Rev.1.10 Nov, 2016

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
3. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics product.
5. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.

   “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; and safety equipment etc.

   Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (nuclear reactor control systems, military equipment etc.). You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application for which it is not intended. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.
6. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You should not use Renesas Electronics products or technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. When exporting the Renesas Electronics products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the contents and conditions set forth in this document, Renesas Electronics assumes no responsibility for any losses incurred by you or third parties as a result of unauthorized use of Renesas Electronics products.
11. This document may not be reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

Notes for CMOS devices

(1) Voltage application waveform at input pin:

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIL (MAX) and VIH (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (MAX) and VIH (MIN).

(2) Handling of unused input pins:

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

(3) Precaution against ESD:

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

(4) Status before initialization:

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

(5) Power ON/OFF sequence:

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

(6) Input of signal during power off state:

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

How to Use This Manual

Readers This manual is intended for users who wish to understand the functions of the RH850/F1K and design application systems using the following RH850/F1K microcontrollers:

Purpose This manual is intended to give users an understanding of the hardware functions of the RH850/F1K shown in the *Organization* below.

Organization This manual is divided into two parts: Hardware (this manual) and Architecture (RH850G3KH User's Manual: Software).

Hardware	Software
Pin functions	Overview
CPU function	Processor Model
On-chip peripheral functions	Register Reference
Flash memory programming	Exceptions and Interrupts
	Memory Management
	Instruction Reference
	Reset
	Appendix

How to read this manual It is assumed that the readers of this manual have general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.

To understand the overall functions of the RH850/F1K.

→ Read this manual according to the Contents.

To understand the details of an instruction function

→ See RH850G3KH User's Manual: Software (R01US0165E) available separately.

Conventions

Data significance: Higher digits on the left and lower digits on the right

Active low representation: xxx (overscore over pin or signal name)

Memory map address: Higher addresses on the top and lower addresses on the bottom

Note: Footnote for item marked with Note in the text

Caution: Information requiring particular attention

Remark: Supplementary information

Numeric representation: Binary ... xxxx or $xxxx_B$

Decimal ... xxxx

Hexadecimal ... $xxxx_H$

Prefix indicating power of 2 (address space, memory capacity):

K (kilo): $2^{10} = 1,024$

M (mega): $2^{20} = 1,024^2$

G (giga): $2^{30} = 1,024^3$

Description of Registers

Each register description includes register access, register address, and register value after a reset, a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meaning of the bit settings.

The standard format for bit charts and tables are described below.

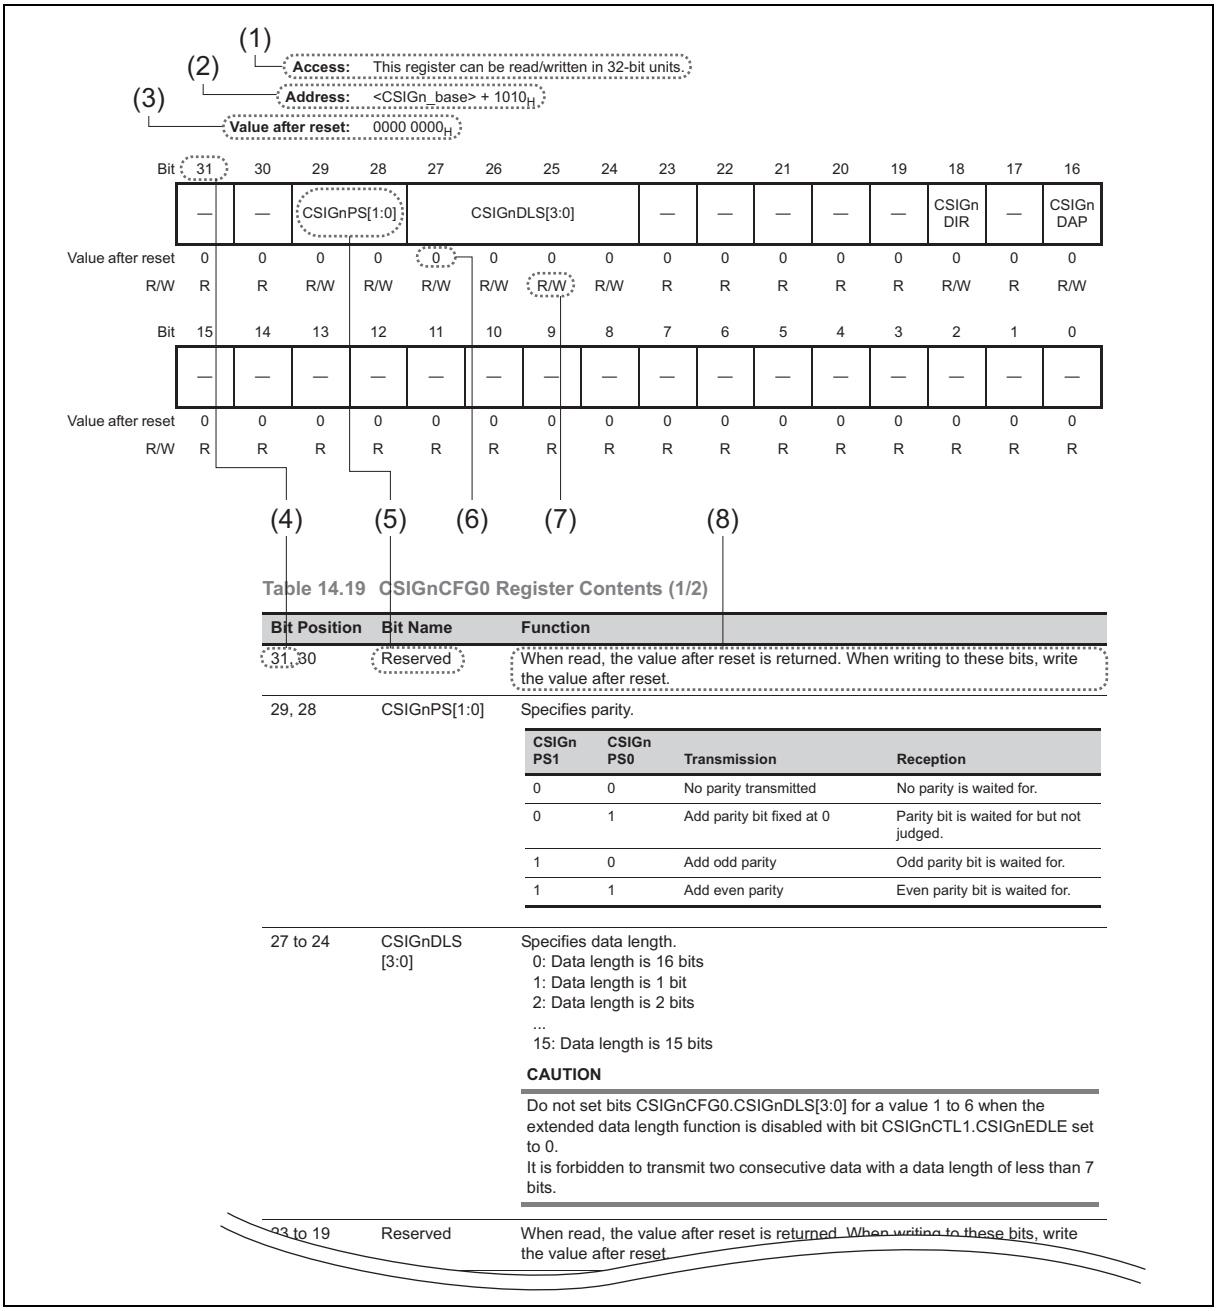

Table 14.19 CSIGnCFG0 Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
29, 28	CSIGnPS[1:0]	Specifies parity.
27 to 24	CSIGnDLS [3:0]	Specifies data length. 0: Data length is 16 bits 1: Data length is 1 bit 2: Data length is 2 bits ... 15: Data length is 15 bits
23 to 19	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

CSIGn PS1	CSIGn PS0	Transmission	Reception
0	0	No parity transmitted	No parity is waited for.
0	1	Add parity bit fixed at 0	Parity bit is waited for but not judged.
1	0	Add odd parity	Odd parity bit is waited for.
1	1	Add even parity	Even parity bit is waited for.

CAUTION

Do not set bits CSIGnCFG0.CSIGnDLS[3:0] for a value 1 to 6 when the extended data length function is disabled with bit CSIGnCTL1.CSIGnEDLE set to 0.
It is forbidden to transmit two consecutive data with a data length of less than 7 bits.

(1) Access

The register can be accessed in the bit unit indicated here.

(2) Address

This is the register address.
For base address, see description of base address in each section.

(3) Value after a reset (in hexadecimal notation)

This is the value of all bits of the register after a reset. Values for bytes are given as numbers in the range from 0 to 9 and letters from A to F or as X where they are undefined.

(4) Bit position

This is the bit number.
The bits are numbered from 31 to 0 for 32-bit registers, 15 to 0 for 16-bit registers, and 7 to 0 for 8-bit registers.

(5) Bit name

Bit name or field name is indicated.
When clearly identifying the digits of a bit field is required, do so by using a form such as CSIGnDLS[3:0] above.
Indicate reserved bits by using a dash (—).

(6) Value after a reset (in binary notation)

This is the bit values after a reset.

0	:	The value after a reset is 0.
1	:	The value after a reset is 1.
—	:	The value after a reset is undefined.

(7) R/W

This is the bit attribute of all bits of the register.

R/W	:	The bit or field is readable and writable.
R	:	The bit or field is readable. Note that all reserved bits are indicated as R. When written, the value specified in the bit chart or the value after a reset should be written.
W	:	This bit or field is writable. When read, the value is undefined. If a value is indicated in the bit chart, the value is returned.

(8) Function

This is function of the bit.

All trademarks and registered trademarks are the property of their respective owners.

7.10 Exception Handler Address 338
7.10.1 Direct Vector Method 339
7.10.2 Table Reference Method 341

Section 8 DMA Controller 343

8.1 Features of RH850/F1K DMA Controller 343
8.1.1 Number of Channels 343
8.1.2 Register Base Address 343
8.1.3 Interrupt Requests 344
8.1.4 DMA Trigger Factors 345
8.2 Overview 349
8.2.1 Overview 349
8.2.2 Term Definition 350
8.3 DMA Function 351
8.3.1 Basic Operation of DMA Transfer 351
8.3.1.1 Transfer Mode 351
8.3.1.2 Executing a DMA Cycle 351
8.3.1.3 Updating Transfer Information 351
8.3.1.4 Last Transfer and Address Reload Transfer 352
8.3.1.5 Transfer Completion Interrupt Output 352
8.3.1.6 Continuous Transfer 353
8.3.2 Channel Priority Order 355
8.3.2.1 DMAC Channel Arbitration 355
8.3.2.2 Interface Arbitration 356
8.3.3 Reload Function 357
8.3.3.1 Overview of the Reload Function 357
8.3.3.2 Operation of Reload Function 1 357
8.3.3.3 Reload Function 2 358
8.3.3.4 Timing of Setting DMAC Reload Registers 360
8.3.4 Chain Function 361
8.3.4.1 Overview 361
8.3.4.2 Setting Up the Chain Function 362

8.3.4.3 Caution for Using the Chain Function ... 362
8.3.5 DMAC Operation ... 363
8.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests ... 363
8.3.5.2 Generating and Accepting a Software DMA Transfer Request ... 363
8.3.5.3 Executing DMA Transfer ... 363
8.4 Suspension, Resume, Transfer Abort, and Clearing of a DMA Transfer Request ... 364
8.4.1 DMA Suspension and Resume by Software Control ... 364
8.4.2 Suspension, Resume, and Transfer Abort of a DMAC Channel ... 364
8.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR ... 365
8.4.4 List of Suspend, Resume, and Transfer Abort Functions ... 366
8.5 Error Control ... 367
8.5.1 Type of Error ... 367
8.5.2 DMA Transfer Error ... 367
8.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs ... 367
8.6 Reliability Functions ... 368
8.6.1 Overview ... 368
8.6.2 Register Access Protection Function ... 368
8.6.2.1 Identifying the Accessing Master ... 368
8.6.2.2 Master Access ... 368
8.6.2.3 Channel Assignment ... 368
8.6.2.4 Illegal Access ... 369
8.6.3 Master Information Inherit Function ... 370
8.6.4 Other Reliability Functions ... 370
8.6.4.1 Restriction on the Next Channel in the Chain ... 370
8.7 Setting Up DMA Transfer ... 371
8.7.1 Overview of Setting Up DMA ... 371
8.7.2 Setting Up the Overall DMA Operation ... 372
8.7.3 Setting Up the DMA Channel Setting ... 372
8.7.3.1 Setting Up the DMAC Channel Setting ... 372
8.8 Global Registers ... 374
8.8.1 List of Global Register Address ... 374
8.8.2 Details of Global Registers ... 375
8.8.2.1 DMACTL — DMA Control Register ... 375
8.8.2.2 DMACER — DMAC Error Register ... 376
8.8.2.3 DM0CMV — DMAC0 Register Access Protection Violation Register ... 377
8.8.2.4 DM1CMV — DMAC1 Register Access Protection Violation Register ... 378
8.8.2.5 CMVC — Register Access Protection Violation Clear Register ... 379
8.8.2.6 DMniCM — DMAC Channel Master Setting (ni = 00 to 07 and 10 to 17) ... 380
8.9 DMAC Channel Registers ... 381
8.9.1 DMAC Channel Register Addresses ... 381
8.9.2 Details of DMAC Channel Registers ... 382
8.9.2.1 DSAm — DMAC Source Address Register ... 382
8.9.2.2 DDAm — DMAC Destination Address Register ... 383
8.9.2.3 DTCm — DMAC Transfer Count Register ... 384
8.9.2.4 DTCTm — DMAC Transfer Control Register ... 385
8.9.2.5 DRSAm — DMAC Reload Source Address Register ... 388

8.9.2.6 DRDAm — DMAC Reload Destination Address Register ... 389
8.9.2.7 DRTCm — DMAC Reload Transfer Count Register ... 390
8.9.2.8 DCENm — DMAC Channel Operation Enable Setting Register ... 391
8.9.2.9 DCSTm — DMAC Transfer Status Register ... 392
8.9.2.10 DCSTSm — DMAC Transfer Status Set Register ... 394
8.9.2.11 DCSTCm — DMAC Transfer Status Clear Register ... 395
8.9.2.12 DTFRm — DTFR Setting Register ... 396
8.9.2.13 DTFRRQm — DTFR Transfer Request Status Register ... 397
8.9.2.14 DTFRRQCm — DTFR Transfer Request Clear Register ... 398

Section 9 Reset Controller ... 399

9.1 Overview ... 399
9.1.1 Reset Sources ... 399
9.1.2 Reset Controller Redundancy ... 400
9.1.3 Reset Output ($\overline{\text{RESETOUT}}$) ... 401
9.1.4 Reset Flag ... 401
9.1.5 Clock Supply ... 401
9.2 Configuration ... 402
9.2.1 Block Diagram ... 402
9.3 Registers ... 405
9.3.1 Reset Controller Registers Overview ... 405
9.3.2 Details of Reset Flag Registers ... 406
9.3.2.1 RESF — Reset Factor Register ... 406
9.3.2.2 RESFC — Reset Factor Clear Register ... 408
9.3.2.3 RESFR — Redundant Reset Factor Register ... 409
9.3.2.4 RESFCR — Redundant Reset Factor Clear Register ... 411
9.3.3 Details of Software Reset Control Registers ... 412
9.3.3.1 SWRESA — Software Reset Register ... 412
9.3.4 Details of Cyclic RUN Mode Reset Vector Address Register ... 413
9.3.4.1 CYCRBASE — Cyclic RUN mode RBASE Register ... 413
9.4 Functional Description ... 414
9.4.1 Reset Flags ... 414
9.4.2 Power-On-Clear (POC) Reset ... 414
9.4.3 Low-Voltage Indicator (LVI) Reset ... 417
9.4.4 Core Voltage Monitor (CVM) Reset ... 418
9.4.5 External Reset ($\overline{\text{RESET}}$) ... 419
9.4.6 Watchdog Timer (WDTA) Reset ... 420
9.4.7 Software Reset ... 420
9.4.8 Clock Monitor (CLMA) Reset ... 421
9.4.9 Debugger Reset ... 421
9.4.10 Reset Vector Address of CPU ... 421

Section 10 Power Supply Circuit ... 422

10.1 Function ... 422
10.1.1 Power Supply Pins ... 423
10.1.2 Block Diagram of Power Domains ... 424

10.1.3 Power Domains Arrangement ... 426

Section 11 Supply Voltage Monitor ... 427

11.1 Overview ... 427
11.1.1 Functional Overview ... 427
11.1.2 Power-On Clear (POC) ... 428
11.1.3 Low Voltage Indicator Circuit (LVI) ... 428
11.1.3.1 LVI Reference Voltage ... 428
11.1.3.2 LVI Reset (LVIRES) ... 428
11.1.3.3 LVI Interrupt (INTLVIL/INTLVIH) ... 429
11.1.3.4 LVI Setting Procedure ... 430
11.1.3.5 Clock Supply to the LVI ... 430
11.1.4 Core Voltage Monitor (CVM) ... 431
11.1.4.1 CVM Reset ($\overline{\text{CVMRES}}$) ... 431
11.1.4.2 CVM Setting ... 431
11.1.4.3 Diagnostic (DIAG) Mode ... 431
11.1.4.4 Clock Supply to the CVM ... 432
11.1.5 RAM Retention Voltage Indicator (Very-Low-Voltage Detection Circuit, VLVI) ... 433
11.1.5.1 Clock Supply to the VLVI ... 433
11.1.5.2 Retention RAM Content Retention ... 433
11.1.6 Block Diagram ... 434
11.2 Registers ... 435
11.2.1 List of Registers ... 435
11.2.2 Low-Voltage Indicator Reset Control Registers ... 436
11.2.2.1 LVICNT — LVI Control Register ... 436
11.2.3 Core Voltage Monitor Control Registers ... 437
11.2.3.1 CVMF — CVM Factor Register ... 437
11.2.3.2 CVMDE — CVM Detection Enable Register ... 438
11.2.3.3 CVMDIAG — CVM Diagnostic Mode Setting Register ... 439
11.2.4 Very-Low-Voltage Detection Control Registers ... 440
11.2.4.1 VLVF — Very-Low-Voltage Detection Register ... 440
11.2.4.2 VLVFC — Very-Low-Voltage Detection Clear Register ... 441

Section 12 Clock Controller ... 442

12.1 Features of Clock Controller of RH850/F1K ... 442
12.2 Configuration of Clock Controller ... 444
12.2.1 Clock Generation Circuits ... 446
12.2.2 Clock Selection ... 447
12.2.3 Clock Domains ... 448
12.2.4 Resetting Clock Oscillators ... 448
12.3 Clock Oscillators ... 449
12.3.1 Main Oscillator (MainOSC) ... 449
12.3.2 Sub Oscillator (SubOSC) ... 451
12.3.3 High Speed Internal Oscillator (HS IntOSC) ... 452
12.3.4 Low Speed Internal Oscillator (LS IntOSC) ... 454
12.3.5 PLL ... 455

12.3.5.1 PLL Parameters ... 457
12.4 Registers ... 458
12.4.1 List of Registers ... 458
12.4.2 Clock Oscillator Registers ... 460
12.4.2.1 MOSCE — MainOSC Enable Register ... 460
12.4.2.2 MOSCS — MainOSC Status Register ... 462
12.4.2.3 MOSCC — MainOSC Control Register ... 463
12.4.2.4 MOSCST — MainOSC Stabilization Time Register ... 464
12.4.2.5 MOSCSTPM — MainOSC Stop Mask Register ... 465
12.4.2.6 MOSCM — MainOSC Mode Control Register ... 466
12.4.2.7 SOSCE — SubOSC Enable Register ... 467
12.4.2.8 SOSCS — SubOSC Status Register ... 468
12.4.2.9 SOSCST — SubOSC Stabilization Time Register ... 469
12.4.2.10 ROSCE — HS IntOSC Enable Register ... 470
12.4.2.11 ROSCS — HS IntOSC Status Register ... 471
12.4.2.12 ROSCSTPM — HS IntOSC Stop Mask Register ... 472
12.4.2.13 PLLE — PLL Enable Register ... 473
12.4.2.14 PLLS — PLL Status Register ... 474
12.4.2.15 PLLC — PLL Control Register ... 475
12.4.2.16 PLL Input Clock Selection ... 479
12.4.2.17 PPLLCLK Source Clock Selection ... 481
12.4.2.18 ROSCUT — HS IntOSC User Trimming Register ... 483
12.4.3 Clock Selector Control Register ... 484
12.4.3.1 WDTA0 Clock Domain C_AWO_WDTA ... 484
12.4.3.2 TAUJ Clock Domain C_AWO_TAUJ ... 487
12.4.3.3 RTCA Clock Domain C_AWO_RTCA ... 492
12.4.3.4 ADCA0 Clock Domain C_AWO_ADCA ... 497
12.4.3.5 FOUT Clock Domain C_AWO_FOUT ... 502
12.4.3.6 CPU Clock Domain C_ISO_CPUCLK ... 505
12.4.3.7 Peripheral Clock Domains C_ISO_PERI1 and C_ISO_PERI2 ... 509
12.4.3.8 RLIN Clock Domains C_ISO_LIN ... 513
12.4.3.9 ADCA1 Clock Domain C_ISO_ADCA ... 518
12.4.3.10 RS-CAN Clock Domains C_ISO_CAN and C_ISO_CANOSC ... 522
12.4.3.11 CSI Clock Domain C_ISO_CSI ... 528
12.4.3.12 IIC Clock Domain C_ISO_IIC ... 530
12.5 Clock Domain Setting Method ... 532
12.5.1 Clock Domain Setting ... 532
12.5.1.1 Overview of Clock Selector Register ... 532
12.5.1.2 Setting Procedure for Clock Domain ... 533
12.5.2 Stopping the Clock in Stand-by Mode ... 533
12.5.3 Clock Domain Settings ... 534
12.6 Frequency Output Function (FOUT) ... 536
12.6.1 Functional Overview ... 536
12.6.2 Clock Supply ... 536
12.6.3 Registers ... 537
12.6.3.1 List of Registers ... 537
12.6.3.2 FOUTDIV — Clock Division Ratio Register ... 538
12.6.3.3 FOUTSTAT — Clock Divider Status Register ... 539

Section 13 Clock Monitor (CLMA) 540
13.1 Features of RH850/F1K CLMA 540
13.1.1 Number of Channels 540
13.1.2 Register Base Addresses 540
13.1.3 Clock Supply to CLMA 540
13.1.4 Reset Sources 541
13.1.5 Internal Input/Output Signals 541
13.2 Overview 542
13.2.1 Functional Overview 542
13.3 Enabling CLMA 543
13.4 Functions 544
13.4.1 Detection of Abnormal Clock Frequencies 544
13.4.2 Notification of Abnormal Clock Frequency 546
13.5 Registers 547
13.5.1 List of Registers 547
13.5.2 CLMAnCTL0 — CLMAn Control Register 0 548
13.5.3 CLMAnCMPH — CLMAn Compare Register H 549
13.5.4 CLMAnCMPL — CLMAn Compare Register L 549
13.5.5 CLMATEST — CLMA Test Register 550
13.5.6 CLMATESTS — CLMA Test Status Register 551
13.5.7 CLMAnEMU0 — CLMAn Emulation Register 0 552
13.6 Usage Notes for CLMAn 553
Section 14 Stand-By Controller (STBC) 554
14.1 Functions 554
14.1.1 Types of Stand-By Mode 554
14.1.2 Wake-Up Control 555
14.1.2.1 Wake-Up Factors for Stand-By Modes 555
14.1.2.2 Setting of Wake-Up Factors 557
14.1.3 On-Chip Debug Wake-Up 560
14.1.4 I/O Buffer Control 561
14.1.4.1 I/O Buffer Hold State 561
14.1.4.2 I/O Buffers during STOP Mode 561
14.1.4.3 I/O Buffers during DeepSTOP Mode 561
14.1.5 Transition to Stand-By Mode 562
14.1.6 Clock Supply 562
14.2 Registers 563
14.2.1 List of Registers 563
14.2.2 Details of Stand-By Controller Control Registers 564
14.2.2.1 STBC0PSC — Power Save Control Register 564
14.2.2.2 STBC0STPT — Power Stop Trigger Register 565
14.2.2.3 WUF0/WUF20/WUF_ISO0 — Wake-Up Factor Registers 566
14.2.2.4 WUFMSK0/WUFMSK20/WUFMSK_ISO0 — Wake-Up Factor Mask Registers 567
14.2.2.5 WUFC0/WUFC20/WUFC_ISO0 — Wake-Up Factor Clear Registers 568
14.2.2.6 IOHOLD — I/O Buffer Hold Control Register 569

14.3 Mode Transition 570
14.3.1 STOP Mode 570
14.3.2 DeepSTOP Mode 572
14.3.3 Cyclic RUN Mode 575
14.3.4 Cyclic STOP Mode 577
14.4 Writing to the Stand-By Controller Related Registers 578
14.5 Clock Oscillator Behavior During Stand-By Mode Transition 578
14.6 Cautions when Using Stand-By Modes 584
14.6.1 Cautions Concerning Transitioning to DeepSTOP Mode When Using a Debugger 584

Section 15 Low-Power Sampler (LPS) 585

15.1 Features of RH850/F1K LPS 585
15.1.1 Number of Units 585
15.1.2 Register Base Address 586
15.1.3 Clock Supply 586
15.1.4 Interrupt Request 586
15.1.5 Reset Sources 587
15.1.6 External Input/Output Signals 587
15.1.7 Internal Input/Output Signals 587
15.2 Overview 588
15.2.1 Functional Overview 588
15.3 Registers 589
15.3.1 List of Registers 589
15.3.2 SCTLR — LPS Control Register 590
15.3.3 EVFR — Event Flag Register 592
15.3.4 DPSELR0 — DPIN Select Register 0 593
15.3.5 DPSELRM — DPIN Select Register M 594
15.3.6 DPSELRH — DPIN Select Register H 595
15.3.7 DPDSR0 — DPIN Data Set Register 0 596
15.3.8 DPDSRM — DPIN Data Set Register M 597
15.3.9 DPDSRH — DPIN Data Set Register H 598
15.3.10 DPDIMR0 — DPIN Data Input Monitor Register 0 599
15.3.11 DPDIMR1 — DPIN Data Input Monitor Register 1 599
15.3.12 DPDIMR2 — DPIN Data Input Monitor Register 2 600
15.3.13 DPDIMR3 — DPIN Data Input Monitor Register 3 600
15.3.14 DPDIMR4 — DPIN Data Input Monitor Register 4 601
15.3.15 DPDIMR5 — DPIN Data Input Monitor Register 5 601
15.3.16 DPDIMR6 — DPIN Data Input Monitor Register 6 602
15.3.17 DPDIMR7 — DPIN Data Input Monitor Register 7 602
15.3.18 CNTVAL — Count Value Register 603
15.3.19 SOSTR — LPS Operation Status Register 604
15.4 Digital Input Mode 605
15.4.1 Digital Port Error Interrupt 611
15.5 Analog Input Mode 611

15.5.1 Analog Port Error Interrupt ... 616

Section 16 Clocked Serial Interface G (CSIG) ... 617

16.1 Features of RH850/F1K CSIG ... 617
16.1.1 Number of Units ... 617
16.1.2 Register Base Address ... 617
16.1.3 Clock Supply ... 617
16.1.4 Interrupt Request ... 618
16.1.5 Reset Sources ... 618
16.1.6 External Input/Output Signals ... 619
16.1.7 Data Consistency Check ... 619
16.2 Overview ... 620
16.2.1 Functional Overview ... 620
16.2.2 Functional Overview Description ... 620
16.2.3 Block Diagram ... 621
16.3 Registers ... 622
16.3.1 List of Registers ... 622
16.3.2 CSIGnCTL0 — CSIGn Control Register 0 ... 623
16.3.3 CSIGnCTL1 — CSIGn Control Register 1 ... 624
16.3.4 CSIGnCTL2 — CSIGn Control Register 2 ... 626
16.3.5 CSIGnSTR0 — CSIGn Status Register 0 ... 627
16.3.6 CSIGnSTCR0 — CSIGn Status Clear Register 0 ... 629
16.3.7 CSIGnBCTL0 — CSIGn Rx-Only Mode Control Register 0 ... 630
16.3.8 CSIGnCFG0 — CSIGn Configuration Register 0 ... 631
16.3.9 CSIGnTX0W — CSIGn Transmission Register 0 for Word Access ... 633
16.3.10 CSIGnTX0H — CSIGn Transmission Register 0 for Half Word Access ... 634
16.3.11 CSIGnRX0 — CSIGn Reception Register 0 ... 634
16.3.12 CSIGnEMU — CSIGn Emulation Register ... 635
16.3.13 List of Cautions ... 636
16.4 Interrupt Sources ... 637
16.4.1 Interrupt Delay ... 637

21.4.5 Details of Receive Buffer-Related Registers ... 1112
21.4.5.1 RSCANnRMNB — Receive Buffer Number Register ... 1112
21.4.5.2 RSCANnRMNDy — Receive Buffer New Data Register (y = 0 to 2) ... 1113
21.4.5.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 95) ... 1114
21.4.5.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 95) ... 1115
21.4.5.5 RSCANnRMDF0q — Receive Buffer Data Field 0 Register (q = 0 to 95) ... 1116
21.4.5.6 RSCANnRMDF1q — Receive Buffer Data Field 1 Register (q = 0 to 95) ... 1117
21.4.6 Details of Receive FIFO Buffer-Related Registers ... 1118
21.4.6.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) ... 1118
21.4.6.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) ... 1120
21.4.6.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7) ... 1122
21.4.6.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7) ... 1123
21.4.6.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7) 1124
21.4.6.6 RSCANnRFDF0x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7) ... 1125
21.4.6.7 RSCANnRFDF1x — Receive FIFO Buffer Access Data Field 1 Register (x = 0 to 7) ... 1126
21.4.7 Details of Transmit/Receive FIFO Buffer-Related Registers ... 1127
21.4.7.1 RSCANnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 17) ... 1127
21.4.7.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 17) ... 1131
21.4.7.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 17) ... 1134
21.4.7.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 17) ... 1136
21.4.7.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 17) ... 1138
21.4.7.6 RSCANnCFDF0k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 17) ... 1140
21.4.7.7 RSCANnCFDF1k — Transmit/receive FIFO Buffer Access Data Field 1 Register (k = 0 to 17) ... 1141
21.4.8 Details of FIFO Status-Related Registers ... 1142
21.4.8.1 RSCANnFESTS — FIFO Empty Status Register ... 1142
21.4.8.2 RSCANnFFSTS — FIFO Full Status Register ... 1144
21.4.8.3 RSCANnFMSTS — FIFO Message Lost Status Register ... 1146

21.4.8.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register 1148
21.4.8.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register 1149
21.4.8.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register 1151
21.4.9 Details of Transmit Buffer-Related Registers 1153
21.4.9.1 RSCANnTMCp — Transmit Buffer Control Register (p = 0 to 95) 1153
21.4.9.2 RSCANnTMSTSp — Transmit Buffer Status Register (p = 0 to 95) 1155
21.4.9.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 95) 1157
21.4.9.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 95) 1159
21.4.9.5 RSCANnTMDF0p — Transmit Buffer Data Field 0 Register (p = 0 to 95) 1161
21.4.9.6 RSCANnTMDF1p — Transmit Buffer Data Field 1 Register (p = 0 to 95) 1162
21.4.9.7 RSCANnTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0 to 2) 1163
21.4.10 Details of Transmit Buffer Status-Related Registers 1165
21.4.10.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0 to 2) 1165
21.4.10.2 RSCANnTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0 to 2) 1167
21.4.10.3 RSCANnTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0 to 2) 1169
21.4.10.4 RSCANnTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0 to 2) 1171
21.4.11 Details of Transmit Queue-Related Registers 1173
21.4.11.1 RSCANnTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 5) 1173
21.4.11.2 RSCANnTXQSTSm — Transmit Queue Status Register (m = 0 to 5) 1175
21.4.11.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 5) 1177
21.4.12 Details of Transmit history-related Registers 1178
21.4.12.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0 to 5) 1178
21.4.12.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0 to 5) 1180
21.4.12.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 5) 1182
21.4.12.4 RSCANnTHLACCm — Transmit History Access Register (m = 0 to 5) 1183
21.4.13 Details of Test-Related Registers 1185
21.4.13.1 RSCANnGTSTCFG — Global Test Configuration Register 1185
21.4.13.2 RSCANnGTSTCTR — Global Test Control Register 1187
21.4.13.3 RSCANnGLOCKK — Global Lock Key Register 1188
21.4.13.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63) 1189
21.5 Registers (CAN FD Mode) 1190
21.5.1 List of Registers 1190
21.5.2 Details of Interface Mode-Related Registers 1195
21.5.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register 1195
21.5.3 Details of Channel-Related Registers 1196
21.5.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0 to 5) 1196
21.5.3.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0 to 5) 1198
21.5.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0 to 5) 1203
21.5.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0 to 5) 1206

21.5.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration register (m = 0 to 5) ... 1210
21.5.3.6 RSCFDnCFDCmFDCFG — Channel CAN FD Configuration Register (m = 0 to 5) ... 1213
21.5.3.7 RSCFDnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 to 5) ... 1217
21.5.3.8 RSCFDnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 5) ... 1218
21.5.3.9 RSCFDnCFDCmFDCRC — Channel CAN FD CRC Register (m = 0 to 5) ... 1220
21.5.4 Details of Global-Related Registers ... 1222
21.5.4.1 RSCFDnCFDGCFG — Global Configuration Register ... 1222
21.5.4.2 RSCFDnCFDGCTR — Global Control Register ... 1226
21.5.4.3 RSCFDnCFDGSTS — Global Status Register ... 1228
21.5.4.4 RSCFDnCFDGERFL — Global Error Flag Register ... 1230
21.5.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register ... 1232
21.5.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0 ... 1233
21.5.4.7 RSCFDnCFDGTINTSTS1 — Global TX Interrupt Status Register 1 ... 1236
21.5.4.8 RSCFDnCFDGFDCFG — Global FD Configuration Register ... 1238
21.5.5 Details of Receive Rule-related Registers ... 1239
21.5.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register ... 1239
21.5.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0 ... 1240
21.5.5.3 RSCFDnCFDGAFLCFG1 — Receive Rule Configuration Register 1 ... 1242
21.5.5.4 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15) ... 1243
21.5.5.5 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15) ... 1245
21.5.5.6 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15) ... 1246
21.5.5.7 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15) ... 1248
21.5.6 Details of Receive Buffer-related Registers ... 1249
21.5.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register ... 1249
21.5.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0 to 2) ... 1250
21.5.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 95) ... 1251
21.5.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 95) ... 1252
21.5.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 95) ... 1254
21.5.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 95) ... 1255
21.5.7 Details of Receive FIFO Buffer-related Registers ... 1256
21.5.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) ... 1256
21.5.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) ... 1258
21.5.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7) ... 1260
21.5.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7) ... 1261
21.5.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7) ... 1262
21.5.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register (x = 0 to 7) ... 1264
21.5.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x = 0 to 7) ... 1265
21.5.8 Transmit/Receive FIFO Buffer Related Registers ... 1266
21.5.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 17) ... 1266
21.5.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 17) ... 1270

21.5.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 17) ... 1274
21.5.8.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 17) ... 1276
21.5.8.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 17) ... 1278
21.5.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CAN FD Configuration/ Status Register (k = 0 to 17) ... 1280
21.5.8.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 17) ... 1282
21.5.9 Details of FIFO Status-related Registers ... 1283
21.5.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register ... 1283
21.5.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register ... 1285
21.5.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register ... 1287
21.5.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register ... 1289
21.5.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register ... 1290
21.5.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register ... 1292
21.5.10 Details of FIFO DMA-Related Registers ... 1294
21.5.10.1 RSCFDnCFDCDTCT — DMA Enable Register ... 1294
21.5.10.2 RSCFDnCFDCDTSTS — DMA Status Register ... 1296
21.5.11 Details of Transmit Buffer-related Registers ... 1298
21.5.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 95) ... 1298
21.5.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 95) ... 1300
21.5.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 95) ... 1302
21.5.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 95) ... 1304
21.5.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register (p = 0 to 95) ... 1306
21.5.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 95) ... 1308
21.5.11.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0 to 2) ... 1309
21.5.12 Details of Transmit Buffer Status-related Registers ... 1311
21.5.12.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0 to 2) ... 1311
21.5.12.2 RSCFDnCFDTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0 to 2) ... 1313
21.5.12.3 RSCFDnCFDTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0 to 2) ... 1315
21.5.12.4 RSCFDnCFDTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0 to 2) ... 1317
21.5.13 Details of Transmit Queue-related Registers ... 1319
21.5.13.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 5) ... 1319
21.5.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0 to 5) ... 1321
21.5.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 5) ... 1323
21.5.14 Details of Transmit History-related Registers ... 1324
21.5.14.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 to 5) ... 1324
21.5.14.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0 to 5) ... 1326

21.5.14.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 5) ... 1328
21.5.14.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0 to 5) ... 1329
21.5.15 Details of Test-related Registers ... 1331
21.5.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register ... 1331
21.5.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register ... 1333
21.5.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register ... 1334
21.5.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63) ... 1335
21.6 Interrupt Sources and DMA Trigger ... 1336
21.6.1 Interrupt Sources ... 1336
21.6.2 DMA Trigger (Only in CAN FD Mode) ... 1340
21.7 CAN Modes ... 1341
21.7.1 Global Modes ... 1341
21.7.1.1 Global Stop Mode ... 1343
21.7.1.2 Global Reset Mode ... 1343
21.7.1.3 Global Test Mode ... 1343
21.7.1.4 Global Operating Mode ... 1343
21.7.2 Channel Modes ... 1344
21.7.2.1 Channel Stop Mode ... 1345
21.7.2.2 Channel Reset Mode ... 1345
21.7.2.3 Channel Halt Mode ... 1346
21.7.2.4 Channel Communication Mode ... 1346
21.7.2.5 Bus Off State ... 1347
21.7.3 Initializing Registers by Transition to CAN Mode ... 1348
21.8 Reception Function ... 1350
21.8.1 Data Processing Using the Receive Rule Table ... 1350
21.8.1.1 Acceptance Filter Processing ... 1351
21.8.1.2 DLC Filter Processing ... 1352
21.8.1.3 Routing Processing ... 1352
21.8.1.4 Label Addition Processing ... 1352
21.8.1.5 Mirror Function Processing ... 1352
21.8.1.6 Timestamp ... 1353
21.9 Transmission Functions ... 1354
21.9.1 Transmit Priority Determination ... 1355
21.9.2 Transmission Using Transmit Buffers ... 1355
21.9.2.1 Transmit Abort Function ... 1355
21.9.2.2 One-Shot Transmission Function (Retransmission Disabling Function) ... 1356
21.9.2.3 Transmit Buffer Merge Mode (Only in CAN FD Mode) ... 1356
21.9.3 Transmission Using FIFO Buffers ... 1356
21.9.3.1 Interval Transmission Function ... 1357
21.9.4 Transmission Using Transmit Queues ... 1360
21.9.5 Transmit Data Padding (Only in CAN FD Mode) ... 1360
21.9.6 Transmit History Function ... 1360
21.10 Test Function ... 1362
21.10.1 Standard Test Mode ... 1362
21.10.2 Listen-Only Mode ... 1362
21.10.3 Self-Test Mode (Loopback Mode) ... 1363

21.10.3.1 Self-Test Mode 0 (External Loopback Mode) ... 1363
21.10.3.2 Self-Test Mode 1 (Internal Loopback Mode) ... 1364
21.10.4 Restricted Operation Mode (Only in CAN FD Mode) ... 1364
21.10.5 RAM Test ... 1364
21.10.6 Inter-Channel Communication Test ... 1365
21.10.6.1 CRC Error Test ... 1366
21.11 RS-CANFD Setting Procedure ... 1367
21.11.1 Initial Settings ... 1367
21.11.1.1 Clock Setting ... 1369
21.11.1.2 Bit Timing Setting ... 1369
21.11.1.3 Communication Speed Setting ... 1371
21.11.1.4 Receive Rule Setting ... 1373
21.11.1.5 Buffer Setting ... 1374
21.11.1.6 Transmitter Delay Compensation (Only in CAN FD Mode) ... 1376
21.11.2 Reception Procedure ... 1377
21.11.2.1 Receive Buffer Reading Procedure ... 1377
21.11.2.2 FIFO Buffer Reading Procedure ... 1379
21.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer ... 1383
21.11.3 Transmission Procedure ... 1384
21.11.3.1 Procedure for Transmission from Transmit Buffers ... 1384
21.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers ... 1389
21.11.3.3 Procedure for Transmission from the Transmit Queue ... 1393
21.11.3.4 Transmit History Buffer Reading Procedure ... 1394
21.11.4 Test Settings ... 1395
21.11.4.1 Self-Test Mode Setting Procedure ... 1395
21.11.4.2 Procedure for Releasing the Protection ... 1396
21.11.4.3 RAM Test Setting Procedure ... 1397
21.11.4.4 Inter-Channel Communication Test Setting Procedure ... 1398
21.12 Detection and Correction of Errors in RS-CAN0 RAM ... 1400
21.12.1 ECC for the RSCAN0 RAM ... 1400
21.12.2 Interrupt Request ... 1400
21.12.3 List of ECC Registers ... 1401
21.12.4 ECCRCAN0CTL_PHY1/ECCRCANFD0CTL_PHY2 — RSCANn ECC Control Register ... 1402
21.12.5 ECCRCAN0TMC_PHY1/ECCRCANFD0TMC_PHY2 — RSCANn ECC Test Mode Control Register ... 1404
21.12.6 ECCRCAN0TED_PHY1/ECCRCANFD0TED_PHY2 — RSCAN0 ECC Encode/ Decode Input/Output Replacement Test Register ... 1406
21.12.7 ECCRCAN0TRC_PHY1/ECCRCANFD0TRC_PHY2 — RSCAN0 ECC Redundant Bit Data Control Test Register ... 1407
21.12.8 ECCRCAN0AD0_PHY1/ECCRCANFD0AD0_PHY2 — RSCAN0 ECC Error Address Register 0 ... 1408
21.12.9 ECCRCAN0SYND_PHY1/ECCRCANFD0SYND_PHY2 — RSCAN0 ECC Decode Syndrome Data Register ... 1409
21.12.10 ECCRCAN0HORD_PHY1/ECCRCANFD0HORD_PHY2 — RSCAN0 ECC 7-Bit Redundant Bit Data Hold Test Register ... 1410
21.12.11 ECCRCAN0ECRD_PHY1/ECCRCANFD0ECRD_PHY2 — RSCAN0 ECC Encode Test Register ... 1411

21.12.12 ECCRCAN0ERDB_PHY1/ECCRCANFD0ERDB_PHY2 — RSCAN0 ECC Redundant Bit Input/Output Replacement Register ... 1412
21.12.13 SELB_READTEST — ECCREAD Test Select Register ... 1412
21.13 Notes on the RS-CANFD Module ... 1413
21.14 RS-CAN ... 1415
21.14.1 Register Base Address ... 1416
21.14.2 Clock Supply ... 1416
21.14.3 Interrupt Request ... 1417
21.14.4 Reset Sources ... 1417
21.14.5 External Input/Output Signals ... 1417
21.15 Overview ... 1418
21.15.1 Functional Overview ... 1418
21.15.2 Block Diagram ... 1420
21.16 Registers ... 1421
21.16.1 List of Registers ... 1421
21.16.2 RSCAN1CmCFG — Channel Configuration Register (m = 6) ... 1432
21.16.3 RSCAN1CmCTR — Channel Control Register (m = 6) ... 1434
21.16.4 RSCAN1CmSTS — Channel Status Register (m = 6) ... 1438
21.16.5 RSCAN1CmERFL — Channel Error Flag Register (m = 6) ... 1440
21.16.6 RSCAN1GCFG — Global Configuration Register ... 1444
21.16.7 RSCAN1GCTR — Global Control Register ... 1447
21.16.8 RSCAN1GSTS — Global Status Register ... 1449
21.16.9 RSCAN1GERFL — Global Error Flag Register ... 1451
21.16.10 RSCAN1GTINTSTS0 — Global TX Interrupt Status Register 0 ... 1453
21.16.11 RSCAN1GTSC — Global Timestamp Counter Register ... 1455
21.16.12 RSCAN1GAFLECTR — Receive Rule Entry Control Register ... 1456
21.16.13 RSCAN1GAFLCFG0 — Receive Rule Configuration Register 0 ... 1457
21.16.14 RSCAN1GAFLIDj — Receive Rule ID Register (j = 0 to 15) ... 1458
21.16.15 RSCAN1GAFLMj — Receive Rule Mask Register (j = 0 to 15) ... 1460
21.16.16 RSCAN1GAFLP0j — Receive Rule Pointer 0 Register (j = 0 to 15) ... 1461
21.16.17 RSCAN1GAFLP1j — Receive Rule Pointer 1 Register (j = 0 to 15) ... 1463
21.16.18 RSCAN1RMNB — Receive Buffer Number Register ... 1464
21.16.19 RSCAN1RMNDy — Receive Buffer New Data Register (y = 0) ... 1465
21.16.20 RSCAN1RMIDq — Receive Buffer ID Register (q = 0 to 15) ... 1466
21.16.21 RSCAN1RMPTRq — Receive Buffer Pointer Register (q = 0 to 15) ... 1467
21.16.22 RSCAN1RMDF0q — Receive Buffer Data Field 0 Register (q = 0 to 15) ... 1468
21.16.23 RSCAN1RMDF1q — Receive Buffer Data Field 1 Register (q = 0 to 15) ... 1469
21.16.24 RSCAN1RFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) ... 1470
21.16.25 RSCAN1RFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) ... 1472

Section 25 Timer Array Unit D (TAUD) 1852

25.1 Features of RH850/F1K TAUD 1852
25.1.1 Number of Units and Channels 1852
25.1.2 Register Base Address 1852
25.1.3 Clock Supply 1853
25.1.4 Interrupt Requests 1853
25.1.5 Reset Sources 1853
25.1.6 External Input/Output Signals 1854
25.1.7 Internal Input/Output Signals 1855
25.1.8 TAUD0 Input Selection 1855

25.1.8.1 List of Registers ... 1857
25.1.8.2 SELB_TAUD0I — TAUDTTINm Input Signal Selection Register ... 1857
25.2 Overview ... 1858
25.2.1 Functional Overview ... 1858
25.2.2 Terms ... 1859
25.2.3 Functional List of Timer Operations ... 1860
25.2.4 TAUD I/O and Interrupt Request Signals ... 1861
25.2.5 Block Diagram ... 1862
25.2.6 Description of Blocks ... 1863
25.3 Registers ... 1864
25.3.1 List of Registers ... 1864
25.3.2 Details of TAUDn Prescaler Registers ... 1865
25.3.2.1 TAUDnTPS — TAUDn Prescaler Clock Select Register ... 1865
25.3.2.2 TAUDnBRS — TAUDn Prescaler Baud Rate Setting Register ... 1868
25.3.3 Details of TAUDn Control Registers ... 1869
25.3.3.1 TAUDnCDRm — TAUDn Channel Data Register ... 1869
25.3.3.2 TAUDnCNTm — TAUDn Channel Counter Register ... 1870
25.3.3.3 TAUDnCMORm — TAUDn Channel Mode OS Register ... 1871
25.3.3.4 TAUDnCMURm — TAUDn Channel Mode User Register ... 1874
25.3.3.5 TAUDnCSRm — TAUDn Channel Status Register ... 1875
25.3.3.6 TAUDnCSCm — TAUDn Channel Status Clear Register ... 1876
25.3.3.7 TAUDnTS — TAUDn Channel Start Trigger Register ... 1876
25.3.3.8 TAUDnTE — TAUDn Channel Enable Status Register ... 1877
25.3.3.9 TAUDnTT — TAUDn Channel Stop Trigger Register ... 1877
25.3.4 Details of TAUDn Simultaneous Rewrite Registers ... 1878
25.3.4.1 TAUDnRDE — TAUDn Channel Reload Data Enable Register ... 1878
25.3.4.2 TAUDnRDS — TAUDn Channel Reload Data Control Channel Select Register ... 1878
25.3.4.3 TAUDnRDM — TAUDn Channel Reload Data Mode Register ... 1879
25.3.4.4 TAUDnRDC — TAUDn Channel Reload Data Control Register ... 1879
25.3.4.5 TAUDnRDT — TAUDn Channel Reload Data Trigger Register ... 1880
25.3.4.6 TAUDnRSF — TAUDn Channel Reload Status Register ... 1880
25.3.5 Details of TAUDn Output Registers ... 1881
25.3.5.1 TAUDnTOE — TAUDn Channel Output Enable Register ... 1881
25.3.5.2 TAUDnTO — TAUDn Channel Output Register ... 1881
25.3.5.3 TAUDnTOM — TAUDn Channel Output Mode Register ... 1882
25.3.5.4 TAUDnTOC — TAUDn Channel Output Configuration Register ... 1882
25.3.5.5 TAUDnTOL — TAUDn Channel Output Active Level Register ... 1883
25.3.6 Details of TAUDn Dead Time Output Registers ... 1884
25.3.6.1 TAUDnTDE — TAUDn Channel Dead Time Output Enable Register ... 1884
25.3.6.2 TAUDnTDM — TAUDn Channel Dead Time Output Mode Register ... 1884
25.3.6.3 TAUDnTDL — TAUDn Channel Dead Time Output Level Register ... 1885
25.3.7 Details of TAUDn Real-time/Modulation Output Registers ... 1886
25.3.7.1 TAUDnTRE — TAUDn Channel Real-time Output Enable Register ... 1886
25.3.7.2 TAUDnTRC — TAUDn Channel Real-time Output Control Register ... 1886
25.3.7.3 TAUDnTRO — TAUDn Channel Real-time Output Register ... 1887
25.3.7.4 TAUDnTME — TAUDn Channel Modulation Output Enable Register ... 1887
25.3.8 TAUDn Emulation Register ... 1888
25.3.8.1 TAUDnEMU — TAUDn Emulation Register ... 1888

25.4 Operating Procedure 1889
25.5 Concepts of Synchronous Channel Operation 1890
25.5.1 Rules of Synchronous Channel Operation 1890
25.5.2 Simultaneous Start and Stop of Synchronous Channel Counters 1892
25.5.2.1 Simultaneous Start and Stop within the Same Unit 1892
25.5.2.2 Simultaneous Start between the Units 1892
25.6 Simultaneous Rewrite 1893
25.6.1 Overview of Operations 1893
25.6.2 How to Control Simultaneous Rewrite 1895
25.6.2.1 Initial Settings 1896
25.6.2.2 Start Counter and Count Operation 1896
25.6.2.3 Simultaneous Rewrite 1896
25.6.3 Other General Rules of Simultaneous Rewrite 1897
25.6.4 Types of Simultaneous Rewrite 1898
25.6.4.1 Simultaneous Rewrite when the Master Channel (Re)starts Counting (Method A) 1898
25.6.4.2 Simultaneous Rewrite at the Peak of a Triangular Wave of Slave Channel (Method B) 1900
25.6.4.3 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm (Method C1) 1901
25.6.4.4 Simultaneous Rewrite when INTTAUDnIm is Generated on an Upper Channel Specified by TAUDnRDC.TAUDnRDCm that in Turn is Triggered by an External Signal (Method C2) 1903
25.7 Channel Output Modes 1905
25.7.1 General Procedures for Specifying a Channel Output Mode 1907
25.7.2 Channel Output Modes Controlled Independently by TAUDn Signals 1908
25.7.2.1 Independent Channel Output Mode 1 1908
25.7.2.2 Independent Channel Output Mode 1 with Real-Time Output 1908
25.7.2.3 Independent Channel Output Mode 2 1909
25.7.3 Channel Output Modes Controlled Synchronously by TAUDn Signals 1910
25.7.3.1 Synchronous Channel Output Mode 1 1910
25.7.3.2 Synchronous Channel Output Mode 1 with Non-Complementary Modulation Output 1910
25.7.3.3 Synchronous Channel Output Mode 2 1910
25.7.3.4 Synchronous Channel Output Mode 2 with Dead Time Output 1911
25.7.3.5 Synchronous Channel Output Mode 2 with One-Phase PWM Output 1912
25.7.3.6 Synchronous Channel Output Mode 2 with Complementary Modulation Output 1913
25.7.3.7 Synchronous Channel Output Mode 2 with Non-Complementary Modulation Output 1913
25.8 Start Timing in Each Operating Modes 1914
25.8.1 Interval Timer Mode, Judge Mode, Capture Mode, Count-up/-down Mode, and Count Capture Mode 1914
25.8.2 Event Count Mode 1915
25.8.3 Other Operating Modes 1915
25.9 TAUDTTOUTm Output and INTTAUDnIm Generation when Counter Starts or Restarts 1916
25.10 Interrupt Generation upon Overflow 1917
25.10.1 Combination of the TAUDTTINm Input Pulse Interval Measurement Function and the TAUDTTINm Input Interval Timer Function 1918

25.10.2 Combination of the TAUDTTINm Input Signal Width Measurement Function and the Overflow Interrupt Output Function (at Measuring the TAUDTTINm Width) 1919
25.10.3 Combination of the TAUDTTINm Input Position Detection Function and the Interval Timer Function 1920
25.10.4 Combination of the TAUDTTINm Input Period Count Detection Function and the Overflow Interrupt Output Function (at Detecting the TAUDTTINm Input Period Count) 1921
25.11 TAUDTTINm Edge Detection 1922
25.12 Independent Channel Operation Functions 1923
25.12.1 Interval Timer Function 1923
25.12.1.1 Overview 1923
25.12.1.2 Equations 1923
25.12.1.3 Block Diagram and General Timing Diagram 1924
25.12.1.4 Register Settings 1925
25.12.1.5 Operating Procedure for Interval Timer Function 1927
25.12.1.6 Specific Timing Diagrams 1928
25.12.2 TAUDTTINm Input Interval Timer Function 1932
25.12.2.1 Overview 1932
25.12.2.2 Equations 1932
25.12.2.3 Block Diagram and General Timing Diagram 1933
25.12.2.4 Register Settings 1934
25.12.2.5 Operating Procedure for TAUDTTINm Input Interval Timer Function 1936
25.12.2.6 Specific Timing Diagrams 1937
25.12.3 Clock Divide Function 1938
25.12.3.1 Overview 1938
25.12.3.2 Equations 1939
25.12.3.3 Block Diagram and General Timing Diagram 1939
25.12.3.4 Register Settings 1940
25.12.3.5 Operating Procedure for Clock Divide Function 1942
25.12.3.6 Specific Timing Diagrams 1943
25.12.4 External Event Count Function 1945
25.12.4.1 Overview 1945
25.12.4.2 Equations 1945
25.12.4.3 Block Diagram and General Timing Diagram 1946
25.12.4.4 Register Settings 1947
25.12.4.5 Operating Procedure for External Event Count Function 1948
25.12.4.6 Specific Timing Diagrams 1949
25.12.5 Delay Count Function 1951
25.12.5.1 Overview 1951
25.12.5.2 Equations 1951
25.12.5.3 Block Diagram and General Timing Diagram 1952
25.12.5.4 Register Settings 1953
25.12.5.5 Operating Procedure for Delay Count Function 1954
25.12.6 One-Pulse Output Function 1955
25.12.6.1 Overview 1955
25.12.6.2 Equations 1955
25.12.6.3 Block Diagram and General Timing Diagram 1956
25.12.6.4 Register Settings 1957
25.12.6.5 Operating Procedure for One-Pulse Output Function 1959

25.12.7 TAUDTTINm Input Pulse Interval Measurement Function 1960
25.12.7.1 Overview 1960
25.12.7.2 Equations 1961
25.12.7.3 Block Diagram and General Timing Diagram 1962
25.12.7.4 Register Settings 1963
25.12.7.5 Operating Procedure for TAUDTTINm Input Pulse Interval Measurement Function 1964
25.12.7.6 Specific Timing Diagrams: Overflow Operation 1965
25.12.8 TAUDTTINm Input Signal Width Measurement Function 1968
25.12.8.1 Overview 1968

29.4.3 Basic Operation 2423
29.4.4 Asynchronous Hi-Z Control Using Software Trigger 2425
29.4.5 Operating Procedure 2426
29.4.6 TAPA0 Hi-Z Control Input Selection 2427
29.4.7 Registers 2428
29.4.7.1 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0) 2428
29.5 INT Signal Output Selection Function 2429
29.5.1 Configuration of the INT Signal Output Selection Function 2429
29.5.2 Block Diagram 2430
29.5.3 Registers 2431
29.5.3.1 PIC0REG2n0 — Timer I/O Control Register 2n0 (n = 0) 2431
29.6 A/D Converter Conversion Trigger Selection Function 2432
29.6.1 Configuration of A/D Converter Conversion Trigger Selection Function 2432
29.6.2 Block Diagram 2433
29.6.3 Waveforms of A/D Converter Conversion Trigger Output Control Operation in Triangle PWM Mode 2434
29.6.4 Operating Procedure for A/D Converter Conversion Trigger Selection Function 2436
29.7 ADCA Trigger Selection Function 2437
29.7.1 Functional Overview 2437
29.7.2 Configuration 2437
29.7.3 Registers 2438
29.7.3.1 PIC0ADTEN4nj — A/D Conversion Trigger Output Control Register 4nj (n = 0, j = 0 to 2) 2438
29.7.4 Example of Operation 2439
29.7.5 Setup Flow 2439
29.8 Simultaneous Start Trigger Function 2440
29.8.1 Functional Overview 2440
29.8.2 Configuration 2440
29.8.3 Registers 2441
29.8.3.1 PIC0SSER0 — Simultaneous Start Control Register 0 2441
29.8.3.2 PIC0SSER2 — Simultaneous Start Control Register 2 2441
29.8.3.3 PIC0SST — Simultaneous Start Trigger Control Register 2442
29.8.4 Example of Operation 2443
29.8.5 Setup Flow 2444
29.9 Trigger & Pulse Width Measuring Function 2445
29.9.1 Functional Overview 2445
29.9.2 Configuration 2445
29.9.3 Registers 2447

29.9.3.1 PIC0REG31 — Timer I/O Control Register 31 ... 2447
29.9.4 Example of Operation ... 2449
29.9.5 Setup Flow ... 2451
29.9.6 Setting Examples for Operation Functions ... 2454
29.10 A/D Trigger Encoder Capture Function ... 2457
29.10.1 Functional Overview ... 2457
29.10.2 Configuration ... 2457
29.10.3 Registers ... 2458
29.10.3.1 PIC0REG30 — Timer I/O Control Register 30 ... 2458
29.10.4 Example of Operation ... 2459
29.10.5 Setup Flow ... 2460
29.10.6 Setting Examples for Operation Functions ... 2461
29.11 Three-Phase PWM Output with Dead Time ... 2462
29.11.1 Functional Overview ... 2462
29.11.2 Configuration ... 2462
29.11.3 Registers ... 2465
29.11.3.1 PIC0REG2n2 — Timer I/O Control Register 2n2 (n = 0) ... 2465
29.11.3.2 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0) ... 2466
29.11.4 Operation Example ... 2467
29.11.4.1 Pwm Output ... 2467
29.11.4.2 One-Phase PWM Output ... 2467
29.11.4.3 SR Flip-Flop Circuit ... 2468

29.11.6 Setting Examples for Operation Functions ... 2478
29.11.6.1 TAUDn Settings (Active High Example) ... 2478
29.11.6.2 PIC Settings ... 2483
29.12 High-accuracy Triangle PWM Output with Dead Time ... 2484
29.12.1 Functional Overview ... 2484
29.12.2 Configuration ... 2485
29.12.3 Registers ... 2487
29.12.3.1 PIC0REG2n0 — Timer I/O Control Register 2n0 (n = 0) ... 2487
29.12.3.2 PIC0REG2n1 — Timer I/O Control Register 2n1 (n = 0) ... 2488
29.12.3.3 PIC0REG2n2 — Timer I/O Control Register 2n2 (n = 0) ... 2490
29.12.3.4 PIC0REG2n3 — Timer I/O Control Register 2n3 (n = 0) ... 2491
29.12.3.5 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0) ... 2493
29.12.4 Operation Example ... 2494
29.12.4.1 Triangle PWM Output with Dead Time ... 2494
29.12.4.2 One-shot Pulse Output ... 2494
29.12.4.3 U phase Combination Circuit (PFN001) ... 2495
29.12.4.4 Logical Operation Circuit (FN0i) (i = 0 or 1) ... 2497
29.12.5 Setup Flow ... 2507
29.12.6 Setting Examples for Operation Functions ... 2509
29.12.6.1 TAUDn settings (active high example) ... 2509
29.12.6.2 PIC Settings (Active High Example) ... 2515
29.13 Delay Pulse Output with Dead Time ... 2516
29.13.1 Functional Overview ... 2516
29.13.2 Configuration ... 2516

29.13.2.1 TAUDn configuration ... 2517
29.13.3 Registers ... 2519
29.13.3.1 PIC0REG2n2 — Timer I/O Control Register 2n2 (n = 0) ... 2519
29.13.3.2 PIC0HIZCENn — Hi-Z Output Control Register n (n = 0) ... 2520
29.13.4 Operation Example ... 2521
29.13.4.1 Delay pulse output function ... 2521
29.13.4.2 One-phase PWM output ... 2521
29.13.5 Setup Flow ... 2527
29.13.6 Setting Examples for Operation Functions ... 2530
29.13.6.1 TAUDn Settings ... 2530
29.13.6.2 Peripheral Interconnections Settings ... 2535

Section 30 PWM Output/Diagnostic (PWM-Diag) ... 2536

30.1 Features of RH850/F1K PWM-Diag ... 2536
30.1.1 Number of Units and Channels ... 2536
30.1.2 Register Base Address ... 2537
30.1.3 Clock Supply ... 2537
30.1.4 Interrupt Requests ... 2538
30.1.5 Reset Sources ... 2540
30.1.6 External Input/Output Signals ... 2540
30.1.7 Internal Signals ... 2540
30.1.8 Functional Overview ... 2541
30.1.9 Block Diagram ... 2543
30.2 Registers ... 2544
30.2.1 List of Registers ... 2544
30.2.1.1 PWBAnBRSm Register ... 2545
30.2.1.2 PWBAnTE Register ... 2546
30.2.1.3 PWBAnTS Register ... 2547
30.2.1.4 PWBAnTT Register ... 2548
30.2.1.5 PWBAnEMU Register ... 2549
30.2.1.6 PWGAnCTL — PWGA Control Register ... 2550
30.2.1.7 PWGAnCNT — PWM Cycle Count Register ... 2550
30.2.1.8 PWGAnCSDR — PWM Output Set Condition Register ... 2551
30.2.1.9 PWGAnCRDR — PWM Output Reset Condition Register ... 2551
30.2.1.10 PWGAnCTDR — PWGA_TRGOUTn Generation Condition Register ... 2552
30.2.1.11 PWGAnCSBR — PWGAnCSDR Buffer Register ... 2552
30.2.1.12 PWGAnCRBR — PWGAnCRDR Buffer Register ... 2553
30.2.1.13 PWGAnCTBR — PWGAnCTDR Buffer Register ... 2553
30.2.1.14 PWGAnRSF — Buffer Register Reload Status Register ... 2554
30.2.1.15 PWGAnRDT — Buffer Register Reload Trigger Register ... 2554
30.2.1.16 SLPWGAk — PWGA Synchronous Trigger Register (k = 0 to 2) ... 2555
30.2.1.17 PWSAnCTL Register ... 2556
30.2.1.18 PWSAnSTR Register ... 2556
30.2.1.19 PWSAnSTC Register ... 2557
30.2.1.20 PWSAnQUEj (j = 0 to 7) Register ... 2557
30.2.1.21 PWSAnPVCRx_y (x = 00, 02, 04 ... 70, y = 01, 03, 05 ... 71) Register ... 2558
30.2.1.22 PWSAnEMU — Emulation Control Register ... 2559
30.3 Operating Procedure ... 2560

30.4 Operation Waveform of PWM-Diag ... 2562
30.4.1 PWM Waveform Output by PWGA and Operation Waveform for A/D Conversion Trigger Output ... 2562
30.4.1.1 Basic Operation Waveform of PWGA ... 2562
30.4.1.2 Operation Waveform when Simultaneous Rewrite for PWGA is Executed ... 2563
30.4.1.3 Operation Waveform when Stopping and Restarting PWGA Operation ... 2564
30.4.1.4 Waveforms of PWGA Operation with Specific Settings ... 2566
30.4.2 Operation Waveform when A/D Conversion Trigger Occurs in PWSA ... 2567
30.5 PWM-Diag Related Function in A/D Converter (ADCA) ... 2568
30.5.1 ADCA Registers when the PWM-Diag Function is Used ... 2568

Section 31 A/D Converter (ADCA) ... 2569

31.1 Features of RH850/F1K ADCA ... 2569
31.1.1 Number of Units and Channels ... 2569
31.1.2 Register Base Address ... 2570
31.1.3 Clock Supply ... 2571
31.1.4 Interrupt Requests ... 2571
31.1.5 Reset Sources ... 2571
31.1.6 External Input/Output Signals ... 2572
31.2 Overview ... 2575
31.2.1 Functional Overview ... 2575
31.2.2 Block Diagram ... 2577
31.3 Registers ... 2582
31.3.1 List of Registers ... 2582
31.3.2 ADCA Specific Registers ... 2584
31.3.2.1 ADCAnVCRj — Virtual Channel Register j ... 2584
31.3.2.2 ADCAnPWDVCR — PWM-Diag Virtual Channel Register ... 2586
31.3.2.3 ADCAnDRj — Data Register j ... 2587
31.3.2.4 ADCAnDIRj — Data Supplementary Information Register j ... 2589
31.3.2.5 ADCAnPWDTSNDR — PWM-Diag Data Register ... 2590
31.3.2.6 ADCAnPWDDIR — PWM-Diag Data Supplementary Information Register ... 2591
31.3.2.7 ADCAnADHALTR — A/D Force Halt Register ... 2592
31.3.2.8 ADCAnADCR — A/D Control Register ... 2593
31.3.2.9 ADCAnMPXCURR — MPX Current Register ... 2595
31.3.2.10 ADCAnTHSMPSTCR — T&H Sampling Start Control Register ... 2596
31.3.2.11 ADCAnTHCR — T&H Control Register ... 2597
31.3.2.12 ADCAnTHAHLDSTCR — T&H Group A Hold Start Control Register ... 2598
31.3.2.13 ADCAnTHBHLDSTCR — T&H Group B Hold Start Control Register ... 2599
31.3.2.14 ADCAnTHACR — T&H Group A Control Register ... 2600
31.3.2.15 ADCAnTHBCR — T&H Group B Control Register ... 2601
31.3.2.16 ADCAnTHER — T&H Enable Register ... 2603
31.3.2.17 ADCAnTHGSR — T&H Group Select Register ... 2604
31.3.2.18 ADCAnSMPCR — Sampling Control Register ... 2606
31.3.2.19 ADCAnSFTCR — Safety Control Register ... 2607
31.3.2.20 ADCAnULLMTBR0 to 2 — Upper Limit/Lower Limit Table Registers 0 to 2 ... 2608
31.3.2.21 ADCAnECR — Error Clear Register ... 2609
31.3.2.22 ADCAnULER — Upper Limit/Lower Limit Error Register ... 2610

31.3.2.23 ADCAnOWER — Overwrite Error Register ... 2612
31.3.3 Scan Group (SG) Specific Registers ... 2613
31.3.3.1 ADCAnSGSTCRx — Scan Group x Start Control Register ... 2613
31.3.3.2 ADCAnSGCRx — Scan Group x Control Register ... 2614
31.3.3.3 ADCAnPWDSGCR — PWM-Diag Scan Group Control Register ... 2615
31.3.3.4 ADCAnSGVCSPx — Scan Group x Start Virtual Channel Pointer ... 2616
31.3.3.5 ADCAnSGVCEPx — Scan Group x End Virtual Channel Pointer ... 2617
31.3.3.6 ADCAnSGMCYCRx — Scan Group x Multicycle Register ... 2618
31.3.3.7 ADCAnPWDSGSEFCR — PWM-Diag Scan End Flag Clear Register ... 2619
31.3.3.8 ADCAnSGSEFCRx — Scan Group x Scan End Flag Clear Register ... 2620
31.3.3.9 ADCAnSGSTR — Scan Group Status Register ... 2621
31.3.4 Hardware Trigger Specific Register ... 2623
31.3.4.1 ADCAnSGTSELx — Scan Group x Start Trigger Control Register x ... 2623
31.3.5 Self-Diagnosis Specific Registers ... 2625
31.3.5.1 ADCAnDGCTL0 — Self-Diagnosis Control Register 0 ... 2625
31.3.5.2 ADCAnDGCTL1 — Self-Diagnosis Control Register 1 ... 2626
31.3.5.3 ADCAnPDCTL1 — Pull Down Control Register 1 ... 2627
31.3.5.4 ADCAnPDCTL2 — Pull Down Control Register 2 ... 2628
31.3.6 Emulation Specific Register ... 2629
31.3.6.1 ADCAnEMU — Emulation Control Register ... 2629
31.4 Operation ... 2630
31.4.1 Initial Setting ... 2630
31.4.2 Trigger Input ... 2631
31.4.3 Ending A/D Conversion ... 2632
31.4.4 Example of Scan Group Operation ... 2633
31.4.5 Channel Repeat Mode ... 2635
31.4.6 Example of Simultaneous Track and Hold Operation ... 2637
31.4.7 A/D Conversion with External Analog Multiplexer ... 2639
31.4.7.1 A/D Conversion with PWM-Diag Enabled ... 2641
31.4.8 Example of Synchronous Suspend and Resume Operation ... 2643
31.4.9 Example of Asynchronous Suspend and Resume Operation ... 2644
31.4.10 Error Detecting Functions ... 2645
31.4.10.1 Upper-Limit/Lower-Limit Error Detecting Function ... 2645
31.4.10.2 Overwrite Error Detecting Function ... 2645
31.4.10.3 SVSTOP Operation ... 2645
31.4.11 Activating Scan Group by a Hardware Trigger ... 2649
31.4.11.1 Stopping Scan Group by ADHALT ... 2649
31.4.12 Scan End Interrupt Request ... 2650
31.4.13 A/D Error Interrupt Request ... 2651
31.5 Self-Diagnostic Function ... 2652
31.5.1 Diagnosis of A/D Conversion Circuit ... 2653
31.5.1.1 Diagnostic procedure ... 2653
31.5.2 Diagnosis of Channel Multiplexer ... 2654
31.5.2.1 Diagnostic procedure ... 2655
31.5.3 Diagnosis of Open Pins ... 2656
31.5.3.1 Diagnostic procedure ... 2657
31.5.4 Diagnosis of T&H Circuit ... 2658

31.5.4.1 Diagnostic Procedure (in case of T&H circuit ch0 diagnosis) 2658
31.5.4.2 Diagnosis Mechanism 2660
31.6 Definition of A/D Conversion Accuracy 2661
31.7 Usage Notes 2662
31.7.1 Range of Channel Input Voltage 2662
31.7.2 Notes on Application Design 2662

Section 32 Key Return (KR) 2667

32.1 Features of RH850/F1K KR 2667
32.1.1 Number of Units and Channels 2667
32.1.2 Register Base Address 2667
32.1.3 Clock Supply 2668
32.1.4 Interrupt Requests 2668
32.1.5 Reset Sources 2668
32.1.6 External Input/Output Signals 2668
32.2 Overview 2669
32.2.1 Functional Overview 2669
32.2.2 Block Diagram 2669
32.3 Registers 2670
32.3.1 List of Registers 2670
32.3.2 KRnKRM — Key Return Mode Register 2670
32.4 Operation 2671
32.4.1 Interrupt Request INTKRn 2671

Section 33 Functional Safety 2672

33.1 Overview 2672
33.2 ECC 2673
33.2.1 Overview 2673
33.2.2 Code Flash ECC 2675
33.2.2.1 Overview 2675
33.2.2.2 Interrupt Requests 2676
33.2.2.3 List of Registers 2677
33.2.2.4 Details of Registers 2678
33.2.3 Data Flash ECC 2686
33.2.3.1 Overview 2686
33.2.3.2 Interrupt Requests 2686
33.2.3.3 List of Registers 2687
33.2.3.4 Details of Registers 2688
33.2.4 Local RAM (Including the Retention RAM) ECC 2694
33.2.4.1 Overview 2694
33.2.4.2 Interrupt Requests 2695
33.2.4.3 List of Registers 2696
33.2.4.4 Details of Registers 2697
33.2.5 Peripheral RAM ECC 2704
33.3 Memory Protection 2705

33.3.1 Overview ... 2705
33.3.1.1 Identifiers for Slave Guard ... 2706
33.3.2 PBG ... 2707
33.3.2.1 List of Registers ... 2711
33.3.2.2 Details of Registers ... 2716
33.3.3 PBG for CPU System ... 2722
33.3.3.1 List of Registers ... 2723
33.3.3.2 Details of Registers ... 2724

Section 34 Data CRC (DCRA) ... 2730

34.1 Features of RH850/F1K DCRA ... 2730
34.1.1 Number of Units ... 2730
34.1.2 Register Base Address ... 2730
34.1.3 Clock Supply ... 2731
34.1.4 Reset Sources ... 2731
34.2 Overview ... 2732
34.2.1 Functional Overview ... 2732
34.2.2 Block Diagram ... 2732
34.2.3 Operational Circuit ... 2733
34.3 Registers ... 2734
34.3.1 List of Registers ... 2734
34.3.2 DCRAnCIN — CRC Input Register ... 2735
34.3.3 DCRAnCOUT — CRC Data Register ... 2736
34.3.4 DCRAnCTL — CRC Control Register ... 2737
34.4 Operation ... 2738

Section 35 Security Function ... 2739

Section 36 On-Chip Debug Unit (OCD) ... 2740

36.1 Overview of RH850/F1K OCD ... 2740
36.1.1 Functional Overview ... 2740
36.1.2 External Input/Output Pins ... 2742
36.2 Peripheral Break Control ... 2743
36.3 Hot Plug-in in Each Mode ... 2745
36.3.1 RUN Mode ... 2745
36.3.2 STOP/DeepSTOP Mode ... 2745
36.3.3 Cyclic RUN Mode ... 2745
36.3.4 Cyclic STOP Mode ... 2746
36.4 Registers ... 2747
36.4.1 EPC — Emulation Peripheral Control Register ... 2747
36.5 Cautions on Using On-Chip Debugging ... 2748
36.5.1 Treatment of Devices Used for Debugging ... 2748
36.5.2 Reset Assertion When a Debugger is Connected ... 2748
36.5.3 Restrictions When HS IntOSC is Used as the Main Clock Source Instead of MainOSC ... 2748

36.5.4 Restrictions When the Writing of OCD_MD and RESET are Occur at the Same Time, or Restrictions When the Writing of MTR (DBG_CTRLP) and RESET are Occur at the Same Time 2748
36.5.5 Transition to DeepSTOP Mode When a Debugger is Connected 2748

Section 37 Flash Memory 2749

37.1 Features 2749
37.2 Structure of Memory 2750
37.2.1 Mapping of Code Flash Memory 2750
37.2.2 Mapping of Data Flash Memory 2750
37.3 Operating Modes Associated with Flash Memory 2751
37.4 Functions 2752
37.4.1 Functional Overview 2752
37.5 Serial Programming 2756
37.5.1 Environments for Programming 2756
37.6 Communication Modes 2757
37.6.1 Asynchronous Flash Programming Interface - 1-Wire UART 2757
37.6.2 Asynchronous Flash Programming Interface - 2-Wire UART 2757
37.6.3 Synchronous Flash Programming Interface CSI 2757
37.6.4 Selection of Communication Method 2758
37.7 Self-Programming 2759
37.7.1 Outline 2759
37.7.2 Background Operation 2760
37.7.3 Enabling Self-Programming 2760
37.7.3.1 FLMDCNT Register 2760
37.8 Reading Flash Memory 2761
37.8.1 Reading Code Flash Memory 2761
37.8.2 Reading Data Flash Memory 2761
37.8.2.1 EEPRDCYCL — Data Flash Wait Cycle Control Register 2762
37.8.2.2 PRDNAMEn — Product Name Storage Register (n = 1 to 3) 2763
37.8.2.3 CHIPIDnXX — Chip ID Register (n = 1,2, XX = LL,LH,HL,HH) 2765
37.9 Option Bytes 2766
37.9.1 Option Byte Setting 2766
37.9.2 OPBT0 — Option Byte 0 2767
37.9.3 OPBT1 — Option Byte 1 2769
37.10 Usage Notes 2770

Section 38 RAM 2772

38.1 Features 2772
38.2 Memory Configuration 2773
38.3 Usage Notes 2774

Section 39 Boundary Scan 2775

39.1 Overview 2775

39.2 Features ... 2775
39.3 External Input/Output Pins ... 2777
39.4 Register Descriptions ... 2778
39.4.1 Instruction Register (SDIR) ... 2779
39.4.2 ID Register (SDID) ... 2779
39.4.3 Bypass Register (SDBPR) ... 2779
39.4.4 Boundary Scan Register (SDBSR) ... 2779
39.5 Operation ... 2780
39.5.1 TAP Controller ... 2780
39.5.2 Supported Instructions ... 2781
39.5.2.1 BYPASS ... 2781
39.5.2.2 SAMPLE/PRELOAD ... 2781
39.5.2.3 EXTEST ... 2781
39.5.2.4 IDCODE ... 2781
39.5.3 Pins Subject to Boundary Scan ... 2782
39.6 Usage Notes ... 2783

Section 40 Electrical Characteristics ... 2784

40.1 Overview ... 2784
40.1.1 Pin Groups ... 2784
40.1.1.1 176 pin ... 2784
40.1.1.2 144 pin ... 2784
40.1.1.3 100 pin ... 2784
40.1.2 General Measurement Conditions ... 2784
40.1.2.1 Common Conditions ... 2784
40.1.2.2 AC Characteristic Measurement Condition ... 2785
40.2 Absolute Maximum Ratings ... 2786
40.2.1 Supply Voltages ... 2786
40.2.2 Port Voltages ... 2786
40.2.3 Port Current ... 2787
40.2.3.1 176 pin ... 2788
40.2.3.2 144 pin ... 2789
40.2.3.3 100 pin ... 2790

Section 1 Overview

1.1 RH850/F1K Product Features

The features of the RH850/F1K are described below.

The RH850/F1K is a 32-bit single-chip microcontroller with a G3KH CPU core. The key features of the F1K are low power consumption, high computational processing power, and a wide variety of internal peripheral functions. To reduce supply current in a variety of applications, a wide range of power reducing measures are available. For example, there is a Low Power Sampler (LPS), that can poll signals input to the analog and digital input pins without CPU core interaction, and DeepSTOP mode in which the power supply to the most circuits of the microcontroller can be turned off.

Applications

The RH850/F1K is ideal for automotive electronics, such as BCM (body control module), gateway, HVAC, lighting modules, and many other applications.

1.2 RH850/F1K Functions

Table 1.1 Overview of Product (1/2)

Product name			RH850/F1K		
			100 pin	144 pin	176 pin
Memory			See **Table 1.2, Product Lineup**.		
External memory interface (MEMC)			Not provided		
CPU	CPU System		G3KH		
	CPU frequency		120 MHz max. (ADVANCED/ PREMIUM)	80 MHz max. (ECO) 120 MHz max. (ADVANCED/PREMIUM)	
	FPU		Single-precision		
	Memory Protection Unit (MPU)		Provided		
DMA			16 channels		
Operating clock	Main Oscillator (MainOSC)		16/20/24 MHz		
	Low Speed Internal Oscillator (LS IntOSC)		240 kHz (typ.)		
	High Speed Internal Oscillator (HS IntOSC)		8 MHz (typ.)		
	PLL		Provided		
	Sub Oscillator (SubOSC)		Not provided	32.768 kHz	
I/O port			81	120	150
A/D converter	ADC0	Physical input channels	Total 36 ch (12 bit resolution: 16 ch + 10 bit resolution: 20 ch)	Total 36 ch (12 bit resolution: 16 ch + 10 bit resolution: 20 ch)	Total 36 ch (12 bit resolution: 16 ch + 10 bit resolution: 20 ch)
		External multiplexer support for channel number extension	Provided		
		Channels with T&H	6		
	ADC1	Physical input channels	Not provided	Total 12 ch (12 bit resolution: 8 ch + 10 bit resolution: 4 ch)	Total 24 ch (12 bit resolution: 16 ch + 10 bit resolution: 8 ch)
		External multiplexer support for channel number extension	Not provided		
		Channels with T&H	Not provided		
Timer	Timer Array Unit D (TAUD)		1 unit (16 bit resolution timers × 16 channels /unit)		
	Timer Array Unit B (TAUB)		1 unit (16 bit resolution timers × 16 channels /unit)		2 units (16 bit resolution timers × 16 channels /unit)
	Timer Array Unit J (TAUJ)		2 units (32 bit resolution timers × 4 channels /unit)		
	Operating System Timer (OSTM)		5 units		
	Real-Time Counter (RTCA)		Not provided	1 unit	
	Encoder Timer (ENCA)		1 unit		
	Window Watchdog Timer A (WDTA)		2 units		

Table 1.1 Overview of Product (2/2)

Product name		RH850/F1K		
		100 pin	144 pin	176 pin
Serial interfaces	Clocked Serial Interface G (CSIG)	1 channel	2 channels	
	Clocked Serial Interface H (CSIH)	4 channels		
	CAN Interface	ADVANCED	ECO/ADVANCED	
		RSCAN 6 channels (Total 480 message buffers)	RSCAN 6 channels (Total 480 message buffers)	RSCAN 7 channels (Total 560 message buffers)
		PREMIUM		
		RS-CANFD 6 channels (Total 480 message buffers)	RS-CANFD 6 channels (Total 480 message buffers)	RS-CANFD 6 channels + RSCAN 1 channel (Total 560 message buffers)
	LIN/UART Interface (RLIN3)	4 channels	6 channels	
	LIN Master Interface (RLIN2)	3 channels	6 channels	10 channels
	I^2C Interface (RIIC)	1 channel		
External Interrupts	Maskable	13	16	
	Non-maskable (NMI)	1		
Other functions	Clock Monitors (CLMA)	For PLL, HS IntOSC, MainOSC		
	Data CRC (DCRA)	4 channels		
	Low-Voltage Indicator (LVI)	Provided		
	Power-On-Clear (POC)	Provided		
	Core Voltage Monitors (CVM)	Provided		
	Error Correction Coding (ECC)	For Code flash, Data flash, Local RAM, Retention RAM, CSIH, RS-CAN		
	Low Power Sampling (LPS)	Provided		
	PWM diagnosis (PWM_DIAG)	48 channels	64 channels	72 channels
	Motor Control	1 unit		
	Key Return (KR)	8 channels		
	CLOCK OUTPUT (FOUT)	Provided		
	RESET OUTPUT (RESETOUT)	Provided		
	ICUSE (Intelligent Cryptographic Unit E)	Provided		
	SWDT (Secure WDT)	Provided		
	On-Chip debug (OCD)	Provided		
	Boundary Scan	Provided		
Voltage supply	Internal supply	VPOC to 5.5 V		
	Input/output buffer supplies	VPOC to 5.5 V		
	A/D Converter supplies	3.0 to 5.5 V		
Package		100 pin LQFP	144 pin LQFP	176pin LQFP

2.2 Pin Description

Table 2.4 Pin Functions (1/4)

Pin Name	No. of Pins			IO	Pin Function	Unit
	100 pins	144 pins	176 pins			
AnVREF	√	√	√	—	ADCAn voltage supply and reference voltage	ADCAn
	n = 0	n = 0, 1	n = 0, 1			
AnVSS	√	√	√	—	ADCAn ground	
	n = 0	n = 0, 1	n = 0, 1			
ADCA0Im	√	√	√	I	ADCA0 input channel m with 12-bit resolution	
	m = 0 to 15	m = 0 to 15	m = 0 to 15			
ADCA1Im	—	√	√	I	ADCA1 input channel m with 12-bit resolution	
		m = 0 to 7	m = 0 to 15			
ADCA0ImS	√	√	√	I	ADCA0 input channel m with 10-bit resolution	
	m = 0 to 19	m = 0 to 19	m = 0 to 19			
ADCA1ImS	—	√	√	I	ADCA1 input channel m with 10-bit resolution	
		m = 0 to 3	m = 0 to 7			
ADCA0SELy	√	√	√	O	External MPX selection pin y for ADCA0 input	
	y = 0 to 2	y = 0 to 2	y = 0 to 2			
ADCAnTRGy	√	√	√	I	ADCAn external trigger pin y	
	n = 0, y = 0 to 2	n = 0, 1, y = 0 to 2	n = 0, 1, y = 0 to 2			
AP0_m	√	√	√	IO	Analog port 0_m	Port
	m = 0 to 15	m = 0 to 15	m = 0 to 15			
AP1_m	—	√	√	IO	Analog port 1_m	
		m = 0 to 7	m = 0 to 15			
APO	√	√	√	O	Port output signal for analog input	LPS
AWOVCL	√	√	√	—	Voltage regulator for Always-On area (AWO area) capacitor connection	Power
AWOVSS	√	√	√	—	Internal logic for Always-On area (AWO area) ground	
CANmRX	√	√	√	I	CANm receive data input	RS-CANn
	m = 0 to 5	m = 0 to 5	m = 0 to 6			
CANmTX	√	√	√	O	CANm transmit data output	
	m = 0 to 5	m = 0 to 5	m = 0 to 6			
CSCXFOUT	√	√	√	O	Clock output	Clock
CSIGnRYI	√	√	√	I	CSIGn ready (1) / busy (0) input signal	CSIGn
	n = 0	n = 0, 1	n = 0, 1			
CSIGnRYO	√	√	√	O	CSIGn ready (1) / busy (0) output signal	
	n = 0	n = 0, 1	n = 0, 1			
CSIGnSC	√	√	√	IO	CSIGn serial clock signal	
	n = 0	n = 0, 1	n = 0, 1			
CSIGnSI	√	√	√	I	CSIGn serial data input	
	n = 0	n = 0, 1	n = 0, 1			
CSIGnSO	√	√	√	O	CSIGn serial data output	
	n = 0	n = 0, 1	n = 0, 1			
$\overline{\text{CSIGnSSI}}$	√	√	√	I	CSIGn SS function control input signal	
	n = 0	n = 0, 1	n = 0, 1

TAPA0WP	√	√	√	O	Motor control output W phase (positive)	
TAUD0Im	√	√	√	I	TAUD0 channel input m	TAUD0
	m = 0 to 15	m = 0 to 15	m = 0 to 15			
TAUD0Om	√	√	√	O	TAUD0 channel output m	
	m = 0 to 15	m = 0 to 15	m = 0 to 15			
TAUBnIm	√	√	√	I	TAUBn channel input m	TAUBn
	n = 0, m = 0 to 15	n = 0, m = 0 to 15	n = 0, 1, m = 0 to 15			
TAUBnOm	√	√	√	O	TAUBn channel output m	
	n = 0, m = 0 to 15	n = 0, m = 0 to 15	n = 0, 1, m = 0 to 15			
TAUJnIm	√	√	√	I	TAUJn channel input m	TAUJn
	n = 0, 1, m = 0 to 3	n = 0, 1, m = 0 to 3	n = 0, 1, m = 0 to 3			
TAUJnOm	√	√	√	O	TAUJn channel output m	
	n = 0, 1, m = 0 to 3	n = 0, 1, m = 0 to 3	n = 0, 1, m = 0 to 3			
X1, X2	√	√	√	—	MainOSC connections	MOSC
XT1, XT2	—	√	√	—	SubOSC connections	SOSC

CAUTION

- **When pin functions for a peripheral module are allocated to multiple pins, use the pins from the same port group or nearby pins as the pins for a given channel.**
  (e.g.) When RS-CAN channel 0 is used:
  CAN0TX P0_0 P10_1
  CAN0RX P0_1 P10_0
  Use one of the following pin combinations:
  - **P0_0 and P0_1, or**
  - **P10_0 and P10_1.**
- **The combinations of P0_0 and P10_0, and P0_1 and P10_1 are not allowed.**

2.3 Pin Functions During and After Reset

Table 2.5 Pin Functions During and After Reset

Pins	During Reset	After Reset
JP0_0	High impedance	JP0_0 : Input Serial programming mode: FPDR, FPDT (1 wire UART) FPDR (2 wire UART) Nexus I/F : DCUTDI input LPD (4pin) : LPDI input LPD (1pin) : LPDIO input/output
JP0_1	High impedance	JP0_1 : Input Serial programming mode: FPDT Nexus I/F : DCUTDO output LPD (4pin) : LPDO output LPD (1pin) : High impedance
JP0_2	High impedance	JP0_2 : Input Serial programming mode: FPCK Nexus I/F : DCUTCK input LPD (4pin) : LPDCLK input LPD (1pin) : High impedance
JP0_3	High impedance	JP0_3 : Input Serial programming mode: High impedance Nexus I/F : DCUTMS input LPD (4pin) : High impedance LPD (1pin) : High impedance
JP0_4	Input*3	JP0_4 : Input Serial programming mode: High impedance Nexus I/F : $\overline{\text{DCUTRST}}$ input*1 LPD (4pin) : High impedance LPD (1pin) : High impedance
JP0_5	High impedance	JP0_5 : Input Serial programming mode: High impedance Nexus I/F : $\overline{\text{DCURDY}}$ output LPD (4pin) : LPDCLKOUT output LPD (1pin) : High impedance
JP0_6	High impedance	JP0_6 : Input Serial programming mode: High impedance Nexus I/F : $\overline{\text{EVTO}}$ output LPD (4pin) : High impedance LPD (1pin) : High impedance
P8_6	Output*2, *4	Output (OPBT0.RESETOUTEN = 1)*2 High impedance (OPBT0.RESETOUTEN = 0)*2, *4
P0 to P2, P8 to P12, P18 and P20 (except P8_6, P10_1, P10_2, P10_6 and P10_8)	High impedance	High impedance
P10_1	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE0 input (FLMD0 = 1, FLMD1 = 1)
P10_2	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) MODE1 input (FLMD0 = 1, FLMD1 = 1)
P10_6	High impedance	High impedance (FLMD0 = 0) High impedance (FLMD0 = 1, FLMD1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 0) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 0, MODE1 = 1) High impedance (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 0) MODE2 input (FLMD0 = 1, FLMD1 = 1, MODE0 = 1, MODE1 = 1)
P10_8	High impedance	High impedance (FLMD0 = 0) FLMD1 input (FLMD0 = 1)
FLMD0	Input	Input
$\overline{\text{RESET}}$	Input	Input
AP0, AP1	High impedance	High impedance

Note 1. When Nexus is enabled and no external device is connected, the level of the pin must always be fixed to low.

Note 2. $\overline{\text{RESETOUT}}$ is output. For details, see **Section 2.11, Port (Special I/O) Function Overview**.

Note 3. When the power is turned on or when a reset is deasserted, the JP0_4 pin should be driven Low.

Note 4. If OPBT0.RESETOUTEN = 0, P8_6 pin status has a possibility to become unstable (less than 15 µs) at the transition moment to reset status by internal reset factors.

2.4 Port state in Standby Mode

For the port state in standby mode, see **Section 14.1.4, I/O Buffer Control**.

2.5 Recommended Connection of Unused Pins

If the pins are not used, it is recommended to connect them as shown below.

Table 2.6 Recommended Connection of Unused Pins

Pin	Recommended Connection of Unused Pins
A0VREF, A1VREF*1	Connected to EVCC
A0VSS, A1VSS*1	Connected to EVSS
$\overline{\text{RESET}}$	Connected to EVCC via a resistor
XT1	Connected to REGVCC or AWOVSS via a resistor*3 (bit 0 of IPIBC0 = 1) Connected to AWOVSS (bit 0 of IPIBC0 = 0)
X1	Connected to AWOVSS via a resistor
X2	Open
FLMD0	Must be used
IP0_0	Connected to REGVCC or AWOVSS via a resistor*3 (bit 0 of IPIBC0 = 1) Open (bit 0 of IPIBC0 = 0)
JP0 (excluding JP0_4) P0 P1 P2 P8 (excluding P8_6) P9 P20	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
P8_6	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
JP0_4	Connected to EVSS via a resistor*2
P10 (excluding P10_1, P10_2, P10_6, P10_8) P11 P12 P18	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVCC or EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
P10_1, P10_2, P10_6, P10_8	Input: Open (when the PIBCn_m and PMCn_m bits are 0) Connected to EVSS via a resistor (when the PIBCn_m or PMCn_m bits are 1) Output: Open
AP0	Input: Open (when the PIBCn_m bit is 0) Connected to A0VREF or A0VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
AP1	Input: Open (when the PIBCn_m bit is 0) Connected to A1VREF or A1VSS via a resistor (when the PIBCn_m bit is 1) Output: Open
Nexus/LPD I/F (JP0)	DCUTDI/LPDI/LPDIO (JP0_0): Connected to EVCC via a resistor DCUTDO/LPDO (JP0_1): Open DCUTCK/LPDCLK (JP0_2): Open DCUTMS (JP0_3): Connected to EVCC via a resistor $\overline{\text{DCUTRST}}$ (JP0_4): Connected to EVSS via a resistor*2 $\overline{\text{DCURDY}}$/LPDCLKOUT (JP0_5):Open $\overline{\text{EVTO}}$ (JP0_6): Open*1

Note 1. Only in 176 and 144 pin devices.

Note 2. For details, see the specifications of the development tool.

Note 3. XT1 = IP0_0 (XT2) = REGVCC or AWOVSS should be set.
XT1 is connected to IP0_0 (XT2) through an internal resistor. Therefore, it is necessary to maintain equal voltage level in order not to make a current path.

2.6 RH850/F1K Port Features

2.6.1 Port Group

The RH850/F1K provides the following port groups, indicated by the numbers in the table below.

Table 2.7 Port Groups in RH850/F1K

No. of Pins	Port Group	RH850/F1K
100 pins	Number	7
	Name	P0, P8 to P11, JP0, AP0
144 pins	Number	13
	Name	P0, P1, P8 to P12, P18, P20, JP0, AP0, AP1, IP0
176 pins	Number	14
	Name	P0 to P2, P8 to P12, P18, P20, JP0, AP0, AP1, IP0

2.6.2 Port Group Index n

Throughout this section, the port groups are identified by using the index “n” (n = 0 to 2, 8 to 12, 18, and 20). For example, the port mode control register of the Pn pin is PMCn.

2.6.3 Register Base Address

Port and JTAG port base addresses are listed in the following table.

Port and JTAG port register addresses are given as offsets from the base addresses.

Table 2.8 Register Base Addresses

Base Address Name	Base Address
<PORTn_base>	FFC1 0000_H
<JPORT0_base>	FFC2 0000_H

2.6.4 Clock Supply

The clock supply to ports is shown in the following table.

Table 2.9 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Port	Register access clock	CPUCLK4
		CPUCLK2

2.7 Port Functions

This product has various pins for input/output ports. The ports are organized in port groups.

The RH850/F1K also has several control registers to enable pins to be used as other than general purpose input/output pins.

For a description of the terms pin, port, and port group, see **Section 2.7.2, Terms**.

2.7.1 Functional Overview

- All the port settings can be specified individually.
- The maximum number of bits (pins) in a port is 16.
- The output level of any pin can be set independently without affecting the other pins in the same port.
- Input buffers are enabled through registers settings.
- Pin level is read by dedicated port-pin-read register (PPR)
- All possible port functions are shown in the tables listed below.
  Table 2.38, **Table 2.40**, **Table 2.42**, **Table 2.44**, **Table 2.46**, **Table 2.48**, **Table 2.50**, **Table 2.52**, **Table 2.54**, **Table 2.56**, **Table 2.58**, **Table 2.60**, **Table 2.62**, **Table 2.64** and **Section 2.9.2, Pin Function Configuration**.

CAUTION

Some input or output functions may be assigned to more than one port. Only activate a given function on a single pin. Do not activate a function on multiple pins at the same time. This also applies in cases where multiple peripheral functions are assigned to a single multiplexed function and only one of these functions is used.

[Example]

INTP0 is assigned to the following pins on this device. However, the INTP0 function should not be activated on more than one pin. After activating the function on one pin, do not activate it on another.

- **JP0_0 (1st input alternative function)**
- **P0_1 (2nd, 3rd input alternative function)**
- **P10_0 (2nd input alternative function)**

In the above case, when the 1st input alternative function (INTP0) of JP0_0 is selected, using the 2nd input alternative function (CAN0RX/INTP0) of P0_1 only for the CAN signal is also prohibited.

2.7.2 Terms

The following terms are used in this section:

Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.

A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

Port mode and ports

A pin in port mode works as a general purpose input/output pin. It is then called “port”.

The corresponding name is Pn_m. For example, P0_7 denotes port 7 of port group 0. It is referenced as “port P0_7”.

Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions, such as the input/output pin of on-chip peripherals.

The corresponding pin name depends on the selected function. For example, pin INTP0 denotes the pin for one of the external interrupt inputs.

Note that two different names can refer to the same physical pin, for example P0_0 and INTP0. The different names indicate the function of the pin at that time.

2.7.2.1 JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging. These are special port groups provided because the microcontroller cannot be used for the user's application while on-chip debugging is being executed. When a debugger is not connected and the microcontroller is operating normally, these port groups can be used in the same way as the other port groups.

JTAG port group registers and bit names are prefixed by a “J”. For example, JP0 denotes JTAG port group 0, and JPM0.JPM0_m denotes the JPM0_m port mode bit of the JPM0 port mode register.

NOTE

In this section, the descriptions about all ports and their registers other than PFCAEn and PIPCn apply to the JTAG port unless otherwise specified.

2.7.3 Overview of Pin Functions

Pins can operate in three modes.

- Port mode (PMCn.PMCn_m bit = 0)

  A pin in port mode operates as a general purpose input/output pin. The I/O mode is selected by setting the PMn.PMn_m bit.

- Software I/O control alternative mode (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 0)

  In this mode, the pins operate as alternative functions. The I/O mode is selected by setting the PMn.PMn_m bit.

- Direct I/O control alternative mode (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 1)

  In this mode, the pins operate as alternative functions. Unlike the software I/O control alternative mode, however, the I/O mode is directly controlled by the alternative function.

An overview of the register settings is given in the tables below.

Table 2.10 Pin Function Configuration (Overview)

Mode	Bit			I/O
	PMCn_m	PMn_m	PIPCn_m	
Port mode	0	0	X	O
		1*1		I
Software I/O control alternative mode	1	0	0	O
		1	0	I
Direct I/O control alternative mode		X	1	Controlled by the alternative function

Note 1. The input buffer must be enabled (PIBCn_m bit = 1).

- Software I/O control alternative mode (PIPCn.PIPCn_m bit = 0)
  - Output (PMn_m bit = 0): Alternative output mode 1 to Alternative output mode 7
  - Input (PMn_m bit = 1): Alternative input mode 1 to Alternative input mode 7
- Direct I/O control alternative mode (PIPCn.PIPCn_m bit = 1)
  - The I/O mode for Alternative output mode 1 to Alternative output mode 7 and Alternative input mode 1 to Alternative input mode 7 is directly selected by the alternative function.

Table 2.11 Alternative Mode Selection Overview (PMCn.PMCn_m Bit = 1)

Mode	Register					I/O
	PIPC*1	PM*1	PFCAE	PFCE	PFC	
Alternative output mode 1 (ALT-OUT1)	0	0	0	0	0	O
Alternative input mode 1 (ALT-IN1)		1				I
Alternative output mode 2 (ALT-OUT2)		0	0	0	1	O
Alternative input mode 2 (ALT-IN2)		1				I
Alternative output mode 3 (ALT-OUT3)		0	0	1	0	O
Alternative input mode 3 (ALT-IN3)		1				I
Alternative output mode 4 (ALT-OUT4)		0	0	1	1	O
Alternative input mode 4 (ALT-IN4)		1				I
Alternative output mode 5 (ALT-OUT5)		0	1	0	0	O
Alternative input mode 5 (ALT-IN5)		1				I
Alternative output mode 6 (ALT-OUT6)		0	1	0	1	O
Alternative input mode 6 (ALT-IN6)		1				I
Alternative output mode 7 (ALT-OUT7)		0	1	1	0	O
Alternative input mode 7 (ALT-IN7)		1				I
Other than the above	Setting prohibited					

Note 1. If PIPCn.PIPCn_m bit = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

If a pin is in alternative mode (PMCn.PMCn_m bit = 1), one of up to seven alternative functions can be selected for that pin by using the PFCn, PFCEn, and PFCAEn registers.

2.7.4 Pin Data Input/Output

The registers used for data input/output are described below.

The location that is read via the PPRn register differs depending on the pin mode.

2.7.4.1 Output Data

In the port mode (PMCn.PMCn_m bit = 0), the value of the Pn.Pn_m bit is output from the Pn_m pin.

2.7.4.2 Input Data

When the PPRn register is read, either the value of the Pn_m pin, the value of the Pn.Pn_m bit, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits.

The different PPRn read modes are shown in the table below.

Table 2.12 PPRn_m Read Values

PMC n_m	PM n_m	PIBC n_m	PIPC n_m	PODC n_m	Mode	PPRn_m Read Value
0	1	0	X	X	Port input, input buffer disabled	Pn.Pn_m bit
		1		X	Port input, input buffer enabled	Pn_m pin
	0	X		0	Port push-pull output	Pn.Pn_m bit*1
				1	Port open-drain output	
1	1	X	0	X	Software I/O control alternative input	Pn_m pin
	0			0	Software I/O control alternative push-pull output	Output signal from the alternative function*1
				1	Software I/O control alternative open-drain output	
	X		1	0	Direct I/O control alternative input or push-pull output	I/O port in alternative mode: • Input: Pn_m pin • Output: Output signal from the alternative function*1
				1	Direct I/O control alternative input or open-drain output	

Note 1. When PBDCn_m = 1, the level of the Pn_m pin is returned by the PPRn_m bit.

The control registers in the above table have the following effects:

- PMCn.PMCn_m bit
  This bit selects port mode (PMCn_m = 0) or alternative mode (PMCn_m = 1).
- PMn.PMn_m bit
  This bit selects input (PMn_m = 1) or output (PMn_m = 0) when the port mode (PMCn_m = 0) and software I/O control alternative mode (PMCn_m = 1, PIPCn_m = 0) have been selected.
- PIBCn.PIBCn_m bit
  This bit disables (PIBCn_m = 0) or enables (PIBCn_m = 1) the input buffer in input port mode (PMCn_m = 0 and PMn_m = 1). If the input buffer is disabled, PPRn_m reads the Pn.Pn_m bit; otherwise the Pn_m pin level is returned.
  If alternative mode (PMCn_m = 1), this bit must always set to 0.
- PIPCn.PIPCn_m bit
  This bit selects software I/O control alternative mode or direct I/O control alternative mode.

- PODCn.PODCn_m bit
  This bit selects push-pull output (PODCn_m = 0) or open-drain output (PODCn_m = 1).
- PBDCn.PBDCn_m bit
  In output mode, when this bit is set to 1, the pin enters the bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

CAUTION

When using Pn_m as an alternative output function (PMCn.PMCn_m bit = 1, PMn.PMn_m bit = 0), the level of the Pn_m pin can be read at the PPRn.PPRn_m bit by enabling bidirectional mode (PBDCn.PBDCn_m bit = 1).

Note, however, that the level of the Pn_m pin will be input to the alternative input function that the Pn_m pin is being used as.

2.7.4.3 Writing to the Pn Register

The data to be output via port Pn_m in port mode (PMCn.PMCn_m bit = 0) is held in port register Pn.

Pn data can be overwritten in two ways:

- By writing data directly to the Pn register.
  In this case, new data can be written directly to the Pn register.
- By performing an indirect bitwise operation (a “set”, “reset”, or “not” operation) on the Pn register.
  An indirect bitwise operation (“set”, “reset”, or “not”) can be performed on the Pn register by using the following two registers:
  - Port Set/Reset register PSRn
    If the PSRn.PSRn (m + 16) bit = 1, the value of the Pn.Pn_m bit is determined by the value of the PSRn.PSRn_m bit.
    In other words, the Pn_m bit can be set or reset without writing directly to the Pn register.
  - Port NOT register PNOTn
    By setting PNOTn.PNOTn_m bit to 1, the Pn.Pn_m bit can be inverted without writing directly to the Pn register.

An indirect bitwise operation on the Pn register (“set”, “reset”, or “not”) has no effect on the bits that do not need to be updated, allowing you to overwrite only the bit or bits that need to be overwritten.

2.8 Schematic View of Port Control

The following figure is a schematic view of the port control functions.

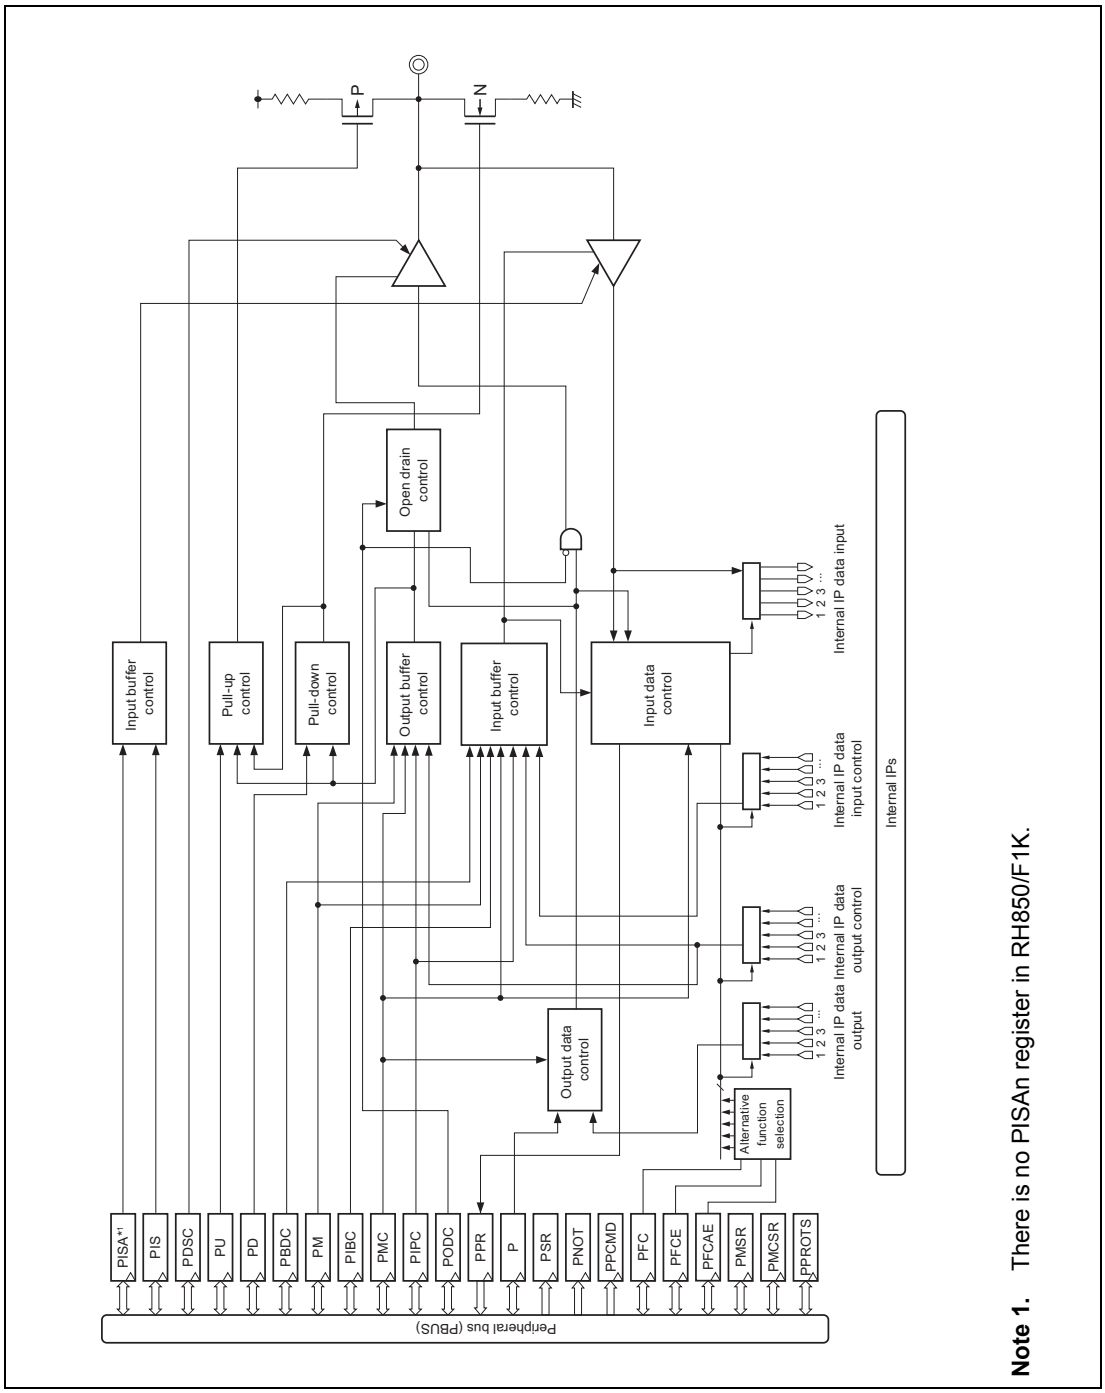

Figure 2.4 Schematic View of Port Control

CAUTION

Use documented alternative functions only.

2.9 Port Group Configuration Registers

This section starts with an overview of all configuration registers and then describes all registers in detail. The configuration registers are grouped as follows:

- **Section 2.9.2, Pin Function Configuration**
- **Section 2.9.3, Pin Data Input/Output**
- **Section 2.9.4, Configuration of Electrical Characteristics**

2.9.1 Overview

The following registers are used for setting the individual pins of the port groups.

For details on <PORTn_base> and <JPORT0_base>, see **Section 2.6.3, Register Base Address**.

Table 2.13 Port Group Configuration Registers (1/2)

Module Name	Register Name	Symbol	Address
Pin function configuration			
PORT	Port mode control register	PMCn	<PORTn_base> + 0400_H + n × 4
JTAG		JPMC0	<JPORT0_base> + 0040_H
PORT	Port mode control set/reset register	PMCSRn	<PORTn_base> + 0900_H + n × 4
JTAG		JPMCSR0	<JPORT0_base> + 0090_H
PORT	Port IP control register	PIPCn	<PORTn_base> + 4200_H + n × 4
PORT	Port mode register	PMn	<PORTn_base> + 0300_H + n × 4
		APMn	<PORTn_base> + $03C8_H$ + n × 4
JTAG		JPM0	<JPORT0_base> + 0030_H
PORT	Port mode set/reset register	PMSRn	<PORTn_base> + 0800_H + n × 4
		APMSRn	<PORTn_base> + $08C8_H$ + n × 4
JTAG		JPMSR0	<JPORT0_base> + 0080_H

JTAG	Port input buffer selection advanced register	JPISA0	<JPORT0_base> + $04A0_H$
Port protection			
PORT	Port protection command register	PPCMDn	<PORTn_base> + $4C00_H$ + n × 4
JTAG		JPPCMD0	<JPORT0_base> + $04C0_H$
PORT	Port protection status register	PPROTSn	<PORTn_base> + $4B00_H$ + n × 4
JTAG		JPPROTS0	<JPORT0_base> + $04B0_H$

Index n

In **Table 2.13, Port Group Configuration Registers**, the index "n" in register symbols denotes the actual indices of the individual port groups. For example, PMCn generically indicates a port mode control register for port group n (Pn). The values for n differ according to the number of pins on the device in the way shown in **Table 2.14**.

Table 2.14 Number of Pins on the Device, Name of Port Groups, and Values for "n" in Register Symbols

Number of Pins on the Device	Port Groups	Values for "n"
100 pins	P0, P8, P9, P10, P11	0, 8, 9, 10, 11
	AP0	0
144 pins	P0, P1, P8, P9, P10, P11, P12, P18, P20	0, 1, 8, 9, 10, 11, 12, 18, 20
	AP0, AP1	0, 1
176 pins	P0, P1, P2, P8, P9, P10, P11, P12, P18, P20	0, 1, 2, 8, 9, 10, 11, 12, 18, 20
	AP0, AP1	0, 1

JTAG port registers

JTAG port registers are not explicitly described in the following register descriptions.

All descriptions (except for those of the PFCAEn register and PIPCn register) apply to JTAG port registers. Note, however, that the JTAG port register base address differs from that of regular ports.

Value after reset

The values after reset depend on the ports. For the values after reset, see the register descriptions in the following pages.

2.9.2 Pin Function Configuration

2.9.2.1 PMCn / JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Access: PMCn: This register can be read or written in 16-bit units.
JPMC0: This register can be read or written in 8-bit units.

Address: PMCn: <PORTn_base> + 0400_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPMC0: <JPORT0_base> + 0040_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCn_15	PMCn_14	PMCn_13	PMCn_12	PMCn_11	PMCn_10	PMCn_9	PMCn_8	PMCn_7	PMCn_6	PMCn_5	PMCn_4	PMCn_3	PMCn_2	PMCn_1	PMCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

Table 2.15 PMCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMCn_[15:0]	Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode

CAUTIONS

1. I/O is not controlled by only setting alternative mode (PMCn.PMCn_m bit = 1). If the alternative function requires direct I/O control, also set the PIPCn.PIPCn_m bit to 1.
2. If a port is to be used as an input pin in alternative mode, the signals from some pins will pass through a noise filter. These pins may require the setting of the FCLA0CTLm_<name>, DNFA<name>CTL and the DNFA<name>EN register. For details, see **Section 2.12, Noise Filter & Edge/Level Detector**, and **Section 2.13, Description of Port Noise Filter & Edge/Level Detection**.

NOTE

The control bits of the JTAG port mode control register (JPMC0) are JPMC0_[7:0].

2.9.2.2 PMCSRn / JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.

The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value of PMCn.PMCn_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

Access: PMCSRn: This register can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of register PMCn.
JPMCSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000_H. Reading bits 7 to 0 returns the value of register JPMC0.

Address: PMCSRn: <PORTn_base> + 0900_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPMCSR0: <JPORT0_base> + 0090_H*1

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMCSRn_31	PMCSRn_30	PMCSRn_29	PMCSRn_28	PMCSRn_27	PMCSRn_26	PMCSRn_25	PMCSRn_24	PMCSRn_23	PMCSRn_22	PMCSRn_21	PMCSRn_20	PMCSRn_19	PMCSRn_18	PMCSRn_17	PMCSRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

Table 2.16 PMCSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMCSRn_ [31:16]	Enable bits that specify whether the value of the corresponding lower bit PMCSRn_m (PMCSRn_[15:0]) is written to PMCn_m. 0: PMCn_m is not affected by PMCSRn_m. 1: PMCn_m is PMCSRn_m. Example: If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15.
15 to 0	PMCSRn_ [15:0]	Data bits that specify the value of PMCn_m if PMCSRn_m of the corresponding upper bit (PMCSRn_[31:16]) is 1. 0: PMCn_m is 0. 1: PMCn_m is 1.

NOTE

The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0_[31:0].

2.9.2.3 PIPCn — Port IP Control Register

This register specifies whether the I/O direction of the Pn_m pin is controlled by the port mode register PMn.PMn_m or by an alternative function.

If the Pn_m pin is operated in alternative mode (PMCn.PMCn_m = 1) and the alternative function requires direct control of the I/O direction, then PIPCn.PIPCn_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn_m setting.

Regarding the alternative functions for which the PIPC register must be set, see **Section 2.11, Port (Special I/O) Function Overview**

Access: This register can be read or written in 16-bit units.

Address: PIPCn: <PORTn_base> + 4200_H + n × 4 (n = 0, 10, 11) *1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPCn_15	PIPCn_14	PIPCn_13	PIPCn_12	PIPCn_11	PIPCn_10	PIPCn_9	PIPCn_8	PIPCn_7	PIPCn_6	PIPCn_5	PIPCn_4	PIPCn_3	PIPCn_2	PIPCn_1	PIPCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.41, Control Registers (P0)**, **Table 2.51, Control Registers (P10)**, and **Table 2.53, Control Registers (P11)**.

Table 2.17 PIPCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIPCn_[15:0]	Specifies the I/O mode. 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control).

2.9.2.4 PMn / APMn / JPM0 — Port Mode Register

This register specifies whether the individual pins of the port group n are in input mode or in output mode.

Access: PMn, APMn: These registers can be read or written in 16-bit units.
JPM0: This register can be read or written in 8-bit units.

Address: PMn: <PORTn_base> + 0300_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APMn: <PORTn_base> + $03C8_H$ + n × 4 (n = 0, 1)
JPM0: <JPORT0_base> + 0030_H*1

Value after reset: $FFFF_H$*2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn_15	PMn_14	PMn_13	PMn_12	PMn_11	PMn_10	PMn_9	PMn_8	PMn_7	PMn_6	PMn_5	PMn_4	PMn_3	PMn_2	PMn_1	PMn_0
Value after reset	1	1	1	1	1	1	1	1	1	1*3	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

Note 2. The PM8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8 register is $FFBF_H$.
When the OPBT0.RESETOUTEN = 0, the PM8 register is $FFFF_H$.

Note 3. The PM8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PM8_6 bit is 0.
When the OPBT0.RESETOUTEN = 0, the PM8_6 bit is 1.

Table 2.18 PMn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMn_[15:0]	Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled)

NOTES

1. To use a port in input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), the input buffer must be enabled (PIBCn.PIBCn_m = 1).
2. By default, PMn.PMn_m specifies the I/O direction in port mode (PMCn.PMCn_m = 0) and alternative mode (PMCn.PMCn_m=1), since PIPCn.PIPCn_m = 0 (I/O mode is controlled by PMn.PMn_m) after reset.
3. The control bits of the analog port register (APMn) are APMn_[15:0].
4. The control bits of the JTAG port mode register (JPM0) are JPM0_[7:0].

2.9.2.5 PMSRn / APMSRn / JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write data to the PMn register.

The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn_m is set by the corresponding bit in the lower 16 bits of PMSRn.

Access: PMSRn, APMSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000_H.
Reading bits 15 to 0 returns the value of registers PMn and APMn.
JPMSR0: This registers can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000_H.
Reading bits 7 to 0 returns the value of register JPM0.

Address: PMSRn: <PORTn_base> + 0800_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APMSRn: <PORTn_base> + $08C8_H$ + n × 4 (n = 0, 1)
JPMSR0: <JPORT0_base> + 0080_H*1

Value after reset: 0000 $FFFF_H$*2

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMSRn_31	PMSRn_30	PMSRn_29	PMSRn_28	PMSRn_27	PMSRn_26	PMSRn_25	PMSRn_24	PMSRn_23	PMSRn_22	PMSRn_21	PMSRn_20	PMSRn_19	PMSRn_18	PMSRn_17	PMSRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMSRn_15	PMSRn_14	PMSRn_13	PMSRn_12	PMSRn_11	PMSRn_10	PMSRn_9	PMSRn_8	PMSRn_7	PMSRn_6	PMSRn_5	PMSRn_4	PMSRn_3	PMSRn_2	PMSRn_1	PMSRn_0
Value after reset	1	1	1	1	1	1	1	1	1	1*3	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

Note 2. The PMSR8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8 register is 0000 $FFBF_H$.
When the OPBT0.RESETOUTEN = 0, the PMSR8 register is 0000 $FFFF_H$.

Note 3. The PMSR8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PMSR8_6 bit is 0.
When the OPBT0.RESETOUTEN = 0, the PMSR8_6 bit is 1.

Table 2.19 PMSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMSRn_[31:16]	Enable bits that specify whether the value of the corresponding lower bit PMSRn_m (PMSRn_[15:0]) is written to PMn_m. 0: PMn_m is not affected by PMSRn_m. 1: PMn_m is PMSRn_m. Example: If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15.
15 to 0	PMSRn_[15:0]	Data bits that specify the value of PMn_m if PMSRn_m of the corresponding upper bit (PMSRn_[31:16]) is 1. 0: PMn_m is 0. 1: PMn_m is 1.

NOTES

1. The control bits of the JTAG port mode set/reset register (JPMSR0) are JPMSR0_[31:0].
2. The control bits of the analog port mode set/reset register (APMSRn) are APMSRn_[31:0].

2.9.2.6 PIBCn / APIBCn / JPIBC0 / IPIBC0 — Port Input Buffer Control Register

In input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), this register enables the port pin's input buffer.

Access: PIBCn, APIBCn, IPIBC0: These registers can be read or written in 16-bit units.
JPIBC0: This register can be read or written in 8-bit units.

Address: PIBCn: <PORTn_base> + 4000_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APIBCn: <PORTn_base> + $40C8_H$+ n × 4 (n = 0, 1)
JPIBC0: <JPORT0_base> + 0400_H
IPIBC0: <PORTn_base> + $40F0_H$*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBCn_15	PIBCn_14	PIBCn_13	PIBCn_12	PIBCn_11	PIBCn_10	PIBCn_9	PIBCn_8	PIBCn_7	PIBCn_6	PIBCn_5	PIBCn_4	PIBCn_3	PIBCn_2	PIBCn_1	PIBCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, **Table 2.63, Control Registers (AP1)**, and **Table 2.65, Control Registers (IP0)**.

Table 2.20 PIBCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enables/disables the input buffer. 0: Input buffer disabled 1: Input buffer enabled

NOTES

1. When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.
2. The control bits of the JTAG port input buffer control register (JPIBC0) are JPIBC0_[7:0].

CAUTION

Settings in this register are overruled in bidirectional mode (PBDCn.PBDCn_m = 1).

2.9.2.7 PFCn / JPFC0 — Port Function Control Register

This register, together with register PFCEn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is selected by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCn: This register can be read or written in 16-bit units.
JPFC0: This register can be read or written in 8-bit units.

Address: PFCn: <PORTn_base> + 0500_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPFC0: <JPORT0_base> + 0050_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCn_15	PFCn_14	PFCn_13	PFCn_12	PFCn_11	PFCn_10	PFCn_9	PFCn_8	PFCn_7	PFCn_6	PFCn_5	PFCn_4	PFCn_3	PFCn_2	PFCn_1	PFCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**..

Table 2.21 PFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2.24, Setting Alternative Functions**.

NOTE

The control bits of the JTAG port function control register (JPFC0) are JPFC0_[7:0].

2.9.2.8 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with register PFCn and PFCAEn, specifies an alternative function of the pins.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCEn: This register can be read or written in 16-bit units.
JPFCE0: This register can be read or written in 8-bit units.

Address: PFCEn: <PORTn_base> + 0600_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 20)
JPFCE0: <JPORT0_base> + 0060_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCEn_15	PFCEn_14	PFCEn_13	PFCEn_12	PFCEn_11	PFCEn_10	PFCEn_9	PFCEn_8	PFCEn_7	PFCEn_6	PFCEn_5	PFCEn_4	PFCEn_3	PFCEn_2	PFCEn_1	PFCEn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**:**Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**,**Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, and **Table 2.59, Control Registers (P20)**.

Table 2.22 PFCEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCEn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2.24, Setting Alternative Functions**.

NOTE

The control bits of the JTAG port function control register (JPFCE0) are JPFCE0_[7:0].

2.9.2.9 PFCAEn — Port Function Control Additional Expansion Register

This register selects the alternative peripheral functions together with PFCEn, PFCn registers.

Some alternative functions directly control the I/O of the Pn_m pin. For such alternative functions, PIPCn.PIPCn_m must be set to 1 and the I/O is specified by the peripheral function.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: This register can be read or written in 16-bit units.

Address: PFCAEn: <PORTn_base> + $0A00_H$ + n × 4 (n = 0, 1, 2, 10, 11, 12, 20)*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCAEn_15	PFCAEn_14	PFCAEn_13	PFCAEn_12	PFCAEn_11	PFCAEn_10	PFCAEn_9	PFCAEn_8	PFCAEn_7	PFCAEn_6	PFCAEn_5	PFCAEn_4	PFCAEn_3	PFCAEn_2	PFCAEn_1	PFCAEn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, and **Table 2.59, Control Registers (P20)**.

Table 2.23 PFCAEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCAEn_[15:0]	Specifies the alternative function of the pin. For details, see **Table 2.24, Setting Alternative Functions**.

Table 2.24 Setting Alternative Functions

PFCAEn_m	PFCEn_m	PFCn_m	PMn_m	Function
0	0	0	1	Alternative input mode 1
			0	Alternative output mode 1
		1	1	Alternative input mode 2
			0	Alternative output mode 2
	1	0	1	Alternative input mode 3
			0	Alternative output mode 3
		1	1	Alternative input mode 4
			0	Alternative output mode 4
1	0	0	1	Alternative input mode 5
			0	Alternative output mode 5
		1	1	Alternative input mode 6
			0	Alternative output mode 6
	1	0	1	Alternative input mode 7
			0	Alternative output mode 7
		1	X	Setting prohibited

CAUTION

- After selecting the alternative function by the PFCn_m, PFCEn_m, or PFCAEn_m bit, set the PMCn_m bit to “1”.
- With this product, the I/O of some functions is assigned to two or more pins, but a specific pin function can only be set to one pin at a time. Setting the same pin function to two or more pins at the same time is prohibited.
  For example, if the a/b/c pin is used as b, the b/d/e pin cannot be used as b. In this case, the b/d/e pin must be configured as a pin function other than b.

NOTE

For more details on the assignment of each function, see **Sections 2.10.1** to **2.10.14**.

2.9.3 Pin Data Input/Output

2.9.3.1 PBDCn / APBDCn / JPBDC0 — Port Bidirection Control Register

This register enables the input buffer in output mode and sets the port to bidirectional mode. In bidirectional mode, the level of the signal on a Pn_m pin can be read from PPRn.PPRn_m.

Access: PBDCn, APBDCn: These registers can be read or written in 16-bit units.
JPBDC0: This register can be read or written in 8-bit units.

Address: PBDCn: <PORTn_base> + 4100_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APBDCn: <PORTn_base> + $41C8_H$ + n × 4 (n = 0, 1)
JPBDC0: <JPORT0_base> + 0410_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDCn_15	PBDCn_14	PBDCn_13	PBDCn_12	PBDCn_11	PBDCn_10	PBDCn_9	PBDCn_8	PBDCn_7	PBDCn_6	PBDCn_5	PBDCn_4	PBDCn_3	PBDCn_2	PBDCn_1	PBDCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

Table 2.25 PBDCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin. 0: Bidirectional mode disabled 1: Bidirectional mode enabled

CAUTION

When the Pn_m port is used for the alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m = 0), the level of the Pn_m pin can be read from PPRn.PPRn_m by enabling the bidirectional mode (PBDCn.PBDCn_m = 1).

However, output of that alternative output function is input to the alternative input function of the same pin (the alternative input function set by PFCn.PFCn_m, PFCEn.PFCEn_m, and PFCAEn.PFCAEn_m). If the alternative input function in question is being used by another pin, the alternative input function is not guaranteed.

NOTE

The control bits of the JTAG port bidirection control register (JPBDC0) are JPBDC0_[7:0].

2.9.3.2 PPRn / APPRn / JPPR0 / IPPR0 — Port Pin Read Register

This register reflects the actual level of the Pn_m pin, whether it is the value of the Pn.Pn_m bit or the level of an alternative output function.

Access: PPRn, APPRn, IPPR0: These registers are read-only registers that can be read in 16-bit units.
JPPR0: This register is a read-only register that can be read in 8-bit units.

Address: PPRn: <PORTn_base> + 0200_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APPRn: <PORTn_base> + $02C8_H$ + n × 4 (n = 0, 1)
JPPR0: <JPORT0_base> + 0020_H
IPPR0: <PORTn_base> + $02F0_H$*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PPRn_15	PPRn_14	PPRn_13	PPRn_12	PPRn_11	PPRn_10	PPRn_9	PPRn_8	PPRn_7	PPRn_6	PPRn_5	PPRn_4	PPRn_3	PPRn_2	PPRn_1	PPRn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, **Table 2.63, Control Registers (AP1)**, and **Table 2.65, Control Registers (IP0)**.

Table 2.26 PPRn Register Contents

Bit Position	Bit Name	Function
15 to 0	PPRn_[15:0]	The Pn_m Pin, Pn.Pn_m value or alternative function output.

NOTES

1. For the read values of the PPRn register, see **Section 2.7.4, Pin Data Input/Output**.
2. The control bits of the JTAG port pin read register (JPPR0) are JPPR0_[7:0].

2.9.3.3 Pn / APn / JP0 — Port Register

This register holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 0).

Access: Pn, APn: These registers can be read or written in 16-bit units.
JP0: This register can be read or written in 8-bit units.

Address: Pn: <PORTn_base> + 0000_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APn: <PORTn_base> + $00C8_H$ + n × 4 (n = 0, 1)
JP0: <JPORT0_base> + 0000_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn_15	Pn_14	Pn_13	Pn_12	Pn_11	Pn_10	Pn_9	Pn_8	Pn_7	Pn_6	Pn_5	Pn_4	Pn_3	Pn_2	Pn_1	Pn_0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

Table 2.27 Pn Register Contents

Bit Position	Bit Name	Function
15 to 0	Pn_[15:0]	Sets the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

NOTE

The control bits of the JTAG port register (JP0) are JP0_[7:0].

2.9.3.4 PNOTn / APNOTn / JPNOT0 — Port NOT Register

This register allows the Pn_m bit of the port register Pn to be inverted without directly writing to Pn.

Access: PNOTn, APNOTn: These registers are write-only registers that can be written in 16-bit units. When read, 0000_H is returned.
JPNOT0: This register is a write-only register that can be written in 8-bit units. When read, 00_H is returned.

Address: PNOTn: <PORTn_base> + 0700_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APNOTn: <PORTn_base> + $07C8_H$ + n × 4 (n = 0, 1)
JPNOT0: <JPORT0_base> + 0070_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOTn_15	PNOTn_14	PNOTn_13	PNOTn_12	PNOTn_11	PNOTn_10	PNOTn_9	PNOTn_8	PNOTn_7	PNOTn_6	PNOTn_5	PNOTn_4	PNOTn_3	PNOTn_2	PNOTn_1	PNOTn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

Table 2.28 PNOTn Register Contents

Bit Position	Bit Name	Function
15 to 0	PNOTn_[15:0]	Specifies if Pn.Pn_m is inverted. 0: Pn.Pn_m is not inverted (Pn_m → Pn_m) 1: Pn.Pn_m is inverted ($\overline{Pn_m}$ → Pn_m)

NOTE

The control bits of the JTAG port NOT register are JPNOT0_[7:0].

2.9.3.5 PSRn / APSRn / JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to the Pn register.

The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn_m is set by the corresponding bit in the lower 16 bits of PSRn.

Access: PSRn, APSRn: These registers can be read or written in 32-bit units. Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of registers Pn and APn.
JPSR0: This register can be read or written in 32-bit units. Bits 31 to 8 are always read as 000000_H. Reading bits 7 to 0 returns the value of register JP0.

Address: PSRn: <PORTn_base> + 0100_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
APSRn: <PORTn_base> + $01C8_H$ + n × 4 (n = 0, 1)
JPSR0: <JPORT0_base> + 0010_H*1

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSRn_31	PSRn_30	PSRn_29	PSRn_28	PSRn_27	PSRn_26	PSRn_25	PSRn_24	PSRn_23	PSRn_22	PSRn_21	PSRn_20	PSRn_19	PSRn_18	PSRn_17	PSRn_16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, **Table 2.59, Control Registers (P20)**, **Table 2.61, Control Registers (AP0)**, and **Table 2.63, Control Registers (AP1)**.

Table 2.29 PSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PSRn_[31:16]	Specifies whether the value of the corresponding lower bit PSRn_m (PSRn_[15:0]) is written to Pn_m. 0: Pn_m is not affected by PSRn_m. 1: Pn_m is PSRn_m Example: If PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15.
15 to 0	PSRn_[15:0]	Specifies the Pn_m value if the corresponding upper bit (PSRn_[31:16]) PSRn_m is 1. 0: Pn_m = 0 1: Pn_m = 1

NOTE

The control bits of the JTAG port set/reset register (JPSR0) are JPSR0_[31:0].

2.9.4 Configuration of Electrical Characteristics

2.9.4.1 PUn / JPU0 — Pull-Up Option Register

This register specifies whether an internal pull-up resistor is connected to an input pin.

Access: PUn: This register can be read or written in 16-bit units.
JPU0: This register can be read or written in 8-bit units.

Address: PUn: <PORTn_base> + 4300_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11,12, 18, 20)
JPU0: <JPORT0_base> + 0430_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PUn_15	PUn_14	PUn_13	PUn_12	PUn_11	PUn_10	PUn_9	PUn_8	PUn_7	PUn_6	PUn_5	PUn_4	PUn_3	PUn_2	PUn_1	PUn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

Table 2.30 PUn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUn_[15:0]	Specifies whether an internal pull-up resistor is connected to the corresponding pin. 0: No internal pull-up resistor connected 1: An internal pull-up resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-up option register (JPU0) are JPU0_[7:0].

2.9.4.2 PDn / JPD0 — Pull-Down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

Access: PDn: This register can be read or written in 16-bit units.
JPD0: This register can be read or written in 8-bit units.

Address: PDn: <PORTn_base> + 4400_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPD0: <JPORT0_base> + 0440_H*1

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDn_15	PDn_14	PDn_13	PDn_12	PDn_11	PDn_10	PDn_9	PDn_8	PDn_7	PDn_6	PDn_5	PDn_4	PDn_3	PDn_2	PDn_1	PDn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

Table 2.31 PDn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDn_[15:0]	Specifies whether to connect an internal pull-down resistor to the corresponding pin: 0: No internal pull-down resistor connected 1: An internal pull-down resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPD0) are JPD0_[7:0].

2.9.4.3 PDSCn / JPDSC0 — Port Drive Strength Control Register

This register specifies the output driver strength of the port pin. This function selects the fast mode (high drive strength) or slow mode (low drive strength) of the output buffer. The correct write sequence using the PPCMDn register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**. Regarding the alternative functions for which the PDSC register needs to be set, see **Section 2.11.3.3, Output Buffer Control (PDSC)**.

Access: PDSCn, JPDSC0: These registers can be read or written in 32-bit units.

Address: PDSCn: <PORTn_base> + 4600_H + n × 4 (n = 0, 1, 2, 10, 11, 12, 18, 20)
JPDSC0: <JPORT0_base> + 0460_H*1

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	PDSCn_15	PDSCn_14	PDSCn_13	PDSCn_12	PDSCn_11	PDSCn_10	PDSCn_9	PDSCn_8	PDSCn_7	PDSCn_6	PDSCn_5	PDSCn_4	PDSCn_3	PDSCn_2	PDSCn_1	PDSCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

Table 2.32 PDSCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PDSCn_[15:0]	Specifies the port drive strength of the output buffer of the port pin. 0: Lower drive strength (when the frequency output from the pin is 10 MHz or below) 1: High drive strength (when the frequency output from the pin is 40 MHz or less).

NOTE

The control bits of the JTAG port drive strength control register (JPDSC0) are JPDSC0_[31:0].

2.9.4.4 PODCn / JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function. The correct write sequence using the PPCMDn and JPPCMD0 registers is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Access: PODCn, JPODC0: These registers can be read or written in 32-bit units.

Address: PODCn: <PORTn_base> + 4500_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPODC0: <JPORT0_base> + 0450_H*1

Value after reset: 0000 0000_H*2

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

Note 2. The PODC8 register is as follows.
When the OPBT0.RESETOUTEN = 1, the PODC8 register is 0000 0040_H.
When the OPBT0.RESETOUTEN = 0, the PODC8 register is 0000 0000_H.

Note 3. The PODC8_6 bit is as follows.
When the OPBT0.RESETOUTEN = 1, the PODC8_6 bit is 1.
When the OPBT0.RESETOUTEN = 0, the PODC8_6 bit is 0.

Table 2.33 PODCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PODCn_[15:0]	Specifies the output buffer function. 0: Push-pull 1: Open-drain

NOTE

The control bits of the JTAG port open drain control register (JPODC0) are JPODC0_[31:0].

2.9.4.5 PISn/JPIS0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

Access: PISn: This register can be read or written in 16-bit units.
JPIS0: This register can be read or written in 8-bit units.

Address: PISn: <PORTn_base> + 4700_H + n × 4 (n = 0, 1, 2, 8, 9, 10, 11, 12, 18, 20)
JPIS0: <JPORT0_base> + 0470_H*1

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PISn_15	PISn_14	PISn_13	PISn_12	PISn_11	PISn_10	PISn_9	PISn_8	PISn_7	PISn_6	PISn_5	PISn_4	PISn_3	PISn_2	PISn_1	PISn_0
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**, **Table 2.41, Control Registers (P0)**, **Table 2.43, Control Registers (P1)**, **Table 2.45, Control Registers (P2)**, **Table 2.47, Control Registers (P8)**, **Table 2.49, Control Registers (P9)**, **Table 2.51, Control Registers (P10)**, **Table 2.53, Control Registers (P11)**, **Table 2.55, Control Registers (P12)**, **Table 2.57, Control Registers (P18)**, and **Table 2.59, Control Registers (P20)**.

Table 2.34 PISn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISn_[15:0]	Specifies the input buffer Characteristics: 0: Type 1 (SHMT1) 1: Type 2 (SHMT4)

NOTE

1. Details of the definition of type 1 and type 2 are given in **Section 2.11.3.2, Input Buffer Control (PISn/JPIS0, JPISA0)**. For details, also see the **Section 40, Electrical Characteristics** for input buffer characteristics.
2. The control bits of the JTAG port input buffer selection register (JPIS0) are JPIS0_[7:0].

2.9.4.6 JPISA0 — Port Input Buffer Selection Advanced Register

This register specifies the input buffer characteristics.

Access: This register can be read or written in 8-bit units.

Address: JPISA0: <JPORT0_base> + $04A0_H$*1

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	-	-	-	-	JPISA0_3	JPISA0_2	-	JPISA0_0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R/W

Note 1. The valid bit positions (value for the index m) vary depending on the number of pins for each device. See the following tables in **Section 2.10, Port (General I/O) Function Overview**: **Table 2.39, Control Registers (JP0)**.

Table 2.35 JPISA0 Register Contents

Bit Position	Bit Name	Function
7 to 4, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2, 0	JPISA0_[3, 2, 0]	Specifies the input buffer characteristics: 0: Type 2 (SHMT4) 1: Type 5 (TTL)

Table 2.36 JTAG Port Input Selection Advanced Register Contents

JPISA0	JPIS0	Function
0	0	Type 1 input buffer is selected (SHMT1)
	1	Type 2 input buffer is selected (SHMT4)
1	X	Type 5 input buffer is selected (TTL)

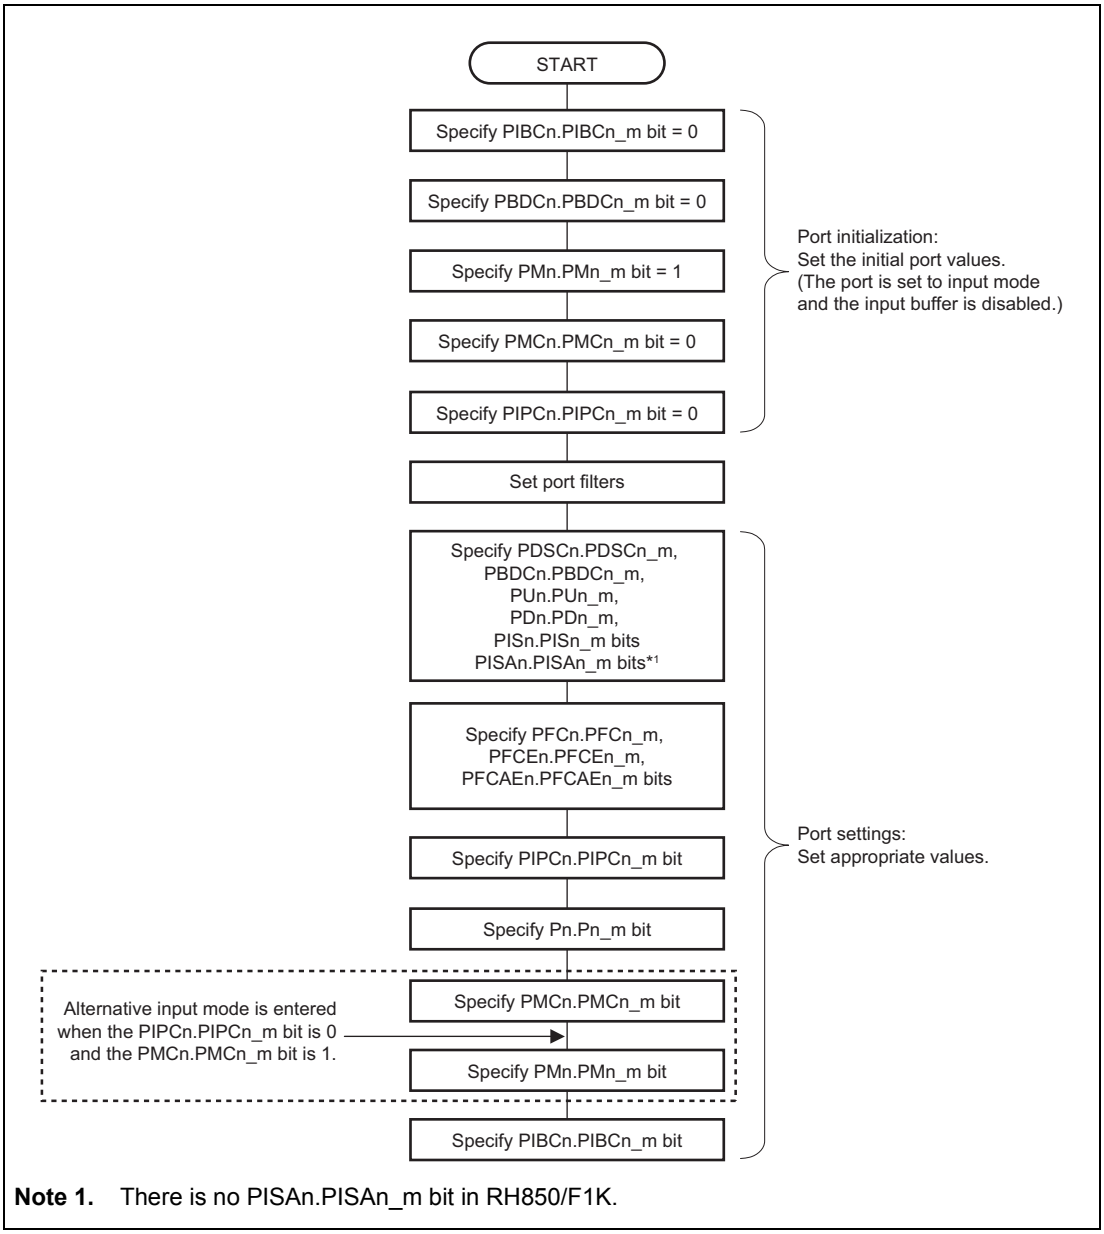
NOTE

Details of the definition of type 2 and type 5 are given in **Section 2.11.3.2, Input Buffer Control (PISn/JPIS0, JPISA0)**. For details, also see the **Section 40, Electrical Characteristics** for input buffer characteristics.

2.9.5 Port Register Protection

RH850/F1K has Port Protection Command Registers (PPCMDn) and Port Protection Status Registers (PPROTSn) which implement the Port Protection Cluster Function. For details on the registers, see **Section 5, Write-Protected Registers**.

2.9.6 Flowchart Examples for Port Settings



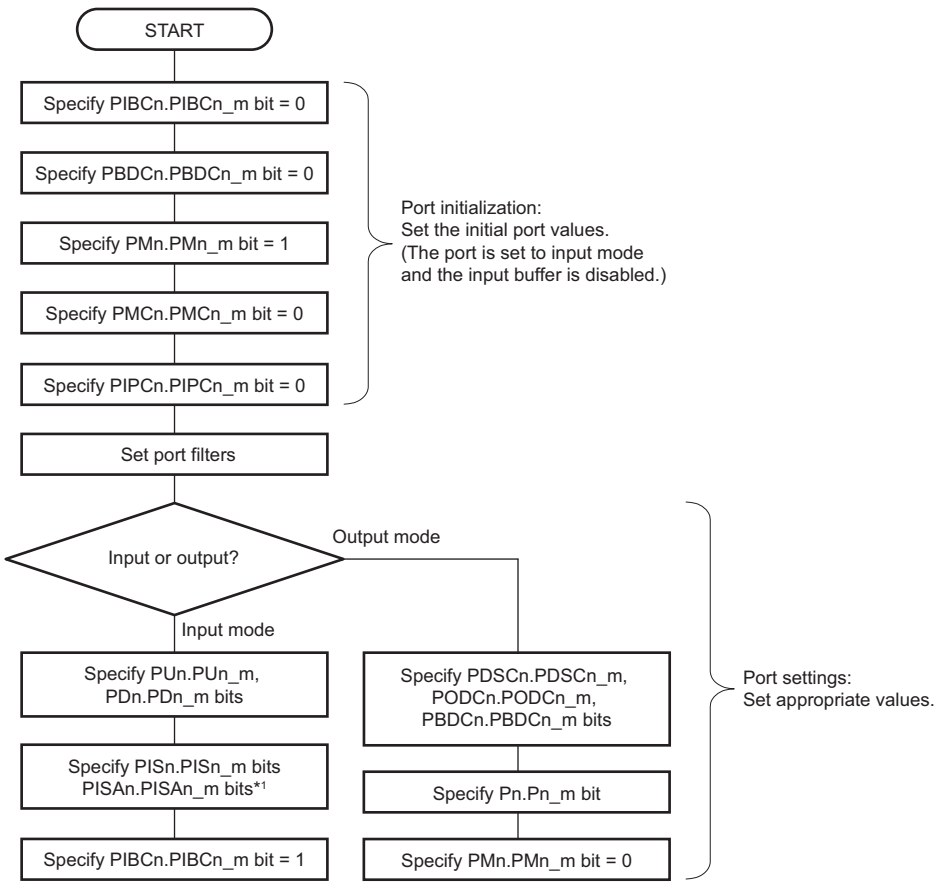
Examples of the port settings are shown in the flowchart below.

CAUTION

If the port is set to the PIPCn.PIPCn_m bit = 0 and alternative output mode, the port might briefly enter alternative input mode. This will occur between when the PMCn.PMCn_m bit is set to 1 and when the PMn.PMn_m bit is set to 0. If an interrupt-related signal is specified as an alternate function of the port, the mode will temporarily become the alternative input mode, so either disable the interrupt in question, or specify that the interrupt is ignored.

2.9.6.1 Batch Setting

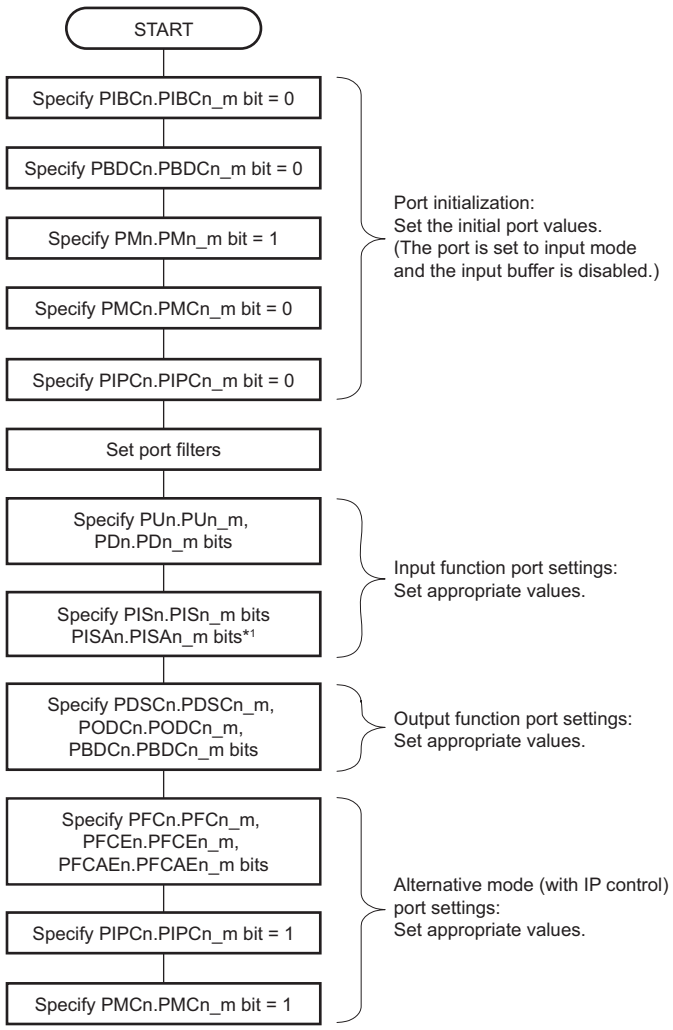
An example of specifying batch port group settings is shown in the flowchart below.



Note 1. There is no PISAn.PISAn_m bit in RH850/F1K.

Figure 2.5 Example of Port Settings (When Specified in Batch)

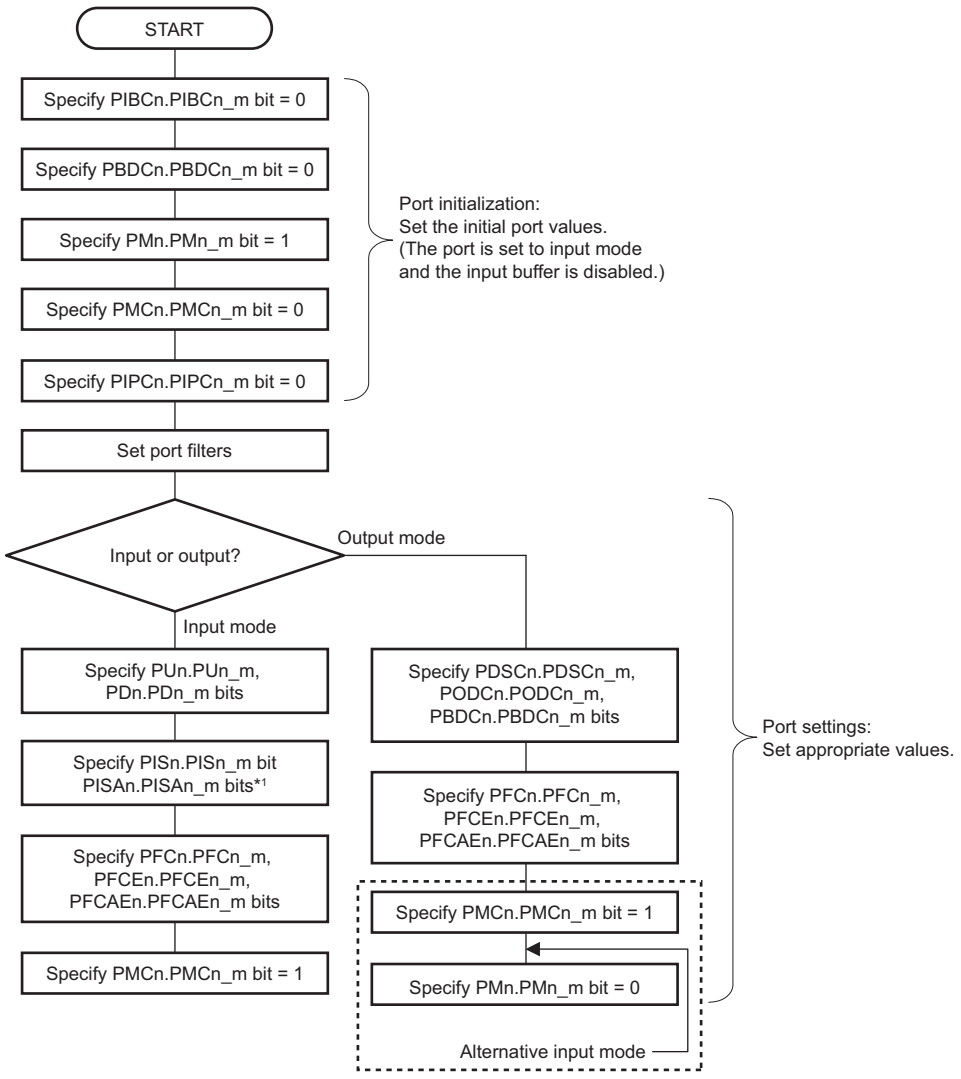
2.9.6.2 Individual Settings



An example of specifying individual port settings is shown in the flowchart below.

Note 1. There is no PISAn.PISAn_m bit in RH850/F1K.

Figure 2.6 Example of Port Settings (in Port Mode)



(a) With IP control

Note 1. There is no PISAn.PISAn_m bit in RH850/F1K.

Figure 2.7 Example of Port Settings (in Alternative Mode) (1/2)

(b) Without IP control

Note 1. There is no PISAn.PISAn_m bit in RH850/F1K.

Figure 2.8 Example of Port Settings (in Alternative Mode) (2/2)

2.10 Port (General I/O) Function Overview

This section explains the port (general I/O) functions and all the functions assigned to the ports. See the following pages for details.

In addition, whether the port mode is alternative mode or not can be selected by PMCn register setting. When PMCn.PMCn_m = 1, alternative functions are selected by the PFCn, PFCEn, and PFCAEn registers.

Table 2.37 Port Function

Port	Pin Name	Size	Direction	Power Domain	Special Alternative Function	Device		
						100 pins	144 pins	176 pins
JTAG Port 0	JP0_0 - 5	6 bits	In/Out	AWO	JTAG, LPD	√	—	—
	JP0_0 - 6	7 bits				—	√	√
Port 0	P0_0 - 14	15 bits	In/Out	AWO		√	√	√
Port 1	P1_0 - 11	12 bits	In/Out	AWO		—	√	—
	P1_0 - 15	16 bits				—	—	√
Port 2	P2_0 - 6	7 bits	In/Out	AWO		—	—	√
Port 8	P8_0 - 12	13 bits	In/Out	AWO	ADCA0 (10-bit resolution) RESETOUT	√	√	√
Port 9	P9_0 - 6	7 bits	In/Out	ISO	ADCA0 (10-bit resolution)	√	√	√
Port 10	P10_0 - 15	16 bits	In/Out	ISO		√	√	√
Port 11	P11_0 - 7	8 bits	In/Out	ISO		√	—	—
	P11_0 - 15	16 bits				—	√	√
Port 12	P12_0 - 2	3 bits	In/Out	ISO		—	√	—
	P12_0 - 5	6 bits				—	—	√
Port 18	P18_0 - 3	4 bits	In/Out	ISO	ADCA1 (10-bit resolution)	—	√	—
	P18_0 - 7	8 bits			ADCA1 (10-bit resolution)	—	—	√
Port 20	P20_4 - 5	2 bits	In/Out	ISO		—	√	—
	P20_0 - 5	6 bits				—	—	√
Analog Port 0	AP0_0 - 15	16 bits	In/Out	AWO	ADCA0 (12/10-bit resolution)	√	√	√
Analog Port 1	AP1_0 - 7	8 bits	In/Out	ISO	ADCA1 (12/10-bit resolution)	—	√	—
	AP1_0 - 15	16 bits			ADCA1 (12/10-bit resolution)	—	—	√
Input Port 0	IP0_0	1 bit	In	AWO	SOSC (XT2 pin)	—	√	√

2.10.1 JTAG Port 0 (JP0)

2.10.1.1 Alternative Function

The following alternative functions are available when JTAG port 0 is configured as a general-purpose I/O port by setting OPJTAG[1:0] on the corresponding option byte to 00_B.

Table 2.38 JTAG Port 0 (JP0)

Port Mode (JPMC0_m = 0)	Alternative Mode (JPMC0_m = 1)										Special Function	PKG No.		
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative					
	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output		100 pins	144 pins	176 pins
JP0_0*1	INTP0				FPDR	FPDT					DCUTDI/LPDI/ LPDIO	28	39	47
JP0_1	INTP1		TAUJ0I0	TAUJ0O0		FPDT					DCUTDO/LPDO	27	38	46
JP0_2	INTP2		TAUJ0I1	TAUJ0O1	FPCK						DCUTCK/ LPDCLK	26	37	45
JP0_3	INTP3	CSCXFOUT	TAUJ0I2	TAUJ0O2							DCUTMS	25	36	44
JP0_4											$\overline{\text{DCUTRST}}$	24	35	43
JP0_5	NMI	RTCA0OUT*2	TAUJ0I3	TAUJ0O3							$\overline{\text{DCURDY}}$/ LPDCLKOUT	23	34	42
JP0_6											$\overline{\text{EVTO}}$	—	54	66

Note 1. In LPD (1-pin) mode, the JP0_0 output buffer state is Open-drain.

Note 2. Non-existent in 100 pins PKG.

CAUTION

The behavior and performance are not guaranteed when alternative functions are not assigned to the register.

2.10.1.2 Control Registers

Table 2.39 Control Registers (JP0) (1/2)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device

P8_3	TAUJ0I1	TAUJ0O1	DPIN3	CSIH0CSS1	INTP7	PWGA23O					ADCA0I5S		44	66	82
P8_4	TAUJ0I2	TAUJ0O2	DPIN4	CSIH0CSS2	INTP8	PWGA36O					ADCA0I6S		45	67	83
P8_5	TAUJ0I3	TAUJ0O3	NMI	CSIH0CSS3	INTP9*1	PWGA37O					ADCA0I7S		46	68	84
P8_6	NMI	CSIH0CSS4		PWGA38O		RTCA0OUT*1					ADCA0I8S	$\overline{\text{RESETOUT}}$	47	69	85
P8_7		CSIH3CSS0		PWGA39O		ADCA0SEL0		RTCA0OUT			ADCA0I14S		48	70	86
P8_8		CSIH3CSS1		PWGA40O		ADCA0SEL1					ADCA0I15S		49	71	87
P8_9		CSIH3CSS2		PWGA41O		ADCA0SEL2					ADCA0I16S		50	72	88
P8_10		CSIH3CSS3	DPIN14	PWGA42O							ADCA0I17S		20	31	39
P8_11	TAUJ1I2	TAUJ1O2	DPIN15	PWGA43O		CSIH1CSS4					ADCA0I18S		21	32	40
P8_12	TAUJ1I3	TAUJ1O3	DPIN16	PWGA44O		CSIH1CSS5					ADCA0I19S		22	33	41

Note 1. Non-existent in 100 pins PKG.

CAUTIONS

1. The behavior and performance are not guaranteed when alternative functions are not assigned to the register.
2. Use ADC functions with their initial settings.
3. When the $\overline{\text{RESETOUT}}$ function is selected for the P8_6 pin, the P8_6 pin outputs a low-level as the $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is released. For details, see **Section 2.11.1.1, P8_6: RESETOUT**.

2.10.5.2 Control Registers

Table 2.47 Control Registers (P8)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device		
			Position	R/W*1			100 pins	144 pins	176 pins
P8	Port register 8	16	12-0	R/W	0020_H	0000_H	√	√	√
PSR8	Port set/reset register 8	32	28-16, 12-0	R/W	0120_H	0000 0000_H	√	√	√
PPR8	Port pin read register 8	16	12-0	R	0220_H	0000_H	√	√	√
PM8	Port mode register 8	16	12-0	R/W	0320_H	$FFBF_H$	√	√	√
PMC8	Port mode control register 8	16	12-0	R/W	0420_H	0000_H	√	√	√
PFC8	Port function control register 8	16	12-0	R/W	0520_H	0000_H	√	√	√
PFCE8	Port function control expansion register 8	16	12, 11, 9-7, 5-0	R/W	0620_H	0000_H	√	—	—
			12, 11, 9-0				—	√	√
PNOT8	Port NOT register 8	16	12-0	W	0720_H	0000_H	√	√	√
PMSR8	Port mode set/reset register 8	32	28-16, 12-0	R/W	0820_H	0000 $FFBF_H$	√	√	√
PMCSR8	Port mode control set/reset register 8	32	28-16, 12-0	R/W	0920_H	0000 0000_H	√	√	√
PIBC8	Port input buffer control register 8	16	12-0	R/W	4020_H	0000_H	√	√	√
PBDC8	Port bidirection control register 8	16	12-0	R/W	4120_H	0000_H	√	√	√
PU8	Pull-up option register 8	16	12-0	R/W	4320_H	0000_H	√	√	√
PD8	Pull-down option register 8	16	12-0	R/W	4420_H	0000_H	√	√	√
PODC8	Port open drain control register 8	32	12-0	R/W	4520_H	0000 0040_H	√	√	√
PIS8	Port input buffer selection register 8	32	12-0	R/W	4720_H	$FFFF_H$	√	√	√
PPROTS8	Port protection status register 8	32	0	R	$4B20_H$	0000 0000_H	√	√	√
PPCMD8	Port protection command register 8	32	7-0	W	$4C20_H$	xxxx $xx00_H$	√	√	√

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

CAUTION

P8_6 drives a low level after any kind of reset release, until it is later configured differently by register settings.

To avoid a data collision, the outside circuit connected to this pin must not drive a high level.

2.10.6 Port 9 (P9)

2.10.6.1 Alternative Function

Table 2.48 Port 9 (P9)

Port Mode (PMC9_m = 0)	Alternative Mode (PMC9_m = 1)										ADC	PKG No.		
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative					
	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output		100 pins	144 pins	176 pins

AP1_14											ADCA1I14	—	—	135
AP1_15											ADCA1I15	—	—	134

CAUTION

Use ADC functions with their initial settings.

2.10.13.2 Control Registers

Table 2.63 Control Registers (AP1)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device		
			Position	R/W*1			100 pins	144 pins	176 pins
AP1	Analog port register 1	16	7-0	R/W	$00CC_H$	0000_H	—	√	—
			15-0				—	—	√
APSR1	Analog port set/reset register 1	32	23-16, 7-0	R/W	$01CC_H$	$0000\ 0000_H$	—	√	—
			31-16, 15-0				—	—	√
APPR1	Analog port pin read register 1	16	7-0	R	$02CC_H$	0000_H	—	√	—
			15-0				—	—	√
APM1	Analog port mode register 1	16	7-0	R/W	$03CC_H$	$FFFF_H$	—	√	—
			15-0				—	—	√
APNOT1	Analog port NOT register 1	16	7-0	W	$07CC_H$	0000_H	—	√	—
			15-0				—	—	√
APMSR1	Analog port mode Set/reset register 1	32	23-16, 7-0	R/W	$08CC_H$	$0000\ FFFF_H$	—	√	—
			31-16, 15-0				—	—	√
APIBC1	Analog port input buffer control register 1	16	7-0	R/W	$40CC_H$	0000_H	—	√	—
			15-0				—	—	√
APBDC1	Analog port bidirection control register 1	16	7-0	R/W	$41CC_H$	0000_H	—	√	—
			15-0				—	—	√

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

2.10.14 Input Port 0 (IP0)

2.10.14.1 Alternative Function

Table 2.64 Input Port 0 (IP0)

Port Mode	Alternative Mode										Special Function	PKG No.		
	1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative			100 pins	144 pins	176 pins
	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output				
IP0_0											XT2	—	47	57

2.10.14.2 Control Registers

Table 2.65 Control Registers (IP0)

Register	Function	Register Size	Effective Bit		Offset Address	Value after Reset	Device		
			Position	R/W*1			100 pins	144 pins	176 pins
IPPR0	Input port pin read register 0	16	0	R	$02F0_H$	0000_H	—	√	√
IPIBC0	Port input buffer control register 0	16	0	R/W	$40F0_H$	0000_H	—	√	√

Note 1. The unused bits are read-only (R). When read, the value after reset is returned.
When writing to unused bits, write the value after reset.

CAUTION

When the IP0_0/XT2 pin is used as an input port, set the IPIBC0_0 bit to 1 while stopping the SOSC operation. For details on the settings for SOSC operations, see **Section 12.4.2.7, SOSCE — SubOSC Enable Register**. When the IP0_0/XT2 pin is used for the SubOSC (SOSC) not as an input port, set the IPIBC0_0 bit to 0.

2.11 Port (Special I/O) Function Overview

This section describes the port (special I/O) functions.

2.11.1 Special I/O after Reset

The special port function after reset is deasserted is shown below.

2.11.1.1 P8_6: $\overline{\text{RESETOUT}}$

The P8_6 pin ($\overline{\text{RESETOUT}}$ signal) changes PM8.PM8_6 and PODC8.PODC8_6 registers value after reset by OPBT0.RESETOUTEN setting.

The P8_6 pin outputs a low level while a reset is asserted, and pin status of after the reset is different.

(Case 1) : OPBT0.RESETOUTEN = 1

- P8.P8_6 = 0 : Outputs low level
- PM8.PM8_6 = 0 : Output mode
- PODC8.PODC8_6 = 1 : Open-drain

(Case 2) : OPBT0.RESETOUTEN = 0

- P8.P8_6 = 0 : Outputs low level
- PM8.PM8_6 = 1 : Input mode
- PODC8.PODC8_6 = 0 : Push-pull

For detail of OPBT0.RESETOUTEN register, see **Section 37.9.2, OPBT0 — Option Byte 0**, also see **Section 9.4.2, Power-On-Clear (POC) Reset**.

When the P8_6 pin setting is updated with another value, the pin operates by new setting.

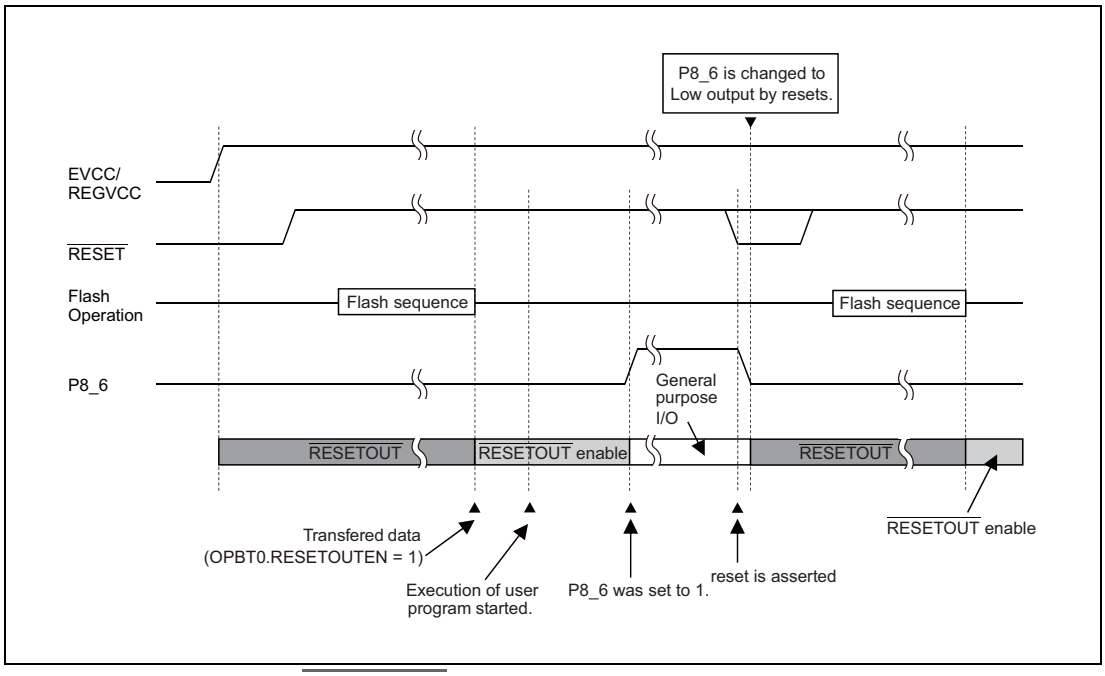

Figure 2.9 P8_6 Pin ($\overline{\text{RESETOUT}}$ Signal) Operation While a Reset is asserted and released : (Case 1) OPBT0.RESETOUTEN setting is 1

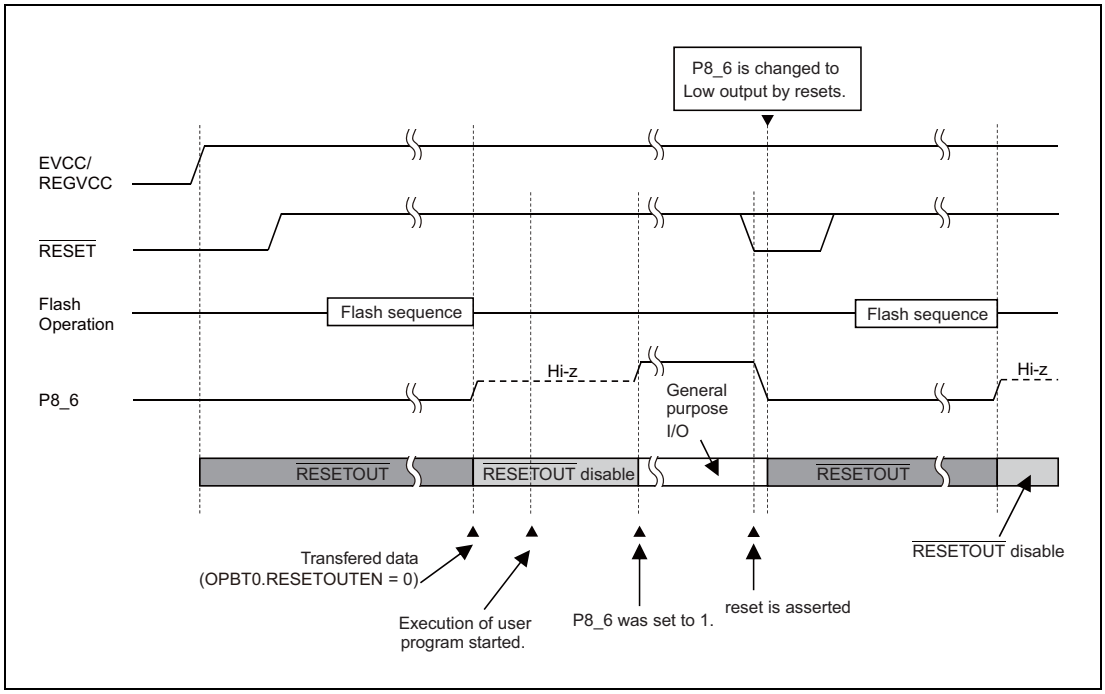

Figure 2.10 P8_6 Pin ($\overline{\text{RESETOUT}}$ Signal) Operation While a Reset is asserted and released : (Case 2) OPBT0.RESETOUTEN setting is 0

2.11.1.2 JP0_0 to JP0_6: Debug Interface

If the OPJTAG[1:0] setting is the combination below, the pins of the JTAG port group can be used as a debug interface after reset release.

Table 2.66 Debug Intterface

OPJTAG1	OPJTAG0	Mode	JP0_0	JP0_1	JP0_2	JP0_3	JP0_4	JP0_5	JP0_6
1	1	Nexus I/F	DCUTDI input	DCUTDO output	DCUTCK input	DCUTMS input	$\overline{\text{DCUTRST}}$ input	$\overline{\text{DCURDY}}$ output	$\overline{\text{EVTO}}$*1 output
0	1	LPD (4-pin)	LPDI input	LPDO output	LPDCLK input	Port/ alternative function	Port/ alternative function	LPDCLK OUT output	Port/ alternative function
1	0	LPD (1-pin)	LPDIO input/ output	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function	Port/ alternative function

Note 1. Only available for 176 pin and 144 pin devices.

Consequently, the port and alternative functions on these pins cannot be used while the debugger is connected. (The pins with port/alternative function can be used.)

NOTE

For the OPJTAG[1:0] settings, see **Section 37.9.2, OPBT0 — Option Byte 0**.

2.11.1.3 FPDR(JP0_0), FPDT(JP0_1), FPCK(JP0_2): Flash Programmer

These pins are used for connecting a flash programmer. See *Flash Programmer's Manual* for details.

2.11.1.4 Mode Pins

The FLMD0 pin in combination with the P10_8: FLMD1 pin can select serial programming mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_2: MODE1 and the P10_1: MODE0 pins can select boundary scan mode.

The FLMD0 pin in combination with the P10_8: FLMD1, the P10_6: MODE2, the P10_2: MODE1 and the P10_1: MODE0 pins can select user boot mode.

For details on the mode selection, see **Section 6, Operating Mode**.

2.11.1.5 IP0_0: XT2

This pin is the SubOSC (SOSC) input pin. When the IPIBC0_0 bit = 1, the IP0_0/XT2 pin is used as an input port. If you make this setting, stop SOSC operation at the same time.

2.11.2 A/D Input Alternative I/O

The following ports are permanently connected to A/D input functions. (However, an analog input to the A/D is controlled by the A/D module.)

Table 2.67 A/D Input Alternative Pins (1/2)

Port	A/D Input	Device		
		100 pins	144 pins	176 pins
P8_0	ADCA0I0S	√	√	√

2.11.3 Special I/O Control

2.11.3.1 Direct I/O Control (PIPC)

Some alternative functions take over the input and output control of the ports.

The following table lists all alternative functions where PIPCn.PIPCn_m must be set to 1.

For details, see **Section 2.9.2.3, PIPCn — Port IP Control Register**.

Table 2.68 Alternative Modes that Require Setting PIPCn.PIPCn_m = 1

Function	Alternative functions Name	Port Name	Power Supply Area	Control	Reference Section
TAPA	TAPA0UP	P10_0	ISO	U phase Hi-Z control	**Section 29**
	TAPA0UN	P10_1	ISO		
	TAPA0VP	P10_2	ISO	V phase Hi-Z control	
	TAPA0VN	P10_3	ISO		
	TAPA0WP	P10_4	ISO	W phase Hi-Z control	
	TAPA0WN	P10_5	ISO

	CSIH3SC	P11_7	ISO	Master (1) / slave (0) mode signal	

2.11.3.2 Input Buffer Control (PISn/JPIS0, JPISA0)

The port input buffer characteristics (Type 1 or Type 2) of this device can be selected using the PISn/JPIS0 register. The applicable pins are shown in the following table.

The JTAG port input buffer characteristics (Type 1/2 or Type 5) of this device can be selected using the JPISA0 register. The applicable pins are shown in **Table 2.70**.

Table 2.69 Port Input Buffer Characteristics Selection (1/3)

Port Name	Input Buffer Selection		Device		
	Type 1 (PISn_m = 0)	Type 2 (PISn_m = 1)	100 pins	144 pins	176 pins

JP0_5	SHMT1	SHMT4	—	√	√	√
JP0_6	SHMT1	SHMT4	—	—	√	√

Note 1. TTL is selected for Boundary scan mode without JPISA0 register setting.
Note 2. TTL is selected for Nexus in normal operating mode without JPISA0 register setting.
Note 3. TTL is selected for LPD (4-pin) in normal operating mode without JPISA0 register setting.
Note 4. TTL is selected for LPD (1-pin) in normal operating mode without JPISA0 register setting.

NOTES

1. For the SHMT1, SHMT4, and TTL pin characteristics, see the **Section 40, Electrical Characteristics**.
2. For the input buffer after reset, type 2 (SHMT4) is selected.

2.11.3.3 Output Buffer Control (PDSC)

The port output driver strength (slow mode/fast mode) can be selected using the PDSCn register. The applicable pins are shown in the following table. Only slow mode is supported for ports other than those listed below.

Table 2.71 Output Buffer Characteristics Selection (1/3)

Port Name	Output Drive Strength Selection		Device		
	Slow Mode (PDSCn_m = 0)	Fast Mode (PDSCn_m = 1)	100 pins	144 pins	176 pins

Note 1. Supports Cload: 100pF

Note 2. Supports Cload: 50pF (Set fast mode if the load capacitance of CSIH is 50 pF.)

2.12 Noise Filter & Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. The RH850/F1K supports both analog and digital filters.

It also supports the function for edge and level detection after the signals have passed through a filter.

The first part of this section provides an overview of port input pins that are equipped with a filter and the filter type, noise filter & edge/level detection control registers and control bits, and register addresses.

For details on the digital/analog filter function and noise filter & edge/level detection control registers, see **Section 2.13, Description of Port Noise Filter & Edge/Level Detection**.

NOTE

In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

2.12.1 Port Filter Assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

2.12.1.1 Input Pins that Incorporate Analog Filter Type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

- Filter control register FCLA0CTLm_<name> (m = 0 to 7)
  A dedicated FCLA0CTLm_<name> register is provided for each pin in a port that incorporates an analog filter.

Table 2.72 Input Pins that Incorporate Analog Filter Type A

Module Name	Input Pin	FCLA0CTL Register Configuration		Device		
		Register	Address	100 pins	144 pins	176 pins
FCLA0	NMI	FCLA0CTL0_NMI	FFC3 4000$_H$	√	√	√
	INTP0	FCLA0CTL0_INTPL	FFC3 4020$_H$	√	√	√
	INTP1	FCLA0CTL1_INTPL	FFC3 4024$_H$	√	√	√
	INTP2	FCLA0CTL2_INTPL	FFC3 4028$_H$	√	√	√
	INTP3	FCLA0CTL3_INTPL	FFC3 402C$_H$	√	√	√
	INTP4	FCLA0CTL4_INTPL	FFC3 4030$_H$	√	√	√
	INTP5	FCLA0CTL5_INTPL	FFC3 4034$_H$	√	√	√

KR0I6	Low level detection	√	√	√
KR0I7	Low level detection	√	√	√

Note 1. For details on edge detection for TAUJ, see **Section 26.3.3.4, TAUJnCMURm — TAUJn Channel Mode User Register**.

Note 2. For details on edge detection for TAPA, see **Section 29.3.2, TAPAnCTL0 — TAPA Control Register 0**.

2.12.1.3 Input Pins that Incorporate Analog Filter Type C

The input pins of analog filter type C only incorporate an analog filter function.

Table 2.74 Input Pins that Incorporate Analog Filter Type C

Input Pin
FLMD0
FLMD1
MODE0
MODE1
MODE2
$\overline{\text{RESET}}$
$\overline{\text{DCUTRST}}$

2.12.1.4 Input Pins that Incorporate Digital Filter Type D

The input pins of digital filter type D incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLA0CTLm_<name> (m = 0 to 2)
  Each port with a digital filter has a special FCLA0CTLm_<name> register.
- Digital noise elimination control register DNFA<name>CTL
  Each DNFA<name>CTL control register controls digital filter processing for three input signals per group.
- Digital noise elimination enable register DNFA<name>EN
  The setting of the DNFA<name>ENL[2:0] bits in DNFA<name>EN enables or disables digital noise elimination for three input signals per group.

Table 2.75 Input Pins that Incorporate Digital Filter Type D

Input Pin	Device			Digital Noise Elimination Control Register		Digital Noise Elimination Enable Register			Filter Control Register	
	100 pin	144 pin	176 pin	Control Register	Address	Control Register	Control Bit	Address	Control Register	Address

ADCA1TRG2	—	√	√				DNFAADCTL1ENL2		FCLA0CTL2 _ADC1	FFC3 4088$_H$

2.12.1.5 Input Pins that Incorporate Digital Filter Type E

The input pins of digital filter type E incorporate a digital filter. The digital filter is controlled by the following registers. Edge detection is controlled by the registers for individual peripheral functions.

- Digital noise elimination control register DNFA<name>CTL
  Each DNFA<name>CTL control register controls digital filter processing for up to 16 input signals per group.
- Digital noise elimination enable register DNFA<name>EN
  The setting of the DNFA<name>ENL[7:0] and DNFA<name>ENH[7:0] bits in DNFA<name>EN enables or disables digital noise elimination for up to 16 input signals per group.

Table 2.76 Input Pins that Incorporate Digital Filter Type E (1/3)

TAUB1	Isolated area	Digital filter type E	DNFATCKI	CKSC_IPERI2S_CTL	—
ENCA0	Isolated area	Digital filter type E	DNFATCKI	CKSC_IPERI1S_CTL	—

Note 1. Power Domain

NOTE

For the Setting Register, see **Section 12.4.3, Clock Selector Control Register**.

2.13 Description of Port Noise Filter & Edge/Level Detection

External signals pass through different types of filters according to the use of each external input signal.

NOTE

In this section, <name> in the noise filter control register represents the peripheral function connected to a filter.

2.13.1 Overview

2.13.1.1 Analog Filter Types

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.
  Used for external interrupt signals.
- Type B: An analog filter
  Edge detection is performed by each peripheral function. Used for the timer input signals, asynchronous Hi-Z control input signals, and key return input signals.
- Type C: An analog filter only
  Used for the external $\overline{\text{RESET}}$ input and mode signals.

2.13.1.2 Digital Filter Types

The digital filter characteristics can be adjusted to suit the application.

- Type D: A digital filter with edge detection.
  Used for the A/D converter external trigger pin.
- Type E: A digital filter. Edge detection is performed by each peripheral function.
  Used for the timer input signals and encoder input signals.

2.13.2 Analog Filters

2.13.2.1 Analog Filter Characteristic

See the **Section 40, Electrical Characteristics** for the input conditions for signals input to pins that incorporate an analog filter.

2.13.2.2 Analog Filter Control Registers

A dedicated FCLA0CTLm_<name> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in **Table 2.72, Input Pins that Incorporate Analog Filter Type A**, in **Section 2.12.1, Port Filter Assignment**.

2.13.2.3 Analog Filter in Standby Mode

Analog filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Analog filters in the Always-On area (AWO area) always operate.

The analog filter in standby mode and its wake-up capability depend on the filter types. See the description of the analog filter types below.

(1) Analog Filter Type A

A block diagram of analog filter type A is shown below.

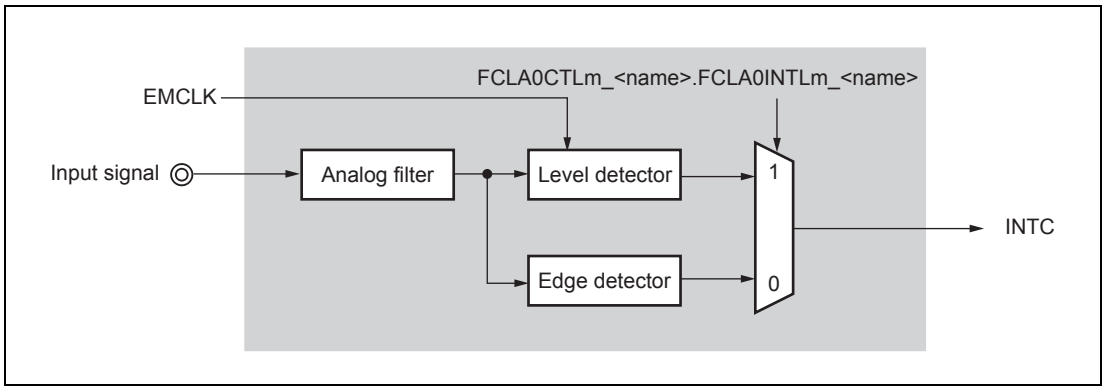

Figure 2.11 Block Diagram of Analog Filter Type A

After passing an external signal through the filter to eliminate noise and glitches, an output signal is generated according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit FCLA0CTLm_<name>.FCLA0INTLm_<name>.

- FCLA0INTLm_<name> bit = 0: Edge detection

  Whether a rising or falling edge is detected can be specified by setting the FCLA0CTLm_<name>.FCLA0INTRm_<name> and FCLA0CTLm_<name>.FCLA0INTFm_<name> bits.

- FCLA0INTLm_<name> bit = 1: Level detection

  The detection of a high level or low level can be specified by setting FCLA0CTLm_<name>.FCLA0INTRm_<name> bit.

The table below summarizes the detection conditions of the analog filter.

Table 2.78 Analog Filter Event Detection Conditions

FCLA0INTLm_<name>	FCLA0INTFm_<name>	FCLA0INTRm_<name>	Edge Detection	Level Detection
0	0	0	No edge detected	Disabled
	0	1	Rising edge	
	1	0	Falling edge	
	1	1	Rising and falling edges	
1	X	0	Disabled	Low level
	X	1		High level

Analog filter type A in Standby mode

The output signal of an analog filter type A can always be used as a standby mode wake-up signal.

(2) Analog filter type B

A block diagram of analog filter type B is shown below.

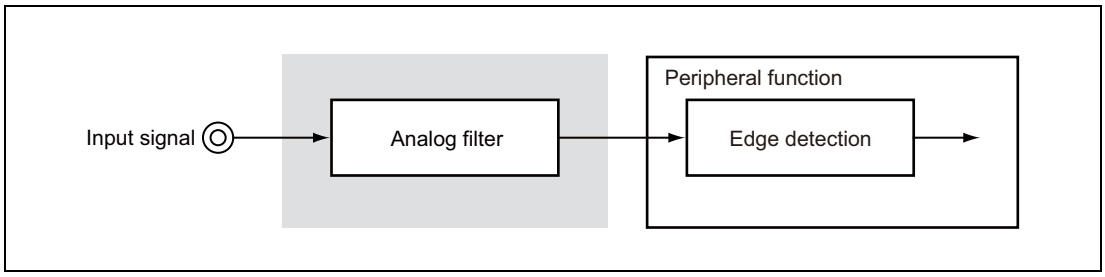

Figure 2.12 Block Diagram of Analog Filter Type B

Analog filter type B in Standby mode

The output signal of an analog filter type B can always be used as a standby mode wake-up signal.

(3) Analog filter type C

A block diagram of analog filter type C is shown below.

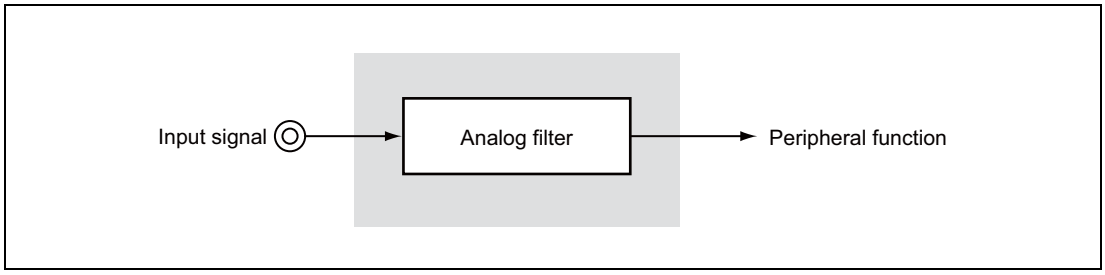

Figure 2.13 Block Diagram of Analog Filter Type C

The generated signals are always input signals that have passed through an analog filter.

Analog filter type C in Standby mode

Pins equipped with type C analog filters in this product do not support the input of event signals to trigger wake-up from standby.

2.13.3 Digital Filters

2.13.3.1 Digital Filter Characteristic

The digital filters allow the filter characteristics to be adjusted accordingly to the needs of the application.

The input signal is sampled with the sampling frequency fs.

If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFA<name>CTL.DNFA<name>PRS[2:0] select the sampling frequency based on
  $fs = f_{DNFATCKI} / 2^{DNFA<name>PRS[2:0]}$
  where $f_{DNFATCKI}$ is the frequency of the DNFATCKI clock.
- DNFA<name>CTL.DNFA<name>NFSTS[1:0] determines the number of same level samples, "s", (2 to 5):

  s = DNFA<name>NFSTS[1:0] + 2

External signal pulses shorter than the following are suppressed at all times.

s ×1/fs

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

(s + 1) × 1/fs

External signal pulses in the following range may be suppressed or judged as valid.

s × 1/fs to (s + 1) × 1/fs

The filter operation is illustrated in the figure below with DNFA<name>NFSTS[1:0] = 01_B, i.e. s = 3 same level samples.

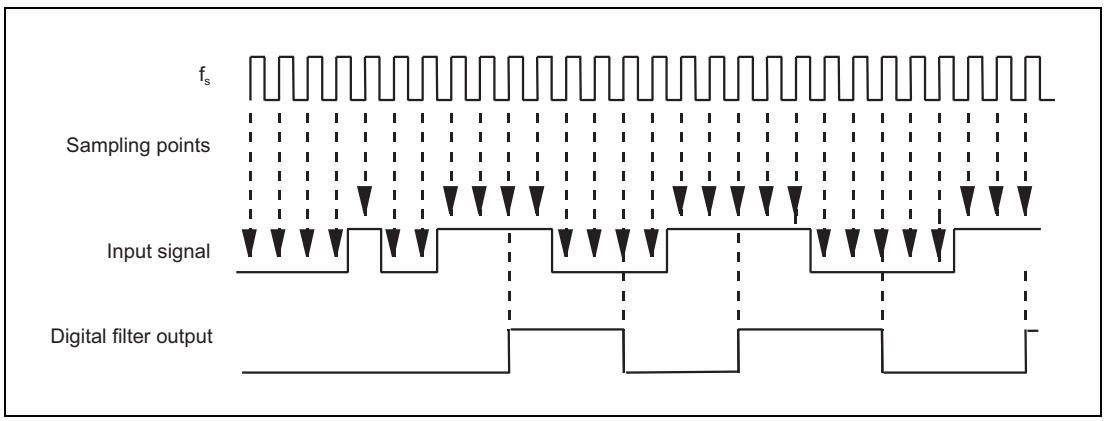

Figure 2.14 Digital Filter Function

2.13.3.2 Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.

The digital filter characteristics, specified by DNFA<name>CTL.DNFA<name>PRS[2:0] and DNFA<name>NFSTS[1:0] apply to the signals.

However, the digital filter for each signal can be enabled or disabled separately by DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7).

CAUTIONS

1. **When the output signal from the digital filter is input to an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1) for the port pin to switch to the alternative function.**
   s = DNFA<name>NFSTS[1:0] + 2
   $s \times 1/f_S + 2 \times 1/f_{DNFATCKI}$
2. **When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.**
   $s \times 1/f_S + 3 \times 1/f_{DNFATCKI}$

2.13.3.3 Digital Filters in Standby Mode

Digital filters for the function of waking-up from the DeepSTOP mode are located in the Always-On area (AWO area). Digital filters on the Always-On area (AWO area) are always operating.

Digital noise elimination requires the clock supply DNFATCKI to operate.
Pins equipped with digital filters in this product do not support the input of event signals to trigger wake-up from standby.

2.13.3.4 Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFA<name>CTL and digital noise elimination enable register DNFA<name>EN are used to set all the filters in the same group (<name> = peripheral function group).

The DNFA<name>CTL register specifies the characteristics of the digital noise elimination filter for the digital filter of <name>.

The DNFA<name>EN register enables/disables each filter by setting the corresponding bit in DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The FCLA0CTL0_ADCn registers are ordered in groups of 3 registers with the same index n. The register index n is in 0 or 1.

The assignment of the input signals to the control registers and their addresses are given in **Table 2.75, Input Pins that Incorporate Digital Filter Type D** and **Table 2.76, Input Pins that Incorporate Digital Filter Type E** in **Section 2.12.1, Port Filter Assignment**.

CAUTION

Do not change any control register settings while the corresponding digital filter is enabled by DNFA<name>EN.DNFA<name>ENLm (m = 0 to 7) = 1 and DNFA<name>EN.DNFA<name>ENHm (m = 0 to 7) = 1. Otherwise an unintended filter output may be generated.

(1) Digital filter type D

A block diagram of digital filter type D is shown below.

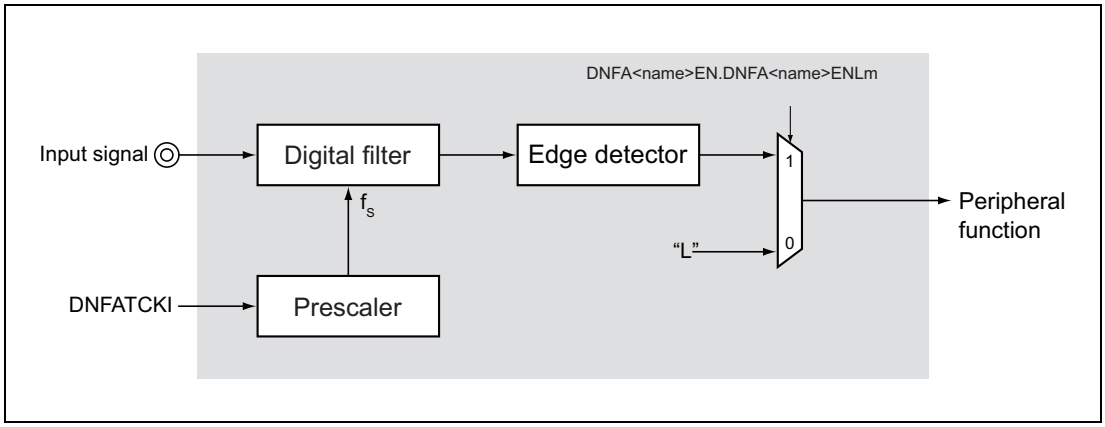

Figure 2.15 Block Diagram of Digital Filter Type D

The generated signal depends on the register setting, as shown in the following table.

Table 2.79 Output Options for Digital Filter Type D

DNFA<name>EN.DNFA<name>ENLm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

(2) Digital filter type E

A block diagram of digital filter type E is shown below.

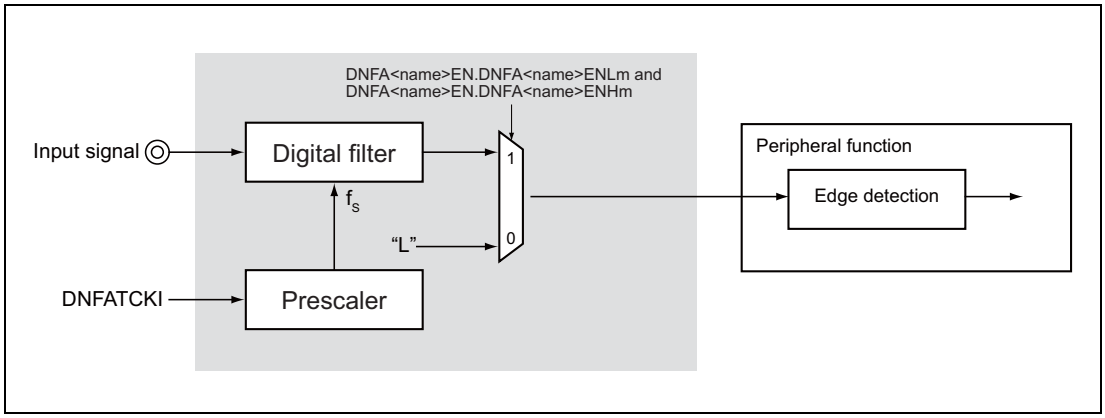

Figure 2.16 Block Diagram of Digital Filter Type E

The generated signal depends on the register setting, as shown in the following table.

Table 2.80 Output Options for Digital Filter Type E

DNFA<name>EN.DNFA<name>ENLm and DNFA<name>EN.DNFA<name>ENHm	Signals Output to Peripheral Functions
0	Fixed to low level
1	Input signal passed through filter

2.13.4 Filter Control Registers

The analog and digital filters are controlled and operated by the following registers:

Table 2.81 List of Filter Registers

Module Name	Register Name	Symbol	Address
FCLA0	Filter control register m	FCLA0CTLm_<name>	The addresses are shown in the tables in **Section 2.12.1, Port Filter Assignment**.
DNF	Digital noise elimination control register	DNFA<name>CTL	
	Digital noise elimination enable register	DNFA<name>EN	
	Digital noise elimination enable H register	DNFA<name>ENH	
	Digital noise elimination enable L register	DNFA<name>ENL	

2.13.4.1 FCLA0CTLm_<name> — Filter Control Register

This register controls the analog and digital filter operation.

Access: This register can be read or written in 8-bit units.

Address: The allocation of input signals to FCLA0CTLm_<name> registers and the address of each register are shown in the tables in **Section 2.12.1, Port Filter Assignment**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	FCLA0INTLm _<name>	FCLA0INTFm _<name>	FCLA0INTRm _<name>
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 2.82 FCLA0CTLm_<name> Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	FCLA0INTLm _<name>	Detection Mode Selection 0: Edge detection 1: Level detection **Note:** This bit is only valid for analog filter type A.
1	FCLA0INTFm _<name>	• In level detection mode (FCLA0INTLm_<name> = 1): This bit has no effect. • In edge detection mode (FCLA0INTLm_<name> = 0): Falling edge detection control 0: Falling edge detection disabled 1: Falling edge detection enabled **Note:** This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.
0	FCLA0INTRm _<name>	• In level detection mode (FCLA0INTLm_<name> = 1): Detected level selection 0: Low level detection 1: High level detection • In edge detection mode (FCLA0INTLm_<name> = 0): Rising edge detection control 0: Rising edge detection disabled 1: Rising edge detection enabled **Note:** This bit is only valid for analog filter type A and digital filter type D. However, digital filter type D is placed in edge detection mode.

CAUTION

Digital filter type D: Always set bit 2 to "0".

2.13.4.2 DNFA<name>CTL — Digital Noise Elimination Control Register

This register is used to specify the filter characteristics of the digital noise elimination filter.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 8-bit units.

Address: For the correspondence between the DNFA<name>CTL register and input signals, and the addresses of individual registers, see **Table 2.75, Input Pins that Incorporate Digital Filter Type D** and **Table 2.76, Input Pins that Incorporate Digital Filter Type E** in **Section 2.12.1, Port Filter Assignment**.

Value after reset: 00_H

001_B	DNFATCKI/2
010_B	DNFATCKI/4
011_B	DNFATCKI/8
100_B	DNFATCKI/16
101_B	DNFATCKI/32
110_B	DNFATCKI/64
111_B	DNFATCKI/128

2.13.4.3 DNFA<name>EN — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 16-bit units.
The upper- and lower-order bytes (DNFA<name>ENH[7:0] and DNFA<name>ENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFA<name>ENH. and DNFA<name>ENL.

Address: For the correspondence between the DNFA<name>EN register and input signals, and the addresses of individual registers, see **Table 2.75, Input Pins that Incorporate Digital Filter Type D** and **Table 2.76, Input Pins that Incorporate Digital Filter Type E** in **Section 2.12.1, Port Filter Assignment**.

Value after reset: 0000_H

2.13.4.4 DNFA<name>ENH – Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of the DNFA<name>ENH register.

NOTE

This register is only valid for digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: For the correspondence between the DNFA<name>ENH register and input signals, and the addresses of individual registers, see **Table 2.76, Input Pins that Incorporate Digital Filter Type E** in **Section 2.12.1, Port Filter Assignment**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	DNFA <name> ENH7	DNFA <name> ENH6	DNFA <name> ENH5	DNFA <name> ENH4	DNFA <name> ENH3	DNFA <name> ENH2	DNFA <name> ENH1	DNFA <name> ENH0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

For details of the respective bit functions, see **Section 2.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register**.

2.13.4.5 DNFA<name>ENL – Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of the DNFA<name>ENL register.

NOTE

This register is only valid for digital filter type D and digital filter type E.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: For the correspondence between the DNFA<name>ENL register and input signals, and the addresses of individual registers, see **Table 2.75, Input Pins that Incorporate Digital Filter Type D** and **Table 2.76, Input Pins that Incorporate Digital Filter Type E** in **Section 2.12.1, Port Filter Assignment**.

Value after reset: 00_H

	DNFA <name> ENL7	DNFA <name> ENL6	DNFA <name> ENL5	DNFA <name> ENL4	DNFA <name> ENL3	DNFA <name> ENL2	DNFA <name> ENL1	DNFA <name> ENL0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

For details of the respective bit functions, see **Section 2.13.4.3, DNFA<name>EN — Digital Noise Elimination Enable Register**.

Section 3 CPU System

3.1 Overview

3.1.1 Block Configuration

Figure 3.1 shows the block configuration diagram of RH850/F1K.

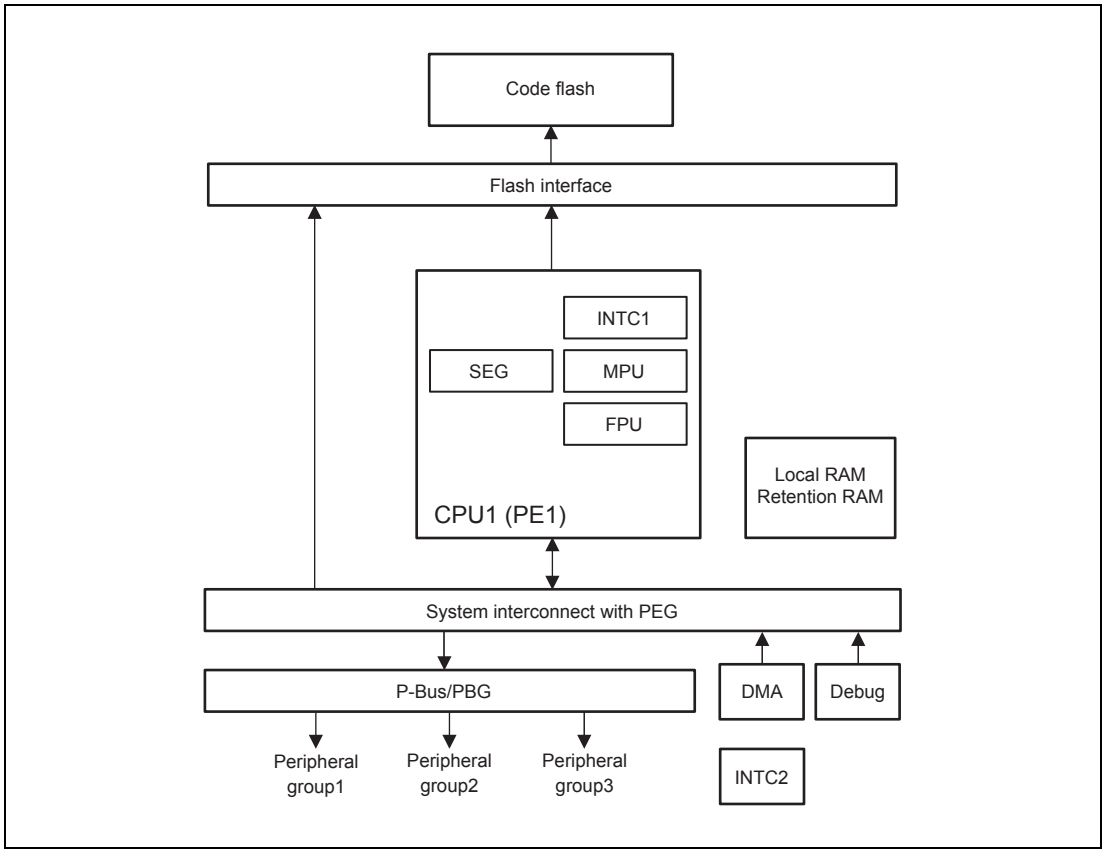

Figure 3.1 Block Configuration Diagram of the RH850/F1K

CPU1 (PE1)

The RH850 G3KH Core is used as the main CPU.

Local RAM

This is a high-speed accessible RAM

Retention RAM

The retention RAM is used to retain values in DeepSTOP mode. Since the continuous local RAM area is assigned for the retention RAM, the retention RAM can also serve as a local RAM for sharing data with the DMA.

Code flash

The code flash memory is included for program storage. It is connected with CPU1 via the flash interface.

Data flash

The data flash memory can be rewritten by the CPU1. It has a greater write endurance than the code flash memory.

P-Bus

The P-Bus connects the peripheral IPs. The P-Bus is divided into three peripheral groups, 1 to 3.

INTC1, INTC2

There are two interrupt controllers, INTC1 and INTC2.

DMA

The DMA transfer module (DMAC) is included.

Slave guard

The slave guard is a function to prevent unauthorized access from the specific bus master, and consists of the following guard structures:

(1) PE guard (PEG)

The PE guard is a function to prevent unauthorized access to the resources (local RAM and retention RAM) in the PE from an external master. After reset is released, access from other than the own PE is prohibited.

(2) System error generation (SEG)

The registers control how to response SYSERR.

(3) Peripheral guard (PBG)

The peripheral guard is a function to prevent unauthorized access to peripherals. The control registers in the peripheral circuits are protected against illegal accesses.

For details, see **Section 33, Functional Safety**.

3.2 CPU

3.2.1 Core Functions

3.2.1.1 Features

Table 3.1 lists features of the RH850 G3KH core.

Table 3.1 Features of the RH850 G3KH Core

Item	Feature
CPU	• Advanced 32-bit architecture for embedded control • 32-bit internal data bus • Thirty-two 32-bit general-purpose registers • RISC-type instruction set – Long-/short-format load/store instructions – Three-operand instructions – Instruction set based on C language • CPU operating modes – User mode and supervisor mode • Address space: 4-Gbyte linear address space for both data and instructions
Coprocessor	• Floating-point operation coprocessor (FPU) – Supports single precision (32 bits) – Supports data types and exceptions conforming to IEEE754. – Rounding mode: Neighborhood, 0 direction, +∞ direction, and –∞ direction – Handling of denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754
Exception/ Interrupt	• 16 interrupt priority levels settable for each channel • Vector selection method selectable according to performance request or memory usage – Direct branching exception vectors – Indirect branching exception vectors referring to the address table • Supports the high-speed save/return processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt
Memory management	• Memory protection function (MPU): 16 areas settable
Cache	• No cache memory is equipped.

3.2.1.2 Register Set

This subsection explains the program registers and system registers incorporated in this CPU.

(1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).

Table 3.2 Program Registers

Program Register	Name	Function	Description
General-purpose registers	r0	Zero register	Always retains “0”
	r1	Assembler reserved register	Used as working register for generating addresses
	r2	Register for address and data variables (used when the real-time OS used does not use this register)	
	r3	Stack pointer (SP)	Used for generating a stack frame when a function is called
	r4	Global pointer (GP)	Used for accessing a global variable in the data area
	r5	Text pointer (TP)	Used as a register that indicates the start of the text area (area where program code is placed)
	r6 to r29	Register for address and data variables	
	r30	Element pointer (EP)	Used as a base pointer for generating addresses when accessing memory
	r31	Link pointer (LP)	Used when the compiler calls a function
Program counter	PC	Retains instruction addresses during execution of programs	

NOTE

For further descriptions of r1, r3 to r5, and r31 used by the assembler and/or C compiler, see the specification of each software development environment.

(a) General-purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables. Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

1. r0, r3, r30

   These registers are implicitly used by instructions.

   r0 is a register that always retains "0". It is used for operations that use 0 and addressing with base address being 0.

   r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.

   r30 is used as a base pointer when the SLD or SST instruction accesses memory.

2. r1, r4, r5, r31

   These registers are implicitly used by the assembler and C compiler.

   When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

3. r2

   This register might be used by a real-time OS in some cases. If the real-time OS that is being used does not use r2, r2 can be used as a register for address variables or data variables.

(b) PC – Program Counter

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0, and branching to an odd number address is disabled.

Note: The value after reset differs depending on the setting value of the reset vector. For details, see **(q) RBASE — Reset Vector Base Address Register**.

(2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.

System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and a selection ID.

Table 3.3 Basic System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR0, 0	EIPC	Status save registers when acknowledging EI level exception	SV
SR1, 0	EIPSW	Status save registers when acknowledging EI level exception	SV
SR2, 0	FEPC	Status save registers when acknowledging FE level exception	SV
SR3, 0	FEPSW	Status save registers when acknowledging FE level exception	SV
SR5, 0	PSW	Program status word	*1
SR6, 0	FPSR	(Refer to FPU function registers.)	CU and SV
SR7, 0	FPEPC	(Refer to FPU function registers.)	CU and SV
SR8, 0	FPST	(Refer to FPU function registers.)	CU
SR9, 0	FPCC	(Refer to FPU function registers.)	CU
SR10, 0	FPCFG	(Refer to FPU function registers.)	CU
SR11, 0	FPEC	(Refer to FPU function registers.)	CU and SV
SR13, 0	EIIC	EI level exception cause	SV
SR14, 0	FEIC	FE level exception cause	SV
SR16, 0	CTPC	CALLT execution status save register	UM
SR17, 0	CTPSW	CALLT execution status save register	UM
SR20, 0	CTBP	CALLT base pointer	UM
SR28, 0	EIWR	EI level exception working register	SV
SR29, 0	FEWR	FE level exception working register	SV
SR0, 1	MCFG0	Machine configuration	SV
SR2, 1	RBASE	Reset vector base address	SV
SR3, 1	EBASE	Exception handler vector address	SV
SR4, 1	INTBP	Base address of the interrupt handler address table	SV
SR5, 1	MCTL	CPU control	SV
SR6, 1	PID	Processor ID	SV
SR11, 1	SCCFG	SYSCALL operation setting	SV
SR12, 1	SCBP	SYSCALL base pointer	SV
SR0, 2	HTCFG0	Thread configuration	SV
SR6, 2	MEA	Memory error address	SV
SR7, 2	ASID	Address space ID	SV
SR8, 2	MEI	Memory error information	SV

Note 1. The access permission differs depending on the bit.

(a) EIPC — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see "*Types of Exceptions*" in *Software Manual*).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address cannot be specified.

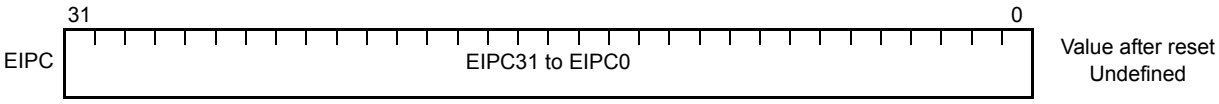

Table 3.4 EIPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	EIPC31 to EIPC1	These bits indicate the PC saved when an EI level exception is acknowledged.	R/W	Undefined
0	EIPC0	This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0.	R/W	Undefined

(b) EIPSW — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

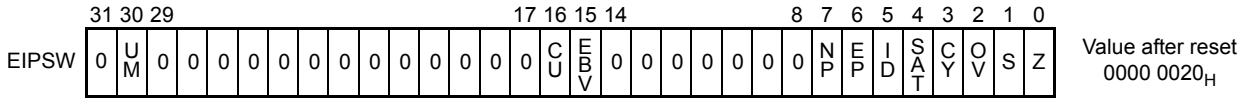

Table 3.5 EIPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an EI level exception is acknowledged.	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit stores the PSW.CU field setting when an EI level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an EI level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an EI level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an EI level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an EI level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an EI level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an EI level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an EI level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an EI level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an EI level exception is acknowledged.	R/W	0

(c) FEPC — Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see *"Types of Exceptions"* in *Software Manual*).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address cannot be specified.

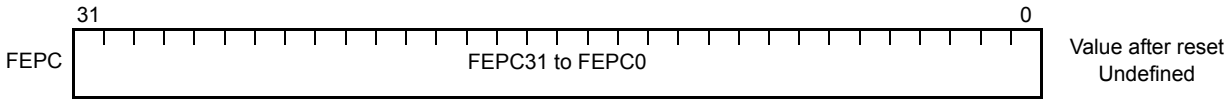

Table 3.6 FEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FEPC31 to FEPC1	These bits indicate the PC saved when an FE level exception is acknowledged.	R/W	Undefined
0	FEPC0	This bit indicates the PC saved when an FE level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0.	R/W	Undefined

(d) FEPSW — Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

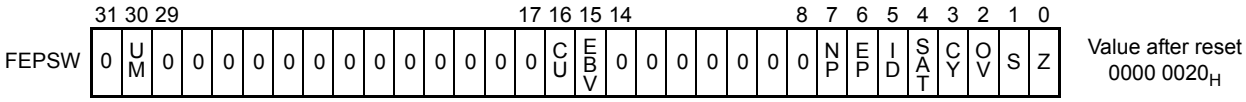

Table 3.7 FEPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an FE level exception is acknowledged.	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit stores the PSW.CU field setting when an FE level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an FE level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an FE level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an FE level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an FE level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an FE level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an FE level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an FE level exception is acknowledged.	R/W	0

(e) PSW — Program Status Word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by conditional instructions (Bcond, CMOV, etc.)).

CAUTIONS

1. **When the LDSR instruction is used to change the contents of each bit in this register, the changed contents become valid immediately after completion of the LDSR instruction execution.**
2. **The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See Table 3.8, Access Permission for PSW Register for the access permission for each bit.**

Table 3.8 Access Permission for PSW Register

Bit		Access Permission When Reading	Access Permission When Writing
30	UM	UM	SV*1
16	CU	UM	SV*1
15	EBV	UM	SV*1
7	NP	UM	SV*1
6	EP	UM	SV*1
5	ID	UM	SV*1
4	SAT	UM	UM
3	CY	UM	UM
2	OV	UM	UM
1	S	UM	UM
0	Z	UM	UM

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1. In this case, writing is ignored.

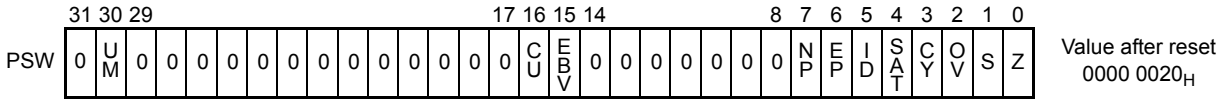

Table 3.9 PSW Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit indicates that the CPU is in user mode (in UM mode). 0: Supervisor mode 1: User mode	R/W	0
29 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	CU	This bit indicates the coprocessor use permissions. When the bit corresponding to the coprocessor is 0, a coprocessor unusable exception occurs if an instruction for the coprocessor is executed or a coprocessor resource (system register) is accessed. CU bit 16: FPU	R/W	0

Table 3.9 PSW Register Contents (2/2)

Bit Position	Bit Name	Function	R/W	Value after Reset
15	EBV	This bit indicates the reset vector and exception vector operation. See the description on RBASE ((q) RBASE — Reset Vector Base Address Register) and EBASE ((r) EBASE — Exception Handler Vector Address Register) in this section.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see **Table 7.1, List of Exception Sources**. 0: The acknowledgement of FE level exception is enabled. 1: The acknowledgement of FE level exception is disabled.	R/W	0
6	EP	This bit indicates that an exception other than an interrupt controlled by the interrupt controller is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. 0: An exception other than an interrupt is not being serviced. 1: An exception other than an interrupt is being serviced.	R/W	0
5	ID	This bit disables the acknowledgement of EI level exception. When an EI level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level exception. As for the exceptions which the ID bit disables the acknowledgment, see **Table 7.1, List of Exception Sources**. This bit is also used to disable EI level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. 0: EI level exception is not being processed or the section is not a critical section (after execution of EI instruction). 1: EI level exception is being processed or the section is a critical section (after execution of DI instruction).	R/W	1
4	SAT*1	This bit indicates that the operation result is saturated because the operation result of a saturated operation instruction has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1, but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed. 0: Not saturated 1: Saturated	R/W	0
3	CY	This bit indicates whether a carry or borrow has occurred in the operation result. 0: Carry and borrow have not occurred. 1: Carry or borrow has occurred.	R/W	0
2	OV*1	This bit indicates whether or not an overflow has occurred during an operation. 0: Overflow has not occurred. 1: Overflow has occurred.	R/W	0
1	S*1	This bit indicates whether or not the result of an operation is negative. 0: Result of operation is positive or 0. 1: Result of operation is negative.	R/W	0
0	Z	This bit indicates whether or not the result of an operation is 0. 0: Result of operation is not 0. 1: Result of operation is 0.	R/W	0

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. The SAT flag is set to 1 only when the OV flag is set to 1 in a saturated operation.

Operation Result Status	Flag Status			Operation Result after Saturation Processing
	SAT	OV	S	
Exceeded positive maximum value	1	1	0	7FFF FFFF$_H$
Exceeded negative maximum value	1	1	1	8000 0000$_H$
Positive (maximum value not exceeded)	Value prior to operation is retained.	0	0	Operation result itself
Negative (maximum value not exceeded)			1	

(f) EIIC — EI Level Exception Source Register

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

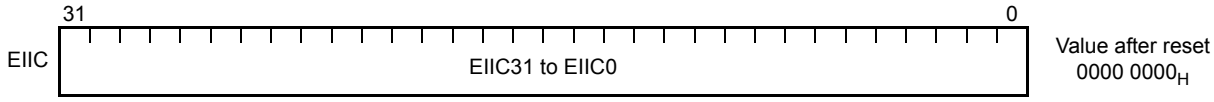

Table 3.10 EIIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIIC31 to EIIC0	These bits store the exception source code when an EI level exception is acknowledged. The EIIC15 to EIIC0 field stores the lower 16 bits of the exception source code. The EIIC31 to EIIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0.	R/W	0

(g) FEIC — FE Level Exception Source Register

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception source code corresponding to a specific exception source.

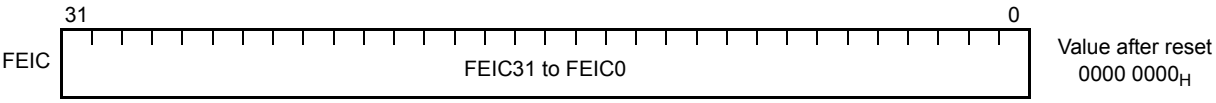

Table 3.11 FEIC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEIC31 to FEIC0	These bits store the exception source code when an FE level exception is acknowledged. The FEIC15 to FEIC0 field stores the lower 16 bits of the exception source code. The FEIC31 to FEIC16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition of a function related to the exception, these bits are set to 0.	R/W	0

(h) CTPC — Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address cannot be specified.

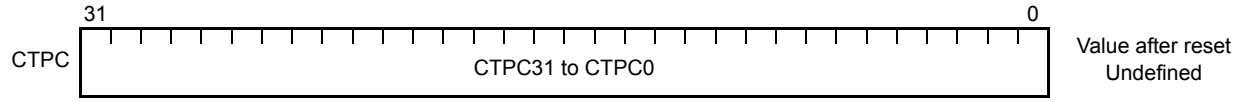

Table 3.12 CTPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTPC31 to CTPC1	These bits indicate the PC of the instruction after the CALLT instruction.	R/W	Undefined
0	CTPC0	This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0.	R/W	Undefined

(i) CTPSW — Status Save Register when Executing CALLT Instruction

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

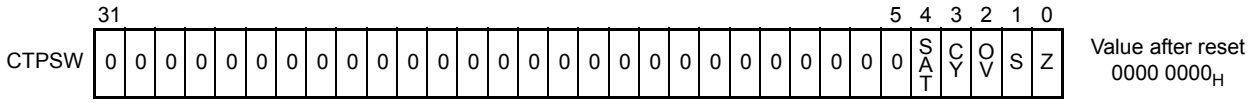

Table 3.13 CTPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4	SAT	This bit stores the PSW.SAT bit setting when the CALLT instruction is executed.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when the CALLT instruction is executed.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when the CALLT instruction is executed.	R/W	0
1	S	This bit stores the PSW.S bit setting when the CALLT instruction is executed.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when the CALLT instruction is executed.	R/W	0

(j) CTBP — CALLT Base Pointer Register

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.

Be sure to set the CTBP register to a halfword address.

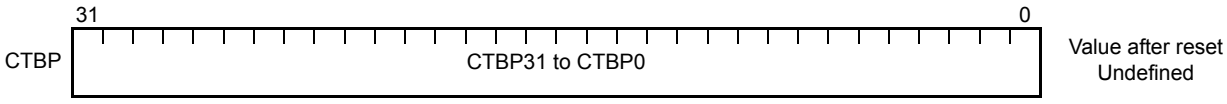

Table 3.14 CTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	CTBP31 to CTBP1	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the start address of the table used by the CALLT instruction.	R/W	Undefined
0	CTBP0	This bit indicates the base pointer address of the CALLT instruction. This bit indicates the start address of the table used by the CALLT instruction. Always set this bit to 0.	R	0

(k) ASID — Address Space ID Register

This register indicates the address space ID. This is used to identify the address space provided by the memory management function.

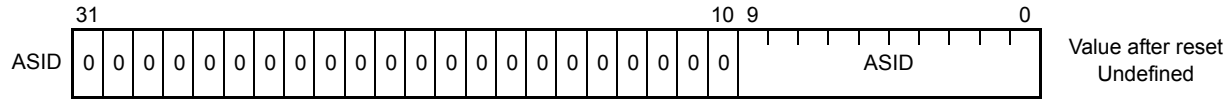

Table 3.15 ASID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 10	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
9 to 0	ASID	These bits indicate the address space ID.	R/W	Undefined

(l) EIWR — EI Level Exception Working Register

The EIWR register is used as a working register when an EI level exception has occurred.

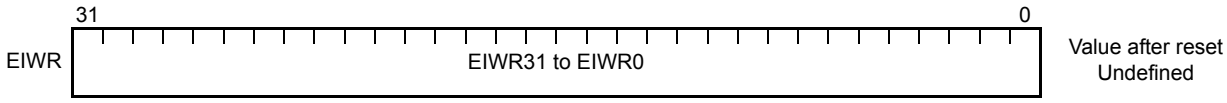

Table 3.16 EIWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	EIWR31 to EIWR0	These bits constitute a working register that can be used for any purpose during the servicing of an EI level exception. This register can be used to temporarily save the values of general-purpose registers, etc.	R/W	Undefined

(m) FEWR — FE Level Exception Working Register

The FEWR register is used as a working register when an FE level exception has occurred.

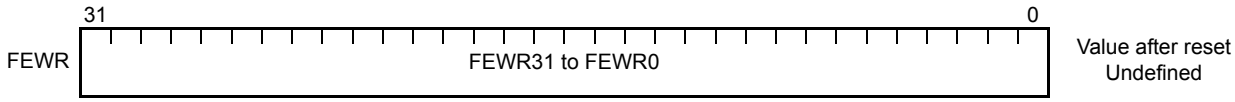

Table 3.17 FEWR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	FEWR31 to FEWR0	These bits constitute a working register that can be used for any purpose during the servicing of an FE level exception. This register can be used to temporarily save the values of general-purpose registers, etc.	R/W	Undefined

(n) HTCFG0 — Thread Configuration Register

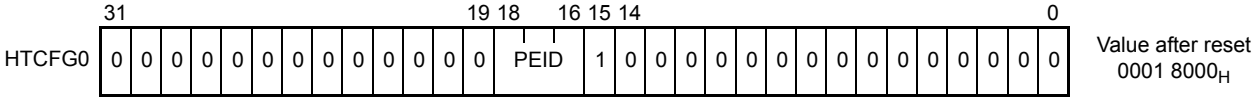

Table 3.18 HTCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 19	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
18 to 16	PEID	These bits indicate the processor element number.	R	001_B
15	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
14 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(o) MEA — Memory Error Address Register

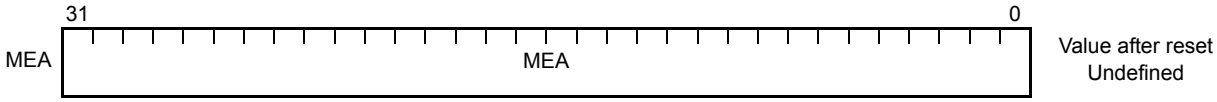

Table 3.19 MEA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MEA	These bits store the violation address when an MAE (misaligned) or MPU occurs.	R/W	Undefined

(p) MEI — Memory Error Information Register

This register is used to store information about the instruction that caused a misaligned (MAE) or memory protection (MDP) exception when such an exception occurred. This information is used during emulation.

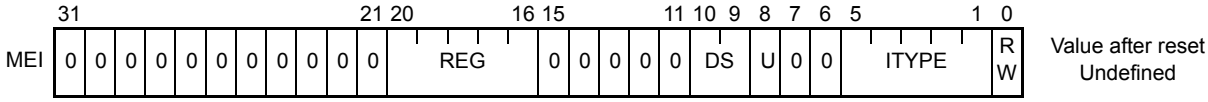

Table 3.20 MEI Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 21	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
20 to 16	REG	These bits indicate the number of the source or destination register accessed by the instruction that caused the exception. For details, see **Table 3.21**.	R/W	Undefined
15 to 11	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
10, 9	DS	These bits indicate the data type of the instruction that caused the exception.*1 0: Byte (8 bits) 1: Halfword (16 bits) 2: Word (32 bits) 3: Double-word (64 bits) For details, see **Table 3.21**.	R/W	Undefined
8	U	This bit indicates the sign extension method of the instruction that caused the exception. 0: Signed 1: Unsigned For details, see **Table 3.21**.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5 to 1	ITYPE	These bits indicate the instruction that caused the exception. For details, see **Table 3.21**.	R/W	Undefined
0	RW	This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory). 0: Read (Load-memory) 1: Write (Store-memory) For details, see **Table 3.21**.	R/W	Undefined

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3.21 Instructions Causing Exceptions and Values of MEI Register (1/2)

Instruction	REG	DS	U	RW	ITYPE
SLD.B	dst	0 (byte)	0 (signed)	0 (read)	00000_B

Interrupt (table reference)*1	—	2 (word)	0 (signed)	0 (read)	10101_B

Note 1. When reading the interrupt vector by using the table reference method.

NOTE

dst: destination register number, src: source register number

(q) RBASE — Reset Vector Base Address Register

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this vector address is also used as the exception vector address.

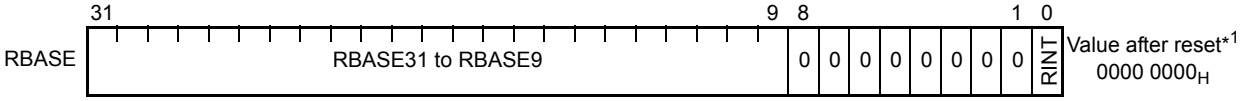

Table 3.22 RBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	RBASE31 to RBASE9	These bits indicate the reset vector when there is a reset. When PSW.EBV = 0, this address is also used as the exception vector. For RBASE8 to RBASE0, 0 is used implicitly.	R	0000 0000 0000 0000 0000 000B*1
8 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See **Section 7.10.1, Direct Vector Method**. This bit is valid when PSW.EBV = 0.	R	0

Note 1. The value depends on the reset vector. The values set at shipment are shown in the table. When the reset vector is modified, the address will be changed.

(r) EBASE — Exception Handler Vector Address Register

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

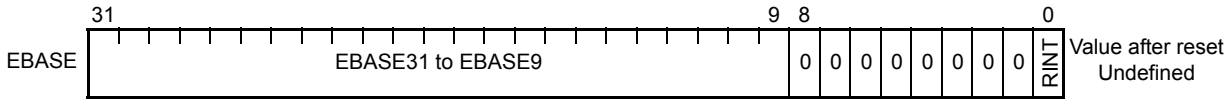

Table 3.23 EBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	EBASE31 to EBASE9	The exception handler routine address is changed to the address resulting from adding the offset address of each exception to the base address specified for this register. For EBASE8 to EBASE0, 0 is used implicitly.	R/W	Undefined
8 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt servicing is reduced. See **Section 7.10.1, Direct Vector Method**.	R/W	Undefined

(s) INTBP — Base Address Register of the Interrupt Handler Address Table

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

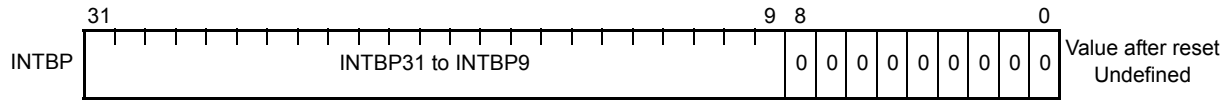

Table 3.24 INTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	INTBP31 to INTBP9	These bits indicate the base pointer address for an interrupt when the table reference method is used. The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified by the table reference method (EIINT0 to EIINT511) is acknowledged. For INTBP8 to INTBP0, 0 is used implicitly.	R/W	Undefined
8 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(t) PID — Processor ID Register

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

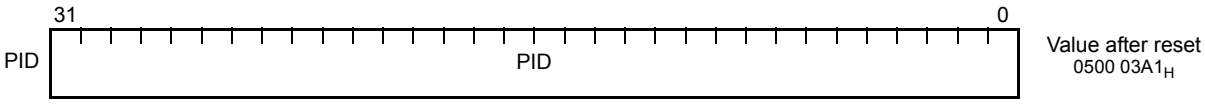

Table 3.25 PID Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 24	PID	Architecture Identifier This identifier indicates the architecture of the processor.	R	05_H
23 to 8		Function Identifier This identifier indicates the functions of the processor. These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). Bits 23 to 11: Reserved Bit 10: Double-precision floating-point operation function Bit 9: Single-precision floating-point operation function Bit 8: Memory protection function (MPU)	R	0003_H
7 to 0		Version Identifier This identifier indicates the version of the processor.	R	$A1_H$

(u) SCCFG — SYSCALL Operation Setting Register

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

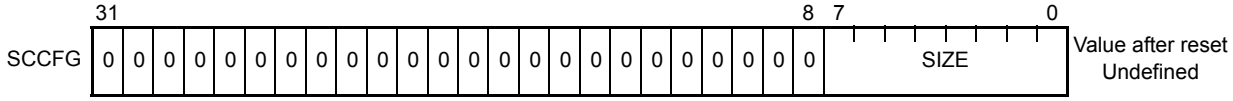

Table 3.26 SCCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	SIZE	These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255. By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used. If vectors exceeding the maximum number of entries are specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry.	R/W	Undefined

(v) SCBP — SYSCALL Base Pointer Register

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

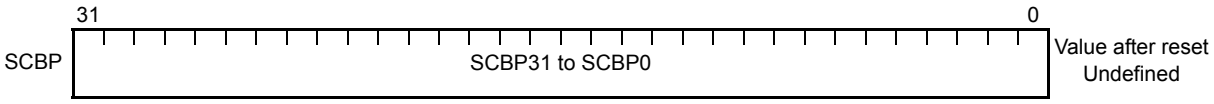

Table 3.27 SCBP Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	SCBP31 to SCBP2	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction.	R/W	Undefined
1, 0	SCBP1, SCBP0	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction. Always set these bits to 0.	R	0

(w) MCFG0 — Machine Configuration Register

This register indicates the CPU configuration.

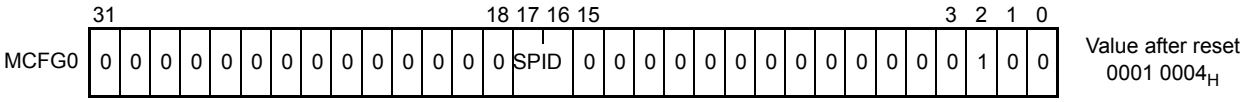

Table 3.28 MCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 18	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
17, 16	SPID	These bits indicate the system protection number.	R/W	01_B
15 to 3	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
2	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(x) MCTL — Machine Control Register

This register is used to control the CPU.

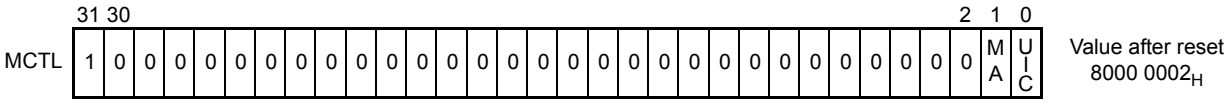

Table 3.29 MCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
30 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	MA	This bit is used to control the misaligned access. 0: In the event of a misaligned access, an exception is always generated.*1 1: The correct operation is controlled by hardware.*2	R/W	1
0	UIC	This bit is used to control the interrupt enable/disable operation in user mode. When this bit is set to 1, executing the EI/DI instruction in user mode becomes possible.	R/W	0

Note 1. Excluding LD.DW, and ST.DW for word boundary allocation.

Note 2. Exception still occurs in case of LD.DW or ST.DW for misaligned access except word boundary allocation.

(3) Interrupt Function Registers

Table 3.30 Interrupt Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR7, 1	FPIPR	FPI exception interrupt priority setting	SV
SR10, 2	ISPR	Priority of interrupt being serviced	SV
SR11, 2	PMR	Interrupt priority masking	SV
SR12, 2	ICSR	Interrupt control status	SV
SR13, 2	INTCFG	Interrupt function setting	SV

(a) FPIPR — FPI Exception Interrupt Priority Setting Register

This register is used to set the interrupt priority of FPI exception.

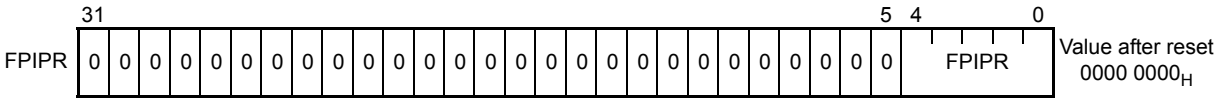

Table 3.31 FPIPR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	FPIPR	These bits are used to specify the interrupt priority of floating-point operation exceptions (imprecise) (FPI). Specify values from 0 to 16. Specifying 17 or greater is prohibited. FPI exceptions are handled using the specified interrupt priority. If an FPI exception occurs at the same time as an interrupt that has the same priority, the FPI exception is prioritized. **NOTE** A set value of more than 16 is treated as 16.	R/W	0

(b) ISPR — Priority of Interrupt being Serviced Register

This register retains the priority of the EIINTn interrupt being serviced by the CPU. This priority value is then used to perform priority ceiling processing when multiple interrupts occur.

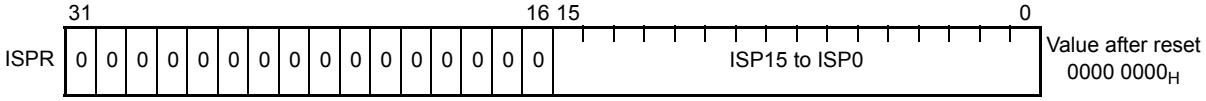

Table 3.32 ISPR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	ISP15 to ISP0	These bits indicate the acknowledgment status of an EIINTn interrupt with a priority that corresponds to the relevant bit position. 0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged. 1: An interrupt request for an interrupt whose priority corresponds to the relevant bit position is being serviced by the CPU core. The bit positions correspond to the following priority levels. **Bit** / **Priority** 0 / Priority 0 (highest) 1 / Priority 1 ... 14 / Priority 14 15 / Priority 15 (lowest) When an interrupt request (EIINTn) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to ISP0 bits that are set to 1 (0 is the highest priority) is cleared to 0.*1 While a bit in this register is set to 1, same or lower priority interrupts (EIINTn) and FPI exceptions*2 are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged. When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit.	R*3	0

Note 1. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) to the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.

Note 2. Since FPI exceptions have the same level of priority as EIINTn interrupts, they are affected by interrupts in the same way as the ISPR. The priority of FPI exceptions is set by the FPIPR register.

Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

(c) PMR — Interrupt Priority Masking Register

This register is used to mask the specified interrupt priority.

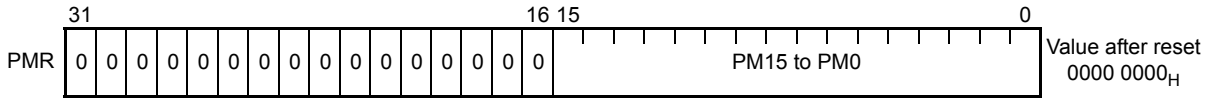

Table 3.33 PMR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	PM15 to PM0	These bits mask an interrupt request with a priority level that corresponds to the relevant bit position. 0: Servicing of an interrupt with a priority that corresponds to the relevant bit position is enabled. 1: Servicing of an interrupt with a priority that corresponds to the relevant bit position is disabled. The bit positions correspond to the following priority levels: **Bit** / **Priority** 0 / Priority 0 (highest) 1 / Priority 1 ... 14 / Priority 14 15 / Priority 15 and priority 16 (lowest) While a bit in this register is set to 1, interrupts (EIINTn) and FPI exceptions*1 with the priority corresponding to that bit are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged*2.	R/W	0

Note 1. Since FPI exceptions are specified as the same level of priority as that of interrupts (EIINTn), it is affected by the PMR like interrupts. The priority of FPI exceptions is set by the FPIPR register.

Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, $FF00_H$ can be set, but $F0F0_H$ or $00FF_H$ cannot.

(d) ICSR — Interrupt Control Status Register

This register indicates the interrupt control status in the CPU.

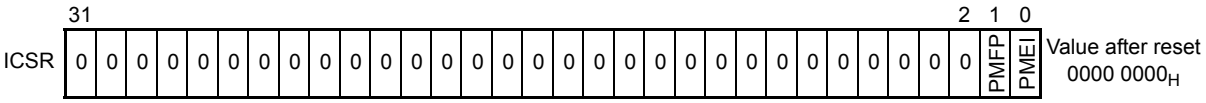

Table 3.34 ICSR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	PMFP	This bit indicates that an FPI exception with the priority level masked by the PMR register exists.	R	0
0	PMEI	This bit indicates that an interrupt (EIINTn) with the priority level masked by the PMR register exists.	R	0

(e) INTCFG — Interrupt Function Setting Register

This register is used to specify settings related to the CPU's internal interrupt function.

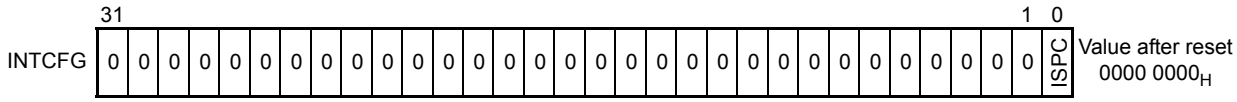

Table 3.35 INTCFG Register Contents

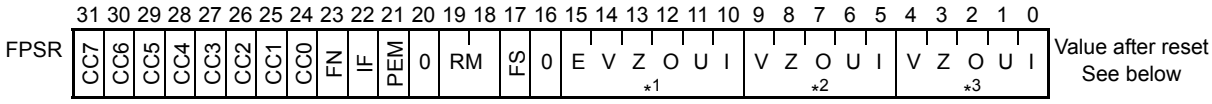
Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	ISPC	This bit specifies how the ISPR register is updated. 0: The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored. 1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed. If this bit is cleared to 0, the bits of the ISPR register are automatically set to 1 when an interrupt (EIINTn) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, updating by the program (via execution of an LDSR instruction) is ignored. If this bit is set to 1, the bits of the ISPR register are not updated by the acknowledgement of an interrupt (EIINTn) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program. In normal cases, the ISPC bit should be cleared to 0. When performing software-based control of interrupt priorities, however, set this bit (1) and perform priority control by using the PMR register.	R/W	0

(4) FPU Function Registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations. The RH850/F1K supports single-precision floating-point instruction and thirty-two 32-bit registers can be specified.



These registers correspond to general-purpose registers r0 to r31. The FPU can use the following system registers to control floating-point operation.

Table 3.36 FPU System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR6, 0	FPSR	Floating-point operation setting/status	CU and SV
SR7, 0	FPEPC	Floating-point operation exception program counter	CU and SV
SR8, 0	FPST	Floating-point status	CU
SR9, 0	FPCC	Floating-point operation comparison result	CU
SR10, 0	FPCFG	Floating-point function setting	CU
SR11, 0	FPEC	Floating-point operation exception control	CU and SV

(a) FPSR — Floating-point Operation Setting/Status Register

This register indicates the execution status of floating-point operations and any exceptions that occur.

Note 1. Cause bits (XC)
Note 2. Enable bits(XE)
Note 3. Preservation bits (XP)

Table 3.37 FPSR Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 24	CC[7:0]	These are the CC (condition) bits. They store the results of floating-point comparison instructions. The CC7 to CC0 bits are not affected by any instructions except the comparison instruction and LDSR instruction. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined
23	FN	This bit enables flush-to-nearest mode. When the FN bit is set to 1, if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number.	R/W	0
22	IF	This bit accumulates and indicates information about the flushing of input operands.	R/W	0
21	PEM	This bit specifies whether to handle an exception as a precise exception. If the PEM bit is 1, exceptions that are caused by the execution of a floating-point operation instruction are handled as precise exceptions.	R/W	0
20	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

Table 3.37 FPSR Register Contents (2/2)

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th><th>R/W</th><th>Value after Reset</th></tr>
<tr><td>19, 18</td><td>RM</td><td>These are the rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions.
<table>
<tr><th colspan="2">RM bits</th><th rowspan="2">Mnemonic</th><th rowspan="2">Description</th></tr>
<tr><th>19</th><th>18</th></tr>
<tr><td>0</td><td>0</td><td>RN</td><td>Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.</td></tr>
<tr><td>0</td><td>1</td><td>RZ</td><td>Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.</td></tr>
<tr><td>1</td><td>0</td><td>RP</td><td>Rounds the result toward +∞. The result is nearest to a value greater than the accurate result with infinite accuracy.</td></tr>

</table>

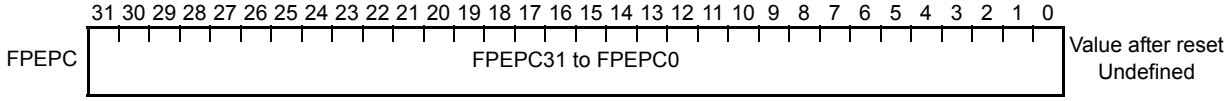
(b) FPEPC — Floating-point Exception Program Counter Register

When an exception that is enabled by an enable bit occurs, the program counter (PC) of the instruction that caused the exception is stored.



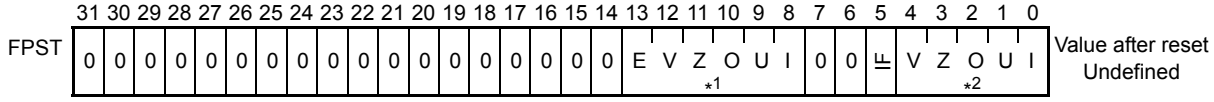


Table 3.38 FPEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	FPEPC31 to FPEPC1	These bits store the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs.	R/W	Undefined
0	FPEPC0	This bit stores the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs. Always set this bit to 0.	R	0

(c) FPST — Floating-point Operation Status Register

This register reflects the contents of the FPSR register bits related to the operation status.

Note 1. Cause bits (XC)

Note 2. Preservation bits (XP)

Table 3.39 FPST Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 14	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
13 to 8	XC (E, V, Z, O, U, I)	These are cause bits. Values written to these bits are reflected in FPSR.XC bits.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	IF	This bit accumulates and indicates information about the flushing of input operands.	R/W	0
4 to 0	XP (V, Z, O, U, I)	These are preservation bits. Values written to these bits are reflected in FPSR.XP bits.	R/W	Undefined

(d) FPCC — Floating-point Operation Comparison Result Register

This register reflects the contents of the FPSR.CC[7:0] bits.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
FPCC	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	CC7	CC6	CC5	CC4	CC3	CC2	CC1	CC0	Value after reset Undefined

Table 3.40 FPCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	CC[7:0]	These are CC (condition) bits. They store the result of a floating-point comparison instruction. The CC[7:0] bits are not affected by any instructions except the comparison instruction and LDSR instruction. Values written to these bits are reflected in the CC[7:0] bits of FPSR. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined

(e) FPCFG — Floating-point Operation Configuration Register

This register reflects the contents of the FPSR register bits related to the operation settings.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
FPCFG	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	RM		0	0	0	V	Z	O *1	U	I	Value after reset 0000 0000_H

Note 1. Enable bits (XE)

Table 3.41 FPCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 10	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
9, 8	RM	These are rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions. Values written to these bits are reflected in RM bits of FPSR.	R/W	0

RM bits			
9	8	Mnemonic	Description
0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.
0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.
1	0	RP	Rounds the result toward + ∞. The result is nearest to a value greater than the accurate result with infinite accuracy.
1	1	RM	Rounds the result toward – ∞. The result is nearest to a value less than the accurate result with infinite accuracy.

7 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	XE (V, Z, O, U, I)	These are the enable bits.	R/W	0

(f) FPEC — Floating-point Exception Control Register

This register controls the floating-point operation exception.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
FPEC	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	FPIVD	Value after reset 0000 0000$_H$

Table 3.42 FPEC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	FPIVD*1	This bit indicates the status of reporting the FPI exception. If this bit is set to 1, the FPI exception is reported to the CPU but is not acknowledged. It is automatically cleared to 0 when the CPU acknowledges the FPI exception. While this bit is set to 1, all the floating-point instructions are invalidated. Report of the FPI exception can be canceled by clearing (0) this bit by the LDSR instruction while it is set to 1. When report of the FPI exception is canceled, the CPU does not acknowledge the FPI exception. 0: FPI exception is not reported. 1: FPI exception is reported.	R/W	0

Note 1. The FPIVD bit can only be cleared to 0 by the write operation of the LDSR instruction. It cannot be set to 1.

(5) MPU Function Registers

Table 3.43 MPU Function System Registers (1/2)

Register No. (regID, selID)	Symbol	Function	Access Permission
SR0, 5	MPM	Memory protection operation mode setting	SV
SR1, 5	MPRC	MPU region control	SV
SR4, 5	MPBRGN	MPU base region number	SV
SR5, 5	MPTRGN	MPU end region number	SV
SR8, 5	MCA	Memory protection setting check address	SV
SR9, 5	MCS	Memory protection setting check size	SV
SR10, 5	MCC	Memory protection setting check command	SV
SR11, 5	MCR	Memory protection setting check result	SV
SR0, 6	MPLA0	Protection area lower limit address	SV

SR30, 7	MPAT15	Protection area attribute	SV

(a) MPM — Memory Protection Operation Mode Register

The memory protection mode register is used to define the basic operating state of the memory protection function. The settings for this register are normally specified once on startup and are not changed during program execution.

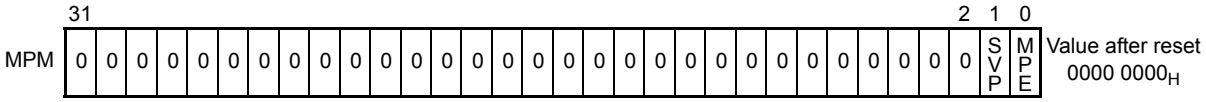

Table 3.44 MPM Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	SVP	In SV mode (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.*1 0: As usual, implicitly enable all access in SV mode. 1: Restrict access according to the SX, SW, and SR bits even in SV mode.*2	R/W	0
0	MPE	This bit is used to specify whether to enable or disable the MPU function. 0: Disable 1: Enable	R/W	0

Note 1. If the SVP bit is set to 1, access will be restricted in accordance with the setting for each protection area, even in SV mode. Therefore, specify the protection area beforehand so that the access from the program which set the SVP bit is not restricted.

Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

(b) MPRC — MPU Region Control Register

Bits used to perform special memory protection function operations are located in this register.

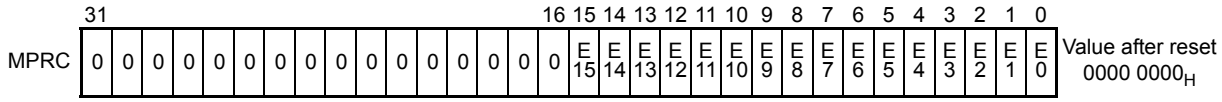

Table 3.45 MPRC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	E15 to E0	These are the enable bits for each protection area. Bit En is a copy of bit MPATn.E (where n = 15 to 0).	R/W	0

(c) MPBRGN — MPU Base Region Register

This register indicates the minimum usable MPU area number.

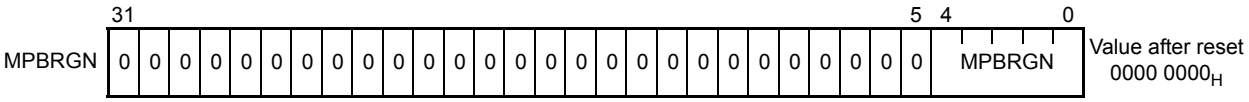

Table 3.46 MPBRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	MPBRGN	These bits indicate the smallest number of an MPU area. These bits always indicate 0.	R	0

(d) MPTRGN — MPU End Region Register

This register indicates the maximum usable MPU area number + 1.

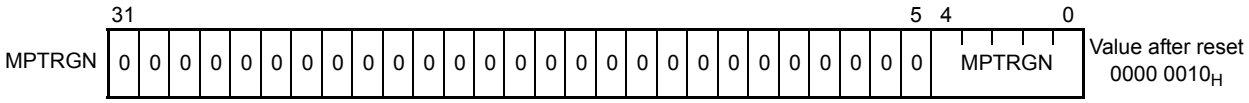

Table 3.47 MPTRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	MPTRGN	These bits indicate the largest number of an MPU area + 1. These bits indicate the maximum number of MPU areas incorporated into the hardware.	R	10000B

(e) MCA — Memory Protection Setting Check Address Register

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

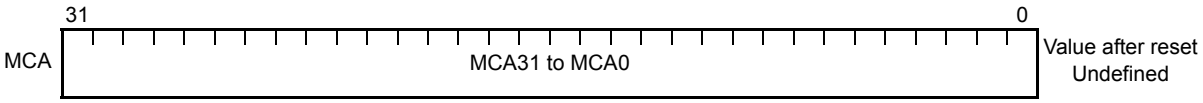

Table 3.48 MCA Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCA31 to MCA0	These bits are used to specify the start address of the memory area that is subject to a memory protection setting check in bytes.	R/W	Undefined

(f) MCS — Memory Protection Setting Check Size Register

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

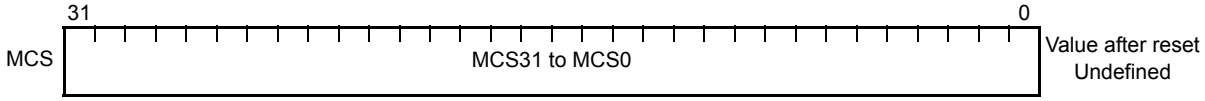

Table 3.49 MCS Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCS31 to MCS0	These bits are used to specify the size of the memory area that is subject to a memory protection setting check and the size of the target area in bytes. Because the specified size is assumed to represent an unsigned integer, it is not possible to check an area in the direction in which the address value decreases relative to the MCA register value. Do not specify 0000 0000_H for the MCS register.	R/W	Undefined

(g) MCC — Memory Protection Setting Check Command Register

This register is used to specify the base address of the area where memory protection settings are checked.

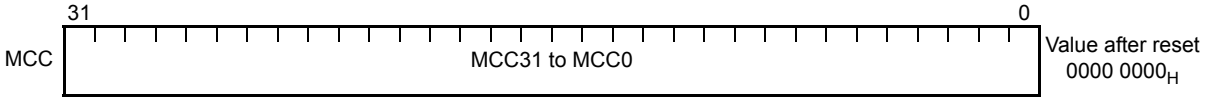

Table 3.50 MCC Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 0	MCC31 to MCC0	When any value is written to the MCC register, a memory protection setting check starts. By setting up the MCA/MCS register and then writing to the MCC register, results are stored in MCR. Because the check is started by any written value, a check can be started by using r0 as the source register without using any unnecessary registers. Note that, for the check, the results are applied according to each area setting regardless of the state of the PSW.UM bit. When the MCC register is read, value 0000 0000_H is always returned.	R/W	0

(h) MCR — Memory Protection Setting Check Result Register

This register is used to store the results of a memory protection setting check.

Be sure to clear bits 31 to 9, 7 and 6.

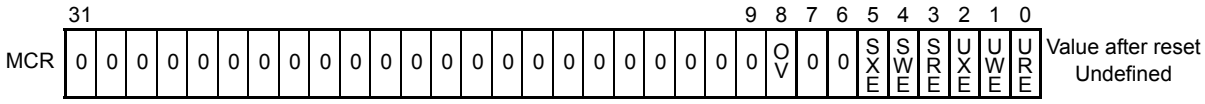

Table 3.51 MCR Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 9	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
8	OV	If the specified area includes 0000 0000$_H$ or 7FFF FFFF$_H$, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	SXE	If the specified area is contained within one of the protection areas and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
4	SWE	If the specified area is contained within one of the protection areas and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
3	SRE	If the specified area is contained within one of the protection areas and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
2	UXE	If the specified area is contained within one of the protection areas and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
1	UWE	If the specified area is contained within one of the protection areas and writing to that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
0	URE	If the specified area is contained within one of the protection areas and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined

(i) MPLAn — Protection Area Lower Limit Address Register

These registers indicate the lower limit address of area n (where n = 0 to 15).

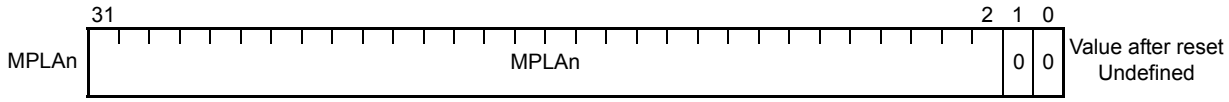

Table 3.52 MPLAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPLA31 to MPLA2	These bits indicate the lower limit address of area n. For MPLA1 and MPLA0, 0 is used implicitly.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(j) MPUAn — Protection Area Upper Limit Address Register

These registers indicate the upper limit address of area n (where n = 0 to 15).

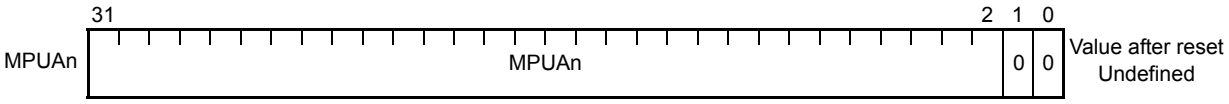

Table 3.53 MPUAn Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 2	MPUA31 to MPUA2	These bits indicate the upper limit address of area n. For MPUAn.MPUA1 and MPUA0, 1 is used implicitly.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(k) MPATn — Protection Area Attribute Register

These registers indicate the attributes of area n (where n = 0 to 15).

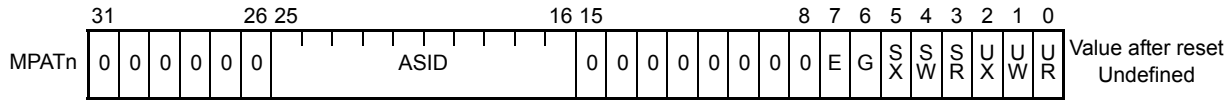

Table 3.54 MPATn Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 26	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
25 to 16	ASID	These bits indicate the ASID value to be used as the area match condition.	R/W	Undefined
15 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	E	This bit indicates whether area n is enabled or disabled. 0: Area n is disabled. 1: Area n is enabled.	R/W	0
6	G	0: Areas match only if ASIDs are equal. 1: Areas match even if ASIDs are not equal. If this bit is 0, MPATn.ASID = ASID.ASID is used as the area match condition. If this bit is 1, areas may match even if the values of MPATn.ASID and ASID.ASID are not equal.	R/W	Undefined

Table 3.54 MPATn Register Contents (2/2)

Bit Position	Bit Name	Function	R/W	Value after Reset
5	SX	This bit indicates the execution privilege for the supervisor mode.*1 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
4	SW	This bit indicates whether writing is enabled in the supervisor mode.*1 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
3	SR	This bit indicates whether writing is enabled in the supervisor mode.*1 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined
2	UX	This bit indicates the execution privilege for the user mode. 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
1	UW	This bit indicates whether writing is enabled in the user mode. 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
0	UR	This bit indicates whether writing is enabled in the user mode. 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access by the exception handler and to the memory area necessary for exception handling is permitted.

(6) Cache Operation Function Registers

The RH850/F1K does not include a cache operation function, so all the following registers return a value of 0 when read, and writing to these registers is ignored.

Table 3.55 Cache Operation Function Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR12, 4	BWERRL	Not implemented. A value of 0 is returned when read and writing is ignored.	SV
SR13, 4	BWERRH		SV
SR14, 4	BRERRL		SV
SR15, 4	BRERRH		SV
SR16, 4	ICTAGL		SV
SR17, 4	ICTAGH		SV
SR18, 4	ICDATL		SV
SR19, 4	ICDATH		SV
SR20, 4	DCTAGL		SV
SR21, 4	DCTAGH		SV
SR22, 4	DCDATL		SV
SR23, 4	DCDATH		SV
SR24, 4	ICCTRL		SV
SR25, 4	DCCTRL		SV
SR26, 4	ICCFG		SV
SR27, 4	DCCFG		SV
SR28, 4	ICERR		SV
SR29, 4	DCERR		SV

3.2.1.3 Instruction

See *"Instruction" in Software Manual*.

A snooze instruction halts operation of the CPU core for 32 clocks.

3.2.2 Buffers for Code Flash

3.2.2.1 Features

CPU accesses Code flash by two paths; instruction fetch access is direct to Flash interface, and data access is via System interconnect to Code Flash. Both paths equip buffers, which can be cleared by software. See also **Figure 33.1 "Block Diagram of Code Flash ECC"** for ECC decoders in these paths.

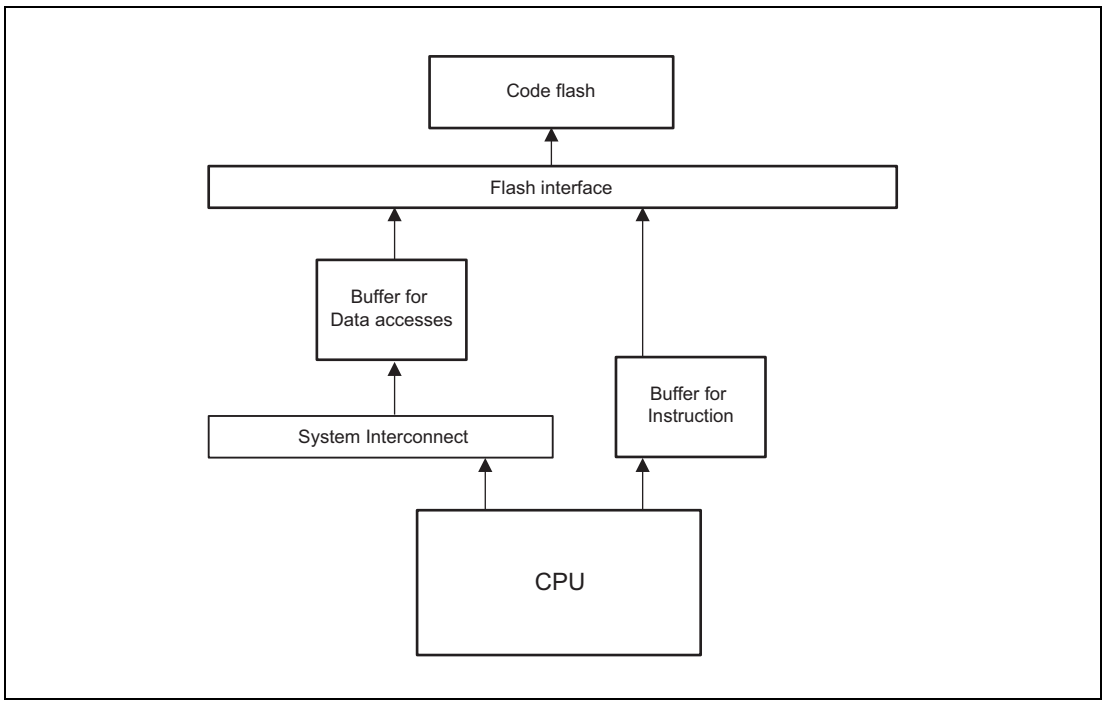

Figure 3.2 Buffers for Code Flash

3.2.2.2 Function of Buffers

One-line buffer with 128 bits is mounted for instruction fetches to code flash. The data is read out from the buffer after the next access to the same address, so the code flash is not accessed again within 128 bits location.

One-line buffer with 128 bits is mounted as a data buffer. This buffer is not only used by the CPU but also used by DMA via system interconnect. The data is read out from the buffer if the next access is within the same 128 bits boundary.

One buffer control register named FBUFCCTL is equipped. Using the FBUFCCTL register, the software can clear these two buffers.

3.2.2.3 Registers for Buffer Control

(1) List of Buffer Control Registers

Table 3.56 Buffer Control Register (Base Address: FFC5 B000$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32	
FBUF_CTRL	+000$_H$	4	Flash Buffer Clear Control Register	FBUFCCTL	—	R/W	—	√	√	√	0000 0000$_H$

(2) Register Sets

	31																												0	
FBUFCCTL	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	FBUFCLR

Value after reset
0000 0000$_H$

Table 3.57 FBUFCCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value after Reset
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.	R	0
0	FBUFCLR	Buffer clear bits. To clear buffers, write 1 to this bit and then write 0. 0: Buffers are valid 1: Buffers are invalid (cleared)	R/W	0

Please do following procedures when you want to clear the buffers.

Step 1: Write 0 to FBUFCCTL.FBUFCLR

Step 2: Write 1 to FBUFCCTL.FBUFCLR

Step 3: Write 0 to FBUFCCTL.FBUFCLR

Step 4: Read the FBUFCCTL register (dummy read)

Step 5: Execute the SYNCP instruction

Step 6: Execute the SYNCI instruction

If you do not do Step 3 after Step 2, the buffers are kept invalid during FBUFCCTL.FBUFCLR = 1.

3.2.3 Reliability Functions

3.2.3.1 PE Guard Function (PEG)

(1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the CPU (PE) from an external master. This function protects access to the local RAM and the retention RAM in the PE. In the initial state after a reset, access by masters other than own PE is disabled. Setting the registers listed in **(3) List of PEG Protection Setting Registers** enables access by masters other than own PE.

(1) Detecting PE guard violation
If an external master makes an unauthorized access to the resource area in a PE for which PE guard is set, the access is detected as a PE guard violation.

(2) Blocking unauthorized access
When a PE guard violation is detected, unauthorized access to the internal resources of the PE are blocked to prevent unauthorized modification of the contents of PE resources.

(3) Notifying occurrence of violation
An error response to an unauthorized access is sent to the request source of external master. When DMA Controller makes an unauthorized access, meanwhile, a DMA transfer error is detected. A PE guard violation is notified as INTGUARD interrupt request which is a source of FEINT.

(2) Protection Made by SPID

- Setting PEG Protection
  - Up to four areas can be set depending on the Local RAM address and the retention RAM address of the own PE.
  - The area range is specified by the base address and the mask bit (4 kbytes to 4 Gbytes).
  - “Read enable” and “write enable” can be set for each area.
  - “Enable” or “disable” can be selected based on the system protection identifier (SPID) for each area.
- Procedure for permitting access by using the system protection identifier (SPID)

1. Is the area subject to access is the local RAM area or the retention RAM area? If so, go to step 2.
2. Is the area subject to access is within the range of valid areas 0, 1, 2, or 3? If so, go to step 3. Otherwise, return an error response.
3. Are all the conditions below for the relevant area satisfied? If so, permit access.
   - The system protection identifier (SPID) is enabled.
   - Required operations (read/write) are enabled.

   Otherwise, return an error response.

(3) List of PEG Protection Setting Registers

Specify the necessary settings in the registers below to protect PE resources from unauthorized access by an external master.

- Whether to permit access to the local RAM and the retention RAM in the PE can be specified.

Table 3.58 PEG registers (Base Address : FFFE E600$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after Reset
							1	8	16	32	
PEG	+00C$_H$	4	PEG SPID control register	PEGSP	—	R/W	—	√	√	√	0000 0000$_H$
	+080$_H$	4	PEG area 0 mask setting register	PEGG0MK	—	R/W	—	√	√	√	0000 0000$_H$
	+084$_H$	4	PEG area 0 base setting register	PEGG0BA	—	R/W	—	√	√	√	0000 0000$_H$
	+090$_H$	4	PEG area 1 mask setting register	PEGG1MK	—	R/W	—	√	√	√	0000 0000$_H$
	+094$_H$	4	PEG area 1 base setting register	PEGG1BA	—	R/W	—	√	√	√	0000 0000$_H$
	+0A0$_H$	4	PEG area 2 mask setting register	PEGG2MK	—	R/W	—	√	√	√	0000 0000$_H$
	+0A4$_H$	4	PEG area 2 base setting register	PEGG2BA	—	R/W	—	√	√	√	0000 0000$_H$
	+0B0$_H$	4	PEG area 3 mask setting register	PEGG3MK	—	R/W	—	√	√	√	0000 0000$_H$
	+0B4$_H$	4	PEG area 3 base setting register	PEGG3BA	—	R/W	—	√	√	√	0000 0000$_H$

(4) Register Set

(a) PEGSP — PEG SPID Control Register

Access: PEGSP register can be read or written in 32-bit units.
PEGSPL register can be read or written in 16-bit units.
PEGSPLL register can be read or written in 8-bit units.

Address: PEGSP: FFFE E60C$_H$
PEGSPL: FFFE E60C$_H$
PEGSPLL: FFFE E60C$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 3.59 PEGSP Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SPEN	Access permission to external master with specified SPID. 0: Not permit. 1: Permit.

(b) PEGGnMK — PEG Area n Mask Setting Register (n = 0 to 3)

The PEGGnMK register defines which bits of PEGGnBA.GnBASE are compared with the access address. If bit PEGGnMK.GnMASK[m] is cleared, bit PEGGnBA.GnBASE[m] is compared with bit m of the access address.

Access: PEGGnMK register can be read or written in 32-bit units.
PEGGnMKL, PEGGnMKH registers can be read or written in 16-bit units.
PEGGnMKLH, PEGGnMKHL, PEGGnMKHH registers can be read or written in 8-bit units.

Address: PEGGnMK: FFFE $E680_H$ + (10_H × n)
PEGGnMKL: FFFE $E680_H$ + (10_H × n),
PEGGnMKH: FFFE $E682_H$ + (10_H × n)
PEGGnMKLH: FFFE $E681_H$ + (10_H × n),
PEGGnMKHL: FFFE $E682_H$ + (10_H × n),
PEGGnMKHH: FFFE $E683_H$ + (10_H × n)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 3.60 PEGGnMK Register Contents

Bit Position	Bit Name	Function
31 to 12	GnMASK	0: Target bits are compared when determining the PE guard area. 1: Target bits are not compared when determining the PE guard area.
11 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

NOTE

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

(c) PEGGnBA — PEG Area n Base Setting Register (n = 0 to 3)

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n. Setting the GnEN bit to 1 validates the access enable conditions specified by this register and the PEGGnMK register.

Access: PEGGnBA register can be read or written in 32-bit units.
PEGGnBAL, PEGGnBAH registers can be read or written in 16-bit units.
PEGGnBALL, PEGGnBALH, PEGGnBAHL, PEGGnBAHH registers can be read or written in 8-bit units.

Address: PEGGnBA: FFFE $E684_H$ + (10_H × n)
PEGGnBAL: FFFE $E684_H$ + (10_H × n),
PEGGnBAH: FFFE $E686_H$ + (10_H × n)
PEGGnBALL: FFFE $E684_H$ + (10_H × n),
PEGGnBALH: FFFE $E685_H$ + (10_H × n),
PEGGnBAHL: FFFE $E686_H$ + (10_H × n),

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Table 3.61 PEGGnBA Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 12	GnBASE	Base address that specifies the range of PE guard protection area n.
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	GnSP3	Access permission setting from SPID = 3 external master to PE guard protection area n. 0: Not permit. 1: Permit.
6	GnSP2	Access permission setting from SPID = 2 external master to PE guard protection area n. 0: Not permit. 1: Permit.
5	GnSP1	Access permission setting from SPID = 1 external master to PE guard protection area n. 0: Not permit. 1: Permit.
4	GnSP0	Access permission setting from SPID = 0 external master to PE guard protection area n. 0: Not permit. 1: Permit.
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	GnWR	Write access permission to PE guard protection area n. 0: Write access is disabled. 1: Write access is enabled.
1	GnRD	Read access permission to PE guard protection area n. 0: Read access is disabled. 1: Read access is enabled.

Table 3.61 PEGGnBA Register Contents (2/2)

Bit Position	Bit Name	Function
0	GnEN	Enables or Disables the setting for the access enable conditions to PE guard protection area n. 0: Settings for access enable conditions are disabled. 1: Settings for access enable conditions are enabled.

NOTE

When you write to the PEGGnMK register, the corresponding GnEN bit in the PEGGnBA register is cleared automatically.

3.2.3.2 System Error Generator Function (SEG)

SEG (SysErrGen) controls interrupt notification and recording after a system error occurred by a data access.

Multiple error occurrence inputs are categorized according to error factor, and are processed sequentially from the highest-priority error factor, generating an FE-level asynchronous exception (SYSERR).

The bit position of the SEGFLAG register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits.

Error address information is recorded only once regardless of error frequency.

The error with the highest priority among the error factors is valid when errors occur simultaneously. Recorded error address information is not overwritten by subsequent errors.

(1) List of SEG Function Control Registers

Table 3.62 SEG Registers (Base Address: FFFE E980$_H$)

Module Name	Address Offset	Size (Byte)	Register Name	Abbreviation	Right *1	R/W	Operable Bit				Value after Reset
							1	8	16	32	
SEG	+00$_H$	2	SEG Error control register	SEGCONT	SV	R/W	—	—	√	—	0000$_H$
	+02$_H$	2	SEG Error flag register	SEGFLAG	SV	R/W	—	—	√	—	0000$_H$
	+08$_H$	4	SEG Error address information register	SEGADDR	SV	R/W	—	—	—	√	Undefined (retained)

Note 1. Registers for which “SV” is described are writable with the SV right (UM = 0). Attempting to write, if these conditions do not hold, leads to a SYSERR exception with setting VCIF flag. No restriction is provided for read accesses.

(2) Register Set

(a) SEGCONT — SEG Error Control Register

This register is used to enable (= 1) or disable (= 0) notification of SysErr request in response to error flags that store the error occurrence status for each factor.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCSE	APIE	—	—	TCME	—	VCIE	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R	R	R/W	R	R/W	R	R	R	R

Table 3.63 SEGCONT Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	VCSE	This bit enables notification of an error response detected inside system interconnect.
9	APIE	This bit enables notification of an error response from peripherals. The error notification includes the following cases: • Error response from peripherals in write access • PBG error in write access
8 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCME	This bit enables notification of an error during data access to its own local RAM and retention RAM. The error notification includes the following cases: • ECC uncorrectable error • Detection of an access to RAM unimplemented area
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	VCIE	• This bit enables notification of an error response during access to P-Bus. The error notification includes the following cases: – Error response from peripherals (excluding errors in write access) – PBG error (excluding errors in write access) • This bit enables notification of an error response during access to code flash. The error notification includes the following cases: – ECC uncorrectable error • This bit enables notification of an error response when accessing to a part of access prohibited areas in address map.
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

(b) SEGFLAG — SEG Error Flag Register

This register indicates error flags that store error occurrence status of each factors. The flags are set to 1 by an error occurrence input. The flags are not automatically cleared to 0. Both setting and clearing of each flag are supported in writing to the register.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VCSF	APIF	—	—	TCMF	—	VCIF	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R	R	R/W	R	R/W	R	R	R	R

Table 3.64 SEGFLAG Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	VCSF	Flag corresponding to bit 10 of the SEGCONT register
9	APIF	Flag corresponding to bit 9 of the SEGCONT register
8 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCMF	Flag corresponding to bit 6 of the SEGCONT register
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	VCIF	Flag corresponding to bit 4 of the SEGCONT register
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

NOTE

An error may lead to setting of multiple error flags in SEG.

(c) SEGADDR — Error Address Information Register

Address information (one record) which is notified with error occurence is stored in the register. The register is not updated while one or more bits in SEGFLAG register are set.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Address[31:16]															
Value after reset	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Address[15:0]															
Value after reset	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

×: Undefined (retained)

Table 3.65 SEGADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	Address	These bits store the error address information.

Note 1. SEGADDR stores error address information in case of an error occurrence related to VCIF bit or TCMF bit in SEGFLAG register. SEGADDR register stores all 0 data in case of an error occurrence related to VCSF bit and APIF bit in SEGFLAG register.

Note 2. In case of an error occurrence related to TCMF bit in SEGFLAG register, bit[18:0] of the error address are stored in SEGADDR[18:0] and SEGADDR[31:19] are filled with 0.

(3) SEG Function

(a) SEG Function: SYSERR request notification by error Flag

- Setting an error flag takes precedence over clearing the same flag.
  - A simultaneous clearing operation is ignored.
- Priority of error factors
  - The bit position of each flags in SEGFLAG register which error notification is enabled by SEGCONT register becomes the error factor priority. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
  - The bit position of error factors is reported as a “SysErr factor code.”
- Conditions for starting SysErr request notification
  - Even if a flag which error notification is disabled by SEGCONT register is set to 1, notification is not made.
  - Notification is made immediately after a flag which error notification is enabled by SEGCONT register is set to 1.
  - After clearing of a flag, notification is made if an other flag which error notification is enabled by SEGCONT register remains set.
- Finishing notification at a SysErr acknowledgement
  - Even after notification is finished, the flag is not cleared automatically.
  - Notification is not made until setting or clearing the flag again.
  - If an error flag that is prioritized higher than the error factor is set prior to an acknowledgement, the notification information may be replaced with a higher prioritized SysErr factor code.

(b) SEG Function: Recording Error Address Information

- When an error which error notification is enabled by SEGCONT register occurs, the error address is retained in the SEGADDR register.
  - No information is retained by setting or clearing an error flag in SEGFLAG register.
  - When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While a flag which error notification is enabled by SEGCONT register is set to 1, overwrite to the SEGADDR register is inhibited.
  - If error occurrence input continues, information of subsequent error factors is not retained.
  - To reset the inhibition of overwrite to the register, clear either SEGCONT or SEGFLAG register (or both of them).

(c) Supplementary Notes on SYSERR Exception

- Even when a SYSERR exception occurs, the value of the PSW.EBV bit is held, and the base address of the exception handler does not switch.

3.3 Notes

3.3.1 Synchronization of Store Instruction Completion and Subsequent Instruction Execution

When a control register is updated by a store instruction, there is a time lag after the CPU executes the store instruction and before the control register is actually updated. Therefore, if the updated content of the control register is to be used by the instruction following the store instruction, the appropriate synchronization is required. How to perform synchronization processing is shown below.

For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see *APPENDIX A. Hazard Resolution Procedure for System Registers* in the *RH850G3KH User's Manual: Software.*

When the updated results in the control registers are to be used by the subsequent instruction:

Example 1: An interrupt is enabled by execution of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits. Proceed as follows in this case.

(1) Execute the store instruction to update a control register (ST.W, etc).

(2) Perform a dummy read of the above control register (LD.W, etc).

(3) Execute SYNCP.

(4) Execute the subsequent instruction (EI).

In case of RH850/F1K, SYNCM instruction has the same effects as above-mentioned (2) and (3).

Example 2: When you must wait until a control register (control register A) has been completely updated before accessing another control register (control register B), execute similar processing. For example, different peripheral functions are linked, or the interrupt mask for INTC is cleared after the peripheral function is set. Note that this processing is not required if the control registers A and B belong to the same peripheral group.

(1) Execute the store instruction to update the control register A (ST.W, etc).

(2) Perform a dummy read of the above control register (LD.W, etc).

(3) Execute SYNCP.

(4) Execute the store instruction to access the control register B (ST.W, LD.W, etc).

In case of RH850/F1K, SYNCM instruction has the same effects as above-mentioned (2) and (3).

The similar processing is also required when starting to access a memory or control register to be protected is started after a safety function (such as some kind of memory protection and ECC) has been completely set up.

When the updated results of the control register or memory to be used in the instruction fetch of the subsequent instruction:

(a) In case of writing the instructions to the RAM before jumping to the RAM to execute instructions from the RAM, take the following procedure.

(1) Execute the store instruction to update a memory (ST.W, etc).

(2) Perform a dummy read of the above memory (LD.W, etc).

(3) Execute SYNCP.

(4) Execute SYNCI.

(5) Execute the subsequent instruction (branch instruction, etc).

(b) In case of updating control registers for memory protection and ECC functions before jumping to the memory to be controlled by the registers, take the following procedure.

(1) Execute the store instruction to update a control register (ST.W, etc).

(2) Perform a dummy read of the control register (LD.W, etc).

(3) Execute SYNCP.

(4) Execute SYNCI.

(5) Execute the subsequent instruction (branch instruction, etc).

When switching the code flash memory area:

In this case, see *Section 10, Usage Notes, (7) Updating the BFASELR register* in the *RH850/F1K Flash Memory User's Manual: Hardware Interface*.

3.3.2 Ensure Coherency after Rewriting the Code Flash

The CPU1 is equipped with the buffer for the code flash area as described in **Section 3.2.2, Buffers for Code Flash**.

Therefore, clear the buffer to ensure coherency after rewriting the code flash by self-programming.

3.3.3 Access to Registers by Using Bit-Manipulation Instructions

Writing bit-manipulation instructions consists of read-modify-write processing in 8-bit units. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

3.3.4 Caution of Prefetching

There is a possibility that the reading of the memory occurs by pre-fetch from the area where instruction codes do not exist. Secure more than 40-byte initialized area after the area where instruction codes are stored.

Section 4 Address Space

4.1 Address Space

Table 4.1, **Table 4.2**, **Table 4.3** and **Table 4.4** show the address space of the RH850/F1K.

CAUTION

Do not access an address with which no register is mapped in the on-chip I/O register space. In addition, do not access any access prohibited area specified in Table 4.1, Table 4.2, Table 4.3 and Table 4.4. If such an address is accessed, operation is not guaranteed.

NOTE

CPU1 area: Address area accessible from CPU and DMA

Self area: Address area accessible only from CPU to refer the CPU's self resource

Table 4.1 Address Space (2-MB 100, 144, 176 Pin Product)

Address	Address Space Type	Size
$0000\ 0000_H$ to $001F\ FFFF_H$	Code flash	2 MB
$0020\ 0000_H$ to $00FF\ FFFF_H$	Access prohibited area	
$0100\ 0000_H$ to $0100\ 7FFF_H$	Code flash (extended user area)	32 KB
$0100\ 8000_H$ to $FEBC\ FFFF_H$	Access prohibited area	
$FEBD\ 0000_H$ to $FEBE\ FFFF_H$	Local RAM (CPU1 area)	128 KB
$FEBF\ 0000_H$ to $FEBF\ FFFF_H$	Retention RAM (CPU1 area)	64 KB
$FEC0\ 0000_H$ to $FEDC\ FFFF_H$	Access prohibited area	
$FEDD\ 0000_H$ to $FEDE\ FFFF_H$	Local RAM (self area)	128 KB
$FEDF\ 0000_H$ to $FEDF\ FFFF_H$	Retention RAM (self area)	64 KB
$FEE0\ 0000_H$ to $FF1F\ FFFF_H$	Access prohibited area	
$FF20\ 0000_H$ to $FF20\ FFFF_H$	Data flash	64 KB
$FF21\ 0000_H$ to $FF9F\ FFFF_H$	Access prohibited area	
$FFA0\ 0000_H$ to $FFFD\ FFFF_H$	On-chip peripheral I/O area	6 MB - 128 KB
$FFFE\ 0000_H$ to $FFFE\ DFFF_H$	Access prohibited area	
$FFFE\ E000_H$ to $FFFE\ FFFF_H$	On-chip peripheral I/O area (self area)	8 KB
$FFFF\ 0000_H$ to $FFFF\ 4FFF_H$	Access prohibited area	
$FFFF\ 5000_H$ to $FFFF\ FFFF_H$	On-chip peripheral I/O area	44 KB

Table 4.2 Address Space (1.5-MB 100, 144, 176 Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 0017 FFFF$_H$	Code flash	1.5 MB
0018 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code flash (extended user area)	32 KB
0100 8000$_H$ to FEBD 7FFF$_H$	Access prohibited area	
FEBD 8000$_H$ to FEBE FFFF$_H$	Local RAM (CPU1 area)	96 KB
FEBF 0000$_H$ to FEBF FFFF$_H$	Retention RAM (CPU1 area)	64 KB
FEC0 0000$_H$ to FEDD 7FFF$_H$	Access prohibited area	
FEDD 8000$_H$ to FEDE FFFF$_H$	Local RAM (self area)	96 KB
FEDF 0000$_H$ to FEDF FFFF$_H$	Retention RAM (self area)	64 KB
FEE0 0000$_H$ to FF1F FFFF$_H$	Access prohibited area	
FF20 0000$_H$ to FF20 FFFF$_H$	Data flash	64 KB
FF21 0000$_H$ to FF9F FFFF$_H$	Access prohibited area	
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area	
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area	
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	44 KB

Table 4.3 Address Space (1-MB 100, 144, 176 Pin Product)

Address	Address Space Type	Size
0000 0000$_H$ to 000F FFFF$_H$	Code flash	1 MB
0010 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	
0100 0000$_H$ to 0100 7FFF$_H$	Code flash (extended user area)	32 KB
0100 8000$_H$ to FEBD FFFF$_H$	Access prohibited area	
FEBE 0000$_H$ to FEBE FFFF$_H$	Local RAM (CPU1 area)	64 KB
FEBF 0000$_H$ to FEBF FFFF$_H$	Retention RAM (CPU1 area)	64 KB
FEC0 0000$_H$ to FEDD FFFF$_H$	Access prohibited area	
FEDE 0000$_H$ to FEDE FFFF$_H$	Local RAM (self area)	64 KB
FEDF 0000$_H$ to FEDF FFFF$_H$	Retention RAM (self area)	64 KB
FEE0 0000$_H$ to FF1F FFFF$_H$	Access prohibited area	
FF20 0000$_H$ to FF20 FFFF$_H$	Data flash	64 KB
FF21 0000$_H$ to FF9F FFFF$_H$	Access prohibited area	
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area	
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area	
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	44 KB

Table 4.4 Address Space (768-KB 100, 144 Pin Product)

Address	Address Space Type	Size
0000 0000_H to 000B $FFFF_H$	Code flash	768 KB
000C 0000_H to 00FF $FFFF_H$	Access prohibited area	
0100 0000_H to 0100 $7FFF_H$	Code flash (extended user area)	32 KB
0100 8000_H to FEBE $7FFF_H$	Access prohibited area	
FEBE 8000_H to FEBE $FFFF_H$	Local RAM (CPU1 area)	32 KB
FEBF 0000_H to FEBF $FFFF_H$	Retention RAM (CPU1 area)	64 KB
FEC0 0000_H to FEDE $7FFF_H$	Access prohibited area	
FEDE 8000_H to FEDE $FFFF_H$	Local RAM (self area)	32 KB
FEDF 0000_H to FEDF $FFFF_H$	Retention RAM (self area)	64 KB
FEE0 0000_H to FF1F $FFFF_H$	Access prohibited area	
FF20 0000_H to FF20 $FFFF_H$	Data flash	64 KB
FF21 0000_H to FF9F $FFFF_H$	Access prohibited area	
FFA0 0000_H to FFFD $FFFF_H$	On-chip peripheral I/O area	6 MB - 128 KB
FFFE 0000_H to FFFE $DFFF_H$	Access prohibited area	
FFFE $E000_H$ to FFFE $FFFF_H$	On-chip peripheral I/O area (self area)	8 KB
FFFF 0000_H to FFFF $4FFF_H$	Access prohibited area	
FFFF 5000_H to FFFF $FFFF_H$	On-chip peripheral I/O area	44 KB

4.2 Address Space Viewed from Each Bus Master

Table 4.5 shows address spaces viewed from each bus master.

4.2.1 Space in which Instructions can be Fetched

Instructions of the CPU can be fetched from the Code flash, Local RAM, and Retention RAM.

4.2.2 Data Space Accessible by CPU

See **Table 4.5** for the spaces accessible from the CPU.

4.2.3 Data Space Accessible by DMA

See **Table 4.5** for the spaces accessible from the DMA.

Table 4.5 Address Space Viewed from Each Bus Master (2-MB Product)

Address	Access from CPU	Access from DMA
0000 0000$_H$ to 001F FFFF$_H$	Code flash	Code flash
0020 0000$_H$ to 00FF FFFF$_H$	Access prohibited area	Access prohibited area
0100 0000$_H$ to 0100 7FFF$_H$	Code flash (extended user area)	Code flash (extended user area)
0100 8000$_H$ to FEBC FFFF$_H$	Access prohibited area	Access prohibited area
FEBD 0000$_H$ to FEBE FFFF$_H$	Local RAM (CPU1 area)	Local RAM (CPU1 area)
FEBF 0000$_H$ to FEBF FFFF$_H$	Retention RAM (CPU1 area)	Retention RAM (CPU1 area)
FEC0 0000$_H$ to FEDC FFFF$_H$	Access prohibited area	Access prohibited area
FEDD 0000$_H$ to FEDE FFFF$_H$	Local RAM (self area)	Access prohibited area
FEDF 0000$_H$ to FEDF FFFF$_H$	Retention RAM (self area)	Access prohibited area
FEE0 0000$_H$ to FF1F FFFF$_H$	Access prohibited area	Access prohibited area
FF20 0000$_H$ to FF20 FFFF$_H$	Data flash	Data flash
FF21 0000$_H$ to FF9F FFFF$_H$	Access prohibited area	Access prohibited area
FFA0 0000$_H$ to FFFD FFFF$_H$	On-chip peripheral I/O area	On-chip peripheral I/O area
FFFE 0000$_H$ to FFFE DFFF$_H$	Access prohibited area	Access prohibited area
FFFE E000$_H$ to FFFE FFFF$_H$	On-chip peripheral I/O area (self area)	Access prohibited area
FFFF 0000$_H$ to FFFF 4FFF$_H$	Access prohibited area	Access prohibited area
FFFF 5000$_H$ to FFFF FFFF$_H$	On-chip peripheral I/O area	On-chip peripheral I/O area

Note: The following color coding is used in the map above.

Fetch and data access available
Data access available
Access prohibited

4.3 Peripheral I/O Address Map

Table 4.6 shows peripheral I/O address map.

Table 4.6 Peripheral I/O Address Map (1/5)

Address	Peripheral Group	Peripheral I/O
FF00 0000$_H$ to FF1F FFFF$_H$	—	Access prohibited area
FF20 0000$_H$ to FF20 FFFF$_H$	2	Data flash
FF21 0000$_H$ to FF9F FFFF$_H$	—	Access prohibited area
FFA0 0000$_H$ to FFA0 001F$_H$	1	FLMD (FLMDCNT)
FFA0 0020$_H$ to FFA0 0FFF$_H$	—	Access prohibited area
FFA0 1000$_H$ to FFA0 103F$_H$	—	Access prohibited area
FFA0 1040$_H$ to FFA0 1FFF$_H$	—	Access prohibited area
FFA0 2000$_H$ to FFA0 201F$_H$	—	Access prohibited area
FFA0 2020$_H$ to FFA0 FFFF$_H$	—	Access prohibited area
FFA1 0000$_H$ to FFA1 1FFF$_H$	1	Flash controller
FFA1 2000$_H$ to FFA1 FFFF$_H$	—	Access prohibited area
FFA2 0000$_H$ to FFA2 FFFF$_H$	1	FACI command-issuing area
FFA3 0000$_H$ to FFBF FFFF$_H$	—	Access prohibited area
FFC0 0000$_H$ to FFC0 000F$_H$	1	FENMI
FFC0 0010$_H$ to FFC0 00FF$_H$	—	Access prohibited area

FFF7 8000_H to FFF7 8003_H	1	KR0
FFF7 8004_H to FFF7 $FFFF_H$	—	Access prohibited area
FFF8 0000_H to FFF8 $000F_H$	1	Write protected register (WPROTR)
FFF8 0010_H to FFF8 $00FF_H$	—	Access prohibited area
FFF8 0100_H to FFF8 $011F_H$	1	STBC0
FFF8 0120_H to FFF8 $03FF_H$	—	Access prohibited area
FFF8 0400_H to FFF8 $040F_H$	1	STBC_WUF0
FFF8 0410_H to FFF8 $051F_H$	—	Access prohibited area
FFF8 0520_H to FFF8 $052F_H$	1	STBC_WUF20
FFF8 0530_H to FFF8 $075F_H$	—	Access prohibited area
FFF8 0760_H to FFF8 $0AFF_H$	1	Reset controller/Supply voltage monitor (LVI, VLVI)
FFF8 $0B00_H$ to FFF8 $0FFF_H$	1	STBC_IOHOLD
FFF8 1000_H to FFF8 $2FFF_H$	1	Clock controller (CLKCTL)
FFF8 3000_H to FFF8 $307F_H$	1	LPS0
FFF8 3080_H to FFF8 $30FF_H$	—	Access prohibited area
FFF8 3100_H to FFF8 3207_H	1	Supply voltage monitor (CVM)
FFF8 3208_H to FFF8 $35FF_H$	—	Access prohibited area
FFF8 3600_H to FFF8 3603_H	1	Reset controller (CYCRBASE)
FFF8 3604_H to FFF8 $7FFF_H$	—	Access prohibited area
FFF8 8000_H to FFF8 $800F_H$	1	Write protected register (WPROTR)
FFF8 8010_H to FFF8 $810F_H$	—	Access prohibited area
FFF8 8110_H to FFF8 $811F_H$	1	STBC_WUFISO
FFF8 8120_H to FFF8 $BFFF_H$	1	Clock controller (CLKCTL)
FFF8 $C000_H$ to FFF8 $CFFF_H$	1	CLMA0
FFF8 $D000_H$ to FFF8 $DFFF_H$	1	CLMA1
FFF8 $E000_H$ to FFF8 $EFFF_H$	1	CLMA2
FFF8 $F000_H$ to FFF8 $FFFF_H$	—	Access prohibited area

Table 4.6 Peripheral I/O Address Map (5/5)

Address	Peripheral Group	Peripheral I/O
FFF9 0000$_H$ to FFF9 004F$_H$	1	P-Bus guard (PBG50)
FFF9 0050$_H$ to FFF9 3FFF$_H$	—	Access prohibited area
FFF9 4000$_H$ to FFF9 404F$_H$	3	P-Bus guard (PBG30)
FFF9 4050$_H$ to FFF9 40FF$_H$	—	Access prohibited area
FFF9 4100$_H$ to FFF9 414F$_H$	3	P-Bus guard (PBG31)
FFF9 4150$_H$ to FFF9 41FF$_H$	—	Access prohibited area
FFF9 4200$_H$ to FFF9 424F$_H$	3	P-Bus guard (PBG32)
FFF9 4250$_H$ to FFFE DFFF$_H$	—	Access prohibited area
FFFE E000$_H$ to FFFE E0FF$_H$	CPU local peripheral	Access prohibited area
FFFE E100$_H$ to FFFE E5FF$_H$		Access prohibited area
FFFE E600$_H$ to FFFE E6FF$_H$		PEG
FFFE E700$_H$ to FFFE E97F$_H$		Access prohibited area
FFFE E980$_H$ to FFFE E9FF$_H$		SEG
FFFE EA00$_H$ to FFFE EBFF$_H$		INTC1
FFFE EC00$_H$ to FFFF 4FFF$_H$		Access prohibited area
FFFF 5000$_H$ to FFFF 7FFF$_H$	—	Access prohibited area
FFFF 8000$_H$ to FFFF AFFF$_H$	2	DMAC
FFFF B000$_H$ to FFFF BFFF$_H$	2	INTC2
FFFF C000$_H$ to FFFF FFFF$_H$	—	Access prohibited area

Section 5 Write-Protected Registers

This section contains a generic description of the write-protected registers.

The first part in this section describes the features specific to the write-protected registers, and the ensuing sections describe the various registers.

5.1 Overview

5.1.1 Functional Overview

The RH850/F1K products require a special procedure using write-protected registers to set important registers that affect the system, such as clock, reset, and port-related registers. The settings of protected registers are protected against illegal writing by programs by requiring a special procedure. For details about the protected registers, see **Section 5.1.5, Write-Protection Target Registers**. Write-protected registers are managed in units of protected registers called register protection clusters.

5.1.2 Writing Procedure to Write-Protected Registers

Write access to a write-protected register is enabled by using the following protection unlock sequence:

1. Write the fixed value 0000 $00A5_H$ to the protection command register.
2. Write the desired value to the protected register.
3. Write the bit-wise inversion of the desired value to the protected register.
4. Write the desired value to the protected register.
5. Verify that the desired value has been written to the protected register.
   Verify successful write of the desired value to the protected register by verifying that the error monitor bit in the protection status register is “0”.
   In case the write was not successful, indicated by the error monitor bit set to “1”, the entire sequence has to be restarted at step 1.

If another register (second register) is accessed between step 1 and step 4 of the above sequence for writing to a write-protected register (first register), the protection mechanism operates as follows:

- If the second register belongs to the same cluster, the write to the protected register fails (the error monitor bit is set to 1). The entire sequence has to be restarted at step 1.
- If the second register does not belong to the same cluster, the protection unlock sequence is not disrupted and the write to the first register completes successfully.

5.1.3 Interrupt during Write Protection Unlock

If an interrupt occurs during the protection unlock sequence, the protection mechanism operates as follows:

(1) If an interrupt request is accepted during the protection unlock sequence and write access to a register of the same cluster is performed

The protection unlock sequence is disrupted, so the write operation to the protected register cannot be completed upon returning from the interrupt service routine. **Figure 5.1** shows an execution example.

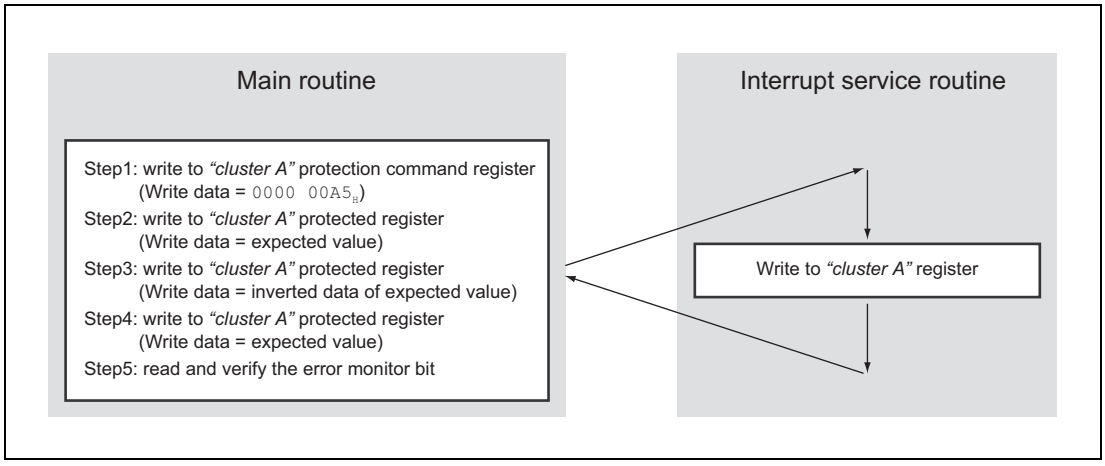

Figure 5.1 Example of Interruption of Register Protection Unlock Sequence

(2) If an interrupt request is accepted during the protection unlock sequence and write access to a register of a different cluster is performed

The protection unlock sequence is not disrupted, so the write operation to the protected register is completed upon returning from the interrupt service routine. **Figure 5.2** shows an execution example.

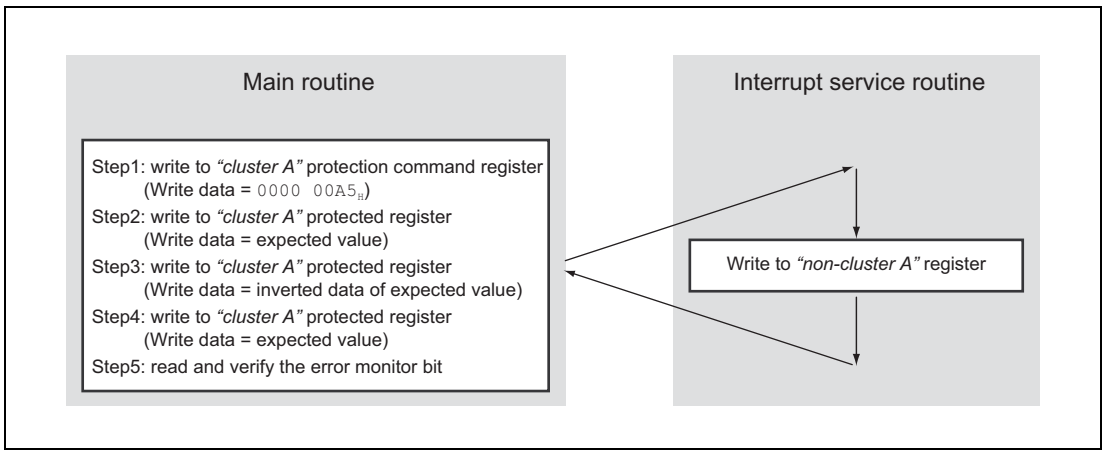

Figure 5.2 Example of Successful Protection Unlock Sequence

For more information on registers of RH850/F1K register protection clusters, see **Section 5.1.5, Write-Protection Target Registers**.

5.1.4 Emulation Break during Write Protection Unlock Sequence

If an emulation break occurs during the protection unlock sequence, e.g. because of a breakpoint hit, the register protection is suspended until normal operation is resumed.
Even if any register of the same cluster is accessed during the break, the protection unlock sequence is not disrupted and the error monitor bit is not set to 1.

5.1.5 Write-Protection Target Registers

The registers that are protected through the write-protection control registers are listed below.

Table 5.1 Write-Protection Target Registers (1/2)

Protection Target	Protection Target Register	Protection Control Register		Protection Cluster
		Command Register	Status Register	
Clock controller	MOSCE	PROTCMD0	PROTS0	Control protection cluster 0
	ROSCE			
	SOSCE			
	CKSC_AWDTAD_CTL			
	CKSC_ATAUJS_CTL			
	CKSC_ATAUJD_CTL			
	CKSC_ARTCAS_CTL			
	CKSC_ARTCAD_CTL			
	CKSC_AADCAS_CTL			
	CKSC_AADCAD_CTL			
	CKSC_AFOUTS_CTL			
	ROSCUT			
Stand-by function	STBC0PSC			
	STBC0STPT			
	IOHOLD			
Reset function	LVICNT			
	SWRESA			
	CYCRBASE			
Clock Controller	PLLE	PROTCMD1	PROTS1	Control protection cluster 1
	CKSC_CPUCLKS_CTL			
	CKSC_CPUCLKD_CTL			
	CKSC_IPERI1S_CTL			
	CKSC_IPERI2S_CTL			
	CKSC_ILINS_CTL			
	CKSC_IADCAS_CTL			
	CKSC_IADCAD_CTL			
	CKSC_ILIND_CTL			
	CKSC_ICANS_CTL			
	CKSC_ICANOSCD_CTL			
	CKSC_ICSIS_CTL			
	CKSC_IIICS_CTL			
	CKSC_PPLLCLKS_CTL			
	CKSC_PLLIS_CTL			

Table 5.1 Write-Protection Target Registers (2/2)

Protection Target	Protection Target Register	Protection Control Register		Protection Cluster
		Command Register	Status Register	
Clock Monitors	CLMA0CTL0	CLMA0PCMD	CLMA0PS	Clock Monitor control protection cluster 0
	CLMA1CTL0	CLMA1PCMD	CLMA1PS	Clock Monitor control protection cluster 1

	PDSC11	PPCMD11	PPROTS11	
	PDSC12	PPCMD12	PPROTS12	
	PDSC18	PPCMD18	PPROTS18	
	PDSC20	PPCMD20	PPROTS20	
Core Voltage Monitor	CVMF	PROTCMDCVM	PROTSCVM	Core Voltage Monitor protection cluster
	CVMDIAG			
Self-programming function	FLMDCNT	FLMDPCMD	FLMDPS	Self-programming protection cluster

Note 1. Each port group has its own protection command register and status register. For details, see **(1) Port protection clusters** on the next page.

(1) Port protection clusters

The following port control registers have a write protection function:

- Port open drain control registers (PODCn, JPODC0)
- Port drive strength control registers (PDSCn, JPDSC0)

The write protected port registers are divided into two port protection clusters as shown in the following table:

Table 5.2 Port Protection Clusters

Port Protection Cluster	Port Group
0	JP0, P0, P1, P2, P8
1	P9, P10, P11, P12, P18, P20

NOTE

Each port group n has its own port protection command register PPCMDn and port protection status register PPROTSn.

However, any port protection command registers of the same port protection cluster can be used in the protection unlock sequence. For instance, PPCMD1 can be used to unlock the protection of PODC2.

5.2 Registers

5.2.1 List of Registers

The following table lists the write-protection control registers.

Table 5.3 List of Write-Protection Control Registers (1/2)

Module Name	Register Name	Symbol	Address
Control protection clusters			
WPROTR	Protection command register 0	PROTCMD0	FFF8 0000$_H$
	Protection command register 1	PROTCMD1	FFF8 8000$_H$
	Protection status register 0	PROTS0	FFF8 0004$_H$
	Protection status register 1	PROTS1	FFF8 8004$_H$
Clock monitor control and test protection cluster			
CLMAn	Protection command register 0	CLMA0PCMD	FFF8 C010$_H$

5.2.2 Details of Control Protection Cluster Registers

5.2.2.1 PROTCMDn — Protection Command Register

This register is used to initiate the write protection unlock sequence for write-protected registers.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

Access: This register is a write-only register that can be written in 32-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: XXXX XX00$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write 0.
7 to 0	PCMDn[7:0]	Protection command register bits to enable writing to protected registers of control protection cluster

5.2.2.2 PROTSn — Protection Status Register

This register indicates the status of the protection unlock sequence performed by PROTCMDn.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

31 to 1	Reserved	When read, the value after reset is returned.
0	PROTSnERR	Write sequence protection error monitor 0: No protection error occurred 1: Protection error occurred

5.2.3 Details of Clock Monitor Protection Cluster Registers

5.2.3.1 CLMAnPCMD — CLMAn Protection Command Register

This register is a protection command register for the CLMAnCTL0 register.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

Access: This register is a write-only register that can be written in 8-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CLMAnREG[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W

Table 5.6 CLMAnPCMD Register Contents

Bit Position	Bit Name	Function
7 to 0	CLMAnREG[7:0]	Protection command register bits to enable writing to the CLMAnCTL0 register

5.2.3.2 CLMAnPS — CLMAn Protection Status Register

This register is used to verify whether the write-protected register (CLMAnCTL0) has been successfully written or not.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

Access: This register is a read-only register that can be read in 8-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

5.2.3.3 PROTCMDCLMA — Clock Monitor Test Protection Command Register

This register is a protection command register for the CLMATEST register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: XXXX $XX00_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write “0”.
7 to 0	CLMATREG[7:0]	Protection command register bits to enable writing to the CLMATEST register

5.2.3.4 PROTSCLMA — Clock Monitor Test Protection Status Register

This register is used to verify whether the write-protected register (CLMATEST) has been successfully written or not.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

5.2.4 Details of Core Voltage Monitor Protection Cluster Registers

5.2.4.1 PROTCMDCVM — Core Voltage Monitor Protection Command Register

This register is a protection command register for the CVMF and CVMDIAG registers.

Access: This register is a write-only register that can be written in 32-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: XXXX XX00$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7 to 0	CVMFREG[7:0]	Protection command register bits to enable writing to the CVMF and CVMDIAG registers

5.2.4.2 PROTSCVM — Core Voltage Monitor Protection Status Register

This register is used to verify whether the write-protected register (CVMF, CVMDIAG) has been successfully written or not.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

5.2.5 Details of Port Protection Cluster Registers

5.2.5.1 PPCMDn — Port Protection Command Register

PPCMDn is a protection command register for port group n.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

Access: This register is a write-only register that can be written in 32-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: XXXX $XX00_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

NOTE

The protection command register for port group JP0 is JPPCMD0. Its bits are JPPCMD0[7:0].

Table 5.12 PPCMDn Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing to these bits, write 0.
7 to 0	PPCMDn[7:0]	Protection command register bits that enable writing to port protection cluster registers

5.2.5.2 PPROTSn — Port Protection Status Register

PPROTSn is a protection status register for write-protected registers of port group n. It indicates the status of the protection sequence operated by PPCMDn.

Index n

An index “n” denotes the number of protection command registers. For details, see **Table 5.1, Write-Protection Target Registers**.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

NOTE

The protection status register for port group JP0 is JPPROTS0. Its bit is JPPROTS0PRERR.

Table 5.13 PPROTSn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	PPROTSn PRERR	Write protection sequence error monitor 0: No protection error occurred 1: Protection error occurred

5.2.6 Details of Self-Programming Protection Cluster Registers

5.2.6.1 FLMDPCMD — FLMD Protection Command Register

FLMDPCMD is a protection command register for the FLMDCNT register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: XXXX $XX00_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

31 to 8	Reserved	When writing to these bits, write 0.
7 to 0	FLMDPC[7:0]	Protection command register bits that enable writing to FLMDCNT register

5.2.6.2 FLMDPS — FLMD Protection Error Status Register

This register is used to verify whether the write-protected register (FLMDCNT) has been successfully written or not.

Access: This register is a read-only register that can be read in 32-bit units.

Address: See **Table 5.3, List of Write-Protection Control Registers**.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 5.15 FLMDPS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	FLMDPRERR	Write protection sequence error monitor 0: No protection error occurred 1: Protection error occurred

Section 6 Operating Mode

This section describes the operating mode and mode selection of the RH850/F1K.

The RH850/F1K has the operating mode shown below.

- Normal operating mode

  This mode is for execution of the user program. The on-chip debug functions also use this mode. If FLMD0 is pulled up high during operation in this mode, writing to the code flash memory through self-programming is enabled.

- Serial programming mode

  The dedicated flash memory programmer enables erasing/writing to flash memory.

- Boundary scan mode

  This mode allows boundary scan tests compliant with IEEE Standard 1149.1.

- User boot mode

  This mode is the same as normal operating mode except that the reset vector base address is fixed to "01000000_H", and transition to standby modes is not supported.

When an external reset or power-on-clear reset is generated, the state of the FLMD0, FLMD1, MODE0, MODE1, and MODE2 pins are used to determine the operating mode after reset is released. The operating mode is fixed by the release of these reset factors. **Table 6.1** lists the relationship between the pin settings and the operating mode.

Table 6.1 Selection of Operating Mode

Pins					Operating Mode
FLMD0	FLMD1 (P10_8)	MODE0 (P10_1)	MODE1 (P10_2)	MODE2 (P10_6)	
0	x	x	x	x	Normal operating mode
1	0	x	x	x	Serial programming mode
1	1	0	1	x	Boundary scan mode
1	1	1	1	1	User boot mode
Other than the above					Setting prohibited

CAUTION

To change operating mode, restart from power-on clear reset. (Remove the power supply once and apply it again.) In the case of only by the external reset, some functions are not initialized after the mode transitions. For details of functions not initialized by the external reset, see Section 9.1.1, Reset Sources.

Section 7 Exception/Interrupts

7.1 Features

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions.

The details on exceptions are described in the *RH850G3KH User's Manual: Software*.

Table 7.1 List of Exception Sources

Name	Symbol	Source	Priority	Saved to
Reset	RESET	Reset input	High	—
FE level non-maskable interrupt*1	FENMI	FENMI input		FE
System error exception	SYSERR	SYSERR input		FE
FE level maskable interrupt*1	FEINT	FEINT input		FE
Floating-point arithmetic exception (imprecise)	FPI	Execution of FPU instruction		EI
EI level maskable interrupt*1	EIINT	Interrupt controller		EI
Memory protection exception (execution right)	MIP	Memory protection violation		FE
System error exception	SYSERR	Error input at instruction fetch		FE
Reserved instruction exception	RIE	Execution of reserved instruction		FE
Coprocessor unusable exception	UCPOP	Execution of coprocessor instruction/ access right violation		FE
Privileged instruction exception	PIE	Execution of privileged instruction		FE
Misaligned exception	MAE	Generation of misaligned access		FE
Memory protection exception (access right)	MDP	Memory protection violation		FE
Floating-point arithmetic exception (precise)	FPP	Execution of FPU instruction		EI
System call	SYSCALL	Execution of SYSCALL instruction		EI
FE level trap	FETRAP	Execution of FETRAP instruction		FE
EI level trap 0	TRAP0	Execution of TRAP instruction		EI
EI level trap 1	TRAP1	Execution of TRAP instruction	Low	EI

Note 1. These interrupt exceptions are described in this section.

(1) Interrupts

The following three exceptions in **Table 7.1** are called interrupts, and are described in this section.

- FE level non-maskable interrupt (FENMI)
  An FENMI interrupt is acknowledged even if another FE level interrupt - FEINT - has been generated.
  - An FENMI interrupt is acknowledged even if the CPU system register PSW.NP = 1.
  - Return from an FENMI interrupt is not possible and neither is recovery.
- FE level maskable interrupt (FEINT)
  - FEINT can be acknowledged if the CPU system register PSW.NP = 0. It is masked if PSW.NP = 1.
  - Return from an FEINT interrupt is possible and so is recovery.
- EI level maskable interrupt (EIINT)
  An EIINT interrupt can be acknowledged if an FE level interrupt - FENMI or FEINT - has not been generated.
  - EIINT can be acknowledged if the CPU system register PSW.NP = 0.
    It is masked if PSW.NP = 1, EIINT with a higher priority is being processed, or PSW.ID = 1.
  - Return from an EIINT interrupt is possible and so is recovery.
  - Interrupt masking can be specified for each interrupt channel.
  - 16 interrupt priority levels can be specified for each interrupt channel
  - In this section, the EIINT that corresponds to interrupt channel n is indicated by “INTn”, whereas the EIINT that corresponds to interrupt source xxx is indicated by “INTxxx”.

  For the PSW register, see **Table 3.9 PSW Register Contents** and the *RH850G3KH User's Manual: Software*.

NOTE

Return: Indicates whether or not the program can resume from where it was interrupted.

Recovery: Indicates whether or not the processor status (status of processor resources including general purpose registers and system registers) can be restored to the status they were in when the program was interrupted.

These interrupt sources are described in **Section 7.2, Interrupt Sources**.

(2) Overview of interrupts

- Priority levels for interrupt
  16 priority levels of maskable interrupts by request can be set by interrupt control register.
- Detecting methods of external interrupts (TNMI/INTPm)
  A method of detecting external interrupts (TNMI and INTPm) can be selected from five types: rising edge, falling edge, both edges, low level, and high level.
- 2 types of interrupt handler address setting Direct branching method or table referencing method is selectable by register setting.

7.2 Interrupt Sources

7.2.1 Interrupt Sources

7.2.1.1 FE Level Non-Maskable Interrupts

(1) Priority

See **Table 7.1, List of Exception Sources**.

(2) Return PC

Return or recovery from an FE non-maskable interrupt is not possible.

(3) Status Register

See **Section 7.4.4, FNC — FE Level NMI Status Register**.

(4) Return Instruction

None

Table 7.2 FE Level Non-Maskable Interrupt Requests

Interrupt			Interrupt Request		Unit	Priority	Exception Source Code	Handler Address 00000...
	Control Register							
Symbol	Name	Address	Name	Source				
FENMI	FNC	FFFE EA78$_H$	TNMI	NMI pin	Port	*1	0E0$_H$	0E0$_H$
			WDTA0NMI	WDTA0 FENMI interrupt	WDTA0			
			WDTA1NMI	WDTA1 FENMI interrupt	WDTA1			

Note 1. See **Table 7.1, List of Exception Sources**.

The source of the FENMI interrupt can be evaluated by a dedicated flag register. See **Section 7.2.3, FE Level Non-Maskable Interrupt Sources** for details.

7.2.1.2 FE Level Maskable Interrupts

(1) Priority

See **Table 7.1, List of Exception Sources**.

(2) Return PC

The return PC returned from an interrupt handling routine by the FERET instruction is the PC from when the program was suspended (current PC).

(3) Status Register

See **Section 7.4.5, FIC — FE Level Maskable Interrupt Status Register**.

(4) Return Instruction

FERET

Table 7.3 FE Level Maskable Interrupt Requests

Interrupt			Interrupt Request		Unit	100 pin	144 pin	176 pin	Priority	Exception Source Code	Handler Address 00000...
	Control Register										
Symbol	Name	Address	Name	Source							
FEINT	FIC	FFFE EA7A$_H$	INTLVIL	LVI voltage detection (falling)	LVI	√	√	√	*1	0F0$_H$	0F0$_H$
			INTECCDEEP0	Data flash ECC 1-bit error or 2-bit error interrupt	Data flash	√	√	√			
			INTECCDCNRAM0	RSCAN0 ECC 1-bit error or 2-bit error interrupt	RSCAN0 (ch0-5)	√	√	√			
			INTECCDCNRAM1	RSCAN1 ECC 1-bit error or 2-bit error interrupt	RSCAN1 (ch6)	—	—	√			
			INTECCDCSIH0	CSIH0 ECC 1-bit error or 2-bit error interrupt	CSIH0	√	√	√			
			INTECCDCSIH1	CSIH1 ECC 1-bit error or 2-bit error interrupt	CSIH1	√	√	√			
			INTECCDCSIH2	CSIH2 ECC 1-bit error or 2-bit error interrupt	CSIH2	√	√	√			
			INTECCDCSIH3	CSIH3 ECC 1-bit error or 2-bit error interrupt	CSIH3	√	√	√			
			INTECCSCFLI0	Code Flash ECC 1-bit error or 2-bit error interrupt	Code flash	√	√	√			
			INTECCRAM	RAM ECC 1-bit error or 2-bit error interrupt	RAM	√	√	√			
			INTOSTM0_FE*2	OSTM0 interrupt	OSTM0	√	√	√			
			INTLVIH	LVI voltage detection (rising)	LVI	√	√	√			
			INTGUARD	PE Guard (PEG) error or Peripheral Guard (PBG) error or PBG for CPU System error interrupt	CPU, PBG, PBGC	√	√	√			
			INTOSTM1_FE	OSTM1 interrupt	OSTM1	√	√	√			
			INTOSTM2_FE	OSTM2 interrupt	OSTM2	√	√	√			
			INTOSTM3_FE	OSTM3 interrupt	OSTM3	√	√	√			
			INTOSTM4_FE	OSTM4 interrupt	OSTM4	√	√	√			
			INTDMAERR	DMA transfer error interrupt	DMAC	√	√	√			

Note 1. See **Table 7.1, List of Exception Sources**.

Note 2. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it both ways at the same time is prohibited.
When INTOSTM0 is used as FEINT, it is generated by the TSU (timing supervision unit) function of OSTM0

* Timing monitor (TSU)
This prevents the illicit use of CPU time by non-trusted programs, manages properties, and controls the intervals over which interrupts are disabled.

7.2.1.3 EI Level Maskable Interrupts

(1) Interrupt Naming Rules

The composition of the interrupt request signal names, their assigned interrupt control registers and the bits in these registers follow special rules.

In the following the name of the specific interrupt request is represented by **<*name*>**.

For details of the names used in **IC**<*name*>, see **Table 7.4**.

- Interrupt request name: **INT<*name*>**
  The prefix **"INT"** is appended to **<*name*>**.
- Interrupt request control register: **IC<*name*>**
  The prefix **"IC"** is appended to **<*name*>**.
  The 16-bit register **IC<*name*>** can also be accessed in byte units:
  - Low byte (bits [7:0]) of the **IC<*name*>** register: **IC<*name*>L**
    The suffix **"L"** is appended to the register name **IC<*name*>**.
  - High byte (bits [15:8]) of the **IC<*name*>** register: **IC<*name*>H**
    The suffix **"H"** is appended to the register name **IC<*name*>**.
- Interrupt control register bit names: **CT<*name*>**, **RF<*name*>**, **MK<*name*>**, **TB<*name*>**, **P3<*name*>**, **P2<*name*>**, **P1<*name*>**, **P0<*name*>**
  The bit prefix "**CT**", "**RF**", "**MK**", "**TB**", "**P3**", "**P2**", "**P1**", or "**P0**" is appended to the interrupt <*name*>.

Example

The interrupt request from channel 2 of TAUD0 channel (**<*name*>** = *TAUD0I2*) is named

INT*TAUD0I2*

The related interrupt control registers are

IC*TAUD0I2*, **IC***TAUD0I2L*, **IC***TAUD0I2H*

The bits in this register are

CT*TAUD0I2*,**RF***TAUD0I2*, **MK***TAUD0I2*, **TB***TAUD0I2*, **P3***TAUD0I2*, **P2***TAUD0I2*, **P1***TAUD0I2*, **P0***TAUD0I2*

(2) Priority

See **Table 7.1, List of Exception Sources**.

(3) Return PC

The return PC returned from an interrupt handling routine by the EIRET instruction is the PC from when the program was suspended (current PC).

(4) Control Register

EI level maskable interrupt control register

See **Section 7.4.2, ICxxx — EI Level Interrupt Control Registers**.

(5) Return Instruction

EIRET instruction

(6) Configuration

EI-level maskable interrupts are controlled by the two controllers, INTC1 and INTC2. The interrupts are supported on a total of 358 channels with a cascade connection of INTC1 and INTC2.

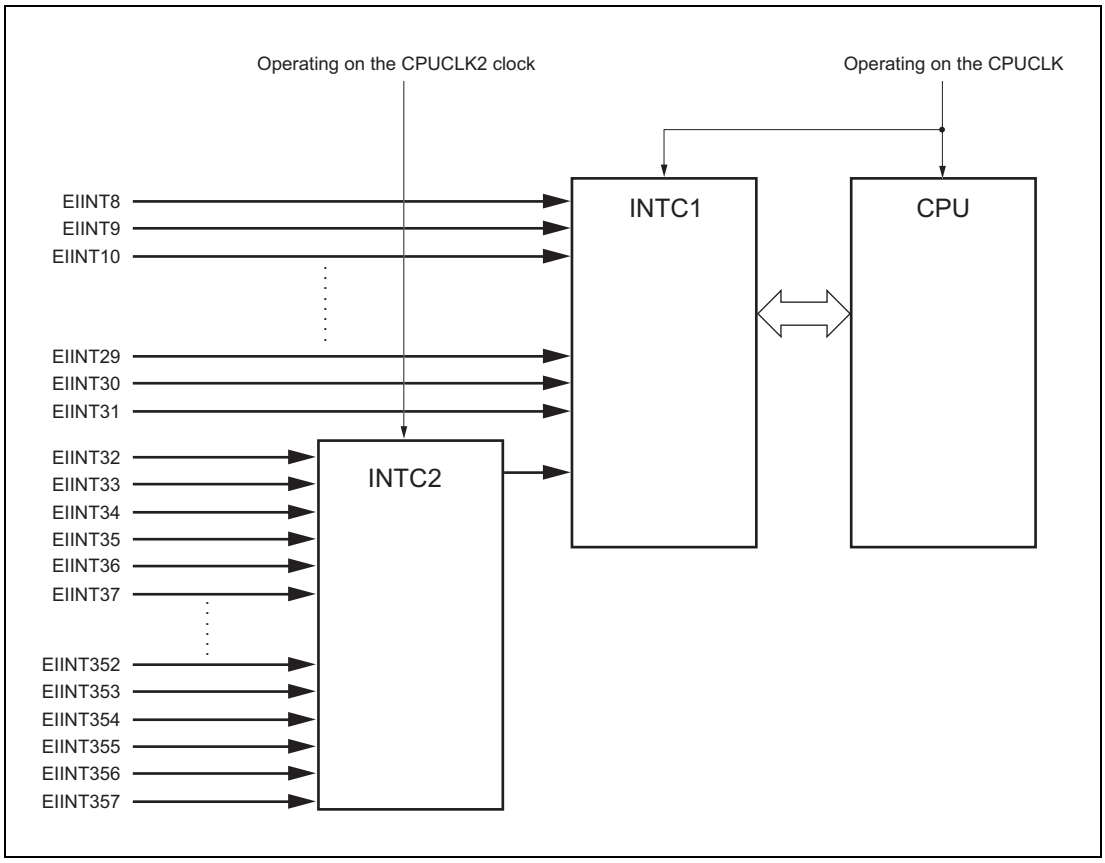

Figure 7.1 Configuration Diagram of EI Level Maskable Interrupt

CAUTION

As CPUCLK2 is the operating clock for INTC2, the EIINT32 to EIINT357 interrupts, which are connected to INTC2, are delayed more than the interrupts directly connected to INTC1.

Table 7.4 lists EI level maskable interrupts.

Table 7.4 EI Level Maskable Interrupt Sources (1/9)

Interrupt			Interrupt Request				Exception Source Code	100 pins	144 pins	176 pins	Handler Address (Offset)*8

353	Reserved	FFFF B2C2$_H$					1161$_H$	—	—	—			+584$_H$
354	Reserved	FFFF B2C4$_H$					1162$_H$	—	—	—			+588$_H$
355	Reserved	FFFF B2C6$_H$					1163$_H$	—	—	—			+58C$_H$
356	ICDPE	FFFF B2C8$_H$	INTDPE	LPS digital port error interrupt	LPS0	Level	1164$_H$	√	√	√			+590$_H$
357	ICAPE	FFFF B2CA$_H$	INTAPE	LPS analog port error interrupt	LPS0	Level	1165$_H$	√	√	√			+594$_H$

Note 1. Each interrupt is connected to INTC1 channel 8 to 31 and INTC2 channel 32 to 357.

Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the value after reset of an EI level interrupt control register. For details, see **Section 7.4.2, ICxxx — EI Level Interrupt Control Registers**. For detection at level, an interrupt source is cleared by accessing to the register that retains an interrupt source. Dummy-reading of the register and execution of the SYNCP instruction are required to reflect the result of the register update to the subsequent instruction.

Note 3. Irrespective of interrupt channels, an offset address is determined in the range from +100$_H$ to 1F0$_H$ according to the priority (0 to 15).

Note 4. Irrespective of the priority, offset addresses are uniformly +100$_H$.

Note 5. The table reference method uses a table for reading an exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.
Exception handler address read position = INTBP register + channel number × 4 bytes

Note 6. The same interrupt source is assigned to different interrupt channels. For details, see **Section 7.5.2, SELB_INTC1 — INTC1 Interrupt Select Register**.

Note 7. Two interrupt sources are assigned to the same interrupt channel. For details, see **Section 7.5.3, SELB_INTC2 — INTC2 Interrupt Select Register**.

Note 8. For details, see **Section 7.10, Exception Handler Address**.
Note 9. INTOSTM0 can operate as an EIINT or FEINT interrupt, but using it in both ways at the same time is not possible. It is used as FEINT when OSTM0 functions as the TSU (timing supervision unit). It is used as EIINT when OSTM0 functions as anything other than the TSU.
Note 10. For details on the interrupt source, see the *RH850/F1K Flash Memory User's Manual: Hardware Interface*.

7.2.2 List of Registers

Interrupt sources registers are listed in the following table.

Table 7.5 List of Registers

Module Name	Register Name	Symbol	Address
ECON_NMI	FENMI Factor Register	WDTNMIF	FFC0 0000_H
	WDTNMI Factor Clear Register	WDTNMIFC	FFC0 0008_H
ECON_FEINT	FEINT Factor Register	FEINTF	FFC0 0100_H
	FEINT Factor Mask Register	FEINTFMSK	FFC0 0104_H
	FEINT Factor Clear Register	FEINTFC	FFC0 0108_H

7.2.3 FE Level Non-Maskable Interrupt Sources

7.2.3.1 WDTNMIF — FENMI Factor Register

This register contains information about which source has generated the FE level non-maskable interrupt (FENMI). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC0 0000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTA1 NMIF	WDTA0 NMIF	TNMIF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.6 WDTNMIF Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	WDTA1NMIF	WDTA1NMI flag 0: No WDTA1NMI occurred 1: WDTA1NMI has occurred
1	WDTA0NMIF	WDTA0NMI flag 0: No WDTA0NMI occurred 1: WDTA0NMI has occurred
0	TNMIF	Input signal flag from the NMI pin 0: No TNMI occurred 1: TNMI has occurred

7.2.3.2 WDTNMIFC — WDTNMI Factor Clear Register

This register clears the FE level non-maskable interrupt flags of the WDTNMIF register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FFC0 0008$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTA1NMIFC	WDTA0NMIFC	TNMIFC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W	W

Table 7.7 WDTNMIFC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When writing, write the value after reset.
2	WDTA1NMIFC	WDTA1NMIF flag clear 0: — 1: Clear
1	WDTA0NMIFC	WDTA0NMIF flag clear 0: — 1: Clear
0	TNMIFC	TNMIF flag clear 0: — 1: Clear

7.2.4 FE Level Maskable Interrupt Sources

7.2.4.1 FEINTF — FEINT Factor Register

This register contains information about which source has generated the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFC0 0100$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.8 FEINTF Register Contents (1/2)

Bit Position	Bit Name	Function
31	DMAFEIF	INTDMAERR interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
30 to 23	Reserved	When read, the value after reset is returned.
22	ECCDCNRAM1FEIF*1	INTECCDCNRAM1 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
21	OSTM4FEIF	INTOSTM4_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
20	OSTM3FEIF	INTOSTM3_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
19	OSTM2FEIF	INTOSTM2_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
18	OSTM1FEIF	INTOSTM1_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
17	GUARDFEIF	INTGUARD interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
16	Reserved	When read, the value after reset is returned.
15	LVIHFEIF	INTLVIH interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
14	OSTM0FEIF	INTOSTM0_FE interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred

Table 7.8 FEINTF Register Contents (2/2)

Bit Position	Bit Name	Function
13	ECCRAM FEIF	INTECCRAM interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
12	ECCSCFLI0 FEIF	INTECCSCFLI0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
11	Reserved	When read, the value after reset is returned.
10	ECCDCSIH3 FEIF	INTECCDCSIH3 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
9	ECCDCSIH2 FEIF	INTECCDCSIH2 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
8	ECCDCSIH1 FEIF	INTECCDCSIH1 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
7	ECCDCSIH0 FEIF	INTECCDCSIH0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
6	ECCDCNRAM0 FEIF	INTECCDCNRAM0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
5	Reserved	When read, the value after reset is returned.
4	ECCDEEP0 FEIF	INTECCDEEP0 interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
3 to 1	Reserved	When read, the value after reset is returned.
0	LVILFEIF	INTLVIL interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred

Note 1. For the supported products, see **Table 7.3, FE Level Maskable Interrupt Requests**.

7.2.4.2 FEINTFMSK — FEINT Factor Mask Register

This register masks the FE level maskable interrupt (FEINT). This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFC0 0104$_H$

Value after reset: FFFF FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMAFEIFMSK	—	—	—	—	—	—	—	—	ECCDCNRAM1FEIFMSK	OSTM4FEIFMSK	OSTM3FEIFMSK	OSTM2FEIFMSK	OSTM1FEIFMSK	GUARDFEIFMSK	—

Table 7.9 FEINTFMSK Register Contents (1/2)

Bit Position	Bit Name	Function
31	DMAFEIFMSK	INTDMAERR interrupt mask 0: Not masked 1: Masked
30 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22	ECCDCNRAM1FEIFMSK*1	INTECCDCNRAM1 interrupt mask 0: Not masked 1: Masked
21	OSTM4FEIFMSK	INTOSTM4_FE interrupt mask 0: Not masked 1: Masked
20	OSTM3FEIFMSK	INTOSTM3_FE interrupt mask 0: Not masked 1: Masked
19	OSTM2FEIFMSK	INTOSTM2_FE interrupt mask 0: Not masked 1: Masked
18	OSTM1FEIFMSK	INTOSTM1_FE interrupt mask 0: Not masked 1: Masked
17	GUARDFEIFMSK	INTGUARD interrupt mask 0: Not masked 1: Masked
16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	LVIHFEIFMSK	INTLVIH interrupt mask 0: Not masked 1: Masked
14	OSTM0FEIFMSK	INTOSTM0_FE interrupt mask 0: Not masked 1: Masked
13	ECCRAMFEIFMSK	INTECCRAM interrupt mask 0: Not masked 1: Masked

Table 7.9 FEINTFMSK Register Contents (2/2)

Bit Position	Bit Name	Function
12	ECCSCFLI0 FEIFMSK	INTECCSCFLI0 interrupt mask 0: Not masked 1: Masked
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	ECCDCSIH3FEI FMSK	INTECCDCSIH3 interrupt mask 0: Not masked 1: Masked
9	ECCDCSIH2FEI FMSK	INTECCDCSIH2 interrupt mask 0: Not masked 1: Masked
8	ECCDCSIH1FEI FMSK	INTECCDCSIH1 interrupt mask 0: Not masked 1: Masked
7	ECCDCSIH0FEI FMSK	INTECCDCSIH0 interrupt mask 0: Not masked 1: Masked
6	ECCDCNRAM0 FEIFMSK	INTECCDCNRAM0 interrupt mask 0: Not masked 1: Masked
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECCDEEP0FEI FMSK	INTECCDEEP0 interrupt mask 0: Not masked 1: Masked
3 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LVILFEIFMSK	INTLVIL interrupt mask 0: Not masked 1: Masked

Note 1. For the supported products, see **Table 7.3, FE Level Maskable Interrupt Requests**.

7.2.4.3 FEINTFC — FEINT Factor Clear Register

This register clears the bits of the FEINT factor register (FEINTF).

Access: This register is a write-only register that can be written in 32-bit units.

Address: FFC0 0108$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DMAFEIFC	—	—	—	—	—	—	—	—	ECCDCNRAM1FEIFC	OSTM4FEIFC	OSTM3FEIFC	OSTM2FEIFC	OSTM1FEIFC	GUARDFEIFC	—

0	LVILFEIFC	LVILFEIF flag clear 0: — 1: Clear

Note 1. For the supported products, see **Table 7.3, FE Level Maskable Interrupt Requests**.

7.3 Edge/Level Detection

External interrupts (TNMI and INTPm) can be specified to be generated when a rising edge, falling edge, rising or falling edge, low level, or high level is detected at an external interrupt pin.

The following registers are used to specify the edge and level of each interrupt:

Table 7.11 External Interrupt Edge/Level Detection Registers

Interrupt	Register
TNMI	FCLA0CTL0_NMI
INTP0	FCLA0CTL0_INTPL
INTP1	FCLA0CTL1_INTPL
INTP2	FCLA0CTL2_INTPL
INTP3	FCLA0CTL3_INTPL
INTP4	FCLA0CTL4_INTPL
INTP5	FCLA0CTL5_INTPL
INTP6	FCLA0CTL6_INTPL
INTP7	FCLA0CTL7_INTPL
INTP8	FCLA0CTL0_INTPH
INTP9*1	FCLA0CTL1_INTPH
INTP10	FCLA0CTL2_INTPH
INTP11	FCLA0CTL3_INTPH
INTP12	FCLA0CTL4_INTPH
INTP13	FCLA0CTL5_INTPH
INTP14*1	FCLA0CTL6_INTPH
INTP15*1	FCLA0CTL7_INTPH

Note 1. For the supported products, see **Table 7.4, EI Level Maskable Interrupt Sources**.

See **Section 2, Pin Function** for details of these registers.

7.4 Interrupt Controller Control Registers

Writing to the ICxxx, IMRm (m = 0 to 11), FNC, and FIC registers is enabled only in supervisor mode (PSW.UM = 0).

7.4.1 List of Registers

Interrupt Controller Control Registers are listed in the following table.

Table 7.12 List of Registers

Module Name	Register Name	Symbol	Address
INTC1	EI Level Interrupt Control Registers (Channel No.8 to 31)	ICxxx (see **Table 7.4**)	see **Table 7.4**.
INTC2	EI Level Interrupt Control Registers (Channel No.32 to 357)	ICxxx (see **Table 7.4**)	see **Table 7.4**.
INTC1	EI Level Interrupt Mask Registers (m = 0)	IMR0	FFFE EAF0$_H$
INTC2	EI Level Interrupt Mask Registers (m = 1 to 11)	IMRm	FFFF B400$_H$ + (04$_H$ × m)
INTC1	FE Level NMI Status Register	FNC	FFFE EA78$_H$
	FE Level Maskable Interrupt Status Register	FIC	FFFE EA7A$_H$

7.4.2 ICxxx — EI Level Interrupt Control Registers

One of these registers is assigned to each EI level maskable interrupt (EIINT) channel and is used to set the conditions for controlling that channel. This register is initialized by any reset. For each source, see **Table 7.4, EI Level Maskable Interrupt Sources**.

CAUTION

If 0 is written to the RFxxx bit immediately after a peripheral module generates the corresponding interrupt request in edge detection mode (before an interrupt is accepted by the CPU), the request may be lost.

Writing 1 to the RFxxx bit immediately after an interrupt is accepted by the CPU may lead to re-issuing of the request.

Writing method to these registers contains the use of bit manipulation instructions (set1, clr1, and not1).

For bit-manipulation instructions, see also Section 3.3.3, Access to Registers by Using Bit-Manipulation Instructions.

Executing a bit-manipulation instruction to the lower bytes including the MKxxx bit has no effect on the RFxxx bit.

Access: ICxxx can be read or written in 16-bit units.
ICxxxH and ICxxxL can be read or written in 8- or 1-bit units.
Access to bits 14, 13, 11 to 8, 5, and 4 by using a SET1, CLR1, or NOT1 instruction is prohibited.

Address: See **Table 7.4, EI Level Maskable Interrupt Sources**.

Value after reset: $008F_H$ (edge detection), $808F_H$ (level detection)*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTxxx	—	—	RFxxx	—	—	—	—	MKxxx	TBxxx	—	—	P3xxx	P2xxx	P1xxx	P0xxx
Value after reset	0/1*1	0	0	0	0	0	0	0	1	0	0	0	1	1	1	1
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Note 1. The value after reset differs depending on the detection type of a given interrupt (edge detection: 0, level detection: 1). For details, see **Table 7.4, EI Level Maskable Interrupt Sources**.

Table 7.13 ICxxx Register Contents (1/2)

Bit Position	Bit Name	Function
15	CTxxx	This bit indicates the type of interrupt detection. This bit is read only. 0: Edge detection 1: Level detection When writing in 8-bit or 16-bit units, write the value after reset.
14, 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	RFxxx	This is an interrupt request flag. The RFxxx bit can be written from a program. Setting the RFxxx bit to 1 generates an EI level maskable interrupt n (EIINTn), just as when an interrupt request is acknowledged. 0: No interrupt request is made. 1: Interrupt request is made. **Input Interface** / **Operation** Edge detection (CTxxx = 0) / This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software. Level detection (CTxxx = 1) / This bit cannot be set or cleared by software. It can only be read. It is not cleared when an interrupt request is acknowledged by the CPU core.
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 7.13 ICxxx Register Contents (2/2)

Bit Position	Bit Name	Function
7	MKxxx	This is the interrupt request mask bit. When the MKxxx bit is set, interrupt requests from the channel are masked and are not issued to the CPU core. The interrupt pending status is not reflected in the ICSR.PMEI bit for any channels that are masked. When the interrupt request from the channel is masked with MKxxx = 1, the RFxxx still reflects the interrupt request for the channel and can be polled in software. When the MKxxx bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the MKxxx bit is also reflected in the corresponding IMRm register. 0: Enables interrupt processing 1: Disables interrupt processing
6	TBxxx	This bit is used to select the way to determine the interrupt vector. 0: Direct jumping to an address determined from the level of priority 1: Table reference For details on the way to determine the interrupt vector, see the *RH850G3KH User's Manual: Software*.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	P3xxx to P0xxx	These bits specify the interrupt priority as one of 16 levels, with 0 as the highest and 15 as the lowest. When multiple EI level-interrupt requests are made simultaneously, the interrupt from the source with the highest priority setting in these bits is selected and conveyed to the CPU core for servicing first. When P3xxx to P0xxx bits specify the same priority level for simultaneously occurring interrupt requests, the source with the lower channel number takes priority.

CAUTION

Do not access ICxxx registers of interrupt channels listed as "Reserved" in **Table 7.4, EI Level Maskable Interrupt Sources** and of the channels which are not incorporated in the product.

7.4.3 IMRm — EI Level Interrupt Mask Registers (m = 0 to 11)

These registers are a collection of the MKxxx bits of the ICxxx registers. Each bit of IMRm reflects the setting of the corresponding MKxxx bit. The setting for IMRm is also reflected in the corresponding MKxxx bit. This register is initialized by any reset.

Access: IMRm can be read or written in 32-bit units.
IMRmH and IMRmL can be read or written in 16-bit units.
IMRmHH, IMRmHL, IMRmLH, and IMRmLL can be read or written in 8- or 1-bit units.

Address: IMR0: FFFE EAF0$_H$
IMRm (m = 1 to 11): FFFF B400$_H$ + (04$_H$ × m)

Value after reset: FFFF FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IMRmEIMK (m × 32 + 31)	IMRmEIMK (m × 32 + 30)	IMRmEIMK (m × 32 + 29)	IMRmEIMK (m × 32 + 28)	IMRmEIMK (m × 32 + 27)	IMRmEIMK (m × 32 + 26)	IMRmEIMK (m × 32 + 25)	IMRmEIMK (m × 32 + 24)	IMRmEIMK (m × 32 + 23)	IMRmEIMK (m × 32 + 22)	IMRmEIMK (m × 32 + 21)	IMRmEIMK (m × 32 + 20)	IMRmEIMK (m × 32 + 19)	IMRmEIMK (m × 32 + 18)	IMRmEIMK (m × 32 + 17)	IMRmEIMK (m × 32 + 16)
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IMRmEIMK (m × 32 + 15)	IMRmEIMK (m × 32 + 14)	IMRmEIMK (m × 32 + 13)	IMRmEIMK (m × 32 + 12)	IMRmEIMK (m × 32 + 11)	IMRmEIMK (m × 32 + 10)	IMRmEIMK (m × 32 + 9)	IMRmEIMK (m × 32 + 8)	IMRmEIMK (m × 32 + 7)	IMRmEIMK (m × 32 + 6)	IMRmEIMK (m × 32 + 5)	IMRmEIMK (m × 32 + 4)	IMRmEIMK (m × 32 + 3)	IMRmEIMK (m × 32 + 2)	IMRmEIMK (m × 32 + 1)	IMRmEIMK (m × 32 + 0)
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.14 IMRm Register Contents

Bit Position	Bit Name	Function
31 to 0	IMRmEIMK (m × 32 + 31) to IMRmEIMK (m × 32 + 0)	These are interrupt mask bits for EI level maskable interrupt (EIINT) channels 0 to 357. 0: Enables interrupt servicing 1: Disables interrupt servicing

CAUTION

MKxxx bits which correspond to channels listed as “Reserved” in **Table 7.4, EI Level Maskable Interrupt Sources**, and to channels which are not incorporated in the product must be set to “1”.

7.4.4 FNC — FE Level NMI Status Register

This register indicates the status of an FE level non-maskable interrupt (FENMI).

Access: FNC is a read-only register that can be read in 16-bit units.
FNCH is a read-only register that can be read in 8- or 1-bit units.

Address: FNC: FFFE EA78$_H$
FNCH: FFFE EA79$_H$

Value after reset: 0000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FNRF	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.15 FNC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FNRF	Interrupt request flag 0: No interrupt request 1: Interrupt request occurred This bit is automatically cleared when an FE level NMI interrupt request is acknowledged by the CPU core.
11 to 0	Reserved	When read, the value after reset is returned.

7.4.5 FIC — FE Level Maskable Interrupt Status Register

This register indicates the status of an FE level maskable interrupt (FEINT).

Access: FIC is a read-only register that can be read in 16-bit units.
FICH is a read-only register that can be read in 8- or 1-bit units.

Address: FIC: FFFE EA7A$_H$
FICH: FFFE EA7B$_H$

Value after reset: 8000$_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIRF	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.16 FIC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FIRF	Interrupt request flag 0: No interrupt request 1: Interrupt request occurred This bit cannot be set or cleared by software. It can only be read.
11 to 0	Reserved	When read, the value after reset is returned.

7.5 EI Level Maskable Interrupt Select Registers

The following registers are used to select an EI level maskable interrupt.

7.5.1 List of Registers

Interrupt select registers are listed in the following table.

Table 7.17 List of Registers

Module Name	Register Name	Symbol	Address
SL_INTC	INTC1 Interrupt Select Register	SELB_INTC1	FFC0 1000_H
	INTC2 Interrupt Select Register	SELB_INTC2	FFC0 1004_H

7.5.2 SELB_INTC1 — INTC1 Interrupt Select Register

When two interrupt sources are assigned to one interrupt channel, this register selects which interrupt sources is enabled.

NOTE

The channel described in each bit setting indicates the channel of an interrupt and the priority. For details on channels, see **Table 7.4, EI Level Maskable Interrupt Sources**.

Access: This register can be read or written in 16-bit units.

Address: FFC0 1000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SELB_INTC1_12	SELB_INTC1_11	SELB_INTC1_10	SELB_INTC1_9	SELB_INTC1_8	SELB_INTC1_7	SELB_INTC1_6	SELB_INTC1_5	SELB_INTC1_4	SELB_INTC1_3	SELB_INTC1_2	SELB_INTC1_1	SELB_INTC1_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.18 SELB_INTC1 Register Contents (1/2)

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	SELB_INTC1_12	Interrupt channel selection 0: INTADCA0I2 (Channel 20) INTCSIH0IJC (Channel 32) 1: INTCSIH0IJC_1 (Channel 20) INTADCA0I2_2 (Channel 32)
11	SELB_INTC1_11	Interrupt channel selection 0: INTTAUD0I14 (Channel 15) INTCSIH3IJC (Channel 161) 1: INTCSIH3IJC_1 (Channel 15) INTTAUD0I14_2 (Channel 161)
10	SELB_INTC1_10	Interrupt channel selection 0: INTTAUD0I12 (Channel 14) INTCSIH3IRE (Channel 160) 1: INTCSIH3IRE_1 (Channel 14) INTTAUD0I12_2 (Channel 160)
9	SELB_INTC1_9	Interrupt channel selection 0: INTTAUD0I10 (Channel 13) INTCSIH3IR (Channel 159) 1: INTCSIH3IR_1 (Channel 13) INTTAUD0I10_2 (Channel 159)
8	SELB_INTC1_8	Interrupt channel selection 0: INTTAUD0I2 (Channel 9) INTCSIH3IC (Channel 158) 1: INTCSIH3IC_1 (Channel 9) INTTAUD0I2_2 (Channel 158)
7	SELB_INTC1_7	Interrupt channel selection 0: INTTAUD0I8 (Channel 12) INTCSIH2IJC (Channel 135) 1: INTCSIH2IJC_1 (Channel 12) INTTAUD0I8_2 (Channel 135)
6	SELB_INTC1_6	Interrupt channel selection 0: INTTAUD0I6 (Channel 11) INTCSIH2IRE (Channel 134) 1: INTCSIH2IRE_1 (Channel 11) INTTAUD0I6_2 (Channel 134)

Table 7.18 SELB_INTC1 Register Contents (2/2)

Bit Position	Bit Name	Function
5	SELB_INTC1_5	Interrupt channel selection 0: INTTAUD0I4 (Channel 10) INTCSIH2IR (Channel 133) 1: INTCSIH2IR_1 (Channel 10) INTTAUD0I4_2 (Channel 133)
4	SELB_INTC1_4	Interrupt channel selection 0: INTTAUD0I0 (Channel 8) INTCSIH2IC (Channel 132) 1: INTCSIH2IC_1 (Channel 8) INTTAUD0I0_2 (Channel 132)
3	SELB_INTC1_3	Interrupt channel selection 0: INTCSIG0IR (Channel 28) INTCSIH1IJC (Channel 119) 1: INTCSIH1IJC_1 (Channel 28) INTCSIG0IR_2 (Channel 119)
2	SELB_INTC1_2	Interrupt channel selection 0: INTCSIG0IC (Channel 27) INTCSIH1IRE (Channel 118) 1: INTCSIH1IRE_1 (Channel 27) INTCSIG0IC_2 (Channel 118)
1	SELB_INTC1_1	Interrupt channel selection 0: INTTAPA0IVLY0 (Channel 17) INTCSIH1IR (Channel 117) 1: INTCSIH1IR_1 (Channel 17) INTTAPA0IVLY0_2 (Channel 117)
0	SELB_INTC1_0	Interrupt channel selection 0: INTTAPA0IPEK0 (Channel 16) INTCSIH1IC (Channel 116) 1: INTCSIH1IC_1 (Channel 16) INTTAPA0IPEK0_2 (Channel 116)

CAUTION

The operation of peripheral functions should be enabled after setting the corresponding interrupt source by SELB_INTC1.

7.5.3 SELB_INTC2 — INTC2 Interrupt Select Register

When two interrupt sources are assigned to one interrupt channel, this register selects which interrupt sources is enabled.

Access: This register can be read or written in 16-bit units.

Address: FFC0 1004_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SELB_INTC2_10	SELB_INTC2_9	SELB_INTC2_8	SELB_INTC2_7	SELB_INTC2_6	SELB_INTC2_5	SELB_INTC2_4	SELB_INTC2_3	SELB_INTC2_2	SELB_INTC2_1	SELB_INTC2_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.19 SELB_INTC2 Register Contents

Bit Position	Bit Name	Function
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	SELB_INTC2_10	Interrupt channel 157 selection 0: INTTAUB0I15 1: INTPWGA31
9	SELB_INTC2_9	Interrupt channel 155 selection 0: INTTAUB0I13 1: INTPWGA30
8	SELB_INTC2_8	Interrupt channel 153 selection 0: INTTAUB0I11 1: INTPWGA26
7	SELB_INTC2_7	Interrupt channel 151 selection 0: INTTAUB0I9 1: INTPWGA19
6	SELB_INTC2_6	Interrupt channel 149 selection 0: INTTAUB0I7 1: INTPWGA18
5	SELB_INTC2_5	Interrupt channel 147 selection 0: INTTAUB0I5 1: INTPWGA17
4	SELB_INTC2_4	Interrupt channel 145 selection 0: INTTAUB0I3 1: INTPWGA16
3	SELB_INTC2_3	Interrupt channel 88 selection 0: INTENCA0I1 1: INTPWGA7
2	SELB_INTC2_2	Interrupt channel 87 selection 0: INTENCA0I0 1: INTPWGA6
1	SELB_INTC2_1	Interrupt channel 86 selection 0: INTENCA0IUD 1: INTPWGA5
0	SELB_INTC2_0	Interrupt channel 85 selection 0: INTENCA0IOV 1: INTPWGA4

CAUTION

The operation of peripheral functions should be enabled after setting the corresponding interrupt source by SELB_INTC2.

7.6 Interrupt Function System Registers

See **Table 3.30, Interrupt Function System Registers**.

7.6.1 FPIPR — FPI Exception Interrupt Priority

See **Table 3.31, FPIPR Register Contents**.

7.6.2 ISPR — Priority of Interrupt being Serviced

See **Table 3.32, ISPR Register Contents**.

7.6.3 PMR — Interrupt Priority Masking

See **Table 3.33, PMR Register Contents**.

7.6.4 ICSR — Interrupt Control Status

See **Table 3.34, ICSR Register Contents**.

7.6.5 INTCFG — Interrupt Function Setting

See **Table 3.35, INTCFG Register Contents**.

7.7 Operation when Acknowledging an Interrupt

Check whether each interrupt that is reported during instruction execution is acknowledged according to the priority. The procedure for acknowledging each interrupt is shown below.

(1) Check whether the acknowledgment conditions are satisfied and whether interrupts are acknowledged according to their priority.

(2) Calculate the exception handler address according to the current PSW value.*1

(3) For FE-level non-maskable/maskable interrupts, the following processing is performed:

- Save the PC to the FEPC.
- Save the PSW to the FEPSW.
- Store the exception source code in the FEIC.
- Update the PSW and MCTL.*2
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

(4) For EI level exceptions, the following processing is performed:

- Save the PC to the EIPC.
- Save the PSW to the EIPSW.
- Store the exception source code in the EIIC.
- Update the PSW and MCTL.*2
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

Note 1. For details, see **Section 7.10, Exception Handler Address**.

Note 2. For the values to be updated, see *Table 4.1 Exception Cause List* in the *RH850G3KH User's Manual: Software*.

The following figure shows steps (1) to (4).

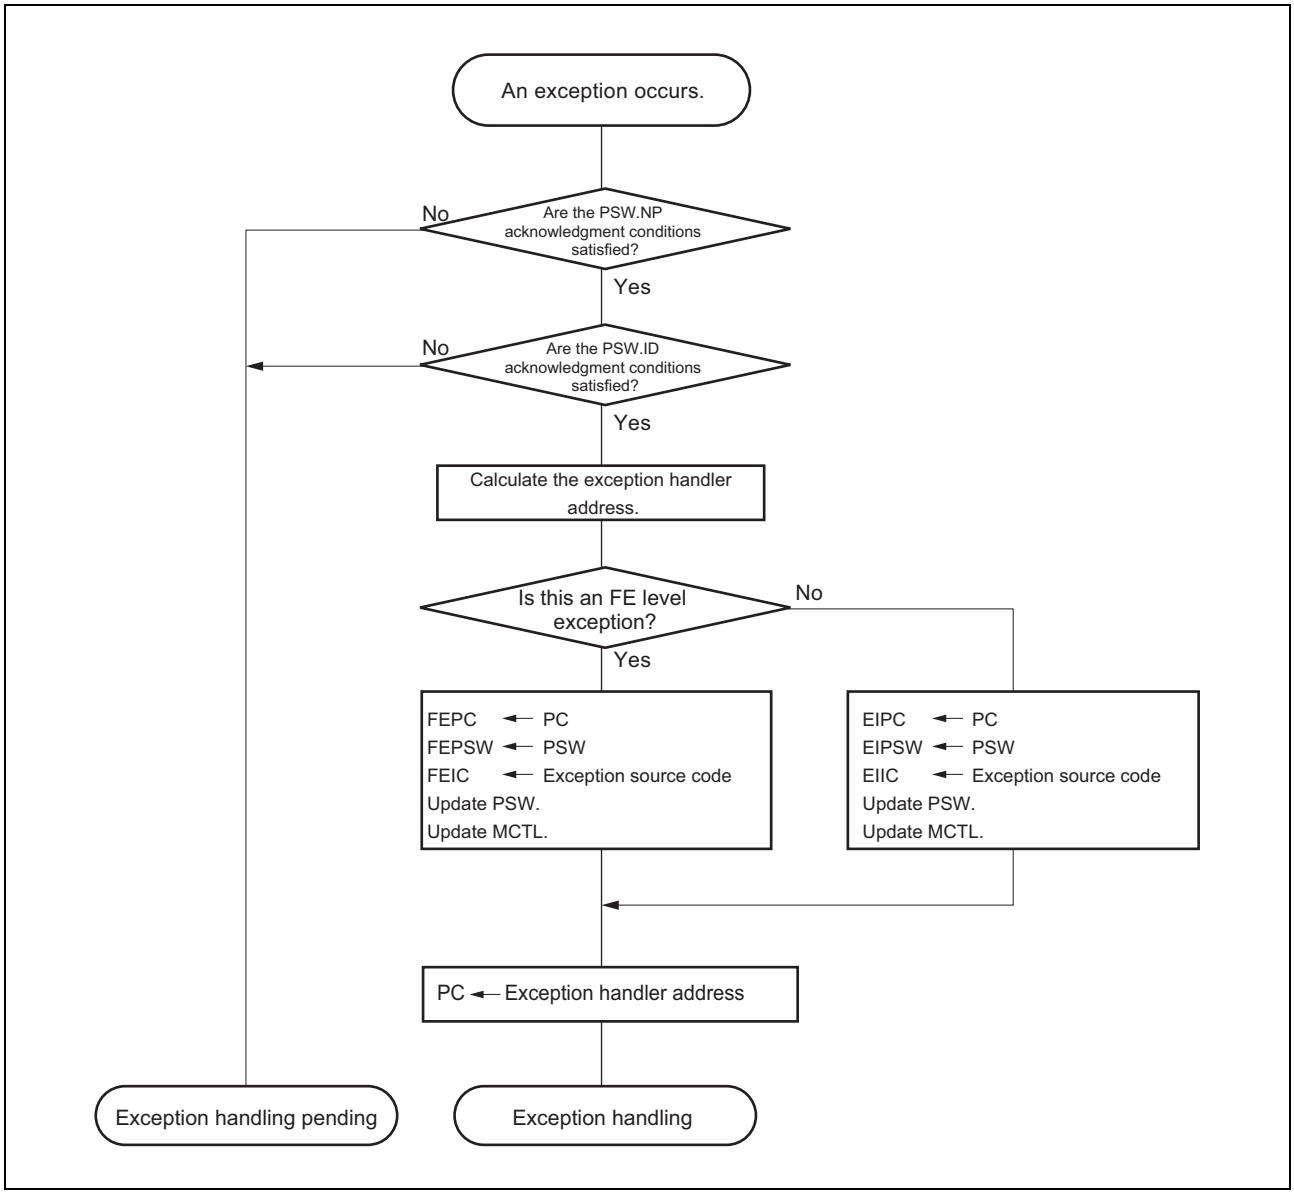

Figure 7.2 Operation when Acknowledging an Interrupt

7.7.1 Exception Source Codes for Different Types of SYSERR Exceptions

The following table lists exception source codes for the different types of SYSERR exceptions.

Table 7.20 Exception Source Codes for Different Types of SYSERR Exceptions

Exception Source Code	Source of SYSERR Generation
11_H	• Detection of an error during the fetching of an instruction from the code flash memory area
13_H	• Detection of an error during the fetching of an instruction from the local or retention RAM areas
14_H	• Detection of an error during access to data in the code flash area • Detection of an error during read access to a module via the system interconnect or PBUS The exception source code reports an occurrence of a system error factor corresponding to VCIF bit of SEGFLAG register*1
16_H	• Detection of an error during access to data in the local or retention RAM areas The exception source code reports an occurrence of a system error factor corresponding to TCMF bit of SEGFLAG register*1
19_H	• Detection of an error during write access to a module via the PBUS The exception source code reports an occurrence of a system error factor corresponding to APIF bit of SEGFLAG register*1
$1A_H$	• Detection of an error inside system interconnect The exception source code reports an occurrence of a system error factor corresponding to VCSF bit of SEGFLAG register*1

Note 1. See **Section 3.2.3.2, System Error Generator Function (SEG)** for details.

7.8 Return from Interrupts

To return from interrupt handling, execute the return instruction (EIRET or FERET) corresponding to each relevant interrupt level.

When a context has been saved in a stack and the like, the context must be restored before executing the return instruction.

The EIRET instruction is used to return from the EI level maskable interrupt handling and the FERET instruction is used to return from FE-level maskable interrupt handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes its control to the return PC address:

(1) When returning from the service routine for an EI-level exception, the PC and PSW values on return are loaded from the EIPC and EIPSW registers.
When returning from the service routine for an FE-level exception, the PC and PSW values on return are loaded from the FEPC and FEPSW registers.

(2) Control is passed to the addresses indicated by the return PC and PSW that were loaded.

(3) When EP = 0 and INTCFG.ISPC = 0, the CPU updates the ISPR register.

The flows for returning from exception handling using the EIRET and FERET instructions are shown below.

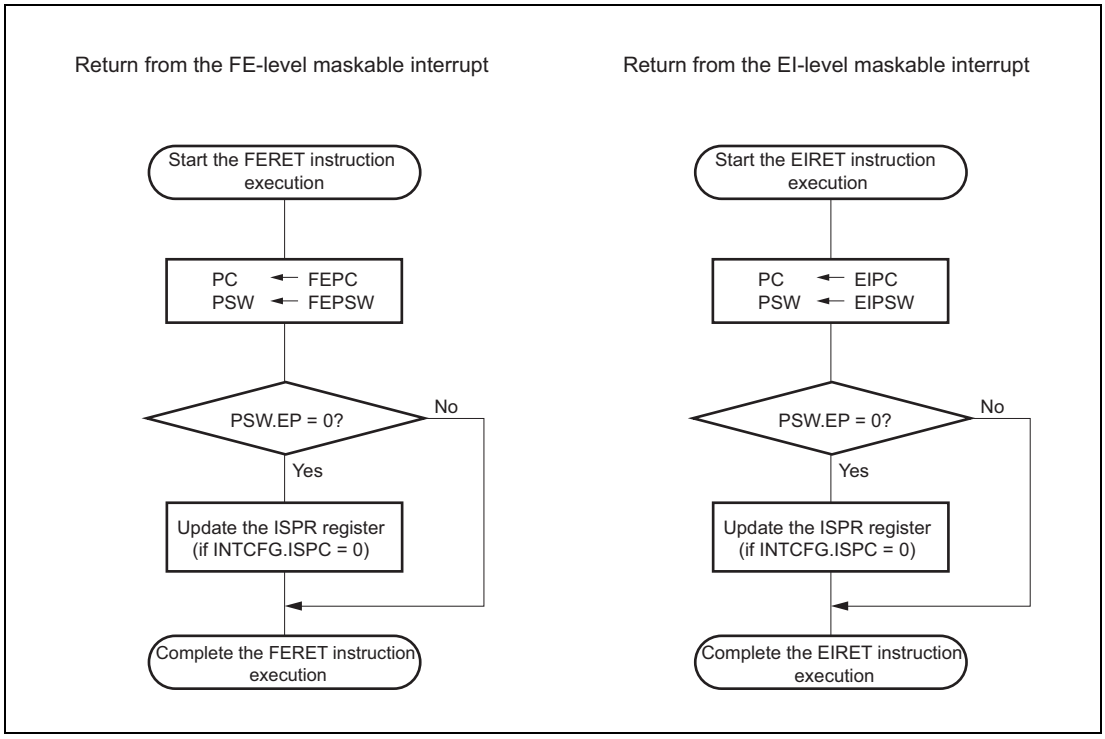

Figure 7.3 Flow of Return from Interrupts

7.9 Interrupt Operation

7.9.1 Interrupt Mask Function of EI Level Maskable Interrupt (EIINT)

Interrupt masking can be specified for each respective interrupt channel of EIINT. Interrupt masking is performed by the following register settings.

Table 7.21 Operation of the MKxxx Bit

ICxxx.MKxxx	Operation
1	Masks interrupt
0	Enables interrupt

The ICxxx.MKxxx bits can also be read and written via the corresponding IMRmEIMKn bits of the IMRm registers. The interrupt mask state is reflected in both the ICxxx registers and the IMRm registers.

[Operation example]

(1) When a 1 is written to an IMRm.IMRmEIMKn bit, interrupts are prohibited for the corresponding channel.

(2) When the corresponding ICxxx.MKxxx bit is read, 1 is returned.

CAUTION

If the MKxxx bit is set to 0 while an interrupt request is pending (RFxxx = 1), the interrupt service routine will be executed at that time (subject to the rules of interrupt prioritization). Even if an interrupt request is issued in software by setting the RFxxx bit to 1, the interrupt will not occur as long as the interrupt is masked with MKxxx = 1.

To cancel an interrupt request that is pending, clear the corresponding RFxxx bit in software.

7.9.2 Interrupt Priority Level Judgment

When FE level non-maskable interrupts (FENMI), FE level maskable interrupts (FEINT), and EI level maskable interrupts (EIINT) are input, priorities including other exceptions are determined, and the exception with the highest priority (including interrupts) is processed. Exceptions occurred at the same time (including interrupts) are processed in a pre-allocated priority order (the default priority order). The priority orders of FENMI, FEINT, and EIINT interrupts are as follows.

FENMI > FEINT > EIINT

See the *RH850G3KH User's Manual: Software* for other exceptions.

For EIINT(INTn) interrupts, the interrupt priority can be set independently for each interrupt source. Specify the interrupt priority with the bits P3xxx to P0xxx. The interrupt priority levels can be set from 0 to 15: 0 is the highest and 15 is the lowest. Among multiple EIINT(INTn) interrupts with the same priority level, the interrupt with the lowest interrupt channel number has priority.

Table 7.22 Example of EIINT (INTn) Interrupt Priority Level Settings and Priority Levels During Operation

EIINT(INTn)	ICxxx.P[3:0]xxx Setting	Priority Level During Operation
INT0	3	10
INT1	4	11
INT2	0	1
INT3	0	2
INT4	1	3
INT5	2	6
INT6	2	7
INT7	1	4
INT8	1	5
INT9	2	8
INT10	2	9

The interrupt controller executes multiple interrupt handling when another interrupt request is acknowledged while an interrupt processing is being executed. When multiple EIINT(INTn) interrupts occur at the same time, the interrupt to be acknowledged is determined by the following procedure.

7.9.2.1 Comparison with the Priority Level of the Interrupt Currently being Handled

Interrupts with the same or lower priority level as the interrupt currently being handled are held pending.

The priority level of the interrupt currently being handled is stored in the ISPR register.

Interrupts with a higher priority level than the interrupt currently being handled proceed to the next priority judgment stage.

7.9.2.2 Masking through Priority Mask Register (PMR)

Only interrupts enabled by the PMR register proceed to the next priority judgment stage.

For the PMR register, see **Table 3.33, PMR Register Contents**, or the *RH850G3KH User's Manual: Software*.

7.9.2.3 The Requested Interrupt Source with the Highest Priority Level is Selected

When interrupts are requested simultaneously from multiple sources, the interrupt set the highest priority by ICxxx.P[3:0]xxx bits takes priority.

When there are multiple highest priority interrupts, the lowest interrupt channel number is selected.

7.9.2.4 Interrupt Suspended by CPU

Interrupt acknowledgment is held according to the state of the NP and ID bits of the PSW register. At this time, priority judgment among EIINT interrupts, and priority judgment among EIINT, FEINT and FENMI interrupts are performed even while interrupt acknowledgment is pending, and the interrupt with the highest priority is selected when the acknowledgment condition is satisfied.

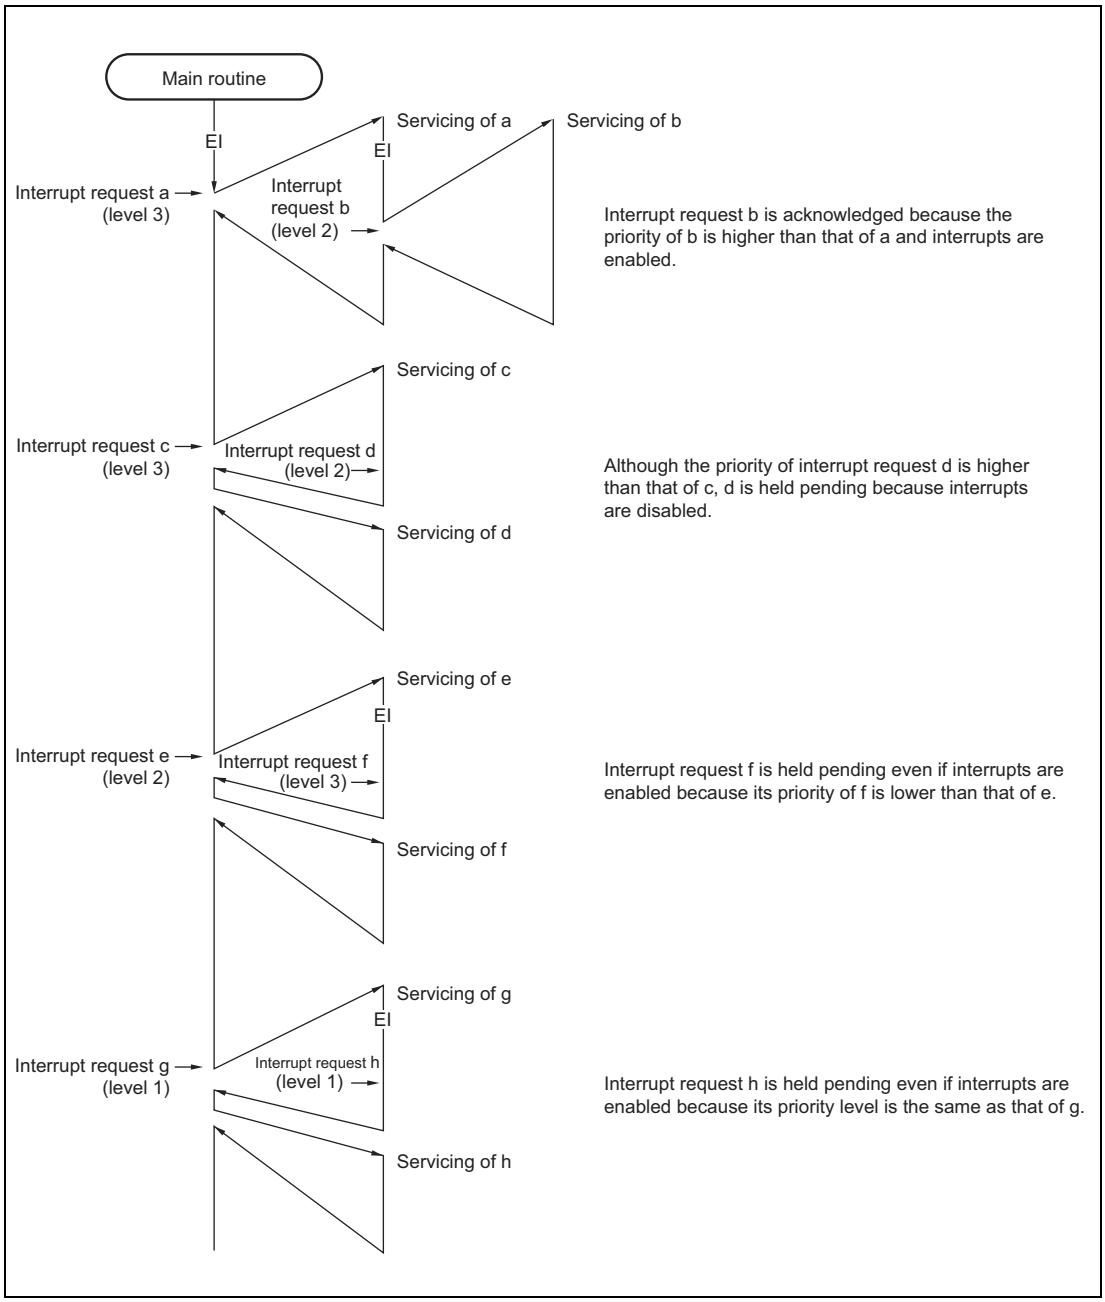
Example

An EIINT interrupt with the priority level 5 has already been requested and interrupt generation is pending because the value of the PSW.ID bit is 1. If a subsequent EIINT interrupt with the priority

level 3 is requested and the PSW.ID bit is cleared to 0, the latter EIINT interrupt (with the priority level 3) will be generated.

Figure 7.4 shows an example of multiple interrupt handling when another interrupt request is acknowledged while interrupt processing is being executed.

When an interrupt request signal is acknowledged, the PSW.ID flag is automatically set to 1. Therefore, the ID flag should be cleared to 0 to execute multiple interrupt handling. Specifically, execute the EI instruction and the like in an interrupt handling program to enable the interrupt.



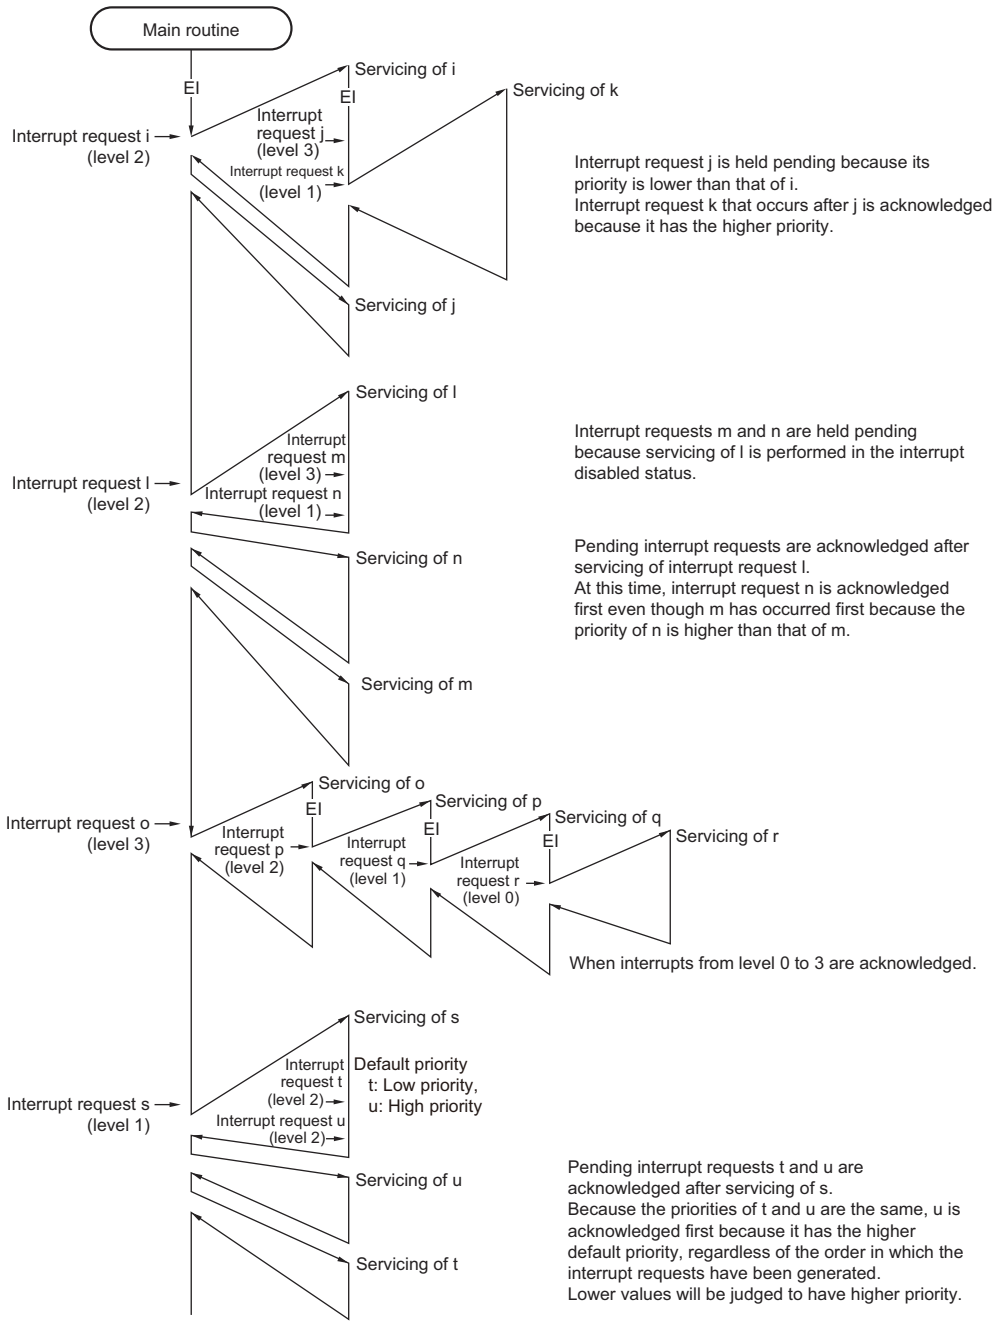


Figure 7.4 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (1)

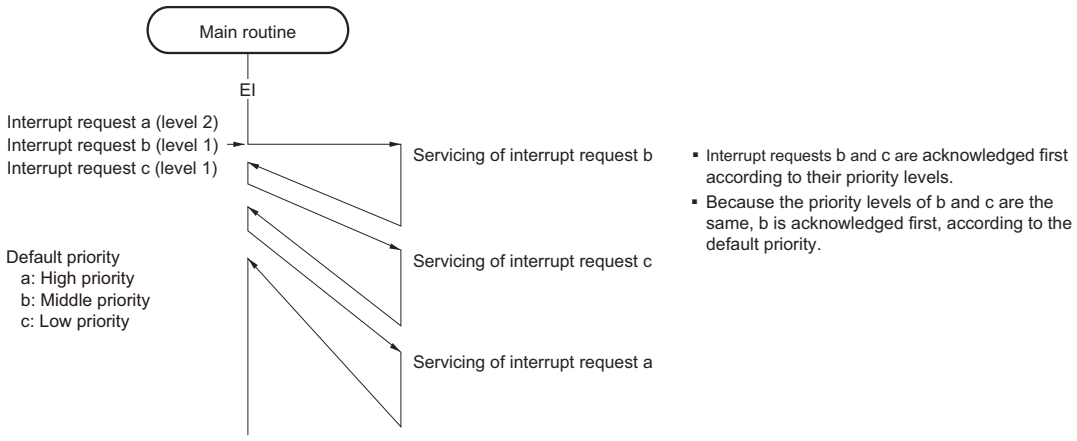

NOTES

1. “a” to “u” in the figure are the temporary names of interrupt request signals shown for the sake of explanation.
2. The default priority (high/low) in the figure indicates the relative priority between two interrupt request signals.

Figure 7.5 Example of Processing in which an Interrupt Request Signal is Issued while Another Interrupt is being Handled (2)

CAUTION

To perform multiple interrupt servicing, the values of the EIPC and EIPSW registers must be saved before executing the EI instruction. When returning from multiple interrupt servicing, restore the values of EIPC and EIPSW after executing the DI instruction.

NOTES

1. “a” to “u” in the figure are the temporary names of interrupt request signals shown for the sake of explanation.
2. The default priority in the figure indicates the relative priority between two interrupt request signals.

Figure 7.6 Example of Servicing Simultaneously Generated Interrupt Requests

7.9.3 Interrupt Request Acknowledgement Conditions and the Priority

See the *RH850G3KH User's Manual: Software*.

7.9.4 Exception Priority of Interrupts and the Priority Mask

See the *RH850G3KH User's Manual: Software*.

7.9.5 Interrupt Priority Mask

See the *RH850G3KH User's Manual: Software*.

7.9.6 Priority Mask Function

The priority mask function prohibits all EIINT interrupts of the specified interrupt priority level.

The interrupt priority levels to be masked are specified in the PMR register. Masking and acknowledgment can be set for each priority level.

The following operations are possible using this function:

- Temporary prohibition of interrupts that have a priority level that is lower than a given priority level
- Temporary prohibition of interrupts that have a given priority level

Table 7.23 Operation of the PMR.PMm Bit

PMR.PMm	Operation
0	Acknowledges requests from priority level m interrupt source.
1	Masks requests from priority level m interrupt source.

Note: m = 0 to 15

The presence of EIINT interrupts held pending with this function can be checked with **Section 7.9.7, Exception Management**.

For details on the PMR register, see **Table 3.33, PMR Register Contents**, or the *RH850G3KH User's Manual: Software*.

7.9.7 Exception Management

Pending interrupts can be checked in the RH850/F1K. For details, see the *RH850G3KH User's Manual: Software*.

7.10 Exception Handler Address

In the RH850/F1K, the exception handler address from which the handler is executed after a reset is input or when an exception or interrupt is acknowledged can be changed according to a setting.

The exception handler address for resets and exceptions (including interrupts) is determined with the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, the RBASE register, and the EBASE register. For interrupts, the direct vector method and table reference method can be selected for each channel. If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory.

CAUTION

The exception handler address of EIINT(INTn) selected using the direct vector method differs from that of the V850E2 core products. In the V850E2 core products, a different exception handler address is individually assigned to each interrupt channel (EIINT(INTn)). In the RH850/F1K, one exception handler address is assigned to each interrupt priority. Consequently, interrupts that have the same priority level branch to the same exception handler.

7.10.1 Direct Vector Method

The CPU uses the result of adding the offset shown in **Table 7.24, Selection of Base Register/ Offset Address** to the base address indicated by the RBASE or EBASE register as the exception handler address.

Select whether the RBASE or EBASE register is used as the base address by using the PSW.EBV bit*1. When the PSW.EBV bit is set to 1, the value of the EBASE register is used as the base address. When the PSW.EBV bit is cleared to 0, the value of the RBASE register is used as the base address.

For reset input and some exceptions*2, however, the RBASE register is always used for reference.

In addition, user interrupts see the RINT bit of the corresponding base register, and reduce the offset address according to the bit status. If the RBASE.RINT bit or EBASE.RINT bit is set to 1, all user interrupts are handled using an offset of 100_H. If the bit is cleared to 0, the offset address is determined according to **Table 7.24, Selection of Base Register/Offset Address**.

Note 1. Exception acknowledgment itself may sometimes update the status of the PSW.EBV bit. In this case, the base register is selected based on the updated value.

Note 2. The exceptions that always see the RBASE register are determined according to the hardware specifications.

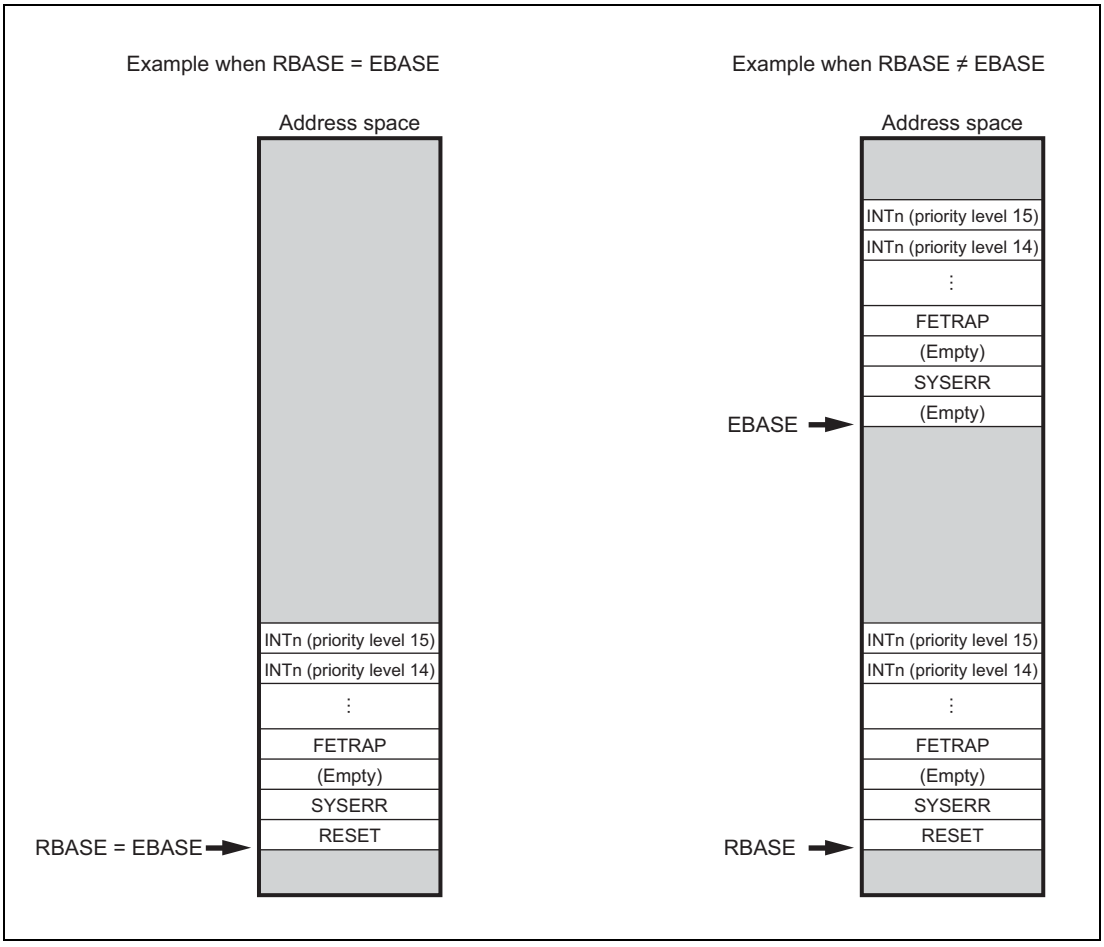

Figure 7.7 Direct Vector Method

The table below shows how base register selection and offset address reduction function for each exception to determine the exception handler address. The value of the PSW bit determines the exception handler address on the basis of the value updated by the acknowledgment of an exception.

Table 7.24 Selection of Base Register/Offset Address

Exception/Interrupt	PSW.EBV = 0	PSW.EBV = 1	RINT = 0	RINT = 1
	Base Register		Offset Address	
RESET	RBASE	N.A.	000_H	000_H
SYSERR		EBASE	010_H	010_H
Reserved			020_H	020_H
FETRAP			030_H	030_H
TRAP0			040_H	040_H
TRAP1			050_H	050_H
RIE			060_H	060_H
FPP/FPI			070_H	070_H
UCPOP			080_H	080_H
MIP/MDP			090_H	090_H
PIE			$0A0_H$	$0A0_H$
Debug			$0B0_H$	$0B0_H$
MAE			$0C0_H$	$0C0_H$
Reserved			$0D0_H$	$0D0_H$
FENMI			$0E0_H$	$0E0_H$
FEINT			$0F0_H$	$0F0_H$
INTn (Priority level 0)			100_H	100_H
INTn (Priority level 1)			110_H	
INTn (Priority level 2)			120_H	
INTn (Priority level 3)			130_H	
INTn (Priority level 4)			140_H	
INTn (Priority level 5)			150_H	
INTn (Priority level 6)			160_H	
INTn (Priority level 7)			170_H	
INTn (Priority level 8)			180_H	
INTn (Priority level 9)			190_H	
INTn (Priority level 10)			$1A0_H$	
INTn (Priority level 11)			$1B0_H$	
INTn (Priority level 12)			$1C0_H$	
INTn (Priority level 13)			$1D0_H$	
INTn (Priority level 14)			$1E0_H$	
INTn (Priority level 15)			$1F0_H$	

Base register selection is used to execute exception handling for resets and some hardware errors by using the programs in a relatively reliable area such as ROM instead of the areas that are easily affected by software errors such as RAM and cache area. The user interrupt offset address reduction function is used to reduce the memory occupation size required by the exception handler for specific system-internal operating modes. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

7.10.2 Table Reference Method

With the direct vector method, there is one user-interrupt exception handler for each interrupt priority level, and interrupt channels that indicate multiple interrupts with the same priority branch to the same interrupt handler, but some users might want to use different code areas for each interrupt handler from the beginning.

The RH850/F1K uses the table reference method for interrupts that assume the above usage.

If the table reference method is specified as the interrupt channel vector selection method in the interrupt controller and the like, the method for determining the exception handler address when an interrupt request corresponding to that interrupt channel is acknowledged differs as follows:

<1> In any of the following cases, the exception handler address is determined by using the direct vector method:

- When PSW.EBV = 0 and RBASE.RINT = 1
- When PSW.EBV = 1 and EBASE.RINT = 1
- When the interrupt channel setting is not the table reference method

<2> In cases other than <1>, calculate the table reference position.
Exception handler address read position = INTBP register + channel number × 4 bytes

<3> Read word data starting at the interrupt handler address read position calculated in <2>.

<4> Use the word data read in <3> as the exception handler address.

Table 7.25 shows the exception handler address read positions corresponding to each interrupt channel and **Figure 7.8** shows an overview of the allocation in memory.

Table 7.25 Exception Handler Address Expansion

Type of Interrupt	Exception Handler Address Read Position
EI level maskable interrupt channel 0	INTBP register value + 0 × 4
EI level maskable interrupt channel 1	INTBP register value + 1 × 4
EI level maskable interrupt channel 2	INTBP register value + 2 × 4
:	:
EI level maskable interrupt channel 356	INTBP register value + 356 × 4
EI level maskable interrupt channel 357	INTBP register value + 357 × 4

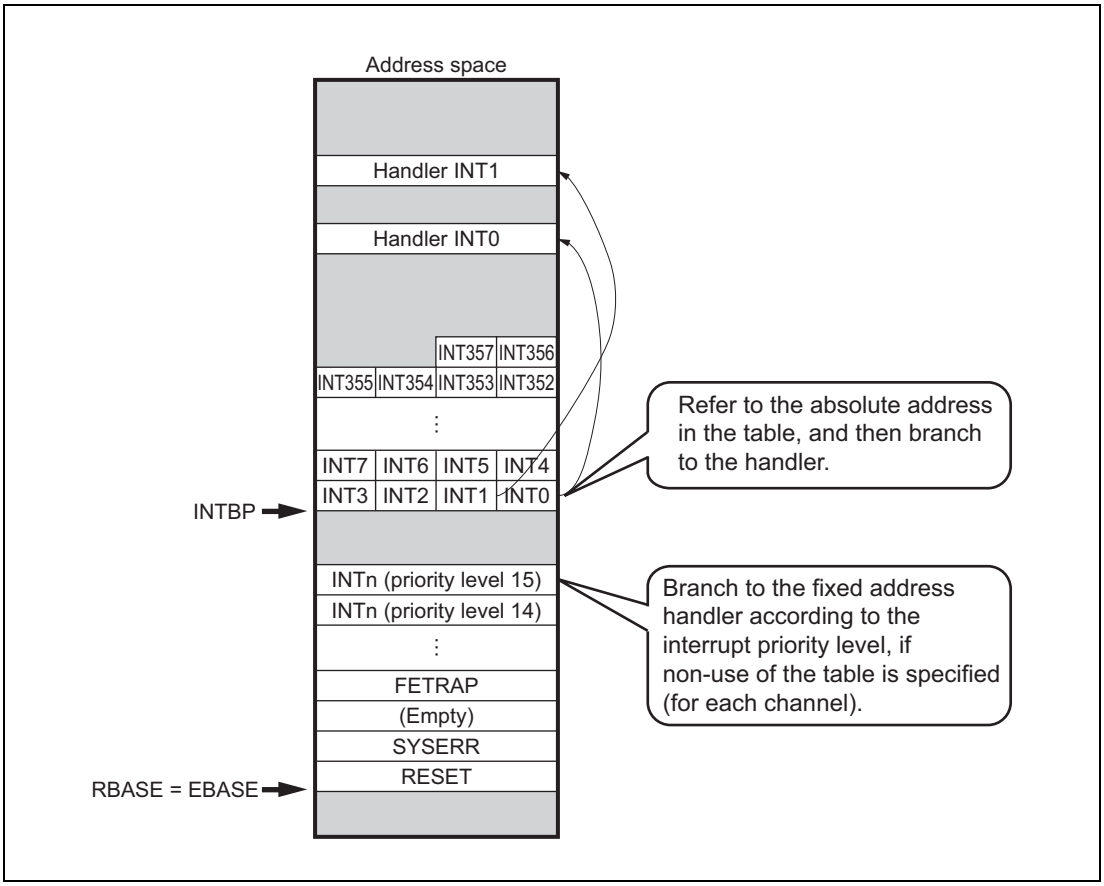

Figure 7.8 Table Reference Method

Section 8 DMA Controller

This section explains about the DMA controller (DMA) in general.

The first part in this section describes the features specific to the RH850/F1K, including the number of channels and register base addresses. The ensuing sections describe the DMA functions and registers.

8.1 Features of RH850/F1K DMA Controller

8.1.1 Number of Channels

The products of the RH850/F1K series incorporate a DMA with the number of channels indicated below.

Table 8.1 Number of Channels

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of channels	16 ch (8ch × 2)		

Table 8.2 Indices

Index	Description
n	In this section, the DMA units are identified with an index “n” (n = 0, 1) for example, as DMACn.
m	In this section, the DMA channels are identified with an index “m” (m = 0 to 15). For example, DSAm is the DMA source address register.
i	In this section, the DMAC channels are identified with an index “i” (i = 0 to 7). For example, DMniCM is the DMAC channel master.

8.1.2 Register Base Address

The DMA base address is indicated in the following table.

The DMA register address is expressed as an offset of the base address.

Table 8.3 Register Base Address

Base Address Name	Base Address
<DMA_base>	FFFF 8000_H

8.1.3 Interrupt Requests

The DMA interrupt requests are listed in the following table.

Table 8.4 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number
INTDMA0	DMA00 transfer completion	60
INTDMA1	DMA01 transfer completion	61
INTDMA2	DMA02 transfer completion	62
INTDMA3	DMA03 transfer completion	63
INTDMA4	DMA04 transfer completion	64
INTDMA5	DMA05 transfer completion	65
INTDMA6	DMA06 transfer completion	66
INTDMA7	DMA07 transfer completion	67
INTDMA8	DMA10 transfer completion	68
INTDMA9	DMA11 transfer completion	69
INTDMA10	DMA12 transfer completion	70
INTDMA11	DMA13 transfer completion	71
INTDMA12	DMA14 transfer completion	72
INTDMA13	DMA15 transfer completion	73
INTDMA14	DMA16 transfer completion	74
INTDMA15	DMA17 transfer completion	75

Table 8.5 Interrupt Request (FE Level Non-Maskable Interrupts)

Unit Interrupt Signal	Description	Interrupt Name
INTDMAERR	DMA transfer error interrupt	INTDMAERR

8.1.4 DMA Trigger Factors

DMA trigger factors can be selected by setting the DTFRm.REQSEL[6:0] bits.

The following table lists all DMA trigger factors which can be selected by the DTFRm register.

Table 8.6 DMA Trigger Factors (1/4)

8.2 Overview

8.2.1 Overview

Direct memory access (DMA) is used to access data without intervention of the CPU.

DMA includes a DMA transfer module called DMAC. A DMAC includes registers for storing transfer information. DMA has two 8-channel DMAC modules.

In this manual, DTFR denotes the function to select among hardware DMA transfer sources for a DMAC and retain the DMA transfer request. The DTFR can handle 128 types of hardware DMA transfer sources.

The address space that can be used for DMA transfer is a 4 GB address space represented by a 32-bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DMA, see **Section 4, Address Space**.

CAUTION

DMA can be used after PEG access permission setting.

When accessing from the DMA to the local RAM and the retention RAM in the PE, the PEGSP register, PEGGnMK register (n = 0 to 3), PEGGnBA register (n = 0 to 3) and DMniCM register (ni = 00 to 07, 10 to 17) must be set.

8.2.2 Term Definition

Table 8.7 shows the terms used in this section.

Table 8.7 List of Term Definitions

Term	Description
DMA transfer	A general term for data transfer carried out by DMA.
DMA cycle	A series of actions that consist of reading an amount of data specified by the transfer size (8/16/32/64/128 bits) from the address specified by the source address and writing it to the address specified by the destination address. The first half of the DMA cycle (reading part) is called a read cycle, and the second half (writing part) is called a write cycle.
Hardware DMA transfer source	A trigger for a DMA transfer request sent by an internal peripheral device.
Hardware DMA transfer request	A DMA transfer request generated by a hardware DMA transfer source
Software DMA transfer request	A DMA transfer request generated by software writing to a register.
DMA transfer request	A trigger to start DMA transfer with the DMAC.
Transfer information	The information required for DMA transfer, including the source address, destination address, transfer data size, and transfer count.
Single transfer	DMA transfer consisting of one DMA cycle started by one DMA transfer request.
Block transfer 1	DMA transfer consisting of the number of DMA cycles specified by the transfer count in the transfer information, started by one DMA transfer request.
Block transfer 2	DMA transfer consisting of the number of DMA cycles specified by the address reload count in the transfer information, started by one DMA transfer request.
Block transfer	A general term for both block transfer 1 and block transfer 2.
Last transfer	The DMA cycle carried out when the transfer count in the transfer information is 1.
Address reload transfer	The DMA cycle carried out when the address reload count in the transfer information is 1 if the reload function 2 is used.
Suspension	An action of pausing DMA transfer during block transfer. You can resume DMA transfer after suspension.
Resume	An action of resuming suspended DMA transfer.
Transfer abort	An action of aborting DMA transfer in the middle. You cannot resume DMA transfer after that.

8.3 DMA Function

8.3.1 Basic Operation of DMA Transfer

8.3.1.1 Transfer Mode

DMA has three transfer modes.

Single Transfer

One DMA cycle is executed when a DMA transfer request is acknowledged.

Block Transfer 1

The number of DMA cycles specified in the transfer count register are executed when a DMA transfer request is acknowledged.

Block Transfer 2

The number of DMA cycles specified by the address reload count are executed when a DMA transfer request is acknowledged. If the value specified in the address reload count is larger than the value in the transfer count register, the number of DMA cycles specified in the transfer count register are executed.

8.3.1.2 Executing a DMA Cycle

DMA always executes a write cycle after a read cycle is complete.

For example, if the transfer data size is 128 bits, a write cycle is executed after a read cycle for the 128-bit data is finished. A write cycle never starts in the middle of a read cycle.

8.3.1.3 Updating Transfer Information

When a DMA cycle is executed, DMA updates transfer information as follows:

Source Address and Destination Address

Transfer information will be updated as described in **Table 8.8** according to the settings in the transfer control register such as the count directions of source address and destination address and transfer data size.

Table 8.8 Updating the Source Addresses and the Destination Addresses

Count Direction	Transfer Data Size	Address after Update
Increment	8 bits	(address before update) + 0000_0001_H
	16 bits	(address before update) + 0000_0002_H
	32 bits	(address before update) + 0000_0004_H
	64 bits	(address before update) + 0000_0008_H
	128 bits	(address before update) + 0000_0010_H
Decrement	8 bits	(address before update) - 0000_0001_H
	16 bits	(address before update) - 0000_0002_H
	32 bits	(address before update) - 0000_0004_H
	64 bits	(address before update) - 0000_0008_H
	128 bits	(address before update) - 0000_0010_H
Fixed	—	Same as the address before update.

When you use the reload function, a special update rule is applied other than the one described in **Table 8.8** for the last transfer and the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

Transfer Count/Address Reload Count

The transfer count is decremented by one for every DMA cycle.

The address reload count is decremented by one for every DMA cycle when the reload function 2 or block transfer 2 is used. When the reload function 2 or block transfer 2 is not used, it is not updated.

When you use the reload function, a special update rule is applied for the last transfer and the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

Other transfer information

Other transfer information is not updated during execution of a DMA cycle.

8.3.1.4 Last Transfer and Address Reload Transfer

The last transfer means a DMA cycle executed when the value in the transfer count register, which shows the remaining number of transfers, is one. The last transfer differs in operation compared to other DMA cycles as follows.

- The transfer completion flag (DCSTm.TC) is set when the last transfer is complete.
  The channel operation enable (DCENm.DTE) bit is cleared when the last transfer is complete (when continuous transfer is disabled).
- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When the reload function 1 is enabled, the reload function 1 is executed at the timing of the last transfer. For details, see **Section 8.3.3, Reload Function**.

The address reload transfer means a DMA cycle executed when the reload function 2 is enabled and the address reload count is one. The reload function 2 is executed during the address reload transfer. For details, see **Section 8.3.3, Reload Function**.

8.3.1.5 Transfer Completion Interrupt Output

DMA can output a transfer completion interrupt to external devices.

Transfer Completion Interrupt Output

When the transfer completion interrupt output enable (DTCTm.TCE) is set in the transfer control register, a DMAC requests a transfer completion interrupt when the last transfer is complete.

Figure 8.1 shows the operation of the transfer completion interrupt.

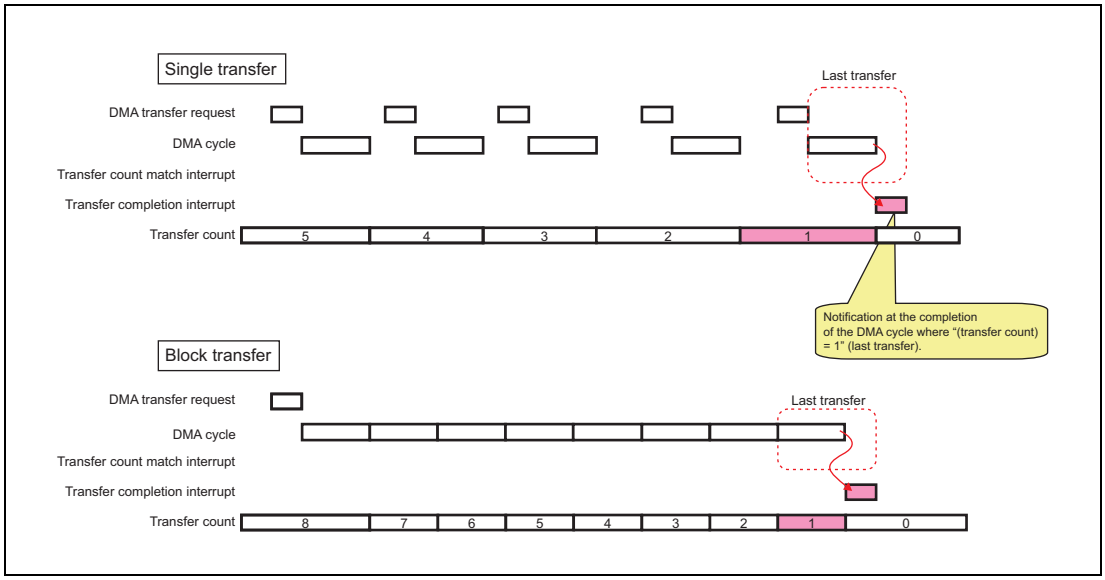

Figure 8.1 Transfer Completion Interrupt

8.3.1.6 Continuous Transfer

If the continuous transfer is not used, a DMAC sets the transfer completion flag (DCSTm.TC) and clears the channel operation enable (DCENm.DTE) bit when the last transfer is complete. In this case, a DMA transfer request is not accepted when the request is generated after the completion of the last transfer.

If the continuous transfer is used, the channel operation enable (DCENm.DTE) bit is not cleared when the last transfer is complete, and a DMA transfer request can be accepted even when the transfer completion flag is set. If DMA is used for a case where a specified number of DMA transfers are executed repetitively, software overhead associated with clearing the transfer completion flag and setting the channel operation enable bit after the completion of the last transfer can be reduced by using the continuous transfer.

The continuous transfer is enabled by setting the continuous transfer enable (DTCTm.MLE) in the DMAC transfer control register.

The continuous transfer is designed to work with the reload function 1. The continuous transfer function itself does not update the source address register, destination address register, and transfer count register. If, after the last transfer is complete, you want to restore the source address register, destination address register, and transfer count register to the state before the DMA transfer starts, use the reload function 1 and set the values of the source address register, destination address register, and the transfer count register before the DMA transfer starts to the reload source address register, reload destination address register, and reload transfer count register respectively.

Figure 8.2 shows an operation of continuous transfer by a DMAC.

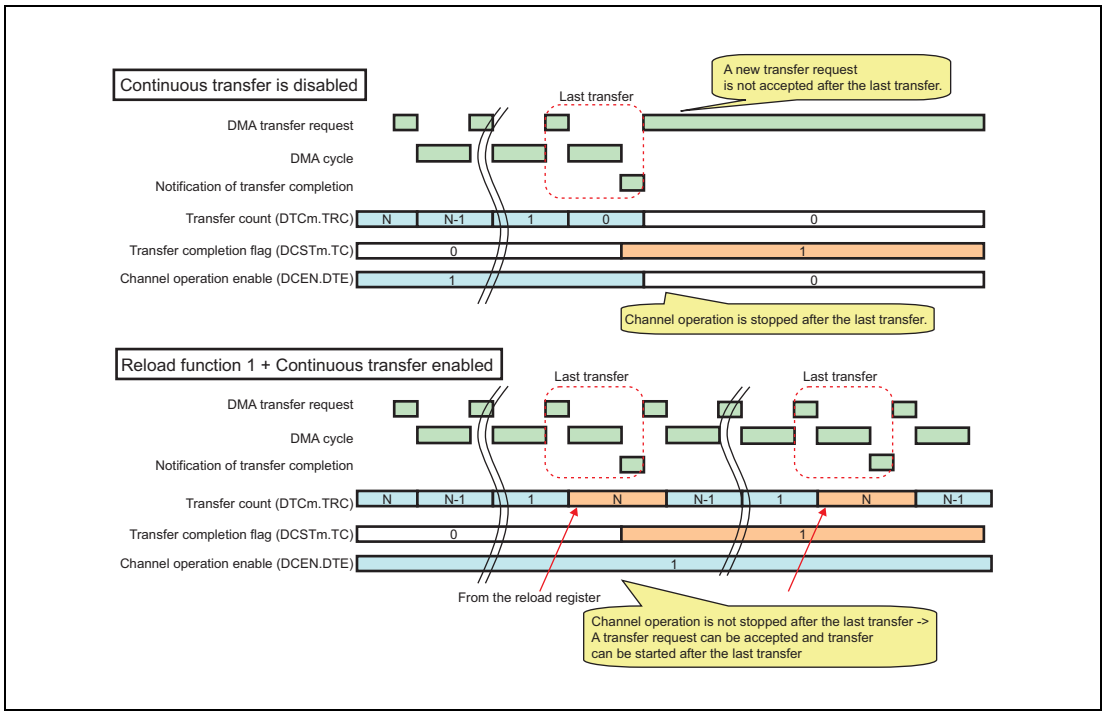

Figure 8.2 Operation of Continuous Transfer by a DMAC

8.3.2 Channel Priority Order

This subsection explains arbitration between multiple DMA channels.

8.3.2.1 DMAC Channel Arbitration

A DMAC select one channel out of eight channels with arbitration. Arbitration is done according to the fixed priority order. The priority order is “channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7” for DMAC0, and “channel 8 > channel 9 > channel 10 > channel 11 > channel 12 > channel 13 > channel 14 > channel 15” for DMAC1.

Arbitration is done for every DMA cycle. No arbitration occurs between the read and write of a DMA cycle.

If, at the timing when one DMA cycle completes in the middle of a block transfer of a channel, there is a DMA transfer request from a channel with a higher priority, a DMA cycle of the channel with the higher priority will be executed as the result of arbitration.

If a DMAC executes the block transfer 1 or block transfer 2, DMAC channel arbitration is done for every DMA cycle, and possibly a DMA cycle of another DMAC channel with a higher priority may interrupt.

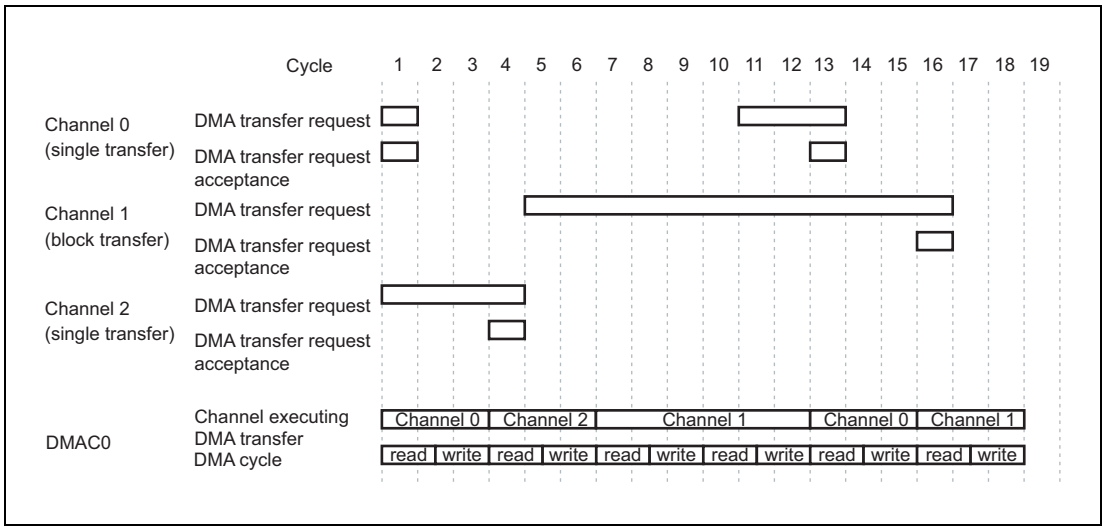

Figure 8.3 DMAC Channel Arbitration

Cycle numbers shown in **Figure 8.3** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 8.3**, DMA transfer requests for channels 0 and 2 are generated at Cycle 1. As a result of arbitration, a DMA cycle for channel 0 starts because its priority is higher. At Cycle 4, a DMA cycle for channel 2 starts. At Cycle 5, a DMA transfer request for channel 1 is generated. However, since the DMA cycle for channel 2 is still ongoing, no arbitration is done at this point. At Cycle 7, a DMA cycle for channel 1 starts. Because channel 1 uses block transfer, this DMA cycle continues at Cycle 10 where there are no other DMA transfer requests from other channel. At Cycle 11, a DMA transfer request for channel 0 is generated. However, since the DMA cycle for channel 1 is still ongoing, no arbitration is done at this point. At Cycle 12, the DMA cycle for channel 1 is complete. At Cycle 13, a DMA cycle for channel 0 starts as a result of arbitration between DMA channels 0 and 1.

It should be noted that, even though a block transfer of channel 1 has been already started, a DMA cycle of not channel 1 but channel 0 is executed at Cycle 13 because the priority of the latter is higher. At Cycle 15, the DMA cycle for channel 0 is complete. At Cycle 16, a DMA cycle for channel 1 starts again. At Cycle 18, the last DMA cycle of the block transfer of channel 1 is complete.

8.3.2.2 Interface Arbitration

DMAC0 and DMAC1 work independently and execute DMA transfer.

8.3.3 Reload Function

8.3.3.1 Overview of the Reload Function

The reload function updates a portion of transfer information, more specifically, the source address, destination address, transfer count, and address reload count, to the predefined values during DMA transfer.

The reload function has two types of functions: reload function 1 and reload function 2.

8.3.3.2 Operation of Reload Function 1

When the reload function 1 is enabled, actions described in **Table 8.9** are executed at the timing of the last transfer according to the reload function 1 setting.

Table 8.9 Operation of Reload Function 1

Reload Function 1 Setting	Register	Action at the Last Transfer
00 (Reload function 1 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Transfer count	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 1 enabled. Reloading source address and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded. • If the reload function 2 is enabled: The reload address reload count is copied to this.
10 (Reload function 1 enabled. Reloading destination address and transfer count.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded. • If the reload function 2 is enabled: The reload address reload count is copied to this.
11 (Reload function 1 enabled. Reloading source address, destination address, and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded • If the reload function 2 is enabled: The reload address reload count is copied to this.

Figure 8.4 shows an operation of the reload function 1.

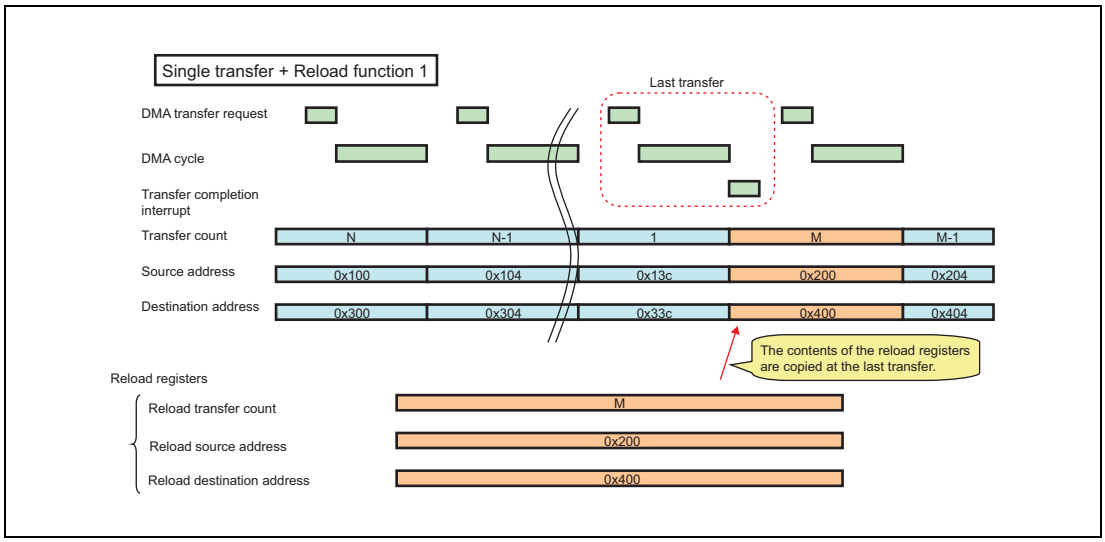

Figure 8.4 Operation of Reload Function 1

8.3.3.3 Reload Function 2

When the reload function 2 is enabled, actions described in **Table 8.10** are executed at the timing of the address reload transfer according to the reload function 2 setting.

Table 8.10 Operation of Reload Function 2

Reload Function 2 Setting	Register	Action at the Address Reload Transfer
00 (Reload function 2 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 2 enabled. Reloading source address and address reload count.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Address reload count	The reload address reload count is copied to this.
10 (Reload function 2 enabled. Reloading destination address and address reload count.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.
11 (Reload function 2 enabled. Reloading source address and destination address and address reload count.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.

Figure 8.5 shows an operation of the reload function 2.

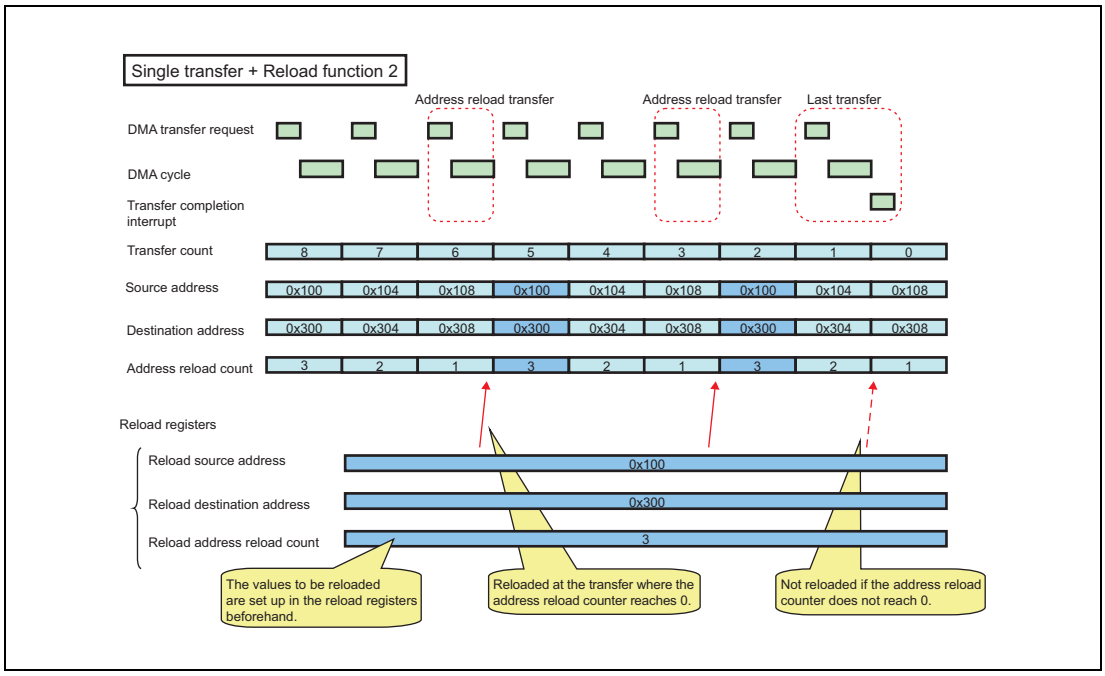

Figure 8.5 Operation of Reload Function 2

Figure 8.6 shows an operation when both the reload function 1 and the reload function 2 are used simultaneously.

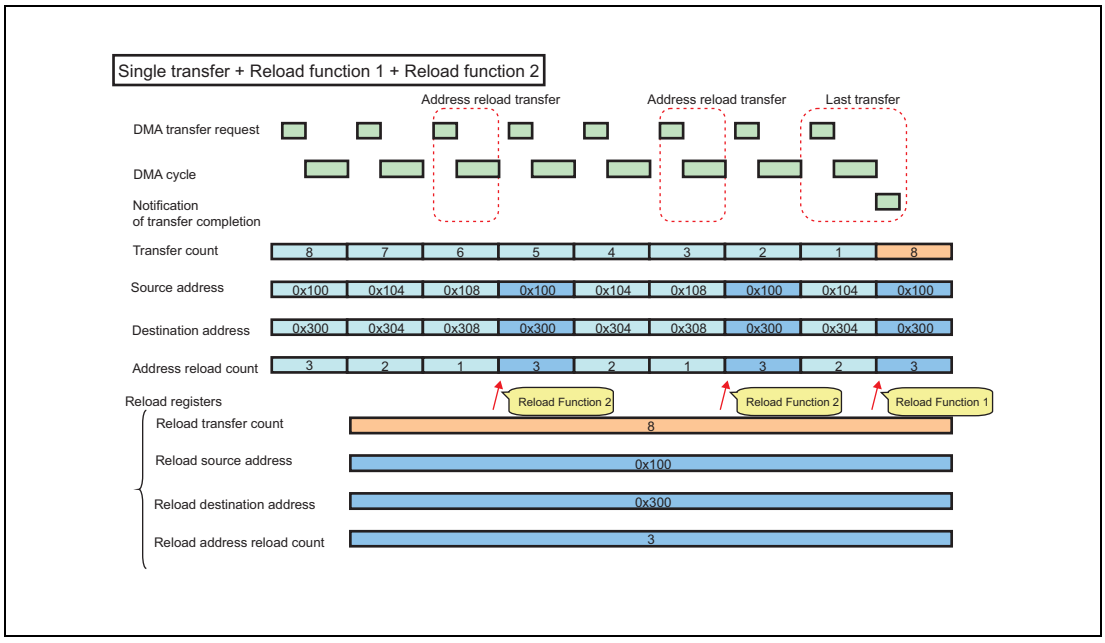

Figure 8.6 Operation when Combining the Reload Function 1 and the Reload Function 2

8.3.3.4 Timing of Setting DMAC Reload Registers

You can set up the reload source address register, reload destination address register, and reload transfer count register any time (even during DMA transfer). However, if you update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, there may be a conflict between reloading at the last transfer or address reload transfer and update of the reload register by users. In order to avoid this conflict, setting up reload registers must be completed before the last transfer or address reload transfer starts.

8.3.4 Chain Function

8.3.4.1 Overview

DMA offers a function called a chain function. With this function, the completion of the DMA cycle or last transfer for one channel can trigger a DMA transfer request for another channel. A DMA transfer request for another channel initiated by the chain function is called a chain request.

You can select the condition for generating a chain request from the following two options:

- Always chain: A chain request is generated at the completion of every DMA cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

Figure 8.7 shows the operation of “always chain.”

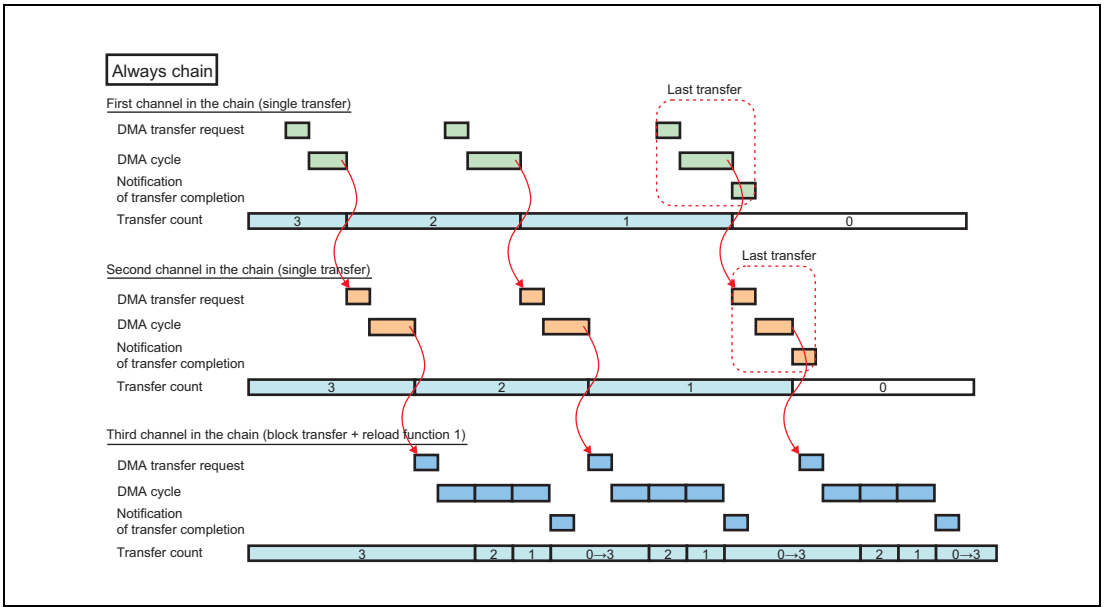

Figure 8.7 Operation of “Always Chain”

Figure 8.8 shows the operation of "chain at the last transfer."

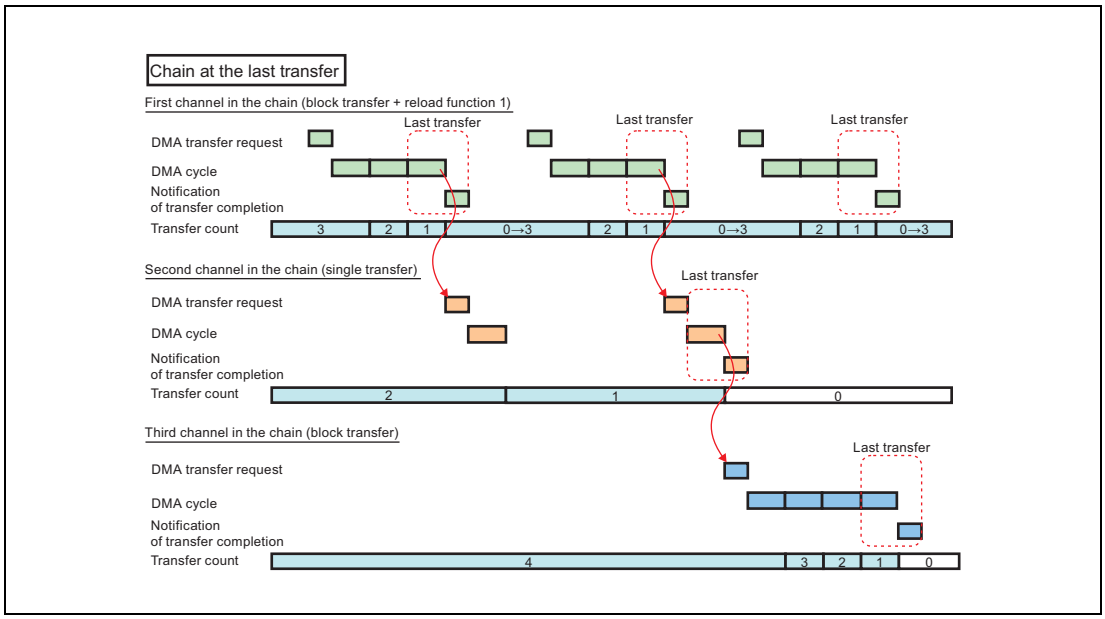

Figure 8.8 Operation of "Chain at the Last Transfer"

8.3.4.2 Setting Up the Chain Function

For a DMAC, you need to write to the chain enable (DTCTm.CHNE) and the next channel in the chain selection (DTCTm.CHNSEL) in the DMAC transfer control register in order to set up the type of chain function and the next channel number in the chain.

8.3.4.3 Caution for Using the Chain Function

The chain function is enabled by setting the software DMA transfer request flag of the next channel in the chain as a part of its function. Therefore, you need to set up the channel settings of the next channel in the chain in the same way as when the software DMA transfer request is used. If you specify a channel using the hardware DMA transfer request for the next channel in the chain, the chain function does not work.

A channel and its next channel in the chain must belong to the same module (DMAC0 and DMAC1). You cannot specify a channel in another module for its next channel in the chain.

8.3.5 DMAC Operation

8.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request selection assignment (DTCTm.DRS) bit in the DMAC transfer control register (DTCTm) determines whether a hardware DMA transfer request or a software DMA transfer request is used.

In the case of a hardware DMA transfer request for a DMAC, DTFR selects one out of 128 hardware DMA transfer factor and assigned to each channel of the DMAC. This assignment is configured in the DTFR setting registers.

8.3.5.2 Generating and Accepting a Software DMA Transfer Request

By setting the software DMA transfer request flag (DCSTm.SR) in the DMAC transfer status register (DCSTm) using the DMAC transfer status set register (DCSTSm), a software DMA transfer request can be generated.

The software DMA transfer request flag is automatically cleared when the DMAC processes the DMA transfer request. The timing when the software DMA transfer request flag is automatically cleared differs depending on the transfer mode of the DMA transfer to be executed.

- In the single transfer mode, the software DMA transfer request flag is cleared whenever the software DMA transfer request is accepted.
- In the block transfer 1 mode, the software DMA transfer request flag is cleared when the last transfer starts.
- In the block transfer 2 mode, the software DMA transfer request flag is cleared when the last transfer or address reload transfer starts.

The software DMA transfer request flag can also be cleared by software using the DMAC transfer status clear register (DCSTCm). When you abort a DMA transfer of a DMAC channel, you must clear the software DMA transfer request flag.

8.3.5.3 Executing DMA Transfer

When the DMAC accepts a DMA transfer request for a channel, the DMAC executes DMA transfer of the channel. If there are DMA transfer requests from multiple channels, DMAC does DMAC channel arbitration and decides a channel to be acknowledged.

8.4 Suspension, Resume, Transfer Abort, and Clearing of a DMA Transfer Request

8.4.1 DMA Suspension and Resume by Software Control

The DMA control register (DMACTL) is used to suspend DMA transfer for all channels.

When the DMA suspension bit (DMACTL.DMASPD) in the DMA control register is set, DMA puts all channels into the suspended state. If all channels are in the suspended state and the DMA suspension bit in the DMA control register is cleared, DMA restores all channels from the suspended state to the normal state and resumes the DMA transfer of the suspended channel.

When all channels are in the suspended state, DMA transfer is suspended for all channels without changing the value of the DCENm.DTE bit of each DMAC channel.

8.4.2 Suspension, Resume, and Transfer Abort of a DMAC Channel

You can suspend the DMA transfer of a DMAC channel by clearing the channel operation enable bit (DCENm.DTE) in the DMAC channel operation enable setting register for the channel. If a DMA cycle is ongoing, the DMA transfer of the channel is suspended after the currently ongoing DMA cycle is finished. If you set the DCENm.DTE bit again while the DMA transfer of the channel is suspended, the DMA transfer of the channel is resumed.

If you want to abort the currently ongoing DMA transfer of a DMAC channel, similarly clear the channel operation enable bit (DCENm.DTE) in the DMAC channel operation enable setting register, and then clear the hardware DMA transfer request in the DTFR in the case of a hardware DMA transfer request, or clear the software DMA transfer request flag (DCSTm.SR) using the DMAC transfer request flag clear bit (DCSTCm.SRC) in the DMAC transfer status clear register in the case of a software DMA transfer request.

In case that the continuous transfer enable bit (DTCTm.MLE) is set, the channel operation enable bit (DCENm.DTE) is kept to be set. Even though the channel operation enable bit (DCENm.DTE) is cleared by software during a DMA cycle in a last transfer, the function of the continuous transfer enable bit (DTCTm.MLE) is given high priority and the channel operation enable bit (DCENm.DTE) is set after completion of the last transfer.

If you want to abort an ongoing DMA transfer of a DMAC channel when continuous transfer function is enabled, please clear the continuous transfer enable bit (DTCTm.MLE) first and then clear the channel operation enable bit (DCENm.DTE) to abort DMA transfer of the DMAC channel. Only for the operation, DMAC Transfer Control Register (DTCTm) can be written under the channel operation is enabled (DCENm.DTE = 1).

Figure 8.9 shows an example of suspension, resume, and transfer abort of a DMAC channel.

In **Figure 8.9**, both channels 0 and 1 execute block transfer. At time tick 1, DMA transfer of channel 1 starts. At time tick 2, a DMA transfer request for channel 0 is accepted. As a result of DMAC channel arbitration, DMA transfer of channel 0 starts because channel 0 has a higher priority than channel 1. At time tick 3, the last transfer of channel 0 is complete, and the remaining DMA transfer in the block transfer of channel 1 starts. At time tick 4, the last transfer of channel 1 is complete. After time tick 5, DMA transfer of channel 0 and DMA transfer of channel 1 are executed similarly. At time tick 7, the DMA transfer of channel 0 is suspended and, as a result of DMAC channel arbitration, the DMA transfer of channel 1 starts. At time tick 8, the last transfer of channel 1 is complete, and then, at time tick 9, the DMA transfer of channel 0 resumes. At time tick 10, the DMA transfer of channel 0 is suspended again, and then, at time tick 11, the DMA transfer of channel 0 is aborted. At time tick 12,

the suspended state for channel 0 is cleared, but the DMA transfer of channel 0 is not executed because the DMA transfer is aborted at time tick 11.

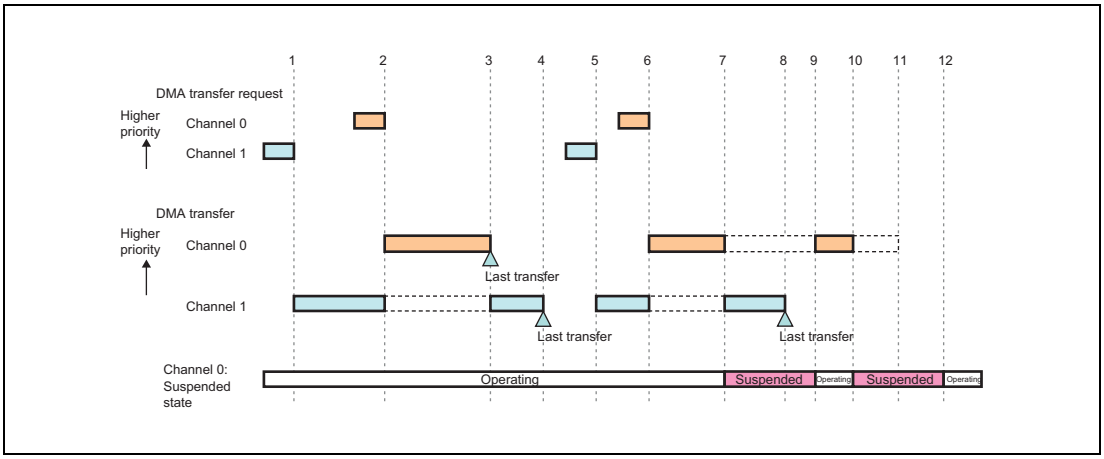

Figure 8.9 Example of Suspension, Resume, and Transfer Abort of a DMAC Channel

8.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR

If a DMAC uses a hardware DMA transfer request, you can temporarily disable (mask) the hardware DMA transfer request output from the DTFR to the DMAC by clearing the hardware DMA transfer source selection enable bit (DTFRm.REQEN) in the DTFR setting register.

Also, if a hardware DMA transfer source is used, you can clear a hardware DMA transfer request retained in the DTFR by using the hardware DMA transfer request clear (DTFRRQCm.DRQC) bit in the DTFR transfer request clear register.

Even if you suspend or abort DMA transfer of a DMAC channel, the hardware DMA transfer request selection/hold circuit of the DTFR is still running, and consequently, the DTFR may retain a hardware DMA transfer request that was input to the DTFR during the suspension or transfer abort period of the DMAC channel. When you resume or start DMA transfer of a DMAC channel, clear the hardware DMA transfer request retained in the DTFR as required.

In case that DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode, if DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the ongoing block transfer is suspended.

8.4.4 List of Suspend, Resume, and Transfer Abort Functions

Table 8.11 List of Suspend, Resume, and Transfer Abort Functions

Function	How to execute the function	Operation	Possibility of DMA transfer abort	Master that can execute the function (See Section 8.6, Reliability Functions.)
DMA suspension and resume by software control	Setting and clearing the DMACTL.DMASPD	All channels are in the suspended state.	Not possible*1	Special master
Suspension and resume of a DMAC channel	Clearing and setting the DCENm.DTE in each channel register*2	DMA transfer of a channel is suspended.	Possible (by clearing the DMA transfer request flag in suspension state)	Special master, and general master assigned to the channel.

Note 1. In order to abort DMA transfer, you need to abort transfer for the DMAC channel.

Note 2. In case that the continuous transfer enable bit (DTCTm.MLE) is set, please clear the continuous transfer enable bit (DTCTm.MLE) first before clearing the DCENm.DTE bit to suspend the channel and set the continuous transfer enable bit (DTCTm.MLE) before setting the DCENm.DTE bit to resume the channel.

8.5 Error Control

8.5.1 Type of Error

DMA can generate the following type of error.

- DMA Transfer Error
  This error is generated when error is detected in the read cycle or write cycle in a DMA cycle.
  This error can be generated in all DMAC channels during execution of DMA transfer.
  A DMA transfer error leads to INTDMAERR interrupt request which is a source of FEINT.

8.5.2 DMA Transfer Error

8.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs

When DMA transfer error occurs in a DMAC, the transfer error flag (DCSTm.ER) in the DMAC transfer status register of the channel where the DMA transfer error occurred is set. The DMAC error register (DMACER) shows the transfer error flags of all 16 DMAC channels.

On a channel where the transfer error flag is set, a new DMA cycle is not executed if the transfer disable on transfer error setting (DTCTm.ESE) bit is set. On the other hand, a DMA cycle is executed regardless of the value of the transfer error flag if the transfer error case DMA transfer disable setting (DTCTm.ESE) bit is cleared.

If you want to abort the DMA transfer of a channel where the DMA transfer error occurred is set, follow the procedure to abort DMA transfer of the DMAC channel.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the result of write operation is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address register, destination address register, transfer count register, and address reload count register are updated.

8.6 Reliability Functions

8.6.1 Overview

In this product, DMA provides the following reliability functions:

- Register access protection function
- Master information inherit function

8.6.2 Register Access Protection Function

The register access protection function allows write access to the transfer information of each DMA channel only from the master assigned to the channel and prohibits write access from other masters.

The register access protection function enables you, for example, to prevent the settings of the channel from being updated by masters other than the one assigned to the channel.

8.6.2.1 Identifying the Accessing Master

DMA identifies a master based on the processor element ID number (PEID) of the accessing master, the system protection ID configured by the accessing CPU (SPID), and whether the CPU is in the supervisor mode (PSW.UM=0) or the user mode (PSW.UM=1).

8.6.2.2 Master Access

DMA handles accesses from CPU in the supervisor mode (PSW.UM = 0) as accesses from special masters. Special masters are allowed to read from or write to all DMA registers.

DMA handles the other masters except special masters as general masters. General masters are allowed to read from all DMA registers, but allowed to write to the following specific registers.

- Channel registers of the channels assigned by the channel assignment. (For details, see **Section 8.6.2.3, Channel Assignment**.)

From general masters, write access to registers other than the above is not allowed.

8.6.2.3 Channel Assignment

To each channel, DMA can assign a master so that the master is allowed to use the channel. Channel assignment is configured in the channel master setting register (DMniCM) by the CPU in the supervisor mode (PSW.UM = 0).

In general master access, the master assigned to a channel by the channel assignment is allowed to write the channel registers of the channel. If the channel registers of a channel is written by a master other than the master assigned to the channel, the access is called illegal access. For information about illegal access, see **Section 8.6.2.4, Illegal Access**.

8.6.2.4 Illegal Access

DMA handles the following access as illegal access.

(a) Write access to global registers from general masters

(b) Write access to channel registers from general masters who are not assigned to the channel

DMA never treat read access from any master as illegal access.

DMA's actions against illegal access are as follows:

For both cases (a) and (b),

- Write access is ignored.

Only for the case (b),

- The information about the illegal access is stored in a register access protection violation register.
- The DMAC0 and DMAC1 have their own register access protection violation registers (DM0CMV and DM1CMV respectively).

Only the special master can access the register access protection violation registers. The special master can check whether illegal access has occurred by checking the register access protection violation registers periodically.

In addition, it is recommended that, when a master uses DMA and configures transfer information in the channel registers, the master should check whether the configuration has been successfully completed without illegal access by, for example, reading back the settings.

8.6.3 Master Information Inherit Function

In this product, DMA inherits master information that is equivalent to the master information of the master to which the DMA channel is assigned.

The master information that is output from DMA is shown in **Table 8.12**.

Table 8.12 Master Information That is Output from DMA

Meaning	Value that is output from DMA
UM	UM bit value in the channel master setting register
SPID	SPID bit value in the channel master setting register
PEID	PEID bit value in the channel master setting register
DMA	1

8.6.4 Other Reliability Functions

8.6.4.1 Restriction on the Next Channel in the Chain

The reliability function limits the channels you can select as the next channel in the chain.

When you use the chain function, the channel master settings of a channel and its next channel in the chain must be the same.

The chain function is designed so that a channel and its next channel in the chain are managed by the same master.

When DMA detects that different masters are assigned to a channel and its next channel in the chain, it is deemed illegal and the chain function is suppressed. More specifically, when DMA tries to execute the chain function, DMA compares the chain master settings of the channel and its next channel in the chain, and if the settings are the same for both PEID and UM, the chain function is allowed and a chain request is sent to the next channel. If the channel master settings are not the same for either PEID or UM, a chain request is not sent.

8.7 Setting Up DMA Transfer

8.7.1 Overview of Setting Up DMA

Table 8.13 Overview of Setting Up DMA

No.	Master that Configures the Setting	Description	Register		Necessity of the Setting
1	Special master (CPU in the supervisor mode (UM = 0))	Overall DMA operation setting	DM00CM to DM17CM	DMAC channel master setting	Mandatory
2		Status clear	CMVC	Channel protection violation clear register	Recommended
3	Master assigned to the DMAC channel	Channel setting	DSAm	DMAC source address	Mandatory
4			DDAm	DMAC destination address	Mandatory
5			DTCm	DMAC transfer count	Mandatory
6			DTCTm	DMAC transfer control	Mandatory
7			DRSAm	DMAC reload source address	Mandatory if the reload function is used
8			DRDAm	DMAC reload destination address	Mandatory if the reload function is used
9			DRTCm	DMAC reload transfer count	Mandatory if the reload function is used
10			DTFRm	DTFR setting register	Mandatory
11		Status clear	DCSTCm	DMAC transfer status clear	Mandatory
12			DTFRRQCm	DTFR transfer request clear	Recommended
13		Channel operation enable	DCENm	DMAC channel operation enable setting	Mandatory

8.7.2 Setting Up the Overall DMA Operation

You need to set up the overall DMA operation before you start using DMA.

To configure the overall DMA operation, the special master (a CPU in the supervisor mode (UM = 0)) needs to set up global registers. Global registers can be set up only by special master access. For details, see **Section 8.6, Reliability Functions**.

The following register must be set up to configure the overall DMA operation.

- DMAC channel master setting registers (DMniCM)

These registers configure channel assignment. (For details, see **Section 8.6, Reliability Functions**.)

If the DMAC channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

Also, if errors are detected in the following registers while the overall DMA operation is set up, clearing the errors is recommended.

- DMAC0 register access protection violation register (DM0CMV)
- DMAC1 register access protection violation register (DM1CMV)

8.7.3 Setting Up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC.

To configure the DMA channel setting, each channel's master assigned by the channel assignment sets channel registers.

8.7.3.1 Setting Up the DMAC Channel Setting

Follow the procedure below to set up the DMAC channel setting in case of using DMAC.

(1) Disabling the DMAC Channel Operation

If the channel operation enable (DCENm.DTE) in the DMAC channel operation enable setting register (DCENm) is set, clear the DCENm.DTE bit to disable the channel operation.

(2) Setting Up the Transfer Information

When you set up the transfer information of the DMAC, the following registers need to be set up.

- DMAC source address register (DSAm)
- DMAC destination address register (DDAm)
- DMAC transfer count register (DTCm)
- DMAC transfer control register (DTCTm)
- DMAC reload source address register (DRSAm)
- DMAC reload destination address register (DRDAm)
- DMAC reload transfer count register (DRTCm)

(3) Setting Up the DMA Transfer Request

While setting the transfer information, you need to set up the DMA transfer request selection assignment (DTCTm.DRS) bit in the DMAC transfer control register (DTCTm) to define whether the hardware or software DMA transfer request is used.

You cannot use both the hardware and software DMA transfer requests for the same channel at the same time.

If you use the hardware DMA transfer request, you need to select the source used as the hardware DMA transfer request out of 128 hardware DMA transfer sources using the hardware DMA transfer source selection (DTFRm.REQSEL) in the DTFR setting register. Also, you need to enable the hardware DMA transfer source selection (DTFRm.REQEN) in the same register.

The DTFR may retain a hardware DMA transfer request before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (DTFRRQm.DRQ) retained in the DTFR using the DTFR transfer request clear register (DTFRRQCm) if necessary.

If you use the software DMA transfer request, disable the hardware DMA transfer source selection (DTFRm.REQEN) in the DTFR setting register.

(4) Clearing the Transfer Status

The DMAC transfer status register (DCSTm) may retain the result of the previous DMA transfer, so clear the flags in the DMAC transfer status register using the DMAC transfer status clear register (DCSTCm).

(5) Enabling the DMAC Channel Operation

Set the channel operation enable (DCENm.DTE) bit in the DMAC channel operation enable setting register to enable the channel operation.

After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and become ready for DMA transfer.

8.8 Global Registers

8.8.1 List of Global Register Address

The global register addresses are listed in the table below.

For <DMA_base>, see **Section 8.1.2, Register Base Address**.

Table 8.14 List of Global Register Addresses

Unit Name	Register Name	Register Symbol	Address	Access Permission	
				Special Master	General Master
DMAC	DMA control register	DMACTL	<DMA_base> + 0000_H	√	—*1
	DMAC error register	DMACER	<DMA_base> + 0020_H	√	√
	DMAC0 register access protection violation register	DM0CMV	<DMA_base> + 0030_H	√	—*1
	DMAC1 register access protection violation register	DM1CMV	<DMA_base> + 0034_H	√	—*1
	Register access protection violation clear register	CMVC	<DMA_base> + $003C_H$	√	—*1
	DMAC0 channel 0 channel master setting	DM00CM	<DMA_base> + 0100_H	√	—*1
	DMAC0 channel 1 channel master setting	DM01CM	<DMA_base> + 0104_H	√	—*1
	DMAC0 channel 2 channel master setting	DM02CM	<DMA_base> + 0108_H	√	—*1
	DMAC0 channel 3 channel master setting	DM03CM	<DMA_base> + $010C_H$	√	—*1
	DMAC0 channel 4 channel master setting	DM04CM	<DMA_base> + 0110_H	√	—*1
	DMAC0 channel 5 channel master setting	DM05CM	<DMA_base> + 0114_H	√	—*1
	DMAC0 channel 6 channel master setting	DM06CM	<DMA_base> + 0118_H	√	—*1
	DMAC0 channel 7 channel master setting	DM07CM	<DMA_base> + $011C_H$	√	—*1
	DMAC1 channel 0 channel master setting	DM10CM	<DMA_base> + 0120_H	√	—*1
	DMAC1 channel 1 channel master setting	DM11CM	<DMA_base> + 0124_H	√	—*1
	DMAC1 channel 2 channel master setting	DM12CM	<DMA_base> + 0128_H	√	—*1
	DMAC1 channel 3 channel master setting	DM13CM	<DMA_base> + $012C_H$	√	—*1
	DMAC1 channel 4 channel master setting	DM14CM	<DMA_base> + 0130_H	√	—*1
	DMAC1 channel 5 channel master setting	DM15CM	<DMA_base> + 0134_H	√	—*1
	DMAC1 channel 6 channel master setting	DM16CM	<DMA_base> + 0138_H	√	—*1
	DMAC1 channel 7 channel master setting	DM17CM	<DMA_base> + $013C_H$	√	—*1

Note 1. The registers are read only for general master.

8.8.2 Details of Global Registers

8.8.2.1 DMACTL — DMA Control Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA SPD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.15 DMACTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DMASPD	DMA suspension This bit indicates that DMA transfer for all channels is suspended. If a user writes 1 to this bit, DMA transfer for all channels can be suspended. If a user writes 0 to this bit, suspension of DMA transfer for all channels can be released. The suspension controlled by this bit is independent from the suspension controlled by the transfer enable bit (DCENm.DTE) of each DMAC channel. That means, if this bit is set to 1, all DMA transfers are suspended regardless of the values of the DCENm.DTE bit of each DMAC channel. Writing to this bit does not affect the DCENm.DTE bit of each DMAC channel. 0: DMA suspension cleared 1: DMA suspension request/DMA suspension ongoing

8.8.2.2 DMACER — DMAC Error Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <DMA_base> + 0020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DM1 ER7	DM1 ER6	DM1 ER5	DM1 ER4	DM1 ER3	DM1 ER2	DM1 ER1	DM1 ER0	DM0 ER7	DM0 ER6	DM0 ER5	DM0 ER4	DM0 ER3	DM0 ER2	DM0 ER1	DM0 ER0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.16 DMACER Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 8	DM1ER[7:0]	DMAC1 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC1. Each bit is mapped from the DCSTm.ER bit of each channel of the DMAC1 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated
7 to 0	DM0ER[7:0]	DMAC0 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC0. Each bit is mapped from the DCSTm.ER bit of each channel of the DMAC0 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated

8.8.2.3 DM0CMV — DMAC0 Register Access Protection Violation Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <DMA_base> + 0030_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	PEID2	PEID1	PEID0	SPID1	SPID0	UM	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	VCH2	VCH1	VCH0	—	—	—	VF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.17 DM0CMV Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned.
22 to 17	PEID[2:0] SPID[1:0] UM	Illegal access master information These bits retain the accessing master information of the first illegal access after the DM0CMV.VF bit is cleared to 0. If illegal access occurs while the DM0CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
16 to 7	Reserved	When read, the value after reset is returned.
6 to 4	VCH[2:0]	Channel where an illegal access occurred. These bits retain the channel number (0 to 7) of the first illegal access after the DM0CMV.VF bit is cleared to 0. If illegal access occurs while the DM0CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is returned.
0	VF	Illegal access flag This bit shows whether illegal access occurred in the DMAC0. 0: No illegal access has occurred in the DMAC0 1: Illegal access has occurred in the DMAC0 If illegal access occurs in the DMAC0 while this bit is 0, this bit is set, and DM0CMV.PEID[2:0], DM0CMV.SPID[1:0], DM0CMV.UM and DM0CMV.VCH[2:0] store their respective information. If illegal access occurs in the DMAC0 while this bit is 1, this bit remains 1, and the contents of DM0CMV.PEID[2:0], DM0CMV.SPID[1:0], DM0CMV.UM and DM0CMV.VCH[2:0] do not change. This bit can be cleared by using the CMVC register.

8.8.2.4 DM1CMV — DMAC1 Register Access Protection Violation Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <DMA_base> + 0034_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	PEID2	PEID1	PEID0	SPID1	SPID0	UM	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	VCH2	VCH1	VCH0	—	—	—	VF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.18 DM1CMV Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned.
22 to 17	PEID[2:0] SPID[1:0] UM	Illegal access master information These bits retain the accessing master information of the first illegal access after the DM1CMV.VF bit is cleared to 0. If illegal access occurs while the DM1CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
16 to 7	Reserved	When read, the value after reset is returned.
6 to 4	VCH[2:0]	Channel where an illegal access occurred. These bits retain the channel number (0 to 7) of the first illegal access after the DM1CMV.VF bit is cleared to 0. If illegal access occurs while the DM1CMV.VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is returned.
0	VF	Illegal access flag This bit shows whether illegal access occurred in the DMAC1. 0: No illegal access has occurred in the DMAC1 1: Illegal access has occurred in the DMAC1 If illegal access occurs in the DMAC1 while this bit is 0, this bit is set, and DM1CMV.PEID[2:0], DM1CMV.SPID[1:0], DM1CMV.UM and DM1CMV.VCH[2:0] store their respective information. If illegal access occurs in the DMAC1 while this bit is 1, this bit remains 1, and the contents of DM1CMV.PEID[2:0], DM1CMV.SPID[1:0], DM1CMV.UM and DM1CMV.VCH[2:0] do not change. This bit can be cleared by using the CMVC register.

8.8.2.5 CMVC — Register Access Protection Violation Clear Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + $003C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DM1VC	DM0VC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 8.19 CMVC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	DM1VC	DMAC1 illegal access flag clear The DMAC1 illegal access flag (DM1CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.
0	DM0VC	DMAC0 illegal access flag clear The DMAC0 illegal access flag (DM0CMV.VF) can be cleared by writing 1 to this bit. When read, this bit is always read as 0.

8.8.2.6 DMniCM — DMAC Channel Master Setting (ni = 00 to 07 and 10 to 17)

Access: This register can be read or written in 32-bit units.

Address: DM0iCM: <DMA_base> + 0100_H + 4_H × Ch. No. i (i = 0 to 7)
DM1iCM: <DMA_base> + 0120_H + 4_H × Ch. No. i (i = 0 to 7)

Value after reset: $0000\ 0010_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	PEID2	PEID1	PEID0	SPID1	SPID0	UM	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 8.20 DMniCM Register Contents

Bit Position	Bit Name	Function ion
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 4	PEID[2:0]	Channel master PEID setting Specifies the PEID information of the master assigned to the channel.
3, 2	SPID[1:0]	Channel master SPID setting Specifies the SPID information used by the master assigned to the channel.
1	UM	Channel master UM setting 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

DM00CM to DM07CM configure the channel master information of the DMAC0 channel 0 to 7 respectively.

DM10CM to DM17CM configure the channel master information of the DMAC1 channel 0 to 7 respectively.

For information about the functions this register offers, see **Section 8.6, Reliability Functions**.

8.9 DMAC Channel Registers

8.9.1 DMAC Channel Register Addresses

The DMAC channel registers are listed in the table below.

For <DMA_base>, see **Section 8.1.2, Register Base Address**.

Table 8.21 DMAC Channel Register Addresses

Unit Name	Register Name	Register Symbol	Address	Access Permission	
				Special Master	General Master
DMAC	DMAC source address	DSAm	<DMA_base> + 0400_H + 40_H × [channel number]	√	√
	DMAC destination address	DDAm	<DMA_base> + 0404_H + 40_H × [channel number]	√	√
	DMAC transfer count	DTCm	<DMA_base> + 0408_H + 40_H × [channel number]	√	√
	DMAC transfer control	DTCTm	<DMA_base> + $040C_H$ + 40_H × [channel number]	√	√
	DMAC reload source address	DRSAm	<DMA_base> + 0410_H + 40_H × [channel number]	√	√
	DMAC reload destination address	DRDAm	<DMA_base> + 0414_H + 40_H × [channel number]	√	√
	DMAC reload transfer count	DRTCm	<DMA_base> + 0418_H + 40_H × [channel number]	√	√
	DMAC channel operation enable setting	DCENm	<DMA_base> + 0420_H + 40_H × [channel number]	√	√
	DMAC transfer status	DCSTm	<DMA_base> + 0424_H + 40_H × [channel number]	√	√
	DMAC transfer status set	DCSTSm	<DMA_base> + 0428_H + 40_H × [channel number]	√	√
	DMAC transfer status clear	DCSTCm	<DMA_base> + $042C_H$ + 40_H × [channel number]	√	√
	DTFR setting	DTFRm	<DMA_base> + 0430_H + 40_H × [channel number]	√	√
	DTFR transfer request status	DTFRRQm	<DMA_base> + 0434_H + 40_H × [channel number]	√	√
	DTFR transfer request clear	DTFRRQCm	<DMA_base> + 0438_H + 40_H × [channel number]	√	√

Note 1. The [channel number] in the offset addresses and “m” in the register symbols are numbers in the range from 0 to 15, and the correspondence is as follows.

Channel number m	Channel
0	DMAC0 channel 0
1	DMAC0 channel 1
2	DMAC0 channel 2
3	DMAC0 channel 3
4	DMAC0 channel 4
5	DMAC0 channel 5
6	DMAC0 channel 6
7	DMAC0 channel 7
8	DMAC1 channel 0
9	DMAC1 channel 1
10	DMAC1 channel 2
11	DMAC1 channel 3
12	DMAC1 channel 4
13	DMAC1 channel 5
14	DMAC1 channel 6
15	DMAC1 channel 7

8.9.2 Details of DMAC Channel Registers

The “m” in the register symbols indicates the DMA channel number (m = 0 to 15).

8.9.2.1 DSAm — DMAC Source Address Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0400_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA31	SA30	SA29	SA28	SA27	SA26	SA25	SA24	SA23	SA22	SA21	SA20	SA19	SA18	SA17	SA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA15	SA14	SA13	SA12	SA11	SA10	SA9	SA8	SA7	SA6	SA5	SA4	SA3	SA2	SA1	SA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.22 DSAm Register Contents

Bit Position	Bit Name	Function
31 to 0	SA[31:0]	Source address Specifies the DMA transfer source address. These bits are updated whenever a DMA cycle is executed. If you read from these bits, the transfer source address for the next DMA cycle is read.

CAUTIONS

1. It is forbidden to write to these bits when the channel operation is enabled (DCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the source address is updated.
3. DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.)
   The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	SA3	SA2	SA1	SA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

8.9.2.2 DDAm — DMAC Destination Address Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0404_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA31	DA30	DA29	DA28	DA27	DA26	DA25	DA24	DA23	DA22	DA21	DA20	DA19	DA18	DA17	DA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DA15	DA14	DA13	DA12	DA11	DA10	DA9	DA8	DA7	DA6	DA5	DA4	DA3	DA2	DA1	DA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.23 DDAm Register Contents

Bit Position	Bit Name	Function
31 to 0	DA[31:0]	Destination address Specifies the DMA transfer destination address. These bits are updated whenever a DMA cycle is executed. If you read from these bits, the transfer destination address for the next DMA cycle is read.

CAUTIONS

1. It is forbidden to write to these bits when the channel operation is enabled (DCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
3. DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.)
   The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	DA3	DA2	DA1	DA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

8.9.2.3 DTCm — DMAC Transfer Count Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0408_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARC15	ARC14	ARC13	ARC12	ARC11	ARC10	ARC9	ARC8	ARC7	ARC6	ARC5	ARC4	ARC3	ARC2	ARC1	ARC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRC15	TRC14	TRC13	TRC12	TRC11	TRC10	TRC9	TRC8	TRC7	TRC6	TRC5	TRC4	TRC3	TRC2	TRC1	TRC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.24 DTCm Register Contents

Bit Position	Bit Name	Function
31 to 16	ARC[15:0]	Address reload count Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. If you read from those bits during DMA transfer, the address reload count for the next DMA cycle is read. When the reload function 2 or block transfer 2 is used, DTCm.ARC[15:0] is decremented by one for every DMA cycle. When the reload function 2 or block transfer 2 is not used, DTCm.ARC[15:0] is not updated. If the value is 0000H, it means that the number of transfers until the address reload when the reload function 2 is used and the number of transfers when the block transfer 2 is used are 65536.
15 to 0	TRC[15:0]	Transfer count Configures the number of transfers. DTCm.TRC[15:0] is decremented by one whenever a DMA cycle is executed. If you read from those bits, the remaining number of transfers for the next DMA cycle is read. If the reload function is not used, after the last transfer is complete, the value at the completion (0000H) is retained.

TRC15-0	Operation
0000_H	The number of transfers is 65536, or the transfer is complete.
0001_H	The number of transfers is 1, or remaining transfer count is 1.
:	:
$FFFF_H$	The number of transfers is 65535, or remaining transfer count is 65535.

CAUTIONS

1. It is forbidden to write to those bits when the channel operation is enabled (DCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.

8.9.2.4 DTCTm — DMAC Transfer Control Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + $040C_H$ + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	ESE	DRS	—	—	—	—	—	CHNSEL2	CHNSEL1	CHNSEL0	CHNE1	CHNE0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.25 DTCTm Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
27	ESE	DMA transfer disable on transfer error setting Specifies whether to execute a DMA cycle when the DCSTm.ER bit is set due to DMA transfer error. If this bit is cleared to 0, even when the DCSTm.ER bit is set due to DMA transfer error, the following DMA cycles can be executed. If this bit is set to 1, the following DMA cycles are not executed when the DCSTm.ER bit is set due to DMA transfer error. 0: DMA cycles are executed while the DCSTm.ER bit is set. 1: DMA cycles are not executed while the DCSTm.ER bit is set.
26	DRS	DMA transfer request selection assignment Selects the type of DMA transfer requests to be accepted. 0: Software DMA transfer request 1: Hardware DMA transfer request
25 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20 to 18	CHNSEL[2:0]	Selection of next channel in the chain Specifies the next channel in the chain. The next channel must be another channel in the same DMAC. You cannot specify a channel in the different DMAC. It is prohibited to specify the channel as the next channel in the chain. (If you do, the correct operation is not guaranteed.)
17, 16	CHNE[1:0]	Chain enable Selects the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle when the remaining transfer count is one. 10: Setting prohibited. (The operation is not guaranteed.) 11: Always chain A chain request is generated at the completion of every DMA cycle.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	TCE	Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer.

Table 8.25 DTCTm Register Contents (2/3)

Bit Position	Bit Name	Function
13	MLE	Continuous transfer enable If this bit is set, the DCENm.DTE bit is not cleared at the completion of DMA transfer. Even if the DCSTm.TC bit is not cleared, DMA transfer starts when there is a DMA transfer request. 0: The DCENm.DTE bit is cleared at the completion of DMA transfer. The next DMA transfer starts only after the DCSTm.TC bit is cleared. 1: The DCENm.DTE bit is not cleared at the completion of DMA transfer. Even if the DCSTm.TC bit is not cleared, DMA transfer starts when there is a DMA transfer request.
12, 11	RLD2M[1:0]	Reload function 2 setting Specifies the reload function 2. 00: Reload function 2 is disabled. 01: Reload function 2 is enabled. The source address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 10: Reload function 2 is enabled. The destination address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 11: Reload function 2 is enabled. The source address, destination address, and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1.
10, 9	RLD1M[1:0]	Reload function 1 setting Specifies the reload function 1. 00: Reload function 1 is disabled. 01: Reload function 1 is enabled. The source address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 10: Reload function 1 is enabled. The destination address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 11: Reload function 1 is enabled. The source address, destination address, and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.)
8, 7	DACM[1:0]	Destination address count direction Specifies the count direction of the destination address.

DACM1	DACM0	Direction of Count
0	0	Increment
0	1	Decrement
1	0	Fixed
1	1	Setting prohibited (The operation is not guaranteed.)

6, 5	SACM[1:0]	Source address count direction Specifies the count direction of the source address.

SACM1	SACM0	Direction of Count
0	0	Increment
0	1	Decrement
1	0	Fixed
1	1	Setting prohibited (The operation is not guaranteed.)

Table 8.25 DTCTm Register Contents (3/3)

Bit Position	Bit Name	Function
4 to 2	DS[2:0]	Transfer data size Specifies the transfer data size.
1, 0	TRM[1:0]	Transfer mode Specifies the DMA transfer mode. 00: Single transfer 01: Block transfer 1 (The number of transfers is specified by the transfer count.) 10: Block transfer 2 (The number of transfers is specified by the address reload count.) 11: Setting prohibited (The operation is not guaranteed.)

DS2	DS1	DS0	Transfer Data Size
0	0	0	8 bits
0	0	1	16 bits
0	1	0	32 bits
0	1	1	64 bits
1	0	0	128 bits
Other than the above			Setting prohibited (The operation is not guaranteed.)

CAUTIONS

1. Except for the case to clear DTCTm.MLE bit, it is forbidden to write to those bits when the channel operation is enabled (DCENm.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If forbidden settings are used for each bits, the correct operation is not guaranteed.

8.9.2.5 DRSAm — DMAC Reload Source Address Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0410_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSA31	RSA30	RSA29	RSA28	RSA27	RSA26	RSA25	RSA24	RSA23	RSA22	RSA21	RSA20	RSA19	RSA18	RSA17	RSA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.26 DRSAm Register Contents

Bit Position	Bit Name	Function
31 to 0	RSA[31:0]	Reload source address Specifies the source address to be reloaded to the DMA source address register when the reload function 1 or reload function 2 is used.

CAUTION

DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.) The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	RSA3	RSA2	RSA1	RSA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

8.9.2.6 DRDAm — DMAC Reload Destination Address Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0414_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDA31	RDA30	RDA29	RDA28	RDA27	RDA26	RDA25	RDA24	RDA23	RDA22	RDA21	RDA20	RDA19	RDA18	RDA17	RDA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.27 DRDAm Register Contents

Bit Position	Bit Name	Function
31 to 0	RDA[31:0]	Reload destination address Specifies the destination address to be reloaded to the DMA destination address register when the reload function 1 or reload function 2 is used.

CAUTION

DMA transfer for misaligned data is not supported. The lower 4 bits of the address corresponding to each transfer data size is as follows. (× denotes an arbitrary bit.) The correct operation is not guaranteed if you set otherwise than the following table.

Data Size	RDA3	RDA2	RDA1	RDA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

8.9.2.7 DRTCm — DMAC Reload Transfer Count Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0418_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RARC15	RARC14	RARC13	RARC12	RARC11	RARC10	RARC9	RARC8	RARC7	RARC6	RARC5	RARC4	RARC3	RARC2	RARC1	RARC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 8.28 DRTCm Register Contents

Bit Position	Bit Name	Function
31 to 16	RARC[15:0]	Reload address reload count Specifies the value to be reloaded to the address reload count in the transfer count register at the timing of reload when the reload function 2 is used.
15 to 0	RTRC[15:0]	Reload transfer count Specifies the value to be reloaded to the transfer count in the transfer count register at the timing of reload when the reload function 1 is used.

8.9.2.8 DCENm — DMAC Channel Operation Enable Setting Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0420_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.29 DCENm Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DTE	Channel operation enable Specifies whether to enable or disable the transfer operation of the channel. If the DCENm.DTE bit is 1, DMA transfer starts when there is a DMA transfer request. If the DTCTm.MLE bit is 0, this bit is automatically cleared when DMA transfer is completed. In addition, if 0 is written to the DCENm.DTE bit during DMA transfer, the DMA transfer is suspended. If 1 is written to the DCENm.DTE bit during suspension, the suspension is cleared and the DMA transfer resumes. 0: Channel operation is disabled/Channel suspended 1: Channel operation is enabled/Channel suspension cleared

8.9.2.9 DCSTm — DMAC Transfer Status Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <DMA_base> + 0424_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	ERWR	—	—	CY	ER	—	—	TC	—	—	DR	SR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.30 DCSTm Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned.
11	ERWR	DMA Transfer Error occurring cycle This bit is updated at the same time as setting of the DMA transfer error flag (DCSTm.ER), indicating in which cycle of read or write the DMA transfer error occurred. This bit is not updated when a new DMA transfer error occurs after the DCSTm.ER bit has been set. If the DCSTm.ER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in the read cycle. 1: DMA transfer error occurs in the write cycle.
10, 9	Reserved	When read, the value after reset is returned.
8	CY	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing.
7	ER	Transfer error flag This bit is set when DMA transfer error is generated. If this bit is 1 and the DTCTm.ESE bit is set, a DMA cycle is not executed even when a DMA transfer request is generated. 0: No DMA transfer error is generated 1: DMA transfer error is generated
6, 5	Reserved	When read, the value after reset is returned.
4	TC	Transfer completion flag This bit is set at the completion of the last transfer and indicates that the DMA transfer is complete. If the DTCTm.MLE bit is 0 and this bit is 1, a DMA cycle is not executed when a DMA transfer request is generated. 0: DMA transfer is incomplete 1: DMA transfer is complete
3, 2	Reserved	When read, the value after reset is returned.
1	DR	Hardware DMA transfer request status This bit shows whether there is a hardware DMA transfer request (DMARQ) from the DTFR. This bit changes regardless of the value of the DCENm.DTE bit when a hardware DMA transfer request from the DTFR is generated. If the software DMA transfer request has been selected in the transfer request selection bit (DTCTm.DRS) in the DMAC transfer control register, this bit is not set even when a hardware DMA transfer request is input from the DTFR. 0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request

Table 8.30 DCSTm Register Contents (2/2)

Bit Position	Bit Name	Function
0	SR	Software DMA transfer request flag This bit shows whether there is a software DMA transfer request. This bit is automatically cleared when executing the DMA transfer. A user can set this bit by writing 1 to the DCSTSm.SRS bit in the DMAC transfer status set register (DCSTSm). In addition, a user can clear this bit by writing 1 to the DCSTCm.SRC bit in the DMAC transfer status clear register (DCSTCm), but if this is done, the ongoing DMA transfer is aborted and cannot be resumed. 0: There is no software DMA transfer request 1: There is a software DMA transfer request

8.9.2.10 DCSTSm — DMAC Transfer Status Set Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0428_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 8.32 DCSTCm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ERC	Transfer error flag clear The DMA transfer error flag (DCSTm.ER) can be cleared by writing 1 to this bit. When read, this bit is always read as 0..
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	TCC	Transfer completion flag clear The transfer completion flag (DCSTm.TC) can be cleared by writing 1 to this bit. When read, this bit is always read as 0..
3 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SRC	Software DMA transfer request flag clear The software DMA transfer request flag (DCSTm.SR) can be cleared by writing 1 to this bit. When read, this bit is always read as 0..

8.9.2.12 DTFRm — DTFR Setting Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0430_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 8.33 DTFRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 1	REQSEL[6:0]	Hardware DMA transfer source selection Selects one out of 128 hardware DMA transfer sources as the hardware DMA transfer request. 000_0000: Select the DMACTRG[0] input : 111_1111: Select the DMACTRG[127] input
0	REQEN	Hardware DMA transfer source selection enable This bit enables/disables the hardware DMA transfer source selection. 0: Hardware DMA transfer source selection is disabled. 1: Hardware DMA transfer source selection is enabled. If this bit is 0, even when the hardware DMA transfer source selected by the DTFRm.REQSEL[6:0] bits is activated, it is not recognized as a hardware DMA transfer request, and a hardware DMA transfer request is not generated.

8.9.2.13 DTFRRQm — DTFR Transfer Request Status Register

Access: This register is a read-only register that can be read in 32-bit units.

Address: <DMA_base> + 0434_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.34 DTFRRQm Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	DRQ	Hardware DMA transfer request status This bit indicates that a hardware DMA transfer request exists or is retained. • This bit indicates whether a hardware DMA transfer request is retained or not. When the DMA transfer request acceptance signal from the DMAC is asserted, this bit is automatically cleared. A user can clear this bit by writing 1 to the DTFRRQCm.DRQC bit. This bit changes regardless of the value of the DTFRm.REQEN bit when a hardware DMA transfer request from the outside is generated. 0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request

8.9.2.14 DTFRRQCm — DTFR Transfer Request Clear Register

Access: This register can be read or written in 32-bit units.

Address: <DMA_base> + 0438_H + 40_H × Ch. No. m (m = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DRQC

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.35 DTFRRQCm Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DRQC	Hardware DMA transfer request clear A user can clear the DTFRRQm.DRQ bit by writing 1 to this bit. When read, this bit is always read as 0.

Section 9 Reset Controller

9.1 Overview

Several system reset functions are provided in order to initialize CPU core and peripheral functions as well as their associated registers.

A reset can be caused by the following events:

- External reset ($\overline{\text{RESET}}$)
- Power-on-clear (POCRES)
- Watchdog timer reset (WDTA0RES, WDTA1RES)
- Clock monitor reset ($\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$)
- Low-voltage indicator reset ($\overline{\text{LVIRES}}$)
- Software reset (SWRES)
- Debugger reset ($\overline{\text{DBRES}}$)
- Core voltage monitor reset ($\overline{\text{CVMRES}}$)
- Transition to DeepSTOP mode

9.1.1 Reset Sources

Reset levels and reset sources are shown below.

Various reset sources are assigned to the different levels of the reset.

Table 9.1 Reset Sources and Reset Targets

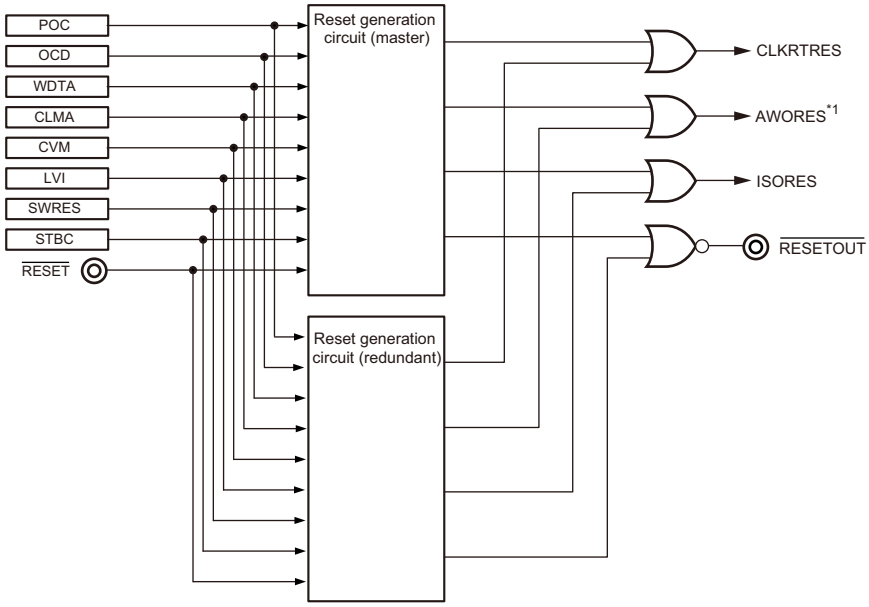
Reset Level	Reset Source	Clock Generator (except PLL)/ Real-Time Clock/CVM/LVI	Always-On Area Modules*1	Isolated area Modules*2
1	Power-on-clear (POCRES) Debugger reset ($\overline{\text{DBRES}}$)	Reset	Reset	Reset
2	External reset ($\overline{\text{RESET}}$) Watchdog timer reset (WDTA0RES, WDTA1RES) Clock monitor reset ($\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$) Core voltage monitor reset ($\overline{\text{CVMRES}}$) Low voltage indicator reset ($\overline{\text{LVIRES}}$) Software reset (SWRES)	Not reset target*3	Reset	Reset
3	Reset by DeepSTOP mode	Not reset target	Not reset target	Reset

Note 1. Clock generator, real-time clock, CVM, and LVI are excluded.
Note 2. PLL is included.
Note 3. In clock monitor reset, oscillator-related registers for clock monitoring are initialized.

Reset level 1: Initializes the entire microcontroller.

Reset level 2: For a quick return to normal operating mode by eliminating the oscillator stabilization time, initializes the entire microcontroller except for the clock generator and the real-time clock.

Reset level 3: At the transition to DeepSTOP mode, initializes all the Isolated area (ISO area).



If Power-on-clear (POCRES), Core voltage monitor reset (CVMRES), or Clock monitor reset (CLMA0RES, CLMA1RES, CLMA2RES) generates while writing to Retention RAM, Retention RAM data is not retained.

If reset source other than shown above is generated while writing to Retention RAM, Retention RAM data can be retained. In this case, data value will be before or after writing.

9.1.2 Reset Controller Redundancy

The reset controller of the microcontroller has a redundant configuration, and includes duplicated reset generation circuits. Such configuration enables initialization of the reset targeted area without failure even if one of the two reset generation circuits fails.

The configuration of the reset generation circuits is shown in the figure below.

Note 1. Real-time clock is excluded.

Figure 9.1 Reset Controller Redundancy

At the generation of a reset, the same reset source signal is input to two reset generation circuits.

According to the reset source, the two reset generation circuits output the Always-On area reset signal (AWORES), Isolated area reset signal (ISORES), clock generator/real-time clock reset signal (CLKRTRES), and $\overline{\text{RESETOUT}}$ signal.

The AWORES, ISORES, CLKRTRES, and $\overline{\text{RESETOUT}}$ signals are generated by executing the logical OR of the signals output from two reset generation circuits. Thus, a reset signal is generated normally even if one of the two reset generation circuits fails.

Whether a reset generation circuit operates normally can be checked by reading and comparing the reset factor registers of the respective reset generation circuits.

9.1.3 Reset Output ($\overline{\text{RESETOUT}}$)

When a reset source of reset level 1 or 2 is generated, a reset output signal ($\overline{\text{RESETOUT}}$) is output to the outside. Reset output is used to reset external devices at the same time as a reset is generated inside the microcontroller.

For details, see **Section 2.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

9.1.4 Reset Flag

To identify a reset source, two registers with a flag for each reset source are provided. The main elements of the reset controller are shown in **Figure 9.2, Block Diagram of the Reset Controller**.

9.1.5 Clock Supply

The clock supply to the reset controller is shown in the following table.

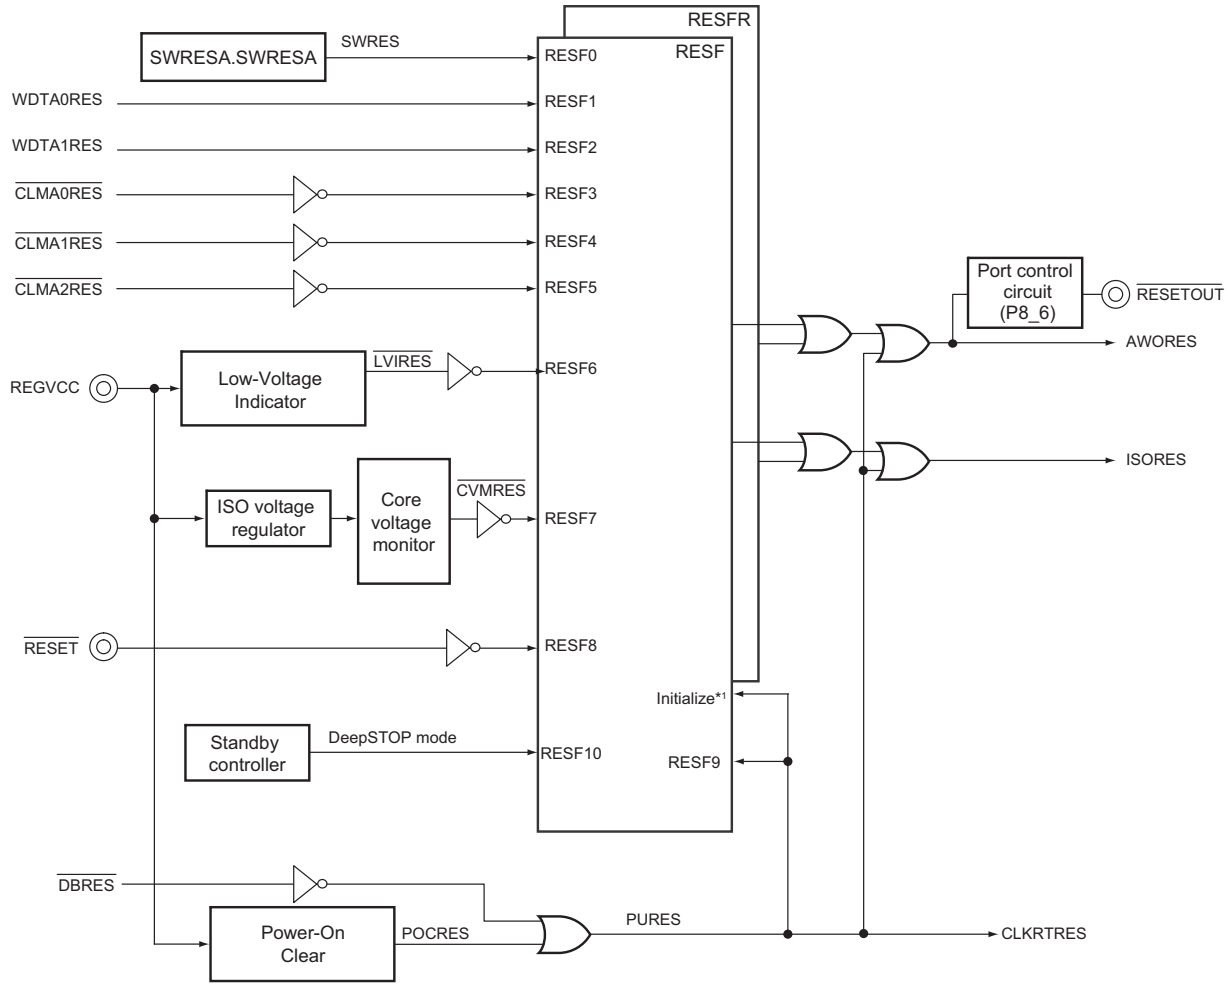


Table 9.2 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Reset	Register access clock	CPUCLK4

9.2 Configuration

9.2.1 Block Diagram

A block diagram of the reset controller is shown below.

Note 1. Registers RESF and RESFR are initialized by PURES.
After an initialization, bits RESF9 and RESFR9 are set to 1.

Figure 9.2 Block Diagram of the Reset Controller

(1) Reset signals

The reset controller manages the generation of three reset signals upon occurrence of reset signals from various reset sources:

- Always-On area (AWO area) reset (AWORES)
  AWORES is generated by all reset sources except the transition to DeepSTOP mode.
  AWORES resets all modules in the Always-On area (AWO area) except clock generation circuit, real-time clock, core voltage monitor, and low-voltage detection circuit.
- Isolated area (ISO area) reset (ISORES)
  ISORES is generated by all reset sources.
  ISORES resets all modules (including PLL) in the Isolated area (ISO area).
- CLKRTRES
  CLKRTRES is generated by the power-on clear or debugger reset sources.
  CLKRTRES resets the clock generation circuit (excluding PLL) and real-time clock.

The power-up reset (PURES) is generated by the power-on clear and debugger reset sources.

Following the generation of an AWORES reset, with the exception of the PLL, all clock-generation circuits that were operating at the time (LS IntOSC, HS IntOSC, MainOSC, SubOSC) continue to operate. On the generation of a $\overline{\text{CLMA0RES}}$ reset, the HS IntOSC that was the target for CLMA0 monitoring is reset. On the generation of a $\overline{\text{CLMA1RES}}$ reset, the MainOSC that was the target for CLMA1 monitoring is reset.

The PURES initializes all of the clock generation circuits. It is necessary to restart the clock generation circuit after recovery from the PURES.

The CPU reset is the Isolated area (ISO area) reset (ISORES) to the CPU sub system.

(2) Reset flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) hold a flag for each reset source, and this flag is set when the corresponding reset is asserted.

All reset flags except RESF9 and RESFR9 are initialized by a power-up reset (PURES). (Bits RESF9 and RESFR9 are set to 1 after initialization.) In addition, all the bits can be cleared by software.

For details, see **Section 9.1.4, Reset Flag**.

(3) On-chip module resets

(a) Watchdog timer resets

The watchdog timers 0, 1 can generate two types of resets: WDTA0RES and WDTA1RES.
For details, see **Section 9.4.6, Watchdog Timer (WDTA) Reset**.

(b) Clock monitor resets

The clock monitors can generate three resets: $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, and $\overline{\text{CLMA2RES}}$.
For details, see **Section 9.4.8, Clock Monitor (CLMA) Reset**.

(c) Debugger reset

A reset is generated by a command from a debugger. This leads to a generation of power-up reset PURES. For details, see **Section 9.4.9, Debugger Reset**.

(4) Software controlled reset (SWRES)

A software reset SWRES can be generated by use of the software reset register SWRESA.

For details, see **Section 9.4.7, Software Reset**.

(5) Reset output signal

During reset and after release from the reset, port P8_6 outputs low level as $\overline{\text{RESETOUT}}$ function. For details, see **Section 2.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

(6) Power supply monitoring

The following power supply detection circuits observe the level of the external power supply REGVCC.

(a) Low-Voltage Indicator

The low-voltage indicator (LVI) generates the $\overline{\text{LVIRES}}$ reset, if the voltage level of REGVCC drops below a certain level. The level can be adjusted and the $\overline{\text{LVIRES}}$ can be masked.
For details, see **Section 9.4.3, Low-Voltage Indicator (LVI) Reset**.

(b) Power-On-Clear

The power-on-clear circuit (POC) continuously compares the power supply voltage REGVCC with an internal reference voltage. Thus, a reset is generated when the power supply voltage goes below a certain level.
For details, see **Section 9.4.2, Power-On-Clear (POC) Reset**.

(c) Core Voltage Monitor

A reset can be generated when the core voltage monitor (CVM) detects over- or undervoltage in core voltage. (Output/not output can be set by option byte.)
For details, see **Section 9.4.4, Core Voltage Monitor (CVM) Reset**.

(7) Masking of reset sources in debugging mode

The following reset sources can be masked during debugging:

Table 9.3 Reset Sources to be Masked during Debugging

Reset Source	Maskable/Non-maskable
Power-on clear (POCRES)	—
Debugger reset ($\overline{\text{DBRES}}$)	—
External reset ($\overline{\text{RESET}}$)	√
Low-voltage indicator reset ($\overline{\text{LVIRES}}$)	√
Clock monitor reset ($\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, $\overline{\text{CLMA2RES}}$)	√
Watchdog timer reset (WDTA0RES, WDTA1RES)	√
Core voltage monitor reset ($\overline{\text{CVMRES}}$)	√
Software reset (SWRES)	√
Reset by DeepSTOP mode	—

9.3 Registers

This section contains a description of all registers of the reset controller.

9.3.1 Reset Controller Registers Overview

The reset controller is controlled and operated by the following registers:

Table 9.4 Reset Controller Registers Overview

Module Name	Register Name	Symbol	Address
RESCTL	**Reset flag registers**		
	Reset factor register	RESF	FFF8 0760_H
	Reset factor clear register	RESFC	FFF8 0768_H
	Redundant reset factor register	RESFR	FFF8 0860_H
	Redundant reset factor clear register	RESFCR	FFF8 0868_H
	Software reset control register		
	Software reset register	SWRESA	FFF8 $0A04_H$
	Cyclic RUN mode reset vector address register		
	Cyclic RUN mode RBASE register	CYCRBASE	FFF8 3600_H

NOTES

1. For the LVI related, RAM store related, and CVM related registers, see **Section 11, Supply Voltage Monitor**.
2. As for the protection registers, see **Section 5, Write-Protected Registers**.

9.3.2 Details of Reset Flag Registers

9.3.2.1 RESF — Reset Factor Register

This register contains information about which type of resets occurred after the last power-on clear reset. This register is initialized by a power-up reset PURES.

Each reset condition sets the corresponding flag in the register.

For example, if a clock monitor reset $\overline{\text{CLMA0RES}}$ occurs after a watchdog timer reset WDTA0RES, RESF reads 0000 000A$_H$.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 0760$_H$

Value after reset: 0000 0200$_H$ / 0000 0300$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9.3.2.3 RESFR — Redundant Reset Factor Register

This register is a duplication of the reset factor register. This register is initialized by a power-up reset PURES.

In accordance with the setting conditions for each bit in the reset factor register, the same bits are set in this register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 0860_H

Value after reset: $0000\ 0200_H$ / $0000\ 0300_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9.3.3 Details of Software Reset Control Registers

9.3.3.1 SWRESA — Software Reset Register

This register is used to generate a software reset SWRES. The correct write sequence using the PROTCMD0 register is required in order to update this register.

For details, see **Section 5, Write-Protected Registers**.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FFF8 0A04$_H$

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 9.9 SWRESA Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write “0”.
0	SWRESA	Software reset trigger 0: No Software reset trigger is generated. 1: Software reset trigger is generated.

9.3.4 Details of Cyclic RUN Mode Reset Vector Address Register

9.3.4.1 CYCRBASE — Cyclic RUN mode RBASE Register

This register is used to specify the reset vector address (RBASE) of the CPU, when the CPU returns to Cyclic RUN mode from DeepSTOP mode. The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Update of this register is only permitted when the chip is in RUN mode. Do not change the value in Cyclic RUN mode.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 3600_H

Value after reset: FEBF 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CYCRBASE[31:16]															
Value after reset	1	1	1	1	1	1	1	0	1	0	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 9.10 CYCRBASE Register Contents

Bit Position	Bit Name	Function
31 to 9	CYCRBASE	Reset vector base address (RBASE) in Cyclic RUN mode. Specifies the RBASE value in Cyclic RUN mode. The default value is set to the start address of the Retention RAM.
8 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

9.4 Functional Description

9.4.1 Reset Flags

The reset factor register (RESF) and the redundant reset factor register (RESFR) provide reset flags for each reset source.

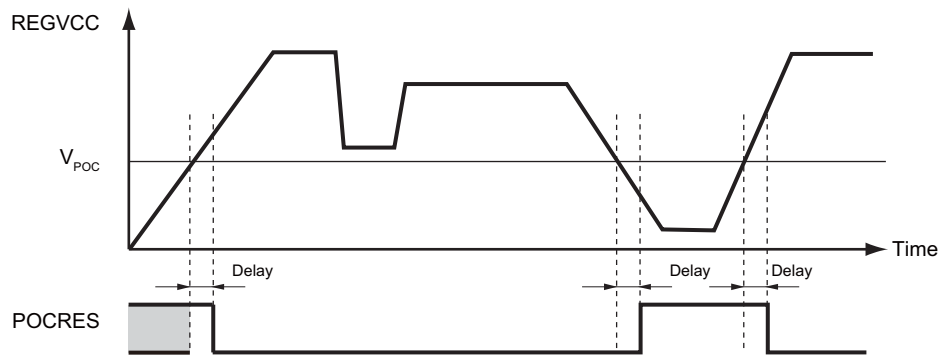
If a reset has occurred, the corresponding flag is set. According to this, the source of the reset is evaluated.

RESF and RESFR are initialized by a power-up reset PURES (POCRES or $\overline{\text{DBRES}}$) (though bits RESF9 and RESFR9 are set to 1 after initialization). In addition, flags in RESF and RESFR can be cleared by the reset factor clear register (RESFC) and the redundant reset factor clear register (RESFRC).

Each reset source can set the corresponding flag independently from other reset sources.

9.4.2 Power-On-Clear (POC) Reset

The power-on-clear circuit (POC) constantly compares the power supply voltage REGVCC with the internal reference voltage V_{POC}. It ensures that the microcontroller only operates as long as the power supply exceeds a certain level.

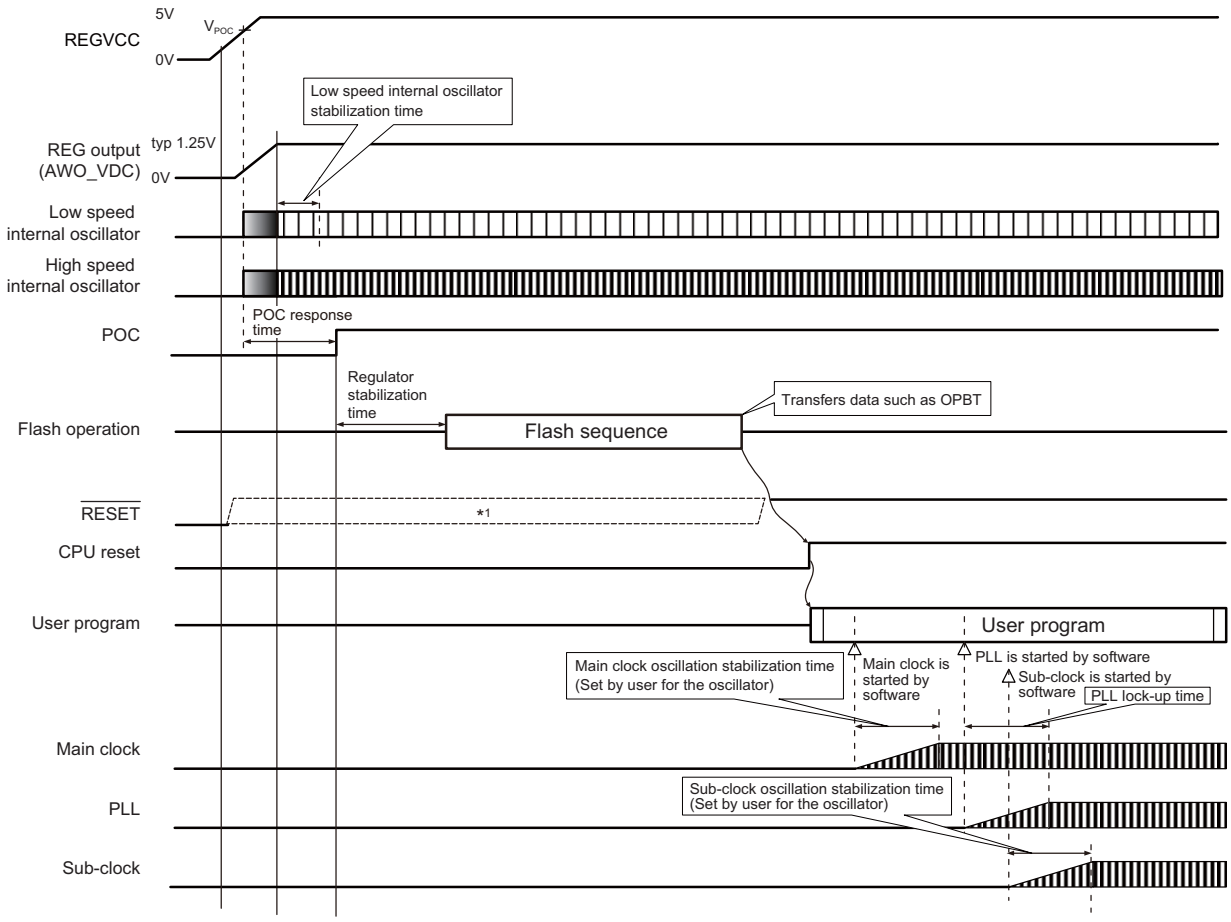


If REGVCC falls below the internal reference voltage (REGVCC < V_{POC}), the internal reset signal POCRES and a power-up reset PURES are generated.

For details on the specification of the internal voltage reference level V_{POC}, see **Section 40, Electrical Characteristics**.

The reset factor register (RESF) and the redundant reset factor register (RESFR) are cleared by the power-on clear reset. RESF9 and RESFR9 are set to 1 after initialization.

The power-on-clear function holds the microcontroller in reset state as long as the power supply voltage does not exceed the threshold level V_{POC}.



The following figure illustrates the timing of a POCRES.

Note: Delay:
When the REGVCC exceeds the V_{POC}, the POCRES is released after certain delay. When the REGVCC falls below the V_{POC}, the POCRES is asserted after certain delay.
See **Section 40, Electrical Characteristics** for the delay time.

Figure 9.3 POC Reset Timing

(1) Overview of CPU system startup after power-on-clear

Note 1. The timing of releasing the $\overline{\text{RESET}}$ pin depends on the external circuit of the microcontroller.
If the $\overline{\text{RESET}}$ pin is low level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 1. If the $\overline{\text{RESET}}$ pin is high level, the values after reset of both RESF.RESF8 and RESFR.RESFR8 are set to 0.

Figure 9.4 When $\overline{\text{RESET}}$ is Released before the Flash Sequence is Completed

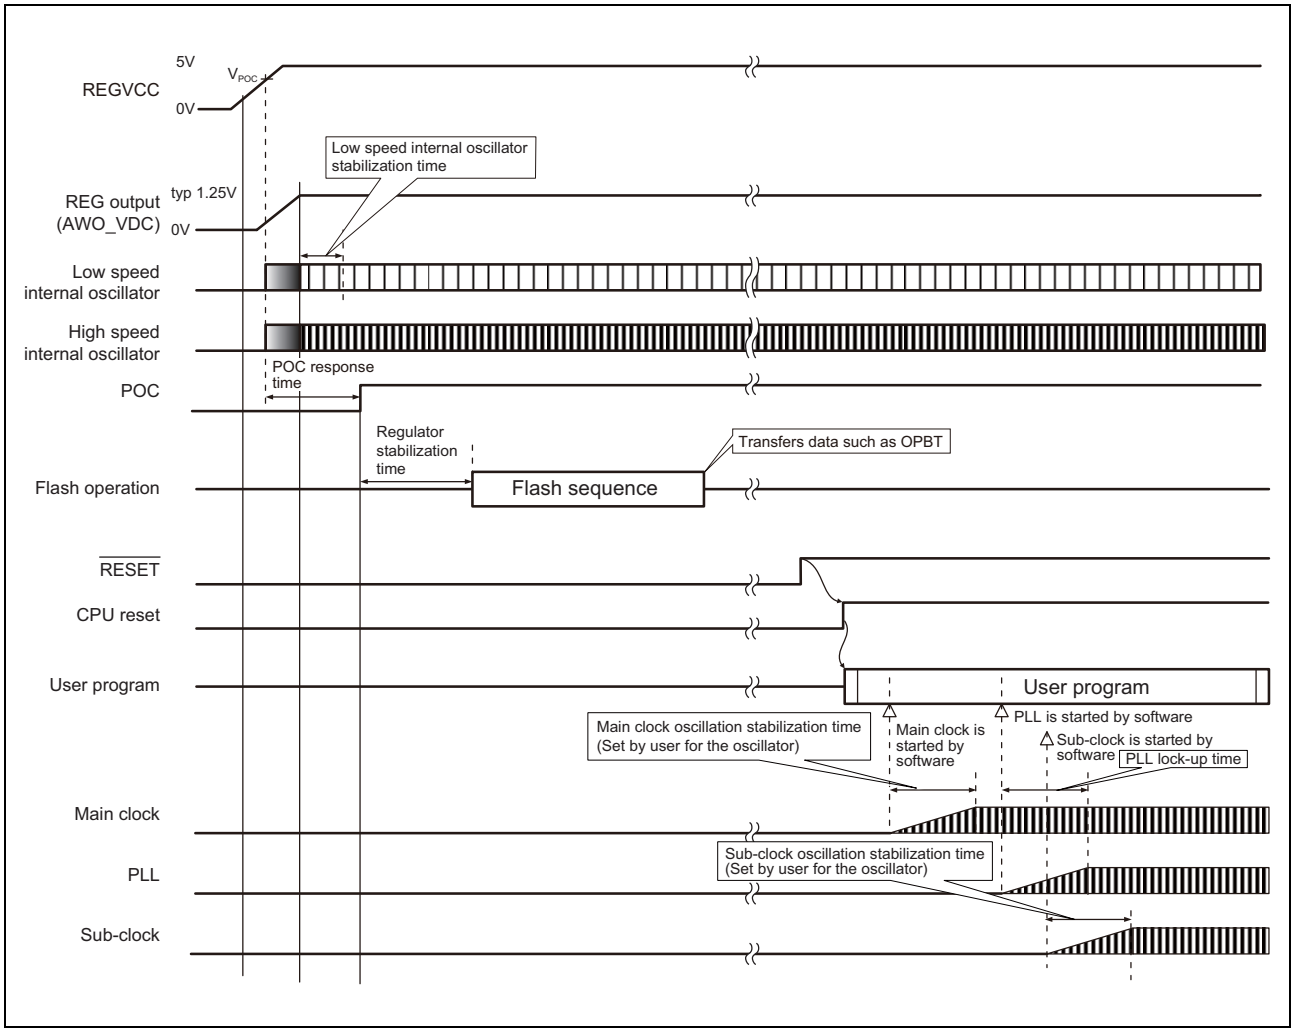


Figure 9.5 When $\overline{\text{RESET}}$ is Released after the Flash Sequence is Completed

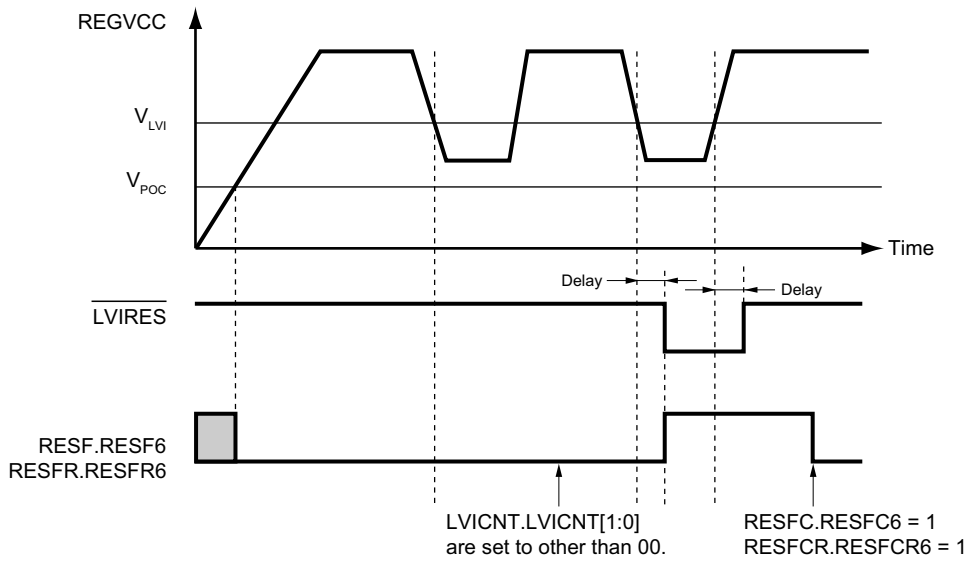
9.4.3 Low-Voltage Indicator (LVI) Reset

The low-voltage indicator (LVI) constantly compares the power supply voltage REGVCC with the LVI internal reference voltage V_{LVI}.

When setting the LVI detection voltage and releasing the LVIRESMK, if REGVCC falls below the internal reference voltage (REGVCC < V_{LVI}), the internal reset signal $\overline{\text{LVIRES}}$ is generated.



Additionally, the $\overline{\text{LVIRES}}$ flags (bits RESF.RESF6 and RESFR.RESFR6) are set.

After that, even if REGVCC exceeds V_{LVI}, bits RESF.RESF6 and RESFR.RESFR6 are not cleared automatically. They are cleared as described below.

- Setting the RESFC.RESFC6 bit to 1 clears the RESF.RESF6 bit.
  Setting the RESFCR.RESFCR6 bit to 1 clears the RESFR.RESFR6 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

For details on the LVI functions, see **Section 11, Supply Voltage Monitor**.

The following figure illustrates the timing of a $\overline{\text{LVIRES}}$ and bits RESF.RESF6 and RESFR.RESFR6.

Note: Delay:
When REGVCC falls below V_{LVI}, $\overline{\text{LVIRES}}$ is asserted and the VLVI reset flags (RESF.RESF6 and RESFR.RESFR6) are set after a certain delay. After that, when REGVCC exceeds V_{LVI}, $\overline{\text{LVIRES}}$ is released after a certain delay.
See **Section 40, Electrical Characteristics** for the delay time.

Figure 9.6 LVI Reset Timing

9.4.4 Core Voltage Monitor (CVM) Reset

Core voltage monitor is used to monitor the core voltage inside the microcontroller.

The reset $\overline{\text{CVMRES}}$ is generated if the core voltage is not in the specified voltage range while CVM is enabled. Moreover, the $\overline{\text{CVMRES}}$ flags (RESF.RESF7 and RESFR.RESFR7) are set.

After that, the RESF.RESF7 and RESFR.RESFR7 bits are not automatically cleared even if the core voltage returns to the specified voltage range. The RESF.RESF7 and RESFR.RESFR7 bits are cleared as described below.

- Setting the RESFC.RESFC7 bit to 1 clears the RESF.RESF7 bit.
  Setting the RESFCR.RESFCR7 bit to 1 clears the RESFR.RESFR7 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

If the CVM detects an abnormal high voltage, the power supply to the Isolated area (ISO area) is switched off. Once $\overline{\text{CVMRES}}$ is generated upon high voltage detection, the microcontroller stays in the reset state. To cancel this state, it is mandatory to use the external reset ($\overline{\text{RESET}}$) input. Release the external reset ($\overline{\text{RESET}}$) after the voltage level becomes lower than the high detection voltage.

For details on the CVM function, see **Section 11, Supply Voltage Monitor**.

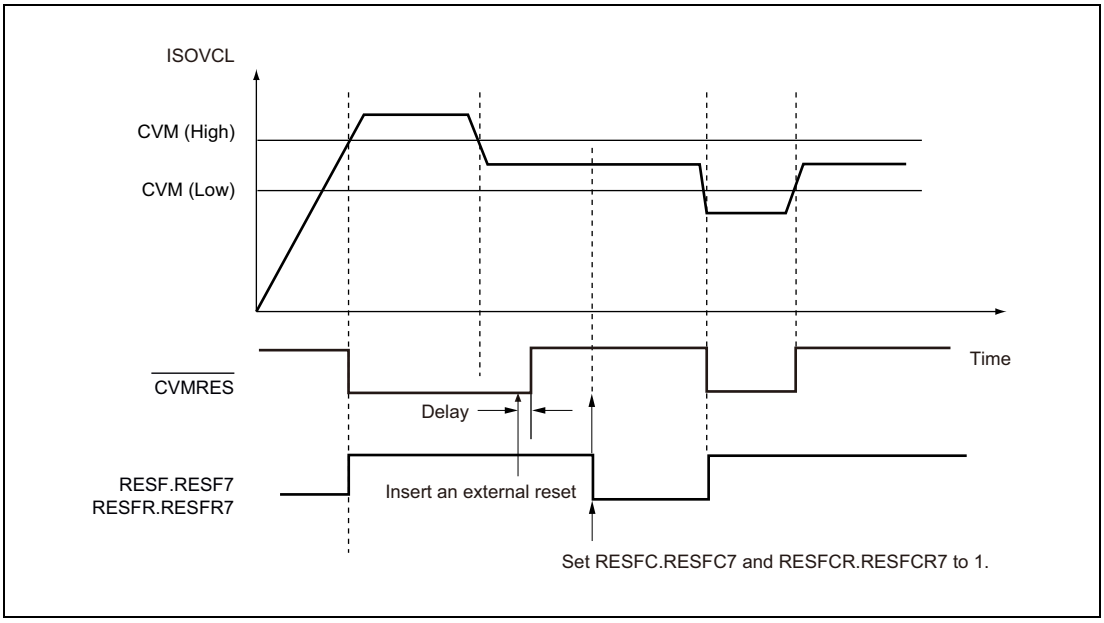


Figure 9.7 CVM Reset Timing

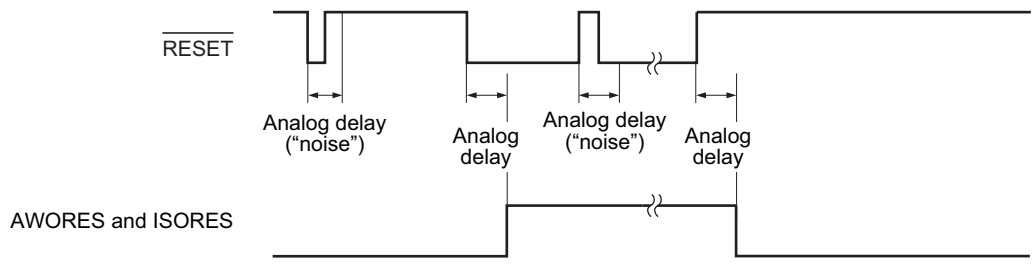
9.4.5 External Reset ($\overline{\text{RESET}}$)



When a low level input is applied to the $\overline{\text{RESET}}$ pin, a reset is asserted and the RESF.RESF8 and RESFR.RESFR8 bits are set.

After that, bits RESF.RESF8 and RESFR.RESFR8 are not cleared automatically, even if the low-level input to the $\overline{\text{RESET}}$ pin is released. Bits RESF.RESF8 and RESFR.RESFR8 are cleared as described below.

- Setting the RESFC.RESFC8 bit to 1 clears the RESF.RESF8 bit.
  Setting the RESFCR.RESFCR8 bit to 1 clears the RESFR.RESFR8 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

The $\overline{\text{RESET}}$ pin includes an analog noise filter to prevent erroneous resets due to noise.

The following figure shows the timing when AWORES and ISORES are generated by an external reset. This figure also shows the effect of the noise filter.

Note: The analog delay is caused by the analog filter. The filter regards pulses up to a certain width as noise and suppresses them.
For the minimum $\overline{\text{RESET}}$ pulse width, see **Section 40, Electrical Characteristics**.

Figure 9.8 External Reset ($\overline{\text{RESET}}$)

9.4.6 Watchdog Timer (WDTA) Reset

The watchdog timers can be configured to generate a reset if the overflow time is exceeded. After a watchdog timer reset is asserted, the corresponding watchdog timer reset flags (the RESF.RESF1 and RESFR.RESFR1 bits for WDTA0RES, and the RESF.RESF2 and RESFR.RESFR2 bits for WDTA1RES) are set.

After that, bits RESF.RESF1 and RESFR.RESFR1 (or bits RESF.RESF2 and RESFR.RESFR2) are not cleared automatically, even if WDTA0RES (or WDTA1RES) is released.

Bits RESF.RESF1 and RESFR.RESFR1, and bits RESF.RESF2 and RESFR.RESFR2 are cleared as described below.

- WDTA0RES:
  Setting the RESFC.RESFC1 bit to 1 clears the RESF.RESF1 bit.
  Setting the RESFCR.RESFCR1 bit to 1 clears the RESFR.RESFR1 bit.
- WDTA1RES:
  Setting the RESFC.RESFC2 bit to 1 clears the RESF.RESF2 bit.
  Setting the RESFCR.RESFCR2 bit to 1 clears the RESFR.RESFR2 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

9.4.7 Software Reset

The software reset SWRES can be asserted by setting SWRESA.SWRESA to 1.

SWRES sets the reset flag RESF.RESF0 and the RESFR.RESFR0 bit.

RESF.RESF0 and RESFR.RESFR0 are not cleared automatically. RESF.RESF0 and RESFR.RESFR0 are cleared as described below.

- Setting the RESFC.RESFC0 bit to 1 clears the RESF.RESF0 bit.
  Setting the RESFCR.RESFCR0 bit to 1 clears the RESFR.RESFR0 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

9.4.8 Clock Monitor (CLMA) Reset

The clock monitors can generate the following resets:

- $\overline{\text{CLMA0RES}}$, if a frequency abnormality in HS IntOSC is detected
- $\overline{\text{CLMA1RES}}$, if a frequency abnormality in MainOSC is detected
- $\overline{\text{CLMA2RES}}$, if a frequency abnormality in PLL is detected

When the Clock Monitor detects frequency abnormality of the respective clocks, resets $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, and $\overline{\text{CLMA2RES}}$ are generated.

In addition, flags $\overline{\text{CLMA0RES}}$, $\overline{\text{CLMA1RES}}$, and $\overline{\text{CLMA2RES}}$ (RESF.RESF3, RESFR.RESFR3, RESF.RESF4, RESFR.RESFR4, RESF.RESF5, and RESFR.RESFR5) are set.

These flags are not cleared automatically. They are cleared as described below.

- $\overline{\text{CLMA0RES}}$:
  Setting the RESFC.RESFC3 bit to 1 clears the RESF.RESF3 bit.
  Setting the RESFCR.RESFCR3 bit to 1 clears the RESFR.RESFR3 bit.
- $\overline{\text{CLMA1RES}}$:
  Setting the RESFC.RESFC4 bit to 1 clears the RESF.RESF4 bit.
  Setting the RESFCR.RESFCR4 bit to 1 clears the RESFR.RESFR4 bit.
- $\overline{\text{CLMA2RES}}$:
  Setting the RESFC.RESFC5 bit to 1 clears the RESF.RESF5 bit.
  Setting the RESFCR.RESFCR5 bit to 1 clears the RESFR.RESFR5 bit.
- Power-up reset PURES (POCRES or $\overline{\text{DBRES}}$)

9.4.9 Debugger Reset

Debugger reset ($\overline{\text{DBRES}}$) is generated via a debugger command. $\overline{\text{DBRES}}$ activates PURES, and therefore operates in the same way as the power-on-clear reset POCRES:

- The clock generators are reset and stop operating. The clock generators should be restarted after release from the reset state.
- The reset factor register RESF and the redundant reset factor register RESFR are cleared (Bits RESF9 and RESFR9 are set to 1 after initialization.).

9.4.10 Reset Vector Address of CPU

The default value of the reset vector base address (RBASE) of CPU is set to 0000 0000_H at shipment. In Cyclic RUN mode, the reset vector base address is automatically switched to the address specified by the CYCRBASE register. After returning to the RUN mode, the reset vector base address automatically switches back to the default address.

For details about the RBASE register, see **Section 3, CPU System**.

Section 10 Power Supply Circuit

This section describes the power supply and power domains of the RH850/F1K.

10.1 Function

The internal circuits are separated into two independent power domains, the Always-On area (AWO area) and the Isolated area (ISO area).

The power supply of the Always-On area is always on in all operating modes and stand-by modes.

The power supply of the Isolated area can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For each power domain, a dedicated on-chip voltage regulator generates the internal supply voltage.

For operation of the device, the following voltages are required:

- Power supply voltage REGVCC for the on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in each power domain.
- Power supply voltage EVCC for the I/O ports.
- Power supply voltages A0VREF and A1VREF*1 for the A/D converters and the separated I/O ports.

Note 1. Only available for 144 pin, and 176 pin devices.

10.1.1 Power Supply Pins

The table below lists all power supply pins and what they are used for.

Table 10.1 Power Supply Pins

Power Supply	Power Supply Pins	Power Supply for
Power supply for internal circuits	REGVCC	• On-chip voltage regulators for the Always-On area and Isolated area • Port group IP0*2 • MainOSC • SubOSC*2 • POC / LVI
	AWOVCL*1	
	AWOVSS	
	ISOVCL*1	
	ISOVSS	
Power supply for I/O port	EVCC	• $\overline{\text{RESET}}$ • FLMD0 (176 pin devices) • Port groups JP0, P0, P1, P2, P8, P9, P10, P11, P12, P18, P20 (144 pin devices) • Port groups JP0, P0, P1, P8, P9, P10, P11, P12, P18, P20 (100 pin devices) • Port groups JP0, P0, P8, P9, P10, P11
	EVSS	
Power supply for A/D converters	A0VREF	• Analog circuits of ADCA0, port group AP0
	A0VSS	
	A1VREF	(144 pin and 176 pin devices) • Analog circuits of ADCA1, port group AP1
	A1VSS	

Note: See **Section 40, Electrical Characteristics** for the voltage range of each power supply.

Note 1. Pin to connect a stabilization capacitor for on-chip voltage regulator.

Note 2. Supported only by the 144 pin and 176 pin devices.

10.1.2 Block Diagram of Power Domains

The figure below shows the overview of power supply circuit.

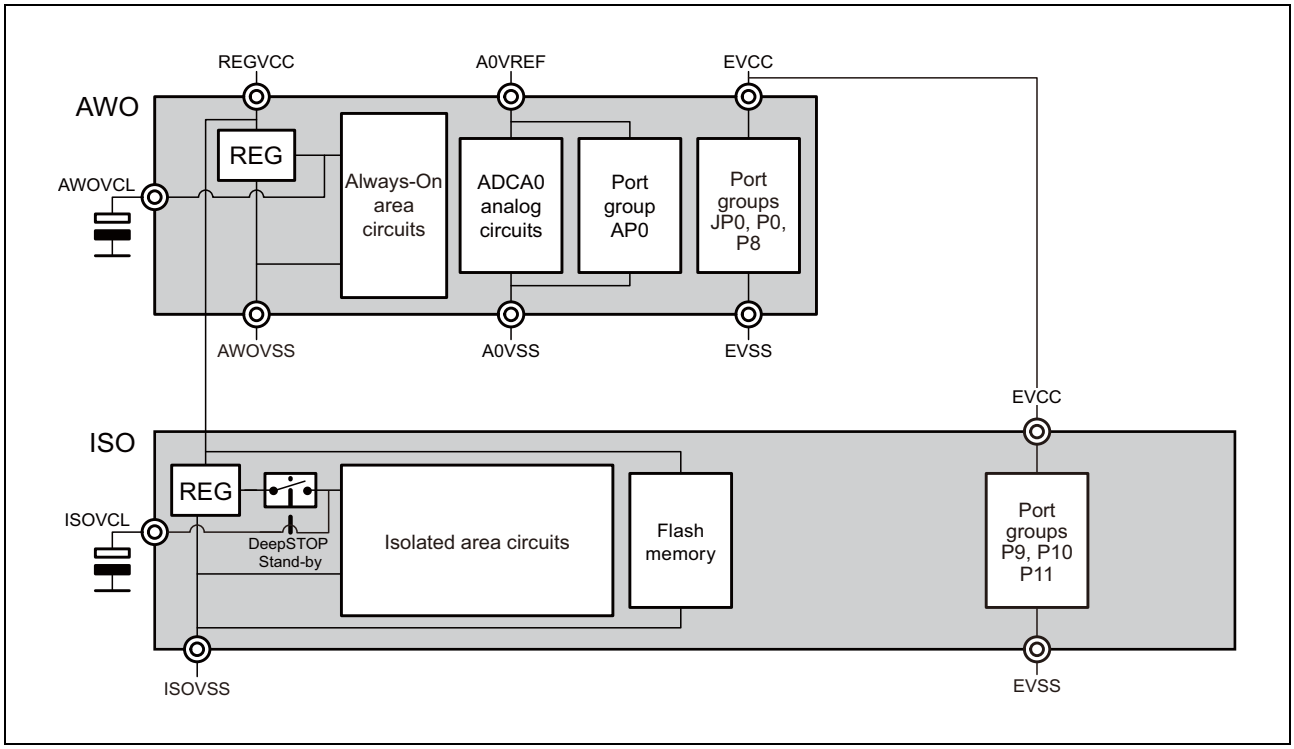


Figure 10.1 Overview of Power Supply Circuit (100 pin)

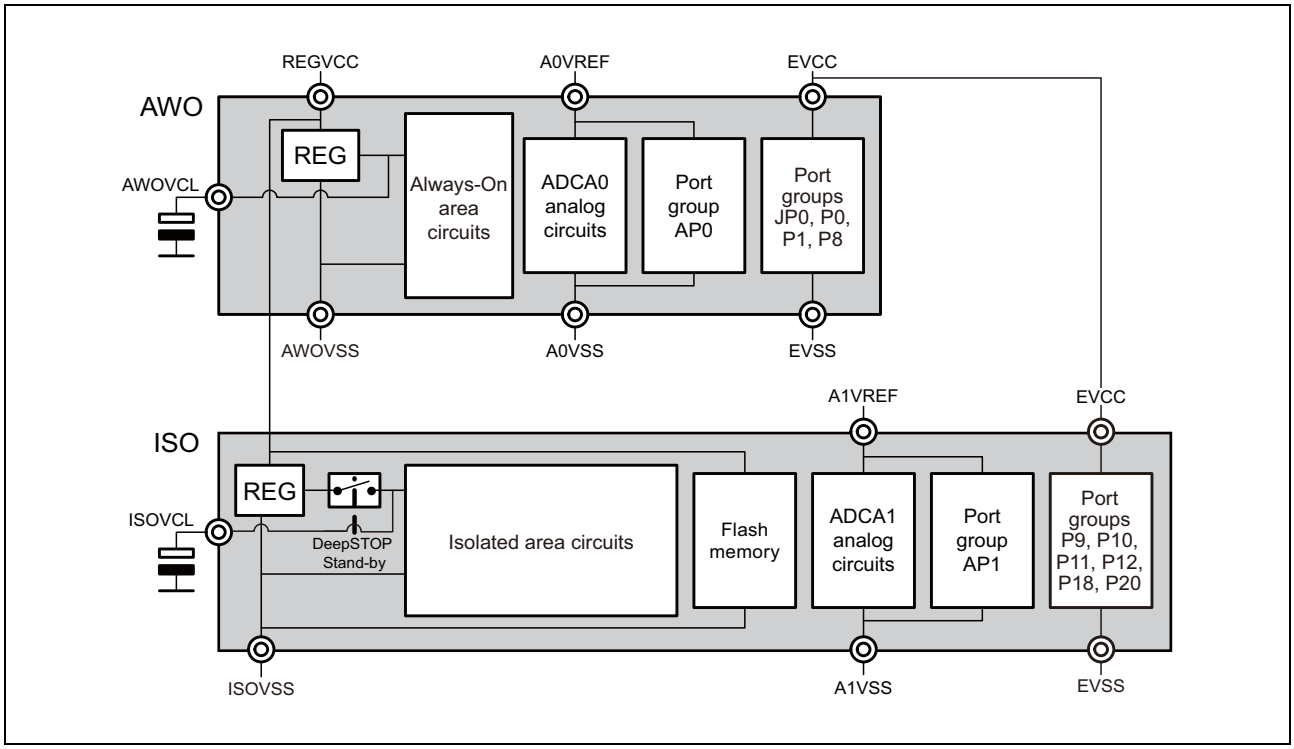

Figure 10.2 Overview of Power Supply Circuit (144 pin)

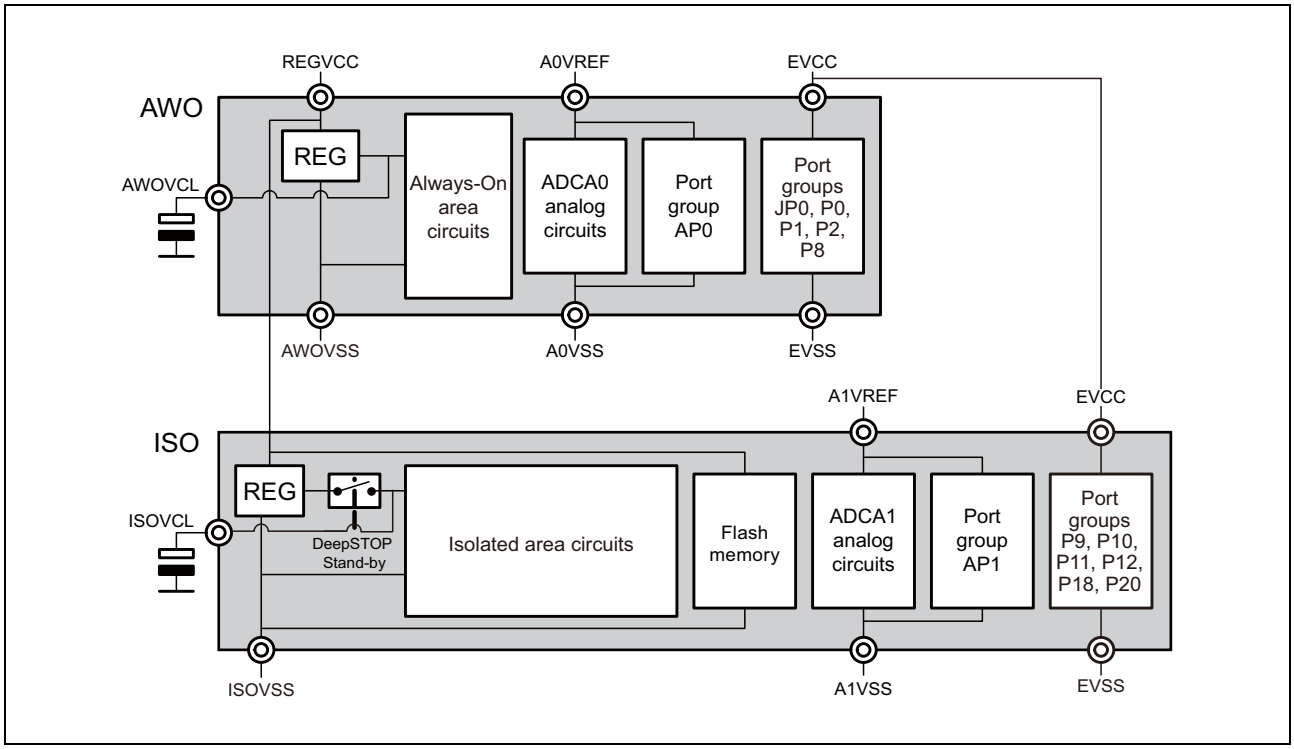

Figure 10.3 Overview of Power Supply Circuit (176 pin)

10.1.3 Power Domains Arrangement

The table below lists the microcontroller functional modules for each power domain.

Table 10.2 Functional Modules and Power Domain

Power Domain	Functions
Always-On area (AWO area)	• STBC, Reset controller • Retention RAM • MainOSC, SubOSC, LS IntOSC, HS IntOSC, CLMA0, CLMA1 • WDTA0, RTCAn, TAUJ0, ADCA0, LPS • Port groups JP0, P0, P1, P2, P8, AP0, IP0
Isolated area (ISO area)	• CPU subsystem • Code flash, Data flash, Local RAM • PLL, CLMA2 • WDAT1, DCRAn, TAUDn, TAUBn, TAUJ1, OSTMn, PWM-Diag, CSIGn, CSIHn, RSCANn, RLIN2m, RLIN3n, RIICn, ADCA1, Motor Control, ENCAn, KRn • Port groups P9, P10, P11, P12, P18, P20, AP1

Section 11 Supply Voltage Monitor

This section explains in general about the supply voltage monitor.

The first part in this section describes the supply voltage monitor function, and the ensuing sections describe the registers.

This supply voltage monitor is for detecting and control of a power supply failure. However, the supply voltage monitor does not detect all of the possible failures.

Therefore, a power supply monitoring with an external device is required for the following terminals, in case that the customer's system requires an appropriate failure detection and control for Functional Safety.

- REGVCC
- EVCC
- A0VREF
- A1VREF
- AWOVCL
- ISOVCL

For the detail of required power supply specification for power supply monitoring with external device, see **Section 40.8, Power Management Characteristics**.

11.1 Overview

11.1.1 Functional Overview

The supply voltage monitor continuously monitors multiple external and internal supply voltages in order to ensure that the device operates with a supply voltage within the specified range. If the voltage drops below the reference voltage or comparison voltage, an interrupt request signal or internal reset signal is generated. The following table lists the supply voltage monitor functions.

Table 11.1 Supply Voltage Monitor Functions

Function Name	Monitor Voltage	Signal Generated when Voltage Drops below Certain Level
Power-On Clear (POC)	REGVCC	Internal reset signal
Low-Voltage Indicator Circuit (LVI)	REGVCC	Internal reset signal, interrupt request signal
Core Voltage Monitor (CVM)	Isolated area voltage	Internal reset signal
RAM Retention Voltage Indicator (VLVI)	REGVCC	—

NOTES

1. The RAM Retention Voltage Indicator sets the very-low voltage detection flag (VLVF) when the voltage drops below the RAM retention voltage.
2. When the internal core voltage monitor (CVM) is used for customer's system as the functional safety measure, the voltage of the Always-On area (AWO area) shall be monitored by the external voltage monitor.

11.1.2 Power-On Clear (POC)

The POC continuously monitors the external power supply voltage REGVCC. This ensures that the microcontroller only operates at or above power-on-clear detection voltage (V_{POC}).

If REGVCC falls below the POC detection voltage (REGVCC < V_{POC}), the internal reset signal (POCRES) is generated.

For details, see **Section 9.4.2, Power-On-Clear (POC) Reset**.

11.1.3 Low Voltage Indicator Circuit (LVI)

The LVI continuously compares the external power supply voltage REGVCC with the LVI reference voltage V_{LVI}.

If REGVCC falls below the reference voltage (REGVCC < V_{LVI}), an internal reset signal or interrupt request signal is generated.

11.1.3.1 LVI Reference Voltage

The LVI reference voltage V_{LVI} can be selected from three different levels by LVICNT.LVICNT[1:0].

If LVICNT.LVICNT[1:0] is set to 00_B, the LVI is disabled.

For the specification of the reference voltage level V_{LVI}, see **Section 11.2.2.1, LVICNT — LVI Control Register**.

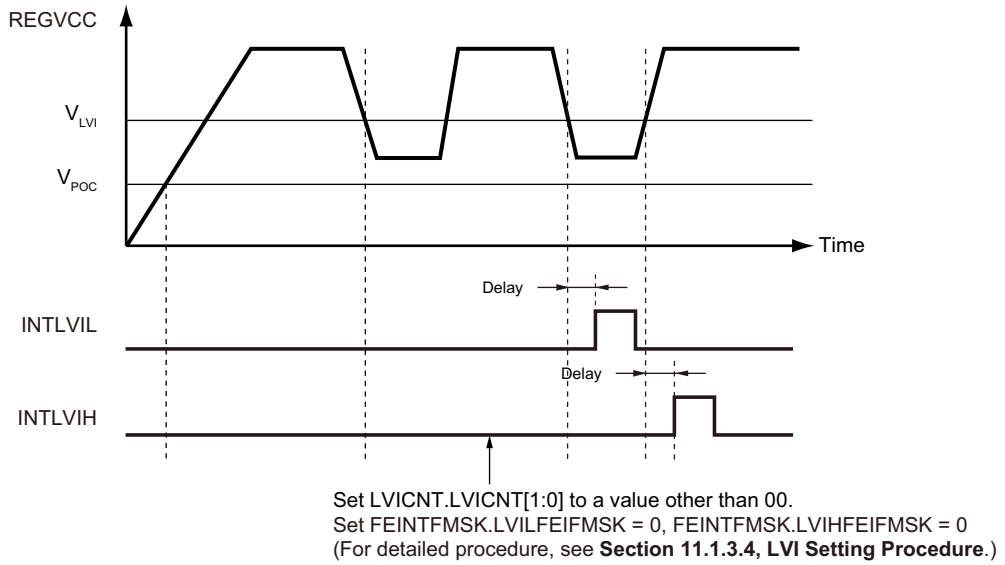
11.1.3.2 LVI Reset (LVIRES)

When the LVI detection voltage is set and LVIRESMK is cleared, if REGVCC falls below the reference voltage (REGVCC < V_{LVI}), the internal reset signal $\overline{\text{LVIRES}}$ is generated.

For the specification of $\overline{\text{LVIRES}}$ generation, see **Section 9.4.3, Low-Voltage Indicator (LVI) Reset**.

11.1.3.3 LVI Interrupt (INTLVIL/INTLVIH)

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REGVCC falls below the reference voltage (REGVCC (MIN) < V_{LVI}), the LVI interrupt INTLVIL is generated.



To use the LVI as an interrupt source, the INTLVIL interrupt must be unmasked.

INTLVIL interrupt can be used as wake-up source from all of standby modes. For details, see Section 14, Stand-By Controller (STBC).

After the LVI detection voltage is set to LVICNT.LVICNT[1:0] and LVICNT.LVIRESMK is set to 1, if REGVCC exceeds the reference voltage (REGVCC (MIN > V_{LVI}), LVI interrupt INTLVIH is generated.

When LVI is used as an interrupt source, INTLVIH interrupt must be unmasked.

The following figure illustrates the timing of INTLVIL/INTLVIH.

Note: Delay:
When REGVCC falls below V_{LVI}, INTLVIL is generated after a certain delay.
After that, when REGVCC exceeds V_{LVI}, INTLVIH is generated after a certain delay.
See **Section 40, Electrical Characteristics** for delay time.

Figure 11.1 INTLVIL/INTLVIH Generation Timing

11.1.3.4 LVI Setting Procedure

The setting procedures for LVI are shown below.

(1) Using LVI as the reset source

(1) Mask LVI reset. (LVICNT.LVIRESMK = 1)*1

(2) Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)

(3) Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])*1

(4) Insert ample wait time by software (see **Section 40, Electrical Characteristics**).

(5) Unmask LVI reset. (LVICNT.LVIRESMK = 0)*1

(2) Using LVI as the interrupt source (FEINT)

(1) Mask LVI reset. (LVICNT.LVIRESMK = 1)*1

(2) Mask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 1, FEINTFMSK.LVIHFEIFMSK = 1)

(3) Set detection voltage and enable operation. (Set LVICNT.LVICNT[1:0])*1

(4) Insert ample wait time by software (see **Section 40, Electrical Characteristics**).

(5) Unmask LVI interrupt. (FEINTFMSK.LVILFEIFMSK = 0, FEINTFMSK.LVIHFEIFMSK = 0)

Note 1. Follow the register protection sequence to set LVICNT register because it is a write-protected register. For details on the write-protected registers, see **Section 5, Write-Protected Registers**.

CAUTION

If REGVCC is not stable around the LVI detection level (V_{LVI}), correct judgment of whether INTLVIH or INTLVIL interrupt processing should proceed may not be possible.

For example, if multiple interrupts consisting of both INTLVIH and INTLVIL occur during INTLVIL interrupt processing due to REGVCC being unstable, the software cannot detect which type of interrupt was generated last.

Consequently, if the last interrupt generated was an INTLVIL interrupt, regardless of REGVCC (min.) being greater than V_{LVI}, the software erroneously judges that REGVCC (min.) < V_{LVI}.

Accordingly, take measures such as programming the software so that LVI detection interrupt processing is completed before a next LVI interrupt. Also, consider control of REGVCC.

11.1.3.5 Clock Supply to the LVI

The clock supply to the LVI is shown in the following table.

Table 11.2 Clock Supply to the LVI

Unit Name	Unit Clock Name	Supply Clock Name
LVI	Register access clock	CPUCLK4

11.1.4 Core Voltage Monitor (CVM)

The core voltage monitor (CVM) monitors the Isolated area voltage (referred to as “core voltage” below) in the microcontroller.

If the regulator output voltage is outside of the specified range, the internal reset signal ($\overline{\text{CVMRES}}$) is generated.

If the CVM detects an abnormal high voltage, the power supply to the Isolated area is switched off in addition to a reset being generated.

When operation shifts to diagnostic mode (DIAG mode), the CVM enters the abnormal core voltage detection state. An abnormal core voltage detected state can be intentionally created by using the DIAG mode so that the CVM abnormal voltage detected flag can be checked for failures.

CAUTION

The CVM cannot detect drifts in the voltage being supplied to the on-chip voltage regulator and Isolated area, or the increase or decrease of voltage.

11.1.4.1 CVM Reset ($\overline{\text{CVMRES}}$)

If the core voltage exceeds the specified level while high-voltage monitor is enabled (CVMDE.H_D_E = 1), then $\overline{\text{CVMRES}}$ is generated and the power supply to the Isolated area is stopped.

If the core voltage falls below the specified level while low voltage monitor is enabled (CVMDE.L_D_E = 1), $\overline{\text{CVMRES}}$ is generated.

For the specification of $\overline{\text{CVMRES}}$ generation, see **Section 9.4.4, Core Voltage Monitor (CVM) Reset**.

11.1.4.2 CVM Setting

Use the option byte to enable the high-voltage monitor and the low-voltage monitor. For details, see **Section 37.9, Option Bytes**.

11.1.4.3 Diagnostic (DIAG) Mode

This product supports diagnostic mode.

In diagnostic (DIAG) mode, whether the CVM abnormal voltage detection flag is set to 1 can be checked.

In diagnostic mode, $\overline{\text{CVMRES}}$ is not output.

The setting procedure for diagnostic mode is described below.

Set the registers according to this procedure. Otherwise the operation is not guaranteed.

(1) Set CVMDIAG.CVM_DIAG_MASK.*1

(2) Set CVMDIAG.CVM_DIAG.*1

(3) Wait for 12 µs.*2

(4) Read the CVMF register to confirm that the H_V_F and L_V_F bits are set to 1 (if these bits are 0, the CVM does not operate normally, requiring error handling).

(5) Clear CVMDIAG.CVM_DIAG.*1

(6) Clear the CVMF register.*1

(7) Read the CVMF register to confirm that the H_V_F and L_V_F bits are set to 0 (if these bits are 1, go back to step 5 again).

(8) Clear CVMDIAG.CVM_DIAG_MASK.*1

Note 1. Follow the register protection sequence to set CVMF and CVMDIAG registers because these are write-protected registers. For details, see **Section 5, Write-Protected Registers**.

Note 2. At least 50 µs must elapse after the following conditions are fulfilled before step (4) is started.

- Release from HALT state
- Release from STOP mode
- Release from the reset state, when a reset other than a reset due to the CVM is generated in RUN/HALT state
- The CPU clock is switched
- Operation of the MainOSC is started or stopped
- Operation of the PLL is started or stopped

11.1.4.4 Clock Supply to the CVM

The clock supply to the CVM is shown in the following table.

Table 11.3 Clock Supply to the CVM

Unit Name	Unit Clock Name	Supply Clock Name
CVM	Register access clock	CPUCLK4

11.1.5 RAM Retention Voltage Indicator (Very-Low-Voltage Detection Circuit, VLVI)

The very-low-voltage detection circuit (VLVI) is used to detect the RAM retention voltage, and continuously compares the power supply voltage REGVCC with the RAM retention voltage V_{VLVI}.

See **Section 40, Electrical Characteristics** for the specification of the RAM retention voltage level V_{VLVI}.

11.1.5.1 Clock Supply to the VLVI

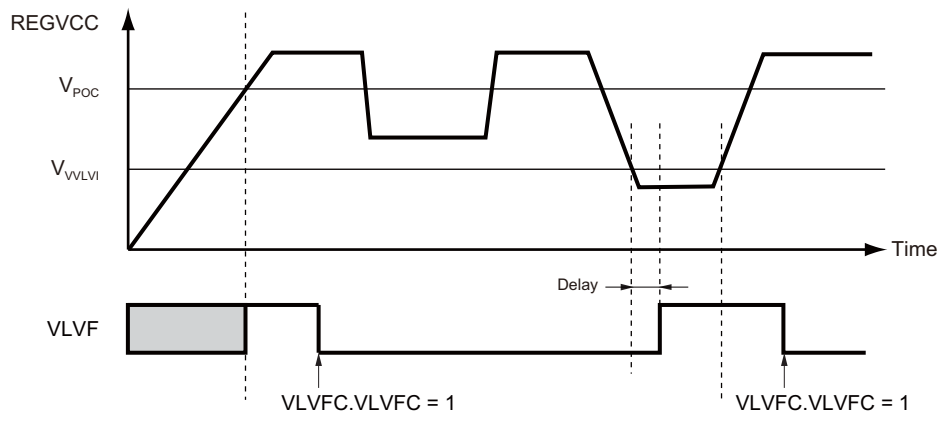
The clock supply to the VLVI is shown in the following table.

Table 11.4 Clock Supply to the VLVI

Unit Name	Unit Clock Name	Supply Clock Name
VLVI	Register access clock	CPUCLK4

11.1.5.2 Retention RAM Content Retention

If the power supply voltage REGVCC does not fall below V_{VLVI}, the content of the Retention RAM (RRAM) is retained. See **Section 9.1.1, Reset Sources** for retention during reset.



If REGVCC falls below V_{VLVI}, the RRAM content cannot be guaranteed. Thus the entire RRAM must be restored before continuing operation.

If REGVCC falls below the RAM retention voltage (REGVCC < V_{VLVI}), the VLVF.VLVF bit is set.

After that, even if REGVCC exceeds V_{VLVI}, the VLVF.VLVF bit is not cleared automatically. It is cleared by

- setting VLVFC.VLVFC bit to 1.

The following figure illustrates the timing of VLVF.

Note: Delay:
When REGVCC falls below V_{VLVI}, the VLVF bit is set to 1 after a certain delay.
See **Section 40, Electrical Characteristics** for delay time.

Figure 11.2 VLVF Operation Timing

11.1.6 Block Diagram

The block diagram of the supply voltage monitor is shown below.

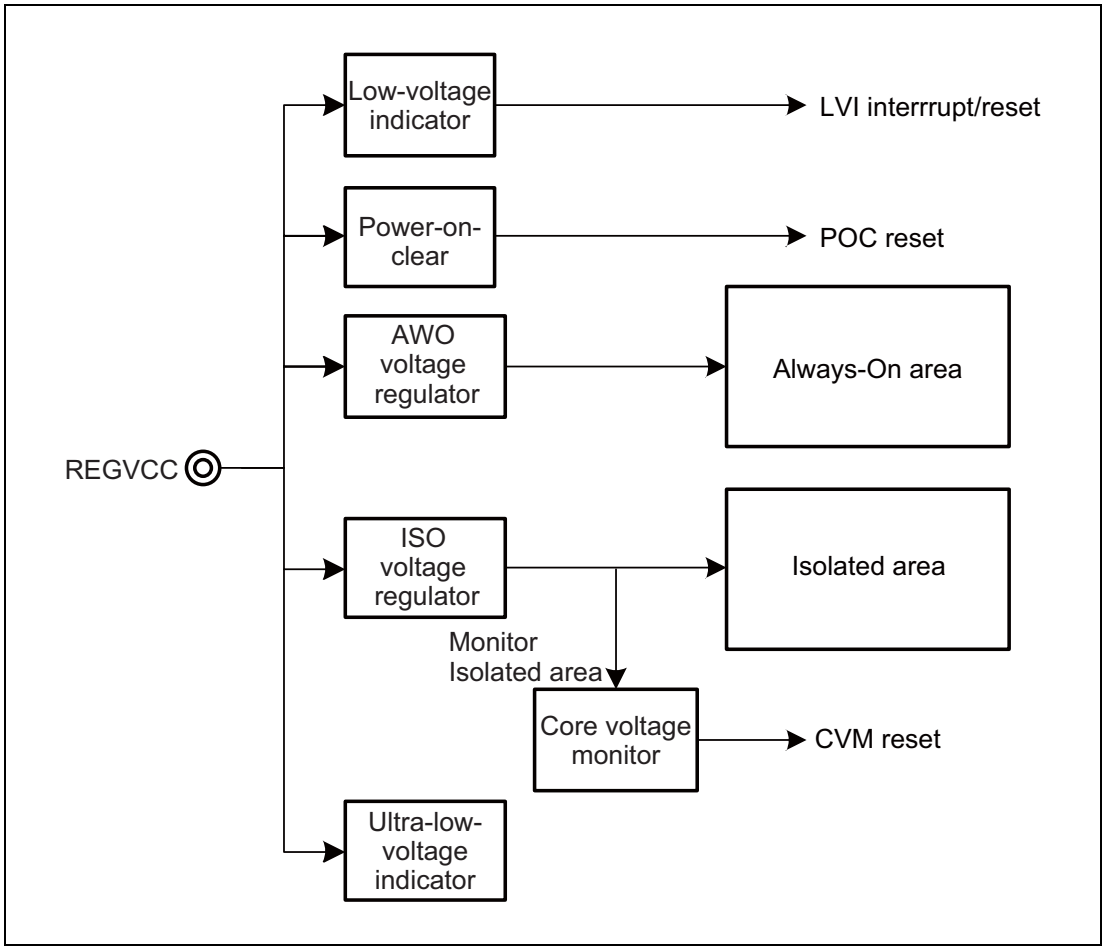


Figure 11.3 Supply Voltage Monitor

11.2 Registers

11.2.1 List of Registers

The following table lists the supply voltage monitor registers.

Table 11.5 Power Supply Voltage Monitor Registers

Module Name	Register Name	Symbol	Address
SVM	**Low-voltage indicator reset control register**		
	LVI control register	LVICNT	FFF8 $0A00_H$
	Core voltage monitor control register		
	CVM factor register	CVMF	FFF8 3100_H
	CVM detection enable register	CVMDE	FFF8 3104_H
	CVM diagnostic mode setting register	CVMDIAG	FFF8 3114_H
	Very-low-voltage detection control register		
	Very-low-voltage detection register	VLVF	FFF8 0980_H
	Very-low-voltage detection clear register	VLVFC	FFF8 0988_H

11.2.2 Low-Voltage Indicator Reset Control Registers

11.2.2.1 LVICNT — LVI Control Register

This register is used to control the Low-Voltage Indicator and to select the LVI detection level.

This register is initialized by power-up reset PURES.

The correct write sequence using the PROTCMD0 register is required in order to update this register For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 0A00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LVIRESMK	Mask LVI Reset 0: LVI reset is not masked 1: LVI reset is masked
1, 0	LVICNT[1:0]	Detection Level 0 0: LVI is ignored 0 1: 4.0+/-0.1 V (drop), 4.0+/-0.13 V (rise) 1 0: 3.7+/-0.1 V (drop), 3.7+/-0.13 V (rise) 1 1: 3.5+/-0.1 V (drop), 3.5+/-0.13 V (rise)

NOTE

To use an LVI interrupt, LVI reset must be masked (LVIRESMK = 1) by LVIRESMK.

11.2.3 Core Voltage Monitor Control Registers

11.2.3.1 CVMF — CVM Factor Register

This register records the core voltage failure state generated after the last power-up reset PURES. The L_V_F bit and the H_V_F bit are set to 1 by hardware when the CVM detects core voltage failure.

If the L_V_F or H_V_F bit of this register is set to 1, that bit is not updated until it is initialized by a power-up reset PURES or by writing 0 to the CVMF.L_V_F or CVMF.H_V_F bit. However, it continuously monitors an error signal from the core voltage monitoring circuit in diagnostic mode.

The correct write sequence using the PROTCMDCVM register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 3100_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	L_V_F	Low-Voltage Failure Detection of the Core Voltage by the CVM Read access 0: No low-voltage failure state is detected 1: Low-voltage failure state is detected Write access 0: Clear the L_V_F bit 1: Invalid

11.2.3.2 CVMDE — CVM Detection Enable Register

This register is used to indicate the voltage detection enabled or disabled state.
This register is initialized only by power-up reset PURES.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 3104_H

Value after reset: The value after reset depends on the option byte setting.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11.2.3.3 CVMDIAG — CVM Diagnostic Mode Setting Register

This register sets the CVM diagnostic mode.

This register is initialized only by power-up reset PURES.

For details on the register settings in diagnostic mode, see **Section 11.1.4.3, Diagnostic (DIAG) Mode**.

The correct write sequence using the PROTCMDCVM register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 3114_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

11.2.4 Very-Low-Voltage Detection Control Registers

11.2.4.1 VLVF — Very-Low-Voltage Detection Register

The very-low-voltage detection register (VLVF) shows the state of the RAM retention voltage detection.

This register is set upon detection of a voltage below the RAM retention voltage (V_{VLVI}).

If VLVF is set, the Retention RAM content cannot be guaranteed.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 0980_H

Value after power on: 0000 0001_H
This register is not initialized by any reset source.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

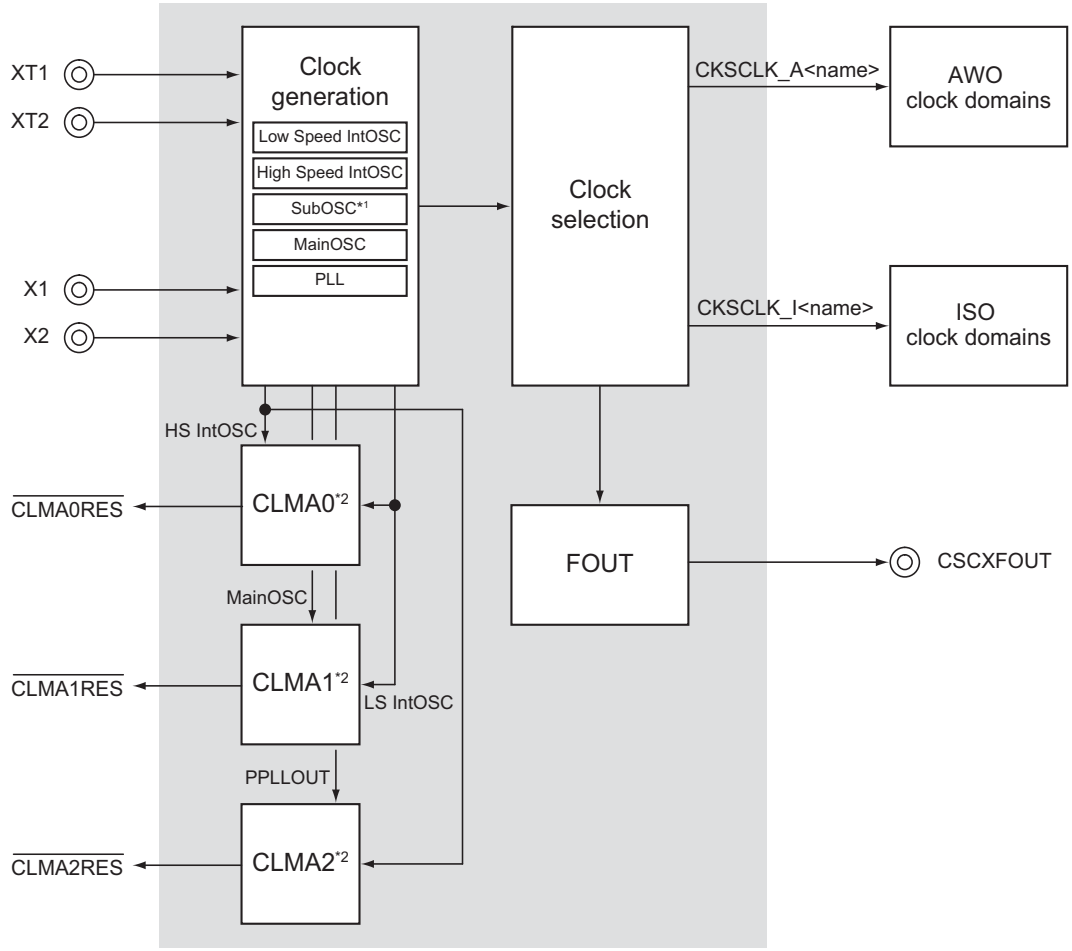
Section 12 Clock Controller

This section explains in general about the clock controller.

The first part in this section describes the specific features of the clock controller of the RH850/F1K microcontrollers. The ensuing sections describe the clock oscillation circuit, clock selectors, and clock output function that make up the clock controller.



12.1 Features of Clock Controller of RH850/F1K

The clock controller of the RH850/F1K microcontrollers has the following features.

- Five on-chip clock oscillators
  - Main Oscillator (MainOSC) with an oscillation frequency of 16, 20, and 24 MHz
  - Sub Oscillator (SubOSC) with an oscillation frequency of 32.768 kHz*1
  - High Speed Internal Oscillator (HS IntOSC) with a nominal frequency of 8 MHz (Typ.)
  - Low Speed Internal Oscillator (LS IntOSC) with a nominal frequency of 240 kHz (Typ.)
  - PLL
- Fine management of clock supply to peripheral modules through clock domains
- On-chip clock monitor that detects clock anomalies when the Main Oscillator, High Speed Internal Oscillator, or PLL are in use. See Section 13, Clock Monitor (CLMA).
- Clock output (FOUT)

Note 1. The Sub Oscillator is supported only for the 144 pin and 176 pin products.

Figure 12.1 shows the schematic diagram of the clock controller.

Note 1. Supported only by 144 pin and 176 pin products.
Note 2. See Section 13, Clock Monitor (CLMA) for details of clock monitors.

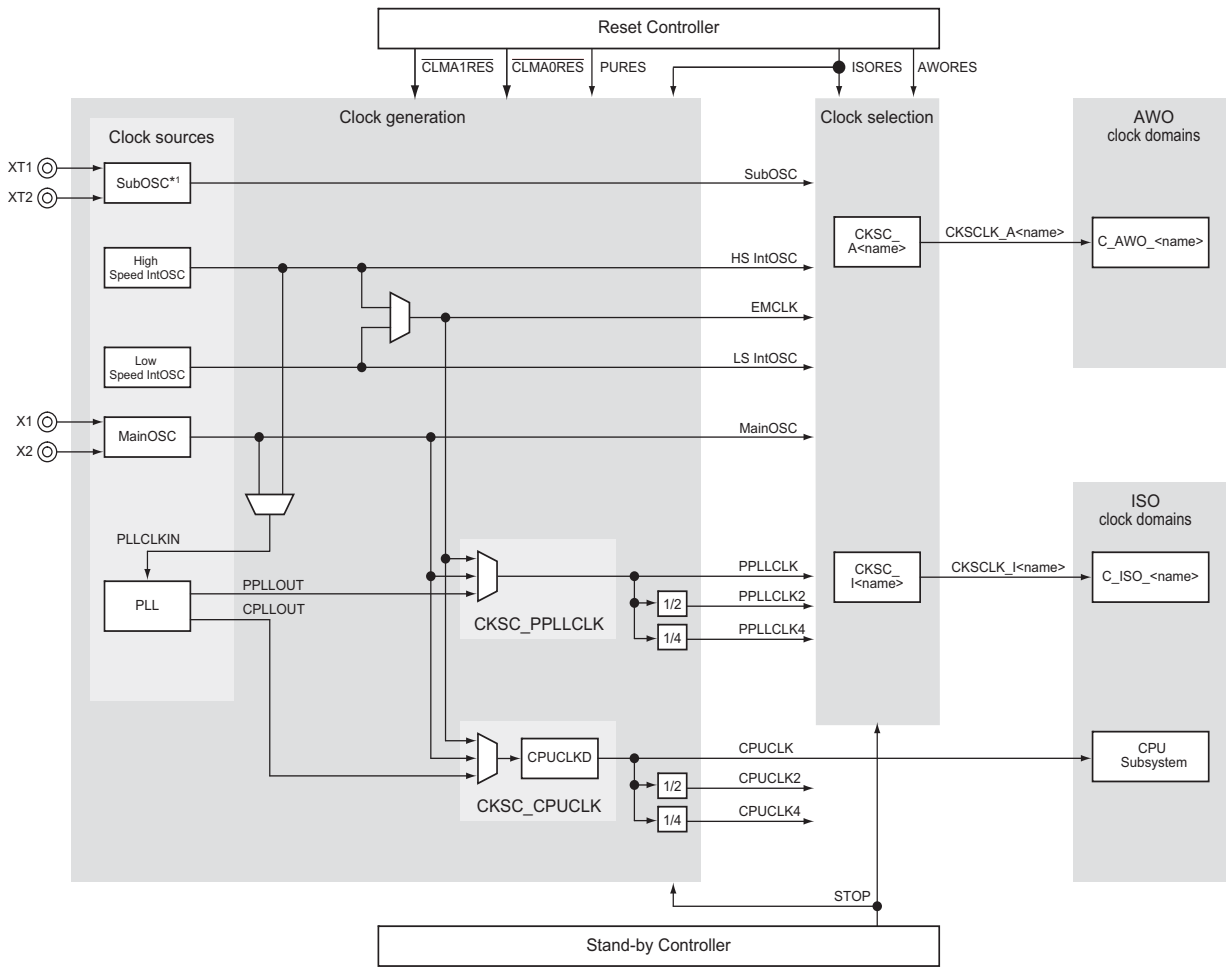


Figure 12.1 Clock Controller Overview

12.2 Configuration of Clock Controller

This section describes the configuration of the clock controller.

The clock controller is composed of clock oscillators and clock generation circuits that generate the clocks for the CPU and the peripheral modules, a clock selector for selecting the optimum clock, and clock domains for the CPU and the peripheral modules.

Figure 12.2 shows the configuration of the clock controller.

Note 1. Supported only by 144 pin and 176 pin products.

Figure 12.2 Clock Controller Configuration

NOTE

Clock domain and clock control register naming conventions

The clock signals and their control registers, etc., described in this section are named according to the following naming conventions to reflect the power domain or clock domain to which they belong. The placeholder “<name>” is used to identify the target module in the clock domain:

- Clock domain names:
  - C_AWO_<name>: Always-On area*1 clock domain
  - C_ISO_<name>: Isolated area*1 clock domain
- Domain clock names:
  - CKSCLK_A<name>: Always-On area domain clock
  - CKSCLK_I<name>: Isolated area domain clock
- Clock selector names:
  - CKSC_A<name>: Always-On area clock selector
  - CKSC_I<name>: Isolated area clock selector
- Clock selector registers:
  - CKSC_A<name>S_CTL: Always-On area source clock selector register
  - CKSC_A<name>D_CTL: Always-On area source clock divider register
  - CKSC_I<name>S_CTL: Isolated area source clock selector register
  - CKSC_I<name>D_CTL: Isolated area source clock divider register

Example

The clock signal CKSCLK_AADCA (placeholder <name> = ADCA) is the clock supplied to the clock domain C_AWO_ADCA in the Always-On area. This clock is selected by the clock selector register CKSC_AADCAS_CTL.

Note 1. Always-On area and Isolated area refer to the power supply domains. Always-On area (AWO area) is an always-on power supply, and Isolated area (ISO area) is an a power supply that is switched on or off by the operation mode.
For details, see **Section 10, Power Supply Circuit**.

12.2.1 Clock Generation Circuits

Five clock oscillators are provided:

Four clock oscillators are located on the Always-On area (AWO area) and PLL is located on the Isolated area (ISO area).

Main Oscillator (MainOSC)

The MainOSC generates the main clock X.
Generation of the clock X requires the connection of an external resonator to X1 and X2.
The clock X is used as the reference clock for the PLL.

Sub Oscillator (SubOSC)

The SubOSC generates the sub-clock XT, which runs at a frequency of 32.768 kHz (Typ.). Generation of the sub clock XT requires the connection of an external resonator to XT1 and XT2.
This clock is mainly used for real-time clock applications.

High Speed Internal Oscillator (HS IntOSC)

The HS IntOSC generates the clock RH, which runs at a frequency of 8 MHz (Typ.).

Low Speed Internal Oscillator (LS IntOSC)

The LS IntOSC generates the clock RL, which runs at a frequency of 240 kHz (Typ.). It starts operation at power up and cannot be stopped, hence it is always operating.

PLL

The PLL circuits generate high speed operation clocks CPLLOUT and PPLLOUT for normal operation of the microcontroller.

The clocks supplied by the clock oscillators (X, XT, RH, RL, CPLLOUT, PPLLOUT) and their divided clocks (CPUCLK, CPUCLK2, CPUCLK4, PPLLCLK, PPLLCLK2, and PPLLCLK4) are all generated in the clock generation circuit.

12.2.2 Clock Selection

The clocks generated by the clock oscillators are input to the clock selectors CKSC_A<name>/ CKSC_I<name>.

Domain clocks CKSCLK_A<name>/CKSCLK_I<name> are selected by dedicated clock selectors from clocks directly input from the oscillators, or in some cases from clocks that have been divided by clock dividers.

- CKSC_I<name>S_CTL/CKSC_I<name>D_CTL registers: determine the clock for the Isolated area clock domains.
- CKSC_A<name>S_CTL/CKSC_A<name>D_CTL registers: determine the clock for the Always-On area clock domains.

Note that not all available clocks generated by the clock oscillators are input to each clock selector.

The following clocks are supplied to the CPU and related modules from the clock generation circuit.

Emergency Clock (EMCLK)

The emergency clock EMCLK is supplied by the

- HS IntOSC, if it is active
- LS IntOSC, if the HS IntOSC is inactive

The selection is done automatically after CLMA0 reset is occurred, so if the HS IntOSC becomes lower than the limit for any reason, vital modules of the microcontroller are still in operation, since the LS IntOSC does not stop.

CPU Subsystem Clock (CPUCLK)

The CPU Subsystem clock CPUCLK is derived from PLL clock CPLLOUT, MainOSC, and EMCLK. The CPU clock selector CKSC_CPUCLK incorporates the selector CPUCLKS, followed by the clock divider CPUCLKD.

The CPUCLK clock divider provides the frequency-divided CPUCLK2 clock signal and CPUCLK4 clock signal derived from CPUCLK.

12.2.3 Clock Domains

The clock controller allows selection of the respective clocks for the CPU and peripheral modules. The clock control scope is called the clock domain. For the correspondence between the CPU and peripheral modules and clock domains, see **Section 12.5.3, Clock Domain Settings**.

12.2.4 Resetting Clock Oscillators

The clock oscillators on the Always-On area are reset by the PURES signal.

The HS IntOSC is reset when $\overline{\text{CLMA0RES}}$ is generated and the MainOSC is reset when $\overline{\text{CLMA1RES}}$ is generated.

The clock oscillator on the Isolated area is reset by the ISORES signal.

For further details on the clock oscillators, see **Section 12.3, Clock Oscillators**.

CAUTION

For the specifications of the frequencies, acceptable variation, and other parameters of the clock generators, see Section 40, Electrical Characteristics.

12.3 Clock Oscillators

12.3.1 Main Oscillator (MainOSC)

The Main Oscillator generates the clock X. X is also used as the PLL input clock PLLCLKIN.

Figure 12.3 shows the basic configuration and signals of the MainOSC.

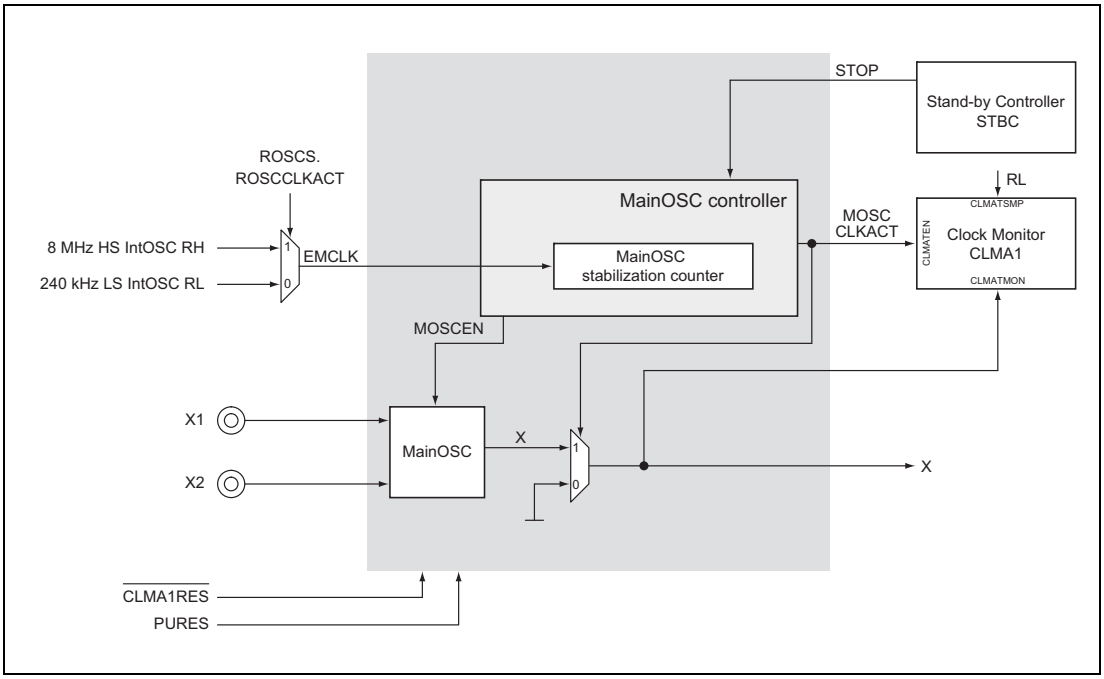

Figure 12.3 Main Oscillator (MainOSC)

MainOSC

The MainOSC stops operating after reset is released. To use the MainOSC, set the MainOSC enable trigger bit (MOSCE.MOSCENTRG) to 1 to start the MainOSC.

MainOSC stabilization

The MOSCST.MOSCCLKST[16:0] bits set the MainOSC oscillation stabilization time.
The MainOSC stabilization counter counts the oscillation stabilization time with EMCLK as the clock source for counting. The oscillation stabilization time can be set to up to 2^{17} –1 EMCLK cycles.
As long as the MainOSC is not stable, the MOSCCLKACT signal disables the X output.
When the MainOSC stabilization counter reaches the value specified in MOSCST.MOSCCLKST[16:0], X is assumed to be stable and MOSCCLKACT switches from 0 to 1 to enable output of X when a waveform is output from MainOSC.

Stable and active X clock is indicated by MOSCS.MOSCCLKACT = 1.

MainOSC amplification gain

By using MOSCC.MOSCAMPSEL[1:0], the MainOSC's input frequency, determined by the external resonator, can be selected from 16MHz, 20 MHz, and 24 MHz.

MainOSC STOP requests in stand-by mode

The STOP signal from the Stand-by Controller requests the MainOSC Controller to switch off the X clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).

The stop request mask bit MOSCSTPM.MOSCSTPMSK controls whether the MainOSC is stopped during stand-by or continues operation:

- MOSCSTPM.MOSCSTPMSK = 0:
  The STOP request signal is not masked, so the MainOSC is stopped in stand-by.
  If the MainOSC is in operation before stand-by, it is automatically re-started after wake-up from stand-by, and the MainOSC stabilization counter counts the oscillation stabilization time.
  However, the STOP request is masked under the following conditions, even if MOSCSTPM.MOSCSTPMSK = 0. Therefore, the MainOSC will continue to operate even in stand-by mode.
  - If the stop mask is set (CKSC_xxxx_STPM = 0000 0003_H) for a clock domain for which the MainOSC is selected.
- MOSCSTPM.MOSCSTPMSK = 1:
  The STOP request signal is not masked, so the MainOSC continues to operate in stand-by.

Clock monitor control

The MainOSC activity signal MOSCCLKACT enables or disables supervision by the Clock Monitor CLMA1. In case the MainOSC is inactive (MOSCCLKACT = 0), supervision of its output clock X by CLMA1 is also disabled.

MainOSC enable/disable trigger

The MainOSC can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger MOSCE.MOSCENTRG = 1 starts the MainOSC.
  Note that setting the enable trigger is only effective if the MainOSC is inactive, i.e. if MOSCS.MOSCCLKACT = 0.
- Disable trigger MOSCE.MOSCDISTRG = 1 stops the MainOSC.
  Note that setting the disable trigger is only effective if the MainOSC is active (MOSCCLKACT = 1) and the MainOSC stop requests are not masked (MOSCSTPM.MOSCSTPMSK = 0).

Direct clock input to X1

A clock waveform from an external clock source can be supplied to X1 pin. In this case, set the MOSCM bit of MOSCM register to 1 before clock input to X1 pin is supplied.

12.3.2 Sub Oscillator (SubOSC)

The Sub Oscillator generates the sub clock XT. XT has usually a frequency of 32.768 kHz and is used for the Real-time Clock.

Figure 12.4 shows the basic structure and signals of the SubOSC.

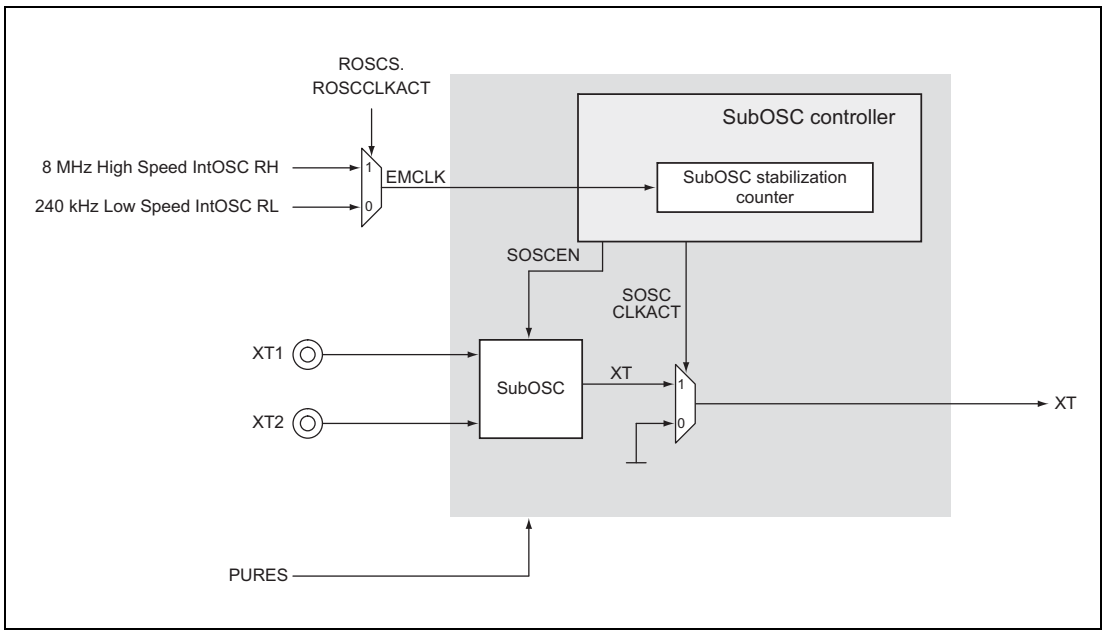

Figure 12.4 Sub Oscillator (SubOSC)

SubOSC enable

The SubOSC stops operating after reset is released. To use the SubOSC, set SubOSC enable trigger bit (SOSCE.SOSCENTRG) to 1 to start the SubOSC.

SubOSC stabilization

The SOSCST.SOSCCLKST[29:0] bits set the SubOSC oscillation stabilization time.
The SubOSC stabilization counter counts the oscillation stabilization time with EMCLK as the clock source for counting.
As long as the SubOSC is not stable, the SOSCCLKACT signal disables the XT output.
When the SubOSC stabilization counter reaches the value specified in SOSCST.SOSCCLKST[29:0], XT is assumed to be stable and SOSCCLKACT switches from 0 to 1 to enable output of XT.
Secure the stabilization time longer than 2 seconds.
Stable and active XT clock is indicated by SOSCS.SOSCCLKACT = 1.

SubOSC input frequencies

The SubOSC input frequency is 32.768 kHz (Typ.).

SubOSC enable trigger/disable trigger

SubOSC can be enabled or disabled by using enable/disable trigger control bit.

- Enable trigger SOSCE.SOSCENTRG = 1 starts the SubOSC.
  Note that setting the enable trigger is only effective if the SubOSC is inactive, i.e. if SOSCS.SOSCCLKACT = 0.

- Disable trigger SOSCE.SOSCDISTRG = 1 stops the SubOSC. Note that setting the disable trigger is only effective if the SubOSC is active; that is, if SOSCS.SOSCCLKACT = 1.

12.3.3 High Speed Internal Oscillator (HS IntOSC)

The High Speed Internal Oscillator generates the clock RH. RH has a nominal frequency of 8 MHz.

Figure 12.5 shows the basic configuration and signals of the HS IntOSC.

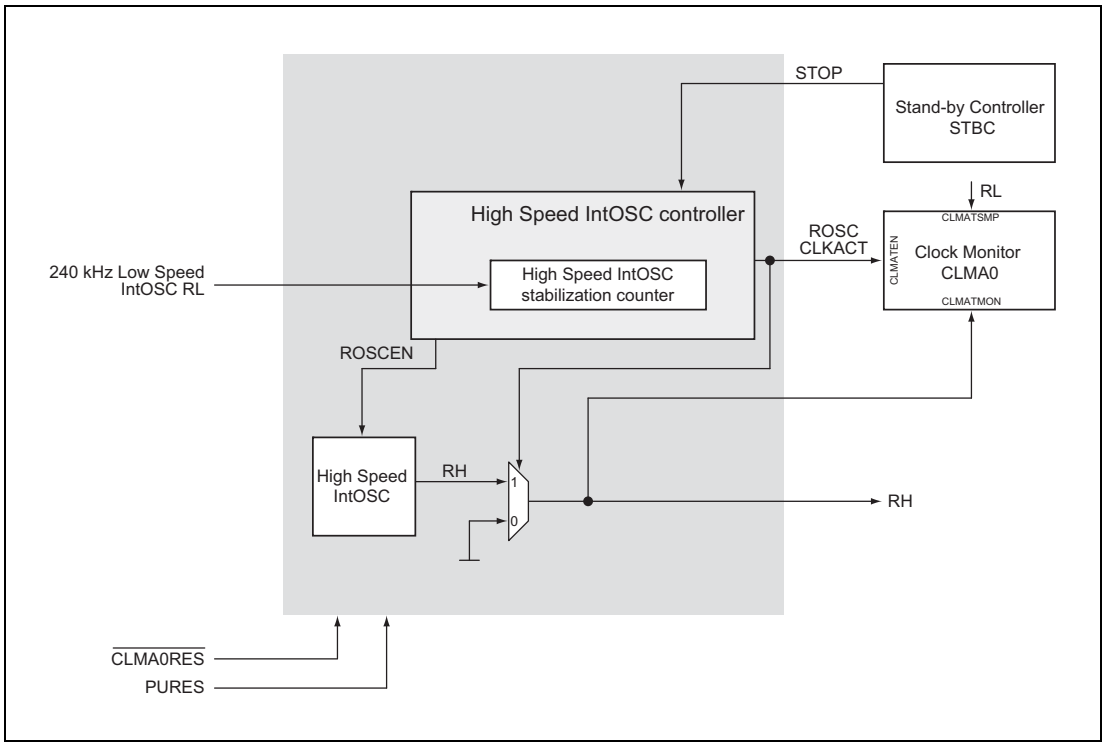

Figure 12.5 High Speed Internal Oscillator (HS IntOSC)

After reset release the HS IntOSC starts operation.

NOTE

The HS IntOSC can neither be stopped nor started by software. It can only be stopped in stand-by mode. On the other hand, when CLMA0 is reset, the HS IntOSC can be enabled to stop by software.

HS IntOSC stabilization

HS IntOSC outputs RH when it is stabilized.
Stable and active RH clock is indicated by ROSCS.ROSCCLKACT = 1.

HS IntOSC STOP requests in stand-by mode

The STOP signal from the Stand-By Controller requests the HS IntOSC Controller to switch off the RH clock in stand-by modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).
The stop request mask bit ROSCSTPM.ROSCSTPMSK controls whether the HS IntOSC is stopped during stand-by or continues operation:

- ROSCSTPM.ROSCSTPMSK = 0:
  The STOP request signal is not masked, so the HS IntOSC is stopped during stand-by and automatically restarted after wake-up from stand-by.
  However, the STOP request is masked under the following conditions, even if ROSCSTPM.ROSCSTPMSK = 0. Therefore, the HS IntOSC will continue to operate even in stand-by mode.
  - If the stop mask is set (CKSC_xxxx_STPM = 0000_0003_H) for a clock domain for which the HS IntOSC is selected.
  - If the low power sampler (LPS) is operating
- ROSCSTPM.ROSCSTPMSK = 1:
  The STOP request signal is masked, so the HS IntOSC continues to operate during stand-by.

Clock Monitor control

The HS IntOSC activity signal ROSCCLKACT enables or disables supervision by the Clock Monitor CLMA0. In case the HS IntOSC is inactive (ROSCCLKACT = 0), supervision of its output clock by CLMA0 is also deactivated.

The HS IntOSC clock RH is used as the sampling clock for Clock Monitor CLMA2.

HS IntOSC disable trigger

The disable trigger, ROSCE.ROSCDISTRG = 1 stops the HS IntOSC.

The setting of the disable trigger is enabled when HS IntOSC is active (ROSCS.ROSCCLKACT = 1) and HS IntOSC stop requests are not masked (ROSCSTPM.ROSCSTPMSK = 0).

HS IntOSC user calibration function

The HS IntOSC user trimming register (ROSCUT) enables adjustment of the HS IntOSC frequency. The initial value of ROSCUT is the preset value of the HS IntOSC trimming data. Overwrite the value with “read value + 1” or “read value – 1” until the HS IntOSC frequency reaches the target frequency range.

12.3.4 Low Speed Internal Oscillator (LS IntOSC)

The Low Speed Internal Oscillator generates the clock RL. RL has a nominal frequency of 240 kHz.

Figure 12.6 shows the basic configuration and signals of the LS IntOSC.

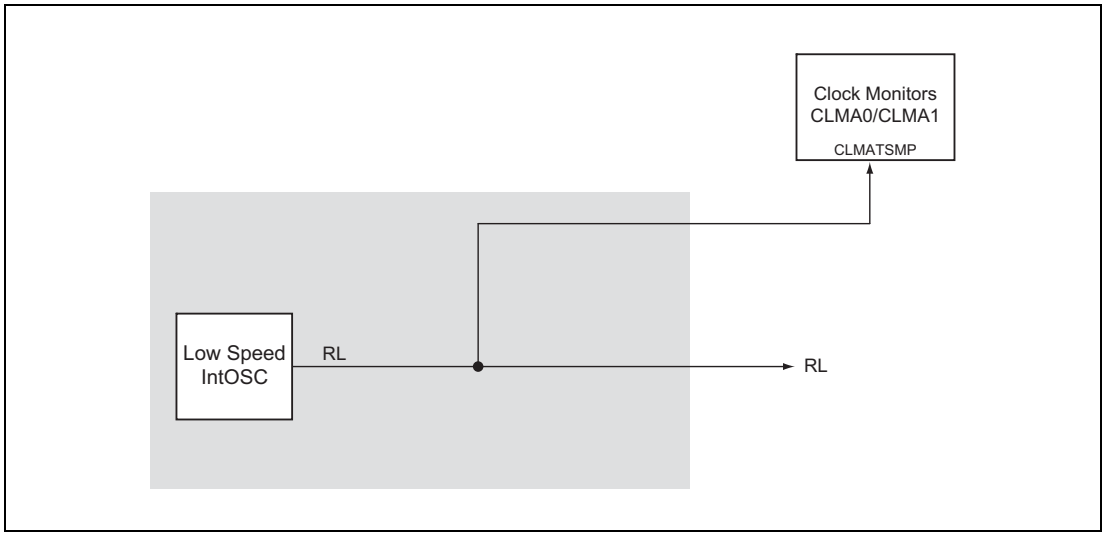

Figure 12.6 Low Speed Internal Oscillator (LS IntOSC)

After reset release the LS IntOSC starts operation. It cannot be stopped.

The LS IntOSC clock RL is used as the sampling clock for the Clock Monitors CLMA0 and CLMA1.

12.3.5 PLL

The MainOSC or HS IntOSC is input to the Phase-Locked Loops (PLL) clock oscillator as PLLCLKIN. The PLL output clocks CPLLOUT and PPLLOUT serve as the main operation clocks for the microcontroller.

Figure 12.7 shows the basic configuration and signals of the PLL.

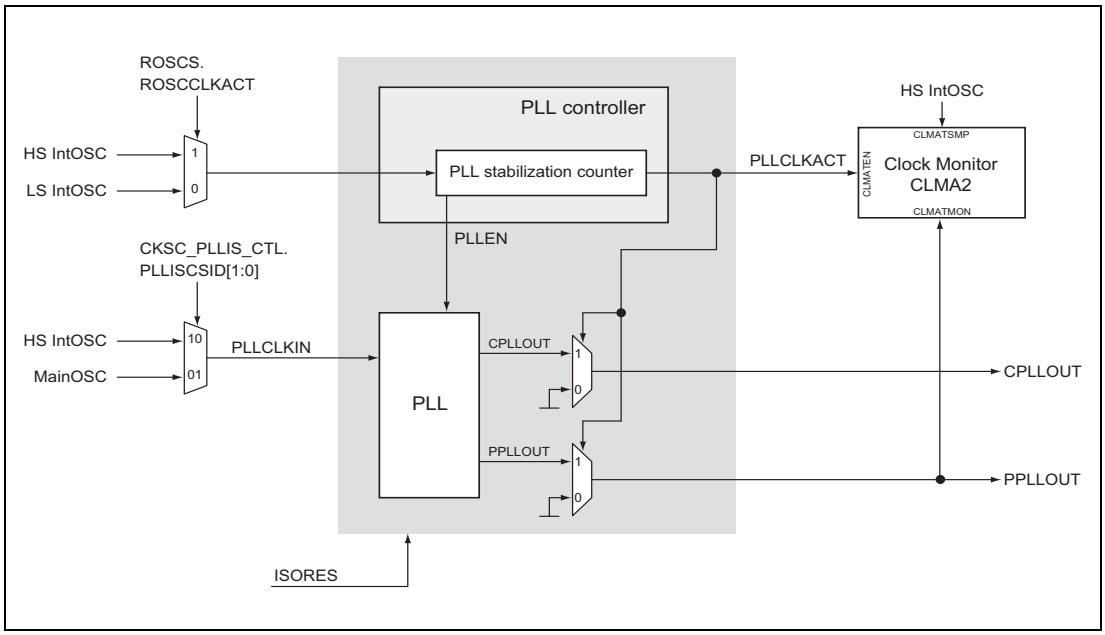

Figure 12.7 PLL

PLL enable

The PLL stops operating after reset is released. To use the PLL, set the PLL enable trigger bit (PLLE.PLLENTRG) to 1 to start the PLL.

PLL stabilization

The PLL stabilization counter starts counting the stabilization time.
As long as the PLL is not stable, the PLLCLKACT signal disables the PPLLOUT and CPLLOUT outputs.
When the PLL stabilization counter reaches the predefined value, PPLLOUT and CPLLOUT are assumed to be stable and PLLCLKACT switches from 0 to 1 to enable output of PPLLOUT and CPLLOUT.

The stable and active state of the PPLLOUT and CPLLOUT clocks is indicated by PLLS.PLLCLKACT = 1.

PLL in stand-by modes

In STOP mode, the PLL is automatically disabled and resumes operation after wake-up from STOP mode, if it was operating before entering STOP mode.

The PLL is also automatically disabled when transitioning to DeepSTOP mode. However, after restoring from DeepSTOP mode, the PLL needs to be reconfigured.

In Cyclic RUN and Cyclic STOP mode, the PLL is not available. Do not enable the PLL by using the PLL Enable register in Cyclic RUN mode.

Clock Monitor control

The PLL activity signal PLLCLKACT enables or disables supervision by the Clock Monitor CLMA2. In case the PLL is inactive (PLLCLKACT = 0), supervision of the output clock PPLLOUT by CLMA2 is also deactivated.

PLL enable/disable trigger

The PLL can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger PLLE.PLLENTRG = 1 starts the PLL
  Note that setting the enable trigger is only effective if the PLL is inactive, i.e. if PLLS.PLLCLKACT = 0.
- Disable trigger PLLE.PLLDISTRG = 1 stops the PLL
  Note that setting the disable trigger is only effective if the PLL is active, i.e. if PLLS.PLLCLKACT = 1.

PLL input clock (PLLCLKIN) selection

The PLL input clock (PLLCLKIN) can be selected from MainOSC and HS IntOSC by using the CKSC_PLLIS_CTL register.

The maximum frequency of CPLLOUT and PPLLOUT is limited when the HS IntOSC is selected as PLL input clock.

12.3.5.1 PLL Parameters

The PLL is configured by a set of parameters, loaded from the control register PLLC and CKSC_CPUCLKD_CTL.

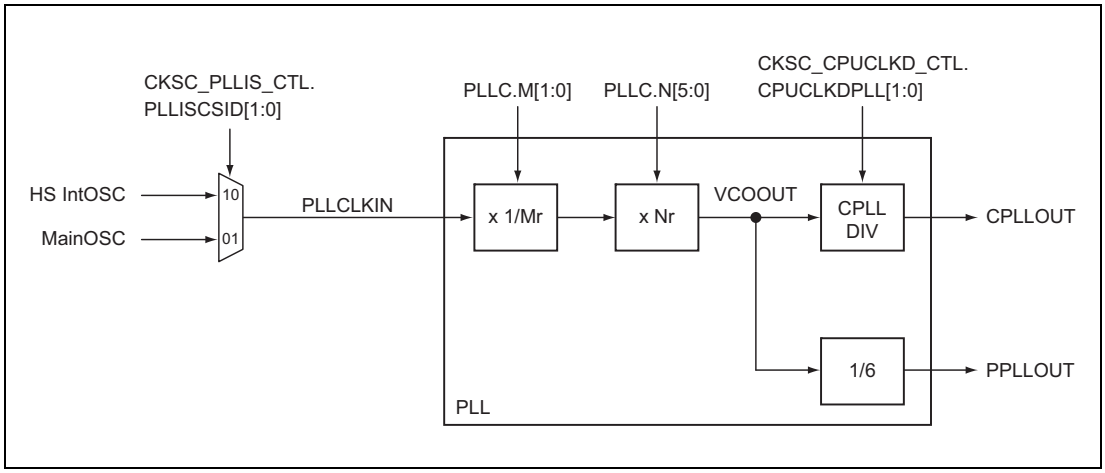

Figure 12.8 PLL Circuit

CPLLOUT and PPLLOUT

The PLL has two clock outputs: “CPLLOUT” and “PPLLOUT”. CPLLOUT is one of the clock sources of the CPU subsystem, and PPLLOUT is one of the clock sources of the peripheral modules. CPLLOUT and PPLLOUT share the same clock source “VCOOUT”, which is the output of the voltage controlled oscillator (VCO). The clock frequency of VCOOUT is calculated by the following formula:

$$f_{VCOOUT} = f_{PLLCLKIN} \times (Nr / Mr)$$

The clock frequency of CPLLOUT “f_{CPLL}” and that of PPLLOUT “f_{PPLL}” are integer fractions of the VCO output frequency f_{VCOOUT}. f_{CPLL} and f_{PPLL} are calculated by the following formulas:

$$f_{CPLL} = f_{VCOOUT} \times 1/Pr = f_{PLLCLKIN} \times (Nr / Mr) \times 1/Pr$$

$$f_{PPLL} = f_{VCOOUT} \times 1/6 = f_{PLLCLKIN} \times (Nr / Mr) \times 1/6$$

The values Nr and Mr are derived from PLLC register bits:

$$Nr = PLLC.N[5:0] + 1$$

$$Mr = PLLC.M[1:0] + 1$$

The setting range of Mr: $1 \leq Mr \leq 3$

The value Pr is derived from CKSC_CPUCLKD_CTL. CPUCLKDPLL[1:0], and the value is 4, 5, or 6.

12.4 Registers

12.4.1 List of Registers

The registers of the clock controller are listed below.

Table 12.1 List of Clock Controller Registers (1/2)

Module Name	Register Name	Symbol	Address
CLKCTL	**Clock oscillator registers:**		
	MainOSC enable register	MOSCE	FFF8 1100$_H$
	MainOSC status register	MOSCS	FFF8 1104$_H$
	MainOSC control register	MOSCC	FFF8 1108$_H$
	MainOSC stabilization time register	MOSCST	FFF8 110C$_H$
	MainOSC stop mask register	MOSCSTPM	FFF8 1118$_H$
	MOSC mode control register	MOSCM	FFF8 111C$_H$
	SubOSC enable register	SOSCE*1	FFF8 1200$_H$
	SubOSC status register	SOSCS*1	FFF8 1204$_H$
	SubOSC stabilization time register	SOSCST*1	FFF8 120C$_H$
	HS IntOSC enable register	ROSCE	FFF8 1000$_H$
	HS IntOSC status register	ROSCS	FFF8 1004$_H$
	HS IntOSC stop mask register	ROSCSTPM	FFF8 1018$_H$
	PLL enable register	PLLE	FFF8 9000$_H$
	PLL status register	PLLS	FFF8 9004$_H$
	PLL control register	PLLC	FFF8 9008$_H$
	PLL input clock selection register	CKSC_PLLIS_CTL	FFF8 A700$_H$
	PLL input clock active register	CKSC_PLLIS_ACT	FFF8 A708$_H$
	PPLLCLK source clock selection register	CKSC_PPLLCLKS_CTL	FFF8 A010$_H$
	PPLLCLK source clock active register	CKSC_PPLLCLKS_ACT	FFF8 A018$_H$
	HS IntOSC user trimming register	ROSCUT	FFF8 101C$_H$
	Clock selectors registers:		
	C_AWO_WDTA clock divider register	CKSC_AWDTAD_CTL	FFF8 2000$_H$
	C_AWO_WDTA clock divider active register	CKSC_AWDTAD_ACT	FFF8 2008$_H$
	C_AWO_WDTA stop mask register	CKSC_AWDTAD_STPM	FFF8 2018$_H$
	C_AWO_TAUJ source clock selection register	CKSC_ATAUJS_CTL	FFF8 2100$_H$
	C_AWO_TAUJ source clock active register	CKSC_ATAUJS_ACT	FFF8 2108$_H$
	C_AWO_TAUJ clock divider register	CKSC_ATAUJD_CTL	FFF8 2200$_H$
	C_AWO_TAUJ clock divider active register	CKSC_ATAUJD_ACT	FFF8 2208$_H$
	C_AWO_TAUJ stop mask register	CKSC_ATAUJD_STPM	FFF8 2218$_H$
	C_AWO_RTCA source clock selection register	CKSC_ARTCAS_CTL*1	FFF8 2300$_H$
	C_AWO_RTCA source clock active register	CKSC_ARTCAS_ACT*1	FFF8 2308$_H$
	C_AWO_RTCA clock divider register	CKSC_ARTCAD_CTL*1	FFF8 2400$_H$
	C_AWO_RTCA clock divider active register	CKSC_ARTCAD_ACT*1	FFF8 2408$_H$
	C_AWO_RTCA stop mask register	CKSC_ARTCAD_STPM*1	FFF8 2418$_H$
	C_AWO_ADCA source clock selection register	CKSC_AADCAS_CTL	FFF8 2500$_H$
	C_AWO_ADCA source clock active register	CKSC_AADCAS_ACT	FFF8 2508$_H$
	C_AWO_ADCA clock divider register	CKSC_AADCAD_CTL	FFF8 2600$_H$
	C_AWO_ADCA clock divider active register	CKSC_AADCAD_ACT	FFF8 2608$_H$

Table 12.1 List of Clock Controller Registers (2/2)

Module Name	Register Name	Symbol	Address
CLKCTL	C_AWO_ADCA stop mask register	CKSC_AADCAD_STPM	FFF8 2618_H
	C_AWO_FOUT source clock selection register	CKSC_AFOUTS_CTL	FFF8 2700_H

	C_ISO_IIC source clock active register	CKSC_IIICS_ACT	FFF8 $AC08_H$

Note 1. Supported only by 144 pin and 176 pin products.

12.4.2 Clock Oscillator Registers

12.4.2.1 MOSCE — MainOSC Enable Register

This register is used to start and stop the MainOSC.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1100$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCDISTRG	MOSCENTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12.2 MOSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MOSCDISTRG	MainOSC Disable Trigger*1,*3 MOSCSTPM.MOSCSTPMSK = 0 0: No function 1: Stops MainOSC MOSCSTPM.MOSCSTPMSK=1 When writing this bit while MOSCSTPM.MOSCSTPMSK = 1, the write value should be 0. 0: No function 1: Setting Prohibited This bit is automatically cleared to 0 by hardware after MainOSC is disabled.
0	MOSCENTRG	MainOSC Enable Trigger*2,*3 0: No function 1: Starts MainOSC This bit is automatically cleared to 0 by hardware after MainOSC is enabled.

Note 1. Follow the procedure given below for stopping the MainOSC by using MOSCDISTRG.

1. Confirm that the MainOSC is neither waiting for being enabled nor stopped (both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).
2. Confirm that the MainOSC is active (MOSCS.MOSCCLKACT = 1).
3. Check that there is no clock domain for which the MainOSC is selected. If the MainOSC is selected for a clock domain, disable the setting or select a clock source other than MainOSC.
4. Confirm that the MainOSC stop mask register is NOT set to "MainOSC continues operation in stand-by mode". Otherwise, set the register to “MainOSC stops operation in stand-by mode” (MOSCSTPM.MOSCSTPMSK = 0).
5. Stop the MainOSC (MOSCE.MOSCDISTRG = 1).
6. Confirm that the MainOSC has been stopped (MOSCS.MOSCCLKACT = 0).

Note 2. Follow the procedure given below for starting the MainOSC by using MOSCENTRG

1. Confirm that the MainOSC is neither waiting for being enabled nor stopped

(both MOSCE.MOSCDISTRG = 0 and MOSCE.MOSCENTRG = 0).

2. Confirm that the MainOSC is inactive (MOSCS.MOSCCLKACT = 0).
3. Start the MainOSC (MOSCE.MOSCENTRG = 1).
4. Confirm that the MainOSC has been started (MOSCS.MOSCCLKACT = 1).

Note 3. Starting and stopping the MainOSC at the same time by using the start and stop bits, i.e., by setting MOSCE.MOSCENTRG = 1 and MOSCE.MOSCDISTRG = 1 at the same time is not allowed.

12.4.2.2 MOSCS — MainOSC Status Register

This register provides active status information about the MainOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 1104_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1*1	0*1
	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCCLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12.3 MOSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	MOSCCLKACT	MainOSC Active Status 0: MainOSC is inactive 1: MainOSC is active
1, 0	Reserved	When read, an undefined value is returned.

12.4.2.3 MOSCC — MainOSC Control Register

This register is used to specify amplification gain of the MainOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1108_H

Value after reset: 0000 0004_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	MOSC AMPSEL[1:0]	MainOSC Amplification Gain Selection 00: Amplification gain for fx = 24MHz 01: Amplification gain for fx = 20MHz 10: Amplification gain for fx = 16MHz 11: Setting prohibited

CAUTION

Set this register when MainOSC is stopped.

12.4.2.4 MOSCST — MainOSC Stabilization Time Register

This register determines the MainOSC stabilization time.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 110C$_H$

Value after reset: 0000 44C0$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 12.5 MOSCST Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16 to 0	MOSC CLKST[16:0]	The MOSCCLKST[16:0] bits specify the count value for the MainOSC stabilization counter. • If HS IntOSC active (ROSCS.ROSCCLKACT = 1): Stabilization time = MOSCCLKST[16:0] / f_{RH} • If HS IntOSC inactive (ROSCS.ROSCCLKACT = 0): Stabilization time = MOSCCLKST[16:0] / f_{RL}

NOTE

See **Section 40, Electrical Characteristics** for information about the MainOSC stabilization time.

CAUTION

Set this register when MainOSC is stopped.

12.4.2.5 MOSCSTPM — MainOSC Stop Mask Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1118$_H$

Value after reset: 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12.6 MOSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCSTPMSK	MainOSC Stop Request Mask 0: MainOSC stops operation in stand-by mode. MainOSC stops operation in the case the MainOSC disable trigger MOSCE.MOSCDISTRG is set to 1. 1: MainOSC continues operation in stand-by mode. MainOSC continues operation even in the case the MainOSC disable trigger MOSCE.MOSCDISTRG is set to 1.

12.4.2.6 MOSCM — MainOSC Mode Control Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA1RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 111C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12.7 MOSCM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCM	MainOSC Mode control 0: OSC mode. (default) 1: EXCLK mode. MainOSC amplifier is disabled.

CAUTION

Set this register when MainOSC is stopped.

12.4.2.7 SOSCE — SubOSC Enable Register

This register is used to start and stop the SubOSC.

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1200$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOSCDISTRG	SOSCENTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12.8 SOSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SOSCDISTRG	SubOSC Disable Trigger*1,*2,*3 0: No function 1: Stops SubOSC This bit is automatically cleared to 0 by hardware after SubOSC is disabled.
0	SOSCENTRG	SubOSC Enable Trigger*3 0: No function 1: Starts SubOSC This bit is automatically cleared to 0 by hardware after SubOSC is enabled.

Note 1. Follow the procedure given below for stopping the SubOSC by using SOSCDISTRG.

1. Confirm that the SubOSC is neither waiting for being enabled nor stopped (SOSCE.SOSCDISTRG = 0 and SOSCE.SOSCENTRG = 0).
2. Confirm that the SubOSC is active (SOSCS.OSCCLKACT = 1).
3. Check that there is no clock domain for which the SubOSC is selected. If the SubOSC is selected for a clock domain, disable the setting or select a clock source other than the SubOSC.
4. Stop the SubOSC (SOSCE.SOSCDISTRG = 1).
5. Confirm that the SubOSC has been stopped (SOSCS.SOSCCLKACT = 0).

Note 2. Follow the procedure given below for starting the SubOSC by using SOSCDISTRG.

1. Confirm that the SubOSC is neither waiting for being enabled nor stopped (SOSCE.SOSCDISTRG = 0 and SOSCE.SOSCENTRG = 0).
2. Confirm that the SubOSC is inactive (SOSCS.OSCCLKACT = 0).
3. Start the SubOSC (SOSCE.SOSCENTRG = 1).
4. Confirm that the SubOSC has been started (SOSCS.SOSCCLKACT = 1).

Note 3. Starting and stopping the SubOSC at the same time by using the start and stop bits, i.e., by setting SOSCE.SOSCENTRG = 1 and SOSSCE.SOSCDISTRG = 1 at the same time is not allowed.

12.4.2.8 SOSCS — SubOSC Status Register

This register provides active status information about the SubOSC.

This register is initialized by the power-up reset signal PURES.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 1204$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1*1	0*1
	—	—	—	—	—	—	—	—	—	—	—	—	—	SOSCCLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12.9 SOSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	SOSCCLKACT	SubOSC Activation Status 0: SubOSC is inactive 1: SubOSC is active
1, 0	Reserved	When read, an undefined value is returned.

12.4.2.9 SOSCST — SubOSC Stabilization Time Register

This register determines the SubOSC stabilization time.

This register is initialized by the power-up reset signal PURES.

Access: This register can be read or written in 32-bit units.

Address: FFF8 120C$_H$

Value after reset: 010C 8E00$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SOSCCLKST[29:16]													
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	1	1	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SOSCCLKST[15:0]															
Value after reset	1	0	0	0	1	1	1	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 12.10 SOSCST Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29 to 0	SOSCCLKST [29:0]	The SOSCCLKST[29:0] bits specify the count value for the SubOSC stabilization time counter. • If the HS IntOSC is active (ROSCS.ROSCCLKACT = 1): Stabilization time = SOSCCLKST[29:0] / f_{RH} • If the HS IntOSC is inactive (ROSCS.ROSCCLKACT = 0): Stabilization time = SOSCCLKST[29:0] / f_{RL}

NOTE

See **Section 40, Electrical Characteristics** for information about the SubOSC stabilization time.

CAUTION

Set this register when SubOSC is stopped.

12.4.2.10 ROSCE — HS IntOSC Enable Register

This register is used to stop the HS IntOSC operation.

The correct write sequence using thePROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

CAUTION

Set the ROSCE.ROSCDISTRG bit only when the $\overline{\text{CLMA0RES}}$ has occurred. In other cases, setting this bit is prohibited.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ROSCDISTRG	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Table 12.11 ROSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ROSCDISTRG	HS IntOSC Disable Trigger ROSCSTPM.ROSCSTPMSK = 0 0: No function 1: Stops HS IntOSC ROSCSTPM.ROSCSTPMSK = 1 Setting prohibited
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

12.4.2.11 ROSCS — HS IntOSC Status Register

This register provides active status information about the HS IntOSC.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 1004_H

Value after reset: 0000 0007_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1*1	0*1
	—	—	—	—	—	—	—	—	—	—	—	—	—	ROSCCLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12.12 ROSCS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	ROSCCLKACT	HS IntOSC Active Status 0: HS IntOSC is inactive 1: HS IntOSC is active
1, 0	Reserved	When read, an undefined value is returned.

12.4.2.12 ROSCSTPM — HS IntOSC Stop Mask Register

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 1018_H

Value after reset: 0000 0002_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ROSCSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 12.13 ROSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ROSCSTPMSK	HS IntOSC Stop Request Mask 0: HS IntOSC stops operation in stand-by mode 1: HS IntOSC continues operation in stand-by mode Do not set the HS IntOSC disable trigger ROSCE.ROSCDISTRG to 1 while ROSCSTPMSK bit is set to 1.

12.4.2.13 PLLE — PLL Enable Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 9000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLLDIS TRG	PLLEN TRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12.14 PLLE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	PLLDISTRG	PLL Disable Trigger*1,*4 0: No function 1: Stops PLL This bit is automatically cleared to 0 by hardware after PLL is disabled.
0	PLLENTRG	PLL Enable Trigger*2,*3,*4 0: No function 1: Starts PLL This bit is automatically cleared to 0 by hardware after PLL is activated.

Note 1. Follow the procedure given below for stopping the PLL by using PLLDISTRG.

1. Confirm that the PLL is neither waiting for being enabled nor stopped (both PLLE.PLLDISTRG = 0 and PLLE.PLLENTRG = 0).
2. Confirm that the PLL is active (PLLS.PLLCLKACT = 1).
3. Check that there is no clock domain for which the PLL is selected. If the PLL is selected for a clock domain, disable the setting or select a clock source other than the PLL.
4. Stop the PLL (PLLE.PLLDISTRG = 1).
5. Confirm that the PLL has been stopped (PLLS.PLLCLKACT = 0).

Note 2. Before starting PLL using PLLENTRG, confirm that the PLL input clock (MainOSC or HS IntOSC, selected by the CKSC_PLLIS_CTL) is operating.

Note 3. Follow the procedure given below for starting the PLL by using PLLENTRG.

1. Confirm that the PLL is neither waiting for being enabled nor stopped (both PLLE.PLLDISTRG = 0 and PLLE.PLLENTRG = 0).
2. Confirm that the PLL is inactive (PLLS.PLLCLKACT = 0).
3. Start the PLL (PLLE.PLLENTRG = 1).
4. Confirm that the PLL has been started (PLLS.PLLCLKACT = 1).

Note 4. Starting and stopping the PLL at the same time by using the start and stop bits, i.e., by setting PLLE.PLLENTRG = 1 and PLLE.PLLDISTRG = 1 at the same time is not allowed.

12.4.2.14 PLLS — PLL Status Register

This register provides active status information about the PLL.

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 9004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1*1	0*1
	—	—	—	—	—	—	—	—	—	—	—	—	—	PLLCLKACT	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The values of bit 1 and 0 are undefined.
After masking bit 1 and 0, check only bit 2 to verify the status.

Table 12.15 PLLS Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	PLLCLKACT	PLL Active Status 0: PLL is inactive 1: PLL is active
1, 0	Reserved	When read, an undefined value is returned.

12.4.2.15 PLLC — PLL Control Register

This register is used to set the PLL VCO output clock frequency f_{VCOOUT}, shown in **Section 12.3.5.1, PLL Parameters**.

This register can only be written, if the PLL is disabled.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 9008_H

Value after reset: 0001 $133B_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	M[1:0]		—	—	—	—	—	N[5:0]					
Value after reset	0	0	0	1	0	0	1	1	0	0	1	1	1	0	1	1
R/W	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 12.16 PLLC Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12, 11	M[1:0]	Division ratio Mr is set. For M[1:0] settings, see **Table 12.17, PLL Output Table**.
10 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	N[5:0]	Division ratio Nr is set. For N[5:0] settings, see **Table 12.17, PLL Output Table**.

CAUTION

Set this register when PLL is stopped.

Table 12.17 PLL Output Table (1/3)

Table 12.17 PLL Output Table (3/3)

PLLCLKIN frequency $f_{PLLCLKIN}$ (MHz)	PLLC. M[1:0] (Mr)	PLLC. N[5:0] (Nr)	VCOOUT frequency f_{VCOOUT} (MHz)	CPLLOUT frequency $f_{CPLLOUT}$ (MHz)*1			PPLLOUT frequency $f_{PPLLOUT}$ (MHz)
				VCOOUT × 1/4 (PREMIUM, ADVANCED)	VCOOUT× 1/5 (PREMIUM, ADVANCED)	VCOOUT × 1/6 (PREMIUM, ADVANCED, ECO)	
8 (HS IntOSC)*2	00_B (Mr = 1)	$3B_H$ (Nr = 60)	480.0	N/A	N/A	80.0*2	80.0*2
		$3A_H$ (Nr = 59)	472.0	N/A	N/A	78.7*2	78.7*2
		39_H (Nr = 58)	464.0	N/A	N/A	77.3*2	77.3*2
		38_H (Nr = 57)	456.0	N/A	N/A	76.0*2	76.0*2
		37_H (Nr = 56)	448.0	N/A	N/A	74.7*2	74.7*2
		36_H (Nr = 55)	440.0	N/A	N/A	73.3*2	73.3*2
		35_H (Nr = 54)	432.0	N/A	N/A	72.0*2	72.0*2
		34_H (Nr = 53)	424.0	N/A	N/A	70.7*2	70.7*2
		33_H (Nr = 52)	416.0	N/A	N/A	69.3*2	69.3*2
		32_H (Nr = 51)	408.0	N/A	N/A	68.0*2	68.0*2
		31_H (Nr = 50)	400.0	N/A	N/A	66.7*2	66.7*2
		30_H (Nr = 49)	392.0	N/A	N/A	65.3*2	65.3*2
		$2F_H$ (Nr = 48)	384.0	N/A	N/A	64.0*2	64.0*2

Note 1. The CPLLOUT frequency is defined by CKSC_CPUCLKD_CTL.CPUCLKDPLL[1:0]. Refer to the CKSC_CPUCLKD_CTL register description.

Note 2. Typical frequencies. User calibration of HS IntOSC is required before setting HS IntOSC as PLLCLKIN.

12.4.2.16 PLL Input Clock Selection

(1) CKSC_PLLIS_CTL — PLL Input Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register can only be written, if the PLL is disabled.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A700$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLLISCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12.18 CKSC_PLLIS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PLLISCSID [1:0]	Source Clock Setting for PLL input clock 01_B: MainOSC (Default) 10_B: HS IntOSC*1 Other than above: Setting prohibited

Note 1. The maximum frequency of CPLLOUT and PPLLOUT is limited when the HS IntOSC is selected as the PLL input clock.

CAUTION

Set this register when PLL is stopped.

(2) CKSC_PLLIS_ACT — PLL Input Clock Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A708$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12.19 CKSC_PLLIS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PLLISACT[1:0]	Source clock for currently active PLL input clock

12.4.2.17 PPLLCLK Source Clock Selection

(1) CKSC_PPLLCLKS_CTL — PPLLCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A010$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12.20 CKSC_PPLLCLKS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	PPLLCLKSCSID [1:0]	Source Clock Setting for PPLLCLK 00_B: Setting prohibited 01_B: EMCLK (default) 10_B: MainOSC 11_B: PPLLOUT

(2) CKSC_PPLLCLKS_ACT — PPLLCLK Source Clock Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A018$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPLLCLKSACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12.21 CKSC_PPLLCLKS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	PPLLCLKSACT [1:0]	Source clock for currently active PPLLCLK*[1]

Note 1. The data read from this register is 00_B if the selected source clock for all of the following clock domains is other than PPLLCLK (or PPLLCLK2):
C_ISO_PERI1, C_ISO_PERI2, C_ISO_LIN, C_ISO_ADCA, C_ISO_CAN, C_ISO_CSI, C_ISO_IIC

12.4.2.18 ROSCUT — HS IntOSC User Trimming Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by the power-up reset signal PURES and $\overline{\text{CLMA0RES}}$.

Access: This register can be read or written in 32-bit units.

Address: FFF8 101C$_H$

Value after reset: 0000 0XXX$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	FADJUST[8:0]								
Value after reset	0	0	0	0	0	0	0	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 12.22 ROSCUT Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	FADJUST[8:0]	Frequency Adjustment parameters of HS IntOSC. The value after reset of this register is pre-set value of HS IntOSC trimming data. Overwrite this register with “read value + 1” or “read value – 1” until the HS IntOSC frequency becomes target frequency range.

12.4.3 Clock Selector Control Register

12.4.3.1 WDTA0 Clock Domain C_AWO_WDTA

(1) CKSC_AWDTAD_CTL — C_AWO_WDTA Clock Divider Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2000$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12.23 CKSC_AWDTAD_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	AWDTADCSID [1:0]	Clock Divider Setting for C_AWO_WDTA 00_B: Setting prohibited 01_B: LS IntOSC / 128 (default) 10_B: LS IntOSC / 1 11_B: Setting prohibited

CAUTION

Confirm that CKSC_AWDTAD_CTL is CKSC_AWDTAD_ACT before setting the CKSC_AWDTAD_CTL register.

(2) CKSC_AWDTAD_ACT — C_AWO_WDTA Clock Divider Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2008$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADACT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0*1	0*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The value in the inactive state. When the value becomes 01$_B$ after entering the active state.

Table 12.24 CKSC_AWDTAD_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	AWDTADACT [1:0]	Clock divider for currently active C_AWO_WDTA

(3) CKSC_AWDTAD_STPM — C_AWO_WDTA Stop Mask Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2018$_H$

Value after reset: 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AWDTADSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12.25 CKSC_AWDTAD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AWDTAD STPMSK*1	0: Clock domain C_AWO_WDTA is stopped in stand-by mode. 1: Clock domain C_AWO_WDTA is not stopped in stand-by mode.

Note 1. The mode transition time can be optimized by setting 1 to this bit.

12.4.3.2 TAUJ Clock Domain C_AWO_TAUJ

(1) CKSC_ATAUJS_CTL — C_AWO_TAUJ Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2100_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ATAUJSCSID[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 12.26 CKSC_ATAUJS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	ATAUJSCSID [2:0]	Source Clock Setting for C_AWO_TAUJ*1 000_B: Disabled 001_B: HS IntOSC (default) 010_B: MainOSC 011_B: LS IntOSC 100_B: PPLLCLK2 Other than above: Setting prohibited

Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK2.

(2) CKSC_ATAUJS_ACT — C_AWO_TAUJ Source Clock Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2108$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12.30 CKSC_ATAUJD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ATAUJD STPMSK	0: Clock domain C_AWO_TAUJ is stopped in stand-by mode. 1: Clock domain C_AWO_TAUJ is not stopped in stand-by mode.

12.4.3.3 RTCA Clock Domain C_AWO_RTCA

(1) CKSC_ARTCAS_CTL — C_AWO_RTCA Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by a power-up reset PURES.

Access: This register can be read or written in 32-bit units.

Address: FFF8 2300$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12.31 CKSC_ARTCAS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	ARTCASCSID [1:0]	Source Clock Setting for C_AWO_RTCA 00_B: Disable (default) 01_B: SubOSC*1 10_B: MainOSC*2 11_B: LS IntOSC

Note 1. Supported only by the 144 pin and 176 pin products.

Note 2. To avoid supplying a clock signal equal to or higher than 4 MHz to the C_AWO_RTCA clock domain, check that CKSC_ARTCAD_ACT = 0000 0000$_H$ (disabled) before setting CKSC_ARTCAS_CTL to 10_B (MainOSC).

(2) CKSC_ARTCAS_ACT — C_AWO_RTCA Source Clock Active Register

This register is initialized by a power-up reset PURES.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2308$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARTCADSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12.35 CKSC_ARTCAD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ARTCAD STPMSK	0: Clock domain C_AWO_RTCA is stopped in stand-by mode. 1: Clock domain C_AWO_RTCA is not stopped in stand-by mode.

12.4.3.4 ADCA0 Clock Domain C_AWO_ADCA

(1) CKSC_AADCAS_CTL — C_AWO_ADCA Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2500_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AADCASCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12.36 CKSC_AADCAS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	AADCASCSID [1:0]	Source Clock Setting for C_AWO_ADCA*1 00_B: Disabled 01_B: HS IntOSC (default) 10_B: MainOSC 11_B: PPLLCLK2

Note 1. Before transitioning to stand-by mode, select a source clock other than PPLLCLK2.

(2) CKSC_AADCAS_ACT — C_AWO_ADCA Source Clock Active Register

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2508$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12.40 CKSC_AADCAD_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AADCAD STPMSK	0: Clock domain C_AWO_ADCA is stopped in stand-by mode. 1: Clock domain C_AWO_ADCA is not stopped in stand-by mode.

12.4.3.5 FOUT Clock Domain C_AWO_FOUT

(1) CKSC_AFOUTS_CTL — C_AWO_FOUT Source Clock Selection Register

The correct write sequence using the PROTCMD0 register is required in order to update this register For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2700$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12.43 CKSC_AFOUTS_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AFOUTS STPMSK	0: Clock domain C_AWO_FOUT is stopped in stand-by mode. 1: Clock domain C_AWO_FOUT is not stopped in stand-by mode.

12.4.3.6 CPU Clock Domain C_ISO_CPUCLK

(1) CKSC_CPUCLKS_CTL — C_ISO_CPUCLK Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A000$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12.44 CKSC_CPUCLKS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	CPUCLKSCSID [1:0]	Source Clock Setting for C_ISO_CPUCLK 00_B: Setting prohibited 01_B: EMCLK (default) 10_B: MainOSC 11_B: CPLLOUT

CAUTION

The clock source selected for the C_ISO_CPUCLK clock domain should not be stopped by software.

(2) CKSC_CPUCLKS_ACT — C_ISO_CPUCLK Source Clock Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A008$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12.45 CKSC_CPUCLKS_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	CPUCLKSACT [1:0]	Source clock for currently active C_ISO_CPUCLK

(3) CKSC_CPUCLKD_CTL — C_ISO_CPUCLK Clock Divider Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 $A100_H$

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 12.47 CKSC_CPUCLKD_ACT Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned.
4, 3	CPUCLKDPLLACT[1:0]	Clock divider for currently active CPLLDIV.
2 to 0	CPUCLKDACT[2:0]	Clock divider for currently active C_ISO_CPUCLK

12.4.3.7 Peripheral Clock Domains C_ISO_PERI1 and C_ISO_PERI2

(1) CKSC_IPERI1S_CTL — C_ISO_PERI1 Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 $A200_H$

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 12.51 CKSC_IPERI2S_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	IPERI2SACT [1:0]	Source clock for currently active C_ISO_PERI2

12.4.3.8 RLIN Clock Domains C_ISO_LIN

(1) CKSC_ILINS_CTL — C_ISO_LIN Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A400$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12.54 CKSC_ILIND_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	ILINDCSID[1:0]	Clock Divider Setting for C_ISO_LIN 00_B: Setting prohibited 01_B: CKSC_ILINS_CTL selection /1 (default) 10_B: CKSC_ILINS_CTL selection /4 11_B: CKSC_ILINS_CTL selection /8

NOTE

The setting of this register is only applicable to RLIN30. The settings 10_B (CKSC_ILINS_CTL selection / 4) and 11_B (CKSC_ILINS_CTL selection /8) are only available in UART mode.

(4) CKSC_ILIND_ACT — C_ISO_LIN Clock Divider Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A808$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 12.55 CKSC_ILIND_ACT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	ILINDACT[1:0]	Clock divider for currently active C_ISO_LIN

(5) CKSC_ILIND_STPM — C_ISO_LIN Stop Mask Register

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A818$_H$

Value after reset: 0000 0002$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILIND STP MSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

CAUTION

Do not change the “1” value after reset of bit 1.

Table 12.56 CKSC_ILIND_STPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ILINDSTPMSK	0: Clock domain C_ISO_LIN is stopped in stand-by mode. 1: Clock domain C_ISO_LIN is not stopped in stand-by mode.

12.4.3.9 ADCA1 Clock Domain C_ISO_ADCA

(1) CKSC_IADCAS_CTL — C_ISO_ADCA Source Clock Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 $A500_H$

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IADCASCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 12.57 CKSC_IADCAS_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	IADCASCSID [1:0]	Source Clock Setting for C_ISO_ADCA 00_B: Disabled 01_B: HS IntOSC (default) 10_B: MainOSC 11_B: PPLLCLK2

CAUTION

The CKSC_IADCAS_CTL register and the CKSC_IADCAD_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of “(1) / (2) = 2 to 4.8”.

(1) Frequency [MHz] specified by the C_ISO_CPUCLK source clock selection register (CKSC_CPUCLKS_CTL) and C_ISO_CPUCLK clock divider selection register (CKSC_CPUCLKD_CTL)

(2) Frequency [MHz] specified by the C_ISO_ADCA source clock selection register (CKSC_IADCAS_CTL) and the C_ISO_ADCA clock divider selection register (CKSC_IADCAD_CTL)

(2) CKSC_IADCAS_ACT — C_ISO_ADCA Source Clock Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A508$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

1, 0	IADCASACT [1:0]	Source clock for currently active C_ISO_ADCA

(3) CKSC_IADCAD_CTL — C_ISO_ADCA Clock Divider Selection Register

The correct write sequence using the PROTCMD1 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources (ISORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 A600$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 12.59 CKSC_IADCAD_CTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	IADCADCSID [1:0]	Clock Divider Setting for C_ISO_ADCA 00_B: Setting prohibited 01_B: CKSC_IADCAS_CTL selection /1 (default) 10_B: CKSC_IADCAS_CTL selection /2*1 11_B: Setting prohibited

Note 1. Make sure that the frequency of CKSC_IADCA is no less than 8 MHz after division by 2.

CAUTION

The CKSC_IADCAS_CTL register and the CKSC_IADCAD_CTL register must be set so that the relationship between frequency (1) and (2) is retained within the range of "(1) / (2) = 2 to 4.8".

(1) Frequency [MHz] specified by the C_ISO_CPUCLK source clock selection register (CKSC_CPUCLKS_CTL) and C_ISO_CPUCLK clock divider selection register (CKSC_CPUCLKD_CTL)

(2) Frequency [MHz] specified by the C_ISO_ADCA source clock selection register (CKSC_IADCAS_CTL) and the C_ISO_ADCA clock divider selection register (CKSC_IADCAD_CTL)

(4) CKSC_IADCAD_ACT — C_ISO_ADCA Clock Divider Active Register

This register is initialized by all reset sources (ISORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 A608$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1, 0	IIICSACT[1:0]	Source clock for currently active C_ISO_IIC

12.5 Clock Domain Setting Method

12.5.1 Clock Domain Setting

12.5.1.1 Overview of Clock Selector Register

The clock selector for a clock domain C_AWO_<name>/C_ISO_<name> can be controlled by the following registers:

- Source clock selection registers
  These registers select the clock to be used as the domain clock from the available source clocks.
  - AWO source clock selection: CKSC_A<name>S_CTL
  - ISO source clock selection: CKSC_I<name>S_CTL
- Clock divider selection registers
  These registers specify the clock division ratio for the selected source clock.
  - AWO clock divider: CKSC_A<name>D_CTL
  - ISO clock divider: CKSC_I<name>D_CTL
- Source clock active registers and clock divider active registers
  These registers return the currently active source clock selection and division ratio, respectively.
  - AWO source clock active register/clock divider active register: CKSC_A<name>S_ACT/ CKSC_A<name>D_ACT
  - ISO source clock active register/clock divider active register: CKSC_I<name>S_ACT/ CKSC_I<name>D_ACT

NOTE

- Not all clock selectors provide all the control functions described above.
- The symbol “I”, which indicates the power domain, is not added to the names of registers within clock domain C_ISO_CPUCLK.

12.5.1.2 Setting Procedure for Clock Domain

Procedure of setting up clock domain is described as below:

1. Set up a source clock
   - Select a source clock. (CKSC_A<name>S_CTL, CKSC_I<name>S_CTL)
   - Confirm completion of selection. (CKSC_A<name>S_ACT, CKSC_I<name>S_ACT)*1
2. Setting a clock divider
   - Select a clock divider. (CKSC_A<name>D_CTL, CKSC_I<name>D_CTL)
   - Confirm completion of selection. (CKSC_A<name>D_ACT, CKSC_I<name>D_ACT)*2

Note 1. Continue processing after CKSC_A<name>S_ACT and CKSC_I<name>S_ACT are updated with the new values written to CKSC_A<name>S_CTL and CKSC_I<name>S_CTL.

Note 2. Continue processing after CKSC_A<name>D_ACT and CKSC_I<name>D_ACT are updated with the new values written to CKSC_A<name>D_CTL and CKSC_I<name>D_CTL.

CAUTION

The source clock to be selected must be operating before performing these settings.

The behavior and performance are not guaranteed if setup is performed while the source clock is stopped.

Access to a peripheral module is prohibited while the clock is not supplied to the module.

12.5.2 Stopping the Clock in Stand-by Mode

In stand-by mode (STOP mode, DeepSTOP mode, and Cyclic STOP mode), clock domain C_AWO_<name>/C_ISO_<name> can be configured to stop or continue its clock CKSCLK_A<name>/CKSCLK_I<name> in response to clock stop requests from the stand-by controller.

The clock stop mask registers are used to determine the operation status of the clock in stand-by mode:

- CKSC_A<name>_STPM.A<name>STPMSK/CKSC_I<name>_STPM.I<name>STPMSK = 0:
  The STOP request signal is not masked, so the domain clock CKSCLK_A<name>/CKSCLK_I<name> is stopped during stand-by mode.
  If the domain clock was in operation before transition to stand-by mode, it is automatically re-started after wake-up from stand-by mode.
  If there is another clock domain for which the same source clock is selected and its stop mask setting is set to 1 (CKSC_A<name>_STPM.A<name>STPMSK/CKSC_I<name>_STPM.I<name>STPMSK=1), the source clock will continue operation in stand-by mode.
  The CPU clock domain C_ISO_CPUCLK is always stopped in stand-by mode.
- CKSC_A<name>_STPM.A<name>STPMSK/CKSC_I<name>_STPM.I<name>STPMSK = 1:
  The STOP request signal is masked, so CKSCLK_A<name>/CKSCLK_I<name> continues to operate during stand-by.
  The source clock selected for the target clock domain will also continue to operate in stand-by mode.
  Supply of a clock signal to the clock domains in the Isolated area will be stopped in DeepSTOP mode.

12.5.3 Clock Domain Settings

The following table shows a selectable source clock, a frequency division ratio, and a register to be used for each clock domain.

Table 12.71 List of Selectable Clocks (1/2)

Clock Domain	Clock Name	Selectable Register		Frequency Divided Register		Maximum Frequency	Applicable Unit
C_AWO_WDTA	CKSCLK_AWDTA	—	**LS IntOSC**	CKSC_AWDTAD_CTL	1/1	240 kHz	WDTA0

C_ISO_IIC	CKSCLK_IIIC	CKSC_IIICS_CTL	**PPLLCLK2**	—	**1/1**	40 MHz	RIICn
			Disable				

Note: The items written in **bold** are the initial setting clocks for each register.

Note 1. Supported only by 144 pin and 176 pin products.

Note 2. These settings are only supported by ADVANCED/PREMIUM products.

Note 3. Operation at 120MHz/96MHz is only supported by ADVANCED/PREMIUM products.

Note 4. The setting of this register only applies to RLIN30. The settings 1/4 and 1/8 are only available in UART mode.

Note 5. CKSC_CPUCLKS_CTL selects selection of MainOSC, CPLLOUT and EMCLK.
CKSC_CPUCLKD_CTL.CPUCLKDPLL[1:0] selects CPLLOUT clock frequency.

CAUTION

To stop the clock source selected for the clock domain before transitioning to STOP/DeepSTOP mode, select “Disable” for that clock domain in advance. Do not stop the source clock of a clock domain for which “Disable” cannot be selected while functions are operating on that clock domain. To stop the clock source selected for the domain by transitioning to STOP/DeepSTOP mode, “Disable” does not need to be selected. Instead of setting “Disable”, select “Stop” for the clock domain in stand-by mode by using the stop mask register.

12.6 Frequency Output Function (FOUT)

The frequency output function (FOUT) allows the clock to be output the clock as the external signal. Furthermore, the frequency can be divided by the clock divider before it is output.

12.6.1 Functional Overview

Figure 12.9 shows the configuration of the frequency output function.

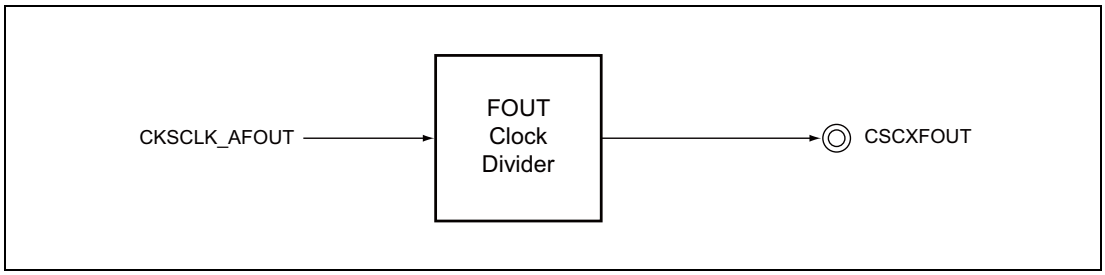

Figure 12.9 Frequency Output Function

The clock output function outputs the CKSCLK_AFOUT clock divided by 1 to 63 through the clock divider from CSCXFOUT. Division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register. Clock output frequency $f_{CSCXFOUT}$ is expressed by the following equation.

$$f_{CSCXFOUT} = (\text{CKSCLK_AFOUT clock frequency}) / N$$

Clock output starts when, after CKSCLK_AFOUT is set and the clock output for the pin function is selected, division ratio N is set to the FOUTDIV[5:0] bits in the FOUTDIV register.

When a new division ratio is written to the FOUTDIV.FOUTDIV[5:0] bits, it becomes effective in synchronization with the CSCXFOUT output clock. Accordingly, the division ratio can be changed even while the CSCXFOUT clock is operating. The clock output is stopped by writing 000_H to the FOUTDIV[5:0] bits.

12.6.2 Clock Supply

The clock supply to the CSCXFOUT is shown in the following table.

Table 12.72 Clock Supply

Module	Unit Clock Name	Supply Clock Name	Description
CSCXFOUT	PCLK	CPUCLK4	Bus clock (Register access)
	CKSCLK_AFOUT	CKSCLK_AFOUT	Clock source of FOUT clock divider

12.6.3 Registers

12.6.3.1 List of Registers

The FOUT registers are listed in the following table.

Table 12.73 Register of the CSCXFOUT Clock Divider

Module Name	Register Name	Symbol	Address
CLKCTL	Clock divider register	FOUTDIV	FFF8 2800_H
	Clock divider status register	FOUTSTAT	FFF8 2804_H

12.6.3.2 FOUTDIV — Clock Division Ratio Register

This register defines the clock divisor.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 2800$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	FOUTDIV[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 12.74 FOUTDIV Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	FOUTDIV[5:0]	Clock Divider N 00_H: Clock output is stopped 01_H: N = 1 02_H: N = 2 ... $3E_H$: N = 62 $3F_H$: N = 63

12.6.3.3 FOUTSTAT — Clock Divider Status Register

This register indicates the clock output status.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 2804$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FOUTCLKACT	FOUTSYNC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12.75 FOUTSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	FOUTCLKACT	Clock Divider Active 0: Frequency output is stopped. 1: Frequency output is ongoing.
0	FOUTSYNC	Clock Divider Synchronized 0: The clock divider is in the process of synchronization. 1: The clock divider is stable (or stopped).

Section 13 Clock Monitor (CLMA)

This section describes clock monitor (CLMA).

The first section describes the attributes specific to the RH850/F1K microcontrollers, including the number of channels, register base addresses, and input/output signal names. The ensuing sections describe the functions relevant to all operations.

13.1 Features of RH850/F1K CLMA

13.1.1 Number of Channels

The RH850/F1K microcontrollers incorporate CLMA with the following number of channels.

Table 13.1 Number of Channels

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of channels		3	
Name		CLMA0, CLMA1, CLMA2	

13.1.2 Register Base Addresses

The CLMA base addresses are listed in the following table.

The CLMA register addresses are expressed as an offset of the base address.

Table 13.2 Register Base Addresses

Base Address Name	Base Address
<CLMA0_base>	FFF8 $C000_H$
<CLMA1_base>	FFF8 $D000_H$
<CLMA2_base>	FFF8 $E000_H$

13.1.3 Clock Supply to CLMA

The clocks monitored by CLMA and the CLMA sampling clocks are indicated below.

Table 13.3 Clock Supply

Channel Name	Unit Clock Name	Supply Clock Name
CLMA0	CLMATMON (monitored clock)	HS IntOSC
	CLMATSMP (sampling clock)	LS IntOSC
	Register access clock	CPUCLK4
CLMA1	CLMATMON (monitored clock)	MainOSC
	CLMATSMP (sampling clock)	LS IntOSC
	Register access clock	CPUCLK4
CLMA2	CLMATMON (monitored clock)	PPLLOUT
	CLMATSMP (sampling clock)	HS IntOSC
	Register access clock	CPUCLK4

13.1.4 Reset Sources

The reset sources of the CLMA are listed in the following table. The CLMA are initialized by these reset sources.

Table 13.4 Reset Sources

Channel Name	Reset Source
CLMA0	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA1	Reset sources other than transition to DeepSTOP mode (AWORES)
CLMA2	All reset sources (ISORES)
Common Registers (CLMATEST, CLMATESTS)	Power-up reset PURES (power-on-clear or debugger reset)

13.1.5 Internal Input/Output Signals

The internal input/output signals of CLMA are listed in the following table.

Table 13.5 Internal Input/Output Signals

Unit Signal Name	Description	Connection
$\overline{\text{CLMATRES}}$	CLMA0 error reset output	Reset controller ($\overline{\text{CLMA0RES}}$)
$\overline{\text{CLMATRES}}$	CLMA1 error reset output	Reset controller ($\overline{\text{CLMA1RES}}$)
$\overline{\text{CLMATRES}}$	CLMA2 error reset output	Reset controller ($\overline{\text{CLMA2RES}}$)

13.2 Overview

13.2.1 Functional Overview

Clock monitor CLMA detects frequency abnormalities in the monitored clock. It uses sampling clock CLMATSMP to monitor whether the frequency of input clock CLMATMON is within a specific range. Upon detection of an abnormal clock, it outputs a reset request signal.

The main components of the clock monitor are shown in **Figure 13.1**.

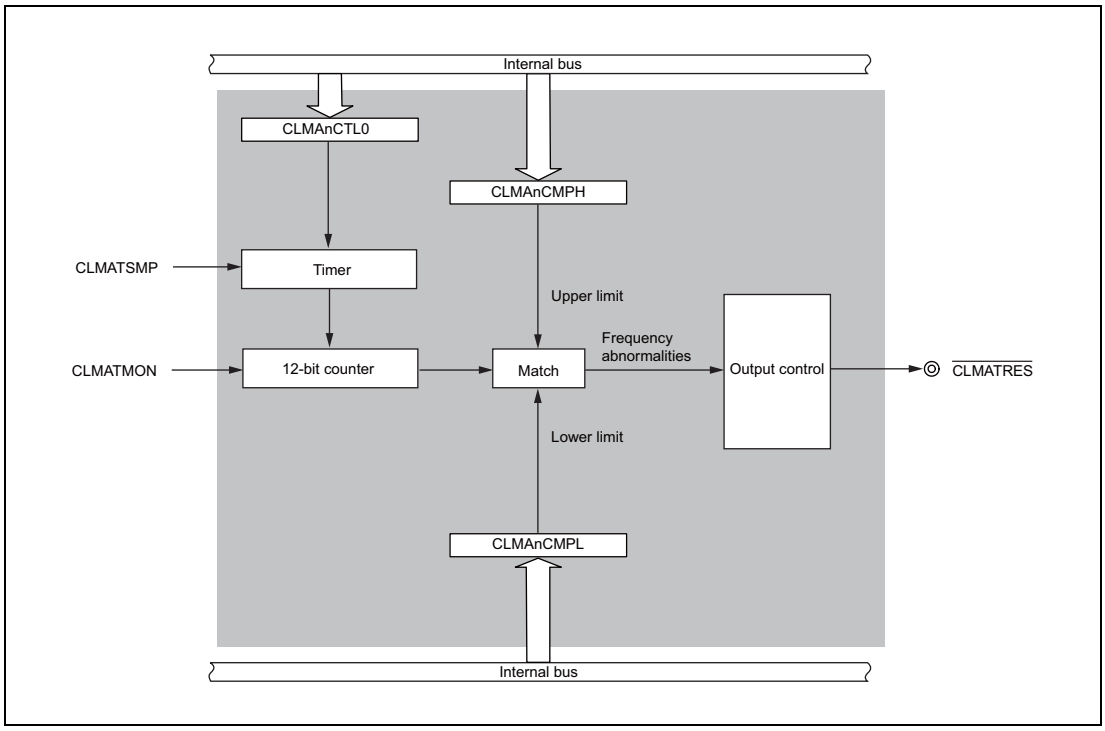

Figure 13.1 Block Diagram of the Clock Monitor

NOTE

Once enabled, only a reset can disable the CLMAn.

13.3 Enabling CLMA

Clock monitoring is started by the clock monitor when CLMAnCTL0.CLMAnCLME = 1.

When the monitored clock is stopped by a register operation or transition to stand-by mode, the corresponding clock monitor is automatically disabled. After the monitored clock starts oscillation again and becomes stable, the clock monitor also starts operation.

Since CLMA2 is initialized on return from DeepSTOP, the CLMA2 register must be set again before further operation is started.

13.4 Functions

13.4.1 Detection of Abnormal Clock Frequencies

Detection Method

1. CLMAn counts the rising edges of the monitored clock CLMATMON within 16 cycles of the sampling clock CLMATSMP and then compares the counter value with the specified thresholds:
   - CLMAnCMPL.CLMAnCMPL[11:0] defines the lower threshold.
   - CLMAnCMPH.CLMAnCMPH[11:0] defines the upper threshold.
2. When CLMATMON frequency*1 is lower than the limit, the counter falls below CLMAnCMPL.CLMAnCMPL[11:0].
3. When the frequency of CLMATMON is higher than the limit, the counter exceeds CLMAnCMPH.CLMAnCMPH[11:0].

Note 1. There is a case that the abnormal state is not detected when the monitor clock completely stops.

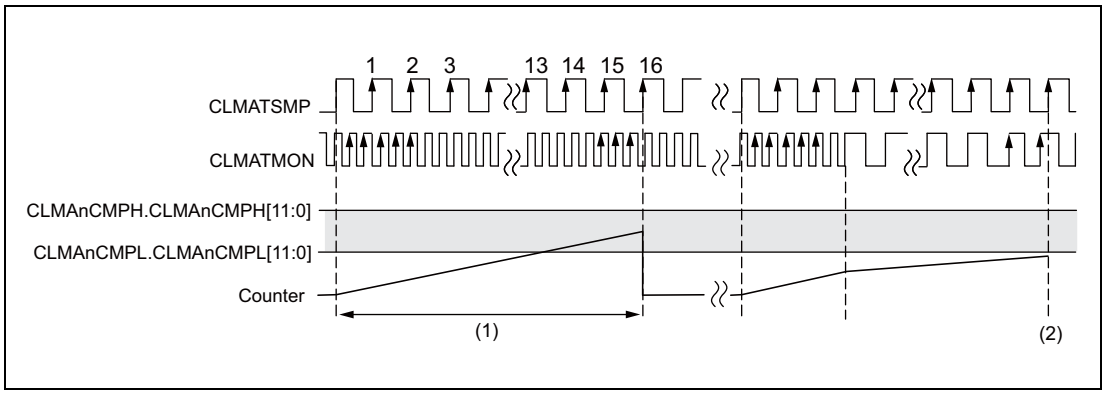

Figure 13.2 Example: $f_{CLMATMON}$ is Lower than the Specified Limit

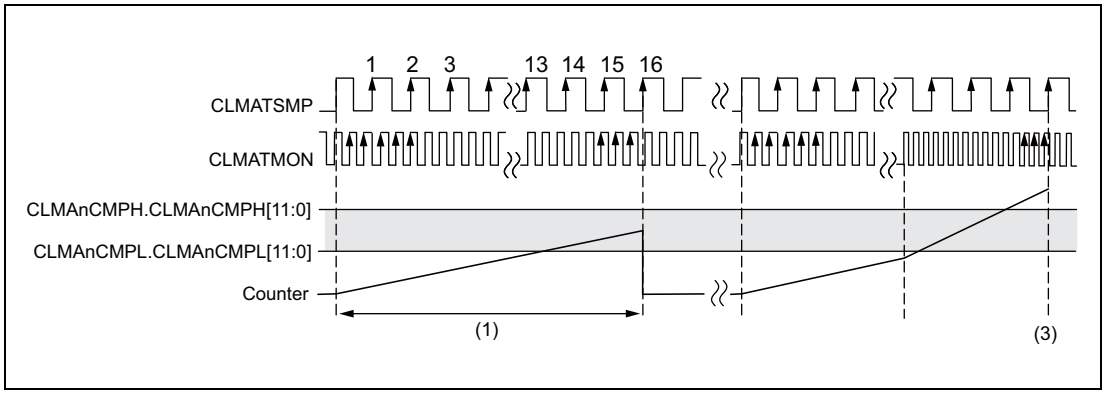

Figure 13.3 Example: $f_{CLMATMON}$ is Higher than the Specified Limit

NOTE

Even if $f_{CLMATMON}$ exceeds or falls below the specified limits during a sampling interval, the counter might be within the valid range.

Abnormal $f_{CLMATMON}$ is detected after one sampling interval.

(1) Calculation method of the thresholds CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]

The compare registers CLMAnCMPL and CLMAnCMPH are configured with the minimum and maximum number of clock cycles of CLMATMON that are assumed to be valid within 16 cycles of the sampling clock CLMATSMP.

The expected number of clock cycles is denoted by N.

$$\frac{16}{f_{CLMATSMP}} = \frac{N}{f_{CLMATMON}}$$

$$N = \frac{f_{CLMATMON}}{f_{CLMATSMP}} \times 16$$

Considering the allowed frequency deviations of CLMATMON and CLMATSMP, the threshold values can be calculated by the following formulas:

$$\text{Lower threshold} = N_{min} = \frac{f_{CLMATMON(dmin)}}{f_{CLMATSMP(max)}} \times 16 - 1$$

$$\text{Upper threshold} = N_{max} = \frac{f_{CLMATMON(max)}}{f_{CLMATSMP(min)}} \times 16 + 1$$

NOTE

The jitter of the PLL is covered by “+1” and “–1” in the formulas.

Example:

When $f_{CLMATSMP}$ = 240 kHz (±8%) and $f_{CLMATMON}$ = 16 MHz (±5%), the recommended threshold values are as follows:

N_{min} = 15,200 / 259.2 × 16 – 1
= 937.27
CLMAnCMPL = 937 = $03A9_H$

N_{max} = 16,800 / 220.8 × 16 + 1
= 1218.39
CLMAnCMPH = 1219 = $04C3_H$

Minimum thresholds

The following restrictions must be taken into account:

- CLMAnCMPL ≥ 0001_H
- CLMAnCMPH ≥ CLMAnCMPL + 0003_H

(2) Definition of the initial value input to the threshold registers

The reset values of the threshold registers are set so that the maximum frequency deviation of the monitored clock is allowed:

- CLMAnCMPL[11:0] = 001_H
- CLMAnCMPH[11:0] = $3FF_H$

13.4.2 Notification of Abnormal Clock Frequency

If $f_{CLMATMON}$ exceeds the upper threshold or falls below the lower threshold, this is indicated as follows:

1. The reset request signal $\overline{\text{CLMATRES}}$ is set to low level.
2. The system reset (AWORES or ISORES) is generated and CLMAn is reset.

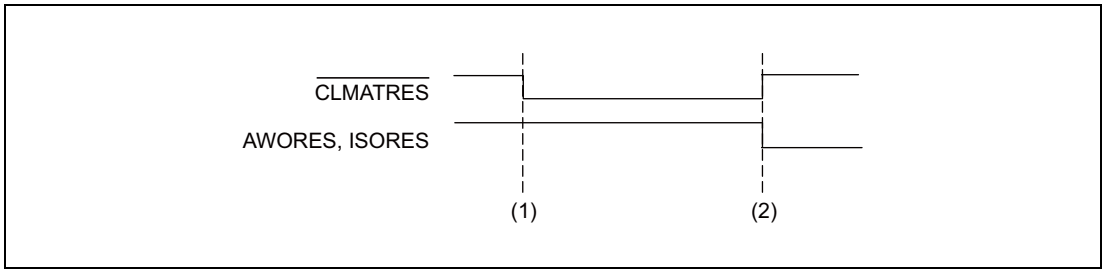

Figure 13.4 Error Request Signal Output if $f_{CLMATMON}$ Exceeds Upper Threshold

CAUTION

For usage notes for CLMAn abnormality detection, see Section 13.6, Usage Notes for CLMAn.

13.5 Registers

13.5.1 List of Registers

The following table lists the CLMA registers.

<CLMAn_base> is defined in **Section 13.1.2, Register Base Addresses**.

Table 13.6 List of Clock Monitor Registers

Module Name	Register Name	Symbol	Address
CLMAn	CLMAn control register 0	CLMAnCTL0	<CLMAn_base> + 00_H
	CLMAn compare register L	CLMAnCMPL	<CLMAn_base> + 08_H
	CLMAn compare register H	CLMAnCMPH	<CLMAn_base> + $0C_H$
	CLMA test register	CLMATEST	FFF8 $C100_H$
	CLMA test status register	CLMATESTS	FFF8 $C104_H$
	CLMAn emulation register 0	CLMAnEMU0	<CLMAn_base> + 18_H

13.5.2 CLMAnCTL0 — CLMAn Control Register 0

This register enables the clock monitor CLMAn.

The correct write sequence using the CLMAnPCMD register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 8-bit units.

Address: <CLMAn_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAnCLME
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 13.7 CLMAnCTL0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CLMAnCLME	Enables or disables the clock monitor. 0: CLMAn is disabled. 1: CLMAn is enabled.

CAUTION

After the CLMAnCTL0.CLMAnCLME bit is set to 1, writing 0 to this bit is ignored. The only condition for clearing the bit is a reset (AWORES, ISORES). In addition, the bit is cleared when the CLMATEST.RESCLM bit is set to 1 during self-test of CLMAn.

13.5.3 CLMAnCMPH — CLMAn Compare Register H

This register specifies the upper limit of frequency.

It can only be written when CLMAn is disabled (CLMAnCTL0.CLMAnCLME = 0).

For details, see **Section 13.4.1 (1) Calculation method of the thresholds CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]**.

Access: This register can be read or written in 16-bit units.

Address: <CLMAn_base> + $0C_H$

Value after reset: $03FF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPH[11:0]											
Value after reset	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.8 CLMAnCMPH Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CLMAnCMPH [11:0]	Specifies the upper threshold. • The recommended value is $f_{CLMATMON\ (max)}$ / $f_{CLMATSMP\ (min)}$ × 16 +1. • The minimum value is CLMAnCMPL + 0003_H.

13.5.4 CLMAnCMPL — CLMAn Compare Register L

This register specifies the lower limit of frequency.
It can only be written when CLMAn is disabled (CLMAnCTL0.CLMAnCLME = 0).

For details, see **Section 13.4.1 (1) Calculation method of the thresholds CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]**.

Access: This register can be read or written in 16-bit units.

Address: <CLMAn_base> + 08_H

Value after reset: 0001_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPL[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.9 CLMAnCMPL Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CLMAnCMPL [11:0]	Specifies the lower threshold. • The recommended value is $f_{CLMATMON\ (min)}$ / $f_{CLMATSMP\ (max)}$ × 16 – 1 • The minimum value is 0001_H.

13.5.5 CLMATEST — CLMA Test Register

This register is used to control self-test of CLMA0, CLMA1, and CLMA2.

The correct write sequence using the PROTCMDCLMA register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

Access: This register can be read or written in 32-bit units.

Address: FFF8 C100$_H$

Value after reset: 0000 0000$_H$ This register is initialized by a power-up reset PURES (power-on-clear or debugger reset).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 13.10 CLMATEST Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CLMA2TESEN	CLMA2 Self-Test Enable/Disable 0: Test disabled 1: Test enabled
4	CLMA1TESEN	CLMA1 Self-Test Enable/Disable 0: Test disabled 1: Test enabled
3	CLMA0TESEN	CLMA0 Self-Test Enable/Disable 0: Test disabled 1: Test enabled
2	ERRMSK	CLMA Test Error Mask Setting Masks a reset request to the reset controller when CLMAn detects an error. When the ERRMSK is set for CLMAn, that CLMAn does not issue a reset request to the reset controller even if it detects an error. The ERRMSK setting is valid only for the CLMAn for which CLMAnTESEN bit is set to 1. 0: Reset request signal generation enabled 1: Reset request signal generation disabled (masked)
1	MONCLKMSK	Monitor Clock Mask Setting Fixes the clock input to the CLMAn to low level. The MONCLKMSK setting is valid only for the CLMAn for which CLMAnTESEN bit is set to 1. 0: Monitor clock enabled 1: Monitor clock disabled (masked)
0	RESCLM	CLMAn Test Reset Signal Control Initializes CLMAn forcibly. The RESCLM setting is valid only for the CLMAn for which CLMAnTESEN bit is set to 1. 0: Reset released 1: Reset executed

13.5.6 CLMATESTS — CLMA Test Status Register

This register is used to confirm the self-test result of CLMA0, CLMA1, and CLMA2.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFF8 C104$_H$

Value after reset: 0000 0000$_H$ This register is initialized by a power-up reset PURES (power-on-clear or debugger reset).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

13.5.7 CLMAnEMU0 — CLMAn Emulation Register 0

This register is used to set pseudo flags for emulation.

This register can be accessed only during break by debugger and is reset by break release.

Access: This register can be read or written in 8-bit units.

Address: <CLMAn_base> + 18_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLMAnSLFST	CLMAnSLSLW
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 13.12 CLMAnEMU0 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CLMAnSLFST	Specifies whether $f_{CLMATMON}$ is assumed to be high. 0: CLMATMON is assumed to be within the normal frequency range 1: CLMATMON is assumed to exceed the upper threshold.
0	CLMAnSLSLW	Specifies whether $f_{CLMATMON}$ is assumed to be low. 0: CLMATMON is assumed to be within the normal frequency range 1: CLMATMON is assumed to fall below the lower threshold.

CAUTION

It is prohibited to emulate a low and high CLMATMON at the same time. Thus CLMAnEMU0 must not be set to 03_H.

13.6 Usage Notes for CLMAn

Do not use a clock for which the CLMAn bit indicates an abnormality. The behavior and performance are not guaranteed if such a clock is used. When CLMA0 detects clock abnormality, modifying the clock domain settings is prohibited.

Table 13.13 provides usage notes for each CLMAn.

Table 13.13 Usage Notes for CLMAn

Monitor Clock	CPU Clock after CLMA Reset Release	Note
HS IntOSC (CLMA0)	EMCLK*1	Set ROSCE.ROSCDISTRG to 1.*1 Do not set the control registers of the MainOSC and the PLL. After $\overline{\text{CLMA0RES}}$ occurs, modifying any of the clock domain settings is prohibited.
MainOSC (CLMA1)	EMCLK (= HS IntOSC)	Do not set control registers of the MainOSC and the PLL. After occurrence of the $\overline{\text{CLMA1RES}}$, do not select a clock whose source clock is the MainOSC or the PLL.
PLL (CLMA2)	EMCLK (= HS IntOSC)	Do not set control registers of the PLL. After occurrence of the $\overline{\text{CLMA2RES}}$, do not select a clock whose source clock is the PLL.

Note 1. The state of EMCLK after reset by $\overline{\text{CLMA0RES}}$ depends on the state of HS IntOSC oscillation. If HS IntOSC is completely stopped, LS IntOSC is supplied as EMCLK. If HS IntOSC continues oscillating but the frequency is outside of the lower threshold and the upper threshold of CLMA0, HS IntOSC is still supplied as EMCLK. After setting the ROSCE.ROSCDISTRG bit to 1, EMCLK is switched from HS IntOSC to LS IntOSC.

Section 14 Stand-By Controller (STBC)

This section describes the functions of the stand-by controller (STBC), the registers, and various stand-by modes.

14.1 Functions

14.1.1 Types of Stand-By Mode

The RH850/F1K supports STOP mode and DeepSTOP mode for system-level low power status. In addition, the RH850/F1K supports cyclic operation (Cyclic RUN mode and Cyclic STOP mode) which supports low-power operation of limited functions. Transition between each mode is described in the **Section 14.1.5, Transition to Stand-By Mode**.

- RUN mode
  RUN mode is a normal operation mode where the CPU is operating and all of other modules can operate. The CPU can enter “HALT” state by executing the “HALT” instruction to stop its operation in this mode.
- STOP mode
  STOP mode is a chip-level stand-by mode in which the clock supply to a certain clock domain can be stopped.
  STOP mode is entered when the STBC0STPT.STBC0STPTRG bit is set to 1.
  The clock supply to clock domains can continue even in STOP mode by setting CKSC_xxx_STPM.xxxSTPMSK = 1. For details on the CKSC_xxx_STPM register, see **Section 12, Clock Controller**.
- DeepSTOP mode
  DeepSTOP mode is a chip-level stand-by mode to reduce power consumption further than STOP mode. In addition to the clock supply stop, the power supply to the Isolated area is switched off.
  DeepSTOP mode is entered when the STBC0PSC.STBC0DISTRG is set to 1.
- Cyclic RUN mode
  Cyclic RUN mode is a low-power operation mode in which limited modules can operate at low speed. In this mode, only the CPU, the peripheral functions in the Always-On area, RLIN3 and CSIG0 can operate. Data/Code flash memory and PLL are not available.
  The CPU executes the instructions in the retention RAM.
  In this mode, the CPU can issue the “HALT” instruction to enter HALT state.
  The mode transition to Cyclic RUN mode from DeepSTOP mode is triggered by wake-up factor 2, and the mode transition to Cyclic RUN mode from Cyclic STOP mode is triggered by either wake-up factor 1 or wake-up factor 2.
  CSIG0 cannot be wake-up factor.
- Cyclic STOP mode
  Cyclic STOP mode is a STOP mode in cyclic operation, and the CPU halts its operation.
  This mode is entered by setting the STBC0STPT.STBC0STPTRG bit to 1 in Cyclic RUN mode.

14.1.2 Wake-Up Control

14.1.2.1 Wake-Up Factors for Stand-By Modes

The stand-by controller can initiate return from stand-by mode by the following wake-up factors.

Table 14.1 Wake-Up Factor 1 (1/2)

Wake-Up Factor	Unit	STOP →RUN	DeepSTOP →RUN	Cyclic RUN →RUN*1	Cyclic STOP →RUN*1
TNMI	Port	√	√	√	√
WDTA0NMI	WDTA0	√	√	√	√
INTLVIL*3	LVI	√	√	√	√

INTRCAN1REC*2	RSCAN0	√	—	—	—
INTRCAN2REC*2	RSCAN0	√	—	—	—
INTRCAN3REC*2	RSCAN0	√	—	—	—
INTRCAN4REC*2	RSCAN0	√	—	—	—

Table 14.1 Wake-Up Factor 1 (2/2)

Wake-Up Factor	Unit	STOP →RUN	DeepSTOP →RUN	Cyclic RUN →RUN*1	Cyclic STOP →RUN*1
INTRCAN5REC*2	RSCAN0	√	—	—	—
INTRCANGRECC1*2	RSCAN1	√	—	—	—
INTRCAN6REC*2	RSCAN1	√	—	—	—

Note 1. The mode returns to RUN mode via DeepSTOP mode. When the transition from Cyclic STOP to Cyclic RUN is made by wake-up factor 1, if the transition to DeepSTOP by STBC0PSC.STBC0DISTRG is made without clearing wake-up factor 1, the transition to RUN mode is made.

Note 2. By using the INTP external interrupt assigned to the alternate-function pin shared with the CAN reception pin, wake-up from stand-by modes such as DeepSTOP is possible. As the trigger for waking up from DeepSTOP, use a pin of port P0 or P1, which is assigned to the Always-On area.
To clear the wake-up factor flag, the interrupt request must be cleared in each CAN module.

Note 3. Cannot be cleared while REGVCC is below the reference voltage (REGVCC (min.) < VLVI).
To clear the wake-up factor flag (WUF0[2]), WUFC0[2] must be set while WUFMSK0[2] = 1 and REGVCC is above the reference voltage (REGVCC (min.) > VLVI). The INTLVIH interrupt can be used to check that REGVCC is above the reference voltage.

Table 14.2 Wake-Up Factor 2

INTRTCA0R	RTCA0	√	√
INTRLIN33	RLIN33	—	√
INTRLIN34	RLIN34	—	√
INTRLIN35	RLIN35	—	√

Note 1. These wake-up factors are only available in LPS analog input mode.

CAUTION

For the pins of the function used for the wake-up factors from DeepSTOP, use the multiplexed functions of the ports assigned to the Always-On area.

14.1.2.2 Setting of Wake-Up Factors

Wake-up factors for returning from stand-by modes are controlled by the following stand-by controller registers:

- Wake-up factor registers: WUF0, WUF20, WUF_ISO0

  Upon occurrence of an effective wake-up factor, the associated wake-up factor flag is set to 1. By checking these registers and their flags, it is possible to identify the wake-up factor.

- Wake-up factor mask registers: WUFMSK0, WUFMSK20, WUFMSK_ISO0

  Each bit of these registers is assigned to a certain wake-up factor. Wake-up by this factor is enabled if its mask bit is set to 0. Wake-up factors assigned to both wake-up factor 1 and 2 should not be enabled at the same time.

- Wake-up factor clear registers: WUFC0, WUFC20, WUFC_ISO0

  By setting the applicable bits in these registers to 1, the wake-up factor bit (WUFy) in the wake-up factor registers (WUF0, WUF20, WUF_ISO0) can be cleared.

NOTE

The wake-up factor flags in the wake-up factor registers (WUF0, WUF20, and WUF_ISO0) only indicate the occurrence of wake-up factor. These flags do not indicate a transition from stand-by mode to normal mode.

The assignment of the wake-up factors to the control register bits and status register bits are shown in the following tables.

For details about the wake-up control and status registers, see **Section 14.2.2.3, WUF0/WUF20/WUF_ISO0 — Wake-Up Factor Registers**, **Section 14.2.2.4, WUFMSK0/WUFMSK20/WUFMSK_ISO0 — Wake-Up Factor Mask Registers**, and **Section 14.2.2.5, WUFC0/WUFC20/WUFC_ISO0 — Wake-Up Factor Clear Registers**.

Table 14.3 Wake-Up Factor 1 Register Assignment

14.1.3 On-Chip Debug Wake-Up

The On-Chip Debug unit (OCD) generates a wake-up event while the microcontroller runs the application program in the following cases:

- The debugger issues a stop request
- A breakpoint is hit

In either case all stand-by modes are terminated, provided the OCD debug event is enabled as a wake-up factor via the WUFMSK0 register.

CAUTION

If the OCD wake-up event is disabled, it is not possible to wake up from stand-by modes via an On-chip debugger request.

The OCD wake-up event can be enabled as a wake-up factor for all stand-by modes by setting WUFMSK0[31] = 0.

When the hot plug-in function is used, make sure to enable the OCD wake-up event and return from stand-by mode by INTDCUTDI interrupt.

14.1.4 I/O Buffer Control

This section describes the behavior of the I/O buffers during various stand-by modes.

The port groups in the Isolated area support the I/O buffer hold state. The port groups in the Always-On area remain their state before entering stand-by mode.
For details on the port group assignment to the Isolated area and to the Always-On area, see **Section 10, Power Supply Circuit**.

14.1.4.1 I/O Buffer Hold State

During the I/O buffer hold state, the I/O buffers maintains the state it was in before entering this state. Therefore, no external or internal signal can change the state of the I/O buffer until the I/O buffer hold state is terminated.

14.1.4.2 I/O Buffers during STOP Mode

In STOP mode, the I/O buffers remain their state before entering STOP mode (I/O buffer hold state is not entered).

14.1.4.3 I/O Buffers during DeepSTOP Mode

In DeepSTOP mode, the I/O buffers of port groups in the Isolated area transition to I/O buffer hold state.

After wake-up from DeepSTOP, the I/O buffers remain in I/O buffer hold state until the state is canceled by software. To cancel I/O buffer hold state, follow the steps shown below.

1. Re-configure the peripheral or port function.
2. Set IOHOLD.IOHOLD = 0.

The following table is a summary of the I/O buffer in the Isolated area during stand-by mode and after wake-up.

Table 14.5 Buffer Operation during Stand-by Mode and after Wake-Up (I/O buffers in the Isolated area)

	Before Stand-By	During Stand-By	After Wake-Up
STOP mode	Normal operation		
DeepSTOP mode	Normal operation	I/O buffer hold state	I/O buffer hold state *1

Note 1. Set the IOHOLD.IOHOLD bit to “0” to release the I/O buffer hold state.

The port groups in the Always-On area don't support I/O buffer hold state. They continue operation and remain its state before entering DeepSTOP. In the case an alternative function of modules in Isolated area is assigned to the pin in the Always-On area, the state of the I/O buffer may change in the transition to the DeepSTOP due to initialization of the modules in the Isolated area by ISORES. To avoid this behavior, it is recommended to change to function of modules in Always-On area (e. g. Port mode) before entering DeepSTOP.

14.1.5 Transition to Stand-By Mode

The figure below shows transition between RUN mode and stand-by mode.

Note 1. Set a clock other than the PLL clock as the CPU clock source.

Note 2. To return from DeepSTOP to RUN, ISO peripheral function registers must be set again. The CPU starts the operation from the reset address on the code flash.

Note 3. The CPU starts the operation from the reset address on the retention RAM.

NOTE

The mode transition time can be optimized by setting 1 to AWDTADSTPMSK bit of CKSC_AWDTAD_STPM register.

Figure 14.1 Transition to Stand-By Mode

14.1.6 Clock Supply

The clock supply to the stand-by controller is shown in the following table.

Table 14.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
Stand-by controller	Register access clock	CPUCLK2
		EMCLK

14.2 Registers

14.2.1 List of Registers

The following table lists the stand-by controller registers.

Table 14.7 List of Registers

Module Name	Register Name	Symbol	Address
STBC0	Power save control register	STBC0PSC	FFF8 0100_H
	Power stop trigger register	STBC0STPT	FFF8 0110_H
STBC_WUF0	Wake-up factor registers	WUF0	FFF8 0400_H

14.2.2 Details of Stand-By Controller Control Registers

14.2.2.1 STBC0PSC — Power Save Control Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 0100_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STBC0DISTRG	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Table 14.8 STBC0PSC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	STBC0DISTRG	0: No effect 1: Transition to DeepSTOP mode This bit is cleared automatically after transition to the DeepSTOP mode.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

14.2.2.2 STBC0STPT — Power Stop Trigger Register

The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 0110$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 14.9 STBC0STPT Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	STBC0STPTRG	0: No effect. 1: Transition to STOP mode – In RUN mode: Transition to STOP mode – In Cyclic RUN mode: Transition to Cyclic STOP mode This bit is cleared automatically after transition to the STOP / Cyclic STOP mode.

14.2.2.3 WUF0/WUF20/WUF_ISO0 — Wake-Up Factor Registers

These registers indicate the generation of wake-up factors.

WUF0 and WUF20 are initialized by all reset sources except the transition to DeepSTOP mode (AWORES). WUF_ISO0 is initialized by all reset sources (ISORES).

Access: These registers are read-only registers that can be read in 32-bit units.

Address: WUF0: FFF8 0400$_H$
WUF20: FFF8 0520$_H$
WUF_ISO0: FFF8 8110$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WUF31	WUF30	WUF29	WUF28	WUF27	WUF26	WUF25	WUF24	WUF23	WUF22	WUF21	WUF20	WUF19	WUF18	WUF17	WUF16

Table 14.10 WUF0/WUF20/WUF_ISO0 Register Contents

Bit Position	Bit Name	Function
31 to 0	WUFy	Indicates the generation of a wake-up factor. 0: Wake-up factor is not generated 1: Wake-up factor is generated

NOTE

While the WUFMSKy bit in the wake-up factor mask register is 1, WUFy is not set to 1 at the generation of a wake-up factor.

Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.3, Wake-Up Factor 1 Register Assignment** and **Table 14.4, Wake-Up Factor 2 Register Assignment**.

The bit to which a wake-up factor is not assigned is read as the value “0”.

14.2.2.4 WUFMSK0/WUFMSK20/WUFMSK_ISO0 — Wake-Up Factor Mask Registers

These registers enable wake-up factors.

WUFMSK0 and WUFMSK20 are initialized by all reset sources except the transition to DeepSTOP mode (AWORES). WUFMSK_ISO0 is initialized by all reset sources (ISORES).

Access: These registers can be read or written in 32-bit units.

Address: WUFMSK0: FFF8 0404$_H$
WUFMSK20: FFF8 0524$_H$
WUFMSK_ISO0: FFF8 8114$_H$

Value after reset: WUFMSK0: FFFF FFFF$_H$
WUFMSK20: FFFF FFFF$_H$
WUFMSK_ISO0: FFFF FFFF$_H$

Table 14.11 WUFMSK0/WUFMSK20/WUFMSK_ISO0 Register Contents

Bit Position	Bit Name	Function
31 to 0	WUFMSKy	Enables/disables a wake-up factor. 0: Wake-up factor is enabled 1: Wake-up factor is disabled

NOTE

While the WUFMSKy bit is 1, WUFy of the wake-up factor register is not set to 1 at the generation of a wake-up factor.

Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.3, Wake-Up Factor 1 Register Assignment** and **Table 14.4, Wake-Up Factor 2 Register Assignment**.

When writing to these registers, write the value “1” to the bits to which wake-up factors are not assigned.

14.2.2.5 WUFC0/WUFC20/WUFC_ISO0 — Wake-Up Factor Clear Registers

These registers clear the WUFy bits in the wake-up factor registers.

Access: These registers are write-only registers that can be written in 32-bit units.

Address: WUFC0: FFF8 0408_H
WUFC20: FFF8 0528_H
WUFC_ISO0: FFF8 8118_H

Value after reset: Undefined

Table 14.12 WUFC0/WUFC20/WUFC_ISO0 Register Contents

Bit Position	Bit Name	Function
31 to 0	WUFCy	Clears the wake-up factor bit WUFy in the wake-up factor registers. 0: WUFy is not modified 1: WUFy is cleared

Wake-Up Factors

As for the assignment of wake-up factors to the wake-up factor register bits, see **Table 14.3, Wake-Up Factor 1 Register Assignment** and **Table 14.4, Wake-Up Factor 2 Register Assignment**.

When writing to these registers, write the value “0” to the bits to which wake-up factors are not assigned.

14.2.2.6 IOHOLD — I/O Buffer Hold Control Register

This register specifies the hold state of the I/O buffer in DeepSTOP mode. The correct write sequence using the PROTCMD0 register is required in order to update this register. For details, see **Section 5, Write-Protected Registers**.

This register is initialized by all reset sources except the transition to DeepSTOP mode (AWORES).

Access: This register can be read or written in 32-bit units.

Address: FFF8 0B00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IOHOLD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 14.13 IOHOLD Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	IOHOLD	0: I/O hold state is released 1: I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is prohibited. To release the I/O hold state after the wake-up, set this bit to 0 by software.

14.3 Mode Transition

This section explains the mode transition procedures.

14.3.1 STOP Mode

In STOP mode, most of the clock supplies to the Always-On area and the Isolated area are stopped. The clock stop mask registers control clock supply to related clock domains in stand-by mode. Stop all of the peripheral functions before transition to STOP mode if the clock supply to the function will be stopped in STOP mode.

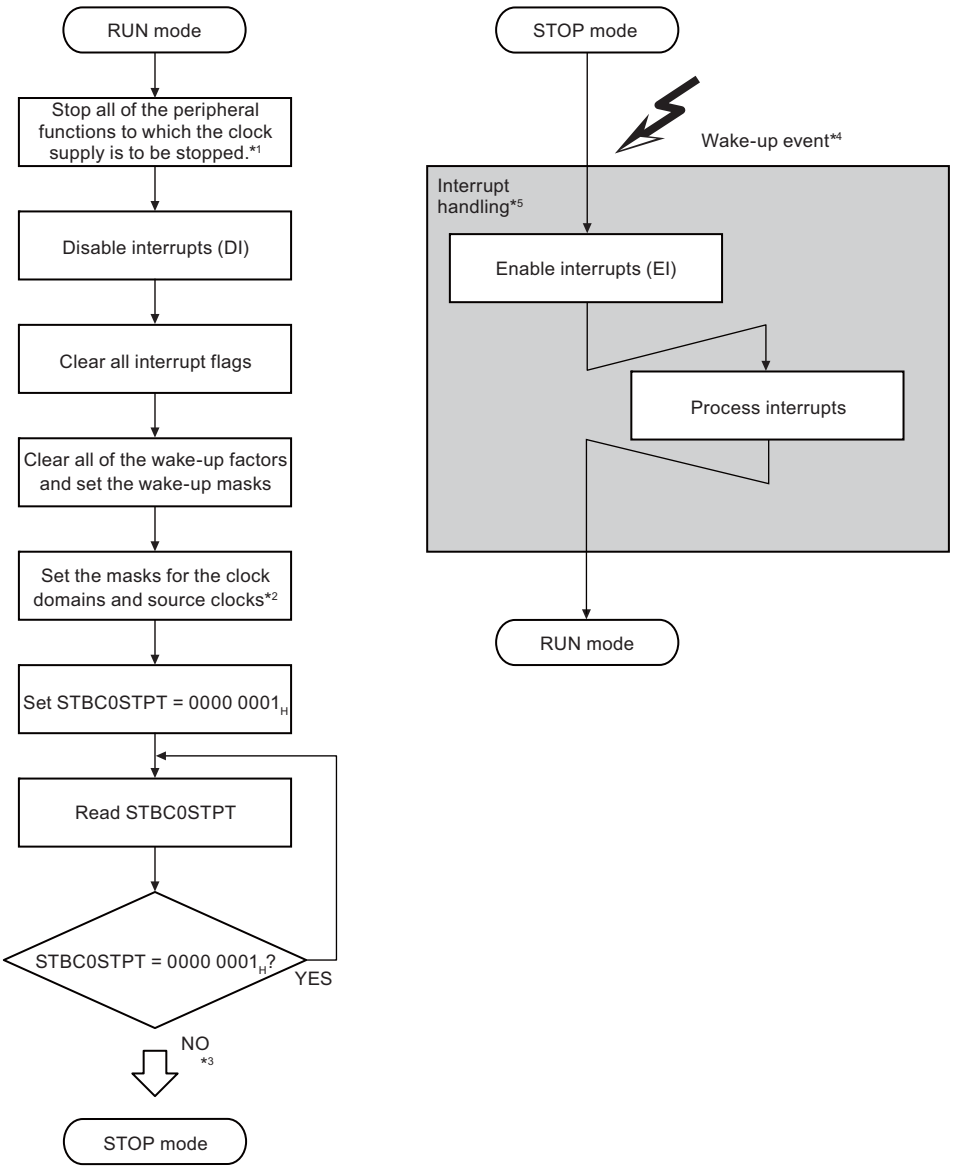
The transition procedure (example) to STOP mode is shown below.

Preparation for stand-by

- Stop all of the peripheral functions to which the clock supply is to be stopped.
- Disable the interrupt handling by issuing the CPU instruction “DI”.
- Set the interrupt control registers.
  - Clear the interrupt flag (ICxxx.RFxxx = 0).
  - Mask the interrupts for non-wake-up factors (ICxxx.MKxxx = 1).
  - Release the masks of the interrupts for wake-up factors (ICxxx.MKxxx = 0).
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC_ISO0 registers).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK_ISO0 registers).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK_ISO0 registers).
- Set the clock stop mask register to select the clock domains to be stopped and the ones to continue operating (using the CKSC_xxx_STPM.xxxxSTPMSK bit).
- Specify whether to oscillate or stop each clock source. In addition, set the clock stop mask register to select the clock sources to be stopped and the ones to continue operating (using the MOSCSTPMSK bit in the MOSCSTPM register and the ROSCSTPMSK bit in the ROSCSTPM register).

Start of stand-by

Set the STBC0STPTRG bit in the STBC0STPT register to 1 to transition to STOP mode.



End of stand-by

When a wake-up factor is generated, the microcontroller returns from STOP mode.

Wake-up handling

The generation of the wake-up factors can be determined by the wake-up factor flags (WUF0, WUF_ISO0).

When an interrupt is enabled by the CPU instruction “EI”, the generated wake-up interrupt will be executed.

Note 1. When the operation of the peripheral function is stopped during operating due to the transition to the STOP mode, the operation of the peripheral function may be incorrect. Before the transition to the STOP mode, stop all of the peripheral functions to which the clock supply is to be stopped.

Note 2. Though the clock mask can be set before this flow is started, it must be set before 0000 0001_H is written to STBC0STPT.

Note 3. The clock supply to the CPU is stopped and the operation transitions to the STOP mode while checking that STBC0STPT = 0000 0001_H.

Note 4. STBC0STPT is set to 0000 0000_H at the generation of a wake-up factor. The generated wake-up factor can be checked by the WUF0 and WUF_ISO0 registers.

Note 5. This processing is optional. It is required when executing the interrupt handling after the wake-up.

Figure 14.2 Example of STOP Mode Transition

14.3.2 DeepSTOP Mode

In DeepSTOP mode, the clock supply to all areas and the power supply to the Isolated area are stopped. However, clock supply to peripheral functions in the Always-On area can be continued by setting the clock stop mask register.

Select the clock other than the PLL as the CPU operating clock, before the transition to DeepSTOP mode.

The transition procedure (example) to DeepSTOP mode is shown below.

Preparation for stand-by

- Stop all of the peripheral functions to which the clock supply is to be stopped.
- Disable the interrupt handling by issuing the CPU instruction “DI”.
- Set the interrupt control registers.
  - Clear the interrupt flag (ICxxx.RFxxx = 0).
  - Mask the interrupts for non-wake-up factors (ICxxx.MKxxx = 1).
  - Release the masks of the interrupts for wake-up factors (ICxxx.MKxxx = 0).
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC20 registers).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK20 registers).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK20 registers).

CAUTION

When a wake-up factor is assigned to both wake-up factor 1 registers and wake-up factor 2 registers, it can be used only in one of them.

- Set the clock stop mask register to select the clock domains to be stopped and the ones to continue operating (using the CKSC_xxx_STPM.xxxxSTPMSK bit).
- Specify whether to oscillate or stop each clock source. In addition, set the clock stop mask register to select the clock sources to be stopped and the ones to continue operating (using the MOSCSTPMSK bit in the MOSCSTPM register and the ROSCSTPMSK bit in the ROSCSTPM register).

Start of stand-by

Set the STBC0DISTRG bit in the STBC0PSC register to 1 to transition to DeepSTOP mode.

End of stand-by

When a wake-up factor is generated, the microcontroller returns from DeepSTOP mode.

Wake-up handling

- When returned from DeepSTOP mode due to wake-up factor 1, the microcontroller starts the operation from the reset vector address.

  If one of the following interrupts has been generated before recovery from DeepSTOP mode to RUN mode, the microcontroller restarts operation from the exception handler address:

  – FENMI: FENMI handler address ($E0_H$)
  – FEINT: FEINT handler address ($F0_H$)

  Note that the General-purpose registers and Local RAM are undefined value after return from DeepSTOP mode.

- The generation of the wake-up factors can be determined by the wake-up factor flags (WUF0).
- The ports in the Isolated area maintain the I/O buffer hold state.
  Release the I/O buffer hold state by executing the following steps:

  1. Re-configure the peripheral functions and port functions.

  2. Set IOHOLD.IOHOLD = 0.

- To execute an interrupt of the wake-up factor after the wake-up, evaluate the information of wake-up factor flag by software and set the interrupt request flag in the interrupt control register. Then, when an interrupt is enabled by the CPU instruction “EI”, the generated wake-up interrupt will be executed.

Note 1. When the operation of the peripheral function is stopped during operating due to the transition to the DeepSTOP mode, the operation of the peripheral function may be incorrect. Before the transition to the DeepSTOP mode, stop all of the peripheral functions to which the clock supply is to be stopped.

Note 2. After setting STBC0PSC = 0000 0002_H, wait for the transition to the DeepSTOP mode by the unconditional loop.

Note 3. The CPU starts the program from the reset vector after the generation of a wake-up factor. The return from the DeepSTOP mode by a reset can be checked by the RESF register. In addition, the generated wake-up factor can be checked by the WUF0 register.

Note 4. This processing is optional. It is required when executing the interrupt handling after the wake-up.

Figure 14.3 Example of DeepSTOP Mode Transition

14.3.3 Cyclic RUN Mode

In Cyclic RUN mode, the functions except the CPU, peripheral functions in Always-On area (AWO area), RLIN3, and CSIG0 are stopped. In this mode, PLL and Flash Memory are not available. The transition procedure (example) to Cyclic RUN mode is shown below.

Preparation of Cyclic RUN

Allocate the program for Cyclic RUN to the Retention RAM. The reset vector base address (RBASE) in Cyclic RUN operation should be specified in the CYCRBASE register described in **Section 9. Reset controller**. Note that neither the code flash memory nor the data flash memory is available in Cyclic RUN mode.

The instruction to transition to DeepSTOP mode should be arranged in the interrupt exception handler or a polling routine of interrupt request which is used as the source of returning to the RUN mode.

For details on the exception vector, see *the RH850G3KH User's Manual: Software*.

CAUTION

Do not change the PSW.EBV bit from its value after reset in Cyclic RUN mode (Do not set the PSW.EBV bit to 1 in Cyclic RUN mode).

- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC20 register).
  - Mask the non-wake-up factor (the WUFMSK20 register).
  - Release the masks of the wake-up factors (the WUFMSK20 register).
- Transition to DeepSTOP mode. For details on the transition to DeepSTOP mode, see **Section 14.3.2, DeepSTOP Mode**.

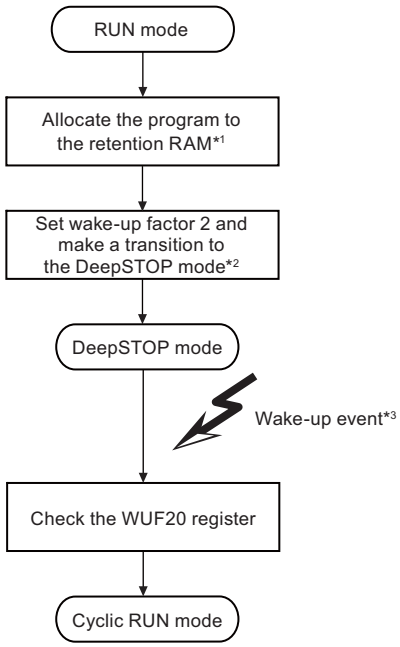
Start of Cyclic RUN

The operation transitions to Cyclic RUN mode from DeepSTOP mode at the generation of wake-up factor 2.

The operation transitions to Cyclic RUN mode from Cyclic STOP mode at the generation of wake-up factors 1 and 2.

The microcontroller starts operation from the reset vector address of Cyclic RUN mode specified by the CYCRBASE register. If one of the following interrupts has been generated during recovery from DeepSTOP mode to Cyclic RUN mode, the microcontroller restart operation from the exception handler address:

- FENMI: FENMI handler address in Cyclic RUN mode (CYCRBASE + $E0_H$)
- FEINT: FEINT handler address in Cyclic RUN mode (CYCRBASE + $F0_H$)



Note that the General-purpose registers and Local RAM are undefined value after the transition to Cyclic RUN mode from DeepSTOP mode.

End of Cyclic RUN

The Cyclic RUN mode ends at the transition to the Cyclic STOP mode by setting the STBC0STPT.STBC0STPTRG bit to 1, or at the transition to the DeepSTOP mode by setting the STBC0PSC.STBC0DISTRG bit to 1.

Wake-up handling

The generation of the wake-up factors can be determined by the wake-up factor flags (WUF20).

Note 1. When the mode transitions from the Cyclic RUN mode to the RUN mode by a wake-up factor, the transition to the DeepSTOP mode should be made in the processing of the interrupt vector for the wake-up factor. In that case, allocate the interrupt processing program to the retention RAM as well.

Note 2. Before the transition to the DeepSTOP mode, clear the flag for wake-up factor 2 in the WUFC20 register and set wake-up factor 2 that is to be used in the WUFMSK20 register. Other parts of the procedure for transition to DeepSTOP mode are the same as the normal procedure.

Note 3. The CPU starts the program from the address specified by CYCRBASE register after the generation of a wake-up factor. The generated wake-up factor can be checked by the WUF20 register.

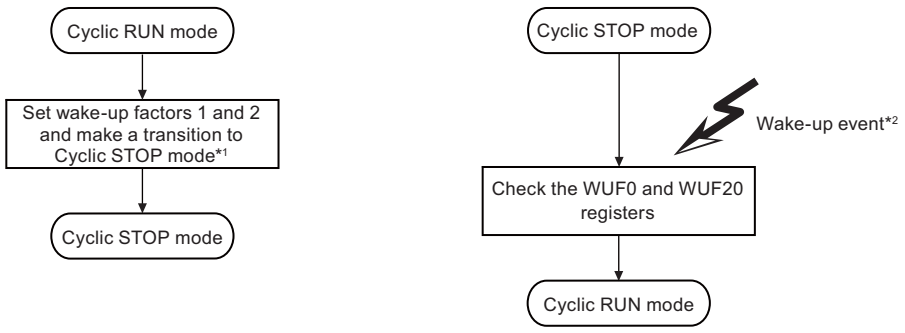
Figure 14.4 Example of Cyclic RUN Mode Transition

14.3.4 Cyclic STOP Mode

In Cyclic STOP mode, the functions except the peripheral functions in the Always-On area (AWO area) and RLIN3 are stopped.

The transition procedure (example) to Cyclic STOP mode is shown below.

Preparation for Cyclic STOP



- Transition to Cyclic RUN mode.
- Set the wake-up related registers.
  - Clear the wake-up factor flags (the WUFC0/WUFC20 register).
  - Mask the non-wake-up factor (the WUFMSK0/WUFMSK20 register).
  - Release the masks of the wake-up factors (the WUFMSK0/WUFMSK20 register).

Start of Cyclic STOP

Set the STBC0STPT.STBC0STPTR bit to 1 to transition to Cyclic STOP mode.

End of Cyclic STOP

The operation transitions to Cyclic RUN mode at the generation of wake-up factor 1 or 2.

Note 1. Set wake-up factors 1 and 2 to be used for transitioning to RUN mode and Cyclic RUN mode, respectively. When the mode transitions to RUN mode by wake-up factor 1, the transition processing to DeepSTOP mode should be added in Cyclic RUN mode.

Note 2. When a wake-up factor is generated in Cyclic STOP mode, the mode transitions to Cyclic RUN mode and the operation starts immediately after the processing shifted to Cyclic STOP mode. The generated wake-up factors can be checked by the WUF0 and WUF20 registers.

Figure 14.5 Example of Cyclic STOP Mode Transition

14.4 Writing to the Stand-By Controller Related Registers

The following stand-by controller registers are write-protected registers.

- STBC0PSC register
- STBC0STPT register
- IOHOLD register

The write-protected registers are protected against the illegal writing due to an incorrect program operation.

For details on the write-protected sequence, see **Section 5, Write-Protected Registers**.

14.5 Clock Oscillator Behavior During Stand-By Mode Transition

The following figures explain clock oscillator behavior during stand-by mode transition. The clock oscillators restart operation automatically if they are used before entering stand-by.

- If MainOSC and PLL are enabled before entering STOP mode, they restart oscillation automatically during wake-up from STOP mode, and CPU restarts operation after oscillations of these clock sources become stable.
- If MainOSC is enabled before entering DeepSTOP mode, it restarts oscillation automatically during wake-up from DeepSTOP mode, and CPU restarts operation after oscillation of MainOSC becomes stable. PLL is not restarted automatically even if it is enabled before entering DeepSTOP mode.
- If MainOSC is enabled before entering Cyclic STOP mode, it restarts oscillation automatically during wake-up from Cyclic STOP mode. CPU restarts operation after oscillation of MainOSC becomes stable.

Note that behavior of HS IntOSC and MainOSC in the following figures is in the case they stop oscillation during stand-by mode. HS IntOSC and MainOSC continue oscillation during stand-by mode if their stop mask register is set to 1 (ROSCSTPMSK bit of ROSCSTPM register and MOSCSTPMSK bit of MOSCSTPM register respectively) or there is a clock domain which uses the source clock during stand-by by setting its stop mask bit (CKSC_xxxx_STPM = 0000_0003_H).

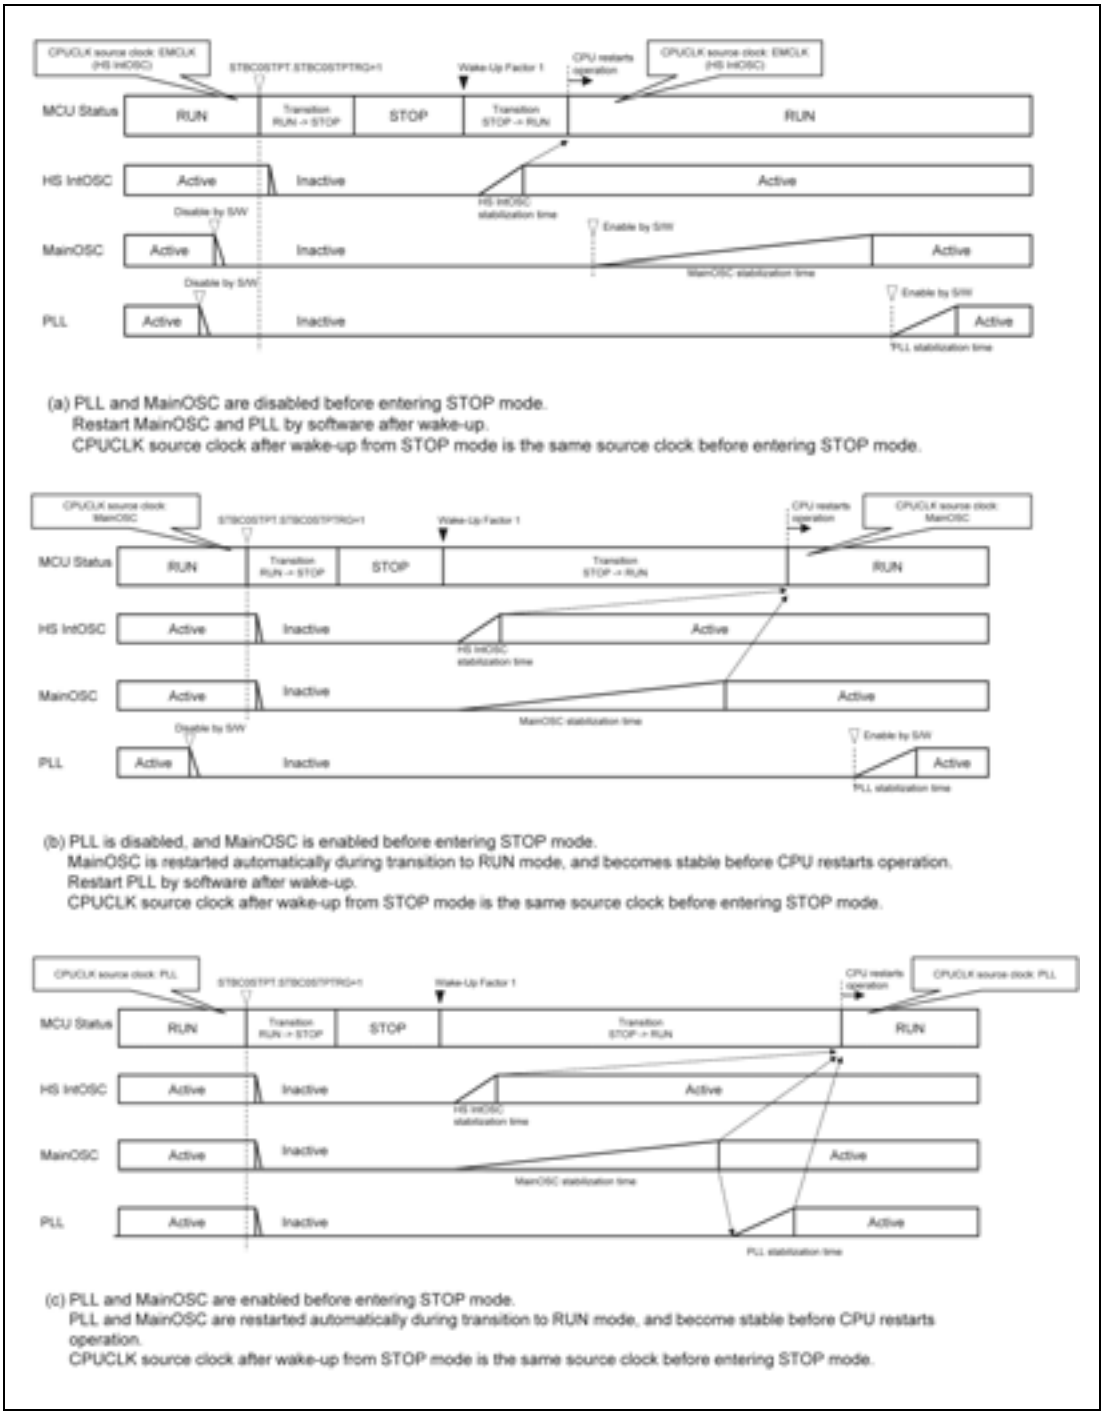


Figure 14.6 Clock oscillators behavior in stand-by mode transition (RUN → STOP → RUN)

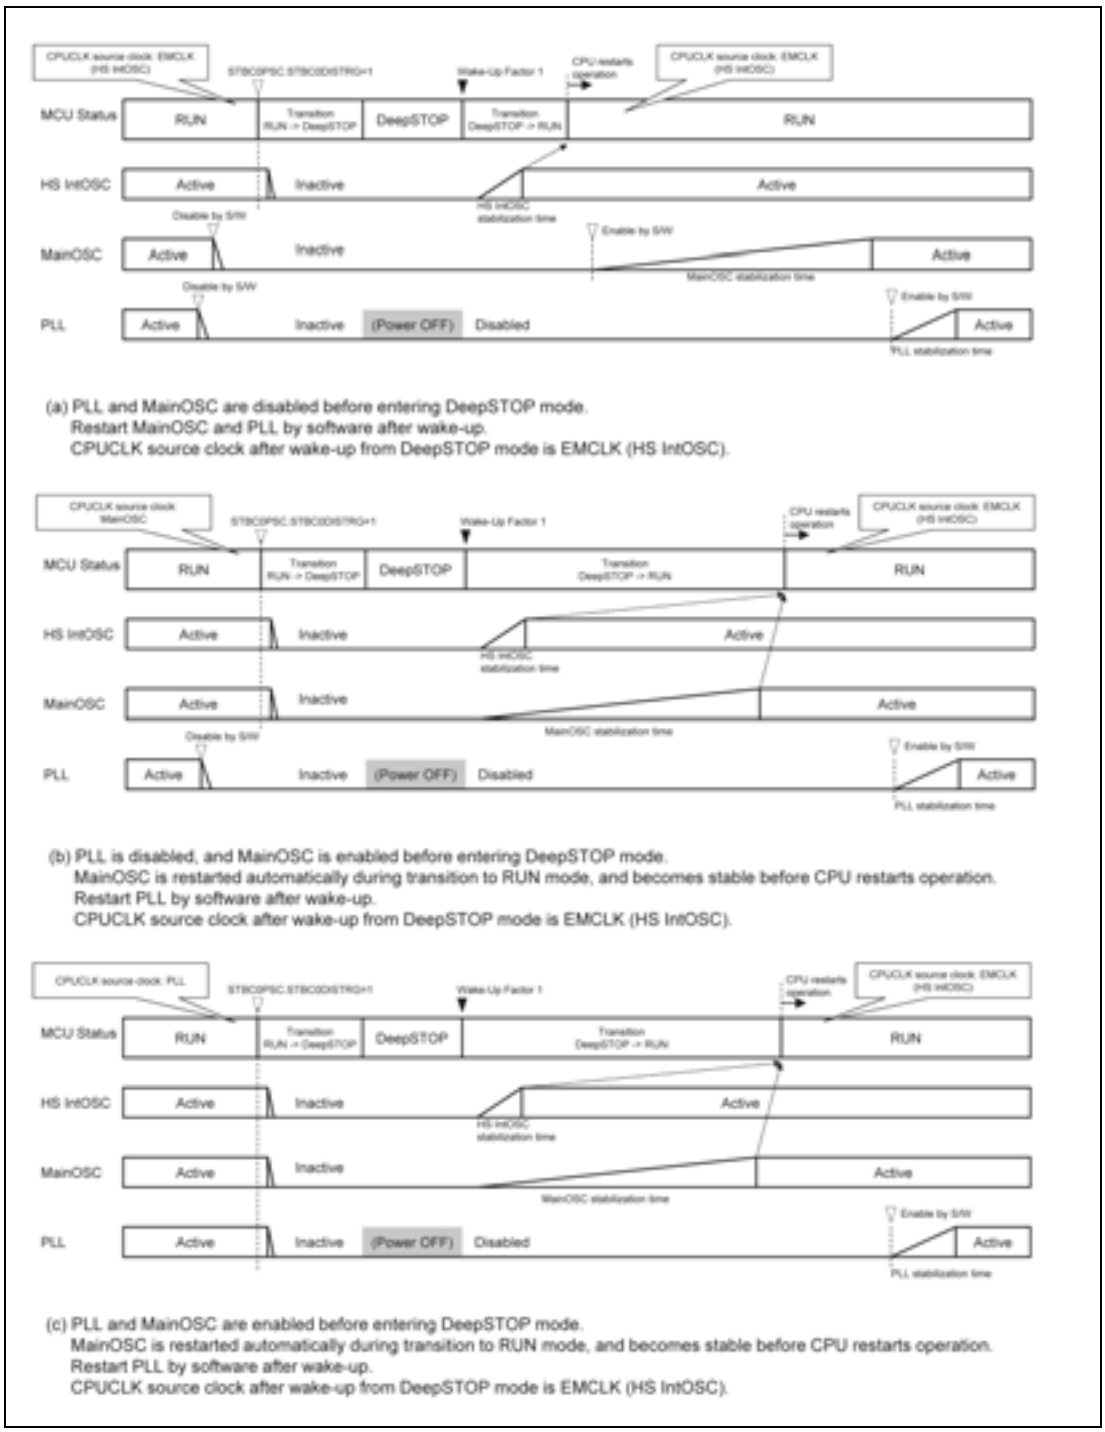

Figure 14.7 Clock oscillators behavior in stand-by mode transition (RUN → DeepSTOP → RUN)

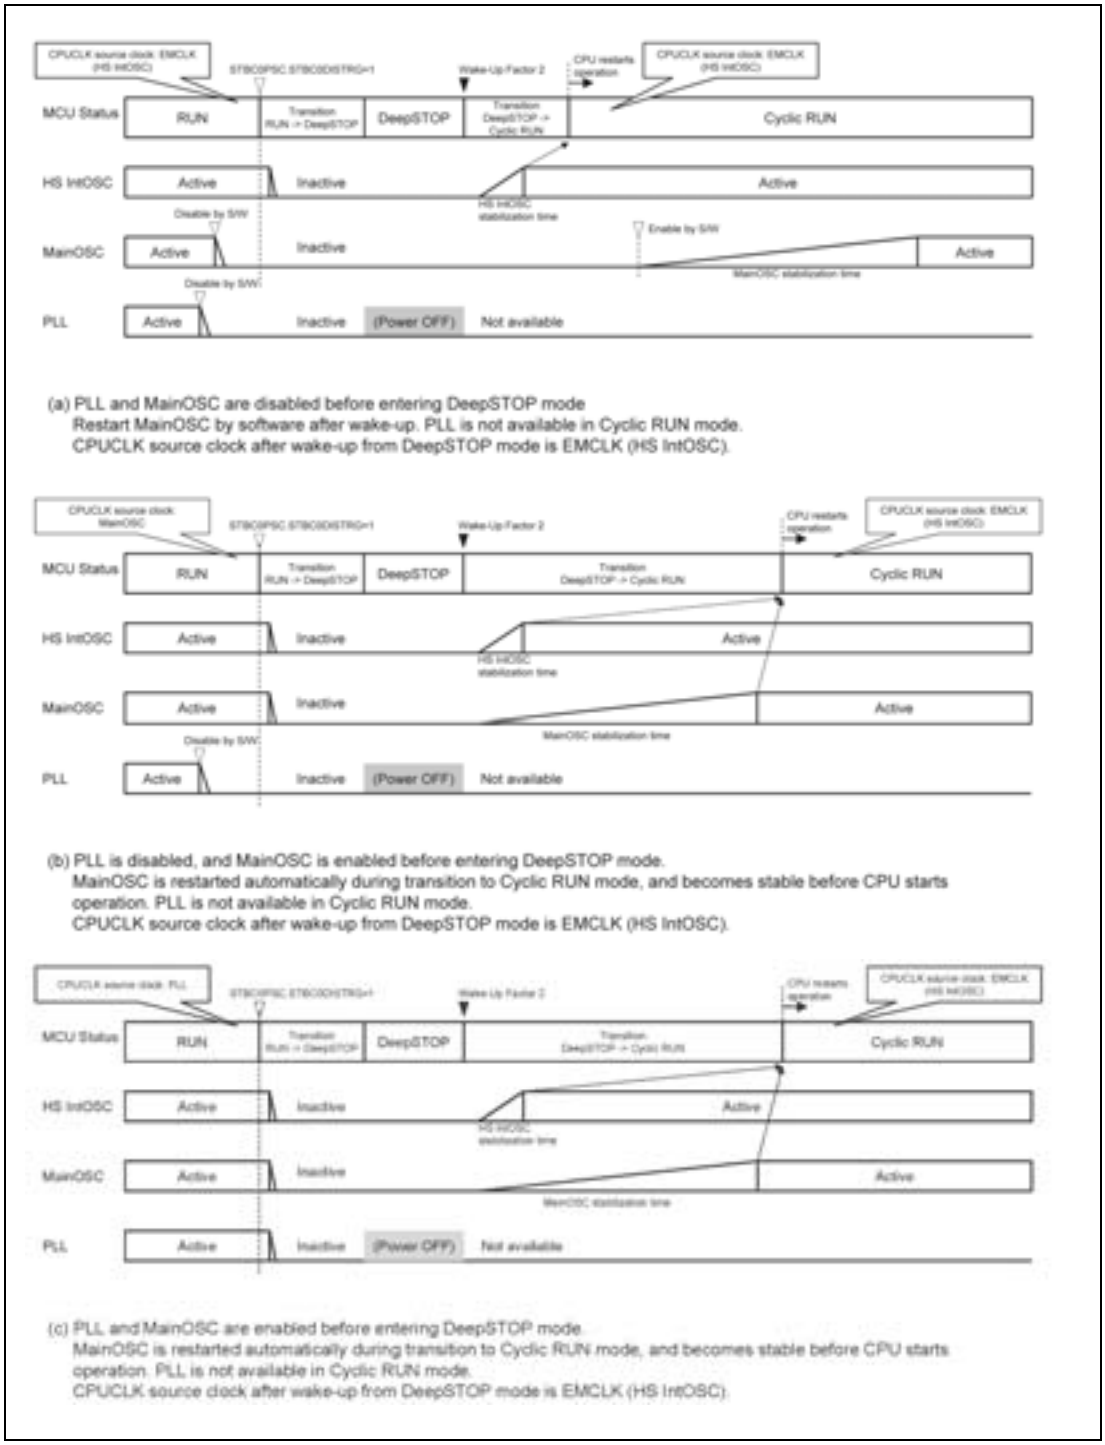

Figure 14.8 Clock oscillators behavior in stand-by mode transition (RUN → DeepSTOP → Cyclic RUN)

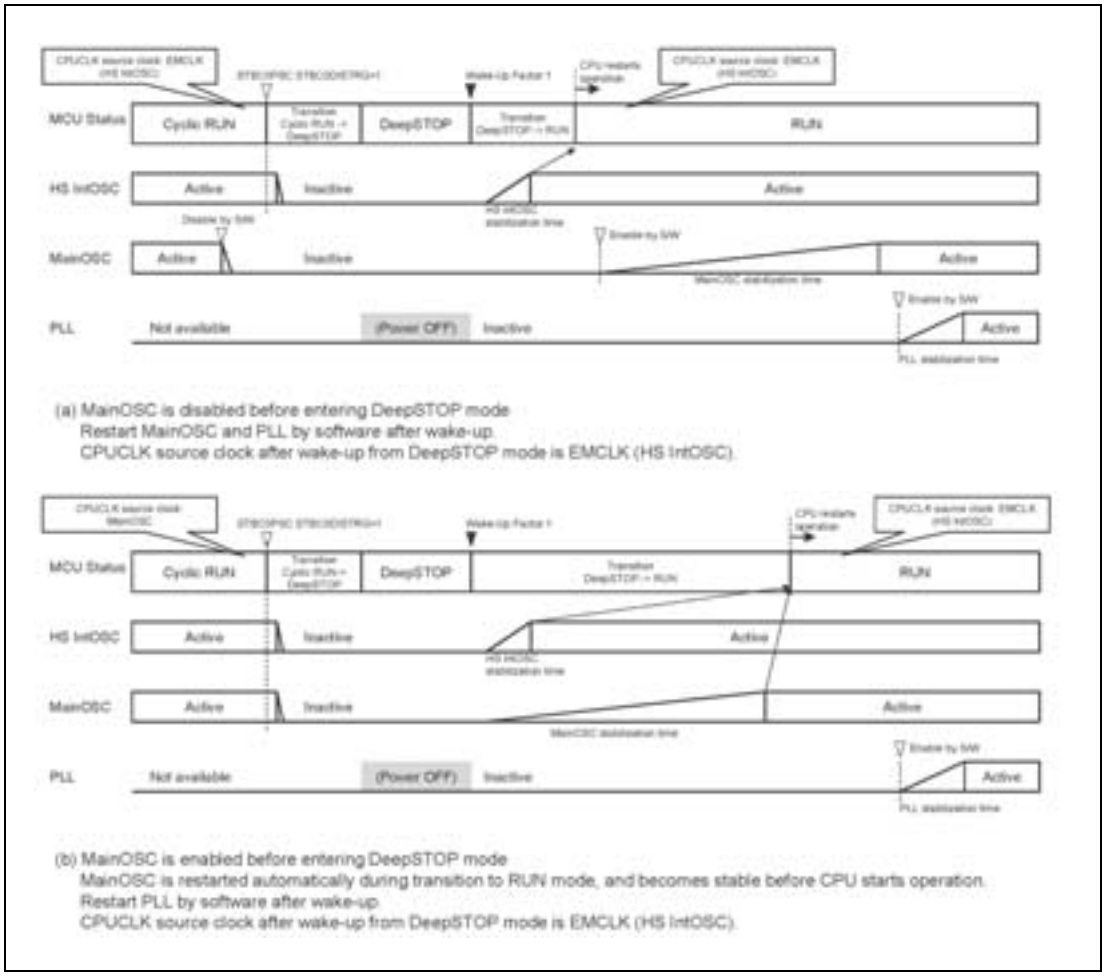

Figure 14.9 Clock oscillators behavior in stand-by mode transition (Cyclic RUN → DeepSTOP → RUN)

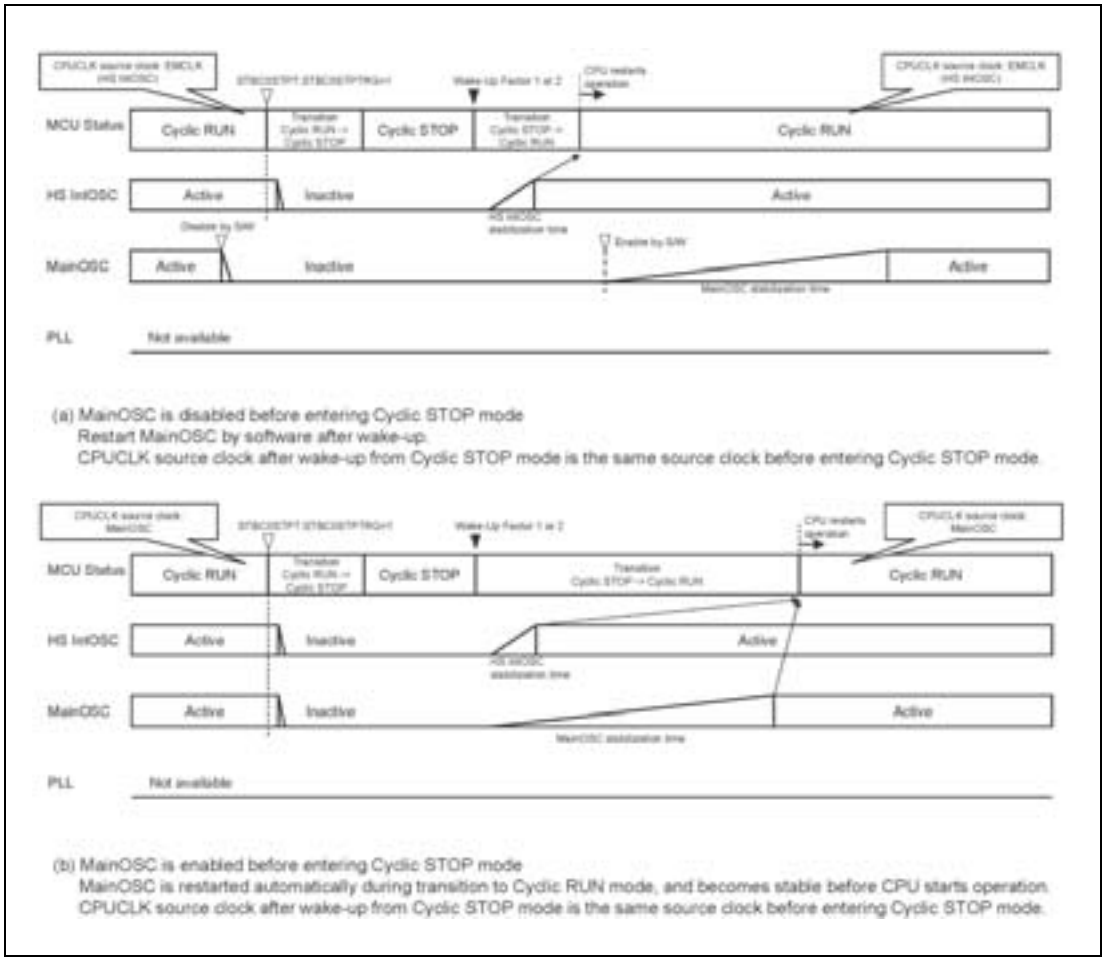

Figure 14.10 Clock oscillators behavior in stand-by mode transition (Cyclic RUN → Cyclic STOP → Cyclic RUN)

14.6 Cautions when Using Stand-By Modes

14.6.1 Cautions Concerning Transitioning to DeepSTOP Mode When Using a Debugger

When using a debugger, executing a program that causes the mode to transition to DeepSTOP mode immediately after the program is started may cause improper communication between the OCD emulator and microcontroller because the microcontroller will enter DeepSTOP mode before the preparations for communication between the OCD emulator and microcontroller are completed.

The communication preparation period depends on the OCD emulator's host PC environment and the operating frequency of the microcontroller, so when performing debugging that causes the program to enter DeepSTOP mode immediately after the program starts, insert a wait between reset release and the DeepSTOP execution instruction so that the debugger starts normally.

In DeepSTOP mode, the debugging controller stops. For return from DeepSTOP mode by the debugger, see **Section 14.1.3, On-Chip Debug Wake-Up**.

Section 15 Low-Power Sampler (LPS)

This section contains a generic description of the low-power sampler (LPS).

The first part in this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the LPS.

15.1 Features of RH850/F1K LPS

15.1.1 Number of Units

This microcontroller has the following number of LPS units.

Table 15.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	1	1	1
Name	LPSn (n = 0)	LPSn (n = 0)	LPSn (n = 0)

Table 15.2 Unit Configurations and Channels

Unit Name LPSn	Channels per Unit	Function	Channel Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
LPS0	1	Digital port input m for port polling	DPINm	17 ch	24 ch	24 ch
		Analog input m for A/D converter	ADCA0Im	16 ch	16 ch	16 ch

Table 15.3 Indices

Index	Description
n	Throughout this section, the individual LPS units are identified by the index “n” (n = 0).
m	Throughout this section, the number of digital port input channels for LPS port polling is indicated by the index “m” (m = 0 to 23) and the number of analog input channels for A/D converter is indicated by the index “m” (m = 0 to 15)
k	The external multiplexer select output signal is indicated by the index “k”.
x	LPS sequence start trigger input signal is indicated by the index “x”.

NOTE

Descriptions of functions and registers in this section are based on the maximum configurations. Adjust the indices in the text to the proper value for each product. When writing a value to a register that will result in writing to bits outside the range of the index for the product you are using, write the value after reset to these bits.

The following table shows values indicated by the indices of each product.

Table 15.4 Indices of Products

Indices of Each Product
100 pins, 144 pins, 176 pins
k = 0 to 2
x = 0 to 3

15.1.2 Register Base Address

The LPS base address is shown in the following table.

LPS register addresses are given as offsets from the base addresses.

Table 15.5 Register Base Address

Base Address Name	Base Address
<LPS0_base>	FFF8 3000_H

15.1.3 Clock Supply

The LPS clock supply is shown in the following table.

If the operation request signal for the low-power sampler (LPS) is at the active level, the clock for clock domains for which the HS IntOSC is selected also operates.

To stop the function of a clock domain, set the target clock domain to “disabled” before making a transition to standby mode.

Table 15.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
LPSn	Register access clock	CPUCLK2
		EMCLK
	Operating clock	EMCLK

15.1.4 Interrupt Request

The LPS interrupt requests are listed in the following table.

Table 15.7 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
LPS0			
INTCWEND	Port polling end interrupt (LPS)	112	—
INTDPE	Digital port error interrupt (LPS)	356	—
INTAPE	Analog port error interrupt (LPS)	357	—
INTADCA0I0*[1]	ADCA0 SG1 end interrupt	18	4
INTADCA0I1*[1]	ADCA0 SG2 end interrupt	19	5
INTADCA0I2*[1]	ADCA0 SG3 end interrupt	20, 32	6

Note 1. These signals are output from ADCA0.

15.1.5 Reset Sources

The LPS reset sources are shown in the following table. The LPS is initialized by these reset sources.

Table 15.8 Reset Sources

Unit Name	Reset Source
LPS0	All reset sources except transition to DeepSTOP mode (AWORES)

15.1.6 External Input/Output Signals

External input/output signals of LPS are listed below.

Table 15.9 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
LPS0		
DPO	Port output signal for digital input	DPO
DPSELk	External multiplexer select output signal for digital port	SELDPk
DPINm	Digital port input signal	DPINm
APO	Port output signal for analog input	APO
ADCA0SELk*1	External analog multiplexer (MPX) output pin	ADCA0SELk
ADCA0Im*1	ADCA input channel signal	ADCA0Im

Note 1. These signals are input/output of ADCA0. For details, see Section 31, A/D Converter (ADCA).

15.1.7 Internal Input/Output Signals

Internal input/output signals for connecting the LPS and the STBC or the LPS and the TAUJ are listed below.

Table 15.10 Internal Input/Output Signals

Unit Signal Name	Description	Connected to
WUTRG0	LPS wake-up source trigger 0 output signal	STBC
WUTRG1	LPS wake-up source trigger 1 output signal	STBC
INTTAUJ0Ix	LPS sequence start trigger x input signal	TAUJ0

15.2 Overview

15.2.1 Functional Overview

To monitor the external input without consuming CPU resources, the low-power sampler (LPS) can check the digital input ports and analog input ports without using the CPU. The figure below shows a connection example between the main components of the LPS and the external circuit.

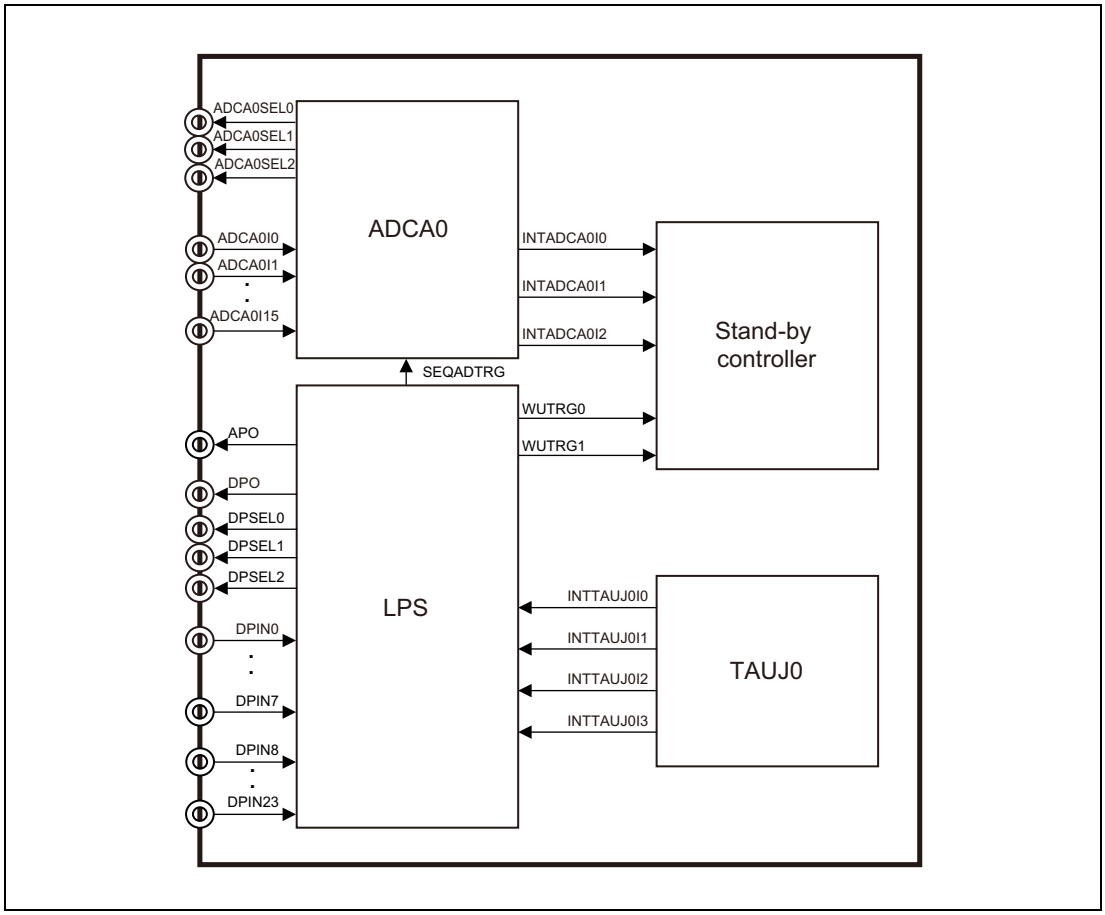

Figure 15.1 Block Diagram of the LPS

CAUTION

DPSEL2 to DPSEL0 are assigned to the same pins as DPIN10 to DPIN8 as alternative-function. They cannot be used simultaneously.

15.3 Registers

15.3.1 List of Registers

LPS registers are listed in the following table.

For details about <LPS0_base>, see **Section 15.1.2, Register Base Address**.

Table 15.11 List of Registers

Module Name	Register Name	Symbol	Address
LPS0	LPS control register	SCTLR	<LPS0_base > + 00_H
	Event flag register	EVFR	<LPS0_base > + 04_H
	DPIN select register 0	DPSELR0	<LPS0_base > + 08_H
	DPIN select register M	DPSELRM	<LPS0_base > + $0C_H$
	DPIN select register H	DPSELRH	<LPS0_base > + 10_H
	DPIN data set register 0	DPDSR0	<LPS0_base > + 14_H
	DPIN data set register M	DPDSRM	<LPS0_base > + 18_H
	DPIN data set register H	DPDSRH	<LPS0_base > + $1C_H$
	DPIN data input monitor register 0	DPDIMR0	<LPS0_base > + 20_H
	DPIN data input monitor register 1	DPDIMR1	<LPS0_base > + 24_H
	DPIN data input monitor register 2	DPDIMR2	<LPS0_base > + 28_H
	DPIN data input monitor register 3	DPDIMR3	<LPS0_base > + $2C_H$
	DPIN data input monitor register 4	DPDIMR4	<LPS0_base > + 30_H
	DPIN data input monitor register 5	DPDIMR5	<LPS0_base > + 34_H
	DPIN data input monitor register 6	DPDIMR6	<LPS0_base > + 38_H
	DPIN data input monitor register 7	DPDIMR7	<LPS0_base > + $3C_H$
	Count value register	CNTVAL	<LPS0_base > + 40_H
	LPS operation status register	SOSTR	<LPS0_base > + 44_H

15.3.2 SCTLR — LPS Control Register

This register is used to configure the LPS.

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 00_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	NUMDP2	NUMDP1	NUMDP0	TJIS1	TJIS0	ADEN	DPEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.12 SCTLR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 4	NUMDP[2:0]	These bits specify the number of times the port is read in digital input mode. If two or more times are specified, the external multiplexer is controlled by the DPSEL[2:0] pins. The bits for which comparison is enabled in the DPSELR0, DPSELRM, and DPSELRH registers are compared regardless of the repeat number setting, and WUTRG will be generated according to the results. **NUMDP[2:0] / Number of Times the Port Is Read** 000_B One time 001_B Two times 010_B Three times 011_B Four times 100_B Five times 101_B Six times 110_B Seven times 111_B Eight times These bits should be set before the TAUJ0 and sequence operations are started (when the SCTLR.DPEN bit = 0, the SCTLR.ADEN bit = 0, and the SOSTR.SOF bit = 0). (When changing the SCTLR.DPEN bit and the SCTLR.ADEN bit, write the same value to these bits.)
3, 2	TJIS[1:0]	Sequence Start Trigger Select 00: INTTAUJ0I0 01: INTTAUJ0I1 10: INTTAUJ0I2 11: INTTAUJ0I3 These bits should be set before the sequence operation is started (when the SCTLR.DPEN bit = 0, the SCTLR.ADEN bit = 0, and the SOSTR.SOF bit = 0). (When changing the SCTLR.DPEN bit and the SCTLR.ADEN bit, write the same value to these bits.)
1	ADEN	0: Analog input mode is disabled 1: Analog input mode is enabled

Table 15.12 SCTLR Register Contents (2/2)

Bit Position	Bit Name	Function
0	DPEN	0: Digital input mode is disabled 1: Digital input mode is enabled

15.3.3 EVFR — Event Flag Register

This register indicates the result of comparing the data sequentially captured at the digital input pins and stored in the DPDIMR7 to DPDIMR0 registers with the comparison target data in the DPDSRH/DPDSRM/DPDSR0 registers.

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DINEVF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 15.13 EVFR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DINEVF	This bit indicates the result of comparing the data captured at the digital input pins and stored in the DPDIMR7 to DPDIMR0 registers with the comparison target data in the DPDSRH/DPDSRM/DPDSR0 registers. Read: 0: The result of comparison is a match. 1: The result of comparison is a mismatch. Write: 0: Clear the bit. 1: Prohibited. This bit is set to 1 when a mismatch is detected even in one bit. Only 0 can be written to clear this bit.

15.3.4 DPSELR0 — DPIN Select Register 0

This register specifies the compare target bits in the DPDSR0 and DPDIMR0 registers.

Write to the DPSELR0 register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 08_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	D0EN_23	D0EN_22	D0EN_21	D0EN_20	D0EN_19	D0EN_18	D0EN_17	D0EN_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	D0EN_15	D0EN_14	D0EN_13	D0EN_12	D0EN_11	D0EN_10	D0EN_9	D0EN_8	D0EN_7	D0EN_6	D0EN_5	D0EN_4	D0EN_3	D0EN_2	D0EN_1	D0EN_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.14 DPSELR0 Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 0	D0EN_n (n = 23 to 0)	These bits enable or disable comparing each bit of the first data captured at the digital input pins and stored in the DPDIMR0 register with the comparison target data in the DPDSR0 register. 0: Disables comparison. 1: Enables comparison.

15.3.5 DPSELRM — DPIN Select Register M

This register specifies the compare target bits in the DPDSRM and DPDIMRm (m = 4 to 1) registers.

Write to the DPSELRM register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: DPSELRM can be read or written in 32-bit units.
DPSELRML and DPSELRMH can be read or written in 16-bit units.
DPSELR1, DPSELR2, DPSELR3, and DPSELR4 can be read or written in 8-bit units.

Address: DPSELRM: <LPS0_base> + $0C_H$
DPSELRML: <LPS0_base> + $0C_H$,
DPSELRMH: <LPS0_base> + $0E_H$
DPSELR1: <LPS0_base> + $0C_H$,
DPSELR2: <LPS0_base> + $0D_H$,
DPSELR3: <LPS0_base> + $0E_H$,
DPSELR4: <LPS0_base> + $0F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	D4EN_7	D4EN_6	D4EN_5	D4EN_4	D4EN_3	D4EN_2	D4EN_1	D4EN_0	D3EN_7	D3EN_6	D3EN_5	D3EN_4	D3EN_3	D3EN_2	D3EN_1	D3EN_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	D2EN_7	D2EN_6	D2EN_5	D2EN_4	D2EN_3	D2EN_2	D2EN_1	D2EN_0	D1EN_7	D1EN_6	D1EN_5	D1EN_4	D1EN_3	D1EN_2	D1EN_1	D1EN_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.15 DPSELRM Register Contents

Bit Position	Bit Name	Function
31 to 24	D4EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the fifth data captured at the digital input pins and stored in the DPDIMR4 register with the comparison target data in the DPDSR4 register. 0: Disables comparison. 1: Enables comparison.
23 to 16	D3EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the fourth data captured at the digital input pins and stored in the DPDIMR3 register with the comparison target data in the DPDSR3 register. 0: Disables comparison. 1: Enables comparison.
15 to 8	D2EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the third data captured at the digital input pins and stored in the DPDIMR2 register with the comparison target data in the DPDSR2 register. 0: Disables comparison. 1: Enables comparison.
7 to 0	D1EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the second data captured at the digital input pins and stored in the DPDIMR1 register with the comparison target data in the DPDSR1 register. 0: Disables comparison. 1: Enables comparison.

15.3.6 DPSELRH — DPIN Select Register H

This register specifies the compare target bits in the DPDSRH and DPDIMRm (m = 7 to 5) registers.

Write to the DPSELRH register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: DPSELRH can be read or written in 32-bit units.
DPSELRHL and DPSELRHH can be read or written in 16-bit units.
DPSELR5, DPSELR6, and DPSELR7 can be read or written in 8-bit units.

Address: DPSELRH: <LPS0_base> + 10_H
DPSELRHL: <LPS0_base> + 10_H,
DPSELRHH: <LPS0_base> + 12_H
DPSELR5: <LPS0_base> + 10_H,
DPSELR6: <LPS0_base> + 11_H,
DPSELR7: <LPS0_base> + 12_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	D7EN_7	D7EN_6	D7EN_5	D7EN_4	D7EN_3	D7EN_2	D7EN_1	D7EN_0

Table 15.16 DPSELRH Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	D7EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the eighth data captured at the digital input pins and stored in the DPDIMR7 register with the compare target data in the DPDSR7 register. 0: Disables comparison. 1: Enables comparison.
15 to 8	D6EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the seventh data captured at the digital input pins and stored in the DPDIMR6 register with the compare target data in the DPDSR6 register. 0: Disables comparison. 1: Enables comparison.
7 to 0	D5EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the sixth data captured at the digital input pins and stored in the DPDIMR5 register with the compare target data in the DPDSR5 register. 0: Disables comparison. 1: Enables comparison.

15.3.7 DPDSR0 — DPIN Data Set Register 0

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR0 register.

Write to the DPDSR0 register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 14_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	D0_23	D0_22	D0_21	D0_20	D0_19	D0_18	D0_17	D0_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.17 DPDSR0 Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 0	D0_n (n = 23 to 0)	Data to be compared with the first digital port input (DPINm)

15.3.8 DPDSRM — DPIN Data Set Register M

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR4 to DPDIMR1 registers.

Write to the DPDSRM register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: DPDSRM can be read or written in 32-bit units.
DPDSRML and DPDSRMH can be read or written in 16-bit units.
DPDSR1, DPDSR2, DPDSR3, and DPDSR4 can be read or written in 8-bit units.

Address: DPDSRM: <LPS0_base> + 18_H
DPDSRML: <LPS0_base> + 18_H,
DPDSRMH: <LPS0_base> + $1A_H$
DPDSR1: <LPS0_base> + 18_H,
DPDSR2: <LPS0_base> + 19_H,
DPDSR3: <LPS0_base> + $1A_H$,
DPDSR4: <LPS0_base> + $1B_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	D4_7	D4_6	D4_5	D4_4	D4_3	D4_2	D4_1	D4_0	D3_7	D3_6	D3_5	D3_4	D3_3	D3_2	D3_1	D3_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	D2_7	D2_6	D2_5	D2_4	D2_3	D2_2	D2_1	D2_0	D1_7	D1_6	D1_5	D1_4	D1_3	D1_2	D1_1	D1_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.18 DPDSRM Register Contents

Bit Position	Bit Name	Function
31 to 24	D4_n (n = 7 to 0)	Data to be compared with the fifth digital port input (DPINm)
23 to 16	D3_n (n = 7 to 0)	Data to be compared with the fourth digital port input (DPINm)
15 to 8	D2_n (n = 7 to 0)	Data to be compared with the third digital port input (DPINm)
7 to 0	D1_n (n = 7 to 0)	Data to be compared with the second digital port input (DPINm)

15.3.9 DPDSRH — DPIN Data Set Register H

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR7 to DPDIMR5 registers.

Write to the DPDSRH register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: DPDSRH can be read or written in 32-bit units.
DPDSRHL and DPDSRHH can be read or written in 16-bit units.
DPDSR5, DPDSR6, and DPDSR7 can be read or written in 8-bit units.

Address: DPDSRH: <LPS0_base> + $1C_H$
DPDSRHL: <LPS0_base> + $1C_H$,
DPDSRHH: <LPS0_base> + $1E_H$
DPDSR5: <LPS0_base> + $1C_H$,
DPDSR6: <LPS0_base> + $1D_H$,
DPDSR7: <LPS0_base> + $1E_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.19 DPDSRH Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	D7_n (n = 7 to 0)	Data to be compared with the eighth digital port input (DPINm)
15 to 8	D6_n (n = 7 to 0)	Data to be compared with the seventh digital port input (DPINm)
7 to 0	D5_n (n = 7 to 0)	Data to be compared with the sixth digital port input (DPINm)

15.3.10 DPDIMR0 — DPIN Data Input Monitor Register 0

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 23)) in digital input mode. DPDIMR0 stores the data acquired for the first time.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <LPS0_base> + 20_H

Value after reset: $0000\ 0000_H$

23 to 0	D0M_n (n = 23 to 0)	The first digital port input (DPINm) data

15.3.11 DPDIMR1 — DPIN Data Input Monitor Register 1

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR1 stores the data acquired for the second time.

Access: This register is a read-only register that can be read in 8-bit units.

15.3.18 CNTVAL — Count Value Register

This register specifies the stabilization time of the external circuits (digital signal source and analog signal source).

- In digital mode
  The time from when the DPO output is set to 1 to the time when the port input is acquired for the first time
- In analog mode
  The time from when the APO output is set to 1 to the time when the LPS outputs the A/D conversion trigger to the ADCA0

Write to the CNTVAL register before the sequence operation is started (when the SOSTR.SOF bit = 0).

CAUTION

In analog mode, make sure to secure the stabilization time longer than 1 μs for the stabilization of the A/D converter.

Access: This register can be read or written in 16-bit units.

Address: <LPS0_base> + 40_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 15.28 CNTVAL Register Contents

Bit Position	Bit Name	Function
15 to 8	CNT1n (n = 7 to 0)	These bits set the stabilization time of the external circuit (analog signal source). Stabilization time = $(1/f_{RH})$ × 16 × CNT1n (set value)
7 to 0	CNT0n (n = 7 to 0)	These bits set the stabilization time of the external circuit (digital signal source). Stabilization time = $(1/f_{RH})$ × 16 × CNT0n (set value)

15.3.19 SOSTR — LPS Operation Status Register

This register indicates the operating state of the LPS.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <LPS0_base> + 44_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SOF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 15.29 SOSTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	SOF	LPS Operation Status Flag 0: Initial state before the occurrence of the start trigger 1: LPS operation is in progress (after the start trigger occurs) If the start trigger occurs while the SOF bit is set to 1 (during the LPS operation), the start trigger is canceled.

15.4 Digital Input Mode

With the digital input port DPINm and the externally connected multiplexer, up to 64 input ports can be monitored as shown in **Table 15.30, Combination of Monitored Ports**.

Port DPSELk is used to switch the external multiplexer. The DPSELk output is switched for the number of times specified in the SCTLR register.

TAUJ0 is used to set the timing to check the value input to the port.

Table 15.30 Combination of Monitored Ports

Combination (Number of Ports x Number of Checks)	Ports Used	Total Number
Direct mode When input ports are checked simultaneously without using the external multiplexer Up to 24 ports × 1	DPIN23 to DPIN0	Up to 24
Multiplexer mode When input ports are checked by using a small number of pins and the external multiplexer Up to 8 ports × 8	DPIN7 to DPIN0 DPSEL2 to DPSEL0	Up to 64
MIX mode When input ports are checked using a combination of the above two modes Up to 14 ports x 1 + Up to 7 ports x 7	DPIN7 to DPIN0 DPIN16 to DPIN11 DPSEL2 to DPSEL0*1	Up to 63

Note 1. DPIN16 to DPIN11 and DPIN7 are checked only for the first time. DPIN10 to DPIN8 cannot be used because they are shared with DPSEL2 to DPSEL0.

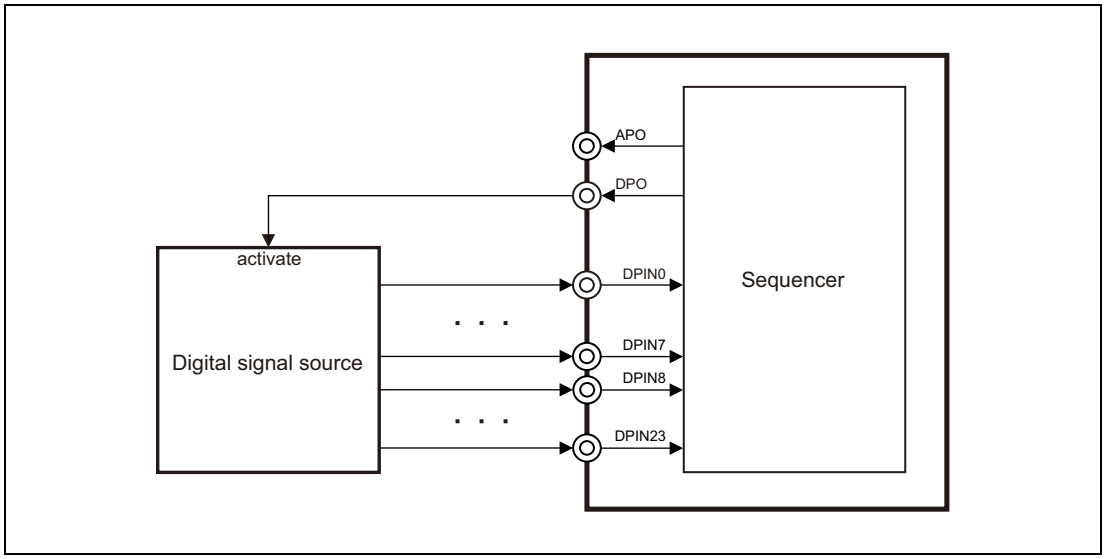

Figure 15.2 Direct Mode Connection Example

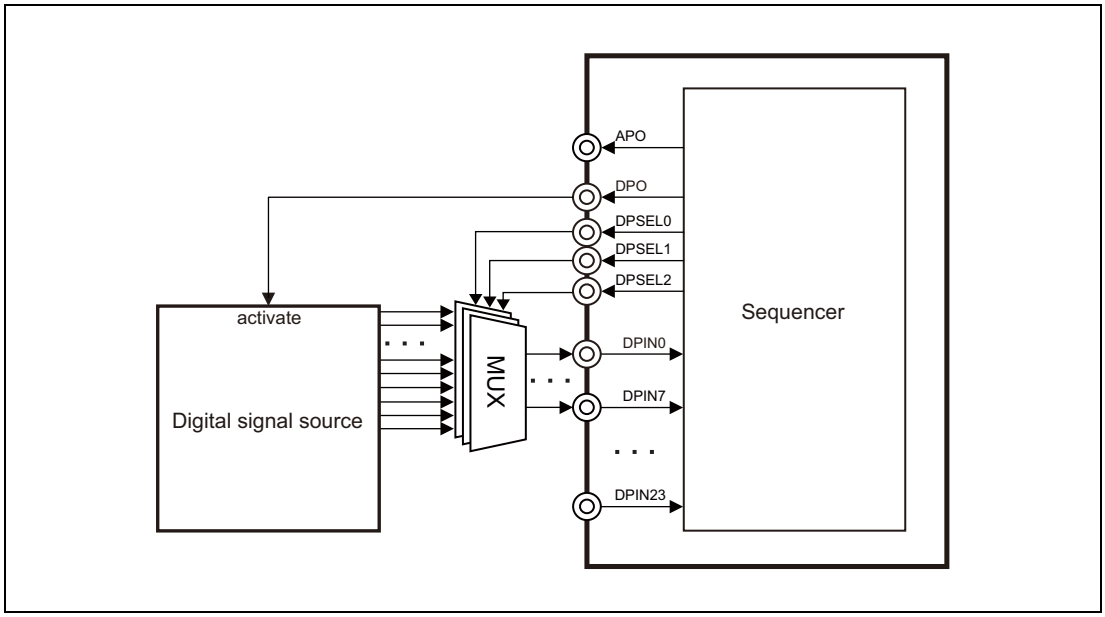

Figure 15.3 Multiplexer Mode Connection Example

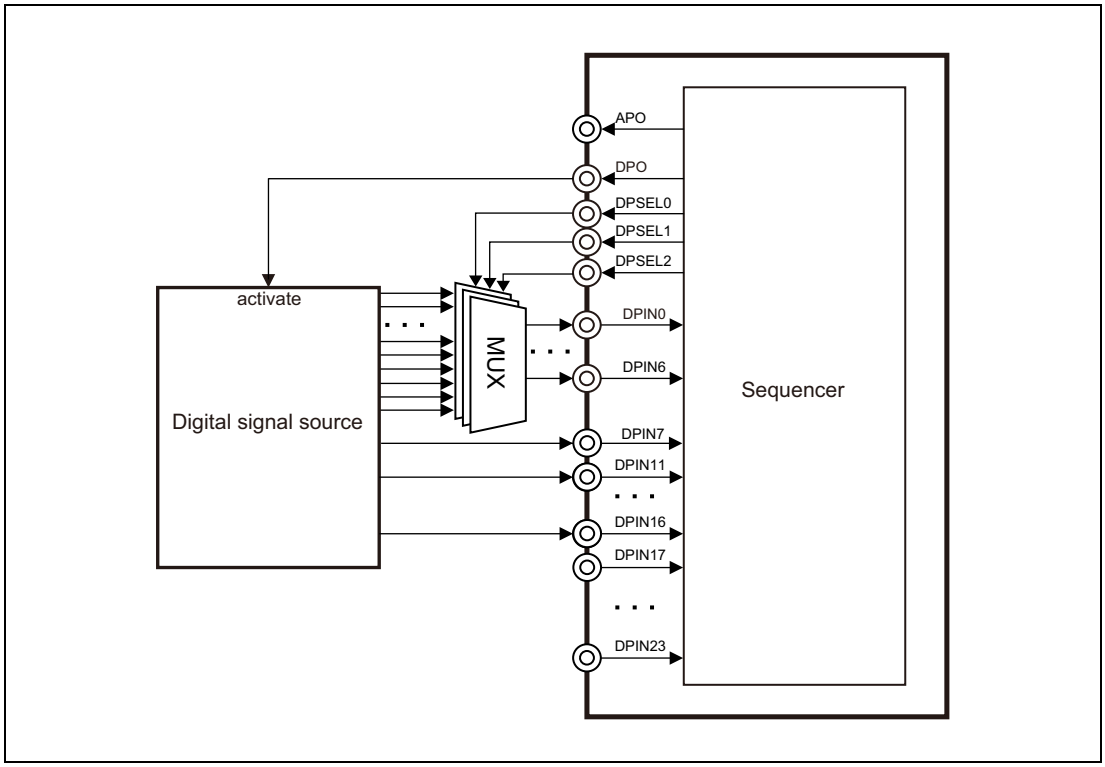

Figure 15.4 MIX Mode Connection Example

CAUTION

DPSEL2 to DPSEL0 are assigned to the same pins as DPIN10 to DPIN8 as alternative-function. They cannot be used simultaneously.

Preparation

- Set NUMDP[2:0] and TJIS[1:0] bits in the SCTLR register to specify the number of times the port is to be read, and the TAUJ0 interrupt to be used as sequence start trigger.
- Set TAUJ0 to interval timer mode.
- Set the wait time of the digital signal source by using the lower 8 bits in the CNTVAL register.
- Set expected values in the DPDSR0, DPDSRM and DPDSRH registers.
- Set the ports to be checked in the DPSELR0, DPSELRM, and DPSELRH registers.

Start

- Start the TAUJ0.
- Set the SCTLR.DPEN bit to 1.

After the operation starts, ports are checked at the interval set in TAUJ0. The operation continues regardless of whether the mode is RUN mode or power save mode. If the HS IntOSC is stopped in stand-by mode, it can only resume operation while the sequencer is running.

Upon completion of checking all ports that have been set, the INTCWEND interrupt occurs. In addition, if the input value of the port is different from the expected value set by the DPDSR0, DPDSRM, or DPDSRH register, the wake-up factor WUTRG0 occurs. The following figures show an example of the operation in digital input mode.

Stop

To stop the LPS operation in Digital Input Mode (by changing the SCTLR.DPEN bit setting from 1 to 0), follow the procedure shown below. In this example, the P0_0 pin is used as DPO.

1. Set the port register to specify low level output on the pin (P0.P0_0 = 0).
2. Change the setting for the P0_0 pin from the alternative port mode to the port mode (PMC0.PMC0_0 = 0).
3. Set SCTLR.DPEN = 0.

Note: The above procedure applies when the P0_0 pin is used as DPO. If the P0_2 pin is used as DPO, specify the P0_2 pin settings in the same way.

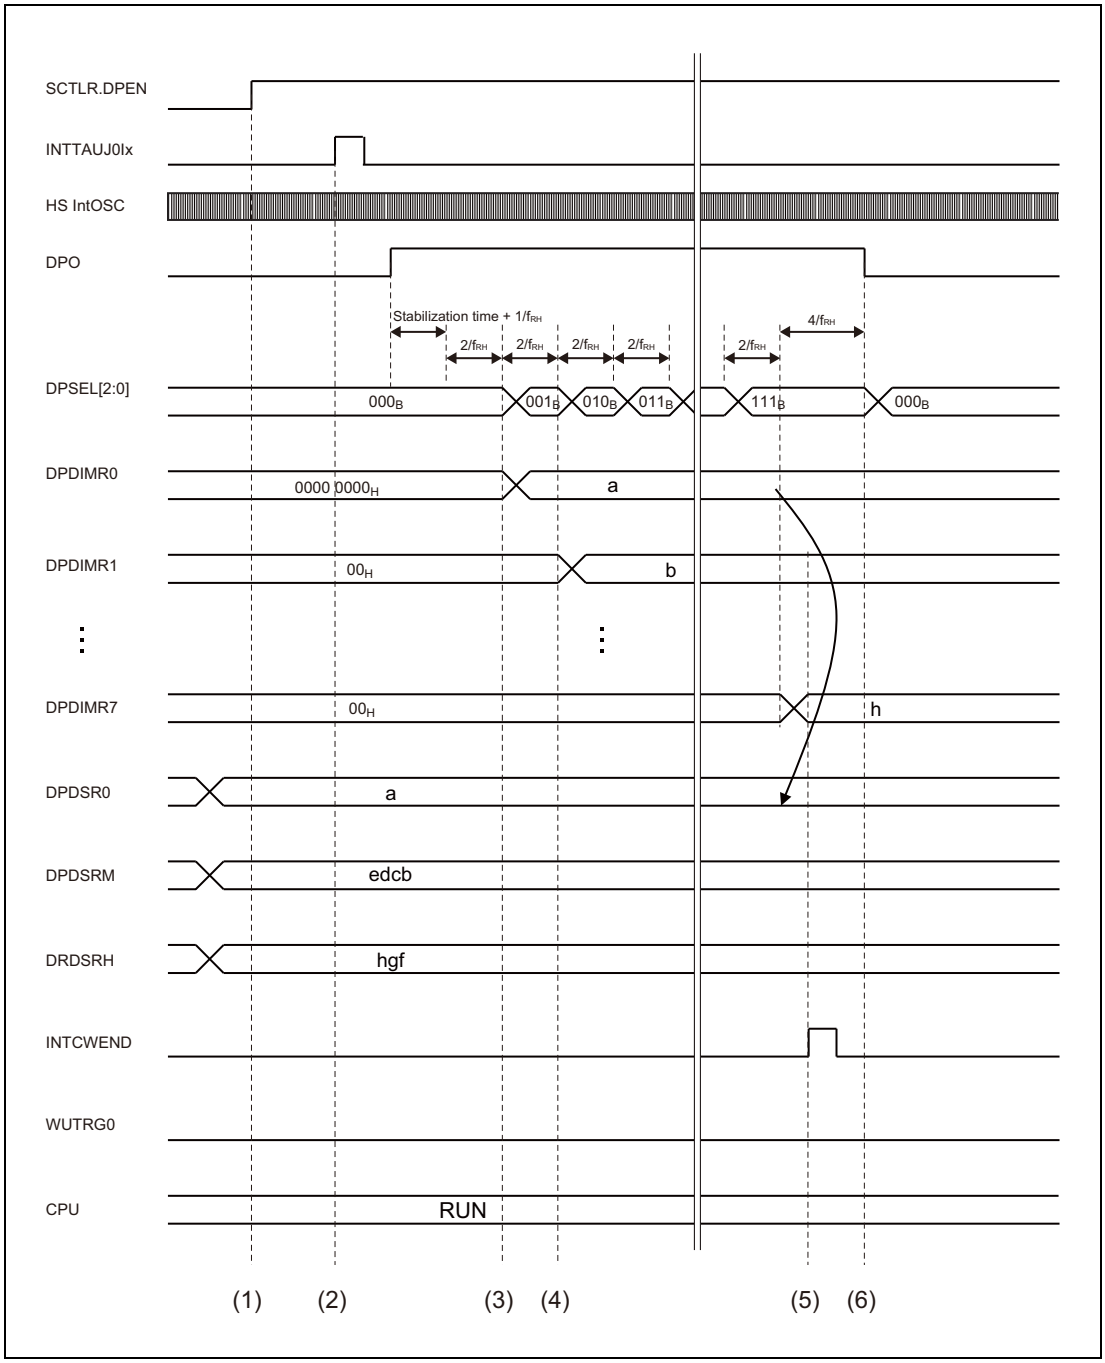

Figure 15.5 Operation of Digital Input Mode (8 Ports × 8) when the Input Value is not Changed (RUN Mode)

(1) Set the SCTLR.DPEN bit to 1 by software to enable the digital input mode of the LPS.

(2) When the INTTAUJ0Ix interrupt specified by the SCTLR.TJIS bit is generated, the sequencer outputs the high level from the DPO pin and waits for the time specified by CNTVAL.CNT0n to secure the stabilization of the external digital signal source.

(3) After the completion of the signal source stabilization, the LPS stores the DPIN[7:0] input value to the DPDIMR0 register and increments the DPSEL[2:0] pins to switch the external multiplexer.

(4) After the switching of the DPSEL[2:0] pins, the LPS stores the values in the DPDIMRn registers in order from DPDIMR1 and continues to increment the DPSEL[2:0] pins.

(5) After the value is stored up to the DPDIMR7 register, the INTCWEND interrupt is generated and the value is compared with the expected value set in the DPDSR0, DPDSRM, and DPDSRH registers.

(6) When the value is not different from the expected value, the wake-up factor WUTRG0 is not generated. The LPS stops the DPO output and returns to the waiting state for the trigger.

High level width of the DPO pin is calculated by the following formula. For the Stabilization time, see **Section 15.3.18, CNTVAL — Count Value Register**.

High level width of the DPO pin

= Stabilization time + $(1/f_{RH}) \times 1 + (1/f_{RH}) \times 2 \times$ (SCTLR.NUMDP (set value) + 1) + $(1/f_{RH}) \times 4$

= Stabilization time + $(1/f_{RH}) \times$ (2 × SCTLR.NUMDP (set value) + 7)

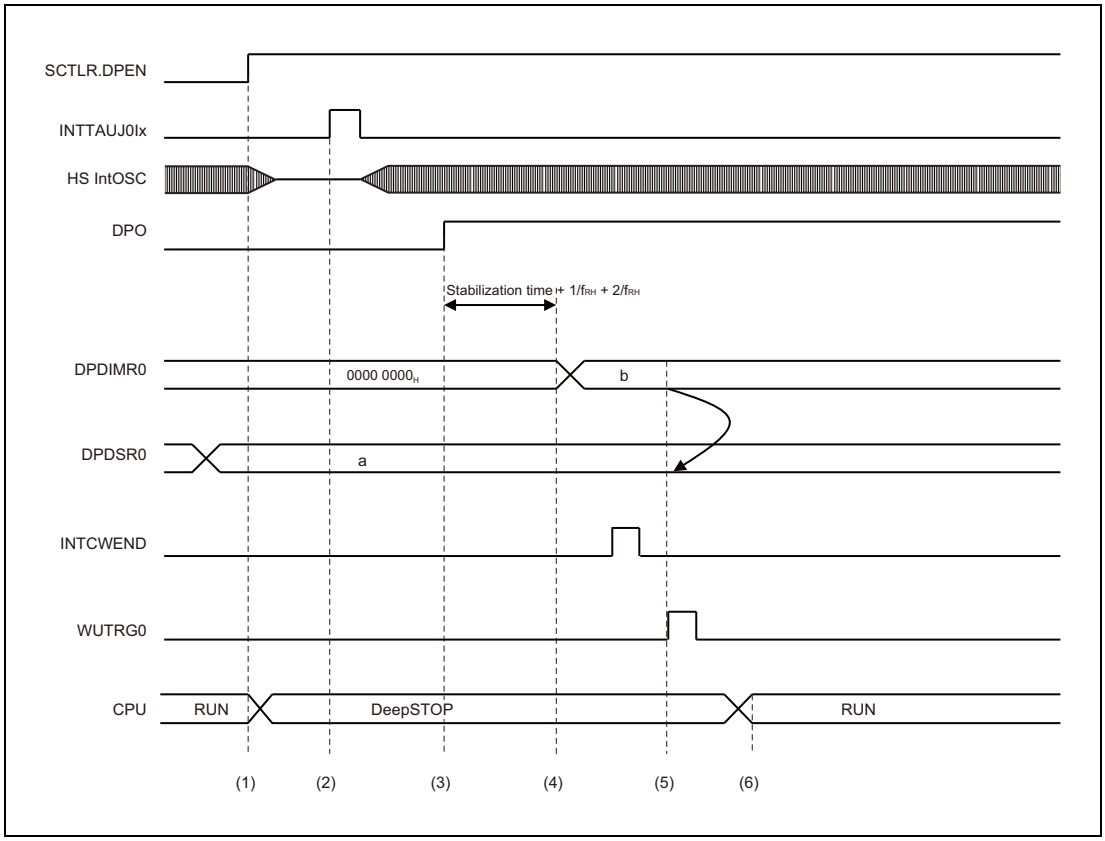

Figure 15.6 Operation of Digital Input Mode (24 Ports × 1) when the Input Value is Changed (DeepSTOP Mode)

(1) Set the STBC0PSC.STBC0DISTRG bit to 1 to transition to the DeepSTOP mode, while the SCTLR.DPEN bit is set to 1 by software to enable the digital input mode of the LPS.

(2) When the INTTAUJ0Ix interrupt specified by the SCTLR.TJIS bit is generated, the LPS enables the HS IntOSC to start the oscillation.

(3) After the completion of the HS IntOSC stabilization time, the LPS outputs the high level from the DPO pin and waits for the time specified by CNTVAL.CNT0n to secure the stabilization of the external digital signal source.

(4) After the completion of the signal source stabilization, the LPS stores the DPIN[23:0] input value to the DPDIMR0 register and the INTCWEND interrupt is generated.

(5) The value stored in the DPDIMR0 register is compared with the expected value set in the DPDSR0 register. When the value is different from the expected value, the wake-up factor WUTRG0 is generated.

(6) The CPU returns to RUN mode at the generation of WUTRG0. The DPO pin is driven high until the EVFR.DINEVF bit is cleared to 0 by software.

15.4.1 Digital Port Error Interrupt

A level sensitive interrupt indicating a data comparison mismatch is generated. This interrupt is generated not only in stand-by mode but also in RUN mode. The set and clear conditions are shown below.

Table 15.31 Digital Port Error Interrupt

Unit Interrupt Signal	Set Condition	Clear Condition
INTDPE	When EVFR.DINEVF is set to 1 by hardware	When EVFR.DINEVF is cleared to 0 by software

15.5 Analog Input Mode

The analog input port ADCA0Im (m = 0 to 15) can be monitored.

TAUJ0 is used to set the timing to check the value input to the port.

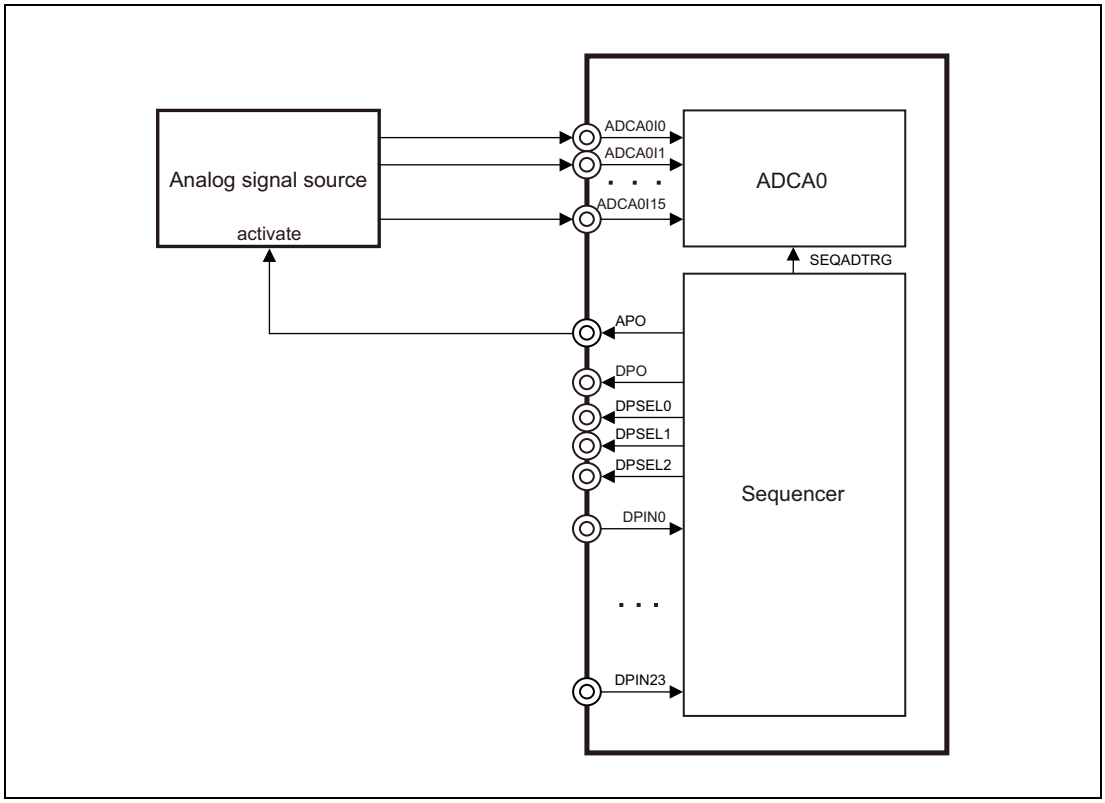

Figure 15.7 Analog Input Mode Connection Example 1

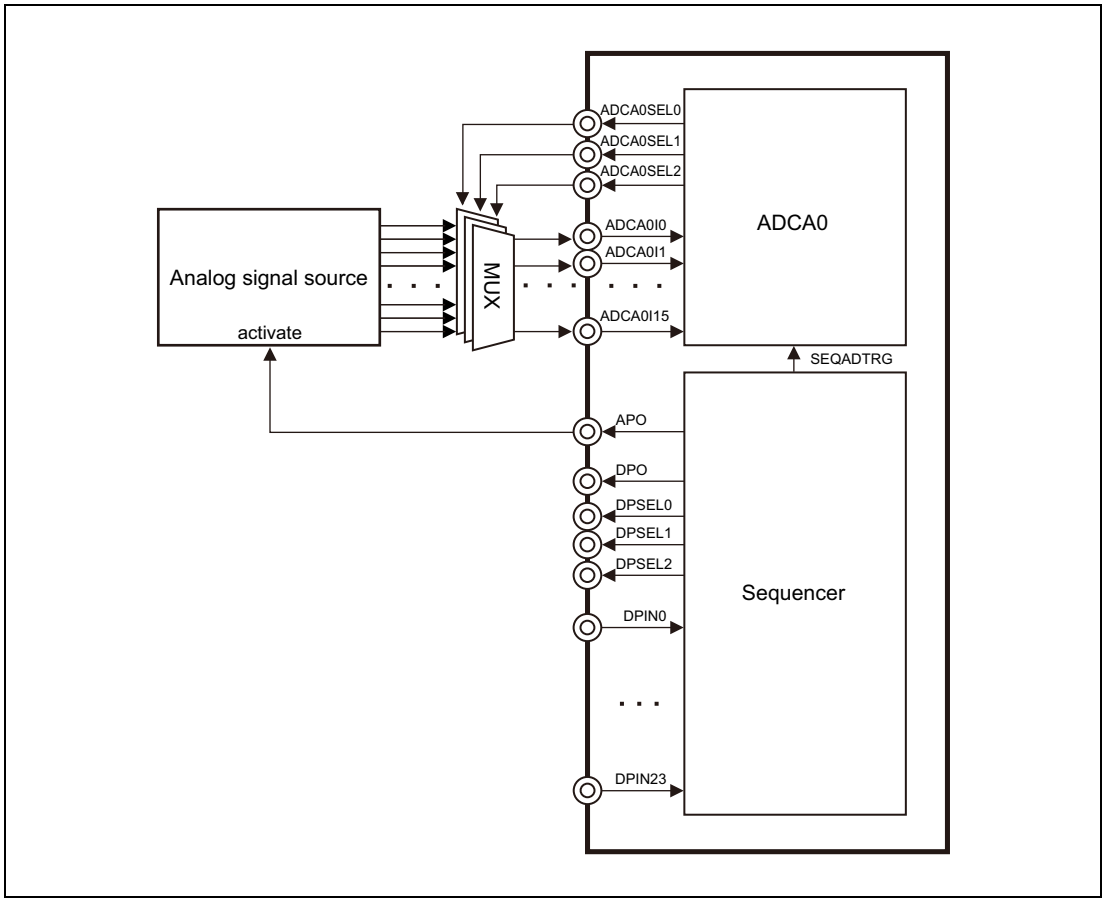

Figure 15.8 Analog Input Mode Connection Example 2

Preparation

- Set TJIS[1:0] bits in the SCTLR register to specify the TAUJ0 interrupt to be used as sequence start trigger.
- Set TAUJ0 to interval timer mode.
- Set the wait time of the analog signal source by using the upper 8 bits in the CNTVAL register.
- Set the ADCA0.

CAUTIONS

1. **When the LPS is in use, the A/D conversion completion interrupt (INT_SGx) should be output after the conversion of all channels of the LPS has been completed. The setting is as follows.**
   - **Set the ADIE bit in virtual channel register j (ADCA0VCRj) to 0 (a scan group x end interrupt (INT_SGx) is not generated when A/D conversion for virtual channel j ends in SGx.).**
   - **Set the ADIE bit in the scan group x control register (ADCA0SGCRx) to 1 (INT_SGx is output when the scan for SGx ends).**
2. **Over the period from the generation of the LPS sequence start trigger set by the SCLTR.TJIS[1:0] bits to the completion of A/D conversion for all channels of the LPS, only proceed with A/D conversion for PWM-Diag.**
   LPS acknowledges the A/D conversion completion interrupts of the scan group

SG1, SG2 or SG3, but does not recognize the kind of SG (three interrupts are ORed to one interrupt). During LPS operation using one SG, an A/D conversion completion interrupt and A/D error interrupt cannot be set for another SG.

3. **Over the period from the generation of the LPS sequence start trigger set by the SCLTR.TJIS[1:0] bits to the completion of A/D conversion for all channels of LPS, do not forcibly end A/D conversion by using the ADCA0ADHALTR.HALT bit.**
4. **When the LPS is in use, do not use the following modes.**
   - **Continuous scan mode (the setting ADCA0SGCRx.SCANMD = 1 is prohibited)**
   - **Multicycle scan mode with 2 or more cycles (the settings ADCA0SGMCYCRx.MCYC = 01_B and 11_B are prohibited)**
   - **Channel repeat mode with 2 or more cycles (the settings ADCA0SGCRx.SCT = 01_B and 10_B are prohibited)**

Start

- Start the TAUJ0.
- Set the SCTLR.ADEN bit to 1.

After the operation starts, ports are checked at the interval set in TAUJ0. The operation continues regardless of whether the mode is RUN mode or power save mode. If the HS IntOSC is stopped in stand-by mode, it can only resume operation while the sequencer is running.

To detect whether the analog input value differs from the expected value, use the A/D error interrupt request (INTADCA0ERR) of the A/D converter.

In addition, if the analog input value is different from the expected value, the wake-up factor WUTRG1 occurs.

For details on the A/D error interrupt request (INTADCA0ERR), see **Section 31.4.13, A/D Error Interrupt Request**[*1]. The following figures show an example of the operation in analog input mode.

Note 1. In **Section 31 A/D Converter (ADCA)**, the name of the A/D error interrupt request is described as “INT_ADE”.

Stop

To stop the LPS operation in Analog Input Mode (by changing the SCTLR.ADEN bit setting from 1 to 0), follow the procedure shown below. Note that the P0_1 pin is used as APO.

1. Set the port register to specify low level output on the pin (P0.P0_1 = 0).
2. Change the setting for the P0_1 pin from the alternative port mode to the port mode (PMC0.PMC0_1 = 0).
3. Set SCTLR.ADEN = 0.

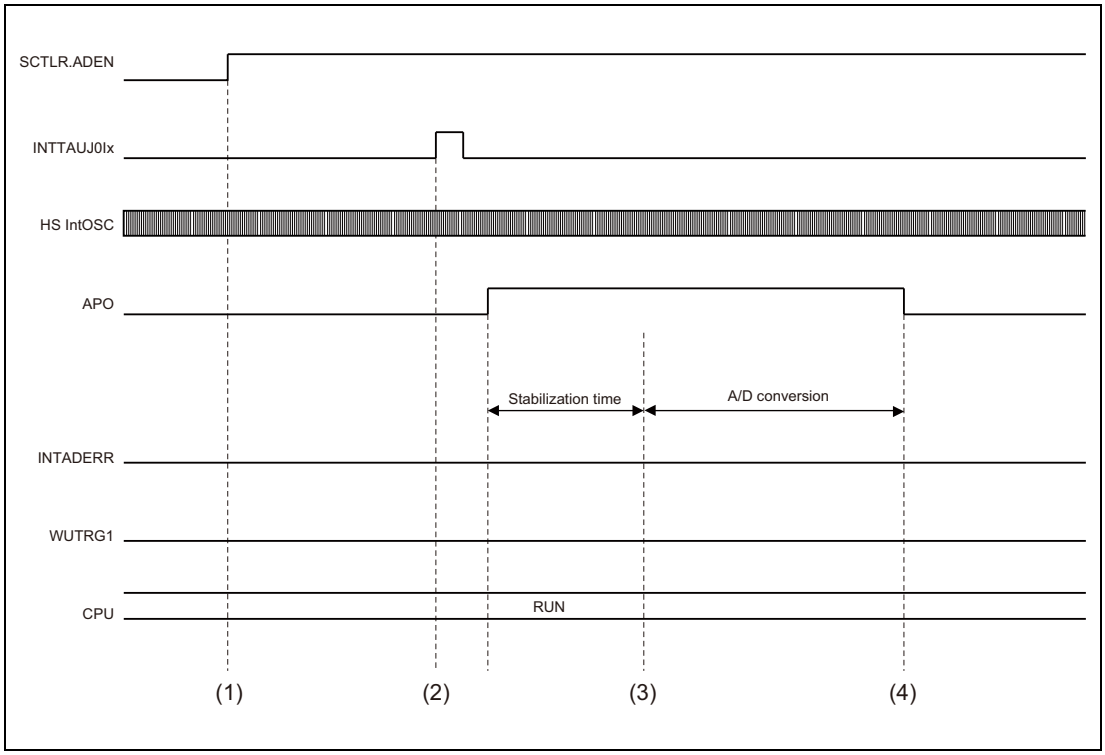

Figure 15.9 Operation of Analog Input Mode when the Conversion Result is within the Expected Range (RUN Mode)

(1) Set the conversion trigger, scan group, and expected range of the A/D converter by software. Then, set the SCTLR.ADEN bit to 1 to enable the analog input mode of the LPS.

(2) When the INTTAUJ0Ix interrupt specified by the SCTLR.TJIS bit is generated, the LPS outputs the high level from the APO pin at the same time it enables the A/D converter, and waits for the time specified by CNTVAL.CNT1n to secure the stabilization of the external analog signal source. Set the stabilization time not less than 1 µs.

(3) After the completion of the signal source stabilization, the LPS triggers the start of conversion to the A/D converter and then the A/D conversion of ADCA0Im (m = 0 to 15), set in the A/D converter scan group, is started.

(4) When the INTADCA0ERR interrupt is not generated as a result of A/D conversion, the LPS halts the A/D converter and resets the APO pin.

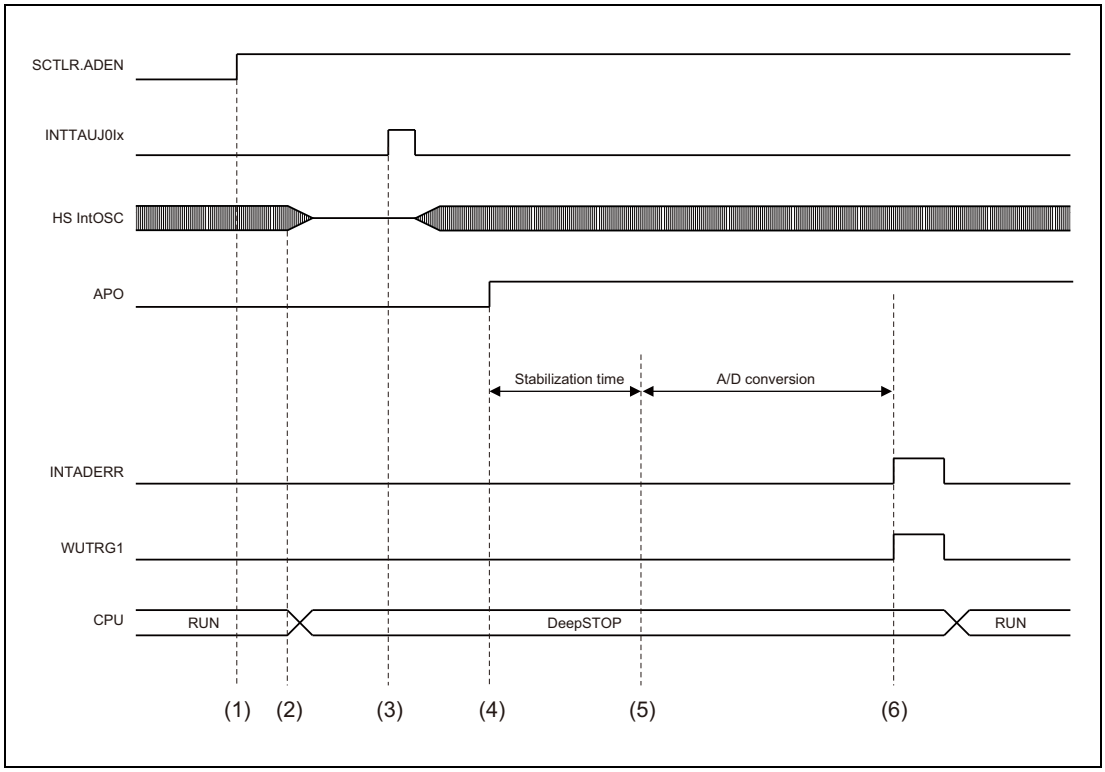

Figure 15.10 Operation of Analog Input Mode when the Conversion Result is not within the Expected Range (DeepSTOP Mode)

(1) Set the conversion trigger, scan group, and expected range of the A/D converter by software. Then, set the SCTLR.ADEN bit to 1 to enable the analog input mode of the LPS.

(2) Set the STBC0PSC.STBC0DISTRG bit to 1 by software to transition to the DeepSTOP mode.

(3) When the INTTAUJ0Ix interrupt specified by the SCTLR.TJIS bit is generated, the LPS enables the HS IntOSC to start the oscillation.

(4) After the completion of the HS IntOSC stabilization, the LPS outputs the high level from the APO pin at the same time it enables the A/D converter, and waits for the time specified by CNTVAL.CNT1n to secure the stabilization of the external analog signal source.

(5) After the completion of the signal source stabilization, the LPS triggers the start of conversion to the A/D converter and then the A/D conversion of ADCA0Im (m = 0 to 15), set in the A/D converter scan group, is started.

(6) When the INTADCA0ERR interrupt is generated as a result of A/D conversion, the wake-up factor WUTRG1 is generated and the CPU returns to RUN mode. The APO pin is driven high until the upper limit/lower limit error flag of the A/D converter is cleared to 0 by software.

NOTE

WUTRG1 is generated when the first ADCA0 SG interrupt occurred after ADCAnULER.UE or ADCAnULER.LE is set.

15.5.1 Analog Port Error Interrupt

A level sensitive interrupt indicating a data comparison mismatch is generated. This interrupt is generated not only in the stand-by mode but also in RUN mode. The set and clear conditions are shown below.

Table 15.32 Analog Port Error Interrupt

Unit Interrupt Signal	Set Condition	Clear Condition
INTAPE	When WUTRG1 is set to 1 by hardware	When both ADCAnULER.UE and ADCAnULER.LE are cleared to 0 by software

Section 16 Clocked Serial Interface G (CSIG)

This section contains a generic description of the Clocked Serial Interface G (CSIG).

The first part in this section describes the features specific to RH850/F1K, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the CSIG.

16.1 Features of RH850/F1K CSIG

16.1.1 Number of Units

This microcontroller has the following number of CSIG units.

Each CSIG unit has one channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 16.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	1	2	2
Name	CSIGn (n = 0)	CSIGn (n = 0, 1)	CSIGn (n = 0, 1)

Table 16.2 Index

Index	Description
n	Throughout this section, the individual CSIG units are identified by the index “n” (n = 0, 1): for example, CSIGnCTL0 is the CSIGn control register 0.

16.1.2 Register Base Address

CSIG base addresses are listed in the following table.

CSIG register addresses are given as offsets from the base addresses.

Table 16.3 Register Base Addresses

Base Address Name	Base Address
<CSIG0_base>	FFD8 8000_H
<CSIG1_base>	FFD8 $A000_H$

16.1.3 Clock Supply

The CSIG clock supply is shown in the following table.

Table 16.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
CSIGn	PCLK	CKSCLK_ICSI	Communication clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_ICSI	

16.1.4 Interrupt Request

CSIG interrupt requests are listed in the following table.

Table 16.5 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
CSIG0			
INTCSIGTIC	Communication status interrupt	27,118	8
INTCSIGTIR	Receive status interrupt	28,119	9
INTCSIGTIRE	Communication error interrupt	57	—
CSIG1			
INTCSIGTIC	Communication status interrupt	223	109
INTCSIGTIR	Receive status interrupt	224	110
INTCSIGTIRE	Communication error interrupt	225	—

16.1.5 Reset Sources

CSIG reset sources are listed in the following table. CSIG is initialized by these reset sources.

Table 16.6 Reset Sources

Unit Name	Reset Source
CSIGn	All reset sources (ISORES)

16.1.6 External Input/Output Signals

External input/output signals of CSIG are listed below.

Table 16.7 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
CSIG0		
CSIGTSCK	Serial clock signal	CSIG0SC
CSIGTSI	Serial data input signal	CSIG0SI
CSIGTSO	Serial data output signal	CSIG0SO
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG0SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG0RYI
CSIGTRYO	Ready / busy output signal	CSIG0RYO
CSIG1		
CSIGTSCK	Serial clock signal	CSIG1SC
CSIGTSI	Serial data input signal	CSIG1SI
CSIGTSO	Serial data output signal	CSIG1SO
$\overline{\text{CSIGTSSI}}$	Slave select input signal	$\overline{\text{CSIG1SSI}}$
CSIGTRYI	Ready / busy input signal	CSIG1RYI
CSIGTRYO	Ready / busy output signal	CSIG1RYO

Note: For the port pins that are used as CSIGnSO and CSIGnSC, set the output driving ability to high (PDSCn_m = 1).

16.1.7 Data Consistency Check

The port and the alternative function for data consistency check of CSIGnSO (CSIGTSO) output are shown in the following table. See **Section 16.5.10, Error Detection** for details on data consistency checking.

Table 16.8 Port Pins for Data Consistency Checking

Unit Signal Name	Port Pin Name	Alternative Function
CSIG0		
CSIGTSO	P0_13	ALT_OUT4
	P10_6	ALT_OUT2
CSIG1		
CSIGTSO	P11_9	ALT_OUT1

16.2 Overview

16.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode or slave mode is selectable.
- Slave select input signal ($\overline{\text{CSIGTSSI}}$) is available.
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, whereas it is determined by the input clock in slave mode.
- Maximum transfer clock frequency:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16)
- Clock phases and data phases are selectable.
- Data transfer with MSB first or LSB first is selectable.
- Transfer data length is selectable from 7 to 16 bits in 1-bit units
- Built-in EDL (extended data length) function for transferring more than 16 bits of data.
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Built-in handshake function
- Built-in error detection (data consistency check, parity, overrun)
- Three different interrupt request signals (INTCSIGTIC, INTCSIGTIR, INTCSIGTIRE)
- Built-in LBM (Loop Back Mode) function for self-test

16.2.2 Functional Overview Description

The CSIG uses three signals for communication:

- Transmission clock CSIGTSCK (output in master mode, input in slave mode)
- Serial data output signal CSIGTSO
- Serial data input signal CSIGTSI

The CSIGnCTL2 register is used to select whether the CSIG should be operated in master mode or slave mode.

Additional signals can be used for external control and monitoring:

- CSIGTSSI: Slave select input signal
- CSIGTRYO: Ready/busy output signal (handshake signal)
- CSIGTRYI: Ready/busy input signal (handshake signal)

Data transmission is bit-wise and serial and synchronous to the transmission clock.

The following table shows the most important registers for setting up CSIG.

Table 16.9 Main Registers of CSIG

Register	Function
CSIGnCTL0	Provides and stops operating clock and enables/disables data transmission and data reception.
CSIGnCTL1	Controls options such as interrupt timing, extended data length, data consistency check, loop-back mode, handshake, etc.
CSIGnCTL2	Selects master or slave mode, and the transfer clock frequency of the built-in baud rate generator (BRG) in master mode.
CSIGnCFG0	Configures the communication protocol.

16.2.3 Block Diagram

The following block diagram shows the main components of the CSIG.

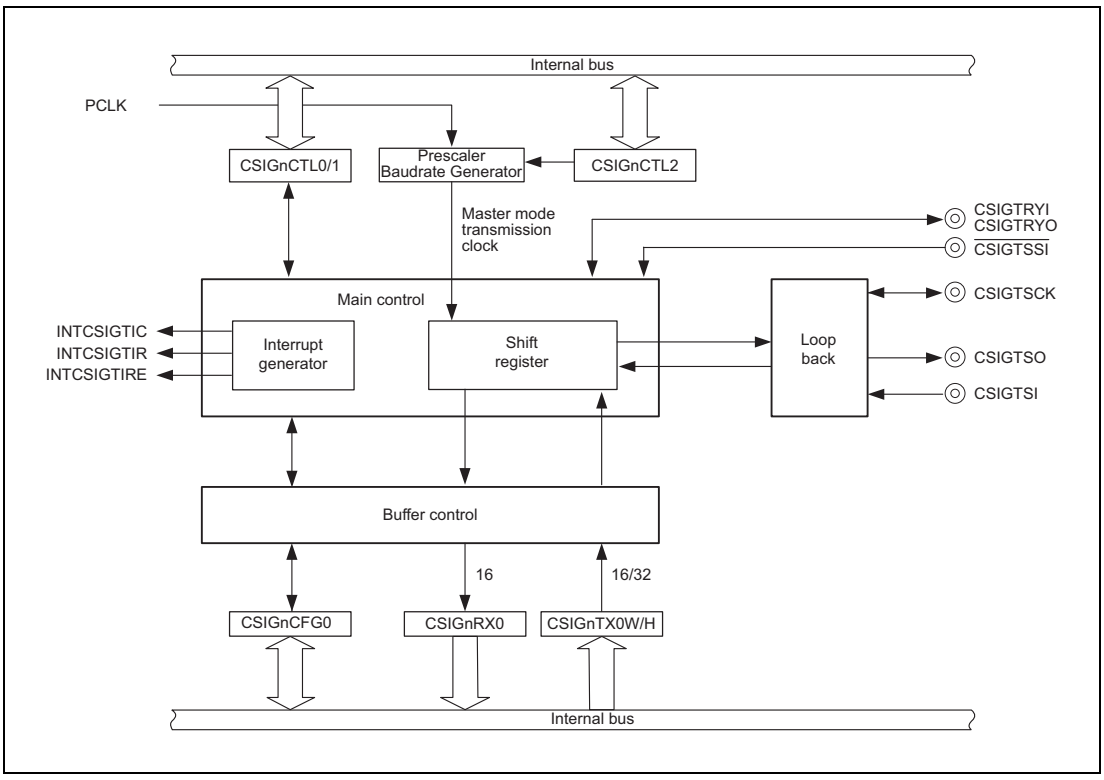

Figure 16.1 CSIG Block Diagram

In master mode, the transmission clock CSIGTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

16.3 Registers

16.3.1 List of Registers

CSIG registers are listed in the following table.

For details on <CSIGn_base>, see **Section 16.1.2, Register Base Address**.

Table 16.10 List of Registers

Module Name	Register Name	Symbol	Address
CSIGn	CSIGn control register 0	CSIGnCTL0	<CSIGn_base> + 0000_H
	CSIGn control register 1	CSIGnCTL1	<CSIGn_base> + 0010_H
	CSIGn control register 2	CSIGnCTL2	<CSIGn_base> + 0014_H
	CSIGn status register 0	CSIGnSTR0	<CSIGn_base> + 0004_H
	CSIGn status clear register 0	CSIGnSTCR0	<CSIGn_base> + 0008_H
	CSIGn Receive-only mode control register 0	CSIGnBCTL0	<CSIGn_base> + 1000_H
	CSIGn configuration register 0	CSIGnCFG0	<CSIGn_base> + 1010_H
	CSIGn transmission register 0 for word access	CSIGnTX0W	<CSIGn_base> + 1004_H
	CSIGn transmission register 0 for half word access	CSIGnTX0H	<CSIGn_base> + 1008_H
	CSIGn reception register 0	CSIGnRX0	<CSIGn_base> + $100C_H$
	CSIGn emulation register	CSIGnEMU	<CSIGn_base> + 0018_H

16.3.2 CSIGnCTL0 — CSIGn Control Register 0

This register controls the operation clock, and enables or disables transmission/reception.

Access: This register can be read or written in 8-bit units.

Address: <CSIGn_base> + 0000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CSIGnPWR	CSIGnTXE	CSIGnRXE	—	—	—	—	CSIGnMBS
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R/W

Table 16.11 CSIGnCTL0 Register Contents

Bit Position	Bit Name	Function
7	CSIGnPWR	Controls operation clock. 0: Stops operation clock. 1: Supplies operation clock. Clearing CSIGnPWR to 0 resets the internal circuits, stops operation, and sets the CSIG to standby state. Clock supply to internal circuits stops. If CSIGnPWR is cleared during communication, ongoing communication is aborted. In this case, communication setting must be started from the beginning.
6	CSIGnTXE	Enables/disables transmission. 0: Transmission disabled 1: Transmission enabled
5	CSIGnRXE	Enables/disables reception. 0: Reception disabled 1: Reception enabled
4 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CSIGnMBS	This bit must be set to 1 (the value after reset is 0).

CAUTION

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

16.3.3 CSIGnCTL1 — CSIGn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, handshake function, and slave select function.

Access: This register can be read or written in 32-bit units.

Address: <CSIGn_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CSIGn CKR	CSIGn SLIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CSIGn EDLE	—	CSIGn DCS	—	CSIGn LBM	CSIGn SIT	CSIGn HSE	CSIGn SSE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 16.12 CSIGnCTL1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17	CSIGnCKR	CSIGTSCK clock inversion function 0: Default level of CSIGTSCK is high. 1: Default level of CSIGTSCK is low. The CSIGnCKR bit is used in combination with the CSIGnCFG0.CSIGnDAP bit. For details, see **Section 16.3.8, CSIGnCFG0 — CSIGn Configuration Register 0**.
16	CSIGnSLIT	Selects the timing of interrupt INTCSIGTIC. 0: Normal interrupt timing (interrupt is generated after the transfer) 1: Interrupt generation when CSIGnTX0W/H is empty and available for storing the next data. For details, see **16.4.2, INTCSIGTIC (Communication Status Interrupt)**
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	CSIGnEDLE	Enables/disables extended data length (EDL) mode. 0: Extended data length mode disabled 1: Extended data length mode enabled For details, see **16.5.5.2, Data Length Selection with Extended Data Length**.
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CSIGnDCS	Enables/disables data consistency check. 0: Data consistency check disabled 1: Data consistency check enabled For details, see **16.5.10.1, Data Consistency Check**.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	CSIGnLBM	Controls loop-back mode (LBM). 0: Loop-back mode deactivated 1: Loop-back mode activated Loop-back mode can be set only in master mode. Set this bit to 0 in slave mode. For details, see **Section 16.5.9, Loop-Back Mode**.

Table 16.12 CSIGnCTL1 Register Contents (2/2)

Bit Position	Bit Name	Function
2	CSIGnSIT	Selects interrupt delay mode. 0: No delay 1: Half clock delay for all interrupts This bit is only valid in master mode. In slave mode, no delay is generated. For details, see **Section 16.4.1, Interrupt Delay**.
1	CSIGnHSE	Enables/disables handshake function. 0: Handshake function disabled 1: Handshake function enabled For details, see **Section 16.5.8, Handshake Function**.
0	CSIGnSSE	Enables/disables slave select function. 0: Input signal $\overline{\text{CSIGTSSI}}$ disabled. 1: Input signal $\overline{\text{CSIGTSSI}}$ enabled. If the slave select function is not used, this bit must be set to 0 (see also **Section 16.5.2, Master/Slave Connections**).

Details about CSIGnCTL1.CSIGnSSE:

Table 16.13 Operation of the Slave Select Function during Reception

CSIGnCTL0. CSIGnRXE	CSIGnCTL1. CSIGnSSE	$\overline{\text{CSIGTSSI}}$	Receive Operation
0	—	—	Reception disabled
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

Table 16.14 Operation of the Slave Select Function during Transmission

CSIGnCTL0. CSIGnTXE	CSIGnCTL1. CSIGnSSE	$\overline{\text{CSIGTSSI}}$	Transmit Operation
0	—	—	Transmission disabled
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

CAUTION

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

16.3.4 CSIGnCTL2 — CSIGn Control Register 2

This register selects the communication clock.

Access: This register can be read or written in 16-bit units.

Address: <CSIGn_base> + 0014_H

Value after reset: $E000_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIGnPRS[2:0]			—	CSIGnBRS[11:0]											
Value after reset	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.15 CSIGnCTL2 Register Contents

Bit Position	Bit Name	Function
15 to 13	CSIGnPRS [2:0]	Selects the value of the prescaler.
12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CSIGnBRS [11:0]	Selects the transfer clock frequency. Settings of the CSIGnBRS[11:0] bits are valid only in master mode. They are ignored in slave mode.

CSIGn PRS2	CSIGn PRS1	CSIGn PRS0	Prescaler Output (PRSOUT)
0	0	0	PCLK (master mode)
0	0	1	PCLK / 2 (master mode)
0	1	0	PCLK / 4 (master mode)
0	1	1	PCLK / 8 (master mode)
1	0	0	PCLK / 16 (master mode)
1	0	1	PCLK / 32 (master mode)
1	1	0	PCLK / 64 (master mode)
1	1	1	External clock via CSIGTSCK (slave mode)

CSIGnBRS [11:0]	Transfer Clock Frequency of CSIGTSCK
0	BRG is stopped
1	PCLK / (2^{α} × 1 × 2)
2	PCLK / (2^{α} × 2 × 2)
3	PCLK / (2^{α} × 3 × 2)
4	PCLK / (2^{α} × 4 × 2)
...	...
4095	PCLK / (2^{α} × 4095 × 2)

Note: α = 0 to 6 (value set by CSIGnPRS[2:0])

CAUTION

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

16.3.5 CSIGnSTR0 — CSIGn Status Register 0

This register indicates the status of the CSIG.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <CSIGn_base> + 0004_H

Value after reset: $0000\ 0010_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CSIGn TSF	—	—	—	CSIGn DCE	—	CSIGn PE	CSIGn OVE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 16.16 CSIGnSTR0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	CSIGnTSF	Transfer Status Flag 0: Idle state 1: Communication is in progress or being prepared The timing to set or clear this bit is as follows: **Master Mode** / **Timing to Set** / **Timing to Clear** Tx-only mode: Writing to transmission register: Within a half clock cycle from the last serial clock edge Tx/Rx mode: Writing to transmission register: Within a half clock cycle from the last serial clock edge Rx-only mode: Reading from reception register: Within a half clock cycle from the last serial clock edge **Slave Mode** / **Timing to Set** / **Timing to Clear** Tx-only mode: Writing to transmission register: Within a half clock cycle from the last serial clock edge Tx/Rx mode: Writing to transmission register: Within a half clock cycle from the last serial clock edge Rx-only mode: CSIGTSCK input: Within a half clock cycle from the last serial clock edge
6 to 4	Reserved	When read, the value after reset is returned.
3	CSIGnDCE	Data Consistency Check Error Flag 0: No data consistency check error detected 1: Data consistency check error detected This bit is cleared by writing 1 to CSIGnSTCR0.CSIGnDCEC. When setting to 1 due to data consistency check error detection and clearing to 0 by CSIGnSTCR0.CSIGnDCEC occur simultaneously, setting to 1 due to data consistency check error detection takes precedence. This bit is initialized when CSIGnCTL0.CSIGnPWR changes from 0 to 1, or from 1 to 0.
2	Reserved	When read, the value after reset is returned.

Table 16.16 CSIGnSTR0 Register Contents (2/2)

Bit Position	Bit Name	Function
1	CSIGnPE	Parity Error Flag 0: No parity error detected 1: Parity error detected This bit is cleared by writing 1 to CSIGnSTCR0.CSIGnPEC. When setting to 1 due to parity error detection and clearing to 0 by writing to CSIGnSTCR0.CSIGnPEC occur simultaneously, setting to 1 due to parity error detection takes precedence. This bit is initialized when CSIGnCTL0.CSIGnPWR changes from 0 to 1, or from 1 to 0.
0	CSIGnOVE	Overrun Error Flag 0: No overrun error detected 1: Overrun error detected This bit is cleared by writing 1 to CSIGnSTCR0.CSIGnOVEC. When setting to 1 due to overrun error detection and clearing to 0 by writing to CSIGnSTCR0.CSIGnOVEC occur simultaneously, setting to 1 due to overrun error detection takes precedence. This bit is initialized by the value of CSIGnCTL0.CSIGnPWR changes from 0 to 1, or from 1 to 0.

CAUTION

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

16.3.6 CSIGnSTCR0 — CSIGn Status Clear Register 0

This register clears the status flags of the CSIGnSTR0 status register.

Access: This register can be read or written in 16-bit units.
When read, the value 0000_H is always returned.

Address: <CSIGn_base> + 0008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CSIGn DCEC	—	CSIGn PEC	CSIGn OVEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W

Table 16.17 CSIGnSTCR0 Register Contents

Bit Position	Bit Name	Function
15 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	CSIGnDCEC	Controls the data consistency check error flag clear command. 0: No operation. Read value is always 0. 1: Clears the data consistency check error flag (CSIGnSTR0.CSIGnDCE).
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CSIGnPEC	Controls the parity error flag clear command. 0: No operation. Read value is always 0. 1: Clears the parity error flag (CSIGnSTR0.CSIGnPE).
0	CSIGnOVEC	Controls the overrun error flag clear command. 0: No operation. Read value is always 0. 1: Clears the overrun error flag (CSIGnSTR0.CSIGnOVE).

16.3.7 CSIGnBCTL0 — CSIGn Rx-Only Mode Control Register 0

This register enables/disables the data transfer in Rx-only mode.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: <CSIGn_base> + 1000_H

Value after reset: 01_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CSIGnSCE
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R/W

Table 16.18 CSIGnBCTL0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CSIGnSCE	Disables/enables the start of the next data reception by reading CSIGnRX0. 0: Next reception disabled 1: Next reception enabled For details, see **Section 16.5.4.2, Receive-Only Mode**.

CAUTION

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

16.3.8 CSIGnCFG0 — CSIGn Configuration Register 0

This register configures the communication protocols such as data length, parity, transfer direction, clock phase, and data phase.

Access: This register can be read or written in 32-bit units.

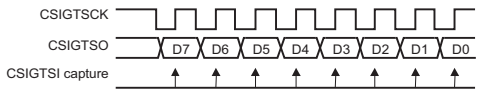
Address: <CSIGn_base> + 1010_H

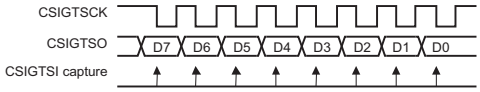
Value after reset: $0000\ 0000_H$

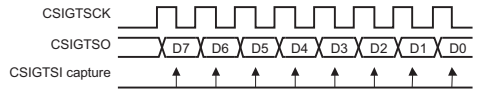
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CSIGnPS[1:0]		CSIGnDLS[3:0]				—	—	—	—	—	CSIGn DIR	—	CSIGn DAP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R	R/W

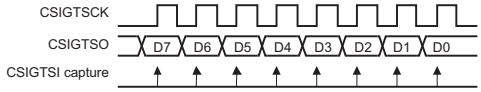
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 16.19 CSIGnCFG0 Register Contents (1/2)









Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29, 28	CSIGnPS[1:0]	Specifies parity.

CSIGn PS1	CSIGn PS0	Transmission	Reception
0	0	Does not transmit any parity bit.	Does not wait for reception of the parity bit.
0	1	Adds a parity bit fixed to 0.	Waits for reception of the parity bit but does not evaluate it.
1	0	Adds the odd parity bit.	Waits for the odd parity bit.
1	1	Adds the even parity bit.	Waits for the even parity bit.

27 to 24	CSIGnDLS [3:0]	Specifies data length. 0: Data length is 16 bits 1: Data length is 1 bit 2: Data length is 2 bits ... 15: Data length is 15 bits **CAUTION** Do not set bits CSIGnCFG0.CSIGnDLS[3:0] to values 1 to 6 when the extended data length function is disabled with bit CSIGnCTL1.CSIGnEDLE set to 0. Transmitting two consecutive data with a data length of less than 7 bits is prohibited.
23 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	CSIGnDIR	Selects the serial data direction. 0: Data is transmitted/received with MSB first 1: Data is transmitted/received with LSB first
17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 16.19 CSIGnCFG0 Register Contents (2/2)

Bit Position	Bit Name	Function
16	CSIGnDAP	Data Phase Selection Used in conjunction with CSIGnCTL1.CSIGnCKR bit to select the data phase. Refer to the following table for the selectable clock phases and data phases.
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CSIGnCTL1.CSIGnCKR	CSIGnDAP	Clock and Data Phase Selection
0	0	
0	1	
1	0	
1	1	

CAUTION

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

16.3.9 CSIGnTX0W — CSIGn Transmission Register 0 for Word Access

This register stores the transmission data and specifies the extended data length.

Access: This register can be read or written in 32-bit units.

Address: <CSIGn_base> + 1004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CSIGnEDL	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIGnTX[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.20 CSIGnTX0W Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29	CSIGnEDL	Specifies the extended data length. 0: Normal operation 1: Extended data length enabled The associated data is transmitted as 16-bit data. This bit can only be set if CSIGnCTL1.CSIGnEDLE = 1.
28 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	CSIGnTX[15:0]	Data to be transmitted

CAUTION

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

16.3.10 CSIGnTX0H — CSIGn Transmission Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of CSIGnTX0W register.
The settings specified by the upper 16 bits of CSIGnTX0W are applied to the transmission.

Access: This register can be read or written in 16-bit units.

Address: <CSIGn_base> + 1008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIGnTX[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.21 CSIGnTX0H Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIGnTX[15:0]	Data to be transmitted

CAUTION

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

16.3.11 CSIGnRX0 — CSIGn Reception Register 0

This register stores the received data.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <CSIGn_base> + $100C_H$

Value after reset: 0000_H

Table 16.22 CSIGnRX0 Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIGnRX [15:0]	Received Data These bits are initialized when CSIGnCTL0.CSIGnPWR changes from 0 to 1 or from 1 to 0. When reading, the values of these bits must be read at least 1 clock before the generation of CSIGTIR interrupt.

CAUTION

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

16.3.12 CSIGnEMU — CSIGn Emulation Register

This register controls operation by SVSTOP.

Access: This register can be read or written in 8-bit or 1-bit units.
Write to this register when EPC.SVSTOP = 0.

Address: <CSIGn_base> + 0018_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CSIGnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 16.23 CSIGnEMU Register Contents

Bit Position	Bit Name	Function
7	CSIGnSVSDIS	Selects whether to continue or stop transmit/receive operation during debugging. • When the EPC.SVSTOP bit is set to 0: Continues transmit/receive operation regardless of the setting of this bit. • When the EPC.SVSTOP bit is set to 1: 0: Stops transmit/receive operation. 1: Continues transmit/receive operation.
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

When configuring this register, see **Table 16.24, List of Cautions when Configuring the Registers**.

16.3.13 List of Cautions

Table 16.24 List of Cautions when Configuring the Registers

Register Name	Bit Name	Cautions
CSIGnCTL0	CSIGnPWR	If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, it is necessary to restart the communication.
CSIGnCTL0	CSIGnTXE CSIGnRXE	Do not modify any of these bits while CSIGnCTL0.CSIGnPWR = 0. (These bits can be modified simultaneously with the CSIGnCTL0.CSIGnPWR bit.) Do not modify these bits while CSIGnSTR0.CSIGnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted.
CSIGnCTL0	CSIGnMBS	When writing, be sure to set to this bit to 1. (The value after reset is “0”.) This bit must be modified simultaneously with CSIGnCTL0.CSIGnPWR bit.
CSIGnCTL1	CSIGnCKR	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnCTL1	CSIGnSLIT CSIGnEDLE CSIGnDCS CSIGnHSE	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnCTL1	CSIGnLBM	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting of this bit is prohibited in slave mode.
CSIGnCTL1	CSIGnSSE	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting this bit to 1 is prohibited in master mode.
CSIGnCTL1	CSIGnSIT	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated.
CSIGnCTL2	CSIGnPRS[2:0] CSIGnBRS[11:0]	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting of the maximum transfer clock frequency is as follows. • Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4) • Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16)
CSIGnSTR0	CSIGnTSF	Writing to this bit is prohibited, and only reading is permitted.
CSIGnSTR0	CSIGnDCE CSIGnPE CSIGnOVE	Writing to these bits is prohibited, and only reading is permitted. These bits are initialized when CSIGnCTL0.CSIGnPWR = 0 → 1 or CSIGnCTL0.CSIGnPWR = 1 → 0.
CSIGnBCTL0	CSIGnSCE	Write to this bit before CSIGnRX0 is read. Fix the CSIGnSCE bit to 0 when the transfer mode is transmit mode or transmit/receive mode.
CSIGnCFG0	CSIGnPS[1:0] CSIGnDLS[3:0] CSIGnDIR CSIGnDAP	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnTX0W	CSIGnEDL	This bit is valid only when CSIGnCTL1.CSIGnEDLE = 1.
CSIGnTX0W CSIGnTX0H		Write access to these bits are prohibited when CSIGnCTL0.CSIGnTXE = CSIGnCTL0.CSIGnRXE = 0.
CSIGnRX0		These bits are initialized when CSIGnCTL0.CSIGnPWR = 0 → 1 or CSIGnCTL0.CSIGnPWR = 1→ 0. Read access to this bit is prohibited when CSIGnCTL0.CSIGnTXE = CSIGnCTL0.CSIGnRXE = 0.
CSIGnEMU	CSIGnSVSDIS	Modification of this bit is prohibited while SVSTOP = 1.

16.4 Interrupt Sources

CSIG can generate the following interrupts:

- INTCSIGTIC (communication status interrupt)
- INTCSIGTIR (reception status interrupt)
- INTCSIGTIRE (communication error interrupt)

16.4.1 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half cycle of the transmission clock CSIGTSCK. This function is not available in slave mode.

The delay is specified by setting CSIGnCTL1.CSIGnSIT = 1. (The setting of the CSIGnSIT bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of CSIGnCTL1.CSIGnSIT = 1 (interrupt delay enabled), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), and CSIGnCFG0.CSIGnDLS[3:0] = 1000_B (data length 8 bits).

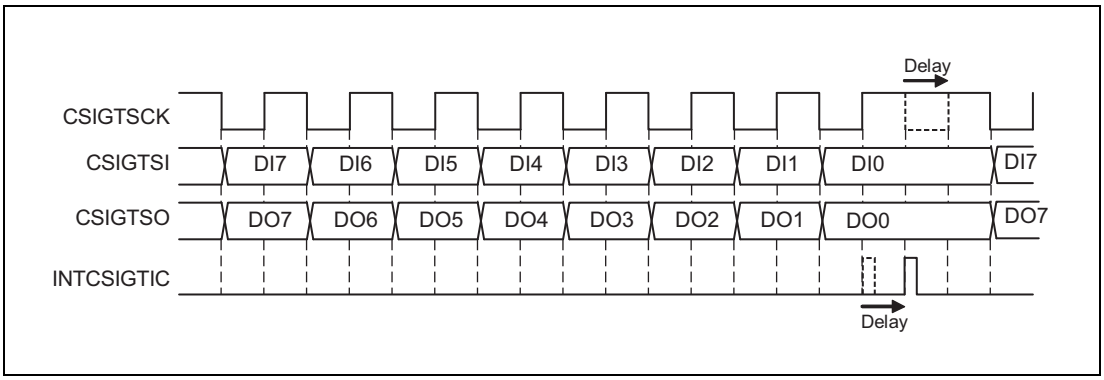

Figure 16.2 Interrupt Delay Function (CSIGnCTL1.CSIGnSIT = 1)

16.4.2 INTCSIGTIC (Communication Status Interrupt)

This interrupt is normally generated after every data transfer. It can be used to trigger a DMA for writing new transmission data to register CSIGnTX0W or CSIGnTX0H.

The following example assumes master mode and a setting of CSIGnCTL1.CSIGnSIT = 0 (no interrupt delay), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), CSIGnCFG0.CSIGnDLS[3:0] = 1000_B (data length 8 bits), and CSIGnCTL1.CSIGnSLIT = 0 (normal interrupt timing).

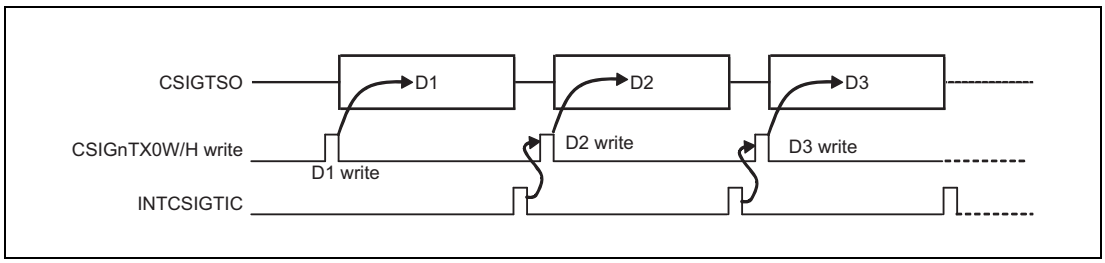

Figure 16.3 Generation of INTCSIGTIC after Communication (CSIGnCTL1.CSIGnSLIT = 0)

However, INTCSIGTIC can also be set up to occur when the CSIGnTX0W/H register is empty and available for receiving the next data. This is specified by setting CSIGnCTL1.CSIGnSLIT = 1.

This mode allows more efficient data transfers.

The effect is illustrated in the figure below.

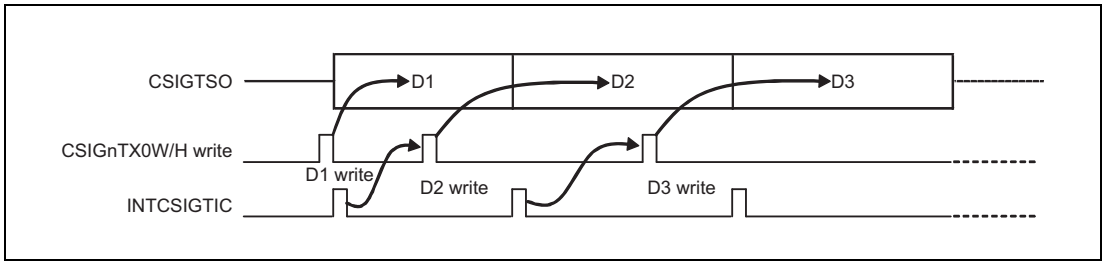

Figure 16.4 Generation of INTCSIGTIC at the Beginning of Communication

16.4.3 INTCSIGTIR (Reception Status Interrupt)

This interrupt is generated in receive-only and transmit/receive mode after data has been received and is available in the reception register. It can be used to trigger a DMA for reading the received data from CSIGnRX0 register.

The following example assumes master mode and a setting of CSIGnCTL1.CSIGnSIT = 0 (no interrupt delay), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), and CSIGnCFG0.CSIGnDLS[3:0] = 1000_B (data length 8 bits).

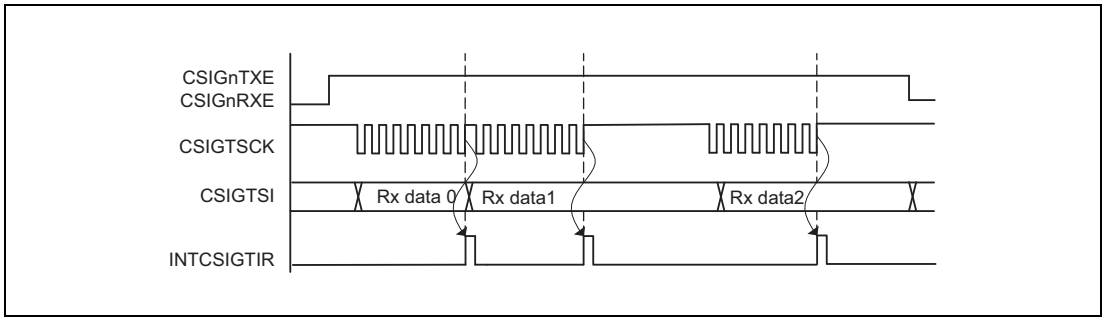

Figure 16.5 Generation of INTCSIGTIR

16.4.4 INTCSIGTIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

Table 16.25 Data Error Types

Error Type	Communication Status After Error Interrupt	Note
Parity error	Interrupt is generated and communication continues.	—
Data consistency check error	Interrupt is generated and communication continues.	—
Overrun error*1	When CSIGnCTL1.CSIGnHSE = 0 (handshake function disabled) in slave mode, interrupt is generated and communication continues.	When CSIGnCTL1.CSIGnHSE = 1 (handshake function enabled) in slave mode, communication stops due to the handshake. An interrupt is not generated and an overrun error does not occur.

Note 1. In master mode, overrun errors do not occur.
In slave mode, communication cannot be stopped.

The type of error that caused the generation of INTCSIGTIRE is indicated in register CSIGnSTR0.

For details about the various error types, see **Section 16.5.10, Error Detection**.

16.5 Operation

16.5.1 Master/Slave Mode

Whether CSIG operates in master mode or in slave mode depends on the setting of bits CSIGnCTL2.CSIGnPRS[2:0]. If master mode is selected, the source of the transmission clock must be selected as well.

16.5.1.1 Master Mode

In master mode, the serial transmission clock is generated by the built-in baud rate generator (BRG) and supplied to the slave via signal CSIGTSCK.

Master mode is enabled by setting bits CSIGnCTL2.CSIGnPRS[2:0] to values other than 111_B. In master mode, the frequency of BRG can be configured by setting bits CSIGnCTL2. CSIGnPRS[2:0] and bits CSIGnCTL2.CSIGnBRS[11:0].

The default level of CSIGTSCK depends on the CSIGTSCK clock inversion function bit; it is high when CSIGnCTL1.CSIGnCKR = 0, and is low when CSIGnCTL1.CSIGnCKR = 1.

The example below shows the communication in master mode for 8-bit data, CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0, and MSB first:

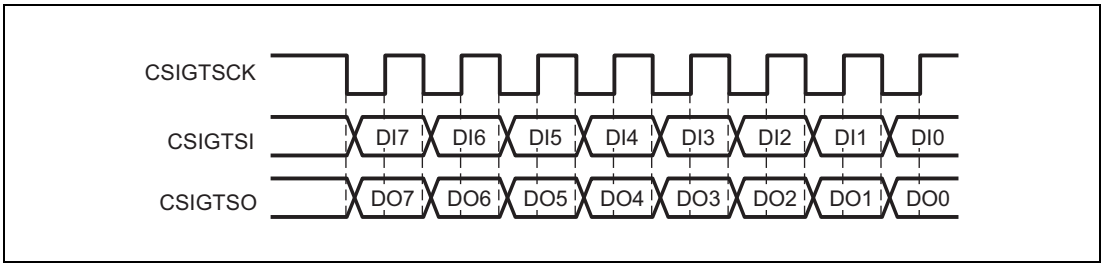

Figure 16.6 Transmission/Reception in Master Mode

16.5.1.2 Slave Mode

In slave mode, another device is the communication master. The external clock is supplied via the signal CSIGTSCK. Transmit/receive operation starts as soon as a clock signal is detected.

Slave mode is selected by setting CSIGnCTL2.CSIGnPRS[2:0] to 111_B.

NOTE

When using slave mode, disable the baud rate generator (BRG) by setting bits CSIGnCTL2.CSIGnBRS[11:0] to 000_H.

The example below shows the communication in slave mode for 8-bit data, CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0, and MSB first:

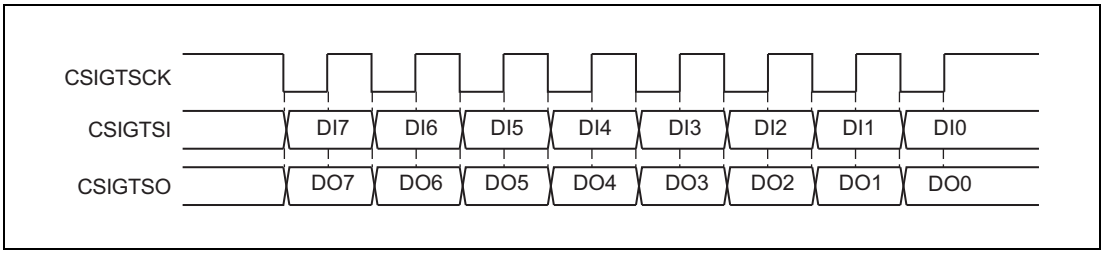

Figure 16.7 Transmission/Reception in Slave Mode

16.5.2 Master/Slave Connections

16.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

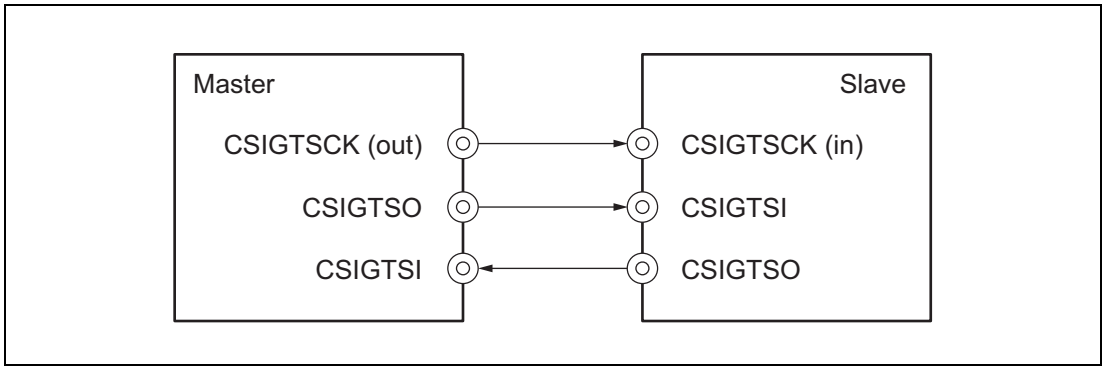

Figure 16.8 Direct Master/Slave Connection

16.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this case, the master must provide one slave select (SS) signal to each of the slaves. This signal is connected to the slave select input $\overline{\text{CSIGTSSI}}$ of the slave.

The $\overline{\text{CSIGTSSI}}$ signal can be enabled or disabled by the CSIGnCTL1.CSIGnSSE bit.

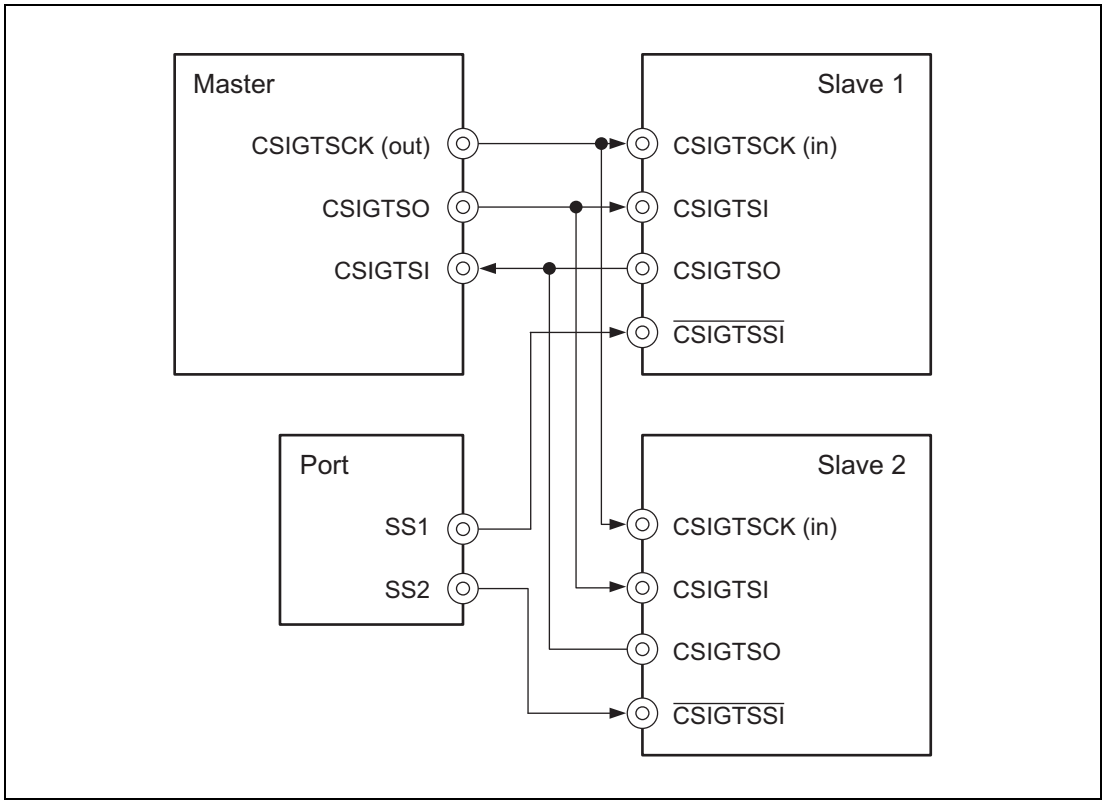

Figure 16.9 Master to Multiple Slaves Connection

A slave is selected (enabled) when its $\overline{\text{CSIGTSSI}}$ signal is low.

If it is not selected, the slave will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set (CSIGnCTL0.CSIGnTXE = 1), the CSIGTSO output buffer of the slave which is not selected is disabled and set to input mode in order to avoid interference with the outputs of other selected slaves.

16.5.3 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the CSIGnPRS[2:0] and CSIGnBRS[11:0] bits in the CSIGnCTL2 register.

The following figure shows a block diagram of the BRG.

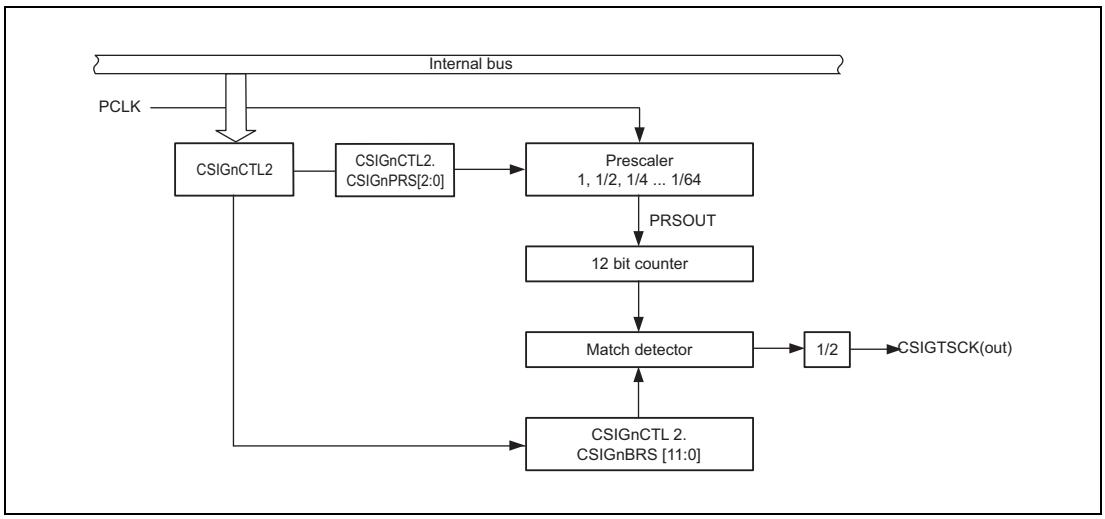

Figure 16.10 BRG Block Diagram

Setting CSIGnCTL2.CSIGnBRS[11:0] to 000_H disables the BRG.

Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated as:

Transfer clock frequency (CSIGTSCK) = PCLK / (division ratio of PCLK) = PCLK / ($2^{\alpha} \times k \times 2$)
where:

α = CSIGnCTL2.CSIGnPRS[2:0] = 0 to 6

k = CSIGnCTL2.CSIGnBRS[11:0] = 1 to 4095

Transfer clock frequency upper and lower limits

When specifying the transfer clock frequency, please note the following:

- For the maximum transfer clock frequency of this product in master mode or slave mode, refer to the CSIG timing shown in the electrical characteristics. In addition, in either mode, specify a frequency within the defined range.
- The minimum transfer clock frequency in master mode and slave mode is PCLK/524160.
- The maximum transfer clock frequency is as follows:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16)

16.5.4 Data Transfer Modes

16.5.4.1 Transmit-Only Mode

Setting CSIGnCTL0.CSIGnTXE = 1 and CSIGnCTL0.CSIGnRXE = 0 places CSIG in transmit-only mode. Transmission starts when data to be transmitted is written in the CSIGnTX0W or CSIGnTX0H register.

CAUTION

When the mode transitions from one of the receive modes to transmit-only mode, the data in the CSIGnRX0 buffer becomes undefined after completion of the first transmission.
Therefore, the reception register CSIGnRX0 has to be read before switching to transmit-only mode.

16.5.4.2 Receive-Only Mode

Setting CSIGnCTL0.CSIGnTXE = 0 and CSIGnCTL0.CSIGnRXE = 1 puts the CSIG in receive-only mode.

In master mode, reception starts when dummy data is read from the CSIGnRX0 register.
All subsequent receptions are triggered by reads from the CSIGnRX0 register, as long as CSIGnBCTL0.CSIGnSCE = 1.

Moreover, CSIGnBCTL0.CSIGnSCE has to be set to 0 before reading the last received data from CSIGnRX0.

The recommended procedure is:

1. Set CSIGnBCTL0.CSIGnSCE = 1.
2. Read CSIGnRX0 (dummy data).
3. Wait for the reception interrupt INTCSIGTIR.
4. Read CSIGnRX0 (received data).
   In case more data receptions follow at step 3, continue to read until all data is received.
   Before reading the last received data from CSIGnRX0, set CSIGnBCTL0.CSIGnSCE = 0.

In slave mode, reception starts when the communication clock CSIGTSCK is received from the master. In this case, it is not necessary to read data from the CSIGnRX0 register of the slave.

NOTE

In slave mode, any previously received data must be read from the reception register CSIGnRX0 in order to avoid any overwrite situation.

16.5.4.3 Transmit/Receive Mode

Setting CSIGnCTL0.CSIGnTXE = 1 and CSIGnCTL0.CSIGnRXE = 1 puts the CSIG in transmit/receive mode.

Data transfer (transmission and reception) starts when the data to be transmitted is written to the CSIGnTX0W or CSIGnTX0H register.

16.5.5 Data Length Selection

16.5.5.1 Data Length Selection without Extended Length

Transmission data length is selectable from 7 to 16 bits using the CSIGnDLS[3:0] bits in the CSIGnCFG0 register. The examples below show the communication with MSB first (CSIGnCFG0.CSIGnDIR = 0):

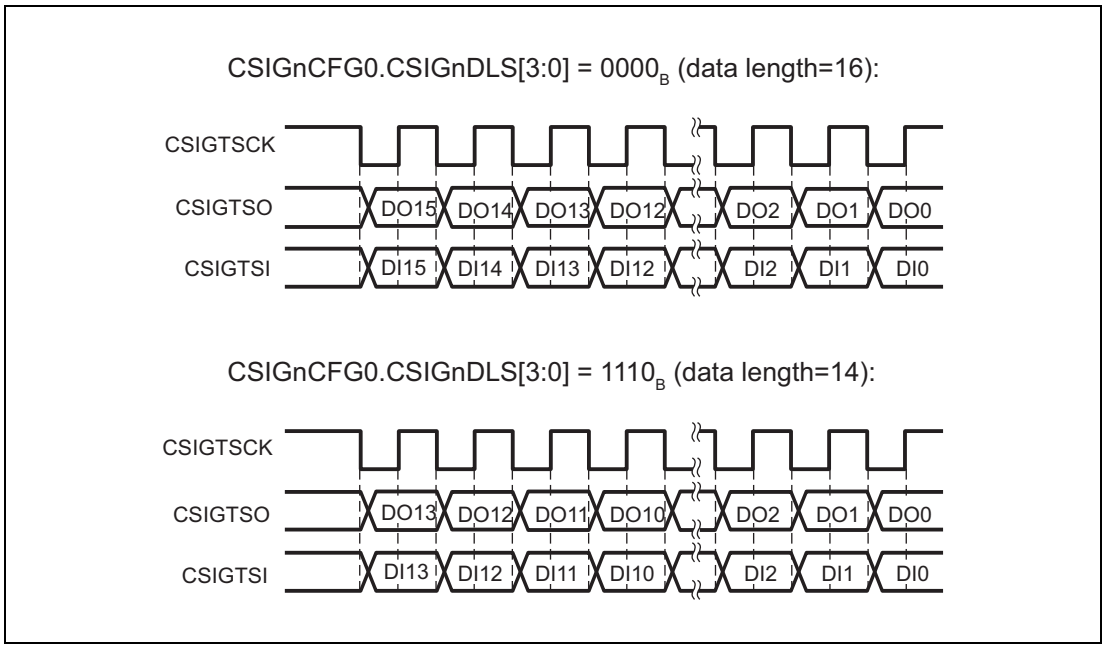

Figure 16.11 Data Length Selection Function

16.5.5.2 Data Length Selection with Extended Data Length

If the data to be transmitted/received exceeds 16 bits, the extended data length (EDL) function can be used.

The EDL function is enabled by setting the CSIGnCTL1.CSIGnEDLE bit to 1.

The following describes how the EDL function works and how to specify the EDL setting.

- The data has to be broken into 16-bit blocks plus remainder. For example, data of 42 bits would be broken into two 16-bit blocks plus 10 bits.
- The bit length of the remainder is set as “data length” in CSIGnCFG0.CSIGnDLS[3:0] bits.
- Set the CSIGnTX0W.CSIGnEDL bit to 1 to transmit the 16-bit blocks. In this case, the data written to the CSIGnTX0W register is sent as 16-bit data regardless of the setting of the CSIGnCFG0.CSIGnDLS[3:0] bits.
- The transfer completes after the data with the specified data length (the remainder when CSIGnTX0W.CSIGnEDL = 0) has been sent.

Example

Example of sending 40 bits of data, $123456789A_H$:

40 bits are split into 2 × 16 bits plus 8 bits.

- Initialize CSIGnCFG0.CSIGnDLS[3:0] = 8_D.
- To transmit the data $123456789A_H$ with MSB first, write the following sequence to CSIGnTX0W:
  - 2000 1234_H (CSIGnTX0W.CSIGnEDL = 1)
  - 2000 5678_H (CSIGnTX0W.CSIGnEDL = 1)
  - 0000 $009A_H$ (CSIGnTX0W.CSIGnEDL = 0)

The following figure illustrates the timing.

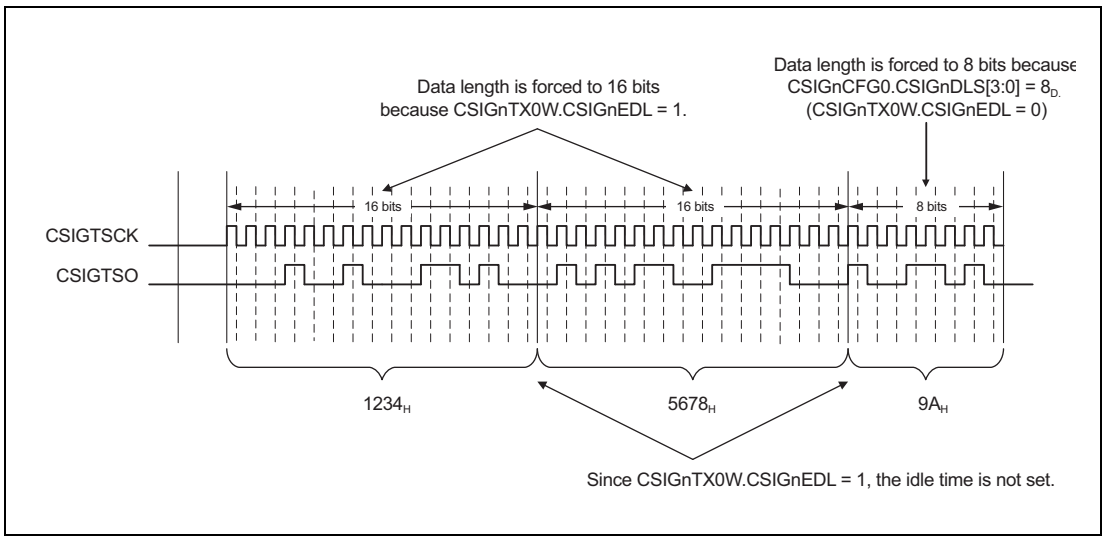

Figure 16.12 EDL Timing Diagram

NOTES

1. Data length with less than 7 bits can be set only when EDL mode is used.
2. It is not possible to transmit two consecutive data with a data length of less than 7 bits.
3. If parity is enabled, the parity bit is added after the last bit.
4. Example for setting the data direction:
   - Data to be transmitted: 123456_H
   - MSB first:
     Set CSIGnCFG0.CSIGnDIR to 0.
     Write 2000 1234_H to CSIGnTX0W (EDL bit = 1).
     Write 0000 0056_H to CSIGnTX0W (EDL bit = 0).
   - LSB first:
     Set CSIGnCFG0.CSIGnDIR to 1.
     Write 2000 3456_H to CSIGnTX0W (EDL bit = 1).
     Write 0000 0012_H to CSIGnTX0W (EDL bit = 0).
5. EDL mode cannot be used in the slave mode configured for receive-only mode. (CSIGnCTL2.CSIGnPRS[2:0] = 111_B, CSIGnCTL0.CSIGnTXE = 0, CSIGnCTL0.CSIGnRXE = 1)

16.5.6 Serial Data Direction Selection Function

The serial data direction is selectable using the CSIGnDIR bit in the CSIGnCFG0 register. The examples below show the communication for 8-bit data (CSIGnCFG0.CSIGnDLS[3:0] = 1000_B):

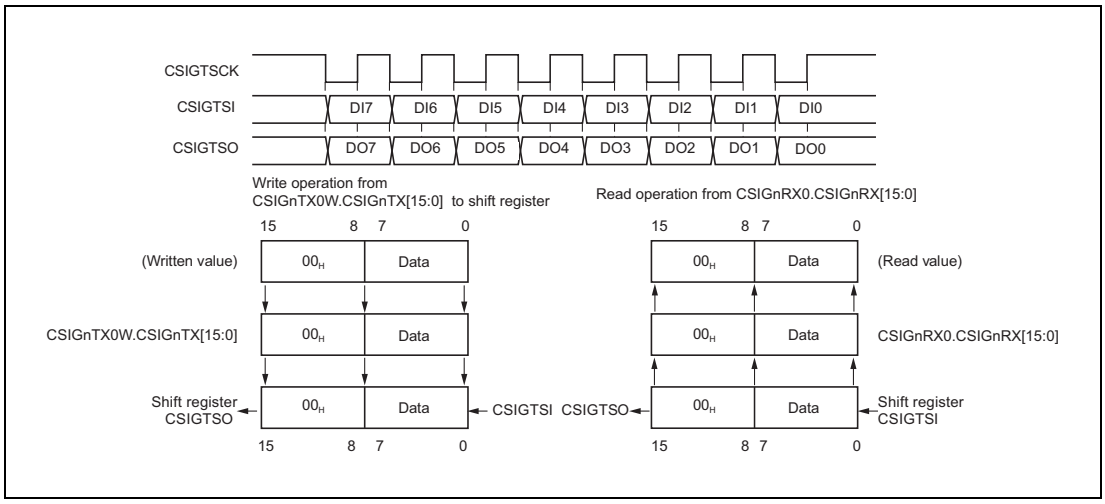

Figure 16.13 Serial Data Direction Select Function — MSB First (CSIGnDIR = 0)

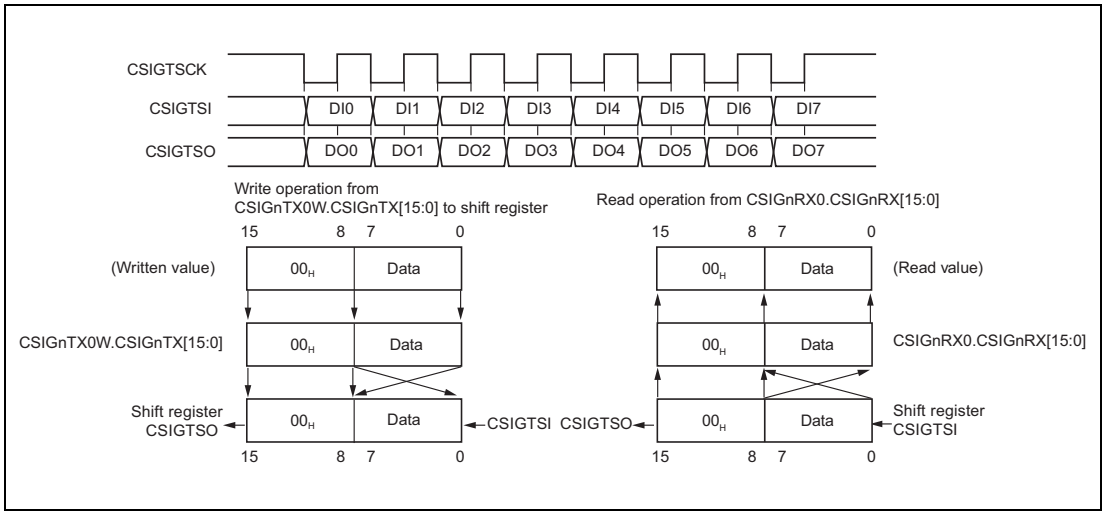

Figure 16.14 Serial Data Direction Select Function — LSB First (CSIGnDIR = 1)

16.5.7 Communication in Slave Mode

The following figure illustrates the communication signals and timing in slave mode.

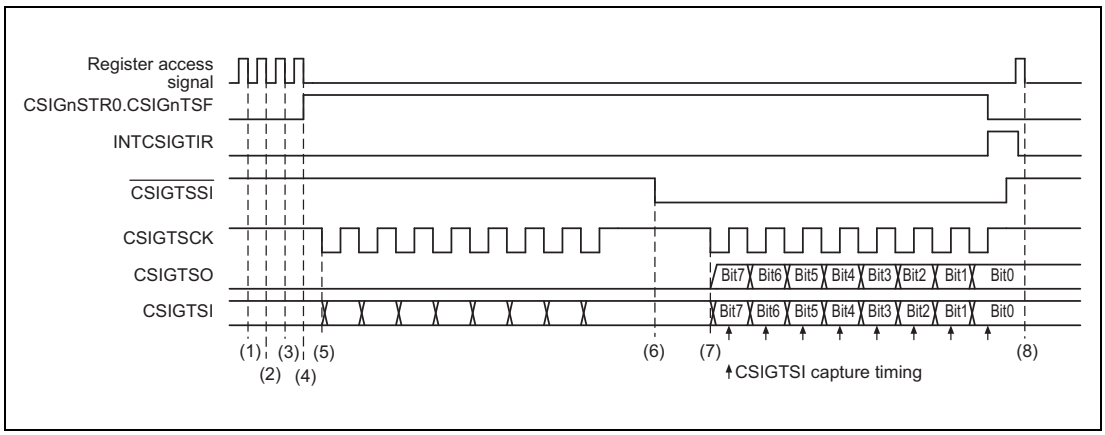

Figure 16.15 Rx/Tx Communication Timing in Slave Mode

1. Slave mode is selected (CSIGnCTL2.CSIGnPRS[2:0] = 111_B), the $\overline{\text{CSIGTSSI}}$ signal is enabled (CSIGnCTL1.CSIGnSSE = 1) and the clock phase is set to the high level (CSIGnCTL1.CSIGnCKR = 1).
2. Data length is 8 bits (CSIGnCFG0.CSIGnDLS[3:0] = 1000_B).
   Data direction is set to MSB first (CSIGnCFG0.CSIGnDIR = 0).
3. CSIG is set to transmit/receive mode (CSIGnCTL0.CSIGnPWR = 1, CSIGnCTL0.CSIGnTXE = 1, CSIGnCTL0.CSIGnRXE = 1).
4. When transfer data is written to the transmission register CSIGnTX0H, the transfer status flag CSIGnSTR0.CSIGnTSF is automatically set and the CSIG waits until signal $\overline{\text{CSIGTSSI}}$ goes low.
5. While signal $\overline{\text{CSIGTSSI}}$ is high, transmission/reception is not started even if the serial clock is input. CSIGTSO retains the values and input at CSIGTSI is ignored.
6. As soon as $\overline{\text{CSIGTSSI}}$ falls to low level, CSIGTSO is enabled.
7. If the serial clock is input to the CSIG while $\overline{\text{CSIGTSSI}}$ is low, transfer data is sent to CSIGTSO in synchronization with the serial clock, and simultaneously data is received from CSIGTSI.
8. The register CSIGnRX0 is read.

16.5.8 Handshake Function

CSIG features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by the CSIGnCTL1.CSIGnHSE bit. For handshake, the signals CSIGTRYI and CSIGTRYO are used.

The busy timing depends on the setting of the data phase selection bit CSIGnCFG0.CSIGnDAP.

16.5.8.1 Slave Mode

If CSIGnCTL1.CSIGnHSE = 1, a low-level CSIGTRYO signal is output when the slave becomes busy. This happens when previously received data is still in the CSIGnRX0 register, and the new data cannot be copied from the shift register to CSIGnRX0 (CSIGnRX0 full condition).

The following examples assume a data length of 8 bits.

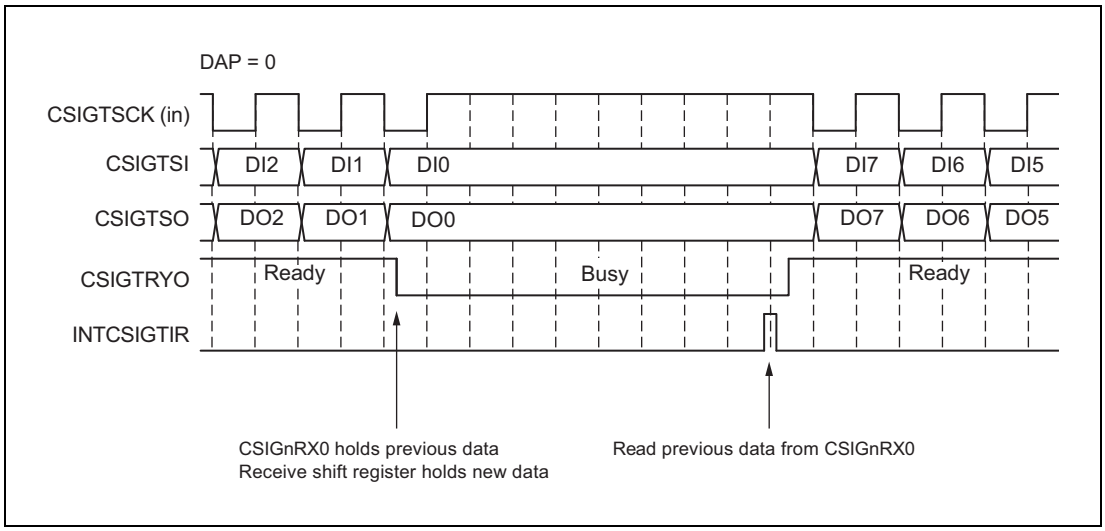

Figure 16.16 Ready/Busy Signal from Slave (CSIGnCFG0.CSIGnDAP = 0)

While the slave is busy, the master has to wait (i.e. suspend the transmission clock). The slave sets CSIGTRYO to high (“ready”) as soon as the read from the reception register CSIGnRX0 completes.

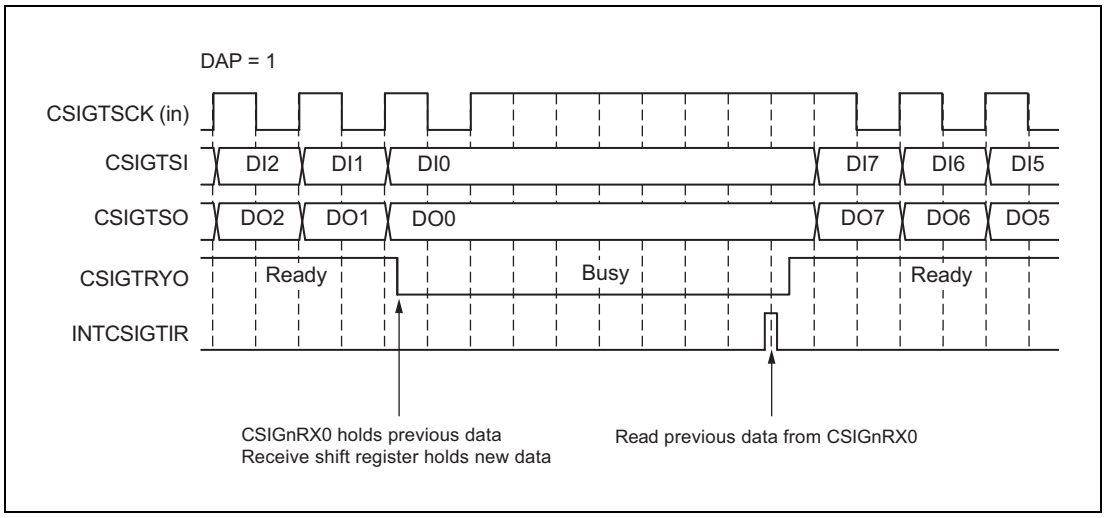

Figure 16.17 Ready/Busy Signal from Slave (CSIGnCFG0.CSIGnDAP = 1)

16.5.8.2 Master Mode

When the master detects low level of the CSIGTRYI while CSIGnCTL1.CSIGnHSE = 1, subsequent transfers are put on hold, the master goes into wait state and suspends the CSIGTSCK clock.

The CSIGTRYI level is checked at each half clock cycle of CSIGTSCK.

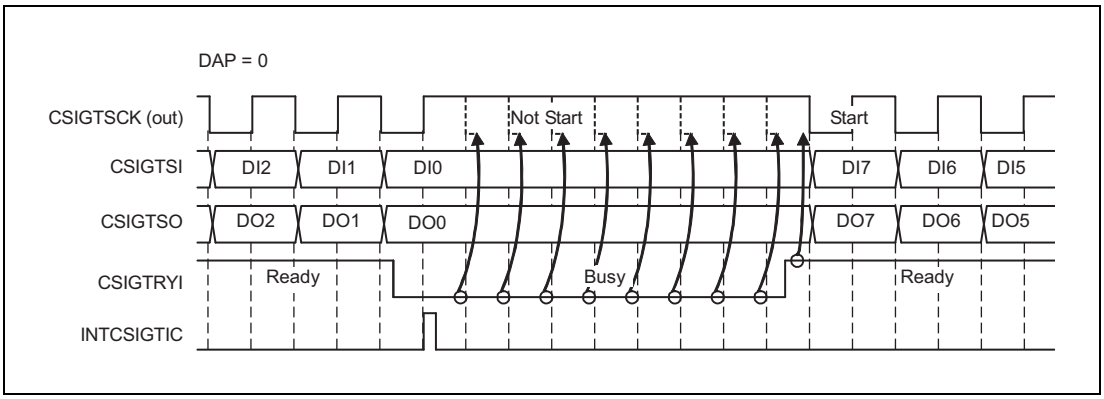

Figure 16.18 Master's Reaction to CSIGTRYI (CSIGnCFG0.CSIGnDAP = 0)

If the CSIGTRYI low signal from the slave is received while data transfer is in progress, the serial clock is suspended after the transfer is complete.

The master resumes the communication as soon as CSIGTRYI becomes high (slave is "ready").

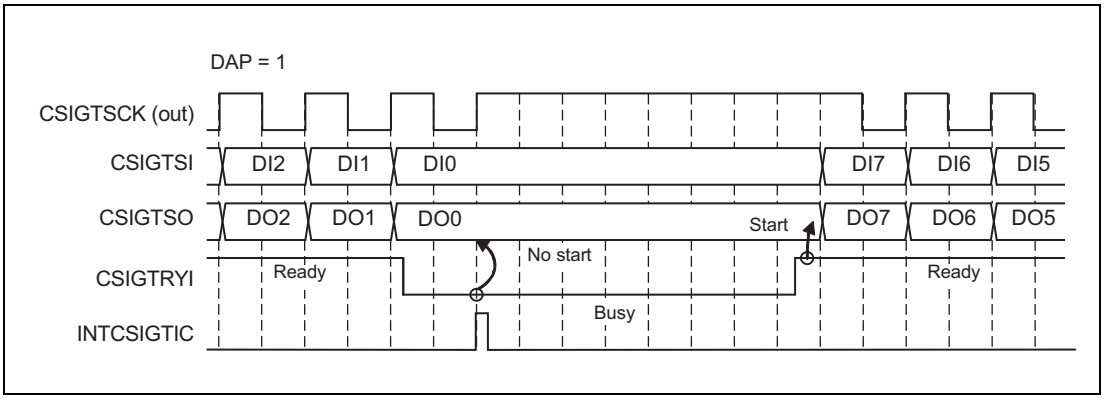

Figure 16.19 Master's Reaction to CSIGTRYI (CSIGnCFG0.CSIGnDAP = 1)

CAUTION

If multiple slaves are connected, the master must only detect the CSIGTRYI signal of the slave it has selected for communication.

CSIGTRYI of the master must be pulled down by the slave before the next transfer starts. Even if the signal is pulled down by the slave during the transfer, the transfer will continue until it completes.

16.5.9 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active (CSIGnCTL1.CSIGnLBM = 1), the transmit and receive signals are internally connected, as shown in the figures below. The signals CSIGTSCK, CSIGTSO, and CSIGTSI are disconnected from the ports. In addition, the CSIGTSO output level is fixed to low, and CSIGTSCK is set to reset level (High). The rest of CSIG works as in normal operation.

In order to test the CSIG, set the loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data.

Table 16.26 Output Level of Pins

Pin	Output Level
CSIGTSCK(out)	High level
CSIGTSO	Low level (not dependent on the previous value)
Interrupt	Normal function
CSIGTRYO	Normal function (Low level)

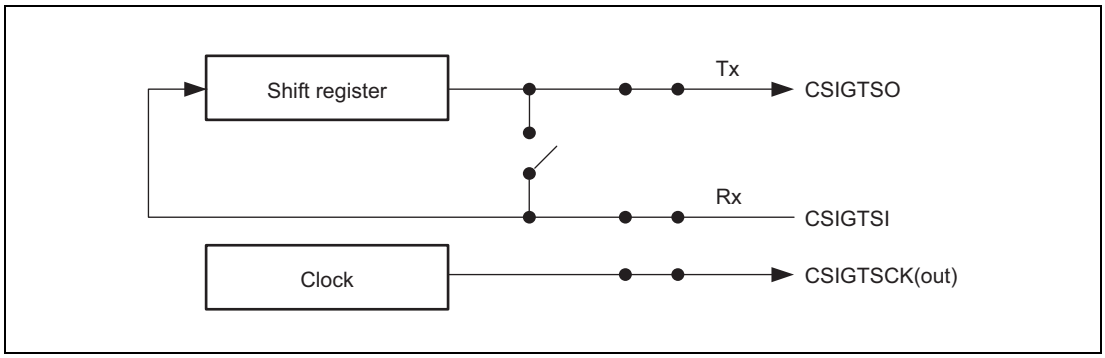

Figure 16.20 Normal Operation

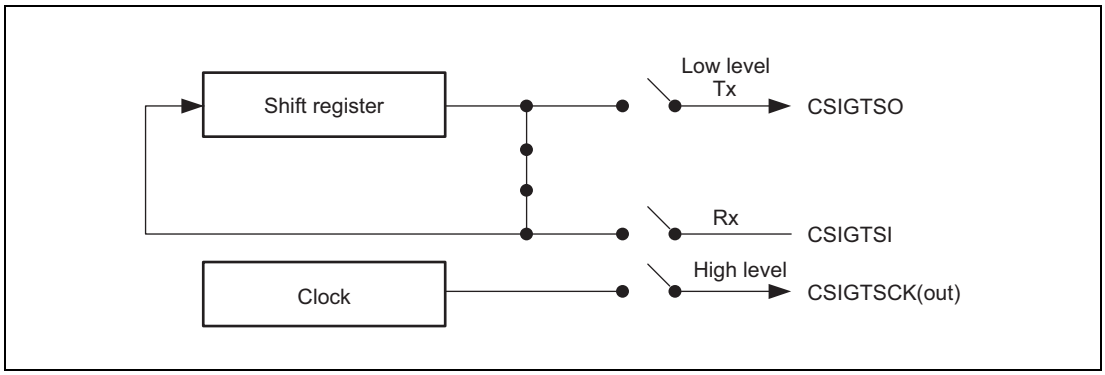

Figure 16.21 Operation in Loop-Back Mode

16.5.10 Error Detection

CSIG can detect three error types:

- Data consistency check error (transmission data)
- Parity error (received data)
- Overrun error (received data)

Data consistency check error and parity error check functions can be individually enabled or disabled.

If one of these errors is detected, the interrupt INTCSIGTIRE is generated.

16.5.10.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent as an output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIGnCTL1.CSIGnDCS bit (when checking data consistency, make sure that PIPCn.PIPCn_m = 1 for CSIGTSO). It will not be enabled if data transmission is disabled (CSIGnCTL0.CSIGnTXE = 0).

When the data consistency check is enabled, the data transferred from CSIGnTX0W or CSIGnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIGTSO are captured and their logical interpretation is written to the corresponding shift register.

After completion of the transmission, the data sent is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIGTIRE is generated.
- The CSIGnSTR0.CSIGnDCE bit is set.

The data consistency check function is illustrated in the following block diagram.

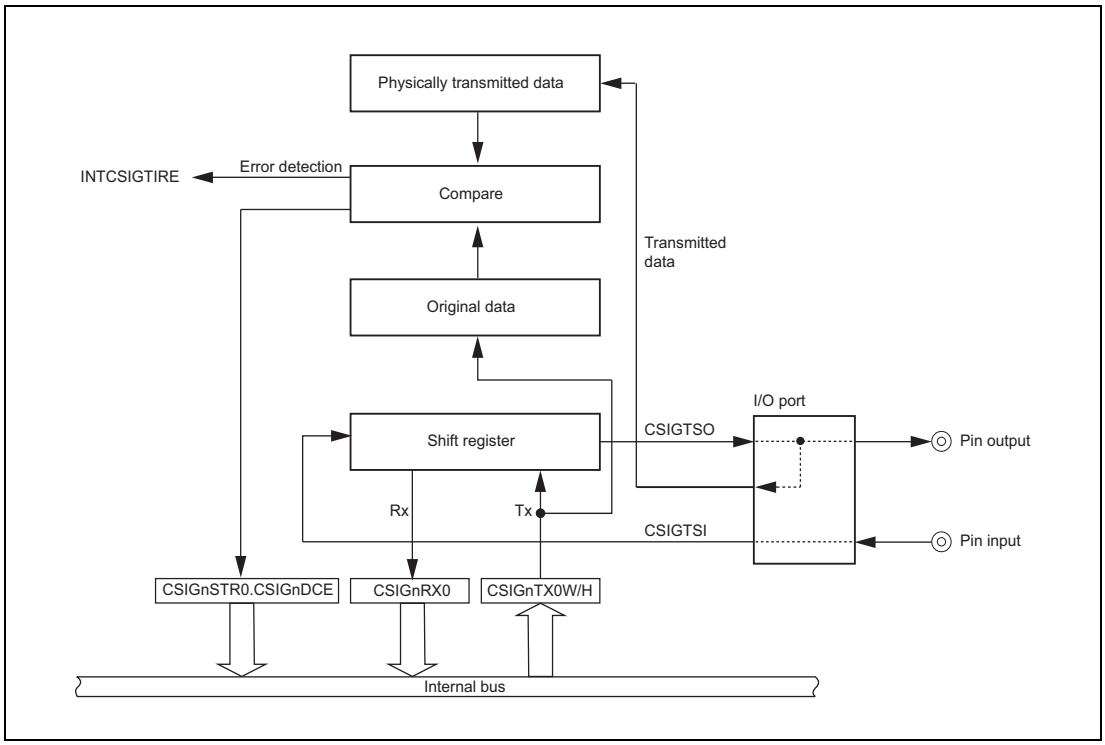

Figure 16.22 Functional Block Diagram of the Data Consistency Check

16.5.10.2 Parity Check

Parity is a common mean to detect a single bit error during data transmission. CSIG can append a parity bit after the last data bit (even if extended data length is used).

The use and type of parity is specified by CSIGnCFG0.CSIGnPS[1:0].

Parity check is enabled if CSIGnCFG0.CSIGnPS[1] = 1.

The parity bit is checked after reception is complete. If a parity error occurs:

- Interrupt INTCSIGTIRE is generated.
- The CSIGnSTR0.CSIGnPE bit is set.

The following figure shows an example.

Data length is 8 bits. The data transmitted is 05_H and 35_H. Parity type is odd.

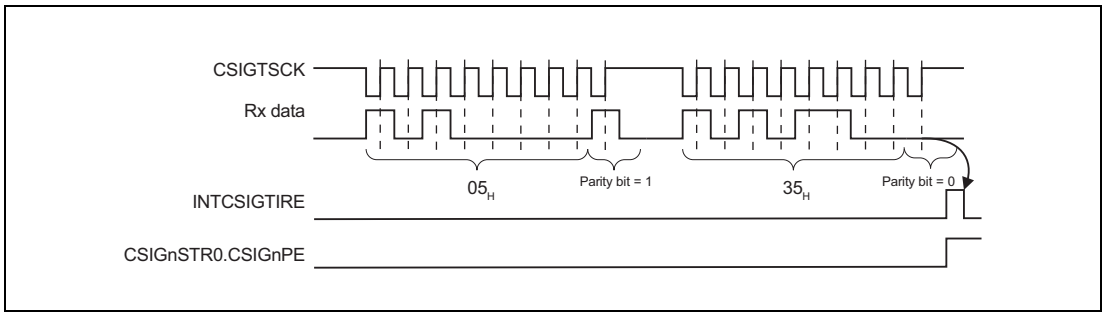

Figure 16.23 Parity Check Example

For the first 8 bits, the parity bit is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

For the second 8 bits, the parity bit is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last data bit.

16.5.10.3 Overrun Error

This error occurs when previously received data still resides in the reception register CSIGnRX0 because it has not been read, and new data is received.

The overrun error is not generated if data reception is disabled (CSIGnCTL0.CSIGnRXE = 0).

If overrun occurs:

- Interrupt INTCSIGTIRE is generated
- The CSIGnSTR0.CSIGnOVE bit is set
- Data in the CSIGnRX0 register is overwritten and communication continues.

The following figure illustrates the overrun error detection function.

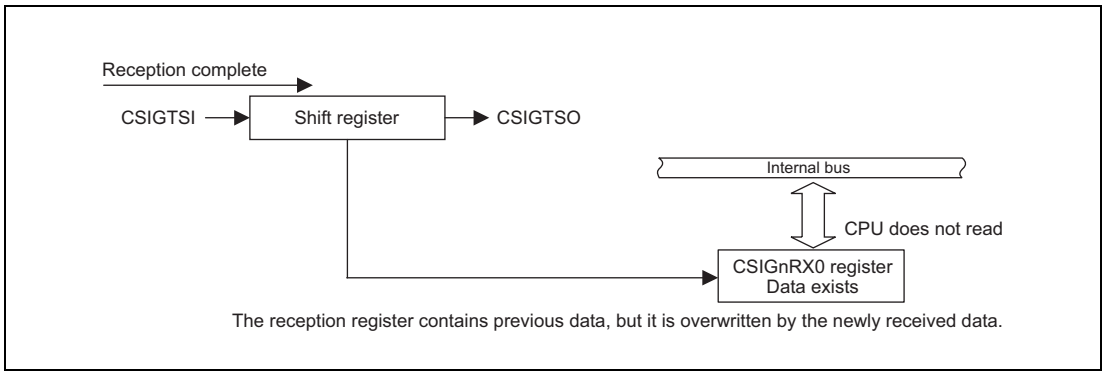

Figure 16.24 Overrun Error Detection

The following figure illustrates an example where:

- Rx data 3 is not read
- Rx data 4 is received, and data is overwritten.

Thus an overrun error occurs.

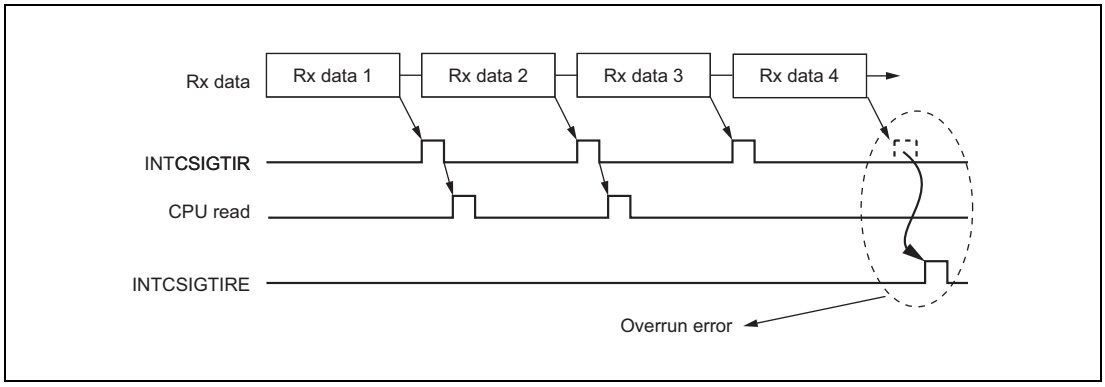

Figure 16.25 Overrun Error Detection - Example

NOTE

An overrun error can be avoided by using the handshake.

When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

For details see **Section 16.5.8, Handshake Function**.

16.6 Operating Procedures

16.6.1 Master Mode Transmission/Reception by DMA

This section describes an example of performing the transmission/reception in master mode in combination with a DMA.

The following instructions are based on the assumption that:

- Transmission data length is 8 bits (CSIGnCFG0.CSIGnDLS[3:0] = 1000_B)
- MSB is transmitted first (CSIGnCFG0.CSIGnDIR = 0)
- INTCSIGTIC interrupt is generated at the end of the transfer (CSIGnCTL1.CSIGnSLIT = 0)
- Normal clock and data phase (CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0)
- The number of data is 10 (0 to 9)

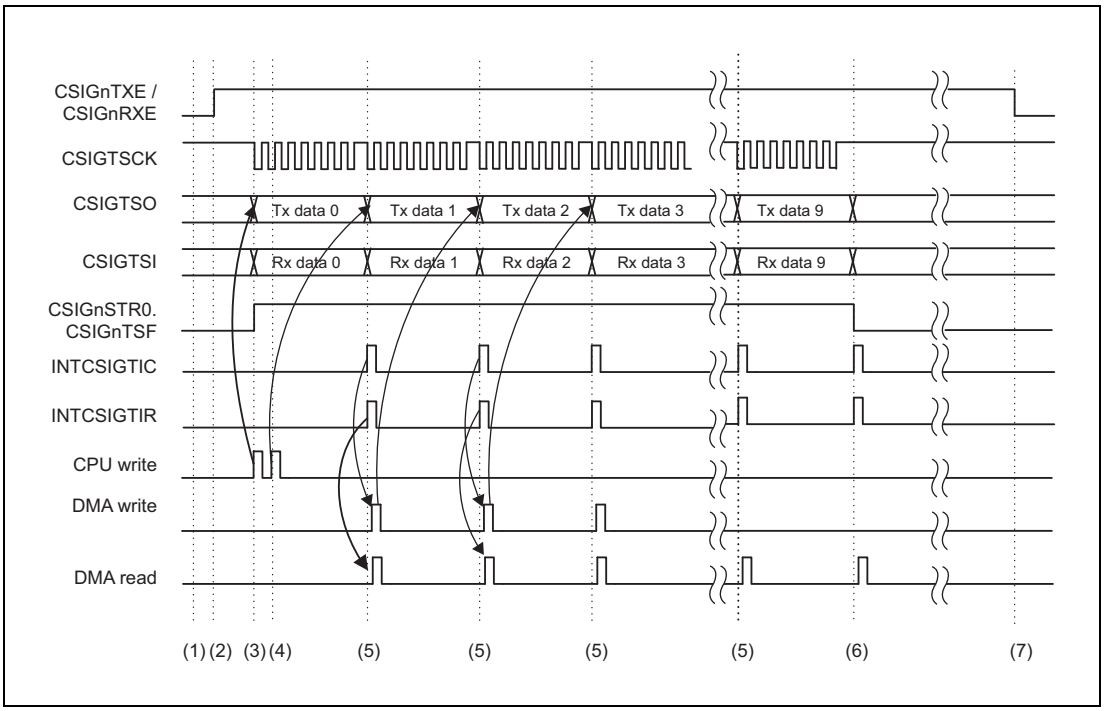

Figure 16.26 Communication in Master Mode

Procedure:

1. Configure the communication protocol in register CSIGnCFG0. Specify the interrupt timing and operation mode by setting the corresponding bits of the CSIGnCTL1 register and CSIGnCTL2 register.
2. In the CSIGnCTL0 register, set CSIGnPWR = 1 (enable clock), CSIGnTXE = 1 (enable transmission), and CSIGnRXE = 1 (enable reception).
3. Write the first data to be sent to the transmission register CSIGnTX0H. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIGnTX0H. Writing the second data immediately after the first one avoids unnecessary delays between the data.

5. After the transmission or reception of each data, INTCSIGTIC or INTCSIGTIR interrupt is generated. INTCSIGTIC indicates that the next data can be written to CSIGnTX0H. INTCSIGTIR indicates that the reception register CSIGnRX0 must be read.
   In this example, CPU write and DMA write are assumed as equivalent.
6. No more write action is required after the transmission of data 8 completes. Data 9 (the last data) has been written after the transmission of data 7. However, the reception register CSIGnRX0 must be read after the reception of data 8 and 9 completes.
7. Finally, to disable the transmit/receive operation, clear CSIGnCTL0.CSIGnTXE and CSIGnCTL0.CSIGnRXE. When no communication is taking place, set CSIGnCTL0.CSIGnPWR to “0” to minimize the power consumption of the CSIGn.

Section 17 Clocked Serial Interface H (CSIH)

This section contains a generic description of the Clocked Serial Interface H (CSIH).

The first part in this section describes the features specific to RH850/F1K, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of CSIH.

17.1 Features of RH850/F1K CSIH

17.1.1 Number of Units

This microcontroller has the following number of CSIH units.

Each CSIH unit has one channel interface.

Table 17.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of units	4	4	4
Name	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)	CSIHn (n = 0 to 3)

Table 17.2 Indices

Index	Description
n	Throughout this section, the individual CSIH units are identified by the index “n” (n = 0 to 3): for example, CSIHnCTL0 is the CSIHn control register 0.
x	CSIHn has a maximum of 8 chip select signals. Throughout this section, the individual chip select signals are identified by the index “x”: that is, CSx denotes a non-specified chip select signal.
y	A variable used for explanation is identified by the index “y”: for example, CSIHnBRSy is the baud rate setting register of CSIHn.

The following table shows values indicated by the indices of each product.

Table 17.3 Indices of Products

Indices of Each Product		
100 pins	**144 pins**	**176 pins**
For the value of x, see **Table 17.4, Number of Chip Select Signals**.		
y = 0 to 3		

The numbers of chip select signals for each of the CSIH units are listed in the following table.

Table 17.4 Number of Chip Select Signals

Unit Name	Chip Select Index		
	100 pins	144 pins	176 pins
CSIH0	CSx (x = 0 to 7)	CSx (x = 0 to 7)	CSx (x = 0 to 7)
CSIH1	CSx (x = 0 to 5)	CSx (x = 0 to 5)	CSx (x = 0 to 5)
CSIH2	CSx (x = 0 to 3)	CSx (x = 0 to 5)	CSx (x = 0 to 5)
CSIH3	CSx (x = 0 to 3)	CSx (x = 0 to 3)	CSx (x = 0 to 3)

17.1.2 Register Base Address

CSIH base addresses are listed in the following table.

CSIH register addresses are given as offsets from the base addresses.

Table 17.5 Register Base Addresses

Base Address Name	Base Address
<CSIH0_base>	FFD8 0000_H
<CSIH1_base>	FFD8 2000_H
<CSIH2_base>	FFD8 4000_H
<CSIH3_base>	FFD8 6000_H

17.1.3 Clock Supply

The CSIH clock supply is shown in the following table.

Table 17.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Descruption
CSIHn	PCLK	CKSCLK_ICSI	Communication clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_ICSI	

17.1.4 Interrupt Requests

CSIH interrupt requests are listed in the following table.

Table 17.7 Interrupt Requests

Unit Interrupt Name	Description	Interrupt Number	DMA Trigger Number
CSIH0			
INTCSIHTIC	Communication status interrupt	29	70
INTCSIHTIR	Receive status interrupt	30	71
INTCSIHTIRE	Communication error interrupt	31	—
INTCSIHTIJC	Job completion interrupt	20, 32	72
CSIH1			
INTCSIHTIC	Communication status interrupt	16, 116	28
INTCSIHTIR	Receive status interrupt	17, 117	29
INTCSIHTIRE	Communication error interrupt	27, 118	—
INTCSIHTIJC	Job completion interrupt	28, 119	30
CSIH2			
INTCSIHTIC	Communication status interrupt	8, 132	89
INTCSIHTIR	Receive status interrupt	10, 133	90
INTCSIHTIRE	Communication error interrupt	11, 134	—
INTCSIHTIJC	Job completion interrupt	12, 135	91
CSIH3			
INTCSIHTIC	Communication status interrupt	9, 158	41
INTCSIHTIR	Receive status interrupt	13, 159	42
INTCSIHTIRE	Communication error interrupt	14, 160	—
INTCSIHTIJC	Job completion interrupt	15, 161	43

17.1.5 Reset Sources

CSIH reset sources are listed in the following table. CSIH is initialized by these reset sources.

Table 17.8 Reset Sources

Unit Name	Reset Source
CSIHn	All reset sources (ISORES)

17.1.6 External Input/Output Signals

External input/output signals of CSIH are listed below.

Table 17.9 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
CSIH0		
CSIHTSCK	Serial clock signal	CSIH0SC*2
CSIHTSI	Serial data input signal	CSIH0SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH0SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH0RYI
CSIHTSO	Serial data output signal	CSIH0SO*2
CSIHTRYO	Ready/busy output signal	CSIH0RYO
CSIHTCSS[7:0]*1	Chip select signal	CSIH0CSS[7:0]*1
CSIH1		
CSIHTSCK	Serial clock signal	CSIH1SC*2
CSIHTSI	Serial data input signal	CSIH1SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH1SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH1RYI
CSIHTSO	Serial data output signal	CSIH1SO*2
CSIHTRYO	Ready/busy output signal	CSIH1RYO
CSIHTCSS[5:0]*1	Chip select signal	CSIH1CSS[5:0]*1
CSIH2		
CSIHTSCK	Serial clock signal	CSIH2SC*2
CSIHTSI	Serial data input signal	CSIH2SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH2SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH2RYI
CSIHTSO	Serial data output signal	CSIH2SO*2
CSIHTRYO	Ready/busy output signal	CSIH2RYO
CSIHTCSS[5:0]*1	Chip select signal	CSIH2CSS[5:0]*1
CSIH3		
CSIHTSCK	Serial clock signal	CSIH3SC*2
CSIHTSI	Serial data input signal	CSIH3SI
$\overline{\text{CSIHTSSI}}$	Slave select input signal	$\overline{\text{CSIH3SSI}}$
CSIHTRYI	Ready/busy input signal	CSIH3RYI
CSIHTSO	Serial data output signal	CSIH3SO*2
CSIHTRYO	Ready/busy output signal	CSIH3RYO
CSIHTCSS[3:0]*1	Chip select signal	CSIH3CSS[3:0]*1

Note 1. For the number of chip select signals, see **Table 17.4, Number of Chip Select Signals**.

Note 2. For the port pins that are used as CSIHnSO and CSIHnSC, set the output driving ability to high (PDSCn_m = 1).

CAUTION

When port P8_6 is used as CSIH0CSS4, port P8_6 outputs a low-level $\overline{\text{RESETOUT}}$ signal while a reset is asserted and continues to output a low level after the reset is deasserted.

For details, see **Section 2.11.1.1, P8_6: $\overline{\text{RESETOUT}}$**.

17.1.7 Data Consistency Check

The port and the alternative function for data consistency check of CSIHnSO (CSIHTSO) output are shown in the following table. See **Section 17.5.12, Error Detection** for details on data consistency checking.

Table 17.10 Port Pins for Data Consistency Checking

Unit Signal Name	Port Pin Name	Alternative Function
CSIH0		
CSIHTSO	P0_3	ALT_OUT4
CSIH1		
CSIHTSO	P0_5	ALT_OUT3
	P10_2	ALT_OUT5
CSIH2		
CSIHTSO	P11_2	ALT_OUT1
CSIH3		
CSIHTSO	P11_6	ALT_OUT3

17.2 Overview

17.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode or slave mode is selectable
- Multiple slaves configuration and RCB (Recessive Configuration for Broadcasting) are possible since there are to eight configurable chip select output signals
- Slave select input signal ($\overline{\text{CSIHTSSI}}$) is usable
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, whereas it is determined by the input clock in slave mode.
- Maximum transfer clock frequency:
  - Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16)
- Clock phases and data phases are selectable
- Data transfer with MSB first or LSB first is selectable
- Transfer data length is selectable from 2 to 16 bits in 1-bit units
- Built-in EDL (extended data length) function for transferring more than 16 bits of data
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Built-in handshake function
- Built-in error detection (data consistency check, parity, time-out, overflow, and overrun)
- Support of job concept
- 128 words I/O buffer memory
- Direct access mode or memory mode (FIFO, dual buffer, and transmit-only buffer) is selectable
- Four different interrupt request signals (INTCSIHTIC, INTCSIHTIR, INTCSIHTIRE, INTCSIHTIJC)
- Built-in LBM (Loop Back Mode) function for self-test
- CPU-controlled high-priority communication function
- Enforced chip select idle setting
- Built-in RCB (Recessive Configuration for Broadcasting) bit
- Built-in JOB enable control bit for AUTOSAR

17.2.2 Functional Overview Description

The CSIH uses three signals for communication:

- Transmission clock CSIHTSCK (output in master mode, input in slave mode)
- Data output signal CSIHTSO
- Data input signal CSIHTSI

Additional signals are available for external control and monitoring:

- $\overline{\text{CSIHTSSI}}$: Slave select input signal
- CSIHTRYO: Ready/busy output signal (handshake signal)
- CSIHTRYI: Ready/busy input signal (handshake signal)
- CSIHTCSS[7:0]: Chip select signals

Data transmission is bit-wise and serial, and performed synchronously with the transmission clock.

The following table shows the most important registers for setting up the CSIH.

Table 17.11 Main Registers of CSIH

Register	Function
CSIHnCTL0	Enables/disables serial clock, and permits/ prohibits data transmission and data reception. Defines end-of-job behavior and enables/disables (bypasses) buffering.
CSIHnCTL1	Controls options such as interrupt timing, extended data length, job feature, data consistency check, loop-back mode, handshake, etc.
CSIHnCTL2	Selects master or slave mode, and the transfer clock frequency of the built-in baud rate generator (BRG) in master mode.
CSIHnBRSy	Specifies the transfer clock frequency for each chip select signal.
CSIHnMCTL0	Selects memory mode and specifies the time-out value.
CSIHnMCTL1	Controls the memory in FIFO mode.
CSIHnMCTL2	Controls the memory in dual buffer mode.
CSIHnCFGx	Configures the communication protocol for each chip select signal.

17.2.3 Block Diagram

The following block diagram shows the main components of the CSIH.

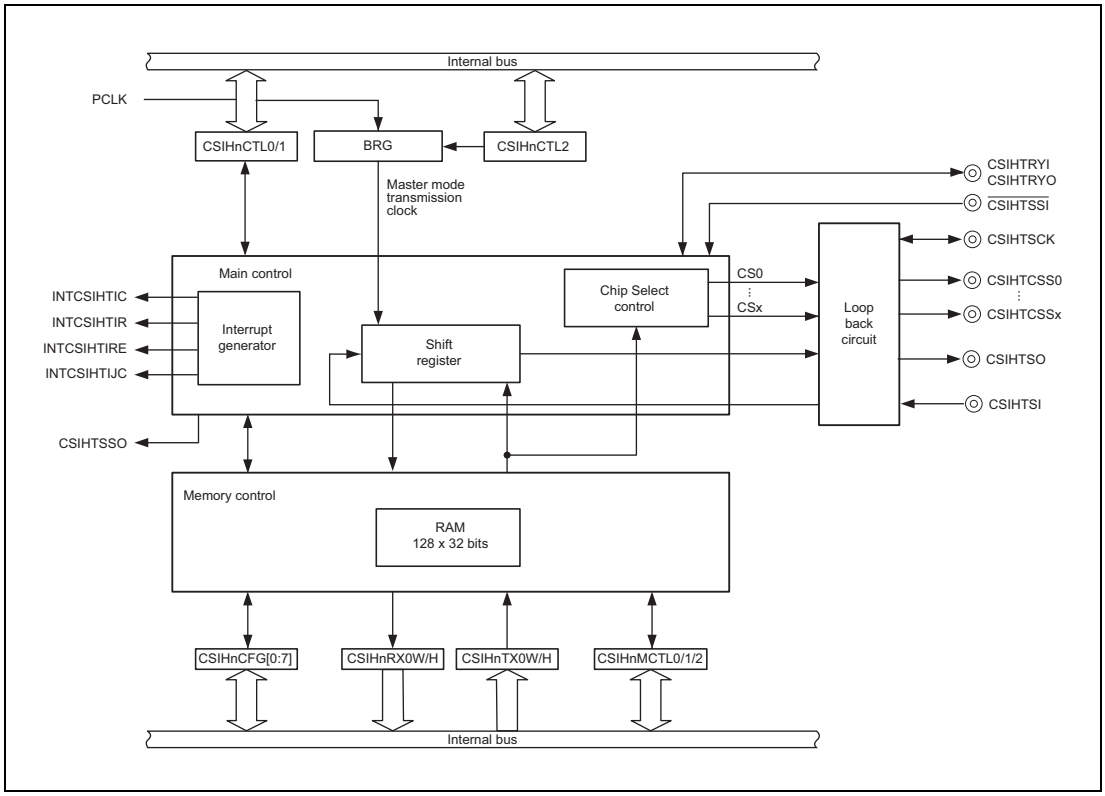

Figure 17.1 CSIH Block Diagram

In master mode, the transmission clock CSIHTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

The built-in memory can be configured as FIFO, dual buffer (separate transmit and receive buffers), or transmit-only buffer. It can also be bypassed for data transmission and reception without buffering.

The loop back circuit disconnects the CSIH completely from the ports and supports internal self-test.

NOTE

This section describes the following modes:

- The “operating mode” is either master mode or slave mode. The master can control and communicate with several slaves only in master mode (for details, see **Section 17.5.1, Operating Modes (Master/Slave)**).
- The “job mode” is related to the AUTOSAR job concept (for details, see **Section 17.5.3.3, Job Concept**).
- The “memory mode” accords with the various configurations of the associated buffer memory (for details, see **Section 17.5.6, CSIH Buffer Memory**).
- The “data transfer mode” specifies the type of communication – transmit-only, receive-only, or transmit/receive (for details, see **Section 17.5.7, Data Transfer Modes**).

17.3 Registers

17.3.1 List of Registers

CSIH registers are listed in the following table.

For details about <CSIHn_base>, see **Section 17.1.2, Register Base Address**.

Table 17.12 List of Registers

Module	Register	Symbol	Address
CSIHn	CSIHn control register 0	CSIHnCTL0	<CSIHn_base> + 0000_H
	CSIHn control register 1	CSIHnCTL1	<CSIHn_base> + 0010_H
	CSIHn control register 2	CSIHnCTL2	<CSIHn_base> + 0014_H
	CSIHn status register 0	CSIHnSTR0	<CSIHn_base> + 0004_H
	CSIHn status clear register 0	CSIHnSTCR0	<CSIHn_base> + 0008_H
	CSIHn memory control register 0	CSIHnMCTL0	<CSIHn_base> + 1040_H
	CSIHn memory control register 1	CSIHnMCTL1	<CSIHn_base> + 1000_H
	CSIHn memory control register 2	CSIHnMCTL2	<CSIHn_base> + 1004_H
	CSIHn memory read/write pointer register 0	CSIHnMRWP0	<CSIHn_base> + 1018_H
	CSIHn configuration register 0	CSIHnCFG0	<CSIHn_base> + 1044_H
	CSIHn configuration register 1	CSIHnCFG1	<CSIHn_base> + 1048_H
	CSIHn configuration register 2	CSIHnCFG2	<CSIHn_base> + $104C_H$
	CSIHn configuration register 3	CSIHnCFG3	<CSIHn_base> + 1050_H
	CSIHn configuration register 4	CSIHnCFG4	<CSIHn_base> + 1054_H
	CSIHn configuration register 5	CSIHnCFG5	<CSIHn_base> + 1058_H
	CSIHn configuration register 6	CSIHnCFG6	<CSIHn_base> + $105C_H$
	CSIHn configuration register 7	CSIHnCFG7	<CSIHn_base> + 1060_H
	CSIHn transmit data register 0 for word access	CSIHnTX0W	<CSIHn_base> + 1008_H
	CSIHn transmit data register 0 for half word access	CSIHnTX0H	<CSIHn_base> + $100C_H$
	CSIHn receive data register 0 for word access	CSIHnRX0W	<CSIHn_base> + 1010_H
	CSIHn receive data register 0 for half word access	CSIHnRX0H	<CSIHn_base> + 1014_H
	CSIHn emulation register	CSIHnEMU	<CSIHn_base> + 0018_H
	CSIHn baud rate setting register 0	CSIHnBRS0	<CSIHn_base> + 1068_H
	CSIHn baud rate setting register 1	CSIHnBRS1	<CSIHn_base> + $106C_H$
	CSIHn baud rate setting register 2	CSIHnBRS2	<CSIHn_base> + 1070_H
	CSIHn baud rate setting register 3	CSIHnBRS3	<CSIHn_base> + 1074_H

17.3.2 CSIHnCTL0 — CSIHn Control Register 0

This register controls the operation clock, enables/disables transmission/reception, and enables/disables the memory allocated for transmission and/or reception. It forces the stop of communication at the end of the current job.

Access: This register can be read or written in 8-bit units.

Address: <CSIHn_base> + 0000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CSIHnPWR	CSIHnTXE	CSIHnRXE	—	—	—	CSIHnJOBE	CSIHnMBS
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R/W	R/W

Table 17.13 CSIHnCTL0 Register Contents

Bit Position	Bit Name	Function
7	CSIHnPWR	Controls the operation clock. 0: Stops operation clock. 1: Supplies operation clock. Clearing CSIHnPWR to 0 resets the internal circuits, stops operation, and sets CSIH to standby state. Clock supply to internal circuits stops. If CSIHnPWR is cleared (to 0) during communication, ongoing communication is immediately aborted. In this case, the communication setting must be reconfigured.
6	CSIHnTXE	Enables/disables transmission. 0: Disables transmission. 1: Enables transmission.
5	CSIHnRXE	Enables/disables reception. 0:Disables reception. 1: Enables reception.
4 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CSIHnJOBE	Stops communication at the end of the current job (communication ends if data is written to the transmission buffer when CSIHnTX0W.CSIHnEOJ = 1 (job completion)). 0: Communication stop is not requested. 1: Stops communication. This bit can be used to abort an ongoing job. This bit is cleared to 0 automatically. Even if this bit is set to 1, the read value is always 0. In FIFO mode, the pointer must be cleared by setting CSIHnSTCR0.CSIHnPCT = 1 before the next communication is started
0	CSIHnMBS	Bypasses the memory for transmission and/or reception data. 0: Memory mode CSIH memory is used for transmission and/or reception data. 1: Direct access mode CSIH memory is bypassed.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.3 CSIHnCTL1 — CSIHn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, handshake functionality, and job mode. It selects the active output level of each chip select signal and the behavior of the chip select signals after the transfer of the final data.

Access: This register can be read or written in 32-bit units.

Address: <CSIHn_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CSIHn SLRS	—	—	—	—	—	CSIHn PHE	CSIHn CKR	CSIHn SLIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn CSL7	CSIHn CSL6	CSIHn CSL5	CSIHn CSL4	CSIHn CSL3	CSIHn CSL2	CSIHn CSL1	CSIHn CSL0	CSIHn EDLE	CSIHn JE	CSIHn DCS	CSIHn CSRI	CSIHn LBM	CSIHn SIT	CSIHn HSE	CSIHn SSE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.14 CSIHnCTL1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	CSIHnSLRS	Sets the internal synchronization timing for receive data input. 0: Rising edge of PCLK 1: Falling edge of PCLK For differences by the setting, see Data Sheet.
23 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	CSIHnPHE	Sets the CPU-controlled priority-based communication function. 0: The CPU-controlled high-priority communication function is disabled. 1: The CPU-controlled high-priority communication function is enabled. To enable the CPU-controlled high-priority communication function, set this bit to 1 and set CSIHnJE = 1. This bit can only be set in transmit-only buffer mode.
17	CSIHnCKR	CSIHTSCK Clock Inversion Function 0: The default level of CSIHTSCK is high 1: The default level of CSIHTSCK is low For details, see **Section 17.3.11, CSIHnCFGx — CSIHn Configuration Register x**.
16	CSIHnSLIT	Selects the timing of interrupt INTCSIHTIC. 0: Normal interrupt timing (interrupt is generated after the transfer) 1: As soon as the contents of the CSIHnTX0W/H register are transferred to the shift register, an interrupt is generated (this function is activated only in direct access mode/transmit-only buffer mode). For details, see **Section 17.4.3, INTCSIHTIC (Communication Status Interrupt)**.
15 to 8	CSIHnCSLx	Selects the active output level of chip select signal x (CSIHTCSSx). 0: Chip select is active low. 1: Chip select is active high. For details, see **Section 17.5.3, Chip Selection (CS) Features**.
7	CSIHnEDLE	Enables/disables extended data length (EDL) mode. 0: Disables extended data length mode. 1: Enables extended data length mode. For details, see **Section 17.5.8.2, Data Length Greater than 16 Bits**.

Table 17.14 CSIHnCTL1 Register Contents (2/2)

Bit Position	Bit Name	Function
6	CSIHnJE	Enables/disables job mode. 0: Disables job mode. 1: Enables job mode. For details, see **Section 17.5.3.3, Job Concept**. The CSIHnCTL0.CSIHnJOBE, CSIHnTX0W.CSIHnEOJ, and CSIHnTX0W.CSIHnCIRE bits are enabled only when CSIHnJE = 1. Setting this bit in slave mode is prohibited. In addition, to enable the CPU-controlled high-priority communication function, set this bit to 1 as well as CSIHnPHE = 1.
5	CSIHnDCS	Enables/disables data consistency check. 0: Disables data consistency check. 1: Enables data consistency check. For details, see **Section 17.5.12.1, Data Consistency Check**.
4	CSIHnCSRI	Defines chip select signal behavior after last data transfer. 0: Chip select signal retains the active level. 1: Chip select signal returns to the inactive level. The last data is determined at the interrupt timing in direct access mode or FIFO mode. When CSIHnCTL1.CSIHnSLIT = 1, the last data is determined in direct access mode.
3	CSIHnLBM	Controls loop-back mode (LBM). 0: Deactivates loop-back mode. 1: Activates loop-back mode. For details, see **Section 17.5.13, Loop-Back Mode**.
2	CSIHnSIT	Selects interrupt delay mode. 0: No delay is generated. 1: Half clock delay is generated for all interrupts. This bit is only valid in master mode. In slave mode, no delay is generated. For details, see **Section 17.4.2, Interrupt Delay**.
1	CSIHnHSE	Enables/disables the handshake function. 0: Disables the handshake function. 1: Enables the handshake function. For details see **Section 17.5.11, Handshake Function**.
0	CSIHnSSE	Enables/disables the slave select function. 0: Input signal $\overline{\text{CSIHTSSI}}$ is disabled. 1: Input signal $\overline{\text{CSIHTSSI}}$ is recognized. If the slave select function is not used, this bit must be set to 0 (see also **Section 17.5.2, Master/Slave Connections**).

Details about CSIHnCTL1.CSIHnSSE are shown in the following tables.

Table 17.15 Operation of the Slave Select Function during Reception

CSIHnCTL0. CSIHnRXE	CSIHnCTL1. CSIHnSSE	$\overline{\text{CSIHTSSI}}$	Receive Operation
0	—	—	Reception is prohibited
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

Table 17.16 Operation of the Slave Select Function during Transmission

CSIHnCTL0. CSIHnTXE	CSIHnCTL1. CSIHnSSE	$\overline{\text{CSIHTSSI}}$	Transmit Operation
0	—	—	Transmission is prohibited
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.4 CSIHnCTL2 — CSIHn Control Register 2

This register selects operating mode and the reference clock value, and specifies the transfer clock frequency.

For details see **Section 17.5.5, Transmission Clock Selection**.

Access: This register can be read or written in 16-bit units.

Address: <CSIHn_base> + 0014_H

Value after reset: $E000_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnPRS[2:0]			—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.17 CSIHnCTL2 Register Contents

Bit Position	Bit Name	Function
15 to 13	CSIHnPRS[2:0]	These bits select the operation mode and the reference clock value.
12 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CSIHnPRS2	CSIHnPRS1	CSIHnPRS0	Selection of Reference Clock (PRSOUT)
0	0	0	PCLK (Master mode)
0	0	1	PCLK/2 (Master mode)
0	1	0	PCLK/4 (Master mode)
0	1	1	PCLK/8 (Master mode)
1	0	0	PCLK/16 (Master mode)
1	0	1	PCLK/32 (Master mode)
1	1	0	PCLK/64 (Master mode)
1	1	1	External clock via CSIHTSCK(in) (Slave mode)

In master mode, the following bits are used to set the transfer clock frequency:

CSIHnCTL2.CSIHnPRS[2:0], CSIHnCFGx.CSIHnBRSS[1:0], CSIHnBRSy.CSIHnBRS[11:0]

In addition, any of the four different transfer clock frequency settings that are specified by the CSIHnBRSy.CSIHnBRS[11:0] bits is selected for each chip select signal. To select the transfer clock frequency setting for each chip select signal, use the CSIHnCFGx.CSIHnBRSS[1:0] bits.

The following table shows the relationship between CSIHnCFGx.CSIHnBRSS[1:0] and CSIHnBRSy.CSIHnBRS[11:0].

CSIHnCFGx. CSIHnBRSS[1:0]	Transfer Clock Frequency Setting Bit to be Selected
00	CSIHnBRS0.CSIHnBRS[11:0]
01	CSIHnBRS1.CSIHnBRS[11:0]
10	CSIHnBRS2.CSIHnBRS[11:0]
11	CSIHnBRS3.CSIHnBRS[11:0]

The following table shows the relationship between the transfer clock frequency and the transfer clock frequency setting (CSIHnBRSy[11:0]) selected by the CSIHnBRSS[1:0] bits when the bit value of the CSIHnPRS[2:0] bits is α.

CSIHnBRSy[11:0]	Transfer clock frequency
0	BRG stopped
1	PCLK / (2^{α} × 1 × 2)
2	PCLK / (2^{α} × 2 × 2)
3	PCLK / (2^{α} × 3 × 2)
4	PCLK / (2^{α} × 4 × 2)
...	…
4095	PCLK / (2^{α} × 4095× 2)

When a time-out error is used in slave mode, the clock selected by this setting is used. In slave mode, the CSIHnPRS[2:0] bits are set to 111_B. In this case, the prescaler has the same setting as when the CSIHnPRS[2:0] bits are set to 000_B. When using a time-out error, set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000_H.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.5 CSIHnSTR0 — CSIHn Status Register 0

This register indicates the status of CSIH.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <CSIHn_base> + 0004_H

Value after reset: $0000\ 0010_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHnSRP[7:0]								CSIHnSPF[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn TMOE	CSIHn OFE	—	—	—	—	—	CSIHn HPST	CSIHn TSF	—	CSIHn FLF	CSIHn EMF	CSIHn DCE	—	CSIHn PE	CSIHn OVE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.18 CSIHnSTR0 Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 24	CSIHnSRP[7:0]	Indicates the number of received data in FIFO mode. **CSIHnSRP[7:0]** / **Description** 00_H — Number of received data packets (0 to 128) … 80_H Other than the above — Undefined These bits are cleared by CSIHnSTCR0.CSIHnPCT. In direct access mode, dual buffer mode, or transmit-only buffer mode, this value is fixed to 00_H. In direct access mode, this bit is fixed to 0 because there is no pointer. In buffer mode, this bit is fixed to 0 because the number of data is managed by CSIHnMCTL2.CSIHnND[7:0].
23 to 16	CSIHnSPF[7:0]	Indicates the number of unsent data in FIFO mode. (The number of data written by the CPU is the number of sent data.) **CSIHnSPF[7:0]** / **Description** 00_H — Number of unsent data (0 to 128) … 80_H Other than the above — Undefined These bits are cleared by CSIHnSTCR0.CSIHnPCT. In direct access mode, dual buffer mode, or transmit-only buffer mode, this value is fixed to 00_H. In direct access mode, this bit is fixed to 0 because there is no pointer. In buffer mode, this bit is fixed to 0 because the number of data is managed by CSIHnMCTL2.CSIHnND[7:0].

Table 17.18 CSIHnSTR0 Register Contents (2/3)

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>15</td><td>CSIHnTMOE</td><td>Time-out Error Flag in FIFO Mode
Indicates whether a time-out error was detected in FIFO mode.
0: No time-out error was detected.
1: A time-out error was detected.
For details, see Section 17.5.12.3, Time-Out Error.
This bit is cleared by CSIHnSTCR0.CSIHnTMOEC.
When setting to 1 by time-out error detection and clearing to 0 by CSIHnSTCR0.CSIHnTMOEC occur simultaneously, setting to 1 takes precedence over clearing to 0.
This bit is also initialized when CSIHnCTL0.CSIHnPWR is changed from 0 to 1 or from 1 to 0.</td></tr>
<tr><td>14</td><td>CSIHnOFE</td><td>Overflow Error Flag in FIFO mode
Indicates whether an overflow error was detected in FIFO mode.
0: No overflow error was detected.
1: An overflow error was detected.
For details, see Section 17.5.12.4, Overflow Error.
This bit is cleared by CSIHnSTCR0.CSIHnOFEC.
When setting to 1 by overflow error detection and clearing to 0 by CSIHnSTCR0.CSIHnOFEC occur simultaneously, setting to 1 takes precedence over clearing to 0.
This bit is also initialized when CSIHnCTL0.CSIHnPWR is changed from 0 to 1 or from 1 to 0.</td></tr>
<tr><td>13 to 9</td><td>Reserved</td><td>When read, the value after reset is returned.</td></tr>
<tr><td>8</td><td>CSIHnHPST</td><td>Communication Priority Indication Flag

</table></td></tr>
<tr><td>6</td><td>Reserved</td><td>When read, the value after reset is returned.</td></tr>
<tr><td>5</td><td>CSIHnFLF</td><td>A flag indicating that the buffer is full in FIFO mode.
0: FIFO buffer is not full.
1: FIFO buffer is full.
This bit is cleared by CSIHnSTCR0.CSIHnPCT.
The FIFO buffer might be filled with unsent data or received data.</td></tr>
</table>

Table 17.18 CSIHnSTR0 Register Contents (3/3)

Bit Position	Bit Name	Function
4	CSIHnEMF	A flag indicating that the buffer is empty in FIFO mode. 0: FIFO buffer is not empty. 1: FIFO buffer is empty. This bit is set to 1 by CSIHnSTCR0.CSIHnPCT. This bit is set to 1 when CSIHnSTR0.CSIHnSRP[7:0] + CSIHnSTR0.CSIHnSPF[7:0] = 00_H. The FIFO buffer might be filled with unsent data or received data.
3	CSIHnDCE	Data Consistency Check Error Flag 0: No data consistency check error is detected. 1: Data consistency check error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnDCEC. When setting to 1 by data consistency check error detection and clearing to 0 by CSIHnSTCR0.CSIHnDCEC occur simultaneously, setting to 1 takes precedence over clearing to 0. This bit is initialized when CSIHnCTL0.CSIHnPWR is changed from 0 to 1 or from 1 to 0.
2	Reserved	When read, the value after reset is returned.
1	CSIHnPE	Parity Error Flag 0: No parity error is detected. 1: Parity error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnPEC. When setting to 1 due to parity error detection and clearing to 0 by CSIHnSTCR0.CSIHnPEC occur simultaneously, setting to 1 by parity error detection takes precedence over clearing to 0. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.
0	CSIHnOVE	Overrun Error Flag (Fixed to 0 in dual buffer mode) 0: No overrun error is detected. 1: Overrun error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnOVEC. When setting to 1 due to overrun error detection and clearing to 0 by writing to CSIHnSTCR0.CSIHnOVEC occur simultaneously, setting to 1 by overrun error detection takes precedence over clearing to 0. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.

Table 17.19 Behaviors in Various Memory Modes

Bit Name	Bit Position	Direct Access Mode	FIFO Mode	Transmit-Only Buffer Mode	Dual Buffer Mode
CSIHnSRP[7:0]	31 to 24	Fixed to 0	Number of received data	Fixed to 0	Fixed to 0
CSIHnSPF[7:0]	23 to 16	Fixed to 0	Number of untransmitted data packets	Fixed to 0	Fixed to 0
CSIHnTMOE	15	Fixed to 0	0: No error is detected. 1: An error is detected.	Fixed to 0	Fixed to 0
CSIHnOFE	14	Fixed to 0	0: No error is detected. 1: An error is detected.	Fixed to 0	Fixed to 0
CSIHnTSF	7	0: Idle state 1: Communication is in progress or being prepared			
CSIHnFLF	5	Fixed to 0	0: FIFO is not full 1: FIFO is full	Fixed to 0	Fixed to 0
CSIHnEMF	4	Fixed to 1	0: FIFO is not empty 1: FIFO is empty	Fixed to 1	Fixed to 1
CSIHnDCE	3	0: No error is detected. 1: An error is detected.			
CSIHnPE	1	0: No error is detected. 1: An error is detected.			
CSIHnOVE	0	0: No error is detected. 1: An error is detected.	0: No error is detected. 1: An error is detected.	0: No error is detected. 1: An error is detected.	Fixed to 0

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.6 CSIHnSTCR0 — CSIHn Status Clear Register 0

This register clears the status flags of the CSIHnSTR0 status register.

Access: This register can be read or written in 16-bit units.
When read, the value 0000_H is always returned.

Address: <CSIHn_base> + 0008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn TMOEC	CSIHn OFEC	—	—	—	—	—	CSIHn PCT	—	—	—	—	CSIHn DCEC	—	CSIHn PEC	CSIHn OVEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R	R	R/W	R	R/W	R/W

Table 17.20 CSIHnSTCR0 Register Contents

Bit Position	Bit Name	Function
15	CSIHnTMOEC	Controls the time-out error flag clear command. 0: No operation. The read value is always 0. 1: Clears the time-out error flag (CSIHnSTR0.CSIHnTMOE).
14	CSIHnOFEC	Controls the overflow error flag clear command. 0: No operation. The read value is always 0. 1: Clears the overflow error flag (CSIHnSTR0.CSIHnOFE).
13 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	CSIHnPCT	Controls the FIFO pointer clear command. 0: No operation. The read value is always 0. 1: Clears the following FIFO buffer pointers (in FIFO mode, dual buffer mode, and transmit-only buffer mode) and status bits. **FIFO Buffer Pointer / Status Bit** CSIHnMRWP0.CSIHnTRWA[6:0] — CSIHnSTR0.CSIHnSPF[7:0] CSIHnMRWP0.CSIHnRRA[6:0] — CSIHnSTR0.CSIHnSRP[7:0] CSIHnMCTL2.CSIHnSOP[6:0] — CSIHnSTR0.CSIHnFLF, CSIHnSTR0.CSIHnTSF Additionally, the CSIHnSTR0.CSIHnEMF bit is set to 1 (FIFO empty) (in FIFO mode only).
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	CSIHnDCEC	Controls the data consistency check error flag clear command. 0: No operation. The read value is always 0. 1: Clears the data consistency check error flag (CSIHnSTR0.CSIHnDCE).
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	CSIHnPEC	Controls the parity error flag clear command. 0: No operation. The read value is always 0. 1: Clears the parity error flag (CSIHnSTR0.CSIHnPE).
0	CSIHnOVEC	Controls the overrun error flag clear command. 0: No operation. The read value is always 0. 1: Clears the overrun error flag (CSIHnSTR0.CSIHnOVE).

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.7 CSIHnMCTL0 — CSIHn Memory Control Register 0

This register selects the memory mode and the time-out setting.

Access: This register can be read or written in 16-bit units.

Address: <CSIHn_base> + 1040_H

Value after reset: $001F_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CSIHn MMS[1:0]		—	—	—	CSIHnTO[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 17.21 CSIHnMCTL0 Register Contents

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 8	CSIHnMMS [1:0]	Selects the memory mode.

CSIHn MMS1	CSIHn MMS0	Description
0	0	FIFO mode
0	1	Dual buffer mode
1	0	Transmit-only buffer mode
1	1	Prohibited

After a change of the memory mode, the respective buffer pointers must be cleared by setting the CSIHnSTCR0.CSIHnPCT bit to 1.
In direct access mode, the setting of these bits is ignored.

7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	CSIHnTO[4:0]	Selects the time-out setting in FIFO mode.

CSIHnTO[4:0]	Description
00000_B	No time-out is detected
00001_B	Time-out is (1 × 8 × BRG output clocks)
00010_B	Time-out is (2 × 8 × BRG output clocks)
...	
11111_B	Time-out is (31 × 8 × BRG output clocks)

CAUTION

Changing the time-out setting is only permitted when CSIHnCTL0.CSIHnPWR = 0.
Set the CSIHnTO[4:0] bits to 00000_B in direct access mode, dual buffer mode, or transmit-only buffer mode (except FIFO mode).
For details about time-out detection, see also **Section 17.5.12.3, Time-Out Error**.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.8 CSIHnMCTL1 — CSIHn Memory Control Register 1

This register selects the conditions to generate the interrupt requests INTCSIHTIC and INTCSIHTIR in FIFO mode.

Access: This register can be read or written in 32-bit units.

Address: <CSIHn_base> + 1000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CSIHnFES[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnFFS[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.22 CSIHnMCTL1 Register Contents

Bit Position	Bit name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	CSIHnFES[6:0]	Selects the conditions to generate the INTCSIHTIC interrupt (transmit data empty) in FIFO mode. When the number of unsent data to be transmitted in FIFO (checked by the CSIHnSTR0.CSIHnSPF[7:0] bit) and CSIHnMCTL1.CSIHnFES[6:0] match, the FIFO empty flag (CSIHnSTR0.CSIHnEMF bit) is set to 1, and the INTCSIHTIC interrupt request is generated.
15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	CSIHnFFS[6:0]	Selects the conditions to generate the INTCSIHTIR interrupt (receive data full) in FIFO mode. When the number of received data in FIFO (checked by the CSIHnSTR0.CSIHnSRP[7:0] bit) and (128 - CSIHnMCTL1.CSIHnFFS[6:0]) match, the INTCSIHTIR interrupt request is generated.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.9 CSIHnMCTL2 — CSIHn Memory Control Register 2

This register controls the operation of the memory in dual buffer or transmit-only buffer mode and triggers to start communication.

Access: This register can be read or written in 32-bit units.

Address: <CSIHn_base> + 1004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHn BTST	—	—	—	—	—	—	—	CSIHnND[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnSOP[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.23 CSIHnMCTL2 Register Contents (1/2)

Bit Position	Bit Name	Function
31	CSIHnBTST	Provides a start trigger for buffer transfer. 0: No operation. 1: Issues the start transfer command. The read value is always 0. **CAUTION** This bit can only be used in dual buffer mode and transmit-only buffer mode.
30 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	CSIHnND[7:0]	Specifies the number of data for each memory mode. The read value indicates the number of remaining communication data.

CSIHn ND[7:0]	Dual Buffer Mode	Transmit-Only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	Send 0 data	Send 0 data	No influence	No influence
01_H	Send 1 data	Send 1 data	No influence	No influence
...	...	...	No influence	No influence
$3F_H$	Send 63 data	Send 63 data	No influence	No influence
40_H	Send 64 data	Send 64 data	No influence	No influence
...	Prohibited	...	No influence	No influence
$7F_H$	Prohibited	Send 127 data	No influence	No influence
80_H	Prohibited	Send 128 data	No influence	No influence
Other than the above	Setting is prohibited.			

The values are automatically decremented after data transfer (not decremented in direct access mode).

15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.23 CSIHnMCTL2 Register Contents (2/2)

Bit Position	Bit Name	Function
6 to 0	CSIHnSOP[6:0]	Selects the pointer of the data to be sent. If communication is forced to stop by setting CSIHnCTL0.CSIHnPWR to 0 or CSIHnSTCR0.CSIHnPCT to 1, these bits are cleared by hardware. In FIFO mode, these bits indicate the send address.

CSIHn SOP[6:0]	Dual Buffer Mode	Transmit-Only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	0000_H	0000_H	0000_H	No influence
01_H	0004_H	0004_H	0004_H	No influence
...	...	...	...	No influence
$3F_H$	$00FC_H$	$00FC_H$	$00FC_H$	No influence
40_H	Prohibited	0100_H	0100_H	No influence
...	Prohibited	...	...	No influence
$7F_H$	Prohibited	$01FC_H$	$01FC_H$	No influence

CAUTION

In direct access mode, these bits are not incremented.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.10 CSIHnMRWP0 — CSIHn Memory Read/Write Pointer Register 0

This register sets the pointers for reading from and writing to the dual buffer or transmit-only buffer.

Access: This register can be read or written in 32-bit units.

Address: <CSIHn_base> + 1018_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CSIHnRRA[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnTRWA[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.24 CSIHnMRWP0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	CSIHnRRA[6:0]	Selects the read pointer of the receive buffer.

CSIHn RRA[6:0]	Dual Buffer Mode	Transmit-Only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	0000_H	No influence	0000_H	No influence
01_H	0004_H	No influence	0004_H	No influence
...	...	No influence	...	No influence
$3F_H$	$00FC_H$	No influence	$00FC_H$	No influence
40_H	Prohibited	No influence	0100_H	No influence
...	Prohibited	No influence	...	No influence
$7F_H$	Prohibited	No influence	$01FC_H$	No influence

These bits are automatically incremented when received data is read.
If an overrun error is generated while reading the CSIHnRX0W or CSIHnRX0H register, the read pointer is not incremented.
These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.
In direct access mode and transmit-only buffer mode, these bits are not incremented.
To perform write access in transmit-only buffer mode, set 00_H to these bits.
In FIFO mode, these bits indicate the read address of the received data.

15 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.24 CSIHnMRWP0 Register Contents (2/2)

Bit Position	Bit Name	Function
6 to 0	CSIHnTRWA [6:0]	Selects the read/write pointer of the transmit buffer.

CSIHn TRWA[6:0]	Dual Buffer Mode	Transmit-Only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	0000_H	0000_H	0000_H	No influence
01_H	0004_H	0004_H	0004_H	No influence
...	...	...	...	No influence
$3F_H$	$00FC_H$	$00FC_H$	$00FC_H$	No influence
40_H	Prohibited	0100_H	0100_H	No influence
...	Prohibited	...	...	No influence
$7F_H$	Prohibited	$01FC_H$	$01FC_H$	No influence

These bits are automatically incremented when the transmission data is written or read.
These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.
In direct access mode, these bits are not incremented.
In FIFO mode, these bits indicate the read/write address of transmission data.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.11 CSIHnCFGx — CSIHn Configuration Register x

These eight registers configure the prescaler, parity, data length, recessive configuration for broadcasting, serial data direction, clock phase and data phase, idle enforcement configuration, idle time, hold time, inter-data time, and setup for each chip select signal, CSIHTCSSx.

Slave mode

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is effective.

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock phase and data phase

In slave mode, set all bits other than above in the CSIHnCFG0 register, and the CSIHnCFG1 to CSIHnCFG7 registers to 0.

Access: This register can be read or written in 32-bit units.

Address: CSIHnCFG0: <CSIHn_base> + 1044_H
CSIHnCFG1: <CSIHn_base> + 1048_H
CSIHnCFG2: <CSIHn_base> + $104C_H$
CSIHnCFG3: <CSIHn_base> + 1050_H
CSIHnCFG4: <CSIHn_base> + 1054_H
CSIHnCFG5: <CSIHn_base> + 1058_H
CSIHnCFG6: <CSIHn_base> + $105C_H$
CSIHnCFG7: <CSIHn_base> + 1060_H

Value after reset: $0000\ 0000_H$

1	—	Setting prohibited

15	CSIHnIDLx	Selects the idle enforcement configuration for chip select signal x 0: If the CSIHnTX0W.CSIHnCSx settings of two consecutive transfers are different, an idle state is inserted between two transfers. If the CSIHnTX0W.CSIHnCSx settings of two consecutive transfers are the same, an idle state is not inserted between two transfers. 1: Regardless of the CSIHnTX0W.CSIHnCSx settings of two consecutive transfers, an idle state are inserted between two transfers. This bit is only available in master mode. For details about the enforced idle state, see **Section 17.5.15, Enforced Chip Select Idle Setting**.

Table 17.25 CSIHnCFGx Register Contents (3/4)

Bit Position	Bit Name	Function
14 to 12	CSIHnIDx[2:0]	Selects the idle time for chip select signal x. **CSIHn IDx[2:0]** / **Idle time** 000_B 0.5 transmission clock cycle 001_B 1.0 transmission clock cycle 010_B 1.5 transmission clock cycles 011_B 2.5 transmission clock cycles 100_B 3.5 transmission clock cycles 101_B 4.5 transmission clock cycles 110_B 6.5 transmission clock cycles 111_B 8.5 transmission clock cycles These bits are only available in master mode.
11 to 8	CSIHnHDx[3:0]	Specifies the hold time for chip select signal x in transmission clock cycles. **CSIHn HDx[3:0]** / **Hold time when CSIHnCTL1.CSIHnSIT is 0** / **Hold time when CSIHnCTL1.CSIHnSIT is 1** 0000_B 0.5 transmission clock cycle 1.0 transmission clock cycle 0001_B 1.0 transmission clock cycle 1.5 transmission clock cycles 0010_B 1.5 transmission clock cycles 2.0 transmission clock cycles 0011_B 2.5 transmission clock cycles 3.0 transmission clock cycles 0100_B 3.5 transmission clock cycles 4.0 transmission clock cycles 0101_B 4.5 transmission clock cycles 5.0 transmission clock cycles 0110_B 6.5 transmission clock cycles 7.0 transmission clock cycles 0111_B 8.5 transmission clock cycles 9.0 transmission clock cycles 1000_B 9.5 transmission clock cycles 10.0 transmission clock cycles 1001_B 10.5 transmission clock cycles 11.0 transmission clock cycles 1010_B 11.5 transmission clock cycles 12.0 transmission clock cycles 1011_B 12.5 transmission clock cycles 13.0 transmission clock cycles 1100_B 14.5 transmission clock cycles 15.0 transmission clock cycles 1101_B 16.5 transmission clock cycles 17.0 transmission clock cycles 1110_B 18.5 transmission clock cycles 19.0 transmission clock cycles 1111_B 20.5 transmission clock cycles 21.0 transmission clock cycles These bits are only available in master mode.

Table 17.25 CSIHnCFGx Register Contents (4/4)

Bit Position	Bit Name	Function
7 to 4	CSIHnINx[3:0]	Specifies the inter-data time for chip select signal x in transmission clock cycles.

CSIHnINx[3:0]	Inter-Data Time when CSIHnCTL1.CSIHnSIT is 0	Inter-Data Time when CSIHnCTL1.CSIHnSIT is 1
0000_B	0.0 transmission clock cycle	0.5 transmission clock cycle
0001_B	0.5 transmission clock cycle	1.0 transmission clock cycle
0010_B	1.0 transmission clock cycle	1.5 transmission clock cycles
0011_B	2.0 transmission clock cycles	2.5 transmission clock cycles
0100_B	3.0 transmission clock cycles	3.5 transmission clock cycles
0101_B	4.0 transmission clock cycles	4.5 transmission clock cycles
0110_B	6.0 transmission clock cycles	6.5 transmission clock cycles
0111_B	8.0 transmission clock cycles	8.5 transmission clock cycles
1000_B	9.0 transmission clock cycles	9.5 transmission clock cycles
1001_B	10.0 transmission clock cycles	10.5 transmission clock cycles
1010_B	11.0 transmission clock cycles	11.5 transmission clock cycles
1011_B	12.0 transmission clock cycles	12.5 transmission clock cycles
1100_B	14.0 transmission clock cycles	14.5 transmission clock cycles
1101_B	16.0 transmission clock cycles	16.5 transmission clock cycles
1110_B	18.0 transmission clock cycles	18.5 transmission clock cycles
1111_B	20.0 transmission clock cycles	20.5 transmission clock cycles

These bits are only available in master mode.

3 to 0	CSIHnSPx[3:0]	Specifies the setup time for chip select signal x in transmission clock cycles.

CSIHnSPx[3:0]	Setup Time
0000_B	0.5 transmission clock cycle
0001_B	1.0 transmission clock cycle
0010_B	1.5 transmission clock cycles
0011_B	2.5 transmission clock cycles
0100_B	3.5 transmission clock cycles
0101_B	4.5 transmission clock cycles
0110_B	6.5 transmission clock cycles
0111_B	8.5 transmission clock cycles
1000_B	9.5 transmission clock cycles
1001_B	10.5 transmission clock cycles
1010_B	11.5 transmission clock cycles
1011_B	12.5 transmission clock cycles
1100_B	14.5 transmission clock cycles
1101_B	16.5 transmission clock cycles
1110_B	18.5 transmission clock cycles
1111_B	20.5 transmission clock cycles

These bits are only available in master mode.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.12 CSIHnTX0W — CSIHn Transmit Data Register 0 for Word Access

This register stores transmission data. In addition, it specifies the communication interrupt request, the end-of-job, the extended data length, and the chip select activation.

Access: This register can be read or written in 32-bit units.

Address: <CSIHn_base> + 1008_H

Value after reset: $X0XX\ XXXX_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHnCIRE	CSIHnEOJ	CSIHnEDL	—	—	—	—	—	CSIHnCS7	CSIHnCS6	CSIHnCS5	CSIHnCS4	CSIHnCS3	CSIHnCS2	CSIHnCS1	CSIHnCS0
Value after reset	—	—	—	0	0	0	0	0	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnTX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.26 CSIHnTX0W Register Contents (1/2)

Bit Position	Bit name	Function
31	CSIHnCIRE	Enables the communication interrupt request INTCSIHTIC in dual buffer or transmit-only buffer mode, or the job completion interrupt request INTCSIHTIJC in FIFO mode. 0: No interrupt is requested. 1: An interrupt is requested. Generates interrupt INTCSIHTIC or INTCSIHTIJC after transmission. For details, see **Section 17.4.3, INTCSIHTIC (Communication Status Interrupt)** and **Section 17.4.6, INTCSIHTIJC (Job Completion Interrupt)**. **CAUTION** This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
30	CSIHnEOJ	Specifies the end of a job. 0: Indicates that it is not end-of-job data. The job continues. 1: Indicates end-of-job data. **CAUTION** This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). This bit must be set to 0 in slave mode.
29	CSIHnEDL	Specifies whether the associated data requires the extended data length (EDL) option. 0: Normal operation 1: Enables the extended data length. The associated data is transmitted as a 16-bit packet. No inter-data time or idle time will be inserted after the data is transmitted. If CSIHnCTL1.CSIHnEDLE = 1 and CSIHnTX0W.CSIHnEDL = 1, the subsequent data must have the same CS selection. If CS is modified for the subsequent data, the correct operation is not assured. **CAUTION** This bit is only available if CSIHnCTL1.CSIHnEDLE = 1.
28 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.26 CSIHnTX0W Register Contents (2/2)

Bit Position	Bit name	Function
23 to 16	CSIHnCS[7:0]	Activates one or more chip select signals. 0: Activates chip select signals x for the associated transmission. 1: Deactivates chip select signals x for the associated transmission. Setting CSIHnTX0W.CSIHnCS[7:0] = FF_H is prohibited. **CAUTION** If several chip select signals are enabled for broadcasting, the configuration of one with CSIHnCFGx.CSIHnRCBx = 0 (dominant) is used. In this case, all dominant chip select signals must be set to precisely the same value. In slave mode, set the CSIHnCS[7:0] bit to FE_H.
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.13 CSIHnTX0H — CSIHn Transmit Data Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of register CSIHnTX0W.

The settings specified by the upper 16 bits of CSIHnTX0W are applied to the transmission. Set transmit data to CSIHnTX0W before using this register because the value of CSIHnTX0W is undefined after the reset.

Access: This register can be read or written in 16-bit units.

Address: <CSIHn_base> + $100C_H$

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnTX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.27 CSIHnTX0H Register Contents

Bit Position	Bit name	Function
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.14 CSIHnRX0W — CSIHn Receive Data Register 0 for Word Access

This register stores the received data.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <CSIHn_base> + 1010_H

Value after reset: $0XXX\ XXXX_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	CSIHn RPE	CSIHn TDCE	CSIHn CS7	CSIHn CS6	CSIHn CS5	CSIHn CS4	CSIHn CS3	CSIHn CS2	CSIHn CS1	CSIHn CS0
Value after reset	0	0	0	0	0	0	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnRX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.28 CSIHnRX0W Register Contents

Bit Position	Bit name	Function
31 to 26	Reserved	When read, the value after reset is returned.
25	CSIHnRPE	Indicates whether a reception data parity error was detected. 0: No parity error was detected on the associated reception data. 1: A parity error was detected on the associated reception data.
24	CSIHnTDCE	Indicates whether a transmission data consistency check error was detected. 0: No consistency error was detected on the associated transmission data. 1: A consistency error was detected on the associated transmission data.
23 to 16	CSIHnCSx (x = 7 to 0)	Indicates which chip select signal was activated. 0: Chip select x was activated for the associated reception. 1: Chip select x was deactivated for the associated reception.
15 to 0	CSIHnRX[15:0]	Stores the received data.

NOTE

Read this register at least one serial clock cycle before an interrupt is generated.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.15 CSIHnRX0H — CSIHn Receive Data Register 0 for Half Word Access

This register stores the received data. This register is the same as bits 15 to 0 of register CSIHnRX0W.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <CSIHn_base> + 1014_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnRX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.29 CSIHnRX0H Register Contents

Bit Position	Bit name	Function
15 to 0	CSIHnRX[15:0]	Stores the received data.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.16 CSIHnEMU — CSIHn Emulation Register

This register controls operation of SVSTOP.

Access: This register can be read or written in 8-bit or 1-bit units.
Perform write operation when (EPC.SVSTOP = 0).

Address: <CSIHn_base> + 0018_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CSIHnSVSDIS	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 17.30 CSIHnEMU Register Contents

Bit Position	Bit name	Function
7	CSIHn SVSDIS	Selects whether to continue or stop transmit/receive operation during debugging. • When the EPC.SVSTOP bit is set to 0 Continues transmit/receive operation regardless of the setting of this bit. • When the EPC.SVSTOP bit is set to 1 0: Stops transmit/receive operation. 1: Continues transmit/receive operation.
6 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.17 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y = 0 to 3)

This register sets the transfer clock frequency for each chip select signal.

With CSIHnCFG0 to 7.CSIHnBRSSx[1:0] bits, one of the four types of transfer clock frequency settings can be selected for each chip select signal. For details of transfer clock frequency setting, see **Section 17.5.5, Transmission Clock Selection**.

Access: This register can be read or written in 16-bit units.

Address: CSIHnBRS0: <CSIHn_base> + 1068_H
CSIHnBRS1: <CSIHn_base> + $106C_H$
CSIHnBRS2: <CSIHn_base> + 1070_H
CSIHnBRS3: <CSIHn_base> + 1074_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CSIHnBRS[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.31 CSIHnBRSy Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CSIHnBRS [11:0]	0: BRG stopped 1: PCLK / (2^{α} × 1 × 2) 2: PCLK / (2^{α} × 2 × 2) 3: PCLK / (2^{α} × 3 × 2) 4: PCLK / (2^{α} × 4 × 2) . . . 4095: PCLK / (2^{α} × 4095 × 2) α is the value of CSIHnCTL2.CSIHnPRS[2:0].

CAUTION

When setting this register, see **Table 17.32, Notes on Setting Registers**.

17.3.18 List of Cautions

Table 17.32 Notes on Setting Registers (1/3)

Register Name	Bit Name	Cautions
CSIHnCTL0	CSIHnPWR	If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, it is necessary to restart the communication.
CSIHnCTL0	CSIHnTXE CSIHnRXE	Do not modify any of these bits while CSIHnCTL0.CSIHnPWR = 0. (These bits can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Do not modify these bits while CSIHnSTR0.CSIHnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted.
CSIHnCTL0	CSIHnJOBE	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid when CSIHnCTL1.CSIHnJE = 1. Setting this bit is prohibited in slave mode.
CSIHnCTL0	CSIHnMBS	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. (This bit can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Modification of this bit is only permitted while CSIHnSTR0.CSIHnTSF = 0. Do not change the mode between FIFO mode and direct access mode while CSIHnCTL0.CSIHnPWR = 1. When the CPU-controlled high-priority communication is enabled, the operation is the same as that in direct access mode regardless of the CSIHnMBS bit setting.
CSIHnCTL1	CSIHnCKR	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. When CS is not used, use this bit instead of CSIHnCFGx.CSIHnCKPx and set CSIHnCFGx.CSIHnCKPx to 0. This bit must be used in slave mode.
CSIHnCTL1	CSIHnSLIT CSIHnCSL[7:0] CSIHnEDLE CSIHnDCS CSIHnCSRI CSIHnHSE	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.
CSIHnCTL1	CSIHnPHE CSIHnJE CSIHnLBM	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of this bit is prohibited in slave mode.
CSIHnCTL1	CSIHnSSE	Modification this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting this bit to 1 is prohibited in master mode.
CSIHnCTL1	CSIHnSIT	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated.
CSIHnCTL2	CSIHnPRS[2:0]	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of the maximum transfer clock frequency is as follows. • Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4) • Slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16)
CSIHnSTR0	CSIHnSRP[7:0] CSIHnSPF[7:0] CSIHnHPST CSIHnFLF CSIHnEMF CSIHnTSF	Writing to these bits is prohibited, and only reading is permitted.
CSIHnSTR0	CSIHnTMOE CSIHnOFE CSIHnDCE CSIHnPE CSIHnOVE	Writing to these bits is prohibited, and only reading is permitted. These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0.
CSIHnSTCR0	CSIHnPCT	If this bit is set to 1 during communication, ongoing communication is aborted.
CSIHnMCTL0	CSIHnMMS[1:0]	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0 and CSIHnCTL0.CSIHnMBS = 0.

Table 17.32 Notes on Setting Registers (2/3)

Register Name	Bit Name	Cautions
CSIHnMCTL0	CSIHnTO[4:0]	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Set these bits to 0 in master mode. Set these bits to 0 in direct access, dual buffer, and transmit-only buffer mode.
CSIHnMCTL1	CSIHnFES[6:0] CSIHnFFS[6:0]	Writing to these bits while communication is ongoing is permitted.
CSIHnMCTL2	CSIHnBTST CSIHnND[7:0] CSIHnSOP[6:0]	Writing to these bits is prohibited when CSIHnCTL0.CSIHnPWR = 0. Writing to these bits is prohibited when CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0. Writing to these bits is prohibited when CSIHnSTR0.CSIHnTSF = 1. Writing to these bits is prohibited in direct access or FIFO mode.
CSIHnMRWP0	CSIHnRRA[6:0]	Writing to these bits while communication is ongoing is permitted. Writing to these bits is prohibited in direct access or FIFO mode. When writing is required, set "00_H" to these bits in transmit-only buffer mode.
CSIHnMRWP0	CSIHnTRWA[6:0]	Writing to these bits while communication is ongoing is permitted. Writing to these bits is prohibited in direct access or FIFO mode.
CSIHnCFGx x = 0 to 7	CSIHnBRSSx[1:0] CSIHnRCBx CSIHnIDLx CSIHnIDx[2:0] CSIHnHDx[3:0] CSIHnINx[3:0] CSIHnSPx[3:0]	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. These bits must be set to 0 in slave mode.
CSIHnCFGx x = 0 to 7	CSIHnPSx[1:0] CSIHnDLSx[3:0] CSIHnDIRx CSIHnDAPx	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. In slave mode, the CSIHnCFG0 setting is used for the configuration. Therefore, all the bits in CSIHnCFG1 to CSIHnCFG7 must be set to 0.
CSIHnCFGx x = 0 to 7	CSIHnCKPx	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Set this bit to 0 as CSIHnCTL1.CSIHnCKR must be used in slave mode. If CS is not used, the CSIHnCTL1.CSIHnCKR bit instead of this bit, and clear this bit to 0.
CSIHnTX0W	CSIHnEOJ CSIHnCIRE	These bits are only valid when CSIHnCTL1.CSIHnJE = 1. While CSIHnCTL1.CSIHnJE = 0, the values of these bits are ignored even if 1 is read. Set these bits to 0 in slave mode.
CSIHnTX0W	CSIHnEDL	This bit is only valid when CSIHnCTL1.CSIHnEDLE = 1. While CSIHnCTL1.CSIHnEDLE = 0, the value of this bit is ignored even if 1 is read.
CSIHnTX0W	CSIHnCS[7:0]	In master mode, setting this bit to "FF_H" is prohibited. In slave mode, set this bit to "FE_H".
CSIHnTX0W CSIHnTX0H		Reading these bits while communication is ongoing is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0, reading and writing to these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0, writing to these bits are prohibited in direct access mode.
CSIHnRX0W		These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1→ 0. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is permitted in the mode (Transmit-only buffer, Dual buffer and Direct access modes) exited FIFO mode. While CSIHnCTL0.CSIHnPWR = 1, writing these bits is prohibited, and reading these bits is permitted. Writing is prohibited and only reading is permitted of these bits while CSIHnCTL0.CSIHnPWR = 1.

Table 17.32 Notes on Setting Registers (3/3)

Register Name	Bit Name	Cautions
CSIHnRX0H		These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1→ 0. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode. Writing is prohibited and only reading is permitted of these bits while CSIHnCTL0.CSIHnPWR = 1. While CSIHnCTL0.CSIHnPWR = 1, writing these bits is prohibited in the FIFO mode and reading these bits is prohibited in the FIFO mode. In spite of CSIHnCTL0.CSIHnPWR value, writing is prohibited and only reading is permitted of these bits in the mode (Transmit-only buffer, Dual buffer and Direct access modes) exited FIFO mode.
CSIHnEMU	CSIHnSVSDIS	Modification of this bit is only permitted while SVSTOP = 0.
CSIHnBRSy y = 0 to 3		Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.

17.4 Interrupt Sources

CSIH can generate the following interrupt requests:

- INTCSIHTIC (communication status interrupt)
- INTCSIHTIR (reception status interrupt)
- INTCSIHTIRE (communication error interrupt)
- INTCSIHTIJC (job completion interrupt)

17.4.1 Overview

The communication error interrupt INTCSIHTIRE is generated when an error is detected. The generation of the other interrupts depends on the memory mode, the job mode, and – in case of the job completion interrupt INTCSIHTIJC –also the operating mode.

The job completion interrupt INTCSIHTIJC is only generated when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). It is not available in slave mode.

The following table gives an overview.

Table 17.33 Interrupt Generation

Memory Mode	Interrupt	Interrupt Source	
		Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	**Job Mode Enabled CSIHnCTL1.CSIHnJE = 1**
FIFO	INTCSIHTIC	Tx data empty*1	Tx data empty*1 except job abort*4
	INTCSIHTIR	Rx data full*2 *and* CSIHnCTL0.CSIHnRXE = 1	Rx data full*2 *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC*3	Not applicable	CSIHnTX0W.CSIHnCIRE = 1 (except Tx data empty), or job abort*4
Transmit-only buffer	INTCSIHTIC	End of communication	CSIHnTX0W.CSIHnCIRE = 1 *and* (CSIHnCTL0.CSIHnJOBE = 0 *or* CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHTIR	Data received *and* CSIHnCTL0.CSIHnRXE = 1	Data received *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC*3	Not applicable	Job abort*4
Dual buffer	INTCSIHTIC	End of communication	CSIHnTX0W.CSIHnCIRE = 1 *and* (CSIHnCTL0.CSIHnJOBE = 0 *or* CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHTIR	End of communication *and* CSIHnCTL0.CSIHnRXE = 1	Data received *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC*3	Not applicable	Job abort*4
Direct access	INTCSIHTIC	One data transfer	One data transfer except the state of job abort*4
	INTCSIHTIR	Data received *and* CSIHnCTL0.CSIHnRXE = 1	Data received *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHTIRE	Error detected	Error detected
	INTCSIHTIJC*3	Not applicable	Job abort*4

Note 1. “Tx data empty” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFES[6:0].

Note 2. “Rx data full” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFFS[6:0].
Note 3. INTCSIHTIJC is not available in slave mode.
Note 4. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1
During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

17.4.2 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half a cycle of the transmission clock, CSIHTSCK. This is not possible in slave mode.

The delay is specified by setting CSIHnCTL1.CSIHnSIT = 1. (The setting of the CSIHnSIT bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of CSIHnCTL1.CSIHnSIT = 1 (interrupt delay enabled), CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0 (clock phase and data phase), and CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B (data length 8 bits).

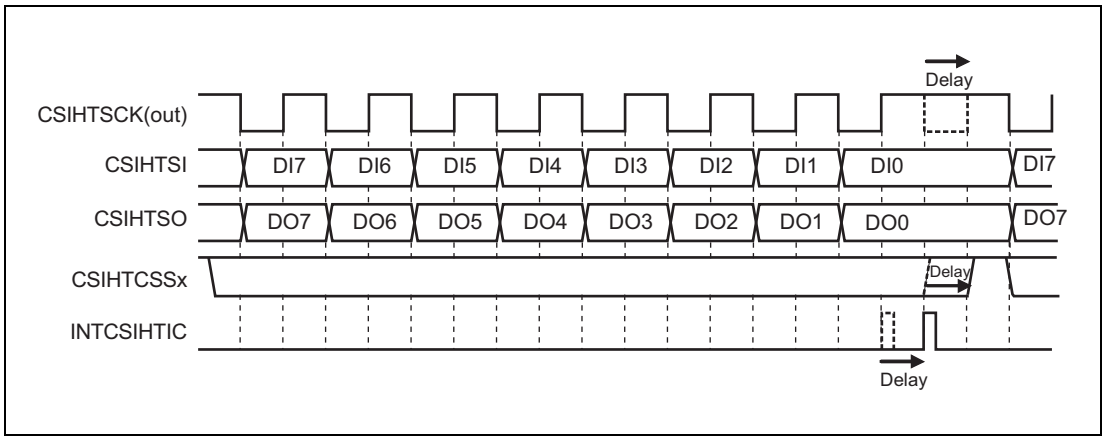

Figure 17.2 Interrupt Delay Function (CSIHnCTL1.CSIHnSIT = 1)

Setting CSIHnCTL1.CSIHnSIT = 1 adds a half cycle delay to the transmission clock. This also delays the end of the current chip select signal (CSIHTCSSx).

17.4.3 INTCSIHTIC (Communication Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions shown in the following table.

Table 17.34 INTCSIHTIC Interrupt Generation

Memory Mode	Interrupt Source	
	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	**Job Mode Enabled CSIHnCTL1.CSIHnJE = 1**
FIFO	This interrupt is generated just before transmission data in the FIFO runs out, notifying the application that new data should be added. INTCSIHTIC is generated if the number of transmit data remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMTCL1.CSIHnFES[6:0].	Similar to “when JE is 0”, an interrupt is generated when the number of transmit data remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMCTL1.CSIHnFES[6:0]. However, it is not generated if a job is aborted.
Transmit-only buffer, dual buffer	An interrupt is generated at the end of communication. (specified by the CSIHnMTLC2.CSIHnND[7:0] bit)	Generated when data is transmitted while CSIHnTX0W.CSIHnCIRE = 1. Note that if data and job abort*1 are transmitted while CSIHnTX0W.CSIHnCIRE = 1, the INTCSIHTIJC interrupt is generated instead of INTCSIHTIC.
Direct access	Generated after every data transfer.	Generated after every data transfer, except when the communication was aborted.

Note 1. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1.
During high priority communication in transmit-only buffer mode, the operation is the same as that in direct access mode.

17.4.3.1 INTCSIHTIC in Direct Access Mode

The examples below show the INTCSIHTIC behavior in direct access mode.

The examples assume:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

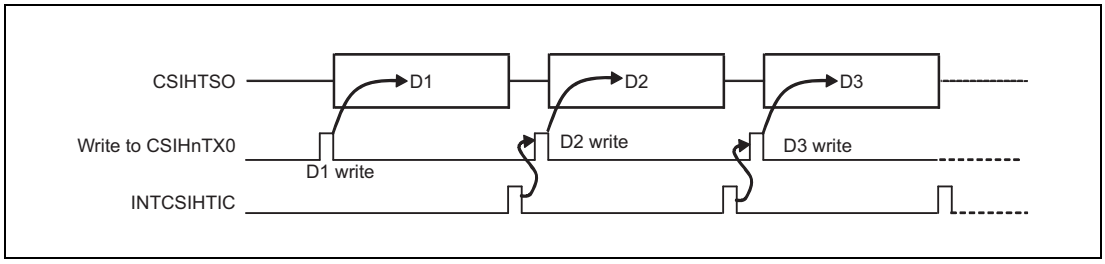

Figure 17.3 Generation of INTCSIHTIC after Transfer (CSIHnCTL1.CSIHnSLIT = 0)

If job mode is enabled (CSIHnCTL1.CSIHnJE = 1) and a job ends because data is sent with CSIHnTXOW.CSIHnEOJ = 1 and communication stop is requested (CSIHnCTL0.CSIHnJOBE = 1), then INTCSIHTIC is replaced by the job completion interrupt INTCSIHTIJC.

INTCSIHTIC can also be set up to occur as soon as the CSIHnTX0W/H register becomes empty and available for storing the next data. This is specified by setting CSIHnCTL1.CSIHnSLIT = 1.

The effect is illustrated in the figure below.

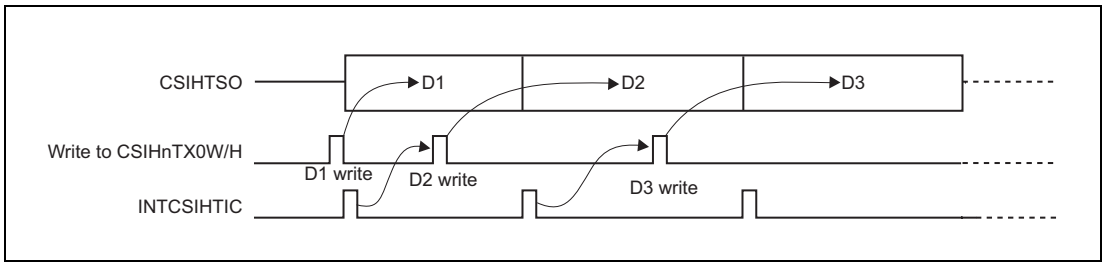

Figure 17.4 Immediate Generation of INTCSIHTIC (CSIHnCTL1.CSIHnSLIT = 1)

Thus, the new data can be written in advance.

NOTE

During high priority communication in transmit-only buffer mode, the operation is in the same as that in direct access mode.

17.4.3.2 INTCSIHTIC in FIFO Mode

The example below shows the INTCSIHTIC behavior in FIFO mode.

The example assumes:

- Master mode
- FIFO mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

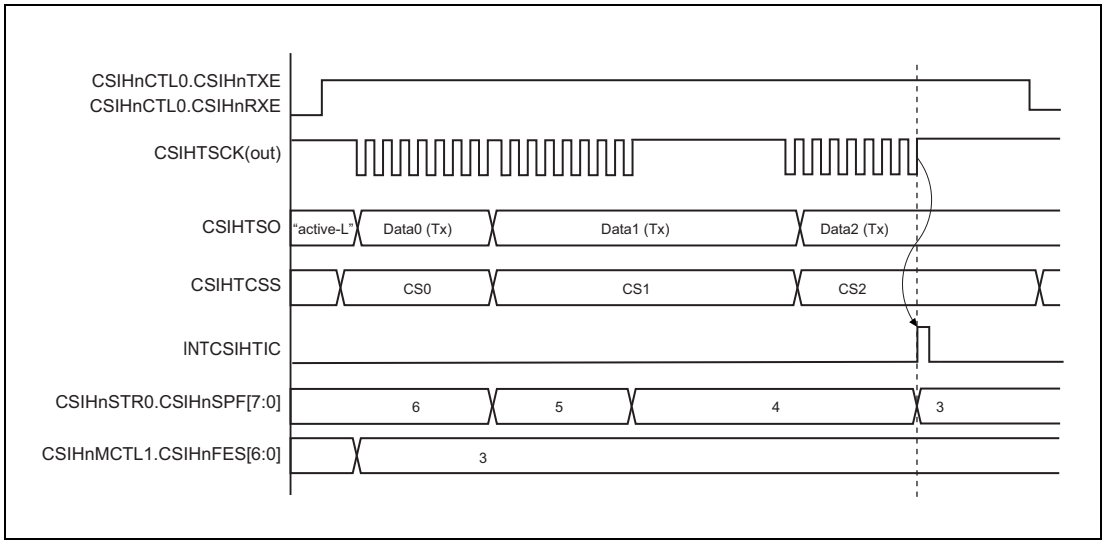

Figure 17.5 Generation of INTCSIHTIC in FIFO Memory Mode

The condition for "FIFO empty" is specified in CSIHnMCTL1.CSIHnFES[6:0]. In the example of the diagram above, the number of unsent data in FIFO is set to 3.

CSIHnSTR0.CSIHnSPF[7:0] indicates the number of unsent data. When both match, the interrupt INTCSIHTIC occurs.

17.4.3.3 INTCSIHTIC in Job Mode

The example below shows the INTCSIHTIC behavior in job mode.

The example assumes:

- Master mode
- Job mode enabled (CSIHnCTL1.CSIHnJE = 1)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

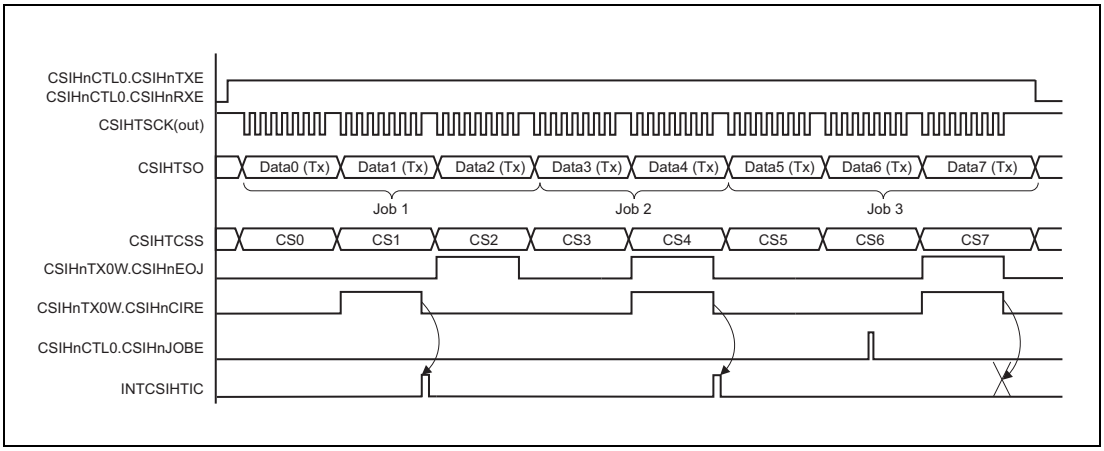

Figure 17.6 Generation of INTCSIHTIC in Job Mode

The rules for generating INTCSIHTIC in job mode are shown in the following table.

Table 17.35 Generation of INTCSIHTIC in Job Mode

CSIHnTX0W. CSIHnEOJ	CSIHnTX0W. CSIHnCIRE	INTCSIHTIC
0	0	Not generated
0	1	Generated
1	0	Not generated
1	1	CSIHnCTL0.CSIHnJOBE = 0: Generated
		CSIHnCTL0.CSIHnJOBE = 1: Not generated, replaced by interrupt INTCSIHTIJC

17.4.4 INTCSIHTIR (Reception Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions below.

Table 17.36 INTCSIHTIR Interrupt Generation

Memory Mode	Interrupt Source	
	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	**Job Mode Enabled CSIHnCTL1.CSIHnJE = 1**
FIFO	This interrupt occurs when CSIHnCTL0.CSIHnRXE is 1 and the FIFO buffer is almost full with received data, notifying the application that the FIFO must be emptied. INTCSIHTIR is generated, if the number of received data in the FIFO (CSIHnSTR0.CSIHnSRP[7:0]) equals (128 – CSIHnMCTL1.CSIHnFFS[6:0]).	
Dual buffer	An interrupt is generated when the communication has finished (as specified by the CSIHnMCTL2.CSIHnND[7:0] bits) and CSIHnCTL0.CSIHnRXE = 1.	An interrupt is generated after every data transfer.
Transmit-only buffer, Direct access	An interrupt is generated after every data transfer.	

17.4.4.1 INTCSIHTIR in Direct Access Mode

The example below shows the INTCSIHTIR behavior in direct access mode.

The example below assumes:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

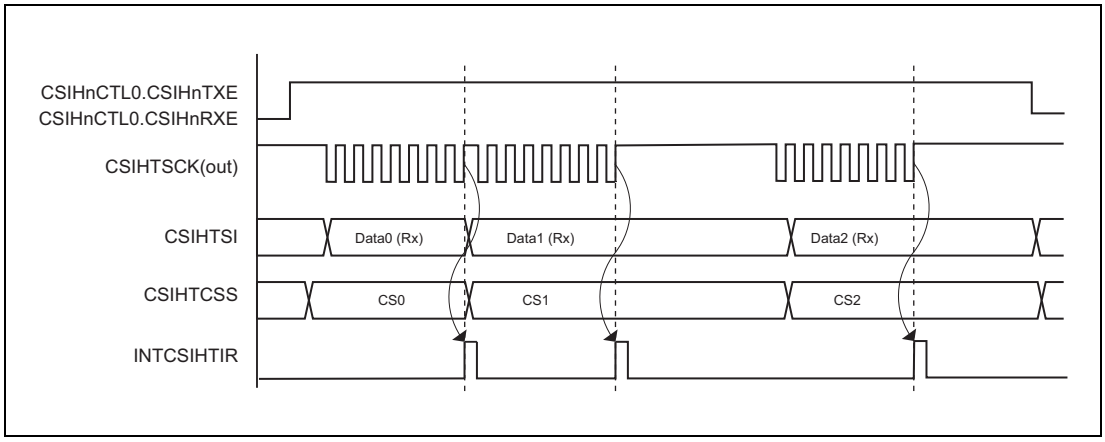

Figure 17.7 Generation of INTCSIHTIR in Direct Access Mode

17.4.4.2 INTCSIHTIR in Dual Buffer Mode

The example below shows the INTCSIHTIR behavior in dual buffer mode.

The example assumes:

- Master mode
- Dual buffer mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Default clock phase and data phase
  (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

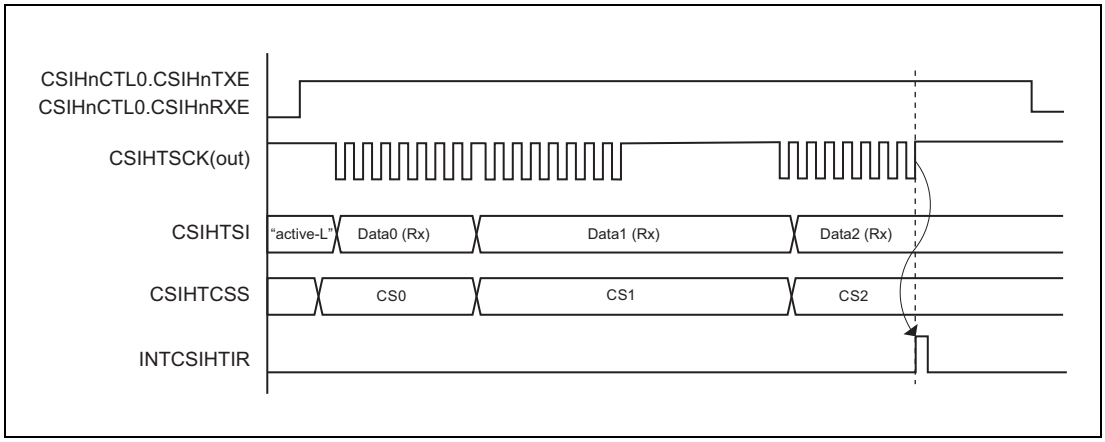

Figure 17.8 Generation of INTCSIHTIR in Dual Buffer Mode

17.4.5 INTCSIHTIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

For details about interrupt generation timing, see **Section 17.5.12, Error Detection**.

Table 17.37 Data Error Types

Error Type	Communication Status after Error Interrupt	Note
FIFO overflow error	Communication continues even if an interrupt is generated.	The data is not written to the FIFO buffer and the data that overflowed is lost, but communications started before the error continue.
Parity error	Communication continues even if an interrupt is generated.	—
Data consistency check error	Communication continues even if an interrupt is generated.	—
Time-out error	Communication continues even if an interrupt is generated.	—
Overrun error	**Condition for errors 1:** In FIFO mode, when the number of received data is 0 and CPU reads the CSIHnRX0W/H register, an interrupt is generated and communication continues.	—
	Condition for errors 2: In slave mode, when CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled): [1] In direct access mode or transmit-only buffer mode, when reception is completed while the previous received data is retained in the CSIHnRX0W/H register, an interrupt is generated, and communication continues. [2] In FIFO mode, when reception by the FIFO buffer is completed and the buffer is in the full state, an interrupt is generated. Communication continues.	In slave mode, when CSIHnCTL1.CSIHnHSE = 1 (handshake function enabled), communication is suspended due to handshake, an overrun error is not generated.

The type of error that caused the generation of INTCSIHTIRE is flagged in register CSIHnSTR0.

Additionally a parity error flag and a data consistency check error flag are attached to the received data in CSIHnRX0W.

For details about the various error types, see **Section 17.5.12, Error Detection**.

17.4.6 INTCSIHTIJC (Job Completion Interrupt)

This interrupt supports the handling of jobs. See **Section 17.5.3.3, Job Concept**. This interrupt is only available in master mode.

Job mode is enabled by setting CSIHnCTL1.CSIHnJE = 1. When CSIHnCTL1.CSIHnJE = 0, INTCSIHTIJC is not generated.

Depending on the memory mode, this interrupt is generated according to the condition shown in the following table.

Table 17.38 INTCSIHTIJC Interrupt Generation

Memory Mode	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	Not applicable	Indicates that the communication stopped at the end of a job after a job abort*1 was triggered If FIFO empty is not detected, INTCSIHTIJC is generated when CSIHnCIRE is 1.
Transmit-only buffer		Indicates that the communication stopped at the end of a job after a job abort*1 was triggered.
Dual buffer		
Direct access		

Note 1. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1

17.5 Operation

17.5.1 Operating Modes (Master/Slave)

Whether CSIH operates in the master or slave mode determines the source of the serial clock.

17.5.1.1 Master Mode

In master mode, the serial transmission clock is generated by the internal baud rate generator (BRG) and supplied to the slave(s) by signal CSIHTSCK.

Master mode is enabled by setting CSIHnCTL2.CSIHnPRS[2:0] to values other than 111_B. In master mode, the BRG frequency can be specified by setting the CSIHnCTL2.CSIHnPRS[2:0] bits in combination with the CSIHnBRSy.CSIHnBRS[11:0] bits.

(1) Chip select signals

In master mode, one or more chip select signals can be used. If several slaves are connected to the master, the chip select signals can be used to select one or more slaves. Only the selected slave is then enabled for communication.

The communication protocol as well as additional parameters are stored separately for each chip select signal. This makes it possible to adapt the data transfer individually to the requirements of each slave. For details, see **Section 17.5.3, Chip Selection (CS) Features**.

(2) Clock defaults

The default level of CSIHTSCK depends on the clock phase inversion function bit of the CSIHTSCK, and is high when CSIHnCTL1.CSIHnCKR = 0 and is low when CSIHnCTL1.CSIHnCKR = 1.

The example below shows the communication in master mode for 8-bit data, CSIHnCTL1.CSIHnCKR = 0, CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0, and MSB first.

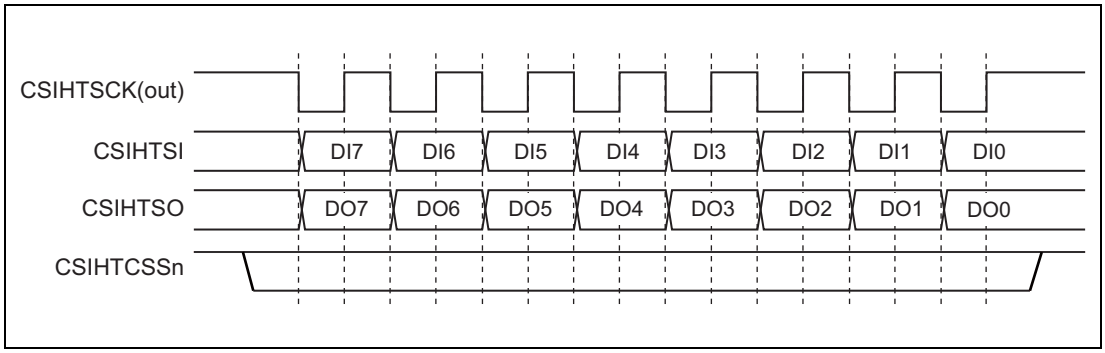

Figure 17.9 Transmission/Reception in Master Mode

17.5.1.2 Slave Mode

In slave mode, another device is the communication master and supplies the transmission clock. Normal transmit/receive operation is started as soon as a clock signal is detected.

Slave mode is selected by setting the CSIHnCTL2.CSIHnPRS[2:0] bits to 111_B.

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is enabled (settings of the CSIHnCFG1 - CSIHnCFG7 registers are disabled).

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock phase and data phase

NOTE

When using slave mode, disable the baud rate generator (BRG) by setting the CSIHnBRSy.CSIHnBRS[11:0] bits to 000_H. However, if you are using a time-out error, set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000_H.

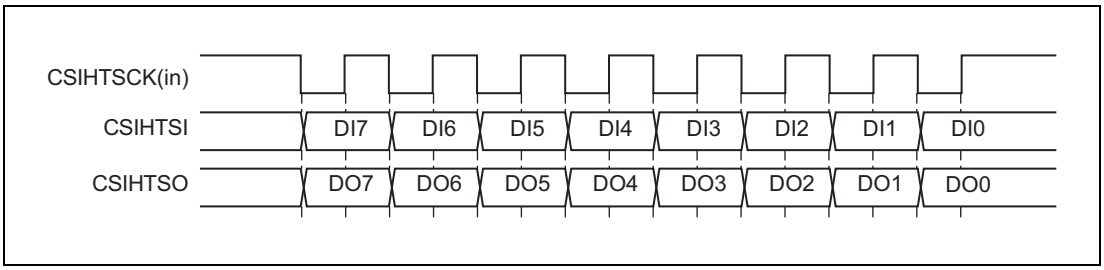

Figure 17.10 Transmission/Reception in Slave Mode

17.5.2 Master/Slave Connections

17.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

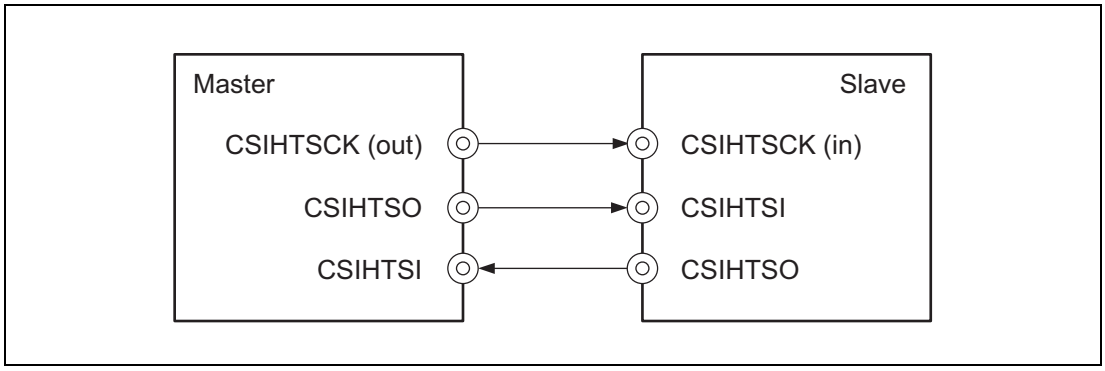

Figure 17.11 Direct Master/Slave Connection

17.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this example, the master supplies one chip select (CS) signal to each of the slaves. This signal is connected to the slave select input $\overline{\text{CSIHTSSI}}$ of the slave.

The $\overline{\text{CSIHTSSI}}$ signal can be enabled/disabled by using the CSIHnCTL1.CSIHnSSE bit.

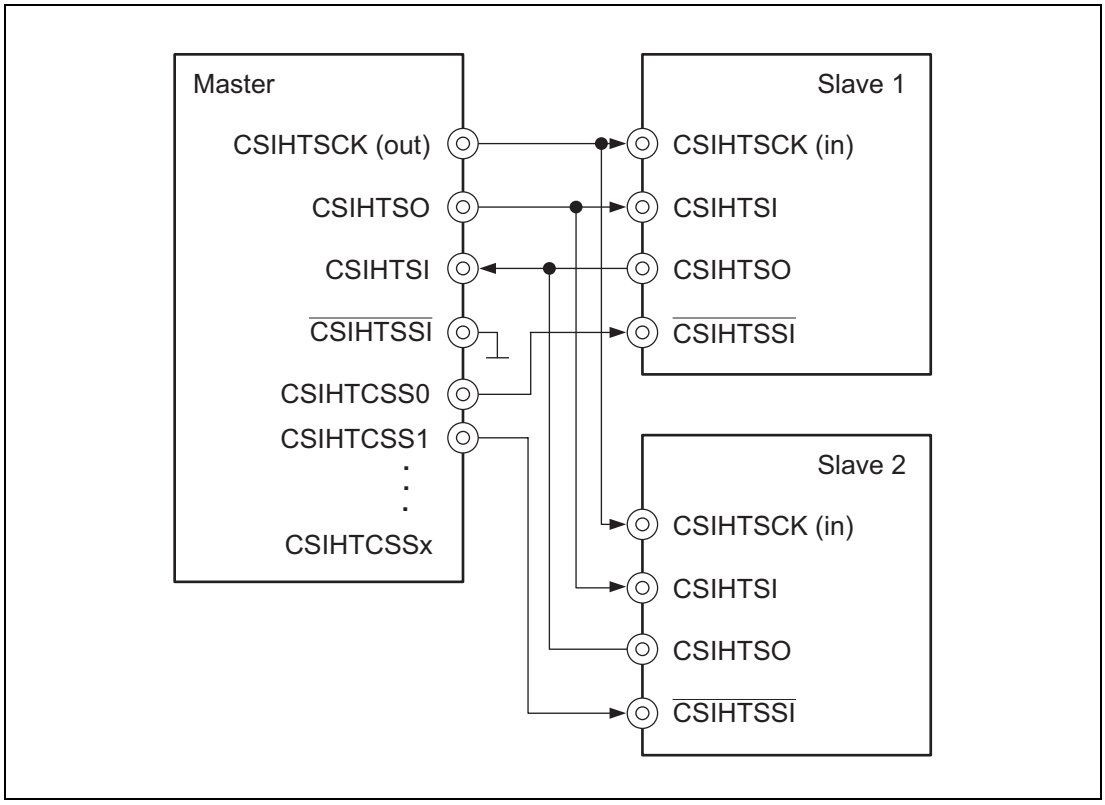

Figure 17.12 Connections between One Master and Multiple Slaves

By default, the chip select level is active low. That means, a slave is selected (enabled) as a CSIH slave when its $\overline{\text{CSIHTSSI}}$ signal is low level. However, to adapt the CS to other devices, the output level of each chip select signal can also be programmed to be active high.

If a slave is not selected, it will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set (CSIHnCTL0.CSIHnTXE = 1), the CSIHTSO output of the slaves that are not selected is disabled and set to input mode in order to avoid interference with the output of the selected slave.

17.5.3 Chip Selection (CS) Features

The chip select signal, CSIHTCSSx can be used by the master to select one or more slaves for communication.

17.5.3.1 Configuration Registers

The parameters for each chip select signal CSIHTCSSx are defined in the corresponding configuration register CSIHnCFGx. The parameters include the communication protocol and additional CS parameters.

The communication protocol specifies:

- Data length: The number of bits to be sent or received.
  (CSIHnCFGx.CSIHnDLSx[3:0])
- Transfer direction: MSB or LSB first.
  (CSIHnCFGx.CSIHnDIRx)
- Parity usage: Odd, even, 0 parity or none.
  (CSIHnCFGx.CSIHnPSx[1:0])
- Clock phase and data phase.
  (CSIHnCFGx.CSIHnCKPx, CSIHnCFGx.CSIHnDAPx)

Additional parameters for each chip select signal that are only available in master mode are:

- Individual selection of the baud rate generator prescaler for each chip select signal
  (CSIHnCFGx.CSIHnBRSSx[1:0])
- Chip select priority: Categorizes chip select signals into “dominant” and “recessive”. The priority applies if two or more chip selects signals with different configurations are simultaneously activated for message broadcasting. In this case, the configuration specified for dominant chip select signals is used. (CSIHnCFGx.CSIHnRCBx)

The principle is also called “Recessive Configuration for Broadcasting” (RCB).

CAUTION

When specifying multiple chip select signals as dominant, be sure to configure the same settings for all dominant signals.

- Chip select timing:
  - Setup time T_{setup}: The time from when the CS signal becomes active to the start of data output.
    (CSIHnCFGx.CSIHnSPx[3:0])
  - Inter-data time T_{inter}: The time between one data and the next data while the same CS signal is active.
    (CSIHnCFGx.CSIHnINx[3:0])
  - Hold time T_{hold}: The time during which the CS signal remains active until CS is switched.
    (CSIHnCFGx.CSIHnHDx[3:0])
  - Idle time T_{idle}: Inactive time after terminating a CS signal or after every data transfer to the same CSx. (CSIHnCFGx.CSIHnIDx[2:0])

The CS timings of the setup time, the inter-data time, the hold time, and the idle time are illustrated in the figure below. When CSIHnCFGx.CSIHnIDLx bit is set to 1, IDLE time is inserted for every transfer regardless of CS signal.

Figure 17.13 provides an example of when the default active low setting is specified for the CSIHTCSS1 and CSIHTCSS2 signals (CSIHnCTL1.CSIHnCSL1 bit = 0, CSIHnCTL1.CSIHnCSL2 bit = 0). The active level can be specified individually for each CS.

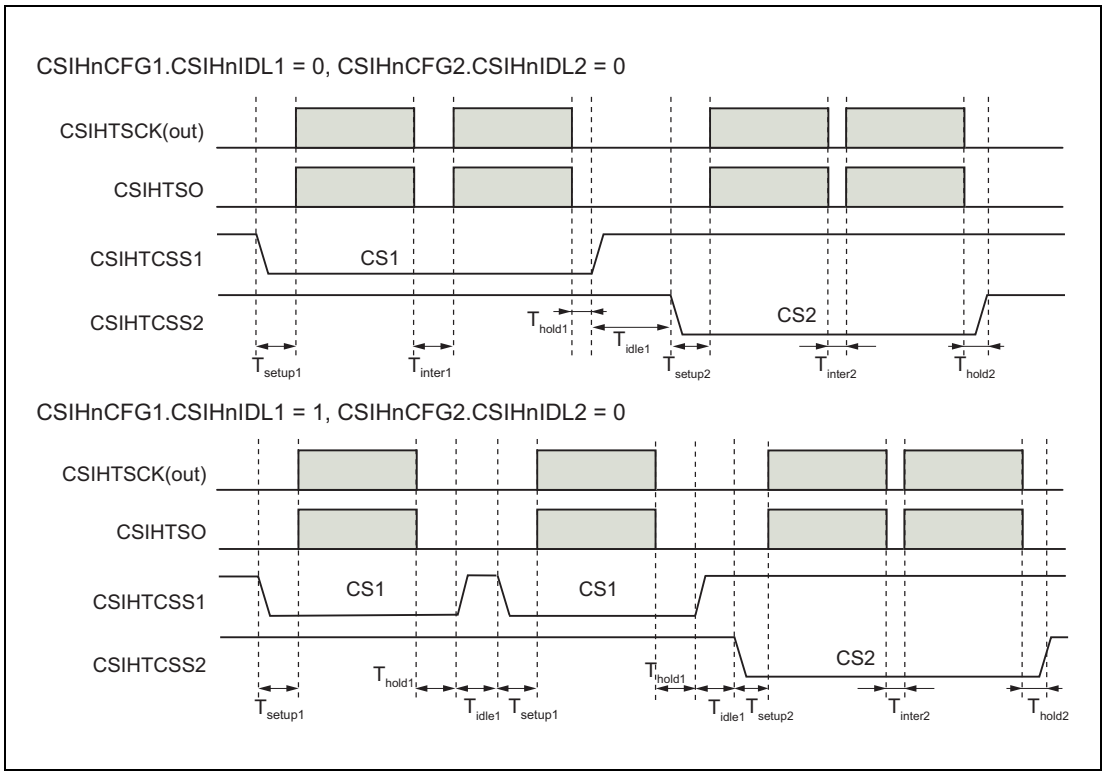

Figure 17.13 Chip Select Timings

Note that each CS signal can have a different value for the setup time, inter-data time, hold time, and idle time.

A particular chip select signal is activated by setting the appropriate bit in the transmission register CSIHnTX0W.CSIHnCSx.

CSIHnRX0W.CSIHnCSx in the reception register indicates the chip select signal associated with the received data.

CAUTION

When high priority communication function by CPU control is enabled (CSIHnCTL1.CSIHnPHE = 1), IDLE state is inserted regardless of IDLn bit settings when priority communication mode is changed from low to high and from high to low.

17.5.3.2 CS Example

The following figure shows an example of two consecutive data transmissions.

The first communication uses CS0 to communicate with a single slave. The second enables CS0 and CS1 to broadcast a message to two slaves. The priority of CS0 is set to “recessive: low priority” and the priority of CS1 to “dominant: high priority”. Consequently, the second communication is conducted using the CS1 settings, which are set as dominant.

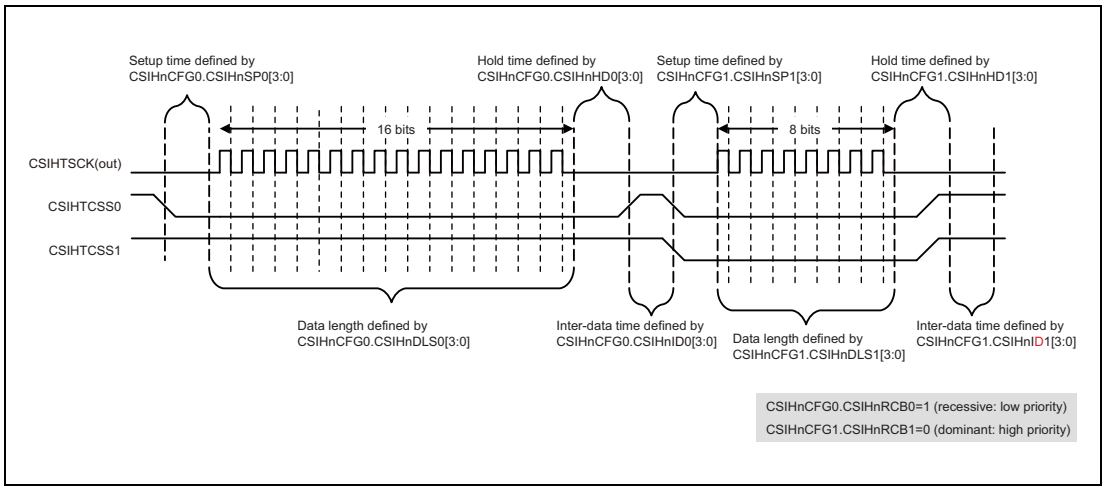

Figure 17.14 Chip Select and RCB Example

17.5.3.3 Job Concept

In CSIH, a job consists of the number of data targeted for transfer.

Job mode enable

The job mode can only be enabled in master mode. The job mode is enabled or disabled by CSIHnCTL1.CSIHnJE, while the CSIH is disabled by CSIHnCTL0.CSIHnPWR = 0.

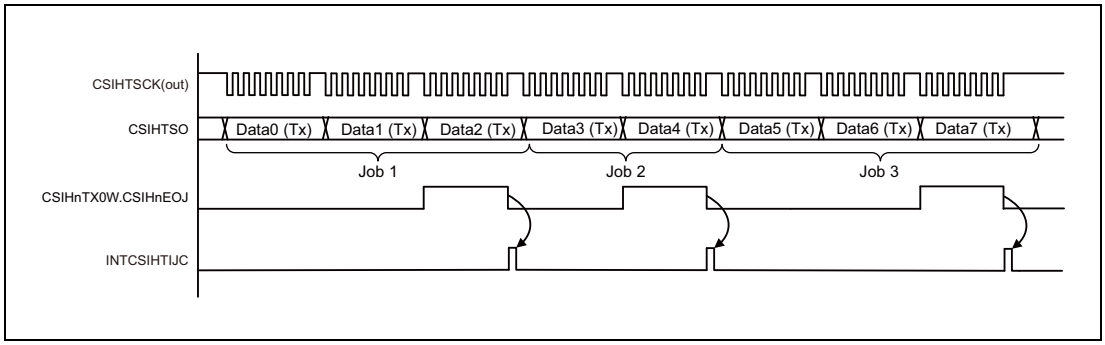

Figure 17.15 Job Examples

A job ends by transmitting data with CSIHnTX0W.CSIHnEOJ = 1.

Communication can be specified to stop when a job is finished. This is done by setting CSIHnCTL0.CSIHnJOBE. When CSIHnJOBE is set, the communication continues until the data for which the CSIHnEOJ bit is set is transmitted. After this data is sent, the communication is stopped and the job completion interrupt INTCSIHTIJC is generated.

17.5.4 Details of Chip Select Timing

17.5.4.1 Changing the Clock Phase

The serial clock level specified by CSIHnCFGx.CSIHnCKPx can be changed while communication is stopped. The minimum value of an idle time is one transmission clock (CSIHTSCK(out)) cycle.

If the idle time is set to 0.5 transmission clock cycles (in CSIHnCFGx.CSIHnIDx[2:0]) and two consecutive data is sent with different CSIHnCFGx.CSIHnCKPx configurations, the idle time is automatically extended to one CSIHTSCK(out) cycle.

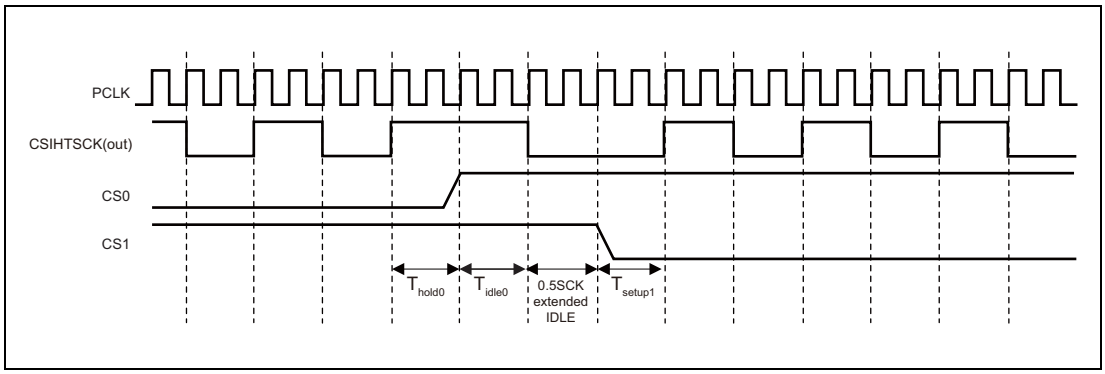

Figure 17.16 Clock Phase Timing with PCLK/4, $T_{hold}0 = T_{setup1}$ = 0.5CSIHTSCK, T_{idle0} = 0.5CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)

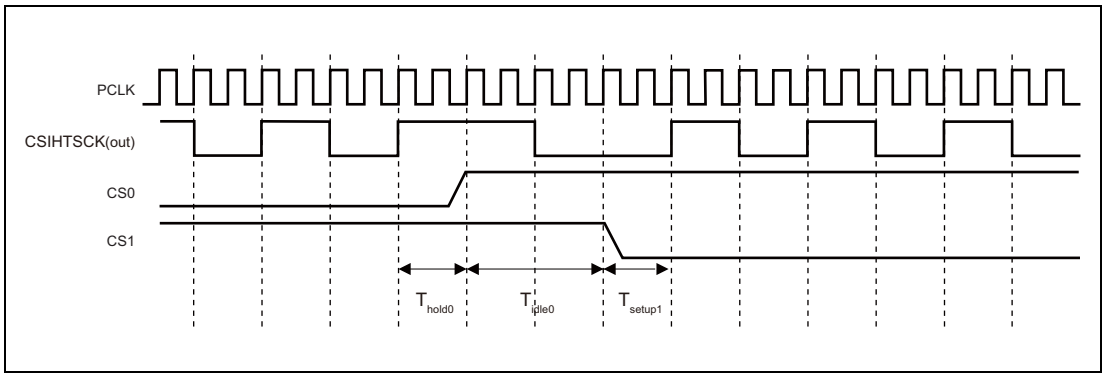

Figure 17.17 Clock Phase Timing with PCLK/4, $T_{hold}0 = T_{setup1}$ = 0.5CSIHTSCK, T_{idle0} = 1CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)

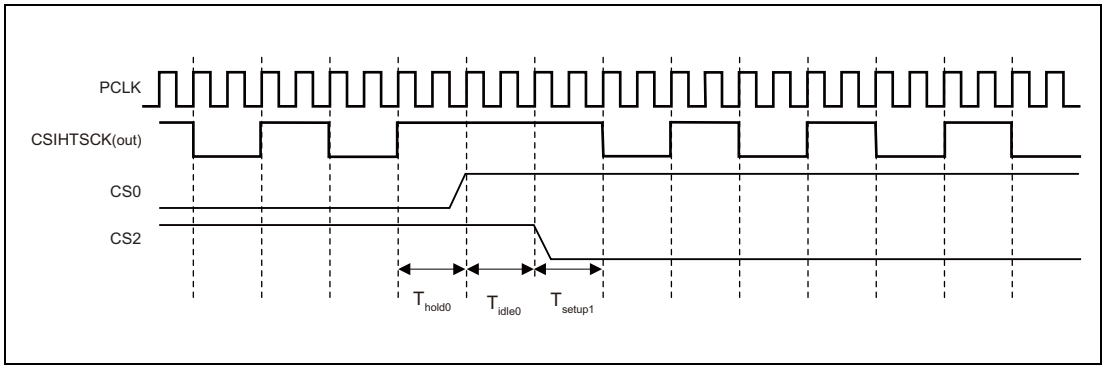

Figure 17.18 Clock Phase Timing with PCLK/4, $T_{hold}0 = T_{setup1}$ = 0.5CSIHTSCK, T_{idle0} = 0.5CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG2.CSIHnCKP2 = 0 (CSIHTCSS2)

17.5.4.2 Changing the Data Phase

The CSIHnCFGx.CSIHnDAPx bit defines the phase of the data bits relative to the clock.

The relation between the setting of the CSIHnCFGx.CSIHnDAPx bit and the hold and setup times is as follows:

Hold time is the period from the last edge of the serial clock (CSIHTSCK) until the signals on CSIHTCSS[7:0] change to the inactive level.

Setup time is the period from when the signals on CSIHTCSS[7:0] change to the active level until to when the transmission data (CSIHTSO) is output.

Therefore, there is a gap of 0.5 CSIHTSCK cycles until the edge of the serial clock signal (CSIHTSCK) is output according to the CSIHnCFGx.CSIHnDAPx setting.

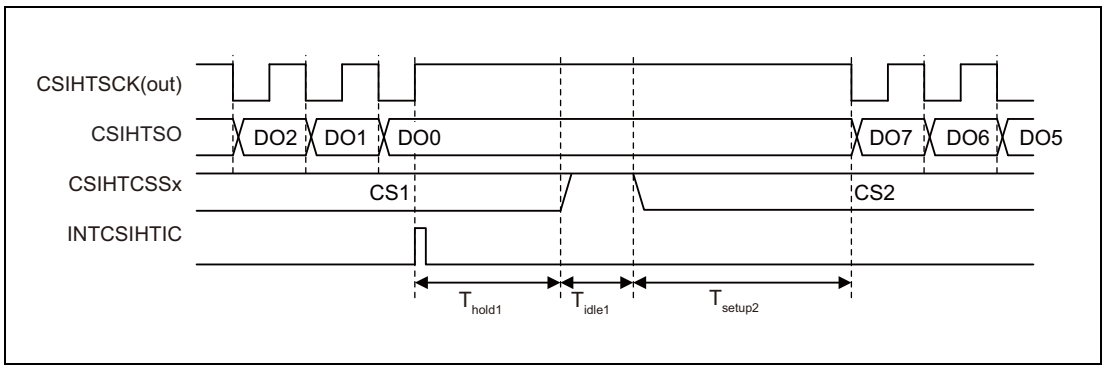

Figure 17.19 Data Phase Timing with CSIHnCFG1.CSIHnCKP1 = 0, CSIHnCFG1.CSIHnDAP1 = 0 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 0

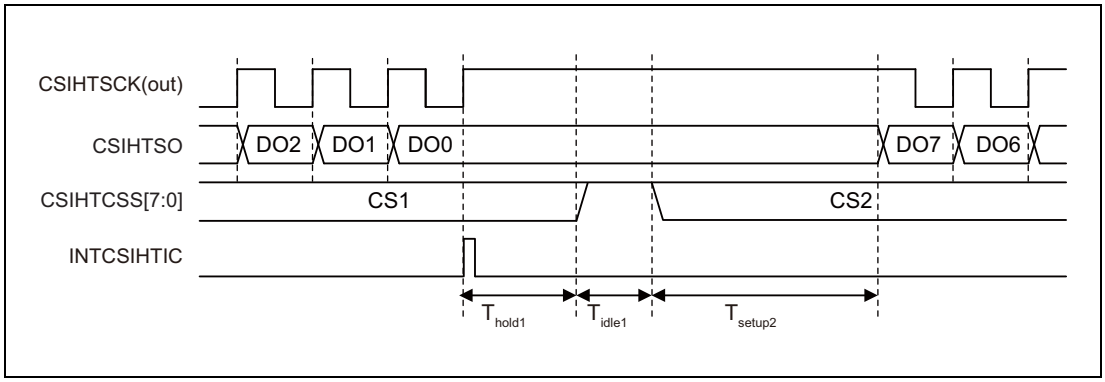

Figure 17.20 Data Phase Timing with CSIHnCFG1.CSIHnCKP1 = 1, CSIHnCFG1.CSIHnDAP1 = 0 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 1

17.5.5 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the following bits:

- CSIHnCTL2.CSIHnPRS[2:0]
- CSIHnBRSy.CSIHnBRS[11:0]
- CSIHnCFGx.CSIHnBRSSx[1:0]

The transfer clock frequency of transmission clock CSIHTSCK is determined by the setting of the CSIHnCTL2.CSIHnPRS[2:0] bits and the setting of the CSIHnBRSy.CSIHnBRS[11:0] bits, but any one of CSIHnBRS3 to CSIHnBRS0 can be selected for each chip select signal by using the CSIHnCFGx.CSIHnBRSSx[1:0] bits.

The following figure shows a block diagram of the baud rate generator.

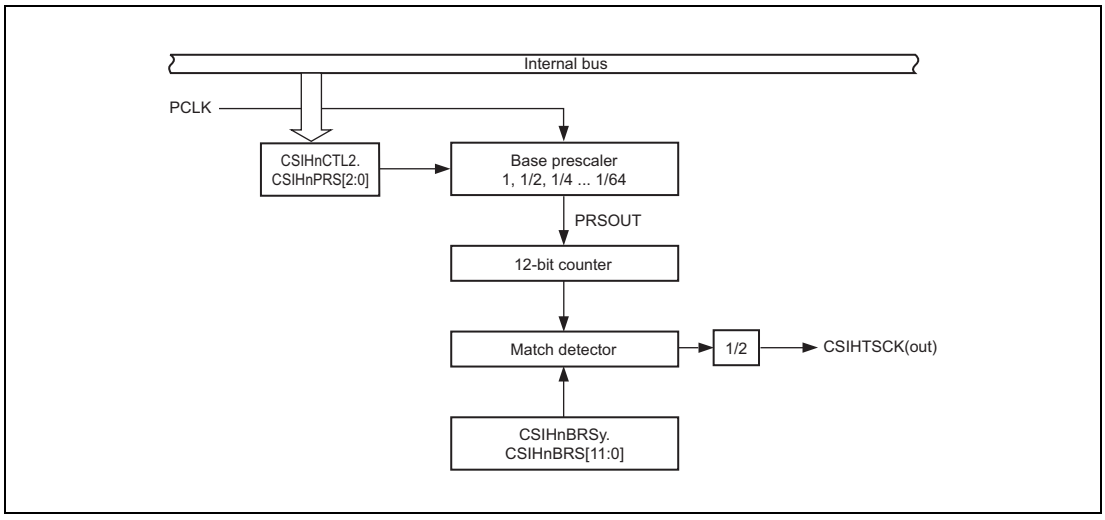

Figure 17.21 Baud Rate Generator Block Diagram

By setting CSIHnBRSy.CSIHnBRS[11:0] to 000_H, the baud rate generator is disabled and all CSIHTSCK are stopped.

Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated as:

Transfer clock frequency (CSIHTSCK) = PCLK / (division ratio of PCLK) = PCLK / ($2^{\alpha} \times k \times 2$),

where:

α = CSIHnCTL2.CSIHnPRS[2:0] = 0 to 6

k = CSIHnBRS0.CSIHnBRS0[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 0)
CSIHnBRS1.CSIHnBRS1[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 1)
CSIHnBRS2.CSIHnBRS2[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 2)
CSIHnBRS3.CSIHnBRS3[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 3)

Transfer clock frequency upper and lower limits

When setting the transfer clock frequency, please note the following:

- The minimum transfer clock frequency in master mode and slave mode is PCLK/524160.
- The maximum transfer clock frequency is as follows:
  - In master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/4)
  - In slave mode: 5.0 MHz (however, it must be equal to or lower than PCLK/16)

17.5.6 CSIH Buffer Memory

The CSIH has a configurable RAM that can be used for buffered I/O. The size is 128 words. One word is comprised of 32-bit data and 7-bit ECC.

The following configurations are available:

Mode	CSIHnCTL0. CSIHnMBS	CSIHnMCTL0. CSIHnMMS[1:0]
FIFO mode	0	00_B
Dual buffer mode		01_B
Transmit-only buffer mode		10_B
Direct access mode	1	X

17.5.6.1 FIFO Mode

In FIFO mode, data can be written to the CSIHnTX0W register without waiting for completion of the transmission, and data can be received without reading the CSIHnRX0W register immediately, provided the FIFO is not full.

Data to be transmitted is stored in the FIFO memory. Transmission and reception occur simultaneously – one data is received as one data is transmitted. That means, received data overwrites the transmitted data in the FIFO.

The CSIH automatically updates the respective FIFO memory pointers when data is written to or read from the FIFO memory, or data is transmitted to or received from the FIFO memory.

Table 17.39 FIFO Mode

Pointer Description	Pointer*1	Range
Number of untransmitted words	CSIHnSTR0.CSIHnSPF[7:0]	0 to 128
Number of words received and stored in the FIFO	CSIHnSTR0.CSIHnSRP[7:0]	0 to 128
Address for write/read of transmit data	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $01FC_H$
Address for read of received data	CSIHnMRWP0.CSIHnRRA[6:0]	0000_H to $01FC_H$
Address to be sent	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $01FC_H$

Note 1. The values are automatically updated after each read/write or data transmit/receive operation.

The CSIH status register contains two FIFO status flags:

- CSIHnSTR0.CSIHnFLF: FIFO full
- CSIHnSTR0.CSIHnEMF: FIFO empty

When this mode is started, bit CSIHnSTCR0.CSIHnPCT must be set. By doing this, CSIHnSTR0.CSIHnEMF is not reset, but set.

All FIFO pointers and FIFO flags except CSIHnSTR0.CSIHnEMF are reset and CSIHnSTR0.CSIHnEMF is set.

17.5.6.2 Dual Buffer Mode

In this mode, the memory is divided into two parts of equal size; 64 words are allocated to transmission data and 64 words to received data. In dual buffer mode, the respective buffer pointers indicate the values shown in the following table.

Table 17.40 Dual Buffer Mode

Pointer Description	Pointer*1	Range
Address of data written to and read from transmit buffer	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $00FC_H$
Address of data read from receive buffer	CSIHnMRWP0.CSIHnRRA[6:0]	0000_H to $00FC_H$
The number of transmit data remaining in the transmit buffer	CSIHnMCTL2.CSIHnND[6:0]	0 to 64
Address to which data is transmitted	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $00FC_H$

Note 1. Pointers are automatically incremented after each read/write.

17.5.6.3 Transmit-Only Buffer Mode

In this mode, the entire memory is used to save transmission data.

Received data must be read directly from CSIHnRX0W/H.

In transmit-only buffer mode, the respective buffer pointer indicates the values shown in the following table.

Table 17.41 Transmit-Only Buffer Mode

Pointer Description	Pointer*1	Range
Address of data written to and read from transmit buffer	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $01FC_H$
The number of transmit data remained in the transmit buffer	CSIHnMCTL2.CSIHnND[6:0]	0 to 128
Address to which data is transmitted	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $01FC_H$

Note 1. Pointers are automatically incremented after each read/write.

17.5.6.4 Direct Access Mode

In direct access mode, the CSIH memory is completely bypassed:

- Transmission data provided by the CPU to the transmission register CSIHnTX0W or CSIHnTX0H is directly copied to the shift register.
- Reception data is directly copied from the shift register to the reception register CSIHnRX0W or CSIHnRX0H.

17.5.7 Data Transfer Modes

17.5.7.1 Transmit-Only Mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 0 puts the CSIH in transmit-only mode. Start of transmission depends on the memory mode:

- In case of FIFO or direct access mode, transmission starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, transmission starts when the CSIHnMCTL2.CSIHnBTST bit is set.

17.5.7.2 Receive-Only Mode

Setting CSIHnCTL0.CSIHnTXE = 0 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in receive-only mode.

In master mode, start of reception depends on the memory mode:

- In case of FIFO or direct access mode, reception starts when dummy data is written to the CSIHnTX0W or CSIHnTX0H register.

In slave mode, reception starts as soon as the CSIHTSCK transmission clock is received from the master. It is not necessary to write data to the CSIHnTX0W or CSIHnTX0H register of the slave.

- In case of dual buffer mode or transmit-only buffer mode, reception starts when the CSIHnMCTL2.CSIHnBTST bit is set.

17.5.7.3 Transmit/Receive Mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in transmit/receive mode.

Start of communication (transmission and reception) depends on the memory mode:

- In case of FIFO or direct access mode, communication starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, communication starts when the CSIHnMCTL2.CSIHnBTST bit is set.

17.5.7.4 Summary

The following table summarizes this section. It shows how data transfer is started in the various memory, operating, and transfer modes.

Table 17.42 Start of Data Transfer

Memory and Operating Mode		Transfer Mode	
		Transmit-Only Transmit/Receive	Receive-Only
FIFO, direct access	Master	Writing to the CSIHnTX0W register or the CSIHnTX0H register	Writing to the CSIHnTX0W register or the CSIHnTX0H register
	Slave	Clock reception from master	Incoming clock from the master
Transmit-only buffer, dual buffer	Master	CSIHnMCTL2.CSIHnBTST = 1	CSIHnMCTL2.CSIHnBTST = 1
	Slave	Clock reception from master	Clock reception from master

17.5.8 Data Length Selection

17.5.8.1 Data Length from 2 to 16 Bits

The length of a data packet is selectable for each chip select signal from 2 to 16 bits using CSIHnCFGx.CSIHnDLSx[3:0]. The examples below show the communication with MSB first (CSIHnCFGx.CSIHnDIRx = 0).

Data length = 16 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 0000_B):

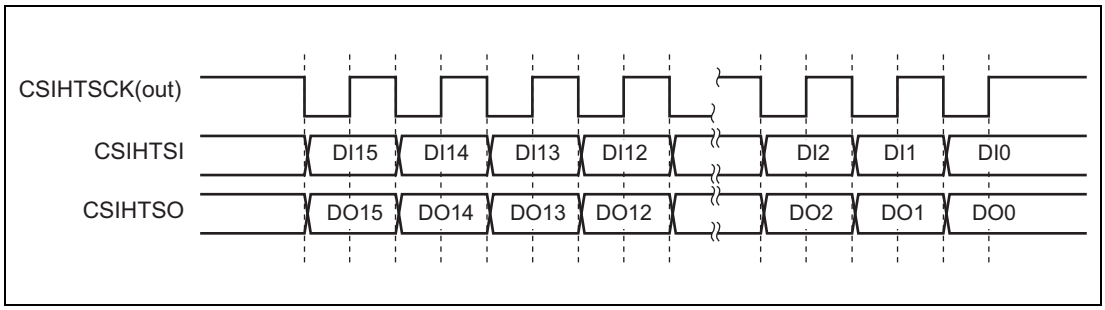

Figure 17.22 16 Bit Data Length, MSB First

Data length = 14 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1110_B):

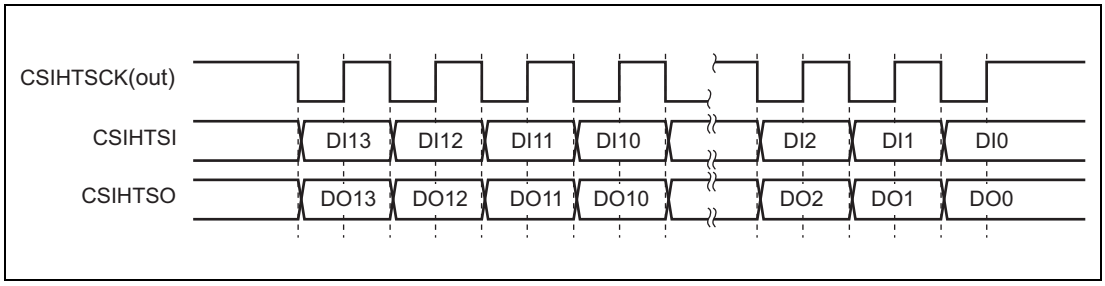

Figure 17.23 14 Bit Data Length, MSB First

17.5.8.2 Data Length Greater than 16 Bits

If the data to be sent/received exceeds 16 bits, the extended data length (EDL) function can be used.

EDL function is enabled by setting the CSIHnCTL1.CSIHnEDLE bit to 1.

EDL function works as follows:

- The data has to be broken into 16-bit blocks plus remainder. For example, data of 42 bits would be broken into two 16-bit blocks plus 10 bits.
- The bit length of the remainder is set as “data length” in CSIHnCFGx.CSIHnDLSx[3:0].
- For transmitting the 16-bit blocks, CSIHnTX0W.CSIHnEDL must be set to 1. In this case, the data written to CSIHnTX0W is sent as a 16-bit data length regardless of the CSIHnCFGx.CSIHnDLSx[3:0] bit setting.
- The transfer is complete after a block with the specified data length (the remainder of data specified with CSIHnTX0W.CSIHnEDL = 0) has been sent.

Example

Example for sending 40-bit data ($123456789A_H$) to CS0:

40 bits are split into two 16-bit blocks plus 8 bits.

- Initialize CSIHnCFG0.CSIHnDLS0[3:0] = 8.
- To transmit $123456789A_H$ with MSB first, write the following sequence to CSIHnTX0W:
  - $20FE\ 1234_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - $20FE\ 5678_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - $00FE\ 009A_H$ (CSIHnTX0W.CSIHnEDL = 0)

The following figure illustrates the timing.

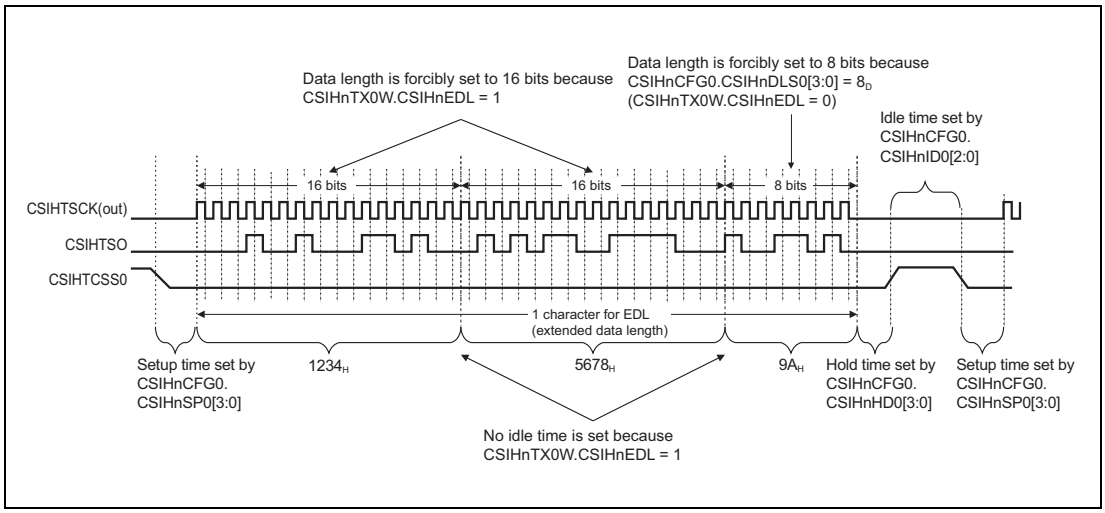

Figure 17.24 EDL Timing Diagram

NOTES

1. 1-bit data length is allowed only when using the EDL mode.
2. If parity is enabled, the parity bit is added after the last bit.
3. When data is sent using extended data length (EDL) function, use the same chip select signal.
4. Example for configuring the data direction:
   - Data to be sent:123456_H
   - MSB first:
     Set CSIHnCFGx.CSIHnDIRx = 0
     Write CSIHnTX0W = 20FE 1234_H (EDL bit = 1)
     Write CSIHnTX0W = 00FE 0056_H (EDL bit = 0)
   - LSB first:
     Set CSIHnCFGx.CSIHnDIRx = 1
     Write CSIHnTX0W = 20FE 3456_H (EDL bit = 1)
     Write CSIHnTX0W = 00FE 0012_H (EDL bit = 0)
5. Operation is not guaranteed if CSIHnTX0W.CSIHnEOJ and CSIHnTX0W.CSIHnEDL are simultaneously set to “1” while CSIHnCTL1.CSIHnJE = 1 and CSIHnCTL1.CSIHnEDLE = 1.
6. EDL mode cannot be used in receive-only mode of slave mode. (CSIHnCTL2.CSIHnPRS[2:0] = 111_B, CSIHnCTL0.CSIHnTXE = 0, CSIHnCTL0.CSIHnRXE = 1)

17.5.9 Serial Data Direction Selection

The serial data direction is selectable for each chip select signal using the CSIHnDIRx bit in the CSIHnCFGx register.

The examples below show communication for a data length of 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).

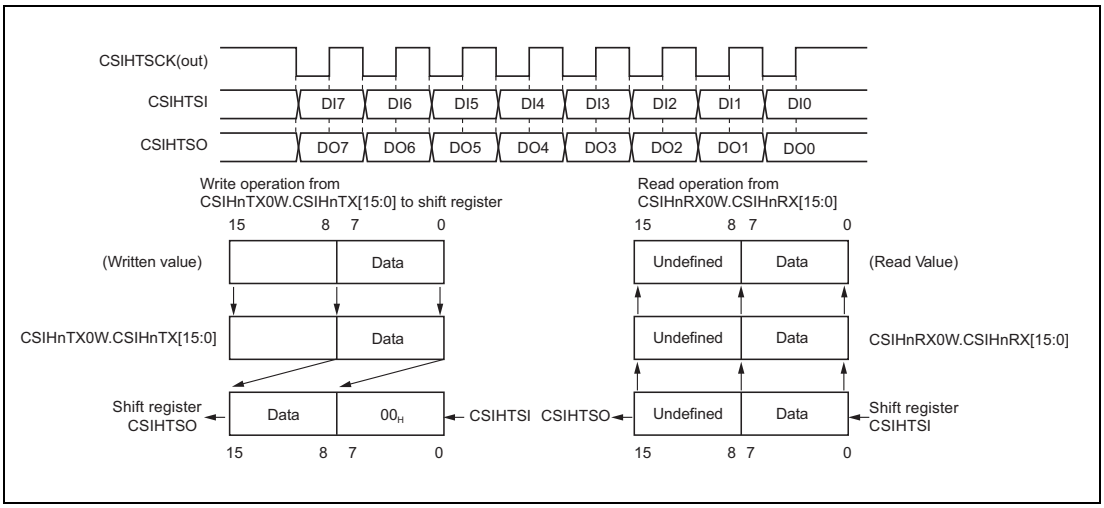

Figure 17.25 Serial Data Direction Select Function - MSB First (CSIHnDIRx = 0)

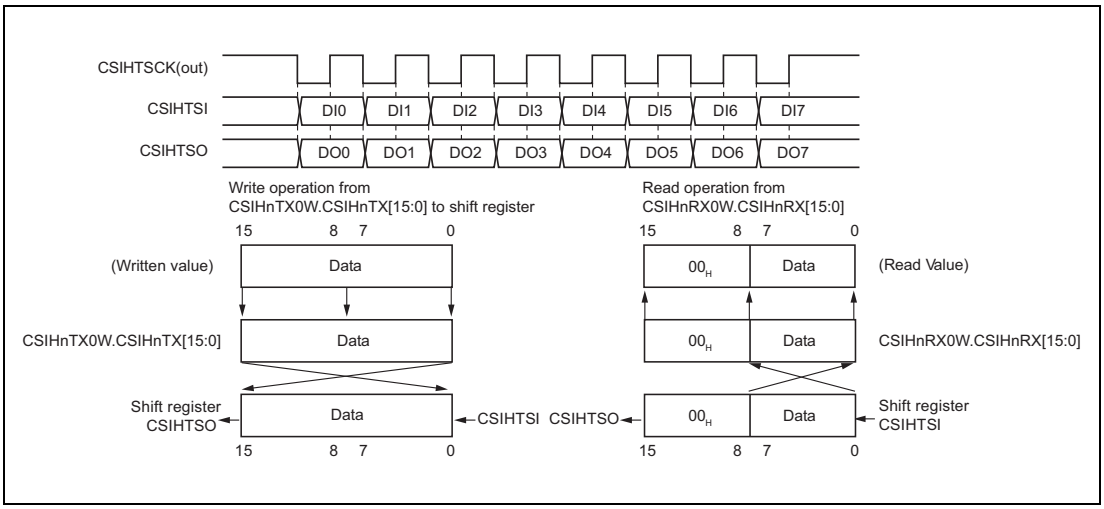

Figure 17.26 Serial Data Direction Select Function - LSB First (CSIHnDIRx = 1)

17.5.10 Slave Select (SS) Function

The Slave Select (SS) function enables communication between one master and multiple slaves (SPI communications).

In master mode, the master device outputs the slave select signal (CSIHTCSSx) to a slave. Communication by a device in slave mode is enabled when the slave input select signal (CSIHTSSI) is at the low level.

See the **Section 17.5.2, Master/Slave Connections**, for examples of connections using the SS function.

17.5.10.1 Communication Timing Using SS Function

The following figure illustrates the communication signal and timings using the SS function.

In slave mode, the data transfer configuration is determined by the CSIHnCFG0 register.

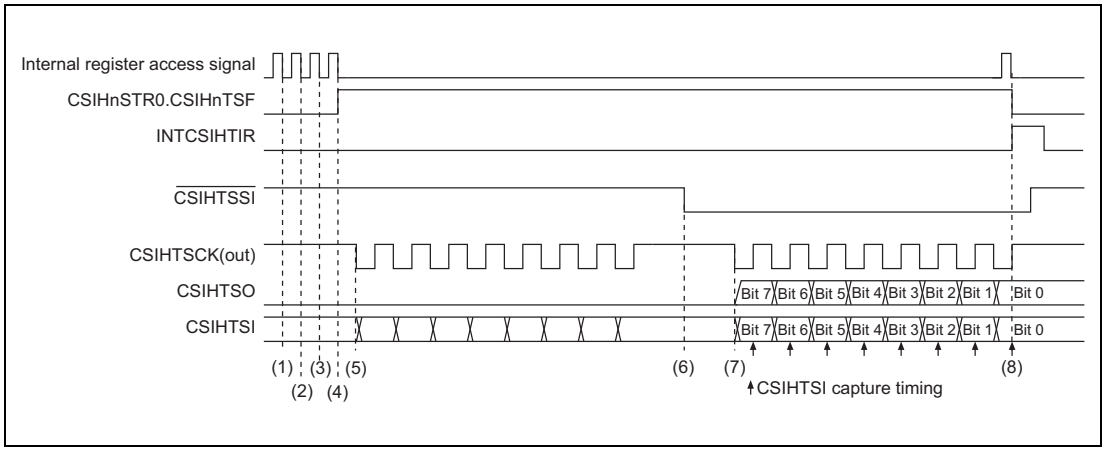

Figure 17.27 Tx/Rx Timing of Communication Using SS Function

(1) CSIH enters slave mode by setting CSIHnCTL2.CSIHnPRS[2:0] = 111_B. CSIHnCFG0.CSIHnCKP0 and CSIHnCFG0.CSIHnDAP0 are 0.

(2) The data length is 8 bits (CSIHnCFG0.CSIHnDLS0[3:0] = 1000_B). The data direction is MSB first (CSIHnCFG0.CSIHnDIR0 = 0).

(3) The transmit/receive mode is set (CSIHnCTL0.CSIHnTXE = 1, CSIHnCTL0.CSIHnRXE = 1, and CSIHnCTL0.CSIHnPWR = 1). Communication start is permitted.

(4) The transfer status flag CSIHnSTR0.CSIHnTSF is automatically set when transfer data is written to the CSIHnTX0W or CSIHnTX0H transmission register during direct access mode or FIFO mode.

(5) While the signal $\overline{\text{CSIHTSSI}}$ is at high level, transmission/reception is not started, even if an external transmission clock CSIHTSCK is input. Input to CSIHTSI is ignored.

(6) $\overline{\text{CSIHTSSI}}$ falling to low level indicates that CSIHTSO is enabled and ready for transmission.

(7) As soon as the external clock signal CSIHTSCK is detected, the slave transmits data to CSIHTSO and simultaneously captures data from CSIHTSI.

(8) Interrupt INTCSIHTIR indicates that the reception is complete. The CSIHnRX0W/H register can be read.

17.5.10.2 CSIHTSSO Operation

CSIHnPWR	CSIHnTXE	CSIHnRXE	CSIHnSSE	CSIHTSSO
0	—	—	—	H
1	—	—	0	H
	0		1	H
	1		1	Inverse value of $\overline{\text{CSIHTSSI}}$ level

The CSIHTSSO pin is a signal to control the I/O function of the chip's SO pin when using the SS function.

The CSIHTSO pin is enabled when the CSIHTSSO pin is "High" (the chip's SO pin is being driven).

The CSIHTSO pin is disabled when the CSIHTSSO pin is "Low" (the chip's SO pin is not being driven).

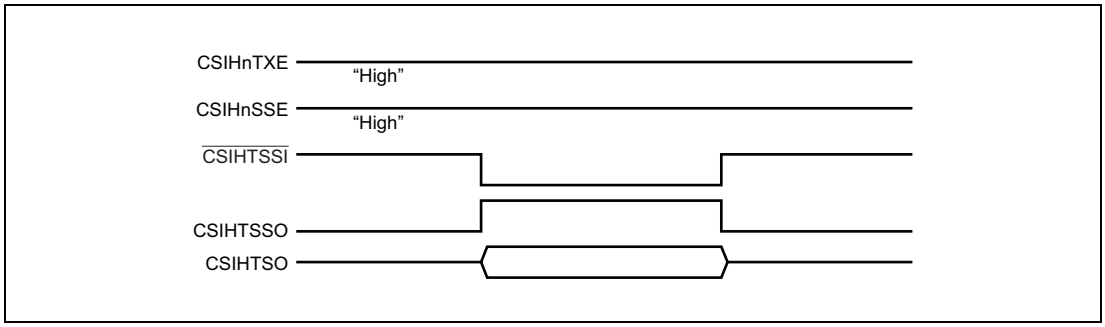

Figure 17.28 Operation of CSIHTSSO

CAUTION

If $\overline{\text{CSIHTSSI}}$ pin is changed during communication (CSIHnSTR0.CSIHnTSF = 1), current communication is not guaranteed.

17.5.11 Handshake Function

CSIH features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by the CSIHnCTL1.CSIHnHSE bit. For handshake, the signals CSIHTRYI and CSIHTRYO are used.

The busy timing depends on the data phase selection bit CSIHnCFGx.CSIHnDAPx.

17.5.11.1 Slave Mode

If CSIHnCTL1.CSIHnHSE = 1, a low-level CSIHTRYO signal is output when the slave becomes busy. This can happen in two cases:

1. When the next data to be sent is not ready:
   When the slave is in transmit-only mode or transmit/receive mode (CSIHnCTL0.CSIHnTXE = 1) and is in any of the states listed below, the CSIHTRYO outputs the busy state (low level).

Table 17.43 Memory Mode and Slave Transfer State

Memory Mode	Slave Transfer State
Direct access mode	When there is no more data to be sent
FIFO mode	When there is no more data to be sent (CSIHnSTR0.CSIHnEMF = 1)
Dual buffer mode	When CSIHnMCTL2.CSIHnBTST is not set to 1
Transmit-only buffer mode	

The following examples assume an eight-bit data length.

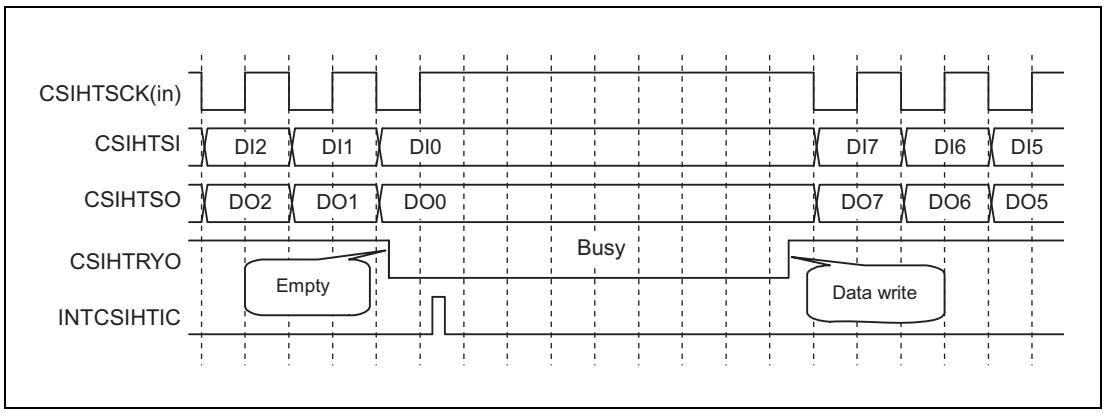

Figure 17.29 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 0)

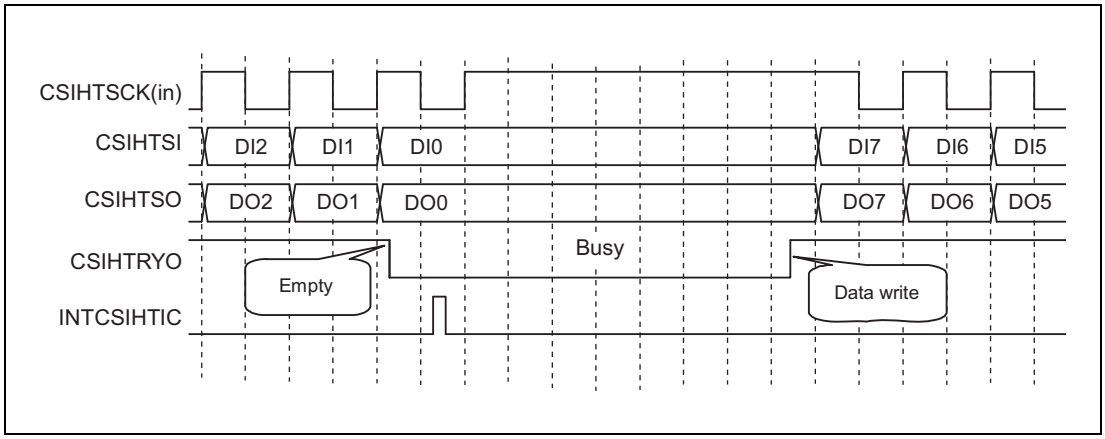

Figure 17.30 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 1)

2. When receive register is full:
   When slave is configured in receive-only mode or transmit/receive mode (CSIHnCTL0.CSIHnRXE = 1), and new data cannot be copied from a shift register to CSIHnRX0W/H because the previously received data is still in the CSIHnRX0W/H register (CSIHnRX0W/H is full).
   When CSIHnCTL0.CSIHnRXE is 1 and is in any of the following states, CSIHTRYO outputs busy state (low level).

Table 17.44 Memory Mode and Slave Reception State

Memory Mode	Slave Reception State
Direct access mode	When CSIHnRX0W or CSIHnRX0H is full
FIFO mode	When received data is remaining in buffer (CSIHnSTR0.CSIHnFLF = 1)
Dual buffer mode	No applicable case
Transmit-only buffer mode	When CSIHnRX0W or CSIHnRX0H is full

The following examples assume an eight-bit data length.

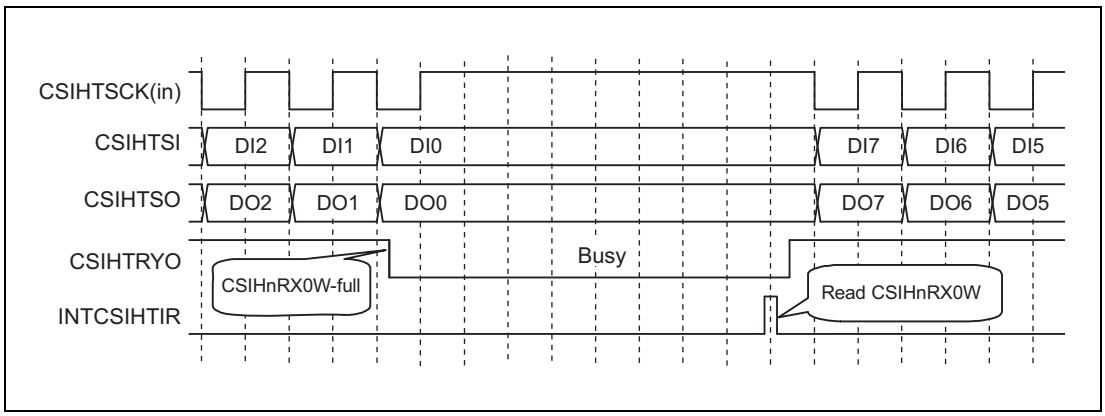

Figure 17.31 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 0)

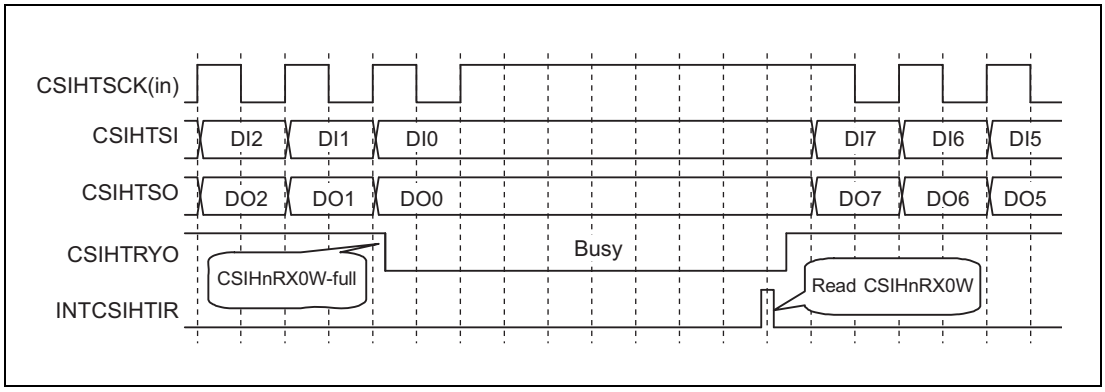

Figure 17.32 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 1)

17.5.11.2 Master Mode

When the master detects CSIHTRYI = 0 while CSIHnCTL1.CSIHnHSE = 1, the subsequent transfers are put on hold, the master goes into wait state and suspends the CSIHTSCK clock.

The CSIHTRYI level is checked at each half clock cycle of CSIHTSCK.

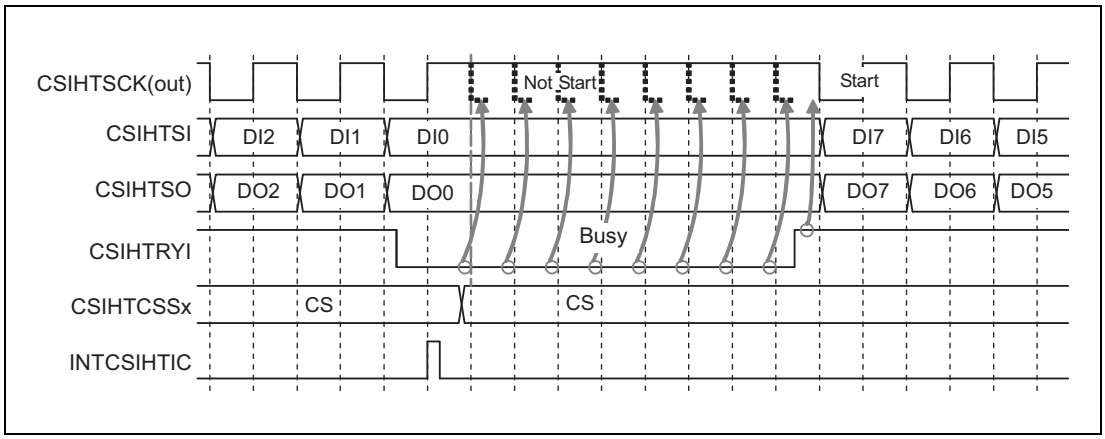

Figure 17.33 Master's Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 0)

The CSIHTRYI signal must be pulled down by the slave before the next transfer starts. If this is done while data transfer is in progress, the serial clock from the master is suspended after the transfer is complete.

The master resumes the communication as soon as CSIHTRYI becomes high (the slave is "ready").

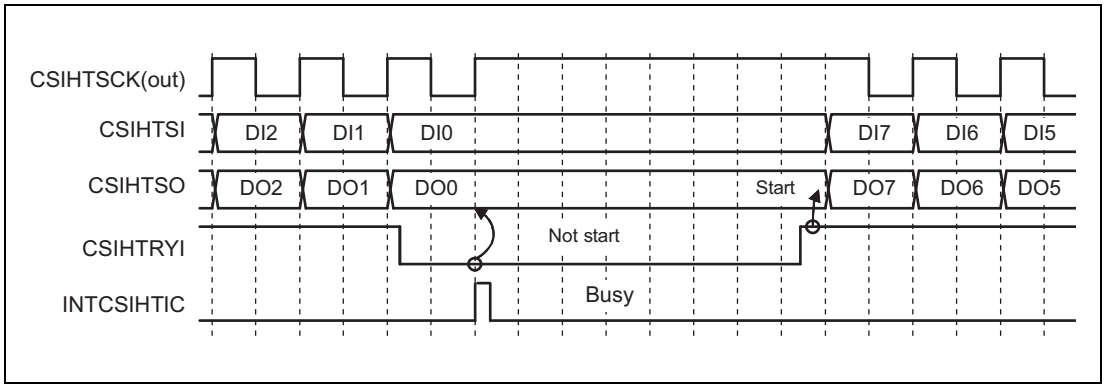

Figure 17.34 Master's Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 1)

CAUTIONS

1. **If multiple slaves are connected, the master must only detect the CSIHTRYI signal of the slave it has selected for communication.**
2. **Even when the CSIHTRYI pin of the master detects a CSIHTRYO signal from the slave during data transfer, the communication is not put on hold but continues until the data transfer is completed.**

17.5.12 Error Detection

CSIH can detect five error types:

- Data consistency check error (transmission data)
- Parity error (received data)
- Overrun error (received data)
- Time-out error (in FIFO mode)
- Overflow error (in FIFO mode)

Check for parity, data consistency and time-out errors can be enabled/disabled individually.

If any of these errors is detected, the interrupt request INTCSIHTIRE is generated and the corresponding flags are set.

17.5.12.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent as output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIHnCTL1.CSIHnDCS bit (when checking data consistency, make sure that PIPCn.PIPCn_m = 1). It will not be enabled if data transmission is disabled (CSIHnCTL0.CSIHnTXE = 0).

When the data consistency check is active, the data transferred from CSIHnTX0W or CSIHnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIHTSO are read back via the CSIHTDCS signal into the corresponding shift register.

After completion of the transmission, the sent data is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnDCE bit is set.

Additionally, CSIHnRX0W.CSIHnTDCE of data that contains the error is set.

The data consistency check function is illustrated in the following block diagram.

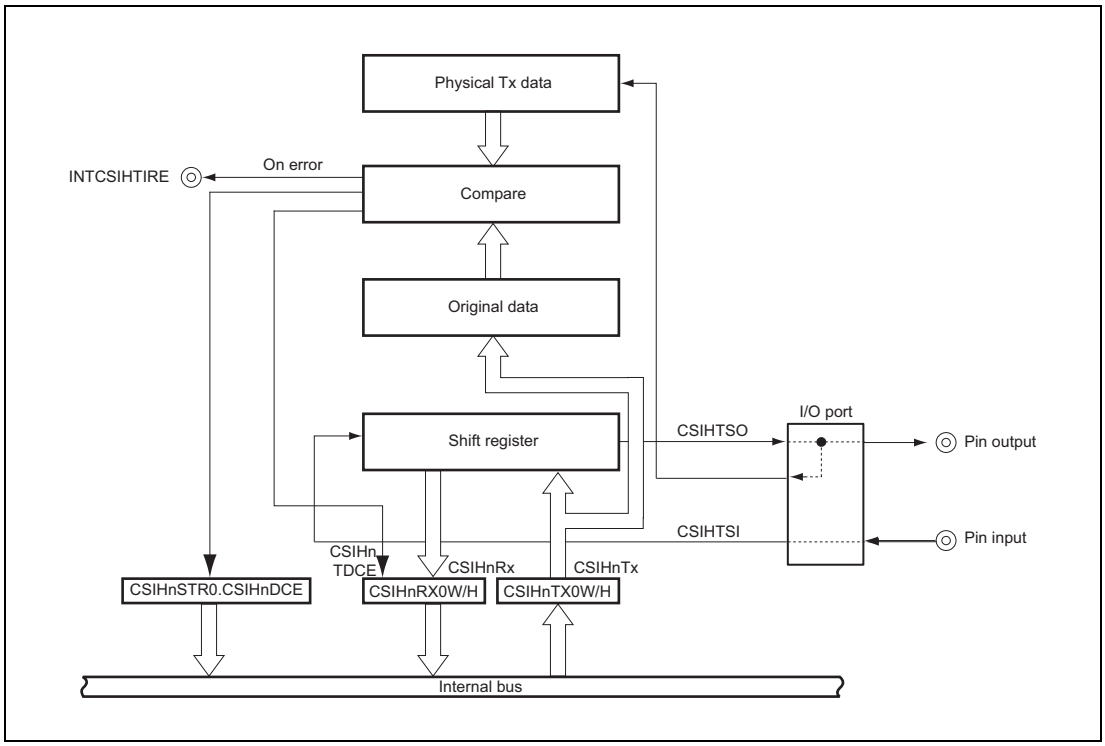

Figure 17.35 Data Consistency Check Functional Block Diagram

17.5.12.2 Parity Check

CSIH can append a parity bit to the last data bit (even if extended data length is used).

The use and type of parity is specified in CSIHnCFGx.CSIHnPSx[1:0].

Parity check is enabled if CSIHnCFGx.CSIHnPSx[1] = 1.

The parity bit is checked after a reception is complete. In case of parity error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnPE bit is set.

Additionally, CSIHnRX0W.CSIHnRPE of data that contains the error is set.

The figure below shows an example.

- Data length is 8 bits.
- The data to be transmitted is 05_H and 35_H.
- Data direction is LSB first.
- Parity type is odd.

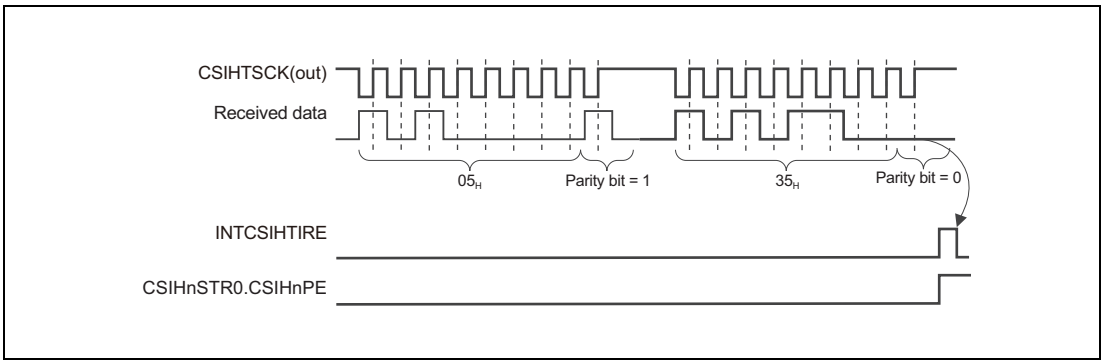

Figure 17.36 Parity Check Example

The parity bit of the first data is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

The parity bit of the second data is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last bit of the data.

17.5.12.3 Time-Out Error

Time-out errors can be checked only in slave FIFO mode.

This error occurs if neither of the following occurred within a certain period of time:

- Received data in FIFO is read
- FIFO receives data from CSIHTSI

The time-out time is defined in CSIHnMCTL0.CSIHnTO[4:0] in units of "8 x transmission clock CSIHTSCK". A time-out error occurs when the specified time is exceeded (the time-out time is not detected when CSIHnMCTL0.CSIHnTO[4:0] = 00000_B).

The dedicated time-out counter is set by the CSIHnCTL2.CSIHnPRS[2:0] and CSIHnBRSy.CSIHnBRS[11:0] bits.

If the value of the CSIHnBRSy.CSIHnBRS[11:0] bits is left as 000_H, the dedicated time-out counter does not operate.

The dedicated time-out counter measures the time between the last and the next read operation.

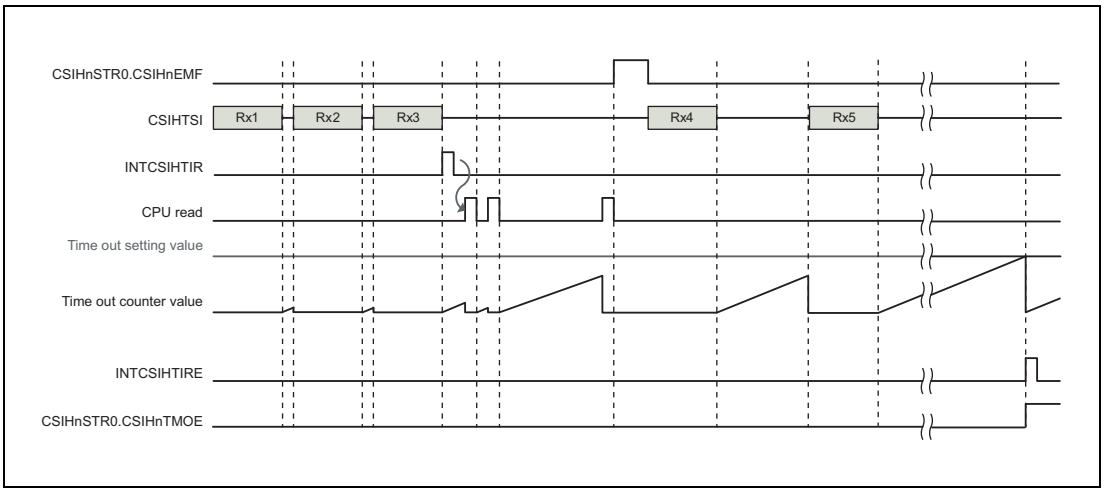

Figure 17.37 Time-Out Check Functional Timing Diagram

The start timing of the time-out counter is as follows:

- When reception is completed
- When data read from the CPU is completed
  (The counter does not start if the buffer is empty.)
- When a time-out error is detected

After a time-out error is detected, if data is still available in FIFO, the time-out counter restarts.

If the value set by bits CSIHnMCTL0.CSIHnTO[4:0] is reached again, the INTCSIHTIRE interrupt is output again.

The timeout counter continues to count until received data is read. To stop the counter, read all received data or set CSIHnSTCR0.CSIHnPCT to 1. Note that the pointer is cleared if you perform the latter.

The counter is reset at the following timing:

- Data is read once.
- A new data item is received.

- A timeout error is detected.
- The CSIHnSTCR0.CSIHnPCT bit is set to 1.

If a timeout error occurs, the following occur:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnTMOE bit is set.

17.5.12.4 Overflow Error

An overflow error can occur in FIFO mode. It occurs when transmission data is written to the CSIHnTX0W register while the FIFO buffer is filled with received data.

Example

100 data packets have been transmitted. That means, the FIFO contains 100 received data packets. The application starts to read the received data.

While the read operation is in progress, the application begins to write another set of 50 transmission data packets to the FIFO. However, only 10 received data packets have been read up to now, and 90 are still in the FIFO.

In this case, only 38 buffers are available for new transmission data. When the CPU tries to write the 39th data, an overflow error occurs.

This is illustrated in the following figure.

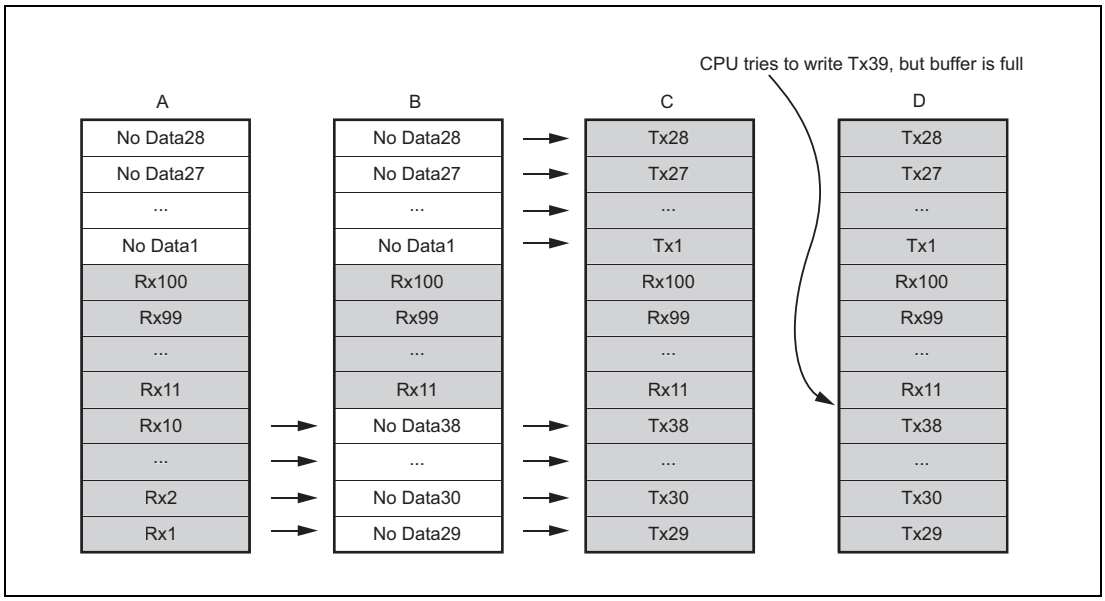

Figure 17.38 FIFO Overview

The 39th and subsequent data packets are discarded. The figure below shows the overflow timing.

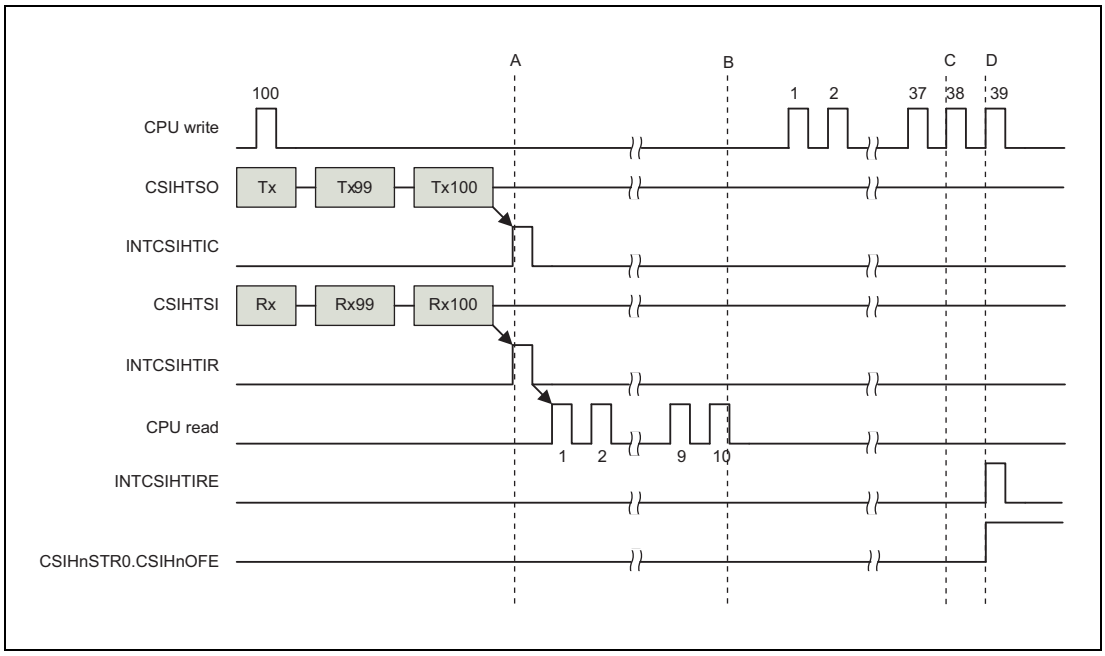

Figure 17.39 FIFO Overflow Timing

In case of overflow error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnOFE bit is set.

17.5.12.5 Overrun Error

An overrun error can occur in direct access, transmit-only buffer, and FIFO modes. It does not occur in dual buffer mode. The overrun error does not occur if data reception is disabled (CSIHnCTL0.CSIHnRXE = 0).

There are two conditions for overrun errors.

Condition for errors 1

- In FIFO mode, if the CPU reads the CSIHnRX0W/H register when the number of received data is 0.

Condition for errors 2

- In slave mode, when CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled):
  - In direct access mode or transmit-only buffer mode, when reception is completed while the previous received data remains in the CSIHnRX0W/H register.
  - In FIFO mode, when reception is completed while the FIFO buffer is still full of receive data.

(1) Direct access/transmit-only buffer

In direct access and transmit-only buffer modes, this error occurs when newly received data cannot be transferred from the shift register to the reception register CSIHnRX0W/H. This happens when CSIHnRX0W/H was not read and therefore contains previously received data.

The following figure illustrates the overrun error detection function.

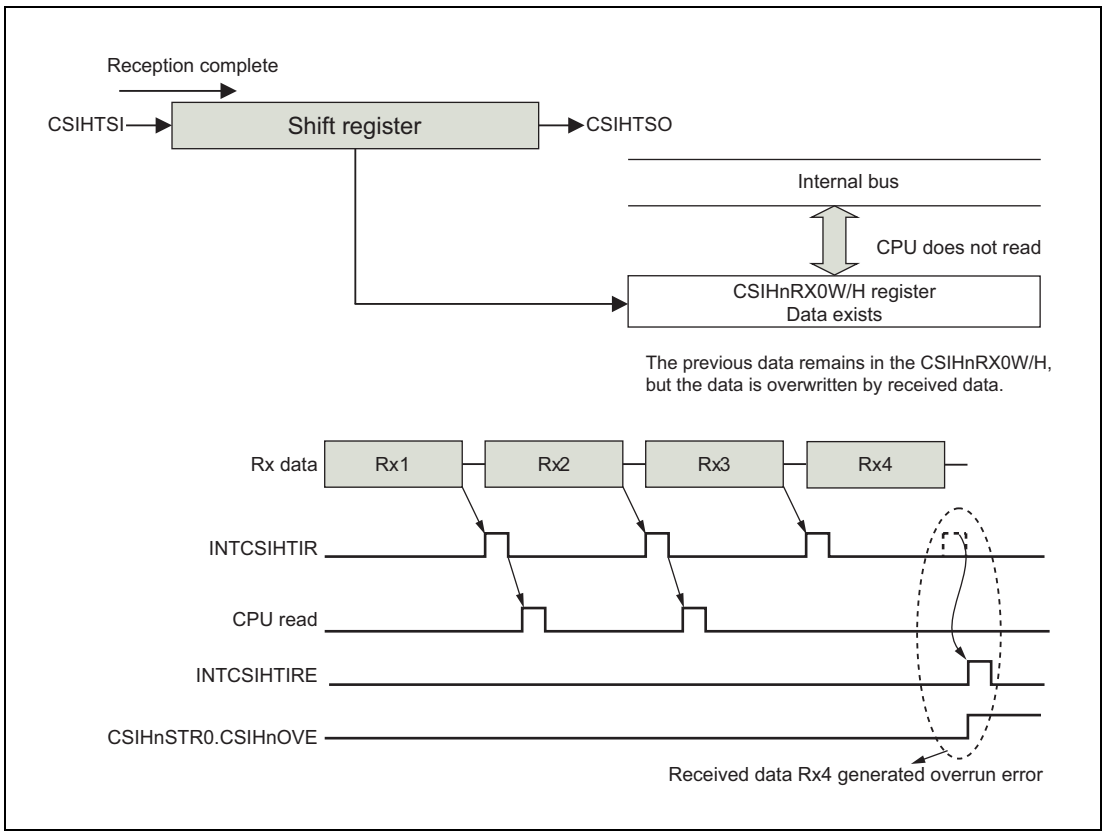

Figure 17.40 Overrun Error Detection in Direct Access and Transmit-Only Buffer Modes

NOTE

An overrun error can be avoided in slave mode by using handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

(2) FIFO mode

In FIFO mode, this error occurs if:

1. Newly received data cannot be transferred from the shift register to the FIFO because the FIFO is full.

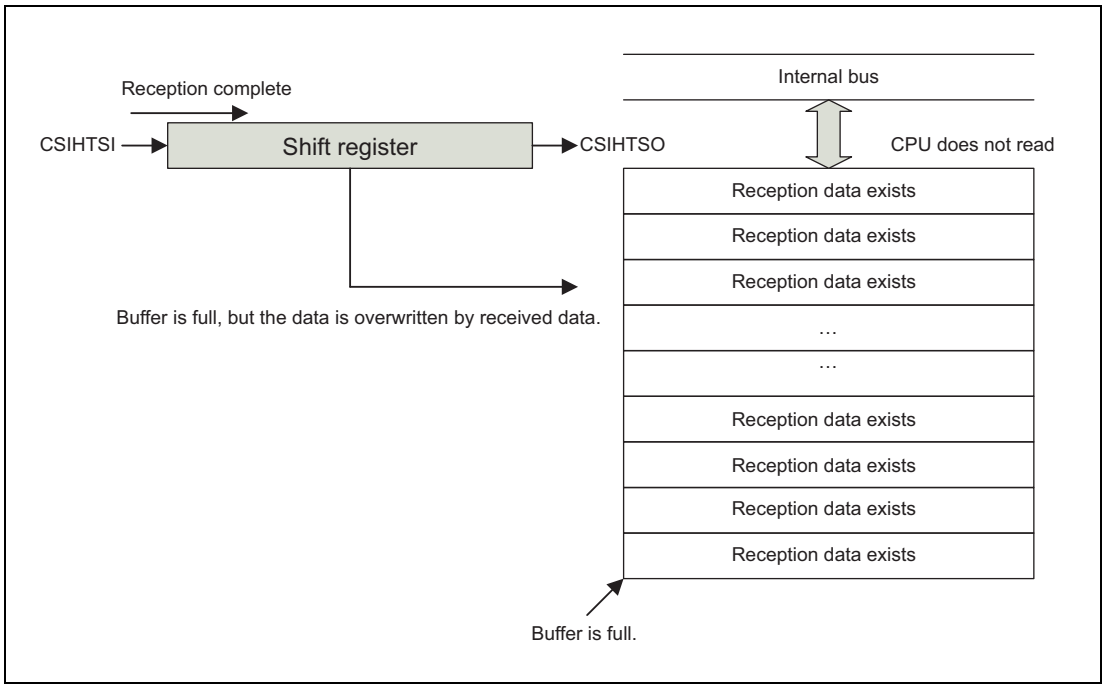

Figure 17.41 Overrun Error Detection in FIFO Mode (FIFO Full)

NOTE

An overrun error can be avoided in slave mode by using the handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

2. The CPU attempts to read non-existent receive data.

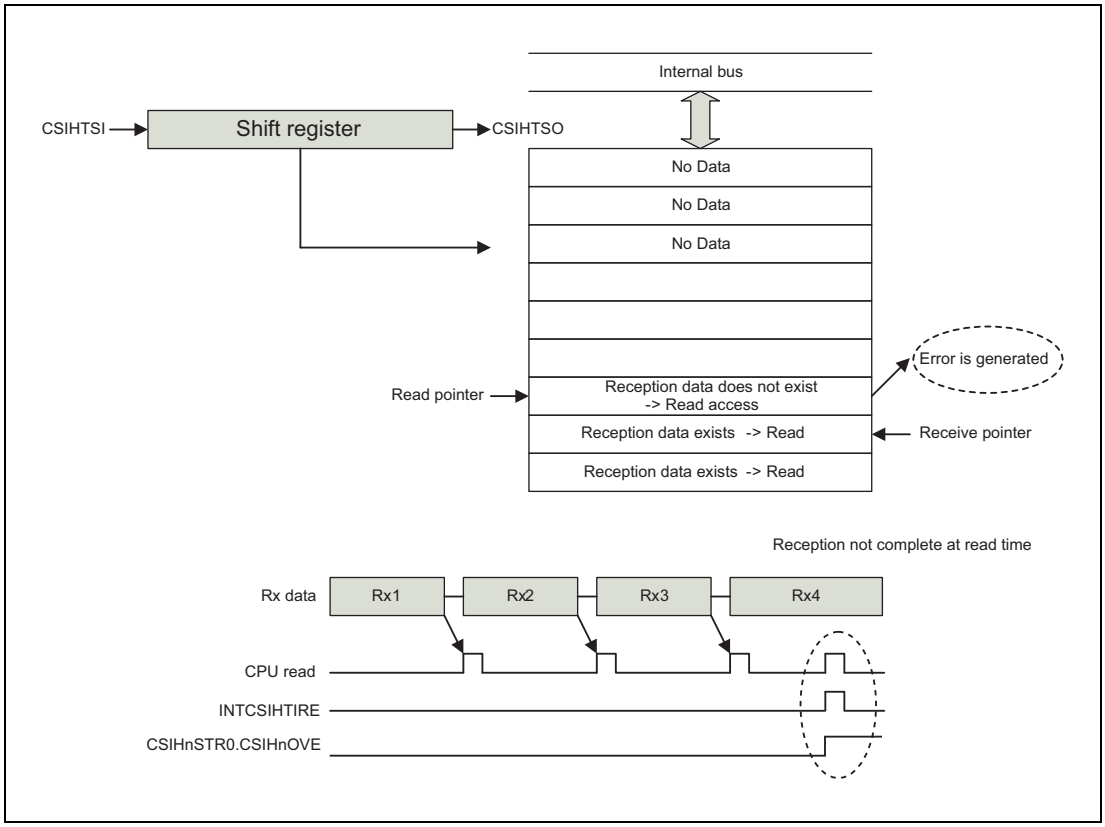

Figure 17.42 Overrun Error Detection in FIFO Mode (No Data)

In case of overrun error:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnOVE bit is set.
- Received data is overwritten and the communication continues.
  (When the CPU tries to read non-existent data, it waits until reception is completed and then resumes reading.)

For details see **Section 17.5.11, Handshake Function**.

17.5.13 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active (CSIHnCTL1.CSIHnLBM = 1), CSIHTCSSx is fixed to the inactive level (the active level is defined by the CSIHnCTL1.CSIHnCSLx value). The transmit and receive signals are internally connected, as shown in the figures below. The signals CSIHTSCK, CSIHTSO, CSIHTSI, and CSIHTCSSx are disconnected from the ports. In addition, the CSIHTSO output level is fixed to low, and CSIHTSCK is set to reset level (High) regardless of the value of the CSIHnCFGx.CSIHnCKPx. The rest of CSIH works as in normal operation.

In order to test CSIH, put it in loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data. Any connected device remains unaffected by the loop-back test.

Table 17.45 Pin Output Level in Loop-Back Mode

Pin Name	Output level
CSIHTSCK(out)	High level
CSIHTCSS[7:0]	Inactive level
CSIHTSO	Low level (not dependent on the previous value)
Interrupt	Normal function
CSIHTRYO	Normal function (Low level)

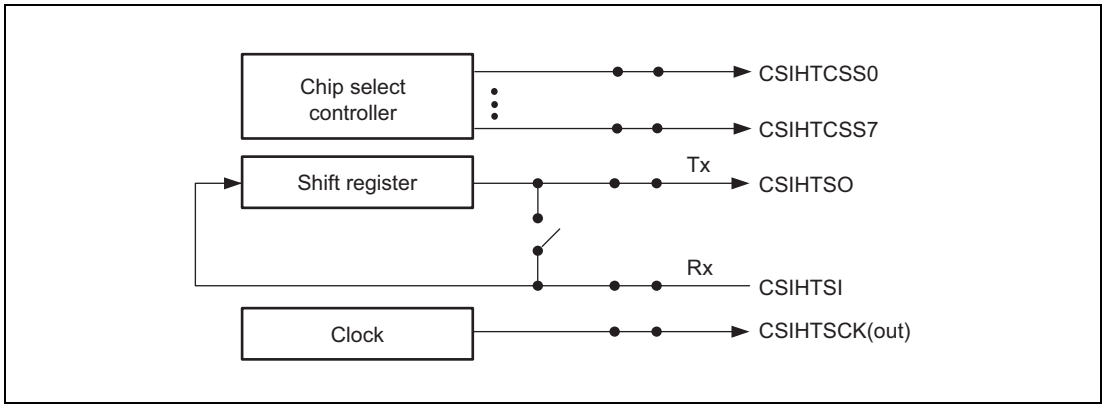

Figure 17.43 Normal Operation

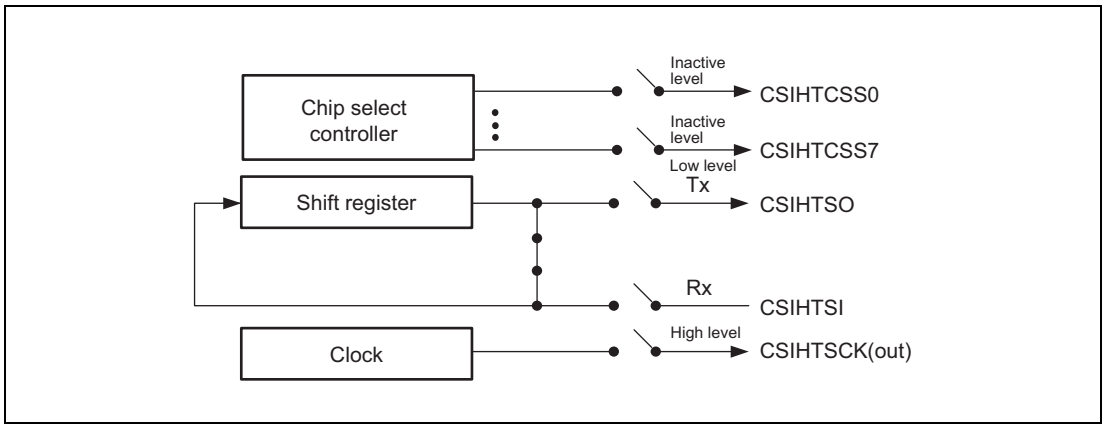

Figure 17.44 Loop-Back Mode Operation

17.5.14 CPU-Controlled High Priority Communication Function

CSIH has a function to abort low priority communication to perform high priority communication if it receives a high-priority communication request from the CPU while low-priority communication is being used. This function supports transmit-only buffer mode as low priority communication and only direct access mode as high-priority communication. To enable this function, CSIHnCTL1.CSIHnPHE and CSIHnCTL1.CSIHnJE must be set to 1.

The following figure illustrates CPU-controlled high-priority communication.

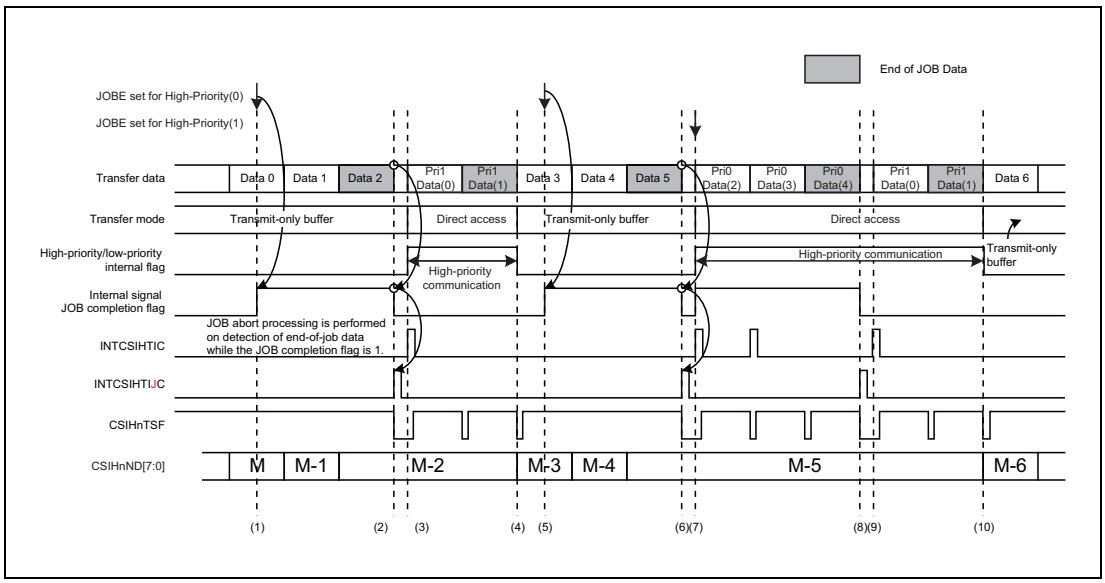

Figure 17.45 Example of CPU-Controlled High-Priority Communication

(1) By setting CSIHnCTL0.CSIHnJOBE = 1 during low-priority communication, start of high-priority communication following end-of-job data is notified, and the internal signal flag is set.

(2) When end-of-job data is detected, the current low-priority communication is aborted and the INTCSIHTIJC interrupt occurs. The internal signal job completion flag is cleared due to the communication abort, and memory mode is automatically switched to direct access mode for the subsequent high-priority communication.

(3) The CPU detects the interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H.

(4) When end-of-job data is detected, communication is aborted. At this time, because the internal signal end-of-job flag is set to 0, the CSIH determines that the next communication is low-priority, automatically switches memory mode to transmit-only buffer mode, and then resumes the aborted low-priority communication.

(5) Same as (1) above.

(6) Same as (2) above.

(7) The CPU detects an interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H. The CPU sets CSIHnCTL0.CSIHnJOBE = 1 again to notify that the next communication is high-priority.

(8) When end-of-job data is detected, communication is aborted and the INTCSIHTIJC interrupt is generated. At this time, the CPU determines that the subsequent communication is also high-priority because the internal signal JOB completion flag is 1, and waits for communication to start.

(9) Same as (3) above.

(10) Same as (4) above.

CAUTION

Memory mode is switched automatically when communication is changed from low priority to high priority (from transmit-only buffer mode to direct access mode) and from high priority to low priority (from direct access mode to transmit-only buffer mode).

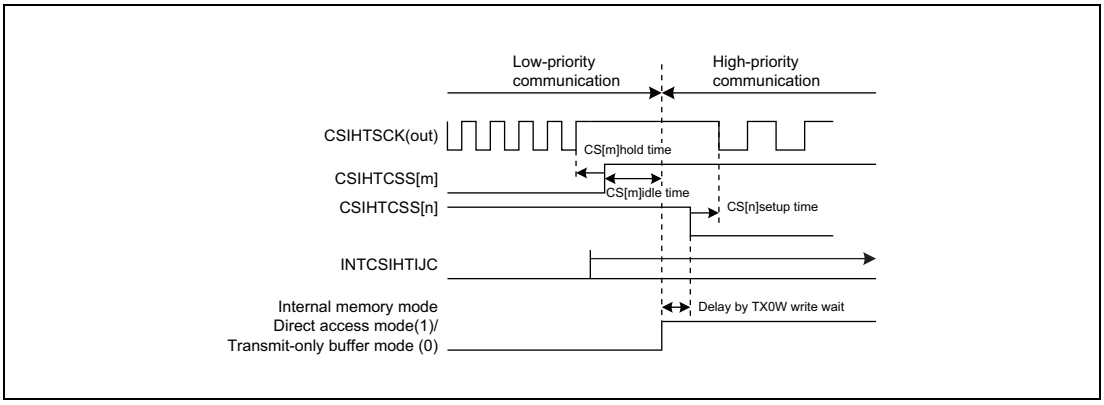

Figure 17.46 Transition from Low-Priority Mode to High-Priority Mode

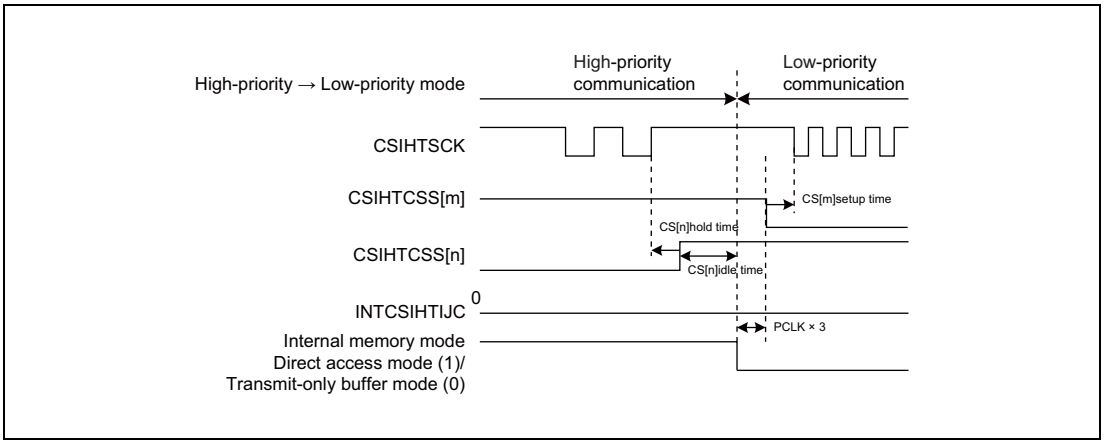

Figure 17.47 Transition from High-Priority Mode to Low-Priority Mode

Do not conduct write operation of communication data or CSIHnCTL0.CSIHnJOBE bit operation during setting inhibited period to switch low and high priority communication mode correctly.

CSIHnTX0W register write inhibited period:

- Period from when CSIHnJOBE bit is set for switching to high priority communication mode to when INTCSIHTIJC interrupt is detected.
- Period from when the last data of high priority communication (End of JOB data) is written to when the CSIHnHPST state = 0 is detected.

CSIHnJOBE register write inhibited period:

- Period from when CSIHnJOBE bit is set for switching to high priority communication mode to when INTCSIHTIJC interrupt is detected.

During high communication mode period, there is no setting inhibited period for CSIHnJOBE bit. It is possible to set CSIHnJOBE bit before writing communication data. For example, to communicate multiple JOB data in high priority mode, it is possible to set CSIHnJOBE bit before writing the first communication data.

CAUTION

When CSIHnJOBE bit is set right before the last communication of high priority communication ends, different operations are required depending on the timing at which setting of CSIHnJOBE bit is internally detected.

If the setting of the CSIHnJOBE bit is detected before the transfer of the last bit is completed, high priority communication mode continues.

When setting of the CSIHnJOBE bit is detected after the transfer of the last bit is completed, the mode temporarily returns to low priority communication. After detection of End of JOB data in low priority communication, the mode changes back to high priority communication.

17.5.15 Enforced Chip Select Idle Setting

It is possible to insert an idle state between two consecutive data transfers by setting CSIHnCFGx.CSIHnIDLx.

1. When CSIHnCFGx.CSIHnIDLx = 0
   If the next CSIHTCSSx is the same as the previous one, an idle state is not inserted, but an inter-data time is inserted instead.
   If the next CSIHTCSSx is different from the previous one, an idle state is inserted.
2. When CSIHnCFGx.CSIHnIDLx = 1
   An idle state is always inserted even if a next CSIHTCSSx is not different from the previous one.

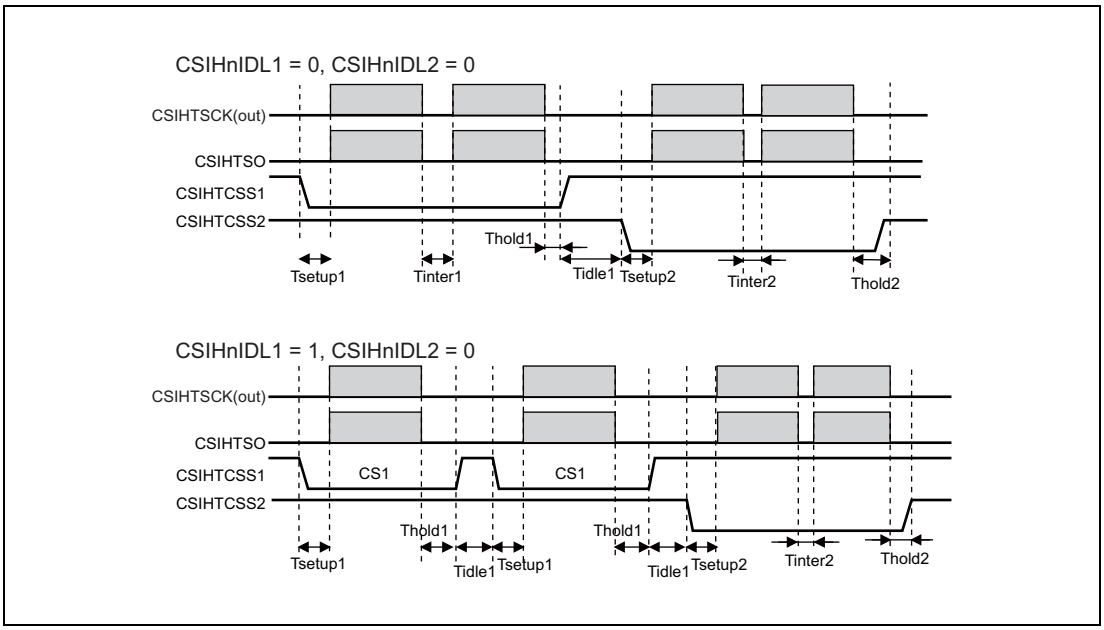

Figure 17.48 Enforced Chip Select Idle Setting Example

CAUTION

If the CPU-controlled high priority communication function is enabled (CSIHnCTL1.CSIHnPHE = 1), when the mode is switched from low priority communication to high priority communication or from high priority communication to low priority communication, an IDLE state is inserted regardless of the setting of CSIHnCFGx.CSIHnIDLx bit.

17.6 Operating Procedures

The examples and procedures below are described according to the memory mode in the following order:

- Direct access mode
- Transmit-only buffer mode
- Dual buffer mode
- FIFO mode

17.6.1 Procedures in Direct Access Mode

Two examples for a master are provided, one with job mode disabled, and the other with job mode enabled.

17.6.1.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below assumes the following conditions:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)

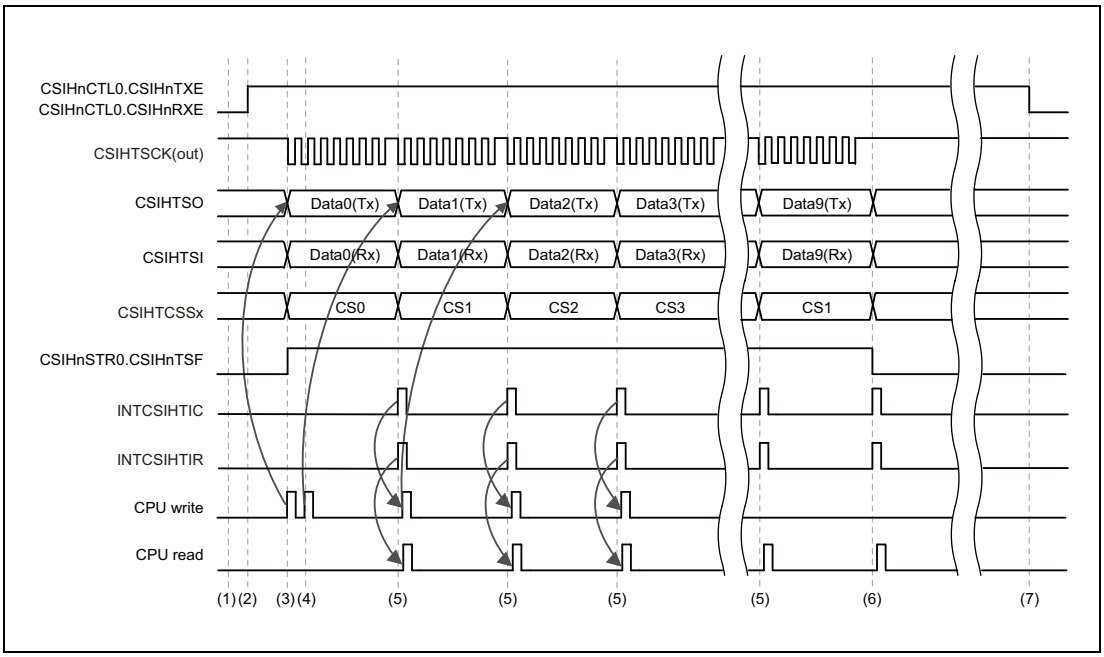

Figure 17.49 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first data to be sent to the transmission register, CSIHnTX0W. Within the same write operation, activate CS0. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIHnTX0W. If required, you can change the CS to address a different device. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every data transmission/reception, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated:
   - INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
   - INTCSIHTIR indicates that the reception register CSIHnRX0W must be read.
6. No more write action is required after completion of data 8. Data 9 (the last data) has been written in advance.
   However, reception register CSIHnRX0W must be read after completion of writing data 8 and 9.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

17.6.1.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)
- Two jobs, each transmitting three data.

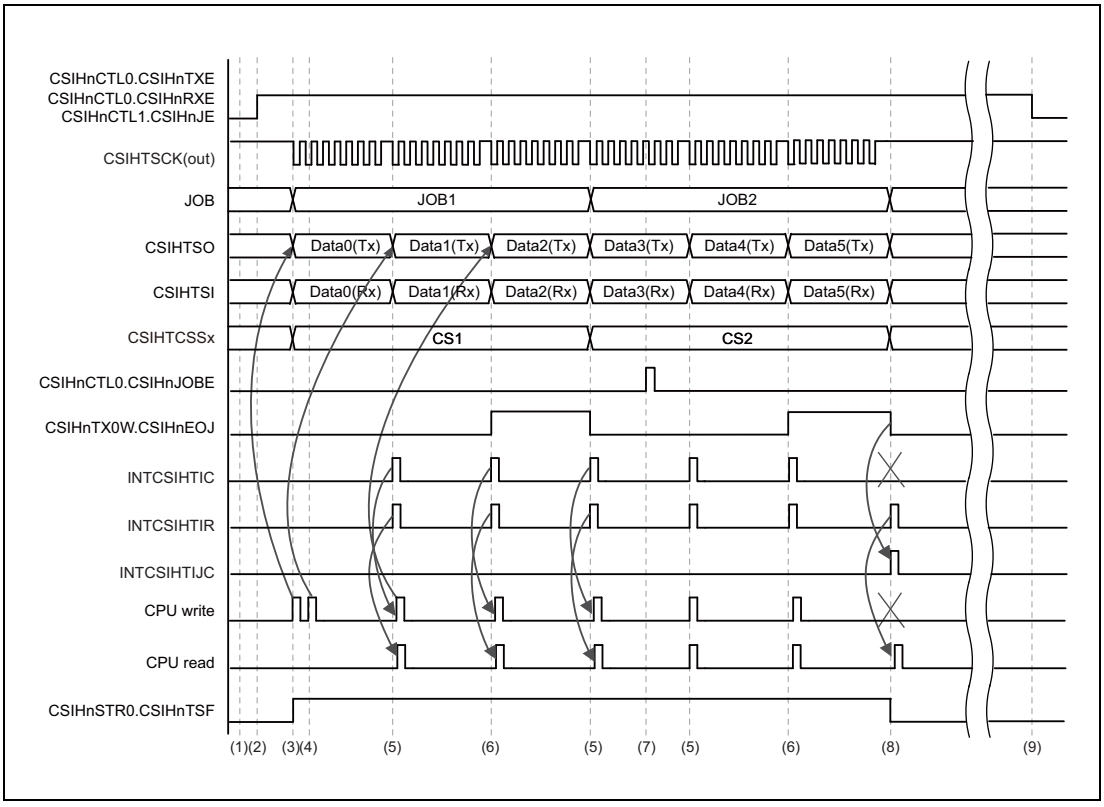

Figure 17.50 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 1

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1 and CS2.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits the reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first data to be sent to the transmission register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
   The CSIHnSTR0.CSIHnTSF flag indicates that communication is in progress.
4. Write the second data to CSIHnTX0W. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every data transmission/reception, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.
   - INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
   - INTCSIHTIR indicates that the reception register, CSIHnRX0W must be read.
6. Setting CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is sent. After that, the next job may begin.
7. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of the current job (JOB2).
8. After the forced stop of communication, the interrupt request, INTCSIHTIC is replaced by INTCSIHTIJC. INTCSIHTIR is generated as usual.
   The interrupt request, INTCSIHTIJC indicates that the communication was forcibly stopped at the end of the current job.
   The interrupt request, INTCSIHTIC is not generated. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
9. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.
   To start another transmission without stopping communication, perform steps 3 and later.

17.6.2 Procedures in Transmit-Only Buffer Mode

Two examples for a master is provided, one with job mode disabled, and the other one with job mode enabled.

17.6.2.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0,CSIHnMCTL0.CSIHnMMS[1:0] = 10_B)

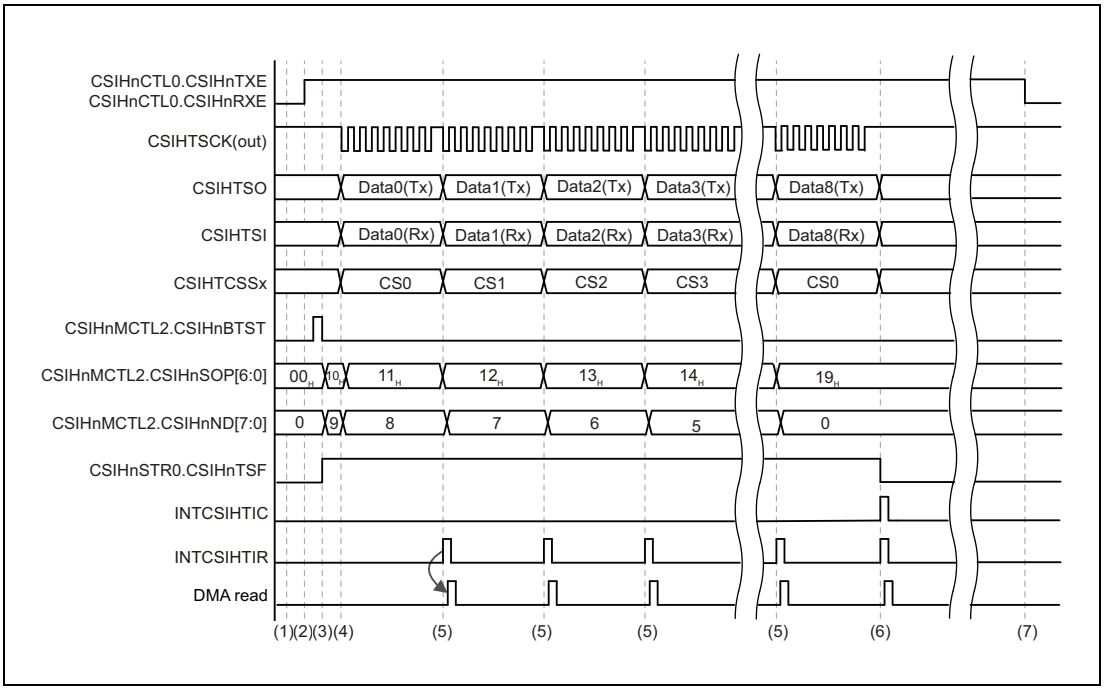

Figure 17.51 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 10_B (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission/reception is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. After every data reception, the interrupt request, INTCSIHTIR is generated. INTCSIHTIR indicates that the receive register CSIHnRX0W must be read.
6. When all transmissions are complete, the interrupt request, INTCSIHTIC is generated.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

17.6.2.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data is 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0,CSIHnMCTL0.CSIHnMMS[1:0] = 10_B)

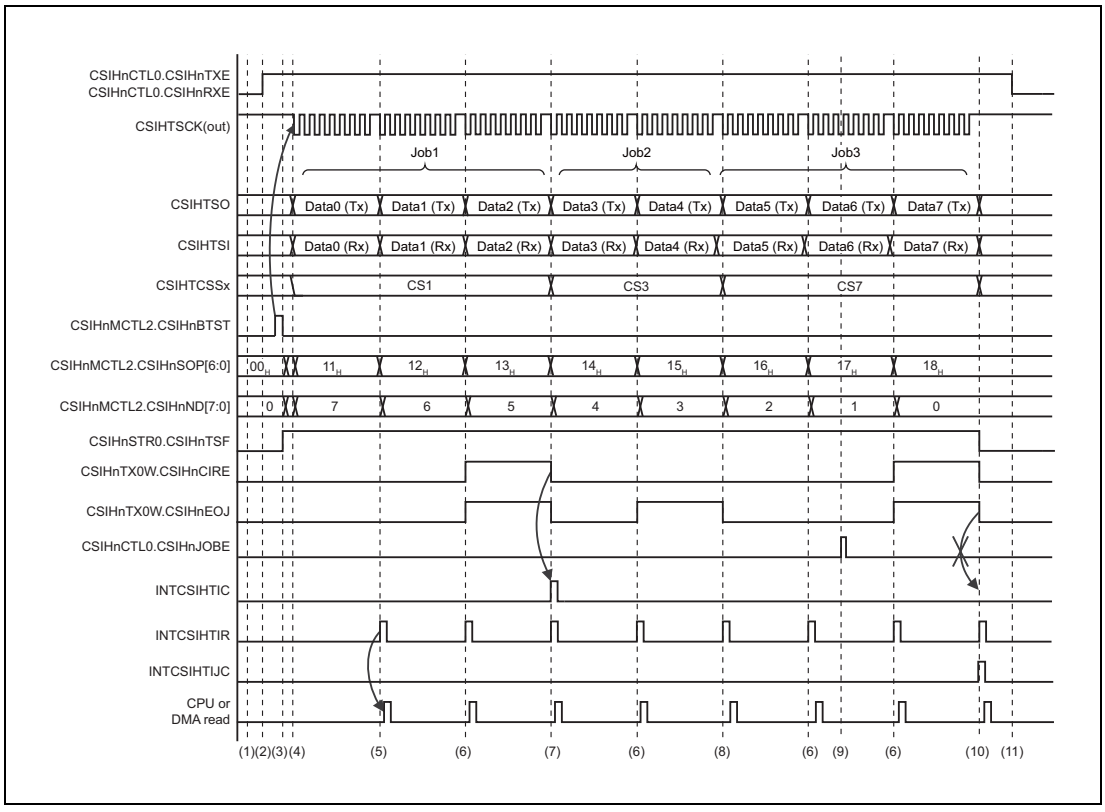

Figure 17.52 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 1

NOTE

The process of writing the data into the buffer is not described.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1, CS3, and CS7.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 10_B (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. After every data reception, the interrupt request, INTCSIHTIR is generated. INTCSIHTIR indicates that the receive register CSIHnRX0W must be read.
6. The CSIHnTX0W.CSIHnEOJ = 1 setting indicates that the last data of the current job is sent.
7. The interrupt request INTCSIHTIC is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
8. The INTCSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CHABnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
10. After the forced stop of communication, interrupt requests INTCSIHTIJC and INTCSIHTIR are generated at the end of job3.
    The INTCSIHTIJC interrupt request indicates that the communication was forcibly stopped at the end of the current job.
    The INTCSIHTIC interrupt request is not generated because the INTCSIHTIJC interrupt request is generated instead of the INTCSIHTIC interrupt request. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

17.6.3 Procedures in Dual Buffer Mode

Examples when job mode is enabled in master mode, disabled in master mode, and disabled in slave mode are provided below.

17.6.3.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CHABnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)

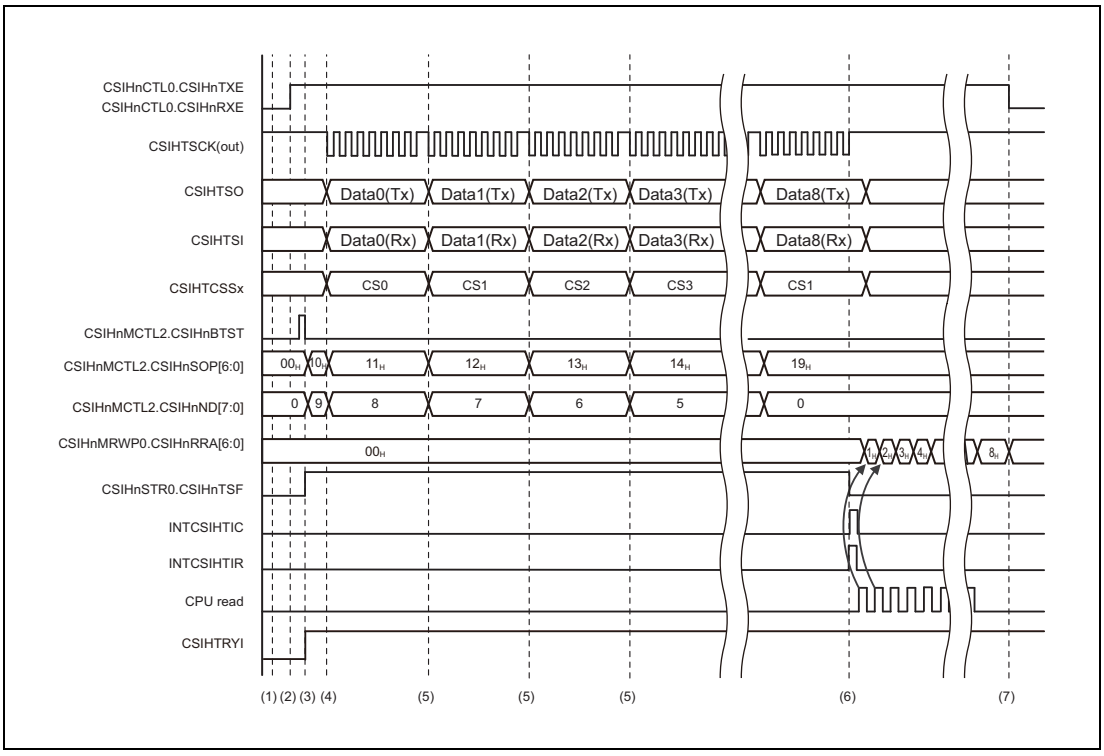

Figure 17.53 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The process of writing the data into the buffer is not described.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0]. Set CSIHnMCTL0.CSIHnMMS[1:0] = 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits the reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Permit buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.
   The interrupt requests INTCSIHTIC and INTCSIHTIR are not generated.
6. When the last data is transmitted/received, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.
   The CPU starts to read the received data from the receive buffer. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0]. These bits are incremented after each data is read.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

17.6.3.2 Transmission/Reception in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data is 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 00_H (CSIHnMCTL2.CSIHnSOP[6:0] = 00_H).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)

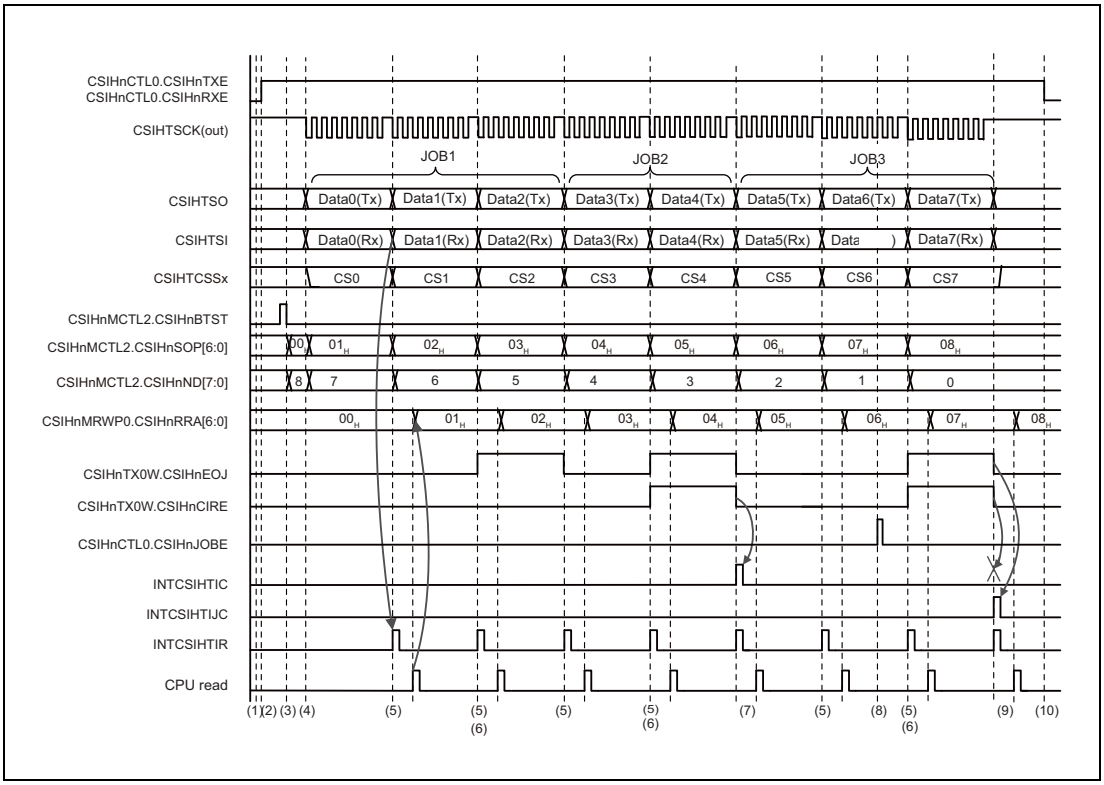

Figure 17.54 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 1

NOTE

The process of writing the data into the buffer is not described.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS0 to CS7.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented, and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission. This is repeated until the last data is transmitted/received.
5. The INTCSIHTIR interrupt request is generated everytime data is received.
   The INTCSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
6. CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is sent.
7. The INTCSIHTIC interrupt request is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
8. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
9. After the forced stop of communication, interrupt requests INTCSIHTIJC and INTCSIHTIR are generated at the end of JOB3.
   The INTCSIHTIJC interrupt request indicates that the communication was forcibly stopped at the end of the current job.
   The INTCSIHTIC interrupt request is not generated because the INTCSIHTIJC interrupt request is generated instead of the INTCSIHTIC interrupt request. Additionally, the transmission data available in register CSIHnTX0W is not sent.
10. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

17.6.3.3 Transmit/Receive in Slave Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCTL1.CSIHnCKR = 0, CSIHnCFG0.CSIHnDAP0 = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)
- Handshake function is enabled (CSIHnCTL1.CSIHnHSE = 1)

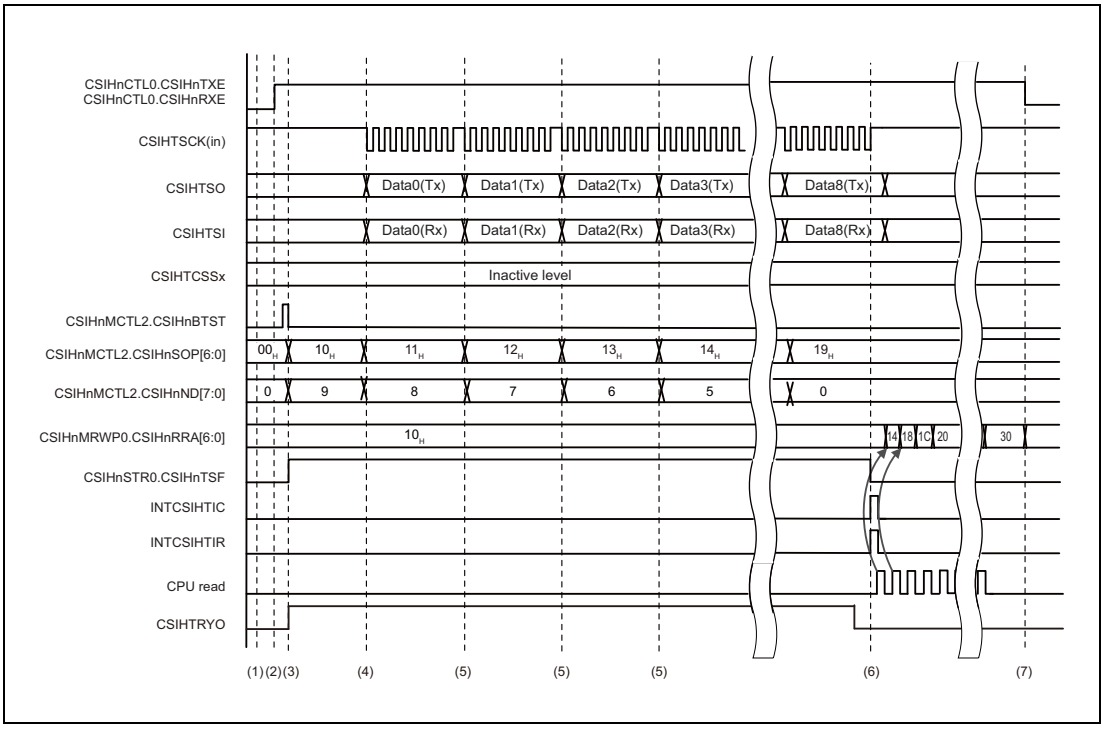

Figure 17.55 Slave in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The process of writing the data into the buffer is not described.

Procedure:

1. Configure the communication protocol in register CSIHnCFG0.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] = 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Specify the transfer start address by setting the CSIHnMCTL2.CSIHnSOP[6:0] bits and the number of data by setting the CSIHnMCTL2.CSIHnND[7:0] bits. Permit the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started when the input clock is received from the master. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.
   The interrupt requests INTCSIHTIC and INTCSIHTIR are not generated because transmission data is sent from the buffer, and received data is stored in the buffer.
6. When the last data is transmitted/received, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.
   The CPU starts to read the received data that is stored in the receive buffer. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0]. These bits are incremented after each data is read.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

17.6.4 Procedures in FIFO Mode

Two examples for a master is provided, one with job mode disabled, the other one with job mode enabled.

17.6.4.1 Transmission/Reception in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00_B)

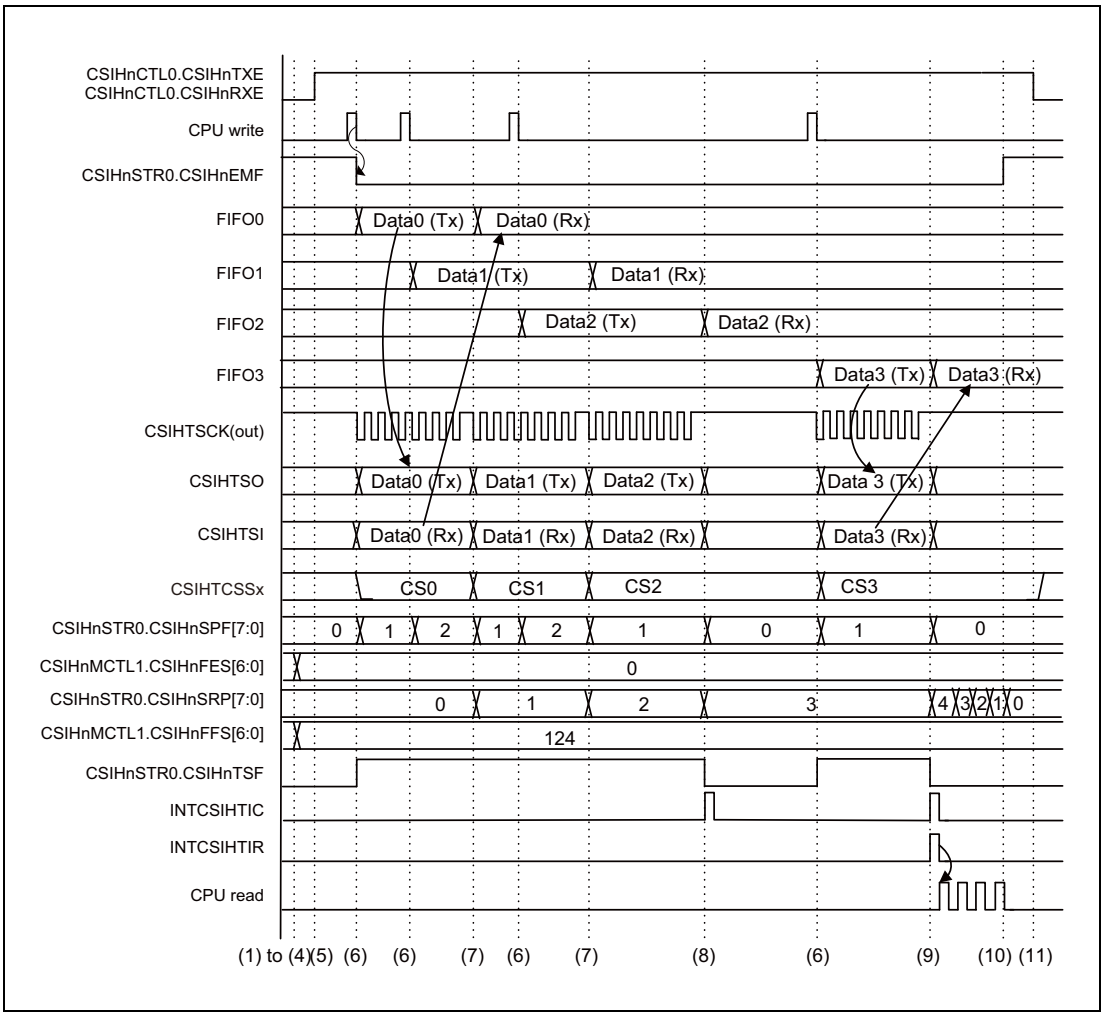

Figure 17.56 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. Specify the job mode disable and master mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2. Specify the FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] = 00_B. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
2. Set CSIHnSTCR0.CSIHnPCT = 1 to clear all buffer pointers.
3. Check that CSIHnSTR0.CSIHnFLF = 0, CSIHnSTR0.CSIHnEMF = 1, and CSIHnSTR0.CSIHnSPF[7:0] = 00_H.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating the INTCSIHTIC interrupt output.
   Specify the conditions for generating the INTCSIHTIR interrupt request in the CSIHnMCTL1.CSIHnFFS[6:0] bits.
5. Set CSIHnCTL0.CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the first transmit data to the transmit register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
   Check that CSIHnSTR0.CSIHnEMF = 0.
7. The current transmission is completed. As the CSIHnFES[6:0] bits are not the same as the CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is not generated.
8. As the CSIHnFES[6:0] bits are the same as the CSIHnSPF[7:0] bits, the interrupt request INTCSIHTIC is generated.
9. When CSIHnFFS[6:0] = 128 - CSIHnSRP[7:0], the interrupt request INTCSIHTIR is generated. Since CSIHnFES[6:0] = CSIHnSPF[7:0], the interrupt request INTCSIHTIC is generated. After the generation of an interrupt, the CPU starts reading received data that is stored in the receive buffer.
10. When the CPU completes reading the received data that is stored in the receive buffer, CSIHnSTR0.CSIHnEMF is set to 1 and the FIFO buffer becomes empty.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. In addition, if communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

17.6.4.2 Transmit/Receive Mode when Job Mode is Enabled in Master Mode

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0)
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- JOB1 consists of four data, JOB2 consists of three data, and JOB3 consists of five data.
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00_B)

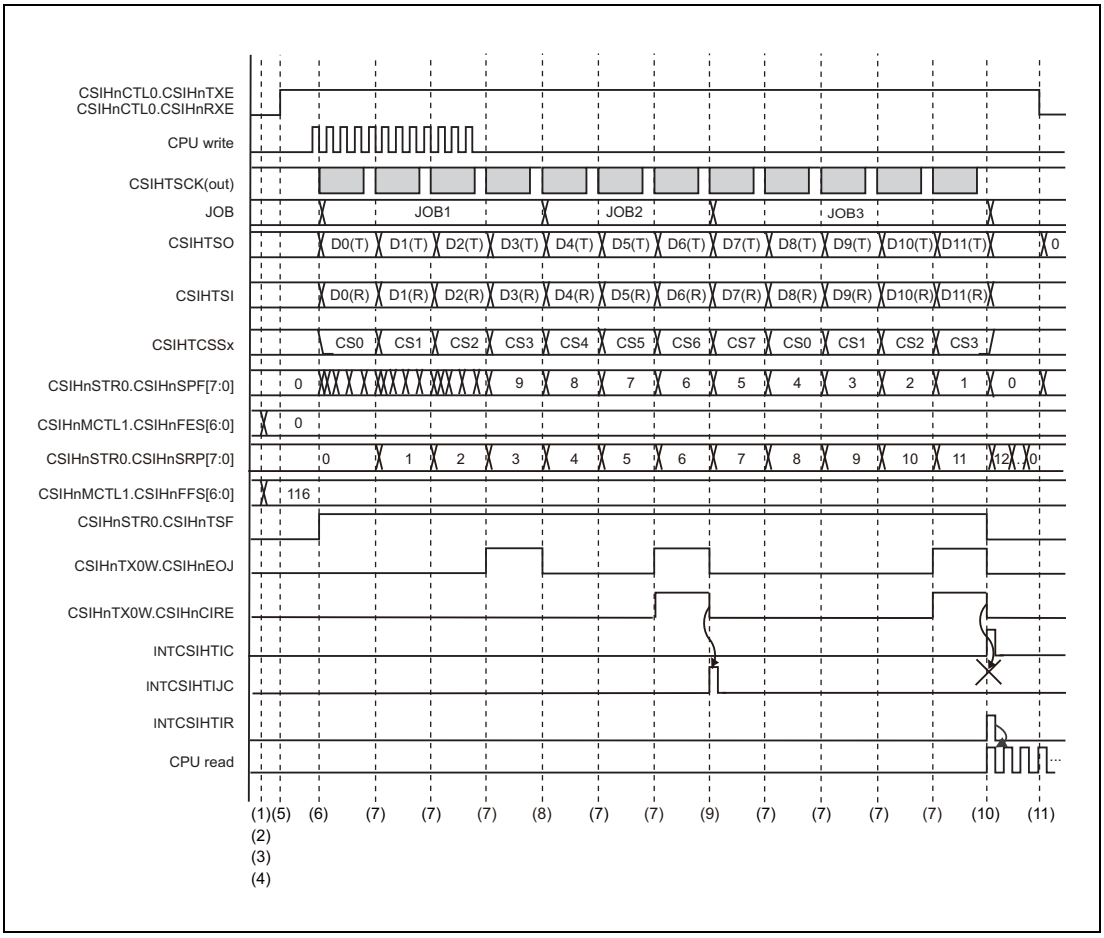

Figure 17.57 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 1

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. Set job mode disable and master mode in the corresponding bits of the CSIHnCTL1 and CSIHnCTL2 registers. Set FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] to 00_B. This example uses chip select signals CS0 to CS7.
2. Set CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
3. Make sure that CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to 00_H.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating the INTCSIHTIC interrupt request. With CSIHnMCTL1.CSIHnFFS[6:0], specify the conditions for generating the INTCSIHTIR interrupt request.
5. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the first data to be sent to the CSIHnTX0W transmission register. Transmission starts automatically when the first data becomes available.
   Make sure CSIHnSTR0.CSIHnEMF is set to 0.
7. The current transmission is completed. Since CSIHnFES[6:0] is not the same as CSIHnSPF[7:0], the interrupt request INTCSIHTIC is not generated.
8. The INTCSIHTIJC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. The INTCSIHTIJC interrupt request is generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
10. The INTCSIHTIC interrupt request is generated because CSIHnFES[6:0] = CSIHnSPF[7:0]. INTCSIHTIC is generated so that INTCSIHTIJC is not generated.
    When CSIHnFFS[6:0] = 128 - CSIHnSRP[7:0], the interrupt request INTCSIHTIR is generated. After the generation of the INTCSIHTIR interrupt, CPU starts reading the received data stored in received buffer.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize power consumption of the CSIHn.

17.7 Detection and Correction of Errors in CSIHn RAM

17.7.1 ECC for the CSIHn RAM

Table 17.46 gives an outline of the ECC functions for the CSIH RAM.

Table 17.46 List of the ECC Functions for the CSIHn RAM

Item	Outline of Functions
ECC error detection/ correction	The RAM is checked for ECC errors. The following options are selectable. • 2-bit error detection and 1-bit error detection/correction • 2-bit error detection and 1-bit error detection The ECC error detection/correction can be disabled by using through mode. With the initial settings, error detection/correction is enabled.
Error notification	When an ECC error is generated, an interrupt signal is generated. • Error notification can be enabled or disabled when an ECC 2-bit error is detected. • Error notification can be enabled or disabled when an ECC 1-bit error is detected. In the initial setting, 2-bit error notification is enabled and 1-bit error notification is disabled. However, if an interrupt is masked by the FEINTFMSK register, an interrupt processing is not executed.
Error status	Monitoring for the detection of ECC 2-bit errors and for the detection of ECC1-bit errors is available. A bit for clearing the error status is provided.
Address capture	Only one address at which an ECC error has occurred can be captured. A signal is generated upon detection of ECC 2-bit or 1-bit error , and the signal is used as a trigger to capture the error-causing address (when the first (1-bit or 2-bit) error is detected after the flag is cleared).

17.7.2 Interrupt Request

Table 17.47 lists the ECC interrupt request of CSIHn RAM.

Table 17.47 CSIHn ECC Interrupt Request (FE-Level Maskable Interrupt)

Unit interrupt signal	Description	Name	DMA Trigger Number
INTECCDCSIHn	CSIHn ECC Bit error interrupt	INTECCDCSIH0	—
		INTECCDCSIH1	
		INTECCDCSIH2	
		INTECCDCSIH3	

17.7.3 Register Base Address

Table 17.48 Register Base Addresses

Base Address Name	Base Address
<ECCCSIH0_base>	FFC7 0100_H
<ECCCSIH1_base>	FFC7 0200_H
<ECCCSIH2_base>	FFC7 0300_H
<ECCCSIH3_base>	FFC7 0400_H

17.7.4 List of Registers

ECC for the CSIHn RAM Registers are listed in the following table.

For details about <ECCCSIHn_base>, see **Section 17.7.3, Register Base Address**.

Table 17.49 List of Registers

Module Name	Register Name	Symbol	Address
ECCCSIHn	CSIHn ECC Control Register	ECCCSIHnCTL	<ECCCSIHn_base> + 00_H
	CSIHn ECC Test Mode Control Register	ECCCSIHnTMC	<ECCCSIHn_base> + 04_H
	CSIHn ECC Encode/Decode Input/Output Replacement Test Register	ECCCSIHnTED	<ECCCSIHn_base> + $0C_H$
	CSIHn ECC Redundant Bit Data Control Test Register	ECCCSIHnTRC	<ECCCSIHn_base> + 08_H
	CSIHn ECC Error Address Register 0	ECCCSIHnAD0	<ECCCSIHn_base> + 10_H
	CSIHn ECC Decode Syndrome Data Register	ECCCSIHnSYND	<ECCCSIHn_base> + $0B_H$
	CSIHn ECC 7-Bit Redundant Bit Data Hold Test Register	ECCCSIHnHORD	<ECCCSIHn_base> + $0A_H$
	CSIHn ECC Encode Test Register	ECCCSIHnECRD	<ECCCSIHn_base> + 09_H
	CSIHn ECC Redundant Bit Input/Output Replacement Register	ECCCSIHnERDB	<ECCCSIHn_base> + 08_H
SL_READTEST	ECCREAD Test Select Register	SELB_READTEST	FFC7 8000_H

17.7.5 ECCCSIHnCTL — CSIHn ECC Control Register

The ECCCSIHnCTL register controls the mode of the ECC and the status for CSIH.

Bits 7, 5, 4 and 3 should be set (written) while the CSIHn operation is stopped.

In addition, when writing to bit 7, EMCA1 and EMCA0 need to be 01_B.

Access: This register can be read or written in 16-bit units.

Address: <ECCCSIHn_base> + 00_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA1	EMCA0	—	—	ECCOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	—
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R	R

Note 1. These bits are always read as 0.

Table 17.50 ECCCSIHnCTL Register Contents (1/2)

Bit Position	Bit Name	Function
15	EMCA1	Access Control Bits 1 and 0 to ECC Mode Selection These bits specify whether updating the ECTHM bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 01_B, writing to bit 7 is enabled.
14	EMCA0	
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	ECCOVFF	By detecting an error while the error status is set and the new error has anotheraddress than the already latched (not cleared or reset is not issued), this bit is set and error notification is generated. 0: Overflow is not occurerred afterr reset of clealing ECER2F and ECER1F. 1: Error address register overflowed **Note:** This bit clear condition is as follows. (1) Reset (2) Writing ECER2C = 1 or ECER1C = 1 (3) Selecting through mode enable (ECTHM = 1)
10	ECER2C	2-Bit ECC Error Detection Flag Clear This bit clears 2-bit error detection flags of ECER2F (bit 2). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER2F bit is set to clear the ECER2F bit. When a conflict between this bit writing and ECER2F bit setting occurs, writing to this bit has a priority.
9	ECER1C	1-Bit ECC Error Detection Correction Accumulation Flag Clear This bit clears 1-bit error detection/correction flags of ECER1F (bit 1). This bit is always read as 0. Writing 0 is ignored. Write 1 to this bit while the ECER1F bit is set to clear the ECER1F bit. When a conflict between this bit writing and ECER1F bit setting occurs, writing to this bit has a priority.
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTHM	ECC Function through Mode Selection Set this bit to select whether to enable or disable the ECC function. Setting this bit to 1 disables the ECC function. When writing to this bit, write 01_B to the EMCA1 and EMCA0 bits at the same time. Set this bit to 1 to disable the ECC function. 0: Passing through mode is disabled (normal operation mode). 1: Passing through mode is enabled. (ECC function disable)

Table 17.50 ECCCSIHnCTL Register Contents (2/2)

Bit Position	Bit Name	Function
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	EC1ECP	1-Bit Error Correction Enable This bit specifies whether to enable or disable 1-bit error correction when the ECC error detection/correction is enabled. 0: When 1-bit error is detected, the error will be corrected. 1: When 1-bit error is detected, the error will not be corrected.
4	EC2EDIC	2-Bit Error Detection Interrupt Control This bit controls whether to generate an interrupt when 2-bit error is detected. 0: When 2-bit error is detected, an INTECCDCSIHn interrupt will not be generated. 1: When 2-bit error is detected, an INTECCDCSIHn interrupt will be generated.
3	EC1EDIC	1-Bit Error Detection Interrupt Control This bit controls whether to generate an interrupt when 1-bit error is detected. 0: When 1-bit error is detected, an INTECCDCSIHn interrupt will not be generated. 1: When 1-bit error is detected, an INTECCDCSIHn interrupt will be generated.
2	ECER2F	2-Bit Error Detection Flag This flag indicates whether 2-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). When 2-bit error interrupt is enabled (EC2EDIC = 1) and this flag is set, an ECC 2-bit error interrupt (INTECCDCSIHn) is output. Write 1 to the ECER2C bit (bit 10) to clear the flag. When through mode is enable (ECTHM = 1), this bit is cleared. If 2-bit error is detected again while this bit is set, an interrupt will not be generated. 0: 2-bit error has not occurred since this bit was cleared. 1: 2-bit error has occurred. This bit is read-only. Writing 0 or 1 does not change internal state.
1	ECER1F	1-Bit Error Detection/Correction Flag This flag indicates whether 1-bit error is detected during read access to the RAM when error determination is enabled (ECTHM = 0). Write 1 to the ECER1C bit (bit 9) to clear the flag. When through mode is enabled (ECTHM = 1), this bit is cleared. 0: 1-bit error has not occurred since this bit was cleared. 1: 1-bit error has occurred. This bit is read-only. Writing 0 or 1 does not change internal state.
0	ECEMF	ECC Error Message Flag This flag indicates whether an error exists in the current read data bus. This bit is updated whenever the RAM outputs data. This bit is also cleared when through mode is enabled (ECTHM = 1) and there is no 1-bit error in decode circuit input data. 0: The current RAM output data does not have bit errors. 1: The current RAM output data have bit errors.

CAUTION

Bits 2 and 1 should be cleared when the ECC error message flag (ECEMF) is not set.

17.7.6 ECCCSIHnTMC — CSIHn ECC Test Mode Control Register

The ECCCSIHnTMC register is used to switch to the test mode, and this register is for test mode control.

This register can be used when CSIHn is not accessed to RAM.

When writing to bit 7, ETMA1 and ETMA0 need to be 10_B.

Access: This register can be read or written in 16-bit units.

Address: <ECCCSIHn_base> + 04_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA1	ETMA0	—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. These bits are always read as 0.

Table 17.51 ECCCSIHnTMC Register Contents (1/2)

Bit Position	Bit Name	Function
15	ETMA1	Access Control Bits 1 and 0 to ECC Test Mode These two bits specify whether updating the ECTMCE bit (bit 7) is disabled or enabled. The value written to these bits is not retained. When these bits are read, the read value is always 0. When these bits are 10_B, writing to bits 7 is enabled.
14	ETMA0	
13 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ECTMCE	ECC Test Mode Enable This bit specifies whether to enable access to test control bits of the test registers and this register. When writing to this bit, write 10_B to the ETMA1 and ETMA0 bits at the same time. 0: Access to the test mode registers and bits is disabled. 1: Access to the test mode registers and bits is enabled. Test registers: ECCCSIHnTED, ECCCSIHnTRC, ECCCSIHnSYND, ECCCSIHnHORD, ECCCSIHnECRD, ECCCSIHnERDB Register test control bits: ECTRRS, ECREOS, ECENS, ECDCS, ECREIS
6, 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ECTRRS	ECC RAM Read Test Mode Selection This bit selects the targets for reading when the ECCCSIHnTED and ECCCSIHnERDB registers are read. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Read value of the ECCCSIHnTED register will be the write value of the ECCCSIHnTED register. Read value of the ECCCSIHnERDB register will be the write value of the ECCCSIHnERDB register. 1: Read value of the ECCCSIHnTED register can read RAM data. Read value of the ECCCSIHnERDB register will be the ECC Data to be written to RAM.
3	ECREOS	ECC Redundant Bit Output Data Selection This bit specifies which is output to the ECC to be stored in RAM, the ECC data generated for write data or the value of the ECCCSIHnERDB register. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated for write data is stored in RAM. 1: The value of ECCCSIHnERDB Register is stored in RAM.

Table 17.51 ECCCSIHnTMC Register Contents (2/2)

Bit Position	Bit Name	Function
2	ECENS	ECC Encoder Input Selection This bit specifies data written to RAM or the value of the ECCCSIHnTED register as the input to the ECC encoder. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: ECC data is generated from write data to RAM 1: ECC data is generated from register value of the ECCCSIHnTED.
1	ECDCS	ECC Decoder Input Selection This bit specifies which data is for generation of syndrome code and error detection, RAM data or the value of ECCCSIHnTED. Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Syndrome code generation and error detection are performed from RAM Data. 1: Syndrome code generation and error detection are performed from ECCCSIHnTED register value.
0	ECREIS	ECC Redundant Bit Input Data Selection This bit specifies which ECC data is for generation of syndrome code and error detection, ECC data stored in RAM or the value of the ECCCSIHnERDB . Writing to this bit is enabled only when ECTMCE = 1 (can be set simultaneously). This bit is cleared when ECTMCE = 0 (cleared synchronously). 0: Syndrome code generation and error detection are performed from ECC data stored in RAM. 1: Syndrome code generation and error detection are performed from ECCCSIHnERDB register value.

17.7.7 ECCCSIHnTED — CSIHn ECC Encode/Decode Input/Output Replacement Test Register

In ECC test mode, this register handles test data.

This register value is used to generate ECC data or syndrome code.

This register can be accessed when ECC test mode in enabled (ECCCSIHnTMC.ECTMCE = 1). When ECCCSIHnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when CSIHn is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: <ECCCSIHn_base> + $0C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEDB[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEDB[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.52 ECCCSIHnTED Register Contents

Bit Position	Bit Name	Function
31 to 0	ECEDB[31:0]	When ECCCSIHnTMC.ECENS = 1, these bits generate ECC data from value of this register and store the register value in RAM. When ECCCSIHnTMC.ECDCS = 1, these bits generate syndrome code from the value of the register and store the register value in ECC decode syndrome data register (ECCCSIHnSYND). In addition, when ECCCSIHnTMC.ECTRRS = 1, RAM data [31:0] instead of written data is read for the value of this register.

17.7.8 ECCCSIHnTRC — CSIHn ECC Redundant Bit Data Control Test Register

This register is a test register for ECC data in ECC test mode and consists of four 8-bit registers, ECCCSIHnSYND, ECCCSIHnHORD, ECCCSIHnECRD, and ECCCSIHnERDB.

This register can be accessed when ECC test mode is enabled (ECCCSIHnTMC.ECTMCE = 1). When ECCCSIHnTMC.ECTMCE = 0, writing to this register is ignored and 0000 0000_H is read.

This register can be used when CSIHn is not accessed to RAM.

Access: This register can be read or written in 32-bit units.

Address: <ECCCSIHn_base> + 08_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

17.7.9 ECCCSIHnAD0 — CSIHn ECC Error Address Register 0

This is read only register to hold the ECC error occurred address.

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as trigger and it is hold as the error occurring address.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <ECCCSIHn_base> + 10_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	ECEAD[30:16]														
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.53 ECCCSIHnAD0 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned.
30 to 0	ECEAD[30:0]	ECEAD0 is a read-only register to hold the address at which an ECC error has occurred. If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in ECEAD0 as the address at which the ECC error has occurred. The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the lat ter is stored. Only one address can be held in ECEAD0

17.7.10 ECCCSIHnSYND — CSIHn ECC Decode Syndrome Data Register

This register is a read-only register for storing generated syndrom data in ECC test mode.

Writing to this register is ignored.

This register is read-only when ECC test mode is enabled (ECCCSIHnTMC.ECTMCE = 1). When ECC test mode is disabled (ECCCSIHnTMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ECCCSIHn_base> + $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SYND6	SYND5	SYND4	SYND3	SYND2	SYND1	SYND0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 17.54 ECCCSIHnSYND Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	SYND[6:0]	These bits store generated syndrome code as needed.

17.7.11 ECCCSIHnHORD — CSIHn ECC 7-Bit Redundant Bit Data Hold Test Register

This register is for storing ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (ECCCSIHnTMC.ECTMCE = 1). When ECC test mode is disabled (ECCCSIHnTMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ECCCSIHn_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	HORD6	HORD5	HORD4	HORD3	HORD2	HORD1	HORD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 17.55 ECCCSIHnHORD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 0	HORD[6:0]	These bits store ECC code for read RAM data as needed. When ECCCSIHnTMC.ECTRRS =1 and if ECCCSIHnTED register is read, ECC code is stored.

17.7.12 ECCCSIHnECRD — CSIHn ECC Encode Test Register

This register is a read-only register for storing generated ECC data for read RAM data in ECC test mode.

Writing to this register is ignored.

This register can be accessed only when ECC test mode is enabled (ECCCSIHnTMC.ECTMCE = 1). When ECC test mode is disabled (ECCCSIHnTMC.ECTMCE = 0), 00_H is read.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <ECCCSIHn_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ECRD6	ECRD5	ECRD4	ECRD3	ECRD2	ECRD1	ECRD0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 17.56 ECCCSIHnECRD Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ECRD[6:0]	These bits can read ECC data generated at the time of RAM data writing and can read ECC data for data written in the ECCCSIHnTED register when ECCCSIHnTMC.ECENS =1.

17.7.13 ECCCSIHnERDB — CSIHn ECC Redundant Bit Input/Output Replacement Register

In ECC test mode, this register handles test data.

This register value can be handled as generated ECC data at the time of writing to RAM or as read ECC data at the time of reading RAM data.

This register can be accessed when ECC test mode in enabled (ECCCSIHnTMC.ECTMCE = 1). When ECCCSIHnTMC.ECTMCE = 0, writing to this register is ignored and 00_H is read.

Access: This register can be read or written in 8-bit units.

Address: <ECCCSIHn_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	ERDB6	ERDB5	ERDB4	ERDB3	ERDB2	ERDB1	ERDB0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.57 ECCCSIHnERDB Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 0	ERDB[6:0]	These bits can store this register value as ECC data when ECCCSIHnTMC.ECREOS = 1. When the register is read while ECCCSIHnTMC.ECREIS =1, the value read from these bits is ECC data read from the RAM. When ECCCSIHnTMC.ECTRRS = 1, ECC data to be stored in RAM will be read for this register value instated of written data.

17.7.14 SELB_READTEST — ECCREAD Test Select Register

SELB_READTEST is used to check read/write access to the CSIHn ECC registers and RS-CANn ECC registers.

Setting 1 to the bit corresponding to each function will enable writing to the read-only bit.

Access: This register can be read or written in 16-bit units.

Address: FFC7 8000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Section 18 LIN Master Interface (RLIN2)

This section contains a generic description of the LIN master interface (RLIN2).

The first part in this section describes the features specific to RH850/F1K, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RLIN2.

18.1 Features of RH850/F1K RLIN2

18.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN2 units and channels.

Table 18.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	1	2	3
Name	RLIN24n (n = 0)	RLIN24n (n = 0, 1)	RLIN24n (n = 0 to 2)

Table 18.2 Configurations of RLIN2 Units and Correspondence between the Number of Channels per Unit and the Channel Numbers of the Units

Unit Name RLIN24n	Channels per Unit	Unit Channel Number (i)	Channel Name RLIN2m	RH850/F1K 100 pins (3 ch)	RH850/F1K 144 pins (6 ch)	RH850/F1K 176 pins (10 ch)
RLIN240	4	0	RLIN20	√	√	√
		1	RLIN21	√	√	√
		2	RLIN22	√	√	√
		3	RLIN23		√	√
RLIN241	4	0	RLIN24		√	√
		1	RLIN25		√	√
		2	RLIN26			√
		3	RLIN27			√
RLIN242	2	0	RLIN28			√
		1	RLIN29			√

Table 18.3 Indices

Index	Description
n	Throughout this section, the individual RLIN2 units are identified by the index “n” (n = 0 to 2).
m	Throughout this section, the individual channels are identified by the index “m” (m = 0 to 9).
i	Throughout this section, the individual channels of units that compose RLIN2 are identified by the index “i” (i = 0 to 3).
b	Throughout this section, the individual data buffers implemented in RLIN2 are identified by the index “b” (b = 1 to 8).

For example, RLN24nGLWBR are the LIN wake-up baud rate select registers, which are the global registers of RLIN2. RLN24nmLiMD are the LIN mode registers, which are the channel registers.

The following lists the indices corresponding to each product.

Table 18.4 Indices Correspondence of Each Product

Indices Correspondence of Each Product		
100 pins	**144 pins**	**176 pins**
i = 0 to 2 (RLIN240)	i = 0 to 3 (RLIN240) i = 0, 1 (RLIN241)	i = 0 to 3 (RLIN240, 1) i = 0,1 (RLIN242)
b = 1 to 8	b = 1 to 8	b = 1 to 8

18.1.2 Register Base Addresses

RLIN2 base addresses are listed in the following table.

RLIN2 register addresses are given as offsets from the base addresses.

Table 18.5 Register Base Addresses

Base Address Name	Base Address
<RLIN240_base>	FFCE 0000$_H$
<RLIN241_base>	FFCE 0080$_H$
<RLIN242_base>	FFCE 0100$_H$

18.1.3 Clock Supply

The RLIN2 clock supply is shown in the following table.

Table 18.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
RLIN24n	LIN communication clock sources	CKSCLK_ILIN	Communication clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_ILIN	

18.1.4 Interrupt Request

RLIN2 interrupt requests are listed in the following table.

Table 18.7 Interrupt Requests (1/2)

Unit Interrupt Signal	Description	Interrupt Number
RLIN240		
INTRLIN0	RLIN20 interrupt	58
INTRLIN1	RLIN21 interrupt	59
INTRLIN2	RLIN22 interrupt	162
INTRLIN3	RLIN23 interrupt	163

Table 18.7 Interrupt Requests (2/2)

Unit Interrupt Signal	Description	Interrupt Number
RLIN241		
INTRLIN4	RLIN24 interrupt	226
INTRLIN5	RLIN25 interrupt	227
INTRLIN6	RLIN26 interrupt	275
INTRLIN7	RLIN27 interrupt	276
RLIN242		
INTRLIN8	RLIN28 interrupt	285
INTRLIN9	RLIN29 interrupt	286

18.1.5 Reset Sources

RLIN2 reset sources are listed in the following table. RLIN2 is initialized by these reset sources.

Table 18.8 Reset Sources

Unit Name	Reset Source
RLIN24n	All reset sources (ISORES)

18.1.6 External Input/Output Signals

External input/output signals of RLIN2 are listed in the following table.

Table 18.9 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN240		
RLIN2mRX (m = 0 to 3)	RLIN240 receive data input	RLIN2mRX (m = 0 to 3)
RLIN2mTX (m = 0 to 3)	RLIN240 transmit data output	RLIN2mTX (m = 0 to 3)
RLIN241		
RLIN2mRX (m = 4 to 7)	RLIN241 receive data input	RLIN2mRX (m = 4 to 7)
RLIN2mTX (m = 4 to 7)	RLIN241 transmit data output	RLIN2mTX (m = 4 to 7)
RLIN242		
RLIN2mRX (m = 8, 9)	RLIN242 receive data input	RLIN2mRX (m = 8, 9)
RLIN2mTX (m = 8, 9)	RLIN242 transmit data output	RLIN2mTX (m = 8, 9)

18.2 Overview

18.2.1 Functional Overview

The LIN Master Interface is a hardware LIN communication controller that complies with LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602 (SEP 2005), and automatically performs frame communication and error determination.

Table 18.10 shows the LIN Master Interface specifications.

Table 18.10 LIN Master Interface Specifications

Item		Specifications
Channel count		10 channels (In this product, 2-channel version and 4-channel version of RLIN2 is included.)
LIN communication function	Protocol	LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602 (SEP 2005)
	Variable frame structure	• Transmission break width: 13 to 28 Tbits • Transmission break delimiter width: 1 to 4 Tbits • Inter-byte space (header): 0 to 7 Tbits (space between Sync field and ID field)*1 • Response space: 0 to 7 Tbits*1 • Inter-byte space: 0 to 3 Tbits (space between data bytes in response area) • Transmit wake-up: 1 to 16 Tbits
	Checksum	• Automatic operation for both transmission and reception • Classic or enhanced selectable (for each frame)
	Response field data byte count	Variable from 0 to 8 bytes
	Frame communication modes	• Mode in which header transmission and response transmission/reception are started with a single transmission start request • Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode)
	Wake-up transmission and reception	Available in LIN wake-up mode • Wake-up transmission (1 to 16 Tbits) • Wake-up reception Low-level width of input signals measured
	Status	• Successful frame/wake-up transmission • Successful header transmission • Successful frame/wake-up reception*2 • Successful data 1 reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)
	Error status	• Bit error • Checksum error • Frame timeout error • Physical bus error • Framing error
	Baud rate selection	Baud rate conforming to the LIN specifications generated using baud rate generator
	Test mode	Self-test mode for user evaluation
	Interrupt function	• Successful frame/wake-up transmission • Successful frame/wake-up reception*2 • Error detection The logical OR of these three events is the interrupt source (INTRLINm) for each channel.

Note 1. Since the same register is used for configuration, the inter-byte space (header) = response space.
Note 2. For wake-up reception, the input signal low-level width count is indicated.

18.2.2 Block Diagram

Figure 18.1 shows a block diagram of the LIN master interface.

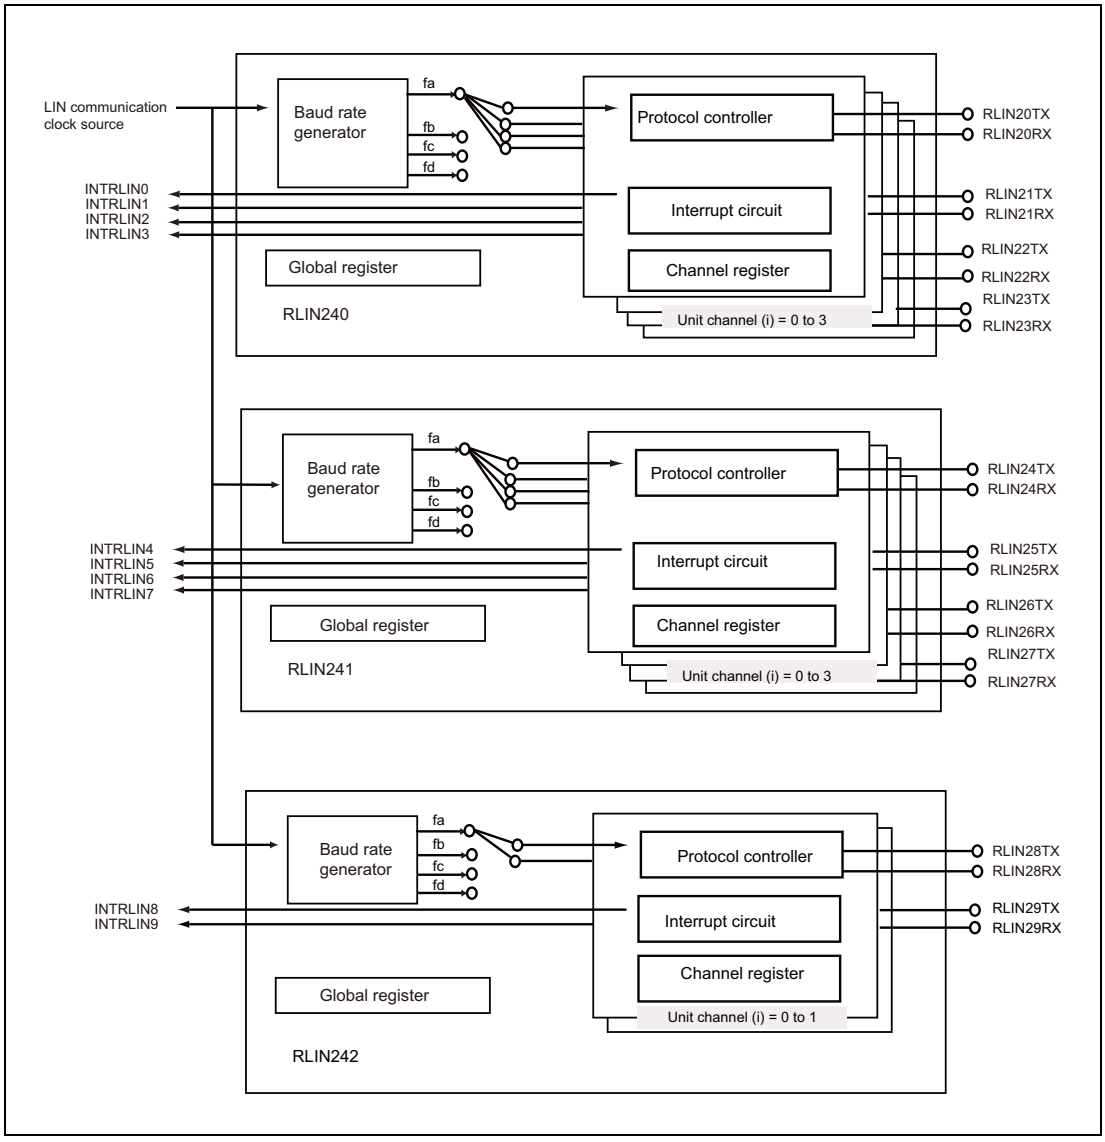

Figure 18.1 LIN Master Interface Block Diagram (176 Pins, RLIN2 10 Channels Embedded)

18.3 Registers

The registers of the LIN master interface include global registers and channel registers. As the global registers are allocated for each unit, they can be individually set for each unit. As the channel registers are allocated for each channel, they can individually control each channel.

18.3.1 List of Registers

RLIN2 registers are listed in the following table.

For details about <RLIN24n_base>, see **Section 18.1.2, Register Base Addresses**.

Table 18.11 Registers

Module	Register	Symbol	Address
Global registers			
RLN24n	LIN wake-up baud rate select register	RLN24nGLWBR	<RLIN24n_base> + 01_H
	LIN baud rate prescaler 0 register	RLN24nGLBRP0	<RLIN24n_base> + 02_H
	LIN baud rate prescaler 1 register	RLN24nGLBRP1	<RLIN24n_base> + 03_H
	LIN self test control register	RLN24nGLSTC	<RLIN24n_base> + 04_H
Channel registers			
RLN24nm	LIN mode register	RLN24nmLiMD	<RLIN24n_base> + 08_H + i × 20_H
	LIN break field configuration register	RLN24nmLiBFC	<RLIN24n_base> + 09_H + i × 20_H
	LIN space configuration register	RLN24nmLiSC	<RLIN24n_base> + $0A_H$ + i × 20_H
	LIN wake-up configuration register	RLN24nmLiWUP	<RLIN24n_base> + $0B_H$ + i × 20_H
	LIN interrupt enable register	RLN24nmLiIE	<RLIN24n_base> + $0C_H$ + i × 20_H
	LIN error detection enable register	RLN24nmLiEDE	<RLIN24n_base> + $0D_H$ + i × 20_H
	LIN control register	RLN24nmLiCUC	<RLIN24n_base> + $0E_H$ + i × 20_H
	LIN transmission control register	RLN24nmLiTRC	<RLIN24n_base> + 10_H + i × 20_H
	LIN mode status register	RLN24nmLiMST	<RLIN24n_base> + 11_H + i × 20_H
	LIN status register	RLN24nmLiST	<RLIN24n_base> + 12_H + i × 20_H
	LIN error status register	RLN24nmLiEST	<RLIN24n_base> + 13_H + i × 20_H
	LIN data field configuration register	RLN24nmLiDFC	<RLIN24n_base> + 14_H + i × 20_H
	LIN ID buffer register	RLN24nmLiIDB	<RLIN24n_base> + 15_H + i × 20_H
	LIN check sum buffer register	RLN24nmLiCBR	<RLIN24n_base> + 16_H + i × 20_H
	LIN data buffer 1 register	RLN24nmLiDBR1	<RLIN24n_base> + 18_H + i × 20_H
	LIN data buffer 2 register	RLN24nmLiDBR2	<RLIN24n_base> + 19_H + i × 20_H
	LIN data buffer 3 register	RLN24nmLiDBR3	<RLIN24n_base> + $1A_H$ + i × 20_H
	LIN data buffer 4 register	RLN24nmLiDBR4	<RLIN24n_base> + $1B_H$ + i × 20_H
	LIN data buffer 5 register	RLN24nmLiDBR5	<RLIN24n_base> + $1C_H$ + i × 20_H
	LIN data buffer 6 register	RLN24nmLiDBR6	<RLIN24n_base> + $1D_H$ + i × 20_H
	LIN data buffer 7 register	RLN24nmLiDBR7	<RLIN24n_base> + $1E_H$ + i × 20_H
	LIN data buffer 8 register	RLN24nmLiDBR8	<RLIN24n_base> + $1F_H$ + i × 20_H

Note: When writing to a register not used, write the value after reset.

18.3.2 Global Registers

18.3.2.1 RLN24nGLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nGLWBR: <RLIN24n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LWBR0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 18.12 RLN24nGLWBR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified by the LCKS bit setting in the RLN24nmLiMD registers is used (when LIN 1.3 is used). 1: In LIN wake-up mode, the clock fa is used regardless of the setting of the LCKS bit in the RLN24nmLiMD registers (when LIN 2.X is used).

Set the RLN24nGLWBR register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

LWBR0 Bit (Wake-Up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN24nGLWBR register to 0. This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.
When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. With this setting, fa is selected as the LIN system clock (f_{LIN}) during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register (the LCKS bit is not changed) and the 2.5-Tbit or longer low-level width of the input signal can be measured.
Setting the baud rate to 19200 bps while fa is selected allows the 130 µs or longer low-level width of the input signal to be detected during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register.

18.3.2.2 RLN24nGLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nGLBRP0: <RLIN24n_base> + 02_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.13 RLN24nGLBRP0 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the LIN communication clock source by N+1. Setting range: 00_H to FF_H

Set the RLN24nGLBRP0 register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

The value set in this register is used to control the frequency of baud rate clock source fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the LIN communication clock source by N+1.

18.3.2.3 RLN24nGLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nGLBRP1: <RLIN24n_base> + 03_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.14 RLN24nGLBRP1 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the LIN communication clock source by M+1. Setting range: 00_H to FF_H

Set the RLN24nGLBRP1 register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the LIN communication clock source by M+1.

18.3.2.4 RLN24nGLSTC — LIN Self-Test Control Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nGLSTC: <RLIN24n_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.15 RLN24nGLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	—	Writing $A7_H$, 58_H, and 01_H successively to the RLN24nGLSTC register places the module in LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN24nGLSTC register cancels protection of LIN self-test mode.

Set the RLN24nGLSTC register when all channels in the same unit are in LIN reset mode (the OMM0 bit in the RLN24nmLiMST register is 0).

Writing $A7_H$, 58_H, and 01_H successively to the RLN24nGLSTC register places the module into LIN self-test mode.

When successive writing is completed and the module is placed in LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For details about transitioning to LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.

When read, bits 6 to 1 return "000000_B", and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For details about exiting LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN24nGLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

18.3.3 Channel Registers

18.3.3.1 RLN24nmLiMD — LIN Mode Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiMD: <RLIN24n_base> + 08_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	LCKS[1:0]		—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R

Table 18.16 RLN24nmLiMD Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Set the RLN24nmLiMD register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.
With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).
With 01_B set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).
With 10_B set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).
With 11_B set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

When the LWBR0 bit in the RLN24nGLWBR is 1 (when LIN 2.x is used) and the RLN24nmLiMST register is 01_H (LIN wake-up mode), regardless of the setting of the LCKS bit, fa is input to the protocol controller (LCKS bit is not changed).

18.3.3.2 RLN24nmLiBFC — LIN Break Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiBFC: <RLIN24n_base> + 09_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.17 RLN24nmLiBFC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	BDT[1:0]	Transmission Break Delimiter (High Level) Width Select b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmission Break (Low Level) Width Select b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN24nmLiBFC register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header.
1 Tbit to 4 Tbits can be specified.

BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header.
13 Tbits to 28 Tbits can be specified.

18.3.3.3 RLN24nmLiSC — LIN Space Configuration Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiSC: <RLIN24n_base> + $0A_H$ + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 18.18 RLN24nmLiSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN24nmLiSC register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.
0 Tbit to 3 Tbits can be specified.
These bits are enabled only during response transmission; they are disabled during response reception.

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.
0 Tbit to 7 Tbits can be specified.
The response space setting is enabled only during response transmission; the setting is disabled during response reception.
The inter-byte space (header) value is equal to the response space value.

18.3.3.4 RLN24nmLiWUP — LIN Wake-Up Configuration Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiWUP: <RLIN24n_base> + $0B_H$ + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 18.19 RLN24nmLiWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low Level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Set the RLN24nmLiWUP register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

WUTL[3:0] Bits (Wake-Up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.
1 Tbit to 16 Tbits can be specified.
When the LWBR0 bit in the RLN24nGLWBR is 1 (when LIN 2.x is used), regardless of the setting of the LCKS bit in the RLN24nmLiMD register, fa is selected as the LIN system clock (f_{LIN}) (LCKS bit is not changed).

18.3.3.5 RLN24nmLiIE — LIN Interrupt Enable Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiIE: <RLIN24n_base> + $0C_H$ + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 18.20 RLN24nmLiIE Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Request Enable 0: Disables successful frame/wake-up reception interrupt request. 1: Enables successful frame/wake-up reception interrupt request.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Request Enable 0: Disables successful frame/wake-up transmission interrupt request. 1: Enables successful frame/wake-up transmission interrupt request.

Set the RLN24nmLiIE register while the OMM0 bit in the RLN24nmLiMST register is 0 (LIN reset mode).

ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables interrupt request upon detection of an error.
With 0 set, the interrupt request is not generated when the ERR flag in the RLN24nmLiST register is set to 1.
With 1 set, the interrupt request is generated when the ERR flag in the RLN24nmLiST register is set to 1.
Errors that constitute interrupt sources are bit errors, physical bus errors, frame timeout errors, framing errors, and checksum errors.
Detection of a bit error, physical bus error, frame timeout error, and framing error can be enabled or disabled using the RLN24nmLiEDE register.

FRCIE Bit (Successful Frame/Wake-Up Reception Interrupt Request Enable)

The FRCIE bit enables or disables interrupt request upon successful reception of a frame or a wake-up signal (counting of low level width of the input signal).
With 0 set, the interrupt request is not generated when the FRC flag in the RLN24nmLiST register is set to 1.
With 1 set, the interrupt request is generated when the FRC flag in the RLN24nmLiST register is set to 1.

FTCIE Bit (Successful Frame/Wake-Up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables interrupt request upon successful transmission of a frame or a wake-up signal.
With 0 set, the interrupt request is not generated when the FTC flag in the RLN24nmLiST register is set to 1.
With 1 set, the interrupt request is generated when the FTC flag in the RLN24nmLiST register is set to 1.

18.3.3.6 RLN24nmLiEDE — LIN Error Detection Enable Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiEDE: <RLIN24n_base> + $0D_H$ + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FERE	FTERE	PBERE	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 18.21 RLN24nmLiEDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Frame Timeout Error Detection Enable 0: Disables frame timeout error detection. 1: Enables frame timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN24nmLiEDE register while the OMM0 bit in the RLN24nmLiMST register is 0_B (LIN reset mode).

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is indicated in the FER flag in the RLN24nmLiEST register.
For details on the framing error, see **Section 18.14, Error Status**.

FTERE Bit (Frame Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error.
With 0 set, the frame timeout error is not detected.
With 1 set, the frame timeout error is detected.
When this bit is set to 1, the detection result is indicated in the FTER flag in the RLN24nmLiEST register.
For details on the frame timeout error, see **Section 18.14, Error Status**.

PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.
With 0 set, the physical bus error is not detected.
With 1 set, the physical bus error is detected.
When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN24nmLiEST register.
For details on the physical bus error, see **Section 18.14, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is indicated in the BER flag in the RLN24nmLiEST register.
For details on the bit error, see **Section 18.14, Error Status**.

18.3.3.7 RLN24nmLiCUC — LIN Control Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiCUC: <RLIN24n_base> + $0E_H$ + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.22 RLN24nmLiCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode. 1: LIN operation mode.
0	OM0	LIN Reset 0: Transition to LIN reset mode. 1: Exit LIN reset mode.

Set the RLN24nmLiCUC register to 01_H to transition to LIN wake-up mode or to 03_H to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN24nmLiCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN24nmLiMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the operating mode (LIN wake-up mode or LIN operation mode) that is entered after exiting LIN reset mode.
Setting this bit to 0 selects LIN wake-up mode.
Setting this bit to 1 selects LIN operation mode.
This bit is enabled only when the OMM0 bit in the RLN24nmLiMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN24nmLiTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects whether to transition to or exit LIN reset mode.
Setting this bit to 0 causes RLIN2 to enter LIN reset mode.
Setting this bit to 1 causes RLIN2 to exit LIN reset mode.

18.3.3.8 RLN24nmLiTRC — LIN Transmission Control Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiTRC: <RLIN24n_base> + 10_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.23 RLN24nmLiTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RTS	Response Transmission Start 0: Response transmission is stopped in frame separate mode. 1: Response transmission is started in frame separate mode.
0	FTS	Frame Transmission/Wake-up Transmission/Reception Start 0: Frame Transmission/wake-up transmission/reception is stopped. 1: Frame Transmission/wake-up transmission/reception is started.

RTS Bit (Response Transmission Start)

Set the RTS bit (response transmit start bit) to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame transmission and transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write 02_H to the RLN24nmLiTRC register using the store instruction.
Writing a value to this bit is disabled when the OMM0 bit is 0 (LIN reset mode). When the OMM1 bit is 0 (LIN wake-up mode), do not write 1.
Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is stopped).

FTS Bit (Frame Transmission/Wake-Up Transmission/Reception Start)

Set the FTS bit to 1 to start frame/wake-up transmission.
Also set this bit to 1 to allow wake-up reception (counting of the low level width of the input signal).
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit is 0 (LIN reset mode).
This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

18.3.3.9 RLN24nmLiMST — LIN Mode Status Register

Access: This register is a read-only register that can be read in 8-bit units.

Address: RLN24nmLiMST: <RLIN24n_base> + 11_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 18.24 RLN24nmLiMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.
When the OMM0 bit is 0_B (LIN reset mode), the value of this bit is disabled.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

18.3.3.10 RLN24nmLiST — LIN Status Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiST: <RLIN24n_base> + 12_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 18.25 RLN24nmLiST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN24nmLiST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

Writing to this register is prohibited while the FTS bit in the RLN24nmLiTRC register is 1 (frame transmission or wake-up transmission/reception is started)

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value from before 1 was written.
"1" is set upon completion of header transmission, but an interrupt request is not generated.
To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value from before 1 is written.
"1" is set upon completion of Data 1 reception, but an interrupt request is not generated.
To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when the value of any of the flags of the RLN24nmLiEST registers is 1). Here, an interrupt request is generated if the ERRIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN24nmLiEST register while in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC Flag (Successful Frame/Wake-Up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value from before 1 is written.
The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request is generated if the FRCIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled).
To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

FTC Flag (Successful Frame/Wake-Up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value from before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request is generated if the FTCIE bit in the RLN24nmLiIE register is 1 (interrupt is enabled).
To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

18.3.3.11 RLN24nmLiEST — LIN Error Status Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiEST: <RLIN24n_base> + 13_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	CSER	—	FER	FTER	PBER	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 18.26 RLN24nmLiEST Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Frame Timeout Error Flag 0: Frame timeout error has not been detected. 1: Frame timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN24nmLiEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN24nmLiTRC register is 1 (frame transmission or wake-up transmission/ reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value from before 1 is written.
The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value from before 1 is written.
The FER flag is set to 1 upon framing error detection when the FERE bit of the RLN24nmLiEST register is 1 (framing error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

FTER Flag (Frame Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value from before 1 is written.
The FTER flag is set to 1 upon frame timeout error detection when the FTERE bit of the RLN24nmLiEDE register is 1 (frame timeout error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode.

PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value from before 1 is written.
The PBER flag is set to 1 upon physical bus error detection when the PBERE bit of the RLN24nmLiEDE register is 1 (physical bus error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value from before 1 is written.
The BER flag is set to 1 upon bit error detection when the BERE bit of the RLN24nmLiEDE register is 1 (bit error detection enabled). To clear the bit to 0 before the next communication is started (when the value of the FTS bit of the RLN24nmLiTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

18.3.3.12 RLN24nmLiDFC — LIN Data Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiDFC: <RLIN24n_base> + 14_H + i × 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	FSM	CSM	RFT	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.27 RLN24nmLiDFC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 bytes + checksum 0 0 0 1: 1 byte + checksum 0 0 1 0: 2 bytes + checksum : 0 1 1 1: 7 bytes + checksum 1 0 0 0: 8 bytes + checksum Settings other than the above are prohibited.

Set the RLN24nmLiDFC register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

FSM Bit (Frame Separate Mode Select)

The FSM bit sets the response transmission mode.

With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN24nmLiTRC register is 1), response is transmitted/received without the RTS bit in the RLN24nmLiTRC register being set.
With 1 set, frame separate mode is selected. When the RTS bit of the RLN24nmLiTRC register is set to 1 during header transmission, response transmission is executed after header transmission has ended.
For response reception (the RFT bit is 0), set the FSM bit to 0.
When transitioning to LIN self-test mode, set this bit to 0 before transition.
For details on frame separate mode, see **Section 18.11.1, Transmission of LIN Frames**.

CSM Bit (Checksum Select)

The CSM bit sets checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When frame timeout error detection is enabled (the FTERE bit in the RLN24nmLiEDE register is 1), the timeout time depends on the setting of this bit. For details, see **Section 18.14, Error Status**.

RFT Bit (Response Field Communication Direction Select)

The RFT bit sets the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low level width of the input signal is counted).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.

18.3.3.13 RLN24nmLiIDB — LIN ID Buffer Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiIDB: <RLIN24n_base> + 15_H + i × 20_H

Value after reset: Undefined

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.28 RLN24nmLiIDB Register Contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bit (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bit (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN24nmLiIDB register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted prior to communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 sets P0 and IDP1 sets P1.
Since parity is not automatically calculated, set the calculation value. Note that even if the specified calculation result is incorrect, it is transmitted as is.

ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

18.3.3.14 RLN24nmLiCBR — LIN Checksum Buffer Register

Access: This register is a read-only register that can be read in 8-bit units. In LIN self-test mode, this register can be read or written in 8-bit units.

Address: RLN24nmLiCBR: <RLIN24n_base> + 16_H + i × 20_H

Value after reset: Undefined

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.29 RLN24nmLiCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

while in LIN operation mode, this register operates as follows:

- When the RFT bit in the RLN24nmLiDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN24nmLiDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN24nmLiDFC register is 1 (transmission):
  After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.
  Writing to this register is invalid.
- When the RFT bit in the RLN24nmLiDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.

Set the RLN24nmLiCBR register when the FTS bit in the RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

18.3.3.15 RLN24nmLiDBRb — LIN Data Buffer b Register

Access: This register can be read or written in 8-bit units.

Address: RLN24nmLiDBR1: <RLIN24n_base> + 18_H + i × 20_H
RLN24nmLiDBR2: <RLIN24n_base> + 19_H + i × 20_H
RLN24nmLiDBR3: <RLIN24n_base> + $1A_H$ + i × 20_H
RLN24nmLiDBR4: <RLIN24n_base> + $1B_H$ + i × 20_H
RLN24nmLiDBR5: <RLIN24n_base> + $1C_H$ + i × 20_H
RLN24nmLiDBR6: <RLIN24n_base> + $1D_H$ + i × 20_H
RLN24nmLiDBR7: <RLIN24n_base> + $1E_H$ + i × 20_H
RLN24nmLiDBR8: <RLIN24n_base> + $1F_H$ + i × 20_H

Value after reset: Undefined

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.30 RLN24nmLiDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or allows the received data to be read. Setting range: 00_H to FF_H

- For response transmission:

  The LiDBRb registers specify the data to be transmitted in the response field.
  Configure these registers when:

  – The RFT bit in RLN24nmLiDFC register is 1 (transmission).
  – The FSM bit in RLN24nmLiDFC register is 0 (not frame separate mode).
  – The FTS bit in RLN24nmLiTRC register is 0 (frame transmission or wake-up transmission/ reception is stopped).

  or

  – The RFT bit in RLN24nmLiDFC register is 1 (transmission).
  – The FSM bit in RLN24nmLiDFC register is 1 (frame separate mode).
  – The RTS bit in RLN24nmLiTRC register is 0 (response transmission is stopped).

- For response reception:

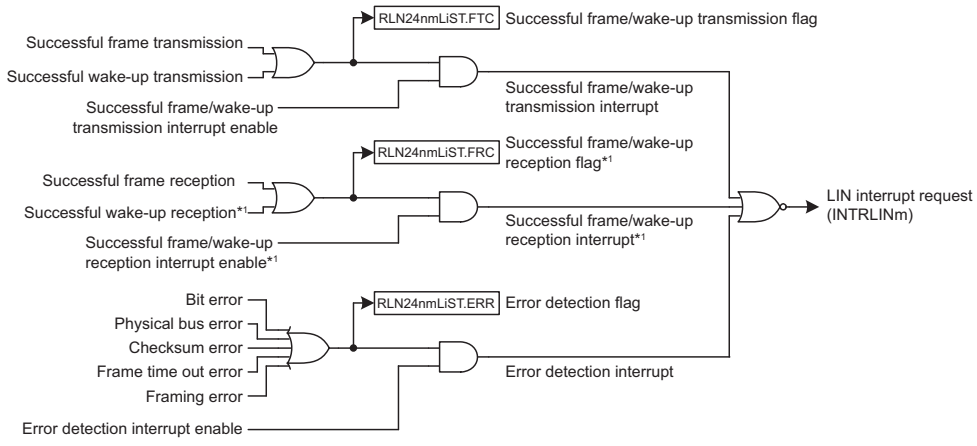
  The LiDBRb registers hold the data received in the response field.
  The received data is overwritten. If an error is detected, the data prior to reception interruption is stored in the register.
  Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/ reception is started)

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted prior to communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.

18.4 Interrupt Sources



The LIN interrupts are interrupt requests generated by the LIN master interface.

There are three interrupt sources for each channel; successful frame/wake-up transmission, successful frame/wakeup reception, and error detection.

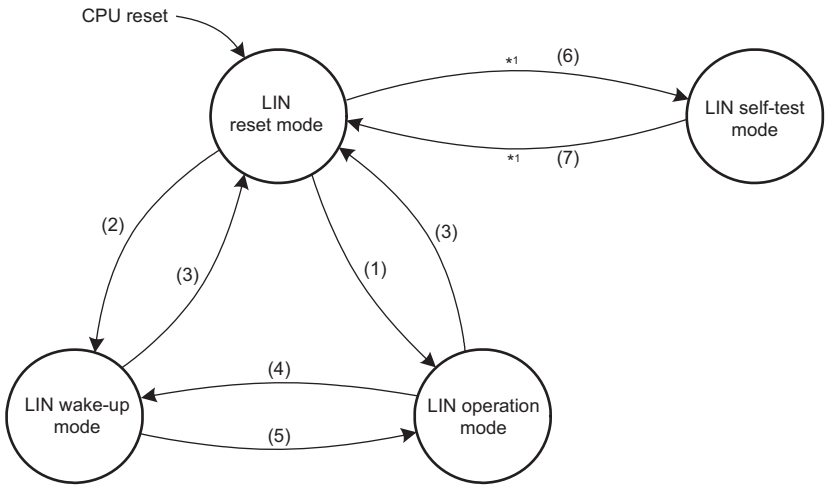
Interrupt requests from these three sources are ORed to generate one interrupt request “LIN interrupt”.

The respective interrupt request is output when the corresponding flag in the RLN24nmLiST register is set to 1 while the corresponding bit in the RLN24nmLiIE register is 1 (interrupt enabled). However, if an interrupt is requested when the corresponding flag in the RLN24nmLiST register has been set to 1, it is ignored. Therefore, clear the corresponding flag to 0 to enable the interrupt again.

Figure 18.2 shows a block diagram of the LIN interrupt.

Note 1. The wake-up receive signal indicates the input signal low level width count.

Figure 18.2 LIN Interrupt Block Diagram



18.5 Modes

The LIN master interface provides the following four modes:

- LIN reset mode
- LIN operation mode
- LIN wake-up mode
- LIN self-test mode

The mode transitions except LIN self-test mode is controlled independently for respective channels.

Figure 18.3 shows mode transitions. **Table 18.31** describes mode transition conditions. **Table 18.32** lists operations available in each mode.

Note 1. See **Section 18.15, LIN Self-Test Mode** for the details.

Figure 18.3 Mode Transitions

Table 18.31 Transition Condition of Each Mode

	Mode Transition			Transition Condition
(1)	LIN reset mode	→	LIN operation mode	RLN24nmLiCUC.OM1,OM0 = 11_B
(2)	LIN reset mode	→	LIN wake-up mode	RLN24nmLiCUC.OM1,OM0 = 01_B
(3)	LIN wake-up mode LIN operation mode	→	LIN reset mode	RLN24nmLiCUC.OM0 = 0_B
(4)	LIN operation mode	→	LIN wake-up mode	RLN24nmLiCUC.OM1,OM0 = 01_B
(5)	LIN wake-up mode	→	LIN operation mode	RLN24nmLiCUC.OM1,OM0 = 11_B
(6)	LIN reset mode	→	LIN self-test mode	See **Section 18.15, LIN Self-Test Mode**.
(7)	LIN self-test mode	→	LIN reset mode	See **Section 18.15, LIN Self-Test Mode**.

Table 18.32 Operations Available in Each Mode

LIN Operation Mode	LIN Wake-Up Mode	LIN Self-Test Mode
Header transmission Response transmission Response reception Error detection	Wake-up transmission Wake-up reception Error detection	self-test

Whether a transition has been made to LIN reset mode, LIN operation mode, or LIN wake-up mode can be verified by reading the OMM1 and OMM0 bits in the RLN24nmLiMST register.

For a description of LIN self-test mode, see **Section 18.15, LIN Self-Test Mode**.

18.6 LIN Reset Mode

Setting the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The transition to LIN reset mode can be verified by determining that the OMM0 bit in the RLN24nmLiMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication stops.

From LIN reset mode, transitions to LIN operation mode, LIN wake-up mode, and LIN self-test mode can be made.

When the mode transitions to LIN reset mode, the following registers are initialized to their reset values and retain their initial values while in LIN reset mode:

- RLN24nmLiTRC register
- RLN24nmLiST register
- RLN24nmLiEST register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN24nGLWBR register
- RLN24nGLBRP0 register
- RLN24nGLBRP1 register
- RLN24nmLiMD register
- RLN24nmLiBFC register
- RLN24nmLiSC register
- RLN24nmLiWUP register
- RLN24nmLiIE register
- RLN24nmLiEDE register
- RLN24nmLiDFC register
- RLN24nmLiIDB register
- RLN24nmLiCBR register
- RLN24nmLiDBRb register

18.7 LIN Operation Mode

While in LIN operation mode, frame processing (header transmission, response transmission, response reception, and error detection) is performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN24nmLiCUC register to 11_B changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN24nmLiMST register to 11_B. Communication settings should be performed after the RLN24nmLiMST register has become 11_B.

18.8 LIN Wake-Up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) is performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN24nmLiCUC register to 01_B changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN24nmLiMST register to 01_B. Communication settings should be performed after the RLN24nmLiMST register has become 01_B.

18.9 Header Transmission/Response Transmission/Response Reception

18.9.1 Header Transmission

Figure 18.4 shows the operation of the LIN master interface in header transmission. **Table 18.33** shows processing in header transmission.

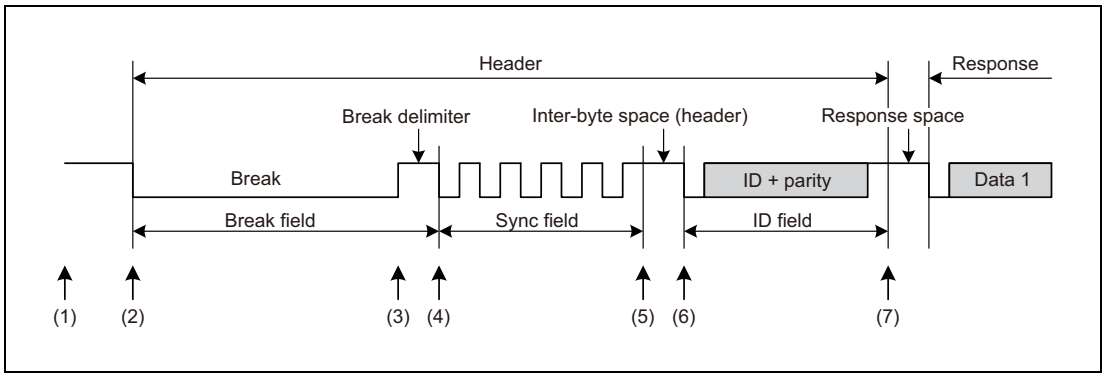


Figure 18.4 Operation in Header Transmission

Table 18.33 Processing in Header Transmission

	Software Processing	LIN Master Interface Processing
(1)	• Sets a baud rate • Enables interrupts • Enables error detection • Sets frame configuration parameters • Transitions to LIN operation mode • Sets information on the frame to be transmitted (ID, parity, data length, response direction, checksum method, and transmission data)	Waits for the FTS bit in the RLN24nmLiTRC register to be set by software (idle).
(2)	Sets the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3)	Waits for an interrupt request	Transmits a break delimiter.
(4)		Transmits a sync field (55_H).
(5)		Transmits an inter-byte space (header).
(6)		Transmits an ID field.
(7)		Sets the successful header transmission flag.

NOTE

For information about error detection, see **Section 18.14, Error Status**.

18.9.2 Response Transmission

Figure 18.5 shows the operation of the LIN master interface in response transmission. **Table 18.34** shows the processing in response transmission.

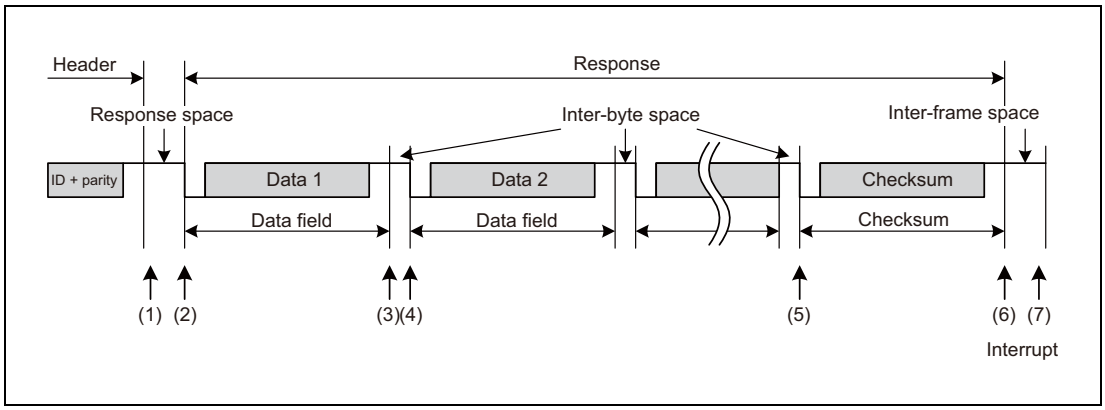

Figure 18.5 Operation in Response Transmission

Table 18.34 Processing in Response Transmission

	Software Processing	LIN Master Interface Processing
(1)	(When in frame separate mode) • Sets the RTS bit in the RLN24nmLiTRC register to 1 (response transmission started) (When not in frame separate mode) • Waits for an interrupt request	(When in frame separate mode) • Waits for the RTS bit in the RLN24nmLiTRC register to be set to 1 by software. (During this time, “1” is output.) • When the bit is set to 1, sends a response space. (When not in frame separate mode) • Sends a response space.
(2)	Waits for an interrupt request	Transmits data 1.
(3)		Transmits an inter-byte space.
(4)		• Transmits data 2. • Transmits an inter-byte space • Transmits data 3. • Transmits an inter-byte space (Repeats the transmission of data and inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN24nmLiDFC register.) : :
(5)		Transmits the checksum.
(6)		• Sets the successful frame/wake-up transmission flag. • Sets the FTS bit in the RLN24nmLiTRC register to 0 (frame transmission or wake-up transmission/reception stopped) (When in frame separate mode) • Sets the RTS bit in the RLN24nmLiTRC register to 0 (response transmission stopped).
(7)	• Processing after communication Checks the RLN24nmLiST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 18.14, Error Status**.

18.9.3 Response Reception

Figure 18.6 shows the operation of the LIN master interface in response reception. **Table 18.35** shows the processing in response reception.

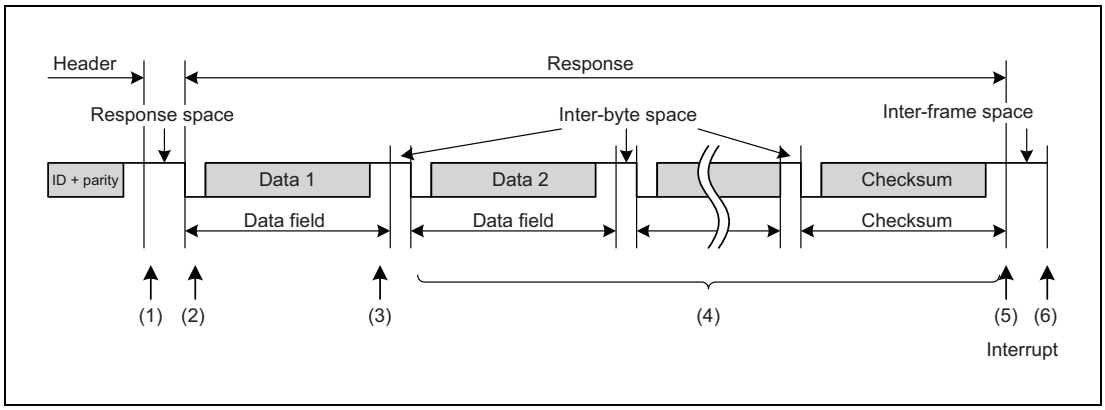

Figure 18.6 Operation in Response Reception

Table 18.35 Processing in Response Reception

	Software Processing	LIN Master Interface Processing
(1)	Waits for an interrupt request (no processing).	Waits for detection of a start bit.
(2)	Waits for an interrupt request.	Receives data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		• Receives data 2 when the start bit is detected. • Receives data 3 when the start bit is detected. (Repeats the reception of data as many times as the data length specified in bits RFDL[3:0] in the RLN24nmLiDFC register.) ⋮ • Receives the checksum when the start bit is detected.
(5)		• Evaluates the checksum. • Sets the successful frame/wake-up reception flag. • Sets the FTS bit in the RLN24nmLiTRC register to 0 (frame transmission or wake-up transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN24nmLiST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 18.14, Error Status**.

18.10 Data Transmission/Reception

18.10.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag of the RLN24nmLiEST register (see **Section 18.14, Error Status**).

In the LIN master interface, because data is generated every 1 Tbit = $16f_{LIN}$, the sampling point for received data is the 13th clock cycle (81.25% position).

Figure 18.7 shows an example of data transmission timing.

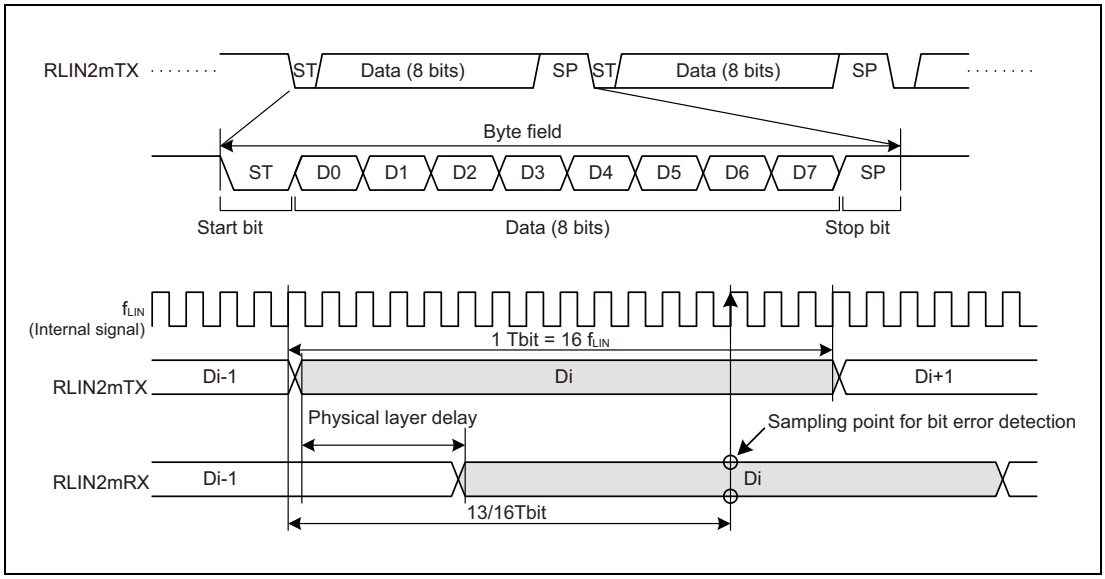

Figure 18.7 Example of Data Transmission Timing

18.10.2 Data Reception

Data reception is performed by using the synchronized RLIN2mRX signal (an internal signal) that is the input from the RLIN2mRX pin synchronized with the LIN system clock (f_{LIN}).

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN2mRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN2mRX signal is low level. The falling edge is not recognized as a start bit if the RLIN2mRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

The bit sampling period after detection of the start bit is one Tbit.

Figure 18.8 shows an example of data reception timing.

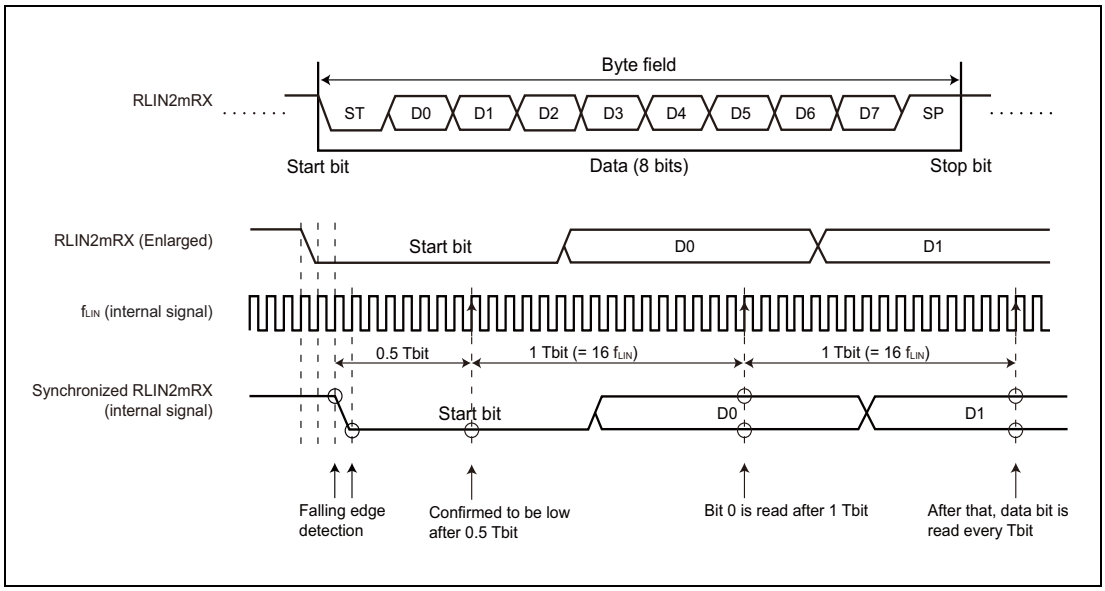

Figure 18.8 Example of Data Reception Timing

18.11 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN master interface sends or receives data continuously.

18.11.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-byte transmission, the contents stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN24nmLiDBR5 to RLN24nmLiDBR8 are not transmitted. The transmitted checksum data is stored in the RLN24nmLiCBR register.

Figure 18.9 shows the LIN transmission processing and the corresponding buffers.

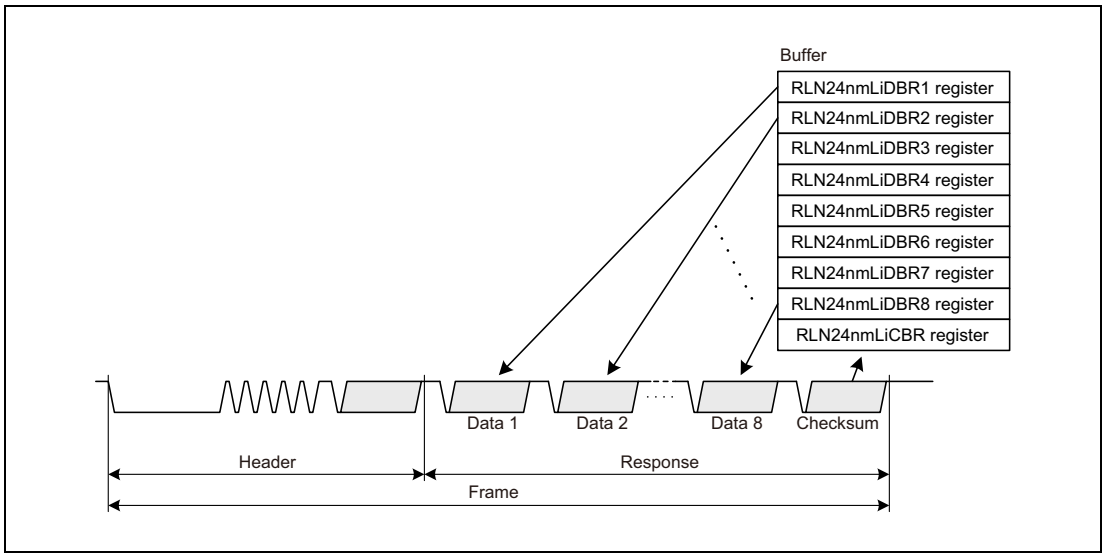

Figure 18.9 LIN Transmission Processing and Corresponding Buffers

(1) Frame Separate Mode

Setting the FSM bit in the RLN24nmLiDFC register to 1 sets the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN24nmLiST register is set to 1 (successful header transmission).

18.11.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame are stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN24nmLiDBR1 to RLN24nmLiDBR4, respectively; no data is stored in registers RLN24nmLiDBR5 to RLN24nmLiDBR8. The received checksum data is stored in the RLN24nmLiCBR register.

Figure 18.10 shows the LIN reception processing and the corresponding buffers.

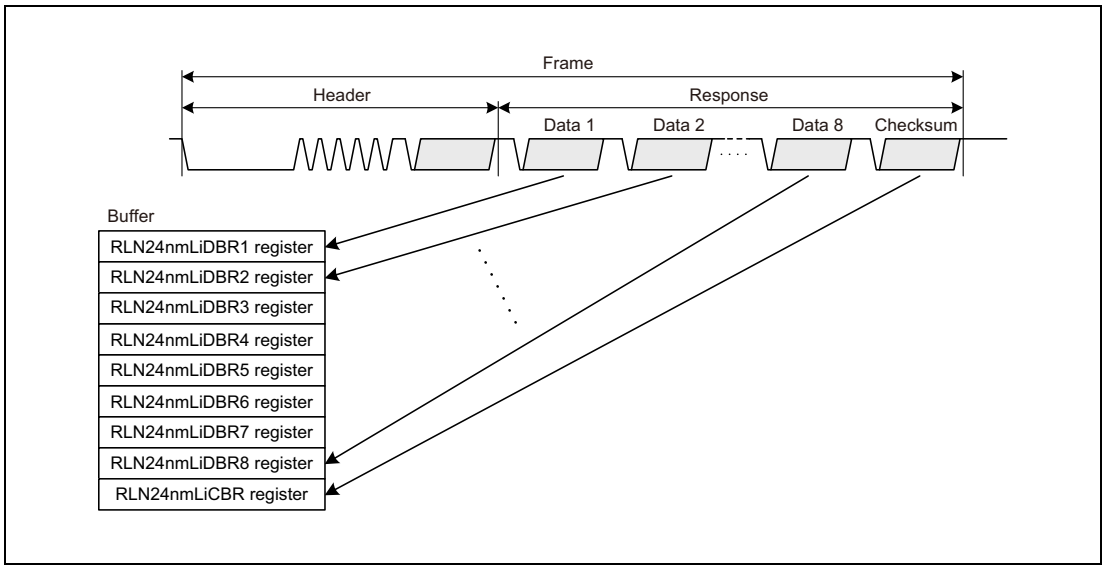

Figure 18.10 LIN Reception Processing and Corresponding Buffers

(1) Reception of Data 1

When the reception of the first byte of data is finished, the D1RC flag in the RLN24nmLiST register is set to 1 (successful data 1 reception).

18.12 Wake-Up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

18.12.1 Wake-Up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN24nmLiDFC register to 1 (transmission) and the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal is set using the WUTL[3:0] bits in the RLN24nmLiWUP register. However, if the value of the LWBR0 bit of the RLN24nGLWBR register is 1 (when LIN 2.x is used), the LIN system clock (f_{LIN}) has the low-level width of fa (JW) regardless of the setting of the LCKS bit of the RLN24nmLiMD register. By setting the baud rate to 19200 bps when fa is selected and setting the WUTL[3:0] bits of the RLN24nmLiWUP register to 0100_B (5 Tbits), 260 µs low level width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN24nmLiMD register.

If a wake-up low level is output without any error, the FTC flag in the RLN24nmLiST register is set to 1 (successful frame or wake-up transmission); when the FTCIE bit in the RLN24nmLiIE register is 1 (successful frame/wake-up transmission interrupt enabled), an interrupt request is generated.

If an error is detected, wake-up transmission is aborted and the error flag for the error detected (the PBER flag or BER flag in the RLN24nmLiEST register) is set to 1 (physical bus error detection / bit error detection).

Figure 18.11 shows the wake-up transmission timing.

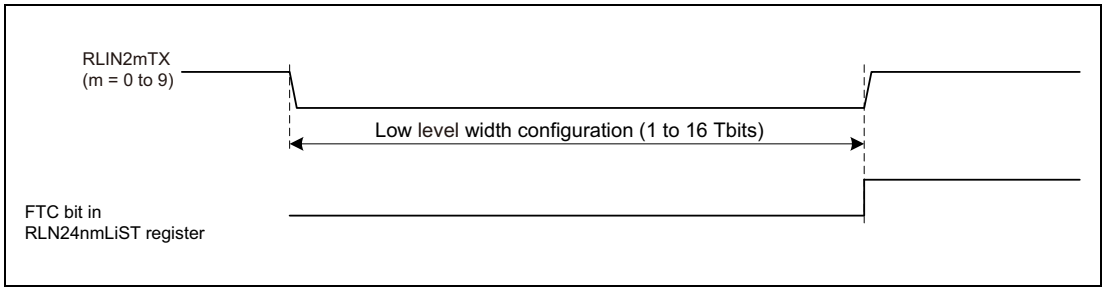

Figure 18.11 Wake-Up Transmission Timing

18.12.2 Wake-Up Reception

The detection of a wake-up signal involves the use of an input signal low level width count function.

The input signal low level width count function measures the low level width of the input signal to the RLIN2mRX pin, using the same sampling point as data reception. This allows an input signal of f_{LIN} with a low-level width of 2.5-Tbit or longer to be measured.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN24nGLWBR register to 0. When LIN Specification Package Revision 2.x is used, set LWBR0 bit to 1.

When LWBR0 bit is set to 1, regardless of the setting of the LCKS bit in the RLN24nmLiMD register, fa is selected as the LIN system clock (f_{LIN}) (the LCKS bit is not changed).

Setting the baud rate to 19200 bps while fa is selected allows an input signal with a low-level width of 130 µs or longer to be detected during LIN wake-up mode regardless of the setting of the LCKS bit in the RLN24nmLiMD register.

When using this function, in LIN wake-up mode set the RFT bit in the RLN24nmLiDFC register to 0 (reception), and the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN24nmLiST register is set to 1 (successful frame or wake-up reception) and if the FRCIE bit in the RLN24nmLiIE register is 1 (successful frame or wake-up reception interrupt enabled), an interrupt request is generated.

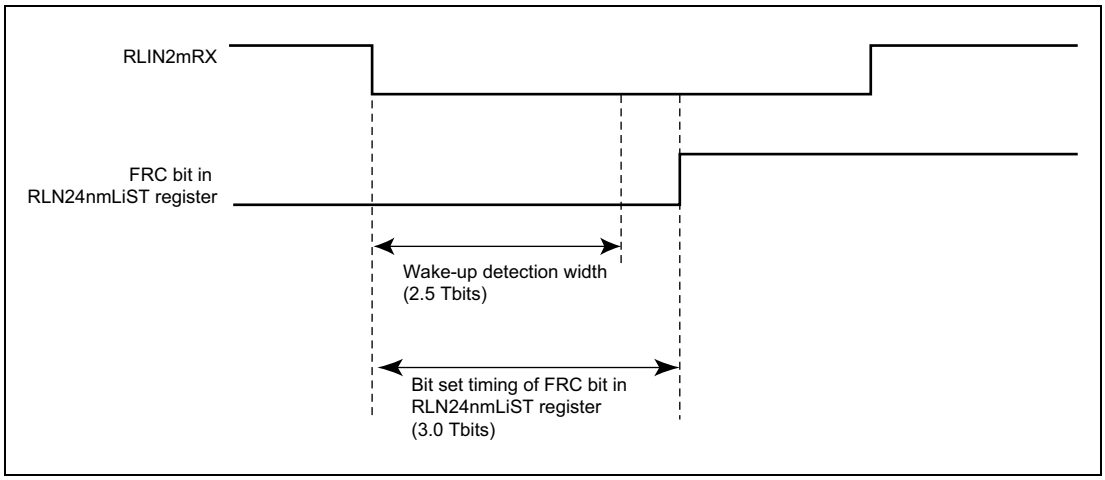

Figure 18.12 Input Signal Low Level Count Function

18.12.3 Wake-Up Collision

If the master node and the slave node transmit wake-up signals simultaneously, a collision will occur on the LIN bus; however the a collision of wake-up signals is not detected in the LIN master interface.

18.13 Status

During LIN mode operation, the LIN master interface can detect seven types of statuses.

Three of these statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, can generate interrupt requests.

Table 18.36 shows the types of statuses.

Table 18.36 Types of Statuses

Status	Status Set Condition	Status Clear Condition	Operation Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN24nmLiCUC register is set to not-LIN-reset-mode, if the LIN master interface actually exits LIN reset mode.	After the OM0 bit in the RLN24nmLiCUC register is set to LIN reset mode, if the LIN master interface enters LIN reset mode.	All modes	OMM0 bit in the RLN24nmLiMST register	—
Operation mode	After the OM1 bit in the RLN24nmLiCUC register is set to LIN operation mode, if the LIN master interface actually enters LIN operation mode.	After the OM1 bit in the RLN24nmLiCUC register is set to LIN wake-up mode, if the LIN master interface enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in the RLN24nmLiMST register	—
Successful frame/wake-up transmission	When a frame (header transmission + response transmission) or a wake-up signal is transmitted successfully.	• When the next communication is started • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in the RLN24nmLiST register	√
Successful frame/wake-up reception	When a frame (header transmission + response reception) or a wake-up signal is received successfully.	• When the next communication is started • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in the RLN24nmLiST register	√
Error detection	If any of the CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN24nmLiEST register is set to 1 (error detected).	• When the next communication is started • When cleared by software*1 • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in the RLN24nmLiST register	√
Successful data 1 reception	When the RFT bit in the RLN24nmLiDFC register is 0 (reception) and the first byte of the response field is received successfully.*2	• When the next communication is started • When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in the RLN24nmLiST register	—
Successful header transmission	When a header field is transmitted successfully.	• When the next communication is started • When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in the RLN24nmLiST register	—

Note 1. While in LIN operation mode, the ERR flag in the RLN24nmLiST register is cleared to 0 by writing 0 to the CSER flag, FER flag, FTER flag, PBER flag, or BER flag in the RLN24nmLiEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN24nmLiDFC register are 0000_B (0 bytes + checksum).

18.14 Error Status

18.14.1 Types of Error Statuses

The LIN master interface can detect five types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN24nmLiEST register.

All error statuses represent interrupt sources.

Table 18.37 shows the types of error statuses.

Table 18.37 Types of Error Statuses

Status	Error Detection Condition	Operating Mode Capable of Error Detection	Communication	Selection of Detection Enable/ Disable	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1	• LIN operation mode • LIN wake-up mode	Aborted	√	BER flag in the RLN24nmLiEST register
Physical bus error	• LIN bus is detected to be high level when sending a break • LIN bus is detected to be low level when sending a break delimiter • LIN bus is detected to be high level when sending a wake-up	• LIN operation mode • LIN wake-up mode	Aborted	√	PBER flag in the RLN24nmLiEST register
Frame timeout error	A frame transmission/reception does not complete within a given time*2	LIN operation mode	Aborted	√	FTER flag in the RLN24nmLiEST register
Framing error	In response field reception, the stop bit of each data byte is low level	LIN operation mode	Aborted	√	FER flag in the RLN24nmLiEST register
Checksum error	In response field reception, checksum test results in an error	LIN operation mode	—	×	CSER flag in the RLN24nmLiEST register

Note 1. If a bit error is detected, the process is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. The timeout time depends on the response field data length (the RFDL[3:0] bits in the RLN24nmLiDFC register) and the checksum selection (the CSM bit in the RLN24nmLiDFC register), and this can be calculated according to the following formula:
When classic checksum is selected (when the CSM bit in the RLN24nmLiDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
When enhanced checksum is selected (when the CSM bit in the RLN24nmLiDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.

The error status is cleared when the next communication is started, when it is cleared by software, or at a transition to LIN reset mode.

18.14.2 Target Time Domain for Error Detection

Figure 18.13 shows the time domain in which the LIN master interface monitors for error detection.

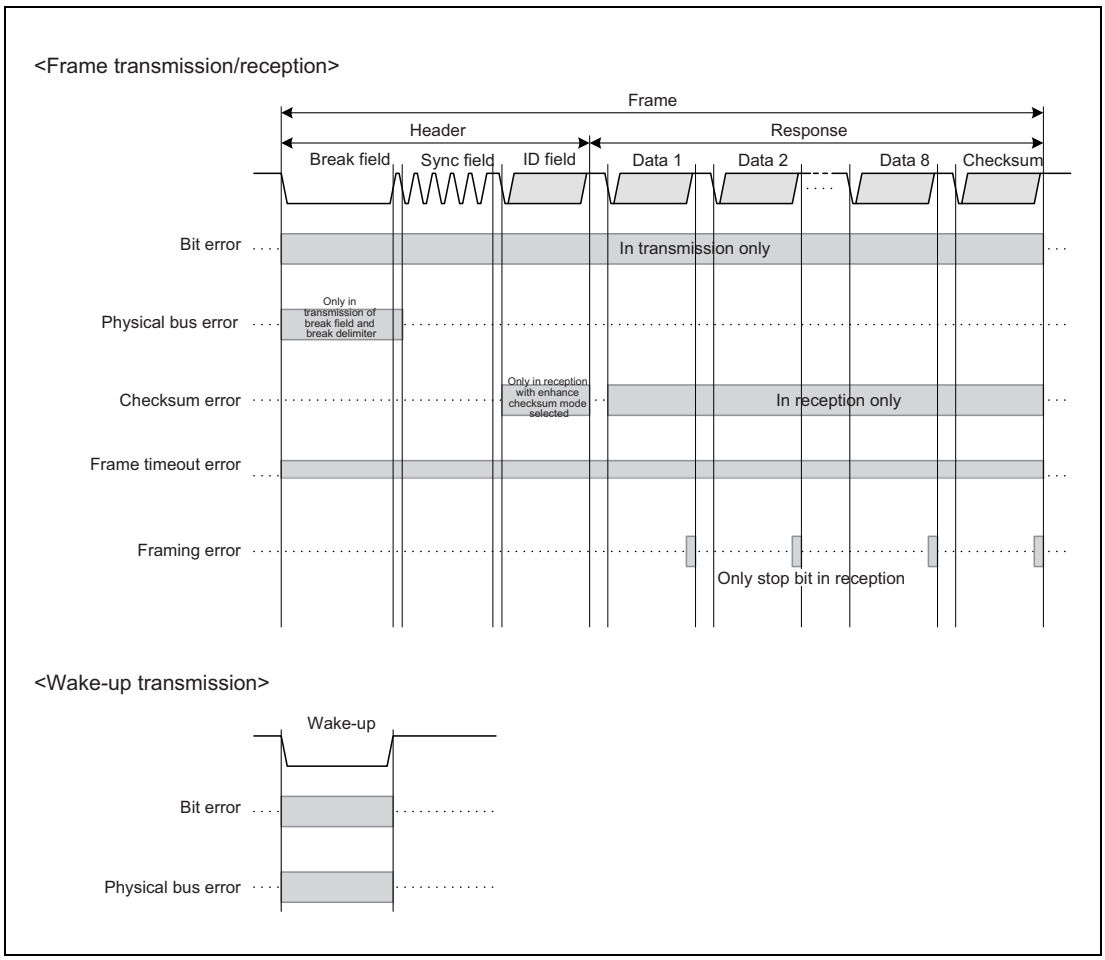

Figure 18.13 Target Time Domain for Error Detection

18.15 LIN Self-Test Mode

The LIN master interface provides LIN self-test mode. When the LIN master interface enters LIN self-test mode, RLIN2mTX and RLIN2mRX are disconnected from the external pins, and are internally connected in the LIN master interface. Thus, the frame transmitted from RLIN2mTX is looped back to RLIN2mRX.

Two types of self-test can be performed:

- LIN self-test mode (transmission): header transmission and response transmission
- LIN self-test mode (reception): header transmission and response reception

In LIN self-test mode, the operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator. Regardless of the setting of the baud rate related registers, the baud rate operates at the LIN communication clock source/16 [bps].

In LIN self-test mode, the following functions are not supported:

- LIN wake-up mode
- Frame separate mode

Do not use these functions.

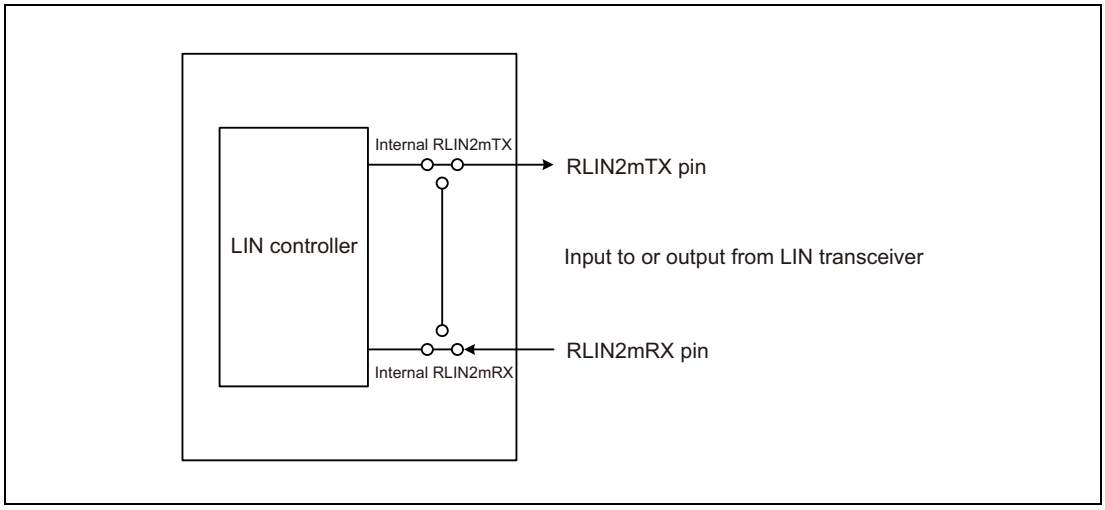

Figure 18.14 Connection in LIN Reset Mode, LIN Wake-Up Mode, and LIN Operation Mode

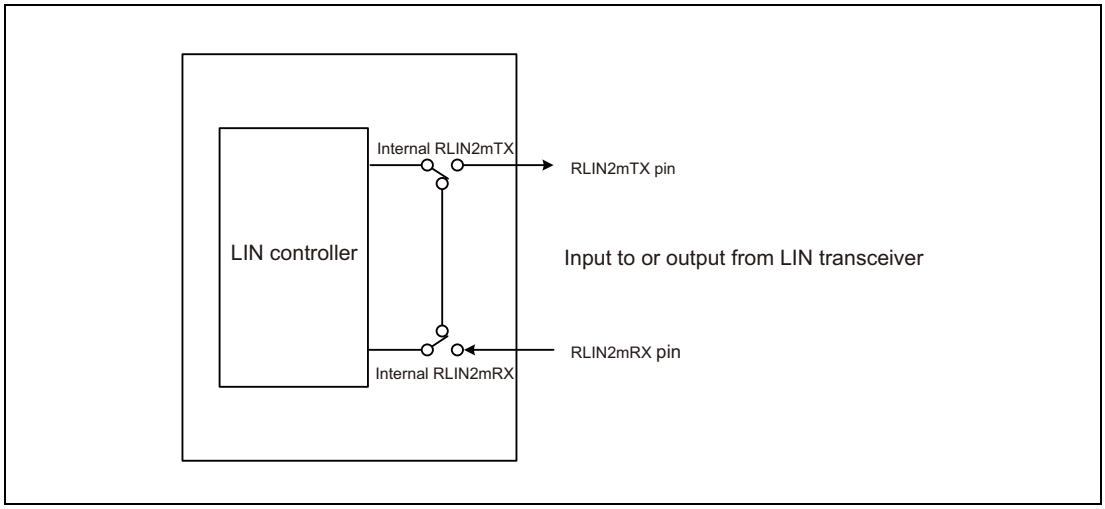

Figure 18.15 Connection in LIN Self-Test Mode

18.15.1 Transition to LIN Self-Test Mode

Writing to the RLN24nGLSTC register enables LIN self-test mode.

The LSTM bit in the RLN24nGLSTC register being set to 1 indicates that the mode has transitioned to LIN self-test mode.

A specific sequence is required to transition to LIN self-test mode. In this sequence, information must be written three times consecutively to the LIN self-test control register, as follows:

- Switch all channels of the unit to LIN reset mode.
  Set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN24nmLiMST register and confirm that it is 0 (LIN reset mode).
- 1st write: RLN24nGLSTC register = $1010\ 0111_B$ ($A7_H$)
- 2nd write: RLN24nGLSTC register = $0101\ 1000_B$ (58_H)
- 3rd write: RLN24nGLSTC register = $0000\ 0001_B$ (01_H)
- Confirm that all channels have transitioned to LIN self-test mode
  Read the LSTM bit in the RLN24nGLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the 1st write step. In addition, if a write to another LIN-related register in the same unit is performed during transition to LIN self-test mode (three consecutive write operations to the RLN24nGLSTC register), the transition is also canceled.

18.15.2 Transmission in LIN Self-Test Mode

To execute a self-test on transmission, perform the procedure below:

- Set the baud rate related registers.
  RLN24nGLBRP0 register = xxxx $xxxx_B$ *1
  RLN24nGLBRP1 register = xxxx $xxxx_B$ *1
  RLN24nmLiMD register = 0000 $xx00_B$ *1
- Set interrupt enable register and error enable related registers.
  RLN24nmLiIE register = 0000 $0xxx_B$ *2
  RLN24nmLiEDE register = 0000 $xxxx_B$
- Set the break field and space related registers.
  RLN24nmLiBFC register = 00xx $xxxx_B$
  RLN24nmLiSC register = 00xx $0xxx_B$
- Exit the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN24nmLiCUC register, and check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are 11_B.
- Set the transmit frame related registers.
  RLN24nmLiDFC register = 00x1 $xxxx_B$
  RLN24nmLiIDB register = xxxx $xxxx_B$
  RLN24nmLiDBR1 to RLN24nmLiDBR8 registers = xxxx $xxxx_B$
- Start header transmission → response transmission
  Set the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started).
  The LIN self-test mode (transmission) is executed, interrupts are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN master interface.
  To suspend the LIN self-test mode (transmission) while it is running, set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode), which causes a transition to the LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN24nmLiIDB, RLN24nmLiDBRb, and RLN24nmLiCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN24nmLiTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN24nmLiTRC register is cleared.

NOTE

x: Don't care

Note 1. The settings of the following registers are not reflected in the operation of the LIN self-test mode:
the RLN24nGLBRP0 register, the RLN24nGLBRP1 register, and the LCKS bit in the RLN24nmLiMD register. Therefore, setting these registers is not necessary.

Note 2. If necessary, set the related registers described in **Section 7, Exception/Interrupts**.

18.15.3 Reception in LIN Self-Test Mode

To execute a self-test on reception, perform the procedure below:

- Set the baud rate related registers.
  RLN24nGLBRP0 register = xxxx $xxxx_B$*1
  RLN24nGLBRP1 register = xxxx $xxxx_B$*1
  RLN24nmLiMD register = 0000 $xx00_B$*1
- Set the interrupt enable and error enable related registers.
  RLN24nmLiIE register = 0000 $0xxx_B$*2
  RLN24nmLiEDE register = 0000 $x0xx_B$
- Set the break field and space related registers.
  RLN24nmLiBFC register = 00xx $xxxx_B$
  RLN24nmLiSC register = 00xx $0xxx_B$*1
- Exit the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN24nmLiCUC register, and check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are 11_B.
- Set the receive frame related registers.
  RLN24nmLiDFC register = 00x0 $xxxx_B$
  RLN24nmLiIDB register = xxxx $xxxx_B$
  RLN24nmLiDBR1 to RLN24nmLiDBR8 registers = xxxx $xxxx_B$
  RLN24nmLiCBR register = xxxx $xxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, perform the calculation and specify the calculated value in the RLN24nmLiCBR register. By specifying an incorrect checksum, the checksum error can be tested.
- Start header transmission → response reception
  Set the FTS bit in the RLN24nmLiTRC register to 1 (frame transmission or wake-up transmission/reception started).
  The LIN self-test mode (reception) is executed, interrupts are generated, and status and error status are also updated.
  To suspend the LIN self-test mode (reception) while it is running, set the OM0 bit in the RLN24nmLiCUC register to 0 (LIN reset mode), which causes a transition to the LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN24nmLiIDB, RLN24nmLiDBRb, and RLN24nmLiCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN24nmLiTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN24nmLiTRC register is cleared.

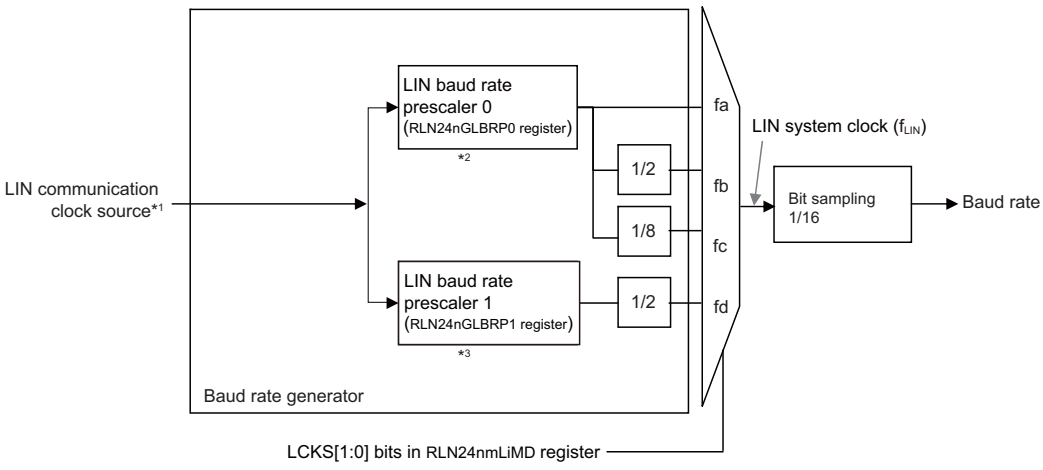
NOTE

x: Don't care

Note 1. The settings of the following registers are not reflected to the operation of the LIN self-test mode:
the RLN24nGLBRP0 register, the RLN24nGLBRP1 register, the LCKS bit in the RLN24nmLiMD register, and the IBS bit and IBHS bit (response space only) in the RLN24nmLiSC register. Therefore, setting these registers is not necessary.

Note 2. If necessary, set the related registers described in **Section 7, Exception/Interrupts**.

18.15.4 Exiting LIN Self-Test Mode



To exit LIN self-test mode, perform the procedure below:

- Switch all channels of the unit to LIN reset mode.
  Write 0 to the OM0 bit in the RLN24nmLiCUC register to make a transition to LIN reset mode. However, if the OMM1 and OMM0 bits in the RLN24nmLiMST register are not 11_B in any channels of the unit after the transition to LIN self-test mode, write 11_B to the OM1 and OM0 bits in the RLN24nmLiCUC register in any one channel. Check that the OMM1 and OMM0 bits in the RLN24nmLiMST register are set to 11_B, and then make a transition to LIN reset mode.
- Verify that the LIN master interface has exited LIN self-test mode.
  Read the LSTM bit in the RLN24nGLSTC register and confirm that it is not 0 (not in LIN self-test mode)
- Verify the transition to LIN reset mode.
  Read the OMM0 bit in the RLN24nmLiMST register and confirm that it is 0 (LIN reset mode).

18.16 Baud Rate Generator

The LIN system clock (f_{LIN}) is obtained by dividing the LIN communication clock source frequency by the baud rate generator, and the baud rate is obtained by dividing that clock by 16. The inverse of this baud rate is called the bit time (Tbit).

Figure 18.16 shows a block diagram of baud rate generation.

Note 1. For the LIN communication clock source, see **12.5.3, Clock Domain Settings**.
Note 2. According to the RLN24nGLBRP0 register, the clock frequency is divided by N + 1 (N = 0 to 255).
Note 3. According to the RLN24nGLBRP1 register, the clock frequency is divided by M + 1 (M = 0 to 255).

Figure 18.16 Block Diagram of Baud Rate Generation

Set the LIN communication clock source in a range from 4 MHz to 40 MHz.

By setting the RLN24nGLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting system clock frequencies are fa = 19200 × 16, fb = 9600 × 16, and fc = 2400 × 16. These system clock frequencies are divided by 16 in the bit timing generator, enabling baud rates of 19200 bps, 9600 bps, and 2400 bps to be generated. Also, by setting the RLN24nGLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting system clock frequency is fd = 10417 × 16. This system clock frequency is divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

The formula for calculating baud rate is shown below.

Baud rate:

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP0 + 1) ÷ 16 [bps] (When fa is selected)

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP0 + 1) ÷ 2 ÷ 16 [bps] (When fb is selected)

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP0 + 1) ÷ 8 ÷ 16 [bps] (When fc is selected)

= {Frequency of LIN communication clock source} ÷ (RLN24nGLBRP1 + 1) ÷ 2 ÷ 16 [bps] (When fd is selected)

Section 19 LIN/UART Interface (RLIN3)

This section contains a generic description of the LIN/UART interface (RLIN3).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RLIN3.

19.1 Features of RH850/F1K RLIN3

19.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN3 units.

Each RLIN3 unit has a single channel interface. “Number of channels” therefore has the same meaning as “number of units” in this section.

Table 19.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of units	4	6	6
Name	RLIN3n (n = 0 to 3)	RLIN3n (n = 0 to 5)	RLIN3n (n = 0 to 5)

Table 19.2 Unit Configurations and Channels

Unit Name (Channel Name) RLIN3n	Channels per Unit	RH850/F1K 100 pins (4 ch)	RH850/F1K 144 pins (6 ch)	RH850/F1K 176 pins (6 ch)
RLIN30	1	√	√	√
RLIN31	1	√	√	√
RLIN32	1	√	√	√
RLIN33	1	√	√	√
RLIN34	1		√	√
RLIN35	1		√	√

Note: The channel names are same as those of the corresponding units.

Table 19.3 Indices

Index	Description
n	Throughout this section, the individual RLIN3 units are identified by the index “n” (n = 0 to 5): for example, RLN3nLCUC is the LIN control register.
b	Throughout this section, the individual transmit/received data buffers of RLIN3n are identified by the index “b” (b = 1 to 8): for example, RLN3nLDBRb is the data buffer register.

The following lists the index value corresponding to each product.

Table 19.4 Index Correspondence of Each Product

Index Correspondence to Product
All products
b = 1 to 8

19.1.2 Register Base Address

RLIN3 base addresses are listed in the following table.

RLIN3 register addresses are given as offsets from the base addresses.

Table 19.5 Register Base Addresses

Base Address Name	Base Address
<RLIN30_base>	FFCE 2000$_H$
<RLIN31_base>	FFCE 2040$_H$
<RLIN32_base>	FFCE 2080$_H$
<RLIN33_base>	FFCE 20C0$_H$
<RLIN34_base>	FFCE 2100$_H$
<RLIN35_base>	FFCE 2140$_H$

19.1.3 Clock Supply

The RLIN3 clock supply is shown in the following table.

Table 19.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
RLIN3n	LIN communication clock sources	CKSCLK_ILIN[*1,*2]	Communication clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_ILIN	

Note 1. The clock domain CKSCLK_ILIN divided clock can be supplied only to RLIN30 channel.

Note 2. Set the LIN communication clock source in the range of 4 MHz to 40 MHz.

19.1.4 Interrupt Request

RLIN3 interrupt requests are listed in the following table.

Table 19.7 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RLIN30			
INTRLIN3n (n = 0)	RLIN30 interrupt	33	—
INTRLIN3nUR0 (n = 0)	RLIN30 transmit interrupt	34	10
INTRLIN3nUR1 (n = 0)	RLIN30 receive completion interrupt	35	11
INTRLIN3nUR2 (n = 0)	RLIN30 status interrupt	36	—
RLIN31			
INTRLIN3n (n = 1)	RLIN31 interrupt	120	—
INTRLIN3nUR0 (n = 1)	RLIN31 transmit interrupt	121	86
INTRLIN3nUR1 (n = 1)	RLIN31 receive completion interrupt	122	87
INTRLIN3nUR2 (n = 1)	RLIN31 status interrupt	123	—
RLIN32			
INTRLIN3n (n = 2)	RLIN32 interrupt	164	—
INTRLIN3nUR0 (n = 2)	RLIN32 transmit interrupt	165	44
INTRLIN3nUR1 (n = 2)	RLIN32 receive completion interrupt	166	45
INTRLIN3nUR2 (n = 2)	RLIN32 status interrupt	167	—
RLIN33			
INTRLIN3n (n = 3)	RLIN33 interrupt	228	—
INTRLIN3nUR0 (n = 3)	RLIN33 transmit interrupt	229	111
INTRLIN3nUR1 (n = 3)	RLIN33 receive completion interrupt	230	112
INTRLIN3nUR2 (n = 3)	RLIN33 status interrupt	231	—
RLIN34			
INTRLIN3n (n = 4)	RLIN34 interrupt	232	—
INTRLIN3nUR0 (n = 4)	RLIN34 transmit interrupt	233	50
INTRLIN3nUR1 (n = 4)	RLIN34 receive completion interrupt	234	51
INTRLIN3nUR2 (n = 4)	RLIN34 status interrupt	235	—
RLIN35			
INTRLIN3n (n = 5)	RLIN35 interrupt	236	—
INTRLIN3nUR0 (n = 5)	RLIN35 transmit interrupt	237	113
INTRLIN3nUR1 (n = 5)	RLIN35 receive completion interrupt	238	114
INTRLIN3nUR2 (n = 5)	RLIN35 status interrupt	239	—

19.1.5 Reset Sources

RLIN3 reset sources are listed in the following table. RLIN3 is initialized by these reset sources.

Table 19.8 Reset Sources

Unit Name	Reset Source
RLIN3n	All reset sources (ISORES)

19.1.6 External Input/output Signals

External input/output signals of RLIN3 are listed below.

Table 19.9 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
RLIN30		
RLIN3nRX (n = 0)	RLIN30 receive data input	RLIN30RX
RLIN3nTX (n = 0)	RLIN30 transmit data output	RLIN30TX
RLIN31		
RLIN3nRX (n = 1)	RLIN31 receive data input	RLIN31RX
RLIN3nTX (n = 1)	RLIN31 transmit data output	RLIN31TX
RLIN32		
RLIN3nRX (n = 2)	RLIN32 receive data input	RLIN32RX
RLIN3nTX (n = 2)	RLIN32 transmit data output	RLIN32TX
RLIN33		
RLIN3nRX (n = 3)	RLIN33 receive data input	RLIN33RX
RLIN3nTX (n = 3)	RLIN33 transmit data output	RLIN33TX
RLIN34		
RLIN3nRX (n = 4)	RLIN34 receive data input	RLIN34RX
RLIN3nTX (n = 4)	RLIN34 transmit data output	RLIN34TX
RLIN35		
RLIN3nRX (n = 5)	RLIN35 receive data input	RLIN35RX
RLIN3nTX (n = 5)	RLIN35 transmit data output	RLIN35TX

19.2 Overview

19.2.1 Functional Overview

The LIN/UART interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602, and automatically performs frame communication and error determination.

The LIN/UART interface is provided with UART mode and can also be used as a UART.

The appropriate mode should be used for the LIN/UART interface according to the application: LIN master, LIN slave, or UART.

LIN master

- LIN reset mode
- LIN mode (LIN master mode)
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

LIN slave

- LIN reset mode
- LIN mode (LIN slave mode [auto baud rate] or LIN slave mode [fixed baud rate])
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

UART

- LIN reset mode
- UART mode

Table 19.10 shows the LIN/UART interface specifications.

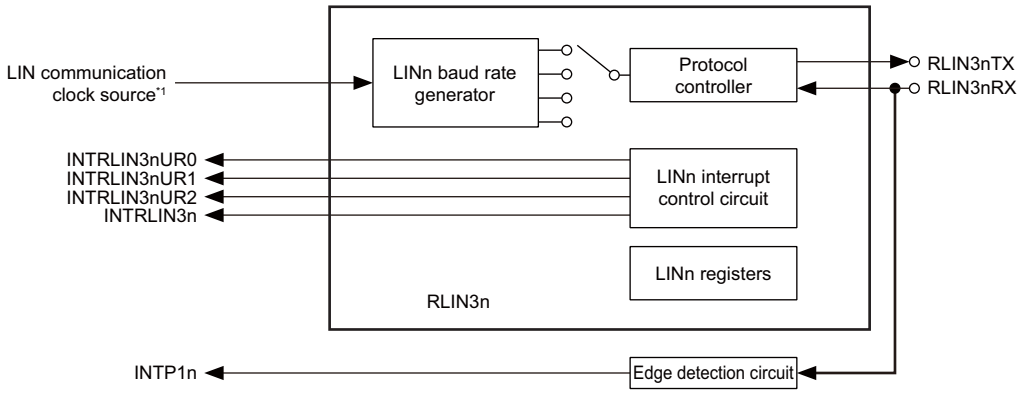
Table 19.10 LIN/UART Interface Specifications (1/3)

Item		Specifications	
	Channel count	Up to 6 channels	
LIN communication function	Protocol	LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602	
	Variable frame structure	Master	• Break transmission width: 13 to 28 Tbits • Break delimiter transmission width: 1 to 4 Tbits • Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*1 • Transmission response space width: 0 to 7 Tbits*1 • Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) • Transmission wake-up width: 1 to 16 Tbits
		Slave	• Break reception width : 9.5 or 10.5 Tbits [for fixed baud rate] : 10 or 11 Tbits [for auto baud rate] • Transmission response space width: 0 to 7 Tbits • Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) • Transmission wake-up width: 1 to 16 Tbits
	Checksum	• Automatic operation for both transmission and reception • Classic or enhanced selectable (for each frame)	
	Response field data byte count	Variable from 0 to 8 bytes Multi-byte (9 or more bytes) response transmission and reception also possible	
	Frame communication modes	Master	• Mode in which header transmission and response transmission/reception are started with a single transmission start request • Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode)
		Slave	• Mode in which header is automatically received with fixed baud rate • Mode in which header is automatically received with the baud rate set according to the sync field measurement result of the sync field and break field detected
	Wake-up transmission and reception	LIN wake-up mode provided • Wake-up transmission (1 to 16 Tbits) • Wake-up reception Low-level width of input signals measured	
	Status	Master	• Successful frame/wake-up transmission • Successful header transmission • Successful frame/wake-up reception*2 • Successful data 1 reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)
		Slave	• Successful response/wake-up transmission • Successful response/wake-up reception*2 • Successful header reception • Successful data 1 reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)

Table 19.10 LIN/UART Interface Specifications (2/3)

Item		Specifications	
LIN communication function	Error status	Master	• Bit error • Checksum error • Frame timeout error/response timeout error • Physical bus error • Framing error • Response preparation error
		Slave	• Bit error • Checksum error • Frame timeout error/response timeout error • Sync field error • ID parity error • Framing error • Response preparation error
	Baud rate selection	Baud rates conforming to the LIN specifications generated using baud rate generator	
	Test mode	Self-test mode for user evaluation	
	Interrupt function	Master	• Successful header/frame/wake-up transmission • Successful frame/wake-up reception*2 • Error detection
		Slave	• Successful response/wake-up transmission • Successful Header/response/wake-up reception*2 • Error detection
UART communication function	Data buffer	• Transmission data buffer/transmission data buffer for wait (exclusively for transmission; data length of 1. Character length of 7, 8, and 9 bits supported) • UART buffer (exclusively for transmission; variable data length from 1 to 9. Character length of 7 and 8 bits supported) • Reception data buffer (exclusively for reception; data length of 1. Character length of 7, 8, and 9 bits supported)	
	Data format	Character length: 7 or 8 bits Length of 9 bits supported by using the expansion bit.	
		Transmission stop bit: 1 or 2 bits	
		Parity function: odd, even, 0, or none	
		LSB- or MSB-first transfer selectable	
		Reverse input/output of transmission/reception data possible	
	Status	• Transmission status • Reception status • Successful UART buffer transmission • Error detection • Expansion bit detection • ID match • Reset mode status	
	Error status	• Bit error • Framing error • Parity error • Overrun error	
	Baud rate selection	With the built-in baud rate generator, any baud rate can be set.	
	When a certain expansion bit is at the expected level, the data received can be compared to the 8-bit data preset in the register.		

Table 19.10 LIN/UART Interface Specifications (3/3)



Item		Specifications
UART communication function	Reception of the stop bit is guaranteed. (Start of transmission can be delayed when start of transmission is attempted during reception of the stop bit).	
	Interrupt function	• Transmission start/complete • Reception complete • Status/error detection

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the input signal low-level width count is indicated.

19.2.2 Block Diagram

Figure 19.1 shows a block diagram of the LIN/UART interface.

Note 1. For the LIN communication clock source, see **Section 12.5.3, Clock Domain Settings**.

Figure 19.1 LIN/UART Interface Block Diagram

19.2.3 Terms used in block diagram

- RLIN3nTX, RLIN3nRX: LIN/UART interface I/O pins
- LINn baud rate generator: Generates the LIN/UART interface communication clock
- LINn registers: LIN/UART interface registers
- LINn interrupt control circuit: Controls interrupt requests generated by the LIN/UART interface

19.3 Registers

19.3.1 List of Registers

RLIN3 registers are listed in the following table.

For details about <RLIN3n_base>, see **Section 19.1.2, Register Base Address**.

Table 19.11 List of Registers (1/2)

Module Name	Register Name	Symbol	Address	LIN Master	LIN Slave	UART
RLN3n	LIN wake-up baud rate select register	RLN3nLWBR	<RLIN3n_base> + 01_H	√	√	√
	LIN / UART baud rate prescaler 01 register	RLN3nLBRP01	<RLIN3n_base> + 02_H	—	√	√
	LIN / UART baud rate prescaler 0 register	RLN3nLBRP0	<RLIN3n_base> + 02_H	√	√	√
	LIN / UART baud rate prescaler 1 register	RLN3nLBRP1	<RLIN3n_base> + 03_H	√	√	√
	LIN self-test control register	RLN3nLSTC	<RLIN3n_base> + 04_H	√	√	—
	LIN / UART mode register	RLN3nLMD	<RLIN3n_base> + 08_H	√	√	√
	LIN break field configuration register/ UART configuration register	RLN3nLBFC	<RLIN3n_base> + 09_H	√	√	√
	LIN / UART space configuration register	RLN3nLSC	<RLIN3n_base> + $0A_H$	√	√	√
	LIN wake-up configuration register	RLN3nLWUP	<RLIN3n_base> + $0B_H$	√	√	—
	LIN interrupt enable register	RLN3nLIE	<RLIN3n_base> + $0C_H$	√	√	—
	LIN / UART error detection enable register	RLN3nLEDE	<RLIN3n_base> + $0D_H$	√	√	√
	LIN / UART control register	RLN3nLCUC	<RLIN3n_base> + $0E_H$	√	√	√
	LIN / UART transmission control register	RLN3nLTRC	<RLIN3n_base> + 10_H	√	√	√
	LIN / UART mode status register	RLN3nLMST	<RLIN3n_base> + 11_H	√	√	√
	LIN / UART status register	RLN3nLST	<RLIN3n_base> + 12_H	√	√	√
	LIN / UART error status register	RLN3nLEST	<RLIN3n_base> + 13_H	√	√	√
	LIN data field configuration register	RLN3nLDFC	<RLIN3n_base> + 14_H	√	√	√
	LIN / UART ID buffer register	RLN3nLIDB	<RLIN3n_base> + 15_H	√	√	√
	LIN checksum buffer register	RLN3nLCBR	<RLIN3n_base> + 16_H	√	√	—
	UART data buffer 0 register	RLN3nLUDB0	<RLIN3n_base> + 17_H	—	—	√
	LIN / UART data buffer 1 register	RLN3nLDBR1	<RLIN3n_base> + 18_H	√	√	√
	LIN / UART data buffer 2 register	RLN3nLDBR2	<RLIN3n_base> + 19_H	√	√	√
	LIN / UART data buffer 3 register	RLN3nLDBR3	<RLIN3n_base> + $1A_H$	√	√	√
	LIN / UART data buffer 4 register	RLN3nLDBR4	<RLIN3n_base> + $1B_H$	√	√	√
	LIN / UART data buffer 5 register	RLN3nLDBR5	<RLIN3n_base> + $1C_H$	√	√	√
	LIN / UART data buffer 6 register	RLN3nLDBR6	<RLIN3n_base> + $1D_H$	√	√	√
	LIN / UART data buffer 7 register	RLN3nLDBR7	<RLIN3n_base> + $1E_H$	√	√	√
	LIN / UART data buffer 8 register	RLN3nLDBR8	<RLIN3n_base> + $1F_H$	√	√	√
	UART operation enable register	RLN3nLUOER	<RLIN3n_base> + 20_H	—	—	√
	UART option register 1	RLN3nLUOR1	<RLIN3n_base> + 21_H	—	—	√
	UART transmission data register	RLN3nLUTDR	<RLIN3n_base> + 24_H	—	—	√
	UART transmission data register L	RLN3nLUTDRL	<RLIN3n_base> + 24_H	—	—	√
	UART transmission data register H	RLN3nLUTDRH	<RLIN3n_base> + 25_H	—	—	√
	UART reception data register	RLN3nLURDR	<RLIN3n_base> + 26_H	—	—	√
	UART reception data register L	RLN3nLURDRL	<RLIN3n_base> + 26_H	—	—	√

Table 19.11 List of Registers (2/2)

Module Name	Register Name	Symbol	Address	LIN Master	LIN Slave	UART
RLN3n	UART reception data register H	RLN3nLURDRH	<RLIN3n_base> + 27_H	—	—	√
	UART wait transmission data register	RLN3nLUWTDR	<RLIN3n_base> + 28_H	—	—	√
	UART wait transmission data register L	RLN3nLUWTDRL	<RLIN3n_base> + 28_H	—	—	√
	UART wait transmission data register H	RLN3nLUWTDRH	<RLIN3n_base> + 29_H	—	—	√

Note: √: Used, —: Not used
When writing to an unused register, write the value after reset.

19.3.2 LIN Master Related Registers

19.3.2.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			LWBR0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.12 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 samplings 1 1 1 1: 16 samplings Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified in the LCKS bit of the RLN3nLMD register is used. (LIN1.3) 1: In LIN wake-up mode, the clock fa is used regardless of the setting in the LCKS bit of the RLN3nLMD register. (LIN2.x)

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In LIN master mode (LIN/UART mode select bits in LIN mode register = 00_B), set these bits to 0000_B or 1111_B (16 sampling).

LPRS[2:0] Bits (Prescaler Clock Select)

These bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

LWBR0 Bit (Wake-up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.
When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects fa as the LIN system clock (f_{LIN}) during LIN wake-up mode regardless of the setting of the

RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.

Setting the baud rate to 19200 bps while fa is selected allows an input signal with a low-level width of 130 us or longer to be detected in the LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

19.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 02_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.13 RLN3nLBRP0 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1. Setting range: 00_H to FF_H

Configure the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by N + 1.

19.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 03_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.14 RLN3nLBRP1 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1. Setting range: 00_H to FF_H

Configure the RLN3nLBRP1 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M+1.

19.3.2.4 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.15 RLN3nLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	—	Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Configure the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed and the mode is changed to LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return "000000_B", and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For exiting LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

19.3.2.5 RLN3nLMD — LIN Mode Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base>+ 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	LCKS[1:0]		LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.16 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: RLIN3n interrupt is used. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are used.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 0: LIN master mode

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, the RLIN3 interrupt is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are generated from the LIN/UART interface.
For each interrupt source, see **Section 19.4, Interrupt Sources**.

LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.
With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).
With 01_B set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).
With 10_B set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).
With 11_B set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

When 1_B is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x), and the RLN3nLMST register is 01_H (LIN wake-up mode), the protocol controller is supplied with fa regardless of the setting of this bit (the LCKS bit is not changed).

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an LIN master, set these bits to 00_B.

19.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.17 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	BDT[1:0]	Transmission Break Delimiter (High Level) Width Select b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmission Break (Low Level) Width Select b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Some combinations of the specified values result in a frame length exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header.
1 Tbit to 4 Tbits can be set.

BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header.
13 Tbits to 28 Tbits can be set.

19.3.2.7 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base>+ $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 19.18 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Specify the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.
0 Tbit to 3 Tbits can be set.
These bits are enabled only during response transmission; these are disabled during response reception.

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.
0 Tbit to 7 Tbits can be set.
The response space setting is enabled only during response transmission; setting is disabled during response reception.
The inter-byte space (header) is equal to the response space.

19.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base>+ $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 19.19 RLN3nLWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low Level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.
1 Tbit to 16 Tbits can be set.

With 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x), fa is selected as the LIN system clock (f_{LIN}) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

19.3.2.9 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 19.20 RLN3nLIE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SHIE	Successful Header Transmission Interrupt Request Enable 0: Disables successful header transmission interrupt request. 1: Enables successful header transmission interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Request Enable 0: Disables successful frame/wake-up reception interrupt request. 1: Enables successful frame/wake-up reception interrupt request.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Request Enable 0: Disables successful frame/wake-up transmission interrupt request. 1: Enables successful frame/wake-up transmission interrupt request.

Configure the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

SHIE Bit (Successful Header Transmission Interrupt Request Enable)

The SHIE bit enables or disables interrupt request upon successful transmission of a header.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n transmission is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.
Occurrence factors are bit errors, physical bus errors, frame/response timeout errors, framing errors, checksum errors, and response preparation errors. Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE Bit (Successful Frame/Wake-up Reception Interrupt Request Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a frame or a wake-up signal (input signal low-level width count).

With 0 set, the interrupt request for RLIN3n successful reception is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for successful RLIN3n reception is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE Bit (Successful Frame/Wake-up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a frame or a wake-up signal.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

19.3.2.10 RLN3nLEDE —LIN Error Detection Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	—	—	—	FERE	FTERE	PBERE	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 19.21 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable *1 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable *1 0: Disables bit error detection. 1: Enables bit error detection.

Note 1. Set FERE bit and BERE bit to 1.

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function applies to frame timeout.
With 1 set, the timeout function applies to response timeout.
For details on the timeout error, see **Section 19.7.7, Error Statuses**.

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
Set this bit to 1. The detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 19.7.7, Error Statuses**.

FTERE Bit (Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.

When this bit is set to 1, the detection result is reflected in the FTER flag of the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected.
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see **Section 19.7.7, Error Statuses**.

PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.
With 0 set, the physical bus error is not detected.
With 1 set, the physical bus error is detected.
When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN3nLEST register.
For details on the physical bus error, see **Section 19.7.7, Error Statuses**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
Set this bit to 1. The detection result is indicated in the BER flag in the RLN3nLEST register.
For details on the bit error, see **Section 19.7.7, Error Statuses**.

19.3.2.11 RLN3nLCUC — LIN Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 19.22 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode 1: LIN operation mode
0	OM0	LIN Reset 0: LIN reset mode 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to transition to LIN wake-up mode or to 03_H to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN3nLCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
With 0 set, LIN wake-up mode.
With 1 set, LIN operation mode.
This bit is enabled only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
With 0 set, LIN reset mode.
With 1 set, LIN reset mode is canceled.

19.3.2.12 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 19.23 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped in frame separate mode. 1: Response transmission/reception is started in frame separate mode.
0	FTS	Frame Transmission/Wake-up Transmission/Reception Start 0: Frame Transmission/wake-up transmission/reception is stopped. 1: Frame Transmission/wake-up transmission/reception is started.

RTS Bit (Response Transmission/Reception Start)

In frame separate mode, set the RTS bit to 1 after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.
Writing a value to this bit is disabled when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).
Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 at the end of data group communication or transition to LIN reset mode.

FTS Bit (Frame Transmission/Wake-up Transmission/Reception Start)

Set the FTS bit to 1 to start frame transmission and reception.
Also set this bit to 1 to allow wake-up transmission and reception (input signal low-level width count).
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication (including error detection) and transition to LIN reset mode.

19.3.2.13 RLN3nLMST — LIN Mode Status Register

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 19.24 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

19.3.2.14 RLN3nLST — LIN Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 19.25 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value it had before 1 is written.
The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt request for RLN3n transmission is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled).
To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value it had before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. To clear the bit to 0 before the next communication is started (when the FTS bit of the

RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register while in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC Flag (Successful Frame/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for RLN3n successful reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC Flag (Successful Frame/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for RLN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

19.3.2.15 RLN3nLEST — LIN Error Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RPER	—	CSER	—	FER	FTER	PBER	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 19.26 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/ reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value it had before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value it had before 1 is written.
The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the value of the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

FTER Flag (Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), the FTER flag is set to 1 upon frame timeout error or response timeout error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode.

PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled), the PBER flag is set to 1 upon physical bus error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. To clear the bit to 0 before the next communication is started (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit while in LIN operation mode or LIN wake-up mode.

19.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	FSM	CSM	RFT	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.27 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received.
With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.
With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.
Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

FSM Bit (Frame Separate Mode Select)

The FSM bit selects the response communication mode.
With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without setting the RTS bit in the RLN3nLTRC register.

With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception which is 8 bytes or less (the RFT bit is 0), set the FSM bit to 0.
When transitioning to LIN self-test mode, set this bit to 0 before transition.
For details on frame separate mode, see **Section 19.7.4.1, Transmission of LIN Frames**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

CSM Bit (Checksum Select)

The CSM bit selects the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error detection is enabled (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details, see **Section 19.7.7, Error Statuses**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.
During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

RFT Bit (Response Field Communication Direction Select)

The RFT bit sets the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the RTS bit in the RLN3nLTRC register is 0).
To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).
Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

19.3.2.17 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.28 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bits (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bits (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

In LIN self-test mode, this register operates as described below.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 is for P0 and IDP1 is for P1.

Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

19.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register is a read-only register that can be read in 8-bit units. In LIN self-test mode, this register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.29 RLN3nLCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Stores the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

19.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

Access: This register can be read or written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.30 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or reads the received data. Setting range: 00_H to FF_H

- For response transmission:
  These registers set the data to be transmitted in the response field.
  Use these registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 0 (not frame separate mode)
  - FTS in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped)

  or
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is stopped)
- For response reception:
  These registers store the data received in the response field.
  The received data is overwritten. If an error is detected, the data prior to reception interruption is stored in the register.
  Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started)
- For transmission of response data of 9 bytes or more:
  Use these registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is stopped)
- For reception of response data of 9 bytes or more:
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as described below.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

19.3.3 LIN Slave Related Registers

19.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 19.31 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 samplings 0 0 1 1: 4 samplings 0 1 1 1: 8 samplings 1 1 1 1: 16 samplings Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
When the frame communication is performed in LIN slave mode (fixed baud rate) (LMD[1:0] bits in the RLN3nLMD register = 11_B), set these bits to "0000_B" or "1111_B" (16 samplings).
When the frame communication is performed in LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10_B), set these bits to "0011_B" (4 samplings) or "0111_B" (8 samplings).

LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler. The LIN communication clock source is divided by this prescaler.

In LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10_B), set these bits so that the prescaler clock becomes as follows according to the target baud rate.

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4MHz*1
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

Note 1. Use the clock with NSPB bits set to "0011_B" (4 samplings).

19.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register

Access: RLN3nLBRP01 can be read or written in 16-bit units.
RLN3nLBRP0 can be read or written in 8-bit units.
RLN3nLBRP1 can be read or written in 8-bit units.

Address: RLN3nLBRP01: <RLIN3n_base> + 02_H
RLN3nLBRP0: <RLIN3n_base> + 02_H
RLN3nLBRP1: <RLIN3n_base> + 03_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.32 RLN3nLBRP01 Register Contents

Bit Position	Bit Name	Function
15 to 0	BRP[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting range: 0000_H to $FFFF_H$

Configure the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units using registers RLN3nLBRP0 and RLN3nLBRP1.

NOTE

In LIN slave mode [auto baud rate], the system automatically sets the result of baud rate correction to the RLN3nLBRP01 register on successful reception of the sync field.

19.3.3.3 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.33 RLN3nLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	-	Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Configure the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed and the module is placed in LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return "000000_B", and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For exiting LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

19.3.3.4 RLN3nLMD — LIN Mode Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 19.34 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: RLIN3 interrupt is used. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are used.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 1 0: LIN Slave mode (auto baud rate) 1 1: LIN Slave mode (fixed baud rate)

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, the RLIN3 interrupt is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are generated from the LIN/UART interface.
For each interrupt source, see **Section 19.4, Interrupt Sources**.

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use this module as an LIN slave, set these bits to "10_B" (auto baud rate) or "11_B" (fixed baud rate).

19.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LBLT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 19.35 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LBLT	Reception Break (Low-Level) Detection Width Setting 0: A break (low-level) is detected in 9.5 or 10 Tbits 1: A break (low-level) is detected in 10.5 or 11 Tbits

Configure the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LBLT Bit (Reception Break (Low-Level) Detection Width Setting)

- When RLN3nLMD.LMD is "10_B" (LIN slave mode (auto baud rate))
  - 0: Low-level width of 10 Tbits or longer is detected.
  - 1: Low-level width of 11 Tbits or longer is detected.
- When RLN3nLMD.LMD is "11_B" (LIN slave mode (fixed baud rate))
  - 0: Low-level width of 9.5 Tbits or longer is detected.
  - 1: Low-level width of 10.5 Tbits or longer is detected.

19.3.3.6 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 19.36 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	IBHS[2:0]	Response Space Setting b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

This register is enabled only during response transmission, and disabled during response reception.

Some combinations of the specified values result in a frame or response length exceeding the timeout time. Specify the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the inter-byte space width of the response transmission.
0 Tbit to 3 Tbits can be set.

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the transmission width of the response space.
0 Tbit to 7 Tbits can be set.

19.3.3.7 RLN3nLWUP — LIN Wake-Up Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 19.37 RLN3nLWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low-level width of the wake-up frame transmission.
1 Tbit to 16 Tbits can be set.

19.3.3.8 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 19.38 RLN3nLIE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SHIE	Successful Header Reception Interrupt Request Enable 0: Disables successful header reception interrupt request. 1: Enables successful header reception interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Response/Wake-up Reception Interrupt Request Enable 0: Disables successful Response/wake-up reception interrupt request. 1: Enables successful Response/wake-up reception interrupt request.
0	FTCIE	Successful Response/Wake-up Transmission Interrupt Request Enable 0: Disables successful Response/wake-up transmission interrupt request. 1: Enables successful Response/wake-up transmission interrupt request.

Configure the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

SHIE Bit (Successful Header Reception Interrupt Request Enable)

The SHIE bit enables or disables an interrupt request upon successful reception of a header.
With 0 set, the interrupt request for RLIN3n successful reception is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n successful reception is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE Bit (Error Detection Interrupt Request Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.
Error types that are interrupt sources are the bit error, frame/response timeout error, framing error, sync filed error, ID parity error, checksum error, and response preparation error.
Detection of the bit error, frame/response timeout error, sync filed error, ID parity error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE Bit (Successful Response/Wake-up Reception Interrupt Request Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a response or a wake-up frame (input signal low-level width count).
With 0 set, the interrupt request for RLIN3n successful reception is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n successful reception is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE Bit (Successful Response/Wake-up Transmission Interrupt Request Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a response or a wake-up frame.
With 0 set, the interrupt request for RLIN3n successful transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n successful transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

19.3.3.9 RLN3nLEDE — LIN Error Detection Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	IPERE	—	SFERE	FERE	TERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W

Table 19.39 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6	IPERE	ID Parity Error Detection Enable 0: Disables ID Parity error detection. 1: Enables ID Parity error detection.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	SFERE	Sync Field Error Detection Enable 0: Disables Sync Field error detection. 1: Enables Sync Field error detection.
3	FERE	Framing Error Detection Enable *1 0: Disables framing error detection. 1: Enables framing error detection.
2	TERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BERE	Bit Error Detection Enable *1 0: Disables bit error detection. 1: Enables bit error detection.

Note 1. Set FERE bit and BERE bit to 1

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function applies to frame timeout.
With 1 set, the timeout function applies to response timeout.
For details on the timeout error, see **Section 19.7.7, Error Statuses**.

IPERE Bit (ID Parity Error Detection Enable)

This bit enables or disables detection of the ID parity error.
With 0 set, the ID parity error is not detected.
With 1 set, the ID parity error is detected.
When this bit is set to 1, the detection result is reflected in the IPER flag of the RLN3nLEST register.
For details on the ID parity error, see **Section 19.7.7, Error Statuses**.

SFERE Bit (Sync Field Error Detection Enable)

This bit enables or disables detection of the sync field error.
With 0 set, the sync field error is not detected.
With 1 set, the sync field error is detected.
Regardless of the setting of this bit, when a sync field error is detected, this module waits for the next header.
When this bit is set to 1, the detection result is reflected in the SFER flag of the RLN3nLEST register.
For details on the sync filed error, see **Section 19.7.7, Error Statuses**.

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
Set this bit to 1. The detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 19.7.7, Error Statuses**.

TERE Bit (Timeout Error Detection Enable)

The TERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.
When this bit is set to 1, the detection result is reflected in the TER flag of the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected.
The timeout error should not be used in LIN slave mode [auto baud rate] (when the LMD[1:0] bits in the RLN3nLMD register are "10_B").
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see **Section 19.7.7, Error Statuses**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
Set this bit to 1. The detection result is indicated in the BER flag in the RLN3nLEST register.
For details on the bit error, see **Section 19.7.7, Error Statuses**.

19.3.3.10 RLN3nLCUC — LIN Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 19.40 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode 1: LIN operation mode
0	OM0	LIN Reset 0: LIN reset mode 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to transition to LIN wake-up mode or to 03_H to transition to LIN operation mode after exiting LIN reset mode.

In LIN self-test mode, set the RLN3nLCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific LIN operation mode (LIN wake-up mode or LIN operation mode) that is entered after exiting LIN reset mode
With 0 set, the LIN/UART interface enters LIN wake-up mode.
With 1 set, the LIN/UART interface enters LIN operation mode.
This bit is enabled only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects whether to transition to or exit LIN reset mode.
With 0 set, the LIN/UART interface enters LIN reset mode.
With 1 set, the LIN/UART interface exits LIN reset mode.

19.3.3.11 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	LNRR	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 19.41 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	LNRR	No LIN Response Request 0: Response for the reception ID 1: No response for the reception ID
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped. 1: Response transmission/reception is started.
0	FTS	LIN Communication Start 0: Header reception/wake-up transmission/reception is stopped. 1: Header reception/wake-up transmission/reception is started.

LNRR Bit (No LIN Response Request)

Set this bit to 1 if no response is to be transmitted/received after receiving the header and checking the received ID.

Once set, this bit is automatically cleared to 0 upon detection of new sync field or transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write 04_H using the store instruction.

Do not set this bit and the RTS bit to 1 simultaneously.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is stopped).

When response data of 9 bytes or more is to be transmitted or received, use this bit only after the completion of the header. (Do not use this bit for the second or later data group.)

RTS Bit (Response Transmission/Reception Start)

Set this bit to 1 to start response transmission or reception after receiving the header and checking the received ID.

Once set, this bit is automatically cleared to 0 upon completion of response transmission or reception (including error detection) or transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.

Do not set this bit and the LNRR bit to 1 simultaneously

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is stopped).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group transmission/reception or transition to LIN reset mode.

FTS Bit (LIN Communication Start)

Set this bit to 1 to start header reception or wake-up transmission/reception.
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

19.3.3.12 RLN3nLMST — LIN Mode Status Register

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RLIN3n_base> +11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 19.42 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1	OMM1	LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

19.3.3.13 RLN3nLST — LIN Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 19.43 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Reception Flag 0: Header reception has not been completed. 1: Header reception has been completed.
6	D1RC	Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	FRC	Successful Response/Wake-up Reception Flag 0: Response or wake-up reception has not been completed. 1: Response or wake-up reception has been completed.
0	FTC	Successful Response/Wake-up Transmission Flag 0: Response or wake-up transmission has not been completed. 1: Response or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, writing a value to this register is disabled. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC Flag (Successful Header Reception Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value before 1 is written. The HTRC flag is set to 1 upon completion of header reception. Here, an interrupt request for RLIN3n successful reception is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if header reception is completed while this bit is 1, an interrupt is not generated. To clear this bit to 0, write 0 to the bit.
To detect a new header in the response field upon completion of header reception, clear this bit after it is set to 1.

D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value it had before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not

generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLIN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if an error is detected while this bit is 1, an interrupt is not generated. To clear the bit to 0, write 0 to the RPER, IPER, CSER, SFER, FER, TER, and BER flags in the RLN3nLEST register. This clears the ERR flag to 0.

FRC Flag (Successful Response/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FRC flag is set to 1 upon completion of response or wake-up reception. Here, an interrupt request for RLIN3n successful reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if response reception or wake-up reception is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC Flag (Successful Response/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value it had before 1 is written.
The FTC flag is set to 1 upon completion of response or wake-up transmission. Here, an interrupt request for RLIN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if response transmission or wake-up transmission is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

19.3.3.14 RLN3nLEST — LIN Error Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RPER	IPER	CSER	SFER	FER	TER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 19.44 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	IPER	ID Parity Error Flag 0: ID parity error has not been detected. 1: ID parity error has been detected.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	SFER	Sync Field Error Flag 0: Sync field error has not been detected. 1: Sync field error has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	TER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value it had before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. Write 0 to clear this bit.

IPER Flag (ID Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.

When the IPERE bit of the RLN3nLEDE register is 1 (ID parity error detection enabled), this bit is set to 1 upon ID parity error detection. Write 0 to clear this bit.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value it had before 1 is written.
The CSER flag is set to 1 upon checksum error detection. Write 0 to clear this bit.

SFER Flag (Sync Field Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
When the SFERE bit of the RLN3nLEDE register is 1 (sync field error detection enabled), this bit is set to 1 upon sync field error detection. Write 0 to clear this bit.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. Write 0 to clear this bit.

TER Flag (Timeout Error Flag)

Only 0 can be written to the TER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the TERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), this flag is set to 1 upon frame timeout error or response timeout error detection. Write 0 to clear this bit.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. Write 0 to clear this bit.

19.3.3.15 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	—	LCS	RCDS	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.45 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Data transmission/reception continues without waiting for reception of the next header.)
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LCS	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RCDS	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one. With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.
When multi-byte response transmission/reception function is not used, set it to “0”.
Set this bit when the RTS bit is 0 (response transmission/reception stopped).

LCS Bit (Checksum Select)

The LCS bit selects the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error detection is enabled (the TERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details on the bit error, see **Section 19.7.7, Error Statuses**.
When the length of the response field data is 0 bytes (the RFDL bit is 0), do not set this bit to “1” (enhanced).

When response data of 9 bytes or more is to be transmitted or received, do not change the LCS bit setting after the first data group through the last data group.
During transmission or reception of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.
Set this bit when the RTS bit is 0 (response transmission/reception stopped).

RCDS Bit (Response Field Communication Direction Select)

This bit selects the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped) in LIN operation mode or when the FTS bit is 0 (header reception or wake-up transmission/reception stopped) in LIN wake-up mode).
When response data of 9 bytes or more is to be transmitted or received, do not change this bit setting after the first data group through the last data group.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
Set these bits when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped).
When response data of 9 bytes or more is to be transmitted or received, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit in the RLN3nLDFC register is 1) include the checksum.

19.3.3.16 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.46 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7, 6	IDP[1:0]	Parity Setting Stores the parity bits (P0 and P1) received in the ID field.
5 to 0	ID[5:0]	ID Setting Stores the 6-bit ID value received in the ID field.

The value in the RLN3nLIDB register is enabled after the completion of header reception. In LIN mode (LIN operation mode, LIN wake-up mode), writing to this register is disabled.

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits store the parity bits (P0 and P1) received in the ID field of the LIN frame. IDP0 is for P0 and IDP1 is for P1.

When the IPERE bit in the RLN3nLEDE register is 1 (ID parity detection enabled), the received value and the value calculated internally are compared. If they do not match, IPER (ID parity error flag) is set.

ID[5:0] Bits (ID Setting)

The ID bits store the 6-bit ID value received in the ID field of the LIN frame.

19.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register is a read-only register that can be read in 8-bit units.
However, in LIN self-test mode, this register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.47 RLN3nLCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Stores the checksum value transmitted or received.

In LIN operation mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN self-test mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is stopped).

19.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

Access: This register can be read or written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.48 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or holds the received data. Setting range: 00_H to FF_H

- For response transmission:
  The RLN3nLDBRb registers set the data to be transmitted in the response field.
  These registers should be set when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stop).
- For response reception:
  The RLN3nLDBRb registers store the data received in the response field.
  The received data is overwritten. If an error is detected, the data prior to reception interruption is stored in the register.
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started)

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

19.3.4 UART Related Registers

19.3.4.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 19.49 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 samplings 0 1 0 1: 6 samplings 0 1 1 0: 7 samplings 0 1 1 1: 8 samplings 1 0 0 0: 9 samplings 1 0 0 1: 10 samplings 1 0 1 0: 11 samplings 1 0 1 1: 12 samplings 1 1 0 0: 13 samplings 1 1 0 1: 14 samplings 1 1 1 0: 15 samplings 1 1 1 1: 16 samplings Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In UART mode, it is possible to set the NSPB bits from 6 samplings to 16 samplings.

LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

19.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register

Access: RLN3nLBRP01 register can be read or written in 16-bit units.
RLN3nLBRP0 register can be read or written in 8-bit units.
RLN3nLBRP1 register can be read or written in 8-bit units.

Address: RLN3nLBRP01: <RLIN3n_base> + 02_H
RLN3nLBRP0: <RLIN3n_base> + 02_H
RLN3nLBRP1: <RLIN3n_base> + 03_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.50 RLN3nLBRP01 Register Contents

Bit Position	Bit Name	Function
15 to 0	BRP[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting range: 0000_H to $FFFF_H$

Configure the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units using the registers RLN3nLBRP0 and RLN3nLBRP1.

19.3.4.3 RLN3nLMD — UART Mode Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	—	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R	R/W	R/W

Table 19.51 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LRDNFS	UART Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 1: UART mode

Configure the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LRDNFS Bit (UART Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an UART, set these bits to 01_B.

19.3.4.4 RLN3nLBFC — UART Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	UTPS	URPS	UPS[1:0]		USBLS	UBOS	UBLS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.52 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	UTPS	UART Output Polarity Switch 0: Transmission data normal output 1: Transmission data with inverted output
5	URPS	UART Input Polarity Switch 0: Reception data normal output 1: Reception data with inverted output
4, 3	UPS[1:0]	UART Parity Select 00: Parity disabled 01: Even parity 10: 0 Parity 11: Odd parity
2	USBLS	UART Stop Bit length Select 0: Stop bit:1 bit 1: Stop bit: 2 bits
1	UBOS	UART Transfer Format Order Select 0: LSB First 1: MSB First
0	UBLS	UART Character Length Select 0: UART 8 bits communication 1: UART 7 bits communication

Configure the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

UTPS Bit (UART Output Polarity Switch)

Sets the output polarity for UART communication.
With 0 set, transmit data is output without inversion.
With 1 set, inverted transmit data is output.
The setting of this bit is valid in all the bits of the UART frame.
In half-duplex communication, this setting should match the setting of URPS bit.

URPS Bit (UART Input Polarity Switch)

This bit specifies the input polarity for UART communication.
With 0 set, received data is input without inversion.
With 1 set, received data is input with inversion.
The setting of this bit is valid in all the bits of the UART frame.
In half-duplex communication, this setting should match the setting of UTPS bit.
When setting this bit to “1” and expansion bit reception ((with expansion bit comparison) or (with data

comparison)) is performed, set the inverse of the expected value to the UEBDL bit in the RLN3nLUOR1 register and RLN3nLIDB register to enable comparison of the inverted values of the received values.

UPS[1:0] Bits (UART Parity Select)

Sets the UART parity.

- When these bits are set to "00_B", data is communicated without the parity.

  [Transmission]

  A parity bit is not added to transmit data.

  [Reception]

  Data is received without parity processing. Therefore, a parity error does not occur.

- When these bits are set to "01_B", data is communicated with the even parity.

  [Transmission]

  If the number of 1s in transmit data is odd, "1" is added to the parity bit. If the number of 1s in transmit data is even, "0" is added to the parity bit.

  [Reception]

  If the number of 1s in receive data including the parity bit is odd, a parity error occurs.

- When these bits are set to "10_B", data is communicated with 0 parity.

  [Transmission]

  Regardless of the number of 1s in transmit data, "0" is added to the parity bit.

  [Reception]

  The value of the parity bit is not evaluated. Therefore, no parity error occurs.

- When these bits are set to "11_B", data is communicated with the odd parity.

  [Transmission]

  If the number of 1s in transmit data is odd, "0" is added to the parity bit. If the number of 1s in transmit data is even, "1" is added to the parity bit.

  [Reception]

  If the number of 1s in receive data including the parity bit is even, a parity error occurs.

USBLS Bit (UART Stop Bit Length Select)

Sets the stop bit length of data for UART communication.
With 0 set, stop bit length of 1 bit is selected.
With 1 set, stop bit length of 2 bits is selected.

UBOS Bit (UART Transfer Format Select)

Sets the bit order of data for UART communication.
With 0 set, LSB first is selected.
With 1 set, MSB first is selected.

UBLS Bit (UART Character Length Select)

Sets the character length of one frame for UART communication.
With 0 set, the character length is 8 bits.
With 1 set, the character length is 7 bits.
When the character length of one frame is 9 bits (the UEBE bit in the RLN3nLUOR1 register is 1), the setting of this bit is ignored.

19.3.4.5 RLN3nLSC — UART Space Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 19.53 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Configure the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the space between the UART frames when transmitting data from the UART buffer. 0 to 3 Tbits can be set.

Set IBS[1:0] bits to "00_B" when UART buffer is not used.

When data is transferred from the UART transmission data register (RLN3nLUTDR) and the UART wait transmission data register (RLN3nLUWTDR), the setting of these bits is ignored.Set these bits to "00_B".

19.3.4.6 RLN3nLEDE —UART Error Detection Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FERE	OERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R/W

Table 19.54 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	OERE	Overrun Error Detection Enable 0: Disables overrun error detection. 1: Enables overrun error detection.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Configure the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is reflected in the FER flag of the RLN3nLEST register.
For details on the framing error, see **Section 19.8.5, Error Statuses**.

OERE Bit (Overrun Error Detection Enable)

This bit enables or disables detection of the overrun error.
With 0 set, the overrun error is not detected.
With 1 set, the overrun error is detected.
When this bit is set to 1, the detection result is reflected in the OER flag of the RLN3nLEST register.
For details on the overrun error, see **Section 19.8.5, Error Statuses**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is reflected in the BER flag of the RLN3nLEST register.
In full-duplex communication, do not set this bit to “1”.
Do not set this register when the NSPB bits in the RLN3nLWBR register are 0101_B (6 samplings) and the LRDNFS bit in the RLN3nLMD register is 0 (noise filtering is enabled).

For details on the bit error, see **Section 19.8.5, Error Statuses**.

19.3.4.7 RLN3nLCUC — UART Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 19.55 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	OM0	LIN Reset 0: LIN reset mode 1: LIN reset mode is canceled.

After a value is written to this register, confirm that the value written is reflected in the RLN3nLMST register before writing another value.

OM0 Bit (LIN Reset)

The OM0 bit selects whether to transition to or exit LIN reset mode.
With 0 set, LIN reset mode.
With 1 set, LIN reset mode is canceled.

19.3.4.8 RLN3nLTRC — UART Transmission Control Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R

Table 19.56 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	RTS	UART Buffer Transmission Start 0: UART Buffer transmission is stopped. 1: UART Buffer transmission is started.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

RTS Bit (UART Buffer Transmission Start)

When transmitting data from the UART buffer, set this bit to “1”.
Only 1 can be written to this bit; 0 cannot be written.
Write to this bit when the UTOE bit in the RLN3nLUOER register is 1 (transmission enable) and the UTS bit in the RLN3nLST register is 0 (transmission is not in progress).
Once set, regardless of errors, this bit is automatically cleared to 0 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDFC register. This bit is also automatically cleared to 0 upon transition to LIN reset mode.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
When writing 1 to this bit while the UTSW bit in the RLN3nLDFC register is 1 (when UART buffer transmission is requested, the start of transmission is delayed until the reception of stop bit is completed), write only during the reception of stop bit.

19.3.4.9 RLN3nLMST — UART Mode Status Register

Access: This register is a read-only register that can be read in 8-bit units.

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 19.57 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: Not in LIN reset mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

19.3.4.10 RLN3nLST — UART Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	URS	UTS	ERR	—	—	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 19.58 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	URS	Reception Status Flag 0: Reception is stopped. 1: Reception is started.
4	UTS	Transmission Status Flag 0: Transmission is stopped. 1: Transmission is started.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	FTC	Successful UART Buffer Transmission Flag 0: UART buffer transmission has not been completed. 1: UART buffer transmission has been completed.

The RLN3nLST register is automatically cleared to "00_H" upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains "00_H". To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

URS Flag (Reception Status Flag)

At the start of the reception, this flag is set to 1.
The reception is started under the following condition.

- When the start bit is detected

At the end of reception, this flag is cleared to 0. While reception is stopped, this flag retains 0.
The reception is ended under the following conditions.

- Sampling point of the first bit of the stop bits

UTS Flag (Transmission Status Flag)

At the start of the transmission, this flag is set to 1. During the transmission, this flag retains 1.
The transmission is started under the following conditions.

- When transmission data is specified in the RLN3nLUTDR or RLN3nLUWTDR register
- When the RTS bit in the RLN3nLTRC register is set to 1

This flag is cleared to 0 at the completion of transmission.
The transmission is ended under the following conditions.

- When transmission of data specified in the RLN3nLUTDR or RLN3nLUWTDR register is completed and next data is not specified
- When transmission from UART buffer is completed (when the RTS bit in the RLN3nLTRC register is cleared to 0)

ERR Flag (Error Detection Flag)

This flag is set to 1 upon detection of an error, detection of an expansion bit, or when ID's match (when at least one of the flags of the RLN3nLEST register is 1). Here, an interrupt request for RLIN3n status is generated. However, if an error or expansion bit is detected or ID's match while this bit is 1, an interrupt is not generated. To clear the bit to 0, write 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register.

FTC Flag (Successful UART Buffer Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that it was before 1 was written.
Regardless of errors, this bit is set to 1 upon completion of transmission of the number of data specified by the MDL bit in the RLN3nLDFC register from the UART buffer. Here, an interrupt request for RLIN3n transmission is generated. Write 0 to clear this flag.

19.3.4.11 RLN3nLEST — UART Error Status Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	UPER	IDMT	EXBT	FER	OER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 19.59 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	UPER	Parity Error Flag 0: Parity error has not been detected. 1: Parity error has been detected.
5	IDMT	ID Match Flag 0: The received data does not match the ID value. 1: The received data matches the ID value.
4	EXBT	Expansion Bit Detection Flag 0: Expansion bit has not been detected. 1: Expansion bit has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	OER	Overrun Error Flag 0: Overrun error has not been detected. 1: Overrun error has been detected.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to, and the value of 00_H is retained. To clear certain bits in this register, write 0 to those bits, and write 1 to the bits not to be cleared by using the store instruction.

UPER Flag (Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.
This flag is set to 1 upon parity error detection. Write 0 to clear this flag.

IDMT Flag (ID Match Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.

The IDMT flag is set to 1 when all the following conditions are met:

- The UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enabled)
- The UECD bit in the RLN3nLUOR1 register is 0 (expansion bit comparison enabled)
- The UEBDCE bit in the RLN3nLUOR1 register is 1 (expansion bit/data comparison enabled)

– The received expansion bit and the value of the UEBDL bit of the RLN3nLUOR1 register match.
– The 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register match.

Write 0 to clear this flag.

EXBT Flag (Expansion Bit Detection Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
When the UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enable), if the received expansion bit matches with the UEBDL bit in the RLN3nLUOR1 register, this flag is set to 1.
Write 0 to clear this flag.

FER Flag (Framing Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
The FER flag is set to 1 upon framing error detection while the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled). Write 0 to clear this flag.

OER Flag (Overrun Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it had before 1 is written.
The OER flag is set to 1 upon overrun error detection while the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). Write 0 to clear this flag.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value it had before 1 is written.
The BER flag is set to 1 when the transmitted data and the data monitored by the receive pin do not match while the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled).
Write 0 to clear this flag.

19.3.4.12 RLN3nLDFC — UART Data Field Configuration Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	UTSW	—	MDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 19.60 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	UTSW	Transmission Start Wait 0: When UART buffer transmission is requested, transmission is started immediately. 1: When UART buffer transmission is requested, transmission is not started until reception of the stop bit is completed.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	MDL[3:0]	UART Buffer Data Length Select b3 b0 0 0 0 0: 9 data 0 0 0 1: 1 data 0 0 1 0: 2 data 0 0 1 1: 3 data 0 1 0 0: 4 data 0 1 0 1: 5 data 0 1 1 0: 6 data 0 1 1 1: 7 data 1 0 0 0: 8 data 1 0 0 1: 9 data Settings other than the above are prohibited.

UTSW Bit (Transmission Start Wait)

This bit controls the transmission start timing of UART buffer.
With 0 set, transmission is started as soon as the start of UART buffer transmission is requested.
With 1 set, transmission is started after the completion of the stop bit reception.
Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.
This bit is enabled when the RTS bit in the RLN3nLTRC register is set to 1. In addition, writing a value to this bit is disabled when the RTS bit is 1 (UART buffer transmission started).
Set this bit to 1 only to switch from reception to transmission in half-duplex communication.

MDL[3:0] Bits (UART Buffer Data Length Select)

These bits specify the data length of the UART buffer.
Writing a value to these bits is disabled when the RTS bit in the RLN3nLTRC register is 1 (UART buffer transmission started).

19.3.4.13 RLN3nLIDB — UART ID Buffer Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ID[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.61 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7 to 0	ID[7:0]	Specifies the ID value that is referred in expansion bit data comparison

ID Bit (ID Bit)

When the UEBE bit in the RLN3nLUOR1 register is set to 1 (expansion bit enabled), the UECD bit is set to 0 (expansion bit comparison enabled), and the UEBDCE bit is set to 1 (data comparison after expansion bit is detected), set the value to be compared with the received data. Write to the RLN3nLIDB register when the URS bit in the RLN3nLST register is 0 (reception is stopped).

19.3.4.14 RLN3nLUDB0 — UART Data Buffer 0 Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 17_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	UDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.62 RLN3nLUDB0 Register Contents

Bit Position	Bit Name	Function
7 to 0	UDB[7:0]	Sets the data to be transmitted. Setting range: 00_H to FF_H

If the data length selection corresponds to 9 data bytes (RLN3nLDFC.MDL bit is "0_H" or "9_H") for multi-byte UART transmission, then the first data value for UART communication is present in this buffer.

Write to the RLN3nLUDB0 register when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

Table 19.63, Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see **Section 19.8.1.2, UART Buffer Transmission**, **(1) UART Buffer Transmission**.

Table 19.63 Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format

19.3.4.15 RLN3nLDBRb — UART Data Buffer b Register (b = 1 to 8)

Access: This register can be read or written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.64 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Specifies the data to be transmitted. Setting range: 00_H to FF_H

These registers specify the data transmitted from the UART buffer.

Write to these registers when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

Table 19.65, Bit Arrangement of the RLN3nLDBRb Register According to Each Communication Format, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see **Section 19.8.1.2, UART Buffer Transmission**, **(1) UART Buffer Transmission**.

19.3.4.16 RLN3nLUOER — UART Operation Enable Register

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	UROE	UTOE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 19.66 RLN3nLUOER Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	UROE	Reception Enable 0: Disables reception. 1: Enables reception.
0	UTOE	Transmission Enable 0: Disables transmission. 1: Enables transmission.

The RLN3nLUOER register is automatically cleared to 00_H upon transition to LIN reset mode.
In LIN reset mode, this register cannot be written to.
In LIN reset mode, the register retains 00_H.

UROE Bit (Reception Enable)

The UROE bit enables or disables reception.
With 0 set, reception is disabled.
With 1 set, reception is enabled.
Do not clear this bit during reception. If the communication is suspended during reception, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to transition to the LIN reset mode. Note that transmission is also aborted.

Do not set this bit to 1 when data transmission from the UART buffer is in progress.

UTOE Bit (Transmission Enable)

The UTOE bit enables or disables transmission.
With 0 set, transmission is disabled.
With 1 set, transmission is enabled.
Do not clear this bit during transmission. If the communication is suspended during transmission, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to transition to the LIN reset mode. Note that reception is also aborted.

19.3.4.17 RLN3nLUOR1 — UART Option Register 1

Access: This register can be read or written in 8-bit units.

Address: <RLIN3n_base> + 21_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	UECD	UTIGTS	UEBDCE	UEBDL	UEBE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 19.67 RLN3nLUOR1 Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UECD	Expansion Bit Comparison Disable 0: Enables expansion bit comparison. 1: Disables expansion bit comparison.
3	UTIGTS	Transmission Interrupt Generation Timing Select 0: Transmission interrupt is generated at the start of transmission. 1: Transmission interrupt is generated at the completion of transmission.
2	UEBDCE	Expansion Bit Data Comparison Enable 0: Disables data comparison after an expansion bit is detected. 1: Enables data comparison after an expansion bit is detected.
1	UEBDL	Expansion Bit Detection Level Select 0: Selects expansion bit value 0 as the expansion bit detection level. 1: Selects expansion bit value 1 as the expansion bit detection level.
0	UEBE	Expansion Bit Enable 0: Disables expansion bit operation. 1: Enables expansion bit operation.

UECD Bit (Expansion Bit Comparison Disable)

The UECD bit enables or disables comparison between the received expansion bit and the UEBDL bit value when the UEBE bit is 1 (expansion bit operation is enabled).
With 0 set, comparison between the received expansion bit and the UEBDL bit value is enabled when the expansion bit is received.
With 1 set, comparison between the received expansion bit and the UEBDL bit value is disabled when the expansion bit is received.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.
Do not set this bit to 1 when the UEBDCE bit is 1 (expansion bit/data comparison enable).

UTIGTS Bit (Transmission Interrupt Generation Timing Select)

The UTIGTS bit selects the generation timing of the transmission interrupt.
With 0 set, the transmission interrupt is generated at the start of transmission.
With 1 set, the transmission interrupt is generated at the completion of transmission.
When transmission from the UART buffer is performed with 0 set, the transmission interrupt is generated only at the start of the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register).
When transmission from the UART buffer is performed with 1 set, the transmission interrupt is

generated only at the completion of the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register).

UEBDCE Bit (Expansion Bit Data Comparison Enable)

After an expansion bit is detected, this bit enables or disables the comparison between the 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register.
With 0 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is disabled.
With 1 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UEBE bit is 0 (expansion bit operation disabled).
Do not set this bit to 1 when the UECD bit is 1 (expansion bit comparison disabled).
Do not set this bit to 1 when the UART buffer is used.

UEBDL Bit (Expansion Bit Detection Level Select)

The UEBDL bit selects the level to be detected as the expansion bit when the UEBE bit is 1 (expansion bit operation is enabled) and the UECD bit is 0 (expansion bit comparison enabled).
With 0 set, expansion bit value 0 is the level to be detected as the expansion bit.
With 1 set, expansion bit value 1 is the level to be detected as the expansion bit.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

UEBE Bit (Expansion Bit Enable Bit)

The UEBE bit enables or disables expansion bit operation.
With 0 set, expansion bit operation is disabled.
With 1 set, expansion bit operation is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

19.3.4.18 RLN3nLUTDR — UART Transmission Data Register

Access: RLN3nLUTDR register can be read or written in 16-bit units.
RLN3nLUTDRL register can be read or written in 8-bit units.
RLN3nLUTDRH register can be read or written in 8-bit units.

Address: RLN3nLUTDR: <RLIN3n_base> + 24_H
RLN3nLUTDRL: <RLIN3n_base> + 24_H
RLN3nLUTDRH: <RLIN3n_base> + 25_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	UTD[8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.68 RLN3nLUTDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	UTD[8:0]	Specifies the data to be transmitted. Setting range: 000_H to $1FF_H$

The RLN3nLUTDR register specifies the data to be transmitted from the transmission data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

This register can be accessed in 8 bits.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

Also, do not write data to this register when a transmission request is being generated due to write access to the RLN3nLUWTDR register.

When transmitting data continuously, do not set another piece of transmission data in this register before the generation of transmission interrupt.

The table below shows the bit arrangement according to the set communication format.

Table 19.69 Bit Arrangement of the RLN3nLUTDR Register According to Each Communication Format

	RLN3nLUTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0

Table 19.70 RLN3nLURDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned.
8 to 0	URD [8:0]	Store the received data

The RLN3nLURDR allows the reception data to be read from the receive data register.

When the UROE bit in the RLN3nLUOER register is 1, the received data is stored in this register and can be read out.

This register is updated upon reception of stop bit in the received data.

This register is also updated even when an error is caused by the parity or stop bit.

However, the value of this register is not updated if an overrun error occurs when the OERE bit of the RLN3nLEDE register is 1 (overrun detection enabled). The value of this register is updated even if an overrun error occurs when the OERE bit is 0 (overrun detection disabled).

Read this register upon occurrence of a reception error (overrun error, framing error, parity error) when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). If the next data is received without reading this register, an overrun error occurs.

This register can be accessed in 8-bit units.

However, when expansion bit is used (UEBE bit of the RLN3nLUOR1 register is 1 (expansion bit operation enabled), do not attempt 8-bit access.

The table below shows the bit arrangement according to the set communication format.

Table 19.71 Bit Arrangement of the RLN3nLURDR Register According to Each Communication Format

	RLN3nLURDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0

9-bit; MSB first	Bit0	Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7	Bit8

19.3.4.20 RLN3nLUWTDR — UART Wait Transmission Data Register

Access: RLN3nLUWTDR register can be read or written in 16-bit units.
RLN3nLUWTDRL register can be read or written in 8-bit units.
RLN3nLUWTDRH register can be read or written in 8-bit units.

Address: RLN3nLUWTDR: <RLIN3n_base> + 28_H
RLN3nLUWTDRL: <RLIN3n_base> + 28_H
RLN3nLUWTDRH: <RLIN3n_base> + 29_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	UWTD[8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.72 RLN3nLUWTDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 0	UWTD[8:0]	Sets the data to be transmitted from the wait transmit data register after waiting for the stop bit reception to be completed. Setting range: 000_H to $1FF_H$

The RLN3nLUWTDR register sets the data to be transmitted from the UART wait transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

Use this register only to switch from reception to transmission in half-duplex communication.

Also, write to this register only while the stop bit is being received.

Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.

When this register is read, the value of the RLN3nLUTDR register is actually read.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

The table below shows the bit arrangement according to the set communication format.

Table 19.73 Bit Arrangement of the RLN3nLUWTDR Register According to Each Communication Format

	RLN3nLUWTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0
7-bit; LSB first	—	—	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

9-bit; MSB first	Bit0	Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7	Bit8

19.4 Interrupt Sources

The LIN/UART interface generates four types of interrupt requests.

- RLIN3n transmission interrupt
- RLIN3n successful reception interrupt
- RLIN3n status interrupt
- RLIN3n interrupt

Setting the LIOS bit in the RLN3nLMD register to 0 allows to perform logical OR operation on all of the interrupt sources, outputting the interrupt request from the RLIN3n interrupt.

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, or RLIN3n status interrupt depending on the interrupt request.

Table 19.74 lists the sources for each interrupt.

Table 19.74 Interrupt Sources

		LIOS bit in RLN3nLMD register is 0	LIOS bit in RLN3nLMD register is 1*1		
		RLIN3n Interrupt	RLIN3n Transmission Interrupt	RLIN3n Successful Reception Interrupt	RLIN3n Status Interrupt
LIN mode	LIN master mode	• Successful frame transmission • Successful frame reception • Successful wake-up transmission • Successful wake-up reception • Successful header transmission • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error	• Successful frame transmission • Successful wake-up transmission • Successful header transmission	• Successful wake-up reception • Successful wake-up reception	• Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error
	LIN slave mode	• Successful response transmission • Successful response reception • Successful wake-up transmission • Successful wake-up reception • Successful header reception • Bit error • Frame/response timeout error • Framing error • Sync field error • Checksum error • ID parity error • Response preparation error	• Successful response transmission • Successful wake-up transmission	• Successful response reception • Successful wake-up reception • Successful header reception	• Bit error • Frame/response timeout error • Framing error • Sync field error • Checksum error • ID parity error • Response preparation error
UART mode		—	• Transmission start/ successful transmission	• Successful reception • Expansion bit mismatch	• Bit error • Overrun error • Framing error • Expansion bit match • ID match • Parity error

Note 1. The LIOS bit setting is valid in LIN Mode. In UART mode, setting the LIOS bit is not required.

In LIN mode, each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is set to 1.

19.5 Modes

The LIN/UART interface provides the following four modes, depending on the specific function to be performed:

- LIN reset mode
- LIN mode
  - LIN master mode
  - LIN slave mode [auto baud rate]
  - LIN slave mode [fixed baud rate]
- UART mode
- LIN self-test mode

Figure 19.2 shows mode transitions. **Table 19.79** describes mode transition conditions. **Table 19.79** lists operations available in each mode.

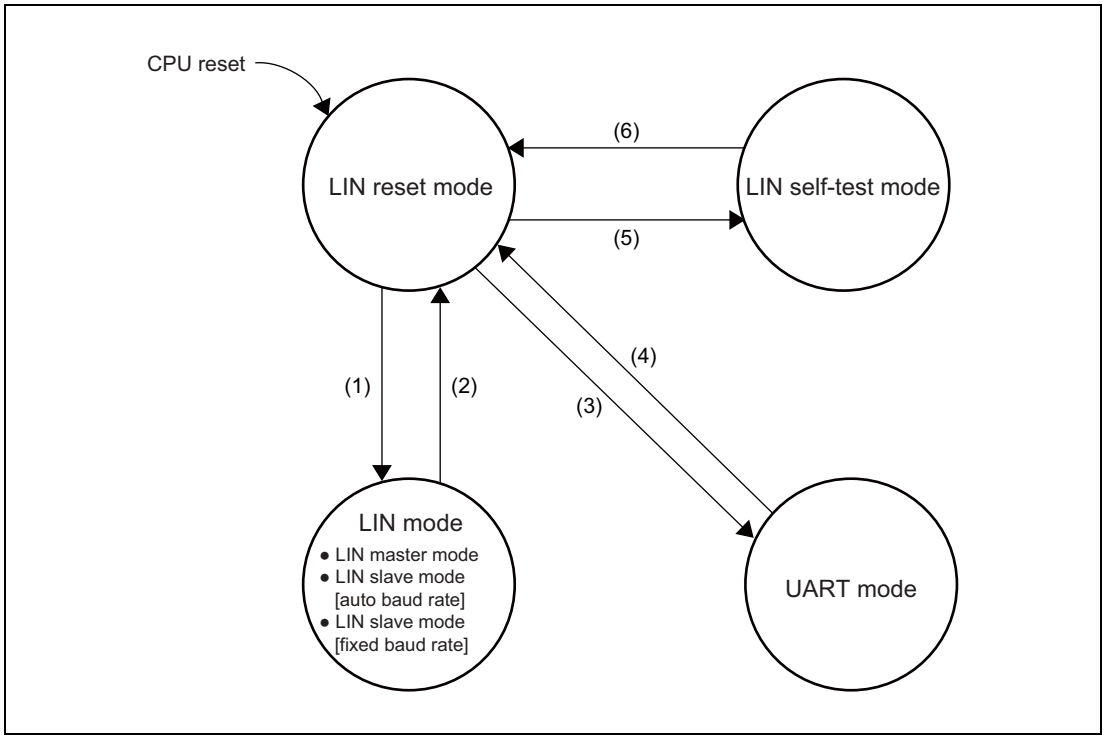

Figure 19.2 Mode Transitions

Table 19.75 Transition Condition of Each Mode

	Mode Transition			Transition Condition
(1)	LIN reset mode	→	LIN mode	
			• LIN master mode	• LMD bits in RLN3nLMD register = 00_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B or 11_B
			• LIN slave mode [auto baud rate]	• LMD bits in RLN3nLMD register = 11_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B or 11_B
			• LIN slave mode [fixed baud rate]	• LMD bits in RLN3nLMD register = 10_B and OM1 and OM0 bits of RLN3nLCUC register = 01_B or 11_B
(2)	LIN mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
(3)	LIN reset mode	→	UART mode	LMD bits in RLN3nLMD register = 01_B and OM0 bit in RLN3nLCUC register = 1_B
(4)	UART mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
(5)	LIN reset mode	→	LIN self-test mode	See **Section 19.9, LIN Self-Test Mode**.
(6)	LIN self-test mode	→	LIN reset mode	See **Section 19.9, LIN Self-Test Mode**.

Table 19.76 Operations Available in Each Mode

LIN Mode			
LIN Master Mode	**LIN Slave Mode [auto baud rate] LIN Slave Mode [fixed baud rate]**	**UART Mode**	**LIN Self-Test Mode**
Header transmission Response transmission Response reception Wake-up transmission Wake-up reception Error detection	Header reception Response transmission Response reception Wake-up transmission Wake-up reception Error detection	UART transmission UART reception Error detection	Self-test

Whether mode has transitioned to LIN reset mode, the LIN mode, or the UART mode can be verified by reading the LMD bits in the RLN3nLMD register and the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see **Section 19.9, LIN Self-Test Mode**.

19.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The transition to LIN reset mode can be verified by checking that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication and the UART communication functions are halted.

From LIN reset mode, transitions to LIN mode, UART mode, and LIN self-test mode can be made.

When the mode transitions to LIN reset mode, the following registers are initialized to their reset values and they retain their initial values while in LIN reset mode:

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register
- RLN3nLUOER register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLUDB0 register
- RLN3nLDBRb register (b = 1 to 8)
- RLN3nLUOR1 register
- RLN3nLUTDR register
- RLN3nLURDR register
- RLN3nLUWTDR register

19.7 LIN Mode

LIN mode can operate in the following submodes: LIN master mode, LIN slave mode [auto baud rate], and LIN slave mode [fixed baud rate].

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00_B (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01_B or 11_B causes the transition to LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01_B to 11_B.

In LIN slave mode [auto baud rate] and LIN slave mode [fixed baud rate], header reception, response transmission, response reception, wake-up transmission, wake-up reception, and error detection can be performed.

The LIN slave mode [auto baud rate] allows automatic detection of the break field and the sync field, and sets a baud rate based on the results of measurement of a sync field. The baud rate can be set to 1 kbps to 20 kbps.

Set the LPRS[2:0] bits in the RLN3nLWBR register so that the prescaler clock (the clock obtained by dividing the frequency of the LIN communication clock source by the prescaler) is configured as follows according to the target baud rate.

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4MHz*1
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

Note 1. Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to "0011_B" (4 samplings).

LIN slave mode [fixed baud rate] allows automatic detection of the break field, the sync field, and the ID field at a baud rate that is preset by the baud rate generator.

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 10_B (LIN slave mode [auto baud rate]) and setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B or 11_B causes the transition to LIN slave mode [auto baud rate]; and setting the LMD bits in the RLN3nLMD register to 11_B (LIN slave mode [fixed baud rate]), and setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B or 11_B causes the transition to LIN slave mode [fixed baud rate], turning the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B or 11_B.

When transitioning form one submode to another submode within LIN mode, transition to LIN reset mode first and change the LMD bits in the RLN3nLMD register.

The LIN mode provides the following two operating modes:

- LIN operation mode
- LIN wake-up mode

Figure 19.3 shows the transition of operating modes. **Table 19.77** describes the transition conditions of operating modes.

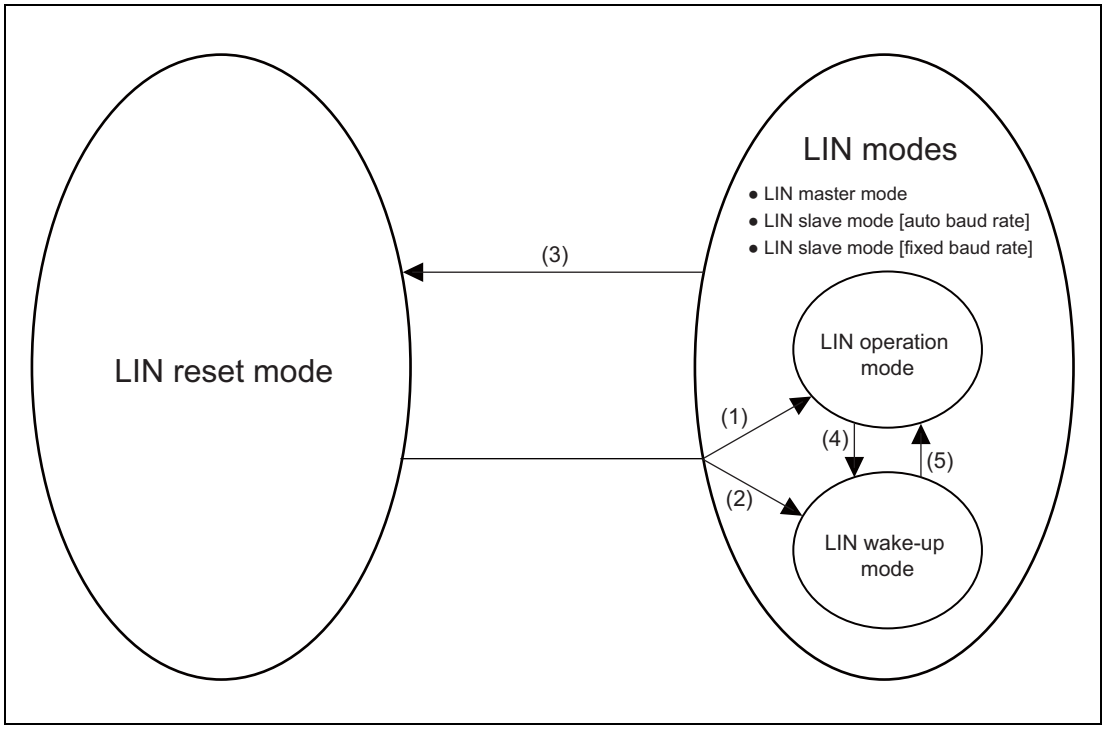

Figure 19.3 Transition of Operating Modes

Table 19.77 Transition Conditions for Operating Modes

	Operation Mode Transition			Transition Condition
(1)	LIN reset mode	→	LIN mode • LIN operation mode	LMD bits in RLN3nLMD register = 00_B or 10_B or 11_B and OM1 and OM0 bits in RLN3nLCUC register = 11_B
(2)	LIN reset mode	→	LIN mode • LIN wake-up mode	LMD bits in RLN3nLMD register = 00_B or 10_B or 11_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B
(3)	LIN mode • LIN operation mode • LIN wake-up mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
(4) *1	LIN mode • LIN operation mode	→	LIN mode • LIN wake-up mode	OM1 and OM0 bits in RLN3nLCUC register = 01_B
(5) *1	LIN mode • LIN wake-up mode	→	LIN mode • LIN operation mode	OM1 and OM0 bits in RLN3nLCUC register = 11_B

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is in progress (when the FTS bit in the RLN3nLTRC register is 1).

(1) LIN Operation Mode

While in LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11_B switches the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11_B. Communication settings should be configured after the OMM1 and OMM0 bits have become 11_B.

(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B switches the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B. Communication settings should be configured after the OMM1 and OMM0 bits have become 01_B.

19.7.1 LIN Master Mode

19.7.1.1 Header Transmission

Figure 19.4 shows the operation of the LIN/UART interface (LIN master mode) in header transmission. **Table 19.78** provides processing in header transmission.

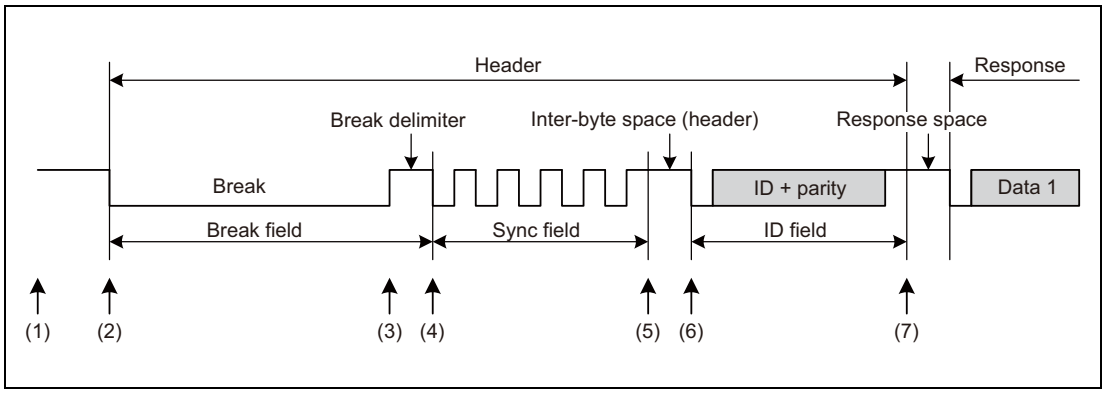

Figure 19.4 Operation in Header Transmission

Table 19.78 Processing in Header Transmission

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Transitions to LIN master mode: LIN operation mode • Configures frame information to be transmitted (ID, parity, data length, response direction, Checksum method, and transmission data)	Waits for the FTS bit in the RLN3nLTRC register to be set by software (idle)
(2)	Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3)	Waits for an interrupt request	Transmits a break delimiter.
(4)		Transmits a sync field (55_H).
(5)		Transmits an inter-byte space (header).
(6)		Transmits an ID field.
(7)		Sets the successful header transmission flag.

NOTE

For information about error detection conditions, see **Section 19.7.7, Error Statuses**.

19.7.1.2 Response Transmission

Figure 19.5 shows the operation of the LIN/UART interface (LIN master mode) in response transmission. **Table 19.79** provides processing in response transmission.

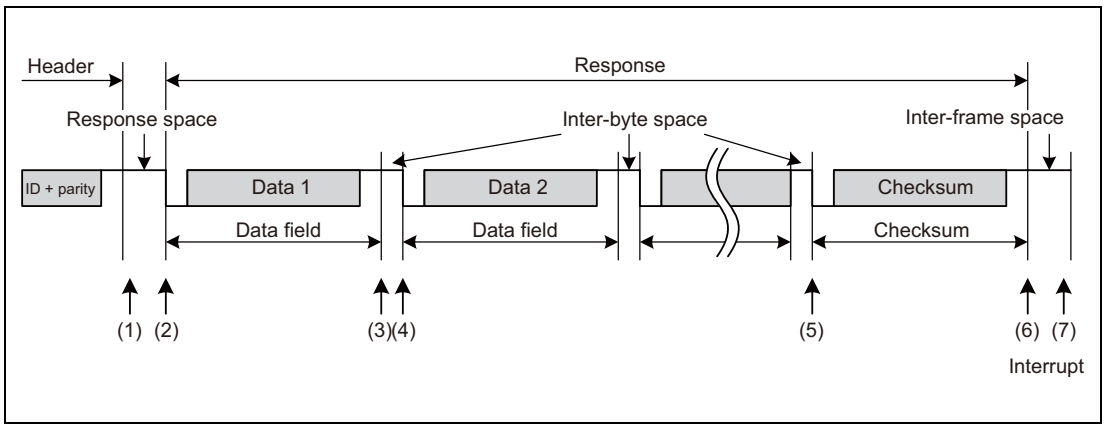

Figure 19.5 Operation in Response Transmission

Table 19.79 Processing in Response Transmission

	Software Processing	LIN/UART Interface Processing
(1)	[When in frame separate mode] • Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started) [When not in frame separate mode] • Waits for an interrupt request	[When in frame separate mode] • Waits for the RTS bit in the RLN3nLTRC register to be set to 1 by software. • When the bit is set to 1, transmits a response space. [When not in frame separate mode] • Transmits a response space.
(2)	Waits for an interrupt request	Transmits data 1.
(3)		Transmits an inter-byte space.
(4)		• Transmits data 2. • Transmits an inter-byte space • Transmits data 3. • Transmits an inter-byte space (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register). : :
(5)		Transmits the checksum.
(6)		• Sets the successful frame/wake-up transmission flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped) [When in frame separate mode] • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception is stopped).
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	Idle

NOTE

For information about error detection conditions, see **Section 19.7.7, Error Statuses**.

19.7.1.3 Response Reception

Figure 19.6 shows the operation of the LIN/UART interface (LIN master mode) in response reception. **Table 19.80** provides processing in response reception.

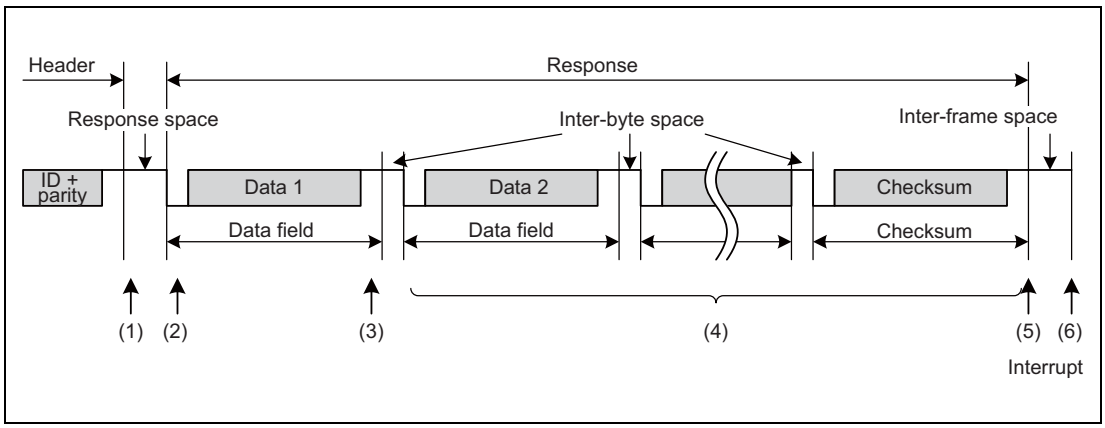

Figure 19.6 Operation in Response Reception

Table 19.80 Processing in Response Reception

	Software Processing	LIN/UART Interface Processing
(1)	Waits for an interrupt request (no processing)	Waits for detection of a start bit.
(2)		Receives data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		• Receives data 2 when the start bit is detected. • Receives data 3 when the start bit is detected. Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register). : : • Receives the checksum when the start bit is detected.
(5)		• Determines the checksum. • Sets the successful frame/wake-up reception flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 19.7.7, Error Statuses**.

19.7.2 LIN Slave Mode

19.7.2.1 Header Reception

Figure 19.7 shows the operation of the LIN/UART interface (LIN slave mode) in header reception.
Table 19.81 provides processing in header reception.

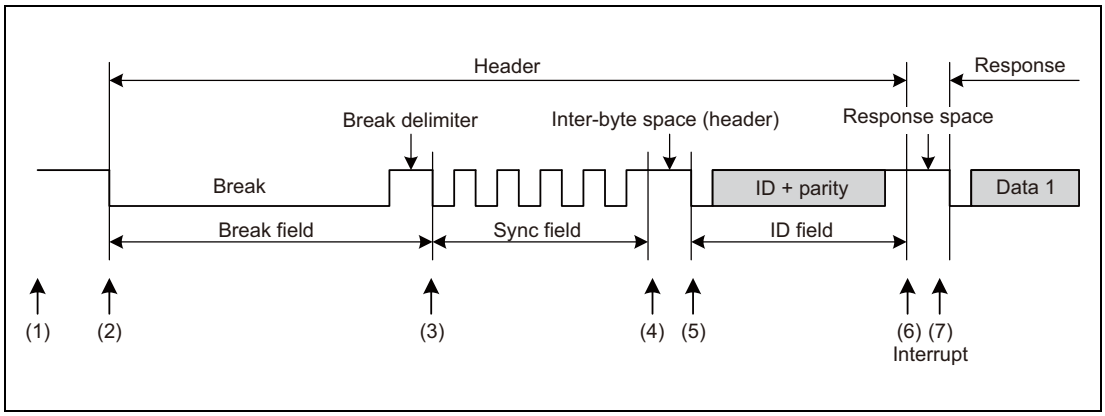

Figure 19.7 Operation in Header Reception

Table 19.81 Processing in Header Reception

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Transitions to the LIN slave mode: LIN operation mode • Sets the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/ reception started)	Waits for the FTS bit in the RLN3nLTRC register to be set by software.
(2)	Waits for an interrupt request.	Waits for detection of break field
(3)		Detects a break field (LIN slave mode [fixed baud rate]). For details about the break field detection timing in the case of LIN slave mode [auto baud rate], see [Auto Baud Rate Correction Function].)
(4)		• Detects a sync field (55_H) • Sets the baud rate generator (in the case of LIN slave mode [auto baud rate]) • Clears the no-response request bit (LNRR bit).
(5)		• Receives an ID field. • Checks the ID parity bit
(6)		Sets the header reception complete flag.
(7)	• Checks the RLN3nLST register, and clears flags. • Checks the RLN3nLIDB register, and prepares a response.	• Completes a header reception process. • Waits for a response request.

NOTE

The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred. For information about error detection conditions, see **Section 19.7.7, Error Statuses**.

[Auto Baud Rate Correction Function]

In LIN slave mode [auto baud rate], the system always measures the low-level widths that are received. If the first "Low level" width is 10 times (if the BLT bit of the RLN3nLBFC register is "0") or 11 times (if the BLT bit of the RLN3nLBFC register is "1") or greater than the bit width calculated from the average of the starting 2 bits (the period of the consecutive falling edges from the beginning of the sync field) of the sync field, the system concludes that the detection of break field was successful and verifies that the data in the sync field is 55_H. If the data in the sync field is indeed 55_H and the system determines that sync field reception was successful, the system automatically sets the baud rate correction result to the RLN3nLBRP01 register.

If data is received up to the ID field without error, a successful header reception interrupt is generated at the stop bit position.

On the other hand, if the data in the sync field is not 55_H and the system determines that sync field reception failed, the system sets the sync field error flag and an error interrupt is generated. In that case, baud rate correction is not performed and the LIN/UART interface waits for the detection of the next break field (low level).

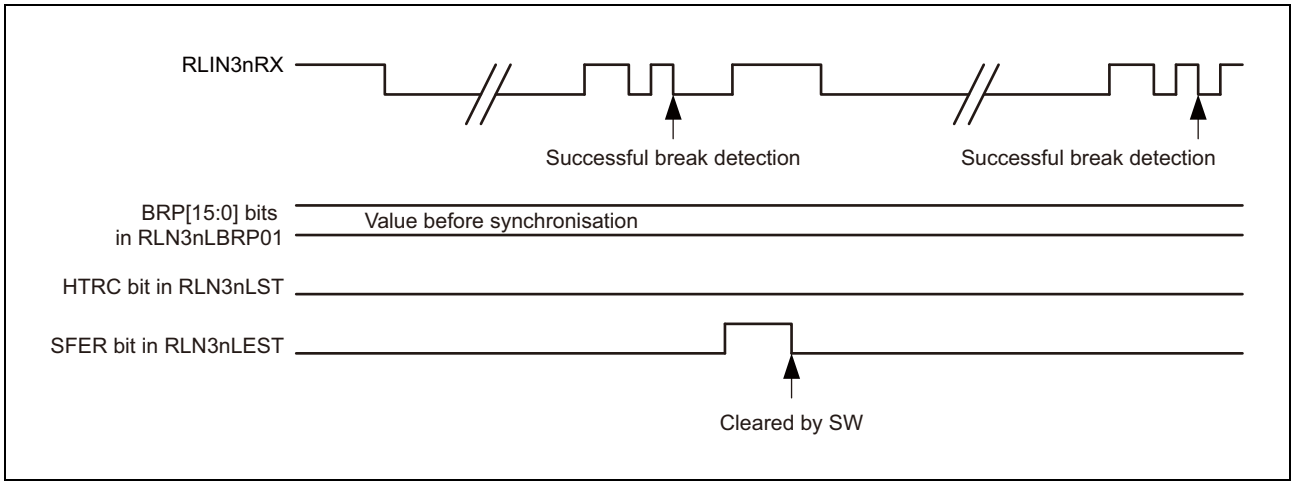

Figure 19.9 Header Reception in LIN Slave Mode [Auto Baud Rate] (Sync Field Error)

19.7.2.2 Response Transmission

Figure 19.10 shows the operation of the LIN/UART interface (LIN slave mode) in response transmission. **Table 19.82** provides processing in response transmission.

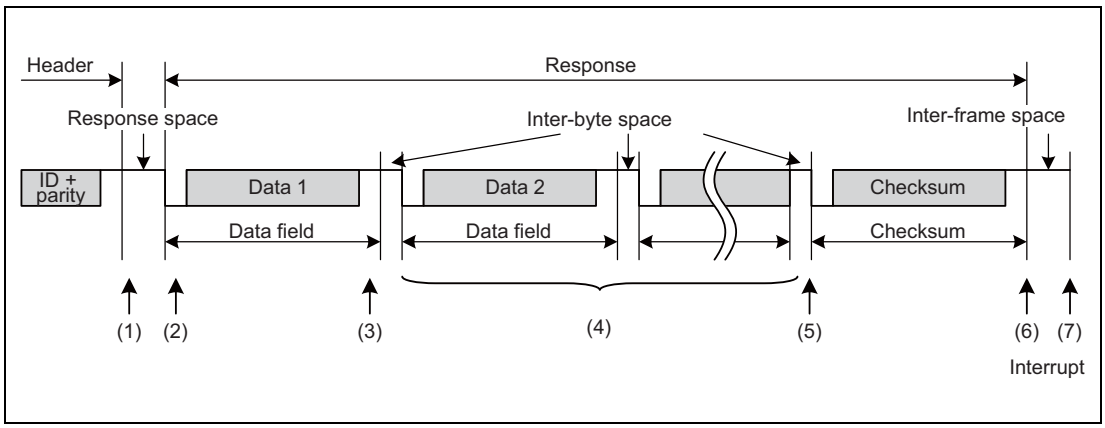

Figure 19.10 Operation in Response Transmission

Table 19.82 Processing in Response Transmission

	Software Processing	LIN/UART Interface Processing
(1)	• Configures the RLN3nLDFC register. • Configures the RLN3nLDBRb registers.(b = 1 to 8) • Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started)	• Waits for the RTS or LNRR bit in the RLN3nLTRC register to be set by software • Transmits the response space after the RTS bit of the RLN3nLTRC register is set to 1
(2)	Waits for an interrupt request.	Transmits data 1.
(3)		Transmits an inter-byte space.
(4)		• Transmits data 2. • Transmits an inter-byte space • Transmits data 3. • Transmits an inter-byte space (Repeats as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register). : :
(5)		Transmits the checksum.
(6)		• Sets the successful response/wake-up transmission flag. • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	• Completes the response transmission process. • Waits for a new break.

NOTE

- For information about error detection, see **Section 19.7.7, Error Statuses**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred.

19.7.2.3 Response Reception

Figure 19.11 shows the operation of the LIN/UART interface (LIN slave mode) in response reception. **Table 19.83** provides processing in response reception.

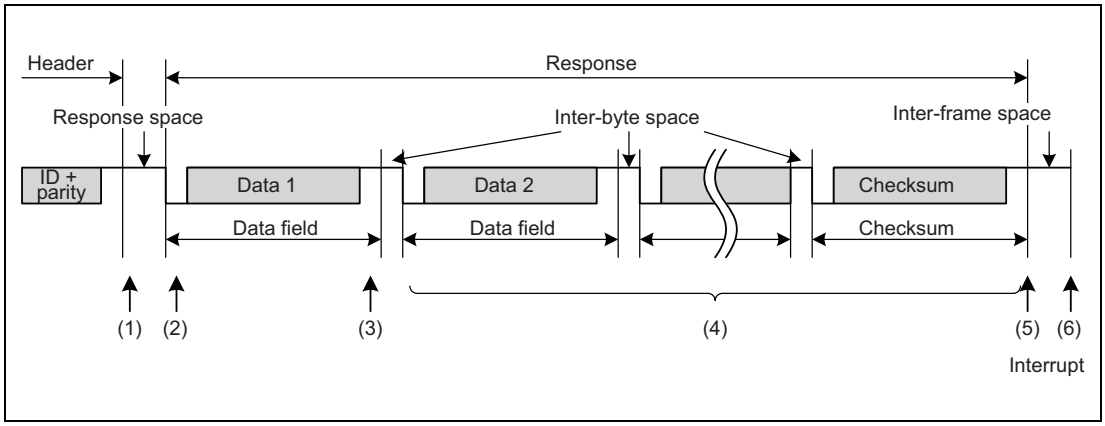

Figure 19.11 Operation in Response Reception

Table 19.83 Processing in Response Reception

	Software Processing	LIN/UART Interface Processing
(1)	• Sets the RLN3nLDFC register. • Sets the response transmission/reception start bit (RTS bit) to 1.	• Waits for the RTS (response transmission/reception start) or LNRR (no-response request) bit to be set by software. • Waits for detection of the start bit.
(2)	Waits for an interrupt request.	Receives data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		• Receives data 2 when the start bit is detected. • Receives data 3 when the start bit is detected. Repeats as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register). : : • Receives the checksum when the start bit is detected.
(5)		• Determines the checksum. • Sets the successful response/wake-up reception flag or error flag. • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	• Completes the response process. • Waits for a new break.

NOTE

- For information about error detection conditions, see **Section 19.7.7, Error Statuses**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the subsequent Sync field and ID field) continues regardless of whether an error occurred.

19.7.2.4 No-response Request

Figure 19.12 shows the operation of the LIN/UART interface (LIN slave mode) when no response is requested. **Table 19.84** shows the processing that occurs when no response is requested.

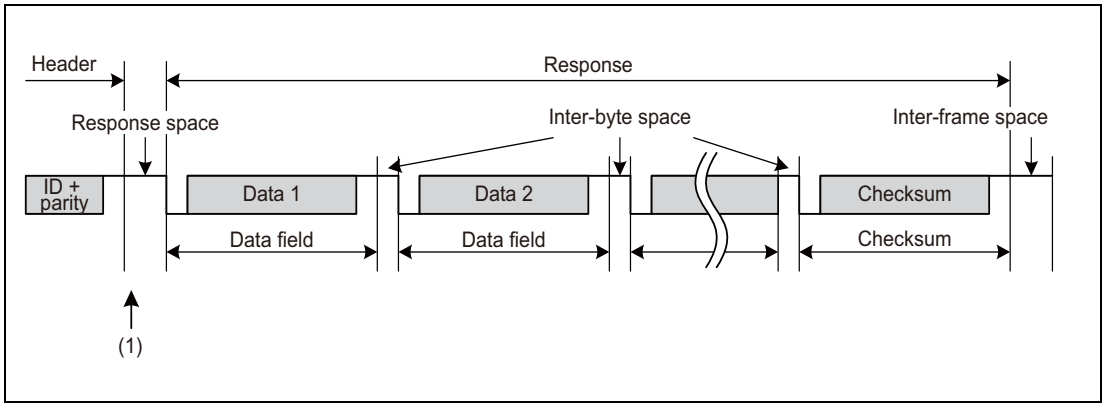

Figure 19.12 Operation when No Response is Requested

Table 19.84 Processing when No Response is Requested

Software Processing	LIN/UART Interface Processing
(1)	• Waits for the LNRR (no-response request) bit to be set by software
• Sets the no-response request bit (LNRR bit) to 1.	• Completes the frame reception process
	• Waits for a new break

19.7.3 Data Transmission/Reception

19.7.3.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag of the RLN3nLEST register (see **Section 19.7.7, Error Statuses**).

In LIN master mode and LIN slave mode [fixed baud rate], 1 Tbit is generated to be $16f_{LIN}$, and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

In LIN slave mode [auto baud rate], if 1 Tbit is generated to be $4f_{LIN}$, the sampling point for received data is at the third clock cycle (75% position). If 1 Tbit is generated to be $8f_{LIN}$, the sampling point for received data is at the 7th clock cycle (87.5% position).

Figure 19.13 shows an example of data transmission timing.

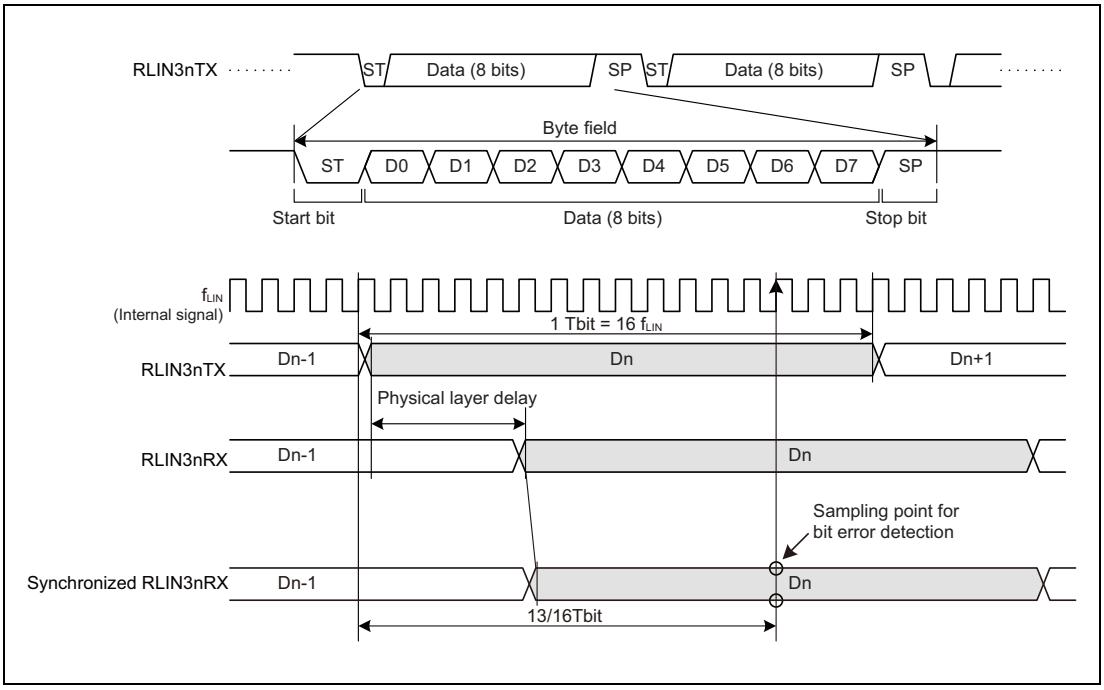

Figure 19.13 Example of Data Transmission Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

19.7.3.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN/UART interface has a noise filter function with respect to reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN/UART interface uses a noise filter, and the value determined by a 3-sampling majority rule on prescaler clocks is used as the sampling value. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN/UART interface does not use a noise filter, and the value of the synchronized RLIN3nRX value at the sampling position is used as the sampling value.

Figure 19.14 shows an example of data reception timing.

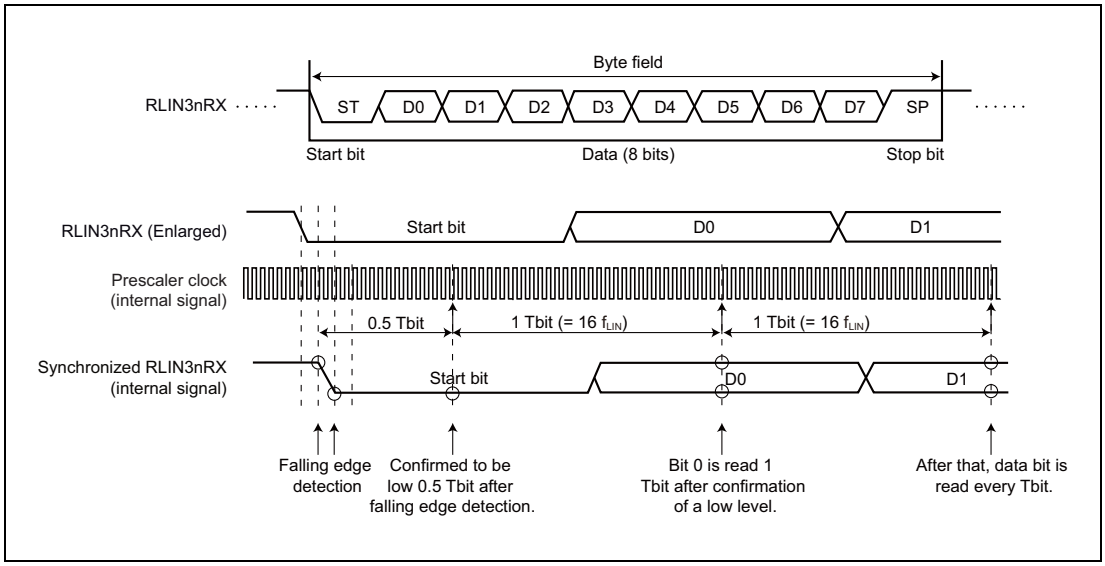

Figure 19.14 Example of Data Reception Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

19.7.4 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN/UART interface transmits or receives data continuously.

19.7.4.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data regions 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data regions 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

Figure 19.15 shows the LIN transmission processing and the corresponding buffers.

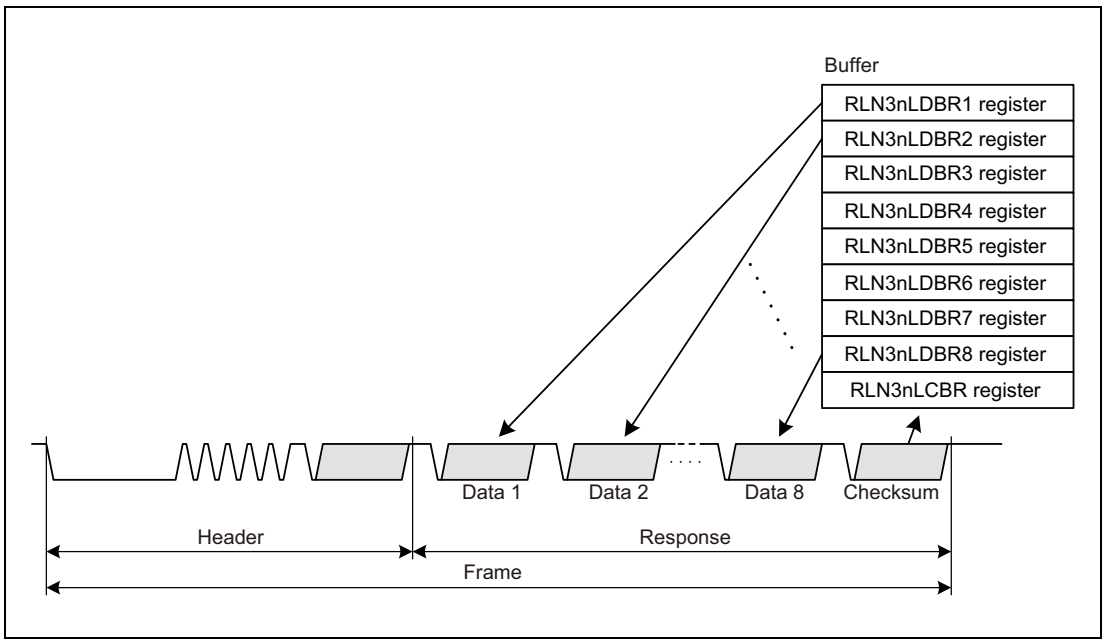

Figure 19.15 LIN Transmission Processing and Corresponding Buffers

[Frame Separate Mode]

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, the header and response are separately transmitted when prompted by respective transmission start requests.

When the transmission of the header is completed, the HTRC flag in the RLN3nLST register is set to 1 (successful header transmission).

Use frame separate mode when transmitting or receiving response data of 9 bytes or greater in LIN master mode.

19.7.4.2 Reception of LIN Frames

For an 8-byte reception, the contents of data regions 1 to 8 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data regions 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

Figure 19.16 depicts the LIN reception processing and the corresponding buffers.

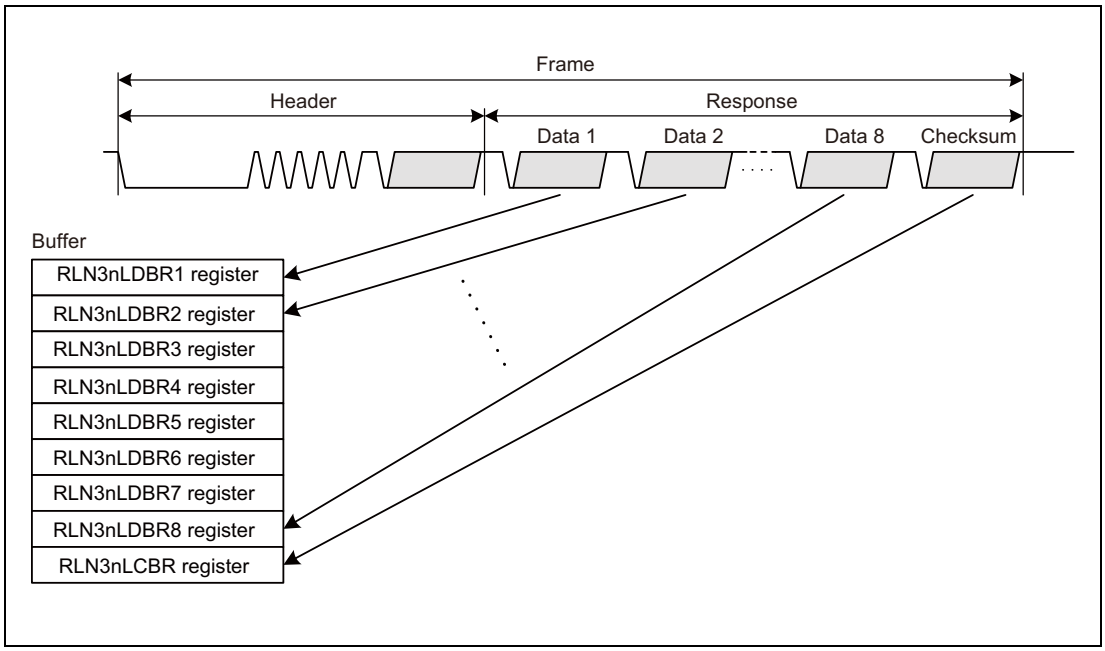

Figure 19.16 LIN Reception Processing and Corresponding Buffers

[Reception of Data 1]

When the reception of the first byte of data is completed, the D1RC flag in the RLN3nLST register is set to 1 (successful data 1 reception).

19.7.4.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses of 10 bytes or greater can also be transmitted and received.

In such case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is greater than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be transmitted or received is not the final data group) in the first data group (variable from 0 to 8 bytes) before transmitting or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the final data group. If it is the final data group, the LSS bit in the RLN3nLDFC register should be set to 0 (indicating that the next data group to be transmitted or received is the final data group) before transmitting or receiving the data group, and a checksum should be appended to the final data group.

By changing the RFDL bit setting in RLN3nLDFC register when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register to 1 (frame separate mode).

NOTE

In LIN slave mode, the LIN/UART interface can detect a new break field during the transmission or reception of a response.

19.7.5 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

19.7.5.1 Wake-up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN3nLDFC register to 1 (LIN master mode: response transmission), or setting the RCDS bit in the RLN3nLDFC register to 1 (LIN slave mode: response transmission), and then the FTS bit in the RLN3nLTRC register to 1 (frame transmission, header reception or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal is set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register in LIN master mode is 1 (LIN2.x), the LIN system clock (f_{LIN}) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register. By setting the WUTL[3:0] bits of the RLN3nLWUP register to 0100_B (5 Tbits), 260 µs low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low-level width is output without any bit error, the FTC flag in the RLN3nLST register is set to 1 (successful frame response or wake-up transmission) and when the FTCIE bit in the RLN3nLIE register is 1 (successful frame response/wake-up transmission interrupt enabled), an interrupt request for RLIN3n transmission is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is aborted and the BER flag of the RLN3nLEST register is set to 1 (bit error detected).
When RLN3nLEDE.PBERE is set in LIN master mode, set RLN3nLEST.PBER flag to 1 (physical bus error detection) at the same time of a bit error.

Figure 19.17 shows the wake-up transmission timing.

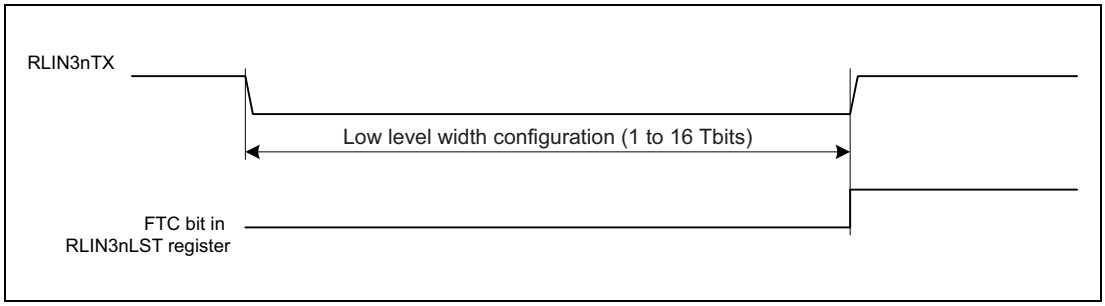

Figure 19.17 Wake-up Transmission Timing

19.7.5.2 Wake-up Reception

To detect a wake-up signal, use the input signal low-level width count function. The input signal low level width count function measures the low level width of the input signal to the RLIN3nRX pin, using the same sampling point as data reception. This allows the 2.5-Tbit or longer low-level width of the input signal of f_{LIN} to be measured.

In LIN master mode, by setting the LWBR0 bit in the RLN3nLWBR register, operation is executed without changing the baud rate generator setting at a transition between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects the LIN system clock (f_{LIN}) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200bps while fa is selected, an input signal with a low-level width of 130 us or longer regardless of the setting of the LCKS bit in the RLN3nLMD register.

To used the wake-up reception function, in LIN wake-up mode, set the RFT bit in the RLN3nLDFC register to 0 (LIN master mode: response reception) or the RCDS bit in the RLN3nLDFC register to 0 (LIN slave mode: response reception), and then set the FTS bit in the RLN3nLTRC register to 1 (frame transmission (header reception) or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register is set to 1 (successful frame response/wake-up reception) and if the FRCIE bit in the RLN3nLIE register is 1 (successful frame response or wake-up reception interrupt enabled), an interrupt request for RLIN3n successful reception is generated.

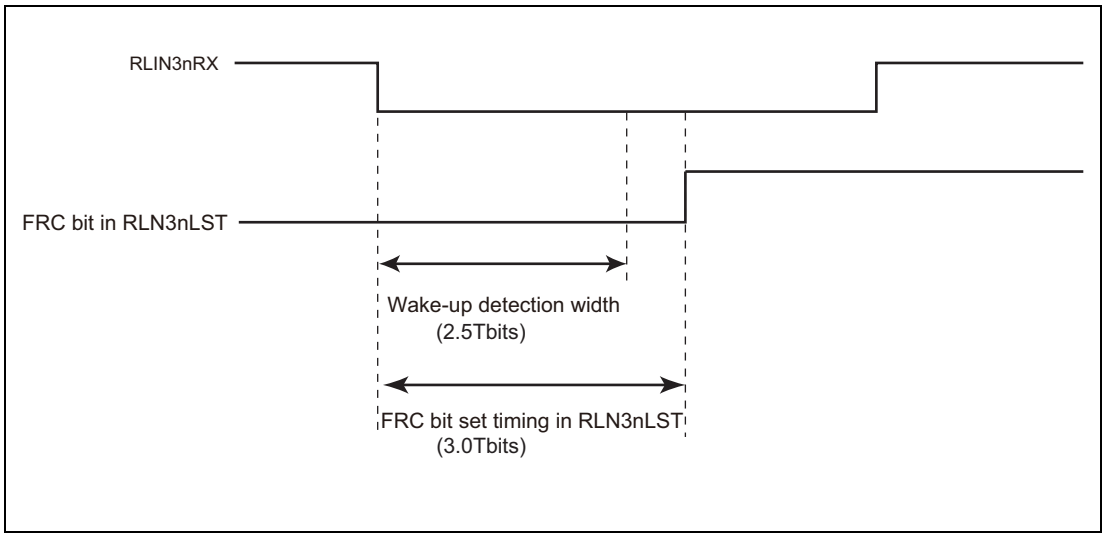

Figure 19.18 Input Signal Low level Count Function

19.7.5.3 Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, however the collision of wakeup signals is not detected in the LIN/UART interface.

19.7.6 Statuses

During LIN mode operation, the LIN/UART interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, successful header transmission/reception, can generate interrupt requests.

Table 19.85 shows the types of statuses available in LIN master mode. **Table 19.86** lists the types of statuses available in LIN slave mode [auto baud rate] and in LIN slave mode [fixed baud rate].

Table 19.85 Types of Statuses in LIN Master Mode

Status	Status Set Condition	Status Clear Condition	Operating Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if the LIN/UART interface actually enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if the LIN/UART interface actually enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Successful frame/wake-up transmission	When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully.	• When the next communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in RLN3nLST register	√
Successful frame/wake-up reception	When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully.	• When the next communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in RLN3nLST register	√
Error detection	If any of the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected).	• When the next communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software*1 • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in RLN3nLST register	√
Successful data 1 reception	When the RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte of each data group is received successfully.*2	• When the next communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Successful header transmission	When a header field is transmitted successfully.	• When the next communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, or BER flag in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

Table 19.86 Types of Statuses in LIN Slave Mode

Status	Status Set Condition	Status Clear Condition	Operating Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode.	After the OM0 bit of the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if the LIN/UART interface actually enters LIN operation mode.	• After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if the LIN/UART interface actually enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Successful response/wake-up transmission	When a response field, a wake-up signal, or a data group is transmitted successfully.	• When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in RLN3nLST register	√
Successful response/wake-up reception	When a response field, a wake-up signal, or a data group is received successfully.	• When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in RLN3nLST register	√
Error detection	If any of the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, and BER flag of the RLN3nLEST register is set to 1 (error detected).	• When cleared by software*1 • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in RLN3nLST register	√
Successful data 1 reception	When the RCDS bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte for each data group is received successfully.*2	• When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Successful header reception	When a header field is received successfully.	• When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, or BER flag of the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

19.7.7 Error Statuses

19.7.7.1 LIN Master Mode

(1) Types of Error Statuses

The LIN/UART interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

All error statuses represent interrupt events.

Table 19.87 shows the types of error statuses.

Table 19.87 Types of Error Statuses in LIN Master Mode

Status	Error Detection Condition	Operating Mode Capable of Error Detection	Communication	Enable/ Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1*2	• LIN operation mode • LIN wake-up mode	Aborted	Enabled	BER flag in RLN3nLEST register
Physical bus error	• LIN bus is detected to be high level when transmitting a break • LIN bus is detected to be low level when transmitting a break delimiter • LIN bus is detected to be high level when transmitting a wake-up	• LIN operation mode • LIN wake-up mode	Aborted	Enabled	PBER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Aborted	Enabled	FTER flag in RLN3nLEST register
Framing error	In response field reception, the stop bit of each data byte is low level	LIN operation mode	Aborted	Enabled	FER flag in RLN3nLEST register
Checksum error	In response field reception, checksum test results in an error	LIN operation mode	—	Disabled	CSER flag in RLN3nLEST register
Response preparation error	One of the following conditions occurs in frame separate mode during a multi-byte response reception: • The first reception data byte is received after completion of header transmission but before a response transmission/reception request is specified • The first reception data byte is received after the completion of previous data group reception but before a transmission/ reception request for the next data group is specified.	LIN operation mode	Aborted	Disabled	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, processing is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately after the bit that caused the error is transmitted. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. In a multi-byte response transmission, bit errors are also detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and can be calculated using the following formula.
When the FSM bit in the RLN3nLDFC register is set to 1 (frame separate mode), the timeout time is that of the 8 data bytes until the RTS bit of the RLN3nLTRC register is set. Once the RTS bit is set, the timeout time is changed to the time based on the response field data length (the RFDL[3:0] bits in the RLN3nLDFC register).

[Frame timeout]
When classic checksum is selected (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
When enhanced checksum is selected (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]
The aforementioned timeout time is longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.
[Response timeout]
Timeout time = (number of data bytes + 1) × 14 [Tbit]

When an error is detected, time-out error detection function stops.

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), when it is cleared by software, or at a transition to LIN reset mode.

(2) Target Time Domain for LIN Error Detection

Figure 19.19 shows the time domain in which the LIN/UART interface in LIN master mode performs monitoring for error detection.

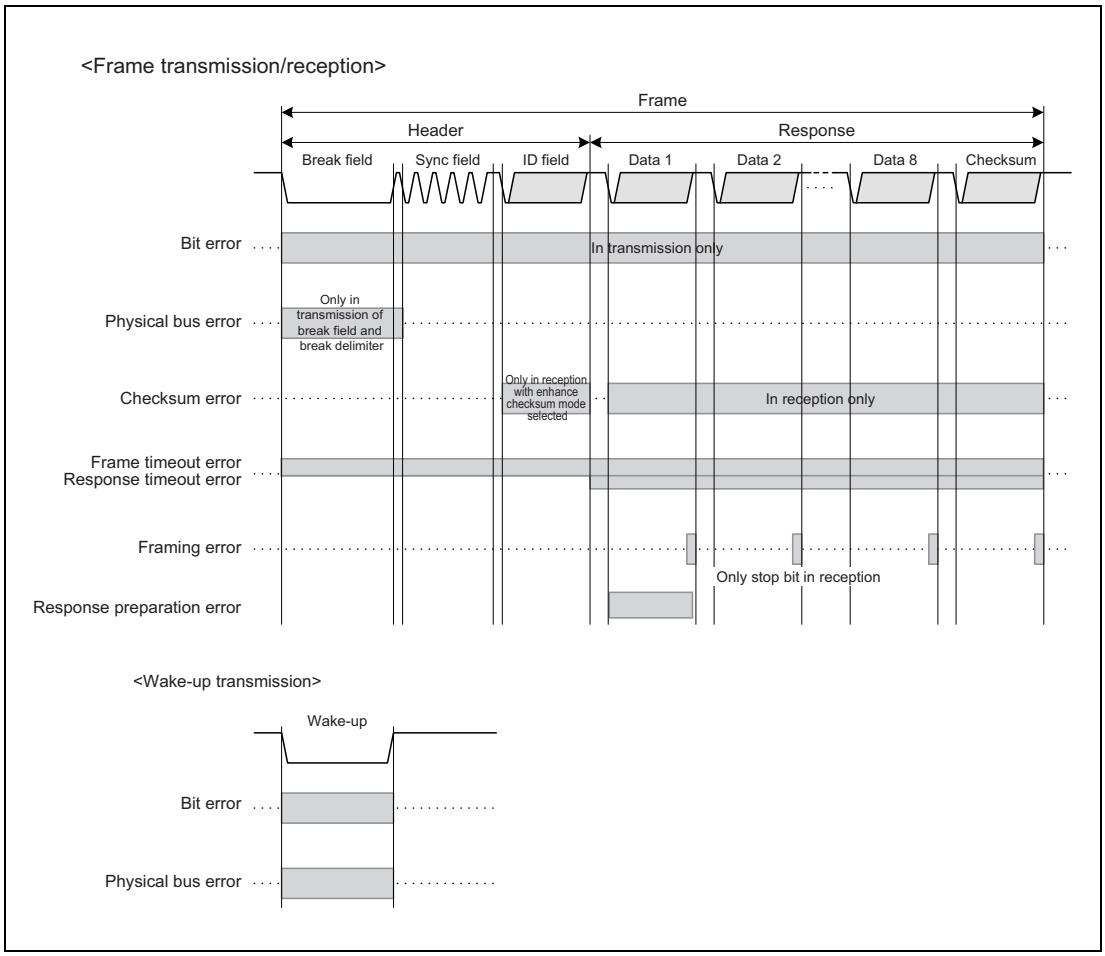

Figure 19.19 Target Time Domain for LIN Error Detection (LIN Master Mode)

19.7.7.2 LIN Slave Mode

(1) Types of Error Statuses

The LIN/UART interface can detect seven types of error statuses in LIN slave mode [auto baud rate] or in LIN slave mode [fixed baud rate]. These error statuses can be verified by checking the corresponding bits in the RLN3nLEST register.

Table 19.88 shows the types of error statuses.

Table 19.88 Types of Error Statuses in LIN Slave Mode

Status	Error Detection Condition	Operating Mode Capable of Error Detection	Communication	Enable/ Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match*1 *2	• LIN operation mode • LIN wake-up mode	Aborted	Enabled	BER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Aborted	Enabled	TER flag in RLN3nLEST register
Framing error	In frame reception, the stop bit of each data byte is low level	LIN operation mode	Aborted	Enabled	FER flag in RLN3nLEST register
Sync field error	If the width of the break low level is greater than the width set by the LBLT bit in the RLN3nLBFC register and the sync field is not 55_H	LIN operation mode	Aborted	Enabled*4	SFER flag in RLN3nLEST register
Checksum error	In response field reception, the checksum test results in an error	LIN operation mode	—*5	Disabled	CSER flag in RLN3nLEST register
ID parity error	If the received ID parity bit does not match the value that is automatically calculated by the LIN/ UART interface	LIN operation mode	Aborted	Enabled	IPER flag in RLN3nLEST register
Response preparation error	• After the reception of a header, if the response is not prepared before the first reception data byte is received • In a multi-byte response reception, if the preparation for the reception of next data group does not complete before the first reception data byte for the next data group is received	LIN operation mode	Aborted	Disabled	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, processing is aborted after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is aborted immediately after the bit that caused the error is transmitted. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is aborted after the bit that caused the error is transmitted.

Note 2. In a multi-byte response transmission, bit errors are also detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the LCS bit in the RLN3nLDFC register), and this can be calculated according to the following formula. The timeout time is that of 8 data bytes until the RTS bit or the LNRR bit of the RLN3nLTRC register is set. When the RTS bit is set, the timeout time is changed to the time based on the response field data length (RFDL[3:0] bit of the RLN3nLDFC register). When the LNRR bit is set, the timeout function stops.

[Frame timeout]
When classic checksum is selected (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
When enhanced checksum is selected (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic checksum is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced checksum is selected.

[Response timeout]
Timeout time = (number of data bytes + 1) × 14 [Tbit]
When en error is detected, time-out error detection function stops.

Note 4. Only reflection of the result to the SFER flag can be enabled/disabled. Error detection cannot be enabled/disabled.

Note 5. Checksum determination is performed upon completion of response frame reception. In case of an error, the successful reception flag is not set to 1.

The error status is cleared by software or at a transition to LIN reset mode.

(2) Target Time Domain for LIN Error Detection

Figure 19.20 shows the time domain in which the LIN/UART interface in slave mode performs monitoring for error detection.

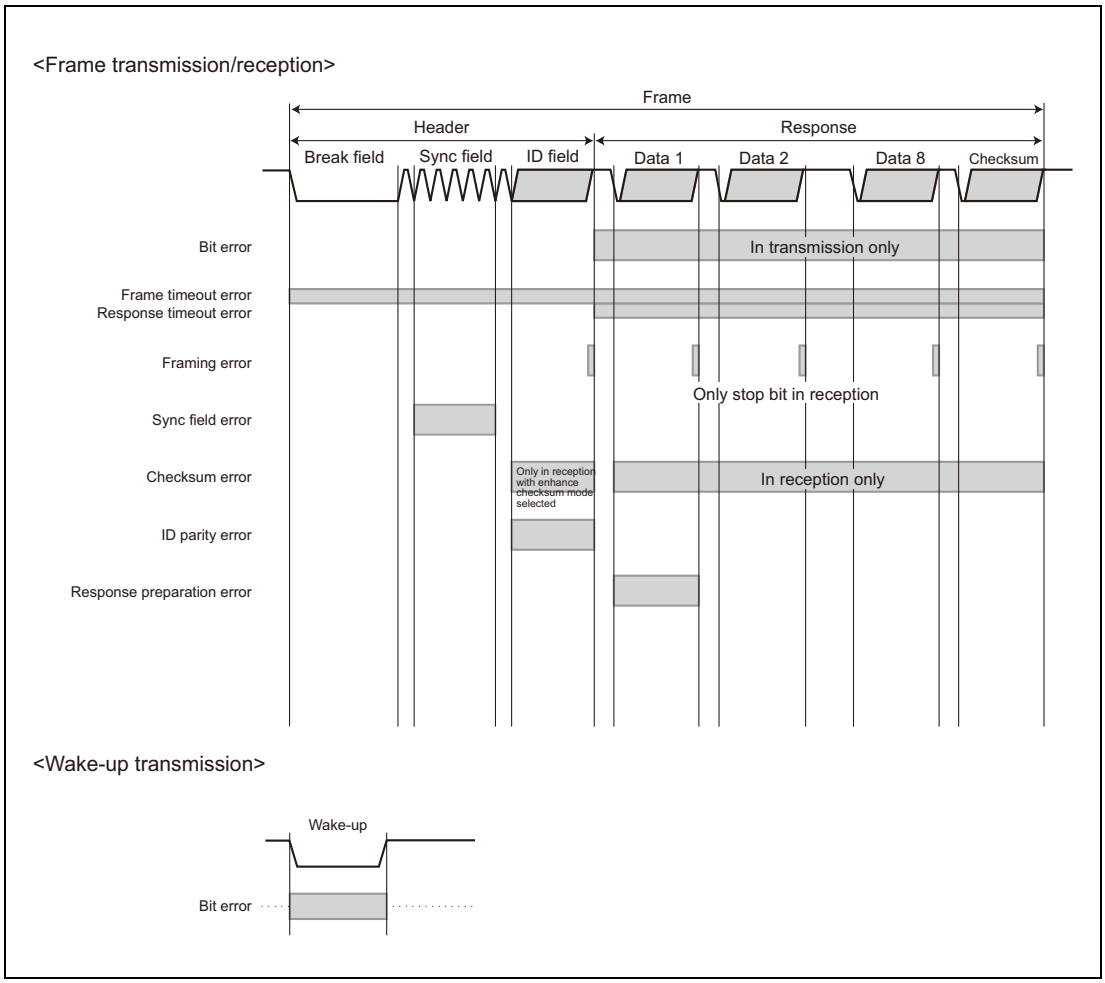

Figure 19.20 Target Time Domain for LIN Error Detection (LIN Slave Mode)

19.8 UART Mode

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 01_B (UART mode) and the OM0 bit in the RLN3nLCUC register to 1 changes the mode to UART mode, turning the OMM0 bit in the RLN3nLMST register to 1.

19.8.1 Transmission

Figure 19.21 shows the operation of the LIN/UART interface (in UART mode) during transmission. **Table 19.89** provides processing of the LIN/UART interface (in UART mode) during transmission.

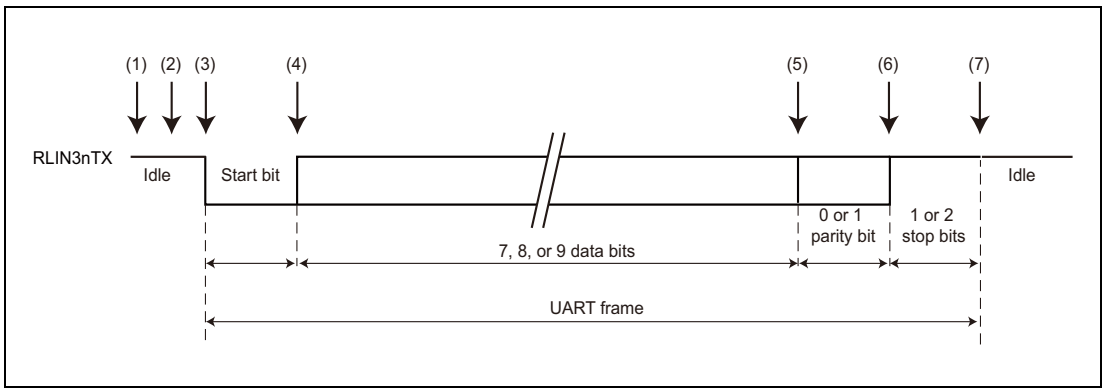

Figure 19.21 LIN/UART Interface (in UART Mode) Transmission Operation

Table 19.89 LIN/UART Interface (UART Mode) Transmission Processing (1/2)

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate. • Sets noise filter ON/OFF. • Enables error detection. • Configures data format. • Sets an interrupt generation timing. • Exits from LIN reset mode. • Sets the transmission enable bit (UTOE bit) to 1.	• Waits for a transmission trigger (RLN3nLUTDR register) by software.
(2)	• Specifies the data to be transmitted in the UART transmit data register (RLN3nLUTDR) or UART wait transmit data register (RLN3nLUWTDR).	• Sets the transmission status flag.
(3)	• Waits for an interrupt request. [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)]	• Transmits a start bit (for switching from reception to transmission in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see **Section 19.8.1.4, Transmission Start Wait Function**. [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • Outputs a transmission interrupt.
(4)	• When transmitting data continuously, specifies the next data to be transmitted in the UART transmission data register (RLN3nLUTDR) and waits for the generation of an interrupt request.	Transmits the data specified in the UART (wait) transmission data register.
(5)		Transmits a parity bit when parity is used.
(6)		Transmits 1 or 2 stop bits.

Table 19.89 LIN/UART Interface (UART Mode) Transmission Processing (2/2)

	Software Processing	LIN/UART Interface Processing
(7)	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • If another item of transmission data is set, goes to step (3).	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • If another piece of transmission data is set, goes to step (3). • If the next data to be transmitted is not specified, clears the transmission status flag.
	[When the UTIGTS bit is 1 (a transmission interrupt is output upon completion of transmission)] • When transmitting data continuously, goes to step (2).	[When the UTIGTS bit is 1 (a transmission interrupt is output upon completion of transmission)] • Generates RLIN3n transmission interrupt request. • Clears the transmission status flag.

19.8.1.1 Continuous Transmission

The LIN/UART interface (in UART mode) can transmit multiple sets of data continuously by using the RLN3nLUTDR register. **Figure 19.22** shows an operation example where the transmission interrupt generation timing is the start of transmission and an operation example where the transmission interrupt generation timing is the completion of transmission.

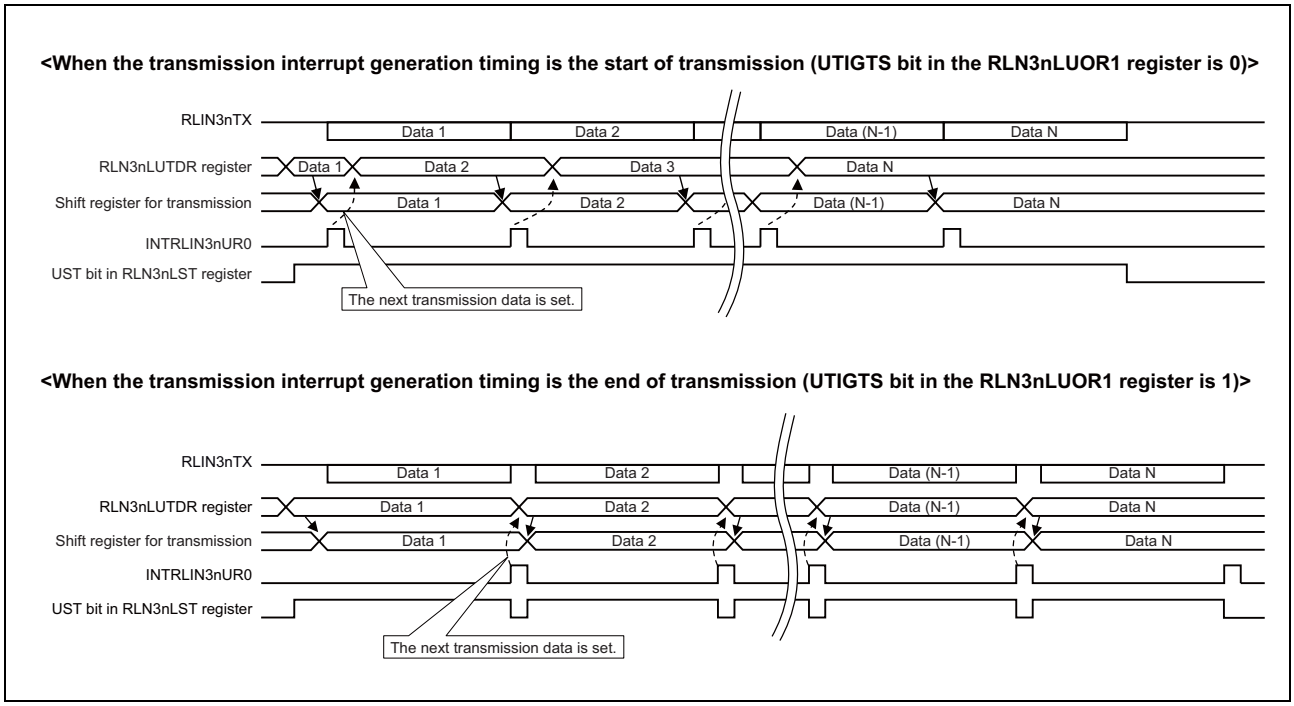

Figure 19.22 Operation Examples of LIN/UART Interface (UART Mode) Continuous Transmission

An interrupt can be generated at the completion of a transmission by changing the UTIGTS bit in the RLN3nLUOR1 register from 0 to 1 after the start of transmission of final data, provided that the transmission interrupt generation timing is the start of transmission and the completion of transmission of final data needs to be known.

19.8.1.2 UART Buffer Transmission

The LIN/UART interface (in UART mode) has a maximum of nine bytes of UART buffers and it is capable of performing continuous transmissions through the use of UART buffers.

Figure 19.23 shows the UART buffer transmission operation of the LIN/UART interface (in UART mode). **Table 19.90** shows the UART buffer transmission processing.

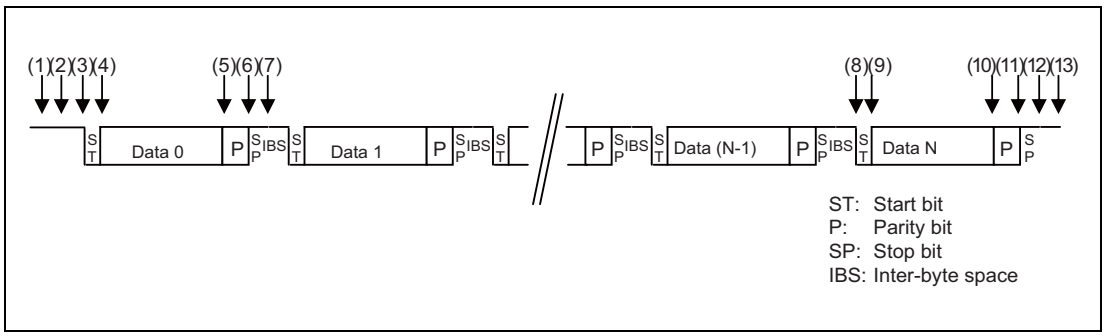

Figure 19.23 UART Buffer Transmission in LIN/UART Interface (in UART Mode)

Table 19.90 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode) (1/2)

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables error detection • Configures data format • Sets the interrupt generation timing to the completion of transmission. • Exits from LIN reset mode. • Sets the transmission enable bit (UTOE bit) to 1	• Waits for a transmission trigger (RTS bit) by software
(2)	• Sets the UART buffer data length and whether the start of transmission must be waited. • Specifies the data to be transmitted in the UART data 0 buffer register (RLN3nLUDB0) and the LIN data buffer b register (RLN3nLDBRb). (b =1 to 8) • Sets the UART buffer transmission start bit (RTS).	• Sets the transmission status flag.
(3)	Waits for an interrupt request.	Transmits a start bit. (For switching from reception to transmission in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see **Section 19.8.1.4, Transmission Start Wait Function**.)
(4)		Transmits the data specified in the UART data buffer 0 register (RLN3nLUDB0) or the LIN/UART data buffer b register (RLN3nLDBRb).
(5)		Transmits a parity bit when parity is used.
(6)		Transmits 1 or 2 stop bits (When the number of data set in UART buffer data length select bits is 1, proceeds to (12).)
(7)		Transmits an inter-byte space (idle).
		Repeats steps (3) to (7) until the number of data set in the UART buffer data length select bits -1 is reached.

Table 19.90 UART Buffer Transmission Processing in LIN/UART Interface (in UART Mode) (2/2)

	Software Processing	LIN/UART Interface Processing
(8)		Transmits a start bit.
(9)		Transmits the data specified in the LIN/UART data buffer b register (RLN3nLDBRb).
(10)		Transmits a parity bit when parity is used.
(11)		Transmits 1 or 2 stop bits.
(12)		• Sets the successful buffer transmission flag. • Clears the UART buffer transmission start bit (RTS). • Generates a transmission interrupt request signal. • Clears the transmission status flag.
(13)	• Checks the RLN3nLST register, and clears flags • When continuously transmitting data, goes to step (2).	

(1) UART Buffer Transmission

For a 9-byte transmission, the contents stored in the RLN3nLUDB0 and RLN3nLDBR1 to RLN3nLDBR8 registers are transmitted to data regions 0 to 8. The RLN3nLUDB0 register is used only if 9-byte transmission is specified. In other cases, the RLN3nLDBR1 to RLN3nLDBR8 registers are selected depending on the data length. For a 4-byte transmission, the contents stored in the RLN3nLDBR1 to RLN3nLDBR4 registers are transmitted to data regions 1 to 4, but the contents of the RLN3nLDBR5 to RLN3nLDBR8 registers are not transmitted. An RLIN3n transmission interrupt is generated after the number of data specified in the MDL [3:0] bits of the RLN3nLDFC register is transmitted. The spaces between each transmitted data can be specified in the IBS bit of the RLN3nLSC register.

Figure 19.24 shows a 9-byte UART buffer and the transmission processing.

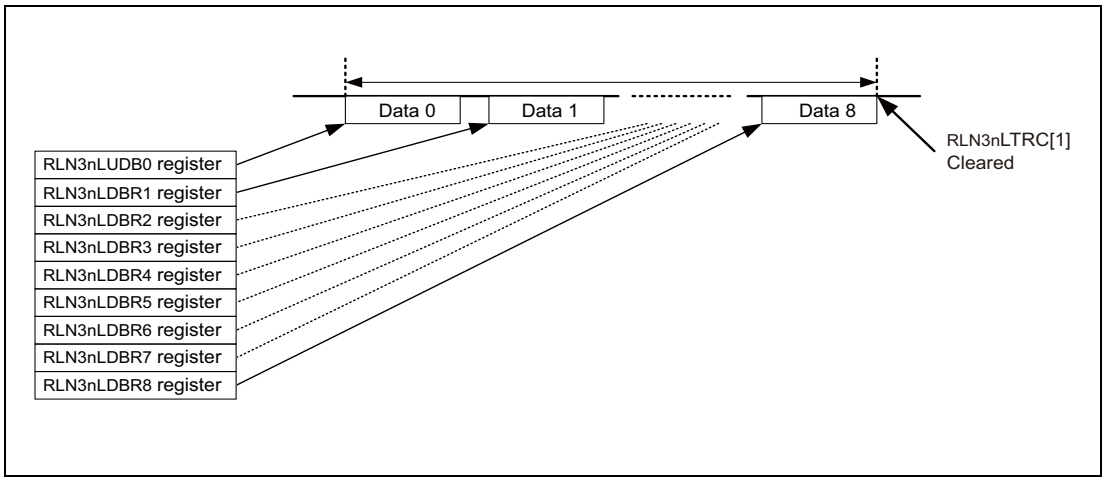

Figure 19.24 UART Buffer and Transmission Processing (for 9-Byte Transmission)

19.8.1.3 Data Transmission

One bit of data is transmitted per Tbit.

In half-duplex communication, if the BERE bit in the RLN3nLEDE register is 1 (bit error detection enabled), the transmission data and the input pin level are compared bit by bit during data transmission, and the results are stored in the BER flag of the RLN3nLEST register (see **Section 19.7.7, Error Statuses**). The timing at which the input pin is sampled during data transmission can vary depending on the settings of the LPRS[2:0] and NSPB[3:0] bits in the RLN3nLWBR register.

The bit error detection timing in UART mode is shown in **Table 19.91**.

Table 19.91 Error Detection Timing in UART Mode

Sampling Count Per Bit	Bit Error Detection Timing
6 samples	3rd clock cycle + 1 prescaler clock
7 samples	4th clock cycle + 1 prescaler clock
8 samples	4th clock cycle + 1 prescaler clock
9 samples	5th clock cycle + 1 prescaler clock
10 samples	5th clock cycle + 1 prescaler clock
11 samples	6th clock cycle + 1 prescaler clock
12 samples	6th clock cycle + 1 prescaler clock
13 samples	7th clock cycle + 1 prescaler clock
14 samples	7th clock cycle + 1 prescaler clock
15 samples	8th clock cycle + 1 prescaler clock
16 samples	8th clock cycle + 1 prescaler clock

Example of Data Transmission Timing (when 1 Tbit = 16 samplings) is shown in **Figure 19.25**

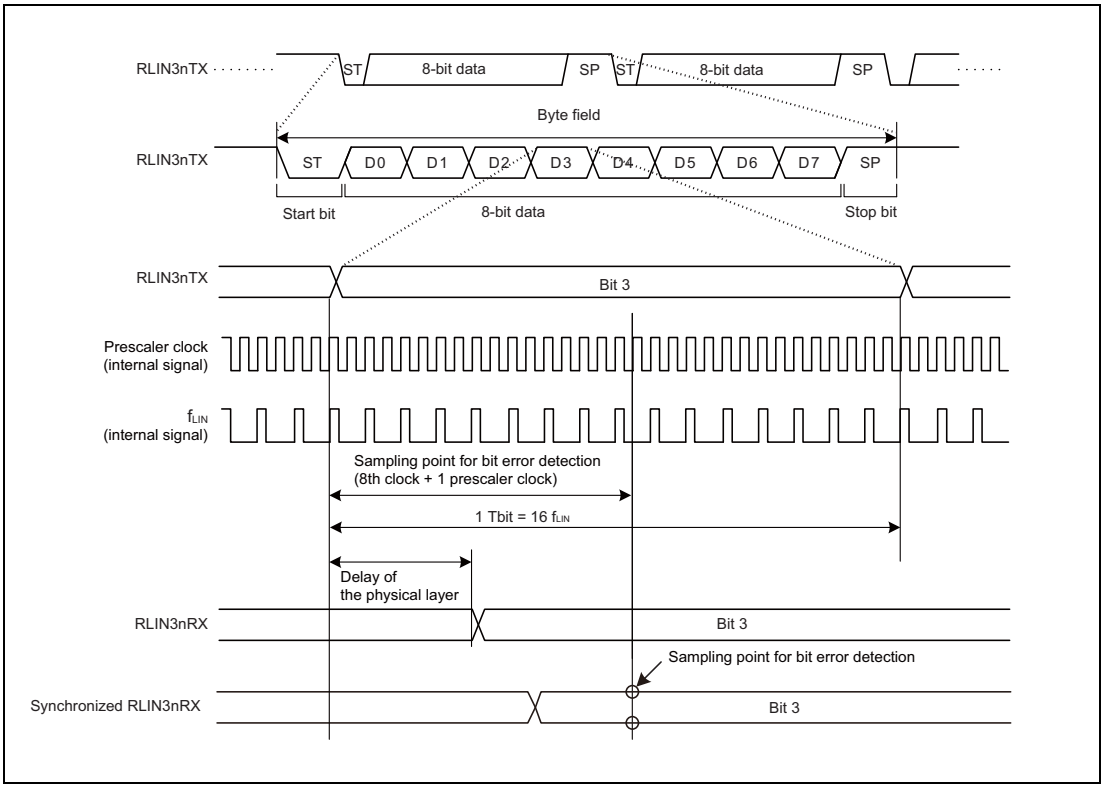

Figure 19.25 Example of Data Transmission Timing (When 1 Tbit = 16 samplings)

19.8.1.4 Transmission Start Wait Function

For performing half-duplex communication, the LIN/UART interface (in UART mode) has the function of securing the reception stop bit length when switching from reception to transmission.

If it is desired to delay the start of transmission until the stop bits for the reception are completed, specify the transmission data in the RLN3nLUWTDR register, which is used only for the wait function, instead of specifying it in the RLN3nLUTDR register as a transmission start request. When transmitting from the UART buffer, set the RTS bit in the RLN3nLTRC register to 1 (UART buffer transmission start) while the UTSW bit in the RLN3nLDFC register is set to 1.

In this case, the LIN/UART interface delays the start of transmission until the stop bits of reception data are completed.

It should be noted that even if the UART stop bit length select bit (USBLS) in RLN3nLBFC register is 1 (stop bits = 2 bits), there is only a 1-bit delay.

Figure 19.26 shows the operation of transmission wait function.

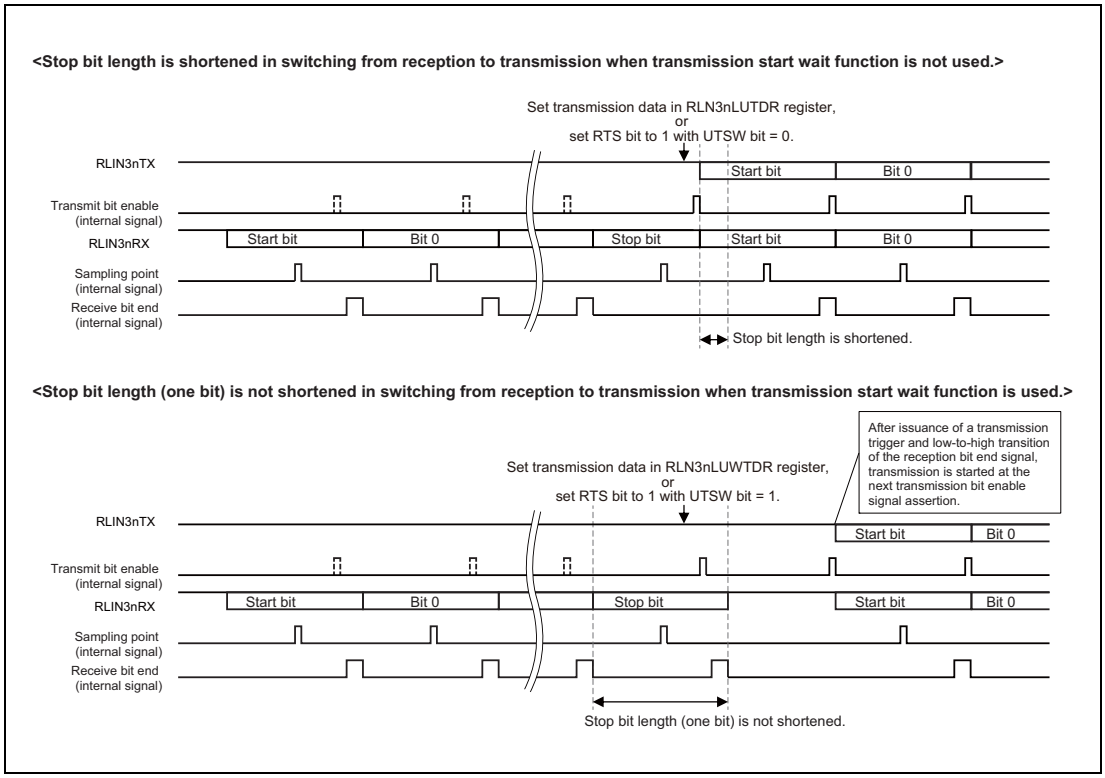

Figure 19.26 Transmission Wait Function (Case When Transmit Data Is Set While Stop Bits Are Being Received)

19.8.2 Reception

Figure 19.27 shows the LIN/UART interface (in UART mode) reception operation.**Table 19.92** shows the LIN/UART interface (in UART mode) reception processing.

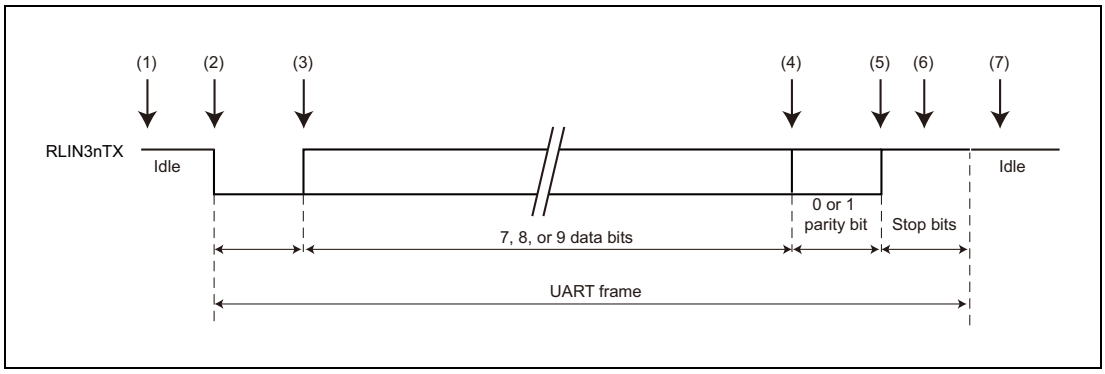

Figure 19.27 LIN/UART Interface (in UART Mode) Reception Operation

Table 19.92 LIN/UART Interface (in UART Mode) Reception Processing

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate. • Sets noise filter ON/OFF. • Enables error detection. • Configures data format. • Exits from LIN reset mode. • Sets the reception enable bit (UROE bit) to 1.	• Waits for the reception to be enabled by software. • Waits for detection of a start bit.
(2)	Waits for an interrupt request.	• Waits for a falling edge from the reception pin, and detects a start bit. • Sets the reception status flag.
(3)		Receives data.
(4)		Receives a parity bit when parity is used.
(5)		Receives only 1 stop bit.
(6)		• Generates a RLIN3n successful reception interrupt request. • Clears the reception status flag.
(7)	Checks the RLN3nLST register, and clears flags	Waits for a falling edge from the reception pin.

19.8.2.1 Data Reception

Data reception is performed by using the synchronized RLIN3nRX (an internal signal) that is the input from the RLIN3nRX pin synchronized with the prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, resampling is performed 0.5 Tbits later when the number of sampling per 1 Tbit is even and {(the number of sampling + 1) / 2} / (the number of sampling) Tbits later when the number is odd. If the synchronized RLIN3nRX signal is low level, the bit is recognized as a start bit. The bit is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected during the resampling.

After the start bit is detected, 1 bit is sampled per Tbit.

However, when the BERE bit in the RLN3nLEDE register is 1, the sampling point is the same as the bit error detection timing.

The LIN/UART interface has a noise filter function for received data. If the LRDNFS bit in the RLN3nLMD register is 0, the noise filter is used. For a sampling value, the value determined by a 3-sampling majority rule by the prescaler clock is used. If the LRDNFS bit in the RLN3nLMD register is 1, the noise filter is not used. In this case, for a sampling value, the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 19.28 shows an example of data reception timing.

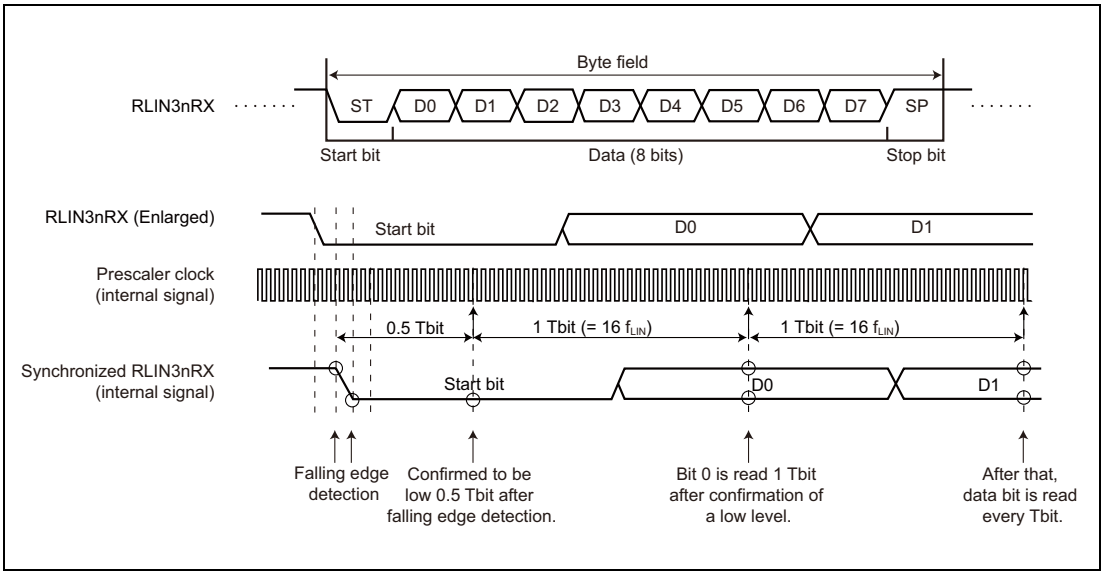

Figure 19.28 Example of Data Reception Timing (When 1 Tbit = 16 samplings)

19.8.3 Expansion Bits

The LIN/UART interface (in UART mode) can transmit and receive 9-bit long data by setting the UEBE bit in the RLN3nLUOR1 register to 1.

19.8.3.1 Expansion Bit Transmission

The LIN/UART interface (in UART mode) can transmit 9-bit long data by writing the 9-bit data to either the UART transmission data register (RLN3nLUTDR) or the UART wait transmission data register (RLN3nLUWTDR) when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1.

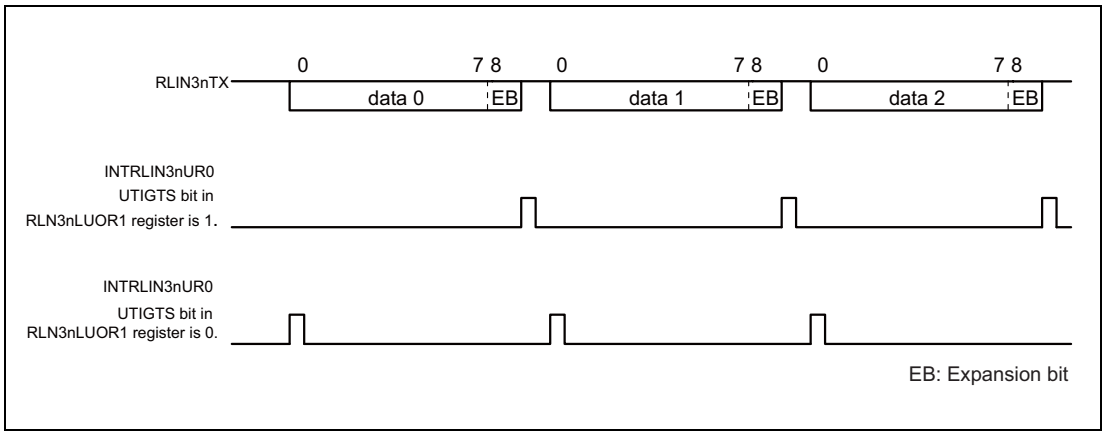

Figure 19.29 Transmission Example When Expansion Bit is Enabled (LSB First)

19.8.3.2 Expansion Bit Reception

The LIN/UART interface (in UART mode) can always receive 9-bit data without comparing the expansion bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 1, and the expansion bit data comparison enable bit (UEBDCE) is 0. Regardless of the expansion bit detection level select bit (UEBDL) setting in the UART option register 1 (RLN3nLUOR1), a RLIN3n successful reception interrupt is generated when 9-bit data is received.

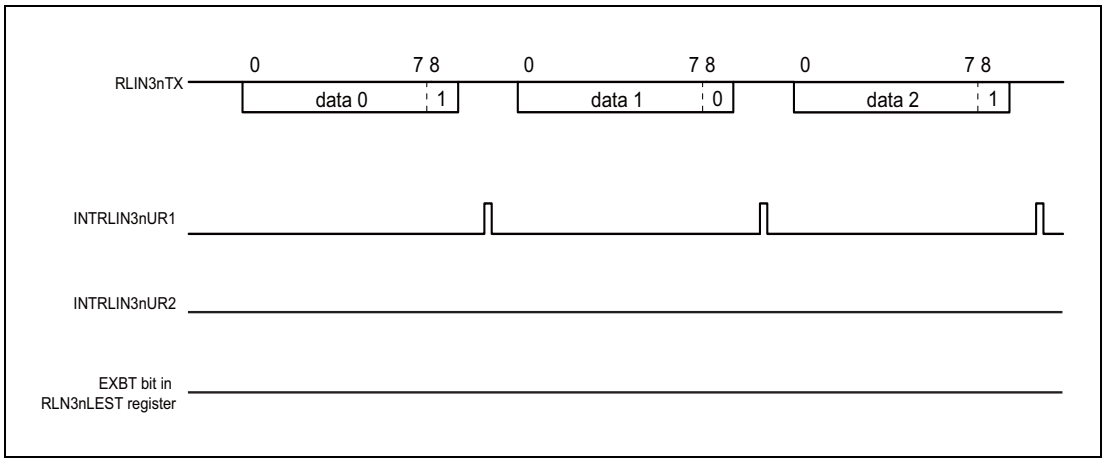

Figure 19.30 Expansion Bit Reception Example (LSB First)

19.8.3.3 Expansion Bit Reception (with Expansion Bit Comparison)

The LIN/UART interface (in UART mode) can compare received expansion bits and the UEBDL bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 0.

If the level that was set in the expansion bit detection level select bit (UEBDL) is detected, an RLIN3n status interrupt request is generated upon completion of data reception, and the expansion bit detection flag (EXBT) in the LIN error status register (RLN3nLEST) is set. If the reversed value of an expansion bit detection level is detected, RLIN3n successful reception interrupt request is generated. In either case, the received data is stored in the UART reception data register (RLN3nLURDR), unless there was an overrun error.

Figure 19.31 shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

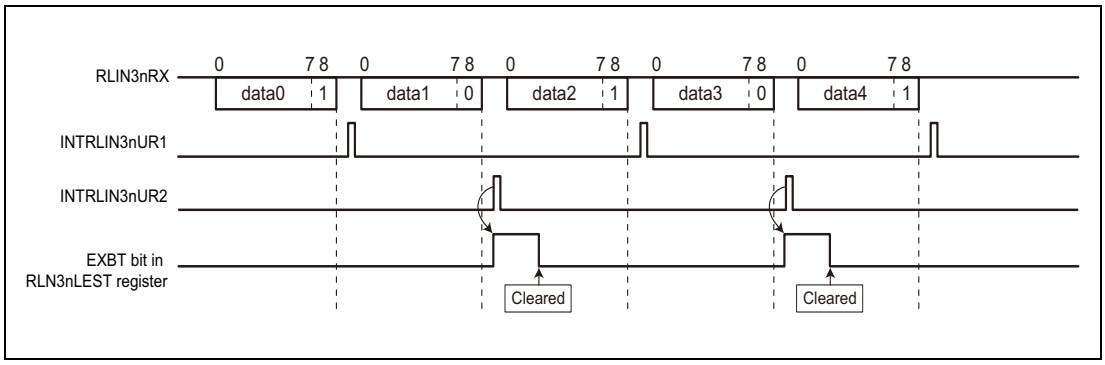

Figure 19.31 Expansion Bit Reception Example (with Expansion Bit Comparison) (LSB First, UEBDL = 0)

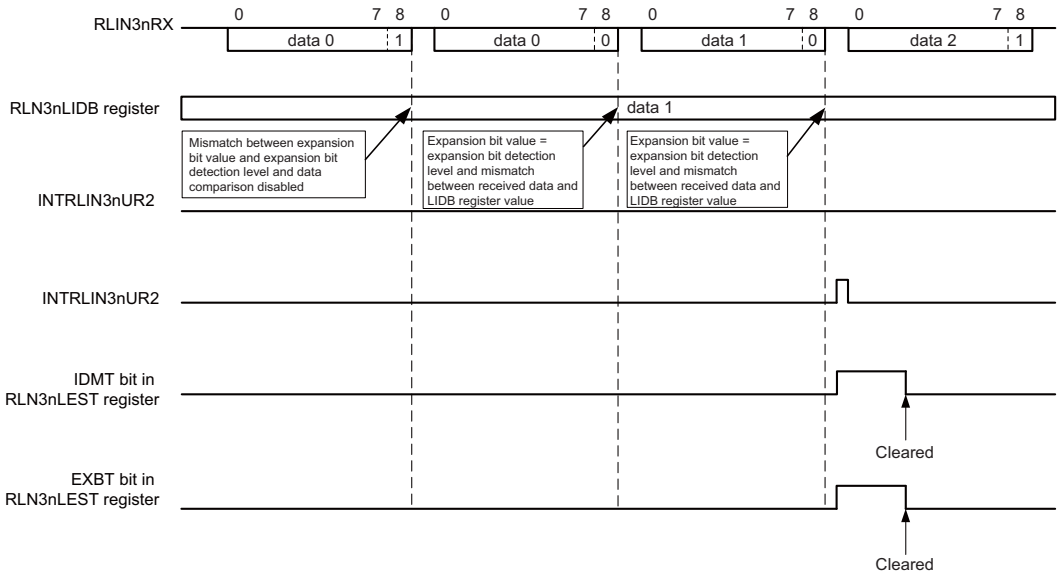
NOTE

- If a reception error (parity error, framing error, or overrun error) occurs in received data 0, 2, or 4 (if a reversed value of an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. In this case, a RLIN3n successful reception interrupt is not generated.
- If a reception error (parity error, framing error, or overrun error) occurs in received data 1 or 3 (if an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs, the expansion bit detection flag (EXBT) is also set.

19.8.3.4 Expansion Bit Reception (with Data Comparison)

If the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 1, when the level that was set by the expansion bit detection level select bit (UEBDL) is detected, the LIN/UART interface (in UART mode) compares the 8 bits of the received data excluding the expansion bit, with the a preset RLN3nLIDB register value.

If the result of the comparison is a match, the LIN/UART interface performs the following operations:



- Generates an RLIN3n status interrupt
- Sets the expansion bit detection flag (EXBT)
- Sets the ID match flag (IDMT)
- Stores the received data in the UART reception data register (RLN3nLURDR)

Even when the result of the comparison is a match, successful RLIN3n successful reception interrupt is not generated.

If the result of the comparison is not a match, no RLIN3n successful reception interrupt or RLIN3n status interrupt is generated, and the EXBT and IDMT flags are not set to 1. The received data is not stored in the UART reception data register (RLN3nLURDR).

When changing the UEBDCE bit to 0, make the change before the reception of the next data is completed.

Figure 19.32 shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

Note: If a reception error (parity error, framing error, or overrun error) occurs, an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs and the result of comparison is a match, the EXBT and IDMT are also set to 1.

Figure 19.32 Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL = 0)

19.8.4 Statuses

In UART mode, the LIN/UART interface can detect five types of statuses.

Two statuses, successful UART buffer transmission and error detection, can generate interrupt requests.

Table 19.93 shows the types of statuses available in UART mode.

Table 19.93 Types of Statuses in UART Mode

Status	Status Set Condition	Status Clear Condition	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if the LIN/UART interface actually exits LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if the LIN/UART interface actually enters LIN reset mode.	OMM0 bit in RLN3nLMST register	—
Successful UART buffer transmission	• When the UTIGTS bit in the RLN3nLUOR1 register is 0 (transmission interrupt request is generated upon start of transmission), if the transmission of the last data (the data length is specified by the MDL bits in the RLN3nLDFC register) is started. • When the UTIGTS bit in the RLN3nLUOR1 register is 1 (transmission interrupt request is generated upon completion of transmission), if the transmission of the data length specified by the MDL bit in the RLN3nLDFC register is completed.	• When cleared by software • After transition to LIN reset mode	FTC flag in RLN3nLST register	√
Error detection	If any of the UPER flag, IDMT flag, EXBT flag, FER flag, OER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected).	• When cleared by software*1 • After transition to LIN reset mode	ERR flag in RLN3nLST register	√
Transmission status	• When data is written to the RLN3nLUTDR or RLN3nLUWTDR register. • When 1 is written to the RTS bit in the RLN3nLTRC register.	• When the transmission of the data specified in the RLN3nLUTDR or RLN3nLUWTDR register is completed, but the next transmission data is not specified. • When the transmission of the data in the UART buffer is completed and the RTS bit in the RLN3nLTRC register is cleared. • After transition to LIN reset mode	UTS flag in RLN3nLST register	—
Reception status	• When a start bit is detected.	• When a sampling point for stop bits is detected • After transition to LIN reset mode	URS flag in RLN3nLST register	—

Note 1. Writing a 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register when not in the LIN reset mode sets the ERR flag in the RLN3nLST register to 0.

19.8.5 Error Statuses

Types of Error Statuses

In UART mode, the LIN/UART interface can detect four types of errors and two types of statuses. The condition of these statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

Table 19.94 lists applicable status types.

Table 19.94 Types of Statuses in UART Mode

Status	Error Detection Condition	Communication	Enable/ Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data monitored on the reception pin do not match*1	Continues until the transmission of the specified transmission data is completed.	Enabled	BER flag in RLN3nLEST register
Overrun error	After received data is stored in the RLN3nLURDR register, the next data is received before the previous data is read. (In this case, no data is stored in the RLN3nLURDR register).	— (Reception is completed by the time this error is detected)	Enabled	OER flag in RLN3nLEST register
Framing error	When the first stop bit is low level in the reception processing.	— (Reception is completed by the time this error is detected)	Enabled	FER flag in RLN3nLEST register
Parity error	The received parity value fails to match the parity value calculated from the received data	Continues until the data reception is completed.	Disabled *2	UPER flag in RLN3nLEST register
Expansion bit detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register.	—	Enabled	EXBT flag in RLN3nLEST register
ID match detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register and the 8-bit received data excluding the expansion bit matches the value of the RLN3nLIDB register.	—	Enabled	IDMT flag in RLN3nLEST register

Note 1. In the case of transmission from the UART buffer, bit errors are detected even in the space between UART frames (inter-byte space).

Note 2. Setting the UPS[1:0] bits in the RLN3nLBFC register to 10_B (0 parity) disables the checking of parity bit values. In this case, no parity error is generated.

The error status is cleared by software or at a transition to LIN reset mode.

19.9 LIN Self-Test Mode

The LIN/UART interface provides a LIN self-test mode. When the LIN/UART interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and they are internally connected within the LIN/UART interface. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX. The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following four modes:

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception
- LIN slave self-test mode (transmission): Header reception and response transmission
- LIN slave self-test mode (reception): Header reception and response reception

In LIN self-test mode, the operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator.

Regardless of the setting of the baud rate related registers, the baud rate setting is the LIN communication clock source/16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to 0000_B or 1111_B.)

In addition, in LIN self-test mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- LIN slave mode (Auto baud rate)
- Frame/response timeout error

Do not use these functions.

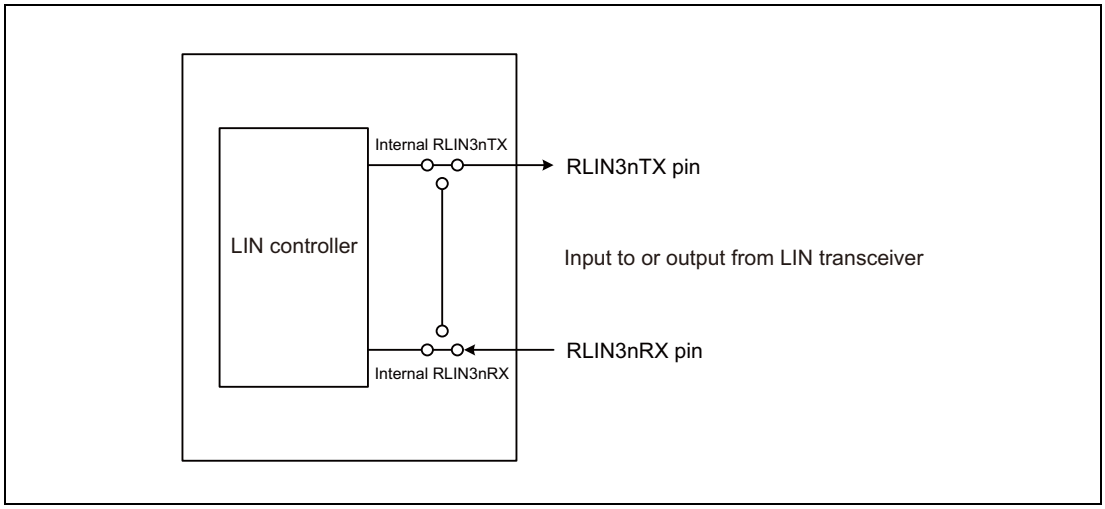


Figure 19.33 Connection in LIN Reset Mode, LIN Mode, and UART Mode

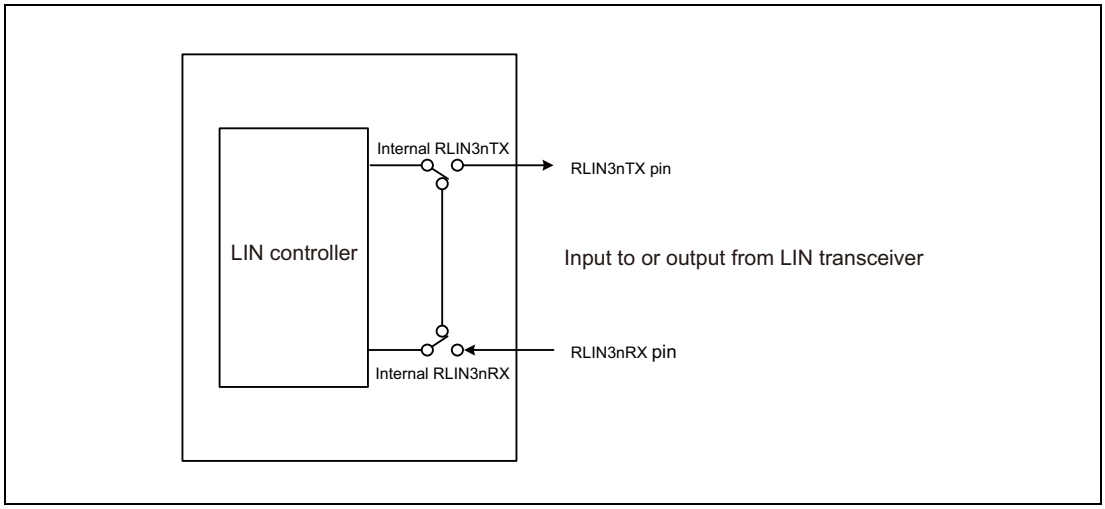

Figure 19.34 Connection in LIN Self-Test Mode

19.9.1 Transition to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.
The LSTM bit in the RLN3nLSTC register set to 1 indicates that the mode has transitioned to the LIN self-test mode.

When transitioning to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be consecutively written three times to the LIN self-test control register, as follows:

- Transition to LIN reset mode
  Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
  LMD bits in RLN3nLMD = 00_B (LIN master mode) or 11_B (LIN slave mode [fixed baud rate])
- 1st write: RLN3nLSTC register = $1010\ 0111_B$ ($A7_H$)
- 2nd write: RLN3nLSTC register = $0101\ 1000_B$ (58_H)
- 3rd write: RLN3nLSTC register = $0000\ 0001_B$ (01_H)
- Verify the transition to LIN self-test mode
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the 1st write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is aborted. The above sequence should be retried from the 1st write step. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also aborted.

19.9.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxxx_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00xx $xx00_B$*1
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = x000 $x0xx_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 00xx $xxxx_B$
  RLN3nLSC register = 00xx $0xxx_B$
- Exit the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11_B.
- Configure the transmission frame related registers.
  RLN3nLDFC register = 00x1 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx $xxxx_B$
- Start header transmission → response transmission
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (transmission) is executed, interrupt is generated, and status and error status are also updated. The checksum is automatically calculated by the LIN/UART interface. To abort the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Arbitrary value can be specified.

Note 1. The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register and the LCKS bit in the RLN3nLMD register. Therefore, configuration of these registers is not necessary.

Note 2. If necessary, configure the related registers described in **Section 7, Exception/Interrupts**.

Note 3. When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).

The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up transmission flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

19.9.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxxx_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00xx $xx00_B$*1
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = x000 $x0xx_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 00xx $xxxx_B$
  RLN3nLSC register = 00xx $0xxx_B$*1
- Exit the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11_B.
- Configure the reception frame related registers.
  RLN3nLDFC register = 00x0 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx $xxxx_B$
  RLN3nCBR register = xxxx $xxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, perform the calculation and specify the calculated value in the RLN3nLCBR register.
- Start header transmission → response reception
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (reception) is executed, interrupt is generated, and status and error status are also updated. To abort the LIN master self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the specified value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Arbitrary value can be specified.

Note 1. The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, configuration of these registers is not necessary.

Note 2. If necessary, configure the related registers described in **Section 7, Exception/Interrupts**.

Note 3. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).
The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

19.9.4 Transmission in LIN Slave Self-Test Mode

To execute a self-test on LIN slave transmission, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxx0_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00x $x0011_B$
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = xx0x $x00x_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 0000 $000x_B$*3
  RLN3nLSC register = 00xx 0001_B
- Exit the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11_B.
- Configure the transmission frame related registers.
  RLN3nLDFC register = 00x1 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 registers = xxxx $xxxx_B$
- Header reception → response transmission started
  Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/ reception started).
  (The header reception and the response transmission are executed in this order, without manipulating the RTS bit in the RLN3nLTRC register.)
  The LIN slave self-test mode (transmission) is executed, interrupt is generated, and status and error status are also updated.
  The checksum is automatically calculated by the LIN/UART interface. To abort the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.

- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Arbitrary value can be specified.

Note 1. The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, and the RLN3nLBRP1 register. Therefore, configuration of these registers is not necessary.

Note 2. If necessary, configure the related registers described in **Section 7, Exception/Interrupts**

Note 3. According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

Note 4. When the successful header reception interrupt and the successful response transmission interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).
The time from setting of the successful header reception flag to setting of the successful response/wake-up transmission flag is calculated by using the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

19.9.5 Reception in LIN Slave Self-Test Mode

To execute a self-test on LIN slave reception, perform the following procedure:

- Configure the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxx0_B$*1
  RLN3nLBRP0 register = $xxxx\ xxxx_B$*1
  RLN3nLBRP1 register = $xxxx\ xxxx_B$*1
  RLN3nLMD register = $00xx\ 0011_B$
- Configure the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = $xx0x\ x00x_B$
- Configure the break field and space related registers.
  RLN3nLBFC register = 0000 $000x_B$*3
  RLN3nLSC register = $00xx\ 0001_B$*1
- Exit the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11_B.
- Configure the reception frame related registers.
  RLN3nLDFC register = $00x0\ xxxx_B$
  RLN3nLIDB register = $xxxx\ xxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 registers = $xxxx\ xxxx_B$
  RLN3nCBR register = $xxxx\ xxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, users must calculate it and set it to the RLN3nLCBR register. A checksum test can be performed by setting an incorrect checksum value here.
- Header reception → response reception started
  Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/ reception started).
  (Without any setting of the RTS bit in the RLN3nLTRC register, the header reception and the response reception are executed in this order.)
  The LIN slave self-test mode (reception) is executed, interrupt is generated, and status and error status are also updated. To abort the LIN slave self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the specified value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Arbitrary value can be specified.

Note 1. The settings of the following registers are not reflected to the operation of the LIN self-test mode: the LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, and the IBS bit in the RLN3nLSC register.
Therefore, configuration of these registers is not necessary.

Note 2. If necessary, configure the related registers described in **Section 7, Exception/Interrupts**.

Note 3. According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

Note 4. When the successful header reception interrupt and the successful response reception interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).
The time required from the set of the successful header reception flag to the set of the successful response/wake-up reception flag is calculated by the following formula.

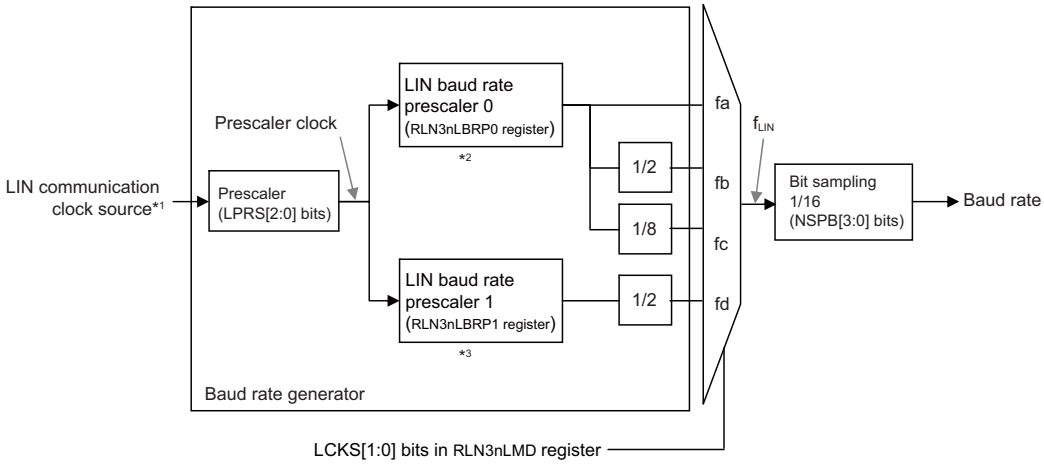
10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN communication clock source × 16

19.9.6 Exiting LIN Self-Test Mode

To exit LIN self-test mode, perform the following procedure:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
  If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11_B, write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11_B, transition to LIN reset mode.
- Verify that LIN/UART interface has exited LIN self-test mode.
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 0 (not in LIN self-test mode)
- Verify the transition to LIN reset mode.
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).



19.10 Baud Rate Generator

The prescaler clock is obtained by dividing the LIN communication clock source frequency by the prescaler, and the LIN system clock (f_{LIN}) is obtained by dividing the prescaler clock frequency by the baud rate generator. The clock obtained by dividing the LIN system clock frequency (f_{LIN}) by the number of samples is the baud rate. The inverse of this baud rate is called the bit time (Tbit).

The LIN/UART interface has two types of baud rate generators. The baud rate generators are switched according to the mode used.

19.10.1 LIN Master Mode

Figure 19.35 shows a block diagram of baud rate generation in LIN master mode.

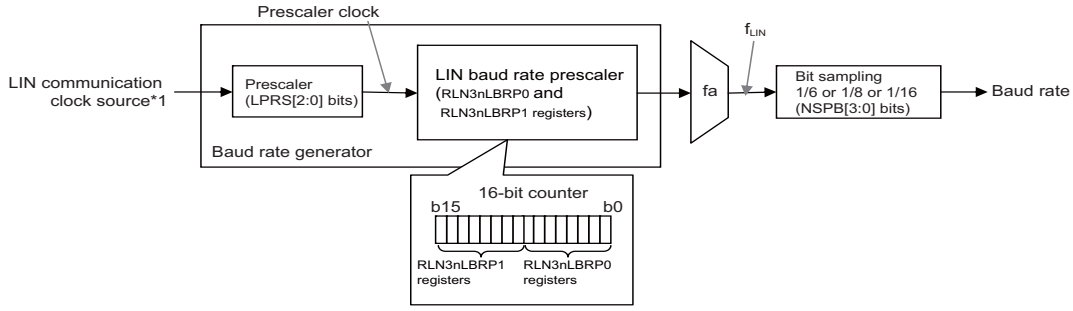
Note 1. For the LIN communication clock source, see **Section 12.5.3, Clock Domain Settings**.
Note 2. When the value in RLN3nLBRP0 register is N (N = 0 to 255), the clock frequency is divided by N + 1.
Note 3. When the value in RLN3nLBRP1 register is M (M = 0 to 255), the clock frequency is divided by M + 1.

Figure 19.35 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLN3nLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting bit rates are fa = 19200 × 16, fb = 9600 × 16, and fc = 2400 × 16. These bit rates are frequency-divided by 16 in the bit timing generator, enabling baud rates of 19200 bps, 9600 bps and 2400 bps, to be generated. Also, by configuring the RLN3nLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting bit rate is fd = 10417 × 16. This bit rate is frequency-divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

Baud rate of LIN master

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP0+ 1) ÷ 16 [bps] (When fa is selected for f_{LIN})



= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP0 + 1) ÷ 2 ÷ 16 [bps] (When fb is selected for f_{LIN})

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP0 + 1) ÷ 8 ÷ 16 [bps] (When fc is selected for f_{LIN})

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP1 + 1) ÷ 2 ÷ 16 [bps] (When fd is selected for f_{LIN})

19.10.2 LIN Slave Mode

Figure 19.36 shows a block diagram of baud rate generation in LIN slave mode.

Note 1. For the LIN communication clock source, see **Section 12.5.3, Clock Domain Settings**.

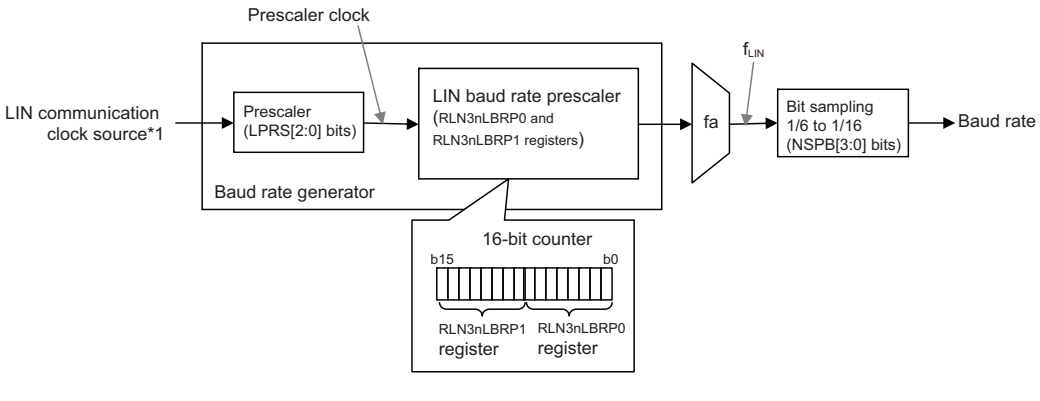
Figure 19.36 Block Diagram of Baud Rate Generation in LIN Slave Mode

In LIN slave mode (auto baud rate), the baud rate can be specified in the range of 1 kbps to 20 kbps. Configure the prescaler clock as follows according to the target baud rate:

[Target baud rate]	[Prescaler clock]
1 kbps to 20 kbps	: 4MHz *1
1 kbps to 2.4 kbps (excluding 2.4 kbps)	: 4MHz
2.4 kbps to 20 kbps	: 8 MHz to 12 MHz

Note 1. Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to "0011_B" (4 samplings).

The formula for baud rate is described below.



Baud rate of LIN slave
= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP01 + 1) ÷ 16 [bps] ([Fixed baud rate])
= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selected clock)
÷ (RLN3nLBRP01 + 1) ÷ 4 or 8 [bps] ([Auto baud rate])

NOTE

For a LIN slave with fixed baud rate, set the NSPB[3:0] bit to "0000_B" (16 samplings) or "1111_B" (16 samplings). For a LIN slave with auto baud rate, set the NSPB[3:0] bits to "0011_B" (4 samplings) or "0100_B" (8 samplings).

19.10.3 UART Mode

Figure 19.37 shows a block diagram of baud rate generation in UART mode.

Note 1. For the LIN communication clock source, see **Section 12.5.3, Clock Domain Settings**.

Figure 19.37 Block Diagram of Baud Rate Generation in UART Mode

UART baud rate is calculated with the following formula:

UART baud rate
= {LIN communication clock source frequency} × (RLN3nLWBR.LPRS[2:0] selected clock) ÷ (RLN3nLBRP01 + 1) ÷ {RLN3nLWBR.NSPB[3:0] selected count} [bps]

19.11 Noise Filter

The LIN/UART interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLN3nLMD register to 0 (use the noise filter), the noise filter is activated. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

Figure 19.38 shows the configuration of the noise filter, **Figure 19.39** shows an example of a noise filter circuit, and **Figure 19.40** shows the determination of the received data when the noise filter is used.

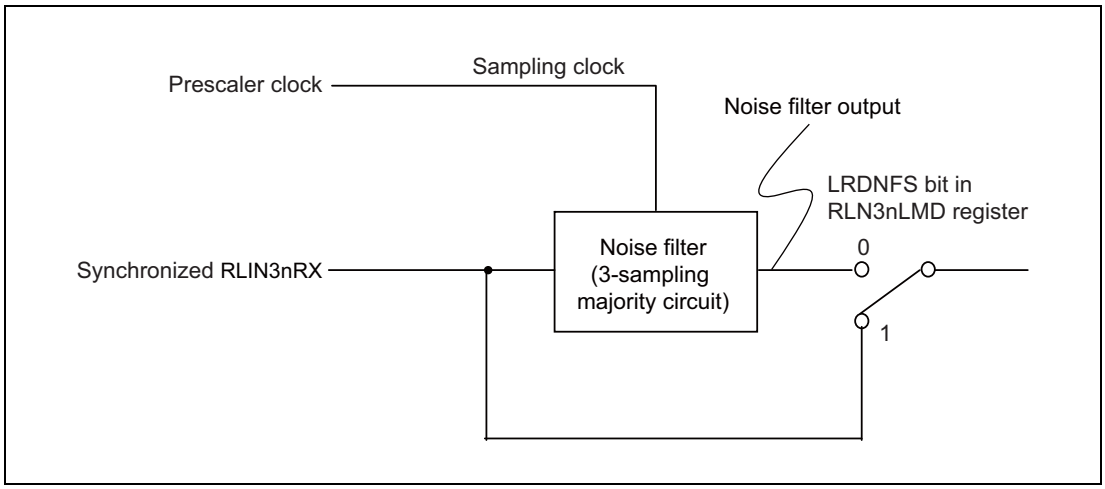


Figure 19.38 Configuration of Noise Filter

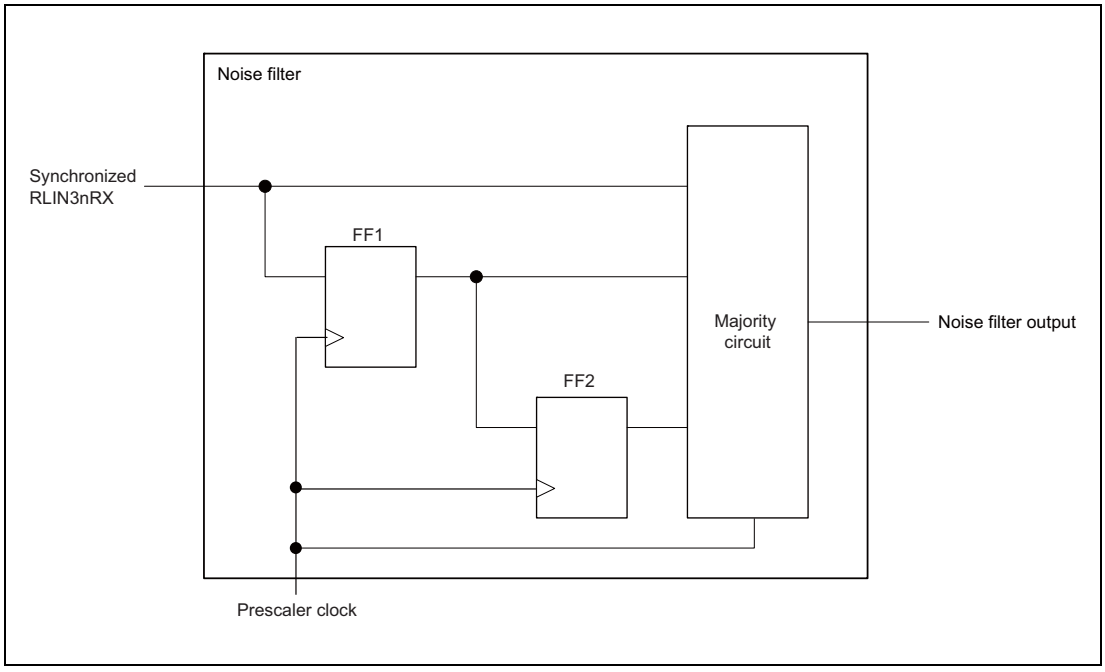

Figure 19.39 Example of Noise Filter Circuit

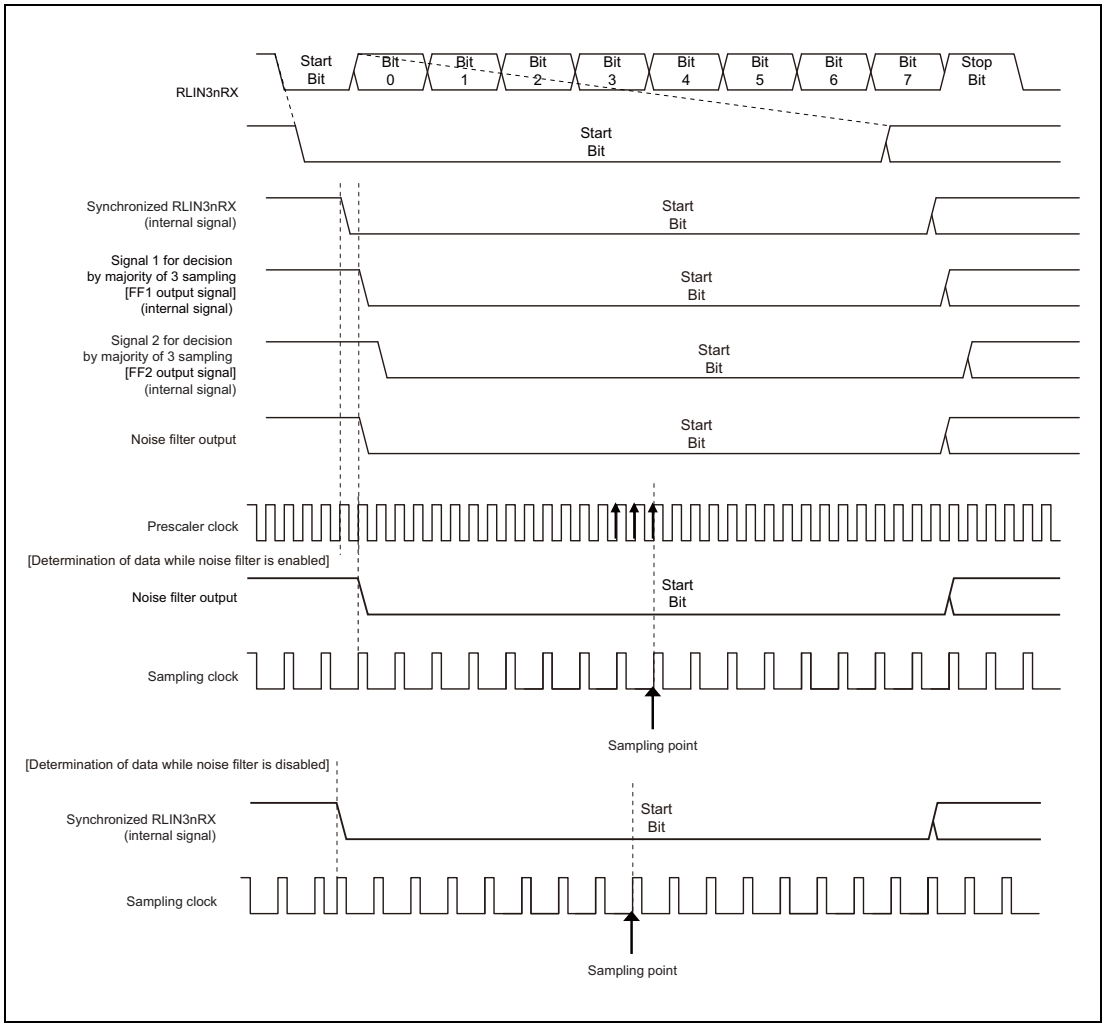

Figure 19.40 Determination of Received Data when Noise Filter is Used

Section 20 I2C Bus Interface (RIIC)

This section contains a generic description of the I2C Bus Interface (RIIC).

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RIIC.

20.1 Features of RH850/F1K RIIC

20.1.1 Number of Units and Channels

This microcontroller has the following number of RIIC units.

Each RIIC unit has one channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 20.1 Number of Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	1		
Name	RIICn (n = 0)		

Table 20.2 Index

Index	Description
n	Throughout this section, the individual RIIC units are identified by the index “n” (n = 0): for example, RIICnCR1 is the I2C bus control register1.

20.1.2 Register Base Address

RIIC base addresses are listed in the following table.

RIIC register addresses are given as offsets from the base addresses.

Table 20.3 Register Base Address

Base Address Name	Base Address
<RIIC0_base>	FFCA 0000H

20.1.3 Clock Supply

The RIIC clock supply is shown in the following table.

Table 20.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
RIICn	PCLK*1	CKSCLK_IIIC	Communication clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_IIIC	

Note 1. Set the period of PCLK no greater than 1/2 of the width at high level of the SCL clock.

20.1.4 Interrupt Requests

RIIC interrupt requests are listed in the following table.

Table 20.5 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RIIC0			
INTRIICnEE	RIIC communication error / event generation interrupt	77	—
INTRIICnRI	RIIC receive end interrupt	78	20
INTRIICnTI	RIIC transmit data empty interrupt	76	19
INTRIICnTEI	RIIC transmit end interrupt	79	—

20.1.5 Reset Sources

RIIC reset sources are listed in the following table. RIIC is initialized by these reset sources.

Table 20.6 Reset Sources

Unit Name	Reset Source
RIIC0	All reset sources (ISORES)

20.1.6 External Input/Output Signals

External input/output signals of RIIC are listed below.

Table 20.7 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
RIIC0		
RIICnSCL	Serial clock I/O pin	RIIC0SCL
RIICnSDA	Serial data I/O pin	RIIC0SDA

When using these ports, the PBDCn register for the corresponding port and the corresponding bit in the PODCn register must be set to 1.

20.2 Overview

20.2.1 Functional Overview

Communications format

- I2C bus format
- Master mode or slave mode selectable
- Automatic securing of the various set-up times, hold times, and bus-free times according to the specified transfer rate

Transfer rate

Up to 400 kbps

SCL clock

- For master operation, the duty cycle of the SCL clock is selectable in the following range:
  - 0% < Duty < 100%

Issuing and detecting conditions

Start, restart, and stop conditions are automatically generated. Start conditions (including restart conditions) and stop conditions are detectable.

Slave address

- Up to three slave-address settings can be made.
- Seven- and ten-bit address formats are supported (along with the use of both at once).
- General call addresses and device ID addresses are detectable.

Acknowledgement

- For transmission, the acknowledge bit is automatically loaded
  - Transfer of the next data for transmission can be automatically suspended on detection of a not-acknowledge bit.
- For reception, the acknowledge bit is automatically transmitted
  - If a wait between the eighth and ninth clock cycles has been selected, software control of the value in the acknowledge field in response to the received value is possible.

Wait function

- In reception, the following periods of waiting can be obtained by holding the clock signal (SCL) at the low level:
  - Waiting between the eighth and ninth clock cycles
  - Waiting between the ninth clock cycle and the first clock cycle of the next transfer (WAIT function)

SDA output delay function

Timing of the output of transmitted data, including the acknowledge bit, can be delayed.

Arbitration

- For multi-master operation
  - Operation to synchronize the SCL (clock) signal in cases of conflict with the SCL signal from another master is possible.
  - When issuing the start condition would create conflict on the bus, loss of arbitration is detected by testing for non-matching between the internal signal for the SDA line and the level on the SDA line.
  - In master operation, loss of arbitration is detected by testing for non-matching of internal and line levels for transmit data.
- Loss of arbitration due to detection of the start condition while the bus is busy can be detected (to prevent the issuing of double start conditions).
- Loss of arbitration in transfer of a not-acknowledge bit due to the internal signal for the SDA line and the level on the SDA line not matching can be detected.
- Loss of arbitration due to non-matching of internal and line levels for data can be detected in slave transmission.

Timeout function

The internal time-out function is capable of detecting long-interval stop of the SCL (clock signal).

Noise removal

The interface incorporates digital noise filters for both the SCL and SDA signals, and the width for noise cancellation by the filters is adjustable by software.

Interrupt sources

- Four sources:
  - Error in transfer or occurrence of events (detection of arbitration loss, NACK, time-out, a start condition including a restart condition, or a stop condition)
  - Reception complete (including matching with a slave address)
  - Transmit-data-empty (including matching with a slave address)
  - Transmission complete

20.2.2 Block Diagram

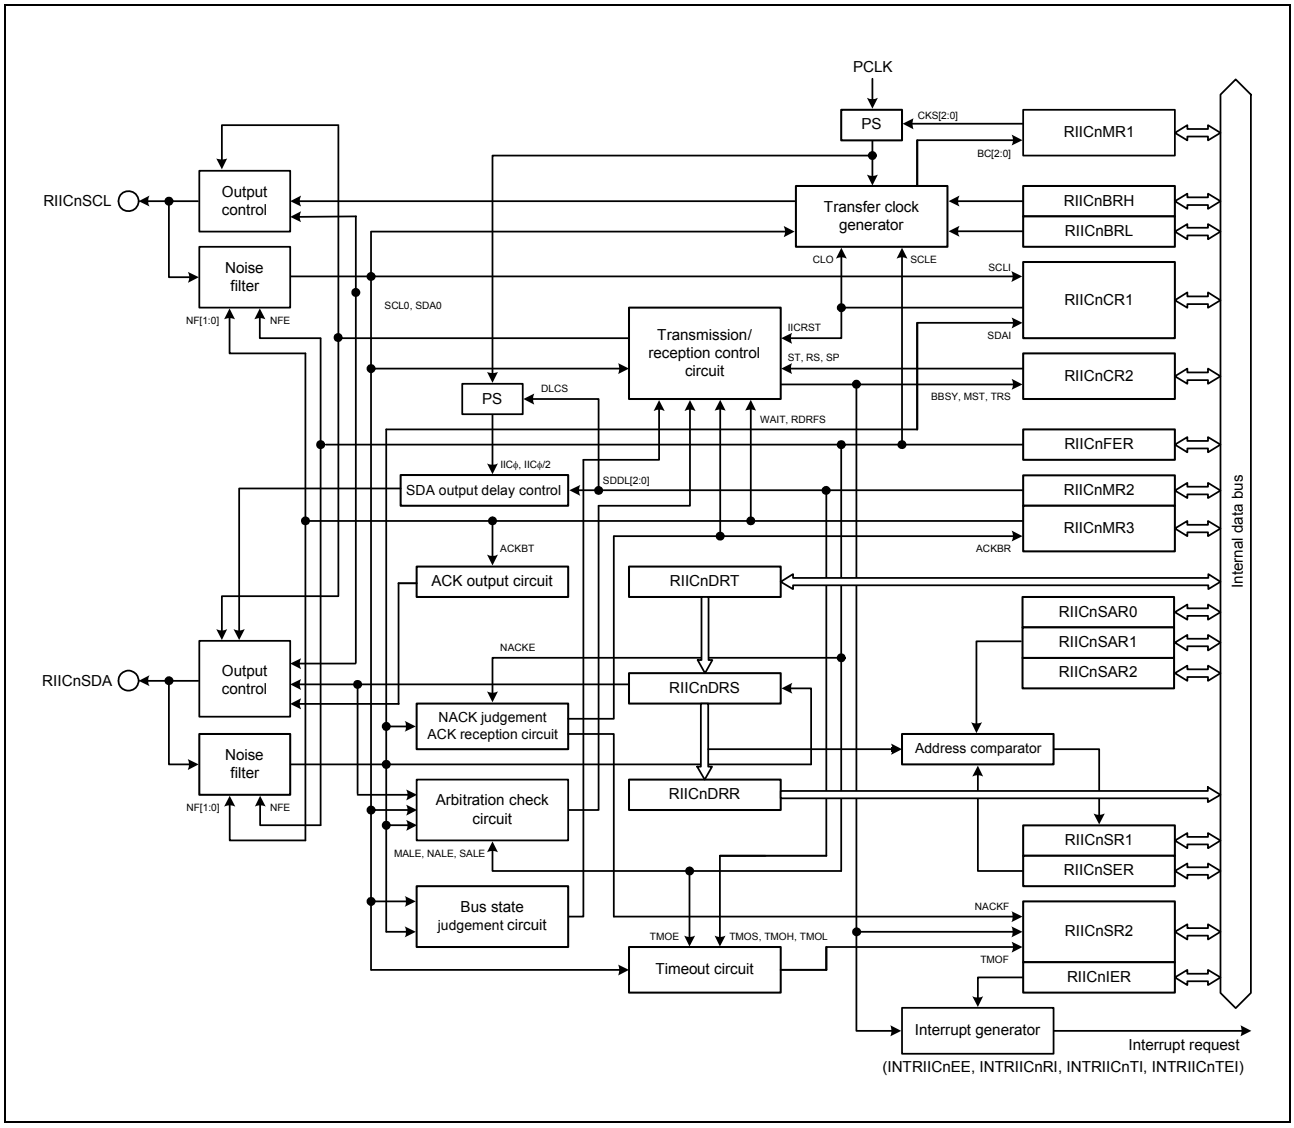

Figure 20.1 Block Diagram of RIIC

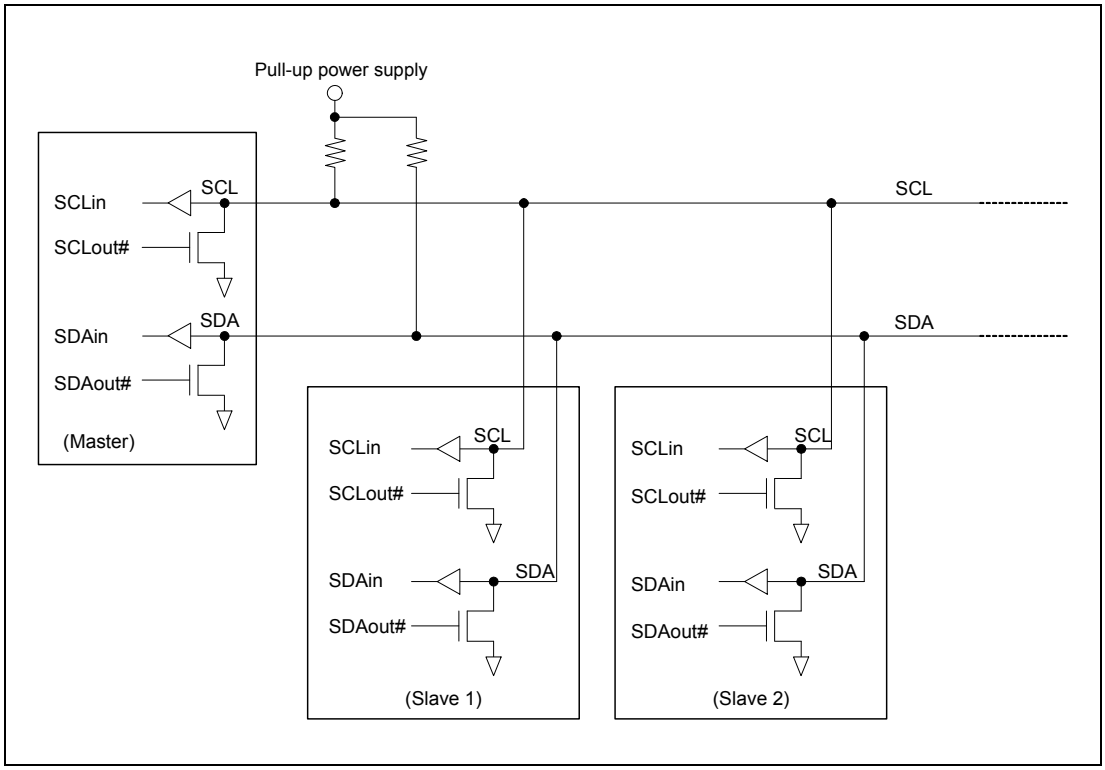

Figure 20.2 Connections to the External Circuit by the I/O Pins (I2C Bus Configuration Example)

20.3 Registers

20.3.1 List of Registers

RIIC registers are listed in the table below.

For details about <RIICn_base>, see **Section 20.1.2, Register Base Address**.

Table 20.8 List of Registers

Module Name	Register Name	Symbol	Address
RIICn	I2C Bus Control Register 1	RIICnCR1	<RIICn_base> + 0000_H
	I2C Bus Control Register 2	RIICnCR2	<RIICn_base> + 0004_H
	I2C Bus Mode Register 1	RIICnMR1	<RIICn_base> + 0008_H
	I2C Bus Mode Register 2	RIICnMR2	<RIICn_base> + $000C_H$
	I2C Bus Mode Register 3	RIICnMR3	<RIICn_base> + 0010_H
	I2C Bus Function Enable Register	RIICnFER	<RIICn_base> + 0014_H
	I2C Bus Status Enable Register	RIICnSER	<RIICn_base> + 0018_H
	I2C Bus Interrupt Enable Register	RIICnIER	<RIICn_base> + $001C_H$
	I2C Bus Status Register 1	RIICnSR1	<RIICn_base> + 0020_H
	I2C Bus Status Register 2	RIICnSR2	<RIICn_base> + 0024_H
	I2C Slave Address Register 0	RIICnSAR0	<RIICn_base> + 0028_H
	I2C Slave Address Register 1	RIICnSAR1	<RIICn_base> + $002C_H$
	I2C Slave Address Register 2	RIICnSAR2	<RIICn_base> + 0030_H
	I2C Bus Bit Rate Low-Level Register	RIICnBRL	<RIICn_base> + 0034_H
	I2C Bus Bit Rate High-Level Register	RIICnBRH	<RIICn_base> + 0038_H
	I2C Bus Transmit Data Register	RIICnDRT	<RIICn_base> + $003C_H$
	I2C Bus Receive Data Register	RIICnDRR	<RIICn_base> + 0040_H
	I2C Bus Shift Register	RIICnDRS	—

20.3.2 RIICnCR1 — I2C Bus Control Register 1

Access: RIICnCR1 register can be read or written in 32-bit units.
RIICnCR1L register can be read or written in 16-bit units.
RIICnCR1LL register can be read or written in 8-bit units.

Address: RIICnCR1: <RIICn_base> + 0000_H

RIICnCR1L: <RIICn_base> + 0000_H

RIICnCR1LL: <RIICn_base> + 0000_H

Value after reset: 0000 $001F_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 20.9 RIICnCR1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	ICE	I2C Bus Interface Enable 0: Disabled (the RIICnSCL and RIICnSDA pins are not driven). 1: Enabled (the RIICnSCL and RIICnSDA pins are driven). (This bit selects an RIIC reset or internal reset in combination with the IICRST bit.)
6	IICRST	I2C Bus Interface Internal Reset 0: Clears the RIIC reset or internal reset. 1: Initiates the RIIC reset or internal reset. (Clears the bit counter and the SCL/SDA output latch)
5	CLO	Extra SCL Clock Cycle Output 0: Does not output an extra SCL clock cycle (default). 1: Outputs an extra SCL clock cycle. (The CLO bit is cleared automatically after one clock cycle is output.)
4	SOWP	SCLO/SDAO Write Protect 0: Bits SCLO and SDAO can be written. 1: Bits SCLO and SDAO are protected. (This bit is read as 1.)
3	SCLO	SCL Output Control/Monitor • Read: 0: The RIIC has driven the RIICnSCL pin low. 1: The RIIC has released the RIICnSCL pin. • Write: 0: The RIIC drives the RIICnSCL pin low. 1: The RIIC releases the RIICnSCL pin.

Table 20.9 RIICnCR1 Register Contents (2/2)

Bit Position	Bit Name	Function
2	SDAO	SDA Output Control/Monitor • Read: 0: The RIIC has driven the RIICnSDA pin low. 1: The RIIC has released the RIICnSDA pin. • Write: 0: The RIIC drives the RIICnSDA pin low. 1: The RIIC releases the RIICnSDA pin.
1	SCLI	SCL Line Monitor 0: RIICnSCL line is low. 1: RIICnSCL line is high.
0	SDAI	SDA Line Monitor 0: RIICnSDA line is low. 1: RIICnSDA line is high.

SDAO Bit (SDA Output Control/Monitor) and SCLO Bit (SCL Output Control/Monitor)

These bits are used to directly control the RIICnSDA and RIICnSCL signals output from the RIIC.

When writing to these bits, also write 0 to the SOWP bit.

The result of setting these bits is input to the RIIC via the input buffer. When slave mode is selected, a START condition may be detected and the bus may be released depending on the bit settings.

Do not rewrite these bits during a START condition, STOP condition, repeated START condition, or during transmission or reception. Operation after rewriting under the above conditions is not guaranteed.

When reading these bits, the state of signals output from the RIIC can be read.

CLO Bit (Extra SCL Clock Cycle Output)

This bit is used to output an extra SCL clock cycle for debugging or error processing.

Normally, set the bit to 0. Setting the bit to 1 in a normal communication state causes a communication error.

For details on this function, see **Section 20.13.2, Extra SCL Clock Cycle Output Function**.

IICRST Bit (I2C Bus Interface Internal Reset)

This bit is used to reset the internal states of the RIIC.

Setting this bit to 1 initiates an RIIC reset or internal reset.

Whether an RIIC reset or internal reset is initiated is determined according to the combination with the ICE bit. **Table 20.10** lists the types of RIIC reset.

The RIIC reset resets all registers (except ICE and IICRST) including the RIICnCR2.BBSY flag and internal states of the RIIC, and the internal reset resets the bit counter (RIICnMR1.BC[2:0] bits), the I2C bus shift register (RIICnDRS), and the I2C bus status registers (RIICnSR1 and RIICnSR2) as well as the internal states of the RIIC. For the reset conditions for each register, see **Section 20.14, Reset Function of RIIC**.

An internal reset initiated with the IICRST bit set to 1 during operation (with the ICE bit set to 1) resets the internal states of the RIIC without initializing the port settings and the control and setting registers of the RIIC when the bus or RIIC hangs up due to a communication errorr, etc.

If the RIIC hangs up in a low level output state, resetting the internal states cancels the low level output state and releases the bus with the RIICnSCL pin and RIICnSDA pin at a high impedance.

CAUTION

If an internal reset is initiated using the IICRST bit for a bus hang-up occurred during communication with the master device in slave mode, the states may become different between the slave device and the master device (due to the difference in the bit counter information). For this reason, do not initiate an internal reset in slave mode, but initiate restoration processing from the master device. If an internal reset is necessary because the RIIC hangs up with the SCL line in a low level output state in slave mode, initiate an internal reset and then issue a restart condition from the master device or resume communication from the start condition issuance after issuing a stop condition. If communication is restarted by initiating a reset solely in the slave device without issuing a start condition or restart condition from the master device, synchronization will be lost because the master and slave devices operate asynchronously.

Table 20.10 RIIC Resets

IICRST	ICE	State	Specifications
1	0	RIIC reset	Resets all registers (except ICE and IICRST) and internal states of the RIIC.
	1	Internal reset	Reset the RIICnMR1.BC[2:0] bits, and the RIICnSR1, RIICnSR2, RIICnDRS registers and the internal states of the RIIC.

ICE Bit (I2C Bus Interface Enable)

The ICE bit selects driving or non-driving of the RIICnSCL and RIICnSDA pins. Moreover, this bit can perform two types of reset in combination with the IICRST bit. For the types of reset, see **Table 20.10, RIIC Resets**.

Set the ICE bit to 1 when using RIIC. Setting the ICE bit to 1 selects driving of the RIICnSCL and RIICnSDA pins.

Set the ICE bit to 0 when RIIC is not to be used. Clearing the ICE bit to 0 stops driving of the RIICnSCL and RIICnSDA pins.

CAUTION

Though the output from RIICnSDA or RIICnSCL is disabled while the ICE bit is 0, the input to RIICnSDA or RIICnSCL is enabled. The RIICnSCL and RIICnSDA pin functions should not be assigned to the RIIC. If assigned, it causes the slave addresses to be compared.

20.3.3 RIICnCR2 — I2C Bus Control Register 2

Access: RIICnCR2 register can be read or written in 32-bit units.
RIICnCR2L register can be read or written in 16-bit units.
RIICnCR2LL register can be read or written in 8-bit units.

Address: RIICnCR2: <RIICn_base> + 0004_H

RIICnCR2L: <RIICn_base> + 0004_H

RIICnCR2LL: <RIICn_base> + 0004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	BBSY	MST	TRS	—	SP	RS	ST	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R

Table 20.11 RIICnCR2 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	BBSY	Bus Busy Detection Flag 0: The I2C bus is released (the bus is free). 1: The I2C bus is occupied (the bus is busy).
6	MST*1	Master/Slave Mode 0: Slave mode 1: Master mode
5	TRS*1	Transmit/Receive Mode 0: Receive mode 1: Transmit mode
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SP	Stop Condition Issuance Request 0: Does not request to issue a stop condition. 1: Requests to issue a stop condition.
2	RS	Restart Condition Issuance Request 0: Does not request to issue a restart condition. 1: Requests to issue a restart condition.
1	ST	Start Condition Issuance Request 0: Does not request to issue a start condition. 1: Requests to issue a start condition.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. When the RIICnMR1.MTWP bit is set to 1, the MST and TRS bits can be written to.

ST Bit (Start Condition Issuance Request)

This bit is used to request transition to master mode and issuance of a start condition.

When this bit is set to 1 to request to issue a start condition, a start condition is issued when the BBSY flag is set to 0 (bus free).

For details on the start condition issuance, see **Section 20.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the ST bit

[Clearing conditions]

- When 0 is written to the ST bit
- When a start condition has been issued
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTION

Set the ST bit to 1 (start condition issuance request) when the BBSY flag is set to 0 (bus free).
Note that arbitration may be lost as the start condition issuance error if the ST bit is set to 1 (start condition issuance request) when the BBSY flag is set to 1 (bus busy).

RS Bit (Restart Condition Issuance Request)

This bit is used to request that a restart condition be issued in master mode.

When this bit is set to 1 to request to issue a restart condition, a restart condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the restart condition issuance, see **Section 20.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the RS bit with the RIICnCR2.BBSY flag set to 1

[Clearing conditions]

- When 0 is written to the RS bit
- When a restart condition has been issued or a start condition is detected
- When a stop condition is detected
- When the RIICnCR2.AL (arbitration-lost) flag is set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTIONS

1. Do not set the RS bit to 1 while issuing a stop condition.
2. It is commended to issue a restart condition in master transmit mode. If the RS bit is set to 1 (restart condition issuance request) in mode other than master mode, the restart condition is not issued in this mode but the RS bit remains set. If the operating mode changes to master mode with the bit not being cleared, the restart condition may be issued.

SP Bit (Stop Condition Issuance Request)

This bit is used to request that a stop condition be issued in master mode.

When this bit is set to 1 to request to issue a stop condition, a stop condition is issued when the BBSY flag is set to 1 (bus busy) and the MST bit is set to 1 (master mode).

For details on the stop condition issuance, see **Section 20.12, Start Condition/Restart Condition/Stop Condition Issuing Function**.

[Setting condition]

When 1 is written to the SP bit with both the RIICnCR2.BBSY flag and the RIICnCR2.MST bit set to 1

[Clearing conditions]

- When 0 is written to the SP bit
- When a stop condition has been issued or a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When a start condition and a restart condition are detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTIONS

1. Writing to the SP bit is not possible while the setting of the BBSY flag is 0 (bus free).
2. Do not set the SP bit to 1 while a restart condition is being issued.

TRS Bit (Transmit/Receive Mode)

This bit indicates transmit or receive mode.

The RIIC is in receive mode when the TRS bit is set to 0 and is in transmit mode when the bit is set to 1. Combination of this bit and the MST bit indicates the operating mode of the RIIC.

The value of the TRS bit is automatically changed to the value for transmission mode or reception mode (1 or 0) by detection or issuing of a start condition, setting or clearing of the R/W# bit, etc. Although writing to the TRS bit is possible when the RIICnMR1.MTWP bit is set to 1, writing to this bit is not necessary during normal usage.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When the address received in slave mode matches the address enabled in RIICnSER, with the R/W# bit set to 1
- When 1 is written to the TRS bit with the RIICnMR1.MTWP bit set to 1

[Clearing conditions]

- When a stop condition is detected
- The RIICnSR2.AL (arbitration-lost) flag being set to 1
- In master mode, reception of a slave address to which an R/W# bit with the value 1 is appended
- In slave transmit mode, a restart condition is detected (a restart condition is detected with RIICnCR2.BBSY = 1 and RIICnCR2.MST = 0)

- When 0 is written to the TRS bit with the RIICnMR1.MTWP bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

MST Bit (Master/Slave Mode)

This bit indicates master or slave mode.

The RIIC is in slave mode when the MST bit is set to 0 and is in master mode when the bit is set to 1. Combination of this bit and the TRS bit indicates the operating mode of the RIIC.

The value of the MST bit is automatically changed to the value for master mode or slave mode (1 or 0) by detection or issuing of a start condition, etc. Although writing to the MST bit is possible when the RIICnMR1.MTWP bit is set to 1, writing to this bit is not necessary during normal usage.

[Setting conditions]

- When a start condition is issued normally according to the start condition issuance request (when a start condition is detected with the ST bit set to 1)
- When 1 is written to the MST bit with the RIICnMR1.MTWP bit set to 1

[Clearing conditions]

- When a stop condition is detected
- When the RIICnSR2.AL (arbitration-lost) flag is set to 1
- When 0 is written to the MST bit with the RIICnMR1.MTWP bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

BBSY Flag (Bus Busy Detection)

The BBSY flag indicates whether the I2C bus is occupied (bus busy) or released (bus free).

This bit is set to 1 when the SDA line changes from high to low under the condition of SCL = high, assuming that a start condition has been issued.

When the SDA line changes from low to high under the condition of SCL = high, this bit is cleared to 0 after the bus free time (specified in RIICnBRL) start condition is not detected, assuming that a stop condition has been issued.

[Setting condition]

When a start condition is detected

[Clearing conditions]

- When the bus free time (specified in RIICnBRL) start condition is not detected after detecting a stop condition
- When 1 is written to the RIICnCR1.IICRST bit with the RIICnCR1.ICE bit set to 0 (RIIC reset)

CAUTION

- When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
- When an internal reset is applied while the bus is not free, the BBSY flag is not cleared.

20.3.4 RIICnMR1 — I2C Bus Mode Register 1

Access: RIICnMR1 register can be read or written in 32-bit units.
RIICnMR1L register can be read or written in 16-bit units.
RIICnMR1LL register can be read or written in 8-bit units.

Address: RIICnMR1: <RIICn_base> + 0008_H

RIICnMR1L: <RIICn_base> + 0008_H

RIICnMR1LL: <RIICn_base> + 0008_H

Value after reset: $0000\ 0008_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MTWP	CKS[2:0]			BCWP	BC[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	W	R/W	R/W	R/W

Table 20.12 RIICnMR1 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	MTWP	MST/TRS Write Protect 0: Disables writing to the RIICnCR2.MST and TRS bits. 1: Enables writing to the RIICnCR2.MST and TRS bits.
6 to 4	CKS[2:0]	Internal Reference Clock Selection (IICϕ) b6 b4 0 0 0: PCLK/1 clock 0 0 1: PCLK/2 clock 0 1 0: PCLK/4 clock 0 1 1: PCLK/8 clock 1 0 0: PCLK/16 clock 1 0 1: PCLK/32 clock 1 1 0: PCLK/64 clock 1 1 1: PCLK/128 clock
3	BCWP*1	BC Write Protect 0: Enables a value to be written in the BC[2:0] bits. (This bit is read as 1.) 1: Protects the BC[2:0] bits.
2 to 0	BC[2:0]	Bit Counter b2 b0 0 0 0: 9 bits 0 0 1: 2 bits 0 1 0: 3 bits 0 1 1: 4 bits 1 0 0: 5 bits 1 0 1: 6 bits 1 1 0: 7 bits 1 1 1: 8 bits

Note 1. When rewriting the BC[2:0] bits, write 0 to the BCWP bit simultaneously.

BC[2:0] Bits (Bit Counter)

These bits function as a counter that indicates the number of bits remaining to be transferred at the detection of a rising edge on the SCL line. Although these bits are writable and readable, it is not necessary to access these bits under normal conditions.

To write to these bits, specify the number of bits to be transferred plus one (data is transferred with an additional acknowledge bit) between transferred frames. When setting any value other than 000_B, set the value while the SCL line is at a low level.

[Clearing conditions]

- When 1 is written to the RIICnCR1.IICRST bit and a RIIC reset or internal reset is initiated.
- Data transfer including the acknowledge bit being completed.
- A start condition including a restart condition being detected.

20.3.5 RIICnMR2 — I2C Bus Mode Register 2

Access: RIICnMR2 register can be read or written in 32-bit units.
RIICnMR2L register can be read or written in 16-bit units.
RIICnMR2LL register can be read or written in 8-bit units.

Address: RIICnMR2: <RIICn_base> + $000C_H$

RIICnMR2L: <RIICn_base> + $000C_H$

RIICnMR2LL: <RIICn_base> + $000C_H$

Value after reset: $0000\ 0006_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DLCS	SDDL[2:0]			—	TMOH	TMOL	TMOS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Table 20.13 RIICnMR2 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	DLCS	SDA Output Delay Clock Source Selection 0: The internal reference clock (IICϕ) is selected as the clock source of the SDA output delay counter. 1: The internal reference clock divided by 2 (IICϕ/2) is selected as the clock source of the SDA output delay counter.*1
6 to 4	SDDL[2:0]	SDA Output Delay Counter • When RIICnMR2.DLCS = 0 (IICϕ) b6 b4 0 0 0: No output delay 0 0 1: 1 IICϕ cycle 0 1 0: 2 IICϕ cycles 0 1 1: 3 IICϕ cycles 1 0 0: 4 IICϕ cycles 1 0 1: 5 IICϕ cycles 1 1 0: 6 IICϕ cycles 1 1 1: 7 IICϕ cycles • When RIICnMR2.DLCS = 1 (IICϕ/2) b6 b4 0 0 0: No output delay 0 0 1: 1 or 2 IICϕ cycles 0 1 0: 3 or 4 IICϕ cycles 0 1 1: 5 or 6 IICϕ cycles 1 0 0: 7 or 8 IICϕ cycles 1 0 1: 9 or 10 IICϕ cycles 1 1 0: 11 or 12 IICϕ cycles 1 1 1: 13 or 14 IICϕ cycles
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TMOH	Timeout H Count Control 0: Disables counting while the SCL line is at a high level. 1: Enables counting while the SCL line is at a high level.

Table 20.13 RIICnMR2 Register Contents (2/2)

Bit Position	Bit Name	Function
1	TMOL	Timeout L Count Control 0: Disables counting while the SCL line is at a low level. 1: Enables counting while the SCL line is at a low level.
0	TMOS	Timeout Detection Time Selection 0: Long mode is selected. 1: Short mode is selected.

Note 1. The setting DLCS = 1 (IICϕ/2) only becomes valid when SCL is at the low level. When SCL is at the high level, the setting DLCS = 1 becomes invalid and the clock source becomes the internal reference clock (IICϕ).

TMOS Bit (Timeout Detection Time Selection)

This bit is used to select long mode or short mode for the timeout detection time when the timeout function is enabled (RIICnFER.TMOE bit = 1). When this bit is set to 0, long mode is selected. When this bit is set to 1, short mode is selected. In long mode, the timeout detection internal counter functions as a 16 bit-counter. In short mode, the counter functions as a 14 bit-counter. While the SCL line is in the state that enables this counter as specified by bits TMOH and TMOL, the counter counts up in synchronization with the internal reference clock (IICϕ) as a count source.

For details on the timeout function, see **Section 20.13.1, Timeout Function**.

TMOL Bit (Timeout L Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held low when the timeout function is enabled (RIICnFER.TMOE bit = 1).

TMOH Bit (Timeout H Count Control)

This bit is used to enable or disable the internal counter of the timeout function to count up while the SCL line is held high when the timeout function is enabled (RIICnFER.TMOE bit = 1).

SDDL[2:0] Bits (SDA Output Delay Setup Counter)

The SDA output can be delayed by the SDDL[2:0] setting. This counter works with the clock source selected by the DLCS bit. The setting of this function can be used for all types of SDA output, including the transmission of the acknowledge bit.

For details on this function, see **Section 20.7, Facility for Delaying SDA Output**.

CAUTION

Set the SDA output delay time to meet the I2C bus standard (within the data enable time/acknowledge enable time*1). Note that, if a value outside the standard is set, communication with communication devices may malfunction or it may seemingly become a start condition or stop condition depending on the bus state.

Note 1. Data enable time/acknowledge enable time
3,450 ns (up to 100 kbps: standard mode [Sm])
900 ns (up to 400 kbps: fast mode [Fm])

20.3.6 RIICnMR3 — I2C Bus Mode Register 3

Access: RIICnMR3 register can be read or written in 32-bit units.
RIICnMR3L register can be read or written in 16-bit units.
RIICnMR3LL register can be read or written in 8-bit units.

Address: RIICnMR3: <RIICn_base> + 0010_H

RIICnMR3L: <RIICn_base> + 0010_H

RIICnMR3LL: <RIICn_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	WAIT	RDRFS	ACKWP	ACKBT	ACKBR	NF[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W

Table 20.14 RIICnMR3 Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	WAIT*2	WAIT 0: No WAIT (The period between ninth clock cycle and first clock cycle is not held low.) 1: WAIT (The period between ninth clock cycle and first clock cycle is held low.) Low-hold is released by reading RIICnDRR.
5	RDRFS*2	RDRF Flag Set Timing Selection 0: The RDRF flag is set at the rising edge of the ninth SCL clock cycle. (The SCL line is not held low at the falling edge of the eighth clock cycle.) 1: The RDRF flag is set at the rising edge of the eighth SCL clock cycle. (The SCL line is held low at the falling edge of the eighth clock cycle.) Low-hold is released by writing a value to the ACKBT bit.
4	ACKWP*1	ACKBT Write Protect 0: Modification of the ACKBT bit is disabled. 1: Modification of the ACKBT bit is enabled.
3	ACKBT*1	Transmit Acknowledge 0: A 0 is sent as the acknowledge bit (ACK transmission). 1: A 1 is sent as the acknowledge bit (NACK transmission).
2	ACKBR	Receive Acknowledge 0: A 0 is received as the acknowledge bit (ACK reception). 1: A 1 is received as the acknowledge bit (NACK reception).
1, 0	NF[1:0]	Digital noise Filter Stage Selection b1 b0 0 0: Noise of up to one IICϕ cycle is filtered out (single-stage filter). 0 1: Noise of up to two IICϕ cycles is filtered out (2-stage filter). 1 0: Noise of up to three IICϕ cycles is filtered out (3-stage filter). 1 1: Noise of up to four IICϕ cycles is filtered out (4-stage filter).

Note 1. If it is attempted to write 1 to both ACKWP and ACKBT bits, the ACKBT bit cannot be set to 1.

Note 2. The WAIT and RDRFS bits are valid only in receive mode (invalid in transmit mode).

NF[1:0] Bits (Digital noise Filter Stage Selection)

These bits are used to select the number of stages of the digital noise filter.

CAUTION

Set the noise range to be filtered out by the noise filter within a range less than the SCL line high-level period or low-level period. If the noise range is set to a value of (SCL clock width: high-level period or low-level period, whichever is shorter) - [1.5 internal reference clock synchronized (IICϕ) cycles] or more, the SCL clock is regarded as noise by the noise filter function of the RIIC, which may prevent the RIIC from operating normally.

ACKBR Bit (Receive Acknowledge)

This bit is used to store the acknowledge bit information received from the receive device in transmit mode.

[Setting condition]

When 1 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When 0 is received as the acknowledge bit with the RIICnCR2.TRS bit set to 1
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

ACKBT Bit (Transmit Acknowledge)

This bit is used to set the bit to be sent at the acknowledge timing in receive mode.

[Setting condition]

When 1 is written to this bit with the ACKWP bit set to 1

[Clearing conditions]

- When 0 is written to this bit after ACKWP reading while the ACKWP bit is set to 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit while the RIICnCR1.ICE bit is 0 (RIIC reset)

CAUTION

The ACKBT bit must be written to while the ACKWP bit is 1. If the ACKBT bit is written to with the ACKWP bit cleared to 0, writing to the ACKBT bit is disabled.

ACKWP Bit (ACKBT Write Protect)

This bit is used to control the modification of the ACKBT bit.

RDRFS Bit (RDRF Flag Set Timing Selection)

This bit is used to select the RDRF flag set timing in receive mode and also to select whether to hold the SCL line low at the falling edge of the eighth SCL clock cycle.

When the RDRFS bit is 0, the SCL line is not held low at the falling edge of the eighth SCL clock cycle, and the RDRF flag is set to 1 at the rising edge of the ninth SCL clock cycle.

When the RDRFS bit is 1, the RDRF flag is set to 1 at the rising edge of the eighth SCL clock cycle and the SCL line is held low at the falling edge of the eighth SCL clock cycle. The low-hold of the SCL line is released by writing a value to the ACKBT bit.

After data is received with this setting, the SCL line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKBT = 0) or NACK (ACKBT = 1) according to receive data.

WAIT Bit (WAIT)

This bit is used to control whether to hold the period between the ninth SCL clock cycle and the first SCL clock cycle low until the receive data buffer (RIICnDRR) is completely read each time single-byte data is received in receive mode.

When the WAIT bit is 0, the receive operation is continued without holding the period between the ninth and the first SCL clock cycle low. When both the RDRFS and WAIT bits are 0, continuous receive operation is enabled with the double buffer.

When the WAIT bit is 1, the SCL line is held low from the falling edge of the ninth clock cycle until the RIICnDRR value is read each time single-byte data is received. This enables receive operation in byte units.

CAUTION

When the value of the WAIT bit is cleared to 0, be sure to read the RIICnDRR beforehand.

20.3.7 RIICnFER — I2C Bus Function Enable Register

Access: RIICnFER register can be read or written in 32-bit units.
RIICnFERL register can be read or written in 16-bit units.
RIICnFERLL register can be read or written in 8-bit units.

Address: RIICnFER: <RIICn_base> + 0014_H

RIICnFERL: <RIICn_base> + 0014_H

RIICnFERLL: <RIICn_base> + 0014_H

Value after reset: $0000\ 0072_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	1	1	1	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 20.15 RIICnFER Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	SCLE	SCL Synchronous Circuit Enable 0: No SCL synchronous circuit is used. 1: An SCL synchronous circuit is used.
5	NFE	Digital Noise Filter Circuit Enable 0: No digital noise filter circuit is used. 1: A digital noise filter circuit is used.
4	NACKE	NACK Reception Transfer Suspension Enable 0: Transfer operation is not suspended during NACK reception (transfer suspension disabled). 1: Transfer operation is suspended during NACK reception (transfer suspension enabled).
3	SALE	Slave Arbitration-Lost Detection Enable 0: Slave arbitration-lost detection is disabled. 1: Slave arbitration-lost detection is enabled.
2	NALE	NACK Transmission Arbitration-Lost Detection Enable 0: NACK transmission arbitration-lost detection is disabled. 1: NACK transmission arbitration-lost detection is enabled.
1	MALE	Master Arbitration-Lost Detection Enable 0: Master arbitration-lost detection is disabled. (Disables the arbitration-lost detection function and does not clear the RIICnCR2.MST and TRS bits automatically when arbitration is lost.) 1: Master arbitration-lost detection is enabled. (Enables the arbitration-lost detection function and clears the RIICnCR2.MST and TRS bits automatically when arbitration is lost.) If 1 is written to the ST bit while the BBSY flag is 1 in slave transmit mode, the TRS bit is not cleared.
0	TMOE	Timeout Function Enable 0: The timeout function is disabled. 1: The timeout function is enabled.

TMOE Bit (Timeout Function Enable)

This bit is used to enable or disable the timeout function.

For details on the timeout function, see **Section 20.13.1, Timeout Function**.

MALE Bit (Master Arbitration-Lost Detection Enable)

This bit is used to select enabling or disabling of the arbitration-lost detection function. Normally, set this bit to 1.

NALE Bit (NACK Transmission Arbitration-Lost Detection Enable)

This bit is used to specify whether the detection of ACK during transmission of NACK in reception (such as when slaves with the same address are present on the bus and each is transmitting different data, or when two or more masters select the same slave device simultaneously with different numbers of bytes for reception) is judged to represent a loss in arbitration.

SALE Bit (Slave Arbitration-Lost Detection Enable)

This bit is used to specify whether to cause arbitration to be lost when a value different from the value being transmitted is detected on the bus in slave transmit mode (such as when slaves with the same address exist on the bus or when a mismatch with the transmit data occurs due to noise).

NACKE Bit (NACK Reception Transfer Suspension Enable)

This bit is used to specify whether to continue or discontinue the transfer operation when NACK is received in transmit mode. Normally, set this bit to 1.

When NACK is received with the NACKE bit set to 1, the next transfer operation is suspended.

When the NACKE bit is 0, the next transfer operation is continued regardless of the received acknowledge content.

SCLE Bit (SCL Synchronous Circuit Enable)

This bit is used to specify whether to synchronize the SCL clock with a rising or falling edge on the SCL line. Normally, set this bit to 1.

When the SCLE bit is cleared to 0 (SCL synchronous circuit not used), the RIIC does not synchronize the SCL clock with the SCL input clock. In this setting, the RIIC outputs the SCL clock with the transfer rate set in RIICnBRH and RIICnBRL regardless of the SCL line state. For this reason, if the bus load of the I2C bus line is much larger than the specification value or if the SCL clock output overlaps in multiple masters, the short-cycle SCL clock that does not meet the specification may be output. When no SCL synchronous circuit is used, it also affects the issuance of a start condition, restart condition, and stop condition, and the continuous output of extra SCL clock cycles.

This bit must not be cleared to 0 except for checking the output of the transfer rate.

20.3.8 RIICnSER — I2C Bus Status Enable Register

Access: RIICnSER register can be read or written in 32-bit units.
RIICnSERL register can be read or written in 16-bit units.
RIICnSERLL register can be read or written in 8-bit units.

Address: RIICnSER: <RIICn_base> + 0018_H

RIICnSERL: <RIICn_base> + 0018_H

RIICnSERLL: <RIICn_base> + 0018_H

Value after reset: $0000\ 0009_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 20.16 RIICnSER Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	DIDE	Device-ID Address Detection Enable 0: Device-ID address detection is disabled. 1: Device-ID address detection is enabled.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	GCE	General Call Address Enable 0: General call address detection is disabled. 1: General call address detection is enabled.
2	SAR2	Slave Address Register 2 Enable 0: Slave address in RIICnSAR2 is disabled. 1: Slave address in RIICnSAR2 is enabled.
1	SAR1	Slave Address Register 1 Enable 0: Slave address in RIICnSAR1 is disabled. 1: Slave address in RIICnSAR1 is enabled.
0	SAR0	Slave Address Register 0 Enable 0: Slave address in RIICnSAR0 is disabled. 1: Slave address in RIICnSAR0 is enabled.

SARy Bit (Slave Address Register y Enable) (y = 0 to 2)

This bit is used to enable or disable the slave address set in RIICnSARy.

When this bit is set to 1, the slave address set in RIICnSARy is enabled and is compared with the received slave address.

When this bit is cleared to 0, the slave address set in RIICnSARy is disabled and is ignored even if it matches the received slave address.

GCAE Bit (General Call Address Enable)

This bit is used to specify whether to ignore the general call address ($0000\ 000_B$ + 0 [W]: All 0) when it is received.

When this bit is set to 1, if the received slave address matches the general call address, the RIIC recognizes the received slave address as the general call address independently of the slave addresses set in RIICnSARy (y = 0 to 2) and performs data receive operation.

When this bit is cleared to 0, the received slave address is ignored even if it matches the general call address.

DIDE Bit (Device-ID Address Detection Enable)

This bit is used to specify whether to recognize and execute the Device-ID address when a device ID ($1111\ 100_B$) is received in the first frame after a start condition or restart condition is detected.

When this bit is set to 1, if the received first frame matches the device ID, the RIIC recognizes that the Device-ID address has been received. When the following R/W# bit is 0 [W], the RIIC recognizes the second and the following frames as slave addresses and continues the receive operation.

When this bit is cleared to 0, the RIIC ignores the received first frame even if it matches the device ID address and recognizes the first frame as a normal slave address.

For details on the device-ID address detection, see **Section 20.9.3, Device-ID Address Detection**.

20.3.9 RIICnIER — I2C Bus Interrupt Enable Register

Access: RIICnIER register can be read or written in 32-bit units.
RIICnIERL register can be read or written in 16-bit units.
RIICnIERLL register can be read or written in 8-bit units.

Address: RIICnIER: <RIICn_base> + $001C_H$

RIICnIERL: <RIICn_base> + $001C_H$

RIICnIERLL: <RIICn_base> + $001C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 20.17 RIICnIER Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	TIE	Transmit Data Empty Interrupt Enable 0: Transmit data empty interrupt request (INTRIICnTI) is disabled. 1: Transmit data empty interrupt request (INTRIICnTI) is enabled.
6	TEIE	Transmit End Interrupt Enable 0: Transmit end interrupt request (INTRIICnTEI) is disabled. 1: Transmit end interrupt request (INTRIICnTEI) is enabled.
5	RIE	Receive Complete Interrupt Enable 0: Receive complete interrupt request (INTRIICnRI) is disabled. 1: Receive complete interrupt request (INTRIICnRI) is enabled.
4	NAKIE	NACK Reception Interrupt Enable 0: NACK reception interrupt request (NAKI) is disabled. 1: NACK reception interrupt request (NAKI) is enabled.
3	SPIE	Stop Condition Detection Interrupt Enable 0: Stop condition detection interrupt request (SPI) is disabled. 1: Stop condition detection interrupt request (SPI) is enabled.
2	STIE	Start Condition Detection Interrupt Enable 0: Start condition detection interrupt request (STI) is disabled. 1: Start condition detection interrupt request (STI) is enabled.
1	ALIE	Arbitration-Lost Interrupt Enable 0: Arbitration-lost interrupt request (ALI) is disabled. 1: Arbitration-lost interrupt request (ALI) is enabled.
0	TMOIE	Timeout Interrupt Enable 0: Timeout interrupt request (TMOI) is disabled. 1: Timeout interrupt request (TMOI) is enabled.

TMOIE Bit (Timeout Interrupt Enable)

This bit is used to enable or disable timeout interrupt requests (TMOI) when the RIICnSR2.TMOF flag is set to 1. A TMOI interrupt request is canceled by clearing the TMOF flag or the TMOIE bit to 0.

ALIE Bit (Arbitration-Lost Interrupt Enable)

This bit is used to enable or disable arbitration-lost interrupt requests (ALI) when the RIICnSR2.AL flag is set to 1. An ALI interrupt request is canceled by clearing the AL flag or the ALIE bit to 0.

STIE Bit (Start Condition Detection Interrupt Enable)

This bit is used to enable or disable start condition detection interrupt requests (STI) when the RIICnSR2.START flag is set to 1. An STI interrupt request is canceled by clearing the START flag or the STIE bit to 0.

SPIE Bit (Stop Condition Detection Interrupt Enable)

This bit is used to enable or disable stop condition detection interrupt requests (SPI) when the RIICnSR2.STOP flag is set to 1. An SPI interrupt request is canceled by clearing the STOP flag or the SPIE bit to 0.

NAKIE Bit (NACK Reception Interrupt Enable)

This bit is used to enable or disable NACK reception interrupt requests (NAKI) when the RIICnSR2.NACKF flag is set to 1. An NAKI interrupt request is canceled by clearing the NACKF flag or the NAKIE bit to 0.

RIE Bit (Receive Complete Interrupt Enable)

This bit is used to enable or disable receive complete interrupt requests (INTRIICnRI) when the RIICnSR2.RDRF flag is set to 1.

TEIE Bit (Transmit End Interrupt Enable)

This bit is used to enable or disable transmit end interrupts (INTRIICnTEI) when the RIICnSR2.TEND flag is set to 1. An INTIICnTEI interrupt request is canceled by clearing the TEND flag or the TEIE bit to 0.

TIE Bit (Transmit Data Empty Interrupt Enable)

This bit is used to enable or disable transmit data empty interrupts (INTRIICnTI) when the RIICnSR2.TDRE flag is set to 1.

20.3.10 RIICnSR1 — I2C Bus Status Register 1

Access: RIICnSR1 register can be read or written in 32-bit units.
RIICnSR1L register can be read or written in 16-bit units.
RIICnSR1LL register can be read or written in 8-bit units.

Address: RIICnSR1: <RIICn_base> + 0020_H

RIICnSR1L: <RIICn_base> + 0020_H

RIICnSR1LL: <RIICn_base> + 0020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R(/W) *1	R	R(/W) *1	R(/W) *1	R(/W) *1	R(/W) *1

Note 1. Only 0 can be written to this bit.

Table 20.18 RIICnSR1 Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	DID	Device-ID Address Detection Flag 0: Device-ID address is not detected. 1: Device-ID address is detected.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	GCA	General Call Address Detection Flag 0: General call address is not detected. 1: General call address is detected.
2	AAS2	Slave Address 2 Detection Flag 0: Slave address 2 is not detected. 1: Slave address 2 is detected.
1	AAS1	Slave Address 1 Detection Flag 0: Slave address 1 is not detected. 1: Slave address 1 is detected.
0	AAS0	Slave Address 0 Detection Flag 0: Slave address 0 is not detected. 1: Slave address 0 is detected.

AASy Flag (Slave Address y Detection) (y = 0 to 2)

[Setting conditions]

<For 7-bit address format: RIICnSARy.FSy = 0>

When the received slave address matches the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

When the received slave address matches a value of (1111 0_B + RIICnSARy.SVA[9:8]) and the following address matches the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the AASy bit after reading AASy = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

<For 7-bit address format: RIICnSARy.FSy = 0>

- When the received slave address does not match the RIICnSARy.SVA[7:1] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

<For 10-bit address format: RIICnSARy.FSy = 1>

- When the received slave address does not match a value of (1111 0_B + RIICnSARy.SVA[9:8]) with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the received slave address matches a value of (1111 0_B + RIICnSARy.SVA[9:8]) and the following address does not match the RIICnSARy.SVA[7:0] value with the RIICnSER.SARy bit set to 1 (slave address y detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.

GCA Flag (General Call Address Detection)

[Setting condition]

- When the received slave address matches the general call address (0000 000_B + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
  This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the GCA bit after reading GCA = 1
- When a stop condition is detected
- When the received slave address does not match the general call address (0000 000_B + 0 [W]) with the RIICnSER.GCE bit set to 1 (general call address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

DID Flag (Device-ID Address Detection)

[Setting condition]

- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID ($1111\ 100_B$) + 0 [W]) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled). This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.
- When a restart condition is detected after a match with the device ID address and the device ID address ($1111\ 100_B$) plus 1[R] has matched while the setting of the RIICnSER.DIDE bit is 1 (device ID address detection enabled). This flag is set to 1 at the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the DID bit after reading DID = 1
- When a stop condition is detected
- When the first frame received immediately after a start condition or restart condition is detected does not match a value of (device ID ($1111\ 100_B$)) with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When the first frame received immediately after a start condition or restart condition is detected matches a value of (device ID ($1111\ 100_B$) + 0 [W]) and the second frame does not match any of slave addresses 0 to 2 with the RIICnSER.DIDE bit set to 1 (Device-ID address detection enabled)
  This flag is cleared to 0 at the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

20.3.11 RIICnSR2 — I2C Bus Status Register 2

Access: RIICnSR2 register can be read or written in 32-bit units.
RIICnSR2L register can be read or written in 16-bit units.
RIICnSR2LL register can be read or written in 8-bit units.

Address: RIICnSR2: <RIICn_base> + 0024_H

RIICnSR2L: <RIICn_base> + 0024_H

RIICnSR2LL: <RIICn_base> + 0024_H

Value after reset: $0000\ 0000_H$

Note 1. Only 0 can be written to this bit.

Table 20.19 RIICnSR2 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	TDRE	Transmit Data Empty Flag 0: RIICnDRT contains transmit data. 1: RIICnDRT contains no transmit data.
6	TEND	Transmit End Flag 0: Data is being transmitted. 1: Data has been transmitted.
5	RDRF	Receive Complete Flag 0: RIICnDRR contains no receive data. 1: RIICnDRR contains receive data.
4	NACKF	NACK Detection Flag 0: NACK is not detected. 1: NACK is detected.
3	STOP	Stop Condition Detection Flag 0: Stop condition is not detected. 1: Stop condition is detected.
2	START	Start Condition Detection Flag 0: Start condition is not detected. 1: Start condition is detected.
1	AL	Arbitration-Lost Flag 0: Arbitration is not lost. 1: Arbitration is lost.
0	TMOF	Timeout Detection Flag 0: Timeout is not detected. 1: Timeout is detected.

TMOF Flag (Timeout Detection)

This flag is set to 1 when the RIIC recognizes timeout after the SCL line state remains unchanged for a certain period.

[Setting condition]

The timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is stuck low or high during the following conditions:

- The bus is busy (the RIICnCR2.BBSY flag is 1) in master mode (the RIICnCR2.MST bit is 1).
- The RIIC's own slave address matches (the RIICnSR1 register is not 00_H) and the bus is busy (the RIICnCR2.BBSY bit is 1) in slave mode (the RIICnCR2.MST bit is 0).
- The bus is free (the RIICnCR2.BBSY flag is 0) while generation of a start condition is requested (the RIICnCR2.ST bit is 1).

[Clearing conditions]

- When 0 is written to the TMOF bit after reading TMOF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

AL Flag (Arbitration-Lost)

This flag shows that bus mastership has been lost (loss in arbitration) due to a bus conflict or some other reason when a start condition is issued or an address and data are transmitted. The RIIC monitors the level on the SDA line during transmission and, if the level on the line does not match the value of the bit being output, sets the value of the AL bit to 1 to indicate that the bus is occupied by another device.

The RIIC can also set the flag to indicate the detection of loss of arbitration during NACK transmission in receive mode or during data transmission in slave mode.

[Setting conditions]

<When master arbitration-lost detection is enabled: RIICnFER.MALE = 1>

- When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data (including slave address) transmission in master transmit mode (when the SDA line is driven low while the internal SDA output is at a high level (the SDA pin is in the high-impedance state))
- When a start condition is detected while the RIICnCR2.ST bit is 1 (start condition issuance request) or the internal SDA output state does not match the SDA line level
- When the RIICnCR2.ST bit is set to 1 (start condition issuance request) with the RIICnCR2.BBSY flag set to 1.

<When NACK arbitration-lost detection is enabled: RIICnFER.NALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock in the ACK period during NACK transmission in receive mode

<When slave arbitration-lost detection is enabled: RIICnFER.SALE = 1>

When the internal SDA output state does not match the SDA line level at the rising edge of SCL clock except for the ACK period during data transmission in slave transmit mode

[Clearing conditions]

- When 0 is written to the AL bit after reading AL = 1

- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

Table 20.20 Relationship between Arbitration-Lost Generation Sources and Arbitration-Lost Enable Functions

RIICnFER			RIICnSR2		
MALE	NALE	SALE	AL	Error	Arbitration-Lost Generation Source
1	—	—	1	Start condition issuance error	When internal SDA output state does not match SDA line level when a start condition is detected while the RIICnCR2.ST bit is 1
					When RIICnCR2.ST is set to 1 with RIICnCR2.BBSY set to 1
			1	Transmit data mismatch	When transmit data (including slave address) does not match the bus state in master transmit mode
—	1	—	1	NACK transmission mismatch	When ACK is detected during transmission of NACK in master receive mode or slave receive mode
—	—	1	1	Transmit data mismatch	When transmit data does not match the bus state in slave transmit mode

—: Don't care

START Flag (Start Condition Detection)

[Setting condition]

When a start condition (or a restart condition) is detected

[Clearing conditions]

- When 0 is written to the START bit after reading START = 1
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

STOP Flag (Stop Condition Detection)

[Setting condition]

When a stop condition is detected

[Clearing conditions]

- When 0 is written to the STOP bit after reading STOP = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

NACKF Flag (NACK Detection)

[Setting condition]

When acknowledge is not received (NACK is received) from the receive device in transmit mode with the RIICnFER.NACKE bit set to 1 (transfer suspension enabled)

[Clearing conditions]

- When 0 is written to the NACKF bit after reading NACKF = 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTION

When the NACKF flag is set to 1, the RIIC suspends data transmission/reception. Writing to RIICnDRT in transmit mode or reading from RIICnDRR in receive mode with the NACKF flag set to 1 does not enable data transmit/receive operation. To restart data transmission/reception, clear the NACKF flag to 0.

RDRF Flag (Receive Complete)

[Setting conditions]

- When receive data has been transferred from RIICnDRS to RIICnDRR
  At the rising edge of the eighth or ninth SCL clock cycle (selected by the RIICnMR3.RDRFS bit)
- When the received slave address matches the address enabled in RIICnSER after a start condition (or a restart condition) is detected with the RIICnCR2.TRS bit cleared to 0
- In master mode, transition to master reception while the R/W# bit appended to the slave address is set to 1

[Clearing conditions]

- When 0 is written to the RDRF bit after reading RDRF = 1
- When data is read from RIICnDRR
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

TEND Flag (Transmit End)

[Setting condition]

At the rising edge of the ninth SCL clock cycle while the TDRE flag is 1

[Clearing conditions]

- When 0 is written to the TEND bit after reading TEND = 1
- When data is written to RIICnDRT
- When a stop condition is detected
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

TDRE Flag (Transmit Data Empty)

[Setting conditions]

- When data has been transferred from RIICnDRT to RIICnDRS and RIICnDRT becomes empty
- When the RIICnCR2.TRS bit is set to 1
  - When the RIICnCR2.MST bit is set to 1 after a start condition is detected
  - When 1 is written to the RIICnCR2.TRS bit while the RIICnMR1.MTWP bit is 1
- When the received slave address matches the address enabled in RIICnSER after a start condition including a restart condition is detected with the RIICnCR2.TRS bit set to 1

[Clearing conditions]

- When data is written to RIICnDRT
- When the RIICnCR2.TRS bit is cleared to 0
  - When a stop condition is detected
  - When the RIIC enters receive mode from transmit mode
  - When 0 is written to the RIICnCR2.TRS bit while the RIICnMR1.MTWP bit is 1
- When 1 is written to the RIICnCR1.IICRST bit to apply an RIIC reset or an internal reset

CAUTION

When the NACKF flag is set to 1 while the RIICnFER.NACKE bit is 1, the RIIC suspends data transmission/reception. Here, if the TDRE flag is 0 (next transmit data has been written), data is transferred to the RIICnDRS register and the RIICnDRT register becomes empty at the rising edge of the ninth clock cycle, but the TDRE flag is not set to 1.

20.3.12 RIICnSARy — I2C Slave Address Register y (y = 0 to 2)

Access: RIICnSARy register can be read or written in 32-bit units.
RIICnSARyL register can be read or written in 16-bit units.
RIICnSARyLL and RIICnSARyLH registers can be read or written in 8-bit units.

Address: RIICnSAR0: <RIICn_base> + 0028_H

RIICnSAR0L: <RIICn_base> + 0028_H

RIICnSAR0LL: <RIICn_base> + 0028_H,
RIICnSAR0LH: <RIICn_base> + 0029_H

RIICnSAR1: <RIICn_base> + $002C_H$

RIICnSAR1L: <RIICn_base> + $002C_H$

RIICnSAR1LL: <RIICn_base> + $002C_H$,
RIICnSAR1LH: <RIICn_base> + $002D_H$

RIICnSAR2: <RIICn_base> + 0030_H

RIICnSAR2L: <RIICn_base> + 0030_H

RIICnSAR2LL: <RIICn_base> + 0030_H,
RIICnSAR2LH: <RIICn_base> + 0031_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FSy	—	—	—	—	—	SVA[9:1]									SVA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 20.21 RIICnSARy Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	FSy	7-Bit/10-Bit Address Format Selection 0: The 7-bit address format is selected. 1: The 10-bit address format is selected.
14 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 1	SVA[9:1]	7-Bit Address/10-Bit Address Upper Bits A slave address is set. • When the FSy bit is 0 (7-bit address format), the SVA[7:1] bits are valid and form a 7-bit slave address. • When the FSy bit is 1 (10-bit address format), SVA[9:1] bits form a 10-bit slave address (combined with the SVA0 bit).
0	SVA0	10-Bit Address LSB The least significant bit (LSB) of a 10-bit slave address is set. • When the FSy bit is 0 (7-bit address format), this bit is invalid. • When the FSy bit is 1 (10-bit address format), this bit is a 10-bit slave address (combined with the SVA[9:1] bits).

SVA0 Bit (10-Bit Address LSB)

When the 10-bit address format is selected (RIICnSARy.FSy = 1), this bit functions as the LSB of a 10-bit address and forms a 10-bit address in combination with the SVA[9:1] bits.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, this bit is valid. While the RIICnSARy.FSy bit or SARy bit is 0, the setting of this bit is ignored.

SVA[9:1] Bits (7-Bit Address/10-Bit Address Upper Bits)

When the 7-bit address format is selected (RIICnSARy.FSy = 0), these bits function as a 7-bit address. When the 10-bit address format is selected (RIICnSARy.FSy = 1), these bits function as a 10-bit address in combination with the SVA0 bit.

While the RIICnSER.SARy bit is 0, the setting of these bits is ignored.

FSy Bit (7-Bit/10-Bit Address Format Selection)

This bit is used to select 7-bit address or 10-bit address for slave address y (in RIICnSARy).

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 0, the 7-bit address format is selected for slave address y, the RIICnSARy.SVA[7:1] setting is valid, and the settings of the SVA[9:8] bits and the RIICnSARy.SVA0 bit are ignored.

When the RIICnSER.SARy bit is set to 1 (RIICnSARy enabled) and the RIICnSARy.FSy bit is 1, the 10-bit address format is selected for slave address y and the settings of the SVA[9:1] bits and the SVA0 bit are valid.

While the RIICnSER.SARy bit is 0 (RIICnSARy disabled), the setting of the RIICnSARy.FSy bit is invalid.

20.3.13 RIICnBRL — I2C Bus Bit Rate Low-Level Register

Access: RIICnBRL register can be read or written in 32-bit units.
RIICnBRLL register can be read or written in 16-bit units.
RIICnBRLLL register can be read or written in 8-bit units.

Address: RIICnBRL: <RIICn_base> + 0034_H

RIICnBRLL: <RIICn_base> + 0034_H

RIICnBRLLL: <RIICn_base> + 0034_H

Value after reset: $0000\ 00FF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 20.22 RIICnBRL Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	BRL[4:0]	Bit Rate Low-Level Period Low-level period of SCL clock

The RIICnBRL register is a 5-bit register that is used to set the width at low level for the SCL clock.

It also works to generate the data setup time for automatic SCL low-hold operation (see **Section 20.10, Automatic Low-Hold Function for SCL**); when the RIIC is used only in slave mode, this register needs to be set to a value longer than the data setup time*1.

RIICnBRL counts the low-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits.

Note 1. Data setup time (t_{SU}: DAT)
250 ns (up to 100 kbps: standard mode [Sm])
100 ns (up to 400 kbps: fast mode [Fm])

20.3.14 RIICnBRH — I2C Bus Bit Rate High-Level Register

Access: RIICnBRH register can be read or written in 32-bit units.
RIICnBRHL register can be read or written in 16-bit units.
RIICnBRHLL register can be read or written in 8-bit units.

Address: RIICnBRH: <RIICn_base> + 0038_H

RIICnBRHL: <RIICn_base> + 0038_H

RIICnBRHLL: <RIICn_base> + 0038_H

Value after reset: $0000\ 00FF_H$

	—	—	—	—	—	—	—	—	—	—	—	BRH[4:0]				
Value after reset	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 20.23 RIICnBRH Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	BRH[4:0]	Bit Rate High-Level Period High-level period of SCL clock

RIICnBRH is a 5-bit register to set the high-level period of SCL clock. RIICnICBRH is valid in master mode. If the RIIC is used only in slave mode, this register need not to set the high-level period.

RIICnBRH counts the high-level period with the internal reference clock source (IICϕ) specified by the RIICnMR1.CKS[2:0] bits.

The I2C transfer rate and the SCL clock duty are calculated using the following expression.

(1) When RIICnFER.SCLE = 0
Transfer rate = 1 / {[(RIICnBRH+1) + (RIICnBRL+1)] / IICφ*1 + tr + tf}
Duty cycle = {tr+[(RIICnBRH+1)/ IICφ]}/{ tr + tf + [(RIICnBRH+1) + (RIICnBRL+1)]/IICφ}

(2) When RIICnFER.SCLE=1, RIICnFER.NFE=0, IICφ = PCLK
Transfer rate = 1 / {[(RIICnBRH+3) + (RIICnBRL+3)] / IICφ*1 + tr + tf}
Duty cycle = {tr +[(RIICnBRH+3)/ IICφ]}/{ tr + tf + [(RIICnBRH+3) + (RIICnBRL+3)]/IICφ}

(3) When RIICnFER.SCLE=1, RIICnFER.NFE=1, IICφ = PCLK
Transfer rate =1 / {[(RIICnBRH+3+nf) + (RIICnBRL+3+nf)] / IICφ*1 + tr + tf}
Duty cycle = {tr +[(RIICnBRH+3+nf)/ IICφ]}/{ tr + tf + [(RIICnBRH+3+nf) + (RIICnBRL+3+nf)]/ IICφ}

(4) RIICnFER.SCLE=1, RIICnFER.NFE=0, IICφ < PCLK
Transfer rate =1 / {[(RIICnBRH+2) + (RIICnBRL+2)] / IICφ*1+ tr + tf}
Duty cycle = {tr +[(RIICnBRH+2)/ IICφ]}/{ tr + tf + [(RIICnBRH+2) + (RIICnBRL+2)]/IICφ}

(5) When RIICnFER.SCLE=1, RIICnFER.NFE=1, IICφ < PCLK
Transfer rate =1 / {[(RIICnBRH+2+nf) + (RIICnBRL+2+nf)] / IICφ*1+ tr + tf}
Duty cycle = {tr +[(RIICnBRH+2+nf)/ IICφ]}/{ tr + tf + [(RIICnBRH+2+nf) + (RIICnBRL+2+nf)]/ IICφ}

tf: SCL line falling time [ns]*2
tr: SCL line rising time [ns]*2
nf: Digital noise filter stage
Duty cycle: 0% < Duty < 100%

Note 1. As for IICφ, see CKS[2:0] in **Section 20.3.4, RIICnMR1 — I2C Bus Mode Register 1**.

Note 2. The SCL line rising time [tr] and SCL line falling time [tf] depend on the total bus line capacitance [Cb] and the pull-up resistor [Rp]. For details, see the I2C bus standard from NXP Semiconductors.

Table 20.24 lists examples of the RIICnBRH and RIICnBRL register settings when the SCL synchronization circuit is not used.

Table 20.24 Examples of RIICnBRH/RIICnBRLSettings for Transfer Rate

Transfer Rate (kbps)	PCLK Frequency (MHz)														
	8					10					12.5

CAUTION

CBRH/ICBRL settings in these tables are calculated using the following values:
SCL line rising time (tr): 100 kbps or less, [Sm]: 1000 ns, 400 kbps or less, [Fm]: 300 ns
SCL line falling time (tf): 400 kbps or less, [Sm/Fm]: 300 ns
For the specified values of SCL line rising time (tr) and SCL line falling time (tf), see the I2C bus standard from NXP Semiconductors.

20.3.15 RIICnDRT — I2C Bus Transmit Data Register

Access: RIICnDRT register can be read or written in 32-bit units.
RIICnDRTL register can be read or written in 16-bit units.
RIICnDRTLL register can be read or written in 8-bit units.

Address: RIICnDRT: <RIICn_base> + $003C_H$

RIICnDRTL: <RIICn_base> + $003C_H$

RIICnDRTLL: <RIICn_base> + $003C_H$

Value after reset: $0000\ 00FF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DRT[7:0]							
Value after reset	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When RIICnDRT detects a space in the I2C bus shift register (RIICnDRS), it transfers the transmit data that has been written to RIICnDRT to RIICnDRS and starts transmitting data in transmit mode.

The double-buffer structure of RIICnDRT and RIICnDRS allows continuous transmit operation if the next transmit data has been written to RIICnDRT while the RIICnDRS data is being transmitted.

RIICnDRT can always be read and written. Write transmit data to RIICnDRT once when a transmit data empty interrupt (INTRIICnTI) request is generated. When writing to bit 31 to 8, write the value after reset.

20.3.16 RIICnDRR — I2C Bus Receive Data Register

Access: RIICnDRR register is a read-only register that can be read in 32-bit units.
RIICnDRRL register is a read-only registers that can be read in 16-bit units.
RIICnDRRLL register is a read-only registers that can be read in 8-bit units.

Address: RIICnDRR: <RIICn_base> + 0040_H

RIICnDRRL: <RIICn_base> + 0040_H

RIICnDRRLL: <RIICn_base> + 0040_H

Value after reset: $0000\ 0000_H$

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

When 1 byte of data has been received, the received data is transferred from the I2C bus shift register (RIICnDRS) to RIICnDRR to enable the next data to be received.

The double-buffer structure of RIICnDRS and RIICnDRR allows continuous receive operation if the received data has been read from RIICnDRR while RIICnDRS is receiving data.

RIICnDRR cannot be written. Read data from RIICnDRR once when a receive complete interrupt (INTRIICnRI) request is generated.

If RIIC receives the next receive data before the current data is read from RIICnDRR (while the RIICnSR2.RDRF flag is 1), the RIIC automatically holds the SCL clock low one cycle before the RDRF flag is set to 1 next.

20.3.17 RIICnDRS — I2C Bus Shift Register

Access: This register is not accessible.

Address: —

Value after reset: 0000 00FF$_H$

RIICnDRS is a shift register to transmit and receive data.

During transmission, transmit data is transferred from RIICnDRT to RIICnDRS and is sent from the SDA pin. During reception, data is transferred from RIICnDRS to RIICnDRR after 1 byte of data has been received.

RIICnDRS cannot be accessed directly.

20.4 Interrupt Sources

The RIIC issues four types of interrupt request: transfer error or event generation (arbitration-lost detection, NACK detection, timeout detection, start condition detection, and stop condition detection), receive complete, transmit data empty, and transmit end.

Table 20.25 lists details of the several interrupt requests. The receive complete and transmit data empty interrupt request are both capable of launching data transfer by the DMAC.

Table 20.25 Interrupt Sources

Symbol	Interrupt Source	Interrupt Flag	DMACA Launching	Interrupt Condition
INTRIICnTI	Transmit Data Empty	TDRE	Possible	TDRE = 1 and TIE = 1
INTRIICnTEI	Transmit End	TEND	Not possible	TEND = 1 and TEIE = 1
INTRIICnRI	Receive Complete	RDRF	Possible	RDRF = 1 and RIE = 1
INTRIICnEE	Transfer Error/ Event Generation	AL	Not possible	AL = 1 and ALIE = 1
		NACKF		NACKF = 1 and NAKIE = 1
		TMOF		TMOF = 1 and TMOIE = 1
		START		START = 1 and STIE = 1
		STOP		STOP = 1 and SPIE = 1

Clear or mask the each flag during interrupt handling.

CAUTIONS

1. **There is a latency (delay) between the execution of a write instruction for a peripheral module by the CPU and actual writing to the module. Thus, when an interrupt flag has been cleared or masked, read the relevant flag again to check whether clearing or masking has been completed, and then return from interrupt processing. Returning from interrupt processing without checking that writing to the module has been completed creates a possibility of repeated processing of the same interrupt.**
2. **Since INTRIICnTI is an edge-detected interrupt, it does not require clearing. Furthermore, the RIICnSR2.TDRE flag (a condition for INTRIICnTI) is automatically cleared to 0 when data for transmission are written to RIICnDRT or a stop condition is detected (RIICnSR2.STOP flag = 1).**
3. **Since INTRIICnRI is an edge-detected interrupt, it does not require clearing. Furthermore, the RIICnSR2.RDRF flag (a condition for INTRIICnRI) is automatically cleared to 0 when data are read from RIICnDRR.**
4. **When using the INTRIICnTEI interrupt, clear the RIICnSR2.TEND flag in the INTRIICnTEI interrupt processing.**
   Note that the RIICnSR2.TEND flag is automatically cleared to 0 when data for transmission are written to RIICnDRT or a stop condition is detected (RIICnSR2.STOP flag = 1).

20.5 Operation

20.5.1 Communication Data Format

The I2C bus format consists of 8-bit data and 1-bit acknowledge. The frame following a start condition or restart condition is an address frame used to specify a slave device with which the master device communicates. The specified slave is valid until a new slave is specified or a stop condition is issued.

Figure 20.3 shows the I2C bus format, and **Figure 20.4** shows the I2C bus timing.

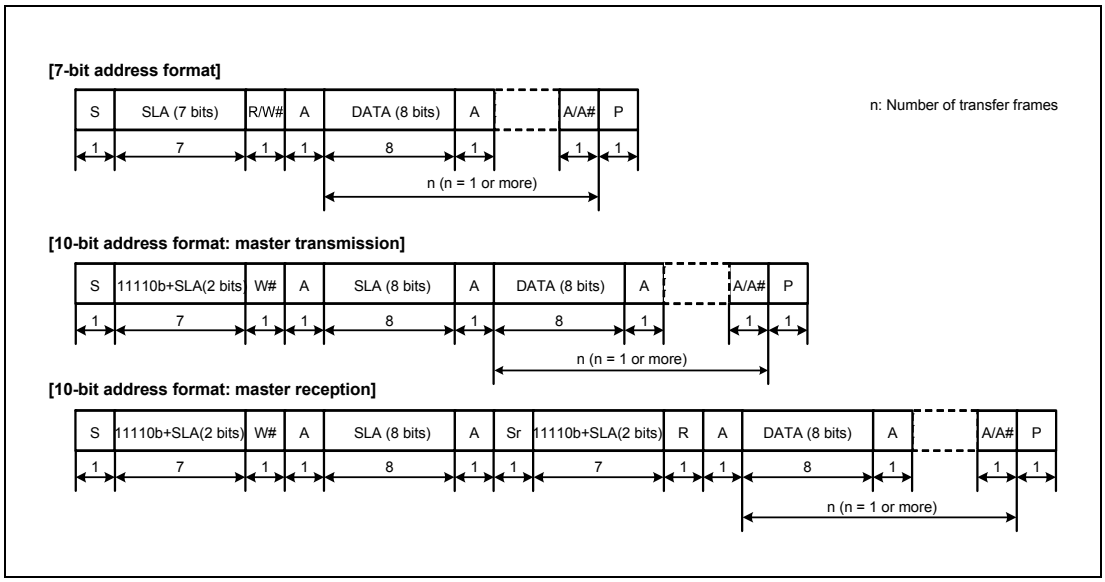

Figure 20.3 I2C Bus Format

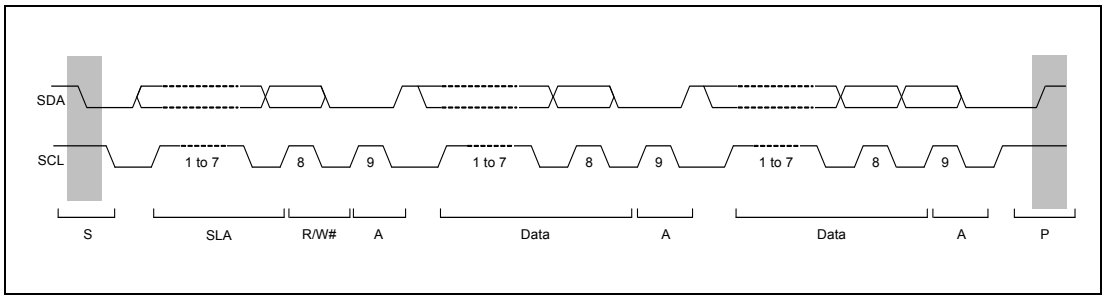

Figure 20.4 I2C Bus Timing (SLA = 7 Bits)

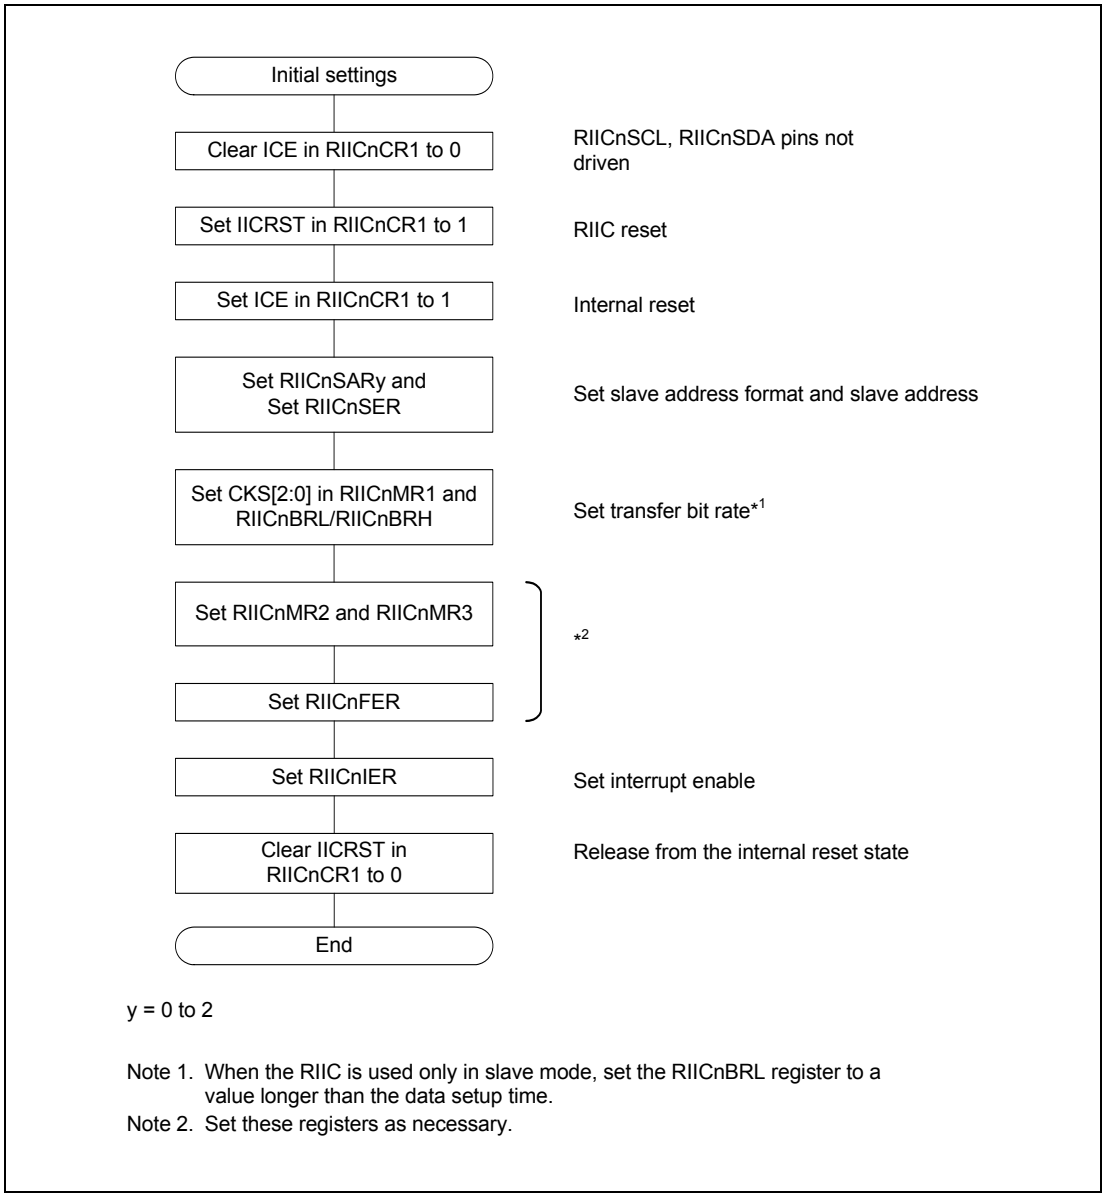
S: Start condition. The master device drives the SDA line low from high level while the SCL line is at a high level.

SLA: Slave address, by which the master device selects a slave device.

R/W#: Indicates the direction of data transfer: from the slave device to the master device when R/W is 1, or from the master device to the slave device when R/W is 0.

A: Acknowledge. The receive device drives the SDA line low. (In master transmit mode, the slave device returns acknowledge. In master receive mode, the master device returns acknowledge.)

A#: Not-acknowledge. The receiving device has not returned a response or is not present so the SDA line has remained at the high level.



Sr: Restart condition. The master device drives the SDA line low from the high level after the setup time has elapsed with the SCL line at the high level.

DATA: Transmitted or received data

P: Stop condition. The master device drives the SDA line high from low level while the SCL line is at a high level.

20.5.2 Initial Settings

Before starting data transmission and reception, initialize the RIIC according to the procedure in **Figure 20.5**. Make initial settings for the RIIC once when starting the RIIC.

Note 1. When the RIIC is used only in slave mode, set the RIICnBRL register to a value longer than the data setup time.

Note 2. Set these registers as necessary.

Figure 20.5 Example of RIIC Initialization Flowchart

20.5.3 Master Transmit Operation

In master transmit operation, the RIIC outputs the SCL (clock) and transmitted data signals as the master device, and the slave device returns acknowledgements. **Figure 20.6** shows an example of usage of master transmission and **Figure 20.7** to **Figure 20.9** show the timing of operations in master transmission.

The following describes the procedure and operations for master transmission.

(1) Set the RIICnCR1.IICRST bit 1 to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 20.5**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. At the same time, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the internal levels for the SDA output state and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS and MST bits to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the slave address including the R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, the RIIC continues in master transmit mode.
Since the RIICnSR2.NACKF flag being 1 at this time indicates that the slave address has not been recognized or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.
For data transmission with an address in the 10-bit format, start by writing 1111 0_B, the two higher-order bits of the slave address, and W# to RIICnDRT as the first address transmission. Then, as the second address transmission, write the eight lower-order bits of the slave address to RIICnDRT.

(4) After confirming that the RIICnSR2.TDRE flag is 1, write the data for transmission to the RIICnDRT register. The RIIC automatically holds the SCL line low until the data for transmission are ready or a stop condition is issued.

(5) After all bytes of data for transmission have been written to the RIICnDRT register, wait until the value of the RIICnSR2.TEND flag returns to 1, and then set the RIICnCR2.SP bit to 1 (stop condition issuance request). Upon receiving a stop condition issuance request, the RIIC issues the stop condition.

(6) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00_B and enters slave receive mode. Furthermore, it automatically clears the RIICnSR2.TDRE and TEND flags to 0, and sets the RIICnSR2.STOP flag in to 1.

(7) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

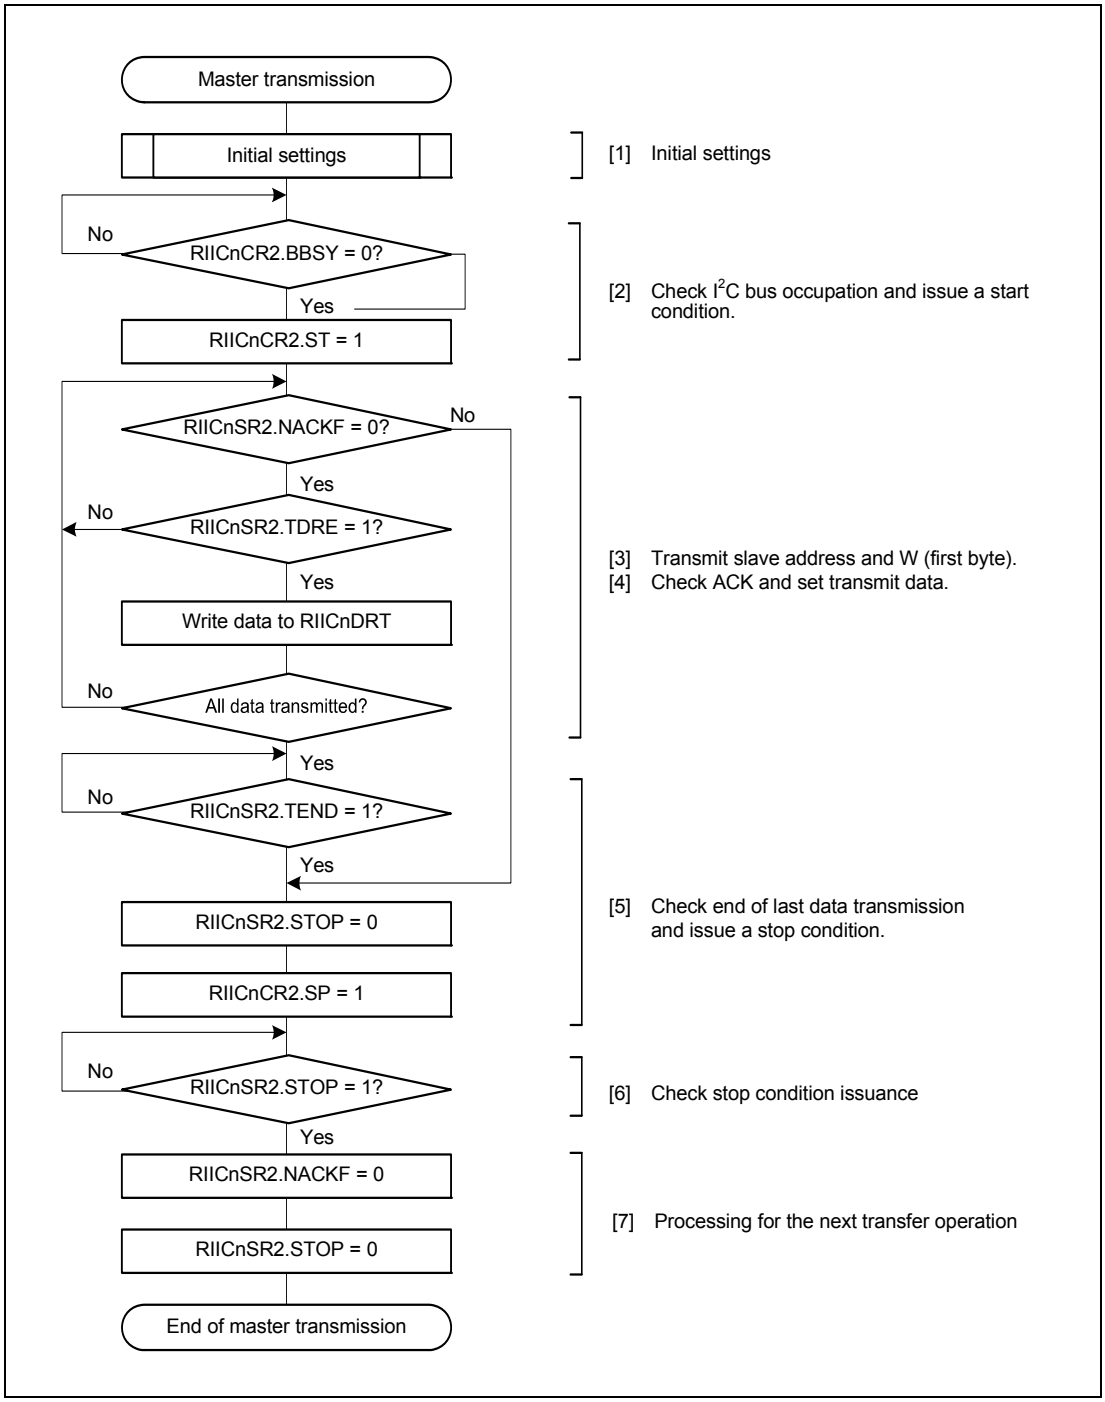


Figure 20.6 Example of Master Transmission Flowchart

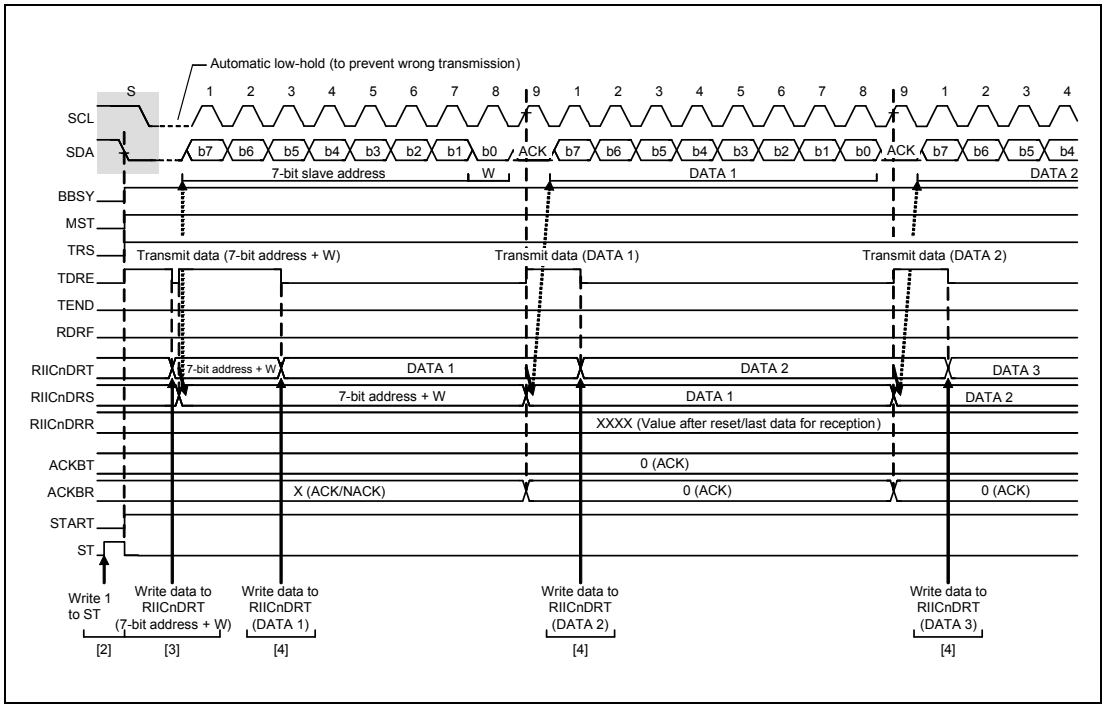

Figure 20.7 Master Transmit Operation Timing (1) (7-Bit Address Format)

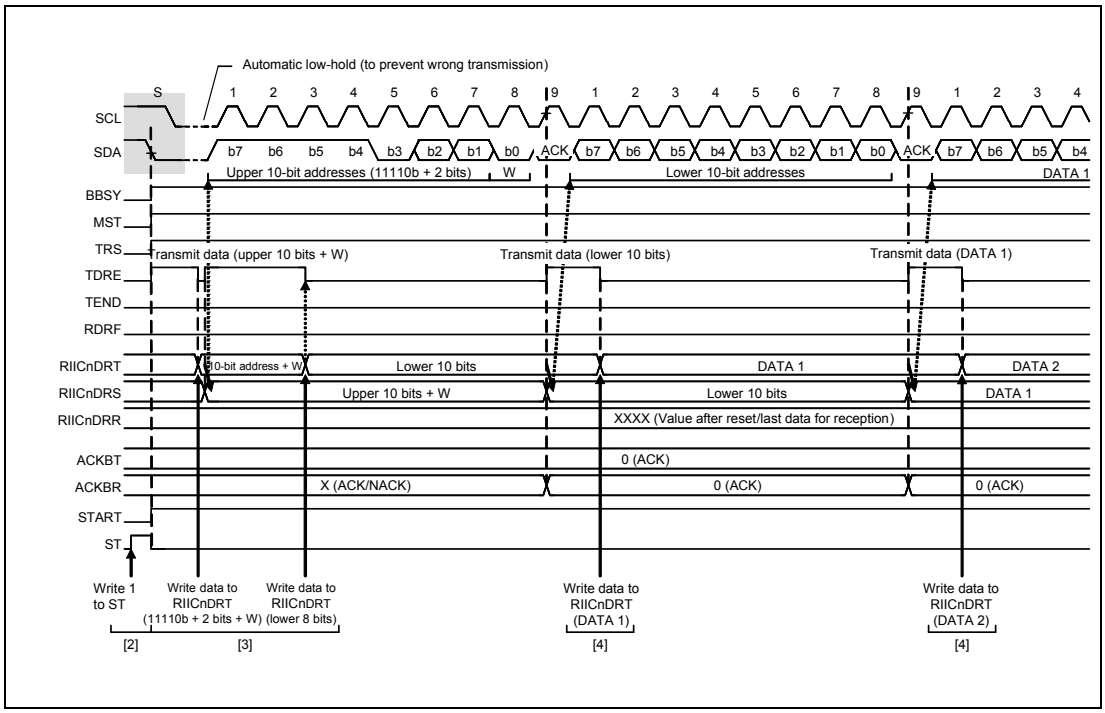

Figure 20.8 Master Transmit Operation Timing (2) (10-Bit Address Format)

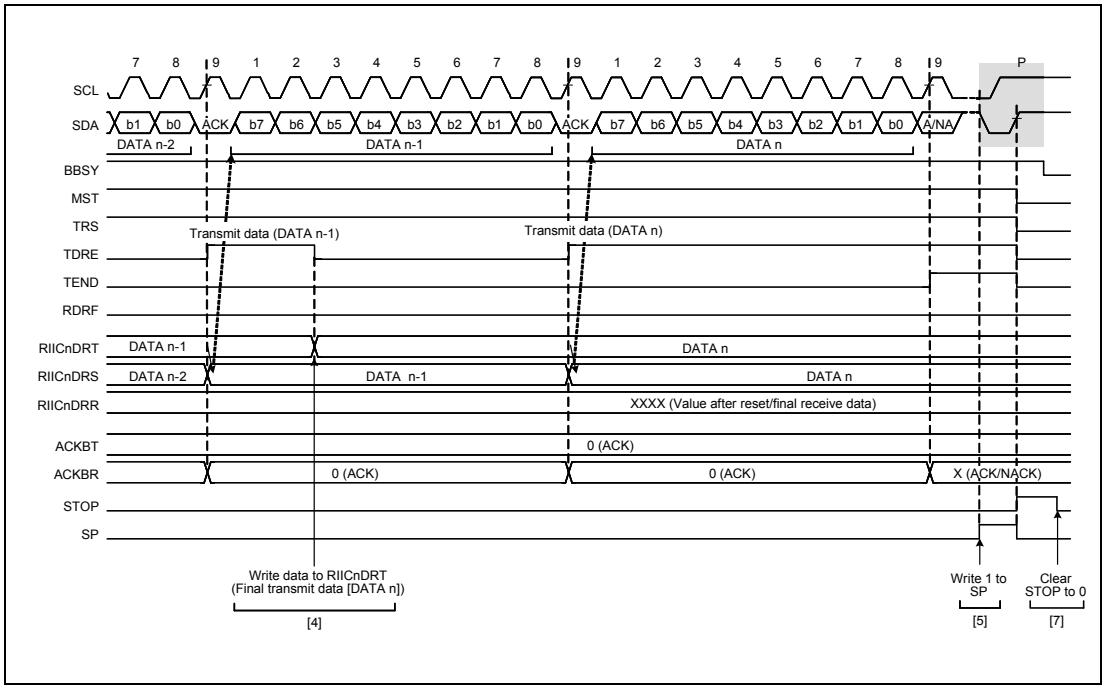

Figure 20.9 Master Transmit Operation Timing (3)

20.5.4 Master Receive Operation

In master receive operation, the RIIC as a master device outputs the SCL (clock) signal, receives data from the slave device, and returns acknowledgements. Since the RIIC must start by sending a slave address to the corresponding slave device, this part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

Figure 20.10 shows an example of master reception flowchart (7-bit address format, 1 or 2 bytes), **Figure 20.11** shows an example of master reception flowchart (7-bit address format, 3 bytes or more), and **Figure 20.12** to **Figure 20.14** show the timing of operations in master reception.

The following describes the procedure and operations for master reception.

(1) Set the RIICnCR1.IICRST bit to 1 (RIIC reset) and then set the RIICnCR1.ICE bit to 1 (internal reset) with the RIICnCR1.ICE bit cleared to 0 (RIICnSCL and RIICnSDA pins not driven). This initializes the internal state and the various flags of RIICnSR1. After that, set registers RIICnSARy, RIICnSER, RIICnMR1, RIICnBRH, and RIICnBRL (y = 0 to 2), and set the other registers as necessary (for initial settings of the RIIC, see **Figure 20.5**). When the necessary register settings have been completed, set the RIICnCR1.IICRST bit to 0 (for release from the reset state). This step is not necessary if initialization of the RIIC has already been completed.

(2) Read the RIICnCR2.BBSY flag to check that the bus is open, and then set the RIICnCR2.ST bit to 1 (start condition issuance request). Upon receiving the request, the RIIC issues a start condition. When the RIIC detects the start condition, the BBSY flag and the RIICnSR2.START flag are automatically set to 1 and the ST bit is automatically cleared to 0. At this time, if the start condition is detected and the levels for the SDA output and the levels on the SDA line have matched while the ST bit is 1, the RIIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and the RIICnCR2.MST and TRS bits are automatically set to 1, placing the RIIC in master transmit mode. The RIICnSR2.TDRE flag is also automatically set to 1 in response to setting of the TRS bit to 1.

(3) Check that the RIICnSR2.TDRE flag is 1, and then write the value for transmission (the slave address and value of the R/W# bit) to RIICnDRT. Once the data for transmission are written to RIICnDRT, the TDRE flag is automatically cleared to 0, the data are transferred from RIICnDRT to RIICnDRS, and the TDRE flag is again set to 1. After the slave address including the R/W# bit has been transmitted, the value of the RIICnCR2.TRS bit is automatically updated to select transmit or receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 1, the RIICnCR2.TRS bit is cleared to 0 on the rising edge of the ninth cycle of SCL (the clock signal), placing the RIIC in master receive mode. At this time, the TDRE flag is automatically cleared to 0 and the RIICnSR2.RDRF flag is automatically set to 1.
Since the RIICnSR2.NACKF flag being 1 at this time indicates that the slave address has not been recognized or there was an error in communications, write 1 to the RIICnCR2.SP bit to issue a stop condition.
For master reception from a device with a 10-bit address, start by using master transmission to transmit the two higher-order bits of the slave address and then the eight lower-order bits of the slave address, and issue a restart condition following generation of the transmission end interrupt (or after TEND = 1) (see **Figure 20.13** for operation timing). After that, transmitting 1111 0_B plus the two higher-order bits of the slave address, and the R bit places the RIIC in master receive mode.

(4) Dummy read RIICnDRR after confirming that the RIICnSR2.RDRF flag is 1; this makes the RIIC start output of the SCL (clock) signal and start data reception.

(5) After 1 byte of data has been received, the RIICnSR2.RDRF flag is set to 1 on the rising edge of the eighth or ninth cycle of SCL clock (the clock signal) as selected by the RIICnMR3.RDRFS bit. Reading out RIICnDRR at this time will produce the received data, and the RDRF flag is automatically cleared to 0 at the same time. Furthermore, the value of the acknowledgement field received during the ninth cycle of SCL clock is returned as the value set in the RIICnMR3.ACKBT bit. Furthermore, if the next byte to be received is the next to last byte, set the RIICnMR3.WAIT bit to 1 (for wait insertion) before reading the RIICnDRR (containing the second byte from last). As well as enabling NACK output even in the case of delays in processing to set the RIICnMR3.ACKBT bit to 1 (NACK) in step (6), due to other interrupts, etc., this fixes the SCL line to the low level on the rising edge of the ninth clock cycle in reception of the last byte, so the state is such that issuing a stop condition is possible.

(6) When the RIICnMR3.RDRFS bit is 0 and the slave device must be notified that it is to end transfer for data reception after transfer of the next (final) byte, set the RIICnMR3.ACKBT bit to 1 (NACK).

(7) After reading out the byte before last from the RIICnDRR register, if the value of the RIICnSR2.RDRF flag is confirmed to be 1, write 1 to the RIICnCR2.SP bit (stop condition issuance request) and then read the last byte from RIICnDRR. When RIICnDRR is read, the RIIC is released from the wait state and issues the stop condition after low-level output in the ninth clock cycle is completed or the SCL line is released from the low-hold state.

(8) Upon detecting the stop condition, the RIIC automatically clears the RIICnCR2.MST and TRS bits to 00_B and enters slave receive mode. Furthermore, detection of the stop condition leads to setting of the RIICnSR2.STOP flag to 1.

(9) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

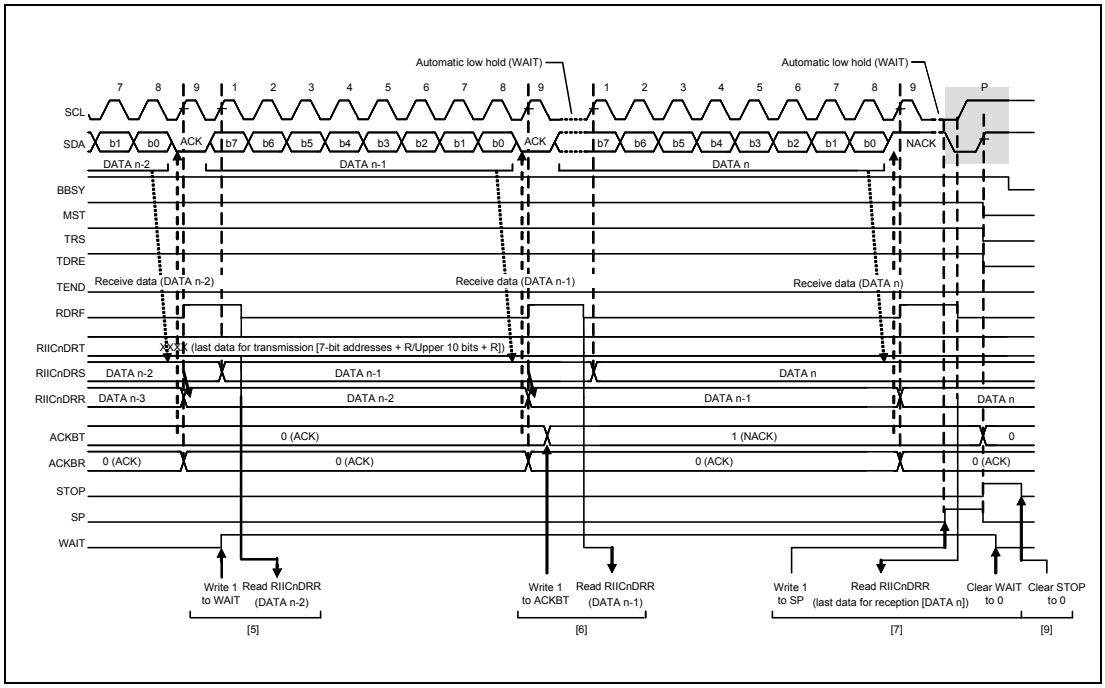

Figure 20.14 Master Receive Operation Timing (3) (when RDRFS = 0)

20.5.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL (clock) signal, the RIIC transmits data as a slave device, and the master device returns acknowledgements.

Figure 20.5 shows an example of usage of slave transmission and **Figure 20.16** and **Figure 20.17** show the timing of operations in slave transmission.

The following describes the procedure and operations for slave transmission.

(1) Follow the procedure in **Figure 20.5** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC automatically sets the BBSY and RIICnSR2.START flags to 1 and automatically clears the ST bit to 0 on detection of a start condition.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 1, the RIIC automatically places itself in slave transmit mode by setting both the RIICnCR2.TRS bit and the RIICnSR2.TDRE flag to 1.

(3) After the RIICnSR2.TDRE flag is confirmed to be 1, write the data for transmission to the RIICnDRT register. At this time, if the RIIC receives no acknowledge from the master device (receives an NACK signal) while the RIICnFER.NACKE bit is 1, the RIIC suspends transfer of the next data.

(4) Wait until the RIICnSR2.TEND flag is set to 1 while the RIICnSR2.TDRE flag is 1, after the RIICnSR2.NACKF flag is set to 1 or the last byte for transmission is written to the RIICnDRT register. When the RIICnSR2.NACKF flag or the TEND flag is 1, the RIIC drives the SCL line low on the ninth falling edge of SCL clock.

(5) When the RIICnSR2.NACKF flag or the RIICnSR2.TEND flag is 1, dummy read RIICnDRR to complete the processing. This releases the SCL line.

(6) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.GCA, and AASy (y = 0 to 2), flags RIICnSR2.TDRE and TEND, and the RIICnCR2.TRS bit to 0, and enters slave receive mode. Furthermore, it automatically sets the RIICnSR2.STOP flag to 1.

(7) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.NACKF and STOP flags to 0 for the next transfer operation.

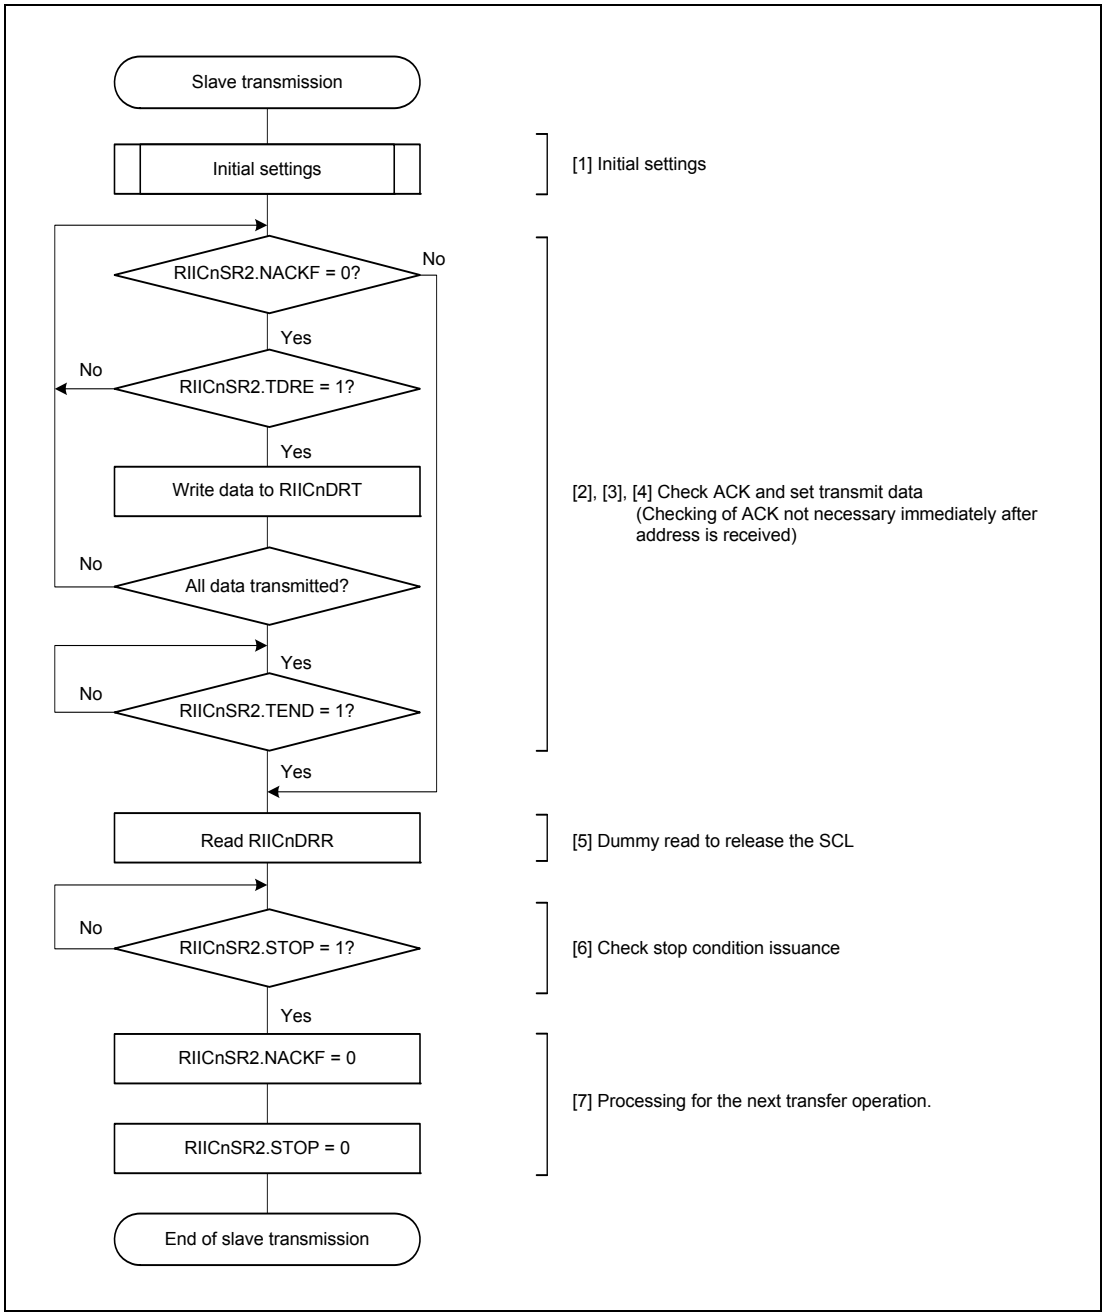

Figure 20.15 Example of Slave Transmission Flowchart

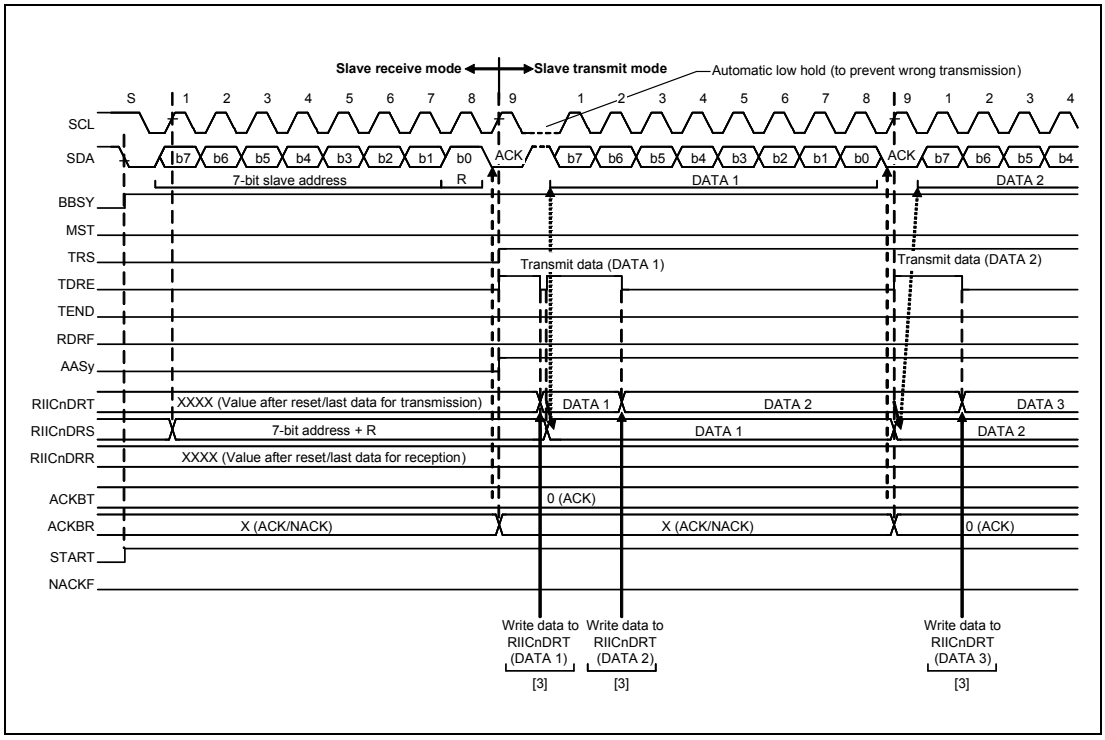

Figure 20.16 Slave Transmit Operation Timing (1) (7-Bit Address Format)

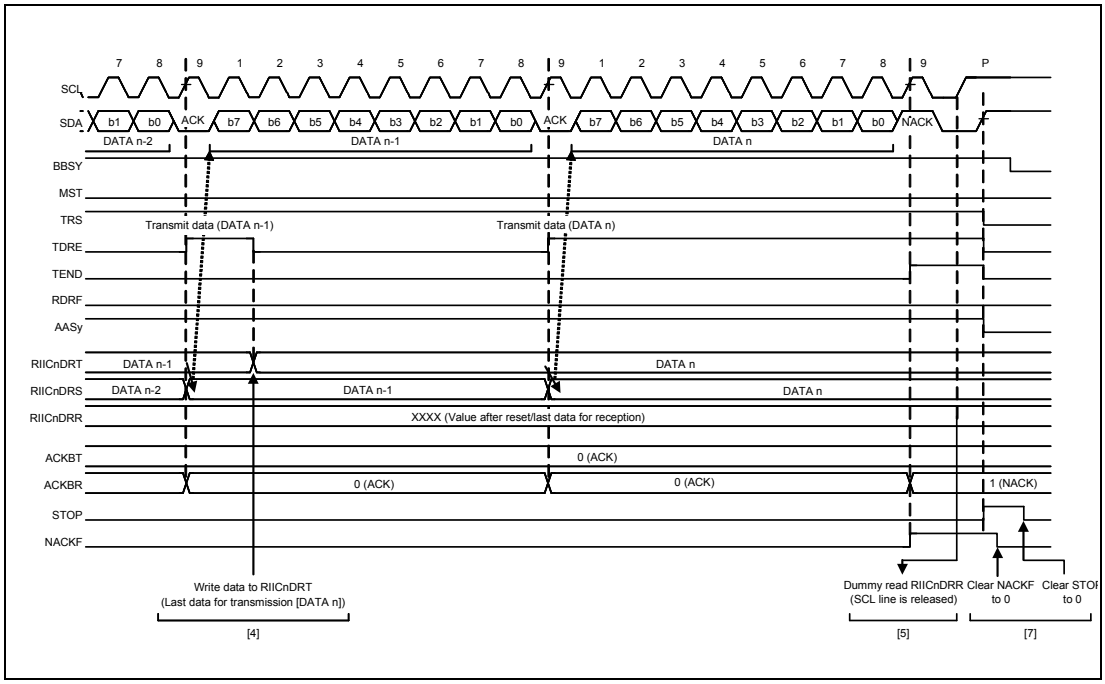

Figure 20.17 Slave Transmit Operation Timing (2)

20.5.6 Slave Receive Operation

In slave receive operation, the master device outputs the SCL clock and transmit data, and the RIIC returns acknowledgements as a slave device.

Figure 20.18 shows an example of usage of slave reception and **Figure 20.19** and **Figure 20.20** show the timing of operations in slave reception.

The following describes the procedure and operations for slave reception.

(1) Follow the procedure in **Figure 20.5** to make initial settings for the RIIC. This step is not necessary if initialization of the RIIC has already been completed. After initial settings, the RIIC automatically sets the BBSY and RIICnSR2.START flags to 1 and automatically clears the ST bit to 0 on detection of a start condition.

(2) After receiving a matching slave address, the RIIC sets one of the corresponding bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 1 on the rising edge of the ninth cycle of SCL clock (the clock signal) and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. If the value of the R/W# bit that was also received at this time is 0, the RIIC continues to place itself in slave receive mode and sets the RIICnSR2.RDRF flag to 1.

(3) After the RIICnSR2.STOP flag is confirmed to be 0 and the RIICnSR2.RDRF flag to be 1, dummy read RIICnDRR as the first read operation (the dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower eight bits when the 10-bit address format is selected).

(4) When RIICnDRR is read, the RIIC automatically clears the RIICnSR2.RDRF flag to 0. If reading of RIICnDRR is delayed and a next byte is received while the RDRF flag is still set to 1, the RIIC holds the SCL line low from one SCL cycle before the timing with which RDRF should be set. In this case, reading RIICnDRR releases the SCL line from being held at the low level.
When the RIICnSR2.STOP flag is 1 and the RIICnSR2.RDRF flag is also 1, read RIICnDRR until all the data is completely received.

(5) Upon detecting the stop condition, the RIIC automatically clears bits RIICnSR1.GCA, and AASy (y = 0 to 2) to 0. Furthermore, it automatically sets the RIICnSR2.STOP flag to 1.

(6) After checking that the RIICnSR2.STOP flag is 1, clear the RIICnSR2.STOP flag to 0 for the next transfer operation.

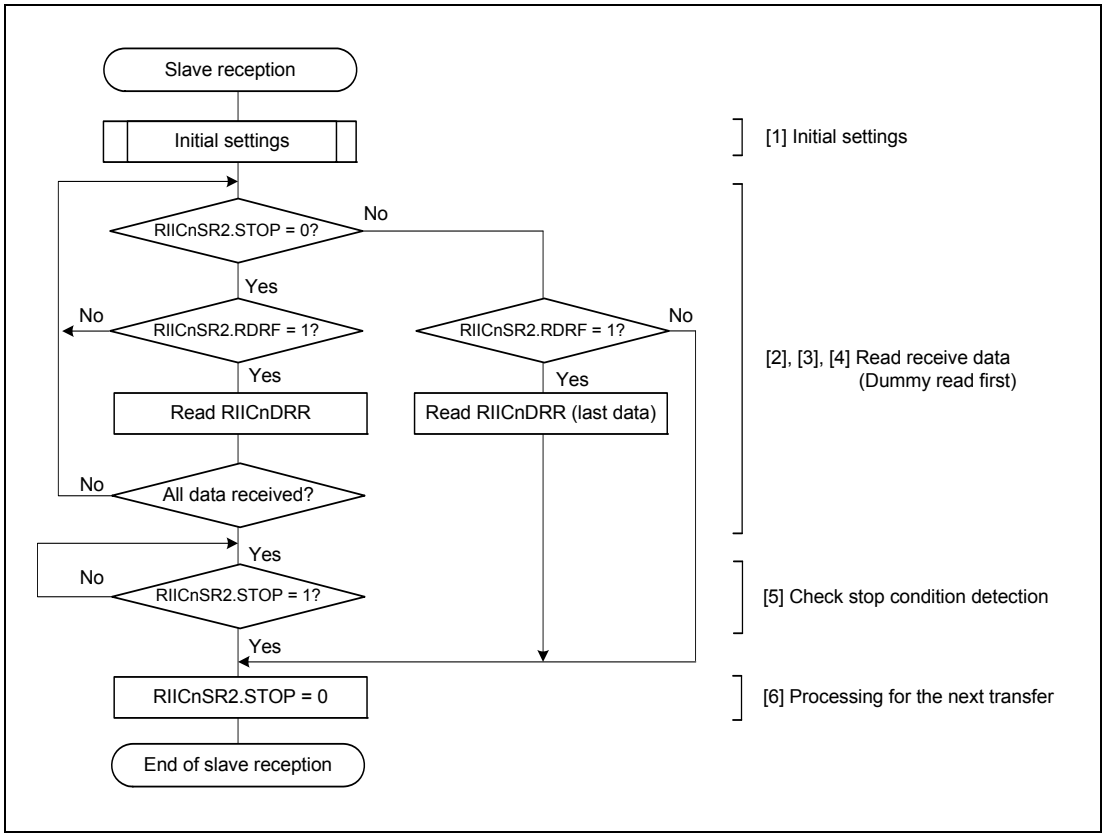

Figure 20.18 Example of Slave Reception Flowchart

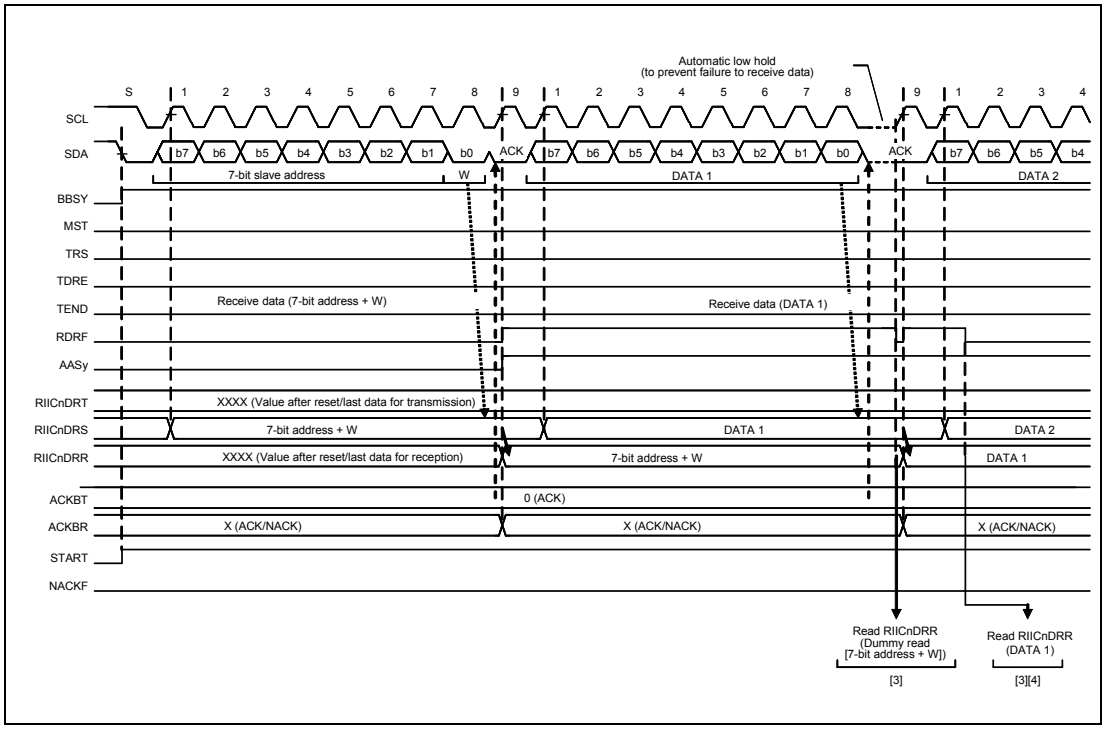

Figure 20.19 Slave Receive Operation Timing (1) (7-Bit Address Format, when RDRFS = 0)

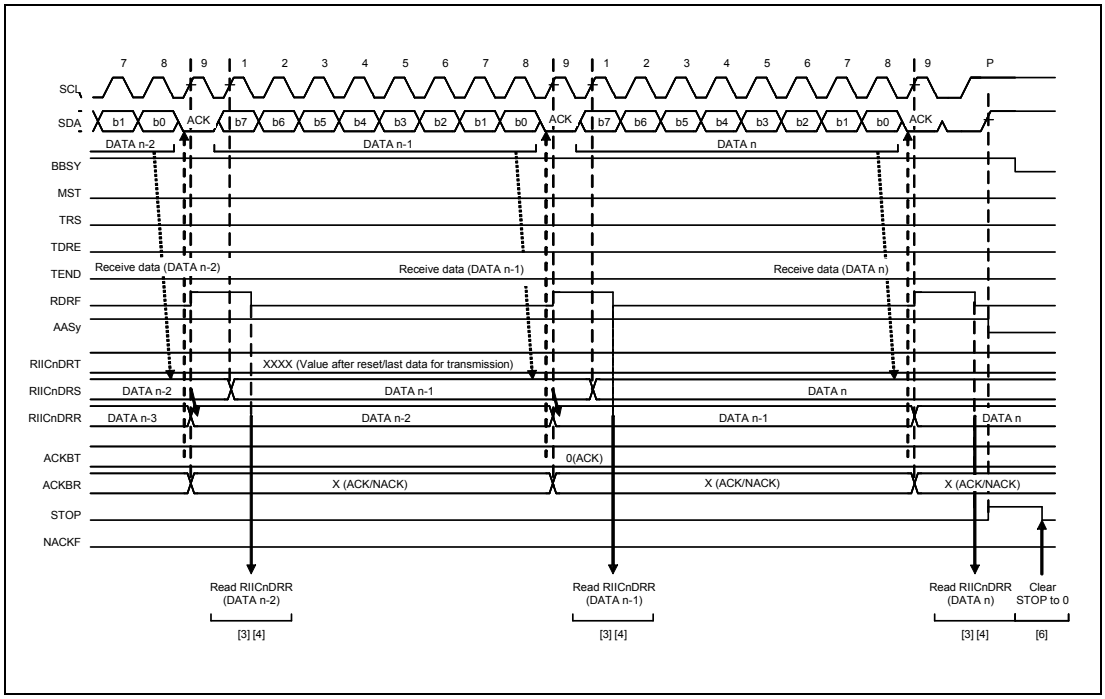

Figure 20.20 Slave Receive Operation Timing (2) (when RDRFS = 0)

20.6 SCL Synchronization Circuit

In generation of the SCL (clock) signal, the RIIC starts counting out the value for width at high level specified in RIICnBRH when it detects a rising edge on the SCL line and drives the SCL line low once counting of the width at high level is complete. When the RIIC detects the falling edge of the SCL line, it starts counting out the width at low level period specified in RIICnBRL, and then stops driving the SCL line (releases the line) once counting of the width at low level is complete. The SCL (clock) signal is thus generated.

If multiple master devices are connected to the I2C bus, a collision of SCL signals may arise due to contention with another master device. In such cases, the master devices have to synchronize their SCL signals. Since this synchronization of SCL signals must be bit by bit, the RIIC is equipped with a facility (the SCL synchronization circuit) to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCL line during communication.

When the RIIC has detected a rising edge on the SCL line and thus started counting out the width at high level specified in RIICnBRH, and the level on the SCL line falls because an SCL signal is being generated by another master device, the RIIC stops counting when it detects the falling edge, drives the level on the SCL line low, and starts counting out the width at low level specified in RIICnBRL. When the RIIC finishes counting out the width at low level, it stops driving the SCL line to the low level (i.e. releases the line). At this time, if the width at low level of the SCL clock signal from the other master device is longer than the width at low level set in the RIIC, the width at low level of the SCL signal will be extended. Once the width at low level for the other master device has ended, the SCL signal rises because the SCL line has been released. That is, in cases of contention of SCL signals from more than one master, the width at high level of the SCL signal is synchronized with that of the clock having the narrower width, and the width at low level of the SCL signal is synchronized with that of the clock having the broader width. However, such synchronization of the SCL signal is only enabled when the RIICnFER.SCLE bit is set to 1.

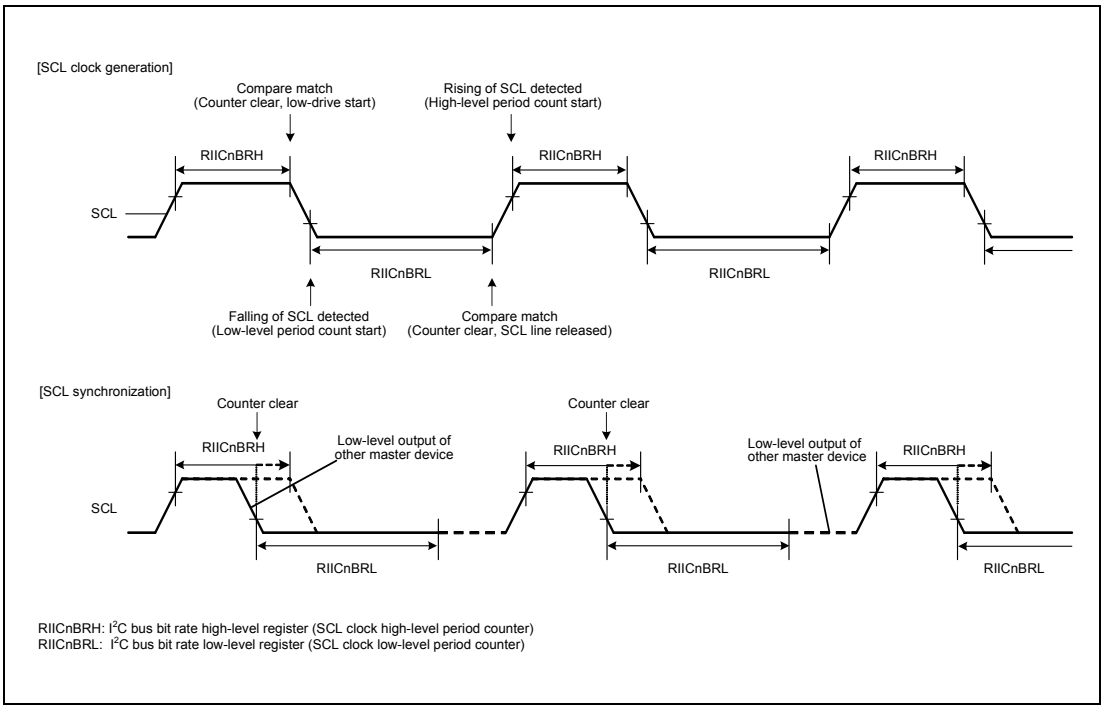

Figure 20.21 Generation and Synchronization of the SCL Signal from the RIIC

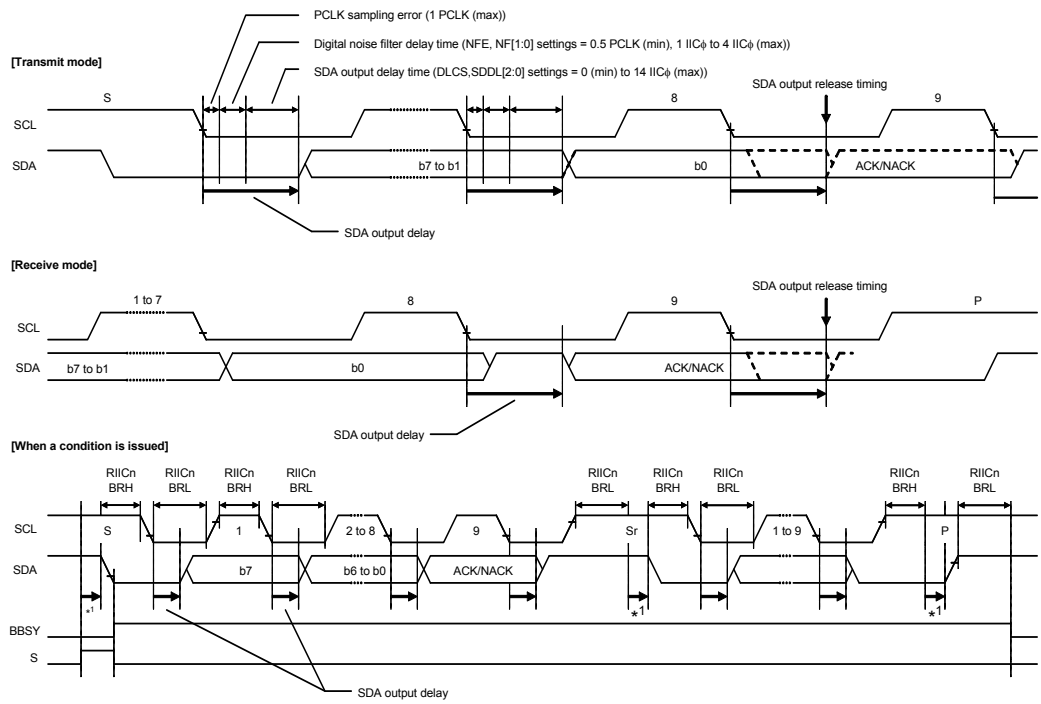


20.7 Facility for Delaying SDA Output

The RIIC module incorporates a facility for delaying output on the SDA line. The delay can be applied to all output (issuing of the start, restart, and stop conditions, data, and the ACK and NACK signals) on the SDA line.

With the SDA output delay facility, SDA output is delayed from detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval over which the SCL (clock) signal is at the low level. Doing this leads to usage with the aim of preventing erroneous operation of communications devices.

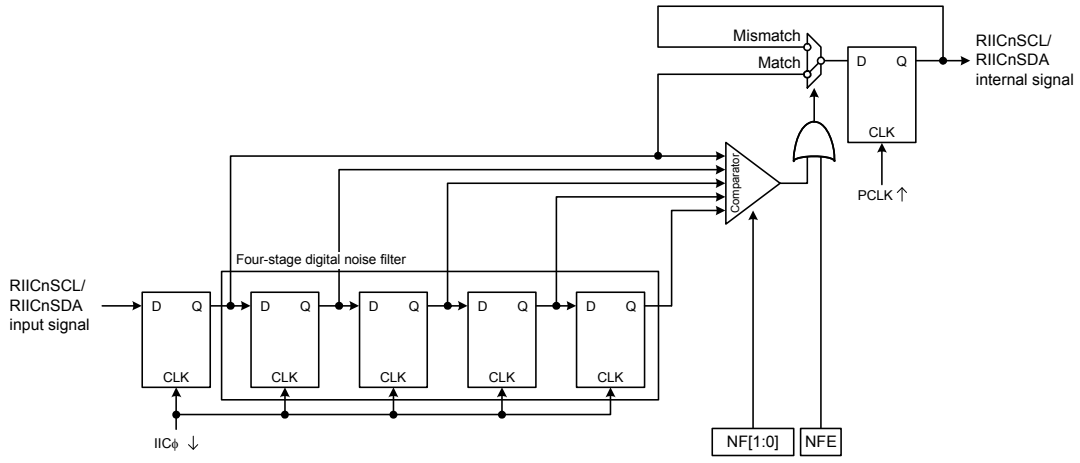
The output delay facility is enabled by setting the RIICnMR2.SDDL[2:0] bits to any value other than 000_B, and disabled by setting the same bits to 000_B.

While the SDA output delay facility is enabled (i.e. while the SDDL[2:0] bits are set to any value other than 000_B), the RIICnMR2.DLCS bit selects the clock source for counting by the SDA output delay counter as the internal base clock (IICϕ) for the RIIC module or as a clock signal derived by dividing the frequency of the internal base clock by two (IICϕ/2). The counter counts the number of cycles set in the SDDL[2:0] bits. After counting of the set number of cycles of delay is completed, the RIIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.

Note 1. The output delay facility is set by the SDDL[2:0] bits when a start (S), restart (Sr), or stop (P) condition is issued.

Figure 20.22 SDA Output Delay Facility

20.8 Digital Noise-Filter Circuits



The states of the RIICnSCL and RIICnSDA pins are conveyed to the internal circuitry through the digital noise-filter circuit. **Figure 20.23** is a block diagram of the digital noise-filter circuit.

The on-chip digital noise-filter circuit of the RIIC consists of four flip-flop circuit stages connected in series and a match-detection circuit.

The number of effective stages in the digital noise filter is selected by the RIICnMR3.NF[1:0] bits. The selected number of effective stages determines the noise-filtering capability as a period from one to four IICϕ cycles.

The input signal to the RIICnSCL pin (or RIICnSDA pin) is sampled on falling edges of the IICϕ signal. When the input signal level matches the output level of the number of effective flip-flop circuit stages as selected by the RIICnMR3.NF[1:0] bits, the signal level is conveyed as an internal signal. If the signal levels do not match, the previous value is retained.

If the ratio between the frequency of the internal operating clock (PCLK) and the transfer rate is small, the characteristics of the digital noise filter may lead to the elimination of needed signals as noise. In such cases, it is possible to disable the digital noise-filter circuit (by clearing the RIICnFER.NFE bit to 0).

Note: NFE: Digital noise filter circuit enable bit
NF[1:0]: Digital noise filter stage selection bit

Figure 20.23 Block Diagram of Digital Noise Filter Circuit

20.9 Address Match Detection

The RIIC can set three unique slave addresses in addition to the general call address and device ID address, and also can set 7-bit or 10-bit slave addresses.

20.9.1 Slave-Address Match Detection

The RIIC can set three unique slave addresses, and has a slave address detection function for each unique slave address. When the RIICnSER.SARy bit (y = 0 to 2) is set to 1, the slave addresses set in RIICnSARy (y = 0 to 2) can be detected.

When the RIIC detects a match of the set slave address, the corresponding RIICnSR1.AASy flag (y = 0 to 2) is set to 1 at the rising edge of the ninth SCL clock cycle and returns the value set in the RIICnMR3.ACKBT bit to the acknowledge bit on the ninth cycle of SCL clock. The RIICnSR2.RDRF flag or the RIICnSR2.TDRE flag is set to 1 by the following R/W# bit. This causes a receive complete interrupt (INTRIICnRI) or transmit data empty interrupt (INTRIICnTI) to be generated. The AASy flag is used to identify which slave address has been specified.

Figure 20.24 to **Figure 20.26** show the AASy flag set timing in three cases.

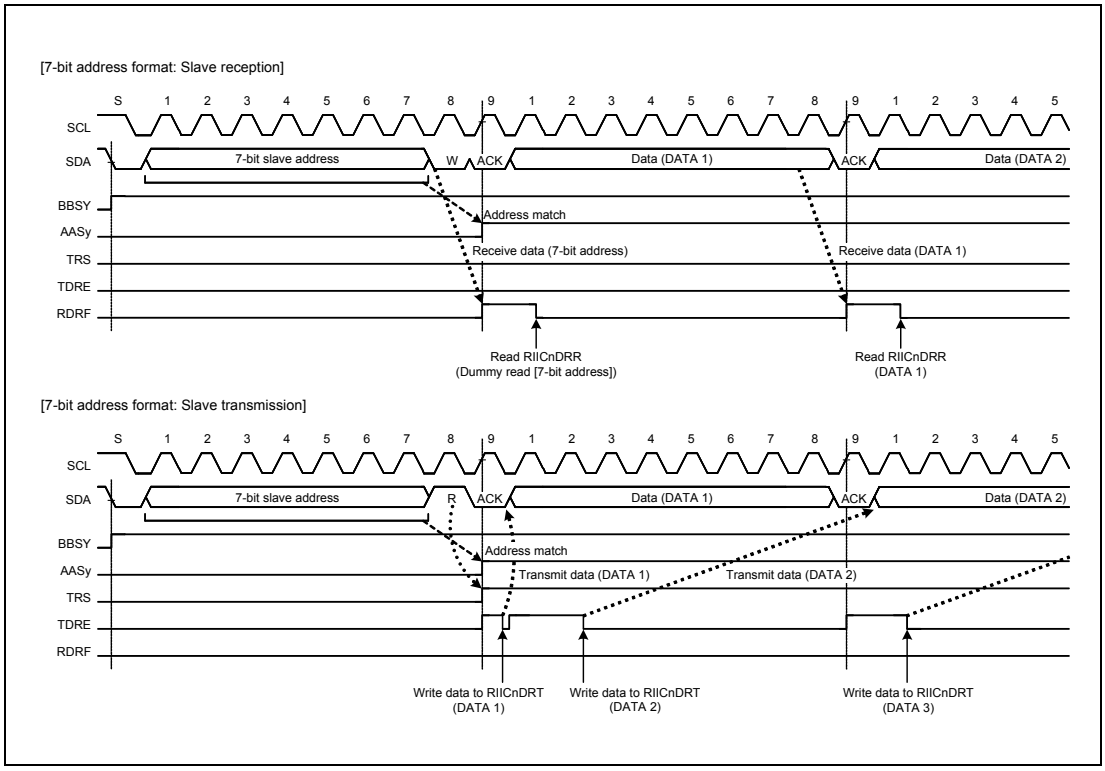


Figure 20.24 AASy Flag Set Timing with 7-Bit Address Format Selected

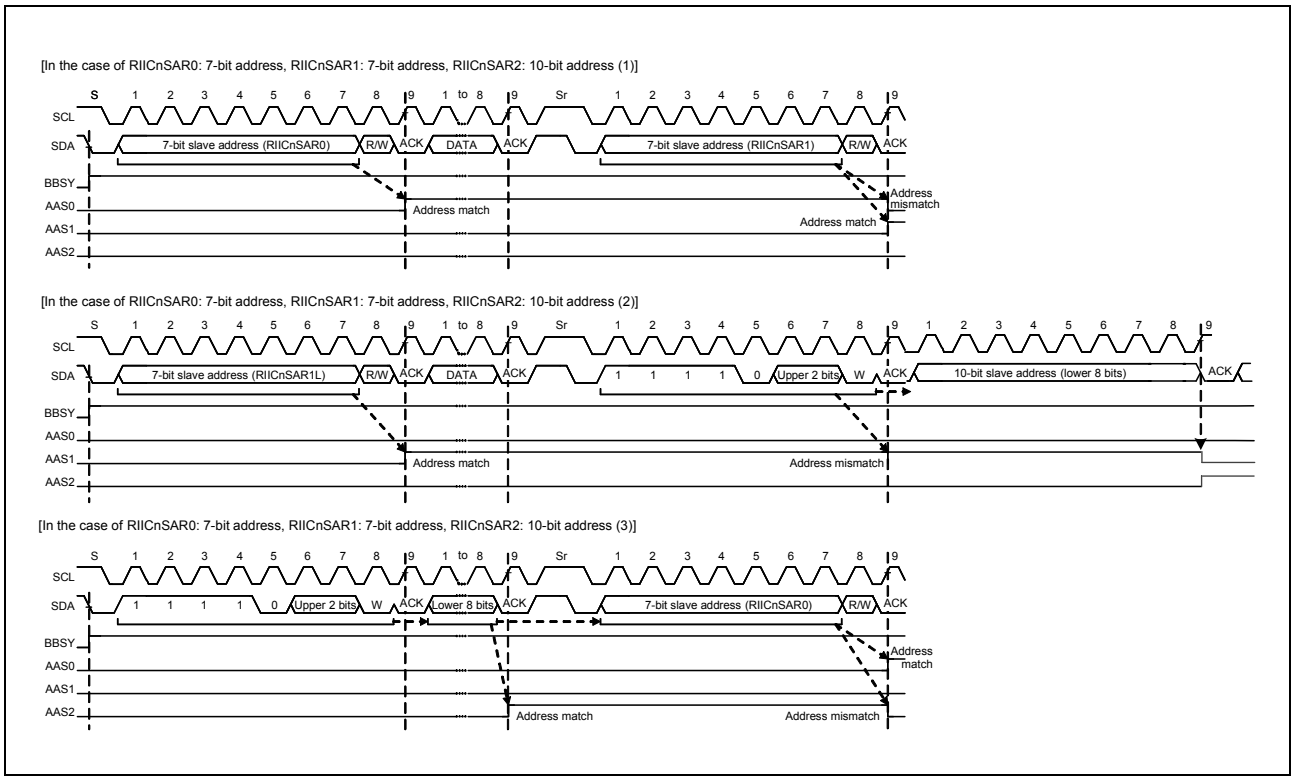

Figure 20.26 AASy Flag Set/Clear Timing with 7-Bit/10-Bit Address Formats Mixed

20.9.2 Detection of the General Call Address

The RIIC has a facility for detecting the general call address (0000 000_B + 0 [W]). This is enabled by setting the RIICnSER.GCAE bit to 1.

If the address received after a start or restart condition is issued is 0000 000_B + 1[R] (start byte), the RIIC recognizes this as the address of a slave device with an “all-zero” address but not as the general call address.

When the RIIC detects the general call address, both the RIICnSR1.GCA flag and the RIICnSR2.RDRF flag are set to 1 on the rising edge of the ninth cycle of SCL clock. This leads to the generation of a receive complete interrupt (INTRIICnRI). The value of the GCA flag can be confirmed to recognize that the general call address has been transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

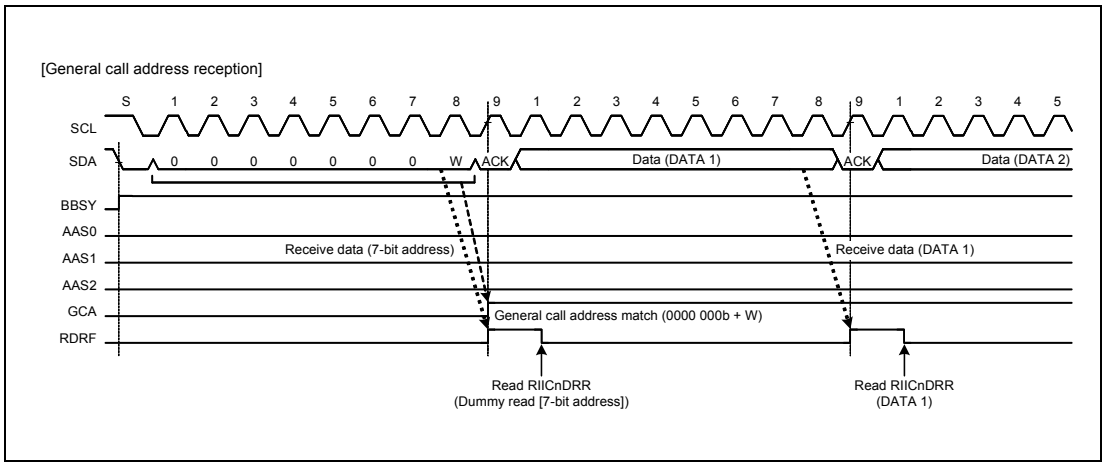

Figure 20.27 Timing of GCA Flag Setting during Reception of General Call Address

20.9.3 Device-ID Address Detection

The RIIC module has a facility for detecting device-ID addresses conforming with the I2C bus specification (Rev. 03). When the RIIC receives 1111 100_B as the first byte after a start condition or restart condition was issued with the RIICnSER.DIDE bit set to 1, the RIIC recognizes the address as a device ID, sets the RIICnSR1.DID flag to 1 on the rising edge of the ninth SCL clock cycle when the following R/W# bit is 0, and then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the RIIC sets the corresponding RIICnSR1.AASy flag (y = 0 to 2) to 1.

After that, when the first byte received after a start or restart condition is issued matches the device ID address (1111 100_B) again and the following R/W# bit is 1, the RIIC does not compare the second and subsequent bytes and sets the RIICnSR2.TDRE flag to 1.

In the device-ID address detection function, the RIIC clears the DID flag to 0 if a match with the RIIC's own slave address is not obtained or a match with the device ID address is not obtained after a match with the RIIC's own slave address and the detection of a restart condition. If the first byte after detection of a start or restart condition matches the device ID address (1111 100_B) and the R/W# bit is 0, the RIIC sets the DID flag to 1 and compares the second and subsequent bytes with the RIIC's slave address. If the R/W# bit is 1, the DID flag holds the previous value and the RIIC does not compare the second and subsequent bytes. Therefore, the reception of a device-ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Furthermore, prepare the device-ID fields (three bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal data for transmission. For details, see I2C Bus Standard from NXP Semiconductors.

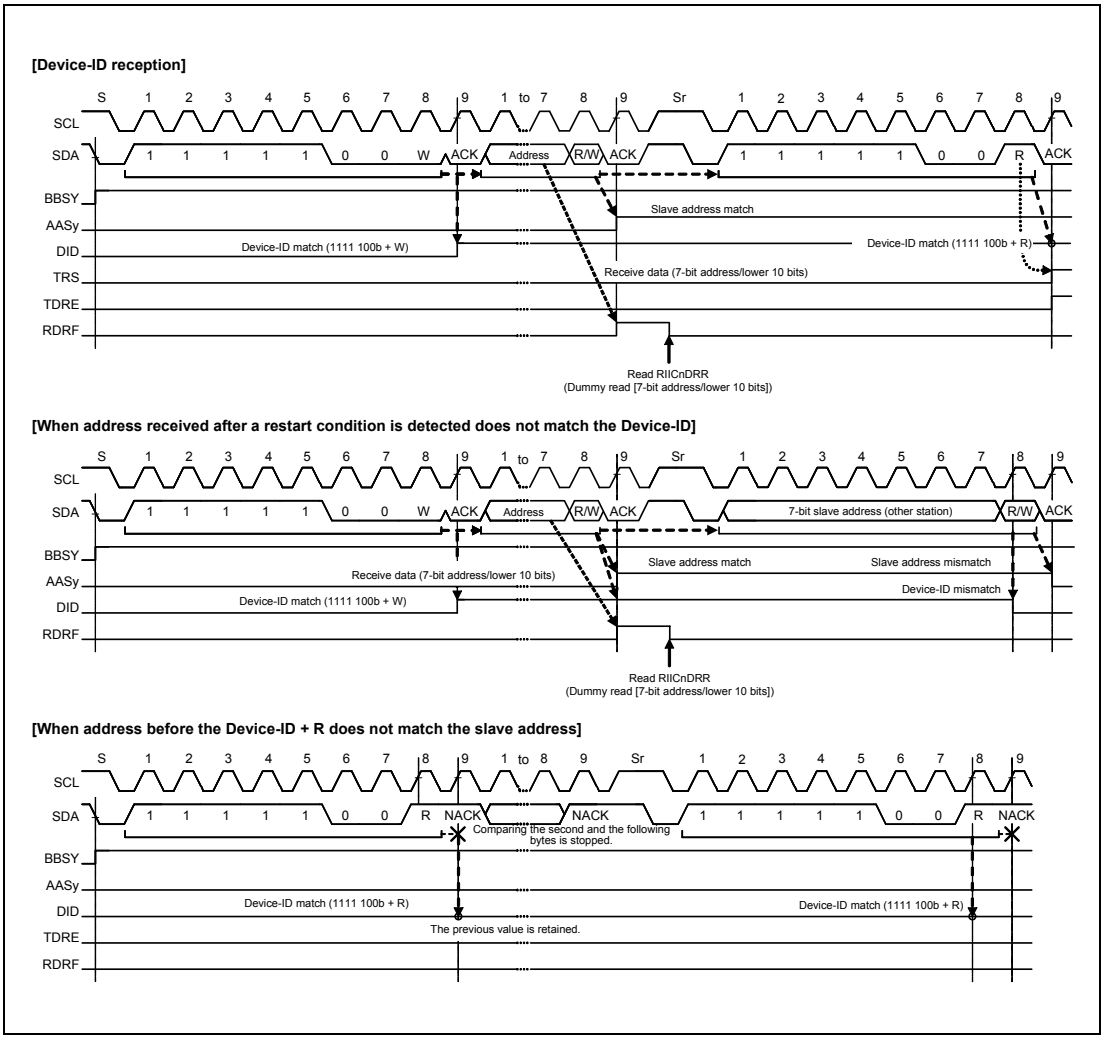

Figure 20.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID

20.10 Automatic Low-Hold Function for SCL

20.10.1 Function to Prevent Wrong Transmission of Transmit Data

To prevent the unintended transmission of erroneous data, this low-hold period is extended until data for transmission have been written. In addition, the RIIC holds the SCL line low over the period until a stop condition is issued and also over the period until the RIICnDRR register is dummy read.

<Master transmit mode>

- Low-level interval after a start condition or restart condition is issued
- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next
- Low-level interval from the ninth clock cycle until a stop condition is issued

<Slave transmit mode>

- Low-level interval between the ninth clock cycle of one transfer and the first clock cycle of the next
- Low-level interval from the ninth clock cycle and the RIICnDRR register is dummy read

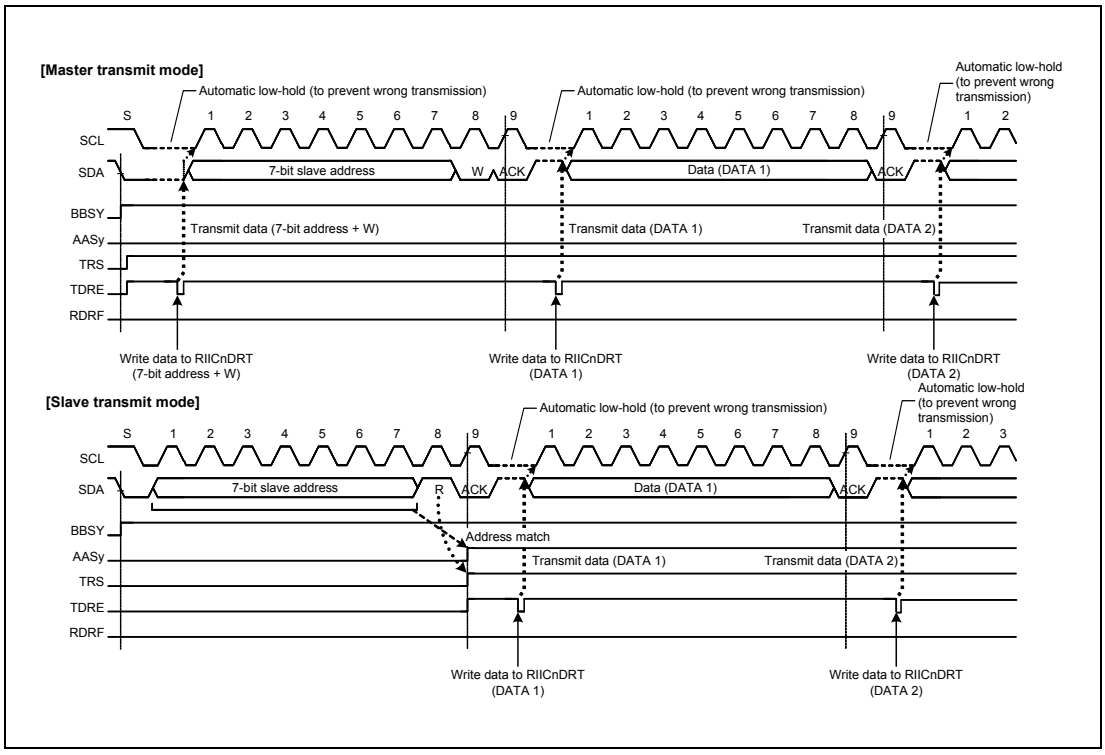

Figure 20.29 Automatic Low-Hold Operation in Transmit Mode

20.10.2 NACK Reception Transfer Suspension Function

The RIIC has a function to suspend transfer operation when NACK is received in transmit mode (RIICnCR2.TRS bit = 1). This function is enabled when the RIICnFER.NACKE bit is set to 1 (transfer suspension enabled). If the next transmit data has already been written (RIICnSR2.TDRE flag = 0) when NACK is received, next data transmission at the falling edge of the ninth SCL clock cycle is automatically suspended. This prevents the SDA line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (RIICnSR2.NACKF flag = 1), transmit operation and receive operation are discontinued. To restore transmit/receive operation, be sure to clear the NACKF flag to 0. In master transmit mode, clear the NACKF flag to 0, issue a restart or stop condition, and then issue a start condition again.

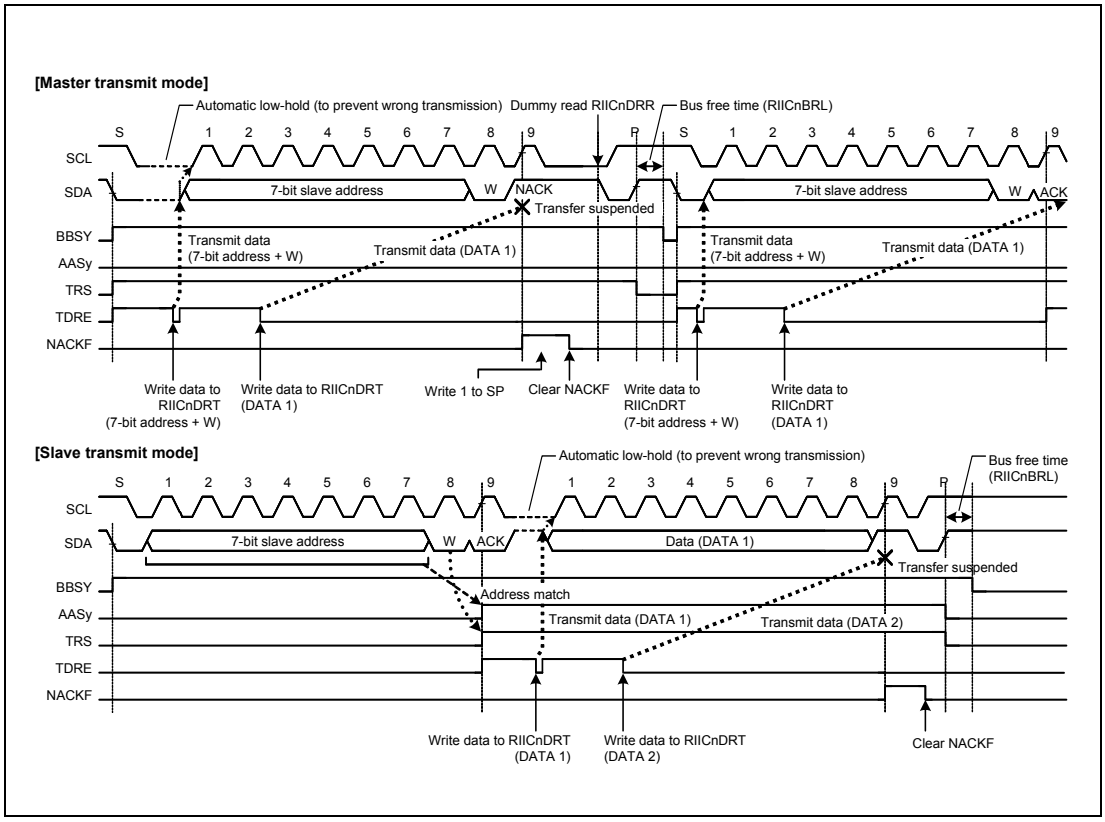

Figure 20.30 Suspension of Data Transfer when NACK is Received (NACKE = 1)

20.10.3 Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (RIICnDRR) read is delayed for a period of one transfer frame or more with receive complete (RIICnSR2.RDRF flag = 1) in receive mode (RIICnCR2.TRS = 0), the RIIC holds the SCL line low automatically immediately before the next data is received to prevent failure to receive data.

This function to prevent failure to receive data using the automatic low-hold function is also enabled even if the read processing of the final receive data is delayed and, in the meantime, the RIIC's own slave address is designated after a stop condition is issued. This function does not disturb other communication because the RIIC does not hold the SCL line low when a mismatch with its own slave address occurs after a stop condition is issued.

Sections in which the SCL line is held low can be selected with a combination of the RIICnMR3.WAIT and RDRFS bits.

(1) One-Byte Receive Operation and Automatic Low-Hold Function Using the WAIT Bit

When the RIICnMR3.WAIT bit is set to 1, the RIIC performs one-byte receive operation using the WAIT bit function.
Furthermore, when the RIICnMR3.RDRFS bit is 0, the RIIC automatically sends the RIICnMR3.ACKBT bit value for the acknowledge bit in the period from the falling edge of the eighth SCL clock cycle to the falling edge of the ninth SCL clock cycle, and automatically holds the SCL line low at the falling edge of the ninth SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from RIICnDRR, which enables bytewise receive operation.

The WAIT bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and device ID address) is obtained in master receive mode or slave receive mode.

(2) One-Byte Receive Operation (ACK/NACK Transmission Control) and Automatic Low-Hold Function Using the RDRFS Bit

When the RIICnMR3.RDRFS bit is set to 1, the RIIC performs one-byte receive operation using the RDRFS bit function.
When the RIICnSR2.RDRFS bit is set to 1, the RDRF flag (receive complete) in RIICnSR2 is set to 1 at the rising edge of the eighth SCL clock cycle, and the SCL line is automatically held low at the falling edge of the eighth SCL clock cycle. This lowhold is released by writing a value to the RIICnMR3.ACKBT bit, but cannot be released by reading data from RIICnDRR, which enables receive operation by the ACK/NACK transmission control according to the data received in byte units.

The RDRFS bit function is enabled for receive frames after a match with the RIIC's own slave address (including the general call address and device ID address) is obtained in master receive mode or slave receive mode.

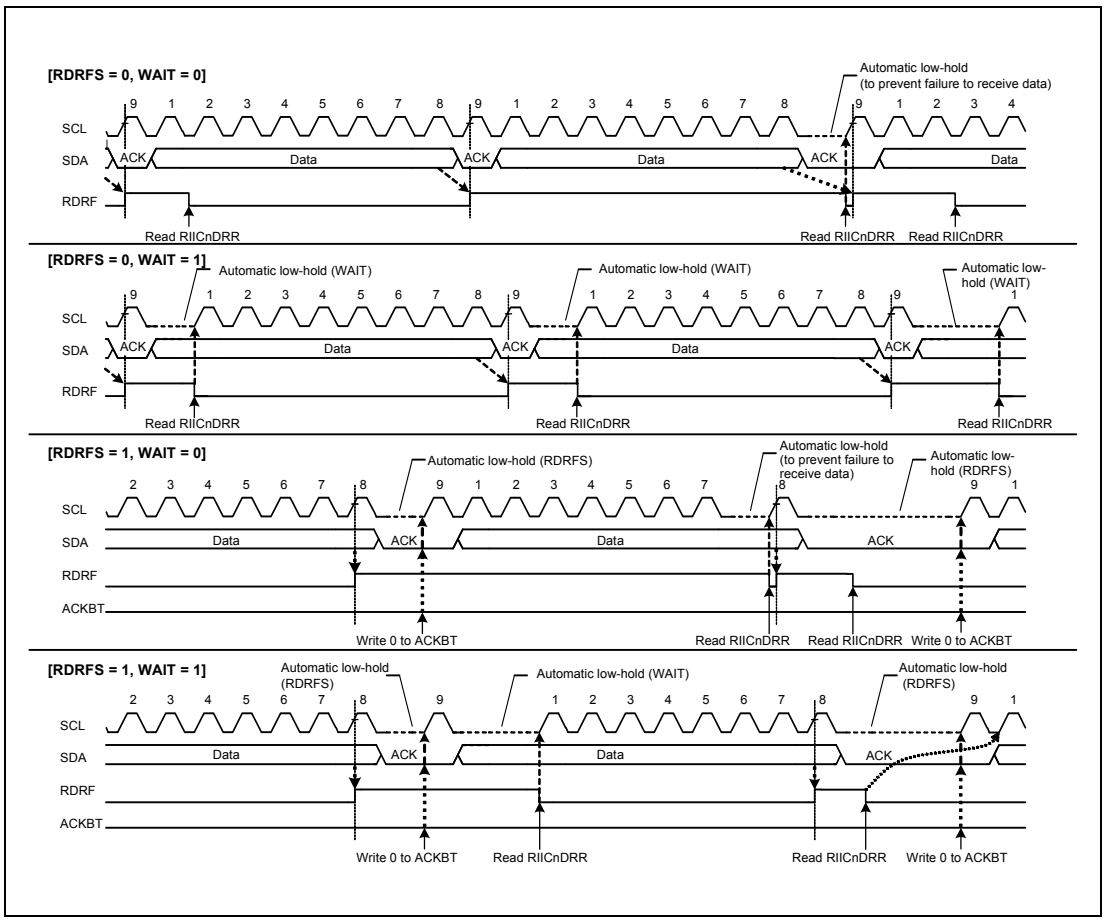

Figure 20.31 Automatic Low-Hold Operation in Receive Mode (Using RDRFS and WAIT Bits)

20.11 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the I2C bus standard, the RIIC has functions to prevent double-issue of a start condition, to detect arbitration-lost during transmission of NACK, and to detect arbitration-lost in slave transmit mode.

20.11.1 Master Arbitration-Lost Detection (MALE Bit)

The RIIC drives the SDA line low to issue a start condition. However, if the SDA line has already been driven low by another master device issuing a start condition, the RIIC considers this a loss in arbitration, so priority is given to transfer by the other master device. Similarly, if the RIICnCR2.ST bit is set to 1 while the bus is busy (RIICnCR2.BBSY flag = 1), the RIIC considers itself to have lost in arbitration, so priority is given to transfer by the other master device and no start condition is generated.

When a start condition is issued successfully, if the data for transmission including the address bits (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state, and the low level is detected on the SDA line), the RIIC loses in arbitration.

After a loss in arbitration of mastership, the RIIC immediately enters slave receive mode. If a slave address (including the general call address) matches its own address at this time, the RIIC continues in slave operation.

A loss in arbitration of mastership is detected when the following conditions are met while the RIICnFER.MALE bit is 1 (master arbitration-lost detection enabled).

[Master arbitration-lost conditions]

- Non-matching of the internal level for output on SDA and the level on the SDA line after a start condition was issued by setting the RIICnCR2.ST bit to 1 while the RIICnCR2.BBSY flag was cleared to 0 (erroneous issuing of a start condition)
- Setting of the RIICnCR2.ST bit to 1 (start condition double-issue error) while the RIICnCR2.BBSY flag is set to 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDA line in master transmit mode (RIICnCR2.MST and TRS bits = 11_B)

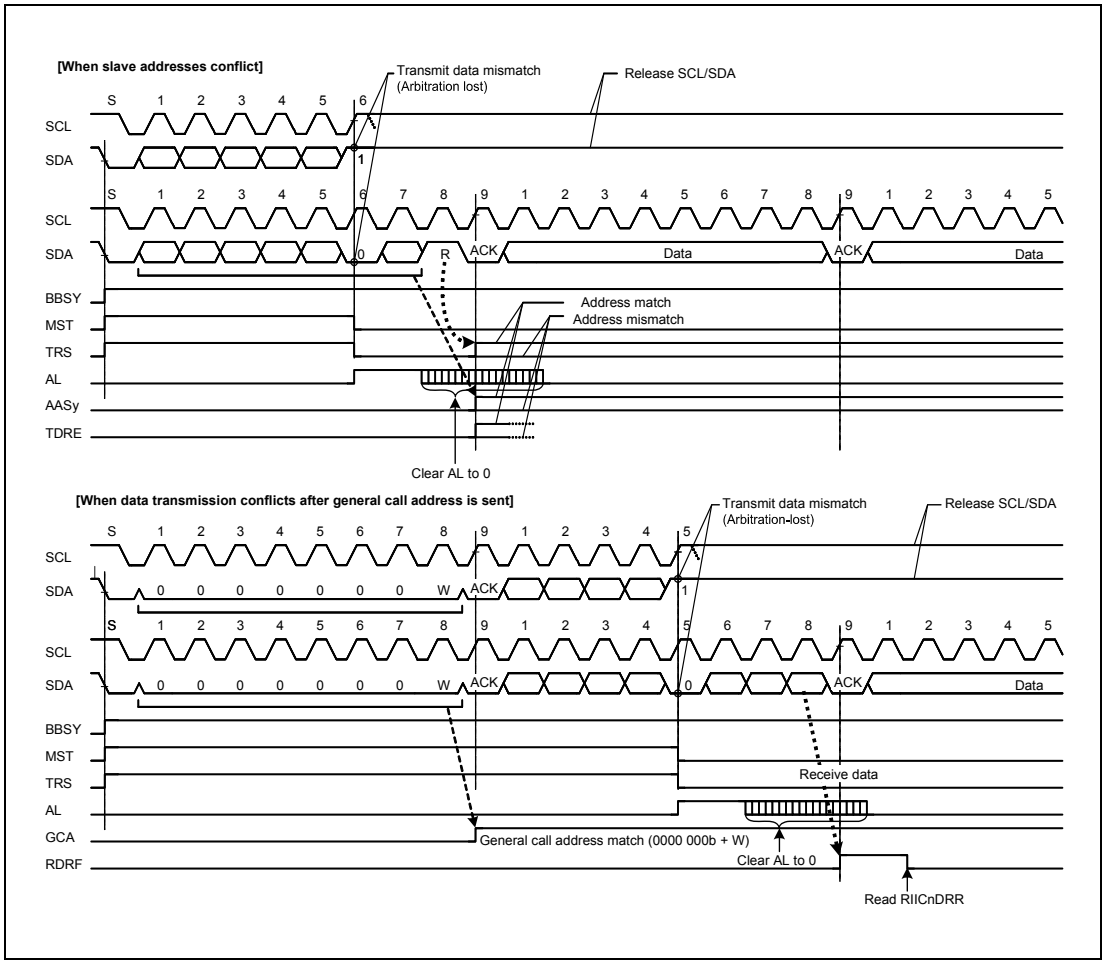

Figure 20.32 Examples of Master Arbitration-Lost Detection (MALE = 1)

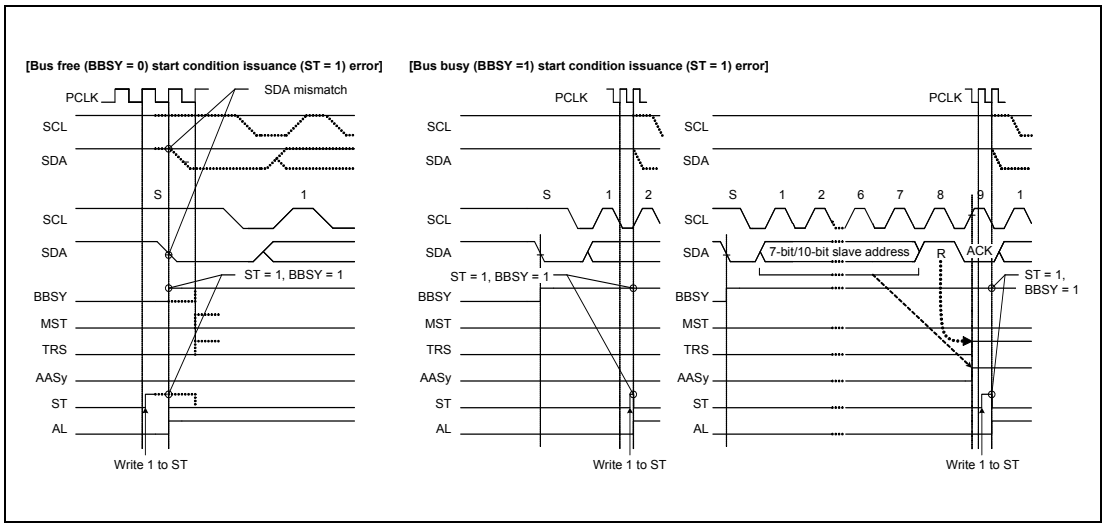

Figure 20.33 Arbitration-Lost when a Start Condition is Issued (MALE = 1)

The TRS bit is not cleared if 1 is written to the ST bit while the BBSY flag is 1 in slave transmit mode.

20.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

The RIIC has a function to cause arbitration to be lost if the internal SDA output level does not match the level on the SDA line (the high output as the internal SDA output; i.e. the SDA pin is in the high-impedance state, and the low level is detected on the SDA line) during transmission of NACK in receive mode. Arbitration is lost due to a conflict of NACK transmission and ACK transmission when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send/receive the same information through a single slave device. **Figure 20.34** shows an example of arbitration-lost detection during transmission of NACK.

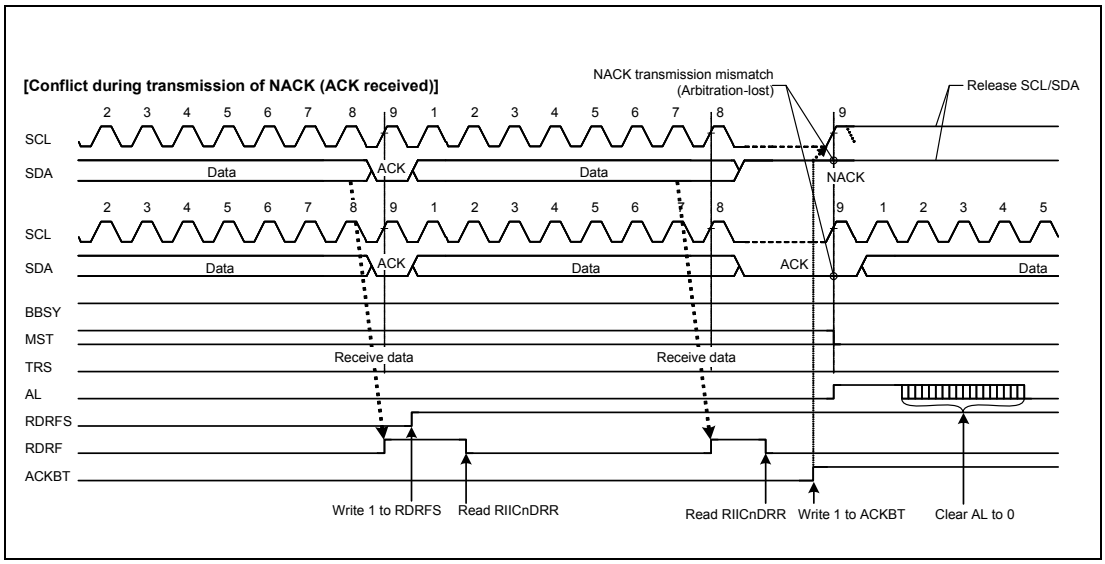

Figure 20.34 Example of Arbitration-Lost Detection during Transmission of NACK (NALE = 1)

The following explains arbitration-lost detection using an example where two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives two bytes of data from the slave device, and master B receives four bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in both master A and master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Here, master A sends NACK when it has received two final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received necessary four bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like this occurs, master A cannot detect ACK transmitted by master B and issues a stop condition.

Therefore, the issuance of the stop condition conflicts with the SCL clock output of master B, which disturbs communication.

When the RIIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost.

If arbitration is lost during transmission of NACK, the RIIC enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

The RIIC detects arbitration-lost during transmission of NACK when the following condition is met with the RIICnFER.NALE bit set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

When the internal SDA output level does not match the SDA line (ACK is received) during transmission of NACK (RIICnMR3.ACKBT bit = 1)

20.11.3 Slave Arbitration-Lost Detection (SALE Bit)

The RIIC has a function to cause arbitration to be lost if the data for transmission (i.e. the internal SDA output level) and the level on the SDA line do not match (the high output as the internal SDA output; i.e. the SDA pin is in the highimpedance state, and the low level is detected on the SDA line) in slave transmit mode.

When it loses slave arbitration, the RIIC enters slave receive mode.

The RIIC detects slave arbitration-lost when the following condition is met with the RIICnFER.SALE bit set to 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

When transmit data excluding acknowledge (internal SDA output level) does not match the SDA line in slave transmit mode (RIICnCR2.MST and TRS bits = 01_B)

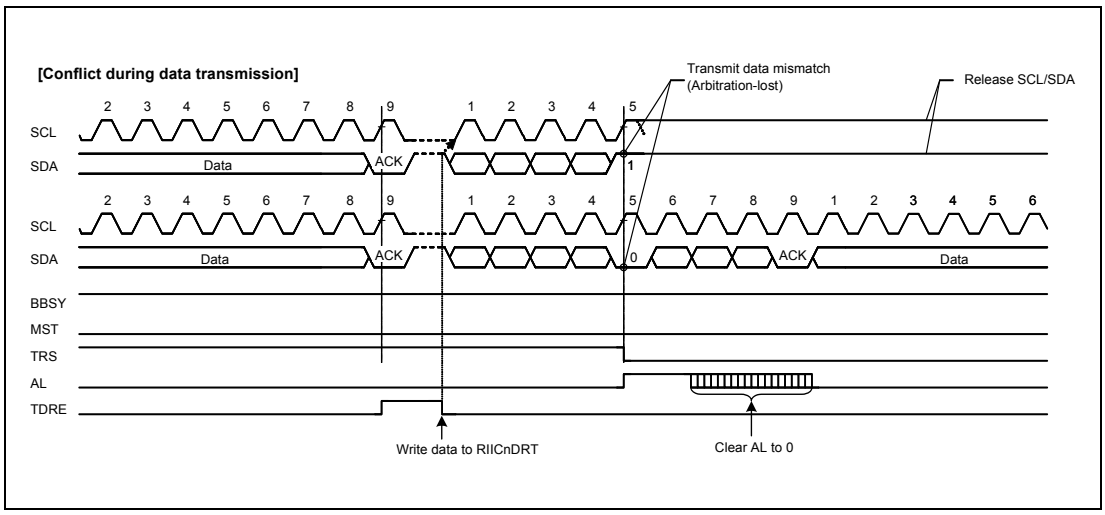

Figure 20.35 Example of Slave Arbitration-Lost Detection (SALE = 1)

20.12 Start Condition/Restart Condition/Stop Condition Issuing Function

20.12.1 Issuing a Start Condition

The RIIC issues a start condition when the RIICnCR2.ST bit is set to 1.

When the ST bit is set to 1, a start condition issuance request is made and the RIIC issues a start condition when the RIICnCR2.BBSY flag is 0 (bus free). When a start condition is issued normally, the RIIC automatically shifts to the master transmit mode.

A start condition is issued in the following sequence.

[Start condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the start condition hold time.
- Drive the SCL line low (high level to low level).
- Detect low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

20.12.2 Issuing a Restart Condition

The RIIC issues a restart condition when the RIICnCR2.RS bit is set to 1.

When the RS bit is set to 1, a restart condition issuance request is made even during communication and the RIIC issues a restart condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

(To detect the issuance of a restart condition, clear the RIICnSR2.START flag before a restart condition is issued.)

A restart condition is issued in the following sequence.

[Restart condition issuance]

- Release the SDA line.
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRL and the restart condition setup time.
- Drive the SDA line low (high level to low level).
- Ensure the time set in RIICnBRH and the restart condition hold time.
- Drive the SCL line low (high level to low level).
- Detect a low level of the SCL line and ensure the low-level period of SCL line set in RIICnBRL.

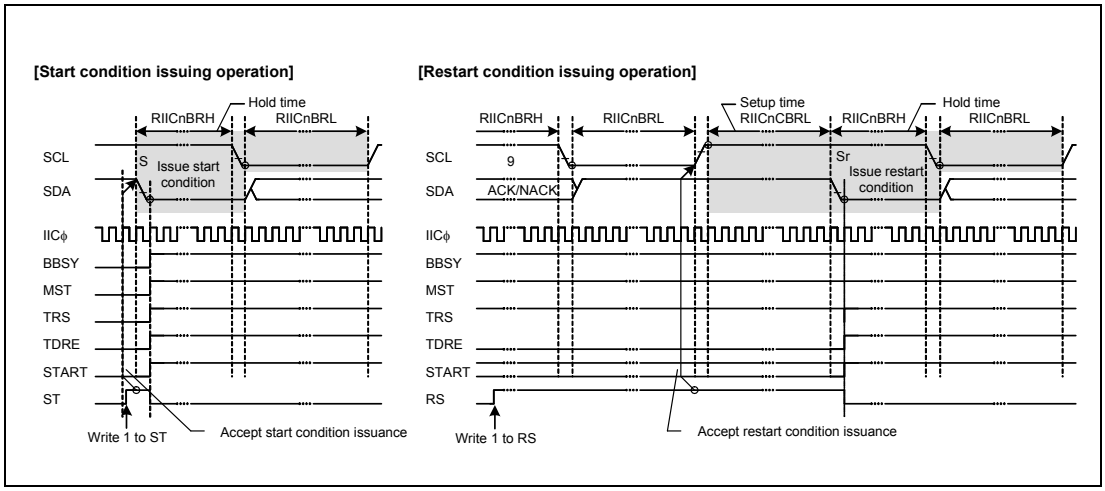

Figure 20.36 Start Condition/Restart Condition Issue Timing (ST and RS Bits)

20.12.3 Issuing a Stop Condition

The RIIC issues a stop condition when the RIICnCR2.SP bit is set to 1.

When the SP bit is set to 1, a stop condition issuance request is made and the RIIC issues a stop condition when the RIICnCR2.BBSY flag is 1 (bus busy) and the RIICnCR2.MST bit is 1 (master mode).

A stop condition is issued in the following sequence.

[Stop condition issuance]

- Drive the SDA line low (high level to low level).
- Ensure the low-level period of SCL line set in RIICnBRL.
- Release the SCL line (low level to high level).
- Detect a high level of the SCL line and ensure the time set in RIICnBRH and the stop condition setup time.
- Release the SDA line (low level to high level).
- Ensure the time set in RIICnBRL and the bus free time.
- Clear the BBSY flag to 0 (to release the bus mastership).

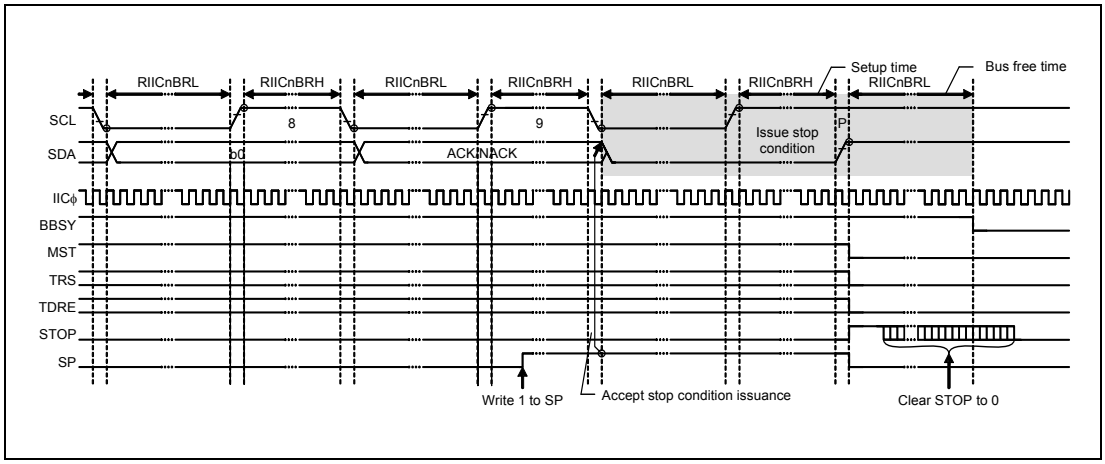

Figure 20.37 Stop Condition Issue Timing (SP Bit)

20.13 Bus Hanging

If the clock signals from the master and slave devices go out of synchronization due to noise or other factors, the I2C bus might hang with a fixed level on the SCL line and/or SDA line.

As measures against the bus hanging, the RIIC has a timeout function to detect hanging by monitoring the SCL line, a function for the output of an extra SCL clock cycle to release the bus from a hung state due to clock signals being out of synchronization, and the RIIC/internal reset function.

By checking the RIICnCR1.SCLO, SDAO, SCLI, and SDAI bits, it is possible to see whether the RIIC or its partner in communications is placing the low level on the SCL or SDA lines.

20.13.1 Timeout Function

The RIIC has the timeout function to detect an abnormality that the SCL line is held for a certain period of time. The RIIC can detect an abnormal bus state by monitoring that the SCL line is held low or high for a predetermined time.

The timeout function monitors the SCL line state and counts the low-level period or high-level period using the internal counter. The timeout function resets the internal counter each time the SCL line changes (rising or falling), but continues to count unless the SCL line changes. If the internal counter overflows due to no SCL line change, the RIIC can detect the timeout and report the bus abnormality.

The internal counter is cleared when one of the conditions is met.

(1) When RIICnMR2.TMOH=0, and RIICnMR2.TMOL=1:
The internal counter is cleared by SCL rising

(2) When RIICnMR2.TMOH=1, and RIICnMR2.TMOL=0:
The internal counter is cleared by SCL falling

(3) When RIICnMR2.TMOH=RIICnMR2.TMOL=1:
The internal counter is cleared by SCL rising or falling

This timeout function is enabled when the RIICnFER.TMOE bit is 1. It detects an abnormal bus state that the SCL line is stuck low or high during the following conditions:

- The bus is busy (RIICnCR2.BBSY flag is 1) in master mode (RIICnCR2.MST bit is 1).
- The RIIC's own slave address matches (RIICnSR1 register is not 00_H) and the bus is busy (RIICnCR2.BBSY flag is 1) in slave mode (RIICnCR2.MST bit is 0).
- The bus is free (RIICnCR2.BBSY flag is 0) while generation of a START condition is requested (RIICnCR2.ST bit is 1).

The internal counter of the timeout function works using the internal reference clock (IICϕ) set by the RIICnMR1.CKS[2:0] bits as a count source. It functions as a 16-bit counter when long mode is selected (RIICnMR2.TMOS bit = 0) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCL line level (low/high or both levels) during which this counter is activated can be selected by the setting of the RIICnMR2.TMOH and TMOL bits. If both TMOL and TMOH bits are cleared to 0, the internal counter does not work.

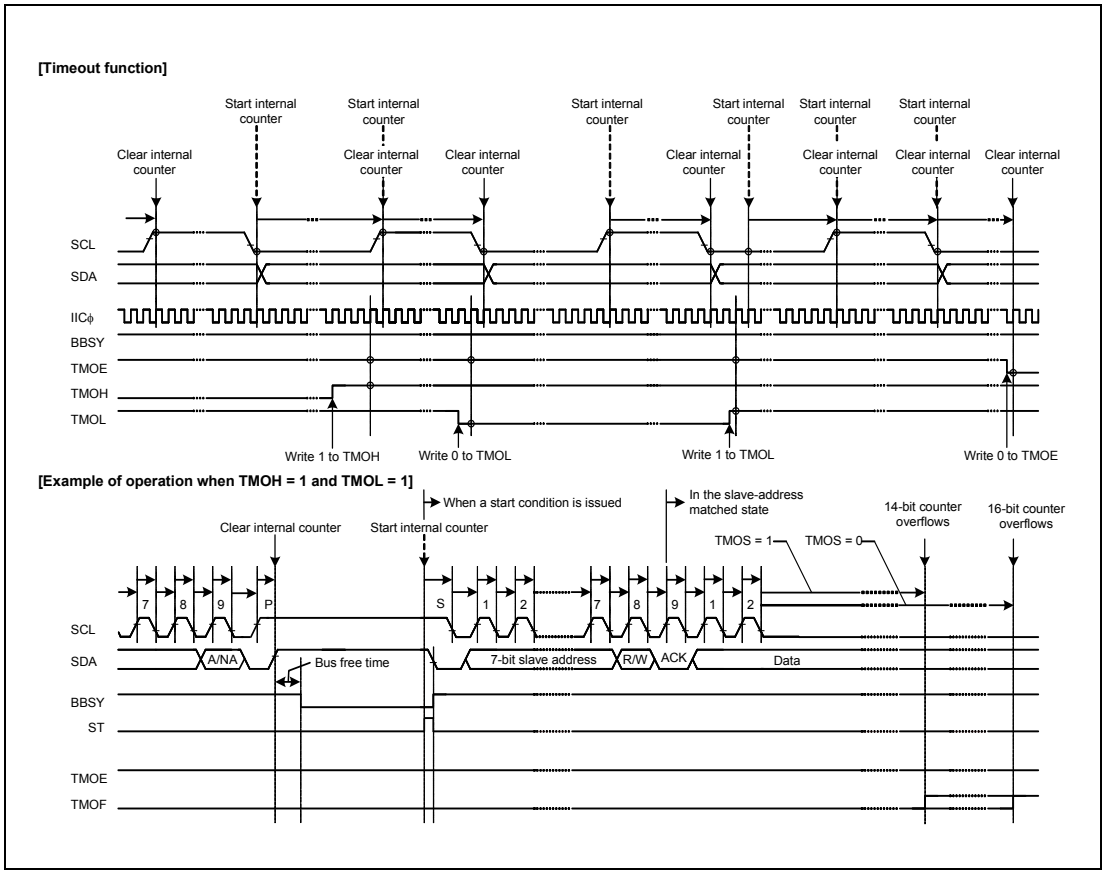

Figure 20.38 Timeout Function (TMOE, TMOS, TMOH, and TMOL Bits)

20.13.2 Extra SCL Clock Cycle Output Function

In master mode, the RIIC module has a facility for the output of extra SCL (clock) cycles to release the SDA line of the slave device from being held at the low level due to the master being out of synchronization with the slave device.

This function is mainly used in master mode to release the SDA line of the slave device from the state of being fixed to the low level by including extra cycles of SCL output from the RIIC with single cycles of the SCL (clock) signal as the unit in the case of a bus error where the RIIC cannot issue a stop condition because the slave device is holding the SDA line at the low level. Do not use this facility in normal situations. Using it when communications are proceeding correctly will lead to malfunctions.

When the RIICnCR1.CLO bit is set to 1 in master mode, a single cycle of the SCL clock at the frequency corresponding to the transfer rate settings (settings of the RIICnMR1.CKS[2:0] bits, and of the RIICnBRH and RIICnBRL registers) is output as an extra clock cycle. After output of this single cycle of the SCL clock, the CLO bit is automatically cleared to 0. Therefore, further extra clock cycles can be output consecutively by the software program writing 1 to the CLO bit after having read CLO = 0.

When the RIIC module is in master mode and the slave device is holding the SDA line at the low level because synchronization with the slave device has been lost due to the effects of noise, etc., the output of a stop condition is not possible. The facility for output of an extra cycle of the SCL (clock) signal can be used to output extra cycles of SCL one by one to make the slave device release the SDA line from being held at the low level, thus recovering the bus from an unusable state. Release of the SDA line by the slave device can be monitored by reading the RIICnCR1.SDAI bit. After confirming release of the SDA line by the slave device, complete communications by reissuing the stop condition.

Use this facility with the RIICnFER.MALE bit (master arbitration-lost detection disabled) cleared to 0. If the MALE bit is set to 1 (master arbitration-lost detection enabled), arbitration is lost when the value of the RIICnCR1.SDAO bit does not match the state of the SDA line, so take care on this point.

[Additional output conditions for the SCL clock]

- In master mode and when the bus is free
- In master mode and the SCL line is not held low (the bus is busy)

Figure 20.39 shows the operation timing of the extra SCL clock cycle output function (CLO bit).

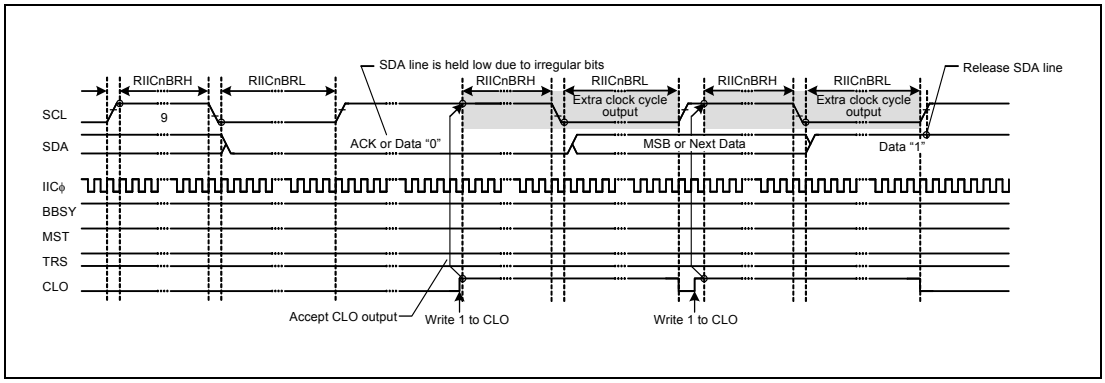

Figure 20.39 Extra SCL Clock Cycle Output Function (CLO Bit)

20.13.3 RIIC Reset and Internal Reset

The RIIC module incorporates a function for resetting itself. There are two types of reset. One is referred to as an RIIC reset; this initializes all registers including the RIICnCR2.BBSY flag. The other is referred to as an internal reset; this releases the RIIC from the slave-address matched state and initializes the internal counter while retaining other settings.

After issuing a reset, be sure to clear the RIICnCR1.IICRST bit to 0.

Both types of reset are effective for release from bus-hung states since both restore the output state of the SCL and SDA pins to the high impedance state.

Issuing a reset during slave operation may lead to a loss of synchronization between the master device clock and the slave device clock, so avoid this where possible. Note that monitoring of the bus state, such as for the presence of a start condition, is not possible during an RIIC reset (RIICnCR1.ICE and IICRST bits = 01_B).

For a detailed description of the RIIC and internal resets, see **Section 20.14, Reset Function of RIIC**.

20.14 Reset Function of RIIC

The RIIC has RIIC reset, and internal reset functions. In addition RIIC is cleared by ISORES. **Table 20.26** lists the scope of each reset and reset conditions.

Table 20.26 RIIC Reset Functions (1/2)

Note 1. When an internal reset is applied while the bus is free after detection of a stop condition, the setting of the BBSY flag is 0 while the bus is free following de-assertion of the internal reset signal.
When an internal reset is applied while the bus is not free, the BBSY flag is not cleared to 0.

Section 21 CAN Interface (RS-CAN)

This section contains a generic description of the CAN Interface (RS-CAN).

A CAN FD interface is also available, but only in PREMIUM models. In ECO and ADVANCED models, the CAN FD channels can be used as classic (non-FD) CAN channels.

The first part of this section describes all RH850/F1K specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RS-CANFD and RS-CAN.

21.1 Features of RH850/F1K RS-CANFD

21.1.1 Number of Units and Channels

This product supports a CAN FD interface that complies with the new ISO/CD 11898-1 standard that revises the CRC field definition to include the stuff bit count. This product can also support the CRC field definition that complies with the ISO/CD 11898-1 standard issued on August 12, 2014 by setting OPBT0.CANFDCRC = 0. For details about OPBT0, see **Section 37, Flash Memory**.

This microcontroller has the following number of RS-CANFD and RS-CAN units.

Table 21.1 Number of RS-CANFD Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	1		
Name	RSCAN0		

Table 21.2 Number of RS-CAN Units

Product Name	RH850/F1K 100 pins	RH850/F1K 144 pins	RH850/F1K 176 pins
Number of Units	—	—	1
Name	—	—	RSCAN1

Each unit has the following number of CAN FD interface channels.

Table 21.3 Unit Configurations and Channels

Unit Name	Channel Name	CAN FD Support*1	RH850/F1K 100 pins (6 ch)	RH850/F1K 144 pins (6 ch)	RH850/F1K 176 pins (7 ch)
RSCAN0	CAN0	Yes	√	√	√
	CAN1	Yes	√	√	√
	CAN2	Yes	√	√	√
	CAN3	Yes	√	√	√
	CAN4	Yes	√	√	√
	CAN5	Yes	√	√	√
RSCAN1	CAN6	No	—	—	√

Note 1. The CAN FD interface is only available in PREMIUM models. In ECO and ADVANCED models, the CAN FD channels can be used as classic (non-FD) CAN channels.

For details about the functions and registers of CAN0 to CAN5 (RS-CANFD), see **Section 21.2, RS-CANFD**.

For details about the functions and registers of CAN6 (RS-CAN), see **Section 21.14, RS-CAN**.

21.2 RS-CANFD

This section describes the functions and registers of RS-CANFD.

The RS-CANFD has two interface modes (classical CAN mode and CAN FD mode) and uses different registers for each mode. There are two types of register names RSCANnXXX and RSCFDnCFDXXX (XXX: arbitrary) depending on the interface mode. When explaining specifications common to two registers, register names are described as RSCANn(CFD)XXX.

Table 21.4 Indices

Index	Description
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index “n” (n = 0); for example, RSCANn(CFD)GCTR is the global control register of the RSCANn unit.
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index “m” (m = 0 to 5); for example, RSCANn(CFD)CmSTS is the channel m status register.
j	The individual registers associated with receive rule table are generically indicated by the index “j” (j = 0 to 15); for example, RSCANn(CFD)GAFLIDj is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index “k” (k = 0 to [channel m × 3 + 2]); for example, RSCANn(CFD)CFCCk is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index “x” (x = 0 to 7); for example, RSCANn(CFD)RFSTSx is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by “d” (classical CAN mode: d = 0 to 1, CAN FD mode: d = 0 to 15). For example, the transmit/receive FIFO buffer data field register is described as RSCANn(CFD)CFDFdk.
q	The individual receive buffers are generically indicated by the index “q” (q = 0 to [channel m × 16 + 15]); for example, RSCANn(CFD)RMIDq is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index “p” (p = 0 to [channel m × 16 + 15]; for example, RSCANn(CFD)TMCp is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by “b” (classical CAN mode: b = 0 to 1, CAN FD mode: b = 0 to 4). For example, the receive buffer data field register is described as RSCANn(CFD)RMDFbq.
r	The individual RAM tests for CAN are generically indicated by the index “r” (r = 0 to 63); for example, RSCANn(CFD)RPGACCr is the RAM test page access register.
y	The registers not covered above are indicated by the index “y” (y = 0 to 2); for example, RSCANn(CFD)RMNDy is a receive buffer new data register.

Note: The functions and descriptions of registers in this section are for a 6-channel RS-CANFD (m = 0 to 5). When referring to information with indices, regard the index values as the ones corresponding to your product. Also, note that, if the value of an index exceeds the range described in this section due to your product, write the value after reset when writing to bits outside the index range.

The following table lists the values of indices for individual products.

Table 21.5 Indices for Individual Products

Indices for Individual Products
100, 144, 176 pins (6 ch)
j = 0 to 15
k = 0 to 17
x = 0 to 7
q = 0 to 95
p = 0 to 95
r = 0 to 63
y = 0 to 2

21.2.1 Register Base Address

RSCAN0 base addresses are listed in the following table.

RSCAN0 register addresses are given as offsets from the base addresses.

Table 21.6 Register Base Addresses

Base Address Name	Base Address
<RSCAN0_base>	FFD0 0000_H
<ECCCAN0_base> for MB RAM	FFC7 1300_H
<ECCCANFD0_base> for AFL RAM	FFC7 1400_H

21.2.2 Clock Supply

The RSCANn clock supply is shown in the following table.

Table 21.7 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
RSCANn (n =0)	clk_xincan	CKSCLK_ICANOSC	Communicatiaon clock from OSC clock
	clkc	CKSCLK_IPERI2	Communication clock
	pclk	CKSCLK_ICAN	Module clock
	Register access clock	CPUCLK2	Bus clock
		CKSCLK_ICAN	

The operating frequency of the RSCANn depends on the transfer rate and the number of channels in use. Use the RSCANn within the frequency range shown in **Table 21.8**.

Table 21.8 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K (1/2)

Condition		Range of Operating Frequency		
Transfer Rate	No. of Channels in Use	pclk	clk_xincan*1	clkc*1, *2
1 Mbps	6ch	pclk ≥ 53MHz	8 MHz ≤ clk_xincan ≤ pclk/2	12.5 MHz ≤ clkc ≤ pclk/2
	5ch	pclk ≥ 46MHz		
	4ch	pclk ≥ 40MHz		
	3ch	pclk ≥ 32MHz		
	2ch	pclk ≥ 26MHz		
	1ch	pclk ≥ 18MHz		
500 kbps	6ch	pclk ≥ 27MHz	4 MHz ≤ clk_xincan ≤ pclk/2	12.5 MHz ≤ clkc ≤ pclk/2
	5ch	pclk ≥ 23MHz		
	4ch	pclk ≥ 20MHz		
	3ch	pclk ≥ 16MHz		
	2ch	pclk ≥ 13MHz		
	1ch	pclk ≥ 8MHz		

Table 21.8 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K (2/2)

Condition		Range of Operating Frequency		
Transfer Rate	No. of Channels in Use	pclk	clk_xincan*1	clkc*1, *2
125 kbps	6ch	pclk ≥ 8MHz	4 MHz ≤ clk_xincan ≤ pclk/2	12.5 MHz ≤ clkc ≤ pclk/2
	5ch			
	4ch			
	3ch			
	2ch			
	1ch			

Note 1. Setting the DCS bit in the RSCANn(CFD)GCFG register enables to select either clk_xincan or clkc. Set clocks less than or equal to pclk/2 (up to 40 MHz).

Note 2. When pclk ≤ 25 MHz, select clk_xincan.

CAUTION

When the RS-CANFD module is used in STOP mode, set the MainOSC as the clock source of the RS-CANFD module. For details about how to set the clock source, see Section 12.4.3.10, RS-CAN Clock Domains C_ISO_CAN and C_ISO_CANOSC.

21.2.3 Interrupt Requests

RSCANn interrupt requests are listed in the following table.

Table 21.9 Interrupt Requests (1/2)

Unit Interrupt Signal		Description	Interrupt Number	DMA Trigger Number (Only in CAN FD Mode)
RSCANn (n = 0)				
Global	INTRCANGERR0	CAN global error interrupt	22	—
	INTRCANGRECC0	CAN receive FIFO interrupt	23	—
	RSCANFDRF0	Reception FIFO Access Message Buffers0	—	60
	RSCANFDRF1	Reception FIFO Access Message Buffers1	—	61
	RSCANFDRF2	Reception FIFO Access Message Buffers2	—	62
	RSCANFDRF3	Reception FIFO Access Message Buffers3	—	63
	RSCANFDRF4	Reception FIFO Access Message Buffers4	—	68
	RSCANFDRF5	Reception FIFO Access Message Buffers5	—	69
	RSCANFDRF6	Reception FIFO Access Message Buffers6	—	82
	RSCANFDRF7	Reception FIFO Access Message Buffers7	—	83
CAN0	INTRCAN0ERR	CAN0 error interrupt	24	—
	INTRCAN0REC	CAN0 transmit/receive FIFO receive complete interrupt	25	—
	INTRCAN0TRX	CAN0 transmit interrupt	26	—
	RSCANFDCF0	CAN0 Common FIFO Access Message Buffers	—	23
CAN1	INTRCAN1ERR	CAN1 error interrupt	113	—
	INTRCAN1REC	CAN1 transmit/receive FIFO receive complete interrupt	114	—
	INTRCAN1TRX	CAN1 transmit interrupt	115	—

Table 21.9 Interrupt Requests (2/2)

Unit Interrupt Signal		Description	Interrupt Number	DMA Trigger Number (Only in CAN FD Mode)
CAN1	RSCANFDCF1	CAN1 Common FIFO Access Message Buffers	—	24
CAN2	INTRCAN2ERR	CAN2 error interrupt	217	—
	INTRCAN2REC	CAN2 transmit/receive FIFO receive complete interrupt	218	—
	INTRCAN2TRX	CAN2 transmit interrupt	219	—
	RSCANFDCF2	CAN2 Common FIFO Access Message Buffers	—	26
CAN3	INTRCAN3ERR	CAN3 error interrupt	220	—
	INTRCAN3REC	CAN3 transmit/receive FIFO receive complete interrupt	221	—
	INTRCAN3TRX	CAN3 transmit interrupt	222	—
	RSCANFDCF3	CAN3 Common FIFO Access Message Buffers	—	27
CAN4	INTRCAN4ERR	CAN4 error interrupt	272	—
	INTRCAN4REC	CAN4 transmit/receive FIFO receive complete interrupt	273	—
	INTRCAN4TRX	CAN4 transmit interrupt	274	—
	RSCANFDCF4	CAN4 Common FIFO Access Message Buffers	—	48
CAN5	INTRCAN5ERR	CAN5 error interrupt	287	—
	INTRCAN5REC	CAN5 transmit/receive FIFO receive complete interrupt	288	—
	INTRCAN5TRX	CAN5 transmit interrupt	289	—
	RSCANFDCF5	CAN5 Common FIFO Access Message Buffers		49

NOTE

For the wake-up factors from standby mode, see **Section 14.1.2.1, Wake-Up Factors for Stand-By Modes**.

21.2.4 Reset Factors

RSCANn reset factors are listed in the following table. RSCANn is initialized by these reset factors.

Table 21.10 Reset Factors

Unit Name	Reset Factor
RSCANn (n = 0)	All reset factors (ISORES)

21.2.5 External Input/Output Signals

External input/output signals of RSCANn are listed below.

Table 21.11 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
RSCANn (n = 0)		
CANmRX (m = 0 to 5)	CANm receive data input	CANmRX (m = 0 to 5)
CANmTX (m = 0 to 5)	CANm transmit data output	CANmTX (m = 0 to 5)

21.3 Overview

21.3.1 Functional Overview

The RH850/F1K incorporates one CAN interface unit (RS-CAN) which consists of six channels (CAN0 to CAN 5) of CAN controllers conforming to the ISO11898-1 specification.

Table 21.12 shows the RS-CANFD module specifications. **Figure 21.1** shows the RS-CANFD module block diagram.

Table 21.12 RS-CANFD Module Specifications (1/3)

Item	Specification
Number of channels	6
Protocol	ISO11898-1 compliant Using CAN FD frames is selectable by switching interface modes.
Communication speed	Classical CAN mode: • Maximum 1 Mbps $\text{Communication speed (CANm bit time clock)} = \frac{1}{\text{CANm bit time}}$ CANm bit time = CANmTq × Tq count per bit $\text{CANmTq} = \frac{\text{(BRP[9:0] bits in the RSCANnCmCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCANnGCFG register) CAN FD mode: • Nominal bit rate: max.1 Mbps, data bit rate: max. 5 Mbps $\text{Transmission rate (CANm nominal bit time clock)} = \frac{1}{\text{CANm nominal bit time}}$ $\text{Transmission rate (CANm data bit time clock)} = \frac{1}{\text{CANm data bit time}}$ CANm nominal bit time = CANmTq(N) × Tq count per nominal bit CANm data bit time = CANmTq(D) × Tq count per data bit $\text{CANmTq(N)} = \frac{\text{(NBRP[9:0] bits in the RSCFDnCFDCmNCFG register + 1)}}{\text{fCAN}}$ $\text{CANmTq(D)} = \frac{\text{(DBRP[7:0] bits in the RSCFDnCFDCmDCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCFDnCFDGCFG register) m = 0 to 5 Tq: Time quantum
Buffer	480 buffers in total • Channel-dedicated: 96 buffers (16 buffers × 6 channels) Transmit buffer: 16 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable) • Shared between channels: 384 buffers for all channels Receive buffer: 0 to 96 buffers Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) • ECC included

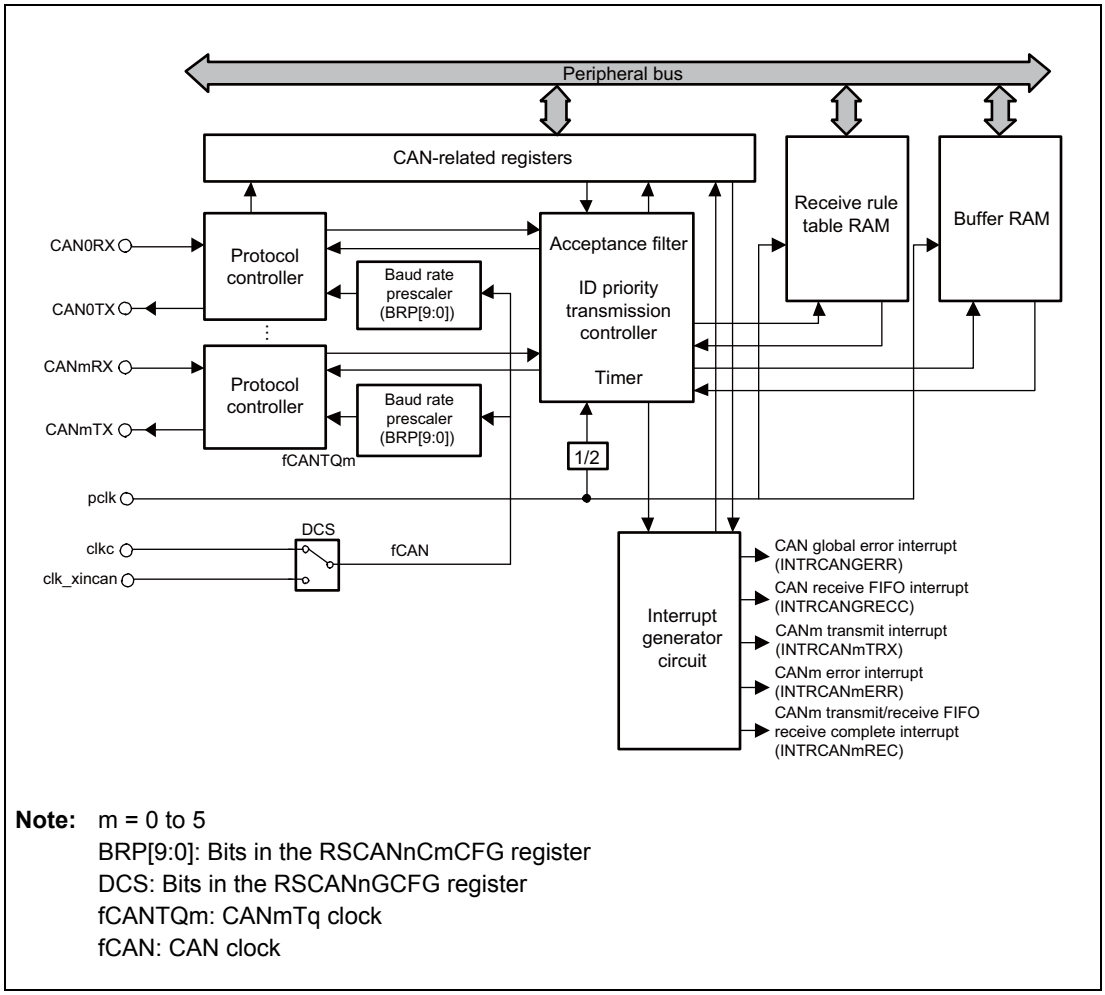
Table 21.12 RS-CANFD Module Specifications (2/3)

Item	Specification
Reception function	• Receives data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be received. • Sets interrupt enable/disable for each FIFO. • Mirror function (reception of messages transmitted from the own CAN node) • Timestamp function (to record message reception time as a 16-bit timer value)
Reception filter function	• Selects receive messages according to 384 receive rules. • Sets the number of receive rules (0 to 128) for each channel. • Acceptance filter processing: Sets ID and mask for each receive rule. • DLC filter processing: Enables DLC filter check for each acceptance rule.
Receive message transfer function	• Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer • Labeling function Stores label information together with a message in a receive buffer and FIFO buffer.
Transmission function	• Transmits data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be transmitted. • Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer. • Selects ID priority transmission or transmit buffer number priority transmission. • Transmission can be aborted (possible to confirm with a flag) • One-shot transmission function
Interval transmission function	Transmits messages at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers)
Transmit queue function	Transmits all stored messages according to the ID priority.
Transmit history function	Stores the history information of transmission-completed messages Adds timestamp (recording message transmission time as a 16-bit timer value) to the history information.
Gateway function	Transmits a received message automatically.
Bus off recovery mode selection	Selects the method for returning from bus off state. • ISO11898-1 compliant • Automatic entry to channel halt mode at bus-off entry • Automatic entry to channel halt mode at bus-off end • Transition to channel halt mode by program request • Transition to the error-active state by program request (forcible return from the bus off state)
Error status monitoring	• Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock). • Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery) • Reads the error counter. • Monitors DLC errors.
Interrupt factor	20 factors • Global Interrupts (2 factors) Receive FIFO interrupt Global error interrupt • Channel interrupts (3 factors/channel) CANm transmit interrupt (m = 0 to 5) – CANm transmit complete interrupt – CANm transmit abort interrupt – CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode) – CANm transmit history interrupt – CANm transmit queue interrupt CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) CANm error interrupt
CAN stop mode	Reduces power consumption by stopping clock supply to the RS-CANFD module.

Table 21.12 RS-CANFD Module Specifications (3/3)

Item	Specification
CAN clock source	Selects the clkc or the clk_xincan. For the operating frequency range, see **Table 21.8**.
Test function	Test function for user evaluation • Listen-only mode • Self-test mode 0 (external loopback) • Self-test mode 1 (internal loopback) • Restricted operation mode • RAM test (read/write test) • Inter-channel communication test [CRC error test enabled]

21.3.2 Interface Modes



The RS-CANFD has two interface modes.

- Classical CAN mode: Handles only classical CAN frames.
- CAN FD mode: Handles classical CAN frames and CAN FD frames.

These two modes use different register maps with the same base address. Register maps change by switching interface modes.

Interface modes are switched by the RCMC bit in the RSCFDnCFDGRMCFG register.

21.3.3 Block Diagram

Note: m = 0 to 5
BRP[9:0]: Bits in the RSCANnCmCFG register
DCS: Bits in the RSCANnGCFG register
fCANTQm: CANmTq clock
fCAN: CAN clock

Figure 21.1 RS-CANFD Module Block Diagram (Classical CAN Mode)

In CAN FD mode, different clock signals are input to the baud rate prescaler and the protocol controller respectively. See **Section 21.11.1.3, Communication Speed Setting**.

21.4 Registers (Classical CAN Mode)

21.4.1 List of Registers

The following tables list RS-CANFD registers to be used in classical CAN mode.

For details about <RSCANn_base>, see **Section 21.2.1, Register Base Address**.

Table 21.13 Registers (1/2)

Module	Register	Symbol	Address	Guard Group
Channel-related registers				
RSCANn	Channel m Configuration register	RSCANnCmCFG	<RSCANn_base> + 0000_H + (10_H × m)	RSCANn Chm
	Channel m control register	RSCANnCmCTR	<RSCANn_base> + 0004_H + (10_H × m)	RSCANn Chm
	Channel m status register	RSCANnCmSTS	<RSCANn_base> + 0008_H + (10_H × m)	RSCANn Chm
	Channel m error flag register	RSCANnCmERFL	<RSCANn_base> + $000C_H$ + (10_H × m)	RSCANn Chm
Global-related registers				
RSCANn	Global configuration register	RSCANnGCFG	<RSCANn_base> + 0084_H	RSCANn global
	Global control register	RSCANnGCTR	<RSCANn_base> + 0088_H	RSCANn global
	Global status register	RSCANnGSTS	<RSCANn_base> + $008C_H$	RSCANn global
	Global error flag register	RSCANnGERFL	<RSCANn_base> + 0090_H	RSCANn global
	Global timestamp counter register	RSCANnGTSC	<RSCANn_base> + 0094_H	RSCANn global
	Global TX Interrupt Status register 0	RSCANnGTINTSTS0	<RSCANn_base> + 0460_H	RSCANn global
	Global TX Interrupt Status register 1	RSCANnGTINTSTS1	<RSCANn_base> + 0464_H	RSCANn global
	Global FD configuration register	RSCANnGFDCFG	<RSCANn_base> + 0474_H	RSCANn global
Receive rule-related registers				
RSCANn	Receive Rule Entry Control register	RSCANnGAFLECTR	<RSCANn_base> + 0098_H	RSCANn global
	Receive Rule Configuration register 0	RSCANnGAFLCFG0	<RSCANn_base> + $009C_H$	RSCANn global
	Receive Rule Configuration register 1	RSCANnGAFLCFG1	<RSCANn_base> + $00A0_H$	RSCANn global
	Receive Rule ID register j	RSCANnGAFLIDj	<RSCANn_base> + 0500_H + (10_H × j)	RSCANn global
	Receive Rule Mask register j	RSCANnGAFLMj	<RSCANn_base> + 0504_H + (10_H × j)	RSCANn global
	Receive Rule Pointer 0 register j	RSCANnGAFLP0j	<RSCANn_base> + 0508_H + (10_H × j)	RSCANn global
	Receive Rule Pointer 1 register j	RSCANnGAFLP1j	<RSCANn_base> + $050C_H$ + (10_H × j)	RSCANn global
Receive buffer-related registers				
RSCANn	Receive Buffer Number register	RSCANnRMNB	<RSCANn_base> + $00A4_H$	RSCANn global
	Receive Buffer New Data register y	RSCANnRMNDy	<RSCANn_base> + $00A8_H$ + (04_H × y)	RSCANn global
	Receive Buffer ID register q	RSCANnRMIDq	<RSCANn_base> + 0600_H + (10_H × q)	RSCANn global
	Receive Buffer Pointer register q	RSCANnRMPTRq	<RSCANn_base> + 0604_H + (10_H × q)	RSCANn global
	Receive Buffer Data Field 0 register q	RSCANnRMDF0q	<RSCANn_base> + 0608_H + (10_H × q)	RSCANn global
	Receive Buffer Data Field 1 register q	RSCANnRMDF1q	<RSCANn_base> + $060C_H$ + (10_H × q)	RSCANn global
Receive FIFO buffer-related registers				
RSCANn	Receive FIFO Buffer Configuration and Control register x	RSCANnRFCCx	<RSCANn_base> + $00B8_H$ + (04_H × x)	RSCANn global
	Receive FIFO Buffer Status register x	RSCANnRFSTSx	<RSCANn_base> + $00D8_H$ + (04_H × x)	RSCANn global
	Receive FIFO Buffer Pointer Control register x	RSCANnRFPCTRx	<RSCANn_base> + $00F8_H$ + (04_H × x)	RSCANn global
	Receive FIFO Buffer Access ID register x	RSCANnRFIDx	<RSCANn_base> + $0E00_H$ + (10_H × x)	RSCANn global
	Receive FIFO Buffer Access Pointer register x	RSCANnRFPTRx	<RSCANn_base> + $0E04_H$ + (10_H × x)	RSCANn global
	Receive FIFO Buffer Access Data Field 0 register x	RSCANnRFDF0x	<RSCANn_base> + $0E08_H$ + (10_H × x)	RSCANn global
	Receive FIFO Buffer Access Data Field 1 register x	RSCANnRFDF1x	<RSCANn_base> + $0E0C_H$ + (10_H × x)	RSCANn global
Transmit/Receive FIFO buffer related registers				

Table 21.13 Registers (2/2)

Module	Register	Symbol	Address	Guard Group
RSCANn	Transmit/receive FIFO Buffer Configuration and Control register k	RSCANnCFCCk	<RSCANn_base> + 0118_H + (04_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Status register k	RSCANnCFSTSk	<RSCANn_base> + 0178_H + (04_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Pointer Control register k	RSCANnCFPCTRk	<RSCANn_base> + $01D8_H$ + (04_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Access ID register k	RSCANnCFIDk	<RSCANn_base> + $0E80_H$ + (10_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Access Pointer register k	RSCANnCFPTRk	<RSCANn_base> + $0E84_H$ + (10_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Access Data Field 0 register k	RSCANnCFDF0k	<RSCANn_base> + $0E88_H$ + (10_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Access Data Field 1 register k	RSCANnCFDF1k	<RSCANn_base> + $0E8C_H$ + (10_H × k)	RSCANn global
FIFO status-related registers				
RSCANn	FIFO Empty Status register	RSCANnFESTS	<RSCANn_base> + 0238_H	RSCANn global
	FIFO Full Status register	RSCANnFFSTS	<RSCANn_base> + $023C_H$	RSCANn global
	FIFO Message Lost Status register	RSCANnFMSTS	<RSCANn_base> + 0240_H	RSCANn global
	Receive FIFO Buffer Interrupt Flag Status register	RSCANnRFISTS	<RSCANn_base> + 0244_H	RSCANn global
	Transmit/receive FIFO Buffer Receive Interrupt Flag Status register	RSCANnCFRISTS	<RSCANn_base> + 0248_H	RSCANn global
	Transmit/receive FIFO Buffer Transmit Interrupt Flag Status register	RSCANnCFTISTS	<RSCANn_base> + $024C_H$	RSCANn global
Transmit buffer-related registers				
RSCANn	Transmit Buffer Control register p	RSCANnTMCp	<RSCANn_base> + 0250_H + (01_H × p)	RSCANn global
	Transmit Buffer Status register p	RSCANnTMSTSp	<RSCANn_base> + $02D0_H$ + (01_H × p)	RSCANn global
	Transmit Buffer ID register p	RSCANnTMIDp	<RSCANn_base> + 1000_H + (10_H × p)	RSCANn global
	Transmit Buffer Pointer register p	RSCANnTMPTRp	<RSCANn_base> + 1004_H + (10_H × p)	RSCANn global
	Transmit Buffer Data Field 0 register p	RSCANnTMDF0p	<RSCANn_base> + 1008_H + (10_H × p)	RSCANn global
	Transmit Buffer Data Field 1 register p	RSCANnTMDF1p	<RSCANn_base> + $100C_H$ + (10_H × p)	RSCANn global
	Transmit Buffer Interrupt Enable Configuration register y	RSCANnTMIECy	<RSCANn_base> + 0390_H + (04_H × y)	RSCANn global
Transmit buffer status-related registers				
RSCANn	Transmit Buffer Transmit Request Status register y	RSCANnTMTRSTSy	<RSCANn_base> + 0350_H + (04_H × y)	RSCANn global
	Transmit Buffer Transmit Abort Request Status register y	RSCANnTMTARSTSy	<RSCANn_base> + 0360_H + (04_H × y)	RSCANn global
	Transmit Buffer Transmit Complete Status register y	RSCANnTMTCSTSy	<RSCANn_base> + 0370_H + (04_H × y)	RSCANn global
	Transmit Buffer Transmit Abort Status register y	RSCANnTMTASTSy	<RSCANn_base> + 0380_H + (04_H × y)	RSCANn global
Transmit queue-related registers				
RSCANn	Transmit Queue Configuration and Control register m	RSCANnTXQCCm	<RSCANn_base> + $03A0_H$ + (04_H × m)	RSCANn Chm
	Transmit Queue Status register m	RSCANnTXQSTSm	<RSCANn_base> + $03C0_H$ + (04_H × m)	RSCANn Chm
	Transmit Queue Pointer Control register m	RSCANnTXQPCTRm	<RSCANn_base> + $03E0_H$ + (04_H × m)	RSCANn Chm
Transmit history-related registers				
RSCANn	Transmit History Configuration and Control register m	RSCANnTHLCCm	<RSCANn_base> + 0400_H + (04_H × m)	RSCANn Chm
	Transmit History Status register m	RSCANnTHLSTSm	<RSCANn_base> + 0420_H + (04_H × m)	RSCANn Chm
	Transmit History Pointer Control register m	RSCANnTHLPCTRm	<RSCANn_base> + 0440_H + (04_H × m)	RSCANn Chm
	Transmit History Access register m	RSCANnTHLACCm	<RSCANn_base> + 1800_H + (04_H × m)	RSCANn Chm
Test-related registers				
RSCANn	Global Test Configuration register	RSCANnGTSTCFG	<RSCANn_base> + 0468_H	RSCANn global
RSCANn	Global Test Control register	RSCANnGTSTCTR	<RSCANn_base> + $046C_H$	RSCANn global
	Global Lock Key register	RSCANnGLOCKK	<RSCANn_base> + $047C_H$	RSCANn global
	RAM Test Page Access register r	RSCANnRPGACCr	<RSCANn_base> + 1900_H + (04_H × r)	RSCANn global

Note: For details about Guard Group, see **Section 33, Functional Safety**.

21.4.2 Details of Channel-Related Registers

21.4.2.1 RSCANnCmCFG — Channel Configuration Register (m = 0 to 5)

Access: RSCANnCmCFG register can be read or written in 32-bit units
RSCANnCmCFGL, RSCANnCmCFGH registers can be read or written in 16-bit units
RSCANnCmCFGLL, RSCANnCmCFGLH, RSCANnCmCFGHL, RSCANnCmCFGHH registers can be read or written in 8-bit units

Address: RSCANnCmCFG: <RSCANn_base> + 0000_H + (10_H × m)

RSCANnCmCFGL: <RSCANn_base> + 0000_H + (10_H × m),
RSCANnCmCFGH: <RSCANn_base> + 0002_H + (10_H × m)

RSCANnCmCFGLL: <RSCANn_base> + 0000_H + (10_H × m),
RSCANnCmCFGLH: <RSCANn_base> + 0001_H + (10_H × m),
RSCANnCmCFGHL: <RSCANn_base> + 0002_H + (10_H × m),
RSCANnCmCFGHH: <RSCANn_base> + 0003_H + (10_H × m)

15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 0	BRP[9:0]	Prescaler Division Ratio Set When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.

Modify the RSCANnCmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before transitioning to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see **Section 21.11.1, Initial Settings**.

SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width. Allowed values are 1 Tq to 4 Tq, inclusive.
Set a value less than or equal to the value of the TSEG2 bits.

TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).
Allowed values are 2 Tq to 8 Tq, inclusive.
Set a value smaller than the value of the TSEG1 bits.

TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).
Allowed values are 4 Tq to 16 Tq, inclusive.

BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

21.4.2.2 RSCANnCmCTR — Channel Control Register (m = 0 to 5)

Access: RSCANnCmCTR register can be read or written in 32-bit units
RSCANnCmCTRL, RSCANnCmCTRH registers can be read or written in 16-bit units
RSCANnCmCTRLL, RSCANnCmCTRLH, RSCANnCmCTRHL, RSCANnCmCTRHH registers can be read or written in 8-bit units

Address: RSCANnCmCTR: <RSCANn_base> + 0004_H + (10_H × m)

RSCANnCmCTRL: <RSCANn_base> + 0004_H + (10_H × m),
RSCANnCmCTRH: <RSCANn_base> + 0006_H + (10_H × m)

RSCANnCmCTRLL: <RSCANn_base> + 0004_H + (10_H × m),
RSCANnCmCTRLH: <RSCANn_base> + 0005_H + (10_H × m),
RSCANnCmCTRHL: <RSCANn_base> + 0006_H + (10_H × m),
RSCANnCmCTRHH: <RSCANn_base> + 0007_H + (10_H × m)

Value after reset: $0000\ 0005_H$

8	BEIE	Bus Error Interrupt Enable 0: Bus error interrupt is disabled. 1: Bus error interrupt is enabled.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	RTBO	Forcible Return from Bus-off When this bit is set to 1, forcible return from the bus off state is made. This bit is always read as 0.
2	CSLPR	Channel Stop Mode 0: Other than channel stop mode 1: Channel stop mode
1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCANnCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCANnCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCANnGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCANnCmERFL register.
When this bit is clear to 0, if any error is detected while the flags of bits 14 to 8 in the RSCANnCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCANnCmCTR register (m = 0 to 5) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bits at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01_B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCANnCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCANnCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCANnCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCANnCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCANnCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCANnCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCANnCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCANnCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register to 00_H and also clears the BOSTS flag in the RSCANnCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCANnCmCTR register are 00_B (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RS-CANFD module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 21.7.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the RS-CANFD module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10_B.

21.4.2.3 RSCANnCmSTS — Channel Status Register (m = 0 to 5)

Access: RSCANnCmSTS register is a read-only register that can be read in 32-bit units
RSCANnCmSTSL, RSCANnCmSTSH registers are read-only registers that can be read in 16-bit units
RSCANnCmSTSLL, RSCANnCmSTSHL, RSCANnCmSTSHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnCmSTS: <RSCANn_base> + 0008_H + (10_H × m)

RSCANnCmSTSL: <RSCANn_base> + 0008_H + (10_H × m),
RSCANnCmSTSH: <RSCANn_base> + $000A_H$ + (10_H × m)

RSCANnCmSTSLL: <RSCANn_base> + 0008_H + (10_H × m),
RSCANnCmSTSHL: <RSCANn_base> + $000A_H$ + (10_H × m),
RSCANnCmSTSHH: <RSCANn_base> + $000B_H$ + (10_H × m)

Value after reset: $0000\ 0005_H$

Table 21.20 RSCANnCmSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 8	Reserved	When read, the value after reset is returned.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the RS-CANFD module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the RS-CANFD module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])). It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel stop mode, and is cleared to 0 when the RS-CANFD module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel halt mode, and is cleared to 0 when the RS-CANFD module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel reset mode, and is cleared to 0 when the RS-CANFD module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the RS-CANFD module transitions from channel reset mode to channel stop mode.

21.4.2.4 RSCANnCmERFL — Channel Error Flag Register (m = 0 to 5)

Access: RSCANnCmERFL register can be read or written in 32-bit units
RSCANnCmERFLL register can be read or written in 16-bit units
RSCANnCmERFLH register is a read-only register that can be read in 16-bit units
RSCANnCmERFLLL, RSCANnCmERFLLH registers can be read or written in 8-bit units
RSCANnCmERFLHL, RSCANnCmERFLHH registers are the read-only registers that can be read in 8-bit units

Address: RSCANnCmERFL: <RSCANn_base> + $000C_H$ + (10_H × m)

RSCANnCmERFLL: <RSCANn_base> + $000C_H$ + (10_H × m),
RSCANnCmERFLH: <RSCANn_base> + $000E_H$ + (10_H × m)

RSCANnCmERFLLL: <RSCANn_base> + $000C_H$ + (10_H × m),

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.21 RSCANnCmERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.

Table 21.21 RSCANnCmERFL Register Contents (2/2)

Bit Position	Bit Name	Function
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCANnCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCANnCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCANnCmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The RS-CANFD module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the RS-CANFD module returns from the bus off state. However, this flag is not set to 1 if the RS-CANFD module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCANnCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCANnCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCANnCmCTR register (m = 0 to 5) are set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127). This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCANnCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

21.4.3 Details of Global-Related Registers

21.4.3.1 RSCANnGCFG — Global Configuration Register

Access: RSCANnGCFG register can be read or written in 32-bit units
RSCANnGCFGL, RSCANnGCFGH registers can be read or written in 16-bit units
RSCANnGCFGLL, RSCANnGCFGLH, RSCANnGCFGHL, RSCANnGCFGHH registers can be read or written in 8-bit units

Address: RSCANnGCFG: <RSCANn_base> + 0084_H

RSCANnGCFGL: <RSCANn_base> + 0084_H,
RSCANnGCFGH: <RSCANn_base> + 0086_H

RSCANnGCFGLL: <RSCANn_base> + 0084_H,
RSCANnGCFGLH: <RSCANn_base> + 0085_H,
RSCANnGCFGHL: <RSCANn_base> + 0086_H,
RSCANnGCFGHH: <RSCANn_base> + 0087_H

Value after reset: $0000\ 0000_H$

6	EEFE	ECC Error Flag Enable 0: The ECC error flag is disabled. 1: The ECC error flag is enabled.
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Note 2. For the CAN clock frequency settings, see **Table 21.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

Modify the RSCANnGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 21.9.3.1, Interval Transmission Function**.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

TSSS Bit

This bit is used to select a clock source of the timestamp counter.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

TMTSCE Bit

Setting this bit to 1 makes it possible to store the timestamp of a transmitted message in the transmit history buffer. The timestamp is stored in TMTS[15:0] bits in the RSCANnTHLACCm register.

EEFE Bit

Setting this bit to 1 sets the EEFm bit in the RSCANnGERFL register to 1 when a 2-bit ECC error is detected during the transmission priority determination. At this time, the message in which a 2-bit ECC error was detected is not transmitted.

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 21.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCANnGAFLP0j register to 0000_B before clearing the DCE bit in the RSCANnGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

21.4.3.2 RSCANnGCTR — Global Control Register

Access: RSCANnGCTR register can be read or written in 32-bit units
RSCANnGCTRL, RSCANnGCTRH registers can be read or written in 16-bit units
RSCANnGCTRLL, RSCANnGCTRLH, RSCANnGCTRHL registers can be read or written in 8-bit units

Address: RSCANnGCTR: <RSCANn_base> + 0088_H

RSCANnGCTRL: <RSCANn_base> + 0088_H,
RSCANnGCTRH: <RSCANn_base> + $008A_H$

RSCANnGCTRLL: <RSCANn_base> + 0088_H,
RSCANnGCTRLH: <RSCANn_base> + 0089_H,
RSCANnGCTRHL: <RSCANn_base> + $008A_H$

Value after reset: $0000\ 0005_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.23 RSCANnGCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCANnGTSC register is cleared to 0000_H.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RS-CANFD module into global stop mode.
Clearing this bit to 0 makes the RS-CANFD module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 21.7.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

21.4.3.3 RSCANnGSTS — Global Status Register

Access: RSCANnGSTS register is a read-only register that can be read in 32-bit units
RSCANnGSTSL register is a read-only register that can be read in 16-bit units
RSCANnGSTSLL register is a read-only register that can be read in 8-bit units

Address: RSCANnGSTS: <RSCANn_base> + $008C_H$

RSCANnGSTSL: <RSCANn_base> + $008C_H$

RSCANnGSTSLL: <RSCANn_base> + $008C_H$

Value after reset: $0000\ 000D_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	GRAMINIT	GSLPSTS	GHLTSTS	GRSTSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.24 RSCANnGSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global stop mode, and is cleared to 0 when the RS-CANFD module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global test mode, and is cleared to 0 when the RS-CANFD module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global reset mode, and is cleared to 0 when the RS-CANFD module has exited global reset mode. This flag remains 1 even when the RS-CANFD module has transitioned from global reset mode to global stop mode.

21.4.3.4 RSCANnGERFL — Global Error Flag Register

Access: RSCANnGERFL register can be read or written in 32-bit units
RSCANnGERFLL, RSCANnGERFLH registers can be read or written in 16-bit units
RSCANnGERFLLL, RSCANnGERFLHL registers can be read or written in 8-bit units

Address: RSCANnGERFL: <RSCANn_base> + 0090_H

RSCANnGERFLL: <RSCANn_base> + 0090_H,
RSCANnGERFLH: <RSCANn_base> + 0092_H

RSCANnGERFLLL: <RSCANn_base> + 0090_H,
RSCANnGERFLHL: <RSCANn_base> + 0092_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	EEF5	EEF4	EEF3	EEF2	EEF1	EEF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.25 RSCANnGERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 22, 15, 14, 7, 6, 4, 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	EEF5	ECC Error Flag for Channel 5 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
20	EEF4	ECC Error Flag for Channel 4 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
19	EEF3	ECC Error Flag for Channel 3 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
18	EEF2	ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
17	EEF1	ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
16	EEF0	ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
13 to 8, 5	Reserved	When read, the undefined value is returned. When writing, write the value after reset.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.

Table 21.25 RSCANnGERFL Register Contents (2/2)

Bit Position	Bit Name	Function
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCANnGERFL register are cleared to 0 in global reset mode.

EEFm Flag

While the EEFE bit in the RSCANnGCFG register is 1, when a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 5), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCANnTHLSTSm register (m = 0 to 5) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCANnRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCANnCFSTSk register (k = 0 to 17) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

21.4.3.5 RSCANnGTSC — Global Timestamp Counter Register

Access: RSCANnGTSC register is a read-only register that can be read in 32-bit units.
RSCANnGTSCL register is a read-only register that can be read in 16-bit units.

Address: RSCANnGTSC: <RSCANn_base> + 0094_H

RSCANnGTSCL: <RSCANn_base> + 0094_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.26 RSCANnGTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer.

Furthermore, while the TMTSCE bit in the RSCANnGCFG register is 1, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter start timing and stop timing depend on the count source.

- When the TSSS bit in the RSCANnGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RS-CANFD module has transitioned to global operating mode.
  This counter stops counting when the RS-CANFD module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

21.4.3.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCANnGTINTSTS0 register is a read-only register that can be read in 32-bit units
RSCANnGTINTSTS0L, RSCANnGTINTSTS0H registers are read-only registers that can be read in 16-bit units
RSCANnGTINTSTS0LL, RSCANnGTINTSTS0LH, RSCANnGTINTSTS0HL, RSCANnGTINTSTS0HH registers are read-only registers that can be read in 8-bit units

Address: RSCANnGTINTSTS0: <RSCANn_base> + 0460_H

RSCANnGTINTSTS0L: <RSCANn_base> + 0460_H,
RSCANnGTINTSTS0H: <RSCANn_base> + 0462_H

RSCANnGTINTSTS0LL: <RSCANn_base> + 0460_H,
RSCANnGTINTSTS0LH: <RSCANn_base> + 0461_H,
RSCANnGTINTSTS0HL: <RSCANn_base> + 0462_H,
RSCANnGTINTSTS0HH: <RSCANn_base> + 0463_H

Value after reset: $0000\ 0000_H$

Table 21.27 RSCANnGTINTSTS0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned.
28	THIF3	Channel 3 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
27	CFTIF3	Channel 3 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
26	TQIF3	Channel 3 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
25	TAIF3	Channel 3 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested
24	TSIF3	Channel 3 Transmit Buffer Transmit Complete Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
23 to 21	Reserved	When read, the value after reset is returned.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.

Table 21.27 RSCANnGTINTSTS0 Register Contents (2/2)

Bit Position	Bit Name	Function
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	When read, the value after reset is returned.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	When read, the value after reset is returned.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the corresponding TMTRF[1:0] flags in the RSCAN0TMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When all TMTRF[1:0] flags that meet the condition to set the TSIFm bit to 1 are cleared to 00_B, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCAN0TMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when all TMTRF[1:0] flags that completed transmit abort are cleared to 00_B.

TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When all CFTXIF bits that meet the condition to set the CFTIFm bit to 1 are cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

21.4.3.7 RSCANnGTINTSTS1 — Global TX Interrupt Status Register 1

Access: RSCANnGTINTSTS1 register is a read-only register that can be read in 32-bit units
RSCANnGTINTSTS1L register is a read-only register that can be read in 16-bit units
RSCANnGTINTSTS1LL, RSCANnGTINTSTS1LH registers are read-only registers that can be read in 8-bit units

Address: RSCANnGTINTSTS1: <RSCANn_base> + 0464_H

RSCANnGTINTSTS1L: <RSCANn_base> + 0464_H

RSCANnGTINTSTS1LL: <RSCANn_base> + 0464_H,
RSCANnGTINTSTS1LH: <RSCANn_base> + 0465_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	THIF5	CFTIF5	TQIF5	TAIF5	TSIF5	—	—	—	THIF4	CFTIF4	TQIF4	TAIF4	TSIF4
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R*1	R*1	R*1	R*1	R*1	R	R	R	R*1	R*1	R*1	R*1	R*1

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 21.28 RSCANnGTINTSTS1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned.
12	THIF5	Channel 5 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF5	Channel 5 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF5	Channel 5 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF5	Channel 5 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF5	Channel 5 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	When read, the value after reset is returned.
4	THIF4	Channel 4 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF4	Channel 4 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF4	Channel 4 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF4	Channel 4 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.

Table 21.28 RSCANnGTINTSTS1 Register Contents (2/2)

Bit Position	Bit Name	Function
0	TSIF4	Channel 4 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the corresponding TMTRF[1:0] flags in the RSCAN0TMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When all TMTRF[1:0] flags that meet the condition to set the TSIFm bit to 1 are cleared to 00_B, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is set to 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when all TMTRF[1:0] flags that completed transmit abort are cleared to 00_B.

TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. Clearing the TXQIE bit to 0 also clears this flag to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When all CFTXIF bits that meet the condition to set the CFTIFm bit to 1 are cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0.

This flag is also cleared to 0 when the THLIE bit is cleared to 0.

21.4.3.8 RSCANnGFDCFG — Global FD Configuration Register

Access: RSCANnGFDCFG register can be read or written in 32-bit unit.
RSCANnGFDCFGL register can be read or written in 16-bit unit.
RSCANnGFDCFGLH register can be read or written in 8-bit unit.

Address: RSCANnGFDCFG: <RSCANn_base> + 0474_H

RSCANnGFDCFGL: <RSCANn_base> + 0474_H

RSCANnGFDCFGLH: <RSCANn_base> + 0475_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 21.29 RSCANnGFDCFG Register Content

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	TSCCFG[1:0]	Timestamp Capture Setting b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Setting prohibited 1 1: Setting prohibited
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	Reserved	When read, an undefined value is returned. The write value should be the value after reset.

TSCCFG[1:0] Bit

Select a point where a timestamp value is captured. Modify this bit only in global reset mode.

21.4.4 Details of Receive Rule-related Registers

21.4.4.1 RSCANnGAFLECTR — Receive Rule Entry Control Register

Access: RSCANnGAFLECTR register can be read or written in 32-bit units
RSCANnGAFLECTRL register can be read or written in 16-bit units
RSCANnGAFLECTRLL, RSCANnGAFLECTRLH registers can be read or written in 8-bit units

Address: RSCANnGAFLECTR: <RSCANn_base> + 0098_H

RSCANnGAFLECTRL: <RSCANn_base> + 0098_H

RSCANnGAFLECTRLL: <RSCANn_base> + 0098_H,
RSCANnGAFLECTRLH: <RSCANn_base> + 0099_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	AFLDAE	—	—	—	AFLPN[4:0]

R/W	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 21.30 RSCANnGAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected in the range of page 0 (00000_B) to page 23 (10111_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 10111_B.

21.4.4.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCANnGAFLCFG0 register can be read or written in 32-bit units
RSCANnGAFLCFG0L, RSCANnGAFLCFG0H registers can be read or written in 16-bit units
RSCANnGAFLCFG0LL, RSCANnGAFLCFG0LH, RSCANnGAFLCFG0HL, RSCANnGAFLCFG0HH registers can be read or written in 8-bit units

Address: RSCANnGAFLCFG0: <RSCANn_base> + $009C_H$

RSCANnGAFLCFG0L: <RSCANn_base> + $009C_H$,
RSCANnGAFLCFG0H: <RSCANn_base> + $009E_H$

RSCANnGAFLCFG0LL: <RSCANn_base> + $009C_H$,
RSCANnGAFLCFG0LH: <RSCANn_base> + $009D_H$,
RSCANnGAFLCFG0HL: <RSCANn_base> + $009E_H$,
RSCANnGAFLCFG0HH: <RSCANn_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RNC0[7:0]								RNC1[7:0]

	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RNC2[7:0]								RNC3[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.31 RSCANnGAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules exclusively used for channel 2.
7 to 0	RNC3[7:0]	Number of Rules for Channel 3 Set the number of receive rules exclusively used for channel 3.

Modify the RSCANnGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC3[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 3 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

21.4.4.3 RSCANnGAFLCFG1 — Receive Rule Configuration Register 1

Access: RSCANnGAFLCFG1 register can be read or written in 32-bit units
RSCANnGAFLCFG1H register can be read or written in 16-bit units
RSCANnGAFLCFG1HL, RSCANnGAFLCFG1HH registers can be read or written in 8-bit units

Address: RSCANnGAFLCFG1: <RSCANn_base> + $00A0_H$

RSCANnGAFLCFG1H: <RSCANn_base> + $00A2_H$

RSCANnGAFLCFG1HL: <RSCANn_base> + $00A2_H$,
RSCANnGAFLCFG1HH: <RSCANn_base> + $00A3_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.32 RSCANnGAFLCFG1 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC4[7:0]	Number of Rules for Channel 4 Set the number of receive rules exclusively used for channel 4.
23 to 16	RNC5[7:0]	Number of Rules for Channel 5 Set the number of receive rules exclusively used for channel 5.
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Modify the RSCANnGAFLCFG1 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC4[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 4 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC5[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 5 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

21.4.4.4 RSCANnGAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access: RSCANnGAFLIDj register can be read or written in 32-bit units
RSCANnGAFLIDjL, RSCANnGAFLIDjH registers can be read or written in 16-bit units
RSCANnGAFLIDjLL, RSCANnGAFLIDjLH, RSCANnGAFLIDjHL, RSCANnGAFLIDjHH registers can be read or written in 8-bit units

Address: RSCANnGAFLIDj: <RSCANn_base> + 0500_H + (10_H × j)

RSCANnGAFLIDjL: <RSCANn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjH: <RSCANn_base> + 0502_H + (10_H × j)

RSCANnGAFLIDjLL: <RSCANn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjLH: <RSCANn_base> + 0501_H + (10_H × j),
RSCANnGAFLIDjHL: <RSCANn_base> + 0502_H + (10_H × j),
RSCANnGAFLIDjHH: <RSCANn_base> + 0503_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Table 21.33 RSCANnGAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCANnGAFLIDj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

21.4.4.5 RSCANnGAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access: RSCANnGAFLMj register can be read or written in 32-bit units
RSCANnGAFLMjL, RSCANnGAFLMjH registers can be read or written in 16-bit units
RSCANnGAFLMjLL, RSCANnGAFLMjLH, RSCANnGAFLMjHL, RSCANnGAFLMjHH registers can be read or written in 8-bit units

Address: RSCANnGAFLMj: <RSCANn_base> + 0504_H + (10_H × j)

RSCANnGAFLMjL: <RSCANn_base> + 0504_H + (10_H × j),
RSCANnGAFLMjH: <RSCANn_base> + 0506_H + (10_H × j)

RSCANnGAFLMjLL: <RSCANn_base> + 0504_H + (10_H × j),
RSCANnGAFLMjLH: <RSCANn_base> + 0505_H + (10_H × j),
RSCANnGAFLMjHL: <RSCANn_base> + 0506_H + (10_H × j),
RSCANnGAFLMjHH: <RSCANn_base> + 0507_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDEM	GAFLRTRM	—	GAFLIDM[28:16]

Table 21.34 RSCANnGAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared
29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCANnGAFLMj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCANnGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

21.4.4.6 RSCANnGAFLP0j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCANnGAFLP0j register can be read or written in 32-bit units
RSCANnGAFLP0jL, RSCANnGAFLP0jH registers can be read or written in 16-bit units
RSCANnGAFLP0jLH, RSCANnGAFLP0jHL, RSCANnGAFLP0jHH registers can be read or written in 8-bit units

Address: RSCANnGAFLP0j: <RSCANn_base> + 0508_H + (10_H × j)

RSCANnGAFLP0jL: <RSCANn_base> + 0508_H + (10_H × j),
RSCANnGAFLP0jH: <RSCANn_base> + $050A_H$ + (10_H × j)

RSCANnGAFLP0jLH: <RSCANn_base> + 0509_H + (10_H × j),
RSCANnGAFLP0jHL: <RSCANn_base> + $050A_H$ + (10_H × j),
RSCANnGAFLP0jHH: <RSCANn_base> + $050B_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.35 RSCANnGAFLP0j Register Contents

Bit Position	Bit Name	Function
31 to 28	GAFLDLC[3:0]	Receive Rule DLC b31 b30 b29 b28 0 0 0 0: DLC check is disabled. 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	GAFLPTR[11:0]	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Modify the RSCANnGAFLP0j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCANnRMNB register.

21.4.4.7 RSCANnGAFLP1j — Receive Rule Pointer 1 Register (j = 0 to 15)

Access: RSCANnGAFLP1j register can be read or written in 32-bit units
RSCANnGAFLP1jL, RSCANnGAFLP1jH registers can be read or written in 16-bit units
RSCANnGAFLP1jLL, RSCANnGAFLP1jLH, RSCANnGAFLP1jHL, RSCANnGAFLP1jHH registers can be read or written in 8-bit units

Address: RSCANnGAFLP1j: <RSCANn_base> + $050C_H$ + (10_H × j)

RSCANnGAFLP1jL: <RSCANn_base> + $050C_H$ + (10_H × j),
RSCANnGAFLP1jH: <RSCANn_base> + $050E_H$ + (10_H × j)

RSCANnGAFLP1jLL: <RSCANn_base> + $050C_H$ + (10_H × j),
RSCANnGAFLP1jLH: <RSCANn_base> + $050D_H$ + (10_H × j),
RSCANnGAFLP1jHL: <RSCANn_base> + $050E_H$ + (10_H × j),
RSCANnGAFLP1jHH: <RSCANn_base> + $050F_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	GAFLFDP[25:16]

Table 21.36 RSCANnGAFLP1j Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25 to 8	GAFLFDP[25:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCANnGAFLP1j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[25:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCANnGAFLP0j register is set to 1 (messages are stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCANnCFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) can be selected.

21.4.5 Details of Receive Buffer-Related Registers

21.4.5.1 RSCANnRMNB — Receive Buffer Number Register

Access: RSCANnRMNB register can be read or written in 32-bit units
RSCANnRMNBL register can be read or written in 16-bit units
RSCANnRMNBLL register can be read or written in 8-bit units

Address: RSCANnRMNB: <RSCANn_base> + $00A4_H$
RSCANnRMNBL: <RSCANn_base> + $00A4_H$
RSCANnRMNBLL: <RSCANn_base> + $00A4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.37 RSCANnRMNB Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 96.

Modify the RSCANnRMNB register only in global reset mode.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

21.4.5.2 RSCANnRMNDy — Receive Buffer New Data Register (y = 0 to 2)

Access: RSCANnRMNDy register can be read or written in 32-bit units
RSCANnRMNDyL, RSCANnRMNDyH registers can be read or written in 16-bit units
RSCANnRMNDyLL, RSCANnRMNDyLH, RSCANnRMNDyHL, RSCANnRMNDyHH registers can be read or written in 8-bit units

Address: RSCANnRMNDy: <RSCANn_base> + $00A8_H$ + (04_H × y)

RSCANnRMNDyL: <RSCANn_base> + $00A8_H$ + (04_H × y),
RSCANnRMNDyH: <RSCANn_base> + $00AA_H$ + (04_H × y)

RSCANnRMNDyLL: <RSCANn_base> + $00A8_H$ + (04_H × y),
RSCANnRMNDyLH: <RSCANn_base> + $00A9_H$ + (04_H × y),
RSCANnRMNDyHL: <RSCANn_base> + $00AA_H$ + (04_H × y),
RSCANnRMNDyHH: <RSCANn_base> + $00AB_H$ + (04_H × y)

Value after reset: $0000\ 0000_H$

Table 21.38 RSCANnRMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCANnRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 95)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message.

These flags are cleared to 0 in global reset mode.

21.4.5.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 95)

Access: RSCANnRMIDq register is a read-only register that can be read in 32-bit units
RSCANnRMIDqL, RSCANnRMIDqH registers are read-only registers that can be read in 16-bit units
RSCANnRMIDqLL, RSCANnRMIDqLH, RSCANnRMIDqHL, RSCANnRMIDqHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnRMIDq: <RSCANn_base> + 0600_H + (10_H × q)

RSCANnRMIDqL: <RSCANn_base> + 0600_H + (10_H × q),
RSCANnRMIDqH: <RSCANn_base> + 0602_H + (10_H × q)

RSCANnRMIDqLL: <RSCANn_base> + 0600_H + (10_H × q),
RSCANnRMIDqLH: <RSCANn_base> + 0601_H + (10_H × q),
RSCANnRMIDqHL: <RSCANn_base> + 0602_H + (10_H × q),

31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	When read, the value after reset is returned.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

21.4.5.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 95)

Access: RSCANnRMPTRq register is a read-only register that can be read in 32-bit units
RSCANnRMPTRqL, RSCANnRMPTRqH registers are read-only registers that can be read in 16-bit units
RSCANnRMPTRqLL, RSCANnRMPTRqLH, RSCANnRMPTRqHL, RSCANnRMPTRqHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnRMPTRq: <RSCANn_base> + 0604_H + (10_H × q)

RSCANnRMPTRqL: <RSCANn_base> + 0604_H + (10_H × q),
RSCANnRMPTRqH: <RSCANn_base> + 0606_H + (10_H × q)

RSCANnRMPTRqLL: <RSCANn_base> + 0604_H + (10_H × q),
RSCANnRMPTRqLH: <RSCANn_base> + 0605_H + (10_H × q),
RSCANnRMPTRqHL: <RSCANn_base> + 0606_H + (10_H × q),
RSCANnRMPTRqHH: <RSCANn_base> + 0607_H + (10_H × q)

Value after reset: $0000\ 0000_H$

15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

21.4.5.5 RSCANnRMDF0q — Receive Buffer Data Field 0 Register (q = 0 to 95)

Access: RSCANnRMDF0q register is a read-only register that can be read in 32-bit units
RSCANnRMDF0qL, RSCANnRMDF0qH registers are read-only registers that can be read in 16-bit units
RSCANnRMDF0qLL, RSCANnRMDF0qLH, RSCANnRMDF0qHL, RSCANnRMDF0qHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnRMDF0q: <RSCANn_base> + 0608_H + (10_H × q)

RSCANnRMDF0qL: <RSCANn_base> + 0608_H + (10_H × q),
RSCANnRMDF0qH: <RSCANn_base> + $060A_H$ + (10_H × q)

Table 21.42 RSCANnRMDF1q Register Contents

Bit Position	Bit Name	Function
31 to 24	RMDB7[7:0]	Receive Buffer Data Byte 7
23 to 16	RMDB6[7:0]	Receive Buffer Data Byte 6
15 to 8	RMDB5[7:0]	Receive Buffer Data Byte 5
7 to 0	RMDB4[7:0]	Receive Buffer Data Byte 4 Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

21.4.6 Details of Receive FIFO Buffer-Related Registers

21.4.6.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access: RSCANnRFCCx register can be read or written in 32-bit units
RSCANnRFCCxL register can be read or written in 16-bit units
RSCANnRFCCxLL, RSCANnRFCCxLH registers can be read or written in 8-bit units

Address: RSCANnRFCCx: <RSCANn_base> + $00B8_H$ + (04_H × x)

RSCANnRFCCxL: <RSCANn_base> + $00B8_H$ + (04_H × x)

RSCANnRFCCxLL: <RSCANn_base> + $00B8_H$ + (04_H × x),
RSCANnRFCCxLH: <RSCANn_base> + $00B9_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Table 21.43 RSCANnRFCCx Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 21.43 RSCANnRFCCx Register Contents (2/2)

Bit Position	Bit Name	Function
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCANnRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCCx register have been done.

This bit is cleared to 0 in global reset mode.

21.4.6.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access: RSCANnRFSTSx register can be read or written in 32-bit units
RSCANnRFSTSxL register can be read or written in 16-bit units
RSCANnRFSTSxLL register can be read or written in 8-bit units
RSCANnRFSTSxLH register is a read-only register that can be read in 8-bit units

Address: RSCANnRFSTSx: <RSCANn_base> + $00D8_H$ + (04_H × x)

RSCANnRFSTSxL: <RSCANn_base> + $00D8_H$ + (04_H × x)

RSCANnRFSTSxLL: <RSCANn_base> + $00D8_H$ + (04_H × x),
RSCANnRFSTSxLH: <RSCANn_base> + $00D9_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.44 RSCANnRFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCANnRFCCx register is set to 0.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCANnRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCANnRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCANnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCANnRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

21.4.6.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access: RSCANnRFPCTRx register is a write-only register that can be written in 32-bit units
RSCANnRFPCTRxL register is a write-only register that can be written in 16-bit units
RSCANnRFPCTRxLL register is a write-only register that can be written in 8-bit units

Address: RSCANnRFPCTRx: <RSCANn_base> + $00F8_H$ + (04_H × x)

RSCANnRFPCTRxL: <RSCANn_base> + $00F8_H$ + (04_H × x)

RSCANnRFPCTRxLL: <RSCANn_base> + $00F8_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 21.45 RSCANnRFPCTRx Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCANnRFSTSx register is decremented. Read the RSCANnRFIDx, RSCANnRFPTRx, RSCANnRFDF0x, and RSCANnRFDF1x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCANnRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCANnRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

21.4.6.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access: RSCANnRFIDx register is a read-only register that can be read in 32-bit units
RSCANnRFIDxL, RSCANnRFIDxH registers are read-only registers that can be read in 16-bit units
RSCANnRFIDxLL, RSCANnRFIDxLH, RSCANnRFIDxHL, RSCANnRFIDxHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnRFIDx: <RSCANn_base> + $0E00_H$ + (10_H × x)

RSCANnRFIDxL: <RSCANn_base> + $0E00_H$ + (10_H × x),
RSCANnRFIDxH: <RSCANn_base> + $0E02_H$ + (10_H × x)

RSCANnRFIDxLL: <RSCANn_base> + $0E00_H$ + (10_H × x),
RSCANnRFIDxLH: <RSCANn_base> + $0E01_H$ + (10_H × x),
RSCANnRFIDxHL: <RSCANn_base> + $0E02_H$ + (10_H × x),

Table 21.46 RSCANnRFIDx Register Contents

Bit Position	Bit Name	Function
31	RFIDE	Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	RFRTR	Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	When read, the value after reset is returned.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

21.4.6.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access: RSCANnRFPTRx register is a read-only register that can be read in 32-bit units
RSCANnRFPTRxL, RSCANnRFPTRxH registers are read-only registers that can be read in 16-bit units
RSCANnRFPTRxLL, RSCANnRFPTRxLH, RSCANnRFPTRxHL, RSCANnRFPTRxHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnRFPTRx: <RSCANn_base> + $0E04_H$ + (10_H × x)

RSCANnRFPTRxL: <RSCANn_base> + $0E04_H$ + (10_H × x),
RSCANnRFPTRxH: <RSCANn_base> + $0E06_H$ + (10_H × x)

RSCANnRFPTRxLL: <RSCANn_base> + $0E04_H$ + (10_H × x),
RSCANnRFPTRxLH: <RSCANn_base> + $0E05_H$ + (10_H × x),
RSCANnRFPTRxHL: <RSCANn_base> + $0E06_H$ + (10_H × x),
RSCANnRFPTRxHH: <RSCANn_base> + $0E07_H$ + (10_H × x)

15 to 0	RFTS[15:0]	Receive FIFO Buffer Timestamp Data Timestamp value of the received message can be read.

RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

21.4.6.6 RSCANnRFDF0x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7)

Access: RSCANnRFDF0x register is a read-only register that can be read in 32-bit units
RSCANnRFDF0xL, RSCANnRFDF0xH registers are read-only registers that can be read in 16-bit units
RSCANnRFDF0xLL, RSCANnRFDF0xLH, RSCANnRFDF0xHL, RSCANnRFDF0xHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnRFDF0x: <RSCANn_base> + $0E08_H$ + (10_H × x)

RSCANnRFDF0xL: <RSCANn_base> + $0E08_H$ + (10_H × x),
RSCANnRFDF0xH: <RSCANn_base> + $0E0A_H$ + (10_H × x)

15 to 8	RFDB5[7:0]	Receive FIFO Buffer Data Byte 5
7 to 0	RFDB4[7:0]	Receive FIFO Buffer Data Byte 4 Data for a message stored in the receive FIFO buffer can be read.

When the RFDLC[3:0] value in the RSCANnRFPTRx register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

21.4.7 Details of Transmit/Receive FIFO Buffer-Related Registers

21.4.7.1 RSCANnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 17)

Access: RSCANnCFCCk register can be read or written in 32-bit units
RSCANnCFCCkL, RSCANnCFCCkH registers can be read or written in 16-bit units
RSCANnCFCCkLL, RSCANnCFCCkLH, RSCANnCFCCkHL, RSCANnCFCCkHH registers can be read or written in 8-bit units

Address: RSCANnCFCCk: <RSCANn_base> + 0118_H + (04_H × k)

RSCANnCFCCkL: <RSCANn_base> + 0118_H + (04_H × k),
RSCANnCFCCkH: <RSCANn_base> + $011A_H$ + (04_H × k)

RSCANnCFCCkLL: <RSCANn_base> + 0118_H + (04_H × k),
RSCANnCFCCkLH: <RSCANn_base> + 0119_H + (04_H × k),
RSCANnCFCCkHL: <RSCANn_base> + $011A_H$ + (04_H × k),

Table 21.50 RSCANnCFCCk Register Contents (2/2)

Bit Position	Bit Name	Function
12	CFIM	Transmit/Receive FIFO Interrupt Source Select 0: • Receive mode/gateway mode When the number of received messages has met the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. • Transmit mode/gateway mode When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. 1: • Receive mode/gateway mode A FIFO receive interrupt request is generated each time a message has been received. • Transmit mode/gateway mode A FIFO transmit interrupt request is generated each time a message has been transmitted.
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	CFDC[2:0]	Transmit/Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 21.15** and **Table 21.16**, for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register × 10.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using another instruction.

21.4.7.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 17)

Access: RSCANnCFSTSk register can be read or written in 32-bit units
RSCANnCFSTSkL register can be read or written in 16-bit units
RSCANnCFSTSkLL register can be read or written in 8-bit units
RSCANnCFSTSkLH register is a read-only register that can be read in 8-bit units

Address: RSCANnCFSTSk: <RSCANn_base> + 0178_H + (04_H × k)

RSCANnCFSTSkL: <RSCANn_base> + 0178_H + (04_H × k)

RSCANnCFSTSkLL: <RSCANn_base> + 0178_H + (04_H × k),
RSCANnCFSTSkLH: <RSCANn_base> + 0179_H + (04_H × k)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CFMC[7:0]								—	—	—	CFTXIF	CFRXIF	CFMLT	CFFLL	CFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.51 RSCANnCFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCANnCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer

- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag

- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCANnCFCCk register.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCANnCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not performing the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCANnCFPCTRk register after data was written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0k, and RSCANnCFDF1k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

21.4.7.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 17)

Access: RSCANnCFPCTRk register is a write-only register that can be written in 32-bit units
RSCANnCFPCTRkL register is a write-only register that can be written in 16-bit units
RSCANnCFPCTRkLL register is a write-only register that can be written in 8-bit units

Address: RSCANnCFPCTRk: <RSCANn_base> + $01D8_H$ + (04_H × k)

RSCANnCFPCTRkL: <RSCANn_base> + $01D8_H$ + (04_H × k)

RSCANnCFPCTRkLL: <RSCANn_base> + $01D8_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

Table 21.52 RSCANnCFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCANnCFCCk register is 00_B):
  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCANnCFSTSk register is decremented. Read the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0k, and RSCANnCFDF1k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCANnCFCCk register is 01_B):
  Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0k, and RSCANnCFDF1k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0k, and RSCANnCFDF1k registers before writing FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 and the CFFLL flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCANnCFCCk register is 10_B):
  Setting prohibited

21.4.7.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 17)

Access: RSCANnCFIDk register can be read or written in 32-bit units
RSCANnCFIDkL, RSCANnCFIDkH registers can be read or written in 16-bit units
RSCANnCFIDkLL, RSCANnCFIDkLH, RSCANnCFIDkHL, RSCANnCFIDkHH registers can be read or written in 8-bit units

Address: RSCANnCFIDk: <RSCANn_base> + $0E80_H$ + (10_H × k)

RSCANnCFIDkL: <RSCANn_base> + $0E80_H$ + (10_H × k),
RSCANnCFIDkH: <RSCANn_base> + $0E82_H$ + (10_H × k)

RSCANnCFIDkLL: <RSCANn_base> + $0E80_H$ + (10_H × k),
RSCANnCFIDkLH: <RSCANn_base> + $0E81_H$ + (10_H × k),
RSCANnCFIDkHL: <RSCANn_base> + $0E82_H$ + (10_H × k),
RSCANnCFIDkHH: <RSCANn_base> + $0E83_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Table 21.53 RSCANnCFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This RSCANnCFIDk register should not be accessed when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

21.4.7.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 17)

Access: RSCANnCFPTRk register can be read or written in 32-bit units
RSCANnCFPTRkL, RSCANnCFPTRkH registers can be read or written in 16-bit units
RSCANnCFPTRkLL, RSCANnCFPTRkLH, RSCANnCFPTRkHL, RSCANnCFPTRkHH registers can be read or written in 8-bit units

Address: RSCANnCFPTRk: <RSCANn_base> + $0E84_H$ + (10_H × k)

RSCANnCFPTRkL: <RSCANn_base> + $0E84_H$ + (10_H × k),
RSCANnCFPTRkH: <RSCANn_base> + $0E86_H$ + (10_H × k)

RSCANnCFPTRkLL: <RSCANn_base> + $0E84_H$ + (10_H × k),
RSCANnCFPTRkLH: <RSCANn_base> + $0E85_H$ + (10_H × k),
RSCANnCFPTRkHL: <RSCANn_base> + $0E86_H$ + (10_H × k),
RSCANnCFPTRkHH: <RSCANn_base> + $0E87_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Table 21.54 RSCANnCFPTRk Register Contents

Bit Position	Bit Name	Function
31 to 28	CFDLC[3:0]	Transmit/Receive FIFO Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 1001_B or more, the actual transmit data defaults to 8 bytes.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

21.4.7.6 RSCANnCFDF0k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 17)

Access: RSCANnCFDF0k register can be read or written in 32-bit units
RSCANnCFDF0kL, RSCANnCFDF0kH registers can be read or written in 16-bit units
RSCANnCFDF0kLL, RSCANnCFDF0kLH, RSCANnCFDF0kHL, RSCANnCFDF0kHH registers can be read or written in 8-bit units

Address: RSCANnCFDF0k: <RSCANn_base> + $0E88_H$ + (10_H × k)

RSCANnCFDF0kL: <RSCANn_base> + $0E88_H$ + (10_H × k),
RSCANnCFDF0kH: <RSCANn_base> + $0E8A_H$ + (10_H × k)

RSCANnCFDF0kLL: <RSCANn_base> + $0E88_H$ + (10_H × k),
RSCANnCFDF0kLH: <RSCANn_base> + $0E89_H$ + (10_H × k),

Table 21.56 RSCANnCFDF1k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB7[7:0]	Transmit/Receive FIFO Buffer Data Byte 7
23 to 16	CFDB6[7:0]	Transmit/Receive FIFO Buffer Data Byte 6
15 to 8	CFDB5[7:0]	Transmit/Receive FIFO Buffer Data Byte 5
7 to 0	CFDB4[7:0]	Transmit/Receive FIFO Buffer Data Byte 4 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode).

This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

21.4.8 Details of FIFO Status-Related Registers

21.4.8.1 RSCANnFESTS — FIFO Empty Status Register

Access: RSCANnFESTS register is a read-only register that can be read in 32-bit units
RSCANnFESTSL, RSCANnFESTSH registers are read-only registers that can be read in 16-bit units
RSCANnFESTSLL, RSCANnFESTSLH, RSCANnFESTSHL, RSCANnFESTSHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnFESTS: <RSCANn_base> + 0238_H

RSCANnFESTSL: <RSCANn_base> + 0238_H,
RSCANnFESTSH: <RSCANn_base> + $023A_H$

RSCANnFESTSLL: <RSCANn_base> + 0238_H,
RSCANnFESTSLH: <RSCANn_base> + 0239_H,
RSCANnFESTSHL: <RSCANn_base> + $023A_H$,
RSCANnFESTSHH: <RSCANn_base> + $023B_H$

Value after reset: $03FF\ FFFF_H$

Table 21.57 RSCANnFESTS Register Contents (2/2)

Bit Position	Bit Name	Function
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCANnFESTS register is set to 03FF $FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 17)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

21.4.8.2 RSCANnFFSTS — FIFO Full Status Register

Access: RSCANnFFSTS register is a read-only register that can be read in 32-bit units
RSCANnFFSTSL, RSCANnFFSTSH registers are read-only registers that can be read in 16-bit units
RSCANnFFSTSLL, RSCANnFFSTSLH, RSCANnFFSTSHL, RSCANnFFSTSHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnFFSTS: <RSCANn_base> + $023C_H$

RSCANnFFSTSL: <RSCANn_base> + $023C_H$,
RSCANnFFSTSH: <RSCANn_base> + $023E_H$

10	CF2FLL	
9	CF1FLL	
8	CF0FLL	

Table 21.58 RSCANnFFSTS Register Contents (2/2)

Bit Position	Bit Name	Function
7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCANnFFSTS register is cleared to 0000 0000_H in global reset mode.

CFkFLL Flag (k = 0 to 17)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).
When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

21.4.8.3 RSCANnFMSTS — FIFO Message Lost Status Register

Access: RSCANnFMSTS register is a read-only register that can be read in 32-bit units
RSCANnFMSTSL, RSCANnFMSTSH registers are read-only registers that can be read in 16-bit units
RSCANnFMSTSLL, RSCANnFMSTSLH, RSCANnFMSTSHL, RSCANnFMSTSHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnFMSTS: <RSCANn_base> + 0240_H

RSCANnFMSTSL: <RSCANn_base> + 0240_H,
RSCANnFMSTSH: <RSCANn_base> + 0242_H

RSCANnFMSTSLL: <RSCANn_base> + 0240_H,
RSCANnFMSTSLH: <RSCANn_base> + 0241_H,
RSCANnFMSTSHL: <RSCANn_base> + 0242_H,
RSCANnFMSTSHH: <RSCANn_base> + 0243_H

Value after reset: $0000\ 0000_H$

5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCANnFMSTS register is cleared to 0000 0000_H in global reset mode.

CFkMLT Flag (k = 0 to 17)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

21.4.8.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCANnRFISTS register is a read-only register that can be read in 32-bit units
RSCANnRFISTSL register is a read-only register that can be read in 16-bit units
RSCANnRFISTSLL register is a read-only register that can be read in 8-bit units

Address: RSCANnRFISTS: <RSCANn_base> + 0244_H

RSCANnRFISTSL: <RSCANn_base> + 0244_H

RSCANnRFISTSLL: <RSCANn_base> + 0244_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.60 RSCANnRFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCANnRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

21.4.8.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCANnCFRISTS register is a read-only register that can be read in 32-bit units
RSCANnCFRISTSL, RSCANnCFRISTSH registers are read-only registers that can be read in 16-bit units
RSCANnCFRISTSLL, RSCANnCFRISTSLH, RSCANnCFRISTSHL registers are read-only registers that can be read in 8-bit units

Address: RSCANnCFRISTS: <RSCANn_base> + 0248_H

RSCANnCFRISTSL: <RSCANn_base> + 0248_H,
RSCANnCFRISTSH: <RSCANn_base> + $024A_H$

RSCANnCFRISTSLL: <RSCANn_base> + 0248_H,
RSCANnCFRISTSLH: <RSCANn_base> + 0249_H,
RSCANnCFRISTSHL: <RSCANn_base> + $024A_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF17RXIF	CF16RXIF

5	CF5RXIF	
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCANnCFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkRXIF Flag (k = 0 to 17)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

21.4.8.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCANnCFTISTS register is a read-only register that can be read in 32-bit units
RSCANnCFTISTSL, RSCANnCFTISTSH registers are read-only registers that can be read in 16-bit units
RSCANnCFTISTSLL, RSCANnCFTISTSLH, RSCANnCFTISTSHL registers are read-only registers that can be read in 8-bit units

Address: RSCANnCFTISTS: <RSCANn_base> + $024C_H$

RSCANnCFTISTSL: <RSCANn_base> + $024C_H$,
RSCANnCFTISTSH: <RSCANn_base> + $024E_H$

RSCANnCFTISTSLL: <RSCANn_base> + $024C_H$,
RSCANnCFTISTSLH: <RSCANn_base> + $024D_H$,
RSCANnCFTISTSHL: <RSCANn_base> + $024E_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF17TXIF	CF16TXIF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.62 RSCANnCFTISTS Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned.
17	CF17TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 17)
16	CF16TXIF	
15	CF15TXIF	
14	CF14TXIF	
13	CF13TXIF	
12	CF12TXIF	
11	CF11TXIF	
10	CF10TXIF	
9	CF9TXIF	
8	CF8TXIF	
7	CF7TXIF	
6	CF6TXIF	
5	CF5TXIF	
4	CF4TXIF	
3	CF3TXIF	
2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCANnCFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkTXIF Flag (k = 0 to 17)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

21.4.9 Details of Transmit Buffer-Related Registers

21.4.9.1 RSCANnTMCp — Transmit Buffer Control Register (p = 0 to 95)

Access: RSCANnTMCp register can be read or written in 8-bit units

Address: RSCANnTMCp: <RSCANn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 21.63 RSCANnTMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCANnTMCp register meets any of the following conditions, set it to 00_H.

- The RSCANnTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCANnCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCANnTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCANnTXQCCm (m = 0 to 5) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).

Bits in the RSCANnTMCp register are all cleared to 0 in channel reset mode. Modify the RSCANnTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCANnTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCANnTMSTSp register is 00_B.

21.4.9.2 RSCANnTMSTSp — Transmit Buffer Status Register (p = 0 to 95)

Access: RSCANnTMSTSp register can be read or written in 8-bit units

Address: RSCANnTMSTSp: <RSCANn_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 21.64 RSCANnTMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCANnTMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCANnTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCANnTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCANnTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCANnTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

21.4.9.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 95)

Access: RSCANnTMIDp register can be read or written in 32-bit units
RSCANnTMIDpL, RSCANnTMIDpH registers can be read or written in 16-bit units
RSCANnTMIDpLL, RSCANnTMIDpLH, RSCANnTMIDpHL, RSCANnTMIDpHH registers can be read or written in 8-bit units

Address: RSCANnTMIDp: <RSCANn_base> + 1000_H + (10_H × p)

RSCANnTMIDpL: <RSCANn_base> + 1000_H + (10_H × p),
RSCANnTMIDpH: <RSCANn_base> + 1002_H + (10_H × p)

RSCANnTMIDpLL: <RSCANn_base> + 1000_H + (10_H × p),
RSCANnTMIDpLH: <RSCANn_base> + 1001_H + (10_H × p),
RSCANnTMIDpHL: <RSCANn_base> + 1002_H + (10_H × p),
RSCANnTMIDpHH: <RSCANn_base> + 1003_H + (10_H × p)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMIDE	TMRTR	THLEN	TMID[28:16]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	TMID[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.65 RSCANnTMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type, and timestamp (timestamp is included if the TMTSCE bit in the RSCANnGCFG register is 1)) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

21.4.9.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 95)

Access: RSCANnTMPTRp register can be read or written in 32-bit units
RSCANnTMPTRpH register can be read or written in 16-bit units
RSCANnTMPTRpHL, RSCANnTMPTRpHH registers can be read or written in 8-bit units

Address: RSCANnTMPTRp: <RSCANn_base> + 1004_H + (10_H × p)

RSCANnTMPTRpH: <RSCANn_base> + 1006_H + (10_H × p)

RSCANnTMPTRpHL: <RSCANn_base> + 1006_H + (10_H × p),
RSCANnTMPTRpHH: <RSCANn_base> + 1007_H + (10_H × p)

Value after reset: $0000\ 0000_H$

Table 21.66 RSCANnTMPTRp Register Contents

Bit Position	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCANnTMIDp register is set to 0 (data frame). If the data length is set to 1001_B or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), set the data length of messages to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

21.4.9.5 RSCANnTMDF0p — Transmit Buffer Data Field 0 Register (p = 0 to 95)

Access: RSCANnTMDF0p register can be read or written in 32-bit units
RSCANnTMDF0pL, RSCANnTMDF0pH registers can be read or written in 16-bit units
RSCANnTMDF0pLL, RSCANnTMDF0pLH, RSCANnTMDF0pHL, RSCANnTMDF0pHH registers can be read or written in 8-bit units

Address: RSCANnTMDF0p: <RSCANn_base> + 1008_H + (10_H × p)

RSCANnTMDF0pL: <RSCANn_base> + 1008_H + (10_H × p),
RSCANnTMDF0pH: <RSCANn_base> + $100A_H$ + (10_H × p)

RSCANnTMDF0pLL: <RSCANn_base> + 1008_H + (10_H × p),
RSCANnTMDF0pLH: <RSCANn_base> + 1009_H + (10_H × p),
RSCANnTMDF0pHL: <RSCANn_base> + $100A_H$ + (10_H × p),
RSCANnTMDF0pHH: <RSCANn_base> + $100B_H$ + (10_H × p)

Value after reset: $0000\ 0000_H$

Table 21.69 RSCANnTMIECy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 95)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCANnTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

Table 21.70 shows the bit assignment.

21.4.10 Details of Transmit Buffer Status-Related Registers

21.4.10.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0 to 2)

Access: RSCANnTMTRSTSy register is a read-only register that can be read in 32-bit units
RSCANnTMTRSTSyL, RSCANnTMTRSTSyH registers are read-only registers that can be read in 16-bit units
RSCANnTMTRSTSyLL, RSCANnTMTRSTSyLH, RSCANnTMTRSTSyHL, RSCANnTMTRSTSyHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnTMTRSTSy: <RSCANn_base> + 0350_H + (04_H × y)

RSCANnTMTRSTSyL: <RSCANn_base> + 0350_H + (04_H × y),
RSCANnTMTRSTSyH: <RSCANn_base> + 0352_H + (04_H × y)

RSCANnTMTRSTSyLL: <RSCANn_base> + 0350_H + (04_H × y),
RSCANnTMTRSTSyLH: <RSCANn_base> + 0351_H + (04_H × y),
RSCANnTMTRSTSyHL: <RSCANn_base> + 0352_H + (04_H × y),
RSCANnTMTRSTSyHH: <RSCANn_base> + 0353_H + (04_H × y)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMTRSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0, 1, 2))

Table 21.71 RSCANnTMTRSTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 95)

These flags indicate the status of the TMTR bit in the RSCANnTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 21.72 shows the bit assignment.

Table 21.77 RSCANnTMTASTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTASTSp	Transmit Buffer Transmit Abort Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: Transmission is not aborted 1: Transmission is aborted
15 to 0	TMTASTSp	Transmit Buffer Transmit Abort Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: Transmission is not aborted. 1: Transmission is aborted.

TMTASTSp Flags (p = 0 to 95)

When the TMTRF[1:0] flag in the RSCANnTMSTSp register is set to 01_B (transmit abort has been completed), the corresponding TMTASTSp flag is set to 1.

A TMTASTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to 00_B or in channel reset mode.

Table 21.78 shows the bit assignment.

21.4.11 Details of Transmit Queue-Related Registers

21.4.11.1 RSCANnTXQCCm — Transmit Queue Configuration and Control Register (m = 0 to 5)

Access: RSCANnTXQCCm register can be read or written in 32-bit units
RSCANnTXQCCmL register can be read or written in 16-bit units
RSCANnTXQCCmLL, RSCANnTXQCCmLH registers can be read or written in 8-bit units

Address: RSCANnTXQCCm: <RSCANn_base> + $03A0_H$ + (04_H × m)

RSCANnTXQCCmL: <RSCANn_base> + $03A0_H$ + (04_H × m)

RSCANnTXQCCmLL: <RSCANn_base> + $03A0_H$ + (04_H × m),
RSCANnTXQCCmLH: <RSCANn_base> + $03A1_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.79 RSCANnTXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 21.9**. Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

21.4.11.2 RSCANnTXQSTSm — Transmit Queue Status Register (m = 0 to 5)

Access: RSCANnTXQSTSm register can be read or written in 32-bit units
RSCANnTXQSTSmL register can be read or written in 16-bit units
RSCANnTXQSTSmLL register can be read or written in 8-bit units

Address: RSCANnTXQSTSm: <RSCANn_base> + $03C0_H$ + (04_H × m)

RSCANnTXQSTSmL: <RSCANn_base> + $03C0_H$ + (04_H × m)

RSCANnTXQSTSmLL: <RSCANn_base> + $03C0_H$ + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.80 RSCANnTXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	Reserved	When read, the undefined value is returned. When writing to these bits, write 0.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCANnTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCANnTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCANnTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

21.4.11.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 to 5)

Access: RSCANnTXQPCTRm register is a write-only register that can be written in 32-bit units
RSCANnTXQPCTRmL register is a write-only register that can be written in 16-bit units
RSCANnTXQPCTRmLL register is a write-only register that can be written in 8-bit units

Address: RSCANnTXQPCTRm: <RSCANn_base> + $03E0_H$ + (04_H × m)

RSCANnTXQPCTRmL: <RSCANn_base> + $03E0_H$ + (04_H × m)

RSCANnTXQPCTRmLL: <RSCANn_base> + $03E0_H$ + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 21.81 RSCANnTXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCANnTMIDp, RSCANnTMPTRp, RSCANnTMDF0p, and RSCANnTMDF1p registers (p = 15, 31, 47, 63, 79, and 95) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCANnTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCANnTXQSTSm register is 0 (the transmit queue is not full).

21.4.12 Details of Transmit history-related Registers

21.4.12.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0 to 5)

Access: RSCANnTHLCCm register can be read or written in 32-bit units
RSCANnTHLCCmL register can be read or written in 16-bit units
RSCANnTHLCCmLL, RSCANnTHLCCmLH registers can be read or written in 8-bit units

Address: RSCANnTHLCCm: <RSCANn_base> + 0400_H + (04_H × m)

RSCANnTHLCCmL: <RSCANn_base> + 0400_H + (04_H × m)

RSCANnTHLCCmLL: <RSCANn_base> + 0400_H + (04_H × m),
RSCANnTHLCCmLH: <RSCANn_base> + 0401_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Table 21.82 RSCANnTHLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit is set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

21.4.12.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0 to 5)

Access: RSCANnTHLSTSm register can be read or written in 32-bit units
RSCANnTHLSTSmL register can be read or written in 16-bit units
RSCANnTHLSTSmLL register can be read or written in 8-bit units
RSCANnTHLSTSmLH register is a read-only register that can be read in 8-bit units

Address: RSCANnTHLSTSm: <RSCANn_base> + 0420_H + (04_H × m)

RSCANnTHLSTSmL: <RSCANn_base> + 0420_H + (04_H × m)

RSCANnTHLSTSmLL: <RSCANn_base> + 0420_H + (04_H × m),
RSCANnTHLSTSmLH: <RSCANn_base> + 0421_H + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THL EMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.83 RSCANnTHLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCANnTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

21.4.12.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0 to 5)

Access: RSCANnTHLPCTRm register is a write-only register that can be written in 32-bit units
RSCANnTHLPCTRmL register is a write-only register that can be written in 16-bit units
RSCANnTHLPCTRmLL register is a write-only register that can be written in 8-bit units

Address: RSCANnTHLPCTRm: <RSCANn_base> + 0440_H + (04_H × m)

RSCANnTHLPCTRmL: <RSCANn_base> + 0440_H + (04_H × m)

RSCANnTHLPCTRmLL: <RSCANn_base> + 0440_H + (04_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	THLPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 21.84 RSCANnTHLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCANnTHLSTSm register is decremented. Write FF_H to the THLPC[7:0] bits after reading from the RSCANnTHLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCANnTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCANnTHLSTSm register is 0.

21.4.12.4 RSCANnTHLACCm — Transmit History Access Register (m = 0 to 5)

Access: RSCANnTHLACCm register is a read-only register that can be read in 32-bit units
RSCANnTHLACCmL, RSCANnTHLACCmH registers are read-only registers that can be read in 16-bit units
RSCANnTHLACCmLL, RSCANnTHLACCmLH, RSCANnTHLACCmHL, RSCANnTHLACCmHH registers are read-only registers that can be read in 8-bit units

Address: RSCANnTHLACCm: <RSCANn_base> + 1800_H + (04_H × m)

RSCANnTHLACCmL: <RSCANn_base> + 1800_H + (04_H × m),
RSCANnTHLACCmH: <RSCANn_base> + 1802_H + (04_H × m)

RSCANnTHLACCmLL: <RSCANn_base> + 1800_H + (04_H × m),
RSCANnTHLACCmLH: <RSCANn_base> + 1801_H + (04_H × m),
RSCANnTHLACCmHL: <RSCANn_base> + 1802_H + (04_H × m),

Table 21.85 RSCANnTHLACCm Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTS[15:0]	Transmit Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	When read, the value after reset is returned.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO buffer or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

When the TMTSCE bit in the RSCANnGCFG register is 1, timestamp values in transmit history data stored in the transmit history buffer are displayed. When the TMTSCE bit is 0, these bits are always read as 0.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

21.4.13 Details of Test-Related Registers

21.4.13.1 RSCANnGTSTCFG — Global Test Configuration Register

Access: RSCANnGTSTCFG register can be read or written in 32-bit units
RSCANnGTSTCFGL, RSCANnGTSTCFGH registers can be read or written in 16-bit units
RSCANnGTSTCFGLL, RSCANnGTSTCFGHL registers can be read or written in 8-bit units

Address: RSCANnGTSTCFG: <RSCANn_base> + 0468_H

RSCANnGTSTCFGL: <RSCANn_base> + 0468_H,
RSCANnGTSTCFGH: <RSCANn_base> + $046A_H$

RSCANnGTSTCFGLL: <RSCANn_base> + 0468_H,
RSCANnGTSTCFGHL: <RSCANn_base> + $046A_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	RTMPS[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 21.86 RSCANnGTSTCFG Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within the range of page 0 (00_H) to page 59 ($3B_H$).
15 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	C5ICBCE	CAN5 Inter-channel Communication Test Enable 0: CAN5 inter-channel communication test is disabled 1: CAN5 inter-channel communication test is enabled.
4	C4ICBCE	CAN4 Inter-channel Communication Test Enable 0: CAN4 inter-channel communication test is disabled 1: CAN4 inter-channel communication test is enabled.
3	C3ICBCE	CAN3 Inter-channel Communication Test Enable 0: CAN3 inter-channel communication test is disabled 1: CAN3 inter-channel communication test is enabled.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled 1: CAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCANnGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to $3B_H$, inclusive.

C5ICBCE Bit

Setting this bit to 1 enables the channel 5 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C4ICBCE Bit

Setting this bit to 1 enables the channel 4 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C3ICBCE Bit

Setting this bit to 1 enables the channel 3 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

21.4.13.2 RSCANnGTSTCTR — Global Test Control Register

Access: RSCANnGTSTCTR register can be read or written in 32-bit units
RSCANnGTSTCTRL register can be read or written in 16-bit units
RSCANnGTSTCTRLL register can be read or written in 8-bit units

Address: RSCANnGTSTCTR: <RSCANn_base> + $046C_H$

RSCANnGTSTCTRL: <RSCANn_base> + $046C_H$

RSCANnGTSTCTRLL: <RSCANn_base> + $046C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RTME	—	ICBCTME
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 21.87 RSCANnGTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ICBCTME	Communication Test between Channels Enable 0: Communication test between channels disabled 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCANnGCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 5) in the RSCANnGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

21.4.13.3 RSCANnGLOCKK — Global Lock Key Register

Access: RSCANnGLOCKK register is a write-only register that can be written in 32-bit units.
RSCANnGLOCKKL register is a write-only register that can be written in 16-bit units.

Address: RSCANnGLOCKK: <RSCANn_base> + $047C_H$

RSCANnGLOCKKL: <RSCANn_base> + $047C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCK[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 21.88 RSCANnGLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCANnGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 21.11.4.2, Procedure for Releasing the Protection**.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCANnGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCANn_base> + 0000_H to <RSCANn_base> + $04FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

21.4.13.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access: RSCANnRPGACCr register can be read or written in 32-bit units
RSCANnRPGACCrL, RSCANnRPGACCrH registers can be read or written in 16-bit units
RSCANnRPGACCrLL, RSCANnRPGACCrLH, RSCANnRPGACCrHL, RSCANnRPGACCrHH registers can be read or written in 8-bit units

Address: RSCANnRPGACCr: <RSCANn_base> + 1900_H + (04_H × r)

RSCANnRPGACCrL: <RSCANn_base> + 1900_H + (04_H × r),
RSCANnRPGACCrH: <RSCANn_base> + 1902_H + (04_H × r)

RSCANnRPGACCrLL: <RSCANn_base> + 1900_H + (04_H × r),
RSCANnRPGACCrLH: <RSCANn_base> + 1901_H + (04_H × r),
RSCANnRPGACCrHL: <RSCANn_base> + 1902_H + (04_H × r),
RSCANnRPGACCrHH: <RSCANn_base> + 1903_H + (04_H × r)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDTA[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDTA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.89 RSCANnRPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA [31:0]	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCANnRPGACCr register in global test mode with the RTME bit in the RSCANnGTSTCTR register set to 1 (RAM test is enabled).

The RSCANnRPGACCr register is readable and writable when the RTME bit is set to 1.

21.5 Registers (CAN FD Mode)

This section describes all registers to be used when the RS-CANFD is used in CAN FD mode.

21.5.1 List of Registers

The following tables list RS-CANFD registers to be used in CAN FD mode.

For details about <RSCANn_base>, see **Section 21.2.1, Register Base Address**.

Table 21.90 Registers (1/3)

Module Name	Register	Symbol	Address	Guard Group
Interface mode-related registers				
RSCFDn	Global interface mode select register	RSCFDnCFDGRMCFG	<RSCANn_base> + $04FC_H$	RSCANn global
Channel-related registers				
RSCFDn	Channel m nominal bit rate configuration register	RSCFDnCFDCmNCFG	<RSCANn_base> + 0000_H + (10_H × m)	RSCANn Chm
	Channel m control register	RSCFDnCFDCmCTR	<RSCANn_base> + 0004_H + (10_H × m)	RSCANn Chm
	Channel m status register	RSCFDnCFDCmSTS	<RSCANn_base> + 0008_H + (10_H × m)	RSCANn Chm
	Channel m error flag register	RSCFDnCFDCmERFL	<RSCANn_base> + $000C_H$ + (10_H × m)	RSCANn Chm
	Channel m data bit rate configuration register	RSCFDnCFDCmDCFG	<RSCANn_base> + 0500_H + (20_H × m)	RSCANn Chm
	Channel m CAN FD configuration register	RSCFDnCFDCmFDCFG	<RSCANn_base> + 0504_H + (20_H × m)	RSCANn Chm
	Channel m CAN FD control register	RSCFDnCFDCmFDCTR	<RSCANn_base> + 0508_H + (20_H × m)	RSCANn Chm
	Channel m CAN FD status register	RSCFDnCFDCmFDSTS	<RSCANn_base> + $050C_H$ + (20_H × m)	RSCANn Chm
	Channel m CAN FD CRC register	RSCFDnCFDCmFDCRC	<RSCANn_base> + 0510_H + (20_H × m)	RSCANn Chm
Global-related registers				
RSCFDn	Global configuration register	RSCFDnCFDGCFG	<RSCANn_base> + 0084_H	RSCANn global
	Global control register	RSCFDnCFDGCTR	<RSCANn_base> + 0088_H	RSCANn global
	Global status register	RSCFDnCFDGSTS	<RSCANn_base> + $008C_H$	RSCANn global
	Global error flag register	RSCFDnCFDGERFL	<RSCANn_base> + 0090_H	RSCANn global
	Global timestamp counter register	RSCFDnCFDGTSC	<RSCANn_base> + 0094_H	RSCANn global
	Global TX Interrupt Status register 0	RSCFDnCFDGTINTSTS0	<RSCANn_base> + 0460_H	RSCANn global
	Global TX Interrupt Status register 1	RSCFDnCFDGTINTSTS1	<RSCANn_base> + 0464_H	RSCANn global
	Global FD configuration register	RSCFDnCFDGFDCFG	<RSCANn_base> + 0474_H	RSCANn global
Receive rule-related registers				
RSCFDn	Receive Rule Entry Control register	RSCFDnCFDGAFLECTR	<RSCANn_base> + 0098_H	RSCANn global
	Receive Rule Configuration register 0	RSCFDnCFDGAFLCFG0	<RSCANn_base> + $009C_H$	RSCANn global
	Receive Rule Configuration register 1	RSCFDnCFDGAFLCFG1	<RSCANn_base> + $00A0_H$	RSCANn global
	Receive Rule ID register j	RSCFDnCFDGAFLIDj	<RSCANn_base> + 1000_H + (10_H × j)	RSCANn global
	Receive Rule Mask register j	RSCFDnCFDGAFLMj	<RSCANn_base> + 1004_H + (10_H × j)	RSCANn global
	Receive Rule Pointer 0 register j	RSCFDnCFDGAFLP0_j	<RSCANn_base> + 1008_H + (10_H × j)	RSCANn global
	Receive Rule Pointer 1 register j	RSCFDnCFDGAFLP1_j	<RSCANn_base> + $100C_H$ + (10_H × j)	RSCANn global
Receive buffer-related registers				
RSCFDn	Receive Buffer Number register	RSCFDnCFDRMNB	<RSCANn_base> + $00A4_H$	RSCANn global
	Receive Buffer New Data register y	RSCFDnCFDRMNDy	<RSCANn_base> + $00A8_H$ + (04_H × y)	RSCANn global
	Receive Buffer ID register q	RSCFDnCFDRMIDq	<RSCANn_base> + 2000_H + (20_H × q)	RSCANn global

Table 21.90 Registers (2/3)

Module Name	Register	Symbol	Address	Guard Group
RSCFDn	Receive Buffer Pointer register q	RSCFDnCFDRMPTRq	<RSCANn_base> + 2004_H + (20_H × q)	RSCANn global
	Receive buffer CAN FD status register q	RSCFDnCFDRMFDSTSq	<RSCANn_base> + 2008_H + (20_H × q)	RSCANn global
	Receive Buffer Data Field b register q	RSCFDnCFDRMDFb_q	<RSCANn_base> + $200C_H$ + (04_H × b) + (20_H × q)	RSCANn global
Receive FIFO buffer-related registers				
RSCFDn	Receive FIFO Buffer Configuration and Control register x	RSCFDnCFDRFCCx	<RSCANn_base> + $00B8_H$ + (04_H × x)	RSCANn global
	Receive FIFO Buffer Status register x	RSCFDnCFDRFSTSx	<RSCANn_base> + $00D8_H$ + (04_H × x)	RSCANn global
	Receive FIFO Buffer Pointer Control register x	RSCFDnCFDRFPCTRx	<RSCANn_base> + $00F8_H$ + (04_H × x)	RSCANn global
	Receive FIFO Buffer Access ID register x	RSCFDnCFDRFIDx	<RSCANn_base> + 3000_H + (80_H × x)	RSCANn global
	Receive FIFO Buffer Access Pointer register x	RSCFDnCFDRFPTRx	<RSCANn_base> + 3004_H + (80_H × x)	RSCANn global
	Receive FIFO CAN FD status register x	RSCFDnCFDRFFDSTSx	<RSCANn_base> + 3008_H + (80_H × x)	RSCANn global
	Receive FIFO Buffer Access Data Field d register x	RSCFDnCFDRFDFd_x	<RSCANn_base> + $300C_H$ + (04_H × d) + (80_H × x)	RSCANn global
Transmit/Receive FIFO buffer related registers				
RSCFDn	Transmit/receive FIFO Buffer Configuration and Control register k	RSCFDnCFDCFCCk	<RSCANn_base> + 0118_H + (04_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Status register k	RSCFDnCFDCFSTSk	<RSCANn_base> + 0178_H + (04_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Pointer Control register k	RSCFDnCFDCFPCTRk	<RSCANn_base> + $01D8_H$ + (04_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Access ID register k	RSCFDnCFDCFIDk	<RSCANn_base> + 3400_H + (80_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Access Pointer register k	RSCFDnCFDCFPTRk	<RSCANn_base> + 3404_H + (80_H × k)	RSCANn global
	Transmit/receive FIFO CAN FD configuration/status register k	RSCFDnCFDCFFDCSTSk	<RSCANn_base> + 3408_H + (80_H × k)	RSCANn global
	Transmit/receive FIFO Buffer Access Data Field d register k	RSCFDnCFDCFDFd_k	<RSCANn_base> + $340C_H$ + (04_H × d) + (80_H × k)	RSCANn global
FIFO status-related registers				
RSCFDn	FIFO Empty Status register	RSCFDnCFDFESTS	<RSCANn_base> + 0238_H	RSCANn global
	FIFO Full Status register	RSCFDnCFDFFSTS	<RSCANn_base> + $023C_H$	RSCANn global
	FIFO Message Lost Status register	RSCFDnCFDFMSTS	<RSCANn_base> + 0240_H	RSCANn global
	Receive FIFO Buffer Interrupt Flag Status register	RSCFDnCFDRFISTS	<RSCANn_base> + 0244_H	RSCANn global
	Transmit/receive FIFO Buffer Receive Interrupt Flag Status register	RSCFDnCFDCFRISTS	<RSCANn_base> + 0248_H	RSCANn global
	Transmit/receive FIFO Buffer Transmit Interrupt Flag Status register	RSCFDnCFDCFTISTS	<RSCANn_base> + $024C_H$	RSCANn global
FIFO DMA-related registers				
RSCFDn	DMA enable register	RSCFDnCFDCDTCT	<RSCANn_base> + 0490_H	RSCANn global
	DMA status register	RSCFDnCFDCDTSTS	<RSCANn_base> + 0494_H	RSCANn global
Transmit buffer-related registers				
RSCFDn	Transmit Buffer Control register p	RSCFDnCFDTMCp	<RSCANn_base> + 0250_H + (01_H × p)	RSCANn global
	Transmit Buffer Status register p	RSCFDnCFDTMSTSp	<RSCANn_base> + $02D0_H$ + (01_H × p)	RSCANn global
	Transmit Buffer ID register p	RSCFDnCFDTMIDp	<RSCANn_base> + 4000_H + (20_H × p)	RSCANn global
	Transmit Buffer Pointer register p	RSCFDnCFDTMPTRp	<RSCANn_base> + 4004_H + (20_H × p)	RSCANn global
	Transmit buffer CAN FD configuration register p	RSCFDnCFDTMFDCTRp	<RSCANn_base> + 4008_H + (20_H × p)	RSCANn global
	Transmit Buffer Data Field b register p	RSCFDnCFDTMDFb_p	<RSCANn_base> + $400C_H$ + (04_H × b) + (20_H × p)	RSCANn global
	Transmit Buffer Interrupt Enable Configuration register y	RSCFDnCFDTMIECy	<RSCANn_base> + 0390_H + (04_H × y)	RSCANn global

Table 21.90 Registers (3/3)

Module Name	Register	Symbol	Address	Guard Group
Transmit buffer status-related registers				
RSCFDn	Transmit Buffer Transmit Request Status register y	RSCFDnCFDTMTRSTSy	<RSCANn_base> + 0350_H + (04_H × y)	RSCANn global
	Transmit Buffer Transmit Abort Request Status register y	RSCFDnCFDTMTARSTSy	<RSCANn_base> + 0360_H + (04_H × y)	RSCANn global
	Transmit Buffer Transmit Complete Status register y	RSCFDnCFDTMTCSTSy	<RSCANn_base> + 0370_H + (04_H × y)	RSCANn global
	Transmit Buffer Transmit Abort Status register y	RSCFDnCFDTMTASTSy	<RSCANn_base> + 0380_H + (04_H × y)	RSCANn global
Transmit queue-related registers				
RSCFDn	Transmit Queue Configuration and Control register m	RSCFDnCFDTXQCCm	<RSCANn_base> + $03A0_H$ + (04_H × m)	RSCANn Chm
	Transmit Queue Status register m	RSCFDnCFDTXQSTSm	<RSCANn_base> + $03C0_H$ + (04_H × m)	RSCANn Chm
	Transmit Queue Pointer Control register m	RSCFDnCFDTXQPCTRm	<RSCANn_base> + $03E0_H$ + (04_H × m)	RSCANn Chm
Transmit history-related registers				
RSCFDn	Transmit History Configuration and Control register m	RSCFDnCFDTHLCCm	<RSCANn_base> + 0400_H + (04_H × m)	RSCANn Chm
	Transmit History Status register m	RSCFDnCFDTHLSTSm	<RSCANn_base> + 0420_H + (04_H × m)	RSCANn Chm
	Transmit History Pointer Control register m	RSCFDnCFDTHLPCTRm	<RSCANn_base> + 0440_H + (04_H × m)	RSCANn Chm
	Transmit History Access register m	RSCFDnCFDTHLACCm	<RSCANn_base> + 6000_H + (04_H × m)	RSCANn Chm
Test-related registers				
RSCFDn	Global Test Configuration register	RSCFDnCFDGTSTCFG	<RSCANn_base> + 0468_H	RSCANn global
	Global Test Control register	RSCFDnCFDGTSTCTR	<RSCANn_base> + $046C_H$	RSCANn global

Table 21.95 RSCFDnCFDGRMCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	RCMC	Interface Mode Select 0: Classical CAN mode 1: CAN FD mode (PREMIUM only)

Note: CAN FD mode for PREMIUM only. Even if RCMC bit is set to 1, CANFD mode does not work in ECO and ADVANCED products. Set RCMC = 0 in ECO and ADVANCED products.

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 0 makes classical CAN mode available. To switch CAN FD mode to classical CAN mode, set the value after reset to all registers and bits allocated to the register map of CAN FD mode and then modify the RSCFDnCFDGRMCFG register.

21.5.3 Details of Channel-Related Registers

21.5.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0 to 5)

Access: RSCFDnCFDCmNCFG register can be read or written in 32-bit units
RSCFDnCFDCmNCFGL, RSCFDnCFDCmNCFGH registers can be read or written in 16-bit units
RSCFDnCFDCmNCFGLL, RSCFDnCFDCmNCFGLH, RSCFDnCFDCmNCFGHL,
RSCFDnCFDCmNCFGHH registers can be read or written in 8-bit units

Address: RSCFDnCFDCmNCFG: <RSCANn_base> + 0000_H + (10_H × m)

RSCFDnCFDCmNCFGL: <RSCANn_base> + 0000_H + (10_H × m),
RSCFDnCFDCmNCFGH: <RSCANn_base> + 0002_H + (10_H × m)

RSCFDnCFDCmNCFGLL: <RSCANn_base> + 0000_H + (10_H × m),
RSCFDnCFDCmNCFGLH: <RSCANn_base> + 0001_H + (10_H × m),
RSCFDnCFDCmNCFGHL: <RSCANn_base> + 0002_H + (10_H × m),

10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 0	NBRP[9:0]	Nominal Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings of bit timing parameters, see **Section 21.11.1, Initial Settings**.

NTSEG2[4:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.

Allowed values are 2 Tq to 32 Tq, inclusive.

Set a value smaller than the value of the NTSEG1[6:0] bits.

NTSEG1[6:0] Bits

These bits are used to specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.

A value of 4 to 128 Tq can be set.

NSJW[4:0] Bits

These bits are used to specify the resynchronization jump width of nominal bit rate as a Tq value. A value of 1 to 32 Tq can be set. Specify a value equal to or smaller than the NTSEG2[4:0] value.

NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

The NBRP[9:0] bit value and the DBRP[7:0] bit value in RSCFDnCFDCmDCFG register should be equal and the two bit rate values be different according to the respective segment values.

21.5.3.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0 to 5)

Access: RSCFDnCFDCmCTR register can be read or written in 32-bit units
RSCFDnCFDCmCTRL, RSCFDnCFDCmCTRH registers can be read or written in 16-bit units
RSCFDnCFDCmCTRLL, RSCFDnCFDCmCTRLH, RSCFDnCFDCmCTRHL, RSCFDnCFDCmCTRHH registers can be read or written in 8-bit units

Address: RSCFDnCFDCmCTR: <RSCANn_base> + 0004_H + (10_H × m)

RSCFDnCFDCmCTRL: <RSCANn_base> + 0004_H + (10_H × m),
RSCFDnCFDCmCTRH: <RSCANn_base> + 0006_H + (10_H × m)

RSCFDnCFDCmCTRLL: <RSCANn_base> + 0004_H + (10_H × m),
RSCFDnCFDCmCTRLH: <RSCANn_base> + 0005_H + (10_H × m),
RSCFDnCFDCmCTRHL: <RSCANn_base> + 0006_H + (10_H × m),

1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

ROM Bit

When the ROM bit and the CTME bit in the RSCFDnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RSCFDnCFDCmCTR register is 00_B (standard test mode). Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCFDnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register. When this bit is cleared to 0, if any error is detected while the flags of bits 14 to 8 in the RSCFDnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 5) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TDCVFIE Bit

When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

SOCOIE Bit

When the SOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

EOCOIE Bit

When the EOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCFDnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCFDnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCFDnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCFDnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCFDnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCFDnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register to 00_H and also clears the BOSTS flag in the RSCFDnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCFDCmCTR register are 00_B (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RS-CANFD module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 21.7.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10_B.

21.5.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0 to 5)

Access: RSCFDnCFDCmSTS register can be read or written in 32-bit units
RSCFDnCFDCmSTSL register can be read or written in 16-bit units
RSCFDnCFDCmSTSH register is a read-only register that can be read in 16-bit units
RSCFDnCFDCmSTSLL register is a read-only register that can be read in 8-bit units
RSCFDnCFDCmSTSLH register can be read or written in 8-bit units
RSCFDnCFDCmSTSHL, RSCFDnCFDCmSTSHH registers are the read-only registers that can be read in 8-bit units

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.98 RSCFDnCFDCmSTS Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	ESIF	Error State Indication Flag 0: No CAN FD message whose ESI bit is recessive has been received. 1: At least one CAN FD message whose ESI bit is recessive has been received.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state

Table 21.98 RSCFDnCFDCmSTS Register Contents (2/2)

Bit Position	Bit Name	Function
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.

This flag is 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])). It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

21.5.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0 to 5)

Access: RSCFDnCFDCmERFL register can be read or written in 32-bit units
RSCFDnCFDCmERFLL register can be read or written in 16-bit units
RSCFDnCFDCmERFLH register is a read-only register that can be read in 16-bit units
RSCFDnCFDCmERFLLL, RSCFDnCFDCmERFLLH registers can be read or written in 8-bit units
RSCFDnCFDCmERFLHL, RSCFDnCFDCmERFLHH registers are the read-only registers that can be read in 8-bit units

Address: RSCFDnCFDCmERFL: <RSCANn_base> + $000C_H$ + (10_H × m)

RSCFDnCFDCmERFLL: <RSCANn_base> + $000C_H$ + (10_H × m),
RSCFDnCFDCmERFLH: <RSCANn_base> + $000E_H$ + (10_H × m)

RSCFDnCFDCmERFLLL: <RSCANn_base> + $000C_H$ + (10_H × m),
RSCFDnCFDCmERFLLH: <RSCANn_base> + $000D_H$ + (10_H × m),
RSCFDnCFDCmERFLHL: <RSCANn_base> + $000E_H$ + (10_H × m),
RSCFDnCFDCmERFLHH: <RSCANn_base> + $000F_H$ + (10_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.99 RSCFDnCFDCmERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data (CRC length:15 bits) A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.

Table 21.99 RSCFDnCFDCmERFL Register Contents (2/2)

Bit Position	Bit Name	Function
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCFDnCFDCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCFDCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CAN FD frame is transmitted or received, the value of CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register is updated.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a bus lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 5) are set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127). This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to other flags.

21.5.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration register (m = 0 to 5)

Access: RSCFDnCFDCmDCFG register can be read or written in 32-bit units
RSCFDnCFDCmDCFGL, RSCFDnCFDCmDCFGH registers can be read or written in 16-bit units
RSCFDnCFDCmDCFGLL, RSCFDnCFDCmDCFGHL, RSCFDnCFDCmDCFGHH registers can be read or written in 8-bit units

Address: RSCFDnCFDCmDCFG: <RSCANn_base> + 0500_H + (20_H × m)

RSCFDnCFDCmDCFGL: <RSCANn_base> + 0500_H + (20_H × m),
RSCFDnCFDCmDCFGH: <RSCANn_base> + 0502_H + (20_H × m)

RSCFDnCFDCmDCFGLL: <RSCANn_base> + 0500_H + (20_H × m),
RSCFDnCFDCmDCFGHL: <RSCANn_base> + 0502_H + (20_H × m),

Table 21.100 RSCFDnCFDCmDCFG Register Contents (2/2)

Bit Position	Bit Name	Function
19 to 16	DTSEG1[3:0]	Data Bit Rate Time Segment 1 Control b19 b18 b17 b16 0 0 0 0: Setting prohibited 0 0 0 1: 2 Tq 0 0 1 0: 3 Tq 0 0 1 1: 4 Tq 0 1 0 0: 5 Tq 0 1 0 1: 6 Tq 0 1 1 0: 7 Tq 0 1 1 1: 8 Tq 1 0 0 0: 9 Tq 1 0 0 1: 10 Tq 1 0 1 0: 11 Tq 1 0 1 1: 12 Tq 1 1 0 0: 13 Tq 1 1 0 1: 14 Tq 1 1 1 0: 15 Tq 1 1 1 1: 16 Tq
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	DBRP[7:0]	Data Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value. For the description and settings of bit timing parameters, see **Section 21.11.1, Initial Settings**.

DSJW[2:0] Bits

These bits are used to specify the resynchronization jump width of data bit rate as a Tq value. A value of 1 to 8 Tq can be set. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of the data bit rate.

Allowed values are 2 Tq to 8 Tq, inclusive.

Set a value smaller than the value of the DTSEG1[3:0] bits.

DTSEG1[3:0] Bits

These bits are used to specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.

A value from 2 to 16 Tq can be set.

DBRP[7:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the data bit rate prescaler ((DBRP[7:0]) + 1) becomes CANmTq(D) clock (fCANTQ(D)m). One clock of the CANmTq(D) clock becomes one Time Quantum (Tq).

The NBRP[9:0] bit value in RSCFDnCFDCmNCFG register and the DBRP[7:0] bit value should be equal and the two bit rate values be different according to the respective segment values.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

21.5.3.6 RSCFDnCFDCmFDCFG — Channel CAN FD Configuration Register (m = 0 to 5)

Access: RSCFDnCFDCmFDCFG register can be read or written in 32-bit units
RSCFDnCFDCmFDCFGL, RSCFDnCFDCmFDCFGH registers can be read or written in 16-bit units
RSCFDnCFDCmFDCFGLL, RSCFDnCFDCmFDCFGLH, RSCFDnCFDCmFDCFGHL,
RSCFDnCFDCmFDCFGHH registers can be read or written in 8-bit units

Address: RSCFDnCFDCmFDCFG: <RSCANn_base> + 0504_H + (20_H × m)

RSCFDnCFDCmFDCFGL: <RSCANn_base> + 0504_H + (20_H × m),

Table 21.101 RSCFDnCFDCmFDCFG Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29	REFE	Reception Data Edge Filter Enable 0: Reception data edge filter disabled 1: Reception data edge filter enabled
28	FDOE	FD-only Mode Enable 0: FD-only mode disabled 1: FD-only mode enabled
27	TMME	Transmit Buffer Merge Mode Enable 0: Transmit buffer merge mode is disabled. 1: Transmit buffer merge mode is enabled.
26	GWBRS	Gateway BRS 0: A frame is transmitted with the BRS bit in the received frame set to 0. 1: A frame is transmitted with the BRS bit in the received frame set to 1.
25	GWFDF	Gateway FDF 0: A frame is transmitted regarding the received frame as a classical CAN frame. 1: A frame is transmitted regarding the received frame as a CAN FD frame.
24	GWEN	CAN-CAN FD Gateway Enable 0: The CAN-CAN FD gateway is disabled. 1: The CAN-CAN FD gateway is enabled.
23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	TDCO[6:0]	Transmitter Delay Compensation Offset These bits are set to the transmitter delay compensation offset value.
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 21.101 RSCFDnCFDCmFDCFG Register Contents (2/2)

Bit Position	Bit Name	Function
10	ESIC	Error State Display Mode Select 0: Always displays the node error state. 1: When the node is not in the error passive state: Displays the message buffer error state. When the node is in the error passive state: Displays the node error state.
9	TDCE	Transmitter Delay Compensation Enable 0: Transmitter delay compensation is disabled. 1: Transmitter delay compensation is enabled.
8	TDCOC	Transmitter Delay Compensation Measurement Select 0: Measurement and offset 1: Only offset
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	EOCCFG[2:0]	Error Occurrence Counting Method Select b2 b1 b0 0 0 0: All transmit messages and receive messages 0 0 1: All transmit messages 0 1 0: All receive messages 0 1 1: Setting prohibited 1 0 0: Only data phase of transmitted or received CAN FD message 1 0 1: Only data phase of transmitted CAN FD message 1 1 0: Only data phase of received CAN FD message 1 1 1: Setting prohibited

REFE bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge.

Modify this bit only in channel reset mode.

FDOE bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CAN FD frame will be sent regardless of the settings to the CFFDF bit in the RSCFDnCFDCFFDCSTSk register or the TMFDF bit in the RSCFDnCFDTMFDCTRp register. When a Classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

TMME Bit

Setting this bit to 1 enables transmit buffer merge mode. Modify this bit only in channel reset mode or channel halt mode.

GWBRS Bit

When the GWEN bit is 1, the BRS bit in a CAN FD frame to be transmitted by the gateway function is set. Write 0 to this bit to clear the GWBRS bit to 0. Modify this bit only in channel reset mode.

GWFDF Bit

When the GWEN bit is 1, the FDF bit in a CAN FD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RSCFDnCFDCFCCk register set to 10_B (gateway mode).

Setting this bit to 1 enables the CAN-CAN FD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWFDF bit and the GWBRS bit. When the DLC value in the received classical CAN frame is 1001_B or more and the GWFDF bit is 1 (CAN FD frame), the DLC value is replaced with 1000_B.

While this bit is 1, do not perform routing for the following frames by using the gateway function.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

While this bit is 1, only the following frame should be transmitted from the corresponding channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frame should be transmitted.
- When GWFDF bit is set to 1, only CAN FD frame should be transmitted.

Table 21.102 shows the settings and formats of transmit frame and receive frame while the CAN-CAN FD gateway is enabled.

Table 21.102 Operation when the CAN-CAN FD Gateway is Enabled

Receive Frame				Transmit Frame		
Format	BRS Bit	Received DLC Value	GWFDF Bit	Format	BRS Bit	DLC Value to be Transmitted
Classical CAN	None	DLC ≤ 1000_B	0	Classical CAN	None	Not replaced
		DLC > 1000_B				
CAN FD	Arbitrary	DLC ≤ 1000_B				
Classical CAN	None	DLC ≤ 1000_B	1	CAN FD	According to GWBRS bit setting	Not replaced
		DLC >1000_B				Replaced with 1000_B
CAN FD	Arbitrary	DLC ≤ 1000_B				Not replaced

TDCO[6:0] Bits

These bits are set to the SSP offset value. How to use this value depends on the TDCOC bit in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded to the nearest integer Tq).

When the TDCOC bit is 1, the transmitter delay compensation result equals to the TDCO[6:0] value.

The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

ESIC Bit

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RSCFDnCFDRSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode.

Table 21.103 ESI Value to Be Transmitted

ESIC Value	Channel Status	ESI Value to be Transmitted
0	Error active	0 (error active node)
	Error passive	1 (error passive node)
1	Error active	ESI value set in the transmit/receive FIFO buffer or transmit buffer (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register)
	Error passive	1 (error passive node)

TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

TDCOC Bit

When this bit is 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is 1, the SSP position is defined only by the SSP offset value.

Modify this bit only in channel reset mode or channel halt mode.

EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

21.5.3.7 RSCFDnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 to 5)

Access: RSCFDnCFDCmFDCTR register can be read or written in 32-bit units
RSCFDnCFDCmFDCTRL register can be read or written in 16-bit units
RSCFDnCFDCmFDCTRLL register can be read or written in 8-bit units

Address: RSCFDnCFDCmFDCTR: <RSCANn_base> + 0508_H + (20_H × m)

RSCFDnCFDCmFDCTRL: <RSCANn_base> + 0508_H + (20_H × m)

RSCFDnCFDCmFDCTRLL: <RSCANn_base> + 0508_H + (20_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 21.104 RSCFDnCFDCmFDCTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	SOCCLR	Successful Communication Occurrence Counter Clear Setting the SOCCLR bit to 1 clears the successful communication occurrence counter. This bit is always read as 0.
0	EOCCLR	Error Occurrence Counter Clear Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0.

SOCCLR Bit

Setting this bit to 1 clears the successful communication occurrence counter (SOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

21.5.3.8 RSCFDnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 to 5)

Access: RSCFDnCFDCmFDSTS register can be read or written in 32-bit units
RSCFDnCFDCmFDSTSL register can be read or written in 16-bit units
RSCFDnCFDCmFDSTSH register is a read-only register that can be read in 16-bit units
RSCFDnCFDCmFDSTSLL, RSCFDnCFDCmFDSTSLH registers can be read or written in 8-bit units
RSCFDnCFDCmFDSTSHL, RSCFDnCFDCmFDSTSHH registers are the read-only registers that can be read in 8-bit units

Address: RSCFDnCFDCmFDSTS: <RSCANn_base> + $050C_H$ + (20_H × m)

RSCFDnCFDCmFDSTSL: <RSCANn_base> + $050C_H$ + (20_H × m),
RSCFDnCFDCmFDSTSH: <RSCANn_base> + $050E_H$ + (20_H × m)

RSCFDnCFDCmFDSTSLL: <RSCANn_base> + $050C_H$ + (20_H × m),
RSCFDnCFDCmFDSTSLH: <RSCANn_base> + $050D_H$ + (20_H × m),
RSCFDnCFDCmFDSTSHL: <RSCANn_base> + $050E_H$ + (20_H × m),
RSCFDnCFDCmFDSTSHH: <RSCANn_base> + $050F_H$ + (20_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SOC[7:0]								EOC[7:0]

R/W	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.105 RSCFDnCFDCmFDSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	SOC[7:0]	Successful Communication Occurrence Counter The successful communication occurrence counter value can be read.
23 to 16	EOC[7:0]	Error Occurrence Counter The error occurrence counter value can be read.
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	SOCO	Successful Communication Occurrence Counter Overflow Flag 0: The successful communication occurrence counter does not overflow. 1: The successful communication occurrence counter has overflowed.
8	EOCO	Error Occurrence Counter Overflow Flag 0: The error occurrence counter does not overflow. 1: The error occurrence counter has overflowed.
7	TDCVF	Transmitter Delay Compensation Violation Flag 0: No transmitter delay compensation violation is present. 1: A transmitter delay compensation violation is present.
6 to 0	TDCR[6:0]	Transmitter Delay Compensation Result Status The transmitter delay compensation result can be read.

SOC[7:0] Bits

These bits show the successful communication occurrence counter value. The successful communication occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches FF_H. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RSCFDnCFDCmFDCTR register. These bits are 0 in channel reset mode.

EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register. This counter stops counting when it reaches FF_H.

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RSCFDnCFDCmFDCTR register. These bits are 0 in channel reset mode.

SOCO Flag

This bit indicates that successful communication occurrence counter overflow has occurred.

This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached FF_H. This flag is 0 in channel reset mode.

EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.

This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register when the EOC[7:0] value has reached FF_H. This flag is 0 in channel reset mode.

TDCVF Flag

This bit indicates violation of transmitter delay compensation.

The transmit data is compared with the reception CAN bus level delayed due to the transceiver's loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CANm bit times - 2 fCAN (CANm bit time is the value of data bit rate).

This flag is 0 in channel reset mode.

TDCR[6:0] Flags

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).

This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

This flag is updated at a falling edge between the FDF bit and res bit when the TDCE bit (transmitter delay compensation enable) in the RSCFDnCFDCmFDCFG register is set to 1 and also the TDCOC bit (transmitter delay compensation measurement select) in the RSCFDnCFDCmFDCFG register is set to 0.

This flag is 0 in channel reset mode.

21.5.3.9 RSCFDnCFDCmFDCRC — Channel CAN FD CRC Register (m = 0 to 5)

Access: RSCFDnCFDCmFDCRC register is a read-only register that can be read in 32-bit units
RSCFDnCFDCmFDCRCL, RSCFDnCFDCmFDCRCH registers are read-only registers that can be read in 16-bit units
RSCFDnCFDCmFDCRCLL, RSCFDnCFDCmFDCRCLH, RSCFDnCFDCmFDCRCHL, RSCFDnCFDCmFDCRCHH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDCmFDCRC: <RSCANn_base> + 0510_H + (20_H × m)

RSCFDnCFDCmFDCRCL: <RSCANn_base> + 0510_H + (20_H × m),
RSCFDnCFDCmFDCRCH: <RSCANn_base> + 0512_H + (20_H × m)

RSCFDnCFDCmFDCRCLL: <RSCANn_base> + 0510_H + (20_H × m),
RSCFDnCFDCmFDCRCLH: <RSCANn_base> + 0511_H + (20_H × m),
RSCFDnCFDCmFDCRCHL: <RSCANn_base> + 0512_H + (20_H × m),
RSCFDnCFDCmFDCRCHH: <RSCANn_base> + 0513_H + (20_H × m)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	SCNT[3:0]				—	—	—	CRCREG[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRCREG[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.106 RSCFDnCFDCmFDCRC Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is returned.
27 to 24	SCNT[3:0]	Stuff count bit Indicate a value of the stuff count in a CAN FD frame. Bits 27 to 25 indicate the Gray-coded value of the stuff bit count module 8 in the transmitted/received frames. Bit 24 indicates an even parity value of bits 27 to 25.
23 to 21	Reserved	When read, the value after reset is returned.
20 to 0	CRCREG[20:0]	CRC Calculation Data (CRC Length:17 Bit or 21 Bit) These bits show the CRC value calculated based on the transmit message or receive message. When the CRC length is 17 bits, bits b20 to b17 are read as 0.

SCNT[3:0] Flags

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CAN FD frame can be read if a message transmitted/received is a CAN FD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. This flag is updated at the first bit in the CRC field of the CAN FD frame. These bits are cleared to 0 in channel reset mode.

CRCREG[20:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CAN FD frame (CRC length = 17 or 21 bits), these flags are updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received, the CRCREG[14:0] value in the RSCFDnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0.

21.5.4 Details of Global-Related Registers

21.5.4.1 RSCFDnCFDGCFG — Global Configuration Register

Access: RSCFDnCFDGCFG register can be read or written in 32-bit units
RSCFDnCFDGCFGL, RSCFDnCFDGCFGH registers can be read or written in 16-bit units
RSCFDnCFDGCFGLL, RSCFDnCFDGCFGLH, RSCFDnCFDGCFGHL, RSCFDnCFDGCFGHH registers can be read or written in 8-bit units

Address: RSCFDnCFDGCFG: <RSCANn_base> + 0084_H

RSCFDnCFDGCFGL: <RSCANn_base> + 0084_H,
RSCFDnCFDGCFGH: <RSCANn_base> + 0086_H

RSCFDnCFDGCFGLL: <RSCANn_base> + 0084_H,
RSCFDnCFDGCFGLH: <RSCANn_base> + 0085_H,
RSCFDnCFDGCFGHL: <RSCANn_base> + 0086_H,
RSCFDnCFDGCFGHH: <RSCANn_base> + 0087_H

Value after reset: $0000\ 0000_H$

7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CMPOC	Payload Overflow Mode Select 0: No message is stored. 1: Messages are stored and payloads exceeding the buffer size are discarded.
4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Note 2. For the CAN clock frequency settings, see **Table 21.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

Modify the RSCFDnCFDGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. For details, see **Section 21.9.3.1, Interval Transmission Function**.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CAN FD frames.

TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit by the TSP[3:0] bits is used as the timestamp counter count source.

CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.

When this bit is 0, the received message in which the payload overflows is not stored in the buffer.

When this bit is 1, the received message in which the payload overflows is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.

The buffer’s payload storage size is set by the following bits.

- Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 21.8, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/F1K**.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to 0000_B before clearing the DCE bit in the RSCFDnCFDGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

21.5.4.2 RSCFDnCFDGCTR — Global Control Register

Access: RSCFDnCFDGCTR register can be read or written in 32-bit units
RSCFDnCFDGCTRL, RSCFDnCFDGCTRH registers can be read or written in 16-bit units
RSCFDnCFDGCTRLL, RSCFDnCFDGCTRLH, RSCFDnCFDGCTRHL registers can be read or written in 8-bit units

Address: RSCFDnCFDGCTR: <RSCANn_base> + 0088_H

RSCFDnCFDGCTRL: <RSCANn_base> + 0088_H,
RSCFDnCFDGCTRH: <RSCANn_base> + $008A_H$

RSCFDnCFDGCTRLL: <RSCANn_base> + 0088_H,
RSCFDnCFDGCTRLH: <RSCANn_base> + 0089_H,
RSCFDnCFDGCTRHL: <RSCANn_base> + $008A_H$

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	CMPOFIE	Payload Overflow Interrupt Enable 0: A payload overflow interrupt is disabled. 1: A payload overflow interrupt is enabled.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCFDnCFDGTSC register is cleared to 0000_H.

CMPOFIE Bit

When the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RS-CANFD module into global stop mode.
Clearing this bit to 0 makes the RS-CANFD module leave from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 21.7.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

21.5.4.3 RSCFDnCFDGSTS — Global Status Register

Access: RSCFDnCFDGSTS register is a read-only register that can be read in 32-bit units
RSCFDnCFDGSTSL register is a read-only register that can be read in 16-bit units
RSCFDnCFDGSTSLL register is a read-only register that can be read in 8-bit units

Address: RSCFDnCFDGSTS: <RSCANn_base> + $008C_H$

RSCFDnCFDGSTSL: <RSCANn_base> + $008C_H$

RSCFDnCFDGSTSLL: <RSCANn_base> + $008C_H$

Value after reset: $0000\ 000D_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	GRAMINIT	GSLPSTS	GHLTSTS	GRSTSTS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.109 RSCFDnCFDGSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

21.5.4.4 RSCFDnCFDGERFL — Global Error Flag Register

Access: RSCFDnCFDGERFL register can be read or written in 32-bit units
RSCFDnCFDGERFLL, RSCFDnCFDGERFLH registers can be read or written in 16-bit units
RSCFDnCFDGERFLLL, RSCFDnCFDGERFLHL registers can be read or written in 8-bit units

Address: RSCFDnCFDGERFL: <RSCANn_base> + 0090_H

RSCFDnCFDGERFLL: <RSCANn_base> + 0090_H,
RSCFDnCFDGERFLH: <RSCANn_base> + 0092_H

RSCFDnCFDGERFLLL: <RSCANn_base> + 0090_H,
RSCFDnCFDGERFLHL: <RSCANn_base> + 0092_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	EEF5	EEF4	EEF3	EEF2	EEF1	EEF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CMPOF	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 21.110 RSCFDnCFDGERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21	EEF5	ECC Error Flag for Channel 5 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
20	EEF4	ECC Error Flag for Channel 4 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
19	EEF3	ECC Error Flag for Channel 3 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
18	EEF2	ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
17	EEF1	ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
16	EEF0	ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	Reserved	When read, the undefined value is returned. When writing, write the value after reset.
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	Reserved	When read, the undefined value is returned. When writing, write the value after reset.

Table 21.110 RSCFDnCFDGERFL Register Contents (2/2)

Bit Position	Bit Name	Function
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	CMPOF	Payload Overflow Flag 0: No payload overflow has occurred. 1: A payload overflow has occurred.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

EEFm Flag

When a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 5), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

CMPOF Flag

When a payload overflow occurs in any of channel m (m = 0 to 5), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register (m = 0 to 5) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCFDnCFDCFSTSk register (k = 0 to 17) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

21.5.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register

Access: RSCFDnCFDGTSC register is a read-only register that can be read in 32-bit units.
RSCFDnCFDGTSCL register is a read-only register that can be read in 16-bit units.

Address: RSCFDnCFDGTSC: <RSCANn_base> + 0094_H

RSCFDnCFDGTSCL: <RSCANn_base> + 0094_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.111 RSCFDnCFDGTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCFDnCFDGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm nominal bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

21.5.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCFDnCFDGTINTSTS0 register is a read-only register that can be read in 32-bit units
RSCFDnCFDGTINTSTS0L, RSCFDnCFDGTINTSTS0H registers are read-only registers that can be read in 16-bit units
RSCFDnCFDGTINTSTS0LL, RSCFDnCFDGTINTSTS0LH, RSCFDnCFDGTINTSTS0HL, RSCFDnCFDGTINTSTS0HH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDGTINTSTS0: <RSCANn_base> + 0460_H

RSCFDnCFDGTINTSTS0L: <RSCANn_base> + 0460_H,
RSCFDnCFDGTINTSTS0H: <RSCANn_base> + 0462_H

RSCFDnCFDGTINTSTS0LL: <RSCANn_base> + 0460_H,
RSCFDnCFDGTINTSTS0LH: <RSCANn_base> + 0461_H,
RSCFDnCFDGTINTSTS0HL: <RSCANn_base> + 0462_H,
RSCFDnCFDGTINTSTS0HH: <RSCANn_base> + 0463_H

Value after reset: $0000\ 0000_H$

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 21.112 RSCFDnCFDGTINTSTS0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is returned.
28	THIF3	Channel 3 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
27	CFTIF3	Channel 3 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
26	TQIF3	Channel 3 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
25	TAIF3	Channel 3 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested
24	TSIF3	Channel 3 Transmit Buffer Transmit Complete Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
23 to 21	Reserved	When read, the value after reset is returned.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.

Table 21.112 RSCFDnCFDGTINTSTS0 Register Contents (2/2)

Bit Position	Bit Name	Function
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	When read, the value after reset is returned.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	When read, the value after reset is returned.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

21.5.4.7 RSCFDnCFDGTINTSTS1 — Global TX Interrupt Status Register 1

Access: RSCFDnCFDGTINTSTS1 register is a read-only register that can be read in 32-bit units
RSCFDnCFDGTINTSTS1L register is a read-only register that can be read in 16-bit units
RSCFDnCFDGTINTSTS1LL, RSCFDnCFDGTINTSTS1LH registers are read-only registers that can be read in 8-bit units

Address: RSCFDnCFDGTINTSTS1: <RSCANn_base> + 0464_H

RSCFDnCFDGTINTSTS1L: <RSCANn_base> + 0464_H

RSCFDnCFDGTINTSTS1LL: <RSCANn_base> + 0464_H,
RSCFDnCFDGTINTSTS1LH: <RSCANn_base> + 0465_H

Value after reset: $0000\ 0000_H$ This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 21.113 RSCFDnCFDGTINTSTS1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned.
12	THIF5	Channel 5 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF5	Channel 5 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF5	Channel 5 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF5	Channel 5 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF5	Channel 5 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	When read, the value after reset is returned.
4	THIF4	Channel 4 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF4	Channel 4 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF4	Channel 4 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF4	Channel 4 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.

Table 21.113 RSCFDnCFDGTINTSTS1 Register Contents (2/2)

Bit Position	Bit Name	Function
0	TSIF4	Channel 4 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When all TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is set to 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when all TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. Clearing the TXQIE bit to 0 also clears this flag to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0.

This flag is also cleared to 0 when the THLIE bit is cleared to 0.

21.5.4.8 RSCFDnCFDGFDCFG — Global FD Configuration Register

Access: RSCFDnCFDGFDCFG register can be read or written in 32-bit unit.
RSCFDnCFDGFDCFGL register can be read or written in 16-bit unit.
RSCFDnCFDGFDCFGLL, RSCFDnCFDGFDCFGLH registers can be read or written in 8-bit unit.

Address: RSCFDnCFDGFDCFG: <RSCANn_base> + 0474_H

RSCFDnCFDGFDCFGL: <RSCANn_base> + 0474_H

RSCFDnCFDGFDCFGLL: <RSCANn_base> + 0474_H,
RSCFDnCFDGFDCFGLH: <RSCANn_base> + 0475_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 21.114 RSCFDnCFDGFDCFG Register Content

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	TSCCFG[1:0]	Timestamp Capture Setting B9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Captured at a sample point of the res bit.*1 1 1: Setting prohibited
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PRED	Protocol Exception Event Detection Disable 0: Protocol exception event detection enabled 1: Protocol exception event detection disabled

Note 1. When a Classical CAN frame is transmitted/received, a timestamp value will be captured at the sample point in the SOF bit.

TSCCFG[1:0] Bits

Select a point where a timestamp value is captured. Modify this bit only in global reset mode.

PRED Bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame will be output. Modify this bit only in global reset mode.

21.5.5 Details of Receive Rule-related Registers

21.5.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register

Access: RSCFDnCFDGAFLECTR register can be read or written in 32-bit units
RSCFDnCFDGAFLECTRL register can be read or written in 16-bit units
RSCFDnCFDGAFLECTRLL, RSCFDnCFDGAFLECTRLH registers can be read or written in 8-bit units

Address: RSCFDnCFDGAFLECTR: <RSCANn_base> + 0098_H

RSCFDnCFDGAFLECTRL: <RSCANn_base> + 0098_H

RSCFDnCFDGAFLECTRLL: <RSCANn_base> + 0098_H,
RSCFDnCFDGAFLECTRLH: <RSCANn_base> + 0099_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 21.115 RSCFDnCFDGAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected from the range of page 0 (00000_B) to page 23 (10111_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 10111_B.

21.5.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCFDnCFDGAFLCFG0 register can be read or written in 32-bit units
RSCFDnCFDGAFLCFG0L, RSCFDnCFDGAFLCFG0H registers can be read or written in 16-bit units
RSCFDnCFDGAFLCFG0LL, RSCFDnCFDGAFLCFG0LH, RSCFDnCFDGAFLCFG0HL,
RSCFDnCFDGAFLCFG0HH registers can be read or written in 8-bit units

Address: RSCFDnCFDGAFLCFG0: <RSCANn_base> + $009C_H$

RSCFDnCFDGAFLCFG0L: <RSCANn_base> + $009C_H$,
RSCFDnCFDGAFLCFG0H: <RSCANn_base> + $009E_H$

RSCFDnCFDGAFLCFG0LL: <RSCANn_base> + $009C_H$,
RSCFDnCFDGAFLCFG0LH: <RSCANn_base> + $009D_H$,
RSCFDnCFDGAFLCFG0HL: <RSCANn_base> + $009E_H$,
RSCFDnCFDGAFLCFG0HH: <RSCANn_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RNC0[7:0]								RNC1[7:0]

Table 21.116 RSCFDnCFDGAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules exclusively used for channel 2.
7 to 0	RNC3[7:0]	Number of Rules for Channel 3 Set the number of receive rules exclusively used for channel 3.

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC3[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 3 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

21.5.5.3 RSCFDnCFDGAFLCFG1 — Receive Rule Configuration Register 1

Access: RSCFDnCFDGAFLCFG1 register can be read or written in 32-bit units
RSCFDnCFDGAFLCFG1H register can be read or written in 16-bit units
RSCFDnCFDGAFLCFG1HL, RSCFDnCFDGAFLCFG1HH registers can be read or written in 8-bit units

Address: RSCFDnCFDGAFLCFG1: <RSCANn_base> + $00A0_H$

RSCFDnCFDGAFLCFG1H: <RSCANn_base> + $00A2_H$

RSCFDnCFDGAFLCFG1HL: <RSCANn_base> + $00A2_H$,
RSCFDnCFDGAFLCFG1HH: <RSCANn_base> + $00A3_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RNC4[7:0]								RNC5[7:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 21.117 RSCFDnCFDGAFLCFG1 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC4[7:0]	Number of Rules for Channel 4 Set the number of receive rules exclusively used for channel 4.
23 to 16	RNC5[7:0]	Number of Rules for Channel 5 Set the number of receive rules exclusively used for channel 5.
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Modify the RSCFDnCFDGAFLCFG1 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC4[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 4 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC5[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 5 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

21.5.5.4 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access: RSCFDnCFDGAFLIDj register can be read or written in 32-bit units
RSCFDnCFDGAFLIDjL, RSCFDnCFDGAFLIDjH registers can be read or written in 16-bit units
RSCFDnCFDGAFLIDjLL, RSCFDnCFDGAFLIDjLH, RSCFDnCFDGAFLIDjHL, RSCFDnCFDGAFLIDjHH registers can be read or written in 8-bit units

Address: RSCFDnCFDGAFLIDj: <RSCANn_base> + 1000_H + (10_H × j)

RSCFDnCFDGAFLIDjL: <RSCANn_base> + 1000_H + (10_H × j),
RSCFDnCFDGAFLIDjH: <RSCANn_base> + 1002_H + (10_H × j)

RSCFDnCFDGAFLIDjLL: <RSCANn_base> + 1000_H + (10_H × j),
RSCFDnCFDGAFLIDjLH: <RSCANn_base> + 1001_H + (10_H × j),
RSCFDnCFDGAFLIDjHL: <RSCANn_base> + 1002_H + (10_H × j),
RSCFDnCFDGAFLIDjHH: <RSCANn_base> + 1003_H + (10_H × j)

Value after reset: 0000 0000_H

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 21.118 RSCFDnCFDGAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

21.5.5.5 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access: RSCFDnCFDGAFLMj register can be read or written in 32-bit units
RSCFDnCFDGAFLMjL, RSCFDnCFDGAFLMjH registers can be read or written in 16-bit units
RSCFDnCFDGAFLMjLL, RSCFDnCFDGAFLMjLH, RSCFDnCFDGAFLMjHL, RSCFDnCFDGAFLMjHH registers can be read or written in 8-bit units

Address: RSCFDnCFDGAFLMj: <RSCANn_base> + 1004_H + (10_H × j)

RSCFDnCFDGAFLMjL: <RSCANn_base> + 1004_H + (10_H × j),
RSCFDnCFDGAFLMjH: <RSCANn_base> + 1006_H + (10_H × j)

RSCFDnCFDGAFLMjLL: <RSCANn_base> + 1004_H + (10_H × j),
RSCFDnCFDGAFLMjLH: <RSCANn_base> + 1005_H + (10_H × j),
RSCFDnCFDGAFLMjHL: <RSCANn_base> + 1006_H + (10_H × j),
RSCFDnCFDGAFLMjHH: <RSCANn_base> + 1007_H + (10_H × j)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDEM	GAFLRTRM	—	GAFLIDM[28:16]

Table 21.119 RSCFDnCFDGAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared
29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCFDnCFDGAFLMj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnCFDGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

21.5.5.6 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access: RSCFDnCFDGAFLP0_j register can be read or written in 32-bit units
RSCFDnCFDGAFLP0_jL, RSCFDnCFDGAFLP0_jH registers can be read or written in 16-bit units
RSCFDnCFDGAFLP0_jLH, RSCFDnCFDGAFLP0_jHL, RSCFDnCFDGAFLP0_jHH registers can be read or written in 8-bit units

Address: RSCFDnCFDGAFLP0_j: <RSCANn_base> + 1008_H + (10_H × j)

RSCFDnCFDGAFLP0_jL: <RSCANn_base> + 1008_H + (10_H × j),
RSCFDnCFDGAFLP0_jH: <RSCANn_base> + $100A_H$ + (10_H × j)

RSCFDnCFDGAFLP0_jLH: <RSCANn_base> + 1009_H + (10_H × j),
RSCFDnCFDGAFLP0_jHL: <RSCANn_base> + $100A_H$ + (10_H × j),

Table 21.120 RSCFDnCFDGAFLP0_j Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 28	GAFLDLC[3:0]	Receive Rule DLC

b31	b30	b29	b28	Classical CAN Frame	CAN FD Frame
0	0	0	0	0 data bytes	
0	0	0	1	1 data byte	
0	0	1	0	2 data bytes	
0	0	1	1	3 data bytes	
0	1	0	0	4 data bytes	
0	1	0	1	5 data bytes	
0	1	1	0	6 data bytes	
0	1	1	1	7 data bytes	
1	0	0	0	8 data bytes	
1	0	0	1	8 data bytes	12 data bytes
1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

27 to 16	GAFLPTR[11:0]	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.

Table 21.120 RSCFDnCFDGAFLP0_j Register Contents (2/2)

Bit Position	Bit Name	Function
7 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Modify the RSCFDnCFDGAFLP0_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCFDnCFDRMNB register.

21.5.5.7 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15)

Access: RSCFDnCFDGAFLP1_j register can be read or written in 32-bit units
RSCFDnCFDGAFLP1_jL, RSCFDnCFDGAFLP1_jH registers can be read or written in 16-bit units
RSCFDnCFDGAFLP1_jLL, RSCFDnCFDGAFLP1_jLH, RSCFDnCFDGAFLP1_jHL,
RSCFDnCFDGAFLP1_jHH registers can be read or written in 8-bit units

Address: RSCFDnCFDGAFLP1_j: <RSCANn_base> + $100C_H$ + (10_H × j)

RSCFDnCFDGAFLP1_jL: <RSCANn_base> +$100C_H$ + (10_H × j),
RSCFDnCFDGAFLP1_jH: <RSCANn_base> + $100E_H$ + (10_H × j)

RSCFDnCFDGAFLP1_jLL: <RSCANn_base> + $100C_H$ + (10_H × j),
RSCFDnCFDGAFLP1_jLH: <RSCANn_base> + $100D_H$ + (10_H × j),
