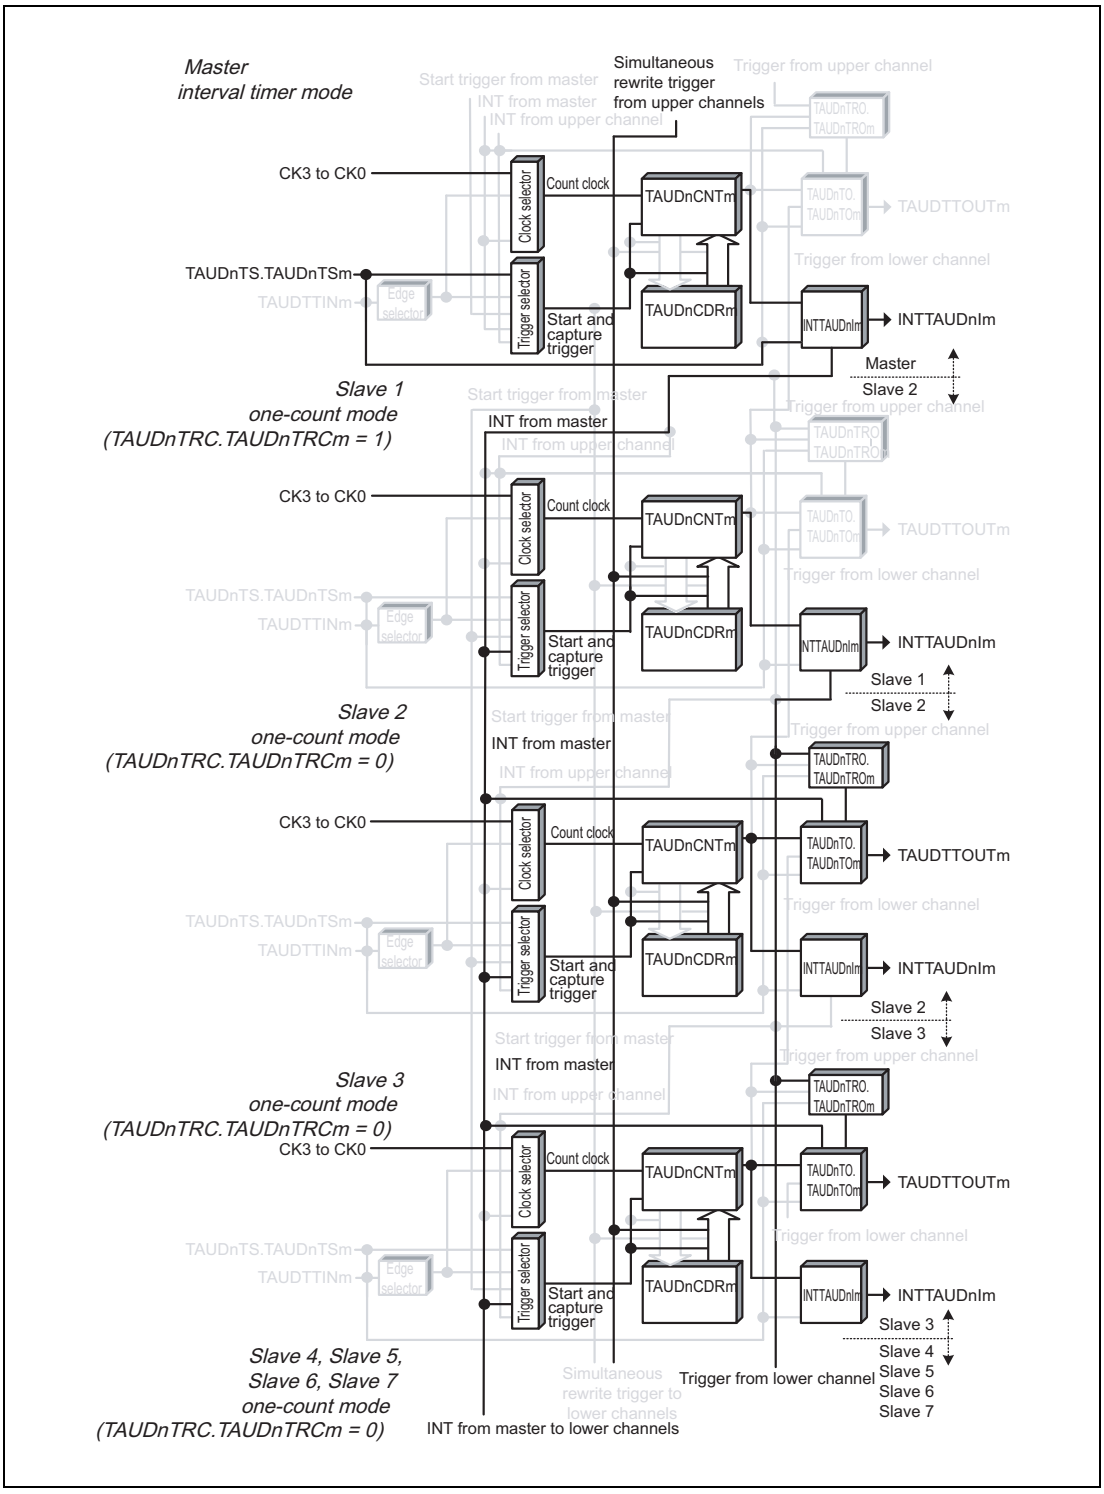

Figure 25.129 Block Diagram of Non-Complementary Modulation Output Function Type 1

The following settings apply to the general timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

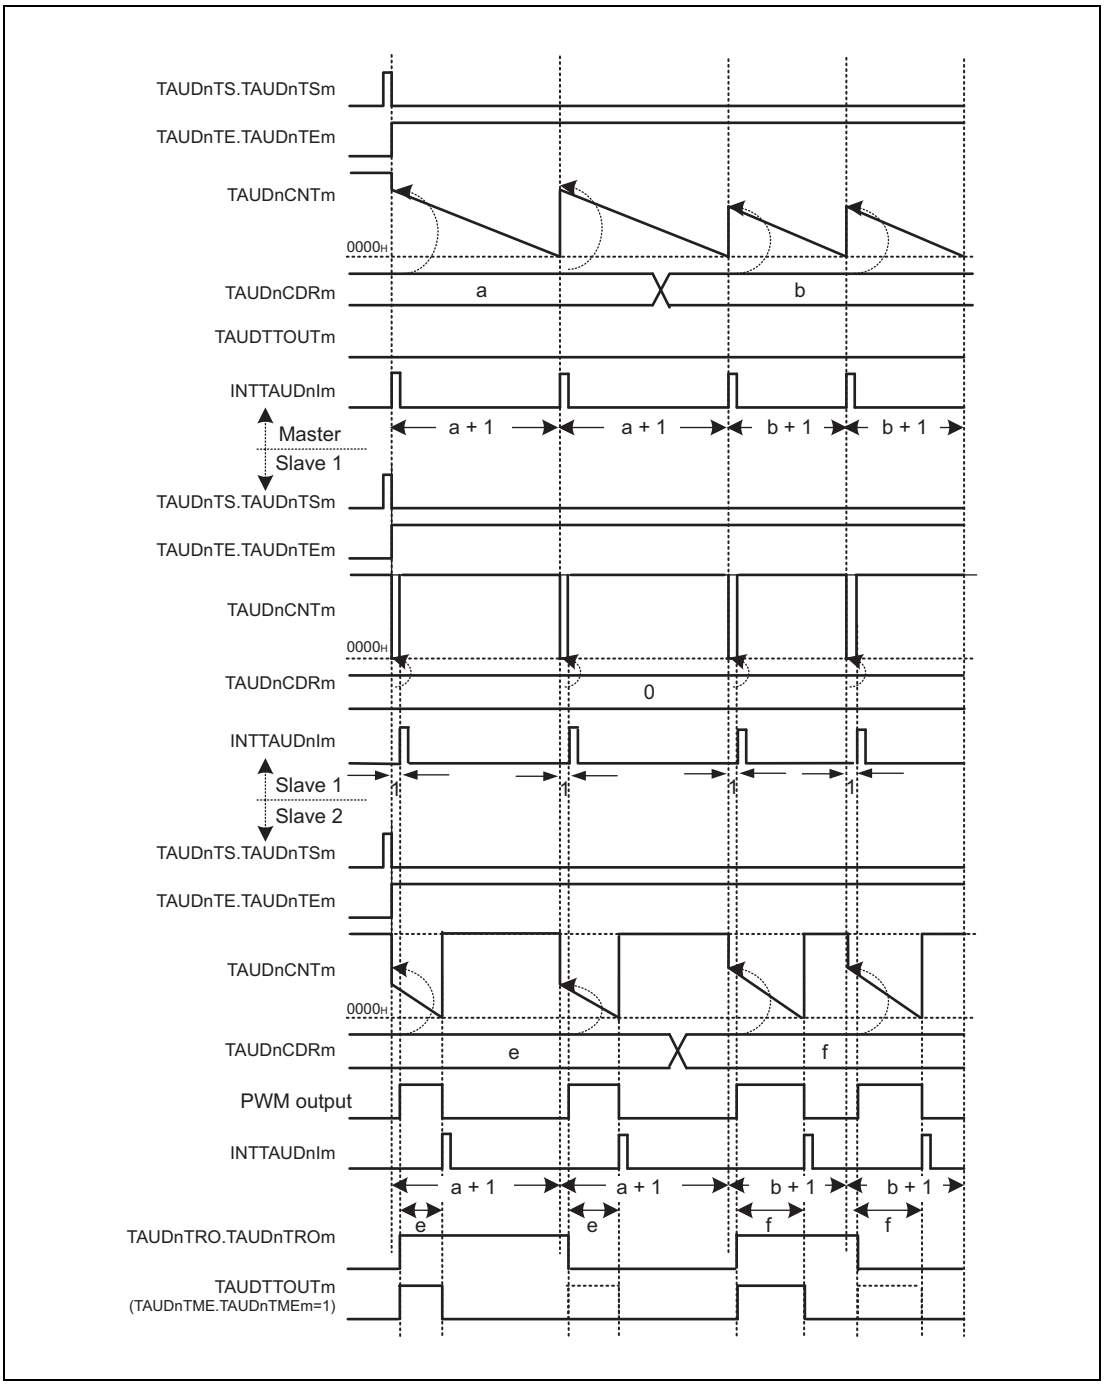

Figure 25.130 General Timing Diagram of Non-Complementary Modulation Output Function Type 1

NOTE

TAUDTTOUTm of slave channel 2 rises with a delay of one clock count after the rise of INTTAUDnIm of the master channel.

25.16.1.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 25.220 Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	1: INTTAUDnIm is generated at the beginning of operation or at a restart time.

(2) TAUDnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.221 Contents of the TAUDnCMURm Register for the Master Channel of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for the master channel

TAUDnTOE.TAUDnTOEm is set to 0 because channel output mode is not used with this function.

(4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.222 Simultaneous Rewrite Settings for the Master Channel of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

NOTE

Use with TAUDnRDS.TAUDnRDSm bit = 1 requires an upper channel higher than the master channel that operates with **Section 25.14.1, Simultaneous Rewrite Trigger Generation Function Type 1**.

Conduct operation settings under the following conditions.

- Simultaneous rewrite trigger output function type 1 setting channel: TAUDnRDCm = 1, TAUDnRDSm = 1
  In addition, TAUDnCDRm settings for this channel are as follows.
  = ((TAUDnCDR setting for the master channel targeted for simultaneous rewrite + 1) × Interrupt count) – 1
- Master channel: TAUDnRDCm = 0, TAUDnRDSm = 1
- Slave channel: TAUDnRDCm = 0, TAUDnRDSm = 1

25.16.1.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for slave channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 25.223 Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is valid.

(2) TAUDnCMURm for slave channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.224 Contents of the TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

(4) Simultaneous rewrite for slave channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.225 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

25.16.1.6 Register Settings for Slave Channels 2 to 7

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	100: INTTAUDnIm of master channel is a start trigger.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Start trigger during operation is valid.

(2) TAUDnCMURm for slave channels 2 to 7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.227 Contents of the TAUDnCMURm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for slave channels 2 to 7

Table 25.228 Control Bit Settings in Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

(4) Simultaneous rewrite of slave channels 2 to 7

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.229 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 1

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	0: Generates a simultaneous rewrite trigger signal when the master channel starts to count.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

25.16.1.7 Operating Procedure for Non-Complementary Modulation Output Function Type 1

Table 25.230 Operating Procedure for Non-Complementary Modulation Output Function Type 1 (1/2)

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.1.4, Register Settings for the Master Channel**. Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.1.5, Register Settings for Slave Channel 1**. Slave channels 2 to 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.1.6, Register Settings for Slave Channels 2 to 7**. Set the value of TAUDnCDRm register of every channel. Set a pulse cycle with TAUDnCDRm of master channel, 0000_H in TAUDnCDRm of slave channel 1, and duty width with TAUDnCDRm of slave channels 2 to 7. Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.	Channel operation is stopped.

Table 25.230 Operating Procedure for Non-Complementary Modulation Output Function Type 1 (2/2)

Restart Operation

	Operation	TAUDn Status
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down.
During Operation	TAUDnCDRm, TAUDnTRO.TAUDnTROm, and TAUDnTMEm.TAUDnTMEm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel, slave channel 1 and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. When the counter of master channel reaches 0000_H: • INTTAUDnIm is generated. • TAUDnCDRm value of master channel is reloaded into TAUDnCNTm to continue counting down. • PWM output signals of slave channels 2 to 7 are set. • TAUDnCDRm value of slave channel 1 is reloaded into TAUDnCNTm to perform counting down. • TAUDnCDRm value of slave channels 2 to 7 is reloaded into TAUDnCNTm to perform counting down. • When the counter of slave channel 1 reaches 0000_H: – INTTAUDnIm is generated. – The TAUDnTRO.TAUDnTROm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output. • When the counter of slave channels 2 to 7 reaches 0000_H: – INTTAUDnIm is generated. – PWM output signals of slave channels 2 to 7 are set. TAUDTTOUTm of slave channels 2 to 7 outputs a PWM signal, a high-level signal or low-level signal depending on the values of real-time output bits (TAUDnTRO.TAUDnTROm) and modulation output bit (TAUDnTME.TAUDnTMEm) of a pair of slave channels.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

25.16.1.8 Specific Timing Diagrams

The following settings apply to the specific timing diagram.

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

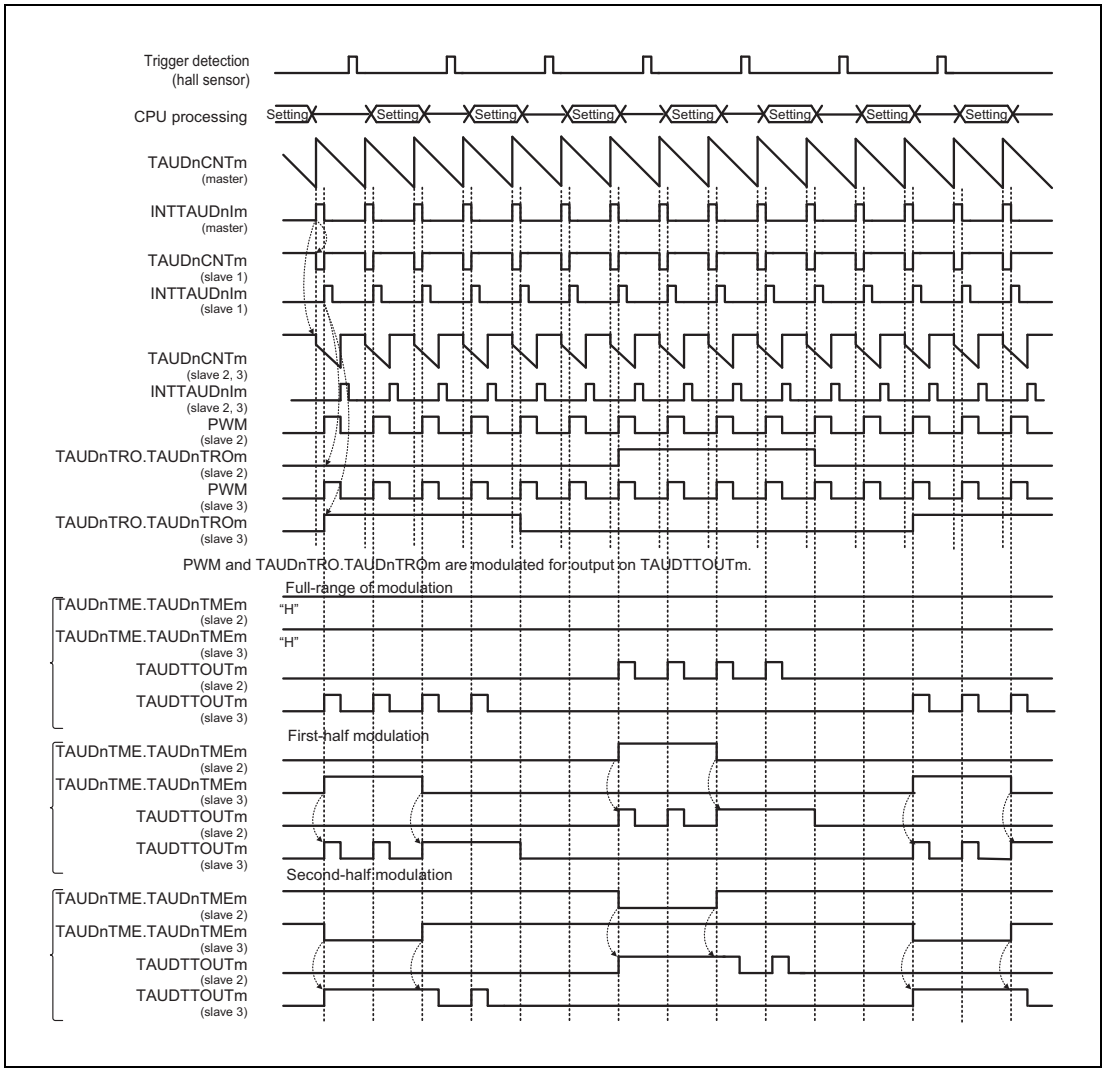

Figure 25.131 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 1

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The "Setting" symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and master channel cycle. According to the modified setting, modulation waveforms are output from TAUDTTOUTm.

A TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

25.16.2 Non-Complementary Modulation Output Function Type 2

25.16.2.1 Overview

Summary

This function outputs a triangular PWM output signal, a high-level signal, or low-level signal from TAUDTTOUTm depending on the real-time output bit value (TAUDnTRO.TAUDnTROm) and the modulation output enable bit value (TAUDnTME.TAUDnTMEm) of a pair of slave channels. Three pairs of channels are typically used.

Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See **Table 25.232, Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 2**).
- The operating mode for slave channel 1 should be set to event count mode (See **Table 25.236, Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2**).
- The operating mode for slave channels 2 to 7 should be set to count-up/-down mode (See **Table 25.239, Contents of the TAUDnCMORm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2**).
- The output mode for the master channel should be set to independent channel output mode 1. (See **Section 25.7, Channel Output Modes**.)
- This function does not use TAUDTTOUTm of slave channel 1 but TAUDnTRC.TAUDnTRCm should be set to 1 (See **Section 25.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with non-complementary modulation output (See **Section 25.7, Channel Output Modes**).

Functional description

The master/slave channel counter is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) is loaded into the counter (TAUDnCNTm).

- Master channel:
  The counter of master channel starts to count down. When the counter reaches 0000_H, INTTAUDnIm is generated.
- Slave channel 1:
  When slave channel 1 detects an interrupt from the master channel, the TAUDnCNTm value is decremented. When an interrupt from the master channel is detected (TAUDnCDRm + 1) times, INTTAUDnIm is generated. Then, the TAUDnCDRm value is loaded into TAUDnCNTm to continue operation subsequently.
  Since slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm = 1), if an interrupt occurs on slave channel 1, the real-time output bit (TAUDnTRO.TAUDnTROm) of the channel which monitors an interrupt on the corresponding channel is reflected to the TAUDTTOUTm output.
- Slave channel 2:
  Once detecting an interrupt from the master channel, TAUDnCNTm counts in the reverse direction. When an interrupt is detected during count-up operation, TAUDnCDRm value is reloaded and then the counter starts to count down.
  If TAUDnCNTm = 0001_H, an interrupt occurs and a PWM output signal is set/reset.

The combined use of the master channel and slave channel 2 generates a PWM output signal. The master channel generates a PWM output cycle and slave channel 2 generate a duty cycle.

Slave channels 3 to 7 operate like slave channel 2.

A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROm) and a modulation output bit value (TAUDnTME.TAUDnTMEm) of the slave channel, as described in **Table 25.231, TAUDTTOUTm Output of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0)**.

This function cannot make a forced restart. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

- If TAUDnTME.TAUDnTMEm = 0 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs a high-level signal.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm = 1 on slave channels 2 to 7 (TAUDnTOL.TAUDnTOLm = 0):
  - If the channel's TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm outputs PWM (positive logic) corresponding to the channel.
  - If the channel's TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic. Only the initial setting of TAUDnTOL.TAUDnTOLm is permitted (cannot be changed during operation).

Table 25.231 TAUDTTOUTm Output of Slave Channels in Non-Complementary Modulation Output Function Type 2 (TAUDnTOL.TAUDnTOLm = 0)

TAUDnTME.TAUDnTMEm	TAUDnTRO.TAUDnTROm	TAUDTTOUTm Output
0	0	Low level
	1	High level
1	0	Low level
	1	PWM (positive logic)

- This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.

25.16.2.2 Equations

Slave channels 2 to 7:

Carrier cycle (down/up) = [TAUDnCDRm (master) + 1] × 2 × count clock cycle

Duty time = [TAUDnCDRm (master) + 1 - TAUDnCDRm (slave)] × 2 × count clock cycle

25.16.2.3 Block Diagram and General Timing Diagram

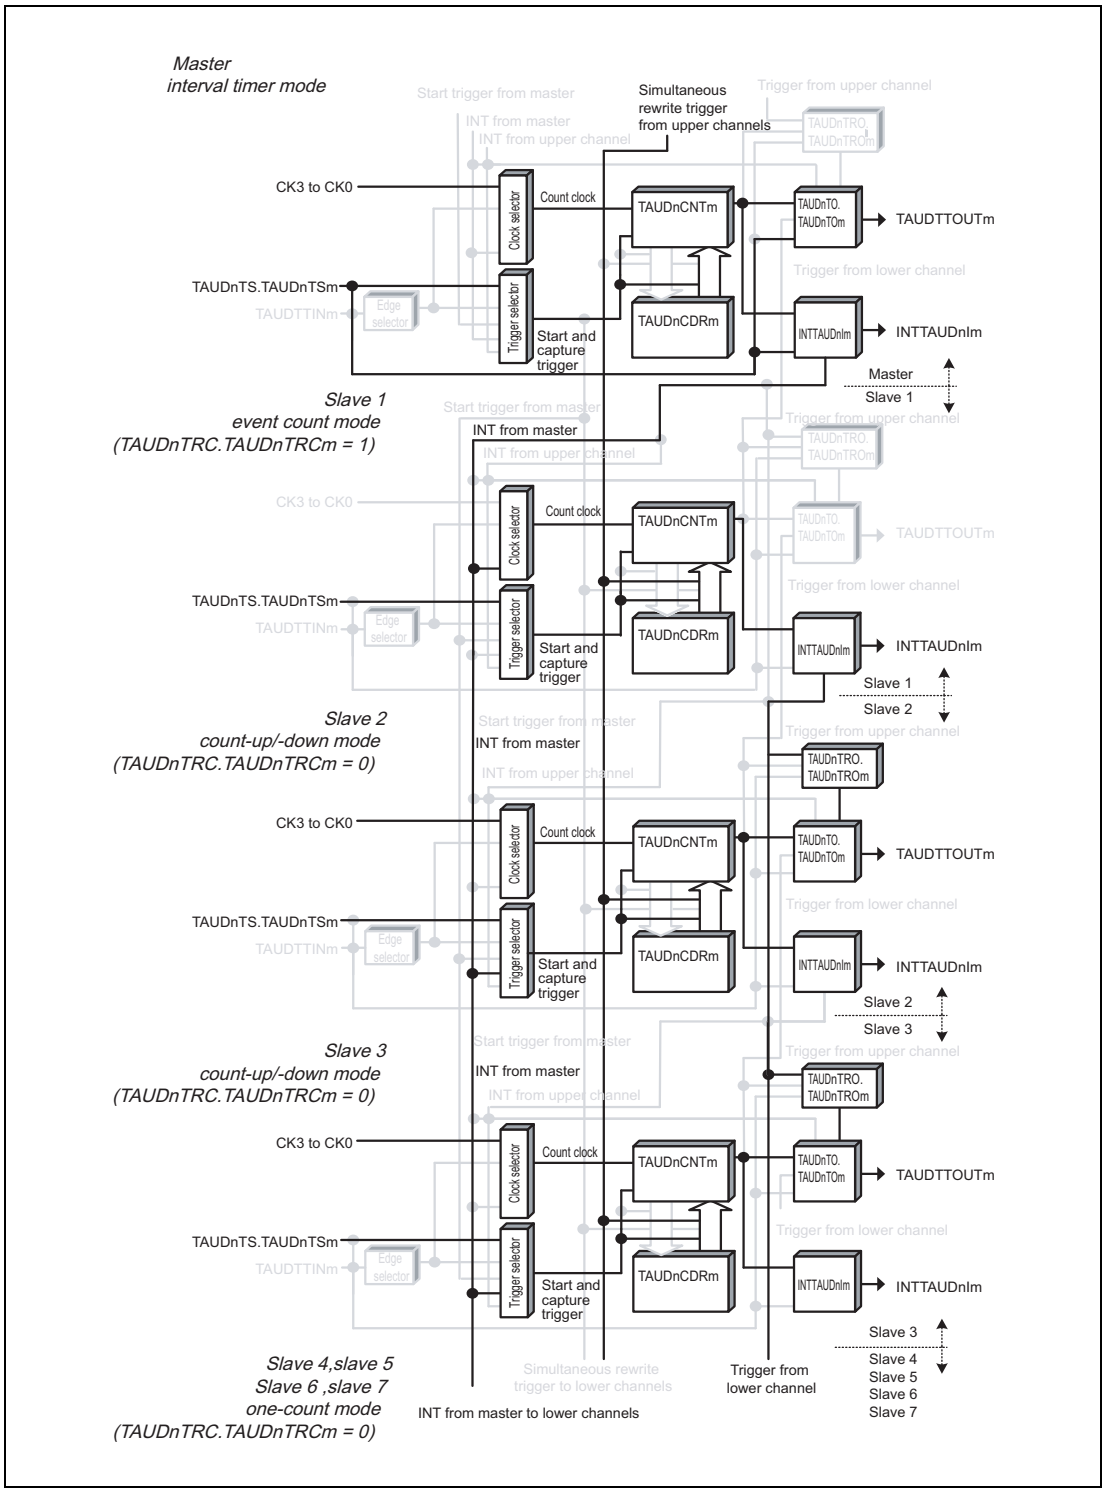

Figure 25.132 Block Diagram of Non-Complementary Modulation Output Function Type 2

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

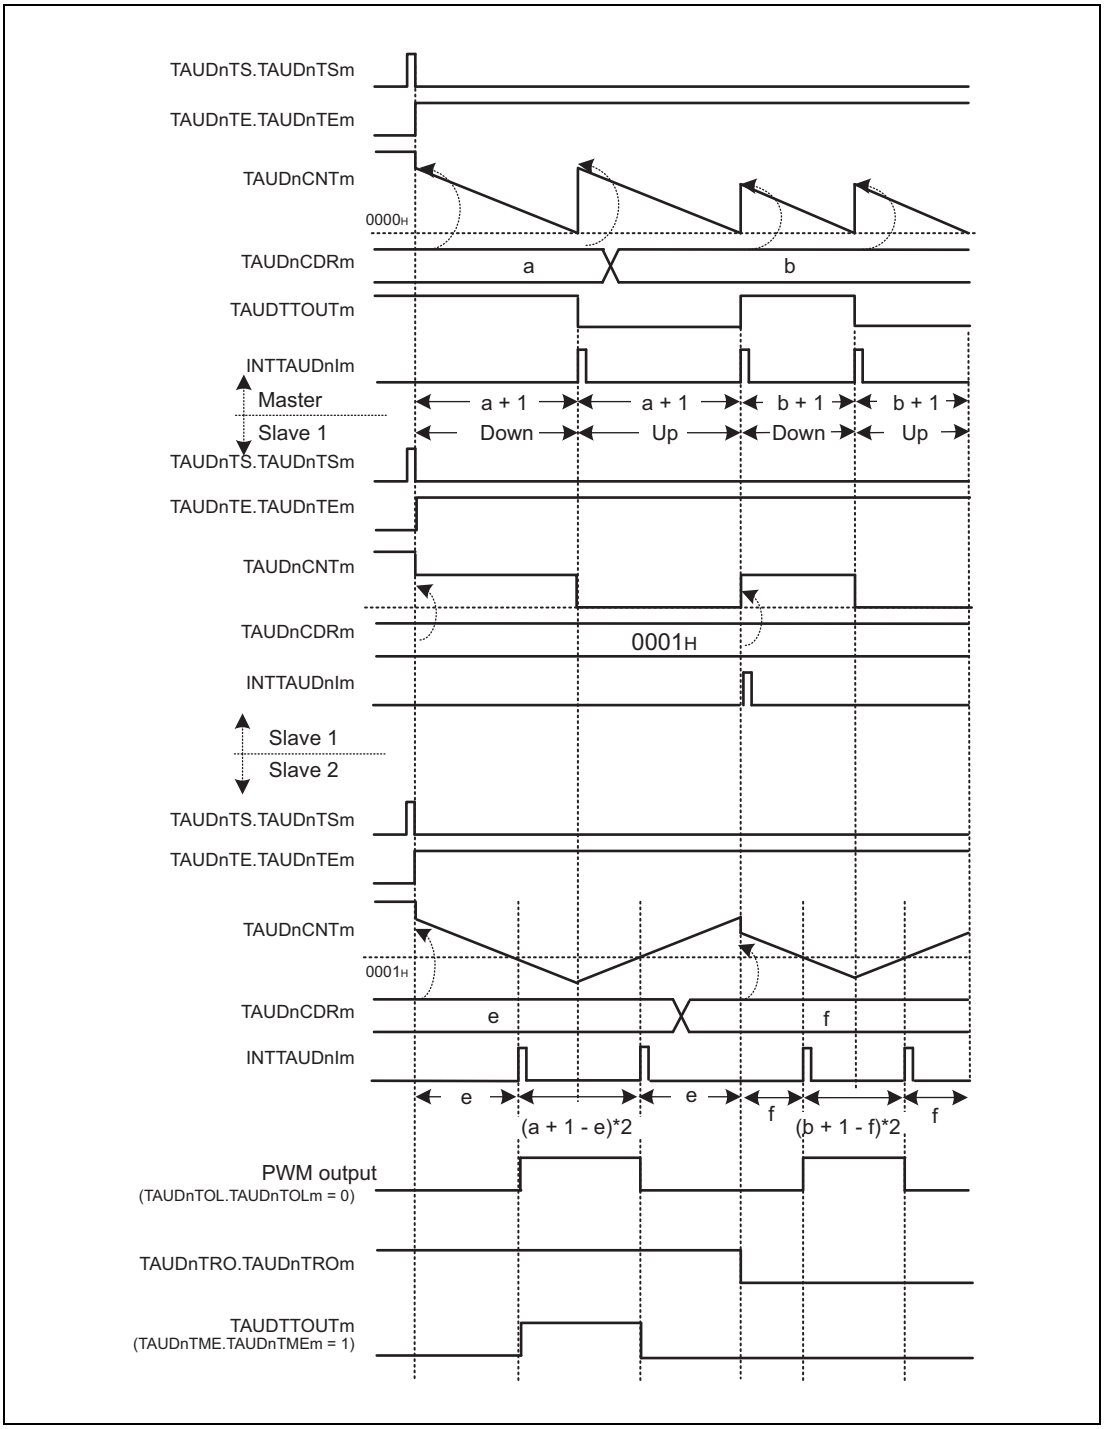

Figure 25.133 General Timing Diagram of Non-Complementary Modulation Output Function Type 2

25.16.2.4 Register Settings for the Master Channel

(1) TAUDnCMORm for the master channel

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 25.232 Contents of the TAUDnCMORm Register for the Master Channel of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time. 1: INTTAUDnIm is generated at the beginning of operation or at a restart time.

(2) TAUDnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.233 Contents of the TAUDnCMURm Register for the Master channel of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for the master channel

Table 25.234 Control Bit Settings for the Master Channel in Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (toggle mode with TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.235 Simultaneous Rewrite Settings for the Master Channel of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

25.16.2.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for slave channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 25.236 Contents of the TAUDnCMORm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	11: INTTAUDnIm of the master channel is used as the count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software. 011: Triggers simultaneous rewrite.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0011: Event count mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

(2) TAUDnCMURm for slave channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.237 Contents of the TAUDnCMURm Register for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

(4) Simultaneous rewrite for slave channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.238 Simultaneous Rewrite Settings for Slave Channel 1 of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

25.16.2.6 Register settings for slave channels 2 to 7

(1) TAUDnCMORm for slave channels 2 to 7

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 25.240 Contents of the TAUDnCMURm Register for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Output mode for slave channels 2 to 7

Table 25.241 Control Bit Settings in Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: The upper channel generates the real-time output trigger for channel m
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

(4) Simultaneous rewrite for slave channels 2 to 7

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.242 Simultaneous Rewrite Settings for Slave Channels 2 to 7 of Non-Complementary Modulation Output Function Type 2

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

25.16.2.7 Operating Procedure for Non-Complementary Modulation Output Function Type 2

Table 25.243 Operating Procedure for Non-Complementary Modulation Output Function Type 2 (1/2)

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.2.4, Register Settings for the Master Channel**. Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.2.5, Register Settings for Slave Channel 1**. Slave channels 2 to 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.2.6, Register settings for slave channels 2 to 7**. Set the value of TAUDnCDRm register of every channel. Set pulse cycle in TAUDnCDRm of master channel, and in TAUDnCDRm of slave channel 1, set the number of interrupts from master channel to be ignored before slave channel 1 generates a real-time output trigger. Set duty width in TAUDnCDRm of slave channels 2 to 7. Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.	Channel operation is stopped.

Table 25.243 Operating Procedure for Non-Complementary Modulation Output Function Type 2 (2/2)

Restart Operation

	Operation	TAUDn Status
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down.
During Operation	TAUDnCDRm, TAUDnTRO.TAUDnTROm, and TAUDnTMEm.TAUDnTMEm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	The TAUDnCDRm value of master channel and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. The TAUDnCDRm value of slave channel 1 is loaded and the counter waits for an interrupt from the master channel. When the counter of master channel reaches 0000_H: • INTTAUDnIm is generated. • TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down. • The TAUDnCNTm value of slave channel 1 decrements by 1 and the counter waits for a next interrupt from the master channel. • TAUDnCNTm of slave channels 2 to 7 reloads the TAUDnCDRm value, or performs counting in opposite direction. • At the same timing when the TAUDnCDRm value is loaded, the TAUDnTME.TAUDnTMEm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output. • When slave channel 1 detects an interrupt from the master channel for the (TAUDnCDRm + 1) times: – INTTAUDnIm is generated. – The TAUDnTRO.TAUDnTROm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output. • When the counter of slave channels 2 to 7 reaches 0001_H: – INTTAUDnIm is generated. – PWM output signals of slave channels 2 to 7 are set/reset.
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

25.16.2.8 Specific Timing Diagrams

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

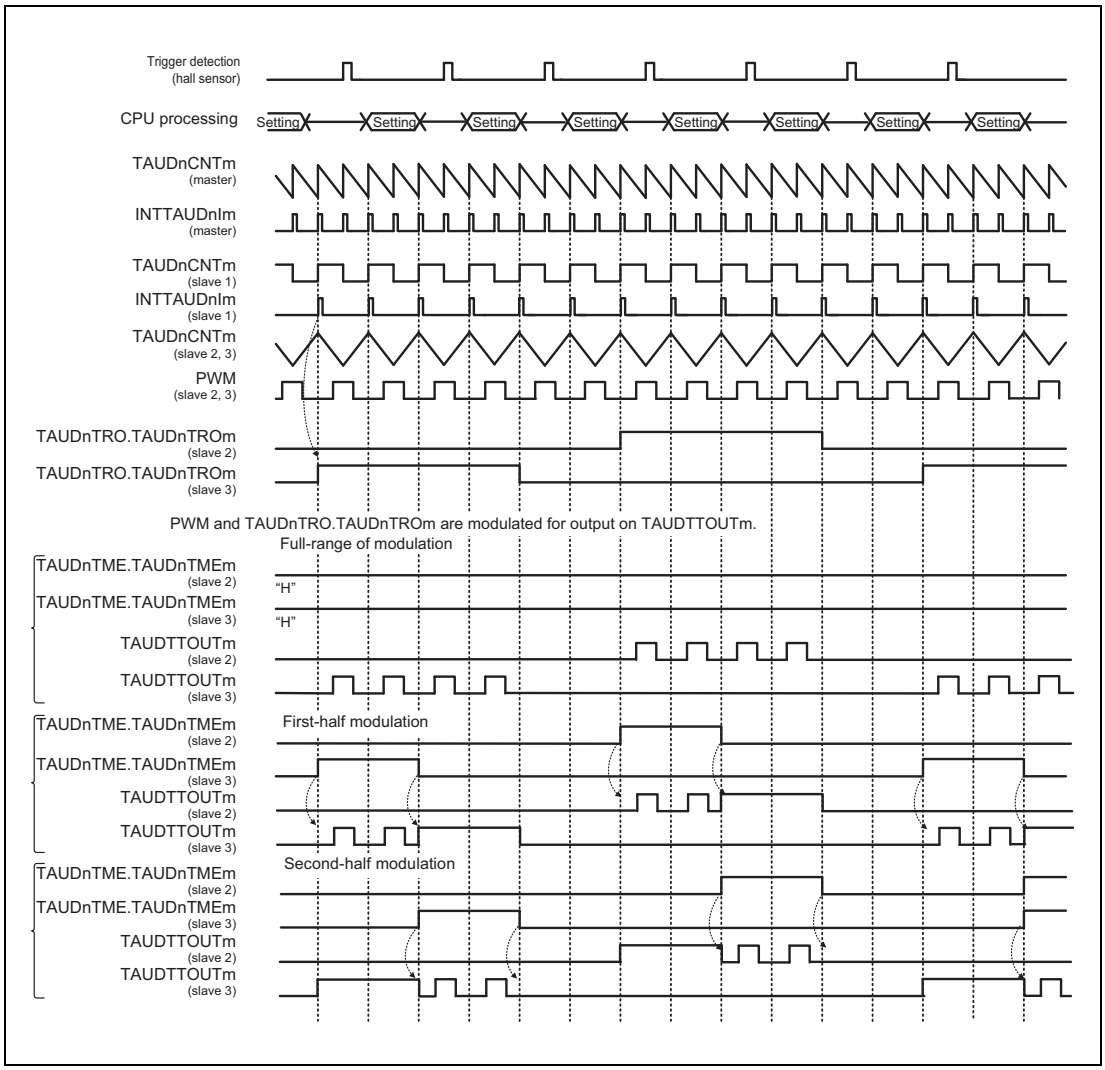

Figure 25.134 Specific Timing Diagram of Non-Complementary Modulation Output Function Type 2

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

The "Setting" symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, and TAUDnTRO.TAUDnTROm can be changed.

TAUDnTME.TAUDnTMEm setting is reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is set by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

25.16.3 Complementary Modulation Output Function

25.16.3.1 Overview

Summary

This function outputs a triangle PWM output signal, a high-level signal, or low-level signal from TAUDTTOUTm with dead time added, depending on the real-time output bit value (TAUDnTRO.TAUDnTROm) and the modulation output bit value (TAUDnTME.TAUDnTMEm) of a pair of slave channels, and an output level bit value (TAUDnTDL.TAUDnTDLm). Three pairs of channels are typically used.

Prerequisites

- One master channel and seven slave channels
- The operation mode of the master channel must be set to interval timer mode (See **Table 25.245, Contents of the TAUDnCMORm Register for the Master Channel of the Complementary Modulation Output Function**).
- The operating mode for slave channel 1 should be set to event count mode (See **Table 25.249, Contents of the TAUDnCMORm Register for Slave Channel 1 of the Complementary Modulation Output Function**).
- The operating mode for slave channels 2, 4 and 6 should be set to count-up/-down mode (See **Table 25.252, Contents of the TAUDnCMORm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function**).
- The operating mode for slave channels 3, 5 and 7 should be set to one-count mode (See **Table 25.256, Contents of the TAUDnCMORm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function**).
  In addition, as the number of occurrences of an interrupt for slave channels 3, 5 and 7 within the carrier cycle is not uniquely determined, do not use the interrupt as an interrupt source.
- The output mode for master channels should be set to independent channel output mode 1 (See **25.7, Channel Output Modes**).
- This function does not use TAUDTTOUTm of slave channel 1 but TAUDnTRC.TAUDnTRCm should be set to 1 (See **Section 25.7, Channel Output Modes**).
- The channel output mode for slave channels 2 to 7 should be set to synchronous channel output mode 2 with complementary modulation output (See **Section 25.7, Channel Output Modes**).

Functional description

- Master channel:
  The counter of the master channel is enabled by setting the channel trigger bit (TAUDnTS.TAUDnTSm) to 1. This sets TAUDnTE.TAUDnTEm = 1, enabling count operation. The value of data register (TAUDnCDRm) of the master channel is loaded into the counter (TAUDnCNTm) and the counter starts to count down from this value.
  When the counter of master channel reaches 0000_H, INTTAUDnIm is generated. This decrements the counter value of slave channel 1 by 1 and the counter of slave channel 2 starts to count in the opposite direction.
- Slave channel 1:
  When the counter reaches 0000_H, slave channel 1 waits for the next interrupt from the master

channel. And the TAUDnCDRm value is reloaded into TAUDnCNTm (slave 1) and INTTAUDnIm is generated.
Slave channel 1 is set as a real-time output trigger channel (TAUDnTRC.TAUDnTRCm = 1). The value of real-time output bit (TAUDnTRO.TAUDnTROm) of each channel is applied to the channel that detects the occurrence of an interrupt on slave channel 1 by an interrupt. The real-time output bit value can be changed in any timing by application software but a new value is not applied until an interrupt occurs on slave channel 1.

- Slave channel 2:
  When the slave channel 2 counter reaches 0001_H, the slave channel 3 counter starts counting down. When the slave channel 3 counter reaches 0000_H, an interrupt occurs.
- Slave channels 2 and 3:
  The combined use of the master channel and slave channels 2 and 3 generates a PWM output signal. The master channel generates a PWM output cycle, slave channel 2 generates a duty cycle, and slave channel 3 generates dead time.
- Slave channels 4 to 7:
  Slave channels 4 and 6 operate like slave channel 2. Slave channels 5 and 7 operate like slave channel 3.

A signal that is output from TAUDTTOUTm depends on a real-time output bit value (TAUDnTRO.TAUDnTROm), a modulation output bit value (TAUDnTME.TAUDnTMEm), and an output level bit value (TAUDnTDL.TAUDnTDLm) of the slave channel, as described in **Table 25.244, TAUDTTOUTm Output (TAUDnTOL.TAUDnTOLm = 0) for a Pair of Slave Channels of Complementary Modulation Output Function**.

It is, however, prohibited that a high-level signal is output from both channel 2 and channel 3 (in order to prevent a motor driver short circuit).

Forced restart is not possible for this function. The counter can be stopped by setting TAUDnTT.TAUDnTTm of master and slave channels to 1. This sets TAUDnTE.TAUDnTEm to 0. TAUDnCNTm and TAUDTTOUTm of master and slave channels stop but retain their values. The counters can be restarted by setting TAUDnTS.TAUDnTSm to 1.

Conditions

- If TAUDnTME.TAUDnTMEm of a pair of channels is set to 1 (TAUDnTOL.TAUDnTOLm = 0):
  - If TAUDnTRO.TAUDnTROm of one channel is set to 1, TAUDTTOUTm outputs the corresponding PWM of the channel.
  - If TAUDnTRO.TAUDnTROm of both channels is set to 0, TAUDTTOUTm of a pair outputs a low-level signal.
- If TAUDnTME.TAUDnTMEm of a pair of channels is set to 0 (TAUDnTOL.TAUDnTOLm = 0):
  - If TAUDnTRO.TAUDnTROm is set to 1, TAUDTTOUTm of the channel outputs a high-level signal.
  - If TAUDnTRO.TAUDnTROm is set to 0, TAUDTTOUTm of the channel outputs a low-level signal.
- If TAUDnTOL.TAUDnTOLm is set to 1, high-level and low-level signals output from TAUDTTOUTm are inverted. The PWM signal is negative logic.

Table 25.244 TAUDTTOUTm Output (TAUDnTOL.TAUDnTOLm = 0) for a Pair of Slave Channels of Complementary Modulation Output Function

TAUDnTME.TAUDnTME02	TAUDnTME.TAUDnTME03	TAUDnTRO.TAUDnTRO02	TAUDnTRO.TAUDnTRO03	TAUDnTDL.TAUDnTDL02	TAUDnTDL.TAUDnTDL03	TAUDTTOUT2 Output	TAUDTTOUT3 Output
0	0	0	0	X	X	Low level	Low level
		0	1	1	0	Low level	High level
		1	0	0	1	High level	Low level
		1	1	X	X	Setting prohibited	Setting prohibited
1	1	0	0	X	X	Low level	Low level
		0	1	1	0	~PWM	PWM
		1	0	0	1	PWM	~PWM
		1	1	X	X	Setting prohibited	Setting prohibited

NOTES

1. In the above table, PWM indicates a positive PWM signal and ~PWM indicates an inverted PWM signal (positive logic). PWM and ~PWM are set by TAUDnTDL.TAUDnTDLm.
2. Any settings not listed above are prohibited.

- If TAUDnTME.TAUDnTMEm is continuously set to 1 while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, full modulation is applied.
- If TAUDnTME.TAUDnTMEm is set to 1 at the first half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, first-half modulation is applied.
- If TAUDnTME.TAUDnTMEm is set to 1 at the second half of the period while TAUDnTRO.TAUDnTROm of one of paired channels is set to 1, second-half modulation is applied.
- Whether dead time is added to a normal or reverse phase PWM signal when two channels become high-level signal outputs simultaneously depends on a TAUDnTDL.TAUDnTDLm bit value.
  - If TAUDnTDL.TAUDnTDLm = 0, dead time is added to a normal phase PWM signal.
  - If TAUDnTDL.TAUDnTDLm = 1, dead time is added to a reverse phase PWM signal.
  - The operation defined by a TAUDnTDL.TAUDnTDLm bit value should be conducted by application software during operation. To modify TAUDnTDL.TAUDnTDLm, rewrite it during the period when TAUDnTRO.TAUDnTROm is 00_B.
- The TAUDnCDRm value of slave channel 1 should be set to the value to generate INTTAUDnIm of slave channel 1 at a carrier cycle (peak interrupt timing).
- If TAUDnTOL.TAUDnTOLm is set to 0 on slave channels 2 to 7:
  - If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.
  - If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.
- If TAUDnTOL.TAUDnTOLm is set to 1 on slave channels 2 to 7:
  - If TAUDnTDL.TAUDnTDLm is set to 0, TAUDnTO.TAUDnTOm is set to 1 (high) before TAUDnTE.TAUDnTEm is set to 0.
  - If TAUDnTDL.TAUDnTDLm is set to 1, TAUDnTO.TAUDnTOm is set to 0 (low) before TAUDnTE.TAUDnTEm is set to 0.

- This function enables simultaneous rewrite. See **Section 25.6, Simultaneous Rewrite**.

25.16.3.2 Equations

Pulse period = (TAUDnCDRm (master) + 1) × count clock cycle

$0000_H \leq$ TAUDnCDRm (master) $< FFFF_H$

Carrier cycle (down/up) = (TAUDnCDRm (master) + 1) × 2 × count clock cycle

For slave channels 2 and 3:

PWM signal width (positive phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2) × 2) – (TAUDnCDRm (slave 3) + 1)] × count clock cycle

PWM signal width (negative phase) = [(TAUDnCDRm (master) + 1 – TAUDnCDRm (slave 2) × 2) + (TAUDnCDRm (slave 3) + 1)] × count clock cycle

For slave channels 4 to 7:

Slave channels 4 and 6 are calculated in the same way as slave channel 2, whereas slave channels 5 and 7 are calculated as slave channel 3.

25.16.3.3 Block Diagram and General Timing Diagram

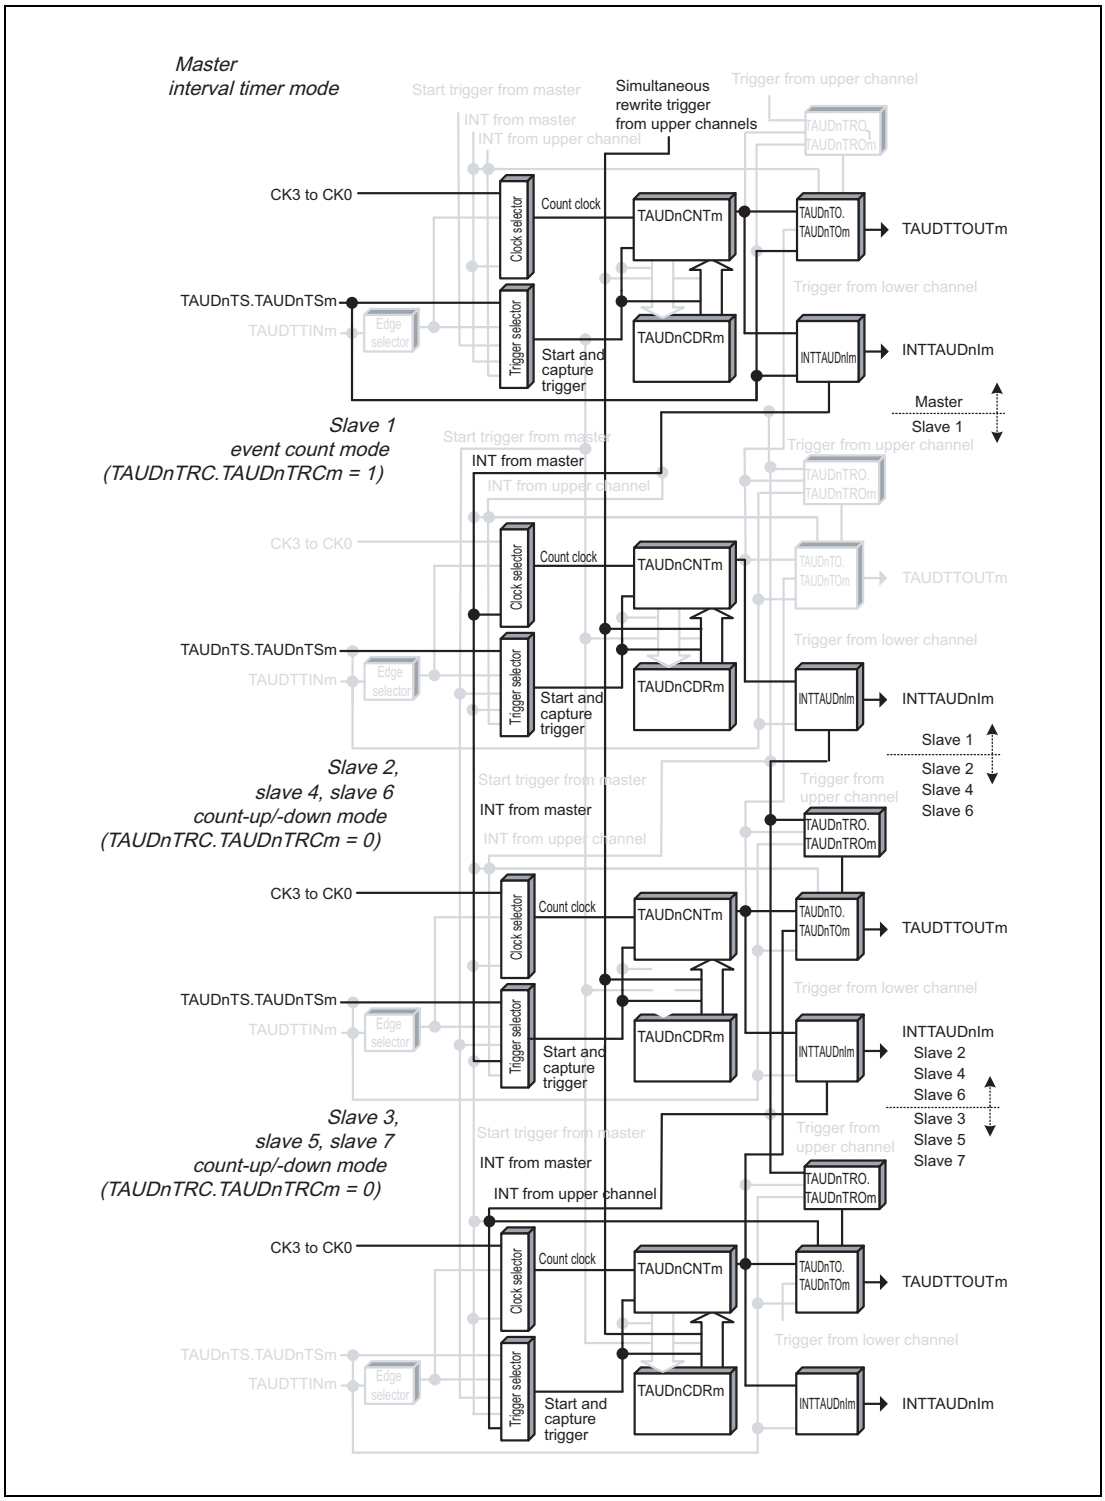

Figure 25.135 Block Diagram of Complementary Modulation Output Function

The following settings apply to the general timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channel 1: TAUDnCDRm = 0001_H

- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

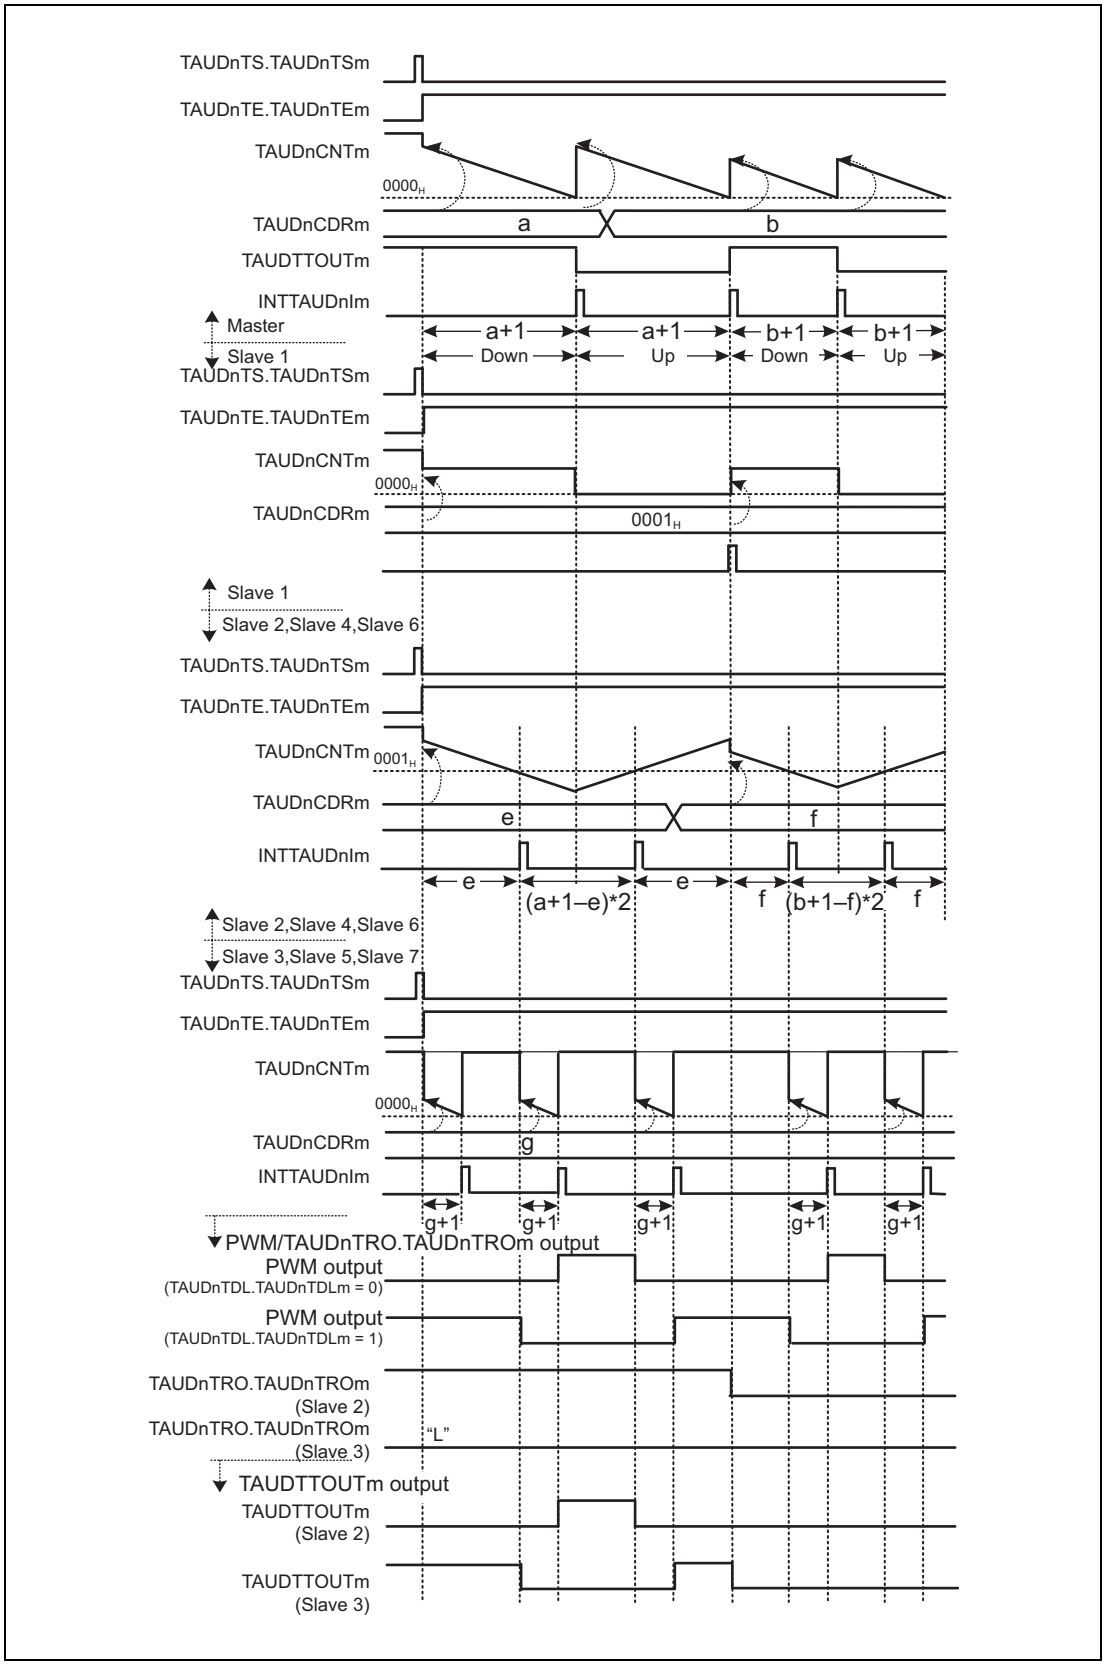

Figure 25.136 General Timing Diagram of Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	1: Master channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0000: Interval timer mode
0	TAUDnMD0	0: INTTAUDnIm is not generated and TAUDTTOUTm is not toggled at the beginning of operation or at a restart time. 1: INTTAUDnIm is generated to toggle TAUDTTOUTm at the beginning of an operation.

(2) TAUDnCMURm for the master channel

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.246 Contents of the TAUDnCMURm Register for the Master Channel of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode for the master channel

Table 25.247 Control Bit Settings in Independent Channel Output Mode 1

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	0: Independent channel output
TAUDnTOC.TAUDnTOCm	0: Operating mode 1 (Toggle mode if TAUDnTOM.TAUDnTOMm = 0)
TAUDnTOL.TAUDnTOLm	0: The setting is disabled in toggle mode (the value after reset).
TAUDnTDE.TAUDnTDEm	0: Disables dead time operation
TAUDnTDM.TAUDnTDMm	0: When dead time operation is disabled (TAUDnTDE.TAUDnTDEm = 0), set these bits to 0
TAUDnTDL.TAUDnTDLm	
TAUDnTRE.TAUDnTREm	0: Disables real-time output
TAUDnTRO.TAUDnTROm	0: When real-time output is disabled (TAUDnTRE.TAUDnTREm = 0), set these bits to 0
TAUDnTRC.TAUDnTRCm	
TAUDnTME.TAUDnTMEm	0: Disables modulation

(4) Simultaneous rewrite for the master channel

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.248 Simultaneous Rewrite Settings for the Master Channel of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

NOTE

If TAUDnRDS.TAUDnRDSm = 1, it is necessary for an upper channel higher than the master channel to generate a simultaneous rewrite trigger signal.

25.16.3.5 Register Settings for Slave Channel 1

(1) TAUDnCMORm for slave channel 1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 25.249 Contents of the TAUDnCMORm Register for Slave Channel 1 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	11: INTTAUDnIm of the master channel is used as the count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	000: Trigger the counter using software. 011: Triggers simultaneous rewrite.
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0011: Event count mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

(2) TAUDnCMURm for slave channel 1

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.250 Contents of the TAUDnCMURm Register for Slave Channel 1 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Channel output mode

TAUDnTOE.TAUDnTOEm is set to 0 because the channel output mode is not used on slave channel 1 with this function. However, this mode can be used in independent channel output mode controlled by software.

CAUTION

TAUDnTRC.TAUDnTRCm should be set to 1 because slave channel 1 is used as a real-time output trigger channel.

(4) Simultaneous rewrite for slave channel 1

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.251 Simultaneous Rewrite Settings for Slave Channel 1 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

25.16.3.6 Register settings for slave channels 2, 4, and 6

(1) TAUDnCMORm for slave channels 2, 4, and 6

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 25.252 Contents of the TAUDnCMORm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	111: Up/down output trigger signal of master channel
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	1001: Count-up/-down mode
0	TAUDnMD0	0: INTTAUDnIm is not generated at the beginning of operation or at a restart time.

(2) TAUDnCMURm for slave channels 2, 4, and 6

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.253 Contents of the TAUDnCMURm Register for Slave Channel 2, 4, and 6 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Output mode for slave channels 2, 4, and 6

Table 25.254 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time output trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

CAUTION

At the PWM output, set TAUDnTDL.TAUDnTDLm exclusively from odd channels.

(4) Simultaneous rewrite for slave channels 2, 4, and 6

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.255 Simultaneous Rewrite Settings for Slave Channels 2, 4, and 6 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: A simultaneous rewrite trigger signal is generated when master channel starts to count and the corresponding slave channel is at the peak of a triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

25.16.3.7 Register settings for slave channels 3, 5, and 7

(1) TAUDnCMORm for slave channels 3, 5, and 7

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUDnCKS[1:0]		TAUDnCCS[1:0]		TAUDn MAS	TAUDnSTS[2:0]			TAUDnCOS[1:0]		—	TAUDnMD[4:1]				TAUDn MD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 25.256 Contents of the TAUDnCMORm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
15, 14	TAUDnCKS[1:0]	Operation Clock Selection 00: Prescaler output = CK0 01: Prescaler output = CK1 10: Prescaler output = CK2 11: Prescaler output = CK3 The value of the TAUDnCKS[1:0] bits of the master and slave channels must be identical.
13, 12	TAUDnCCS[1:0]	00: Uses an operation clock as a count clock
11	TAUDnMAS	0: Slave channel
10 to 8	TAUDnSTS[2:0]	110: Dead time trigger
7, 6	TAUDnCOS[1:0]	00: Unused. Set to 00.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 1	TAUDnMD[4:1]	0100: One-count mode
0	TAUDnMD0	1: Enables start trigger detection while counting.

(2) TAUDnCMURm for slave channels 3, 5, and 7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUDnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.257 Contents of the TAUDnCMURm Register for Slave Channel 3, 5, and 7 of the Complementary Modulation Output Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUDnTIS[1:0]	00: Unused. Set to 00.

(3) Output mode for slave channels 3, 5, and 7

Table 25.258 Control Bit Settings in Synchronous Channel Output Mode 2 with Complementary Modulation Output

Bit Name	Setting
TAUDnTOE.TAUDnTOEm	1: Enables independent channel output mode
TAUDnTOM.TAUDnTOMm	1: Synchronous channel output
TAUDnTOC.TAUDnTOCm	1: Operating mode 2
TAUDnTOL.TAUDnTOLm	0: Positive logic 1: Negative logic
TAUDnTDE.TAUDnTDEm	1: Enables dead time operation.
TAUDnTDM.TAUDnTDMm	0: Adds dead time if an interrupt is detected on an even upper channel and the conditions set by TAUDnTDL.TAUDnTDLm are satisfied.
TAUDnTDL.TAUDnTDLm	0: Adds dead time to normal phase. 1: Adds dead time to reverse phase.
TAUDnTRE.TAUDnTREm	1: Enables real-time output.
TAUDnTRO.TAUDnTROm	0: Real-time output is low. 1: Real-time output is high.
TAUDnTRC.TAUDnTRCm	0: Upper channel generates a real-time trigger for channel m.
TAUDnTME.TAUDnTMEm	0: Disables modulation 1: Enables modulation

CAUTION

At the PWM output, set TAUDnTDL.TAUDnTDLm exclusively from even channels.

(4) Simultaneous rewrite for slave channels 3, 5, and 7

Both the master and slave channels should have the same simultaneous rewrite settings.

Table 25.259 Simultaneous Rewrite Settings for Slave Channels 3, 5, and 7 of Complementary Modulation Output Function

Bit Name	Setting
TAUDnRDE.TAUDnRDEm	1: Enables simultaneous rewrite.
TAUDnRDS.TAUDnRDSm	0: Monitors master channel for simultaneous rewrite triggers. 1: Monitors upper channel other than the channel group for simultaneous rewrite triggers.
TAUDnRDM.TAUDnRDMm	1: Simultaneous rewrite trigger signal is generated when master channel counter is started and the corresponding slave channel is at the peak of triangular wave.
TAUDnRDC.TAUDnRDCm	0: Does not operate as a simultaneous rewrite trigger generation channel. Monitors master channel for simultaneous rewrite triggers, regardless of the value of this bit, when TAUDnRDS.TAUDnRDSm = 0.

25.16.3.8 Operating Procedure for Complementary Modulation Output Function

Table 25.260 Operating Procedure for Complementary Modulation Output Function (1/2)

	Operation	TAUDn Status
Initial Channel Setting	Master channel: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.3.4, Register Settings for the Master Channel**. Slave channel 1: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.3.5, Register Settings for Slave Channel 1**. Slave channels 2, 4, and 6: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.3.6, Register settings for slave channels 2, 4, and 6**. Slave channels 3, 5, and 7: Set TAUDnCMORm and TAUDnCMURm registers and the channel output mode as described in **Section 25.16.3.7, Register settings for slave channels 3, 5, and 7**. Set the value of TAUDnCDRm register of every channel. Set a pulse cycle using TAUDnCDRm of master channel, and an interrupt count of master channel to be ignored using TAUDnCDRm of slave channel 1. Also set a duty width in TAUDnCDRm of slave channels 2, 4, and 6, and a dead time delay on slave channels 3, 5, and 7. Set TAUDnTRC.TAUDnTRCm to 1 on slave channel 1.	Channel operation is stopped.

Table 25.260 Operating Procedure for Complementary Modulation Output Function (2/2)

	Operation	TAUDn Status
Start Operation	Set TAUDnTS.TAUDnTSm of master and slave channels to 1 simultaneously. TAUDnTS.TAUDnTSm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm of master and slave channels is set to 1 and the counter starts counting down.
During Operation	TAUDnCDRm, TAUDnTRO.TAUDnTROm, TAUDnTME.TAUDnTMEm, and TAUDnTDL.TAUDnTDLm can be changed at any time. TAUDnCNTm and TAUDnRSF.TAUDnRSFm can be read at any time. TAUDnRDT.TAUDnRDTm can be changed during operation.	TAUDnCDRm value of master channel and slave channels 2 to 7 is loaded into TAUDnCNTm to perform counting down. TAUDnCDRm value of slave channel 1 is loaded and the counter waits for a master channel interrupt. When the counter of master channel reaches 0000_H: • INTTAUDnIm is generated. • TAUDnCDRm value is reloaded into TAUDnCNTm to continue counting down. • TAUDnCNTm value of slave channel 1 decrements by 1 and the counter waits for the next master channel interrupt. • TAUDnCNTm of slave channels 2, 4, and 6 reloads the TAUDnCDRm value, or performs counting in opposite direction. • At the same timing when the TAUDnCDRm value of slave channels 2, 4, and 6 is loaded, the TAUDnTME.TAUDnTMEm value of slave channels 2 to 7 is reflected to the TAUDTTOUTm output. • The counter of slave channel 1 waits for the next interrupt from the master channel when reaching 0000_H. When the interrupt is detected: – TAUDnCDRm value is reloaded into TAUDnCNTm and the counter waits for the next master channel interrupt. – INTTAUDnIm is generated. – TAUDnTRO.TAUDnTROm is changeable. • When the counter of slave channels 2, 4, and 6 reaches 0001_H: – INTTAUDnIm is generated. – PWM output of slave channel m is set/reset (when the specified condition of the channel output mode is matched). – TAUDnCDRm value of slave channels 3, 5, and 7 is loaded into TAUDnCNTm to perform counting down. • When the counter of slave channels 3, 5, and 7 reaches 0000_H: – INTTAUDnIm is generated. – PWM output of slave channel m is set/reset (when the specified condition of the channel output mode is matched).
Stop Operation	Set TAUDnTT.TAUDnTTm of master and slave channels to 1 simultaneously. TAUDnTT.TAUDnTTm is a trigger bit, which is automatically cleared to 0.	TAUDnTE.TAUDnTEm is cleared to 0 and the counter stops. TAUDnCNTm and TAUDTTOUTm stop and retain their current values.

Restart Operation

25.16.3.9 Specific Timing Diagrams

The following settings apply to the timing diagram.

- Master channel: INTTAUDnIm is not generated at the beginning of operation. (TAUDnCMORm.TAUDnMD0 = 0)
- Slave channel 1: TAUDnCDRm = 0001_H
- Slave channels 2 to 7: Positive logic (TAUDnTOL.TAUDnTOLm = 0)

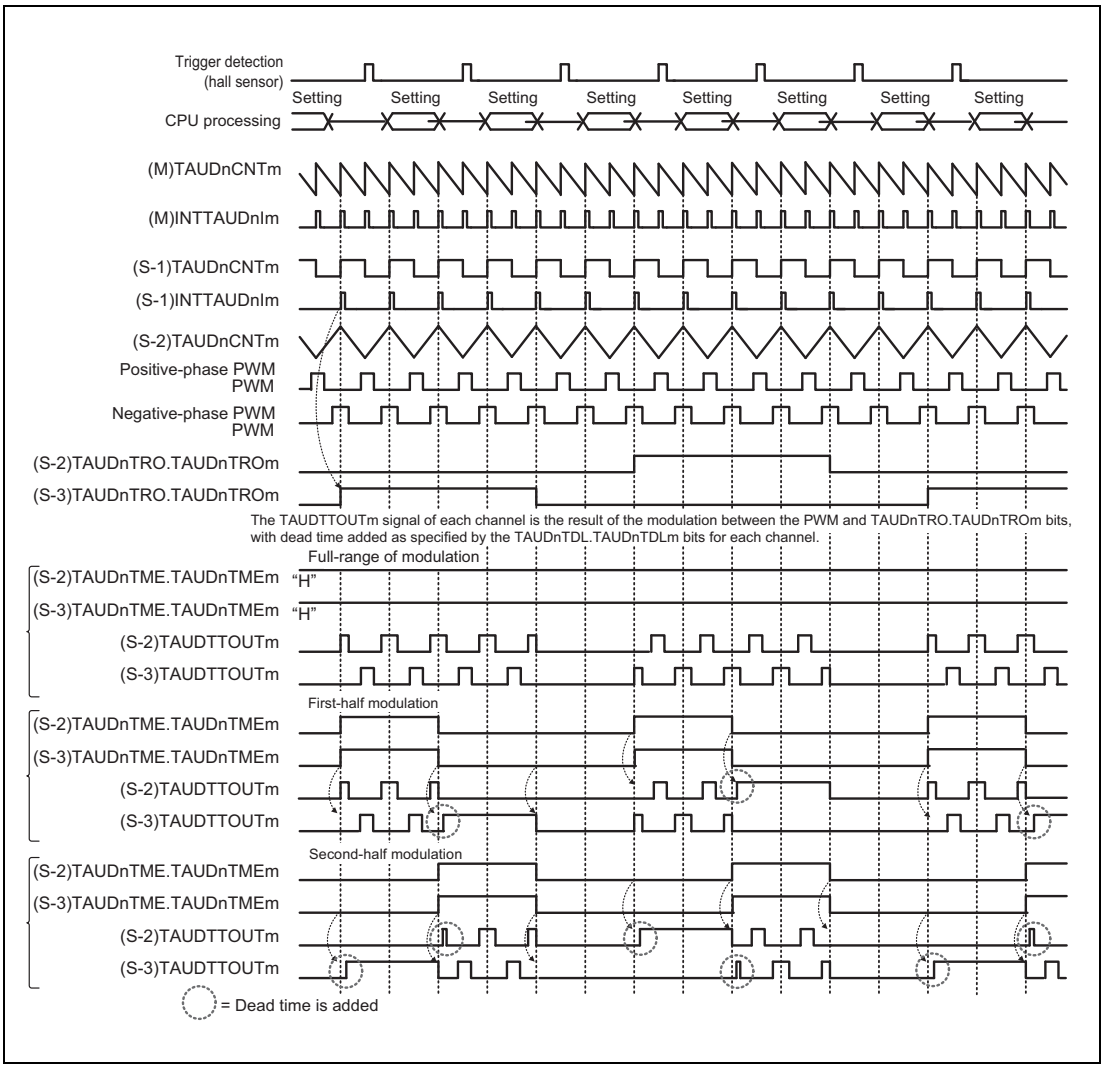

Figure 25.137 Specific Timing Diagram of Complementary Modulation Output Function

The above timing diagram shows how full modulation, first-half modulation, and second-half modulation can be achieved by modifying the TAUDnTME.TAUDnTMEm bits of lower slave channels during operation.

A modulated PWM output signal and TAUDnTRO.TAUDnTROm bit value are output from slave channels 2 and 3.

TAUDnTME.TAUDnTMEm and TAUDnTDL.TAUDnTDLm settings are reflected by detecting the count start timing and triangle PWM carrier cycle (peak interrupt timing).

TAUDnTRO.TAUDnTROm bit value is specified by software, but a new setting is applied only when an interrupt occurs on slave channel 1.

NOTE

Dead time is added to suppress simultaneous change of PWM edges of normal and reverse phases.

The “Setting”symbol indicates a time period when the values of TAUDnCDRm, TAUDnTME.TAUDnTMEm, TAUDnTRO.TAUDnTROm, and TAUDnTDL.TAUDnTDLm can be changed.

Section 26 Timer Array Unit J (TAUJ)

This section contains a generic description of the timer array unit J (TAUJ).

The first part of this section describes the RH850/F1K specific features, such as the number of units and the register base addresses. The remainder of the section describes the functions and registers of the TAUJ.

26.1 Features of RH850/F1K TAUJ

26.1.1 Number of Units

This microcontroller has the following number of TAUJ units.

Table 26.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	2	2	2
Name	TAUJn (n = 0, 1)	TAUJn (n = 0, 1)	TAUJn (n = 0, 1)

TAUJn has the following number of channels of timers.

Table 26.2 TAUJn Unit Configurations and Channels

Unit Name (Channel Name) TAUJn	Number of Channels per Unit	RH850/F1K 100 pins (8 ch)	RH850/F1K 144 pins (8 ch)	RH850/F1K 176 pins (8 ch)
TAUJ0	4	√	√	√
TAUJ1	4	√	√	√

Table 26.3 Indices

Index	Description
n	Throughout this section, the individual TAUJ units are identified by the index “n”; for example, TAUJnTOM is the TAUJn channel output mode register.
m	The TAUJ has 4 channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 3), thus a certain channel is denoted as CHm. The even numbered channels (m = 0, 2) are denoted as CHm_even. The odd numbered channels (m = 1, 3) are denoted as CHm_odd.

26.1.2 Register Base Address

TAUJn base addresses are listed in the following table.

TAUJn register addresses are given as offsets from the base addresses.

Table 26.4 Register Base Addresses

Base Address Name	Base Address
<TAUJ0_base>	$FFE5\ 0000_H$
<TAUJ1_base>	$FFE5\ 1000_H$

26.1.3 Clock Supply

The TAUJn clock supply is shown in the following table.

Table 26.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAUJ0	PCLK	CKSCLK_ATAUJ	Timer count clock
	Register access clock	CPUCLK2	Bus Clock
		CKSCLK_ATAUJ	
TAUJ1	PCLK	CKSCLK_IPERI1	Timer count clock
	Register access clock	CPUCLK2	Bus Clock
		CKSCLK_IPERI1	

26.1.4 Interrupt Requests

TAUJn interrupt requests are listed in the following table.

Table 26.6 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
TAUJ0			
INTTAUJ0I0	Channel 0 interrupt	80	21
INTTAUJ0I1	Channel 1 interrupt	81	80
INTTAUJ0I2	Channel 2 interrupt	82	81
INTTAUJ0I3	Channel 3 interrupt	83	22
TAUJ1			
INTTAUJ1I0	Channel 0 interrupt	168	46
INTTAUJ1I1	Channel 1 interrupt	169	100
INTTAUJ1I2	Channel 2 interrupt	170	47
INTTAUJ1I3	Channel 3 interrupt	171	101

26.1.5 Reset Sources

TAUJn reset sources are listed in the following table. TAUJn is initialized by these reset sources.

Table 26.7 Reset Sources

Unit Name	Reset Source
TAUJ0	All reset sources except the transition to DeepSTOP mode (AWORES)
TAUJ1	All reset sources (ISORES)

26.1.6 External Input/Output Signals

External input/output signals of TAUJn are listed below.

Table 26.8 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
TAUJ0		
TAUJTTIN0, TAUJTTIN1	Channel 0, 1 input	TAUJ0I0, TAUJ0I1
TAUJTTIN2	Channel 2 input	TAUJ0I2 or RTCA0OUT*1
TAUJTTIN3	Channel 3 input	TAUJ0I3 or RTCA0OUT*1
TAUJTTOUT0 to TAUJTTOUT3	Channel 0 to 3 output	TAUJ0O0 to TAUJ0O3
TAUJ1		
TAUJTTIN0 to TAUJTTIN3	Channel 0 to 3 input	TAUJ1I0 to TAUJ1I3
TAUJTTOUT0 to TAUJTTOUT3	Channel 0 to 3 output	TAUJ1O0 to TAUJ1O3

Note 1. For details, see **Section 26.1.8, TAUJ0 Input Selection**.

26.1.7 Internal Input/Output Signals

The internal input/output signals of TAUJn are listed below.

Table 26.9 Internal Input/Output Signals

Unit Signal Name	Description	Connected to
TAUJnTSSTm*1	Simultaneous channel start trigger input	PIC

Note 1. n = 1 only. TAUJ0TSSTm is not connected to PIC.

26.1.8 TAUJ0 Input Selection

The 1-Hz pulse output (RTCA0OUT) from RTCA0 and the output (TAUJTTOUT0) from TAUJ1 can be input to TAUJTTIN2 and TAUJTTIN3 as shown in the following figure.

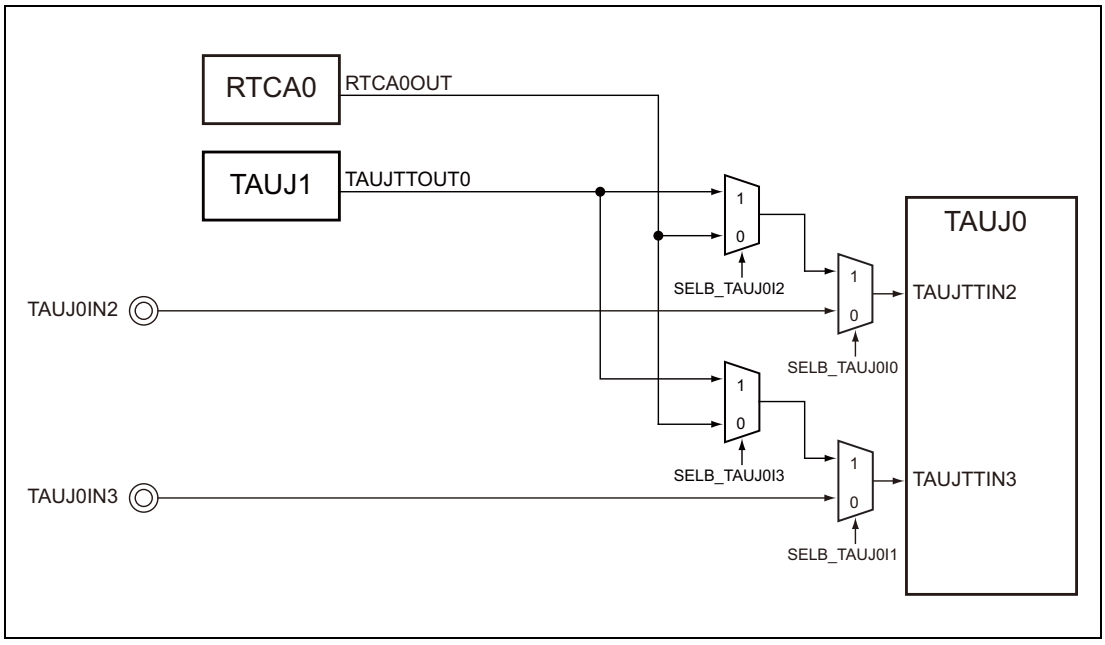

Figure 26.1 Selection of Signals Input to TAUJ0

The following table shows how to select signals input to the TAUJ.

Table 26.10 TAUJ0 Input Selections

Input Signal	Function	Settings			
		SELB_TAUJ0I3	SELB_TAUJ0I2	SELB_TAUJ0I1	SELB_TAUJ0I0
TAUJTTIN2	Port TAUJ0I2	—	—	—	0
	RTCA0OUT (Real-time clock 1-Hz output)	—	0	—	1
	TAUJTTOUT0 (TAUJ1)	—	1	—	1
TAUJTTIN3	Port TAUJ0I3	—	—	0	—
	RTCA0OUT (Real-time clock 1-Hz output)	0	—	1	—
	TAUJTTOUT0 (TAUJ1)	1	—	1	—

26.1.8.1 List of Registers

Input signal selection register is listed in the following table.

Table 26.11 List of Registers

Module Name	Register Name	Symbol	Address
SL_TAUJ0	TAUJTTINm Input Signal Selection Register	SELB_TAUJ0I	FFE5 4000_H

26.1.8.2 SELB_TAUJ0I — TAUJTTINm Input Signal Selection Register

This register selects the TAUJ0 input signals.

Access: This register can be read or written in 8-bit units.

Address: FFE5 4000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SELB_TAUJ0I3	SELB_TAUJ0I2	SELB_TAUJ0I1	SELB_TAUJ0I0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 26.12 SELB_TAUJ0I Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	SELB_TAUJ0I3	Selection of TAUJTTIN3 input signal: 0: RTCA0OUT 1: TAUJTTOUT0
2	SELB_TAUJ0I2	Selection of TAUJTTIN2 input signal: 0: RTCA0OUT 1: TAUJTTOUT0
1	SELB_TAUJ0I1	Selection of TAUJTTIN3 input signal: 0: Port TAUJ0I3 1: Timer Input
0	SELB_TAUJ0I0	Selection of TAUJTTIN2 input signal: 0: Port TAUJ0I2 1: Timer Input

26.2 Overview

26.2.1 Functional Overview

The TAUJ has the following functions:

- Independent channel operation function (operated using a single channel)
- Synchronous channel operation function (operated using a master channel and multiple slave channels)

The TAUJ is used to perform various count or timer operations and to output a signal which depends on the result of the operation. It contains one prescaler block for count clock generation and 4 channels, each equipped with a 32-bit counter TAUJnCNTm and a 32-bit data register TAUJnCDRm to hold the count start value or compare value.

It also contains several control and status registers.

Independent and synchronous operation

Every channel can operate in two operating modes, either independently or in combination with other channels (synchronously). When one master channel and one or more slave channels operate in combination, the slave channels depend on the master channel.

When a channel is operated independently, it can be operated independent of all other channels.

The synchronous operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

26.2.2 Terms

In this section, the following terms are used.

Independent channel operation function/synchronous operation channel operation function

TAUJ has 4 channels, and provides an independent channel operation function that individual channels operate independently and a synchronous channel operation function that is implemented by using a combination of channels.

- The independent channel operation function can be used any channel independently of all other channels.
- The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

Channel group

In the synchronous channel operation function, all channels that depend on each other are referred to as a “channel group”.

A channel group has one master channel and one or more slave channels.

Upper/lower channel

Based on the channel number m, a channel with a smaller channel number or higher channel number can be referred to as “upper” or “lower” channel:

- Upper channel: Channel with a smaller channel number
- Lower channel: Channel with a larger channel number

For instance, as to channel 2, channel 1 is an upper channel and channel 3 is a lower channel. Channel 0 is the highest channel and channel 3 is the lowest channel.

26.2.3 Functional List of Timer Operations

This timer provides the following functions by operating each channel independently or by combining multiple channels.

Table 26.13 Functional List of TAUJ Operations

Operation Function	Example
Independent Channel Operation Functions	**Section 26.12**
Interval Timer Function	**Section 26.12.1**
TAUJTTINm Input Interval Timer Function	**Section 26.12.2**
TAUJTTINm Input Pulse Interval Measurement Function	**Section 26.12.3**
TAUJTTINm Input Signal Width Measurement Function	**Section 26.12.4**
TAUJTTINm Input Position Detection Function	**Section 26.12.5**
TAUJTTINm Input Period Count Detection Function	**Section 26.12.6**
Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)	**Section 26.12.7**
Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)	**Section 26.12.8**
Synchronous Channel Operation Functions	**Section 26.13**
PWM Output Function	**Section 26.13.1**

26.2.4 TAUJ I/O and Interrupt Request Signals

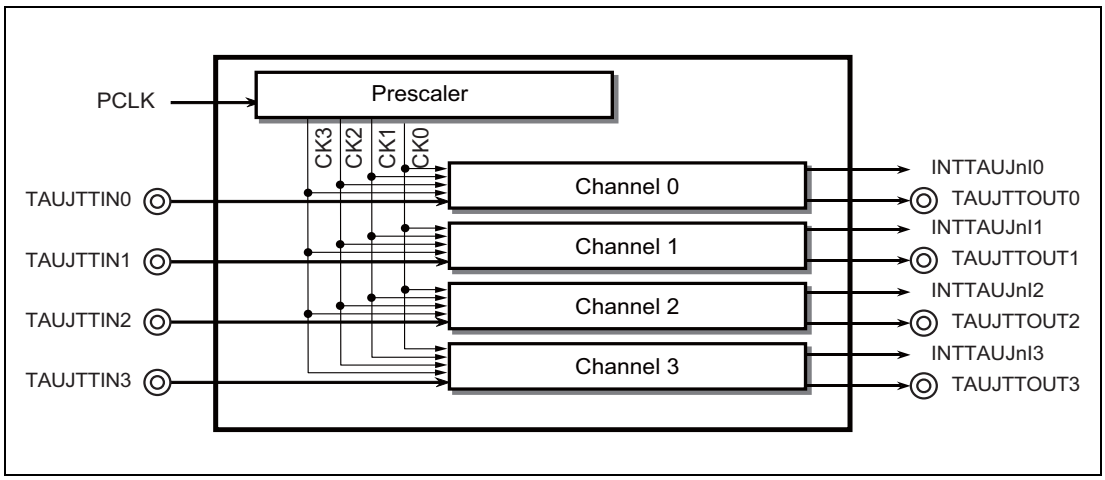

Figure 26.2 TAUJ I/O and Interrupt Request Signals

26.2.5 Block Diagram

The following figure shows the main components of the TAUJ.

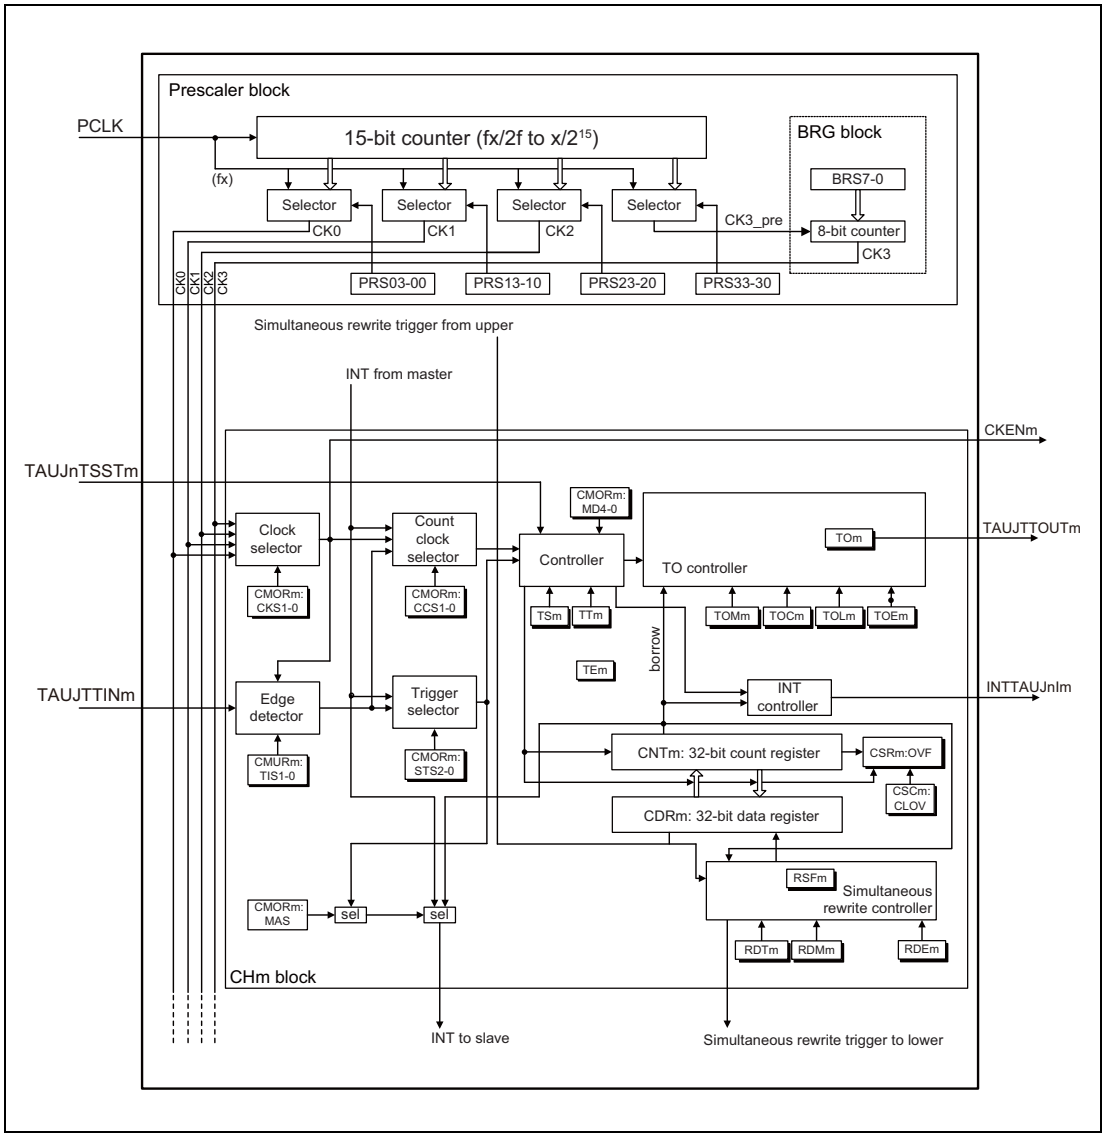

Figure 26.3 Block Diagram of the TAUJ

The prefix “TAUJn” has been omitted from the register names for the sake of clarity in the above figure.

26.2.6 Description of Block Diagram

The following describes the functional blocks.

Prescaler block

The prescaler block provides up to 4 clock signals (CK0 to CK3) that can be used as count clocks for all channels.

Count clocks CK0 to CK2 are derived by dividing PCLK in the prescaler division factor of 2^0 to 2^{15}. The fourth count clock, CK3, is derived by dividing PCLK by a division factor that is not a power of 2 by using the baud rate generator.

Clock and count clock selection

For every channel, the count clock selector selects which of the following is used as the clock source.

– One of CK0 to CK3 clocks (selected by the clock selector)

Controller

The controller controls the main operations of the counter.

- Operating mode (selected with the TAUJnCMORm.TAUJnMD[4:0] bits)
- Counter start enable (TAUJnTS.TAUJnTSm) and counter stop (TAUJnTT.TAUJnTTm)

When counter start is enabled, status flag TAUJnTE.TAUJnTEm is set.

Trigger selector

The counter starts automatically when it is enabled (TAUJnTE.TAUJnTEm = 1), or it waits for an external start trigger signal. Any of the following signals can be used as the start trigger.

– Synchronous channel start trigger input TAUJnTSSTm
– Valid edge of the TAUJTTINm input signal
– INTTAUJnIm from the master channel

Simultaneous rewrite controller

Simultaneous rewrite control is enabled in synchronous operating modes. The data registers of all channels in a channel group (TAUJnCDRm) can be rewritten at any time. The simultaneous rewrite controller ensures that new data register values of all channels become effective at the same time.

TAUJnTO controller

The output control of every channel enables the generation of various output signals such as PWM signals.

26.3 Registers

26.3.1 List of Registers

TAUJ registers are listed in the following table.

For details about <TAUJn_base>, see **Section 26.1.2, Register Base Address**.

Table 26.14 List of Registers

Module Name	Register Name	Symbol	Address
TAUJn prescaler registers			
TAUJn	TAUJn prescaler clock select register	TAUJnTPS	<TAUJn_base> + 90_H
	TAUJn prescaler baud rate setting register	TAUJnBRS	<TAUJn_base> + 94_H
TAUJn control registers			
TAUJn	TAUJn channel data register m	TAUJnCDRm	<TAUJn_base> + m × 4_H

26.3.2 Details of TAUJn Prescaler Registers

26.3.2.1 TAUJnTPS — TAUJn Prescaler Clock Select Register

This register specifies clocks CK0, CK1, CK2, and CK3_PRE for all channels of the PCLK prescalers. CK3 is generated by dividing CK3_PRE by the factor specified in TAUJnBRS.

Access: This register can be read or written in 16-bit units.

Address: <TAUJn_base> + 90_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnPRS3[3:0]				TAUJnPRS2[3:0]				TAUJnPRS1[3:0]				TAUJnPRS0[3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 26.15 TAUJnTPS Register Contents (1/3)

Bit Position	Bit Name	Function
15 to 12	TAUJnPRS3 [3:0]	Specifies a CK3_PRE clock. The CK3_PRE clock is an input clock of the BRG unit which supplies CK3 operation clocks to all channels.

TAUJnPRS3[3:0]	CK3_PRE clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK3 are stopped (TAUJnTE.TAUJnTEm = 0).

Table 26.15 TAUJnTPS Register Contents (2/3)

Bit Position	Bit Name	Function
11 to 8	TAUJnPRS2 [3:0]	Specifies a CK2 clock.

TAUJnPRS2[3:0]	CK2 clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK2 are stopped (TAUJnTE.TAUJnTEm = 0).

Bit Position	Bit Name	Function
7 to 4	TAUJnPRS1 [3:0]	Specifies a CK1 clock.

TAUJnPRS1[3:0]	CK1 clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK1 are stopped (TAUJnTE.TAUJnTEm = 0).

Table 26.15 TAUJnTPS Register Contents (3/3)

Bit Position	Bit Name	Function
3 to 0	TAUJnPRS0 [3:0]	Specifies a CK0 clock.

TAUJnPRS0[3:0]	CK0 clock
0000_B	PCLK/2^0
0001_B	PCLK/2^1
0010_B	PCLK/2^2
0011_B	PCLK/2^3
0100_B	PCLK/2^4
0101_B	PCLK/2^5
0110_B	PCLK/2^6
0111_B	PCLK/2^7
1000_B	PCLK/2^8
1001_B	PCLK/2^9
1010_B	PCLK/2^{10}
1011_B	PCLK/2^{11}
1100_B	PCLK/2^{12}
1101_B	PCLK/2^{13}
1110_B	PCLK/2^{14}
1111_B	PCLK/2^{15}

The above bits are rewritable only when all the counters using CK0 are stopped (TAUJnTE.TAUJnTEm = 0).

NOTE

TAUJn clock input PCLK is defined in the first part of this section, **Section 26.1.3, Clock Supply**.

26.3.2.2 TAUJnBRS — TAUJn Prescaler Baud Rate Setting Register

This register specifies the division factor of prescaler clock CK3.

CK3 is generated by dividing CK3_PRE by the factor specified in this register plus one. The PCLK prescaler for CK3_PRE is specified in TAUJnTPS. TAUJnPRS3[3:0].

Access: This register can be read or written in 8-bit units.

Address: <TAUJn_base> + 94_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TAUJnBRS[7:0]							
Value after reset	0	0	0	0	0	0	0	0

Table 26.16 TAUJnBRS Register Contents

Bit Position	Bit Name	Function
7 to 0	TAUJnBRS [7:0]	Specifies a CK3_PRE clock division factor for generating CK3.

TAUJnBRS[7:0]	CK3 clock
$0000\ 0000_B$	CK3_PRE / 1
$0000\ 0001_B$	CK3_PRE / 2
$0000\ 0010_B$	CK3_PRE / 3
$0000\ 0011_B$	CK3_PRE / 4
:	:
$1111\ 1110_B$	CK3_PRE / 255
$1111\ 1111_B$	CK3_PRE / 256

26.3.3 Details of TAUJn Control Registers

26.3.3.1 TAUJnCDRm — TAUJn Channel Data Register

This register functions either as a compare register or as a capture register, depending on the operating mode specified in TAUJnCMORm.TAUJnMD[4:1].

Access: This register can be read or written in 32-bit units..
- When this register functions as a capture register, only reading is possible. Write operation is ignored.
- When this register functions as a compare register, reading and writing is possible.

Address: <TAUJn_base> + 0_H + m × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 26.17 TAUJnCDRm Register Contents

Bit Position	Bit Name	Function
31 to 0	TAUJnCDR [31:0]	Data register for capture/compare values

26.3.3.2 TAUJnCNTm — TAUJn Channel Counter Register

This is a channel m counter register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <TAUJn_base> + 10_H + m × 4_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TAUJnCNT[31:16]

Table 26.18 TAUJnCNTm Register Contents

Bit Position	Bit Name	Function
31 to 0	TAUJnCNT [31:0]	32-bit counter value

The read value depends on a counter, an operating mode change, or TAUJnTS.TAUJnTSm/ TAUJnTT.TAUJnTTm bit value.

The initial counter read value depends on the operating mode and how the counter is stopped.

- By a reset
- By a counter stop trigger (TAUJnTT.TAUJnTTm = 1)

The following table lists the initial counter read values after the counter is stopped (TAUJnTE.TAUJnTEm = 0) and re-enabled (TAUJnTS.TAUJnTSm = 1).

The table also contains the counter read value one count after the counter is enabled (TAUJnTS.TAUJnTSm = 1) with the counter waiting for a start trigger.

Table 26.19 TAUJnCNTm Read Values after Re-Enabling Counter

Mode Name	Count Method (Up/Down)	TAUJnCNTm		
		Start Value*1	After Stop Trigger	After One Count
Interval timer mode	Count down	FFFF FFFF$_H$	Stop value	—
Capture mode	Count up	0000 0000$_H$	Stop value	—
One-count mode	Count down	FFFF FFFF$_H$	Stop value	Stop value
Capture and one-count mode	Count up	0000 0000$_H$	Stop value	Capture value + 1 (TAUJnCDRm)
Count capture mode	Count up	0000 0000$_H$	Stop value	—
Gate count mode	Count down	FFFF FFFF$_H$	Stop value	Stop value
Capture and gate count mode	Count up	0000 0000$_H$	Stop value	Stop value

Note 1. The value set for TAUJnCNTm when operating mode is changed after a reset is deasserted

26.3.3.3 TAUJnCMORm — TAUJn Channel Mode OS Register

This register controls channel m operation.

Access: This register can be read or written in 16-bit units.
Writable only when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + 80_H + m × 4_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TAUJnCKS[1:0]		TAUJnCCS[1:0]		TAUJn MAS	TAUJnSTS[2:0]			TAUJnCOS[1:0]		—	TAUJnMD[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W

Table 26.20 TAUJnCMORm Register Contents (1/3)

Bit Position	Bit Name	Function
15, 14	TAUJnCKS[1:0]	Selects an operation clock, which is used with the TAUJTTINm input edge detection circuit. Setting of TAUJnCMORm.TAUJnCCS[1:0] bits also allows the operation clock to serve as the TAUJnCNTm count clock.

TAUJn CKS1	TAUJn CKS0	Selection of Operation Clock
0	0	CK0
0	1	CK1
1	0	CK2
1	1	CK3

Bit Position	Bit Name	Function
13, 12	TAUJnCCS[1:0]	Selects a count clock for TAUJnCNTm counter.

TAUJn CCS1	TAUJn CCS0	Selection of Operation Clock
0	0	Operation clock specified by TAUJnCMORm.TAUJnCKS[1:0].
0	1	Setting prohibited
1	0	
1	1	

Bit Position	Bit Name	Function
11	TAUJnMAS	Specifies whether the channel is a master or slave channel during synchronous channel operation. 0: Slave 1: Master This bit setting is valid only for even channels (CHm_even). Odd channels (CHm-odd) are fixed to 0.

Table 26.20 TAUJnCMORm Register Contents (3/3)

Bit Position	Bit Name	Function
4 to 0	TAUJnMD[4:0]	Specifies an operating mode.

TAUJn MD4	TAUJn MD3	TAUJn MD2	TAUJn MD1	TAUJn MD0	Functional Description
0	0	0	0	1/0	Interval timer mode
0	0	0	1	1/0	Setting prohibited
0	0	1	0	1/0	Capture mode
0	0	1	1	0	Setting prohibited
0	1	0	0	1/0	One-count mode
0	1	0	1	1/0	Setting prohibited
0	1	1	0	0	Capture and one-count mode
0	1	1	1	1/0	Setting prohibited
1	0	0	0	0	Setting prohibited
1	0	0	1	0	Setting prohibited
1	0	1	0	1/0	Setting prohibited
1	0	1	1	1/0	Count capture mode
1	1	0	0	0	Gate count mode
1	1	0	1	0	Capture and gate count mode

Mode	Role of TAUJnMD0 Bit
Interval timer mode Capture mode Count capture mode	Specifies whether INTTAUJnIm is generated at the beginning of count operation (when a start trigger is entered) or not. 0: INTTAUJnIm is not generated. 1: INTTAUJnIm is generated.
One-count mode	Enables/disables start trigger detection during counting. 0: Disables detection. 1: Enables detection. **CAUTION** In one-count mode, INTTAUJnIm signal is not output at the beginning of count operation.
Capture and one-count mode Gate count mode Capture and gate count mode	This bit should be set to 0. **CAUTION** INTTAUJnIm signal is not output at the beginning of count operation. In addition, start trigger detected during counting is disabled.

26.3.3.4 TAUJnCMURm — TAUJn Channel Mode User Register

This register specifies a type of valid edge detection used for TAUJTTINm input.

Access: This register can be read or written in 8-bit units.

Address: <TAUJn_base> + 20_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TAUJnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 26.21 TAUJnCMURm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	Specifies a valid edge of TAUJTTINm input signal.

TAUJn TIS1	TAUJn TIS0	Functional Description
0	0	Falling edge
0	1	Rising edge
1	0	Detection of falling and rising edges (selection of low width measurement) Start trigger: Falling edge Stop trigger (capture): Rising edge
1	1	Detection of falling and rising edges (selection of high width measurement) Start trigger: Rising edge Stop trigger (capture): Falling edge

Edge detection of TAUJTTINm input signal is based on the operation clock selected by TAUJnCMORm.TAUJnCKS[1:0].

26.3.3.5 TAUJnCSRm — TAUJn Channel Status Register

This register indicates the overflow status of channel m.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <TAUJn_base> + 30_H + m × 4_H

Value after reset: $0x_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUJnOVF
Value after reset	0	0	0	0	0	0	—	0
R/W	R	R	R	R	R	R	R	R

Table 26.22 TAUJnCSRm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	Reserved	When read, unknown value is returned.
0	TAUJnOVF	Indicates the counter overflow status: 0: No overflow occurs 1: Overflow occurs This bit is used only in the following modes: • Capture mode • Capture and one-count mode The function of this bit depends on the setting of control bits TAUJnCMORm.TAUJnCOS[1:0].

26.3.3.6 TAUJnCSCm — TAUJn Channel Status Clear Trigger Register

This register is a trigger register for clearing the overflow flag TAUJnCSRm.TAUJnOVF of channel m.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 40_H + m × 4_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAUJnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 26.23 TAUJnCSCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAUJnCLOV	0: No function 1: Clears the overflow flag TAUJnCSRm.TAUJnOVF

26.3.3.7 TAUJnTS — TAUJn Channel Start Trigger Register

This register enables the counter operation for each channel.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 54_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTS03	TAUJnTS02	TAUJnTS01	TAUJnTS00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 26.24 TAUJnTS Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	TAUJnTSm	Enables the counter operation for channel m: 0: No function 1: Enables the counter operation and sets TAUJnTE.TAUJnTEm = 1. Only the counter operation is enabled even if TAUJnTE.TAUJnTEm = 1. Whether the counter is started or not depends on the selected operating mode.

26.3.3.8 TAUJnTE — TAUJn Channel Enable Status Register

This register indicates whether a counter operation is enabled.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <TAUJn_base> + 50_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTE03	TAUJnTE02	TAUJnTE01	TAUJnTE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 26.25 TAUJnTE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	TAUJnTEm	Indicates whether channel m's counter operation is enabled. 0: Counter operation is disabled 1: Counter operation is enabled This bit is set to 1 when trigger input of TAUJnTSSTm (synchronous channel start trigger signal) is detected or when TAUJnTS.TAUJnTSm is set to 1. This bit is reset to 0 when TAUJnTT.TAUJnTTm is set to 1.

26.3.3.9 TAUJnTT — TAUJn Channel Stop Trigger Register

This register stops the counter operation of each channel.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 58_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

3 to 0	TAUJnTTm	Stops channel m's counter operation. 0: No function 1: Stops the counter operation and resets TAUJnTE.TAUJnTEm. TAUJnCNTm, TAUJnTO.TAUJnTOm, and TAUJTTOUTm retain the values provided before the counter is stopped.

26.3.4 Details of TAUJn Simultaneous Rewrite Register

26.3.4.1 TAUJnRDE — TAUJn Channel Reload Data Enable Register

This register enables and disables simultaneous rewrite of the data register TAUJnCDRm. It also enables and disables simultaneous rewrite of the data register TAUJnTOLm for the PWM output function.

Access: This register can be read or written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

Address: <TAUJn_base> + $A0_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDE03	TAUJnRDE02	TAUJnRDE01	TAUJnRDE00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 26.27 TAUJnRDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnRDEm	Enables/disables simultaneous rewrite of the data register of channel m: 0: Disables simultaneous rewrite 1: Enabled simultaneous rewrite

26.3.4.2 TAUJnRDM — TAUJn Channel Reload Data Mode Register

This register selects when the signal that controls simultaneous rewrite is generated.

Access: This register can be read or written in 8-bit units. It can only be written when TAUJnTE.TAUJnTEm = 0.

Address: <TAUJn_base> + $A4_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDM03	TAUJnRDM02	TAUJnRDM01	TAUJnRDM00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 26.28 TAUJnRDM Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnRDMm	Specifies when the signal that triggers simultaneous rewrite is generated: 0: When the master channel counter starts counting 1: No function These bits only apply when TAUJnRDE.TAUJnRDEm = 1.

26.3.4.3 TAUJnRDT — TAUJn Channel Reload Data Trigger Register

This register triggers the simultaneous rewrite enabling state.

Access: This register is a write-only register that can be written in 8-bit units. It is always read as 00_H.

Address: <TAUJn_base> + 68_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRDT03	TAUJnRDT02	TAUJnRDT01	TAUJnRDT00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 26.29 TAUJnRDT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	TAUJnRDTm	Triggers the simultaneous rewrite enabling state. 0: No function 1: Simultaneous rewrite enabling state is triggered. The simultaneous rewrite enabling flag (TAUJnRSFm) is set to 1. The system waits for the simultaneous rewrite trigger. These bits only apply when: • TAUJnRDE.TAUJnRDEm = 1

26.3.4.4 TAUJnRSF — TAUJn Channel Reload Status Register

This flag register indicates the simultaneous rewrite status.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <TAUJn_base> + $6C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnRSF03	TAUJnRSF02	TAUJnRSF01	TAUJnRSF00
Value after reset	0	0	0	0	0	0	0	0

Table 26.30 TAUJnRSF Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	TAUJnRSFm	Indicates the simultaneous rewrite status. 0: Indicates that simultaneous rewrite has been completed due to the generation of simultaneous rewrite trigger. 1: Indicates that the system waits for a simultaneous rewrite trigger in the simultaneous rewrite enabling state (TAUJnRDFm = 1).

26.3.5 Details of TAUJn Output Registers

26.3.5.1 TAUJnTOE — TAUJn Channel Output Enable Register

This register enables and disables independent channel output mode controlled by software.

Access: This register can be read or written in 8-bit units.

Address: <TAUJn_base> + 60_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOE03	TAUJnTOE02	TAUJnTOE01	TAUJnTOE00
Value after reset	0	0	0	0	0	0	0	0

3 to 0	TAUJnTOEm	Enables/disables independent channel output function: 0: Disables independent timer output function (controlled by software) 1: Enables independent timer output function

26.3.5.2 TAUJnTO — TAUJn Channel Output Register

This register specifies and reads the level of TAUJTTOUTm.

Access: This register can be read or written in 8-bit units.

Address: <TAUJn_base> + $5C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTO03	TAUJnTO02	TAUJnTO01	TAUJnTO00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 26.32 TAUJnTO Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOm	Specifies and reads the level of TAUJTTOUTm: 0: Low 1: High Only TAUJnTOm bits for which Independent Channel Output function is disabled (TAUJnTOEm = 0) can be written.

26.3.5.3 TAUJnTOM — TAUJn Channel Output Mode Register

This register specifies the output mode of each channel.

Access: This register can be read or written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + 98_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOM03	TAUJnTOM02	TAUJnTOM01	TAUJnTOM00
Value after reset	0	0	0	0	0	0	0	0

Table 26.33 TAUJnTOM Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOMm	Specifies the channel output mode: 0: Independent channel output mode 1: Synchronous channel output mode The output mode depends on the settings of channel output control (TAUJnTOE.TAUJnTOEm) bits.

26.3.5.4 TAUJnTOC — TAUJn Channel Output Configuration Register

This register specifies the output mode of each channel in combination with TAUJnTOMm.

Access: This register can be read or written in 8-bit units. It can only be written when the counter is stopped (TAUJnTE.TAUJnTEm = 0).

Address: <TAUJn_base> + $9C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

Table 26.34 TAUJnTOC Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOCm	Specifies the output mode: 0: Operation mode 1 (= Toggle mode) 1: No function This bit must be set to 0 for all output modes except independent channel output mode controlled by software. The output mode also depends on TAUJnTOM.TAUJnTOMm, as shown in the following table.

TAUJn TOMm	TAUJn TOCm	Functional Description
0	0	Toggle mode: Toggling proceeds when INTTAUJnIm occurs.
0	1	No function
1	0	Synchronous channel operation mode 1: Set when INT occurs on the master channel and reset when INT occurs on the slave channel.
1	1	No function

26.3.5.5 TAUJnTOL — TAUJn Channel Output Active Level Register

This register specifies the output logic of the channel output bit (TAUJnTO.TAUJnTOm).

Access: This register can be read or written in 8-bit units.

Address: <TAUJn_base> + 64_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAUJnTOL03	TAUJnTOL02	TAUJnTOL01	TAUJnTOL00
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 26.35 TAUJnTOL Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	TAUJnTOLm	Specifies the output logic of the channel m output bit (TAUJnTO.TAUJnTOm): 0: Positive logic (active high) 1: Negative logic (active low) These bits apply in all channel output modes except independent channel output mode controlled by software.

26.3.6 TAUJn Emulation Register

26.3.6.1 TAUJnEMU — TAUJn Emulation Register

This register controls operation by SVSTOP.

Access: This register can be read or written in 8-bit units.
A write should be performed when counters are stopped (TAUJnTE.TAUJnTEm = 0) and (EPC.SVSTOP = 0).

Address: <TAUJn_base> + $A8_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TAUJn SVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 26.36 TAUJnEMU Register Contents

Bit Position	Bit Name	Function
7	TAUJnSVSDIS	When EPC.SVSTOP bit = 0: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint), regardless of the value of this bit (1 or 0). When EPC.SVSTOP bit = 1: 0: The count clock is stopped when the debugger takes control of the microcontroller (as in the breakpoint). 1: Supply of the count clock continues when the debugger takes control of the microcontroller (as in the breakpoint).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

26.4 Operating Procedure

The following lists the general operation procedure for the TAUJn:

After a reset is deasserted, the operation of each channel is stopped. Clock supply is started and writing to each register is enabled. All circuits and registers of all channels are initialized. The control register of TAUJTTOUTm is also initialized and outputs a low level.

1. Set the TAUJnTPS and TAUJnBRS registers to specify the clock frequency of CK0 to CK3.
2. Configure the desired TAUJn function:
   - Set the operation mode
   - Set any other control bits
3. Enable the counter by setting the TAUJnTS.TAUJnTSm bit to 1.
   The counter starts to count immediately, or when an appropriate trigger is detected, depending on the bit settings.
4. If desired, and if possible for the configured function, stop the counter or perform a forced restart operation during count operation. The counter can be stopped by setting the TAUJnTT.TAUJnTTm bit to 1. The counter can be forcibly restarted by setting the TAUJnTS.TAUJnTSm bit to 1.
5. Stop the function by setting the TAUJnTT.TAUJnTTm bit to 1.

NOTES

1. A detailed description of the required control bits and the operation of the individual functions are given in **Section 26.12, Independent Channel Operation Functions** and **Section 26.13, Synchronous Channel Operation Functions**.
2. The function can be changed while the counter is stopped (TAUJnTE.TAUJnTEm = 0).

26.5 Concepts of Synchronous Channel Operation Function

The synchronous channel operation function is implemented by using a combination of channel groups (comprised of master and slave channels).

Several rules apply to the settings of channels.

These rules are detailed in **Section 26.5.1, Rules of Synchronous Channel Operation Function**.

The synchronous channel operation function are detailed in the following section.

- **Section 26.13, Synchronous Channel Operation Functions**

26.5.1 Rules of Synchronous Channel Operation Function

Number of master and slave channels

- Only even channels (CH0, CH2) can be set as master channels. Any channel other than CH0 can be set as a slave channel.
- Only channels lower than the master channel can be set as slave channels, and multiple slave channels can be set for one master channel.
  Example: If CH2 is a master channel, CH3 can be set as slave channel.
- If two master channels are used, slave channels cannot cross the master.
  Example: If CH0 and CH2 are master channels, CH1 can be set as slave channel for CH0, but CH3 cannot.

Operation clock

- The same operation clock should be set for the master channel and the synchronized slave channel. This is achieved by setting the same value in the TAUJnCMORm.TAUJnCKS[1:0] bits of the master and slave channels.

The basic concepts of master/slave usage and operation clocks are illustrated in **Figure 26.4**.

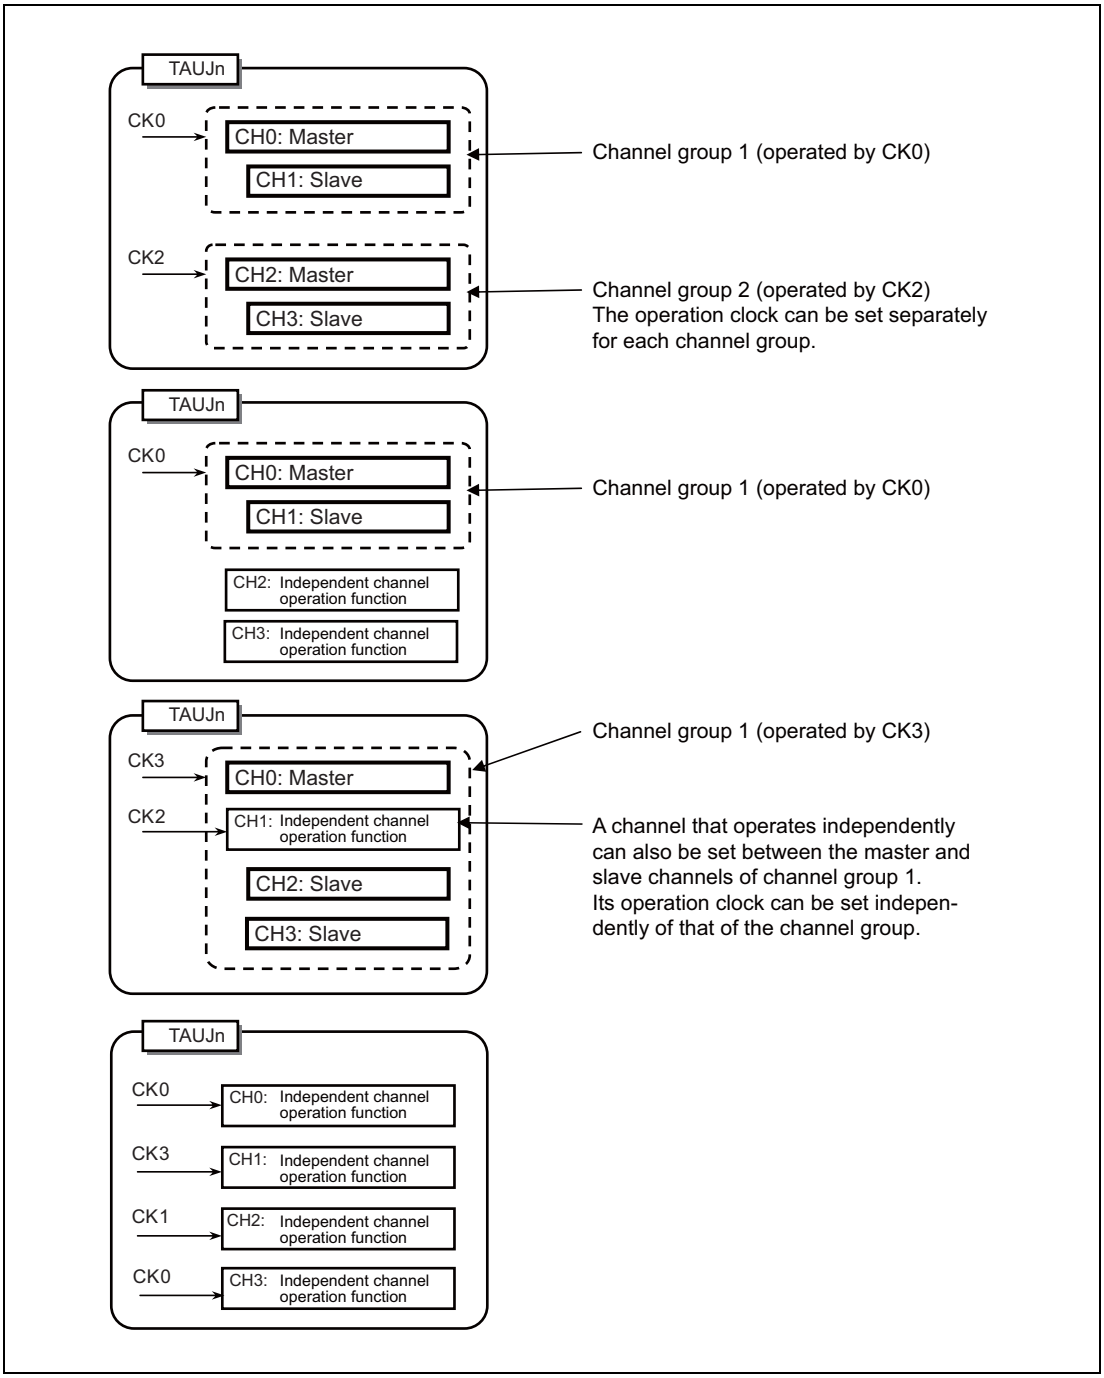

Figure 26.4 Grouping of Channels and Assignment of Operation Clocks

26.5.2 Simultaneous Start and Stop of Synchronous Channel Counters

Channels that are operated synchronously can be started and stopped simultaneously, both within a TAUJ unit and between TAUJ units.

26.5.2.1 Simultaneous Start and Stop within a TAUJ Unit

- To simultaneously start synchronized channels, the TAUJnTS.TAUJnTSm bits of the channels should be set at the same time.
- To simultaneously stop synchronized channels, the TAUJnTT.TAUJnTTm bits of the channels should be set at the same time.

Setting 1 in the TAUJnTS.TAUJnTSm bits sets the corresponding TAUJnTE.TAUJnTEm bits to 1, enabling counting. The count start timing of the counter depends on the operating mode.

26.5.2.2 Simultaneous Start between TAUJ Units

Counters in different TAUJ units can also be started simultaneously if the corresponding counters are enabled before receiving the simultaneous trigger signal.

26.6 Simultaneous Rewrite

26.6.1 How to Control Simultaneous Rewrite

The following figure shows the general procedure for simultaneous rewrite. The three main blocks (Initial settings, Start counter & count operation, and Simultaneous rewrite) are explained afterwards.

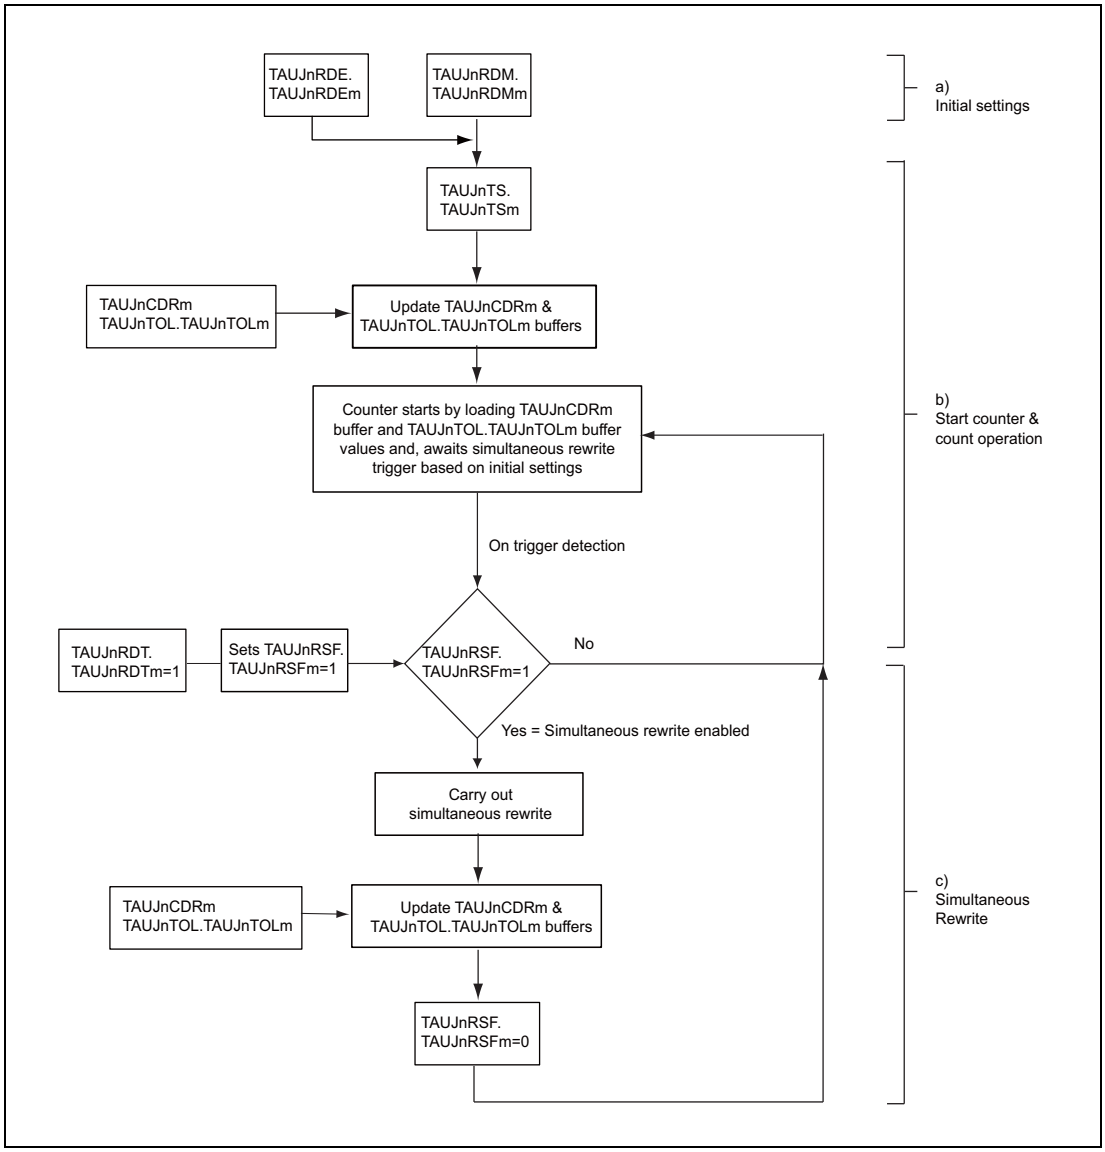

Figure 26.5 General Procedure for Simultaneous Rewrite

26.6.1.1 Initial Settings

- To enable simultaneous rewrite in channel m, set TAUJnRDE.TAUJnRDEm = 1.
- To select simultaneous rewrite when the master channel starts counting, set TAUJnRDM.TAUJnRDMm.

26.6.1.2 Start Counter and Count Operation

- To start all the TAUJnCNTm counters in the channel group, set the corresponding TAUJnTS.TAUJnTSm bits to 1. The values of TAUJnTOL.TAUJnTOLm and the data registers (TAUJnCDRm) are loaded into the corresponding TAUJnTOL.TAUJnTOLm buffer (TAUJnTOL.TAUJnTOLm buf) and data buffer registers (TAUJnCDRm buf) and the counters start.
- Setting the reload data trigger bit (TAUJnRDT.TAUJnRDTm) to 1 sets the reload flag (TAUJnRSF.TAUJnRSFm) to 1, enabling simultaneous rewrite. TAUJnRSF.TAUJnRSFm remains set to 1 until simultaneous rewrite is completed.
- When a specified trigger for simultaneous rewrite is detected, the TAUJnRSF.TAUJnRSFm bit is checked to see if simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1). If enabled, simultaneous rewrite is carried out. Otherwise simultaneous rewrite is not carried out and the system waits for detection of the next simultaneous rewrite trigger.

26.6.1.3 Simultaneous Rewrite

- When the simultaneous rewrite trigger is detected and simultaneous rewrite is enabled (TAUJnRSF.TAUJnRSFm = 1), the current values of the data registers are copied to their buffers. These values are then loaded into the corresponding counters and the values are applied the next time the counter starts or restarts.
- When the simultaneous rewrite is complete, the TAUJnRSF.TAUJnRSFm bit is set to 0, and the system awaits the next simultaneous rewrite trigger.

26.6.2 Other General Rules for Simultaneous Rewrite

The following rules also apply.

- TAUJnRDE.TAUJnRDEm and TAUJnRDM.TAUJnRDMm cannot be changed while the counter is in operation (TAUJnTE.TAUJnTEm = 1).
- TAUJnTOL.TAUJnTOLm can be rewritten only during operation using the PWM output function. For all other functions, TAUJnTOL.TAUJnTOLm should be written before the counter starts. If it is rewritten while any other function is used, TAUJTTOUTm outputs an invalid waveform.

26.6.3 Simultaneous Rewrite Procedure

The simultaneous rewrite procedure with PWM output function is described in the following figure.

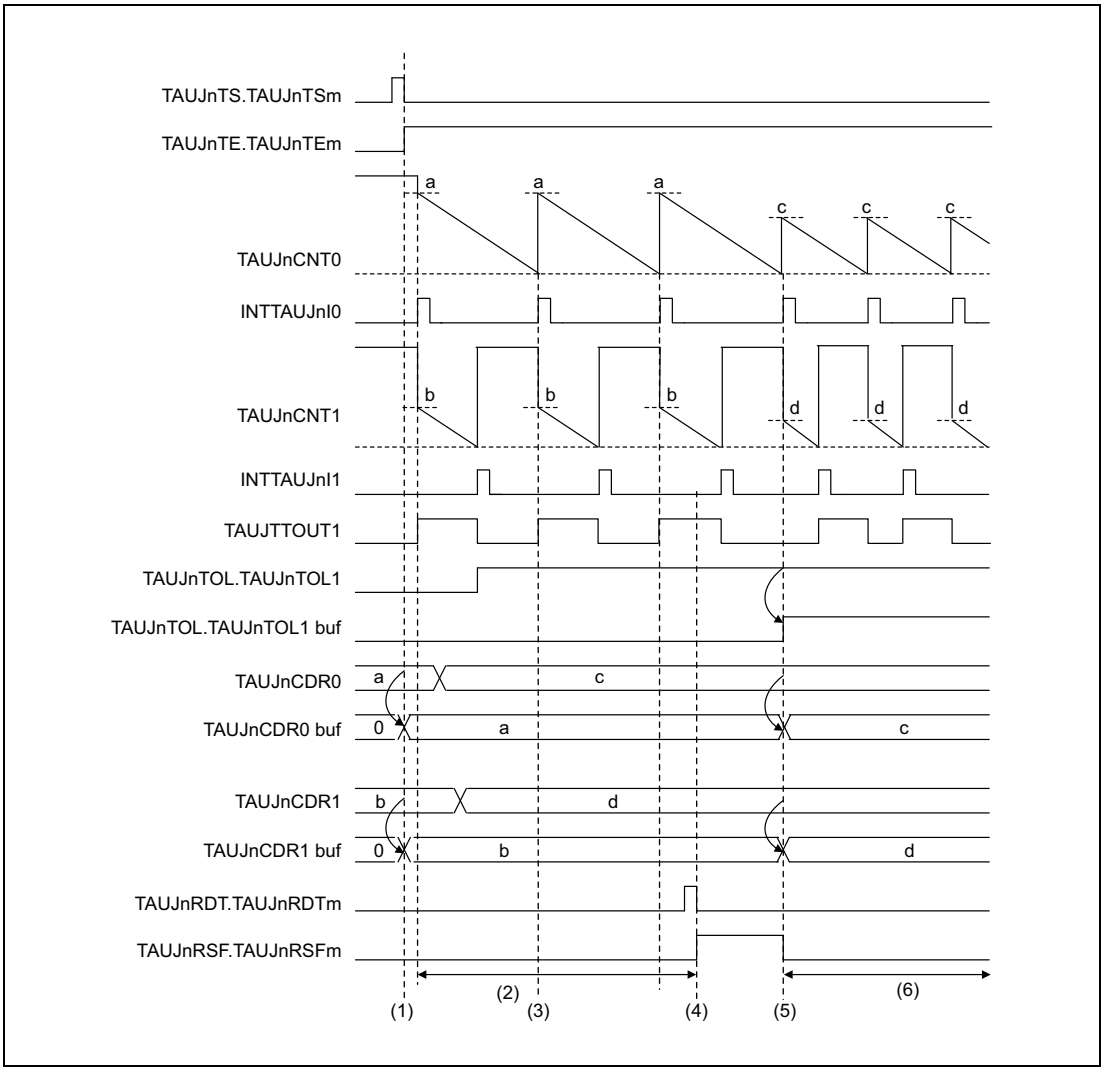

Figure 26.6 Simultaneous Rewrite with PWM Output Function

Setting:

CH0 is a master channel of PWM output function, and CH1 is a slave channel of PWM output function. Simultaneous rewrite is applied when the master channel starts counting.

Description:

(1) When TAUJnTS.TAUJnTSm = 1 is set, the value of TAUJnCDRm is copied to the TAUJnCDRm buffer and the value of TAUJnTOL.TAUJnTOLm is copied to the TAUJnTOL.TAUJnTOLm buffer.

(2) The TAUJnCDRm and TAUJnTOL.TAUJnTOLm registers can be written at any time.

(3) CH0 restarts counting, but simultaneous rewrite does not occur because it is disabled (TAUJnRSF.TAUJnRSFm = 0).

(4) The reload data trigger bit (TAUJnRDT.TAUJnRDTm) is set to 1 which sets the status flag (TAUJnRSF.TAUJnRSFm = 1), enabling simultaneous rewrite.

(5) Simultaneous rewrite is triggered when CH0 restarts counting, because simultaneous rewrite is enabled. The TAUJnCDRm value is loaded into the TAUJnCDRm buffer and the TAUJnTOL.TAUJnTOLm value is loaded into the TAUJnTOL.TAUJnTOLm buffer.

(6) The counters count down and await the next simultaneous rewrite trigger. The values of TAUJnCDRm and TAUJnTOL.TAUJnTOLm can be changed again.

26.7 Channel Output Modes

The output of the TAUJTTOUTm pin can be controlled in two ways, the latter of which can be further split into individual modes.

- By software (TAUJnTOE.TAUJnTOEm = 0)
  When controlled by software, the value written in the output register bit (TAUJnTO.TAUJnTOm) is sent to the output pin (TAUJTTOUTm).
- By TAUJ signals (TAUJnTOE.TAUJnTOEm = 1)
  When controlled by TAUJ signals, the output level of TAUJTTOUTm is set or reset or toggled by internal signals. The value of TAUJnTO.TAUJnTOm is updated accordingly to reflect the value of TAUJTTOUTm.
  - Independently (TAUJnTOM.TAUJnTOMm = 0)
    In case of independent operation, the output of the TAUJTTOUTm pin is only affected by settings of channel m. Therefore, independent channel operation should be selected (TAUJnTOM.TAUJnTOMm = 0).
  - Synchronously (TAUJnTOM.TAUJnTOMm = 1)
    In case of synchronous operation, the output of the TAUJTTOUTm pin is affected by settings of channel m and those of other channels. Therefore, synchronous channel operation should be selected for all synchronized channels (TAUJnTOM.TAUJnTOMm = 1).

The TAUJnTO.TAUJnTOm bit can always be read to determine the current value of TAUJTTOUTm, regardless of whether the pin is controlled by software, operated independently, or operated synchronously.

Control bits

The settings of the control bits required to select a specific channel output mode are listed in **Table 26.37, Channel Output Modes**.

The channel output modes are described in details below.

- **Section 26.7.2, Channel Output Modes Controlled Independently by TAUJn Signals**
- **Section 26.7.3, Channel Output Modes Controlled Synchronously by TAUJn Signals**

Batch operation of TAUJnTOm bit

Whether a set value is reflected to the TAUJnTOm bit or not is controlled by the TAUJnTOE.TAUJnTOEm bit.

The TAUJnTOm setting is written only to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 0 when a write to the TAUJnTO register is attempted. No TAUJnTOm setting is reflected to the bit (channel) set with TAUJnTOE.TAUJnTOEm bit = 1.

NOTE

TAUJnTO.TAUJnTOm bit is placed so that its bit number corresponds to a channel number.

Output logic

Positive logic or negative logic of the output is specified by control bit TAUJnTOL.TAUJnTOLm.

The value of TAUJnTOL.TAUJnTOLm bit should be set before the counter is started. It can only be changed during operation with PWM output function. Otherwise, changes to TAUJnTOL.TAUJnTOLm result in an undefined TAUJTTOUTm signal output.

See **Section 26.6, Simultaneous Rewrite**.

The various channel output modes and the channel output control bits are listed in **Table 26.37**.

Table 26.37 Channel Output Modes

Channel Output Mode	TAUJnTOE.TAUJnTOEm	TAUJnTOM.TAUJnTOMm
By software		
Independent channel output mode controlled by software	0	x
By TAUJ signals, independently		
Independent channel output mode 1	1	0
By TAUJ signals, synchronously		
Synchronous channel output mode 1	1	1

- All combinations not listed in this table are forbidden.
- Bits marked with an x can be set to any value.

NOTE

The following bits cannot be changed during count operation (TAUJnTE.TAUJnTEm = 1):

- TAUJnTOM.TAUJnTOMm
- TAUJnTOC.TAUJnTOCm

26.7.1 General Procedures for Specifying a Channel Output Mode

This section describes the general procedures for specifying a TAUJTTOUTm channel output mode. The prerequisite is that timer output operation is disabled (TAUJnTOE.TAUJnTOEm = 0).

(1) Set TAUJnTO.TAUJnTOm to specify the initial level of the TAUJTTOUTm output.

(2) Set channel output mode according to **Table 26.37, Channel Output Modes**, and the output logic using the TAUJnTOL.TAUJnTOLm bit.

(3) Start the counter (TAUJnTS.TAUJnTSm = 1).

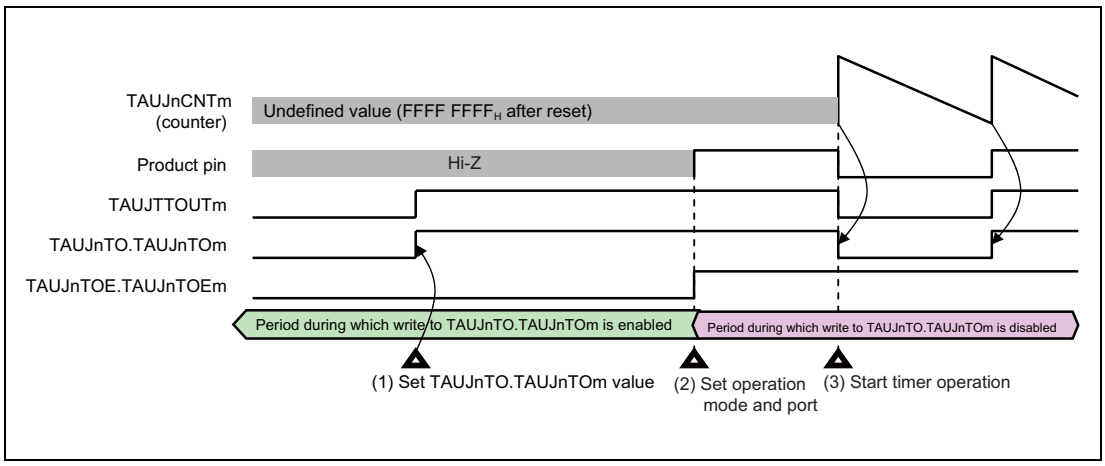

Figure 26.7 General Procedure for Specifying a TAUJTTOUTm Channel Output Mode

26.7.2 Channel Output Modes Controlled Independently by TAUJn Signals

This section lists the channel output modes that are controlled independently by TAUJn signals. The control bits used to specify a mode are listed in **Table 26.37, Channel Output Modes**.

26.7.2.1 Independent Channel Output Mode 1

Set/reset conditions

In this output mode, TAUJTTOUTm toggles when INTTAUJnIm is detected. The value of TAUJnTOL.TAUJnTOLm is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 26.37, Channel Output Modes**.

26.7.3 Channel Output Modes Controlled Synchronously by TAUJn Signals

This section lists the channel output modes that are controlled synchronously by TAUJn signals. The control bits used to specify a mode are listed in **Table 26.37, Channel Output Modes**.

26.7.3.1 Synchronous Channel Output Mode 1

Set/reset conditions

In this output mode, INTTAUJnIm of master channel serves as a set signal and INTTAUJnIm of the slave channel as a reset signal. If INTTAUJnIm of the master channel and INTTAUJnIm of the slave channel are generated at the same time, INTTAUJnIm of the slave channel (reset signal) has priority over INTTAUJnIm (set signal) of the master channel, i.e., the master channel is ignored.

Prerequisites

There are no prerequisites other than those shown in **Table 26.37, Channel Output Modes**.

26.8 Start Timing in Each Operating Modes

This section describes the timing at which the counter starts after TAUJnTS.TAUJnTSm is set to 1 in each operating mode.

In all modes, the value of data register and whether or not an interrupt occurs depends on mode and register settings.

CAUTION

The count start timing described in this section is for your reference. Actually, the count start timing depends on the count clock timing.

26.8.1 Interval Timer Mode, Capture Mode, and Count Capture Mode

The counter starts operating with the next count clock cycle after TAUJnTS.TAUJnTSm is set to 1. The value of data register is also loaded when the counter starts.

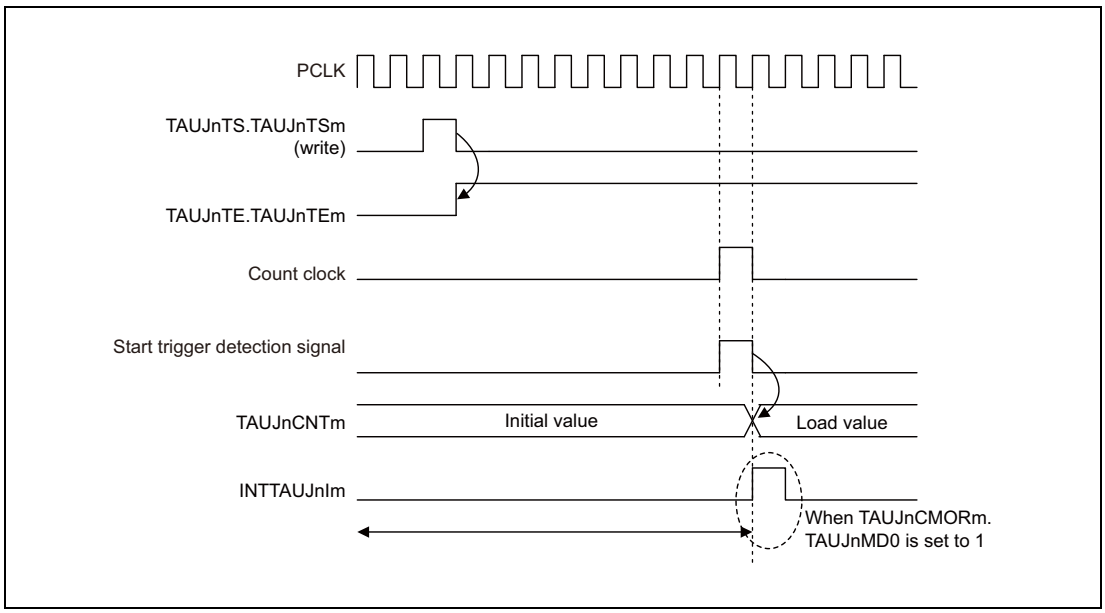

Figure 26.8 Start Timing in Interval Timer Mode, Capture Mode, and Count Capture Mode

26.8.2 Other Operating Modes

In other operating modes, count clock cycle is irrelevant to start of counter operation. The counter operation start timing is triggered only upon detection of a valid edge of TAUJTTINm. Once the counter starts, the value of data register is also loaded. The count clock cycles, which is irrelevant to start of counter operation, determine the frequency with which all operations take place.

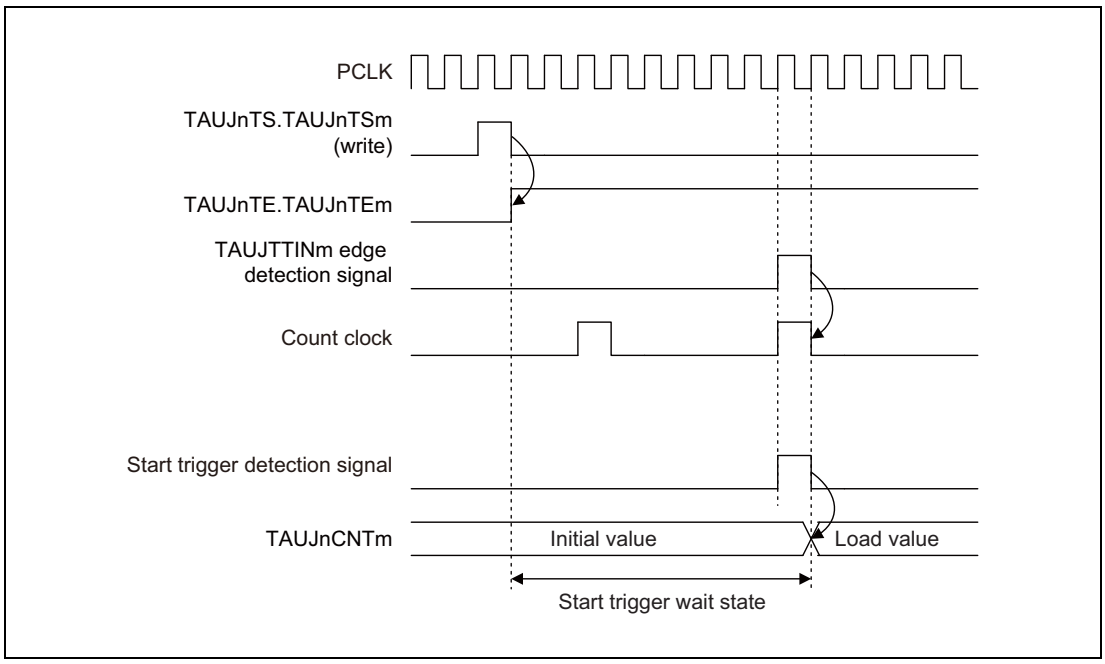

Figure 26.9 Count Start Timing in Other Operating Modes

26.9 TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts

When the counter starts, it is possible to specify whether an INTTAUJnIm is generated using the TAUJnCMORm.TAUJnMD0 bit. The generation of INTTAUJnIm when the TAUJnCMORm.TAUJnMD0 bit starts counting and the effect to TAUJTTOUTm depend on the selected function. For details, refer to the description of TAUJnCMORm.TAUJnMD0 of each function.

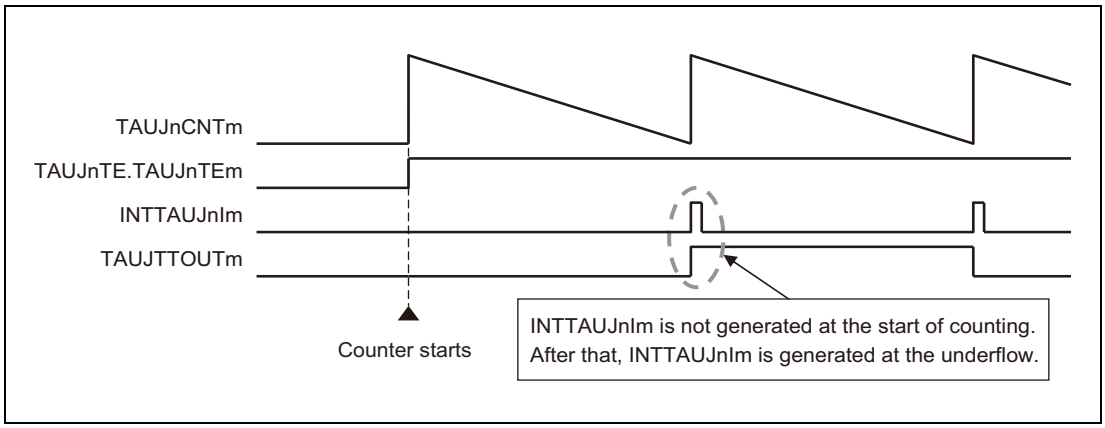

Figure 26.10 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 0)

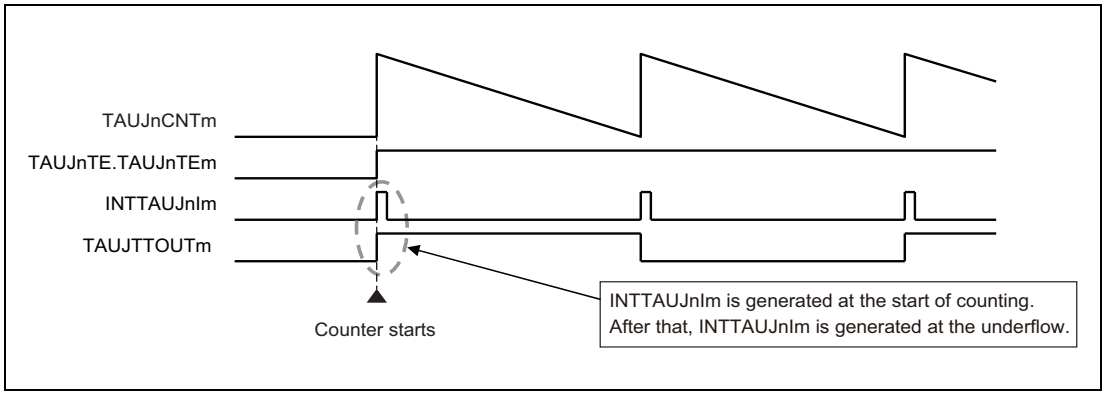

Figure 26.11 INTTAUJnIm Generation Timing (when TAUJnCMORm.TAUJnMD0 = 1)

26.10 Interrupt Generation upon Overflow

In certain independent functions, an interrupt is not generated when the counter value reaches FFFF $FFFF_H$ and an overflow occurs during count-up. This section describes how to generate an interrupt by combining channel operations in a mode that counts up and in a mode that counts down.

The appropriate operation mode for the second channel depends on the operation mode of the first channel. Nevertheless, the principle is the same for all combinations:

- Find an operation mode for the second channel that counts down in such a manner, that it reaches 0000 0000_H at the same time as the first channel overflows (TAUJnCNTm = FFFF $FFFF_H$).
- Set TAUJnCDRm of the second channel to FFFF $FFFF_H$.
- The two channels must count at the same speed (i.e. they must have the same count clock).
- Both channels are triggered by the same TAUJTTINm input.
- The trigger detection settings (TAUJnCMORm.TAUJnSTS[2:0] and TAUJnCMURm.TAUJnTIS[1:0]) must be identical for both channels.

Result:

The down-counter of the second channel reaches 0000 0000_H at exactly the same time as the up-counter of the first channel overflows (TAUJnCNTm = FFFF $FFFF_H$). Thus the second channel generates the desired interrupt.

The following sections list the operating modes that count down that are required to match specific operating modes that count up, as well as example timing diagrams.

26.10.1 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

When the capture trigger is input simultaneously to TAUJTTINm of both channels, INTTAUJnIm of the interval timer function can detect the overflow when TAUJnCNTm of the TAUJTTINm input position detection function exceeds FFFF FFFF$_H$.

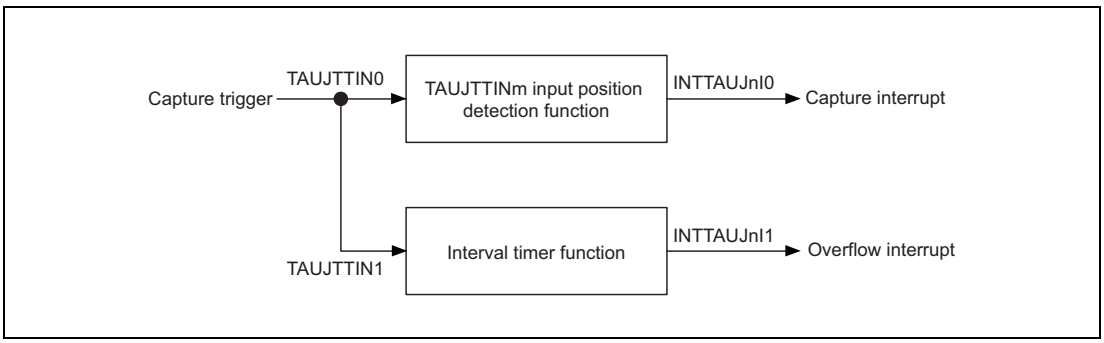

Figure 26.12 Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

Timing diagram

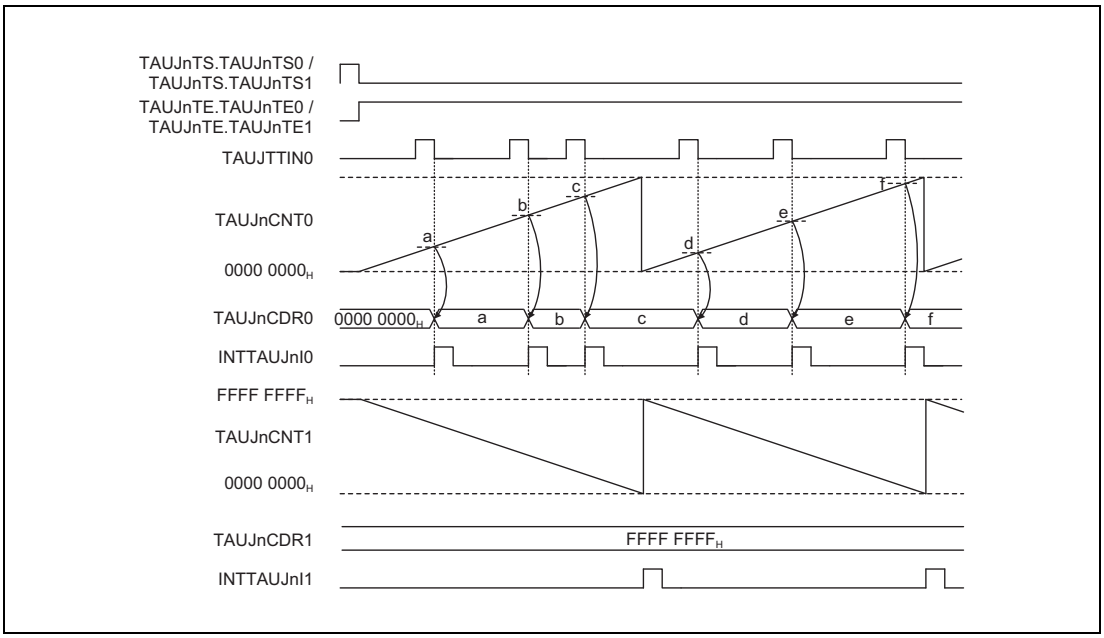

Figure 26.13 Interrupt Generation via Combination of the TAUJTTINm Input Position Detection Function and the Interval Timer Function

26.11 TAUJTTINm Edge Detection

Edge detection is based on the operation clock. This means that an edge can only be detected at the next rising edge of the operation clock. This can lead to a maximum delay of one operation clock cycle.

The following figure shows when edge detection takes place.

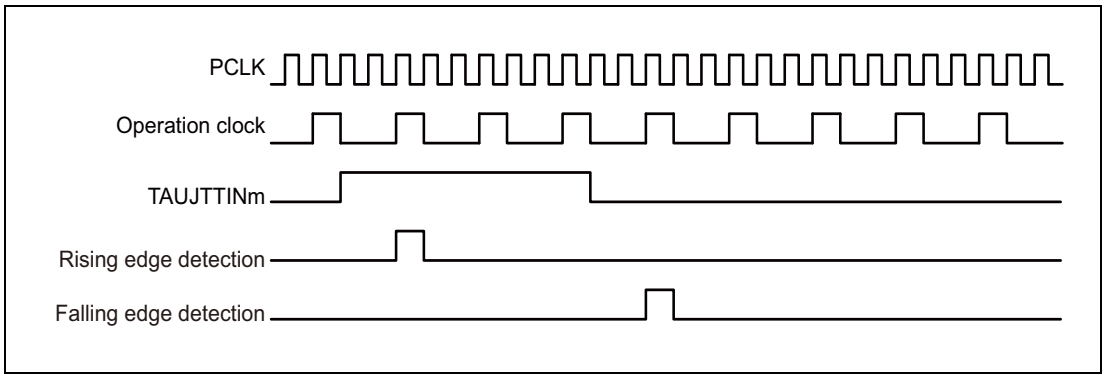

Figure 26.14 Basic Edge Detection Timing

Figure 26.14 shows an image of operation timing. In the actual operation, delay time occurs due to noise filter and synchronization circuit between the TAUJnIm pin and TAUJn.

26.12 Independent Channel Operation Functions

The following sections list the independent channel operation functions provided by the TAUJ. For a general overview of independent channel operation functions, see **Section 26.2, Overview**.

26.12.1 Interval Timer Function

26.12.1.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave.

Functional description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counter starts to count down from this value.

When the counter reaches $0000\ 0000_H$, INTTAUJnIm is generated and the TAUJTTOUTm signal toggles. TAUJnCNTm then loads the TAUJnCDRm value and subsequently continues operation.

The value of TAUJnCDRm can be rewritten at any time, and the changed value of TAUJnCDRm is applied the next time the counter starts to count down.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0. TAUJnCNTm and TAUJTTOUTm stop but retain their values. The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. The counter can also be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.

Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated, and therefore TAUJTTOUTm does not toggle. This results in a reverted TAUJTTOUTm signal compared to when TAUJnCMORm.TAUJnMD0 is set to 1.

26.12.1.2 Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTTOUTm square wave cycle = count clock cycle × (TAUJnCDRm+1) × 2

26.12.1.3 Block Diagram and General Timing Diagram

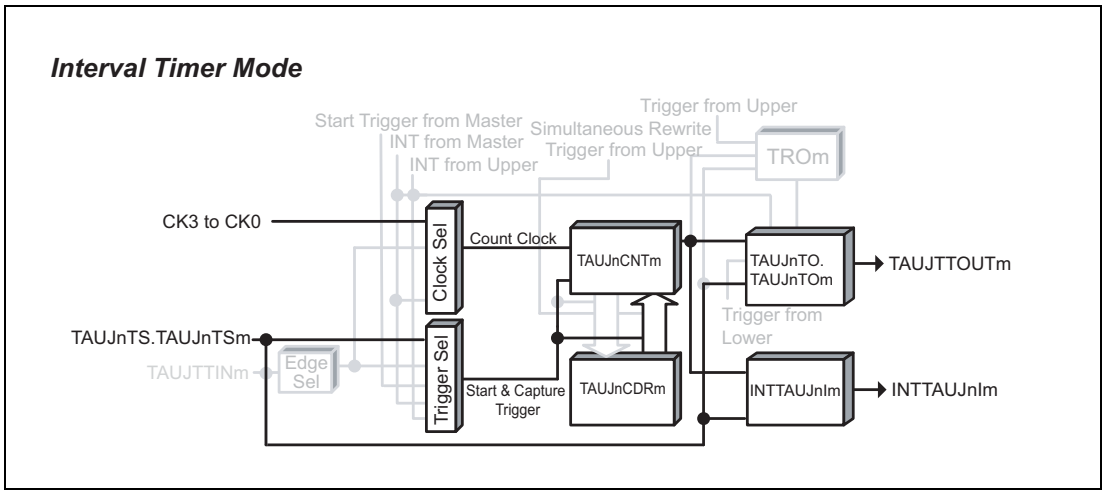

Figure 26.15 Block Diagram for Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1).

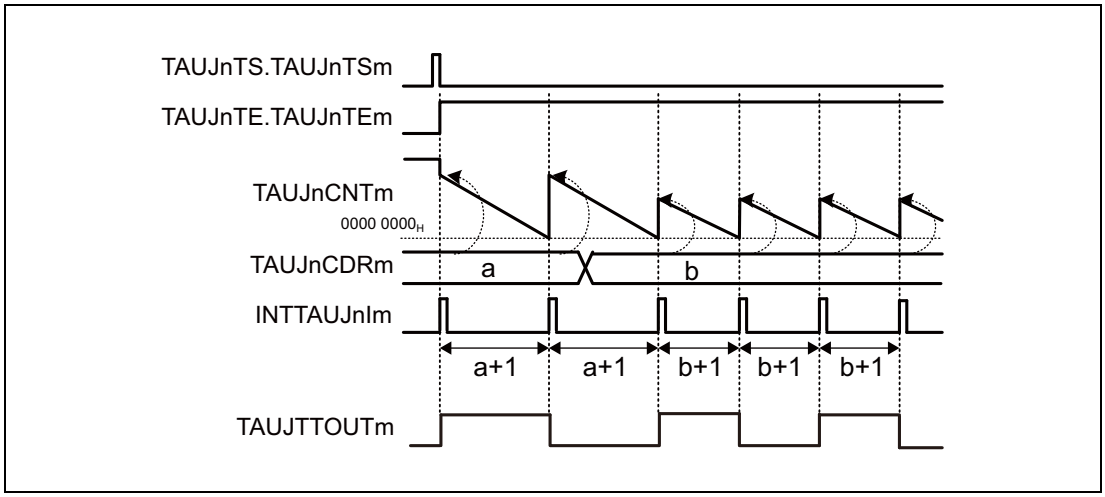

Figure 26.16 General Timing Diagram for Interval Timer Function

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	TAUJnTIS[1:0]	00: Not used, so set to 00.

(3) Channel output mode

Table 26.40 Control Bit Settings in Independent Channel Output Mode 1

Bit name	Setting
TAUJnTOE.TAUJnTOEm	Write 1_B.
TAUJnTOM.TAUJnTOMm	Write 0_B.
TAUJnTOC.TAUJnTOCm	Write 0_B.
TAUJnTOL.TAUJnTOLm	Write 0_B.

NOTE

The channel output mode can also be set to Channel Output Mode Controlled by Software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details see **Section 26.7, Channel Output Modes**.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the interval timer function. Therefore, these registers must be set to 0.

Table 26.41 Simultaneous Rewrite Settings for Interval Timer Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

26.12.1.5 Operating Procedure for Interval Timer Function

Table 26.42 Operating Procedure for Interval Timer Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 26.38, Contents of the TAUJnCMORm register for Interval Timer Function** and **Table 26.39, Contents of the TAUJnCMURm register for Interval Timer Function**. Set the value of the TAUJnCDRm register. Set the channel output mode by setting the control bits as described in **Table 26.40, Control Bit Settings in Independent Channel Output Mode 1**.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm loads the TAUJnCDRm value. When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTTOUTm toggles.
During operation	The TAUJnCDRm register value can be changed at any time. The TAUJnCNTm register can be read at all times.	TAUJnCNTm counts down. When the counter reaches 0000 0000_H: • TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. • INTTAUJnIm is generated and TAUJTTOUTm toggles.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart operation

26.12.1.6 Specific Timing Diagrams

(1) TAUJnCDRm = 0000 0000_H, count clock = PCLK/2

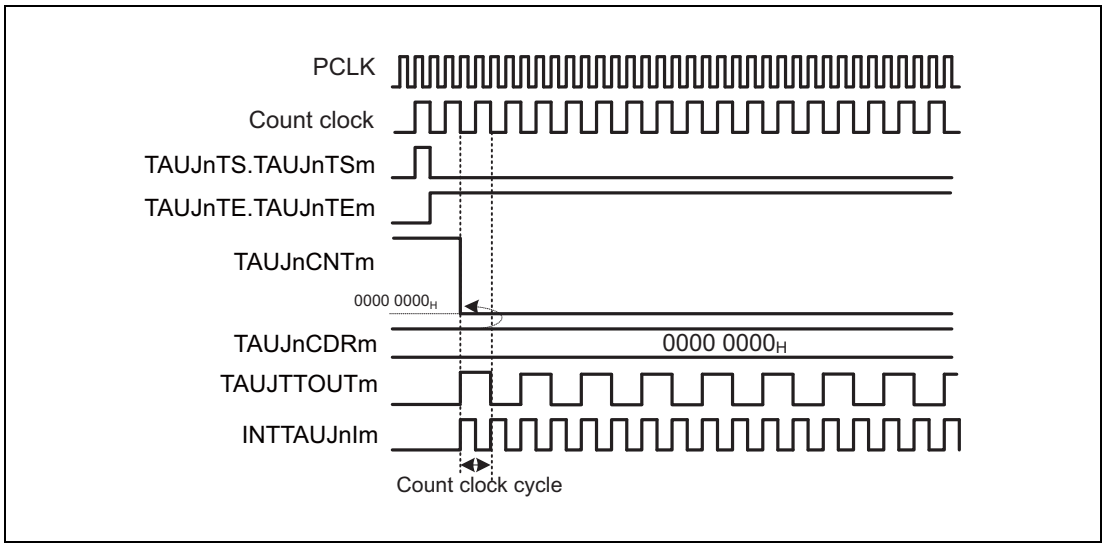

Figure 26.17 TAUJnCDRm = 0000 0000_H, Count Clock = PCLK/2

- If TAUJnCDRm = 0000 0000_H and the count clock = PCLK/2, the TAUJnCDRm value is loaded to TAUJnCNTm every count clock, meaning that TAUJnCNTm is always 0000 0000_H.
- INTTAUJnIm is generated every count clock, resulting in TAUJTTOUTm toggling every count clock.

(2) TAUJnCDRm = 0000 0000$_H$, count clock = PCLK

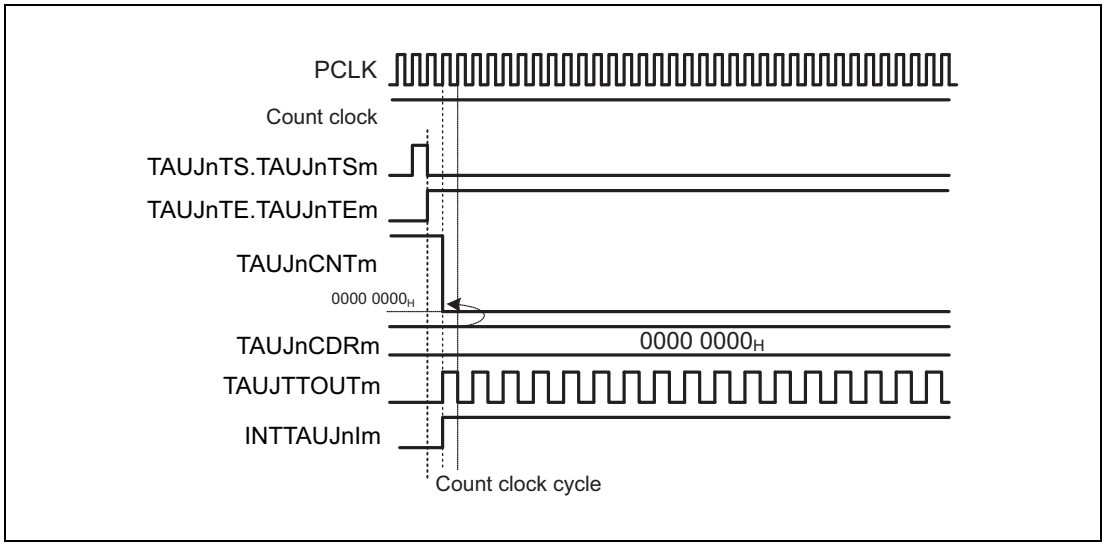

Figure 26.18 TAUJnCDRm = 0000 0000$_H$, Count Clock = PCLK

- If TAUJnCDRm = 0000 0000$_H$ and the count clock = PCLK, the TAUJnCDRm value is loaded to TAUJnCNTm every PCLK clock, meaning that TAUJnCNTm is always 0000 0000$_H$.
- INTTAUJnIm is fixed to the high level. Though the first interrupt is generated, subsequent interrupts are not generated.
  TAUJTTOUTm is toggled every PCLK clock.

(3) Operation stop and restart

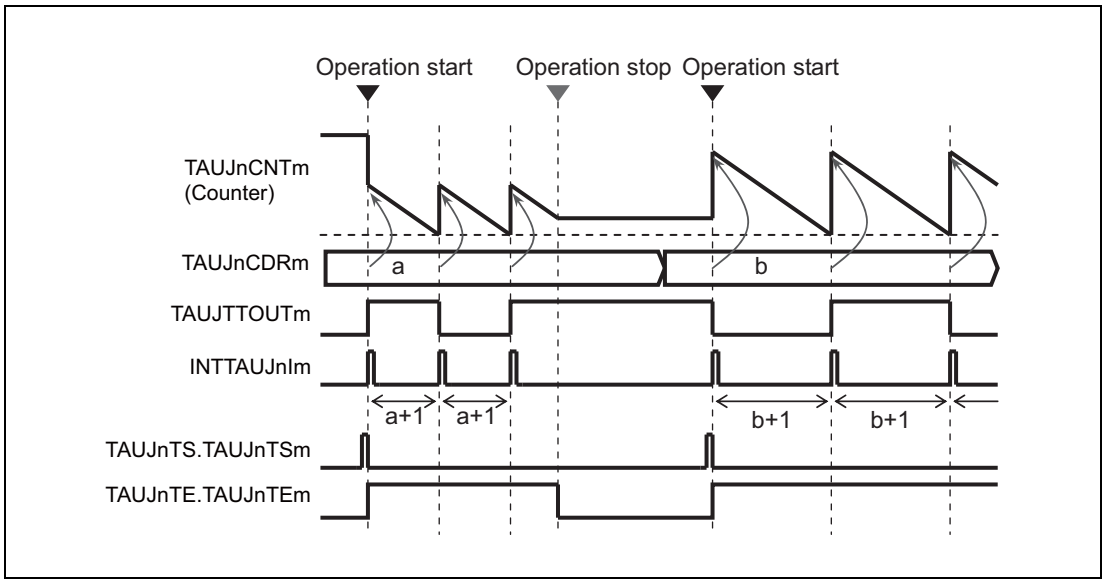

Figure 26.19 Operation Stop and Restart (TAUJnCMORm.TAUJnMD0 = 1)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTTOUTm stop but retain their values.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1.

(4) Forced restart

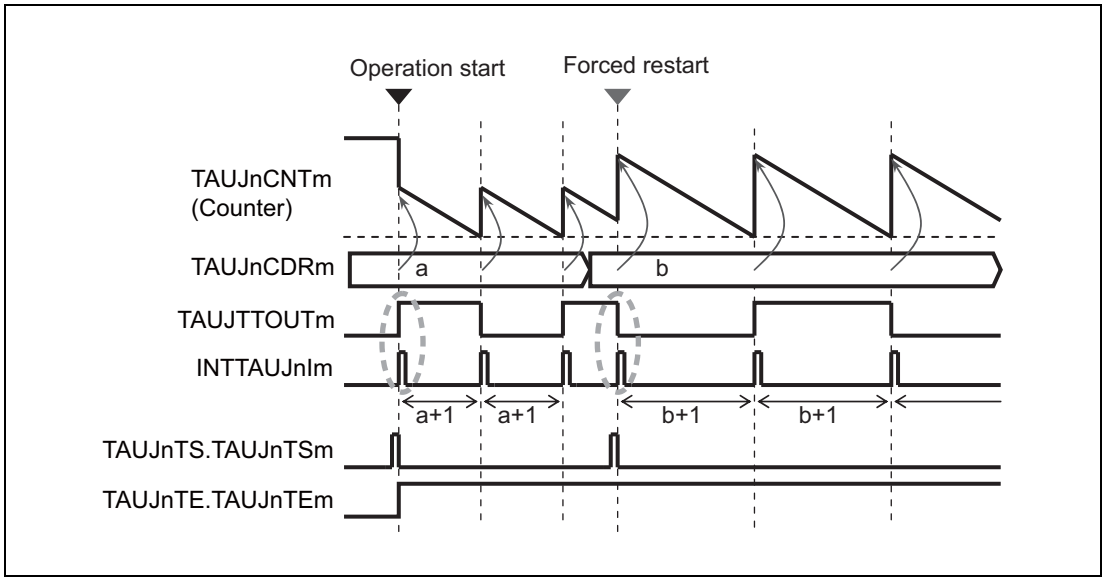

Figure 26.20 Forced Restart Operation (TAUJnCMORm.TAUJnMD0 = 1)

- The counter can be forcibly restarted (without stopping it first) by setting TAUJnTS.TAUJnTSm to 1 during operation.
- If the TAUJnCMORm.TAUJnMD0 bit is set to 1, the first interrupt after a start or restart is generated.
- When a forced restart is made, the TAUJnCDRm value is reflected to TAUJnCNTm and counting starts. Execute a forced restart to reflect the changed TAUJnCDRm value immediately.

26.12.2 TAUJTTINm Input Interval Timer Function

26.12.2.1 Overview

Summary

This function is used as a reference timer for generating timer interrupts (INTTAUJnIm) at regular intervals or when a valid TAUJTTINm input edge is detected. When an interrupt is generated, the TAUJTTOUTm signal toggles, resulting in a square wave. Output of square waves is only supported for TAUJ0.

Description

This function operates in an identical manner to the interval timer function (see **Section 26.12.1, Interval Timer Function**), except that this function is restarted by a valid TAUJTTINm input edge. The type of edge used as the trigger is specified using the TAUJnCMURm.TAUJnTIS[1:0] bits. Either rising edge, falling edge, or rising and falling edges can be selected.

26.12.2.2 Equations

INTTAUJnIm cycle = count clock cycle × (TAUJnCDRm + 1)

TAUJTTOUTm square wave cycle = count clock cycle × (TAUJnCDRm + 1) × 2

26.12.2.3 Block Diagram and General Timing Diagram

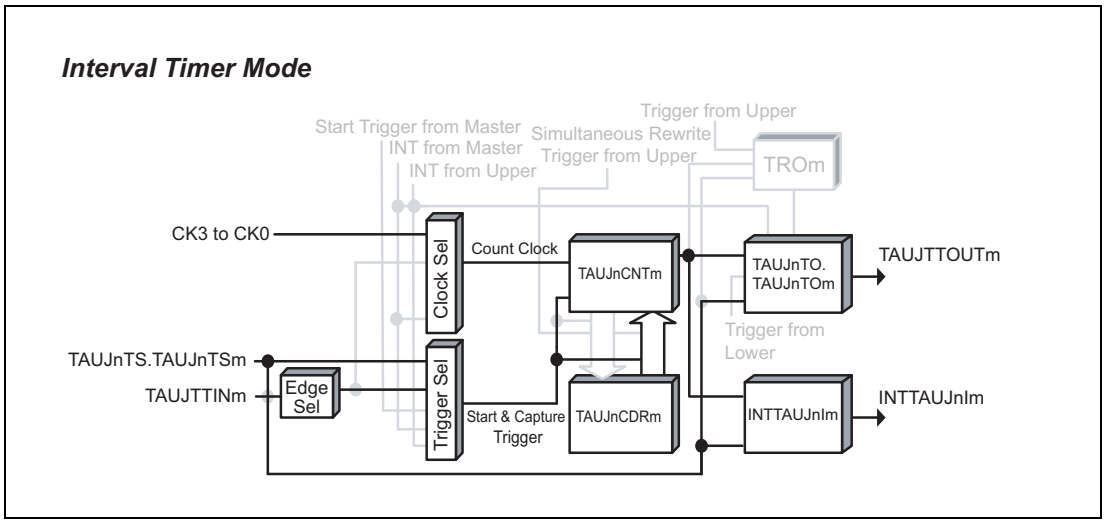

Figure 26.21 Block Diagram for TAUJTTINm Input Interval Timer Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is generated at operation start (TAUJnCMORm.TAUJnMD0 = 1).
- Rising edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 01_B)

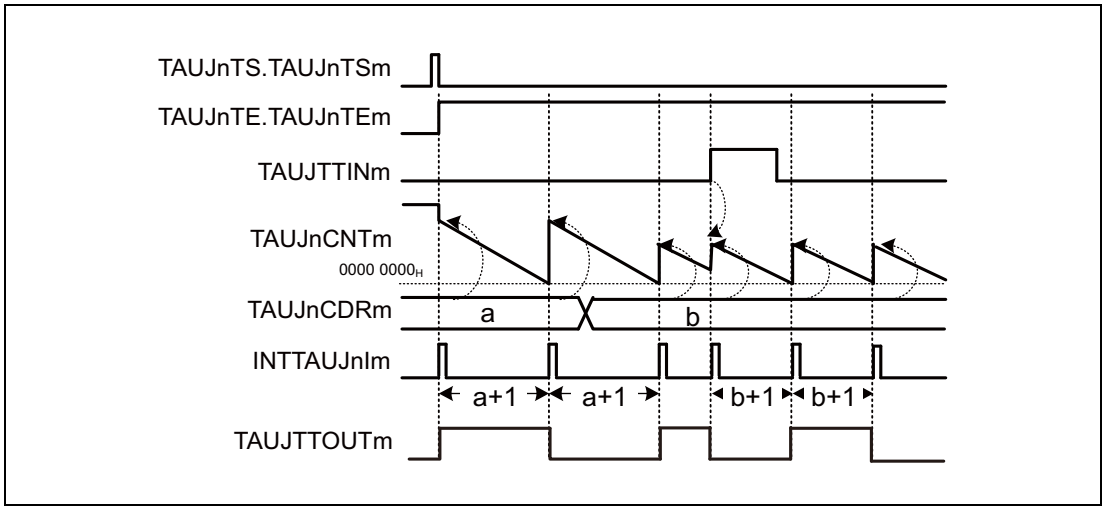

Figure 26.22 General Timing Diagram for TAUJTTINm Input Interval Timer Function

1, 0	TAUJnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

(3) Channel output mode

Table 26.45 Control Bit Settings for Independent Channel Output Mode 1

Bit name	Setting
TAUJnTOE.TAUJnTOEm	Write 1_B.
TAUJnTOM.TAUJnTOMm	Write 0_B.
TAUJnTOC.TAUJnTOCm	Write 0_B.
TAUJnTOL.TAUJnTOLm	Write 0_B.

NOTE

The channel output mode can also be set to channel output mode controlled by software by setting TAUJnTOE.TAUJnTOEm = 0. TAUJTTOUTm can then be controlled independently of the interrupts. For details see **Section 26.7, Channel Output Modes**.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input interval timer function. Therefore, these registers must be set to 0.

Table 26.46 Simultaneous Rewrite Settings for TAUJTTINm Input Interval Timer Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

26.12.2.5 Operating Procedure for TAUJTTINm Input Interval Timer Function

Table 26.47 Operating Procedure for TAUJTTINm Input Interval Timer Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 26.43, Contents of the TAUJnCMORm register for TAUJTTINm Input Interval Timer Function** and **Table 26.44, Contents of the TAUJnCMURm register for TAUJTTINm Input Interval Timer Function**. Set the value of the TAUJnCDRm register Set the channel output mode by setting the control bits as described in **Table 26.45, Control Bit Settings for Independent Channel Output Mode 1**.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm loads the TAUJnCDRm value. When TAUJnCMORm.TAUJnMD0 = 1, INTTAUJnIm is generated and TAUJTTOUTm toggles.
During operation	The values of the TAUJnCMURm.TAUJnTIS[1:0] and TAUJnCDRm registers can be changed at any time. The TAUJnCNTm register can be read at all times. Detection of TAUJTTINm edge	TAUJnCNTm counts down. When the counter reaches 0000 0000_H: • TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. • INTTAUJnIm is generated and TAUJTTOUTm toggles. When a TAUJTTINm input valid edge is detected during count operation, TAUJnCNTm reloads the TAUJnCDRm value and continues count operation. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart operation

26.12.2.6 Specific Timing Diagrams

The timing diagrams in **Section 26.12.1, Interval Timer Function** apply, and in addition the counter can also be restarted by a valid TAUJTTINm input edge.

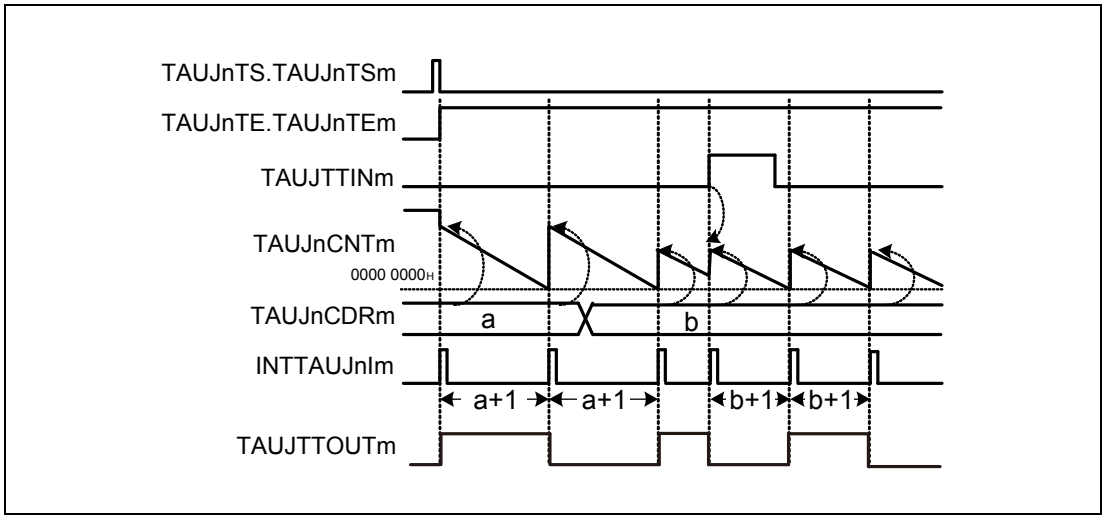

Figure 26.23 Counter Triggered By Rising TAUJTTINm input edge (TAUJnCMURm.TAUJnTIS[1:0] = 01_B), TAUJnCMORm.TAUJnMD0 = 1

If a valid TAUJTTINm input edge is detected, an interrupt is generated which causes TAUJTTOUTm to toggle. In this example, the valid edge is a rising edge (TAUJnCMURm.TAUJnTIS[1:0] = 01_B).

26.12.3 TAUJTTINm Input Pulse Interval Measurement Function

26.12.3.1 Overview

Summary

This function captures the count value and uses this value and the overflow bit TAUJnCSRm.TAUJnOVF to measure the interval of the TAUJTTINm input signals.

Prerequisites

TAUJTTOUTm is not used for this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter TAUJnCNTm starts counting up from 0000 0000_H. When a valid TAUJTTINm edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter resets to 0000 0000_H and subsequently continues operation.

If the counter reaches FFFF $FFFF_H$ before a valid TAUJTTINm edge is detected, it overflows to 0000 0000_H. The counter is reset to 0000 0000_H and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

Table 26.48 Effects of an Overflow

TAUJnCMORm.TAUJnCOS[1:0]	When Overflow Occurs		When a Valid TAUJTTINm Input is then Detected	
	TAUJnCDRm	TAUJnCSRm.TAUJnOVF	TAUJnCDRm and TAUJnCNTm	TAUJnCSRm.TAUJnOVF
00	Unchanged	0	TAUJnCNTm loaded to TAUJnCDRm	1
01		1		
10	Set to FFFF $FFFF_H$	0	TAUJnCNTm set to 0, TAUJnCDRm unchanged	Unchanged
11		1		

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV = 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the interval of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

The function can be stopped by setting TAUJnTT.TAUJnTTm = 1, which in turn sets TAUJnTE.TAUJnTEm = 0. TAUJnCNTm stops but retains its value. While the function is stopped, TAUJTTINm input valid edge detection and TAUJnCNTm capture are not performed.

Conditions

If the TAUJnCMORm.TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated. For details, see **26.9, TAUJTTOUTm Output and INTTAUJnIm Generation when Counter Starts or Restarts**.

NOTE

When TAUJnCMORm.TAUJnCOS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

26.12.3.2 Equations

TAUJTTINm input pulse interval = count clock cycle ×
[(TAUJnCSRm.TAUJnOVF × (FFFF FFFF$_H$ + 1)) + TAUJnCDRm capture value + 1]

26.12.3.3 Block Diagram and General Timing Diagram

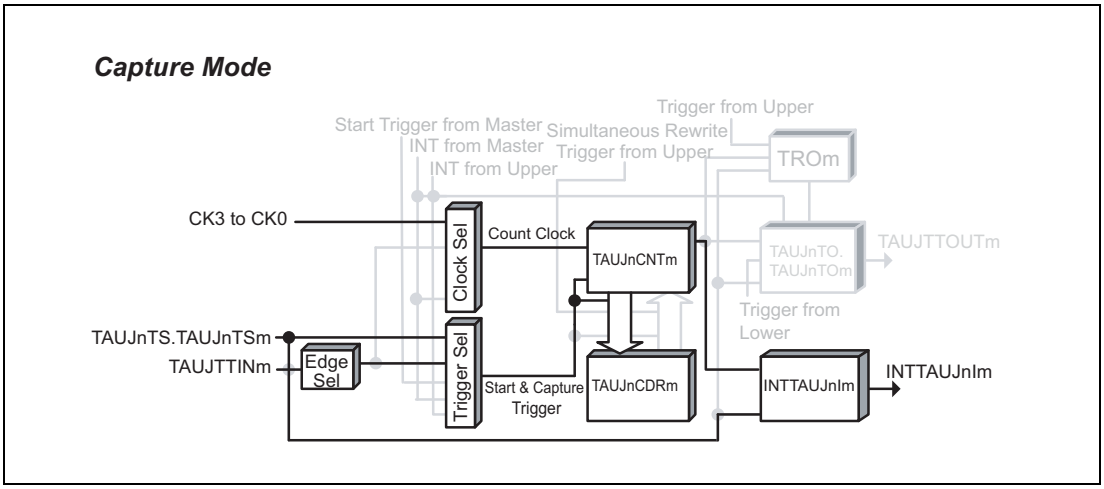

Figure 26.24 Block Diagram for TAUJTTINm Input Pulse Interval Measurement Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00_B)
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = 00_B).

1, 0	TAUJnTIS[1:0]	00: Falling edge detection 01: Rising edge detection 10: Rising and falling edge detection 11: Setting prohibited

(3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input pulse interval measurement function. Therefore, these registers must be set to 0.

Table 26.51 Simultaneous Rewrite Settings for TAUJTTINm Input Pulse Interval Measurement Function

Bit name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

26.12.3.5 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function

Table 26.52 Operating Procedure for TAUJTTINm Input Pulse Interval Measurement Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 26.49, Contents of the TAUJnCMORm Register for TAUJTTINm Input Pulse Interval Measurement Function** and **Table 26.50, Contents of the TAUJnCMURm Register for TAUJTTINm Input Pulse Interval Measurement Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. TAUJnCNTm is cleared to 0000 0000_H. INTTAUJnIm is generated when TAUJnCMORm.TAUJnMD0 is set to 1.
During operation	Detection of TAUJTTINm edges. The values of the TAUJnCMURm.TAUJnTIS[1:0] bits can be changed at any time. The TAUJnCDRm and TAUJnCSRm registers can be read at any time. TAUJnCSCm.TAUJnCLOV bit can be written to 1. (TAUJnCSRm.TAUJnOVF bit is cleared to 0.)	TAUJnCNTm starts to count up from 0000 0000_H. When a TAUJTTINm valid edge is detected: • TAUJnCNTm transfers (captures) its value to TAUJnCDRm, and returns to 0000 0000_H. • INTTAUJnIm is then generated. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values.

Restart operation

26.12.3.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUJnCMORm.TAUJnCOS[1:0] = 00_B

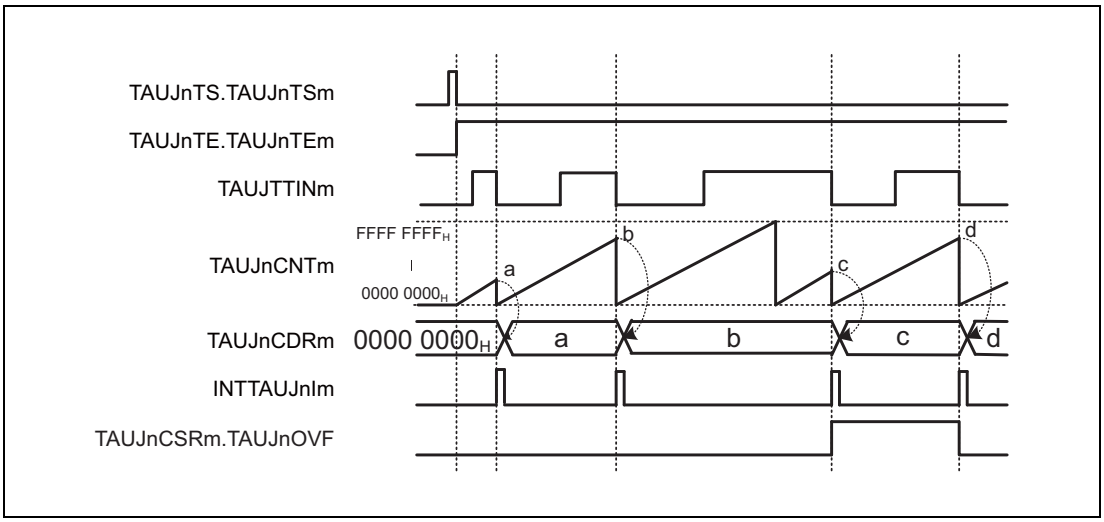

Figure 26.26 TAUJnCMORm.TAUJnCOS[1:0] = 00_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- If the next valid TAUJTTINm input edge is detected when no overflow occurs, TAUJnCSRm.TAUJnOVF is cleared to 0.

(2) TAUJnCMORm.TAUJnCOS[1:0] = 01_B

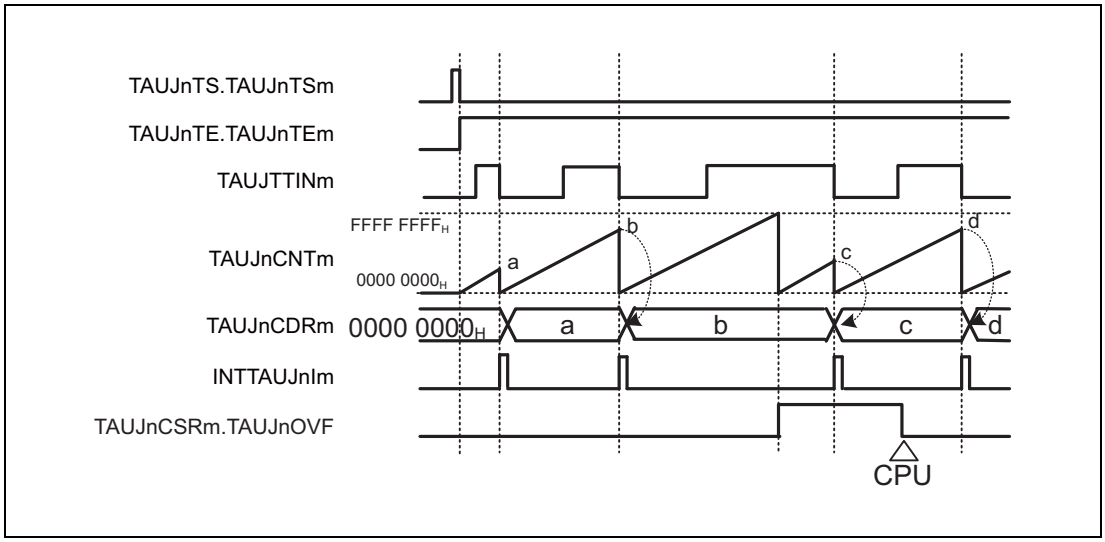

Figure 26.27 TAUJnCMORm.TAUJnCOS[1:0] = 01_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

(3) TAUJnCMORm.TAUJnCOS[1:0] = 10_B

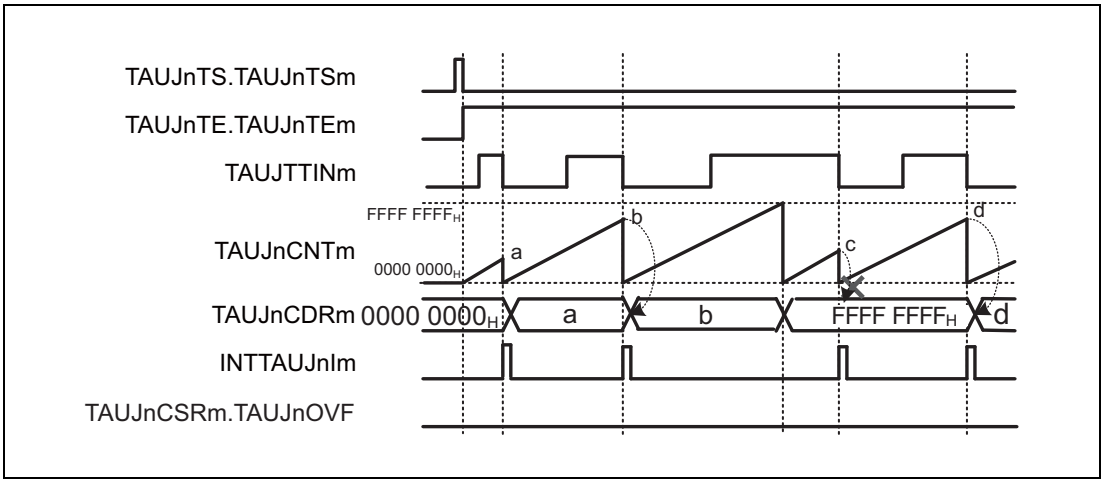

Figure 26.28 TAUJnCMORm.TAUJnCOS[1:0] = 10_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$ and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.

(4) TAUJnCMORm.TAUJnCOS[1:0] = 11_B

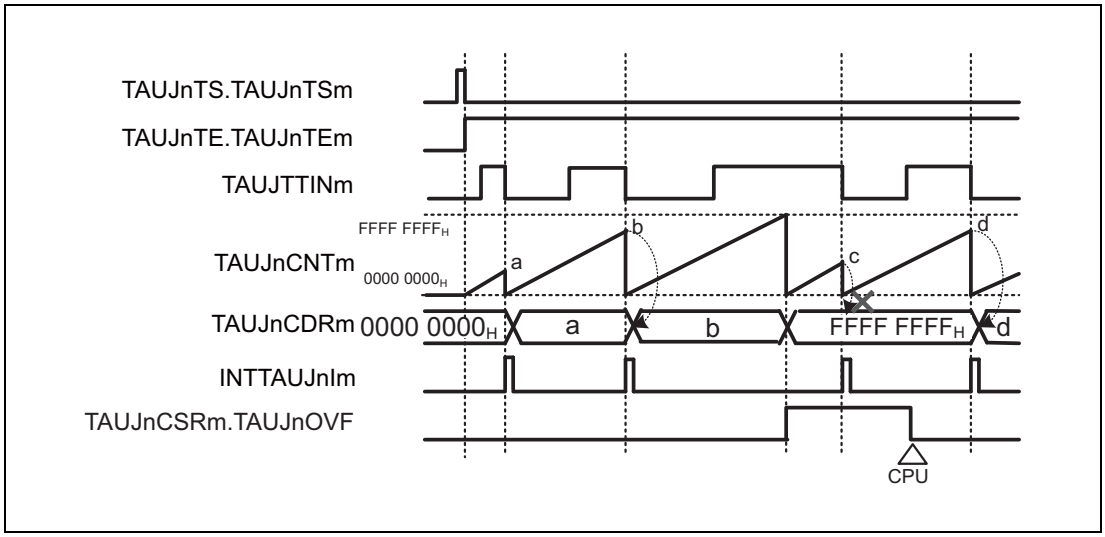

Figure 26.29 TAUJnCMORm.TAUJnCOS[1:0] = 11_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm is reset to 0, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

26.12.4 TAUJTTINm Input Signal Width Measurement Function

26.12.4.1 Overview

Summary

This function measures the width of a TAUJTTINm signal by starting counting on one edge of the TAUJTTINm signal and capturing the counter value on the opposite edge.

Prerequisites

TAUJTTOUTm is not used for this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. When a valid TAUJTTINm start edge is detected, the counter TAUJnCNTm starts counting up from 0000 0000_H. When a valid TAUJTTINm stop edge is detected, the value of TAUJnCNTm is captured, transferred to TAUJnCDRm, and an interrupt INTTAUJnIm is generated. The counter retains its value and awaits the next valid TAUJTTINm input start edge.

If the counter reaches FFFF $FFFF_H$ before a valid TAUJTTINm stop edge is detected, it overflows. The counter is reset to 0000 0000_H and subsequently continues operation. The values transferred to TAUJnCDRm and TAUJnCSRm.TAUJnOVF respectively depend on the values of bits TAUJnCMORm.TAUJnCOS[1:0].

Table 26.53 Effects of an Overflow

TAUJnCMORm.TAUJnCOS[1:0]	When Overflow Occurs		When a Valid TAUJTTINm Input Stop Edge is Detected	
	TAUJnCDRm	TAUJnCSRm.TAUJnOVF	TAUJnCDRm and TAUJnCNTm	TAUJnCSRm.TAUJnOVF
00	Unchanged	0	TAUJnCNTm is loaded to TAUJnCDRm.	1
01		1		
10	Set to FFFF $FFFF_H$	0	TAUJnCNTm stops counting, TAUJnCDRm unchanged	Unchanged
11		1		

When TAUJnCMORm.TAUJnCOS[0] = 1, the overflow bit TAUJnCSRm.TAUJnOVF can only be cleared by setting TAUJnCSCm.TAUJnCLOV to 1.

The combination of the values of TAUJnCDRm and TAUJnCSRm.TAUJnOVF can be used to deduce the width of the TAUJTTINm signal. However, if an overflow occurs multiple times before a valid TAUJTTINm input is detected, the overflow bit TAUJnCSRm.TAUJnOVF cannot indicate this.

This function cannot be forcibly restarted.

NOTE

When TAUJnCMORm.COS[1] = 1, the value of TAUJnCNTm is not loaded to TAUJnCDRm when the first valid TAUJTTINm input edge occurs after an overflow. However, an interrupt is generated.

26.12.4.2 Equations

TAUJTTINm input signal width = count clock cycle ×
[(TAUJnCSRm.TAUJnOVF × (FFFF FFFF$_H$ + 1)) + TAUJnCDRm capture value + 1]

26.12.4.3 Block Diagram and General Timing Diagram

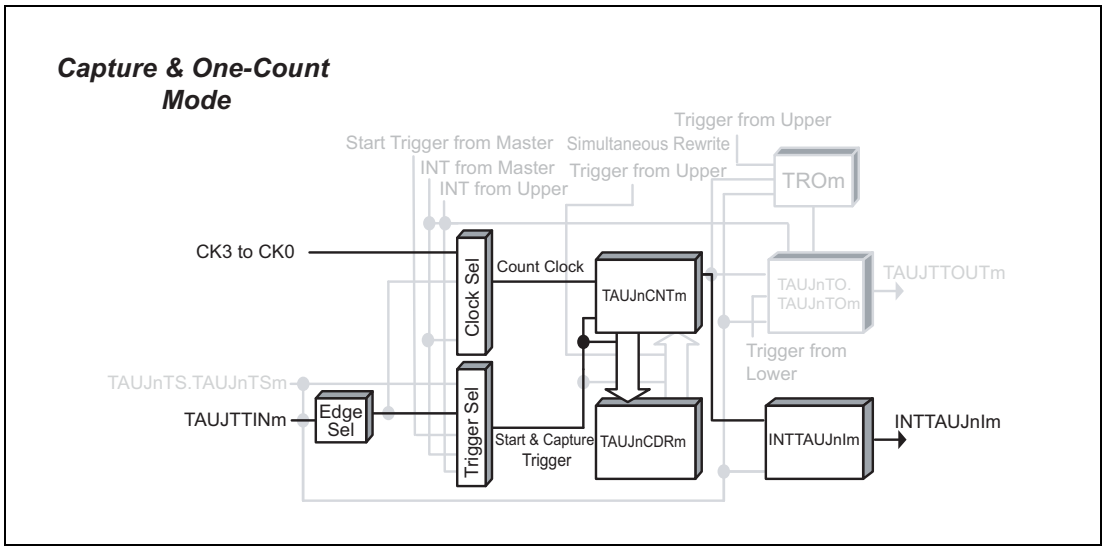

Figure 26.30 Block Diagram for TAUJTTINm Input Signal Width Measurement Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)
- When a valid TAUJTTINm input is detected after an overflow, TAUJnCDRm is changed and TAUJnCSRm.TAUJnOVF is set to 1 (TAUJnCMORm.TAUJnCOS[1:0] = 00_B).

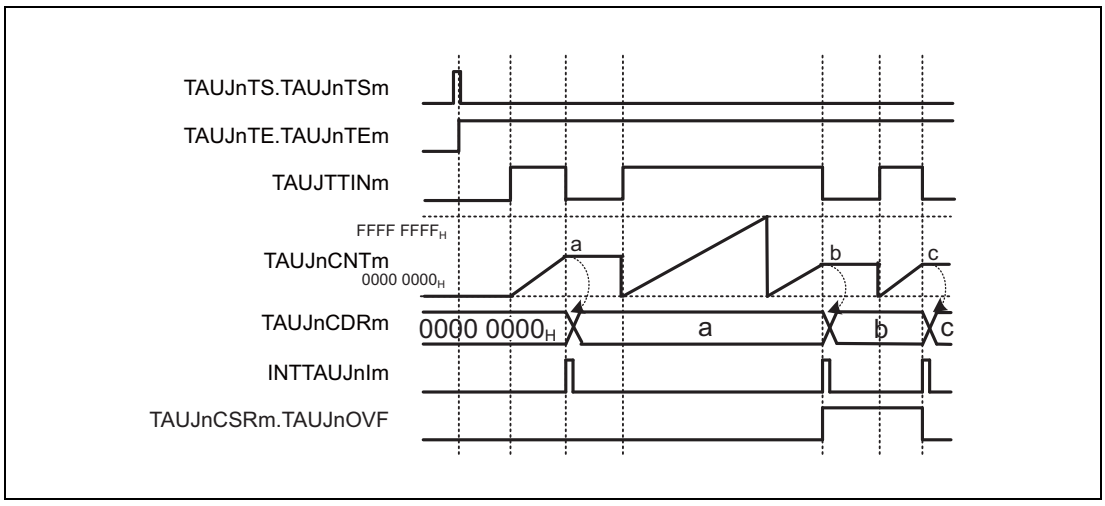

Figure 26.31 General Timing Diagram for TAUJTTINm Input Signal Width Measurement Function

1, 0	TAUJnTIS[1:0]	10: Rising and falling edge detection (low width measurement) 11: Rising and falling edge detection (high width measurement)

(3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input signal width measurement function. Therefore, these registers must be set to 0.

Table 26.56 Simultaneous Rewrite Settings for TAUJTTINm Input Signal Width Measurement Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

26.12.4.5 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

Table 26.57 Operating Procedure for TAUJTTINm Input Signal Width Measurement Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 26.54, Contents of the TAUJnCMORm Register for TAUJTTINm Input Signal Width Measurement Function** and **Table 26.55, Contents of the TAUJnCMURm Register for TAUJTTINm Input Signal Width Measurement Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge. When a TAUJTTINm start edge is detected, TAUJnCNTm starts to count up.
During operation	The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time. The TAUJnCSCm.TAUJnCLOV bit can be set to 1.	TAUJnCNTm starts to count up from 0000 0000_H. When a TAUJTTINm valid edge is detected: • TAUJnCNTm transfers (captures) its value to TAUJnCDRm, and retains its value. • INTTAUJnIm is then generated. • Counting stops at the "value that transferred to TAUJnCDRm + 1" and TAUJnCNTm waits for detection of the TAUJTTINm start edge. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and both it and TAUJnCSRm.TAUJnOVF retain their current values.

Restart operation

26.12.4.6 Specific Timing Diagrams: Overflow Behavior

(1) TAUJnCMORm.TAUJnCOS[1:0] = 00_B

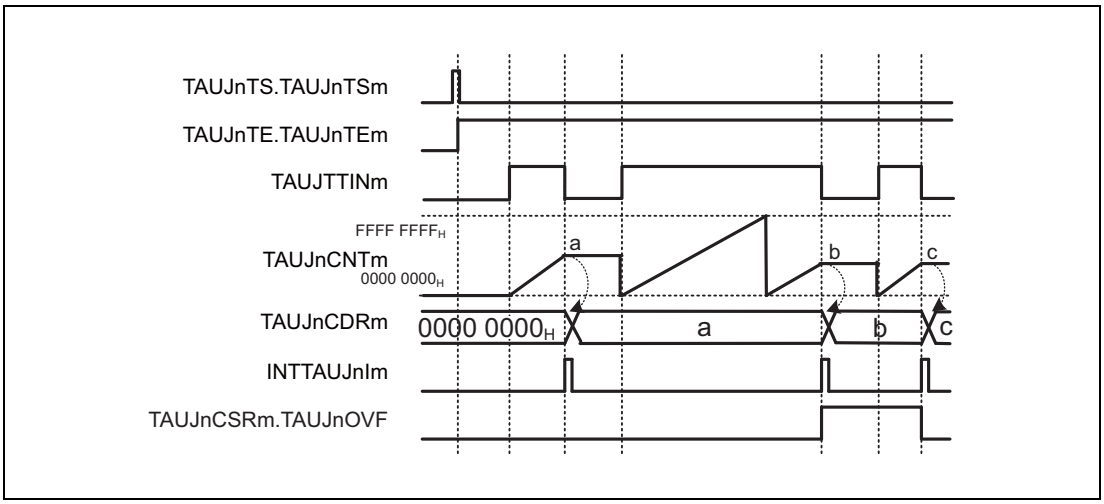

Figure 26.32 TAUJnCMORm.TAUJnCOS[1:0] = 00_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge with no overflow occurring, TAUJnCSRm.TAUJnOVF is cleared to 0.

(2) TAUJnCMORm.TAUJnCOS[1:0] = 01_B

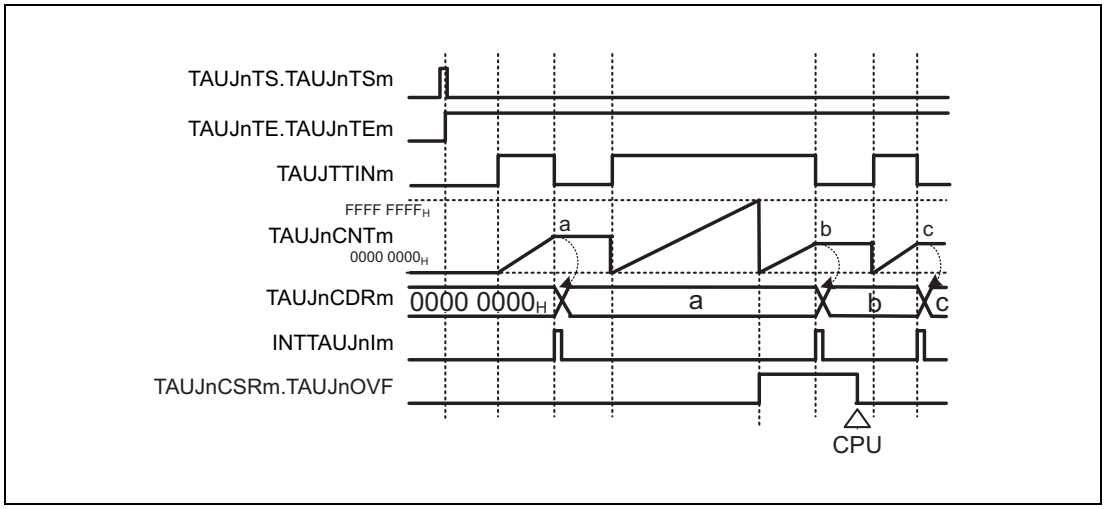

Figure 26.33 TAUJnCMORm.TAUJnCOS[1:0] = 01_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, the value of TAUJnCDRm remains unchanged and the value of TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, the value of TAUJnCNTm is loaded to TAUJnCDRm.
- TAUJnCSRm.TAUJnOVF is only cleared by a CPU command (by setting the TAUJnCSCm.TAUJnCLOV bit to 1).

(3) TAUJnCMORm.TAUJnCOS[1:0] = 10_B

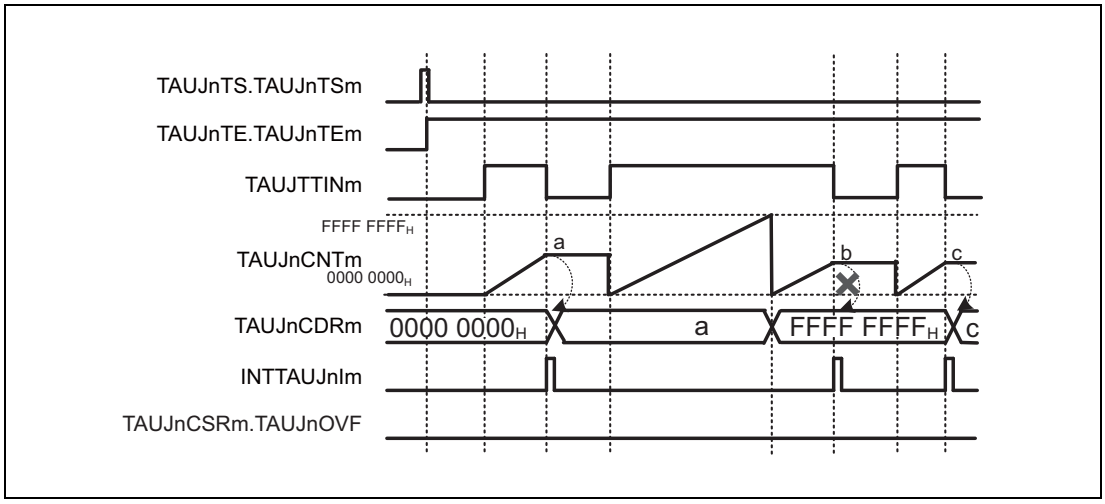

Figure 26.34 TAUJnCMORm.TAUJnCOS[1:0] = 10_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$ and the value of TAUJnCSRm.TAUJnOVF remains 0.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.

(4) TAUJnCMORm.TAUJnCOS[1:0] = 11_B

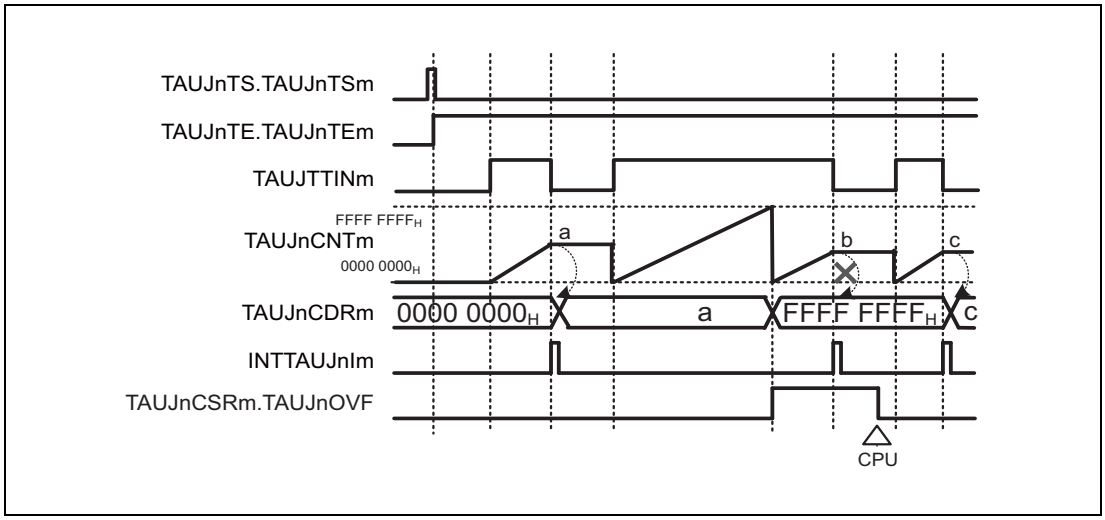

Figure 26.35 TAUJnCMORm.TAUJnCOS[1:0] = 11_B, TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 11_B

- When an overflow occurs, TAUJnCDRm is set to FFFF FFFF$_H$, and TAUJnCSRm.TAUJnOVF is set to 1.
- Upon detection of the next valid TAUJTTINm input edge, TAUJnCNTm stops counting, but TAUJnCDRm and TAUJnCSRm.TAUJnOVF remain unchanged.
- Thus, the next TAUJTTINm input valid edge after the overflow is ignored.
- TAUJnCSRm.TAUJnOVF is cleared by setting the TAUJnCSCm.TAUJnCLOV bit to 1.

26.12.5 TAUJTTINm Input Position Detection Function

26.12.5.1 Overview

Summary

This function measures the interval of input signals by capturing the counter value on a valid edge of the TAUJTTINm signal.

Prerequisites

TAUJTTOUTm is not used for this function

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter starts to count from 0000 0000_H. When a valid TAUJTTINm input edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter continues to count.

When the counter reaches FFFF $FFFF_H$, the counter restarts from 0000 0000_H.

NOTE

The input TAUJTTINm is sampled at the frequency of the operation clock, specified by TAUJnCMORm.TAUJnCKS[1:0] bits. As a result, the output cycle of TAUJTTOUTm has an error of ± 1 operation clock cycle.

Conditions

If the TAUJnCMORm. TAUJnMD0 bit is set to 0, the first interrupt after a start or restart is not generated.

26.12.5.2 Equations

Function duration at a TAUJTTINm input pulse =
count clock cycle × (TAUJnCDRm capture value + 1)

26.12.5.3 Block Diagram and General Timing Diagram

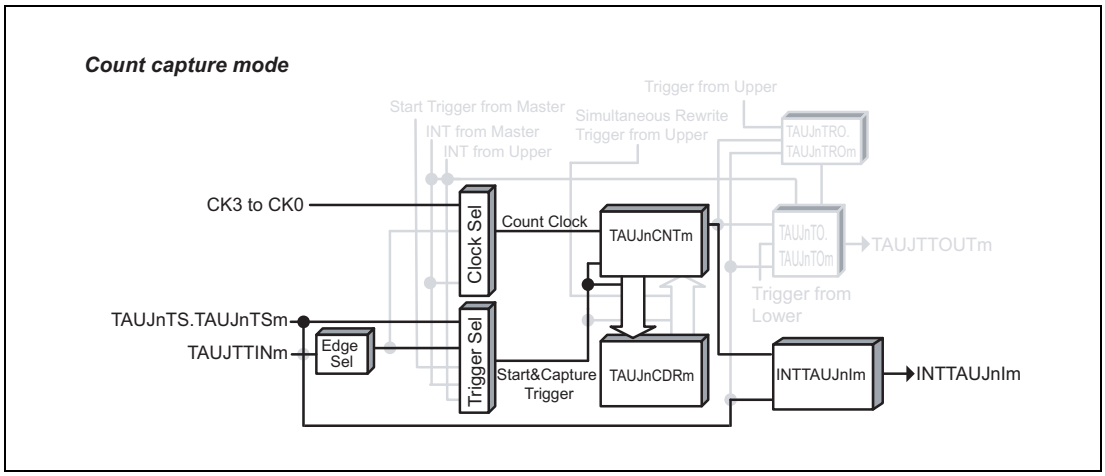

Figure 26.36 Block Diagram of TAUJTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- INTTAUJnIm is not generated when operation starts (TAUJnCMORm.TAUJnMD0 = 0).
- Falling edge detection (TAUJnCMURm.TAUJnTIS[1:0] = 00_B)

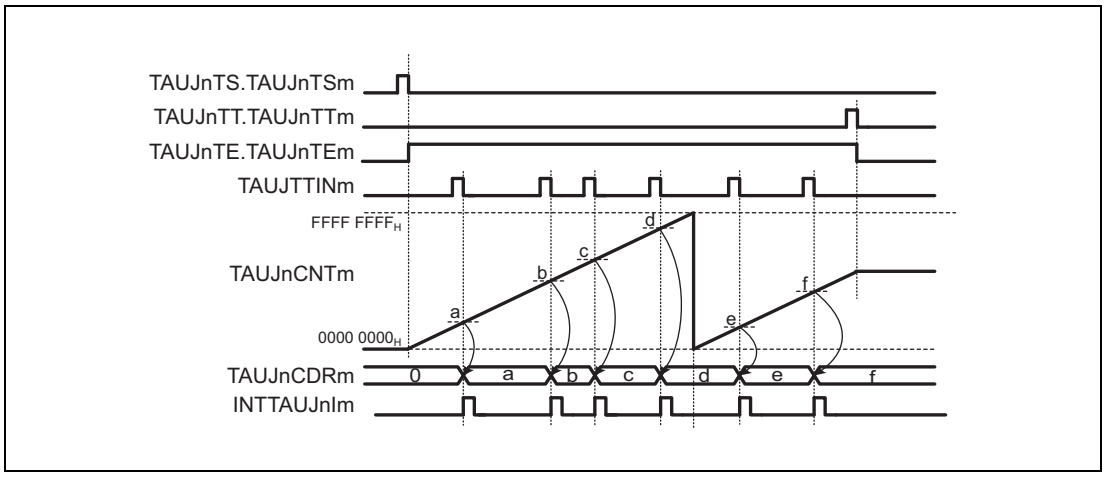

Figure 26.37 General Timing Diagram for TAUJTTINm Input Position Detection Function

(3) Channel output mode

The channel output mode is not used by this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input position detection function. Therefore, these registers must be set to 0.

Table 26.60 Simultaneous Rewrite Settings for TAUJTTINm Input Position Detection Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0

26.12.5.5 Operating Procedure for TAUJTTINm Input Position Detection Function

Table 26.61 Operating Procedure for TAUJTTINm Input Position Detection Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 26.58, Contents of the TAUJnCMORm Register for TAUJTTINm Input Position Detection Function** and **Table 26.59, Contents of the TAUJnCMURm Register for TAUJTTINm Input Position Detection Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and the counter starts. INTTAUJnIm is generated when TAUJnCMORm.TAUJnMD0 is set to 1.
During operation	The values of the TAUJnCMURm.TAUJnTIS[1:0] bits can be changed at any time. The TAUJnCDRm and TAUJnCSRm registers can be read at any time.	TAUJnCNTm starts to count up from 0000 0000_H. When a TAUJTTINm valid edge is detected: • TAUJnCNTm transfers (captures) its value to TAUJnCDRm. • INTTAUJnIm is output. • The counter value is not cleared to 0000 0000_H and TAUJnCNTm continues count operation. Afterwards, this procedure is repeated. When TAUJnCNTm reaches FFFF $FFFF_H$, the counter restarts from 0000 0000_H.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

26.12.5.6 Specific Timing Diagrams

(1) Operation stop and restart

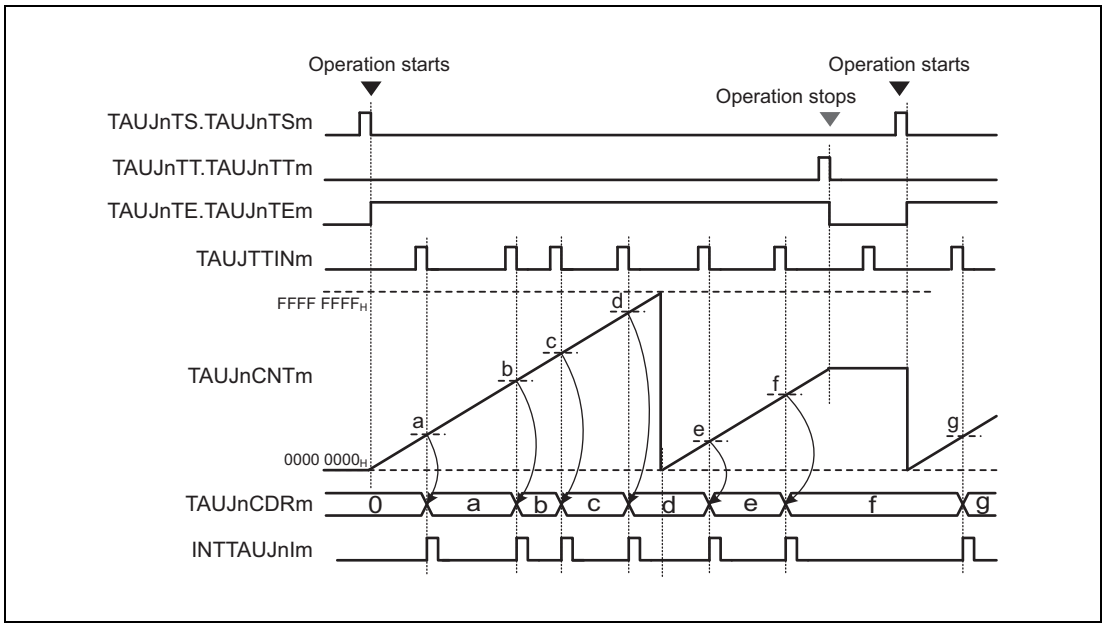

Figure 26.38 Operation Stop and Restart (TAUJnCMORm.TAUJnMD0 = 0, TAUJnCMURm.TAUJnTIS[1:0] = 00_B)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. TAUJnCNTm restarts to count from 0000 0000_H.

26.12.6 TAUJTTINm Input Period Count Detection Function

26.12.6.1 Overview

Summary

This function measures the cumulative width of a TAUJTTINm input signal.

Prerequisites

TAUJTTOUTm is not used for this function.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The counter awaits a valid TAUJTTINm input edge.

When a valid TAUJTTINm input start edge is detected, the counter starts to count from 0000 0000_H.

When a valid TAUJTTINm input stop edge is detected, the current TAUJnCNTm value is loaded to TAUJnCDRm and an interrupt (INTTAUJnIm) is generated. The counter stops and retains its value until the next valid TAUJTTINm input start edge is detected.

When the next valid TAUJTTINm input start edge is detected, the counter restarts counting from the stop value.

When the counter reaches FFFF $FFFF_H$, the counter restarts from 0000 0000_H.

This function cannot be forcibly restarted.

NOTE

The input TAUJTTINm signal is sampled at the frequency of the operation clock, specified by the TAUJnCMORm.TAUJnCKS[1:0] bits.

Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10_B, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11_B, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

26.12.6.2 Equations

Cumulative TAUJTTINm input width =
count clock cycle × (TAUJnCDRm capture value + 1)

26.12.6.3 Block Diagram and General Timing Diagram

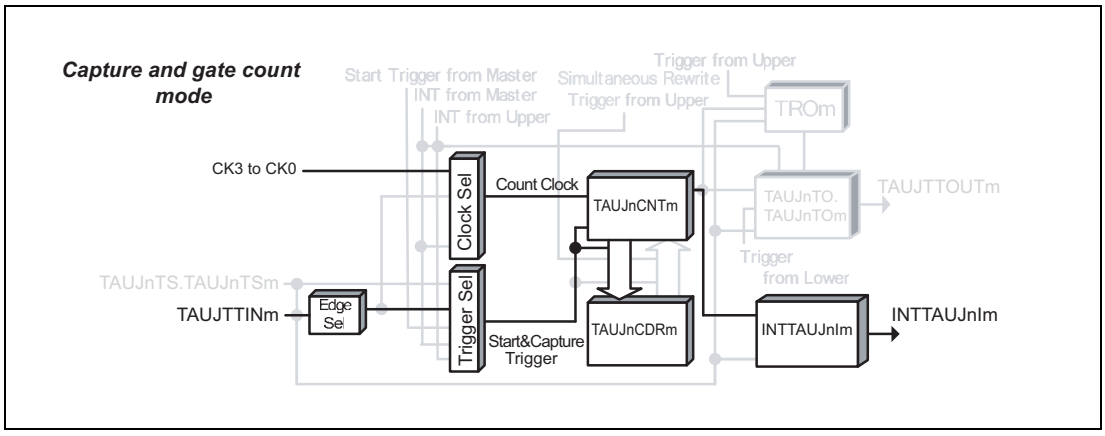

Figure 26.39 Block Diagram for TAUJTTINm Input Period Count Detection Function

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

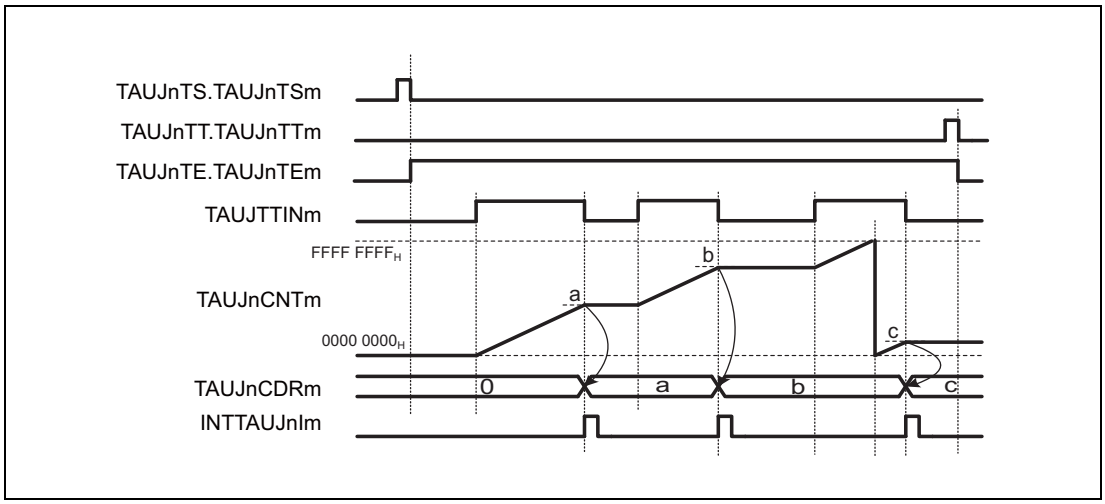

Figure 26.40 General Timing Diagram for TAUJTTINm Input Period Count Detection Function

(3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the TAUJTTINm input period count detection function. Therefore, these registers must be set to 0.

Table 26.64 Simultaneous Rewrite Settings for TAUJTTINm Input Period Count Detection Function

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm=0), set these bits to 0

26.12.6.5 Operating Procedure for TAUJTTINm Input Period Count Detection Function

Table 26.65 Operating Procedure for TAUJTTINm Input Period Count Detection Function

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 26.62, Contents of the TAUJnCMORm Register for TAUJTTINm Input Period Count Detection Function** and **Table 26.63, Contents of the TAUJnCMURm Register for TAUJTTINm Input Period Count Detection Function**. The TAUJnCDRm register functions as a capture register.	Channel operation is stopped.
Start operation	Set TAUJTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the TAUJTTINm start edge.
During operation	TAUJTTINm edge detection The TAUJnCDRm, TAUJnCNTm, and TAUJnCSRm registers can be read at any time.	When a TAUJTTINm start edge (rising edge for high width measurement, falling edge for low width measurement) is detected, TAUJnCNTm starts to count up from the stop value. When TAUJnCNTm detects a stop edge (falling edge for high width measurement, rising edge for low width measurement), it transfers the value to TAUJnCDRm and INTTAUJnIm is generated. Counting stops at the “value transferred to TAUJnCDRm + 1” and TAUJnCNTm waits for detection of the TAUJTTINm start edge. When TAUJnCNTm reaches FFFF FFFF$_H$, the counter restarts from 0000 0000$_H$. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

26.12.6.6 Specific Timing Diagrams

(1) Operation Stop and Restart

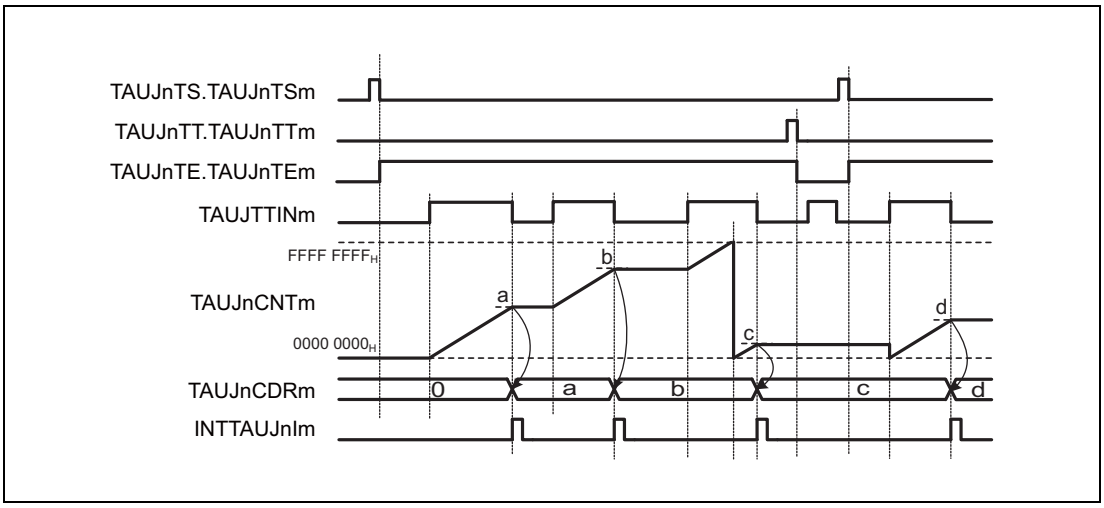

Figure 26.41 Operation Stop and Restart (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1, which in turn sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm stops and the current value is retained.
- If the counter is stopped, valid TAUJTTINm input edges are ignored.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm to 1. TAUJnCNTm restarts to count from $0000\ 0000_H$.

26.12.7 Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

26.12.7.1 Overview

Summary

This function measures the width of an individual TAUJTTINm input signal. An interrupt is generated if the TAUJTTINm input width is longer than FFFF $FFFF_H$ + 1.

Prerequisites

- TAUJTTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFFF $FFFF_H$.

Description

he counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF $FFFF_H$ is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value.

When the next TAUJTTINm input start edge is detected, TAUJnCNTm loads FFFF $FFFF_H$ and starts to count down.

If the counter reaches 0000 0000_H before a stop edge is detected, an interrupt is generated.

Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10_B, the TAUJTTINm input low width is measured. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11_B, the TAUJTTINm input high width is measured. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

26.12.7.2 Block Diagram and General Timing Diagram

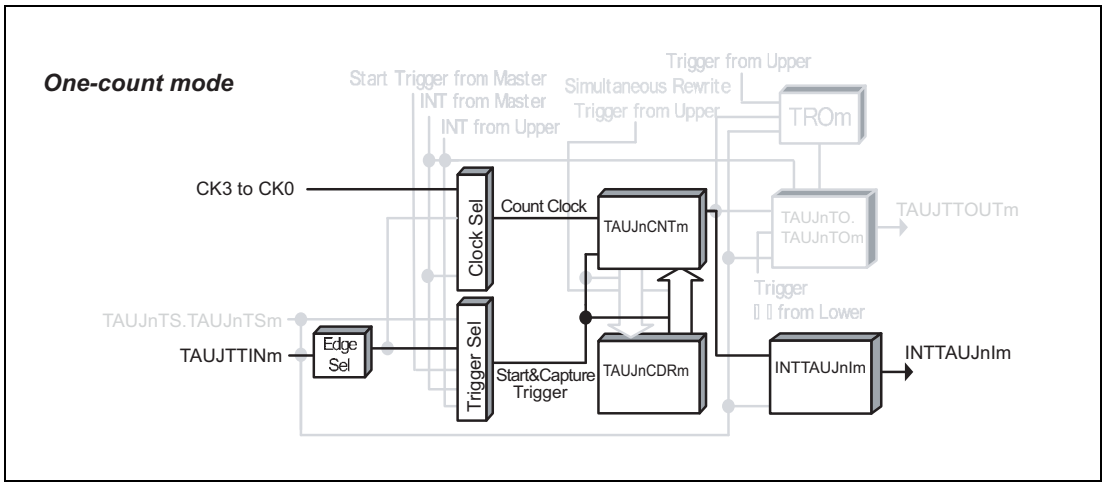

Figure 26.42 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

(3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the overflow interrupt output function (during TAUJTTINm width measurement). Therefore, these registers must be set to 0.

Table 26.68 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

Bit name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0

26.12.7.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

Table 26.69 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm register and TAUJnCMURm registers as described in **Table 26.66, Contents of the TAUJnCMORm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)** and **Table 26.67, Contents of the TAUJnCMURm Register for Overflow Interrupt Output Function (during TAUJTTINm Width Measurement)**. Set the value of the TAUJnCDRm register to FFFF FFFF$_H$.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUJTTINm start edge.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the start edge. When a start edge is detected, TAUJnCNTm loads the TAUJnCDRm value (FFFF FFFF$_H$).
During operation	The TAUJnCNTm register can be read at any time.	TAUJnCNTm counts down. When the counter reaches 0000 0000$_H$: • INTTAUJnIm is generated. When a reverse edge of TAUJTTINm is detected during count operation: • TAUJnCNTm stops counting and waits for a trigger. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

26.12.8 Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

26.12.8.1 Overview

Summary

This function measures the cumulative width of a TAUJTTINm input signal. An interrupt is generated if the cumulative TAUJTTINm input width is longer than FFFF FFFF$_H$, and an overflow interrupt can be output.

Prerequisites

- TAUJTTOUTm is not used for this function.
- The value of TAUJnCDRm must be set to FFFF FFFF$_H$.

Description

The counter is enabled by setting the channel trigger bit (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation.

The counter starts when a valid TAUJTTINm input start edge is detected. FFFF FFFF$_H$ is loaded to TAUJnCNTm and the counter starts to count down.

When a valid stop edge is detected, the counter stops and retains the current value. The counter awaits the next TAUJTTINm input start edge and then continues to count down from the current value.

When the counter reaches 0000 0000$_H$ an interrupt is generated. FFFF FFFF$_H$ is loaded to TAUJnCNTm and the counter continues to count down until a TAUJTTINm input stop edge is detected.

Conditions

The valid start and stop edges are specified by the TAUJnCMURm.TAUJnTIS[1:0] bits.

- If TAUJnCMURm.TAUJnTIS[1:0] = 10$_B$, the TAUJTTINm input low period is counted. The start trigger is a falling edge and the stop trigger is a rising edge.
- If TAUJnCMURm.TAUJnTIS[1:0] = 11$_B$, the TAUJTTINm input high period is counted. The start trigger is a rising edge and the stop trigger is a falling edge.

NOTE

The counter cannot be restarted during operation.

26.12.8.2 Block Diagram and General Timing Diagram

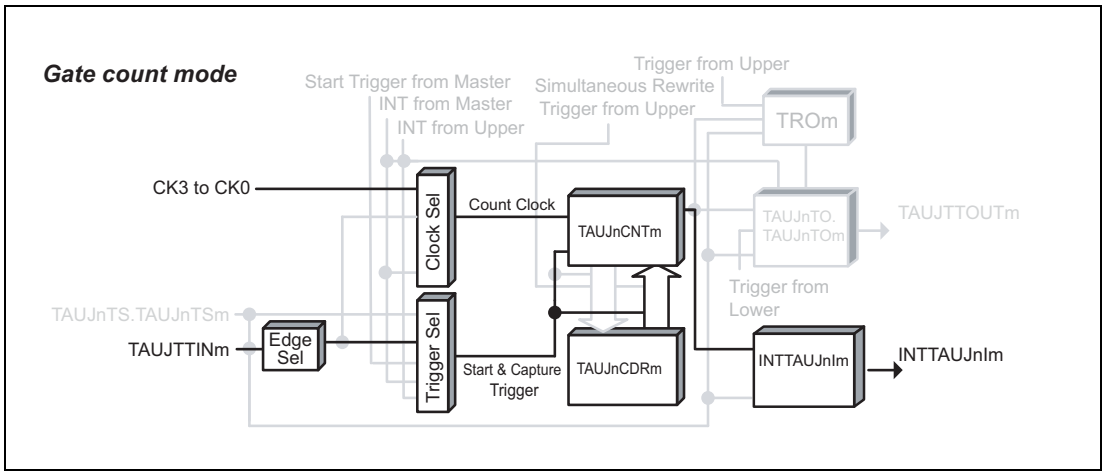

Figure 26.44 Block Diagram for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

The following settings apply to the general timing diagram.

- Rising and falling edge detection = high width measurement (TAUJnCMURm.TAUJnTIS[1:0] = 11_B)

(3) Channel output mode

TAUJnTOE.TAUJnTOEm is set to 0 because the channel output mode is not used with this function.

(4) Simultaneous rewrite

The simultaneous rewrite registers (TAUJnRDE and TAUJnRDM) cannot be used with the Overflow Interrupt Output Function (During TAUJTTINm Input Period Count Detection). Therefore, these registers must be set to 0.

Table 26.72 Simultaneous Rewrite Settings for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

Bit Name	Setting
TAUJnRDE.TAUJnRDEm	0: Disables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: When simultaneous rewrite is disabled (TAUJnRDE.TAUJnRDEm = 0), set these bits to 0.

26.12.8.4 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

Table 26.73 Operating Procedure for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)

	Operation	Status of TAUJn
Initial channel setting	Set the TAUJnCMORm and TAUJnCMURm registers as described in **Table 26.70, Contents of the TAUJnCMORm Register for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)** and **Table 26.71, Contents of the TAUJnCMURm Register for Overflow Interrupt Output Function (during TAUJTTINm Input Period Count Detection)**. Set the value of the TAUJnCDRm register to FFFF FFFF$_H$.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm to 1. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0. Detection of TAUJTTINm start edge.	TAUJnTE.TAUJnTEm is set to 1 and TAUJnCNTm waits for detection of the start edge. When a start edge is detected, the value of TAUJnCDRm (FFFF FFFF$_H$) is loaded to TAUJnCNTm.
During operation	The TAUJnCNTm register can be read at all times	TAUJnCNTm counts down. When the counter reaches 0000 0000$_H$: • INTTAUJnIm is generated. • TAUJnCNTm loads the TAUJnCDRm value (FFFF FFFF$_H$) and continues to count down. When a reverse edge of TAUJTTINm is detected during count operation: • TAUJnCNTm stops and retains the stop value. When a TAUJTTINm valid edge is detected while the counter is stopped: • TAUJnCNTm counts down from the stop value. Afterwards, this procedure is repeated.
Stop operation	Set TAUJnTT.TAUJnTTm to 1. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm stops and retains its current value.

Restart operation

26.13 Synchronous Channel Operation Functions

This section lists all the synchronous channel operation functions provided by the TAUJ. For a general overview of synchronous channel operation, see **Section 26.2, Overview**.

26.13.1 PWM Output Function

26.13.1.1 Overview

Summary

This function generates multiple PWM outputs by using a master and multiple slave channels. It enables the pulse cycle (frequency) and the duty of the TAUJTTOUTm to be set. The pulse cycle is set in the master channel. The duty is set in the slave channel.

Prerequisites

- Two channels
- The operation mode for the master channel should be set to the interval timer mode. (See **Table 26.74, Contents of the TAUJnCMORm Register for the Master Channel of the PWM Output Function**.)
- The operation mode for the slave channel should be set to the one-count mode. (See **Table 26.77, Contents of the TAUJnCMORm Register for the Slave Channel of the PWM Output Function**.)
- TAUJTTOUTm is not used for the master channel of this function.
- The channel output mode for the slave channels should be set to synchronous channel output mode 1. (See **26.7, Channel Output Modes**.)

Description

The counters are enabled by setting the channel trigger bits (TAUJnTS.TAUJnTSm) to 1. This in turn sets TAUJnTE.TAUJnTEm = 1, enabling count operation. The current value of TAUJnCDRm is loaded to TAUJnCNTm and the counters start to count down from these values. INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set or reset to realize the PWM output.

- Master channel:

  When the counter of the master channel reaches 0000 0000_H and pulse cycle time has elapsed, INTTAUJnIm is generated. The TAUJnCDRm value is loaded to TAUJnCNTm, and the counter counts down.

- Slave channel(s):

  INTTAUJnIm generated on the master channel triggers the counter of the slave channel(s). The current value of TAUJnCDRm (slave) is loaded to TAUJnCNTm (slave) and the counter starts to count down from this value. The TAUJTTOUTm signal is set to the active level.
  When the counter reaches 0000 0000_H, i.e. duty time has elapsed, INTTAUJnIm is generated and the TAUJTTOUTm signal is set to the inactive level. The counter returns to FFFF $FFFF_H$ and awaits the next INTTAUJnIm of the master channel, and thus the start of the next pulse cycle.

The counter can be stopped by setting TAUJnTT.TAUJnTTm to 1 for the master and slave channel(s), which in turn sets TAUJnTE.TAUJnTEm to 0. TAUJnCNTm and TAUJTTOUTm of master and slave

channel(s) stop but retain their values. The counters can be restarted by setting TAUJnTS.TAUJnTSm to 1.

Conditions

Simultaneous rewrite can be used with this function. Please see **Section 26.6, Simultaneous Rewrite**.

26.13.1.2 Equations

Pulse cycle = (TAUJnCDRm (master) + 1) × count clock cycle

Duty cycle [%] = (TAUJnCDRm (slave)/(TAUJnCDRm (master) +1)) × 100

– Duty cycle = 0%
  TAUJnCDRm (slave) = 0000 0000_H
– Duty cycle = 100%
  TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1

26.13.1.3 Block Diagram and General Timing Diagram

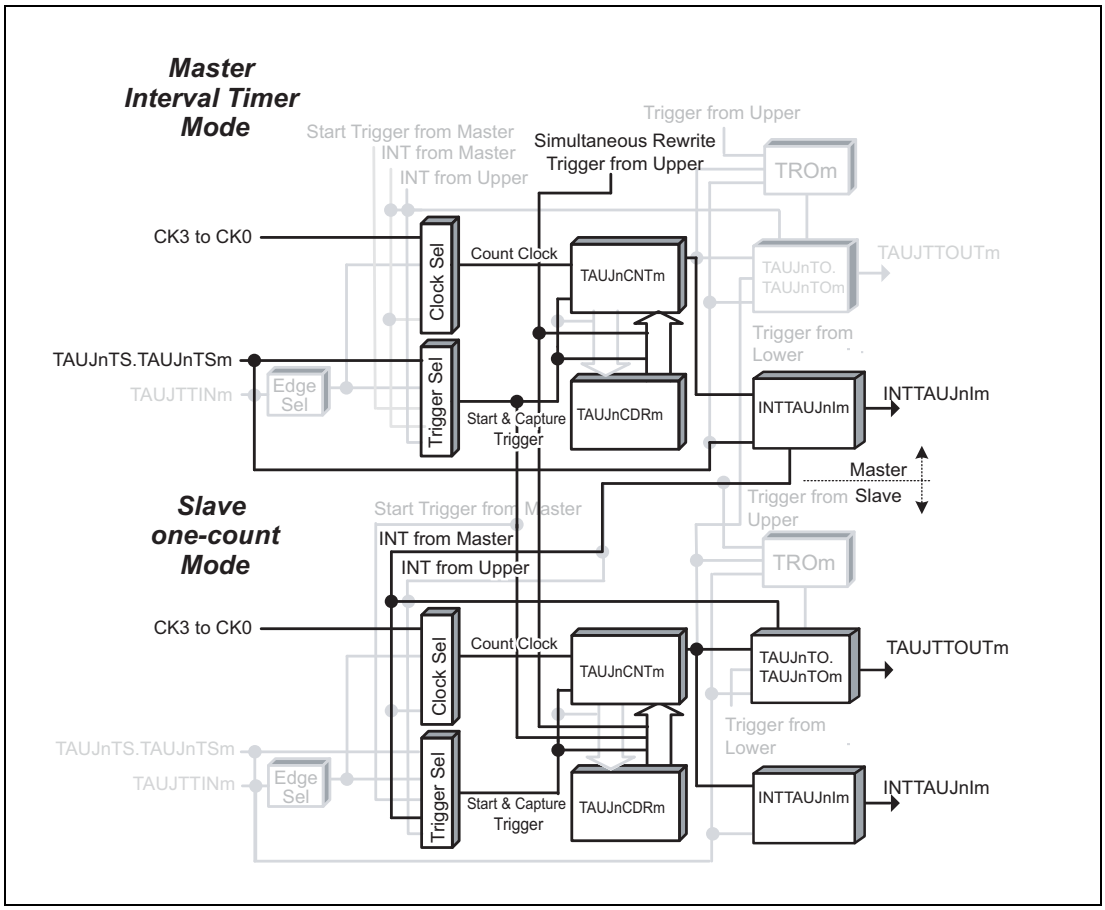

Figure 26.46 Block Diagram for PWM Output Function

The following settings apply to the general timing diagram.

- Slave channel: Positive logic (TAUJnTOL.TAUJnTOLm = 0)

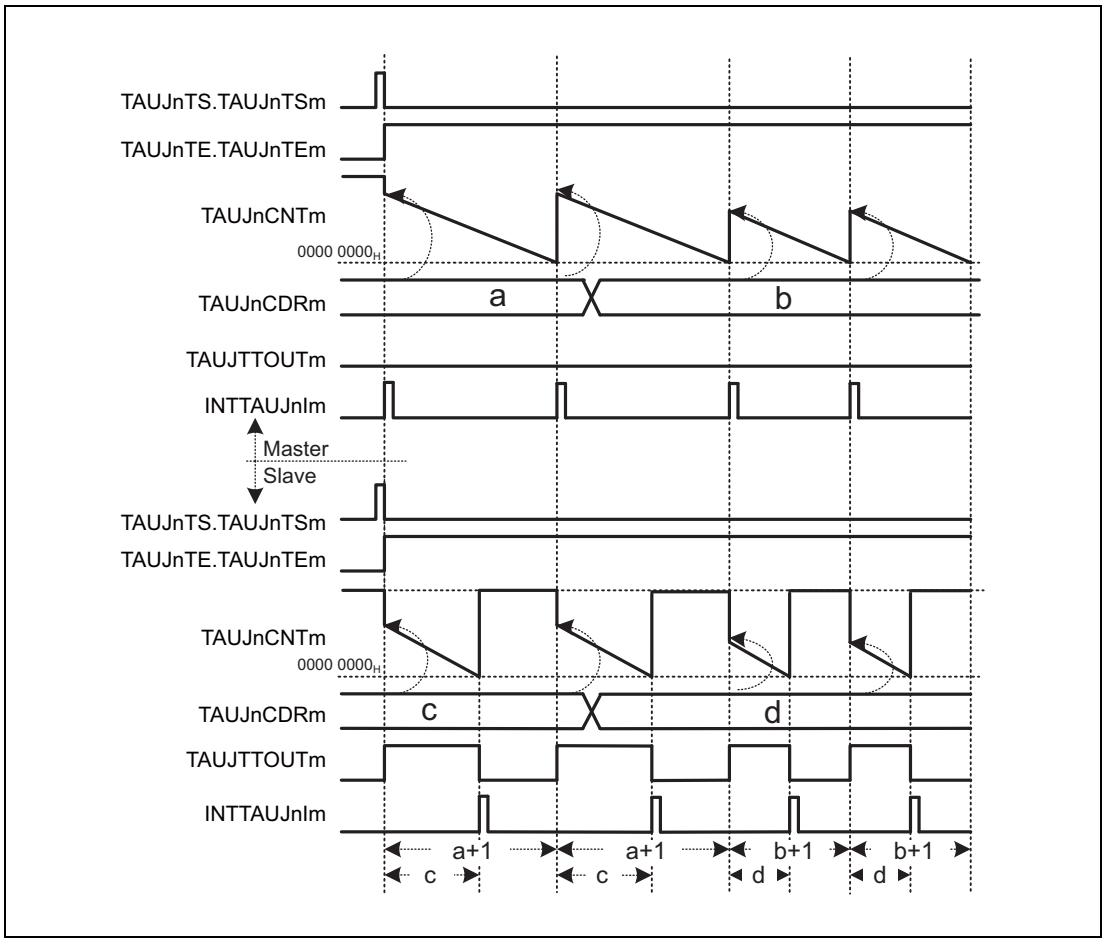

Figure 26.47 General Timing Diagram for PWM Output Function

NOTE

- The interval between the starting to count and an interrupt being generated is the value of corresponding TAUJnCDRm + 1.
- TAUJTTOUTm of the slave channel will rise with a delay of one count clock after the rising of INTTAUJnIm of the master channel.

26.13.1.4 Register Settings for the Master Channel

(4) Simultaneous rewrite for the slave channel(s)

The simultaneous rewrite settings of the master and slave channels must be identical.

Table 26.80 Simultaneous Rewrite Settings for the Slave Channel of the PWM Output Function

Bit name	Setting
TAUJnRDE.TAUJnRDEm	1: Enables simultaneous rewrite.
TAUJnRDM.TAUJnRDMm	0: The simultaneous rewrite trigger signal is generated when the master channel starts counting.

26.13.1.6 Operating Procedure for PWM Output Function

Table 26.81 Operating Procedure for PWM Output Function

	Operation	Status of TAUJn
Initial channel setting	Master channel: Set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in **Section 26.13.1.4, Register Settings for the Master Channel**. Slave channel: Set the TAUJnCMORm and TAUJnCMURm registers and the channel output mode as described in **Section 26.13.1.5, Register Settings for the Slave Channel(s)**. Set the values of the TAUJnCDRm registers of all channels.	Channel operation is stopped.
Start operation	Set TAUJnTS.TAUJnTSm of the master and slave channels to 1 simultaneously. TAUJnTS.TAUJnTSm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm (master and slave channels) is set to 1 and the counters of the master and slave channels start. INTTAUJnIm is generated on the master channel and TAUJTTOUTm (slave) is set.
During operation	TAUJnCDRm can be changed at any time. TAUJnCNTm and TAUJnRSF.TAUJnRSFm can be read at any time. TAUJnRDT.TAUJnRDTm can be changed during operation.	TAUJnCNTm of the master channel loads TAUJnCDRm and counts down. When the counter reaches 0000 0000_H: • INTTAUJnIm (master) is generated. • TAUJnCNTm (master) loads the TAUJnCDRm value and continues count operation. • TAUJnCNTm (slave) loads the TAUJnCDRm value and counts down. • TAUJTTOUTm (slave) is set to the active level. When TAUJnCNTm (slave) reaches 0000 0000_H: • INTTAUJnIm (slave) is generated. • TAUJTTOUTm (slave) is set to the inactive level.
Stop operation	Set TAUJnTT.TAUJnTTm of the master and slave channels to 1 simultaneously. TAUJnTT.TAUJnTTm is a trigger bit, so it is automatically cleared to 0.	TAUJnTE.TAUJnTEm is cleared to 0 and the counter stops. TAUJnCNTm and TAUJTTOUTm stop and retain their current values.

Restart operation

26.13.1.7 Specific Timing Diagrams

(1) Duty cycle = 0%

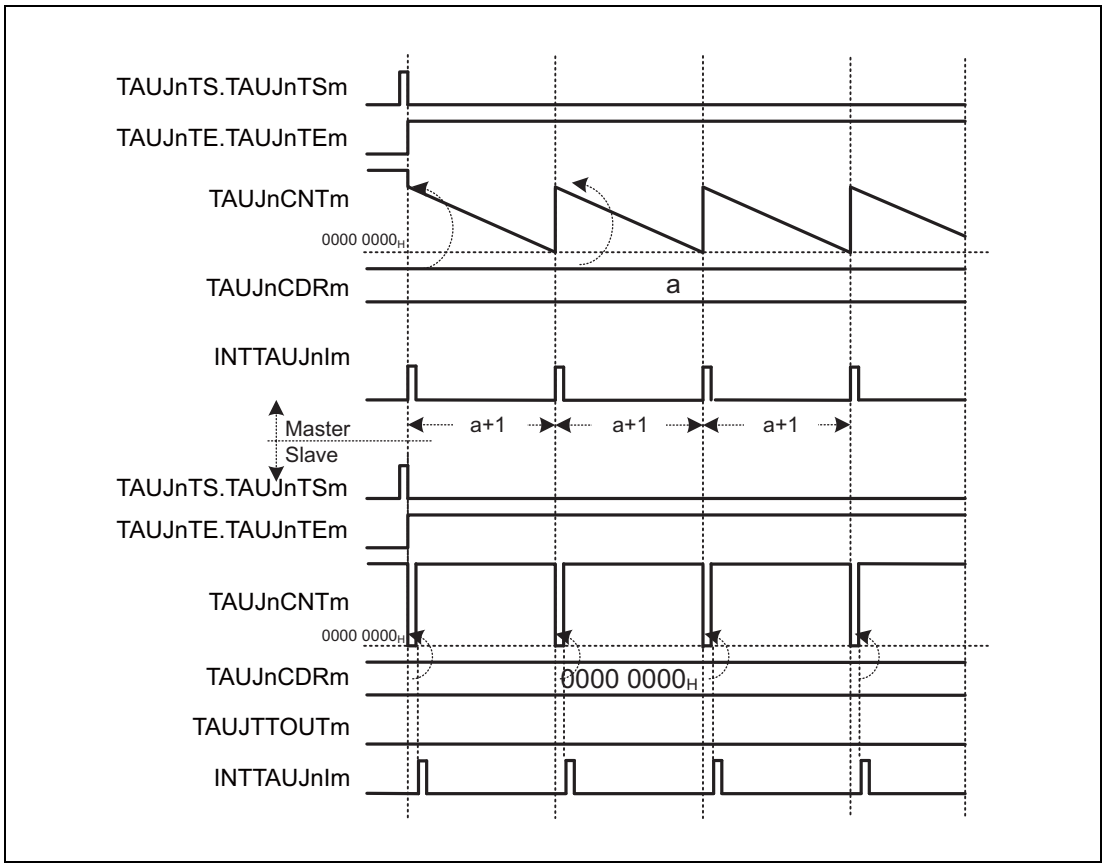

Figure 26.48 TAUJnCDRm (slave) = 0000 0000$_H$, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

- Every time the master channel generates an interrupt (INTTAUJnIm), 0000 0000$_H$ is loaded to TAUJnCNTm (slave). As a result, a slave channel interrupt (INTTAUJnIm) is generated at the same time and TAUJTTOUTm remains inactive.
- The value of TAUJnCDRm is loaded into TAUJnCNTm (slave) to generate an interrupt.

(2) Duty cycle = 100%

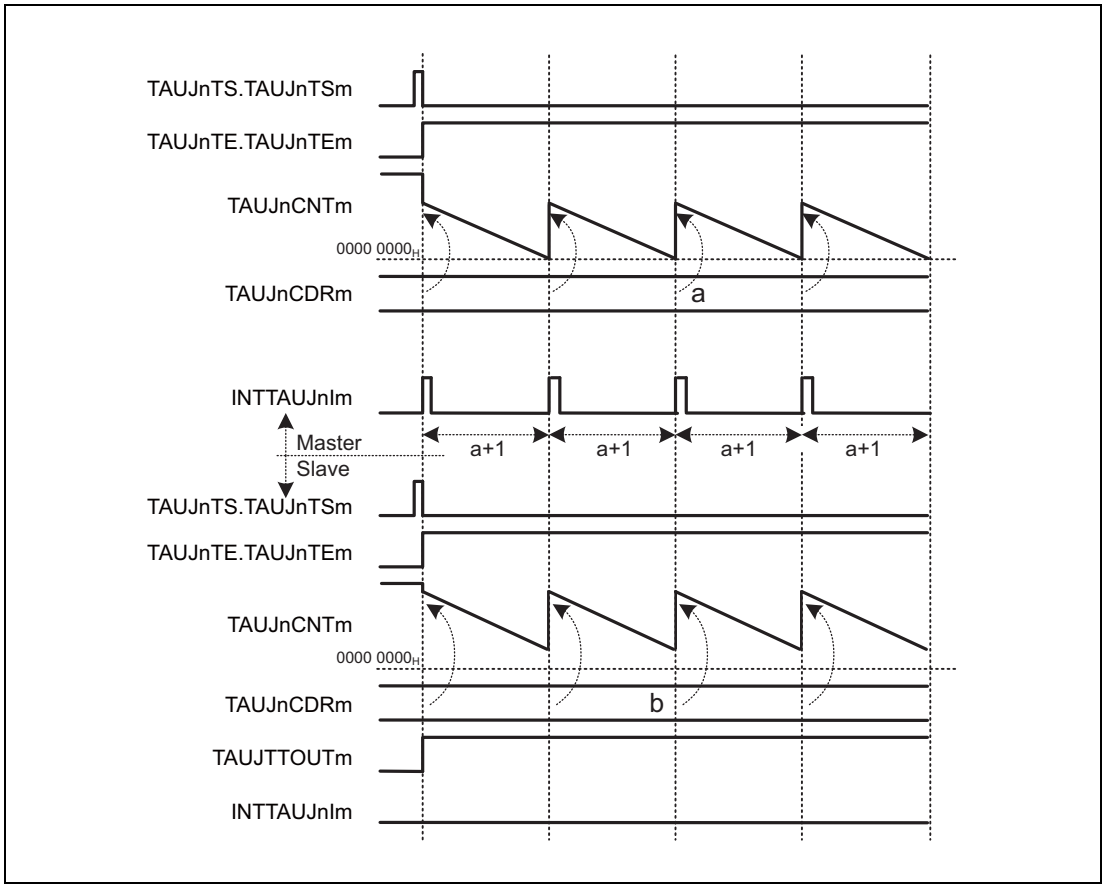

Figure 26.49 TAUJnCDRm (slave) ≥ TAUJnCDRm (master) + 1, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

If the TAUJnCDRm (slave) value is greater than the TAUJnCDRm (master) value, no interrupt occurs because the counter of the slave channel does not reach 0000 0000_H. TAUJTTOUTm remains active.

(3) Operation stop and restart

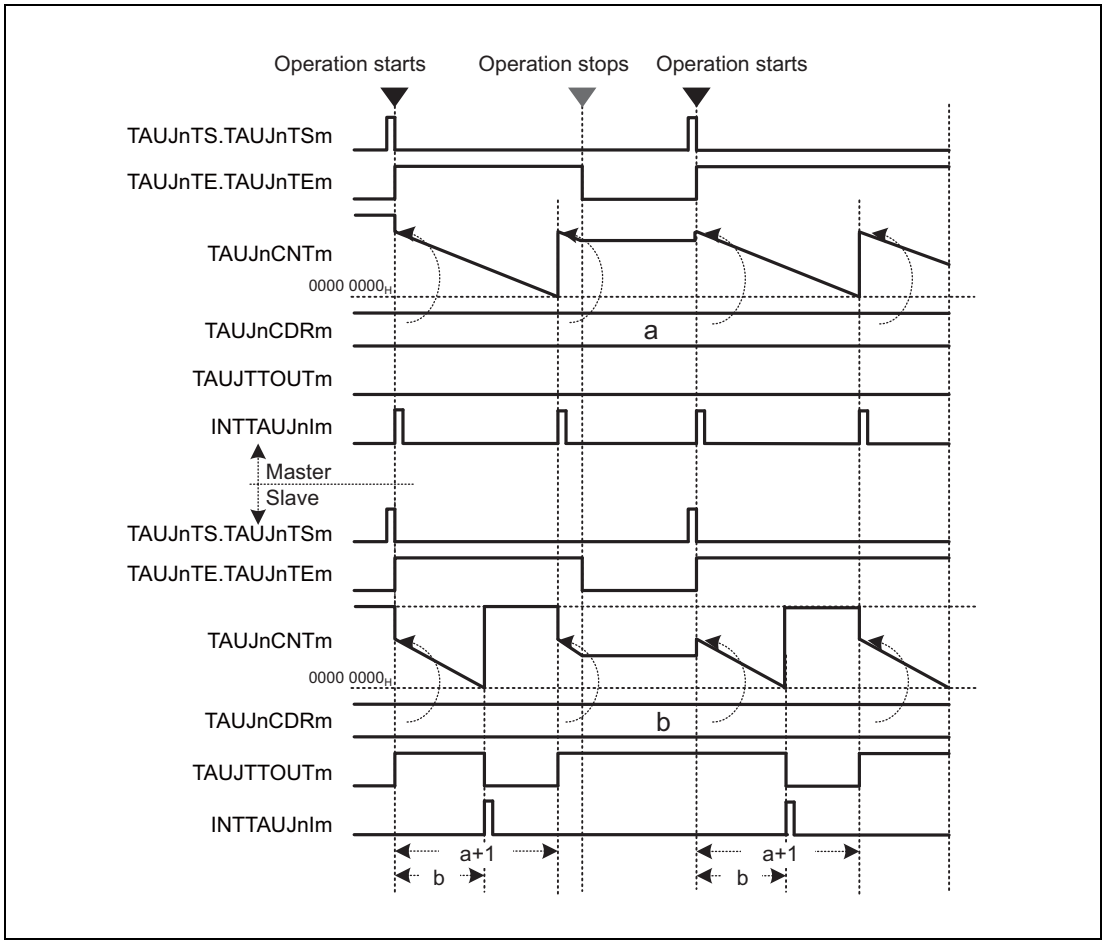

Figure 26.50 Operation Stop and Restart, Positive Logic (TAUJnTOL.TAUJnTOLm (slave) = 0)

- The counter can be stopped by setting TAUJnTT.TAUJnTTm of master and slave channels to 1. This sets TAUJnTE.TAUJnTEm to 0.
- TAUJnCNTm and TAUJTTOUTm of every channel stop and retain their current values. No interrupt occurs.
- The counter can be restarted by setting TAUJnTS.TAUJnTSm of master and slave channels to 1. The TAUJnCDRm value of master and slave channels is loaded into TAUJnCNTm. The counter starts to count down from this value.

Section 27 Real-Time Clock (RTCA)

This section contains a generic description of the Real-Time Clock (RTCA).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the RTCA.

27.1 Features of RH850/F1K RTCA

27.1.1 Number of Units and Channels

This microcontroller has the following number of RTCA units.

Each RTCA unit has one channel RTCA. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 27.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	—	1	
Name	—	RTCAn (n = 0)	

Table 27.2 Index

Index	Description
n	Throughout this section, the individual RTCA units are identified by the index “n” (n = 0); for example, RTCAnCTL0 is the RTCAn control register 0.

27.1.2 Register Base Address

RTCAn base addresses are listed in the following table.

RTCAn register addresses are given as offsets from the base addresses.

Table 27.3 Register Base Address

Base Address Name	Base Address
<RTCA0_base>	FFE7 8000_H

27.1.3 Clock Supply

The RTCAn clock supply is shown in the following table.

Table 27.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
RTCA0	RTCATCKI	CKSCLK_ARTCA	Macro clock
	PCLK	CPUCLK2	Module clock
	Register access clock	CPUCLK2	Bus clock

27.1.4 Interrupt Requests

RTCAn interrupt requests are listed in the following table.

Table 27.5 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RTCA0			
RTCATINT1S	1-second interval interrupt	209	—
RTCATINTAL	Alarm interrupt	210	—
RTCATINTR	Fixed interval interrupt	211	—

27.1.5 Reset Sources

RTCAn reset sources are listed in the following table. RTCAn is initialized by these reset sources.

Table 27.6 Reset Sources

Unit Name	Reset Source
RTCA0	Power-up reset (PURES)

27.1.6 External Input/Output Signals

External input/output signals of RTCAn are listed below.

Table 27.7 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
RTCA0		
RTCAT1HZ	1-Hz pulse output	RTCA0OUT*1

Note 1. RTCA0OUT is connected to TAUJ0. For details, see **Section 26, Timer Array Unit J (TAUJ)**.

CAUTION

When port P8_6 is used as RTCA0OUT, port P8_6 pin outputs a low-level RESETOUT signal while a reset is asserted and continues to output a low level after the reset is deasserted. For details, see Section 2.11.1.1, P8_6: RESETOUT.

27.2 Overview

27.2.1 Functional Overview

The Real-Time Clock (RTCA) has the following features:

- Count clock selection from 32 kHz to 4.194304 MHz
- Counters for years, months, day of the month, day of the week, hours, minutes, seconds, and a sub-counter. The calendar covers 99 years. Leap years are handled by hardware automatically.
- One Hz pulse output function
- Fixed interval interrupt function
- Alarm interrupt function
- Clock error correction function if a 32.768-kHz count clock is used

27.2.2 Block Diagram

The block diagram shows the main components of the RTCA.

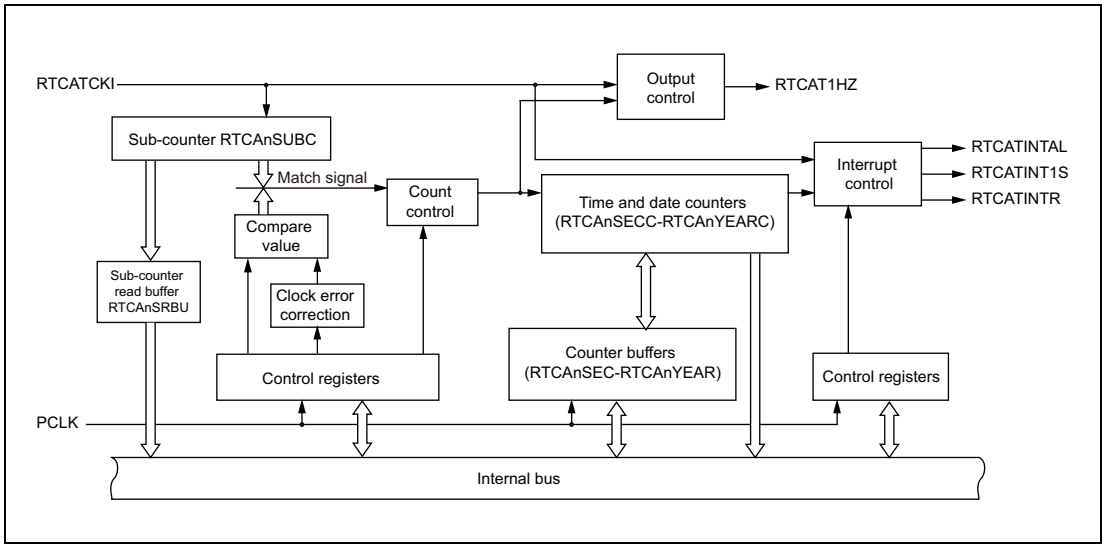

Figure 27.1 Block Diagram of the RTCA

27.2.3 Description of Blocks

The Real-Time Clock RTCA provides information about the present time and date and can generate wake-up signals (interrupts, alarms). This information is derived from the count clock RTCATCKI.

Sub-counter

RTCATCKI is the input to the sub-counter RTCAnSUBC. The sub-counter counts up from 0 until it reaches the compare value. The compare value is always defined as the frequency of RTCATCKI – 1 (in Hz). Thus, the sub-counter overflows after one second. It is then reset to 0 and triggers the seconds counter RTCAnSECC (and, if specified, the interrupt RTCATINT1S).

The sub-counter can generate a fixed interval interrupt every 0.25 seconds, 0.5 seconds, or 1 second, and a 1-Hz output pulse.

Time and date counters

The counters for minutes, hours, day of the week, day of the month, months, and years also count up. They have their own overflow limits. If all the lower counters overflow, the upper counter counts up.

The overflow limit of the counter for the day of the month (RTCAnDAYC) depends on the present month (28, 30, or 31 days) and (in February) on the year counter RTCAnYEARC (years 0, 4, 8, 12, etc. are considered leap years).

The hours counter RTCAnHOURC can be switched between 12- and 24-hour formats.

The counters for seconds, minutes, hours, day of the month, and months can generate a fixed interval interrupt upon overflow (RTCATINTR).

The counters for minutes, hours, and day of the week can also generate an alarm interrupt (RTCATINTAL), e.g. every Tuesday and Thursday at 10:32.

Counter buffers

All counters can be read directly at any time. The clock signal used to access the read/write registers and the count clock are usually asynchronous. An overflow of the sub-counter during the read operation can make all read values obsolete. Therefore, reading the counters must be performed using a special procedure. For details, see **Section 27.5.3, Reading Clock Counters**.

For reasons of synchronization, the counters cannot be written directly.

For reading and writing, all counters are accompanied by buffer registers. The buffer registers provide a synchronized way for reading the counters and for setting time and date. When they are used, the operation of the sub-counter must first be suspended and then re-activated (see also **Section 27.5.3, Reading Clock Counters** and **Section 27.5.2, Updating Clock Counters**.

The RTCAnTIMEC and RTCAnCALC registers and their corresponding buffer registers can be used to check and set the time (hours, minutes and seconds) or the date (day of the week, day of the month, month, and year) with one read/write operation.

27.3 Registers

27.3.1 List of Registers

RTCA registers are listed in the following table.

<RTCAn_base> is defined in **Section 27.1.2, Register Base Address**.

Table 27.8 List of Registers

Module Name	Register Name	Symbol	Address
Control registers			
RTCAn	Control register 0	RTCAnCTL0	<RTCAn_base> + 00_H
	Control register 1	RTCAnCTL1	<RTCAn_base> + 04_H
	Control register 2	RTCAnCTL2	<RTCAn_base> + 08_H
Sub-counter registers			
RTCAn	Sub-count register	RTCAnSUBC	<RTCAn_base> + $0C_H$
	Sub-count register read buffer	RTCAnSRBU	<RTCAn_base> + 10_H
	Clock error correction register	RTCAnSUBU	<RTCAn_base> + 38_H
	Sub-counter compare register	RTCAnSCMP	<RTCAn_base> + $3C_H$
Clock counter and buffer registers			
RTCAn	Seconds count register	RTCAnSECC	<RTCAn_base> + $4C_H$
	Seconds count buffer register	RTCAnSEC	<RTCAn_base> + 14_H
	Minute count register	RTCAnMINC	<RTCAn_base> + 50_H
	Minute count buffer register	RTCAnMIN	<RTCAn_base> + 18_H
	Hour count register	RTCAnHOURC	<RTCAn_base> + 54_H
	Hour count buffer register	RTCAnHOUR	<RTCAn_base> + $1C_H$
	Day of the week count register	RTCAnWEEKC	<RTCAn_base> + 58_H
	Day of the week count buffer register	RTCAnWEEK	<RTCAn_base> + 20_H
	Day count register	RTCAnDAYC	<RTCAn_base> + $5C_H$
	Day count buffer register	RTCAnDAY	<RTCAn_base> + 24_H
	Month count register	RTCAnMONC	<RTCAn_base> + 60_H
	Month count buffer register	RTCAnMONTH	<RTCAn_base> + 28_H
	Year count register	RTCAnYEARC	<RTCAn_base> + 64_H
	Year count buffer register	RTCAnYEAR	<RTCAn_base> + $2C_H$
Special counter and buffer registers			
RTCAn	Time count register	RTCAnTIMEC	<RTCAn_base> + 68_H
	Time count buffer register	RTCAnTIME	<RTCAn_base> + 30_H
	Calendar count register	RTCAnCALC	<RTCAn_base> + $6C_H$
	Calendar count buffer register	RTCAnCAL	<RTCAn_base> + 34_H
Alarm time setting registers			
RTCAn	Alarm minute setting register	RTCAnALM	<RTCAn_base> + 40_H
	Alarm hour setting register	RTCAnALH	<RTCAn_base> + 44_H
	Alarm day of the week setting register	RTCAnALW	<RTCAn_base> + 48_H
Emulation register			
RTCAn	Emulation register	RTCAnEMU	<RTCAn_base> + 74_H

27.3.2 Details of RTCA Control Registers

27.3.2.1 RTCAnCTL0 — RTCA Control Register 0

This register controls the count operation of the sub-counter RTCAnSUBC, the format (12-hour/24-hour) of the hours counter RTCAnHOURC and the alarm hour setting register RTCAnALH, and the operation mode.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: <RTCAn_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnCE	RTCAnCEST	RTCAnAMPM	RTCAnSLSB	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R	R	R	R

Table 27.9 RTCAnCTL0 Register Contents

Bit Position	Bit Name	Function
7	RTCAnCE	Starts/stops the sub-counter RTCAnSUBC operation. 0: Stops the sub-counter operation. All output pins and all status flags in control register RTCAnCTL2 are cleared. 1: Starts the sub-counter operation. The sub-counter counts up.
6	RTCAnCEST	Indicates the operation enabled/stopped status of the sub-counter: 0: Operation stopped status 1: Operation enabled status For details on how to use this status flag, see **Section 27.5.1, Initial Setting of the RTCA**.
5	RTCAnAMPM	Selects the format of the hours counter RTCAnHOURC and the alarm hour setting register RTCAnALH: 0: 12-hour format (1 to 12, am/pm) 1: 24-hour format (0 to 23, military time) For details on the format, see **Table 27.21, 12- and 24-Hour Format**.
4	RTCAnSLSB	Selects the operation mode: 0: 32.768 kHz mode 1: Frequency selection mode For details on the operation modes, see **Section 27.4, Operation**. The operation mode must not be changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1). For details on the initialization of RTCAn, see **Section 27.5.1, Initial Setting of the RTCA**.
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

27.3.2.2 RTCAnCTL1 — RTCA Control Register 1

This register controls the interrupt request generation and the 1-Hz pulse output.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: <RTCAn_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnEN1HZ	RTCAnENALM	RTCAnEN1S	RTCAnCT2	RTCAnCT1	RTCAnCT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.10 RTCAnCTL1 Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	RTCAnEN1HZ	Enables/stops 1-Hz pulse output (RTCAT1HZ): 0: RTCAT1HZ disabled (RTCAT1HZ is fixed to 0) 1: RTCAT1HZ enabled
4	RTCAnENALM	Enables/disables alarm interrupt request generation (RTCATINTAL): 0: RTCATINTAL disabled 1: RTCATINTAL enabled
3	RTCAnEN1S	Enables/disables 1-second interrupt request generation (RTCATINT1S): 0: RTCATINT1S disabled 1: RTCATINT1S enabled
2 to 0	RTCAnCT[2:0]	Specifies the fixed interval interrupt request (RTCATINTR) setting:

RTCAnCT[2:0]	RTCATINTR Interrupt Request Generation	
	Interval	Timing
000	No interrupt request generation	
001	Every 0.25 seconds	Every 0.25, 0.5, 0.75 and 1 second
010	Every 0.5 seconds	Every 0.5 and 1 second
011	Every second	Every 1 second
100	Every minute	Every 1 minute 00 seconds
101	Every hour	Every 1 hour 00 minutes 00 seconds
110	Every day	Every 1 day 00 hours 00 minutes 00 seconds (i.e., every midnight)
111	Every month	Every 1 month first day 00 hours 00 minutes 00 seconds (i.e., every first midnight of a month)

If the settings of RTCAnCT[2:0] are changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), a glitch may be output to RTCATINTR. Implement appropriate interrupt mask processing procedures.

27.3.2.3 RTCAnCTL2 — RTCA Control Register 2

This register contains status information and controls the data transfer from the sub-counter RTCAnSUBC to the dedicated sub-counter read buffer RTCAnSRBU and the operation setting of the clock counters (RTCAnSECC to RTCAnYEARC).

Access: This register can be read or written in 8-bit or 1-bit units.

Address: <RTCAn_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnWUST	RTCAnWSST	RTCAnRSST	RTCAnRSUB	RTCAnWST	RTCAnWAIT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R	R/W

Table 27.11 RTCAnCTL2 Register Contents (1/2)

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	RTCAnWUST	Indicates whether RTCAnSUBU write operation has been completed: 0: RTCAnSUBU write completed 1: RTCAnSUBU write in progress The write operation ends with the next sub-counter overflow. While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1) and if write operation to RTCAnSUBU is completed, this bit is set to 1. See **Section 27.5.5, Writing to RTCAnSUBU**, for details.
4	RTCAnWSST	Indicates whether RTCAnSCMP write operation has been completed: 0: RTCAnSCMP write completed 1: RTCAnSCMP write in progress The write operation ends with the next sub-counter overflow. While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1) and if write operation to RTCAnSCMP is completed, this bit is set to 1. See **Section 27.5.6, Writing to RTCAnSCMP**, for details.
3	RTCAnRSST	Indicates whether the value of the sub-counter (RTCAnSUBC) has been transferred to the sub-count register read buffer (RTCAnSRBU): 0: Transfer in progress, or waiting for a transfer trigger 1: Transfer completed This bit is cleared (transfer is triggered) by RTCAnRSUB=1.This bit is automatically set when the transfer is completed. See **Section 27.5.4, Reading RTCAnSRBU**, for details.
2	RTCAnRSUB	Triggers transfer of the value of the sub-counter (RTCAnSUBC) to the dedicated read buffer (RTCAnSRBU) or clears the transfer state of the sub-counter: 0: Transfer status (RTCAnRSST) is cleared. 1: Transfer is triggered. This bit is used to read the value of RTCAnSRBU when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1). The value of RTCAnSUBC is synchronized with RTCATCKI and loaded to RTCAnSRBU. For details, see **Section 27.5.4, Reading RTCAnSRBU**.
1	RTCAnWST	Indicates the status of all clock counters (RTCAnSECC to RTCAnYEARC): 0: All clock counters are running. 1: All clock counters are stopped The sub-counter is still running. The clock counters must be stopped before reading or writing clock counter values during sub-counter operation (RTCAnCTL0.RTCAnCE = 1). To stop the clock counters, set RTCAnWAIT = 1.

Table 27.11 RTCAnCTL2 Register Contents (2/2)

Bit Position	Bit Name	Function
0	RTCAnWAIT	Restarts/stops all clock counters (RTCAnSECC to RTCAnYEARC): 0: Restarts all clock counters either immediately or immediately after the clock counter write operation finishes. 1: Stops all clock counters temporarily. The sub-counter is still running. The clock counters must be stopped before reading or writing counter buffers during sub-counter operation (RTCAnCTL0.RTCAnCE = 1). **CAUTION** Only one overflow can be held internally. When two overflows occur, the seconds counter is incremented only by one when it is restarted. Thus, the procedure must be completed within one second.

27.3.3 Details of RTCA Sub-Counter Registers

27.3.3.1 RTCAnSUBC — RTCA Sub-Count Register

This counter counts the 1-second reference time. It operates using the count clock RTCATCKI.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RTCAn_base> + $0C_H$

Value after reset: $0000\ 0000_H$

This register is initialized:

– When write operation is performed to the seconds count buffer register (RTCAnSEC) or to the time count buffer register (RTCAnTIME) and the value is reflected to the seconds count register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSUBC[21:16]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RTCAnSUBC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.12 RTCAnSUBC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 0	RTCAnSUBC [21:0]	Sub-counter value The sub-counter only operates while RTCAnCTL0.RTCAnCEST = 1.

NOTES

1. This sub-counter operates with RTCATCKI while the read operation is clocked by PCLK. Reading this sub-counter during operation (RTCAnCTL0.RTCAnCEST = 1) is asynchronous to RTCATCKI and can lead to wrong results.
   Use the sub-count register read buffer (RTCAnSRBU) to read the sub-counter value during operation.
   For details, see **Section 27.5.4, Reading RTCAnSRBU**.
2. The count-operation of this sub-counter depends on the selected operation mode. See **Section 27.4, Operation**, for details.

27.3.3.2 RTCAnSRBU — RTCA Sub-Count Register Read Buffer

This register is the read buffer for the sub-counter RTCAnSUBC.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RTCAn_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSRBU[21:16]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.13 RTCAnSRBU Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 0	RTCAnSRBU [21:0]	Sub-counter value at the time of the last RTCAnSUBC read. When RTCAnCTL2.RTCAnRSUB is set to 1, the value of the RTCAnSUBC is loaded to the read buffer in synchronization with RTCATCKI.

NOTE

Perform RTCAnSRBU read according to the flow described in **Section 27.5.4, Reading RTCAnSRBU**.

27.3.3.3 RTCAnSUBU — RTCA Clock Error Correction Register

This register enables and specifies clock error correction. This register only applies in 32.768-kHz mode (RTCAnCTL0.RTCAnSLSB = 0).

For details on clock error correction, see **Section 27.4.4, Clock Error Correction**.

Access: This register can be read or written in 8-bit units.
Note the following when writing this register during sub-counter operation:
- Previous RTCAnSUBU write must be completed (RTCAnCTL2.RTCAnWUST = 0).
- The write operation ends with the next sub-counter overflow.

Address: <RTCAn_base> + 38_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnDEV	RTCAnF6	RTCAnF[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.14 RTCAnSUBU Register Contents

Bit Position	Bit Name	Function
7	RTCAnDEV	Specifies how often clock error correction is performed per minute: 0: Three times every minute (when RTCAnSECC equals 00, 20, and 40) 1: Once every minute (when RTCAnSECC equals 00)
6	RTCAnF6	Specifies whether the sub-counter value is incremented or decremented: 0: Incremented (+ correction) Incrementation value = (RTCAnF[5:0] value – 1) × 2 1: Decremented (– correction) Decrementation value = (inverted data of RTCAnF[5:0] value + 1) × 2
5 to 0	RTCAnF[5:0]	Error correction value

NOTES

1. When RTCAnF[5:1] = 00000_B, clock error correction is not performed.
2. Perform RTCAnSUBU write as described in
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.5, Writing to RTCAnSUBU**.

27.3.3.4 RTCAnSCMP — RTCA Sub-Counter Compare Register

This register sets the compare value of the sub-counter RTCAnSUBC in frequency selection mode (RTCAnCTL0.RTCAnSLSB = 1).

When the sub-counter values matches the value of this register, an overflow signal is output to the seconds counter RTCAnSECC and the sub-counter is cleared.

Set the value for this register according to the frequency of the input clock RTCATCKI.

Access: This register can be read or written in 32-bit units.
Note the following when writing this register during sub-counter operation:
- Previous RTCAnSCMP write must be completed (RTCAnCTL2.RTCAnWSST = 0).
- The write operation ends with the next sub-counter overflow.

Address: <RTCAn_base> + $3C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnSCMP[21:16]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 27.15 RTCAnSCMP Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 0	RTCAnSCMP [21:0]	Sub-counter compare value in frequency selection mode.

Example

The following example illustrates the setting of RTCAnSCMP:

- RTCATCKI = 4 MHz = 4,000,000 Hz
- RTCAnSCMP = 4,000,000 – 1 = 3,999,999 (decimal code) = $3D08FF_H$
- The seconds counter RTCAnSECC is triggered when the sub-counter value changes from $3D08FF_H$ to 0_H.

NOTES

1. The operation of the RTCA cannot be guaranteed if a value of 3198 (decimal code) or lower is set in this register.
2. Perform RTCAnSCMP write as described in **Section 27.5.1, Initial Setting of the RTCA** and **Section 27.5.6, Writing to RTCAnSCMP**.

27.3.4 Details of RTCA Clock Counter and Buffer Registers

27.3.4.1 RTCAnSECC — RTCA Seconds Count Register

This register is the seconds counter. It counts seconds from 00 to 59 in BCD.

This register counts as follows.

- It is triggered by every overflow of the sub-counter RTCAnSUBC.

  If the sub-counter overflows while the seconds counter is stopped (RTCAnCTL2.RTCAnWST = 1), the seconds counter behaves as follows:

  – If one sub-counter overflow occurs while the seconds counter is stopped, the overflow is held internally.
  The seconds counter is incremented by one when it is restarted.

  – If two or more overflows occur while the seconds counter is stopped, the overflow count cannot be held internally.
  The seconds counter is incremented by one when it is restarted.

  – If the seconds counter was updated while the seconds counter is stopped, the sub-counter overflow(s) are ignored.

- It outputs an overflow signal when the value changes from 59 to 00. The overflow signal triggers the minutes counter (RTCAnMINC).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + $4C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnSECC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.16 RTCAnSECC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnSECC [6:0]	Seconds in BCD

NOTES

1. Perform RTCAnSECC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the seconds count buffer register RTCAnSEC or to the clock time setting register RTCAnTIME. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters**

27.3.4.2 RTCAnSEC — RTCA Seconds Count Buffer Register

This register is a buffer register to read/write the seconds counter RTCAnSECC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnSEC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.17 RTCAnSEC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnSEC [6:0]	Seconds in BCD

NOTES

1. When writing this register, only decimal values between 00 and 59 in BCD are allowed.
2. Perform RTCAnSEC read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

27.3.4.3 RTCAnMINC — RTCA Minutes Count Register

This register is the minutes counter. It counts minutes from 00 to 59 in BCD.

This register counts as follows.

- It is triggered by every overflow of the seconds counter RTCAnSECC.
- It outputs an overflow signal when the value changes from 59 to 00. The overflow signal triggers the hours counter (RTCAnHOURC).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 50_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnMINC[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.18 RTCAnMINC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnMINC [6:0]	Minutes in BCD

NOTES

1. Perform RTCAnMINC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the minutes count buffer register RTCAnMIN or to the time count buffer register RTCAnTIME. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

27.3.4.4 RTCAnMIN — RTCA Minutes Count Buffer Register

This register is a buffer register to read/write the minutes counter RTCAnMINC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnMIN[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.19 RTCAnMIN Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnMIN [6:0]	Minutes in BCD

NOTES

1. When writing this register, only decimal values between 00 and 59 in BCD are allowed.
2. Perform RTCAnMIN read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

27.3.4.5 RTCAnHOURC — RTCA Hours Count Register

This register is the hours counter. It counts the hours in BCD. The count range depends on the selected hour format. See **Table 27.21, 12- and 24-Hour Format**.

This register counts as follows.

- It is triggered by every overflow of the minutes counter RTCAnMINC.
- It outputs an overflow signal when the value changes from 23 to 00 (in 24-hour format) or from 31 to 12 (in 12-hour format). The overflow signal triggers two counters:
  - Day of the week counter (RTCAnWEEKC)
  - Day of the month counter (RTCAnDAYC)

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 54_H

Value after reset: 12_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnHOURC[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R	R	R	R	R	R

Table 27.20 RTCAnHOURC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	RTCAnHOURC [5:0]	Hours in BCD. See **Table 27.21, 12- and 24-Hour Format**, for details.

NOTES

1. Perform RTCAnHOURC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the hours count buffer register RTCAnHOUR or to the time count buffer register RTCAnTIME. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

12- or 24-hour format

The count values of RTCAnHOURC depend on the selected hour format.

If 12-hour format is selected (RTCAnCTL0.RTCAnAMPM = 0), bit 5 in the RTCAnHOURC register is the am/pm indicator:

- RTCAnHOURC[5] = 0: am
- RTCAnHOURC[5] = 1: pm

The following table shows the count range of RTCAnHOURC in both 12- and 24-hour format.

Table 27.21 12- and 24-Hour Format

12-Hour Format (RTCAnAMPM = 0)			24-Hour Format (RTCAnAMPM = 1)	
Time	RTCAnHOURC		Time	RTCAnHOURC
0 am	12_H		0	00_H
1 am	01_H		1	01_H
2 am	02_H		2	02_H
3 am	03_H		3	03_H
4 am	04_H		4	04_H
5 am	05_H		5	05_H
6 am	06_H		6	06_H
7 am	07_H		7	07_H
8 am	08_H		8	08_H
9 am	09_H		9	09_H
10 am	10_H		10	10_H
11 am	11_H		11	11_H
0 pm	32_H	↓ pm indicator in 12-hour format: RTCAnHOUR.RTCAnHOUR[5] = 1	12	12_H
1 pm	21_H		13	13_H
2 pm	22_H		14	14_H
3 pm	23_H		15	15_H
4 pm	24_H		16	16_H
5 pm	25_H		17	17_H
6 pm	26_H		18	18_H
7 pm	27_H		19	19_H
8 pm	28_H		20	20_H
9 pm	29_H		21	21_H
10 pm	30_H		22	22_H
11 pm	31_H		23	23_H

27.3.4.6 RTCAnHOUR — RTCA Hours Count Buffer Register

This register is a buffer register to read/write the hours counter RTCAnHOURC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + $1C_H$

Value after reset: 12_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnHOUR[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.22 RTCAnHOUR Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RTCAnHOUR [5:0]	Hours in BCD See **Table 27.21, 12- and 24-Hour Format**, for details.

NOTES

1. When writing this register, only the following decimal values in BCD are allowed:
   - 12-hour format (RTCAnCTL0.RTCAnAMPM = 0):
     01 to 12 or 21 to 32
   - 24-hour format (RTCAnCTL0.RTCAnAMPM = 1):
     00 to 23
2. Perform RTCAnHOUR read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

27.3.4.7 RTCAnWEEKC — RTCA Day of the Week Count Register

This register is the day of the week counter. It counts from 0 to 6.

This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 58_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	RTCAnWEEKC[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.23 RTCAnWEEKC Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	RTCAnWEEKC [2:0]	Day of the week

NOTES

1. Perform RTCAnWEEKC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the day of the week count buffer register RTCAnWEEK or to the calendar count buffer register RTCAnCAL. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

27.3.4.8 RTCAnWEEK — RTCA Day of the Week Count Buffer Register

This register is a buffer register to read/write the day of the week counter RTCAnWEEKC.

There is no particular correspondence between the value of RTCAnWEEK and the day of the week. Set the correspondence according to the application to be used.

Example: 0 = Sunday, 1 = Monday, …, 6 = Saturday

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	RTCAnWEEK[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 27.24 RTCAnWEEK Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	RTCAnWEEK [2:0]	Day of the week

NOTES

1. When writing this register, only decimal values between 0 and 6 in BCD are allowed.
2. Perform RTCAnWEEK read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

27.3.4.9 RTCAnDAYC — RTCA Day of the Month Count Register

This register is the day of the month counter. It counts from 01 to a maximum of 31 in BCD, depending on the value of the month counter (RTCAnMONC) and the year counter (RTCAnYEARC):

- 01 to 31 (January, March, May, July, August, October, December)
- 01 to 30 (April, June, September, November)
- 01 to 29 (February, leap year)
- 01 to 28 (February, non-leap year)

Years 0, 4, 8, 12, etc., are considered leap years.

This register counts as follows.

- It is triggered by every overflow of the hours counter RTCAnHOURC.
- It outputs an overflow signal when the value changes from 28, 29, 30, or 31 to 01, depending on the current month and year. The overflow signal triggers the month counter (RTCAnMONC).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + $5C_H$

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnDAYC[5:0]					
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 27.25 RTCAnDAYC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned.
5 to 0	RTCAnDAYC [5:0]	Day of the month in BCD

NOTES

1. Perform RTCAnDAYC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the day of the month count buffer register RTCAnDAY or to the calendar count buffer register RTCAnCAL. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

27.3.4.10 RTCAnDAY — RTCA Day of the Month Count Buffer Register

This register is a buffer register to read/write the day of the month counter RTCAnDAYC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 24_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnDAY[5:0]					
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.26 RTCAnDAY Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RTCAnDAY [5:0]	Day of the month in BCD

NOTES

1. When writing this register, only decimal values between 01 and 31 in BCD are allowed:
   - 01 to 31 (January, March, May, July, August, October, December)
   - 01 to 30 (April, June, September, November)
   - 01 to 29 (February, leap year)
   - 01 to 28 (February, non-leap year)
2. Perform RTCAnDAY read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

27.3.4.11 RTCAnMONC — RTCA Month Count Register

This register is the month counter. It counts the month of the year, starting from 01 to 12 in BCD.

This register counts as follows.

- It is triggered by every overflow of the counter for the day of the month RTCAnDAYC.
- It outputs an overflow signal when the value changes from 12 to 01. The overflow signal triggers the year counter (RTCAnYEARC).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 60_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RTCAnMONC[4:0]				
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 27.27 RTCAnMONC Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned.
4 to 0	RTCAnMONC [4:0]	Month of the year in BCD

NOTES

1. Perform RTCAnMONC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the month count buffer register RTCAnMONTH or to the calendar count buffer register RTCAnCAL. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

27.3.4.12 RTCAnMONTH — RTCA Month Count Buffer Register

This register is a buffer register to read/write the month counter RTCAnMONC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 28_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	RTCAnMONTH[4:0]				
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 27.28 RTCAnMONTH Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	RTCAnMONTH [4:0]	Month of the year in BCD

NOTES

1. When writing this register, only decimal values between 01 and 12 in BCD are allowed.
2. Perform RTCAnMONTH read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

27.3.4.13 RTCAnYEARC — RTCA Year Count Register

This register is the year counter. It counts years from 00 to a maximum of 99 in BCD.

Years 00, 04, 08, …, 92, and 96 (every four years) are considered leap years.

This register counts as follows.

- It is triggered by every overflow of the month counter RTCAnMONC.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RTCAn_base> + 64_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnYEARC[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 27.29 RTCAnYEARC Register Contents

Bit Position	Bit Name	Function
7 to 0	RTCAnYEARC [7:0]	Year in BCD

NOTES

1. Perform RTCAnYEARC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the year count buffer register RTCAnYEAR or to the calendar count buffer register RTCAnCAL. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

27.3.4.14 RTCAnYEAR — RTCA Year Count Buffer Register

This register is a buffer register to read/write the year counter RTCAnYEARC.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + $2C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnYEAR[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.30 RTCAnYEAR Register Contents

Bit Position	Bit Name	Function
7 to 0	RTCAnYEAR [7:0]	Year in BCD

NOTES

1. When writing this register, only decimal values between 00 and 99 in BCD are allowed.
2. Perform RTCAnYEAR read/write as described in
   - **Section 27.5.1, Initial Setting of the RTCA,**
   - **Section 27.5.2, Updating Clock Counters**, and
   - **Section 27.5.3, Reading Clock Counters.**

27.3.5 Details of RTCA Special Counter and Buffer Registers

27.3.5.1 RTCAnTIMEC — RTCA Time Count Register

This register enables the RTCAnHOURC, RTCAnMINC, and RTCAnSECC counters to be read simultaneously.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RTCAn_base> + 68_H

Value after reset: $0012\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnHOURC[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	RTCAnMINC[6:0]							—	RTCAnSECC[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 27.31 RTCAnTIMEC Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned.
21 to 16	RTCAnHOURC [5:0]	Hours in BCD. See **Table 27.21, 12- and 24-Hour Format**, for details.
15	Reserved	When read, the value after reset is returned.
14 to 8	RTCAnMINC [6:0]	Minutes in BCD
7	Reserved	When read, the value after reset is returned.
6 to 0	RTCAnSECC [6:0]	Seconds in BCD

NOTES

1. Perform RTCAnTIMEC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the time count buffer register RTCAnTIME. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

27.3.5.2 RTCAnTIME — RTCA Time Count Buffer Register

This register enables the RTCAnHOUR, RTCAnMIN, and RTCAnSEC buffer registers to be read/written simultaneously.

Access: This register can be read or written in 32-bit units.

Address: <RTCAn_base> + 30_H

Value after reset: $0012\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	RTCAnHOUR[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0

Table 27.32 RTCAnTIME Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21 to 16	RTCAnHOUR [5:0]	Hours in BCD See **Table 27.21, 12- and 24-Hour Format**, for details.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14 to 8	RTCAnMIN [6:0]	Minutes in BCD
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnSEC [6:0]	Seconds in BCD

NOTE

Perform RTCAnTIME read/write as described in

- **Section 27.5.1, Initial Setting of the RTCA,**
- **Section 27.5.2, Updating Clock Counters**, and
- **Section 27.5.3, Reading Clock Counters.**

27.3.5.3 RTCAnCALC — RTCA Calendar Count Register

This register enables the RTCAnYEARC, RTCAnMONC, RTCAnDAYC, and RTCAnWEEKC counters to be read simultaneously.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <RTCAn_base> + $6C_H$

Value after reset: $0001\ 0100_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 27.33 RTCAnCALC Register Contents

Bit Position	Bit Name	Function
31 to 24	RTCAnYEARC [7:0]	Year in BCD
23 to 21	Reserved	When read, the value after reset is returned.
20 to 16	RTCAnMONC [4:0]	Month of the year in BCD
15, 14	Reserved	When read, the value after reset is returned.
13 to 8	RTCAnDAYC [5:0]	Day of the month in BCD
7 to 3	Reserved	When read, the value after reset is returned.
2 to 0	RTCAnWEEKC [2:0]	Day of the week in BCD

NOTES

1. Perform RTCAnCALC read according to the flow described in **Section 27.5.3, Reading Clock Counters**.
2. A start value can be assigned to this register by writing to the clock time setting register RTCAnCAL. See
   - **Section 27.5.1, Initial Setting of the RTCA**, and
   - **Section 27.5.2, Updating Clock Counters.**

27.3.5.4 RTCAnCAL — RTCA Calendar Count Buffer Register

This register enables the RTCAnYEAR, RTCAnMONTH, RTCAnDAY, and RTCAnWEEK buffer registers to be read/written simultaneously.

Access: This register can be read or written in 32-bit units.

Address: <RTCAn_base> + 34_H

Value after reset: $0001\ 0100_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RTCAnYEAR[7:0]								—	—	—	RTCAnMONTH[4:0]

Table 27.34 RTCAnCAL Register Contents

Bit Position	Bit Name	Function
31 to 24	RTCAnYEAR [7:0]	Year in BCD
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 16	RTCAnMONTH [4:0]	Month of the year in BCD
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	RTCAnDAY [5:0]	Day of the month in BCD
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	RTCAnWEEK [2:0]	Day of the week in BCD

NOTE

Perform RTCAnCAL read/write as described in

- **Section 27.5.1, Initial Setting of the RTCA.**
- **Section 27.5.2, Updating Clock Counters**, and
- **Section 27.5.3, Reading Clock Counters.**

27.3.6 Details of RTCA Alarm Setting Registers

27.3.6.1 RTCAnALM — RTCA Alarm Minute Setting Register

This register specifies the minute of the alarm interrupt.

For details and example settings, see **Section 27.4.3, Alarm Interrupt Function**.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 40_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnALM[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.35 RTCAnALM Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnALM [6:0]	Minute of the alarm interrupt in BCD

NOTES

1. If decimal values outside the range of 00 to 59 in BCD are set, no alarm interrupt request will be generated.
2. When the setting of RTCAnALM is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to RTCATINTAL. Implement appropriate interrupt mask processing procedures.

27.3.6.2 RTCAnALH — RTCA Alarm Hour Setting Register

This register specifies the hour of the alarm interrupt.

For details and example settings, see **Section 27.4.3, Alarm Interrupt Function**.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 44_H

Value after reset: 12_H

Bit	7	6	5	4	3	2	1	0
	—	—	RTCAnALH[5:0]					
Value after reset	0	0	0	1	0	0	1	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.36 RTCAnALH Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	RTCAnALH [5:0]	Hour of the alarm interrupt in BCD

NOTES

1. If decimal values outside the following range are set, no alarm interrupt request will be generated:
   - 12-hour format (RTCAnCTL0.RTCAnAMPM = 0): 01 to 12 or 21 to 32
   - 24-hour format (RTCAnCTL0.RTCAnAMPM = 1): 00 to 23
2. When the setting of RTCAnALH is changed during sub-counter operation (RTCAnCTL0.RTCAnCEST = 1), a glitch may be output to RTCATINTAL. Implement appropriate interrupt mask processing procedures.

27.3.6.3 RTCAnALW — RTCA Alarm Day of the Week Setting Register

This register specifies the day(s) of the week of the alarm interrupt.

Access: This register can be read or written in 8-bit units.

Address: <RTCAn_base> + 48_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	RTCAnALW[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 27.37 RTCAnALW Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	RTCAnALW [6:0]	Specifies day of the week m (m = 0 to 6) as a day, when an alarm interrupt request is generated: 0: No alarm interrupt request is generated on day m. 1: Alarm interrupt request is generated on day m at the time set using RTCAnALM and RTCAnALH. The bits of this register correspond to the count value of the day of the week counter (RTCAnWEEKC).

NOTE

When the setting of RTCAnALW is changed during sub-counter operation (RTCAnCTL0.RTCAnCE = 1), a glitch may be output to RTCATINTAL. Implement appropriate interrupt mask processing procedures.

Example

If Sunday is RTCAnWEEK = 0, Monday is RTCAnWEEK = 1, Tuesday is RTCAnWEEK = 2, …, Saturday is RTCAnWEEK = 6:

- To set the alarm for Sunday, set RTCAnALW = $0000\ 0001_B$.
- To set the alarm for Monday and Wednesday, set RTCAnALW = $0000\ 1010_B$.
- To set the alarm for Tuesday, Thursday, and Saturday, set RTCAnALW = $0101\ 0100_B$.

For more examples, see **Section 27.4.3, Alarm Interrupt Function**.

27.3.7 RTCA Emulation Register

27.3.7.1 RTCAnEMU — RTCA Emulation Register

This register controls operation by SVSTOP.

Access: This register can be read or written in 8-bit or 1-bit units.
A write should be performed when EPC.SVSTOP = 0.

Address: <RTCAn_base> + 74_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RTCAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 27.38 RTCAnEMU Register Contents

Bit Position	Bit Name	Function
7	RTCAnSVSDIS	When the EPC.SVSTOP bit is set to 0: Count clock is supplied when the debugger gains microcontroller control (at a breakpoint, etc.) regardless of the value of this bit. When the EPC.SVSTOP bit is set to 1: 0: Count clock is stopped when the debugger gains microcontroller control (as at a breakpoint). 1: Count clock continues to be supplied when the debugger gains microcontroller control (at a breakpoint, etc.).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

27.4 Operation

The RTCA provides two operation modes:

- Frequency selection mode
- 32.768-kHz mode

The operation mode that can be used depends on the available input clock RTCATCKI. The operation mode specifies the sub-counter compare value that is used to trigger the seconds counter and thus all subsequent counters. Clock error correction is only possible in 32.768-kHz mode.

The following table provides an overview of the properties of the two operation modes.

Table 27.39 RTCA Operation Mode Overview

		32.768-kHz Mode	
	Frequency Selection Mode	**Clock Correction Disabled**	**Clock Correction Enabled**
Allowed input clock RTCATCKI	Any frequency from 32 kHz to 4.194304 MHz	32.768 kHz	Any frequency from 32.76180000 kHz to 32.77420000 kHz
Sub-counter RTCAnSUBC operation	• Counter overflow at value of RTCAnSCMP • RTCAnSCMP must be set to RTCATCKI-1 (in Hz)	Counter overflow at $7FFF_H$	Counter overflow at $7FFF_H$ or Every 20 or 60 seconds: $7FFF_H$ ±RTCAnSUBU.RTCAnF[5:0]

The operation mode is selected by control bit RTCAnCTL0.RTCAnSLSB. For details on how to set the operation mode during RTCA initialization, see **Section 27.5.1, Initial Setting of the RTCA**.

CAUTIONS

1. **The input clock RTCATCKI must not be outside the allowed frequency range.**
2. **The operation mode must not be changed while sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1).**

27.4.1 Clock Counter Format

The clock counters (RTCAnSECC to RTCAnYEARC) operate on binary coded decimals (BCD): Each digit is represented by its own binary sequence.

Depending on the valid data range, the number of bits for a digit differs. For example, the tens digit of the month of the year counter has only one bit (for 0 and 1) whereas the tens digit of the minutes counter has 3 bits (for 0 to 5).

The following table lists the decimals 0 to 59 in binary and BCD.

Table 27.40 Example of BCD Code – Seconds or Minutes Counter (0 to 59)

Decimal	Binary	BCD
0	000000	000 0000
1	000001	000 0001
2	000010	000 0010
3	000011	000 0011
4	000100	000 0100
5	000101	000 0101
6	000110	000 0110
7	000111	000 0111
8	001000	000 1000
9	001001	000 1001
10	001010	001 0000
11	001011	001 0001
12	001100	001 0010
:	:	:
58	111010	101 1000
59	111011	101 1001

27.4.2 Fixed Interval Interrupt Function

Interrupt RTCATINTR can be specified to occur after every 0.25 seconds, 0.5 seconds, 1 (full) second, 1 (full) minute, 1 (full) hour, 1 (full) day, or 1 (full) month.

The fixed interval interrupt function is controlled by bits RTCAnCTL1.RTCAnCT[2:0].

27.4.3 Alarm Interrupt Function

Interrupt RTCATINTAL can be specified to occur at a certain time on one or several days of the week. This interrupt can be used as a wake-up signal.

The alarm interrupt function is enabled and disabled by bit RTCAnCTL1.RTCAnENALM.

The alarm setting is specified by the following control registers:

- RTCAnALW selects the weekday(s).

The allocation of bits to weekdays is defined by the day of the week count buffer register RTCAnWEEK.

- RTCAnALH and RTCAnALM specify the hour and minute in BCD.

Examples

The following tables show some exemplary settings of the alarm control registers for both 12-hour and 24-hour format.

In this example, Sunday is RTCAnWEEK = 0, Monday is RTCAnWEEK = 1, Tuesday is RTCAnWEEK = 2, …, Saturday is RTCAnWEEK = 6:

Table 27.41 Alarm Setting in 12-Hour Format (RTCAnCTL0.RTCAnAMPM = 0)

Alarm Setting Time	RTCAnALW	RTCAnALH	RTCAnALM
Sunday 7:00 am	01_H	07_H	00_H
Sunday, Monday 12:15 pm	03_H	32_H	15_H
Monday, Wednesday, Friday 5:30 pm	$2A_H$	25_H	30_H
Daily, 10:45 pm	$7F_H$	30_H	45_H

Table 27.42 Alarm Setting in 24-Hour Format (RTCAnCTL0.RTCAnAMPM = 1)

Alarm Setting Time	RTCAnALW	RTCAnALH	RTCAnALM
Sunday 7:00	01_H	07_H	00_H
Sunday, Monday 12:15	03_H	12_H	15_H
Monday, Wednesday, Friday 17:30	$2A_H$	17_H	30_H
Daily, 22:45	$7F_H$	22_H	45_H

27.4.4 Clock Error Correction

Clock error correction compensates for deviations of the oscillator from the nominal clock rate. With clock error correction input clock rates from 32.76180 kHz to 32.77420 kHz are possible.

The clock error correction function is only available in 32.768-kHz operation mode. In this operation mode, a nominal clock rate of 32.768 kHz is expected and the sub-counters overflow value is fixed to $7FFF_H$.

The following figures illustrate the clock error when the input clock rate deviates from the nominal clock.

RTCATCKI = 32.768 kHz

Figure 27.2, RTCATCKI = 32.768 kHz, No Clock Error Correction Required shows the timing diagram if RTCATCKI matches the nominal clock rate of 32.768 kHz. No clock error correction is required.

Counting from 0 to 32767 (0 to $7FFF_H$) with a 32.768-kHz clock is exactly equal to one second.

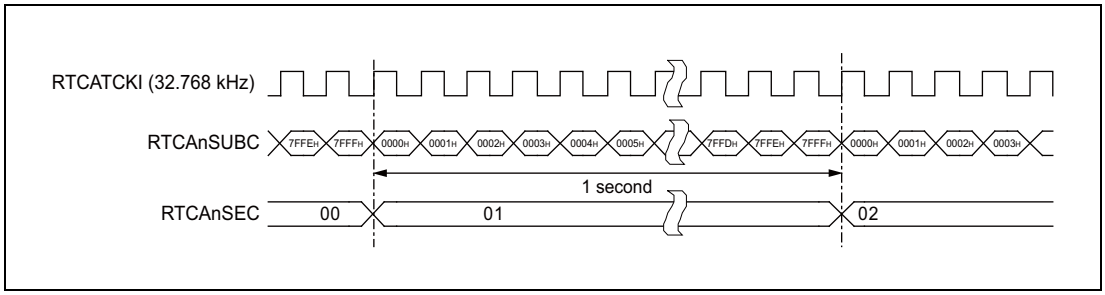

Figure 27.2 RTCATCKI = 32.768 kHz, No Clock Error Correction Required

RTCATCKI = 32.769 kHz

Figure 27.3, RTCATCKI = 32.769 kHz, No Clock Error Correction Enabled shows the timing diagram if RTCATCKI deviates from the nominal clock rate of 32.768 kHz. In this example, RTCATCKI is connected to a 32.769-kHz oscillator. Clock error correction is not enabled.

Counting from 0 to 32767 (0 to $7FFF_H$) with a 32.769-kHz clock is equal to approximately 0.99997 seconds (32768/32769). A "+ error" (faster than 32.768-kHz) occurs. In one month, RTCA deviates approximately –79 seconds from the real time.

Error = (32768/32769 - 1) × 60 (s) × 60 (min) × 24 (h) × 30 (d)

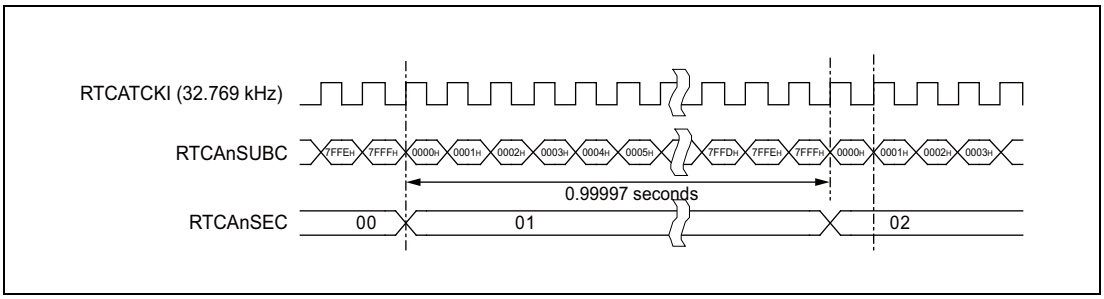

Figure 27.3 RTCATCKI = 32.769 kHz, No Clock Error Correction Enabled

Clock error correction is performed by stretching/reducing the 1-second period of the sub-counter at regular intervals. The sub-counter's upper limit of $7FFF_H$ is increased or decreased by setting the following parameters in register RTCAnSUBU:

- A correction value greater than one
- An operator (add/subtract)
- An interval (20 or 60 seconds)

The corrected overflow value becomes effective every 20 or 60 seconds, so that on the average RTCAnSECC is triggered exactly every second.

27.4.4.1 Setting the Correction Value and the Operator

The correction value and operator are specified by the RTCAnF6, RTCAnF[5:0] bits of the RTCAnSUBU register:

- RTCAnF6 specifies whether the overflow value is incremented or decremented.
- RTCAnF[5:0] specifies the correction value.

The correction values are calculated as follows:

Table 27.43 Correction Value Settings

RTCAnF6	Increment/Decrement	Correction Value
0	Increment	(Value of RTCAnF[5:0] – 1) × 2
1	Decrement	(Inverted value of RTCAnF[5:0] + 1) × 2

Some examples are given in the following table:

Table 27.44 Correction Value Examples

RTCAnF6	RTCAnF[5:0]	Correction Value	Count Limit of RTCAnSUBC
0	15_H	$(15_H - 1) \times 2 = 40$	32768 + 40 = 32808
1	15_H	$(\overline{15}_H + 1) \times 2$ $= (2A_H + 1) \times 2$ $= 86$	32768 – 86 = 32682

27.4.4.2 Impact of the Repetition Interval

The correction value set by RTCAnF6, RTCAnF[5:0] does not change the count limit of RTCAnSUBC every second. The repetition interval at which the correction value becomes effective is specified by bit RTCAnDEV.

This bit also influences the size of the correctable frequency range and the correction accuracy.

The following table summarizes the RTCAnDEV settings.

Table 27.45 Setting of Bit RTCAnSUBU.RTCAnDEV

RTCAnDEV	Count Limit of RTCAnSUBC is Changed	Frequency Range that can be Corrected	Correction Accuracy
0	Every 20 seconds when RTCAnSECC = 00, 20, or 40	32.76180000 to 32.77420000 kHz	
1	Every 60 seconds when RTCAnSECC = 00	32.76593333 to 32.77006667 kHz	Three times higher than for RTCAnDEV = 0

27.4.4.3 Sample Settings

The frequencies that can be corrected, as well as the setting values of bits RTCAnDEV, RTCAnF6, and RTCAnF[5:0], are listed in the following table.

Table 27.46 Correctable Frequency Range when RTCAnDEV = 0

Input Clock Frequency	RTCAnF6	RTCAnF[5:0]	Correction Value of RTCAnSUBC
—	0	000000	No correction
—	0	000001	No correction
32.76810000 kHz	0	000010	Once every 20 s, RTCAnSUBC count value + 2
32.76820000 kHz	0	000011	Once every 20 s, RTCAnSUBC count value + 4
32.76830000 kHz	0	000100	Once every 20 s, RTCAnSUBC count value + 6
:	:	:	:
32.77400000 kHz	0	111101	Once every 20 s, RTCAnSUBC count value + 120
32.77410000 kHz	0	111110	Once every 20 s, RTCAnSUBC count value + 122
32.77420000 kHz (upper limit)	0	111111	Once every 20 s, RTCAnSUBC count value + 124
—	1	000000	No correction
—	1	000001	No correction
32.76180000 kHz (lower limit)	1	000010	Once every 20 s, RTCAnSUBC count value – 124
32.76190000 kHz	1	000011	Once every 20 s, RTCAnSUBC count value – 122
32.76200000 kHz	1	000100	Once every 20 s, RTCAnSUBC count value – 120
:	:	:	:
32.76770000 kHz	1	111101	Once every 20 s, RTCAnSUBC count value – 6
32.76780000 kHz	1	111110	Once every 20 s, RTCAnSUBC count value – 4
32.76790000 kHz	1	111111	Once every 20 s, RTCAnSUBC count value – 2

Table 27.47 Correctable Frequency Range when RTCAnDEV = 1

Input Clock Frequency	RTCAnF6	RTCAnF[5:0]	Correction Value of RTCAnSUBC
—	0	000000	No correction
—	0	000001	No correction
32.76803333 kHz	0	000010	Once every 60 s, RTCAnSUBC count value + 2
32.76806667 kHz	0	000011	Once every 60 s, RTCAnSUBC count value + 4
32.76810000 kHz	0	000100	Once every 60 s, RTCAnSUBC count value + 6
:	:	:	:
32.77000000 kHz	0	111101	Once every 60 s, RTCAnSUBC count value + 120
32.77003333 kHz	0	111110	Once every 60 s, RTCAnSUBC count value + 122
32.77006667 kHz (upper limit)	0	111111	Once every 60 s, RTCAnSUBC count value + 124
—	1	000000	No correction
—	1	000001	No correction
32.76593333 kHz (lower limit)	1	000010	Once every 60 s, RTCAnSUBC count value – 124
32.76596667 kHz	1	000011	Once every 60 s, RTCAnSUBC count value – 122
32.76600000 kHz	1	000100	Once every 60 s, RTCAnSUBC count value – 120
:	:	:	:
32.76790000 kHz	1	111101	Once every 60 s, RTCAnSUBC count value – 6
32.76793333 kHz	1	111110	Once every 60 s, RTCAnSUBC count value – 4
32.76796667 kHz	1	111111	Once every 60 s, RTCAnSUBC count value – 2

27.5 Procedures for Setup, Writing and Reading

The following subsections provide flow charts that illustrate the procedures for RTCA setup and for reading and writing the RTCA clock counters.

27.5.1 Initial Setting of the RTCA

The RTCA must be stopped before setting the initial setting value of each counter.

27.5.1.1 RTCA Stop Procedure

Stop the RTCA according to the following flow.

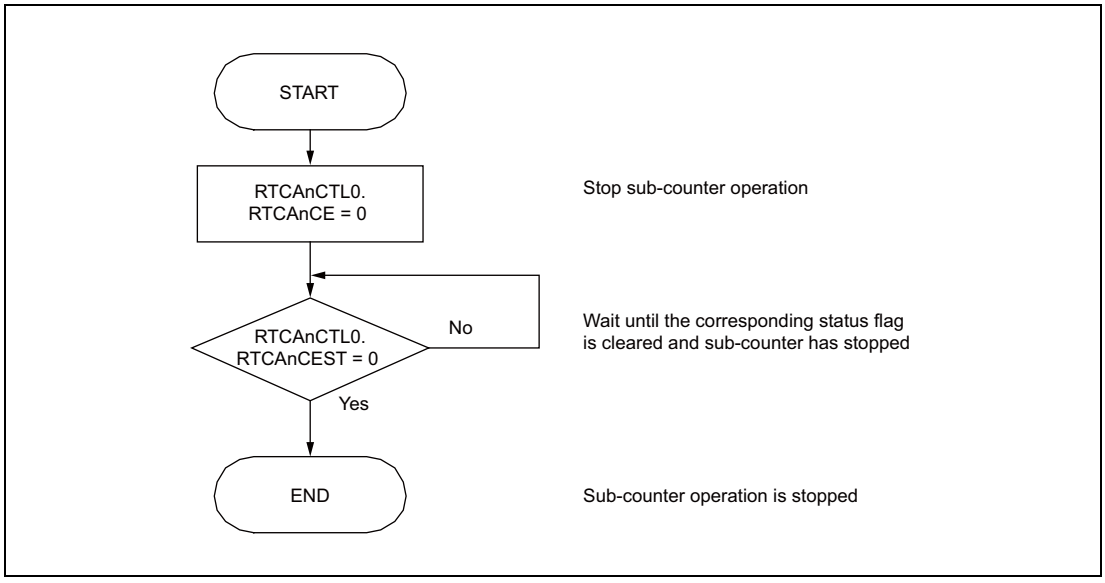

Figure 27.4 RTCA Stop Procedure

27.5.1.2 RTCA Initialization Procedure

Perform the initial setting of the RTCA according to the following flow:

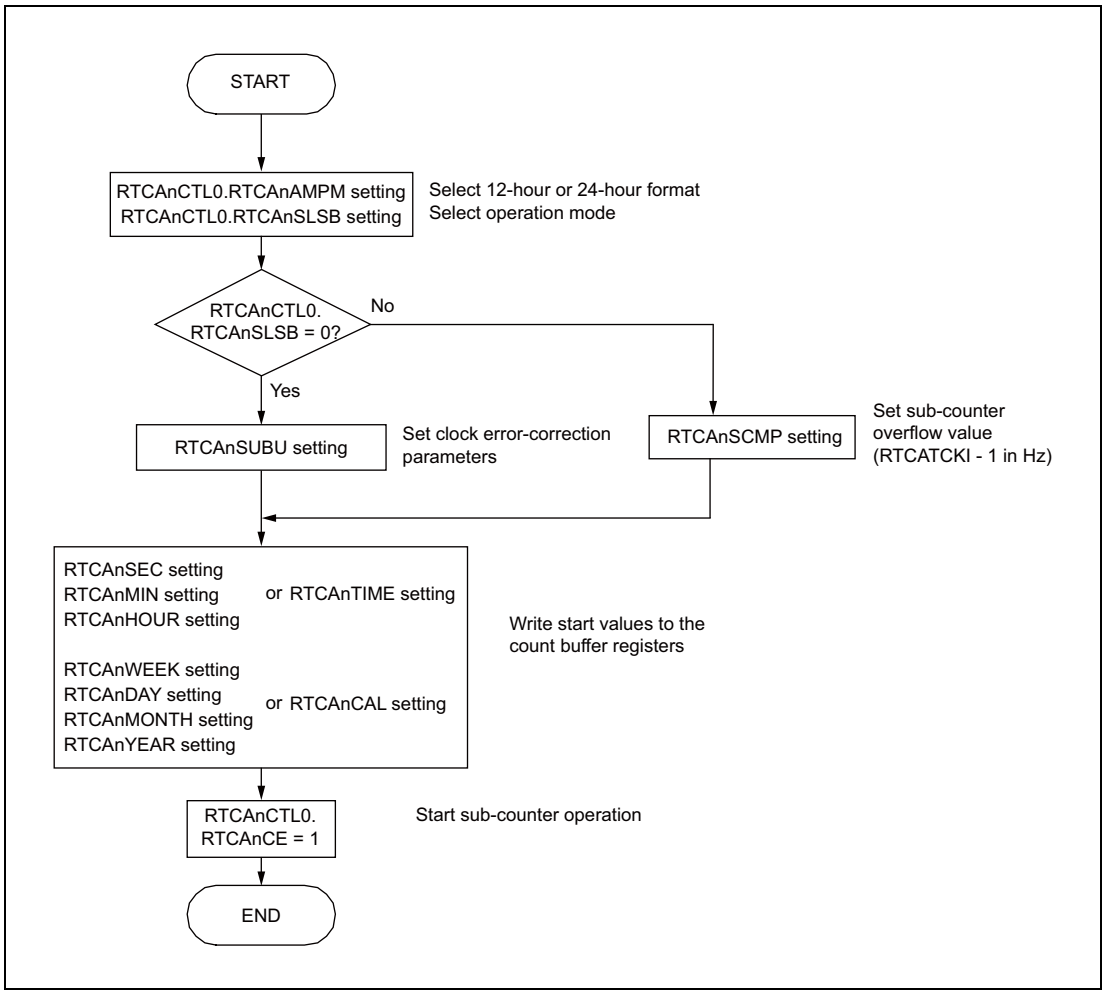

Figure 27.5 RTCA Initial Setup Procedure

CAUTION

The internal clock counter is synchronized with RTCATCKI.

In addition, two RTCATCKI periods are required before the clock counter starting behind END of the above flow.

Therefore, PCLK must be continuously supplied until the completion of the initial setting.

Check that RTCAnCTL0.RTCAnCEST = 1, when the supply of PCLK is stopped after setting the initial setting value of RTCA.

27.5.2 Updating Clock Counters

The clock counters RTCAnSECC to RTCAnYEARC can be stopped and updated while the sub-counter is running.

To update the clock counter when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow the flowchart shown below.

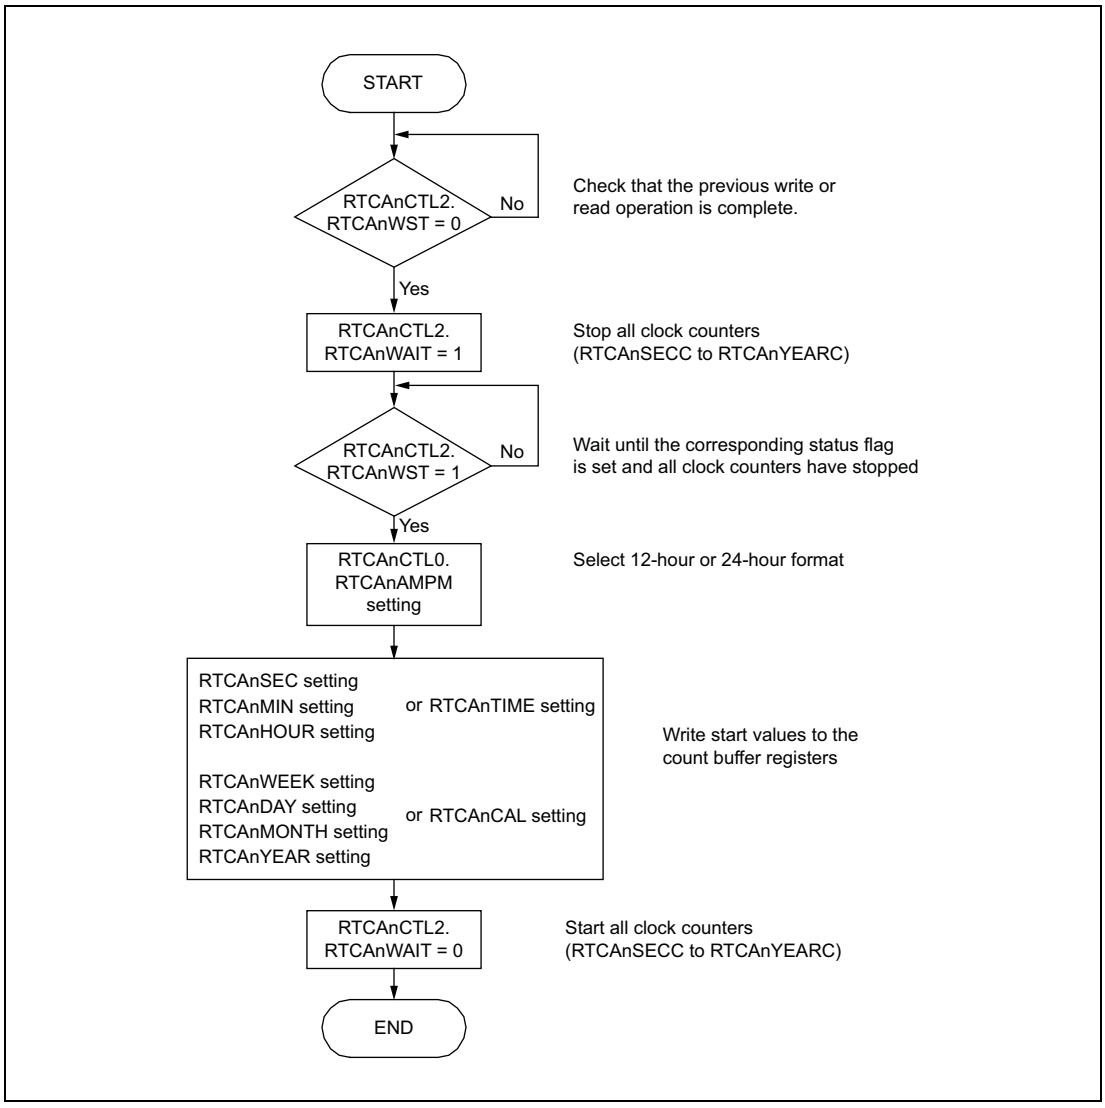

Figure 27.6 Updating Clock Counter Values

CAUTIONS

1. **The internal clock counter is synchronized with RTCATCKI.**
   In addition, two RTCATCKI periods are required before the clock counter updating behind END of the above flow.
   Therefore, PCLK must be continuously supplied until the completion of the clock counter updating.
   Check that RTCAnCTL2.RTCAnWST = 0 before stopping the supply of PCLK after the completion of clock counter updating.
2. **The update procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more:**

3. **Only one sub-counter overflow can be held internally and increment the seconds counter after restarting the clock counters if the value is held.**
4. **If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.**

27.5.3 Reading Clock Counters

There are two methods to read the clock counters while sub-counter operation is enabled:

- Reading count buffer registers
- Reading counter registers

The advantages and disadvantages of the two methods are summarized in the following table.

Table 27.48 Comparison of the Two Read Methods

	Advantage	Disadvantage
Reading count buffer registers	It is unnecessary to read clock counters several times because the clock counters are read synchronously.	A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT = 1 and completion of data transfer.
Reading count registers	Program wait state does not occur.	If the sub-counter increments, the clock counters must be read several times because they are read asynchronously to RTCATCKI.

27.5.3.1 Procedure for Reading Count Buffer Registers

The following operations are necessary:

1. Stop all clock counters (RTCAnCTL2.RTCAnWAIT = 1). The value of the clock counters is transferred to the corresponding count buffer registers.
2. Read the count buffer registers.

A program wait state occurs between setting RTCAnCTL2.RTCAnWAIT = 1 and completion of data transfer.

The maximum delay is three PCLK periods plus two RTCATCKI periods. For example, if the RTCA operates with PCLK = 40 MHz and RTCATCKI = 32.768 kHz, the delay is about 61 µs.

To read the count buffer register when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCEST = 1), follow the flowchart shown below.

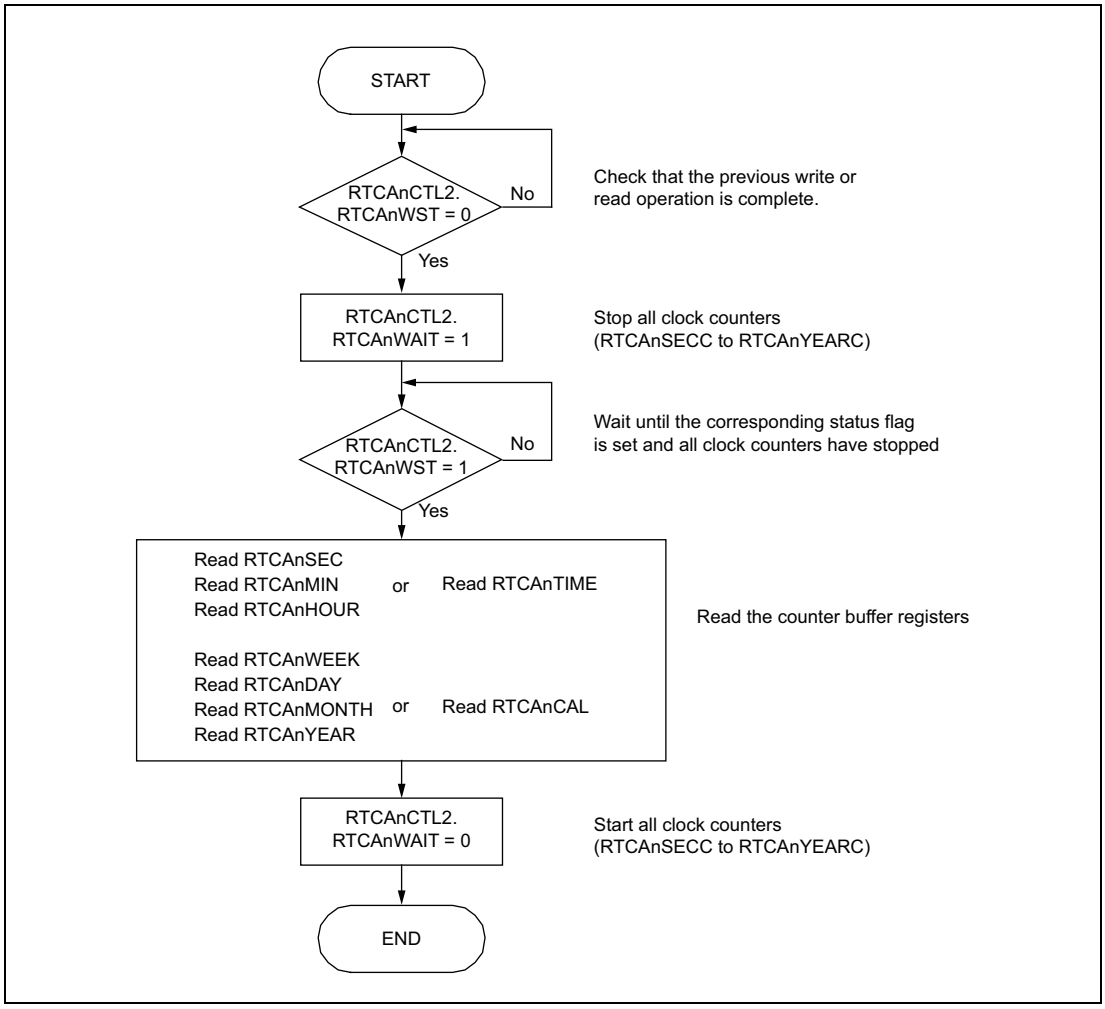

Figure 27.7 Reading Clock Count Buffer Registers

CAUTIONS

1. **The internal clock counter is synchronized with RTCATCKI.**
   In addition, two RTCATCKI periods are required before resuming counter behind END of the above flow.
   Therefore, PCLK must be continuously supplied until the counter resuming.
   Check that RTCAnCTL0.RTCAnCEST = 1 first to stop the supply of PCLK after count buffer register reading.
2. **The reading procedure must be completed within one second. Otherwise the Real-Time Clock will not count correctly any more.**
3. **Only one sub-counter overflow can be held internally. If there is a value held internally when the clock counter restarts, the seconds counter will be incremented by 1.**
4. **If the sub-counter overflows more than once during clock counter stop, the overflow count cannot be held internally. Thus the seconds counter is incremented by one instead of by two when it is restarted.**

27.5.3.2 Procedure for Reading Counter Registers Directly

To ensure that the sub-counter did not overflow while reading the counters, the seconds counter RTCAnSECC must be read twice in the beginning and at the end of the procedure. The first read value is compared with the second read value.

- First read value = second read value:
  No overflow of sub-counter occurred during counter read operation.
- First read value ≠ second read value:
  Overflow of the sub-counter occurred during counter read operation. The counters must be read again to get the current counter values.

To read the counter register directly when the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), follow the flowchart shown below.

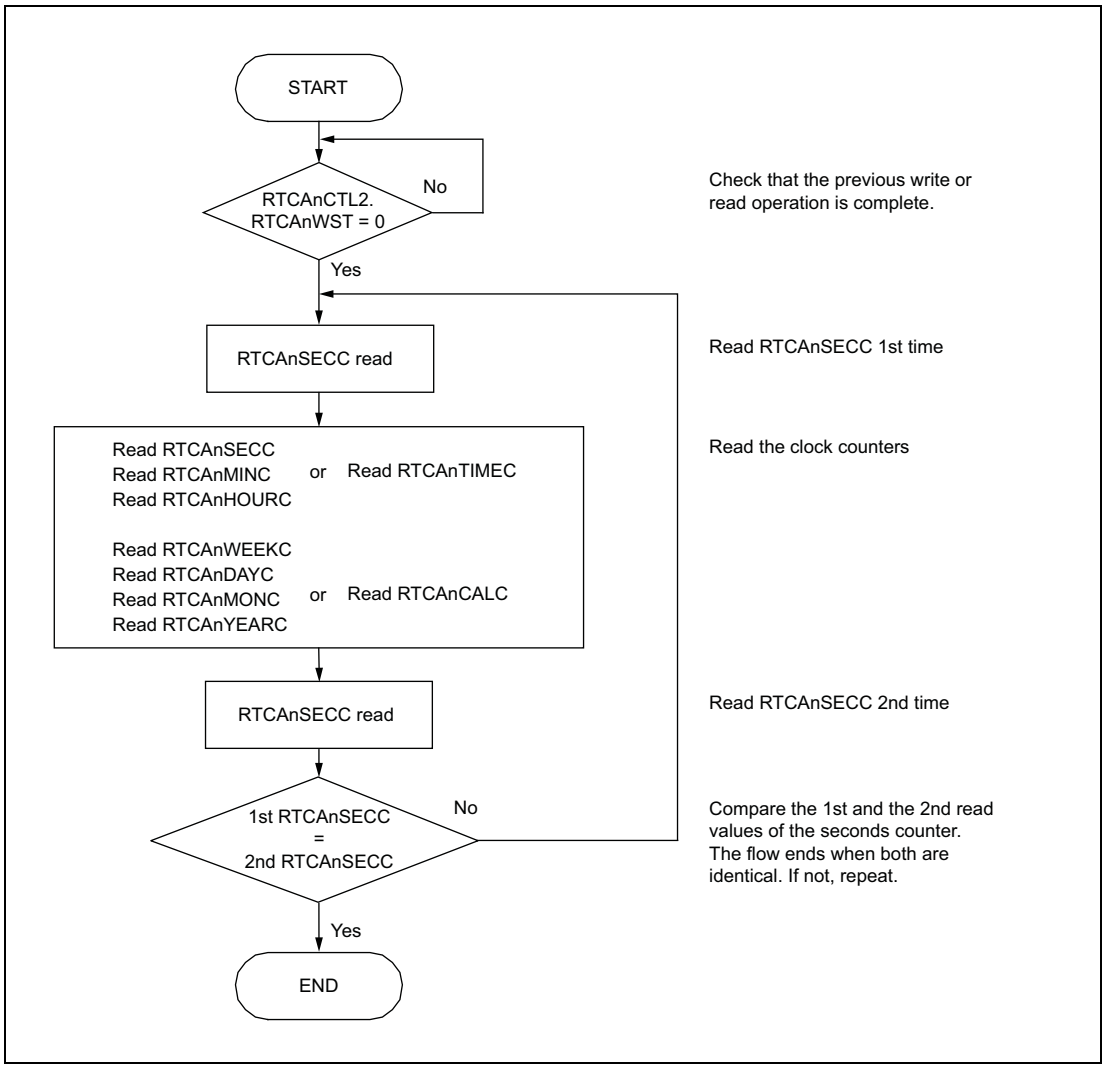

Figure 27.8 Reading Clock Counter Registers

NOTE

The procedure must be completed within one second.

27.5.4 Reading RTCAnSRBU

RTCAnSRBU is the read buffer register for the sub-counter.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), read RTCAnSRBU according to the following flow.

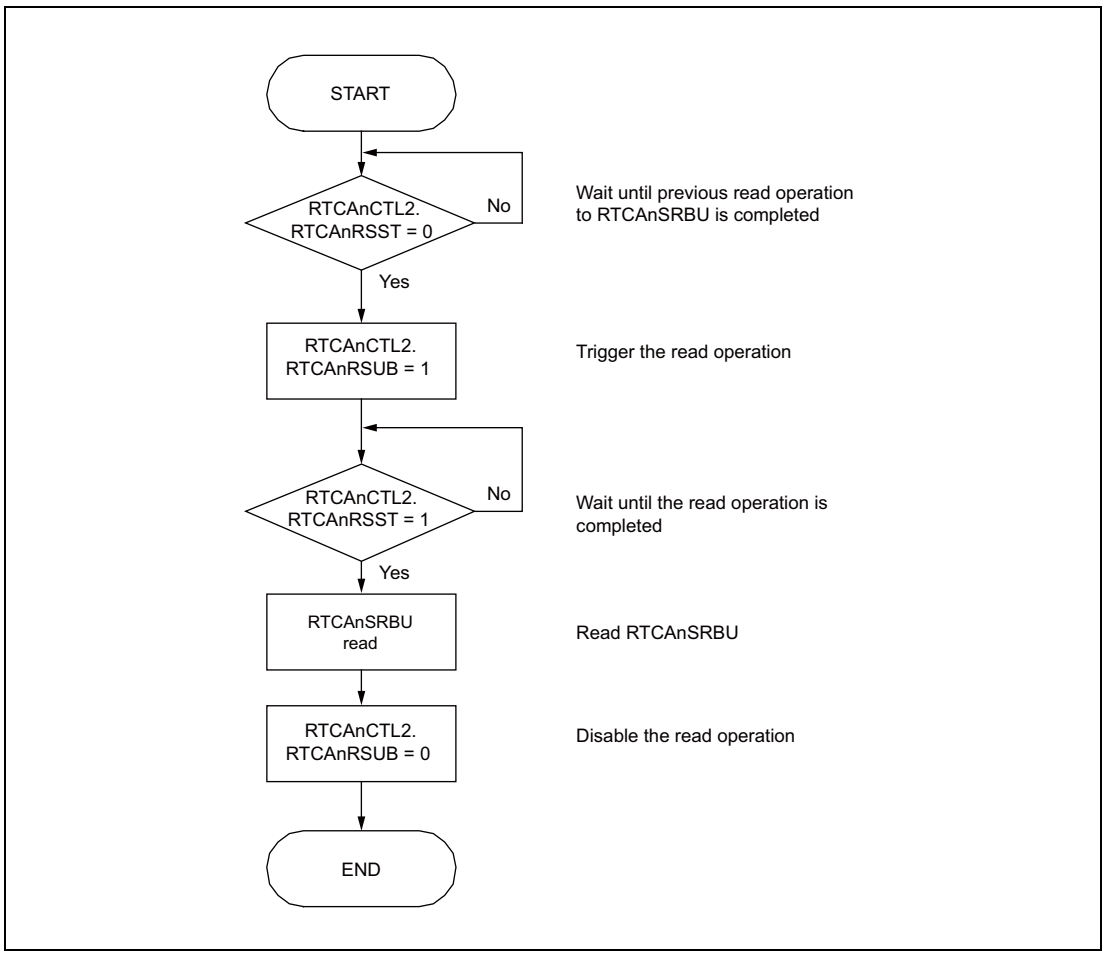

Figure 27.9 Reading the RTCAnSRBU Register

27.5.5 Writing to RTCAnSUBU

RTCAnSUBU is the clock error correction register for the sub-counter.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), write to RTCAnSUBU according to the flow described below.

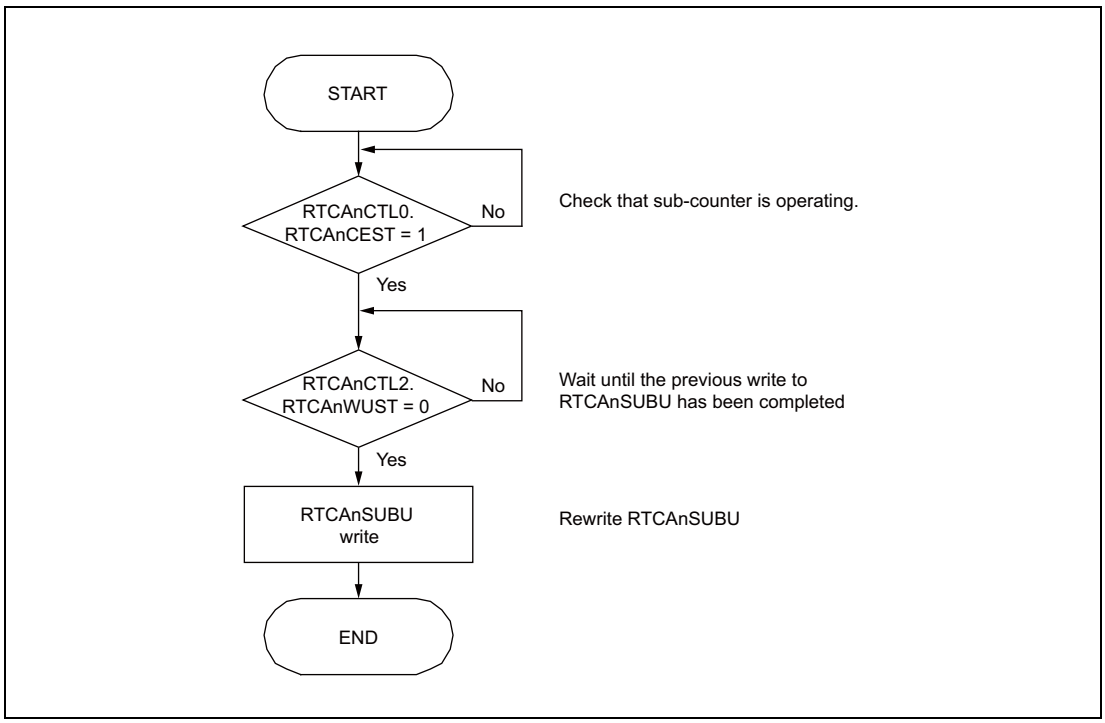

Figure 27.10 Writing to the RTCAnSUBU Register

NOTE

While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), the status flag RTCAnCTL2.RTCAnWUST is set when RTCAnSUBU is written to. It is cleared when the write operation to RTCAnSUBU is completed. This is synchronous with the next RTCAnSUBC overflow.
RTCAnCTL2.RTCAnWUST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWUST = 1 at the beginning of this flow).

27.5.6 Writing to RTCAnSCMP

RTCAnSCMP is the sub-counter compare register.

When the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), write to RTCAnSCMP according to the flow described below.

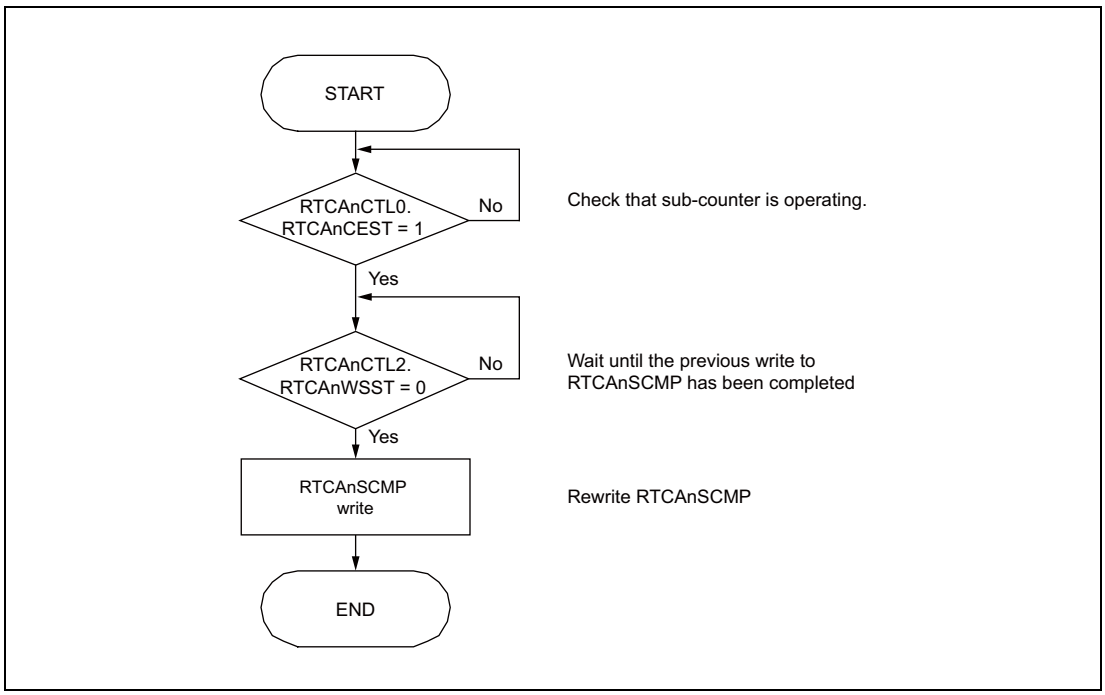

Figure 27.11 Writing the RTCAnSCMP Register

NOTE

While the sub-counter operation is enabled (RTCAnCTL0.RTCAnCE = 1), the status flag RTCAnCTL2.RTCAnWSST is set when RTCAnSCMP is written to. It is cleared when the write operation to RTCAnSCMP is completed. This is synchronous with the next RTCAnSUBC overflow.

RTCAnCTL2.RTCAnWSST can be set for up to one second. Be careful when performing polling (checking if RTCAnCTL2.RTCAnWSST = 1 at the beginning of this flow).

27.6 Timing Diagrams

27.6.1 Timing of Counter Start

The following diagram illustrates the counter start after setting the time in the buffer registers.

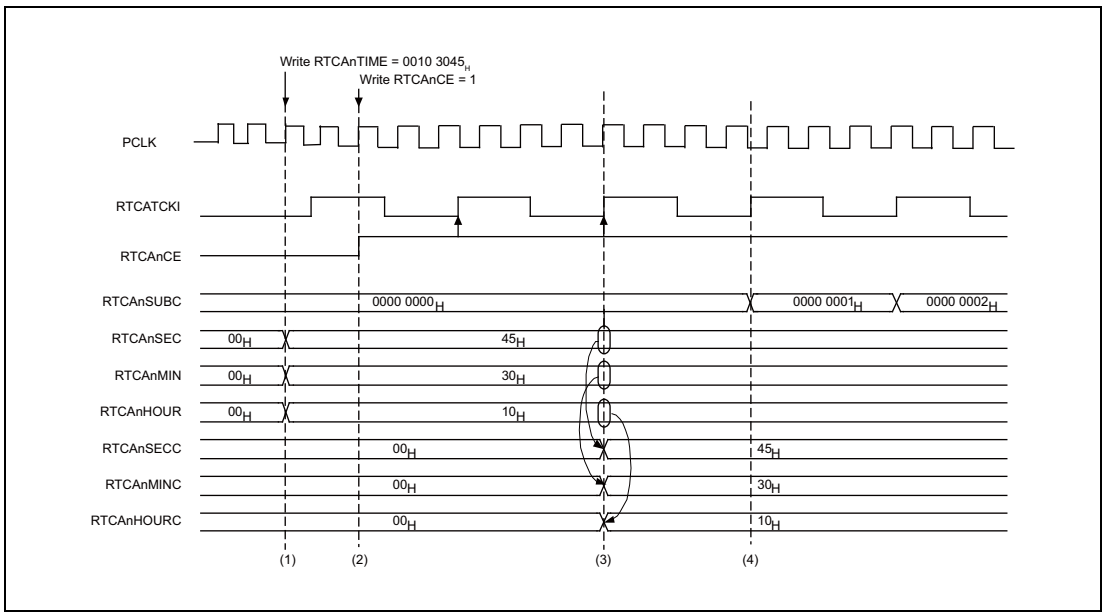

Figure 27.12 Counter Start Timing

The timing diagram above shows the following:

(1) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME = 0010 3045_H.
Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.

(2) Sub-counter operation is started by setting RTCAnCTL0.RTCAnCE = 1.

(3) When the second rising edge of RTCATCKI occurs, the buffer register values are loaded to the corresponding count registers.

(4) When the next rising edge of RTCATCKI occurs, count up of the sub-counter starts.

27.6.2 Timing of Clock Counter Update while Counter Is Enabled

The following diagram illustrates the counter restart after setting the time in the buffer registers.

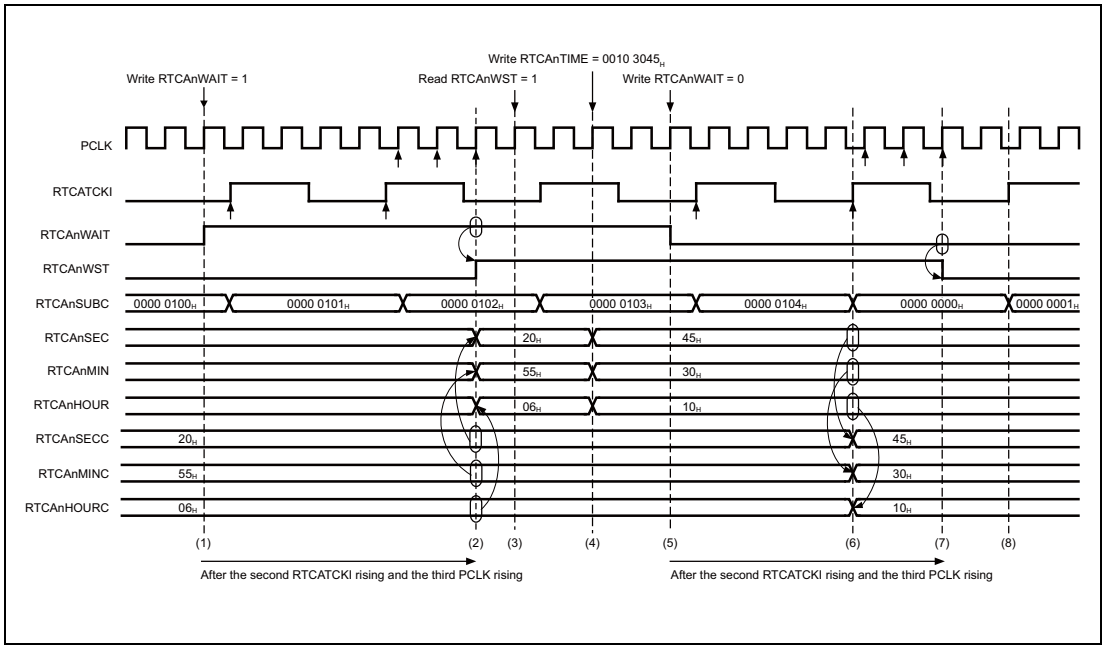

Figure 27.13 Clock Counter Update Timing

The timing diagram above shows the following:

(1) Trigger the clock counters stop (RTCAnCTL2.RTCAnWAIT = 1).

(2) RTCAnCTL2.RTCAnWST is set to 1 after the second rising edge of RTCATCKI and the third rising edge of PCLK, and the counter clock stops. The sub-counter continues counting.

(3) RTCAnCTL2.RTCAnWST = 1 can be readable.

(4) The initial setting value of the time count buffer is set to 10:30:45 by setting RTCAnTIME to 0010 3045_H.
Count buffer registers RTCAnSEC, RTCAnMIN, and RTCAnHOUR are also automatically written.

(5) Trigger the clock counters restart (RTCAnCTL2.RTCAnWAIT = 0).

(6) When the second rising edge of RTCATCKI occurs, the values of the buffer registers are loaded to the corresponding count registers. Write operation to RTCAnSECC is performed and RTCAnSUBC is cleared.

(7) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnWST is set to 0.

(8) Clock counter operation is resumed.

27.6.3 Timing of Sub-Counter Read Buffer Reading while Counter is Enabled

The following diagram illustrates the timing when reading the sub-counter read buffer RTCAnSRBU.

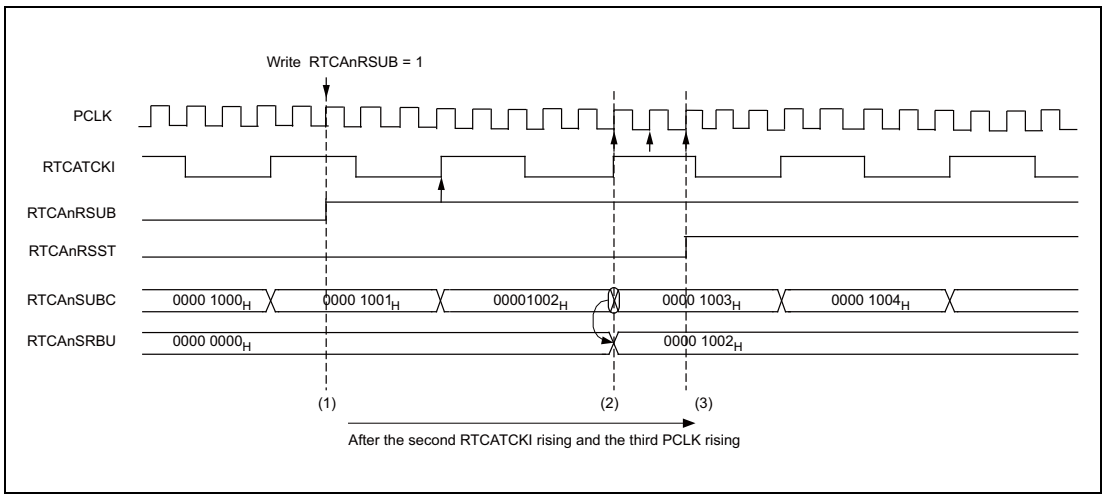

Figure 27.14 Timing when Reading the Sub-Counter Read Buffer Register Value

The timing diagram above shows the following:

(1) Setting RTCAnRSUB = 1 triggers loading of the sub-counter value to RTCAnSRBU.

(2) When the second rising edge of RTCATCKI occurs, the value of RTCAnSUBC is loaded to RTCAnSRBU.

(3) When the third rising edge of PCLK occurs, RTCAnCTL2.RTCAnRSST is set to 1 and RTCAnSRBU can be read.

Section 28 Encoder Timer (ENCA)

This section contains a generic description of the Encoder Timer (ENCA).

The first part in this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the ENCA.

28.1 Features of RH850/F1K ENCA

28.1.1 Number of Units and Channels

This microcontroller has the following number of ENCA units.

Each ENCA unit has one channel ENCA. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 28.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	1		
Name	ENCAn (n = 0)		

Table 28.2 Index

Index	Description
n	Throughout this section, the individual ENCA units are identified by the index “n” (n = 0); for example, ENCAnCTL is the ENCAn control register.

28.1.2 Register Base Address

ENCAn base addresses are listed in the following table.

ENCAn register addresses are given as offsets from the base addresses.

Table 28.3 Register Base Address

Base Address Name	Base Address
<ENCA0_base>	FFE8 0000_H

28.1.3 Clock Supply

The ENCAn clock supply is shown in the following table.

Table 28.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
ENCA0	PCLK	CKSCLK_IPERI1	Module clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_IPERI1	

28.1.4 Interrupt Requests

ENCAn interrupt requests are listed in the following table.

Table 28.5 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
ENCA0			
ENCATIOV	Overflow interrupt	85	—
ENCATIUD	Underflow interrupt	86	—
ENCATINT0	Capture/compare match interrupt 0	87	—
ENCATINT1	Capture/compare match interrupt 1	88	—
ENCATIEC	Encoder clear interrupt	89	—

28.1.5 Reset Sources

ENCAn reset sources are listed in the following table. ENCAn is initialized by these reset sources.

Table 28.6 Reset Sources

Unit Name	Reset Source
ENCA0	All reset sources (ISORES)

28.1.6 External Input/Output Signals

External input/output signals of ENCAn are listed below.

Table 28.7 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
ENCA0		
ENCATTIN0	ENCAn capture trigger input 0*1	ENCA0TIN0
ENCATTIN1	ENCAn capture trigger input 1*1	ENCA0TIN1
ENCAnE0	ENCAn encoder input 0*1	ENCA0E0
ENCAnE1	ENCAn encoder input 1*1	ENCA0E1
ENCAnEC	ENCAn encoder clear input*1	ENCA0EC

Note 1. When channel input pins are to be used, noise filters must be set for the corresponding port pin functions. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**.

28.1.7 Internal Input/Output Signals

Input/output signals to be connected between ENCA and PIC are listed below.

Table 28.8 Internal Input/Output Signals

Unit Signal Name	Description	Connected to
ENCATSST	Simultaneous start trigger	PIC
ENCATTIN1	ENCAn capture trigger input 1	PIC

28.2 Overview

28.2.1 Functional Overview

- Generation of the counter control signal from the encoder input signal, and count operation in synchronization with PCLK
- Capture function for capturing the counter value with an external trigger signal
- Compare function for compare match judgment with the counter value
- Two capture/compare registers that can be set separately for capture operation and for compare operation
- Interrupt mask function for masking the interrupt request signal output as a result of compare match judgment during compare operation
- Function for loading the value of the capture/compare register to the counter upon underflow occurrence
- Encoder input signal can be used as the timer counter clear condition
- Edge or level can be selected for determining the presence of the encoder input signal that is used as the timer counter clear condition
- Detection of counter overflow and underflow and output of error flags and error occurrence interrupts
- Five interrupts: two capture/compare interrupts, one counter clear interrupt, one overflow interrupt, and one underflow interrupt

28.2.2 Block Diagram

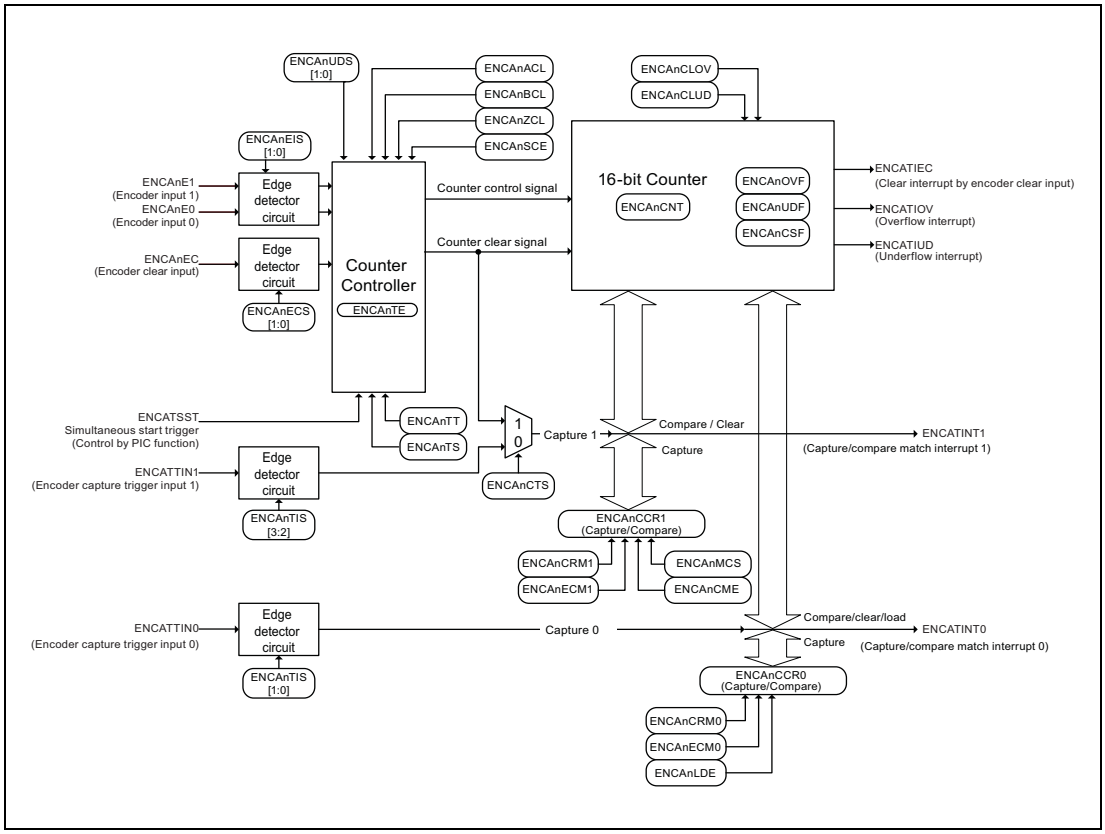

Figure 28.1 ENCA Block Diagram

28.3 Registers

28.3.1 List of Registers

ENCA registers are listed in the following table.

<ENCAn_base> is defined in **Section 28.1.2, Register Base Address**.

Table 28.9 List of Registers

Module Name	Register Name	Symbol	Address
ENCAn	ENCAn capture/compare register 0	ENCAnCCR0	<ENCAn_base>
	ENCAn capture/compare register 1	ENCAnCCR1	<ENCAn_base> + 04_H
	ENCAn counter register	ENCAnCNT	<ENCAn_base> + 08_H
	ENCAn status flag register	ENCAnFLG	<ENCAn_base> + $0C_H$
	ENCAn status flag clear register	ENCAnFGC	<ENCAn_base> + 10_H
	ENCAn timer enable status register	ENCAnTE	<ENCAn_base> + 14_H
	ENCAn timer start trigger register	ENCAnTS	<ENCAn_base> + 18_H
	ENCAn timer stop trigger register	ENCAnTT	<ENCAn_base> + $1C_H$
	ENCAn I/O control register 0	ENCAnIOC0	<ENCAn_base> + 20_H
	ENCAn control register	ENCAnCTL	<ENCAn_base> + 40_H
	ENCAn I/O control register 1	ENCAnIOC1	<ENCAn_base> + 44_H
	ENCAn emulation register	ENCAnEMU	<ENCAn_base> + 48_H

28.3.2 ENCAnCTL — ENCAn Control Register

This register is used to configure various operation settings of the Encoder Timer.

Access: This register can be read or written in 16-bit units.
Writing to this register during operation is prohibited.

Address: <ENCAn_base> + 40_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAn CME	ENCAn MCS	—	—	—	—	ENCAn CRM1	ENCAn CRM0	ENCAn CTS	—	—	ENCAn LDE	ENCAn ECM1	ENCAn ECM0	ENCAnUDS [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Table 28.10 ENCAnCTL Register Contents (1/2)

Bit Position	Bit Name	Function
15	ENCAnCME	Encoder Clear Mask Enable This bit is used to enable/disable masking of compare-match interrupt detection when the compare function is used. 0: Disables the compare-match interrupt (ENCATINT1) mask function for the ENCAnCCR1 register 1: Enables the compare-match interrupt (ENCATINT1) mask function for the ENCAnCCR1 register. This bit is valid only when ENCAnCRM1 = 0. When this bit is set to “1”, setting ENCAnECM1 to “1” is prohibited.
14	ENCAnMCS	Encoder Mask Clear Select This bit is used to select the trigger for cancelling masking of compare-match interrupt detection ENCATINT1 when the compare function is used. This bit is valid only when ENCAnCRM1 = 0. 0: Masking of compare-match interrupt detection is canceled when the ENCAnCCR1 register is written. 1: Masking of compare match interrupt detection is canceled when one of the following three operations is performed. – Timer counter clear operation accompanying encoder clear input – Timer counter clear operation upon compare-match between ENCAnCNT and ENCAnCCR0 when ENCAnECM0 = 1 – Loading from ENCAnCCR0 to the timer counter upon underflow detection when ENCAnLDE = 1
13 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	ENCAnCRM1	ENCAnCCR1 Register Mode 0: ENCAnCCR1 used as compare register. 1: ENCAnCCR1 used as capture register.
8	ENCAnCRM0	ENCAnCCR0 Register Mode 0: ENCAnCCR0 used as compare register. 1: ENCAnCCR0 used as capture register.
7	ENCAnCTS	ENCAnCCR1 Capture Trigger Select This is a trigger selection bit for the capture operation to the ENCAnCCR1 register. This bit is valid only when ENCAnCRM1 = 1. 0: Uses ENCATTIN1 of capture trigger 1 signal as the capture trigger for the ENCAnCCR1 register. 1: The counter clear signal selected with ENCAnSCE is used as the capture trigger for the ENCAnCCR1 register.
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 28.10 ENCAnCTL Register Contents (2/2)

Bit Position	Bit Name	Function
4	ENCAnLDE	ENCAn Counter Load Enable This bit is used to enable/disable setting value loading to the counter upon underflow occurrence. This bit is valid only when ENCAnCRM0 = 0. When ENCAnCRM0 = 1, loading of the ENCAnCCR0 register setting value to the counter upon occurrence of an underflow is not performed, regardless of the value of this bit. 0: Disables loading of ENCAnCCR0 register setting value to counter upon occurrence of a counter underflow. 1: Enables loading of ENCAnCCR0 register setting value to counter upon occurrence of a counter underflow.
3	ENCAnECM1	Encoder Clear Mode 1 This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR1 setting value. This bit is valid only when ENCAnCRM1 = 0. 0: Does not clear the counter to 0000_H upon match of timer counter value and ENCAnCCR1 setting value. 1: Clears the counter to 0000_H upon match of timer counter value and ENCAnCCR1 setting value if the next count is a down-count.
2	ENCAnECM0	Encoder Clear Mode 0 This bit is used to set the counter clear operation upon match between the counter value and ENCAnCCR0 setting value. This bit is valid only when ENCAnCRM0 = 0. 0: Does not clear the counter to 0000_H upon match of timer counter value and ENCAnCCR0 setting value. 1: Clears the counter to 0000_H upon match of timer counter value and ENCAnCCR0 setting value if the next count is a up-count.
1, 0	ENCAnUDS[1:0]	Up/down Count Selection 1 and 0 These are the counter up/down control bits using ENCAnE0 and ENCAnE1. 00: Upon detection of valid edge of ENCAnE0, - down-count when ENCAnE1 = H, - up-count when ENCAnE1 = L 01: Upon detection of valid edge of ENCAnE0, up-count, Upon detection of valid edge of ENCAnE1, down-count 10: At rising edge of ENCAnE0, down-count At falling edge of ENCAnE0, up-count However, count operation is performed only when ENCAnE1 = L. 11: Detection of both edges of ENCAnE0, ENCAnE1. The count operation is determined based on the combination of the detected edge and level.

28.3.3 ENCAnIOC0 — ENCAn I/O Control Register 0

This register is used to select the input edge of capture triggers 0 and 1 (ENCATTIN0, ENCATTIN1).

Access: This register can be read or written in 8-bit units.

Address: <ENCAn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	ENCAnTIS[3:2]		ENCAnTIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 28.11 ENCAnIOC0 Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2	ENCAnTIS[3:2]	Input Edge Selection for Capture Trigger 1 These bits are valid only when ENCAnCTL.ENCAnCRM1 = 1 and ENCAnCTL.ENCAnCTS = 0. All other settings of ENCAnCRM1 and ENCAnCTS are invalid. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection
1, 0	ENCAnTIS[1:0]	Input Edge Selection for Capture Trigger 0 These bits are valid only when ENCAnCTL.ENCAnCRM0 = 1. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

28.3.4 ENCAnIOC1 — ENCAn I/O Control Register 1

This register is used to perform the clear condition setting and edge selection for input from the encoder.

Access: This register can be read or written in 8-bit units.
Writing to this register during operation is prohibited.

Address: <ENCAn_base> + 44_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ENCAnSCE	ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnECS[1:0]		ENCAnEIS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.12 ENCAnIOC1 Register Contents (1/2)

Bit Position	Bit Name	Function
7	ENCAnSCE	Encoder Special-Clear Enable This is an encoder special clear enable bit. When setting this bit to 1, set ENCAnUDS1 and ENCAnUDS0 to 10_B or 11_B. The operation is not guaranteed if this bit is set to 1 with ENCAnUDS1 and ENCAnUDS0 set to 00_B or 01_B. 0: Clears the counter upon detection of ENCAnEC valid edge (set with ENCAnECS1 and ENCAnECS0). 1: Clears the counter upon detection of input level condition of ENCAnE0, ENCAnE1 and ENCAnEC (set with ENCAnZCL bit, ENCAnBCL bit, and ENCAnACL bit).
6	ENCAnZCL	Input-Z Clear Condition Selection This bit is used to set the condition for clearing the encoder clear input (ENCAnEC) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
5	ENCAnBCL	Input-B Clear Condition Selection This bit is used to set the condition for clearing the encoder input 1 (ENCAnE1) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
4	ENCAnACL	Input-A Clear Condition Selection This bit is used to set the condition for clearing the encoder input 0 (ENCAnE0) when using the encoder special clear function. This bit is valid only when ENCAnSCE = 1; it is invalid when ENCAnSCE = 0. 0: Clear condition: Low level 1: Clear condition: High level
3, 2	ENCAnECS[1:0]	Encoder Clear Input Edge Selection 1 and 0 These are the encoder clear input edge selection bits. These bits are valid only when ENCAnSCE = 0; they are invalid when ENCAnSCE = 1. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

Table 28.12 ENCAnIOC1 Register Contents (2/2)

Bit Position	Bit Name	Function
1, 0	ENCAnEIS[1:0]	Encoder Edge Input Selection 1 and 0 These are the encoder input edge selection bits. These bits are valid when ENCAnUDS1 and ENCAnUDS0 = 00_B or 01_B, and are invalid when ENCAnUDS1 and ENCAnUDS0 = 10_B or 11_B. 00: No edge detection 01: Rising edge detection 10: Falling edge detection 11: Both edges detection

28.3.5 ENCAnFLG — ENCAn Status Flag Register

This register holds the status flags of the timer counter of ENCAn.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ENCAn_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENCAnCSF	ENCAnUDF	ENCAnOVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 28.13 ENCAnFLG Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2	ENCAnCSF	Counter Status Flag This bit reflects the current timer counter operation. 0: Timer counter in up-count status 1: Timer counter in down-count status
1	ENCAnUDF	Underflow Flag This bit reflects the occurrence of an underflow during the timer counter operation. This bit is cleared to 0 at the start of count operation. 0: This flag is cleared upon any of the following events: – “1” is written to ENCAnFGC.ENCAnCLUD – The flag is cleared to 0 by setting ENCAnTS bit to “1” when ENCAnTE = 0 or by setting the simultaneous start trigger input (ENCATSST signal) to “High”. 1: This flag is set to “1” upon occurrence of an underflow during the encoder timer count operation.
0	ENCAnOVF	Overflow Flag This bit reflects the occurrence of an overflow during the timer counter operation. This bit is cleared to 0 at the start of count operation. 0: This flag is cleared upon any of the following events: – “1” is written to ENCAnFGC.ENCAnCLOV – The flag is cleared to 0 by setting ENCAnTS bit to “1” when ENCAnTE = 0 or by setting the simultaneous start trigger input (ENCATSST signal) to “High”. 1: This flag is set to “1” upon occurrence of an overflow during the encoder timer count operation.

28.3.6 ENCAnFGC — ENCAn Status Flag Clear Register

This register is used to clear the timer counter status flags of ENCAnFLG.

Access: This register is a write-only register that can be written in 8-bit units.
This register always returns 0 when read.

Address: <ENCAn_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ENCAnCLUD	ENCAnCLOV
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 28.14 ENCAnFGC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	ENCAnCLUD	Underflow Flag Clear This bit clears the underflow flag. 0: Writing is ignored. 1: Clears ENCAnUDF of the ENCAnFLG register (clears underflow detection).
0	ENCAnCLOV	Overflow Flag Clear This bit clears the overflow flag. 0: Writing is ignored. 1: Clears ENCAnOVF of the ENCAnFLG register (clears overflow detection).

28.3.7 ENCAnCCR0 — ENCAn Capture/Compare Register 0

This register is a 16-bit capture/compare register 0.

Access: This register can be read or written in 16-bit units.
When this register functions as a capture register, only reading is possible. Write operation is ignored.
When this register functions as a compare register, reading and writing is possible.

Address: <ENCAn_base> + 00_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCCR0[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.15 ENCAnCCR0 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCCR0 [15:0]	Capture/Compare Register 0 Upon occurrence of an underflow, the setting value of this register may be loaded to the counter according to the ENCAnCTL.ENCAnLDE setting. See the description of the ENCAnLDE bit in ENCA control register ENCAnCTL for details. • If ENCAnCTL.ENCAnCRM0 = 0: ENCAnCCR0 is a compare register. Set the value to be compared with the timer counter value. • If ENCAnCTL.ENCAnCRM0 = 1: ENCAnCCR0 is a capture register. The captured timer counter value is stored.

28.3.8 ENCAnCCR1 — ENCAn Capture/Compare Register 1

This register is a 16-bit capture/compare register 1.

Access: This register can be read or written in 16-bit units.
When this register functions as a capture register, only reading is possible. Write operation is ignored.
When this register functions as a compare register, reading and writing is possible.

Address: <ENCAn_base> + 04_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCCR1[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.16 ENCAnCCR1 Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCCR1 [15:0]	Capture/Compare Register 1 During capture operation, the capture trigger to this register differs according to the ENCAnCTL.ENCAnCTS setting. See the description of the ENCAnCTS bit in ENCA control register ENCAnCTL for details. • If ENCAnCTL.ENCAnCRM1 = 0: ENCAnCCR1 is a compare register. Set the value to be compared with the timer counter value. • If ENCAnCTL.ENCAnCRM1 = 1: ENCAnCCR1 is a capture register. The captured timer counter value is stored.

28.3.9 ENCAnCNT — ENCAn Counter Register

This register is the 16-bit timer counter register.

Access: This register can be read or written in 16-bit units.
This register can be written only when the operation is stopped.

Address: <ENCAn_base> + 08_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ENCAnCNT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.17 ENCAnCNT Register Contents

Bit Position	Bit Name	Function
15 to 0	ENCAnCNT [15:0]	Counter Register • ENCAnTE.ENCAnTE status: 0 (initial setting): Count stop An arbitrary value can be set to timer counter. • ENCAnTE.ENCAnTE status: 0 → 1 (operation start): Count operation start Up/down count operation is started with the set arbitrary value. • ENCAnTE.ENCAnTE status: 1 (operating): Counting Up/down count operation is performed. • ENCAnTE.ENCAnTE status: 1 → 0 (stopped): Count stop The counter value immediately before the operation was stopped is held, and the count operation is stopped.

28.3.10 ENCAnTE — ENCAn Timer Enable Status Register

This register indicates the operating status of ENCAn.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ENCAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 28.18 ENCAnTE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	ENCAnTE	Timer Status Enable This is a status bit that indicates the operation enabled/stopped status of ENCAn. This bit is cleared to 0 when “1” is written to ENCAnTT.ENCAnTT. This bit is set to “1” when “1” is written to ENCAnTS.ENCAnTS, or when the input signal of ENCATSST is set to High level. 0: Operation stopped status 1: Operation enabled status

28.3.11 ENCAnTS — ENCAn Timer Start Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation enabled state.

Access: This register is a write-only register that can be written in 8-bit units.
It is always read as 00_H. This register can be written only when ENCAnTE.ENCAnTE is 0.

Address: <ENCAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 28.19 ENCAnTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ENCAnTS	Timer Start Trigger This is the trigger bit that sets the ENCAn to the operation enabled state. 0: Writing is ignored. 1: The ENCAn is set to the operation enabled state by setting ENCAnTE.ENCAnTE = 1.

28.3.12 ENCAnTT — ENCAn Timer Stop Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation stopped state.

Access: This register is a write-only register that can be written in 8-bit units.
It is always read as 00_H.

Address: <ENCAn_base> + $1C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ENCAnTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 28.20 ENCAnTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ENCAnTT	Timer Stop Trigger This is the trigger bit that sets the ENCAn to the operation stopped state. 0: Writing is ignored. 1: Clears ENCAnTE.ENCAnTE to “0”, to set the ENCAn to the count operation stopped state.

28.3.13 ENCAnEMU — ENCAn Emulation Register

This register controls operations by SVSTOP.

Access: This register can be read or written in 8-bit units.
Writing to this register should be performed in the counter operation stopped status (ENCAnTE.ENCAnTE = 0 and EPC.SVSTOP = 0).

Address: <ENCAn_base> + 48_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ENCAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 28.21 ENCAnEMU Register Contents

Bit Position	Bit Name	Function
7	ENCAnSVSDIS	• When EPC.SVSTOP bit = 0: The count clock continues to be provided when the debugger assumes control of the microcontroller (at a break point, etc.), regardless of the value of this bit (1 or 0). • When EPC.SVSTOP bit = 1: 0: The count clock is stopped when the debugger assumes control of the microcontroller (at a break point, etc.). 1: The count clock continues to be provided when the debugger assumes control of the microcontroller (at a break point, etc.).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

28.4 Operation

The ENCAn operates the timer counter with counter up/down control and clear control by encoder inputs. The ENCAnCCR0 and ENCAnCCR1 registers can be used as dedicated compare registers or as dedicated capture registers.

28.4.1 Timer Counter Operation

The timer counter operations of the ENCAn are described below.

The figure below shows the operation phases. See the corresponding section with the section number for detailed descriptions on each operation.

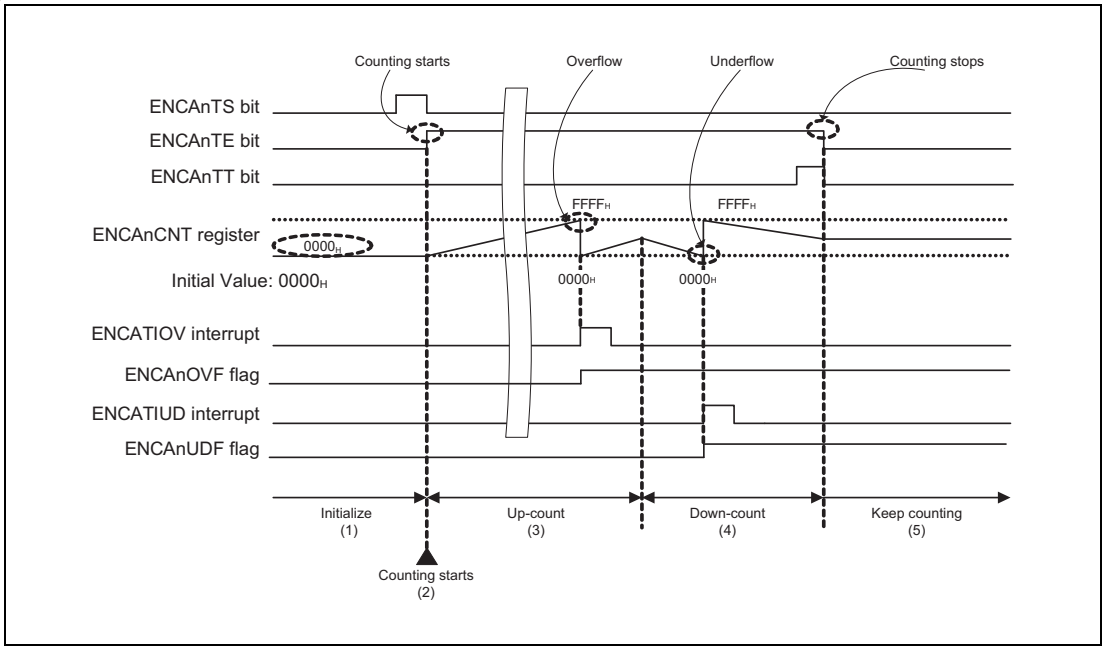

Figure 28.2 Timer Counter Initial Value Setting/Start/Stop

(1) Timer Counter Initial Value Setting

The initial value of the ENCAn counter register (ENCAnCNT) can be set in the counter operation stopped status (ENCAnTE = 0).

(2) Timer Counter Startup

By writing "1" to the timer start trigger bit (ENCAnTS), the timer status enable bit (ENCAnTE) is set to "1", the count operation is enabled, and counting operation is performed upon detection of the valid edge of the encoder input.

(3) Overflow Operation

An overflow occurs when up-counting is performed when the counter value is $FFFF_H$. If the counter value changes from $FFFF_H$ to 0000_H, an overflow interrupt (ENCATIOV) is generated, and the overflow flag (ENCAnOVF) is set to "1". The overflow flag (ENCAnOVF) is cleared to "0" when "1" is set to the overflow flag clear bit (ENCAnCLOV). For details about the operation, see **Section 28.6.1, Overflow Occurrence and Overflow Flag Clear Operation**.

(4) Underflow Operation

An underflow occurs when down-counting is performed when the counter value is 0000_H. If the counter value changes from 0000_H to $FFFF_H$, an underflow interrupt (ENCATIUD) is generated, and the underflow flag (ENCAnUDF) is set to “1”. The underflow flag (ENCAnUDF) is cleared to “0” when “1” is set to the underflow flag clear bit (ENCAnCLUD). For details about the operation, see **Section 28.6.2, Underflow Occurrence and Underflow Flag Clear Operation**.

(5) Timer Counter Stop

By writing “1” to the timer stop trigger bit (ENCAnTT), the timer status enable bit (ENCAnTE) is cleared to “0”, and the count operation is stopped. At this time, the timer counter is not reset to 0000_H and holds the value before count operation stop.

28.4.2 Up/Down Control of Timer Counter

Up/down control is performed by judging the phase of the encoder inputs (ENCAnE0, ENCAnE1) according to the settings of ENCAnUDS1 and ENCAnUDS0.

28.4.2.1 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 00_B

Table 28.22 When ENCAnUDS1, ENCAnUDS0 Bits = 00_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 Pin	ENCAnE1 Pin	Count Operation
0	0	Rising edge	High level	Down
		Falling edge		
		Rising and falling edges		
		Rising edge	Low level	Up
		Falling edge		
		Rising and falling edges		

The valid edge for ENCAnE0 is specified by setting ENCAnEIS1 and ENCAnEIS0.

Up/down count operation is performed when the valid edges and levels of ENCAnE0 and ENCAnE1 match.

The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits = 00_B.

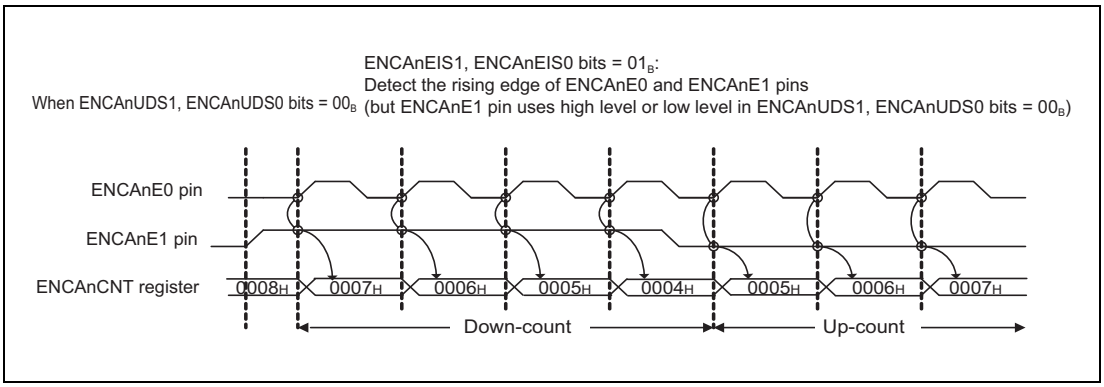

Figure 28.3 Count Operation when the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 00_B

28.4.2.2 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 01_B

Table 28.23 When the ENCAnUDS1, ENCAnUDS0 Bits = 01_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 Pin	ENCAnE1 Pin	Count Operation
0	1	Low level	Rising edge	Down
			Falling edge	
			Rising and falling edges	
		High level	Rising edge	
			Falling edge	
			Rising and falling edges	
		Rising edge	Low level	Up
		Falling edge		
		Rising and falling edges		
		Rising edge	High level	
		Falling edge		
		Rising and falling edges		
		Simultaneous input		Hold

The valid edges for ENCAnE0 and ENCAnE1 are specified by setting ENCAnEIS1 and ENCAnEIS0.

Up/down count operation is performed when the valid edges and levels of the ENCAnE0/ENCAnE1 pins match, and the count is held when the valid edges overlap.

The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits = 01_B.

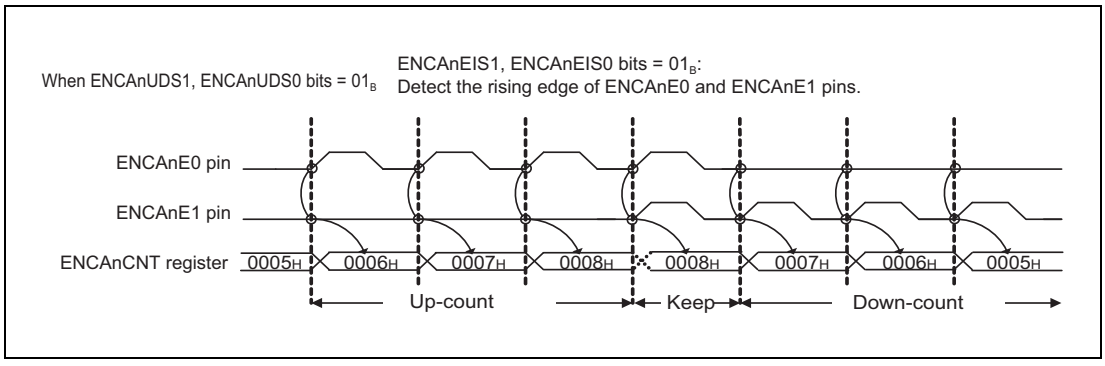

Figure 28.4 Count Operation when the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 01_B

28.4.2.3 When the ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 10_B

Table 28.24 When the ENCAnUDS1, ENCAnUDS0 Bits = 10_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 Pin	ENCAnE1 Pin	Count Operation
1	0	Rising edge	Low level	Down
		Rising edge	Falling edge	
		Falling edge	Low level	Up
		Falling edge	Falling edge	
		Low level	Rising edge	Hold
		Rising edge	Rising edge	
		High level	Rising edge	
		Falling edge	Rising edge	
		Low level	Falling edge	
		Rising edge	High level	
		High level	Falling edge	
		Falling edge	High level	

The valid edge specification for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS1 and ENCAnEIS0) is invalid.

The following timing chart shows the count operation when the ENCAnUDS1, ENCAnUDS0 bits = 10_B.

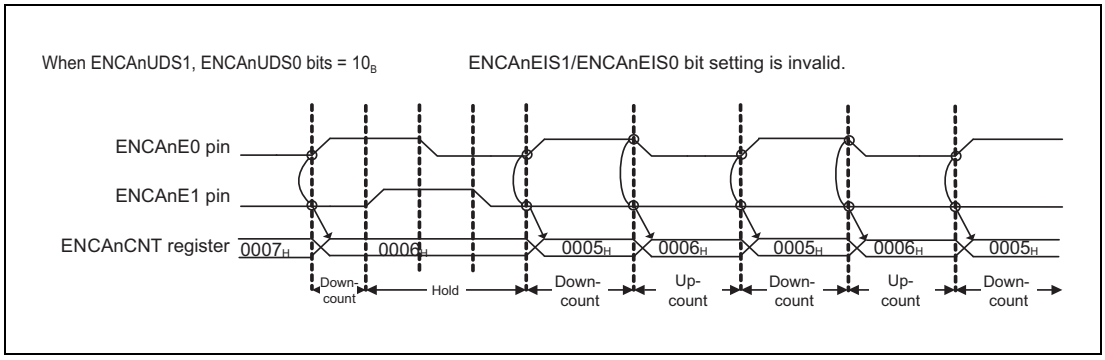

Figure 28.5 Count Operation when ENCAnUDS1, ENCAnUDS0 Bits in ENCAnCTL Register = 10_B

28.4.2.4 When ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 11_B

Table 28.25 When ENCAnUDS1, ENCAnUDS0 Bits = 11_B

ENCAnUDS1	ENCAnUDS0	Operation Description		
		ENCAnE0 Pin	ENCAnE1 Pin	Count Operation
1	1	Low level	Falling edge	Down
		Rising edge	Low level	
		High level	Rising edge	
		Falling edge	High level	
		Rising edge	High level	Up
		High level	Falling edge	
		Falling edge	Low level	
		Low level	Rising edge	
		Simultaneous input		Hold

Valid edge specification for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS1 and ENCAnEIS0) is invalid.

The counter value is held when the valid edges of ENCAnE0 and ENCAnE1 overlap.

The following timing chart shows the count operation when ENCAnUDS1, ENCAnUDS0 bits = 11_B.

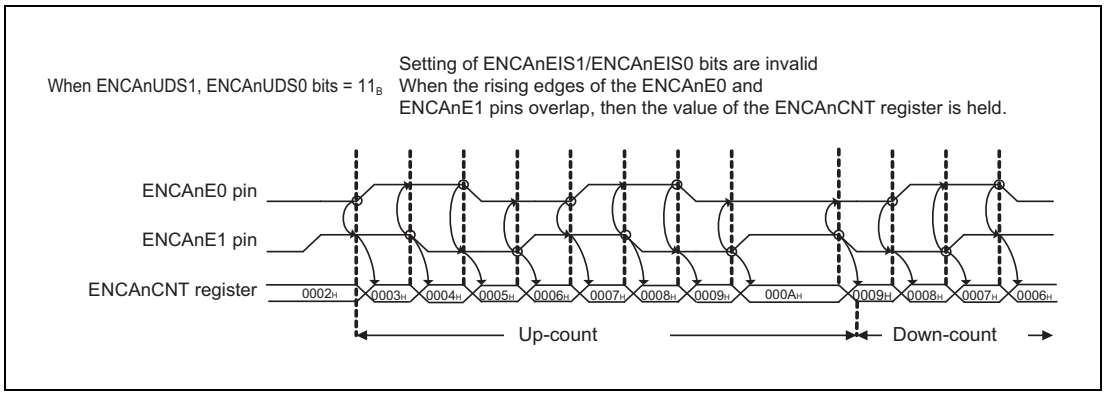

Figure 28.6 Count Operation when ENCAnUDS1, ENCAnUDS0 Bits in the ENCAnCTL Register = 11_B

28.4.3 Timer Counter Clear Control by Encoder Input

The timer counter is cleared to 0000_H by encoder clear input (ENCAnEC).

Two types of clearing methods can be selected by controlling the ENCAnSCE, ENCAnZCL, ENCAnBCL, ENCAnACL, ENCAnECS1, and ENCAnECS0 bits of the ENCAnIOC1 register.

Table 28.26 Timer Counter Clear Control by Encoder Input

Clearing method	ENCAnSCE	ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnECS1, ENCAnECS0
(1)	0	Invalid	Invalid	Invalid	Valid
(2)	1	Valid	Valid	Valid	Invalid

28.4.3.1 Clearing Method when ENCAnSCE = 0

- Upon detection of the valid edge of ENCAnEC, the timer counter is cleared to 0000_H in synchronization with the operation clock.
- The valid edge of ENCAnEC is specified by the setting of the ENCAnECS1 and ENCAnECS0 bits.
- The settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

For details about clear operation when ENCAnSCE = 0, see the timing chart in **Section 28.6.19, Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0**.

28.4.3.2 Clearing Method when ENCAnSCE = 1

- When the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs are detected, the timer counter is cleared to 0000_H in synchronization with the operating clock.
- Specify the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs by the settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits.
- The settings of the ENCAnECS1 and ENCAnECS0 bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

The clearing conditions of the timer counter according to the ENCAnZCL, ENCAnBCL, and ENCAnACL settings are listed in the table below.

Table 28.27 Clearing Conditions of the Timer Counter

Counter Clear Condition Setting			Encoder Pin Input Level		
ENCAnZCL	ENCAnBCL	ENCAnACL	ENCAnEC	ENCAnE1	ENCAnE0
0	0	0	Low	Low	Low
0	0	1	Low	Low	High
0	1	0	Low	High	Low
0	1	1	Low	High	High
1	0	0	High	Low	Low
1	0	1	High	Low	High
1	1	0	High	High	Low
1	1	1	High	High	High

28.4.4 Functions of ENCAnCCR0

28.4.4.1 Compare Function

- When ENCAnCRM0 = 0, the ENCAnCCR0 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR0 setting value, a compare 0 match interrupt (ENCATINT0) is output.
- When ENCAnECM0 = 1, the timer counter is cleared to 0000_H in synchronization with the operating clock upon compare match if the next count operation is up-count.

Table 28.28 Compare Function of ENCAnCCR0

ENCAnCCR0 Function	Compare Match Clear Control	Next Count Operation	Timer Counter Clearing Upon Compare Match with ENCAnCCR0
ENCAnCRM0	ENCAnECM0		
0 (Compare)	0	Up-count	Does not clear (continues count operation).
		Down-count	
	1	Up-count	Clears timer counter to 0000_H.
		Down-count	Does not clear (continues count operation).

When ENCAnLDE = 1

- Upon occurrence of an underflow, the setting value of the ENCAnCCR0 register is loaded to the timer counter.
- An underflow interrupt (ENCATIUD) is output.

NOTE

For the timing chart when ENCAnLDE = 1, see **Section 28.6.8, Using the ENCAnLDE Function Immediately after Startup** to **Section 28.6.12, Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input**.

28.4.4.2 Capture Function

- When ENCAnCRM0 = 1, the ENCAnCCR0 register functions as a dedicated capture register.
- Upon valid edge detection of the capture trigger input 0 (ENCATTIN0), the value of the timer counter is stored into ENCAnCCR0.
- A capture 0 interrupt (ENCATINT0) is output during capture operation.

NOTE

For details about capture operation for ENCAnCCR0, see the timing charts in **Section 28.6.14, Capture Operation between Count Clocks (ENCAnCCR0)** and **Section 28.6.17, Encoder Operation when Compare Match Clear Control is Disabled**.

28.4.5 Functions of ENCAnCCR1

28.4.5.1 Compare Function

- When ENCAnCRM1 = 0, the ENCAnCCR1 register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR1 setting value, a compare 1 match interrupt (ENCATINT1) is output.
- When ENCAnECM1 = 1, the timer counter is cleared to 0000_H in synchronization with the operating clock upon compare match if the next count operation is down-count.

Table 28.29 Compare Function of ENCAnCCR1

ENCAnCCR1 Function	Compare Match Clear Control	Next Count Operation	Timer Counter Clearing Upon Compare Match with ENCAnCCR1
ENCAnCRM1	ENCAnECM1		
0 (Compare)	0	Up-count	Does not clear (continues count operation).
		Down-count	
	1	Up-count	Does not clear (continues count operation).
		Down-count	Clears timer counter to 0000_H.

Compare match interrupt mask function

- When ENCAnCME = 1, the compare 1 match interrupt mask function is enabled. In this state, the compare 1 match interrupt is output upon the first match of the value of the timer counter and the ENCAnCCR1 setting value, and interrupts are then masked for the second and subsequent compare matches.
- When ENCAnCME = 1 and ENCAnMCS = 0, a compare 1 match interrupt is output once upon the first compare match by writing to the ENCAnCCR1 register (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCAnCME = 1 and ENCAnMCS = 1, a compare 1 match interrupt is output once upon the first compare match by a timer counter clear operation accompanying encoder clear input or by a timer counter clear operation upon match between the ENCAnCCR0 register value and the timer counter value (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When ENCAnCME = 1, ENCAnMCS = 1 and ENCAnLDE = 1, a compare 1 match interrupt is output once upon the first compare match by a loading operation of the ENCAnCCR0 register to the timer counter upon underflow detection (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- Setting ENCAnECM1 to “1” is prohibited when enabling the compare 1 match interrupt mask function.

Table 28.30 Compare Match Interrupt Mask Function of ENCAnCCR1

ENCAnCCR1 Function	Compare 1 Match Interrupt Mask	Interrupt Mask Cancel Trigger	Compare 1 Match Interrupt Output upon Compare Match with ENCAnCCR1
ENCAnCRM1	ENCAnCME	ENCAnMCS	
0 (Compare)	0 (Mask function disabled)	— (Setting invalid)	Outputs compare 1 match interrupt upon each compare match.
	1 (Mask function enabled)	0 (Write operation to ENCAnCCR1)	Outputs compare 1 match interrupt once upon the first compare match. (Interrupts are masked for the second and subsequent matches until the cancel trigger occurs.)
		1 (Timer counter clear operation) (Loading from ENCAnCCR0 to the timer counter upon underflow occurrence when ENCAnLDE = 1)	

28.4.5.2 Capture Function

When ENCAnCRM1 = 1, the ENCAnCCR1 register functions as a dedicated capture register.

NOTE

For details about capture operation to ENCAnCCR1, see the timing chart in **Section 28.6.13, Capture Operation between Count Clocks (ENCAnCCR1)**.

The operations for each of the ENCAnCTS settings are shown in the table below.

Table 28.31 Operations for Each of the ENCAnCTS Settings

ENCAnCCR1 Function	Capture Trigger Selection	Capture Trigger Signal	Timer Counter Clearing	Interrupt Occurrence
ENCAnCRM1	ENCAnCTS			
1 (Capture)	0	Capture trigger 1 input (ENCATTIN1)	Does not clear timer counter.	(1) Capture 1 interrupt (ENCATINT1)
	1	Encoder clear input (set with ENCAnSCE)	Clears timer counter.	(1) Capture 1 interrupt (ENCATINT1) (2) Encoder clear interrupt (ENCATIEC)

NOTE

For details about the timing chart when ENCAnCTS = 0 or ENCAnCTS = 1, see the following:

Section 28.6.3, Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin), **Section 28.6.4, Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)**, **Section 28.6.5, Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)**, **Section 28.6.11, Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin)** and **Section 28.6.12, Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input**.

28.4.5.3 Timer Counter Clearing upon Compare Register Match

Timer counter clearing upon compare match between the value of the timer counter and the ENCAnCCR0/1 setting value, according to the settings of the ENCAnECM1 and ENCAnECM0 bits in the ENCAnCTL register, is detailed in the following table.

Table 28.32 Timer Counter Clearing Operation upon Compare Register Match

ENCAnECM1 and ENCAnECM0	Next Count Operation	Timer Counter Clearing upon Compare Match with ENCAnCCR1	Timer Counter Clearing upon Compare Match with ENCAnCCR0
00	Up-count	Does not clear (continues count operation).	Does not clear (continues count operation).
	Down-count	Does not clear (continues count operation).	Does not clear (continues count operation).
01	Up-count	Does not clear (continues count operation).	Clears timer counter to 0000_H.
	Down-count	Does not clear (continues count operation).	Does not clear (continues count operation).
10	Up-count	Does not clear (continues count operation).	Does not clear (continues count operation).
	Down-count	Clears timer counter to 0000_H.	Does not clear (continues count operation).
11	Up-count	Does not clear (continues count operation).	Clears timer counter to 0000_H.
	Down-count	Clears timer counter to 0000_H.	Does not clear (continues count operation).

28.4.6 Startup/Stop of Timer Counter

28.4.6.1 Startup of Timer

The timer operation can be started by setting the ENCAnTS bit to “1”.

PIC setting enables simultaneous start with other timers. For details, see Section 29.8, Simultaneous Start Trigger Function.

28.4.6.2 Stop of Timer

When the ENCAnTT bit is set to “1”, the ENCAnTE bit becomes “0” and the timer stops.

28.5 ENCAn Setting Sequences

28.5.1 ENCAn Setting Procedure

The ENCAn setting procedure is described below.

Table 28.33 ENCAn Setting Procedure

Initial Setting	Action	Setting status
Initial setting	Reset deassertion	Power-on status, operation stopped status. (Writing to each register is enabled)
ENCAn initial setting	Perform the following initial settings. • Setting for counter • Setting for counter clear • Setting for ENCAnCCR0 register • Setting for ENCAnCCR1 register	This is the count operation stopped status. The value of the ENCAnTE bit indicating the operating status is 0.
	Perform the counter initial value settings. • Set any 16-bit value to ENCAnCNT register. (When, after setting this register, the ENCAnTS bit is set to “1”, the counter operation starts from the set count value.)	The set value is set as the initial value of the counter register.
Operation start	Perform the counter operation start setting. • Set the ENCAnTS bit to “1”.	This is the counter operation starts status. The value of the ENCAnTE bit indicating the operating status is 1, and the count clock is supplied to the internal circuit.
Operating	Only those registers whose setting can be changed during operation can be rewritten. • ENCAnCCR0 register setting. • ENCAnCCR1 register setting. • ENCAnIOC0 register setting.	The count operation set with the initial setting is performed, and up/down counting is performed according to ENCAnE0 and ENCAnE1 pins.
Operation stop	Perform the counter operation stop setting during operation. • Set the ENCAnTT bit to “1”.	This is the counter operation stopped status. The value of the ENCAnTE bit indicating the operating status is 0.
ENCAn stop	Reset	The setting registers are initialized.

28.5.1.1 Initial Setting Procedure for the Counter

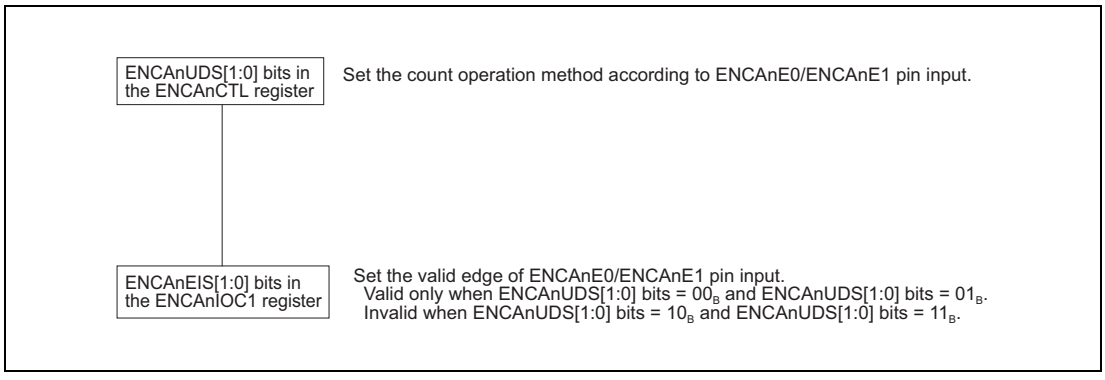

Figure 28.7 Initial Setting Procedure for the Counter

28.5.1.2 Initial Setting Procedure for Counter Clear

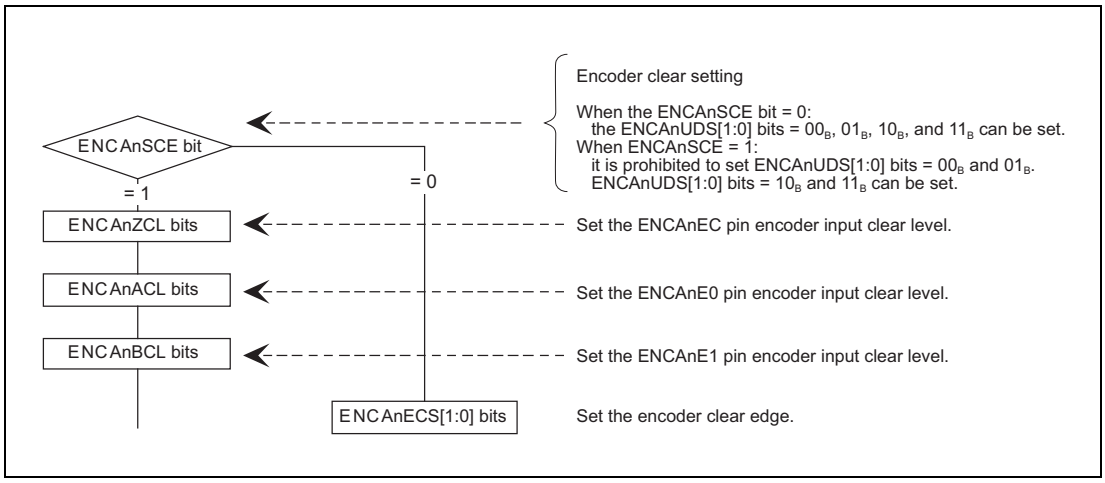

Figure 28.8 Initial Setting Procedure for Counter Clear

28.5.1.3 Setting Procedure for ENCAnCCR0 Register

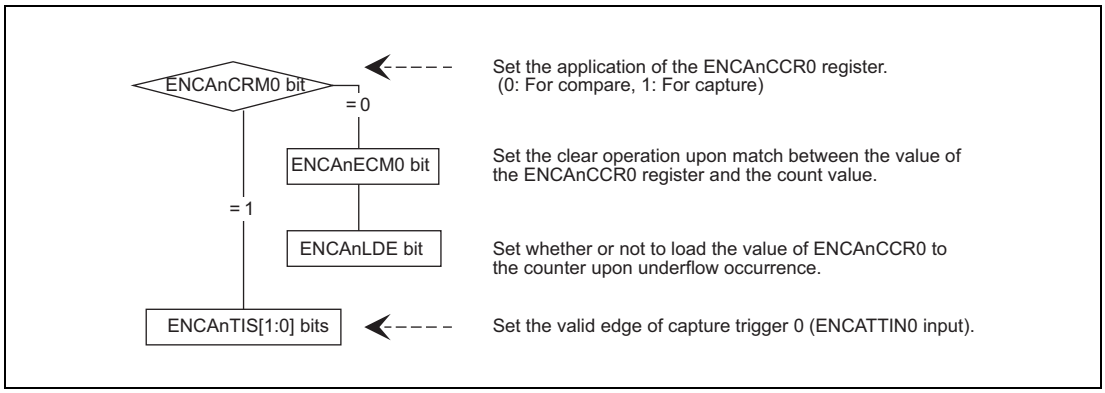

Figure 28.9 Setting Procedure for ENCAnCCR0 Register

28.5.1.4 Setting Procedure for ENCAnCCR1 Register

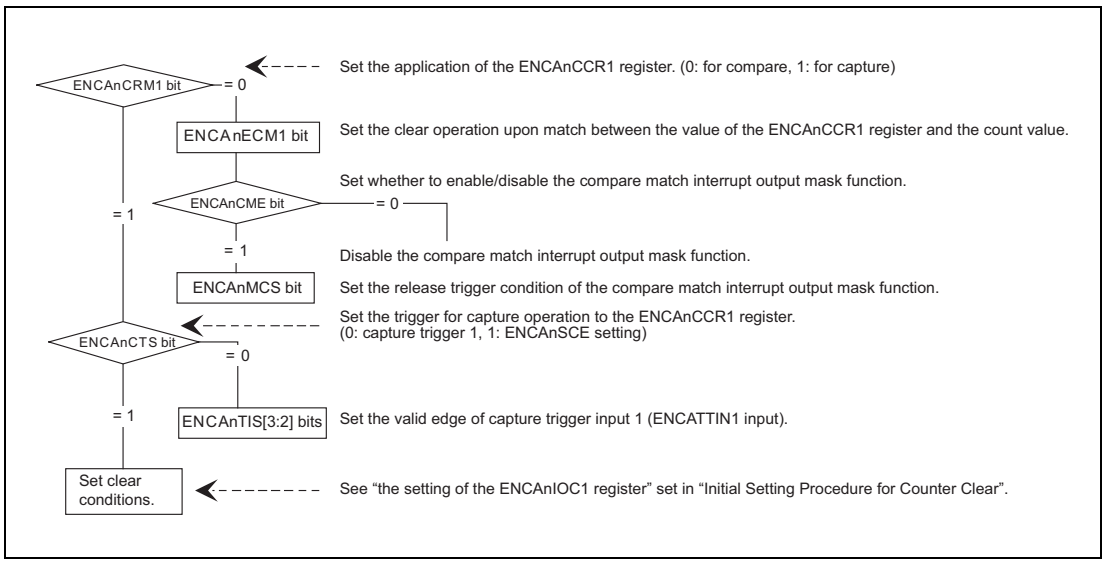

Figure 28.10 Setting Procedure for ENCAnCCR1 Register

28.6 Timing Chart

28.6.1 Overflow Occurrence and Overflow Flag Clear Operation

An overflow occurs when up-counting is performed when the counter value is $FFFF_H$. Once an overflow occurs, an overflow interrupt (ENCATIOV) is output and the overflow flag (ENCAnOVF) is set to 1. When the overflow clear bit (ENCAnCLOV) is set to 1, the overflow flag (ENCAnOVF) is cleared to 0.

The operations of overflow occurrence and overflow flag clearing are described below.

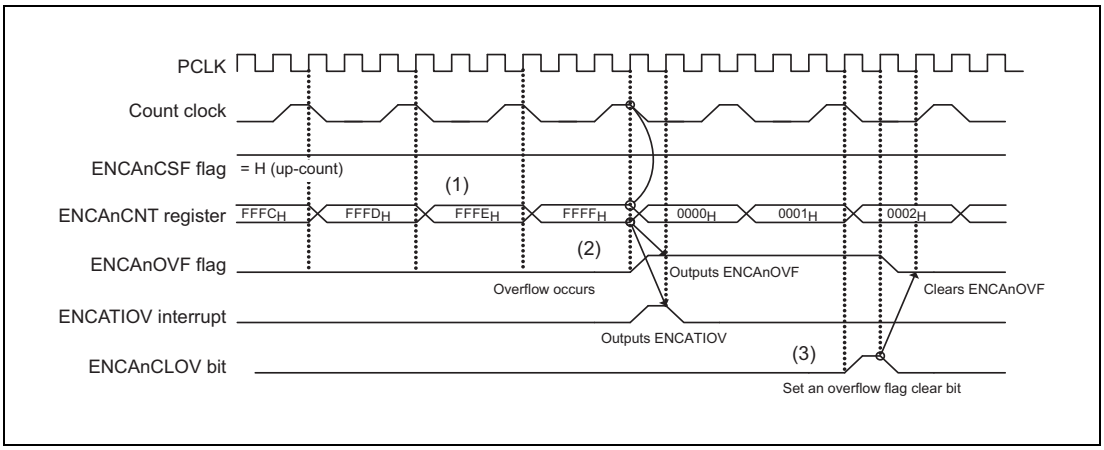

Figure 28.11 Settings of Overflow Occurrence and Overflow Flag Clear

(1) The count value is counted up from $FFFE_H$ to $FFFF_H$.

(2) When the count value changes from $FFFF_H$ to 0000_H, an overflow occurs. At the same time, an overflow interrupt is output and the overflow flag is set to 1.

(3) By setting the ENCAnCLOV bit in the ENCAnFGC register to 1 by the overflow flag clearing method, the overflow flag is cleared to 0. The overflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 when the ENCAnTE bit in the ENCAnTE register is 0, or setting the input signal of ENCATSST (simultaneous start trigger input) to “High”.

28.6.2 Underflow Occurrence and Underflow Flag Clear Operation

An underflow occurs when down-counting is performed when the counter value is 0000_H.
Once an underflow occurs, an underflow interrupt (ENCATIUD) is output and the underflow flag (ENCAnUDF) is set to 1. When the underflow clear bit (ENCAnCLUD) is set to 1, the underflow flag (ENCAnUDF) is cleared to 0.

The operations of underflow occurrence and underflow flag clearing are described below.

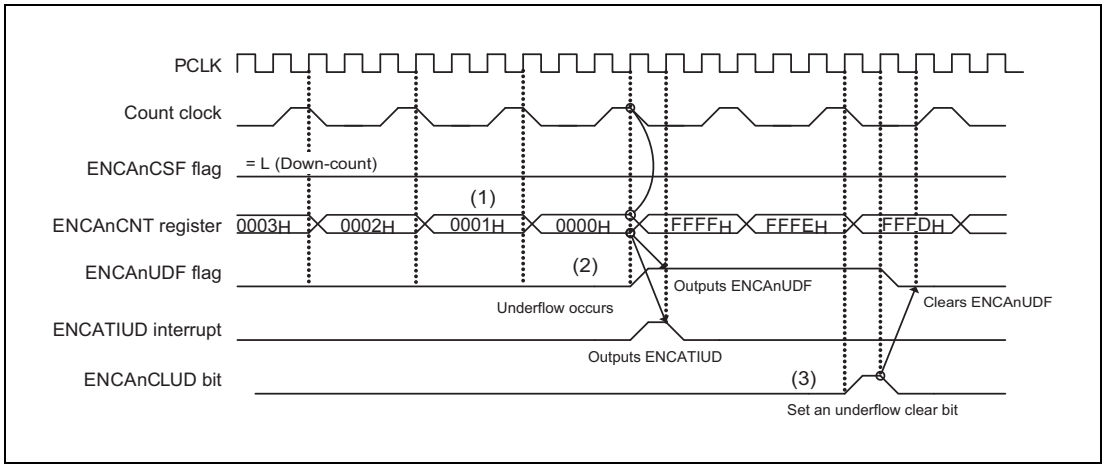

Figure 28.12 Settings of Underflow Occurrence and Underflow Flag Clear

(1) The count value is counted down from 0001_H to 0000_H.

(2) When the count value changes from 0000_H to $FFFF_H$, an underflow occurs. At the same time, an underflow interrupt is output and the underflow flag is set to 1.

(3) By setting the ENCAnCLUD bit in the ENCAnFGC register to 1 by the underflow flag clearing method, the underflow flag is cleared to 0. The underflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 when the ENCAnTE bit in the ENCAnTE register is 0, or by setting the input signal of ENCATSST (simultaneous start trigger) to “High”.

28.6.3 Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

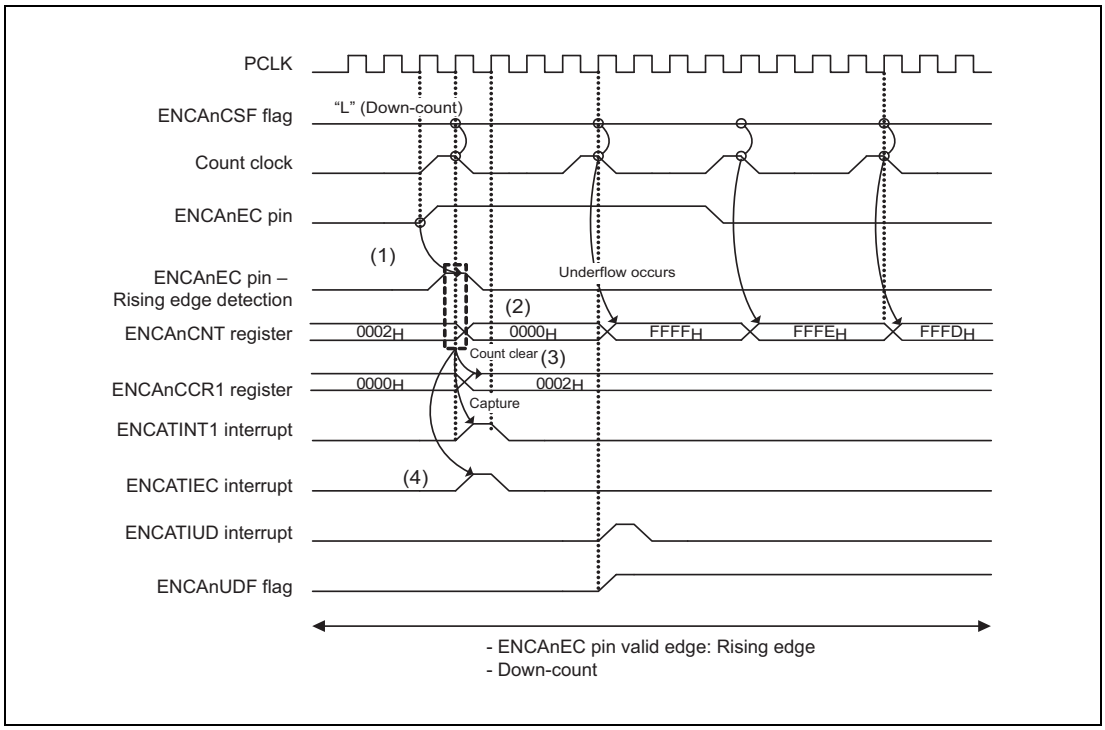

Figure 28.13 Timing Chart of Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

Setting conditions

- ENCAnCRM1 bit in the ENCAnCTL register = 1
  (Select the ENCAnCCR1 register as capture.)
- ENCAnCTS bit in the ENCAnCTL register = 1
  (Select the ENCAnEC pin input as capture trigger input.)
- ENCAnECS1 and ENCAnECS0 bits in the ENCAnIOC1 register = 01_B
  (Select the ENCAnEC pin input as rising edge detection.)

(1) Capture operation is performed by the rising edge of the ENCAnEC pin input trigger.

(2) Clearing is performed by the ENCAnEC pin input and the count value is set to 0000_H.

(3) The counter value (0002_H) is captured in the ENCAnCCR1 register by the rising edge of the ENCAnEC pin input.

(4) At the same time, a clear interrupt (ENCATIEC) and capture interrupt (ENCATINT1) due to the ENCAnEC pin input are output.

28.6.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

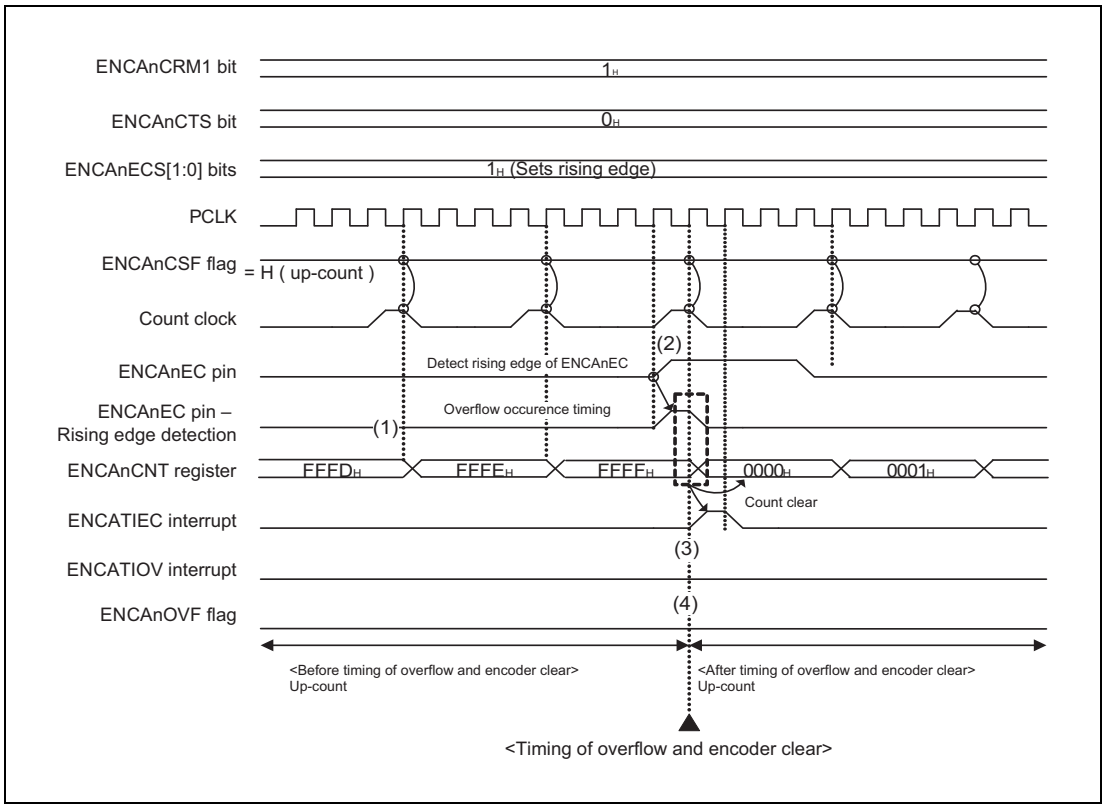

Figure 28.14 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)

(1) An up-count from $FFFD_H$ is continuously performed.

(2) When an overflow occurs if the count value is $FFFF_H$, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. The counter value is cleared to 0000_H.

(3) When the counter value is cleared by the encoder clear input, a clear interrupt (ENCATIEC) by encoder clear input is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the overflow occurrence, an overflow interrupt is not output (An overflow does not occur. Clear operation is performed by the encoder clear input).

(4) Because an overflow does not occur as is the case with step 3, the overflow flag is not set.

28.6.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

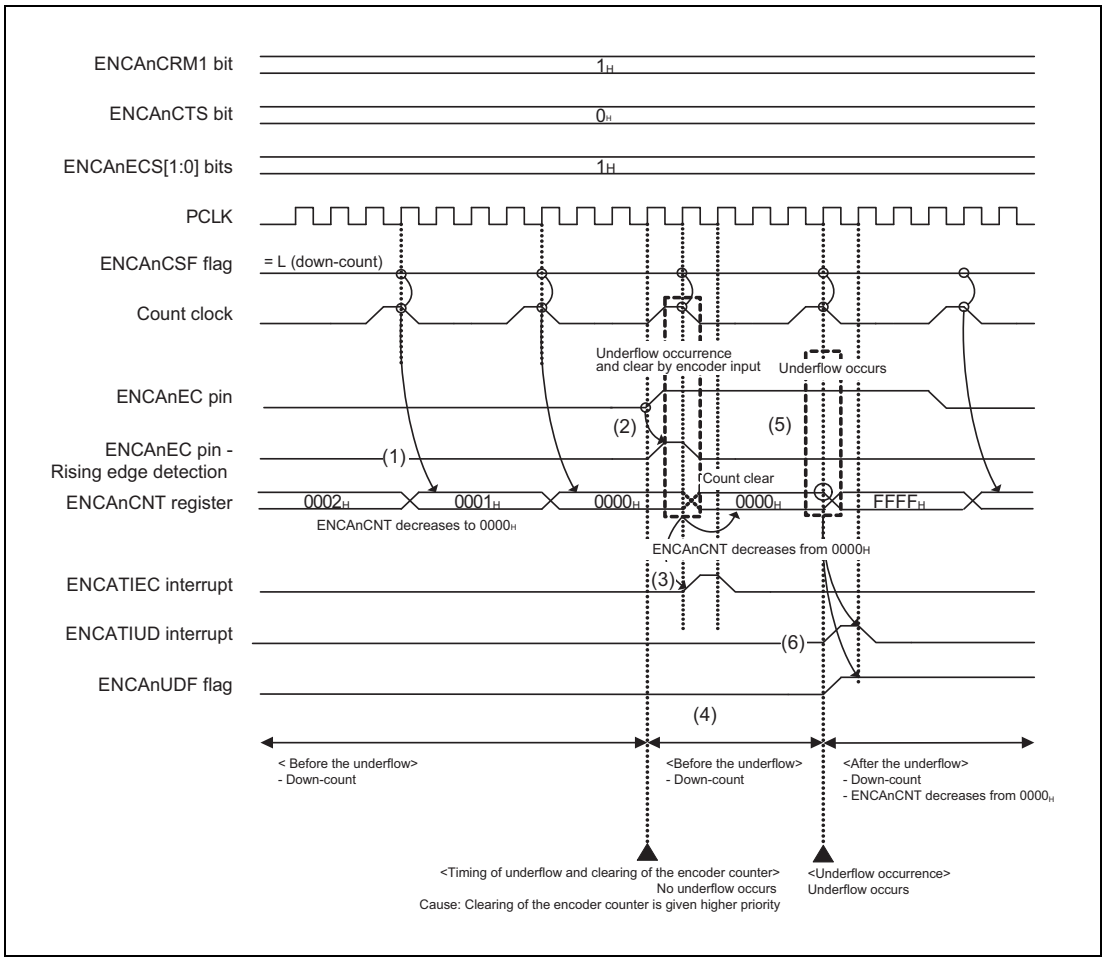

Figure 28.15 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

(1) A down-count from 0002_H is continuously performed.

(2) When an underflow occurs if the count value is 0000_H, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. Even if the next clock signal is input during clear operation, the counter value remains at 0000_H.

(3) When the counter value is cleared by the encoder clear input, an encoder clear interrupt (ENCATIEC) is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the underflow occurrence, an underflow interrupt is not output (An underflow does not occur. Clear operation is performed by the encoder clear input).

(4) Because an underflow does not occur as is the case with step 3, the underflow flag is not set.

(5) When a further down-count is performed after the counter value changes to 0000_H by clear operation by the encoder clear input, the counter value changes from 0000_H to $FFFF_H$, and an underflow occurs.

(6) When an underflow occurs, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

28.6.6 Overflow Operation Immediately after Startup

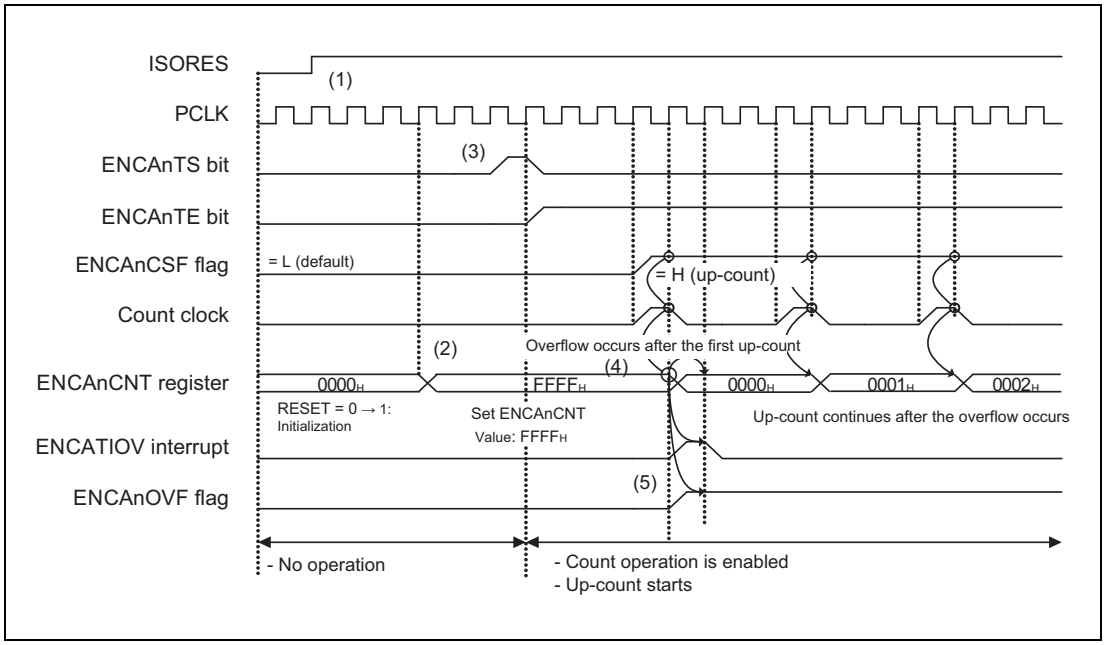

Figure 28.16 Overflow Operation Immediately after Startup

(1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.

(2) The timer counter is set to $FFFF_H$ as the initial value.

(3) ENCAnTS is set to “1”, and operation starts. ENCAnTE changes to “1”, which indicates that operation is enabled.

(4) When an up-count is performed from $FFFF_H$ which is the initially set count value, the counter value changes from $FFFF_H$ to 0000_H, and an overflow occurs immediately after operation starts.

(5) At the same time, by an overflow occurrence immediately after operation starts, an overflow interrupt (ENCATIOV) is output, and the overflow flag (ENCAnOVF) is set.

28.6.7 Underflow Operation Immediately after Startup

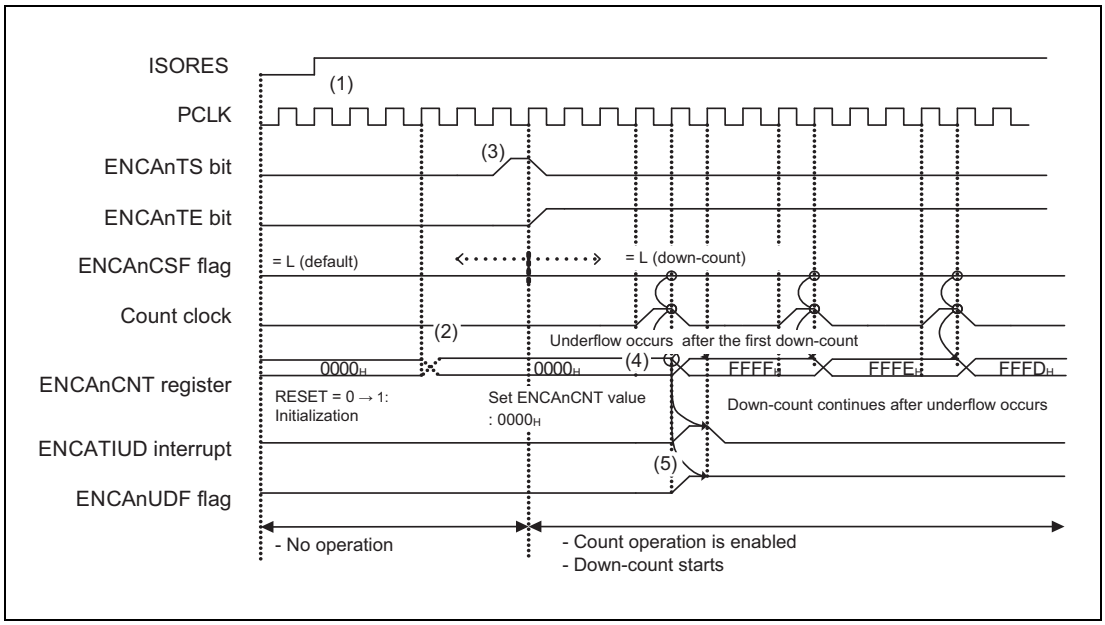

Figure 28.17 Underflow Operation Immediately after Startup

(1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.

(2) The timer counter is set to 0000_H as the initial value.

(3) ENCAnTS is set to “1”, and operation starts. ENCAnTE changes to “1”, which indicates that operation is enabled.

(4) When a down-count is performed from 0000_H which is the initially set count value, the counter value changes from 0000_H to $FFFF_H$, and an underflow occurs immediately after operation starts.

(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

28.6.8 Using the ENCAnLDE Function Immediately after Startup

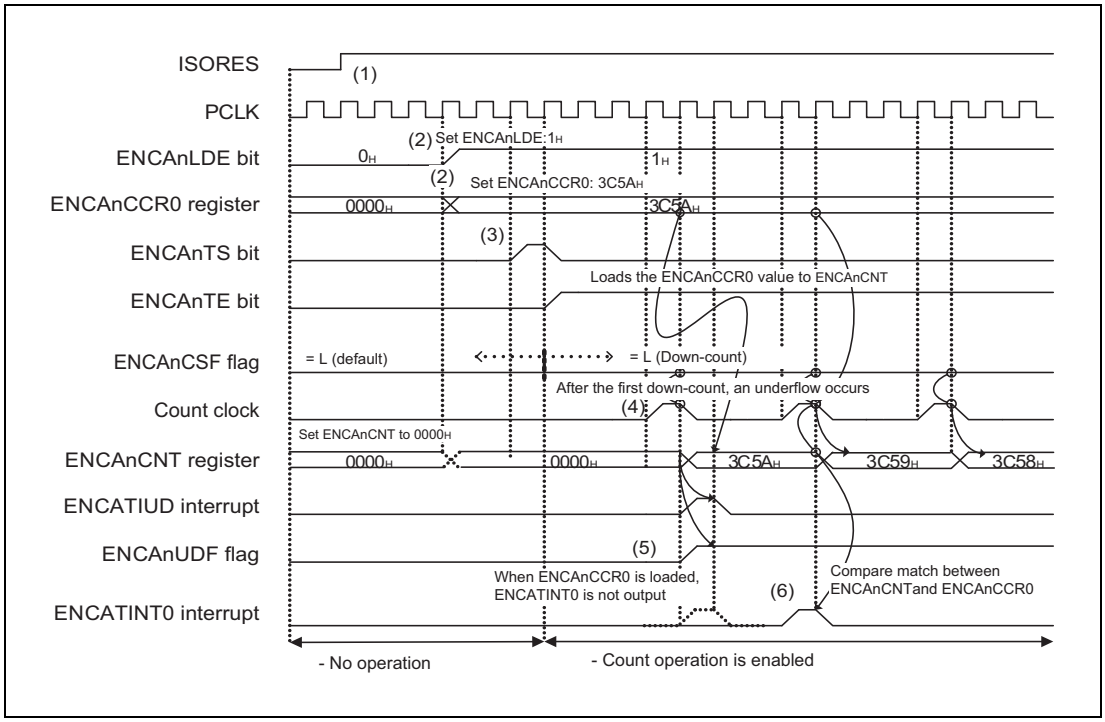

Figure 28.18 Using the ENCAnLDE Function Immediately after Startup

(1) When the ISORES value changes from “0” to “1”, the status changes from “reset asserted” to “reset deasserted”.

(2) The load enable bit (ENCAnLDE) is set to “1”, capture/compare register 0 (ENCAnCCR0) is set to $3C5A_H$, and the timer counter is set to the initial value 0000_H.

(3) ENCAnTS is set to “1”, and operation starts. ENCAnTE changes to “1”, which indicates that operation is enabled.

(4) When a down-count is performed from 0000_H which is the initially set count value, an underflow occurs immediately after operation starts. Because ENCAnLDE is set to “1”, the ENCAnCCR0 value, $3C5A_H$, is loaded to the timer counter (ENCATINT0 is not output during loading).

(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set (after an underflow occurs, down-count operation from the loaded value ($3C5A_H$) continues).

(6) After the ENCAnCCR0 value is loaded to ENCAnCNT, a match with ENCAnCCR0 is detected, and ENCATINT0 is output.

28.6.9 ENCAnLDE Function (Loading Count Value)

(1) <When ENCAnLDE = 0>

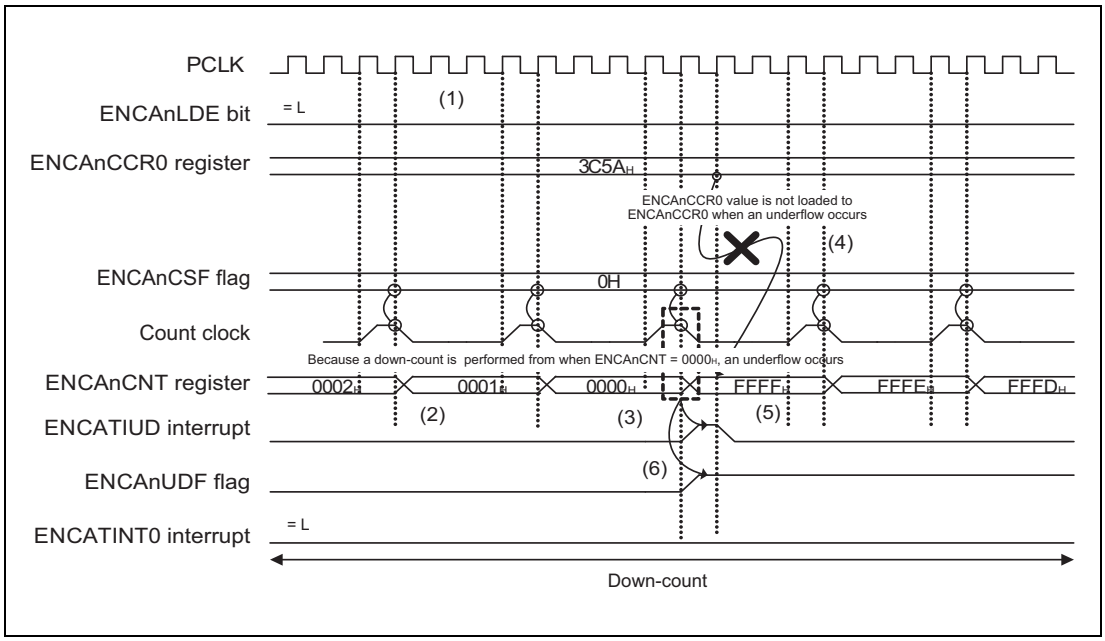

Figure 28.19 ENCAnLDE Function (when ENCAnLDE = 0)

(1) ENCAnLDE is set to “0” (even if an underflow occurs, the ENCAnCCR0 value is not loaded).

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When a further down-count is performed after the counter value changes to 0000_H, an underflow occurs.

(4) Because ENCAnLDE is set to “0”, the setting value of the ENCAnCCR0 register is not loaded to the counter even if an underflow occurs.

(5) Operation changes to underflow operation (counter value: $0000_H \rightarrow FFFF_H$).

(6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

(2) <When ENCAnLDE = 1>

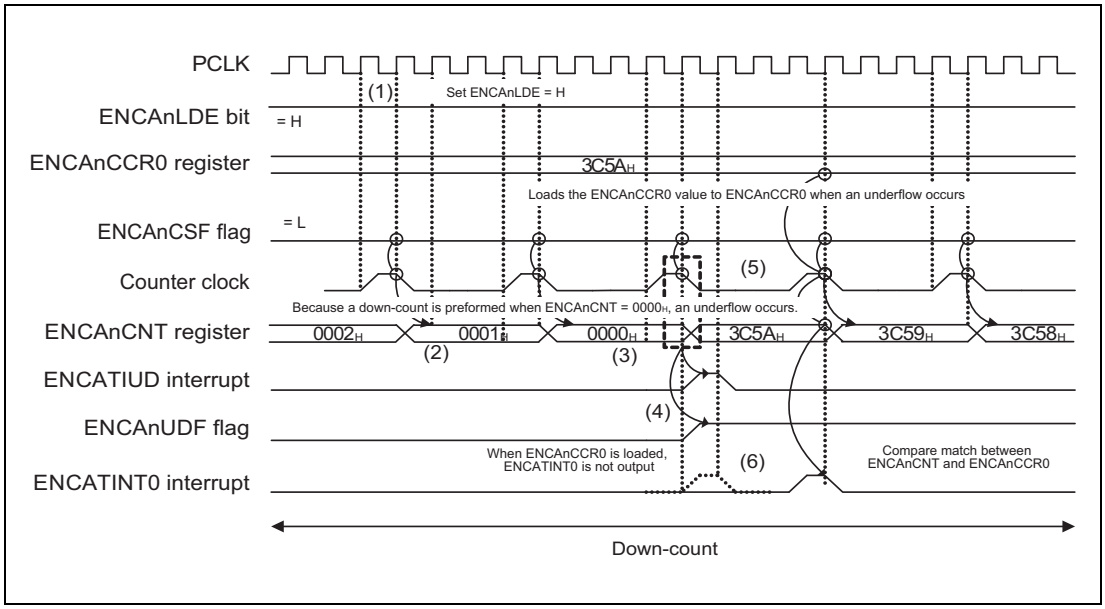

Figure 28.20 ENCAnLDE Function (when ENCAnLDE = 1)

(1) ENCAnLDE is set to “1” (if an underflow occurs, the ENCAnCCR0 value is loaded to the counter).

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When a further down-count is performed after the counter value changes to 0000_H, an underflow occurs.

(4) An underflow interrupt is output, and the underflow flag is set.

(5) Because ENCAnLDE is set to “1”, the setting value of the ENCAnCCR0 register is loaded to the counter if an underflow occurs. ENCAnCNT is set to $3C5A_H$.

(6) After the ENCAnCCR0 value is set to ENCAnCNT, if the ENCAnCNT value matches the ENCAnCCR0 value on a count clock, a compare match interrupt (ENCATINT0) is output.

28.6.10 Conflict between ENCAnLDE Function (Loading Counter Value) and Rewrite of ENCAnCCR0 Register

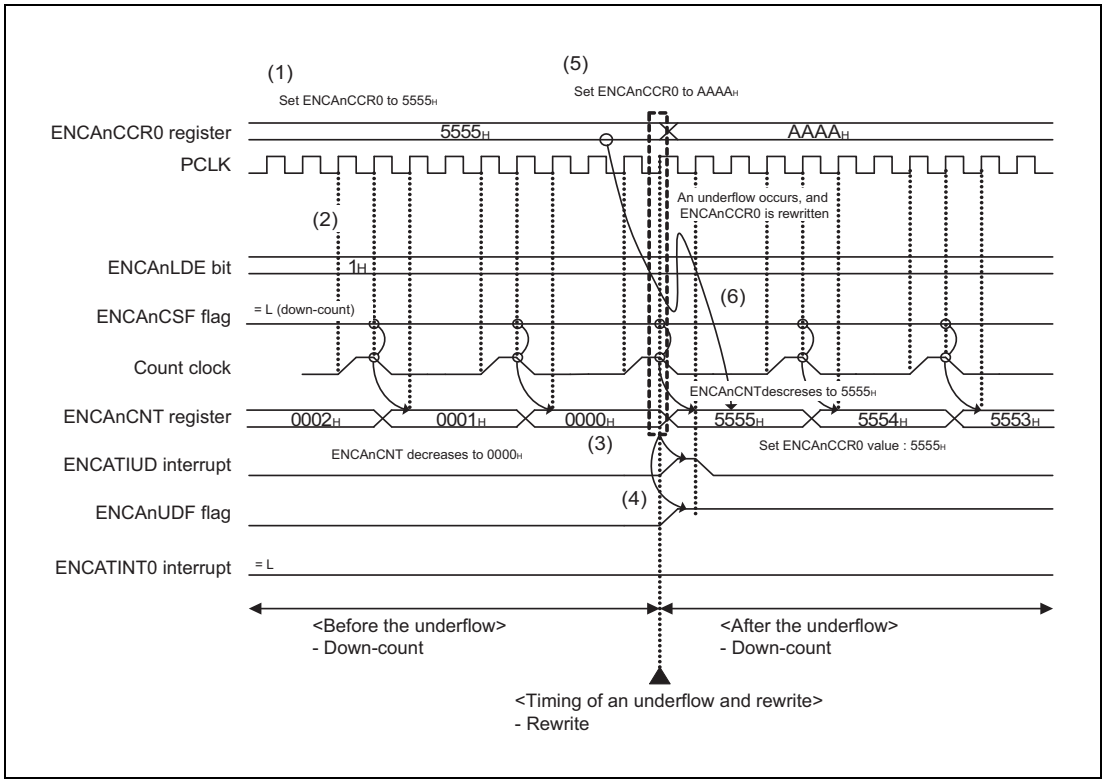

Figure 28.21 Conflict between ENCAnLDE Function and Rewrite of ENCAnCCR0 Register

(1) The ENCAnCCR0 register is currently set to 5555_H.

(2) ENCAnLDE is currently set to “1”.

(3) A down-count is performed ($0002_H \rightarrow 0001_H \rightarrow 0000_H$), and an underflow occurs.

(4) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

(5) When an underflow occurs, the ENCAnCCR0 register value is changed from 5555_H to $AAAA_H$.

(6) Additionally, when an underflow occurs, the ENCAnCCR0 value before the rewrite was performed (5555_H) is set in ENCAnCNT.

28.6.11 Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

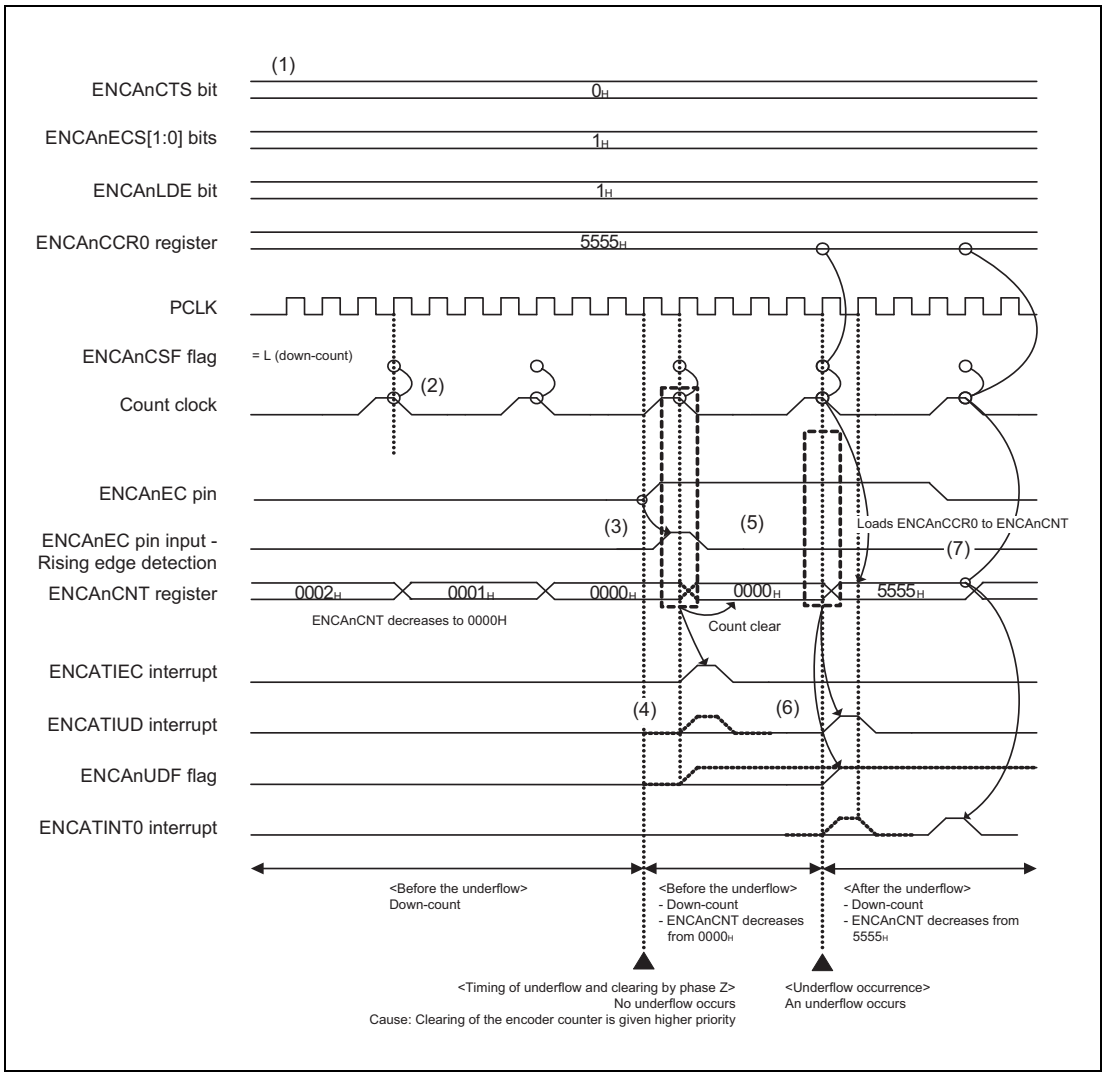

Figure 28.22 Conflict between ENCAnLDE Function and Clear Operation by Encoder Clear Input

(1) The values are set as follows: ENCAnCTS = 0, ENCAnECS[1:0] = 01_B, ENCAnLDE = 1, and ENCAnCCR0 = 5555_H.

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When the count value becomes 0000_H, the rising edge of ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.

(4) Because a count clear is performed when the count value reaches 0000_H, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when the count value is 0000_H. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

(5) After the count value is cleared to 0000_H by clear operation by the encoder clear input, a down-count is performed and an underflow occurs.

(6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

(7) Because ENCAnLDE = “1”, if an underflow occurs, the ENCAnCCR0 value is loaded to ENCAnCNT.

(8) After the ENCAnCCR0 value is set to ENCAnCNT, a compare match is detected according to the count clock. If the ENCAnCNT value matches the ENCAnCCR0 value, a compare match interrupt (ENCATINT0) is output.

28.6.12 Up-count after Conflict between ENCAnLDE Function (Loading Counter Value) and Clear Operation by Encoder Clear Input

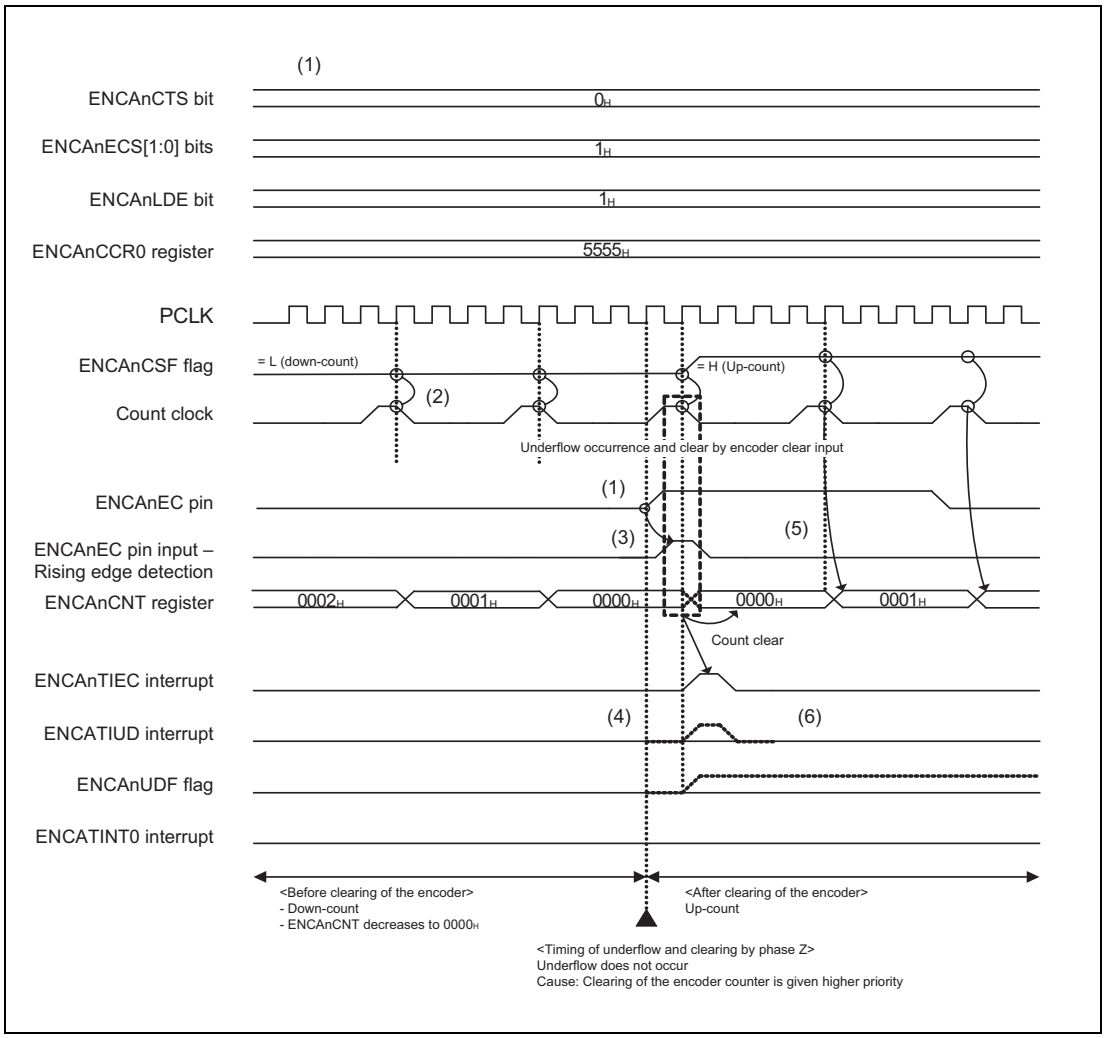

Figure 28.23 Up-count after Conflict between ENCAnLDE Function and Encoder Clear

(1) The values are set as follows: ENCAnCTS = 0, ENCAnECS[1:0] = 01_B, ENCAnLDE = 1, and ENCAnCCR0 = 5555_H.

(2) A down-count is performed: $0002_H \rightarrow 0001_H \rightarrow 0000_H$

(3) When the count value becomes 0000_H, the rising edge of ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.

(4) Because a count clear is performed when the count value reaches 0000_H, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when the count value is 0000_H. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

(5) After the count value is cleared to 0000_H by clear operation by the encoder clear input, an up-count is performed.

(6) An underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

28.6.13 Capture Operation between Count Clocks (ENCAnCCR1)

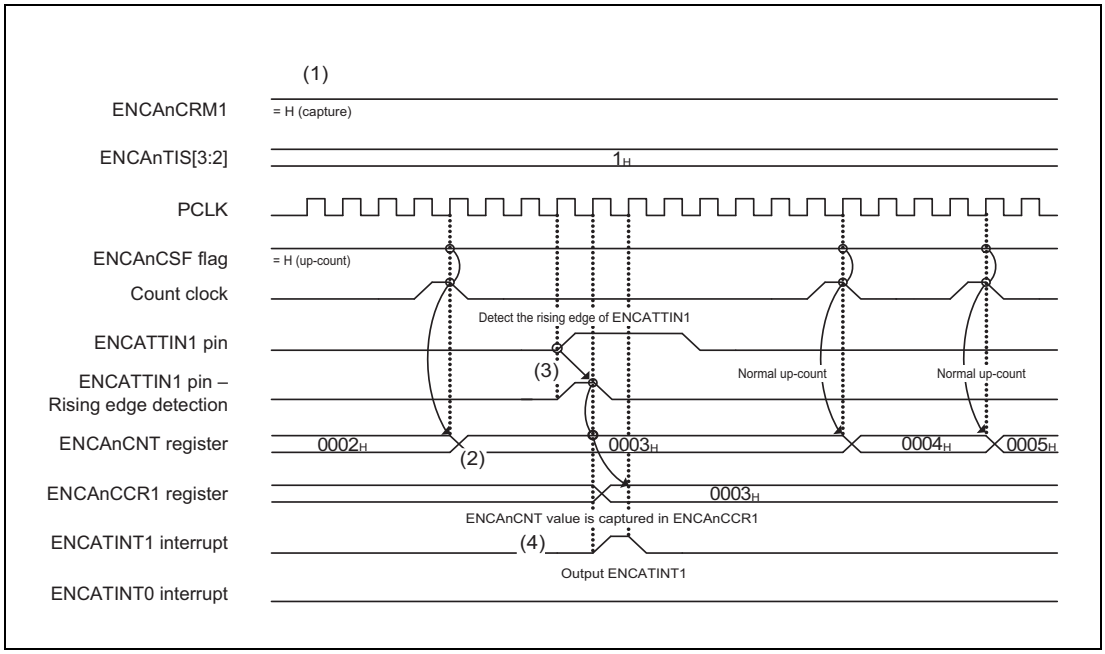

Figure 28.24 Capture Operation between Count Clocks (ENCAnCCR1)

(1) The values are set as follows: ENCAnCRM1 = 1, and ENCAnTIS[3:2] = 01_B.

(2) An up-count is performed.

(3) The rising edge of the ENCATTIN1 input is detected, and the count value is captured in ENCAnCCR1.

(4) An interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register is output.

28.6.14 Capture Operation between Count Clocks (ENCAnCCR0)

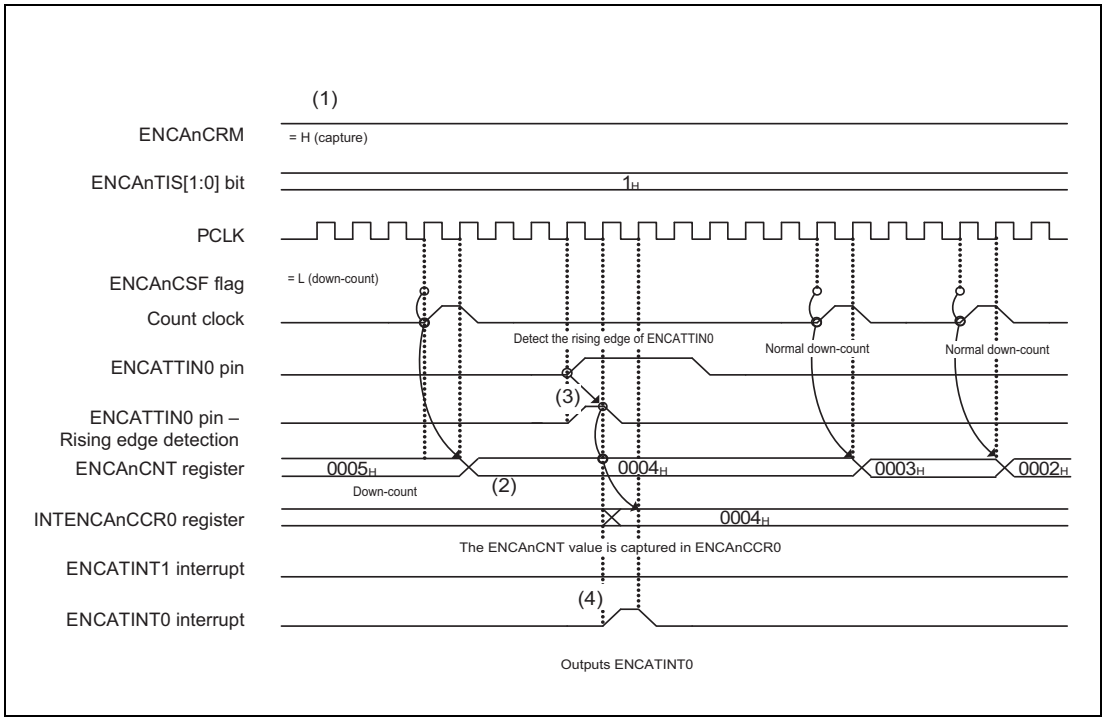

Figure 28.25 Capture Operation between Count Clocks (ENCAnCCR0)

(1) The values are set as follows: ENCAnCRM0 = 1, and ENCAnTIS[1:0] = 01_B.

(2) A down-count is performed.

(3) The rising edge of the ENCATTIN0 input is detected, and the count value is captured in ENCAnCCR0.

(4) An interrupt (ENCATINT0) corresponding to the capture to the ENCAnCCR0 register is output.

28.6.15 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0

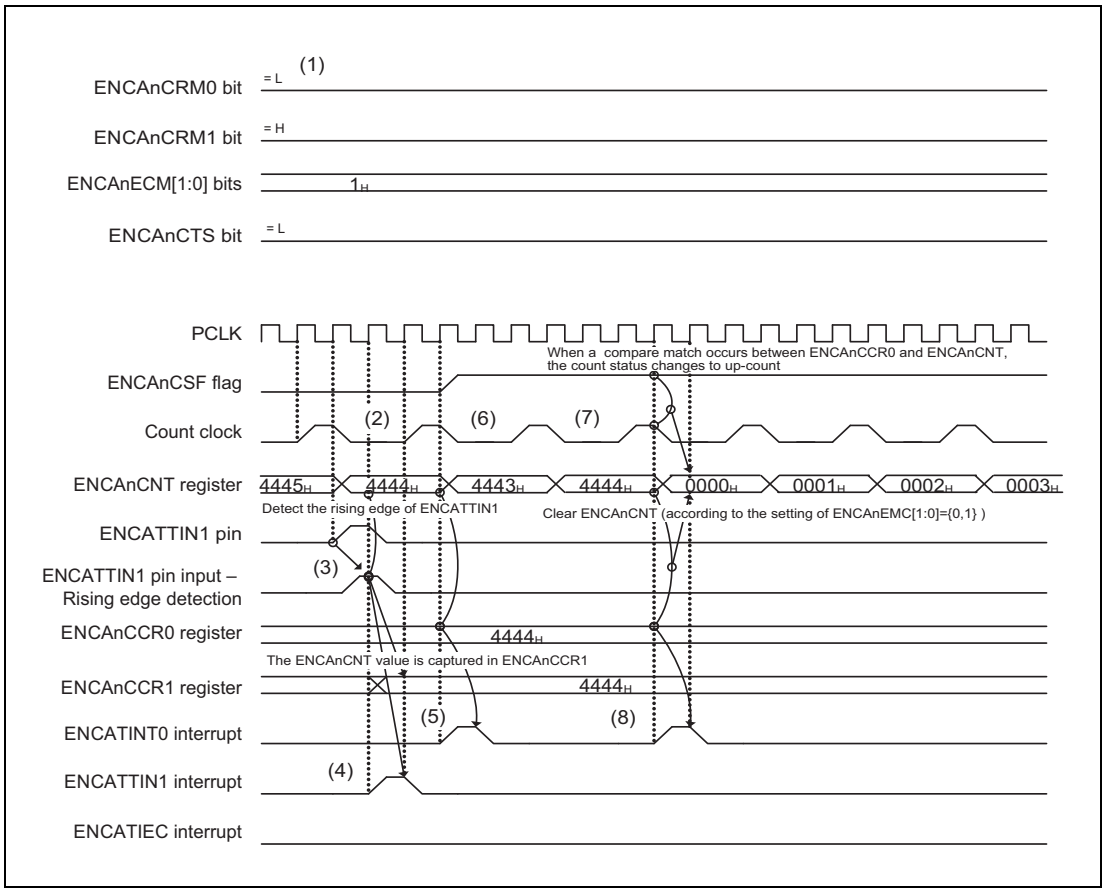

Figure 28.26 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0

(1) The values are set as follows: ENCAnCCR0 = 4444_H, ENCAnCRM0 = 0, ENCAnCRM1 = 1, ENCAnECM[1:0] = 01_B, and ENCAnCTS = 0.

(2) A down-count is performed.

(3) The rising edge of the ENCATTIN1 input is detected, and the ENCAnCNT value (4444_H) is captured in the ENCAnCCR1 register.

(4) An interrupt signal (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register is output.

(5) When a compare match occurs between ENCAnCNT (counted down from 4445_H to 4444_H) and ENCAnCCR0 (4444_H), a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

(6) The count operation changes to up-count.

(7) When ENCAnCNT is counted up from 4443_H to 4444_H, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 (01_B), and the ENCAnCNT value changes to 0000_H.

(8) When ENCAnCNT changes to 4444_H, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

28.6.16 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1

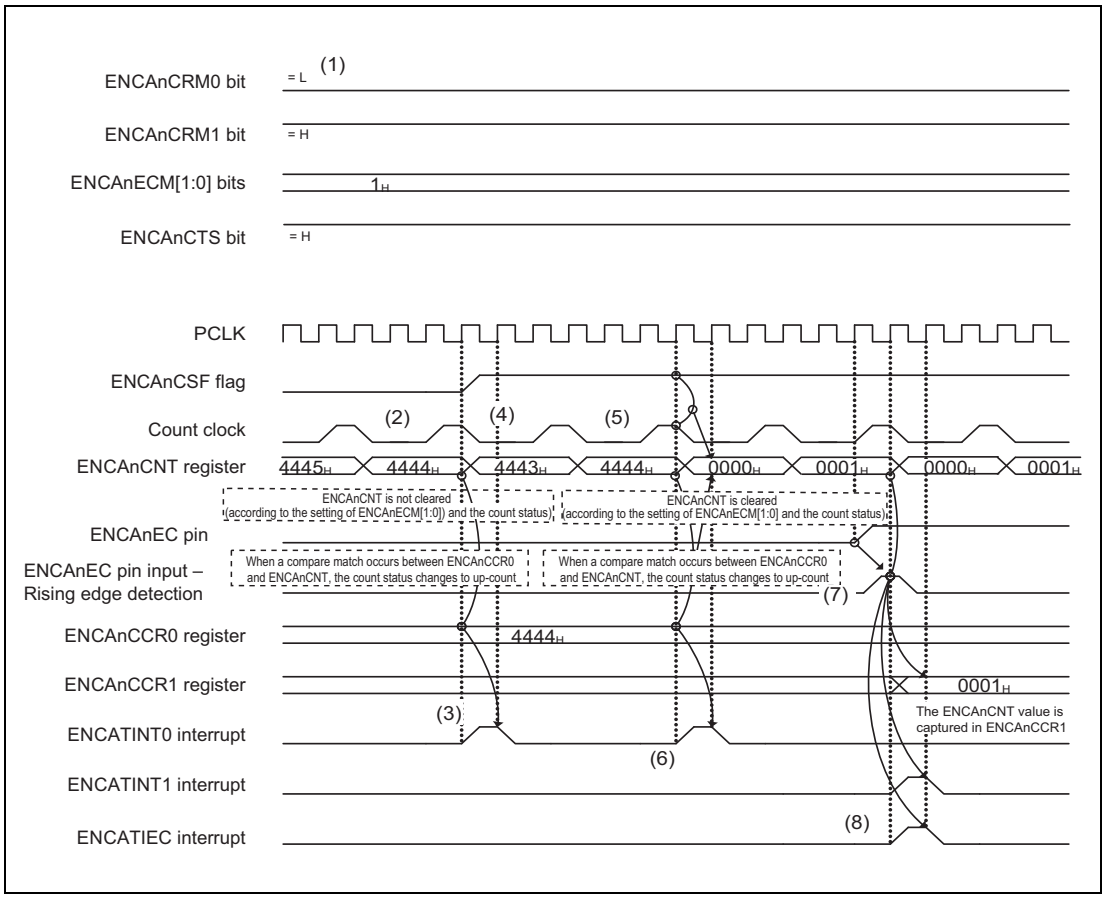

Figure 28.27 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1

(1) The values are set as follows: ENCAnCCR0 = 4444_H, ENCAnCRM0 = 0, ENCAnCRM1 = 1, ENCAnECM[1:0] = 01_B, and ENCAnCTS = 1.

(2) A down-count is performed.

(3) When a compare match occurs between ENCAnCNT (counted down from 4445_H to 4444_H) and ENCAnCCR0 (4444_H), a compare/capture interrupt (ENCATINT0) is output.

(4) The count operation changes to up-count.

(5) When ENCAnCNT is counted up from 4443_H to 4444_H, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 (01_B), and the ENCAnCNT value changes to 0000_H.

(6) When ENCAnCNT changes to 4444_H, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

(7) After the count value is cleared, an up-count is performed, and the count value changes to 0001_H. At this point, the ENCAnCNT value (0001_H) is captured in ENCAnCCR1 by detecting the rising edge of the ENCAnEC signal, and the counter is cleared to 0000_H.

(8) An interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (ENCATIEC) by ENCAnEC are output.

28.6.17 Encoder Operation when Compare Match Clear Control is Disabled

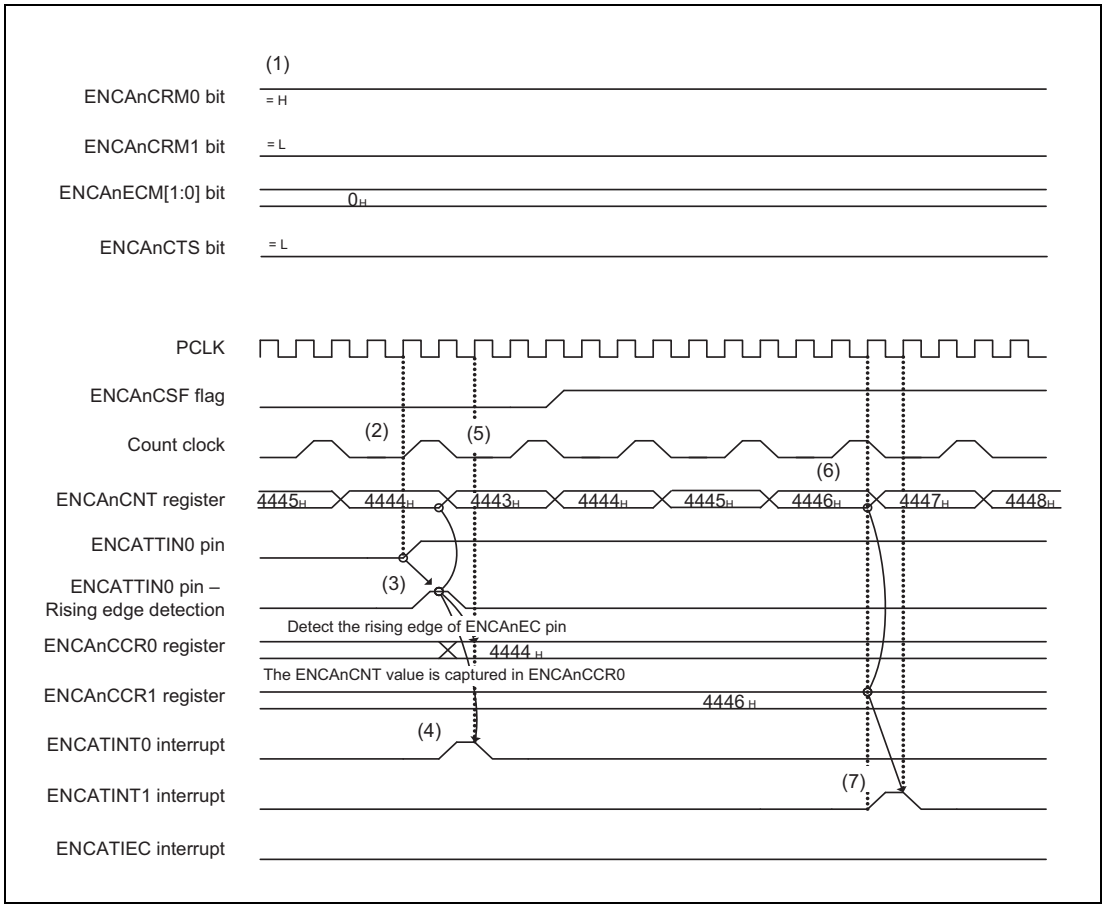

Figure 28.28 Encoder Operation when Compare Match Clear Control is Disabled

(1) The values are set as follows: ENCAnCCR1 = 4446_H, ENCAnCRM0 = 1, ENCAnCRM1 = 0, ENCAnECM[1:0] = 00_B, and ENCAnCTS = 0.

(2) A down-count is performed.

(3) When the rising edge of ENCATTIN0 is detected, the ENCAnCNT value (4444_H) is captured in ENCAnCCR0.

(4) An interrupt signal (ENCATINT0) corresponding to the capture to the ENCAnCCR0 register is output.

(5) The count operation changes to up-count.

(6) When ENCAnCNT changes to 4446_H, a compare match with ENCAnCCR1 is detected.

(7) A compare match interrupt (ENCATINT1) with ENCAnCCR1 is output.

28.6.18 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, ENCAnE1 when ENCAnSCE = 1

28.6.18.1 Accompanying capture operation

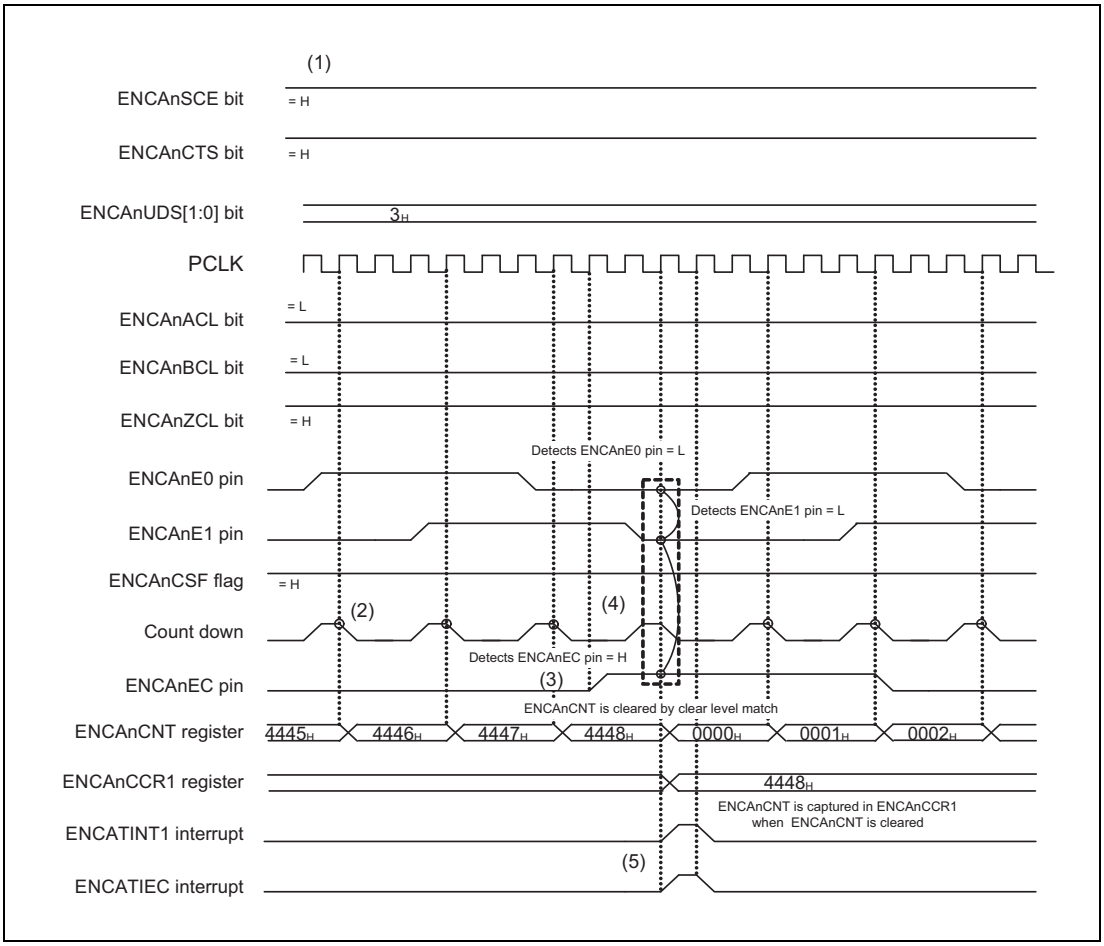

Figure 28.29 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, ENCAnE1 when ENCAnSCE = 1

(1) The values are set as follows: ENCAnSCE = 1, ENCAnCTS = 1, ENCAnUDS[1:0] =11_B, ENCAnACL = 0, ENCAnBCL = 0, and ENCAnZCL = 1.

(2) An up-count is performed.

(3) The count value is not cleared upon the rising edge of ENCAnEC.

(4) When ENCAnE0, ENCAnE1 and ENCAnEC reach the set clear level, the count value is cleared. The count value is captured in ENCAnCCR1 at the time of the clearing.

(5) At the time of the clearing, an interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (ENCATIEC) by ENCAnEC are output.

28.6.18.2 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

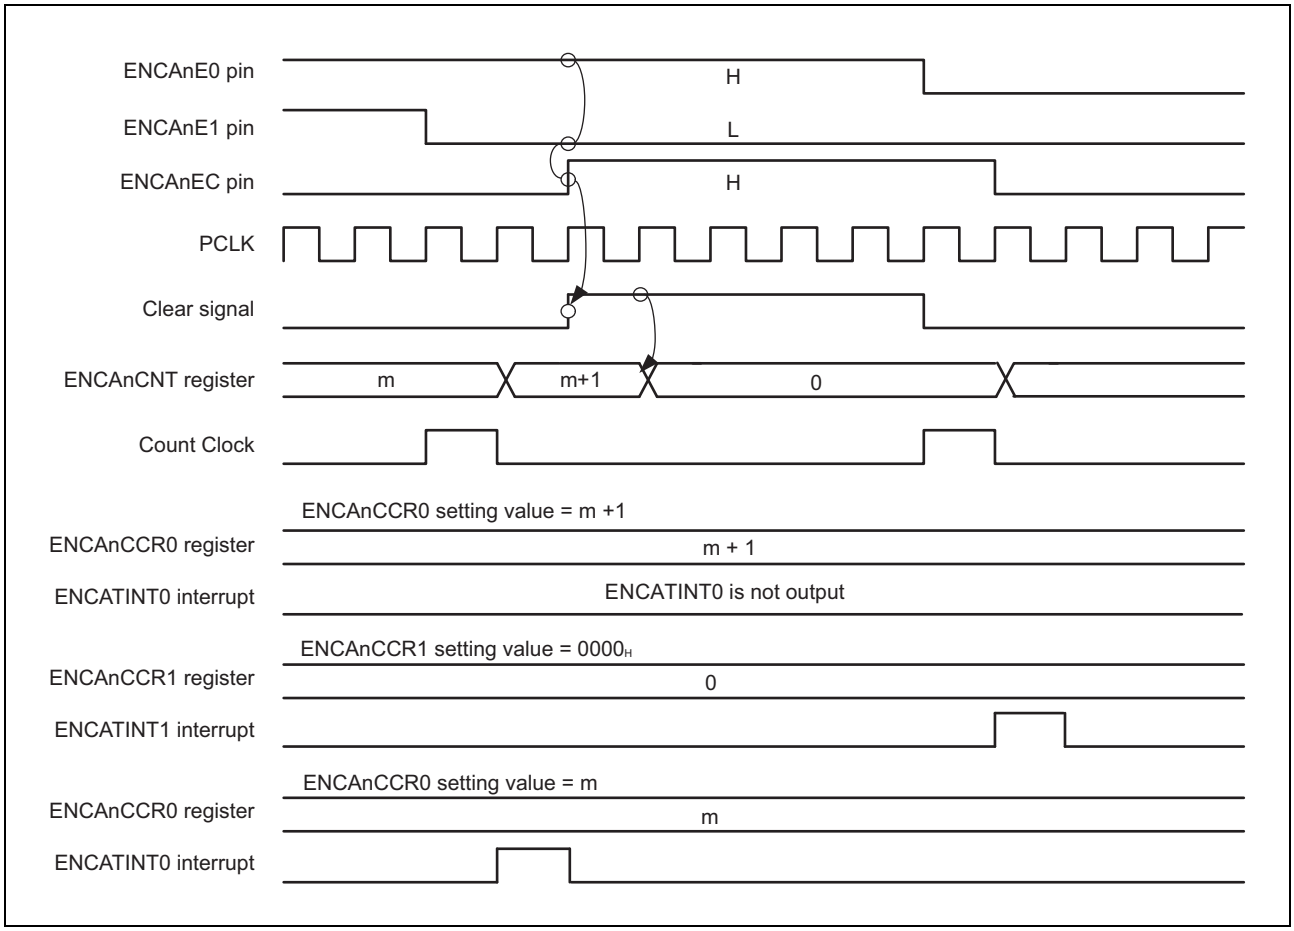

Figure 28.30 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count

28.6.18.3 When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

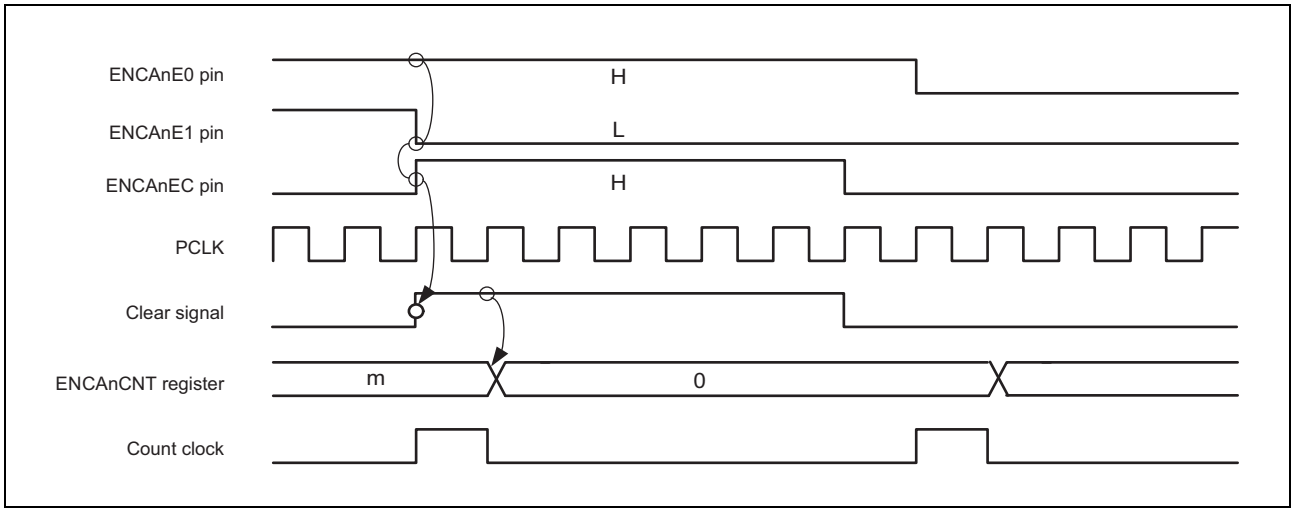

Figure 28.31 Clearing Timing for when the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count

28.6.18.4 When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

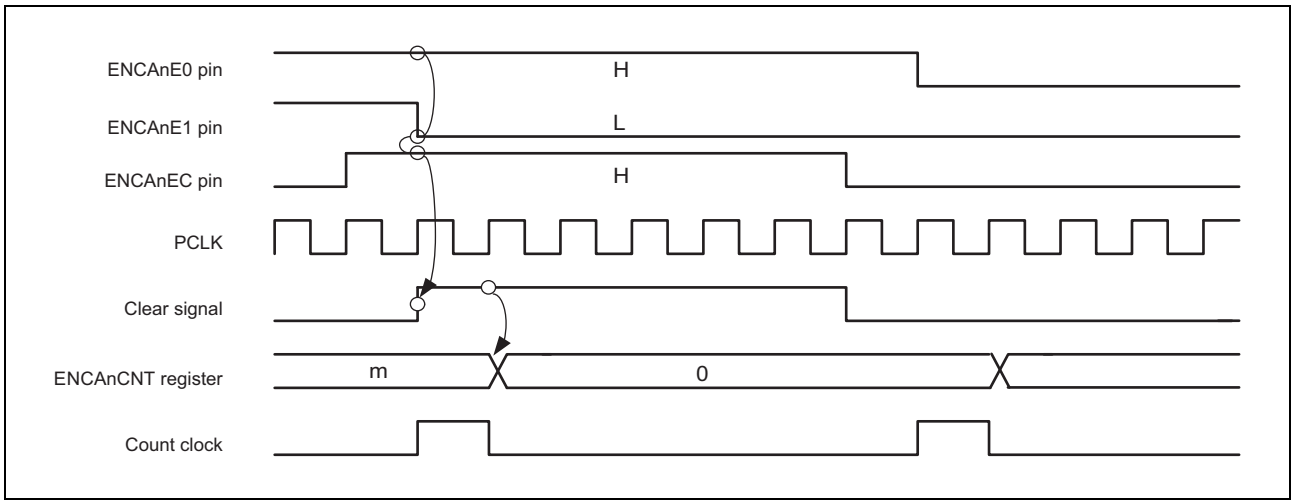

Figure 28.32 Clearing Timing for when the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count

28.6.18.5 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11_B)

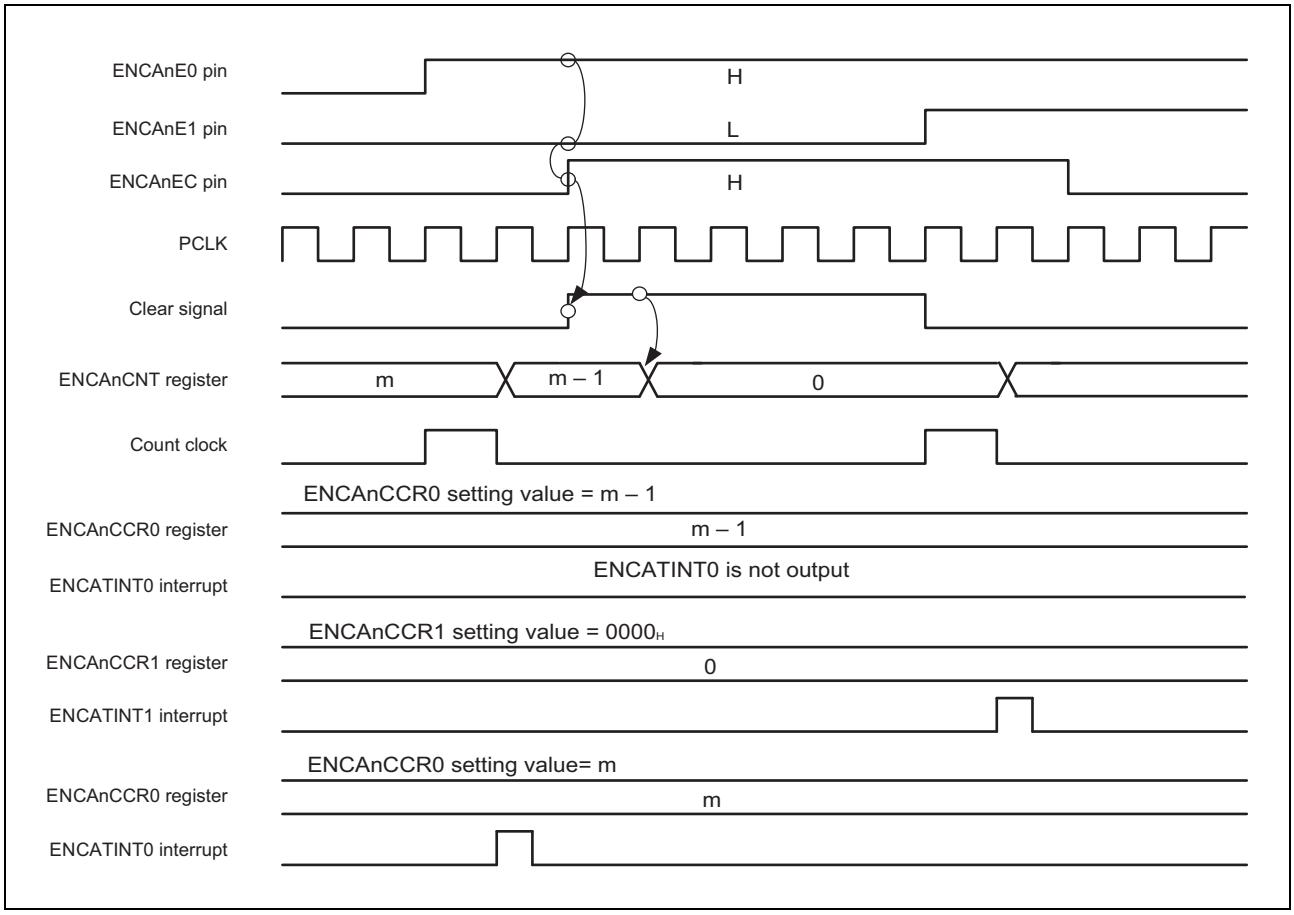

Figure 28.33 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count

28.6.19 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0

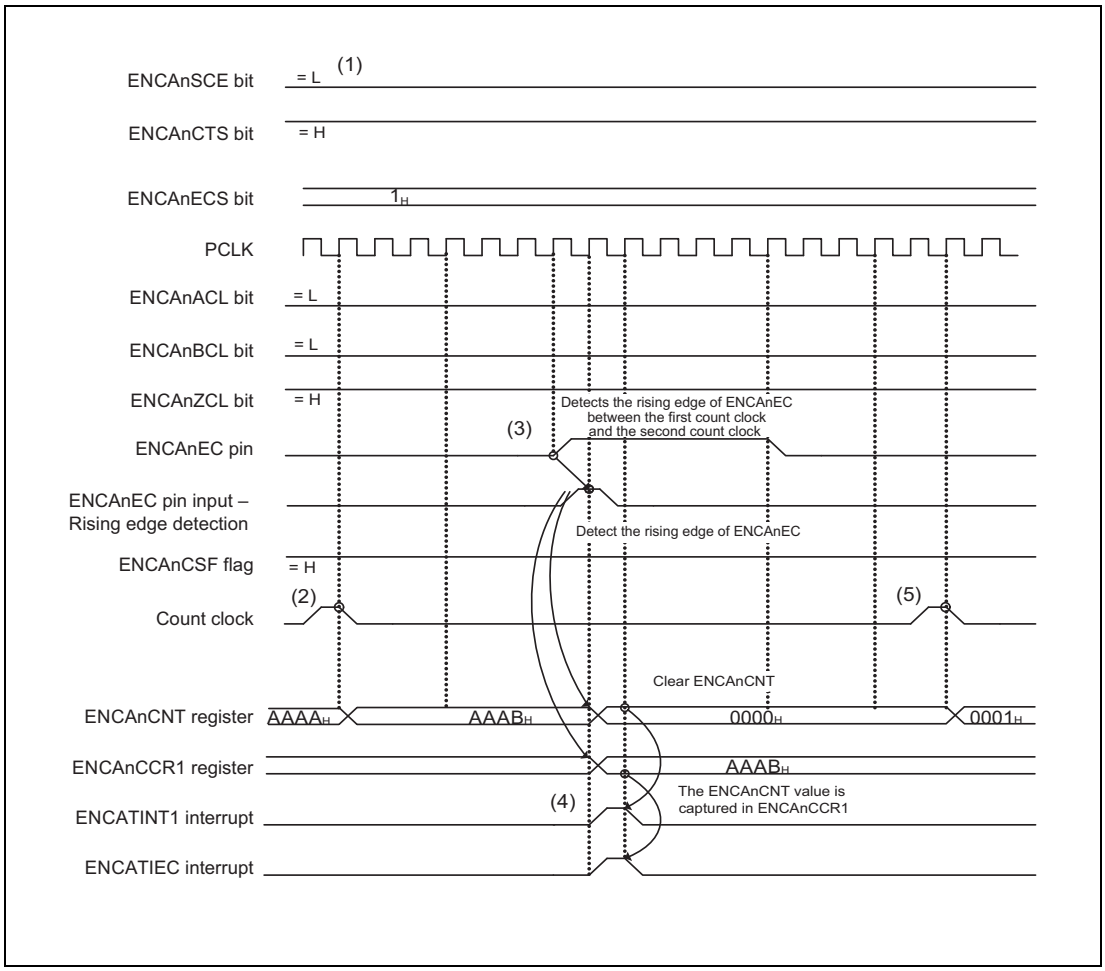

Figure 28.34 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE = 0

(1) The values are set as follows: ENCAnSCE = 0, ENCAnCTS = 1, and ENCAnECS[1:0] = 01_B.

(2) An up-count is performed.

(3) The rising edge of the ENCAnEC input is detected, and the ENCAnCNT value ($AAAB_H$) is captured in the ENCAnCCR1 register. Concurrently, clear operation by ENCAnEC is performed, and ENCAnCNT is cleared to 0000_H.

(4) A capture interrupt 1 (ENCATINT1) to the ENCAnCCR1 register and an encoder clear interrupt (ENCATIEC) by ENCAnEC are output.

(5) After the count value is cleared, an up-count is performed, and the count value changes to 0001_H.

Section 29 Motor Control

This section contains a generic description of the Motor Control.

The first part in this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the Motor Control.

29.1 Features of RH850/F1K Motor Control

29.1.1 Number of Units and Channels

Motor control function comprises the timer motor control units (TAPA) and the peripheral interconnection unit (PIC) to connect the TAPA unit to peripheral timers, and generates motor control waveforms by using a combination of peripheral timers and A/D converters.

This microcontroller has the following number of units of the TAPA and PIC units.

Table 29.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
TAPA			
Number of Units	1		
Name	TAPAn (n = 0)		
PIC			
Number of Units	1		
Name	PIC0		

Table 29.2 Indices

Index	Description
n	Throughout this section, the unit of a timer and A/D converter used by TAPA and the motor control function is identified by the index “n” (n = 0): for example, TAPAnCTL0 is TAPAn control register 0.
m	The channel of a used timer and A/D converter is identified by the index “m”. For example, the TAUDn channel is described as CHm.
x	The scan group of an A/D converter is identified by the index “x” (x = 1 to 3).
j	The scan trigger number of an A/D converter is identified by the index “j” (j = 0 to 2).

The following table lists the values indicated by the indices of each product.

Table 29.3 Indices of Products

Indices of Each Product
All Products
m = 0 to 15 (e.g. TAUDn)
x = 1 to 3
j = 0 to 2

29.1.2 Register Base Address

Base addresses of TAPAn and PIC0 are listed in the following table.

Register addresses of TAPAn and PIC0 are given as offsets from the base addresses.

Table 29.4 Register Base Addresses

Base Address Name	Base Address
<TAPA0_base>	FFE9 0000_H
<PIC0_base>	FFDD 0000_H

29.1.3 Clock Supply

The TAPAn and PIC0 clock supplies are listed in the following table.

Table 29.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
TAPAn	PCLK	CKSCLK_IPERI1	Module clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_IPERI1	
PIC0	PCLK	CKSCLK_IPERI1	Module clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_IPERI1	

29.1.4 Interrupt Request

TAPA0 interrupt requests are listed in the following table.

Table 29.6 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
TAPA0			
TAPATIPEK0	Peak interrupt 0	16, 116	—
TAPATIVLY0	Valley interrupt 0	17, 117	—

29.1.5 Reset Sources

Reset sources of TAPAn and PIC0 are listed in the following table. TAPAn and PIC0 are initialized by these reset sources.

Table 29.7 Reset Sources

Unit Name	Reset Source
TAPA0	All reset sources (ISORES)
PIC0	All reset sources (ISORES)

29.1.6 External Input/Output Signal

External output signals of TAPAn and PIC0 are listed below.

Table 29.8 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
PIC		
TOUTU	Motor control output U phase (positive)	TAPA0UP
TOUTUB	Motor control output U phase (negative)	TAPA0UN
TOUTV	Motor control output V phase (positive)	TAPA0VP
TOUTVB	Motor control output V phase (negative)	TAPA0VN
TOUTW	Motor control output W phase (positive)	TAPA0WP
TOUTWB	Motor control output W phase (negative)	TAPA0WN
TAPA		
TAPATHASIN	Motor control output Hi-Z control input	TAPA0ESO

CAUTION

For the port pins that are used as TAPA0UP, TAPA0UN, TAPA0VP, TAPA0VN, TAPA0WP, and TAPA0WN, set the output driving ability to high (PDSCn_m = 1).

29.1.7 Internal Output Signal

The internal output signals of TAPAn and PIC0 are listed below.

Table 29.9 Internal Output Signals

Unit Signal Name	Description	Connected to
TAPA0		
$\overline{\text{TAPATHZOUT0}}$	TAPA0UP/TAPA0UN output buffers Hi-Z control output*1	Port
$\overline{\text{TAPATHZOUT1}}$	TAPA0VP/TAPA0VN output buffers Hi-Z control output*1	Port
$\overline{\text{TAPATHZOUT2}}$	TAPA0WP/TAPA0WN output buffers Hi-Z control output*1	Port
TAPATADOUT0	A/D trigger signal 0 output*2	ADCA0 hardware trigger expansion
TAPATADOUT1	A/D trigger signal 1 output*2	ADCA0 hardware trigger expansion
PIC0		
TAPATHASIN	TAPA0 asynchronous Hi-Z control signal*1,*3	TAPA0
TAPATSIM0	TAUD master channel interrupt signal (TAUD0: INTTAUD0I0,INTTAUD0I2, INTTAUD0I8)	TAPA0
TAPATUDCM0	TAUD master up/down signal (TAUD0: TAUD0UDC0, TAUD0UDC2, TAUD0UDC8)	TAPA0
TAPATCDENS0	TAUD slave 0 match detect*4 (ADCA0 hardware trigger expansion: ADOPA1ADCATTIN00)	TAPA0
TAPATCDENS1	TAUD slave 1match detect*4 (ADCA0 hardware trigger expansion: ADOPA2ADCATTIN00)	TAPA0

Note 1. See **Section 29.4.6, TAPA0 Hi-Z Control Input Selection** for details.

Note 2. These signals can be used to as a trigger source to start the A/D converter. See **Table 31.49, List of A/D Conversion Hardware Triggers**.

Note 3. This input signal is passed through a noise filter. See **Section 2.12, Noise Filter & Edge/Level Detector** and **Section 2.13, Description of Port Noise Filter & Edge/Level Detection**.

Note 4. These signals are selected by the H/W trigger selection bit of the ADCA0 A/D converter. See **Table 31.49, List of A/D Conversion Hardware Triggers**.

29.2 Overview

29.2.1 Functional Overview

The motor control function provides the following functions by combining the motor control unit (TAPA) and Timer Array Unit D (TAUDn) or A/D (ADCAn):

- Asynchronous Hi-Z control function
  Hi-Z control for TAUDn output can be performed by using pin input or error signals.
- Interrupt signal output function
  Request signals for two types of interrupts, peak interrupts and valley interrupts, can be output by the INTn signals output by TAUDn.
- A/D conversion start trigger selection function
  An A/D conversion start trigger can be output by the INTn signals output by TAUDn.

Additionally, the motor control function provides also the following functions by combining the motor control unit (TAPA) and the peripheral interconnection (PIC):

- Timer simultaneous start trigger function
  The respective channels of TAUD0 and TAUJ1, and the ENCAn timer can be started simultaneously.
- Trigger and pulse width measuring function
  Measurement of trigger periods can be performed by inputting ENCAn interrupt signals to TAUDn or TAUJ1.
- A/D trigger encoder capture function
  The value of the ENCAn counter can be captured at the A/D conversion start trigger timing.
- Three-phase PWM output with dead time / High-accuracy triangle PWM output with dead time
  Three-phase PWM output with dead time can be performed by TAUDn.
- Delay pulse output with dead time
  Delay pulses (with dead time) for the cycle timing can be output.

29.2.2 Basic Structure of Motor Control

The peripheral block configuration of the motor control function is shown below.

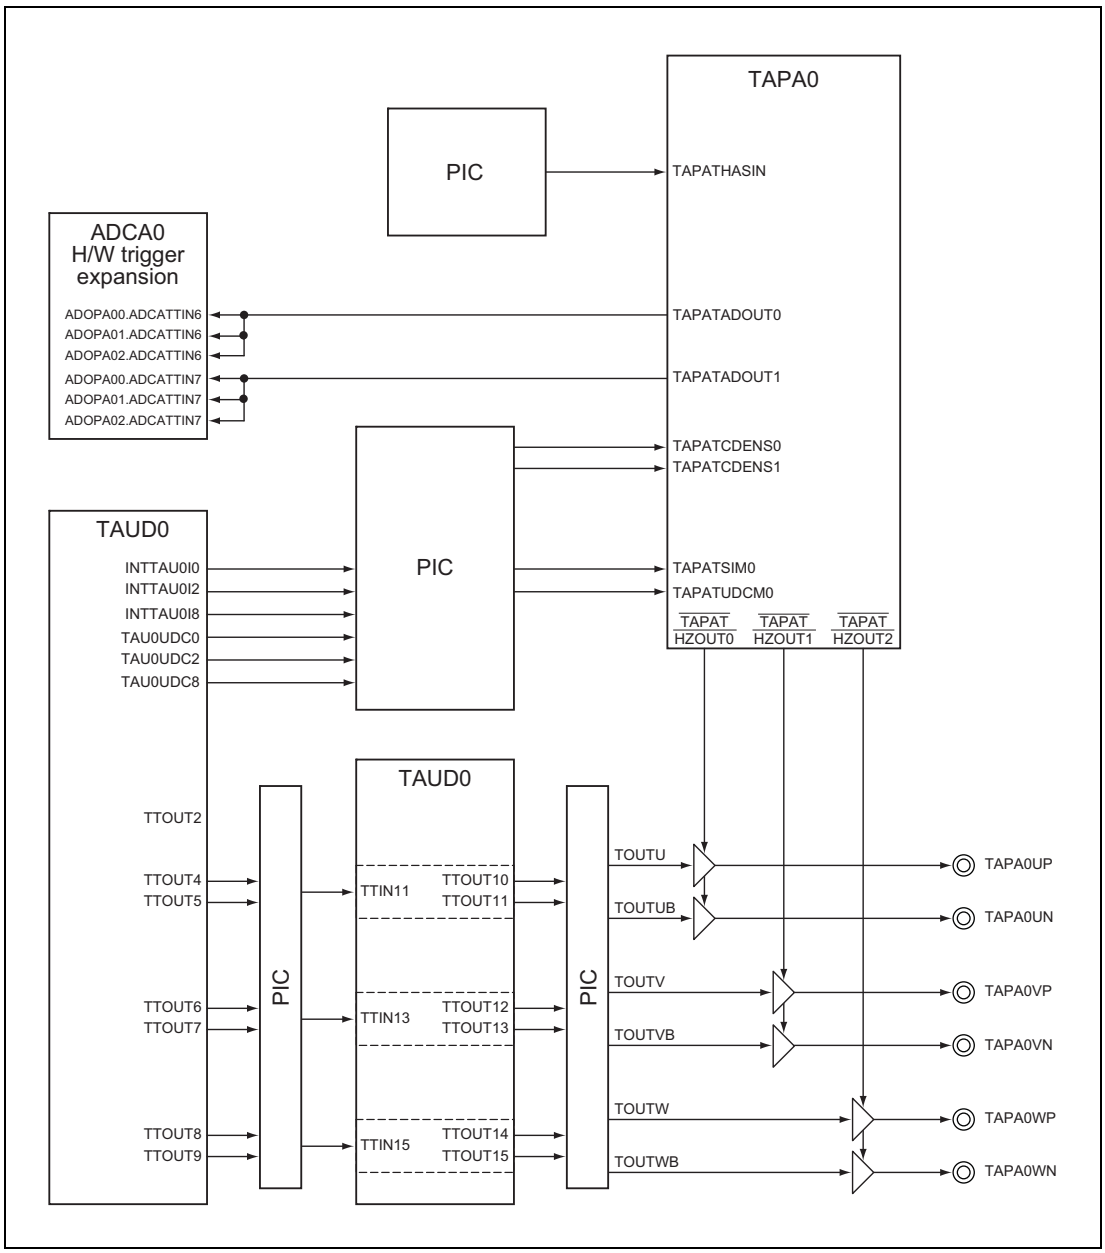

Figure 29.1 Configuration of Motor Control

TAUDn and PIC are used to generate the motor control output signals (three-phase PWM output signals with dead time).

The timer control unit (TAPA) performs Hi-Z control for the motor control output.

Additionally, PIC can provide functions specific to the motor by combining respective channels of TAUDn and TAUJ1, ENCAn, and TAPA.

29.2.3 Block Diagram

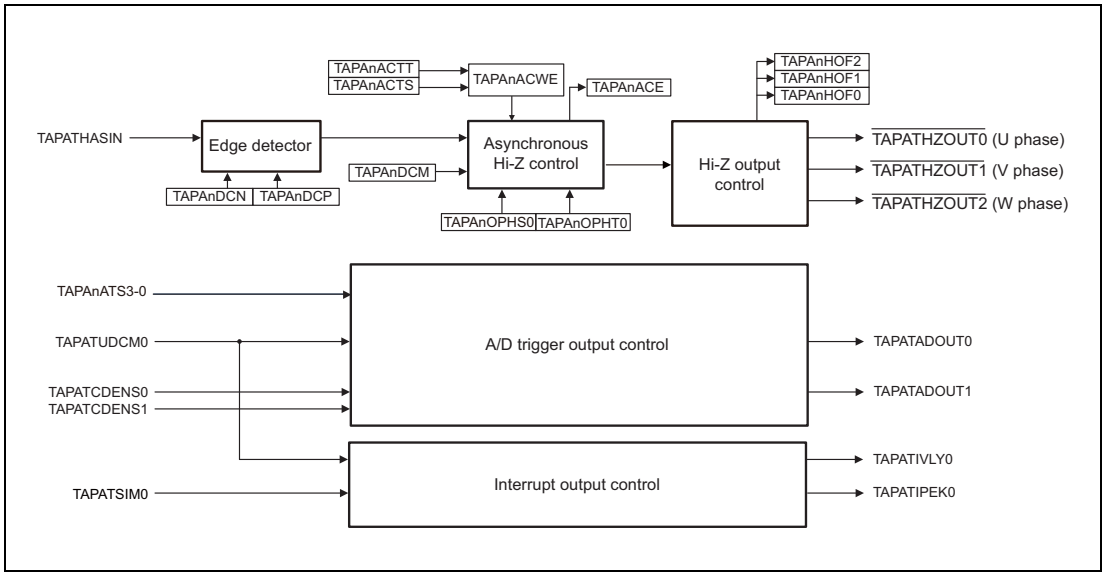

Figure 29.2 TAPA Peripheral Block Diagram

NOTE

For the PIC peripheral block diagram, see the respective section describing each function.

29.2.4 Definition of Terms

Peak and valley interrupts - Peak and valley of timer counter

In this document, the period from a TAUD counting-up status to generation of INT from the master channel is defined as a peak period, and this INT is defined as a peak interrupt.

In contrast, the period from a TAUD counting-down status to generation of INT from the master channel is defined as a valley period, and this INT is defined as a valley interrupt.

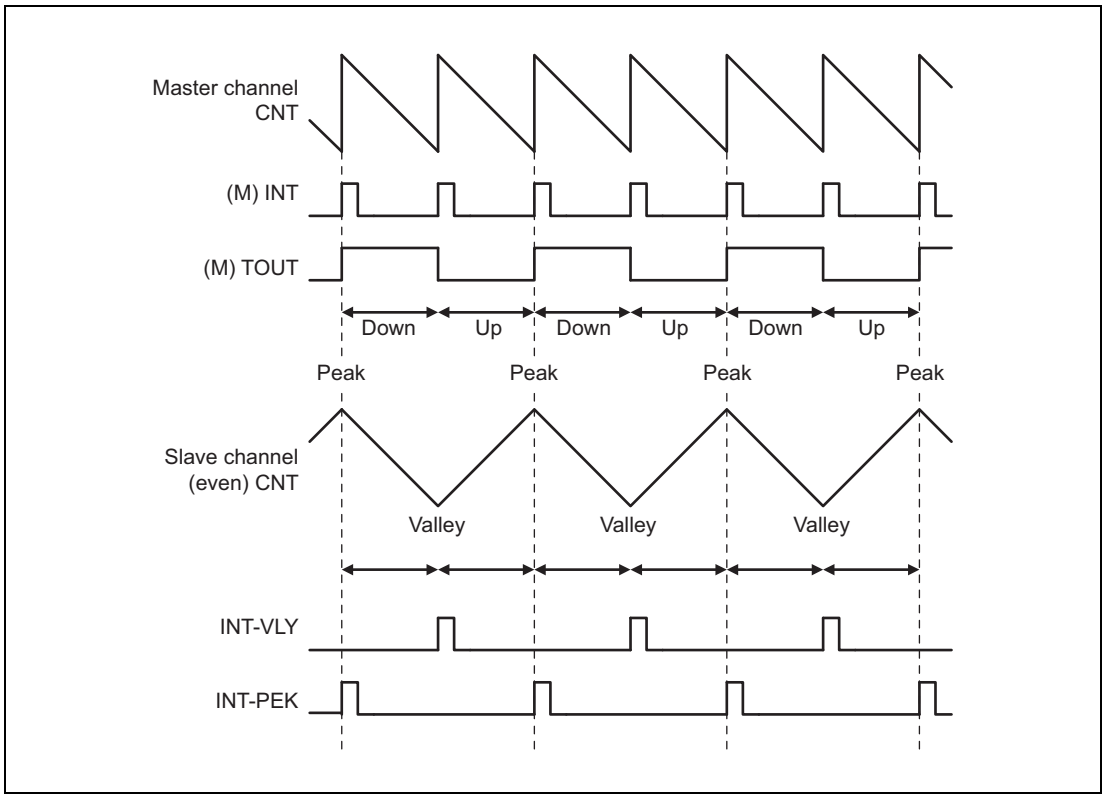

Figure 29.3 Peak and Valley Interrupts

29.3 Registers

29.3.1 List of Registers

The registers of TAPAn and PIC0 are listed in the following table.

For details about <TAPAn_base> and <PIC0_base>, see **Section 29.1.2, Register Base Address**.

Table 29.10 Registers

Module Name	Register Name	Symbol	Address
TAPAn	Control register 0	TAPAnCTL0	<TAPAn_base> + 20_H
	Control register 1	TAPAnCTL1	<TAPAn_base> + 24_H
	Flag register	TAPAnFLG	<TAPAn_base> + 00_H
	Asynchronous Hi-Z control write enable register	TAPAnACWE	<TAPAn_base> + 04_H
	Asynchronous Hi-Z control start trigger register	TAPAnACTS	<TAPAn_base> + 08_H
	Asynchronous Hi-Z control stop trigger register	TAPAnACTT	<TAPAn_base> + $0C_H$
	Hi-Z start trigger register	TAPAnOPHS	<TAPAn_base> + 14_H
	Hi-Z stop trigger register	TAPAnOPHT	<TAPAn_base> + 18_H
	Emulation register	TAPAnEMU	<TAPAn_base> + 28_H
PIC0	Simultaneous start trigger control register	PIC0SST	<PIC0_base> + 04_H
	Simultaneous start control register 0	PIC0SSER0	<PIC0_base> + 10_H
	Simultaneous start control register 2	PIC0SSER2	<PIC0_base> + 18_H
	Hi-Z output control register 0	PIC0HIZCEN0	<PIC0_base> + 80_H
	A/D conversion trigger output control register 400	PIC0ADTEN400	<PIC0_base> + 90_H
	A/D conversion trigger output control register 401	PIC0ADTEN401	<PIC0_base> + 94_H
	A/D conversion trigger output control register 402	PIC0ADTEN402	<PIC0_base> + 98_H
	Timer I/O control register 200	PIC0REG200	<PIC0_base> + $C0_H$
	Timer I/O control register 201	PIC0REG201	<PIC0_base> + $C4_H$
	Timer I/O control register 202	PIC0REG202	<PIC0_base> + $C8_H$
	Timer I/O control register 203	PIC0REG203	<PIC0_base> + CC_H
	Timer I/O control register 30	PIC0REG30	<PIC0_base> + $E8_H$
	Timer I/O control register 31	PIC0REG31	<PIC0_base> + EC_H

NOTE

For details about PIC-related registers, see the respective section describing each function.

29.3.2 TAPAnCTL0 — TAPA Control Register 0

This register is used to set up the asynchronous Hi-Z control function.

The values of this register can be rewritten only when TAPAnFLG.TAPAnACE is 0 and TAUDnTEm for the corresponding TAUD's master channel is 0.

Access: This register can be read or written in 16-bit units.

Address: <TAPAn_base> + 20_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 29.11 TAPAnCTL0 Register Contents

Bit Position	Bit Name	Function
15 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	TAPAnDCM	Clear Condition Configuration This control bit specifies the clear conditions for Hi-Z control output. 0: Enables manipulation of TAPAnOPHT0 regardless of the TAPATHASIN signal input level. 1: Enables manipulation of TAPAnOPHT0 only if the TAPATHASIN signal input is inactive.
3, 2	TAPAnDCN, TAPAnDCP	Hi-Z Input Edge Selection These are control bits that specify the valid edge of TAPATHASIN.

TAPAn DCN	TAPAn DCP	Description
0	0	Does not detect valid edges.
0	1	Detects a rising edge as the valid edge (active level = high).
1	0	Detects a falling edge as the valid edge (active level = low).
1	1	Setting prohibited

1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

29.3.3 TAPAnCTL1 — TAPA Control Register 1

This register is used to specify the A/D conversion trigger.

Access: This register can be read or written in 8-bit units.

Address: <TAPAn_base> + 24_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	TAPAnATS3	TAPAnATS2	TAPAnATS1	TAPAnATS0
Value after reset	0	0	0	0	0	0	0	0

Table 29.12 TAPAnCTL1 Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2	TAPAnATS3, TAPAnATS2	A/D Conversion Trigger 1 Selection These are control bits that specify A/D conversion trigger output 1 (TAPATADOUT1).

TAPAn ATS3	TAPAn ATS2	Description
0	0	INT signal while the triangle wave is falling (counting down)
0	1	INT signal while the triangle wave is rising (counting up)
1	0	INT signal while the triangle wave is rising (counting up) or falling (counting down)
1	1	INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt TAPATIVLY0 signal

Bit Position	Bit Name	Function
1, 0	TAPAnATS1, TAPAnATS0	A/D Conversion Trigger 0 Selection These are control bits that specify the A/D conversion trigger output 0 (TAPATADOUT0).

TAPAn ATS1	TAPAn ATS0	Description
0	0	INT signal while the triangle wave is falling (counting down)
0	1	INT signal while the triangle wave is rising (counting up)
1	0	INT signal while the triangle wave is rising (counting up) or falling (counting down)
1	1	INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt TAPATIVLY0 signal

29.3.4 TAPAnFLG — TAPA Flag Register

This flag register is for asynchronous Hi-Z control.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <TAPAn_base> + 00_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TAPAn HOF2	TAPAn HOF1	TAPAn HOF0	—	—	—	—	—	—	—	TAPAn ACE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.13 TAPAnFLG Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned.
10	TAPAnHOF2	W phase Hi-Z Control Monitor This bit is used to monitor the Hi-Z control status. 0: The present output of TAPAnTHZOUT2 is high level 1: The present output TAPAnTHZOUT2 is low level.
9	TAPAnHOF1	V phase Hi-Z Control Monitor This bit is used to monitor the Hi-Z control status. 0: The present output of TAPAnTHZOUT1 is high level 1: The present output TAPAnTHZOUT1 is low level.
8	TAPAnHOF0	U phase Hi-Z Control Monitor This bit is used to monitor the Hi-Z control status. 0: The present output of TAPAnTHZOUT0 is high level 1: The present output TAPAnTHZOUT0 is low level.
7 to 1	Reserved	When read, the value after reset is returned.
0	TAPAnACE	Asynchronous Hi-Z Control Enable 0: Indicates that the asynchronous Hi-Z control is stopped. 1: Indicates that the asynchronous Hi-Z control is enabled. The conditions for setting or clearing this bit are as follows: Clear condition: Writing 1 to TAPAnACTT while TAPAnACWE = 1 Set condition: Writing 1 to TAPAnACTS while TAPAnACWE = 1

29.3.5 TAPAnACWE — TAPA Asynchronous Hi-Z Control Write Enable Register

This register is used to enable writing for asynchronous Hi-Z control.

Access: This register can be read or written in 8-bit units.

Address: <TAPAn_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnACWE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 29.14 TAPAnACWE Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TAPAnACWE	Asynchronous Control Write Enable This is a write enable bit for asynchronous Hi-Z control. After 1 is written, this bit is automatically cleared to 0 by writing 1 to TAPAnACTS and TAPAnACTT. 0: Disables writing to TAPAnACTS and TAPAnACTT. 1: Enables writing to TAPAnACTS and TAPAnACTT.

29.3.6 TAPAnACTS — TAPA Asynchronous Hi-Z Control Start Trigger Register

This register is used to enable the start trigger for asynchronous Hi-Z control.

Access: This register is a write-only register that can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnACTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 29.15 TAPAnACTS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnACTS	Asynchronous Hi-Z Control Start Trigger This bit enables the start trigger for asynchronous Hi-Z control. The setting of this bit is valid only when TAPAnACWE = 1. 0: Writing 0 is ignored (no function). 1: Enables asynchronous Hi-Z control when TAPAnACE is 1.

29.3.7 TAPAnACTT — TAPA Asynchronous Hi-Z Control Stop Trigger Register

This bit enables the stop trigger for asynchronous Hi-Z control.

Access: This register is a write-only register that can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnACTT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 29.16 TAPAnACTT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnACTT	Asynchronous Hi-Z Control Stop Trigger This bit enables the stop trigger for asynchronous Hi-Z control. The setting of this bit is valid only when TAPAnACWE = 1. 0: Writing 0 is ignored (no function). 1: Disables asynchronous Hi-Z control when TAPAnACE is 0.

29.3.8 TAPAnOPHS — TAPA Hi-Z Start Trigger Register

This software trigger register is used to start Hi-Z control for motor control output pins.

Access: This register is a write-only register that can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnOPHS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 29.17 TAPAnOPHS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnOPHS0	Hi-Z Control Start Trigger This bit starts Hi-Z control for motor control output pins. 0: Writing 0 is ignored (no function). 1: Starts Hi-Z control.

29.3.9 TAPAnOPHT — TAPA Hi-Z Stop Trigger Register

This software trigger register is used to stop Hi-Z control for motor control output pins.

Access: This register is a write-only register that can be written in 8-bit units. This register is always read as 00_H.

Address: <TAPAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TAPAnOPHT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 29.18 TAPAnOPHT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	TAPAnOPHT0	Hi-Z Control Stop Trigger This bit stops Hi-Z control for motor control output pins. 0: Writing 0 is ignored (no function). 1: Stops Hi-Z control. Whether the setting of this bit is valid or invalid depends on the setting of TAPAnCTL0.TAPAnDCM.

29.3.10 TAPAnEMU — TAPA Emulation Register

This register controls SVSTOP for emulation.

Access: This register can be read or written in 8-bit units. (when EPC.SVSTOP = 0, rewritten only)

Address: <TAPAn_base> + 28_H

Value after reset: Reading this register returns always 00_H.

Bit	7	6	5	4	3	2	1	0
	TAPAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 29.19 TAPAnEMU Register Contents

Bit Position	Bit Name	Function
7	TAPAnSVSDIS	This bit is used to control disabling of SVSTOP. 0: SVSTOP is valid. (Sets Hi-Z control output to low level when SVSTOP = 1 is input). 1: SVSTOP is invalid. (Hi-Z control output level does not change according to the level of SVSTOP input).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

29.4 Asynchronous Hi-Z Control Function

If the operation of the timer motor control function controlled by the MCU becomes abnormal, the rotation of the external motor also becomes abnormal. This function can forcibly set the motor control output to the Hi-Z state upon detection of abnormal motor operation, independent of MCU control.

29.4.1 Overview

This function forcibly stops TAPAn output through asynchronous Hi-Z control.

- When the TAPATHASIN signal becomes active, the levels of the motor control output pins are set to Hi-Z, and motor control output is forcibly stopped.
- Motor control output in a Hi-Z state can be resumed by writing the Hi-Z stop trigger register (TAPAnOPHT0).
- The Hi-Z state of motor control output can also be specified by writing the Hi-Z control start trigger register (TAPAnOPHS).
- Setting PIC can enable or disable Hi-Z control input when an error occurs.

29.4.2 System Configuration Example

A system configuration example is shown below, where an external error detection signal (the TAPA0ESO signal) is used for Hi-Z control of the motor control outputs (TAPA0UP / TAPA0UN / TAPA0VP / TAPA0VN / TAPA0WP / TAPA0WN).

When valid edges of the external error detection signal are detected, the level of the motor control outputs is set to Hi-Z.

Because the microcontroller might freeze when an error occurs, external error detection signals are continuously processed so that the motor control timer outputs can be set to Hi-Z even if no clock is supplied.

Note that an error is detected only when the valid edge of the error detection signal is detected. Therefore, no error is detected if the output level is fixed and the signal level does not change.

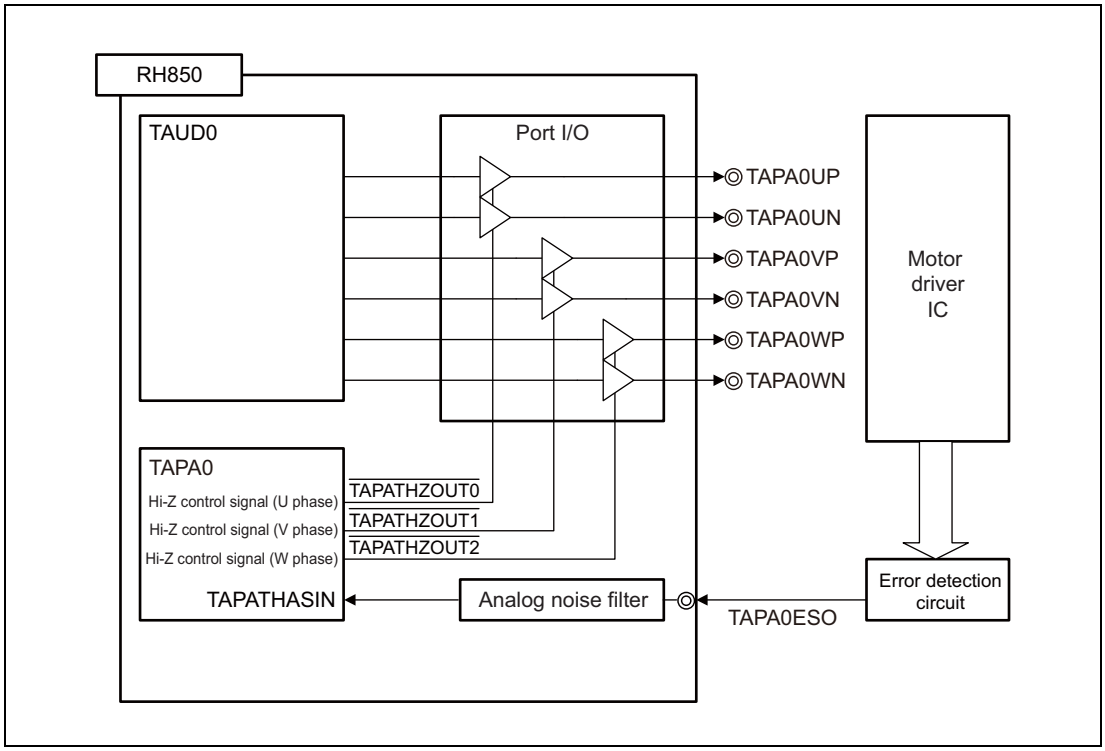

Figure 29.4 System Configuration Example of Asynchronous Hi-Z Control for Pin Input

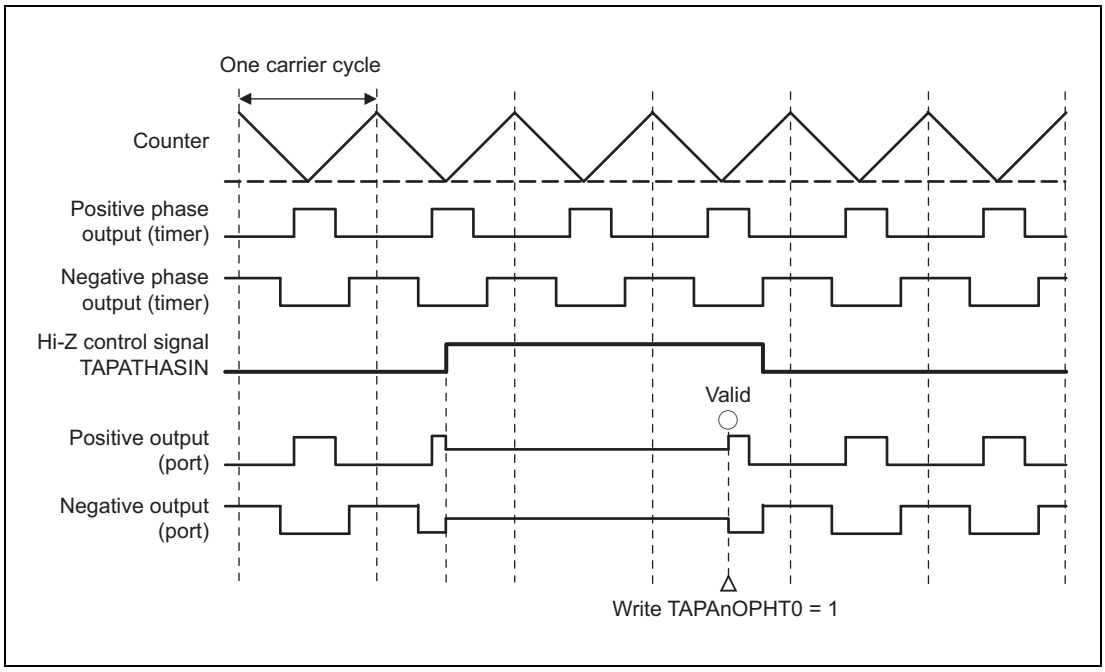
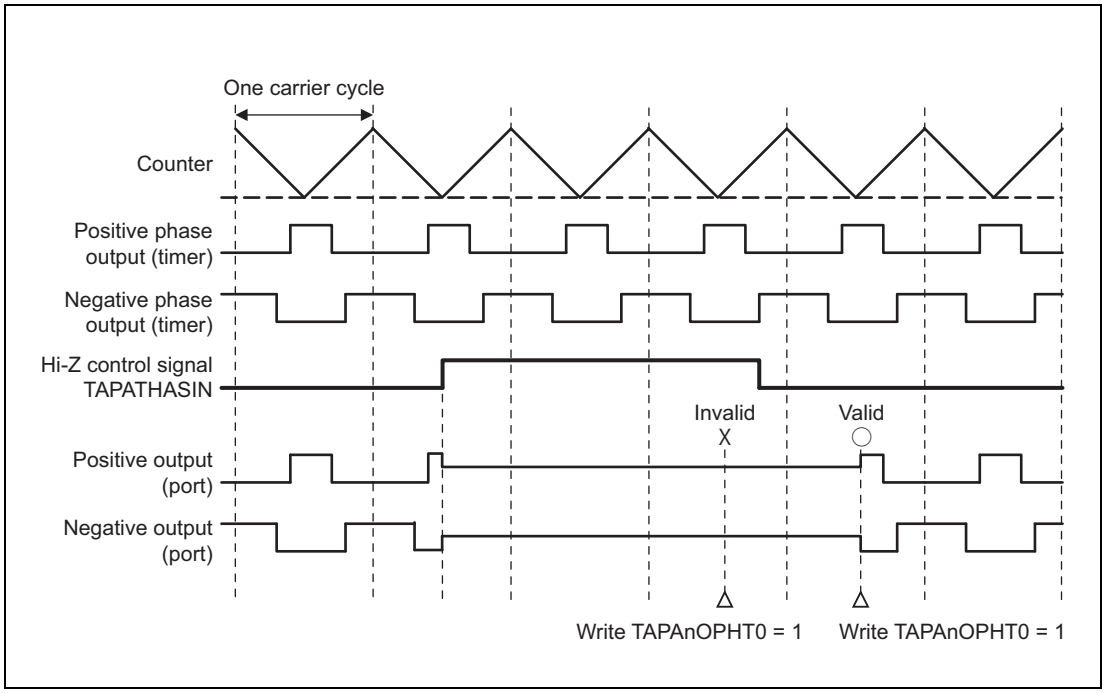


29.4.3 Basic Operation

Hi-Z control for motor control output pins can be started as follows:

- Detecting the valid edge of asynchronous Hi-Z control signal (TAPATHASIN)
- Setting the start trigger bit TAPAnOPHS.TAPAnOPHS0 of the Hi-Z control signal

The levels of the motor control output pins are set to Hi-Z until the stop trigger bit of the Hi-Z control signal (TAPAnOPHT.TAPAnOPHT0) is set. Note that whether the setting of TAPAnOPTH0 is valid or invalid depends on the setting of TAPAnCTL0.TAPAnDCM.



(1) Operation when TAPAnCTL0.TAPAnDCM = 0, TAPAnDCP = 1, and TAPAnDCN = 0

The motor control outputs are forcibly stopped (Hi-Z output) when the valid edge of TAPATHASIN is detected.

The motor control outputs restart when 1 is written to TAPAnOPHT.TAPAnOPHT0, regardless of the level of TAPATHASIN.

(2) Operation when TAPAnCTL0.TAPAnDCM = 1, TAPAnDCP = 1, and TAPAnDCN = 0

The motor control outputs are forcibly stopped (Hi-Z output) when the valid edge of TAPATHASIN is detected.

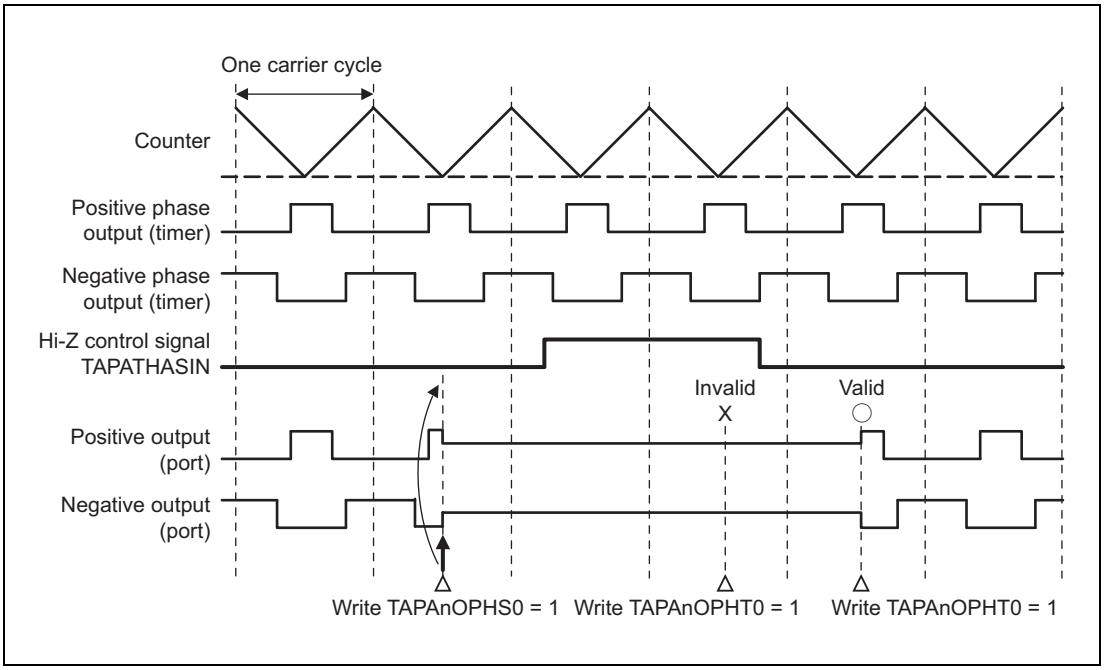
Writing 1 to the stop trigger bit (TAPAnOPHT.TAPAnOPHT0) of the Hi-Z control signal is ignored while TAPATHASIN is active (high level because TAPAnCTL0.TAPAnDCP is 1).

The motor control outputs restart when 1 is written to TAPAnOPHT.TAPAnOPHT0 after TAPATHASIN becomes inactive (low level because TAPAnCTL0.TAPAnDCP is 1).

29.4.4 Asynchronous Hi-Z Control Using Software Trigger

Hi-Z control for motor control output is possible by using the Hi-Z control start trigger bit TAPAnOPHS.TAPAnOPHS0 and Hi-Z control stop trigger bit TAPAnOPHT.TAPAnOPHT0.

(1) Function of Hi-Z control start trigger bit TAPAnOPHS.TAPAnOPHS0



TAPAnDCM	Function
0/1	Writing 1 to TAPAnOPHS0 starts Hi-Z control and forcibly stops the motor control output (Hi-Z output).

(2) Function of Hi-Z control stop trigger bit TAPAnOPHT.TAPAnOPHT0

Whether the Hi-Z control stop trigger is valid or invalid depends on the conditions below:

TAPAnDCM	Function
0	Writing 1 to TAPAnOPHT0 stops Hi-Z control and restarts motor control output.
1	If TAPATHASIN is inactive, writing 1 to TAPAnOPHT0 stops Hi-Z control and restarts motor control output. If TAPATHASIN is active, writing 1 to TAPAnOPHT0 is ignored.

(3) Operation when TAPAnCTL0.TAPAnDCM = 1, TAPAnDCP = 1, and TAPAnDCN = 0

The motor control output (Hi-Z output) is forcibly stopped when 1 is written to TAPAnOPHS0.

After that, the level of the motor control output remains Hi-Z even if the rising edge of TAPATHASIN is detected.

Writing to TAPAnOPHT0 is ignored while TAPATHASIN is active (high level because TAPAnDCN is 0 and TAPAnDCP is 1).

After detection of the falling edge of TAPATHASIN, the motor control output restarts when 1 is written to TAPAnOPHT0 while TAPATHASIN is inactive (low level because TAPAnDCN is 0 and TAPAnDCP is 1).

29.4.5 Operating Procedure

The operating procedure for the asynchronous input Hi-Z control function is shown below:

	Operation	Status of TAPA
Initial setup	Set up the TAPAnCTL0 register. Specify TAPAnDCP and TAPAnDCN to select the input edge. Specify TAPAnDCM to select the clear mode.	Asynchronous Hi-Z control stopped (TAPAnFLG.TAPAnACE = 0)
Start operation	Set up the TAPAnACWE register. Set TAPAnACWE to 1. Set up the TAPAnACTS register. Set TAPAnACTS to 1.	 Writing to TAPAnACTS is enabled. Asynchronous Hi-Z control enabled (TAPAnFLG.TAPAnACE = 1)
During operation	Hi-Z control for the timer function outputs can be started by controlling the following: • TAPAnOPHS register • Asynchronous Hi-Z control signal (TAPATHASIN) Hi-Z control for the timer function outputs can be stopped by controlling the following: • TAPAnOPHT register (If TAPAnDCM is 1, control by the TAPAnOPHT register is enabled only while TAPATHASIN is inactive.) The TAPA operating status can always be read using the TAPAnFLG register.	Hi-Z control for the motor control output pins is started by detecting the valid edge of the asynchronous Hi-Z control signal (TAPATHASIN) or by setting the Hi-Z control start trigger bit TAPAnOPHS0 to 1. Hi-Z control for the motor control output pins is stopped by setting the Hi-Z control stop trigger bit TAPAnOPHT0 to 1 according to the operation mode specified by the TAPAnDCM bit.
Stop operation	Set up the TAPAnACWE register. Set TAPAnACWE to 1. Set up the TAPAnACTT register. Set TAPAnACTT to 1.	 Writing to TAPAnACTT is enabled. Asynchronous Hi-Z control stopped (TAPAnFLG.TAPAnACE = 0)

Restart

29.4.6 TAPA0 Hi-Z Control Input Selection

In order to stop the motor control output in case of errors, error events are selected in PIC and the level of the motor control output is set to Hi-Z in TAPA0, as shown in the diagram below.

The TAPA function can be stopped by setting TAPA0ACTT = 01_H after setting PIC0HIZCEN0 = 00_H or TAPA0ACWE = 01_H.

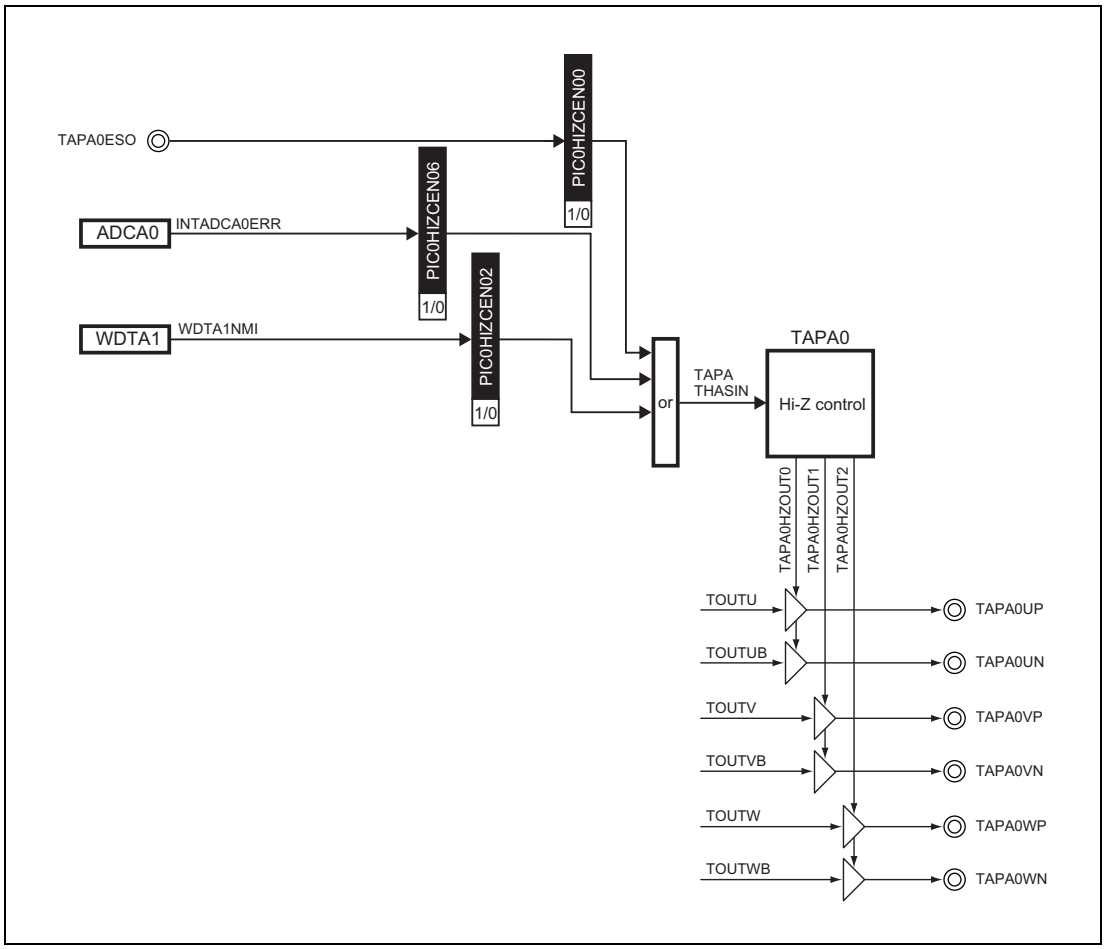


Figure 29.5 Hi-Z Control Block Diagram

Switching into a Hi-Z state can be performed by the following:

- TAPA0ESO pin input
- A/D converter ADCA0 error signal ADCA0ERR
- Window Watchdog Timer WDTA1 non maskable interrupt WDTA1NMI

For details about these signals, see the respective descriptions.

29.4.7 Registers

29.4.7.1 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0)

The PIC0HIZCENn register selects the Hi-Z output control signal of TAPAn.

Access: This register can be read or written in 8-bit units.

Address: <PIC0_base> + 80_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	PIC0HIZCENn6	—	—	—	PIC0HIZCENn2	—	PIC0HIZCENn0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R	R	R	R/W	R	R/W

Table 29.20 PIC0HIZCENn Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	PIC0HIZCENn6	Selects whether to enable or disable Hi-Z output control by the INTADCA0ERR interrupt signal. 0: Disable 1: Enable
5 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PIC0HIZCENn2	Selects whether to enable or disable Hi-Z output control by the WDTA1NMI interrupt signal. 0: Disable 1: Enable
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC0HIZCENn0	Selects whether to enable or disable Hi-Z output control by the TAPA0ESO pin input. 0: Disable 1: Enable

29.5 INT Signal Output Selection Function

29.5.1 Configuration of the INT Signal Output Selection Function

This function generates the peak interrupt TAPATIPEK0 and valley interrupt TAPATIVLY0 by using the TAPATSIM0 signal, which is connected to the INT signal on the TAUD's triangular carrier cycle generation channel (master) and TAPATUDCM0 signal, which is connected to the counter up/down signal.

For the connection destination of TAPATSIM0, see **Section 29.1.7, Internal Output Signal**.

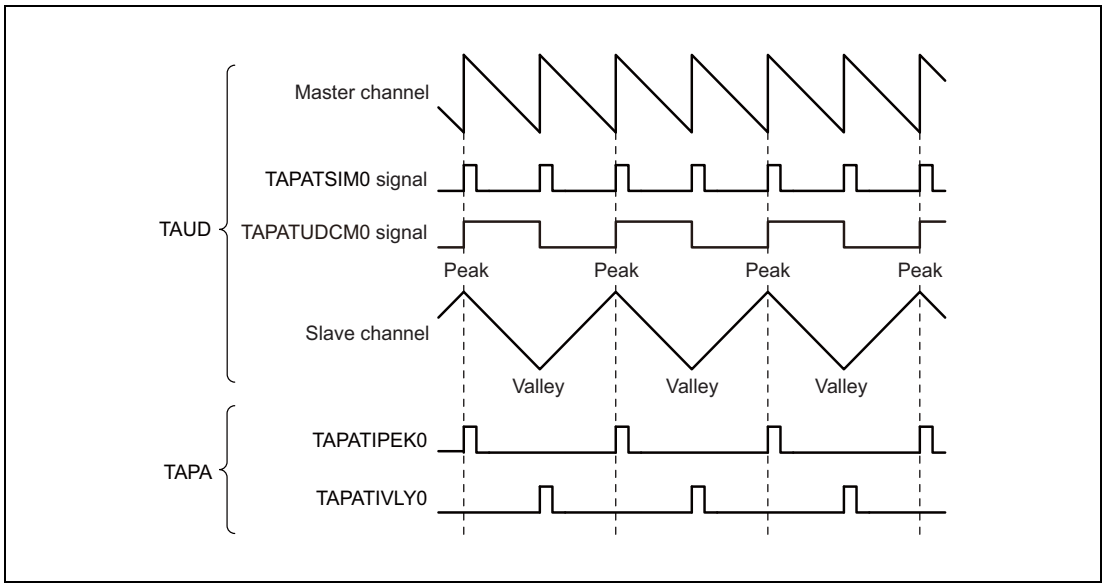

Figure 29.6 Basic Timing of Signals for the INT Signal Output Selection Function

Triangular carrier cycles are generated on the master channel.

The INT signal generated on the master channel in each half triangular carrier cycle is input to TAPAn as the TAPATSIM0 signal. TAPAn generates the TAPATIPEK0 signal (peak interrupt) during high level of the TAPATUDCM0 signal and the TAPATIVLY0 signal (valley interrupt) during low level of the TAPATUDCM0 signal by using the TAPATSIM0 and TAPATUDCM0 input signals.

CAUTION

The peak interrupt TAPATIPEK0 and valley interrupt TAPATIVLY0 are generated regardless of the function of the master channel of TAUD.

When not using these peak and valley interrupts, mask them by using the ICTAPAnIPEK0 and ICTAPAnIVLY0 registers, respectively.

29.5.2 Block Diagram

TAUDn and TAPAn are connected in the registers shown below by the INT signal output selection function.

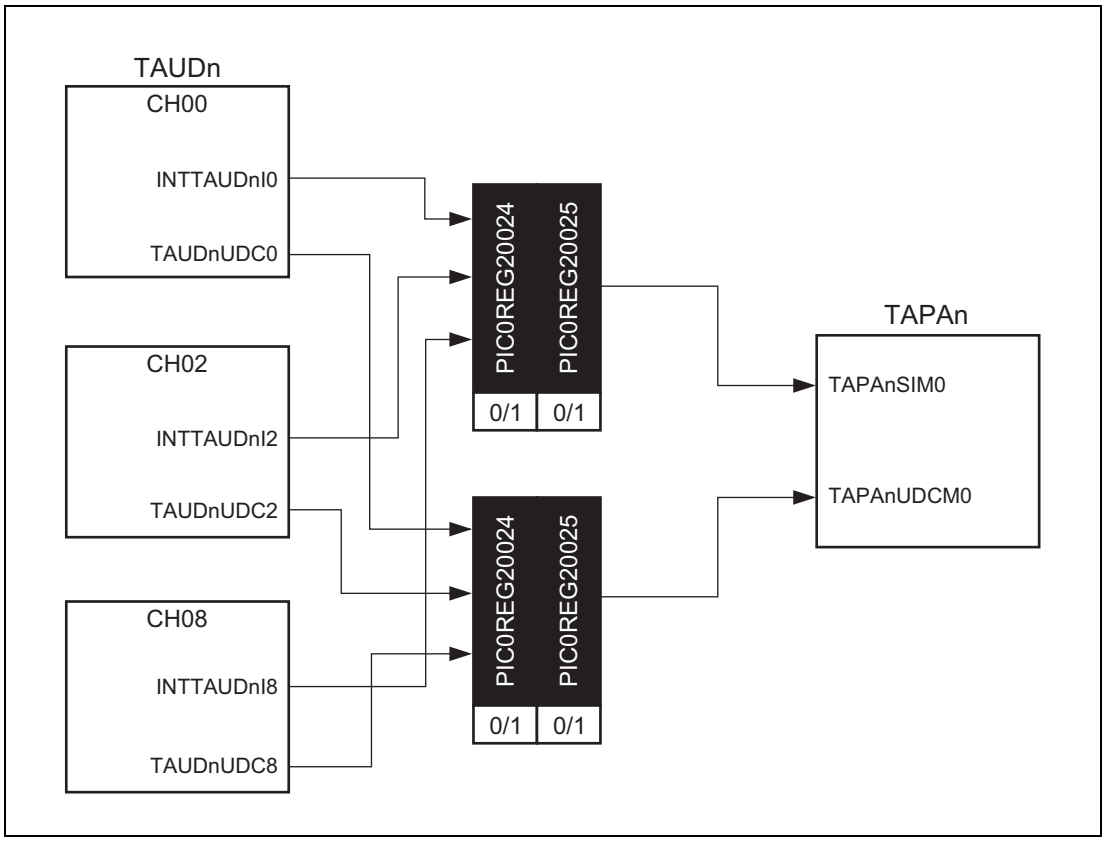

Figure 29.7 Connection of the INT Signals

29.5.3 Registers

29.5.3.1 PIC0REG2n0 — Timer I/O Control Register 2n0 (n = 0)

This register selects the TAPA0 input.

Access: This register can be read or written in 32-bit units.

Address: PIC0REG200: FFDD 00C0$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 26	Reserved	*1
25, 24	PIC0REG2n025 PIC0REG2n024	Select the TAUDn channel used by TAPATSIM0 and TAPATUDCM0. 00: Not selected 01: TAUD0 channel 0 selected 10: TAUD0 channel 2 selected 11: TAUD0 channel 8 selected
23 to 0	Reserved	*1

Note 1. Some of the bits defined as 0 in the PIC0REG2n0 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

29.6 A/D Converter Conversion Trigger Selection Function

This function outputs the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1 from the TAPATCDENS0 and TAPATCDENS1 signals, which are connected to a compare match interrupt based on the triangular carrier cycle of TAUD, or a valley interrupt signal (TAPATIVLY0).

29.6.1 Configuration of A/D Converter Conversion Trigger Selection Function

Table 29.22 Signals Used for TAPATADOUT Generation

Output Signal	Slave Match Detection Signal	Valley Interrupt Signal
TAPATADOUT0	TAPATCDENS0	TAPATIVLY0
TAPATADOUT1	TAPATCDENS1	TAPATIVLY0

Table 29.23 Operation of TAPATADOUT1 According to the Setting of TAPAnCTL1.TAPAnATS[3:2]

TAPAnATS3	TAPAnATS2	Description
0	0	Outputs the INT signal from TAPATADOUT1 while the triangle wave is falling (counting down).
0	1	Outputs the INT signal from TAPATADOUT1 while the triangle wave is rising (counting up).
1	0	Outputs the INT signal from TAPATADOUT1 while the triangle wave is rising (counting up) or falling (counting down).
1	1	Outputs the INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt TAPATIVLY0 from TAPATADOUT1.

Table 29.24 Operation of TAPATADOUT0 According to the Setting of TAPAnCTL1.TAPAnATS[1:0]

TAPAnATS1	TAPAnATS0	Description
0	0	Outputs the INT signal from TAPATADOUT0 while the triangle wave is falling (counting down).
0	1	Outputs the INT signal from TAPATADOUT0 while the triangle wave is rising (counting up).
1	0	Outputs the INT signal from TAPATADOUT0 while the triangle wave is rising (counting up) or falling (counting down).
1	1	Outputs the INT signal while the triangle wave is rising (counting up) or falling (counting down) and valley interrupt TAPATIVLY0 from TAPATADOUT0.

29.6.2 Block Diagram

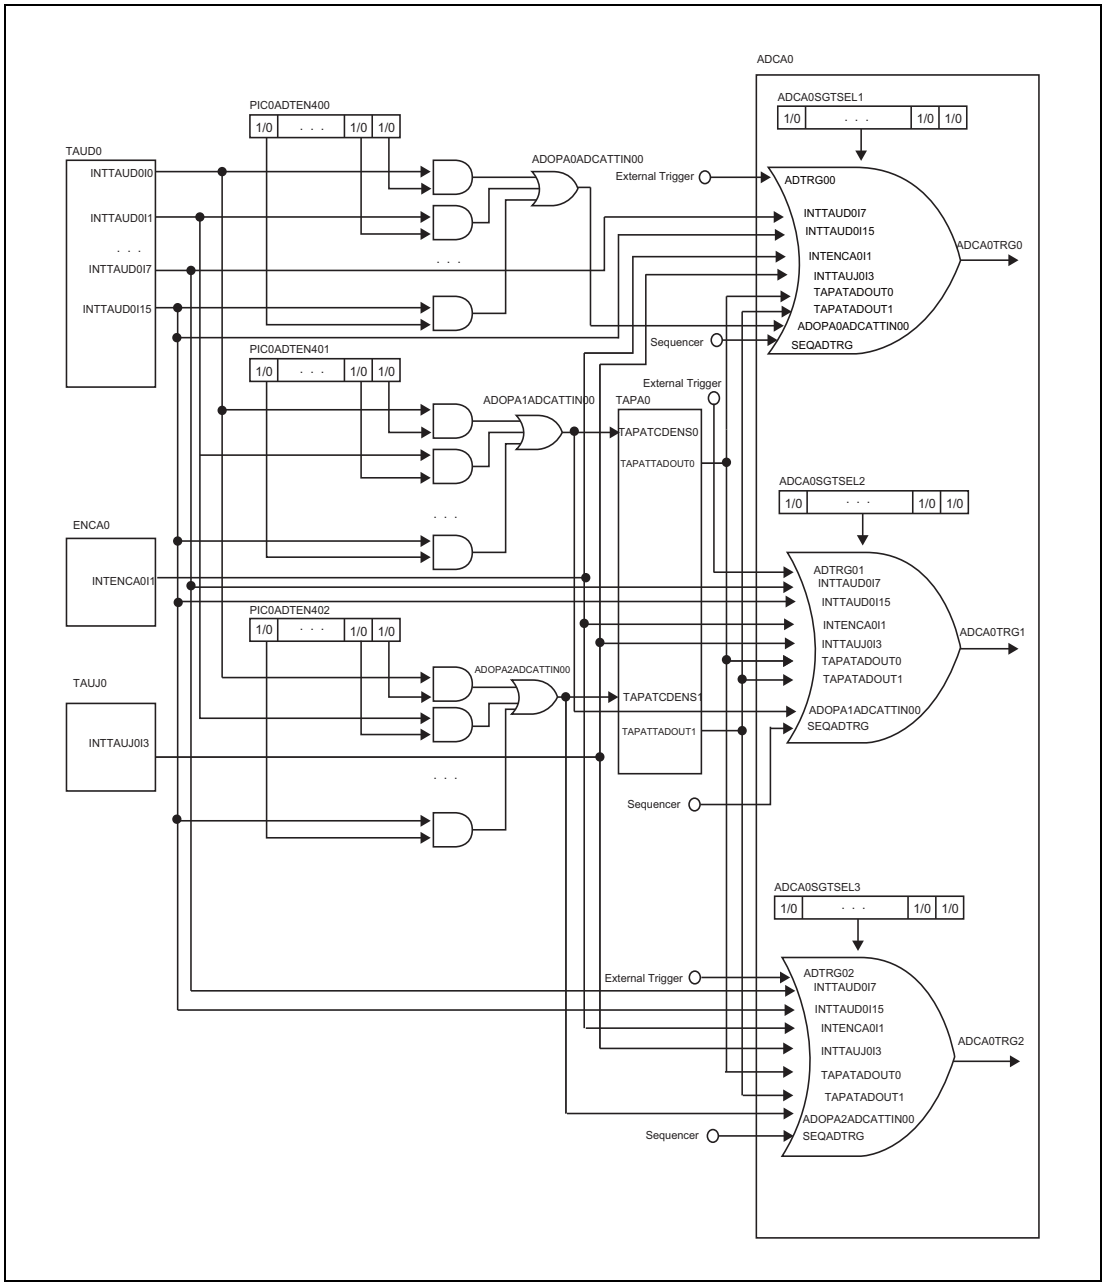

Figure 29.8 Block Diagram of A/D Conversion Trigger Selection Function

NOTE

See **Section 31.3.4.1, ADCAnSGTSELx — Scan Group x Start Trigger Control Register x** for details on the settings of the ADCA0SGTSEL register.

29.6.3 Waveforms of A/D Converter Conversion Trigger Output Control Operation in Triangle PWM Mode

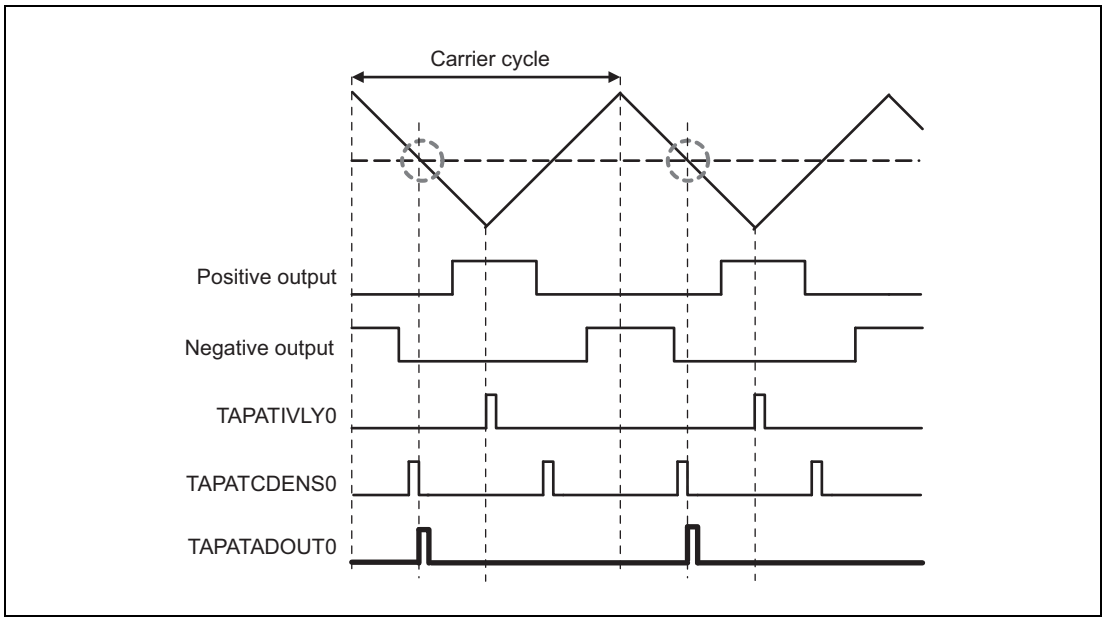

Figure 29.9 TAPAnATS[1:0] bits = 00_B: Output INT Signal while the Triangle Wave is Falling (Counting Down)

While the triangle wave is falling (counting down), the signals TAPATCDENS0 and TAPATCDENS1 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

In this case, no A/D converter conversion trigger signal is output while the triangle wave is rising (counting up).

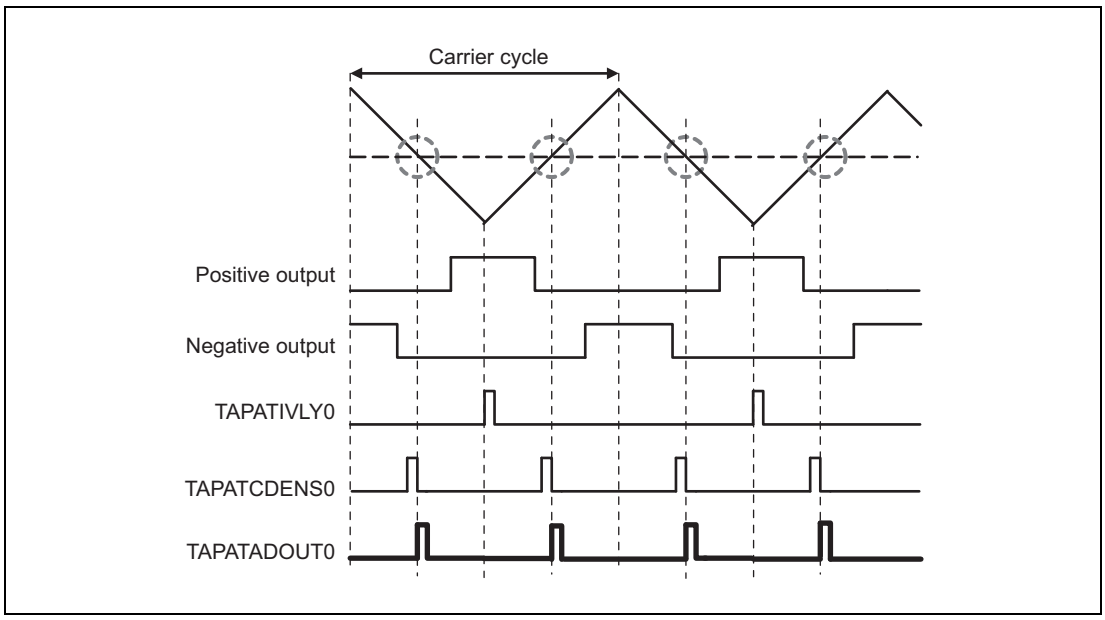

Figure 29.10 TAPAnATS[1:0] bits = 10_B: Output INT Signal while the Triangle Wave is Rising (Counting Up) or Falling (Counting Down)

The signals TAPATCDENS0 and TAPATCDENS1 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

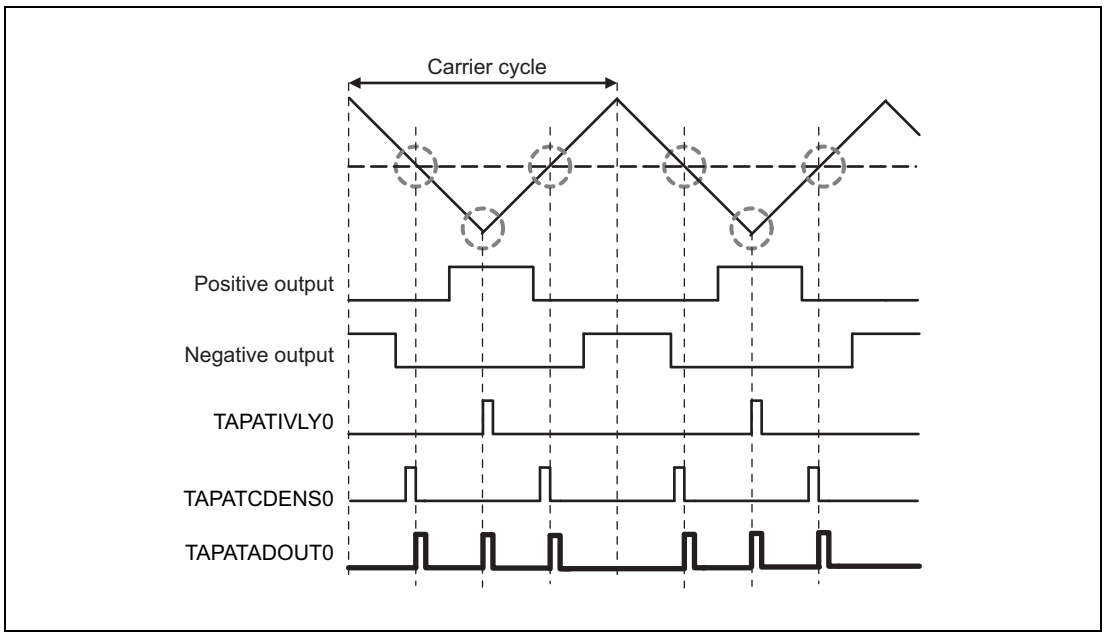

Figure 29.11 TAPAnATS[1:0] bits = 11_B: Output of INT Signal and Valley Interrupt while the Triangle Wave is Rising (Counting Up) or Falling (Counting Down)

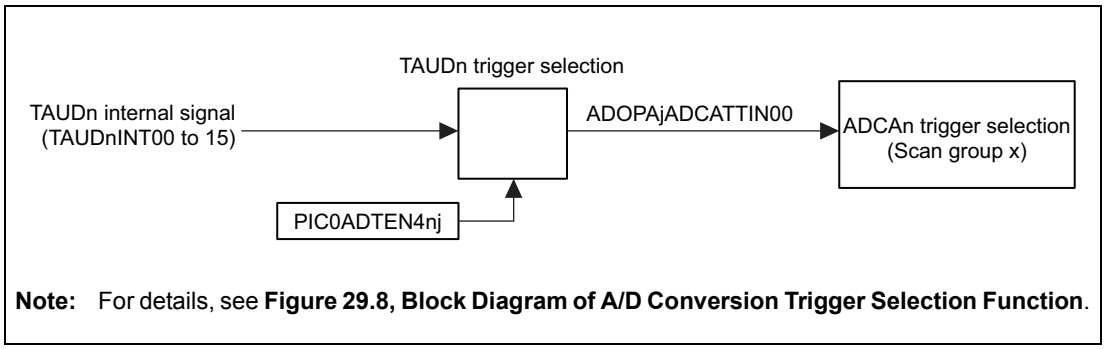
The signals TAPATCDENS0 and TAPATCDENS1 and valley interrupt TAPATIVLY0 are output as the A/D converter conversion trigger signals TAPATADOUT0 and TAPATADOUT1.

29.6.4 Operating Procedure for A/D Converter Conversion Trigger Selection Function

The operating procedure for the A/D converter conversion trigger selection function is shown below.

	Operation	Status of TAUD and TAPA
Initial setup	Initialize TAUD. Specify the timer operation mode. Set up the TAPAnCTL1 register. Specify TAPAnATS[1:0] (TAPATADOUT0 setting). Specify TAPAnATS[3:2] (TAPATADOUT1 setting). Set up the PIC0ADTEN4nj and PIC0REG2n0 registers according to the signal to be used. Specify PIC0ADTEN4nj (TAPATCDENS0 or TAPATCDENS1 setting). Specify PIC0REG2n0 (TAPATIVLY0 setting).	TAUD and TAPA stop the operation.
Start operation	Start the TAUD operation.	TAUD starts the count operation.
During operation	TAUD operates according to the setting of each function.	The A/D conversion trigger selection function outputs either TAPATADOUT0 according to the setting of TAPAnATS[1:0] or TAPATADOUT1 according to the setting of TAPAnATS[3:2], based on the interrupt TAPATCDENS1 or TAPATCDENS0, which is input from TAUD, and the valley interrupt TAPATIVLY0, which is generated by TAPA.
Stop operation	Stop the TAUD operation.	TAUD stops the count operation.



Restart

29.7 ADCA Trigger Selection Function

29.7.1 Functional Overview

This function generates ADCA hardware trigger signals by using TAUDn channel output.

29.7.2 Configuration

Note: For details, see **Figure 29.8, Block Diagram of A/D Conversion Trigger Selection Function**.

Figure 29.12 Block Diagram of ADCA Trigger Selection Function

29.7.3 Registers

29.7.3.1 PIC0ADTEN4nj — A/D Conversion Trigger Output Control Register 4nj (n = 0, j = 0 to 2)

This register selects an ADCA0 start trigger source from TAUDn channel m. (m = 0 to 15)

Access: This register can be read or written in 16-bit units.

Address: <PIC0_base> + 90H + 4 × j

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIC0ADTEN4nj15	PIC0ADTEN4nj14	PIC0ADTEN4nj13	PIC0ADTEN4nj12	PIC0ADTEN4nj11	PIC0ADTEN4nj10	PIC0ADTEN4nj09	PIC0ADTEN4nj08	PIC0ADTEN4nj07	PIC0ADTEN4nj06	PIC0ADTEN4nj05	PIC0ADTEN4nj04	PIC0ADTEN4nj03	PIC0ADTEN4nj02	PIC0ADTEN4nj01	PIC0ADTEN4nj00

Table 29.25 PIC0ADTEN4nj Register Contents

Bit Position	Bit Name	Function
15 to 0	PIC0ADTEN4nj 15 to PIC0ADTEN4nj 00	Sets a trigger source of CHm (m = 0 to 15) in the TAUDn timer. 0: A/D trigger source of CHm in the TAUDn timer is disabled. 1: A/D trigger source of CHm in the TAUDn timer is enabled.

29.7.4 Example of Operation

(1) Initial setting: Set the function of each channel of the TAUD0 to be used.

(2) Setting of the A/D conversion trigger output control register 4nj (PIC0ADTEN4nj):
Setting the bits of A/D conversion trigger output control register 4nj ((PIC0ADTEN4nj) to 1 enables selection of an interrupt request signal from each channel of the TAUD0 as the trigger of the A/D conversion scan group.

– Register setting should be performed when A/D conversion is stopped.

(3) Setting of the A/D conversion trigger selection control register (ADCA0SGTSELx):
Setting the bits corresponding to each trigger to 1 enables to use the signal generated by executing the logical OR of each trigger as the start trigger of the A/D conversion scan group.

– Register setting should be performed when the A/D conversion is stopped.

(4) Enabling of TAUD0 timer operation
Each channel of the TAUD0 timer set in (1) starts.

Table 29.28 PIC0SSER2 Register Contents

Bit Position	Bit Name	Function
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	PIC0SSER214	Enables a simultaneous start trigger for the ENCA0 timer. 0: Simultaneous start trigger is disabled. 1: Simultaneous start trigger is enabled.
13 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	PIC0SSER203 to PIC0SSER200	Set a simultaneous start trigger for the CHm in the TAUJ1 timer. 0: Simultaneous start trigger is disabled. 1: Simultaneous start trigger is enabled.

29.8.3.3 PIC0SST — Simultaneous Start Trigger Control Register

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PIC0_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SYNCTRG
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 29.29 PIC0SST Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	SYNCTRG	Generates a start trigger for the timer whose simultaneous start is enabled. When read, this bit is always read as 0. 0: Disabled. 1: Simultaneous start trigger is generated (the pulse in the width of 1PCLK is output).

29.8.4 Example of Operation

(1) Operation example of timer configuration:
The timers that operates in operation mode to be selected can be simultaneously started in any combinations.

(2) Simultaneous start enable:
Setting the relevant bits in the PIC0SSER0 and PIC0SSER2 registers of the target timers to be simultaneously started to 1 enables these timers to simultaneously start.

(3) Start trigger output:
Writing 1 to the SYNCTRG bit in the PIC0SST register enables the target timers set in (2) to simultaneously start.

(4) Repeating (2) and (3) for the channels that have not started yet enables the different target timers to simultaneously start in multiple batches.

Bit Position	Bit Name	Function
5 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 29.32 PIC0REG31 Register Contents (2/2)

Bit Position	Bit Name	Function
1	PIC0REG3101	Selects a TIN input signal to CH1 of TAUJ1. 0: CH1 of TAUJ1 is not used for trigger width measurement. 1: DT output signal of ENCAT0IEC
0	PIC0REG3100	Selects a TIN input signal to CH0 of TAUJ1. 0: CH0 of TAUJ1 is not used for trigger width measurement. 1: DT output signal of ENCAT0IEC

29.9.4 Example of Operation

The trigger and pulse width measurement function is achieved by combining the ENCA0 trigger signals (ENCAT0IEC, ENCAT0EQ0, ENCAT0EQ1) and the following functions of TAUD0 and TAUJ1.

- TAUDTTINm input pulse interval measurement function (TAUD0)
- TAUJTTINm input pulse interval measurement function (TAUJ1)

Also, the following function of PIC is used to convert the trigger signal input to TINm into a level-sensitive toggle signal.

- DT circuit

The trigger and pulse width measurement function implements measurement of the ENCA0 output trigger signal interval using the TAUDTTINm input pulse interval measurement function of TAUD0 and the TAUJTTINm input pulse interval measurement function of TAUJ1.

(1) TAUDTTINm input pulse interval measurement function, TAUJTTINm input pulse interval measurement function

When the valid TINm edge of TAUD0 or TAUJ1 is detected, the CNTm value is captured into CDRm and CNTm is cleared.

CAUTION

Set both edges (rising and falling edges) of TINm to be detected as valid (TAUD0CMURm.TAUD0TIS[1:0] = 10_B, TAUJ1CMURm.TAUJ1TIS[1:0] = 10_B) for this function.

For details of the TAUD and TAUJ functions, see the corresponding sections.

(2) DT circuit

The DT circuit is used to convert the trigger signal output from ENCA0 into a level-sensitive toggle signal.

As shown in **Figure 29.17, Operation of DT Circuit**, the output signal is toggled upon each input trigger signal generation.

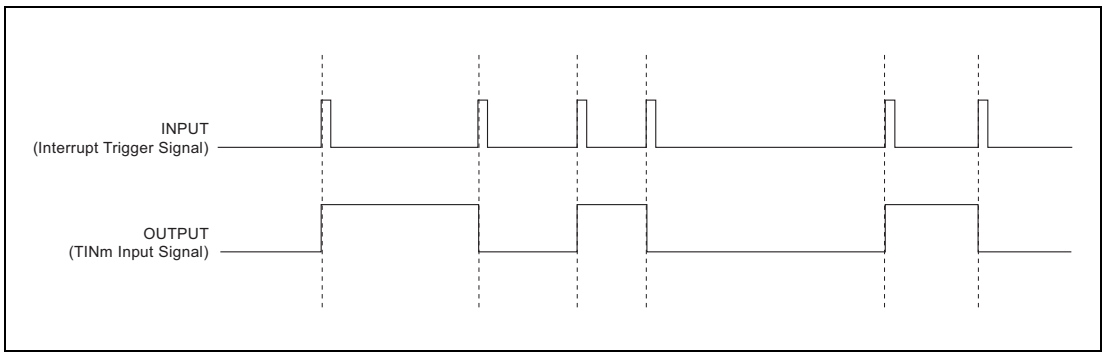

Figure 29.17 Operation of DT Circuit

PIC provides input signal conversion and signal connection to TAUD0 and TAUJ1 to measure the generation interval of trigger signals from ENCA0.

The timing chart of the trigger and pulse width measurement function is shown below.

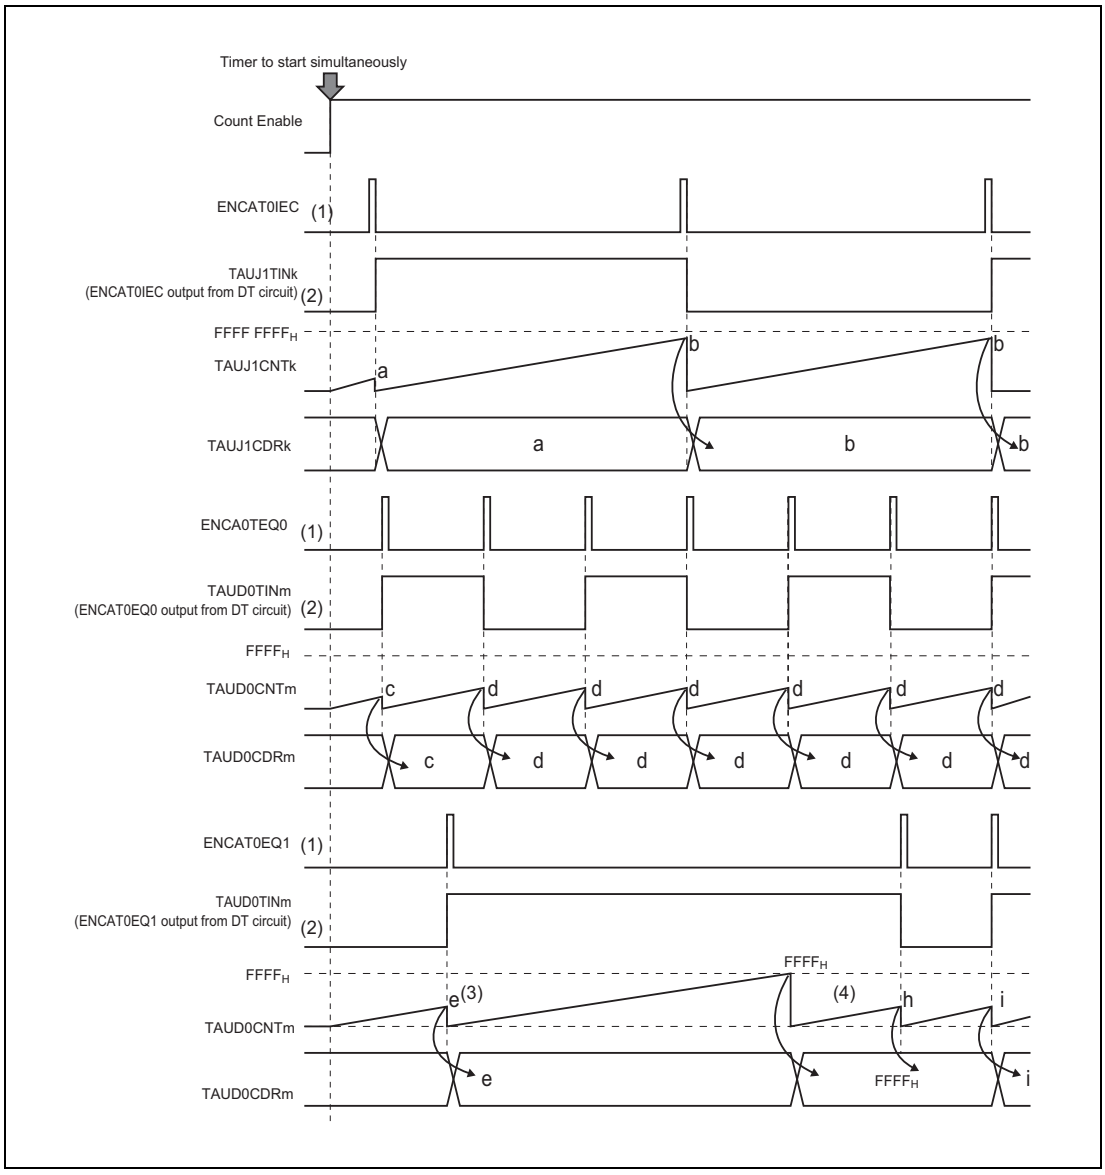

Figure 29.18 Operation Example of the Function of Trigger and Pulse Width Measurement (m = 0 to 2, k = 0, 1)

(1) The following signals are output from ENCA0 as triggers:

- ENCAT0IEC (interrupt trigger signal output when timer counter value is cleared by ENCA0EC input)
- ENCAT0EQ0 (trigger signal output according to timing of a match of timer counter value and value of compare register 0)
- ENCAT0EQ1 (trigger signal output according to timing of a match of timer counter value and value of compare register 1)

(2) The trigger signal output from ENCA0 is converted to a level-sensitive toggle signal by the DT circuit and is output to TINm of TAUD0 and TAUJ1.

(3) By setting both TINm edges (rising and falling edges) of TAUD0 and TAUJ1 as valid, the CNTm value is captured into CDRm at the TINm toggle timing and cleared to 0000_H. This operation is repeated.

The first captured value (shown as “a” in the figure) from the start of operation indicates the interval from the start of TAUJ operation until trigger input.

(4) When an overflow occurs, the count value $FFFF_H$ (FFFF $FFFF_H$ for TAUJ) is captured but the count value is not captured at the first trigger after the overflow.

With the above operation, the trigger generation interval can be measured.

The following table shows the combinations of the trigger signals and measurement timers, and the bit settings of the pertinent PIC registers for setting the signal paths and the I/O selection registers. Appropriately set these bits according to the trigger signal to be measured and the measurement timer to be used.

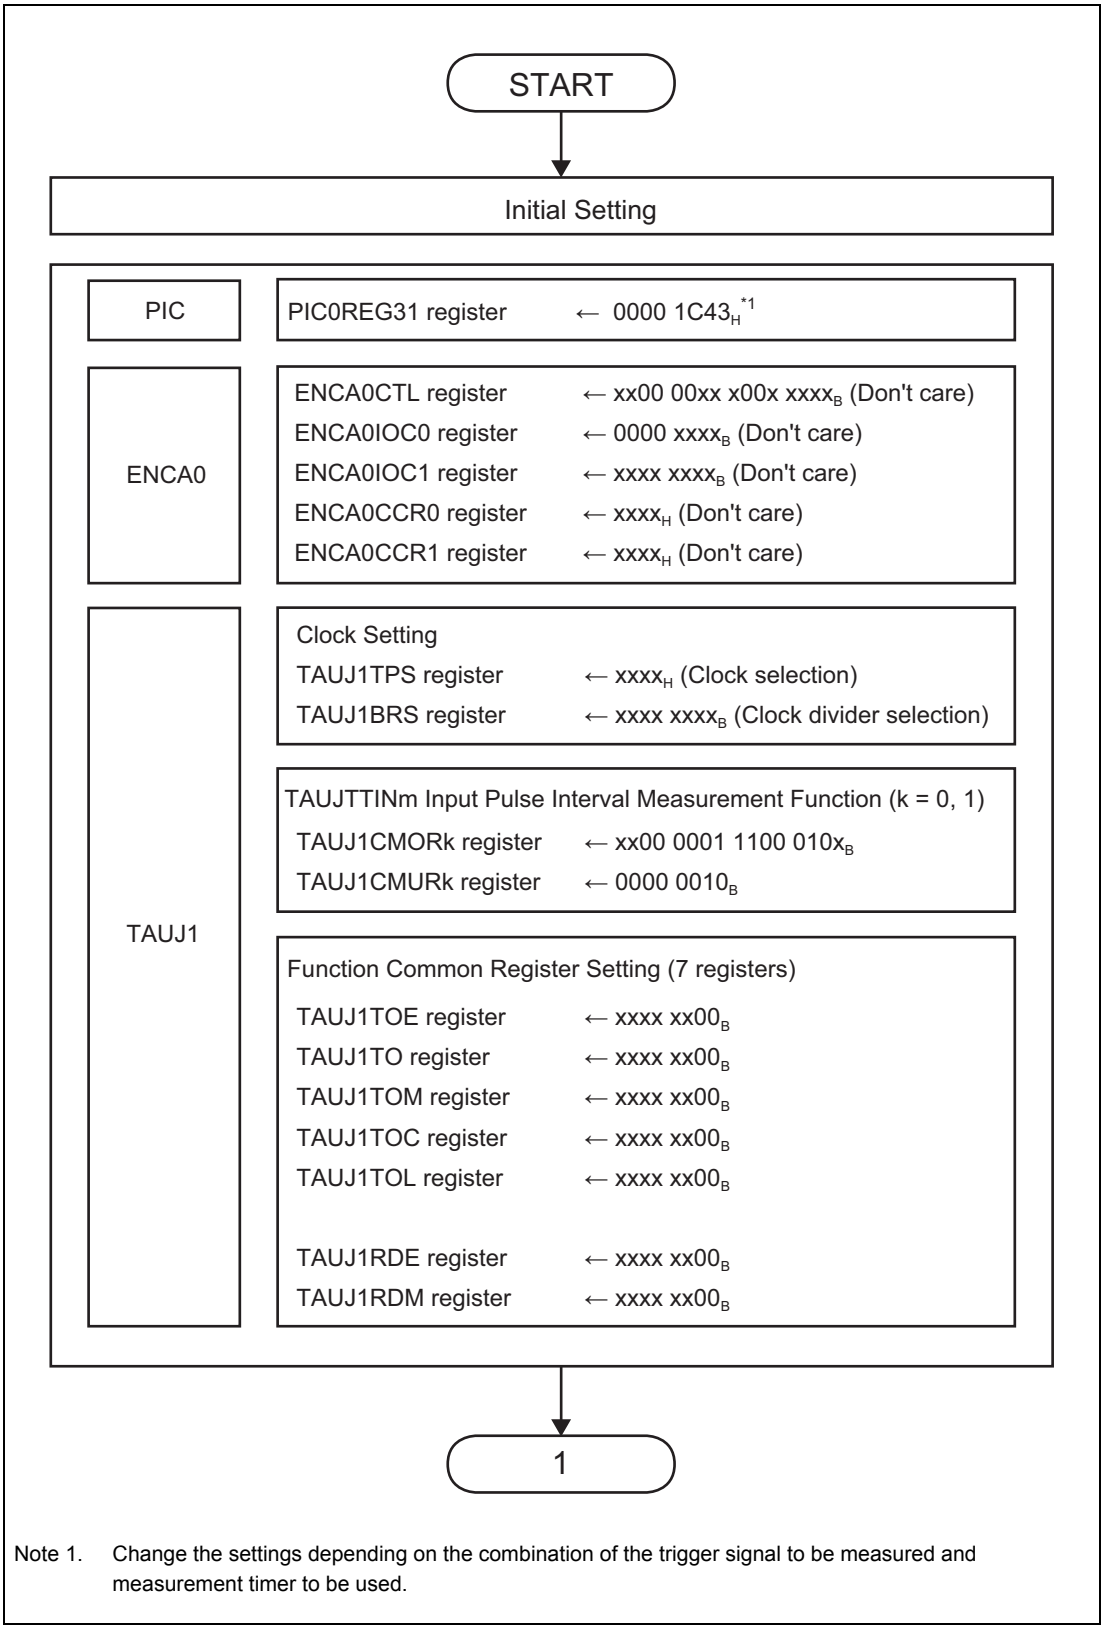

Table 29.33 Combinations of Trigger Signals and Measurement Timers

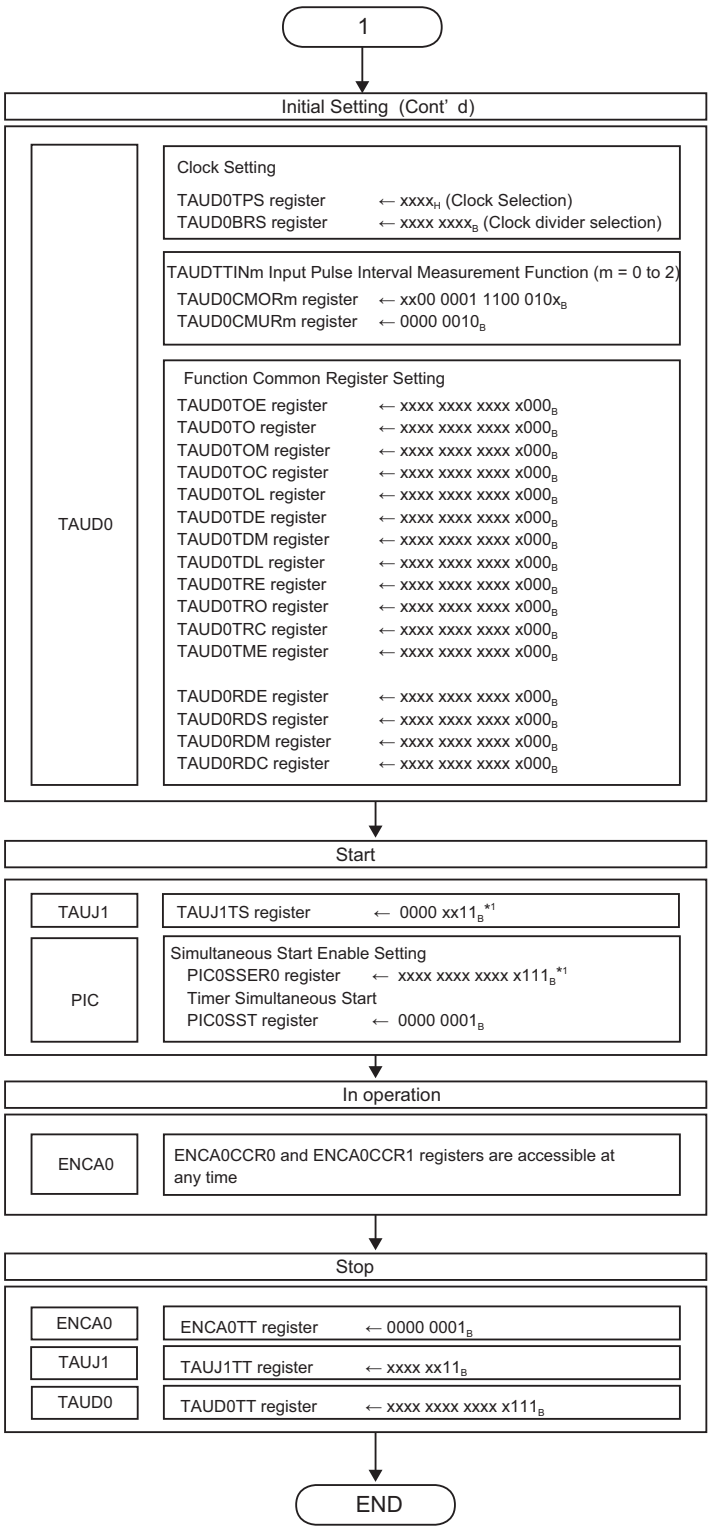
Interrupt Trigger Signal	Measurement Timer	PIC Register Bit Setting	
ENCAT0IEC	TAUJ1 CH0	PIC0REG3100 = 1	
	TAUJ1 CH1	PIC0REG3101 = 1	
ENCAT0EQ0	TAUD0 CH0	PIC0REG3109 = 0 PIC0REG3110 = 1	
	TAUD0 CH2	PIC0REG3112 = 1 PIC0REG3113 = 0	
ENCAT0EQ1	TAUD0 CH0	PIC0REG3106 = 1 PIC0REG3107 = 0 PIC0REG3108 = 0	PIC0REG3109 = 0 PIC0REG3110 = 0
	TAUD0 CH1		PIC0REG3111 = 1

29.9.5 Setup Flow



The setup flow in this section shows the general setup flow to measure the pulse interval, which applies to all the following combinations. For the combinations of the trigger signals and measurement timers, see **Table 29.33, Combinations of Trigger Signals and Measurement Timers**.

Encoder Timer	Trigger Signal	Measurement Timer
ENCA0	ENCAT0IEC	TAUJ1 CH0, TAUJ1 CH1
	ENCAT0EQ0	TAUD0 CH0, TAUD0 CH2
	ENCAT0EQ1	TAUD0 CH0, TAUD0 CH1

Note 1. Change the settings depending on the combination of the trigger signal to be measured and measurement timer to be used.

Figure 29.19 Setup Flow

Note 1. Change the settings depending on the combination of the trigger signal to be measured and measurement timer to be used.

Figure 29.20 Setup Flow (Cont'd)

29.9.6 Setting Examples for Operation Functions

This section provides example settings for each register.

The setup example shown in this section describes how to set up measurement of the pulse interval for all the combinations below. For the combinations of the trigger signals and measurement timers, see **Table 29.33, Combinations of Trigger Signals and Measurement Timers**.

Encoder Timer	Trigger Signal	Measurement Timer
ENCA0	ENCAT0IEC	TAUJ1 CH0, TAUJ1 CH1
	ENCAT0EQ0	TAUD0 CH0, TAUD0 CH2
	ENCAT0EQ1	TAUD0 CH0, TAUD0 CH1

Table 29.34 ENCA0 Setting

Register	Bit Position	Bit Name	Setting Value	Note
ENCA0CTL	15	ENCA0CME	Don't care	Enables or disables compare match interrupt detection mask
	14	ENCA0MCS	Don't care	Selects a cancelation trigger for compare match interrupt detection mask
	13 to 10		0	Fixed to 0
	9	ENCA0CRM1	Don't care	Selects the ENCA0CCR1 register function
	8	ENCA0CRM0	Don't care	Selects the ENCA0CCR0 register function
	7	ENCA0CTS	Don't care	Selects trigger for capture operation of ENCA0CCR1.
	6, 5		0	Fixed to 0
	4	ENCA0LDE	Don't care	Enables or disables reload operation when underflow is generated
	3	ENCA0ECM1	Don't care	Enables or disables clearing of the counter on compare match of ENCA0CCR1
	2	ENCA0ECM0	Don't care	Enables or disables clearing of the counter on compare match of ENCA0CCR0
	1, 0	ENCA0UDS[1:0]	Don't care	Selects the counter up/down control by ENCA0E0 and ENCA0E1
ENCA0IOC0	7 to 4		0	Fixed to 0
	3, 2	ENCA0TIS[3:2]	Don't care	Selects the valid edge for capture trigger 1 (ENCA0I1)
	1, 0	ENCA0TIS[1:0]	Don't care	Selects the valid edge for capture trigger 0 (ENCA0I0)
ENCA0IOC1	7	ENCA0SCE	Don't care	Enables encoder special-clear
	6	ENCA0ZCL	Don't care	Selects the clear level of Z phase for a encoder special-clear
	5	ENCA0BCL	Don't care	Selects the clear level of B phase for a encoder special-clear
	4	ENCA0ACL	Don't care	Selects the clear level of A phase for a encoder special-clear
	3, 2	ENCA0ECS[1:0]	Don't care	Selects encoder clear input (Z phase) edge
	1, 0	ENCA0EIS[1:0]	Don't care	Selects encoder input (A or B phase) edge

Table 29.35 TAUJ1 Setting (k = 0, 1)
TAUJ1 (TAUJTTINm Input Pulse Interval Measurement Function)

Register	Bit Position	Bit Name	Setting Value	Note
TAUJ1CMORk	15,14	TAUJ1CKS[1:0]	Don't care	Operation Clock Setting
	13,12	TAUJ1CCS[1:0]	00	
	11	TAUJ1MAS	0	
	10, 9, 8	TAUJ1STS[2:0]	001	
	7, 6	TAUJ1COS[1:0]	11	
	5		0	Fixed to 0
	4, 3, 2, 1	TAUJ1MD[4:1]	0010	
	0	TAUJ1MD0	Don't care	
TAUJ1CMURk	1, 0	TAUJ1TIS[1:0]	10	

NOTE

When TAUJ1CMORk is used for the TAUDTTINm input pulse interval measurement function, the TAUJ1CKS[1:0] (operating clock selection) and TAUJ1MD0 (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUJ1COS[1:0] (overflow mode selection) bits can also be set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see **Section 26, Timer Array Unit J (TAUJ)**.

For TAUJ common registers (TAUJ1TOE, TAUJ1TO, TAUJ1TOM, TAUJ1TOC, TAUJ1TOL,TAUJ1RDE, and TAUJ1RDM), only set the bits corresponding to the used channels to 0.

Table 29.36 TAUD0 Setting (m = 0 to 2)
TAUD0 (TAUDTTINm Input Pulse Interval Measurement Function)

Register	Bit Position	Bit Name	Setting Value	Note
TAUD0CMORm	15, 14	TAUD0CKS[1:0]	Don't care	Operation Clock Setting
	13, 12	TAUD0CCS[1:0]	00	
	11	TAUD0MAS	0	
	10 to 8	TAUD0STS[2:0]	001	
	7, 6	TAUD0COS[1:0]	11	
	5		0	Fixed to 0
	4 to 1	TAUD0MD[4:1]	0010	
	0	TAUD0MD0	Don't care	
TAUD0CMURm	1, 0	TAUD0TIS[1:0]	10	

NOTE

When TAUD0CMORm is used for the TAUDTTINm input pulse interval measurement function, the TAUD0CKS[1:0] (operating clock selection) and TAUD0MD0 (INTm output control at the start of counting) bits can be set arbitrarily.

Although the TAUD0COS[1:0] (overflow mode selection) bits can also be set arbitrarily, these bits should be fixed values as specified above for this function.

Other control bits have fixed values as specified above. For details, see **Section 25, Timer Array Unit D (TAUD)**

For TAUD common registers (TAUD0TOE, TAUD0TO, TAUD0TOM, TAUD0TOC,TAUD0TOL, TAUD0TDE, TAUD0TDM, TAUD0TDL, TAUD0TRE, TAUD0TRO,TAUD0TRC, TAUD0TME, TAUD0RDE, TAUD0RDS, TAUD0RDM, and TAUD0RDC), only set the bits corresponding to the used channels to 0.

Table 29.37 PIC Setting

Register	Bit Position	Bit Name	Setting Value	Note
PIC0REG31	13, 12	PIC0REG3113 PIC0REG3112	0 1	Selects the DT output signal from ENCAT0EQ0 as TAUD0TTIN2 input signal
	11	PIC0REG3111	1	Selects the signal selected with PIC0REG3106 to PIC0REG3108 (DT output signal from ENCAT0EQ1) as TAUD0TTIN1 input signal
	10, 9	PIC0REG3110 PIC0REG3109	1 0	Selects the DT output signal from ENCAT0EQ0 as TAUD0TTIN0 input signal
	8 to 6	PIC0REG3108 PIC0REG3107 PIC0REG3106	0 0 1	Selects the DT output signal from ENCAT0EQ1 as TAUD0TTIN1 or TAUD0TTIN0 input signal
	1	PIC0REG3101	1	Selects the DT output signal from ENCAT0IEC as TAUJ1TTIN1 input signal
	0	PIC0REG3100	1	Selects the DT output signal from ENCAT0IEC as TAUJ1TTIN0 input signal

29.10 A/D Trigger Encoder Capture Function

29.10.1 Functional Overview

The value of the encoder counter synchronized with A/D conversion can be obtained by using an A/D conversion trigger signal as a capture signal of ENCA0.

29.10.2 Configuration

(1) Configuration

Table 29.38 Configuration of A/D Trigger Encoder Capture Function

A/D Converter	Encoder Timer
ADCA0	ENCA0

(2) Block Diagram

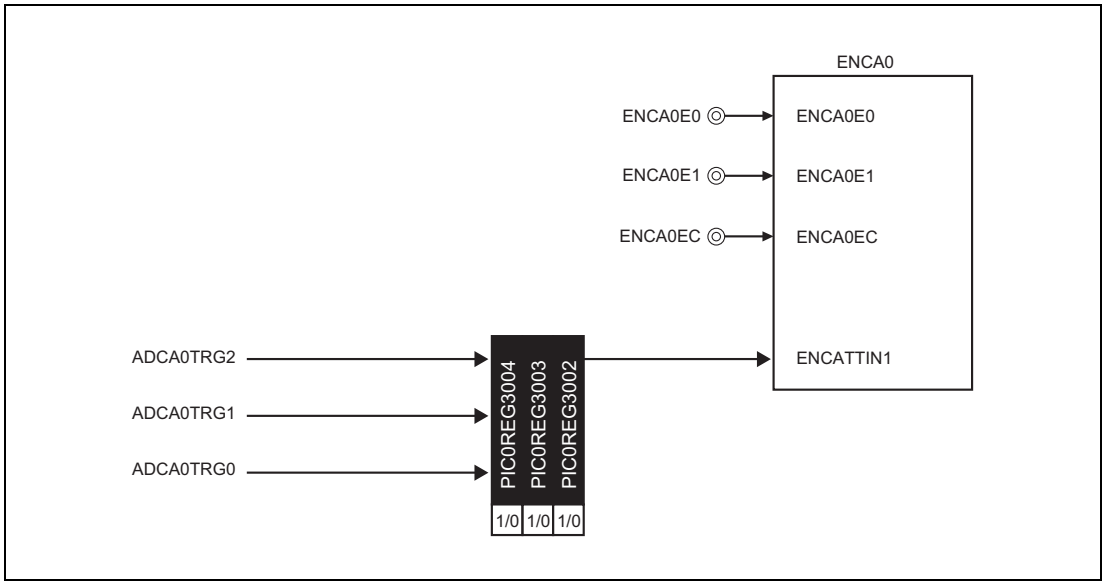


Figure 29.21 Block Diagram of A/D Trigger Encoder Capture Function

CAUTIONS

1. **It takes ENCA0 one additional clock cycle to capture the input signal of the ADCA0TRG0, ADCA0TRG1, and ADCA0TRG2 pins compared with the number of clock cycles it takes to capture the input signal of the ENCA0TIN1 pin when using CKSCLK_IPERI1, and three additional clock cycles when using CKSCLK_AADCA. Be sure to take this into account when configuring your system.**
2. **Configure the edge detection function by using the edge detection function registers of the digital noise filter, which are FCLA0CTL0_ADC0, FCLA0CTL1_ADC0, and FCLA0CTL2_ADC0 (see Section 2.12.1.4, Input Pins that Incorporate Digital Filter Type D, for details), and specify "rising edge" for edge detection of the ENCA0TIN1 capture trigger input of ENCA0 (ENCA0IOC0.ENCA0TIS [3:2] = 01_B). Do not set ENCA0IOC0.ENCA0TIS [3:2] to 10_B (falling edge) or 11_B (both edges).**

29.10.3 Registers

29.10.3.1 PIC0REG30 — Timer I/O Control Register 30

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 2	PIC0REG3004 to PIC0REG3002	Selects an input signal to ENCATTIN1.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

PIC0REG3004	PIC0REG3003	PIC0REG3002	Input signal
0	0	0	Capture is not performed by an A/D trigger signal in ENCA0.
0	1	0	ADCA0TRG2
0	1	1	ADCA0TRG1
1	0	0	ADCA0TRG0
Other than above			Setting prohibited

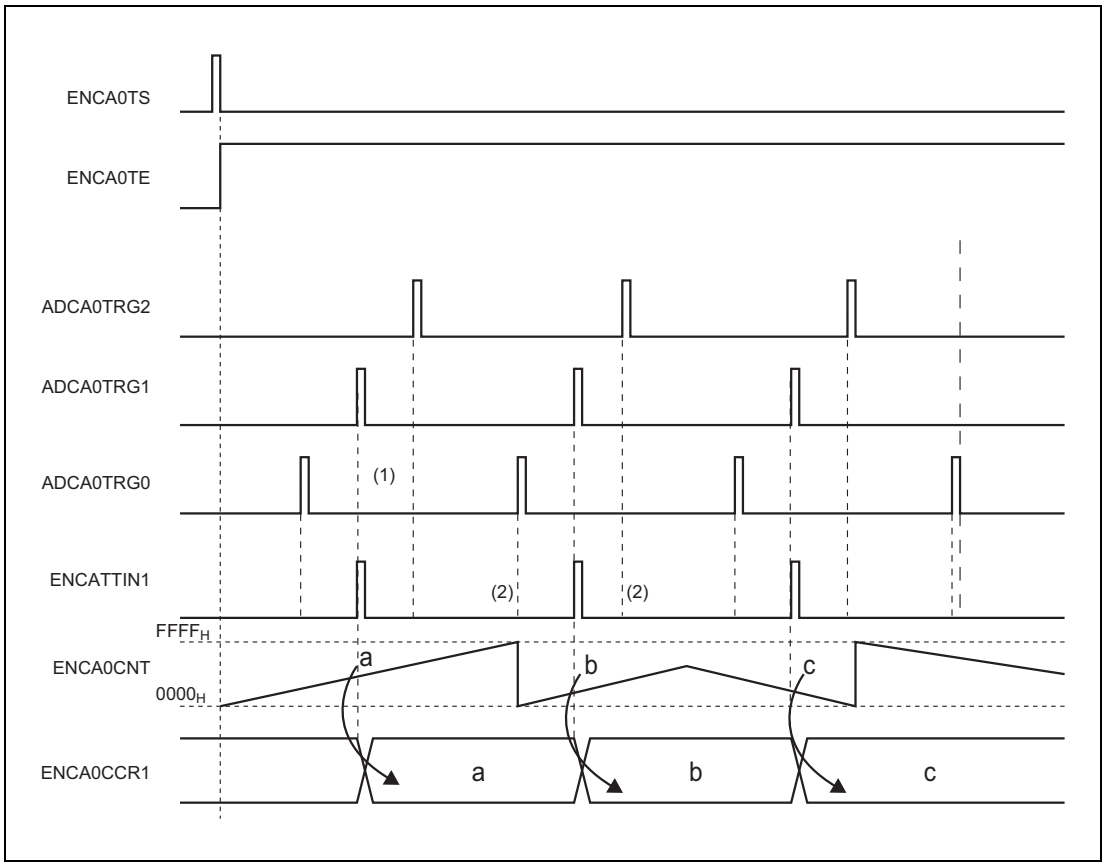
29.10.4 Example of Operation

The A/D trigger encoder capture function is implemented by connecting A/D conversion trigger signal ADCAnTRGi (n = 0, i = 0 to 2) to ENCA0.

CAUTION

When using this function, the ENCA0 interrupt signal ENCATINT1 should not be selected as the A/D converter trigger. If selected, the correct operation cannot be performed because the following loop occurs: ADCAnTRG1 generation → ENCA0 capture operation → ENCATINT1 generation by capture operation → ADCAnTRG1 generation.

The following shows a timing chart of the A/D trigger encoder capture function using the ADCA0TRG1 as a trigger.



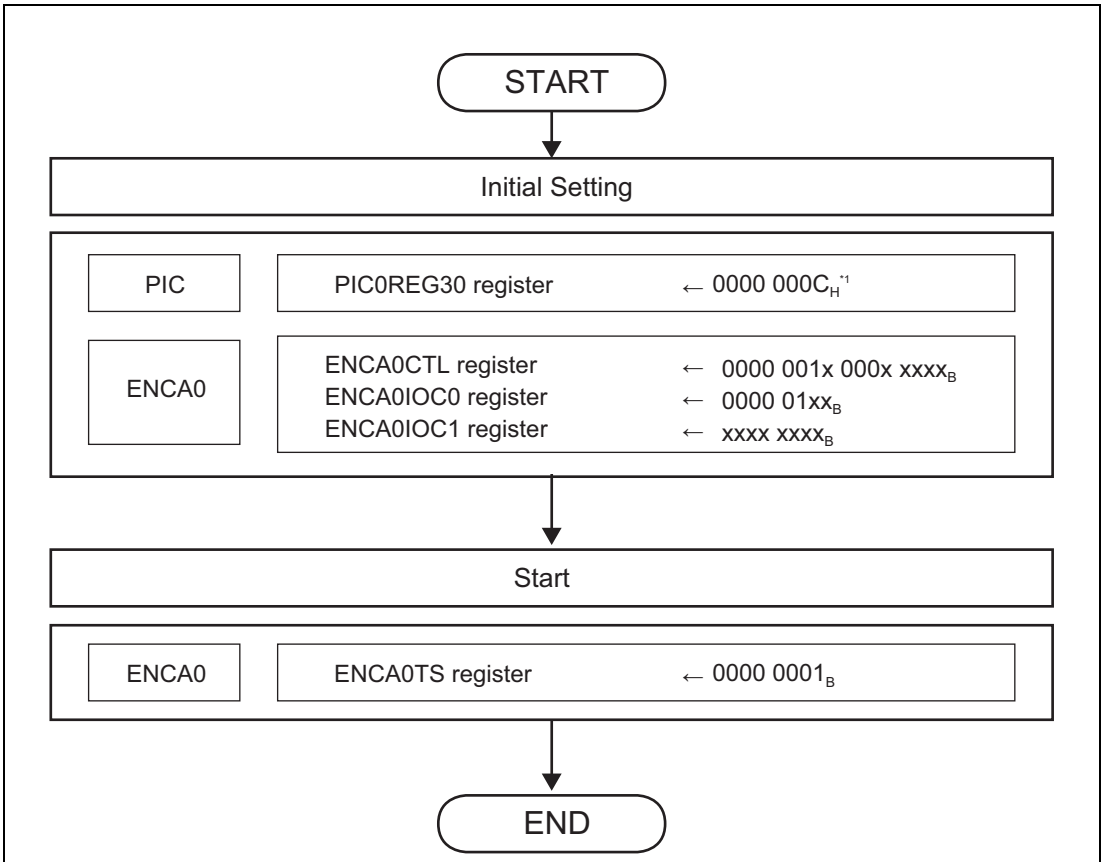


Figure 29.22 Operation Example of Trigger Encoder Capture function

(1) When ADCA0TRG1 is selected as ENCA0 capture trigger 1 signal ENCATTIN1, the valid ADCA0TRG1 is input to ENCA0 as the ENCATTIN1 signal and ENCA0 is captured.

(2) When a hardware trigger signal (ADCA0TRG0, ADCA0TRG2) other than ADCA0TRG1 is generated, the ENCATTIN1 signal is not generated and ENCA0 is not captured.

29.10.5 Setup Flow

The setup flow in this section shows the general setup flow to perform the capture operation of encoder timer ENCA0 based on the ADCA0TRG1 signal.

Note 1. Change the settings depending on the hardware trigger to perform the capture operation.

Figure 29.23 Setup Flow

29.10.6 Setting Examples for Operation Functions

This section provides example settings for each register.

The setup example shown in this section describes how to set up capture operation of encoder timer ENCA0 based on the ADCA0TRG1 signal. Change the settings depending on the hardware trigger to perform the capture operation.

Table 29.40 ENCAn Setting

Register	Bit Position	Bit Name	Setting Value	Remark
ENCAnCTL	15	ENCAnCME	0	Disables compare match interrupt detection masking
	14	ENCAnMCS	0	Selects release trigger for compare match interrupt detection masking
	13 to 10		0	Fixed to 0
	9	ENCAnCRM1	1	Sets the ENCAnCCR1 register for capture operation
	8	ENCAnCRM0	Don't care	Selects the function of ENCAnCCR0 register
	7	ENCAnCTS	0	Selects ENCATTIN1 as trigger for capture operation
	6, 5		0	Fixed to 0
	4	ENCAnLDE	Don't care	Enables or disables reload operation when ENCAnCCR0 register underflow occurs
	3	ENCAnECM1	Don't care	Enables or disables clearing of the counter on compare match of ENCAnCCR1 register
	2	ENCAnECM0	Don't care	Enables or disables clearing of the counter on compare match of ENCAnCCR0 register
	1,0	ENCAnUDS[1:0]	Don't care	Select the counter up/down control by ENCAnE0 and ENCAnE1
ENCAnIOC0	7 to 4		0	Fixed to 0
	3, 2	ENCAnTIS[3:2]	0[*1] 1[*1]	Select the valid edge of capture trigger 1 (ENCATTIN1) for the rising edge detection
	1, 0	ENCAnTIS[1:0]	Don't care	Select the valid edge of capture trigger 0 (ENCATTIN0)
ENCAnIOC1	7	ENCAnSCE	Don't care	Enables encoder special-clear
	6	ENCAnZCL	Don't care	Selects the clear level (input level) of Z phase for encoder special-clear
	5	ENCAnBCL	Don't care	Selects the clear level (input level) of B phase for encoder special-clear
	4	ENCAnACL	Don't care	Selects the clear level (input level) of A phase for encoder special-clear
	3, 2	ENCAnECS[1:0]	Don't care	Select encoder clear input (Z phase) edge
	1, 0	ENCAnEIS[1:0]	Don't care	Select encoder input (A or B phase) edge
PIC0REG30	4	PIC0REG3004	Don't care	Selects ADCA0 trigger signal of ENCATTIN1
	3	PIC0REG3003	Don't care	
	2	PIC0REG3002	Don't care	

Note 1. Change the setting depending on the hardware trigger to perform the capture operation.

NOTE

Bits ENCA0CRM1 and ENCA0CTS in ENCA0CTL are fixed: ENCA0CRM1 = 1 (ENCA0CCR1 register function) and ENCA0CTS = 0 (trigger source of capture to the ENCA0CCR1 register). All the other bits can be set arbitrarily.

29.11 Three-Phase PWM Output with Dead Time

29.11.1 Functional Overview

This feature generates each of the set signals (active level timing signals) and clear signals (inactive level timing signals) once or less per cycle and then uses the results to output a three-phase PWM waveform with dead time.

For the PWM output feature of TAUD, only the clear timing used during each cycle is specified by specifying the duty value, but for the feature described here, the set timing can also be specified, which makes more flexible PWM output with dead time possible.

29.11.2 Configuration

The unit and channel configuration for this feature is shown below. (n = 0)

Table 29.41 Configuration of Three-Phase PWM Output with Dead Time

Timer	Timer Motor Control Function
TAUD0 CH2, CH4 to CH15 (used channels fixed)	TAPA0

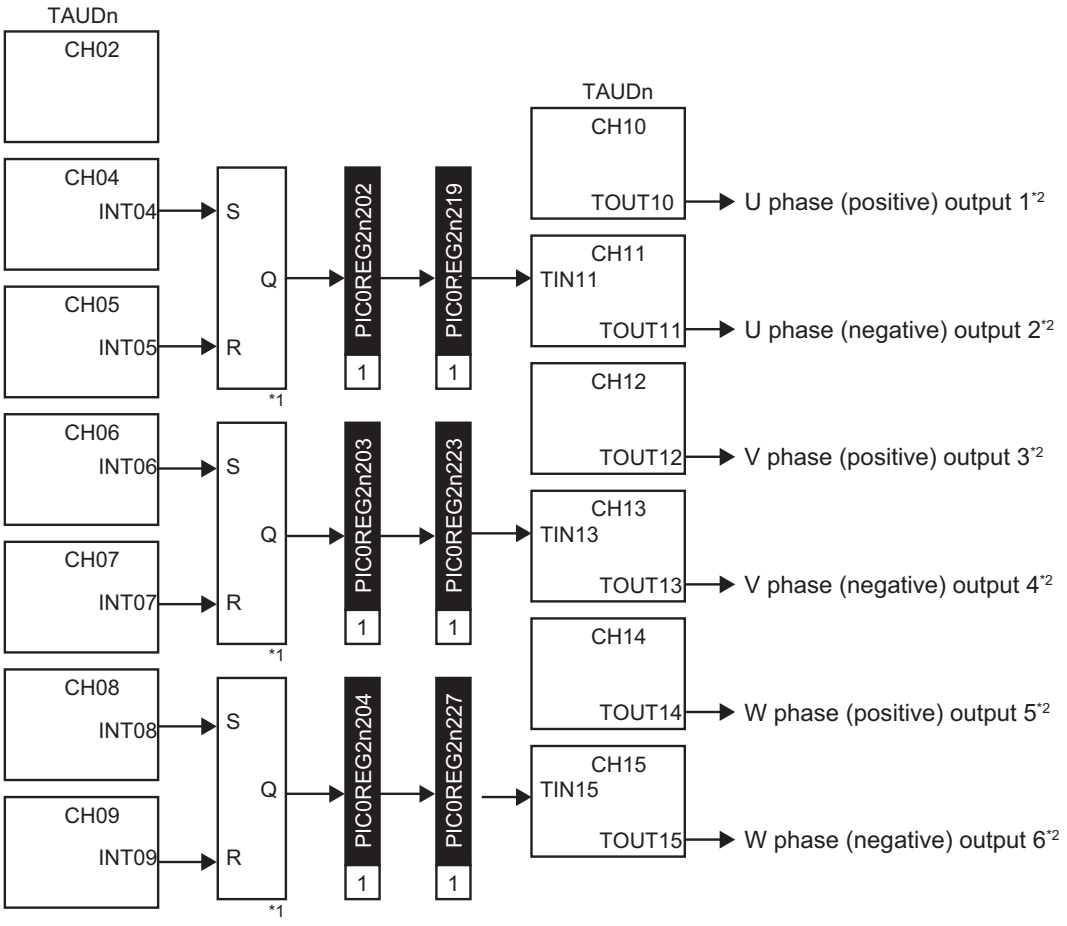
The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm → INTTAUDnIm (TAUDn channel m interrupt)
- TINm → TAUDTTINm (TAUDn channel m input)
- TOUTm → TAUDTTOUTm (TAUDn channel m output)
- CDRm → TAUDnCDRm (TAUDn channel m data register)
- CNTm → TAUDnCNTm (TAUDn channel m counter register)

(1) TAUDn configuration

Because CH10, CH12, and CH14 are only used for TOUTm, these channels can be used for features that do not use TOUTm (m = 10, 12, 14).

Table 29.42 TAUDn Configuration (1/2)



CH	Function Name	M/S	CDR Setting	Description
2	PWM output (CH2 is the master channel for CH4 to CH9.)	M	Cycle	
4		S	Duty (U phase signal setting)	
5		S	Duty (U phase signal clearing)	
6		S	Duty (V phase signal setting)	
7		S	Duty (V phase signal clearing)	
8		S	Duty (W phase signal setting)	
9		S	Duty (W phase signal clearing)	
10	Any feature that does not use TOUT10	S		TOUT10: U phase output
11	One-phase PWM output	S	Dead time (U phase)	TOUT11: UB phase output
12	Any feature that does not use TOUT12	S		TOUT12: V phase output

Table 29.42 TAUDn Configuration (2/2)

CH	Function Name	M/S	CDR Setting	Description
13	One-phase PWM output	S	Dead time (V phase)	TOUT13: VB phase output
14	Any feature that does not use TOUT14	S		TOUT14: W phase output
15	One-phase PWM output	S	Dead time (W phase)	TOUT15: WB phase output

Note: M: Master channel, S: Slave channel

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PIC0REG2n204	PIC0REG2n203	PIC0REG2n202	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R

Table 29.43 PIC0REG2n2 Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	*1
27	PIC0REG2n227	Selects the signal input to TAUDTTIN15. **PIC0REG2n227** / **Input signal** 1 / Signal selected by the PIC0REG2n204 bit. Other than above / Setting prohibited
26 to 24	Reserved	*1
23	PIC0REG2n223	Selects the signal input to TAUDTTIN13. **PIC0REG2n223** / **Input signal** 1 / Signal selected by the PIC0REG2n203 bit. Other than above / Setting prohibited
22 to 20	Reserved	*1
19	PIC0REG2n219	Selects the signal input to TAUDTTIN11. **PIC0REG2n219** / **Input signal** 1 / Signal selected by the PIC0REG2n202 bit Other than above / Setting prohibited
18 to 5	Reserved	*1
4	PIC0REG2n204	Selects the TIN input signal to TAUDTTIN15. 0: Setting prohibited 1: Select the set/clear output according to INTTAUDnI8 and INTTAUDnI9.
3	PIC0REG2n203	Selects the TIN input signal to TAUDTTIN13. 0: Setting prohibited 1: Select the set/clear output according to INTTAUDnI6 and INTTAUDnI7.
2	PIC0REG2n202	Selects the TIN input signal to TAUDTTIN11. 0: Setting prohibited 1: Select the set/clear output according to INTTAUDnI4 and INTTAUDnI5.
1, 0	Reserved	*1

Note 1. Some of the bits defined as 0 in the PIC0REG2n2 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

29.11.3.2 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0)

The PIC0HIZCENn register selects the Hi-Z output control input signal of TAPAn.

Access: This register can be read or written in 8-bit units.

Address: <PIC0_base> + 80_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	PIC0HIZCENn6	—	—	—	PIC0HIZCENn2	—	PIC0HIZCENn0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R	R	R	R/W	R	R/W

Table 29.44 PIC0HIZCENn Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	PIC0HIZCENn6	Selects whether to enable or disable Hi-Z output control by the INTADCA0ERR interrupt signal. 0: Disable 1: Enable
5 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PIC0HIZCENn2	Selects whether to enable or disable Hi-Z output control by the WDTA1NMI interrupt signal. 0: Disable 1: Enable
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC0HIZCENn0	Selects whether to enable or disable Hi-Z output control by the TAPAnESO pin input. 0: Disable 1: Enable

29.11.4 Operation Example

This example shows how to generate each of the set signals and clear signals once or less per cycle and then use the results to output a three-phase PWM waveform with dead time.

This is achieved by combining the following TAUD features:

- PWM output
- One-phase PWM output

In addition, the following peripheral interconnections are used to create the PWM waveform supplied from the set and clear signals generated during PWM output to the input TINm signal (m = 11, 13, or 15) of one-phase PWM output:

- SR flip-flop circuit

Three-phase PWM output is achieved by assigning the one-phase PWM output with dead time achieved using the above features to the U, V, and W phases. Therefore, the set and clear signals of PWM output can be freely specified for each PWM phase. Because the only difference among phases is the assigned channel, only one phase (the U phase) is described below.

29.11.4.1 Pwm Output

PWM output uses a combination of CH2, CH4, and CH5.

By specifying the cycle for CDR02, the U phase set value for CDR04, and the U phase clear value for CDR05, a set/clear signal is generated for the SR flip-flop circuit that generates the input TIN11 signal of one-phase PWM output from INT04 and INT05.

Instead of CH4 and CH5, which are used for the above described U phase set/clear signal generation, the V phase uses CH6 and CH7, and the W phase uses CH8 and CH9.

29.11.4.2 One-Phase PWM Output

One-phase PWM output is generated from TOUT10 and TOUT11 by using a combination of CH10 and CH11.

By specifying the dead time value for CDR11, a one-phase PWM signal with dead time is output for the TIN11 input.

Similarly, the V phase uses CH12 and CH13 to output a one-phase PWM signal with dead time, while the W phase uses CH14 and CH15.

CAUTION

Specify the same clock for each TAUDn channel that uses the PWM output and one-phase PWM output features.

For details about the TAUD functions, see **Section 25, Timer Array Unit D (TAUD)**.

29.11.4.3 SR Flip-Flop Circuit

The PWM waveform supplied to input TIN11 of one-phase PWM output is generated by using the U phase set signal generated by CH4 of TAUD and the U phase clear signal generated by CH5.

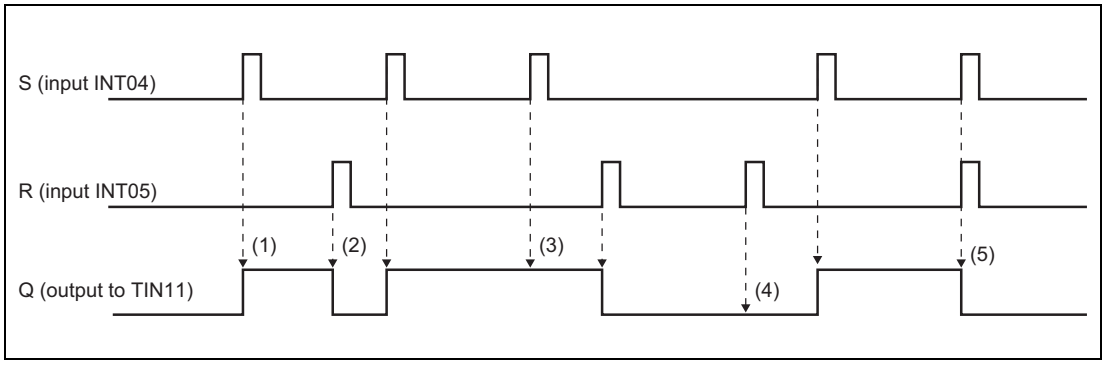

Figure 29.26 SR Flip-Flop Circuit Operation Timing Chart (U phase example)

(1) When a signal is input to input S, output Q goes to the high level at the rising edge of S.

(2) When a signal is input to input R, output Q goes to the low level at the rising edge of R.

(3) If a signal is input to input S while output Q is at the high level, output Q is not affected.

(4) If a signal is input to input R while output Q is at the low level, output Q is not affected.

(5) If a signal is input to input S and input R at the same time, input R is prioritized and output Q goes to the low level at the rising edge of R.

The V phase uses INT06 and INT07 as input to supply a PWM waveform to TIN13, and the W phase uses INT08 and INT09 as input to supply a PWM waveform to TIN15.

The output change timing of the PWM waveform generated during one-phase PWM output is based on PWM output.

The active level output timing set signal and inactive level output timing clear signal of PWM are generated during PWM output. By inputting these signals to the SR flip-flop circuit, a PWM signal that can be changed at any time is generated.

A one-phase PWM signal is output by generating a positive or negative PWM waveform and then adding dead time to it according to changes in the generated PWM signal.

PIC is used to set/clear signal generated during PWM output as the TIN input for one-phase PWM output through the SR flip-flop circuit.

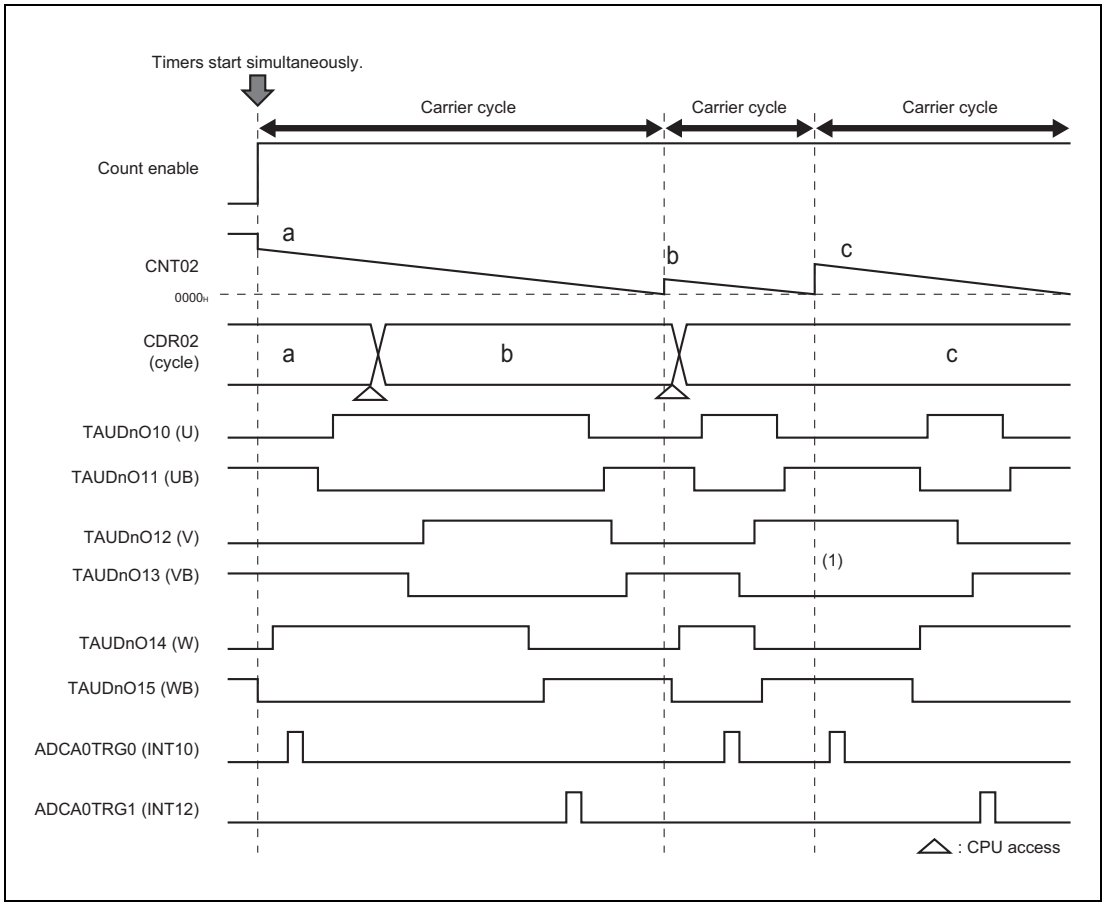

Figure 29.27 Example of Three-Phase PWM (U/UB, V/VB, W/WB) Output with Dead Time

Figure 29.27 shows a typical example of three-phase PWM output with dead time.

By appropriately setting up the set/clear signal output timing, PWM output that extends across carrier cycles (point (1)) and other types of output are also possible.

In this example, ADCA0TRG0 and ADCA0TRG1 (which are at the bottom) use the CNT and INT signals of CH10 and CH12, which are not used for one-phase PWM output, and the A/D trigger signal is output by performing type-1 A/D trigger output.

In this way, because only the TOUTm signal that performs signal output for the channel performing positive phase output is used during one-phase PWM output, any feature that uses CNTm, CDRm, or INTm can be specified. For details, see **Section 25, Timer Array Unit D (TAUD)** (m = 10, 12, or 14).

The following figures show timing charts for outputting a three-phase PWM signal with dead time.

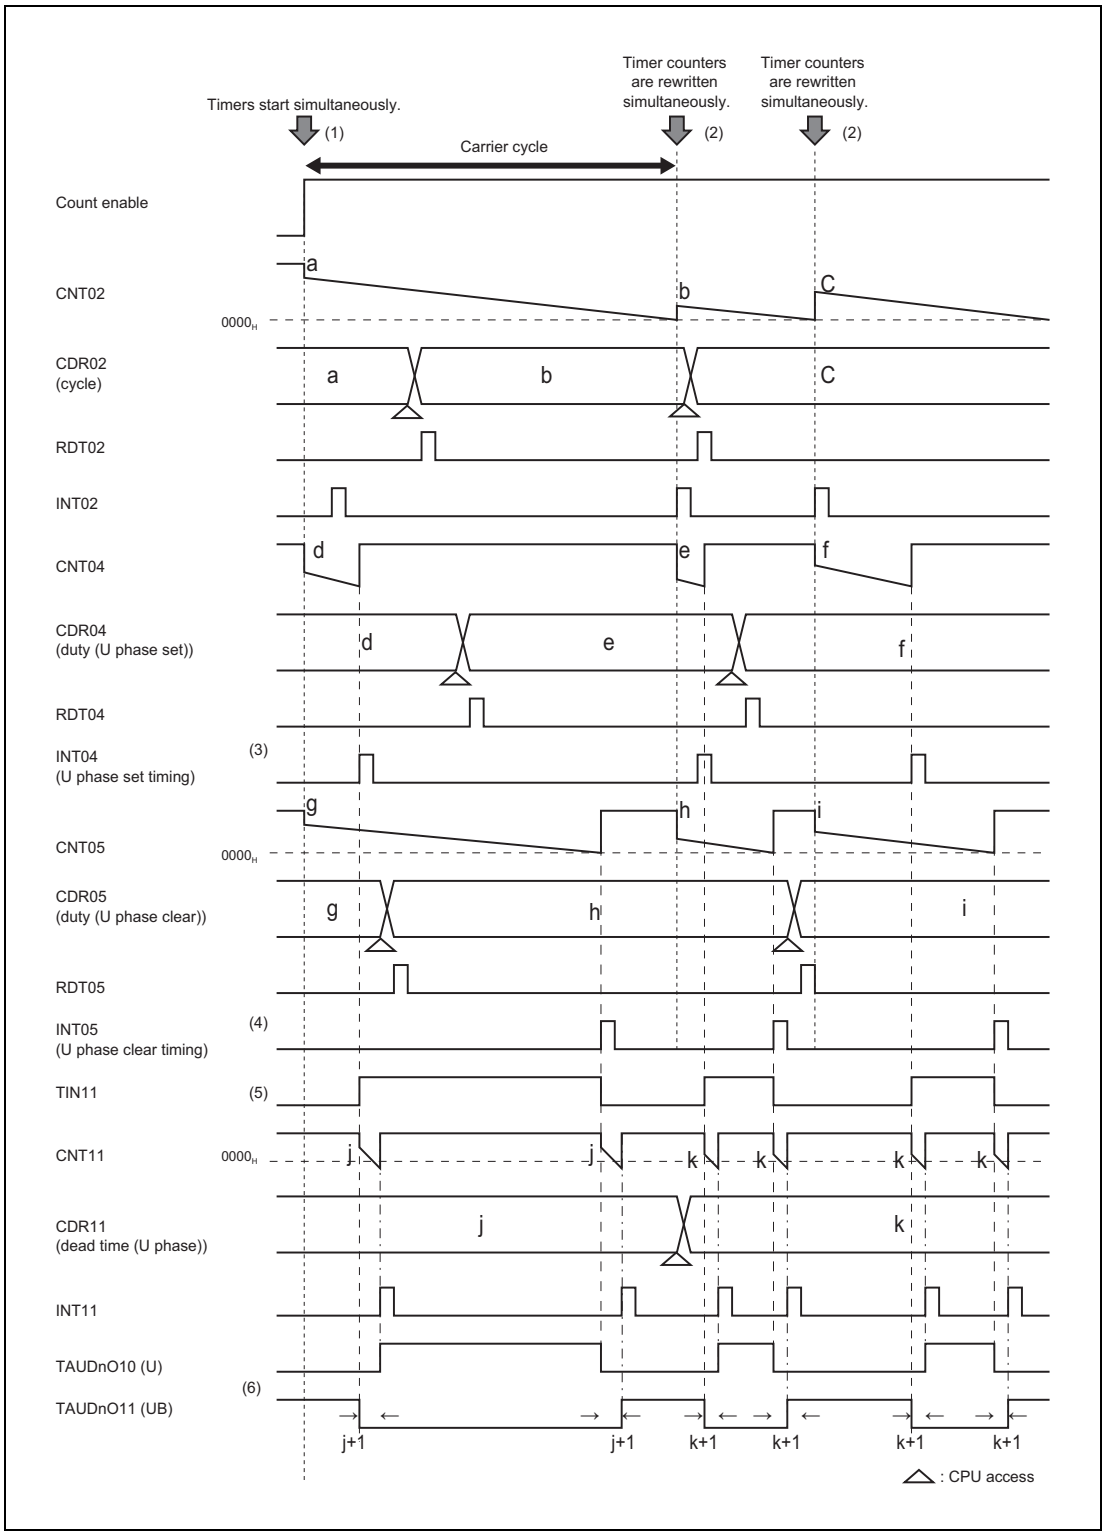

Figure 29.28 Example of One-Phase PWM (U phase, UB phase) Output with Dead Time

An operation example of the timer configuration for performing the U phase PWM output in **Figure 29.28** is provided below.

(1) By simultaneously starting timers, CH2 (the carrier cycle timer), CH4 (the U phase set signal output timing timer), and CH5 (the U phase clear signal output timing timer) are started simultaneously.
The CH11 timer is also enabled, but until a TIN11 edge is detected, which is the count start timing, counting is not performed.

(2) For CH4 and CH5, when there is a CH2 underflow, the settings from CDR04 and CDR05 are reloaded to CNT04 and CNT05.

(3) When there is a CH4 underflow, the U phase set timing signal (INT04) is generated.

(4) When there is a CH5 underflow, the U phase clear timing signal (INT05) is generated.

(5) The peripheral interconnections supply the output of the SR flip-flop circuit that uses INT04 (the set timing signal) and INT05 (the clear timing signal) as input to the input TIN11 signal of one-phase PWM output.

(6) During one-phase PWM output, a PWM waveform with dead time is output by detecting a TIN11 edge.

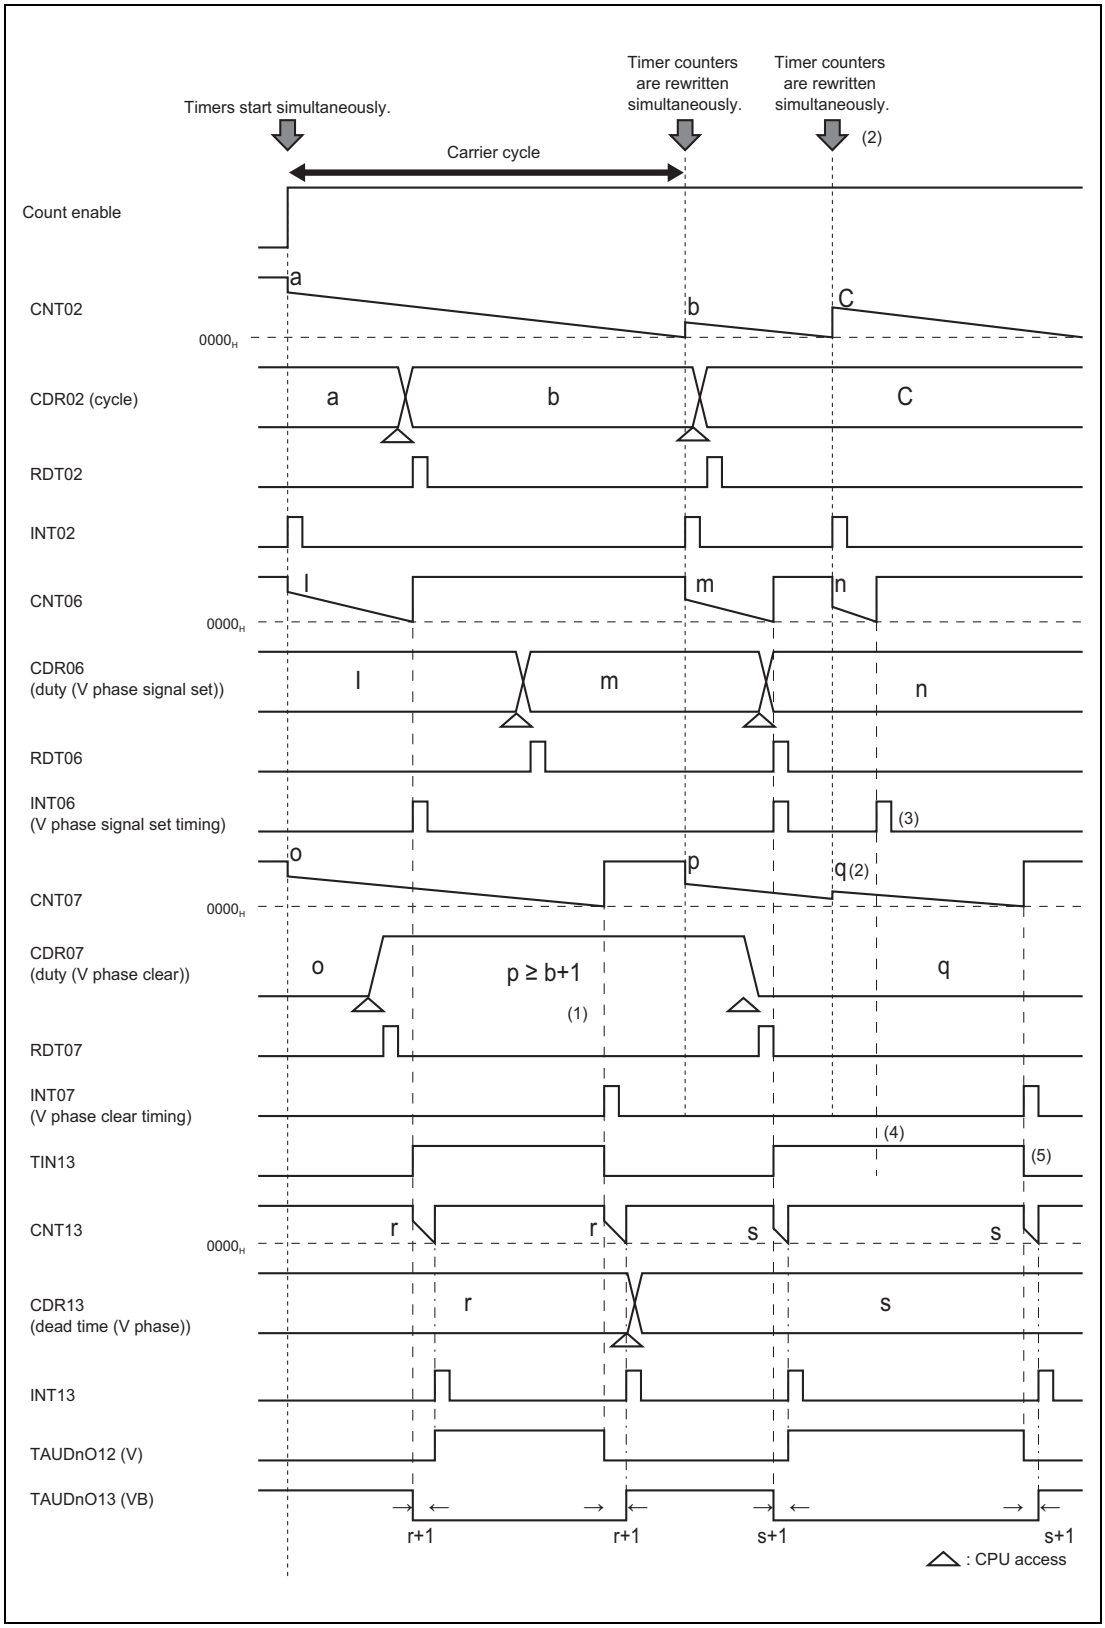

Figure 29.29 Example of One-Phase PWM (V phase, VB phase) Output with Dead Time

An operation example of the timer configuration for performing the V phase PWM output in **Figure 29.29** is provided below.

For details about the operations from when timers are simultaneously started until a one-phase PWM signal is output, see the U phase operation example.

(1) If the setting of CH7 (the V phase clear signal output timing timer), which generates the V phase clear timing signal (INT07), is greater than the CH2 (the carrier cycle timer) setting.

(2) Before a V phase clear timing signal (INT07) is generated by a CH7 underflow, a CH2 (carrier cycle timer) underflow occurs, and the CH7 setting is reloaded.

(3) It causes the V phase clear timing signal (INT07) not to be generated, resulting in consecutive generation of the V phase set timing signal (INT06).

(4) In this case, because the V phase set timing signal (INT06) is ignored by the SR flip-flop circuit, there is no effect on the PWM output waveform. Therefore, a PWM waveform that extends across carrier cycles is output.

(5) The PWM output is changed at the timing of the next V phase clear timing signal (INT07).

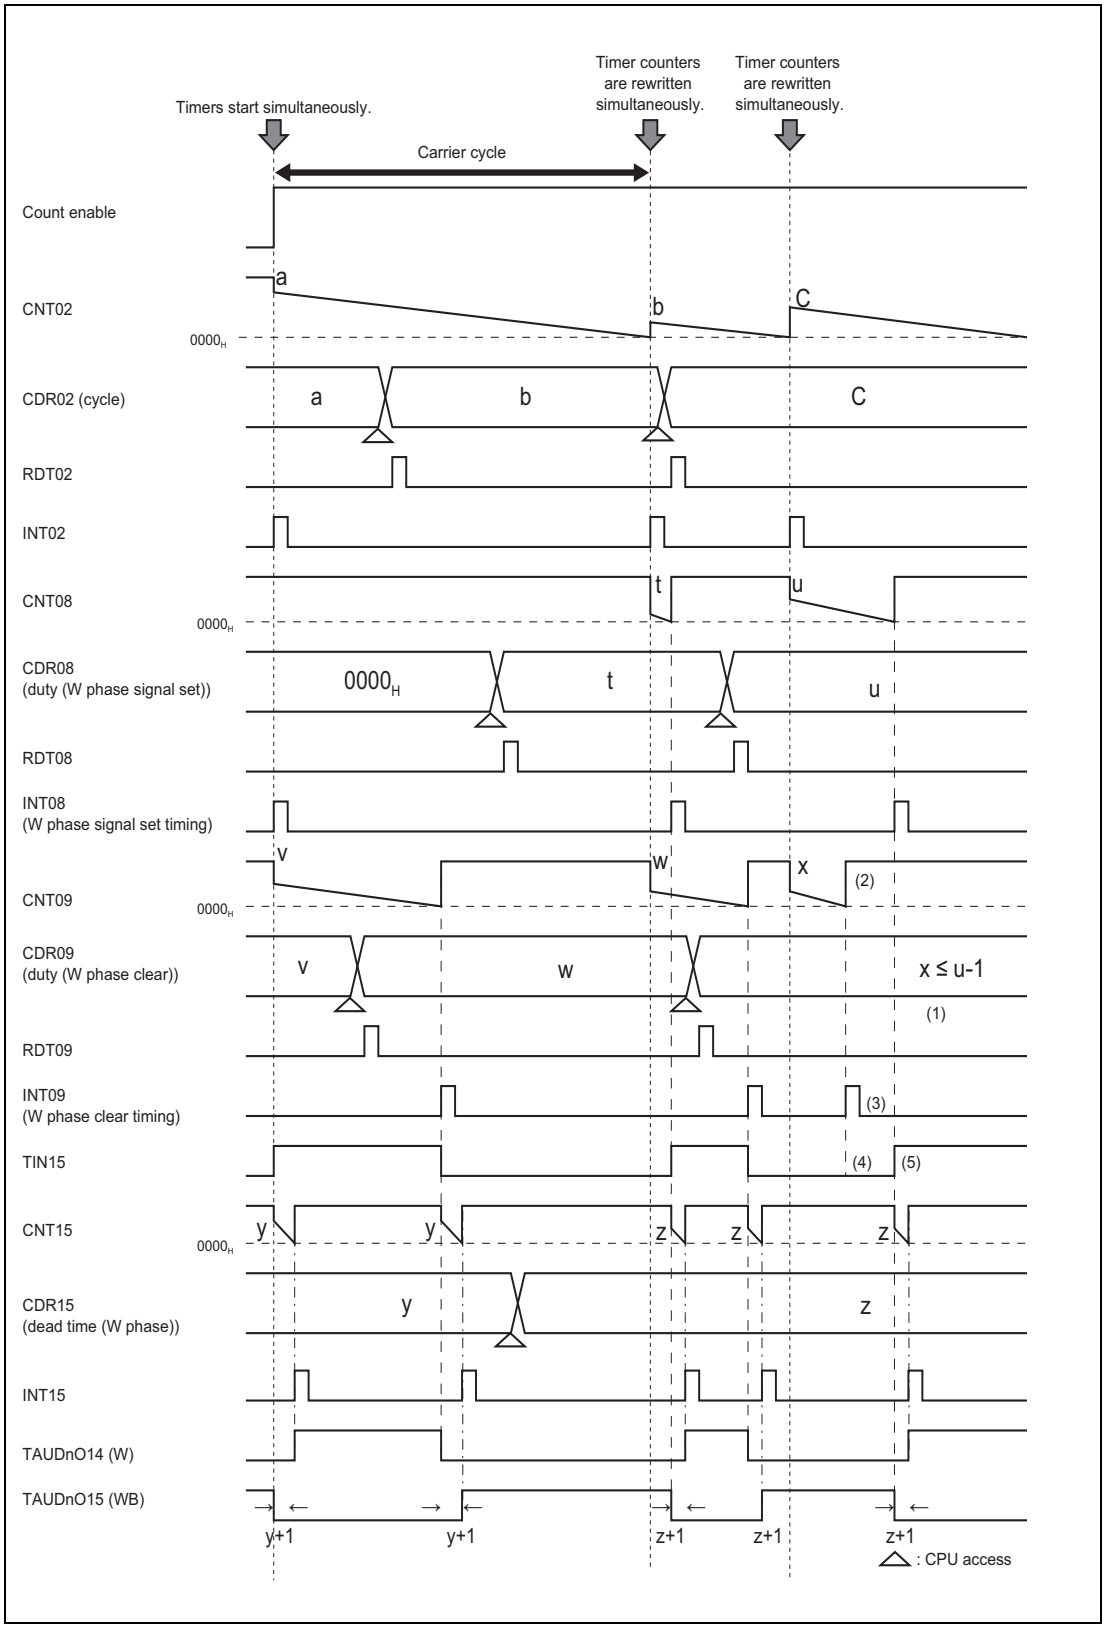

Figure 29.30 Example of One-Phase PWM (W phase, WB phase) Output with Dead Time

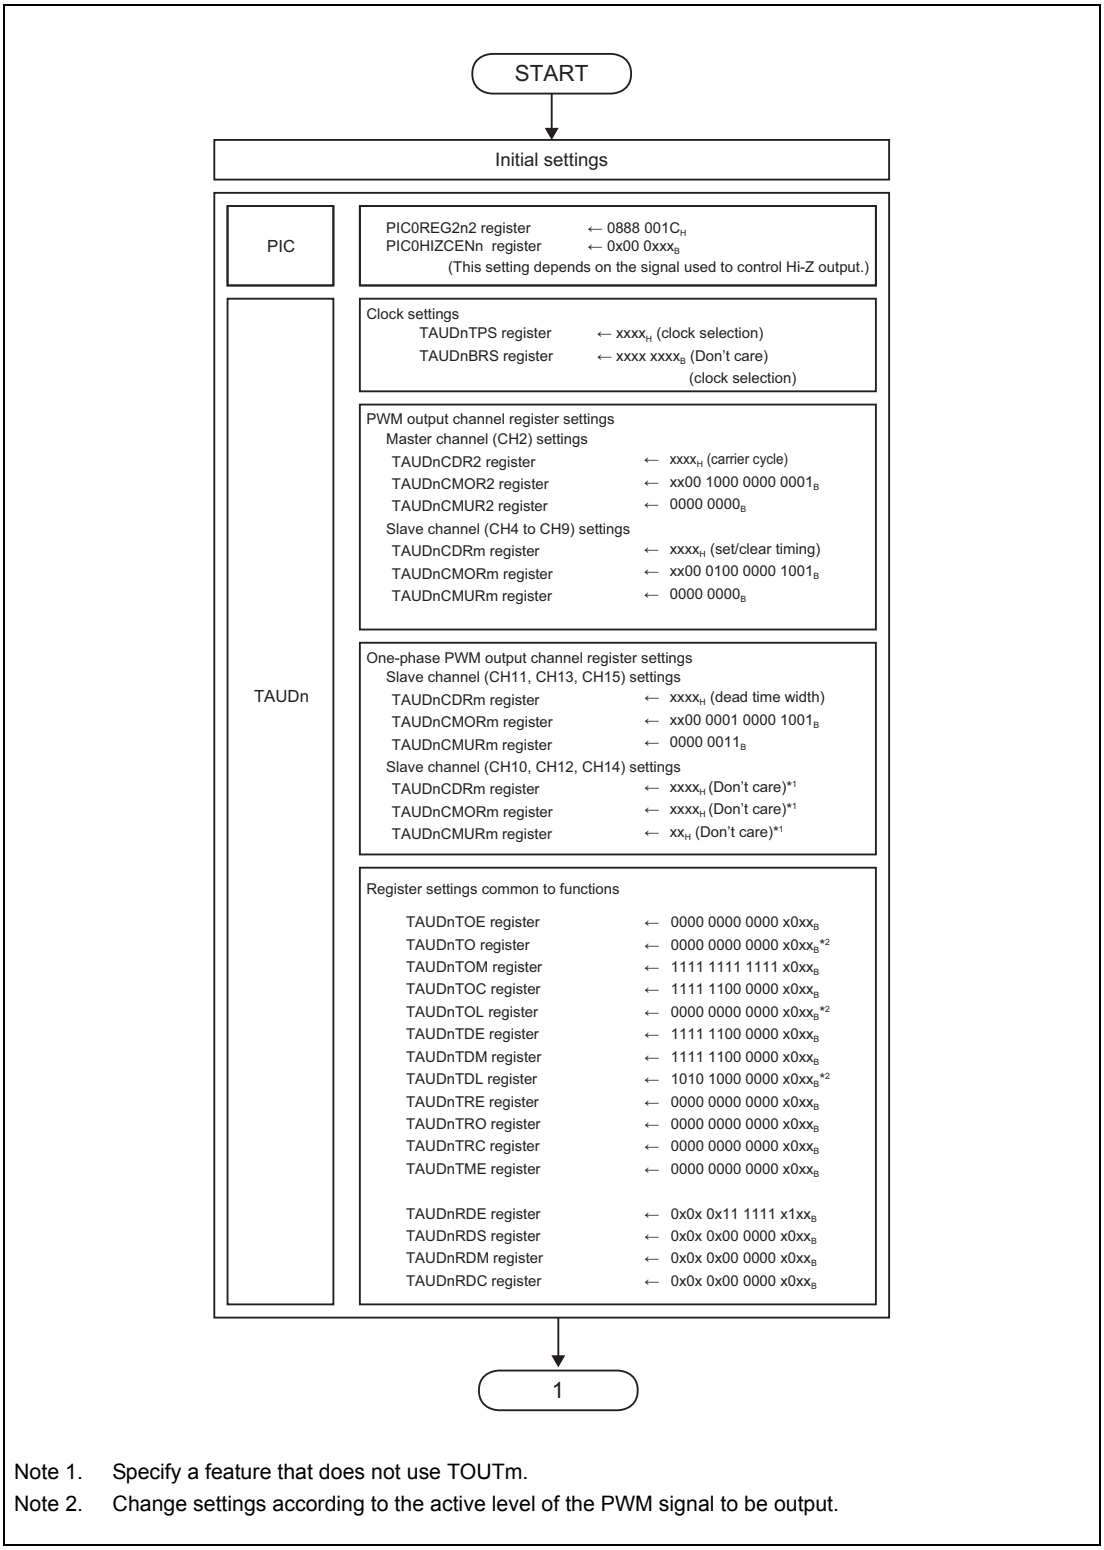
An operation example of the timer configuration for performing the W phase PWM output in **Figure 29.30** is provided below.

For details about the operations from when timers are simultaneously started until a one-phase PWM signal is output, see the U phase operation example.

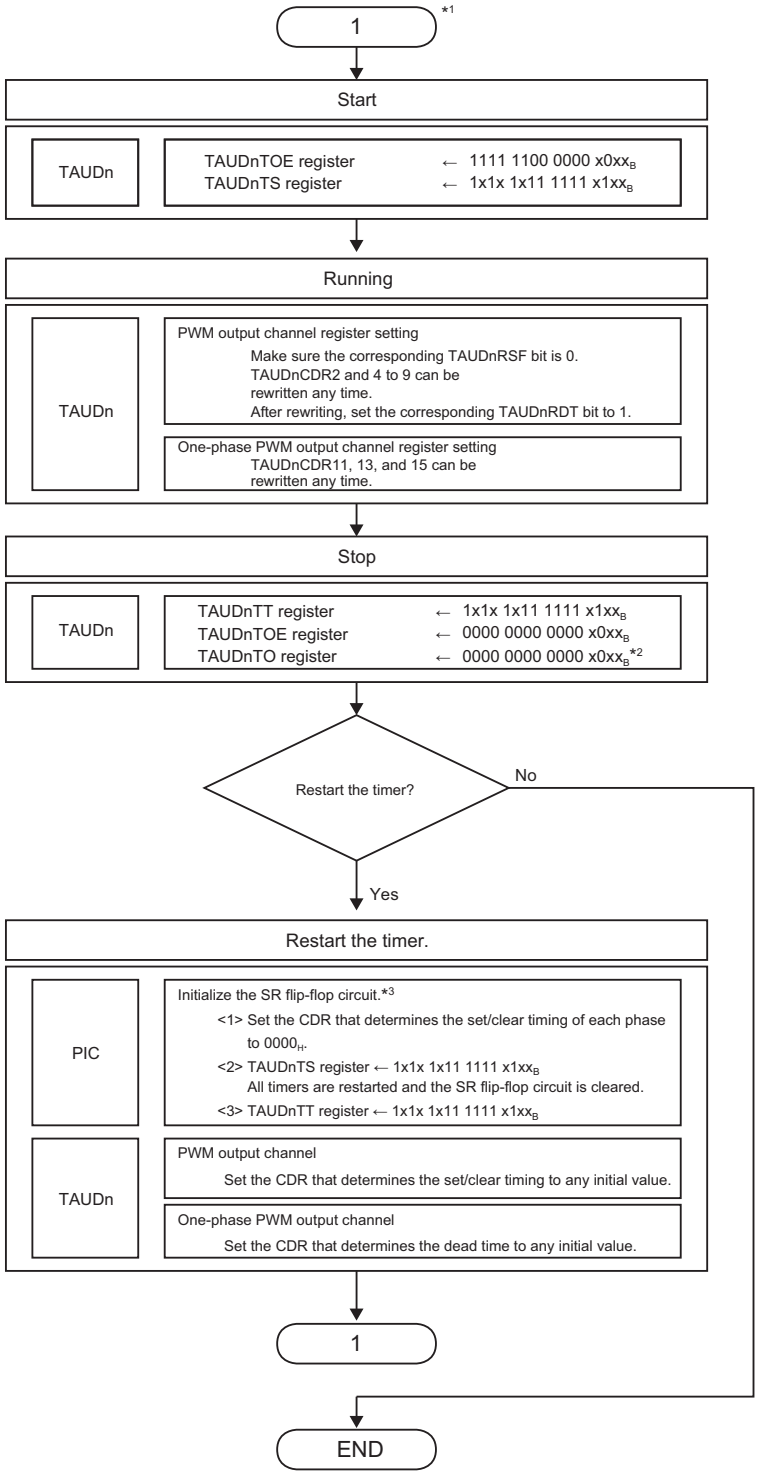
(1) If the setting of CH9 (the W phase clear signal output timing timer), which generates the W phase clear timing signal (INT09), is less than the CH8 (the W phase set signal output timing timer) setting.



(2) Before a W phase set timing signal (INT08) is generated by a CH8 underflow, a CH9 (W phase clear signal output timing timer) underflow occurs, and the W phase clear timing signal (INT09) is generated.

(3) This results in consecutive W phase clear timing signals (INT09) being generated.

(4) In this case, because the consecutively generated W phase clear timing signals (INT09) are ignored by the SR flip-flop circuit, there is no effect on the PWM output waveform.



(5) The PWM output is changed at the timing of the next W phase set timing signal (INT08).

29.11.5 Setup Flow

Note 1. Specify a feature that does not use TOUTm.
Note 2. Change settings according to the active level of the PWM signal to be output.

Figure 29.31 Setup Flow (Active High Example)

Note 1. Specify the selection register and output port to use after specifying the initial settings for the peripheral interconnections and timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

Note 3. If initialization processing is not performed, the SR flip-flop circuit enters the timer-stopped state, and the timer restart output pulse might be output at an unintended level.

Figure 29.32 Setup Flow (Active High Example) (continued)

29.11.6 Setting Examples for Operation Functions

This section provides example settings for each register.

29.11.6.1 TAUDn Settings (Active High Example)

Table 29.45 TAUDn: CH2-related (PWM Output Master Channel*1)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMOR2	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	000	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0000	
	0	TAUDnMD0	1	
TAUDnCMUR2	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD PWM output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 29.46 TAUDn: CH4 to CH9-related (PWM Output Slave Channel*1) (m = 4 to 9)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Any*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD PWM output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

NOTE

For the TAUDnCMORm register used during PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Table 29.47 TAUDn: CH11, CH13, and CH15-related (One-phase PWM Output) (m = 11, 13, or 15)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*1	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	001	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	11	Both rising and falling TINm edges are detected as valid. (High width)

Note 1. Specify the same operation clock settings as for the PWM output master channel (CH2).

NOTE

For the TAUDnCMORm register used during one-phase PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. CH10, CH12, and CH14 can be used with any feature that does not use TOUTm output (such as A/D trigger output). For details, see **Section 25, Timer Array Unit D (TAUD)**.

Table 29.48 Common TAUDn Channel Settings (1/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOE	15 to 10	TAUDnTOE15 to TAUDnTOE10	0 1	Disable the timer. Enable the timer.
	9 to 4	TAUDnTOE09 to TAUDnTOE04	0	These are fixed to 0 because TOUT09 to TOUT04 are not used.
	3	TAUDnTOE03	Don't care	
	2	TAUDnTOE02	0	This is fixed to 0 because TOUT02 is not used.
	1, 0	TAUDnTOE01 TAUDnTOE00	Don't care	
TAUDnTO	15 to 10	TAUDnTO15 to TAUDnTO10	0*1	Output a low-level signal to TOUT15 to TOUT10.
	9 to 4	TAUDnTO09 to TAUDnTO04	0	Output a low-level signal to TOUT09 to TOUT04.
	3	TAUDnTO03	Don't care	
	2	TAUDnTO02	0	Output a low-level signal to TOUT02.
	1, 0	TAUDnTO01 TAUDnTO00	Don't care	
TAUDnTOM	15 to 4	TAUDnTOM15 to TAUDnTOM04	1	Synchronous operation mode
	3	TAUDnTOM03	Don't care	
	2	TAUDnTOM02	0	Independent operation mode
	1, 0	TAUDnTOM01 TAUDnTOM00	Don't care	

Table 29.48 Common TAUDn Channel Settings (2/4)

Register	Bit Position	Bit Name	Setting	Remark
TAUDnTOC	15 to 10	TAUDnTOC15 to TAUDnTOC10	1	Synchronous operation mode 2
	9 to 4	TAUDnTOC09 to TAUDnTOC04	0	Synchronous operation mode 1
	3	TAUDnTOC03	Don't care	
	2	TAUDnTOC02	0	Operation mode 1
	1, 0	TAUDnTOC01 TAUDnTOC00	Don't care	
TAUDnTOL	15 to 4	TAUDnTOL15 to TAUDnTOL04	0*1	Positive logic output (active high)
	3	TAUDnTOL03	Don't care	
	2	TAUDnTOL02	0	Positive logic output (active high)
	1, 0	TAUDnTOL01 TAUDnTOL00	Don't care	
TAUDnTDE	15 to 10	TAUDnTDE15 to TAUDnTDE10	1	Enable dead time control.*2
	9 to 4	TAUDnTDE09 to TAUDnTDE04	0	Disable dead time control.
	3	TAUDnTDE03	Don't care	
	2	TAUDnTDE02	0	Disable dead time control.
	1, 0	TAUDnTDE01 TAUDnTDE00	Don't care	
TAUDnTDM	15 to 10	TAUDnTDM15 to TAUDnTDM10	1	Output dead time upon detecting a TINm input edge at a lower odd channel.
	9 to 4	TAUDnTDM09 to TAUDnTDM04	0	Invalid because dead time control is disabled.
	3	TAUDnTDM03	Don't care	
	2	TAUDnTDM02	0	Invalid because dead time control is disabled.

	3	TAUDnRDM03	Don't care	
	2	TAUDnRDM02	0	Load the signal when the master channel starts counting.
	1, 0	TAUDnRDM01 TAUDnRDM00	Don't care	
TAUDnRDC	15	TAUDnRDC15	0	Invalid because simultaneous rewriting is not enabled.
	14	TAUDnRDC14	Don't care	
	13	TAUDnRDC13	0	Invalid because simultaneous rewriting is not enabled.
	12	TAUDnRDC12	Don't care	
	11	TAUDnRDC11	0	Invalid because simultaneous rewriting is not enabled.
	10	TAUDnRDC10	Don't care	
	9 to 4	TAUDnRDC09 to TAUDnRDC04	0	Do not use this channel to generate the simultaneous rewrite trigger.
	3	TAUDnRDC03	Don't care	
	2	TAUDnRDC02	1	Do not use this channel to generate the simultaneous rewrite trigger.
	1, 0	TAUDnRDC01 TAUDnRDC00	Don't care	

Note 1. Change the setting according to the used system.

Note 2. These are used to control positive/negative phase waveform output for which even channels are paired with odd channels to perform dead time control. For details, see **Section 25, Timer Array Unit D (TAUD)**.

29.11.6.2 PIC Settings

Table 29.49 PIC Settings

Register	Bit Position	Bit Name	Setting	Remark
PIC0REG2n2	27	PIC0REG2n227	1	Select the input selected by the PIC0REG2n204 bit.
	23	PIC0REG2n223	1	Select the input selected by the PIC0REG2n203 bit.
	19	PIC0REG2n219	1	Select the input selected by the PIC0REG2n202 bit.
	4	PIC0REG2n204	1	Select the set/clear output according to INTTAUDnI8 and INTTAUDnI9.
	3	PIC0REG2n203	1	Select the set/clear output according to INTTAUDnI6 and INTTAUDnI7.
	2	PIC0REG2n202	1	Select the set/clear output according to INTTAUDnI4 and INTTAUDnI5.

29.12 High-accuracy Triangle PWM Output with Dead Time

29.12.1 Functional Overview

Compared to the triangle PWM output with dead time of TAUD, this makes it possible to control the variable dead time areas near duties of 100% and 0%. This makes more accurate triangle PWM output possible.

For the triangle PWM output with dead time feature of TAUD, it is not possible to output a UB phase dead time pulse, such as when transitioning to U phase 0% triangular wave output. (See **Figure 29.33**)

For this feature, a pulse is generated in combination with the TAUD timer output, and a pseudo dead time pulse is added.

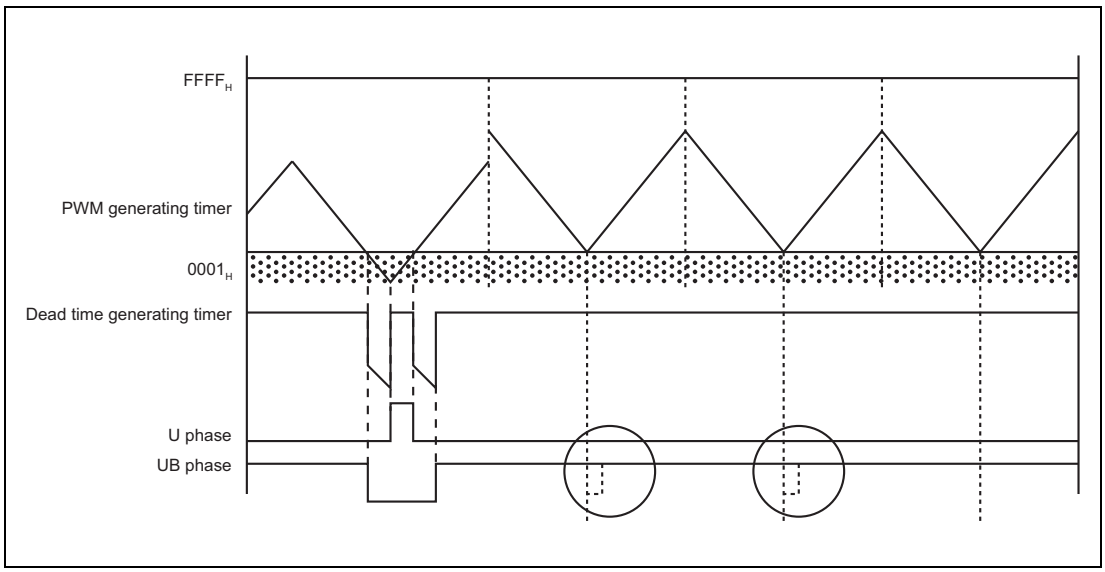

Figure 29.33 Timing of Dead Time Output by the TAUD Feature for Outputting a Triangle PWM Signal with Dead Time

29.12.2 Configuration

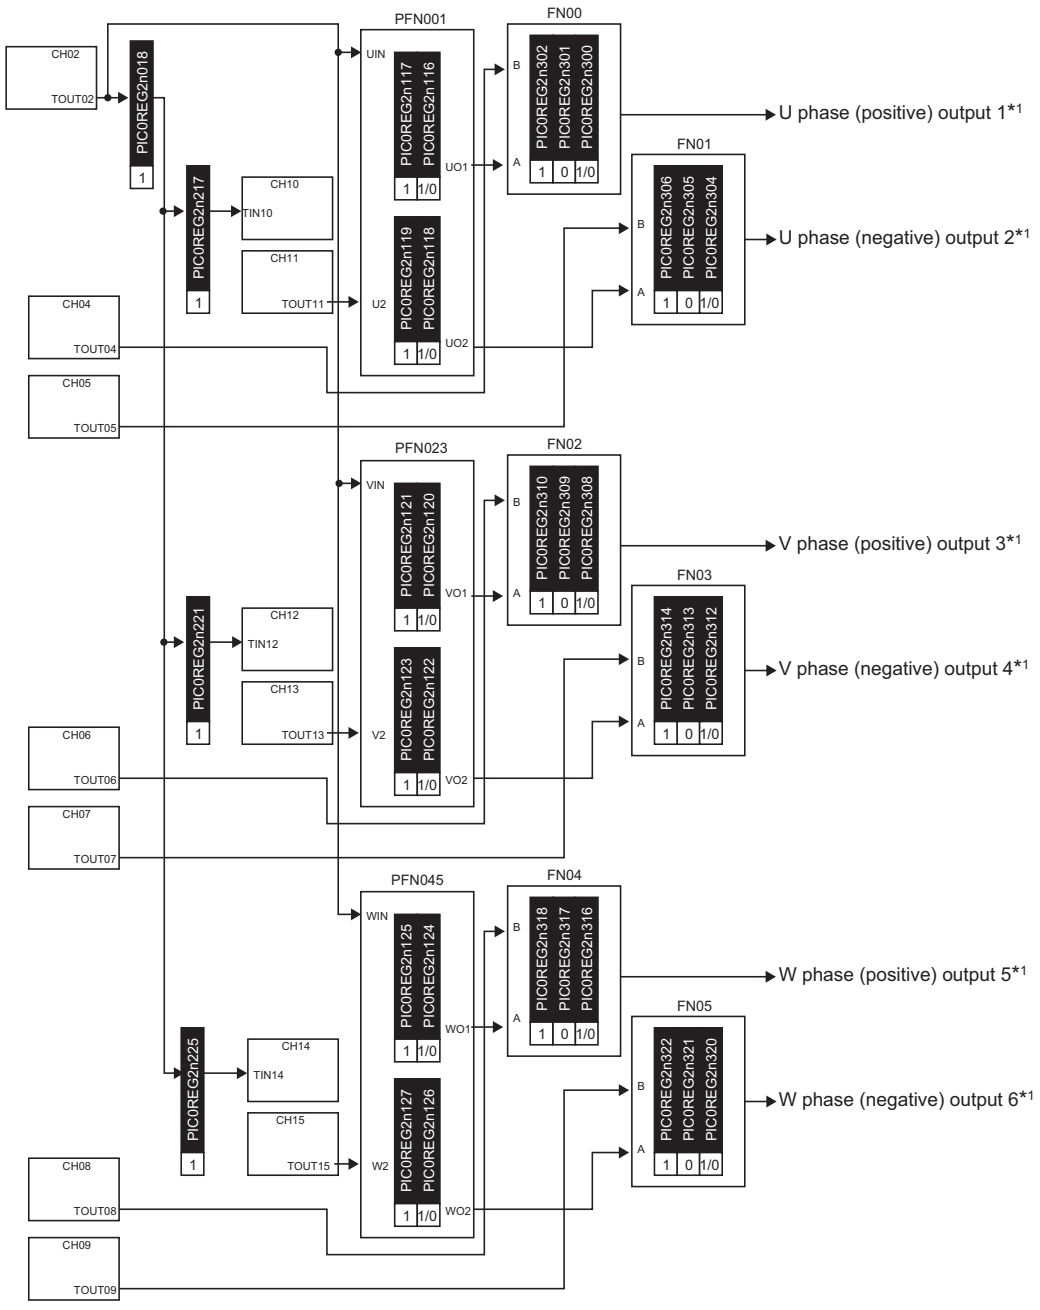
The unit and channel configuration for this feature is shown below. (n = 0)

Table 29.50 Configuration of Delay Pulse Output with Dead Time

Timer	Timer Motor Control Function
TAUD0 CH2, CH4 to CH15 (used channels fixed)	TAPA0

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm → INTTAUDnIm (TAUDn channel m interrupt)
- TINm → TAUDTTINm (TAUDn channel m input)
- TOUTm → TAUDTTOUTm (TAUDn channel m output)
- CDRm → TAUDnCDRm (TAUDn channel m data register)
- CNTm → TAUDnCNTm (TAUDn channel m counter register)



(1) TAUDn configuration

Table 29.51 TAUD Configuration

CH	Function Name	M/S*1	CDR Setting	Description
2	Triangle PWM output with dead time (CH2 is the master channel for CH4 to CH9.)	M	Cycle	
4		S	Duty (U phase)	
5		S	Dead time (U phase)	
6		S	Duty (V phase)	
7		S	Dead time (V phase)	
8		S	Duty (W phase)	
9		S	Dead time (W phase)	
10	One-shot pulse output	M	Delay	Generate the pulse to be inserted into the variable dead time area for U phase PWM.
11		S	Pulse width	
12	One-shot pulse output	M	Delay	Generate the pulse to be inserted into the variable dead time area for V phase PWM.
13		S	Pulse width	
14	One-shot pulse output	M	Delay	Generate the pulse to be inserted into the variable dead time area for W phase PWM.
15		S	Pulse width	

Note 1. M: Master channel, S: Slave channel

(2) Block diagram

Note 1. For the connection destination, see **Figure 29.25, Block Diagram: Motor Output Buffer Control**.

Figure 29.34 Block Diagram: High-Accuracy Triangle PWM Output with Dead Time

29.12.3 Registers

29.12.3.1 PIC0REG2n0 — Timer I/O Control Register 2n0 (n = 0)

This register selects TAUDn input.

Access: This register can be read or written in 32-bit units.

Address: PIC0REG200: FFDD 00C0$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	PIC0HIZCENn6	Select whether to enable or disable Hi-Z output control by the INTADCA0ERR interrupt signal. 0: Disable 1: Enable
5 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PIC0HIZCENn2	Select whether to enable or disable Hi-Z output control by the WDTA1NMI interrupt signal. 0: Disable 1: Enable
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC0HIZCENn0	Select whether to enable or disable Hi-Z output control by the TAPAnESO pin input. 0: Disable 1: Enable

29.12.4 Operation Example

This is achieved by combining the following TAUD features:

- Triangle PWM output with dead time
- One-shot pulse output

In addition, the following PIC is also used because the pulse to be inserted into the variable dead time area is generated for the positive or negative phase:

- Combination circuit (PFN001, PFN023, and PFN045)

In addition, the following peripheral interconnections are also used because the pulse to be inserted into the variable dead time area is combined with the triangle PWM output waveform:

- Logical operation circuit (FN0i) (i = 0 to 5)

A high-accuracy triangle PWM signal with dead time is output by assigning the PWM output achieved using the above features to the U, V, and W phases. Therefore, the PWM output dead time can be freely specified for the PWM signal of each phase. Because the only difference among phases is the assigned channel, only one phase (the U phase) is described below.

29.12.4.1 Triangle PWM Output with Dead Time

A triangle PWM signal with dead time is output from TOUT04 and TOUT05 by using CH2, CH4, and CH5 in combination.

29.12.4.2 One-shot Pulse Output

A CDR11 pulse for which the width is delayed by the delay time (CDR10) from the valid edge of the TIN10 (TOUT02) signal of CH10 is output as TOUT11 by using CH10 and CH11 in combination.

This pulse is used as the variable dead time area pulse used near duties of 100% and 0%.

CAUTION

Specify each CDR setting for one-shot pulse output such that the following condition is satisfied: CDR05 ≥ (CDR10 + CDR11)

If a value that does not satisfy the above condition is specified, the output waveform might be affected. To minimize this effect, in addition to satisfying the above setting condition, leave CDR11 set to 0000_H until the variable dead time area pulse is required. Detect both rising and falling edges as the valid TIN10 (TOUT02) edge, and set TAUDnTOL11 to 1 (active low).
Specify the same operation clock for each TAUDn channel used for outputting a triangle PWM signal with dead time or a one-shot pulse.

For details about the TAUD functions, see **Section 25, Timer Array Unit D (TAUD)**.

29.12.4.3 U phase Combination Circuit (PFN001)

This circuit generates a variable dead time area pulse (FN00 A, FN01 A) for adding a generated one-shot pulse to a generated triangle PWM signal with dead time.

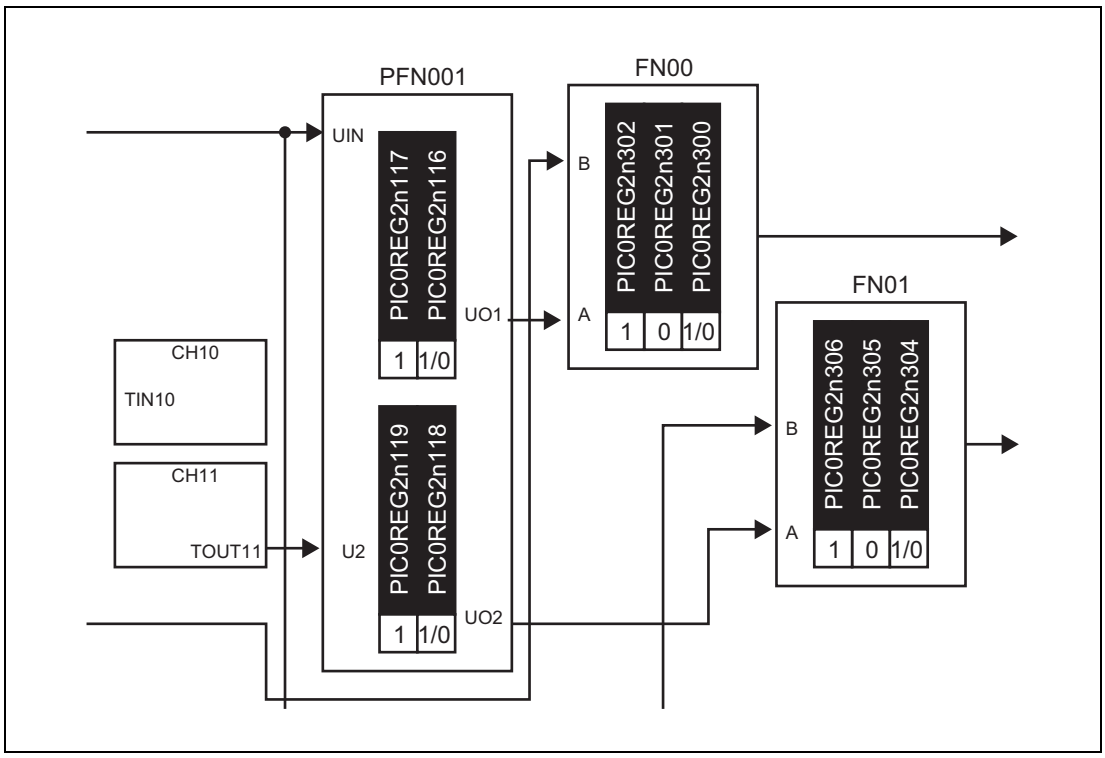

Figure 29.35 Block Diagram Excerpt (PFN001, FN00, and FN01)

The table below shows the relationships between combination circuit input (UIN, U2) and output (UO1, UO2).

Table 29.57 U and UB Phase Combination Circuit (PFN001) I/O Table

- **UO1 (U phase variable dead time area pulse) output**

UIN (TOUT02)	U2 (TOUT11)	UO1	
		PIC0REG2n117, 16 = 10_B U phase output active high (TAUDnTOL04 = 0)	PIC0REG2n117, 16 = 11_B U phase output active low (TAUDnTOL04 = 1)
0	0	1	0
0	1	1	0
1	0	0	1
1	1	1	0

- **UO2 (UB phase variable dead time area pulse) output**

UIN (TOUT02)	U2 (TOUT11)	UO2	
		PIC0REG2n119, 18 = 10_B UB phase output active high (TAUDnTOL05 = 0)	PIC0REG2n119, 18 = 11_B UB phase output active low (TAUDnTOL05 = 1)
0	0	0	1
0	1	1	0
1	0	1	0
1	1	1	0

NOTE

The PIC0REG2n116, PIC0REG2n117, PIC0REG2n118, and PIC0REG2n119 settings change depending on the active U phase and UB phase levels of the generated triangle PWM signal with dead time.

29.12.4.4 Logical Operation Circuit (FN0i) (i = 0 or 1)

This circuit combines an output triangle PWM signal with dead time (TOUT04, TOUT05) with combination circuit output (UO1 and UO2 of PFN001) and generates a PWM signal to which a variable dead time area pulse has been added.

The combination logic for the logical operation circuit is switched according to the PIC0REG2n3 register setting. (Bits 0 to 2 are specified for U phase output, and bits 4 to 6 are specified for UB phase output.)

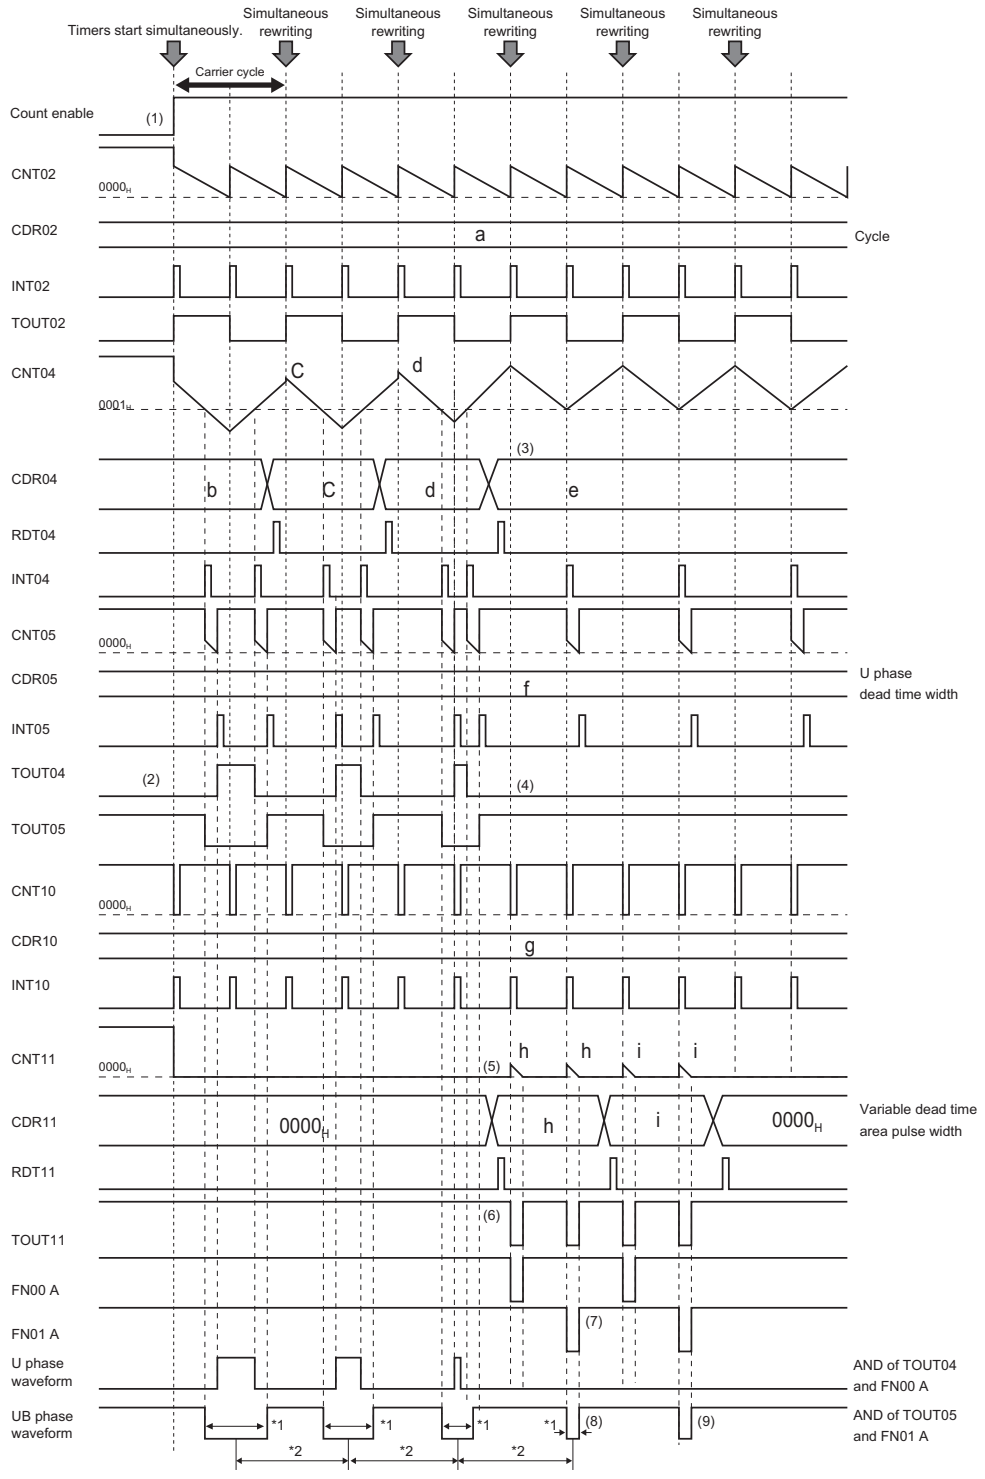
Set up the logical operation circuit as shown in the table below. The combined signal is output from the TAPAnUP and TAPAnUM pins according to the specified combination logic.

Table 29.58 Logical Operation Circuit (FN0i) (i = 0 or 1) Settings and TAPAnUP and TAPAnUM Pin Output

- **U phase output (TOUT04)**

Active level	PIC0REG2n302 to 00	TAPAnUP pin output waveform
Active high (TAUDnTOL04 = 0)	100_B	AND of FN00 B (TOUT04) and FN00 A (UO1)
Active low (TAUDnTOL04 = 1)	101_B	OR of FN00 B (TOUT04) and FN00 A (UO1)

- **UB phase output (TOUT05)**



Active level	PIC0REG2n306 to 04	TAPAnUM pin output
Active high (TAUDnTOL05 = 0)	100_B	AND of FN01 B (TOUT05) and FN01 A (UO2)
Active low (TAUDnTOL05 = 1)	101_B	OR of FN01 B (TOUT05) and FN01 A (UO2)

Because the above makes variable dead time control possible to ensure output accuracy near duties of 0% and 100% even for TAUD, a more accurate triangle PWM signal can be output than that output using the TAUD feature for outputting a triangle PWM signal with dead time.

For the V/VB phase and W/WB phase, the used channels and register bits differ, but the settings are the same, as shown in **Figure 29.34, Block Diagram: High-Accuracy Triangle PWM Output with Dead Time.**

The peripheral interconnections provide a connection for adding the pulse generated during one-shot pulse output to the PWM signal generated during output of a triangle PWM signal with dead time by using the combination circuit and logical operation circuit of the peripheral interconnections.

The following figures show timing charts for outputting a high-accuracy triangle PWM signal with dead time.

Note 1. The variable dead time area pulse uses a sawtooth wave and is therefore expanded on one side, unlike a pulse that uses a triangle wave, which is expanded on both sides.

Note 2. Because the variable dead time area pulse is expanded on one side, the length of the one-phase PWM output cycle for the variable dead time area increases by 1/2 the added variable dead time area pulse width.

Figure 29.36 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))

An operation example in which the system transitions to a U phase of 0% and UB phase of 100% in the timer configuration for performing the U phase PWM output shown in **Figure 29.36** is provided below. Output of a triangle PWM signal with dead time is active high.

(1) When timer operation is started, output of a triangle PWM with dead time is started by the CH2, CH4, and CH5 channels of TAUDn.

(2) A triangle PWM waveform with dead time is generated from TOUT04 and TOUT05.

(3) A U phase duty output value of 0% is specified for CDR04.

(4) Due to the setting in (3), TOUT04 output is the inactive level, and TOUT05 output is the active level. However, no variable dead time area pulse is output during this operation.

(5) To create a variable dead time area pulse, the value to be used as the pulse width is specified for CDR11 when specifying the 0% U phase duty in (3).
For this example, the CDR11 setting is fixed to 0000_H until the system enters the variable dead time area to prevent adverse effects on the output PWM signal.

(6) The variable dead time area pulse is output as a pulse that has the width specified for CDR11 after the delay time specified for CDR10 elapses, starting at the TOUT02 edge.

(7) The pulse output in (6) is converted to a variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A) by the combination circuit (PFN001).

(8) The pulse generated in (7) is combined with the TOUT04 and TOUT05 output waveforms by using the logical operation circuits (FN00, FN01), and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output).

(9) By later changing the CDR11 setting, which specifies the width of the variable dead time area pulse, the desired variable dead time area pulse can be added.

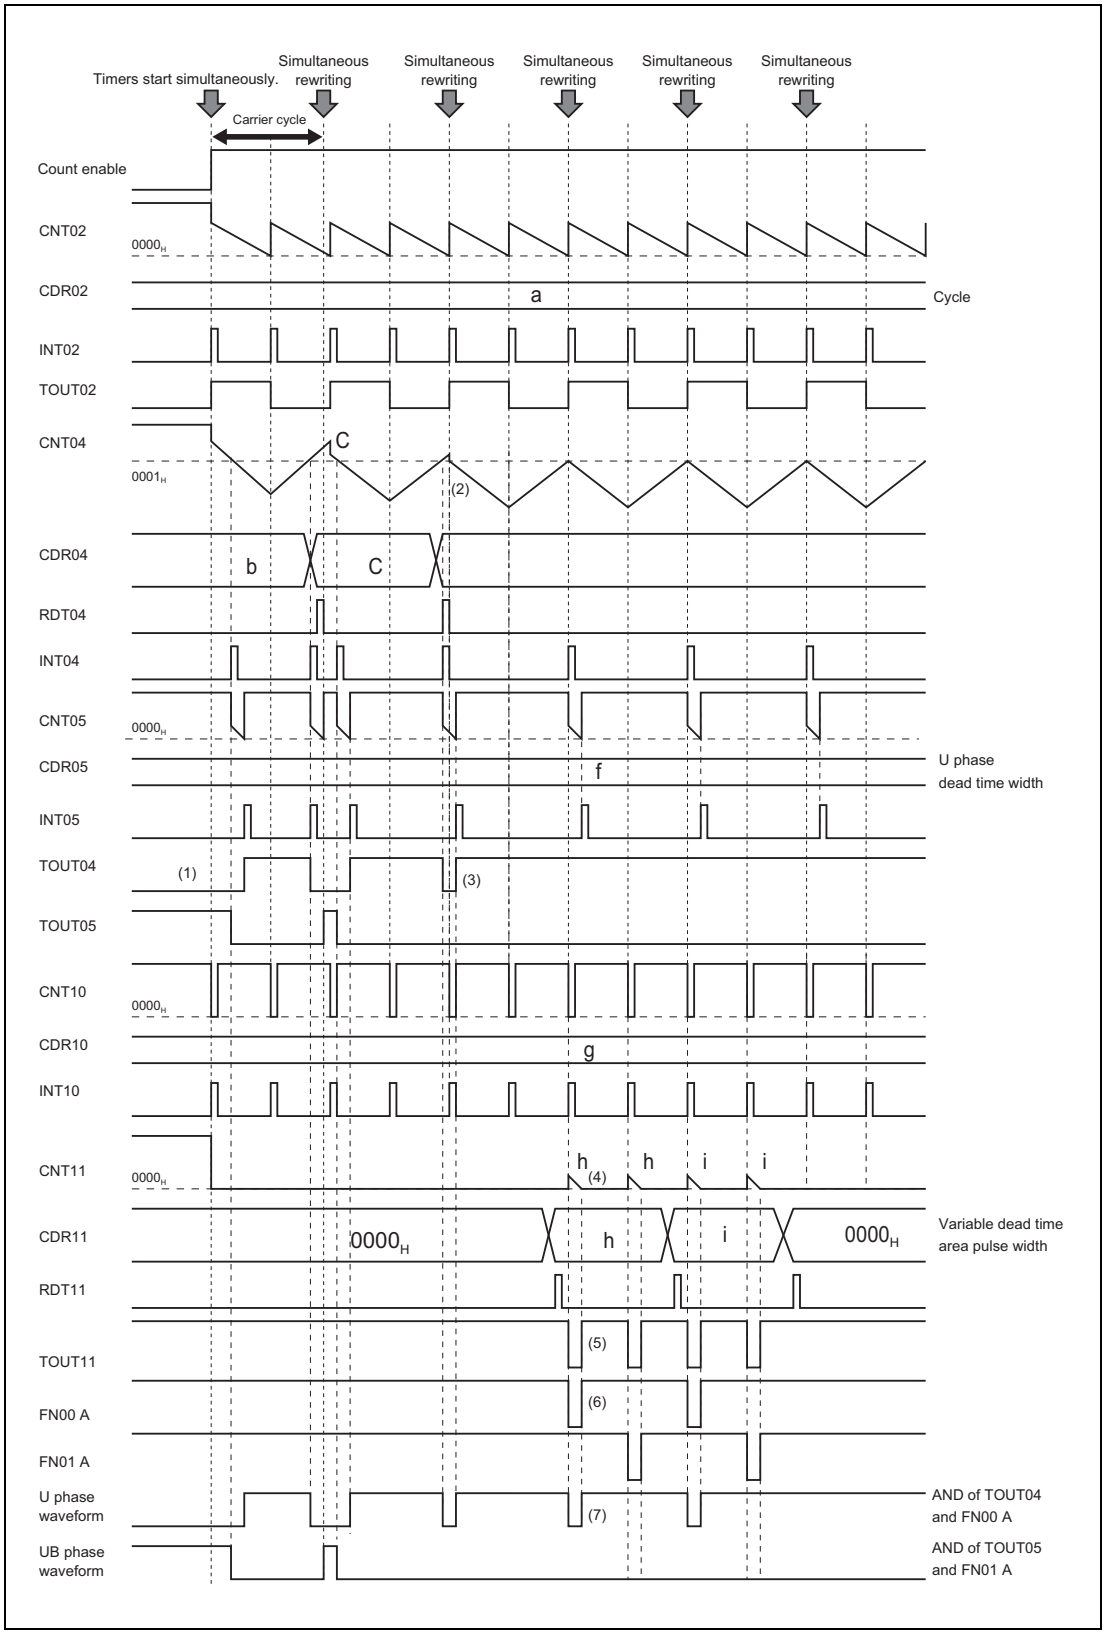


Figure 29.37 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))

An operation example in which the system transitions to a U phase of 100% and UB phase of 0% in the timer configuration for performing the U phase PWM output shown in **Figure 29.37** is provided below. Output of a triangle PWM signal with dead time is active high.

(1) The timer operation from the start of timer operation until the output of a triangle PWM signal with dead time is the same.

(2) A U phase duty output value of 100% (CDR04 = 0000_H) is specified for CDR04.

(3) Due to the setting in (2), TOUT04 output is the active level, and TOUT05 output is the inactive level. However, no variable dead time area pulse is output during this operation.

(4) To create a variable dead time area pulse, the value to be used as the pulse width is specified for CDR11 one cycle after specifying the 100% U phase duty setting in (2).
For this example, the CDR11 setting is fixed to 0000_H until the system enters the variable dead time area to prevent adverse effects on the output PWM signal.

(5) The variable dead time area pulse is output as a pulse that has the width specified for CDR11 after the delay time specified for CDR10 elapses, starting at the TOUT02 edge.

(6) The pulse output in (5) is converted to a variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A) by the combination circuit (PFN001).

(7) The pulse generated in (6) is combined with the TOUT04 and TOUT05 output waveforms by using the logical operation circuits (FN00, FN01), and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output).

CAUTION

If the 100% U phase duty setting for CDR04 and the variable dead time area pulse width for CDR11 are specified at the same time, the variable dead time area pulse is affected by the amount shown by (2) for the last PWM signal output from TOUT04 and shown by feature specification (1), as shown in Figure 29.37.
To cancel this effect, the CDR11 setting is delayed one cycle.

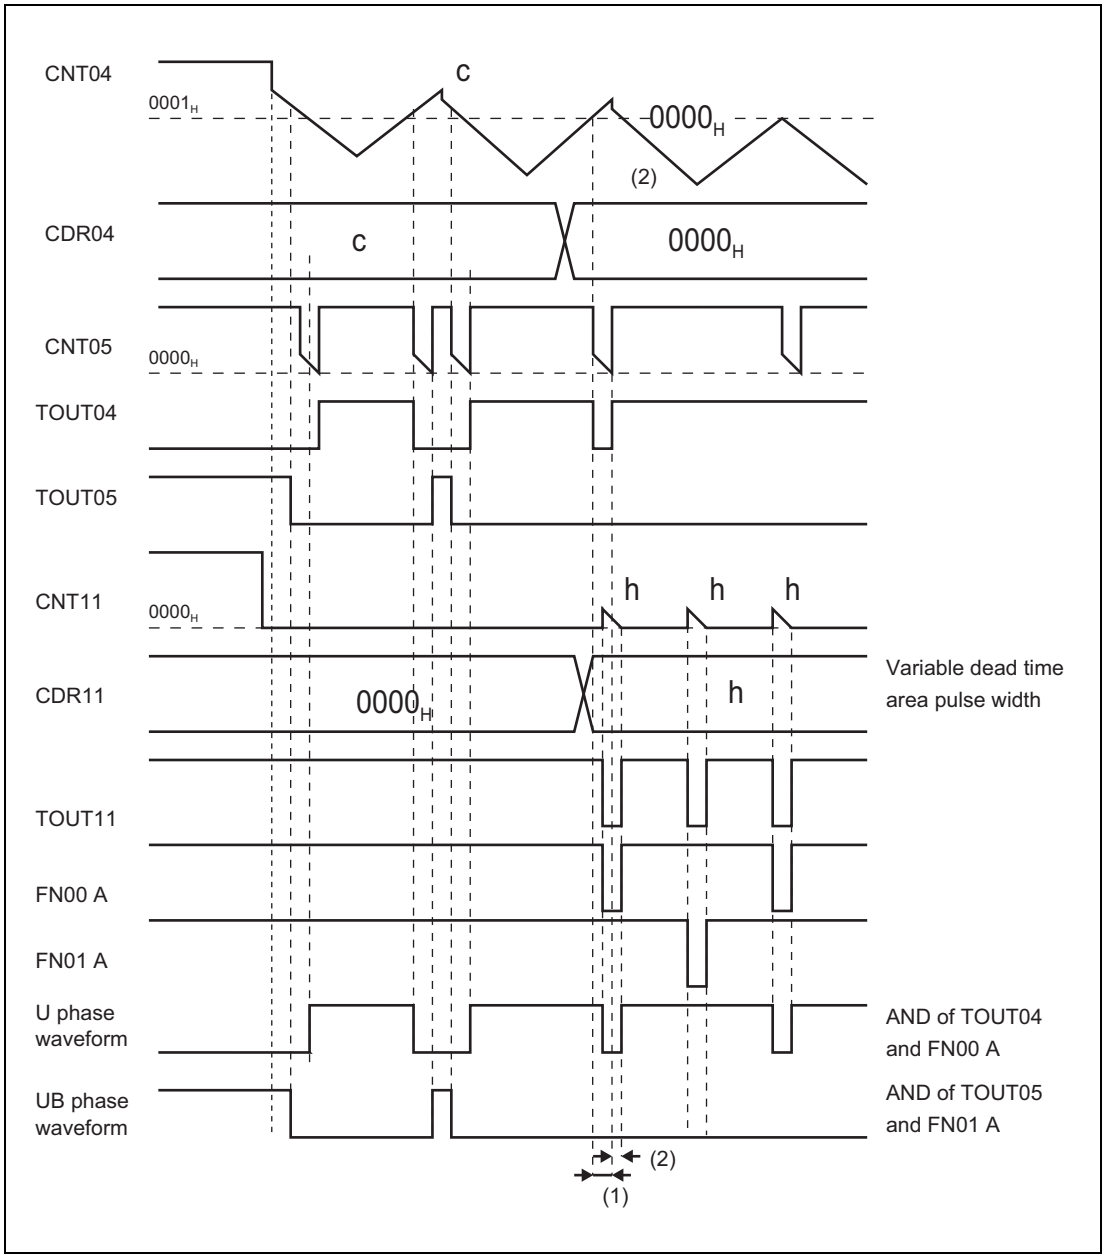

Figure 29.38 Effect on the Output Triangle PWM Wave with Dead Time by the Variable Dead Time Area Pulse

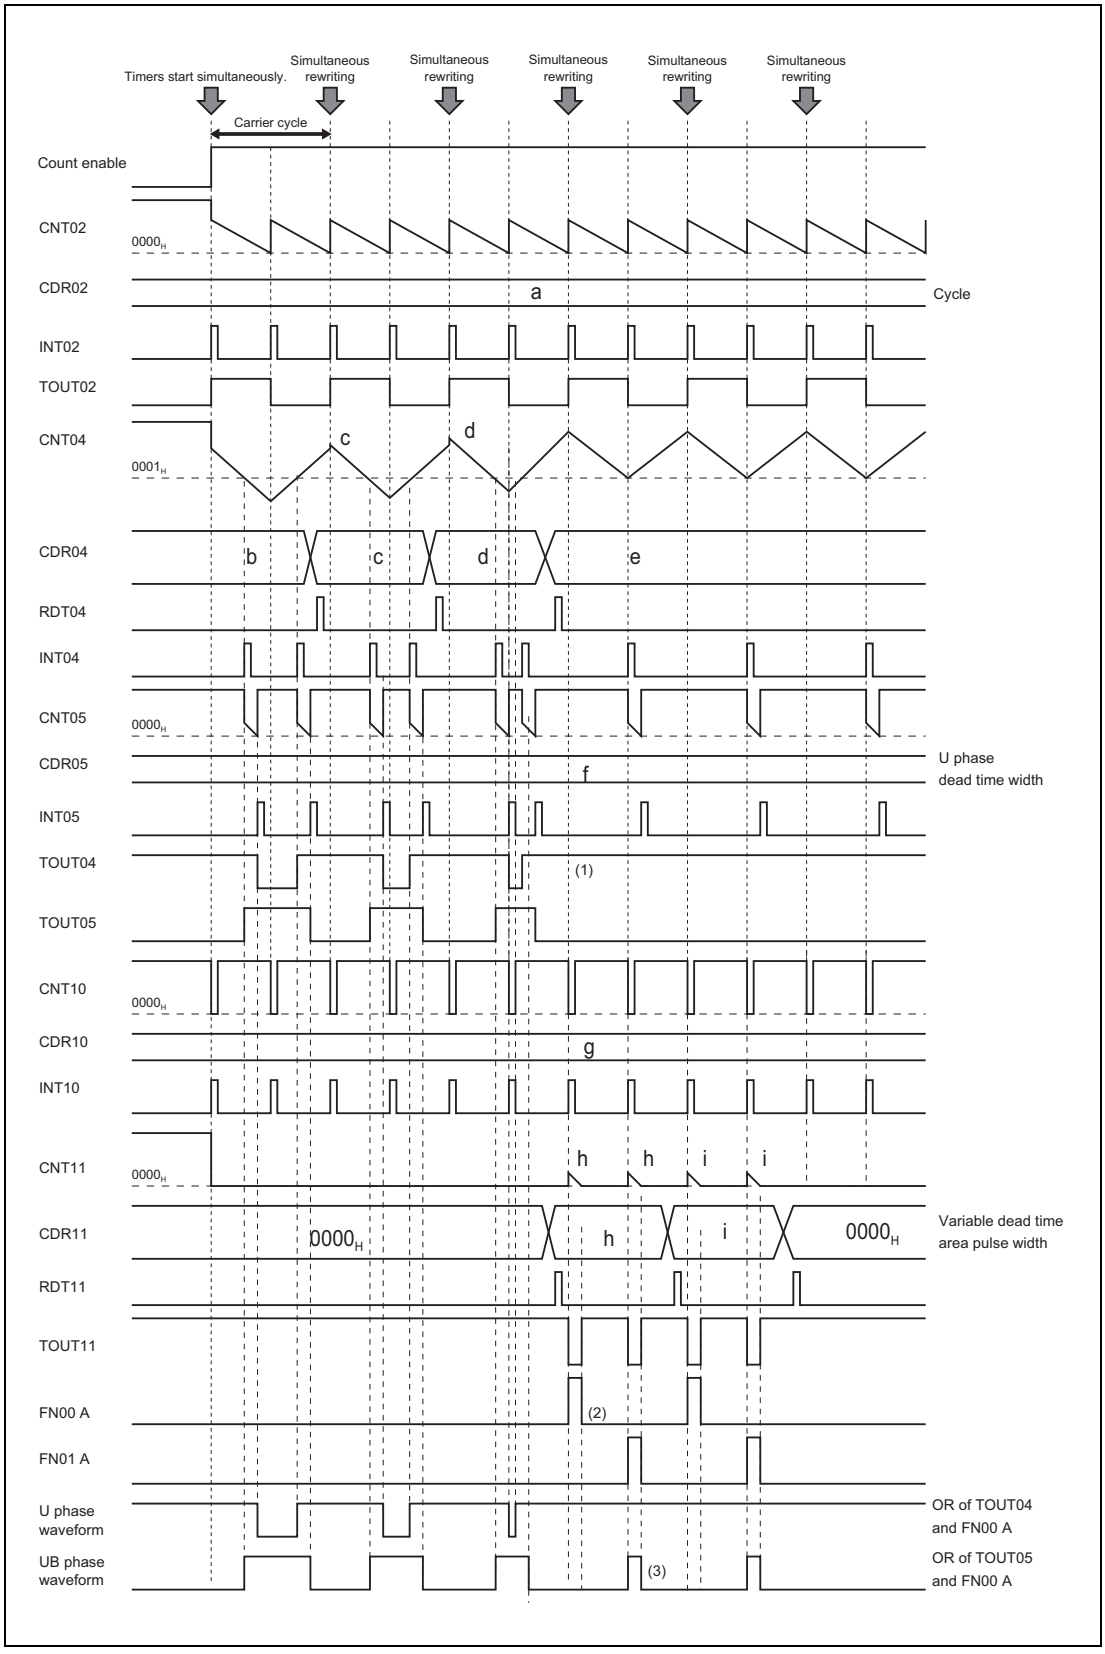

Figure 29.39 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (TAUDnTOL04 = 1 (Active Low), TAUDnTOL05 = 1 (Active Low))

An operation example in which the system transitions to a U phase of 100% and UB phase of 0% in the timer configuration for performing the U phase PWM output shown in **Figure 29.39** is provided below. Output of a triangle PWM signal with dead time is active low.

(1) The timer operation from the start of timer operation until the output of a triangle PWM with dead time is the same as in **Figure 29.36, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**. However, an active low PWM signal is output from TOUT04 and TOUT05.

(2) Therefore, active low output that corresponds with PWM output is specified as the combination circuit setting (PIC0REG2n116 and PIC0REG2n117, and PIC0REG2n118 and PIC0REG2n119). This results in the output of an active low variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A).

(3) In addition, active low output that corresponds with PWM output is also specified as the logical operation circuit setting (PIC0REG2n302 to PIC0REG2n300 and PIC0REG2n306 to PIC0REG2n304). The pulse generated in (2) is combined with the TOUT04 and TOUT05 output waveforms, and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output) as an active low PWM signal.

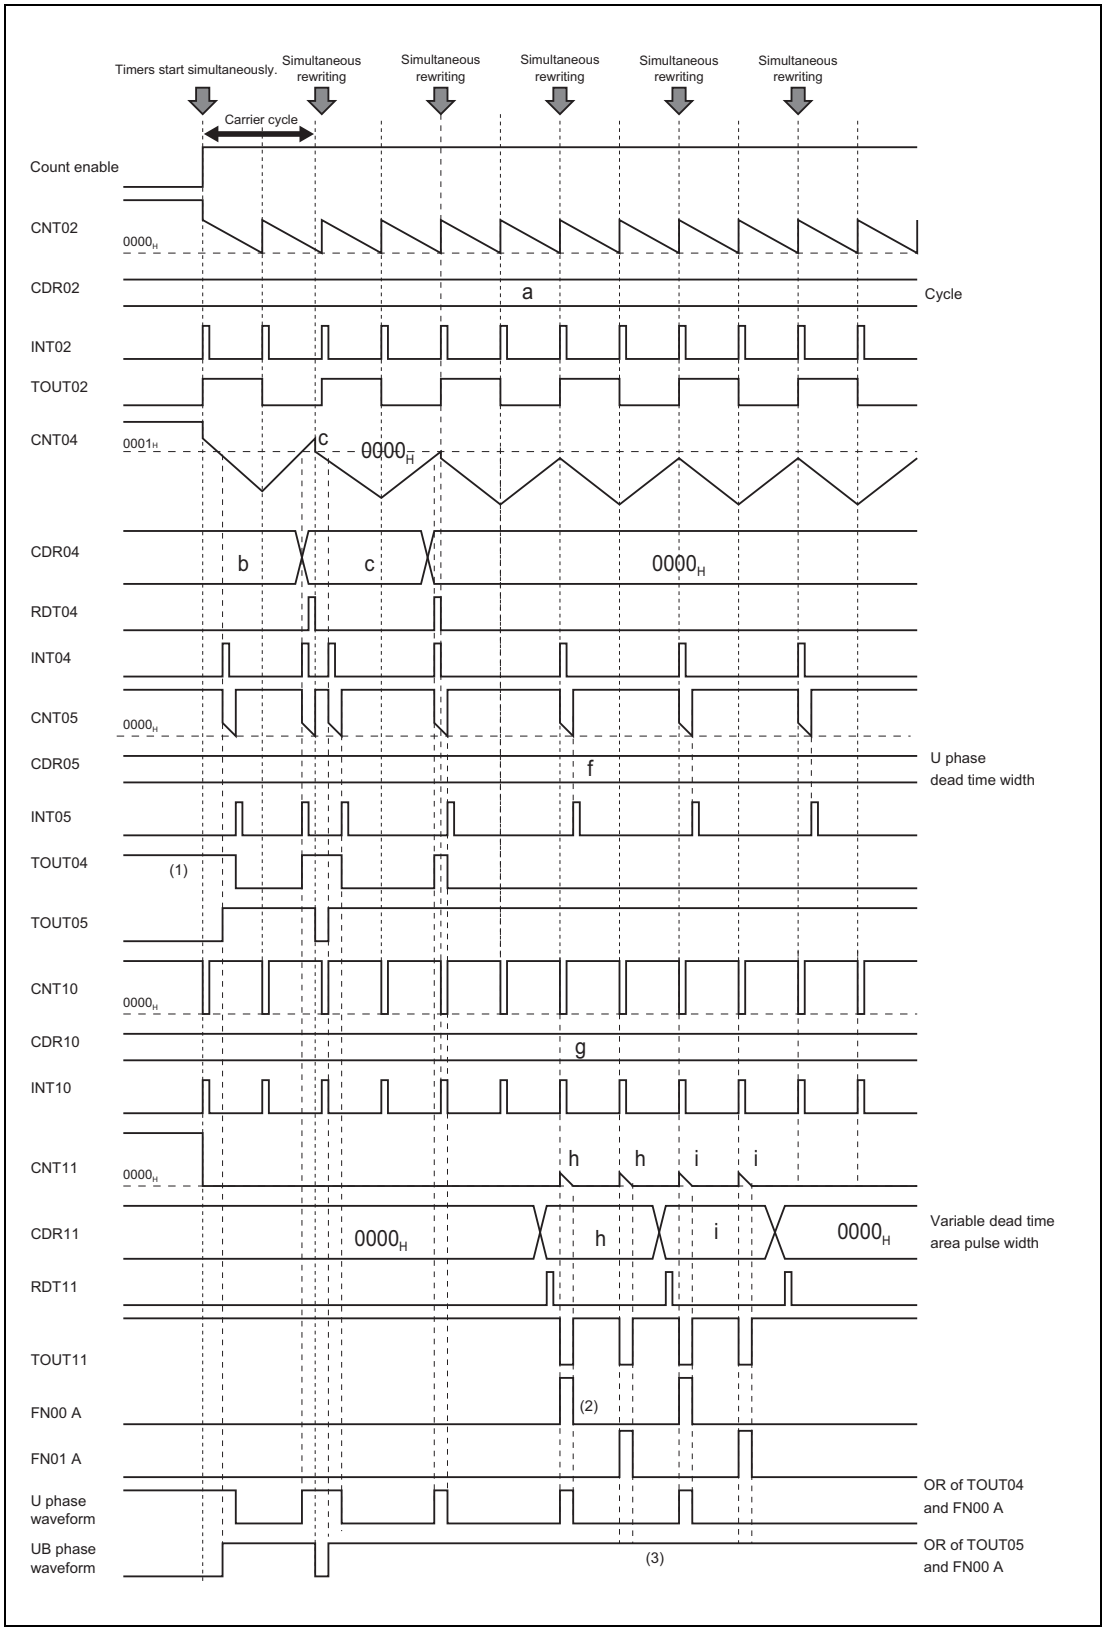

Figure 29.40 Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 0%, UB Phase: 100%) (when TAUDnTOL04 = 0 (Active Low) and TAUDnTOL05 = 0 (Active Low))

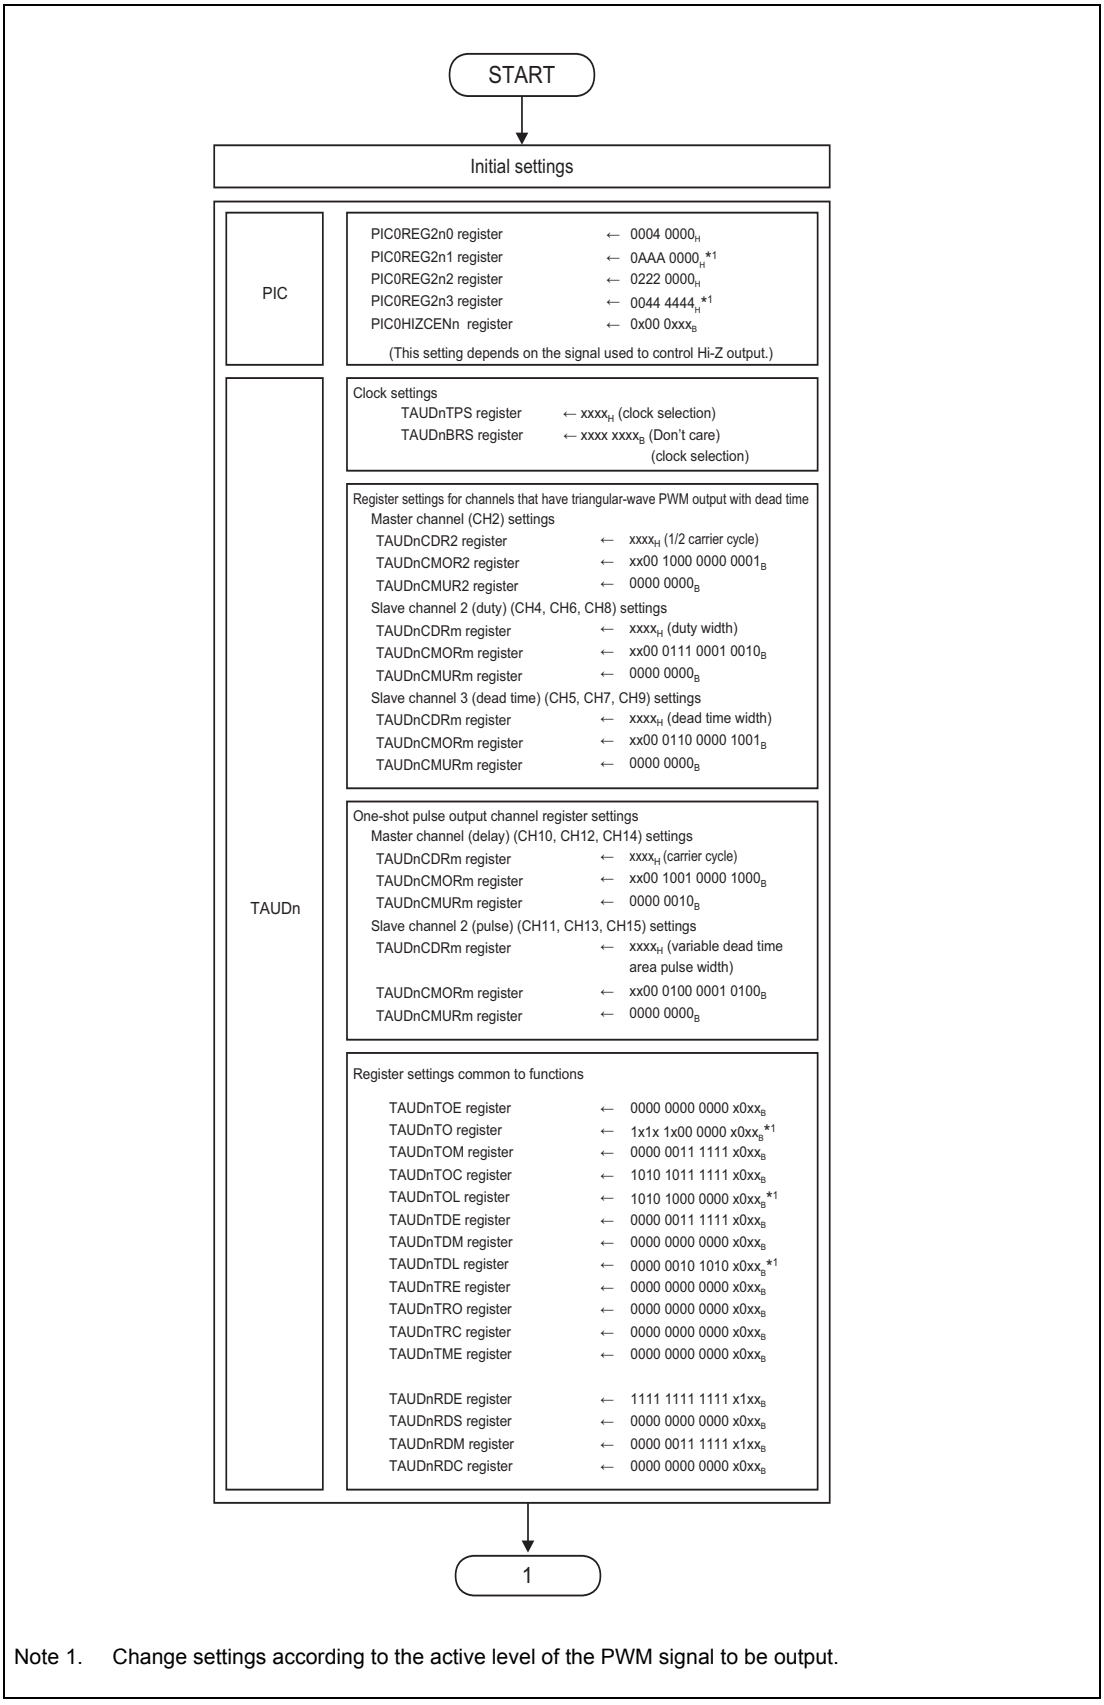
An operation example in which the system transitions to a U phase of 0% and UB phase of 100% in the timer configuration for performing the U phase PWM output shown in **Figure 29.40** is provided below. Output of a triangle PWM signal with dead time is active low.

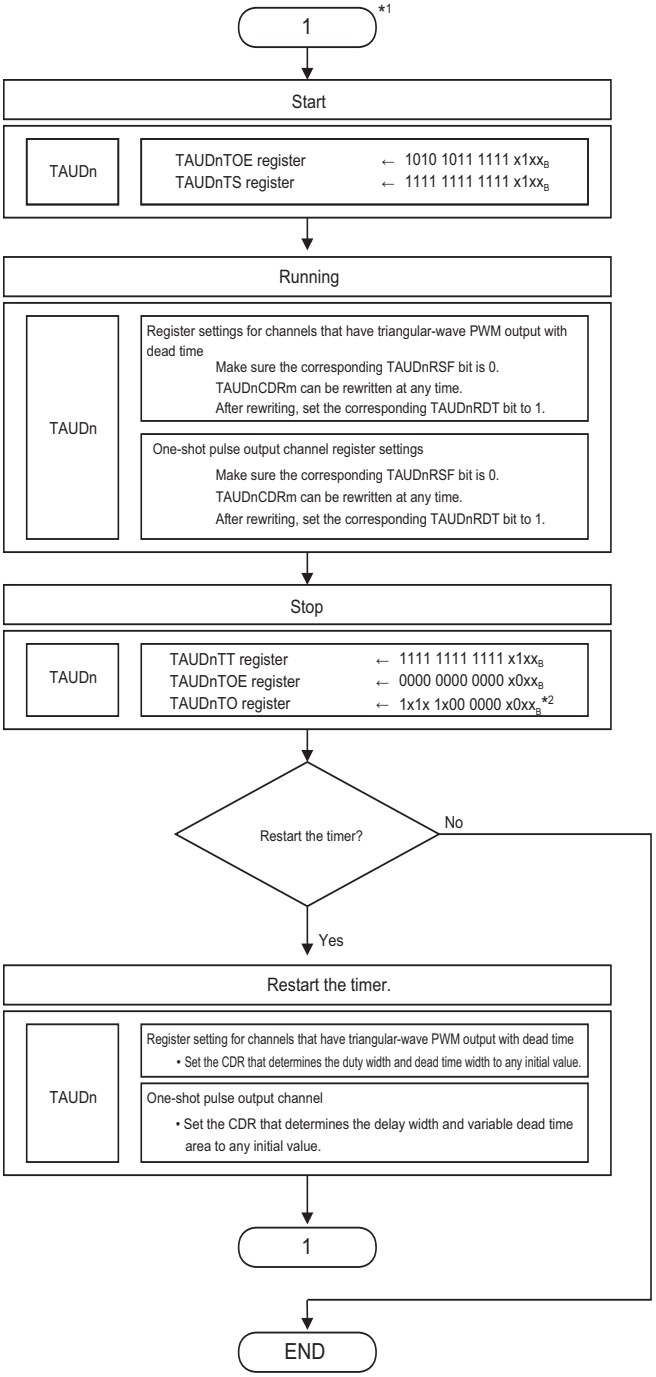
(1) The timer operation from the start of timer operation until the output of a triangle PWM signal with dead time is the same as in **Figure 29.37, Example of a High-Accuracy PWM Signal Output with Dead Time (U Phase: 100%, UB Phase: 0%) (when TAUDnTOL04 = 0 (Active High) and TAUDnTOL05 = 0 (Active High))**. However, an active low PWM signal is output.



(2) Therefore, active low output that corresponds with PWM output is specified as the combination circuit setting (PIC0REG2n116 and PIC0REG2n117, and PIC0REG2n118 and PIC0REG2n119). This results in the output of an active low variable dead time area pulse for the U phase (FN00 A) and UB phase (FN01 A).

(3) In addition, active low output that corresponds with PWM output is also specified as the logical operation circuit setting (PIC0REG2n302 to PIC0REG2n300 and PIC0REG2n306 to PIC0REG2n304). The pulse generated in (2) is combined with the TOUT04 and TOUT05 output waveforms, and the result is output from TAPAnUP (U phase output) and TAPAnUM (UB phase output) as an active low PWM signal.

CAUTION



If the 100% U phase duty setting for CDR04 and the variable dead time area pulse width for CDR11 are specified at the same time, the last PWM signal output from TOUT04 is adversely affected due to the feature specifications.
To cancel this effect, the CDR11 setting is delayed one cycle.
For details, see Figure 29.38, Effect on the Output Triangle PWM Wave with Dead Time by the Variable Dead Time Area Pulse.

29.12.5 Setup Flow

Note 1. Change settings according to the active level of the PWM signal to be output.

Figure 29.41 Setup Flow (Active High Example)

Note 1. Specify the selection register and output port to use after specifying the initial settings for the peripheral interconnections and timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

Figure 29.42 Setup Flow (Active High Example) (continued)

29.12.6 Setting Examples for Operation Functions

This section provides example settings for each register.

29.12.6.1 TAUDn settings (active high example)

Table 29.59 TAUDn: CH2-related (Master Channel Used To Output A Triangle PWM Signal with Dead Time*1)

Register	Bit position	Bit name	Setting	Remark
TAUDnCMOR2	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	000	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	0000	
	0	TAUDnMD0	1	At the start of operation, output INTm and toggle TOUTm.
TAUDnCMUR2	1, 0	TAUDnTIS[1:0]	00	Fixed

Note 1. The master channel and slave channel names are defined for TAUD triangle PWM output with dead time. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

NOTE

For the TAUDnCMORm register of the master channel used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.
For this feature, set TAUDnMD0 to 1.

Table 29.60 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Triangle PWM Signal with Dead Time*1) (m = 4, 6, or 8)

Register	Bit position	Bit name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	111	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	1001	
	0	TAUDnMD0	0	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The same operation clock must be specified for the master channel and slave channel.
For the TAUDnCMORm register of slave channels 2 and 3, which is used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 29.61 TAUDn: CH5, CH7, and CH9-related (Slave Channel 3 used to Output a Triangle PWM Signal with Dead Time*1) (m = 5, 7, or 9)

Register	Bit position	Bit name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	110	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The same operation clock must be specified for the master channel and slave channel.
For the TAUDnCMORm register of slave channels 2 and 3, which is used when outputting a triangle PWM signal with dead time, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 29.62 TAUDn: CH10, CH12, and CH14-related (Master Channel used to Output a One-shot Pulse*1) (m = 10, 12, or 14)

Register	Bit position	Bit name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	001	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	0	Disable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	10	Detect both rising and falling edges as valid.

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 29.63 TAUDn: CH11, CH13, and CH15-related (Slave Channel used to Output a One-Shot Pulse*1) (m = 11, 13, or 15)

Register	Bit position	Bit name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	
	4 to 1	TAUDnMD[4:1]	1010	
	0	TAUDnMD0	0	Disable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD one-shot pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel. Specify the same clock setting as for the master channel (CH2) used to output a triangle PWM signal with dead time.

NOTE

For the TAUDnCMORm register used during one-shot pulse output, TAUDnCKS[1:0] (which selects the operation clock) and TAUDnMD0 can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.
For this feature clear TAUDnMD0 to 0.

Table 29.64 Common TAUDn Channel Settings (1/4)

Register	Bit position	Bit name	Setting	Remark
TAUDnTOE	15	TAUDnTOE15	0 1	Disable the timer. Enable the timer.
	14	TAUDnTOE14	0	
	13	TAUDnTOE13	0 1	Disable the timer. Enable the timer.
	12	TAUDnTOE12	0	
	11	TAUDnTOE11	0 1	Disable the timer. Enable the timer.
	10	TAUDnTOE10	0	
	9 to 4	TAUDnTOE09 to TAUDnTOE04	0 1	Disable the timer. Enable the timer.
	3	TAUDnTOE03	Don't care	
	2	TAUDnTOE02	0 1	Disable the timer. Enable the timer.
	1, 0	TAUDnTOE01 TAUDnTOE00	Don't care	

Table 29.64 Common TAUDn Channel Settings (2/4)

Register	Bit position	Bit name	Setting	Remark
TAUDnTO	15	TAUDnTO15	1*1	Output a high-level signal to TOUT15.
	14	TAUDnTO14	Don't care	
	13	TAUDnTO13	1*1	Output a high-level signal to TOUT13.
	12	TAUDnTO12	Don't care	
	11	TAUDnTO11	1*1	Output a high-level signal to TOUT11.
	10	TAUDnTO10	Don't care	
	9 to 4	TAUDnTO09 to TAUDnTO04	0*1	Output a low-level signal to TOUT09 to TOUT04.
	3	TAUDnTO03	Don't care	
	2	TAUDnTO02	0	Output a low-level signal to TOUT02.
	1, 0	TAUDnTO01 TAUDnTO00	Don't care	
TAUDnTOM	15 to 10	TAUDnTOM15 to TAUDnTOM10	0	Independent operation mode
	9 to 4	TAUDnTOM09 to TAUDnTOM04	1	Synchronous operation mode
	3	TAUDnTOM03	Don't care	
	2	TAUDnTOM02	0	Independent operation mode
	1, 0	TAUDnTOM01 TAUDnTOM00	Don't care

	10	TAUDnTOC10	0	Operation mode 1
	9 to 4	TAUDnTOC09 to TAUDnTOC04	1	Operation mode 2
	3	TAUDnTOC03	Don't care	
	2	TAUDnTOC02	0	Operation mode 1
	1, 0	TAUDnTOC01 TAUDnTOC00	Don't care	
TAUDnTOL	15	TAUDnTOL15	1*1	Inverted logic output (active low)
	14	TAUDnTOL14	Don't care	
	13	TAUDnTOL13	1*1	Inverted logic output (active low)
	12	TAUDnTOL12	Don't care	
	11	TAUDnTOL11	1*1	Inverted logic output (active low)
	10	TAUDnTOL10	Don't care	
	9 to 4	TAUDnTOL09 to TAUDnTOL04	0*1	Positive logic output (active high)
	3	TAUDnTOL03	Don't care	
	2	TAUDnTOL02	0	Positive logic output (active high)
	1, 0	TAUDnTOL01 TAUDnTOL00	Don't care	

Table 29.64 Common TAUDn Channel Settings (3/4)

Register	Bit position	Bit name	Setting	Remark
TAUDnTDE	15 to 10	TAUDnTDE15 to TAUDnTDE10	0	Disable dead time control.
	9 to 4	TAUDnTDE09 to TAUDnTDE04	1	Enable dead time control.*2
	3	TAUDnTDE03	Don't care	
	2	TAUDnTDE02	0	Disable dead time control.
	1, 0	TAUDnTDE01 TAUDnTDE00	Don't care	
TAUDnTDM	15 to 9	TAUDnTDM15 to TAUDnTDM09	0	
	3	TAUDnTDM03	Don't care	
	2	TAUDnTDM02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDM01 TAUDnTDM00	Don't care	
TAUDnTDL	15 to 10	TAUDnTDL15 to TAUDnTDL10	0	Invalid because dead time control is disabled.
	9	TAUDnTDL09	1*1	Dead time is in the negative segment of the W phase output
	8	TAUDnTDL08	0*1	Dead time is in the positive segment of the W phase output
	7	TAUDnTDL07	1*1	Dead time is in the negative segment of the V phase output
	6	TAUDnTDL06	0*1	Dead time is in the positive segment of the V phase output
	5	TAUDnTDL05	1*1	Dead time is in the negative segment of the U phase output
	4	TAUDnTDL04	0*1	Dead time is in the positive segment of the U phase output
	3	TAUDnTDL03	Don't care	
	2	TAUDnTDL02	0	Invalid because dead time control is disabled.
	1, 0	TAUDnTDL01 TAUDnTDL00	Don't care	
TAUDnTRE	15 to 4	TAUDnTRE15 to TAUDnTRE04	0	Disable real-time output.
	3	TAUDnTRE03	Don't care	
	2	TAUDnTRE02	0	Disable real-time output.
	1, 0	TAUDnTRE01 TAUDnTRE00	Don't care	
TAUDnTRO	15 to 4	TAUDnTRO15 to TAUDnTRO04	0	Invalid because real-time output is disabled.
	3	TAUDnTRO03	Don't care	
	2	TAUDnTRO02	0	Invalid because real-time output is disabled.
	1, 0	TAUDnTRO01 TAUDnTRO00	Don't care	
TAUDnTRC	15 to 4	TAUDnTRC15 to TAUDnTRC04	0	Do not use this channel to generate the real-time output trigger.
	3	TAUDnTRC03	Don't care	
	2	TAUDnTRC02	0	Do not use this channel to generate the real-time output trigger.
	1, 0	TAUDnTRC01 TAUDnTRC00	Don't care	

Table 29.64 Common TAUDn Channel Settings (4/4)

Register	Bit position	Bit name	Setting	Remark
TAUDnTME	15 to 4	TAUDnTME15 to TAUDnTME04	0	Disable modulation output for timer output and real-time output.
	3	TAUDnTME03	Don't care	
	2	TAUDnTME02	0	Disable modulation output for timer output and real-time output.
	1, 0	TAUDnTME01 TAUDnTME00	Don't care

29.13 Delay Pulse Output with Dead Time

29.13.1 Functional Overview

This feature outputs a three-phase PWM with dead time that is later than the cycle timing by an amount equal to the delay amount.

Unlike the function of three-phase PWM output with dead time, a PWM signal that has a reset in the next cycle can be output.

29.13.2 Configuration

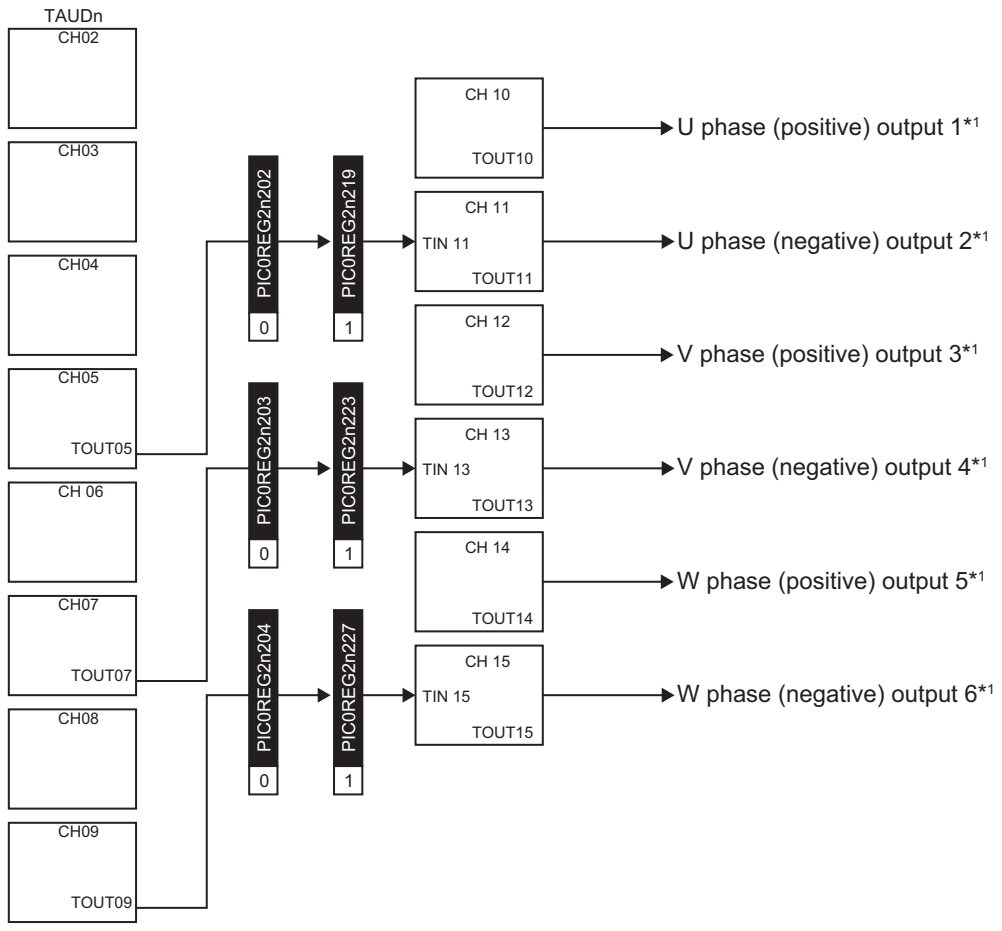
The unit and channel configuration for this feature is shown below. (n = 0, m = 0 to 15)

Table 29.66 Configuration of Delay Pulse Output with Dead Time

Timer	Timer motor control function
TAUD0 CH2 to CH15 (used channels fixed)	TAPA0

The signal names used in the descriptions below are abbreviations. The actual signal names corresponding to each abbreviation are as follows:

- INTm → INTTAUDnIm (TAUDn channel m interrupt)
- TINm → TAUDTTINm (TAUDn channel m input)
- TOUTm → TAUDTTOUTm (TAUDn channel m output)
- CDRm → TAUDnCDRm (TAUDn channel m data register)
- CNTm → TAUDnCNTm (TAUDn channel m counter register)



29.13.2.1 TAUDn configuration

Because the CDRm value of CH3 does not affect TOUT0 to TOUT15, the INTm signal of CH3 can also be used for other purposes such as A/D conversion trigger generation.

Table 29.67 TAUDn configuration

CH	Function name	M/S*1	CDR setting	Description
2	Delay pulse output function (CH2 is the master channel for CH3 to CH9.)	M	Cycle	
3		S		Reserved
4		S	Delay (U phase)	
5		S	Pulse width (U phase)	
6		S	Delay (V phase)	
7		S	Pulse width (V phase)	
8		S	Delay (W phase)	
9		S	Pulse width (W phase)	
10	Any feature that does not use TOUTm	S		TOUT: U phase output
11	One-phase PWM output	S	Dead time (U phase)	TOUT: UB phase output
12	Any feature that does not use TOUTm	S		TOUT: V phase output
13	One-phase PWM output	S	Dead time (V phase)	TOUT: VB phase output
14	Any feature that does not use TOUTm	S		TOUT: W phase output
15	One-phase PWM output	S	Dead time (W phase)	TOUT: WB phase output

Note 1. M: Master channel, S: Slave channel

Note 1. For the connection destination, see **Figure 29.25, Block Diagram: Motor Output Buffer Control**.

Figure 29.43 Block Diagram: Delay Pulse Output with Dead Time

29.13.3 Registers

29.13.3.1 PIC0REG2n2 — Timer I/O Control Register 2n2 (n = 0)

This register selects CHm input signals of the TAUDn timer. This section describes the bits to be used in the delay pulse output with dead time.

Access: This register can be read or written in 32-bit units.

Address: PIC0REG202: FFDD 00C8$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	PIC0REG2n227	—	—	—	PIC0REG2n223	—	—	—	PIC0REG2n219	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PIC0REG2n204	PIC0REG2n203	PIC0REG2n202	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 29.68 PIC0REG2n2 Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	*1
27	PIC0REG2n227	Select the TIN input signal to TAUDTTIN15. **PIC0REG2n227** / **Input signal** 1 / Signal selected by the PIC0REG2n204 bit Other than above / Setting prohibited
26 to 24	Reserved	*1
23	PIC0REG2n223	Select the TIN input signal to TAUDTTIN13. **PIC0REG2n223** / **Input signal** 1 / Signal selected by the PIC0REG2n203 bit Other than above / Setting prohibited
22 to 20	Reserved	*1
19	PIC0REG2n219	Select the TIN input signal to TAUDTTIN11. **PIC0REG2n219** / **Input signal** 1 / Signal selected by the PIC0REG2n202 bit Other than above / Setting prohibited
18 to 5	Reserved	*1
4	PIC0REG2n204	Select the signal supplied to TAUDTTIN15. 0: Select TAUDTTOUT9. 1: Setting prohibited
3	PIC0REG2n203	Select the signal supplied to TAUDTTIN13. 0: Select TAUDTTOUT7. 1: Setting prohibited
2	PIC0REG2n202	Select the signal supplied to TAUDTTIN11. 0: Select TAUDTTOUT5. 1: Setting prohibited
1, 0	Reserved	*1

Note 1. Some of the bits defined as 0 in the PIC0REG2n2 register are defined for the other timer connection functions. For such bits, use the bit definition of those timer connection functions.

29.13.3.2 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0)

This register selects the Hi-Z output control input signal of TAPAn.

Access: This register can be read or written in 8-bit units.

Address: PIC0HIZCEN0: FFDD 0080_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	PIC0HIZCENn6	—	—	—	PIC0HIZCENn2	—	PIC0HIZCENn0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R	R	R	R/W	R	R/W

Table 29.69 PIC0HIZCENn Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	PIC0HIZCENn6	Select whether to enable or disable Hi-Z output control by the INTADCA0ERR interrupt signal. 0: Disable 1: Enable
5 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PIC0HIZCENn2	Select whether to enable or disable Hi-Z output control by the WDTA1NMI interrupt signal. 0: Disable 1: Enable
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PIC0HIZCENn0	Select whether to enable or disable Hi-Z output control by the TAPAnESO pin input. 0: Disable 1: Enable

29.13.4 Operation Example

This is achieved by combining the following TAUD features:

- Delay pulse output function
- One-phase PWM output

The delay pulse output feature generates a PWM signal that is later than the cycle timing by an amount equal to the delay amount. Next, a one-phase PWM signal to which dead time has been added is output for the delayed PWM signal by one-phase PWM output feature.

A delay pulse with dead time is output by assigning the PWM output achieved using the above features to the U, V, and W phases. Therefore, the PWM output dead time can be freely specified for the PWM signal of each phase. Because the only difference between phases is the assigned channel, only one phase (the U phase) is described below.

29.13.4.1 Delay pulse output function

By using a combination of CH2, CH4, and CH5, a basic PWM signal for one-phase PWM is output from TOUT05 delayed by the amount specified by CH4 with respect to the cycle specified by CH2.

Note that CH3 is a reserved timer for achieving this feature, so do not use it for other features.

CAUTION

Do not specify a delay amount that exceeds the cycle.

29.13.4.2 One-phase PWM output

One-phase PWM output is generated from TOUT10 and TOUT11 by using a combination of CH10 and CH11.

By specifying the dead time value for CDR11, a one-phase PWM with dead time is output for the TIN11 input.

Similarly, the V phase uses CH12 and CH13 to output a one-phase PWM with dead time, while the W phase uses CH14 and CH15.

CAUTION

Specify the same clock for each TAUDn channel that uses the delay pulse output and one-phase PWM output features.

For details about the TAUD functions, see **Section 25, Timer Array Unit D (TAUD)**.

The differences between the delay pulse output with dead time and the three-phase PWM output with dead time are described below.

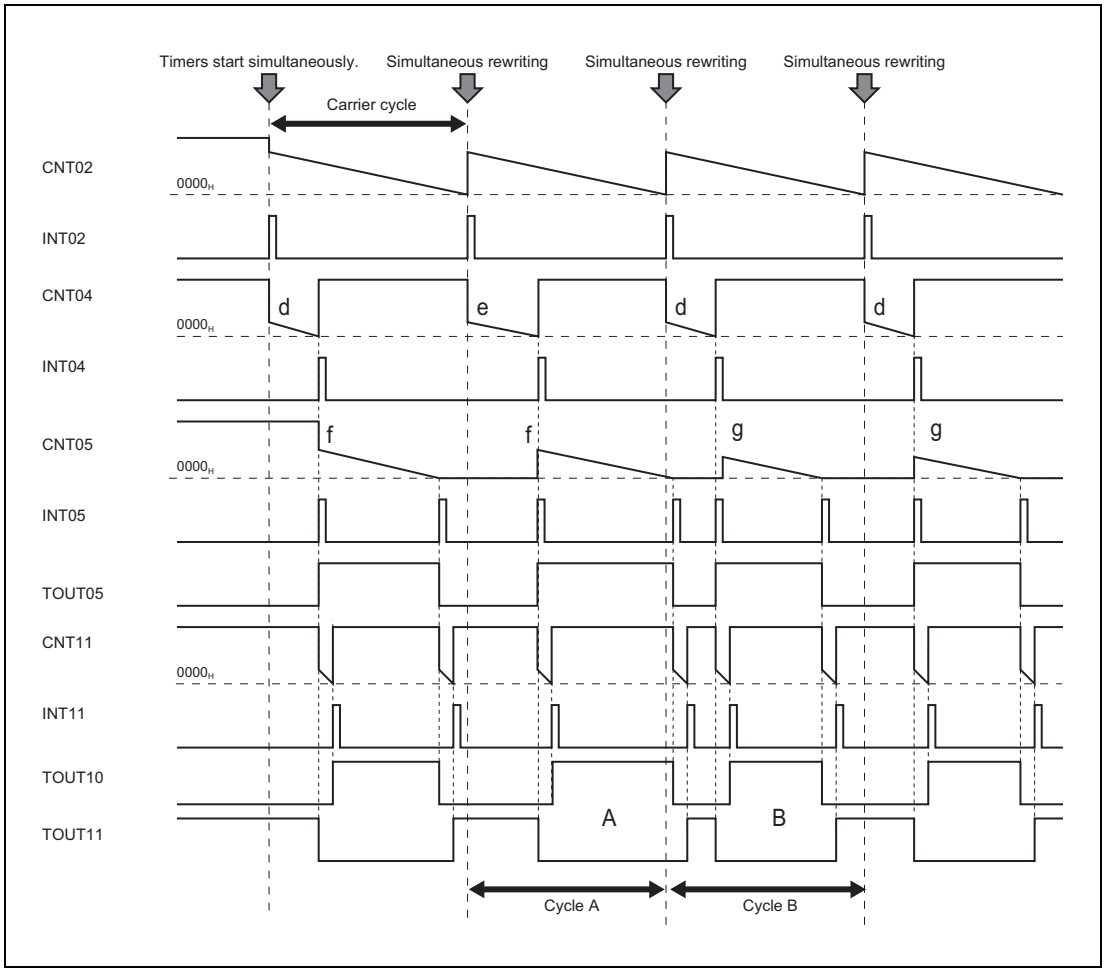

Figure 29.44 PWM Output by Outputting a Delay Pulse with Dead Time

In **Figure 29.44**, PWM waveform A is supposed to be output before cycle A ends, but because the delay timing is too long, the PWM clear position is after the end of cycle A. Next, PWM waveform B, which is for cycle B, is output.

The operations shown below occur when an attempt is made to achieve the operations shown in **Figure 29.44, PWM Output by Outputting a Delay Pulse with Dead Time** by the three-phase PWM output with dead time.

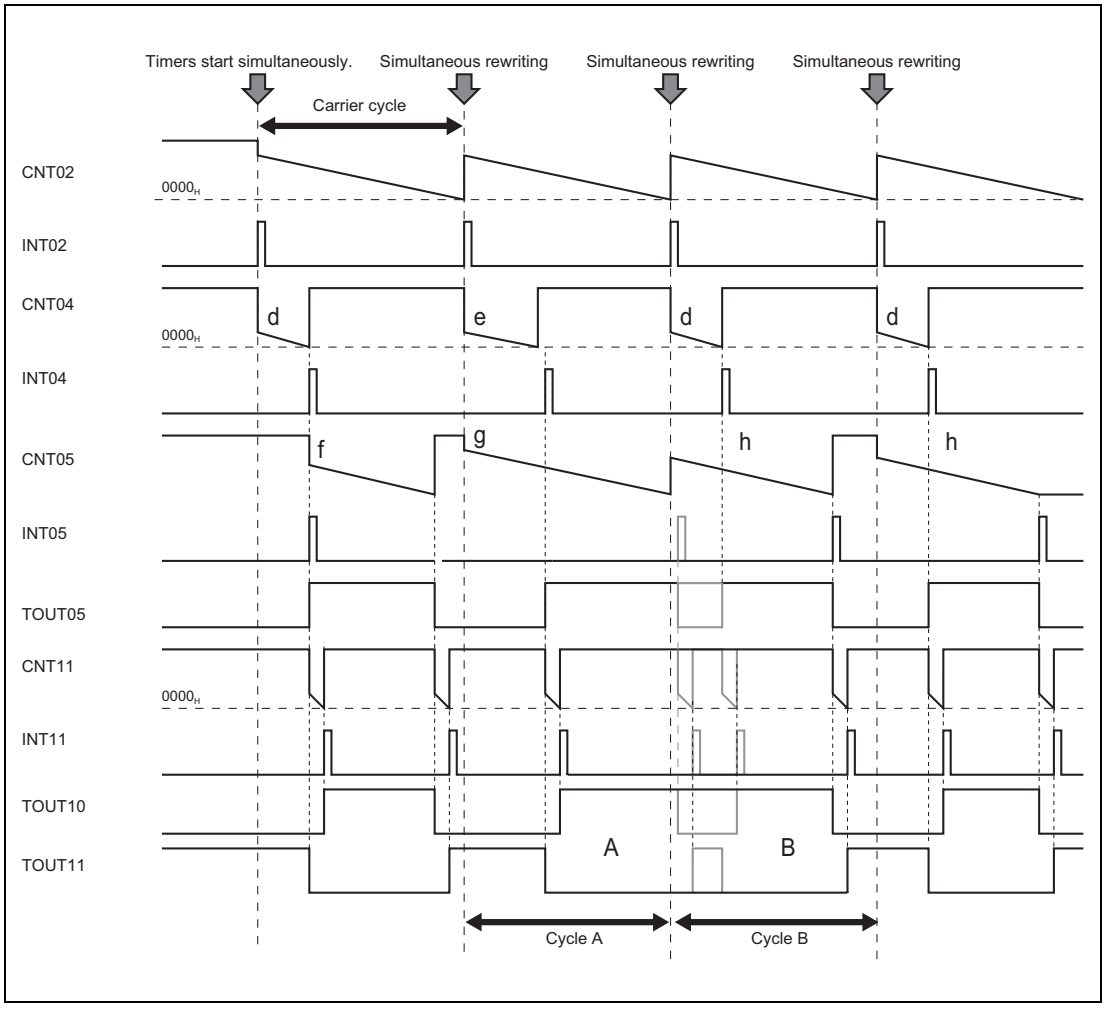

Figure 29.45 Output of a Three-Phase PWM Signal with Dead Time (1)

Figure 29.45 shows an example in which the output PWM signal does not end before carrier cycle A because the set timing for outputting a three-phase PWM signal with dead time is delayed and the clear timing is after the end of the carrier cycle.

For cycle A, the set timing of PWM waveform A is the same as that in the figure on the previous page, but because the clear timing is after the end of cycle A, a reload operation occurs in cycle A before PWM waveform A is cleared, and the clear timing for PWM waveform A does not occur.

In addition, the set timing of PWM waveform B for cycle B is ignored because a PWM waveform is already set. The result is that there is no PWM waveform change until the clear timing of cycle B, and a waveform that combines PWM waveform A and PWM waveform B is output.

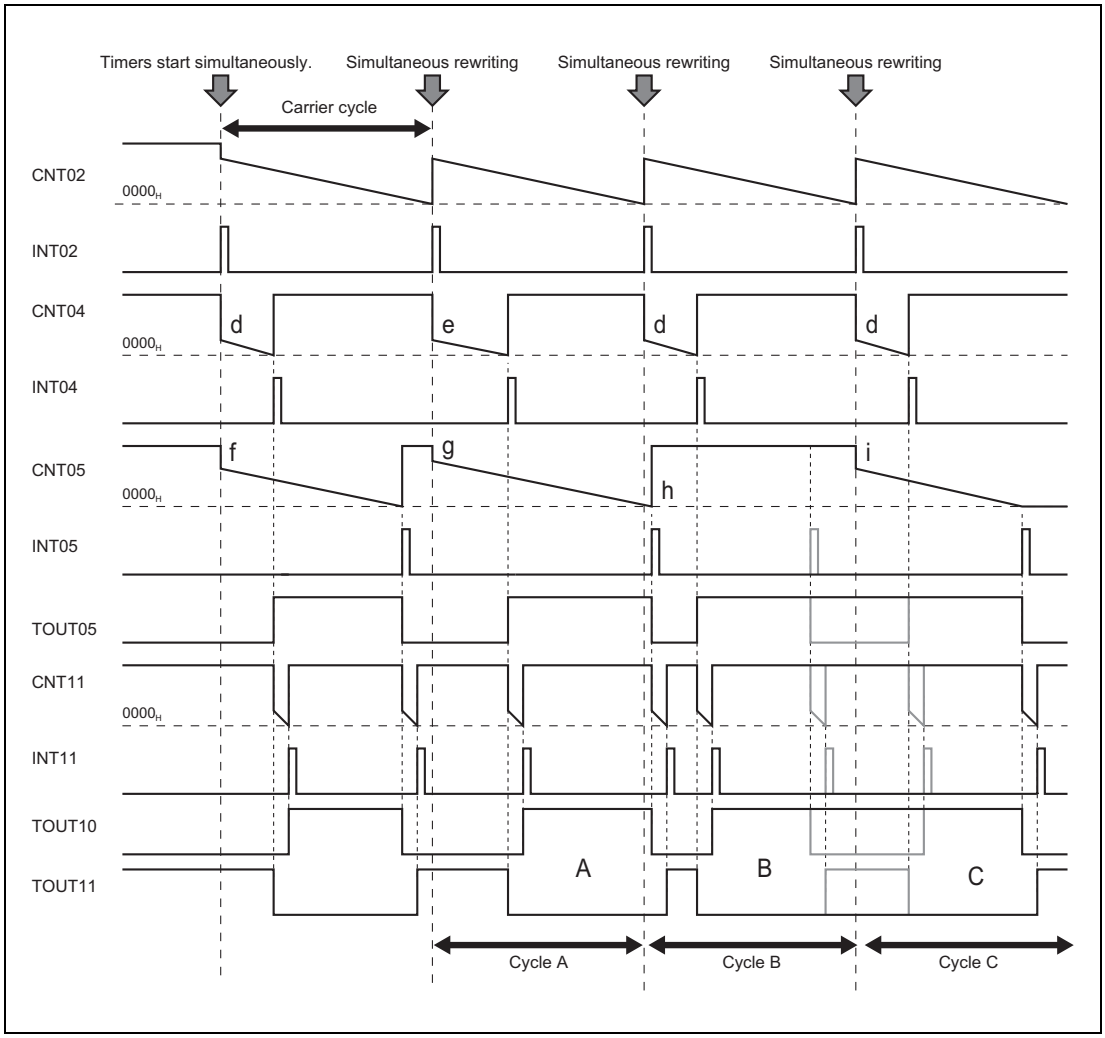

Figure 29.46 Output of a Three-Phase PWM Signal with Dead Time (2)

Figure 29.46 shows an example of outputting a three-phase PWM signal with dead time in which counter operation for which the clear timing is longer than cycle A is continued in cycle B, and PWM output A is cleared at the beginning of cycle B.

The output of PWM waveform A for cycle A is the same as the output of a delay pulse with dead time, but because the clear timing is used at the beginning of cycle B, the clear timing of PWM output B, which is supposed to be output during cycle B, does not occur.

In addition, the set timing of PWM waveform C for cycle C is ignored because a PWM waveform is already set. The result is that there is no PWM waveform change until the clear timing of cycle C, and a waveform that combines PWM waveform B and PWM waveform C is output.

In this way, it is possible to achieve freer PWM output timing when outputting a delay pulse with dead time than when outputting a three-phase PWM signal with dead time.

The peripheral interconnections provide a connection for using the PWM output timing of delay pulse output as input for one-phase PWM output.

Figure 29.47 shows a timing chart for outputting a delay pulse with dead time.

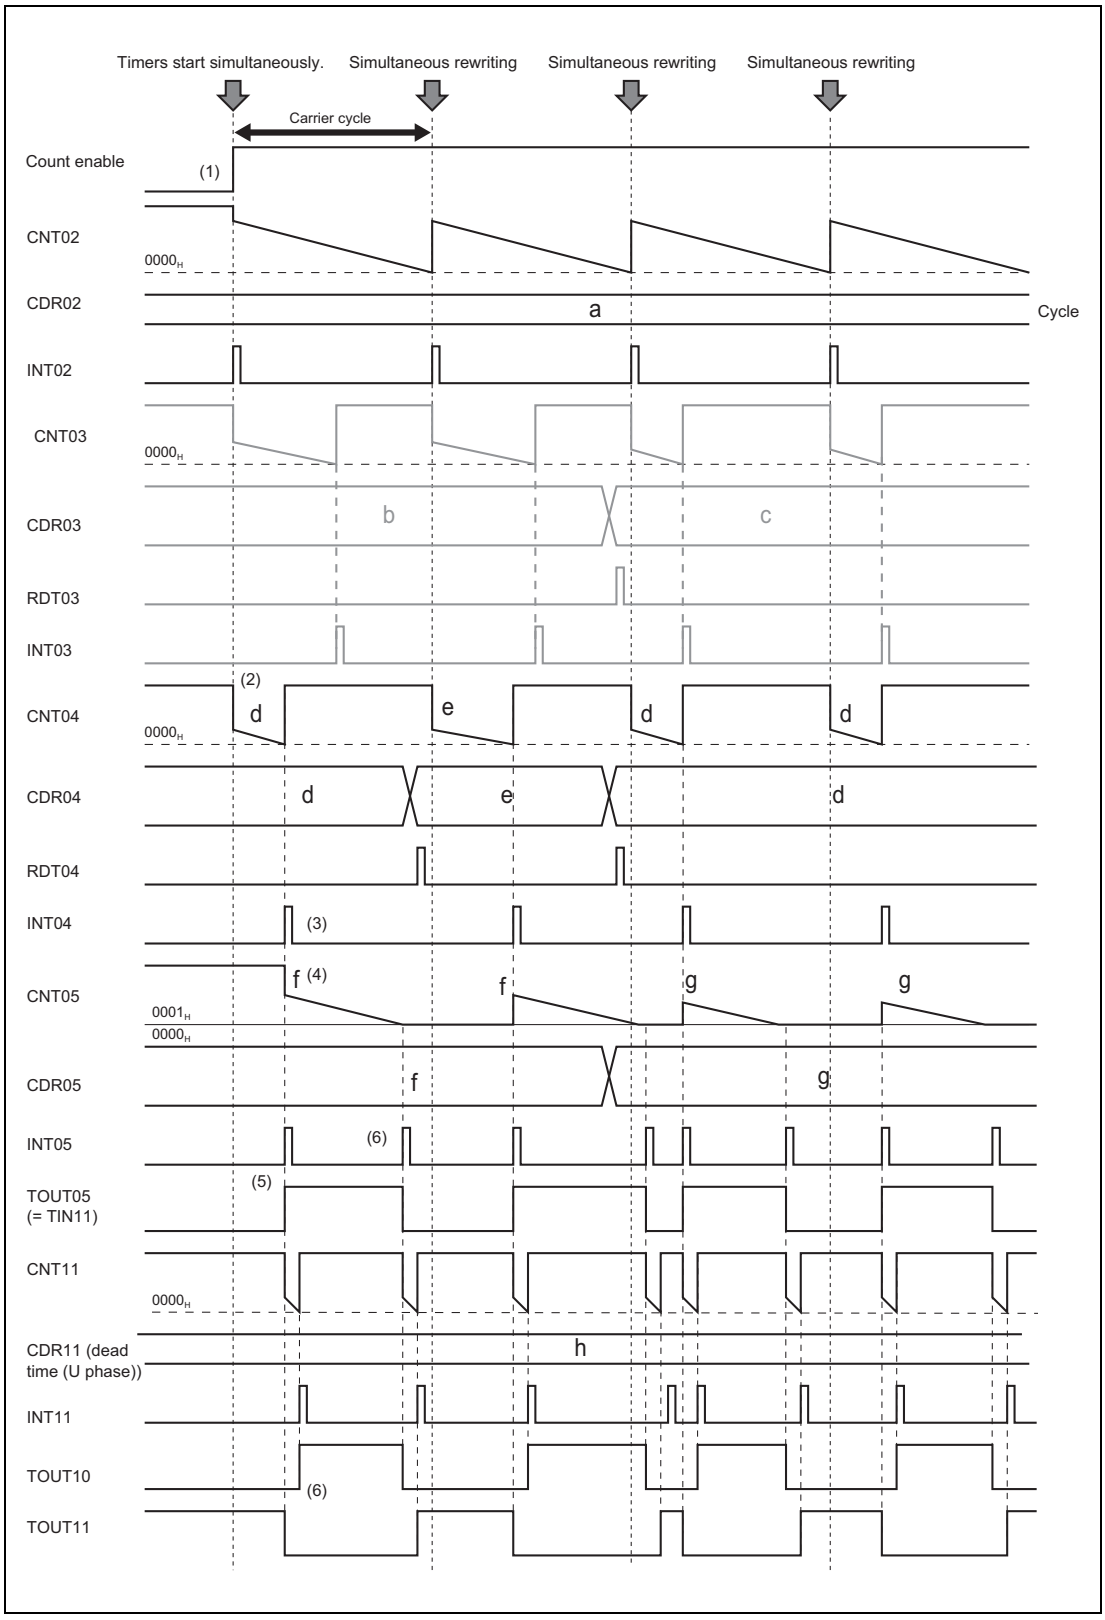

Figure 29.47 Output of a Delay Pulse with Dead Time

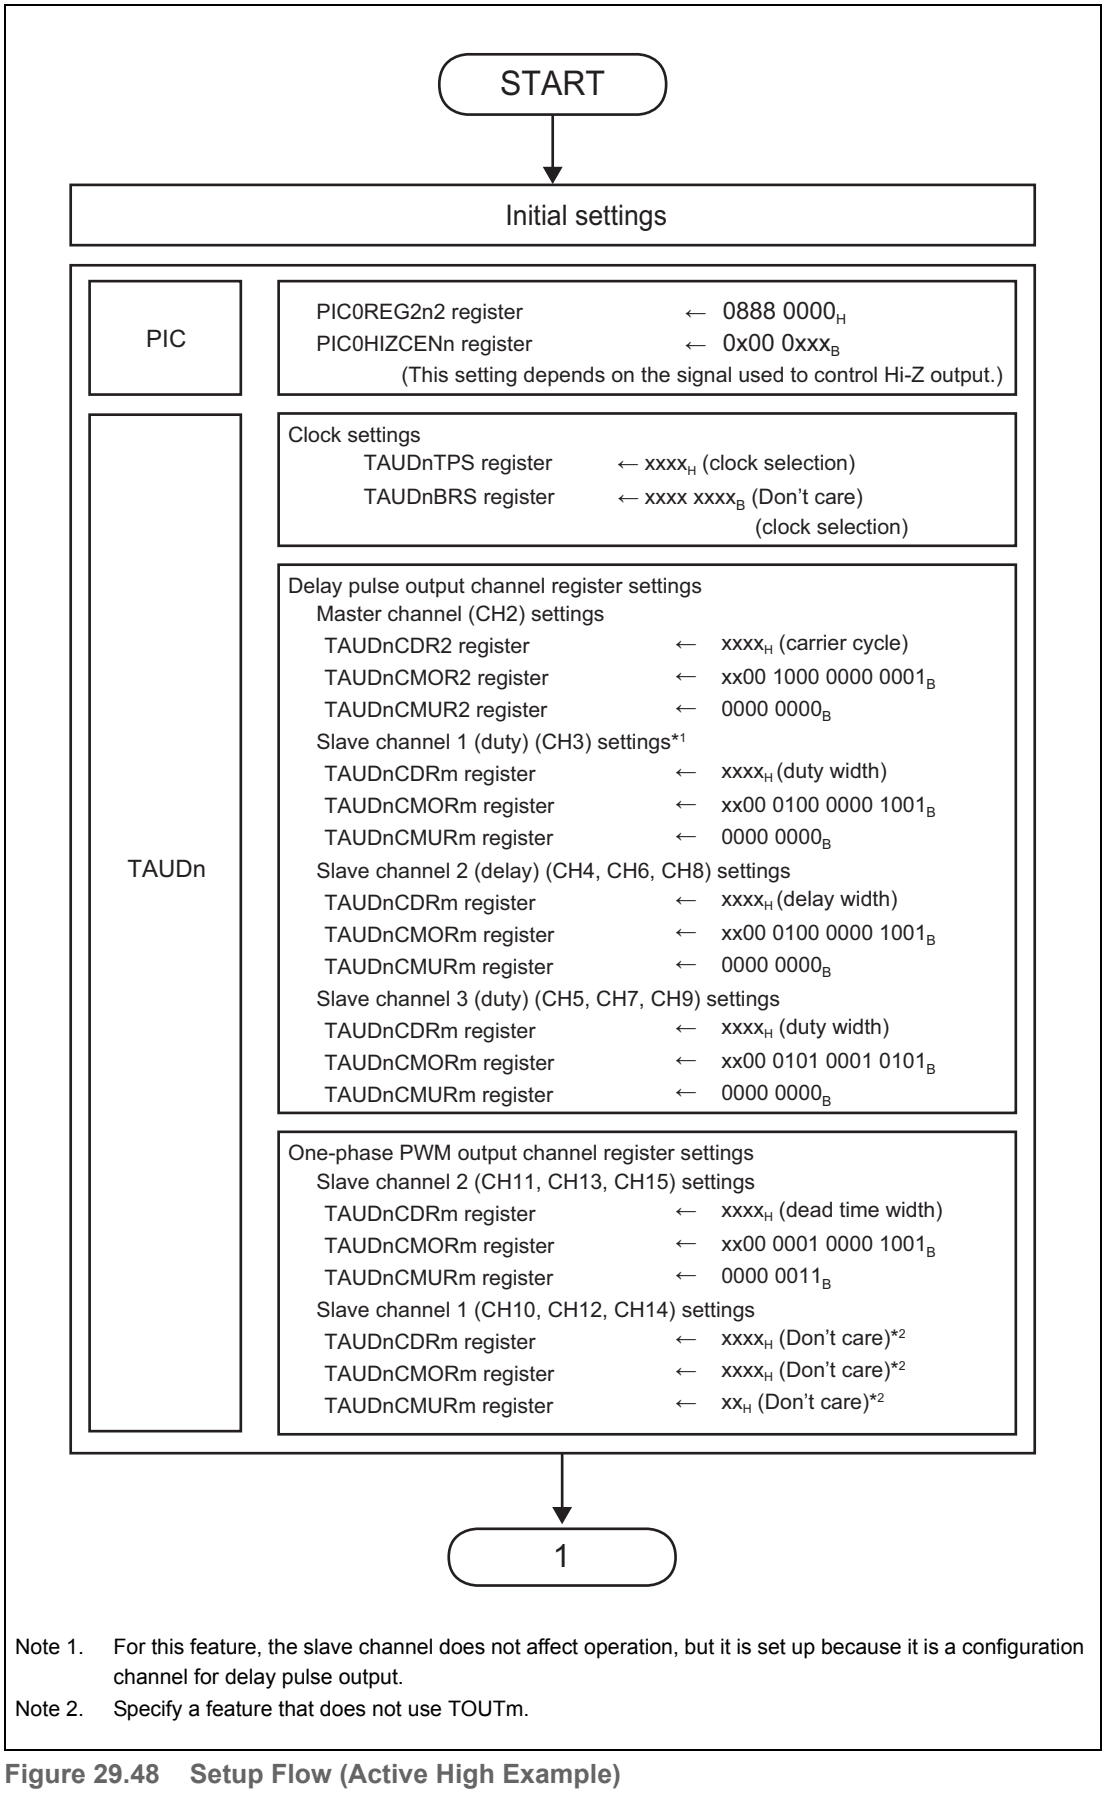
The output of a delay pulse with dead time shown in **Figure 29.47** is described below.

(1) CH2 (the carrier cycle timer) and CH4 (the delay timing timer) are started simultaneously by starting timers simultaneously.
CH5 (the PWM duty timer) and CH11 (the dead time timer) are also enabled, but no counting operations are performed until the edges of INT04, which indicates the count start timing for CH5, and TIN11, which indicates the count start timing for CH11, are detected.
Because CH3 does not affect PWM output for this function, the channel is not described.

(2) For CH4, when there is a CH2 underflow, the settings from CDR04 are reloaded to CNT04.

(3) The CH4 underflow generates the delay timing signal (INT04).

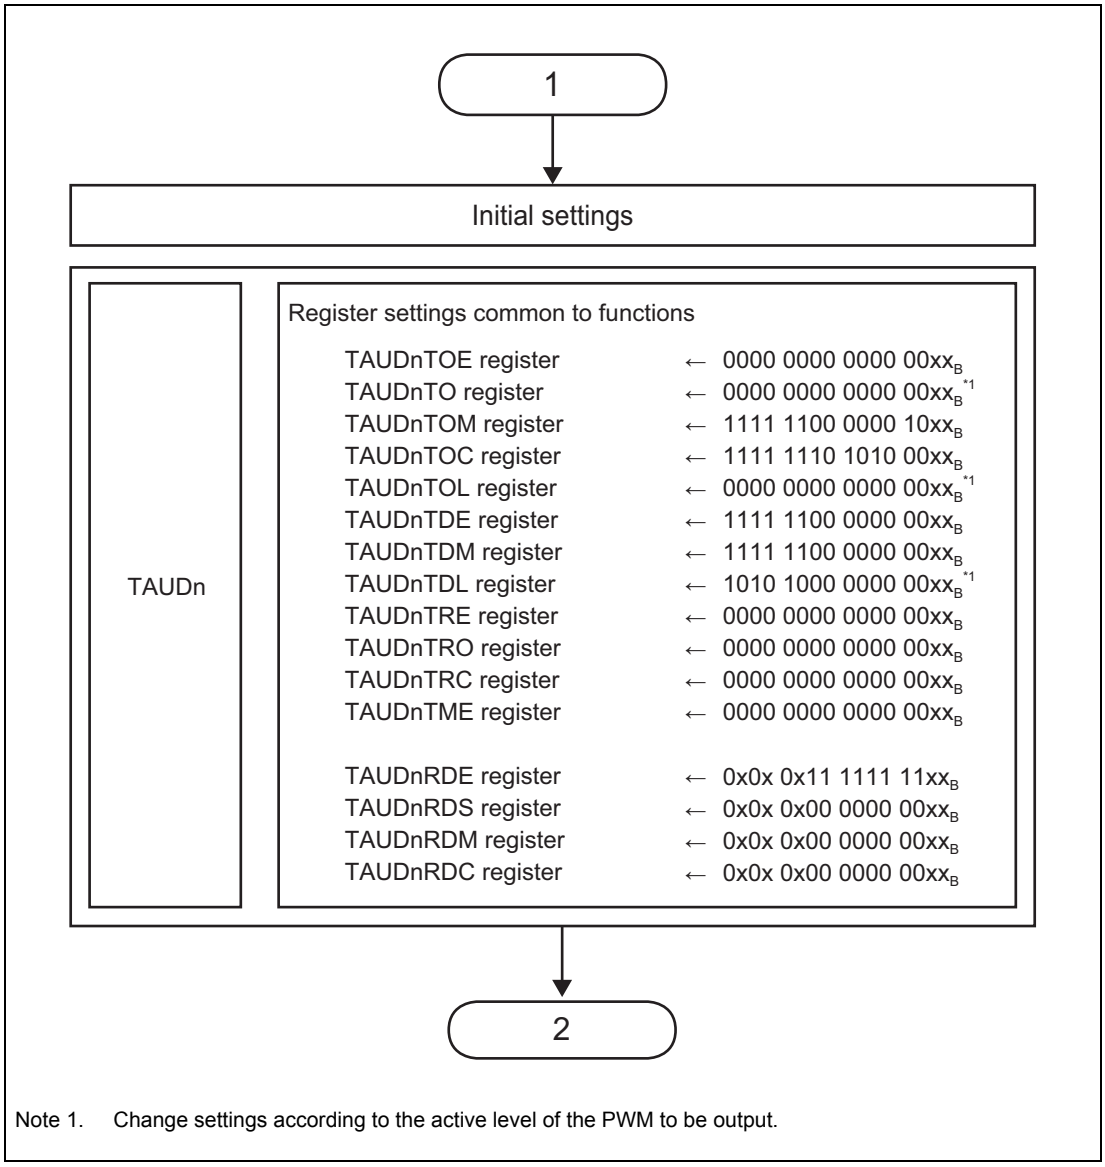


(4) When INT04 is generated, the settings from CDR05 are reloaded to CNT05, and then the CH5 (the PWM duty timer) operation starts.

(5) At this time, INT05 is generated and the TOUT05 output level changes to the active level.

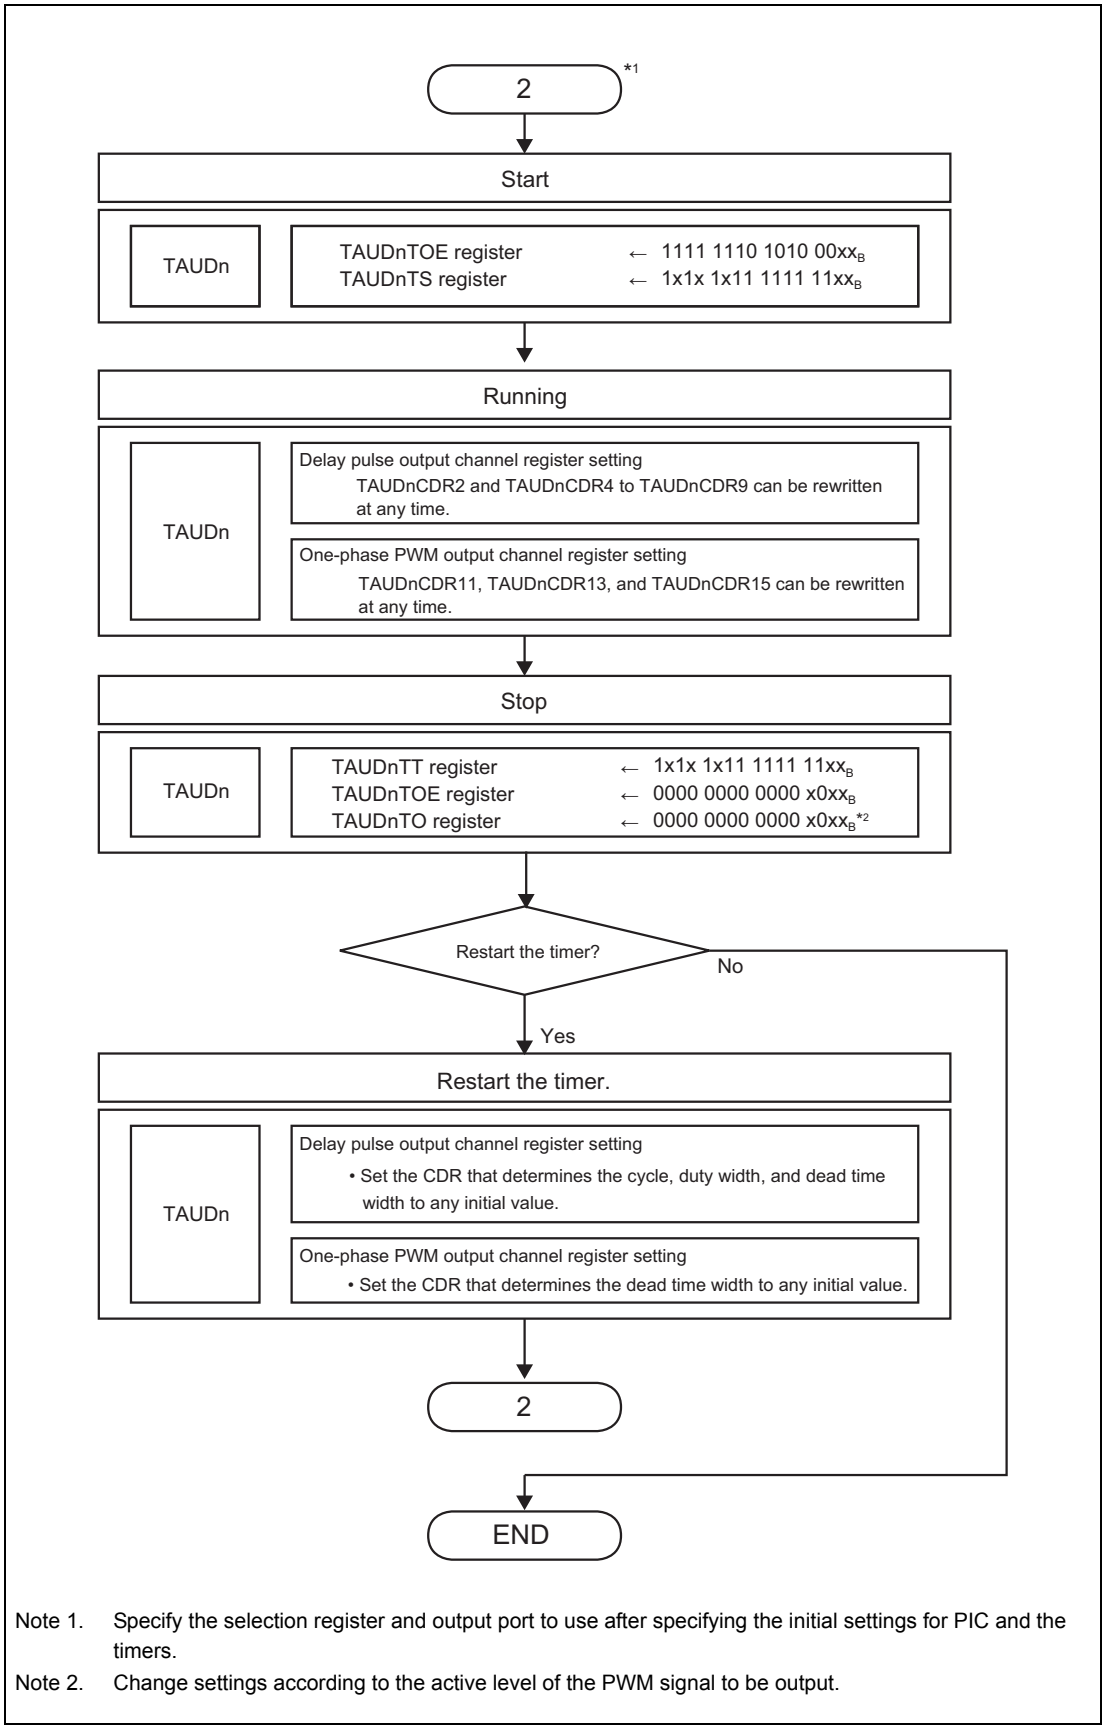
(6) Due to the CH5 underflow, INT05 is generated again, and TOUT05 changes to the inactive level. TOUT05, which is changed by the CH4 and CH5 underflow, is supplied to the TIN11 input of one-phase PWM output.

(7) During one-phase PWM output, a PWM waveform with dead time is output by detecting a TIN11 edge.



29.13.5 Setup Flow

Note 1. For this feature, the slave channel does not affect operation, but it is set up because it is a configuration channel for delay pulse output.



Note 2. Specify a feature that does not use TOUTm.

Figure 29.48 Setup Flow (Active High Example)

Note 1. Change settings according to the active level of the PWM to be output.

Figure 29.49 Setup Flow (Active High Example) (continued)

Note 1. Specify the selection register and output port to use after specifying the initial settings for PIC and the timers.

Note 2. Change settings according to the active level of the PWM signal to be output.

Figure 29.50 Setup Flow (Active High Example) (continued)

29.13.6 Setting Examples for Operation Functions

This section provides example settings for each register.

29.13.6.1 TAUDn Settings

Table 29.70 TAUDn: CH2-related (Master Channel used to Output a Delay Pulse*1)

Register	Bit position	Bit name	Setting	Remark
TAUDnCMOR2	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	1	
	10 to 8	TAUDnSTS[2:0]	000	
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0000	
	0	TAUDnMD0	1	Output INTm at the start of operation.
TAUDnCMUR2	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Table 29.71 TAUDn: CH3-related (Slave Channel used to Output a Delay Pulse*1*2)

Register	Bit position	Bit name	Setting	Remark
TAUDnCMOR3	15, 14	TAUDnCKS[1:0]	Don't care*3	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	Start trigger: INTm detection on the master channel
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMUR3	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the master channel and slave channel.

Note 3. For this feature, the channel does not affect operation, but it is set up because it is a configuration channel for delay pulse output.

NOTE

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Table 29.72 TAUDn: CH4, CH6, and CH8-related (Slave Channel 2 used to Output a Delay Pulse*1) (m = 4, 6, or 8)

Register	Bit position	Bit name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	100	Start trigger: INTm detection on the master channel
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the slave channel and master channel.

NOTE

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Table 29.73 TAUDn: CH5, CH7, and CH9-related (Slave Channel 3 used to Output a Delay Pulse*1) (m = 5, 7, or 9)

Register	Bit position	Bit name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*2	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	101	Start trigger: INTm detection on an upper channel
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	1010	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	00	

Note 1. The master channel and slave channel names are defined for TAUD delay pulse output. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Note 2. The same operation clock must be specified for the slave channel and master channel.

NOTE

For the TAUDnCMORm register used during delay pulse output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.

Table 29.74 TAUDn: CH11, CH13, and CH15-related (One-Phase PWM Output) (m = 11, 13, or 15)

Register	Bit position	Bit name	Setting	Remark
TAUDnCMORm	15, 14	TAUDnCKS[1:0]	Don't care*1	Operation clock setting
	13, 12	TAUDnCCS[1:0]	00	
	11	TAUDnMAS	0	
	10 to 8	TAUDnSTS[2:0]	001	Start trigger: Detection of a TINm-input valid edge
	7, 6	TAUDnCOS[1:0]	00	
	5		0	Fixed to 0
	4 to 1	TAUDnMD[4:1]	0100	
	0	TAUDnMD0	1	Enable start triggers during counting.
TAUDnCMURm	1, 0	TAUDnTIS[1:0]	11	Both rising and falling TINm edges are detected as valid. (High width)

Note 1. Specify the same operation clock settings as for the PWM output master channel (CH2).

NOTE

For the TAUDnCMORm register used during one-phase PWM output, TAUDnCKS[1:0] (which selects the operation clock) can be set to any value, but other control bits have fixed values. For details, see **Section 25, Timer Array Unit D (TAUD)**.
CH10, CH12, and CH14 can be used with any feature that does not use TOUTm output (such as A/D trigger output).

Table 29.75 Common TAUDn Channel Settings (1/4)

Register	Bit position	Bit name	Setting	Remark
TAUDnTOE	15 to 10	TAUDnTOE15 to TAUDnTOE10	0 1	Disable the timer. Enable the timer.
	9	TAUDnTOE09	0 1	Disable the timer. Enable the timer.
	8	TAUDnTOE08	0	This is fixed to 0 because TOUT08 is not used.
	7	TAUDnTOE07	0 1	Disable the timer. Enable the timer.
	6	TAUDnTOE06	0	This is fixed to 0 because TOUT06 is not used
	5	TAUDnTOE05	0 1	Disable the timer. Enable the timer.
	4	TAUDnTOE04	0	This is fixed to 0 because TOUT04 is not used
	3	TAUDnTOE03	0	This is fixed to 0 because TOUT03 is not used
	2	TAUDnTOE02	0	This is fixed to 0 because TOUT02 is not used.
	1, 0	TAUDnTOE01 TAUDnTOE00	Don't care	
TAUDnTO	15 to 10	TAUDnTO15 to TAUDnTO10	0*1	Output a low-level signal to TOUT15 to TOUT10.
	9 to 2	TAUDnTO09 to TAUDnTO02	0	Output a low-level signal to TOUT09 to TOUT02.
	1, 0	TAUDnTO01 TAUDnTO00	Don't care	

Table 29.75 Common TAUDn Channel Settings (2/4)

Register	Bit position	Bit name	Setting	Remark
TAUDnTOM	15 to 10	TAUDnTOM15 to TAUDnTOM10	1	Synchronous operation mode
	9 to 4	TAUDnTOM09 to TAUDnTOM04	0	Independent operation mode
	3	TAUDnTOM03	1	Synchronous operation mode
	2	TAUDnTOM02	0	Independent operation mode
	1, 0	TAUDnTOM01 TAUDnTOM00	Don't care	
TAUDnTOC	15 to 10	TAUDnTOC15 to TAUDnTOC10	1	Synchronous operation mode 2
	9 to 4	TAUDnTOC09 to TAUDnTOC04	1, 0, 1, 0, 1, 0	CH5, CH7, CH9: Operation mode 2 CH4, CH6, CH8: Operation mode 1
	3	TAUDnTOC03	0	Operation mode 1

Section 30 PWM Output/Diagnostic (PWM-Diag)

This section contains a generic description of the PWM output/diagnostic function (PWM-Diag).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the units constituting PWM-Diag.

30.1 Features of RH850/F1K PWM-Diag

30.1.1 Number of Units and Channels

The PWM-Diag unit consists of a PWBA block for generating clock signals, PWGA blocks that generate PWM signals, and a PWSA block for generating triggers for A/D conversion. The numbers of individual units are listed below.

Each PWGA unit has one PWM channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 30.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
PWBA			
Number of Units	1		
Name	PWBAn (n = 0)		
PWGA			
Number of Units	48	64	72
Name	PWGAn (n = 0 to 47)	PWGAn (n = 0 to 63)	PWGAn (n = 0 to 71)
PWSA			
Number of Units	1		
Name	PWSAn (n = 0)		

Table 30.2 Indices

Index	Description
n	Throughout this section, individual units constituting the PWM-Diag function are identified by the index “n”; for example, PWBAnTE indicates the PWBAn status register.
m	The PWBA generation clock is identified by the index “m” (m = 0 to 3); for example, PWBAnBRSm indicates the PWMCLKm clock cycle configuration register.
x, y	An A/D converter configuration register number corresponding to a PWM-Diag channel is identified by the index “x, y”; for example, PWSAnPVCRx_y (x_y = 00_01, 02_03, ..., 70_71).
j	Registers storing trigger channel numbers (encoded value) from PWGAn are identified by the index “j”; for example, the PWSAnQUEj register (j = 0 to 7).
k	Sets of registers where each has the same function are identified by the index “k”; for example, the SLPWGAk register (k = 0 to 2).

The following table shows values indicated by the indices of each product.

Table 30.3 Indices of Products

Indices of each product		
100 pins	**144 pins**	**176 pins**
x = 00, 02, ,,, 46 y = 01, 03, ,,, 47	x = 00, 02, ,,, 62, y = 01, 03, ,,, 63	x = 00, 02, ,,, 70 y = 01, 03, ,,, 71
j = 0 to 7	j = 0 to 7	j = 0 to 7
k = 0, 1	k = 0, 1	k = 0 to 2

30.1.2 Register Base Address

PWM-Diag base addresses are listed in the following table.

PWM-Diag register addresses are given as offsets from the base addresses.

Table 30.4 Register Base Addresses

Base Address Name	Base Address
<PWBAn_base>	FFE7 2800_H
<PWGAn_base>	FFE7 1000_H + 40_H × n
<PWSAn_base>	FFE7 0000_H
<SLPW_base>	FFE7 3000_H

30.1.3 Clock Supply

The PWM-Diag clock supply is shown in the following table.

Table 30.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
PWBAn	PCLK	CKSCLK_IPERI2	Wave form clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_IPERI2	
PWGAn	PCLK	CKSCLK_IPERI2	Wave form clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_IPERI2	
PWSAn	PCLK	CKSCLK_IPERI2	Wave form clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_IPERI2	

30.1.4 Interrupt Requests

PWM-Diag interrupt requests are listed in the following table.

Table 30.6 Interrupt Requests (1/2)

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
PWGA_INT0	PWGA0 interrupt	92	—
PWGA_INT1	PWGA1 interrupt	93	—
PWGA_INT2	PWGA2 interrupt	94	—
PWGA_INT3	PWGA3 interrupt	95	—
PWGA_INT4	PWGA4 interrupt	85	—
PWGA_INT5	PWGA5 interrupt	86	—
PWGA_INT6	PWGA6 interrupt	87	—
PWGA_INT7	PWGA7 interrupt	88	—
PWGA_INT8	PWGA8 interrupt	96	—
PWGA_INT9	PWGA9 interrupt	97	—
PWGA_INT10	PWGA10 interrupt	98	—
PWGA_INT11	PWGA11 interrupt	99	—
PWGA_INT12	PWGA12 interrupt	100	—
PWGA_INT13	PWGA13 interrupt	101	—
PWGA_INT14	PWGA14 interrupt	102	—
PWGA_INT15	PWGA15 interrupt	103	—
PWGA_INT16	PWGA16 interrupt	145	—
PWGA_INT17	PWGA17 interrupt	147	—
PWGA_INT18	PWGA18 interrupt	149	—
PWGA_INT19	PWGA19 interrupt	151	—
PWGA_INT20	PWGA20 interrupt	124	—
PWGA_INT21	PWGA21 interrupt	125	—
PWGA_INT22	PWGA22 interrupt	126	—
PWGA_INT23	PWGA23 interrupt	127	—
PWGA_INT24	PWGA24 interrupt	184	—

PWGA_INT71	PWGA71 interrupt	284	—
PWSA_INT_QFULL	PWSA queue full interrupt	91	—

30.1.5 Reset Sources

PWM-Diag reset sources are listed in the following table. The individual PWM-Diag units are initialized by these reset sources.

Table 30.7 Reset Sources

Unit Name	Reset Source
PWBAn PWGAn PWSAn	All reset sources (ISORES)

30.1.6 External Input/Output Signals

External input/output signals of the PWM-Diag are listed below.

Table 30.8 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
PWGA_TOUTn (Unit: PWGA)	PWGA unit n output	PWGAnO

CAUTION

When port P8_6 is used as PWGA38O, port P8_6 pin outputs a low-level $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is deasserted.
For details, see **Section 2.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

30.1.7 Internal Signals

The I/O signals for connecting two PWM-Diag channels or a PWM-Diag and another function are listed below.

Table 30.9 Internal Output Signals

Unit Signal Name	Description	Connected to
PWBA0		
PWMCLK0	PWGA count clock 0	PWGAn
PWMCLK1	PWGA count clock 1	PWGAn
PWMCLK2	PWGA count clock 2	PWGAn
PWMCLK3	PWGA count clock 3	PWGAn
PWGAn		
PWGA_TRGOUTn	PWGAn trigger	PWSA0
PWSA0		
PWSA_ADTRG[1:0]	A/D converter unit select signal	ADCA0, ADCA1
PWSA_PVCR_VALUE[11:0]	A/D converter control signal	ADCA0, ADCA1
ADCAn		
ADC_CONV_ENDn	A/D conversion completion signal	PWSA0

30.1.8 Functional Overview

This function is comprised of four types of units: clock divider (PWBA), PWM generator (PWGA), A/D conversion trigger select function (PWSA), and A/D converter (ADCA).

PWBA

- Clock divider
  PWBA generates a PWMCLKm count clock signal by frequency division of PCLK and supplies it to the PWM generator PWGA.
  The cycle of the PWMCLKm count clock signal can be calculated from the setting of the PWBAnBRSm register by the equation below.

  PWMCLKm count clock cycle = (PWBAnBRSm value × 2) × PCLK cycle

  In addition, PWBA can control operation when the on-chip debugger is in use by using the PWBAnEMU register.

PWGA

PWGA outputs PWM waveforms and A/D conversion trigger to PWSA by using the clock PWMCLKm input from PWBA.

- PWM waveform output PWGA_TOUTn
  This generator outputs PWM waveforms from the PWGA_TOUTn pin. The PWM cycle is the full count cycle of the PWGAnCNT register (12-bit free-running counter). Set the high-level period of PWM output in the PWGAnCSDR and PWGAnCRDR registers.

  The PWM waveform cycle and duty can be calculated by the equations below.

  PWM waveform cycle = PWGAnCNT (12-bit full count: FFF_H + 1)
  × Count clock cycle
  = 4096 × PWMCLKm count clock cycle

  When PWGAnCRDR[11:0] > PWGAnCSDR[11:0],

  High-level period of PWM waveform =
  (PWGAnCRDR register value – PWGAnCSDR register value)
  × PWMCLKm count clock cycle

  PWM waveform duty (%) = High-level period of PWM waveform/PWM waveform cycle × 100 = (PWGAnCRDR register value – PWGAnCSDR register value)/4096 × 100

  Note that the PWM output is fixed to the low level when the PWGAnCRDR register value is equal to the PWGAnCSDR register value.

  When $1xxx_H$ is set in the PWGAnCRDR register (i.e. bit 12 is set to 1), the PWM output is fixed to the high level.

- A/D conversion trigger output PWGA_TRGOUTn
  The A/D conversion trigger signal PWGA_TRGOUTn for PWSA is generated when the PWGAnCTDR register value and the PWGAnCNT register value match while the PWM output PWGA_TOUTn is at the high level.
  The timing can be calculated by the equation below.

  A/D conversion trigger signal generation timing = PWGAnCTDR register value
  × PWMCLKm count clock cycle

- PWGA interrupt request signal PWGA_INTn
  PWGA generates the interrupt request signal PWGA_INTn at the falling edge of the PWM output PWGA_TOUTn.
  When the PWM output is fixed to the low level, PWGA_INTn is generated when the PWGAnCRDR register value and the PWGAnCNT register value (free-running counter value) match; when the PWM output is fixed to the high level, PWGA_INTn is generated at the timing of overflow of the PWGAnCNT register.

PWSA

PWSA transmits the required setting information to the A/D converter and outputs the A/D conversion start trigger, based on the A/D conversion trigger signal PWGA_TRGOUTn from the PWM generator (PWGA).

- A/D conversion control by PWSA
  PWSA outputs the information required for the A/D conversion, which is set in the corresponding PWSAnPVCRx_y register for the channel number of the trigger input from PWGAn, (i.e., information on ADC physical channel, external MPX control, and error detection level selection) to the A/D converter.
  At the same timing, A/D conversion trigger (PWSA_ADTRG) is output to ADCA0 or ADCA1.
  (A maximum of eight input trigger signal PWGA_TRGOUTn data received during A/D conversion are stored and kept in PWSAnQUE.)
  The setting information to be output to the A/D converter is kept until the next trigger is generated.
  When the A/D conversion triggered by the PWM-Diag function is completed in the A/D converter, PWSA triggers the next A/D conversion based on the data stored in the PWSAnQUE register.
- Queuing of A/D conversion triggers from PWGA
  The A/D conversion trigger signal (PWGA_TRGOUTn) input from PWGAn is stored in the PWSAnQUEj register as a channel number. The PWSAnQUEj register stores a maximum of eight channel numbers of the A/D conversion trigger signal PWGA_TRGOUTn received during A/D conversion in a queue structure.
  A PWSA queue full interrupt occurs in the following states, when the queue of the PWSAnQUEj register becomes full
  - A trigger number is written to PWSAnQUE7
  - A trigger number has already been written to PWSAnQUE7 and cannot be written when PWGA_TRGOUTn is input.

ADCA

A/D conversion is executed upon receipt of information required for A/D conversion and A/D conversion trigger from PWSA.

A/D conversion is executed using the PWM-Diag-dedicated scan group; on completion of the A/D conversion, it is reported to the PWSA.

For the basic operation of the A/D converter, see Section 31, A/D Converter (ADCA).

For the A/D converter operation with the PWM-Diag function, see Section 31.4.7.1, A/D Conversion with PWM-Diag Enabled.

30.1.9 Block Diagram

The following figure shows an example of connecting the LED control circuit combining the PWM-Diag and the A/D converter.

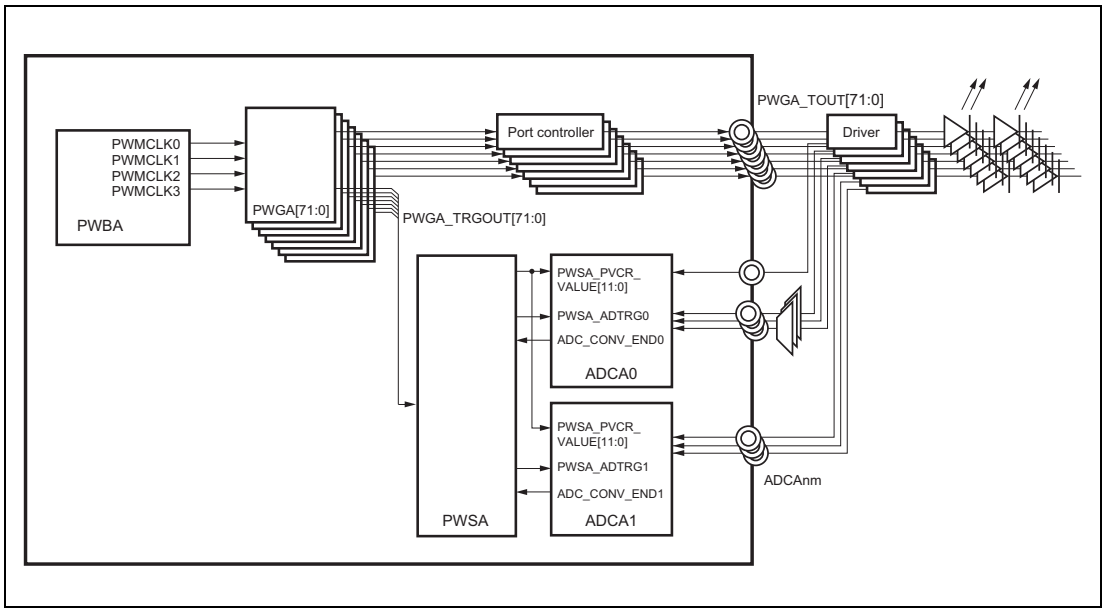

Figure 30.1 Example of Connecting the LED Control Circuit using the PWM-Diag and the A/D Converter

30.2 Registers

30.2.1 List of Registers

PWM Output/Diagnostic registers are listed in the following table.

<PWBAn_base>, <PWSAn_base>, and <PWGAn_base> are defined in **Section 30.1.2, Register Base Address**.

Table 30.10 List of PWM Output/Diagnostic Registers

Module name	Register name	Symbol	Address
PWBAn	PWMCLKm cycle configuration register	PWBAnBRSm	<PWBAn_base> + 0004_H × m
	PWMCLKm enable status register	PWBAnTE	<PWBAn_base> + 0010_H
	PWMCLKm start trigger register	PWBAnTS	<PWBAn_base> + 0014_H
	PWMCLKm stop trigger register	PWBAnTT	<PWBAn_base> + 0018_H
	PWBA emulation register	PWBAnEMU	<PWBAn_base> + $001C_H$
PWGAn	PWM output set condition register	PWGAnCSDR	<PWGAn_base> + 0000_H
	PWM output reset condition register	PWGAnCRDR	<PWGAn_base> + 0004_H
	PWGA_TRGOUTn generation condition register	PWGAnCTDR	<PWGAn_base> + 0008_H
	Buffer register reload trigger register	PWGAnRDT	<PWGAn_base> + $000C_H$
	Buffer register reload status register	PWGAnRSF	<PWGAn_base> + 0010_H
	PWM cycle count register	PWGAnCNT	<PWGAn_base> + 0014_H
	PWGA control register	PWGAnCTL	<PWGAn_base> + 0020_H
	PWGAnCSDR buffer register	PWGAnCSBR	<PWGAn_base> + 0024_H
	PWGAnCRDR buffer register	PWGAnCRBR	<PWGAn_base> + 0028_H
	PWGAnCTDR buffer register	PWGAnCTBR	<PWGAn_base> + $002C_H$
SLPWG	PWGA synchronous trigger register	SLPWGAk	<SLPW_base> + k × 4_H
PWSAn	PWSA control register	PWSAnCTL	<PWSAn_base> + 0000_H
	Trigger queue status register	PWSAnSTR	<PWSAn_base> + 0004_H
	Trigger queue status clear register	PWSAnSTC	<PWSAn_base> + 0008_H
	Trigger queue register	PWSAnQUEj	<PWSAn_base> + 0020_H + j × 4_H
	PWM-Diag mode A/D setting register	PWSAnPVCRx_y	<PWSAn_base> + 0040_H + x × 2_H
	PWSA emulation control register	PWSAnEMU	<PWSAn_base> + $000C_H$

30.2.1.1 PWBAnBRSm Register

This register sets the clock cycle of PWMCLKm.

Access: This register can be read or written in 16-bit units.

Address: <PWBAn_base> + 0004_H × m

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PWBAnBRSm[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.11 PWBAnBRSm Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	PWBAnBRSm [10:0]	Register for setting the clock cycle of PWMCLKm. – PWBAnBRSm = 0: PWMCLKm = PCLK – PWBAnBRSm = 1: PWMCLKm = PCLK / 2 × 1 – PWBAnBRSm = 2: PWMCLKm = PCLK / 2 × 2 ... – PWBAnBRSm = n: PWMCLKm = PCLK / 2 × n (n = 1 to 2047) These bits can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0).

30.2.1.2 PWBAnTE Register

This is a status register that indicates the output status of PWMCLKm (m = 0 to 3).

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWBAn_base> + 0010_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTE3	PWBAnTE2	PWBAnTE1	PWBAnTE0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 30.12 PWBAnTE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3	PWBAnTE3	A status flag indicating the operation status of PWMCLK3 0: Not operating 1: Operating
2	PWBAnTE2	A status flag indicating the operation status of PWMCLK2 0: Not operating 1: Operating
1	PWBAnTE1	A status flag indicating the operation status of PWMCLK1 0: Not operating 1: Operating
0	PWBAnTE0	A status flag indicating the operation status of PWMCLK0 0: Not operating 1: Operating

30.2.1.3 PWBAnTS Register

This register is a start trigger register for PWMCLKm (m = 0 to 3).

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWBAn_base> + 0014_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTS3	PWBAnTS2	PWBAnTS1	PWBAnTS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 30.13 PWBAnTS Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3	PWBAnTS3	Start Trigger for PWMCLK3 0: Writing 0 has no effect. 1: Starts the output of PWMCLK3.
2	PWBAnTS2	Start Trigger for PWMCLK2 0: Writing 0 has no effect. 1: Starts the output of PWMCLK2.
1	PWBAnTS1	Start Trigger for PWMCLK1 0: Writing 0 has no effect. 1: Starts the output of PWMCLK1.
0	PWBAnTS0	Start Trigger for PWMCLK0 0: Writing 0 has no effect. 1: Starts the output of PWMCLK0.

30.2.1.4 PWBAnTT Register

This register is a stop trigger register for PWMCLKm (m = 0 to 3).

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWBAn_base> + 0018_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	PWBAnTT3	PWBAnTT2	PWBAnTT1	PWBAnTT0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 30.14 PWBAnTT Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3	PWBAnTT3	Stop Trigger for PWMCLK3 0: Writing 0 has no effect. 1: Stops the output of PWMCLK3.
2	PWBAnTT2	Stop Trigger for PWMCLK2 0: Writing 0 has no effect. 1: Stops the output of PWMCLK2.
1	PWBAnTT1	Stop Trigger for PWMCLK1 0: Writing 0 has no effect. 1: Stops the output of PWMCLK1.
0	PWBAnTT0	Stop Trigger for PWMCLK0 0: Writing 0 has no effect. 1: Stops the output of PWMCLK0.

30.2.1.5 PWBAnEMU Register

This register sets the operation during emulation.

Access: This register can be read or written in 8-bit units.

Address: <PWBAn_base> + $001C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	PWBAnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 30.15 PWBAnEMU Register Contents

Bit Position	Bit Name	Function
7	PWBAnSVSDIS	(When the EPC.SVSTOP bit = 0) The count clock is provided continuously when the debugger is controlling the microcontroller (by using break points, etc.), regardless of the value of this bit (1 or 0). (When the EPC.SVSTOP bit = 1) 0: The count clock is stopped when the debugger is controlling the microcontroller (by using break points, etc.). 1: The count clock is provided continuously when the debugger is controlling the microcontroller (by using break points, etc.). This bit can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0).
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

30.2.1.6 PWGAnCTL — PWGA Control Register

PWGAnCTL is used to select the count clock from PWBA.

Access: This register can be read or written in 8-bit units.

Address: <PWGAn_base> + 0020_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWGAnCKS[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 30.16 PWGAnCTL Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PWGAnCKS [1:0]	Count Clock Enable Input PWMCLK3 to PWMCLK0 Select 00: Uses PWMCLK0 as count clock 01: Uses PWMCLK1 as count clock 10: Uses PWMCLK2 as count clock 11: Uses PWMCLK3 as count clock These bits can only be rewritten when the PWGAn operation is stopped (SLPWGAk.SLPWGA[31:0] = 0).

30.2.1.7 PWGAnCNT — PWM Cycle Count Register

This is a count register.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGAn_base> + 0014_H

Value after reset: $0FFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCNT[11:0]											
Value after reset	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.17 PWGAnCNT Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned.
11 to 0	PWGAnCNT [11:0]	12-bit counter value

30.2.1.8 PWGAnCSDR — PWM Output Set Condition Register

This register sets the setting condition for PWGA_TOUTn output.

Access: This register can be read or written in 16-bit units.

Address: <PWGAn_base> + 0000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCSDR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.18 PWGAnCSDR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	PWGAnCSDR [11:0]	These bits set the setting condition for PWM output. The set value is reflected to the PWGAnCSBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

30.2.1.9 PWGAnCRDR — PWM Output Reset Condition Register

This register sets the reset condition for PWGA_TOUTn output.

Access: This register can be read or written in 16-bit units.

Address: <PWGAn_base> + 0004_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PWGAnCRDR[12:0]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.19 PWGAnCRDR Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 0	PWGAnCRDR [12:0]	These bits set the reset condition for PWM output. The set value is reflected to the PWGAnCRBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

30.2.1.10 PWGAnCTDR — PWGA_TRGOUTn Generation Condition Register

This register sets the generation condition for PWGA_TRGOUTn.

Access: This register can be read or written in 16-bit units.

Address: <PWGAn_base> + 0008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCTDR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.20 PWGAnCTDR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	PWGAnCTDR [11:0]	These bits set the A/D conversion trigger generation condition for PWSAn. The set value is reflected to the PWGAnCTBR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1).

30.2.1.11 PWGAnCSBR — PWGAnCSDR Buffer Register

This is a buffer register for the PWGAnCSDR register.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGAn_base> + 0024_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCSBR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.21 PWGAnCSBR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned.
11 to 0	PWGAnCSBR [11:0]	The set value is reflected to the PWGAnCSDR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, the pin output is driven high.

30.2.1.12 PWGAnCRBR — PWGAnCRDR Buffer Register

This is a buffer register for the PWGA_TOUTn reset condition.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGAn_base> + 0028_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PWGAnCRBR[12:0]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.22 PWGAnCRBR Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12 to 0	PWGAnCRBR [12:0]	The set value is reflected to the PWGAnCRDR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, the pin output is driven low.

30.2.1.13 PWGAnCTBR — PWGAnCTDR Buffer Register

This is a buffer register for the PWGA_TRGOUTn generation condition.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <PWGAn_base> + $002C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PWGAnCTBR[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.23 PWGAnCTBR Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned.
11 to 0	PWGAnCTBR [11:0]	The set value is reflected to the PWGAnCTDR register at the start of PWGAn operation (SLPWGAk.SLPWGA of the corresponding CH = 1) or when a simultaneous rewrite is performed (PWGAnRDT.PWGAnRDT = 1). When the value matches the PWGAnCNT register value, a trigger is transmitted to PWSAn.

30.2.1.14 PWGAnRSF — Buffer Register Reload Status Register

This register is a status register for simultaneous rewrite control.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWGAn_base> + 0010_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWGAnRSF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 30.24 PWGAnRSF Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	PWGAnRSF	Simultaneous Rewrite Control Status 0: Simultaneous rewrite is enabled. This value indicates the completion of simultaneous rewrite after the generation of a simultaneous rewrite trigger signal. 1: Simultaneous rewrite is in progress. This value indicates the waiting state for completion.

30.2.1.15 PWGAnRDT — Buffer Register Reload Trigger Register

This is a simultaneous rewrite request trigger register.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWGAn_base> + $000C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWGAnRDT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 30.25 PWGAnRDT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	PWGAnRDT	Simultaneous Rewrite Request Trigger 0: Writing 0 has no effect. 1: Triggers the simultaneous rewrite request for the compare registers (PWGAnCSDR, PWGAnCRDR, and PWGAnCTDR), and sets PWGAnRSF.PWGAnRSF to 1.

30.2.1.16 SLPWGAk — PWGA Synchronous Trigger Register (k = 0 to 2)

This register triggers start and stop for multiple channels simultaneously.

Access: This register can be read or written in 32-bit units.

Address: <SLPW_base> + k × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SLPWGA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SLPWGA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.26 SLPWGAk Register Contents

Bit Position	Bit Name	Function
31 to 0	SLPWGA [31:0]	Trigger start and stop to multiple channels simultaneously. 0: Stops the corresponding channels. 1: Starts the corresponding channels. The bits correspond to the following channels. SLPWGA0.SLPWGA[31:0]: PWGA31 - PWGA0 SLPWGA1.SLPWGA[31:0]: PWGA63 - PWGA32 SLPWGA2.SLPWGA[7:0]: PWGA71 - PWGA64

30.2.1.17 PWSAnCTL Register

This register is used to control operations of PWSA.

Access: This register can be read or written in 8-bit units.

Address: <PWSAn_base> + 0000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWSAnENBL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 30.27 PWSAnCTL Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWSAnENBL	Operation Permission Control 0: Operation is prohibited (initial state). Writing 0 initializes PWSAnSTR and PWSAnQUEj. 1: Operation is enabled.

30.2.1.18 PWSAnSTR Register

This is a status register that indicates whether the number of a channel for which an A/D conversion trigger has been generated is stored in a PWSAnQUEj register.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWSAn_base> + 0004_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWSAnQFL	PWSAnQNE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 30.28 PWSAnSTR Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	PWSAnQFL	Indicates the queuing state of the A/D conversion trigger. 0: Some PWSAnQUEj registers do not store a channel number. 1: All of the PWSAnQUEj registers store a channel number.
0	PWSAnQNE	Bit indicating that there is a trigger in the trigger queue 0: A channel number is not stored in a PWSAnQUEj register, or A/D conversion is in progress while only PWSAnQUE0 stores a channel number. 1: The number of the channel waiting for conversion is stored in j = 1 and subsequent PWSAnQUEj registers.

30.2.1.19 PWSAnSTC Register

This register clears the status of the PWSAnSTR register.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <PWSAn_base> + 0008_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PWSAnCLFL	PWSAnCLNE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 30.29 PWSAnSTC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	PWSAnCLFL	PWSAnQFL Clear 0: PWSAnQFL retains the status (Writing 0 has no effect). 1: PWSAnQFL is cleared to 0.
0	PWSAnCLNE	PWSAnQNE Clear 0: PWSAnQNE retains the status (Writing 0 has no effect). 1: PWSAnQNE is cleared to 0.

30.2.1.20 PWSAnQUEj (j = 0 to 7) Register

This register stores the channel number that received the trigger from PWGAn.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <PWSAn_base> + $0020_H + j \times 4_H$

Value after reset: $7F_H$

Bit	7	6	5	4	3	2	1	0
	—	PWSAnQUEj[6:0]						
Value after reset	0	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R

Table 30.30 PWSAnQUEj Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	PWSAnQUEj [6:0]	These bits hold the channel number (0 to 71) of the PWGA for which a trigger was generated in order from PWSAnQUE0 to PWSAnQUE7. After the A/D conversion of PWSAnQUE0 is completed, the values in PWSAnQUE1 to PWSAnQUE7 shift to PWSAnQUE0 to PWSAnQUE6.

NOTE

If a trigger occurs simultaneously for multiple channels, the trigger with the smaller channel number has priority.

30.2.1.21 PWSAnPVCRx_y (x = 00, 02, 04 ... 70, y = 01, 03, 05 ... 71) Register

This register is used to set the corresponding A/D converter for each channel.

Two consecutive channels are set such as PWSA0PVCR02_03, and the 16 higher-order bits of each register correspond to an odd-numbered channel while the 16 lower-order bits correspond to an even-numbered channel.

At the generation of a trigger, the set value is transmitted to the ADCAnPWDVCR register of the A/D converter.

For the ADCAnPWDVCR register, see Section 31, A/D Converter (ADCA).

Access: This register can be read or written in 32-bit units.

Address: <PWSAn_base> + 0040_H + x × 2_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	PWSAnSLADy	PWSAnVRDTy[27]	PWSAnVRDTy[26:24]			PWSAnVRDTy[23:22]		PWSAnVRDTy[21:16]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PWSAnSLADx	PWSAnVRDTx[11]	PWSAnVRDTx[10:8]			PWSAnVRDTx[7:6]		PWSAnVRDTx[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.31 PWSAnPVCRx_y Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28	PWSAnSLADy	RH850/F1K 100 pin products: When writing, write the value after reset. RH850/F1K 144 and 176 pin products: ADCA Select (odd-numbered channel) 0: Output to ADCA0. 1: Output to ADCA1.
27	PWSAnVRDTy [27]	This bit indicates the set value of the ADCAnPWDVCR.MPXE bit (odd-numbered channel).
26 to 24	PWSAnVRDTy [26:24]	These bits indicate the set value of the ADCAnPWDVCR.MPXV[2:0] bits (odd-numbered channel).
23, 22	PWSAnVRDTy [23:22]	These bits indicate the set value of the ADCAnPWDVCR.ULS[1:0] bits (odd-numbered channel).
21 to 16	PWSAnVRDTy [21:16]	These bits indicate the set value of the ADCAnPWDVCR.GCTRL[5:0] bits (odd-numbered channel).
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	PWSAnSLADx	RH850/F1K 100 pin products: When writing, write the value after reset. RH850/F1K 144 and 176 pin products: ADCA Select (even-numbered channel) 0: Output to ADCA0. 1: Output to ADCA1.
11	PWSAnVRDTx [11]	This bit indicates the set value of the ADCAnPWDVCR.MPXE bit. (even-numbered channel)

Table 30.31 PWSAnPVCRx_y Register Contents (2/2)

Bit Position	Bit Name	Function
10 to 8	PWSAnVRDTx [10:8]	These bits indicate the set value of the ADCAnPWDVCR.MPXV[2:0] bits. (even-numbered channel)
7, 6	PWSAnVRDTx [7:6]	These bits indicate the set value of the ADCAnPWDVCR.ULS[1:0] bits. (even-numbered channel)
5 to 0	PWSAnVRDTx [5:0]	These bits indicate the set value of the ADCAnPWDVCR.GCTRL[5:0] bits. (even-numbered channel)

30.2.1.22 PWSAnEMU — Emulation Control Register

This register is used to set the operation for emulation.

Access: This register can be read or written in 8-bit units.

Address: <PWSAn_base> + $000C_H$

Value after reset: 00_H

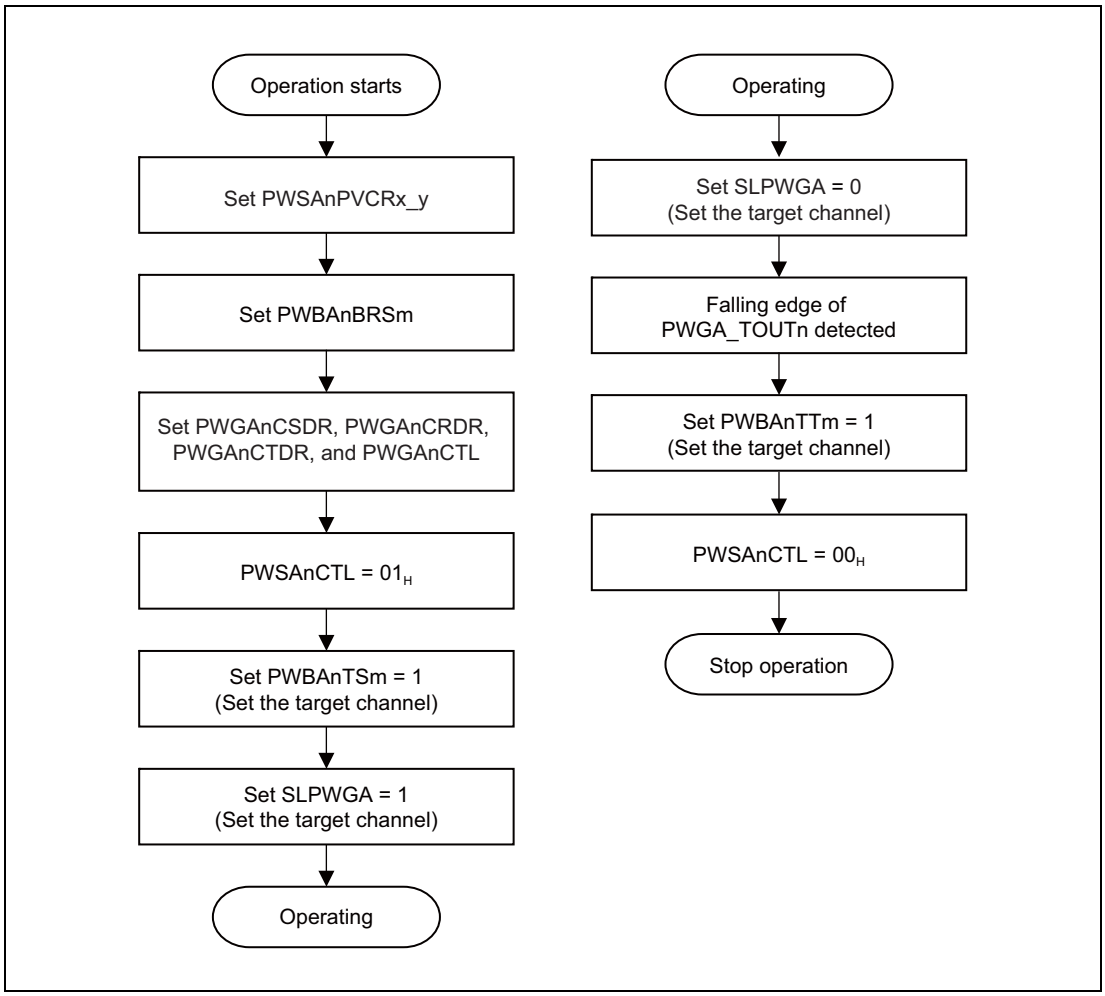
Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PWSAnSVSDIS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 30.32 PWSAnEMU Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWSAnSVSDIS	(When the EPC.SVSTOP bit = 0) The operation continues when the debugger is controlling the microcontroller (by using break points, etc.), regardless of the value of this bit (1 or 0). (When the EPC.SVSTOP bit = 1) 0: When the debugger is controlling the microcontroller (by using break points, etc.); – The output state to A/D is retained, the ADC_CONV_ENDn input at a break point is internally retained, and PWSAnQUEj is updated after break release. – The PWGA_TRGOUTn input is accepted even at a break, and PWSA_INT_QFULL is also output. – Reading and writing to the register is possible. 1: The operation continues when the debugger is controlling the microcontroller (by using break points, etc.). The above bit can only be rewritten when all counters using PWMCLKm are stopped (PWBAnTE.PWBATEm = 0), the operation of all channels PWGAn has stopped (SLPWGAk.SLPWGA), and no trigger has been generated from any of the channels PWGAn (PWSAnQUE0 is the value after reset).

30.3 Operating Procedure

Procedures for setting when starting and stopping operation of PWM-Diag are illustrated below.



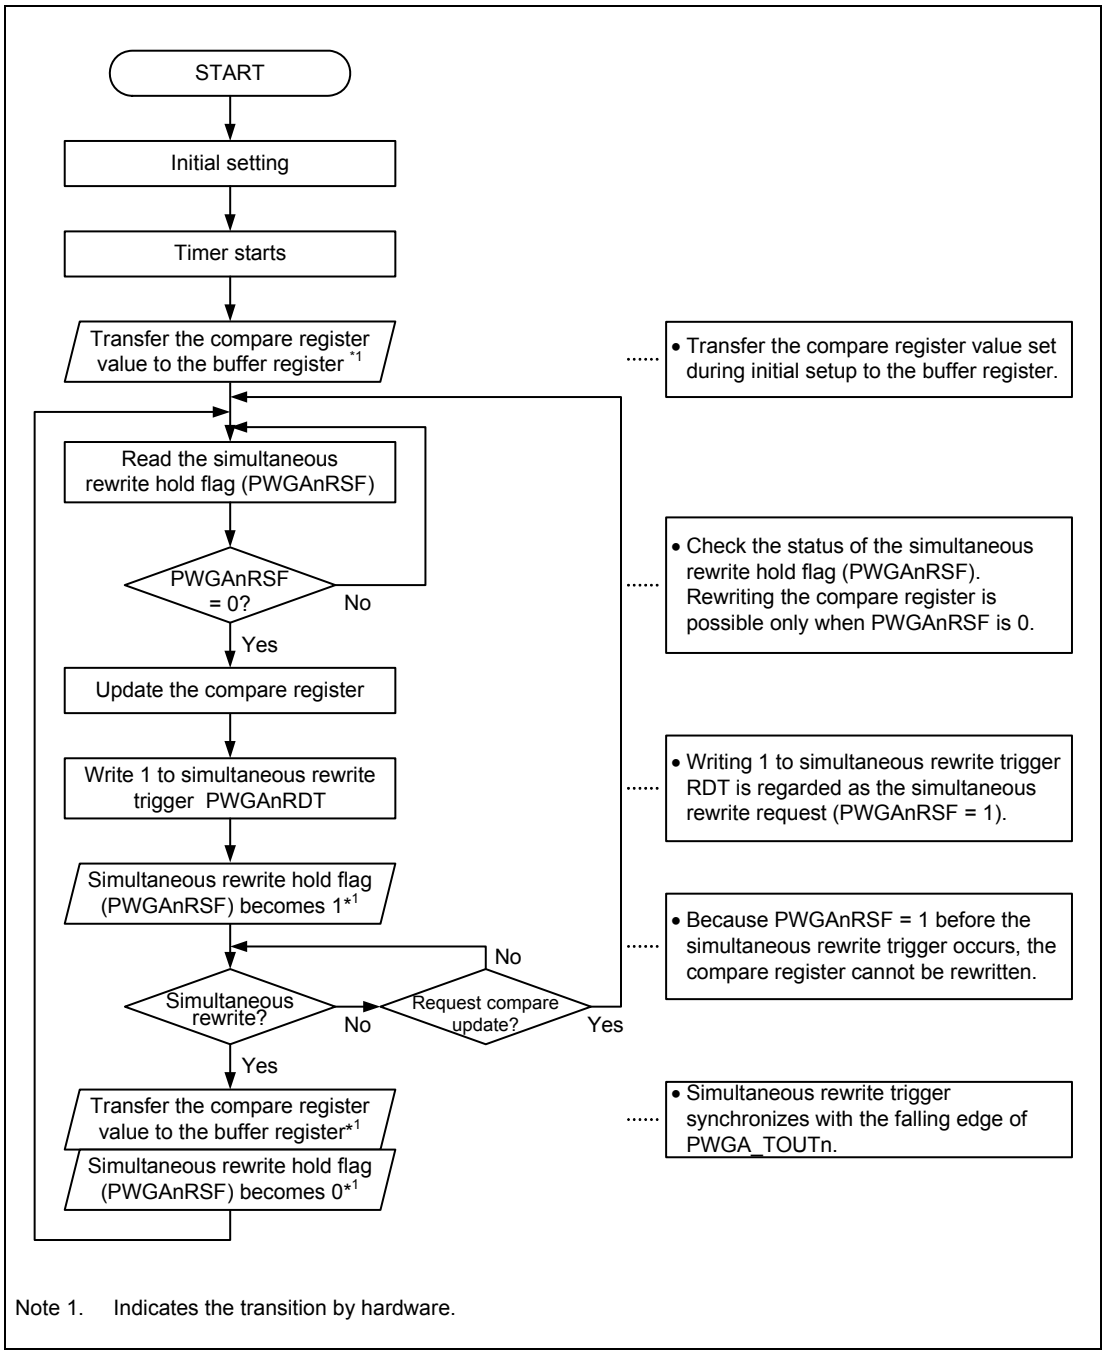


Figure 30.2 PWM-Diag Operating Procedure

Procedures for simultaneous rewrite of PWGA are illustrated below.

The described term “compare register” indicates PWGAnCSDR, PWGAnCRDR, or PWGAnCTDR.

In addition, the described term “buffer register” indicates PWGAnCSBR, PWGAnCRBR, or PWGAnCTBR.

Note 1. Indicates the transition by hardware.

Figure 30.3 Simultaneous Rewrite Procedure

30.4 Operation Waveform of PWM-Diag

30.4.1 PWM Waveform Output by PWGA and Operation Waveform for A/D Conversion Trigger Output

30.4.1.1 Basic Operation Waveform of PWGA

The basic operation waveforms of PWGA are illustrated below.

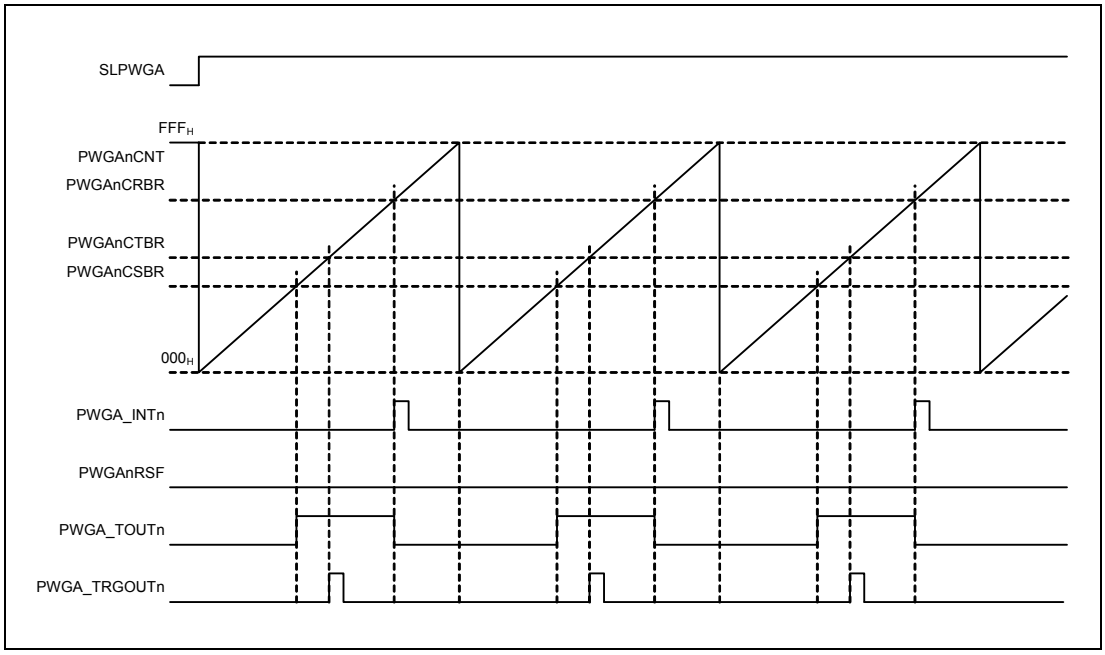

Figure 30.4 Basic Waveform

30.4.1.2 Operation Waveform when Simultaneous Rewrite for PWGA is Executed

The following figure illustrates the operation waveforms when simultaneous rewrite for PWGA is executed.

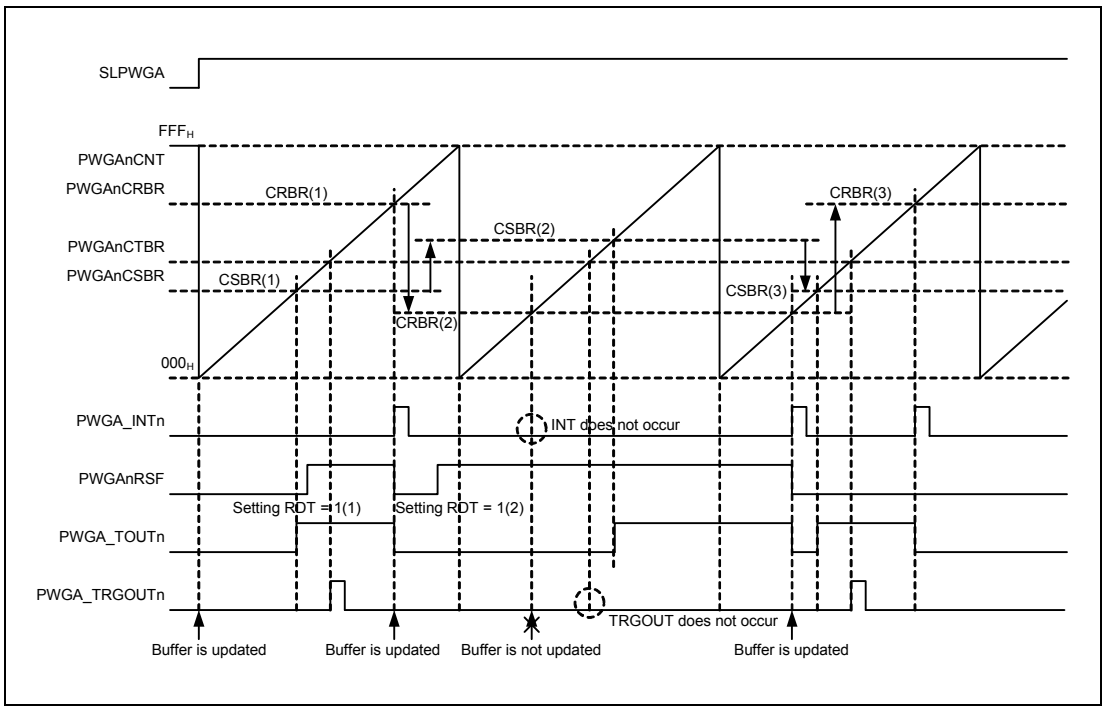

Figure 30.5 Waveform when Simultaneous Rewrite is Executed

Simultaneous rewrite is executed by re-setting the PWGAnCSDR and PWGAnCRDR registers, then setting either the PWGAnRDT or SLPWGAk register.

Moreover, if the relationship between set values in one interval is PWGAnCSDR > PWGAnCRDR, a falling edge in that interval is meaningless, and the falling edge in the next interval is valid.

Moreover, PWGA_TRGOUTn does not become valid unless PWGA_TOUTn is at the high level.

30.4.1.3 Operation Waveform when Stopping and Restarting PWGA Operation

The following figure illustrates the operation waveforms when stopping and restarting PWGA operation.

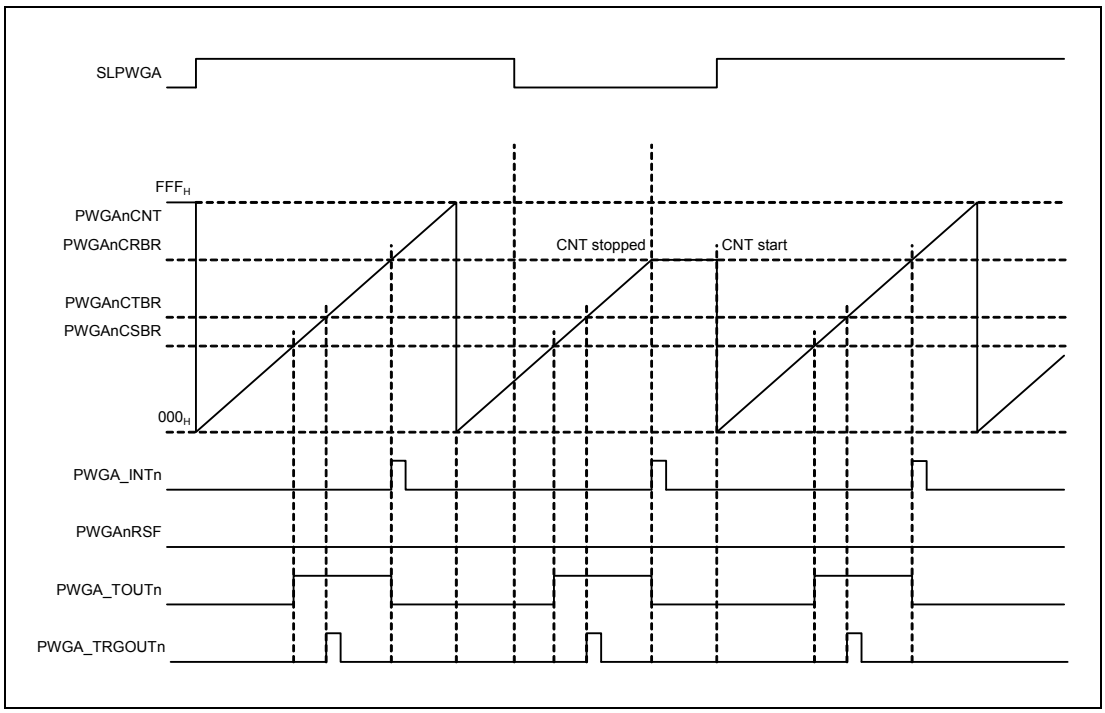

Figure 30.6 Stopping and Resuming Operation (1)

After the setting of SLPWGA has been changed from 1 to 0, PWGAnCNT stops operation because PWGA_INTn is generated.

After PWGA_INTn has been generated, by changing the setting of SLPWGA from 0 to 1, PWGAnCNT resumes counting from 000_H.

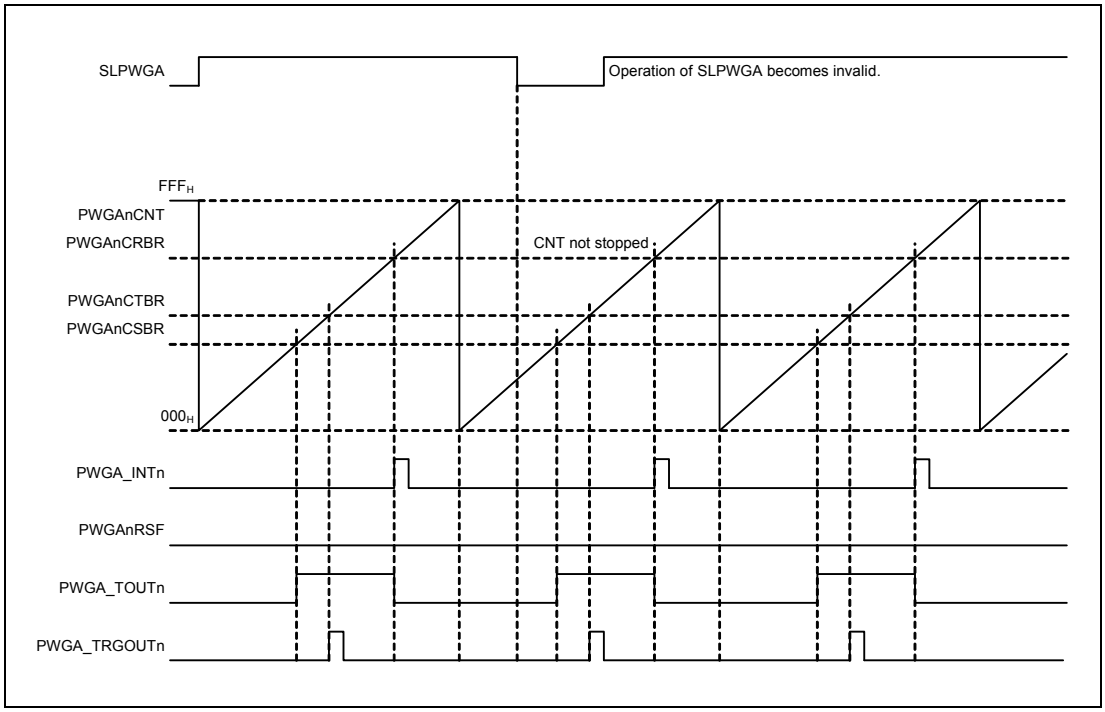

Figure 30.7 Stopping and Resuming Operation (2)

After the setting of SLPWGA has been changed from 1 to 0, if the setting of SLPWGA is changed from 0 to 1 before PWGA_INTn is generated, operations of SLPWGA become invalid, and PWGAnCNT continues counting.

30.4.1.4 Waveforms of PWGA Operation with Specific Settings

The following figures illustrate the waveforms of PWGA operation with specific settings.

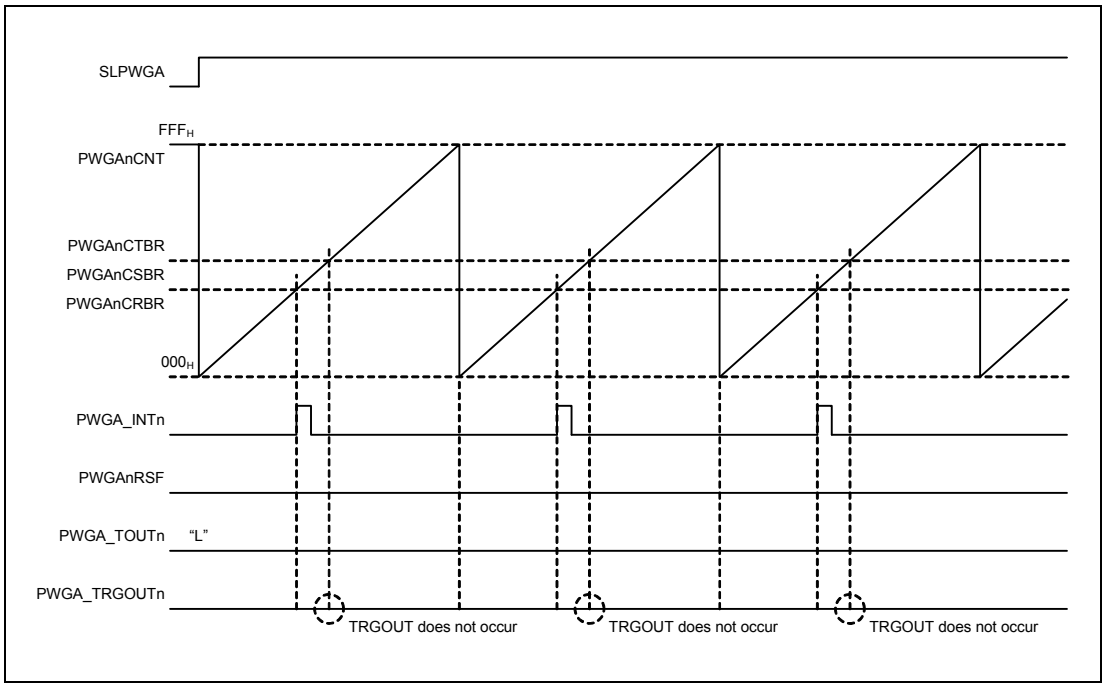

Figure 30.8 PWGA_TOUTn = 0% Output Waveform

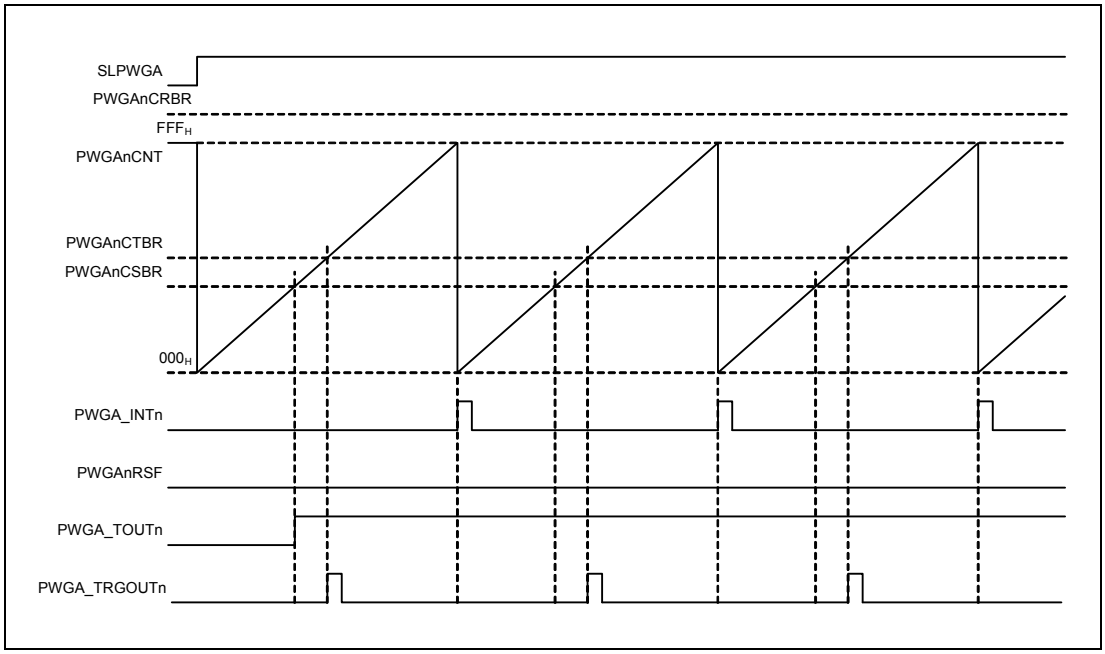

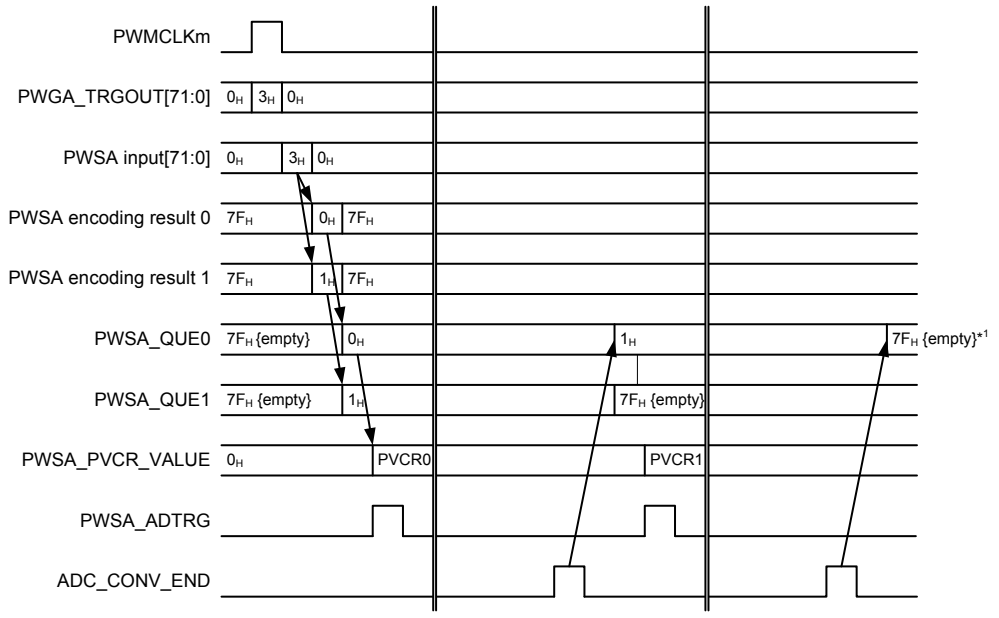

Figure 30.9 PWGA_TOUTn = 100% Output Waveform

30.4.2 Operation Waveform when A/D Conversion Trigger Occurs in PWSA

An example of the PWSA operation is shown below.

Note 1. QUE0 indicates the PWGA_TRG number while the A/D conversion is executed. The initial value (while the A/D conversion is not executed) is $7F_H$.

Figure 30.10 Example of PWSA Operation

(1) Triggers occur simultaneously in channels 0 and 1 of PWGA. Channel 0 with the smaller channel number is stored in PWSAnQUE0, and channel 1 with the larger channel number is stored in PWSAnQUE1. The lower 16-bit data of PWSAnPVCR00_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter. At this time, as the A/D conversion for channel 1 is in the waiting state, the PWSAnSTR.PWSAnQNE bit is set.

(2) On completion of A/D conversion executed in step (1), the channel number of PWSAnQUE1 shifts to PWSAnQUE0 and PWSAnQUE1 enters the empty state.
After that, as similar to step (1), the upper 16-bit data of PWSAnPVCR00_01 corresponding to the value stored in PWSAnQUE0 is transmitted to the A/D converter and a trigger is output to the A/D converter.

(3) On completion of A/D conversion executed in step (2), PWSAnQUE0 enters the empty state.

30.5 PWM-Diag Related Function in A/D Converter (ADCA)

This section describes the A/D converter used in the PWM-Diag function.

30.5.1 ADCA Registers when the PWM-Diag Function is Used

- Before starting PWSA operation, the A/D converter must be set using the following register.
  - PWM-Diag scan group control register (ADCAnPWDSGCR)
- When the PWM-Diag is running, the PWSAnPVCRx_y value corresponding to the channel under conversion is set in the following register of the A/D converter.
  - PWM-Diag virtual channel register (ADCAnPWDVCR)
- After completion of A/D conversion, the conversion result can be checked by reading the following registers.
  - PWM-Diag data register (ADCAnPWDTSNDR)
  - PWM-Diag data supplementary information register (ADCAnPWDDIR)
- When A/D conversion result is outside the expected range, it can be confirmed using the upper/lower limit error detection function. The upper/lower limit error detection function is set by the following register.
  - Upper limit/lower limit error register (ADCAnULER)
- The scan end flag of the PWM-Diag scan group can be cleared using the following register.
  - PWM-Diag scan end flag clear register (ADCAnPWDSGSEFCR)

Section 31 A/D Converter (ADCA)

This section contains a generic description of the A/D Converter (ADCA).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the ADCA.

31.1 Features of RH850/F1K ADCA

31.1.1 Number of Units and Channels

This microcontroller has the following number of ADCA units.

Table 31.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	1	2	2
Name	ADCAn (n = 0)	ADCAn (n = 0, 1)	ADCAn (n = 0, 1)

An ADCAn unit has the same number of physical channels as the number of A/D input pins and the same number of virtual channels as the number of addresses where the results of A/D conversion will be stored. The numbers of channels on individual products are as listed below.

Table 31.2 Unit Configurations and Physical Channels

Unit Name (Number of Channels) ADCAn		RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
ADCA0	12 bit pin for conversion*1	16	16	16
	10 bit pin for conversion*2	20	20	20
ADCA1	12 bit pin for conversion*1	—	8	16
	10 bit pin for conversion*2	—	4	8

Note 1. When 10-bit mode is selected, this pin can be used for 10-bit conversion.

Note 2. When 12-bit mode is selected but a pin is for 10-bit conversion, the 2 low-order bits of the result of conversion must be masked before use.

Table 31.3 Unit Configurations and Virtual Channels

Unit Name (Number of Channels) ADCAn	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
ADCA0	50	50	50
ADCA1	—	36	36

Table 31.4 Indices

Index	Description
n	Throughout this section, the individual ADCA units are identified by the index “n” (n = 0, 1); for example, ADCAnPWDVCR indicates the PWM-Diag virtual channel register.
m	Throughout this section, the individual physical channels (channels in the unit) of ADCAn are identified by the index “m”; for example, ANInm.
j	Throughout this section, the individual virtual channels of ADCAn are identified by the index “j”; for example, ADCAnVCRj indicates the virtual channel register.
x	Throughout this section, the individual scan groups (SG) of ADCAn are identified by the index “x” (x = 1 to 3); for example, ADCAnSGSTCRx indicates the scan group x start control register.
k	Throughout this section, the individual physical channel numbers for T&H are identified by the index “k” (k = 0 to 5); for example, THkE is T&H enable bit of the T&H enable register (ADCAnTHER).

The following table shows values indicated by the indices of each product.

Table 31.5 Indices of Products

Indices of Each Product		
RH850/F1K 100 pins	**RH850/F1K 144 pins**	**RH850/F1K 176 pins**
m = 0 to 35 (ADCA0)	m = 0 to 35 (ADCA0) m = 0 to 7 (ADCA1) 16 to 19 (ADCA1)	m = 0 to 35 (ADCA0) m = 0 to 23 (ADCA1)
j = 00 to 49 (ADCA0)	j = 00 to 49 (ADCA0) j = 00 to 35 (ADCA1)	j = 00 to 49 (ADCA0) j = 00 to 35 (ADCA1)
x = 1 to 3 (ADCA0)	x = 1 to 3 (ADCA0) x = 1 to 3 (ADCA1)	x = 1 to 3 (ADCA0) x = 1 to 3 (ADCA1)
k = 0 to 5 (ADCA0)	k = 0 to 5 (ADCA0)	k = 0 to 5 (ADCA0)

31.1.2 Register Base Address

ADCAn base addresses are listed in the following table.

ADCAn register addresses are given as offsets from the base addresses.

Table 31.6 Register Base Addresses

Base Address Name	Base Address
<ADCA0_base>	FFF2 0000_H
<ADCA1_base>	FFD6 $D000_H$

31.1.3 Clock Supply

The ADCAn clock supply is shown in the following table.

Table 31.7 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
ADCA0	ADCLK	CKSCLK_AADCA	Module clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_AADCA	
ADCA1	ADCLK	CKSCLK_IADCA	Module clock
	Register access clock	CPUCLK2	Bus clock

31.1.4 Interrupt Requests

ADCAn interrupt requests are listed in the following table.

Table 31.8 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number	Other Trigger Signals
ADCA0				
INT_ADE	A/D error interrupt	56	—	Motor control
INT_SG1	Scan group 1 (SG1) end interrupt	18	4	LPS
INT_SG2	Scan group 2 (SG2) end interrupt	19	5	LPS
INT_SG3	Scan group 3 (SG3) end interrupt	20, 32	6	LPS
ADC_CONV_END0	Scan group 4 (SG4) A/D conversion end signal	—	7	—
ADCA1				
INT_ADE	A/D error interrupt	212	—	—
INT_SG1	Scan group 1 (SG1) end interrupt	213	103	—
INT_SG2	Scan group 2 (SG2) end interrupt	214	104	—
INT_SG3	Scan group 3 (SG3) end interrupt	215	105	—
ADC_CONV_END1	Scan group 4 (SG4) A/D conversion end signal	—	106	—

31.1.5 Reset Sources

ADCAn reset sources are listed in the following table. ADCAn is initialized by these reset sources.

Table 31.9 Reset Sources

Unit Name	Reset Source
ADCA0	Reset sources other than transition to DeepSTOP mode (AWORES)
ADCA1	All reset sources (ISORES)

31.1.6 External Input/Output Signals

External input/output signals of ADCAn are listed below.

Table 31.10 ADCA0 Analog Input Signals

Unit Signal Name	Alternative Port Pin Signal	Resolution	T&H	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins

ADCA0SEL1	External analog multiplexer (MPX) output pin 1	ADCA0SEL1
ADCA0SEL2	External analog multiplexer (MPX) output pin 2	ADCA0SEL2

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**.

CAUTION

When port P8_6 is used as ADCA0I8S, port P8_6 pin outputs a low-level $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is deasserted.
For details, see Section 2.11.1.1, P8_6: $\overline{\text{RESETOUT}}$.

ADCA1TRG2	External trigger pin (scan group 3)*1	ADCA1TRG2

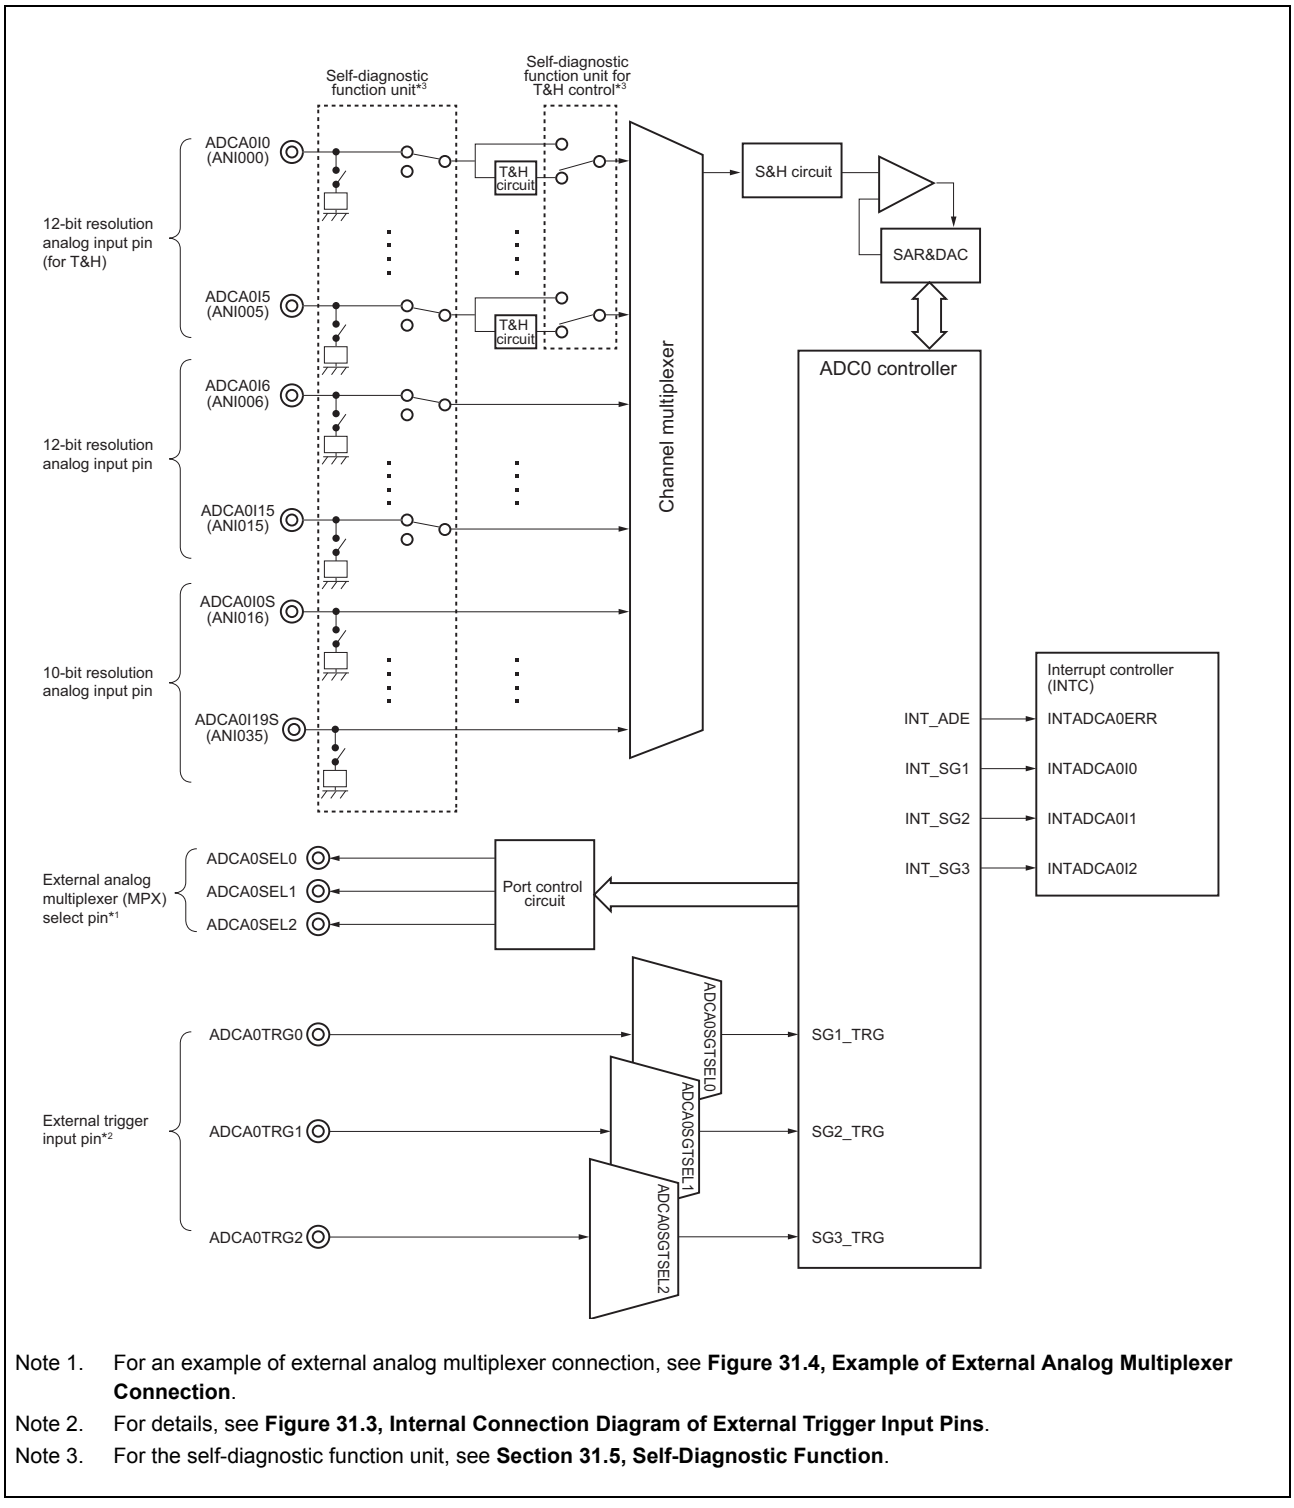
Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**.

31.2 Overview

31.2.1 Functional Overview

ADCA has the following features.

- 10-bit/12-bit resolution
- Successive approximation conversion method
- Number of A/D input channels
  A/D conversion is available for a maximum of 36 ADCA0 channels and 24 ADCA1 channels. Additionally, ADCA0 supports the connection of an external analog multiplexer (MPX) to extend the number of analog input channels.
- Internal track and hold (T&H) circuit
  ANI000 to ANI005 (ADCA0I0 to ADCA0I5) of ADCA0 include the track and hold circuit. The track and hold circuit can sample up to 6 channels of analog input simultaneously.
- A/D conversion control by scan groups
  The A/D conversion channel or conversion mode (scan mode) can be set for each scan group.
- Two scan modes
  Multi-cycle scan mode: Specified number of scans are executed.
  Continuous scan mode: Scans are executed repeatedly and continuously.
- Asynchronous/synchronous suspend and resume function
  A processing for a scan group can be interrupted to run the processing for another scan group.
- Start trigger for each scan group
  Software, hardware, and external trigger can start processing of each scan group.
- Scan end interrupt and DMA transfer are supported.
  For each scan group, an interrupt request to INTC can be issued or DMA transfer can be started, each time a processing for the virtual channel indicated by the end virtual channel pointer ends, or a virtual channel ends.
- A/D conversion channel repeat function
  A/D conversion is performed for the same channel two or four times sequentially, and the result is stored in the data register.
- Abundant safety functions
  Abundant safety functions are provided, such as A/D converter diagnosis, diagnosis of the channel multiplexer, diagnosis of open pins, diagnosis of the T&H circuit, upper limit/lower limit check for the A/D converter, overwrite check for data registers, and read and clear function for data registers.
- Shortest A/D conversion time per channel
  1.15 µs (when MPX is not used)
  2.30 µs (when MPX is used)



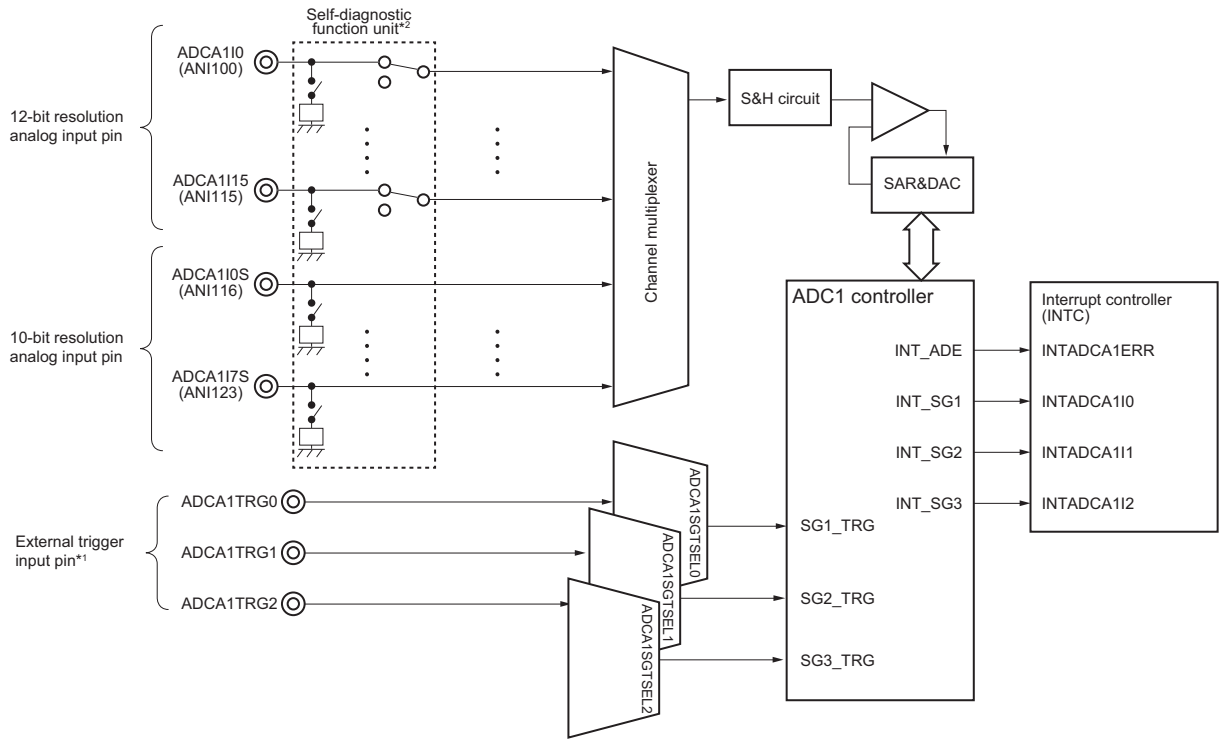
NOTE

- Physical channel (ANInm)
  Each A/D input channel of ADCA0 and ADCA1 units is called a physical channel. The physical channel of each unit is represented as ANI0m (m = 0 to 35) for ADCA0 and ANI1m (m = 0 to 23) for ADCA1.
  In RH850/F1K, the alternative port pins for 12-bit resolution A/D input channel and 10-bit resolution A/D input channel are represented as ADCAnIm and ADCAnImS, respectively. In this section, the physical channels and the corresponding alternative port pins are listed together.
- Virtual channel (ADCAnVCRj)
  ADCA0 has a maximum of 50 virtual channels, and ADCA1 has a maximum of 36 virtual channels. The virtual channel specifies the physical channel to be scanned.
  Scans are executed in sequence from the smallest virtual channel number. The scan order can be arbitrarily-specified by using virtual channels. In addition, the scanned result is stored in the data register (ADCAnDRj) corresponding to the virtual channel.
- Scan group (SGx)
  ADCA has three scan groups (SG1, SG2, SG3) and one PWM-Diag group (SG4). A/D conversion is executed in scan group unit. The channel to be scanned can be selected for each group by specifying the scan range, that is, the conversion start virtual channel and the conversion end virtual channel.

31.2.2 Block Diagram

The block diagram of ADCA0 is shown in **Figure 31.1**. The block diagram of ADCA1 is shown in **Figure 31.2**.

(1) Configuration of ADCA0



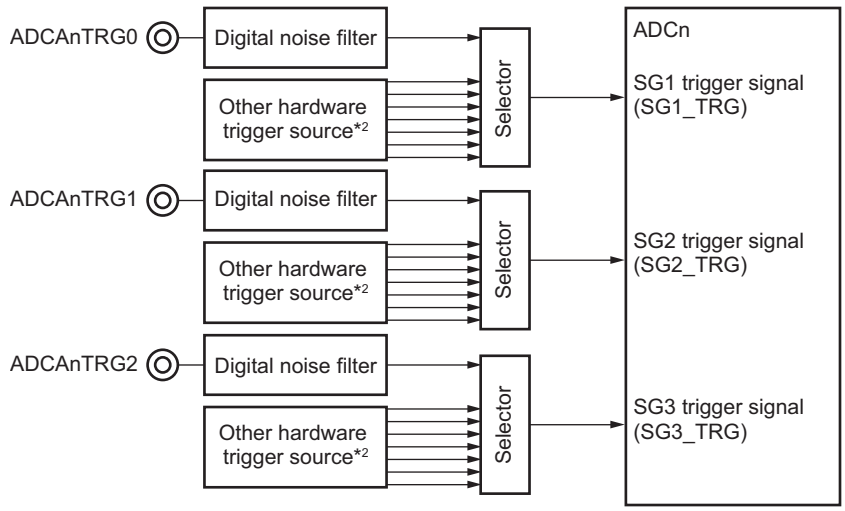
Note 1. For an example of external analog multiplexer connection, see **Figure 31.4, Example of External Analog Multiplexer Connection**.

Note 2. For details, see **Figure 31.3, Internal Connection Diagram of External Trigger Input Pins**.

Note 3. For the self-diagnostic function unit, see **Section 31.5, Self-Diagnostic Function**.

Figure 31.1 ADCA0 Block Diagram (RH850/F1K with 176 Pins)

(2) Configuration of ADCA1



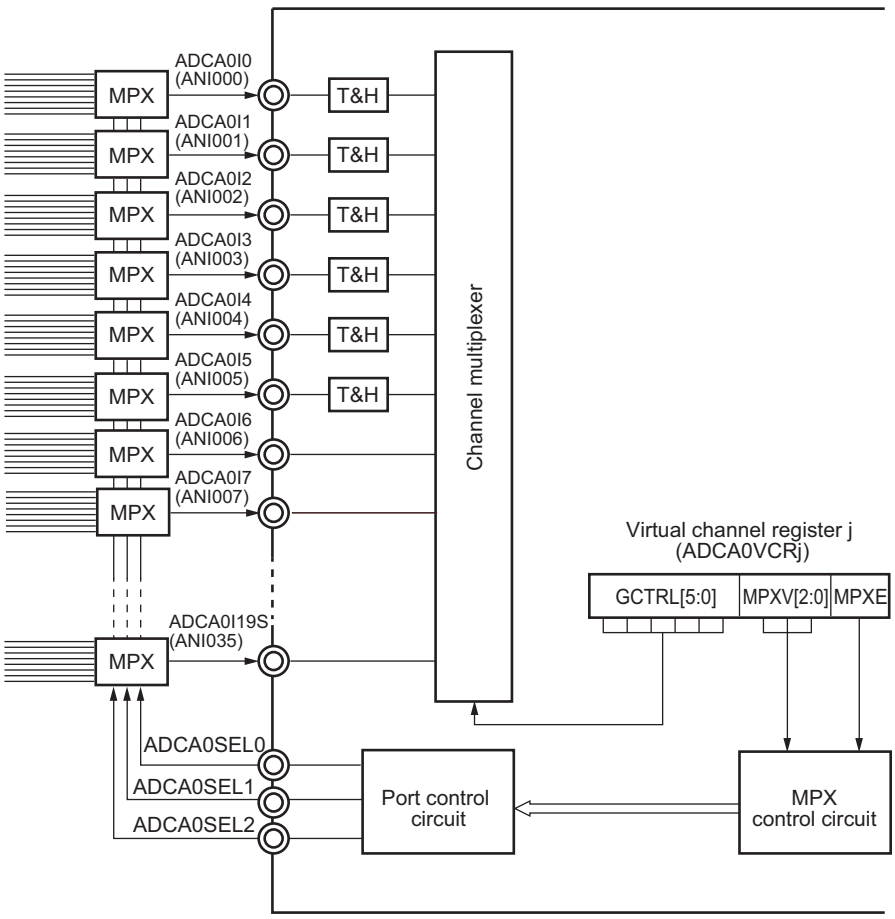
Note 1. For details, see **Figure 31.3, Internal Connection Diagram of External Trigger Input Pins**.
Note 2. For the self-diagnostic function unit, see **Section 31.5, Self-Diagnostic Function**.

Figure 31.2 ADCA1 Block Diagram (RH850/F1K with 176 Pins)

(3) Configuration of external trigger input pins

An external trigger input pin is a hardware trigger source to activate ADCAn.

The configuration of external trigger input pins is shown below.



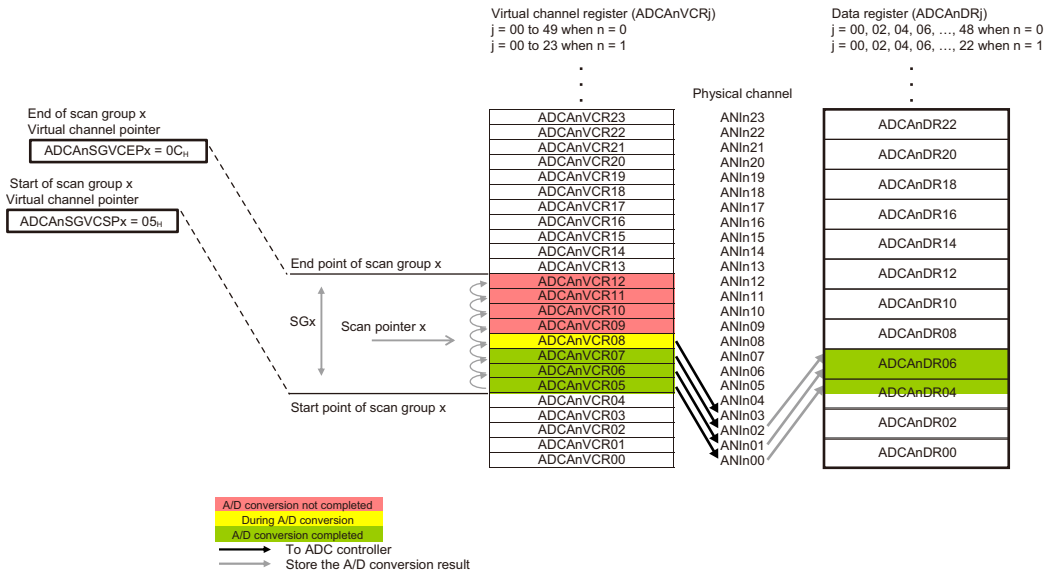
Note 1. For the condition setting to accept a trigger from an external trigger input pin, see **Section 2.12, Noise Filter & Edge/Level Detector**.

Note 2. For the hardware trigger sources, see **Table 31.49, List of A/D Conversion Hardware Triggers**.

Figure 31.3 Internal Connection Diagram of External Trigger Input Pins

(4) Configuration of external analog multiplexer (MPX)

The external analog multiplexer (MPX) can be connected to any input signal pins ADCA0I0 to ADCA0I19S. An example of the external analog multiplexer connection is shown below.



Note: The T&H function is disabled when the external analog multiplexer (MPX) is used.

Figure 31.4 Example of External Analog Multiplexer Connection

(5) Virtual channel

The virtual channel specifies the physical address to be scanned.
The virtual channel is controlled by the ADCAnVCRj register.
A usage example of the virtual channel is shown below.

Example) When scan group x starts scanning 5th to 12th virtual channels

1. The ADCAnVCRj register specifies the physical channel (ANInm) for which virtual channel j executes the A/D conversion. The A/D conversion pins can be set in any order. (The figure above shows an example when ANIn0 to ANIn7 are selected.)
2. The scan pointer x sequentially reads the physical channels specified in the ADCAnVCRj register from “start point of scan group x” to “end point of scan group x”, and starts the A/D conversion for the read physical address.
3. The scanned result of virtual channel j is stored in data register j.

Figure 31.5 Usage Example of Virtual Register

31.3 Registers

31.3.1 List of Registers

The ADCA registers are listed in the following table.

For details about <ADCAn_base>, see **Section 31.1.2, Register Base Address**.

Table 31.14 List of Registers (1/2)

Module Name	Register Name	Symbol	Address
ADCA Specific Registers (Virtual Channel)			
ADCAn	Virtual Channel Register j	ADCAnVCRj	<ADCAn_base> + j × 4_H
	PWM-Diag Virtual Channel Register	ADCAnPWDVCR	<ADCAn_base> + $0F4_H$
	Data Register j	ADCAnDRj	<ADCAn_base> + 100_H + j × 2_H
	Data Supplementary Information Register j	ADCAnDIRj	<ADCAn_base> + 200_H + j × 4_H
	PWM-Diag data register	ADCAnPWDTSNDR	<ADCAn_base> + 178_H
	PWM-Diag Data Supplementary Information Register	ADCAnPWDDIR	<ADCAn_base> + $2F4_H$
ADCA Specific Registers (Control)			
ADCAn	A/D Force Halt Register	ADCAnADHALTR	<ADCAn_base> + 300_H
	A/D Control Register	ADCAnADCR	<ADCAn_base> + 304_H
	MPX Current Register	ADCAnMPXCURR	<ADCAn_base> + $30C_H$
	T&H Sampling Start Control Register	ADCAnTHSMPSTCR	<ADCAn_base> + 314_H
	T&H Control Register	ADCAnTHCR	<ADCAn_base> + 318_H
	T&H Group A Hold Start Control Register	ADCAnTHAHLDSTCR	<ADCAn_base> + $31C_H$
	T&H Group B Hold Start Control Register	ADCAnTHBHLDSTCR	<ADCAn_base> + 320_H
	T&H Group A Control Register	ADCAnTHACR	<ADCAn_base> + 324_H
	T&H Group B Control Register	ADCAnTHBCR	<ADCAn_base> + 328_H
	T&H Enable Register	ADCAnTHER	<ADCAn_base> + $32C_H$
	T&H Group Select Register	ADCAnTHGSR	<ADCAn_base> + 330_H
	Sampling Control Register	ADCAnSMPCR	<ADCAn_base> + 380_H
ADCA Specific Registers (Safety-related)			
ADCAn	Safety Control Register	ADCAnSFTCR	<ADCAn_base> + 334_H
	Upper Limit/Lower Limit Table Register 0	ADCAnULLMTBR0	<ADCAn_base> + 338_H
	Upper Limit/Lower Limit Table Register 1	ADCAnULLMTBR1	<ADCAn_base> + $33C_H$
	Upper Limit/Lower Limit Table Register 2	ADCAnULLMTBR2	<ADCAn_base> + 340_H
	Error Clear Register	ADCAnECR	<ADCAn_base> + 344_H
	Upper Limit/Lower Limit Error Register	ADCAnULER	<ADCAn_base> + 348_H
	Overwrite Error Register	ADCAnOWER	<ADCAn_base> + $34C_H$
Scan Group Specific Registers			
ADCAn	Scan Group x Start Control Register	ADCAnSGSTCRx	<ADCAn_base> + x × 40_H + 400_H
	PWM-Diag Scan Group Control Register	ADCAnPWDSGCR	<ADCAn_base> + 508_H
	Scan Group x Control Register	ADCAnSGCRx	<ADCAn_base> + x × 40_H + 408_H

31.3.2 ADCA Specific Registers

This section describes the registers that are equipped in each of ADCA0 and ADCA1.

31.3.2.1 ADCAnVCRj — Virtual Channel Register j

This register is used to control the virtual channel.

Access: ADCAnVCRj register can be read or written in 32-bit units.
ADCAnVCRjL register can be read or written in 16-bit units.
ADCAnVCRjLL and ADCAnVCRjLH registers can be read or written in 8-bit units.

Address: ADCAnVCRj: <ADCAn_base> + j × 4_H
ADCAnVCRjL: <ADCAn_base> + j × 4_H
ADCAnVCRjLL: <ADCAn_base> + j × 4_H
ADCAnVCRjLH: <ADCAn_base> + j × 4_H + 1_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 31.15 ADCAnVCRj Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	MPXE*1	MPX Enable 0: The use of MPX is prohibited. No wait is inserted before A/D conversion is performed. 1: The use of MPX is permitted. The MPXV[2:0] bits are output from ADCAnSEL0 to ADCAnSEL2 when the virtual channel starts, and a wait of one A/D-conversion time is inserted before A/D conversion is performed.
14 to 12	MPXV[2:0]*1	These bits are used to set the MPX value to be transferred to an external analog multiplexer.
11, 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	CNVCLS*1, *2	A/D Conversion Type Select for Self-Diagnosis 0: A/D conversion of the hold value is performed during a self-diagnosis. 1: Normal A/D conversion is performed during a self-diagnosis. When normal A/D conversion is performed during a self-diagnosis and MPX is in use (MPXE is set), however, a wait of one A/D conversion time is inserted before A/D conversion is performed. On the other hand, MPX cannot be used when A/D conversion of the hold value is performed during a self-diagnosis.
8	ADIE	A/D Conversion End Interrupt Enable 0: A scan group x end interrupt (INT_SGx) is not generated when A/D conversion for virtual channel j ends in SGx. 1: A scan group x end interrupt (INT_SGx) is generated when A/D conversion for virtual channel j ends in SGx.
7, 6	ULS[1:0]	Upper Limit/Lower Limit Table Select 00: Upper limit and lower limit are not checked. 01: Upper limit and lower limit are checked for ADCAnULLMTBR0. 10: Upper limit and lower limit are checked for ADCAnULLMTBR1. 11: Upper limit and lower limit are checked for ADCAnULLMTBR2.

Table 31.15 ADCAnVCRj Register Contents (2/2)

Bit Position	Bit Name	Function
5 to 0	GCTRL[5:0]	Physical Channel Select 0_H to 23_H: Corresponding ANInm is selected. 24_H: Diagnosis channel for A/D converter is selected. Others: Setting prohibit **Note:** These bits shall set the physical channel which is supported. See **Table 31.5, Indices of Products**, **Table 31.10, ADCA0 Analog Input Signals** and **Table 31.12, ADCA1 Analog Input Signals**.

Note 1. These bits are only supported for ADCA0. For ADCA1, when writing, write the value after reset.

Note 2. This bit is only supported when j = 33 to 35. Otherwise, when writing, write the value after reset.

CAUTION

To prevent malfunction, ADCAnVCRj should be set when SGACT of applicable scan groups is 0 (before scan groups are started) and TRGMD of applicable scan groups is 0.

Other than above						Setting prohibited

Note 1. This setting only applies to ADCA0. Setting is prohibited in ADCA1 (RH850/F1K with 176 pins).
Note 2. This setting only applies to ADCA0. Setting is prohibited in ADCA1 (RH850/F1K with 144 pins).
Note 3. This setting only applies to ADCA0. Setting is prohibited in ADCA1 (RH850/F1K with 100 pins).

31.3.2.2 ADCAnPWDVCR — PWM-Diag Virtual Channel Register

This register is used to indicate virtual channel setting (PWSAnPVCRx_y register setting) of the PWM-Diag (SG4).

Access: ADCAnPWDVCR register is a read-only register that can be read in 32-bit units.
ADCAnPWDVCRL register is a read-only register that can be read in 16-bit units.
ADCAnPWDVCRLL register is a read-only register that can be read in 8-bit units.
ADCAnPWDVCRLH register is a read-only register that can be read in 8-bit units.

Address: ADCAnPWDVCR: <ADCAn_base> + $0F4_H$
ADCAnPWDVCRL: <ADCAn_base> + $0F4_H$
ADCAnPWDVCRLL: <ADCAn_base> + $0F4_H$
ADCAnPWDVCRLH: <ADCAn_base> + $0F4_H$ + 1_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.17 ADCAnPWDVCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15	MPXE*1	The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[27] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[11] (even channel) bit. MPX Enable Set this bit to 1 when an external analog multiplexer is used. 0: The use of MPX is prohibited. 1: The use of MPX is permitted. The MPXV[2:0] bits are output from ADCAnSEL0 to ADCAnSEL2 when the virtual channel starts, and a wait of one A/D-conversion time is inserted before A/D conversion is performed.
14 to 12	MPXV[2:0]*1	These bits are used to set the MPX value to be transferred to an external analog multiplexer by using the PWSAnPVCRx_y.PWSAnVRDTy[26:24] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[10:8] (even channel) bit.
11 to 8	Reserved	When read, the value after reset is returned.
7 to 6	ULS[1:0]	The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[23:22] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[7:6] (even channel) bit. Upper Limit/Lower Limit Table Select 00: Upper limit and lower limit are not checked. 01: Upper limit and lower limit are checked for ADCAnULLMTBR0. 10: Upper limit and lower limit are checked for ADCAnULLMTBR1. 11: Upper limit and lower limit are checked for ADCAnULLMTBR2.
5 to 0	GCTRL[5:0]	The following setting is made by setting the PWSAnPVCRx_y.PWSAnVRDTy[21:16] (odd channel) or PWSAnPVCRx_y.PWSAnVRDTx[5:0] (even channel) bit. Physical Channel Select These bits are used to specify a physical channel to be assigned to virtual channel j. For the selection of the channel, see **Table 31.16, Selection of Physical Channels**.

Note 1. These bits are only supported for ADCA0. For ADCA1, when read, the value after reset is returned.

31.3.2.3 ADCAnDRj — Data Register j

This register is a 32-/16-bit read-only register that stores the A/D conversion results corresponding to ADCAnVCRj and ADCAnVCR(j+1). As the A/D conversion results, the conversion result for ADCAnVCR(j+1) is stored in the upper bits (ADCAnDR(j+1)), and the conversion result for ADCAnVCRj is stored in the lower bits (ADCAnDRj).

Access: ADCAnDRj register is a read-only register that can be read in 32-bit units.
ADCAnDRjL and ADCAnDRjH registers are read-only registers that can be read in 16-bit units.

Address: ADCAnDRj: <ADCAn_base> + 100_H + j × 2_H
ADCAnDRjL: <ADCAn_base> + 100_H + j × 2_H
ADCAnDRjH: <ADCAn_base> + 100_H + j × 2_H + 2_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DR(j+1)[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRj[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.18 ADCAnDRj Register Contents

Bit Position	Bit Name	Function
31 to 16	DR(j+1)[15:0]	These bits are used to store the A/D conversion result data. (The A/D conversion result for the channel set in ADCAnVCR(j+1) are transferred.)
15 to 0	DRj[15:0]	These bits are used to store the A/D conversion result data. (The A/D conversion result for the channel set in ADCAnVCRj are transferred.)

CAUTION

If the number of channels is odd, the higher-order bits (DR(j+1)[15:0]) in the ADCAnDRj register cannot be used. If virtual channels 33, 34, and 35 are used exclusively for self-diagnosis, the lower-order bits (DRj[15:0]) for channel 32 cannot be used.

NOTES

1. j = 00, 02, …, 46, 48 (for ADCA0)
   j = 00, 02, …, 32, 34 (for ADCA1 of the RH850/F1K with 176 pins and 144 pins)
2. By controlling ADCAnADCR.CRAC and ADCAnADCR.CTYP, the data format of this register becomes as follows:
   - ADCAnADCR.CTYP = 0 and ADCAnADCR.CRAC = 0 → Right alignment is used.
     →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 27 to 16, and the A/D conversion result for ADCAnVCRj is transferred to bits 11 to 0.
   - ADCAnADCR.CTYP = 0 and ADCAnADCR.CRAC = 1 → Left alignment is used.
     →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 31 to 20, and the A/D conversion result for ADCAnVCRj is transferred to bits 15 to 4.
   - ADCAnADCR.CTYP = 1 and ADCAnADCR.CRAC = 0 → Right alignment is used.
     →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 25 to 16, and the A/D conversion result for ADCAnVCRj is transferred to bits 9 to 0.
   - ADCAnADCR.CTYP = 1 and ADCAnADCR.CRAC = 1 → Left alignment is used.
     →The A/D conversion result for ADCAnVCR(j+1) is transferred to bits 31 to 22, and the A/D conversion result for ADCAnVCRj is transferred to bits 15 to 6.

31.3.2.4 ADCAnDIRj — Data Supplementary Information Register j

This register is a 32-bit read-only register that stores the A/D conversion result for ADCAnDRj and information incidental to the A/D converted value.

As the A/D conversion result, the ADCAnDRj value is transferred. As information incidental to the A/D converted value, information about the write flag (WFLG), the MPX value (MPXV[2:0]), and the physical channel (ID[5:0]) is transferred. The data format of the A/D conversion result stored in ADCAnDIRj is the same as that for the ADCAnDRj register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ADCAn_base> + 200_H + j × 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MPXE *1	MPXV[2:0]*1			—	—	WFLG	—	—	—	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.19 ADCAnDIRj Register Contents

Bit Position	Bit Name	Function
31	MPXE*1	MPX Enable Flag 0: MPX function is not used. 1: MPX function is used.
30 to 28	MPXV[2:0]*1	These bits are used to store the MPX value. The MPX value to be stored is the MPX value of the most recent conversion result.
27, 26	Reserved	When read, the value after reset is returned.
25	WFLG	Write Flag 0: ADCAnDRj or ADCAnDIRj is read (cleared when read). 1: A/D converted value is stored in ADCAnDRj (set when the value is stored).
24 to 22	Reserved	When read, the value after reset is returned.
21 to 16	ID[5:0]	These bits store the physical channel number (GCTRL) corresponding to the conversion result. The physical channel number to be stored is the number corresponding to the most recent conversion result.
15 to 0	DR[15:0]	These bits are used to store the A/D conversion result.

Note 1. These bits are only supported by ADCA0.
For ADCA1, when read, the value after reset is returned.

31.3.2.5 ADCAnPWDTSNDR — PWM-Diag Data Register

This register is a 32-/16-bit read-only register that stores the A/D conversion results corresponding to the PWM-Diag. As the A/D conversion results, the conversion result for the PWM-Diag (PWDDR) is stored in the upper bits.

Access: ADCAnPWDTSNDR register is a read-only register that can be read in 32-bit units.
ADCAnPWDTSNDRH register is a read-only register that can be read in 16-bit units.

Address: ADCAnPWDTSNDR: <ADCAn_base> + 178_H
ADCAnPWDTSNDRH: <ADCAn_base> + $17A_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.20 ADCAnPWDTSNDR Register Contents

Bit Position	Bit Name	Function
31 to 16	PWDDR[15:0]	These bits are used to store the A/D conversion result data for the PWM-Diag.
15 to 0	Reserved	When read, the value after reset is returned.

NOTE

The data format of this register is controlled by ADCAnADCR.CRAC and ADCAnADCR.CTYP, as shown below.

- ADCAnADCR.CTYP = 0, ADCAnADCR.CRAC = 0 → Right alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 27 to 16.
- ADCAnADCR.CTYP = 0, ADCAnADCR.CRAC = 1 → Left alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 31 to 20.
- ADCAnADCR.CTYP = 1, ADCAnADCR.CRAC = 0 → Right alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 25 to 16.
- ADCAnADCR.CTYP = 1, ADCAnADCR.CRAC = 1 → Left alignment is used.
  → The A/D conversion result for ADCAnPWDVCR is transferred to bits 31 to 22.

31.3.2.6 ADCAnPWDDIR — PWM-Diag Data Supplementary Information Register

This register is a 32-bit read-only register that stores the A/D conversion result when PWM-Diag is used, and information incidental to the A/D converted value.

As the A/D conversion result, the ADCAnPWDSNDR.PWDDR[15:0] value is transferred. As supplementary information to the A/D converted value, the write flag (WFLG), MPX value (MPXV[2:0]), and physical channel (ID[5:0]) are transferred. The data format of the A/D conversion result stored in ADCAnPWDDIR is the same as that for the ADCAnPWDTSNDR register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ADCAn_base> + $2F4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.21 ADCAnPWDDIR Register Contents

Bit Position	Bit Name	Function
31	MPXE*1	MPX Enable Flag 0: The MPX function is not used. 1: The MPX function is used.
30 to 28	MPXV[2:0]*1	These bits are used to store the MPX value. The MPX value to be stored is the MPX value of the most recent conversion result.
27, 26	Reserved	When read, the value after reset is returned.
25	WFLG	Write Flag 0: ADCAnPWDTSNDR or ADCAnPWDDIR is read (cleared when read). 1: The A/D converted value is stored in ADCAnPWDTSNDR (set when the value is stored).
24 to 22	Reserved	When read, the value after reset is returned.
21 to 16	ID[5:0]	These bits are used to store the physical channel number (GCTRL) corresponding to the conversion result. The physical channel number to be stored is the physical channel number corresponding to the most recent conversion result.
15 to 0	PWDDR[15:0]	These bits are used to store the A/D conversion result for PWM-Diag.

Note 1. These bits are only supported for ADCA0.
For ADCA1, when read, the value after reset is returned.

31.3.2.7 ADCAnADHALTR — A/D Force Halt Register

This register is used to halt conversion for all SGs of ADCAn. The read value is always 0.

Access: ADCAnADHALTR register is a write-only register that can be written in 32-bit units.
ADCAnADHALTRL register is a write-only register that can be written in 16-bit units.
ADCAnADHALTRLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnADHALTR:<ADCAn_base> + 300_H
ADCAnADHALTRL:<ADCAn_base> + 300_H
ADCAnADHALTRLL:<ADCAn_base> + 300_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HALT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 31.22 ADCAnADHALTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	HALT	ADCA Force Halt Trigger All scan groups are halted and initialized, and ADCA becomes idle state. Writing of 0: No effect Writing of 1: Scan groups are halted.

31.3.2.8 ADCAnADCR — A/D Control Register

This register is used for ADCAn common control.

Access: ADCAnADCR register can be read or written in 32-bit units.
ADCAnADCRL register can be read or written in 16-bit units.
ADCAnADCRLL register can be read or written in 8-bit units.

Address: ADCAnADCR: <ADCAn_base> + 304_H
ADCAnADCRL: <ADCAn_base> + 304_H
ADCAnADCRLL: <ADCAn_base> + 304_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DGON	—	CRAC	CTYP	—	—	SUSMTD[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R	R	R/W	R/W

Table 31.23 ADCAnADCR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	DGON	Self-Diagnostic Voltage Standby Control 0: The self-diagnostic voltage circuit is turned off. 1: The self-diagnostic voltage circuit is turned on, or the reference voltage is updated.
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CRAC	Alignment Control 0: The results of conversion to PWDDR and ADCAnDRj are stored right-aligned. 1: The results of conversion to PWDDR and ADCAnDRj are stored left-aligned.
4	CTYP	12/10 Bit Select Mode 0: 12-bit mode 1: 10-bit mode
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	SUSMTD [1:0]	Suspend Mode Select These bits are used to select the suspend method when a higher-priority scan group interrupts a lower-priority scan group. 00: Synchronous suspend when a higher-priority SG or SVSTOP interrupts. 01: Asynchronous suspend when a higher-priority SG (SG2, SG3, SG4) and SVSTOP interrupt SG1, and synchronous suspend when a higher-priority SG (SG3, SG4) and SVSTOP interrupt SG2, or when a higher-priority SG (SG4) and SVSTOP interrupt SG3. 10: Asynchronous suspend when a higher-priority SG or SVSTOP interrupts. 11: Setting prohibited

CAUTION

To prevent malfunction, ADCAnADCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

- Synchronous suspend:
  If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the A/D conversion for the higher-priority SG is performed after the on-going A/D conversion of a channel is completed. After processing for the higher-priority SG is completed, the suspended A/D channel processing for the lower-priority SG is resumed.
- Asynchronous suspend:
  If a request from a higher-priority SG occurs while a lower-priority SG is being processed, the on-going channel processing is suspended, and then the A/D conversion for the higher-priority SG is performed. After processing for the higher-priority SG is completed, the suspended A/D channel conversion for the lower-priority SG is resumed.

For details, see **Figure 31.21, Example of Synchronous Suspend and Resume Operation** and **Figure 31.22, Example of Asynchronous Suspend and Resume Operation**.

31.3.2.9 ADCAnMPXCURR — MPX Current Register

This register is used to store the MPX value for an external analog multiplexer.

Access: ADCAnMPXCURR register is a read-only register that can be read in 32-bit units.
ADCAnMPXCURRL register is a read-only register that can be read in 16-bit units.
ADCAnMPXCURRLL register is a read-only register that can be read in 8-bit units.

Address: ADCAnMPXCURR: <ADCAn_base> + $30C_H$
ADCAnMPXCURRL: <ADCAn_base> + $30C_H$
ADCAnMPXCURRLL: <ADCAn_base> + $30C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	MPXCUR[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.24 ADCAnMPXCURR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2 to 0	MPXCUR[2:0]	These bits are used to store the current MPX value. If conversion of a virtual channel starts after setting ADCAnVCRj.MPXE to 1, the setting of ADCAnVCRj.MPXV[2:0] is stored. If conversion of a virtual channel starts after setting ADCAnPWDVCR.MPXE to 1, the setting of ADCAnPWDVCR.MPXV[2:0] is stored.

NOTE

In RH850/F1K, only ADCA0 supports this function.

31.3.2.10 ADCAnTHSMPSTCR — T&H Sampling Start Control Register

This register is used to control the start of sampling for all T&Hk (k = 0 to 5). The bits are always read as 0.

Access: ADCAnTHSMPSTCR register is a write-only register that can be written in 32-bit units.
ADCAnTHSMPSTCRL register is a write-only register that can be written in 16-bit units.
ADCAnTHSMPSTCRLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnTHSMPSTCR: <ADCAn_base> + 314_H
ADCAnTHSMPSTCRL: <ADCAn_base> + 314_H
ADCAnTHSMPSTCRLL: <ADCAn_base> + 314_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SMPST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 31.25 ADCAnTHSMPSTCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SMPST	T&H Sampling Start Control Trigger 0: No effect 1: Sampling for all T&H is started. The conditions to place the T&H circuit in the sampling state are as follows: • Condition to start sampling while T&H is stopped: 1 being written to ADCAnTHSMPSTCR.SMPST while ADCAnTHER.THkE = 1 (k = 0 to 5). • Condition to start continuous sampling in automatic sampling: A/D conversion of the hold value for T&Hk being completed while ADCAnTHER.THkE = 1 (k = 0 to 5) and ADCAnTHCR.ASMPMSK = 1.

NOTE

In RH850/F1K, only ADCA0 supports this function.

31.3.2.11 ADCAnTHCR — T&H Control Register

This register controls the sampling transition after A/D conversion of the hold value for T&H is completed.

Automatic start of sampling on the T&H circuit after A/D conversion of the hold value for T&H is completed shortens the time required for the generation of succeeding hold completion triggers.

Access: ADCAnTHCR register can be read or written in 32-bit units.
ADCAnTHCRL register can be read or written in 16-bit units.
ADCAnTHCRLL register can be read or written in 8-bit units.

Address: ADCAnTHCR: <ADCAn_base> + 318_H
ADCAnTHCRL: <ADCAn_base> + 318_H
ADCAnTHCRLL: <ADCAn_base> + 318_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ASMPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 31.26 ADCAnTHCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ASMPMSK	Automatic Sampling Mask Control 0: Automatic sampling is not performed. 1: Automatic sampling is performed.

CAUTION

To prevent malfunction, ADCAnTHCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1K, only ADCA0 supports this function.

31.3.2.12 ADCAnTHAHLDSTCR — T&H Group A Hold Start Control Register

This register is used to control the start of the hold for T&H group A. The bits are always read as 0.

Access: ADCAnTHAHLDSTCR register is a write-only register that can be written in 32-bit units.
ADCAnTHAHLDSTCRL register is a write-only register that can be written in 16-bit units.
ADCAnTHAHLDSTCRLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnTHAHLDSTCR: <ADCAn_base> + $31C_H$
ADCAnTHAHLDSTCRL: <ADCAn_base> + $31C_H$
ADCAnTHAHLDSTCRLL: <ADCAn_base> + $31C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HLDST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 31.27 ADCAnTHAHLDSTCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	HLDST	T&H Group A Hold Start Control Trigger 0: No effect 1: Hold for T&H group A is started. The condition to place T&H group A in the hold state is as follows: • 1 being written to ADCAnTHAHLDSTCR.HLDST while ADCAnTHER.THkE = 1 (k = 0 to 5) and ADCAnTHGSR.THkGS = 0 (k = 0 to 5).

NOTE

In RH850/F1K, only ADCA0 supports this function.

31.3.2.13 ADCAnTHBHLDSTCR — T&H Group B Hold Start Control Register

This register is used to control the start of the hold for T&H group B. The bits are always read as 0.

Access: ADCAnTHBHLDSTCR register is a write-only register that can be written in 32-bit units.
ADCAnTHBHLDSTCRL register is a write-only register that can be written in 16-bit units.
ADCAnTHBHLDSTCRLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnTHBHLDSTCR: <ADCAn_base> + 320_H
ADCAnTHBHLDSTCRL: <ADCAn_base> + 320_H
ADCAnTHBHLDSTCRLL: <ADCAn_base> + 320_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 31.28 ADCAnTHBHLDSTCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	HLDST	T&H Group B Hold Start Control Trigger 0: No effect 1: Hold for T&H group B is started. The condition to place T&H group B in the hold state is as follows: • 1 being written to ADCAnTHBHLDSTCR.HLDST while ADCAnTHER.THkE = 1 (k = 0 to 5) and ADCAnTHGSR.THkGS = 1 (k = 0 to 5).

NOTE

In RH850/F1K, only ADCA0 supports this function.

31.3.2.14 ADCAnTHACR — T&H Group A Control Register

This register is used to control T&H group A.

Access: ADCAnTHACR register can be read or written in 32-bit units.
ADCAnTHACRL register can be read or written in 16-bit units.
ADCAnTHACRLL register can be read or written in 8-bit units.

Address: ADCAnTHACR: <ADCAn_base> + 324_H
ADCAnTHACRL: <ADCAn_base> + 324_H
ADCAnTHACRLL: <ADCAn_base> + 324_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	HLDCTE	HLDTE	—	—	SGS[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Table 31.29 ADCAnTHACR Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	HLDCTE	T&H Group A Hold Completion Trigger Enable This bit is used when self-diagnosis of the T&H circuit is to proceed. 0: Self-diagnosis does not proceed. 1: Self-diagnosis proceeds. **Note:** The SGx_TRG (x = 1 to 3) trigger is selected for the trigger input of the scan group that is not selected in SGS[1:0] of ADCAnTHACR and SGS[1:0] of ADCAnTHBCR.
4	HLDTE	T&H Group A Hold Trigger Enable 0: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is selected for the hold start trigger of T&H group A. 1: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is not selected for the hold start trigger of T&H group A. **Note:** ADCAnTHAHLDSTCR.HLDST becomes a hold start trigger regardless of the ADCAnTHACR.HLDTE setting. Set this bit to 0 when self-diagnosis of the T&H circuit is to proceed.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	SGS[1:0]	T&H Group A Scan Group Select 00: No scan group is selected for T&H group A. 01: SG1 is selected for T&H group A. 10: SG2 is selected for T&H group A. 11: SG3 is selected for T&H group A. **Note:** 1. If ADCAnTHACR.SGS[1:0] is set to 0_H, T&H does not operate. When you enable T&Hk in ADCAnTHER.THkE, make sure that a scan group is specified in SGS[1:0]. 2. Selecting the same scan group as T&H group B is prohibited.

CAUTION

To prevent malfunction, ADCAnTHACR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1K, only ADCA0 supports this function.

31.3.2.15 ADCAnTHBCR — T&H Group B Control Register

This register is used to control T&H group B.

Access: ADCAnTHBCR register can be read or written in 32-bit units.
ADCAnTHBCRL register can be read or written in 16-bit units.
ADCAnTHBCRLL register can be read or written in 8-bit units.

Address: ADCAnTHBCR: <ADCAn_base> + 328_H
ADCAnTHBCRL: <ADCAn_base> + 328_H
ADCAnTHBCRLL: <ADCAn_base> + 328_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	HLDCTE	HLDTE	—	—	SGS[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Table 31.30 ADCAnTHBCR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	HLDCTE	T&H Group B Hold Completion Trigger Enable This bit is used when self-diagnosis of the T&H circuit is to proceed. 0: Self-diagnosis does not proceed. 1: Self-diagnosis proceeds. **Note:** The SGx_TRG (x = 1 to 3) trigger is selected for the trigger input of the scan group that is not selected in SGS[1:0] of ADCAnTHACR and SGS[1:0] of ADCAnTHBCR.
4	HLDTE	T&H Group B Hold Trigger Enable 0: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is selected for the hold start trigger of T&H group B. 1: The SGx (x = 1 to 3) trigger selected in SGS[1:0] is not selected for the hold start trigger of T&H group B. **Note:** ADCAnTHBHLDSTCR.HLDST becomes a hold start trigger regardless of the ADCAnTHBCR.HLDTE setting. Set this bit to 0 when self-diagnosis of the T&H circuit is to proceed.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 31.30 ADCAnTHBCR Register Contents (2/2)

Bit Position	Bit Name	Function
1 to 0	SGS[1:0]	T&H Group B Scan Group Select 00: No scan group is selected for T&H group B. 01: SG1 is selected for T&H group B. 10: SG2 is selected for T&H group B. 11: SG3 is selected for T&H group B. **Note:** 1. If ADCAnTHBCR.SGS[1:0] is set to 0_H, T&H does not operate. When you enable T&Hk in ADCAnTHER.THkE, make sure that a scan group is specified in SGS[1:0]. 2. Selecting the same scan group as T&H group A is prohibited.

CAUTION

To prevent malfunction, ADCAnTHBCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1K, only ADCA0 supports this function.

31.3.2.16 ADCAnTHER — T&H Enable Register

This register controls enabling and disabling of each T&H.

Access: ADCAnTHER register can be read or written in 32-bit units.
ADCAnTHERL register can be read or written in 16-bit units.
ADCAnTHERLL register can be read or written in 8-bit units.

Address: ADCAnTHER: <ADCAn_base> + $32C_H$
ADCAnTHERL: <ADCAn_base> + $32C_H$
ADCAnTHERLL: <ADCAn_base> + $32C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 31.31 ADCAnTHER Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	TH5E	T&H5 Enable 0: T&H5 is disabled. 1: T&H5 is enabled. **Note:** If TH5E is set to 0, T&H5 is always stopped.
4	TH4E	T&H4 Enable 0: T&H4 is disabled. 1: T&H4 is enabled. **Note:** If TH4E is set to 0, T&H4 is always stopped.
3	TH3E	T&H3 Enable 0: T&H3 is disabled. 1: T&H3 is enabled. **Note:** If TH3E is set to 0, T&H3 is always stopped.
2	TH2E	T&H2 Enable 0: T&H2 is disabled. 1: T&H2 is enabled **Note:** If TH2E is set to 0, T&H2 is always stopped.
1	TH1E	T&H1 Enable 0: T&H1 is disabled. 1: T&H1 is enabled. **Note:** If TH1E is set to 0, T&H1 is always stopped.
0	TH0E	T&H0 Enable 0: T&H0 is disabled. 1: T&H0 is enabled **Note:** If TH0E is set to 0, T&H0 is always stopped.

CAUTION

To prevent malfunction, ADCAnTHER should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1K, only ADCA0 supports this function.

31.3.2.17 ADCAnTHGSR — T&H Group Select Register

This register is used to select a T&H group for each T&H.

Access: ADCAnTHGSR register can be read or written in 32-bit units.
ADCAnTHGSRL register can be read or written in 16-bit units.
ADCAnTHGSRLL register can be read or written in 8-bit units.

Address: ADCAnTHGSR: <ADCAn_base> + 330_H
ADCAnTHGSRL: <ADCAn_base> + 330_H
ADCAnTHGSRLL: <ADCAn_base> + 330_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TH5GS	TH4GS	TH3GS	TH2GS	TH1GS	TH0GS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.32 ADCAnTHGSR Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	TH5GS	T&H5 Group Select 0: T&H5 is selected to group A. 1: T&H5 is selected to group B.
4	TH4GS	T&H4 Group Select 0: T&H4 is selected to group A. 1: T&H4 is selected to group B.
3	TH3GS	T&H3 Group Select 0: T&H3 is selected to group A. 1: T&H3 is selected to group B.
2	TH2GS	T&H2 Group Select 0: T&H2 is selected to group A. 1: T&H2 is selected to group B.
1	TH1GS	T&H1 Group Select 0: T&H1 is selected to group A. 1: T&H1 is selected to group B.
0	TH0GS	T&H0 Group Select 0: T&H0 is selected to group A. 1: T&H0 is selected to group B.

CAUTION

- Do not set T&H0 to T&H2 to the same group as T&H3 to T&H5.
  Example
  - Group A: 0ch, 1ch, 2ch
    Group B: 3ch, 4ch, 5ch → Setting allowed
  - Group A: 0ch
    Group B: 1ch, 2ch → Setting allowed
  - Group A: 0ch, 1ch, 3ch
    Group B: 2ch, 4ch → Setting prohibited
- To prevent malfunction, ADCAnTHGSR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

In RH850/F1K, only ADCA0 supports this function.

31.3.2.18 ADCAnSMPCR — Sampling Control Register

This register controls sampling.

ADCTLnSMPCR controls the sampling time for SG4 (PWM-Diag) and SG1 to SG3.

Access: ADCAnSMPCR register can be read or written in 32-bit units.
ADCAnSMPCRL register can be read or written in 16-bit units.
ADCAnSMPCRLL register can be read or written in 8-bit units.

Address: ADCAnSMPCR: <ADCAn_base> + 380_H
ADCAnSMPCRL: <ADCAn_base> + 380_H
ADCAnSMPCRLL: <ADCAn_base> + 380_H

Value after reset: 0000 0018_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SMPT[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.33 ADCAnSMPCR Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	SMPT[7:0]	These bits are used to set the sampling time (the number of cycles). 12_H: 18 cycles (ADCLK = 8 MHz to 32 MHz) 18_H: 24 cycles (ADCLK = 8 MHz to 40 MHz) Settings other than above are prohibited.

CAUTION

- To prevent malfunction, ADCATLnSMPCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
- When SMPT is changed, the A/D conversion wait time is also changed when MPX is used by virtual channel register j (ADCAnVCRj) or PWM-Diag virtual channel register (ADCAnPWDVCR).

31.3.2.19 ADCAnSFTCR — Safety Control Register

This is a register for safety control.

Access: ADCAnSFTCR register can be read or written in 32-bit units.
ADCAnSFTCRL register can be read or written in 16-bit units.
ADCAnSFTCRLL register can be read or written in 8-bit units.

Address: ADCAnSFTCR: <ADCAn_base> + 334_H
ADCAnSFTCRL: <ADCAn_base> + 334_H
ADCAnSFTCRLL: <ADCAn_base> + 334_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	RDCLRE	ULEIE	OWEIE	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R

Table 31.34 ADCAnSFTCR Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	RDCLRE	Read & Clear Enable When the A/D conversion result is read, this bit selects whether the A/D conversion result is cleared by hardware. 0: ADCAnPWDTSNDR/ADCAnDRj and ADCAnPWDDIR/ADCAnDIRj are not cleared when ADCAnPWDTSNDR/ADCAnDRj or ADCAnPWDDIR/ADCAnDIRj is read. 1: ADCAnPWDTSNDR/ADCAnDRj and ADCAnPWDDIR/ADCAnDIRj are cleared when ADCAnPWDTSNDR/ADCAnDRj or ADCAnPWDDIR/ADCAnDIRj is read. WFLG of ADCAnDIRj is cleared regardless of the RDCLRE setting when ADCAnDRj or ADCAnDIRj is read.
3	ULEIE	A/D Error Interrupt (INT_ADE) Enable on Upper/Lower Limit Error Detection 0: Disabled 1: Enabled
2	OWEIE	A/D Error Interrupt (INT_ADE) Enable on Overwrite Error Detection 0: Disabled 1: Enabled
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

To prevent malfunction, ADCAnSFTCR should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

31.3.2.20 ADCAnULLMTBR0 to 2 — Upper Limit/Lower Limit Table Registers 0 to 2

These registers are used to set the threshold for detection of an upper limit or lower limit error in the A/D converted value. Any of ADCAnULLMTBR0 to ADCAnULLMTBR2 is specified by setting ADCAnPWDVCR.ULS[1:0] and ADCAnVCRj.ULS[1:0] and compared with ADCAnPWDTSNDR and ADCAnDRj.

Access: ADCAnULLMTBR0 to 2 register can be read or written in 32-bit units.
ADCAnULLMTBR0L to 2L and ADCAnULLMTBR0H to 2H registers can be read or written in 16-bit units.

Address: ADCAnULLMTBR0: <ADCAn_base> + 338_H
ADCAnULLMTBR1: <ADCAn_base> + $33C_H$
ADCAnULLMTBR2: <ADCAn_base> + 340_H

ADCAnULLMTBR0L: <ADCAn_base> + 338_H
ADCAnULLMTBR1L: <ADCAn_base> + $33C_H$
ADCAnULLMTBR2L: <ADCAn_base> + 340_H

ADCAnULLMTBR0H: <ADCAn_base> + 338_H + 2_H
ADCAnULLMTBR1H: <ADCAn_base> + $33C_H$+ 2_H
ADCAnULLMTBR2H: <ADCAn_base> + 340_H + 2_H

Value after reset: FFF0 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ULMTB[11:0]												—	—	—	—
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LLMTB[11:0]												—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 31.35 ADCAnULLMTBR0 to 2 Registers Contents

Bit Position	Bit Name	Function
31 to 20	ULMTB[11:0]	Upper Limit Table Specify the threshold for detection of an upper limit error in the A/D converted value. The upper limit error (ADCAnULER.UE) is set when the following condition is met: ULMTB[11:0] < A/D converted value
19 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 4	LLMTB[11:0]	Lower Limit Table Specify the threshold for detection of a lower limit error in the A/D converted value. The lower limit error (ADCAnULER.LE) is set when the following condition is met: LLMTB[11:0] > A/D converted value
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

- When A/D conversion is executed in 10-bit mode (ADCAnADCR.CTYP = 1), ULMTB[1:0] and LLMTB[1:0] should be set to 11_B and 00_B, respectively.
- To prevent malfunction, ADCAnULLMTBR0 to 2 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
- The upper-limit table (ULMTB[11:0]) must be greater than the lower-limit table (LLMTB[11:0]).

31.3.2.21 ADCAnECR — Error Clear Register

This register is used to control clearing of an error. The read value is always 0.

Access: ADCAnECR register is a write-only register that can be written in 32-bit units.
ADCAnECRL register is a write-only register that can be written in 16-bit units.
ADCAnECRLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnECR: <ADCAn_base> + 344_H
ADCAnECRL: <ADCAn_base> + 344_H
ADCAnECRLL: <ADCAn_base> + 344_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	ULEC	OWEC	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	W	W	R	R

Table 31.36 ADCAnECR Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When writing, write the value after reset.
3	ULEC	Upper Limit Error Flag (ADCAnULER.UE) / Lower Limit Error Flag (ADCAnULER.LE) Clear, Upper/Lower Limit Error Capture (ADCAnULER.ULECAP[5:0]), Scan Group Bit (ULSG[1:0]) When Upper/Lower Limit Error Occurs, MPX Usage Bit (MPXE), and the MPX Value Storing Bit (MPXV[2:0]) Clear When Upper/Lower Limit Error Occurs 0: No effect. 1: Clears the flag.
2	OWEC	Overwrite Error Flag (ADCAnOWER.OWE) and Overwrite Error Capture (ADCAnOWER.OWECAP[5:0]) Clear 0: No effect. 1: Clears the flag.
1, 0	Reserved	When writing, write the value after reset.

31.3.2.22 ADCAnULER — Upper Limit/Lower Limit Error Register

This register is a read-only register that indicates information regarding the upper limit/lower limit errors.

Access: ADCAnULER register is a read-only register that can be read in 32-bit units.
ADCAnULERL register is a read-only register that can be read in 16-bit units.

ADCAnULERLH register is a read-only register that can be read in 8-bit units.
ADCAnULERLL register is a read-only register that can be read in 8-bit units.

Address: ADCAnULER: <ADCAn_base> + 348_H
ADCAnULERL: <ADCAn_base> + 348_H

ADCAnULERLL: <ADCAn_base> + 348_H
ADCAnULERLH: <ADCAn_base> + 348_H + 1_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UE	LE	ULSG[1:0]		MPXE	MPXV[2:0]			—	—	ULECAP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.37 ADCAnULER Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15	UE	Upper Limit Error Flag 0: An upper limit error is not detected. 1: An upper limit error is detected. Setting condition: The A/D converted value exceeds the upper limit threshold specified by the upper limit/lower limit table registers 0 to 2 (ADCAnULLMTBR0 to 2). If a subsequent upper limit error is detected in A/D conversion while this bit is set to 1, the ADCAnULER register is not updated. Clearing condition: 1 is written to ADCAnECR.ULEC.
14	LE	Lower Limit Error Flag 0: A lower limit error is not detected. 1: A lower limit error is detected. Setting condition: The A/D converted value is lower than the lower limit threshold specified by the upper limit/lower limit table registers 0 to 2 (ADCAnULLMTBR0 to 2). If a subsequent lower limit error is detected in A/D conversion while this bit is set to 1, the ADCAnULER register is not updated. Clearing condition: 1 is written to ADCAnECR.ULEC.
13, 12	ULSG[1:0]	Scan Group where an Upper Limit/Lower Limit Error Occurs 00: No upper limit/lower limit error occurred. 01: The scan group where an upper limit/lower limit error occurred is SG1 to SG3. 10: The scan group where an upper limit/lower limit error occurred is PWM-Diag. Capture condition: When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0. Clearing condition: When 1 is written to ADCAnECR.ULEC.

Table 31.37 ADCAnULER Register Contents (2/2)

Bit Position	Bit Name	Function
11	MPXE*1	MPX Usage 0: The MPX function was not used when an upper limit/lower limit error occurred. 1: The MPX function was used when an upper limit/lower limit error occurred. Capture condition: When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0 Clearing condition: When 1 is written to ADCAnECR.ULEC.
10 to 8	MPXV[2:0]*1	The value of MPX is stored when the errors of the upper and lower limit occurred Capture condition: When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0. Clearing condition: When 1 is written to ADCAnECR.ULEC.
7	Reserved	When read, an undefined value is read.
6	Reserved	When read, the value after reset is returned.
5 to 0	ULECAP[5:0]	Upper Limit/Lower Limit Error Capture The physical channel is captured when an upper limit/lower limit error occurred. Capturing condition: When the A/D converted value exceeds the range of the specified upper- or lower-limit table while UE = 0 and LE = 0. Clearing condition: 1 is written to ADCAnECR.ULEC.

Note 1. These bits are only supported for ADCA0.
For ADCA1, when read, the value after reset is returned.

NOTE

ADCAnULER is updated when the A/D converted value is set in ADCAnDRj or ADCAnPWDTSNDR.

31.3.2.23 ADCAnOWER — Overwrite Error Register

This register is a 32/16/8-bit read-only register that indicates an overwrite error. The target for overwrite errors is SG1 to SG3, and not PWM-Diag.

Access: ADCAnOWER register is a read-only register that can be read in 32-bit units.
ADCAnOWERL register is a read-only register that can be read in 16-bit units.
ADCAnOWERLL register is a read-only register that can be read in 8-bit units.

Address: ADCAnOWER: <ADCAn_base> + $34C_H$
ADCAnOWERL: <ADCAn_base> + $34C_H$
ADCAnOWERLL: <ADCAn_base> + $34C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	OWE	—	OWECAP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.38 ADCAnOWER Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	OWE	Overwrite Error Flag 0: An overwrite error is not detected. 1: An overwrite error is detected. Setting condition: ADCAnDIRj.WFLG = 1, and the A/D converted value is written to ADCAnDRj. If a subsequent overwrite error is detected in A/D conversion while this bit is set to 1, the ADCAnOWER register is not updated. Clearing condition: 1 is written to ADCAnECR.OWEC.
6	Reserved	When read, the value after reset is returned.
5 to 0	OWECAP[5:0]	Overwrite Error Capture The virtual channel number is captured when an overwrite error occurs. Capturing condition: OWE = 0 and ADCAnDIRj.WFLG = 1, and the A/D converted value is written to ADCAnDRj Clearing condition: 1 is written to ADCAnECR.OWEC.

NOTE

ADCAnOWER is updated when the A/D converted value is set in ADCAnDRj.

31.3.3 Scan Group (SG) Specific Registers

This section describes the registers provided for each scan group.

31.3.3.1 ADCAnSGSTCRx — Scan Group x Start Control Register

This register is used to control the start of scan group x. The read value is always 0.

Access: ADCAnSGSTCRx is a write-only register that can be written in 32-bit units.
ADCAnSGSTCRxL is a write-only register that can be written in 16-bit units.
ADCAnSGSTCRxLL is a write-only register that can be written in 8-bit units.

Address: ADCAnSGSTCRx: <ADCAn_base> + 400_H + x × 40_H
ADCAnSGSTCRxL: <ADCAn_base> + 400_H + x × 40_H
ADCAnSGSTCRxLL: <ADCAn_base> + 400_H + x × 40_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SGST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 31.39 ADCAnSGSTCRx Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SGST	Scan Group Start Trigger Writing 1 to SGST while ADCAnSGSTR.SGACT[3:1] = 0 starts the target SGx.

31.3.3.2 ADCAnSGCRx — Scan Group x Control Register

This register controls scan group x.

Access: ADCAnSGCRx register can be read or written in 32-bit units.
ADCAnSGCRxL register can be read or written in 16-bit units.
ADCAnSGCRxLL register can be read or written in 8-bit units.

Address: ADCAnSGCRx: <ADCAn_base> + x × 40_H + 408_H
ADCAnSGCRxL: <ADCAn_base> + x × 40_H + 408_H
ADCAnSGCRxLL: <ADCAn_base> + x × 40_H + 408_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	SCANMD	ADIE	SCT[1:0]		—	TRGMD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W

Table 31.40 ADCAnSGCRx Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	SCANMD	Scan Mode 0: Multicycle scan mode 1: Continuous scan mode Write 0 to this bit for SG2 and SG3.
4	ADIE	Scan End Interrupt Enable 0: INT_SGx is not output when the scan for SGx ends. 1: INT_SGx is output when the scan for SGx ends.
3, 2	SCT[1:0]	Channel Repeat Times Select 00: The selected number of channel repeat times is one. 01: The selected number of channel repeat times is two. 10: The selected number of channel repeat times is four. 11: Setting prohibited
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TRGMD	Trigger Mode 0: Trigger input to SGx_TRG is disabled (Hardware trigger disabled). 1: SGx_TRG start trigger or hold complete trigger A/B is selected for the trigger input to SGx. **NOTE** The software trigger is valid regardless of the TRGMD bit setting.

CAUTION

To prevent malfunction, ADCAnSGCRx should be set (except clearing TRGMD upon completion of A/D conversion) when SGACT of all scan groups is 0 (before the scan group is started) and TRGMD of all scan groups is 0.

31.3.3.3 ADCAnPWDSGCR — PWM-Diag Scan Group Control Register

This register is used to control PWM-Diag.

Access: ADCAnPWDSGCR register can be read or written in 32-bit units.
ADCAnPWDSGCRL register can be read or written in 16-bit units.
ADCAnPWDSGCRLL register can be read or written in 8-bit units.

Address: ADCAnPWDSGCR: <ADCAn_base> + 508_H
ADCAnPWDSGCRL: <ADCAn_base> + 508_H
ADCAnPWDSGCRLL: <ADCAn_base> + 508_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWDTRGMD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 31.41 ADCAnPWDSGCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PWDTRGMD	PWM-Diag Trigger Mode Select 0: PWSA_ADTRG trigger input is disabled. 1: PWSA_ADTRG is selected for the trigger input to the PWM-Diag scan group.

CAUTION

To prevent malfunction, ADCAnPWDSGCR should be set when SGACT of the PWM-Diag scan group (SG4) is 0 (before the scan group is started).

31.3.3.4 ADCAnSGVCSPx — Scan Group x Start Virtual Channel Pointer

This register specifies the start pointer of a virtual channel.

Access: ADCAnSGVCSPx register can be read or written in 32-bit units.
ADCAnSGVCSPxL register can be read or written in 16-bit units.
ADCAnSGVCSPxLL register can be read or written in 8-bit units.

Address: ADCAnSGVCSPx: <ADCAn_base> + x × 40_H + $40C_H$
ADCAnSGVCSPxL: <ADCAn_base> + x × 40_H + $40C_H$
ADCAnSGVCSPxLL: <ADCAn_base> + x × 40_H + $40C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	VCSP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.42 ADCAnSGVCSPx Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	VCSP[5:0]	Start Virtual Channel Pointer These bits are used to specify the virtual channel from which the SGx scan is to be started.

CAUTION

- ADCAnSGVCSPx must be equal to or smaller than ADCAnSGVCEPx.
- When writing to the channel pointers, be sure to write in the following order: ADCAnSGVCSPx → ADCAnSGVCEPx. When SGx is started, the A/D conversion for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is executed.
- Though ADCAnSGVCSPx can be written during the A/D conversion, the register is updated at the time when ADCAnSGVCEPx is written. The new setting is applied when SGx is started next time.
- When the hardware trigger is used, writing to this register during operation is prohibited.

31.3.3.5 ADCAnSGVCEPx — Scan Group x End Virtual Channel Pointer

This register specifies the end pointer of a virtual channel.

Access: ADCAnSGVCEPx register can be read or written in 32-bit units.
ADCAnSGVCEPxL register can be read or written in 16-bit units.
ADCAnSGVCEPxLL register can be read or written in 8-bit units.

Address: ADCAnSGVCEPx: <ADCAn_base> + x × 40_H + 410_H
ADCAnSGVCEPxL: <ADCAn_base> + x × 40_H + 410_H
ADCAnSGVCEPxLL: <ADCAn_base> + x × 40_H + 410_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	VCEP[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 31.43 ADCAnSGVCEPx Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	VCEP[5:0]	End Virtual Channel Pointer These bits are used to specify the virtual channel at which the SGx scan is to be ended.

CAUTION

- ADCAnSGVCSPx must be equal to or smaller than ADCAnSGVCEPx.
- When SGx is started, processing for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is executed.
  ADCAnSGVCEPx can be rewritten even when SGx is being processed. The new setting is applied when SGx is started next time.

31.3.3.6 ADCAnSGMCYCRx — Scan Group x Multicycle Register

This register is a 32/16/8-bit read/write register that indicates the number of scan times in multicycle scan mode.

Access: ADCAnSGMCYCRx register can be read or written in 32-bit units.
ADCAnSGMCYCRxL register can be read or written in 16-bit units.
ADCAnSGMCYCRxLL register can be read or written in 8-bit units.

Address: ADCAnSGMCYCRx: <ADCAn_base> + x × 40_H + 414_H
ADCAnSGMCYCRxL: <ADCAn_base> + x × 40_H + 414_H
ADCAnSGMCYCRxLL: <ADCAn_base> + x × 40_H + 414_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MCYC[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 31.44 ADCAnSGMCYCRx Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	MCYC[1:0]	Multicycle Number Specification These bits are used to specify the number of scan times in multicycle scan mode. 00_B: Number of scans = 1 01_B: Number of scans = 2 10_B: Setting prohibited 11_B: Number of scans = 4

CAUTION

- To prevent malfunction, ADCAnSGMCYCRx should be set when SGACT of scan group x is 0 (before the scan group is started) and TRGMD is 0.
- When SGx is started, the scan for the virtual channels within the range specified in ADCAnSGVCSPx and ADCAnSGVCEPx is repeatedly executed as many times as specified in ADCAnSGMCYCRx.

31.3.3.7 ADCAnPWDSGSEFCR — PWM-Diag Scan End Flag Clear Register

This register is used to control the clearing of PWM-Diag scan end flag (SEF). The bits are always read as 0.

Access: ADCAnPWDSGSEFCR register is a write-only register that can be written in 32-bit units.
ADCAnPWDSGSEFCRL register is a write-only register that can be written in 16-bit units.
ADCAnPWDSGSEFCRLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnPWDSGSEFCR: <ADCAn_base> + 518_H
ADCAnPWDSGSEFCRL: <ADCAn_base> + 518_H
ADCAnPWDSGSEFCRLL: <ADCAn_base> + 518_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWDSEFC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 31.45 ADCAnPWDSGSEFCR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	PWDSEFC	PWM-Diag Scan End Flag Clear Trigger 0: No effect. 1: Clears the PWM-Diag scan end flag (ADCAnSGSTR.SEF[4]).

31.3.3.8 ADCAnSGSEFCRx — Scan Group x Scan End Flag Clear Register

This register is a write-only register that clears the scan end flag (ADCAnSGSTR.SEFx). The read value is always 0.

Access: ADCAnSGSEFCRx register is a write-only register that can be written in 32-bit units.
ADCAnSGSEFCRxL register is a write-only register that can be written in 16-bit units.
ADCAnSGSEFCRxLL register is a write-only register that can be written in 8-bit units.

Address: ADCAnSGSEFCRx: <ADCAn_base> + x × 40_H + 418_H
ADCAnSGSEFCRxL: <ADCAn_base> + x × 40_H + 418_H
ADCAnSGSEFCRxLL: <ADCAn_base> + x × 40_H + 418_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEFC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 31.46 ADCAnSGSEFCRx Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SEFC	Scan End Flag Clear Trigger 0: No effect. 1: Clears the target SG scan end flag (ADCAnSGSTR.SEF[3:1]).

31.3.3.9 ADCAnSGSTR — Scan Group Status Register

This register indicates the state of T&H, SVSTOP, scan group x, and PWM-Diag scan group. The SHACT and SGACT bits are cleared when HALT is executed.

Access: ADCAnSGSTR register is a read-only register that can be read in 32-bit units.
ADCAnSGSTRL register is a read-only register that can be read in 16-bit units.

Address: ADCAnSGSTR: <ADCAn_base> + 308_H
ADCAnSGSTRL: <ADCAn_base> + 308_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SHACT	SGACT[5:1]					—	—	—	—	SEF[4:1]				—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.47 ADCAnSGSTR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 15	Reserved	When read, the value after reset is returned.
14	SHACT	T&H Status Flag 0: T&H is stopped. 1: T&H conversion or sampling is in progress.
13	SGACT[5]	SVSTOP Status Flag 0: SVSTOP is canceled. 1: SVSTOP is accepted.
12	SGACT[4]	PWM-Diag Scan Group (SG4) Status Flag 0: A/D conversion for PWM-Diag (SG4) is completed. 1: A/D conversion for PWM-Diag (SG4) is in processing or suspension.
11	SGACT[3]	Scan Group 3 (SG3) Status Flag 0: A/D conversion for SG3 is completed. 1: A/D conversion for SG3 is in processing or suspension.
10	SGACT[2]	Scan Group 2 (SG2) Status Flag 0: A/D conversion for SG2 is completed. 1: A/D conversion for SG2 is in processing or suspension.
9	SGACT[1]	Scan Group 1 (SG1) Status Flag 0: A/D conversion for SG1 is completed. 1: A/D conversion for SG1 is in processing or suspension.
8 to 5	Reserved	When read, the value after reset is returned.
4	SEF[4]	PWM-Diag Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: • ADCAnPWDTSNDR for PWM-Diag is read. • ADCAnPWDDIR for PWM-Diag is read. • ADCAnPWDSGSEFCR.PWDSEFC is written as 1. 1: The A/D conversion result is written to ADCAnPWDTSNDR for PWM-Diag.

Table 31.47 ADCAnSGSTR Register Contents (2/2)

Bit Position	Bit Name	Function
3	SEF[3]	SG3 Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: • ADCAnDRj for the virtual channel which ADCAnSGVCEP3 indicates is read. • ADCAnDIRj for the virtual channel which ADCAnSGVCEP3 indicates is read. • ADCAnSGSEFCRx.SEFC is written as 1. 1: The A/D conversion result is written to ADCAnDRj for the virtual channel which ADCAnSGVCEP3 indicates.
2	SEF[2]	SG2 Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: • ADCAnDRj for the virtual channel which ADCAnSGVCEP2 indicates is read. • ADCAnDIRj for the virtual channel which ADCAnSGVCEP2 indicates is read. • ADCAnSGSEFCRx.SEFC is written as 1. 1: The A/D conversion result is written to ADCAnDRj for the virtual channel which ADCAnSGVCEP2 indicates.
1	SEF[1]	SG1 Scan End Flag Indicates the status of the scan result data. 0: The flag is cleared when any of the following operations is performed: • ADCAnDRj for the virtual channel which ADCAnSGVCEP1 indicates is read. • ADCAnDIRj for the virtual channel which ADCAnSGVCEP1 indicates is read. • ADCAnSGSEFCRx.SEFC is written as 1. 1: The A/D conversion result is written to ADCAnDRj for the virtual channel which ADCAnSGVCEP1 indicates.
0	Reserved	When read, the value after reset is returned.

31.3.4 Hardware Trigger Specific Register

31.3.4.1 ADCAnSGTSELx — Scan Group x Start Trigger Control Register x

This register is used to select the A/D conversion trigger (hardware trigger) for SGx.

Access: ADCAnSGTSELx register can be read or written in 32-bit units.
ADCAnSGTSELxL register can be read or written in 16-bit units.

Address: ADCAnSGTSELx: <ADCAn_base> + x × 40_H + $41C_H$
ADCAnSGTSELxL: <ADCAn_base> + x × 40_H + $41C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TxSEL8 *1	TxSEL7 *1	TxSEL6 *1	TxSEL5 *1	TxSEL4 *1	TxSEL3 *1	TxSEL2 *1	TxSEL1 *1	TxSEL0 *1
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. ADCA1 supports only TxSEL0 to TxSEL3. When writing to the other bits, write the value after reset.

Table 31.48 ADCAnSGTSELx Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	TxSELp (p = 0 to 8)	A/D Conversion Trigger (Hardware Trigger) Select 0: Hardware trigger is disabled. 1: Hardware trigger is enabled. **CAUTION** When setting TxSELp to 1, set only one of the bits to 1.

The list below shows the hardware triggers to be selected.

Table 31.49 List of A/D Conversion Hardware Triggers (1/2)

Unit	Control Register/Bit		Trigger Input Signal	
	Register Name	Bit Name	Symbol	Connection Destination Unit

		T2SEL3	INTTAUB0I15	TAUB0
	ADCA1SGTSEL3	T3SEL0	ADCA1TRG2	External trigger pin
		T3SEL1	INTTAUJ1I3	TAUJ1
		T3SEL2	INTTAUB0I7	TAUB0
		T3SEL3	INTTAUB0I15	TAUB0

CAUTIONS

1. When enabling the LPS trigger factor (SEQADTRG), select and enable only one of ADCA0SGTSEL1.T1SEL4, ADCA0SGTSEL2.T2SEL4, and ADCA0SGTSEL3.T3SEL4.
2. To prevent malfunction, ADCAnSGTSELx should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

31.3.5 Self-Diagnosis Specific Registers

31.3.5.1 ADCAnDGCTL0 — Self-Diagnosis Control Register 0

This register controls the self-diagnostic voltage level.

Access: ADCAnDGCTL0 register can be read or written in 32-bit units.
ADCAnDGCTL0L register can be read or written in 16-bit units.
ADCAnDGCTL0LL register can be read or written in 8-bit units.

Address: ADCAnDGCTL0: <ADCAn_base> + 350_H
ADCAnDGCTL0L: <ADCAn_base> + 350_H
ADCAnDGCTL0LL: <ADCAn_base> + 350_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31.3.5.2 ADCAnDGCTL1 — Self-Diagnosis Control Register 1

This register controls the self-diagnostic channel.

Access: ADCAnDGCTL1 register can be read or written in 32-bit units.
ADCAnDGCTL1L register can be read or written in 16-bit units.

Address: ADCAnDGCTL1: <ADCAn_base> + 354_H
ADCAnDGCTL1L: <ADCAn_base> + 354_H

Value after reset: $0000\ 0000_H$

14, 11, 8, 5, 2	CDG [14, 11, 8, 5, 2]	Self-Diagnostic Channel Select 0: ANInm is selected. 1: DIAGOUT2 is selected.

CAUTION

To prevent malfunction, ADCAnDGCTL1 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

31.3.5.3 ADCAnPDCTL1 — Pull Down Control Register 1

This register specifies the channel to which the pull down resistor is connected.

For details, see **Section 31.5.3, Diagnosis of Open Pins**.

Access: ADCAnPDCTL1 register can be read or written in 32-bit units.
ADCAnPDCTL1L register can be read or written in 16-bit units.

Address: ADCAnPDCTL1: <ADCAn_base> + 358_H
ADCAnPDCTL1L: <ADCAn_base> + 358_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.52 ADCAnPDCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PDNA[15:0]	Pull Down Enable Control These bits set whether an on-chip pull-down resistor is to be connected to the corresponding physical channel (ANIn[00:15]). 0: An on-chip pull-down resistor is not connected. 1: An on-chip pull-down resistor is connected.

CAUTION

To prevent malfunction, ADCAnPDCTL1 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

For on-chip pull-down resistor values, see the Electrical Characteristics section in the Data Sheet document.

31.3.5.4 ADCAnPDCTL2 — Pull Down Control Register 2

This register specifies the channel to which the pull down resistor is connected.

For details, see **Section 31.5.3, Diagnosis of Open Pins**.

Access: ADCAnPDCTL2 register can be read or written in 32-bit units.
ADCAnPDCTL2H and ADCAnPDCTL2L registers can be read or written in 16-bit units.
ADCAnPDCTL2HL, ADCAnPDCTL2LH, and ADCAnPDCTL2LL registers can be read or written in 8-bit units.

Address: ADCAnPDCTL2: <ADCAn_base> + $35C_H$
ADCAnPDCTL2L: <ADCAn_base> + $35C_H$
ADCAnPDCTL2H: <ADCAn_base> + $35C_H$ + 2_H
ADCAnPDCTL2HL: <ADCAn_base> + $35C_H$ +2_H
ADCAnPDCTL2LL: <ADCAn_base> + $35C_H$
ADCAnPDCTL2LH: <ADCAn_base> + $35C_H$ + 1_H

Value after reset: $0000\ 0000_H$

Note 1. ADCA1 supports only PDNB[7:0]. When writing to the other bits, write the value after reset.

Table 31.53 ADCAnPDCTL2 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 0	PDNB[19:0]	Pull Down Enable Control These bits set whether the on-chip pull-down resistor is to be connected with the corresponding physical channel (ANIn[16:35]). 0: The on-chip pull-down resistor is not connected. 1: The on-chip pull-down resistor is connected.

CAUTION

To prevent malfunction, ADCAnPDCTL2 should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

NOTE

For on-chip pull-down resistor values, see the Electrical Characteristics section in the Data Sheet document.

31.3.6 Emulation Specific Register

31.3.6.1 ADCAnEMU — Emulation Control Register

This register controls the SVSTOP disable signal.

Access: This register can be read or written in 8-bit units.

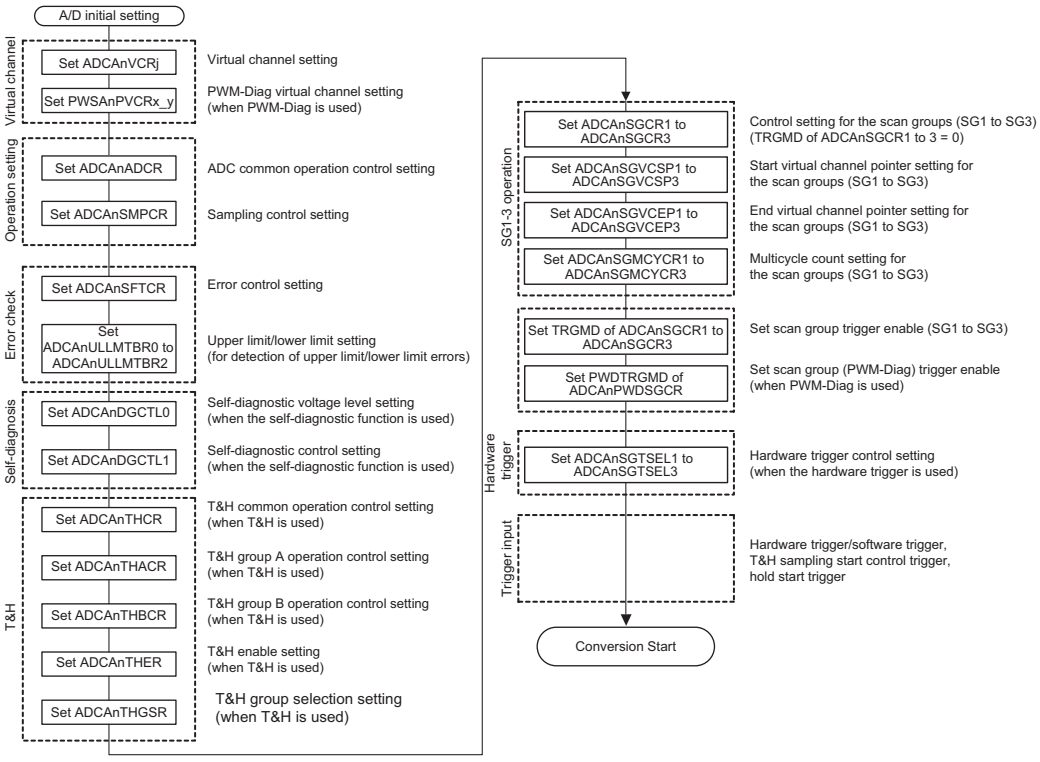
Address: <ADCAn_base> + 388_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	SVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 31.54 ADCAnEMU Register Contents

Bit Position	Bit Name	Function
7	SVSDIS	SVSTOP Disable 0: SVSTOP is enabled 1: SVSTOP is disabled For the A/D conversion when SVSTOP is enabled, see **Section 31.4.10.3, SVSTOP Operation**.
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.



CAUTION

To prevent malfunction, SVSDIS should be set when SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.

31.4 Operation

31.4.1 Initial Setting

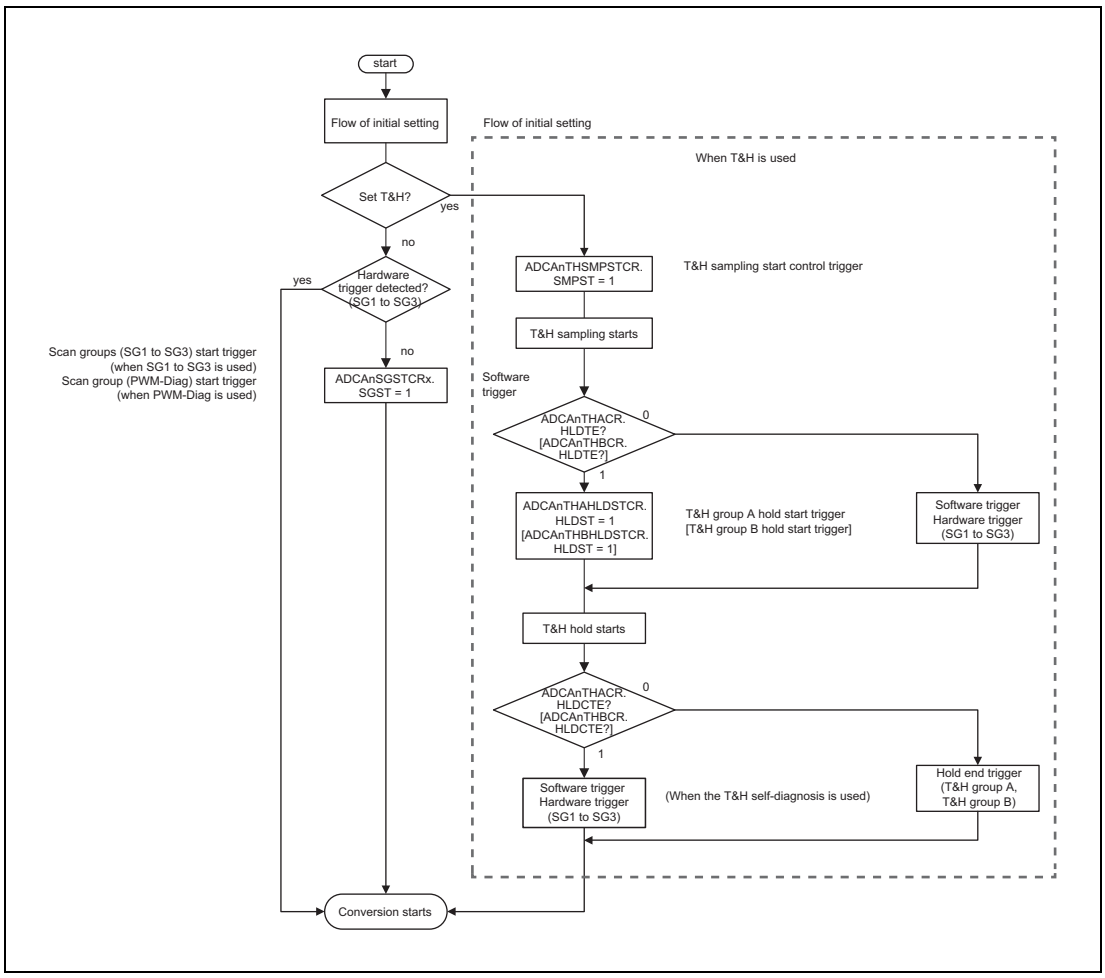
Figure 31.6 shows an initial setting example of the A/D conversion. For trigger input, see **Figure 31.7** in the next section. For interrupt request signals, see **Section 31.4.12, Scan End Interrupt Request**.

Note: Set these registers as necessary.

Figure 31.6 Flowchart for Initial Setting

31.4.2 Trigger Input

The following figure shows the flowchart for trigger input.



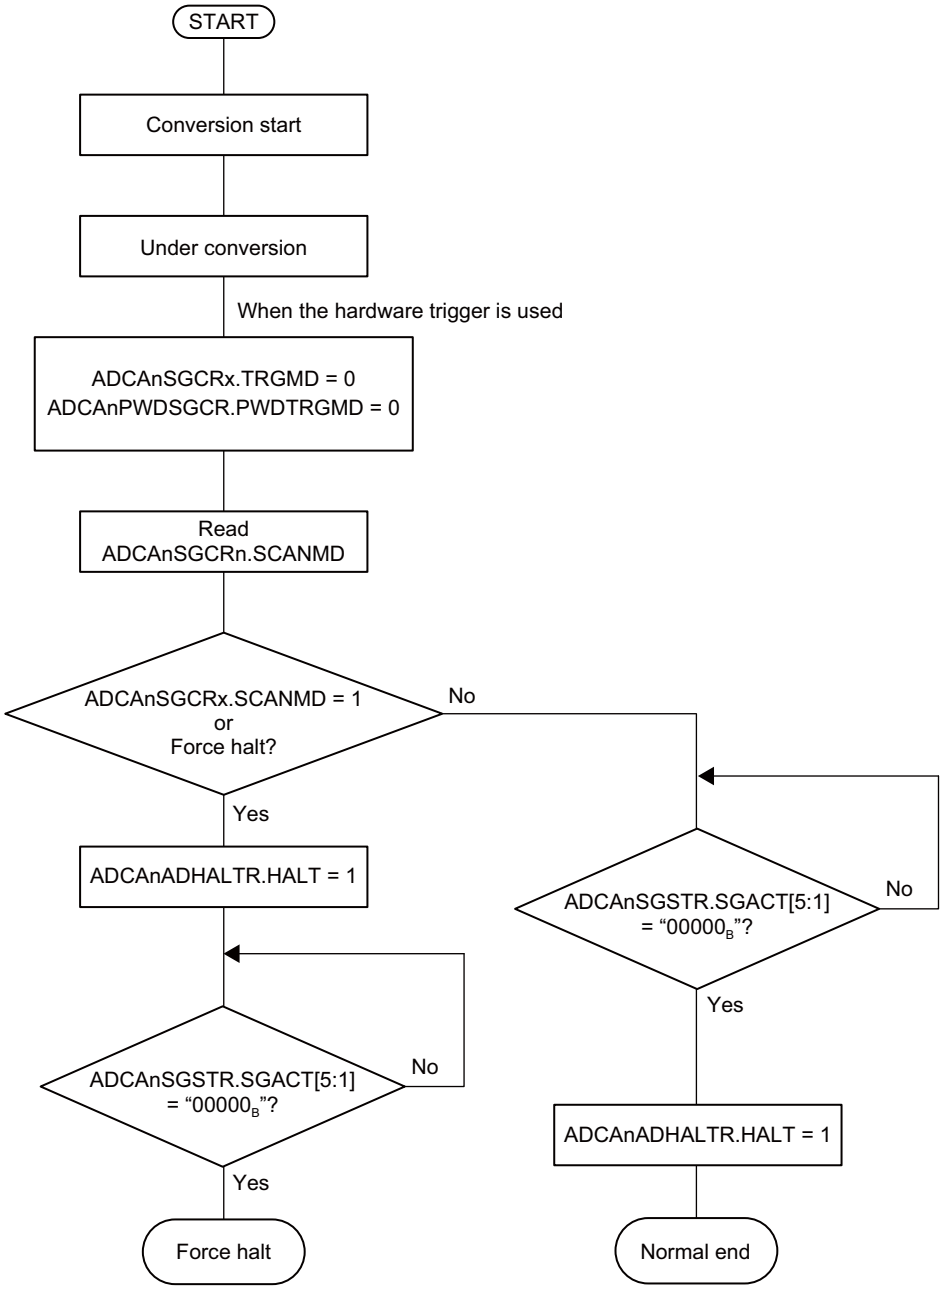


Figure 31.7 Flowchart for Trigger Input

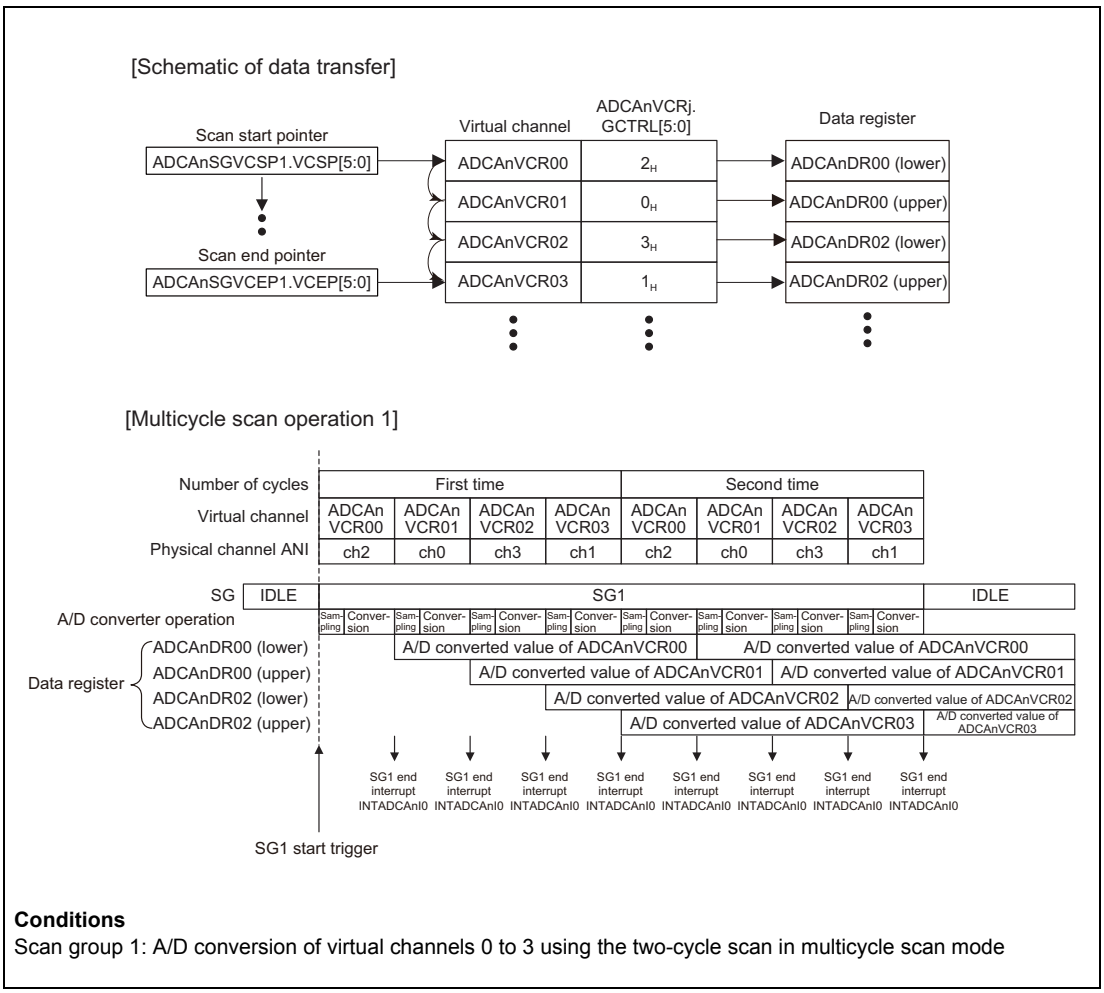
NOTE

When an SG start trigger is generated during scanning, the SG start trigger is ignored.

31.4.3 Ending A/D Conversion

The flow for ending A/D conversion is shown below.

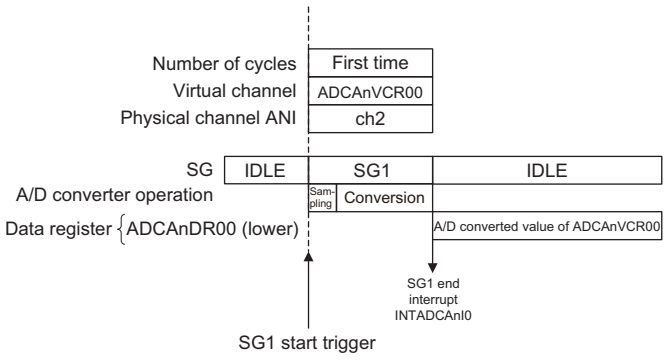


Note: The final setting of HALT when A/D conversion ends normally is done to clarify whether the status is "Conversion" or "IDLE". Whether HALT is set or not when A/D conversion ends normally does not effect the A/D conversion accuracy.

Figure 31.8 Flowchart for Ending A/D Conversion

31.4.4 Example of Scan Group Operation

(1) Multicycle scan mode

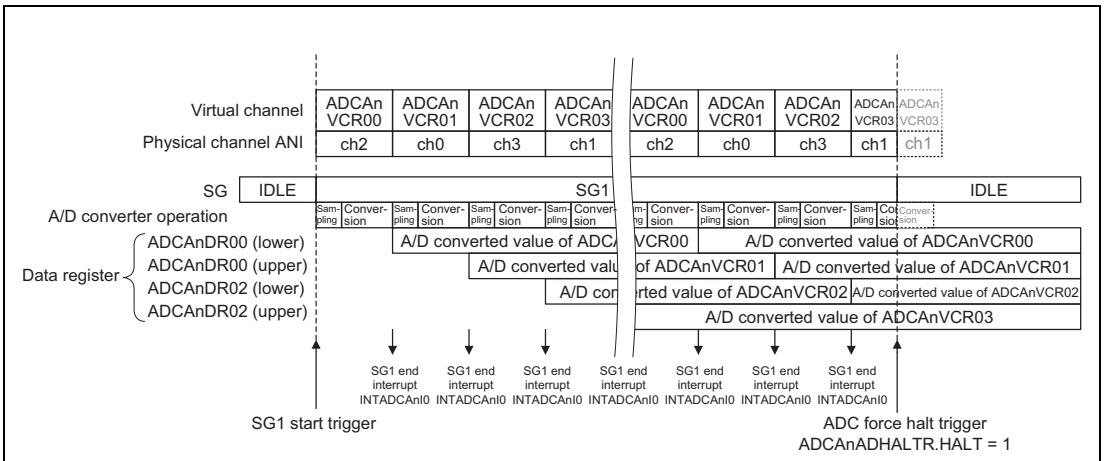


The following figure illustrates an operation example where four virtual channels of scan group 1 are converted using the two-cycle scan in multicycle scan mode.

Conditions
Scan group 1: A/D conversion of virtual channels 0 to 3 using the two-cycle scan in multicycle scan mode

Figure 31.9 Example of Multicycle Scan Operation 1

The following figure illustrates an operation example where a pin is scanned once in multicycle scan mode.



Conditions
Scan group 1: A/D conversion of virtual channel 0 in which a pin is scanned once in multicycle scan mode

Figure 31.10 Example of Multicycle Scan Operation 2

(2) Continuous scan mode

Continuous scan mode allows A/D conversion of the SG channels indicated by the pointers specified by ADCAnSGVCSPx.VCSP[5:0] to ADCAnSGVCEPx.VCEP[5:0] to continue until ADCAnADHALTR.HALT is asserted. This mode can be used only with SG1.

The following figure shows an example of operation in continuous scan mode.

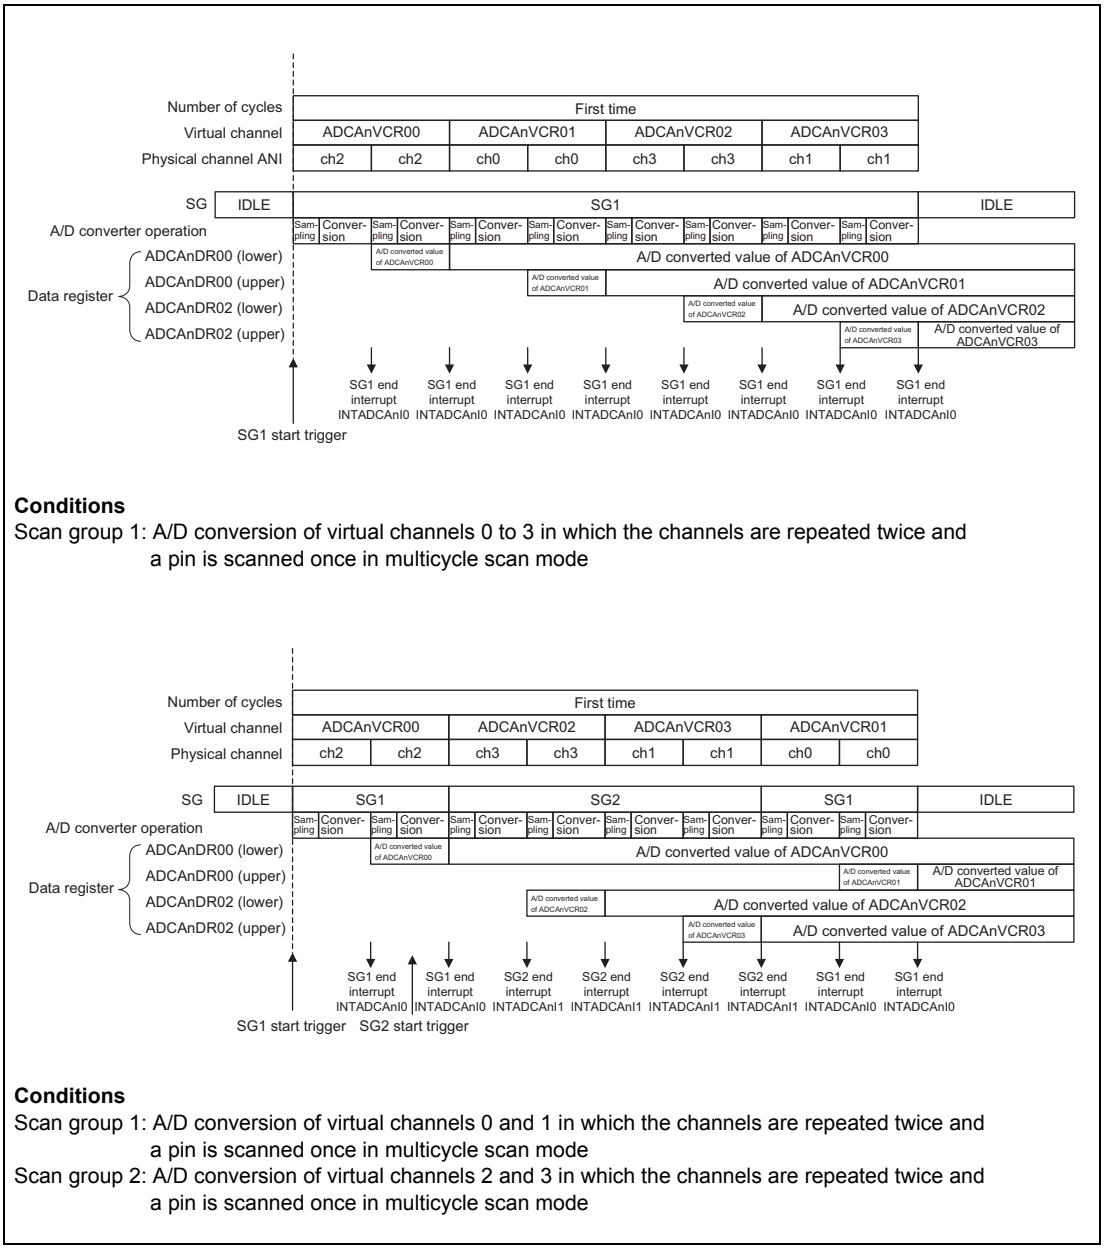
Conditions
Scan group 1: A/D conversion of virtual channels 0 to 3 in continuous scan mode

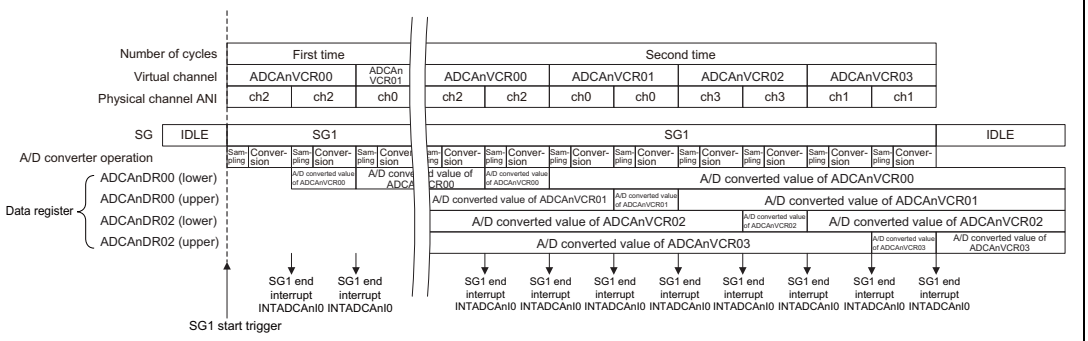
Figure 31.11 Example of Continuous Scan Operation

31.4.5 Channel Repeat Mode

Channel repeat mode allows A/D conversion of the SG channel indicated by the pointer specified by ADCAnSGVCSPx.VCSP[5:0] to ADCAnSGVCEPx.VCEP[5:0] to repeat number of channel repeat times specified by ADCAnSGCRx.SCT[1:0]. This mode operates exclusively in each SG. The number of channel repeat times is selectable from 1, 2, and 4.

The following figures show examples of operation under respective conditions.





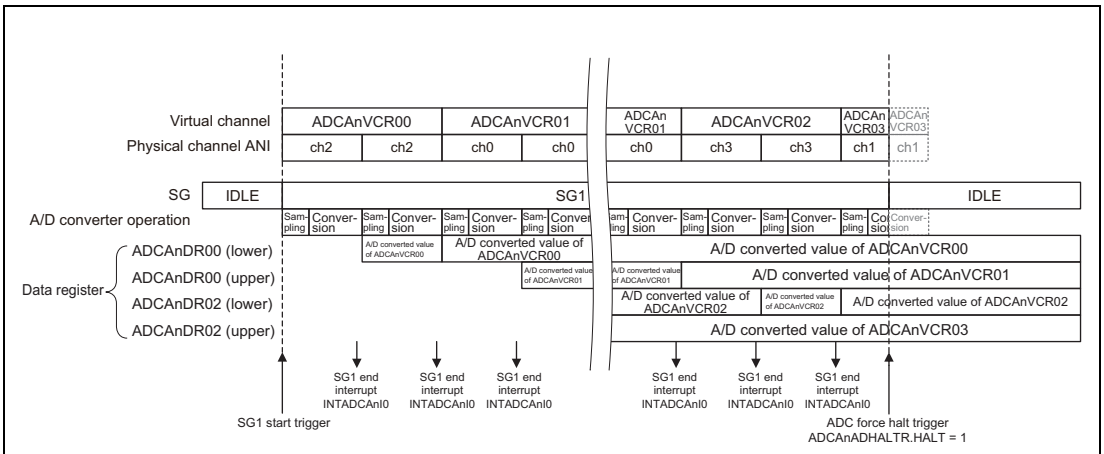


Figure 31.12 Example of Channel Repeat Operation 1

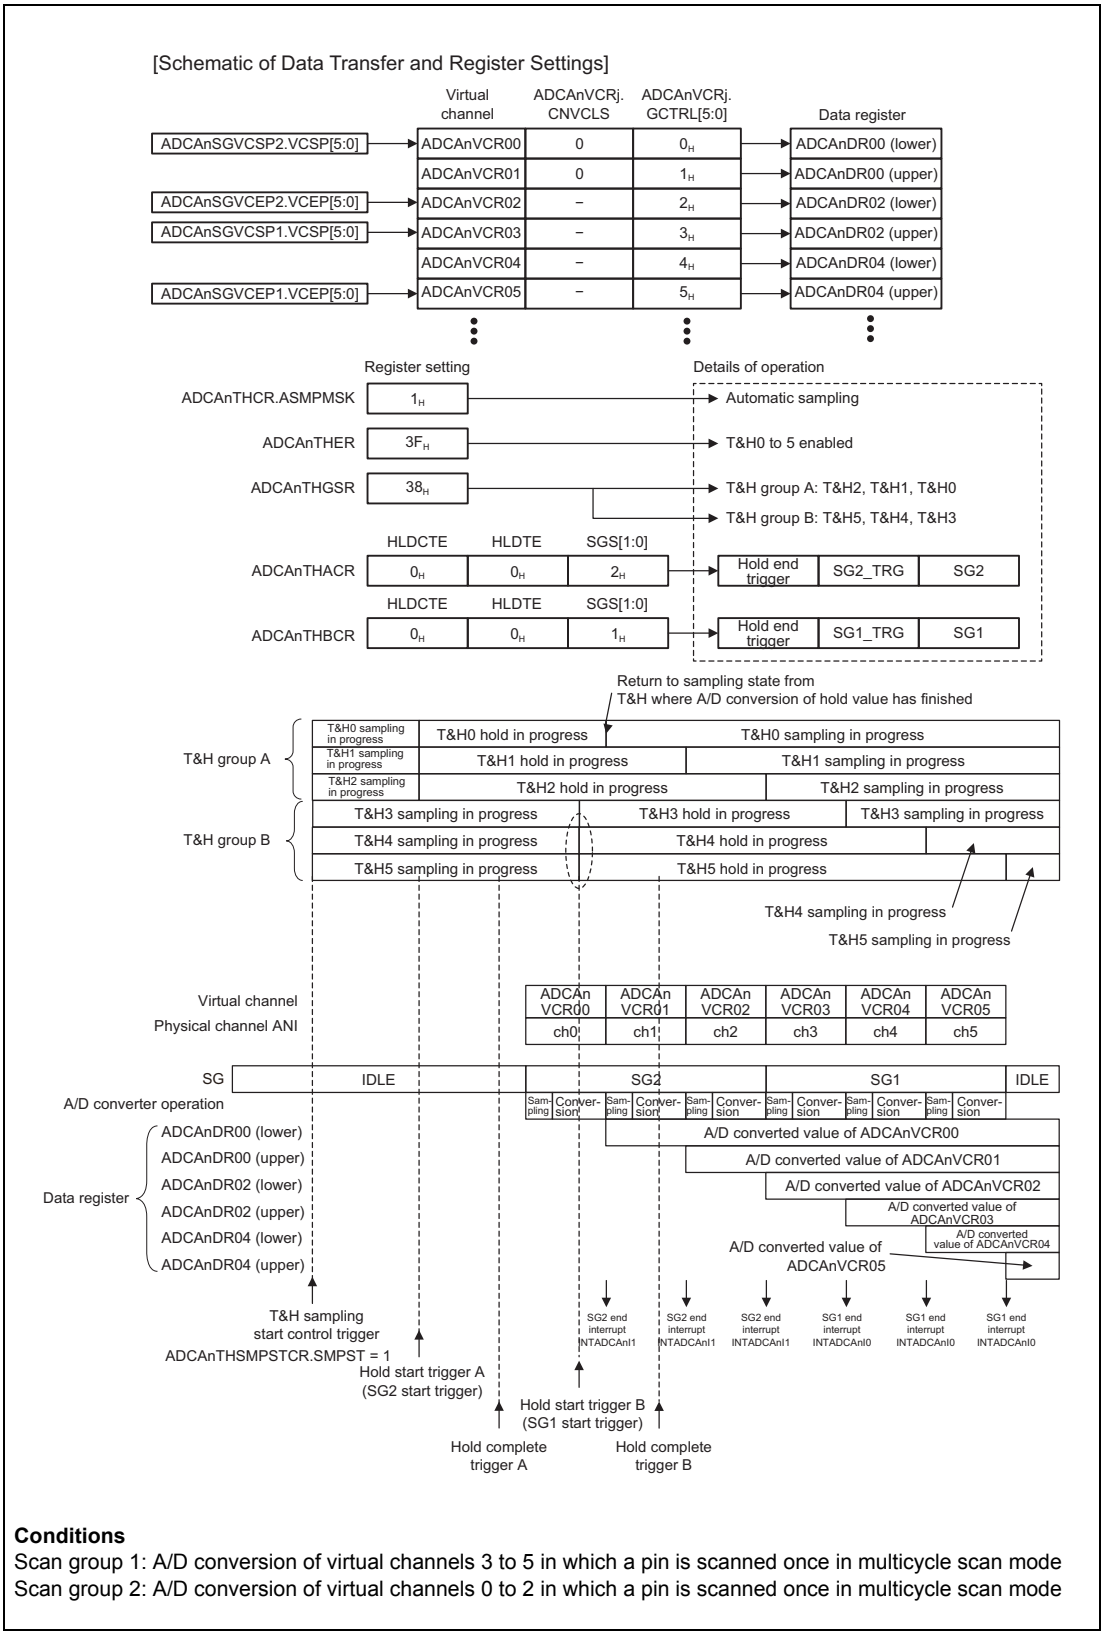
Conditions

Scan group 1: A/D conversion of virtual channels 0 to 3 in which the channels are repeated twice and the two-cycle scan is used in multicycle scan mode

Figure 31.13 Example of Channel Repeat Operation 2



Conditions

Scan group 1: A/D conversion of virtual channels 0 to 3 in which the channels are repeated twice in continuous scan mode

Figure 31.14 Example of Channel Repeat Operation 3

31.4.6 Example of Simultaneous Track and Hold Operation

Figure 31.15 shows an operation example of simultaneous track and hold.

Conditions
Scan group 1: A/D conversion of virtual channels 3 to 5 in which a pin is scanned once in multicycle scan mode
Scan group 2: A/D conversion of virtual channels 0 to 2 in which a pin is scanned once in multicycle scan mode

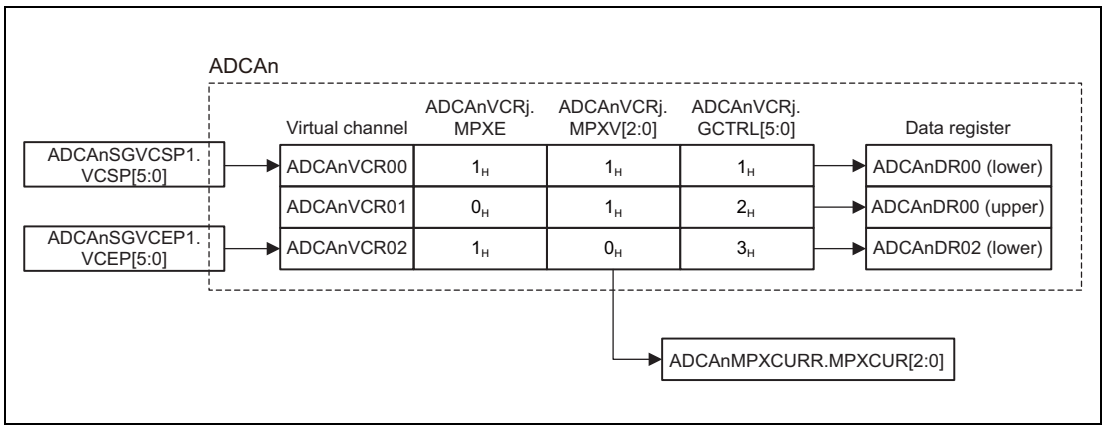
Figure 31.15 Example of Simultaneous Track & Hold Operation 1

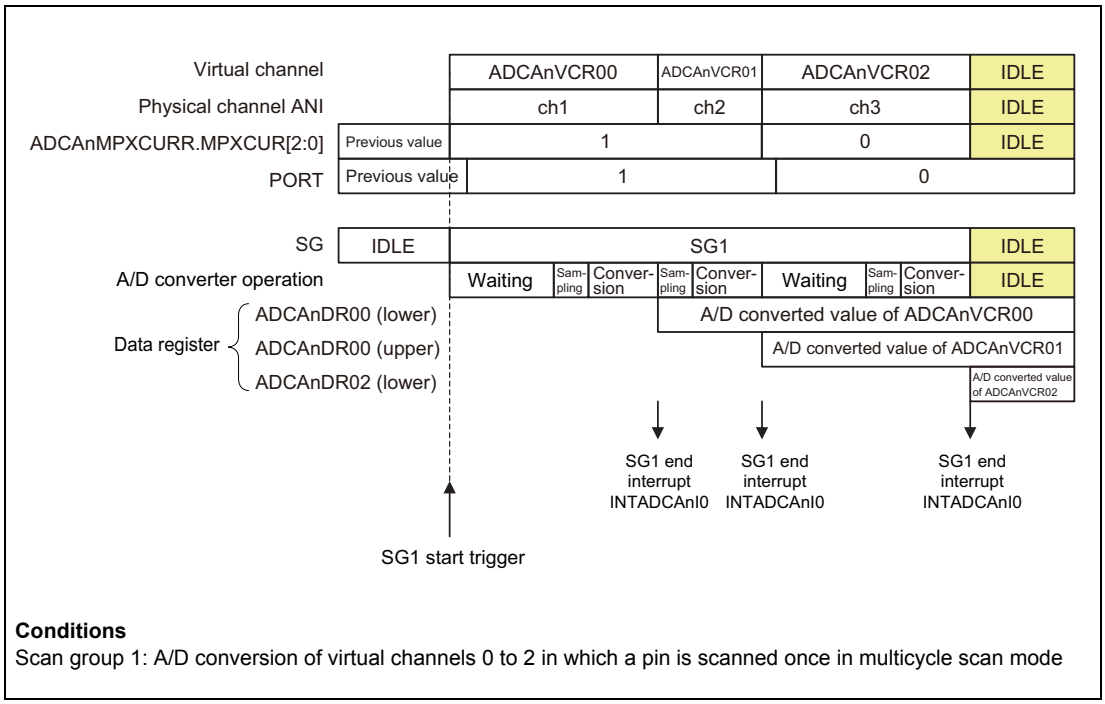
CAUTION

- **Do not specify the same physical channel in different groups.**
- **Two-cycle (or more) scan in multicycle scan mode and track & hold operation using continuous scan mode are prohibited.**
- **Because ADCAnTHSMPSTCR.SMPST is common to group A and group B, set SMPST after T&H operation for both group A and group B has been completed.**
- **If the hardware trigger is asserted before HLDCTE = 1 and HLDTE = 1 of ADCAnTHACR register or ADCAnTHBCR register are set and HLDST of ADCAnTHAHLDSTCR register or ADCAnTHBHLDSTCR register is written to hold T&H, scan operation starts. In that case, the channel switch opens with T&H staying in the sampling state. Therefore, all scan results are undefined. Do not assert the hardware trigger by setting HLDCTE = 1 and HLDTE = 1 before writing HLDST.**
- **Setting any channel from among 0 to 2 and any channel from among 3 to 5 in the same scan group is prohibited.**
- **Set the interval between T&H sampling start control trigger and hold start trigger to be 450 ns or more.**
- **Set the interval between hold start trigger and completion of the group A/D conversion to be 10 µs or less.**
  In suspend mode, do not use T&H for the channel of a scan group with low priority setting, if suspend time exceeds 10 µs.

31.4.7 A/D Conversion with External Analog Multiplexer

The following figures show examples of A/D conversion in each case.





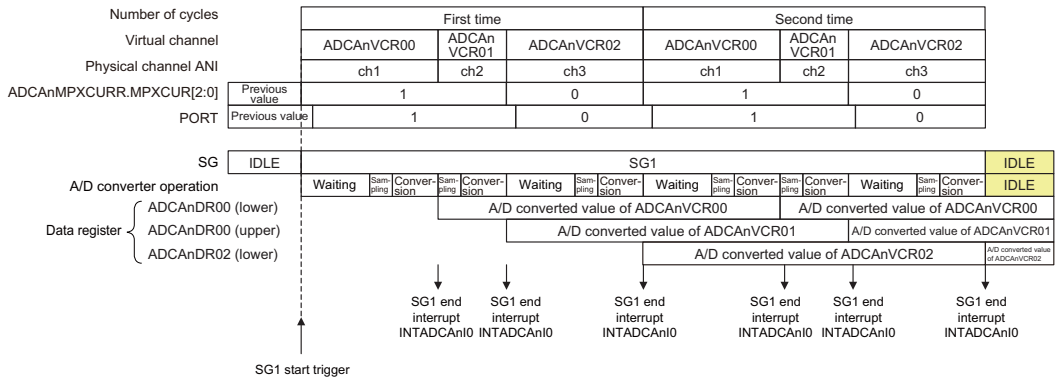


Figure 31.16 Schematic of Data Transfer and Register Settings

Conditions
Scan group 1: A/D conversion of virtual channels 0 to 2 in which a pin is scanned once in multicycle scan mode

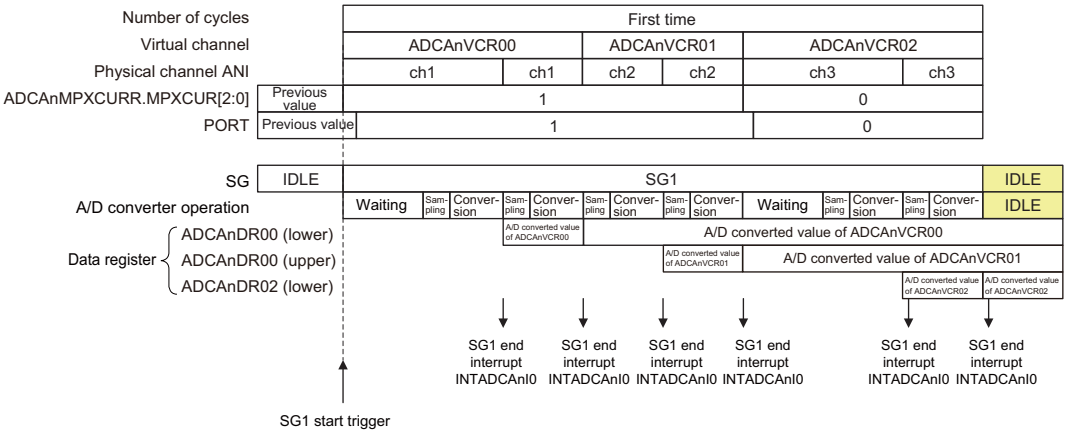

Figure 31.17 A/D Conversion 1 at an External Analog Multiplexer

Conditions
Scan group 1: A/D conversion of virtual channels 0 to 2 using the two-cycle scan in multicycle scan mode

Note: Waiting period is 1 A/D conversion time.

Figure 31.18 A/D Conversion 2 at an External Analog Multiplexer

Conditions
Scan group 1: A/D conversion of virtual channels 0 to 2 in which the channels are repeated twice and a pin is scanned once in multicycle scan mode

Figure 31.19 A/D Conversion 3 at an External Analog Multiplexer

31.4.7.1 A/D Conversion with PWM-Diag Enabled

With the PWM-Diag function enabled, A/D conversion is performed by the signal from the PWM-Diag.

For details on the PWM-Diag function, see **Section 30, PWM Output/Diagnostic (PWM-Diag)**.

To control the A/D conversion, the A/D converter receives the setting information on the MPX by the A/D conversion trigger select (PWSA) signal. The flow of A/D conversion with PWM-Diag is as follows.

(1) Set the channel MPX value of the MPX to ADCAnPWDVCR.MPXV[2:0]. Up to 8 channels can be specified to the MPX.

(2) The A/D conversion is started by the trigger signal PWSA_ADTRG from the PWM-Diag. In addition, when the MPX enable bit (ADCAnPWDVCR.MPXE) is 1, a wait of one A/D-conversion time is inserted before A/D conversion is performed.

(3) At the end of A/D conversion, the scan end is notified to the PWM-Diag.

CAUTION

As the trigger signal PWSA_ADTRG of PWM-Diag function has a higher-priority than SGx_TRG (x = 1 to 3), the operation of other scan groups may be kept waiting until the PWM-Diag function is ended.

Figure 31.20 shows an example of PWM-Diag operation using an MPX.

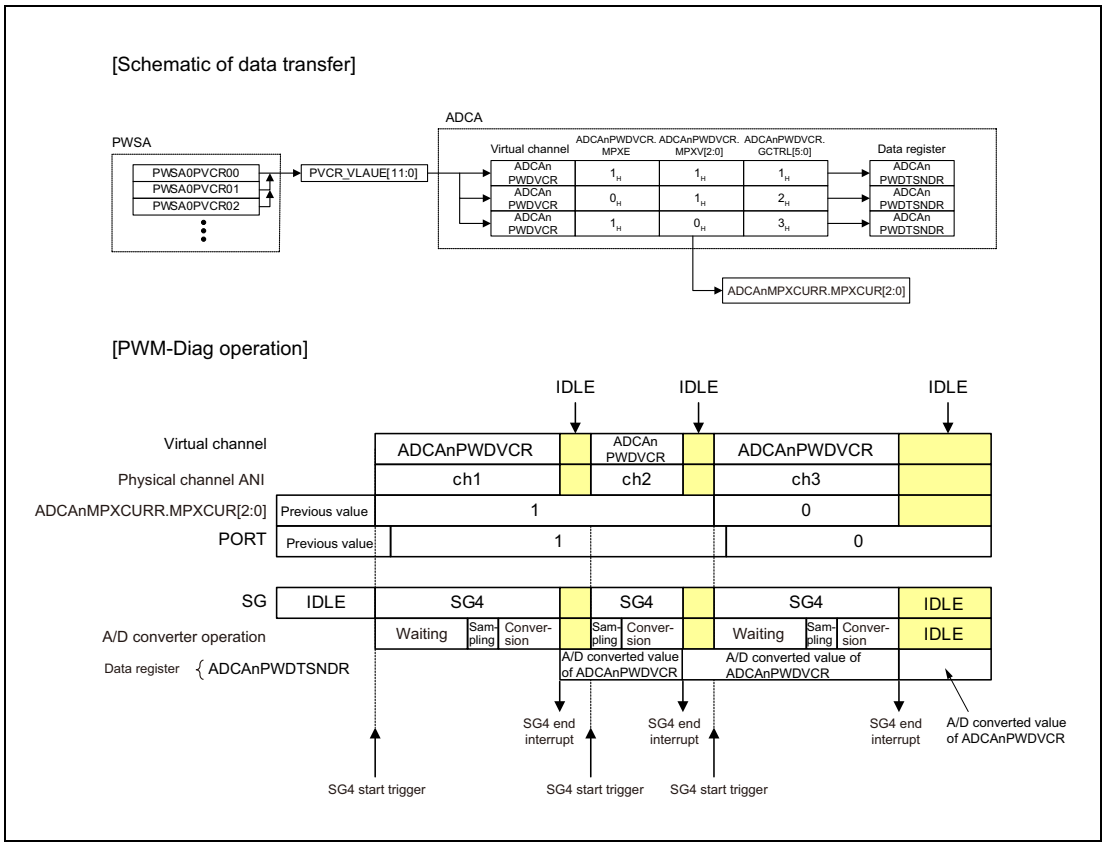

Figure 31.20 PWM-Diag Operation

31.4.8 Example of Synchronous Suspend and Resume Operation

Figure 31.21 shows an example of synchronous suspend and resume operation. In this example, a higher-priority SG interrupts a lower-priority SG.

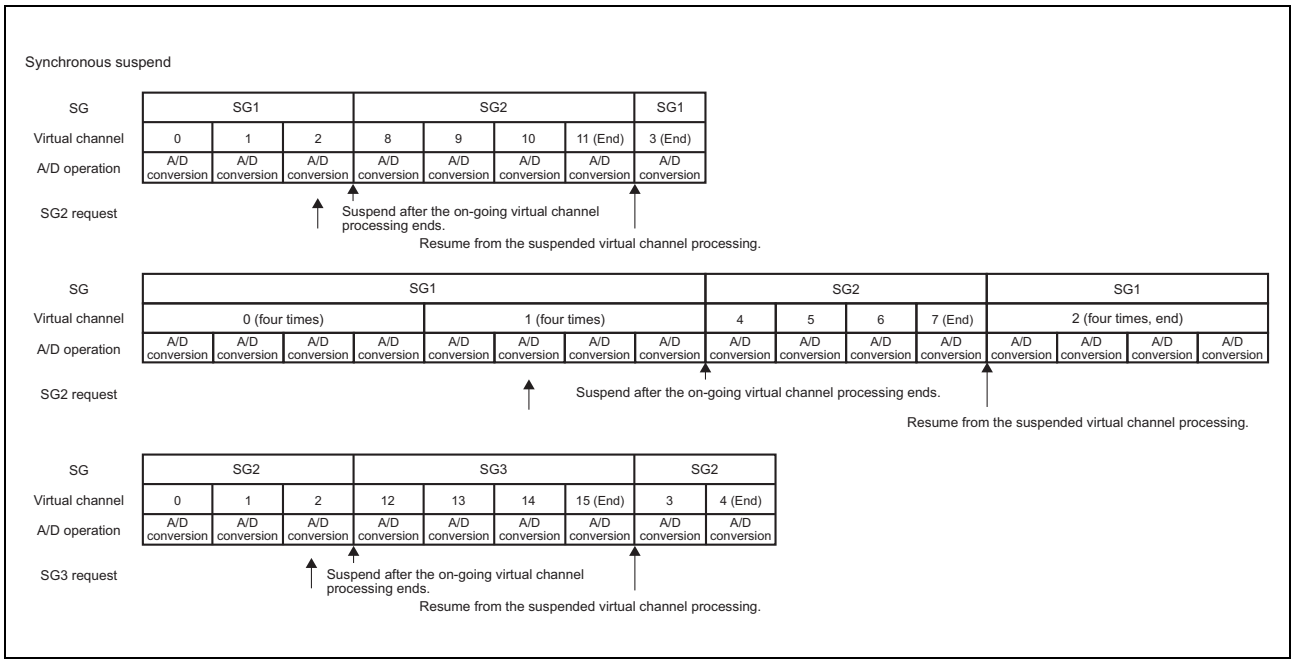

Figure 31.21 Example of Synchronous Suspend and Resume Operation

NOTE

Priority of scan groups is as follows.

Lower Higher

SG1 < SG2 < SG3 < PWM-Diag (SG4)

31.4.9 Example of Asynchronous Suspend and Resume Operation

Figure 31.22 shows an example of asynchronous suspend and resume operation. In this example, a higher-priority SG interrupts a lower-priority SG.

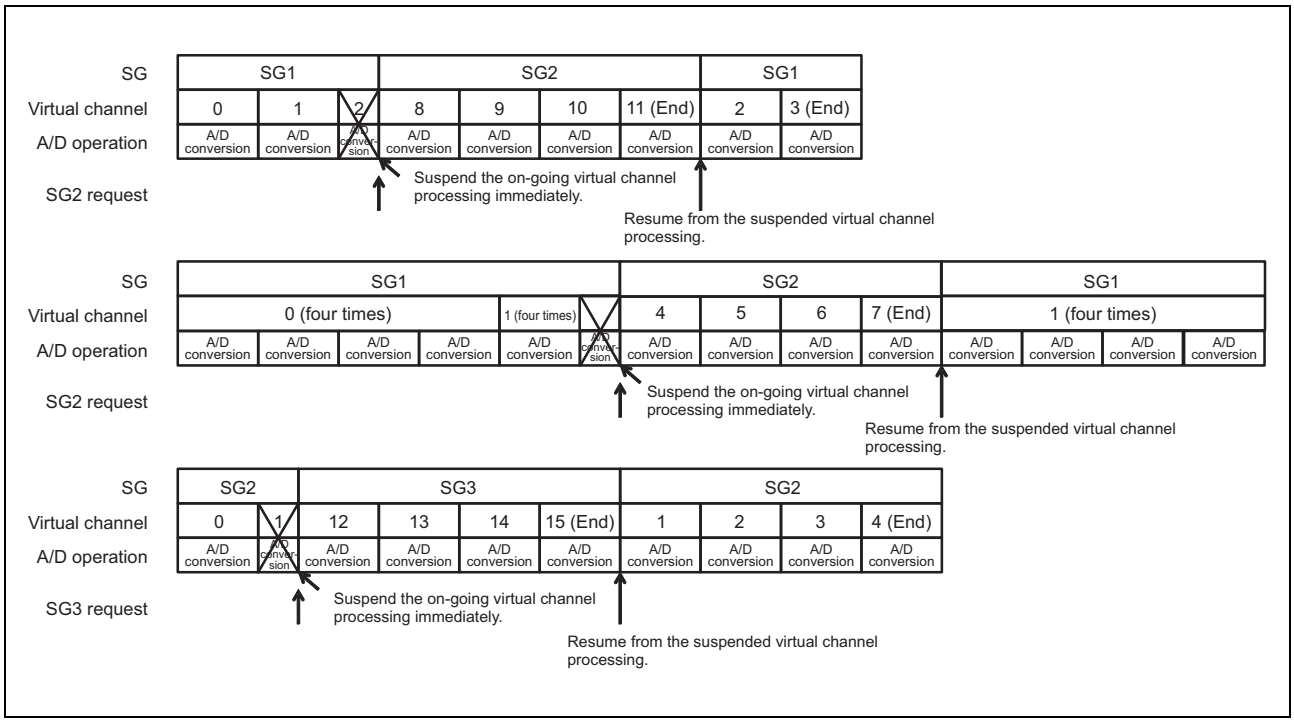

Figure 31.22 Example of Asynchronous Suspend and Resume Operation

NOTE

Priority of scan groups is as follows.

Lower Higher

SG1 < SG2 < SG3 < PWM-Diag (SG4)

31.4.10 Error Detecting Functions

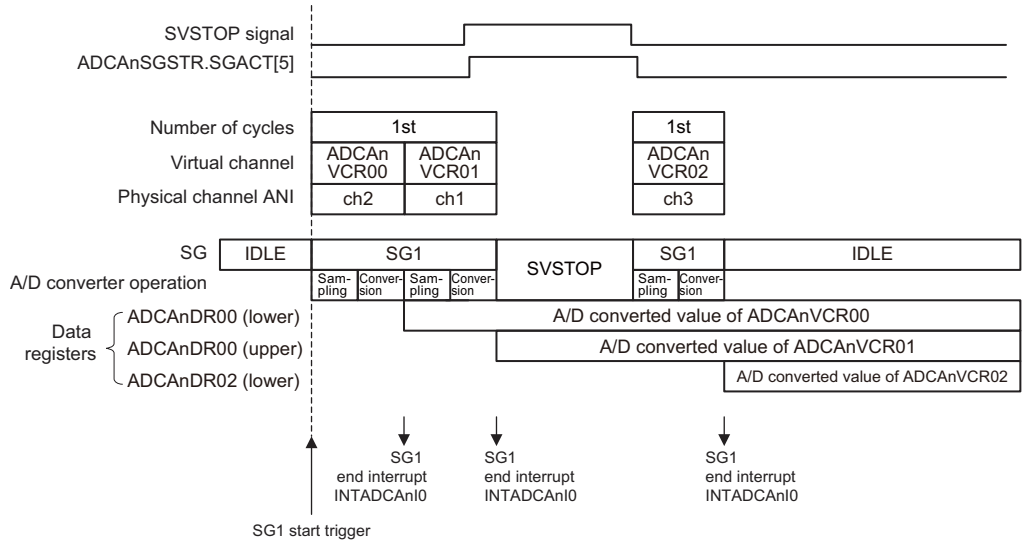
ADCAn covers upper-limit error, lower-limit error, and overwrite error.

31.4.10.1 Upper-Limit/Lower-Limit Error Detecting Function

The upper-limit/lower-limit error detecting function determines whether the A/D converted data is larger than the upper-limit table ADCAnULLMTBR0.ULMTB[11:0] or smaller than the lower-limit table ADCAnULLMTBR0.LLMTB[11:0] at the end of A/D conversion.

31.4.10.2 Overwrite Error Detecting Function

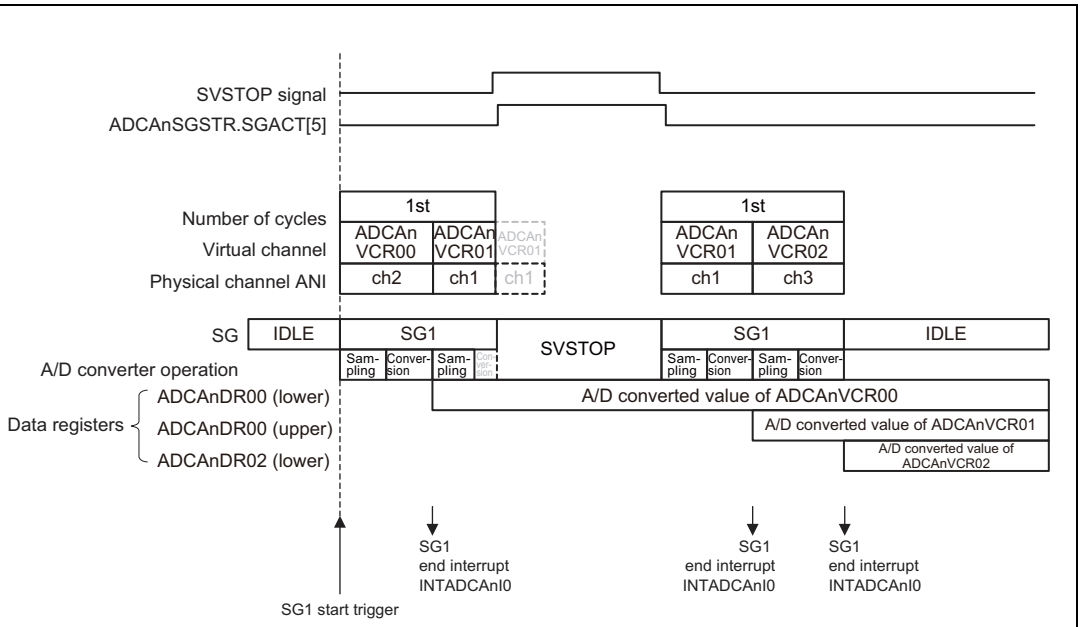
If the ADCAnDIRj register or ADCAnDRj register of a virtual channel is not read while ADCAnDIRj.WFLG = 1 (A/D converted value is stored) and the next A/D converted value is written in the ADCAnDRj register, an overwrite error is detected.



31.4.10.3 SVSTOP Operation

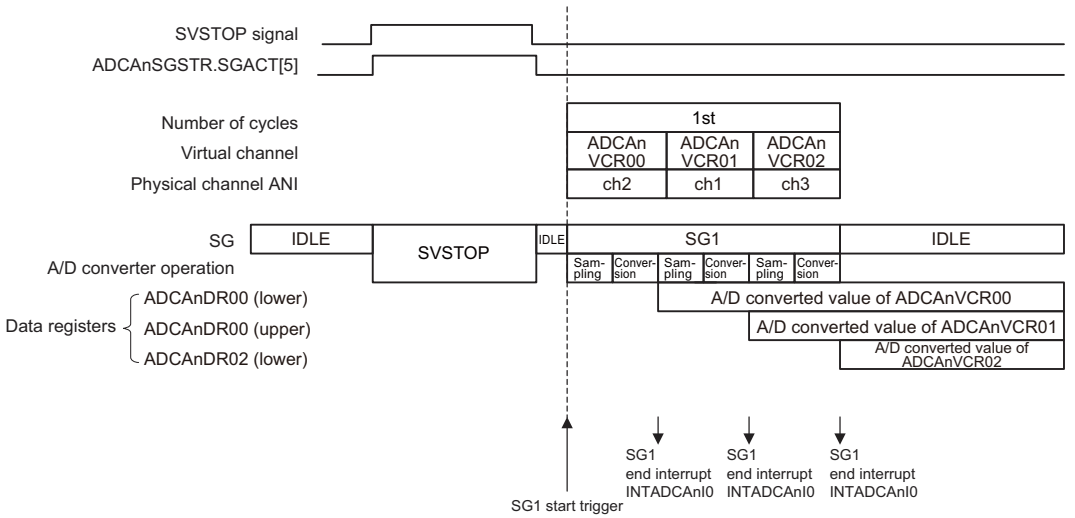
The SVSTOP function is supported by the SVSTOP signal sent from the on-chip debugger control unit. The SVSTOP function stops conversion of the A/D converter when the SVSTOP signal is input during an emulation break. While the SVSTOP signal is high, reading registers ADCAnDRj, ADCAnDIRj, ADCAnSGSTR, ADCAnULER, ADCAnOWER, ADCAnPWDTSNDR, and ADCAnPWDDIR by external access does not affect these registers.

When the high level is input to SVSTOP while ADCAnEMU.SVSDIS = 0, ADCAnSGSTR.SGACT[5] is set to 1 to make a transition to the SVSTOP state. Hardware triggers and software triggers are valid in the SVSTOP state. When the high level is input to SVSTOP while ADCAnEMU.SVSDIS = 1, the ADCA does not make a transition to the SVSTOP state. ADHALT (forced termination of A/D conversion) should not be performed in the SVSTOP state.



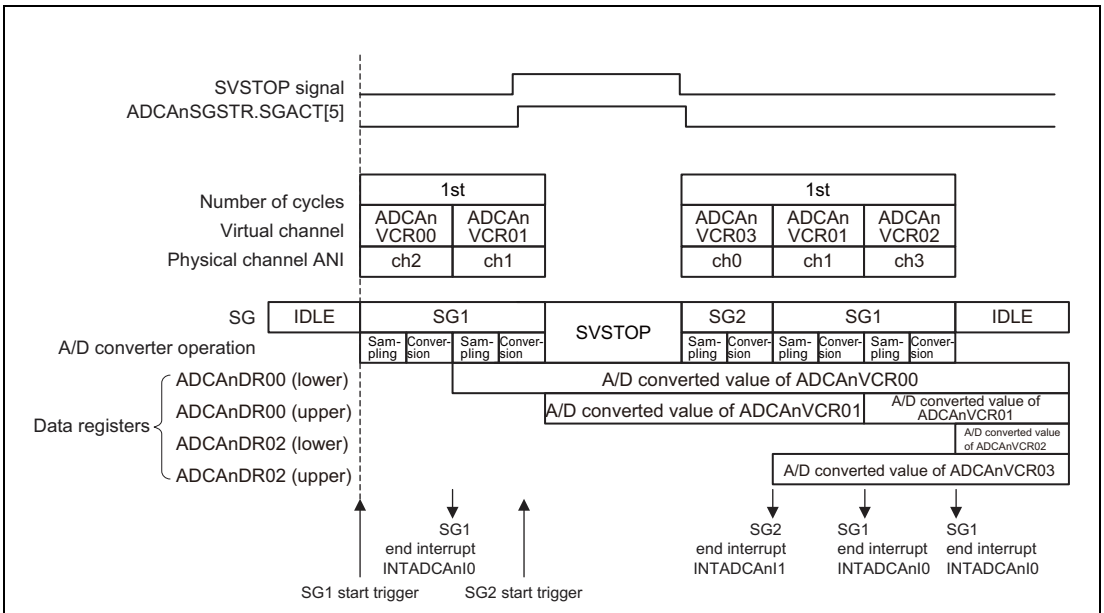
In operations for synchronous suspension, a new start trigger cannot be accepted over the time from when the high level is input to SVSTOP to the completion of conversion on the channel where conversion is currently proceeding. This time can be up to the time taken for one A/D conversion.

The following example illustrates a SVSTOP operation example.



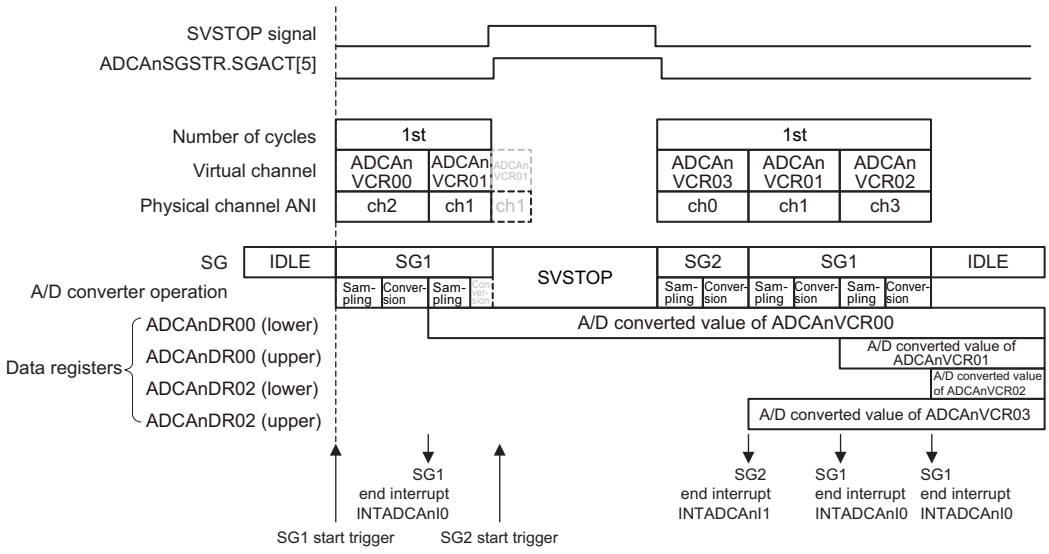
Note: An SG start trigger is accepted even during SVSTOP after the completion of conversion.

Figure 31.23 Example of SVSTOP Operation (ADCAnADCR.SUSMTD = 00 and ADCAnEMU.SVSDIS = 0)



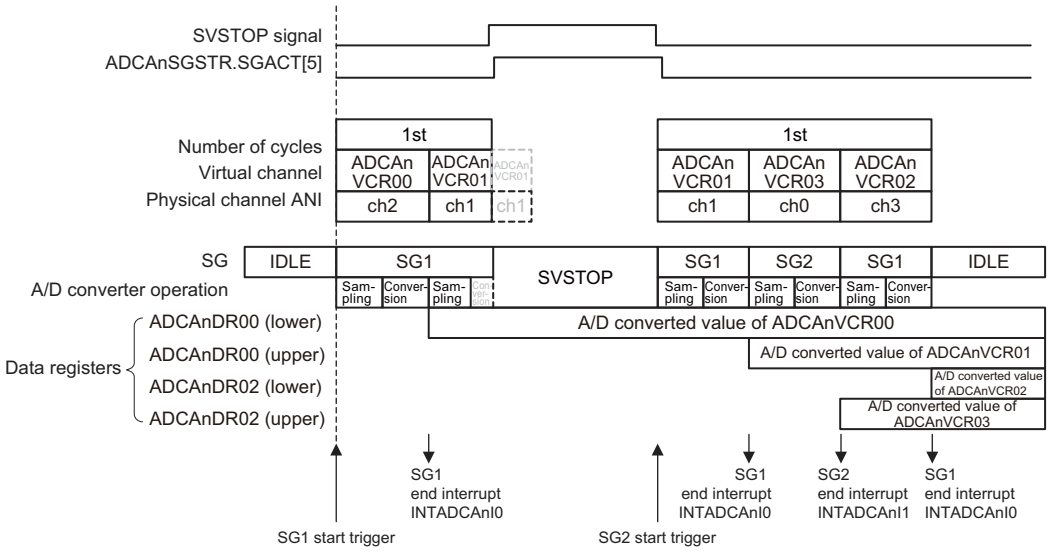
Note: An SG start trigger is accepted even during SVSTOP.

Figure 31.24 Example of SVSTOP Operation (ADCAnADCR.SUSMTD = 10 and ADCAnEMU.SVSDIS = 0)



Note: An SG start trigger is accepted even during SVSTOP.

Figure 31.25 Example of SVSTOP Operation in the IDLE State (ADCAnADCR.SUSMTD = 00 and ADCAnEMU.SVSDIS = 0)



Note: Though the channel where conversion is currently proceeding is not stopped even after the acceptance of SVSTOP, an SG end interrupt is not generated.
This channel is converted again after SVSTOP has been cleared.
After the completion of conversion, the SG start trigger is accepted even during SVSTOP.

Figure 31.26 Conflict of SVSTOP Start and High-Priority SG Start Trigger (ADCAnADCR.SUSMTD = 00, ADCAnEMU.SVSDIS = 0)

Note: An SG start trigger is accepted even during SVSTOP.

Figure 31.27 Conflict of SVSTOP Start and High-Priority SG Start Trigger (ADCAnADCR.SUSMTD = 10, ADCAnEMU.SVSDIS = 0)

Note: An SG start trigger is accepted even during SVSTOP.
In cases of conflict between clearing of SVSTOP and setting of the scan group start trigger bit, conversion of the suspended scan group is resumed regardless of its priority.

Figure 31.28 Conflict of SVSTOP Clear and High-Priority SG Start Trigger (ADCAnADCR.SUSMTD = 10, ADCAnEMU.SVSDIS = 0)

31.4.11 Activating Scan Group by a Hardware Trigger

Scan group x can be activated by the hardware trigger input to SGx_TRG. As for the hardware trigger sources to be used, see **Table 31.49, List of A/D Conversion Hardware Triggers**. When activating SGx_TRG by the hardware trigger, set the peripheral function to be used by the trigger and set the start trigger in the A/D conversion trigger select control register (ADCAnSGTSELx).
A hardware trigger from external trigger input pin requires digital filter setting. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**. More than one start trigger can be specified.

31.4.11.1 Stopping Scan Group by ADHALT

Setting ADCAnADHALTR.HALT (A/D force halt trigger) to 1 forcibly halts the A/D conversion and clears the scan group status register (ADCAnSGSTR). The error flag of ADCAnULER (upper limit/ lower limit error register) is not cleared. When ADCAnADHALTR.HALT is set, make sure that ADCAnSGSTR.SGACT has been cleared.

31.4.12 Scan End Interrupt Request

Scan group x can issue a scan end interrupt request (INT_SGx) to INTC. If ADIE of ADCAnSGCRx is set to 1, INT_SGx can be output after the SGx scan ends. If ADIE of ADCAnSGCRx is set to 0, the INT_SGx output when the SGx scan ends can be disabled. If ADIE of ADCAnVCRj is set to 1, INT_SGx can be output when A/D conversion for virtual channel j in SGx ends. If ADIE of ADCAnVCRj is set to 0, the INT_SGx output when A/D conversion for virtual channel j in SGx ends can be disabled. Since SGx scan ending is simultaneous with A/D conversion ending for virtual channel j in SGx when ADIEs of both ADCAnSGCRx and ADCAnVCRj are set to 1, INT_SGx occurs only once.

Example 1: A scan is executed for virtual channel 0 or 1 in SG1 when ADIE of ADCAnSGCR1 is 0, ADIE of VCR0 is 1, and ADIE of VCR1 is 0.
INT_SG1 is output when A/D conversion ends for virtual channel 0.

Example 2: A scan is executed for virtual channel 0 or 1 in SG2 when ADIE of ADCAnSGCR2 is 0, ADIE of VCR0 is 1, and ADIE of VCR1 is 1.
INT_SG2 is output when A/D conversion ends for virtual channel 0 and virtual channel 1.

Example 3: A scan is executed for virtual channel 0 or 1 in SG3 when ADIE of ADCAnSGCR3 is 1, ADIE of VCR0 is 0, and ADIE of VCR1 is 0.
INT_SG3 is output when a scan ends (when A/D conversion for virtual channel 1 ends).

Furthermore, the DMAC can be started when scan ends.

For the setting of DMAC, see **Section 8, DMA Controller**.

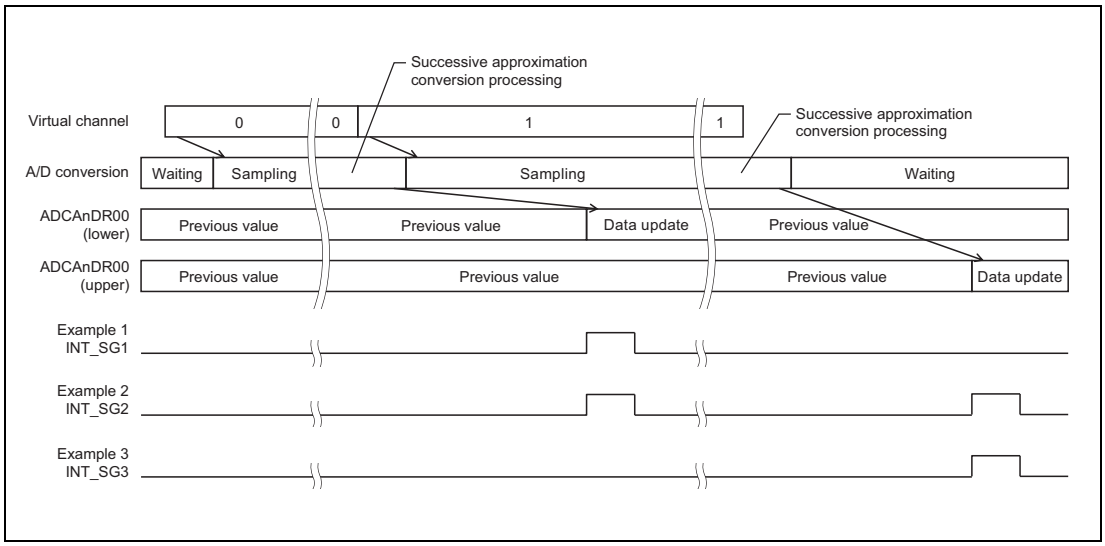


Figure 31.29 Example of a Scan Conversion End Interrupt Occurrence

31.4.13 A/D Error Interrupt Request

ADCA can issue an A/D error interrupt request (INT_ADE) to INTC. For an error source for which ULEIE and OWEIE of ADCAnSFTCR are set to 1, the OR condition of the error source is issued as INT_ADE. For an error source for which ULEIE and OWEIE of ADCAnSFTCR are set to 0, INT_ADE does not output an interrupt.

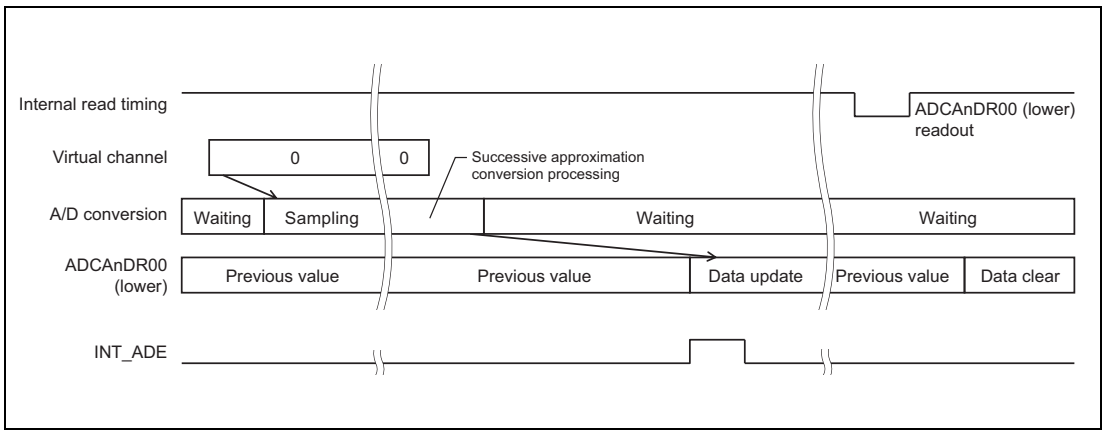

Figure 31.30 A/D Error Interrupt (Example: Overwrite Error)

31.5 Self-Diagnostic Function

To check the ADCAn function, the following self-diagnostic functions are available.

Section 31.5.1, Diagnosis of A/D Conversion Circuit

Section 31.5.2, Diagnosis of Channel Multiplexer

Section 31.5.3, Diagnosis of Open Pins

Section 31.5.4, Diagnosis of T&H Circuit

The overview of the self-diagnostic functions is shown in the figure below. A detailed description is given in the following sections.

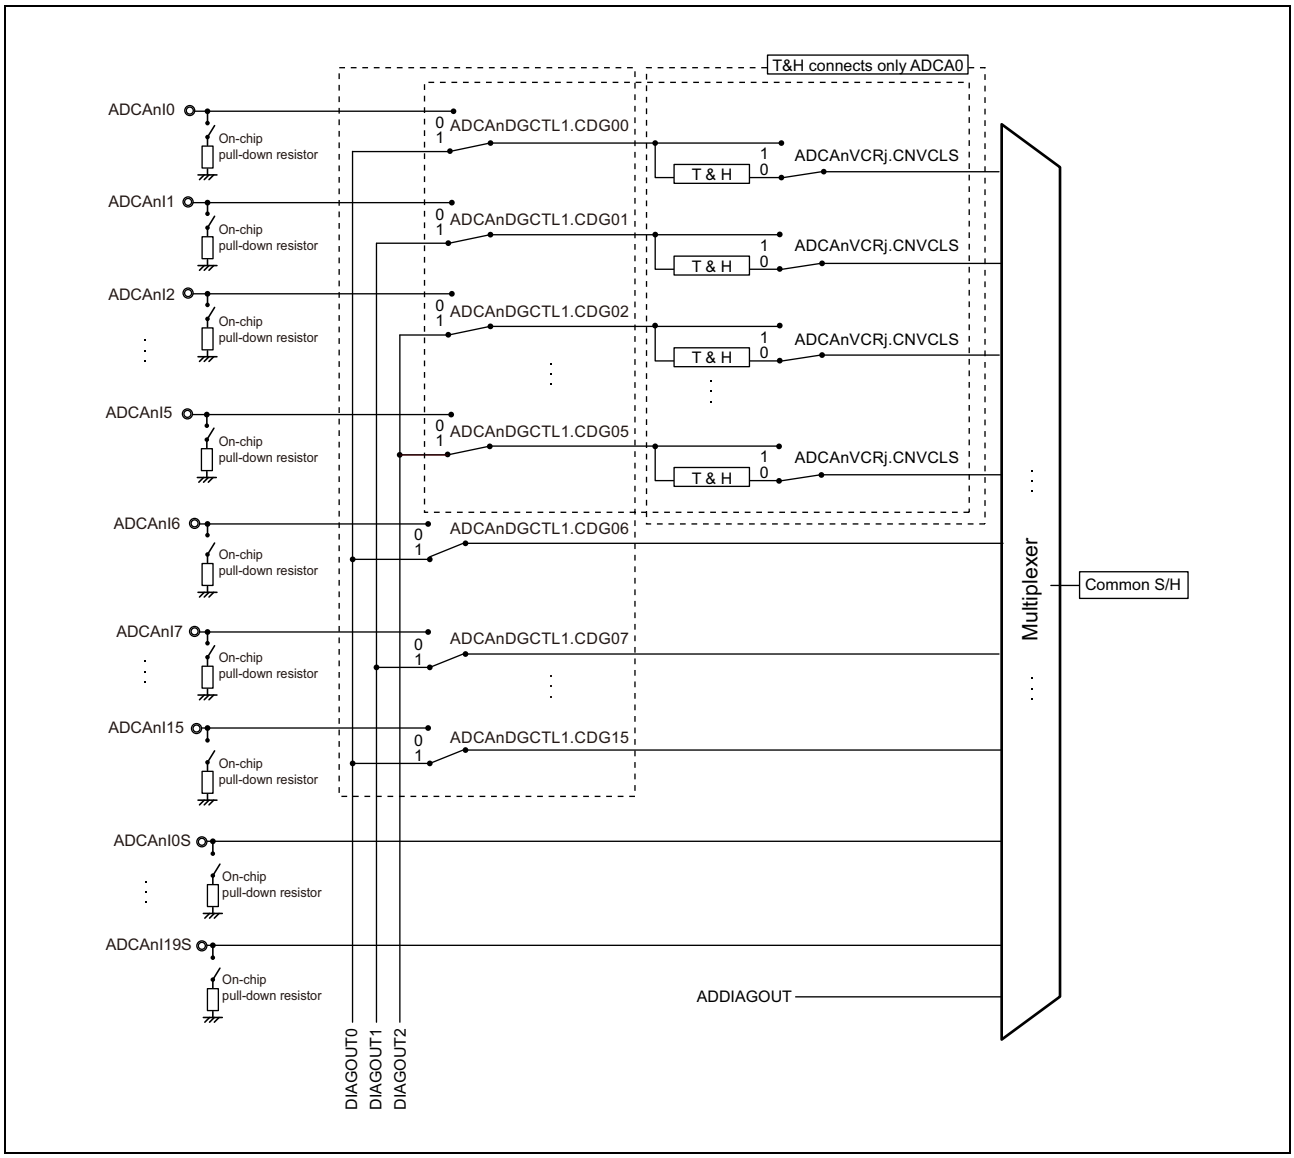

Figure 31.31 Overview of Self-Diagnostic Functions

NOTE

The functions in the dashed-line frames depend on the product.

31.5.1 Diagnosis of A/D Conversion Circuit

This function checks whether the A/D converter is operating normally by verifying the A/D conversion for self-diagnostic voltage (ADDIAGOUT) and the result of conversion. If the result of A/D conversion differs from the expected value, an internal circuit may be broken. The features of self-diagnosis of the A/D converter are as follows:

- As the self-diagnostic voltage (ADDIAGOUT) level, AnV_{REF}, $2/3AnV_{REF}$, $1/3AnV_{REF}$, $1/2AnV_{REF}$, and AnVSS are selectable by the PSEL[2:0] bits in the ADCAnDGCTL0 register.
- Self-diagnosis of the A/D converter is enabled by performing A/D conversion on one of SG1 to SG3.

31.5.1.1 Diagnostic procedure

The diagnostic procedures are shown below.

Common settings for ADC should be made before self-diagnosis is to proceed.

1. Set ADCAnADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCAnDGCTL0.PSEL[2:0] to select a self-diagnostic voltage level.
4. Set ADCAnADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Set an arbitrary bit of ADCAnVCRj.GCTRL[5:0] to 100100_B to select the diagnosis channel.
7. Set ADCAnVCRj.ADIE = 1 to enable the A/D conversion end interrupt.
8. Set ADCAnSGVCSPx to specify the start pointer of virtual channel.
9. Set ADCAnSGVCEPx to specify the end pointer of virtual channel.
10. Generate the start trigger of scan group to perform the A/D conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the A/D conversion was performed successfully.

NOTE

- During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCAnDGCTL0.PSEL[2:0]. However, the value of ADCAnDGCTL0.PSEL[2:0] becomes effective from the next A/D conversion.
- To clear ADCAnADCR.DGON, follow the procedure below:
  1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
  2. Clear ADCAnDGCTL0.PSEL[2:0].
  3. Clear ADCAnADCR.DGON.

31.5.2 Diagnosis of Channel Multiplexer

This function checks whether the path from the analog input to the A/D converter is normal.
Set the A/D conversion reference voltage (DIAGOUT0, DIAGOUT1, DIAGOUT2) by ADCAnDGCTL0.PSEL[2:0] and the channels to be connected by the ADCAnDGCTL1 register to perform A/D conversion using multiple analog channels.
If the result of A/D conversion differs from the expected value, an internal circuit may be broken. The features of self-diagnosis of the channel multiplexer are as follows:

- Channels for diagnosis can be arbitrarily selected from among ADCA0I0 to ADCA0I15 and ADCA1I0 to ADCA1I15.
- As the self-diagnostic voltage level, $2/3AnV_{REF}$, $1/3AnV_{REF}$, and $1/2AnV_{REF}$ are selectable and one of the three reference voltage levels can be allocated to each channel.

Table 31.55 Selection of Channel to be Diagnosed

Connection	Select Channel
DIAGOUT0	Channels 0, 3, 6, 9, 12, and 15
DIAGOUT1	Channels 1, 4, 7, 10, and 13
DIAGOUT2	Channels 2, 5, 8, 11, and 14

- Self-diagnosis of the channel multiplexer is enabled by performing A/D conversion on one of SG1 to SG3 by using multiple channels.

31.5.2.1 Diagnostic procedure

The diagnostic procedure is shown below.

Common settings for ADC should be made before self-diagnosis is to proceed.

1. Set ADCAnADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCAnDGCTL0.PSEL[2:0] to select a self-diagnostic voltage level.
4. Set ADCAnADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Use two or more ADCAnVCRj registers.
   Set ADCAnVCRj.GCTRL[5:0] bits to select physical channels.
   Set ADCAnVCRj.ADIE bit to enable the A/D conversion end interrupt.
7. Set ADCAnSGVCSPx register to specify the start pointer of virtual channel.
8. Set ADCAnSGVCEPx register to specify the end pointer of virtual channel.
9. Set ADCAnDGCTL1 register to specify the physical channel to the self-diagnostic channel.
10. Generate the start trigger of scan group to perform the A/D conversion.
11. When the conversion interrupt occurs, read the result and compare it with the expected one.
12. If the result is the expected one, the A/D conversion was performed successfully.

NOTE

- During A/D conversion, the self-diagnostic voltage level can be changed by writing to ADCAnDGCTL0.PSEL[2:0]. However, the value of ADCAnDGCTL0.PSEL[2:0] becomes effective from the next A/D conversion.
- To clear ADCAnADCR.DGON, follow the procedure below:
  1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
  2. Clear ADCAnDGCTL0.PSEL[2:0].
  3. Clear ADCAnADCR.DGON.

31.5.3 Diagnosis of Open Pins

This function detects whether the analog input pin (ADCAnIm, ADCAnImS) is open due to disconnection, etc.
An internal pull-down resistor can be connected to diagnose the analog input pin.
Connect the analog input pin (ADCAnIm, ADCAnImS) with the pull-down resistor for self-diagnosis for A/D conversion of the target channels.

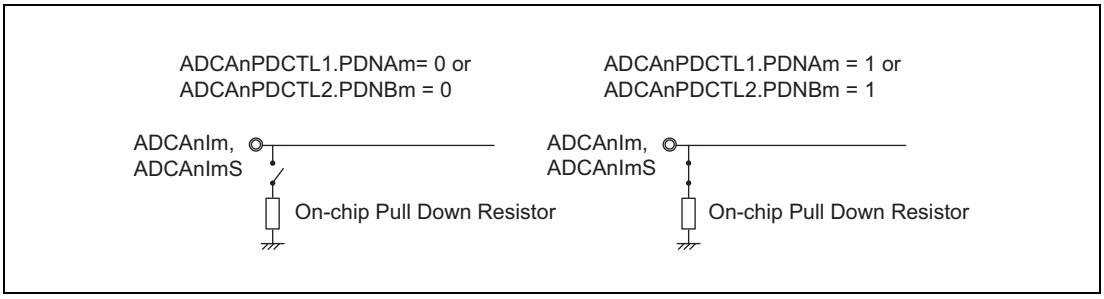

Figure 31.32 Setting of On-chip Pull Down Resistor

When there is a disconnection, the conversion result is almost 0 V and it indicates an open detection.

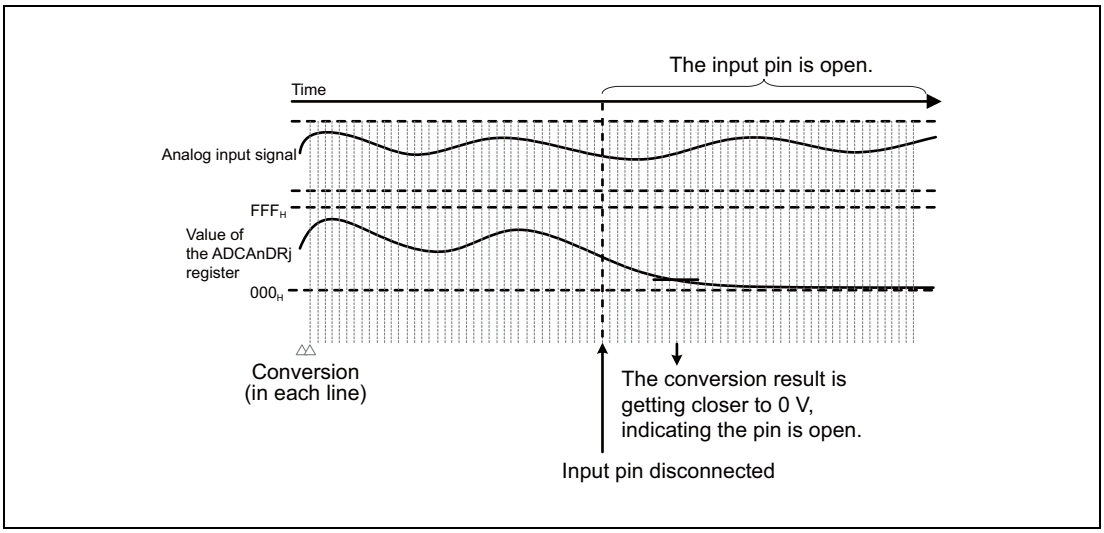

Figure 31.33 Analog Input Signal Disconnection Detection

CAUTIONS

1. **The pull-down resistors must not be connected during normal A/D conversion operation. Connected pull-down resistors may lead to a drop in the input voltage and result in erroneous A/D conversion results.**
2. **When the analog input voltage is nearly equal to the voltage level which is pulled down, a disconnection cannot be detected by this function.**

31.5.3.1 Diagnostic procedure

1. Set the ADCAnPDCTL1.PDNA or ADCAnPDCTL2.PDNB bit which correspond to analog input pins (ADCAnIm, ADCAnImS) to be diagnosed to enable the pull down resistor.
2. Generate the start trigger of scan group to perform the A/D conversion.
3. Perform the A/D conversion multiple times on the same analog input.
4. Monitor the channel's A/D conversion results and check if any result declines to 0 V.

31.5.4 Diagnosis of T&H Circuit

This function is used to diagnose proper operation of the T&H0 to T&H5 circuits for ADCA0I0 to ADCA0I5.

Virtual channel registers 33 to 35 (ADCA0VCR33 to 35) are used exclusively for comparison of the potential conversion result using the T&H circuit and that obtained without using the T&H circuit to detect a failure of the T&H circuit.

For this diagnosis, the ADCA0THACR.HLDCTE is set to 1 (ADCA0THBCR.HLDCTE = 1) and ADCA0THACR.HLDTE to 0 (ADCA0THBCR.HLDTE = 0) and the A/D conversion trigger is used as the hold start/end trigger. Connect the reference voltage signal (DIAGOUT0, DIAGOUT1, or DIAGOUT2) selected by ADCAnDGCTL0.PSEL[2:0] to the target channels for diagnosis by using the ADCAnDGCTL1 register.

31.5.4.1 Diagnostic Procedure (in case of T&H circuit ch0 diagnosis)

1. Set ADCA0ADCR.DGON = 1 to enable the self-diagnostic voltage circuit.
2. Wait for 500 ns.
3. Set ADCA0DGCTL0.PSEL[2:0] = 001_B to select $1/3AnV_{REF}$ voltage level.
4. Set ADCA0ADCR.DGON = 1 to update the voltage level.
5. Wait for 500 ns.
6. Set ADCA0DGCTL1.CDG0 = 1 to enable DIAGOUT0.
7. Set ADCA0VCR33.GCTRL[5:0] to ADCAVCR35.GCTRL[5:0] to 000000_B to select physical ch0.
8. Set ADCA0VCR33.CNVCLS and ADCA0VCR34.CNVCLS to1 to select normal conversion.
9. Set ADCA0VCR35.CNVCLS = 0 to select hold value conversion.
10. Set ADCA0THACR.SGS[1:0] = 01_B to select SG1 to “T&H group A”.
11. Set ADCA0THER.TH0E = 1 to enable T&H circuit ch0.
12. Set ADCA0THGSR.TH0GS = 0 to select T&H circuit ch0 to “T&H group A”.
13. Set ADCA0SGVCSP1.VCSP[5:0] =100001_B to select SG1 start pointer to VCR33.
14. Set ADCA0SGVCEP1.VCEP[5:0] = 100011_B to select SG1 end pointer to VCR35.
15. Set ADCA0DGCTL0.PSEL[2:0] = 011_B to select $2/3AnV_{REF}$ voltage level.
16. Set ADCA0THSMPSTCR.SMPST = 1 to execute T&H sampling.
17. Wait for 500 ns.
18. Set ADCA0SGSTCR1.SGST = 1 to execute SG1 A/D conversion.
19. Read ADCA0DIR33 to ADCA0DIR35, and check A/D conversion result to see if SG1 A/D conversion has finished.

NOTES

To clear ADCAnADCR.DGON, follow the procedure below:

1. Confirm that SGACT of all scan groups is 0 (before scan groups are started) and TRGMD of all scan groups is 0.
2. Use the ADCAnTHER register to disable the diagnosed T&Hk.
3. Clear ADCAnDGCTL0.PSEL[2:0].
4. Clear ADCAnADCR.DGON.

31.5.4.2 Diagnosis Mechanism

(1) A reference voltage “A” is applied to one of the reference voltage signals DIAGOUT0 to DIAGOUT2. The T&H circuit holds the voltage “A” and an A/D conversion is performed without using the T&H circuit.

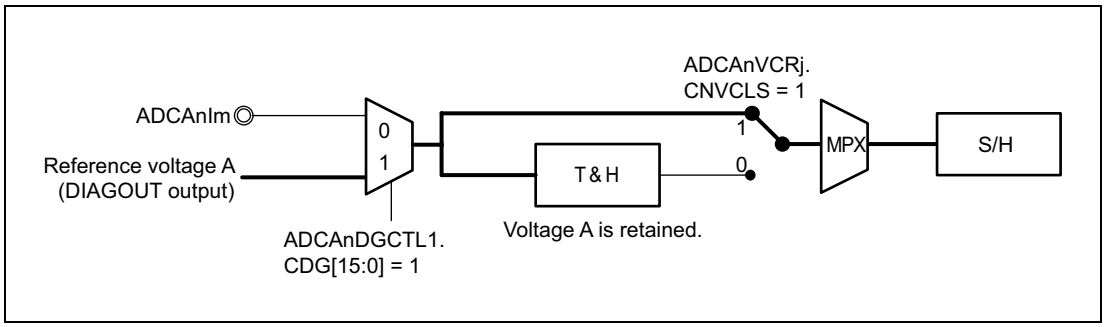

Figure 31.34 T&H Circuit Diagnostic Mechanisms (1)

(2) A reference voltage “B” is applied to one of the reference voltage signals DIAGOUT0 to DIAGOUT2. The T&H circuit still holds the voltage “A” and an A/D conversion is performed without using the T&H circuit.
Note that since reference voltage “A” is being held, reference voltage “B” is not held.

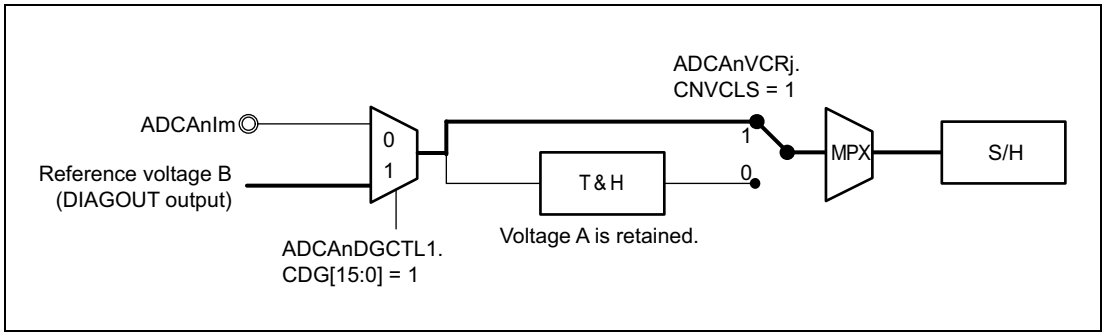

Figure 31.35 T&H Circuit Diagnostic Mechanisms (2)

(3) An A/D conversion is performed using the T&H circuit. The T&H circuit continues to hold the voltage A.

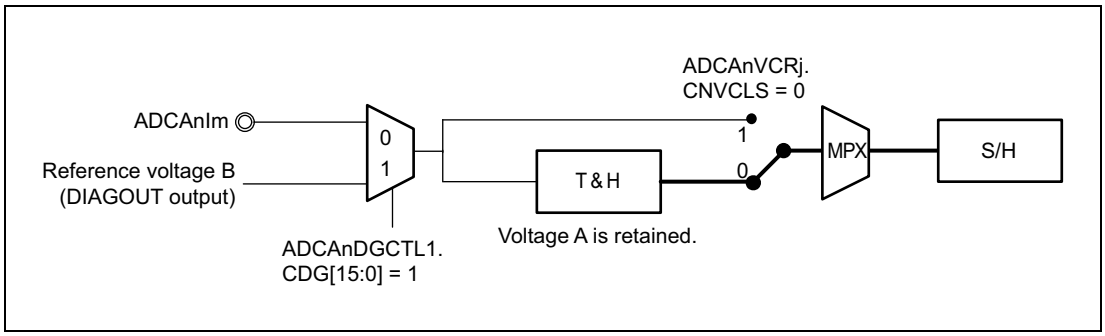

Figure 31.36 T&H Circuit Diagnostic Mechanisms (3)

(4) The diagnosis of T&H circuit is successful if the following results are obtained:
1. The first result (step 1) is voltage “A”.
2. The second result (step 2) is voltage “B”.
3. The last result (step 3) is voltage “A” again.

31.6 Definition of A/D Conversion Accuracy

A/D conversion accuracy is defined as follows:

- Resolution
  Digital output code value from the A/D converter
- Quantization error
  An error essentially contained in the A/D converter, which is assumed as 1/2 LSB (**Figure 31.37**).
- Offset error
  Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from the minimum voltage value 000_H to 001_H. However, the quantization error is not included.
- Full scale error
  Deviation of the analog input voltage value from the ideal A/D conversion characteristics when the digital output changes from FFE_H to FFF_H. However, the quantization error is not included.
- DNL (Differential nonlinear error)
  Deviation between the ideal digital output code width (Vq) and the actual digital output code width (Va), which is assumed as (Va – Vq)/Vq. However, the offset error, the full scale error, and the quantization error are not included.
- INL (Integral nonlinear error)
  Deviation of the actual value from the ideal A/D conversion characteristics between the zero voltage and the full scale voltage, which is assumed as an integral of DNL from 000_H to a digital output code. However, the offset error, the full scale error, and the quantization error are not included.
- Absolute accuracy
  Deviation between the digital value and the analog input value. The offset error, the full scale error, the quantization error, DNL, and INL are included.

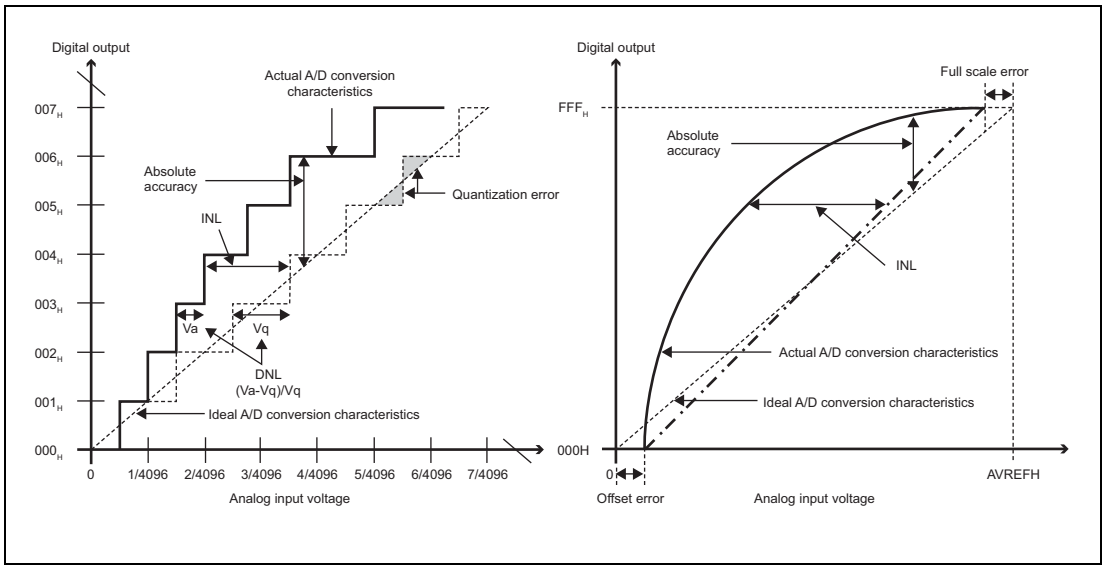

Figure 31.37 Definition of A/D Conversion Accuracy

31.7 Usage Notes

31.7.1 Range of Channel Input Voltage

CAUTION

ADCAnIm and ADCAnImS input voltages should be used within the specification range. If the channel input voltage exceeds AnVREF or falls below AnVSS, the converted accuracy of the channel not guaranteed. When an over-voltage is applied to a pin ADCAnIm and at the same pin the ADC selfdiagnosis (diagnosis of channel multiplexer) is executed an offset voltage to the diagnosis voltage can be measured.

When ADCAnDGCTL1 include the pins over-voltage applied, self diagnosis show always over-voltage pin effect. For avoid this issue, ADCAnDGCTL1 should not select over-voltage applied pin.

31.7.2 Notes on Application Design

(1) Analog input pins (ADCAnIm, ADCAnImS)

- Ensure that the input voltages on the ADCAnIm and ADCAnImS pins are within the specified ranges. We recommend using diodes with V_F of 0.3V or below to form a clamp to avoid the input of voltages at or above AnVREF and at or below AnVSS. The results of conversion for input voltages at or above AnVREF and at or below AnVSS are undefined and so are not guaranteed. Input of such voltages can also affect the results of conversion on other channels.
- Reduce noise on the analog input pins (ADCAnIm and ADCAnImS) by connecting a resistor Re between the pins and the external sources of analog input signals for conversion and capacitor Ce to the AnVSS pins.
- Avoid analog signal lines crossing digital signal lines and vice versa, since this can introduce noise and reduce performance in A/D conversion.
- We recommend avoiding the driving of large currents through input and output pins near the ADCAnIm and ADCAnImS pins and toggled signals in particular should be kept away from these pins.
- If you are using the standby functions, confirm the stop of A/D conversion. Then, set the ADCAnSGCRx.TRGMD and ADCAnTHER.THkE bits, which are to be effective on standby, to 0.
- If you are using the LPS on ADCA0 (also when standby function is used), set the ADCA0SGCRx.TRGMD bit to 1 and the ADCA0SGTSELx.TxSEL bits to SEQTRG (LPS). For details, see **Section 15, Low-Power Sampler (LPS)**.
- Do not connect a channel to be used with the T&H function to an external analog multiplexer.
- Changes to physical and virtual channels during operation while the T&H function is in use is prohibited.
- Writing to PWM-Diag-related registers while PWM-Diag is not in use is prohibited.

(2) Power Wiring

The following methods are recommended to minimize the influence of switching noise from digital circuits on A/D converter accuracy.

- Connect markedly thick wiring patterns to the mesh pattern or connect solid patterns to the power-supply lines.
- Insert bypass capacitors between power-supply pins (EVCC and AnVREF) and ground pins (EVSS and AnVSS).
- We recommend separating the analog power supply (AnVREF) from the digital power supplies (EVCC) and providing the voltages from a series regulator. If the analog power supply is to come from the same source as that of the digital power supplies, wire the analog and digital power supplies to an electrolytic capacitor, and provide separate wiring patterns on the board.
  We also recommend inserting a chip inductor in the input for the analog power supply.
  Furthermore, earth the analog and digital grounds to the same point on an electrolytic capacitor, and provide separate wiring patterns for the grounds on the board.
  The analog power supply also serves as the analog reference voltage for this product.

(3) Variation in A/D converted data

The effects of noise and variations in the power supply voltages lead to dispersal of the results of A/D conversion. Furthermore, noise on the analog input pins (ADCAnIm and ADCAnImS) or on the reference voltage input pins (AnVREF and AnVSS) can lead to the results of A/D conversion being incorrect.

Apply software processing to avoid ill effects on the system of fluctuations in or incorrectness of the results of A/D conversion.

Examples of software handling are described below.

- Use averaged values from several rounds of A/D conversion
- Execute A/D conversion for several time and omit extreme results
- Repeat the processing for abnormalities to check for repeated abnormalities in the case of results of A/D conversion which will cause malfunctions of the system.

There is a possibility that A/D conversion accuracy of high priority SG become worse when following both conditions are applicable.

(1) During the A/D conversion of low priority SG (e.g. SG1), conversion trigger of the high priority SG (e.g. SG3) occur.

(2) The channel T&H function of high priority SG (e.g. SG3) is enabled.

The above case is one of an example of SG combination. The SG priority is SG4 > SG3 > SG2 > SG1. The fluctuation of conversion error depends on the external circuit and devices mounted on the customer board.

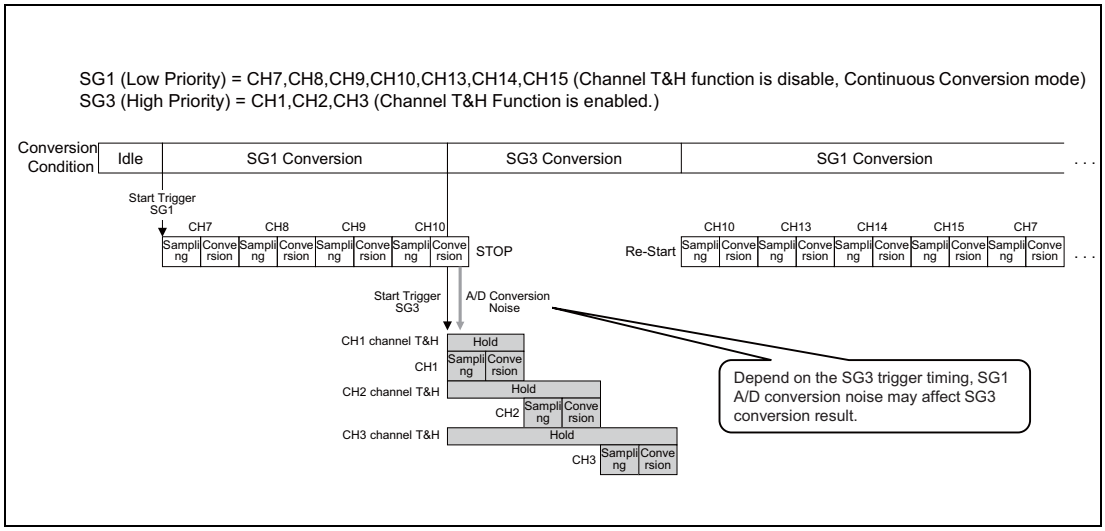

Figure 31.38 SG priority

Examples of software handling are described below.

- Low priority SG (e.g. SG1) A/D conversion have to be finished 3 ADCLK before the conversion trigger of high priority SG (e.g. SG3), if the SG3 contains the channels which channel T&H is available.
- If there is a case that high priority SG (e.g. SG3) conversion trigger occur during the conversion of low priority SG (e.g. SG1), disable the high priority SG channel T&H function.
- If the both conditions mentioned in previous page need to be used, adjust high priority SG (e.g. SG3) conversion trigger timing to synchronize with the following timing (the period shown by arrowed line in the following figure) during A/D conversion of low priority SG (e.g. SG1).

Even if trigger timing is adjusted above recommendation time, conversion error specified in Data Sheet cannot be removed.

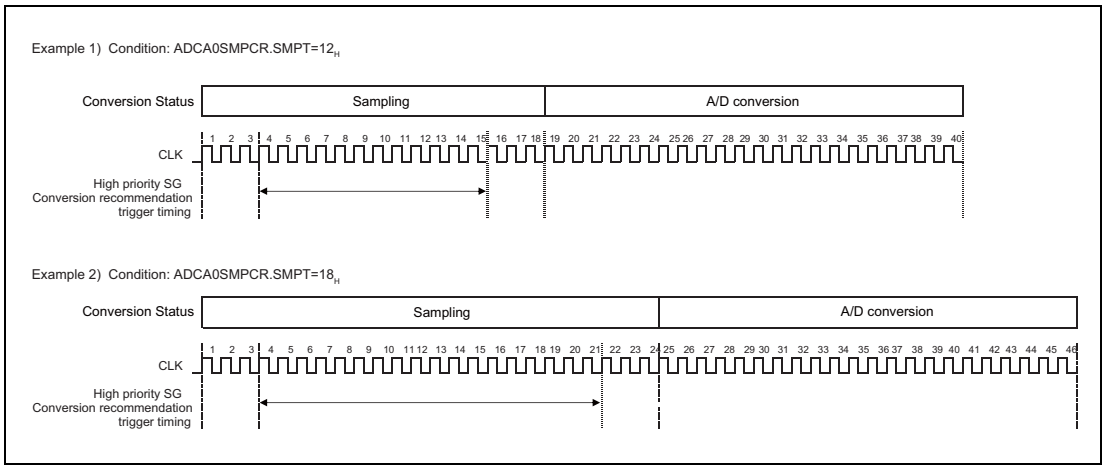

Figure 31.39 SG conversion trigger timing

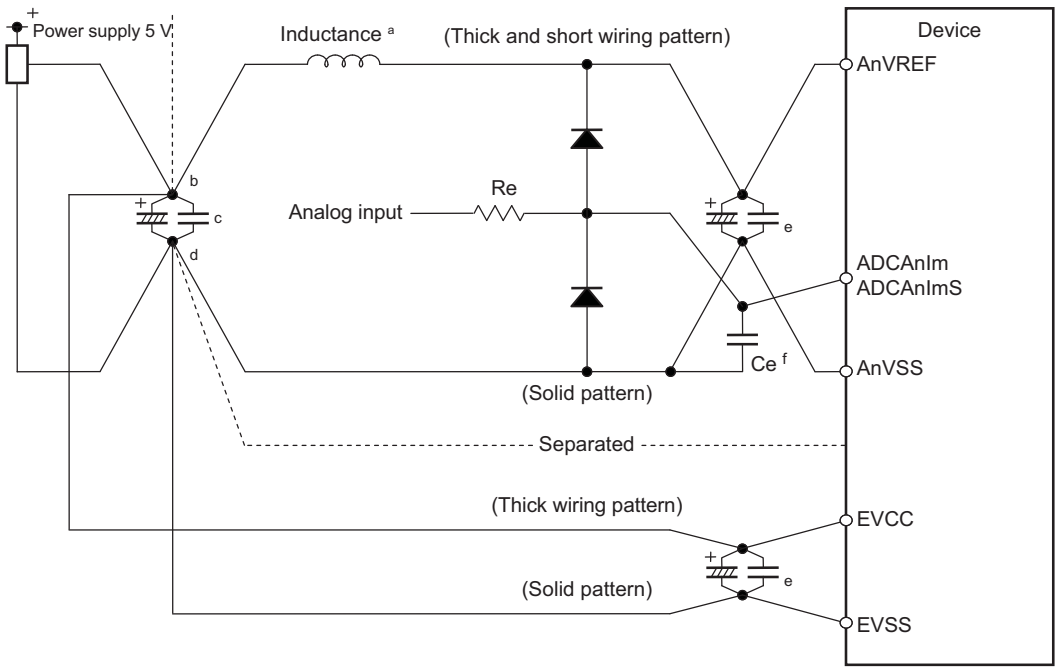
When it is not possible to use the above 3 software handlings, following process is recommended.

- Doing A/D conversion several times and using average of several A/D conversion results.

- Doing continuous A/D conversion several times, remove abnormal conversion result and use only the other results.

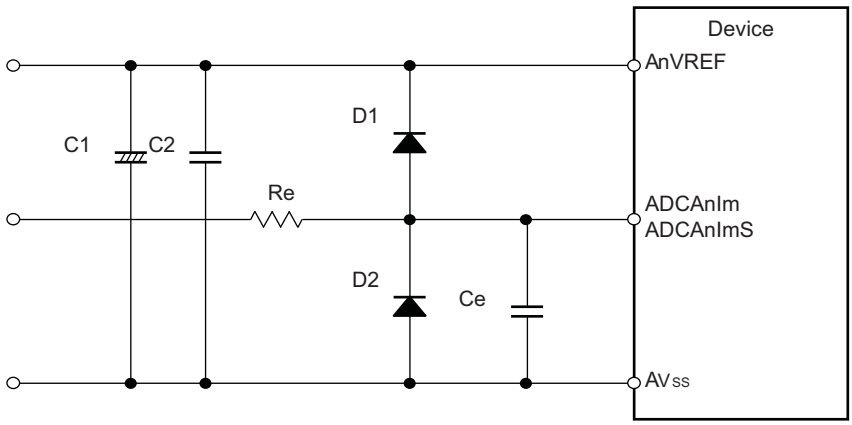
- When abnormal A/D conversion result is detected, not to proceed abnormal operation immediately, doing one more A/D conversion before proceeding abnormal operation.



The effect of above process is depend on the external circuit and devices mounted on the customer board. Sufficient evaluation of the system is recommended.

(4) Alternative Input/Output

Analog input (ADCAnIm, ADCAnImS) pins can be used as port pins.



Do not read from input port pins or write to output port pins while an ADCAnIm or ADCAnImS pin function is selected and handling A/D conversion. Doing so may reduce the accuracy of conversion.

Fluctuations in output current from output port pins due to the effects of an external circuit connected to a port pin while A/D conversion is in progress may also reduce the accuracy of conversion. If digital pulses are applied to or digital pulses are output through a pin adjacent to a pin for which A/D conversion is in progress, the A/D converted value may not be as expected due to coupling noise. Accordingly, do not apply pulses to or output pulses from a pin adjacent to a pin for which A/D conversion is in progress.

a) Insert an inductor for the analog power input.
b) Wire the analog and digital supplies to a single point near the 5V power supply and provide separate wiring patterns on the board.
c) Place a bypass capacitor (electrolytic or laminated ceramic) near the common power supply.
d) Wire the analog and digital grounds to a single point near the power supplies, and provide separate wiring patterns for each on the board.
e) Place bypass capacitors (electrolytic or laminated ceramic) near the respective power supply pins.
f) Place capacitor Ce near the analog input pins of the device.

Figure 31.40 Example of Power Wiring

Note: C1: 4.7uF to 10uF
C2: 0.01uF to 0.1uF
Ce: 5 to 10nF
Re: 0 to 1kΩ
The values above are for reference.
D1, D2: $V_F \leq 0.3$ V

Figure 31.41 Example of Noise Protection for Analog Input Circuit

Capacitor C1 is effective for low-frequency noise, and capacitors C2 and Ce are effective for high-frequency noise.

The voltage on an AnVREF pin is undefined immediately after switching from the stopped state to the start of conversion operations, and this may have the effect of reducing the accuracy of conversion. As a countermeasure for this situation, connect capacitors C1 and C2 to the AnVREF pins.

Section 32 Key Return (KR)

This section contains a generic description of the Key Return (KR) function.

The first part in this section describes the RH850/F1K specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the KR.

32.1 Features of RH850/F1K KR

32.1.1 Number of Units and Channels

This microcontroller has the following number of KR units.

Table 32.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	1		
Name	KRn (n = 0)		

The KR unit has the Key Return function of the following number of channels.

Table 32.2 KRn Unit Configurations and Channels

Unit Name (Channel Name) KRn	No. of Channels	RH850/F1K 100 pins (8 ch)	RH850/F1K 144 pins (8 ch)	RH850/F1K 176 pins (8 ch)
KR0	8	√	√	√

Table 32.3 Indices

Index	Description
n	Throughout this section, the individual KR units are identified by the index “n” (n = 0); for example, KRnKRM indicates the key return mode register.
m	Throughout this section, the individual KR channels are identified by the index “m” (m = 0 to 7); for example, KRnKRMm indicates the key input enable bit of KRnKRM (key return mode register).

32.1.2 Register Base Address

KRn base addresses are listed in the following table.

KRn register addresses are given as offsets from the base addresses.

Table 32.4 Register Base Address

Base Address Name	Base Address
<KR0_base>	FFF7 8000_H

32.1.3 Clock Supply

The KRn clock supply is shown in the following table.

Table 32.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
KR0	PCLK	CPUCLK4	Module clock
	Register access clock	CPUCLK2	Bus clock
		CPUCLK4	

32.1.4 Interrupt Requests

KRn interrupt requests are listed in the following table:

Table 32.6 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
KR0			
INTKRn	Key interrupt	90	—

32.1.5 Reset Sources

KRn reset sources are listed in the following table. KRn is initialized by these reset sources.

Table 32.7 Reset Sources

Unit Name	Reset Source
KR0	All reset sources (ISORES)

32.1.6 External Input/Output Signals

External input/output signals of KRn are listed below.

Table 32.8 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
KR0		
KRnTPKR7 to KRnTPKR0	Key input signal	KR0I7 to KR0I0

32.2 Overview

32.2.1 Functional Overview

The Key Return function has the following features:

A key interrupt request signal (INTKRn) can be generated by inputting a falling signal, that goes from high to low, to any of the eight key input pins (KRnTPKR7 to KRnTPKR0).

32.2.2 Block Diagram

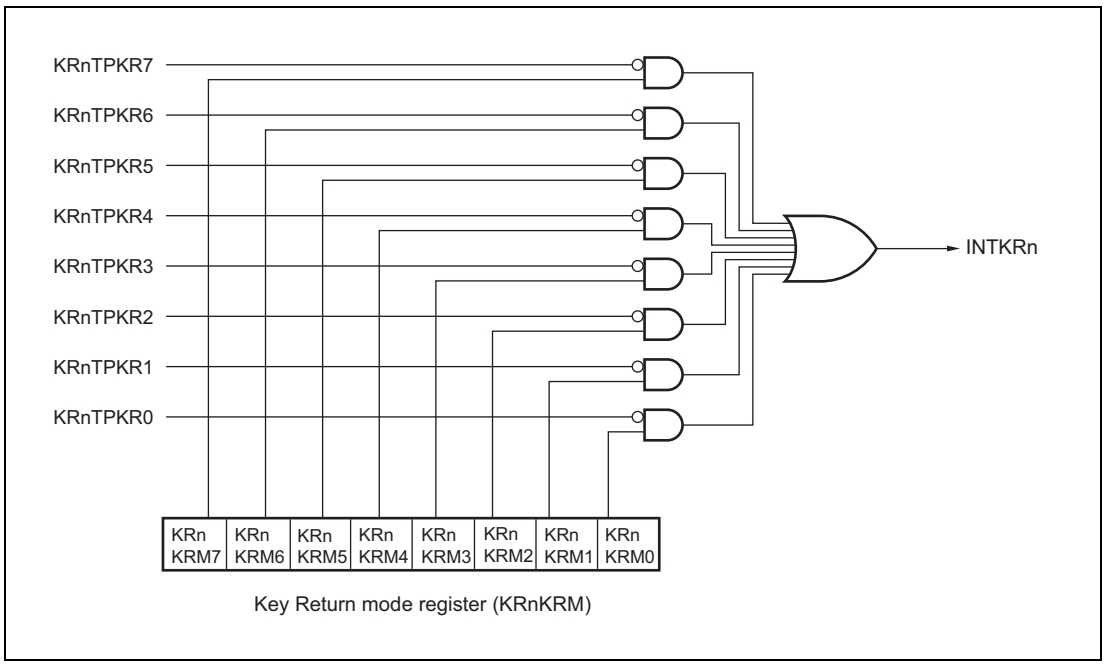


Figure 32.1 Block Diagram of the Key Return Function

32.3 Registers

32.3.1 List of Registers

KR registers are listed in the following table.

For details about <KRn_base>, see **Section 32.1.2, Register Base Address**.

Table 32.9 List of Registers

Module Name	Register Name	Symbol	Address
KRn	Key return mode register	KRnKRM	<KRn_base>

32.3.2 KRnKRM — Key Return Mode Register

This register enables/disables the key input signal detection.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: <KRn_base>

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	KRnKRM7	KRnKRM6	KRnKRM5	KRnKRM4	KRnKRM3	KRnKRM2	KRnKRM1	KRnKRM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.10 KRnKRM - Key Return Mode Register Contents

Bit position	Bit name	Function
7 to 0	KRnKRMm	Enables/disables the key input signal detection. 0: Disabled 1: Enabled

32.4 Operation

32.4.1 Interrupt Request INTKRn

The interrupt request INTKRn is generated when the level of the corresponding key input pin KRnTPKRm is changed from high to low while input to the key input pin KRnTPKRm is enabled (KRnKRM.KRnKRMm = 1).

Figure 32.2 shows how the interrupt request is generated:

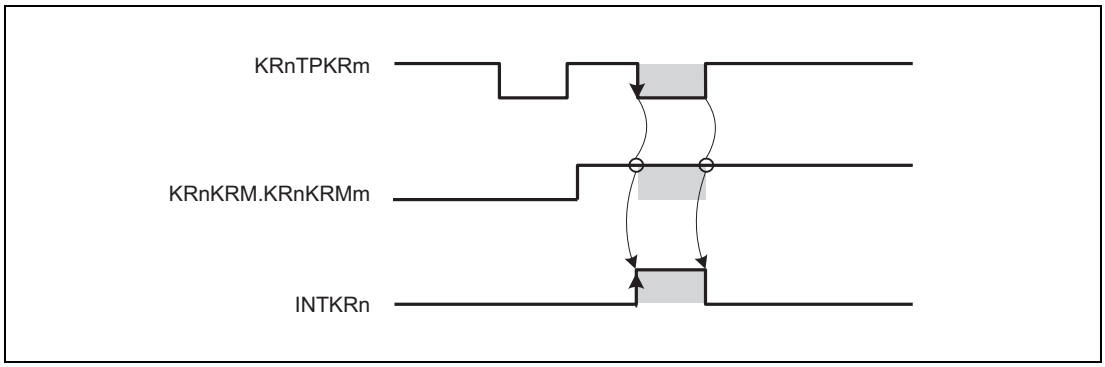

Figure 32.2 Interrupt Request Generation

CAUTIONS

1. **The change of a key input pin (KRnTPKRm) level from high to low does not trigger another INTKRn if any of the key return input pins are already low. The next INTKRn is only triggered by a key input pin level changing from high to low if all other key input pins are high.**
2. **If the key input value changes at the same time the setting of KRnKRM.KRnKRMm is changed, an unintended key interrupt request INTKRn might be generated. Therefore, mask (disable) INTKRn of the interrupt controller before changing KRnKRM.KRnKRMm from 0 to 1, or from 1 to 0.**

Section 33 Functional Safety

This section provides an overview of the safety mechanisms included in the RH850/F1K Series.

This microcontroller has been developed as a Safety Element out of Context (SEooC) in accordance with ISO26262.

For more information about the development process and safety mechanisms, please contact our sales office.

The following are the failure detection functions provided by this microcontroller.

33.1 Overview

ECC

Detects failures of memories and data transfer paths and corrects some types of failures.

Memory Protection

Detects erroneous access to memories and peripheral circuits to protect the data in these elements from erroneous access.

Clock Monitor

Monitors the clock operation to detect abnormal operations.

For details, see **Section 13, Clock Monitor (CLMA)**.

Data CRC

Generates CRC to detect data errors.

For details, see **Section 34, Data CRC (DCRA)**.

Write-Protected Registers

The write-protected registers are protected from inadvertent write access due to erroneous program execution.

For details, see **Section 5, Write-Protected Registers**.

33.2 ECC

33.2.1 Overview

This product incorporates an ECC for the following memories. The ECC enables detection and correction of errors of the data retained in the memories. The ECC also enables detection and correction of errors produced between the ECC encoder and memories and between memories and ECC decoder.

Table 33.1 ECC Overview

Applicable Memory		Applicable Data Width [bits]	Operation upon Error Detection					Failure Insertion
			Detection/ Correction	SYSERR	Interrupt Notice	Error Status	Address Capture	
Code flash		128	SEC-DED	DED*2	SEC-DED	Possible	Possible	Possible
Data flash		32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
Local RAM (CPU1/Self) Retention RAM (CPU1/Self)		32	SEC-DED	DED*2	SEC-DED	Possible	Possible	Possible
Peripheral RAM*1	CSIH	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible
	RSCAN, CAN FD	32	SEC-DED	—	SEC-DED	Possible	Possible	Possible

Note 1. For details of ECC for each peripheral IP, see the corresponding sections below.
- RS-CAN RAM: **Section 21.12, Detection and Correction of Errors in RS-CAN0 RAM** and **Section 21.23, Detection and Correction of Errors in RS-CAN RAM**
- CSIHnRAM: **Section 17.7, Detection and Correction of Errors in CSIHn RAM**

Note 2. For details, see **Section 33.2.2.2, Interrupt Requests** and **Section 33.2.4.2, Interrupt Requests**.

Applicable Data Width

This is the data width to be ECC encoded.

To write data with a smaller data width than shown, the following processing is required. ECC is also performed for a read in (1).

(1) Reading data to be ECC-encoded including data to be rewritten

(2) Replacing data to be rewritten

(3) Writing back data generated in (2)

Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected.

SED-DED: 1-bit errors and 2-bit errors can only be detected.

SYSERR

SYSERR can be generated upon error detection.

Interrupt Notice

An interrupt can be generated upon error detection.

Error Status

The status of a detected error is retained.

Address Capture

The address of a detected error is retained.

Failure Insertion

Self-diagnosis of the ECC decoder error notification function can be performed by using an intentionally generated ECC error.

33.2.2 Code Flash ECC

33.2.2.1 Overview

RH850/F1K has two code flash ECC decoder circuits implemented, one inside the Processor Element (PE1) and one on the VCI (system interconnect).

Figure 33.1 shows the location of two ECC decoders for the code flash.

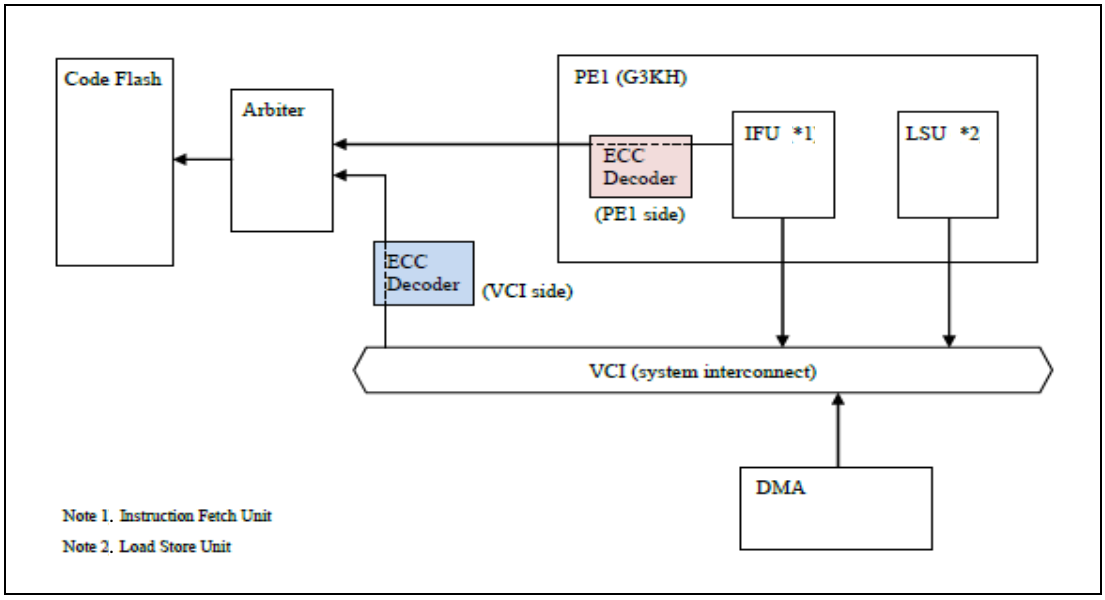

Figure 33.1 Block Diagram of Code Flash ECC

The code flash ECC is summarized in the table below.

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. • 2-bit error detection and 1-bit error detection/correction. • 2-bit error detection / 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. **ECC error:** • Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit errors is selectable. For details of the SYSERR, see **Section 3, CPU System**. • Enabling or disabling of error notification in the case of detection of a 1-bit ECC error is selectable. In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors can be monitored. The ECC 1-bit error status is set only when no error status has been set. The ECC 2-bit error status is set even when the ECC 1-bit error status is set. A register for clearing the error status is provided.

Item	Description
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also captured.
Self-diagnosis	ROM data and the ECC bit can be read directly. Arbitrary data can be written to ROM data and the ECC bit.
Inhibiting instruction execution	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching avoids the execution of incorrect instructions.

33.2.2.2 Interrupt Requests

Interrupt requests for code flash ECC are listed below.

Table 33.2 Code Flash ECC Interrupt Requests (During CPU Fetching)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	INTECCSCFLI0	—
—	ECC 2-bit error interrupt of code flash	SYSERR	—

Table 33.3 Code Flash ECC Interrupt Requests (During CPU Data Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	INTECCSCFLI0	—
—	ECC 2-bit error interrupt of code flash	INTECCSCFLI0 or SYSERR	—

Table 33.4 Code Flash ECC Interrupt Requests (During Bus Master Access except CPU)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of code flash	INTECCSCFLI0	—
—	ECC 2-bit error interrupt of code flash	INTECCSCFLI0	—

33.2.2.3 List of Registers

Table 33.5 List of Registers

Module Name	Register Name	Symbol*1	Address
CFECC_VCI	Code flash ECC control register (VCI)	CFECCCTL_VCI	FFC6 2200$_H$
	Code flash error information control register (VCI)	CFERRINT_VCI	FFC6 2204$_H$
	Code flash status clear register (VCI)	CFSTCLR_VCI	FFC6 2208$_H$
	Code flash error count overflow status register (VCI)	CFOVFSTR_VCI	FFC6 220C$_H$
	Code flash 1st error status register (VCI)	CF1STERSTR_VCI	FFC6 2210$_H$
	Code flash 1st error address register (VCI)	CF1STEADR0_VCI	FFC6 2250$_H$
CFECC_CPU1	Code flash ECC control register (PE1)	CFECCCTL_PE1	FFC6 2400$_H$
	Code flash error information control register (PE1)	CFERRINT_PE1	FFC6 2404$_H$
	Code flash status clear register (PE1)	CFSTCLR_PE1	FFC6 2408$_H$
	Code flash error count overflow status register (PE1)	CFOVFSTR_PE1	FFC6 240C$_H$
	Code flash 1st error status register (PE1)	CF1STERSTR_PE1	FFC6 2410$_H$
	Code flash 1st error address register (PE1)	CF1STEADR0_PE1	FFC6 2450$_H$
CFECC_VCI	Code flash sub-test control register (VCI)	CFSTSTCTL_VCI	FFC6 2350$_H$
CFECC_CPU1	Code flash sub-test control register (PE1)	CFSTSTCTL_PE1	FFC6 2550$_H$

Note 1. The registers suffixed with symbols "_VCI" and "_PE1" are provided to ECC controllers corresponding to each access port: registers with "_VCI" are provided to the ECC controller for access from the system interconnect 1 to the code flash and registers with "_PE1" are provided to the ECC controller for access from the CPU1.

33.2.2.4 Details of Registers

(1) CFECCCTL_VCI/PE1 — Code Flash ECC Control Register

CFECCCTL_VCI/PE1 enables or disables ECC error detection and correction and 1-bit error correction. When writing to CFECCCTL_VCI/PE1, PROT1 and PROT0 need to be 01_B.

Access: CFECCCTL_VCI and CFECCCTL_PE1 can be read or written in 32-bit units.
CFECCCTL_VCIL and CFECCCTL_PE1L can be read or written in 16-bit units.

Address: CFECCCTL_VCI: FFC6 2200_H
CFECCCTL_VCIL: FFC6 2200_H
CFECCCTL_PE1: FFC6 2400_H
CFECCCTL_PE1L: FFC6 2400_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 33.6 CFECCCTL_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFECCCTL.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) CFERRINT_VCI/PE1 — Code Flash Error Information Control Register

CFERRINT_VCI/PE1 enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: CFERRINT_VCI and CFERRINT_PE1 can be read or written in 32-bit units.
CFERRINT_VCIL and CFERRINT_PE1L can be read or written in 16-bit units.
CFERRINT_VCILL and CFERRINT_PE1LL can be read or written in 8-bit units.

Address: CFERRINT_VCI: FFC6 2204_H
CFERRINT_VCIL: FFC6 2204_H
CFERRINT_VCILL: FFC6 2204_H
CFERRINT_PE1: FFC6 2404_H
CFERRINT_PE1L: FFC6 2404_H
CFERRINT_PE1LL: FFC6 2404_H

Value after reset: $0000\ 0003_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE *1	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 33.7 CFERRINT_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE*1	ECC 2-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

Note 1. This bit is not supported in CFERRINT_PE1. When writing to this bit in CFERRINT_PE1, always write 1.

Note 2. Regarding the interrupt request, see the **33.2.2.2, Interrupt Requests**.

(3) CFSTCLR_VCI/PE1 — Code Flash Status Clear Register

CFSTCLR_VCI/PE1 clears the error flags in the error status register (CF1STERSTR_VCI/PE1), the overflow flag in the error overflow status register (CFOVFSTR_VCI/PE1), and the error address register (CF1STEADR0_VCI/PE1).

Access: CFSTCLR_VCI and CFSTCLR_PE1 are write-only registers that can be written in 32-bit units.
CFSTCLR_VCIL and CFSTCLR_PE1L are write-only registers that can be written in 16-bit units.
CFSTCLR_VCILL and CFSTCLR_PE1LL are write-only registers that can be written in 8-bit units.

Address: CFSTCLR_VCI: FFC6 2208$_H$
CFSTCLR_VCIL: FFC6 2208$_H$
CFSTCLR_VCILL: FFC6 2208$_H$
CFSTCLR_PE1: FFC6 2408$_H$
CFSTCLR_PE1L: FFC6 2408$_H$
CFSTCLR_PE1LL: FFC6 2408$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCLR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 33.8 CFSTCLR_VCI/_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	STCLR0	Error Status Clear 0: No effect (Setting 0 does not affect the DEDF0 and SEDF0 flags in CF1STERSTR; ERROVF0 flag in CFOVFSTR; and CF1STEADR0.) 1: Writing 1 to this bit clears the DEDF0 and SEDF0 flags in CF1STERSTR; ERROVF0 flag in CFOVFSTR; and CF1STEADR0.

(4) CFOVFSTR_VCI/PE1 — Code Flash Error Count Overflow Status Register

CFOVFSTR_VCI/PE1 monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set.

Access: CFOVFSTR_VCI and CFOVFSTR_PE1 are read-only registers that can be read in 32-bit units.
CFOVFSTR_VCIL and CFOVFSTR_PE1L are read-only registers that can be read in 16-bit units.
CFOVFSTR_VCILL and CFOVFSTR_PE1LL are read-only registers that can be read in 8-bit units.

Address: CFOVFSTR_VCI: FFC6 220C$_H$
CFOVFSTR_VCIL: FFC6 220C$_H$
CFOVFSTR_VCILL: FFC6 220C$_H$
CFOVFSTR_PE1: FFC6 240C$_H$
CFOVFSTR_PE1L: FFC6 240C$_H$
CFOVFSTR_PE1LL: FFC6 240C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.9 CFOVFSTR_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF0	Error Overflow Flag ERROVF0 shows whether a second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register has occurred, except when both of the error address and source of the second error are the same as those of the first error. 0: Did not occur. 1: Occurred. Clearing condition: Set the STCLR0 bit in CFSTCLR to 1.

(5) CF1STERSTR_VCI/PE1 — Code Flash 1st Error Status Register

CF1STERSTR_VCI/PE1 monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0. If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the 2-bit ECC error flag is set while retaining the 1-bit ECC error flag.

Access: CF1STERSTR_VCI and CF1STERSTR_PE1 are read-only registers that can be read in 32-bit units.
CF1STERSTR_VCIL and CF1STERSTR_PE1L are read-only registers that can be read in 16-bit units.
CF1STERSTR_VCILL and CF1STERSTR_PE1LL are read-only registers that can be read in 8-bit units.

Address: CF1STERSTR_VCI: FFC6 2210$_H$
CF1STERSTR_VCIL: FFC6 2210$_H$
CF1STERSTR_VCILL: FFC6 2210$_H$
CF1STERSTR_PE1: FFC6 2410$_H$
CF1STERSTR_PE1L: FFC6 2410$_H$
CF1STERSTR_PE1LL: FFC6 2410$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF0	SEDF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.10 CF1STERSTR_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF0	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. Clearing condition: Set the STCLR0 bit in CFSTCLR to 1. Setting condition: ECC 2-bit error is detected when DEDF0 is 0.
0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected when DEDF0 flag is 0. Clearing condition: Set the STCLR0 bit in CFSTCLR to 1. Setting condition: ECC 1-bit error is detected when DEDF0, SEDF0 are 0.

(6) CF1STEADR0_VCI/PE1 — Code Flash 1st Error Address Register

CF1STEADR0_VCI/PE1 holds the address at which an error has occurred.

The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR_VCI/PE1. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error occurs, the address is not updated.

In addition, the EADR[24:4] bits in this register correspond to the [24:4] bits of the real address. The real address can be calculated by adding the upper address [31:25] bits, to which code flash is mapped, as a base address.

The CF1STERSTR register is cleared by an internal reset, external reset, or by setting the STCLR bit in the CFSTCLR register to 1.

Access: CF1STEADR0_VCI and CF1STEADR0_PE1 are read-only registers that can be read in 32-bit units.
CF1STEADR0_VCIL, CF1STEADR0_VCIH, CF1STEADR0_PE1L and CF1STEADR0_PE1H are read-only registers that can be read in 16-bit units.
CF1STEADR0_VCILL, CF1STEADR0_VCILH, CF1STEADR0_VCIHL, CF1STEADR0_VCIHH, CF1STEADR0_PE1LL, CF1STEADR0_PE1LH, CF1STEADR0_PE1HL and CF1STEADR0_PE1HH are read-only registers that can be read in 8-bit units.

Address: CF1STEADR0_VCI: FFC6 2250$_H$
CF1STEADR0_VCIL: FFC6 2250$_H$
CF1STEADR0_VCIH: FFC6 2252$_H$
CF1STEADR0_VCILL: FFC6 2250$_H$
CF1STEADR0_VCILH: FFC6 2251$_H$
CF1STEADR0_VCIHL: FFC6 2252$_H$
CF1STEADR0_VCIHH: FFC6 2253$_H$
CF1STEADR0_PE1: FFC6 2450$_H$
CF1STEADR0_PE1L: FFC6 2450$_H$
CF1STEADR0_PE1H: FFC6 2452$_H$
CF1STEADR0_PE1LL: FFC6 2450$_H$
CF1STEADR0_PE1LH: FFC6 2451$_H$
CF1STEADR0_PE1HL: FFC6 2452$_H$
CF1STEADR0_PE1HH: FFC6 2453$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	EADR[24:16]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EADR[15:4]												—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.11 CF1STEADR0_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned.
24 to 4	EADR[24:4]	1st Error Address Monitors the address of the first error. The error address is updated if an error occurs while all the error flags are 0 in CF1STERSTR. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. If an ECC 2-bit error occurs, the address is not updated. Clearing condition: Set the STCLR0 bit in CFSTCLR to 1.
3 to 0	Reserved	When read, the value after reset is returned.

(7) CFSTSTCTL_VCI/PE1 — Code Flash Sub-Test Control Register

CFSTSTCTL_VCI/PE1 is used for the ECC test (self-diagnosis). This register is dedicated for code flash. After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read directly.

When writing to CFSTSTCTL_VCI/PE1, PROT1 and PROT0 need to be 01_B.

Access: CFSTSTCTL_VCI and CFSTSTCTL_PE1 can be read or written in 32-bit units.
CFSTSTCTL_VCIL and CFSTSTCTL_PE1L can be read or written in 16-bit units.

Address: CFSTSTCTL_VCI: FFC6 2350_H
CFSTSTCTL_VCIL: FFC6 2350_H
CFSTSTCTL_PE1: FFC6 2550_H
CFSTSTCTL_PE1L: FFC6 2550_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 33.12 CFSTSTCTL_VCI/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST bit. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to CFSTSTCTL.
14	PROT0	
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, ECC bits can be read directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

Correctly reading instructions from the code flash access port is not possible while ECC test mode is selected (ECCTST = 1). While the access port for the CPU is set to test mode (including during changes to the value of the ECCTST bit), the CPU must run a program from the local RAM or retention RAM and must not fetch instructions from the code flash memory.

The CPU has a small data buffer. If an old value remains in this buffer, the correct value cannot be read even when the ECCTST bit is switched. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see **Section 3, CPU System**.

From the code flash access port with ECC test mode selected, access must be made by reading 4 bytes aligned to 16n address. The results of reading code flash are as follows:

Table 33.13 Results of Reading Code Flash

Bit Number	Meaning	Bit Position	Description
bit[31:10]	all-0	31 to 10	These bits are always 0.
bit[9]	Reserved	9	Unknown
bit[8:0]	ECC bits	8 to 0	ECC bits

33.2.3 Data Flash ECC

33.2.3.1 Overview

The data flash ECC is summarized in the table below.

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. • 2-bit error detection / 1-bit error detection and correction. • 2-bit error detection / 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, this function is enabled, and 1-bit errors are detected and corrected, 2-bit errors are detected.
Error notification	A notification is sent when an ECC error occurs. • It is notified to the interrupt controller. Enabling or disabling of error notification in the case of detection of ECC 1-bit error is selectable. • Enabling or disabling of error notification in the case of detection of ECC 2-bit errors is selectable. In the initial state, error notification is enabled upon detection of an ECC 2-bit error and error notification is disabled upon detection of an ECC 1-bit error. However, if an interrupt is masked by the FEINTFMSK register of the Interrupt Controller, an interrupt processing is not executed.
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors is can be monitored. The function is set only while no error status is set. A register for clearing the error status is provided.
Address capture	When no ECC error status has been set, the address at which the first ECC error occurred is captured. ECC error address is captured when both SEDF and DEDF of DFERSTR are 0.
Self-diagnosis	ROM data and the ECC bit can be read directly. Arbitrary data can be written to ROM data and the ECC bit.

33.2.3.2 Interrupt Requests

The interrupt requests for data flash ECC are shown below.

Table 33.14 Data Flash ECC Interrupt Requests (During Read Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of data flash	INTECCDEEP0	—
—	ECC 2-bit error interrupt of data flash	INTECCDEEP0	—

33.2.3.3 List of Registers

Table 33.15 List of Registers

Module Name	Register Name	Symbol	Address
DFECC	Data flash ECC control register	DFECCCTL	FFC6 2A00$_H$
	Data flash error status register	DFERSTR	FFC6 2A04$_H$
	Data flash error status clear register	DFERSTC	FFC6 2A08$_H$
	Data flash error overflow status register	DFOVFSTR	FFC6 2A0C$_H$
	Data flash error overflow status clear register	DFOVFSTC	FFC6 2A10$_H$
	Data flash error notification control register	DFERRINT	FFC6 2A14$_H$
	Data flash 1st error address register	DFEADR	FFC6 2A18$_H$
	Data flash test control register	DFTSTCTL	FFC6 2A1C$_H$

33.2.3.4 Details of Registers

(1) DFECCCTL — Data Flash ECC Control Register

DFECCCTL enables or disables ECC error detection and correction and 1-bit error correction. When writing to DFECCCTL, PROT1 and PROT0 need to be 01_B.

Access: DFECCCTL can be read or written in 16-bit units.

Address: DFECCCTL: FFC6 $2A00_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SEDDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 33.16 DFECCCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCDIS and SEDDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFECCCTL.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SEDDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.

The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection and correction are enabled, and the DEDF bit is set if an ECC 2-bit error is detected.

Access: DFERSTR is a read-only register that can be read in 8-bit units.

Address: DFERSTR: FFC6 2A04$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDF	SEDF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 33.17 DFERSTR Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	DEDF	ECC 2-Bit Error Monitor Flag 0: An ECC 2-bit error is not detected. 1: An ECC 2-bit error is detected. Clearing condition: Set the ERRCLR bit in DFERSTC to 1. Setting condition: ECC 2-bit error is detected when both SEDF and DEDF are 0.
0	SEDF	ECC 1-Bit Error Monitor Flag 0: An ECC 1-bit error is not detected. 1: An ECC 1-bit error is detected. Clearing condition: Set the ERRCLR bit in DFERSTC to 1. Setting condition: ECC 1-bit error is detected when both SEDF and DEDF are 0.

(3) DFERSTC — Data Flash Error Status Clear Register

DFERSTC clears the error flags in the data flash error status register.

Access: DFERSTC is a write-only register that can be written in 8-bit units.

Address: DFERSTC: FFC6 2A08$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERRCLR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 33.18 DFERSTC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ERRCLR	SEDF/DEDF Flag Clear 0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF and SEDF flags in DFERSTR.) 1: The SEDF/DEDF flag in DFERSTR is cleared.

(4) DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of data flash error overflow.

Access: DFOVFSTR is a read-only register that can be read in 8-bit units.

Address: DFOVFSTR: FFC6 2A0C$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 33.19 DFOVFSTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF	Error Overflow Flag ERROVF is set if an ECC error occurs while the error address register is full. 0: Did not occur. 1: Occurred. Clearing condition: Set the ERROVFCLR bit in data flash error overflow status clear register.

(5) DFOVFSTC — Data Flash Error Overflow Status Clear Register

DFOVFSTC clears the data flash error overflow flag.

Access: DFOVFSTC is a write-only register that can be written in 8-bit units.

Address: DFOVFSTC: FFC6 2A10$_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ERROVFCLR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 33.20 DFOVFSTC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ERROVFCLR	Error Overflow Flag Clear 0: No effect (Setting the ERROVFCLR bit to 0 does not affect the ERROVF flag in DFOVFSTR.) 1: The ERROVF flag in DFOVFSTR is cleared.

(6) DFERRINT — Data Flash Error Notification Control Register

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: DFERRINT can be read or written in 8-bit units.

Address: DFERRINT: FFC6 2A14$_H$

Value after reset: 02_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 33.21 DFERRINT Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	ECC 2-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Control Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(7) DFEADR — Data Flash 1st Error Address Register

DFEADR holds the address at which an ECC error has occurred while both of the SEDF and DEDF bits in the data flash error status register are 0.

Access: DFEADR is a read-only register that can be read in 32-bit units.

Address: DFEADR: FFC6 2A18$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	DFEADR[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DFEADR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.22 DFEADR Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned.
20 to 2	DFEADR[20:2]	ECC Error Address DFEADR is read-only field to monitor the address at which an ECC error has occurred. This register holds an internal address. Convert it to the actual address by adding the data flash base address FF20 0000$_H$.
1 to 0	Reserved	When read, the value after reset is returned.

(8) DFTSTCTL — Data Flash Test Control Register

DFTSTCTL is used for the ECC test.

After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read.

When writing to DFTSTCTL, PROT1 and PROT0 need to be 01_B.

Access: DFTSTCTL can be read or written in 16-bit units.

Address: FFC6 2A1C$_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 33.23 DFTSTCTL Register Contents

Bit Position	Bit Name	Function
15	PROT1	Enables or disables modification of the ECCTST bit. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to DFTSTCTL.
14	PROT0	
13 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ECCTST	ECC Test Sets ECC test mode. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).

33.2.4 Local RAM (Including the Retention RAM) ECC

33.2.4.1 Overview

CAUTION

The retention RAM is a part of the local RAM. The ECC for the retention RAM is shared with the local RAM. Therefore, use for the retention RAM the same register as that for the local RAM.

Local RAM ECC of CPU1 is summarized in the table below.

Item	Description
ECC error detection and correction	ECC error detection and correction can be enabled or disabled. When enabled, either of the following settings can be selected. • 2-bit error detection and 1-bit error detection/correction. • 2-bit error detection and 1-bit error detection. When disabled, neither error detection nor correction is carried out. In the initial state, the ECC function is enabled, and 1-bit errors are detected and corrected, 2-bit errors detected.
Error notification	A notification is sent when an ECC error occurs. **ECC error:** • Enabling or disabling of error (SYSERR exception) notification in the case of detection of ECC 2-bit errors is selectable. For details of the SYSERR, see **Section 3, CPU System**. • Enabling or disabling of error notification in the case of detection of ECC 1-bit errors is selectable. In the initial state, notification of the 2-bit error is enabled and notification of the 1-bit error is enabled. However, if an interrupt is masked by the FEINTFMSK register of the interrupt controller, an interrupt processing is not executed.
Error status	The detection of ECC 2-bit errors and ECC 1-bit errors is can be monitored. The function is set only while no error status is set. A register for clearing the error status is provided.
Address capture	When no error status has been set, the address at which the first error occurred is captured. In addition, when the retained address source is a 1-bit ECC error, the address of the 2-bit ECC error is also captured.
Self-diagnosis	Arbitrary data can be written to RAM data and the ECC bit. RAM data and the ECC bit can be read directly.
Others	Generating a SYSERR exception in response to the detection of a 2-bit ECC error during instruction fetching prevents the execution of incorrect instructions.

CAUTION

When ECC error detection/correction for the local RAM is enabled for access, initialize the RAM with the 32-bit length of RAM access before the RAM is used. If the RAM before initialization is read, an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

Moreover, if the RAM is not initialized with the 32-bit length (for example, initialized with 8- or 16-bit length of access), an FE-level maskable interrupt or SYSERR exceptional processing may be generated.

33.2.4.2 Interrupt Requests

Local RAM ECC interrupt requests are listed below.

Table 33.24 Local RAM ECC Interrupt Requests (During CPU Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	INTECCRAM	—
—	ECC 2-bit error interrupt of RAM	INTECCRAM or SYSERR	—

Table 33.25 Local RAM ECC Interrupt Requests (During Read Access except CPU Access)

Unit Interrupt Signal	Description	Name	DMA Trigger Number
—	ECC 1-bit error interrupt of RAM	INTECCRAM	—
—	ECC 2-bit error interrupt of RAM	INTECCRAM	—

33.2.4.3 List of Registers

Table 33.26 List of Registers

Module Name	Register Name	Symbol	Address
LRTST	Local RAM test control register (PE1)	LRTSTCTL_PE1	FFC6 5004_H
	Local RAM test data read buffer 0 (PE1)	LRTDATBF0_PE1	FFC6 5008_H
LRECC	Local RAM ECC control register (PE1)	LRECCCTL_PE1	FFC6 5400_H
	Local RAM error information control register (PE1)	LRERRINT_PE1	FFC6 5404_H
	Local RAM status clear register (PE1)	LRSTCLR_PE1	FFC6 5408_H
	Local RAM error count overflow status register (PE1)	LROVFSTR_PE1	FFC6 $540C_H$
	Local RAM 1st error status register (PE1)	LR1STERSTR_PE1	FFC6 5410_H
	Local RAM 1st error address register 0 (PE1)	LR1STEADR0_PE1	FFC6 5450_H

33.2.4.4 Details of Registers

(1) LRTSTCTL_PE1 — Local RAM Test Control Register

LRTSTCTL is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, any data can be written to the ECC bits. The DATSEL bit is used to select RAM data or the ECC bits.

When writing to LRTSTCTL, PROT1 and PROT0 need to be 01_B.

Access: LRTSTCTL_PE1 register can be read or written in 32-bit units.
LRTSTCTL_PE1L register can be read or written in 16-bit units.

Address: LRTSTCTL_PE1: FFC6 5004_H
LRTSTCTL_PE1L: FFC6 5004_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST	DATSEL
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 33.27 LRTSTCTL Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCTST and DATSEL bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRTSTCTL.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC bits can be read directly. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1).
0	DATSEL	Data Select This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: RAM data is selected. 1: The ECC bits are selected.

CAUTION

When ECC test mode for the local RAM is enabled (ECCTST = 1), the local RAM should be accessed in 4-byte units.

(2) LRTDATBF0_PE1 — Local RAM Test Data Read Buffer 0

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

Access: LRTDATBF0_PE1 register is a read only register that can be read in 32-bit units.

Address: FFC6 5008_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	LRDATABF[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.28 LRTDATBF0 Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned.
6 to 0	LRDATABF [6:0]	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the local RAM, the ECC bits for the local RAM are stored in LRTDATABF[6:0].

(3) LRECCCTL_PE1 — Local RAM ECC Control Register

LRECCCTL enables or disables ECC error detection and correction and 1-bit error correction.

When writing to LRECCCTL, PROT1 and PROT0 need to be 01_B.

Access: LRECCCTL_PE1 register can be read or written in 32-bit units.
LRECCCTL_PE1L register can be read or written in 16-bit units.

Address: LRECCCTL_PE1: FFC6 5400_H
LRECCCTL_PE1L: FFC6 5400_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 33.29 LRECCCTL Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to LRECCCTL.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables correction of a 1-bit error upon detection. 1: Disables correction of a 1-bit error upon detection.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with the setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(4) LRERRINT_PE1 — Local RAM Error Information Control

LRERRINT enables or disables generation of the error notification signal to the interrupt controller upon detection of an ECC 2-bit error or an ECC 1-bit error.

Access: LRERRINT_PE1 register can be read or written in 32-bit units.
LRERRINT_PE1L register can be read or written in 16-bit units.
LRERRINT_PE1LL register can be read or written in 8-bit units.

Address: LRERRINT_PE1: FFC6 5404$_H$
LRERRINT_PE1L: FFC6 5404$_H$
LRERRINT_PE1LL: FFC6 5404$_H$

Value after reset: 0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 33.30 LRERRINT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DEDIE	ECC 2-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(5) LRSTCLR_PE1 — Local RAM Status Clear Register

LRSTCLR clears the error flags in the error status register (LR1STERSTR), the overflow flag in the error overflow status register (LROVFSTR), and the error address register (LR1STEADR0). LRSTCLR is a write-only register and is always read as 0.

Access: LRSTCLR_PE1 register is a write only register that can be written in 32-bit units.
LRSTCLR_PE1L register is a write only register that can be written in 16-bit units.
LRSTCLR_PE1LL register is a write only register that can be written in 8-bit units.

Address: LRSTCLR_PE1: FFC6 5408$_H$
LRSTCLR_PE1L: FFC6 5408$_H$
LRSTCLR_PE1LL: FFC6 5408$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 33.31 LRSTCLR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	STCLR0	Error Status Flag Clear Writing 1 to this bit clears the DEDF0 and SEDF0 flags in LR1STERSTR; ERROVF0 flag in LROVFSTR; and LR1STEADR0.

(6) LROVFSTR_PE1 — Local RAM Error Count Overflow Status Register

LROVFSTR monitors occurrence of error overflow. If a second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF0 is cleared by an internal reset, an external reset, or setting the STCLR0 bit to 1 in LRSTCLR.

Access: LROVFSTR_PE1 register is a read only register that can be read in 32-bit units.
LROVFSTR_PE1L register is a read only register that can be read in 16-bit units.
LROVFSTR_PE1LL register is a read only register that can be read in 8-bit units.

Address: LROVFSTR_PE1: FFC6 540C$_H$
LROVFSTR_PE1L: FFC6 540C$_H$
LROVFSTR_PE1LL: FFC6 540C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.32 LROVFSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ERROVF0	Error Overflow Flag ERROVF0 is set if a second error occurs while any of the error flags (DEDF0 and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(7) LR1STERSTR_PE1 — Local RAM 1st Error Status Register

LR1STERSTR monitors occurrence of the first error. The error status is set if an error occurs while the error flag is 0.

If more than one error occurs simultaneously, all the corresponding error flags are set. LR1STERSTR is cleared by an internal reset, an external reset, or setting 1 to the STCLR0 bit in LRSTCLR.

Access: LR1STERSTR_PE1 register is a read only register that can be read in 32-bit units.
LR1STERSTR_PE1L register is a read only register that can be read in 16-bit units.
LR1STERSTR_PE1LL register is a read only register that can be read in 8-bit units.

Address: LR1STERSTR_PE1: FFC6 5410$_H$
LR1STERSTR_PE1L: FFC6 5410$_H$
LR1STERSTR_PE1LL: FFC6 5410$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.33 LR1STERSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	DEDF0	ECC 2-Bit Error Monitor Flag 0: ECC 2-bit error is not detected. 1: ECC 2-bit error is detected. Clearing condition: Set the STCLR0 bit in LRSTCLR to 1. Setting condition: ECC 2-bit error is detected with DEDF0 being 0.
0	SEDF0	ECC 1-Bit Error Monitor Flag 0: ECC 1-bit error is not detected. 1: ECC 1-bit error is detected. Clearing condition: Set the STCLR0 bit in LRSTCLR to 1. Setting condition: ECC 1-bit error is detected with both SEDF0 and DEDF0 being 0.

(8) LR1STEADR0_PE1 — Local RAM 1st Error Address Register 0

LR1STEADR0 holds the address at which an error has occurred.

The error address is set if an error occurs while error flags are 0 in LR1STERSTR. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.

Since this register holds the internal address, add the base address of the associated memory to transform the internal address to the real address. LR1STEADR0 is cleared by an internal reset, an external reset, or setting the STCLR0 bit to 1 in LRSTCLR.

Access: LR1STEADR0_PE1 register is a read only register that can be read in 32-bit units.
LR1STEADR0_PE1L and LR1STEADR0_PE1H registers are read only registers that can be read in 16-bit units.
LR1STEADR0_PE1LL, LR1STEADR0_PE1LH, and LR1STEADR0_PE1HL registers are read only registers that can be read in 8-bit units.

Address: LR1STEADR0_PE1: FFC6 5450$_H$
LR1STEADR0_PE1L: FFC6 5450$_H$,
LR1STEADR0_PE1H: FFC6 5452$_H$
LR1STEADR0_PE1LL: FFC6 5450$_H$,
LR1STEADR0_PE1LH: FFC6 5451$_H$,
LR1STEADR0_PE1HL: FFC6 5452$_H$

Value after reset: 0000 0000$_H$

Table 33.34 LR1STEADR0 Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned.
18 to 2	EADR[18:2]	1st Error Address Monitors the address of the first error. The error address is held if an error occurs while all the error flags are 0 in LR1STERSTR. The address is updated if an ECC 2-bit error occurs while the ECC 1-bit error flag is set as the first error. Once an ECC 2-bit error occurs, the address is not updated.
1 to 0	Reserved	When read, the value after reset is returned.

33.2.5 Peripheral RAM ECC

CSIH and RS-CAN have the ECC function for RAM. For details of these ECC function, see **Section 17.7, Detection and Correction of Errors in CSIHn RAM**, **Section 21.12, Detection and Correction of Errors in RS-CAN0 RAM** and **Section 21.23, Detection and Correction of Errors in RS-CAN RAM**.

33.3 Memory Protection

33.3.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU
  The CPU protects memory against illegal access by itself. The CPU does not generate the signals for access to addresses where access is prohibited by the MPU. For details, see the *RH850 Family User's Manual: Software*.
- Slave Guard
  A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.
  - PEG
    The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG. For details, see **Section 3, CPU System**.
  - PBG
    The control registers in the peripheral circuits are protected against illegal accesses. For details, see **Section 33.3.2, PBG**.
  - PBGC
    The CPU system has a dedicated PBG function which is called a PBG for CPU system. For details, see **Section 33.3.3, PBG for CPU System**.

33.3.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.

Table 33.35 Identifiers for Slave Guard

Identifier	Function
UM	When the CPU makes an access, this indicates the operating mode of the CPU. 0: Supervisor mode 1: User mode When the DMAC makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 0.
SPID	When the CPU makes an access, this indicates the system protection identifier SPID that is assigned to the CPU. When the DMAC makes an access, the value of this identifier is the value in the channel master setting register. When another master makes an access, the value of this identifier is always 00_B.
PEID	This indicates the access source bus master. 000_B: Reserved 001_B: CPU1 010_B: Reserved 011_B: Reserved 100_B: Reserved 101_B: Reserved 110_B: Reserved 111_B: Reserved When the DMAC makes an access, the value of this identifier is the value in the channel master setting register.

33.3.2 PBG

The PBG module is divided into several PBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG channel can designate the access against which a single peripheral circuit should be protected.

Each PBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG group names, and the PBG channel numbers.

Table 33.36 PBG Groups and Channels and Target Modules (1/4)

PBG Group	Group No.	PBG Channel Number	Protection Target Module	Target Register
PBG10	00	0	FENMI	WDTNMIF WDTNMIFC
		1	FEINT	FEINTF FEINTFMSK FEINTFC

Table 33.37 List of PBG Protection Registers (4/4)

PBG Group	Group No.	Register Symbol	Register Name	R/W	Value after Reset	Address	Access Size	Power Domain
PBG50	06	FSGD06PROT0	PBG06 protection register 0	R/W	066F FFF7$_H$	FFF9 0000$_H$	8/16/32	ISO
		FSGD06PROT1	PBG06 protection register 1	R/W	0647 FF77$_H$	FFF9 0004$_H$	8/16/32	
		—	Reserved	—	—	FFF9 0008$_H$	—	
		—	Reserved	—	—	FFF9 000C$_H$	—	
		FSGD06PROT4	PBG06 protection register 4	R/W	066F FFF7$_H$	FFF9 0010$_H$	8/16/32	
		FSGD06PROT5	PBG06 protection register 5	R/W	066F FFF7$_H$	FFF9 0014$_H$	8/16/32	
		—	Reserved	—	—	FFF9 0018$_H$	—	
		FSGD06PROT7	PBG06 protection register 7	R/W	066F FFF7$_H$	FFF9 001C$_H$	8/16/32	
		FSGD06PROT8	PBG06 protection register 8	R/W	066F FFF7$_H$	FFF9 0020$_H$	8/16/32	

The following table lists the registers provided for each PBG group.

Table 33.38 List of PBG Error Registers

Module Name	Register Symbol	Register Name	R/W	Value after Reset	Address	Access Size
PBGxx	ERRSLVxxCTL	PBGxx error control register	W	0000 0000_H	<base_addr0> + 0_H	8/16/32
	ERRSLVxxSTAT	PBGxx error status register	R	0000 0000_H	<base_addr0> + 4_H	8/16/32
	ERRSLVxxADDR	PBGxx error address register	R	0000 0000_H	<base_addr0> + 8_H	32
	ERRSLVxxTYPE	PBGxx error type register	R	0000 0000_H	<base_addr0> + C_H	16/32

In the above table, “xx” in the register names and symbols represents the PBG group numbers. The table below shows the base address values <base_addr0>, which correspond to each of the PBG group numbers.

Table 33.39 PBG Group Numbers and Error Base Addresses

PBG Group	PBG Group Number	<base_addr0>
PBG10	00	FFC4 0040_H
PBG11	01	FFC4 0140_H
PBG12	07	FFC4 0440_H
PBG13	08	FFC4 0540_H
PBG20	02	FFDD $D040_H$
PBG21	09	FFDD $D140_H$
PBG30	03	FFF9 4040_H
PBG31	04	FFF9 4140_H
PBG32	05	FFF9 4240_H
PBG50	06	FFF9 0040_H

33.3.2.2 Details of Registers

(1) FSGDxxPROTn — PBGxx Protection Register n

FSGDxxPROTn specifies the access to be rejected for protecting the target peripheral circuit control registers. Any access that is disabled with any of the identifiers is rejected as an illegal access. "n" in the register names and symbols represents the PBG channel number.

Access: FSGDxxPROTn register can be read or written in 32-bit units.
FSGDxxPROTnL and FSGDxxPROTnH registers can be read or written in 16-bit units.
FSGDxxPROTnLL, FSGDxxPROTnLH, FSGDxxPROTnHL, and FSGDxxPROTnHH registers can be read or written in 8-bit units.

Address: See **Table 33.37, List of PBG Protection Registers**

Value after reset: See **Table 33.37, List of PBG Protection Registers**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROTLOCK	—	—	—	—	—	PROTUM	PROTPEID[7:0]								—
Value after reset	0	0	0	0	0	1	1	*1	*1	*1	*1	*1	*1	*1	*1	1
R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—							PROTSPID[3:0]				—	PROTRDPDEF	PROTWRPDEF	PROTRD	PROTWR
Value after reset	1	1	1	1	1	1	1	*1	*1	*1	*1	1	0	1	1	1
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Note 1. It varies depending on each register. See **Section 33.3.2.1, List of Registers**.

Table 33.40 FSGDxxPROTn Register Contents (1/2)

Bit Position	Bit Name	Function
31	PROTLOCK	Register Lock 0: Enables FSGDxxPROTn rewrite. 1: Disables FSGDxxPROTn rewrite. When PROTLOCK is set to 1, the value is held until reset is asserted.
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 17	PROTPEID[7:0]	PEID Access*1 The PROTPEID field is a bit list, in which one bit corresponds to one PEID value. Setting multiple bits enables multiple ID values simultaneously. For example, setting the PROTPEID field to 0000 0110_B enables access with PEID = 1 and PEID = 2. 0: Disables access with PEIDn. 1: Enables access with PEIDn.
16 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 5	PROTSPID[3:0]	SPID Access*2 The PROTSPID field is a bit list, in which one bit corresponds to one SPID value. Setting multiple bits enables multiple SPID values simultaneously. For example, setting the PROTSPID field to 0110_B enables access with SPID = 1 and SPID = 2. 0: Disables access with SPIDn. 1: Enables access with SPIDn.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 33.40 FSGDxxPROTn Register Contents (2/2)

Bit Position	Bit Name	Function
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master. 1: Only enables read access from the master having passed the filter.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master. 1: Only enables write access from the master having passed the filter.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

(2) ERRSLVxxCTL — PBGxx Error Control Register

ERRSLVxxCTL clears the status in error status register PBGxx.

Access: ERRSLVxxCTL register is a write only register that can be written in 32-bit units.
ERRSLVxxCTLL register is a write only register that can be written in 16-bit units.
ERRSLVxxCTLLL register is a write only register that can be written in 8-bit units.

Address: ERRSLVxxCTL: <base_addr0> + 0_H
ERRSLVxxCTLL: <base_addr0> + 0_H
ERRSLVxxCTLLL: <base_addr0> + 0_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 33.41 ERRSLVxxCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CLRO	Clears the overflow flag. 0: Does not clear the overflow flag. 1: Clears the overflow flag.
0	CLRE	Clears the error flag. 0: Does not clear the error flag. 1: Clears the error flag.

CLRO	CLRE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

(3) ERRSLVxxSTAT — PBGxx Error Status Register

ERRSLVxxSTAT holds the status of the illegal access rejected with the PBGxx.

Access: ERRSLVxxSTAT register is a read only register that can be read in 32-bit units.
ERRSLVxxSTATL register is a read only register that can be read in 16-bit units.
ERRSLVxxSTATLL register is a read only register that can be read in 8-bit units.

Address: ERRSLVxxSTAT: <base_addr0> + 4_H
ERRSLVxxSTATL: <base_addr0> + 4_H
ERRSLVxxSTATLL: <base_addr0> + 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.42 ERRSLVxxSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred. If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBG error entry stages is 1. Note that this overflow is not notified to INTGUARD. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	Error Status Flag 0: No PBG protection violation 1: A PBG protection violation occurred.

(4) ERRSLVxxADDR — PBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx. The register is not updated when corresponding ERRSLVxxSTAT.ERR is 1.

Access: ERRSLVxxADDR register is a read only register that can be read in 32-bit units.

Address: <base_addr0> + 8_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.43 ERRSLVxxADDR Register Contents

Bit Position	Bit Name	Function
31 to 2	ADDR[31:2]	Address in which the PBG protection violation is generated.
1, 0	Reserved	When read, the value after reset is returned.

(5) ERRSLVxxTYPE — PBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx.

Access: ERRSLVxxTYPE register is a read only register that can be read in 32-bit units.
ERRSLVxxTYPEL register is a read only register that can be read in 16-bit units.

Address: ERRSLVxxTYPE: <base_addr0> + C_H
ERRSLVxxTYPEL: <base_addr0> + C_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 33.44 ERRSLVxxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	PEID of the access source from which the PBG protection violation is generated.
12 to 10	Reserved	When read, the value after reset is returned.
9, 8	SPID[1:0]	SPID of the access source from which the PBG protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBG protection violation is generated.
5	Reserved	When read, the value after reset is returned.
4 to 1	Reserved	These bits are read as an undefined value.
0	WRITE	This bit is set to 1 when the access that has generated the PBG protection violation is a write access.

33.3.3 PBG for CPU System

The PBGC module is divided into two PBGC groups, PBGC0 and PBGC1. PBGC0 group contains protection registers for INTC2 and DMA functions. PBGC1 group contains protection registers for ECC control function etc. Each PBGC group holds the information of the access that has been rejected.

The following table lists the target registers to be protected and the corresponding PBGC group names.

Table 33.45 Target Registers of PBG for CPU Subsystem

PBGC Group	Group No.	Channel Number	Protection Target Module	Target Register
PBGC0	C0 (PBC group 0 for CPU system)	0	INTC2	ICxxx (xxx=32 to 357) IMRm (m=1 to 11) (described in **Section 7, Exception/ Interrupts**)
		1	DMA	All registers inside DMA controller (described in **Section 8, DMA Controller**)
PBGC1	C1 (PBC group 1 for CPU system)	0	Flash memory (Programing function)	BFASELR*1
		1	Code flash ECC control register (VCI)	CFECCCTL_VCI CFERRINT_VCI CFSTCLR_VCI CFOVFSTR_VCI CF1STERSTR_VCI CF1STEADR0_VCI CFSTSTCTL_VCI
		2	Code flash ECC control register (PE1)	CFECCCTL_PE1 CFERRINT_PE1 CFSTCLR_PE1 CFOVFSTR_PE1 CF1STERSTR_PE1 CF1STEADR0_PE1 CFSTSTCTL_PE1
		3	Local RAM ECC control register (PE1)	LRTSTCTL_PE1 LRTDATBF0_PE1 LRECCCTL_PE1 LRERRINT_PE1 LRSTCLR_PE1 LROVFSTR_PE1 LR1STERSTR_PE1 LR1STEADR0_PE1
		4	On-Chip Debug module	EPC (described in **Section 36, On-Chip Debug Unit (OCD)**)
		5	Buffer controller	FBUFCCTL (described in **Section 3, CPU System**)

Note 1. Regarding the PBGC registers for the flash memory, see the *RH850/F1K Flash Memory User's Manual:Hardware Interface*.

33.3.3.1 List of Registers

The following table lists the registers provided for each PBGC group. And PBG group is equal to module name.

Table 33.46 List of PBGC Protection Registers

PBG Group	Group No.	Register Symbol	Register Name	R/W	Value after Reset	Address	Access Size	Power Domain
PBGC0	C0	FSGDC0PROT0	PBGC0 protection register 0	R/W	07FF FFFF$_H$	FFC4 C000$_H$	8/16/32	ISO
		FSGDC0PROT1	PBGC0 protection register 1	R/W	07FF FFFF$_H$	FFC4 C004$_H$	8/16/32	
PBGC1	C1	FSGDC1PROT0	PBGC1 protection register 0	R/W	07FF FFFF$_H$	FFC4 C120$_H$	8/16/32	ISO
		FSGDC1PROT1	PBGC1 protection register 1	R/W	07FF FFFF$_H$	FFC4 C124$_H$	8/16/32	
		FSGDC1PROT2	PBGC1 protection register 2	R/W	07FF FFFF$_H$	FFC4 C128$_H$	8/16/32	
		FSGDC1PROT3	PBGC1 protection register 3	R/W	07FF FFFF$_H$	FFC4 C12C$_H$	8/16/32	
		FSGDC1PROT4	PBGC1 protection register 4	R/W	07FF FFFF$_H$	FFC4 C130$_H$	8/16/32	
		FSGDC1PROT5	PBGC1 protection register 5	R/W	07FF FFFF$_H$	FFC4 C134$_H$	8/16/32	

Table 33.47 List of PBGC Error Registers

Module Name	Register Name	Symbol	Address
PBGC0	PBGC0 error control register	ERRSLVC0CTL	FFC4 C800$_H$
	PBGC0 error status register	ERRSLVC0STAT	FFC4 C804$_H$
	PBGC0 error address register	ERRSLVC0ADDR	FFC4 C808$_H$
	PBGC0 error type register	ERRSLVC0TYPE	FFC4 C80C$_H$
PBGC1	PBGC1 error control register	ERRSLVC1CTL	FFC4 C900$_H$
	PBGC1 error status register	ERRSLVC1STAT	FFC4 C904$_H$
	PBGC1 error address register	ERRSLVC1ADDR	FFC4 C908$_H$
	PBGC1 error type register	ERRSLVC1TYPE	FFC4 C90C$_H$

33.3.3.2 Details of Registers

(1) FSGDCxPROTn — PBGCx Protection Register n

FSGDCxPROTn specifies the access to be rejected for protecting the target registers. Any access that is disabled with any of the identifiers is rejected as an illegal access.

"n" in the register names and symbols represents the PBGC channel number.

Access: FSGDCxPROTn register can be read or written in 32-bit units.
FSGDCxPROTnL and FSGDCxPROTnH registers can be read or written in 16-bit units.
FSGDCxPROTnLL, FSGDCxPROTnLH, FSGDCxPROTnHL, and FSGDCxPROTnHH registers can be read or written in 8-bit units.

Address: See **Table 33.46, List of PBGC Protection Registers**

Value after reset: See **Table 33.46, List of PBGC Protection Registers**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PROTUM	PROTPEID[7:0]								—
Value after reset	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PROTSPID[3:0]				—	PROTRDPDEF	PROTWRPDEF	PROTRD	PROTWR
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Table 33.48 FSGDCxPROTn Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 17	PROTPEID[7:0]	PEID Access*1 The PROTPEID field is a bit list, in which one bit corresponds to one PEID value. Setting multiple bits enables multiple ID values simultaneously. For example, setting the PROTPEID field to 0000 0110_B enables access with PEID = 1 and PEID = 2. 0: Disables access with PEIDn. 1: Enables access with PEIDn.
16 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 5	PROTSPID[3:0]	SPID Access*2 The PROTSPID field is a bit list, in which one bit corresponds to one SPID value. Setting multiple bits enables multiple SPID values simultaneously. For example, setting the PROTSPID field to 0110_B enables access with SPID = 1 and SPID = 2. 0: Disables access with SPIDn. 1: Enables access with SPIDn.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master. 1: Only enables read access from the master having passed the filter.

Table 33.48 FSGDCxPROTn Register Contents (2/2)

Bit Position	Bit Name	Function
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master. 1: Only enables write access from the master having passed the filter.
1	PROTRD	Read Permission 0: Disables reading by a bus master subject to access filtering. 1: Enables reading by a bus master subject to access filtering.
0	PROTWR	Write Permission 0: Disables writing by a bus master subject to access filtering. 1: Enables writing by a bus master subject to access filtering.

Note 1. Access with PEID
PROTPEID is a bit list with each bit corresponding to a PEID value.
Setting multiple bits enables ID values of multiple bus masters at the same time.

Note 2. Access with SPID
PROTSPID is a bit list with each bit representing an SPID value.
Setting multiple bits enables ID values of multiple masters at the same time.

(2) ERRSLVCxCTL — PBGCx Error Control Register

ERRSLVCxCTL clears the status in error status register PBGCx.

Access: ERRSLVCxCTL register is a write only register that can be written in 32-bit units.
ERRSLVCxCTLL register is a write only register that can be written in 16-bit units.
ERRSLVCxCTLLL register is a write only register that can be written in 8-bit units.

Address: ERRSLVCxCTL: FFC4 C800H + (100_H × x)
ERRSLVCxCTLL: FFC4 C800H + (100_H × x)
ERRSLVCxCTLLL: FFC4 C800H + (100_H × x)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 33.49 ERRSLVCxCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	CLRO	Clears the overflow flag. 0: Does not clear the overflow flag. 1: Clears the overflow flag.
0	CLRE	Clears the error flag. 0: Does not clear the error flag. 1: Clears the error flag.

CLRO	CLRE	Function
0	0	Clears neither of the bits.
0	1	Setting prohibited
1	0	Clears the OVF bit.
1	1	Clears the OVF and ERR bits.

(3) ERRSLVCxSTAT — PBGCx Error Status Register

ERRSLVCxSTAT holds the status of the illegal access rejected with the PBGCx.

Access: ERRSLVCxSTAT register is a read only register that can be read in 32-bit units.
ERRSLVCxSTATL register is a read only register that can be read in 16-bit units.
ERRSLVCxSTATLL register is a read only register that can be read in 8-bit units.

Address: ERRSLVCxSTAT: FFC4 C804H + (100_H × x)
ERRSLVCxSTATL: FFC4 C804H + (100_H × x)
ERRSLVCxSTATLL: FFC4 C804H + (100_H × x)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.50 ERRSLVCxSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	OVF	Error Entry Overflow Flag 0: No overflow 1: An overflow occurred. If a second guard violation occurs with the error detection flag being set after the first guard violation occurs, the error entry overflows and this flag is set because the number of PBGC error entry stages is 1. Note that this overflow is not notified to INTGUARD. The error information of the guard violation when an overflow occurs are not captured.
0	ERR	Error Status Flag 0: No PBG protection violation 1: A PBG protection violation occurred.

(4) ERRSLVCxADDR — PBGCx Error Address Register

ERRSLVCxADDR holds the address of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Access: ERRSLVCxADDR register is a read only register that can be read in 32-bit units.

Address: FFC4 C808H + (100_H × x)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.51 ERRSLVCxADDR Register Contents

Bit Position	Bit Name	Function
31 to 2	ADDR[31:2]	Address in which the PBG protection violation is generated.
1, 0	Reserved	When read, the value after reset is returned.

(5) ERRSLVCxTYPE — PBGCx Error Type Register

ERRSLVCxTYPE holds the type of the illegal access rejected with the PBGCx.

The register is not updated when corresponding ERRSLVCxSTAT.ERR is 1.

Access: ERRSLVCxTYPE register is a read only register that can be read in 32-bit units.
ERRSLVCxTYPEL register is a read only register that can be read in 16-bit units.

Address: ERRSLVCxTYPE: FFC4 C80CH + (100_H × x)
ERRSLVCxTYPEL: FFC4 C80CH + (100_H × x)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEID[2:0]			—	—	—	SPID[1:0]		—	UM	—	—	—	—	—	WRITE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.52 ERRSLVCxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 13	PEID[2:0]	PEID of the access source from which the PBG protection violation is generated.
12 to 10	Reserved	When read, the value after reset is returned.
9, 8	SPID[1:0]	SPID of the access source from which the PBG protection violation is generated.
7	Reserved	When read, the value after reset is returned.
6	UM	UM of the access source from which the PBG protection violation is generated.
5 to 1	Reserved	When read, the value after reset is returned.
0	WRITE	This bit is set to 1 when an access that has generated the PBG protection violation is the write.

Section 34 Data CRC (DCRA)

This section contains a generic description of the data CRC function A (DCRA).

The first part in this section describes the RH850/F1K specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the DCRA.

34.1 Features of RH850/F1K DCRA

34.1.1 Number of Units

This microcontroller has the following number of DCRA units.

Table 34.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	4		
Name	DCRAn (n = 0 to 3)		

Table 34.2 Index

Index	Description
n	Throughout this section, the individual data CRC function A units are identified by the index “n” (n = 0 to 3); for example, DCRAnCTL indicates the DCRAn control register.

34.1.2 Register Base Address

DCRAn base addresses are listed in the following table.

DCRAn register addresses are given as offsets from the base addresses.

Table 34.3 Register Base Addresses

Base Address Name	Base Address
<DCRA0_base>	FFF7 0000_H
<DCRA1_base>	FFF7 1000_H
<DCRA2_base>	FFF7 2000_H
<DCRA3_base>	FFF7 3000_H

34.1.3 Clock Supply

The DCRAn clock supply is shown in the following table.

Table 34.4 Clock Supply

Unit Name	Unit Clock Name	Clock Supply Name	Description
DCRAn	PCLK	CPUCLK4	Module clock
	Register access clock	CPUCLK2	Bus clock
		CPUCLK4	

34.1.4 Reset Sources

DCRAn reset sources are listed in the following table. DCRAn is initialized by these reset sources.

Table 34.5 Reset Sources

Unit Name	Reset Source
DCRAn	All reset sources (ISORES)

34.2 Overview

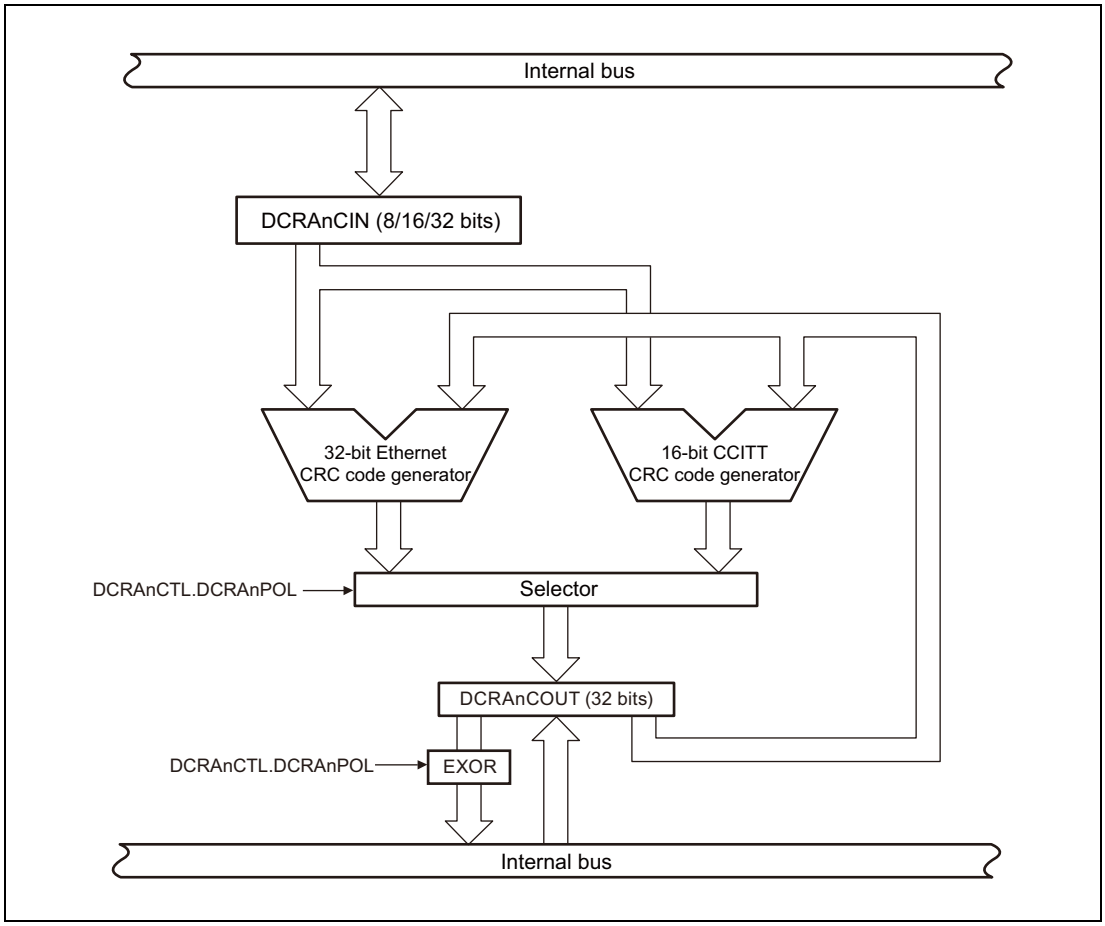
34.2.1 Functional Overview

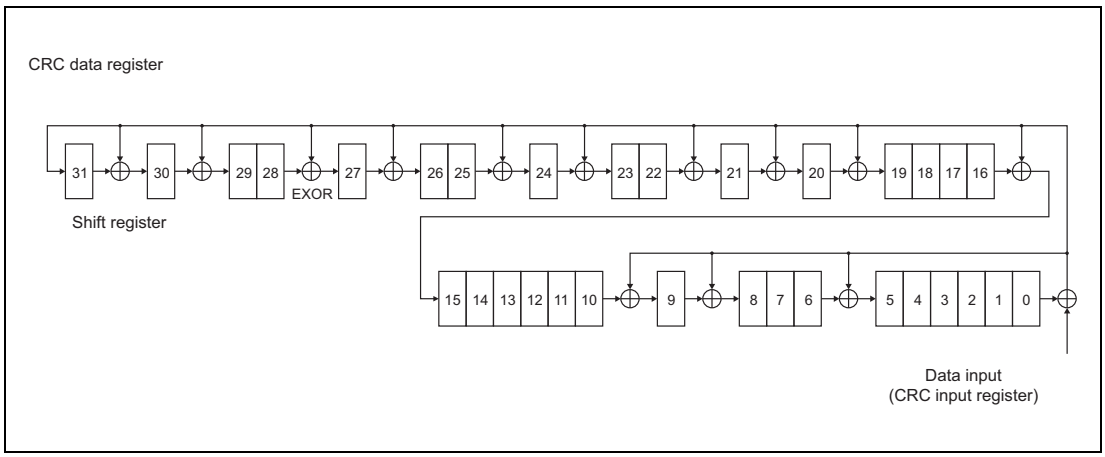
The data CRC function A can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- 32-bit Ethernet CRC
  $(X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^{8}+X^{7}+X^{5}+X^{4}+X^{2}+X^{1}+1)$
- 16-bit CCITT CRC
  $(X^{16}+X^{12}+X^{5}+1)$
- CRC of an arbitrary data block length can be generated.
- After initialization of the CRC data register, every write access to the CRC input register generates a new CRC according to the selected polynomial, and the result is stored in the CRC data register.

34.2.2 Block Diagram

The following picture shows the block diagram of the data CRC function A.





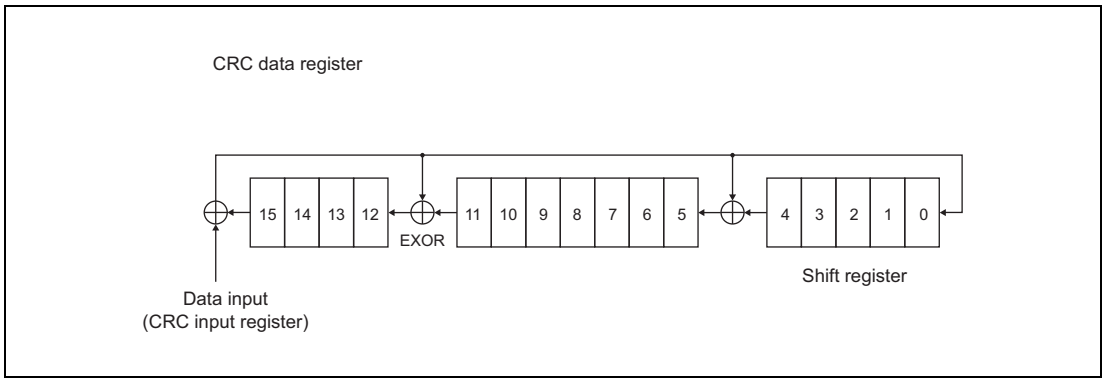


Figure 34.1 Block Diagram of Data CRC Function A

34.2.3 Operational Circuit

- 32-bit Ethernet

- 16-bit CCITT

34.3 Registers

34.3.1 List of Registers

DCRA registers are listed in the following table.

For details about <DCRAn_base>, see **Section 34.1.2, Register Base Address**.

Table 34.6 List of Registers

Module Name	Register Name	Symbol	Address
DCRAn	CRC input register	DCRAnCIN	<DCRAn_base> + 00_H
	CRC data register	DCRAnCOUT	<DCRAn_base> + 04_H
	CRC control register	DCRAnCTL	<DCRAn_base> + 20_H

34.3.2 DCRAnCIN — CRC Input Register

This register holds the input data for CRC calculation. The effective bit width used for CRC calculation must be set by DCRAnCTL.DCRAnISZ[1:0].

When data is written to this register, the CRC code is generated.

The CRC calculation is immediately started after the DCRAnCIN register is written. The DCRAnCOUT register must be initialized with the initial starting value, before the first data of the data block is written to DCRAnCIN register.

Access: This register can be read or written in 32-bit units.

Address: <DCRAn_base>

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRAnCIN[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRAnCIN[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 34.7 DCRAnCIN Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRAnCIN [31:0]	Input Data for CRC Calculation The valid bits are: • For 32 bit effective bit width: DCRAnCIN[31:0] • For 16 bit effective bit width: DCRAnCIN[15:0] • For 8 bit effective bit width: DCRAnCIN[7:0]

34.3.3 DCRAnCOUT — CRC Data Register

This register stores the result of the CRC code generated by the 32-bit Ethernet polynomial or the 16-bit CCITT polynomial.

Access: This register can be read or written in 32-bit units.

Address: <DCRAn_base> + 4_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRAnCOUT[31:16]															
Value after reset *1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRAnCOUT[15:0]															
Value after reset *1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The read value after reset is 0000 0000_H since the 32-bit Ethernet CRC polynomial is selected as the CRC generating function after reset.

Table 34.8 DCRAnCOUT Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRAnCOUT [31:0]	Result of the CRC Code Generation When the 16-bit CCITT polynomial is enabled, the bits 15 to 0 show the CRC result. The bits 31 to 16 are undefined. The read value of this register is a value obtained by performing EXOR calculation for the following value: • For 32-bit Ethernet polynomial: FFFF $FFFF_H$ • For 16-bit CCITT polynomial: 0000_H For example, when DCRAnCOUT = 5555 5555_H for the 32-bit Ethernet polynomial, AAAA $AAAA_H$ is read.

CAUTION

This register must initialized by setting the initial start value before the first data of the data block is written to DCRAnCIN register.

34.3.4 DCRAnCTL — CRC Control Register

This register controls the CRC generation process.

Access: This register can be read or written in 8-bit units.

Address: <DCRAn_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	DCRAnISZ[1:0]		DCRAnPOL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 34.9 DCRAnCTL Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2, 1	DCRAnISZ[1:0]	Specify the CRC input bit width. 00: 32 bits (DCRAnCIN[31:0]) 01: 16 bits (DCRAnCIN[15:0]) 10: 8 bits (DCRAnCIN[7:0]) 11: Setting prohibited
0	DCRAnPOL	Specifies the CRC generation method. 0: 32-bit Ethernet CRC polynomial generation. The byte order of the DCRAnCIN register is LSB (least significant bit) first. This means that, if the CRC input bit width is 8 bits (DCRAnISZ[1:0] = 10_B), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 0 (LSB) is the start bit of the input data. 1: 16-bit CCITT CRC polynomial generation. The byte order of the DCRAnCIN register is MSB (most significant bit) first. This means that, if the CRC input bit width is 8 bits (DCRAnISZ[1:0] = 10_B), bit positions 7 to 0 of the DCRAnCIN register contain the input data and bit position 7 (MSB) is the start bit of the input data.

CAUTION

- If the CRC generation method (DCRAnCTL.DCRAnPOL) is changed, the DCRAnCOUT register must be initialized by setting the initial start value.
- The CRC input bit width (DCRAnCTL.DCRAnISZ[1:0]) must be set according to the data block bit width. Changing the CRC input bit width is not allowed during processing of a data block (a data block consists of N bytes, half-words or one word). After the final CRC result is read from DCRAnCOUT register, the bit width can be changed. In that case, the DCRAnCOUT register must be initialized with the initial start value.

34.4 Operation

The data CRC function A generates a CRC (cyclic redundancy check) of an arbitrary data block length. The data is forwarded to the data CRC function in 8-, 16- or 32-bit units. The CRC polynomial can either be selected for 32-bit Ethernet or 16-bit CCITT. The initial starting value must be set at the DCRAnCOUT register before the first write access to the CRC input register (DCRAnCIN) is performed.

The flowchart below shows the CRC generating procedure.

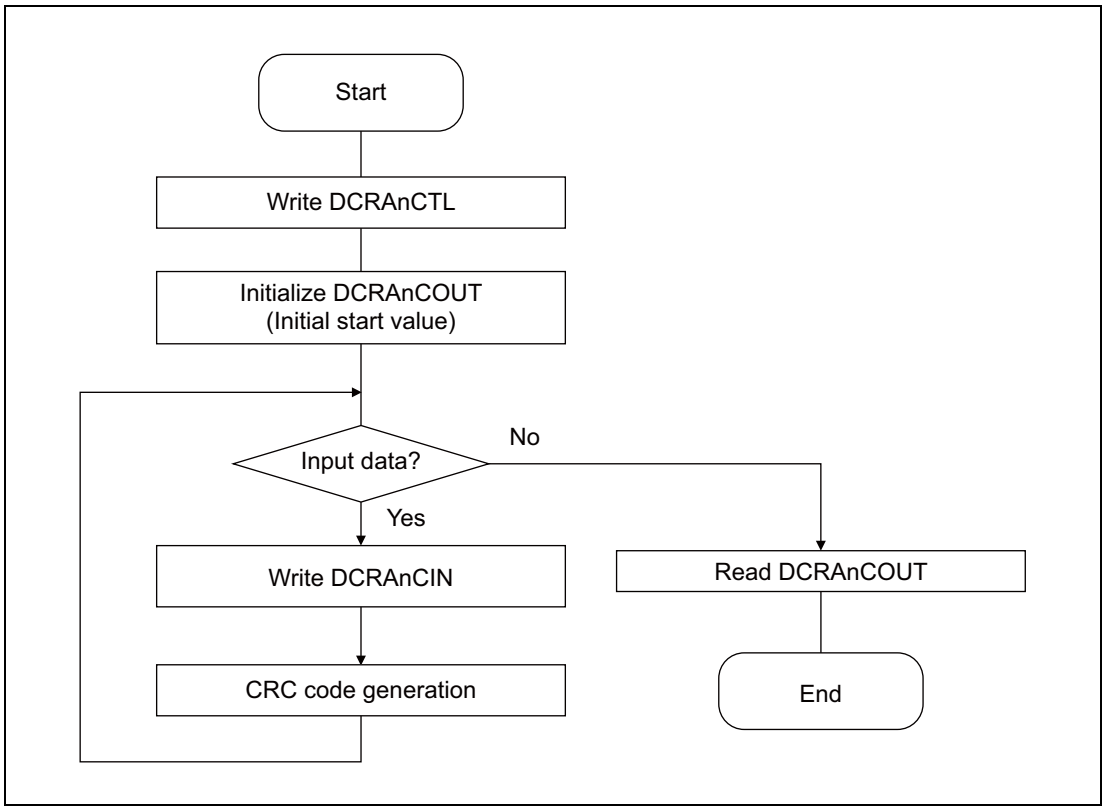

Figure 34.2 Flowchart of Data CRC Function A

NOTES

1. Before writing the first data to DCRAnCIN, the CRC output register DCRAnCOUT must be initialized with the initial start value.
2. DCRAnCOUT must be re-initialized by setting the initial start value when the polynomial is changed by changing DCRAnCTL.DCRAnPOL.
3. Setting example of the initial start values of the respective polynomials
   The following is the example of setting values.

Table 34.10 Setting Example of Initial Start Values (When Read at a Reset)

	Initial Start Value	EXOR Value	DCRAnCOUT Read Value
16-bit CCITT	XXXX $FFFF_H$	XXXX 0000_H	XXXX $FFFF_H$
32-bit Ethernet	$FFFF\ FFFF_H$	$FFFF\ FFFF_H$	$0000\ 0000_H$

Note: X: undefined

Section 35 Security Function

Please refer to separate volumes about security function which consist of 3 volumes as shown below.

1. Basic Security
2. Secure Watchdog Timer
3. ICUSE

Section 36 On-Chip Debug Unit (OCD)

This microcontroller has an on-chip debug function. By using the on-chip debug emulator, programs can be debugged with the microcontroller mounted in the target system.

The debug functions incorporated in this microcontroller conform to IEEE-ISTO 5001™-2003 Class 3*1, a Nexus debug interface standard.

Note 1. This function is supported only by products with an $\overline{\text{EVTO}}$ pin.

CAUTION

The debug functions described in this section are supported by the microcontroller but whether they are usable depends on the debugger. For details on debugging, see the user's manual of the debugger.

36.1 Overview of RH850/F1K OCD

36.1.1 Functional Overview

The on-chip debug functions described below are supported by the microcontroller.

(1) Debug interface

This microcontroller supports the following as debug interfaces: Nexus Interface, Low Pin Debug Interface (1-pin) - hereinafter called “LPD (1-pin)”, and Low Pin Debug Interface (4-pin) - hereinafter called “LPD (4-pin)”.

On-chip debug can be performed using these debug interfaces.

NOTE

When LPD (1-pin) is used, LPD is operating by the clock of MainOSC.

(2) Debug monitoring function

Debug-dedicated monitor program space is mounted and is used during debugging.

The basic debug functions below can be used by running a monitoring program.

- Downloading the user-created program
- Reading and writing the memory and registers
- Running the user-created program starting at any address

(3) On-chip break

A maximum of 12 breakpoints can be specified at any execution address. Of the 12 breakpoints, a maximum of four breakpoints can be specified for any access (access address, access data).

(4) Software break

Software break points can be specified at any execution address.

(5) Peripheral break

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the user-created program is stopped, for instance upon a breakpoint hit.

(6) Forced break

Execution of the user-created program can be interrupted forcibly.

(7) Forced reset

This device (microcontroller) can be forcibly reset.

(8) Real time RAM monitoring (RRM)

The memory can be read during program execution. Because this read access uses debug-dedicated DMA, it has minimal effect on program execution.

(9) Dynamic memory modification (DMM)

The memory can be written during program execution. Because this write access uses debug-dedicated DMA, it has minimal effect on program execution.

(10) Timer function

Using a 32-bit counter, the time for running the user-created program can be measured based on the clock for debug.

For the measurement accuracy, see the user's manual of the debugger.

(11) Mask function

Masking the following factors is possible.

- All reset sources except for a POC reset and a wakeup reset

(12) Hot plug-in function

Debugging can be started in normal operating mode without external reset input.

NOTE

When the hot plug-in function is used in power save mode, the INTDCUTDI interrupt is required to return from power save mode as the wake-up process. About the INTDCUTDI interrupt, see Table 7.4, EI Level Maskable Interrupt Sources (Channel No. 21).

(13) Security function

To prevent the contents of the flash memory from being read by an unauthorized person, a 128-bit ID code can be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code written to the microcontroller, the flash memory cannot be accessed.

For details on how to set the ID code, see the user's manual of the debugger.

(14) Trace function

Execution history, data changes, etc. of the user-created program can be obtained.

NOTE

The trace function is only available in devices with 2-MB memory.

36.1.2 External Input/Output Pins

Table 36.1 External Input/Output Pins

Pin	Special Function	PKG No		
		100 pins	144 pins	176 pins
JP0_0	DCUTDI/LPDI/LPDIO	√	√	√
JP0_1	DCUTDO/LPDO	√	√	√
JP0_2	DCUTCK/LPDCLK	√	√	√
JP0_3	DCUTMS	√	√	√
JP0_4	$\overline{\text{DCUTRST}}$	√	√	√
JP0_5	$\overline{\text{DCURDY}}$/LPDCLKOUT	√	√	√
JP0_6	$\overline{\text{EVTO}}$		√	√

36.2 Peripheral Break Control

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the user-created program is stopped, for instance upon a breakpoint hit.

During peripheral break, the peripheral modules operate as follows.

a. Modules that stop unconditionally regardless of the EPC.SVSTOP setting

Table 36.2 Modules that Stop Unconditionally Regardless of the EPC.SVSTOP Setting

Module
Window watchdog timer (WDTA)

b. Modules that continue to operate by the setting of emulation registers even when EPC.SVSTOP = 1

Table 36.3 Modules that Continue to Operate by the Setting of Emulation Registers even when EPC.SVSTOP = 1

Module	Emulation Register	n
OS timer (OSTM)	OSTMnEMU.OSTMnSVSDIS 0: Stops during break 1: Continues during break	0 to 4
Timer array unit D (TAUD)	TAUDnEMU.TAUDnSVSDIS 0: Stops during break 1: Continues during break	0
Timer Array Unit B (TAUB)	TAUBnEMU.TAUBnSVSDIS 0: Stops during break 1: Continues during break	0, 1
Timer array unit J (TAUJ)	TAUJnEMU.TAUJnSVSDIS 0: Stops during break 1: Continues during break	0, 1
Real-Time Clock (RTCA)	RTCAnEMU.RTCAnSVSDIS 0: Stops during break 1: Continues during break	0
Clocked serial interface G (CSIG)	CSIGnEMU.CSIGnSVSDIS 0: Stops during break 1: Continues during break	0, 1
Clocked serial interface H (CSIH)	CSIHnEMU.CSIHnSVSDIS 0: Stops during break 1: Continues during break	0 to 3
Timer Motor Control Function (TAPA)	TAPAnEMU.TAPAnSVSDIS 0: Stops during break 1: Continues during break	0
Encoder Timer (ENCA)	ENCAnEMU.ENCAnSVSDIS 0: Stops during break 1: Continues during break	0
PWM Output/Diagnostic (PWM-Diag)	PWBAnEMU.PWBAnSVSDIS 0: Stops during break 1: Continues during break	0
	PWSAnEMU.PWSAnSVSDIS 0: Stops during break 1: Continues during break	0
A/D converter (ADCA)	ADCAnEMU.ADCAnSVSDIS 0: Stops during break 1: Continues during break	0, 1

CAUTION

For details on the registers, see the register description of the corresponding section.

c. Modules that stop when EPC.SVSTOP = 1

Table 36.4 Modules that Stop when EPC.SVSTOP = 1

Module
LIN/UART interface (RLIN3)
Low-Power Sampler (LPS)

36.3 Hot Plug-in in Each Mode

36.3.1 RUN Mode

When Hot Plug-in has occurred in RUN mode, it is necessary to maintain the current state.

36.3.2 STOP/DeepSTOP Mode

When Hot Plug-in has occurred in STOP/DeepSTOP mode, it is necessary to transfer in RUN mode.

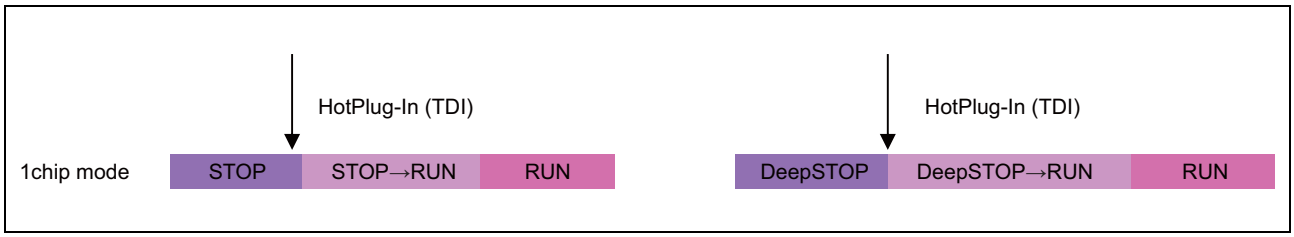

Figure 36.1 Hot Plug-in in STOP/DeepSTOP mode

36.3.3 Cyclic RUN Mode

When Hot Plug-in has occurred in Cyclic RUN mode, it is necessary to transfer in DeepSTOP mode and wakeup to RUN mode.

All regulators in ISO are made operating state in OCD mode.

Then, on the occurrence of interrupt of “DCUTDI Low level Detection interrupt (INTDCUTDI)”, it is necessary for a transfer order to be executed to DeepSTOP mode by user (software) if on-chip debugging is performed.

The sequence of the time when to enter to OCD mode in Cyclic RUN mode is mentioned below.

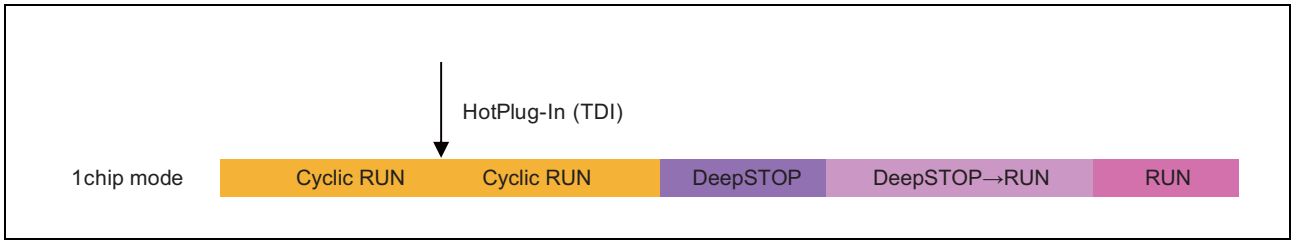

Figure 36.2 Hot Plug-in in Cyclic RUN mode

36.3.4 Cyclic STOP Mode

When Hot Plug-in has occurred in Cyclic STOP mode, it is necessary to transfer in Cyclic RUN mode.

Then, on the occurrence of wakeup factor of DCUTDI, it is necessary for a transfer to be executed as the same case of Cyclic RUN mode.

The sequence of the time when to enter to OCD mode in Cyclic STOP mode is mentioned below.

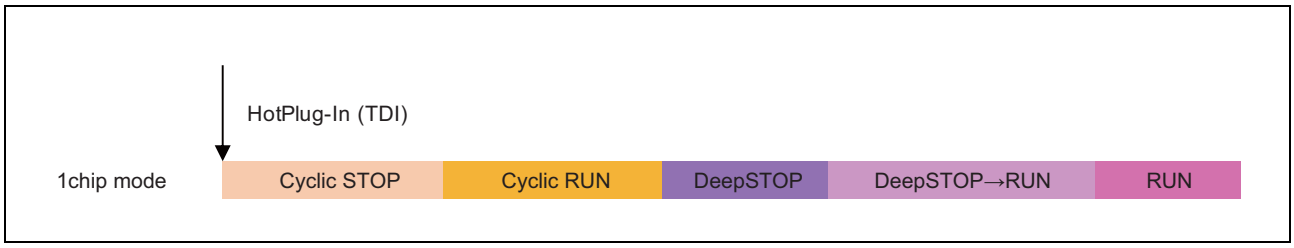

Figure 36.3 Hot Plug-in in Cyclic STOP mode

36.4 Registers

36.4.1 EPC — Emulation Peripheral Control Register

This register stops operation of peripheral functions (timer, serial interface, and A/D converter) in debug mode (SVSTOP).

Access: Accessing from the user program is prohibited.

Address: —

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SVSTOP	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	—	—	—	—	—	—	—	—

Table 36.5 EPC Register Contents

Bit Position	Bit Name	Function
7	Reserved	—
6	SVSTOP	Stops operation of peripheral functions (timer, serial interface, and A/D converter) during debugging. 0: Does not stop operation 1: Stops operation
5 to 0	Reserved	—

NOTE

EPC is set by the debugger. Setting by the user program is prohibited. As for the setting of the debugger, see the user's manual of the debugger.

36.5 Cautions on Using On-Chip Debugging

36.5.1 Treatment of Devices Used for Debugging

Do not install a device that was used for debugging on a mass-produced product, because the flash memory was rewritten during system debugging and thus the write/erase endurance of the flash memory cannot be guaranteed.

36.5.2 Reset Assertion When a Debugger is Connected

If a program in which a reset is asserted at the start of program execution is executed when a debugger is being used, the microcontroller is reset before preparation for communications between the OCD emulator and microcontroller is complete. For this reason, communications may not proceed correctly.

The period of preparation for communications depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer. To ensure that the debugger operates properly when debugging a program in which a reset is asserted at the start of program execution, insert a wait between the start of program and reset assertion.

36.5.3 Restrictions When HS IntOSC is Used as the Main Clock Source Instead of MainOSC

Need to change the debug interface configuration (OPJTAG) to LPD (4-pin) in advance if E1 Emulator is used for debug.

LPD (1-pin) mode can’t be used.

36.5.4 Restrictions When the Writing of OCD_MD and RESET are Occur at the Same Time, or Restrictions When the Writing of MTR (DBG_CTRLP) and RESET are Occur at the Same Time

When the writing of OCD_MD and RESET are occur at the same time, or the writing of MTR (DBG_CTRLP) and RESET are occur at the same time, it is a possibility of terminal hazard.

If the debugger was disconnected, please reconnect the debugger.

36.5.5 Transition to DeepSTOP Mode When a Debugger is Connected

When a debugger is in use, when a program to transition to DeepSTOP mode is executed immediately following the start of the program, the microcomputer stops power supply to the Isolated area before preparation for communications between the OCD emulator and microcomputer is complete. For this reason, communications may not proceed correctly.

The period of preparation for communications depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer. A wait must be inserted during the period from release from the reset state and transition to DeepSTOP mode by the emulator for correct operation of the debugger when debugging a program to transition to DeepSTOP mode immediately after the program starts.

Section 37 Flash Memory

This section describes the flash memory mounted on RH850/F1K.

The first part in this section describes the characteristics of the mounted flash memory and the characteristics specific to RH850/F1K, such as the memory map, flash memory programming, and ECC.

37.1 Features

- Includes code flash memory and data flash memory
  The code flash memory can store program codes and data and has the user area and the extended user area.
  The data flash memory is used for storing data.
- Method of flash memory programming
  Flash memory programming via a serial interface and programming of flash memory by a user program (self-programming) are supported.
- Support for BGO (Back Ground Operation)
  The BGO function allows programs to be executed in the code flash memory while the data flash memory is being programmed/erased.
- Flash memory data security
  - Support for security functions to protect against illicit tampering with or reading out of data in the flash memory
  - Support for protection functions to protect against erroneous overwriting of the flash memory
- Option byte function
  Sets the operation after releasing reset for ports, WDTA, CVM, and CAN FD CRC(Supported only for PREMIUM), and RESETOUT.
- Support for the error detection/correction function (ECC) in the code flash memory and data flash memory
  Built-in ECC function can detect 2-bit errors and detect/correct 1-bit errors.
- Interrupts can be acknowledged in self-programming mode.

For code flash sizes and data flash sizes of each product, see the following sections.

- **Section 4.1, Address Space**

37.2 Structure of Memory

37.2.1 Mapping of Code Flash Memory

Figure 37.1 illustrates the mapping of the code flash memory for the 2 MB, 1.5 MB, 1 MB, and 768 KB devices. The user area of the code flash memory of the RH850/F1K is divided into 8 and 32 KB blocks, which serve as the units of erasure. A single 32 KB block is also incorporated as the extended user area. The user area and extended user area are available as areas for storing the user program.

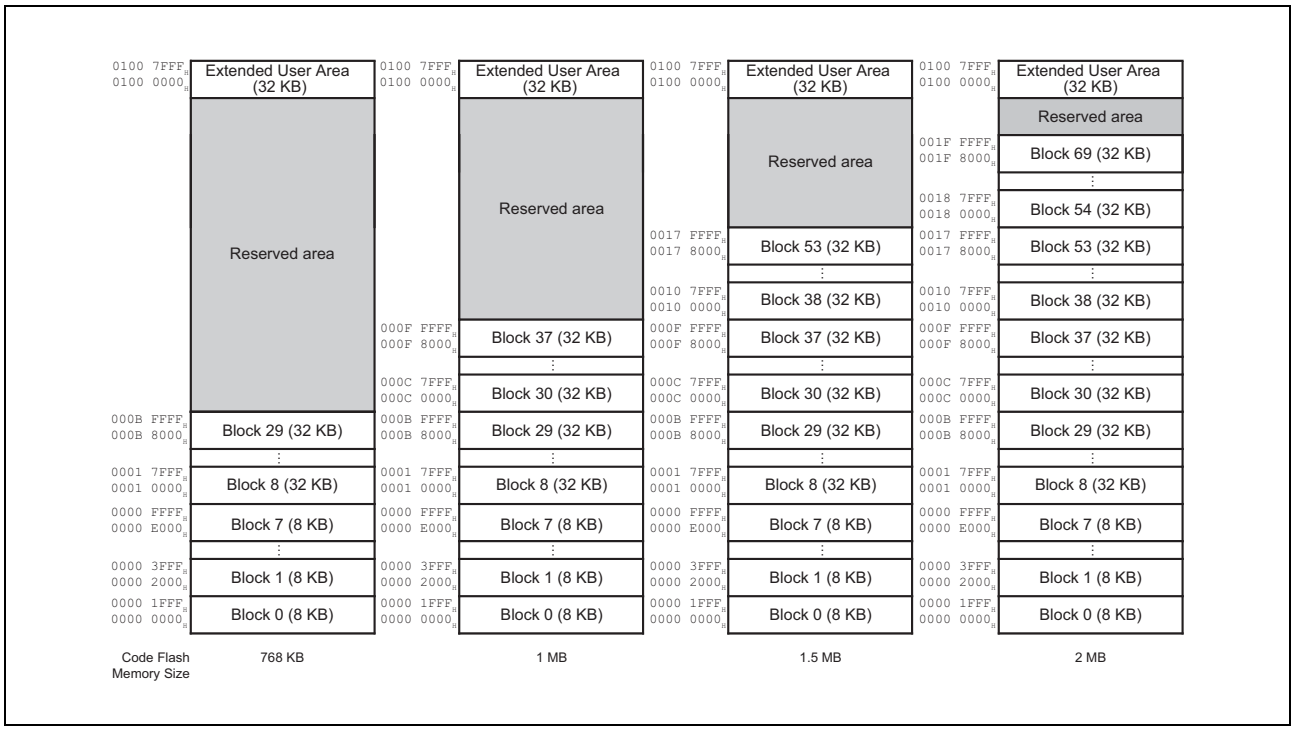

Figure 37.1 Mapping of the Code Flash Memory

37.2.2 Mapping of Data Flash Memory

The data area of the data flash memory in the RH850/F1K is divided into 64-byte blocks, with each being a unit for erasure. **Figure 37.2** shows the mapping of the data flash memory.

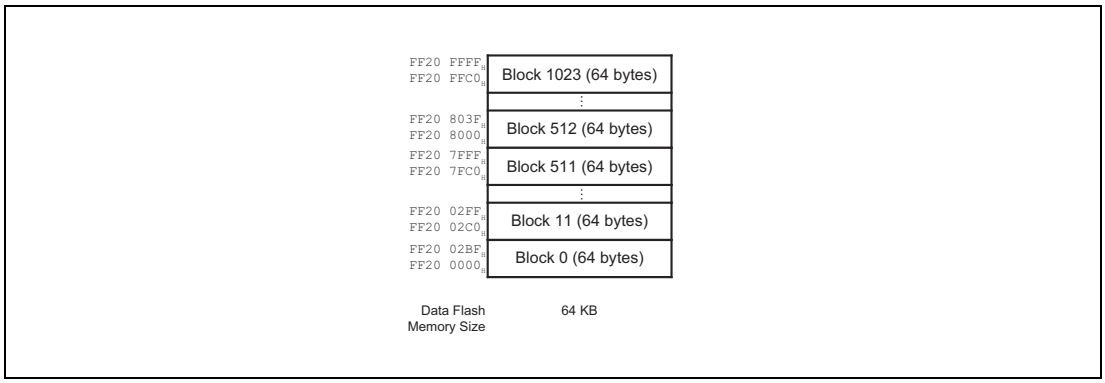

Figure 37.2 Mapping of the Data Flash Memory

37.3 Operating Modes Associated with Flash Memory

Figure 37.3 is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, see **Section 6, Operating Mode**.

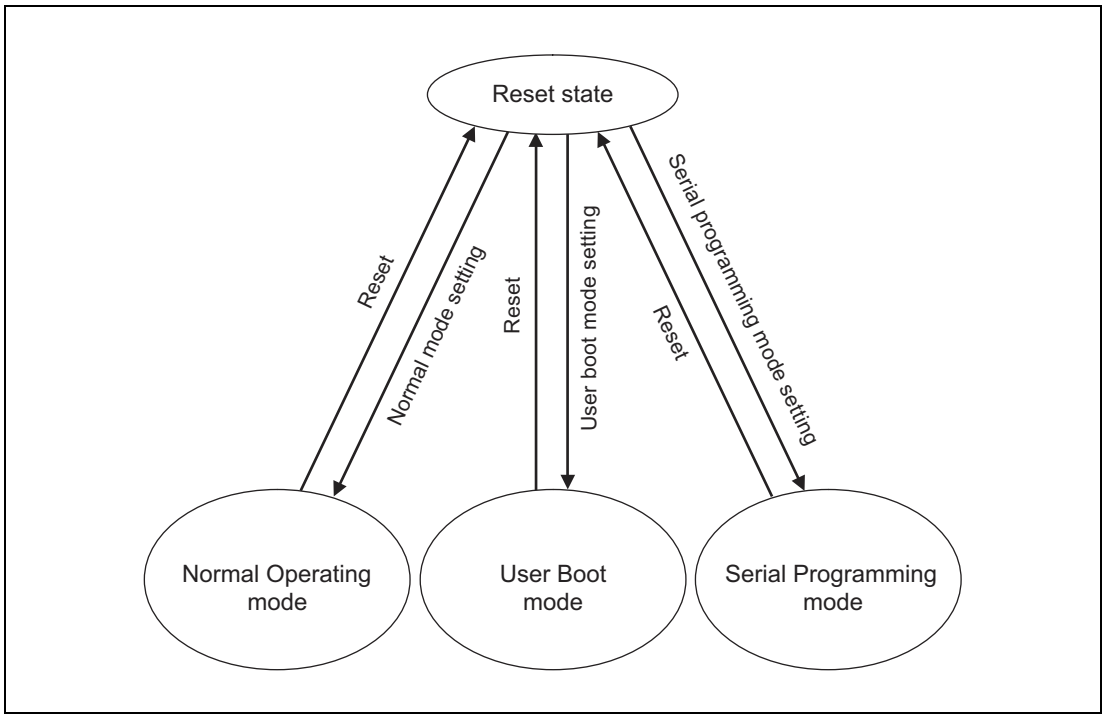

Figure 37.3 Mode Transition Associated with Flash Memory

Table 37.1 shows the flash memory area which is programmable and erasable in each mode and the boot program after reset release.

Table 37.1 Programmable and Erasable Area in Each Mode and the Boot Program after Reset Release

Item	Normal Operating Mode	User Boot Mode	Serial Programming Mode
Programmable and erasable area	• User area • Extended user area • Data area	• User area • Data area	• User area • Extended user area • Data area
Boot program after reset release	Program in user area or extended user area (Changeable by using the variable reset vector)	Program in extended user area. (Reset vector is 0100 0000_H)	Firmware program for serial programming

37.4 Functions

37.4.1 Functional Overview

The flash memory of the RH850/F1K can be updated via a serial interface by a dedicated flash memory programmer (serial programming), before being mounted on the target system or on a flash adapter system.

Furthermore, security functions to prohibit updating of the user program written in the flash memory are incorporated, and this can prevent tampering by third parties.

Programming by the user program (self-programming) is suited for applications where the target system program may require updating after deployed to the end user. Protection features for the safe rewriting of the flash memory are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as external communications, etc., and this allows programming under various conditions. **Table 37.2** gives an overview of the methods of programming and the corresponding operating modes.

Table 37.2 Methods of Programming

Method of Programming	Description	Operating Mode
Serial programming	A dedicated flash memory programmer allows on-board programming of the flash memory after the device is mounted on the target system.	Serial programming mode
	A dedicated flash memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system.	
Self-programming	The user program that is written to code flash memory in advance by serial programming also allows updating the flash memory. The background operation capability makes it possible to fetch instructions or otherwise read data in code flash memory while the data flash memory is self-programming. For this reason, it is possible to update the data flash memory by executing a program written to the code flash memory. Instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being updated by self-programming. In such cases, a program for updating must be transferred to the local RAM in advance and executed.	Normal operating mode User boot mode

Renesas provides a library for self-programming. For details on this library, see the user's manuals for the code flash library and data flash library of this device.

Table 37.3 lists the functions of the flash memory. Dedicated flash memory programmer commands enable serial programming, while reading of the flash memory by a library function or the user program enables self-programming.

Table 37.3 Basic Functions at a Glance

Function	Description	Level of Support (√: Supported, △: Conditionally Supported, —: Not Supported)	
		Serial programming	Self-programming
Blank checking	This is used to check a specified block to ensure that writing to it has not already proceeded. Results of reading from code flash memory and data flash memory to which nothing has been written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	√	△ (Only data flash is supported)
Block erasure	This is for erasing the contents of a specified block of memory.	√	√
Programming	This is for writing to a specified address.	√	√
Verification and checksum	Data that are read out from flash memory are compared with data transferred from the flash memory programmer.	√	— (Reading of data by the user program is possible)
Reading	Data that have been written to the flash memory are read out.	√	√
Setting for OTP (one-time programming)	A specified block of code flash memory is set for OTP (OTP can only be set, that is, it is not possible to release a block's OTP setting).	√	√
Setting an ID	An ID setting is made for use in controlling the connection of a dedicated flash memory programmer for serial programming, controlling of the on-chip debugger, and programming of the code flash memory by self-programming.	√	√
Security settings	Security settings are for use in serial programming.	√	△ (Only when setting is prohibited after being permitted)
Protection settings	Settings for block protection of code flash memory and variable reset vector are provided.	△ (Setting of the reset vector values for variable reset vector function is not supported.)	√
Setting of option bytes	Option bytes are set to change them from the initial values for the RH850/F1K.	√	√
Clearing the configuration	ID setting, security settings, protection settings, and option byte settings are initialized.	√	—

For details on serial programming, see the user’s manual of the flash programmer.

For details on self-programming, see the user’s manuals for the code flash library and data flash library of this device.

The flash memory supports various security functions.

The OTP setting and authentication of the ID code are security functions for use with serial programming and self-programming.

In serial programming, authentication of the ID code, prohibiting connection of a dedicated flash memory programmer, and prohibition of commands (for block erasure, programming, and reading) are available for use as security functions.

The security functions supported by the flash memory are listed in **Table 37.4**.

For details on security function, see the *RH850/F1K Basic Security User's Manual:Hardware*.

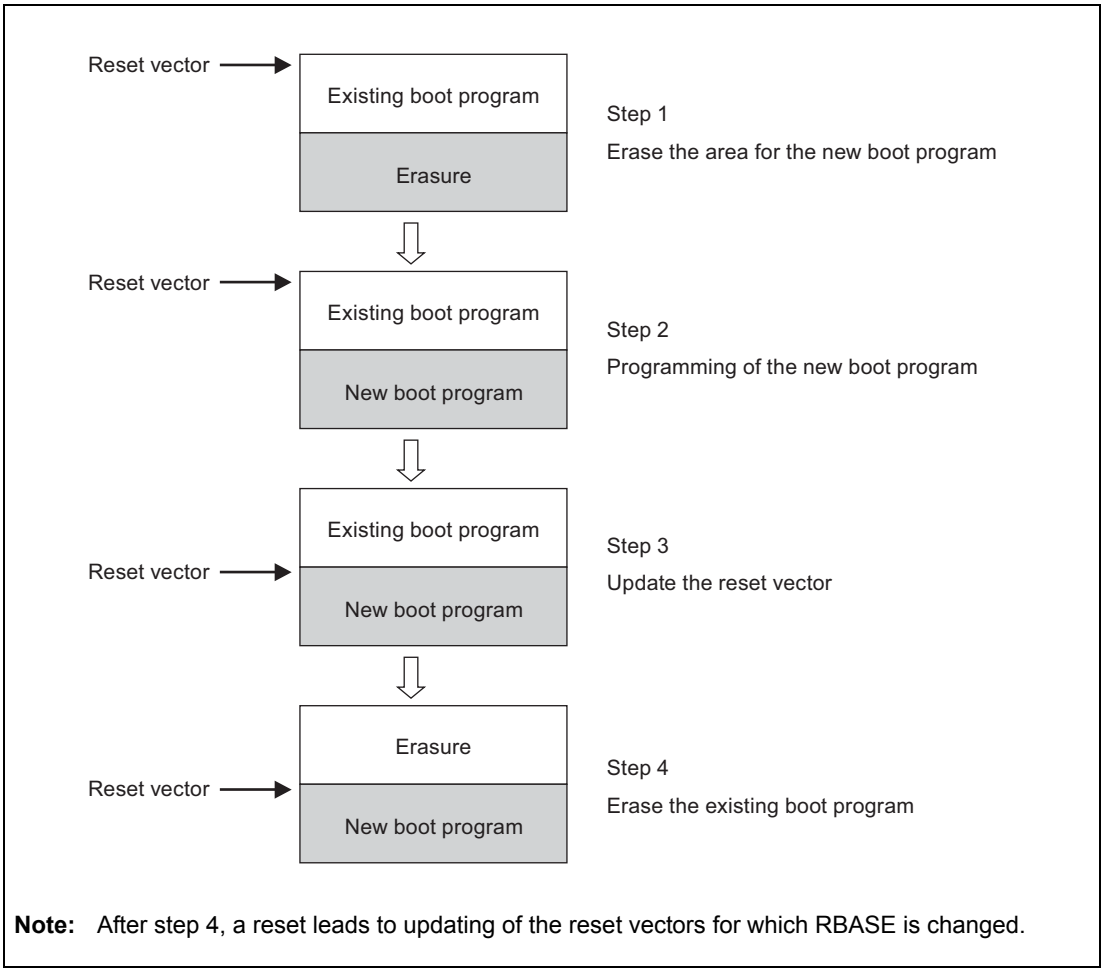

Table 37.4 Summary of Security Functions

Function	Description
OTP	OTP can be individually set for each block of the user area and the extended user area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self-programming is prohibited. Once set, the OTP setting cannot be released. Furthermore, since execution of the configuration clearing command is prohibited for any area for which OTP has been set, changing a security setting from “prohibited” to “permitted” is not possible.
ID authentication	The result of ID authentication can be used to control the connection of a dedicated flash memory programmer for serial programming. The result of ID authentication can also be used to control enabling of self-programming.
Prohibition of connection of a dedicated flash memory programmer	The connection of a dedicated flash memory programmer for serial programming is prohibited. Since execution of the configuration clearing command is also prohibited when the connection of a dedicated flash memory programmer is prohibited, changing a security setting from “prohibited” to “permitted” is not possible.
Prohibition of block erasure commands	Block erasure commands at the time of serial programming are prohibited. Since execution of the configuration clearing command is also prohibited when block erasure commands are prohibited, changing a security setting from “prohibited” to “permitted” is not possible.
Prohibition of programming commands	Block erasure commands and programming commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.
Prohibition of read commands	Read commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.

The flash memory supports various protection functions. The protection functions supported by the flash memory are listed in **Table 37.5**.

Table 37.5 Summary of Protection Functions

Function	Description
Block protection	Lock bit settings can be individually made to enable or disable programming and erasure of each block of the user area and the extended user area of code flash memory. Programming and erasure by self-programming of an area for which the lock bit is set and the lock bit function is enabled are prohibited. Programming or erasure can proceed again when the lock bit function is disabled after having been enabled. When a block of code flash memory is erased, the lock bit for that block is also erased.
Hardware protection	The level on the FLMD0 pin can be set to prohibit programming and erasure of the code flash memory. - FLMD0 = 0: Programming prohibited - FLMD0 = 1: Programming permitted
Variable reset vector	The protection settings include control of the reset vector. As shown in **Figure 37.4**, after programming of a new boot program while leaving the existing boot program in place, changing the reset vector is a safe way to change to the area holding the new boot program. The areas that can be specified by using the reset vector are the user area and extended user area.

Note: After step 4, a reset leads to updating of the reset vectors for which RBASE is changed.

Figure 37.4 Utilizing the Variable Reset Vector Function to Update the Boot Program

37.5 Serial Programming

A dedicated flash memory programmer can be used to handle flash memory in serial programming mode.

Serial programming

The microcontroller is mounted on the system board at the time of serial programming. Providing a connector to the board enables handling of the microcontroller by the flash memory programmer to proceed.

37.5.1 Environments for Programming

The recommended environments for handling the flash memory of the microcontroller with data are described below.

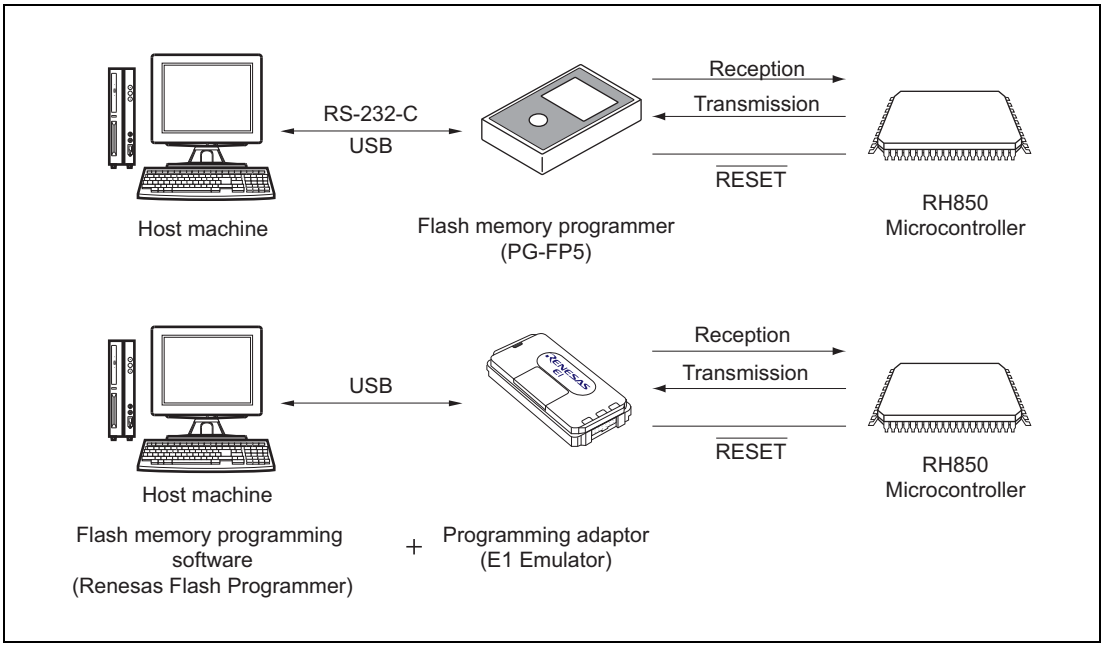

Figure 37.5 Environments for Handling Programs of the Flash Memory

By using the PG-FP5 flash memory programmer or the combination of the Renesas Flash Programmer (software for writing to flash memory) running on the host machine and the E1 emulator as an programming adaptor, the user is easily able to erase, program, and verify the contents of the on-chip memory of flash-memory-equipped microcontrollers from Renesas Electronics.

The PG-FP5 flash memory programmer handles programming from a host machine or programming in stand-alone mode while the Renesas Flash Programmer only handles programming from a host machine.

NOTE

For details on the PG-FP5, see the *PG-FP5 Flash Memory Programmer User's Manual*. For details on the Renesas Flash Programmer of flash programming software, see the *Renesas Flash Programmer Flash Programming Software User's Manual*.

37.6 Communication Modes

37.6.1 Asynchronous Flash Programming Interface - 1-Wire UART

The single-wire asynchronous serial programming interface, 1-wire UART is connected to the flash memory programmer with the following port.

- FPDR (JP0_0): Receive data input/transmit data output

37.6.2 Asynchronous Flash Programming Interface - 2-Wire UART

The double-wire asynchronous serial programming interface, 2-wire UART is connected to the flash memory programmer with the following ports.

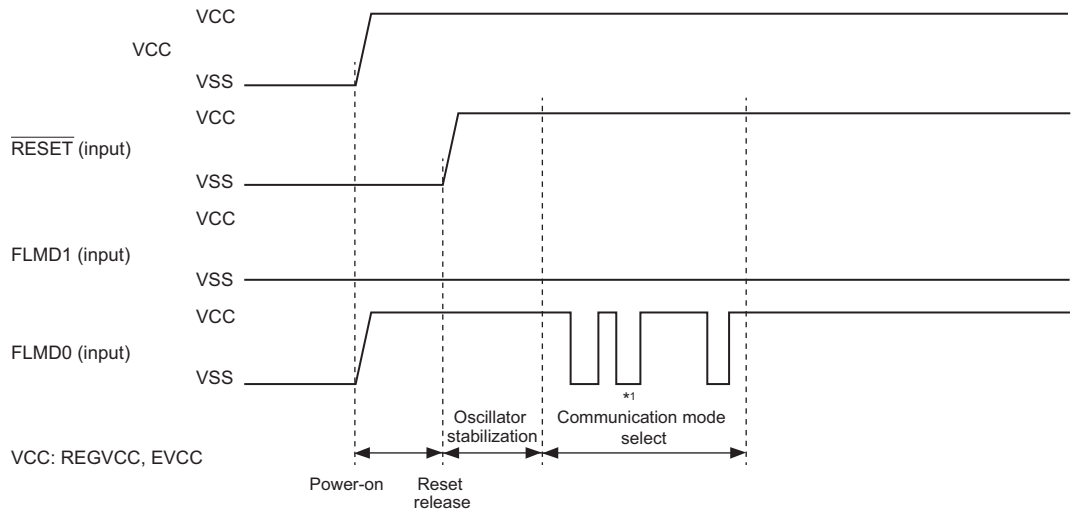
- FPDR (JP0_0): Receive data input
- FPDT (JP0_1): Transmit data output

37.6.3 Synchronous Flash Programming Interface CSI

The synchronous serial programming interface CSI is connected to the flash memory programmer with the following ports.

- FPDR (JP0_0): Receive data input
- FPDT (JP0_1): Transmit data output
- FPCK (JP0_2): Serial clock input

The flash memory programmer outputs the serial data clock SCK, and the microcontroller operates as a slave.



NOTE

For details on Renesas Flash Programmer, see the *Renesas Flash Programmer Flash Programming Software User's Manual*.

37.6.4 Selection of Communication Method

In RH850/F1K, communication method can be selected by pulse input to the FLMD0 pin (up to 7 pulses) after transition to the flash memory programming mode. The FLMD0 pulse is generated by a dedicated flash memory programmer.

Figure 37.6 shows the relation between the number of pulses and communication method.

Note 1. The number of clock cycles to be inserted depends on the communication method as in the following table.

FLMD0 Pulse	Communication Method
0	2-wire UART
7	1-wire UART
3	CSI
Other than above	Setting prohibited

Figure 37.6 Selection of Communication Method

37.7 Self-Programming

37.7.1 Outline

The RH850/F1K supports programming of the flash memory by the user program itself. Renesas Electronics provides a code flash library and a data flash library for use with user programs. These libraries can be used for writing to the code flash memory and to the data flash memory.

When the data flash memory is programmed, the background operation facility makes it possible to execute a programming program from the code flash memory to program the data flash memory. Furthermore, the programming program can be copied to local RAM in advance of the programming operation, and executed from the given destination to perform the programming.

The programming program can be copied to the local RAM in advance and executed to program the code flash memory.

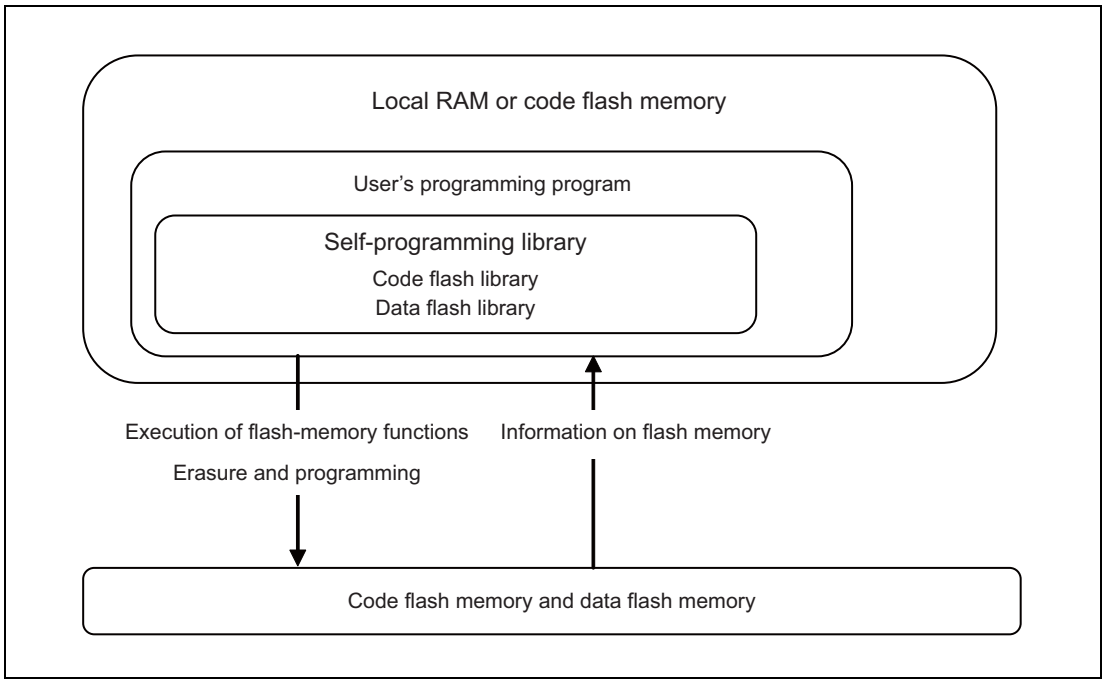


Figure 37.7 Schematic View of Self-Programming

For details on the self-programming of flash memory, see the user's manuals for the code flash and data flash libraries for this device.

37.7.2 Background Operation

Background operations can be used when the combination of the flash memory for writing and the flash memory for reading is any of those listed below.

Table 37.6 Conditions under which Background Operation is Usable

Range for Writing	Range for Reading
Data flash memory	Code flash memory

37.7.3 Enabling Self-Programming

The self-programming function can be activated in normal operating mode and user boot mode.

Erasure and programming of the code flash memory by the self-programming function is enabled by making the FLMD0 pin high level.

This prevents unnecessary overwriting of the program if the device operates incorrectly.

The FLMD0 pin is made high level by using one of the following methods.

- The FLMD0 pin is externally pulled up.
- The FLMD0 pin is pulled up by the FLMDCNT register.

The outline of the FLMDCNT register is described in **Section 37.7.3.1, FLMDCNT Register**.

37.7.3.1 FLMDCNT Register

This register specifies the internal pull-up or pull-down of the FLMD0 pin.

The correct write sequence using the FLMDPCMD register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFA0 0000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

37.8 Reading Flash Memory

37.8.1 Reading Code Flash Memory

Special settings are not required to read code flash memory in normal mode. Data can simply be read out through access to addresses in the code flash memory.

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception.

37.8.2 Reading Data Flash Memory

Configure the number of read cycles in the EEPRDCYCL register prior to reading data from data flash memory in normal mode. Once this register is properly configured, data can be read by simply accessing addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programmed again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

37.8.2.1 EEPRDCYCL — Data Flash Wait Cycle Control Register

This register is used to specify the number of wait cycles to be inserted when reading the data in the data flash.

Set the number of wait cycles to be inserted in the clock cycle when reading the data flash according to the operating clock frequency of the CPU (f_{CPUCLK}).

Access: This register can be read or written in 8-bit units.

Address: FFC5 9810_H

Value after reset: $0F_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	WAIT[3:0]			
Value after reset	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 37.8 EEPRDCYCL Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	WAIT[3:0]	Number of Wait Cycles

WAIT [3:0]	Number of Wait Cycles	CPU Operation Frequency		
		f_{CPUCLK} ≤ 40 MHz	40 MHz < f_{CPUCLK} ≤ 80 MHz	80 MHz < f_{CPUCLK} ≤ 120 MHz
0000	1	√	Setting prohibited	Setting prohibited
0001	2	√	√	Setting prohibited
0010	3	√	√	√
0011	4	√	√	√
0100	5	√	√	√
0101	6	√	√	√
0110	7	√	√	√
0111	8	√	√	√
1000	9	√	√	√
Other than above	10	√	√	√

NOTES

1. The read access time to the data flash is calculated by the number of wait cycles.

   Read access time to the data flash = {17 + (Number of wait cycles) × 4)} / CPU operating frequency

   However, the time may be changed depending on the combination of instructions before and after the execution.
2. √ indicates the number of wait cycles that can be set.

37.8.2.2 PRDNAMEn — Product Name Storage Register (n = 1 to 3)

This register stores the product name. The product part name is stored in 16-byte ASCII code, and PRDNAME1, PRDNAME2, and PRDNAME3 correspond to the fourth to first bytes, eighth to fifth bytes, and twelfth to ninth bytes of the product part name respectively.

Access: These registers are read-only registers that can be read in 32-bit units.

Address: PRDNAME1: FFCD 00D0$_H$
PRDNAME2: FFCD 00D4$_H$
PRDNAME3: FFCD 00D8$_H$

Value after reset: See **Table 37.10** to **Table 37.12**.

37.8.2.3 CHIPIDnXX — Chip ID Register (n = 1,2, XX = LL,LH,HL,HH)

The RH850/F1K provides the option of a unique chip ID of the device.

Access: These registers are read-only registers that can be read in 32-bit units.

Address: CHIPID1LL: FFCD 00E0$_H$
CHIPID1LH: FFCD 00E4$_H$
CHIPID1HL: FFCD 00E8$_H$
CHIPID1HH: FFCD 00EC$_H$
CHIPID2LL: FFCD 00F0$_H$
CHIPID2LH: FFCD 00F4$_H$
CHIPID2HL: FFCD 00F8$_H$
CHIPID2HH: FFCD 00FC$_H$

Value after reset: Unique value

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CHIPIDnXX[31:24]*1								CHIPIDnXX[23:16]*1							
Value after reset

Value after reset																
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. n = 1, 2 XX = LL, LH, HL, HH

37.9 Option Bytes

The option bytes of the flash memory are an expansion area and hold data specified by the user for a variety of purposes. Initial settings for peripheral modules and so on as specified by the option bytes become effective on release from the reset state.

37.9.1 Option Byte Setting

Be sure to set the option byte area that corresponds to the optional functions listed below, before writing a program to the flash memory.

The optional functions specified by the option bytes are as follows.

- Function of port group JP0
- Activation code method of WDTA1
- Start mode of WDTA1
- Enabling or disabling WDTA1
- Activation code method of WDTA0
- Start mode of WDTA0
- Enabling or disabling WDTA0
- Initial value of the overflow interval time for WDTA1 and WDTA0
- Protocol of CAN FD CRC (Supported only for PREMIUM)
- Enabling or disabling of $\overline{\text{RESETOUT}}$
- Enabling the high voltage monitor
- Enabling the low voltage monitor

37.9.2 OPBT0 — Option Byte 0

The settings and bit positions of the option bytes are listed below.

For details on how to set an option byte, see the user's manual of the flash programmer for serial programming as well as the code flash library for self-programming.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	OPJTAG[1:0]		—	—	WDT 1_3	—	WDT 1_1	WDT 1_0	WDT 0_3	—	WDT 0_1	WDT 0_0	WDT_2	WDT_1	WDT_0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	CANFD CRC	RESET OUTEN	—	—	—	CVM_H D_EN	CVM_L D_EN	—	—	—	—

Table 37.13 Option Byte 0 Settings (1/2)

Bit Position	Bit Name	Function
31	Reserved	When writing, write “1”.
30, 29	OPJTAG[1:0]	These bits control the function of port group JP0. 00: JP0 is used for general purpose/alternative function port. 01: JP0 is used for LPD 4-pin mode. 10: JP0 is used for LPD 1-pin mode. 11: JP0 is used for Nexus I/F.
28, 27	Reserved	When writing, write “1”.
26	WDT1_3	Specifies the activation code method of WDTA1. 0: Fixed activation code 1: Variable activation code
25	Reserved	When writing, write “1”.
24	WDT1_1	Specifies the start mode of WDTA1. 0: Software trigger start mode 1: Default start mode
23	WDT1_0	Enables or disables WDTA1. 0: WDTA1 is disabled 1: WDTA1 is enabled
22	WDT0_3	Specifies the activation code method of WDTA0. 0: Fixed activation code 1: Variable activation code
21	Reserved	When writing, write “1”.
20	WDT0_1	Specifies the start mode of WDTA0. 0: Software trigger start mode 1: Default start mode
19	WDT0_0	Enables or disables WDTA0. 0: WDTA0 is disabled 1: WDTA0 is enabled
18 to 16	WDT_[2:0]	Control of the overflow interval time for WDTA0 and WDTA1 These bits specify the reset value of WDTAnMD.WDTAnOVF[2:0].
15 to 11	Reserved	When writing, write “1”.
10	CANFDCRC*1	CAN FD CRC protocol 0: Original protocol 1: New protocol
9	RESETOUTEN	$\overline{\text{RESETOUT}}$ control 0: $\overline{\text{RESETOUT}}$ disable 1: $\overline{\text{RESETOUT}}$ enable
8 to 6	Reserved	When writing, write “1”.

Table 37.13 Option Byte 0 Settings (2/2)

Bit Position	Bit Name	Function
5	CVM_HD_EN	High Voltage Monitor Enable 0: Disable high voltage detection 1: Enable high voltage detection
4	CVM_LD_EN	Low Voltage Monitor Enable 0: Disable low voltage detection 1: Enable low voltage detection
3 to 0	Reserved	When writing, write “1”.

Note 1. This bit is supported only for PREMIUM.

37.9.3 OPBT1 — Option Byte 1

The settings and bit positions of the option bytes are listed below.

For details on how to set an option byte, see the user's manual of the flash programmer for serial programming as well as the code flash library for self-programming.

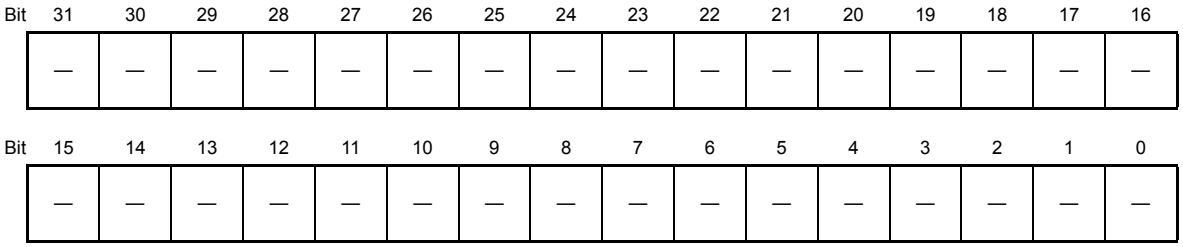

Table 37.14 Option Byte 1 Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When writing, write “1”.
9	Reserved	When writing, write “0”.
8 to 0	Reserved	When writing, write “1”.

37.10 Usage Notes

(1) Reading areas where programming or erasure was interrupted

When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid the reading out of undefined data, which might cause a malfunction, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.

(2) Reading the code flash memory that has been erased but not yet been programmed again

Note that reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.

(3) Prohibition of additional writing

Writing to a given area two or more times is not possible. When overwriting data in an area of flash memory after writing to the area has been completed, erase the area first.

(4) Resets during programming and erasure

In the case of an external reset during programming and erasure, wait for at least the minimum value of $\overline{\text{RESET}}$ input low level width once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.

(5) Allocation of vectors for interrupts and other exceptions during programming and erasure

Generation of an interrupt or other exception during programming or erasure may lead to fetching of the vector from the code flash memory. If this does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.

(6) Abnormal termination of programming and erasure

Even if programming/erasure ends abnormally due to the assertion of a reset by the $\overline{\text{RESET}}$ pin, the programming/erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming/erasure ends abnormally, the blank check function cannot judge whether the area is erased successfully or not. Erase the area again to ensure that the corresponding area is completely erased before using.

If programming and erasure of code flash memory are not completed normally, the lock bit for the target area may be enabled (locked). In such cases, erase the block to erase the lock bit while the lock bit is in the disabled state (the area is not locked).

(7) Items prohibited during programming and erasure

Do not perform the following operations during programming and erasure.

- Set the operating voltage from the power supply outside the allowed range.
- Change the frequency of the peripheral clock.

(8) Erasure of all flash memory before clearing the configuration

Erase the user area of code flash and all of the data area of data flash before clearing the configuration.

(9) Restriction on serial programming when HS IntOSC is used

- 1-wire/2-wire UART mode cannot be used.
- The E1 emulator cannot be used.

Section 38 RAM

This section describes the local RAM mounted on RH850/F1K.

38.1 Features

- RH850/F1K includes the following RAMs:
  - Local RAM
    The local RAM is accessible at high speed. Values in the local RAM are not retained in DeepSTOP mode.
  - Retention RAM
    The retention RAM is a part of the local RAM and is also accessible at high speed. Values in the retention RAM are retained in DeepSTOP mode.
    In addition except for the write access, even if the power-supply voltage (REGVCC) falls below the POC voltage, data in the retention RAM are retained as long as the voltage does not fall below the RAM retention voltage (V_{VLVI}).

Access time for each RAM is shown in the table below.

Table 38.1 RAM Access Time

Type of Access	RAM	1st Access (CPUCLK)	Continuous Access (CPUCLK)
Instruction fetch	Local RAM	5	5
	Retention RAM	5	5
Read access	Local RAM	1	1
	Retention RAM	1	1
Write access	Local RAM	1	1
	Retention RAM	1	1

NOTE

There is possibility that number of access clock of above table is changed depending on the combination before and after instructions.

When RAM access is misaligned, these number is increased.

- Error detection/correction function (ECC) in the local RAM and retention RAM
  The ECC function is included, which can detect 2-bit errors and detect/correct 1-bit errors. For details, see **Section 33, Functional Safety**.

38.2 Memory Configuration

Figure 38.1 shows the memory map of the local RAM and the retention RAM.

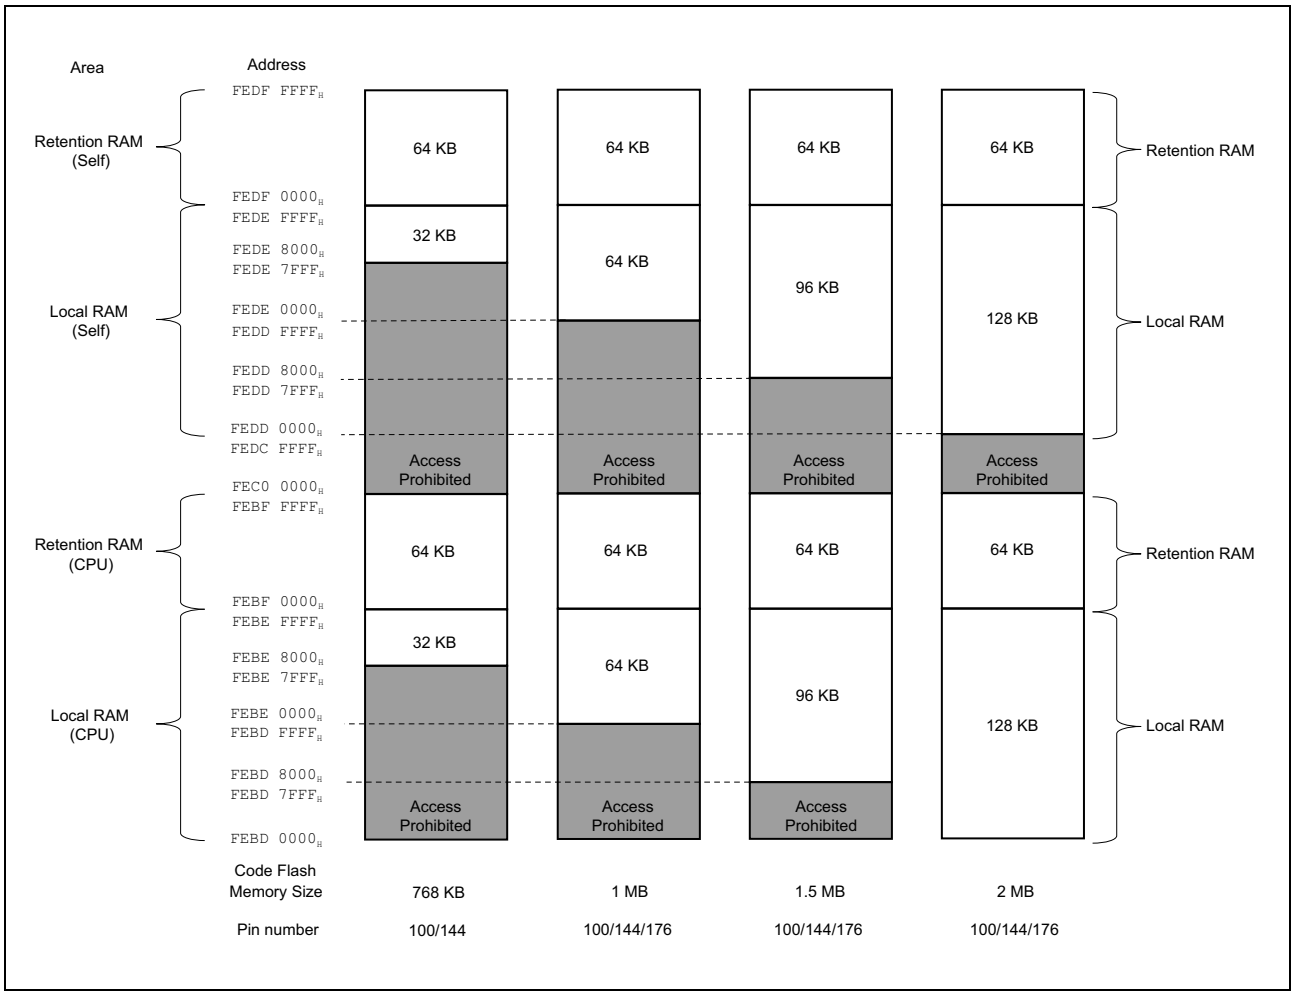

Figure 38.1 Memory Map of the Local RAM and the Retention RAM

38.3 Usage Notes

Before accessing the local or retention RAM with ECC error detection and correction enabled, initialize the RAM by setting the access size to the largest bit length.

Accessing the RAM before initializing it may lead to the detection of ECC errors. ECC errors may be detected if initialization is not handled in the maximum unit of access, for example, when 32-bit word RAM is accessed in 8- or 16-bit units.

Section 39 Boundary Scan

This section contains a generic description of boundary scan.

The RH850/F1K has a JTAG interface and provides a boundary scan function.

39.1 Overview

Boundary scan is a test method defined in the IEEE standard 1149.1 that is used to test the connection between the devices mounted on the printed-circuit board. The boundary scan of the RH850/F1K conforms to IEEE Std 1149.1-2001.

39.2 Features

- Five control signals (DCUTCK, DCUTDI, DCUTDO, DCUTMS, and $\overline{\text{DCUTRST}}$)
- TAP controller
- Instruction register
- Bypass register
- Boundary scan register

The JTAG interface has four instructions.

- BYPASS
  Test mode conforming to the IEEE 1149.1
- EXTEST
  Test mode conforming to the IEEE 1149.1
- SAMPLE/PRELOAD
  Test mode conforming to the IEEE 1149.1
- IDCODE
  Test mode conforming to the IEEE 1149.1

Figure 39.1 shows a block diagram of the JTAG interface.

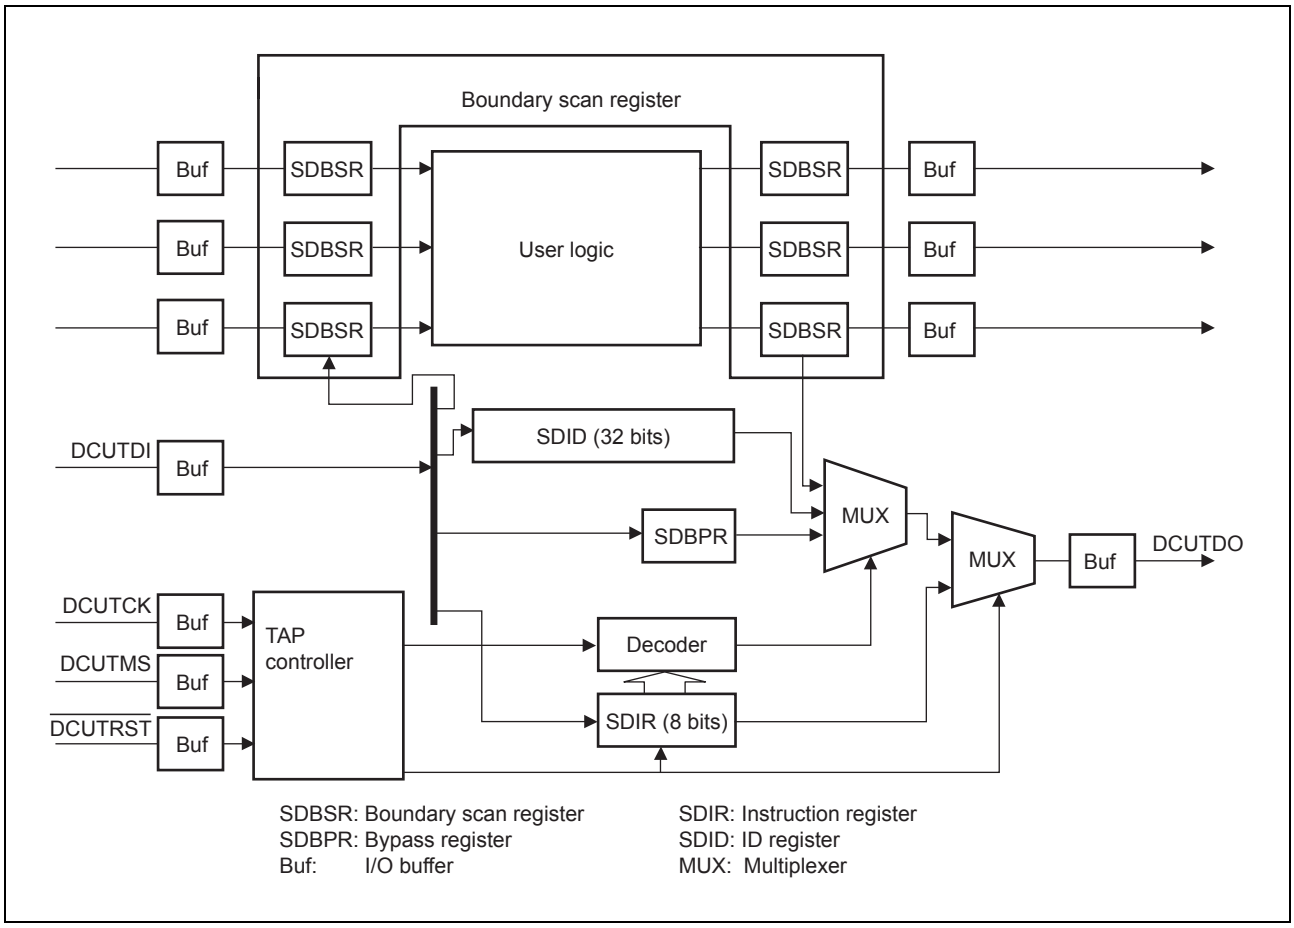

Figure 39.1 Block Diagram of JTAG Interface

39.3 External Input/Output Pins

There are five JTAG control signals: DCUTCK, DCUTDI, DCUTMS, DCUTDO, and $\overline{\text{DCUTRST}}$.

Table 39.1 shows the pin configuration.

Table 39.1 Pin Configuration

Pin Name	Description
DCUTCK	Serial data input/output clock pin Data is input to DCUTDI and is output from DCUTDO in synchronization with this clock signal.
DCUTMS	Mode select input pin Changing the level of this signal in synchronization with DCUTCK changes the state of the TAP controller. For the protocol, see **Figure 39.2, TAP Controller State Transition Diagram**.
$\overline{\text{DCUTRST}}$	Reset input pin A low-level input of this signal resets the JTAG interface. This signal is accepted asynchronously with DCUTCK.
DCUTDI	Serial data input pin Data is input in synchronization with DCUTCK and sent to the JTAG interface.
DCUTDO	Serial data output pin Data to be read from the JTAG interface is output in synchronization with DCUTCK.

39.4 Register Descriptions

The JTAG interface has the following registers. None of the registers can be accessed by the CPU.

- SDIR: Instruction register
- SDID: ID register
- SDBPR: Bypass register
- SDBSR: Boundary scan register

Table 39.2 Register Configuration

Register Name	Symbol	Access Size	Value After Reset*1
Instruction register	SDIR	8	55_H
ID register	SDID	32	See **Table 39.5, ID Register Codes**
Bypass register	SDBPR	1	Undefined
Boundary scan register	SDBSR	—	Undefined

Note 1. Registers are initialized when $\overline{\text{DCUTRST}}$ pin is 0 or when TAP is in the Test-Logic-Reset state.

Instructions can be serially transferred from the serial data input pin (DCUTDI) and input to the instruction register (SDIR). The bypass register (SDBPR) is a 1-bit register, to which DCUTDI and DCUTDO are connected in BYPASS mode. The boundary scan register (SDBSR) is connected to DCUTDI and DCUTDO in SAMPLE/PRELOAD mode and EXTEST mode. The ID register (SDID) is a 32-bit register, from which the fixed code is output via DCUTDO in IDCODE mode.

Table 39.3 shows the serial transfer types possible with the JTAG interface registers.

Table 39.3 Serial Transfer Types

Register	Serial Input	Serial Output
SDIR	Possible	Impossible*1
SDBPR	Possible	Possible
SDBSR	Possible	Possible
SDID	Impossible	Possible

Note 1. A fixed value is read out.

39.4.1 Instruction Register (SDIR)

The instruction register (SDIR) is an 8-bit register that holds a boundary scan instruction. SDIR is initialized by a low-level input of $\overline{\text{DCUTRST}}$ or in the TAP Test-Logic-Reset state. Operation is not guaranteed if a reserved instruction is set in this register.

Table 39.4 Boundary Scan Instructions

Instruction Code								Description
0	0	0	0	0	0	0	0	JTAG EXTEST
0	1	0	0	0	0	0	0	JTAG SAMPLE/PRELOAD
0	1	0	1	0	1	0	1	JTAG IDCODE (initial value)
1	1	1	1	1	1	1	1	JTAG BYPASS
Other than above								Reserved

39.4.2 ID Register (SDID)

The ID register (SDID) is a 32-bit register with a device specific ID.

SDID can be read from the JTAG interface when the IDCODE instruction is set, but cannot be accessed from the CPU.

For the read values, see **Table 39.2, Register Configuration** and **Table 39.5, ID Register Codes**.

Table 39.5 ID Register Codes

PKG	ID Register Codes			
	31 to 28	27 to 12	11 to 1	0
176 pins	0001	1000 0011 0000 1000	0100 0100 011	1
144 pins	0001	1000 0011 0001 0010	0100 0100 011	1
100 pins	0001	1000 0011 0001 0011	0100 0100 011	1

39.4.3 Bypass Register (SDBPR)

The bypass register (SDBPR) is a 1-bit register. When SDIR is set to BYPASS mode, SDBPR is connected to the position between DCUTDI and DCUTDO. The value after reset is undefined. SDBPR is not initialized by a power-on reset or by a low-level input of $\overline{\text{DCUTRST}}$.

39.4.4 Boundary Scan Register (SDBSR)

The boundary scan register (SDBSR) is a shift register for controlling the external I/O pins. When SDIR is set to SAMPLE/PRELOAD or EXTEST mode, SDBSR is connected to the position between DCUTDI and DCUTDO. The value after reset is undefined. SDBSR is not initialized by a power-on reset or a low-level input of $\overline{\text{DCUTRST}}$.

39.5 Operation

39.5.1 TAP Controller

Table 39.2 shows the state transition of the TAP controller. The transition condition is the DCUTMS value at the rising edge of DCUTCK.

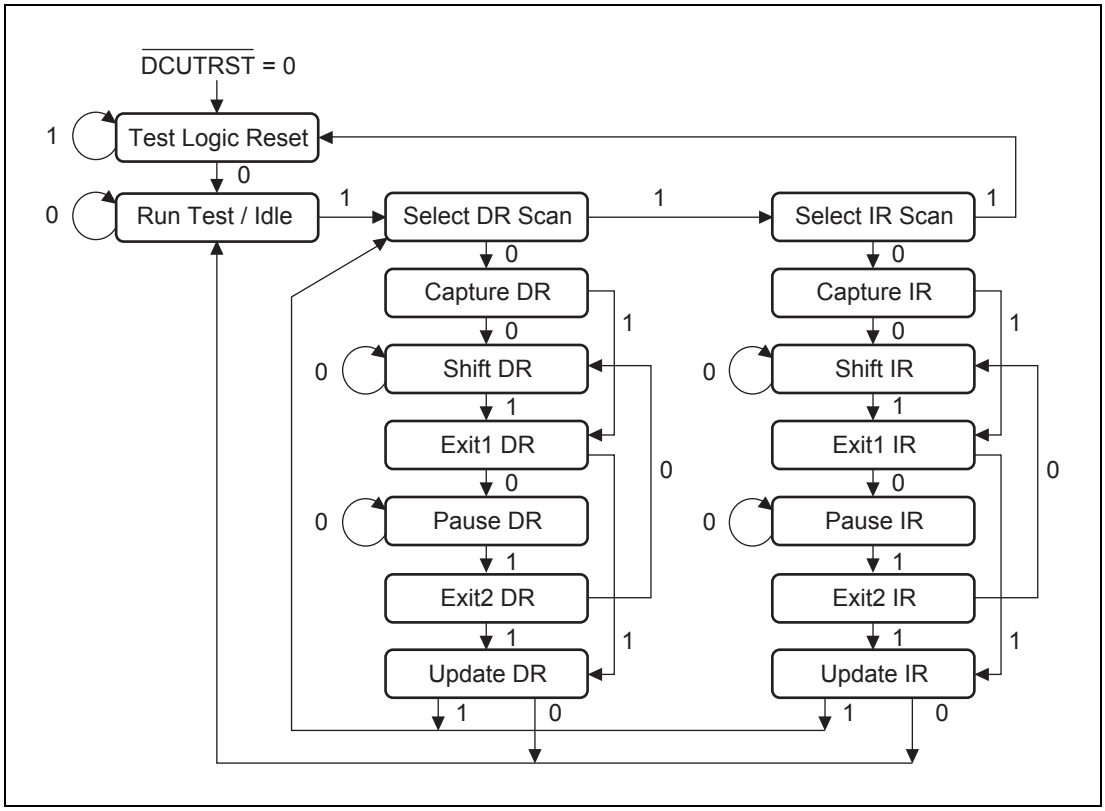

Figure 39.2 TAP Controller State Transition Diagram

NOTE

The DCUTDI value is sampled at the rising edge of DCUTCK and is shifted at the falling edge. DCUTDO is in the high-impedance state in the states other than Shift-DR and Shift-IR. A low-level input of $\overline{\text{DCUTRST}}$ causes transition to Test-Logic-Reset state asynchronously with DCUTCK.

39.5.2 Supported Instructions

39.5.2.1 BYPASS

The BYPASS instruction is a required standard instruction to operate the bypass register. This instruction shortens the shift path to achieve high-speed serial data transfer of other devices on the printed-circuit board. During execution of this instruction, the test circuit has no effect on the system circuit.

39.5.2.2 SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input the value to the boundary scan register from the internal circuits of this device; to output the value from the scan path; and to load data onto the scan path. During execution of this instruction, the level of the input pin of this device is sent to the internal circuits as is, and the value of the internal circuits is output to the outside via the output pin as is. Executing this instruction has no effect on the system circuit of this device.

The SAMPLE operation allows taking in the snapshots of the value to be transferred to the internal circuits from the input pin or the value to be transferred to the output pin from the internal circuits to the boundary scan register and allows reading the snapshots from the scan path. Snapshots can be taken in without preventing the normal operation of this device.

The PRELOAD operation allows setting the initial value to the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. If the EXTEST instruction is executed without PRELOAD operation, an undefined value is output from the output pin until the first scan sequence is completed (transfer to the output latch) because the parallel output latch value is always output to the output pin by the EXTEST instruction.

39.5.2.3 EXTEST

The EXTEST instruction is used to test the external circuits when this device is mounted on the printed-circuit board. When this instruction is executed, the output pin is used to output the test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed-circuit board; whereas the input pin is used to take in the test result from the printed-circuit board to the boundary scan register. When the EXTEST instruction is executed N times for testing, the test data for the Nth execution is scanned in at the (N - 1)th scan-out.

If the data is loaded onto the boundary scan register of the output pin in the Capture-DR state of this instruction, it is not used for testing the external circuits (replaced through shift operation).

39.5.2.4 IDCODE

The IDCODE instruction sets the JTAG interface pins to IDCODE mode, which is defined by the JTAG standard. When the JTAG interface is initialized (by a low-level input of $\overline{\text{DCUTRST}}$ or placing TAP in the Test-Logic-Reset state), IDCODE mode is set.

39.5.3 Pins Subject to Boundary Scan

All pins, excluding pins such as external clock input pins or power supply pins, are subject to boundary scan.

The pins which are not subjected to boundary scan are listed in **Table 39.6**.

Table 39.6 Pins not Subject to Boundary Scan

Type	Pins
JTAG interface	DCUTCK, DCUTDI, DCUTDO, DCUTMS, $\overline{\text{DCUTRST}}$
Power supply pins	REGVCC, AWOVCL, AWOVSS, ISOVCL, ISOVSS EVCC, EVSS
Power supply pins (A/D converter)	A0VREF, A1VREF*1, A0VSS, A1VSS*1
Clock	X1, X2, XT1*1, IP0_0/XT2*1
Mode setting	P10_8/FLMD1, P10_1/MODE0, P10_2/MODE1

Note 1. Only available for 176 pin and 144 pin devices.

The following signals are only sampled in boundary scan mode.

Table 39.7 Pins Subject to Boundary Scan (Sampling Only)

Function	Pin Name
Reset	$\overline{\text{RESET}}$
Mode setting	FLMD0

The following pins are shared by the analog buffer. Accordingly, boundary scan only applies to general I/O pins.

Table 39.8 Pins Subject to Boundary Scan (Only General I/O Pins)

Function	Pin Name
ADCA0 input	P8_0-12, P9_0-6, AP0_0-15
ADCA1 input	P18_0-7, AP1_0-15

NOTE

In boundary scan mode, the level of the following pins must be fixed:
P10_1 = Low, P10_2 = High, and P10_8 = High

39.6 Usage Notes

1. Once an instruction is set, it is not modified until another instruction is issued. To issue the same instruction twice in a row, insert an instruction that has no effect on chip operation (such as BYPASS) between the instructions.
2. To start the system in boundary scan mode, de-assert $\overline{\text{DCUTRST}}$ while $\overline{\text{RESET}}$ is high. Also be sure to set DCUTMS to high before de-asserting $\overline{\text{DCUTRST}}$ and ensure that DCUTMS remains high for 600 ns + five DCUTCK clock cycles after de-asserting $\overline{\text{DCUTRST}}$.
3. For the maximum clock frequency that can be input to DCUTCK, see the Electrical Characteristics section in the Data Sheet document.
4. If serial transfer is performed exceeding the number of bits of the register connected between DCUTDI and DCUTDO, the data that is input from DCUTDI is output from DCUTDO as is.
5. If the serial transfer sequence is corrupted, be sure to assert $\overline{\text{DCUTRST}}$. In this case, transfer starts again from the beginning regardless of the point of transfer corruption.
6. Data is output via DCUTDO at the falling edge of DCUTCK.
7. To facilitate debugging, route $\overline{\text{DCUTRST}}$ on the board in such a way that patterns can be easily cut.

Section 40 Electrical Characteristics

40.1 Overview

The electrical spec of this device is guaranteed by the following operational condition. But, this condition is different depends on each characteristics, so refer to each chapter for more detail.

40.1.1 Pin Groups

40.1.1.1 176 pin

Symbol	Pin Group Supplied by	Related Pins/Ports
PgR	REGVCC, AWOVSS	X1, X2, XT1, XT2/IP0_0
PgE	EVCC, EVSS	Related ports: JP0, P0, P1, P2, P8, P9, P10, P11, P12, P18, P20 Related pins: $\overline{\text{RESET}}$, FLMD0
PgA0	A0VREF, A0VSS	Related port: AP0
PgA1	A1VREF, A1VSS	Related port: AP1

40.1.1.2 144 pin

Symbol	Pin Group Supplied by	Related Pins/Ports
PgR	REGVCC, AWOVSS	X1, X2, XT1, XT2/IP0_0
PgE	EVCC, EVSS	Related ports: JP0, P0, P1, P8, P9, P10, P11, P12, P18, P20 Related pins: $\overline{\text{RESET}}$, FLMD0
PgA0	A0VREF, A0VSS	Related port: AP0
PgA1	A1VREF, A1VSS	Related port: AP1

40.1.1.3 100 pin

Symbol	Pin Group Supplied by	Related Pins/Ports
PgR	REGVCC, AWOVSS	X1, X2
PgE	EVCC, EVSS	Related ports: JP0, P0, P8, P9, P10, P11 Related pins: $\overline{\text{RESET}}$, FLMD0
PgA0	A0VREF, A0VSS	Related port: AP0

40.1.2 General Measurement Conditions

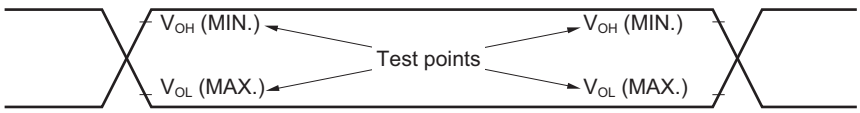
40.1.2.1 Common Conditions

- Power supply
  - REGVCC = EVCC = VPOC*1 to 5.5 V
  - A0VREF = 3.0 V to 5.5 V
  - A1VREF = 3.0 V to 5.5 V
  - AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V

- Capacitance of the internal regulator
  - CAWOVCL: 0.1 µF ± 30%
  - CISOVCL: 0.1 µF ± 30%
- Operating temperature
  - Tj = –40 to +130°C @R7F7015xx3AFP*
    @R7F7016yy3AFP*
  - Tj = –40 to +150°C @R7F7015xx4AFP*
    @R7F7016yy4AFP*

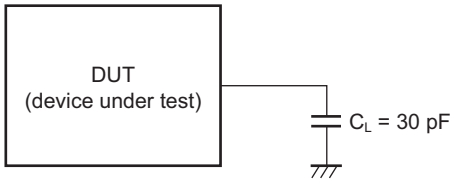
  xx = 42, 43, 46, 47, 57, 60, 61, 62, 63, 66, 67, 77, 80, 81, 82, 83, 86, 87, 97
  yy = 02, 03, 10, 11, 12, 13, 20, 21, 22, 23

  Regarding operation temperature of each product, see **Section 1.3, RH850/F1K Product Lineup**.
- Load conditions
  - CL = 30 pF



Note 1. "VPOC" means POC (power on clear) detection voltage. For more detail, see **Section 40.8.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

40.1.2.2 AC Characteristic Measurement Condition



(1) AC test input measurement points

(2) AC test output measurement points

(3) Load conditions

CAUTION

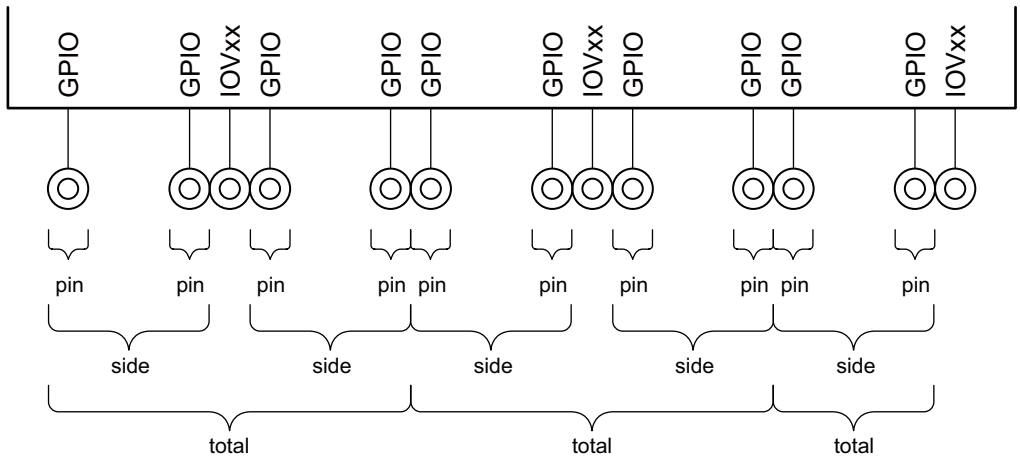
If the load capacitance exceeds 30pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce capacitance to less than 30pF.

40.2 Absolute Maximum Ratings

CAUTIONS

1. **Do not directly connect outputs (or input/outputs) to each other, power supply and ground.**
2. **Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.**
3. **When designing an external circuit ensure that the connections don't conflict with the port state of this device.**

40.2.1 Supply Voltages



Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
System supply voltage	REGVCC		–0.5		6.5	V
	AWOVSS		–0.5		0.5	V
	ISOVSS		–0.5		0.5	V
Port supply voltage	EVCC		–0.5		6.5	V
	EVSS		–0.5		0.5	V
A/D-converter supply voltage	A0VREF		–0.5		6.5	V
	A1VREF		–0.5		6.5	V
	A0VSS		–0.5		0.5	V
	A1VSS		–0.5		0.5	V

40.2.2 Port Voltages

Item	Pin Group*1	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	PgR	VI		–0.5		REGVCC + 0.5 (Do not exceed 6.5 V)	V
	PgE			–0.5		EVCC + 0.5 (Do not exceed 6.5 V)	V
	PgA0			–0.5		A0VREF + 0.5 (Do not exceed 6.5 V)	V
	PgA1			–0.5		A1VREF + 0.5 (Do not exceed 6.5 V)	V

Note 1. The characteristics of the alternative-function pins are the same as those of the port pins unless otherwise specified.

40.2.3 Port Current

Definition of the condition:

- **Per pin:** Output current of one GPIO
- **Per side:** Total output current of all GPIO pins on one side of one IOVxx
- **Total:** Total output current of both sides of one IOVxx

Note:

- **GPIO:** General-purpose I/O pin (JP0, P0, P1, P2, P8, P9, P10, P11, P12, P18, P20, AP0, AP1)
- **IOVxx:** Power supply pin for I/O pins (EVCC/EVSS, A0VREF/A0VSS, A1VREF/A1VSS)

40.2.3.1 176 pin

Item	Symbol	Pin Group	Condition	MIN.	TYP.	MAX.	Unit
High-level output current	IOH	PgE	Per pin			–10	mA
			Per side1 (Total of P9_0 to P9_6, P20_0 to P20_5)			–48	mA
			Per side2 (Total of P10_6 to P10_9, P18_0 to P18_7)			–48	mA
			Per side3 (Total of P10_10 to P10_14, P11_1 to P11_7, P11_15, P12_0 to P12_2)			–48	mA
			Per side4 (Total of P10_0 to P10_5)			–48	mA
			Per side5 (Total of P0_0 to P0_3, P10_15, P11_0, P11_8 to P11_14, P12_3 to P12_5)			–48	mA
			Per side6 (Total of JP0_3 to JP0_5, P0_4 to P0_6, P0_11 to P0_14, P1_0 to P1_3, P1_12, P1_13, P2_6, P8_2, P8_10 to P8_12)			–48	mA
			Per side7 (Total of JP0_0 to JP0_2, P1_8 to P1_11, P2_0, P2_1)			–48	mA
			Per side8 (Total of JP0_6, P0_7 to P0_10, P1_4 to P1_7, P1_14, P1_15, P2_2 to P2_5, P8_0, P8_1, P8_3 to P8_9)			–48	mA
			Total (EVCC: side1 to side4.)			–60	mA
			Total (EVCC: side4 to side8.)			–60	mA
		PgA0	Per pin			–10	mA
			Total (A0VREF)			–48	mA
		PgA1	Per pin			–10	mA
			Total (A1VREF)			–48	mA
Low-level output current	IOL	PgE	Per pin			10	mA
			Per side1 (Total of P9_0 to P9_6, P20_0 to P20_5)			48	mA
			Per side2 (Total of P18_0 to P18_7)			48	mA
			Per side3 (Total of P10_6 to P10_14, P11_1, P11_2)			48	mA
			Per side4 (Total of P11_3 to P11_7, P11_15, P12_0 to P12_2)			48	mA
			Per side5 (Total of P10_0 to P10_5)			48	mA
			Per side6 (Total of P10_15, P11_0, P11_8 to P11_14, P12_3 to p12_5)			48	mA
			Per side7 (Total of P0_0 to P0_6, P0_11 to P0_14, P1_0 to P1_3, P1_12, P1_13, P2_6)			48	mA
			Per side8 (Total of JP0_0 to JP0_5, P1_8 to P1_11, P2_0, P2_1, P8_2, P8_10 to P8_12)			48	mA
			Per side9 (Total of JP0_6, P0_7 to P0_10, P2_2, P2_3)			48	mA
			Per side10 (Total of P1_4 to P1_7, P1_14, P1_15, P2_4, P2_5, P8_0, P8_1, P8_3 to P8_9)			48	mA
			Total (EVCC: side1 to side5.)			60	mA
			Total (EVCC: side5 to side10.)			60	mA
		PgA0	Per pin			10	mA
			Total (A0VSS)			48	mA
		PgA1	Per pin			10	mA
			Total (A1VSS)			48	mA

40.2.3.2 144 pin

Item	Symbol	Pin Group	Condition	MIN.	TYP.	MAX.	Unit
High-level output current	IOH	PgE	Per pin			–10	mA
			Per side1 (Total of P9_0 to P9_6, P20_4, P20_5)			–48	mA

			Per side (Total of P11_3 to P11_7)			48	mA
			Per side (Total of P10_0 to P10_2)			30	mA
			Total (EVCC)			60	mA
		PgA0	Per pin			10	mA
			Total (A0VSS)			48	mA

40.2.4 Temperature Condition

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Storage temperature	Tstg		–55		170	°C
Junction temperature	Tj	R7F7015xx3AFP* R7F7016yy3AFP*	–40		130	°C
		R7F7015xx4AFP* R7F7016yy4AFP*	–40		150	°C

xx = 42, 43, 46, 47, 57, 60, 61, 62, 63, 66, 67, 77, 80, 81, 82, 83, 86, 87, 97
yy = 02, 03, 10, 11, 12, 13, 20, 21, 22, 23

Regarding operation temperature of each product, see **Section 1.3, RH850/F1K Product Lineup**.

40.3 Capacitance

Condition: REGVCC = EVCC = A0VREF = A1VREF = AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V, Ta = 25°C

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input capacitance	CI*1	f = 1 MHz 0 V for non measurement pins			10	pF
Input/output capacitance	CIO*2				10	pF

Note 1. CI: Capacitance between the input pin and ground

Note 2. CIO: Capacitance between the input/output pin and ground

40.4 Operational Condition

ECO

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CPU clock frequency	f_{CPUCLK}				80	MHz
	$f_{CPUCLK2}$	for OSTMn			40	MHz
Peripheral clock (clock domain) frequency*1	f_{CKSCLK_AWDTA}	for WDTA0			240*2	kHz
	f_{CKSCLK_ATAUJ}	for TAUJ0			40	MHz
	f_{CKSCLK_ARTCA}	for RTCA0			4	MHz
	f_{CKSCLK_AADCA}	for ADCA0			40	MHz
	f_{CKSCLK_AFOUT}	for FOUT			24	MHz
	f_{CKSCLK_IPERI1}	for TAUD0			80	MHz
		for TAUJ1				
		for ENCA0				
		for TAPA0				
		for PIC0				
	f_{CKSCLK_IPERI2}	for TAUBn			40	MHz
		for RS-CANn (clkc)				
		for PWBAn				
		for PWGAn				
		for PWSAn				
	f_{CKSCLK_ILIN}	for RLIN2m			40	MHz
		for RLIN3n				
	f_{CKSCLK_IADCA}	for ADCA1			40	MHz
	$f_{CKSCLK_ICANOSC}$	for RS-CANn (clk_xincan)			24	MHz
	f_{CKSCLK_ICSI}	for CSIGn			80	MHz
		for CSIHn				
	$f_{LS\ IntOSC}$	for WDTA1			240*2	kHz
	f_{CKSCLK_IIIC}	for RIICn			40	MHz
	f_{EMCLK}	for LPSn			8	MHz
Power supply	REGVCC	REGVCC = EVCC	VPOC*3		5.5	V
	EVCC					
	A0VREF		3.0		5.5	V
	A1VREF					
Normal operation voltage	AWOVCL		1.1	1.25	1.35	V
	ISOVCL					
Limited operation voltage*4	AWOVCL		1.35		1.43	V
	ISOVCL					

Note 1. For clock specification of peripherals, see **Section 12, Clock Controller**.

Note 2. This frequency depends on the internal oscillator (LS IntOSC).

Note 3. "VPOC" means POC (power on clear) detection voltage (TYP. 2.85 V). For detail, see **Section 40.8.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.
In addition, the guaranteed operation in DC characteristic.
And AC characteristic is guaranteed when more than 3.0 V.
When the power supply voltage is VPOC to 3.0 V, the device does not malfunction.

Note 4. Reliability restrictions from 1.35 V to 1.43 V

ADVANCED, PREMIUM

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CPU clock frequency	f_{CPUCLK}				120	MHz
	$f_{CPUCLK2}$	for OSTMn			60	MHz

And AC characteristic is guaranteed when more than 3.0 V.
When the power supply voltage is VPOC to 3.0 V, the device does not malfunction.

Note 4. Reliability restrictions from 1.35 V to 1.43 V

40.5 Oscillator Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C

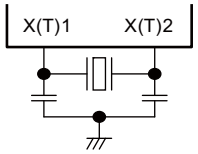
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MainOSC frequency*4	f_{MOSC}	Crystal/Ceramic	16	20	24	MHz
MainOSC current consumption	I_{MOSC}	Crystal/Ceramic After stabilization		1.9*3	2.3*3	mA
MainOSC oscillation start point	V_{MOSCSP}	Crystal/Ceramic	VPOC			V
MainOSC oscillation operating point	V_{MOSCOP}	Crystal/Ceramic		0.5 × REGVCC*3		V
MainOSC oscillation amplitude	$V_{MOSCAMP}$	Crystal/Ceramic	0.4 × REGVCC – 0.2*3			V
MainOSC oscillation stabilization time	t_{MSTB}	Crystal/Ceramic		2 *1, *3		ms
X1 clock Input frequency*4	f_{EX}		16	20	24	MHz
X1 clock Input cycle time	t_{EXCYC}		41.7	50	62.5	ns
X1 High level Input voltage	V_{IH}		0.7 × REGVCC		REGVCC + 0.5	V
		@Flash Programming Interface*5	0.8 × REGVCC		REGVCC + 0.5	V
X1 Low level Input voltage	V_{IL}		–0.5		0.3 × REGVCC	V
		@Flash Programming Interface*5	–0.5		0.2 × REGVCC	V
X1 Input leakage current	I_{LIH}	VI = REGVCC			0.5	µA
	I_{LIL}	VI = 0 V			–0.5	µA
X1 clock Input low-level pulse width	t_{EXL}	f_{EX}=16MHz	26			ns
		f_{EX}=20MHz	20			ns
		f_{EX}=24MHz	16			ns
X1 clock Input high-level pulse width	t_{EXH}	f_{EX}=16MHz	26			ns
		f_{EX}=20MHz	20			ns
		f_{EX}=24MHz	16			ns
X1 clock Input period jitter			–0.3		0.3	ns
SubOSC frequency	f_{SOSC}	Crystal	30	32.768	38	kHz
SubOSC current consumption	I_{SOSC}	After stabilization		1.5*3	4*3	µA
SubOSC DC operating point	$V_{SOSCDCOP}$			0.65*3		V
SubOSC oscillation stabilization time	t_{SSTB}			*2		s

Note 1. Oscillator stabilization time is time until being set (“1”) in MOSCS.MOSCCLKACT bit after MOSCE.MOSCENTRG bit is written “1”, and depends on the setting value of MOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

Note 2. Oscillator stabilization time is time until being set (“1”) in SOSCS.SOSCCLKACT bit after SOSCE.SOSCENTRG bit is written “1”, and depends on the setting value of SOSCST register. Please decide appropriate oscillation stabilization time by matching test with resonator and oscillation circuit.

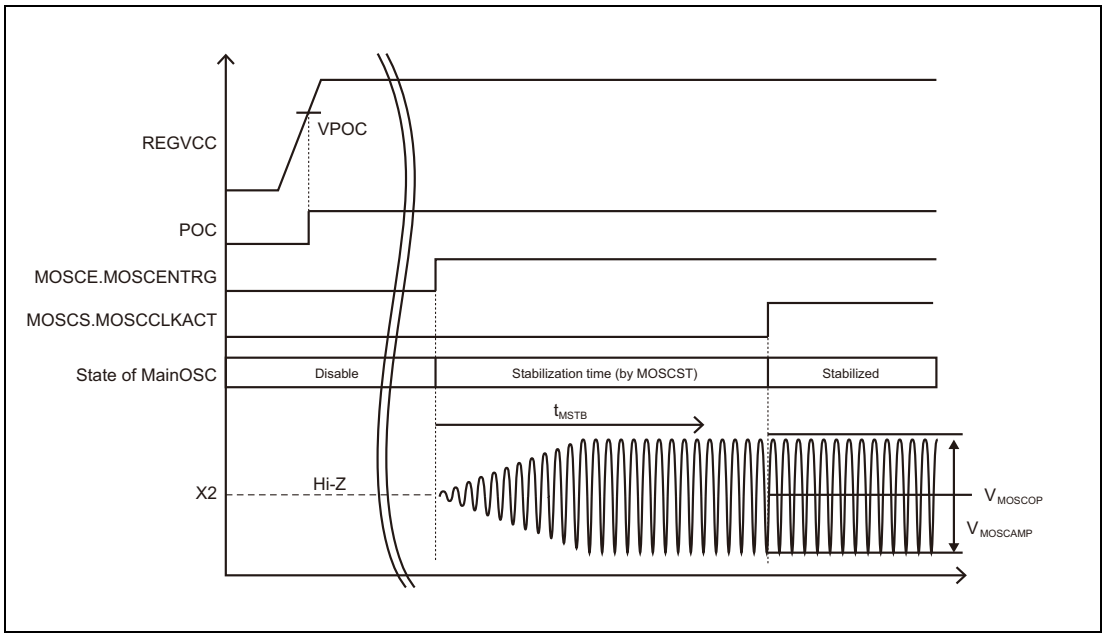
Note 3. This is reference value.

Note 4. The following three crystal/ceramic resonator frequencies are supported: 16 MHz, 20 MHz and 24 MHz.



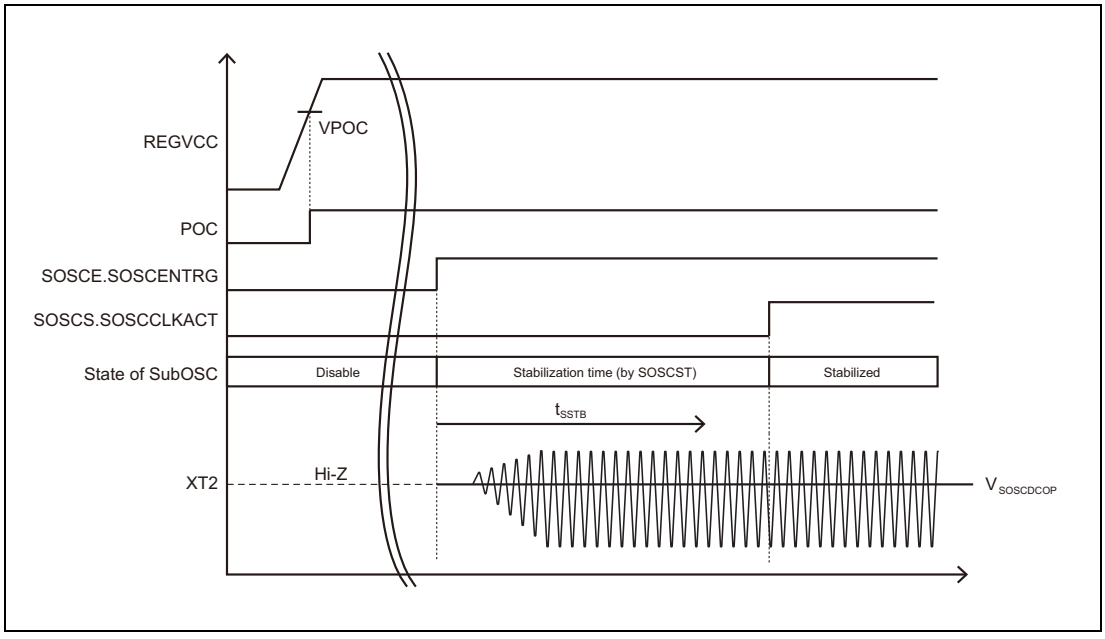
Note 5. X2 should be open and its parasitic capacitance should be less than 5pF.

CAUTION

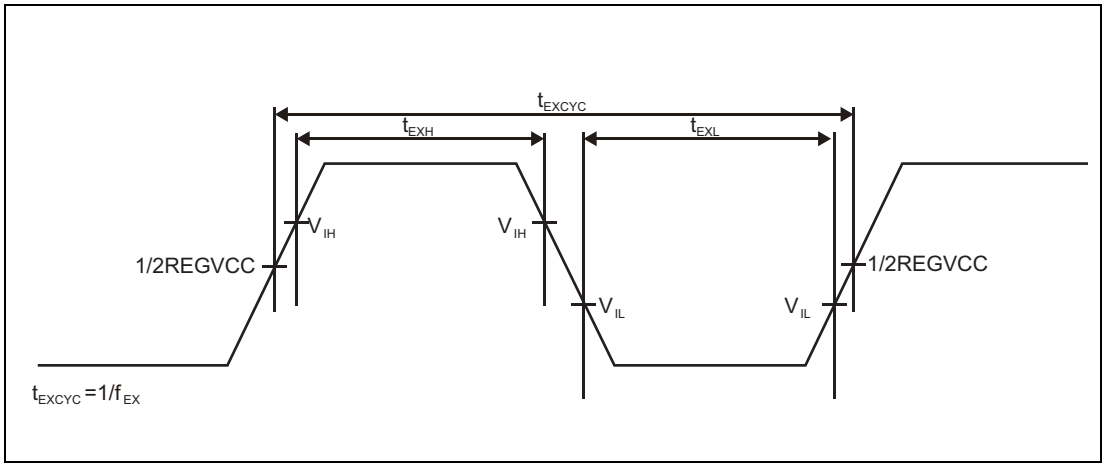


The oscillation stabilization time differs according the matching with the external resonator circuit. It is recommended to determine the oscillation stabilization time by an oscillator matching test.

NOTE



Recommended oscillator circuit is shown below.



MainOSC

SubOSC

External clock

40.6 Internal Oscillator Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
LS IntOSC frequency	f_{RL}		220.8	240	259.2	kHz
HS IntOSC frequency	f_{RH}		7.6	8	8.4	MHz
		After user trimming @ trimming temp	7.92	8	8.08	MHz
HS IntOSC current consumption	I_{RH}	After stabilization			170*1	µA
HS IntOSC oscillation stabilization time	t_{RHSTB}				54.4	µs

Note 1. This is reference value.

40.7 PLL Characteristics

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input frequency	$f_{PLLICLK}$	MainOSC	16	20	24	MHz
		HS IntOSC After user trimming @ trimming temp*3	7.92	8.0	8.08	MHz
Output frequency (PLL for CPU)	f_{CPLL}	ECO	63.3		80	MHz
		ADVANCED, PREMIUM	63.3		120	MHz
Output frequency (PLL for Peripheral)	f_{PPLL}		63.3		80	MHz
Output period jitter*1	t_{CPJ}		–100		100	ps
Long term jitter*1	t_{LTJ}	term = 1 µs	–500		500	ps
		term = 10 µs	–1		1	ns
		term = 20 µs	–2		2	ns
Lock time*2	t_{LCKP}		104	112.3	122.1	µs

Note 1. This is reference value.

Note 2. Lock time is time until being set (“1”) in PLLS.PLLCLKACT bit after PLLE.PLLENTRG bit is written “1”.

Note 3. HS IntOSC supports F_{CPLL} = 80 MHz only. Please use it after an evaluation in customers enough.

40.8 Power Management Characteristics

40.8.1 Regulator Characteristics

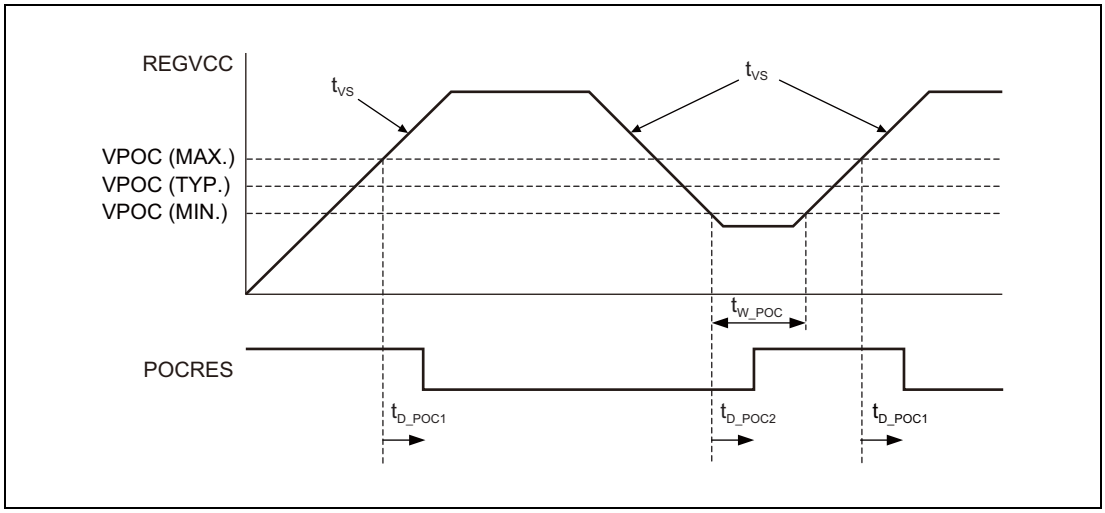
Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
Tj = –40 to (depend on the product) °C, CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	REGVCC		VPOC*1		5.5	V
Output voltage	AWOVCL	AWOVCL pin	1.15	1.25	1.35	V
	ISOVCL	ISOVCL pin	1.15	1.25	1.35	V
Capacitance	CAWOVCL	AWOVCL pin	0.07	0.10	0.13	µF
	CISOVCL	ISOVCL pin	0.07	0.10	0.13	µF
Equivalent series resistance for load capacitance	RVRAWO	for CAWOVCL			40*2	mΩ
	RVRISO	for CISOVCL			40*2	mΩ
Inrush current during power-on					120	mA

Note 1. “VPOC” means POC (power on clear) detection voltage (typ. 2.85V). For detail, see **Section 40.8.2, Voltage Detector (POC, LVI, VLVI, CVM) Characteristics**.

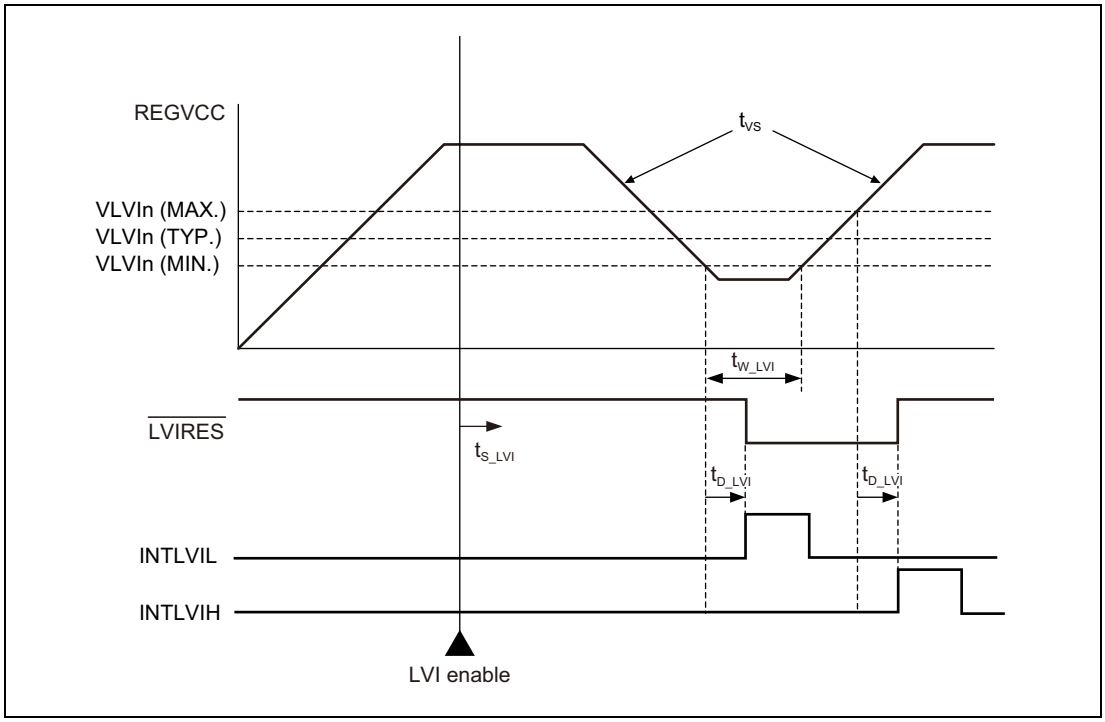
Note 2. This is reference value.

40.8.2 Voltage Detector (POC, LVI, VLVI, CVM) Characteristics



Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition			MIN.	TYP.	MAX.	Unit
Detection voltage (REGVCC)	VPOC	POC			2.7	2.85	3.0	V
	VLVI0	LVI	Rise		3.87	4.0	4.13	V
			Fall		3.9	4.0	4.1	V
	VLVI1		Rise		3.57	3.7	3.83	V
			Fall		3.6	3.7	3.8	V
	VLVI2		Rise		3.37	3.5	3.63	V
			Fall		3.4	3.5	3.6	V
	VVLVI	VLVI			1.8	1.9	2.0	V
Detection voltage (ISOVCL)	VCVMH	CVM	High voltage**Caution**		1.35	1.39	1.43	V
	VCVML*8		Low voltage**Caution**		1.10	1.15	1.20	V
Response time	t_{D_POC1}*6	POC	At power-on (Rise)	*1			2	ms
				*2			6.3	ms
			After power-on (Rise)	*3			2	ms
				*4			5	ms
	t_{D_POC2}*7		After power-on (Fall)	*5			5	µs
	t_{D_LVI}	LVI					2	ms
	t_{D_VLVI}	VLVI		*3			2	ms
				*4			5	ms
	t_{D_CVM}	CVM			0.2		10	µs
Setup time	t_{S_LVI}	LVI	LVICNT0,1 bits are set to 1 (except 00_B), then LVI is ready to operate				80	µs
REGVCC minimum width	t_{W_POC}	POC			0.2			ms
	t_{W_LVI}	LVI			0.2			ms
	t_{W_VLVI}	VLVI			0.2			ms



Note 1. Voltage slope (t_{VS}) : 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms
Note 2. Voltage slope (t_{VS}) : 0.5 V/ms < t_{VS} ≤ 500 V/ms
Note 3. Voltage slope (t_{VS}) : 0.02 V/ms ≤ t_{VS} ≤ 20 V/ms
Note 4. Voltage slope (t_{VS}) : 20 V/ms < t_{VS} ≤ 500 V/ms
Note 5. Voltage slope (t_{VS}) : 0.02 V/ms ≤ t_{VS} ≤ 500 V/ms
Note 6. t_{D_POC1} is the time from detection voltage to release of reset signal.
Note 7. t_{D_POC2} is the time from detection voltage to occurrence of reset signal.
Note 8. The CVM monitors the internal voltage regulator output to ensure that ISOVCL is upper than specified minimum level.

Caution: A detection of the voltage ISOVCL outside the specified level of VCVMH and VCVML is not ensured by CVM.

FLMD0 setup time (vs $\overline{\text{RESET}}$ ↓)	t_{SMDF}		0			µs
$\overline{\text{RESET}}$ ↓ to REGVCC ↓ and IOVCC*1 ↓ delay time	t_{DRPD}		0			ms

Note 1. IOVCC means EVCC, A0VREF and A1VREF.

Table 40.2 In case the $\overline{\text{RESET}}$ pin is used (for Serial programming mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REGVCC and IOVCC*1)	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 µs/V)	V/ms
REGVCC ↑ and IOVCC*1 ↑ to $\overline{\text{RESET}}$ ↑ delay time	t_{DPOR}	Voltage slope (t_{VS}) : 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}) : 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 setup time (vs $\overline{\text{RESET}}$ ↑)	t_{SMD0R}		1			ms
$\overline{\text{RESET}}$ ↓ to REGVCC ↓ and IOVCC*1 ↓ delay time	t_{DRPD}		0			ms

Note 1. IOVCC means EVCC, A0VREF and A1VREF.

Table 40.3 In case the $\overline{\text{RESET}}$ pin is used (for Boundary scan mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REGVCC and IOVCC*1)	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 µs/V)	V/ms
$\overline{\text{REGVCC}}$ ↑ and IOVCC*1 ↑ to $\overline{\text{RESET}}$ ↑ delay time	t_{DPOR}	Voltage slope (t_{VS}) : 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}) : 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 setup time (vs $\overline{\text{RESET}}$ ↑)	t_{SMD0R}		1			ms
FLMD1, MODE0, MODE1 setup time (vs FLMD0 ↑)	t_{SMD1R}		1			µs
FLMD0 hold time (vs $\overline{\text{RESET}}$ ↓)	t_{HMD0F}		1			µs
FLMD1, MODE0, MODE1, MODE2 hold time (vs FLMD0 ↓)	t_{HMD1F}		1			µs
$\overline{\text{RESET}}$↓ to REGVCC ↓ and IOVCC*1 ↓ delay time	t_{DRPD}		0			ms
$\overline{\text{DCUTRST}}$ input delay time (vs $\overline{\text{RESET}}$ ↑)	t_{DRTRST}		1			ms
$\overline{\text{RESET}}$ hold time (vs $\overline{\text{DCUTRST}}$ ↓)	t_{HRTRST}		0			ms

Note 1. IOVCC means EVCC, A0VREF and A1VREF.

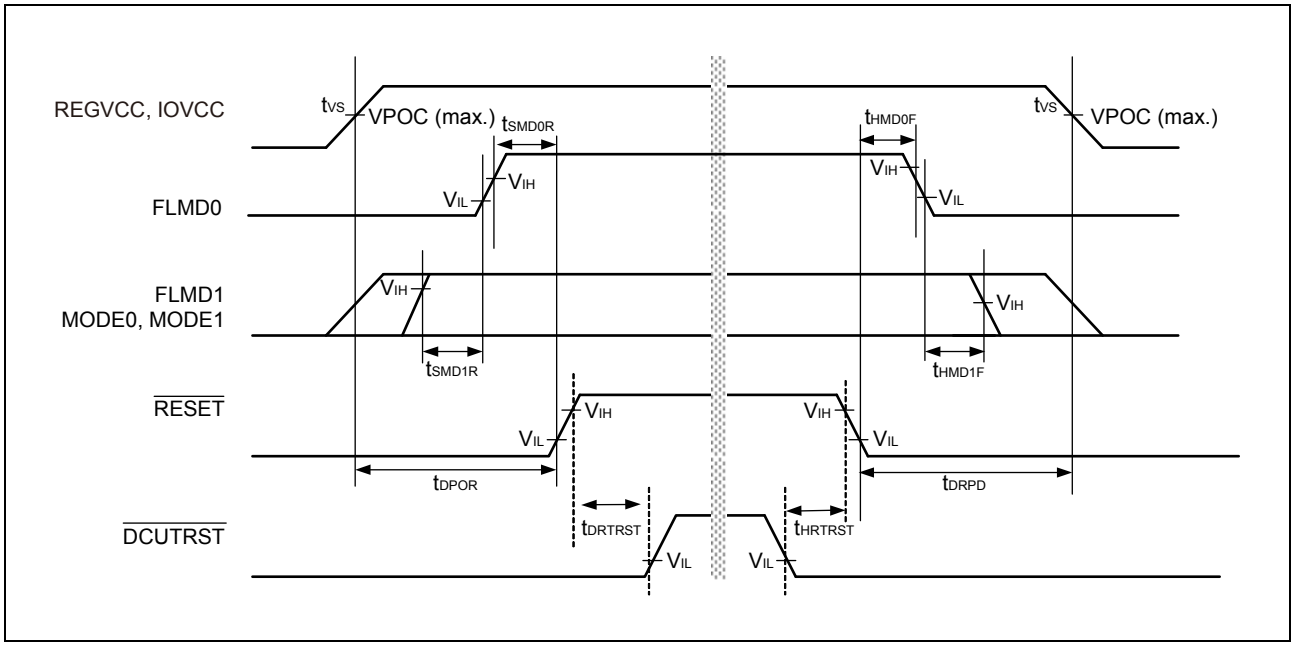

Table 40.4 In case the $\overline{\text{RESET}}$ pin is used (for User boot mode)

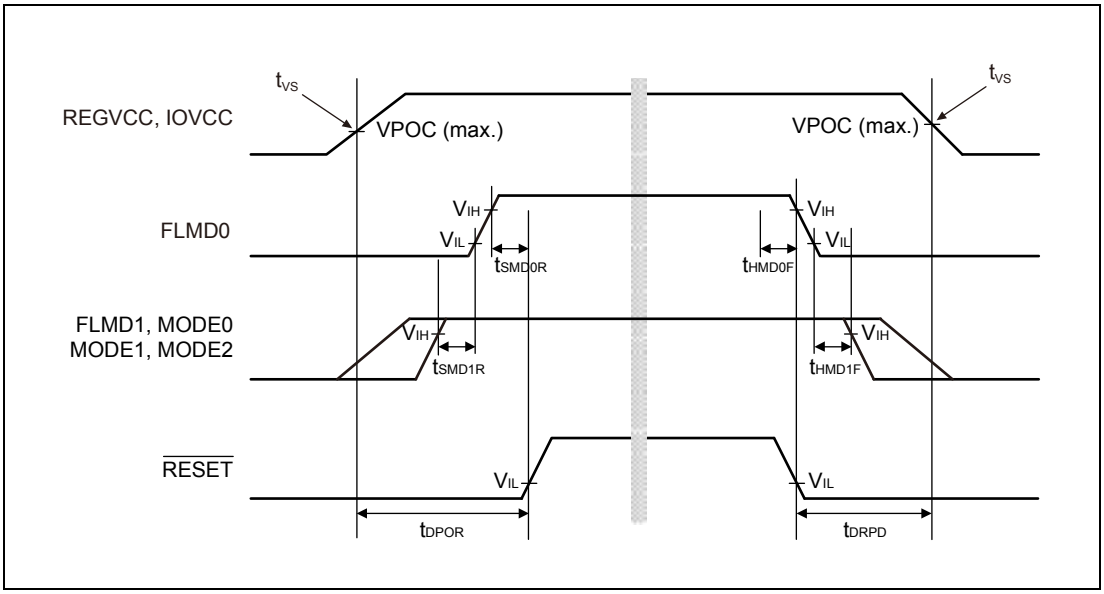
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REGVCC and IOVCC*1)	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 µs/V)	V/ms
REGVCC ↑ and IOVCC*1 ↑ to $\overline{\text{RESET}}$ ↑ delay time	t_{DPOR}	Voltage slope (t_{VS}) : 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}) : 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 setup time (vs $\overline{\text{RESET}}$ ↑)	t_{SMD0R}		1			ms
FLMD1, MODE0, MODE1, MODE2 setup time (vs FLMD0 ↑)	t_{SMD1R}		1			µs
FLMD0 hold time (vs $\overline{\text{RESET}}$ ↓)	t_{HMD0F}		1			µs
FLMD1, MODE0, MODE1, MODE2 hold time (vs FLMD0 ↓)	t_{HMD1F}		1			µs
$\overline{\text{RESET}}$ ↓ to REGVCC ↓ and IOVCC*1 ↓ delay time	t_{DRPD}		0			ms

Note 1. IOVCC means EVCC, A0VREF and A1VREF.



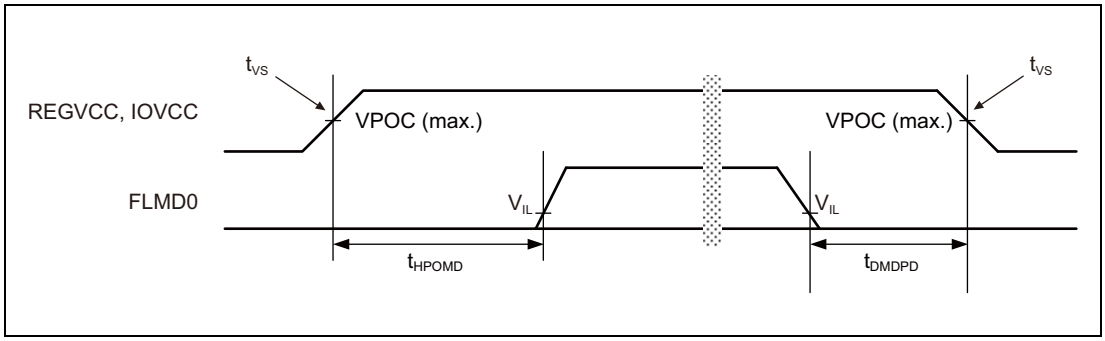


Table 40.5 In case the $\overline{\text{RESET}}$ pin is not used and fixed to high level by pull-up*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Voltage slope (REGVCC and IOVCC*2)	t_{VS}		0.02 (= 50 ms/V)		500 (= 2 µs/V)	V/ms
REGVCC ↑ and IOVCC*2 ↑ to FLMD0 hold time	t_{HPOMD}	Voltage slope (t_{VS}) : 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms	2			ms
		Voltage slope (t_{VS}) : 0.5 V/ms < t_{VS} ≤ 500 V/ms	6.3			ms
FLMD0 ↓ to REGVCC ↓ and IOVCC*2 ↓ delay time	t_{DMDPD}		1			µs

Note 1. This operating condition is available only in normal operation mode (include self-programming mode). When the device is used in except normal operation mode, please use the $\overline{\text{RESET}}$ pin.

Note 2. IOVCC means EVCC, A0VREF and A1VREF.

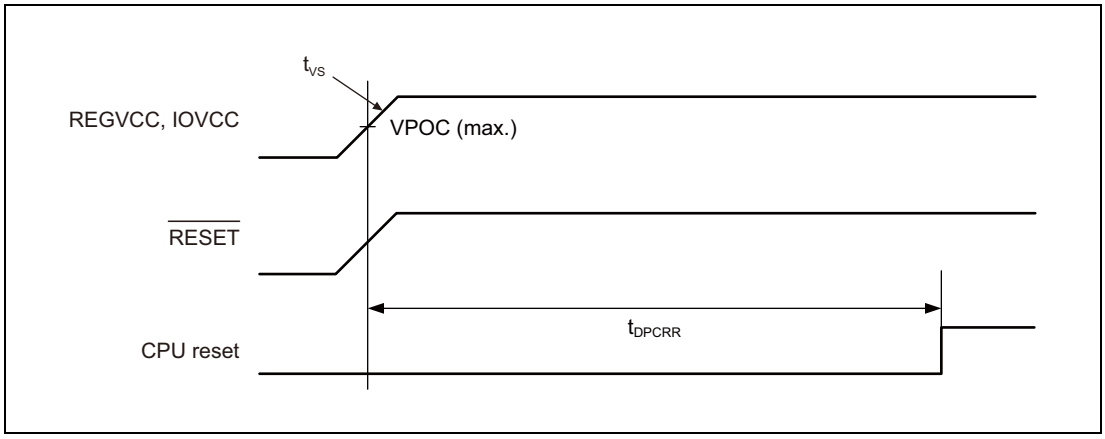
40.8.4 CPU Reset Release Timing

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Table 40.6 In case the $\overline{\text{RESET}}$ pin is not used

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
REGVCC ↑ to CPU reset release*1	t_{DPCRR}	Voltage slope (t_{VS}) : 0.02 V/ms ≤ t_{VS} ≤ 0.5 V/ms			2.58	ms
		Voltage slope (t_{VS}) : 0.5 V/ms < t_{VS} ≤ 500 V/ms			8.3	ms

Note 1. This is reference value.



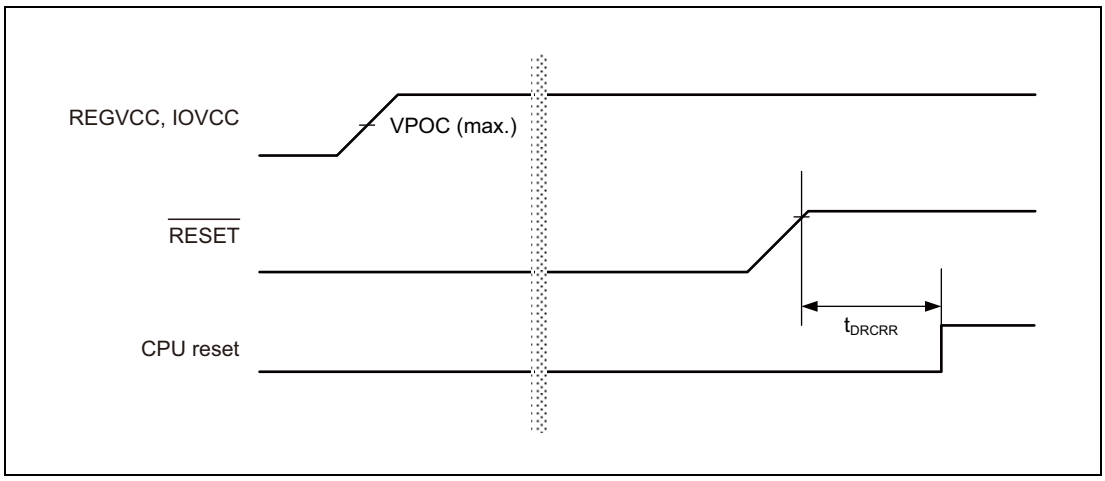


Table 40.7 In case the $\overline{\text{RESET}}$ pin is used

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ ↑ to CPU reset release*1	t_{DRCRR}				16*2	µs

Note 1. This is reference value.

Note 2. At least t_{DPCRR} time is necessary reaching from VPOC (max) even if power up sequence is kept shown on **Section 40.8.3, Power Up/Down Timing**.

40.9 Pin Characteristics

Condition: Some of the conditions mentioned in this chapter can be selected by software and described in the hardware user's manual.

Note 1. Pull-down resistor for ADC diagnostic purpose. Control via ADC self-diagnostic register.

Note 2. Supports Cload: 100pF

Note 3. Supports Cload: 50pF

Note 4. Pull-down resistors for ADC diagnostic and internal pull-down purposes. For ADC diagnostic, control via ADC self-diagnostic register. For internal pull-down, control via PD register.

Note 5. TTL is selected for Boundary scan mode or Nexus in normal operating mode.

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Note: For detail of the definition of “side” and “total”, see **Section 40.2.3, Port Current**.

40.10 Power Supply Currents

Condition: REGVCC, EVCC, A0VREF and A1VREF total current. But the I/O buffer is stopped.

ECO

Item	Symbol	Condition				MIN.	TYP.*1	MAX.	Unit
		CPU	PLL	Tj	Peripheral*2				
RUN mode current	IDDR	Run (80 MHz)	Run	–40 to 150°C	Run(#1)		26	74	mA
				25°C	Stop(#1)		20		mA
RUN mode current (During data/code flash programming)	IDDR3	Run (80 MHz)	Run	–40 to 150°C	Run(#2)		37	89	mA
HALT mode current	IDDH	Run (80 MHz)	Run	–40 to 150°C	Run(#3)		23	72	mA

ADVANCED, PREMIUM

Item	Symbol	Condition				MIN.	TYP.*1	MAX.	Unit
		CPU	PLL	Tj	Peripheral*2				
RUN mode current	IDDR	Run (120 MHz)	Run	–40 to 150°C	Run(#1)		32	81	mA
				25°C	Stop(#1)		26		mA
RUN mode current (During data/code flash programming)	IDDR3	Run (120 MHz)	Run	–40 to 150°C	Run(#2)		43	96	mA
HALT mode current	IDDH	Run (120 MHz)	Run	–40 to 150°C	Run(#3)		29	77	mA

Item	Symbol	Condition				MIN.	TYP.*1	MAX.	Unit
		CPU	PLL	Tj	Peripheral*2				
STOP mode current	IDDS	Stop	Stop	–40 to 90°C	Stop(#2)		0.7	12	mA
				110°C	Stop(#2)			17	mA
				135°C	Stop(#2)			31	mA
DeepSTOP mode current	IDDDS	Power off	Power off	–40 to 85°C	Stop(#3)		50	470	µA
				105°C	Stop(#3)			830	µA
				125°C	Stop(#3)			1370	µA
Cyclic RUN mode current	IDDCR	Run (HS IntOSC)	Stop	–40 to 90°C	Run(#4)		3.6	21	mA
				115°C	Run(#4)			28	mA
				135°C	Run(#4)			40	mA
Cyclic STOP mode current	IDDCS	Stop	Stop	–40 to 90°C	Run(#5)		1.1	13	mA
				110°C	Run(#5)			18	mA
				135°C	Run(#5)			32	mA

Note 1. The condition of “TYP.” shows the specification with the following conditions. Also, the value is just for reference only.
- Tj = 25°C
- REGVCC = EVCC = A0VREF = A1VREF = 5.0 V
- AWOVSS = EVSS = A0VSS = A1VSS = 0 V

Note 2. Operating condition of each peripheral function is shown in the table of next page.

Caution: It must be ensured that the junction temperature in the Ta range remains below Tj≤150°C and does not exceed its limit under application conditions (thermal resistance, power supply current, peripheral current (if not included in power supply current), port output current and injection current).

Function		Run					Stop

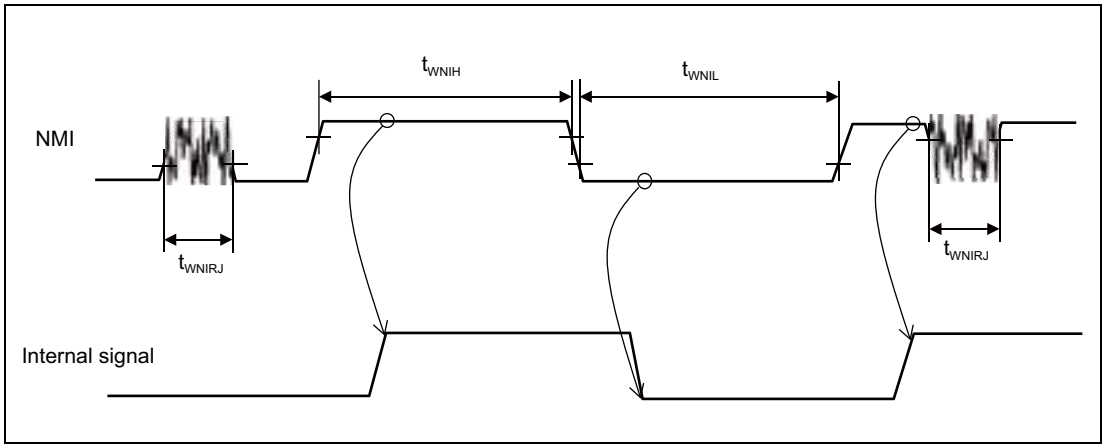
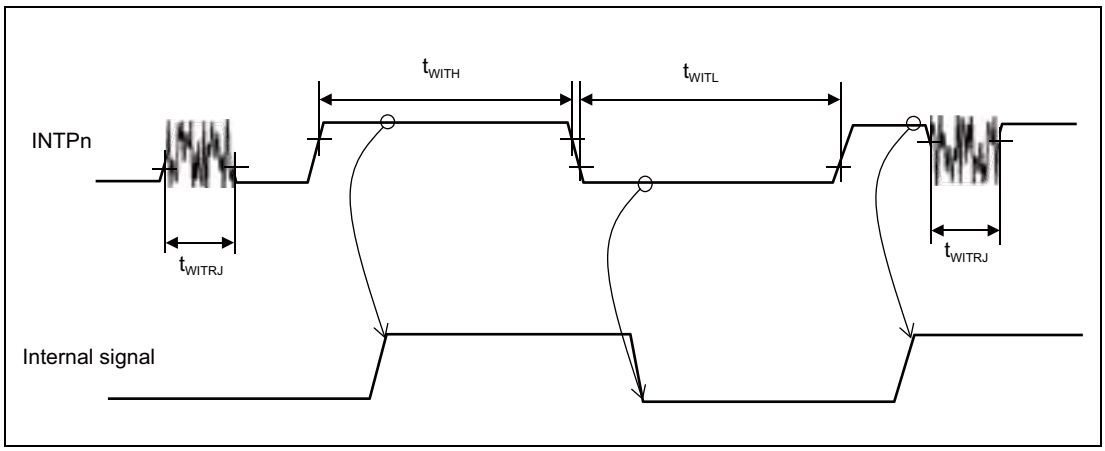
Note 1. T&H used.



40.11 Interrupt Timing

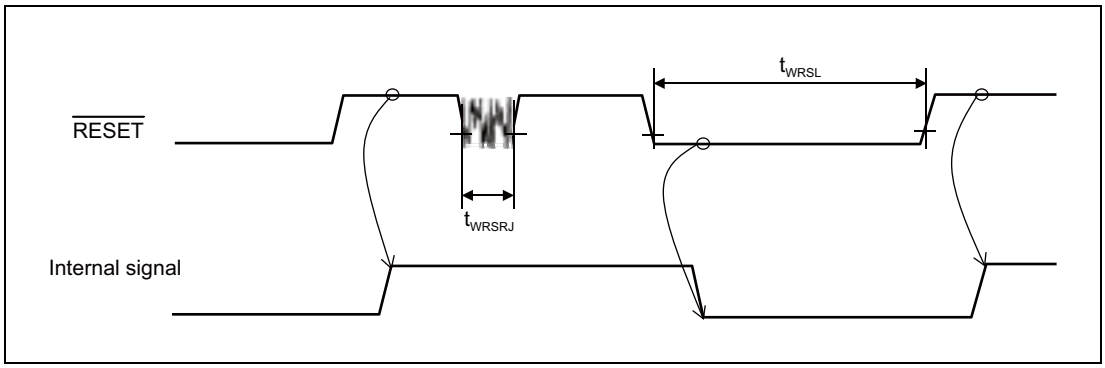


Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
NMI input high/low level width*1	t_{WNIH}/ t_{WNIL}	Edge detection mode	600			ns
		Level detection mode (EMCLK is operated by HS IntOSC)	756			ns
		Level detection mode (EMCLK is operated by LS IntOSC)	5.13			µs
NMI pulse rejection*2	t_{WNIRJ}		100			ns
INTPn input high/low level width*1	t_{WITH}/ t_{WITL}	Edge detection mode	600			ns
		Level detection mode (EMCLK is operated by HS IntOSC)	756			ns
		Level detection mode (EMCLK is operated by LS IntOSC)	5.13			µs
INTPn pulse rejection*2	t_{WITRJ}		100			ns

Note 1. NMI and INTPn input width is needed to ensure that the internal interrupt signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.



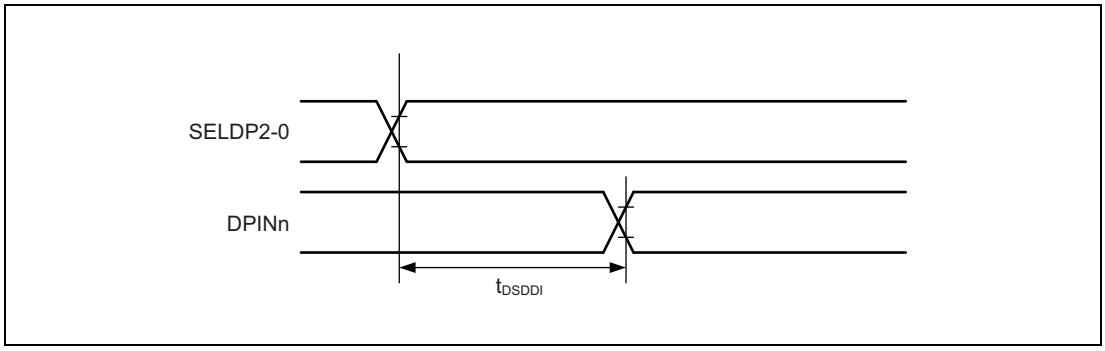
40.12 $\overline{\text{RESET}}$ Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ input low level width*1	t_{WRSL}	Except power on	600			ns
$\overline{\text{RESET}}$ pulse rejection*2	t_{WRSRJ}		100			ns

Note 1. $\overline{\text{RESET}}$ input width is needed to ensure that the internal reset signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.



40.13 Low Power Sampler (DPIN input) Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
DPINn input delay time (vs SELDP2-0)	t_{DSDDI}				150	ns

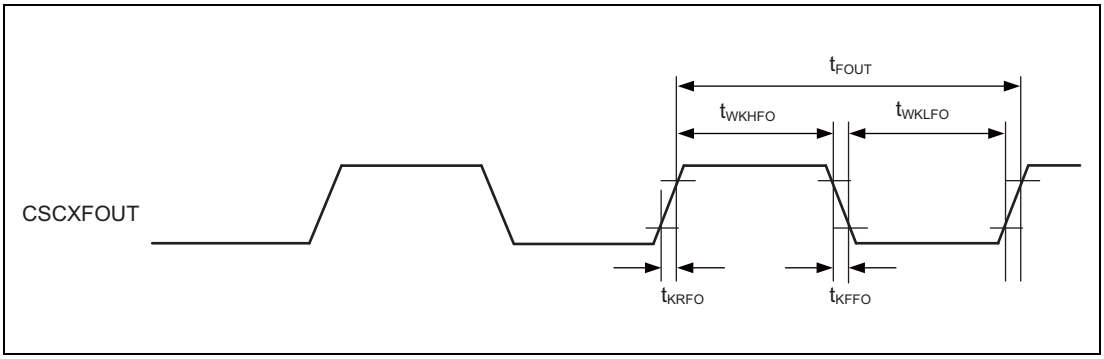
n = 7 to 0

40.14 CSCXFOUT Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF +/–30%, CISOVCL: 0.1µF +/–30%, Ta = –40 to (depend on the product) °C,
CL = 30 pF

<Output driver strength>

CSCXFOUT: Slow or fast mode (refer to the condition in the following table)



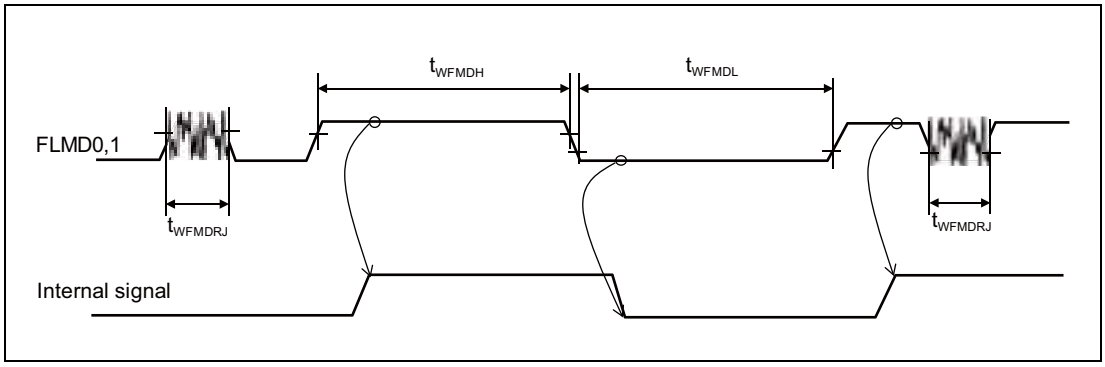
Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
CSCXFOUT output cycle	t_{FOUT}	Slow mode		100 (max. 10 MHz)			ns
		Fast mode (Except JP0_3 pin)*1		41.6 (max. 24 MHz)			ns
CSCXFOUT high level width	t_{WKHFO}	Slow mode	N: 1*2 or even value*3	t_{FOUT} / 2 – 37			ns
			N: Odd value (N ≥ 5)*3, *4	t_{FOUT} × (N+1) / 2N – 37			ns
		Fast mode (Except JP0_3 pin)*1	N: 1*2 or even value*3	t_{FOUT} / 2 – 10			ns
			N: Odd value (N ≥ 3)*3	t_{FOUT} × (N+1) / 2N – 10			ns
CSCXFOUT low level width	t_{WKLFO}	Slow mode	N: 1*2 or even value*3	t_{FOUT} / 2 – 37			ns
			N: Odd value (N ≥ 5)*3, *4	t_{FOUT} × (N–1) / 2N – 37			ns
		Fast mode (Except JP0_3 pin)*1	N: 1*2 or even value*3	t_{FOUT} / 2 – 10			ns
			N: Odd value (N ≥ 3)*3	t_{FOUT} × (N–1) / 2N – 10			ns
CSCXFOUT rise/ fall time	t_{KRFO}/ t_{KFFO}	Slow mode				37	ns
		Fast mode (Except JP0_3 pin)*1				10	ns

Note 1. JP0_3 does not support fast mode.

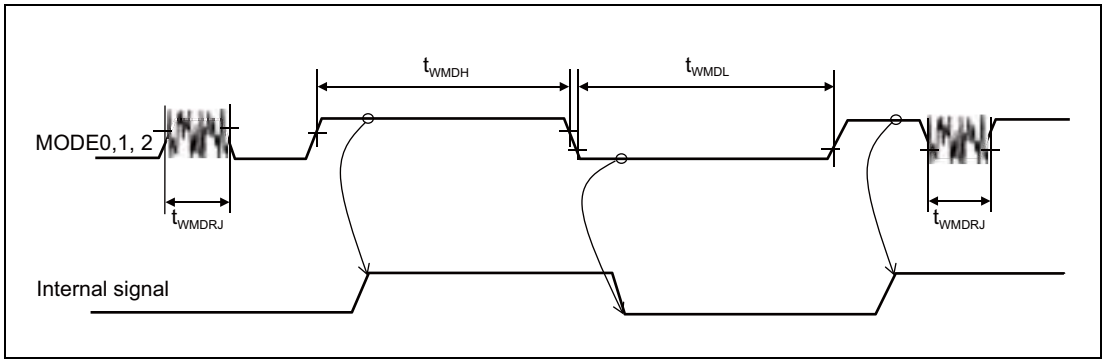
Note 2. When MainOSC, HS IntOSC, LS IntOSC or SubOSC is selected as source clock with the condition of N=1, the characteristics of output signal depends on the selected source clock. It is recommended to use output signal after evaluation on an actual environment.

Note 3. “N” is the value of “Clock divisor N” defined by FOUTDIV register.

Note 4. The selection of N = 3 is prohibited when slow mode is used.



40.15 Mode Timing



Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

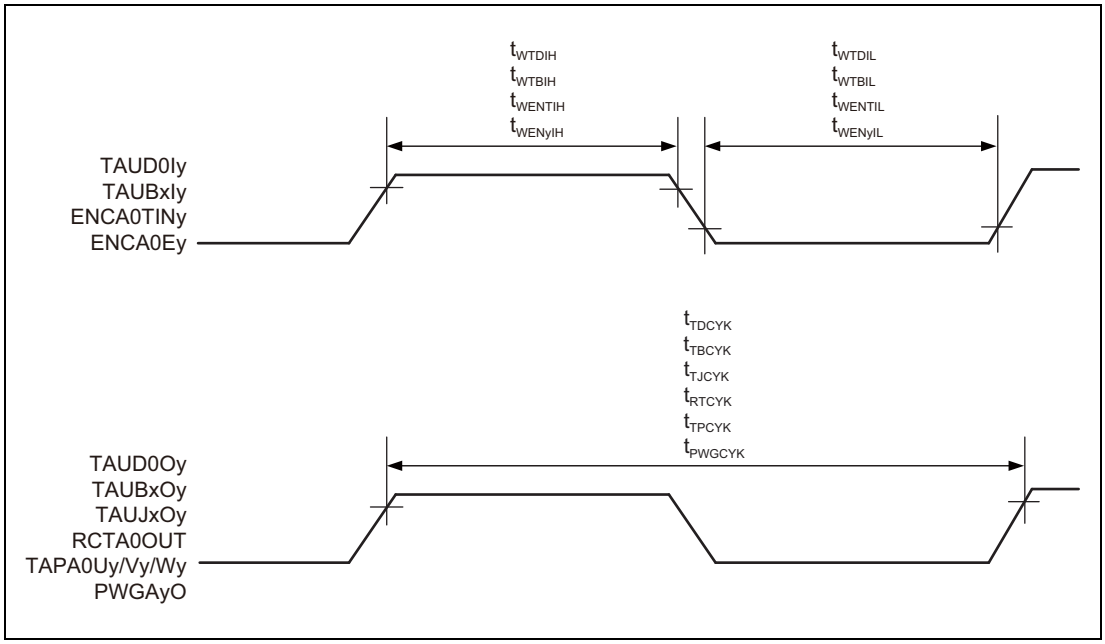
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0,1 input high/low level width*1	t_{WFMDH}/ t_{WFMDL}		600			ns
FLMD0, 1 pulse rejection*2	t_{WFMDRJ}		100			ns
MODE0, 1, 2 input high/low level width*1	t_{WMDH}/ t_{WMDL}		600			ns
MODE0, 1, 2 pulse rejection*2	t_{WMDRJ}		100			ns

Note 1. FLMD0,1 and MODE0,1, 2 input width is needed to ensure that the internal mode signal is activated.

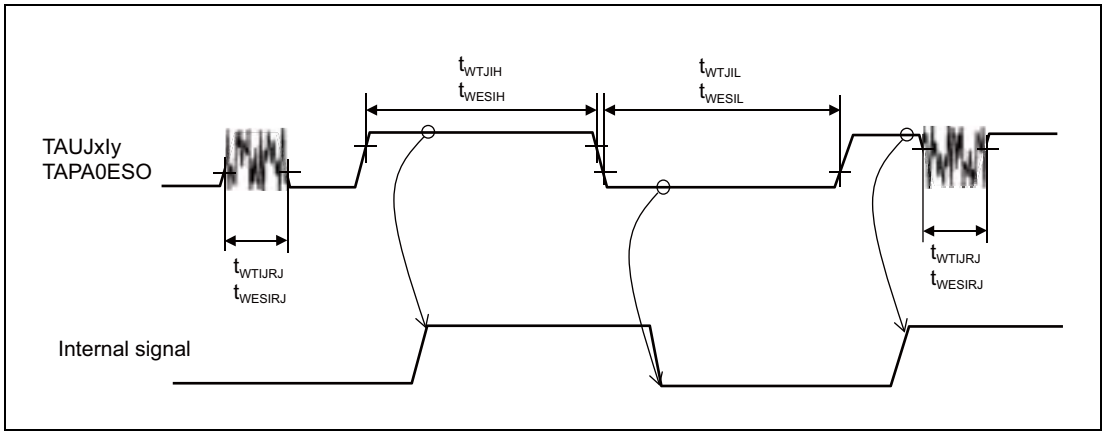
Note 2. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.

40.16 Timer Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF



Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
TAUD0Iy input high/low level width (y = 0 to 15)	t_{WTDIH}/ t_{WTDIL}		n × Tsamp + 20[*1, *2]			ns
TAUD0Oy output cycle (y = 0 to 15)	t_{TDCYK}	Slow mode			10	MHz
TAUBxIy input high/low level width (x = 0, 1, y = 0 to 15)	t_{WTBIH}/ t_{WTBIL}		n × Tsamp + 20[*1, *2]			ns
TAUBxOy output cycle (x = 0, 1, y = 0 to 15)	t_{TBCYK}	Slow mode			10	MHz
TAUJxIy input high/low level width[*3] (x = 0, 1, y = 0 to 3)	t_{WTJIH}/ t_{WTJIL}		600			ns
TAUJxIy pulse rejection[*4]	t_{WTIJRJ}		100			ns
TAUJxOy output cycle (x = 0, 1, y = 0 to 3)	t_{TJCYK}	Slow mode			10	MHz
RTCA0OUT output cycle	t_{RTCYK}			1		Hz
TAPA0ESO input high/low level width[*3]	t_{WESIH}/ t_{WESIL}		600			ns
TAPA0ESO pulse rejection[*4]	t_{WESIRJ}		100			ns
TAPA0Uy/Vy/Wy output cycle (y = P, N)	t_{TPCYK}	Slow mode			10	MHz
ENCA0TINy input high/low level width (y = 0, 1)	t_{WENTIH}/ t_{WENTIL}		n × Tsamp + 20[*1]			ns
ENCA0Ey input high/low level width (y = 0,1,C)	t_{WENyIH}/ t_{WENyIL}		n × Tsamp + 20[*1]			ns
PWGAyO output cycle (y = 0 to 71)	t_{PWGCYK}	Slow mode			10	MHz



Note 1. n: Sampling number of the digital noise filter for each input.
Tsamp: Sampling time of the digital noise filter for each input.

Note 2. Input more than 1 count clock width of each timer counter channel.

Note 3. TAUJxIy and TAPA0ESO input width is needed to ensure that the internal timer input signal is activated.

Note 4. Pulses shorter than this minimum is ignored. This is reference value. Noise such as the figure can be filtered.

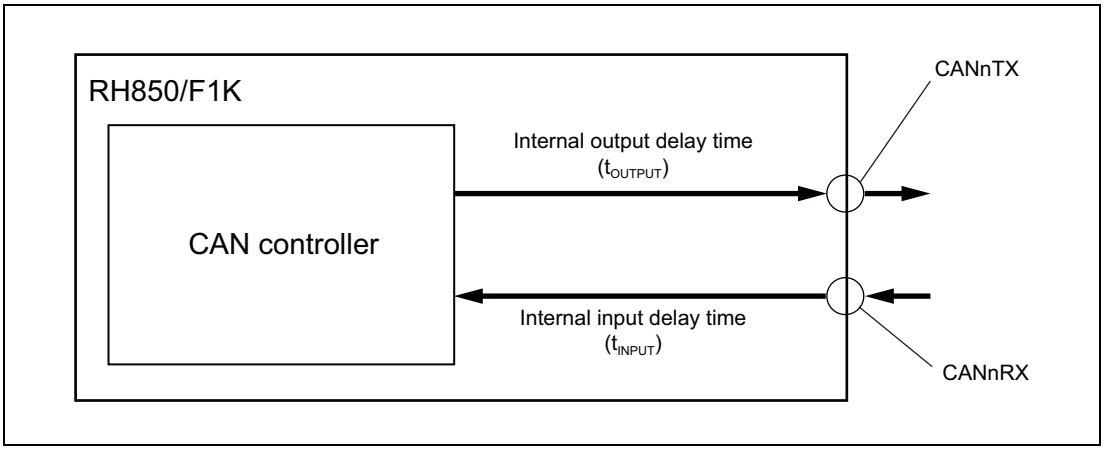
40.17 RLIN2/RLIN3 timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RLIN3 transfer rate		LIN specification	1		20	kbps
		LIN extended baud rate	1		115.2*1	kbps
		UART function			1.5	Mbps
RLIN2 transfer rate		LIN specification	1		20	kbps



Note 1. The LIN extended baud rate is not part of the LIN standard specification.

40.18 RS-CAN Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Transfer rate		ECO, ADVANCED			1	Mbps
		PREMIUM Data rate			5 (@ TQ = 8)	Mbps
Internal delay time*1	t_{NODE}				100	ns

Note 1. t_{NODE} = Internal input delay time (t_{INPUT}) + Internal output delay time (t_{OUTPUT})

40.19 CSI Timing

40.19.1 CSIG Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF +/–30%, CISOVCL: 0.1µF +/–30%, Ta = –40 to (depend on the product) °C,
CL = 30 pF

Table 40.8 CSIG Timing (Master Mode)

<Output driver strength>

CSIGnSO, CSIGnSC (output): Fast mode

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Macro operation clock cycle time	t_{KCYGn}		12.5 (max. 80 MHz)			ns
CSIGnSC cycle time	t_{KCYMGn}		100			ns
CSIGnSC high level width	t_{KWHMGn}		0.5 × t_{KCYMGn} – 10			ns

CL = 30 pF

Table 40.10 CSIH Timing (Master Mode)

<Output driver strength>

CSIHnSO, CSIHnSC (output): Fast mode (CL = 100pF@n=0 / 50pF@n=1-3)

CSIHnCSSm: Slow mode

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Macro Operation clock cycle time	t_{KCYHn}		12.5 (max. 80 MHz)			ns
CSIHnSC cycle time	t_{KCYMHn}		100			ns
CSIHnSC high level width	t_{KWHMHn}		0.5 × t_{KCYMHn} – 10			ns
CSIHnSC low level width	t_{KWLMHn}		0.5 × t_{KCYMHn} – 10			ns
CSIHnSI setup time (vs. CSIHnSC)	t_{SSIMHn}	SI positive edge mode (CSIHnCTL1.CSIHnSLRS = 0)	19			ns
		SI negative edge mode (CSIHnCTL1.CSIHnSLRS = 1)	14			ns
CSIHnSI hold time (vs. CSIHnSC)	t_{HSIMHn}	SI positive edge mode (CSIHnCTL1.CSIHnSLRS = 0)	0			ns
		SI negative edge mode (CSIHnCTL1.CSIHnSLRS = 1)	t_{KCYHn}/2			ns
CSIHnSO output delay (vs. CSIHnSC)	t_{DSOMHn}				7	ns
CSIHnRYI setup time (vs. CSIHnSC)	t_{SRYIHn}	CSIHnCTL1.CSIHnSIT = x CSIHnCTL1.CSIHnHSE = 1	2 × t_{KCYHn} + 25			ns
CSIHnRYI high level width	t_{WRYIHn}	CSIHnCTL1.CSIHnHSE = 1	t_{KCYHn} + 5			ns
CSIHnCSS0-7 inactive width	$t_{WSCSBHn}$		CSIDLE × t_{KCYMHn} – 15			ns
CSIHnCSS0-7 setup time (vs. CSIHnSC)	$t_{SSCSBHn0}$	CSIHnCFGx.CSIHnDAP = 0	CSSETUP × t_{KCYMHn} – 23			ns
	$t_{SSCSBHn1}$	CSIHnCFGx.CSIHnDAP = 1	(CSSETUP + 0.5) × t_{KCYMHn} – 23			ns
CSIHnCSS0-7 hold time (vs. CSIHnSC)	$t_{HSCSBHn0}$	CSIHnCTL1.CSIHnSIT = 0	CSSHOLD × t_{KCYMHn} – 5			ns
	$t_{HSCSBHn1}$	CSIHnCTL1.CSIHnSIT = 1	(CSSHOLD + 0.5) × t_{KCYMHn} – 5			ns

n = 0 to 3

NOTE

CSIDLE: Setting value of CSIHnCFGx.CSIHnIDx[2:0]

CSSETUP: Setting value of CSIHnCFGx.CSIHnSPx[3:0]

CSSHOLD: Setting value of CSIHnCFGx.CSIHnHDx[3:0]

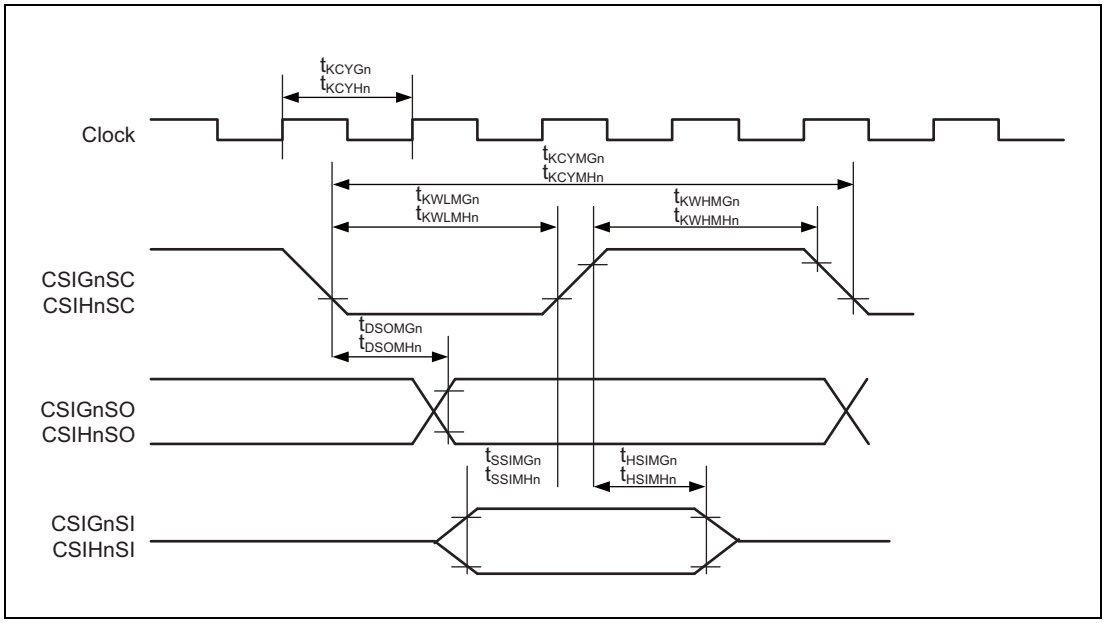
x: Depends on number of the chip select signals.

CAUTION

When the serial clock level is changed during the communication (CSIHnCFGx.CSIHnCKPx) and the IDLE has a setting of 0.5 transmission clock cycles, an inactive width time $t_{WSCSBHn}$ of "0.5 × t_{KCYMHn}" is added.

Table 40.11 CSIH Timing (Slave Mode)

<Output driver strength>
CSIHnSO, CSIHnSC (output): Fast mode
CSIHnRYO: Slow mode



Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit

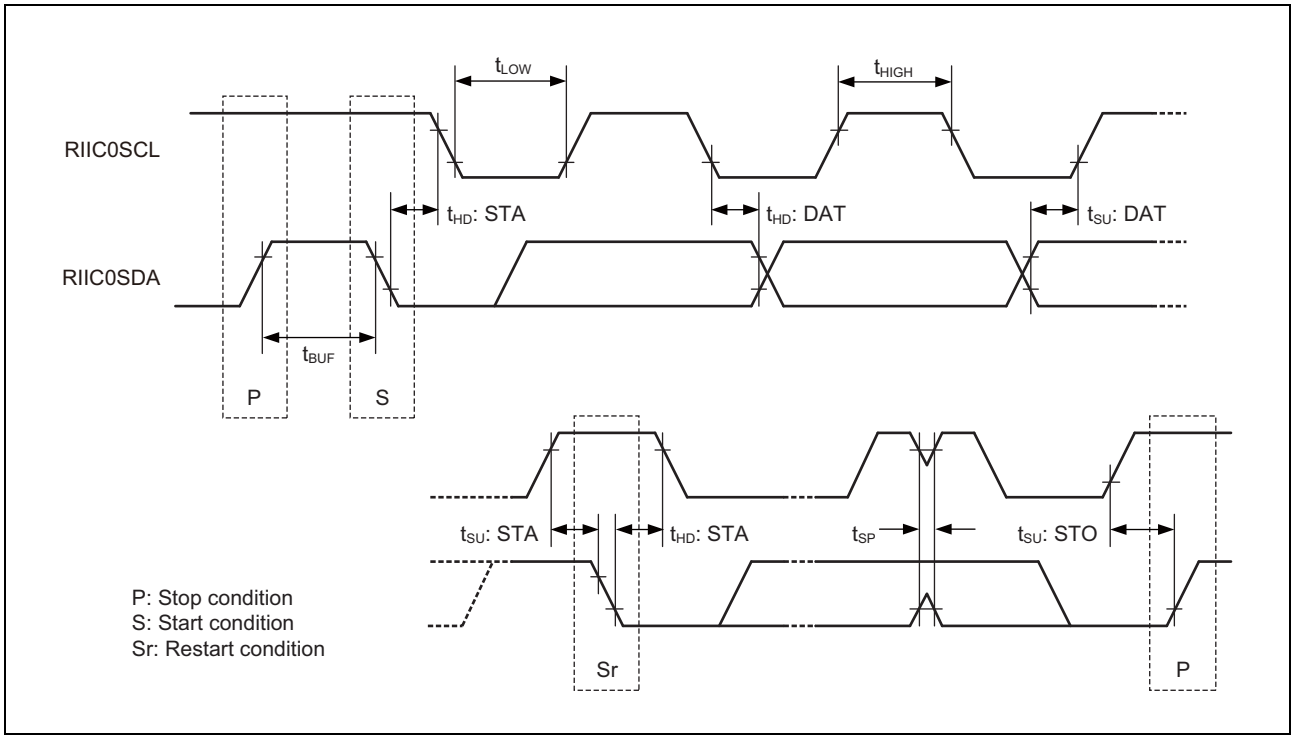
RIIC0SCL clock high-level time	t_{HIGH}		4.0			µs
Setup time for start/restart condition	t_{SU}: STA		4.7			µs
Data hold time	t_{HD}: DAT	CBUS compatible master	5.0			µs
		I^2C mode	0*2			µs
Data setup time	t_{SU}: DAT		250			ns
Stop condition setup time	t_{SU}: STO		4.0			µs
Capacitance load of each bus line	Cb				400	pF

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIIC0SDA signal (at VIH min. of RIIC0SCL signal). In order to occupy the undefined area at the falling edge of RIIC0SCL.

Note: If the system does not extend the RIIC0SCL signal low hold time (t_{Low}), only the maximum data hold time (t_{HD}: DAT) needs to be satisfied.

Table 40.13 RIIC Timing (Fast Mode)



Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RIIC0SCL clock period	f_{CLK}				400	kHz
Bus free time (between stop/start condition)	t_{BUF}		1.3			µs
Hold time*1	t_{HD}: STA		0.6			µs
RIIC0SCL clock low-level width	t_{LOW}		1.3			µs
RIIC0SCL clock high-level time	t_{HIGH}		0.6			µs
Setup time for start/restart condition	t_{SU}: STA		0.6			µs
Data hold time	t_{HD}: DAT	I^2C mode	0*2			µs
Data setup time	t_{SU}: DAT		100*3			ns
Stop condition setup time	t_{SU}: STO		0.6			µs
Pulse width with spike suppressed by input filter	t_{SP}		0		50	ns
Capacitance load of each bus line	Cb				400	pF

Note 1. At the start condition, the first clock pulse is generated after the hold time.

Note 2. The system requires a minimum of 300 ns hold time internally for the RIIC0SDA signal (at VIH min. of RIIC0SCL signal). In order to occupy the undefined area at the falling edge of RIIC0SCL.

Note 3. The fast mode I^2C bus can be used in normal mode I^2C bus system. In this case, set the fast mode I^2C bus so that it meets the following conditions.
- If the system does not extend the RIIC0SCL signal's low state hold time: t_{SU}: DAT ≥ 250 ns
- If the system extends the RIIC0SCL signal's low state hold time:
Transmit the following data bit to the RIIC0SDA line prior to releasing the RIIC0SCL line (1250 ns: Normal mode I^2C bus specification).

Note: If the system does not extend the RIIC0SCL signal low hold time (t_{Low}), only the maximum data hold time (t_{HD}: DAT) needs to be satisfied.

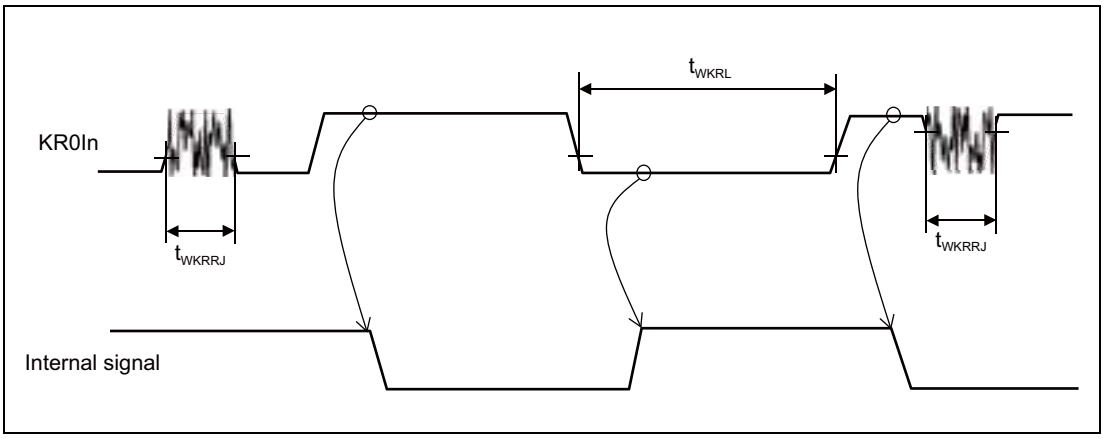
40.21 ADTRG Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
ADCAnTRGm input high/ low level width	t_{WADH}/ t_{WADL}		k × Tsamp + 20*1			ns

Note 1. k: Sampling number of the digital noise filter for each input.
Tsamp: Sampling time of the digital noise filter for each input.

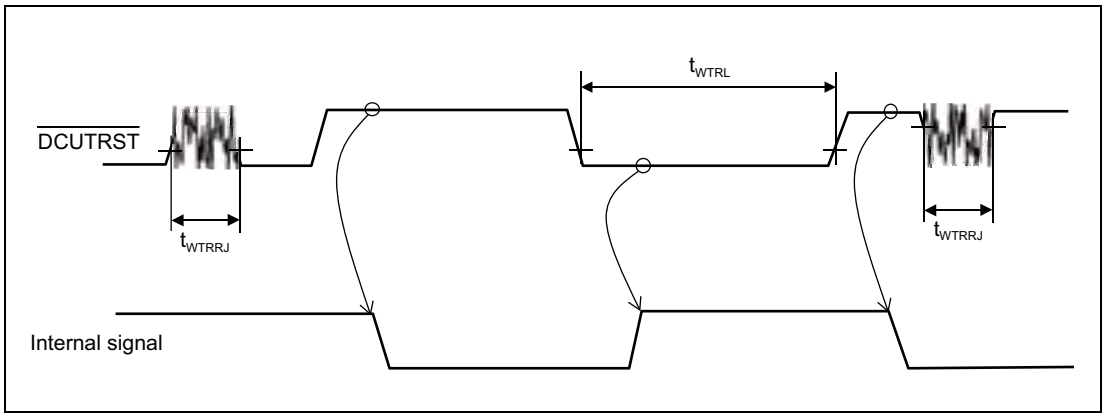


40.22 Key Return Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
KR0In input low level width*1	t_{WKRL}		600			ns
KR0In pulse rejection*2	t_{WKRRJ}		100			ns

Note 1. KR0In input width is needed to ensure that the internal key input signal is activated.
Note 2. Pulses shorter than this minimum is ignored. This is reference value.
Noise such as the figure can be filtered.



40.23 $\overline{\text{DCUTRST}}$ Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{DCUTRST}}$ input low level width*1	t_{WTRL}		600			ns
$\overline{\text{DCUTRST}}$ pulse rejection*2	t_{WTRRJ}		100			ns

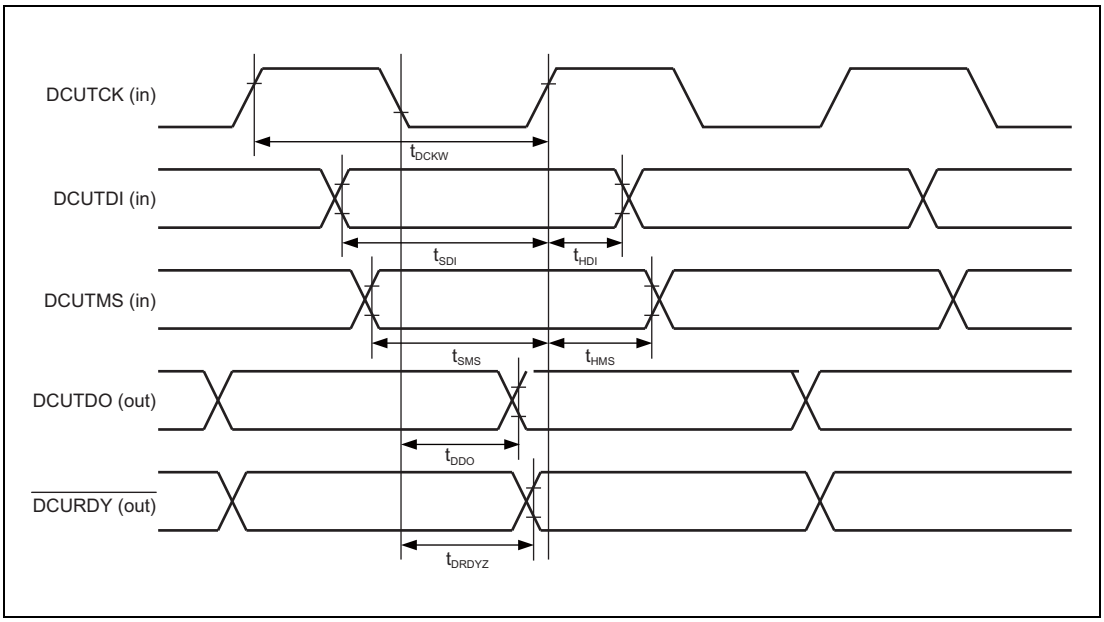
Note 1. $\overline{\text{DCUTRST}}$ input width is needed to ensure that the internal DCU reset input signal is activated.

Note 2. Pulses shorter than this minimum is ignored. This is reference value.
Noise such as the figure can be filtered.

40.24 Debug Interface Characteristics

40.24.1 Nexus Interface Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF



<Input buffer>

DCUTDI, DCUTCK, DCUTMS, $\overline{\text{DCUTRST}}$: TTL

<Output driver strength>

DCUTDO, $\overline{\text{DCURDY}}$: Fast mode

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
DCUTCK cycle width	t_{DCKW}		50			ns
DCUTDI setup time (vs DCUTCK ↑)	t_{SDI}		12			ns
DCUTDI hold time (vs DCUTCK ↑)	t_{HDI}		3			ns
DCUTMS setup time (vs DCUTCK ↑)	t_{SMS}		12			ns
DCUTMS hold time (vs DCUTCK ↑)	t_{HMS}		3			ns
DCUTDO delay time (↓ DCUTCK)	t_{DDO}		0		20	ns
$\overline{\text{DCURDY}}$ delay time (↓ DCUTCK)	t_{RDYZ}		0		20	ns

40.24.2 LPD (4 pin) Interface Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,

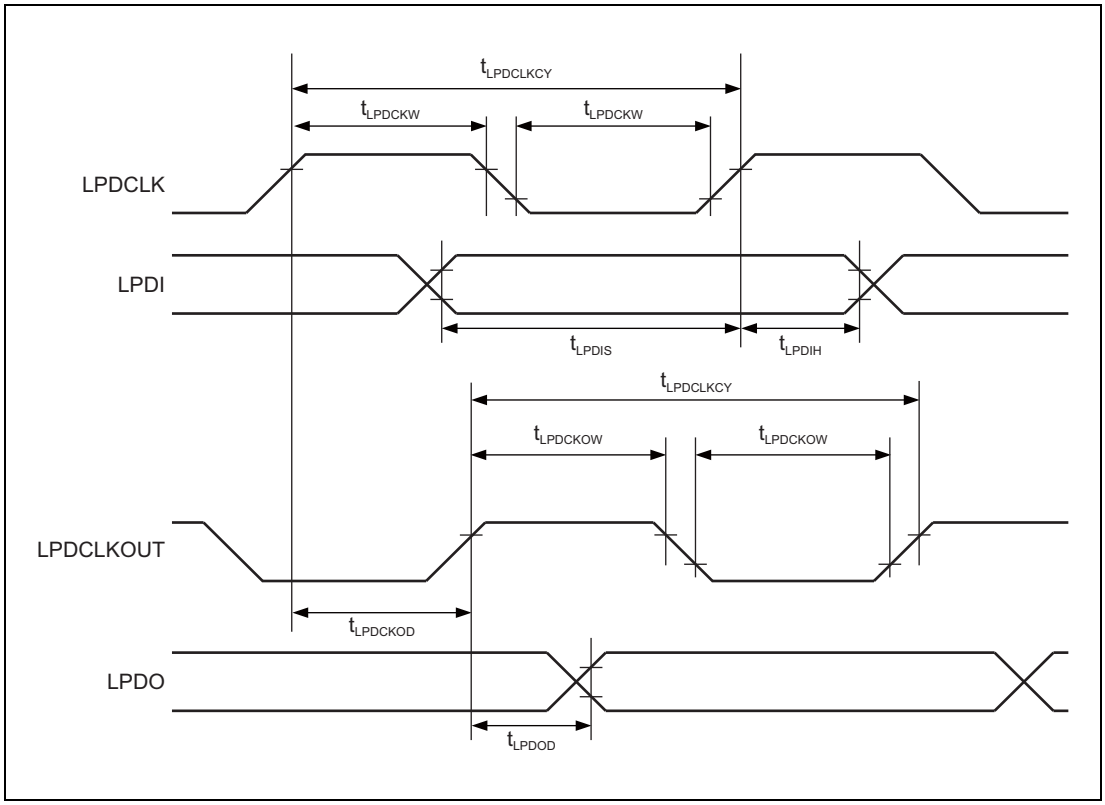
CL = 100 pF



<Input buffer>

LPDCLK, LPDI: TTL

<Output driver strength>

LPDCLKOUT, LPDO: Fast mode

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
LPDCLK cycle time/ LPDCLKOUT cycle time	$t_{LPDCLKCY}$		83.3 (max.12MHz)			ns
LPDCLK High-level width/ LPDCLK Low-level width	t_{LPDCKW}		0.5 × $t_{LPDCLKCY}$ – 10			ns
LPDCLKOUT High-level width/ LPDCLKOUT low-level width	$t_{LPDCKOW}$		t_{LPDCKW} – 10			ns
LPDI setup time (LPDCLK ↑)	t_{LPDIS}		41			ns
LPDI hold time (LPDCLK ↑)	t_{LPDIH}		3			ns
LPDCLK to LPDCLKOUT delay time	$t_{LPDCKOD}$				44	ns
LPDO delay time (LPDCLKOUT ↑)	t_{LPDOD}		0		15	ns

40.24.3 LPD (1 pin) Interface Timing

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 50 pF

<Input buffer>

LPDIO: TTL

<Output driver strength>

LPDIO: Fast mode

<External pull-up resistor>

LPDIO: 4.7 kΩ to 10 kΩ

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
LPD (1 pin) Baud rate					2.0	Mbps

40.25 Flash Programming Characteristics

40.25.1 Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Table 40.14 Basic characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{PCLK}*3	ECO	4*4		20	MHz
		ADVANCED, PREMIUM	4*4		30	MHz
Number of rewrites*1	CWRT	Data retention of 20 years*2	1000			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 1000), the device can be erased “n” times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the code flash memory.

Note 3. f_{PCLK} = 1/4 f_{CPUCLK}: System operating frequency for internal flash.

Note 4. Only for program/erase operation.

Table 40.15 Programming characteristic (1/2)

Item	Symbol	Condition	Block size	MIN.	TYP.	MAX.	Unit

			1.5 MB		8.1	25.2	s
			2 MB		10.8	33.6	s

Note 1. Only the processing time of the hardware. The overhead required by the software is not included.

40.25.2 Data Flash

The data flash memory is shipped in the erased state. If the data flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception

Condition: REGVCC = EVCC = VPOC to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Table 40.16 Basic characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{PCLK}*3	ECO	4*4		20	MHz
		ADVANCED, PREMIUM	4*4		30	MHz
Number of rewrites*1	CWRT	Data retention 20 years*2	125 k			times
		Data retention 3 years*2	250 k			times

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 125000), the device can be erased “n” times for each block. For example, when a block of 64 bytes is erased after 4 bytes of writing have been performed for different addresses 168 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. Retention period under average Ta = 85°C. This is the period starting on completion of a successful erasure of the data flash memory.

Note 3. f_{PCLK} = 1/4 f_{CPUCLK}: System operating frequency for internal flash.

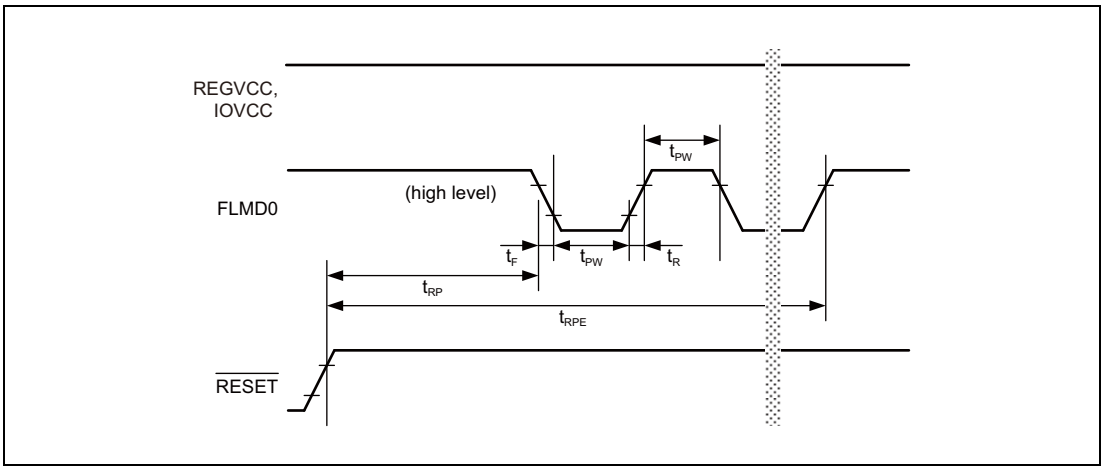
Note 4. Only for program/erase operation.

Table 40.17 Programming characteristics

Item	Symbol	Condition	Block size	MIN.	TYP.	MAX.	Unit
Programming time		f_{PCLK} ≥ 20 MHz	4 B		0.16*1	1.7*1	ms
		f_{PCLK} ≥ 20 MHz	32 KB		1.4	6.8	s
		f_{PCLK} ≥ 20 MHz	64 KB		2.79	13.44	s
Erase time		f_{PCLK} ≥ 20 MHz	64 B		1.7*1	10*1	ms
		f_{PCLK} ≥ 20 MHz	32 KB		0.9	5.2	s
		f_{PCLK} ≥ 20 MHz	64 KB		1.74	10.24	s
Blank check time		f_{PCLK} ≥ 20 MHz	4 B			30*1	µs
			64 B			100*1	µs
			32 KB			35.2	ms
			64 KB			70.4	ms

Note 1. Only the processing time of the hardware. The overhead required by the software is not included.

40.25.3 Serial Programming Interface



40.25.3.1 Serial Programmer Setup Timing

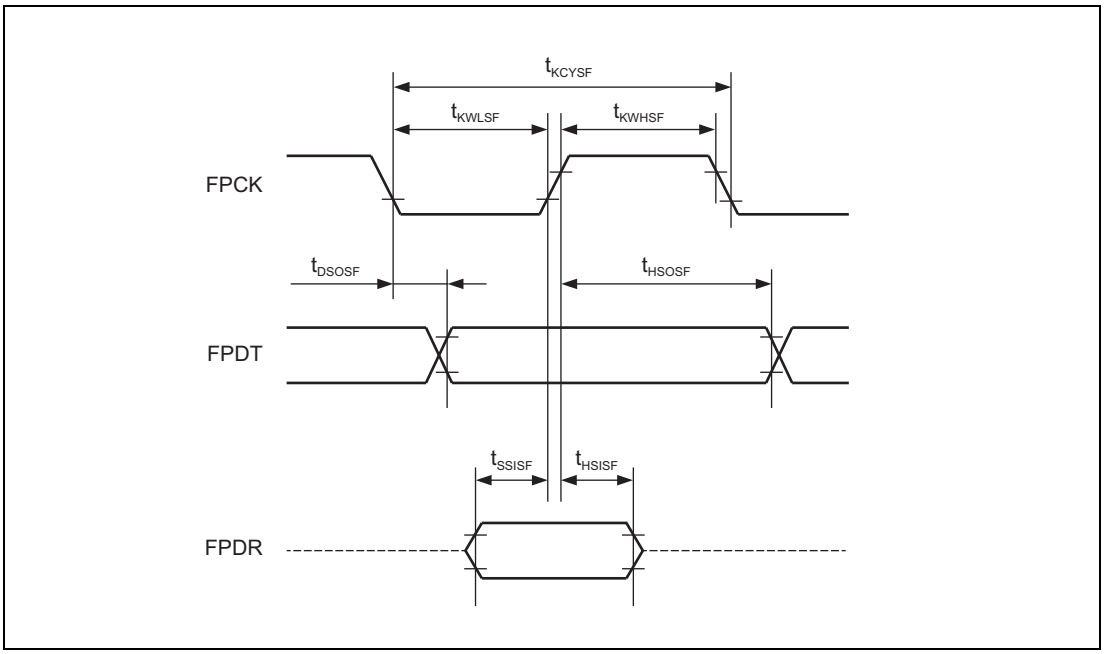
Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0 pulse input start time	t_{RP}		1.5			ms
FLMD0 pulse input end time	t_{RPE}				101.5	ms
FLMD0 low/high level width	t_{PW}		1.6			µs
FLMD0 rise time	t_R				20	ns
FLMD0 fall time	t_F				20	ns

NOTE

IOVCC: EVCC = A0VREF = A1VREF

40.25.3.2 Flash Programming Interface



Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,
CAWOVCL: 0.1µF ±30%, CISOVCL: 0.1µF ±30%, Tj = –40 to (depend on the product) °C,
CL = 30 pF

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Flash Programming transfer rate		1-wired UART mode			1	Mbps
		2-wired UART mode (ECO)			1	Mbps
		2-wired UART mode (PREMIUM, ADVANCED)			1.5	Mbps
FPCK cycle time	t_{KCYSF}	3-wired clock sync mode	200*1			ns
FPCK high level width	t_{KWHSF}	3-wired clock sync mode	t_{KCYSF} / 2 – 15			ns
FPCK low level width	t_{KWLSF}	3-wired clock sync mode	t_{KCYSF} / 2 – 15			ns
FPDR setup time (vs. FPCK)	t_{SSISF}	3-wired clock sync mode	t_{Pcyc} × 2			ns
FPDR hold time (vs. FPCK)	t_{HSISF}	3-wired clock sync mode	t_{Pcyc} × 2			ns
FPDT output delay (vs. FPCK)	t_{DSOSF}	3-wired clock sync mode Not continuous transfer (data: 1st bit)			0	ns
		3-wired clock sync mode Not continuous transfer (data: except 1st bit)			$–t_{KWHSF}$ + 3 × t_{Pcyc} + 36	ns
FPDT hold time (vs. FPCK)	t_{HSOSF}	3-wired clock sync mode	t_{Pcyc} × 2			ns

Note 1. Input an external clock that is more than 6 clocks of PCLK.

NOTE

t_{Pcyc} is period of PCLK.

40.26 A/D Converter Characteristics

Condition: REGVCC = EVCC = 3.0 V to 5.5 V, A0VREF = 3.0 V to 5.5 V,
A1VREF = 3.0 V to 5.5 V, AWOVSS = ISOVSS = EVSS = A0VSS = A1VSS = 0 V,

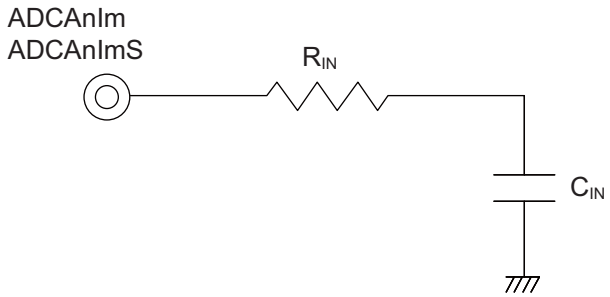
Full scale error*1	FSEn	12-bit mode	AnVREF = 4.5 V to 5.5 V	ADCAnIm (w/o T&H)			±3.5	LSB
				ADCA0I0-5 (w/ T&H)			±5.5	LSB
			AnVREF = 3.0 V to 4.5 V	ADCAnIm (w/o T&H)			±5.5	LSB
				ADCA0I0-5 (w/ T&H)			±7.5	LSB
		10-bit mode	AnVREF = 4.5 V to 5.5 V	ADCAnIm			±0.5	LSB
				ADCAnImS			±1.5	LSB
			AnVREF = 3.0 V to 4.5 V	ADCAnIm			±1.0	LSB
				ADCAnImS			±2.0	LSB

Note 1. This does not include quantization error.

Note 2. 3.0 + 1.3 × (the number of used T&H)

Note 3. Include the oscillation accuracy of HS IntOSC.



Note 4. When the external multiplexer is used, the detailed time of A/D conversion is MPX setup time, sampling time and successive approximation time. MPX setup time is same as “sampling time + successive approximation time”.
Conversion precision include the influence of the injection current.

Note: Conversion accuracy when ADCA0ImS terminal is converted in 12-bit mode: Conversion accuracy can be applied if lower 2-bit is ignored from conversion result.

CAUTION

When an external digital pulse is applied to AP0, AP1, P8, P9 and P18 pins during an A/D conversion this may lead to an A/D conversion result with a larger conversion error as expected due to the coupling noise of the external digital pulse.
The same behavior may apply when the digital buffer is used as output pin. For the output port the potential degradation increases with the driven total output current of the port. In addition the conversion resolution may drop if the output current fluctuates at adjacent pins due to the coupling effect of the external circuit connected to these port pins.

40.26.1 Equivalent Circuit of the Analog Input Block

Terminals	Condition	R_{IN} (kΩ)	C_{IN} (pF)
ADCA0I0 to 15	When T&H is used	14.0	1.8
	When T&H is not used	3.9	2.1
ADCA0I0S to 3S, 5S to 16S		5.0	8.6
ADCA0I4S, 17S to 19S	—	5.4	8.6
ADCA1I0 to 15	—	3.6	1.8
ADCA1I0S to 7S	—	4.7	4.5

CAUTION

This specification is not tested during outgoing inspection. Therefore R_{IN} and C_{IN} are reference values only and not guaranteed. In addition these values are specified as maximum values.

40.27 Injection Currents

Table 40.18 Definition of Pin Group (176 pin)

Symbol	Power Supply for Pin Group	Pin
PgR	REGVCC, AWOVSS	IP0_0
PgE	EVCC, EVSS	JP0, P0, P1, P2, P10, P11, P12, P20
PgE’	EVCC, EVSS	P8, P9, P18
PgA0	A0VREF, A0VSS	AP0
PgA1	A1VREF, A1VSS	AP1

Table 40.19 Definition of Pin Group (144 pin)

Symbol	Power Supply for Pin Group	Pin
PgR	REGVCC, AWOVSS	IP0_0
PgE	EVCC, EVSS	JP0, P0, P1, P10, P11, P12, P20
PgE’	EVCC, EVSS	P8, P9, P18
PgA0	A0VREF, A0VSS	AP0
PgA1	A1VREF, A1VSS	AP1

Table 40.20 Definition of Pin Group (100 pin)

Symbol	Power Supply for Pin Group	Pin
PgE	EVCC, EVSS	JP0, P0, P10, P11
PgE’	EVCC, EVSS	P8, P9
PgA0	A0VREF, A0VSS	AP0

40.27.1 Absolute Maximum Ratings

40.27.1.1 176 pin and 144 pin

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJPM}	PgE	Per pin			10	mA
			Total			120	mA
		PgE’	Per pin			10	mA
			Total			120	mA
		PgA0	Per pin			10	mA
			Total			60	mA
		PgA1	Per pin			10	mA
			Total			60	mA
		PgR	Per pin			10	mA
Negative overload current VIN < VSS	I_{INJNM}	PgE	Per pin			–10	mA
			Total			–120	mA
		PgE’	Per pin			–10	mA
			Total			–120	mA
		PgA0	Per pin			–10	mA
			Total			–60	mA
		PgA1	Per pin			–10	mA
			Total			–60	mA
		PgR	Per pin			–10	mA

CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of injected current for PgA0 and PgA1, TESH0SN cannot be kept. Its deviating value will increase sharply with increasing absolute value of injection current.

40.27.1.2 100 pin

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJPM}	PgE	Per pin			10	mA
			Total			60	mA
		PgE’	Per pin			10	mA
			Total			60	mA
		PgA0	Per pin			10	mA
			Total			60	mA
Negative overload current VIN < VSS	I_{INJNM}	PgE	Per pin			–10	mA
			Total			–60	mA
		PgE’	Per pin			–10	mA
			Total			–60	mA
		PgA0	Per pin			–10	mA
			Total			–60	mA

CAUTIONS

1. The DC injection current (Total) must satisfy the specifications of the injection current per pin.
2. In case of injected current for PgA0, TESH0SN cannot be kept. Its deviating value will increase sharply with increasing absolute value of injection current.

40.27.2 DC Characteristics for Overload Current

40.27.2.1 176 pin and 144 pin

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJP}	PgE	Per pin			2	mA
			Total			100	mA
		PgE’	Per pin			3	mA
			Total			40	mA
		PgA0	Per pin			3	mA
			Total			20	mA
		PgA1	Per pin			3	mA
			Total			20	mA
		PgR	Per pin			2	mA
Negative overload current VIN < VSS	I_{INJN}	PgE	Per pin			–2	mA
			Total			–100	mA
		PgE’	Per pin			–3	mA
			Total			–40	mA
		PgA0	Per pin			–3	mA
			Total			–20	mA
		PgA1	Per pin			–3	mA
			Total			–20	mA
		PgR	Per pin			–2	mA

NOTE

These specifications are not tested on sorting and are specified based on the device characterization.

40.27.2.2 100 pin

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Positive overload current VIN > VCC	I_{INJP}	PgE	Per pin			2	mA
			Total			50	mA
		PgE’	Per pin			3	mA
			Total			20	mA
		PgA0	Per pin			3	mA
			Total			20	mA
Negative overload current VIN < VSS	I_{INJN}	PgE	Per pin			–2	mA
			Total			–50	mA
		PgE’	Per pin			–3	mA
			Total			–20	mA
		PgA0	Per pin			–3	mA
			Total			–20	mA

NOTE

These specifications are not tested on sorting and are specified based on the device characterization.

40.28 Thermal Characteristics

40.28.1 Parameters

Package	Item	Symbol	Estimate	Unit	Note
176 pin LQFP	Thermal Resistance	Θja	35.5	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	27.6		
144 pin LQFP	Thermal Resistance	Θja	35.5	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	26.9		
100 pin LQFP	Thermal Resistance	Θja	38.3	°C/W	Conforming to JESD51-7 (4 layers)
	Thermal Characterization Parameter	ψjb	28.1		

Note: The thermal resistance and characterization parameters depend on the usage environment.

40.28.2 Board

Conforming to JESD51-7 (4 layers)

	Board Size (mm)		
	X	Y	Area (mm^2)
Board	76.2	114.3	8709.66
Remaining copper rates	Thickness of conductors		
50-95-95-50%	70-35-35-70μm
