Rev.1.40 Aug 2018

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

(Rev.4.0-1 November 2017)

General Precautions

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Preface

1. About this Document

This manual describes the functions and electrical characteristics of the Renesas Synergy™ Microcontroller.

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microcontroller (MCU) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas Synergy Microcontroller. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MCU.

3. Renesas Publications

Renesas provides the following documents for the Renesas Synergy Microcontroller. Before using any of these documents, visit renesassynergy.com/docs for the most up-to-date version of the document.

Component	Document type	Description
Microcontrollers	Datasheet	Features, overview, and electrical characteristics of the MCU
	User's Manual: Microcontrollers	MCU specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions
	Application Notes	Technical notes, board design guidelines, and software migration information
	Technical Update (TU)	Preliminary reports on product specifications such as restriction and errata
Software	Datasheet	Functional descriptions and specific performance data for software modules that are included in Renesas Synergy Software Package (SSP)
	User's Manual: Software	API reference including SSP architecture and programming information
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications
Tools & Kits, Solutions	User's Manual: Development Tools	User's manual and quick start guide for developing embedded software applications with Development Kit (DK), Starter Kit (SK), Promotion Kit (PK), Target Board Kit (TB), Product Examples (PE), and Application Examples (AE)
	User's Manual: Software	
	Quick Start Guide	
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications

4. Numbering Notation

The following numbering notation is used throughout this manual:

Example	Description
011b	Binary number. For example, the binary equivalent of the number 3 is 011b.
1Fh	Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 1Fh. In some cases, a hexadecimal number is shown with the prefix 0x, based on C/C++ formatting.
1234	Decimal number. Decimal numbers are generally shown without a suffix.

5. Typographic Notation

The following typographic notation is used throughout this manual:

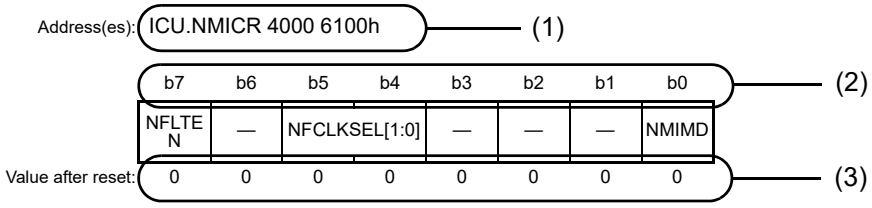
Example	Description
ICU.NMICR.NMIMD	Periods separate a function module symbol (ICU), register symbol (NMICR), and bit field symbol (NMIMD)
ICU.NMICR	A period separates a function module symbol (ICU) and register symbol (NMICR)
NMICR.NMIMD	A period separates a register symbol (NMICR) and bit field symbol (NMIMD)
NFCLKSEL[1:0]	In a register bit name, the bit range enclosed in square brackets indicates the number of bits in the field at this location. In this example, NFCLKSEL[1:0] represents a 2-bit field at the specified location in the NMI Pin Interrupt Control Register (NMICR).

6. Unit Prefix

The following unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

Prefix	Description
b	Bit
B	Byte. This unit prefix is generally used for memory specification of the MCU and address space.
k	1000 = 10^3. k is also used to denote 1024 (2^{10}) but this unit prefix is used to denote 1000 (10^3) throughout this manual.
K	1024 = 2^{10}. This unit prefix is used to denote 1024 (2^{10}) not 1000 (10^3) throughout this manual.

7. Special Terms



The following terms have special meanings:

Term	Description
NC	Not connected pin. NC means the pin is not connected to the MCU.
Hi-Z	High impedance

8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.

X.X.X NMI Pin Interrupt Control Register (NMICR)

(6)

(4) (5)

Bit	Symbol	Bit name	Description	R/W
b0	NMIMD	NMI Detection Set	0: Falling edge 1: Rising edge.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5, b4	NFCLKSEL[1:0]	NMI Digital Filter Sampling Clock Select	b5 b4 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64.	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	NFLTEN	NMI Digital Filter Enable	0: Disable the digital filter 1: Enable the digital filter.	R/W

(1) Function module symbol, register symbol, and address assignment

Function module symbol, register symbol, and address assignment of this register are generally expressed. ICU.NMICR 4000 6100h means NMI Pin Interrupt Control Register (NMICR) of Interrupt Controller Unit (ICU) is assigned to address 4000 6100h.

(2) Bit number

This number indicates the bit number. These bits are shown in order from b31 to b0 for a 32-bit register, from b15 to b0 for a 16-bit register, and from b7 to b0 for an 8-bit register.

(3) Value after reset

This symbol or number indicates the value of each bit after a reset. The value is shown in binary unless specified otherwise.
0: Indicates that the value is 0 after a reset.
1: Indicates that the value is 1 after a reset.
x: Indicates that the value is undefined after a reset.

(4) Bit symbol

Bit symbol indicates the short name of the bit field. Reserved bit is expressed with a —.

(5) Bit name

Bit name indicates the full name of the bit field.

(6) R/W

The R/W column indicates access type: whether the bit field is read or write.
R/W: The bit field is read and write.
R/(W): The bit field is read and write. But writing to this bit field has some limitations. For details on the limitations, see the description or notes of respective registers.
R: The bit field is read-only. Writing to this bit field has no effect.
W: The bit field is write-only. The read value is undefined.

9. Abbreviations

Abbreviations used in this manual are shown in the following table:

Abbreviation	Description
AES	Advanced Encryption Standard
AHB	Advanced High-Performance Bus
AHB-AP	AHB Access Port
APB	Advanced Peripheral Bus
ARC	Alleged RC
ATB	Advanced Trace Bus
BCD	Binary Coded Decimal
BSDL	Boundary Scan Description Language
DES	Data Encryption Standard
DSA	Digital Signature Algorithm
ECC	Elliptic Curve Cryptography
ETB	Embedded Trace Buffer
ETM	Embedded Trace Macrocell
FLL	Frequency Locked Loop
FPU	Floating-Point Unit
GSM	Global System for Mobile communications
HMI	Human Machine Interface
IrDA	Infrared Data Association
LSB	Least Significant Bit
MSB	Most Significant Bit
NVIC	Nested Vector Interrupt Controller
PC	Program Counter
PFS	Port Function Select
PLL	Phase Locked Loop
POR	Power-On Reset
PWM	Pulse Width Modulation
RSA	Rivest Shamir Adleman
SHA	Secure Hash Algorithm
S/H	Sample and Hold
SP	Stack Pointer
SWD	Serial Wire Debug
SW-DP	Serial Wire-Debug Port
TRNG	True Random Number Generator
UART	Universal Asynchronous Receiver/Transmitter

10.2 Register Descriptions 188
10.2.1 CAC Control Register 0 (CACR0) 188
10.2.2 CAC Control Register 1 (CACR1) 189
10.2.3 CAC Control Register 2 (CACR2) 190
10.2.4 CAC Interrupt Control Register (CAICR) 191
10.2.5 CAC Status Register (CASTR) 192
10.2.6 CAC Upper-Limit Value Setting Register (CAULVR) 193
10.2.7 CAC Lower-Limit Value Setting Register (CALLVR) 193
10.2.8 CAC Counter Buffer Register (CACNTBR) 193
10.3 Operation 194
10.3.1 Measuring Clock Frequency 194
10.3.2 Digital Filtering of Signals on CACREF Pin 195
10.4 Interrupt Requests 195
10.5 Usage Note 195
10.5.1 Settings for the Module-Stop Function 195
11. Low Power Modes 196
11.1 Overview 196
11.2 Register Descriptions 200
11.2.1 Standby Control Register (SBYCR) 200
11.2.2 Module Stop Control Register A (MSTPCRA) 201
11.2.3 Module Stop Control Register B (MSTPCRB) 202
11.2.4 Module Stop Control Register C (MSTPCRC) 204
11.2.5 Module Stop Control Register D (MSTPCRD) 205
11.2.6 Operating Power Control Register (OPCCR) 206
11.2.7 Sub Operating Power Control Register (SOPCCR) 207
11.2.8 Snooze Control Register (SNZCR) 209
11.2.9 Snooze End Control Register (SNZEDCR) 209
11.2.10 Snooze Request Control Register (SNZREQCR) 211
11.2.11 Deep Software Standby Control Register (DPSBYCR) 213
11.2.12 Deep Software Standby Interrupt Enable Register 0 (DPSIER0) 214
11.2.13 Deep Software Standby Interrupt Enable Register 1 (DPSIER1) 214
11.2.14 Deep Software Standby Interrupt Enable Register 2 (DPSIER2) 215
11.2.15 Deep Software Standby Interrupt Enable Register 3 (DPSIER3) 216
11.2.16 Deep Software Standby Interrupt Flag Register 0 (DPSIFR0) 217
11.2.17 Deep Software Standby Interrupt Flag Register 1 (DPSIFR1) 218

11.2.18 Deep Software Standby Interrupt Flag Register 2 (DPSIFR2) 219
11.2.19 Deep Software Standby Interrupt Flag Register 3 (DPSIFR3) 220
11.2.20 Deep Software Standby Interrupt Edge Register 0 (DPSIEGR0) 221
11.2.21 Deep Software Standby Interrupt Edge Register 1 (DPSIEGR1) 222
11.2.22 Deep Software Standby Interrupt Edge Register 2 (DPSIEGR2) 222
11.2.23 System Control OCD Control Register (SYOCDCR) 223
11.2.24 Standby Condition Register (STCONR) 224
11.3 Reducing Power Consumption by Switching Clock Signals 224
11.4 Module-Stop Function 224
11.5 Function for Lower Operating Power Consumption 225
11.5.1 Setting the Operating Power Control Mode 225
11.6 Sleep Mode 226
11.6.1 Transition to Sleep Mode 226
11.6.2 Canceling Sleep Mode 227
11.7 Software Standby Mode 227
11.7.1 Transition to Software Standby Mode 227
11.7.2 Canceling Software Standby Mode 228
11.7.3 Example of Software Standby Mode Application 229
11.8 Snooze Mode 229
11.8.1 Transition to Snooze Mode 229
11.8.2 Canceling Snooze Mode 230
11.8.3 Return to Software Standby Mode 231
11.8.4 Snooze Operation Example 233
11.9 Deep Software Standby Mode 236
11.9.1 Transition to Deep Software Standby Mode 236
11.9.2 Canceling Deep Software Standby Mode 236
11.9.3 Pin States when Deep Software Standby Mode is Canceled 237
11.9.4 Example of Deep Software Standby Mode Application 238
11.9.5 Usage Flow for Deep Software Standby Mode 239
11.10 Usage Notes 240
11.10.1 Register Access 240
11.10.2 I/O Port States 241
11.10.3 Module-Stop State of DMAC and DTC 241
11.10.4 Internal Interrupt Sources 241
11.10.5 Input Buffer Control by the DIRQnE Bit (n = 0 to 15) 241
11.10.6 Transition to Low Power Modes 242
11.10.7 Timing of WFI Instruction 242
11.10.8 Writing to the WDT and IWDT Registers by the DMAC or DTC in Sleep or Snooze Mode 242
11.10.9 Oscillators in Snooze Mode 242
11.10.10 Snooze Mode Entry by RXD0 Falling Edge 242
11.10.11 Using SCI0 in Snooze Mode 242

11.10.12 Conditions of A/D Conversion Start in Snooze Mode 242
11.10.13 Conditions of CTSU in Snooze Mode 242
11.10.14 ELC Events in Snooze Mode 243
11.10.15 Restrictions on Wakeup from Software Standby Mode 243
11.10.16 Module-Stop Function for ADC12 245
12. Battery Backup Function 246
12.1 Overview 246
12.1.1 Features of Battery Backup Function 246
12.1.2 Battery Power Supply Switch 246
12.1.3 Backup Registers 246
12.1.4 Time Capture Pin Detection 246
12.2 Register Descriptions 247
12.2.1 VBATT Backup Register (VBTBKRn) (n = 0 to 511) 247
12.2.2 VBATT Input Control Register (VBTICTLR) 248
12.3 Operation 248
12.3.1 Battery Backup Function 248
12.3.2 VBATT Battery Power Supply Switch Usage 250
12.3.3 VBATT Backup Register Usage 250
12.4 Usage Notes 250
13. Register Write Protection 251
13.1 Overview 251
13.2 Register Descriptions 251
13.2.1 Protect Register (PRCR) 251
14. Interrupt Controller Unit (ICU) 252
14.1 Overview 252
14.2 Register Descriptions 253
14.2.1 IRQ Control Register i (IRQCRi) (i = 0 to 15) 254
14.2.2 Non-Maskable Interrupt Status Register (NMISR) 255
14.2.3 Non-Maskable Interrupt Enable Register (NMIER) 257
14.2.4 Non-Maskable Interrupt Status Clear Register (NMICLR) 259
14.2.5 NMI Pin Interrupt Control Register (NMICR) 260
14.2.6 ICU Event Link Setting Register n (IELSRn) (n = 0 to 95) 261
14.2.7 DMAC Event Link Setting Register n (DELSRn) (n = 0 to 7) 262
14.2.8 SYS Event Link Setting Register (SELSR0) 262
14.2.9 Wake Up Interrupt Enable Register (WUPEN) 263
14.3 Vector Table 265
14.3.1 Interrupt Vector Table 265
14.3.2 Event Numbers 267
14.4 Interrupt Operation 276
14.4.1 Detecting Interrupts 276
14.4.2 Selecting Interrupt Request Destinations 277

14.4.3 Digital Filter ... 278
14.4.4 External Pin Interrupts ... 279
14.5 Non-Maskable Interrupt Operation ... 280
14.6 Return from Low Power Modes ... 281
14.6.1 Return from Sleep Mode ... 281
14.6.2 Return from Software Standby Mode ... 281
14.6.3 Return from Snooze Mode ... 281
14.7 Using the WFI Instruction with Non-Maskable Interrupts ... 281
14.8 Reference ... 281
15. Buses ... 282
15.1 Overview ... 282
15.2 Description of Buses ... 284
15.2.1 Main Buses ... 284
15.2.2 Slave Interface ... 284
15.2.3 External Bus ... 284
15.2.4 Parallel Operations ... 287
15.2.5 Bus Settings ... 287
15.2.6 Restrictions ... 287
15.3 Register Descriptions ... 288
15.3.1 CSn Control Register (CSnCR) (n = 0 to 7) ... 288
15.3.2 CSn Recovery Cycle Register (CSnREC) (n = 0 to 7) ... 289
15.3.3 CS Recovery Cycle Insertion Enable Register (CSRECEN) ... 290
15.3.4 CSn Mode Register (CSnMOD) (n = 0 to 7) ... 291
15.3.5 CSn Wait Control Register 1 (CSnWCR1) (n = 0 to 7) ... 292
15.3.6 CSn Wait Control Register 2 (CSnWCR2) (n = 0 to 7) ... 294
15.3.7 SDC Control Register (SDCCR) ... 296
15.3.8 SDC Mode Register (SDCMOD) ... 297
15.3.9 SDRAM Access Mode Register (SDAMOD) ... 297
15.3.10 SDRAM Self-Refresh Control Register (SDSELF) ... 298
15.3.11 SDRAM Refresh Control Register (SDRFCR) ... 298
15.3.12 SDRAM Auto-Refresh Control Register (SDRFEN) ... 299
15.3.13 SDRAM Initialization Sequence Control Register (SDICR) ... 300
15.3.14 SDRAM Initialization Register (SDIR) ... 300
15.3.15 SDRAM Address Register (SDADR) ... 302
15.3.16 SDRAM Timing Register (SDTR) ... 302
15.3.17 SDRAM Mode Register (SDMOD) ... 304
15.3.18 SDRAM Status Register (SDSR) ... 304
15.3.19 Master Bus Control Register (BUSMCNT<master>) ... 305
15.3.20 Slave Bus Control Register (BUSSCNT<slave>) ... 306
15.3.21 Bus Error Address Register (BUSnERRADD) (n = 1 to 11) ... 308
15.3.22 Bus Error Status Register (BUSnERRSTAT) (n = 1 to 11) ... 308

15.4 Endianness and Data Alignment 310
15.4.1 Data Alignment Control for the CS Areas 310
15.4.2 Data Alignment Control for the SDRAM Area 312
15.5 Operation of CS Area Controller 314
15.5.1 Separate Bus 314
15.5.2 External Wait Function 323
15.5.3 Insertion of Recovery Cycles 324
15.5.4 No Access State 327
15.5.5 Write Buffer Function (External Bus) 327
15.5.6 Restrictions 328
15.6 SDRAM Area Controller Operation 328
15.6.1 Enabling/Disabling SDRAM Access and Setting the SDRAM Bus Width 328
15.6.2 No Access State 328
15.6.3 Insertion of Recovery Cycles 328
15.6.4 Write Buffer Function 329
15.6.5 SDRAM Commands 329
15.6.6 Conditions for Setting the SDRAMC Registers 330
15.6.7 Self-Refresh 330
15.6.8 Auto-Refresh 332
15.6.9 Initialization Sequencer 334
15.6.10 Setting the Mode Register 334
15.6.11 SDRAMC Setting Examples 335
15.6.12 Address Multiplexing 346
15.6.13 Example SDRAM Connections 347
15.6.14 Restrictions 349
15.7 Bus Error Monitoring Section 350
15.7.1 Bus Error Types 350
15.7.2 Operation When a Bus Error Occurs 350
15.7.3 Conditions Leading to Illegal Address Access Errors 350
15.7.4 Timeout 351
15.8 Constraint on Using the Flash Cache 351
15.9 References 351
16. Memory Protection Unit (MPU) 352

17. DMA Controller (DMAC) ... 383
17.1 Overview ... 383
17.2 Register Descriptions ... 385
17.2.1 DMA Source Address Register (DMSAR) ... 385
17.2.2 DMA Destination Address Register (DMDAR) ... 385
17.2.3 DMA Transfer Count Register (DMCRA) ... 386
17.2.4 DMA Block Transfer Count Register (DMCRB) ... 387
17.2.5 DMA Transfer Mode Register (DMTMD) ... 387
17.2.6 DMA Interrupt Setting Register (DMINT) ... 388
17.2.7 DMA Address Mode Register (DMAMD) ... 389
17.2.8 DMA Offset Register (DMOFR) ... 391
17.2.9 DMA Transfer Enable Register (DMCNT) ... 391
17.2.10 DMA Software Start Register (DMREQ) ... 392
17.2.11 DMA Status Register (DMSTS) ... 393
17.2.12 DMACA Module Activation Register (DMAST) ... 394
17.3 Operation ... 395
17.3.1 Transfer Mode ... 395
17.3.2 Extended Repeat Area Function ... 398
17.3.3 Address Update Function Using Offset ... 399
17.3.4 Activation Sources ... 403
17.3.5 Operation Timing ... 403
17.3.6 Execution Cycles of DMAC ... 404
17.3.7 Activating the DMAC ... 405
17.3.8 Starting DMA Transfer ... 406
17.3.9 Registers during DMA Transfer ... 406
17.3.10 Channel Priority ... 407
17.4 Ending DMA Transfer ... 407
17.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations ... 407
17.4.2 Transfer End by Repeat Size End Interrupt ... 407
17.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow ... 408
17.4.4 Precautions for the End of DMA Transfer ... 408
17.5 Interrupts ... 409
17.6 Event Link ... 410
17.7 Low-Power Functions ... 410
17.8 Usage Notes ... 411
17.8.1 DMA Transfer to External Devices ... 411
17.8.2 Access to Registers during DMA Transfer ... 411

17.8.3 DMA Transfer to Reserved Areas 411
17.8.4 Setting the DMAC Event Link Setting Register (DELSRn) of the Interrupt Controller Unit 411
17.8.5 Suspending or Restarting DMA Activation 411
18. Data Transfer Controller (DTC) 412
18.1 Overview 412
18.2 Register Descriptions 414
18.2.1 DTC Mode Register A (MRA) 414
18.2.2 DTC Mode Register B (MRB) 415
18.2.3 DTC Transfer Source Register (SAR) 416
18.2.4 DTC Transfer Destination Register (DAR) 416
18.2.5 DTC Transfer Count Register A (CRA) 417
18.2.6 DTC Transfer Count Register B (CRB) 418
18.2.7 DTC Control Register (DTCCR) 418
18.2.8 DTC Vector Base Register (DTCVBR) 419
18.2.9 DTC Module Start Register (DTCST) 419
18.2.10 DTC Status Register (DTCSTS) 420
18.3 Activation Sources 420
18.3.1 Allocating Transfer information and the DTC Vector Table 421
18.4 Operation 422
18.4.1 Transfer information Read Skip Function 424
18.4.2 Transfer information Write-Back Skip Function 425
18.4.3 Normal Transfer Mode 425
18.4.4 Repeat Transfer Mode 426
18.4.5 Block Transfer Mode 427
18.4.6 Chain Transfer 428
18.4.7 Operation Timing 429
18.4.8 Execution Cycles of DTC 431
18.4.9 DTC Bus Mastership Release Timing 431
18.5 DTC Setting Procedure 432
18.6 Examples of DTC Usage 433
18.6.1 Normal Transfer 433
18.6.2 Chain Transfer 433
18.6.3 Chain Transfer When Counter = 0 435
18.7 Interrupt Sources 436
18.8 Event Link 436
18.9 Snooze Control Interface 436
18.10 Module-Stop Function 437
18.11 Usage Notes 437
18.11.1 Transfer information Start Address 437
19. Event Link Controller (ELC) 438
19.1 Overview 438

19.2 Register Descriptions ... 439
19.2.1 Event Link Controller Register (ELCR) ... 439
19.2.2 Event Link Software Event Generation Register n (ELSEGRn) (n = 0, 1) ... 439
19.2.3 Event Link Setting Register n (ELSRn) (n = 0 to 18) ... 440
19.3 Operation ... 447
19.3.1 Relation between Interrupt Handling and Event Linking ... 447
19.3.2 Linking Events ... 447
19.3.3 Example Procedure for Linking Events ... 447
19.4 Usage Notes ... 448
19.4.1 Linking DMAC or DTC Transfer End Signals as Events ... 448
19.4.2 Setting Clocks ... 448
19.4.3 Settings for the Module-Stop Function ... 448
19.4.4 ELC Delay Time ... 448
20. I/O Ports ... 449
20.1 Overview ... 449
20.2 Register Descriptions ... 451
20.2.1 Port Control Register 1 (PCNTR1/PODR/PDR) ... 451
20.2.2 Port Control Register 2 (PCNTR2/EIDR/PIDR) ... 452
20.2.3 Port Control Register 3 (PCNTR3/PORR/POSR) ... 453
20.2.4 Port Control Register 4 (PCNTR4/EORR/EOSR) ... 454
20.2.5 Port mn Pin Function Select Register (PmnPFS/PmnPFS_HA/PmnPFS_BY) (m = 0 to 9, A, B; n = 00 to 15) ... 455
20.2.6 Write-Protect Register (PWPR) ... 457
20.2.7 Ethernet Control Register (PFENET) ... 457
20.3 Operation ... 458
20.3.1 General I/O Ports ... 458
20.3.2 Port Function Select ... 458
20.3.3 Port Group Function for the ELC ... 458
20.4 Handling of Unused Pins ... 460
20.5 Usage Notes ... 460
20.5.1 Procedure for Specifying the Pin Functions ... 460
20.5.2 Procedure for Using Port Group Input ... 461
20.5.3 Port Output Data Register (PODR) Summary ... 461
20.5.4 Notes on Using Analog Functions ... 461
20.5.5 I/O Buffer Specification ... 461
20.6 Peripheral Select Settings for Each Product ... 462
20.7 Notes on the PmnPFS Register Setting ... 462
21. Key Interrupt Function (KINT) ... 475
21.1 Overview ... 475
21.2 Register Descriptions ... 477
21.2.1 Key Return Control Register (KRCTL) ... 477
21.2.2 Key Return Flag Register (KRF) ... 477

21.2.3 Key Return Mode Register (KRM) ... 477
21.3 Operation ... 478
21.3.1 Operation When Not Using the Key Interrupt Flags (KRMD = 0) ... 478
21.3.2 Operation When Using the Key Interrupt Flags (KRMD = 1) ... 479
21.4 Usage Notes ... 480
22. Port Output Enable for GPT (POEG) ... 481
22.1 Overview ... 481
22.2 Register Descriptions ... 483
22.2.1 POEG Group n Setting Register (POEGGn) (n = A to D) ... 483
22.3 Output-Disable Control Operation ... 484
22.3.1 Pin Input Level Detection Operation ... 484
22.3.2 Output-Disable Requests from the GPT ... 485
22.3.3 Comparator Interrupt Detection ... 485
22.3.4 Output-Disable Control Using Detection of Stopped Oscillation ... 485
22.3.5 Output-Disable Control Using Registers ... 485
22.3.6 Release from Output-Disable ... 485
22.4 Interrupt Sources ... 486
22.5 External Trigger Output to the GPT ... 487
22.6 Usage Notes ... 487
22.6.1 Transition to Software Standby Mode ... 487
22.6.2 Specifying Pins Associated with the GPT ... 487
23. General PWM Timer (GPT) ... 488
23.1 Overview ... 488
23.2 Register Descriptions ... 492
23.2.1 General PWM Timer Write-Protection Register (GTWP) ... 494
23.2.2 General PWM Timer Software Start Register (GTSTR) ... 495
23.2.3 General PWM Timer Software Stop Register (GTSTP) ... 496
23.2.4 General PWM Timer Software Clear Register (GTCLR) ... 496
23.2.5 General PWM Timer Start Source Select Register (GTSSR) ... 497
23.2.6 General PWM Timer Stop Source Select Register (GTPSR) ... 500
23.2.7 General PWM Timer Clear Source Select Register (GTCSR) ... 503
23.2.8 General PWM Timer Up Count Source Select Register (GTUPSR) ... 506
23.2.9 General PWM Timer Down Count Source Select Register (GTDNSR) ... 509
23.2.10 General PWM Timer Input Capture Source Select Register A(GTICASR) ... 512
23.2.11 General PWM Timer Input Capture Source Select Register B(GTICBSR) ... 515
23.2.12 General PWM Timer Control Register (GTCR) ... 518
23.2.13 General PWM Timer Count Direction and Duty Setting Register (GTUDDTYC) ... 519
23.2.14 General PWM Timer I/O Control Register (GTIOR) ... 521
23.2.15 General PWM Timer Interrupt Output Setting Register (GTINTAD) ... 525
23.2.16 General PWM Timer Status Register (GTST) ... 527
23.2.17 General PWM Timer Buffer Enable Register (GTBER) ... 532

23.2.18 General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register (GTITC) 535
23.2.19 General PWM Timer Counter (GTCNT) 537
23.2.20 General PWM Timer Compare Capture Register n (GTCCRn) (n = A to F) 537
23.2.21 General PWM Timer Cycle Setting Register (GTPR) 538
23.2.22 General PWM Timer Cycle Setting Buffer Register (GTPBR) 538
23.2.23 General PWM Timer Cycle Setting Double-Buffer Register (GTPDBR) 538
23.2.24 A/D Converter Start Request Timing Register m (GTADTRm) (m = A, B) 539
23.2.25 A/D Converter Start Request Timing Buffer Register m (GTADTBRm) (m = A, B) 539
23.2.26 A/D Converter Start Request Timing Double-Buffer Register m (GTADTDBRm) (m = A, B) 540
23.2.27 General PWM Timer Dead Time Control Register (GTDTCR) 540
23.2.28 General PWM Timer Dead Time Value Register m (GTDVm) (m = U, D) 542
23.2.29 General PWM Timer Dead Time Buffer Register m (GTDBm) (m = U, D) 542
23.2.30 General PWM Timer Output Protection Function Status Register (GTSOS) 543
23.2.31 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR) 543
23.2.32 Output Phase Switching Control Register (OPSCR) 544
23.3 Operation 546
23.3.1 Basic Operation 546
23.3.2 Buffer Operation 556
23.3.3 PWM Output Operating Mode 567
23.3.4 Automatic Dead Time Setting Function 579
23.3.5 Count Direction Changing Function 584
23.3.6 Function of Output Duty 0% and 100% 585
23.3.7 Hardware Count Start/Count Stop and Clear Operation 587
23.3.8 Synchronized Operation 593
23.3.9 PWM Output Operation Examples 597
23.3.10 Phase Counting Function 603
23.3.11 Output Phase Switching (GPT_OPS) 608
23.4 Interrupt Sources 615
23.4.1 Interrupt Sources 615
23.4.2 DMAC/DTC Activation 621
23.4.3 Interrupt and A/D Conversion Request Skipping Function 621
23.5 A/D Converter Start Request 625
23.6 Operations Linked by the ELC 628
23.6.1 Event Signal Output to the ELC 628
23.6.2 Event Signal Inputs from the ELC 628
23.7 Noise Filter Function 628
23.8 Protection Function 629
23.8.1 Write-Protection for Registers 629

23.8.2 Disabling of Buffer Operation 629
23.8.3 GTIOC Pin Output Negate Control 630
23.8.4 Output Protection Function for GTIOC Pin Output 631
23.9 Initialization Method of Output Pins 636
23.9.1 Pin Settings after Reset 636
23.9.2 Pin Initialization Caused by Error during Operation 637
23.10 Usage Notes 637
23.10.1 Settings for the Module-Stop Function 637
23.10.2 GTCCRn Settings during Compare Match Operation (n = A to F) 637
23.10.3 Setting Range for the GTCNT Counter 638
23.10.4 Starting and Stopping the GTCNT Counter 638
23.10.5 Priority Order of Each Event 638
24. PWM Delay Generation Circuit 640
24.1 Overview 640
24.2 Register Descriptions 641
24.2.1 PWM Output Delay Control Register (GTDLYCR) 641
24.2.2 PWM Output Delay Control Register 2 (GTDLYCR2) 642
24.2.3 GTIOCnA Rising Output Delay Register (GTDLYRnA) (n = 0 to 3) 643
24.2.4 GTIOCnA Falling Output Delay Register (GTDLYFnA) (n = 0 to 3) 644
24.2.5 GTIOCnB Rising Output Delay Register (GTDLYRnB) (n = 0 to 3) 645
24.2.6 GTIOCnB Falling Output Delay Register (GTDLYFnB) (n = 0 to 3) 646
24.3 Operation 647
24.3.1 Adjustments to the Timing of Rising and Falling Edges in PWM Waveforms 647
24.3.2 Timing for Transfer of GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB Register Settings 648
24.4 Usage Notes 649
24.4.1 Settings for the Module-Stop Function 649
24.4.2 Notes on Delay Settings for PWM Delay Generation Circuit 649
25. Asynchronous General-Purpose Timer (AGT) 651
25.1 Overview 651
25.2 Register Descriptions 653
25.2.1 AGT Counter Register (AGT) 653
25.2.2 AGT Compare Match A Register (AGTCMA) 653
25.2.3 AGT Compare Match B Register (AGTCMB) 654
25.2.4 AGT Control Register (AGTCR) 654
25.2.5 AGT Mode Register 1 (AGTMR1) 656
25.2.6 AGT Mode Register 2 (AGTMR2) 657
25.2.7 AGT I/O Control Register (AGTIOC) 658
25.2.8 AGT Event Pin Select Register (AGTISR) 659
25.2.9 AGT Compare Match Function Select Register (AGTCMSR) 659
25.2.10 AGT Pin Select Register (AGTIOSEL) 660

25.3 Operation 661
25.3.1 Reload Register and Counter Rewrite Operation 661
25.3.2 Reload Register and Compare Register A/B Rewrite Operation 663
25.3.3 Timer Mode 664
25.3.4 Pulse Output Mode 665
25.3.5 Event Counter Mode 666
25.3.6 Pulse Width Measurement Mode 667
25.3.7 Pulse Period Measurement Mode 668
25.3.8 Compare Match Function 669
25.3.9 Output Settings for Each Mode 670
25.3.10 Standby Mode 671
25.3.11 Interrupt Sources 672
25.3.12 Output to the Event Link Controller (ELC) 672
25.4 Usage Notes 672
25.4.1 Count Operation Start and Stop Control 672
25.4.2 Access to Counter Register 673
25.4.3 When Changing Mode 673
25.4.4 Digital Filter 673
25.4.5 How to Calculate Event Number, Pulse Width, and Pulse Period 673
25.4.6 When Count Is Forcibly Stopped by TSTOP Bit 673
25.4.7 When Selecting AGT0 Underflow as the Count Source 674
25.4.8 Reset of I/O Register 674
25.4.9 When Selecting PCLKB, PCLKB/8, or PCLKB/2 as the Count Source 674
25.4.10 When Selecting AGTSCLK or AGTLCLK as the Count Source 674
26. Realtime Clock (RTC) 675
26.1 Overview 675
26.2 Register Descriptions 677
26.2.1 64-Hz Counter (R64CNT) 677
26.2.2 Second Counter (RSECCNT)/Binary Counter 0 (BCNT0) 677
26.2.3 Minute Counter (RMINCNT)/Binary Counter 1 (BCNT1) 678
26.2.4 Hour Counter (RHRCNT)/Binary Counter 2 (BCNT2) 679
26.2.5 Day-of-Week Counter (RWKCNT)/Binary Counter 3 (BCNT3) 680
26.2.6 Day Counter (RDAYCNT) 681
26.2.7 Month Counter (RMONCNT) 681
26.2.8 Year Counter (RYRCNT) 682
26.2.9 Second Alarm Register (RSECAR)/Binary Counter 0 Alarm Register (BCNT0AR) 683
26.2.10 Minute Alarm Register (RMINAR)/Binary Counter 1 Alarm Register (BCNT1AR) 684
26.2.11 Hour Alarm Register (RHRAR)/Binary Counter 2 Alarm Register (BCNT2AR) 685
26.2.12 Day-of-Week Alarm Register (RWKAR)/Binary Counter 3 Alarm Register (BCNT3AR) 686
26.2.13 Date Alarm Register (RDAYAR)/Binary Counter 0 Alarm Enable Register (BCNT0AER) 687

26.2.14 Month Alarm Register (RMONAR)/Binary Counter 1 Alarm Enable Register (BCNT1AER) 688
26.2.15 Year Alarm Register (RYRAR)/Binary Counter 2 Alarm Enable Register (BCNT2AER) 689
26.2.16 Year Alarm Enable Register (RYRAREN)/Binary Counter 3 Alarm Enable Register (BCNT3AER) 690
26.2.17 RTC Control Register 1 (RCR1) 691
26.2.18 RTC Control Register 2 (RCR2) 692
26.2.19 RTC Control Register 4 (RCR4) 695
26.2.20 Frequency Register (RFRH/RFRL) 695
26.2.21 Time Error Adjustment Register (RADJ) 696
26.2.22 Time Capture Control Register y (RTCCRy) (y = 0 to 2) 697
26.2.23 Second Capture Register y (RSECCPy) (y = 0 to 2)/BCNT0 Capture Register y (BCNT0CPy) (y = 0 to 2) 698
26.2.24 Minute Capture Register y (RMINCPy) (y = 0 to 2)/BCNT1 Capture Register y (BCNT1CPy) (y = 0 to 2) 699
26.2.25 Hour Capture Register y (RHRCPy) (y = 0 to 2)/BCNT2 Capture Register y (BCNT2CPy) (y = 0 to 2) 700
26.2.26 Date Capture Register y (RDAYCPy) (y = 0 to 2)/BCNT3 Capture Register y (BCNT3CPy) (y = 0 to 2) 701
26.2.27 Month Capture Register y (RMONCPy) (y = 0 to 2) 702
26.3 Operation 702
26.3.1 Outline of Initial Settings of Registers after Power On 702
26.3.2 Clock and Count Mode Setting Procedure 703
26.3.3 Setting the Time 704
26.3.4 30-Second Adjustment 704
26.3.5 Reading 64-Hz Counter and Time 705
26.3.6 Alarm Function 706
26.3.7 Procedure for Disabling Alarm Interrupt 707
26.3.8 Time Error Adjustment Function 707
26.4 Interrupt Sources 710
26.5 Output to the Event Link Controller (ELC) 711
26.5.1 Interrupt Handling and Event Linking 711
26.6 Usage Notes 712
26.6.1 Register Writing during Counting 712
26.6.2 Use of Periodic Interrupts 712
26.6.3 RTCOUT (1-Hz/64-Hz) Clock Output 713
26.6.4 Transitions to Low Power Modes after Setting Registers 713
26.6.5 Notes on Writing to and Reading from Registers 713
26.6.6 Changing the Count Mode 713
26.6.7 Initialization Procedure When the Realtime Clock Is Not to Be Used 713
27. Watchdog Timer (WDT) 715
27.1 Overview 715

27.2 Register Descriptions ... 716
27.2.1 WDT Refresh Register (WDTRR) ... 716
27.2.2 WDT Control Register (WDTCR) ... 716
27.2.3 WDT Status Register (WDTSR) ... 719
27.2.4 WDT Reset Control Register (WDTRCR) ... 720
27.2.5 WDT Count Stop Control Register (WDTCSTPR) ... 720
27.2.6 Option Function Select Register 0 (OFS0) ... 720
27.3 Operation ... 721
27.3.1 Count Operation in Each Start Mode ... 721
27.3.2 Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers ... 724
27.3.3 Refresh Operation ... 724
27.3.4 Reset Output ... 725
27.3.5 Interrupt Sources ... 725
27.3.6 Reading the Down-Counter Value ... 725
27.3.7 Associations between Option Function Select Register 0 (OFS0) and WDT Registers ... 726
27.4 Output to the Event Link Controller (ELC) ... 726
27.5 Usage Notes ... 726
27.5.1 Restrictions on the ICU Event Link Setting Register n (IELSRn) Setting ... 726
28. Independent Watchdog Timer (IWDT) ... 727
28.1 Overview ... 727
28.2 Register Descriptions ... 728
28.2.1 IWDT Refresh Register (IWDTRR) ... 728
28.2.2 IWDT Status Register (IWDTSR) ... 729
28.2.3 Option Function Select Register 0 (OFS0) ... 730
28.3 Operation ... 732
28.3.1 Auto-Start Mode ... 732
28.3.2 Refresh Operation ... 733
28.3.3 Status Flags ... 734
28.3.4 Reset Output ... 735
28.3.5 Interrupt Sources ... 735
28.3.6 Reading the Down-Counter Value ... 735
28.4 Output to the Event Link Controller (ELC) ... 735
28.5 Usage Notes ... 736
28.5.1 Refresh Operations ... 736
28.5.2 Restrictions on the Clock Division Ratio Setting ... 736
29. Ethernet MAC Controller (ETHERC) ... 737
29.1 Overview ... 737
29.2 Register Descriptions ... 740
29.2.1 ETHERC Mode Register (ECMR) ... 740
29.2.2 Receive Frame Maximum Length Register (RFLR) ... 741
29.2.3 ETHERC Status Register (ECSR) ... 742

29.2.4 ETHERC Interrupt Enable Register (ECSIPR) ... 743
29.2.5 PHY Interface Register (PIR) ... 743
29.2.6 PHY Status Register (PSR) ... 744
29.2.7 Random Number Generation Counter Upper Limit Setting Register (RDMLR) ... 744
29.2.8 Interpacket Gap Register (IPGR) ... 745
29.2.9 Automatic PAUSE Frame Register (APR) ... 745
29.2.10 Manual PAUSE Frame Register (MPR) ... 746
29.2.11 Received PAUSE Frame Counter (RFCF) ... 746
29.2.12 PAUSE Frame Retransmit Count Setting Register (TPAUSER) ... 747
29.2.13 PAUSE Frame Retransmit Counter (TPAUSECR) ... 747
29.2.14 Broadcast Frame Receive Count Setting Register (BCFRR) ... 748
29.2.15 MAC Address Upper Bit Register (MAHR) ... 748
29.2.16 MAC Address Lower Bit Register (MALR) ... 749
29.2.17 Transmit Retry Over Counter Register (TROCR) ... 749
29.2.18 Late Collision Detect Counter Register (CDCR) ... 750
29.2.19 Lost Carrier Counter Register (LCCR) ... 750
29.2.20 Carrier Not Detect Counter Register (CNDCR) ... 751
29.2.21 CRC Error Frame Receive Counter Register (CEFCR) ... 751
29.2.22 Frame Receive Error Counter Register (FRECR) ... 752
29.2.23 Too-Short Frame Receive Counter Register (TSFRCR) ... 752
29.2.24 Too-Long Frame Receive Counter Register (TLFRCR) ... 753
29.2.25 Received Alignment Error Frame Counter Register (RFCR) ... 753
29.2.26 Multicast Address Frame Receive Counter Register (MAFCR) ... 754
29.3 Operation ... 754
29.3.1 Transmission ... 754
29.3.2 Reception ... 756
29.3.3 Frame Timing ... 757
29.3.4 Accessing the MII and RMII Registers ... 759
29.3.5 Magic Packet Detection ... 761
29.3.6 Adjusting Transmission Efficiency by Changing the IPG ... 761
29.3.7 Flow Control ... 762
29.4 Interrupts ... 763
29.5 Usage Notes ... 763
29.5.1 Preventing the LCHNG Flag from Erroneously Setting to 1 ... 763
29.5.2 Input to RMIIn_RX_ER Pin While RMII Is Selected ... 763
30. Ethernet PTP Controller (EPTPC) ... 764
30.1 Overview ... 764
30.1.1 Combination of Clock Device and Ethernet Port ... 765
30.1.2 Frame Format of PTP Messages ... 766
30.1.3 PTP Message Type and Processing Details ... 767
30.2 Register Descriptions ... 768

30.2.1 ETHER_MINT Interrupt Source Status Register (MIESR) 768
30.2.2 ETHER_MINT Interrupt Request Enable Register (MIEIPR) 771
30.2.3 ELC Output/ETHER_IPLS Interrupt Request Permission Register (ELIPPR) 772
30.2.4 ELC Output/ETHER_IPLS Interrupt Permission Automatic Clearing Register (ELIPACR) 773
30.2.5 STCA Status Register (STSR) 775
30.2.6 STCA Status Notification Enable Register (STIPR) 776
30.2.7 STCA Clock Frequency Setting Register (STCFR) 776
30.2.8 STCA Operating Mode Register (STMR) 777
30.2.9 Sync Message Reception Timeout Register (SYNTOR) 779
30.2.10 ETHER_IPLS Interrupt Request Timer Select Register (IPTSELR) 779
30.2.11 ETHER_MINT Interrupt Request Timer Select Register (MITSELR) 780
30.2.12 ELC Output Timer Select Register (ELTSELR) 781
30.2.13 Time Synchronization Channel Select Register (STCHSELR) 782
30.2.14 Slave Time Synchronization Start Register (SYNSTARTR) 782
30.2.15 Local Clock Counter Initial Value Load Directive Register (LCIVLDR) 783
30.2.16 Synchronization Loss Detection Threshold Register (SYNTDARU, SYNTDARL) 783
30.2.17 Synchronization Detection Threshold Register (SYNTDBRU, SYNTDBRL) 784
30.2.18 Local Clock Counter Initial Value Register (LCIVRU, LCIVRM, LCIVRL) 785
30.2.19 Worst 10 Acquisition Directive Register (GETW10R) 786
30.2.20 Positive Gradient Limit Register (PLIMITRU, PLIMITRM, PLIMITRL) 787
30.2.21 Negative Gradient Limit Register (MLIMITRU, MLIMITRM, MLIMITRL) 788
30.2.22 Statistical Information Retention Control Register (GETINFOR) 790
30.2.23 Local Clock Counter (LCCVRU, LCCVRM, LCCVRL) 790
30.2.24 Positive Gradient Worst 10 Value Register (PW10VRU, PW10VRM, PW10VRL) 792
30.2.25 Negative Gradient Worst 10 Value Register (MW10RU, MW10RM, MW10RL) 793
30.2.26 Timer Start Time Setting Register m (TMSTTRUm, TMSTTRLm) (m = 0 to 5) 794
30.2.27 Timer Cycle Setting Registers m (TMCYCRm) (m = 0 to 5) 795
30.2.28 Timer Pulse Width Setting Register m (TMPLSRm) (m = 0 to 5) 795
30.2.29 Timer Start Register (TMSTARTR) 796
30.2.30 PRC-TC Status Register (PRSR) 797
30.2.31 PRC-TC Status Notification Enable Register (PRIPR) 798
30.2.32 Channel 0 Local MAC Address Register (PRMACRU0, PRMACRL0) 799
30.2.33 Channel 1 Local MAC Address Register (PRMACRU1, PRMACRL1) 800
30.2.34 Packet Transmission Control Register (TRNDISR) 801
30.2.35 Relay Mode Register (TRNMR) 801
30.2.36 Cut-Through Transfer Start Threshold Register (TRNCTTDR) 802
30.2.37 SYNFP Status Register (SYSR) 803
30.2.38 SYNFP Status Notification Enable Register (SYIPR) 805
30.2.39 SYNFP MAC Address Register (SYMACRU, SYMACRL) 806
30.2.40 SYNFP LLC-CTL Value Register (SYLLCCTLR) 807

30.2.41 SYNFP Local IP Address Register (SYIPADDRR) ... 807
30.2.42 SYNFP Specification Version Setting Register (SYSPVRR) ... 808
30.2.43 SYNFP Domain Number Setting Register (SYDOMR) ... 808
30.2.44 Announce Message Flag Field Setting Register (ANFR) ... 809
30.2.45 Sync Message Flag Field Setting Register (SYNFR) ... 810
30.2.46 Delay_Req Message Flag Field Setting Register (DYRQFR) ... 810
30.2.47 Delay_Resp Message Flag Field Setting Register (DYRPFR) ... 811
30.2.48 SYNFP Local Clock ID Register (SYCIDRU, SYCIDRL) ... 812
30.2.49 SYNFP Local Port Number Register (SYPNUMR) ... 813
30.2.50 SYNFP Register Value Load Directive Register (SYRVLDR) ... 813
30.2.51 SYNFP Reception Filter Register 1 (SYRFL1R) ... 814
30.2.52 SYNFP Reception Filter Register 2 (SYRFL2R) ... 816
30.2.53 SYNFP Transmission Enable Register (SYTRENR) ... 816
30.2.54 Master Clock ID Register (MTCIDU, MTCIDL) ... 817
30.2.55 Master Clock Port Number Register (MTPID) ... 818
30.2.56 SYNFP Transmission Interval Setting Register (SYTLIR) ... 818
30.2.57 SYNFP Received logMessageInterval Value Indication Register (SYRLIR) ... 819
30.2.58 offsetFromMaster Value Register (OFMRU, OFMRL) ... 820
30.2.59 meanPathDelay Value Register (MPDRU, MPDRL) ... 821
30.2.60 grandmasterPriority Field Setting Register (GMPR) ... 822
30.2.61 grandmasterClockQuality Field Setting Register (GMCQR) ... 822
30.2.62 grandmasterIdentity Field Setting Register (GMIDRU, GMIDRL) ... 823
30.2.63 currentUtcOffset/timeSource Field Setting Register (CUOTSR) ... 824
30.2.64 stepsRemoved Field Setting Register (SRR) ... 824
30.2.65 PTP-primary Message Destination MAC Address Setting Register (PPMACRU, PPMACRL) ... 825
30.2.66 PTP-pdelay Message MAC Address Setting Register (PDMACRU, PDMACRL) ... 826
30.2.67 PTP Message Ethertype Setting Register (PETYPER) ... 827
30.2.68 PTP-primary Message Destination IP Address Setting Register (PPIPR) ... 827
30.2.69 PTP-pdelay Message Destination IP Address Setting Register (PDIPR) ... 828
30.2.70 PTP Event Message TOS Setting Register (PETOSR) ... 828
30.2.71 PTP general Message TOS Setting Register (PGTOSR) ... 829
30.2.72 PTP-primary Message TTL Setting Register (PPTTLR) ... 829
30.2.73 PTP-pdelay Message TTL Setting Register (PDTTLR) ... 830
30.2.74 PTP Event Message UDP Destination Port Number Setting Register (PEUDPR) ... 830
30.2.75 PTP general Message UDP Destination Port Number Setting Register (PGUDPR) ... 831
30.2.76 Frame Reception Filter Setting Register (FFLTR) ... 832
30.2.77 Frame Reception Filter MAC Address 0 Setting Register (FMAC0RU, FMAC0RL) ... 833
30.2.78 Frame Reception Filter MAC Address 1 Setting Register (FMAC1RU, FMAC1RL) ... 834
30.2.79 Asymmetric Delay Setting Register (DASYMRU, DASYMRL) ... 835
30.2.80 Timestamp Latency Setting Register (TSLATR) ... 836

30.2.81 SYNFP Operation Setting Register (SYCONFR) 837
30.2.82 SYNFP Frame Format Setting Register (SYFORMR) 838
30.2.83 Response Message Reception Timeout Register (RSTOUTR) 838
30.2.84 PTP Reset Register (PTRSTR) 839
30.2.85 STCA Clock Select Register (STCSELR) 839
30.2.86 Bypass 1588 Module Register (BYPASS) 840
30.3 Operation 841
30.3.1 Transmission, Reception, and Relaying of Non-PTP Messages 841
30.3.2 Paths for the Transfer of Non-PTP Messages 842
30.3.3 Transmission, Reception, and Relaying of PTP Messages 843
30.3.4 Paths for the Transfer of PTP Messages 843
30.3.5 Clock Devices 845
30.3.6 EPTPC Initialization 848
30.3.7 Operation as an E2E Master 850
30.3.8 Operation as an E2E Slave 852
30.3.9 P2P Operation (Shared by Master and Slave) 855
30.3.10 Operation as a P2P Master 857
30.3.11 Operation as a P2P Slave 858
30.3.12 Operation as an E2E TC 860
30.3.13 Operation as a P2P TC 860
30.3.14 Monitoring of Received Messages 861
30.3.15 Correcting Time Synchronization 861
30.3.16 Local Clock Counter 866
30.3.17 Pulse Output Timer 866
30.3.18 Priority Control in Transmission 868
30.4 Interrupts 870
30.5 Event Link (Output) 872
30.6 Usage Notes 873
30.6.1 Restrictions on Register Access 873
30.6.2 Wait Cycles for Register Access 875
31. Ethernet DMA Controller (EDMAC) 876
31.1 Overview 876
31.2 Register Descriptions 877
31.2.1 EDMAC Mode Register (EDMR) 877
31.2.2 EDMAC Transmit Request Register (EDTRR) 878
31.2.3 EDMAC Receive Request Register (EDRRR) 879
31.2.4 Transmit Descriptor List Start Address Register (TDLAR) 879
31.2.5 Receive Descriptor List Start Address Register (RDLAR) 880
31.2.6 ETHERC/EDMAC Status Register (EDMACn.EESR) (n = 0, 1) 880
31.2.7 PTP/EDMAC Status Register (PTPEDMAC.EESR) 883
31.2.8 ETHERC/EDMAC Status Interrupt Enable Register (EDMACn.EESIPR)

(n = 0, 1) 886
31.2.9 PTP/EDMAC Status Interrupt Enable Register (PTPEDMAC.EESIPR) 887
31.2.10 ETHERC/EDMAC Transmit/Receive Status Copy Enable Register (EDMACn.TRSCER) (n = 0, 1) 888
31.2.11 Missed-Frame Counter Register (RMFCR) 889
31.2.12 Transmit FIFO Threshold Register (TFTR) 889
31.2.13 FIFO Depth Register (FDR) 890
31.2.14 Receive Method Control Register (RMCR) 890
31.2.15 Transmit FIFO Underflow Counter (TFUCR) 891
31.2.16 Receive FIFO Overflow Counter (RFOCR) 891
31.2.17 Independent Output Signal Setting Register (IOSR) 892
31.2.18 Flow Control Start FIFO Threshold Setting Register (FCFTR) 892
31.2.19 Receive Data Padding Insert Register (RPADIR) 893
31.2.20 Transmit Interrupt Setting Register (TRIMD) 893
31.2.21 Receive Buffer Write Address Register (RBWAR) 894
31.2.22 Receive Descriptor Fetch Address Register (RDFAR) 894
31.2.23 Transmit Buffer Read Address Register (TBRAR) 894
31.2.24 Transmit Descriptor Fetch Address Register (TDFAR) 895
31.3 Operation 895
31.3.1 Descriptor Lists and Data Buffers 895
31.3.2 Transmission 900
31.3.3 Reception 901
31.3.4 Multi-Buffer Frame Transmission 902
31.3.5 EDMAC Channel Priority 904
31.4 Interrupts 905
31.5 Usage Notes 905
31.5.1 Settings for the Module-Stop Function 905
31.5.2 Stopping the EDMAC during Operation 905
32. USB 2.0 Full-Speed Module (USBFS) 906
32.1 Overview 906
32.2 Register Descriptions 908
32.2.1 System Configuration Control Register (SYSCFG) 908
32.2.2 System Configuration Status Register 0 (SYSSTS0) 909
32.2.3 Device State Control Register 0 (DVSTCTR0) 910
32.2.4 CFIFO Port Register (CFIFO/CFIFOL)
D0FIFO Port Register (D0FIFO/D0FIFOL)
D1FIFO Port Register (D1FIFO/D1FIFOL) 912
32.2.5 CFIFO Port Select Register (CFIFOSEL)
D0FIFO Port Select Register (D0FIFOSEL)
D1FIFO Port Select Register (D1FIFOSEL) 914
32.2.6 CFIFO Port Control Register (CFIFOCTR)
D0FIFO Port Control Register (D0FIFOCTR)
D1FIFO Port Control Register (D1FIFOCTR) 917

32.2.7 Interrupt Enable Register 0 (INTENB0) ... 918
32.2.8 Interrupt Enable Register 1 (INTENB1) ... 919
32.2.9 BRDY Interrupt Enable Register (BRDYENB) ... 920
32.2.10 NRDY Interrupt Enable Register (NRDYENB) ... 920
32.2.11 BEMP Interrupt Enable Register (BEMPENB) ... 921
32.2.12 SOF Output Configuration Register (SOFCFG) ... 922
32.2.13 Interrupt Status Register 0 (INTSTS0) ... 923
32.2.14 Interrupt Status Register 1 (INTSTS1) ... 925
32.2.15 BRDY Interrupt Status Register (BRDYSTS) ... 927
32.2.16 NRDY Interrupt Status Register (NRDYSTS) ... 928
32.2.17 BEMP Interrupt Status Register (BEMPSTS) ... 929
32.2.18 Frame Number Register (FRMNUM) ... 929
32.2.19 Device State Change Register (DVCHGR) ... 930
32.2.20 USB Address Register (USBADDR) ... 931
32.2.21 USB Request Type Register (USBREQ) ... 932
32.2.22 USB Request Value Register (USBVAL) ... 933
32.2.23 USB Request Index Register (USBINDX) ... 933
32.2.24 USB Request Length Register (USBLENG) ... 934
32.2.25 DCP Configuration Register (DCPCFG) ... 934
32.2.26 DCP Maximum Packet Size Register (DCPMAXP) ... 935
32.2.27 DCP Control Register (DCPCTR) ... 936
32.2.28 Pipe Window Select Register (PIPESEL) ... 939
32.2.29 Pipe Configuration Register (PIPECFG) ... 939
32.2.30 Pipe Maximum Packet Size Register (PIPEMAXP) ... 941
32.2.31 Pipe Cycle Control Register (PIPEPERI) ... 942
32.2.32 PIPEn Control Registers (PIPEnCTR) (n = 1 to 9) ... 943
32.2.33 PIPEn Transaction Counter Enable Register (PIPEnTRE) (n = 1 to 5) ... 949
32.2.34 PIPEn Transaction Counter Register (PIPEnTRN) (n = 1 to 5) ... 950
32.2.35 Device Address n Configuration Register (DEVADDn) (n = 0 to 5) ... 951
32.2.36 PHY Cross Point Adjustment Register (PHYSLEW) ... 951
32.2.37 Deep Software Standby USB Transceiver Control/Pin Monitor Register (DPUSR0R) 952
32.2.38 Deep Software Standby USB Suspend/Resume Interrupt Register (DPUSR1R) ... 953
32.3 Operation ... 955
32.3.1 System Control ... 955
32.3.2 Interrupts ... 963
32.3.3 Interrupt Descriptions ... 966
32.3.4 Pipe Control ... 975
32.3.5 FIFO Buffer ... 979
32.3.6 FIFO Buffer Clearing ... 980
32.3.7 FIFO Port Functions ... 980
32.3.8 DMA Transfers (D0FIFO and D1FIFO Ports) ... 981

32.3.9 Control Transfers Using the DCP 982
32.3.10 Bulk Transfers (Pipes 1 to 5) 984
32.3.11 Interrupt Transfers (Pipes 6 to 9) 984
32.3.12 Isochronous Transfers (Pipes 1 and 2) 984
32.3.13 SOF Interpolation Function 991
32.3.14 Pipe Schedule 991
32.4 Usage Notes 992
32.4.1 Settings for the Module-Stop Function 992
32.4.2 Clearing the Interrupt Status Register on Exiting Software Standby Mode 992
32.4.3 Clearing the Interrupt Status Register after Setting Up the Port Function 992
33. USB 2.0 High-Speed Module (USBHS) 993
33.1 Overview 993
33.2 Register Descriptions 995
33.2.1 System Configuration Control Register (SYSCFG) 995
33.2.2 CPU Bus Wait Register (BUSWAIT) 997
33.2.3 System Configuration Status Register (SYSSTS0) 997
33.2.4 PLL Status Register (PLLSTA) 999
33.2.5 Device State Control Register 0 (DVSTCTR0) 999
33.2.6 USB Test Mode Register (TESTMODE) 1002
33.2.7 CFIFO Port Register (CFIFO)
D0FIFO Port Register (D0FIFO)
D1FIFO Port Register (D1FIFO) 1003
33.2.8 CFIFO Port Selection Register (CFIFOSEL) 1005
33.2.9 D0FIFO Port Selection Register (D0FIFOSEL)
D1FIFO Port Selection Register (D1FIFOSEL) 1006
33.2.10 CFIFO Port Control Register (CFIFOCTR)
D0FIFO Port Control Register (D0FIFOCTR)
D1FIFO Port Control Register (D1FIFOCTR) 1008
33.2.11 Interrupt Enable Register 0 (INTENB0) 1010
33.2.12 Interrupt Enable Register 1 (INTENB1) 1010
33.2.13 BRDY Interrupt Enable Register (BRDYENB) 1011
33.2.14 NRDY Interrupt Enable Register (NRDYENB) 1012
33.2.15 BEMP Interrupt Enable Register (BEMPENB) 1012
33.2.16 SOF Output Configuration Register (SOFCFG) 1013
33.2.17 PHY Setting Register (PHYSET) 1014
33.2.18 Interrupt Status Register 0 (INTSTS0) 1015
33.2.19 Interrupt Status Register 1 (INTSTS1) 1017
33.2.20 BRDY Interrupt Status Register (BRDYSTS) 1019
33.2.21 NRDY Interrupt Status Register (NRDYSTS) 1020
33.2.22 BEMP Interrupt Status Register (BEMPSTS) 1020
33.2.23 Frame Number Register (FRMNUM) 1021
33.2.24 µFrame Number Register (UFRMNUM) 1022

33.2.25 USB Address Register (USBADDR) ... 1022
33.2.26 USB Request Type Register (USBREQ) ... 1024
33.2.27 USB Request Value Register (USBVAL) ... 1024
33.2.28 USB Request Index Register (USBINDX) ... 1025
33.2.29 USB Request Length Register (USBLENG) ... 1025
33.2.30 DCP Configuration Register (DCPCFG) ... 1026
33.2.31 DCP Maximum Packet Size Register (DCPMAXP) ... 1027
33.2.32 DCP Control Register (DCPCTR) ... 1028
33.2.33 Pipe Window Select Register (PIPESEL) ... 1031
33.2.34 Pipe Configuration Register (PIPECFG) ... 1032
33.2.35 Pipe Buffer Register (PIPEBUF) ... 1035
33.2.36 Pipe Maximum Packet Size Register (PIPEMAXP) ... 1036
33.2.37 Pipe Cycle Control Register (PIPEPERI) ... 1037
33.2.38 Pipe n Control Register (PIPEnCTR) (n = 1 to 9) ... 1038
33.2.39 Pipe n Transaction Counter Enable Register (PIPEnTRE) (n = 1 to 5) ... 1043
33.2.40 Pipe n Transaction Counter Register (PIPEnTRN) (n = 1 to 5) ... 1044
33.2.41 Device Address m Configuration Register (DEVADDm) (m = 0 to A) ... 1045
33.2.42 Low Power Control Register (LPCTRL) ... 1046
33.2.43 Low Power Status Register (LPSTS) ... 1046
33.2.44 Battery Charging Control Register (BCCTRL) ... 1048
33.2.45 Function L1 Control Register 1 (PL1CTRL1) ... 1049
33.2.46 Function L1 Control Register 2 (PL1CTRL2) ... 1051
33.2.47 Host L1 Control Register 1 (HL1CTRL1) ... 1051
33.2.48 Host L1 Control Register 2 (HL1CTRL2) ... 1052
33.2.49 Deep Software Standby USB Transceiver Control/Pin Monitor Register (DPUSR0R) ... 1053
33.2.50 Deep Software Standby USB Suspend/Resume Interrupt Register (DPUSR1R) ... 1054
33.2.51 Deep Software Standby USB Suspend/Resume Interrupt Register (DPUSR2R) ... 1055
33.2.52 Deep Software Standby USB Suspend/Resume Command Register (DPUSRCR) ... 1055
33.3 Operation ... 1056
33.3.1 System Control ... 1056
33.3.2 Controlling the USB Data Bus Using Resistors ... 1056
33.3.3 Supplying the Clock ... 1056
33.3.4 Restrictions on Stopping the Clock ... 1057
33.3.5 Interrupts ... 1058
33.3.6 Interrupt Descriptions ... 1061
33.3.7 Pipe Control ... 1071
33.3.8 FIFO Buffer ... 1076
33.3.9 Control Transfers Using the DCP ... 1080
33.3.10 Bulk Transfers (Pipes 1 to 5) ... 1082
33.3.11 Interrupt Transfers (Pipes 6 to 9) ... 1083

33.3.12 Isochronous Transfers (Pipes 1 and 2) 1083
33.3.13 SOF Complementation Function 1090
33.3.14 Pipe Schedule 1090
33.3.15 Battery Charging Detection Processing 1091
33.3.16 Link Power Management Processing 1095
33.3.17 Release from Deep Software Standby Mode Because of USB Suspend/Resume Interrupts 1097
33.3.18 Example External Connection Circuits 1101
33.4 Usage Notes 1105
33.4.1 Settings for the Module-Stop Function 1105
33.4.2 Setup for Transitioning to Deep Software Standby Mode 1105
33.4.3 Clearing the Interrupt Status Register on Exiting Software Standby Mode 1105
33.4.4 Clearing the Interrupt Status Register after Setting Up the Port Function 1105
34. Serial Communications Interface (SCI) 1106
34.1 Overview 1106
34.2 Register Descriptions 1111
34.2.1 Receive Shift Register (RSR) 1111
34.2.2 Receive Data Register (RDR) 1111
34.2.3 Receive 9-Bit Data Register (RDRHL) 1111
34.2.4 Receive FIFO Data Register H, L, HL (FRDRH, FRDRL, FRDRHL) 1112
34.2.5 Transmit Data Register (TDR) 1113
34.2.6 Transmit 9-Bit Data Register (TDRHL) 1113
34.2.7 Transmit FIFO Data Register H, L, HL (FTDRH, FTDRL, FTDRHL) 1114
34.2.8 Transmit Shift Register (TSR) 1114
34.2.9 Serial Mode Register (SMR) for Non-Smart Card Interface Mode (SCMR.SMIF = 0) 1115
34.2.10 Serial Mode Register for Smart Card Interface Mode (SMR_SMCI) (SCMR.SMIF = 1) 1116
34.2.11 Serial Control Register (SCR) for Non-Smart Card Interface Mode (SCMR.SMIF = 0) 1118
34.2.12 Serial Control Register for Smart Card Interface Mode (SCR_SMCI) (SCMR.SMIF = 1) 1120
34.2.13 Serial Status Register (SSR) for Non-Smart Card Interface and Non-FIFO Mode (SCMR.SMIF = 0 and FCR.FM = 0) 1121
34.2.14 Serial Status Register for Non-Smart Card Interface and FIFO Mode (SSR_FIFO) (SCMR.SMIF = 0 and FCR.FM = 1) 1123
34.2.15 Serial Status Register for Smart Card Interface Mode (SSR_SMCI) (SCMR.SMIF = 1) 1126
34.2.16 Smart Card Mode Register (SCMR) 1128
34.2.17 Bit Rate Register (BRR) 1129
34.2.18 Modulation Duty Register (MDDR) 1139
34.2.19 Serial Extended Mode Register (SEMR) 1141
34.2.20 Noise Filter Setting Register (SNFR) 1143

34.2.21 IIC Mode Register 1 (SIMR1) 1144
34.2.22 IIC Mode Register 2 (SIMR2) 1145
34.2.23 IIC Mode Register 3 (SIMR3) 1146
34.2.24 IIC Status Register (SISR) 1148
34.2.25 SPI Mode Register (SPMR) 1148
34.2.26 FIFO Control Register (FCR) 1150
34.2.27 FIFO Data Count Register (FDR) 1151
34.2.28 Line Status Register (LSR) 1152
34.2.29 Compare Match Data Register (CDR) 1153
34.2.30 Data Compare Match Control Register (DCCR) 1154
34.2.31 Serial Port Register (SPTR) 1155
34.3 Operation in Asynchronous Mode 1156
34.3.1 Serial Data Transfer Format 1156
34.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode 1158
34.3.3 Clock 1159
34.3.4 Double-Speed Operation and Frequency of 6 Times the Bit Rate 1159
34.3.5 CTS and RTS Functions 1160
34.3.6 Address Match (Receive Data Match Detection) Function 1160
34.3.7 SCI Initialization in Asynchronous Mode 1163
34.3.8 Serial Data Transmission in Asynchronous Mode 1164
34.3.9 Serial Data Reception in Asynchronous Mode 1169
34.4 Multi-Processor Communication Function 1176
34.4.1 Multi-Processor Serial Data Transmission 1178
34.4.2 Multi-Processor Serial Data Reception 1180
34.5 Operation in Clock Synchronous Mode 1185
34.5.1 Clock 1185
34.5.2 CTS and RTS Functions 1186
34.5.3 SCI Initialization in Clock Synchronous Mode 1186
34.5.4 Serial Data Transmission in Clock Synchronous Mode 1189
34.5.5 Serial Data Reception in Clock Synchronous Mode 1193
34.5.6 Simultaneous Serial Data Transmission/Reception in Clock Synchronous Mode 1197
34.6 Operation in Smart Card Interface Mode 1199
34.6.1 Example Connection 1199
34.6.2 Data Format (Except in Block Transfer Mode) 1199
34.6.3 Block Transfer Mode 1200
34.6.4 Receive Data Sampling Timing and Reception Margin 1200
34.6.5 Initialization of the SCI 1201
34.6.6 Serial Data Transmission (Except in Block Transfer Mode) 1203
34.6.7 Serial Data Reception (Except in Block Transfer Mode) 1206
34.6.8 Clock Output Control 1207
34.7 Operation in Simple IIC Mode 1208

34.7.1 Generation of Start, Restart, and Stop Conditions ... 1209
34.7.2 Clock Synchronization ... 1210
34.7.3 SDA Output Delay ... 1210
34.7.4 SCI Initialization in Simple IIC Mode ... 1211
34.7.5 Operation in Master Transmission in Simple IIC Mode ... 1212
34.7.6 Master Reception in Simple IIC Mode ... 1214
34.8 Operation in Simple SPI Mode ... 1216
34.8.1 States of Pins in Master and Slave Modes ... 1217
34.8.2 SS Function in Master Mode ... 1217
34.8.3 SS Function in Slave Mode ... 1217
34.8.4 Relationship between Clock and Transmit/Receive Data ... 1217
34.8.5 SCI Initialization in Simple SPI Mode ... 1218
34.8.6 Transmission and Reception of Serial Data in Simple SPI Mode ... 1218
34.9 Bit Rate Modulation Function ... 1219
34.10 Interrupt Sources ... 1219
34.10.1 Buffer Operation for SCIn_TXI and SCIn_RXI Interrupts (non-FIFO selected) ... 1219
34.10.2 Buffer Operation for SCIn_TXI and SCIn_RXI Interrupts (FIFO selected) ... 1219
34.10.3 Interrupts in Asynchronous, Clock Synchronous, and Simple SPI Modes ... 1220
34.10.4 Interrupts in Smart Card Interface Mode ... 1221
34.10.5 Interrupts in Simple IIC Mode ... 1222
34.11 Event Linking ... 1222
34.12 Address Non-match Event Output (SCI0_DCUF) ... 1223
34.13 Noise Cancellation Function ... 1223
34.14 Usage Notes ... 1225
34.14.1 Settings for the Module-Stop State ... 1225
34.14.2 SCI Operation during Low Power State ... 1225
34.14.3 Break Detection and Processing ... 1230
34.14.4 Mark State and Production of Breaks ... 1230
34.14.5 Receive Error Flags and Transmit Operation in Clock Synchronous and Simple SPI Modes ... 1230
34.14.6 Restrictions on Clock Synchronous Transmission in Clock Synchronous and Simple SPI Modes ... 1230
34.14.7 Restrictions on Using DMAC or DTC ... 1232
34.14.8 Notes on Starting Transfer ... 1232
34.14.9 External Clock Input in Clock Synchronous and Simple SPI Modes ... 1232
34.14.10 Limitations on Simple SPI Mode ... 1232
35. IrDA Interface ... 1234
35.1 Overview ... 1234
35.2 Register Descriptions ... 1235
35.2.1 IrDA Control Register (IRCR) ... 1235
35.3 Operation ... 1235
35.3.1 IrDA Interface Setup Procedure ... 1235

35.3.2 Transmission 1235
35.3.3 Reception 1236
35.4 Usage Notes 1236
35.4.1 Settings for the Module-Stop Function 1236
35.4.2 Asynchronous Reference Clock for SCI1 1236
36. I2C Bus Interface (IIC) 1237
36.1 Overview 1237
36.2 Register Descriptions 1240
36.2.1 I2C Bus Control Register 1 (ICCR1) 1240
36.2.2 I2C Bus Control Register 2 (ICCR2) 1242
36.2.3 I2C Bus Mode Register 1 (ICMR1) 1245
36.2.4 I2C Bus Mode Register 2 (ICMR2) 1245
36.2.5 I2C Bus Mode Register 3 (ICMR3) 1247
36.2.6 I2C Bus Function Enable Register (ICFER) 1249
36.2.7 I2C Bus Status Enable Register (ICSER) 1250
36.2.8 I2C Bus Interrupt Enable Register (ICIER) 1252
36.2.9 I2C Bus Status Register 1 (ICSR1) 1253
36.2.10 I2C Bus Status Register 2 (ICSR2) 1255
36.2.11 I2C Bus Wakeup Unit Register (ICWUR) 1258
36.2.12 Reserved (ICWUR2) 1259
36.2.13 Slave Address Register L y (SARLy) (y = 0 to 2) 1259
36.2.14 Slave Address Register U y (SARUy) (y = 0 to 2) 1260
36.2.15 I2C Bus Bit Rate Low-Level Register (ICBRL) 1260
36.2.16 I2C Bus Bit Rate High-Level Register (ICBRH) 1261
36.2.17 I2C Bus Transmit Data Register (ICDRT) 1262
36.2.18 I2C Bus Receive Data Register (ICDRR) 1262
36.2.19 I2C Bus Shift Register (ICDRS) 1262
36.3 Operation 1263
36.3.1 Communication Data Format 1263
36.3.2 Initial Settings 1264
36.3.3 Master Transmit Operation 1265
36.3.4 Master Receive Operation 1268
36.3.5 Slave Transmit Operation 1273
36.3.6 Slave Receive Operation 1276
36.4 SCL Synchronization Circuit 1278
36.5 SDA Output Delay Function 1279
36.6 Digital Noise Filter Circuits 1280
36.7 Address Match Detection 1280
36.7.1 Slave-Address Match Detection 1280
36.7.2 Detection of General Call Address 1282
36.7.3 Device-ID Address Detection 1283

36.7.4 Host Address Detection ... 1284
36.8 Wakeup Function ... 1284
36.8.1 Normal Wakeup Mode 1 ... 1285
36.8.2 Normal Wakeup Mode 2 ... 1288
36.8.3 Command Recovery Mode and EEP Response Mode (Special Wakeup Modes) ... 1290
36.8.4 Precautions for WFI instruction Execution ... 1293
36.9 Automatic Low-Hold Function for SCL ... 1293
36.9.1 Function to Prevent Wrong Transmission of Transmit Data ... 1293
36.9.2 NACK Reception Transfer Suspension Function ... 1294
36.9.3 Function to Prevent Failure to Receive Data ... 1295
36.10 Arbitration-Lost Detection Functions ... 1297
36.10.1 Master Arbitration-Lost Detection (MALE Bit) ... 1297
36.10.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit) ... 1299
36.10.3 Slave Arbitration-Lost Detection (SALE Bit) ... 1300
36.11 Start, Restart, and Stop Condition Issuing Function ... 1300
36.11.1 Issuing a Start Condition ... 1300
36.11.2 Issuing a Restart Condition ... 1301
36.11.3 Issuing a Stop Condition ... 1303
36.12 Bus Hanging ... 1303
36.12.1 Timeout Function ... 1304
36.12.2 Extra SCL Clock Cycle Output Function ... 1305
36.12.3 IIC Reset and Internal Reset ... 1305
36.13 SMBus Operation ... 1306
36.13.1 SMBus Timeout Measurement ... 1306
36.13.2 Packet Error Code (PEC) ... 1307
36.13.3 SMBus Host Notification Protocol (Notify ARP Master Command) ... 1307
36.14 Interrupt Sources ... 1308
36.14.1 Buffer Operation for IICn_TXI and IICn_RXI Interrupts ... 1308
36.15 State of Registers When Issuing Each Condition ... 1309
36.16 Output to the Event Link Controller (ELC) ... 1309
36.16.1 Interrupt Handling and Event Linking ... 1310
36.17 Usage Notes ... 1310
36.17.1 Settings for the Module-Stop Function ... 1310
36.17.2 Starting Transfer after an Interrupt Occurrence ... 1310
37. Controller Area Network (CAN) Module ... 1311
37.1 Overview ... 1311
37.2 Register Descriptions ... 1313
37.2.1 Control Register (CTLR) ... 1313
37.2.2 Bit Configuration Register (BCR) ... 1316
37.2.3 Mask Register k (MKRk) (k = 0 to 7) ... 1317
37.2.4 FIFO Received ID Compare Registers 0 and 1 (FIDCR0 and FIDCR1) ... 1318

37.2.5 Mask Invalid Register (MKIVLR) ... 1319
37.2.6 Mailbox Register j (MBj_ID, MBj_DL, MBj_Dm, MBj_TS) (j = 0 to 31; m = 0 to 7) ... 1319
37.2.7 Mailbox Interrupt Enable Register (MIER) ... 1323
37.2.8 Mailbox Interrupt Enable Register for FIFO Mailbox Mode (MIER_FIFO) ... 1324
37.2.9 Message Control Register for Transmit (MCTL_TXj) (j = 0 to 31) ... 1325
37.2.10 Message Control Register for Receive (MCTL_RXj) (j = 0 to 31) ... 1327
37.2.11 Receive FIFO Control Register (RFCR) ... 1328
37.2.12 Receive FIFO Pointer Control Register (RFPCR) ... 1330
37.2.13 Transmit FIFO Control Register (TFCR) ... 1331
37.2.14 Transmit FIFO Pointer Control Register (TFPCR) ... 1332
37.2.15 Status Register (STR) ... 1333
37.2.16 Mailbox Search Mode Register (MSMR) ... 1335
37.2.17 Mailbox Search Status Register (MSSR) ... 1335
37.2.18 Channel Search Support Register (CSSR) ... 1336
37.2.19 Acceptance Filter Support Register (AFSR) ... 1337
37.2.20 Error Interrupt Enable Register (EIER) ... 1338
37.2.21 Error Interrupt Factor Judge Register (EIFR) ... 1339
37.2.22 Receive Error Count Register (RECR) ... 1341
37.2.23 Transmit Error Count Register (TECR) ... 1341
37.2.24 Error Code Store Register (ECSR) ... 1342
37.2.25 Time Stamp Register (TSR) ... 1343
37.2.26 Test Control Register (TCR) ... 1343
37.3 Operation Modes ... 1345
37.3.1 CAN Reset Mode ... 1345
37.3.2 CAN Halt Mode ... 1346
37.3.3 CAN Sleep Mode ... 1347
37.3.4 CAN Operation Mode (Excluding Bus-Off State) ... 1347
37.3.5 CAN Operation Mode (Bus-Off State) ... 1348
37.4 Data Transfer Rate Configuration ... 1349
37.4.1 Clock Setting ... 1349
37.4.2 Bit Timing Setting ... 1349
37.4.3 Data Transfer Rate ... 1349
37.5 Mailbox and Mask Register Structure ... 1351
37.6 Acceptance Filtering and Masking Functions ... 1352
37.7 Reception and Transmission ... 1354
37.7.1 Reception ... 1355
37.7.2 Transmission ... 1357
37.8 Interrupts ... 1358
37.9 Usage Notes ... 1358
37.9.1 Settings for the Module-Stop Function ... 1358
37.9.2 Settings for the Operating Clock ... 1358

38. Serial Peripheral Interface (SPI) ... 1359
38.1 Overview ... 1359
38.2 Register Descriptions ... 1361
38.2.1 SPI Control Register (SPCR) ... 1361
38.2.2 SPI Slave Select Polarity Register (SSLP) ... 1363
38.2.3 SPI Pin Control Register (SPPCR) ... 1363
38.2.4 SPI Status Register (SPSR) ... 1364
38.2.5 SPI Data Register (SPDR/SPDR_HA) ... 1366
38.2.6 SPI Sequence Control Register (SPSCR) ... 1369
38.2.7 SPI Sequence Status Register (SPSSR) ... 1370
38.2.8 SPI Bit Rate Register (SPBR) ... 1371
38.2.9 SPI Data Control Register (SPDCR) ... 1372
38.2.10 SPI Clock Delay Register (SPCKD) ... 1373
38.2.11 SPI Slave Select Negation Delay Register (SSLND) ... 1374
38.2.12 SPI Next-Access Delay Register (SPND) ... 1374
38.2.13 SPI Control Register 2 (SPCR2) ... 1375
38.2.14 SPI Command Registers 0 to 7 (SPCMD0 to SPCMD7) ... 1376
38.3 Operation ... 1378
38.3.1 Overview of SPI Operation ... 1378
38.3.2 Controlling the SPI Pins ... 1379
38.3.3 SPI System Configuration Examples ... 1381
38.3.4 Data Formats ... 1385
38.3.5 Transfer Formats ... 1394
38.3.6 Data Transfer Modes ... 1395
38.3.7 Transmit Buffer Empty and Receive Buffer Full Interrupts ... 1397
38.3.8 Error Detection ... 1399
38.3.9 Initializing the SPI ... 1403
38.3.10 SPI Operation ... 1404
38.3.11 Clock Synchronous Operation ... 1416
38.3.12 Loopback Mode ... 1422
38.3.13 Self-Diagnosis of Parity Bit Function ... 1423
38.3.14 Interrupt Sources ... 1424
38.4 Output to the Event Link Controller (ELC) ... 1425
38.4.1 Receive Buffer Full Event Output ... 1425
38.4.2 Transmit Buffer Empty Event Output ... 1425
38.4.3 Mode Fault, Underrun, Overrun, or Parity Error Event Output ... 1425
38.4.4 SPI Idle Event Output ... 1425
38.4.5 Transmission-Completed Event Output ... 1426
38.5 Usage Notes ... 1426
38.5.1 Settings for the Module-Stop Function ... 1426
38.5.2 Constraint on Low-Power Functions ... 1426

38.5.3 Restrictions on Starting Transfer 1426
38.5.4 Restrictions on Mode Fault, Underrun, Overrun, or Parity Error Event Output 1426
38.5.5 Restrictions on the SPRF and SPTEF Flags 1426
39. Quad Serial Peripheral Interface (QSPI) 1427
39.1 Overview 1427
39.2 Register Descriptions 1428
39.2.1 Transfer Mode Control Register (SFMSMD) 1428
39.2.2 Chip Selection Control Register (SFMSSC) 1429
39.2.3 Clock Control Register (SFMSKC) 1430
39.2.4 Status Register (SFMSST) 1431
39.2.5 Communication Port Register (SFMCOM) 1432
39.2.6 Communication Mode Control Register (SFMCMD) 1432
39.2.7 Communication Status Register (SFMCST) 1433
39.2.8 Instruction Code Register (SFMSIC) 1433
39.2.9 Address Mode Control Register (SFMSAC) 1434
39.2.10 Dummy Cycle Control Register (SFMSDC) 1435
39.2.11 SPI Protocol Control Register (SFMSPC) 1436
39.2.12 Port Control Register (SFMPMD) 1436
39.2.13 External QSPI Address Register (SFMCNT1) 1437
39.3 Memory Map 1437
39.3.1 Internal Bus Space 1437
39.3.2 Address Width of the SPI Space and SPI Bus 1438
39.4 SPI Bus 1439
39.4.1 SPI Protocol 1439
39.4.2 SPI Mode 1441
39.5 SPI Bus Timing Adjustment 1441
39.5.1 SPI Bus Reference Cycles 1441
39.5.2 QSPCLK Signal Duty Ratio 1442
39.5.3 Minimum High-Level Width for the QSSL Signal 1443
39.5.4 QSSL Signal Setup Time 1443
39.5.5 QSSL Signal Hold Time 1443
39.5.6 Hold Time of the Serial Data Output Enable 1444
39.5.7 Setup Time for Serial Data Output 1444
39.5.8 Hold Time for Serial Data Output 1445
39.5.9 Serial Data Receiving Latency 1445
39.6 SPI Instruction Set Used for Flash Access 1446
39.6.1 SPI Instructions That Are Automatically Generated 1446
39.6.2 Standard Read Instruction 1447
39.6.3 Fast Read Instruction 1448
39.6.4 Fast Read Dual Output Instruction 1449
39.6.5 Fast Read Dual I/O Instruction 1450

39.6.6 Fast Read Quad Output Instruction ... 1451
39.6.7 Fast Read Quad I/O Instruction ... 1452
39.6.8 Enter 4-Byte Mode Instruction ... 1453
39.6.9 Exit 4-Byte Mode Instruction ... 1453
39.6.10 Write Enable Instruction ... 1453
39.7 SPI Bus Cycle Arrangement ... 1454
39.7.1 Flash Read Based on Individual Conversion ... 1454
39.7.2 Flash Read Using the Prefetch Function ... 1454
39.7.3 Halt of Prefetching ... 1455
39.7.4 Direct Specification of Prefetch Destination ... 1455
39.7.5 Prefetch State Polling ... 1455
39.7.6 Flash Read Using the SPI Bus Cycle Extension Function ... 1455
39.8 XIP Control ... 1456
39.8.1 Selecting the XIP Mode ... 1457
39.8.2 Releasing the XIP Mode ... 1457
39.9 QIO2 and QIO3 Pin States ... 1457
39.10 Direct Communication Mode ... 1458
39.10.1 About Direct Communication ... 1458
39.10.2 Using Direct Communication Mode ... 1458
39.10.3 Generating the SPI Bus Cycle during Direct Communication ... 1458
39.11 Operation ... 1460
39.11.1 Procedure for Changing Settings in Multiple Control Registers ... 1460
39.12 Interrupts ... 1460
39.13 Usage Note ... 1460
39.13.1 Settings for the Module-Stop Function ... 1460
40. Cyclic Redundancy Check (CRC) Calculator ... 1461
40.1 Overview ... 1461
40.2 Register Descriptions ... 1462
40.2.1 CRC Control Register 0 (CRCCR0) ... 1462
40.2.2 CRC Control Register 1 (CRCCR1) ... 1463
40.2.3 CRC Data Input Register (CRCDIR/CRCDIR_BY) ... 1463
40.2.4 CRC Data Output Register (CRCDOR/CRCDOR_HA/CRCDOR_BY) ... 1464
40.2.5 Snoop Address Register (CRCSAR) ... 1465
40.3 Operation ... 1466
40.3.1 Basic Operation ... 1466
40.3.2 CRC Snoop ... 1468
40.4 Usage Notes ... 1469
40.4.1 Settings for the Module-Stop Function ... 1469
40.4.2 Note on Transmission ... 1469
41. Serial Sound Interface (SSI) ... 1470
41.1 Overview ... 1470

41.2 Register Descriptions ... 1473
41.2.1 Control Register (SSICR) ... 1473
41.2.2 Status Register (SSISR) ... 1477
41.2.3 FIFO Control Register (SSIFCR) ... 1479
41.2.4 FIFO Status Register (SSIFSR) ... 1480
41.2.5 Transmit FIFO Data Register (SSIFTDR) ... 1482
41.2.6 Receive FIFO Data Register (SSIFRDR) ... 1482
41.2.7 TDM Mode Register (SSITDMR) ... 1483
41.3 Operation ... 1483
41.3.1 Bus Format ... 1483
41.3.2 Non-Compression Mode ... 1483
41.3.3 WS Continue Mode ... 1488
41.3.4 Operating States ... 1489
41.3.5 Transmit Operation ... 1490
41.3.6 Receive Operation ... 1493
41.3.7 Serial Bit Clock Control ... 1494
41.4 Interrupts ... 1495
41.5 Usage Notes ... 1495
41.5.1 Settings for the Module-Stop Function ... 1495
41.5.2 Notes on Changing Transfer Modes ... 1495
41.5.3 Restrictions on the WS Continue Mode ... 1495
42. Sampling Rate Converter (SRC) ... 1496
42.1 Overview ... 1496
42.2 Register Descriptions ... 1497
42.2.1 Input Data Register (SRCID) ... 1497
42.2.2 Output Data Register (SRCOD) ... 1497
42.2.3 Input Data Control Register (SRCIDCTRL) ... 1498
42.2.4 Output Data Control Register (SRCODCTRL) ... 1499
42.2.5 Control Register (SRCCTRL) ... 1500
42.2.6 Status Register (SRCSTAT) ... 1503
42.2.7 Filter Coefficient Table n (SRCFCTRn) (n = 0 to 5551) ... 1505
42.3 Operation ... 1505
42.3.1 Initial Settings ... 1505
42.3.2 Data Input ... 1506
42.3.3 Data Output ... 1508
42.4 Interrupts ... 1509
42.5 Usage Notes ... 1510
42.5.1 Notes on Accessing Registers ... 1510
42.5.2 Notes on Flush Processing ... 1510
42.5.3 Notes on DMAC or DTC Transfer ... 1510
42.5.4 Notes on SRC Operation ... 1510

42.5.5 Settings for the Module-Stop Function ... 1510
43. SD/MMC Host Interface (SDHI) ... 1511
43.1 Overview ... 1511
43.2 Register Descriptions ... 1512
43.2.1 Command Type Register (SD_CMD) ... 1512
43.2.2 SD Command Argument Register (SD_ARG) ... 1513
43.2.3 SD Command Argument Register 1 (SD_ARG1) ... 1514
43.2.4 Data Stop Register (SD_STOP) ... 1514
43.2.5 Block Count Register (SD_SECCNT) ... 1515
43.2.6 SD Card Response Register 10 (SD_RSP10), SD Card Response Register 32 (SD_RSP32), SD Card Response Register 54 (SD_RSP54) ... 1515
43.2.7 SD Card Response Register 1 (SD_RSP1), SD Card Response Register 3 (SD_RSP3), SD Card Response Register 5 (SD_RSP5) ... 1516
43.2.8 SD Card Response Register 76 (SD_RSP76) ... 1516
43.2.9 SD Card Response Register 7 (SD_RSP7) ... 1516
43.2.10 SD Card Interrupt Flag Register 1 (SD_INFO1) ... 1517
43.2.11 SD Card Interrupt Flag Register 2 (SD_INFO2) ... 1520
43.2.12 SD INFO1 Interrupt Mask Register (SD_INFO1_MASK) ... 1524
43.2.13 SD INFO2 Interrupt Mask Register (SD_INFO2_MASK) ... 1525
43.2.14 SD Clock Control Register (SD_CLK_CTRL) ... 1526
43.2.15 Transfer Data Length Register (SD_SIZE) ... 1527
43.2.16 SD Card Access Control Option Register (SD_OPTION) ... 1527
43.2.17 SD Error Status Register 1 (SD_ERR_STS1) ... 1528
43.2.18 SD Error Status Register 2 (SD_ERR_STS2) ... 1529
43.2.19 SD Buffer Register (SD_BUF0) ... 1530
43.2.20 SDIO Mode Control Register (SDIO_MODE) ... 1531
43.2.21 SDIO Interrupt Flag Register (SDIO_INFO1) ... 1533
43.2.22 SDIO INFO1 Interrupt Mask Register (SDIO_INFO1_MASK) ... 1534
43.2.23 DMA Mode Enable Register (SD_DMAEN) ... 1534
43.2.24 Software Reset Register (SOFT_RST) ... 1535
43.2.25 SD Interface Mode Setting Register (SDIF_MODE) ... 1536
43.2.26 Swap Control Register (EXT_SWAP) ... 1536
43.3 Operation ... 1537
43.3.1 SD/MMC Interface ... 1537
43.3.2 Card Detect/Write Protect ... 1539
43.3.3 Interrupt Request and DMA Transfer Request ... 1540
43.3.4 Communication Errors and Timeouts ... 1541
43.3.5 Command without Data Transfer (SD/MMC) ... 1543
43.3.6 Single Block Read (SD/MMC) ... 1544
43.3.7 Single Block Write (SD/MMC) ... 1546
43.3.8 Multiple Block Read (SD/MMC) ... 1548
43.3.9 Multiple Block Write (SD/MMC Using Internal Timer) ... 1550

43.3.10 Multiple Block Write (MMC using external timer) ... 1552
43.3.11 IO_RW_DIRECT Command (SD: CMD52) ... 1554
43.3.12 IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) ... 1555
43.3.13 IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write) ... 1557
43.3.14 DMA Transfer (SD/MMC) ... 1559
43.3.15 Example of SD_CMD Register Setting ... 1561
43.4 Usage Notes ... 1563
43.4.1 SD_BUF Illegal Write Access (SD/MMC) ... 1563
43.4.2 Block Number Constraint for Multiple Block Read (SD)] ... 1563
43.4.3 Automatic Control of SD/MMC Clock Output (SD/MMC) ... 1564
43.4.4 Control of the C52PUB Setting for Multiple Block Write (SD) ... 1564
43.4.5 Notes on SD_CLK_CTRL Register Settings (SD/MMC) ... 1565
43.4.6 Specification Limitations ... 1565
43.4.7 STP Bit Setting during Multiple Block Read (SD/MMC) ... 1565
43.4.8 Register Setting Notes ... 1565
44. Parallel Data Capture Unit (PDC) ... 1566
44.1 Overview ... 1566
44.2 Register Descriptions ... 1568
44.2.1 PDC Control Register 0 (PCCR0) ... 1568
44.2.2 PDC Control Register 1 (PCCR1) ... 1570
44.2.3 PDC Status Register (PCSR) ... 1570
44.2.4 PDC Pin Monitor Register (PCMONR) ... 1572
44.2.5 PDC Receive Data Register (PCDR) ... 1573
44.2.6 Vertical Capture Register (VCR) ... 1574
44.2.7 Horizontal Capture Register (HCR) ... 1575
44.3 Operation ... 1576
44.3.1 Transfer Formats ... 1576
44.3.2 Transfer Timing ... 1577
44.3.3 VCR and HCR Register Settings and the Capture Range ... 1578
44.3.4 Reception Operation ... 1580
44.3.5 Operation during Horizontal Blanking Period ... 1581
44.3.6 Continued Reception Operations at Frame End ... 1581
44.3.7 Error Detection ... 1582
44.3.8 Initial Settings ... 1584
44.3.9 Operation Flows ... 1585
44.3.10 Interrupt Sources ... 1587
44.3.11 Reset State ... 1588
44.4 Usage Notes ... 1589
44.4.1 Settings for the Module-Stop Function ... 1589
44.4.2 Restrictions on the Low-Power Function ... 1589
44.4.3 Restrictions on Error Interrupts ... 1589

44.4.4 Restrictions on Using the DTC ... 1589
44.4.5 Restrictions on Using the DMAC ... 1589
45. Boundary Scan ... 1590
45.1 Overview ... 1590
45.2 Register Descriptions ... 1591
45.2.1 Instruction Register (JTIR) ... 1591
45.2.2 ID Code Register (JTIDR) ... 1592
45.2.3 Bypass Register (JTBPR) ... 1592
45.2.4 Boundary Scan Register (JTBSR) ... 1592
45.3 Operation ... 1593
45.3.1 TAP Controller ... 1593
45.3.2 Commands ... 1593
45.4 Usage Notes ... 1595
46. Secure Cryptographic Engine (SCE7) ... 1596
46.1 Overview ... 1596
46.2 Operation ... 1598
46.2.1 Encryption Engine ... 1598
46.2.2 Encryption and Decryption ... 1599
46.3 Usage Notes ... 1599
46.3.1 Software Standby Mode ... 1599
46.3.2 Settings for the Module-Stop Function ... 1599
47. 12-Bit A/D Converter (ADC12) ... 1600
47.1 Overview ... 1600
47.2 Register Descriptions ... 1605
47.2.1 A/D Data Registers y (ADDRy), A/D Data Duplexing Register (ADDBLDR), A/D Data Duplexing Register A (ADDBLDRA), A/D Data Duplexing Register B (ADDBLDRB), A/D Temperature Sensor Data Register (ADTSDR), A/D Internal Reference Voltage Data Register (ADOCDR) ... 1605
47.2.2 A/D Self-Diagnosis Data Register (ADRD) ... 1609
47.2.3 A/D Control Register (ADCSR) ... 1612
47.2.4 A/D Channel Select Register A0 (ADANSA0) ... 1616
47.2.5 A/D Channel Select Register A1 (ADANSA1) ... 1616
47.2.6 A/D Channel Select Register B0 (ADANSB0) ... 1617
47.2.7 A/D Channel Select Register B1 (ADANSB1) ... 1617
47.2.8 A/D-Converted Value Addition/Average Channel Select Register 0 (ADADS0) ... 1618
47.2.9 A/D-Converted Value Addition/Average Channel Select Register 1 (ADADS1) ... 1619
47.2.10 A/D-Converted Value Addition/Average Count Select Register (ADADC) ... 1619
47.2.11 A/D Control Extended Register (ADCER) ... 1620
47.2.12 A/D Conversion Start Trigger Select Register (ADSTRGR) ... 1622
47.2.13 A/D Conversion Extended Input Control Register (ADEXICR) ... 1623
47.2.14 A/D Sampling State Register n (ADSSTRn) (n = 00 to 06, L, T, O) ... 1625
47.2.15 A/D Sample and Hold Circuit Control Register (ADSHCR) ... 1626

47.2.16 A/D Sample and Hold Operation Mode Selection Register (ADSHMSR) 1626
47.2.17 A/D Disconnection Detection Control Register (ADDISCR) 1627
47.2.18 A/D Group Scan Priority Control Register (ADGSPCR) 1628
47.2.19 A/D Compare Function Control Register (ADCMPCR) 1629
47.2.20 A/D Compare Function Window A Channel Select Register 0 (ADCMPANSR0) 1630
47.2.21 A/D Compare Function Window A Channel Select Register 1 (ADCMPANSR1) 1631
47.2.22 A/D Compare Function Window A Extended Input Select Register (ADCMPANSER) 1631
47.2.23 A/D Compare Function Window A Comparison Condition Setting Register 0 (ADCMPLR0) 1632
47.2.24 A/D Compare Function Window A Comparison Condition Setting Register 1 (ADCMPLR1) 1634
47.2.25 A/D Compare Function Window A Extended Input Comparison Condition Setting Register (ADCMPLER) 1635
47.2.26 A/D Compare Function Window A Lower-Side Level Setting Register (ADCMPDR0), A/D Compare Function Window A Upper-Side Level Setting Register (ADCMPDR1), A/D Compare Function Window B Lower-Side Level Setting Register (ADWINLLB), A/D Compare Function Window B Upper-Side Level Setting Register (ADWINULB) 1636
47.2.27 A/D Compare Function Window A Channel Status Register 0 (ADCMPSR0) 1638
47.2.28 A/D Compare Function Window A Channel Status Register1 (ADCMPSR1) 1639
47.2.29 A/D Compare Function Window A Extended Input Channel Status Register (ADCMPSER) 1640
47.2.30 A/D Compare Function Window B Channel Select Register (ADCMPBNSR) 1641
47.2.31 A/D Compare Function Window B Status Register (ADCMPBSR) 1643
47.2.32 A/D Compare Function Window A/B Status Monitor Register (ADWINMON) 1643
47.2.33 A/D Programmable Gain Amplifier Control Register (ADPGACR) 1645
47.2.34 A/D Programmable Gain Amplifier Gain Setting Register 0 (ADPGAGS0) 1646
47.2.35 A/D Programmable Gain Amplifier Differential Input Control Register (ADPGADCR0) 1647
47.3 Operation 1648
47.3.1 Scanning Operation 1648
47.3.2 Single Scan Mode 1649
47.3.3 Continuous Scan Mode 1658
47.3.4 Group Scan Mode 1665
47.3.5 Compare Function for Windows A and B 1674
47.3.6 Analog Input Sampling and Scan Conversion Time 1677
47.3.7 Usage Example of A/D Data Register Automatic Clearing Function 1679
47.3.8 A/D-Converted Value Addition/Average Mode 1680
47.3.9 Disconnection Detection Assist Function 1680
47.3.10 Starting A/D Conversion with an Asynchronous Trigger 1682
47.3.11 Starting A/D Conversion with a Synchronous Trigger from a Peripheral Module 1682
47.3.12 Programmable Gain Amplifiers 1682
47.4 Interrupt Sources and DTC/DMAC Transfer Requests 1683
47.4.1 Interrupt Requests 1683

47.5 Event Link Function ... 1685
47.5.1 Event Output to the ELC ... 1685
47.5.2 ADC12 Operation through an Event from the ELC ... 1685
47.6 Usage Notes ... 1685
47.6.1 Restrictions on Reading the Data Registers ... 1685
47.6.2 Notes on Stopping A/D Conversion ... 1686
47.6.3 A/D Conversion Restart and Termination Timing ... 1686
47.6.4 Restrictions on Scan End Interrupt Handling ... 1686
47.6.5 Settings for the Module-Stop Function ... 1686
47.6.6 Notes on Entering the Low-Power States ... 1687
47.6.7 Error in Absolute Accuracy When Disconnection Detection Assistance Is in Use ... 1687
47.6.8 Available Functions and Register Settings of AN000 to AN002 and AN100 to AN102 ... 1687
47.6.9 Operating Modes and Status Bits ... 1688
47.6.10 Notes on Board Design ... 1688
47.6.11 Noise Reduction ... 1689
47.6.12 Port Settings When Using the 12-bit A/D Converter Input ... 1689
47.6.13 Relationship between the A/D Converter and ACMPHS ... 1689
48. 12-Bit D/A Converter (DAC12) ... 1691
48.1 Overview ... 1691
48.2 Register Descriptions ... 1692
48.2.1 D/A Data Register m (DADRm) (m = 0, 1) ... 1692
48.2.2 D/A Control Register (DACR) ... 1692
48.2.3 DADRm Format Select Register (DADPR) ... 1694
48.2.4 D/A A/D Synchronous Start Control Register (DAADSCR) ... 1694
48.2.5 D/A Output Amplifier Control Register (DAAMPCR) ... 1695
48.2.6 D/A A/D Synchronous Unit Select Register (DAADUSR) ... 1695
48.3 Operation ... 1696
48.3.1 Minimizing Interference between D/A and A/D Conversion ... 1696
48.4 Event Link Operation Setting Procedure ... 1698
48.4.1 DA0 Event Link Operation Setting Procedure ... 1698
48.4.2 DA1 Event Link Operation Setting Procedure ... 1698
48.5 Usage Notes on Event Link Operation ... 1699
48.6 Usage Notes ... 1699
48.6.1 Settings for the Module-Stop Function ... 1699
48.6.2 DAC12 Operation in Module-Stop State ... 1699
48.6.3 DAC12 Operation in Software Standby Mode ... 1699
48.6.4 DAC12 Operation in Deep Software Standby Mode ... 1699
48.6.5 Restrictions on Use of the Output Amplifier ... 1699
48.6.6 Restrictions on Usage When Interference Reduction between D/A and A/D Conversion Is Enabled ... 1699

49. Temperature Sensor (TSN) ... 1700
49.1 Overview ... 1700
49.2 Register Descriptions ... 1701
49.2.1 Temperature Sensor Control Register (TSCR) ... 1701
49.3 Using the Temperature Sensor ... 1701
49.3.1 Preparation for Using the Temperature Sensor ... 1701
49.3.2 Procedures for Using the Temperature Sensor ... 1702
49.4 Usage Notes ... 1703
49.4.1 Settings for the Module-Stop Function ... 1703
49.4.2 Restrictions ... 1703
50. High-Speed Analog Comparator (ACMPHS) ... 1704
50.1 Overview ... 1704
50.2 Register Descriptions ... 1706
50.2.1 Comparator Control Register (CMPCTL) ... 1706
50.2.2 Comparator Input Select Register (CMPSEL0) ... 1707
50.2.3 Comparator Reference Voltage Select Register (CMPSEL1) ... 1707
50.2.4 Comparator Output Monitor Register (CMPMON) ... 1708
50.2.5 Comparator Output Control Register (CPIOC) ... 1708
50.3 Operation ... 1709
50.4 Noise Filter ... 1710
50.5 ACMPHS Interrupts ... 1711
50.6 ACMPHS Output to the Event Link Controller (ELC) ... 1711
50.7 ACMPHS Pin Output ... 1711
50.8 Usage Note ... 1711
50.8.1 Settings for the Module-Stop Function ... 1711
50.8.2 Relationship with the ADC12 ... 1711
51. Capacitive Touch Sensing Unit (CTSU) ... 1712
51.1 Overview ... 1712
51.2 Register Descriptions ... 1714
51.2.1 CTSU Control Register 0 (CTSUCR0) ... 1714
51.2.2 CTSU Control Register 1 (CTSUCR1) ... 1716
51.2.3 CTSU Synchronous Noise Reduction Setting Register (CTSUSDPRS) ... 1717
51.2.4 CTSU Sensor Stabilization Wait Control Register (CTSUSST) ... 1717
51.2.5 CTSU Measurement Channel Register 0 (CTSUMCH0) ... 1718
51.2.6 CTSU Measurement Channel Register 1 (CTSUMCH1) ... 1719
51.2.7 CTSU Channel Enable Control Register 0 (CTSUCHAC0) ... 1719
51.2.8 CTSU Channel Enable Control Register 1 (CTSUCHAC1) ... 1720
51.2.9 CTSU Channel Enable Control Register 2 (CTSUCHAC2) ... 1720
51.2.10 CTSU Channel Transmit/Receive Control Register 0 (CTSUCHTRC0) ... 1721
51.2.11 CTSU Channel Transmit/Receive Control Register 1 (CTSUCHTRC1) ... 1721
51.2.12 CTSU Channel Transmit/Receive Control Register 2 (CTSUCHTRC2) ... 1722

51.2.13 CTSU High-Pass Noise Reduction Control Register (CTSUDCLKC) 1722
51.2.14 CTSU Status Register (CTSUST) 1723
51.2.15 CTSU High-Pass Noise Reduction Spectrum Diffusion Control Register (CTSUSSC) 1724
51.2.16 CTSU Sensor Offset Register 0 (CTSUSO0) 1725
51.2.17 CTSU Sensor Offset Register 1 (CTSUSO1) 1725
51.2.18 CTSU Sensor Counter (CTSUSC) 1727
51.2.19 CTSU Reference Counter (CTSURC) 1727
51.2.20 CTSU Error Status Register (CTSUERRS) 1728
51.3 Operation 1728
51.3.1 Principles of Measurement Operation 1728
51.3.2 Measurement Modes 1730
51.3.3 Functions Common to Multiple Modes 1738
51.4 Usage Notes 1740
51.4.1 Measurement Result Data (CTSUSC and CTSURC Counters) 1740
51.4.2 Software Trigger 1740
51.4.3 External Triggers 1741
51.4.4 Notes on Forcing Operation Stop 1741
51.4.5 TSCAP Pin 1741
51.4.6 Notes on Measurement Operation (CTSUCR0.CTSUSTRT Bit = 1) 1741
52. Data Operation Circuit (DOC) 1742
52.1 Overview 1742
52.2 Register Descriptions 1743
52.2.1 DOC Control Register (DOCR) 1743
52.2.2 DOC Data Input Register (DODIR) 1744
52.2.3 DOC Data Setting Register (DODSR) 1744
52.3 Operation 1744
52.3.1 Data Comparison Mode 1744
52.3.2 Data Addition Mode 1745
52.3.3 Data Subtraction Mode 1745
52.4 Interrupt Request and Output to the Event Link Controller (ELC) 1746
52.5 Usage Note 1746
52.5.1 Settings for the Module-Stop Function 1746
53. SRAM 1747
53.1 Overview 1747
53.2 Register Descriptions 1748
53.2.1 SRAM Parity Error Operation After Detection Register (PARIOAD) 1748
53.2.2 SRAM Protection Register (SRAMPRCR) 1748
53.2.3 SRAM Wait State Control Register (SRAMWTSC) 1749
53.2.4 DED Operating Mode Control Register (DEDMODE) 1750
53.2.5 DED 2-Bit Error Status Register (DED2STS) 1750

53.2.6 DED 1-Bit Error Information Update Enable Register (DED1STSEN) 1751
53.2.7 DED 1-Bit Error Status Register (DED1STS) 1751
53.2.8 DED Protection Register (DEDPRCR) 1752
53.2.9 SRAM DED Error Operation After Detection Register (DEDOAD) 1752
53.3 Operation 1753
53.3.1 Low-Power Functions 1753
53.3.2 DED Function 1753
53.3.3 DED Error Generation 1753
53.3.4 Parity Calculation Function 1753
53.3.5 SRAM Error Sources 1755
53.3.6 Access Cycles 1756
53.4 Usage Notes 1757
53.4.1 Wait State Insertion 1757
53.4.2 Instruction Fetch from the SRAM Area 1757
53.4.3 Store Buffer of SRAM 1757
54. Standby SRAM 1758
54.1 Overview 1758
54.2 Operation 1758
54.2.1 Data Retention 1758
54.2.2 Low-Power Function 1758
54.2.3 Parity Calculation Function 1758
54.2.4 Access Cycle 1758
54.3 Usage Notes 1759
54.3.1 Instruction Fetch from the Standby SRAM area 1759
55. Flash Memory 1760
55.1 Overview 1760
55.2 Structure of Memory 1761
55.3 Flash Cache 1762
55.3.1 Overview 1762
55.3.2 Register Descriptions 1763
55.4 Operation 1764
55.4.1 Notice to use Flash Cache 1765
55.5 Operating Modes Associated with the Flash Memory 1765
55.5.1 ID Code Protection 1765
55.6 Overview of Functions 1766
55.6.1 Configuration Area Bit Map 1768
55.6.2 Startup Area Select 1769
55.6.3 Protection by Access Window 1769
55.7 Programming Commands 1771
55.8 Suspend Operation 1771
55.9 Protection 1772

55.10 Serial Programming Mode 1772
55.10.1 SCI Boot Mode 1772
55.10.2 USB Boot Mode 1773
55.11 Using a Serial Programmer for Programming 1773
55.11.1 Serial Programming 1773
55.11.2 Programming Environments 1773
55.12 Programming through Self-Programming 1774
55.12.1 Overview 1774
55.12.2 Background Operation 1774
55.13 Reading the Flash Memory 1775
55.13.1 Reading the Code Flash Memory 1775
55.13.2 Reading the Data Flash Memory 1775
55.14 Usage Notes 1775
55.14.1 Reading Areas Where Programming or Erasure Was Interrupted 1775
55.14.2 Constraint on Additional Writes 1775
55.14.3 Resets during Programming and Erasure 1775
55.14.4 Allocation of Vectors for Interrupts and Other Exceptions during Programming and Erasure 1775
55.14.5 Restrictions during Programming and Erasure 1775
55.14.6 Abnormal Termination of Programming and Erasure 1775
56. 2D Drawing Engine (DRW) 1776
56.1 Overview 1776
56.2 Register Descriptions 1779
56.2.1 Geometry Control Register (CONTROL) 1779
56.2.2 Surface Control Register (CONTROL2) 1780
56.2.3 Interrupt Control Register (IRQCTL) 1783
56.2.4 Cache Control Register (CACHECTL) 1783
56.2.5 Status Control Register (STATUS) 1784
56.2.6 Hardware Version and Feature Set ID Register (HWREVISION) 1785
56.2.7 Base Color Register (COLOR1) 1786
56.2.8 Secondary Color Register (COLOR2) 1786
56.2.9 Pattern Register (PATTERN) 1787
56.2.10 Limiter N Start Value Register (LnSTART) 1787
56.2.11 Limiter N X-Axis Increment Register (LnXADD) 1787
56.2.12 Limiter N Y-Axis Increment Register (LnYADD) 1788
56.2.13 Limiter M Band Width Parameter Register (LmBAND) 1788
56.2.14 Texture Base Address Register (TEXORIGIN) 1788
56.2.15 Texels Per Texture Line Register (TEXPITCH) 1789
56.2.16 Texture Size or Texture Address Mask Register (TEXMASK) 1789
56.2.17 U Limiter Start Value Register (LUSTART) 1790
56.2.18 U Limiter X-Axis Increment Register (LUXADD) 1790

56.2.19 U Limiter Y-Axis Increment Register (LUYADD) 1790
56.2.20 V Limiter Start Value Integer Part Register (LVSTARTI) 1791
56.2.21 V Limiter Start Value Fractional Part Register (LVSTARTF) 1791
56.2.22 V Limiter X-Axis Increment Integer Part Register (LVXADDI) 1791
56.2.23 V Limiter Y-Axis Increment Integer Part Register (LVYADDI) 1792
56.2.24 V Limiter Increment Fractional Parts Register (LVYXADDF) 1792
56.2.25 CLUT Start Address Register (TEXCLADDR) 1793
56.2.26 CLUT Data Register (TEXCLDATA) 1793
56.2.27 CLUT Offset Register (TEXCLOFFSET) 1794
56.2.28 Color Key Register (COLKEY) 1794
56.2.29 Bounding Box Dimension Register (SIZE) 1795
56.2.30 Framebuffer Pitch And Spanstore Delay Register (PITCH) 1795
56.2.31 Framebuffer Base Address Register (ORIGIN) 1796
56.2.32 Display List Start Address Register (DLISTSTART) 1796
56.2.33 Performance Counters Control Register (PERFTRIGGER) 1797
56.2.34 Performance Counter k (PERFCOUNTk) (k = 1, 2) 1797
56.3 Drawing Features 1798
56.3.1 Drawing Features Summary 1798
56.3.2 Vector Drawing 1799
56.3.3 BitBLT 1799
56.4 Input and Output Data Formats 1800
56.4.1 Source and Destination Data 1800
56.4.2 Framebuffer Color Formats 1801
56.4.3 Texture Color Formats 1801
56.5 Texture Data Processing 1802
56.5.1 Texture Color Format 1802
56.5.2 Run Length Encoded (RLE) Unit 1802
56.5.3 Color Lookup Table (CLUT) 1804
56.5.4 Color Keying 1805
56.6 Rendering Pipeline 1806
56.6.1 Coordinate Transformation 1806
56.6.2 Rasterization 1806
56.6.3 Texturing 1818
56.6.4 Colorization 1821
56.6.5 Blending 1821
56.7 Rendering Modes 1825
56.7.1 Register Mode 1825
56.7.2 Display List Mode 1825
56.7.3 Stopping the Render Process 1828
56.8 Interrupts 1829
56.8.1 Interrupt sources 1829

56.8.2 Interrupt Control ... 1829
56.9 Performance Counters ... 1830
56.10 Stopping the 2D Drawing Engine Render Process ... 1830
57. JPEG Codec ... 1831
57.1 Overview ... 1831
57.2 Register Descriptions ... 1832
57.2.1 JPEG Code Mode Register (JCMOD) ... 1832
57.2.2 JPEG Code Command Register (JCCMD) ... 1833
57.2.3 JPEG Code Quantization Table Number Register (JCQTN) ... 1833
57.2.4 JPEG Code Huffman Table Number Register (JCHTN) ... 1834
57.2.5 JPEG Code DRI Upper Register (JCDRIU) ... 1834
57.2.6 JPEG Code DRI Lower Register (JCDRID) ... 1834
57.2.7 JPEG Code Vertical Size Upper Register (JCVSZU) ... 1835
57.2.8 JPEG Code Vertical Size Lower Register (JCVSZD) ... 1835
57.2.9 JPEG Code Horizontal Size Upper Register (JCHSZU) ... 1835
57.2.10 JPEG Coded Horizontal Size Lower Register (JCHSZD) ... 1836
57.2.11 JPEG Code Data Count Upper Register (JCDTCU) ... 1836
57.2.12 JPEG Code Data Count Middle Register (JCDTCM) ... 1836
57.2.13 JPEG Code Data Count Lower Register (JCDTCD) ... 1837
57.2.14 JPEG Interrupt Enable Register 0 (JINTE0) ... 1837
57.2.15 JPEG Interrupt Status Register 0 (JINTS0) ... 1838
57.2.16 JPEG Code Decode Error Register (JCDERR) ... 1838
57.2.17 JPEG Code Reset Register (JCRST) ... 1839
57.2.18 JPEG Interface Compression Control Register (JIFECNT) ... 1839
57.2.19 JPEG Interface Compression Source Address Register (JIFESA) ... 1840
57.2.20 JPEG Interface Compression Line Offset Register (JIFESOFST) ... 1840
57.2.21 JPEG Interface Compression Destination Address Register (JIFEDA) ... 1841
57.2.22 JPEG Interface Compression Source Line Count Register (JIFESLC) ... 1841
57.2.23 JPEG Interface Decompression Control Register (JIFDCNT) ... 1842
57.2.24 JPEG Interface Decompression Source Address Register (JIFDSA) ... 1843
57.2.25 JPEG Interface Decompression Line Offset Register (JIFDDOFST) ... 1844
57.2.26 JPEG Interface Decompression Destination Address Register (JIFDDA) ... 1844
57.2.27 JPEG Interface Decompression Source Data Count Register (JIFDSDC) ... 1845
57.2.28 JPEG Interface Decompression Destination Line Count Register (JIFDDLC) ... 1845
57.2.29 JPEG Interface Decompression alpha Set Register (JIFDADT) ... 1846
57.2.30 JPEG Interrupt Enable Register 1 (JINTE1) ... 1846
57.2.31 JPEG Interrupt Status Register 1 (JINTS1) ... 1847
57.3 Operation ... 1848
57.3.1 Compression ... 1848
57.3.2 Decompression ... 1854
57.3.3 Output Pixel Format in Decompression ... 1859

57.3.4 Storing Image Data ... 1862
57.4 Interrupts ... 1862
57.4.1 Compression/Decompression Process Interrupt Request (JPEG_JEDI) ... 1862
57.4.2 Data Transfer Interrupt Request (JPEG_JDTI) ... 1863
57.5 Bus Reset Processing ... 1863
58. Graphics LCD Controller (GLCDC) ... 1864
58.1 Functional Overview ... 1865
58.1.1 GLCDC Configuration ... 1866
58.1.2 Screen Format ... 1868
58.1.3 Graphics and Color Palette (CLUT) Data Formats ... 1868
58.1.4 Output Control for Data Format ... 1869
58.1.5 Output Control for Panel-Oriented Correction Process ... 1874
58.1.6 Output Control for TCON ... 1874
58.1.7 Graphics Data Interface ... 1875
58.1.8 Blending ... 1875
58.2 Register Descriptions ... 1878
58.2.1 Color Palette (CLUT) ... 1878
58.2.2 Background Plane Setting Operation Control Register (BG_EN) ... 1879
58.2.3 Background Plane Setting Free-Running Period Register (BG_PERI) ... 1880
58.2.4 Background Plane Setting Synchronization Position Register (BG_SYNC) ... 1881
58.2.5 Background Plane Setting Full Image Vertical Size Register (BG_VSIZE) ... 1882
58.2.6 Background Plane Setting Full Image Horizontal Size Register (BG_HSIZE) ... 1883
58.2.7 Background Plane Setting Background Color Register (BG_BGC) ... 1884
58.2.8 Background Plane Setting Status Monitor Register (BG_MON) ... 1885
58.2.9 Graphics 1 Register Update Control Register (GR1_VEN)
Graphics 2 Register Update Control Register (GR2_VEN) ... 1886
58.2.10 Graphics 1 Frame Buffer Read Control Register (GR1_FLMRD)
Graphics 2 Frame Buffer Read Control Register (GR2_FLMRD) ... 1887
58.2.11 Graphics 1 Frame Buffer Control Register 1 (GR1_FLM1)
Graphics 2 Frame Buffer Control Register 1 (GR2_FLM1) ... 1888
58.2.12 Graphics 1 Frame Buffer Control Register 2 (GR1_FLM2)
Graphics 2 Frame Buffer Control Register 2 (GR2_FLM2) ... 1889
58.2.13 Graphics 1 Frame Buffer Control Register 3 (GR1_FLM3)
Graphics 2 Frame Buffer Control Register 3 (GR2_FLM3) ... 1890
58.2.14 Graphics 1 Frame Buffer Control Register 5 (GR1_FLM5)
Graphics 2 Frame Buffer Control Register 5 (GR2_FLM5) ... 1890
58.2.15 Graphics 1 Frame Buffer Control Register 6 (GR1_FLM6)
Graphics 2 Frame Buffer Control Register 6 (GR2_FLM6) ... 1892
58.2.16 Graphics 1 Alpha Blending Control Register 1 (GR1_AB1)
Graphics 2 Alpha Blending Control Register 1 (GR2_AB1) ... 1893
58.2.17 Graphics 1 Alpha Blending Control Register 2 (GR1_AB2)
Graphics 2 Alpha Blending Control Register 2 (GR2_AB2) ... 1895
58.2.18 Graphics 1 Alpha Blending Control Register 3 (GR1_AB3)
Graphics 2 Alpha Blending Control Register 3 (GR2_AB3) ... 1896

58.2.19 Graphics 1 Alpha Blending Control Register 4 (GR1_AB4)
Graphics 2 Alpha Blending Control Register 4 (GR2_AB4) 1897
58.2.20 Graphics 1 Alpha Blending Control Register 5 (GR1_AB5)
Graphics 2 Alpha Blending Control Register 5 (GR2_AB5) 1898
58.2.21 Graphics 1 Alpha Blending Control Register 6 (GR1_AB6)
Graphics 2 Alpha Blending Control Register 6 (GR2_AB6) 1899
58.2.22 Graphics 1 Alpha Blending Control Register 7 (GR1_AB7)
Graphics 2 Alpha Blending Control Register 7 (GR2_AB7) 1900
58.2.23 Graphics 1 Alpha Blending Control Register 8 (GR1_AB8)
Graphics 2 Alpha Blending Control Register 8 (GR2_AB8) 1901
58.2.24 Graphics 1 Alpha Blending Control Register 9 (GR1_AB9)
Graphics 2 Alpha Blending Control Register 9 (GR2_AB9) 1902
58.2.25 Graphics 1 Background Color Control Register (GR1_BASE)
Graphics 2 Background Color Control Register (GR2_BASE) 1903
58.2.26 Graphics 1 CLUT Table Interrupt Control Register (GR1_CLUTINT)
Graphics 2 CLUT Table Interrupt Control Register (GR2_CLUTINT) 1904
58.2.27 Graphics 1 Status Monitor Register (GR1_MON)
Graphics 2 Status Monitor Register (GR2_MON) 1905
58.2.28 Gamma G Register Update Control Register (GAMG_LATCH)
Gamma B Register Update Control Register (GAMB_LATCH)
Gamma R Register Update Control Register (GAMR_LATCH) 1906
58.2.29 Gamma Correction Block Function Switch Register (GAM_SW) 1907
58.2.30 Gamma G Correction Block Table Setting Register 1 (GAMG_LUT1)
Gamma B Correction Block Table Setting Register 1 (GAMB_LUT1)
Gamma R Correction Block Table Setting Register 1 (GAMR_LUT1) 1907
58.2.31 Gamma G Correction Block Table Setting Register 2 (GAMG_LUT2)
Gamma B Correction Block Table Setting Register 2 (GAMB_LUT2)
Gamma R Correction Block Table Setting Register 2 (GAMR_LUT2) 1909
58.2.32 Gamma G Correction Block Table Setting Register 3 (GAMG_LUT3)
Gamma B Correction Block Table Setting Register 3 (GAMB_LUT3)
Gamma R Correction Block Table Setting Register 3 (GAMR_LUT3) 1910
58.2.33 Gamma G Correction Block Table Setting Register 4 (GAMG_LUT4)
Gamma B Correction Block Table Setting Register 4 (GAMB_LUT4)
Gamma R Correction Block Table Setting Register 4 (GAMR_LUT4) 1911
58.2.34 Gamma G Correction Block Table Setting Register 5 (GAMG_LUT5)
Gamma B Correction Block Table Setting Register 5 (GAMB_LUT5)
Gamma R Correction Block Table Setting Register 5 (GAMR_LUT5) 1912
58.2.35 Gamma G Correction Block Table Setting Register 6 (GAMG_LUT6)
Gamma B Correction Block Table Setting Register 6 (GAMB_LUT6)
Gamma R Correction Block Table Setting Register 6 (GAMR_LUT6) 1913
58.2.36 Gamma G Correction Block Table Setting Register 7 (GAMG_LUT7)
Gamma B Correction Block Table Setting Register 7 (GAMB_LUT7)
Gamma R Correction Block Table Setting Register 7 (GAMR_LUT7) 1914
58.2.37 Gamma G Correction Block Table Setting Register 8 (GAMG_LUT8)
Gamma B Correction Block Table Setting Register 8 (GAMB_LUT8)
Gamma R Correction Block Table Setting Register 8 (GAMR_LUT8) 1915
58.2.38 Gamma G Correction Block Area Setting Register 1 (GAMG_AREA1)
Gamma B Correction Block Area Setting Register 1 (GAMB_AREA1)
Gamma R Correction Block Area Setting Register 1 (GAMR_AREA1) 1916

58.2.39 Gamma G Correction Block Area Setting Register 2 (GAMG_AREA2)
Gamma B Correction Block Area Setting Register 2 (GAMB_AREA2)
Gamma R Correction Block Area Setting Register 2 (GAMR_AREA2)..... 1917
58.2.40 Gamma G Correction Block Area Setting Register 3 (GAMG_AREA3)
Gamma B Correction Block Area Setting Register 3 (GAMB_AREA3)
Gamma R Correction Block Area Setting Register 3 (GAMR_AREA3)..... 1918
58.2.41 Gamma G Correction Block Area Setting Register 4 (GAMG_AREA4)
Gamma B Correction Block Area Setting Register 4 (GAMB_AREA4)
Gamma R Correction Block Area Setting Register 4 (GAMR_AREA4)..... 1919
58.2.42 Gamma G Correction Block Area Setting Register 5 (GAMG_AREA5)
Gamma B Correction Block Area Setting Register 5 (GAMB_AREA5)
Gamma R Correction Block Area Setting Register 5 (GAMR_AREA5)..... 1920
58.2.43 Output Control Block Register Update Control Register (OUT_VLATCH) 1921
58.2.44 Output Control Block Output Interface Register (OUT_SET) 1922
58.2.45 Output Control Block Brightness Correction Register 1 (OUT_BRIGHT1)..... 1923
58.2.46 Output Control Block Brightness Correction Register 2 (OUT_BRIGHT2)..... 1924
58.2.47 Output Control Block Contrast Correction Register (OUT_CONTRAST)..... 1925
58.2.48 Output Control Block Panel Dither Correction Register (OUT_PDTHA) 1926
58.2.49 Output Control Block Output Phase Control Register (OUT_CLKPHASE) 1928
58.2.50 TCON Reference Timing Setting Register (TCON_TIM)..... 1930
58.2.51 TCON Vertical Timing Setting Register A1 (TCON_STVA1)
TCON Vertical Timing Setting Register B1 (TCON_STVB1)..... 1932
58.2.52 TCON Vertical Timing Setting Register A2 (TCON_STVA2)
TCON Vertical Timing Setting Register B2 (TCON_STVB2)..... 1933
58.2.53 TCON Horizontal Timing Setting Register STHA1 (TCON_STHA1)
TCON Horizontal Timing Setting Register STHB1 (TCON_STHB1) 1934
58.2.54 TCON Horizontal Timing Setting Register STHA2 (TCON_STHA2)
TCON Horizontal Timing Setting Register STHB2 (TCON_STHB2) 1936
58.2.55 TCON Data Enable Polarity Setting Register (TCON_DE) 1937
58.2.56 System Control Block State Detection Control Register (SYSCNT_DTCTEN) 1938

Leading performance 240-MHz Arm® Cortex®-M4 core, up to 4-MB code flash memory, 640-KB SRAM, Graphics LCD Controller, 2D Drawing Engine, Capacitive Touch Sensing Unit, Ethernet MAC Controller with IEEE 1588 PTP, USB 2.0 High-Speed, USB 2.0 Full-Speed, SDHI, Quad SPI, security and safety features, and advanced analog.

Features

■ Arm Cortex-M4 Core with Floating Point Unit (FPU)
- Armv7E-M architecture with DSP instruction set
- Maximum operating frequency: 240 MHz
- Support for 4-GB address space
- On-chip debugging system: JTAG, SWD, and ETM
- Boundary scan and Arm Memory Protection Unit (Arm MPU)

■ Memory
- Up to 4-MB code flash memory (80 MHz zero wait states)
- 64-KB data flash memory (125,000 erase/write cycles)
- Up to 640-KB SRAM
- Flash Cache (FCACHE)
- Memory Protection Units (MPU)
- Memory Mirror Function (MMF)
- 128-bit unique ID

■ Connectivity
- Ethernet MAC Controller (ETHERC) × 2
- Ethernet DMA Controller (EDMAC)
- Ethernet PTP Controller (EPTPC)
- USB 2.0 High-Speed (USBHS) module
  - On-chip transceiver
  - USB battery charge version 1.2 supported
- USB 2.0 Full-Speed (USBFS) module
  - On-chip transceiver
- Serial Communications Interface (SCI) with FIFO × 10
- Serial Peripheral Interface (SPI) × 2
- I^2C bus interface (IIC) × 3
- CAN module (CAN) × 2
- Serial Sound Interface (SSI) × 2
- SD/MMC Host Interface (SDHI) × 2
- Quad Serial Peripheral Interface (QSPI)
- IrDA interface
- Sampling Rate Converter (SRC)
- External memory space
  - 8-bit or 16-bit bus space is selectable per area
  - SDRAM support

■ Analog
- 12-bit A/D Converter (ADC12) with 3 sample-and-hold circuits each × 2
- 12-bit D/A Converter (DAC12) × 2
- High-Speed Analog Comparator (ACMPHS) × 6
- Programmable Gain Amplifier (PGA) × 6
- Temperature Sensor (TSN)

■ Timers
- General PWM Timer 32-bit Enhanced High Resolution (GPT32EH) × 4
- General PWM Timer 32-bit Enhanced (GPT32E) × 4
- General PWM Timer 32-bit (GPT32) × 6
- Asynchronous General-Purpose Timer (AGT) × 2
- Watchdog Timer (WDT)

■ Safety
- SRAM parity error check
- Flash area protection
- ADC self-diagnosis function
- Clock Frequency Accuracy Measurement Circuit (CAC)
- Cyclic Redundancy Check (CRC) calculator
- Data Operation Circuit (DOC)
- Port Output Enable for GPT (POEG)
- Independent Watchdog Timer (IWDT)
- GPIO readback level detection
- Register write protection
- Main oscillator stop detection
- Illegal memory access

■ System and Power Management
- Low power modes
- Switching regulator
- Realtime Clock (RTC) with calendar and VBATT support
- Event Link Controller (ELC)
- DMA Controller (DMAC) × 8
- Data Transfer Controller (DTC)
- Key Interrupt Function (KINT)
- Power-on reset
- Low Voltage Detection (LVD) with voltage settings

■ Security and Encryption
- AES128/192/256
- 3DES/ARC4
- SHA1/SHA224/SHA256/MD5
- GHASH
- RSA/DSA/ECC
- True Random Number Generator (TRNG)

■ Human Machine Interface (HMI)
- Graphics LCD Controller (GLCDC)
- JPEG Codec
- 2D Drawing Engine (DRW)
- Capacitive Touch Sensing Unit (CTSU)
- Parallel Data Capture Unit (PDC)

■ Multiple Clock Sources
- Main clock oscillator (MOSC) (8 to 24 MHz)
- Sub-clock oscillator (SOSC) (32.768 kHz)
- High-speed on-chip oscillator (HOCO) (16/18/20 MHz)
- Middle-speed on-chip oscillator (MOCO) (8 MHz)
- Low-speed on-chip oscillator (LOCO) (32.768 kHz)
- IWDT-dedicated on-chip oscillator (15 kHz)
- Clock trim function for HOCO/MOCO/LOCO
- Clock out support

■ General-Purpose I/O Ports
- Up to 172 input/output pins
  - Up to 9 CMOS input
  - Up to 163 CMOS input/output
    - Up to 22 input/output 5 V tolerant
    - Up to 24 high current (20 mA)

■ Operating Voltage
- VCC: 2.7 to 3.6 V

■ Operating Temperature and Packages
- Ta = -40°C to +85°C
  - 224-pin BGA (13 mm × 13 mm, 0.8 mm pitch)
  - 176-pin BGA (13 mm × 13 mm, 0.8 mm pitch)
  - 145-pin LGA (7 mm × 7 mm, 0.5 mm pitch)
- Ta = -40°C to +105°C
  - 176-pin LQFP (24 mm × 24 mm, 0.5 mm pitch)
  - 144-pin LQFP (20 mm × 20 mm, 0.5 mm pitch)
  - 100-pin LQFP (14 mm × 14 mm, 0.5 mm pitch)

1. Overview

The MCU integrates multiple series of software- and pin-compatible Arm®-based 32-bit cores that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

The MCU in this series incorporates a high-performance Arm Cortex®-M4 core running up to 240 MHz with the following features:

- Up to 4-MB code flash memory
- 640-KB SRAM
- Graphics LCD Controller (GLCDC)
- 2D Drawing Engine (DRW)
- Capacitive Touch Sensing Unit (CTSU)
- Ethernet MAC Controller (ETHERC) with IEEE 1588 PTP, USBFS, USBHS, SD/MMC Host Interface
- Quad Serial Peripheral Interface (QSPI)
- Security and safety features
- Analog peripherals.

1.1 Function Outline

Table 1.1 Arm core

Feature	Functional description
Arm Cortex-M4 core	• Maximum operating frequency: up to 240 MHz • Arm Cortex-M4 core: - Revision: r0p1-01rel0 - Armv7E-M architecture profile - Single precision floating-point unit compliant with the ANSI/IEEE Std 754-2008 • Arm Memory Protection Unit (Arm MPU): - Armv7 Protected Memory System Architecture - 8 protect regions • SysTick timer: - Driven by SYSTICCLK (LOCO) or ICLK.

Table 1.2 Memory

Feature	Functional description
Code flash memory	Maximum 4 MB of code flash memory. See section 55, Flash Memory.
Data flash memory	64 KB of data flash memory. See section 55, Flash Memory.
Option-setting memory	The option-setting memory determines the state of the MCU after a reset. See section 7, Option-Setting Memory.
Memory Mirror Function (MMF)	The Memory Mirror Function (MMF) can be configured to mirror the wanted application image load address in code flash memory to the application image link address in the 23-bit unused memory space (memory mirror space addresses). Your application code is developed and linked to run from this MMF destination address. The application code does not need to know the load location where it is stored in code flash memory. See section 5, Memory Mirror Function (MMF).
SRAM	On-chip high-speed SRAM providing either parity-bit or Double-bit Error Detection (DED). The first 32 KB of SRAM0 is subject to DED. Parity check is performed for other areas. See section 53, SRAM.
Standby SRAM	On-chip SRAM that can retain data in Deep Software Standby mode. See section 54, Standby SRAM.

Table 1.3 System (1 of 2)

Feature	Functional description
Operating modes	Two operating modes: - Single-chip mode - SCI or USB boot mode. See section 3, Operating Modes.
Resets	14 resets: • RES pin reset • Power-on reset • Voltage monitor 0 reset • Voltage monitor 1 reset • Voltage monitor 2 reset • Independent watchdog timer reset • Watchdog timer reset • Deep Software Standby reset • SRAM parity error reset • SRAM DED error reset • Bus master MPU error reset • Bus slave MPU error reset • Stack pointer error reset • Software reset. See section 6, Resets.
Low Voltage Detection (LVD)	The Low Voltage Detection (LVD) function monitors the voltage level input to the VCC pin, and the detection level can be selected using a software program. See section 8, Low Voltage Detection (LVD).
Clocks	• Main clock oscillator (MOSC) • Sub-clock oscillator (SOSC) • High-speed on-chip oscillator (HOCO) • Middle-speed on-chip oscillator (MOCO) • Low-speed on-chip oscillator (LOCO) • PLL frequency synthesizer • IDWT-dedicated on-chip oscillator • Clock out support. See section 9, Clock Generation Circuit.
Clock Frequency Accuracy Measurement Circuit (CAC)	The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock to be used as a measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated. See section 10, Clock Frequency Accuracy Measurement Circuit (CAC).
Interrupt Controller Unit (ICU)	The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC/DTC module and DMAC module. The ICU also controls NMI interrupts. See section 14, Interrupt Controller Unit (ICU).
Key interrupt function (KINT)	A key interrupt can be generated by setting the Key Return Mode register (KRM) and inputting a rising or falling edge to the key interrupt input pins. See section 21, Key Interrupt Function (KINT).
Low power modes	Power consumption can be reduced in multiple ways, including by setting clock dividers, controlling EBCLK output, controlling SDCLK output, stopping modules, selecting power control mode in normal operation, and transitioning to low power modes. See section 11, Low Power Modes.
Battery backup function	A battery backup function is provided for partial powering by a battery. The battery-powered area includes the RTC, SOSC, backup memory, and switch between VCC and VBATT. See section 12, Battery Backup Function.
Register write protection	The register write protection function protects important registers from being overwritten because of software errors. See section 13, Register Write Protection.
Memory Protection Unit (MPU)	Three Memory Protection Units (MPUs) and a CPU stack pointer monitor function are provided for memory protection. See section 16, Memory Protection Unit (MPU).

Table 1.3 System (2 of 2)

Feature	Functional description
Watchdog Timer (WDT)	The Watchdog Timer (WDT) is a 14-bit down-counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, a non-maskable interrupt or interrupt can be generated by an underflow. A refresh-permitted period can be set to refresh the counter and used as the condition for detecting when the system runs out of control. See section 27, Watchdog Timer (WDT).
Independent Watchdog Timer (IWDT)	The Independent Watchdog Timer (IWDT) consists of a 14-bit down-counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or interrupt for a timer underflow. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail safe mechanism when the system runs out of control. The IWDT can be triggered automatically on a reset, underflow, or refresh error, or by a refresh of the count value in the registers. See section 28, Independent Watchdog Timer (IWDT).

Table 1.4 Event link

Feature	Functional description
Event Link Controller (ELC)	The Event Link Controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals to connect them to different modules, enabling direct interaction between the modules without CPU intervention. See section 19, Event Link Controller (ELC).

Table 1.5 Direct memory access

Feature	Functional description
Data Transfer Controller (DTC)	A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request. See section 18, Data Transfer Controller (DTC).
DMA Controller (DMAC)	An 8-channel DMA Controller (DMAC) module is provided for transferring data without the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address. See section 17, DMA Controller (DMAC).

Table 1.6 External bus interface

Feature	Functional description
External buses	• CS area (EXBIU): Connected to the external devices (external memory interface) • SDRAM area (EXBIU): Connected to the SDRAM (external memory interface) • QSPI area (EXBIUT2): Connected to the QSPI (external device interface).

Table 1.7 Timers (1 of 2)

Feature	Functional description
General PWM Timer (GPT)	The General PWM Timer (GPT) is a 32-bit timer with 14 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer. See section 23, General PWM Timer (GPT).
Port Output Enable for GPT (POEG)	Use the Port Output Enable for GPT (POEG) function to place the General PWM Timer (GPT) output pins in the output disable state. See section 22, Port Output Enable for GPT (POEG).
Asynchronous General-Purpose Timer (AGT)	The Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting of external events. This 16-bit timer consists of a reload register and a down-counter. The reload register and the down-counter are allocated to the same address, and can be accessed with the AGT register. See section 25, Asynchronous General-Purpose Timer (AGT).

Table 1.7 Timers (2 of 2)

Feature	Functional description
Realtime Clock (RTC)	The Realtime Clock (RTC) has two counting modes, calendar count mode and binary count mode, that are controlled by the register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar. See section 26, Realtime Clock (RTC).

Table 1.8 Communication interfaces (1 of 2)

Feature	Functional description
Serial Communications Interface (SCI)	The Serial Communications Interface (SCI) is configurable to five asynchronous and synchronous serial interfaces: • Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA)) • 8-bit clock synchronous interface • Simple IIC (master-only) • Simple SPI • Smart card interface. The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. Each SCI has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator. See section 34, Serial Communications Interface (SCI).
IrDA Interface (IrDA)	The IrDA interface sends and receives IrDA data communication waveforms in cooperation with the SCI1 based on the IrDA (Infrared Data Association) standard 1.0. See section 35, IrDA Interface.
I²C bus Interface (IIC)	The 3-channel I²C bus interface (IIC) conforms with and provides a subset of the NXP I²C (Inter-Integrated Circuit) bus interface functions. See section 36, I²C Bus Interface (IIC).
Serial Peripheral Interface (SPI)	Two independent Serial Peripheral Interface (SPI) channels are capable of high-speed, full-duplex synchronous serial communications with multiple processors and peripheral devices. See section 38, Serial Peripheral Interface (SPI).
Serial Sound Interface (SSI)	The Serial Sound Interface Enhanced (SSIE) peripheral provides functionality to interface with digital audio devices for transmitting PCM audio data over a serial bus with the MCU. The SSI supports an audio clock frequency of up to 50 MHz, and can be operated as a slave or master receiver, transmitter, or transceiver to suit various applications. The SSI includes 8-stage FIFO buffers in the receiver and transmitter, and supports interrupts and DMA-driven data reception and transmission. See section 41, Serial Sound Interface (SSI).
Quad Serial Peripheral Interface (QSPI)	The Quad Serial Peripheral Interface (QSPI) is a memory controller for connecting a serial ROM (nonvolatile memory such as a serial flash memory, serial EEPROM, or serial FeRAM) that has an SPI-compatible interface. See section 39, Quad Serial Peripheral Interface (QSPI).
Controller Area Network (CAN) module	The Controller Area Network (CAN) module provides functionality to receive and transmit data using a message-based protocol between multiple slaves and masters in electromagnetically-noisy applications. The CAN module complies with the ISO 11898-1 (CAN 2.0A/CAN 2.0B) standard and supports up to 32 mailboxes, which can be configured for transmission or reception in normal mailbox and FIFO modes. Both standard (11-bit) and extended (29-bit) messaging formats are supported. See section 37, Controller Area Network (CAN) Module.
USB 2.0 Full-Speed (USBFS) module	The USB 2.0 Full-Speed (USBFS) module can operate as a host controller or device controller. The module supports full-speed and low-speed (host controller only) transfer as defined in Universal Serial Bus Specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in Universal Serial Bus Specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 10 pipes. Pipes 1 to 9 can be assigned any endpoint number based on the peripheral devices used for communication or based on your system. See section 32, USB 2.0 Full-Speed Module (USBFS).

Table 1.8 Communication interfaces (2 of 2)

Feature	Functional description
USB 2.0 High-Speed (USBHS) module	The USB 2.0 High-Speed (USBHS) module can operate as a host controller or a device controller. As a host controller, the USBHS supports high-speed transfer, full-speed transfer, and low-speed transfer as defined in Universal Serial Bus Specification 2.0. As a device controller, the USBHS supports high-speed transfer and full-speed transfer as defined in Universal Serial Bus Specification 2.0. The USBHS has an internal USB transceiver and supports all of the transfer types defined in Universal Serial Bus Specification 2.0. The USBHS has FIFO buffers for data transfer, providing a maximum of 10 pipes. Any endpoint number can be assigned to pipes 1 to 9, based on the peripheral devices or your system for communication. See section 33, USB 2.0 High-Speed Module (USBHS).
Ethernet MAC with IEEE 1588 PTP (ETHERC)	Two-channel Ethernet MAC Controller (ETHERC) compliant with the Ethernet/IEEE802.3 Media Access Control (MAC) layer protocol. Each ETHERC channel provides one channel of the MAC layer interface, connecting the MCU to the physical layer LSI (PHY-LSI) that allows transmission and reception of frames compliant with the Ethernet and IEEE802.3 standards. The ETHERC is connected to the Ethernet DMA Controller (EDMAC) so data can be transferred without using the CPU. To handle timing and synchronization between devices, an on-chip Precision Time Protocol (PTP) module for the Ethernet PTP Controller (EPTPC) applies the PTP defined in the IEEE 1588-2008 version 2.0 standard. The EPTPC is composed of: • Synchronization Frame Processing units (SYNFP0 and SYNFP1) • A Packet Relation Controller unit (PRC-TC) • A Statistical Time Correction Algorithm unit (STCA). Use the EPTPC in combination with the on-chip Ethernet MAC Controller (ETHERC) and the DMA Controller for the PTP Ethernet Controller (PTPEDMAC). See section 29, Ethernet MAC Controller (ETHERC).
SD/MMC Host Interface (SDHI)	The SDHI and MultiMediaCard (MMC) interface module provides the functionality required to connect a variety of external memory cards to the MCU. The SDHI supports both 1-bit and 4-bit buses for connecting memory cards that support SD, SDHC, and SDXC formats. When developing host devices that are compliant with the SD Specifications, you must comply with the SD Host/Ancillary Product License Agreement (SD HALA). The MMC interface supports 1-bit, 4-bit, and 8-bit MMC buses that provide eMMC 4.51 (JEDEC Standard JESD 84-B451) device access. This interface also provides backward compatibility and supports high-speed SDR transfer modes. See section 43, SD/MMC Host Interface (SDHI).

Table 1.9 Analog

Feature	Functional description
12-bit A/D Converter (ADC12)	Up to two successive approximation 12-bit A/D Converters (ADC12) are provided. In unit 0, up to 13 analog input channels are selectable. In unit 1, up to 12 analog input channels, the temperature sensor output, and an internal reference voltage are selectable for conversion. The A/D conversion accuracy is selectable from 12-bit, 10-bit, and 8-bit conversion, making it possible to optimize the tradeoff between speed and resolution in generating a digital value. See section 47, 12-Bit A/D Converter (ADC12).
12-bit D/A Converter (DAC12)	A 12-bit D/A Converter (DAC12) converts data and includes an output amplifier. See section 48, 12-Bit D/A Converter (DAC12).
Temperature sensor (TSN)	The on-chip Temperature Sensor (TSN) can determine and monitor the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is linear. The output voltage is provided to the ADC12 for conversion and can also be used by the end application. See section 49, Temperature Sensor (TSN).
High-Speed Analog Comparator (ACMPHS)	The High-Speed Analog Comparator (ACMPHS) compares a test voltage with a reference voltage and provides a digital output based on the conversion result. Both the test and reference voltages can be provided to the comparator from internal sources such as the DAC12 output and internal reference voltage, and an external source with or without an internal PGA. Such flexibility is useful in applications that require go/no-go comparisons to be performed between analog signals without necessarily requiring A/D conversion. See section 50, High-Speed Analog Comparator (ACMPHS).

Table 1.10 Human machine interfaces

Feature	Functional description
Capacitive Touch Sensing Unit (CTSU)	The Capacitive Touch Sensing Unit (CTSU) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by the software, which enables the CTSU to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed with an electrical insulator so that fingers do not come into direct contact with the electrodes. See section 51, Capacitive Touch Sensing Unit (CTSU).

Table 1.11 Graphics

Feature	Functional description
Graphics LCD Controller (GLCDC)	The Graphics LCD Controller (GLCDC) provides multiple functions and supports various data formats and panels. Key GLCDC features include: • GPX bus master function for accessing graphics data • Superimposition of three planes (single color background plane, graphic 1 plane, and graphic 2 plane) • Support for many types of 32-bit or 16-bit per pixel graphics data and 8-bit, 4-bit, or 1-bit LUT data format • Digital interface signal output supporting a video image size of WVGA or greater. See section 58, Graphics LCD Controller (GLCDC).
2D Drawing Engine (DRW)	The 2D Drawing Engine (DRW) provides flexible functions that can support almost any object geometry rather than being bound to only a few specific geometries such as lines, triangles, or circles. The edges of every object can be independently blurred or antialiased. Rasterization is executed at one pixel per clock on the bounding box of the object from left to right and top to bottom. The DRW can also raster from bottom to top to optimize the performance in certain cases. In addition, optimization methods are available to avoid rasterization of many empty pixels of the bounding box. The distances to the edges of the object are calculated by a set of edge equations for every pixel of the bounding box. These edge equations can be combined to describe the entire object. If a pixel is inside the object, it is selected for rendering. If it is outside, it is discarded. If it is on the edge, an alpha value can be chosen proportional to the distance of the pixel to the nearest edge for antialiasing. Every pixel that is selected for rendering can be textured. The resulting aRGB quadruple can be modified by a general raster operation approach independently for each of the four channels. The aRGB quadruples can then be blended with one of the multiple blend modes of the DRW. The DRW provides two inputs (texture read and framebuffer read), and one output (framebuffer write). The internal color format is always aRGB (8888). The color formats from the inputs are converted to the internal format on read and a conversion back is made on write. See section 56, 2D Drawing Engine (DRW).
JPEG Codec (JPEG)	The JPEG Codec (JPEG) incorporates a JPEG codec that conforms to the JPEG baseline compression and decompression standard. This provides high-speed compression of image data and high-speed decoding of JPEG data. See section 57, JPEG Codec.
Parallel Data Capture (PDC) unit	One Parallel Data Capture (PDC) unit is provided for communicating with external I/O devices, including image sensors, and transferring parallel data such as an image output from the external I/O device through the DTC or DMAC to the on-chip SRAM and external address spaces (the CS and SDRAM areas). See section 44, Parallel Data Capture Unit (PDC).

Table 1.12 Data processing (1 of 2)

Feature	Functional description
Cyclic Redundancy Check (CRC) calculator	The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generating polynomials are available. The snoop function allows monitoring reads from and writes to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer. See section 40, Cyclic Redundancy Check (CRC) Calculator.

Table 1.12 Data processing (2 of 2)

Feature	Functional description
Data Operation Circuit (DOC)	The Data Operation Circuit (DOC) compares, adds, and subtracts 16-bit data. See section 52, Data Operation Circuit (DOC).
Sampling Rate Converter (SRC)	The Sampling Rate Converter (SRC) converts the sampling rate of data produced by various audio decoders, such as the WMA, MP3, and AAC. Both 16-bit stereo and monaural data are supported. See section 42, Sampling Rate Converter (SRC).

Table 1.13 Security

Feature	Functional description
Secure Crypto Engine 7 (SCE7)	• Security algorithms: - Symmetric algorithms: AES, 3DES, and ARC4 - Asymmetric algorithms: RSA, DSA, and ECC. • Other support features: - TRNG (True Random Number Generator) - Hash-value generation: SHA1, SHA224, SHA256, GHASH, and MD5 - 128-bit unique ID.

1.2 Block Diagram

Figure 1.1 shows the block diagram of the MCU superset, some individual devices within the group have a subset of the features.

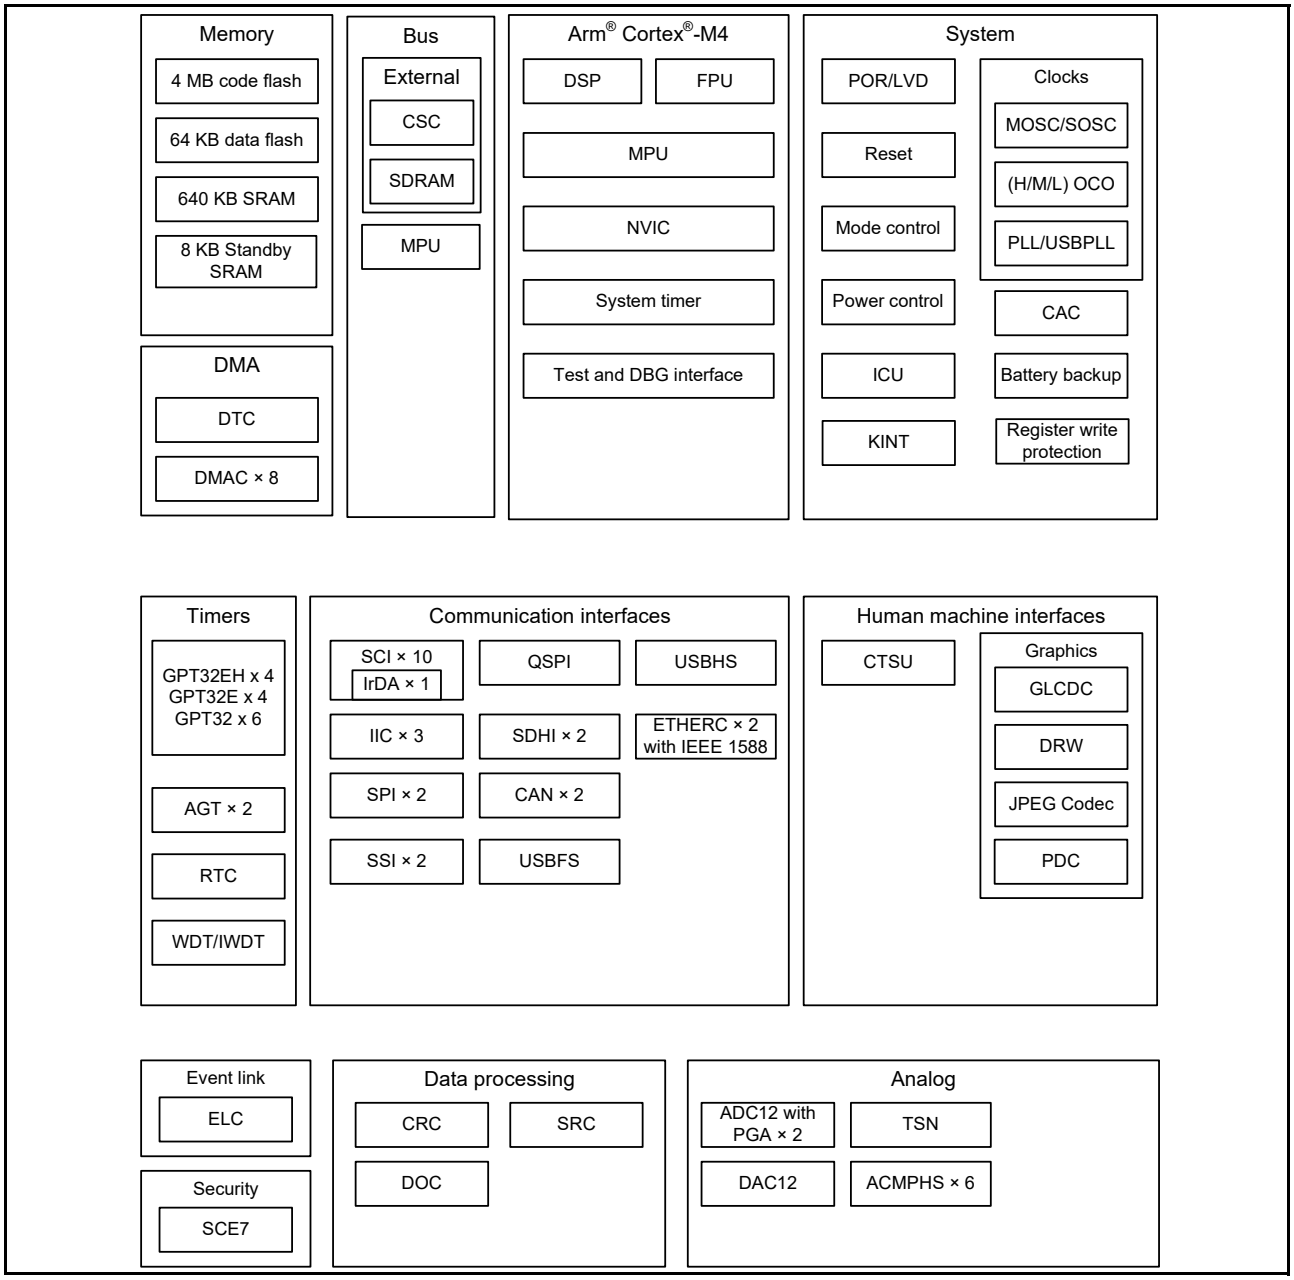

Figure 1.1 Block diagram

1.3 Part Numbering

Figure 1.2 shows product part number information, including memory capacity and package type. Table 1.14 shows a list of products.

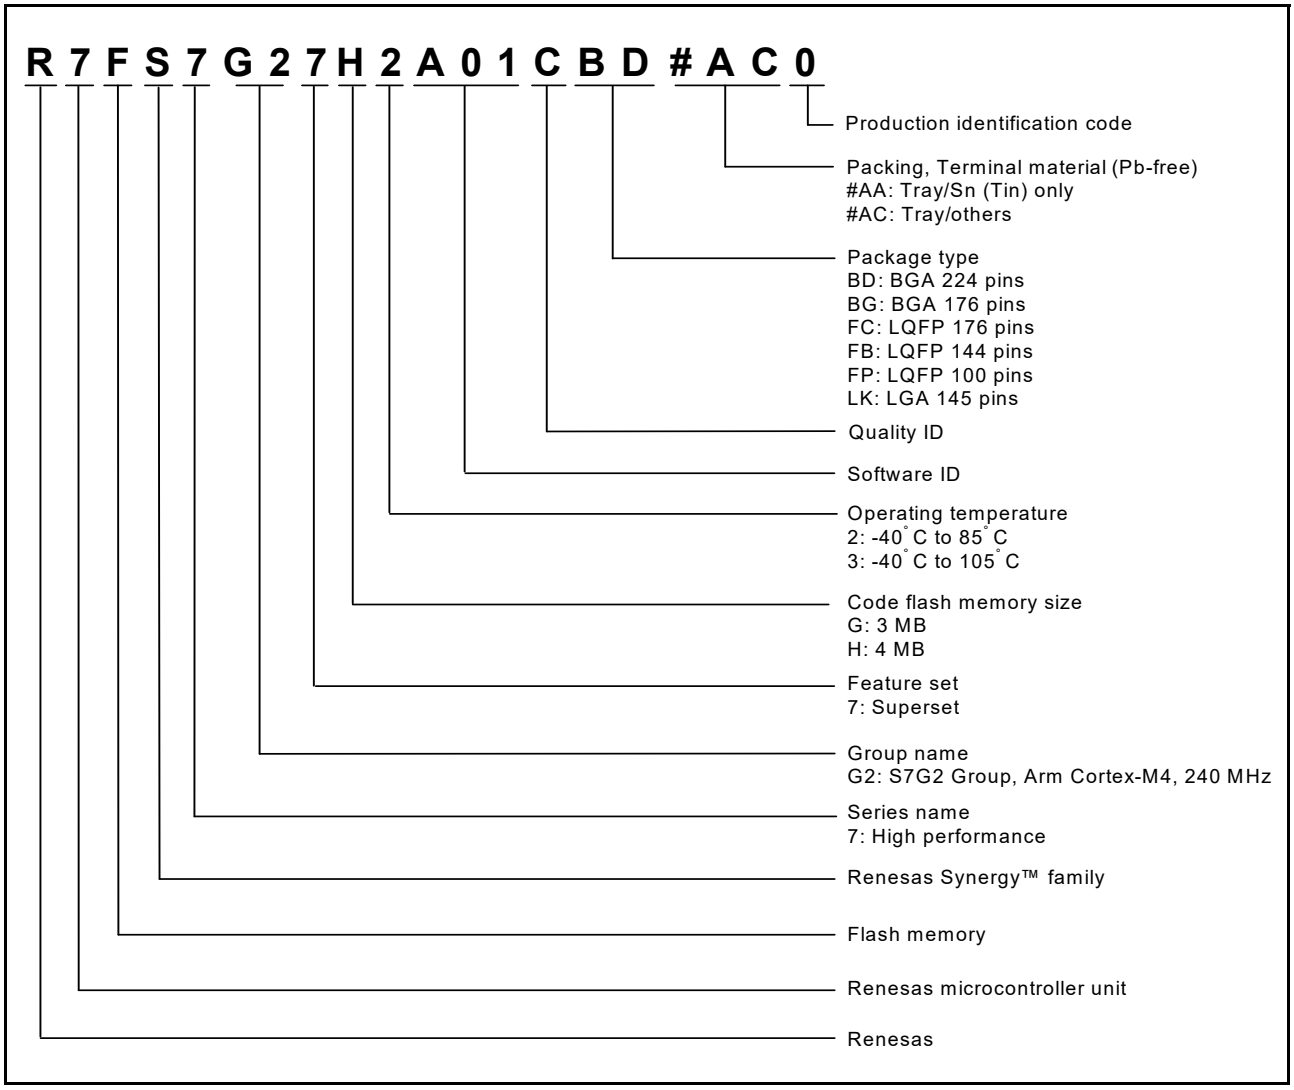

Figure 1.2 Part numbering scheme

Table 1.14 Product list

Part number	Orderable part number	Package	Code flash	Data flash	SRAM	Operating temperature

1.5 Pin Functions

Table 1.16 Pin functions (1 of 5)

Function	Signal	I/O	Description
Power supply	VCC	Input	Power supply pin. Connect this pin to the system power supply. Connect it to VSS through a 0.1-μF capacitor. Place the capacitor close to the pin.
	VCC_DCDC	Input	Switching regulator power supply pin.
	VLO	I/O	Switching regulator pin.
	VCL0 to VCL2	Input	Connect this pin to VSS through a smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin.
	VCL_F	Input	
	VSS	Input	Ground pin. Connect to the system power supply (0 V).
	VBATT	Input	Backup power pin
Clock	XTAL	Output	Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin.
	EXTAL	Input	
	XCIN	Input	Input/output pins for the sub-clock oscillator. Connect a crystal resonator between XCOUT and XCIN.
	XCOUT	Output	
	EBCLK	Output	Outputs the external bus clock for external devices
	SDCLK	Output	Outputs the SDRAM-dedicated clock
	CLKOUT	Output	Clock output pin
Operating mode control	MD	Input	Pin for setting the operating mode. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
System control	RES	Input	Reset signal input pin. The MCU enters the reset state when this signal goes low.
CAC	CACREF	Input	Measurement reference clock input pin
Interrupt	NMI	Input	Non-maskable interrupt request pin
	IRQ0 to IRQ15	Input	Maskable interrupt request pins
KINT	KR00 to KR07	Input	A key interrupt can be generated by inputting a falling edge to the key interrupt input pins
On-chip emulator	TMS	I/O	On-chip emulator or boundary scan pins
	TDI	Input	
	TCK	Input	
	TDO	Output	
	TCLK	Output	This pin outputs the clock for synchronization with the trace data
	TDATA0 to TDATA3	Output	Trace data output
	SWDIO	I/O	Serial wire debug data input/output pin
	SWCLK	Input	Serial wire clock pin
	SWO	Output	Serial wire trace output pin
External bus interface	RD	Output	Strobe signal indicating that reading from the external bus interface space is in progress, active-low
	WR	Output	Strobe signal indicating that writing to the external bus interface space is in progress, in 1-write strobe mode, active-low
	WR0, WR1	Output	Strobe signals indicating that either group of data bus pins (D07 to D00 or D15 to D08) is valid in writing to the external bus interface space, in byte strobe mode, active-low
	BC0, BC1	Output	Strobe signals indicating that either group of data bus pins (D07 to D00 or D15 to D08) is valid in access to the external bus interface space, in 1-write strobe mode, active-low
	WAIT	Input	Input pin for wait request signals in access to the external space, active-low
	CS0 to CS7	Output	Select signals for CS areas, active-low
	A00 to A23	Output	Address bus
	D00 to D15	I/O	Data bus

Table 1.16 Pin functions (2 of 5)

Function	Signal	I/O	Description
SDRAM interface	CKE	Output	SDRAM clock enable signal
	SDCS	Output	SDRAM chip select signal, active-low
	RAS	Output	SDRAM low address strobe signal, active-low
	CAS	Output	SDRAM column address strobe signal, active-low
	WE	Output	SDRAM write enable signal, active-low
	DQM0	Output	SDRAM I/O data mask enable signal for DQ07 to DQ00
	DQM1	Output	SDRAM I/O data mask enable signal for DQ15 to DQ08
	A00 to A15	Output	Address bus
	DQ00 to DQ15	I/O	Data bus
GPT	GTETRGA, GTETRGB, GTETRGC, GTETRGD	Input	External trigger input pins
	GTIOC0A to GTIOC13A, GTIOC0B to GTIOC13B	I/O	Input capture, output compare, or PWM output pins.
	GTIU	Input	Hall sensor input pin U
	GTIV	Input	Hall sensor input pin V
	GTIW	Input	Hall sensor input pin W
	GTOUUP	Output	3-phase PWM output for BLDC motor control (positive U phase)
	GTOULO	Output	3-phase PWM output for BLDC motor control (negative U phase)
	GTOVUP	Output	3-phase PWM output for BLDC motor control (positive V phase)
	GTOVLO	Output	3-phase PWM output for BLDC motor control (negative V phase)
	GTOWUP	Output	3-phase PWM output for BLDC motor control (positive W phase)
	GTOWLO	Output	3-phase PWM output for BLDC motor control (negative W phase)
AGT	AGTEE0, AGTEE1	Input	External event input enable signals
	AGTIO0, AGTIO1	I/O	External event input and pulse output pins
	AGTO0, AGTO1	Output	Pulse output pins
	AGTOA0, AGTOA1	Output	Output compare match A output pins
	AGTOB0, AGTOB1	Output	Output compare match B output pins
RTC	RTCOUT	Output	Output pin for 1-Hz or 64-Hz clock
	RTCIC0 to RTCIC2	Input	Time capture event input pins
SCI	SCK0 to SCK9	I/O	Input/output pins for the clock (clock synchronous mode)
	RXD0 to RXD9	Input	Input pins for received data (asynchronous mode/clock synchronous mode)
	TXD0 to TXD9	Output	Output pins for transmitted data (asynchronous mode/clock synchronous mode)
	CTS0_RTS0 to CTS9_RTS9	I/O	Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low
	SCL0 to SCL9	I/O	Input/output pins for the clock (simple IIC mode)
	SDA0 to SDA9	I/O	Input/output pins for the data (simple IIC mode)
	SCK0 to SCK9	I/O	Input/output pins for the clock (simple SPI mode)
	MISO0 to MISO9	I/O	Input/output pins for slave transmission of data (simple SPI mode)
	MOSI0 to MOSI9	I/O	Input/output pins for master transmission of data (simple SPI mode)
	SS0 to SS9	Input	Chip-select input pins (simple SPI mode), active-low
IIC	SCL0 to SCL2	I/O	Input/output pins for the clock
	SDA0 to SDA2	I/O	Input/output pins for data
SSI	SSISCK0	I/O	SSI serial bit clock pin
	SSISCK1		
	SSIWS0	I/O	Word select pins
	SSIWS1		
	SSITXD0	Output	Serial data output pins
	SSIRXD0	Input	Serial data input pins
	SSIDATA1	I/O	Serial data input/output pins
	AUDIO_CLK	Input	External clock pin for audio (input oversampling clock)

Table 1.16 Pin functions (3 of 5)

Function	Signal	I/O	Description
SPI	RSPCKA, RSPCKB	I/O	Clock input/output pin
	MOSIA, MOSIB	I/O	Input or output pins for data output from the master
	MISOA, MISOB	I/O	Input or output pins for data output from the slave
	SSLA0, SSLB0	I/O	Input or output pin for slave selection
	SSLA1 to SSLA3, SSLB1 to SSLB3	Output	Output pins for slave selection
QSPI	QSPCLK	Output	QSPI clock output pin
	QSSL	Output	QSPI slave output pin
	QIO0 to QIO3	I/O	Data0 to Data3
CAN	CRX0, CRX1	Input	Receive data
	CTX0, CTX1	Output	Transmit data
USBFS	VCC_USB	Input	Power supply pins
	VSS_USB	Input	Ground pins
	USB_DP	I/O	D+ I/O pin of the USB on-chip transceiver. Connect this pin to the D+ pin of the USB bus
	USB_DM	I/O	D- I/O pin of the USB on-chip transceiver. Connect this pin to the D- pin of the USB bus
	USB_VBUS	Input	USB cable connection monitor pin. Connect this pin to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller.
	USB_EXICEN	Output	Low-power control signal for external power supply (OTG) chip
	USB_VBUSEN	Output	VBUS (5 V) supply enable signal for external power supply chip
	USB_OVRCURA, USB_OVRCURB	Input	Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected.
	USB_ID	Input	Connect the MicroAB connector ID input signal to this pin during operation in OTG mode
USBHS	VCC_USBHS	Input	Power supply pin
	VSS1_USBHS	Input	Ground pin
	VSS2_USBHS	Input	Ground pin
	AVCC_USBHS	Input	Analog power supply pin for the USBHS
	AVSS_USBHS	Input	Analog ground pin for the USBHS. Must be shorted to the PVSS_USBHS pin.
USBHS	PVSS_USBHS	Input	PLL circuit ground pin for the USBHS. Must be shorted to the AVSS_USBHS pin.
	USBHS_RREF	I/O	USBHS reference current source pin. Connect this pin to the AVSS_USBHS pin through a 2.2-kΩ resistor (±1%).
	USBHS_DP	I/O	USB bus D+ data pin
	USBHS_DM	I/O	USB bus D- data pin
	USBHS_EXICEN	Output	Connect this pin to the OTG power supply IC
	USBHS_ID	Input	Connect this pin to the OTG power supply IC
	USBHS_VBUSEN	Output	VBUS power enable signal for USB
	USBHS_OVRCURA, USBHS_OVRCURB	Input	Overcurrent pin for USB
	USBHS_VBUS	Input	USB cable connection monitor input pin

Table 1.16 Pin functions (4 of 5)

Function	Signal	I/O	Description
ETHERC	REF50CK0, REF50CK1	Input	50-MHz reference clocks. These pins input reference signals for transmission/reception timing in RMII mode.
	RMII0_CRS_DV, RMII1_CRS_DV	Input	Indicate carrier detection signals and valid receive data on RMII_RXD1 and RMII_RXD0 in RMII mode
	RMII0_TXD0, RMII0_TXD1, RMII1_TXD0, RMII1_TXD1	Output	2-bit transmit data in RMII mode
	RMII0_RXD0, RMII0_RXD1, RMII1_RXD0, RMII1_RXD1	Input	2-bit receive data in RMII mode
	RMII0_TXD_EN, RMII1_TXD_EN	Output	Output pins for data transmit enable signals in RMII mode
	RMII0_RX_ER, RMII1_RX_ER	Input	Indicate an error occurred during reception of data in RMII mode
	ET0_CRS, ET1_CRS	Input	Carrier detection/data reception enable signals
	ET0_RX_DV, ET1_RX_DV	Input	Indicate valid receive data on ETn_ERXD3 to ETn_ERXD0 (n = 0, 1)
	ET0_EXOUT, ET1_EXOUT	Output	General-purpose external output pins
	ET0_LINKSTA, ET1_LINKSTA	Input	Input link status from the PHY-LSI
	ET0_ETXD0 to ET0_ETXD3, ET1_ETXD0 to ET1_ETXD3	Output	4 bits of MII transmit data
	ET0_ERXD0 to ET0_ERXD3, ET1_ERXD0 to ET1_ERXD3	Input	4 bits of MII receive data
	ET0_TX_EN, ET1_TX_EN	Output	Transmit enable signals. Function as signals indicating that transmit data is ready on ETn_ETXD3 to ETn_ETXD0 (n = 0, 1).
	ET0_TX_ER, ET1_TX_ER	Output	Transmit error pins. Function as signals notifying the PHY_LSI of an error during transmission.
	ET0_RX_ER, ET1_RX_ER	Input	Receive error pins. Function as signals to recognize an error during reception.
	ET0_TX_CLK, ET1_TX_CLK	Input	Transmit clock pins. These pins input reference signals for output timing from ETn_TX_EN, ETn_ETXD3 to ETn_ETXD0, and ETn_TX_ER (n = 0, 1).
	ET0_RX_CLK, ET1_RX_CLK	Input	Receive clock pins. These pins input reference signals for input timing to ETn_RX_DV, ETn_ERXD3 to ETn_ERXD0, and ETn_RX_ER (n = 0, 1).
	ET0_COL, ET1_COL	Input	Input collision detection signals
	ET0_WOL, ET1_WOL	Output	Receive Magic packets
	ET0_MDC, ET1_MDC	Output	Output reference clock signals for information transfer through ETn_MDIO (n = 0, 1)
ETHERC	ET0_MDIO, ET1_MDIO	I/O	Input or output bidirectional signals for exchange of management data with PHY-LSI
SDHI	SD0CLK, SD1CLK	Output	SD clock output pins
	SD0CMD, SD1CMD	I/O	Command output pin and response input signal pins
	SD0DAT0 to SD0DAT7, SD1DAT0 to SD1DAT7	I/O	SD and MMC data bus pins
	SD0CD, SD1CD	Input	SD card detection pins
	SD0WP, SD1WP	Input	SD write-protect signals

Table 1.16 Pin functions (5 of 5)

Function	Signal	I/O	Description
Analog power supply	AVCC0	Input	Analog voltage supply pin. Connect this pin to VCC.
	AVSS0	Input	Analog ground pin. Connect this pin to VSS.
	VREFH0	Input	Analog reference voltage supply pin for the ADC12. Connect this pin to VCC when not using the ADC12.
	VREFL0	Input	Analog reference ground pin for the ADC12. Connect this pin to VSS when not using the ADC12.
	VREFH	Input	Reference voltage input pin for the ADC12 (unit 1) and D/A converter. This is used as the analog power supply for the respective modules. Connect this pin to VCC if the ADC12 (unit 1) or DAC12 is not in use.
	VREFL	Input	Reference ground pin for the ADC12 and D/A converter. This is used as the analog ground for the respective modules. Set this pin to the same potential as the VSS pin.
ADC12	AN000 to AN006, AN016 to AN021	Input	Input pins for the analog signals to be processed by the ADC12
	AN100 to AN106, AN116 to AN120	Input	
	ADTRG0	Input	Input pins for the external trigger signals that start the A/D conversion, active-low
	ADTRG1	Input	
	PGAVSS000/PGAVSS100	Input	Differential input pins
DAC12	DA0, DA1	Output	Output pins for the analog signals processed by the D/A converter
ACMPHS	VCOUT	Output	Comparator output pin
	IVREF0 to IVREF3	Input	Reference voltage input pin for comparator
	IVCMP0 to IVCMP2	Input	Analog voltage input pins for comparator
CTSU	TS00 to TS17	Input	Capacitive touch detection pins (touch pins)
	TSCAP	-	Secondary power supply pin for the touch driver
I/O ports	P000 to P007	Input	General-purpose input pins
	P008 to P011, P014, P015	I/O	General-purpose input/output pins
	P100 to P115	I/O	General-purpose input/output pins
	P200	Input	General-purpose input pin
	P201 to P207, P212, P213	I/O	General-purpose input/output pins
	P300 to P315	I/O	General-purpose input/output pins
	P400 to P415	I/O	General-purpose input/output pins
	P500 to P515	I/O	General-purpose input/output pins
	P600 to P615	I/O	General-purpose input/output pins
	P700 to P713	I/O	General-purpose input/output pins
	P800 to P813	I/O	General-purpose input/output pins
	P900 to P915	I/O	General-purpose input/output pins
	PA00 to PA15	I/O	General-purpose input/output pins
	PB00 to PB07	I/O	General-purpose input/output pins
GLCDC	LCD_DATA00 to LCD_DATA23	Output	Data output pins for panel
	LCD_TCON0 to LCD_TCON3	Output	Output pins for panel timing adjustment
	LCD_CLK	Output	Panel clock output pin
	LCD_EXTCLK	Input	Panel clock source input pin
PDC	PIXCLK	Input	Image transfer clock pin
	VSYNC	Input	Vertical synchronization signal pin
	HSYNC	Input	Horizontal synchronization signal pin
	PIXD0 to PIXD7	Input	8-bit image data pins
	PCKO	Output	Output pin for dot clock

1.6 Pin Assignments

Figure 1.3 to Figure 1.8 show the pin assignments.

Note: Some pin names have the added suffix of _A, _B, and _C. When assigning the IIC, SPI, and SSI functionality, select the functional pins with the same suffix. The other pins can be selected regardless of the suffix.

2. CPU

The MCU is based on the Arm® Cortex®-M4 core.

2.1 Overview

2.1.1 CPU

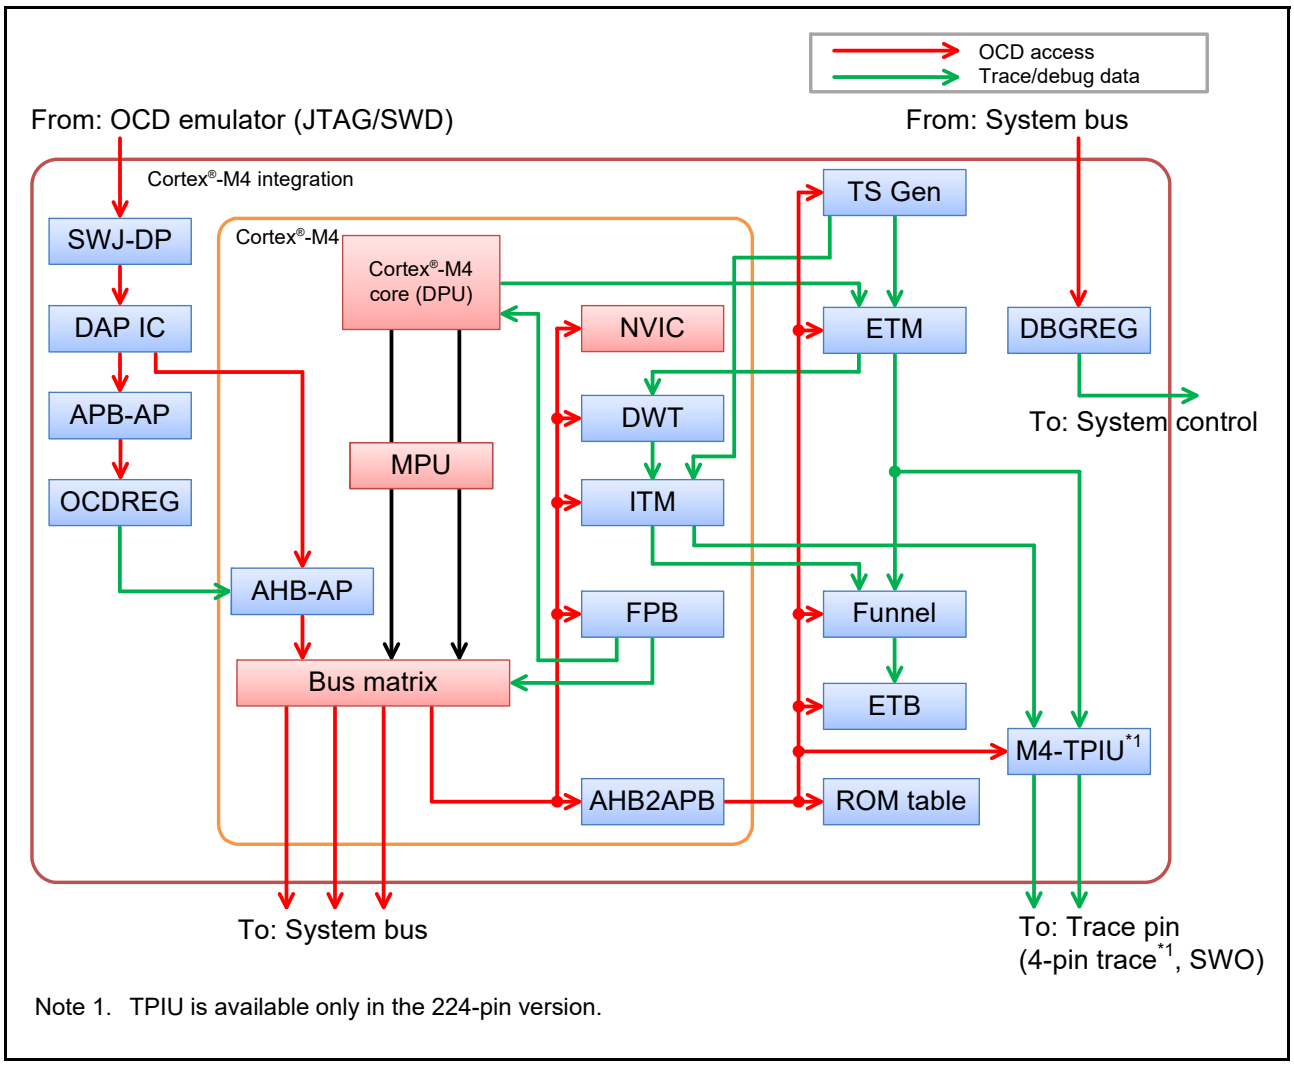
- Arm Cortex-M4
  - Revision: r0p1-01rel0
  - Armv7E-M architecture profile
  - Single Precision Floating-Point Unit compliant with the ANSI/IEEE Std 754-2008.
- Memory Protection Unit (MPU)
  - Armv7 Protected Memory System Architecture
  - 8 protected regions.
- SysTick timer
  - Driven by SYSTICCLK (LOCO) or ICLK.

See reference 1. and reference 2. for details.

2.1.2 Debug

- Arm CoreSight™ ETM-M4
  - Revision: r0p1-00rel0
  - Arm ETM architecture version 3.5.
- CoreSight Instrumentation Trace Macrocell (ITM)
- Data Watchpoint and Trace Unit (DWT)
  - 4 comparators for watchpoints and triggers.
- Flash Patch and Breakpoint Unit (FPB)
  - 6 instruction comparators
  - 2 literal comparators.
- CoreSight Time Stamp Generator (TSG)
  - Time stamp for ETM and ITM
  - Driven by CPU clock.
- Debug Register Module (DBGREG)
  - Reset control
  - Halt control.
- CoreSight Debug Access Port (DAP)
  - JTAG Debug Port (JTAG-DP)
  - Serial Wire Debug Port (SW-DP).
- Cortex-M4 Trace Port Interface Unit (TPIU)
  - 4-bit TPIU formatter output
  - Serial Wire Output.
- CoreSight Embedded Trace Buffer (ETB)
  - CoreSight Trace Memory Controller with ETB configuration

- Buffer size: 2 KB.



See reference 1. and reference 2. for details.

2.1.3 Operating Frequency

The operating frequencies for the MCU are as follows:

- CPU: maximum 240 MHz
- Trace (4-bit TPIU): maximum 120 MHz
- Trace (SWO): maximum 60 MHz
- JTAG interface: maximum 25 MHz
- SWD interface: maximum 25 MHz.

Figure 2.1 shows a block diagram of the Cortex-M4 core.

Note 1. TPIU is available only in the 224-pin version.

Figure 2.1 Cortex-M4 CPU block diagram

2.2 MCU Implementation Options

Table 2.1 Implementation options

Option	Implementation
MPU	Included, 8 protect regions
FPU	Included
Number of interrupts	96
Number of priority bits	4
Number of wakeup interrupt controllers (WIC*1)	Not included
Sleep mode power saving	Sleep mode and other low power modes are supported. For more details, see section 11, Low Power Modes. SCB.SCR.SLEEPDEEP is ignored.
Endianness	Little-endian
SysTick SYST_CALIB register	SYST_CALIB = 4000 0147h Bit [31] = 0 Reference clock provided Bit [30] = 1 TERMS value is inexact Bits [29:24] = 00h Reserved Bits [23:0] = 000147h TERM: (32768 × 10ms) - 1 / 32.768 kHz = 326.66 decimal = 327 with skew = 000147h
Event input/output	Not implemented
System reset request output	The SYSRESETREQ bit in the Application Interrupt and Reset Control Register causes a CPU reset
Auxiliary fault inputs (AUXFAULT)	Not implemented

Note 1. The ICU can wake up the CPU instead of a Wakeup Interrupt Controller (WIC). For details, see section 14, Interrupt Controller Unit (ICU).

2.3 Trace Interface

A Trace Port Interface Unit (TPIU) and Serial Wire Output (SWO) provide trace output. The TPIU is only available in the 224-pin version. Table 2.2 shows the MCU pins for the function. These pins are multiplexed with other functions.

Table 2.2 Trace function pins

Name	I/O	Width	Function	When not in use
TCLK	Output	1 bit	Trace clock	Open
TDATA0	Output	1 bit	Trace data output 0	Open
TDATA1	Output	1 bit	Trace data output 1	Open
TDATA2	Output	1 bit	Trace data output 2	Open
TDATA3	Output	1 bit	Trace data output 3	Open
TDO/SWO	Output	1 bit	Serial wire output multiplexed with JTAG TDO pin	Open

2.4 JTAG/SWD Interface

Table 2.3 shows the JTAG/SWD MCU pins.

Table 2.3 JTAG/SWD pins

Name	I/O	P/N	Width	Function	When not in use
TCK/SWCLK	Input	Pos.	1 bit	JTAG clock pin	Pull-up
TMS/SWDIO	I/O	Neg.	1 bit	JTAG TMS pin Serial wire data in/out pin	Pull-up
TDI	Input	Pos.	1 bit	JTAG TDI pin	Pull-up
TDO/SWO	Output	Neg.	1 bit	JTAG TDO pin Multiplexed with Serial Wire Output	Open

2.5 Debug Mode

2.5.1 Debug Mode Definition

In single-chip mode, the connected debug state is defined as OCD mode, and the unconnected debug state is defined as User mode.

Table 2.4 shows the two CPU debug modes and their usage conditions.

Table 2.4 CPU debug mode and conditions

Conditions		Mode	
OCD connect	**JTAG/SWD authentication**	**Debug mode**	**Debug authentication**
Not connected	—	User mode	Disabled
Connected	Failed	User mode	Disabled
Connected	Passed	OCD mode	Enabled

Note 1. OCD connect is determined by the CDBGPWRUPREQ bit output in the SWJ-DP register. The bit can only be written by the OCD. However, the level of the bit can be confirmed by reading the DBGSTR.CDBGPWRUPREQ bit.

Note 2. Debug Authentication is defined by the Armv7-M Architecture. Enabled means that both invasive and non-invasive CPU debugging are permitted. Disabled means that both are not permitted.

2.5.2 Debug Mode Effects

This section describes the effects of debug mode, which occur both internally and externally to the CPU.

2.5.2.1 Low-Power Mode

All CoreSight™ debug components can store the register settings even when the CPU enters Software Standby, Snooze, or Deep Software Standby mode. However, AHB-AP cannot respond to On-Chip Debug (OCD) access in these low power modes. The OCD must wait for cancellation of the low power mode to access the CoreSight™ debug components. To request low-power mode cancellation, the OCD can set the DBIRQ bit in the MCUCTRL register. For details, see section 2.6.5.3, MCU Control Register (MCUCTRL).

2.5.2.2 Reset

In OCD mode, some resets depend on the CPU status and the DBGSTOPCR setting.

Table 2.5 Reset or interrupt and mode setting

Reset or interrupt name	Control in On-Chip Debug (OCD) mode	
	OCD break mode	OCD RUN mode
RES pin reset	Same as user mode	
Power-on reset	Same as user mode	
Independent Watchdog Timer reset/interrupt	Does not occur*1	Depends on DBGSTOPCR setting*2
Watchdog Timer reset/interrupt	Does not occur*1	Depends on DBGSTOPCR setting*2
Voltage monitor 0 reset	Depends on DBGSTOPCR setting*3	
Voltage monitor 1 reset/interrupt	Depends on DBGSTOPCR setting*3	
Voltage monitor 2 reset/interrupt	Depends on DBGSTOPCR setting*3	
SRAM parity error reset/interrupt	Depends on DBGSTOPCR setting*3	
SRAM DED error reset/interrupt	Depends on DBGSTOPCR setting*3	
MPU bus master reset/interrupt	Same as user mode	
MPU bus slave reset/interrupt	Same as user mode	
Stack pointer error reset/interrupt	Same as user mode	
Deep Software Standby reset	Same as user mode	
Software reset	Same as user mode	

Note: In OCD break mode, the CPU is halted. In OCD RUN mode, the CPU is in OCD mode and the CPU is not halted.
Note 1. The IWDT and WDT always stop in this mode.
Note 2. IWDT and WDT operation depends on the DBGSTOPCR setting.
Note 3. Reset or interrupt masking depends on the DBGSTOPCR setting.

2.6 Programmers Model

2.6.1 Address Spaces

The MCU debug system includes two CoreSight™ Access Ports (AP):

- AHB-AP, which is connected to the CPU bus matrix and has the same access to the system address space as the CPU
- APB-AP, which has a dedicated address space (OCD address space) and is connected to the OCD register.

Figure 2.2 shows the block diagram of the AP connection and address spaces.

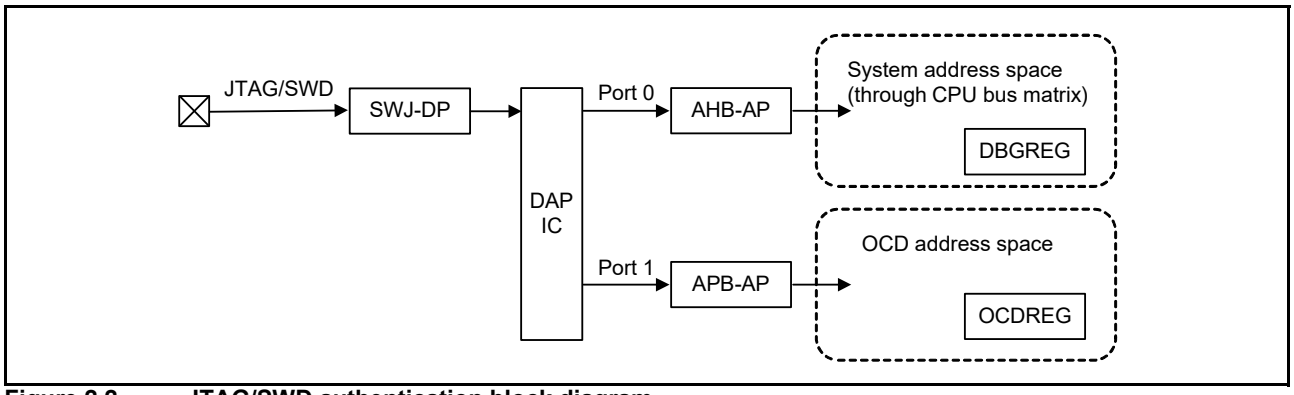


Figure 2.2 JTAG/SWD authentication block diagram

For debugging purposes, there are two register modules, DBGREG and OCDREG. DBGREG is located in the system address space can be accessed from the OCD emulator, CPU, and other bus masters in the MCU. OCDREG is located in the OCD address space and can only be accessed from the OCD tool. The CPU and other bus masters cannot access the OCD registers.

2.6.2 Cortex®-M4 Peripheral Address Map

In the system address space, the Cortex®-M4 core has a Private Peripheral Bus (PPB), which can be accessed only from the CPU and OCD emulator. The PPB is expanded from the Cortex®-M4 original implementation for this MCU. Table 2.6 shows the address map of the MCU.

Table 2.6 Cortex®-M4 peripheral address map

Component name	Start address	End address	Note
ITM	E000 0000h	E000 0FFFh	See reference 2.
DWT	E000 1000h	E000 1FFFh	See reference 2.
FPB	E000 2000h	E000 2FFFh	See reference 2.
SCS	E000 E000h	E000 EFFFh	See reference 2.
TPIU	E004 0000h	E004 0FFFh	See reference 2.
ETM	E004 1000h	E004 1FFFh	See reference 5.
ATB funnel	E004 2000h	E004 2FFFh	See section 2.7 and reference 4.
ETB	E004 3000h	E004 3FFFh	See reference 6.
Time Stamp Generator	E004 4000h	E004 4FFFh	See section 2.9 and reference 4.
ROM Table	E00F F000h	E00F FFFFh	See section 2.6.3 and reference 7.

2.6.3 CoreSight™ ROM Table

The MCU contains one CoreSight™ ROM table, which lists the Arm® components.

2.6.3.1 ROM Entries

The ROM entries list the components in the system. The OCD emulator can use the ROM entries to determine which components are implemented in a system. See reference 7. for details.

Table 2.7 ROM entries in the CoreSight™ ROM table

#	Address	Access size	R/W	Value	Component
0	E00F F000h	32 bits	R	FFF0F003	SCS
1	E00F F004h	32 bits	R	FFF02003	DWT
2	E00F F008h	32 bits	R	FFF03003	FPB
3	E00F F00Ch	32 bits	R	FFF01003	ITM
4	E00F F010h	32 bits	R	FFF41003	TPIU
5	E00F F014h	32 bits	R	FFF42003	ETM
6	E00F F018h	32 bits	R	FFF43003	Funnel
7	E00F F01Ch	32 bits	R	FFF44003	ETB
8	E00F F020h	32 bits	R	FFF45003	TSG
9	E00F F024h	32 bits	R	00000000	(End of entries)

2.6.3.2 CoreSight™ Component Registers

The CoreSight™ ROM table lists the CoreSight™ Component Registers defined in the Arm® CoreSight™ architecture. See reference 7. for details.

Table 2.8 CoreSight™ Component Registers in the CoreSight™ ROM table

Name	Address	Access size	R/W	Initial value
DEVTYPE	E00F FFCCh	32 bits	R	00000001h
PID4	E00F FFD0h	32 bits	R	00000004h
PID5	E00F FFD4h	32 bits	R	00000000h
PID6	E00F FFD8h	32 bits	R	00000000h
PID7	E00F FFDCh	32 bits	R	00000000h
PID0	E00F FFE0h	32 bits	R	00000001h
PID1	E00F FFE4h	32 bits	R	00000030h
PID2	E00F FFE8h	32 bits	R	0000000Ah
PID3	E00F FFECh	32 bits	R	00000000h
CID0	E00F FFF0h	32 bits	R	0000000Dh
CID1	E00F FFF4h	32 bits	R	00000010h
CID2	E00F FFF8h	32 bits	R	00000005h
CID3	E00F FFFCh	32 bits	R	000000B1h

2.6.4 DBGREG Module

The DBGREG module controls the debug functionalities and is implemented as a CoreSight™-compliant component. Table 2.9 lists the DBGREG registers other than the CoreSight™ component registers.

Table 2.9 Non-CoreSight™ DBGREG registers

Name		DAP port	Address	Access size	R/W
Debug Status Register	DBGSTR	Port 0	4001 B000h	32 bits	R
Debug Stop Control Register	DBGSTOPCR	Port 0	4001 B010h	32 bits	R/W
Trace Control Register	TRACECTR	Port 0	4001 B020h	32 bits	R/W

2.6.4.1 Debug Status Register (DBGSTR)

Address(es): DBG.DBGSTR 4001 B000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	CDBGPWRUPACK	CDBGPWRUPREQ	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b27 to b0	—	Reserved	These bits are read as 0.	R
b28	CDBGPWRUPREQ	Debug power-up request	0: OCD is not requesting debug power-up 1: OCD is requesting debug power-up.	R
b29	CDBGPWRUPACK	Debug power-up acknowledge	0: Debug power-up request is not acknowledged 1: Debug power-up request is acknowledged.	R
b31, b30	—	Reserved	These bits are read as 0.	R

2.6.4.2 Debug Stop Control Register (DBGSTOPCR)

Address(es): DBG.DBGSTOPCR 4001 B010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	DBGSTOP_RDEDR	DBGSTOP_RPER	—	—	—	—	—	DBGSTOP_LVD[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DBGSTOP_WDT	DBGSTOP_IWDT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Bit name	Description	R/W
b0	DBGSTOP_IWDT	Mask bit for IWDT reset or interrupt	0: Enable IWDT reset or interrupt 1: Mask IWDT reset or interrupt and stop WDT count when CPU is in OCD break mode.	R/W
b1	DBGSTOP_WDT	Mask bit for WDT reset or interrupt	0: Enable WDT reset or interrupt 1: Mask WDT reset or interrupt and stop WDT count when CPU is in OCD break mode.	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	DBGSTOP_LVD[2:0]	Mask bit for LVD0 reset	0: Enable LVD0 reset 1: Mask LVD0 reset.	R/W
b17		Mask bit for LVD1 reset or interrupt	0: Enable LVD1 reset or interrupt 1: Mask LVD1 reset or interrupt.	R/W
b18		Mask bit for LVD2 reset or interrupt	0: Enable LVD2 reset or interrupt 1: Mask LVD2 reset or interrupt.	R/W
b23 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b24	DBGSTOP_RPER	Mask bit for SRAM parity error reset or interrupt	0: Enable SRAM parity error reset or interrupt 1: Mask SRAM parity error reset or interrupt.	R/W
b25	DBGSTOP_RDEDR	Mask bit for SRAM DED error reset or interrupt	0: Enable SRAM DED error reset or interrupt 1: Mask SRAM DED error reset or interrupt.	R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The Debug Stop Control Register (DBGSTOPCR) specifies the functional stop in OCD mode. All bits in the register are regarded as 0 when the MCU is not in OCD mode.

2.6.4.3 Trace Control Register (TRACECTR)

Address(es): DBG.TRACECTR 4001 B020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31	ENETBFULL	Enable bit for halt request on ETB full	0: ETB full does not cause a CPU halt 1: ETB full causes a CPU halt.	R/W

2.6.4.4 DBGREG CoreSight™ Component Registers

The DBGREG module provides the CoreSight™ Component Registers defined in the Arm® CoreSight™ architecture. Table 2.10 lists these registers. See reference 7. for details.

Table 2.10 DBGREG CoreSight™ Component Registers

Name	Address	Access size	R/W	Initial value
PID4	4001 BFD0h	32 bits	R	00000004h
PID5	4001 BFD4h	32 bits	R	00000000h
PID6	4001 BFD8h	32 bits	R	00000000h
PID7	4001 BFDCh	32 bits	R	00000000h
PID0	4001 BFE0h	32 bits	R	00000005h
PID1	4001 BFE4h	32 bits	R	00000030h
PID2	4001 BFE8h	32 bits	R	0000001Ah
PID3	4001 BFECh	32 bits	R	00000000h
CID0	4001 BFF0h	32 bits	R	0000000Dh
CID1	4001 BFF4h	32 bits	R	000000F0h
CID2	4001 BFF8h	32 bits	R	00000005h
CID3	4001 BFFCh	32 bits	R	000000B1h

2.6.5 OCDREG Module

The OCDREG module controls the On-Chip Debug (OCD) emulator functionalities. OCDREG is implemented as a CoreSight™-compliant component. Table 2.11 lists the OCDREG registers other than the CoreSight™ component registers.

Table 2.11 Non-CoreSight™ OCDREG registers

Name		DAP port	Address	Access size	R/W
ID Authentication Code Register 0	IAUTH0	Port 1	8000_0000	32 bits	W
ID Authentication Code Register 1	IAUTH1	Port 1	8000_0100	32 bits	W
ID Authentication Code Register 2	IAUTH2	Port 1	8000_0200	32 bits	W
ID Authentication Code Register 3	IAUTH3	Port 1	8000_0300	32 bits	W
MCU Status Register	MCUSTAT	Port 1	8000 0400h	32 bits	R
MCU Control Register	MCUCTRL	Port 1	8000 0410h	32 bits	R/W

Note: OCDREG is located in the dedicated OCD address space. This address map is independent from the system address map. See section 2.6.2, Cortex®-M4 Peripheral Address Map.

2.6.5.1 ID Authentication Code Register (IAUTH0 to 3)

Four authentication registers are provided for writing the 128-bit key. The registers must be written in sequential order from IAUTH0 to IAUTH3. If the set of register writes is not compliant with this order, the result is unpredictable.

Only 32-bit writes are permitted. The initial value of the registers is all 1s. This means that JTAG/SWD access is initially permitted when the ID code in the OSIS register has the initial value. See section 2.10.2, Unlock ID Code.

Address(es): IAUTH0 8000 0000h

b31	b0
IAUTH0: AID 31-0 bits	
Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	

Address(es): IAUTH1 8000 0100h

IAUTH1: AID 63-32 bits	
Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	

Address(es): IAUTH2 8000 0200h

b31	b0
IAUTH2: AID 95-64 bits	
Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	

Address(es): IAUTH3 8000 0300h

b31	b0
IAUTH3: AID 127-96 bits	
Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	

2.6.5.2 MCU Status Register (MCUSTAT)

Address(es): MCUSTAT 8000 0400h

b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset: 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
—	—	—	—	—	—	—	—	—	—	—	—	—	CPUSTOPCLK	CPUSLEEP	AUTH
Value after reset: 0	0	0	0	0	0	0	0	0	0	0	0	0	1/0*1	1/0*1	0

Bit	Symbol	Bit name	Description	R/W
b0	AUTH	Authentication status	0: Authentication failed 1: Authentication succeeded.	R
b1	CPUSLEEP		0: CPU is not in Sleep mode 1: CPU is in Sleep mode.	R
b2	CPUSTOPCLK		0: CPU clock is not stopped, indicating that the MCU is in Normal or Sleep mode 1: CPU clock is stopped, indicating that the MCU is in Snooze, Software Standby, or Deep Software Standby mode.	R
b31 to b3	—	Reserved	These bits are read as 0.	R

Note 1. Depends on the MCU status.

2.6.5.3 MCU Control Register (MCUCTRL)

Address(es): MCUCTRL 8000 0410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DBIRQ	—	—	—	—	—	—	—	EDBGRQ
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	EDBGRQ	External Debug Request	Writing 1 to the bit causes a CPU halt or debug monitor exception: 0: Do not request debug event 1: Request debug event. When the EDBGRQ bit is set to 0 or the CPU is halted, the EDBCRQ bit is cleared.	R/W
b7 to b1	—	Reserved	These bits are read as 0.	R
b8	DBIRQ	Debug Interrupt Request	Writing 1 to the bit wakes the MCU from low power mode: 0: Do not request debug interrupt 1: Request debug interrupt. The condition can be cleared by writing 0 to the DBIRQ bit.	R/W
b31 to b9	—	Reserved	These bits are read as 0.	R

Note: Set DBIRQ and EDBGRQ as the same value.

2.6.5.4 OCDREG CoreSight™ Component Registers

The OCDREG module provides the CoreSight™ Component Registers defined in the Arm® CoreSight™ architecture. Table 2.12 lists these registers. See reference 7. for details.

Table 2.12 OCDREG CoreSight™ Component Registers

Name	Address	Access size	R/W	Initial value
PID4	8000 0FD0h	32 bits	R	00000004h
PID5	8000 0FD4h	32 bits	R	00000000h
PID6	8000 0FD8h	32 bits	R	00000000h
PID7	8000 0FDCh	32 bits	R	00000000h
PID0	8000 0FE0h	32 bits	R	00000004h
PID1	8000 0FE4h	32 bits	R	00000030h
PID2	8000 0FE8h	32 bits	R	0000000Ah
PID3	8000 0FECh	32 bits	R	00000000h
CID0	8000 0FF0h	32 bits	R	0000000Dh
CID1	8000 0FF4h	32 bits	R	000000F0h
CID2	8000 0FF8h	32 bits	R	00000005h
CID3	8000 0FFCh	32 bits	R	000000B1h

2.7 CoreSight™ ATB Funnel

There is one CoreSight™ ATB funnel in the MCU. The funnel has two ATB slaves and one ATB master, and it is used to select the debug trace source from ETM and ITM to ETB. Figure 2.3 shows the CoreSight™ ATB connection in the MCU.

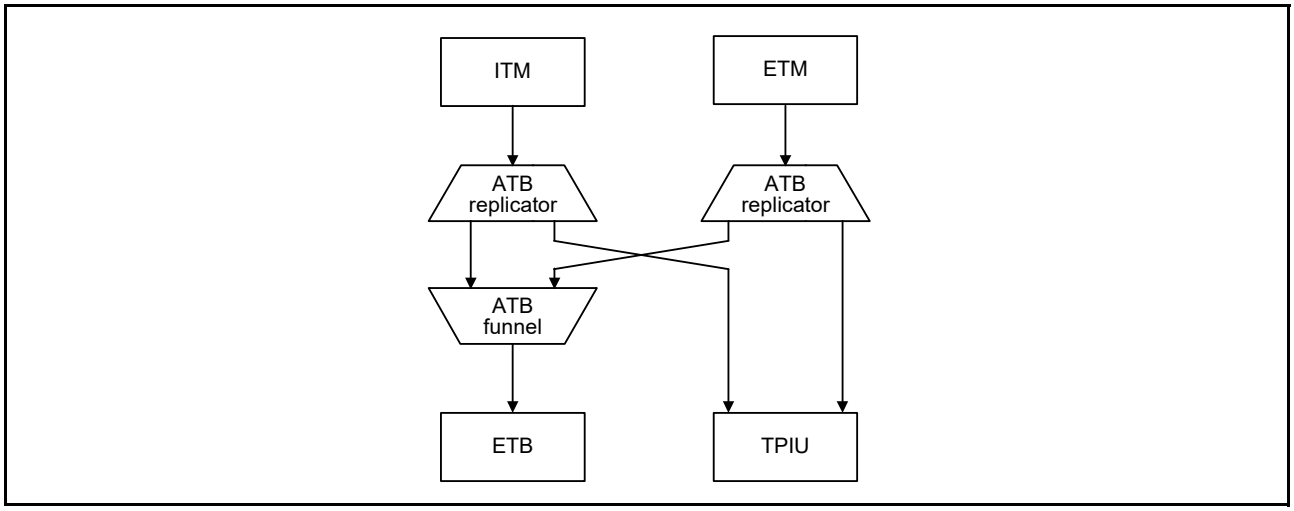

Figure 2.3 CoreSight™ ATB connection

Table 2.13 shows the ATB slave connection for the funnel.

Table 2.13 ATB slave connection

ATB slave number	Connected trace source
#0	ITM
#1	ETM

For details on the ATB and funnel, see reference 4.

2.8 SysTick System Timer

The SysTick system timer provides a simple 24-bit down counter. The reference clock for the timer can be selected as the CPU clock (ICLK) or SysTick Timer clock (SYSTICCLK). See reference 1.*1 for details.

Note 1. In the reference, the IMPLEMENTATION DEFINED external reference clock is SYSTICCLK (LOCO), and the processor clock is ICLK.

2.9 CoreSight™ Time Stamp Generator

A CoreSight™ Time Stamp Generator provides a CPU clock-based timestamp to ITM and ETM. The 48 LSB bits of the 64-bit counter are used for the two components. See reference 4. for details.

2.10 OCD Emulator Connection

A JTAG/SWD authentication mechanism checks access permission for debug and MCU resources. To obtain full debug functionality, a pass result of the authentication mechanism is required. Figure 2.4 shows the block diagram of the authentication mechanism.

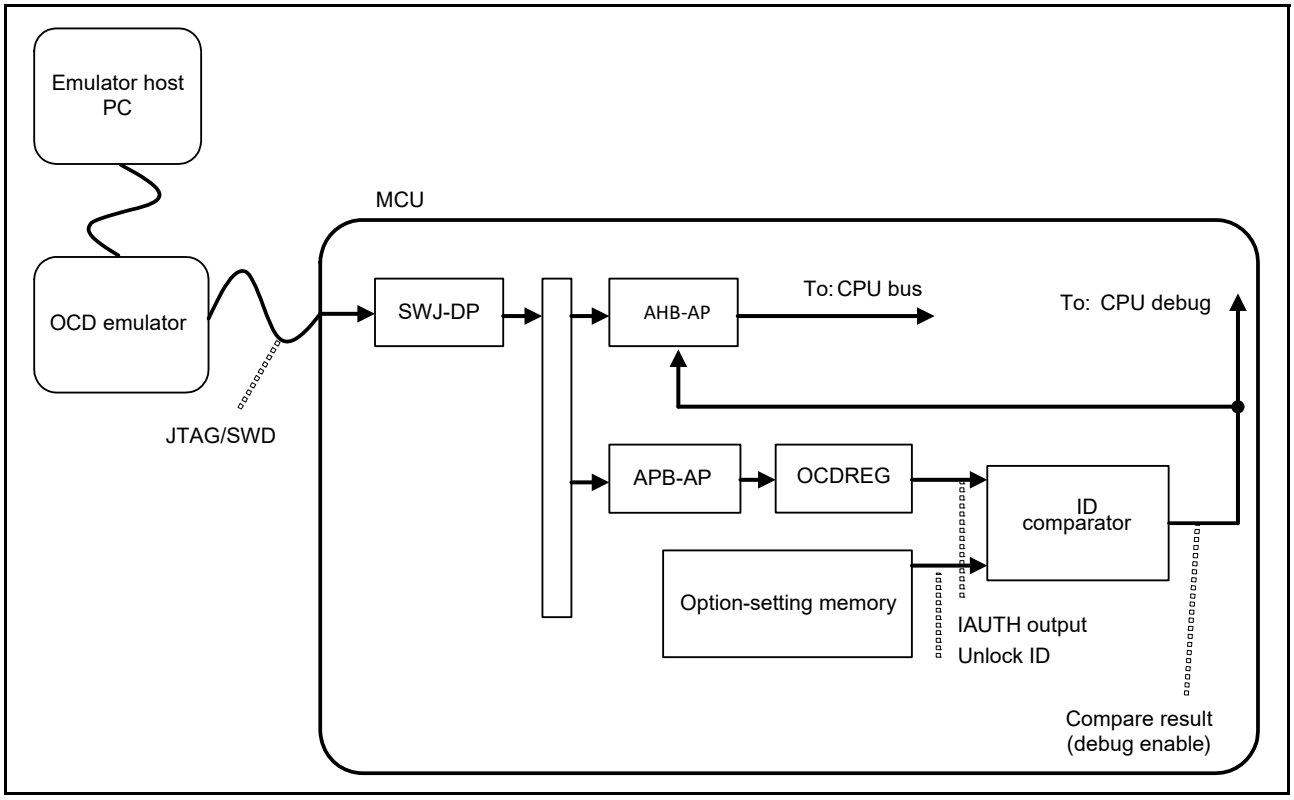

Figure 2.4 Authentication mechanism block diagram

An ID comparator is available in the MCU for authentication. The comparator compares the 128-bit IAUTH output from OCDREG and the 128-bit unlock ID code from the option-setting memory. When the two outputs are identical, the CPU debug functions and system bus access from the OCD emulator are permitted.

2.10.1 DBGEN

After the OCD emulator gets access permission, the OCD emulator must set the DBGEN bit in the System Control OCD Control Register (SYOCDCR). In addition, the OCD emulator must clear the DBGEN bit before disconnecting it. See section 11, Low Power Modes for details.

2.10.2 Unlock ID Code

The unlock ID code is used for checking permissions for debug and access to on-chip resources. If the unlock ID code matches the 128-bit data written in ID Authentication Registers 0 to 3, the JTAG/SWD debugger obtains access permission. The unlock ID code is written in the OCD/Serial Programmer ID Setting Register (OSIS) in the option-setting memory. The initial value of the unlock ID code is all 1s (FFFFFFFF_FFFFFFFF_FFFFFFFFh). See section 7, Option-Setting Memory.

2.10.3 Restrictions on Connecting an OCD Emulator

This section describes the restrictions on emulator access.

2.10.3.1 Starting Connection While in a Low-Power Mode

When starting a JTAG/SWD connection from an OCD emulator, the MCU must be in Normal or Sleep mode. If the MCU is in Software Standby, Snooze, or Deep Software Standby mode, the OCD emulator can cause the MCU to hang.

2.10.3.2 Changing a Low-Power Mode While in OCD Mode

When the MCU is in OCD mode, the low power mode can be changed in the MCU. However, system bus access from AHB-AP is prohibited in Software Standby, Snooze, or Deep Software Standby mode. Only SWJ-DP, APB-AP, and OCDREG can be accessed from the OCD emulator in these modes. Table 2.14 shows the restrictions.

Table 2.14 Restrictions by mode

Active mode	Start OCD emulator connection	Change low power mode	Access AHB-AP and system bus	Access APB-AP and OCDREG
Normal	Yes	Yes	Yes	Yes
Sleep	Yes	Yes	Yes	Yes
Software Standby	No	Yes	No	Yes
Snooze	No	Yes	No	Yes
Deep Software Standby	No	Yes	No	Yes

If system bus access is required in Software Standby, Snooze, or Deep Software Standby mode, set the OCUCTRL.DBIRG bit in OCDREG to wake the MCU from the low power modes. Simultaneously, using the OCUCTRL.EDBGRQ bit in OCDREG, the OCD emulator can wake the MCU without starting CPU execution by using a CPU break.

2.10.3.3 Modifying the Unlock ID Code in OSIS

After changing the unlock ID code in the OSIS, the OCD emulator must reset the MCU by asserting the RES pin or setting the SYSRESETREQ bit of the Application Interrupt and Reset Control Register in the system control block to 1. The changed unlock ID code is reflected after reset.

2.10.4 Connecting Sequence and JTAG/SWD Authentication

Because the OCD emulator is protected by the JTAG/SWD authentication mechanism, the OCD might be required to input the ID code to the authentication registers. The OSIS value in the option-setting memory determines whether the code is required.

After the negation of reset, a 8.5 µs wait time is required before comparing the OSIS value at the time of cold start.

(1) When MSB of OSIS is 0 (Bit 127 = 0)

The ID code is always non-matching, and connection to the on-chip debugger is prohibited.

(2) When OSIS is all 1s (default)

OCD authentication is not required and the OCD can use the AHB-AP without authentication.

1. Connect the OCD emulator to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access the DAP bus. In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJ-DP Control Status Register, then wait until CSDBGPWRUPACK in the same register is asserted.
3. Set up the AHB-AP to access the system address space. The AHB-AP is connected to DAP bus port 0.
4. Start accessing the CPU debug resources using the AHB-AP.

(3) When OSIS[127:126] = 10b

OCD authentication is required and the OCD must write the unlock ID code to IAUTH registers 0 to 3 in OCDREG before using the AHB-AP.

1. Connect the OCD debugger to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access the DAP bus. In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJ-DP Control Status Register, and then wait until CSDBGPWRUPACK in the same register is asserted.
3. Set up the APB-AP to access OCDREG. This APB-AP is connected to DAP bus port 1.
4. Write the 128-bit ID code to IAUTH registers 0 to 3 in the OCDREG using the APB-AP.
5. If the 128-bit ID code matches the value of the OSIS, the AHB-AP is authorized to issue an AHB transaction. The authorization result can be confirmed in the AUTH bit in the MCUSTAT register or the DbgStatus bit in the AHB-AP Control Status Word register.
   - When the DbgStatus bit is 1, the 128-bit ID code matches the OSIS value. AHB transfers are permitted.
   - When the DbgStatus bit is 0, the 128-bit ID code does not match the OSIS value. AHB transfers are not permitted.

6. Set up the AHB-AP to access the system address space. The AHB-AP is connected to DAP bus port 0.
7. Start accessing the CPU debug resources using the AHB-AP.

(4) When OSIS[127:126] = 11b

OCD authentication is required and the OCD must write the unlock ID code to IAUTH registers 0 to 3 in OCDREG. The connection sequence is the same as when OSIS[127:126] is 10b except for the "ALeRASE" capability.

When IATUH registers 0 to 3 are written with the "ALeRASE" in ASCII code, the content of code flash, data flash, and configuration area are erased at once. See section 55, Flash Memory for details.

The ALeRASE sequence is as follows:

1. Connect the OCD debugger to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access DAP bus. In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJDP Control Status Register, and then wait until CSDBGPWRUPACK in the same register is asserted.
3. Set the APB-AP to access OCDREG. This APB-AP is connected to DAP bus port 1.
4. Write the 128-bit ID code to IAUTH registers 0 to 3 in the OCDREG using the APB-AP.
5. If the 128-bit ID code is "ALeRASE" in ASCII code (414C_6552_4153_45FF_FFFF_FFFF_FFFF_FFFFh), the contents of code flash, data flash, and configuration area are erased. Then, the MCU transit to Sleep mode.

3. Operating Modes

3.1 Operating Mode Types and Selection

Table 3.1 shows the selection of operating modes by the mode-setting pin. For details, see section 3.2, Details of Operating Modes. Operation starts when the on-chip flash memory is enabled, regardless of the mode in which operation started.

Table 3.1 Selection of operating modes by the mode-setting pin

Mode-setting pin		On-chip flash memory	
MD	Operating mode		External bus
1	Single-chip mode	Enable	Disable
0	SCI/USB boot mode	Enable	Disable

3.2 Details of Operating Modes

3.2.1 Single-Chip Mode

In single-chip mode, all I/O pins are available for use as input or output ports, inputs or outputs for peripheral functions, or as interrupt inputs. When a reset is released while the MD pin is high, the MCU starts in single-chip mode and the on-chip flash is enabled.

3.2.2 SCI Boot Mode

In this mode, the on-chip flash memory programming routine (SCI boot program), stored in a dedicated area within the MCU, is used. The on-chip flash, including code flash memory and data flash memory, can be modified from outside the MCU by using a universal asynchronous receiver/transmitter (UART) SCI. For details, see section 55, Flash Memory. The MCU starts in boot mode if the MD pin is held low on release from the reset state.

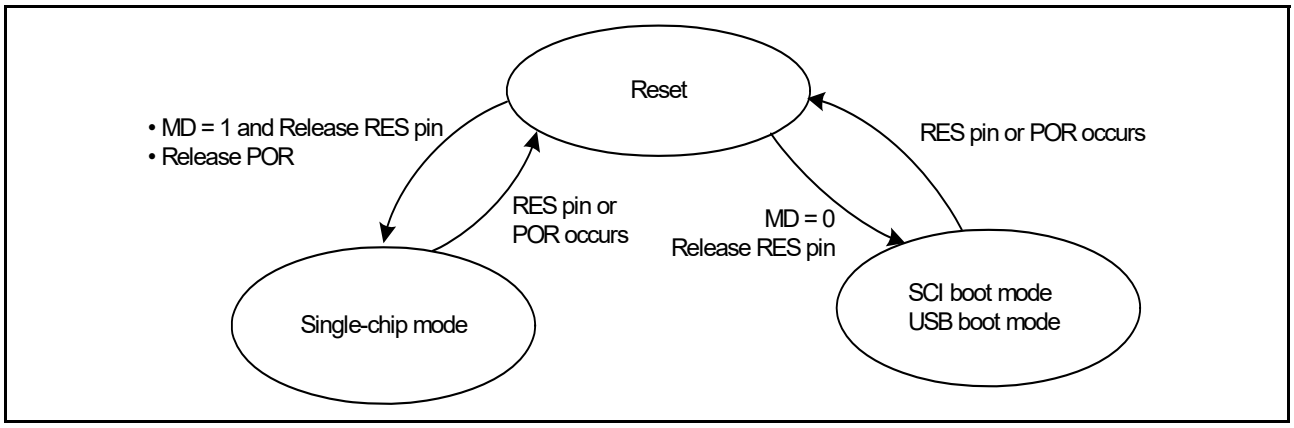
3.2.3 USB Boot Mode

In this mode, the on-chip flash memory programming routine (USB boot program), stored in the boot area within the MCU, is used. The on-chip flash, including code flash memory and data flash memory, can be modified from outside the MCU by using USB. For details, see section 55, Flash Memory. The MCU starts in USB boot mode if the MD pin is held low on release from the reset state.

3.3 Operating Mode Transitions

3.3.1 Operating Mode Transitions as Determined by the Mode-Setting Pin

Figure 3.1 shows operating mode transitions determined by the settings of the MD pin.



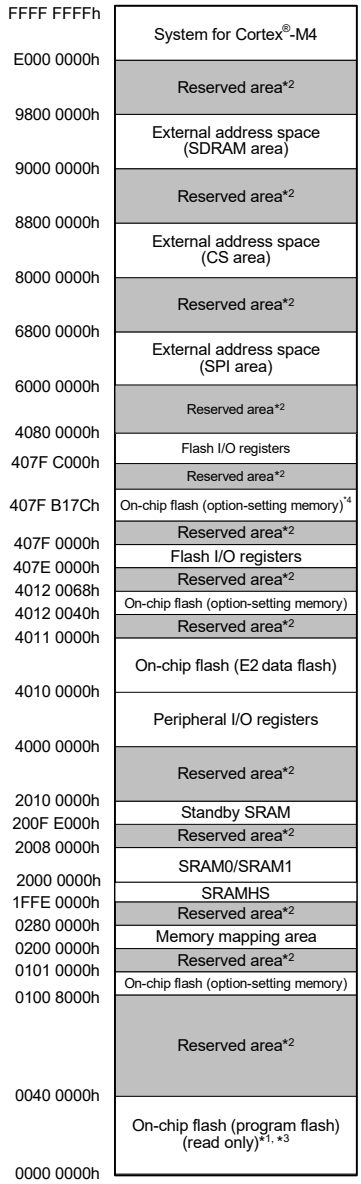


Figure 3.1 Mode-setting pin level and operating mode

4. Address Space

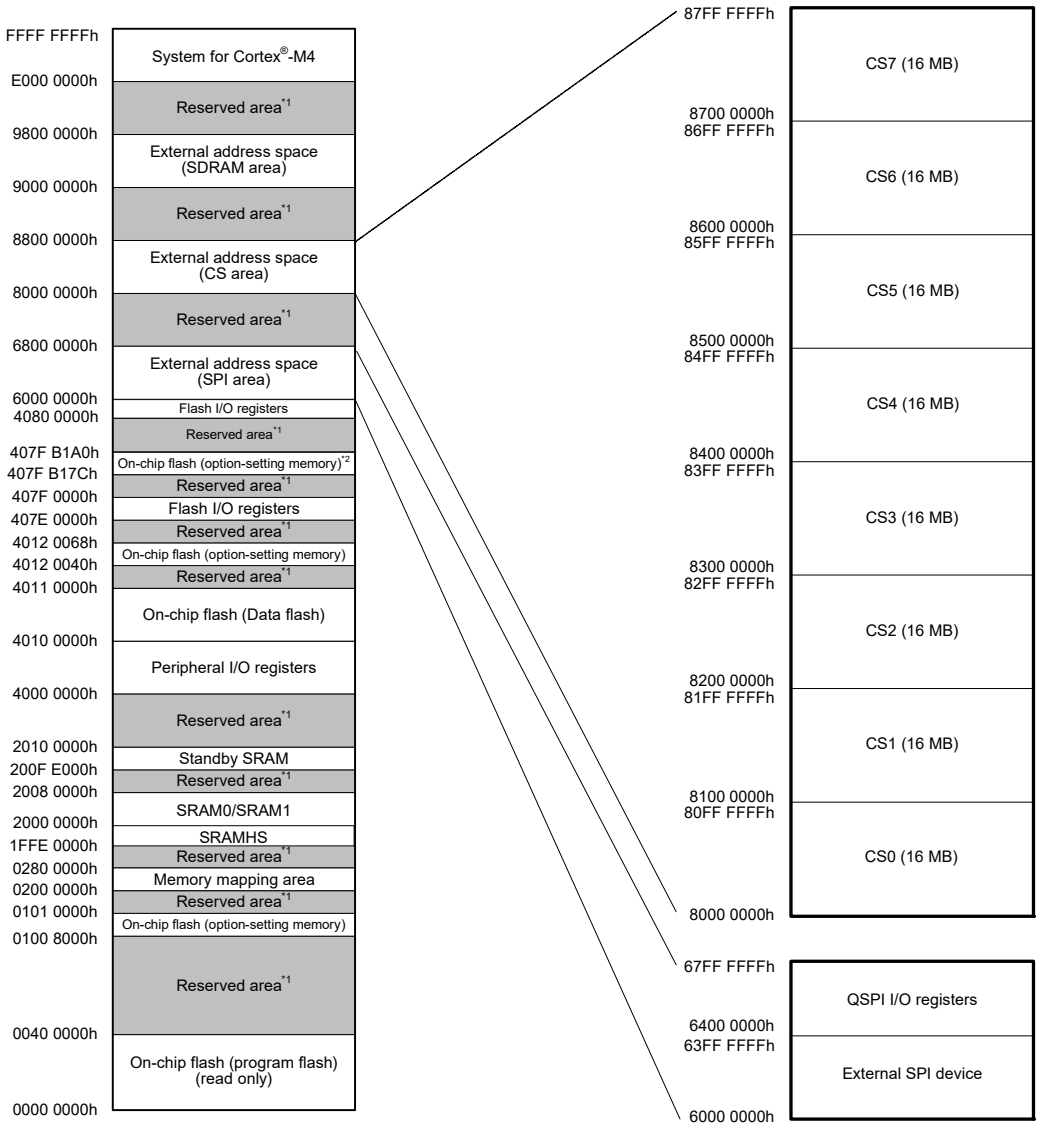
4.1 Address Space

The MCU supports a 4-GB linear address space ranging from 0000 0000h to FFFF FFFFh that can contain both program and data. Figure 4.1 shows the memory map.

Note 1. The capacity of the flash differs depending on the products:

Product	Address
4-MB product	0000 0000h to 003F FFFFh
3-MB product	0000 0000h to 002F FFFFh

Note 2. Do not access reserved areas.



Note 3. Some regions are reserved for the option-setting memory. For details, see section 7, Option-Setting Memory.

Note 4. Do not access from 407F B180h to 407F B19Bh.

Figure 4.1 Memory map

4.2 External Address Space

The external address space is divided into CS areas (CS0 to CS7), SDRAM area (SDCS), and SPI area. The eight CS areas (CS0 to CS7) each correspond to the CSn signal output from a CSn (n = 0 to 7) pin. The SPI area is divided into two areas, QSPI I/O registers and external SPI device space. Figure 4.2 shows the address ranges corresponding to the individual CS areas (CS0 to CS7), SDRAM area (SDCS) and SPI area.

Note 1. Do not access reserved areas.
Note 2. Do not access from 407F B180h to 407F B19Bh.

Figure 4.2 Association between external address spaces and CS areas

5. Memory Mirror Function (MMF)

5.1 Overview

The MCU provides a Memory Mirror Function (MMF). You can configure the MMF to map an application image load address in the code flash memory to the application image link address in the unused 23-bit memory mirror space addresses. Your application code must be developed and linked to run from this MMF destination address. The code is not required to know the load location where it is stored in code flash memory. Table 5.1 lists the MMF specifications.

Table 5.1 MMF specifications

Parameter	Specifications
Memory mirror space	8 MB (0200 0000h to 027F FFFFh)
Memory mirror boundary	128 bytes

5.2 Register Descriptions

5.2.1 MemMirror Special Function Register (MMSFR)

Address(es): MMF.MMSFR 4000 1000h

	KEY[7:0]								—	MEMMIRADDR[15:9]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MEMMIRADDR[8:0]									—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b22 to b7	MEMMIRADDR[15:0]	Memory Mirror Address	0000h to FFFFh (8 MB)	R/W
b23	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b31 to b24	KEY[7:0]	MMSFR Key Code	These bits enable or disable rewriting of the MEMMIRADDR bits.	R/W

MEMMIRADDR[15:0] bits (Memory Mirror Address)

The MEMMIRADDR bits specify bits [22:7] of the memory mirror address. They define where the start address of the memory mirror space addresses (0200 0000h) is linked to. Writing to these bits is enabled only when this register is accessed in 32-bit words and the value DBh is written to the KEY[7:0] bits.

KEY[7:0] bits (MMSFR Key Code)

The KEY[7:0] bits enable or disable rewriting of the MEMMIRADDR bits. Data written to the KEY bits is not saved. These bits are read as 0. The KEY code and MEMMIRADDR must be written to in the same cycle.

5.2.2 MemMirror Enable Register (MMEN)

Address(es): MMF.MMEN 4000 1004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	KEY[7:0]								—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Symbol	Bit name	Description	R/W
b0	EN	Memory Mirror Function Enable	0: Disable MMF 1: Enable MMF.	R/W
b23 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b31 to b24	KEY[7:0]	MMEN Key Code	These bits enable or disable rewriting of the EN bit.	R/W

EN bit (Memory Mirror Function Enable)

Writing to the EN bit is enabled only when the MemMirror Enable Register is accessed in 32-bit words and the value DBh is written to the KEY[7:0] bits.

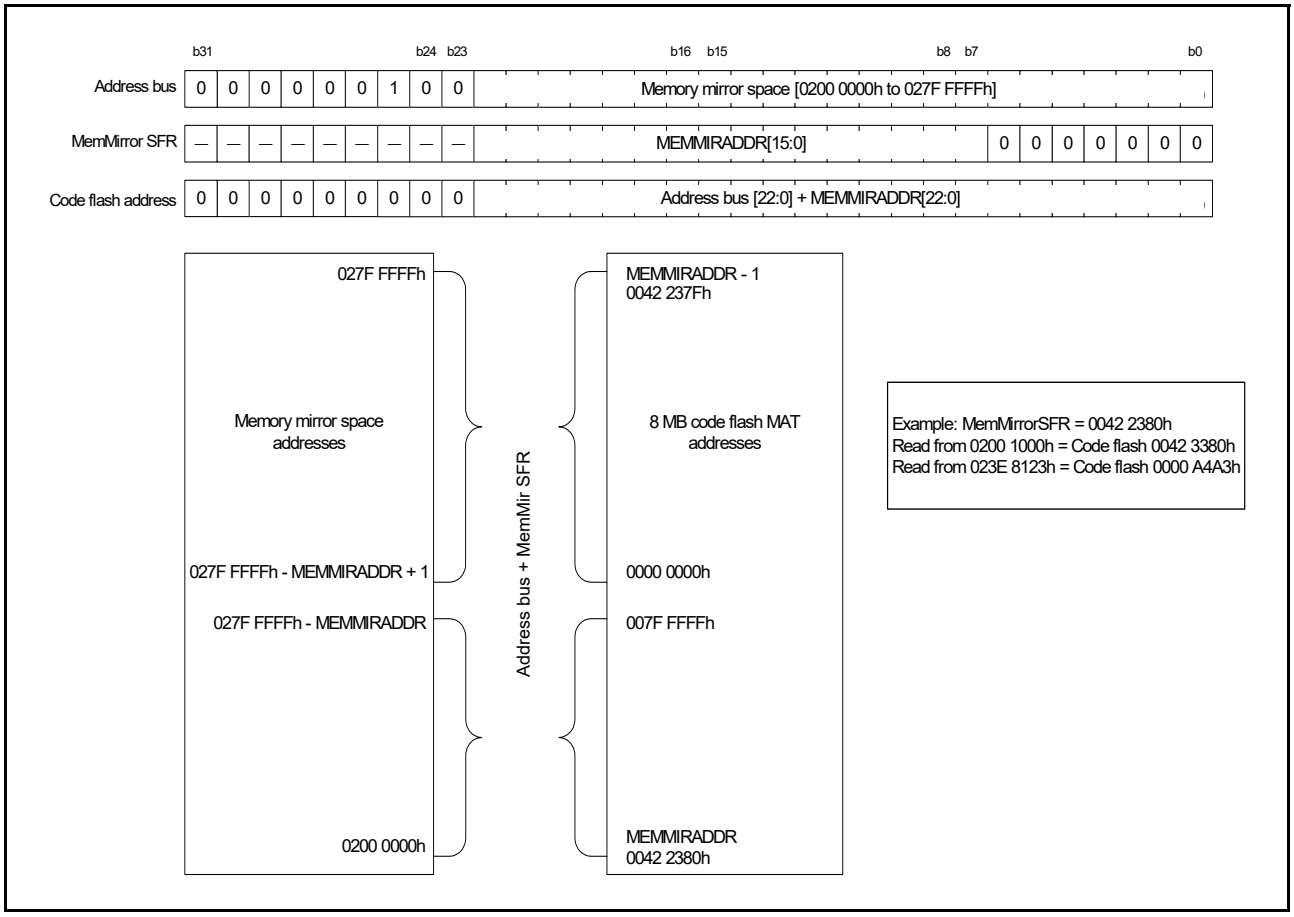
KEY[7:0] bits (MMEN Key Code)

The KEY[7:0] bits enable or disable rewriting of the EN bit. Data written to the KEY[7:0] bits is not saved. These bits are read as 0. The KEY code and EN must be written to in the same cycle.

5.3 Operation

5.3.1 MMF Operation

The MMF links the memory mirror space (0200 0000h to 027F FFFFh) to the code flash area. If MMEN.EN = 1, the CPU can access code flash using both normal addresses (starting at 0000 0000h) and memory mirror space addresses (starting at 0200 0000h). Figure 5.1 shows an overview of the MMF. MMSFR.MEMMIRADDR specifies where the start address of the memory mirror space addresses (0200 0000h) is linked to. Figure 5.2, Figure 5.3, and Figure 5.4 show the MMF operation. Figure 5.5 shows the setting procedure of the MMF.



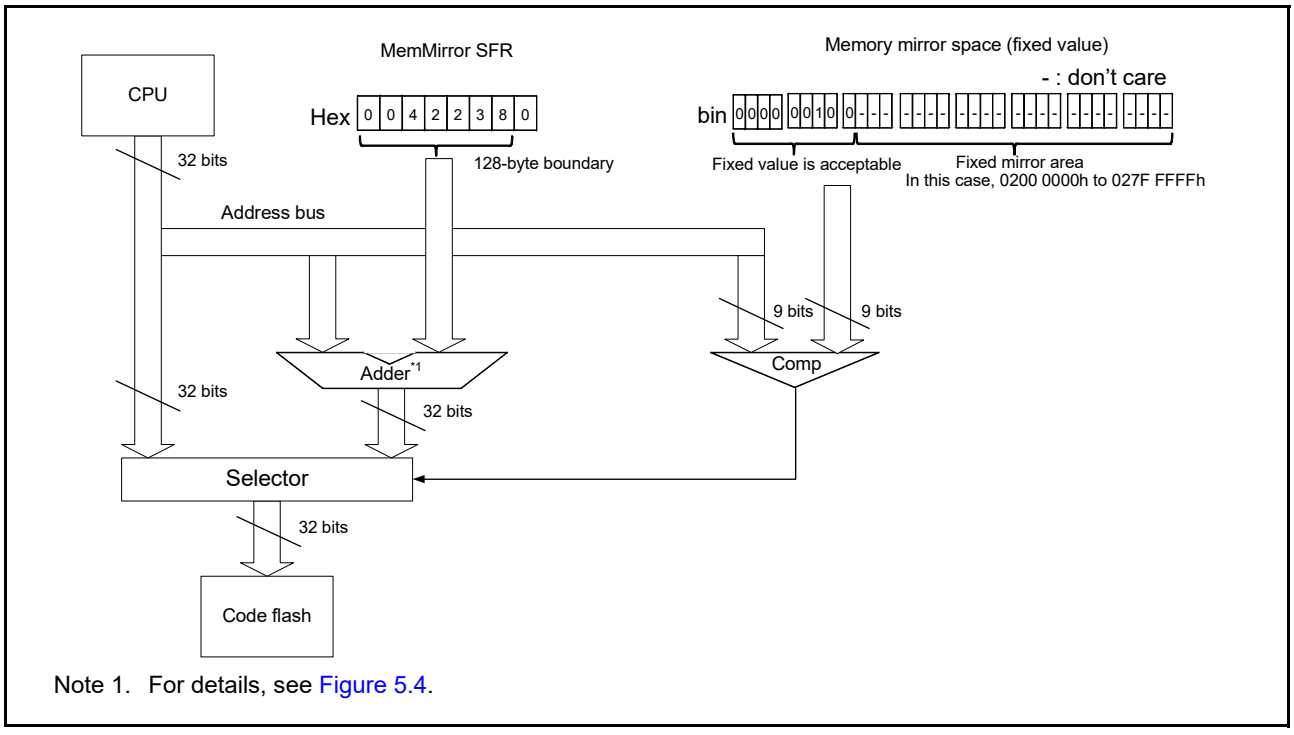


Figure 5.1 MMF operation

Note 1. For details, see Figure 5.4.

Figure 5.2 MMF block diagram

Figure 5.3 shows addresses handled by each module. The Arm® MPU uses the original address of the CPU.

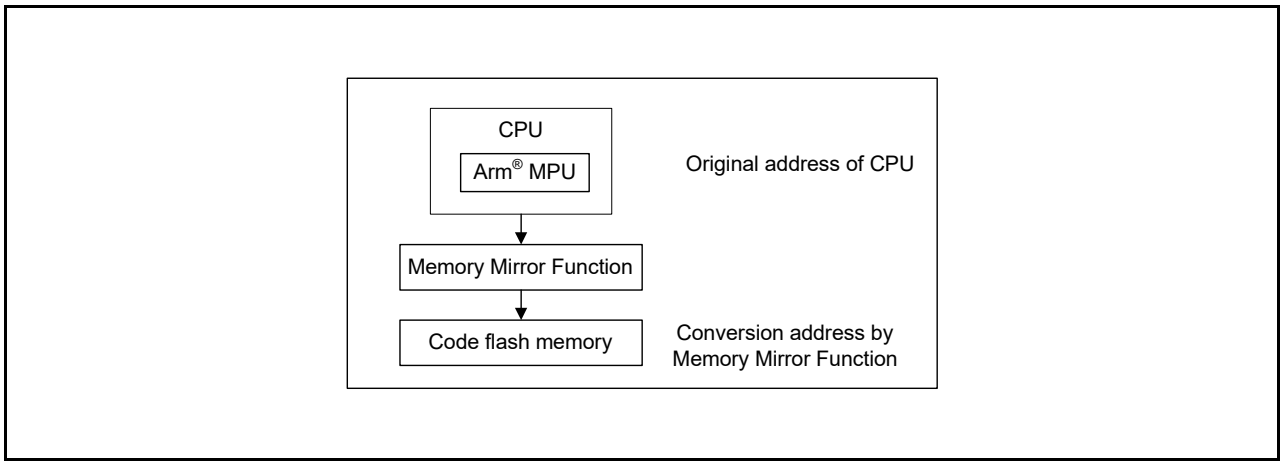

Figure 5.3 Addresses handled by each module

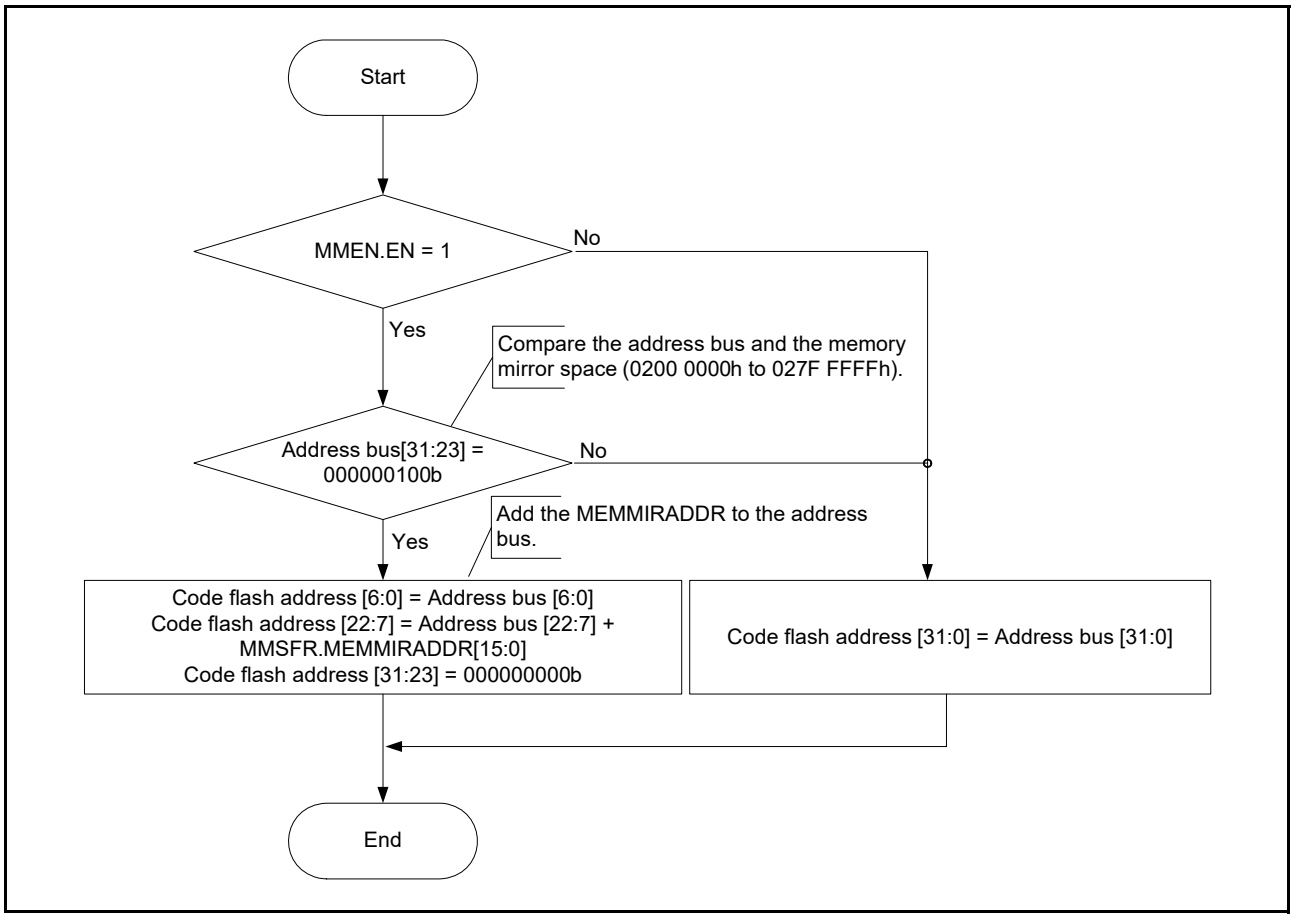

Figure 5.4 MMF operation flow

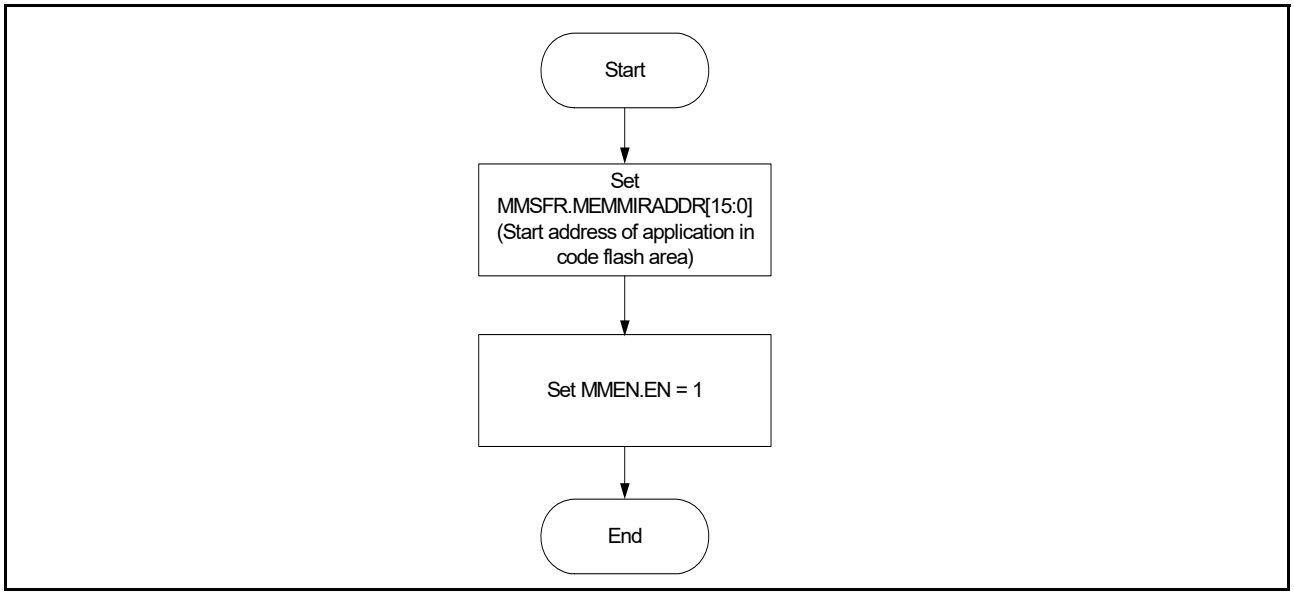

Figure 5.5 MMF setup flow

5.3.2 Setting Example

The target application code on the code flash can be accessed from the address 0200 0000h on the memory mirror space by setting up the code flash start address in MMSFR.MEMMIRADDR and setting MMEN.EN = 1.

Figure 5.6 shows an example of how to use the MMF.

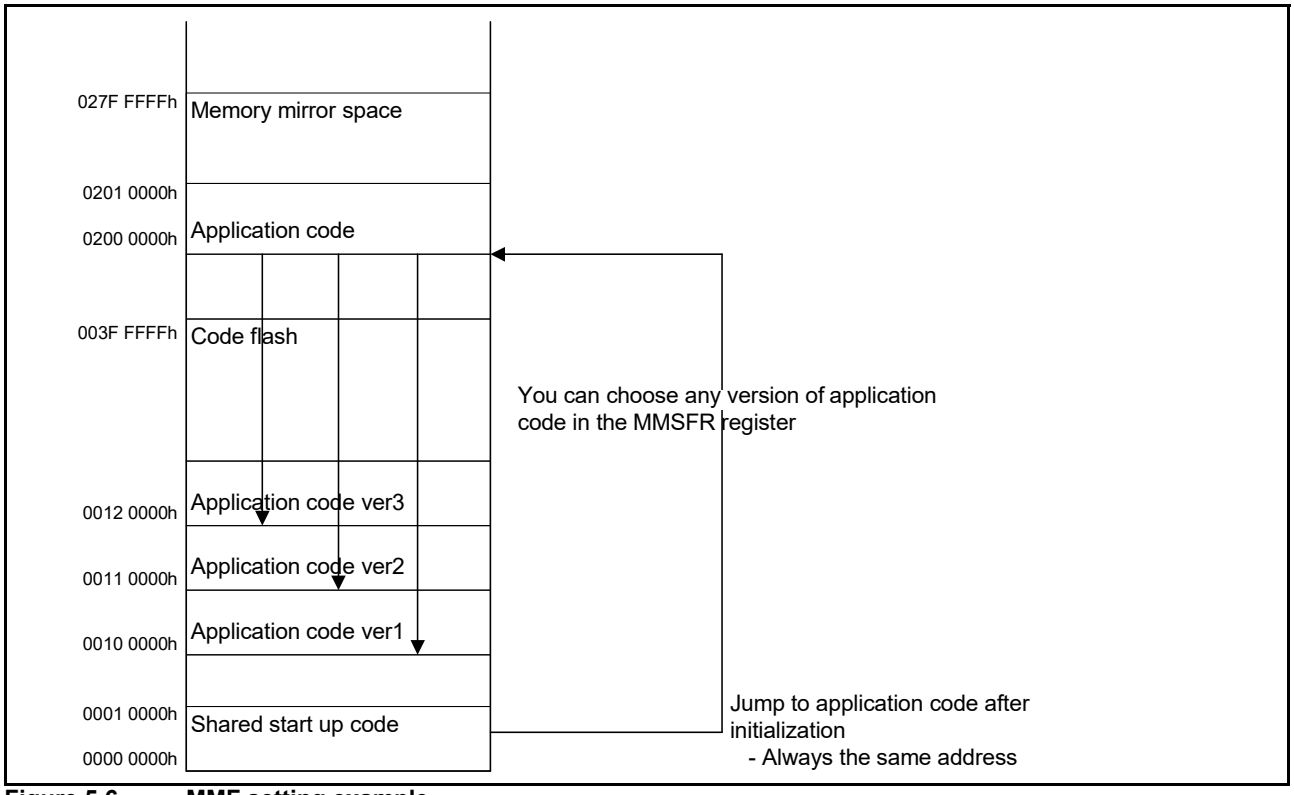

Figure 5.6 MMF setting example

Set the MMSFR register to DB10 0000h to use the application code ver 1.

Set the MMSFR register to DB11 0000h to use the application code ver 2.

Set the MMSFR register to DB12 0000h to use the application code ver 3.

6. Resets

6.1 Overview

The MCU provides 14 resets:

- RES pin reset
- Power-on reset
- Independent Watchdog Timer reset
- Watchdog Timer reset
- Voltage monitor 0 reset
- Voltage monitor 1 reset
- Voltage monitor 2 reset
- SRAM parity error reset
- SRAM DED error reset
- Bus master MPU error reset
- Bus slave MPU error reset
- Stack pointer error reset
- Deep Software Standby reset
- Software reset.

Table 6.1 lists the reset names and sources.

Table 6.1 Reset names and sources

Reset name	Source
RES pin reset	Voltage input to the RES pin is driven low
Power-on reset	VCC rise (voltage detection: VPOR)*1
Independent Watchdog Timer reset	IWDT underflow or refresh error
Watchdog Timer reset	WDT underflow or refresh error
Voltage monitor 0 reset	VCC fall (voltage detection: Vdet0)*1
Voltage monitor 1 reset	VCC fall (voltage detection: Vdet1)*1
Voltage monitor 2 reset	VCC fall (voltage detection: Vdet2)*1
SRAM parity error reset	SRAM parity error detection
SRAM DED error reset	SRAM DED error detection
Bus master MPU error reset	Bus master MPU error detection
Bus slave MPU error reset	Bus slave MPU error detection
Stack pointer error reset	Stack pointer error detection
Deep Software Standby reset	Canceling of Deep Software Standby mode by an interrupt.
Software reset	Register setting (Arm® software reset bit, AIRCR.SYSRESETREQ)

Note 1. For details on the voltages to be monitored (VPOR, Vdet0, Vdet1, and Vdet2), see section 8, Low Voltage Detection (LVD) and section 60, Electrical Characteristics.

The internal state and pins are initialized by a reset. Table 6.2 and Table 6.3 list the targets initialized by resets.

Table 6.2 Reset detect flags initialized by each reset source

Flag to be initialized	Reset source							
	RES pin reset	Power-on reset	Voltage monitor 0 reset	Independent Watchdog Timer reset	Watchdog Timer reset	Voltage monitor 1 reset	Voltage monitor 2 reset	Software reset
Power-On Reset Detect Flag (RSTSR0.PORF)	✓	×	×	×	×	×	×	×

							DEEPCUT[0] = 0	DEEPCUT[0] = 1
Low-power function registers	DPSBYCR, DPSIER0 to DPSIER3, DPSIFR0 to DPSIFR3, DPSIEGR0 to DPSIEGR2	✓	✓	✓	✓	✓	×	×
Battery backup register		×	×	×	×	×	×	×
Registers other than those shown, CPU, and internal state		✓	✓	✓	✓	✓	✓	✓

✓: Initialized, ×: Not initialized

Note 1. For the initial value of each register, see section 9, Clock Generation Circuit.

Note 2. The RTC has a software reset. RCR1.RTCOS, CIE, and RCR2.RTCOE, ADJ30, RESET are initialized by all types of resets. For details on the target bits, see section 26, Realtime Clock (RTC).

Note 3. Depends on the setting of DPSBYCR.IOKEEP.

The RTC is not initialized by any reset source. SOSC and LOCO can be selected as the clock source of RTC. The following are the states of SOSC and LOCO when a reset occurs.

Table 6.4 States of SOSC when a reset occurs

State		Reset source	
		POR	Other
SOSC	Enable or disable	Initialized to enable	Continue with the state that was selected before the reset occurred
	Drive capability	Continue with the state that was selected before the reset occurred	

Table 6.5 States of LOCO when a reset occurs

State		Reset source	
		POR, LVD0, LVD1, LVD2/ Deep Software Standby (DEEPCUT[0] = 1)	Other
LOCO	Enable or disable	Initialized to enable	
	Oscillation accuracy*1	Initialized to accuracy before trimming by LOCOUTCR (accuracy: +/- 15%)	Continue the accuracy that was trimmed by LOCOUTCR

Note 1. The LOCO User Trimming Control Register (LOCOUTCR) is reset by POR, LVD0, LVD1, LVD2, and Deep Software Standby (DEEPCUT[0] = 1) resets, returning the LOCO to the default oscillation accuracy. This can affect RTC accuracy if the RTC uses the LOCO (with a user trimming value in LOCOUTCR) as the RTC source clock. To restore the pre-reset LOCO oscillation accuracy, reload the required trimming value into LOCOUTCR after any of these resets.

Table 6.6 lists the pin related to the reset function.

Table 6.6 Reset I/O pin

Pin name	I/O	Function
RES	Input	Reset pin

6.2 Register Descriptions

6.2.1 Reset Status Register 0 (RSTSR0)

Address(es): SYSTEM.RSTSR0 4001 E410h

	b7	b6	b5	b4	b3	b2	b1	b0
	DPSRSTF	—	—	—	LVD2RF	LVD1RF	LVD0RF	PORF
Value after reset:	x*1	0	0	0	x*1	x*1	x*1	x*1

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	PORF	Power-On Reset Detect Flag	0: Power-on reset not detected 1: Power-on reset detected.	R(/W)*2
b1	LVD0RF	Voltage Monitor 0 Reset Detect Flag	0: Voltage monitor 0 reset not detected 1: Voltage monitor 0 reset detected.	R(/W)*2
b2	LVD1RF	Voltage Monitor 1 Reset Detect Flag	0: Voltage monitor 1 reset not detected 1: Voltage monitor 1 reset detected.	R(/W)*2
b3	LVD2RF	Voltage Monitor 2 Reset Detect Flag	0: Voltage monitor 2 reset not detected 1: Voltage monitor 2 reset detected.	R(/W)*2
b6 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	DPSRSTF	Deep Software Standby Reset Flag	0: Deep Software Standby mode cancellation not requested by an interrupt 1: Deep Software Standby mode cancellation requested by an interrupt.	R(/W)*2

Note 1. The value after reset depends on the reset source.
Note 2. Only 0 can be written, to clear the flag. The flag must be cleared by writing 0 after 1 is read.

PORF flag (Power-On Reset Detect Flag)

The PORF flag indicates that a power-on reset occurred.

[Setting condition]

- When a power-on reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to PORF.

LVD0RF flag (Voltage Monitor 0 Reset Detect Flag)

The LVD0RF flag indicates that the VCC voltage fell below Vdet0.

[Setting condition]

- When a voltage monitor 0 reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to LVD0RF.

LVD1RF flag (Voltage Monitor 1 Reset Detect Flag)

The LVD1RF flag indicates that the VCC voltage fell below Vdet1.

[Setting condition]

- When a voltage monitor 1 reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to LVD1RF.

LVD2RF flag (Voltage Monitor 2 Reset Detect Flag)

The LVD2RF flag indicates that the VCC voltage fell below Vdet2.

[Setting condition]

- When a voltage monitor 2 reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to LVD2RF.

DPSRSTF flag (Deep Software Standby Reset Flag)

The DPSRSTF flag indicates that Deep Software Standby mode was canceled by an external or internal interrupt and that an internal reset (Deep Software Standby reset) occurred when an exception from Deep Software Standby mode occurred.

[Setting condition]

- When Deep Software Standby mode is canceled by an external or internal interrupt. For details, see section 11, Low Power Modes.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to DPSRSTF.

6.2.2 Reset Status Register 1 (RSTSR1)

Address(es): SYSTEM.RSTSR1 4001 E0C0h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SPERF	BUSMRF	BUSSRF	REERF	RPERF	—	—	—	—	—	SWRF	WDTRF	IWDTRF
Value after reset:	0	0	0	x*1	x*1	x*1	x*1	x*1	0	0	0	0	0	x*1	x*1	x*1

Bit	Symbol	Bit name	Description	R/W
b0	IWDTRF	Independent Watchdog Timer Reset Detect Flag	0: Independent Watchdog Timer reset not detected 1: Independent Watchdog Timer reset detected	R(/W) *2
b1	WDTRF	Watchdog Timer Reset Detect Flag	0: Watchdog Timer reset not detected 1: Watchdog Timer reset detected.	R(/W) *2
b2	SWRF	Software Reset Detect Flag	0: Software reset not detected 1: Software reset detected.	R(/W) *2
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	RPERF	SRAM Parity Error Reset Detect Flag	0: SRAM parity error reset not detected 1: SRAM parity error reset detected.	R(/W) *2
b9	REERF	SRAM DED Error Reset Detect Flag	0: SRAM DED error reset not detected 1: SRAM DED error reset detected.	R(/W) *2
b10	BUSSRF	Bus Slave MPU Error Reset Detect Flag	0: Bus slave MPU error reset not detected 1: Bus slave MPU error reset detected.	R(/W) *2
b11	BUSMRF	Bus Master MPU Error Reset Detect Flag	0: Bus master MPU error reset not detected 1: Bus master MPU error reset detected.	R(/W) *2
b12	SPERF	SP Error Reset Detect Flag	0: SP error reset not detected 1: SP error reset detected.	R(/W) *2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value after reset depends on the reset source.
Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

IWDTRF flag (Independent Watchdog Timer Reset Detect Flag)

The IWDTRF flag indicates that an Independent Watchdog Timer reset occurred.

[Setting condition]

- When an Independent Watchdog Timer reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to IWDTRF.

WDTRF flag (Watchdog Timer Reset Detect Flag)

The WDTRF flag indicates that a Watchdog Timer reset occurred.

[Setting condition]

- When a Watchdog Timer reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to WDTRF.

SWRF flag (Software Reset Detect Flag)

The SWRF flag indicates that a software reset occurred.

[Setting condition]

- When a software reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to SWRF.

RPERF flag (SRAM Parity Error Reset Detect Flag)

The RPERF flag indicates that an SRAM parity error reset occurred.

[Setting condition]

- When an SRAM parity error reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to RPERF.

REERF flag (SRAM DED Error Reset Detect Flag)

The REERF flag indicates that an SRAM DED error reset occurred.

[Setting condition]

- When an SRAM DED error reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to REERF.

BUSSRF flag (Bus Slave MPU Error Reset Detect Flag)

The BUSSRF flag indicates that a bus slave MPU error reset occurred.

[Setting condition]

- When a bus slave MPU error reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to BUSSRF.

BUSMRF flag (Bus Master MPU Error Reset Detect Flag)

The BUSMRF flag indicates that a bus master MPU error reset occurred.

[Setting condition]

- When a bus master MPU error reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to BUSMRF.

SPERF flag (SP Error Reset Detect Flag)

The SPERF flag indicates that a stack pointer error reset occurred.

[Setting condition]

- When a stack pointer error reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 1 is read from and then 0 is written to SPERF.

6.2.3 Reset Status Register 2 (RSTSR2)

Address(es): SYSTEM.RSTSR2 4001 E411h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CWSF
Value after reset:	0	0	0	0	0	0	0	x*1

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	CWSF	Cold/Warm Start Determination Flag	0: Cold start 1: Warm start.	R(/W) *2
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value after reset depends on the reset source.
Note 2. Only 1 can be written to set the flag.

RSTSR2 determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

CWSF flag (Cold/Warm Start Determination Flag)

The CWSF flag indicates the type of reset processing, either cold start or warm start. The CWSF flag is initialized by a power-on reset. It is not initialized by a reset signal generated by the RES pin.

[Setting condition]

- When 1 is written by software. Writing 0 to CWSF does not set it to 0.

[Clearing condition]

- When a reset listed in Table 6.2 occurs.

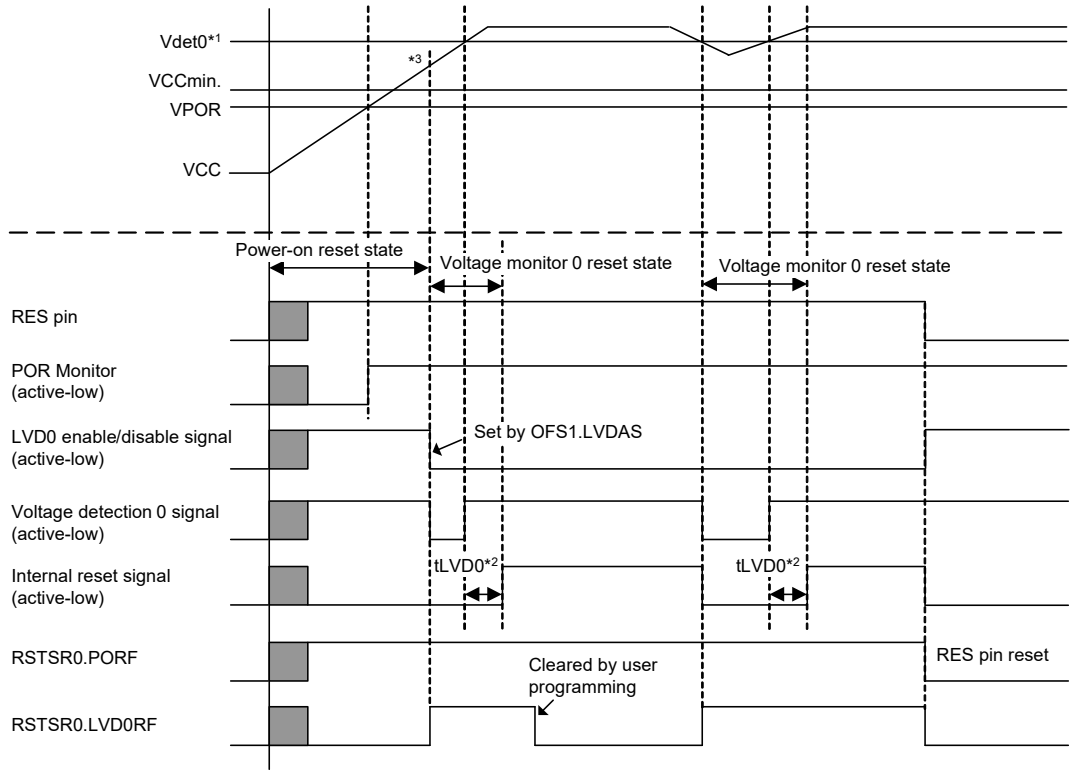
6.3 Operation

6.3.1 RES Pin Reset

The RES pin generates this reset. When the RES pin is driven low, all the processing in progress is aborted and the MCU enters a reset state. To successfully reset the MCU, the RES pin must be held low for the power supply stabilization time specified for power-on.

When the RES pin is driven high from low, the internal reset is canceled after the post-RES cancellation wait time (tRESWT) elapses, and then the CPU starts the reset exception handling.

For details, see section 60, Electrical Characteristics.



6.3.2 Power-On Reset

The power-on reset circuit generates this internal reset. If the RES pin is in a high-level state when power is supplied, a power-on reset is generated. After VCC exceeds VPOR and the specified period (power-on reset time) elapses, the internal reset is canceled and the CPU starts the reset exception handling. The power-on reset time is the stabilization period for the external power supply and the MCU circuit. After a power-on reset is generated, the PORF flag in the RSTSR0 is set to 1. The PORF flag is initialized by the RES pin reset.

The voltage monitor 0 reset is an internal reset generated by the voltage monitor circuit. If the Voltage Detection 0 Circuit Start bit (LVDAS) in Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below Vdet0, the RSTSR0.LVD0RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 0 reset. Clear the OFS1.LVDAS bit to 0 if the voltage monitor 0 reset is to be used.

After VCC exceeds Vdet0 and the voltage monitor 0 reset time (tLVD0) elapses, the internal reset is canceled and the CPU starts the reset exception handling. The Vdet0 voltage detection level can be changed by the setting in the VDSEL[1:0] bits in Option Function Select Register 1 (OFS1).

Figure 6.1 shows an example of operations during a power-on reset and voltage monitor 0 reset.

Note: For details on the electrical characteristics, see section 60, Electrical Characteristics.
Note 1. Vdet0 shows a voltage monitoring 0 reset detection level, and VPOR shows a power-on reset detection level, and VCCmin shows minimum guaranteed voltage of MCU.
Note 2. tLVD0 shows a time for voltage monitoring 0 reset.
Note 3. At power-on, VCC should have risen to the minimum guaranteed voltage before the POR reset is released.

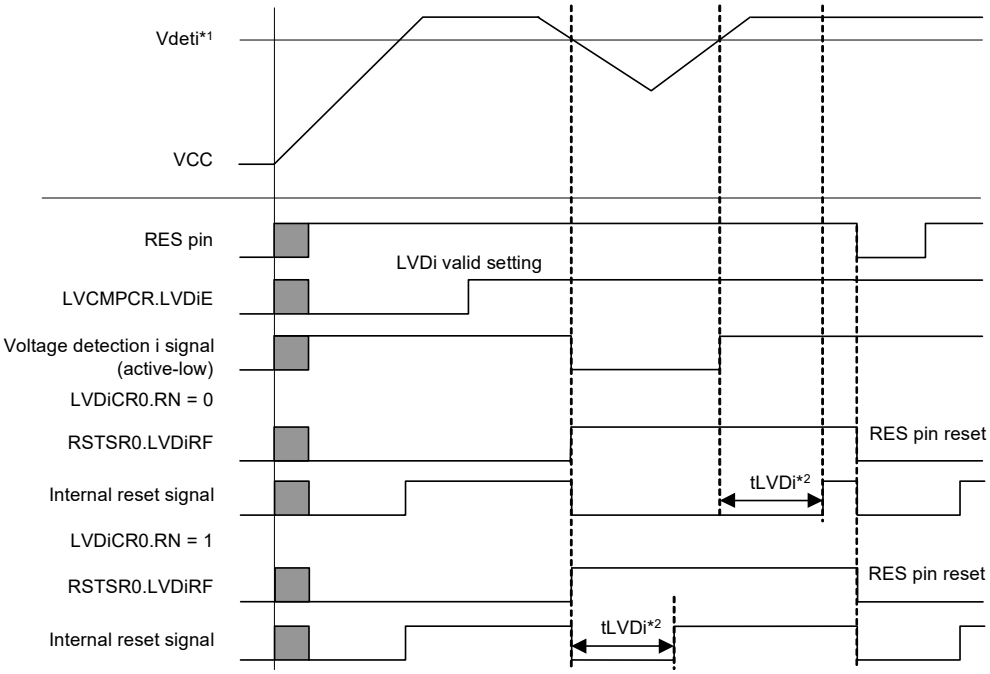
Figure 6.1 Example of operations during power-on and voltage monitor 0 resets

6.3.3 Voltage Monitor Reset

The voltage monitor 0 reset is an internal reset generated by the voltage monitor circuit. If the Voltage Detection 0 Circuit Start bit (LVDAS) in Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below Vdet0, the RSTSR0.LVD0RF flag is set to 1 and the voltage detection circuit generates voltage monitor 0 reset. Clear the OFS1.LVDAS bit to 0 if the voltage monitor 0 reset is to be used. After VCC exceeds Vdet0 and the voltage monitor 0 reset time (tLVD0) elapses, the internal reset is canceled and the CPU starts the reset exception handling.

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (LVD1CR0.RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (LVD1CR0), the RSTSR0.LVD1RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 1 reset if VCC falls to or below Vdet1.

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (LVD2CR0), the RSTSR0.LVD2RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 2 reset if VCC falls to or below Vdet2.



Similarly, timing for release from the voltage monitor 1 reset state is selectable in the Voltage Monitor 1 Reset Negate Select bit (RN) in LVD1CR0. When the RN bit is 0 and VCC falls to or below Vdet1, the CPU is released from the

internal reset state and starts reset exception handling when the LVD1 reset time (tLVD1) elapses after VCC rises above Vdet1. When the LVD1CR0.RN bit is 1 and VCC falls to or below Vdet1, the CPU is released from the internal reset state and starts reset exception handling when the LVD1 reset time (tLVD1) elapses.

Likewise, timing for release from the voltage monitor 2 reset state is selectable in the Voltage Monitor 2 Reset Negate Select bit (RN) in the LDV2CR0 register.

Detection levels Vdet1 and Vdet2 can be changed in the Voltage Detection Level Select Register (LDVLVLR).

Figure 6.2 shows examples of operations during voltage monitor 1 and 2 resets. For details on the voltage monitor 1 reset and voltage monitor 2 reset, see section 8, Low Voltage Detection (LVD).

Note: For details on the electrical characteristics, see section 60, Electrical Characteristics.
Note 1. Vdeti indicates the detection level of a voltage monitor 1 reset and voltage monitor 2 reset. (i = 1, 2)
Note 2. tLVDi indicates the time for a voltage monitor 1 reset and voltage monitor 2 reset. (i = 1, 2)

Figure 6.2 Examples of operation during voltage monitor 1 and voltage monitor 2 resets

6.3.4 Deep Software Standby Reset

The deep software standby reset is an internal reset generated when Deep Software Standby mode is canceled by an associated interrupt. The deep software standby reset is canceled after tDSBY (return time after Deep Software Standby mode cancellation) elapses. At the same time, Deep Software Standby mode is also canceled.

When tDSBYWT (wait time after Deep Software Standby mode cancellation) elapses after Deep Software Standby mode is canceled, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the deep software standby reset, see section 11, Low Power Modes.

6.3.5 Independent Watchdog Timer Reset

The independent watchdog timer reset is an internal reset generated by the Independent Watchdog Timer (IWDT). Output of the independent watchdog timer reset from the IWDT can be selected by settings in Option Function Select Register 0 (OFS0).

When output of the independent watchdog timer reset is selected, the reset is generated if the IWDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (tRESW2) elapses after the independent watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the independent watchdog timer reset, see section 28, Independent Watchdog Timer (IWDT).

6.3.6 Watchdog Timer Reset

The watchdog timer reset is an internal reset generated from the Watchdog Timer (WDT). Output of the watchdog timer reset from the WDT can be selected in the WDT Reset Control Register (WDTRCR) or Option Function Select Register 0 (OFS0).

When output of the Watchdog Timer reset is selected, the reset is generated if the WDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (tRESW2) elapses after the Watchdog Timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the Watchdog Timer reset, see section 27, Watchdog Timer (WDT).

6.3.7 Software Reset

This internal reset is generated by a software setting of the SYSRESETREQ bit in the AIRCR register in the Arm® core. When the SYSRESETREQ bit is set to 1, a software reset is generated. When the internal reset time (tRESW2) elapses after the software reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

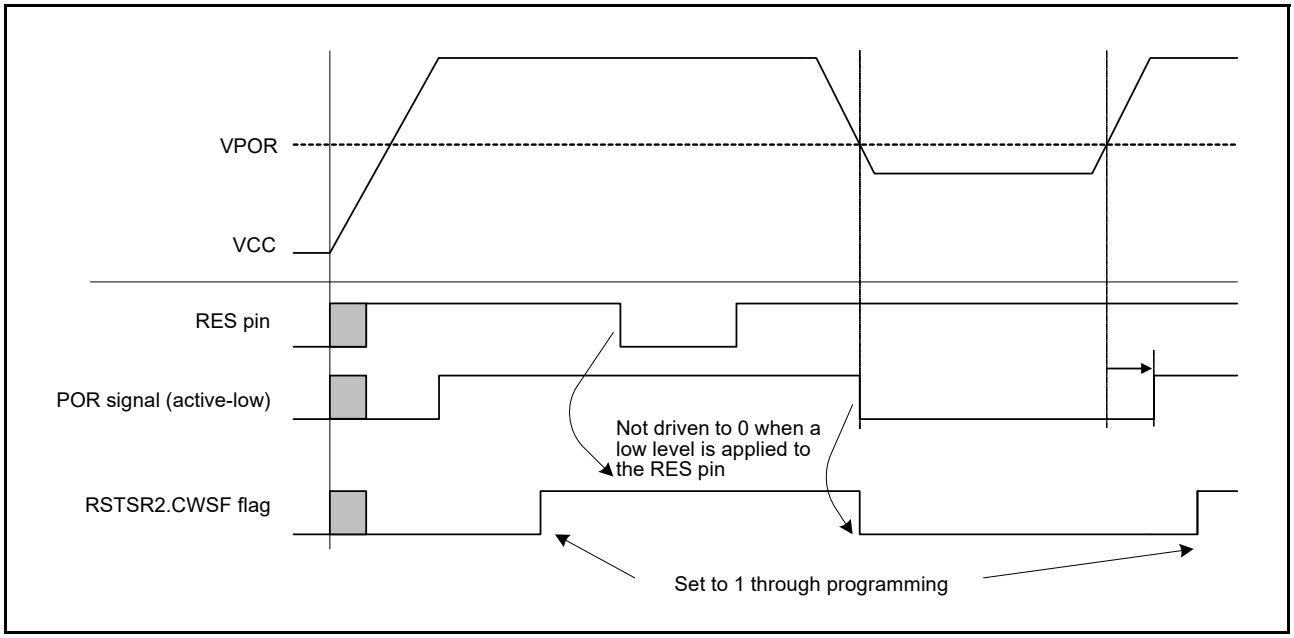
For details on the SYSRESETREQ bit, see the *ARM® Cortex®-M4 Technical Reference Manual*.

6.3.8 Determination of Cold/Warm Start

Read the CWSF flag in RSTSR2 to determine the cause of reset processing. The flag indicates whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

The flag is set to 0 when a power-on reset occurs (cold start). Otherwise, the flag is not set to 0. The flag is set to 1 when 1 is written to it through software. It is not set to 0 even when 0 is written.

Figure 6.3 shows an example of a cold/warm start determination operation.



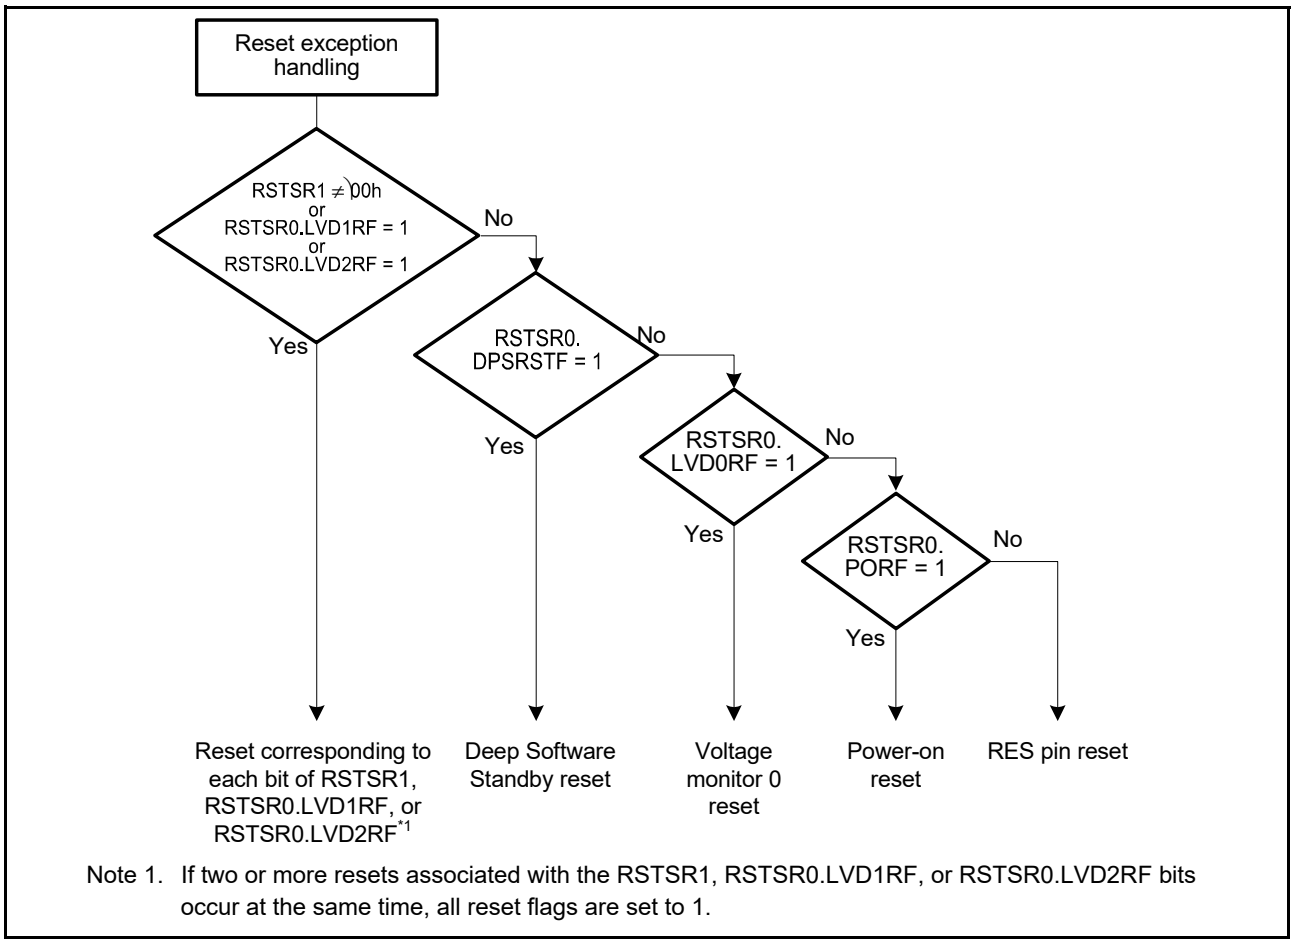


Figure 6.3 Example of cold/warm start determination operation

6.3.9 Determination of Reset Generation Source

Read RSTSR0 and RSTSR1 to determine which reset is used to execute the reset exception handling. Figure 6.4 shows an example of the flow for identifying a reset generation source. The reset flag must be written with 0 after it is read as 1.

Note 1. If two or more resets associated with the RSTSR1, RSTSR0.LVD1RF, or RSTSR0.LVD2RF bits occur at the same time, all reset flags are set to 1.

Figure 6.4 Example of reset generation source determination flow

7. Option-Setting Memory

7.1 Overview

The option-setting memory determines the state of the MCU after a reset. It is allocated to the configuration setting area and the program flash area of the flash memory, and the available methods of setting are different for the two areas. Figure 7.1 shows the option-setting memory area.

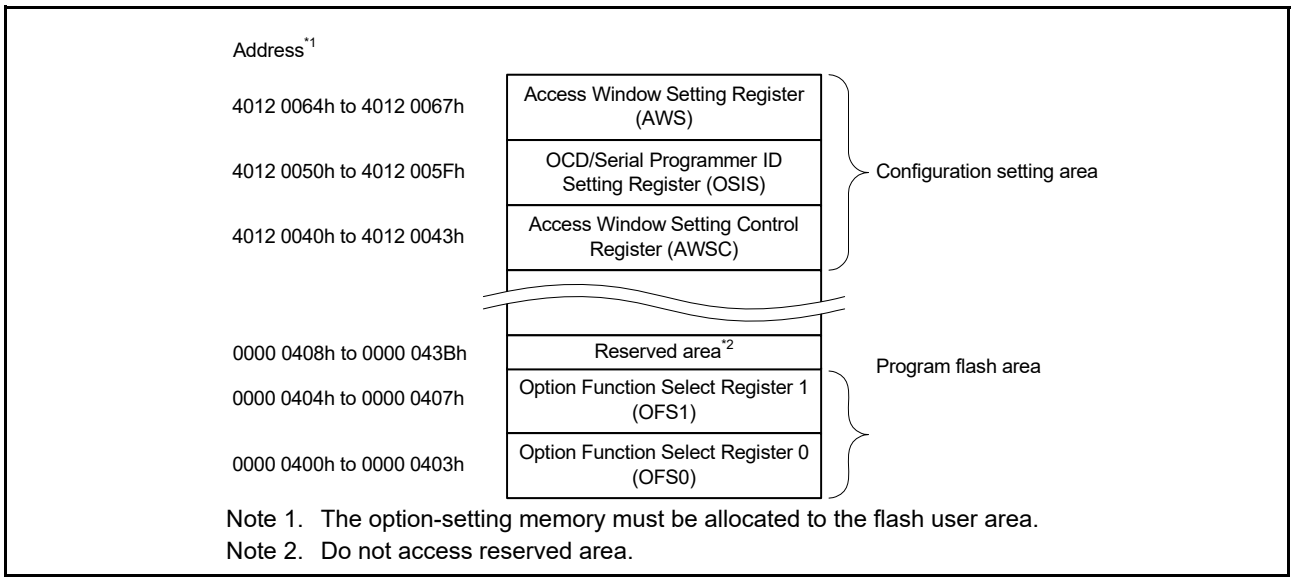

Figure 7.1 Option-setting memory area

Note 1. The value in a blank product is FFFF FFFFh. It is set to the value written by your application.

IWDTSTRT bit (IWDT Start Mode Select)

The IWDTSTRT bit selects the mode in which the IWDT is activated after a reset (stopped state or activated state).

IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits specify the timeout period, the time it takes for the down counter to underflow, as 128, 512, 1024, or 2048 cycles of the frequency-divided clock set in the IWDTCKS[3:0] bits. The number of clock cycles that the counter takes to underflow after a refresh operation is determined by the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits.

For details, see section 28, Independent Watchdog Timer (IWDT).

IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of the clock for the IWDT as 1/1, 1/16, 1/32, 1/64, 1/128, or 1/256. Using this setting combined with the IWDTTOPS[1:0] bit setting, the IWDT counting period can be set from 128 to 524,288 IWDT clock cycles.

For details, see section 28, Independent Watchdog Timer (IWDT).

IWDTRPES[1:0] bits (IWDT Window End Position Select)

The IWDTRPES[1:0] bits specify the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the count value. The value of the window end position must be smaller than the value of the window start position. Otherwise, only the value for the window start position is valid.

The counter values corresponding to the settings for the start and end positions of the window, in the IWDTRPSS[1:0] and IWDTRPES[1:0] bits, vary with the setting in the IWDTTOPS[1:0] bits.

For details, see section 28, Independent Watchdog Timer (IWDT).

IWDTRPSS[1:0] bits (IWDT Window Start Position Select)

The IWDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the window start and end positions becomes the period in which a refresh is possible. Refresh is not possible outside this period.

For details, see section 28, Independent Watchdog Timer (IWDT).

IWDTRSTIRQS bit (IWDT Reset Interrupt Request Select)

The IWDTRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The operation is selectable to an Independent Watchdog Timer reset, non-maskable interrupt request, or interrupt request.

For details, see section 28, Independent Watchdog Timer (IWDT).

IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit specifies whether to stop counting when entering Sleep mode, Snooze mode, or Software Standby mode.

For details, see section 28, Independent Watchdog Timer (IWDT).

WDTSTRT bit (WDT Start Mode Select)

The WDTSTRT bit selects the mode in which the WDT is activated after a reset (stopped state or activated state). When the WDT is activated in auto-start mode, the OFS0 register setting for the WDT is valid.

WDTTOPS[1:0] bits (WDT Timeout Period Select)

The WDTTOPS[1:0] bits specify the timeout period, the time it takes for the down counter to underflow, as 1024, 4096, 8192, or 16384 cycles of the frequency-divided clock set in the WDTCKS[3:0] bits. The number of PCLKB cycles that the counter takes to underflow after a refresh operation is determined by the combination of the WDTCKS[3:0] and WDTTOPS[1:0] bits.

For details, see section 27, Watchdog Timer (WDT).

WDTCKS[3:0] bits (WDT Clock Frequency Division Ratio Select)

The WDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the PCLKB frequency as 1/4, 1/64, 1/128, 1/512, 1/2048, or 1/8192. Using this setting combined with the WDTTOPS[1:0] bit setting, the WDT counting period can be set from 4,096 to 134,217,728 PCLKB cycles.

For details, see section 27, Watchdog Timer (WDT).

WDTRPES[1:0] bits (WDT Window End Position Select)

The WDTRPES[1:0] bits specify the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the counted value. The value of the window end position must be smaller than the value of the window start position. Otherwise, only the value for the window start position is valid.

The counter values corresponding to the settings for the start and end positions of the window, in the WDTRPSS[1:0] and WDTRPES[1:0] bits, vary with the setting of the WDTTOPS[1:0] bits.

For details, see section 27, Watchdog Timer (WDT).

WDTRPSS[1:0] bits (WDT Window Start Position Select)

The WDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the window start and end positions becomes the period in which a refresh is possible. Refresh is not possible outside this period.

For details, see section 27, Watchdog Timer (WDT).

WDTRSTIRQS bit (WDT Reset Interrupt Request Select)

The WDTRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The operation is selectable to a Watchdog Timer reset, non-maskable interrupt request, or interrupt request.

For details, see section 27, Watchdog Timer (WDT).

WDTSTPCTL bit (WDT Stop Control)

The WDTSTPCTL bit specifies whether to stop counting when entering Sleep mode. For details, see section 27, Watchdog Timer (WDT).

7.2.2 Option Function Select Register 1 (OFS1)

Address(es): OFS1 0000 0404h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31 to b11	—	Reserved	When read, these bits return the written value. The write value should be 1.	R

Note 1. The value in a blank product is FFFF FFFFh. It is set to the value written by your application.

VDSEL0[1:0] bits (Voltage Detection 0 Level Select)

The VDSEL0[1:0] bits select the voltage detection level of the voltage detection 0 circuit.

LVDAS bit (Voltage Detection 0 Circuit Start)

The LVDAS bit selects whether the voltage monitor 0 reset is enabled or disabled after a reset.

HOCOEN bit (HOCO Oscillation Enable)

The HOCOEN bit selects whether the HOCO oscillation is enabled or disabled after a reset. Setting this bit to 0 allows the HOCO oscillation to start before the CPU starts operation, which reduces the wait time for oscillation stabilization.

Note: When the HOCOEN bit is set to 0, the system clock source is not switched to HOCO. The system clock source is only switched to HOCO by setting the clock source select bits (SCKSCR.CKSEL[2:0]). If you use the HOCO clock, you must set the OFS1.HOCOFRQ0 bit to an optimum value.

HOCOFRQ0[1:0] bits (HOCO Frequency Setting 0)

The HOCOFRQ0[1:0] bits specify the HOCO frequency after a reset as 16, 18, or 20 MHz.

7.2.3 Access Window Setting Control Register (AWSC)

Address(es): AWSC 4012 0040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit name	Description	R/W
b27 to b0	—	Reserved	When read, these bits return the written value. The write value should be 1.	R
b28	FSPR	Protection of Access Window and Startup Area Select Function	This bit controls programming of the program/erase protection for the access window, the Startup Area Select flag (AWS.BTFLG), and the temporary boot swap. Once this bit is set to 0, it cannot be changed to 1. 0: Executing the configuration setting command for programming the access window (FAWE[10:0], FAWS[10:0]) and the Startup Area Select flag (AWS.BTFLG) is invalid. 1: Executing the configuration setting command for programming the access window (FAWE[10:0], FAWS[10:0]) and the Startup Area Select flag (AWS.BTFLG) is valid.	R
b31 to b29	—	Reserved	When read, these bits return the value written by your application. The write value should be 1.	R

7.2.4 Access Window Setting Register (AWS)

Address(es): AWS 4012 0064h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	BTFLG	—	—	—	—	FAWE[10:0]										
Value after reset:	User setting															

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	FAWS[10:0]										
Value after reset:	User setting															

Bit	Symbol	Bit name	Description	R/W
b10 to b0	FAWS[10:0]	Access Window Start Block Address	These bits specify the start block address for the access window. They do not represent the block number of the access window. The access window is only valid in the program flash area. The block address specifies the first address of the block and consists of the address bits [23:13].	R
b15 to b11	—	Reserved	When read, these bits return the written value. The write value should be 1.	R
b26 to b16	FAWE[10:0]	Access Window End Block Address	These bits specify the end block address for the access window. They do not represent the block number of the access window. The access window is only valid in the program flash area. The end block address for the access window is the next block to the region acceptable for programming and erasure defined by the access window. The block address specifies the first address of the block and consists of the address bits [23:13]	R
b30 to b27	—	Reserved	When read, these bits return the value written by your application. The write value should be 1.	R
b31	BTFLG	Startup Area Select Flag	This bit specifies whether the address of the startup area is exchanged for the boot swap function or not. 0: Exchange the first 8-KB area (0000 0000h to 0000 1FFFh) and second 8-KB area (0000 2000h to 0000 3FFFh) 1: Do not exchange the first 8-KB area (0000 0000h to 0000 1FFFh) and second 8-KB area (0000 2000h to 0000 3FFFh).	R

Issuing the program or erase command to the area outside the access window causes a command-locked state. The access window is only valid in the program flash area. The access window provides protection in self-programming mode, serial programming mode, and on-chip debug mode. The access window can be locked by the FSPR bit.

The access window is specified in both the FAWS and FAWE bits. The following describes how to set the FAWS and FAWE bits:

- FAWE = FAWS: The P/E command is allowed to execute in the full program flash area.
- FAWE > FAWS: The P/E command is only allowed to execute in the window from the block pointed to by the FAWS bits to the block one lower than the block pointed to by the FAWE bits.
- FAWE < FAWS: The P/E command is not allowed to execute in the program flash area.

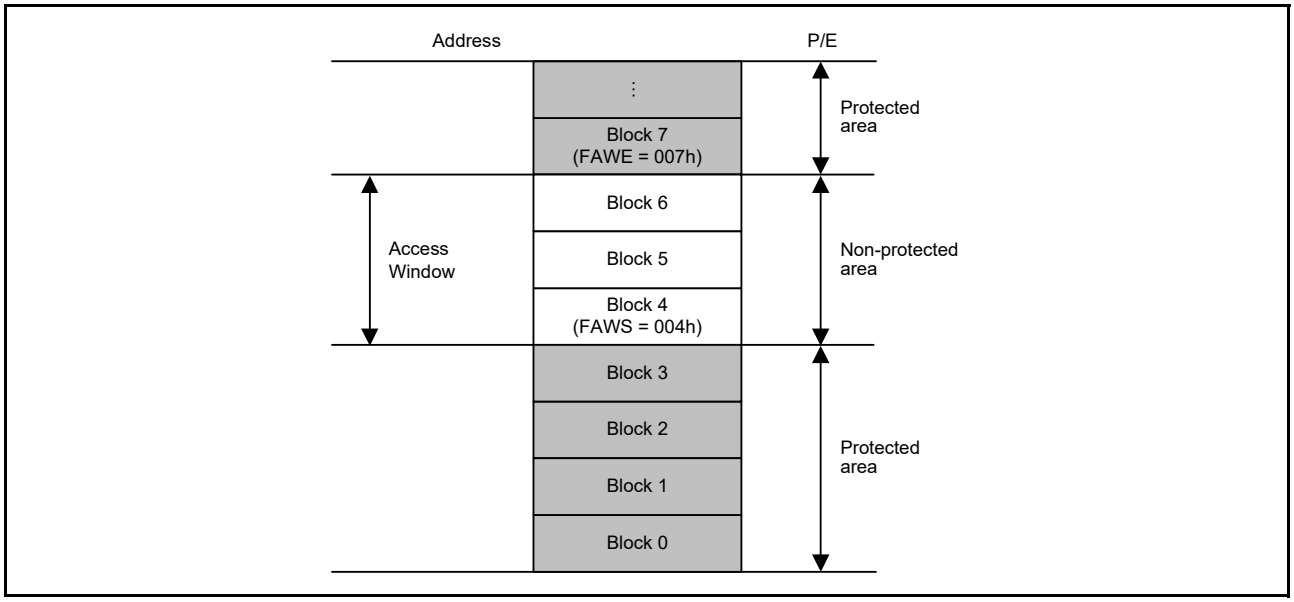

Figure 7.2 Access window overview

7.2.5 OCD/Serial Programmer ID Setting Register (OSIS)

This register stores the ID for ID code protection of the OCD/serial programmer. When connecting the OCD/serial programmer, write values so that the MCU can determine whether to permit the connection. Use this register to check whether a code transmitted from the OCD/serial programmer matches the ID code in the option-setting memory.

When the ID codes match, connection of the OCD/serial programmer is permitted. If not, connection with the OCD/serial programmer is not possible. The OSIS register must be set in 32-bit units.

Address(es): OSIS 4012 0050h, OSIS 4012 0054h, OSIS 4012 0058h, OSIS 4012 005Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	User setting															

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	User setting															

These fields hold the ID for use in ID authentication for the OCD/serial programmer.

ID code bits [127] and [126] determine whether ID code protection is enabled and the method of authentication to use with the host. Table 7.1 shows how ID code determines the method of authentication.

Table 7.1 Specifications for ID code protection

Operating mode on boot up	ID code	State of protection	Operations on connection to programmer or on-chip debugger
Serial programming mode (SCI/USB boot mode) On-chip debug mode (JTAG/SWD boot mode)	FFh, …, FFh (all bytes are FFh)	Protection disabled	The ID code is not checked, ID code always matches, and connection to programmer or on-chip debugger is permitted.
	Bit [127] = 1, bit [126] = 1, and at least one of the 16 bytes is not FFh.	Protection enabled	Matching ID code = Authentication is complete and connection with the programmer or the on-chip debugger is permitted. Non-matching ID code = Transition to the ID code protection wait state. When the ID code sent from the programmer or the on-chip debugger is "ALeRASE" in ASCII code (414C_6552_4153_45FF_FFFF_FFFF_FFFF_FFFFh), the content of the user flash (code and data) area and configuration area are erased. However, forced erasure is not executed when the FSPR bit is 0.
	Bit [127] = 1 and [126] = 0	Protection enabled	Matching ID code = Authentication is complete and connection with the programmer or the on-chip debugger is permitted. Non-matching ID code = Transition to the ID code protection wait state.
	Bit [127] = 0	Protection enabled	The ID code is not checked, the ID code is always non-matching, and connection to the programmer or the on-chip debugger is prohibited.

7.3 Setting the Option-Setting Memory

7.3.1 Allocation of Data in the Option-Setting Memory

Programming data is allocated to the addresses in the option-setting memory shown in Figure 7.1. The allocation of data is for use by tools such as a flash programming software or an on-chip debugger.

Note: Programming formats vary depending on the compiler. See the compiler manual for details.

7.3.2 Setting Data for Programming the Option-Setting Memory

Allocating data as shown in Figure 7.1 does not alone result in the data being written to the option-setting memory. You must also follow one of the actions described in this section.

(1) Changing the option-setting memory by self-programming

To write data to the program flash area, use the programming command. To write data to the option-setting memory in the configuration setting area, use the configuration setting command. In addition, use startup area select function to safely update the boot program that includes the option-setting memory.

For details on the programming command, the configuration setting command, and the startup area select function, see section 55, Flash Memory.

(2) Debugging through an OCD or programming by a flash writer

This procedure depends on the tool in use, so see the tool manual for details. The MCU provides the following setting procedures:

- Read the data allocated as shown in Figure 7.1 from an object file or Motorola S-format file generated by the compiler, and write the data to the MCU.
- Use the GUI interface of the tool to program the same data as shown in Figure 7.1.

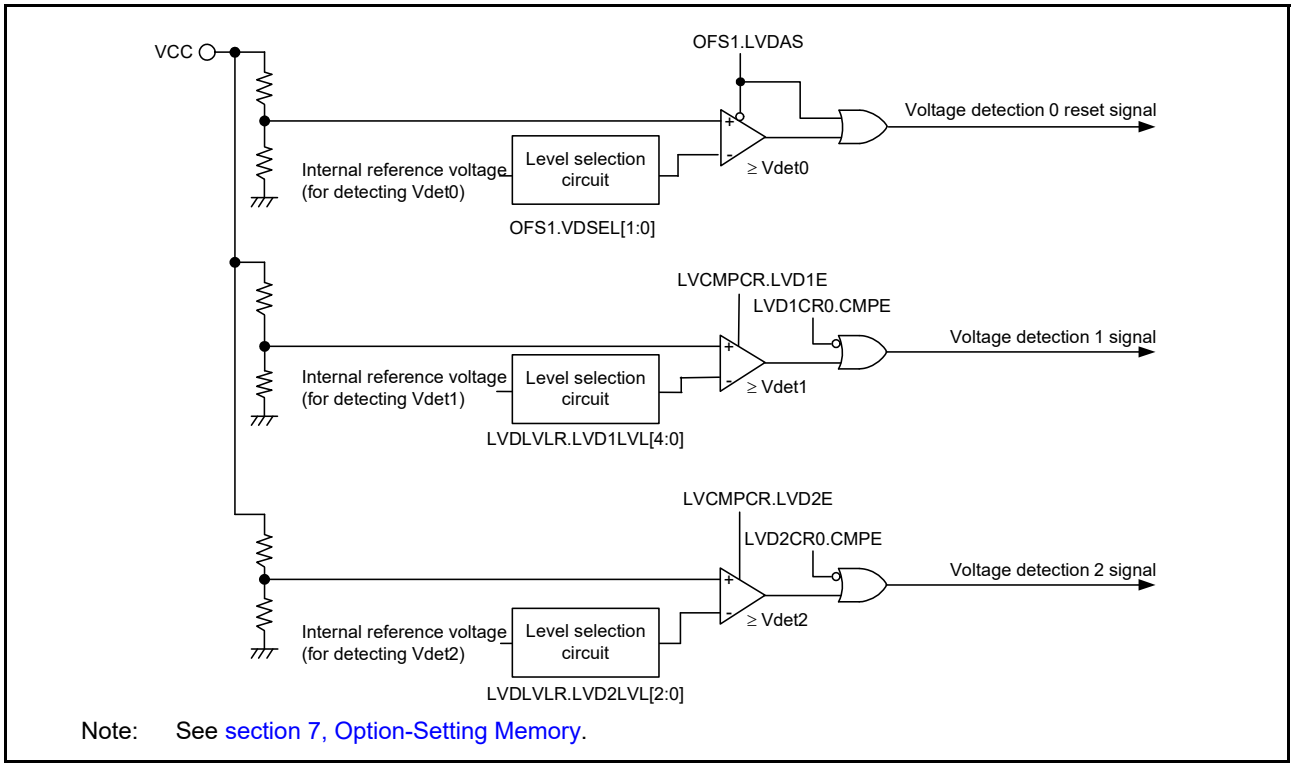
7.4 Usage Note

7.4.1 Data for Programming Reserved Areas and Reserved Bits in the Option-Setting Memory

When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 1 to all bits in reserved areas and all reserved bits.

8. Low Voltage Detection (LVD)

8.1 Overview



The Low Voltage Detection (LVD) module monitors the voltage level input to the VCC pin, and the detection level can be selected using a software program. The LVD module consists of three separate voltage level detectors, 0, 1, and 2, which measure the voltage level input to the VCC pin. LVD voltage detection registers allow your application to configure detection of VCC changes at various voltage thresholds.

Each voltage level detector has a voltage monitor associated with it, for example voltage monitors 0, 1, and 2. Voltage monitor registers are used to configure the LVD to trigger an interrupt, event link output, or reset when the thresholds are crossed.

Table 8.1 lists the LVD specifications. Figure 8.1 shows a block diagram of voltage detectors 0, 1, and 2, Figure 8.2 shows a block diagram of the voltage monitor 1 interrupt and reset circuit, and Figure 8.3 shows a block diagram of the voltage monitor 2 interrupt and reset circuit.

Table 8.1 LVD specifications

Parameter		Voltage monitor 0	Voltage monitor 1	Voltage monitor 2
VCC monitoring	Monitored voltage	Vdet0	Vdet1	Vdet2
	Detected event	Voltage falls past Vdet0	Voltage rises or falls past Vdet1	Voltage rises or falls past Vdet2
	Detection voltage	Selectable from three different levels in the OFS1.VDSEL0[1:0] bits	Selectable from three different levels in the LVDLVLR.LVD1LVL[4:0] bits	Selectable from three different levels in the LVDLVLR.LVD2LVL[2:0] bits
	Monitor flag	None	LVD1SR.MON flag: Monitors whether voltage is higher or lower than Vdet1	LVD2SR.MON flag: Monitors whether voltage is higher or lower than Vdet2
			LVD1SR.DET flag: Vdet1 passage detection	LVD2SR.DET flag: Vdet2 passage detection
Process on voltage detection	Reset	Voltage monitor 0 reset	Voltage monitor 1 reset	Voltage monitor 2 reset
		Reset when Vdet0 > VCC CPU restart after specified time with VCC > Vdet0	Reset when Vdet1 > VCC CPU restart timing selectable: after specified time with VCC > Vdet1 or Vdet1 > VCC	Reset when Vdet2 > VCC CPU restart timing selectable: after specified time with VCC > Vdet2 or Vdet2 > VCC
	Interrupt	No interrupt	Voltage monitor 1 interrupt	Voltage monitor 2 interrupt
			Non-maskable or maskable interrupt selectable	Non-maskable or maskable interrupt selectable
			Interrupt request issued when Vdet1 > VCC or VCC > Vdet1	Interrupt request issued when Vdet2 > VCC or VCC > Vdet2
Digital filter	Enable/ Disable switching	Digital filter function not available	Available	Available
	Sampling time	—	1/n LOCO frequency × 2 (n: 2, 4, 8, 16)	1/n LOCO frequency × 2 (n: 2, 4, 8, 16)
Event linking		None	Available Output of event signals on detection of Vdet1 crossings	Available Output of event signals on detection of Vdet2 crossings

Note: See section 7, Option-Setting Memory.

Figure 8.1 Voltage detection 0, 1, and 2 block diagram

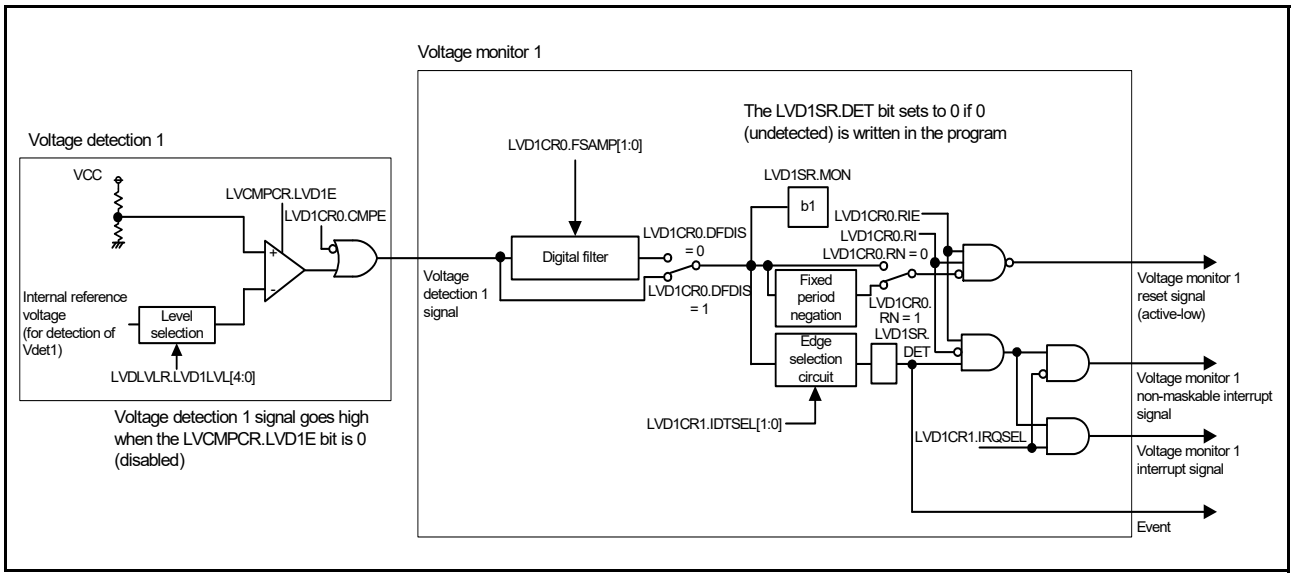


Figure 8.2 Voltage monitor 1 interrupt and reset circuit block diagram

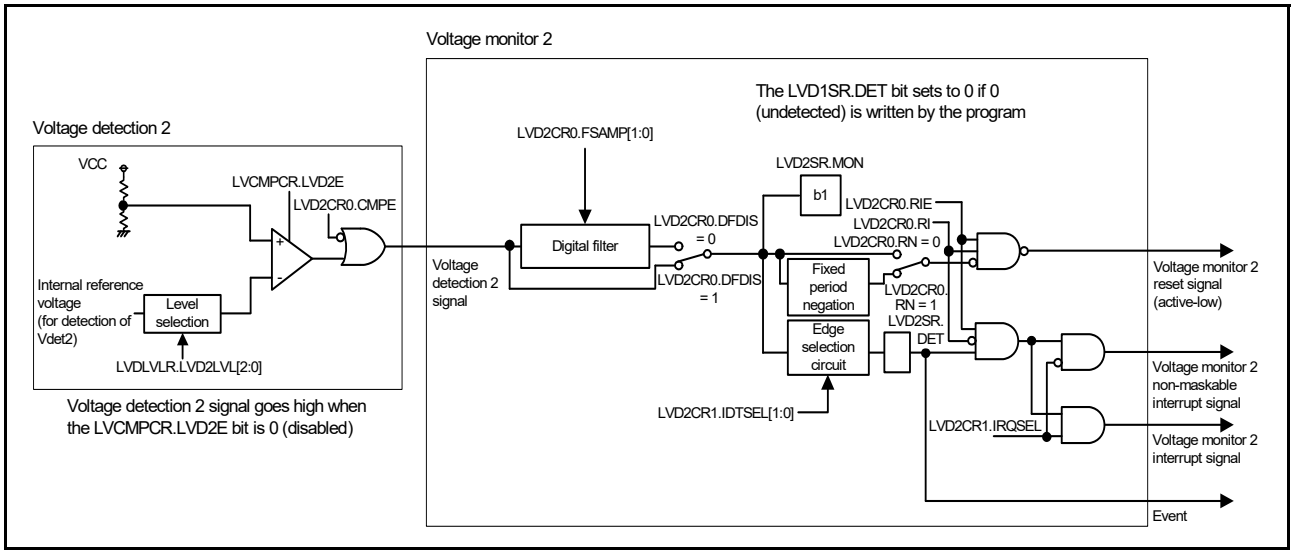

Figure 8.3 Voltage monitor 2 interrupt and reset circuit block diagram

8.2 Register Descriptions

8.2.1 Voltage Monitor 1 Circuit Control Register 1 (LVD1CR1)

Address(es): SYSTEM.LVD1CR1 4001 E0E0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	IRQSEL	IDTSEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit name	Description	R/W
b1, b0	IDTSEL[1:0]	Voltage Monitor 1 Interrupt Generation Condition Select	b1 b0 0 0: When VCC ≥ Vdet1 (rise) is detected 0 1: When VCC < Vdet1 (fall) is detected 1 0: When fall and rise are detected 1 1: Settings prohibited.	R/W
b2	IRQSEL	Voltage Monitor 1 Interrupt Type Select	0: Non-maskable interrupt 1: Maskable interrupt.*1	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. When enabling maskable interrupts, do not change the value of the NMIER.LVD1EN bit in the ICU from the reset state.

8.2.2 Voltage Monitor 1 Circuit Status Register (LVD1SR)

Address(es): SYSTEM.LVD1SR 4001 E0E1h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MON	DET
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Bit name	Description	R/W
b0	DET	Voltage Monitor 1 Voltage Change Detection Flag	0: Not detected 1: Vdet1 passage detected.	R(/W) *1
b1	MON	Voltage Monitor 1 Signal Monitor Flag	0: VCC < Vdet1 1: VCC ≥ Vdet1 or MON is disabled.	R
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock cycles are required for the bit to be read as 0.

DET flag (Voltage Monitor 1 Voltage Change Detection Flag)

The DET flag is enabled when the LVCMPCR.LVD1E bit is 1 (voltage detection 1 circuit enabled) and the LVD1CR0.CMPE bit is 1 (voltage monitor 1 circuit comparison result output enabled).

Set the DET flag to 0 after LVD1CR0.RIE is set to 0 (disabled). LVD1CR0.RIE can be set to 1 (enabled) after 2 or more PCLKB cycles have elapsed. A wait time of 2 or more PCLKB cycles might be required, depending on the number of PCLKB cycles required to read a given I/O register.

MON flag (Voltage Monitor 1 Signal Monitor Flag)

The MON flag is enabled when the LVCMPCR.LVD1E bit is 1 (voltage detection 1 circuit enabled) and the LVD1CR0.CMPE bit is 1 (voltage monitor 1 circuit comparison result output enabled).

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

8.2.3 Voltage Monitor 2 Circuit Control Register 1 (LVD2CR1)

Address(es): SYSTEM.LVD2CR1 4001 E0E2h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	IRQSEL	IDTSEL [1:0]	
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit name	Description	R/W
b1, b0	IDTSEL [1:0]	Voltage Monitor 2 Interrupt Generation Condition Select	b1 b0 0 0: When VCC ≥ Vdet2 (rise) is detected 0 1: When VCC < Vdet2 (fall) is detected 1 0: When fall and rise are detected 1 1: Settings prohibited.	R/W
b2	IRQSEL	Voltage Monitor 2 Interrupt Type Select	0: Non-maskable interrupt 1: Maskable interrupt.*1	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. When enabling maskable interrupts, do not change the value of the NMIER.LVD1EN bit in the ICU from the reset state.

8.2.4 Voltage Monitor 2 Circuit Status Register (LVD2SR)

Address(es): SYSTEM.LVD2SR 4001 E0E3h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MON	DET
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Bit name	Description	R/W
b0	DET	Voltage Monitor 2 Voltage Change Detection Flag	0: Not detected 1: Vdet2 passage detection.	R(/W) *1
b1	MON	Voltage Monitor 2 Signal Monitor Flag	0: VCC < Vdet2 1: VCC ≥ Vdet2 or MON is disabled.	R
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock cycles are required for the bit to be read as 0.

DET flag (Voltage Monitor 2 Voltage Change Detection Flag)

The DET flag is enabled when the LVCMPCR.LVD2E bit is 1 (voltage detection 2 circuit enabled) and the LVD2CR0.CMPE bit is 1 (voltage monitor 2 circuit comparison result output enabled).

The DET flag must be set to 0 after LVD2CR0.RIE is set to 0 (disabled). LVD2CR0.RIE can be set to 1 (enabled) after 2 or more PCLKB cycles have elapsed.

A wait time of 2 or more PCLKB cycles might be required, depending on the number of PCLKB cycles required to read a given I/O register.

MON flag (Voltage Monitor 2 Signal Monitor Flag)

The MON flag is enabled when the LVCMPCR.LVD2E bit is 1 (voltage detection 2 circuit enabled) and the LVD2CR0.CMPE bit is 1 (voltage monitor 2 circuit comparison result output enabled).

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

8.2.5 Voltage Monitor Circuit Control Register (LVCMPCR)

Address(es): SYSTEM.LVCMPCR 4001 E417h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	LVD2E	LVD1E	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b4 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5	LVD1E	Voltage Detection 1 Enable	0: Voltage detection 1 circuit disabled 1: Voltage detection 1 circuit enabled.	R/W
b6	LVD2E	Voltage Detection 2 Enable	0: Voltage detection 2 circuit disabled 1: Voltage detection 2 circuit enabled.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

LVD1E bit (Voltage Detection 1 Enable)

When using voltage detection 1 interrupt/reset or the LVD1SR.MON bit, set the LVD1E bit to 1. The voltage detection 1 circuit starts when td(E-A) elapses after the LVD1E bit value is changed from 0 to 1. When using the voltage detection 1 circuit in Deep Software Standby mode, do not set the DPSBYCR.DEEPCUT[1:0] bits to 11b.

LVD2E bit (Voltage Detection 2 Enable)

When using voltage detection 2 interrupt/reset or the LVD2SR.MON bit, set the LVD2E bit to 1. The voltage detection 2 circuit starts when td(E-A) elapses after the LVD2E bit value is changed from 0 to 1. When using the voltage detection 2 circuit in Deep Software Standby mode, do not set the DPSBYCR.DEEPCUT[1:0] bits to 11b.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

8.2.6 Voltage Detection Level Select Register (LVDLVLR)

Address(es): SYSTEM.LVDLVLR 4001 E418h

	b7	b6	b5	b4	b3	b2	b1	b0
	LVD2LVL[2:0]			LVD1LVL[4:0]				
Value after reset	1	1	1	1	0	0	1	1

Bit	Symbol	Bit name	Description	R/W
b4 to b0	LVD1LVL[4:0]	Voltage Detection 1 Level Select (Standard voltage during fall in voltage)	b4 b0 1 0 0 0 1: 2.99 V (Vdet1_1) 1 0 0 1 0: 2.92 V (Vdet1_2) 1 0 0 1 1: 2.85 V (Vdet1_3). Other settings are prohibited.	R/W
b7 to b5	LVD2LVL[2:0]	Voltage Detection 2 Level Select (Standard voltage during fall in voltage)	b7 b5 1 0 1: 2.99 V (Vdet2_1) 1 1 0: 2.92 V (Vdet2_2) 1 1 1: 2.85 V (Vdet2_3). Other settings are prohibited.	R/W

The contents of the LVDLVLR register can only be changed if the LVCMPCR.LVD1E and LVCMPCR.LVD2E bits (voltage detection n circuit disable, n = 1, 2) are both 0. Do not set LVD detectors 1 and 2 to the same voltage detection level.

Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

8.2.7 Voltage Monitor 1 Circuit Control Register 0 (LVD1CR0)

Address(es): SYSTEM.LVD1CR0 4001 E41Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	RN	RI	FSAMP[1:0]		—	CMPE	DFDIS	RIE
Value after reset:	1	0	0	0	x	0	1	0

Bit	Symbol	Bit name	Description	R/W
b0	RIE	Voltage Monitor 1 Interrupt/Reset Enable	0: Disable 1: Enable.	R/W
b1	DFDIS	Voltage Monitor 1 Digital Filter Disable Mode Select	0: Enable digital filter 1: Disable digital filter.	R/W
b2	CMPE	Voltage Monitor 1 Circuit Comparison Result Output Enable	0: Disable voltage monitor 1 circuit comparison result output 1: Enable voltage monitor 1 circuit comparison result output.	R/W
b3	—	Reserved	The read value is undefined. The write value should be 1.	R/W
b5, b4	FSAMP[1:0]	Sampling Clock Select	b5 b4 0 0: 1/2 LOCO frequency 0 1: 1/4 LOCO frequency 1 0: 1/8 LOCO frequency 1 1: 1/16 LOCO frequency.	R/W
b6	RI	Voltage Monitor 1 Circuit Mode Select	0: Generate voltage monitor 1 interrupt on Vdet1 passage 1: Enable voltage monitor 1 reset when the voltage falls to and below Vdet1.	R/W
b7	RN	Voltage Monitor 1 Reset Negate Select	0: Negate after a stabilization time (tLVD1) when VCC > Vdet1 is detected 1: Negate after a stabilization time (tLVD1) on assertion of the LVD1 reset.	R/W

RIE bit (Voltage Monitor 1 Interrupt/Reset Enable)

The RIE bit enables or disables voltage monitor 1 interrupt/reset. Set this bit to ensure that neither a voltage monitor 1 interrupt nor a voltage monitor 1 reset is generated during programming or erasure of the flash memory.

DFDIS bit (Voltage Monitor 1 Digital Filter Disable Mode Select)

The DFDIS bit enables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (LOCO operating) if this bit is 0 (enabled). Set the bit to 1 (disabled) when using the voltage monitor 1 circuit in Software Standby or Deep Software Standby mode.

FSAMP[1:0] bits (Sampling Clock Select)

Only change the FSAMP[1:0] bits when the LVD1CR0.DFDIS bit is 1 (digital filter circuit disabled), but not when LVD1CR0.DFDIS is 0 (digital filter circuit enabled).

RI bit (Voltage Monitor 1 Circuit Mode Select)

When the RI bit is 1 (voltage monitor 1 reset selected) or when the LVD2CR0.RI bit is 1 (voltage monitor 2 reset selected), transition to Deep Software Standby mode cannot be made, and operation transitions to Software Standby mode instead. To enter Deep Software Standby mode, set the RI bit to 0 (voltage monitor 1 interrupt selected) and the LVD2CR0.RI bit to 0 (voltage monitor 2 interrupt selected).

RN bit (Voltage Monitor 1 Reset Negate Select)

If the RN bit is to be set to 1 (negation follows a stabilization time on assertion of the LVD1 reset signal), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). Additionally, for a transition to Software Standby or Deep Software Standby, the only possible value for the RN bit is 0 (negation follows a stabilization time when VCC > Vdet1 is detected). Do not set the RN bit to 1 when this is the case.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

8.2.8 Voltage Monitor 2 Circuit Control Register 0 (LVD2CR0)

Address(es): SYSTEM.LVD2CR0 4001 E41Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	RN	RI	FSAMP[1:0]		—	CMPE	DFDIS	RIE
Value after reset:	1	0	0	0	x	0	1	0

Bit	Symbol	Bit name	Description	R/W
b0	RIE	Voltage Monitor 2 Interrupt/Reset Enable	0: Disable 1: Enable.	R/W
b1	DFDIS	Voltage Monitor 2 Digital Filter Disable Mode Select	0: Enable digital filter 1: Disable digital filter.	R/W
b2	CMPE	Voltage Monitor 2 Circuit Comparison Result Output Enable	0: Disable voltage monitor 2 circuit comparison result output 1: Enable voltage monitor 2 circuit comparison result output.	R/W
b3	—	Reserved	The read value is undefined. The write value should be 1.	R/W
b5, b4	FSAMP[1:0]	Sampling Clock Select	b5 b4 0 0: 1/2 LOCO frequency 0 1: 1/4 LOCO frequency 1 0: 1/8 LOCO frequency 1 1: 1/16 LOCO frequency.	R/W
b6	RI	Voltage Monitor 2 Circuit Mode Select	0: Generate voltage monitor 2 interrupt on Vdet2 passage 1: Enable voltage monitor 2 reset when the voltage falls to and below Vdet2.	R/W
b7	RN	Voltage Monitor 2 Reset Negate Select	0: Negate after a stabilization time (tLVD2) when VCC > Vdet2 is detected 1: Negate after a stabilization time (tLVD2) on assertion of the LVD2 reset.	R/W

RIE bit (Voltage Monitor 2 Interrupt/Reset Enable)

The RIE bit enables or disables voltage monitor 2 resets and voltage monitor 2 interrupts. Ensure that neither a voltage monitor 2 reset nor a voltage monitor 2 interrupt is generated during programming or erasure of the flash memory.

DFDIS bit (Voltage Monitor 2 Digital Filter Disable Mode Select)

The DFDIS bit enables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (LOCO operating) if this bit is 0 (enabled). Set the bit to 1 (disabled) when using the voltage monitor 2 circuit in Software Standby or Deep Software Standby mode.

FSAMP[1:0] bits (Sampling Clock Select)

Only change the FSAMP[1:0] bits when the LVD2CR0.DFDIS bit is 1 (digital filter circuit disabled), but not when LVD2CR0.DFDIS is 0 (digital filter circuit enabled).

RI bit (Voltage Monitor 2 Circuit Mode Select)

When the RI bit is 1 (voltage monitor 2 reset selected) or when the LVD1CR0.RI bit is 1 (voltage monitor 1 reset selected), transition to Deep Software Standby mode cannot be made, and operation transitions to Software Standby mode instead. To enter Deep Software Standby mode, set the RI bit to 0 (voltage monitor 2 interrupt selected) and the LVD1CR0.RI bit to 0 (voltage monitor 1 interrupt selected).

RN bit (Voltage Monitor 2 Reset Negate Select)

If the RN bit is to be set to 1 (negation follows a stabilization time on assertion of the LVD2 reset signal), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). Additionally, for a transition to Software Standby or Deep Software Standby, the only possible value for the RN bit is 0 (negation follows a stabilization time when VCC > Vdet2 is detected). Do not set the RN bit to 1 when this is the case.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

8.3 VCC Input Voltage Monitor

8.3.1 Monitoring Vdet0

The comparison results from voltage monitor 0 are not available for reading.

8.3.2 Monitoring Vdet1

Table 8.2 shows the procedure to set up monitoring against Vdet1. After the settings are complete, the comparison results from voltage monitor 1 can be monitored with the LVD1SR.MON flag.

Table 8.2 Procedure to set up monitoring against Vdet1

Step		Monitoring the comparison results from voltage monitor 1
Setting up the voltage detection 1 circuit	1	Set LVCMPCR.LVD1E = 0 to disable voltage detection 1 before writing to LVDLVLR register.
	2	Select the detection voltage in the LVDLVLR.LVD1LVL[4:0] bits.
	3	Set LVCMPCR.LVD1E = 1 to enable voltage detection 1.
	4	Wait for at least td(E-A) for the LVD operation stabilization time after LVD is enabled.*1
Setting up the digital filter*2	5	Select the sampling clock for the digital filter in the LVD1CR0.FSAMP[1:0] bits.
	6	Set LVD1CR0.DFDIS = 0 to enable the digital filter.
	7	Wait for at least 2n + 3 cycles of the LOCO, where n = 2, 4, 8, 16 and the sampling clock for the digital filter is the LOCO frequency-divided by n.
Enabling output	8	Set LVD1CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 1.

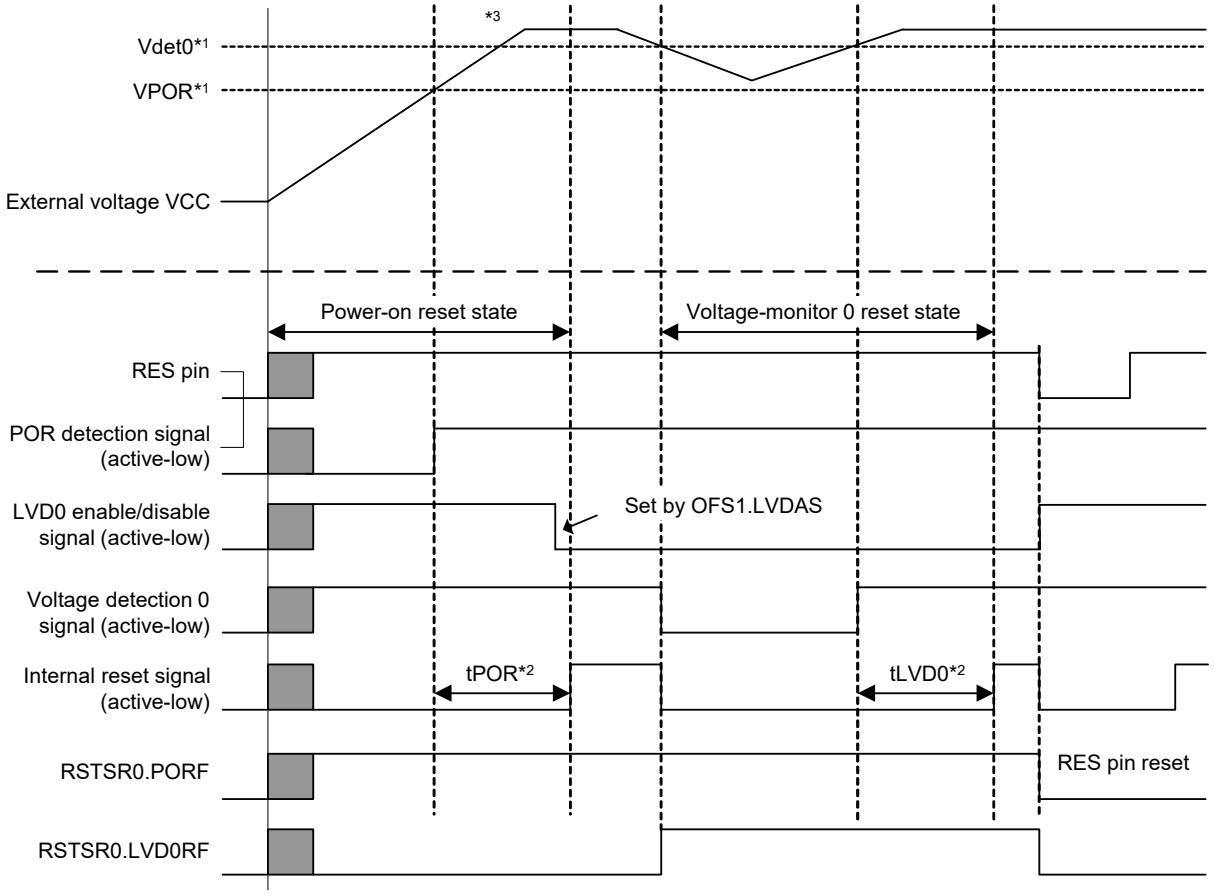
Note 1. Steps 5 to 7 can be performed during the wait time in step 4. For details on td(E-A), see section 60, Electrical Characteristics.

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

8.3.3 Monitoring Vdet2

Table 8.3 shows the procedure to set up monitoring against Vdet2. After the settings are complete, the comparison results from voltage monitor 2 can be monitored with the LVD2SR.MON flag.

Table 8.3 Procedure to set up monitoring against Vdet2



Step		Monitoring the comparison results from voltage monitor 2
Setting up the voltage detection 2 circuit	1	Set LVCMPCR.LVD2E = 0 to disable voltage detection 2 before writing to the LVDLVLR register.
	2	Select the detection voltage in the LVDLVLR.LVD2LVL[2:0] bits.
	3	Set LVCMPCR.LVD2E = 1 to enable the voltage detection 2 circuit.
	4	Wait for at least td(E-A) for the LVD operation stabilization time after LVD is enabled.*1
Setting up the digital filter*2	5	Select the sampling clock for the digital filter in the LVD2CR0.FSAMP[1:0] bits.
	6	Set LVD2CR0.DFDIS = 0 to enable the digital filter.
	7	Wait for at least 2n + 3 cycles of the LOCO, where n = 2, 4, 8, 16 and the sampling clock for the digital filter is the LOCO frequency-divided by n.
Enabling output	8	Set LVD2CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 2.

Note 1. Steps 5 to 7 can be performed during the wait time in step 4. For details on td(E-A), see section 60, Electrical Characteristics.

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

8.4 Reset from Voltage Monitor 0

When using the reset from voltage monitor 0, clear the OFS1.LVDAS bit to 0 to enable the voltage monitor 0 reset after a reset. However, at boot mode, the reset from voltage monitor 0 is disabled regardless of the value of OFS1.LVDAS bit. Figure 8.4 shows an example of operations for a voltage monitor 0 reset.

Note: For details on the electrical characteristics, see section 60, Electrical Characteristics.
Note 1. VPOR indicates the detection level for a power-on reset and Vdet0 indicates the detection level for a voltage monitor 0 reset.
Note 2. tPOR indicates the period of a power-on reset and tLVD0 indicates the period of a voltage monitor 0 reset.
Note 3. At power-on, raise VCC to the minimum guaranteed voltage before releasing the POR reset.

Figure 8.4 Example of voltage monitor 0 reset operation

8.5 Interrupt and Reset from Voltage Monitor 1

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 1 circuit.

Table 8.4 shows the procedure for setting bits related to the voltage monitor 1 interrupt and reset so that voltage monitoring operates. Table 8.5 shows the procedure for setting bits related to the voltage monitor 1 interrupt and reset so that voltage monitoring stops. Figure 8.5 shows an example of operations for a voltage monitor 1 interrupt. For the operation of the voltage monitor 1 reset, see Figure 6.2 in section 6, Resets.

When using the voltage monitor 1 circuit in Software Standby or Deep Software Standby, set up the circuit with the following procedures.

(1) Settings in Software Standby mode

- Disable the digital filter (LVD1CR0.DFDIS = 1)
- When VCC > Vdet1 is detected, negate the voltage monitor 1 reset signal (LVD1CR0.RN = 0) following a stabilization time.

(2) Settings in Deep Software Standby mode

- Disable the digital filter (LVD1CR0.DFDIS = 1)
- Enable voltage monitor 1 interrupts (LVD1CR0.RI = 0). If the voltage monitor 1 reset is enabled (LVD1CR0.RI = 1), a transition to Deep Software Standby mode is not possible, and the operation transitions to Software Standby mode instead.
- When the DPSBYCR.DEEPCUT[1:0] bits are 11b, the voltage monitor 1 circuit stops. To use the voltage monitor 1 circuit in Deep Software Standby mode, set the DPSBYCR.DEEPCUT[1:0] bits to a value other than 11b.

Table 8.4 Procedure for setting bits related to the voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring operates

Step		Voltage monitor 1 interrupt (voltage monitor 1 ELC event output)	Voltage monitor 1 reset
Setting up the voltage detection 1 circuit	1	Set LVCMPCR.LVD1E = 0 to disable voltage detection 1 before writing to the LVDLVLR register.	
	2	Select the detection voltage in the LVDLVLR.LVD1LVL[3:0] bits.	
	3	Set LVCMPCR.LVD1E = 1 to enable the voltage detection 1 circuit.	
	4	Wait for at least td(E-A) for the LVD operation stabilization time after LVD is enabled.*1	
Setting up the digital filter *2	5	Select the sampling clock for the digital filter in the LVD1CR0.FSAMP[1:0] bits.	
	6	Set LVD1CR0.DFDIS = 0 to enable the digital filter.	
	7	Wait for at least 2n + 3 LOCO clock cycles, where n = 2, 4, 8, 16 and the sampling clock for the digital filter is the LOCO frequency-divided by n.*4	
Setting up the voltage monitor 1 interrupt or reset	8	Set LVD1CR0.RI = 0 to select the voltage monitor 1 interrupt.	• Set LVD1CR0.RI = 1 to select the voltage monitor 1 reset • Select the type of reset negation in the LVD1CR0.RN bit.
	9	• Select the interrupt request timing in the LVD1CR1.IDTSEL[1:0] bits • Select the interrupt type in the LVD1CR1.IRQSEL bit.	—
Enabling output	10	Set LVD1SR.DET = 0.	
	11	Set LVD1CR0.RIE = 1 to enable the voltage monitor 1 interrupt or reset.*3	
	12	Set LVD1CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 1.	

Note 1. Steps 5 to 11 can be performed during the wait time in step 4. For details on td(E-A), see section 60, Electrical Characteristics.
Note 2. Steps 5 to 7 are not required if the digital filter is not in use.
Note 3. Step 11 is not required if only the ELC event signal is to be output.
Note 4. Steps 8 to 11 can be performed during the wait time in step 7.

Table 8.5 Procedure for setting bits related to the voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring stops

Step		Voltage monitor 1 interrupt (voltage monitor 1 ELC event output), voltage monitor 1 reset
Settings to stop enabling output	1	Set LVD1CR0.CMPE = 0 to disable output of the comparison results from voltage monitor 1.
	2	Wait for at least 2n + 3 LOCO clock cycles, where n = 2, 4, 8, 16 and the sampling clock for the digital filter is the LOCO frequency-divided by n.*1
	3	Set LVD1CR0.RIE = 0 to disable the voltage monitor 1 interrupt or reset.*2
Stopping the digital filter	4	Set LVD1CR0.DFDIS = 1 to disable the digital filter.*1, *3
Stopping the voltage detection 1 circuit	5	Set LVCMPCR.LVD1E = 0 to disable the voltage detection 1 circuit.

Note 1. Steps 2 and 4 are not required if the digital filter is not in use.
Note 2. Step 3 is not required if only the ELC event signal is to be output.
Note 3. To disable the digital filter from its enabled state and then re-enable it, disable it and wait at least 2 LOCO cycles before re-enabling it.

If the voltage monitor 1 interrupt or reset setting is to be made again after it is used and stopped once, omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting or stopping the voltage detection 1 circuit is not required if the settings for the circuit do not change
- Setting or stopping the digital filter is not required if the settings for the digital filter do not change
- Setting the voltage monitor 1 interrupt or reset is not required if the settings for the voltage monitor 1 interrupt or reset do not change.

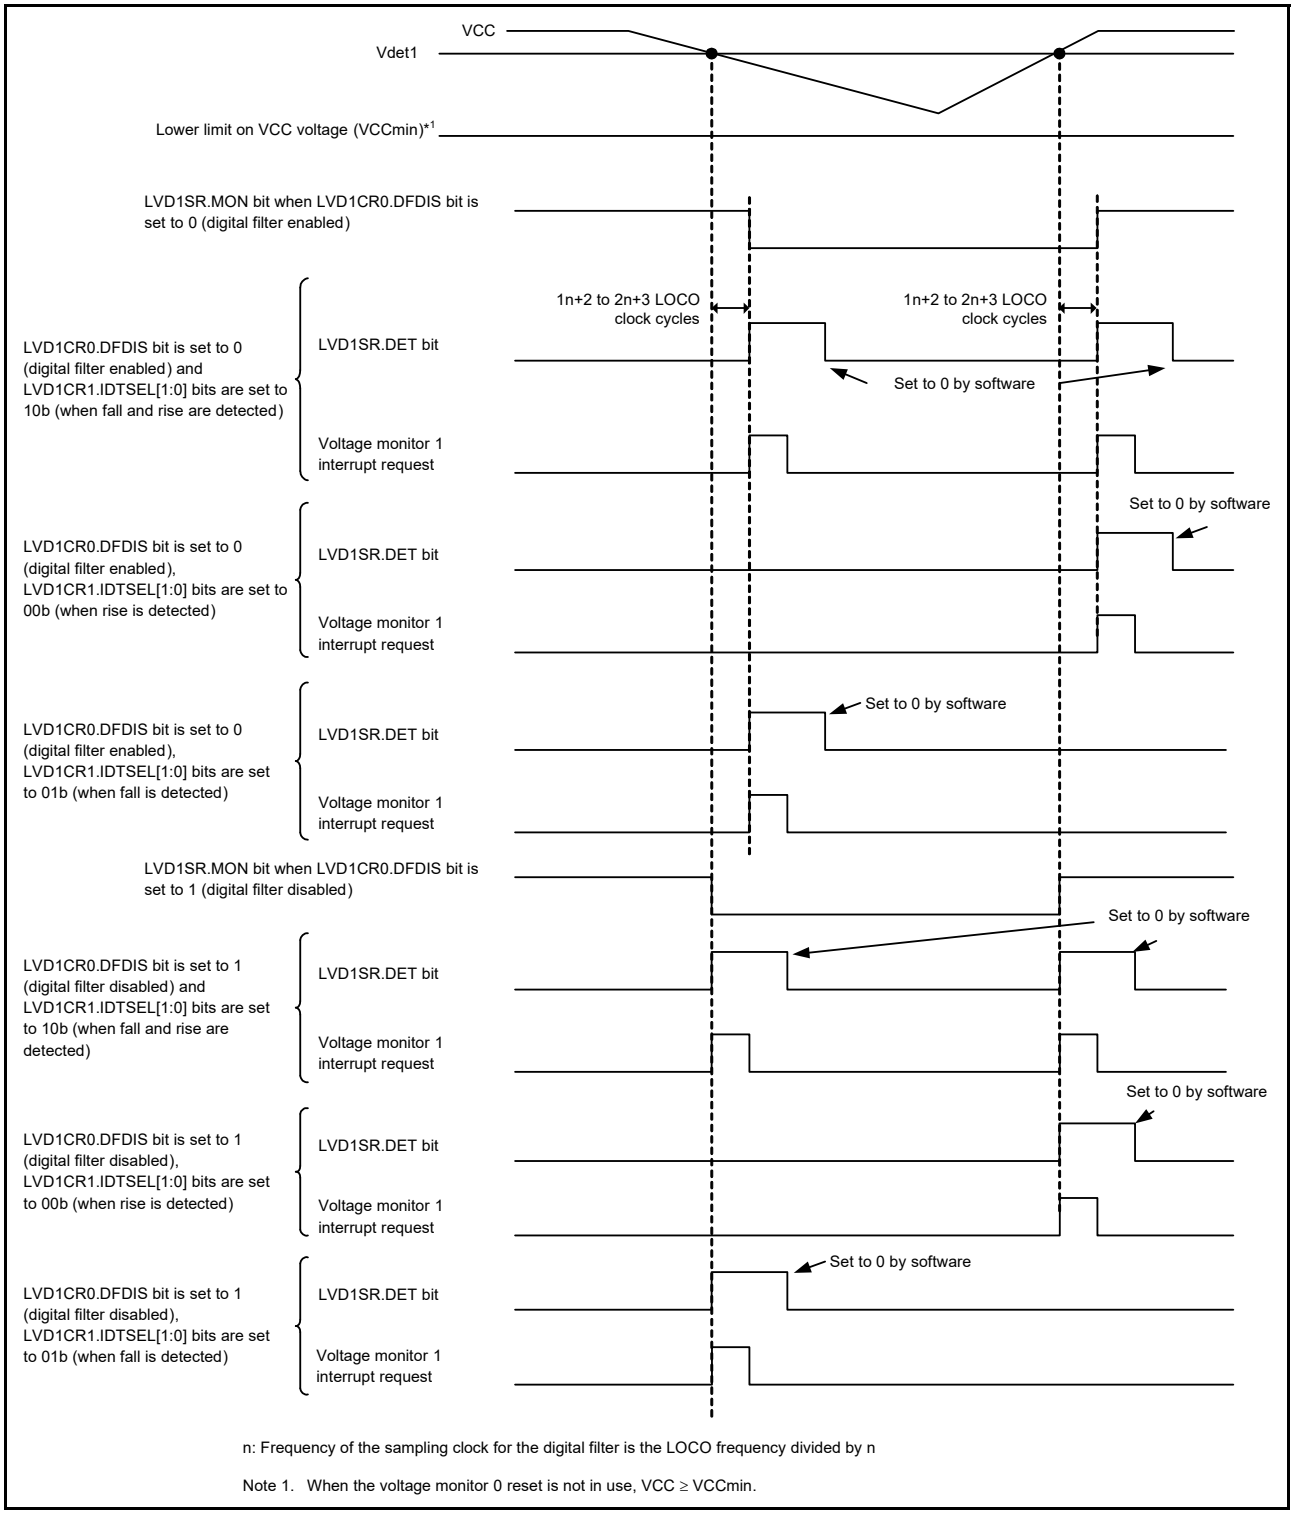


Figure 8.5 Voltage monitor 1 interrupt operation example

8.6 Interrupt and Reset from Voltage Monitor 2

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 2 circuit.

Table 8.6 shows the procedure for setting bits related to the voltage monitor 2 interrupt and reset so that voltage monitoring operates. Table 8.7 shows the procedure for setting bits related to the voltage monitor 2 interrupt and reset so that voltage monitoring stops. Figure 8.6 shows an example of operations for a voltage monitor 2 interrupt. For the operation of the voltage monitor 2 reset, see Figure 6.2 in section 6, Resets.

When using the voltage monitor 2 circuit in Software Standby or Deep Software Standby, set up the circuit with the following procedures.

(1) Settings in Software Standby mode

- Disable the digital filter (LVD2CR0.DFDIS = 1)
- When VCC > Vdet2 is detected, negate the voltage monitor 2 reset signal (LVD2CR0.RN = 0) following a stabilization time.

(2) Settings in Deep Software Standby mode

- Disable the digital filter (LVD2CR0.DFDIS = 1)
- Enable voltage monitor 2 interrupts (LVD2CR0.RI = 0). If the voltage monitor 2 reset is enabled (LVD2CR0.RI = 1), a transition to Deep Software Standby mode is not possible, and the operation transitions to Software Standby mode instead.
- When the DPSBYCR.DEEPCUT[1:0] bits are 11b, the voltage monitor 2 circuit stops. To use the voltage monitor 2 circuit in Deep Software Standby mode, set the DPSBYCR.DEEPCUT[1:0] bits to a value other than 11b.

Table 8.6 Procedures for setting bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring occurs

Step		Voltage monitor 2 interrupt (voltage monitor 2 ELC event output)	Voltage monitor 2 reset
Setting up the voltage detection 2 circuit	1	Set LVCMPCR.LVD2E = 0 to disable voltage detection 2 before writing to the LVDLVLR register.	
	2	Select the detection voltage in the LVDLVLR.LVD2LVL[2:0] bits.	
	3	Set LVCMPCR.LVD2E = 1 to enable the voltage detection 2 circuit.	
	4	Wait for at least td(E-A) for the LVD operation stabilization time after LVD is enabled.*1	
Setting up the digital filter *2	5	Select the sampling clock for the digital filter in the LVD2CR0.FSAMP[1:0] bits.	
	6	Set LVD2CR0.DFDIS = 0 to enable the digital filter.	
	7	Wait for at least 2n + 3 LOCO clock cycles, where n = 2, 4, 8, 16, and the sampling clock for the digital filter is the LOCO frequency-divided by n.*4	
Setting up the voltage monitor 2 interrupt or reset	8	Set LVD2CR0.RI = 0 to select the voltage monitor 2 interrupt.	• Set LVD2CR0.RI = 1 to select the voltage monitor 2 reset • Select the type of reset negation in the LVD2CR0.RN bit.
	9	• Select the interrupt request timing in the LVD2CR1.IDTSEL[1:0] bits • Select the interrupt type in the LVD2CR1.IRQSEL bit.	—
Enabling output	10	Set LVD2SR.DET = 0.	
	11	Set LVD2CR0.RIE = 1 to enable the voltage monitor 2 interrupt or reset.*3	
	12	Set LVD2CR0.CMPE = 1 to enable output of the comparison results from the voltage monitor 2.	

Note 1. Steps 5 to 11 can be performed during the wait time in step 4. For details on td(E-A), see section 60, Electrical Characteristics.
Note 2. Steps 5 to 7 are not required if the digital filter is not in use.
Note 3. Step 11 is not required if only the ELC event signal is to be output.
Note 4. Steps 8 to 11 can be performed during the wait time in step 7.

Table 8.7 Procedure for setting bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring stops

Step		Voltage monitor 2 interrupt (voltage monitor 2 ELC event output), voltage monitor 2 reset
Settings to stop enabling output	1	Set LVD2CR0.CMPE = 0 to disable output of the results of comparison by voltage monitor 2.
	2	Wait for at least 2n + 3 LOCO clock cycles, where n = 2, 4, 8, 16, and the sampling clock for the digital filter is the LOCO frequency-divided by n.*1
	3	Set LVD2CR0.RIE = 0 to disable the voltage monitor 2 interrupt or reset.*2
Stopping the digital filter	4	Set LVD2CR0.DFDIS = 1 to disable the digital filter.*1, *3
Stopping the voltage detection 1 circuit	5	Set LVCMPCR.LVD2E = 0 to disable the voltage detection 2 circuit.

Note 1. Steps 2 and 4 are not required if the digital filter is not in use.
Note 2. Step 3 is not required if only the ELC event signal is to be output.
Note 3. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least two cycles of the LOCO before re-enabling it.

If the voltage monitor 2 interrupt or reset setting is to be made again after it is used and stopped once, omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting or stopping the voltage detection 2 circuit is not required if the settings for the circuit do not change
- Setting or stopping the digital filter is not required if the settings for the digital filter do not change
- Setting the voltage monitor 2 interrupt or reset is not required if the settings for the voltage monitor 2 interrupt or voltage monitor 2 reset do not change.

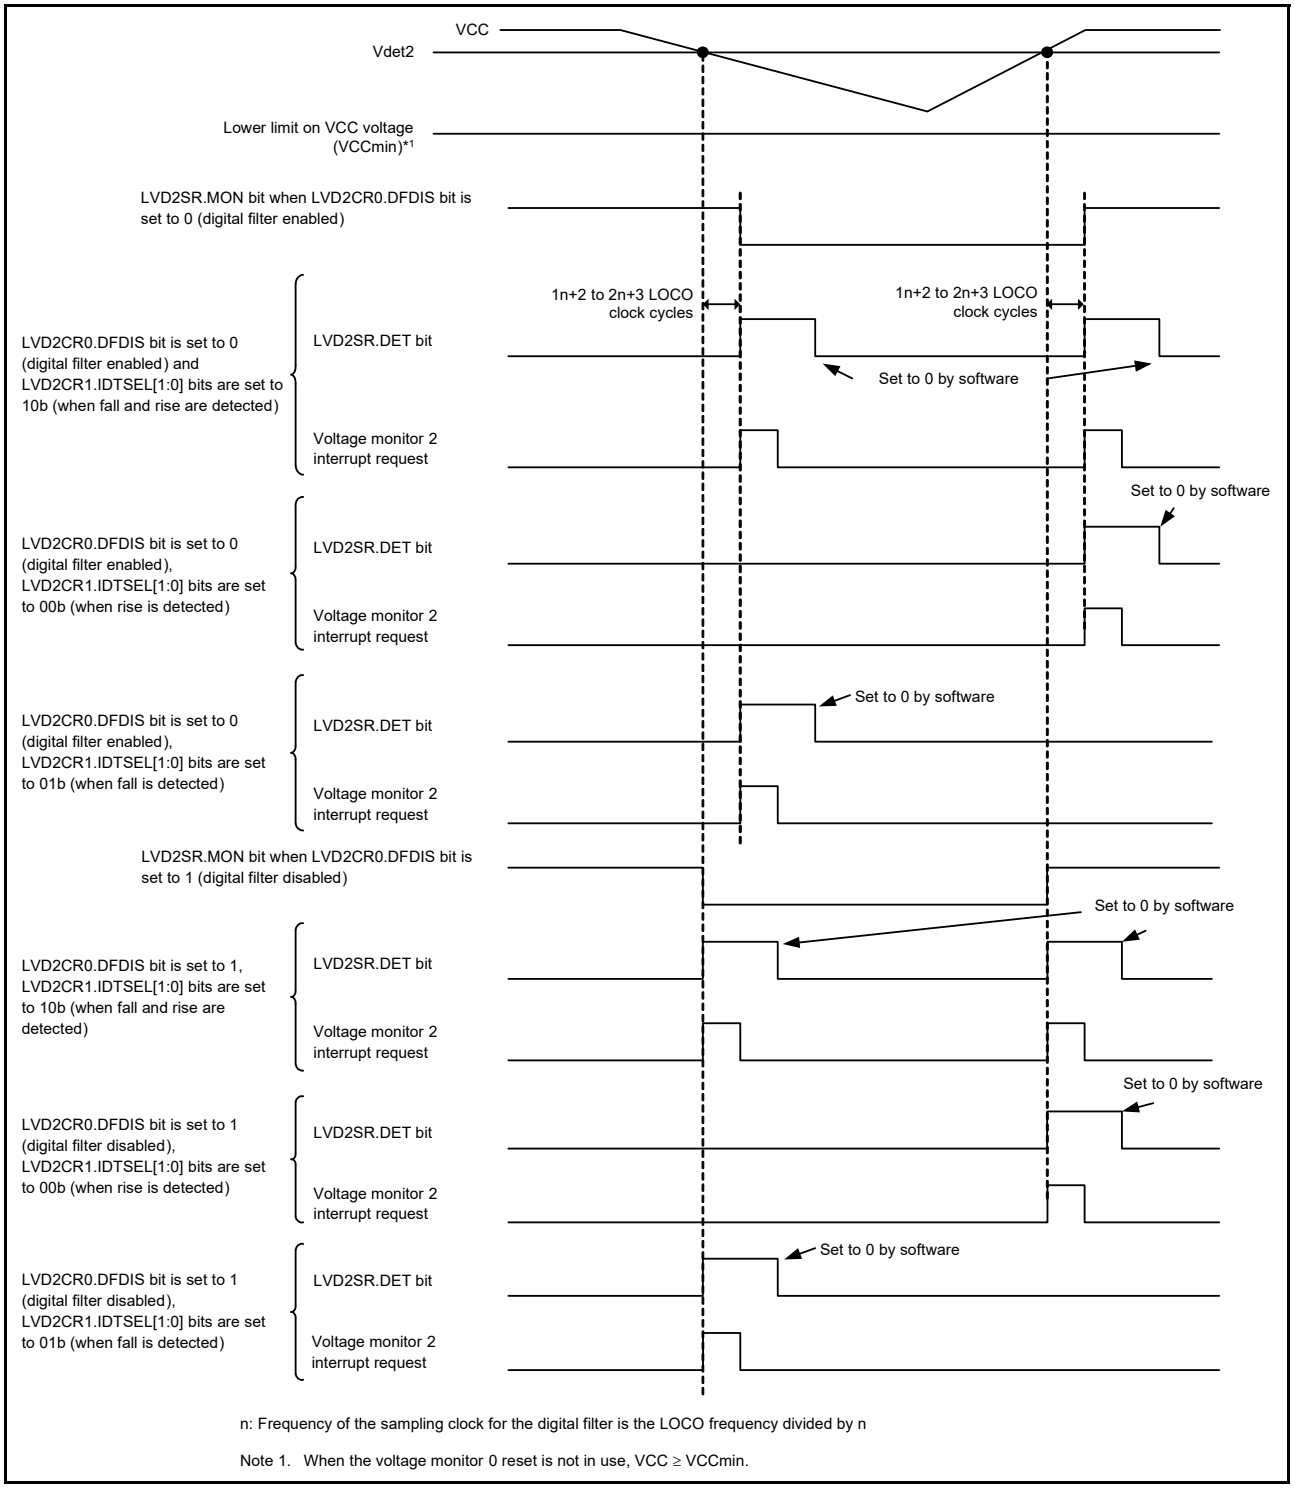

Figure 8.6 Example of voltage monitor 2 interrupt operation

8.7 Event Link Output

The LVD can output the event signals to the Event Link Controller (ELC).

(1) Vdet1 Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the Vdet1 voltage while both the voltage detection 1 circuit and the voltage monitor 1 circuit comparison result output are enabled.

(2) Vdet2 Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the Vdet2 voltage while both the voltage detection 2 circuit and the voltage monitor 2 circuit comparison result output are enabled.

When enabling the event link output function of the LVD, you must enable the LVD before enabling the LVD event link function of the ELC. To stop the event link output function of the LVD, you must stop the LVD before disabling the LVD event link function of the ELC.

8.7.1 Interrupt Handling and Event Linking

The LVD provides bits to separately enable or disable the voltage monitor 1 and 2 interrupts. When an interrupt source is generated and the interrupt is enabled by the interrupt enable bit, the interrupt signal (LVD1CR0.RIE or LVD2CR0.RIE) is output to the CPU.

On the other hand, as soon as an interrupt source is generated, the event link signal is output as the event signal to the other module through the ELC regardless of the state of the interrupt enable bit.

It is possible to output voltage monitor 1 and 2 interrupts in Software Standby and Deep Software Standby modes. The event signals for the ELC in Software Standby and Deep Software Standby modes are output as follows:

- When a Vdet1 or Vdet2 passage event is detected in Software Standby mode, event signals are not generated for the ELC because the clock is not supplied in Software Standby mode. Because the Vdet1 and Vdet2 passage detection flags are saved, when the clock supply resumes after returning from Software Standby mode, the event signals for the ELC are output based on the state of the Vdet1 and Vdet2 detection flags.
- When a Vdet1 or Vdet2 passage event is detected in Deep Software Standby mode, event signals are not generated for the ELC.

9. Clock Generation Circuit

9.1 Overview

Table 9.1 and Table 9.2 list the clock generation circuit specifications, Figure 9.1 shows the block diagram, and Table 9.3 lists the I/O pins.

Table 9.1 Specifications of the clock generation circuit for the clock sources

Clock source	Parameter	Specifications
Main clock oscillator (MOSC)	Resonator frequency	8 to 24 MHz USB boot mode: 8, 10, 12, 15, 16, 20, 24 MHz
	External clock input frequency	Up to 24 MHz
	External resonator or additional circuit: ceramic resonator, crystal	Available
	Connection pins EXTAL, XTAL	
	Drive capability switching	
	Oscillation stop detection function	
Sub-clock oscillator (SOSC)	Resonator frequency	32.768 kHz
	External resonator or additional circuit: crystal resonator	Available
	Connection pins: XCIN, XCOUT	
	Drive capability switching	
PLL circuit	Input clock source	Main, HOCO
	Input pulse frequency division ratio	Selectable from 1, 2, and 3
	Input frequency	8 to 24 MHz
	Frequency multiplication ratio	Selectable from 10 to 30 (0.5 steps) *1,*2
	PLL output frequency	120 to 240 MHz
High-speed on-chip oscillator (HOCO)	Oscillation frequency	16, 18, 20 MHz
	User trimming	Available
Middle-speed on-chip oscillator (MOCO)	Oscillation frequency	8 MHz
	User trimming	Available
Low-speed on-chip oscillator (LOCO)	Oscillation frequency	32.768 kHz
	User trimming	Available
IWDT-dedicated on-chip oscillator (IWDTLOCO)	Oscillation frequency	15 kHz
External clock input for JTAG (TCK)	Input clock frequency	Up to 25 MHz
External clock input for SWD (SWCLK)	Input clock frequency	Up to 25 MHz

Note 1. Selectable from 10 to 20 when oscillation stop detection function is enabled and input frequency less than 12 MHz is used.

Note 2. Except for the condition in note 1, oscillation stop detection function is available by CAC.

Table 9.2 Specifications of the Clock Generation Circuit for the internal clocks (1 of 2)

Parameter	Clock sources	Clock supply	Specifications
System clock (ICLK)	MOSC, SOSC, HOCO, MOCO, LOCO, PLL	CPU, DTC, DMAC, ROM, RAM	Up to 240 MHz Division ratios: 1, 2, 4, 8, 16, 32, 64
Peripheral module clock A (PCLKA)	MOSC, SOSC, HOCO, MOCO, LOCO, PLL	Peripheral modules (ETHERC, EDMAC, USBHS, QSPI, SPI, SCI, SCE7, Graphics LCD, SDHI, CRC, JPEG engine, DRW, IrDA, GPT bus-clock, Standby SRAM)	Up to 120 MHz*2 Division ratios: 1, 2, 4, 8, 16, 32, 64
Peripheral module clock B (PCLKB)	MOSC, SOSC, HOCO, MOCO, LOCO, PLL	Peripheral modules (IIC, SSI, SRC, DOC, CAC, CAN, DAC12, POEG, CTSU,AGT, ELC, I/O Ports, RTC, WDT, IWDT, ADC12, KINT, USBFS, ACMPHS, TSN, PDC)	Up to 60 MHz Division ratios: 1, 2, 4, 8, 16, 32, 64
Peripheral module clock C (PCLKC)	MOSC, SOSC, HOCO, MOCO, LOCO, PLL	Peripheral module (ADC12 conversion clock)	Up to 60 MHz Division ratios: 1, 2, 4, 8, 16, 32, 64
Peripheral module clock D (PCLKD)	MOSC, SOSC, HOCO, MOCO, LOCO, PLL	Peripheral module (GPT count-clock)	Up to 120 MHz Division ratios: 1, 2, 4, 8, 16, 32, 64
Flash interface clock (FCLK)	MOSC, SOSC, HOCO, MOCO, LOCO, PLL	Flash interface	4 to 60 MHz (P/E) Up to 60 MHz (read) *1 Division ratios: 1, 2, 4, 8, 16, 32, 64
External bus clock (BCLK)	MOSC, SOSC, HOCO, MOCO, LOCO, PLL	External bus	Up to 120 MHz Division ratios: 1, 2, 4, 8, 16, 32, 64
EBCLK pin output (EBCLK)	BCLK or 1/2 BCLK	EBCLK pin	Up to 60 MHz Division ratios: 1, 2
SDCLK pin output (SDCLK)	BCLK	SDCLK pin	Up to 120 MHz
USB clock (UCLK)	PLL	USB	48 MHz Division ratios: 3, 4, 5
USB-PHY clock (USBMCLK)	MOSC	USB-PHY	20 or 24 MHz
CAN clock (CANMCLK)	MOSC	CAN	8 to 24 MHz
LCD_CLK pin output (LCD_CLK) and graphic LCD pixel clock (PXCLK)	LCD_EXTCLK, PLL output	LCD_CLK pin, peripheral module (Graphics LCD Controller)	Up to 54 MHz (parallel RGB) Up to 60 MHz (serial RGB) LCD_CLK division ratios: 1, 2, 3, 4, 5, 6, 7, 8, 9, 12, 16, 24, 32 LCD_CLK : PXCLK = 1:1 (parallel RGB) LCD_CLK : PXCLK = 4:1 (serial RGB)
AGT clock (AGTSCLK, AGTLCLK)	SOSC, LOCO	AGT	32.768 kHz
CAC main clock (CACMCLK)	MOSC	CAC	Up to 24 MHz
CAC sub-clock (CACSCLK)	SOSC	CAC	32.768 kHz
CAC LOCO clock (CACLCLK)	LOCO	CAC	32.768 kHz
CAC MOCO clock (CACMOCLK)	MOCO	CAC	8 MHz
CAC HOCO clock (CACHCLK)	HOCO	CAC	16, 18, 20 MHz
CAC IWDTLOCO clock (CACILCLK)	IWDTLOCO	CAC	15 kHz

Table 9.2 Specifications of the Clock Generation Circuit for the internal clocks (2 of 2)

Parameter	Clock sources	Clock supply	Specifications
RTC clock (RTCSCLK, RTCLCLK)	SOSC, LOCO	RTC	32.768 kHz
IWDT clock (IWDTCLK)	IWDTLOCO	IWDT	15 kHz
SysTick timer clock (SYSTICCLK)	LOCO	SysTick timer	32.768 kHz
JTAG clock (JTAGTCK)	TCK pin	JTAG	Up to 25 MHz
Clock and buzzer output (CLKOUT)	MOSC, SOSC, LOCO, MOCO, HOCO	CLKOUT pin	Up to 24 MHz Division ratios: 1, 2, 4, 8, 16, 32, 64, 128
Serial wire clock (SWCLK)	SWCLK pin	OCD	Up to 25 MHz
Trace clock (TRCLK)	MOSC, SOSC, HOCO, MOCO, LOCO, PLL	CPU-OCD	Up to 120 MHz Division ratios: 1, 2, 4
TCLK pin output (TCLK)	1/2 TRCLK	TCLK pin	Up to 60 MHz

Note: Restrictions on clock frequency settings: ICLK ≥ PCLKA ≥ PCLKB, PCLKD ≥ PCLKA ≥ PCLKB
Restrictions on clock frequency ratio (N: integer, and up to 64):
ICLK:FCLK = N:1, ICLK:BCLK = N:1, ICLK:PCLKA = N:1, ICLK:PCLKB = N:1
ICLK:PCLKC = N:1 or 1:N, ICLK:PCLKD= N:1 or 1:N
If the A/D converter is enabled, clock frequency ratio is constrained as below.
PCLKB:PCLKC = 1:1 or 1:2 or 1:4 or 2:1 or 4:1 or 8:1

Note: Clocks have a permissible frequency range. (See Table 9.2.)
Flash memory and SRAM also have a permissible operating frequency range in each wait cycle setting. (See section 53, SRAM, section 55, Flash Memory.)
Those clock frequency ranges must be satisfied even if the HOCO has its maximum or minimum frequency. (See section 60, Electrical Characteristics.)

Note: If PLL reference clock source is HOCO, PLL multiplication setting must be set to 120 - 240 MHz in consideration of HOCO frequency (min/max).

Note 1. The minimum FCLK frequency is 4 MHz in Programming/Erasure (P/E) mode.

Note 2. When using the ETHERC, the PCLKA frequency is in the range 12.5 MHz ≤ PCLKA ≤ 120 MHz.

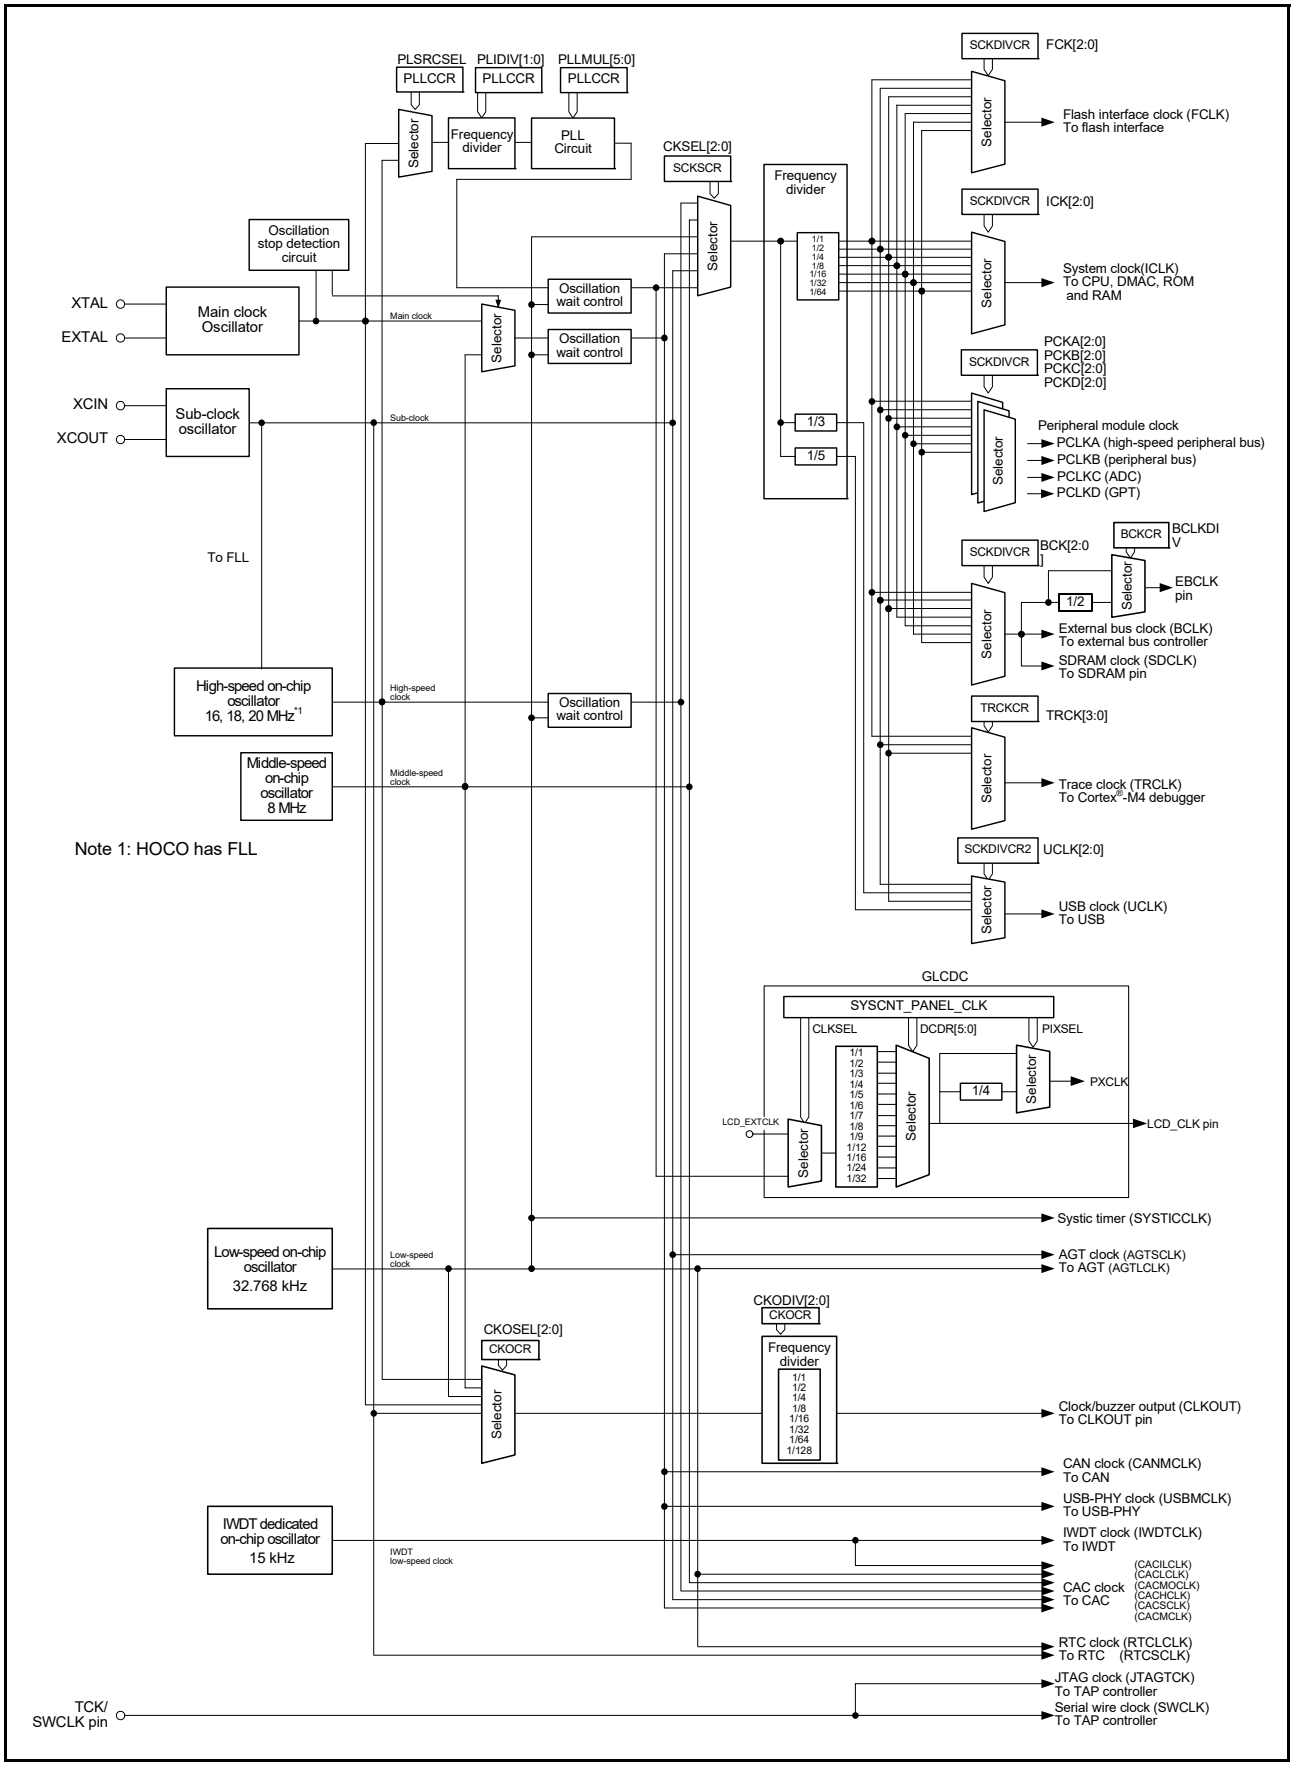

Figure 9.1 Clock Generation Circuit block diagram

Table 9.3 Clock Generation Circuit I/O pins

Pin name	I/O	Description
XTAL	Output	Crystal resonator connections The EXTAL pin can also be used to input an external clock. For details, section 9.3.2, External Clock Input.
EXTAL	Input	
XCIN	Input	32.768-kHz crystal resonator connection
XCOUT	Output	
TCK/SWCLK	Input	JTAG clock input
EBCLK	Output	External bus clock (EBCLK) supply for external devices
SDCLK	Output	SDRAM clock (SDCLK) supply for external devices
CLKOUT	Output	CLKOUT and BUZZER clock output

9.2 Register Descriptions

9.2.1 System Clock Division Control Register (SCKDIVCR)

Address(es): SYSTEM.SCKDIVCR 4001 E020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit name	Description	R/W
b2 to b0	PCKD[2:0]	Peripheral Module Clock D (PCLKD) Select*4	b2 b1 b0 0 0 0: ×1/1 0 0 1: ×1/2 0 1 0: ×1/4 0 1 1: ×1/8 1 0 0: ×1/16 1 0 1: ×1/32 1 1 0: ×1/64. Other settings are prohibited.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6 to b4	PCKC[2:0]	Peripheral Module Clock C (PCLKC) Select*4	b6 b5 b4 0 0 0: ×1/1 0 0 1: ×1/2 0 1 0: ×1/4 0 1 1: ×1/8 1 0 0: ×1/16 1 0 1: ×1/32 1 1 0: ×1/64. Other settings are prohibited.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit name	Description	R/W
b10 to b8	PCKB[2:0]	Peripheral Module Clock B (PCLKB) Select*3	b10 b8 0 0 0: ×1/1 0 0 1: ×1/2 0 1 0: ×1/4 0 1 1: ×1/8 1 0 0: ×1/16 1 0 1: ×1/32 1 1 0: ×1/64. Other settings are prohibited.	R/W
b11	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b14 to b12	PCKA[2:0]	Peripheral Module Clock A (PCLKA) Select*3	b14 b12 0 0 0: ×1/1 0 0 1: ×1/2 0 1 0: ×1/4 0 1 1: ×1/8 1 0 0: ×1/16 1 0 1: ×1/32 1 1 0: ×1/64. Other settings are prohibited.	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b18 to b16	BCK[2:0]	External Bus Clock (BCLK) Select*2	b18 b16 0 0 0: ×1/1 0 0 1: ×1/2 0 1 0: ×1/4 0 1 1: ×1/8 1 0 0: ×1/16 1 0 1: ×1/32 1 1 0: ×1/64. Other settings are prohibited.	R/W
b23 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b26 to b24	ICK[2:0]	System Clock (ICLK) Select*1,*2,*3,*4,*5	b26 b24 0 0 0: ×1/1 0 0 1: ×1/2 0 1 0: ×1/4 0 1 1: ×1/8 1 0 0: ×1/16 1 0 1: ×1/32 1 1 0: ×1/64. Other settings are prohibited.	R/W
b27	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b30 to b28	FCK[2:0]	Flash Interface Clock (FCLK) Select*1	b30 b28 0 0 0: ×1/1 0 0 1: ×1/2 0 1 0: ×1/4 0 1 1: ×1/8 1 0 0: ×1/16 1 0 1: ×1/32 1 1 0: ×1/64. Other settings are prohibited.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. The following association is required between the frequencies of the system clock (ICLK) and the flash interface clock (FCLK):
ICLK:FCLK = N:1 (N: integer)
If a setting where ICLK < FCLK is written, the write is ignored.

Note 2. The following association is required between the frequencies of the system clock (ICLK) and the external bus clock (BCLK):
ICLK:BCLK = N:1 (N: integer)
If a setting where ICLK < BCLK is written, the write is ignored.

Note 3. The following association is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKA, PCLKB): ICLK:PCLKA = N:1, ICLK:PCLKB = N:1 (N: integer)
If a setting where ICLK < PCLKA or ICLK < PCLKB is written, the write is ignored.

Note 4. The following association is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKC, PCLKD): ICLK:PCLKC, PCLKD = N:1 or 1:N (N: integer).

Note 5. The frequency of the system clock (ICLK) is limited to the flash wait cycle register (FLWT). See section 55, Flash Memory.

The SCKDIVCR register selects the frequencies of the system clock (ICLK), peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD), flash interface clock (FCLK), external bus clock (BCLK), and SDRAM clock (SDCLK).

PCKD[2:0] bits (Peripheral Module Clock D (PCLKD) Select)

The PCKD[2:0] bits select the frequency for peripheral module clock D (PCLKD).

PCKC[2:0] bits (Peripheral Module Clock C (PCLKC) Select)

The PCKC[2:0] bits select the frequency for peripheral module clock C (PCLKC).

PCKB[2:0] bits (Peripheral Module Clock B (PCLKB) Select)

The PCKB[2:0] bits select the frequency for peripheral module clock B (PCLKB).

PCKA[2:0] bits (Peripheral Module Clock A (PCLKA) Select)

The PCKA[2:0] bits select the frequency for peripheral module clock A (PCLKA).

BCK[2:0] bits (External Bus Clock (BCLK) Select)

The BCK[2:0] bits select the frequency for the external bus clock (BCLK) and the SDRAM clock (SDCLK).

ICK[2:0] bits (System Clock (ICLK) Select)

The ICK[2:0] bits select the frequency for the system clock for the CPU, DMAC, and DTC.

FCK[2:0] bits (Flash Interface Clock (FCLK) Select)

The FCK[2:0] bits select the frequency for the flash interface clock (FCLK).

9.2.2 System Clock Division Control Register 2 (SCKDIVCR2)

Address(es): SYSTEM.SCKDIVCR2 4001 E024h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	UCK[2:0]			—	—	—	—
Value after reset:	0	1	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6 to b4	UCK[2:0]	USB Clock (UCLK) Select	b6 b4 0 1 0: ×1/3 0 1 1: ×1/4 1 0 0: ×1/5. Other settings are prohibited.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note: Do not write to SCKDIVCR2 and SCKSCR at the same time by 32-bit access.

The SCKDIVCR2 register selects the frequency of the USB clock (UCLK).

UCK[2:0] bits (USB Clock (UCLK) Select)

The UCK[2:0] bits select the frequency of the USB clock (UCLK). The duty ratio is 2:1 when ×1/3 is selected or 3:2 when ×1/5 is selected.

9.2.3 System Clock Source Control Register (SCKSCR)

Address(es): SYSTEM.SCKSCR 4001 E026h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	CKSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit name	Description	R/W
b2 to b0	CKSEL[2:0]	Clock Source Select	b2 b0 0 0 0: HOCO 0 0 1: MOCO 0 1 0: LOCO 0 1 1: Main clock oscillator 1 0 0: Sub-clock oscillator 1 0 1: PLL. Other settings are prohibited.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Do not write to SCKDIVCR2 and SCKSCR at the same time by 32-bit access.

The SCKSCR register selects the clock source for the system clock.

CKSEL[2:0] bits (Clock Source Select)

The CKSEL[2:0] bits select the clock source for the following modules:

- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, and PCLKD)
- Flash interface clock (FCLK)
- External bus clock (BCLK)
- SDRAM clock (SDCLK)
- USBFS clock (UCLK).

The bits select from one of the following sources:

- Low-speed on-chip oscillator (LOCO)
- Middle-speed on-chip oscillator (MOCO)
- High-speed on-chip oscillator (HOCO)
- Main clock oscillator
- Sub-clock oscillator
- PLL circuit.

Transitions to clock sources that are not in operation are prohibited.

9.2.4 PLL Clock Control Register (PLLCCR)

Address(es): SYSTEM.PLLCCR 4001 E028h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	PLLMUL[5:0]						—	—	—	PLSRCSEL	—	—	PLIDIV[1:0]	
Value after reset:	0	0	0	1	0	0	1	1	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	PLIDIV[1:0]	PLL Input Frequency Division Ratio Select*1	b1 b0 0 0: × 1 0 1: × 1/2 1 0: × 1/3 1 1: Setting prohibited.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	PLSRCSEL	PLL Clock Source Select	0: Main clock oscillator*4 1: HOCO.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13 to b8	PLLMUL[5:0]	PLL Frequency Multiplication Factor Select*2,*3	b13 b8 0 1 0 0 1 1: × 10.0 0 1 0 1 0 0: × 10.5 0 1 0 1 0 1: × 11.0 … 0 1 1 1 0 0: × 14.5 0 1 1 1 0 1: × 15.0 0 1 1 1 1 0: × 15.5 … 1 1 1 0 1 0: × 29.5 1 1 1 0 1 1: × 30.0. Other settings are prohibited.	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. PLIDIV[1:0] must be set so that the frequency of the PLL input signal is within the range listed in Table 9.1.
Note 2. PLLMUL[5:0] must be set so that the frequency of the PLL output signal is within the range listed in Table 9.1.
Note 3. PLLMUL[5:0] should be set up to 19 when oscillation stop detection function is enabled and input frequency less than 12 MHz is used.
Note 4. PLSRCSEL must be set to 0 when using UCLK.

The PLLCCR register sets up the operation of the PLL circuit. Writing to the PLLCCR is prohibited when the PLL is operating (when the PLLCR.PLLSTP bit is 0).

PLIDIV[1:0] bits (PLL Input Frequency Division Ratio Select*1)

The PLIDIV[1:0] bits select the frequency division ratio for the PLL clock source.

PLSRCSEL bit (PLL Clock Source Select)

The PLSRCSEL bit selects the clock source for the PLL.

PLLMUL[5:0] bits (PLL Frequency Multiplication Factor Select*2,*3)

The PLLMUL[5:0] bits select the frequency multiplication factor for the PLL circuit.

9.2.5 PLL Control Register (PLLCR)

Address(es): SYSTEM.PLLCR 4001 E02Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	PLLSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit name	Description	R/W
b0	PLLSTP	PLL Stop Control	0: Operate the PLL 1: Stop the PLL.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PLLCR register controls the operation of the PLL circuit.

PLLSTP bit (PLL Stop Control)

The PLLSTP bit starts or stops the PLL circuit. When selecting the main clock oscillator as the clock source for the PLL in the PLLCCR.PLSRCSEL bit, you must also set the Main Clock Oscillator Wait Control Register (MOSCWTCR).

After setting the PLLSTP bit to 0, confirm that the OSCSF.PLLSF bit is set to 1 before using the PLL clock. A fixed stabilization wait is required after setting the PLL to start operation. A fixed wait for oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the PLL, confirm that the OSCSF.PLLSF bit is 0 before restarting the PLL
- Confirm that the PLL is operating and that the OSCSF.PLLSF bit is 1 before stopping the PLL
- Regardless of whether the PLL clock is selected as the system clock, after setting the PLL to start operation, confirm that the OSCSF.PLLSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow a setting to stop the PLL, confirm that the OSCSF.PLLSF bit is cleared to 0 before executing the WFI instruction.

Writing 1 to PLLSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL).

Make sure the following conditions apply before writing 0 to PLLSTP:

- When PLL source clock = MOSC, OSCSF.MOSCSF bit = 1
- When PLL source clock = HOCO, OSCSF.HOCOSF bit = 1.

9.2.6 External Bus Clock Control Register (BCKCR)

Address(es): SYSTEM.BCKCR 4001 E030h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	BCLKDIV
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	BCLKDIV	EBCLK Pin Output Select	0: BCLK 1: BCLK/2.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The BCKCR register controls the external bus clock pin.

BCLKDIV bit (EBCLK Pin Output Select)

The BCLKDIV bit selects the clock signal for output from the EBCLK pin. The signal can be selected from either the BCLK clock with the frequency selected in the BCK[2:0] bits in SCKDIVCR or the BCLK clock divided by 2.

9.2.7 Main Clock Oscillator Control Register (MOSCCR)

Address(es): SYSTEM.MOSCCR 4001 E032h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	MOSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit name	Description	R/W
b0	MOSTP	Main Clock Oscillator Stop	0: Operate the main clock oscillator*1 1: Stop the main clock oscillator.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The MOMCR register must be set before setting MOSTP to 0.

The MOSCCR register controls the main clock oscillator.

MOSTP bit (Main Clock Oscillator Stop)

The MOSTP bit starts or stops the main clock oscillator. To start the main clock oscillator, set this bit to 0. When changing the value of the bit, only execute subsequent instructions after reading the bit to check that the value was updated. When using the main clock oscillator, you must set the Main Clock Oscillator Mode Oscillation Control Register (MOMCR) and the Main Clock Oscillator Wait Control Register (MOSCWTCR) before setting MOSTP to 0.

After setting the MOSTP bit to 0, confirm that the OSCSF.MOSCSF bit is set to 1 before using the main clock oscillator. A fixed stabilization wait is required after setting the main clock oscillator to start operation. A fixed wait for oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the main clock oscillator, confirm that the OSCSF.MOSCSF bit is 0 before restarting the main clock oscillator
- Confirm that the main clock oscillator is operating and that the OSCSF.MOSCSF bit is 1 before stopping the main clock oscillator
- Regardless of whether the main clock oscillator is selected as the system clock, confirm that the OSCSF.MOSCSF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow a setting to stop the main clock oscillator, confirm that the OSCSF.MOSCSF bit is cleared to 0 before executing the WFI instruction.

Writing 1 to MOSTP is prohibited under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and PLLCR.PLLSTP = 0 (PLL is operating).

9.2.8 Subclock Oscillator Control Register (SOSCCR)

Address(es): SYSTEM.SOSCCR 4001 E480h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SOSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SOSTP	Sub-Clock Oscillator Stop	0: Operate the sub-clock oscillator*1 1: Stop the sub-clock oscillator.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The SOMCR register must be set before setting SOSTP to 0.

The SOSCCR register controls the sub-clock oscillator.

SOSTP bit (Sub-Clock Oscillator Stop)

The SOSTP bit starts or stops the sub-clock oscillator. When changing the value of the bit, only execute subsequent instructions after reading the bit to check that the value was updated. Use the SOSTP bit when using the sub-clock oscillator as the source for a peripheral module, for example the RTC. When using the sub-clock oscillator, you must set the Sub-Clock Oscillator Mode Control Register (SOMCR) before setting SOSTP to 0.

After setting SOSTP to 0, only use the sub-clock oscillator after the sub-clock oscillation stabilization wait time (tSUBOSCOWT) elapses. A fixed stabilization wait is required after setting the sub-clock oscillator to start operation. A fixed wait for oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the sub-clock oscillator, allow a stop interval of at least 5 SOSC cycles before restarting it
- Confirm that sub-clock oscillation is stable before stopping the sub-clock oscillator
- Regardless of whether the sub-clock oscillator is selected as the system clock, confirm that sub-clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby mode
- When a transition to Software Standby mode is to follow a setting to stop the sub-clock oscillator, wait for at least 3 SOSC cycles after the stop setting before executing the WFI instruction.

Writing 1 to SOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 100b (system clock source = SOSC).

9.2.9 Low-Speed On-Chip Oscillator Control Register (LOCOCR)

Address(es): SYSTEM.LOCOCR 4001 E490h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	LCSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	LCSTP	LOCO Stop	0: Operate the LOCO clock 1: Stop the LOCO clock.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The LOCOCR register controls the LOCO clock.

LCSTP bit (LOCO Stop)

The LCSTP bit starts or stops the LOCO clock. After setting LCSTP bit to 0 to start the LOCO clock, only use the clock after the LOCO clock oscillation stabilization wait time (tLOCOWT) elapses. A fixed stabilization wait is required after setting the LOCO clock to start operation. A fixed wait for oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the LOCO clock, allow a stop interval of at least 5 LOCO cycles before restarting it
- Confirm that LOCO oscillation is stable before stopping the LOCO clock
- Regardless of whether the LOCO clock is selected as the system clock, confirm that LOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow a setting to stop the LOCO clock, wait for at least 3 LOCO cycles after the stop setting before executing the WFI instruction.

Writing 1 to LOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 010b (system clock source = LOCO)

Because the LOCO clock measures the wait time for other oscillators, it continues to oscillate while measuring this time, regardless of the setting in LOCOCR.LCSTP. As a result, the LOCO clock might be unintentionally supplied even when the LCSTP is set to stop.

9.2.10 High-Speed On-Chip Oscillator Control Register (HOCOCR)

Address(es): SYSTEM.HOCOCR 4001 E036h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	HCSTP
Value after reset:	0	0	0	0	0	0	0	0/1*1

Bit	Symbol	Bit name	Description	R/W
b0	HCSTP	HOCO Stop	0: Operate the HOCO clock*2 1: Stop the HOCO clock.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The HCSTP bit value after a reset is 0 when the OFS1.HOCOEN bit is 0. It is 1 when the OFS1.HOCOEN bit is 1.
Note 2. If you are using the HOCO (HCSTP = 0), you must set the OFS1.HOCOFRQ1 bit to the optimum value.

The HOCOCR register controls the HOCO clock.

HCSTP bit (HOCO Stop)

The HCSTP bit starts or stops the HOCO clock. For the HOCO to operate, the HOCO Wait Control Register (HOCOWTCR) must also be set. After setting the HCSTP bit to 0 to start the HOCO clock, confirm that the OSCSF.HOSCSF bit is set to 1 before using the clock. When OFS1.HOCOEN is set to 1, confirm that the OSCSF.HOCOSF is also set to 1 before using the HOCO clock. A fixed stabilization wait time is required after setting the HOCO clock to start operation. A fixed wait time is also required for oscillation to stop after setting the HOCO clock to stop.

The following restrictions apply when starting and stopping operation:

- After stopping the HOCO, confirm that the OSCSF.HOCOSF bit is 0 before restarting the HOCO clock
- Confirm that the HOCO clock is operating and that the OSCSF.HOCOSF bit is 1 before stopping the HOCO clock
- Regardless of whether the HOCO clock is selected as the system clock, confirm that the OSCSF.HOSCSF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow a setting to stop the HOCO clock, confirm that the OSCSF.MOSCSF bit is cleared to 0 before executing the WFI instruction.

Writing 1 to HCSTP is prohibited under the following conditions:

- SCKSCR.CKSEL[2:0] = 000b (system clock source = HOCO)
- PLLCCR.PLSRCSEL = 1 (PLL source clock = HOCO) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
- PLLCCR.PLSRCSEL = 1 (PLL source clock = HOCO) and PLLCR.PLLSTP = 0 (PLL is operating).

9.2.11 High-Speed On-Chip Oscillator Wait Control Register (HOCOWTCR)

Address(es): SYSTEM.HOCOWTCR 4001 E0A5h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	HSTS[2:0]		
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	HSTS[2:0]	HOCO Wait Time Setting	Wait time (s) = (HSTS[2:0] setting +3) /fLOCO	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R

HSTS[2:0] bit (HOCO Wait Time Setting)

The HSTS[2:0] bits must be set to 110b. However, when using SCI0 in Snooze mode, HSTS[2:0] must be set to 010b.

9.2.12 Middle-Speed On-Chip Oscillator Control Register (MOCOCR)

Address(es): SYSTEM.MOCOCR 4001 E038h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	MCSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	MCSTP	MOCO Stop	0: Operate the MOCO clock 1: Stop the MOCO clock.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The MOCOCR register controls the MOCO clock.

MCSTP bit (MOCO Stop)

The MCSTP bit starts or stops the MOCO clock. After setting MCSTP to 0 to start the MOCO clock, only use the clock after the MOCO clock oscillation stabilization time (tMOCOWT) elapses. A fixed stabilization wait is required after setting the MOCO clock to start operation. A fixed wait for oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the MOCO clock, allow a stop interval of at least 5 MOCO cycles before restarting it
- Confirm that MOCO oscillation is stable before stopping the MOCO clock
- Regardless of whether the MOCO clock is selected as the system clock, confirm that MOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow a setting to stop the MOCO clock, wait for at least 3 MOCO clock cycles after the stop setting before executing the WFI instruction.

Writing 1 to MCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 001b (system clock source = MOCO).

Writing 1 to the MCSTP bit (stopping the MOCO) is prohibited if oscillation stop detection is enabled in the Oscillation Stop Detection Control Register (OSTDCR.OSTDE).

9.2.13 FLL Control Register 1 (FLLCR1)

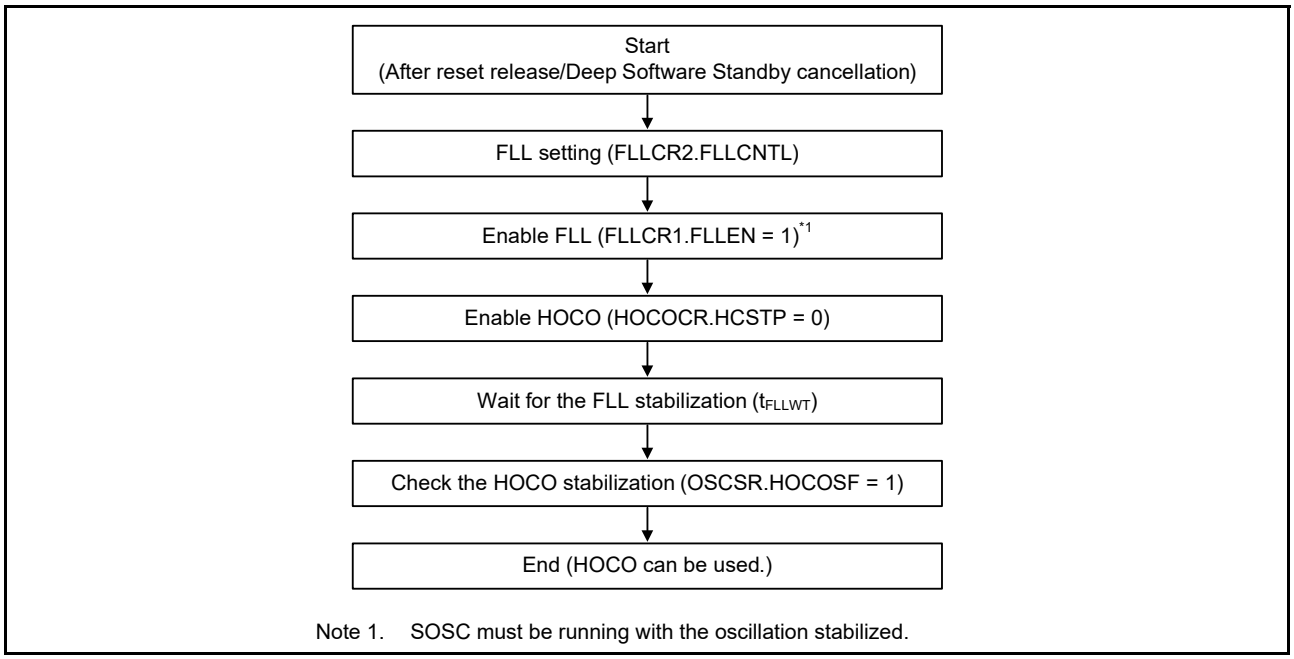
Address(es): SYSTEM.FLLCR1 4001 E039h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	FLLEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FLLEN	FLL Enable	0: FLL function is disabled 1: FLL function is enabled	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: HOCO must be stopped (HOCOCR.HCSTP = 1) before FLLCR1.FLLEN is changed.
Note: SOSC must be operating with stabilization while FLL is enabled (FLLCR1.FLLEN = 1).

The FLLCR1 register controls the FLL function of the HOCO. The purpose of FLL is to utilize SOSC when available, to get better accuracy in the HOCO.



FLLEN bit (FLL Enable)

This bit enables or disables the FLL function of the HOCO.

If FLL is enabled, the frequency accuracy is guaranteed after FLL is stabilized. The FLL stabilization can be checked by the frequency measurement of the Clock Frequency Accuracy Measurement Circuit (CAC) after the HOCO is stabilized.

The FLL must be disabled before the transition to Software Standby mode. Therefore, this bit must be set to 0 before the transition to Software Standby mode.

Figure 9.2 and Figure 9.3 shows an example flow of the FLL setting in each case.

Note 1. SOSC must be running with the oscillation stabilized.

Figure 9.2 FLL setting flow (after reset release / Deep Software Standby cancellation)

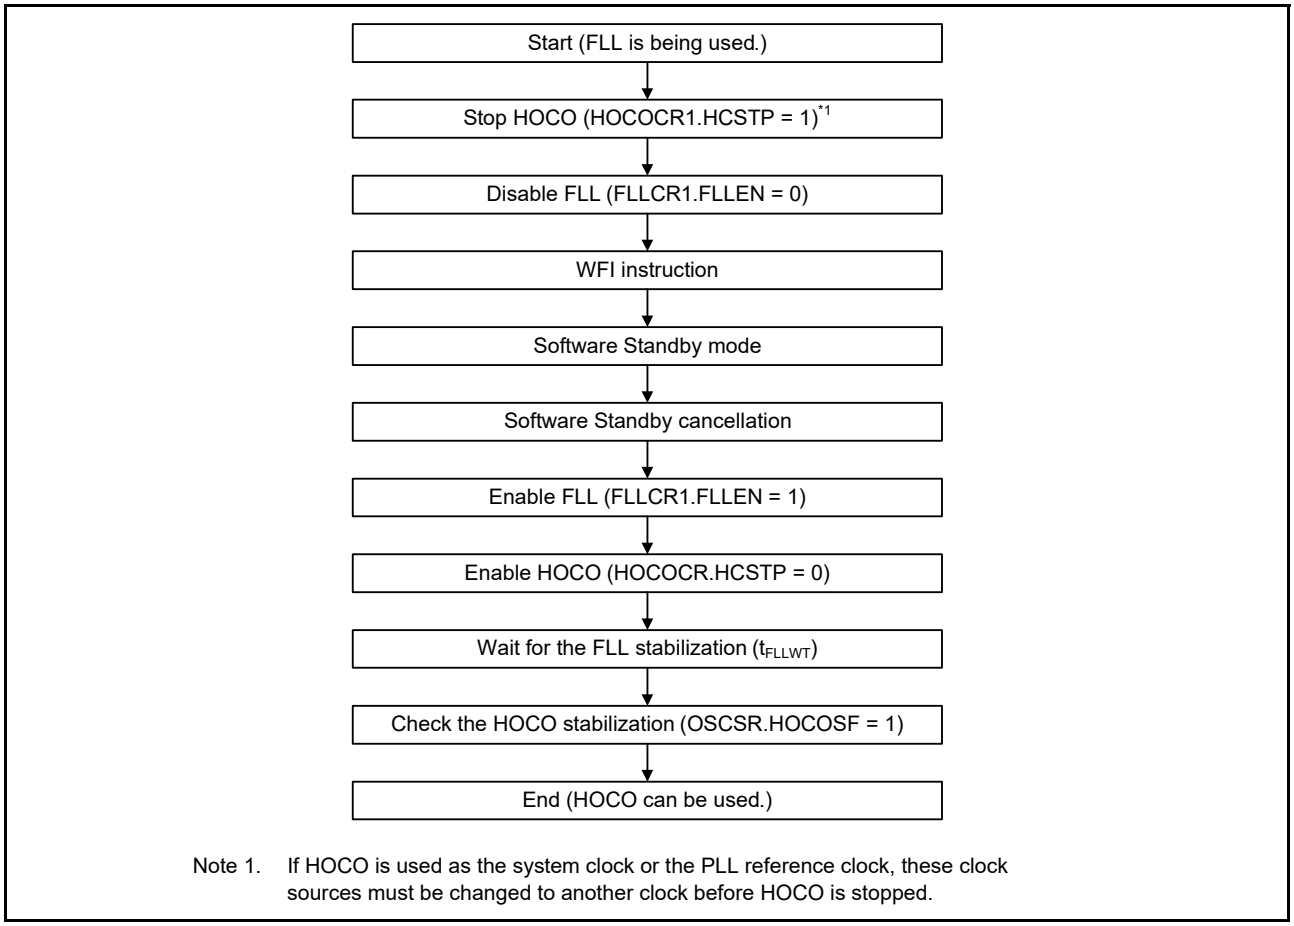


Figure 9.3 Software Standby transition / cancellation flow

9.2.14 FLL Control Register 2 (FLLCR2)

Address(es): SYSTEM.FLLCR2 4001 E03Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	FLLCNTL[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b10 to b0	FLLCNTL[10:0]	FLL Multiplication Control	• When OFS1.HOCOFRQ0[1:0] is 00b (16 MHz), these bits must be set to 1E9h • When OFS1.HOCOFRQ0[1:0] is 01b (18 MHz), these bits must be set to 226h • When OFS1.HOCOFRQ0[1:0] is 10b (20 MHz), these bits must be set to 263h. Other settings are prohibited.	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The FLLCR2 register controls the FLL function of the HOCO.

FLLCNTL[10:0] bits (FLL Multiplication Control)

These bits select the multiplication ratio of the FLL reference clock.

These bits must be set before FLL is enabled (FLLCR1.FLLEN = 1).

9.2.15 Oscillation Stabilization Flag Register (OSCSF)

Address(es): SYSTEM.OSCSF 4001 E03Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	PLLSF	—	MOSCSF	—	—	HOCOSF
Value after reset:	0	0	0	0	0	0	0	0/1*1

Bit	Symbol	Bit name	Description	R/W
b0	HOCOSF	HOCO Clock Oscillation Stabilization Flag	0: HOCO clock is stopped or is not yet stable 1: HOCO clock is stable, so is available for use as the system clock.	R
b2, b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b3	MOSCSF	Main Clock Oscillation Stabilization Flag	0: Main clock oscillator is stopped (MOSTP = 1) or is not yet stable*2 1: Main clock oscillator is stable, so is available for use as the system clock.	R
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5	PLLSF	PLL Clock Oscillation Stabilization Flag	0: PLL clock is stopped or is not yet stable 1: PLL clock is stable, so is available for use as the system clock.	R
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value after reset depends on the OFS1.HOCOEN setting.
When OFS1.HOCOEN = 0, the value after reset of HOCOSF is 0.
When OFS1.HOCOEN = 1, the HOCOSF value is set to 0 immediately after reset is released, and HOCOSF is set to 1 after the HOCO oscillation stabilization wait time elapses.

Note 2. This is true when an appropriate value is set in the wait control register for the given oscillator. If the wait time value is not sufficient, the oscillation stabilization flag is set to 1 and supply of the clock signal to the internal circuits starts before oscillation is stable.

The OSCSF register flags indicate the operating status of the counters in the oscillation stabilization wait circuits for the individual oscillators. After oscillation starts, these counters measure the wait time until their associated oscillator output clocks are supplied to the internal circuits. An overflow of a counter indicates that the clock supply is stable and available for the associated circuit.

HOCOSF flag (HOCO Clock Oscillation Stabilization Flag)

The HOCOSF flag indicates the operating status of the counter that measures the wait time for the high-speed clock oscillator (HOCO). When OFS1.HOCOEN is set to 1, confirm that the OSCSF.HOCOSF is also set to 1 before using the HOCO clock.

[Setting condition]

- After the HOCO clock stops and the HOCOCR.HCSTP bit is set to 0, supply of the clock to the MCU starts after the number of LOCO cycles associated with the setting of the HOCOWTCR register elapse.

[Clearing condition]

- When the HOCO clock is operating and then is deactivated because the HOCOCR.HCSTP bit is set to 1.

MOSCSF flag (Main Clock Oscillation Stabilization Flag)

The MOSCSF flag indicates the operating status of the counter that measures the wait time for the main clock oscillator.

[Setting condition]

- After the main clock oscillator stops and the MOSCCR.MOSTP bit is set to 0, supply of the clock to the MCU starts after the number of LOCO cycles associated with the setting of the MOSCWTCR register elapse.

[Clearing condition]

- When the main clock oscillator is operating and then is deactivated because the MOSCCR.MOSTP bit is set to 1.

PLLSF flag (PLL Clock Oscillation Stabilization Flag)

The PLLSF flag indicates the operating status of the counter that measures the wait time for the PLL.

[Setting condition]

- After the PLL stops and the PLLCR.PLLSTP bit is set to 0, supply of the clock to the MCU starts after 31 LOCO cycles elapse. If oscillation by the PLL clock source selected in the PLLCCR.PLSRCSEL bit is not stable when the PLLSTP bit is set to 0, counting of the LOCO cycles continues after the PLL clock source oscillation is stabilized. Wait time is calculated as:

  1 cycle = LOCO (32.768 kHz) x 8 (3.81 µs TYP).

[Clearing condition]

- When the PLL is operating and then is deactivated because the PLLCCR.PLLSTP bit is set to 1.

9.2.16 Oscillation Stop Detection Control Register (OSTDCR)

Address(es): SYSTEM.OSTDCR 4001 E040h

	b7	b6	b5	b4	b3	b2	b1	b0
	OSTDE	—	—	—	—	—	—	OSTDIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OSTDIE	Oscillation Stop Detection Interrupt Enable	0: Disable oscillation stop detection interrupt (do not notify the POEG) 1: Enable oscillation stop detection interrupt (notify the POEG).	R/W
b6 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	OSTDE	Oscillation Stop Detection Function Enable	0: Disable oscillation stop detection function 1: Enable oscillation stop detection function.	R/W

The OSTDCR register controls the oscillation stop detection function.

OSTDIE bit (Oscillation Stop Detection Interrupt Enable)

The OSTDIE bit enables the oscillation stop detection function interrupt. It also controls whether oscillation stop detection is reported to the POEG.

If the oscillation stop detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) requires clearing, clear the OSTDIE bit to 0 before clearing OSTDF. Wait at least 2 PCLKB cycles before setting OSTDIE to 1. A longer PCLKB wait time might be required, depending on the number of cycles required to read a given I/O register.

OSTDE bit (Oscillation Stop Detection Function Enable)

The OSTDE bit enables the oscillation stop detection function. When OSTDE is 1 (enable), the MOCO stop bit (MOCOCR.MCSTP) is cleared to 0 and MOCO operation starts. The MOCO clock cannot be stopped while the oscillation stop detection function is enabled. Writing 1 to the MOCOCR.MCSTP bit (MOCO stopped) is invalid.

When the oscillation stop detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) is 1 (main clock oscillation stop detected), writing 0 to the OSTDE bit is invalid.

OSTDE must be cleared before invoking Software Standby or Deep Software Standby mode. To transition to either of these modes, first clear OSTDE to 0 and then execute the WFI instruction.

The following restrictions apply when using the oscillation stop detection function:

- In low-speed mode, selecting division by 1, 2, 4, 8 for ICLK, FCLK, BCLK, PCLKA, PCLKB, PCLKC, PCLKD is prohibited.

9.2.17 Oscillation Stop Detection Status Register (OSTDSR)

Address(es): SYSTEM.OSTDSR 4001 E041h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	OSTDF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OSTDF	Oscillation Stop Detection Flag	0: Main clock oscillation stop not detected 1: Main clock oscillation stop detected.	R(/W)*1
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. This bit can only be set to 0.

The OSTDSR register indicates the stop detection status of the main clock oscillator.

OSTDF flag (Oscillation Stop Detection Flag)

The OSTDF flag indicates the main clock oscillator status. When OSTDF is 1, it indicates that a main clock oscillation stop was detected. After this stop is detected, the OSTDF flag is not cleared to 0 even when oscillation is restarted. The OSTDF flag is cleared to 0 by writing 0 after reading it as 1.

At least 3 ICLK cycles of wait time are required between writing 0 to OSTDF and reading OSTDF as 0. If the OSTDF flag is cleared to 0 when the main clock oscillation is stopped, the OSTDF flag becomes 0 and then returns to 1.

OSTDSR.OSTDF cannot be cleared to 0 under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL).

The OSTDF flag must be set to 0 after switching the clock source to sources other than the main clock oscillator and PLL.

[Setting condition]

- The main clock oscillator is stopped while OSTDCR.OSTDE = 1 (oscillation stop detection enabled).

[Clearing condition]

- 1 is read and then 0 is written when the SCKSCR.CKSEL[2:0] bits are not 011b (system clock = MOSC) or 101b (system clock = PLL) and the PLLCCR.PLSRCSEL bit is not 0 (PLL source clock = MOSC).

9.2.18 Main Clock Oscillator Wait Control Register (MOSCWTCR)

Address(es): SYSTEM.MOSCWTCR 4001 E0A2h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MSTS[3:0]			
Value after reset:	0	0	0	0	0	1	0	1

Bit	Symbol	Bit name	Description	R/W
b3 to b0	MSTS[3:0]	Main Clock Oscillator Wait Time Setting	b3 b0 0 0 0 1: Wait time = 35 cycles (133.5 µs) 0 0 1 0: Wait time = 67 cycles (255.6 µs) 0 0 1 1: Wait time = 131 cycles (499.7 µs) 0 1 0 0: Wait time = 259 cycles (988.0 µs) 0 1 0 1: Wait time = 547 cycles (2086.6 µs) (value after reset) 0 1 1 0: Wait time = 1059 cycles (4039.8 µs) 0 1 1 1: Wait time = 2147 cycles (8190.2 µs) 1 0 0 0: Wait time = 4291 cycles (16368.9 µs) 1 0 0 1: Wait time = 8163 cycles (31139.4 µs). Other settings are prohibited. Wait time is calculated as: 1 cycle (µs) = 1 / (f_LOCO [MHz] x 8) = 1 / (0.032768 x 8) = 3.81 µs	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R

MSTS[3:0] bits (Main Clock Oscillator Wait Time Setting)

Set the MSTS[3:0] bits to select the oscillation stabilization wait time for the main clock oscillator. Specify a time period longer than or equal to the stabilization time recommended by the oscillator manufacturer. When the main clock is input externally, set these bits to 0001b, because the oscillation stabilization time is not required.

The wait time set in these bits is counted using:

1 cycle (µs) = 1 / (f_ LOCO [MHz] × 8) = 1 / (0.032768 x 8) = 3.81 (µs).

The LOCO clock automatically oscillates when necessary, regardless of the value of the LOCOCR.LOSTP bit. After the specified wait time elapses, supply of the main clock oscillator starts internally in the MCU, and the OSCSF.MOSCSF flag is set to 1. If the specified wait time is short, supply of the main clock oscillator starts before oscillation of the clock becomes stable.

Only rewrite the MOSCWTCR register when the MOSCCR.MOSTP bit is 1 and the OSCSF.MOSCSF flag is 0. Do not rewrite this register under any other conditions.

9.2.19 Main Clock Oscillator Mode Oscillation Control Register (MOMCR)

Address(es): SYSTEM.MOMCR 4001 E413h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	MOSEL	MODRV0[1:0]		—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5, b4	MODRV0[1:0]	Main Clock Oscillator Drive Capability 0 Switching	b5 b4 0 0: 20 to 24 MHz 0 1: 16 to 20 MHz 1 0: 8 to 16 MHz 1 1: 8 MHz.	R/W
b6	MOSEL	Main Clock Oscillator Switching	0: Resonator 1: External clock input.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note: The EXTAL/XTAL pins are also used as ports. In the initial state, the port function is selected.
Note: The MOSTP bit must be 1 (MOSC = stopped) before changing this register.

MODRV0[1:0] bits (Main Clock Oscillator Drive Capability 0 Switching)

The MODRV0[1:0] bits switch the drive capability of the main clock oscillator.

MOSEL bit (Main Clock Oscillator Switching)

The MOSEL bit switches the source for the main clock oscillator.

9.2.20 Subclock Oscillator Mode Control Register (SOMCR)

Address(es): SYSTEM.SOMCR 4001 E481h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	SODRV1	—
Value after reset:	0	0	0	0	0	0	x	0

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b1	SODRV1	Sub-Clock Oscillator Drive Capability Switching	0: Standard 1: Low.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: The SOSCCR.SOSTP bit must be 1 (SOSC = stopped) before changing this register.

SODRV1 bit (Sub-Clock Oscillator Drive Capability Switching)

The SODRV1 bit switches the drive capability of the sub-clock oscillator. This bit is undefined at the first power on, but the value after reset of SOSCCR.SOSTP is 0 (SOSC = operating). Set up the SOSC as follows at the first power on:

1. Set the SOSCCR.SOSTP bit to 1 (SOSC = stopped).
2. Set this bit to the correct value for the current capacitor.
3. Clear the SOSCCR.SOSTP to 0 (SOSC = operating).

9.2.21 Clock Out Control Register (CKOCR)

Address(es): SYSTEM.CKOCR 4001 E03Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	CKOEN	CKODIV[2:0]			—	CKOSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	CKOSEL[2:0]	Clock Out Source Select	b2 b0 0 0 0: HOCO 0 0 1: MOCO 0 1 0: LOCO 0 1 1: MOSC 1 0 0: SOSC. Other settings are prohibited.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6 to b4	CKODIV[2:0]	Clock Out Input Frequency Division Select	b6 b4 0 0 0: ×1 0 0 1: /2 0 1 0: /4 0 1 1: /8 1 0 0: /16 1 0 1: /32 1 1 0: /64 1 1 1: /128.	R/W
b7	CKOEN	Clock Out Enable	0: Disable clock out 1: Enable clock out.	R/W

CKOSEL[2:0] bits (Clock Out Source Select)

The CKOSEL[2:0] bits specify the HOCO, MOCO, LOCO, MOSC, or SOSC clock as the source of the clock to be output from the CLKOUT pin. When changing the CLKOUT source clock, clear the CKOEN bit to 0.

CKODIV[2:0] bits (Clock Out Input Frequency Division Select)

The CKODIV[2:0] bits specify the clock division ratio. Clear the CKOEN bit to 0 when changing the division ratio. The division ratio of the output clock frequency must be set to a value no higher than the characteristics of the CLKOUT pin output frequency. For details on the characteristics of the CLKOUT pin, see section 60, Electrical Characteristics.

CKOEN bit (Clock Out Enable)

The CKOEN bit enables output from the CLKOUT pin. When CKOEN is set to 1, the selected clock is output. When CKOEN is set to 0, low is output. When changing this bit, confirm that the clock out source clock selected in the CKOSEL[2:0] bits is stable. Otherwise, a glitch might be generated in the output.

Clear the CKOEN bit before entering Software Standby or Deep Software Standby mode if the selected clock out source clock is stopped in that mode.

9.2.22 External Bus Clock Output Control Register (EBCKOCR)

Address(es): SYSTEM.EBCKOCR 4001 E052h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	EBCKOEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	EBCKOEN	EBCLK Pin Output Control	0: Disable EBCLK pin output (fixed high) 1: Enable EBCLK pin output.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

9.2.23 SDRAM Clock Output Control Register (SDCKOCR)

Address(es): SYSTEM.SDCKOCR 4001 E053h

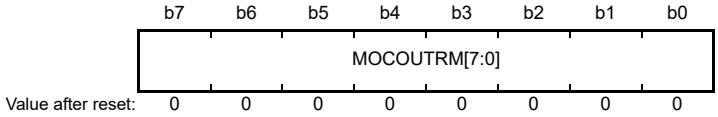
	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SDCKOEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SDCKOEN	SDCLK Pin Output Control	0: Disable SDCLK pin output (fixed high) 1: Enable SDCLK pin output.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

9.2.24 LOCO User Trimming Control Register (LOCOUTCR)

Address(es): SYSTEM.LOCOUTCR 4001 E492h

	b7	b6	b5	b4	b3	b2	b1	b0
	LOCOUTRM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0



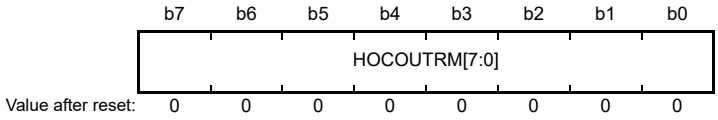
Bit	Symbol	Bit name	Description	R/W
b7 to b0	LOCOUTRM[7:0]	LOCO User Trimming	b7 b0 1 0 0 0 0 0 0 0: -128 1 0 0 0 0 0 0 1: -127 1 0 0 0 0 0 1 0: -126 … 1 1 1 1 1 1 1 1: -1 0 0 0 0 0 0 0 0: Center Code 0 0 0 0 0 0 0 1: +1 … 0 1 1 1 1 1 0 1: +125 0 1 1 1 1 1 1 0: +126 0 1 1 1 1 1 1 1: +127. These bits are added to the original LOCO trimming bits.	R/W

Note: MCU operation is not guaranteed when LOCOUTCR is set to a value that causes the LOCO frequency to be outside of the specification range.

Note: When LOCOUTCR is changed, the frequency stabilization wait required corresponds to the frequency stabilization wait at the start of MCU operation.

9.2.25 MOCO User Trimming Control Register (MOCOUTCR)

Address(es): SYSTEM.MOCOUTCR 4001 E061h



Bit	Symbol	Bit name	Description	R/W
b7 to b0	MOCOUTRM[7:0]	MOCO User Trimming	b7 b0 1 0 0 0 0 0 0 0: -128 1 0 0 0 0 0 0 1: -127 1 0 0 0 0 0 1 0: -126 … 1 1 1 1 1 1 1 1: -1 0 0 0 0 0 0 0 0: Center Code 0 0 0 0 0 0 0 1: +1 … 0 1 1 1 1 1 0 1: +125 0 1 1 1 1 1 1 0: +126 0 1 1 1 1 1 1 1: +127. These bits are added to the original MOCO trimming bits.	R/W

Note: MCU operation is not guaranteed when MOCOUTCR is set to a value that causes the MOCO frequency to be outside of the specification range.

Note: When MOCOUTCR is changed, the frequency stabilization wait required corresponds to the frequency stabilization wait at the start of MCU operation.

9.2.26 HOCO User Trimming Control Register (HOCOUTCR)

Address(es): SYSTEM.HOCOUTCR 4001 E062h

Bit	Symbol	Bit name	Description	R/W
b7 to b0	HOCOUTRM[7:0]	HOCO User Trimming	b7 b0 1 0 0 0 0 0 0 0: -128 1 0 0 0 0 0 0 1: -127 1 0 0 0 0 0 1 0: -126 … 1 1 1 1 1 1 1 1: -1 0 0 0 0 0 0 0 0: Center Code 0 0 0 0 0 0 0 1: +1 … 0 1 1 1 1 1 0 1: +125 0 1 1 1 1 1 1 0: +126 0 1 1 1 1 1 1 1: +127. These bits are added to the original HOCO trimming bits.	R/W

Note: MCU operation is not guaranteed when HOCOUTCR is set to a value that causes the HOCO frequency to be outside of the specification range.

Note: When HOCOUTCR is changed, the frequency stabilization wait required corresponds to the frequency stabilization wait at the start of MCU operation.

Note: These bits must be 00000000b when FLL is enabled (FLLCR1.FLLEN = 1).

9.2.27 Trace Clock Control Register (TRCKCR)

Address(es): SYSTEM.TRCKCR 4001 E03Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	TRCKEN	—	—	—	TRCK[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit name	Description	R/W
b3 to b0	TRCK[3:0]	Trace Clock Operating Frequency Select	b3 b0 0 0 0 0: /1 0 0 0 1: /2 (value after reset) 0 0 1 0: /4. Other settings are prohibited.	R/W
b6 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	TRCKEN	Trace Clock Operation Enable	0: Disable operation 1: Enable operation.	R/W

The Trace Clock Control Register (TRCKCR) controls the switching of the trace clock. Before changing the TRCLK frequency, set the TRCKEN bit to 0. The TRCKCR register is initialized by all reset sources.

9.3 Main Clock Oscillator

Use one of the following ways to supply the clock signal to the main clock oscillator:

- Connect an oscillator
- Connect the input of an external clock signal.

9.3.1 Connecting the Crystal Resonator

Figure 9.4 shows an example connection to a crystal resonator. A damping resistor (Rd) can be added, if required. Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor (Rf), insert an Rf between EXTAL and XTAL by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the main clock oscillator as described in Table 9.1.

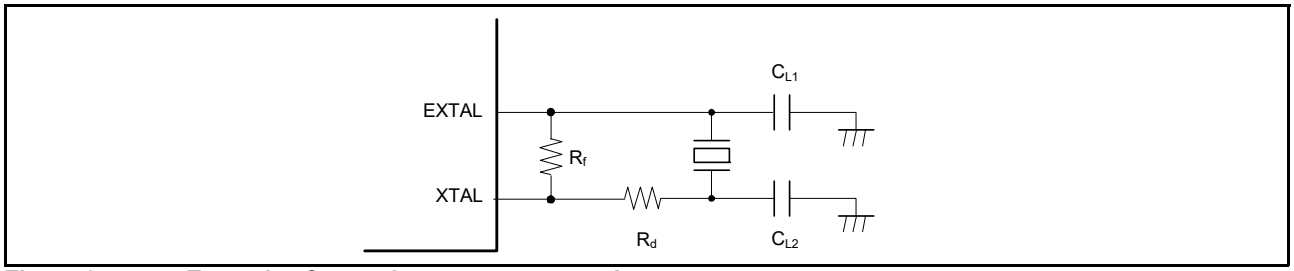


Figure 9.4 Example of crystal resonator connection

Figure 9.5 shows an equivalent circuit of the crystal resonator.

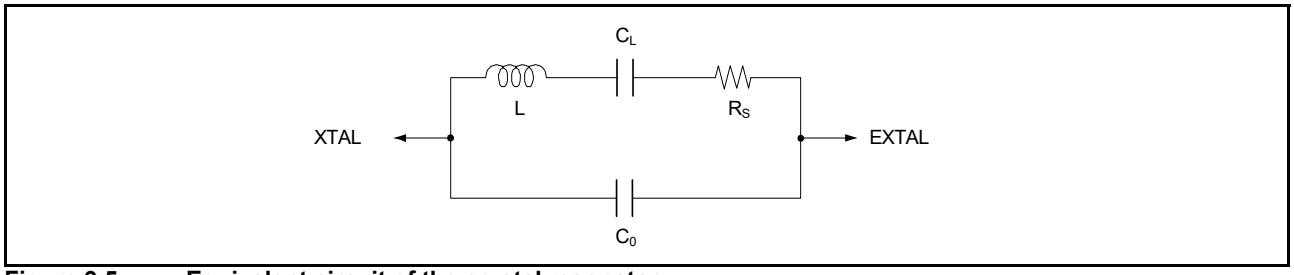

Figure 9.5 Equivalent circuit of the crystal resonator

9.3.2 External Clock Input

Figure 9.6 shows an example connection to an external clock input. To operate the oscillator with an external clock signal, set the MOMCR.MOSEL bit to 1. The XTAL pin is the function that is set in PFS.P213PFS.

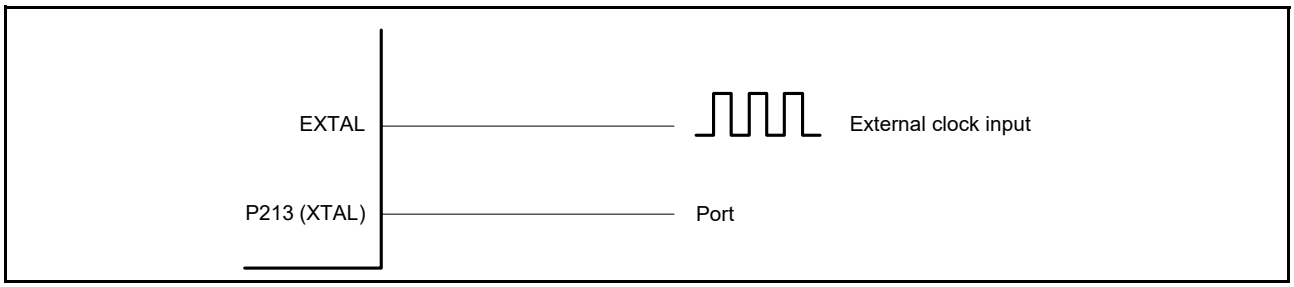

Figure 9.6 Equivalent circuit for external clock

9.3.3 Notes on External Clock Input

The frequency of the external clock input can only be changed while the main clock oscillator is stopped. Do not change the frequency of the external clock input when the main clock oscillator stop bit (MOSCCR.MOSTP) is 0.

9.4 Sub-Clock Oscillator

The only way of supplying a clock signal to the sub-clock oscillator is by connecting a crystal oscillator.

9.4.1 Connecting a 32.768-kHz Crystal Resonator

To supply a clock to the sub-clock oscillator, connect a 32.768-kHz crystal resonator as shown in Figure 9.7. A damping resistor (Rd) can be added, if required. Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor (Rf), insert an Rf between XCIN and XCOUT by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the sub-clock oscillator as described in Table 9.1.

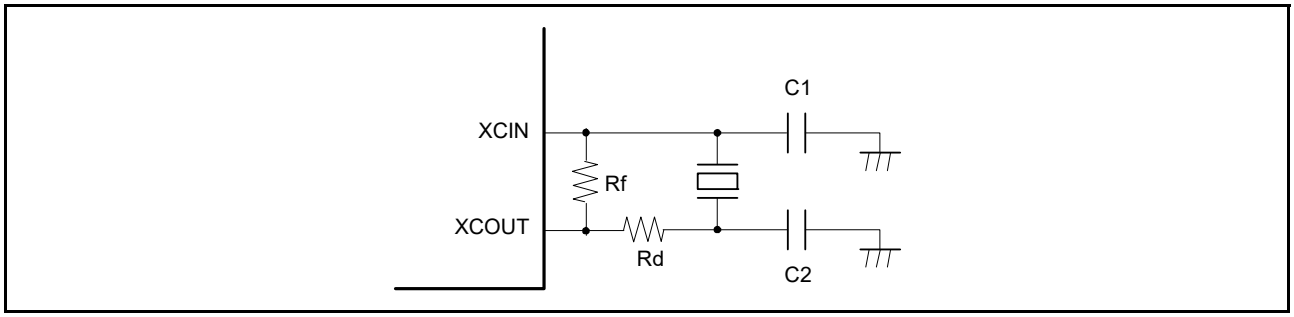

Figure 9.7 Connection example of 32.768-kHz crystal resonator

Figure 9.8 shows an equivalent circuit for the 32.768-kHz crystal resonator.

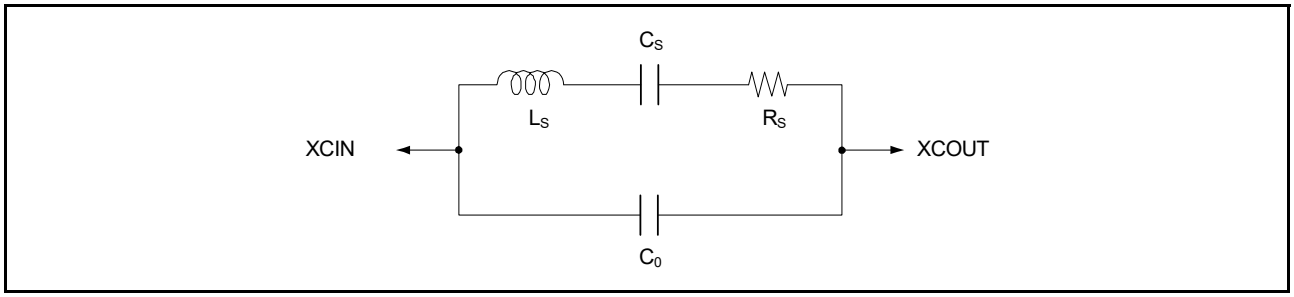

Figure 9.8 Equivalent circuit for the 32.768-kHz crystal resonator

9.4.2 Handling of Pins When the Sub-Clock Oscillator Is Not Used

When the sub-clock oscillator is not in use, connect the XCIN pin to VSS through a resistor (to pull VSS down) and leave the XCOUT pin open as shown in Figure 9.9. In addition, if an oscillator is not connected, set the sub-clock oscillator stop bit (SOSCCR.SOSTP) to 1 to stop the oscillator.

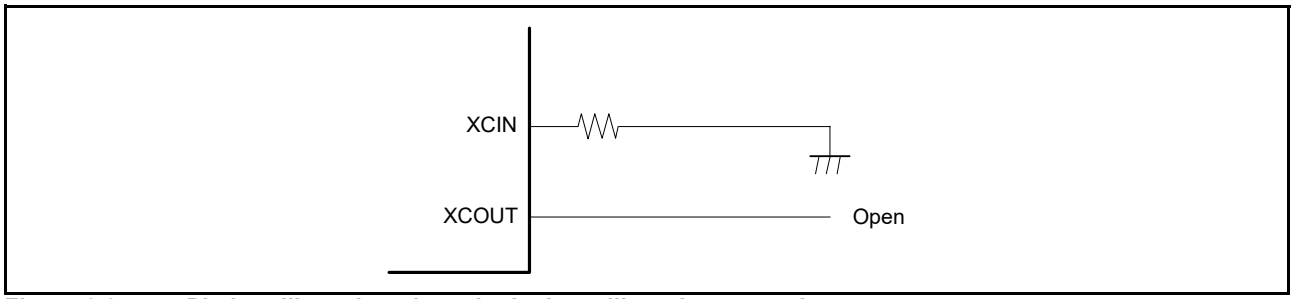

Figure 9.9 Pin handling when the sub-clock oscillator is not used

9.5 Oscillation Stop Detection Function

9.5.1 Oscillation Stop Detection and Operation after Detection

The oscillation stop detection function detects the main clock oscillator stop. When an oscillation stop is detected, the system clock switches as follows:

- If an oscillation stop is detected with SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC), the system clock source switches to the MOCO clock.
- If an oscillation stop is detected with PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL), the PLL clock remains as the system clock source. The frequency becomes free-running, and the setting in the SCKSCR.CKSEL[2:0] bits does not change.

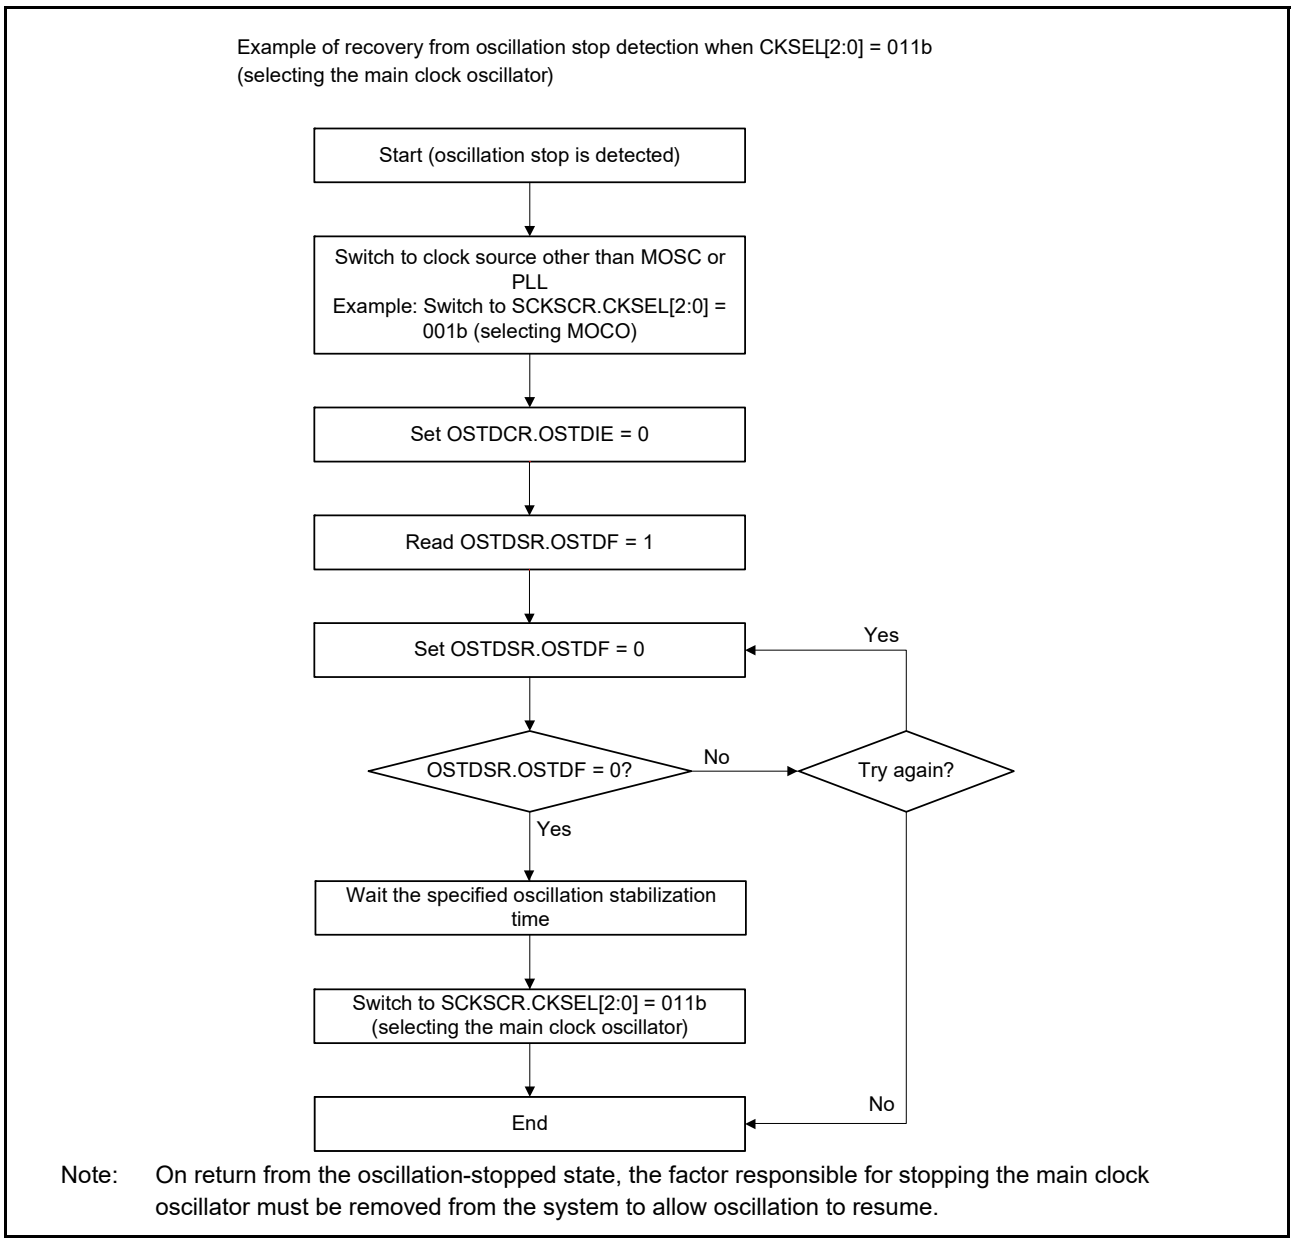
An oscillation stop detection interrupt request can be generated when an oscillation stop is detected. In addition, the General PWM Timer (GPT) output can be forced to a high-impedance state on detection.

The main clock oscillation stop is detected when the input clock remains at 0 or 1 for a certain period, for example, when a malfunction occurs in the main clock oscillator. See section 60, Electrical Characteristics.

Switching between the main clock oscillator and the MOCO clock or between the PLL clock and the PLL free-running clock is controlled by the oscillation stop detection flag (OSTDSR.OSTDF).

The OSTDF flag controls the switched clock as follows:

- When SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC):
  - When OSTDF changes from 0 to 1, the clock source switches to the MOCO clock.
  - When OSTDF changes from 1 to 0, the clock source switches to MOSC again.
- When PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
  - When OSTDF changes from 0 to 1, the clock source switches to the PLL free-running oscillation clock.
  - When OSTDF changes from 1 to 0, the clock source switches to PLL again.



To switch the clock source to the main clock oscillator or PLL clock again after oscillation stop detection, set the CKSEL[2:0] bits to a clock source other than the main clock oscillator or PLL clock, and clear the OSTDF flag to 0. Also, check that the OSTDF flag is not 1, and then set the CKSEL[2:0] bits to the main clock oscillator or PLL clock after the specified oscillation stabilization time elapses.

After a reset release, the main clock oscillator is stopped and the oscillation stop detection function is disabled. To enable the oscillation stop detection function, activate the main clock oscillator and write 1 to the oscillation stop detection function enable bit (OSTDCR.OSTDE) after the specified oscillation stabilization time elapses.

The oscillation stop detection function detects when the main clock oscillator is stopped by an external cause. This means that the oscillation stop detection function must be disabled before the main clock oscillator is stopped by software or before entering Software Standby or Deep Software Standby mode.

The oscillation stop detection function switches the following clocks to the MOCO clock (when the system clock is MOSC) or the PLL free-running clock (when the system clock is PLL):

- All clocks that can be selected as the MOSC clock or PLL except CLKOUT
- The system clock (ICLK) frequency during MOCO operation (when the system clock is MOSC) or PLL free-running operation (when the system clock is PLL) is specified in the MOCO oscillation frequency and the division ratio set in the system clock select bits (SCKDIVCR.ICK[2:0]).

Note: On return from the oscillation-stopped state, the factor responsible for stopping the main clock oscillator must be removed from the system to allow oscillation to resume.

Figure 9.10 Flow of recovery on detection of oscillator stop

9.5.2 Oscillation Stop Detection Interrupts

An oscillation stop detection interrupt (MOSC_STOP) is generated when the oscillation stop detection flag (OSTDSR.OSTDF) is 1 and the oscillation stop detection interrupt enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE) is 1 (enabled). The Port Output Enable for GPT (POEG) is notified of the main clock oscillator stop. On receiving the notification, the POEG sets the Oscillation Stop Detection Flag in the POEG Group n Setting Register (POEGGn.OSTPF) to 1 (n = A, B, C, D).

After the oscillation stop is detected, wait at least 10 cycles of PCLKB before writing to the POEGGn.OSTPF flag.

When the OSTDSR.OSTDF flag requires clearing, do so after clearing the oscillation stop detection interrupt enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE). Wait for at least 2 PCLKB cycles before setting the OSTDCR.OSTDIE bit to 1 again. A longer PCLKB wait time might be required, depending on the number of cycles required to read a given I/O register.

The oscillation stop detection interrupt is a non-maskable interrupt. Because non-maskable interrupts are disabled in the initial state after a reset release, enable non-maskable interrupts through software before using oscillation stop detection interrupts. For details, see section 14, Interrupt Controller Unit (ICU).

9.6 PLL Circuit

The PLL circuit provides a function for multiplying the frequency from the oscillator.

9.7 Internal Clock

Clock sources for the internal clock signals include:

- Main clock oscillator
- Sub-clock oscillator
- HOCO clock
- MOCO clock
- LOCO clock
- PLL clock
- Dedicated clock for the IWDT
- External clock for JTAG.

The following internal clocks are produced from these sources:

- Operating clock for the CPU, DMAC, DTC, flash memory, and SRAM — system clock (ICLK)
- Operating clocks for peripheral modules — PCLKA, PCLKB, PCLKC, and PCLKD
- Operating clock for the flash interface — FCLK
- Clock for the external bus controller and external pin output — EBCLK
- Clock for the external bus controller and external pin output for the SDRAM — SDCLK
- Operating clock for the USBFS and USBHS — UCLK
- Operating clock for the USBHS — USBMCLK
- Operating clock for the CAN — CANMCLK
- Operating clock for the CAC — CACCLK
- Operating clock for the RTC LOCO clock — RTCLCLK
- Operating clock for the RTC sub-clock — RTCSCLK
- Operating clock for the IWDT — IWDTCLK
- Operating clock for the AGT LOCO clock — AGTLCLK
- Operating clock for the AGT sub-clock — AGTSCLK
- Operating clock for the SysTick timer — SYSTICCLK
- Clock for external pin output — CLKOUT
- Operating clock for the JTAG — JTAGTCK.

For details on the registers used to set the frequencies of the internal clocks, see section 9.7.1, System Clock (ICLK) to section 9.7.15, JTAG Clock (JTAGTCK). If the value of any of these bits is changed, subsequent operation is at the frequency determined by the new value.

9.7.1 System Clock (ICLK)

The system clock, ICLK, is the operating clock for the CPU, DMAC, DTC, flash memory, and SRAM. Specify the frequency in the following bits:

- ICK[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

9.7.2 Peripheral Module Clock (PCLKA, PCLKB, PCLKC, PCLKD)

The peripheral module clocks, PCLKA, PCLKB, PCLKC, and PCLKD, are the operating clocks for the peripheral modules. Specify the frequency in the following bits:

- PCKA[2:0], PCKB[2:0], PCKC[2:0], and PCKD[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

9.7.3 Flash Interface Clock (FCLK)

The flash interface clock, FCLK, is the operating clock for the flash memory interface. In addition to reading from the data flash, it is used for the programming and erasure of the code flash and data flash. Specify the frequency in the following bits:

- FCK[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

9.7.4 External Bus Clock (BCLK)

The external bus clock, BCLK, is an operating clock for the external bus controller. It is also output externally from the EBCLK pin for the external connection bus. To output BCLK from the EBCLK pin, set the EBCKOCR.EBCKOEN bit to 1 and set the PmnPFS.PSEL[4:0] bits to 01011b. Only change the PmnPFS.PSEL[4:0] bits to 01011b when the EBCKOCR.EBCKOEN bit is 0. When the BCKCR.BCLKDIV bit is set to 1, the BCLK clock divided by 2 is output from the EBCLK pin. Specify the frequency in the following bits:

- BCK[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

Do not set BCLK to a frequency higher than that of the system clock (ICLK).

9.7.5 SDRAM Clock (SDCLK)

The SDRAM clock, SDCLK, is an operating clock for the external bus controller. It is output externally from the SDCLK pin for the SDRAM that is connected to the external bus. To output SDCLK on the SDCLK pin, set the SDCKOCR.SDCKOEN bit to 1 and set the PmnPFS.PSEL[4:0] bits to 01011b (enabling SDCLK output). Only change the value in the PmnPFS.PSEL[4:0] bits when the SDCKOCR.SDCKOEN bit is 0. Specify the frequency in the following bits:

- SCKDIVCR.BCK[2:0], SCKSCR.CKSEL[2:0], the PLLMUL[5:0], and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

Do not set SDCLK to a frequency higher than that of the system clock (ICLK).

9.7.6 USB Clock (UCLK)

The USB clock, UCLK, is the operating clock for the USBFS module. A 48-MHz clock must be supplied to the USBFS module. When the module is used, the UCLK clock must be specified as 48 MHz. Specify the frequency in the following bits:

- UCK[2:0] bits in SCKDIVCR2
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR.

9.7.7 USB-PHY Clock (USBMCLK)

The USB-PHY clock, USBMCLK, is the operating clock for the USBHS-PHY. The USBMCLK frequency is 24 MHz supplied from the main clock oscillator.

9.7.8 CAN Clock (CANMCLK)

The CAN clock, CANMCLK, is the operating clock for the CAN module. CANMCLK is generated by the main clock oscillator.

9.7.9 CAC Clock (CACCLK)

The CAC clock, CACCLK, is the operating clock for the CAC. CACCLK is generated by the following oscillators:

- Main clock oscillator
- Sub-clock oscillator
- High-speed clock oscillator (HOCO)
- Middle-speed clock oscillator (MOCO)
- Low-speed on-chip oscillator (LOCO)
- IWDT-dedicated on-chip oscillator.

9.7.10 RTC-Dedicated Clock (RTCSCLK, RTCLCLK)

The RTC-dedicated clocks, RTCSCLK and RTCLCLK, are the operating clocks for the RTC. RTCSCLK is generated by the sub-clock oscillator and RTCLCLK by the LOCO clock.

9.7.11 IWDT-Dedicated Clock (IWDTCLK)

The IWDT-dedicated clock, IWDTCLK, is the operating clock for the IWDT. IWDTCLK is internally generated by the IWDT-dedicated on-chip oscillator.

9.7.12 AGT-Dedicated Clock (AGTSCLK, AGTLCLK)

The AGT-dedicated clocks, AGTSCLK and AGTLCLK, are the operating clocks for the AGT. AGTSCLK is generated by the sub-clock oscillator and AGTLCLK is generated by the LOCO clock.

9.7.13 SysTick Timer-Dedicated Clock (SYSTICCLK)

The SysTick timer-dedicated clock, SYSTICCLK, is the operating clock for the SYSTICCLK. SYSTICCLK is generated by the LOCO clock.

9.7.14 Clock/Buzzer Output Clock (CLKOUT)

The CLKOUT is output externally from the CLKOUT pin for the clock or buzzer output. CLKOUT is output to the CLKOUT pin when CKOCR.CKOEN is set to 1. Only change the value in the CKODIV[2:0] or CKOSEL[2:0] bits in CKOCR when the CKOCR.CKOEN bit is 0. Specify the frequency in the following bits:

- CKODIV[2:0] or CKOSEL[2:0] bits in CKOCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ[1:0] bits in OFS1.

9.7.15 JTAG Clock (JTAGTCK)

The JTAG-dedicated clock, JTAGTCK, is the operating clock for the JTAG. JTAGTCK is generated by the external clock for JTAG (TCK).

9.8 Usage Notes

9.8.1 Restrictions on Clock Generation Circuit

The frequencies of the system clock (ICLK), peripheral module clock (PCLKA to PCLKD), flash interface clock (FCLK), external bus clock (BCLK), and SDRAM clock (SDCLK) supplied to each module change according to the settings in SCKDIVCR. Each frequency must meet the following conditions:

- Each frequency must be selected within the operation-guaranteed range of the clock cycle time (tcyc) specified in the AC electrical characteristics. See section 60, Electrical Characteristics.
- The frequencies must not exceed the ranges listed in Table 9.2.
- The peripheral modules operate on PCLKB and PCLKA. As a result, the operating speed of modules such as the timer and SCI is different before and after the frequency is changed.
- The system clock (ICLK), peripheral module clock (PCLKA to PCLKD), flash interface clock (FCLK), and external bus clock (BCLK) must be set as shown in Table 9.2.

Do not change the clock frequency during external bus access. Additionally, when external bus access starts after a change to the clock frequency, always confirm that the frequency changes are complete before starting the access. To ensure correct processing after the clock frequency changes, first write to the relevant clock control register to change the frequency, then read the value from the register, and finally perform the subsequent processing.

9.8.2 Restrictions on the Resonator

Because the resonator characteristics relate closely to your board design, adequate evaluation is required before use. See the resonator connection example in Figure 9.7. The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Always consult the resonator manufacturer when determining the circuit constants. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

9.8.3 Restrictions on Board Design

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Route other signal lines away from the oscillation circuit, as shown in Figure 9.11, to prevent electromagnetic induction from interfering with correct oscillation.

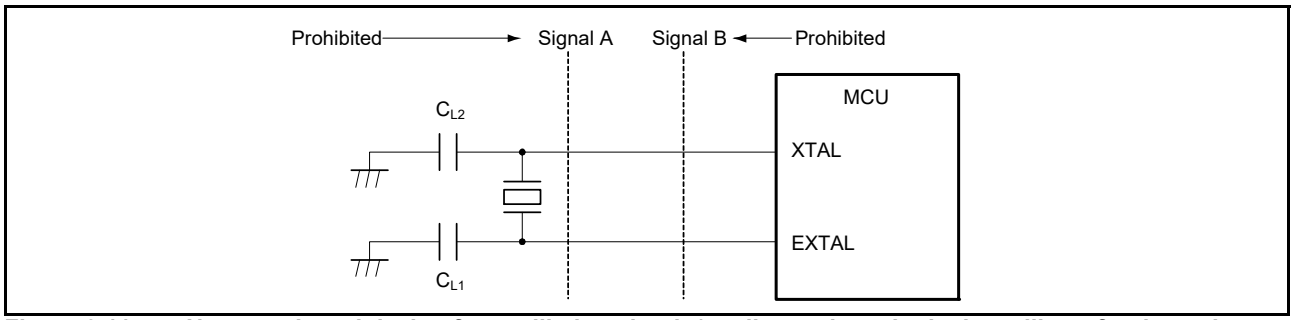


Figure 9.11 Notes on board design for oscillation circuit (applies to the sub-clock oscillator for the main clock oscillator)

9.8.4 Restrictions on the Resonator Connect Pin

When the main clock oscillator is not used, the EXTAL and XTAL pins can be used as general ports P212 and P213. When these pins are used as general ports, the main clock oscillator must be stopped (MOSCCR.MOSTP must be set to 1).

10. Clock Frequency Accuracy Measurement Circuit (CAC)

10.1 Overview

The Clock Frequency Accuracy Measurement Circuit (CAC) counts the number of pulses of the system clock to be measured (measurement target clock) within the time generated by the clock to be used as a measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range.

When measurement is completed or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.

Table 10.1 lists the CAC specifications, Figure 10.1 shows the block diagram, and Table 10.2 describes the I/O pins.

Table 10.1 CAC specifications

Parameter	Specifications
Measurement target clocks	Frequency can be measured for: • Main clock oscillator • Sub-clock oscillator • HOCO clock • MOCO clock • LOCO clock • IWDTCLK clock • Peripheral module clock B (PCLKB)
Measurement reference clocks	Frequency can be referenced to: • External clock input to the CACREF pin • Main clock oscillator • Sub-clock oscillator • HOCO clock • MOCO clock • LOCO clock • IWDTCLK clock • Peripheral module clock B (PCLKB)
Selectable function	Digital filter
Interrupt sources	• Measurement end • Frequency error • Overflow
Module-stop function	Module-stop state can be set to reduce power consumption

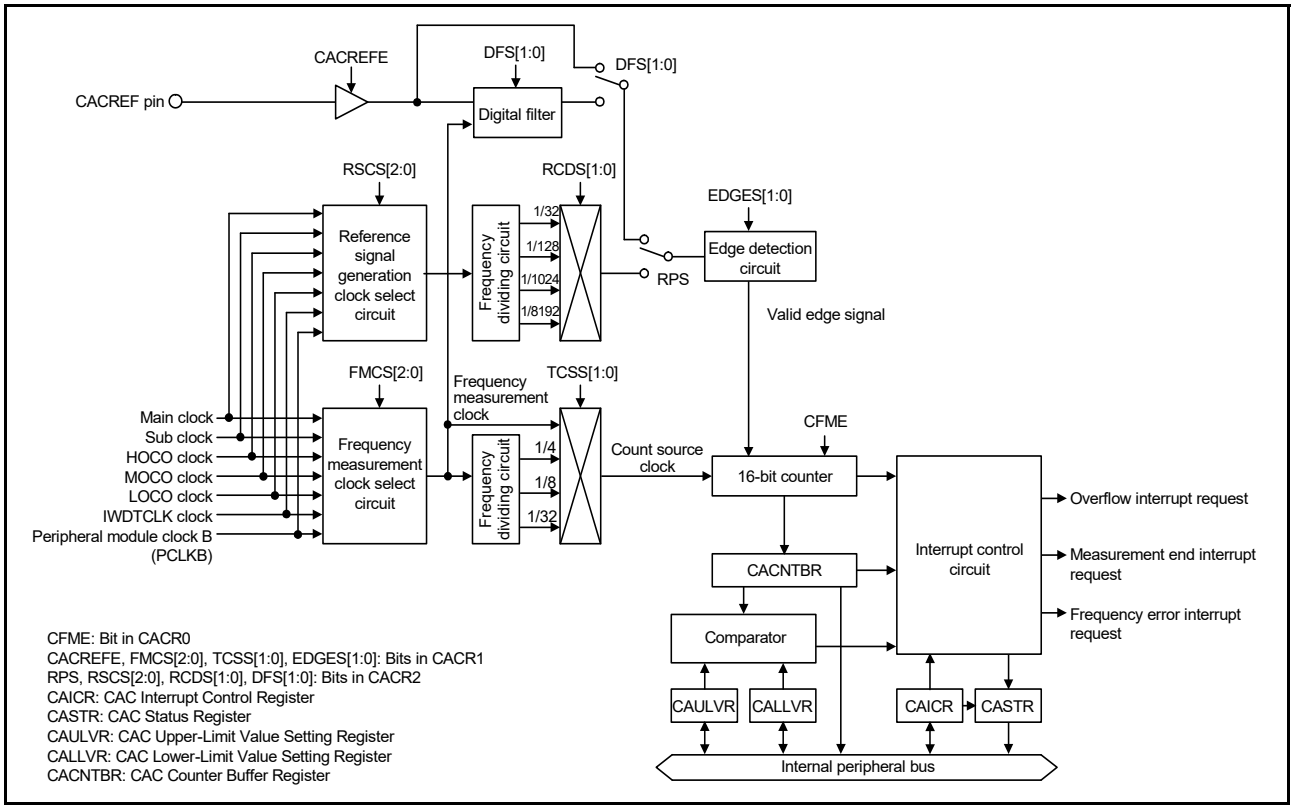

Figure 10.1 CAC block diagram

Table 10.2 CAC I/O pin

Pin name	I/O	Function
CACREF	Input	Measurement reference clock input pin

10.2 Register Descriptions

10.2.1 CAC Control Register 0 (CACR0)

Address(es): CAC.CACR0 4004 4600h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CFME
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CFME	Clock Frequency Measurement Enable	0: Disable 1: Enable.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CFME bit (Clock Frequency Measurement Enable)

The CFME bit enables clock frequency measurement. Read the CFME bit to confirm that the bit value has changed. Additional write accesses are ignored before the change is complete.

10.2.2 CAC Control Register 1 (CACR1)

Address(es): CAC.CACR1 4004 4601h

	b7	b6	b5	b4	b3	b2	b1	b0
	EDGES[1:0]		TCSS[1:0]		FMCS[2:0]			CACREFE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CACREFE	CACREF Pin Input Enable	0: Disable 1: Enable.	R/W
b3 to b1	FMCS[2:0]	Measurement Target Clock Select	b3 b1 0 0 0: Main clock oscillator 0 0 1: Sub-clock oscillator 0 1 0: HOCO clock 0 1 1: MOCO clock 1 0 0: LOCO clock 1 0 1: Peripheral module clock (PCLKB) 1 1 0: IWDTCLK clock 1 1 1: Setting prohibited.	R/W
b5, b4	TCSS[1:0]	Measurement Target Clock Frequency Division Ratio Select	b5 b4 0 0: No division 0 1: ×1/4 clock 1 0: ×1/8 clock 1 1: ×1/32 clock.	R/W
b7, b6	EDGES[1:0]	Valid Edge Select	b7 b6 0 0: Rising edge 0 1: Falling edge 1 0: Both rising and falling edges 1 1: Setting prohibited.	R/W

Note 1. Set the CACR1 register when the CACR0.CFME bit is 0.

CACREFE bit (CACREF Pin Input Enable)

The CACREFE bit enables the CACREF pin input.

FMCS[2:0] bits (Measurement Target Clock Select)

The FMCS[2:0] bits select the measurement target clock whose frequency is to be measured.

TCSS[1:0] bits (Measurement Target Clock Frequency Division Ratio Select)

The TCSS[1:0] bits select the division ratio of the measurement target clock.

EDGES[1:0] bits (Valid Edge Select)

The EDGES[1:0] bits select the valid edge for the reference signal.

10.2.3 CAC Control Register 2 (CACR2)

Address(es): CAC.CACR2 4004 4602h

	b7	b6	b5	b4	b3	b2	b1	b0
	DFS[1:0]		RCDS[1:0]		RSCS[2:0]			RPS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	RPS	Reference Signal Select	0: CACREF pin input 1: Internal clock (internally generated signal).	R/W
b3 to b1	RSCS[2:0]	Measurement Reference Clock Select	b3 b1 0 0 0: Main clock oscillator 0 0 1: Sub-clock oscillator 0 1 0: HOCO clock 0 1 1: MOCO clock 1 0 0: LOCO clock 1 0 1: Peripheral module clock (PCLKB) 1 1 0: IWDTCLK clock 1 1 1: Setting prohibited.	R/W
b5, b4	RCDS[1:0]	Measurement Reference Clock Frequency Division Ratio Select	b5 b4 0 0: ×1/32 clock 0 1: ×1/128 clock 1 0: ×1/1024 clock 1 1: ×1/8192 clock.	R/W
b7, b6	DFS[1:0]	Digital Filter Select	b7 b6 0 0: Disable digital filtering 0 1: Use sampling clock for the digital filter as the frequency measuring clock 1 0: Use sampling clock for the digital filter as the frequency measuring clock divided by 4 1 1: Use sampling clock for the digital filter as the frequency measuring clock divided by 16.	R/W

Note 1. Set the CACR2 register when the CACR0.CFME bit is 0.

RPS bit (Reference Signal Select)

The RPS bit selects whether to use the CACREF pin input or an internal clock (internally generated signal) as the reference signal.

RSCS[2:0] bits (Measurement Reference Clock Select)

The RSCS[2:0] bits select the reference clock for measurement.

RCDS[1:0] bits (Measurement Reference Clock Frequency Division Ratio Select)

The RCDS[1:0] bits select the division ratio of the reference clock, when an internal reference clock is selected (RPS = 1). When RPS = 0 (CACREF pin is used as the reference clock source), the reference clock is not divided.

DFS[1:0] bits (Digital Filter Select)

The setting of the DFS[1:0] bits enables or disables the digital filter and selects its sampling clock.

10.2.4 CAC Interrupt Control Register (CAICR)

Address(es): CAC.CAICR 4004 4603h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	OVFFCL	MENDFCL	FERRFCL	—	OVFIE	MENDIE	FERRIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FERRIE	Frequency Error Interrupt Request Enable	0: Disable 1: Enable.	R/W
b1	MENDIE	Measurement End Interrupt Request Enable	0: Disable 1: Enable.	R/W
b2	OVFIE	Overflow Interrupt Request Enable	0: Disable 1: Enable.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	FERRFCL	FERRF Clear	When 1 is written to this bit, the CASTR.FERRF flag is cleared. This bit is read as 0.	R/W
b5	MENDFCL	MENDF Clear	When 1 is written to this bit, the CASTR.MENDF flag is cleared. This bit is read as 0.	R/W
b6	OVFFCL	OVFF Clear	When 1 is written to this bit, the CASTR.OVFF flag is cleared. This bit is read as 0.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

FERRIE bit (Frequency Error Interrupt Request Enable)

The FERRIE bit enables the frequency error interrupt request.

MENDIE bit (Measurement End Interrupt Request Enable)

The MENDIE bit enables the measurement end interrupt request.

OVFIE bit (Overflow Interrupt Request Enable)

The OVFIE bit enables the overflow interrupt request.

FERRFCL bit (FERRF Clear)

Writing 1 to the FERRFCL bit clears the CASTR.FERRF flag.

MENDFCL bit (MENDF Clear)

Writing 1 to the MENDFCL bit clears the CASTR.MENDF flag.

OVFFCL bit (OVFF Clear)

Writing 1 to the OVFFCL bit clears the CASTR.OVFF flag.

10.2.5 CAC Status Register (CASTR)

Address(es): CAC.CASTR 4004 4604h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	OVFF	MENDF	FERRF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FERRF	Frequency Error Flag	0: Clock frequency is within the allowable range 1: Clock frequency has deviated beyond the allowable range (frequency error).	R
b1	MENDF	Measurement End Flag	0: Measurement is in progress 1: Measurement ended.	R
b2	OVFF	Overflow Flag	0: Counter has not overflowed 1: Counter overflowed.	R
b7 to b3	—	Reserved	These bits are read as 0.	R

FERRF flag (Frequency Error Flag)

The FERRF flag indicates a deviation of the clock frequency from the set value (frequency error).

[Setting condition]

- The clock frequency is outside the allowable range defined in the CAULVR and CALLVR registers.

[Clearing condition]

- 1 is written to the FERRFCL bit.

MENDF flag (Measurement End Flag)

The MENDF flag indicates the end of measurement.

[Setting condition]

- Measurement completes.

[Clearing condition]

- 1 is written to the MENDFCL bit.

OVFF flag (Overflow Flag)

The OVFF flag indicates that the counter overflowed.

[Setting condition]

- The counter overflows.

[Clearing condition]

- 1 is written to the OVFFCL bit.

10.2.6 CAC Upper-Limit Value Setting Register (CAULVR)

Address(es): CAC.CAULVR 4004 4606h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CAULVR is a 16-bit read/write register that specifies the upper value of the allowable range. When the counter value exceeds the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0.

The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.

10.2.7 CAC Lower-Limit Value Setting Register (CALLVR)

Address(es): CAC.CALLVR 4004 4608h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CALLVR is a 16-bit read/write register that specifies the lower value of the allowable range. When the counter value falls below the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0.

The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.

10.2.8 CAC Counter Buffer Register (CACNTBR)

Address(es): CAC.CACNTBR 4004 460Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CACNTBR is a 16-bit read-only register that stores the measurement result.

10.3 Operation

10.3.1 Measuring Clock Frequency

The CAC measures the clock frequency using the CACREF pin input or an internal clock as a reference. Figure 10.2 shows an operating example of the CAC.

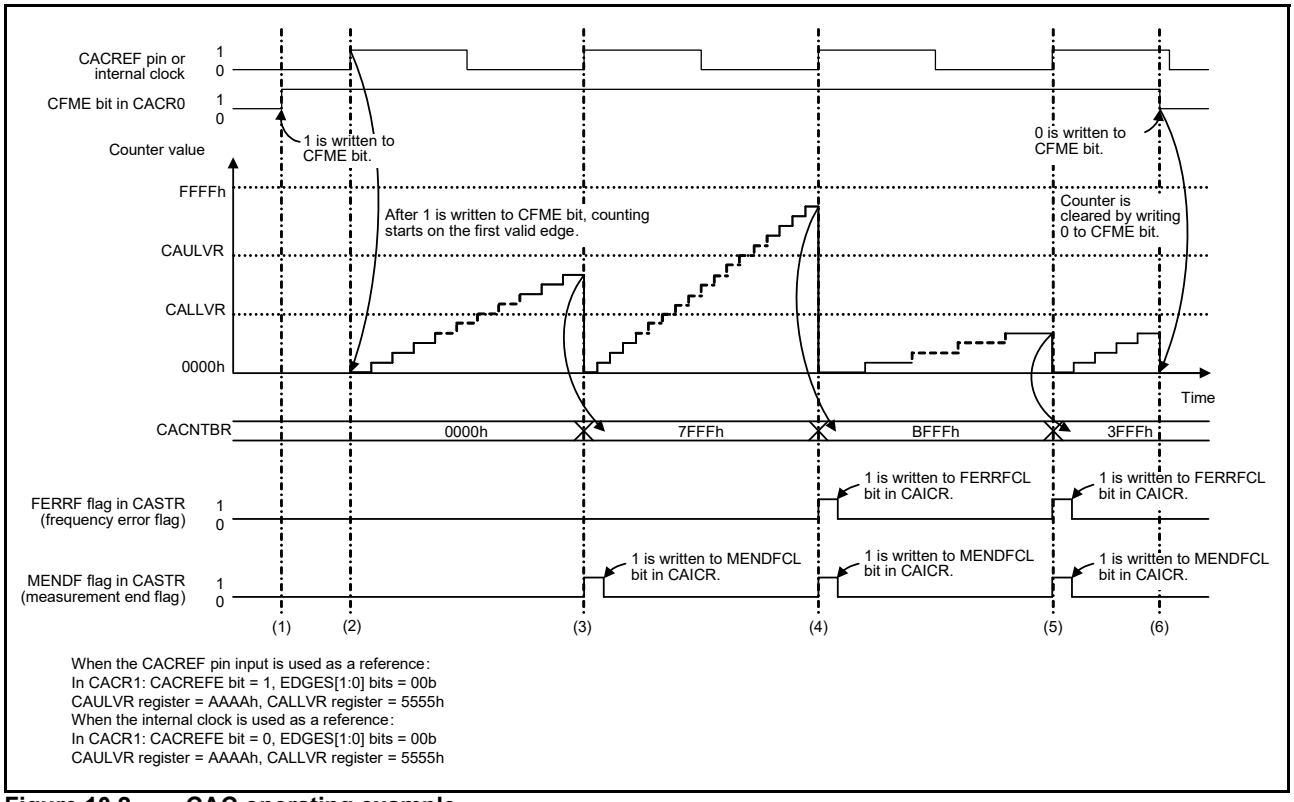

Figure 10.2 CAC operating example

The events in Figure 10.2 are:

1. Before writing 1 to CACR0.CFME, set CACR1 and CACR2 to define the measurement target clock and measurement reference clock. Writing 1 to the CACR0.CFME bit enables clock frequency measurement.
2. The timer starts counting up if the valid edge selected in the CACR1.EDGES[1:0] bits is input from the measurement reference clock. In Figure 10.2, the valid edge is a rising edge (CACR1.EDGES[1:0] = 00b).
3. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If both CACNTBR ≤ CAULVR and CACNTBR ≥ CALLVR are true, only the MENDF flag in CASTR is set to 1, because the clock frequency is correct. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
4. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If CACNTBR > CAULVR, the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
5. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If CACNTBR < CALLVR, the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
6. When the CFME bit in CACR0 is 1, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR every time a valid edge is input. Writing 0 to the CFME bit in CACR0 clears the counter and stops up-counting.

10.3.2 Digital Filtering of Signals on CACREF Pin

The CACREF pin has a digital filter, and levels on the CACREF pin are transmitted to the internal circuitry after three consecutive matches in the selected sampling interval. The same level continues to be transmitted internally until the level on the pin has three consecutive matches again. Enabling or disabling of the digital filter and its sampling clock are selectable.

The counter value transferred to CACNTBR might be in error by up to one cycle of the sampling clock because of the difference between the phases of the digital filter and the signal input to the CACREF pin. When a frequency dividing clock is selected as a count source clock, the counter value error is obtained by the following formula:

Counter value error = (One cycle of the count source clock) / (One cycle of the sampling clock)

10.4 Interrupt Requests

The CAC generates three interrupt requests:

- Frequency error interrupt
- Measurement end interrupt
- Overflow interrupt.

When an interrupt source is generated, the associated status flag is set to 1. Table 10.3 provides information on the CAC interrupt requests.

Table 10.3 CAC interrupt requests

Interrupt request	Interrupt enable bit	Status flag	Interrupt sources
Frequency error interrupt	CAICR.FERRIE	CASTR.FERRF	Result of comparing CACNTBR with CAULVR and CALLVR is either CACNTBR > CAULVR or CACNTBR < CALLVR
Measurement end interrupt	CAICR.MENDIE	CASTR.MENDF	• Valid edge is input from the CACREF pin or internal clock • Measurement end interrupt does not occur at the first valid edge after writing 1 to the CACR0.CFME bit
Overflow interrupt	CAICR.OVFIE	CASTR.OVFF	Counter overflows

10.5 Usage Note

10.5.1 Settings for the Module-Stop Function

CAC operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The CAC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

11. Low Power Modes

11.1 Overview

The MCU provides multiple functions for reducing power consumption, such as setting clock dividers, controlling EBCLK output, controlling SDCLK output, stopping modules, selecting power control mode in normal mode, and transitioning to low power modes.

Table 11.1 lists the specifications of the low power mode functions. Table 11.2 list the conditions to transition to low power modes, the states of the CPU and peripheral modules, and the method for canceling each mode. After a reset, the MCU enters the program execution state, but only the DMAC, DTC, and SRAM operate.

Table 11.1 Specifications of the low power mode functions

Parameter	Specifications
Reducing power consumption by switching clock signals	Frequency division ratio independently selectable for the system clock (ICLK), peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD), external bus clock (BCLK), and flash interface clock (FCLK)*1
EBCLK output control	Selectable to BCLK output or high-level output
SDCLK output control	Selectable to SDCLK output or high-level output
Module-stop state	Peripheral module functions can be stopped independently
Low-power modes	• Sleep mode • Software Standby mode • Snooze mode • Deep Software Standby mode
Power control modes	Power consumption can be reduced in Normal, Sleep, and Snooze modes by selecting an appropriate operating power control mode according to the operating frequency and voltage. Available operating power control modes: • High-speed mode • Low-speed mode • Subosc-speed mode

Note 1. For details, see section 9, Clock Generation Circuit.

Table 11.2 Operating conditions of each low power mode (1 of 3)

Parameter	Sleep mode	Software Standby mode	Snooze mode*1	Deep Software Standby mode
Transition condition	WFI instruction while SBYCR.SSBY = 0	WFI instruction while SBYCR.SSBY = 1 and DPSBYCR.DPSBY = 0	Snooze request trigger in Software Standby mode. SNZCR.SNZE = 1	WFI instruction while SBYCR.SSBY = 1 and DPSBYCR.DPSBY = 1
Canceling method	All interrupts. Any reset available in the mode.	Interrupts shown in Table 11.3. Any reset available in the mode.	Interrupts shown in Table 11.3. Any reset available in the mode.	Interrupts shown in Table 11.3. Any reset available in the mode.

Power-on reset circuit	Operating	Operating	Operating	Operating*17
Other peripheral modules	Selectable	Stop (Retained)	Operation prohibited	Stop (Undefined)
I/O Ports	Operating	Retained*18	Operating	Retained*18

Note: Selectable means that operating or not operating can be selected by the control registers.
Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.
Operation prohibited means that the function must be stopped before entering Software Standby mode.
Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.

Note 1. All modules whose module-stop bits are 0 start as soon as PCLKs are supplied after entering Snooze mode. To avoid an increase in ICC in Snooze mode, set the module-stop bit of modules that are not required in Snooze mode to 1 before entering Software Standby mode.

Note 2. When using SCI0 in Snooze mode, the MOSCCR.MOSTP and PLLCR.PLLSTP bits must be 1.

Note 3. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, the oscillator status is the same as before entering Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, the oscillator stops when the MCU enters Deep Software Standby mode.

Note 4. Stopped when the clock output source select bits (CKOCR.CKOSEL[2:0]) are set to a value other than 010b (LOCO) and 100b (SOSC).

Note 5. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, data in the Standby SRAM is retained in Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, data in the Standby SRAM is retained is undefined in Deep Software Standby mode.

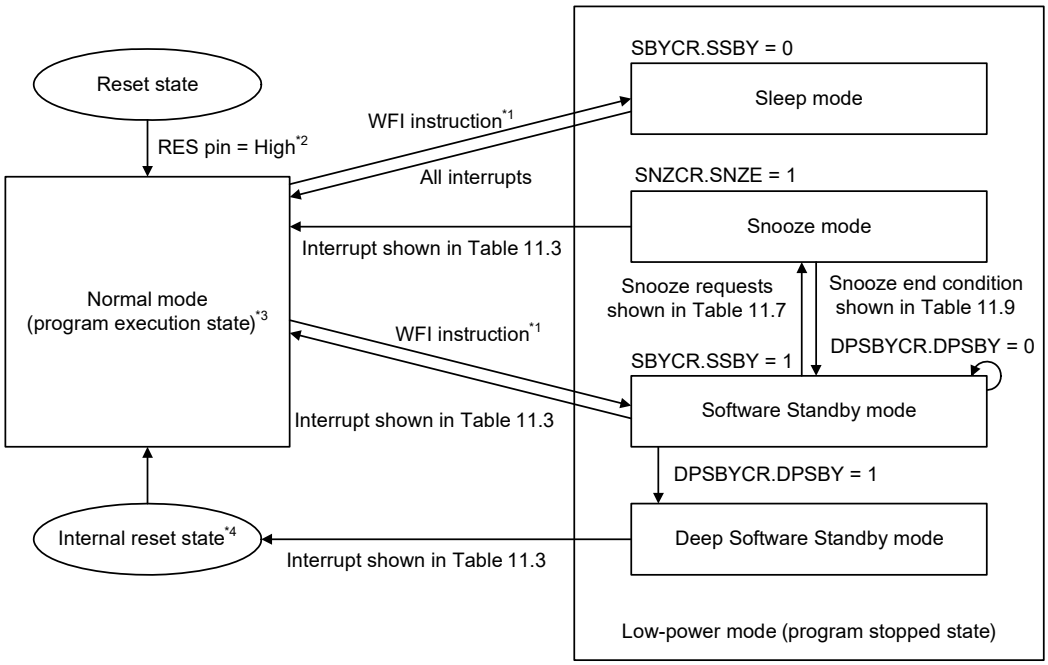
Note 6. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, the values of the USB resume detection circuit registers are retained and detection of USB resumption is enabled, and the values of other registers are undefined in Deep Software Standby mode.
When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, the values of all registers are undefined in Deep Software Standby mode.

Note 7. In IWDT-dedicated on-chip oscillator and IWDT, operating or stopping is selected by setting the IWDT Stop Control Bit (IWDTSTPCTL) in Option Function Select Register 0 (OFS0) in IWDT auto-start mode.
In WDT, operating or stopping is selected by setting the WDT Stop Control bit (WDTSTPCTL) in Option Function Select Register 0 (OFS0) in WDT auto-start mode.

Note 8. When the RCR4.RCKSEL bit set to 1 (LOCO), the DPSBYCR.DEEPCUT[1:0] bits must set to 00b before entering Deep Software Standby mode.

Note 9. AGT0 operation is possible when 100b (AGTLCLK) or 110b (AGTSCLK) is selected in the AGT0.AGTMR1.TCK[2:0] bits.
AGT1 operation is possible when 100b (AGTLCLK), 110b (AGTSCLK) or 101 (underflow event signal from AGT0) is selected in the AGT1.AGTMR1.TCK[2:0] bits.
When 100b (AGTLCLK) is selected in AGTn.AGTMR1.TCK[2:0] bits (n = 0, 1), the DPSBYCR.DEEPCUT[1:0] bits must set to 00b before entering Deep Software Standby mode.

Note 10. Event lists the restrictions described in section 11.10.14, ELC Events in Snooze Mode.



Note 11. Only VCOUT function is permitted. The VCOUT pin operates when ACMPHS uses no digital filter.
For details on digital filter, see section 50., High-Speed Analog Comparator (ACMPHS).

Note 12. When CMPCTL0.CSTEN bit is 1, canceling Software Standby Mode or entering Snooze mode by the comparator detection is available.
Note 13. When using the Programmable Gain Amplifiers, MSTPDn (n = 15, 16) must be set to 0. For details, see section 47.3.12, Programmable Gain Amplifiers.
Note 14. IIC0 wakeup interrupt is available.
Note 15. Serial communication mode of SCI0 is asynchronous mode.
Note 16. When using LVD in Deep Software Standby mode, DPSBYCR.DEEPCUT[1:0] bits must be 00b or 01b before entering Deep Software Standby mode.
Note 17. When the MCU enters Deep Software Standby mode with the DPSBYCR.DEEPCUT[1:0] bits set to 11b, the LVD circuit stops and the low-power function of the power-on reset circuit is enabled.
Note 18. For the address bus and bus control signals (For SRAM: [CS0 to CS7, RD, WR0 to WR1, WR, and BC0 to BC1], and for SDRAM: [SDCS, RAS, CAS and WE]), keeping the output state or changing to the high-impedance state can be selected in the SBYCR.OPE bit.
Note 19. When using the 12-Bit A/D Converter in Snooze mode, the ADCMPCR.CMPAE and ADCMPCR.CMPBE bits must be 1.

Table 11.3 Interrupt sources for canceling Snooze, Software Standby, and Deep Software Standby modes

Interrupt source	Name	Software Standby mode	Snooze mode	Deep Software Standby mode
NMI		Yes	Yes	Yes
Port	PORT_IRQn (n = 0 to 15)	Yes	Yes	No
	PORT_IRQn-DS (n = 0 to 15)	Yes	Yes	Yes
LVD	LVD_LVD1	Yes	Yes	Yes
	LVD_LVD2	Yes	Yes	Yes
IWDT	IWDT_NMIUNDF	Yes	Yes	No
USBFS	USBFS_USBR	Yes	Yes	Yes
USBHS	USBHS_USBIR	Yes	Yes	Yes
RTC	RTC_ALM	Yes	Yes	Yes
	RTC_PRD	Yes	Yes	Yes
KINT	KEY_INTKR	Yes	Yes	No
AGT1	AGT1_AGTI	Yes	Yes*3	Yes
	AGT1_AGTCMAI	Yes	Yes	No
	AGT1_AGTCMBI	Yes	Yes	No
ACMPHS	ACMP_HS0	Yes	Yes	No
IIC0	IIC0_WUI	Yes	No	No
ADC12n (n = 0, 1)	ADC12n_WCMPM	No	Yes with SELSR0*1,*3	No
	ADC12n_WCMPUM	No	Yes with SELSR0*1,*3	No
SCI0	SCI0_AM	No	Yes with SELSR0*1,*2	No
	SCI0_RXI_OR_ERI	No	Yes with SELSR0*1,*2	No
DTC	DTC_COMPLETE	No	Yes with SELSR0*1,*3	No
DOC	DOC_DOPCI	No	Yes with SELSR0*1	No
CTSU	CTSU_CTSUFN	No	Yes with SELSR0*1	No

Note 1. To use the interrupt request as a trigger for exiting Snooze mode, the request must be selected in SELSR0. See section 14, Interrupt Controller Unit (ICU). When a trigger selected in SELSR0 occurs after executing a WFI instruction and during the transition from Normal to Software Standby mode, the request might or might not be accepted, depending on the timing of the occurrence.
Note 2. Only one of either SCI0_AM or SCI0_RXI_OR_ERI can be set.
Note 3. The event that is enabled by the SNZEDCR register must not be used.

Note 1. When an interrupt that acts as a trigger for cancel is received during a transition to the program stopped state after the execution of a WFI instruction, the MCU executes interrupt exception handling instead of transitioning to low power mode.
Note 2. The MOCO clock is the source of the operating clock following a transition from the reset state to Normal mode.
Note 3. The transition to Normal mode is made because of an interrupt from Sleep, Snooze, or Software Standby mode. The clock source is the same as before entering the low power mode.
Note 4. When an available interrupt request is generated, an internal reset (Deep Software Standby reset) is generated over a fixed period. Canceling of Deep Software Standby mode accompanies release from the internal reset state, and then the MCU transitions to Normal mode and execute a reset exception processing with the MOCO clock as the source of the operating clock.

Figure 11.1 Mode transitions

11.2 Register Descriptions

11.2.1 Standby Control Register (SBYCR)

Address(es): SYSTEM.SBYCR 4001 E00Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SSBY	OPE	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b13 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	OPE	Output Port Enable	0: In Software Standby or Deep Software Standby mode, set the address bus and bus control signals to the high-impedance state. In Snooze mode, the status of the address bus and bus control signals are the same as before entering Software Standby mode. 1: In Software Standby or Deep Software Standby mode, retain the output state of the address bus and bus control signals.	R/W
b15	SSBY	Software Standby	0: Sleep mode 1: Software Standby mode when DPSBYCR.DPSBY = 0 and Deep Software Standby mode when DPSBYCR.DPSBY = 1.	R/W

OPE bit (Output Port Enable)

The OPE bit specifies whether to set to the high-impedance state or to retain the output of the address bus and bus control signals (for SRAM: CS0 to CS7, RD, WR0 to WR1, WR, and BC0 to BC1, and for SDRAM: SDCS, RAS, CAS, and WE) in Software Standby mode or Deep Software Standby mode.

SSBY bit (Software Standby)

The SSBY bit specifies the target transition after a WFI instruction is executed. When the SSBY bit is set to 1, the MCU enters Software Standby mode after executing the WFI instruction. When the MCU cancels Software Standby mode by an interrupt, the SSBY bit remains set to 1. The SSBY bit can be cleared by writing 0 to it.

When the OSTDCR.OSTDE bit is 1, the SSBY bit is ignored. Even if the SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

When the FENTRYR.FENTRYi bit (i = 0 to 3) is 1 or the FENTRYR.FENTRYD bit is 1, the SSBY bit is ignored. Even if the SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction. See Table 11.6 for details.

When using the HOCO clock to enter Software Standby mode, STCONR.STCON[1:0] must be set to 00b, and HOCOWTCR.HSTS[2:0] must be set to 110b. However, when using SCI0 in Snooze mode, HOCOWTCR.HSTS[2:0] must be set to 010b.

11.2.2 Module Stop Control Register A (MSTPCRA)

Address(es): SYSTEM.MSTPCRA 4001 E01Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	MSTPA22	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	0	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	MSTPA7	MSTPA6	MSTPA5	—	—	—	MSTPA1	MSTPA0
Value after reset:	1	1	1	1	1	1	1	1	0	0	0	1	1	1	0	0

Bit	Symbol	Bit name	Description	R/W
b0	MSTPA0	SRAM0 Module Stop*1	Target module: SRAM0 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b1	MSTPA1	SRAM1 Module Stop	Target module: SRAM1 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b4 to b2	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b5	MSTPA5	High-Speed SRAM Module Stop	Target module: high-speed SRAM 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b6	MSTPA6	DED SRAM Module Stop*1	Target module: DED SRAM 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b7	MSTPA7	Standby SRAM Module Stop	Target module: Standby SRAM 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b21 to b8	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b22	MSTPA22	DMA Controller/Data Transfer Controller Module Stop*2	Target modules: DMAC, DTC 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b31 to b23	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note 1. The MSTPA0 and MSTPA6 bit settings must be the same.
Note 2. When rewriting the MSTPA22 bit from 0 to 1, disable the DMAC and DTC before setting the MSTPA22 bit.

11.2.3 Module Stop Control Register B (MSTPCRB)

Address(es): MSTP.MSTPCRB 4004 7000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MSTPB15	MSTPB14	MSTPB13	MSTPB12	MSTPB11	—	MSTPB9	MSTPB8	MSTPB7	MSTPB6	MSTPB5	—	—	MSTPB2	MSTPB1	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b1	MSTPB1	Controller Area Network 1 Module Stop*1	Target module: CAN1 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b2	MSTPB2	Controller Area Network 0 Module Stop*1	Target module: CAN0 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b4, b3	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b5	MSTPB5	IrDA Module Stop	Target module: IrDA 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b6	MSTPB6	Quad Serial Peripheral Interface Module Stop	Target module: QSPI 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b7	MSTPB7	I2C Bus Interface 2 Module Stop	Target module: IIC2 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b8	MSTPB8	I2C Bus Interface 1 Module Stop	Target module: IIC1 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b9	MSTPB9	I2C Bus Interface 0 Module Stop	Target module: IIC0 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b10	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b11	MSTPB11	Universal Serial Bus 2.0 FS Interface Module Stop*2	Target module: USBFS 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b12	MSTPB12	Universal Serial Bus 2.0 HS Interface Module Stop	Target module: USBHS 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b13	MSTPB13	EPTPC and PTPEDMAC Module Stop*3	Target modules: EPTPC and PTPEDMAC 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b14	MSTPB14	ETHERC1 and EDMAC1 Module Stop	Target modules: ETHERC1 and EDMAC1 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b15	MSTPB15	ETHERC0 and EDMAC0 Controller Module Stop	Target modules: ETHERC0, EDMAC0 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b17, b16	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Bit	Symbol	Bit name	Description	R/W
b18	MSTPB18	Serial Peripheral Interface 1 Module Stop	Target module: SPI1 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b19	MSTPB19	Serial Peripheral Interface 0 Module Stop	Target module: SPI0 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b21, b20	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b22	MSTPB22	Serial Communication Interface 9 Module Stop	Target module: SCI9 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b23	MSTPB23	Serial Communication Interface 8 Module Stop	Target module: SCI8 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b24	MSTPB24	Serial Communication Interface 7 Module Stop	Target module: SCI7 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b25	MSTPB25	Serial Communication Interface 6 Module Stop	Target module: SCI6 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b26	MSTPB26	Serial Communication Interface 5 Module Stop	Target module: SCI5 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b27	MSTPB27	Serial Communication Interface 4 Module Stop	Target module: SCI4 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b28	MSTPB28	Serial Communication Interface 3 Module Stop	Target module: SCI3 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b29	MSTPB29	Serial Communication Interface 2 Module Stop	Target module: SCI2 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b30	MSTPB30	Serial Communication Interface 1 Module Stop	Target module: SCI1 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b31	MSTPB31	Serial Communication Interface 0 Module Stop	Target module: SCI0 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W

Note 1. The MSTPBi bit must be written to while the oscillation of the clock controlled by this bit is stable. To enter Software Standby mode after writing to this bit, wait for two CAN clock (CANMCLK) cycles after writing, then execute a WFI instruction (i = 0 to 2).

Note 2. To enter Software Standby mode after writing to the MSTPB11 bit, wait for two USB clock (UCLK) cycles after writing, then execute a WFI instruction.

Note 3. Even when EPTPC and PTPEDMAC operation is enabled (MSTPB13 = 0), some registers in the EPTPC module become inaccessible depending on the combination of the MSTPB14 bit, MSTPB15 bit, and EPTPC bypass bit (EPTPC_CFG.BYPASS.BYPASS[1:0] bit) settings. For details, see section 30, Ethernet PTP Controller (EPTPC).

11.2.4 Module Stop Control Register C (MSTPCRC)

Address(es): MSTP.MSTPCRC 4004 7004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MSTPC31	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Symbol	Bit name	Description	R/W
b1, b0	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b2	MSTPD2	Asynchronous General Purpose Timer 1 Module Stop*1	Target module: AGT1 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b3	MSTPD3	Asynchronous General Purpose Timer 0 Module Stop*2	Target module: AGT0 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b4	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b5	MSTPD5	General PWM Timer 32EH0 to 32EH3 and 32E4 to 32E7 and PWM Delay Generation Circuit Module Stop	Target modules: GPT32EHx (x = 0 to 3), GPT32Ey (y = 4 to 7), PWM Delay Generation Circuit 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b6	MSTPD6	General PWM Timer 328 to 3213 Module Stop	Target modules: GPT32x (x = 8 to 13) 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b13 to b7	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b14	MSTPD14	Port Output Enable for GPT Module Stop	Target module: POEG 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b15	MSTPD15	12-Bit A/D Converter 1 Module Stop	Target module: ADC121 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b16	MSTPD16	12-Bit A/D Converter 0 Module Stop	Target module: ADC120 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b19 to b17	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b20	MSTPD20	12-Bit D/A Converter Module Stop	Target module: DAC12 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b21	—	Reserved	This bit is read as 1. The write value should be 1.	R/W

Bit	Symbol	Bit name	Description	R/W
b22	MSTPD22	Temperature Sensor Module Stop	Target module: TSN 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b23	MSTPD23	High-Speed Analog Comparator 5 Module Stop	Target module: ACMPHS5 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b24	MSTPD24	High-Speed Analog Comparator 4 Module Stop	Target module: ACMPHS4 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b25	MSTPD25	High-Speed Analog Comparator 3 Module Stop	Target module: ACMPHS3 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b26	MSTPD26	High-Speed Analog Comparator 2 Module Stop	Target module: ACMPHS2 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b27	MSTPD27	High-Speed Analog Comparator 1 Module Stop	Target module: ACMPHS1 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b28	MSTPD28	High-Speed Analog Comparator 0 Module Stop	Target module: ACMPHS0 0: Cancel the module-stop state 1: Enter the module-stop state.	R/W
b31 to b29	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note 1. When the count source is sub-clock oscillator or LOCO, AGT1 counting does not stop even if MSTPD2 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT1 registers.

Note 2. When the count source is sub-clock oscillator or LOCO, AGT0 counting does not stop even if MSTPD3 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT0 registers.

11.2.6 Operating Power Control Register (OPCCR)

Address(es): SYSTEM.OPCCR 4001 E0A0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	OPCMTSF	—	—	OPCM[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	OPCM[1:0]	Operating Power Control Mode Select	b1 b0 0 0: High-speed mode 1 1: Low-speed mode. Other settings are prohibited.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	OPCMTSF	Operating Power Control Mode Transition Status Flag	• Read 0: Transition complete 1: Transition in progress. • Write The write value should be 0.	R
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The OPCCR register is used to reduce power consumption in Normal and Sleep modes by specifying a lower operating frequency and operating voltage. For the procedure for changing the operating power control modes, see section 11.5, Function for Lower Operating Power Consumption.

When transitioning from Software Standby mode to Normal or Snooze mode, the settings in the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits are as follows, regardless of their settings before entering Software Standby mode:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)
- SOPCCR.SOPCM = 0b (not Subosc-speed mode).

If Software Standby mode is canceled before the transition to Software Standby completes, the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits retain their settings from before the WFI instruction executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

OPCM[1:0] bits (Operating Power Control Mode Select)

The OPCM[1:0] bits select the operating power control mode in Normal and Sleep modes. Table 11.4 shows the relationship between the operating power control modes and the OPCM[1:0] and SOPCM settings.

OPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The OPCMTSF flag indicates the switching control state when the operating power control mode is switched. The flag is set to 1 on a write access to the OPCM[1:0] bits, and to 0 when the mode transition completes. Confirm that the flag is 0 before proceeding to the next step.

11.2.7 Sub Operating Power Control Register (SOPCCR)

Address(es): SYSTEM.SOPCCR 4001 E0AAh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SOPCMTSF	—	—	—	SOPCM
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SOPCM	Sub Operating Power Control Mode Select	0: Not Subosc-speed mode 1: Subosc-speed mode.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	SOPCMTSF	Sub Operating Power Control Mode Transition Status Flag	0: Transition complete 1: Transition in progress.	R
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SOPCCR register is used to reduce power consumption in Normal and Sleep modes by initiating entry to and exit from Subosc-speed mode. Subosc-speed mode is only available when using the sub-clock oscillator or LOCO without dividing the frequency.

The flash cache function should be set to disabled by setting FCACHEE.FCACHEEN to 0 before switching the operating power control mode. For details, see section 55, Flash Memory.

For the procedure for changing operating power control modes, see section 11.5, Function for Lower Operating Power Consumption.

SOPCM bit (Sub Operating Power Control Mode Select)

The SOPCM bit selects the operating power control mode in Normal and Sleep modes. Setting this bit to 1 allows transition to Subosc-speed mode. Setting this bit to 0 allows a return to the operating mode (set in OPCCR.OPCM[1:0]) that was active prior to the transition to Subosc-speed mode.

When transitioning from Software Standby mode to Normal mode or Snooze mode, the OPCCR.OPCM[1:0] and SOPCCR.SOPCM settings are as follows, regardless of their settings before entering Software Standby mode:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)
- SOPCCR.SOPCM = 0b (not Subosc-speed mode).

If Software Standby mode is canceled before the transition to Software Standby completes, the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits retain their settings from before the WFI instruction executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

Table 11.4 shows the relationship between the operating power control modes and the OPCM[1:0] and SOPCM settings.

SOPCMTSF flag (Sub Operating Power Control Mode Transition Status Flag)

The SOPCMTSF flag indicates the switching control state when the operating power control mode is switched to Subosc-speed mode or from Subosc-speed mode. The flag is set to 1 on a write access to the SOPCM bit, and to 0 when the mode transition completes. Confirm that the flag is 0 before proceeding further.

Table 11.4 Relationship between the operating power control modes and the OPCM[1:0] and SOPCM settings

Operating power control mode	OPCM[1:0] bits	SOPCM bit	Power consumption
High-speed mode	00b	0	High
Low-speed mode	11b	0	↓
Subosc-speed mode	00b, 11b	1	Low

Note: See section 60, Electrical Characteristics, for the operating frequency range and voltage range.

High-speed operating mode

After a reset cancellation, the MCU is activated in this mode.

Low-speed mode

The following restrictions apply in Low-speed mode:

- Programming and erasure operations for the flash memory are prohibited
- Using the PLL is prohibited. See section 11.10.1, Register Access.

In this mode, lower power consumption is possible than in High-speed mode when the same operation is performed under the same conditions, such as operating frequency and operating voltage.

Subosc-speed mode

The following restrictions apply in Subosc-speed mode:

- Programming and erasure operations for the flash memory are prohibited
- Reading of the data flash is prohibited
- Using MOSC, PLL, MOCO, or HOCO is prohibited. See section 11.10.1, Register Access.
- Using the divided clock for ICK or FCK is prohibited. See section 11.10.1, Register Access.
- Using the oscillation stop detection function of the main clock oscillator is prohibited.

In this mode, lower power consumption is possible than in Low-speed mode when the same operation is performed under the same conditions, such as operating frequency and operating voltage.

11.2.8 Snooze Control Register (SNZCR)

Address(es): SYSTEM.SNZCR 4001 E092h

	b7	b6	b5	b4	b3	b2	b1	b0
	SNZE	—	—	—	—	—	SNZDTCEN	RXDREQEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	RXDREQEN	RXD0 Snooze Request Enable	0: Ignore the RXD0 falling edge in Software Standby mode 1: Detect the RXD0 falling edge in Software Standby mode.	R/W
b1	SNZDTCEN	DTC Enable in Snooze mode	0: Disable DTC operation in Snooze mode 1: Enable DTC operation in Snooze mode.	R/W
b6 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	SNZE	Snooze Mode Enable	0: Disable Snooze mode 1: Enable Snooze mode.	R/W

RXDREQEN bit (RXD0 Snooze Request Enable)

The RXDREQEN bit specifies whether to detect a falling edge of the RXD0 pin in Software Standby mode. This bit is only available when SCI0 is operating in asynchronous mode. To detect a falling edge of the RXD0 pin, set this bit before entering Software Standby mode. When this bit is set to 1, a falling edge of the RXD0 pin in Software Standby mode causes the MCU to enter Snooze mode.

SNZDTCEN bit (DTC Enable in Snooze mode)

The SNZDTCEN bit specifies whether to use the DTC and SRAM in Snooze mode. To use the DTC and SRAM in Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, the DTC can be activated by setting IELSRn (ICU Event Link setting Register n).

SNZE bit (Snooze Mode Enable)

The SNZE bit enables or disables a transition from Software Standby to Snooze mode. To use Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, one of the event triggers shown in Table 11.7 occurring in Software Standby mode causes the MCU to enter Snooze mode. After the MCU transitions from Software Standby or Snooze mode to Normal mode, clear the SNZE bit once and then set it before re-entering Software Standby mode. For details, see section 11.8, Snooze Mode.

11.2.9 Snooze End Control Register (SNZEDCR)

Address(es): SYSTEM.SNZEDCR 4001 E094h

	b7	b6	b5	b4	b3	b2	b1	b0
	SCI0UMTED	AD1UMTED	AD1MATED	AD0UMTED	AD0MATED	DTCNZRED	DTCZRED	AGTUNFED
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	AGTUNFED	AGT1 Underflow Snooze End Enable	0: Disable the Snooze end request 1: Enable the Snooze end request.	R/W
b1	DTCZRED	Last DTC Transmission Completion Snooze End Enable	0: Disable the Snooze end request 1: Enable the Snooze end request.	R/W
b2	DTCNZRED	Not Last DTC Transmission Completion Snooze End Enable	0: Disable the Snooze end request 1: Enable the Snooze end request.	R/W

Bit	Symbol	Bit name	Description	R/W
b3	AD0MATED	AD Compare Match 0 Snooze End Enable	0: Disable the Snooze end request 1: Enable the Snooze end request.	R/W
b4	AD0UMTED	AD Compare Mismatch 0 Snooze End Enable	0: Disable the Snooze end request 1: Enable the Snooze end request.	R/W
b5	AD1MATED	AD Compare Match 1 Snooze End Enable	0: Disable the Snooze end request 1: Enable the Snooze end request.	R/W
b6	AD1UMTED	AD Compare Mismatch 1 Snooze End Enable	0: Disable the Snooze end request 1: Enable the Snooze end request.	R/W
b7	SCI0UMTED	SCI0 Address Mismatch Snooze End Enable	0: Disable the Snooze end request 1: Enable the Snooze end request.	R/W

To use one of the triggers shown in Table 11.8 as a condition for switching from Snooze to Software Standby mode, set the associated bit in the SNZEDCR register to 1. The event that is used for returning to Normal mode from Snooze mode as listed in Table 11.3 must not be enabled in the SNZEDCR register.

AGTUNFED bit (AGT1 Underflow Snooze End Enable)

The AGTUNFED bit enables or disables a transition from Snooze to Software Standby mode on an AGT1 underflow. For details on the trigger conditions, see section 25, Asynchronous General-Purpose Timer (AGT).

DTCZRED bit (Last DTC Transmission Completion Snooze End Enable)

The DTCZRED bit enables or disables a transition from Snooze to Software Standby mode on completion of the last DTC transmission, signaled when the CRA or CRB register in the DTC is 0. For details on the trigger conditions, see section 18, Data Transfer Controller (DTC).

DTCNZRED bit (Not Last DTC Transmission Completion Snooze End Enable)

The DTCNZRED bit enables or disables a transition from Snooze to Software Standby mode on completion of each DTC transmission, signaled when the CRA or CRB register in the DTC is not 0. For details on the trigger conditions, see section 18, Data Transfer Controller (DTC).

AD0MATED bit (AD Compare Match 0 Snooze End Enable)

The AD0MATED bit enables or disables a transition from Snooze to Software Standby mode on an AD0 event when a conversion result matches the expected data. For details on the trigger conditions, see section 47, 12-Bit A/D Converter (ADC12).

AD0UMTED bit (AD Compare Mismatch 0 Snooze End Enable)

The AD0UMTED bit enables or disables a transition from Snooze to Software Standby mode on an AD0 event when the conversion result does not match the expected data. For details on the trigger conditions, see section 47, 12-Bit A/D Converter (ADC12).

AD1MATED bit (AD Compare Match 1 Snooze End Enable)

The AD1MATED bit enables or disables a transition from Snooze to Software Standby mode on an AD1 event when the conversion result matches the expected data. For details on the trigger conditions, see section 47, 12-Bit A/D Converter (ADC12).

AD1UMTED bit (AD Compare Mismatch 1 Snooze End Enable)

The AD1UMTED bit enables or disables a transition from Snooze to Software Standby mode on an AD1 event when the conversion result does not match the expected data. For details on the trigger conditions, see section 47, 12-Bit A/D Converter (ADC12).

SCI0UMTED bit (SCI0 Address Mismatch Snooze End Enable)

The SCI0UMTED bit enables or disables a transition from Snooze to Software Standby mode on an SCI0 event when an address received in Software Standby mode does not match the expected data. For details on the trigger conditions, see section 34, Serial Communications Interface (SCI). Only set this bit to 1 when SCI0 is operating in asynchronous mode.

11.2.10 Snooze Request Control Register (SNZREQCR)

Address(es): SYSTEM.SNZREQCR 4001 E098h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	SNZREQEN30	SNZREQEN29	SNZREQEN28	—	—	SNZREQEN25	SNZREQEN24	—	SNZREQEN22	—	—	—	—	SNZREQEN17	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SNZREQEN15	SNZREQEN14	SNZREQEN13	SNZREQEN12	SNZREQEN11	SNZREQEN10	SNZREQEN9	SNZREQEN8	SNZREQEN7	SNZREQEN6	SNZREQEN5	SNZREQEN4	SNZREQEN3	SNZREQEN2	SNZREQEN1	SNZREQEN0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SNZREQEN0	Snooze Request Enable 0	Enables the IRQ0 pin Snooze request: 0: Disable 1: Enable.	R/W
b1	SNZREQEN1	Snooze Request Enable 1	Enables the IRQ1 pin Snooze request: 0: Disable 1: Enable.	R/W
b2	SNZREQEN2	Snooze Request Enable 2	Enables the IRQ2 pin Snooze request: 0: Disable 1: Enable.	R/W
b3	SNZREQEN3	Snooze Request Enable 3	Enables the IRQ3 pin Snooze request: 0: Disable 1: Enable.	R/W
b4	SNZREQEN4	Snooze Request Enable 4	Enables the IRQ4 pin Snooze request: 0: Disable 1: Enable.	R/W
b5	SNZREQEN5	Snooze Request Enable 5	Enables the IRQ5 pin Snooze request: 0: Disable 1: Enable.	R/W
b6	SNZREQEN6	Snooze Request Enable 6	Enables the IRQ6 pin Snooze request: 0: Disable 1: Enable.	R/W
b7	SNZREQEN7	Snooze Request Enable 7	Enables the IRQ7 pin Snooze request: 0: Disable 1: Enable.	R/W
b8	SNZREQEN8	Snooze Request Enable 8	Enables the IRQ8 pin Snooze request: 0: Disable 1: Enable.	R/W
b9	SNZREQEN9	Snooze Request Enable 9	Enables the IRQ9 pin Snooze request: 0: Disable 1: Enable.	R/W
b10	SNZREQEN10	Snooze Request Enable 10	Enables the IRQ10 pin Snooze request: 0: Disable 1: Enable.	R/W
b11	SNZREQEN11	Snooze Request Enable 11	Enables the IRQ11 pin Snooze request: 0: Disable 1: Enable.	R/W
b12	SNZREQEN12	Snooze Request Enable 12	Enables the IRQ12 pin Snooze request: 0: Disable 1: Enable.	R/W
b13	SNZREQEN13	Snooze Request Enable 13	Enables the IRQ13 pin Snooze request: 0: Disable 1: Enable.	R/W

Bit	Symbol	Bit name	Description	R/W
b14	SNZREQEN14	Snooze Request Enable 14	Enables the IRQ14 pin Snooze request: 0: Disable 1: Enable.	R/W
b15	SNZREQEN15	Snooze Request Enable 15	Enables the IRQ15 pin Snooze request: 0: Disable 1: Enable.	R/W
b16	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b17	SNZREQEN17	Snooze Request Enable 17	Enables the Key Interrupt Snooze request: 0: Disable 1: Enable.	R/W
b21 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b22	SNZREQEN22	Snooze Request Enable 22	Enables the ACMPHS0 Snooze request: 0: Disable 1: Enable.	R/W
b23	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b24	SNZREQEN24	Snooze Request Enable 24	Enables the RTC alarm Snooze request: 0: Disable 1: Enable.	R/W
b25	SNZREQEN25	Snooze Request Enable 25	Enables the RTC period Snooze request: 0: Disable 1: Enable.	R/W
b27, b26	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b28	SNZREQEN28	Snooze Request Enable 28	Enables the AGT1 underflow Snooze request: 0: Disable 1: Enable.	R/W
b29	SNZREQEN29	Snooze Request Enable 29	Enables the AGT1 compare match A Snooze request: 0: Disable 1: Enable.	R/W
b30	SNZREQEN30	Snooze Request Enable 30	Enables the AGT1 compare match B Snooze request: 0: Disable 1: Enable.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

The SNZREQCR register controls which triggers cause the MCU to switch from Software Standby to Snooze mode. If a trigger is selected as a request to cancel Software Standby mode in the WUPEN register (see section 14, Interrupt Controller Unit (ICU)), the MCU enters Normal mode when the trigger is generated even when the associated bit of the SNZREQCR is 1. The WUPEN register setting always has higher priority than the SNZREQCR register setting. For details, see section 11.8, Snooze Mode, and section 14, Interrupt Controller Unit (ICU).

11.2.11 Deep Software Standby Control Register (DPSBYCR)

Address(es): SYSTEM.DPSBYCR 4001 E400h

	b7	b6	b5	b4	b3	b2	b1	b0
	DPSBY	IOKEEP	—	—	—	—	DEEPCUT[1:0]	
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit name	Description	R/W
b1, b0	DEEPCUT[1:0]	Power-Supply Control	b1 b0 0 0: Supply power to the Standby SRAM, low-speed on-chip oscillator, AGTn, and USBFS/USBHS resume detecting unit in Deep Software Standby mode 0 1: Do not supply power to the Standby SRAM, low-speed on-chip oscillator, AGTn, and USBFS/USBHS resume detecting unit in Deep Software Standby mode 1 0: Setting prohibited 1 1: Do not supply power to the Standby SRAM, low-speed on-chip oscillator, AGTn, and USBFS/USBHS resume detecting unit in Deep Software Standby mode. In addition, disable the LVD and enable the low-power function of the power-on reset circuit.	R/W
b5 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	IOKEEP	I/O Port Retention	0: When Deep Software Standby mode is canceled, clear the I/O ports to the reset state 1: When Deep Software Standby mode is canceled, keep the I/O ports in the same state as in Deep Software Standby mode.	R/W
b7	DPSBY	Deep Software Standby	0: Sleep mode (SBYCR.SSBY = 0) or Software Standby mode (SBYCR.SSBY = 1) 1: Sleep mode (SBYCR.SSBY = 0) or Deep Software Standby mode (SBYCR.SSBY = 1).	R/W

The DPSBYCR register is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source.

DEEPCUT[1:0] bits (Power-Supply Control)

The DEEPCUT[1:0] bits control the internal power supply to the Standby SRAM, low-speed on-chip oscillator, AGTn, and USBFS/USBHS resume detecting unit in Deep Software Standby mode. In addition, these bits control the state of the LVD and power-on reset circuit in Deep Software Standby mode. When a USBFS/HS suspend/resume interrupt is used as a canceling source for Deep Software Standby mode, the DEEPCUT[1:0] bits must be set to 00b. When an LVD interrupt is used in Deep Software Standby mode, the DEEPCUT[1:0] bits must be set to 00b or 01b.

For lower power consumption, set the DEEPCUT[1:0] bits to 11b so that the LVD is stopped and the low power mode function of the power-on reset circuit is enabled. The internal power supply of the SRAM stops in Deep Software Standby mode regardless of the DEEPCUT[1:0] bit settings.

IOKEEP bit (I/O Port Retention)

In Deep Software Standby mode, the I/O ports keep the same states as in Software Standby mode. The IOKEEP bit specifies whether to reset the state of the I/O ports when Deep Software Standby mode is canceled.

DPSBY bit (Deep Software Standby)

The DPSBY bit controls transitions to Deep Software Standby mode. See Table 11.6 for details.

When the WFI instruction is executed while the SBYCR.SSBY and DPSBYCR.DPSBY bits are both 1, the MCU enters Deep Software Standby mode through Software Standby mode.

The DPSBY bit remains 1 when Deep Software Standby mode is canceled by certain pins that are the sources of external pin interrupts (NMI and IRQ0-DS to IRQ15-DS) or by a peripheral interrupt (RTC alarm, RTC interval, USB suspend/resume, voltage monitor 1, or voltage monitor 2). Write 0 to this bit to clear it.

The DPSBY setting is invalid when the OFS0.IWDTSTPCTL bit is 0 (counting continues), regardless of the setting in the OFS0.IWDTSTRT or DPSBYCR.DPSBY bit. When the SBYCR.SSBY and DPSBY bits are 1, the MCU transitions to Software Standby mode on execution of a WFI instruction.

The DPSBY setting is invalid when the voltage monitor 1 reset is enabled (LVD1CR0.RI = 1) or when the voltage monitor 2 reset is enabled (LVD2CR0.RI = 1). When the SBYCR.SSBY and the DPSBY bits are 1, the MCU transitions to Software Standby mode on execution of a WFI instruction.

11.2.12 Deep Software Standby Interrupt Enable Register 0 (DPSIER0)

Address(es): SYSTEM.DPSIER0 4001 E402h

	b7	b6	b5	b4	b3	b2	b1	b0
	DIRQ7E	DIRQ6E	DIRQ5E	DIRQ4E	DIRQ3E	DIRQ2E	DIRQ1E	DIRQ0E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DIRQ0E	IRQ0-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ0-DS pin: 0: Disable 1: Enable.	R/W
b1	DIRQ1E	IRQ1-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ1-DS pin: 0: Disable 1: Enable.	R/W
b2	DIRQ2E	IRQ2-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ2-DS pin: 0: Disable 1: Enable.	R/W
b3	DIRQ3E	IRQ3-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ3-DS pin: 0: Disable 1: Enable.	R/W
b4	DIRQ4E	IRQ4-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ4-DS pin: 0: Disable 1: Enable.	R/W
b5	DIRQ5E	IRQ5-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ5-DS pin: 0: Disable 1: Enable.	R/W
b6	DIRQ6E	IRQ6-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ6-DS pin: 0: Disable 1: Enable.	R/W
b7	DIRQ7E	IRQ7-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ7-DS pin: 0: Disable 1: Enable.	R/W

The DPSIER0 register is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source. After a setting in DPSIER0 is changed, an edge can be internally generated depending on the associated pin state, resulting in the associated DPSIFR0 bit being set to 1. Clear DPSIFR0 to 0 before entering Deep Software Standby mode.

11.2.13 Deep Software Standby Interrupt Enable Register 1 (DPSIER1)

Address(es): SYSTEM.DPSIER1 4001 E403h

	b7	b6	b5	b4	b3	b2	b1	b0
	DIRQ15E	DIRQ14E	DIRQ13E	DIRQ12E	DIRQ11E	DIRQ10E	DIRQ9E	DIRQ8E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DIRQ8E	IRQ8-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ8-DS pin: 0: Disable 1: Enable.	R/W

Bit	Symbol	Bit name	Description	R/W
b1	DIRQ9E	IRQ9-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ9-DS pin: 0: Disable 1: Enable.	R/W
b2	DIRQ10E	IRQ10-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ10-DS pin: 0: Disable 1: Enable.	R/W
b3	DIRQ11E	IRQ11-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ11-DS pin: 0: Disable 1: Enable.	R/W
b4	DIRQ12E	IRQ12-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ12-DS pin: 0: Disable 1: Enable.	R/W
b5	DIRQ13E	IRQ13-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ13-DS pin: 0: Disable 1: Enable.	R/W
b6	DIRQ14E	IRQ14-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ14-DS pin: 0: Disable 1: Enable.	R/W
b7	DIRQ15E	IRQ15-DS Pin Enable	Enables canceling of Deep Software Standby mode by the IRQ15-DS pin: 0: Disable 1: Enable.	R/W

The DPSIER1 register is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source. After a setting in DPSIER1 is changed, an edge can be internally generated depending on the associated pin state, resulting in the associated DPSIFR1 bit being set to 1. Clear DPSIFR1 to 0 before entering Deep Software Standby mode.

11.2.14 Deep Software Standby Interrupt Enable Register 2 (DPSIER2)

Address(es): SYSTEM.DPSIER2 4001 E404h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	DNMIE	DRTCAIE	DRTCIIE	DLVD2IE	DLVD1IE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DLVD1IE	LVD1 Deep Software Standby Cancel Signal Enable	Enables canceling of Deep Software Standby mode by the voltage monitor 1 signal: 0: Disable 1: Enable.	R/W
b1	DLVD2IE	LVD2 Deep Software Standby Cancel Signal Enable	Enables canceling of Deep Software Standby mode by the voltage monitor 2 signal: 0: Disable 1: Enable.	R/W
b2	DRTCIIE	RTC Interval Interrupt Deep Software Standby Cancel Signal Enable	Enables canceling of Deep Software Standby mode by the RTC interval interrupt signal: 0: Disable 1: Enable.	R/W
b3	DRTCAIE	RTC Alarm Interrupt Deep Software Standby Cancel Signal Enable	Enables canceling of Deep Software Standby mode by the RTC alarm interrupt signal: 0: Disable 1: Enable.	R/W
b4	DNMIE	NMI Pin Enable	Enables canceling of Deep Software Standby mode by the NMI pin: 0: Disable 1: Enable.	R/W*1
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. 1 can be written only once. After 1 is written to this bit, subsequent write accesses are disabled.

The DPSIER2 register is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source. After a setting in DPSIER2 is changed, an edge can be internally generated depending on the associated pin state, resulting in the associated DPSIFR2 bit being set to 1. Clear DPSIFR2 to 0 before entering Deep Software Standby mode.

11.2.15 Deep Software Standby Interrupt Enable Register 3 (DPSIER3)

Address(es): SYSTEM.DPSIER3 4001 E405h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	DAGT1IE	DUSBHSIE	DUSBFSIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DUSBFSIE	USBFS Suspend/Resume Deep Software Standby Cancel Signal Enable	Enables canceling of Deep Software Standby mode by a USBFS suspend/resume: 0: Disable 1: Enable.	R/W
b1	DUSBHSIE	USBHS Suspend/Resume Deep Software Standby Cancel Signal Enable	Enables canceling of Deep Software Standby mode by a USBHS suspend/resume: 0: Disable 1: Enable.	R/W
b2	DAGT1IE	AGT1 Underflow Deep Software Standby Cancel Signal Enable	Enables canceling of Deep Software Standby mode by an AGT1 underflow: 0: Disable 1: Enable.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The DPSIER3 register is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source. After a setting in DPSIER3 is changed, an edge can be internally generated depending on the associated pin state, resulting in the associated DPSIFR3 bit setting to 1. Clear DPSIFR3 to 0 before entering Deep Software Standby mode.

11.2.16 Deep Software Standby Interrupt Flag Register 0 (DPSIFR0)

Address(es): SYSTEM.DPSIFR0 4001 E406h

	b7	b6	b5	b4	b3	b2	b1	b0
	DIRQ7F	DIRQ6F	DIRQ5F	DIRQ4F	DIRQ3F	DIRQ2F	DIRQ1F	DIRQ0F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DIRQ0F	IRQ0-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ0-DS pin: 0: No request generated 1: Request generated.	R(/W) *1
b1	DIRQ1F	IRQ1-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ1-DS pin: 0: No request generated 1: Request generated.	R(/W) *1
b2	DIRQ2F	IRQ2-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ2-DS pin: 0: No request generated 1: Request generated.	R(/W) *1
b3	DIRQ3F	IRQ3-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ3-DS pin: 0: No request generated 1: Request generated.	R(/W) *1
b4	DIRQ4F	IRQ4-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ4-DS pin: 0: No request generated 1: Request generated.	R(/W) *1
b5	DIRQ5F	IRQ5-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ5-DS pin: 0: No request generated 1: Request generated.	R(/W) *1
b6	DIRQ6F	IRQ6-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ6-DS pin: 0: No request generated 1: Request generated.	R(/W) *1
b7	DIRQ7F	IRQ7-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ7-DS pin: 0: No request generated 1: Request generated.	R(/W) *1

Note 1. Only 0 can be written to clear the flag.

The flags in the DPSIFR0 register set to 1 when the associated cancel request specified in DPSIEGR0 is generated. Each flag can be set to 1 when a cancel request is generated in any mode, not only in Deep Software Standby mode, or when the setting in DPSIER0 is changed. Clear DPSIFR0 to 00h before entering Deep Software Standby mode.

To clear DPSIFR0 to 00h after modifying DPSIER0, wait for at least six PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0. DPSIFR0 is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source.

DIRQnF flags (IRQn-DS Deep Software Standby Cancel Flag) (n = 0 to 7)

The DIRQnF flag indicates that a cancel request was generated by the IRQn-DS pin.

[Setting condition]

- A cancel request generated by an IRQn-DS pin specified in DPSIEGR0.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

11.2.17 Deep Software Standby Interrupt Flag Register 1 (DPSIFR1)

Address(es): SYSTEM.DPSIFR1 4001 E407h

	b7	b6	b5	b4	b3	b2	b1	b0
	DIRQ15F	DIRQ14F	DIRQ13F	DIRQ12F	DIRQ11F	DIRQ10F	DIRQ9F	DIRQ8F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DIRQ8F	IRQ8-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ8-DS pin: 0: No request generated 1: Request generated.	R(/W)*1
b1	DIRQ9F	IRQ9-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ9-DS pin: 0: No request generated 1: Request generated.	R(/W)*1
b2	DIRQ10F	IRQ10-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ10-DS pin: 0: No request generated 1: Request generated.	R(/W)*1
b3	DIRQ11F	IRQ11-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ11-DS pin: 0: No request generated 1: Request generated.	R(/W)*1
b4	DIRQ12F	IRQ12-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ12-DS pin: 0: No request generated 1: Request generated.	R(/W)*1
b5	DIRQ13F	IRQ13-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ13-DS pin: 0: No request generated 1: Request generated.	R(/W)*1
b6	DIRQ14F	IRQ14-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ14-DS pin: 0: No request generated 1: Request generated.	R(/W)*1
b7	DIRQ15F	IRQ15-DS Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the IRQ15-DS pin: 0: No request generated 1: Request generated.	R(/W)*1

Note 1. Only 0 can be written to clear the flag.

The flags in the DPSIFR1 register set to 1 when the associated cancel request specified in DPSIEGR1 is generated. Each flag can be set to 1 when a cancel request is generated in any mode, not only in Deep Software Standby mode, or when the setting in DPSIER1 is changed. Clear DPSIFR1 to 00h before entering Deep Software Standby mode.

To clear DPSIFR1 to 00h after modifying DPSIER1, wait for at least six PCLKB cycles, read DPSIFR1, and then write 0 to DPSIFR1. Six or more PCLKB cycles can be secured, for example, by reading DPSIER1. DPSIFR1 is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source.

DIRQnF flags (IRQn-DS Deep Software Standby Cancel Flag) (n = 8 to 15)

The DIRQnF flag indicates that a cancel request was generated by the IRQn-DS pin.

[Setting condition]

- A cancel request generated by the IRQn-DS pin specified in DPSIEGR1.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

11.2.18 Deep Software Standby Interrupt Flag Register 2 (DPSIFR2)

Address(es): SYSTEM.DPSIFR2 4001 E408h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	DNMIF	DRTCAIF	DRTCIIF	DLVD2IF	DLVD1IF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DLVD1IF	LVD1 Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the voltage monitor 1 signal: 0: No request generated 1: Request generated.	R(/W)*1
b1	DLVD2IF	LVD2 Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the voltage monitor 2 signal: 0: No request generated 1: Request generated.	R(/W)*1
b2	DRTCIIF	RTC Interval Interrupt Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the RTC interval interrupt signal: 0: No request generated 1: Request generated.	R(/W)*1
b3	DRTCAIF	RTC Alarm Interrupt Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the RTC alarm interrupt signal: 0: No request generated 1: Request generated.	R(/W)*1
b4	DNMIF	NMI Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by the NMI pin: 0: No request generated 1: Request generated.	R(/W)*1
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the flag.

The flags in the DPSIFR2 register set to 1 when the associated cancel request specified in DPSIEGR2 is generated. Each flag can be set to 1 when a cancel request is generated in any mode, not only in Deep Software Standby mode, or when the setting in DPSIER2 is changed. Clear DPSIFR2 to 00h before entering Deep Software Standby mode.

To clear DPSIFR2 to 00h after modifying DPSIER2, wait for at least six PCLKB cycles, read DPSIFR2, and then write 0 to DPSIFR2. Six or more PCLKB cycles can be secured, for example, by reading DPSIER2. DPSIFR2 is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source.

DLVDmIF flag (LVDm Deep Software Standby Cancel Flag) (m = 1 or 2)

The DLVDmIF flag indicates that a cancel request was generated by the voltage monitor m signal.

[Setting condition]

- A cancel request generated by the voltage monitor m signal specified in DPSIEGR2.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

DRTCIIF flag (RTC Interval Interrupt Deep Software Standby Cancel Flag)

The DRTCIIF flag indicates that a cancel request was generated by the RTC interval interrupt signal.

[Setting condition]

- A cancel request generated by the RTC interval interrupt signal.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

DRTCAIF flag (RTC Alarm Interrupt Deep Software Standby Cancel Flag)

The DRTCAIF flag indicates that a cancel request was generated by the RTC alarm interrupt signal.

[Setting condition]

- A cancel request generated by the RTC alarm interrupt signal.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

DNMIF flag (NMI Deep Software Standby Cancel Flag)

The DNMIF flag indicates that a cancel request was generated by the NMI pin.

[Setting condition]

- A cancel request generated by the NMI pin specified in DPSIEGR2.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

11.2.19 Deep Software Standby Interrupt Flag Register 3 (DPSIFR3)

Address(es): SYSTEM.DPSIFR3 4001 E409h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	DAGT1IF	DUSBHSIF	DUSBFSIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DUSBFSIF	USBFS Suspend/Resume Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by a USBFS suspend/resume: 0: No request generated 1: Request generated.	R(/W)*1
b1	DUSBHSIF	USBHS Suspend/Resume Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by a USBHS suspend/resume: 0: No request generated 1: Request generated.	R(/W)*1
b2	DAGT1IF	AGT1 Underflow Deep Software Standby Cancel Flag	Indicates Deep Software Standby cancel request by an AGT1 underflow: 0: No request generated 1: Request generated.	R(/W)*1
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the flag.

The flags in the DPSIFR3 register set to 1 when the associated cancel request is generated. Each flag can be set to 1 when a cancel request is generated in any mode, not only in Deep Software Standby mode, or when the setting in DPSIER3 is changed. Clear DPSIFR3 to 00h before entering Deep Software Standby mode.

To clear DPSIFR3 to 00h after modifying DPSIER3, wait for at least six PCLKB cycles, read DPSIFR3, and then write 0 to DPSIFR3. Six or more PCLKB cycles can be secured, for example, by reading DPSIER3. DPSIFR3 is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see section 6, Resets.

DUSBFSIF flag (USBFS Suspend/Resume Deep Software Standby Cancel Flag)

The DUSBFSIF flag indicates that a cancel request was generated by a USBFS suspend/resume.

[Setting condition]

- A cancel request generated by the USBFS suspend/resume.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

DUSBHSIF flag (USBHS Suspend/Resume Deep Software Standby Cancel Flag)

This DUSBHSIF flag indicates that a cancel request was generated by a USBHS suspend/resume.

[Setting condition]

- A cancel request generated by the USBHS suspend/resume.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

DAGT1IF flag (AGT1 Underflow Deep Software Standby Cancel Flag)

The DAGT1IF flag indicates that a cancel request was generated by an AGT1 underflow.

[Setting condition]

- A cancel request generated by the AGT1 underflow.

[Clearing condition]

- Writing 0 to the flag after reading it as 1.

11.2.20 Deep Software Standby Interrupt Edge Register 0 (DPSIEGR0)

Address(es): SYSTEM.DPSIEGR0 4001 E40Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	DIRQ7EG	DIRQ6EG	DIRQ5EG	DIRQ4EG	DIRQ3EG	DIRQ2EG	DIRQ1EG	DIRQ0EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DIRQ0EG	IRQ0-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b1	DIRQ1EG	IRQ1-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b2	DIRQ2EG	IRQ2-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b3	DIRQ3EG	IRQ3-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b4	DIRQ4EG	IRQ4-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b5	DIRQ5EG	IRQ5-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b6	DIRQ6EG	IRQ6-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b7	DIRQ7EG	IRQ7-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W

The DPSIEGR0 register is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source.

11.2.21 Deep Software Standby Interrupt Edge Register 1 (DPSIEGR1)

Address(es): SYSTEM.DPSIEGR1 4001 E40Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	DIRQ15EG	DIRQ14EG	DIRQ13EG	DIRQ12EG	DIRQ11EG	DIRQ10EG	DIRQ9EG	DIRQ8EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DIRQ8EG	IRQ8-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b1	DIRQ9EG	IRQ9-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b2	DIRQ10EG	IRQ10-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b3	DIRQ11EG	IRQ11-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b4	DIRQ12EG	IRQ12-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b5	DIRQ13EG	IRQ13-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b6	DIRQ14EG	IRQ14-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b7	DIRQ15EG	IRQ15-DS Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W

The DPSIEGR1 register is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source.

11.2.22 Deep Software Standby Interrupt Edge Register 2 (DPSIEGR2)

Address(es): SYSTEM.DPSIEGR2 4001 E40Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	DNMIEG	—	—	DLVD2EG	DLVD1EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DLVD1EG	LVD1 Edge Select	0: Generate cancel request when VCC < Vdet1 (fall) is detected 1: Generate cancel request when VCC ≥ Vdet1 (rise) is detected.	R/W
b1	DLVD2EG	LVD2 Edge Select	0: Generate cancel request when VCC < Vdet2 (fall) is detected 1: Generate cancel request when VCC ≥ Vdet2 (rise) is detected.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	DNMIEG	NMI Pin Edge Select	0: Generate cancel request on falling edge 1: Generate cancel request on rising edge.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The DPSIEGR2 register is not initialized by the internal reset signal that cancels Deep Software Standby mode. For details, see Table 6.2, Reset detect flags initialized by each reset source.

11.2.23 System Control OCD Control Register (SYOCDCR)

Address(es): SYSTEM.SYOCDCR 4001 E40Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	DBGEN	—	—	—	—	—	—	DOCDF
Value after reset:	0	0	0	0	0	0	0	x

Bit	Symbol	Bit name	Description	R/W
b0	DOCDF	Deep Software Standby OCD Flag	Indicates cancel request by the MCUCTRL.DBIRQ bit: 0: DBIRQ is not generated 1: DBIRQ is generated.	R/(W)*1
b6 to b1	—	Reserved	These bits are read as 0. The write value must be 0.	R/W
b7	DBGEN	Debugger Enable Bit	0: Disable on-chip debugger 1: Enable on-chip debugger. Set to 1 first in on-chip debug mode.	R/W

Note 1. Writing 0 clears the flag. Writing 1 is ignored.

SYOCDCR is not initialized by the internal reset signal that cancels Deep Software Standby mode.

DOCDF flag (Deep Software Standby OCD Flag)

The DOCDF flag indicates that a Deep Software Standby cancel request was generated by the MCUCTRL.DBIRQ bit. The flag is set to 1 when the cancel request is generated. The flag can be set to 1 when a cancel request is generated in any mode, not only in Deep Software Standby mode. Clear the DOCDF flag to 0 before entering Deep Software Standby mode.

[Setting condition]

- A cancel request generated by the MCUCTRL.DBIRQ bit.

[Clearing condition]

- Writing 0 to the flag after reading it as 1
- When the DBGEN bit is 0.

DBGEN bit (Debugger Enable Bit)

The DBGEN bit enables the on-chip debugger mode. This bit must be set to 1 first in the on-chip debug mode.

[Setting condition]

- Writing 1 to the bit when the debugger is connected.

[Clearing condition]

- Power-on reset is generated
- Writing 0 to the bit.

11.2.24 Standby Condition Register (STCONR)

Address(es): SYSTEM.STCONR 4001 E40Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	STCON 1	STCON 0
Value after reset:	1	1	0	0	0	0	1	1

Bit	Symbol	Bit name	Description	R/W
b1, b0	STCON[1:0]	SSTBY Condition Bit	b1 b0 0 0: Set this value to transition to Software Standby mode when using HOCO 1 1: Set this value to transition to Software Standby mode when not using HOCO.	R/W
b5 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7 to b6	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

STCON[1:0] bits (SSTBY Condition Bit)

The STCON[1:0] bits must always be set to 00b when using HOCO to enter Software Standby mode.

11.3 Reducing Power Consumption by Switching Clock Signals

When the SCKDIVCR.FCK[2:0], ICK[2:0], BCK[2:0], PCKA[2:0], PCKB[2:0], PCKC[2:0], and PCKD[2:0] bits are set, the clock frequency changes. The module and clock associations are as follows:

- The CPU, DMAC, DTC, flash, and SRAM use the operating clock specified in the ICK[2:0] bits
- Peripheral modules use the operating clocks specified in the PCKA[2:0], PCKB[2:0], PCKC[2:0], and PCKD[2:0] bits
- The flash memory interface uses the operating clock specified in the FCK[2:0] bits
- The external bus uses the operating clock specified in the BCK[2:0] bits.

For details, see section 9, Clock Generation Circuit.

11.4 Module-Stop Function

The module-stop function can be set for each on-chip peripheral module. When the MSTPmi bit (m = A to D; i = 31 to 0) in MSTPCRA to MSTPCRD is set to 1, the specified module stops operating and enters the module-stop state, but the CPU continues to operate independently. Clearing the MSTPmi bit to 0 cancels the module-stop state, allowing the module to resume operation at the end of the bus cycle. The internal states of the modules are retained in the module-stop state.

After a reset is canceled, all modules other than the DMAC, DTC, and SRAM modules are placed in the module-stop state. Do not access the module while the associated MSTPmi bit is 1. Otherwise, the read/write data and the operation of the module is not guaranteed. Do not set the MSTPmi bit to 1 while the associated module is being accessed.

11.5 Function for Lower Operating Power Consumption

Power consumption can be reduced in Normal, Sleep, and Snooze modes by selecting an appropriate operating power mode for the given operating frequency and operating voltage.

11.5.1 Setting the Operating Power Control Mode

Make sure that the operating conditions, such as the voltage and frequency ranges, are always within the specified ranges before and after switching the operating power control modes. This section provides example procedures for switching operating power control modes.

Table 11.5 Available oscillators in each mode

	Oscillator						
Mode	PLL	High-speed on-chip oscillator	Middle-speed on-chip oscillator	Low-speed on-chip oscillator	Main clock oscillator	Sub-clock oscillator	IWDT-dedicated on-chip oscillator
High-speed	Available	Available	Available	Available	Available	Available	Available
Low-speed	N/A	Available	Available	Available	Available	Available	Available
Subosc-speed	N/A	N/A	N/A	Available	N/A	Available	Available

(1) Switching from a higher to a lower power mode

Example 1: To switch from High-speed mode to Low-speed mode:

Operation begins in High-speed mode.

1. Change the oscillator to that used in Low-speed mode. Set the frequency of each clock lower than the maximum operating frequency in Low-speed mode.
2. Turn off the oscillator that is not required in Low-speed mode.
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Set the OPCCR.OPCM[1:0] bits to 11b (Low-speed mode).
5. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).

Operation is now in Low-speed mode.

Example 2: To switch from High-speed mode to Subosc-speed mode:

Operation begins in High-speed mode.

1. Disable the flash cache by resetting FCACHEE.FCACHEEN when the flash cache is cacheable in High-speed mode.
2. Change the clock source to the sub-clock oscillator. Turn off HOCO, MOCO, LOCO, main oscillator, and PLL.
3. Confirm that all clock sources except the sub-clock oscillator are stopped.
4. Set FLWT.FLWT[2:0] to 000b.
5. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
6. Set the SOPCCR.SOPCM bit to 1 (Subosc-speed mode).
7. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
8. Perform the following steps when the flash cache is cacheable in Subosc-speed mode:
   a. Invalidate the flash cache by setting FCACHEIV.FCACHEIV.
   b. Check that FCACHEIV.FCACHEIV is 0.
   c. Enable the flash cache by setting FCACHEE.FCACHEEN.

Operation is now in Subosc-speed mode.

(2) Switching from a lower to a higher power mode

Example 1: To switch from Subosc-speed mode to High-speed mode:

Operation begins in Subosc-speed mode.

1. Disable the flash cache by resetting FCACHEE.FCACHEEN when the flash cache is cacheable in Subosc-speed mode.
2. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
3. Set the SOPCCR.SOPCM bit to 0 (High-speed mode).
4. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
5. Set the appropriate wait cycle for the clock frequency by setting FLWT.FLWT[2:0].
6. Turn on the oscillator wanted in High-speed mode.
7. Set the frequency of each clock lower than the maximum operating frequency for High- or Low-speed mode.
8. Perform the following steps when the flash cache is cacheable in High-speed mode:
   a. Invalidate the flash cache by setting FCACHEIV.FCACHEIV.
   b. Check that FCACHEIV.FCACHEIV is 0.
   c. Enable the flash cache by setting FCACHEE.FCACHEEN.

   Operation is now in High-speed mode.

Example 2: To switch Low-speed mode to High-speed mode:

Operation begins in Low-speed mode.

1. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
2. Set the OPCCR.OPCM[1:0] bits to 00b (High-speed mode).
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Turn on any oscillator wanted in High-speed mode.
5. Set the frequency of each clock lower than the maximum operating frequency for High-speed mode.

   Operation is now in High-speed mode.

11.6 Sleep Mode

11.6.1 Transition to Sleep Mode

When a WFI instruction is executed while the SBYCR.SSBY bit is 0, the MCU enters Sleep mode. In Sleep mode, the CPU stops operating, but the contents of its internal registers are retained. Other peripheral functions do not stop. Available resets or interrupts in Sleep mode cause the MCU to cancel Sleep mode. All interrupt sources are available. If using an interrupt to cancel Sleep mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see section 14, Interrupt Controller Unit (ICU).

Counting by the IWDT stops when the MCU enters Sleep mode while the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep, Software Standby, or Snooze mode).

Counting by the IWDT continues when the MCU enters Sleep mode while the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep, Software Standby, or Snooze mode).

Counting by the WDT stops when the MCU enters Sleep mode while the WDT is in auto-start mode and the OFS0.WDTSTPCTL bit is 1 (WDT stops in Sleep mode). In the same way, counting by the WDT stops when the MCU enters Sleep mode while the WDT is in register start mode and the WDTCSTPR.SLCSTP bit in is 1 (WDT stops in Sleep mode).

Counting by the WDT continues when the MCU enters Sleep mode while the WDT is in auto-start mode and the OFS0. WDTSTPCTL bit is 0 (WDT does not stop in Sleep mode). In the same way, counting by the WDT continues when the MCU enters Sleep mode while the WDT is in register start mode and the WDTCSTPR.SLCSTP bit is 0 (WDT does not stop in Sleep mode).

11.6.2 Canceling Sleep Mode

Sleep mode is canceled by any interrupt, RES pin reset, power-on reset, voltage monitor reset, SRAM parity error reset, SRAM DED error reset, Bus master MPU error reset, Bus slave MPU error reset, or reset caused by IWDT or WDT underflow. The operations are as follows:

- Canceling by an interrupt
  When an available interrupt request (see Table 11.3) is generated, Sleep mode is canceled and the MCU starts the interrupt handling.
- Canceling by RES pin reset
  When the RES pin is driven low, the MCU enters the reset state. You must keep the RES pin low for the time period specified in section 60, Electrical Characteristics. When the RES pin is driven high after the specified time period, the CPU starts reset exception handling.
- Canceling by IWDT reset
  Sleep mode is canceled by an internal reset generated by an IWDT underflow, and the MCU starts reset exception handling. Under the following conditions, the IWDT stops in Sleep mode and an internal reset for canceling Sleep mode is not generated:
  - OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1.
- Canceling by WDT reset
  Sleep mode is canceled by an internal reset generated by an WDT underflow and the MCU starts reset exception handling. Under the following conditions, the WDT stops in Sleep mode even when counting in Normal mode and an internal reset for canceling Sleep mode is not generated:
  - OFS0.WDTSTRT = 0 (auto-start mode) and OFS0.WDTSTPCTL = 1
  - OFS0.WDTSTRT = 1 (register start mode) and WDTCSTPR.SLCSTP = 1.
- Canceling by other resets available in Sleep mode
  Sleep mode is canceled by the associated resets, and the MCU starts reset exception handling.

Note: For details on correct setting of the interrupts, see section 14, Interrupt Controller Unit (ICU).

11.7 Software Standby Mode

11.7.1 Transition to Software Standby Mode

When a WFI instruction is executed while the SBYCR.SSBY bit is 1 and the DPSBYCR.DPSBY bit is 0, the MCU enters Software Standby mode. In this mode, the CPU, most of the on-chip peripheral functions, and the oscillators stop. However, the contents of the CPU internal registers and the SRAM data, the states of the on-chip peripheral functions, and the I/O port states are retained. Software Standby mode allows a significant reduction in power consumption because most of the oscillators stop in this mode. Table 11.2 shows the status of the on-chip peripheral functions and oscillators. Available resets or interrupts in Software Standby mode cause the MCU to cancel Software Standby mode. See Table 11.3 for available interrupt sources and section 14.2.9, Wake Up Interrupt Enable Register (WUPEN) for information on waking up the MCU from Software Standby mode. If using an interrupt to cancel Software Standby mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see section 14, Interrupt Controller Unit (ICU).

The status of the address bus and bus control signals in Software Standby mode can be selected with the SBYCR.OPE bit.

Clear the DMAST.DMST and DTCST.DTCST bits to 0 before executing a WFI instruction, except when using the DTC in Snooze mode. If the DTC is required in Snooze mode, set the DTCST.DTCST bit to 1 before executing a WFI instruction.

Counting by the IWDT stops when the MCU enters Software Standby mode while the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep, Software Standby, or Snooze mode).

Counting by the IWDT continues when the MCU enters Software Standby mode while the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep mode, Software Standby, or Snooze mode).

The WDT stops counting when the MCU enters Software Standby mode.

Do not enter Software Standby mode while OSTDCR.OSTDE is 1 (oscillation stop detection function enabled). To enter Software Standby mode, execute a WFI instruction after disabling the oscillation stop detection function (OSTDCR.OSTDE is 0). If the software executes a WFI instruction while OSTDCR.OSTDE is 1, the MCU enters Sleep mode even when SBYCR.SSBY is 1. Do not enter Software Standby mode while the flash memory is performing a programming or erasing procedure. To enter Software Standby mode, execute a WFI instruction after the programming or erasing procedure completes.

Table 11.6 shows the setting of the related control bits and the modes entered on execution of a WFI instruction.

Table 11.6 Bit settings that affect modes on WFI instruction execution

Other bit settings		SBYCR.SSBY and DPSBYCR.DPSBY bit settings			
		SSBY = 0, DPSBY = 0	SSBY = 0, DPSBY = 1	SSBY = 1, DPSBY = 0	SSBY = 1, DPSBY = 1
OSTDCR.OSTDE	0	Sleep mode	Sleep mode	Software Standby mode	Deep Software Standby mode
	1			Sleep mode	Sleep mode
FENTRYR.FENTRYi	0	Sleep mode	Sleep mode	Software Standby mode	Deep Software Standby mode
	1			Sleep mode	Sleep mode
OFS0.IWDTSTPCTL	0	Sleep mode	Sleep mode	Software Standby mode	Software Standby mode
	1				Deep Software Standby mode
LVD1CR0.RI	0	Sleep mode	Sleep mode	Software Standby mode	Deep Software Standby mode
	1				Software Standby mode
LVD2CR0.RI	0	Sleep mode	Sleep mode	Software Standby mode	Deep Software Standby mode
	1				Software Standby mode

11.7.2 Canceling Software Standby Mode

Software Standby mode is canceled by the interrupts shown in Table 11.3, a RES pin reset, a power-on reset, a voltage monitor reset, or a reset caused by an IWDT underflow. On exiting Software Standby, the oscillators operating before transitioning to the mode restart. After all of these oscillators are stabilized, the MCU cancels Software Standby mode. See section 14.2.9, Wake Up Interrupt Enable Register (WUPEN), for information on waking up the MCU from Software Standby mode.

You can cancel Software Standby mode in any of the following ways:

- Canceling by an interrupt
  When an available interrupt request (see Table 11.3) is generated, all oscillators that were operating before the transition to Software Standby mode restart. After all of these oscillators are stabilized, the MCU cancels Software Standby mode and starts the interrupt handling.
- Canceling by RES pin reset
  When the RES pin is driven low, the MCU enters the reset state and the oscillators start operating in their default status. Make sure to keep the RES pin low for the time period specified in section 60, Electrical Characteristics. When the RES pin is driven high after the specified time period, the CPU starts reset exception handling.
- Canceling by IWDT reset
  Software Standby mode is canceled by an internal reset generated by an IWDT underflow, and the MCU starts reset exception handling. Under the following conditions, the IWDT stops in Software Standby mode and an internal reset for canceling Software Standby mode is not generated:
  - OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1.
- Canceling by other resets available in Software Standby mode
  Software Standby mode is canceled by the associated resets, and the MCU starts reset exception handling.

11.7.3 Example of Software Standby Mode Application

Figure 11.2 shows an example of entry to Software Standby mode on detection of a falling edge of the IRQn pin, and exit from Software Standby mode on a rising edge of the IRQn pin. In this example, an IRQn pin interrupt is accepted when the IRQCRi.IRQMD[1:0] bits of the ICU are set to 01b (falling edge) in Normal mode, and then set to 10b (rising edge). Next, the SBYCR.SSBY bit is set to 1 and a WFI instruction is executed. Entry to Software Standby mode completes, and then exit from Software Standby mode is initiated by a rising edge of the IRQn pin.

Setting the ICU is also required to exit Software Standby mode. For details, see section 14, Interrupt Controller Unit (ICU). The oscillation stabilization time in Figure 11.2 is specified in section 60, Electrical Characteristics.

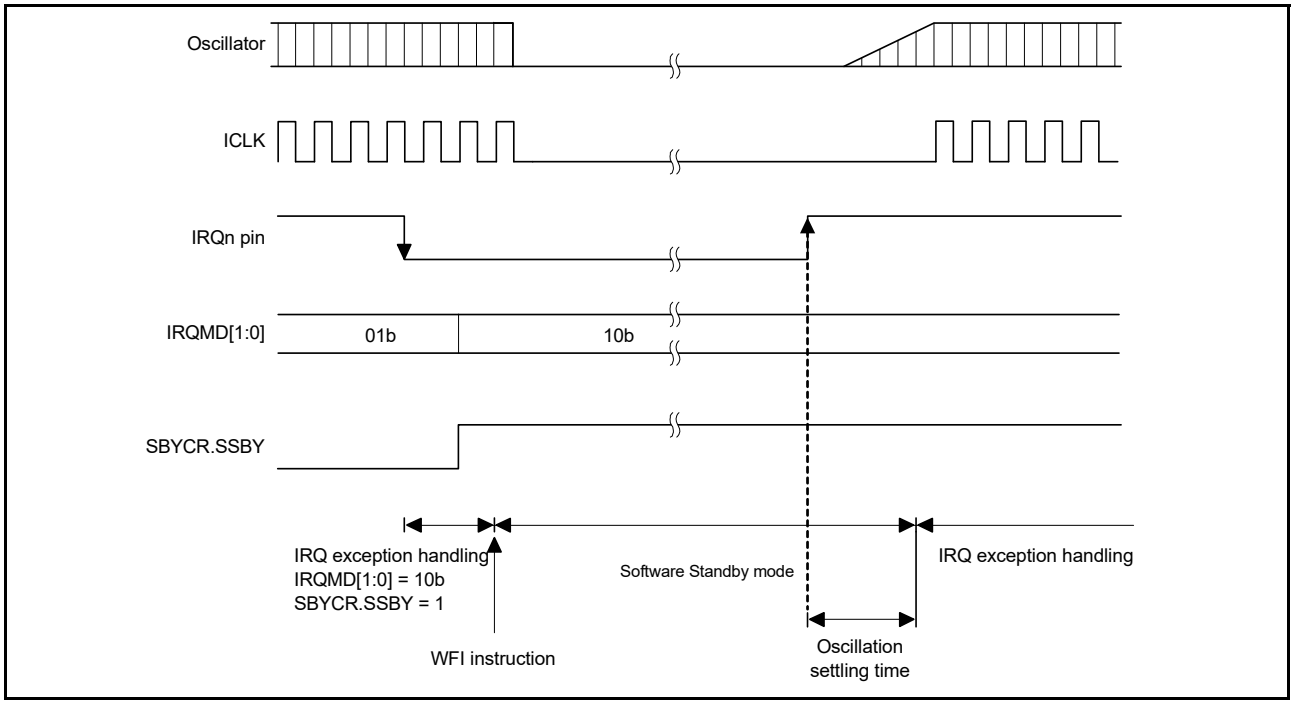

Figure 11.2 Example of Software Standby mode application

11.8 Snooze Mode

11.8.1 Transition to Snooze Mode

Figure 11.3 shows Snooze mode entry configuration. When the Snooze control circuit receives a Snooze request in Software Standby mode, the MCU transitions to Snooze mode. In this mode, some peripheral modules operate without waking up the CPU. Table 11.2 shows the peripheral modules that can operate in Snooze mode. Also, DTC operation can be selected in Snooze mode by setting the SNZCR.SNZDTCEN bit.

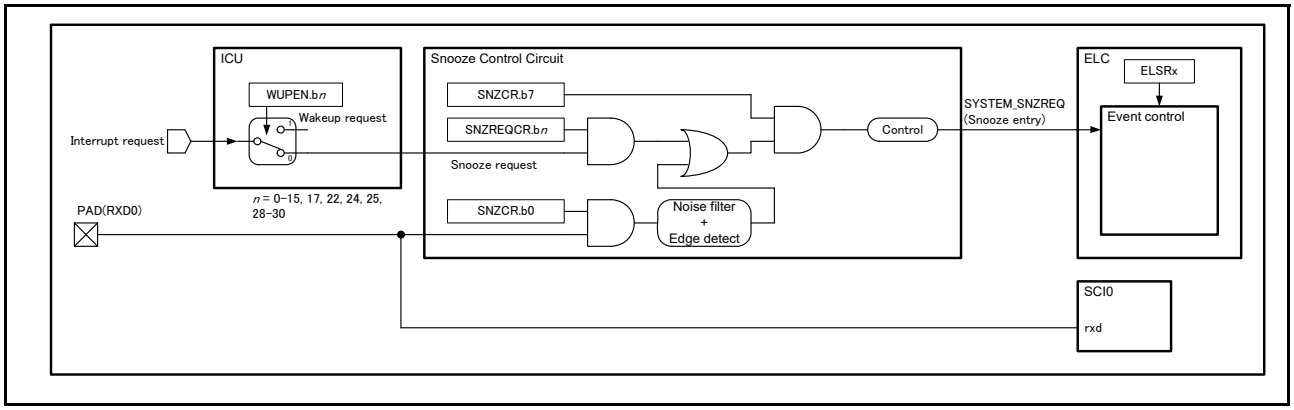

Figure 11.3 Snooze entry configuration

Table 11.7 shows the Snooze requests that switch the MCU from Software Standby to Snooze mode. To use a listed Snooze requests as a trigger to switch to Snooze mode, you must set the associated SNZREQENn bit of the SNZREQCR register or RXDREQEN bit of the SNZCR register before entering Software Standby mode.

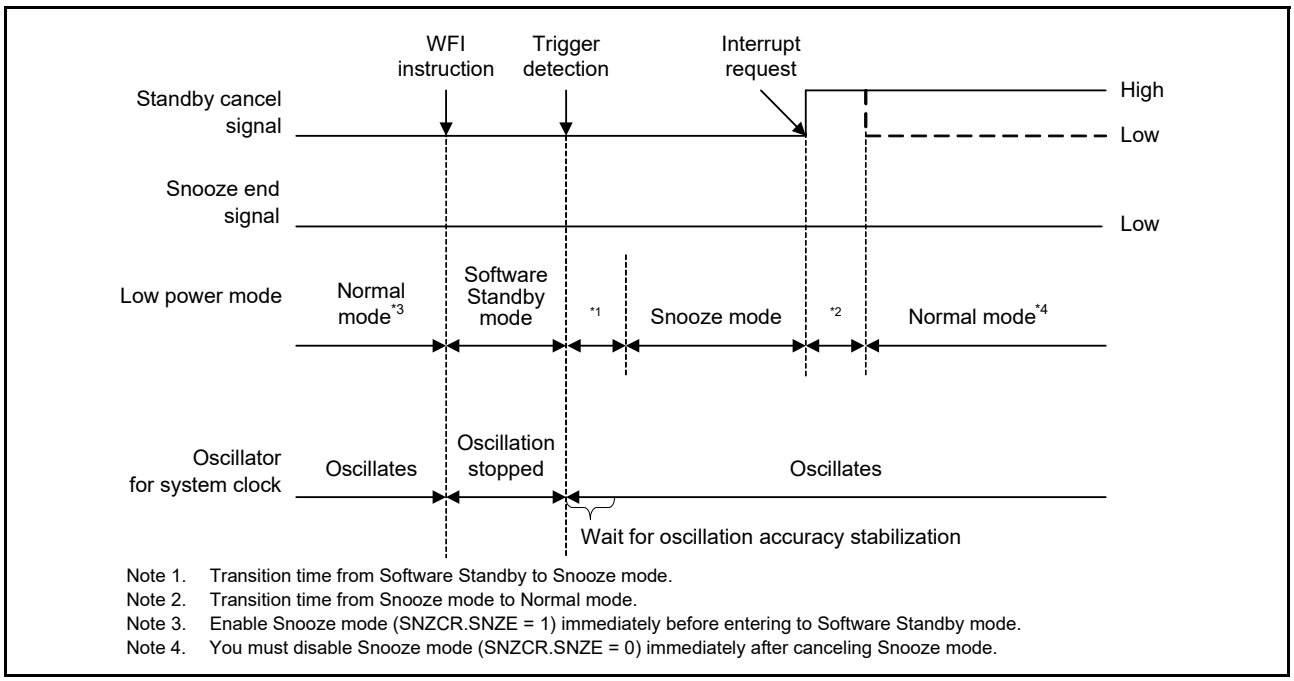

Table 11.7 Available events for invoking Snooze mode

	Control Register	
Snooze request	**Register**	**Bit*1**
PORT_IRQn (n = 0 to 15)	SNZREQCR	SNZREQENn (n = 0 to 15)
KEY_INTKR	SNZREQCR	SNZREQEN17
ACMP_HS0	SNZREQCR	SNZREQEN22
RTC_ALM	SNZREQCR	SNZREQEN24
RTC_PRD	SNZREQCR	SNZREQEN25
AGT1_AGTI	SNZREQCR	SNZREQEN28
AGT1_AGTCMAI	SNZREQCR	SNZREQEN29
AGT1_AGTCMBI	SNZREQCR	SNZREQEN30
RXD0 falling edge	SNZCR	RXDREQEN*2

Note 1. Do not enable multiple Snooze requests at the same time.
Note 2. Do not set the RXDREQEN bit to 1 except in asynchronous mode.

11.8.2 Canceling Snooze Mode

Snooze mode is canceled by any interrupt request that is available in Software Standby mode or any reset. Table 11.3 shows the requests that can be used to exit each mode. On exiting Snooze mode, the MCU transitions to Normal mode and proceeds with exception processing for the given interrupt or reset. An action triggered by the interrupt requests selected in SELSR0 cancels Snooze mode. The interrupt(s) canceling Snooze mode must be selected in IELSRn (n = 0 to 95) to link to the NVIC for the corresponding interrupt handling. See section 14, Interrupt Controller Unit (ICU), for information on setting SELSR0 and IELSRn.

Note 1. Transition time from Software Standby to Snooze mode.
Note 2. Transition time from Snooze mode to Normal mode.
Note 3. Enable Snooze mode (SNZCR.SNZE = 1) immediately before entering to Software Standby mode.
Note 4. You must disable Snooze mode (SNZCR.SNZE = 0) immediately after canceling Snooze mode.

Figure 11.4 Canceling of Snooze mode when an interrupt request signal is generated

11.8.3 Return to Software Standby Mode

Table 11.8 shows the Snooze end requests that can be used as triggers to return to Software Standby mode. The Snooze end requests are available only in Snooze mode. If the requests are generated when the MCU is not in Snooze mode, they are ignored. When multiple requests are selected, each one of the requests invokes transition to Software Standby mode from Snooze mode.

Table 11.9 shows the Snooze end conditions that consist of the Snooze end requests and the conditions of the peripheral modules. The CTSU, SCI0, ADC120, ADC121, and DTC modules can keep the MCU in Snooze mode until they complete their operation.

An AGT1 underflow as a trigger to return to Software Standby mode cancels Snooze mode without waiting for the completion of the SCI0 operation.

Figure 11.5 shows the timing chart for the transition from Snooze mode to Software Standby mode. This mode transition occurs according to which Snooze end requests are set in the SNZEDCR register. A Snooze request is cleared automatically after it is returned to Software Standby mode.

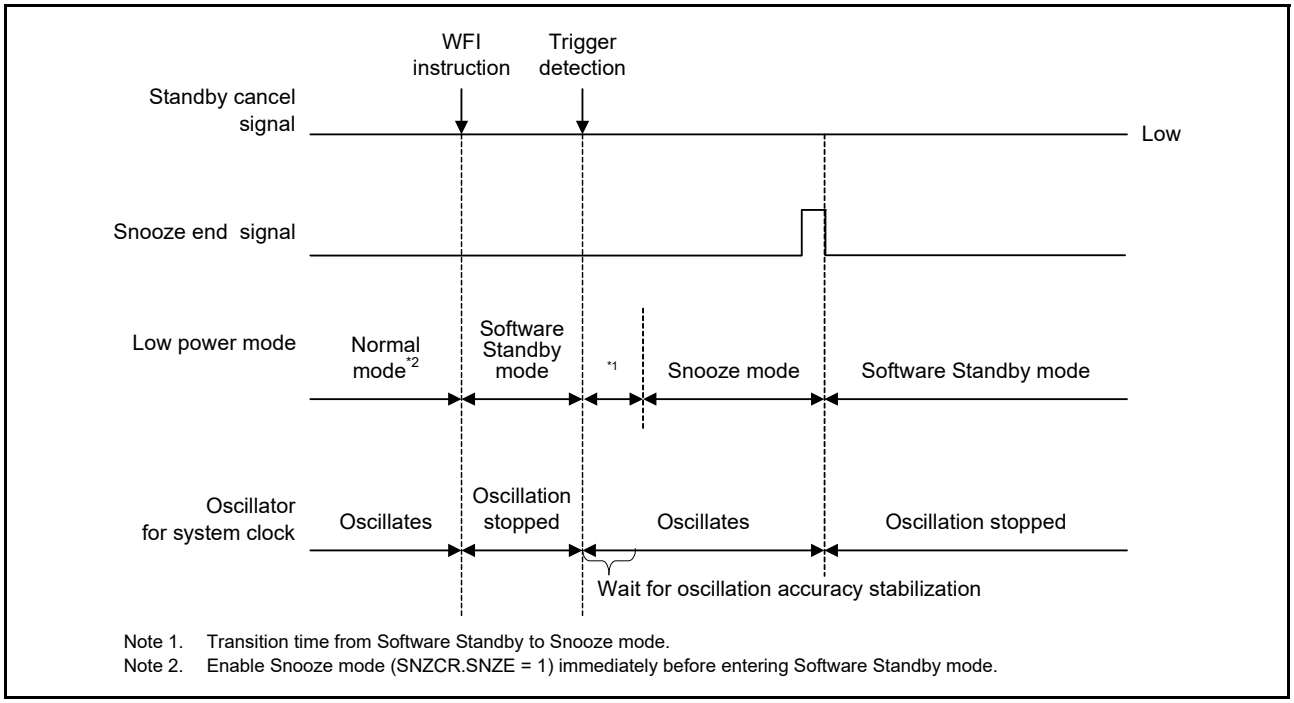

Table 11.8 Available Snooze end requests (triggers to return to Software Standby mode)

	Enable/disable control	
Snooze end request	**Register**	**Bit**
AGT1 Unterflow or measurement complete (AGT1_AGTI)	SNZEDCR	b0
DTC transfer completion (DTC_COMPLETE)	SNZEDCR	b1
Not DTC transfer completion (DTC_TRANSFER)	SNZEDCR	b2
ADC120 window A/B compare match (ADC120_WCMPM)	SNZEDCR	b3
ADC120 window A/B compare mismatch (ADC120_WCMPUM)	SNZEDCR	b4
ADC121 window A/B compare match (ADC121_WCMPM)	SNZEDCR	b5
ADC121 window A/B compare mismatch (ADC121_WCMPUM)	SNZEDCR	b6
SCI0 address mismatch (SCI0_DCUF)	SNZEDCR	b7

Table 11.9 Snooze end conditions

<table>
<tr><th rowspan="2">Module operating when a Snooze end request occurs</th><th colspan="2">Snooze end request</th></tr>
<tr><th>AGT1 underflow</th><th>All except AGT1 underflow</th></tr>
<tr><td>DTC</td><td rowspan="4">The MCU transitions to Software Standby mode after all of these modules complete operation</td><td rowspan="5">The MCU transitions to Software Standby mode after all of these modules complete operation</td></tr>
<tr><td>ADC120</td></tr>
<tr><td>ADC121</td></tr>
<tr><td>CTSU</td></tr>
<tr><td>SCI0</td><td>The MCU transitions to Software Standby mode immediately after the Snooze end request is generated</td></tr>
<tr><td>All other modules</td><td colspan="2">The MCU transitions to Software Standby mode immediately after the Snooze end request is generated</td></tr>
</table>

Note: If the DTC is used to activate the ADC120, ADC121, CTSU, or SCI, the MCU transitions to Software Standby mode immediately after a Snooze end request is generated.

Note 1. Transition time from Software Standby to Snooze mode.
Note 2. Enable Snooze mode (SNZCR.SNZE = 1) immediately before entering Software Standby mode.

Figure 11.5 Canceling of Snooze mode when interrupt request signal is not generated

11.8.4 Snooze Operation Example

Figure 11.6 shows an example setting for using ELC in Snooze mode.

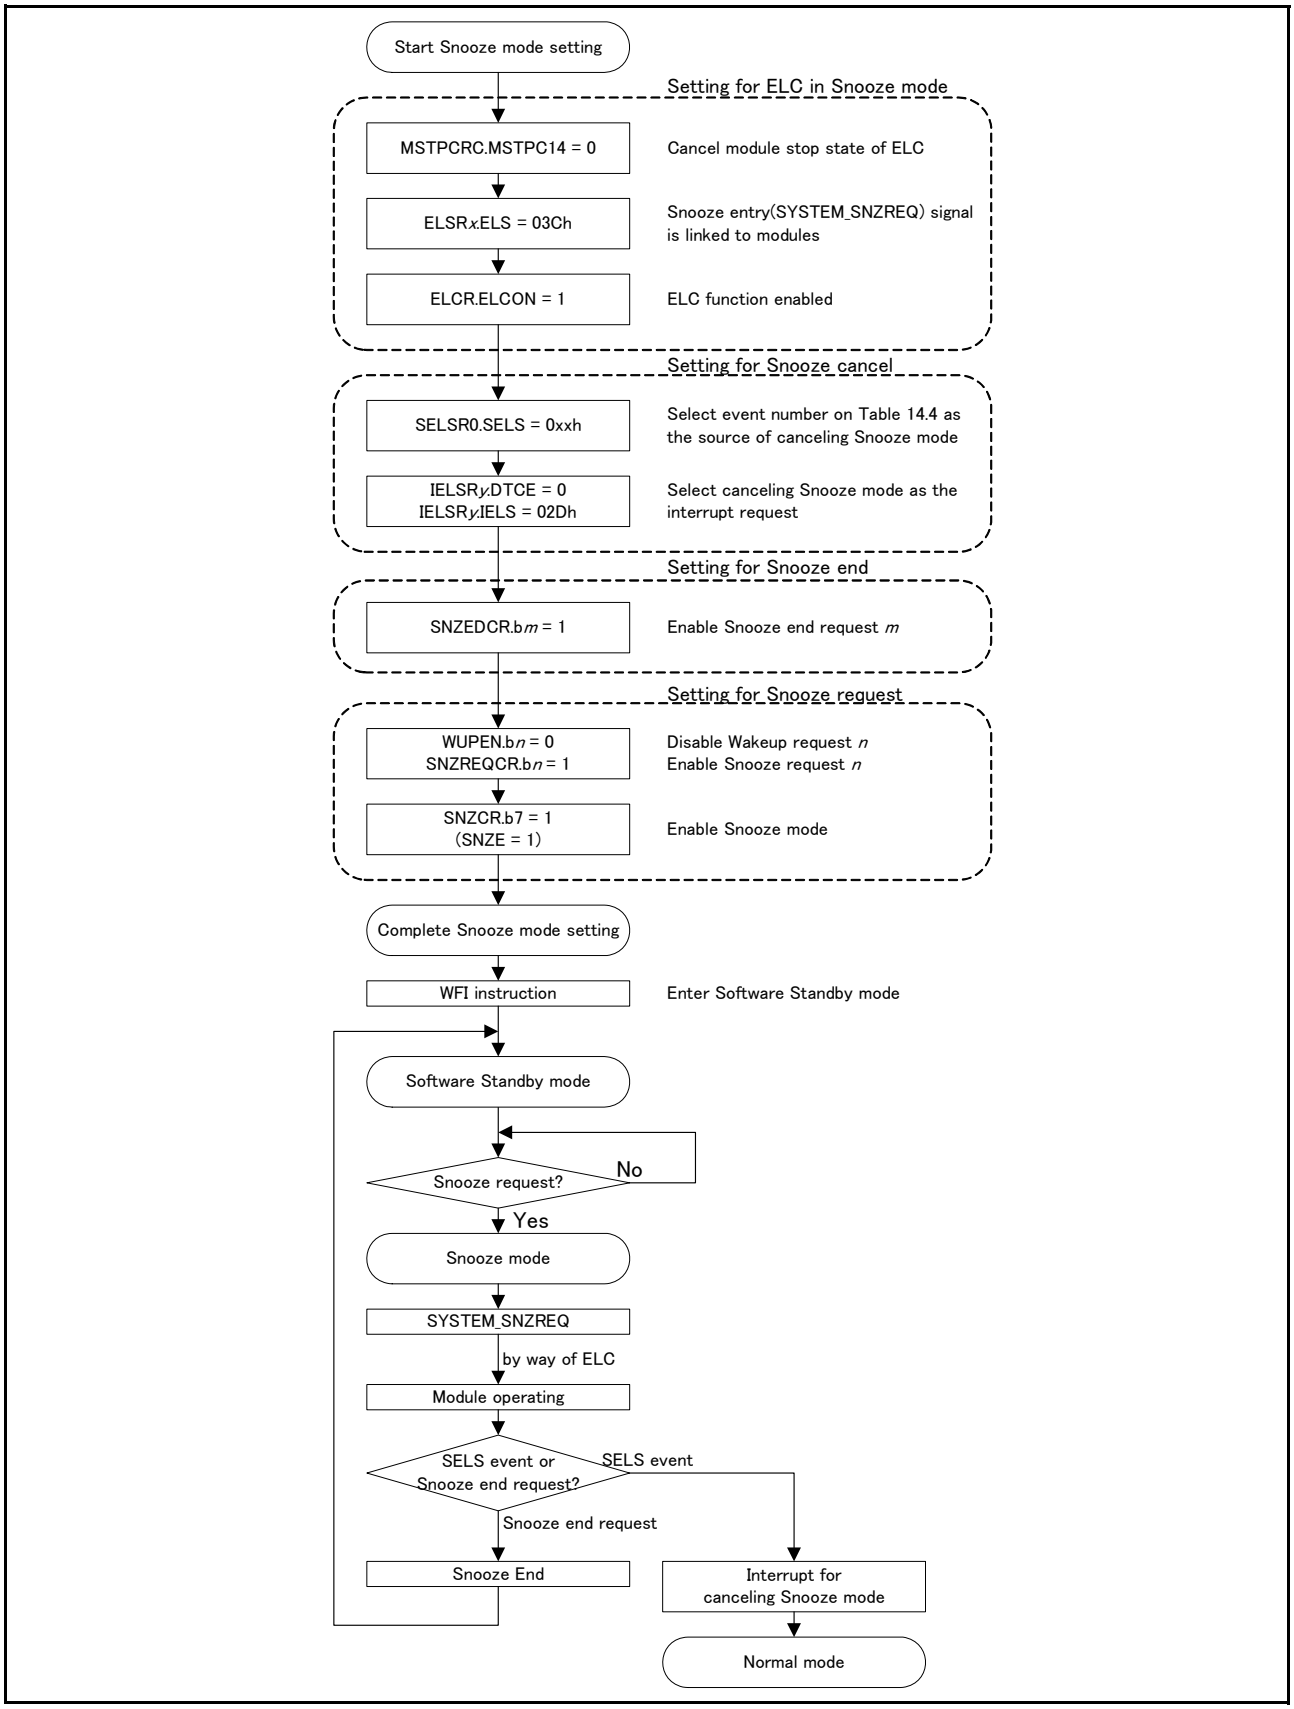

Figure 11.6 Setting example of using ELC in Snooze mode

The MCU is capable of data transmission/reception in SCI0 asynchronous mode without CPU intervention. Table 11.10 shows the maximum transfer rate of SCI0 in Snooze mode. When using the SCI0 in Snooze mode use one of the following operating modes: High-speed mode or Low-speed mode.

Do not use Subosc-speed mode.

Table 11.10 HOCO: ± 2.4% (Ta = -20 to 105°C) (Unit: bps)

Maximum division ratio of ICLK, PCLKA, PCLKB, PCLKC, PCLKD, FCLK, BCLK, and TRCLK	HOCO frequency					
	LOCO is operating			LOCO is not operating		
	16 MHz	18 MHz	20 MHz	16 MHz	18 MHz	20 MHz
1	2400			600		
2						
4						
8	1200					
16						
32						
64						

Note: When SCI0 is used in Snooze mode, the following settings must be used: BGDM = 0, ABCS = 0, ABCSE = 0. See section 34, Serial Communications Interface (SCI) for details.

Figure 11.7 shows an example setting for using SCI0 in Snooze mode entry.

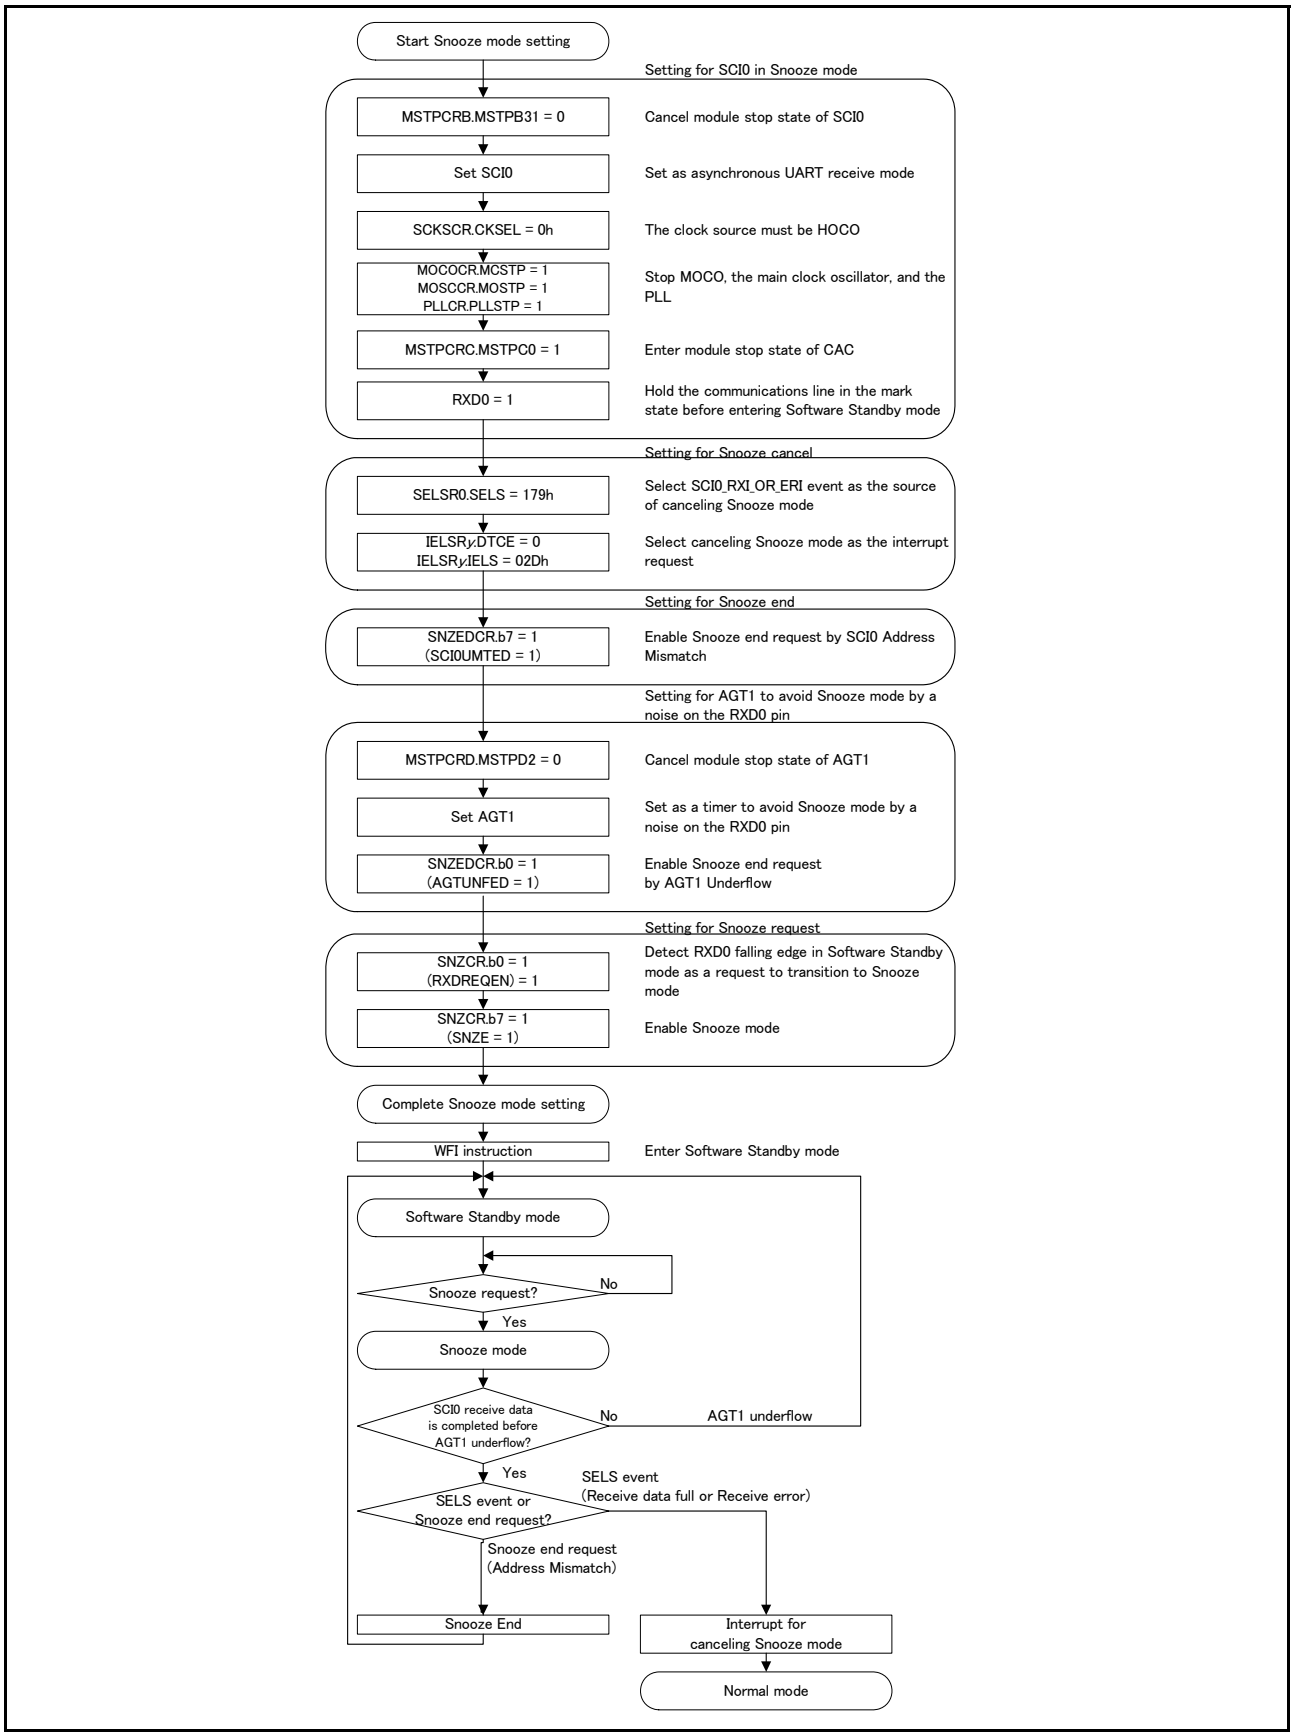

Figure 11.7 Setting example of using SCI0 in Snooze mode entry

11.9 Deep Software Standby Mode

11.9.1 Transition to Deep Software Standby Mode

The MCU enters Deep Software Standby mode when a WFI instruction is executed with the SBYCR.SSBY bit set to 1 and the DPSBYCR.DPSBY bit set to 1. See Table 11.6 for the settings of the related control bits.

In Deep Software Standby mode, the CPU, on-chip peripheral functions except for the RTC alarm, RTC interval, and USB suspend/resume detecting unit, SRAM (not the Standby SRAM), and all oscillators except for the sub-clock oscillator and low-speed on-chip oscillator are stopped. Power consumption is reduced because the internal power supply to these modules is stopped. The contents of all of the CPU registers and internal peripheral modules, except for the RTC alarm, RTC interval, and USB suspend/resume detecting unit, become undefined.

Data in the Standby SRAM is saved if the setting in the DEEPCUT[1:0] bits is 00b. If the setting in the DEEPCUT[1:0] bits is 01b, the internal power supply to the Standby SRAM and the USB resume detecting unit is cut off, and power consumption is reduced. Data in the Standby SRAM becomes undefined at this time.

If the setting in the DEEPCUT[1:0] bits is 11b, the internal power supply to the Standby SRAM and the USB resume detecting unit is cut off, the LVD is stopped, and the low power mode function of the power-on reset circuit is enabled. Therefore, power consumption is further reduced. For details, see section 60, Electrical Characteristics.

When the MCU enters Deep Software Standby mode while the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 1, power supply to the IWDT-dedicated clock and the IWDT is cut off. Counting by the IWDT also stops.

When the OFS0.IWDTSTPCTL bit is 0, the MCU enters Software Standby mode instead of Deep Software Standby mode, regardless of the setting in the OFS0.IWDTSTRT or DPSBYCR.DPSBY bit. When the OFS0.IWDTSTPCTL bit is 0 while the OFS0.IWDTSTRT bit is 0 (auto-start mode), the IWDT-dedicated clock and IWDT continue operation.

When the LVD1CR0.RI bit is 1 (selecting the voltage monitor 1 reset) or the LVD2CR0.RI bit is 1 (selecting the voltage monitor 2 reset), the MCU enters Software Standby mode instead of Deep Software Standby mode. The I/O port states are the same as in Software Standby mode.

Note 1. Conditions on the DTC, DMAC, and IWDT for transition to Software Standby mode must be met before the WFI instruction is executed. For details, see section 11.7, Software Standby Mode.

11.9.2 Canceling Deep Software Standby Mode

Deep Software Standby mode is canceled by the interrupts shown in Table 11.3, a RES pin reset, a power-on reset, or a voltage monitor 0 reset. The operations are as follows:

1. Canceling by an interrupt
   Canceling by interrupts is controlled by DPSIERn (n = 0 to 3) and DPSIFRn (n = 0 to 3). When an available interrupt request is generated, the associated flag in DPSIFRn is set to 1. If the interrupt is enabled in DPSIERn, Deep Software Standby mode is canceled. Rising or falling edge detection can be selected in DPSIEGRn (n = 0 to 2). The detection edge can be selected for the NMI, IRQ0-DS to IRQ15-DS, voltage monitor 1, and voltage monitor 2 interrupts. When a Deep Software Standby mode canceling request occurs, internal power is supplied, the MOCO clock starts to oscillate, and then an internal reset (Deep Software Standby reset) is generated for the entire MCU. The stable MOCO clock is supplied to the entire MCU and Deep Software Standby reset is canceled. The MCU starts reset exception handling.
   When Deep Software Standby mode is canceled by an external interrupt pin or internal interrupt signal, the RSTSR0.DPSRSTF flag is set to 1.
2. Canceling by RES pin reset
   When the RES pin is driven low, the MCU cancels Deep Software Standby mode and enters a reset state. Make sure to keep the RES pin low for the time period specified in section 60, Electrical Characteristics. When the RES pin is driven high after the specified time period, the CPU starts reset exception handling.
3. Canceling by power-on reset
   Deep Software Standby mode is canceled by a power-on reset, and the MCU starts reset exception handling.
4. Canceling by voltage monitor 0 reset
   Deep Software Standby mode is canceled by a voltage monitor 0 reset from the voltage detection circuit, and the MCU starts reset exception handling.

11.9.3 Pin States when Deep Software Standby Mode is Canceled

In Deep Software Standby mode, the I/O ports retain the same states from Software Standby mode. The MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, and reset exception handling starts immediately. The DPSBYCR.IOKEEP bit setting determines whether to initialize the I/O ports or to retain the I/O ports states for Software Standby mode. The following is the state of the I/O ports for each bit setting:

- When the DPSBYCR.IOKEEP bit = 0
  The I/O ports are initialized by an internal reset generated when Deep Software Standby mode is canceled.
- When the DPSBYCR.IOKEEP bit = 1
  Although the MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, the I/O ports retain their states from Software Standby mode regardless of the MCU internal state. The I/O ports states remain unchanged from Software Standby mode even when settings are made to the I/O ports or peripheral modules. The retained I/O ports states are released by clearing the DPSBYCR.IOKEEP bit to 0, and the MCU operates according to the internal state. The DPSBYCR.IOKEEP bit is not initialized by any internal reset generated when Deep Software Standby mode is canceled.

11.9.4 Example of Deep Software Standby Mode Application

(1) Entering and exiting Deep Software Standby mode

Figure 11.8 shows an example transition to Deep Software Standby mode on the falling edge of the IRQn-DS pin, and an exit from Deep Software Standby mode on the rising edge of the IRQn-DS pin. In this example, an IRQn interrupt is accepted with the IRQCRi.IRQMD[1:0] bits of the ICU set to 01b (falling edge). After the DPSIEGRy.DIRQnEG bit (y = 0, 1 and n = 0 to 15) is set to 1 (rising edge) and the SBYCR.SSBY and DPSBYCR.DPSBY bits are both set to 1, the WFI instruction is executed. As a result, the MCU transitions to Deep Software Standby mode. Deep Software Standby mode is then canceled on the rising edge of the IRQn-DS pin.

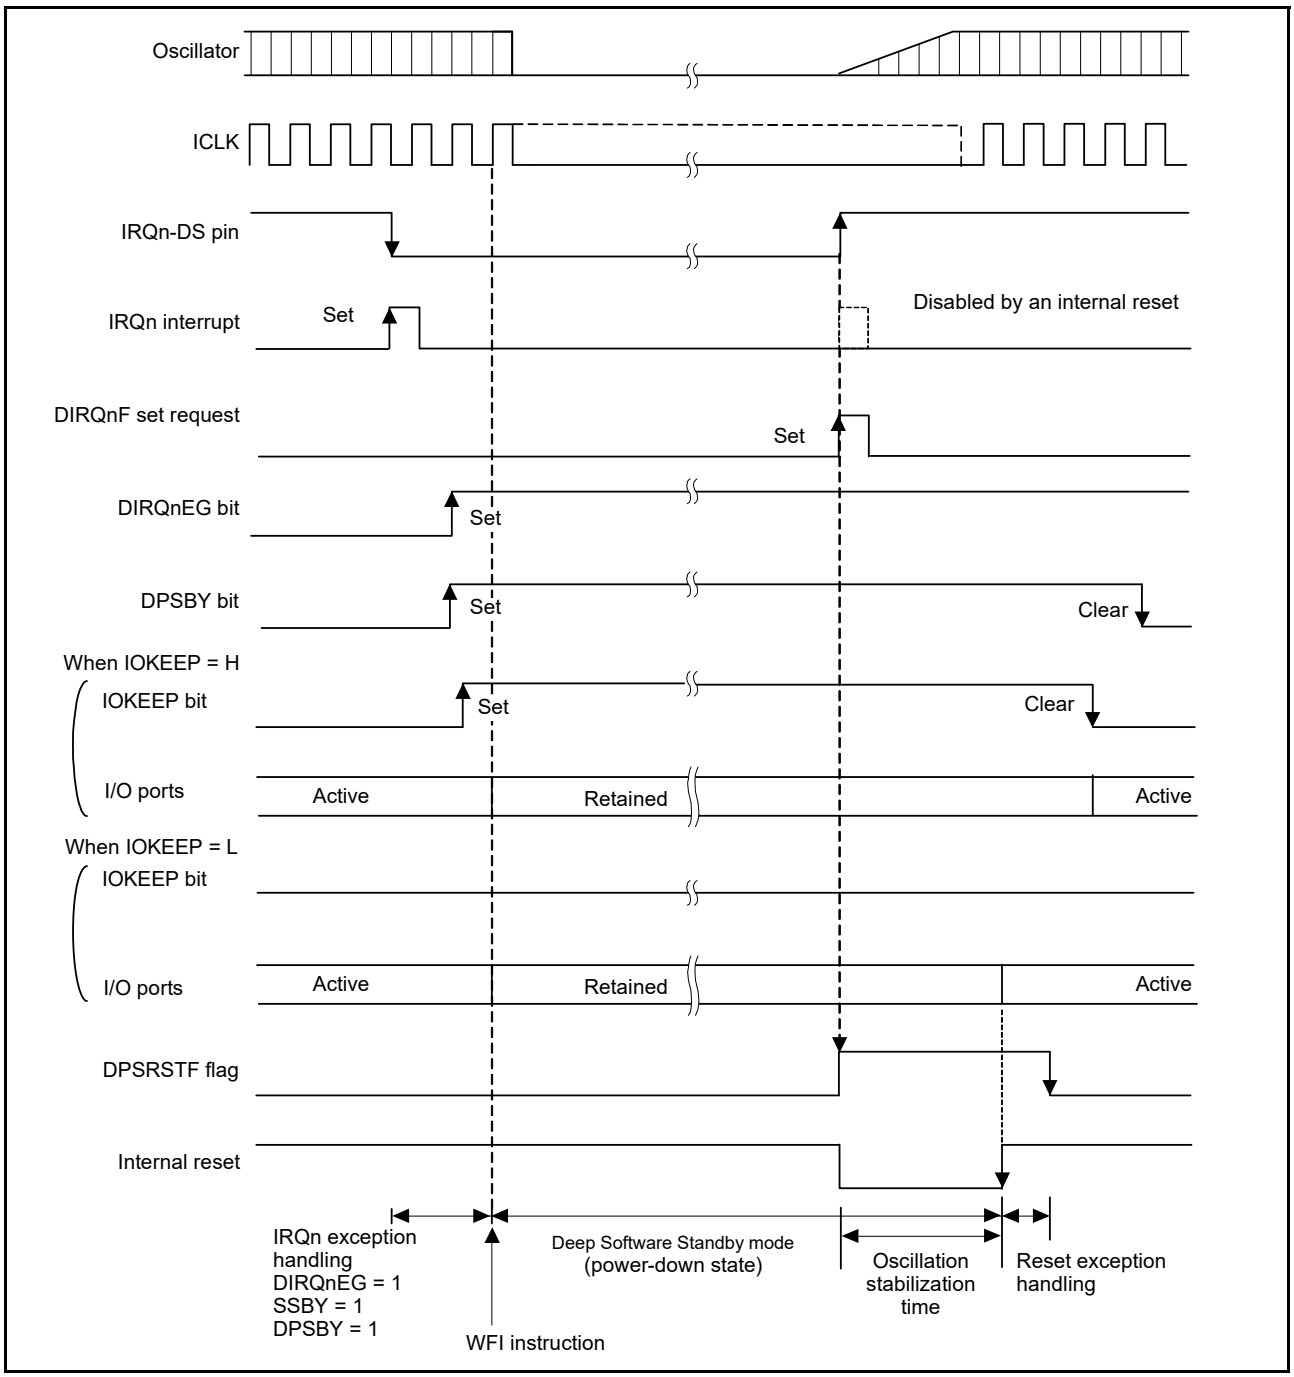

Figure 11.8 Example of Deep Software Standby mode application

11.9.5 Usage Flow for Deep Software Standby Mode

Figure 11.9 shows an example flow for using Deep Software Standby mode. In this example, the RSTSR0.DPSRSTF flag of the reset function is read after reset exception handling to determine whether the reset was generated by the RES pin or by the cancellation of Deep Software Standby mode. For a reset by the RES pin, the MCU transitions to Deep Software Standby mode after the required register settings are made. For a reset by the cancellation of Deep Software Standby mode, the DPSBYCR.IOKEEP bit clears to 0 after the I/O port settings are made.

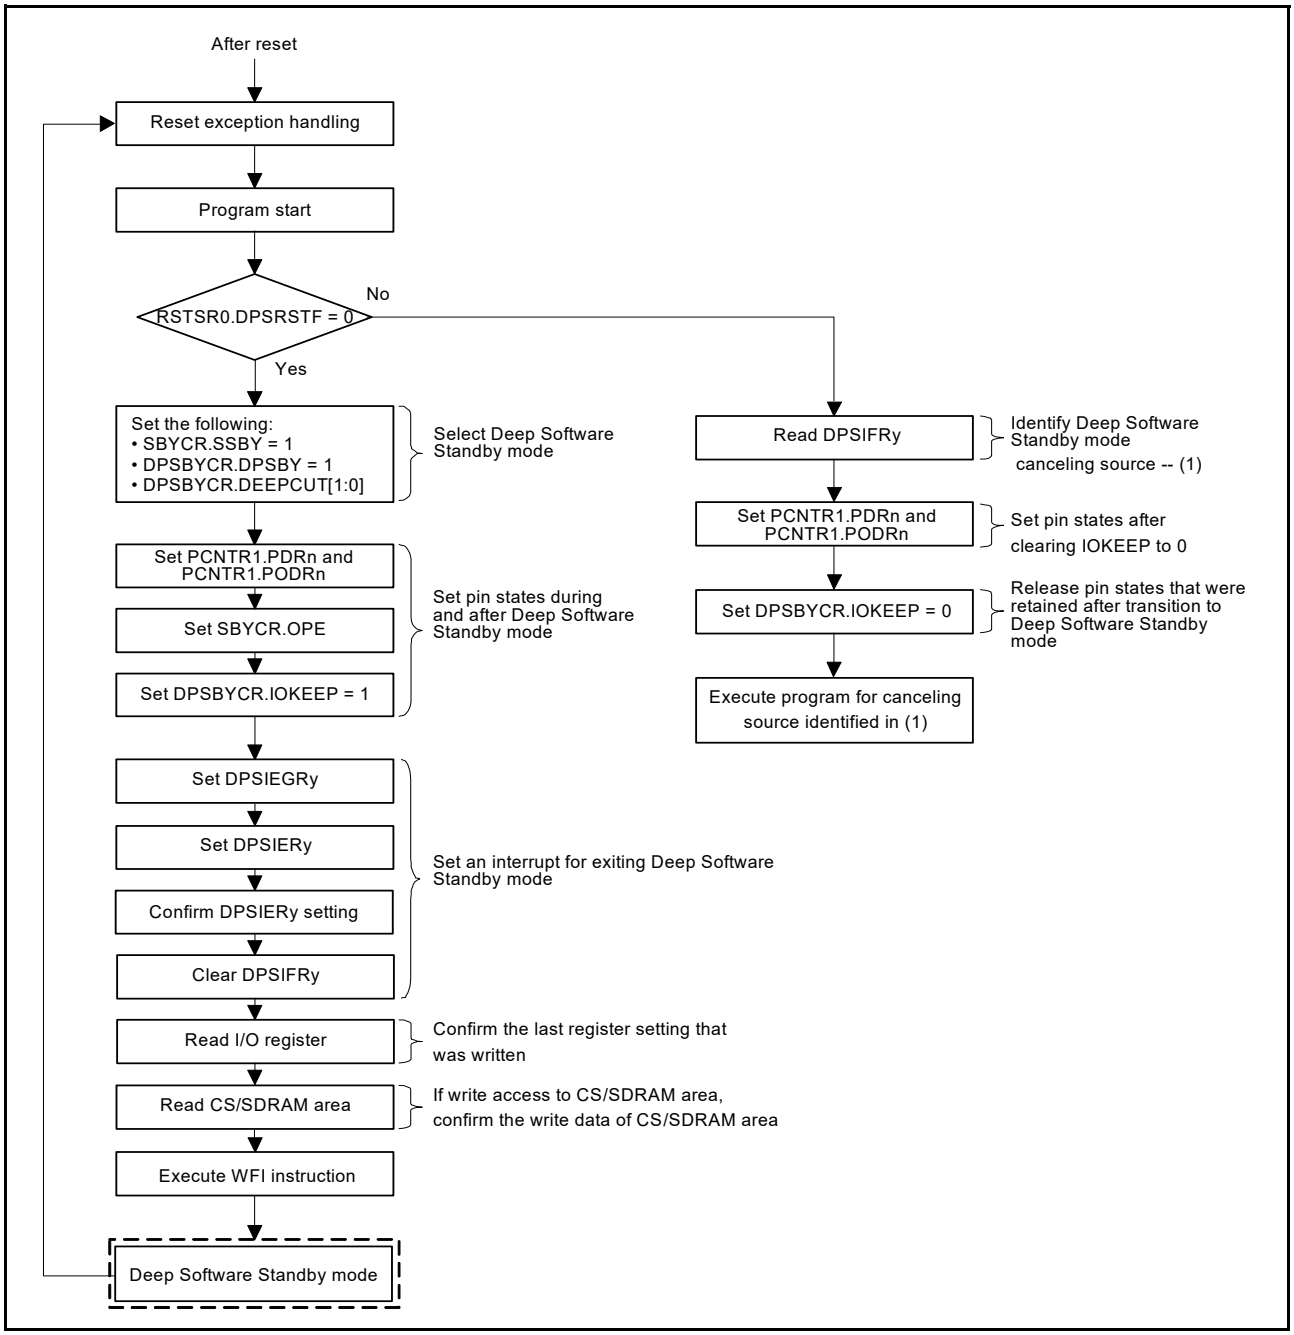

Figure 11.9 Example flow for use of Deep Software Standby mode

11.10 Usage Notes

11.10.1 Register Access

(1) Invalid register write accesses during specific modes or transitions

Do not write to registers listed in this section under any of the listed conditions.

[Registers]

- All registers with a peripheral name of "SYSTEM".

[Conditions]

- OPCCR.OPCMTSF = 1 or SOPCCR.SOPCMTSF = 1 (during transition of the operating power control mode)
- During time period from executing a WFI instruction to returning to Normal mode
- When FENTRYR.FENTRYi = 1 (i = 0 to 3) (flash P/E mode) or FENTRYR.FENTRYD = 1 (data flash P/E mode).

(2) Valid settings for the clock-related registers

Table 11.11 and Table 11.12 show the valid settings of the clock-related registers in each operating power control mode. Do not write any value other than the valid setting. Any other written value is ignored. Each register has certain prohibited settings under conditions other than those related to the operating power control modes. See section 9, Clock Generation Circuit, for these other conditions for each register.

Table 11.11 Valid settings for the clock-related registers (1)

Mode	Valid settings							
	SCKSCR. CKSEL[2:0] CKOCR. CKOSEL[2:0]	SCKDIVCR. FCK[2:0] ICK[2:0]	PLLCR. PLLSTP	HOCOCR. HCSTP	MOCOCR. MCSTP	LOCOCR. LCSTP	MOSCCR. MOSTP	SOSCCR. SOSTP
High-speed	000b (HOCO) 001b (MOCO) 010b (LOCO) 011b (Main clock) 100b (Sub-clock) 101b (PLL)*1	000b (1/1) 001b (1/2) 010b (1/4) 011b (1/8) 100b (1/16) 101b (1/32) 110b (1/64)	0 (operating) 1 (stopped)	0 (operating) 1 (stopped)	0 (operating) 1 (stop)	0 (operating) 1 (stopped)	0 (operating) 1 (stopped)	0 (operating) 1 (stopped)
Low-speed	000b (HOCO) 001b (MOCO) 010b (LOCO) 011b (Main clock) 100b (Sub-clock)		1 (stopped)					
Subosc-speed	010b (LOCO) 100b (Sub-clock)	000b (1/1)	1 (stopped)	1 (stopped)	1 (stopped)	0 (operating) 1 (stopped)	1 (stopped)	0 (operating) 1 (stopped)

Note 1. SCKSCR.CKSEL[2:0] only.

Table 11.12 Valid settings for the clock related registers (2)

Operating oscillator	Valid settings	
	OPCCR. OPCM[1:0]	SOPCCR. SOPCM
PLL	00b	0
High-speed on-chip oscillator	00b, 11b	0
Middle-speed on-chip oscillator		
Main clock oscillator		
Low-speed on-chip oscillator	00b, 11b	0, 1
Sub-clock oscillator		
IWDT-dedicated on-chip oscillator		

(3) Invalid register write accesses in subosc-speed mode

Do not write to registers listed in this section under the listed condition.

[Registers]

- SCKSCR, OPCCR.

[Condition]

- SOPCCR.SOPCM = 1 (Subosc-speed mode).

(4) Invalid register write accesses by the DTC or DMAC

Do not write to registers listed in this section by the DTC or DMAC.

[Registers]

- MSTPCRA, MSTPCRB, MSTPCRC, MSTPCRD.

(5) Invalid register write accesses in Snooze mode

Do not write to registers listed in this section in Snooze mode. They must be set before entering Software Standby mode.

[Registers]

- SNZCR, SNZEDCR, SNZREQCR.

(6) Invalid write access to FLWT.FLWT[2:0]

Do not write any value other than 000b to the FLWT.FLWT[2:0] bits under the listed condition.

[Condition]

- SOPCCR.SOPCM = 1 (Subosc-speed mode)

(7) Invalid write access when PRCR.PRC1 is 0

Do not write to registers listed in this section when the PRCR.PRC1 bit is 0.

[Registers]

- SBYCR, SNZCR, SNZEDCR, SNZREQCR, OPCCR, SOPCCR, DPSBYCR, DPSIERn (n = 0 to 3), DPSIFRn (n = 0 to 3), DPSIEGRn (n = 0 to 2), and SYOCDCR.

11.10.2 I/O Port States

The I/O port states in Software Standby, Deep Software Standby, and Snooze modes (except when modifying in Snooze mode) are the same before entering the modes. Therefore, the power consumption is not reduced while the output signals are held high.

11.10.3 Module-Stop State of DMAC and DTC

Before writing 1 to MSTPCRA.MSTPA22, clear the DMAST.DMST bit of the DMAC and the DTCST.DTCST bit of the DTC to 0.

11.10.4 Internal Interrupt Sources

Interrupts do not operate in the module-stop state. If the module-stop bit is set when an interrupt request is generated, a CPU interrupt source or a DMAC or DTC startup source cannot be cleared. Always disable the associated interrupts before setting the module-stop bits.

11.10.5 Input Buffer Control by the DIRQnE Bit (n = 0 to 15)

Setting the DPSIERy.DIRQnE bit (y = 0, 1 and n = 0 to 15) to 1 enables the associated input buffer of the IRQ0-DS to IRQ15-DS pins. Although inputs to these pins are sent to the DPSIFRy.DIRQnF bits (y = 0, 1 and n = 0 to 15), they are not sent to the ICU, peripheral modules, or I/O ports.

11.10.6 Transition to Low Power Modes

Because the MCU does not support wakeup by events, do not enter the low power modes (Sleep, Software Standby, or Deep Software Standby mode) by executing a WFE instruction. Also, do not set the SLEEPDEEP bit of the System Control Register in the Cortex®-M4 core, because the MCU does not support low power modes by SLEEPDEEP.

11.10.7 Timing of WFI Instruction

It is possible for the WFI instruction to be executed before I/O register and CS/SDRAM area writes are complete, in which case operation might not proceed as intended. This can happen if the WFI is placed immediately after a write to an I/O register or CS/SDRAM area. To avoid this problem, read back the register or CS/SDRAM area that was written to confirm that the write completed.

For example, reading the MSTPCRB register before execution of the WFI instruction can secure the period needed to complete writing into I/O register.

11.10.8 Writing to the WDT and IWDT Registers by the DMAC or DTC in Sleep or Snooze Mode

Do not write to the WDT or IWDT registers by the DMAC or DTC while the WDT or IWDT is stopped after entering Sleep or Snooze mode.

11.10.9 Oscillators in Snooze Mode

Oscillators that stop on entering Software Standby mode automatically restart when a trigger for switching to Snooze mode is generated. The MCU does not enter Snooze mode until all of the oscillators stabilize. In Snooze mode, you must disable oscillators that are not required in Snooze mode before entering Software Standby mode. Otherwise, the transition from Software Standby to Snooze mode takes longer.

11.10.10 Snooze Mode Entry by RXD0 Falling Edge

When the SNZCR.RXDREQEN bit is 1, noise on the RXD0 pin might make the MCU transition from Software Standby to Snooze mode. Any subsequent RXD0 data can be received in Snooze mode by noise on the RXD0 pin. If the MCU does not receive any RXD0 data after the noise, interrupts such as SCI0_ERI or SCI0_RXI and address mismatch events are not generated, and the MCU stays in Snooze mode. To avoid this, an AGT1 underflow interrupt must be used to return to Software Standby or Normal mode when using SCI0 in Snooze mode. However, do not use the AGT1 underflow as a source to return to Software Standby mode during an SCI communication. This makes the SCI0 stop the operation in a half-finished state.

11.10.11 Using SCI0 in Snooze Mode

When using SCI0 in Snooze mode, the AGT1 underflow must be used for the interrupt request or Snooze end request. Do not use any other trigger.

When using SCI0 in Snooze mode, the following conditions must be satisfied:

- The clock source must be HOCO
- MOCO, the main clock oscillator, and the PLL must stop before entering Software Standby mode
- The RXD0 pin must be kept at the high level before entering Software Standby mode
- A transition to Software Standby mode must not occur during an SCI communication
- The MSTPCRC.MSTPC0 bit must be 1 before entering Software Standby mode.

11.10.12 Conditions of A/D Conversion Start in Snooze Mode

The ADC12 can only be triggered by the ELC in Snooze mode. Do not use a software trigger or ADTRGn pin.

11.10.13 Conditions of CTSU in Snooze Mode

The CTSU can only be started by the ELC in Snooze mode.

11.10.14 ELC Events in Snooze Mode

Only the ELC events listed in this section are available in Snooze mode. Do not use any other events. If starting peripheral modules for the first time after entering Snooze mode, the Event Link Setting Register (ELSRn) must set a Snooze mode entry event (SYSTEM_SNZREQ) as the trigger.

- Snooze mode entry (SYSTEM_SNZREQ)
- DTC transfer end (DTC_DTCEND)
- ADC12n Window A/B compare match (ADC12n_WCMPM) (n = 0, 1)
- ADC12n Window A/B compare mismatch (ADC12n_WCMPUM) (n = 0, 1)
- Data operation circuit interrupt (DOC_DOPCI)

11.10.15 Restrictions on Wakeup from Software Standby Mode

When the MCU wakes up from Software Standby mode because of a peripheral interrupt and transitions to Software Standby mode again before negating the interrupt signal, if the same peripheral interrupt occurs for wakeup, the MCU cannot cancel Software Standby mode (see Figure 11.10). To avoid this, when the application iteratively executes transitions between Software Standby and Normal modes, wait until the negation of the peripheral interrupt signal before entering Software Standby mode (see Figure 11.11).

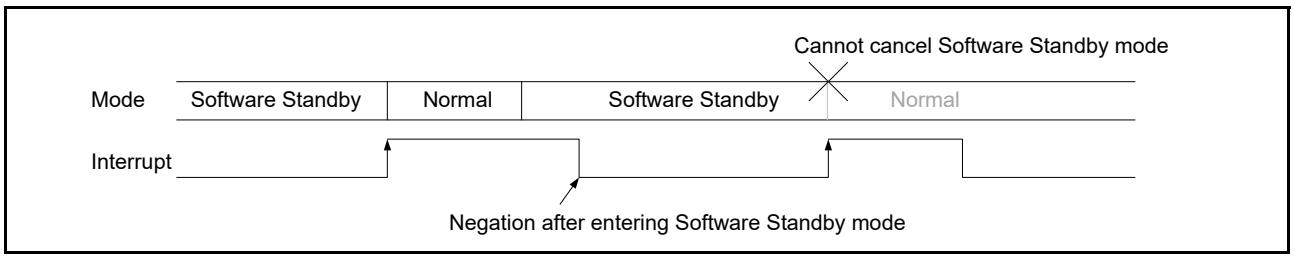

Figure 11.10 Entering Software Standby mode before negating the interrupt signal

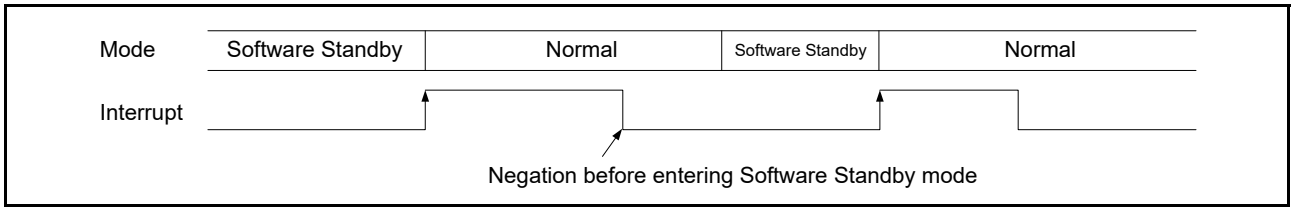

Figure 11.11 Entering Software Standby mode after negating the interrupt signal

The associated peripheral interrupts are as follows:

- AGT1 interrupt (AGT1_AGTI: Event number 043h)
- AGT1 Compare match A (AGT1_AGTCMAI: Event number 044h)
- AGT1 Compare match B (AGT1_AGTCMBI: Event number 045h)
- Alarm interrupt (RTC_ALM: Event number 048h)
- Periodic interrupt (RTC_PRD: Event number 049h)
- Comparator interrupt 0 (ACMP_HS0: Event number 057h).

Table 11.13 lists the assertion period and confirmation methods for the peripheral interrupt signals.

Table 11.13 Assertion periods and confirmation methods for peripheral interrupt signals

Interrupt signal	Assertion period	Confirmation method
AGT1_AGT1	• When the clock source is sub-clock oscillator or LOCO, 1 to 128 clock cycles of clock source - 30 µs to 3.9 ms • When the clock source is underflow signal of AGT channel 0, pulse width of underflow signal - 30 µs to 25.6 s	AGT1.AGTCR.TUNDF
AGT1_AGTCMAI		AGT1.AGTCR.TCMAF
AGT1_AGTCMBI		AGT1.AGTCR.TCMBF
RTC_ALM	• During alarm condition matching (depends on alarm register settings) - more than 1 s	None
RTC_PRD	• 2 clock cycles of count source - 60 µs	None
ACMP_HS0	• Depends on state of comparison signal - Unknown	ACMPHS0.CMPMON.CMPMON

When the application cannot wait until the negation of the peripheral interrupt signal before entering Software Standby mode, an auxiliary timer with additional resources such as one timer and one interrupt vector can be used to cancel Software Standby mode. Figure 11.12 shows this method of using an auxiliary timer. GPT and AGT can be used as the timer.

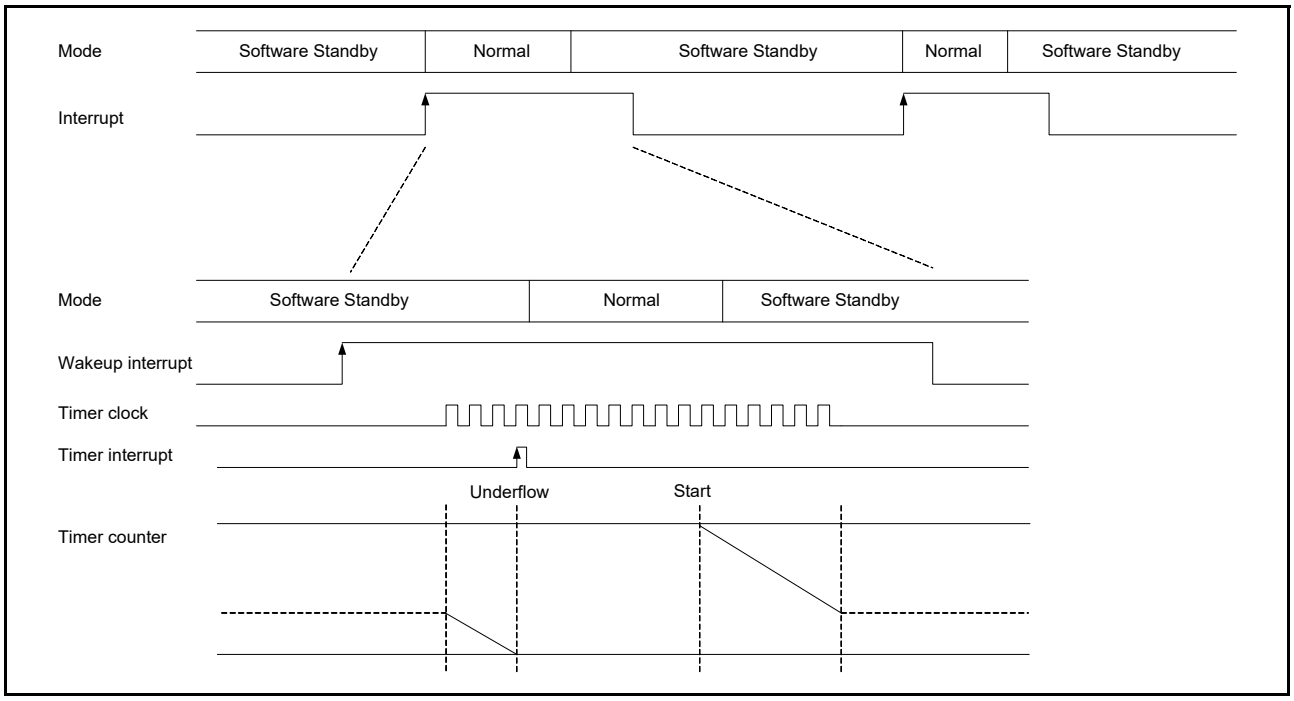

Figure 11.12 Example of using AGT and GPT as an auxiliary timer to cancel Software Standby mode

To use an auxiliary timer to cancel Software Standby mode:

1. Choose the timer and assign the interrupt vector.
2. Before executing a WFI instruction, start the auxiliary timer count. When the clock stops, the MCU enters Software Standby mode.
3. When a wakeup interrupt occurs, the MCU cannot cancel Software Standby mode. However, the auxiliary timer begins counting again.
4. When the auxiliary timer underflows, an interrupt is generated, and the MCU can cancel Software Standby mode. The auxiliary timer must be stopped in the interrupt handler. The application can then invoke the original wakeup interrupt handler.
5. The same operation is repeated for the next transition to Software Standby mode.

Note: If execution of the WFI instruction is faster than negation of the peripheral interrupt signal, the MCU can wake up from Software Standby mode normally.

Note: If you have multiple factors to wake up the MCU from Software Standby mode, stop the auxiliary timer in the first interrupt handler. Otherwise, it might generate an unnecessary interrupt.

11.10.16 Module-Stop Function for ADC12

When entering Software Standby mode, it is recommended to set the ADC12 module-stop (MSTPD15 or MSTPD16 bit) state to reduce power consumption.

In this case, the ADC12 can be available in Snooze mode with releasing the ADC12 module-stop using the DTC. Similarly, set module-stop using the DTC before returning to the Software Standby mode from the Snooze mode.

In addition, when using the analog voltage input source (IVCMP2 or IVCMP3) of ACMPHS in the Software Standby mode, do not set the ADC12 module-stop.

12. Battery Backup Function

12.1 Overview

The battery backup function maintains partial battery powering in the event of power loss. Switching between VCC and VBATT, it always maintains power to the RTC, SOSC, and backup memory. During normal operation, the battery powered area is powered by the main power supply, the VCC pin. When a VCC voltage drop is detected, the power source switches to the dedicated battery backup power pin, the VBATT pin. When the voltage rises again, the power source switches back from VBATT to VCC.

12.1.1 Features of Battery Backup Function

Battery backup features include:

- Battery power supply switch
- Backup registers
- Time capture pin detection.

12.1.2 Battery Power Supply Switch

When the voltage applied to the VCC pin drops, this feature switches the power supply from the VCC pin to the VBATT pin. When the voltage rises, it switches the power supply from the VBATT pin back to the VCC pin.

12.1.3 Backup Registers

The battery powered area provides 512 one-byte backup registers. These registers retain data only when VBATT is supplied and VCC is powered off.

12.1.4 Time Capture Pin Detection

The RTC detects input level changes on the time capture pin. For more information, see section 26, Realtime Clock (RTC).

Note: When VCC is < VDETBATT and > (VBATT + 0.6 V), the injected current connects from the VCC to the VBATT pin through an internal diode. If the power supply battery connected to the VBATT pin cannot support this current injection, for example if the battery is not rechargeable, Renesas strongly recommends that you connect through a low-voltage threshold diode between the power supply battery and the VBATT pin.

Note: You must enable voltage monitor 0 resets to use the battery backup function. The voltage monitor 0 level must be higher than the VBATT switch level.

Figure 12.1 shows the configuration of the battery backup function.

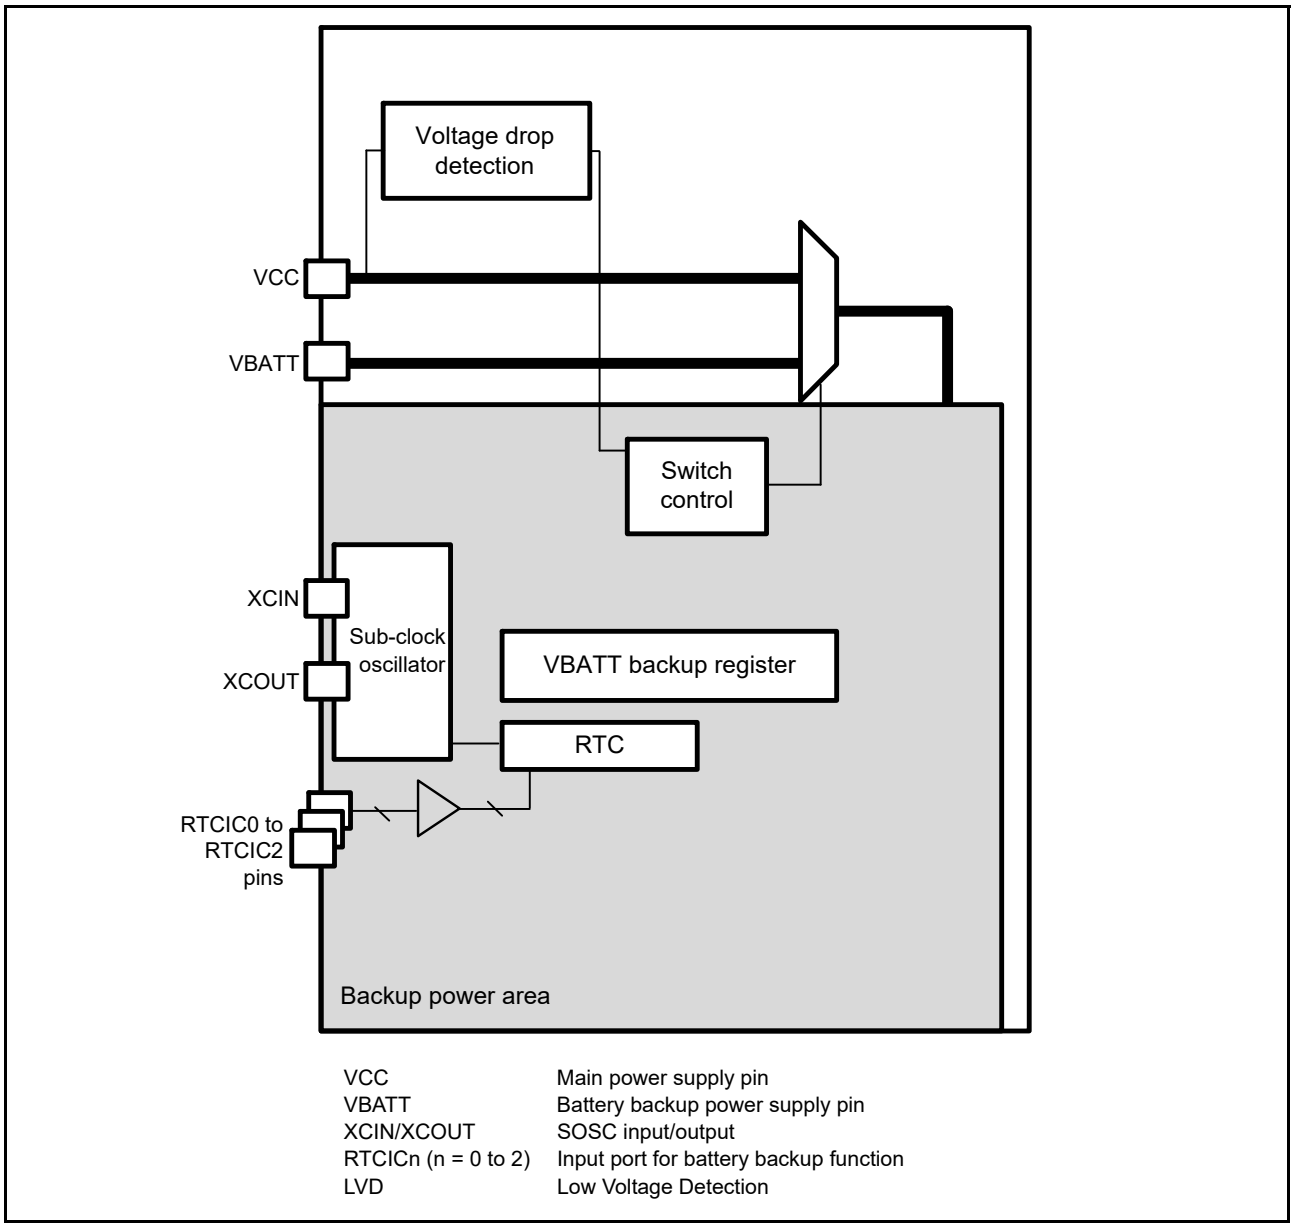

Figure 12.1 Configuration of the battery backup function

12.2 Register Descriptions

12.2.1 VBATT Backup Register (VBTBKRn) (n = 0 to 511)

Address(es): SYSTEM.VBTBKR[0] 4001 E500h to SYSTEM.VBTBKR[511] 4001 E6FFh

	b7	b6	b5	b4	b3	b2	b1	b0
	VBTBKR[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

VBTBKRn is an 8-bit access read/write register for storing data powered by VBATT. The value of this register is retained when VCC is not powered and VBATT is powered. This register is not initialized by any reset.

12.2.2 VBATT Input Control Register (VBTICTLR)

Address(es): SYSTEM.VBTICTLR 4001 E4BBh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	VCH2INEN	VCH1INEN	VCH0INEN
Value after reset:	0	0	0	0	0	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	VCH0INEN	VBATT CH0 Input Enable	0: Disable 1: Enable.	R/W
b1	VCH1INEN	VBATT CH1 Input Enable	0: Disable 1: Enable.	R/W
b2	VCH2INEN	VBATT CH2 Input Enable	0: Disable 1: Enable.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The VBTICTLR register selects the VBATT I/O direction as input.

VCHnINEN bit (VBATT CHn Input Enable Bit) (n = 0 to 2)

The VCHnINEN bit enables the input direction on the associated VBATT channel.

For more information on CH0 to CH2 corresponding function, see section 20.5.5, I/O Buffer Specification.

12.3 Operation

12.3.1 Battery Backup Function

When the voltage on the VCC pin drops, power can be supplied to the RTC and sub-clock oscillator from the VBATT pin. When a power supply drop from the VCC pin is detected, the power connection switches from the power supply to the VBATT pin. The power supply from the VCC pin is resumed when the voltage on the VCC pin exceeds VDETBATT. This power supply change does not affect the RTC operation.

You must enable voltage monitor 0 resets to use the battery backup function. The RTC supports time capture detection, triggered by a change to the time capture pin input level.

The VBATT pin supplies power to the following modules:

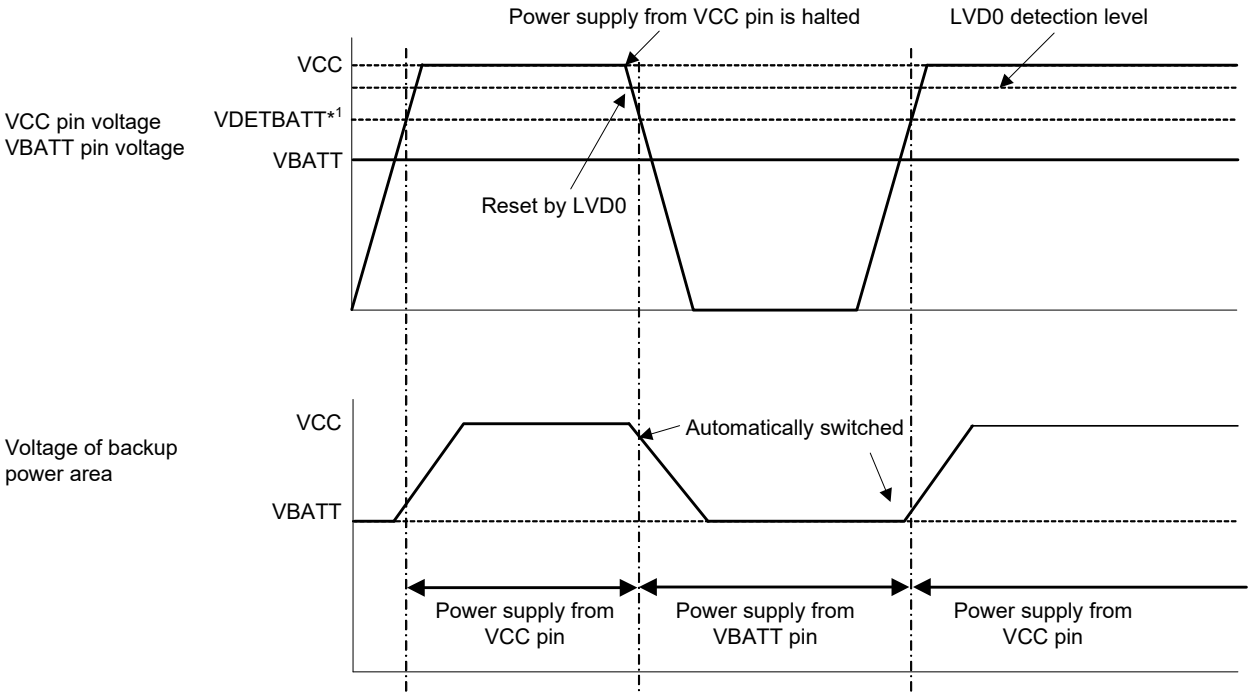
- RTC
- Sub-clock oscillator (including XCIN and XCOUT pins)
- VBATT Backup Register.

Table 12.1 shows the operating states in VBATT mode.

Table 12.1 Operating states in VBATT mode (1 of 2)

Operating state	VBATT mode
Transition condition	Detection of VCC voltage drop
Canceling method other than reset	Detection of VCC voltage rise
State after cancellation by an interrupt	—
State after cancellation by a reset	—
Main clock oscillator	Stopped
Sub-clock oscillator	Operating
High-speed on-chip oscillator	Stopped

Table 12.1 Operating states in VBATT mode (2 of 2)



Operating state	VBATT mode
Middle-speed on-chip oscillator	Stopped
Low-speed on-chip oscillator	Stopped
IWDT-dedicated on-chip oscillator	Stopped
PLL	Stopped
CPU	Stopped (undefined)
SRAM (DED SRAM included)	Stopped (undefined)
Standby SRAM	Stopped (undefined)
VBATT Backup Register	Stopped (retained)
Flash memory	Stopped (retained)
Realtime Clock (RTC)	Selectable when selecting clock that serves as the count source
AGTn (n = 0, 1)	Stopped (undefined)
Low Voltage Detection (LVD)	Stopped
Power-on reset circuit	Stopped
Other peripheral modules	Stopped (undefined)
I/O ports	• RTCICn ports (n = 0 to 2): Operating • All ports not specified here: Undefined

Note: *Selectable* means that operating or stopped is selectable in the control registers. Some modules are also controlled by the associated module-stop bit.

Note: *Stopped (retained)* means that the contents of the internal registers are retained but the operations are suspended.

Note: *Stop (undefined)* means that the contents of the internal registers are undefined and power to the internal circuit is cut off.

Figure 12.2 shows the switching sequence of the battery backup function.

Note: For details on electrical characteristics, see section 60, Electrical Characteristics.
Note 1. VDETBATT indicates the threshold level of the power supply change between the VCC pin and the VBATT pin.

Figure 12.2 Switching sequence for the battery backup function

12.3.2 VBATT Battery Power Supply Switch Usage

The battery power supply switch can switch the power supply from the VCC pin to the VBATT pin when the voltage being applied to the VCC pin drops. When the voltage rises, this switch changes the power supply from the VBATT pin to the VCC pin.

Note: You must enable voltage monitor 0 resets to use the battery backup function. Voltage monitor 0 level must be higher than the VBATT switch level.

12.3.3 VBATT Backup Register Usage

Use the VBATT backup registers VBTBKRn, where n = 0 to 511, to store or restore data with an 8-bit read or write operation.

12.4 Usage Notes

1. Operation of the sub-clock oscillator and RTC are not guaranteed when the voltage level on VBATT is lower than the guaranteed operation range. The RTC must be initialized to restart the power supply after the VBATT pin falls below the guaranteed operating voltage.
2. A reset generated while writing to registers described in this section might destroy the register value.
3. When VCC is higher than VDETBATT, the VCC pin and VBATT pin are separated. When VCC is lower than VDETBATT and the switch is connected to the VBATT pin, and if the voltage on VBATT drops lower than (VCC - 0.6 V), current might flow into the VBATT pin through the parasitic diode between the VCC and VBATT pins.
4. During RTC operation using the voltage from the VBATT pin and the I/O ports (P402, P403 and P404) within the backup, the power supply area can only be used as time capture event input pins for the RTC.

13. Register Write Protection

13.1 Overview

The register write protection function protects important registers from being overwritten because of software errors. The registers to be protected are set with the Protect Register (PRCR). Table 13.1 lists the association between the PRCR bits and the registers to be protected.

Table 13.1 Association between PRCR bits and registers to be protected

PRCR bit	Registers to be protected
PRC0	• Registers related to the Clock Generation Circuit: SCKDIVCR, SCKDIVCR2, SCKSCR, PLLCCR, PLLCR, BCKCR, MOSCCR, HOCOCR, MOCOCR, CKOCR, TRCKCR, OSTDCR, OSTDSR, EBCKOCR, SDCKOCR, MOCOUTCR, HOCOUTCR, MOSCWTCR, MOMCR, SOSCCR, SOMCR, LOCOCR, LOCOUTCR, HOCOWTCR, FLLCR1, FLLCR2
PRC1	• Registers related to the low power modes: SBYCR, SNZCR, SNZEDCR, SNZREQCR, OPCCR, SOPCCR, DPSBYCR, DPSIER0-3, DPSIFR0-3, DPSIEGR0-2, SYOCDCR, STCONR • Registers related to the battery backup function: VBTBKRn (n = 0 to 511), VBTICTLR
PRC3	• Registers related to the LVD: LVD1CR1, LVD1SR, LVD2CR1, LVD2SR, LVCMPCR, LVDLVLR, LVD1CR0, LVD2CR0

13.2 Register Descriptions

13.2.1 Protect Register (PRCR)

Address(es): SYSTEM.PRCR 4001 E3FEh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PRKEY[7:0]								—	—	—	—	PRC3	—	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

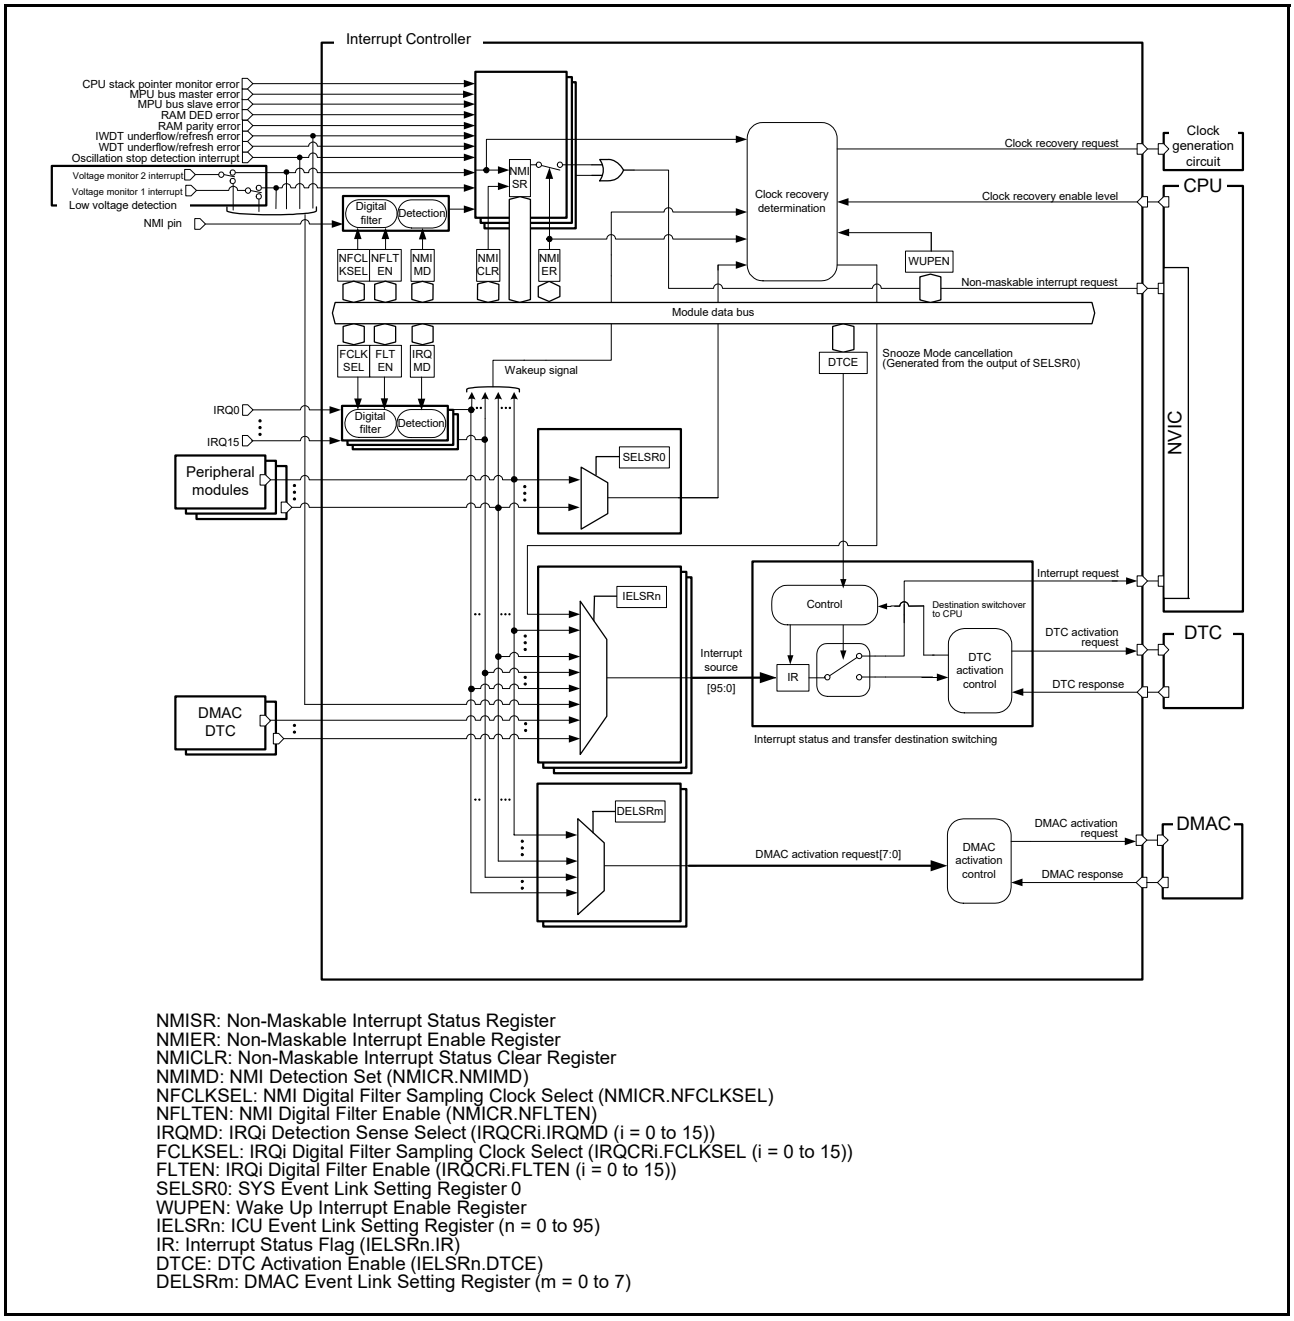
Bit	Symbol	Bit name	Function	R/W
b0	PRC0	Protect Bit 0	Enables writing to the registers related to the Clock Generation Circuit: 0: Disable writes 1: Enable writes.	R/W
b1	PRC1	Protect Bit 1	Enables writing to the registers related to the low power modes and the battery backup function: 0: Disable writes 1: Enable writes.	R/W
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b3	PRC3	Protect Bit 3	Enables writing to the registers related to the LVD: 0: Disable writes 1: Enable writes.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b8	PRKEY[7:0]	PRC Key Code	These bits control write access to the PRCR register. To modify the PRCR register, write A5h to the eight higher-order bits and the wanted value to the eight lower-order bits as a 16-bit unit.	W*1

Note 1. Write data is not retained. Always reads 00h.

PRCn bits (Protect Bit n) (n = 0, 1, 3)

The PRCn bits enable or disable writing to the protected registers listed in Table 13.1. Setting PRCn to 1 or 0 enables or disables writing, respectively.

14. Interrupt Controller Unit (ICU)



14.1 Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC, DTC, and DMAC modules. The ICU also controls non-maskable interrupts. Table 14.1 lists the ICU specifications, Figure 14.1 shows the block diagram, and Table 14.2 lists the I/O pins.

Table 14.1 ICU specifications

Parameter		Specifications
Interrupts	Peripheral function interrupts	• Interrupts from peripheral modules Number of sources: 316 (select factors within event list numbers 64 to 511)
	External pin interrupts	• Interrupt detection on low level, falling edge, rising edge, rising and falling edges One of these detection methods can be set for each source. • Digital filter function supported • 16 sources, with interrupts from IRQ0 to IRQ15 pins
	DTC and DMAC control	The DTC and DMAC can be activated using interrupt sources*1
	Interrupt sources for NVIC	96 sources
Non-maskable interrupts*2	NMI pin interrupt	• Interrupt from the NMI pin • Interrupt detection on falling edge or rising edge • Digital filter function supported
	Oscillation stop detection interrupt*3	Interrupt on detecting that the main oscillator has stopped
	WDT underflow/refresh error*3	Interrupt on an underflow of the down-counter or occurrence of a refresh error
	IWDT underflow/refresh error*3	Interrupt on an underflow of the down-counter or occurrence of a refresh error
	Voltage monitor 1 interrupt*3	Voltage monitor interrupt of Low Voltage Detection detector 1 (LVD1)
	Voltage monitor 2 interrupt*3	Voltage monitor interrupt of Low Voltage Detection detector 2 (LVD2)
	RPEST	Interrupt on SRAM parity error
	RDEDST	Interrupt on SRAM DED error
	BUSSST	Interrupt on MPU bus slave error
	BUSMST	Interrupt on MPU bus master error
	SPEST	Interrupt on CPU stack pointer monitor
Return from low power mode*4		• Sleep mode: Return is initiated by non-maskable interrupts or any other interrupt source • Software Standby mode: Return is initiated by non-maskable interrupts Interrupts can be selected in the WUPEN register. • Snooze mode: Return is initiated by non-maskable interrupts Interrupts can be selected in the SELSR0 and WUPEN registers. See section 14.2.8, SYS Event Link Setting Register (SELSR0), and section 14.2.9, Wake Up Interrupt Enable Register (WUPEN).

Note 1. For the DTC and DMAC activation sources, see Table 14.4.
Note 2. Non-maskable interrupts can be enabled only once after a reset release.
Note 3. These non-maskable interrupts can also be used as event signals. When used as interrupts, do not change the value of the NMIER register from the reset state. To enable voltage monitor 1 and 2 interrupts, set the LVD1CR1.IRQSEL and LVD2CR1.IRQSEL bits to 1.
Note 4. For return from Deep Software Standby mode, see section 11.9, Deep Software Standby Mode.

NMISR: Non-Maskable Interrupt Status Register
NMIER: Non-Maskable Interrupt Enable Register
NMICLR: Non-Maskable Interrupt Status Clear Register
NMIMD: NMI Detection Set (NMICR.NMIMD)
NFCLKSEL: NMI Digital Filter Sampling Clock Select (NMICR.NFCLKSEL)
NFLTEN: NMI Digital Filter Enable (NMICR.NFLTEN)
IRQMD: IRQi Detection Sense Select (IRQCRi.IRQMD (i = 0 to 15))
FCLKSEL: IRQi Digital Filter Sampling Clock Select (IRQCRi.FCLKSEL (i = 0 to 15))
FLTEN: IRQi Digital Filter Enable (IRQCRi.FLTEN (i = 0 to 15))
SELSR0: SYS Event Link Setting Register 0
WUPEN: Wake Up Interrupt Enable Register
IELSRn: ICU Event Link Setting Register (n = 0 to 95)
IR: Interrupt Status Flag (IELSRn.IR)
DTCE: DTC Activation Enable (IELSRn.DTCE)
DELSRm: DMAC Event Link Setting Register (m = 0 to 7)

Table 14.2 ICU I/O pins

Pin name	I/O	Description
NMI	Input	Non-maskable interrupt request pin
IRQ0 to IRQ15	Input	External interrupt request pins

14.2 Register Descriptions

This chapter does not describe the Arm® NVIC internal registers. For information on these registers, see the *ARM® Cortex®-M4 Processor Technical Reference Manual (ARM DDI 0439D)*.

14.2.1 IRQ Control Register i (IRQCRi) (i = 0 to 15)

Address(es): ICU.IRQCR0 4000 6000h, ICU.IRQCR1 4000 6001h, ICU.IRQCR2 4000 6002h, ICU.IRQCR3 4000 6003h, ICU.IRQCR4 4000 6004h, ICU.IRQCR5 4000 6005h, ICU.IRQCR6 4000 6006h, ICU.IRQCR7 4000 6007h

ICU.IRQCR8 4000 6008h, ICU.IRQCR9 4000 6009h, ICU.IRQCR10 4000 600Ah, ICU.IRQCR11 4000 600Bh, ICU.IRQCR12 4000 600Ch, ICU.IRQCR13 4000 600Dh, ICU.IRQCR14 4000 600Eh, ICU.IRQCR15 4000 600Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	FLTEN	—	FCLKSEL[1:0]		—	—	IRQMD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	IRQMD[1:0]	IRQi Detection Sense Select	b1 b0 0 0: Falling edge 0 1: Rising edge 1 0: Rising and falling edges 1 1: Low level.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5, b4	FCLKSEL[1:0]	IRQi Digital Filter Sampling Clock Select	b5 b4 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64.	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	FLTEN	IRQi Digital Filter Enable	0: Disable 1: Enable.	R/W

IRQCRi register changes must satisfy the following conditions:

- For a CPU interrupt or DTC trigger:
  Change the IRQCRi register setting before setting the target IELSRn register (n = 0 to 95).
  You can change the register values only when the IELSRn.IELS[8:0] bits are 0000h.
- For a DMAC trigger:
  Change the IRQCRi register setting before setting the target DELSRn register (n = 0 to 7).
  You can change the register values only when the DELSRn.DELS[8:0] bits are 0000h.
- For a wakeup enable signal:
  Change the IRQCRi register setting before setting the target WUPEN.IRQWUPENn bit (n = 0 to 15).
  You can change the register values only when the target WUPEN.IRQWUPENn bit is 0.

IRQMD[1:0] bits (IRQi Detection Sense Select)

The IRQMD[1:0] bits set the detection sensing method for the IRQi external pin interrupt sources. For more information on the settings, see section 14.4.4, External Pin Interrupts.

FCLKSEL[1:0] bits (IRQi Digital Filter Sampling Clock Select)

The FCLKSEL[1:0] bits select the digital filter sampling clock for the IRQi external pin interrupt requests, selectable to:

- PCLKB (every cycle)
- PCKLB/8 (once every eight cycles)
- PCKLB/32 (once every 32 cycles)
- PCKLB/64 (once every 64 cycles).

For details on the digital filter, see section 14.4.3, Digital Filter.

FLTEN bit (IRQi Digital Filter Enable)

The FLTEN bit enables the digital filter used for the IRQi external pin interrupt sources. The filter is enabled when FLTEN is 1 and disabled when FLTEN is 0. The IRQi pin level is sampled at the cycle specified in FCLKSEL[1:0]. When the sampled level matches three times, the output level from the digital filter changes. For details on the digital filter, see section 14.4.3, Digital Filter.

14.2.2 Non-Maskable Interrupt Status Register (NMISR)

Address(es): ICU.NMISR 4000 6140h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SPEST	BUSMST	BUSSST	RDEDST	RPEST	NMIST	OSTST	—	—	LVD2ST	LVD1ST	WDTST	IWDTST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	IWDTST	IWDT Underflow/Refresh Error Status Flag	0: Interrupt not requested 1: Interrupt requested.	R
b1	WDTST	WDT Underflow/Refresh Error Status Flag	0: Interrupt not requested 1: Interrupt requested.	R
b2	LVD1ST	Voltage Monitor 1 Interrupt Status Flag	0: Interrupt not requested 1: Interrupt requested.	R
b3	LVD2ST	Voltage Monitor 2 Interrupt Status Flag	0: Interrupt not requested 1: Interrupt requested.	R
b5, b4	—	Reserved	These bits are read as 0.	R
b6	OSTST	Main Oscillation Stop Detection Interrupt Status Flag	0: Interrupt not requested for main oscillation stop 1: Interrupt requested for main oscillation stop.	R
b7	NMIST	NMI Status Flag	0: NMI pin interrupt not requested 1: NMI pin interrupt requested.	R
b8	RPEST	SRAM Parity Error Interrupt Status Flag	0: Interrupt not requested 1: Interrupt requested.	R
b9	RDEDST	SRAM DED Error Interrupt Status Flag	0: Interrupt not requested 1: Interrupt requested.	R
b10	BUSSST	MPU Bus Slave Error Interrupt Status Flag	0: Interrupt not requested 1: Interrupt requested.	R
b11	BUSMST	MPU Bus Master Error Interrupt Status Flag	0: Interrupt not requested 1: Interrupt requested.	R
b12	SPEST	CPU Stack Pointer Monitor Interrupt Status Flag	0: Interrupt not requested 1: Interrupt requested.	R
b15 to b13	—	Reserved	These bits are read as 0.	R

The NMISR register monitors the status of non-maskable interrupt sources. Writes to the NMISR register are ignored. The setting in the Non-Maskable Interrupt Enable Register (NMIER) does not affect the status flags in this register. Before the end of the non-maskable interrupt handler, check that all of the bits in this register are set to 0 to confirm that no other NMI requests have occurred during handler processing.

IWDTST flag (IWDT Underflow/Refresh Error Status Flag)

The IWDTST flag indicates an IWDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.IWDTCLR bit.

[Setting condition]

When an IWDT underflow/refresh error interrupt occurs and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.IWDTCLR bit.

WDTST flag (WDT Underflow/Refresh Error Status Flag)

The WDTST flag indicates a WDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.WDTCLR bit.

[Setting condition]

When a WDT underflow/refresh error interrupt occurs.

[Clearing condition]

When 1 is written to the NMICLR.WDTCLR bit.

LVD1ST flag (Voltage Monitor 1 Interrupt Status Flag)

The LVD1ST flag indicates a request for voltage monitor 1 interrupt. It is read-only and cleared by the NMICLR.LVD1CLR bit.

[Setting condition]

When a voltage monitor 1 interrupt occurs and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.LVD1CLR bit.

LVD2ST flag (Voltage Monitor 2 Interrupt Status Flag)

The LVD2ST flag indicates a request for voltage monitor 2 interrupt. It is read-only and cleared by the NMICLR.LVD2CLR bit.

[Setting condition]

When a voltage monitor 2 interrupt occurs and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.LVD2CLR bit.

OSTST flag (Main Oscillation Stop Detection Interrupt Status Flag)

The OSTST flag indicates a main oscillation stop detection interrupt request. It is read-only and cleared by the NMICLR.OSTCLR bit.

[Setting condition]

When an oscillation stop detection interrupt occurs.

[Clearing condition]

When 1 is written to the NMICLR.OSTCLR bit.

NMIST flag (NMI Status Flag)

The NMIST flag indicates an NMI pin interrupt request. It is read-only and cleared by the NMICLR.NMICLR bit.

[Setting condition]

When an edge specified in the NMICR.NMIMD bit is input to the NMI pin.

[Clearing condition]

When 1 is written to the NMICLR.NMICLR bit.

RPEST flag (SRAM Parity Error Interrupt Status Flag)

The RPEST flag indicates an SRAM parity error interrupt request.

[Setting condition]

When an interrupt occurs in response to an SRAM parity error.

[Clearing condition]

When 1 is written to the NMICLR.RPECLR bit.

RDEDST flag (SRAM DED Error Interrupt Status Flag)

The RDEDST flag indicates an SRAM DED error interrupt request.

[Setting condition]

When an interrupt occurs in response to an SRAM DED error.

[Clearing condition]

When 1 is written to the NMICLR.RDEDCLR bit.

BUSSST flag (MPU Bus Slave Error Interrupt Status Flag)

The BUSSST flag indicates a bus slave error interrupt request.

[Setting condition]

When an interrupt occurs in response to a bus slave error.

[Clearing condition]

When 1 is written to the NMICLR.BUSSCLR bit.

BUSMST flag (MPU Bus Master Error Interrupt Status Flag)

The BUSMST flag indicates a bus master error interrupt request.

[Setting condition]

When an interrupt occurs in response to a bus master error.

[Clearing condition]

When 1 is written to the NMICLR.BUSMCLR bit.

SPEST flag (CPU Stack Pointer Monitor Interrupt Status Flag)

The SPEST flag indicates a CPU stack pointer monitor interrupt request.

[Setting condition]

When an interrupt occurs in response to a CPU stack pointer monitor error.

[Clearing condition]

When 1 is written to the NMICLR.SPECLR bit.

14.2.3 Non-Maskable Interrupt Enable Register (NMIER)

Address(es): ICU.NMIER 4000 6120h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SPEEN	BUSMEN	BUSSEN	RDEDEN	RPEEN	NMIEN	OSTEN	—	—	LVD2EN	LVD1EN	WDTEN	IWDTEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	IWDTEN	IWDT Underflow/Refresh Error Interrupt Enable	0: Disable 1: Enable.	R/(W) *1, *2
b1	WDTEN	WDT Underflow/Refresh Error Interrupt Enable	0: Disable 1: Enable.	R/(W) *1, *2
b2	LVD1EN	Voltage Monitor 1 Interrupt Enable	0: Disable 1: Enable.	R/(W) *1, *2

Bit	Symbol	Bit name	Description	R/W
b3	LVD2EN	Voltage Monitor 2 Interrupt Enable	0: Disable 1: Enable.	R/(W) *1, *2
b5, b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	OSTEN	Oscillation Stop Detection Interrupt Enable	0: Disable for main oscillation 1: Enable for main oscillation.	R/(W) *1, *2
b7	NMIEN	NMI Pin Interrupt Enable	0: Disable 1: Enable.	R/(W) *1
b8	RPEEN	SRAM Parity Error Interrupt Enable	0: Disable 1: Enable.	R/(W) *1, *2
b9	RDEDEN	SRAM DED Error Interrupt Enable	0: Disable 1: Enable.	R/(W) *1, *2
b10	BUSSEN	MPU Bus Slave Error Interrupt Enable	0: Disable 1: Enable.	R/(W) *1, *2
b11	BUSMEN	MPU Bus Master Error Interrupt Enable	0: Disable 1: Enable.	R/(W) *1, *2
b12	SPEEN	CPU Stack Pointer Monitor Interrupt Enable	0: Disable 1: Enable.	R/(W) *1, *2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. A 1 can be written to this bit only once after reset, and subsequent write accesses are invalid. Writing 0 to this bit is invalid.

Note 2. Do not write 1 to this bit when the source is used as an event signal.

IWDTEN bit (IWDT Underflow/Refresh Error Interrupt Enable)

The IWDTEN bit enables IWDT underflow/refresh error interrupts as an NMI trigger.

WDTEN bit (WDT Underflow/Refresh Error Interrupt Enable)

The WDTEN bit enables WDT underflow/refresh error interrupts as an NMI trigger.

LVD1EN bit (Voltage Monitor 1 Interrupt Enable)

The LVD1EN bit enables voltage monitor 1 interrupts as an NMI trigger.

LVD2EN bit (Voltage Monitor 2 Interrupt Enable)

The LVD2EN bit enables voltage monitor 2 interrupts as an NMI trigger.

OSTEN bit (Oscillation Stop Detection Interrupt Enable)

The OSTEN bit enables main oscillation stop detection interrupts as an NMI trigger.

NMIEN bit (NMI Pin Interrupt Enable)

The NMIEN bit enables NMI pin interrupts as an NMI trigger.

RPEEN bit (SRAM Parity Error Interrupt Enable)

The RPEEN bit enables SRAM parity error interrupts as an NMI trigger.

RDEDEN bit (SRAM DED Error Interrupt Enable)

The RDEDEN bit enables SRAM DED error interrupts as an NMI trigger.

BUSSEN bit (MPU Bus Slave Error Interrupt Enable)

The BUSSEN bit enables bus slave error interrupts as an NMI trigger.

BUSMEN bit (MPU Bus Master Error Interrupt Enable)

The BUSMEN bit enables bus master error interrupts as an NMI trigger.

SPEEN bit (CPU Stack Pointer Monitor Interrupt Enable)

The SPEEN bit enables CPU stack pointer monitor interrupts as an NMI trigger.

14.2.4 Non-Maskable Interrupt Status Clear Register (NMICLR)

Address(es): ICU.NMICLR 4000 6130h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SPECLR	BUSMCLR	BUSSCLR	RDEDCLR	RPECLR	NMICLR	OSTCLR	—	—	LVD2CLR	LVD1CLR	WDTCLR	IWDTCLR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	IWDTCLR	IWDT Clear	0: No effect 1: Clear the NMISR.IWDTST flag.	R/(W)*1
b1	WDTCLR	WDT Clear	0: No effect 1: Clear the NMISR.WDTST flag.	R/(W)*1
b2	LVD1CLR	LVD1 Clear	0: No effect 1: Clear the NMISR.LVD1ST flag.	R/(W)*1
b3	LVD2CLR	LVD2 Clear	0: No effect 1: Clear the NMISR.LVD2ST flag.	R/(W)*1
b5, b4	—	Reserved	The write value should be 0.	R/(W)*1
b6	OSTCLR	OST Clear	0: No effect 1: Clear the NMISR.OSTST flag.	R/(W)*1
b7	NMICLR	NMI Clear	0: No effect 1: Clear the NMISR.NMIST flag.	R/(W)*1
b8	RPECLR	SRAM Parity Error Clear	0: No effect 1: Clear the NMISR.RPEST flag.	R/(W)*1
b9	RDEDCLR	SRAM DED Error Clear	0: No effect 1: Clear the NMISR.RDEDST flag.	R/(W)*1
b10	BUSSCLR	Bus Slave Error Clear	0: No effect 1: Clear the NMISR.BUSSST flag.	R/(W)*1
b11	BUSMCLR	Bus Master Error Clear	0: No effect 1: Clear the NMISR.BUSMST flag.	R/(W)*1
b12	SPECLR	CPU Stack Pointer Monitor Interrupt Clear	0: No effect 1: Clear the NMISR.SPEST flag.	R/(W)*1
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/(W)*1

Note 1. Only 1 can be written to this bit.

IWDTCLR bit (IWDT Clear)

Writing 1 to the IWDTCLR bit clears the NMISR.IWDTST flag. This bit is read as 0.

WDTCLR bit (WDT Clear)

Writing 1 to the WDTCLR bit clears the NMISR.WDTST flag. This bit is read as 0.

LVD1CLR bit (LVD1 Clear)

Writing 1 to the LVD1CLR bit clears the NMISR.LVD1ST flag. This bit is read as 0.

LVD2CLR bit (LVD2 Clear)

Writing 1 to the LVD2CLR bit clears the NMISR.LVD2ST flag. This bit is read as 0.

OSTCLR bit (OST Clear)

Writing 1 to the OSTCLR bit clears the NMISR.OSTST flag. This bit is read as 0.

NMICLR bit (NMI Clear)

Writing 1 to the NMICLR bit clears the NMISR.NMIST flag. This bit is read as 0.

RPECLR bit (SRAM Parity Error Clear)

Writing 1 to the RPECLR bit clears the NMISR.RPEST flag. This bit is read as 0.

RDEDCLR bit (SRAM DED Error Clear)

Writing 1 to the RDEDCLR bit clears the NMISR.RDEDST flag. This bit is read as 0.

BUSSCLR bit (Bus Slave Error Clear)

Writing 1 to the BUSSCLR bit clears the NMISR.BUSSST flag. This bit is read as 0.

BUSMCLR bit (Bus Master Error Clear)

Writing 1 to the BUSMCLR bit clears the NMISR.BUSMSST flag. This bit is read as 0.

SPECLR bit (CPU Stack Pointer Monitor Interrupt Clear)

Writing 1 to the SPECLR bit clears the NMISR.SPEST flag. This bit is read as 0.

14.2.5 NMI Pin Interrupt Control Register (NMICR)

Address(es): ICU.NMICR 4000 6100h

	b7	b6	b5	b4	b3	b2	b1	b0
	NFLTEN	—	NFCLKSEL[1:0]		—	—	—	NMIMD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	NMIMD	NMI Detection Set	0: Falling edge 1: Rising edge.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5, b4	NFCLKSEL[1:0]	NMI Digital Filter Sampling Clock Select	b5 b4 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64.	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	NFLTEN	NMI Digital Filter Enable	0: Disable 1: Enable.	R/W

Change the NMICR register settings before enabling NMI pin interrupts (before setting NMIER.NMIEN to 1).

NMIMD bit (NMI Detection Set)

The NMIMD bit selects the detection sensing method for NMI pin interrupts.

NFCLKSEL[1:0] bits (NMI Digital Filter Sampling Clock Select)

The NFCLKSEL[1:0] bits select the digital filter sampling clock for NMI pin interrupts, selectable to:

- PCLKB (every cycle)
- PCKLB/8 (once every eight cycles)
- PCKLB/32 (once every 32 cycles)
- PCKLB/64 (once every 64 cycles).

For details on the digital filter, see section 14.4.3, Digital Filter.

NFLTEN bit (NMI Digital Filter Enable)

The NFLTEN bit enables the digital filter used for NMI pin interrupts. The filter is enabled when NFLTEN is 1 and disabled when NFLTEN is 0. The NMI pin level is sampled at the cycle specified in NMIFLTC.NFCLKSEL[1:0]. When the sampled level matches three times, the output level from the digital filter changes. For details on the digital filter, see section 14.4.3, Digital Filter.

14.2.6 ICU Event Link Setting Register n (IELSRn) (n = 0 to 95)

Address(es): ICU.IELSR0 4000 6300h, ICU.IELSR1 4000 6304h, ICU.IELSR2 4000 6308h, ICU.IELSR3 4000 630Ch.....
.....ICU.IELSR92 4000 6470h, ICU.IELSR93 4000 6474h, ICU.IELSR94 4000 6478h, ICU.IELSR95 4000 647Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	DTCE	—	—	—	—	—	—	—	IR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	IELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b8 to b0	IELS[8:0]	ICU Event Link Select	b8 b0 000000000: Disable interrupts to the associated NVIC or DTC module 000000001 to 111111111: Event signal number to be linked. For details, see Table 14.4.	R/W*1
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	IR	Interrupt Status Flag	0: No interrupt request occurred 1: Interrupt request occurred.	R/(W)*2
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b24	DTCE	DTC Activation Enable	0: Disable 1: Enable.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This register requires halfword or word access.
Note 2. Writing 1 to the IR flag is prohibited.

The IELSRn register selects the IRQ source used by the NVIC. For details, see Table 14.4. IELSRn, where n = 0 to 95, corresponds to the NVIC IRQ input source numbers 0 to 95.

IELS[8:0] bits (ICU Event Link Select)

The IELS[8:0] bits link an event signal to the associated NVIC or DTC module. All IELS[8:0] bits must be written to simultaneously.

IR flag (Interrupt Status Flag)

The IR flag indicates an individual interrupt request from the event specified in IELS[8:0].

[Setting condition]

When an interrupt request is received from the associated peripheral module or IRQi pin.

[Clearing conditions]

When 0 is written to the bit. DTCE must be set to 0 before writing 0 to the IR flag.

To clear the IR flag:

1. Negate the input interrupt signal.
2. Read access the peripheral once and wait for 2 clock cycles of the target module clock.
3. Clear the IR flag by writing 0.

DTCE bit (DTC Activation Enable)

When the DTCE bit is set to 1, the associated event is selected as the source for DTC activation.

[Setting condition]

When 1 is written to the DTCE bit.

[Clearing conditions]

- When the specified number of transfers is complete. For chain transfers, when the specified number of transfers for the last chain transfer is complete
- When 0 is written to the bit.

14.2.7 DMAC Event Link Setting Register n (DELSRn) (n = 0 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Address(es): ICU.DELSR0 4000 6280h, ICU.DELSR1 4000 6284h, ICU.DELSR2 4000 6288h, ICU.DELSR3 4000 628Ch, ICU.DELSR4 4000 6290h, ICU.DELSR5 4000 6294h, ICU.DELSR6 4000 6298h, ICU.DELSR7 4000 629Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b8 to b0	DELS[8:0]	DMAC Event Link Select	b8 b0 000000000: Disable DMA start requests to the associated DMAC module 000000001 to 111111111: Event signal number to be linked. For details, see Table 14.4.	R/W
b31 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register requires halfword or word access.

DELS[8:0] bits (DMAC Event Link Select)

The DELS[8:0] bits link an event signal to the DMAC module. All DELS[8:0] bits must be written to simultaneously.

14.2.8 SYS Event Link Setting Register (SELSR0)

Address(es): ICU.SELSR0 4000 6200h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b8 to b0	SELS[8:0]	SYS Event Link Select	b8 b0 000000000: Disable event output to the associated low power mode module 000000001 to 111111111: Event signal number to be linked. For details, see Table 14.4.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register requires halfword access.

The SELSR0 register selects the events that wake the CPU from Snooze mode. You can only use the events listed in Table 14.4 checked under "Canceling Snooze using SELSR0". Events specified in this register are defined as ICU_SNZCANCEL (02Dh) in Table 14.4. When 02Dh is set in IELSRn.IELS, the SELSR0 event interrupt occurs.

SELS[8:0] bits (SYS Event Link Select)

All SELS[8:0] bits must be written to simultaneously.

14.2.9 Wake Up Interrupt Enable Register (WUPEN)

Address(es): ICU.WUPEN 4000 61A0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	IRQWUPEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	IRQWUPEN[15:0]	IRQ Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by IRQ interrupts 1: Enable Software Standby returns by IRQ interrupts.	R/W
b16	IWDTWUPEN	IWDT Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by IWDT interrupts 1: Enable Software Standby returns by IWDT interrupts.	R/W
b17	KEYWUPEN	Key Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by KEY interrupts 1: Enable Software Standby returns by KEY interrupts.	R/W
b18	LVD1WUPEN	LVD1 Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by LVD1 interrupts 1: Enable Software Standby returns by LVD1 interrupts.	R/W
b19	LVD2WUPEN	LVD2 Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by LVD2 interrupts 1: Enable Software Standby returns by LVD2 interrupts.	R/W
b21, b20	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b22	ACMPHS0WUPEN	ACMPHS0 Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by ACMPHS0 interrupts 1: Enable Software Standby returns by ACMPHS0 interrupts.	R/W
b23	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b24	RTCALMWUPEN	RTC Alarm Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by RTC alarm interrupts 1: Enable Software Standby returns by RTC alarm interrupts.	R/W
b25	RTCPRDWUPEN	RTC Period Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by RTC period interrupts 1: Enable Software Standby returns by RTC period interrupts.	R/W
b26	USBHSWUPEN	USBHS Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by USBHS interrupts 1: Enable Software Standby returns by USBHS interrupts.	R/W
b27	USBFSWUPEN	USBFS Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by USBFS interrupts 1: Enable Software Standby returns by USBFS interrupts.	R/W
b28	AGT1UDWUPEN	AGT1 Underflow Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by AGT1 underflow interrupts 1: Enable Software Standby returns by AGT1 underflow interrupts.	R/W
b29	AGT1CAWUPEN	AGT1 Compare Match A Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by AGT1 compare match A interrupts 1: Enable Software Standby returns by AGT1 compare match A interrupts.	R/W

Bit	Symbol	Bit name	Description	R/W
b30	AGT1CBWUPEN	AGT1 Compare Match B Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by AGT1 compare match B interrupts 1: Enable Software Standby returns by AGT1 compare match B interrupts.	R/W
b31	IIC0WUPEN	IIC0 Address Match Interrupt Software Standby Returns Enable	0: Disable Software Standby returns by IIC0 address match interrupts 1: Enable Software Standby returns by IIC0 address match interrupts.	R/W

The bits in this register control whether the associated interrupt can wake the CPU from Software Standby mode.

IRQWUPEN[15:0] bits (IRQ Interrupt Software Standby Returns Enable)

The IRQWUPEN[15:0] bits enable the use of IRQn interrupts to cancel Software Standby mode.

IWDTWUPEN bit (IWDT Interrupt Software Standby Returns Enable)

The IWDTWUPEN bit enables the use of IWDT interrupts to cancel Software Standby mode.

KEYWUPEN bit (Key Interrupt Software Standby Returns Enable)

The KEYWUPEN bit enables the use of key interrupts to cancel Software Standby mode.

LVD1WUPEN bit (LVD1 Interrupt Software Standby Returns Enable)

The LVD1WUPEN bit enables the use of LVD1 interrupts to cancel Software Standby mode.

LVD2WUPEN bit (LVD2 Interrupt Software Standby Returns Enable)

The LVD2WUPEN bit enables the use of LVD2 interrupts to cancel Software Standby mode.

ACMPHS0WUPEN bit (ACMPHS0 Interrupt Software Standby Returns Enable)

The ACMPHS0WUPEN bit enables the use of ACMPHS0 interrupts to cancel Software Standby mode.

RTCALMWUPEN bit (RTC Alarm Interrupt Software Standby Returns Enable)

The RTCALMWUPEN bit enables the use of RTC alarm interrupts to cancel Software Standby mode.

RTCPRDWUPEN bit (RTC Period Interrupt Software Standby Returns Enable)

The RTCPRDWUPEN bit enables the use of RTC period interrupts to cancel Software Standby mode.

USBHSWUPEN bit (USBHS Interrupt Software Standby Returns Enable)

The USBHSWUPEN bit enables the use of USBHS interrupts to cancel Software Standby mode.

USBFSWUPEN bit (USBFS Interrupt Software Standby Returns Enable)

The USBFSWUPEN bit enables the use of USBFS interrupts to cancel Software Standby mode.

AGT1UDWUPEN bit (AGT1 Underflow Interrupt Software Standby Returns Enable)

The AGT1UDWUPEN bit enables the use of AGT1 underflow interrupts to cancel Software Standby mode.

AGT1CAWUPEN bit (AGT1 Compare Match A Interrupt Software Standby Returns Enable)

The AGT1CAWUPEN bit enables the use of AGT1 compare match A interrupts to cancel Software Standby mode.

AGT1CBWUPEN bit (AGT1 Compare Match B Interrupt Software Standby Returns Enable)

The AGT1CBWUPEN bit enables the use of AGT1 compare match B interrupts to cancel Software Standby mode.

IIC0WUPEN bit (IIC0 Address Match Interrupt Software Standby Returns Enable)

The IIC0WUPEN bit enables the use of IIC0 interrupts to cancel Software Standby mode.

14.3 Vector Table

The ICU detects two types of interrupts, maskable and non-maskable. Interrupt priorities are set up in the Arm® NVIC. See the NVIC chapter of the *ARM® Cortex®-M4 Processor Technical Reference Manual (ARM DDI 0439D)*.

14.3.1 Interrupt Vector Table

Table 14.3 describes the interrupt vectors. The addresses conform to the NVIC specifications.

Table 14.3 Interrupt vector table (1 of 3)

Exception number	IRQ number	Vector offset	Source	Description
0	-	000h	Arm®	Initial stack pointer
1	-	004h	Arm®	Initial program counter (reset vector)
2	-	008h	Arm®	Non-maskable interrupt (NMI)
3	-	00Ch	Arm®	Hard fault
4	-	010h	Arm®	MemManage fault
5	-	014h	Arm®	Bus fault
6	-	018h	Arm®	Usage fault

14.3.2 Event Numbers

The following table lists heading details for Table 14.4, which describes each event number.

Heading	Description
Interrupt request source	Name of the source generating the interrupt request
Name	Name of the interrupt
Connect to NVIC	"✓" indicates the interrupt can be used as a CPU interrupt (IELSRn setting)
Invoke DTC	"✓" indicates the interrupt can be used to request DTC activation (IELSRn setting)
Invoke DMAC	"✓" indicates the interrupt can be used to request DMAC activation (DELSRn setting)
Canceling Snooze mode	"✓" indicates the interrupt can be used to request a return from Snooze mode using SELSR0. Otherwise, "✓" indicates it can be used directly.
Canceling Software Standby mode	"✓" indicates the interrupt can be used to request a return from Software Standby mode
Canceling Deep Software Standby mode	"✓" indicates the interrupt can be used to request a return from Deep Software Standby mode

Note 1. Only supported when CMPCTL0.CSTEN = 1.
Note 2. Only supported when KRCTL.KRMD = 1.
Note 3. Only the first edge detection is valid.
Note 4. Only interrupts after DTC transfer are supported.
Note 5. Using SELSR0.

14.4 Interrupt Operation

The ICU performs the following functions:

- Detecting interrupts
- Enabling and disabling interrupts
- Selecting interrupt request destinations such as CPU interrupt, DTC activation, or DMAC activation.

14.4.1 Detecting Interrupts

External pin interrupt requests are detected by either the edge or level (falling edge, rising edge, rising and falling edges, or low level) of the interrupt signal. Set the IRQMD[1:0] bits in the IRQCRi register to select the detection mode for the IRQi pins. For interrupt sources associated with peripheral modules, see section 14.3.2, Event Numbers. Events must be accepted by the NVIC before an interrupt occurs and is accepted by the CPU.

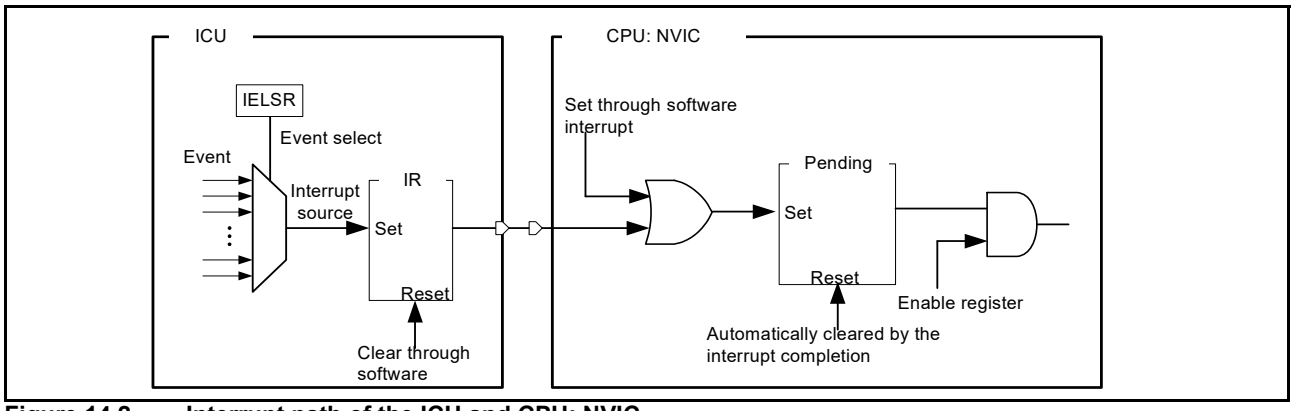

Figure 14.2 Interrupt path of the ICU and CPU: NVIC

Use the following procedures for detecting interrupts:

- General operations during an interrupt
  - When a non-software interrupt occurs:
    The IELSRn.IR flag and Interrupt Set/Clear-Pending register (NVIC) are set.
  - When a software interrupt occurs:
    Set the Interrupt Set-Pending register.
  - When an interrupt is complete:
    Clear the IELSRn.IR flag in the software.
    The Interrupt Set/Clear-Pending register clears automatically.
- When interrupts are enabled
  a. Set the Interrupt Set-Enable register (NVIC).
  b. Set the IELSRn.IELS bits as the interrupt source.
  c. Specify the operation settings for the event source.
- When interrupts are disabled
  a. Disable the settings for the event source.
  b. Clear the IELSRn.IELS bits (IELSRn.IELS = 0000h). Clear the IELSRn.IR flag as required.
  c. Clear the Interrupt Clear-Enable register. Clear the Interrupt Clear-Pending register as required.
- When polling for interrupts
  a. Set the Interrupt Clear-Enable register (disabling interrupts).
  b. Set the IELSRn.IELS bits (selecting the source).
  c. Specify the operation settings for the event source.
  d. Poll the Interrupt Set-Pending register.
  e. When polling is no longer required, follow the procedure for clearing an interrupt when it is complete. (Clear the IELSRn.IR flag in the software.)

14.4.2 Selecting Interrupt Request Destinations

The interrupt output destination, CPU, DTC, or DMAC, can be independently selected for each interrupt source. The available destinations are fixed for each interrupt, as described in Table 14.4.

Note: Do not use an interrupt request destination setting that is not indicated by a "✓" in the event list (Table 14.4).

If you select the CPU or DTC in one IELSRn register, setting the same interrupt factor in any other IELSRn register is prohibited. Similarly, if you select the DMAC in one DELSRn register, setting the same interrupt factor in any other DELSRn register is prohibited.

Note: Setting the same interrupt factor for IELSRn and DELSRn is prohibited.

If the DMAC or DTC is selected as the destination for requests from an IRQi pin, you must set the IRQMD[1:0] bits in IRQCRi for that interrupt to select edge detection.

14.4.2.1 CPU Interrupt Request

When IELSRn.DTCE = 0, the event specified in the IELSRn register is output to the NVIC. Use the following procedure:

Set the IELSRn.IELS bits to the target event and the IELSRn.DTCE bit to 0.

14.4.2.2 DTC Activation

When IELSRn.DTCE = 1, the event specified in the IELSRn register is output to the DTC. After DTC transmission completes, the associated interrupt occurs. Use the following procedure:

1. Set the IELSRn.IELS bits to the target event and the IELSRn.DTCE bit to 1.
2. Set the DTC module start bit (DTCST.DTCST) to 1.

Table 14.5 shows operation when the DTC is the request destination.

Table 14.5 Operations when the DTC is activated

Interrupt request destination	DISEL*1	Remaining transfer operations	Operations per request	IR*2	Interrupt request destination after transfer
DTC*3	1	≠ 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	DTC
		= 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	The IELSRn.DTCE bit is cleared and the CPU becomes the destination
	0	≠ 0	DTC transfer	Cleared at the start of DTC data transfer after DTC transfer data is read	DTC
		= 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	The IELSRn.DTCE bit is cleared and the CPU becomes the destination

Note 1. Set the interrupt request mode for the DTC in the DTC.MRB.DISEL bit.
Note 2. When the IELSRn.IR flag is 1, an interrupt request (DTC activation request) that occurs again is ignored.
Note 3. For chain transfers, DTC transfer continues until the last chain transfer ends. At this point, the DISEL bit state and the remaining transfer count determine whether a CPU interrupt occurs, the IELSRn.IR flag clear timing, and the interrupt request destination after transfer. See Table 18.3, Chain transfer conditions, in section 18, Data Transfer Controller (DTC).

14.4.2.3 Operations with the DMAC Activated

Events specified in the DELSRn registers are output to the DMAC. When using interrupts, you must select the DMAC as the interrupt source in the IELSRn.IELS[8:0] bits and enable DMAC output by setting IELSRn.DTCE to 1. When IELSRn.DTCE is 0, the events specified in the IELSRn registers are output to the NVIC. Use the following procedure:

1. Set the DELSRn.DELS[8:0] bits to the target event.
2. When using interrupts, set the IELSRn.IELS bit to DMAC interrupts as the source, and set the IELSRn.DTCE bit to 1.
3. Set the activation source for the target DMAC channel (DMACm.DMTMD.DCTG[1:0]) to 01b (interrupt module detection).
4. Set the DMAC transfer enable bit for the target DMAC channel (DMACm.DMCNT.DTE) to 1.
5. Set the DMAC operation enable bit (DMACm.DMAST.DMST) to 1.

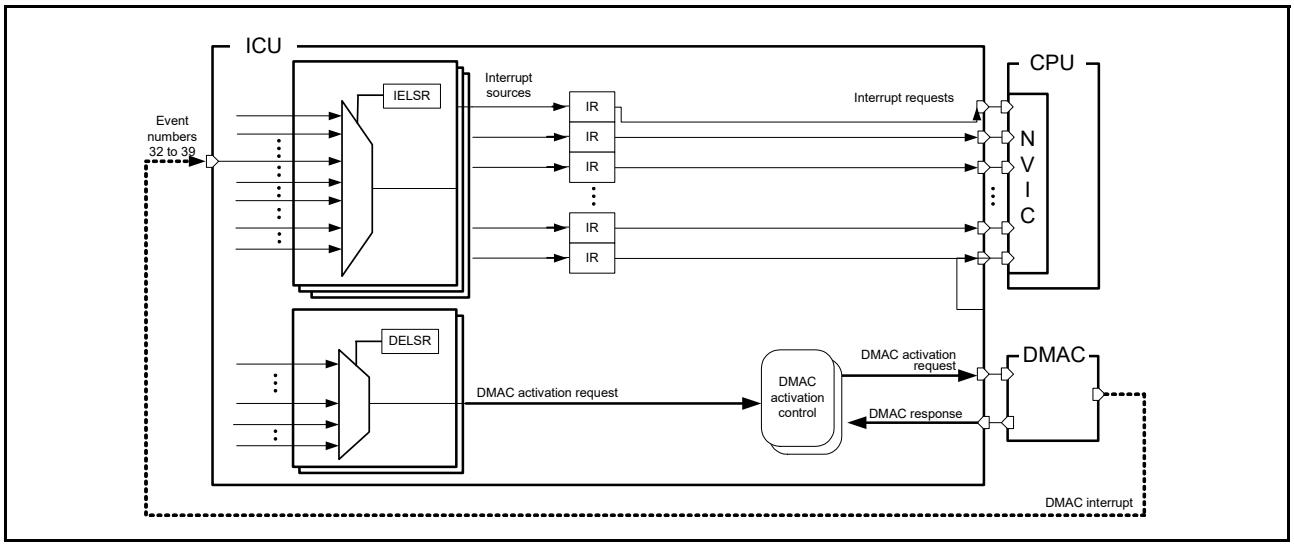

Figure 14.3 DMAC request trigger and interrupt path

14.4.3 Digital Filter

A digital filter function is provided for the external interrupt request pins (IRQi, i = 0 to 15) and NMI pin interrupt. It samples input signals on the filter sampling clock (PCLKB) and removes any signal with a pulse width less than three sampling cycles.

To use the digital filter for an IRQi pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the IRQCRi.FCLKSEL[1:0] bits.
2. Set the IRQCRi.FLTEN bit to 1 (digital filter enabled).

To use the digital filter for the NMI pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the NMICR.NFCLKSEL[1:0] bits.
2. Set the NMICR.NFLTEN bit to 1 (digital filter enabled).

Figure 14.4 shows an example of digital filter operation.

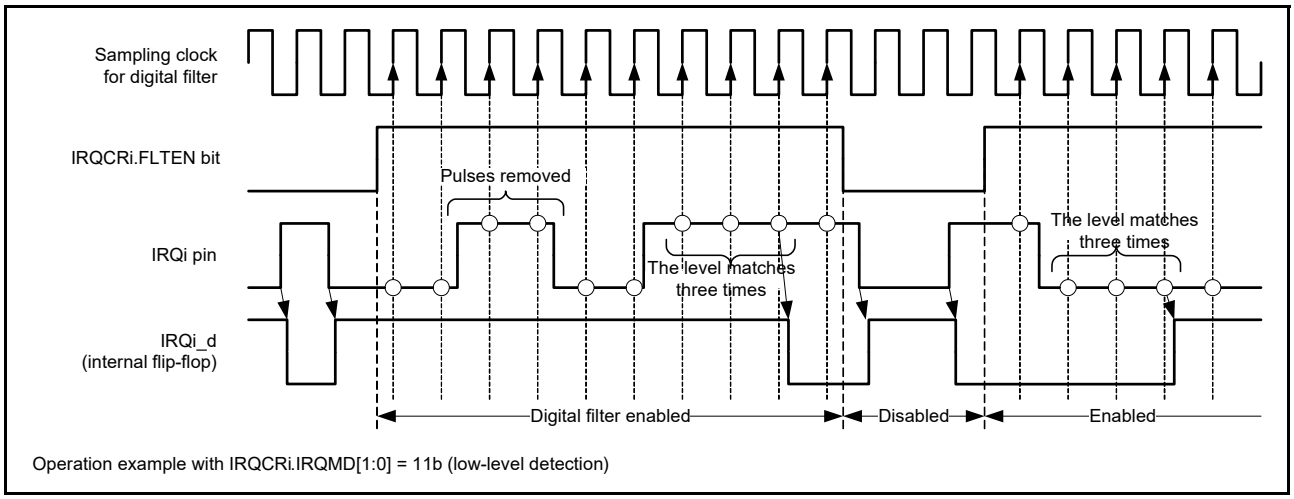

Figure 14.4 Digital filter operation example

Before entering Software Standby mode, disable the digital filters by clearing the IRQCRi.FLTEN and NMICR.NFLTEN bits. The clock for the ICU stops in Software Standby mode. On exiting Software Standby, the circuit detects the edge by comparing the state before standby to the state after standby release. If the input changes during Software Standby, an incorrect edge might be detected. You can enable the digital filters again after exiting Software Standby mode.

14.4.4 External Pin Interrupts

To use external pin interrupts:

1. Clear the IRQCRi.FLTEN bit (i = 0 to 15) to 0 (digital filter disabled).
2. Make or confirm the I/O port settings.
3. Set the IRQMD[1:0] bits, FCLKSEL[1:0] bits, and FLTEN bit of the IRQCRi register.
4. Select the IRQ pin as follows:
   - If the IRQ pin is to be used for CPU interrupt requests, set the IELSRn.IELS bits and set the IELSRn.DTCE bit to 0
   - If the IRQ pin is to be used for DTC activation, set the IELSRn.IELS bits and set the IELSRn.DTCE bit to 1
   - If the IRQ pin is to be used for DMAC activation, set the DELSRn.DELS bits.

14.5 Non-Maskable Interrupt Operation

The following sources can trigger a non-maskable interrupt:

- NMI pin interrupt
- Oscillation stop detection interrupt
- WDT underflow/refresh error interrupt
- IWDT underflow/refresh error interrupt
- Voltage monitor 1 interrupt
- Voltage monitor 2 interrupt
- SRAM parity error interrupt
- SRAM DED error interrupt
- MPU bus master error interrupt
- MPU bus slave error interrupt
- CPU stack pointer monitor interrupt.

Non-maskable interrupts can only be used with the CPU, not to activate the DTC or DMAC. Non-maskable interrupts take precedence over all other interrupts. The non-maskable interrupt states can be verified in the Non-Maskable Interrupt Status Register (NMISR). Confirm that all bits in the NMISR are 0 before returning from the NMI handler.

Non-maskable interrupts are disabled by default. To use non-maskable interrupts, you must:

1. To use the NMI pin, clear the NMICR.NFLTEN bit to 0 (digital filter disabled).
2. To use the NMI pin, set the NMIMD bit, NFCLKSEL[1:0] bits, and NFLTEN bit of NMICR register.
3. To use the NMI pin, write 1 to the NMICLR.NMICLR bit to clear the NMISR.NMIST flag to 0.
4. Enable the non-maskable interrupt by writing 1 to the associated bit in the Non-Maskable Interrupt Enable Register (NMIER).

After 1 is written to the NMIER register, subsequent write access to the NMIEN bit in NMIER is ignored. An NMI interrupt cannot be disabled when enabled, except by a reset.

14.6 Return from Low Power Modes

Table 14.4 lists the interrupt sources you can use to exit Sleep or Software Standby mode. For more information, see section 11, Low Power Modes. Sections 14.6.1 to 14.6.3 describe how to use interrupts to return from Sleep, Software Standby, and Snooze modes. For Deep Software Standby, see section 11.9, Deep Software Standby Mode.

14.6.1 Return from Sleep Mode

To return from Sleep mode in response to an interrupt:

1. Select the CPU as the interrupt request destination.
2. Enable the interrupt in the NVIC.

To return from Sleep mode in response to a non-maskable interrupt, enable the wanted interrupt request in the NMIER register.

14.6.2 Return from Software Standby Mode

The ICU can return from Software Standby mode using a non-maskable interrupt or an interrupt selected in the WUPEN register. See section 14.2.9, Wake Up Interrupt Enable Register (WUPEN).

To return from Software Standby mode, you must:

1. Select the interrupt source that enables return from Software Standby.
   - For non-maskable interrupts, use the NMIER register to enable the wanted interrupt request.
   - For maskable interrupts, use the WUPEN register to enable the wanted interrupt request.
2. Select the CPU as the interrupt request destination.
3. Enable the interrupt in the NVIC.

14.6.3 Return from Snooze Mode

The ICU can return from Snooze mode using the interrupts provided for this mode.

To return from Snooze mode to Normal mode:

1. Use either of the following methods to select the event that you want to trigger a return from Snooze mode to Normal mode:
   - Set the event that you want to trigger a return from Snooze mode to Normal mode in SELSR0.SEL and set the value 02Dh (ICU_SNZCANCEL) in IELSRn.IELS.
   - Set the event that you want to trigger a return from Snooze mode to Normal mode in IELSRn.IELS.
2. Select the CPU as the interrupt request destination.
3. Enable the interrupt in the NVIC.

Note: In Snooze mode, a clock is supplied to ICU. If an event selected in IELSRn is detected, the CPU can acknowledge the interrupt after returning to Normal mode from Software Standby mode. If an event selected in DELSRn is detected, the DMAC can acknowledge the interrupt after returning to Normal mode from Software Standby mode.

14.7 Using the WFI Instruction with Non-Maskable Interrupts

Whenever a WFI instruction is executed, confirm that all status flags in the NMISR register are 0.

14.8 Reference

ARM® Cortex®-M4 Processor Technical Reference Manual (ARM DDI 0439D).

15. Buses

15.1 Overview

Table 15.1 lists the bus specifications, Figure 15.1 shows the bus configuration, and Table 15.2 lists the addresses assigned for each bus.

Table 15.1 Bus specifications

Bus type		Specifications
Main bus	ICode bus (CPU)	• Connected to the CPU • Connected to the on-chip memory (code flash memory, SRAMHS).
	DCode bus (CPU)	• Connected to the CPU • Connected to the on-chip memory (code flash memory, SRAMHS).
	System bus (CPU)	• Connected to the CPU • Connected to the on-chip memory, internal peripheral buses, and external bus.
	DMA bus	• Connected to the DMAC and DTC • Connected to the on-chip memory, internal peripheral buses, and external bus.
	ETHER bus	• Connected to the EDMAC • Connected to the on-chip memory, internal peripheral buses, and external bus.
	GPX bus	• Connected to the JPEG Codec, GLCDC, and 2D Drawing Engine • Connected to the on-chip memory and external bus.
Slave interface	Memory bus 1	• Connected to the code flash memory
	Memory bus 2	• Connected to the SRAMHS
	Memory bus 3	• Connected to the code flash memory and SRAMHS through the DMA bus, ETHER bus, and GPX bus
	Memory bus 4	• Connected to SRAM0
	Memory bus 5	• Connected to SRAM1 and the Standby SRAM
	Internal peripheral bus 1	• Connected to system control related to peripheral modules
	Internal peripheral bus 3	• Connected to peripheral modules (CAC, ELC, I/O ports, POEG, RTC, WDT, IWDT, IIC, CAN, SSI, SRC, ADC12, DAC12, TSN, and DOC)
	Internal peripheral bus 4	• Connected to peripheral modules (GPT, ETHERC, EPTPC, EDMAC, USBHS, SCI, IrDA, SPI, CRC, and SDHI)
	Internal peripheral bus 5	• Connected to peripheral modules (KINT, AGT, USBFS, PDC, ACMPHS, and CTSU)
	Internal peripheral bus 7	• Connected to Secure IPs (SCE7)
	Internal peripheral bus 8	• Connected to graphic IPs (JPEG Codec, GLCDC, and 2D Drawing Engine)
	Internal peripheral bus 9	• Connected to the flash memory (in P/E)*1, data flash memory, and TSN
External bus	CS area	• Connected to external devices
	SDRAM area	• Connected to the SDRAM
	QSPI area	• Connected to external SPI devices

Note 1. P/E: Programming and erasure.

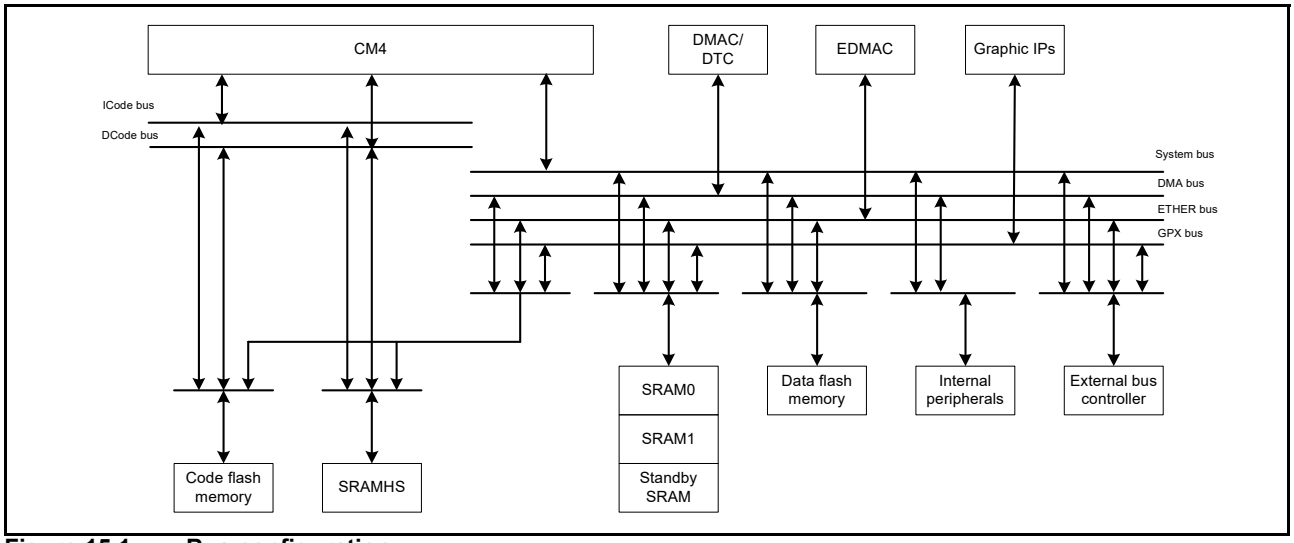

Figure 15.1 Bus configuration

Table 15.2 Addresses assigned for each bus

Addresses	Bus	Area
0000 0000h to 01FF FFFFh	Memory bus 1, 3	Code flash memory
1FFE 0000h to 1FFF FFFFh	Memory bus 2, 3	SRAMHS
2000 0000h to 2003 FFFFh	Memory bus 4	SRAM0
2004 0000h to 200F FFFFh	Memory bus 5	SRAM1 and Standby SRAM
4000 0000h to 4001 FFFFh	Internal peripheral bus 1	Peripheral I/O registers
4004 0000h to 4005 FFFFh	Internal peripheral bus 3	
4006 0000h to 4007 FFFFh	Internal peripheral bus 4	
4008 0000h to 4009 FFFFh	Internal peripheral bus 5	
400C 0000h to 400D FFFFh	Internal peripheral bus 7	Secure IPs
400E 0000h to 400F FFFFh	Internal peripheral bus 8	Graphic IPs (JPEG Codec, GLCDC, and 2D Drawing Engine)
4010 0000h to 407F FFFFh	Internal peripheral bus 9	Flash memory (in P/E*1) , data flash memory, and TSN
6000 0000h to 67FF FFFFh	External bus	QSPI area
8000 0000h to 97FF FFFFh	External bus	CS area and SDRAM area

Note 1. P/E: Programming and erasure.

15.2 Description of Buses

15.2.1 Main Buses

The main bus for the CPU consists of the ICode bus, DCode bus, and system bus.

- The ICode and DCode buses are connected to the code flash memory and SRAMHS. The ICode bus is used for instruction access to the CPU, and the DCode bus is used for data access to the CPU.
- The system bus is connected to the SRAM0, SRAM1, Standby SRAM, data flash memory, internal peripheral buses, and external bus. It is used for instruction and data accesses to the CPU.

The main bus for modules other than the CPU consists of the DMA bus, ETHER bus, and GPX bus.

- The DMA bus is connected to the code flash memory, SRAMHS, SRAM0, SRAM1, Standby SRAM, data flash memory, and external bus.
- The ETHER bus is connected to the code flash memory, SRAMHS, SRAM0, SRAM1, Standby SRAM, data flash memory, and external bus.
- The GPX bus is connected to the code flash memory, SRAMHS, SRAM0, SRAM1, Standby SRAM, and external bus.

Different master and slave transfer combinations can proceed simultaneously.

Arbitration between the DMAC and DTC for the mastership of the DMA bus occurs in the DMAC and DTC. The following fixed-priority order is used:

DMAC0 > DMAC1 > DMAC2 > DMAC3 > DMAC4 > DMAC5 > DMAC6 > DMAC7 > DTC.

Only one DTC channel and DMAC channel that have accepted the activation requests can issue the bus mastership request. In addition, requests for bus access from masters other than the DTC are not accepted during reads of transfer control information for the DTC.

Request for mastership of the GPX bus from the JPEG Codec, GLCDC, and 2D Drawing Engine are arbitrated. The arbitration protocol is selectable as either fixed-priority or round-robin. For more information, see section 15.3.20, Slave Bus Control Register (BUSSCNT<slave>).

15.2.2 Slave Interface

Products using the Cortex®-M4 core contain ICode and DCode bus areas and a system bus area.

To create the ICode and DCode bus areas, a bus matrix connects the ICode bus, DCode bus, and memory bus 3 from the main bus to the slave interfaces of the code flash memory and SRAMHS. Bus access to the slave interfaces is arbitrated between the three buses. The arbitration protocol is selectable as either fixed-priority or round-robin. For more information, see section 15.3.20, Slave Bus Control Register (BUSSCNT<slave>).

To create the system bus area, a bus matrix connects the system bus, DMA bus, ETHER bus, and GPX bus from the main bus to the slave interfaces of the SRAM0, SRAM1, Standby SRAM, data flash memory, internal peripherals, and external bus. Bus access to the slave interfaces is arbitrated between the four buses. The arbitration protocol is selectable as either fixed-priority or round-robin. For more information, see section 15.3.20, Slave Bus Control Register (BUSSCNT<slave>).

For connections from the main bus to the slave interfaces, see the slave interfaces in Table 15.1. For a description of the external bus, see section 15.2.3, External Bus.

Different master and slave transfer combinations can proceed simultaneously.

15.2.3 External Bus

The external bus controller arbitrates requests for bus access on the external address space from the CPU system bus, DMAC bus, ETHER bus, and GPX bus. The priority order can be set using the external bus priority control bits (BUSSCNT.ARBMET). For more information, see section 15.3.20, Slave Bus Control Register (BUSSCNT<slave>).

The bus system provides an external space for the QSPI. See section 39, Quad Serial Peripheral Interface (QSPI).

Table 15.3 lists the external bus specifications and Table 15.4 lists the I/O pins.

Table 15.3 External bus specifications

Parameter	Specifications
External address space	• The external address space is divided into 8 CS areas (CS0 to CS7) and the SDRAM area (SDCS) for management • Chip select signals can be output for each area • The bus width can be set for each area: - Separate bus: Selectable to 8-bit or 16-bit bus space. • Endian mode can be specified for each area.
CS area controller	• Recovery cycles can be inserted: - Read recovery: Up to 15 cycles - Write recovery: Up to 15 cycles. • Cycle wait function: Wait for up to 31 cycles (for page access, up to 7 cycles) • Use wait control to set up the following: - Assertion and negation timing of chip select signals (CS0 to CS7) - Assertion timing of the read signal (RD) and write signals (WR0/WR and WR1) - Timing of data output starts and ends. • Write access modes: - Single-write strobe mode and byte strobe mode.
SDRAM area controller	• Multiplexed output of row address and column address (8, 9, 10, or 11 bits) • Self-refresh and auto-refresh selectable • CAS latency can be specified from 1 to 3 cycles.
Write buffer function	When write data from the bus master is written to the write buffer, write access by the bus master is complete.
Frequency	• The CS area controller (CSC) operates in synchronization with the external bus clock (BCLK)*1 • The frequency of the EBCLK pin output is the same as BCLK by default. Half of the BCLK cycles can be supplied by setting the EBCLK Pin Output Select bit, BCKCR.BCLKDIV, in the External Bus Clock Control Register. For more information, see section 9, Clock Generation Circuit. • The SDRAM area controller (SDRAMC) operates in synchronization with the SDRAM clock (SDCLK).

Note: BCLK and the SDCLK must operate at the same frequency when the SDRAM is in use.

Table 15.4 External bus I/O pins (1 of 2)

Pin name	I/O	Related function	Description
EBCLK, SDCLK*1	Output	CSC, SDRAMC	Clock output pin
A23 to A00*2	Output	CSC, SDRAMC	Address output pins
D15 to D00 DQ15 to DQ00	I/O	CSC, SDRAMC	D15 to D00 are CSC data input/output pins. DQ15 to DQ00 are SDRAMC data input/output pins: • D15 to D00, DQ15 to DQ00 pins are enabled when the 16-bit bus space is specified • D07 to D00, DQ07 to DQ00 pins are enabled when the 8-bit bus space is specified.
BC0	Output	CSC	• Strobe signal (when low) indicates that D07 to D00 are valid during access to an external address space in single-write strobe mode, active-low • When an 8-bit bus space is specified, this output pin is always held low regardless of the write access mode.
BC1	Output	CSC	• Strobe signal (when low) indicates that D15 to D08 are valid during access to an external address space in single-write strobe mode, active-low • This pin is not used when the 8-bit bus space is specified.
CS0*3	Output	CSC	Chip select signal for area 0 (CS0), active-low
CS1*3	Output	CSC	Chip select signal for area 1 (CS1), active-low
CS2*3	Output	CSC	Chip select signal for area 2 (CS2), active-low
CS3*3	Output	CSC	Chip select signal for area 3 (CS3), active-low
CS4	Output	CSC	Chip select signal for area 4 (CS4), active-low
CS5	Output	CSC	Chip select signal for area 5 (CS5), active-low
CS6	Output	CSC	Chip select signal for area 6 (CS6), active-low
CS7	Output	CSC	Chip select signal for area 7 (CS7), active-low

Table 15.4 External bus I/O pins (2 of 2)

Pin name	I/O	Related function	Description
RD	Output	CSC	Strobe signal indicates that a read from an external address space (CS0 to CS7) is in progress, active-low
WR0/WR*4	Output	CSC	• WR0 signal is a strobe signal that indicates (when low) that a write to an external address space is in progress in byte strobe mode, and D07 to D00 are valid, active-low • WR signal is a strobe signal that indicates (when low) that a write to an external address space is in progress in single-write strobe mode, active-low • When an 8-bit bus space is specified, this output pin is held low during a write access regardless of the write access mode.
WR1	Output	CSC	• Strobe signal (when low) indicates that D15 to D08 are valid during a write to an external address space in byte strobe mode, active-low • This signal is invalid in single-write strobe mode • This pin is not used when the 8-bit bus space is specified.
WAIT	Input	CSC	Wait request signal (when low) used when accessing the external address space (CS0 to CS7), active-low
CKE	Output	SDRAMC	Clock enable signal
SDCS	Output	SDRAMC	Chip select signal, active-low
RAS	Output	SDRAMC	Row address strobe signal, active-low
CAS	Output	SDRAMC	Column address strobe signal, active-low
WE	Output	SDRAMC	Write enable signal, active-low
DQM0	Output	SDRAMC	I/O data mask enable signal for DQ07 to DQ00
DQM1	Output	SDRAMC	I/O data mask enable signal for DQ15 to DQ08

Note 1. The EBCLK and the SDCLK pin functions are shared by the CS area controller (CSC) and the SDRAM area controller (SDRAMC). When using the CSC and the SDRAMC simultaneously, the SDCLK pin function is valid.

Note 2. The A23 to A00 pin functions are shared by the CSC and the SDRAMC.
When using the CSC only:
The A00 and BC0 pin functions share the same pin, and either becomes effective according to the area. The function is A00 in byte strobe mode and BC0 in single-write strobe mode. Setting the 8-bit external bus width is prohibited in single-write strobe mode.
When using the SDRAMC only:
The A15 to A00 pin functions are valid. The A00 and DQM1 pin functions share the same pin, and either becomes effective according to the external bus width. When selecting 8-bit bus width, the function is A00. When selecting 16-bit bus width, the function is DQM1.
When using the CSC and the SDRAMC simultaneously:
The A23 to A16 pin functions are valid for CSC. The A15 to A00 pin functions are shared by the CSC and the SDRAMC.
For the CSC, the A00/BC0 pin function is as described above.
For the SDRAMC, the A00/DQM1 pin function is as described above.

Note 3. The CS0 to CS3 (CSC) and SDRAMC pin functions share the same pin. When using the CSC and the SDRAMC simultaneously, the CS0 to CS3 pin functions are invalid.

Note 4. The WR0 signal and WR signal are identical. The WR0 signal is referred to as WR in single-write strobe mode.

15.2.4 Parallel Operations

Parallel operations are possible when different bus masters request access to different slave modules. For example, if the CPU fetches an instruction from the flash and an operand from the SRAM, the DMAC can handle transfers between a peripheral bus and the external bus at the same time.

An example of parallel operations is shown in Figure 15.2. In this example, the CPU uses the instruction and operand buses for simultaneous access to the flash and SRAM, respectively. Additionally, the DMAC/DTC, EDMAC, and JPEG Codec/GLCDC/2D Drawing Engine simultaneously use the DMA bus (DMAC/DTC), ETHER bus (EDMAC), and GPX bus (JPEG Codec/GLCDC/2D Drawing Engine) for access to a peripheral bus or external bus during access to the flash memory and SRAM by the CPU.

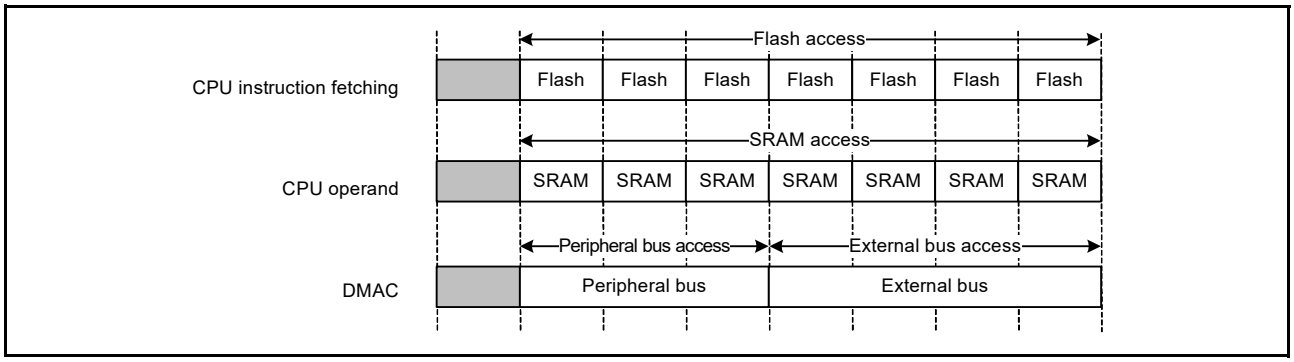

Figure 15.2 Example of parallel operations

15.2.5 Bus Settings

Set up the external bus with the following registers:

- Mode settings:
  CSn Mode Register (CSnMOD), CSn Wait Control Register 1 (CSnWCR1), CSn Wait Control Register 2 (CSnWCR2), CSn Control Register (CSnCR), CSn Recovery Cycle Setting Register (CSnREC), CS Recovery Cycle Insertion Enable Register (CSRECEN), and Bus Priority Control Register (BUSSCNT)
- I/O port assignments:
  PmnPFS.PMR = 1 and PmnPFS.PSEL[4:0] = 0Bh
- Frequency of the external bus clock (BCLK) and SDRAM clock (SDCLK):
  SCKDIVCR register.

See section 20, I/O Ports, for information on PmnPFS and section 9, Clock Generation Circuit for information on SCKDIVCR.

15.2.6 Restrictions

(1) Endianness constraint

Memory space must be little-endian to execute code on the Cortex®-M4 core.

15.3 Register Descriptions

15.3.1 CSn Control Register (CSnCR) (n = 0 to 7)

Address(es): BUS.CS0CR 4000 3802h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	EMODE	—	—	BSIZE[1:0]		—	—	—	EXENB
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	1

Address(es): BUS.CS1CR 4000 3812h, BUS.CS2CR 4000 3822h, BUS.CS3CR 4000 3832h, BUS.CS4CR 4000 3842h, BUS.CS5CR 4000 3852h, BUS.CS6CR 4000 3862h, BUS.CS7CR 4000 3872h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	EMODE	—	—	BSIZE[1:0]		—	—	—	EXENB
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	EXENB	Operation Enable	0: Disable operation 1: Enable operation.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5, b4	BSIZE[1:0]	External Bus Width Select	b5 b4 0 0: 16-bit bus space 0 1: Setting prohibited 1 0: 8-bit bus space 1 1: Setting prohibited.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	EMODE	Endian Mode	0: Little endian 1: Big endian.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Do not attempt to write to the CSnCR register while the external bus is being accessed.

EXENB bit (Operation Enable)

The EXENB bit enables operation of the associated CS areas. On MCU reset, operation is enabled (EXENB = 1) only for area 0. Operation in other areas is disabled (EXENB = 0). Attempts to access disabled areas have no effect.
When the CSC and SDRAMC are in use at the same time, BCLK and SDCLK must operate at the same frequency.

BSIZE[1:0] bits (External Bus Width Select)

The BSIZE[1:0] bits specify the data bus width for the associated area.

EMODE bit (Endian Mode)

The EMODE bit specifies the endianness for the associated area. The Cortex®-M4 core is fixed at little-endian order, so instruction code can only be allocated to external spaces with little-endian specified. If an area is specified as big-endian, no instruction code can be allocated to it.

15.3.2 CSn Recovery Cycle Register (CSnREC) (n = 0 to 7)

Address(es): BUS.CS0REC 4000 380Ah, BUS.CS1REC 4000 381Ah, BUS.CS2REC 4000 382Ah, BUS.CS3REC 4000 383Ah, BUS.CS4REC 4000 384Ah, BUS.CS5REC 4000 385Ah, BUS.CS6REC 4000 386Ah, BUS.CS7REC 4000 387Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	WRCV[3:0]				—	—	—	—	RRCV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	RRCV[3:0]	Read Recovery	b3 b0 0 0 0 0: Do not insert any recovery cycles 0 0 0 1: Insert 1 recovery cycle 0 0 1 0: Insert 2 recovery cycles 0 0 1 1: Insert 3 recovery cycles 0 1 0 0: Insert 4 recovery cycles 0 1 0 1: Insert 5 recovery cycles 0 1 1 0: Insert 6 recovery cycles 0 1 1 1: Insert 7 recovery cycles 1 0 0 0: Insert 8 recovery cycles 1 0 0 1: Insert 9 recovery cycles 1 0 1 0: Insert 10 recovery cycles 1 0 1 1: Insert 11 recovery cycles 1 1 0 0: Insert 12 recovery cycles 1 1 0 1: Insert 13 recovery cycles 1 1 1 0: Insert 14 recovery cycles 1 1 1 1: Insert 15 recovery cycles.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b11 to b8	WRCV[3:0]	Write Recovery	b11 b8 0 0 0 0: Do not insert any recovery cycles 0 0 0 1: Insert 1 recovery cycle 0 0 1 0: Insert 2 recovery cycles 0 0 1 1: Insert 3 recovery cycles 0 1 0 0: Insert 4 recovery cycles 0 1 0 1: Insert 5 recovery cycles 0 1 1 0: Insert 6 recovery cycles 0 1 1 1: Insert 7 recovery cycles 1 0 0 0: Insert 8 recovery cycles 1 0 0 1: Insert 9 recovery cycles 1 0 1 0: Insert 10 recovery cycles 1 0 1 1: Insert 11 recovery cycles 1 1 0 0: Insert 12 recovery cycles 1 1 0 1: Insert 13 recovery cycles 1 1 1 0: Insert 14 recovery cycles 1 1 1 1: Insert 15 recovery cycles.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Do not attempt to write to the CSnREC register while the external bus is being accessed.
When the preceding bus access is from a separate bus, CSnREC is valid when the recovery cycle insertion is enabled in the Separate Bus Recovery Cycle Insertion Enable bit (RCVENi (i = 0 to 7)) in CSRECEN. For more information, see section 15.5.3, Insertion of Recovery Cycles.

RRCV[3:0] bits (Read Recovery)

The RRCV[3:0] bits specify the number of recovery cycles inserted after a read access on the external bus for CSn (n = 0 to 7). When recovery cycle insertion is enabled and a value other than 0000b is set, 1 to 15 recovery cycles are inserted when:

- After a read access to the external bus, a read access is made to the external bus in the same area
- After a read access to the external bus, a read access is made to the external bus in a different area
- After a read access to the external bus, a write access is made to the external bus in the same area
- After a read access to the external bus, a write access is made to the external bus in a different area.

WRCV[3:0] bits (Write Recovery)

The WRCV[3:0] bits specify the number of recovery cycles inserted after a write access on the external bus for CSn (n = 0 to 7). When recovery cycle insertion is enabled and a value other than 0000b is set, 1 to 15 recovery cycles are inserted when:

- After a write access to the external bus, a read access is made to the external bus in the same area
- After a write access to the external bus, a read access is made to the external bus in a different area
- After a write access to the external bus, a write access is made to the external bus in the same area
- After a write access to the external bus, a write access is made to the external bus in a different area.

15.3.3 CS Recovery Cycle Insertion Enable Register (CSRECEN)

Address(es): BUS.CSRECEN 4000 3880h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	RCVEN7	RCVEN6	RCVEN5	RCVEN4	RCVEN3	RCVEN2	RCVEN1	RCVEN0
Value after reset:	0	0	1	1	1	1	1	0	0	0	1	1	1	1	1	0

Bit	Symbol	Bit name	Description	R/W
b0	RCVEN0	Separate Bus Recovery Cycle Insertion Enable 0	0: Disable 1: Enable.	R/W
b1	RCVEN1	Separate Bus Recovery Cycle Insertion Enable 1	0: Disable 1: Enable.	R/W
b2	RCVEN2	Separate Bus Recovery Cycle Insertion Enable 2	0: Disable 1: Enable.	R/W
b3	RCVEN3	Separate Bus Recovery Cycle Insertion Enable 3	0: Disable 1: Enable.	R/W
b4	RCVEN4	Separate Bus Recovery Cycle Insertion Enable 4	0: Disable 1: Enable.	R/W
b5	RCVEN5	Separate Bus Recovery Cycle Insertion Enable 5	0: Disable 1: Enable.	R/W
b6	RCVEN6	Separate Bus Recovery Cycle Insertion Enable 6	0: Disable 1: Enable.	R/W
b7	RCVEN7	Separate Bus Recovery Cycle Insertion Enable 7	0: Disable 1: Enable.	R/W
b8	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b13 to b9	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Do not attempt to write to the CSRECEN register while the external bus is being accessed. For more information on insertion recovery cycles, see 15.5.3 Insertion of Recovery Cycles.

RCVENi bit (Separate Bus Recovery Cycle Insertion Enable i) (i = 0 to 7)

The RCVENi bit enables the insertion of read or write recovery cycles when, after a read or write access on the external bus, a read or write access is made on the external bus to the same or different area.

Table 15.5 Access type associations with the RCVENi bits

Access type	External address space	Insertion of recovery cycles	Associated bits
Read access after read access	Same area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN0
	Different area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN1
Write access after read access	Same area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN2
	Different area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN3
Read access after write access	Same area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN4
	Different area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN5
Write access after write access	Same area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN6
	Different area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN7

15.3.4 CSn Mode Register (CSnMOD) (n = 0 to 7)

Address(es): BUS.CS0MOD 4000 3002h, BUS.CS1MOD 4000 3012h, BUS.CS2MOD 4000 3022h, BUS.CS3MOD 4000 3032h, BUS.CS4MOD 4000 3042h, BUS.CS5MOD 4000 3052h, BUS.CS6MOD 4000 3062h, BUS.CS7MOD 4000 3072h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PRMOD	—	—	—	—	—	PWENB	PRENB	—	—	—	—	EWENB	—	—	WRMOD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	WRMOD	Write Access Mode Select	0: Byte strobe mode 1: Single-write strobe mode.	R/W
b2, b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b3	EWENB	External Wait Enable	0: Disable 1: Enable.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	PRENB	Page Read Access Enable	0: Disable 1: Enable.	R/W
b9	PWENB	Page Write Access Enable	0: Disable 1: Enable.	R/W
b14 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	PRMOD	Page Read Access Mode Select	0: Normal access compatible mode 1: External data read continuous assertion mode.	R/W

Do not write to the CSnMOD register while access to the CSn area is in progress.

WRMOD bit (Write Access Mode Select)

The WRMOD bit selects the write access operating mode. Writing 0 selects byte strobe mode, in which data writes are controlled by the WRn signals (n = 0 to 1) associated with the respective byte positions. Writing 1 selects single-write strobe mode, in which data writes are controlled by the BCn (n = 0 to 1) and WR signals associated with the respective byte positions.

Note: Setting the external bus width to 8 bits is prohibited in single-write strobe mode.

Table 15.6 Control signals for write access modes

	Pin name			
Write access mode	**WR1**	**WR0/WR**	**BC1**	**BC0**
Byte strobe mode	✓	✓ (WR0)	×	×
Single-write strobe mode	×	✓ (WR)	✓	✓

✓: Enabled, ×: Disabled

EWENB bit (External Wait Enable)

The EWENB bit enables external waits. Writing 0 disables the WAIT signal. Writing 1 selects external wait and allows the WAIT signal to control the number of waits per cycle. In this state, wait cycles are inserted when the WAIT signal is low.

PRENB bit (Page Read Access Enable)

The PRENB bit enables page read accesses.

PWENB bit (Page Write Access Enable)

The PWENB bit enables page write accesses.

PRMOD bit (Page Read Access Mode Select)

The PRMOD bit selects the operating mode for page read accesses. Writing 0 selects normal access compatible mode, in which the RD signal is negated and an RD assert wait is inserted each time a unit of data is read. When there is no RD assert wait, the RD signal is negated only in the final transfer of the external bus access.

Writing 1 selects external data read continuous assertion mode, in which an RD assert wait is inserted and the RD signal is continuously asserted during the wait.

15.3.5 CSn Wait Control Register 1 (CSnWCR1) (n = 0 to 7)

Address(es): BUS.CS0WCR1 4000 3004h, BUS.CS1WCR1 4000 3014h, BUS.CS2WCR1 4000 3024h, BUS.CS3WCR1 4000 3034h, BUS.CS4WCR1 4000 3044h, BUS.CS5WCR1 4000 3054h, BUS.CS6WCR1 4000 3064h, BUS.CS7WCR1 4000 3074h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b20 to b16	CSWWAIT[4:0]	Normal Write Cycle Wait Select	b20 b16 0 0 0 0 0: Do not insert wait 0 0 0 0 1: Insert wait of 1 clock cycle 0 0 0 1 0: Insert wait of 2 clock cycles 0 0 0 1 1: Insert wait of 3 clock cycles Set value = the n-bit number of clock cycles inserted 1 1 1 0 1: Insert wait of 29 clock cycles 1 1 1 1 0: Insert wait of 30 clock cycles 1 1 1 1 1: Insert wait of 31 clock cycles.	R/W
b23 to b21	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b28 to b24	CSRWAIT[4:0]	Normal Read Cycle Wait Select	b28 b24 0 0 0 0 0: Do not insert wait 0 0 0 0 1: Insert wait of 1 clock cycle 0 0 0 1 0: Insert wait of 2 clock cycles 0 0 0 1 1: Insert wait of 3 clock cycles. Set value = the n-bit number of clock cycles inserted 1 1 1 0 1: Insert wait of 29 clock cycles 1 1 1 1 0: Insert wait of 30 clock cycles 1 1 1 1 1: Insert wait of 31 clock cycles.	R/W
b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The CSPWWAIT[2:0] value is only valid when the PWENB bit in CSnMOD is set to 1.
Note 2. The CSPRWAIT[2:0] value is only valid when the PRENB bit in CSnMOD is set to 1.

Do not attempt to write to the CSnWCR1 register while the external bus is being accessed. Set each of these bits to satisfy the restrictions described in section 15.5.6, Restrictions, (1) Restrictions on using a separate bus interface.

CSPWWAIT[2:0] bits (Page Write Cycle Wait Select)

The CSPWWAIT[2:0] bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page write cycle. The setting is enabled when the PWENB bit in CSnMOD is set to 1.

Note: The settings must satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

CSPRWAIT[2:0] bits (Page Read Cycle Wait Select)

The CSPRWAIT[2:0] bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page read cycle. The setting is enabled when the PRENB bit in CSnMOD is set to 1.

Note: The settings must satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSPRWAIT[2:0] value.

CSWWAIT[4:0] bits (Normal Write Cycle Wait Select)

The CSWWAIT[4:0] bits specify the number of wait cycles to be inserted into the first access during a normal write cycle or page write cycle.

Note: The settings must satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

CSRWAIT[4:0] bits (Normal Read Cycle Wait Select)

The CSRWAIT[4:0] bits specify the number of wait cycles to be inserted into the first access during a normal read cycle or page read cycle.

Note: The settings must satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

15.3.6 CSn Wait Control Register 2 (CSnWCR2) (n = 0 to 7)

R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Do not attempt to write to the CSnWCR2 register while the external bus is being accessed. Set each of these bits to satisfy the restrictions described in section 15.5.6, Restrictions, (1), Restrictions on using a separate bus interface.

CSROFF[2:0] bits (Read-Access CS Extension Cycle Select)

The CSROFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (RD signal negated) until the CSn signal (n = 0 to 7) is negated in read access mode.

CSWOFF[2:0] bits (Write-Access CS Extension Cycle Select)

The CSWOFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (WRn signal (n = 0 to 1) negated) until the CSn signal (n = 0 to 7) is negated in write access mode.

Note: The settings must satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

WDOFF[2:0] bits (Write Data Output Extension Cycle Select)

The WDOFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (WRn signal (n = 0 to 1) negated) until the write-data output is complete in write access mode.

Note: The settings must satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

RDON[2:0] bits (RD Assert Wait Select)

The RDON[2:0] bits specify the number of wait cycles to be inserted before the RD signal is asserted.

Note: For normal read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.
For page read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSPRWAIT[2:0] value.

WRON[2:0] bits (WR Assert Wait Select)

The WRON[2:0] bits specify the number of wait cycles to be inserted before the WRn signal (n = 0 to 1) is asserted.

Note: For normal write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.
For page write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

WDON[2:0] bits (Write Data Output Wait Select)

The WDON[2:0] bits specify the number of wait cycles to be inserted before the write data is output.

Note: For normal write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.
For page write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

CSON[2:0] bits (CS Assert Wait Select)

The CSON[2:0] bits specify the number of wait cycles to be inserted before the CSn signal (n = 0 to 7) is asserted.

Note: For normal read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.
For page read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSPRWAIT[2:0] value.
For normal write access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.
For page write access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

15.3.7 SDC Control Register (SDCCR)

Address(es): BUS.SDCCR 4000 3C00h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	BSIZE[1:0]		—	—	—	EXENB
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	EXENB	Operation Enable	0: Disable 1: Enable.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5, b4	BSIZE[1:0]	SDRAM Bus Width Select	b5 b4 0 0: 16-bit bus space 0 1: Setting prohibited 1 0: 8-bit bus space 1 1: Setting prohibited.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

EXENB bit (Operation Enable)

The EXENB bit enables the operation of the SDRAM address space. On reset, operation is disabled (EXENB = 0). Attempts to access disabled areas have no effect.

When CSC and SDRAMC are in use at the same time, BCLK and SDCLK must operate at the same frequency.

15.3.8 SDC Mode Register (SDCMOD)

Address(es): BUS.SDCMOD 4000 3C01h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	EMODE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	EMODE	Endian Mode	0: Endian order of SDRAM address space is the same as the endian order of the operating mode 1: Endian order of SDRAM address space is not the endian order of the operating mode.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

EMODE bit (Endian Mode)

The EMODE bit specifies the endianness for the SDRAM address space. The Cortex®-M4 core is fixed at little-endian order, so instruction code can only be allocated to external spaces with little-endian specified. If an area is specified as big-endian, no instruction code can be allocated to it.

15.3.9 SDRAM Access Mode Register (SDAMOD)

Address(es): BUS.SDAMOD 4000 3C02h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	BE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	BE	Continuous Access Enable	0: Disable 1: Enable.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SDAMOD can only be set when the conditions in Table 15.13 are satisfied. Otherwise, operation is not guaranteed.

BE bit (Continuous Access Enable)

The BE bit enables continuous access to the SDRAM access space.

Note: When the SDRAM area is accessed from bus masters other than graphic IPs, continuous access is always disabled regardless of the setting.

15.3.10 SDRAM Self-Refresh Control Register (SDSELF)

Address(es): BUS.SDSELF 4000 3C10h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SFEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SFEN	SDRAM Self-Refresh Enable	0: Disable 1: Enable.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SDSELF can only be set when the conditions in Table 15.13 are satisfied. Otherwise, operation is not guaranteed.

SFEN bit (SDRAM Self-Refresh Enable)

The SFEN bit controls the self-refresh operation. Setting this bit to 1 initiates an auto-refresh cycle, after which self-refresh begins. Clearing this bit to 0 ends the self-refresh, and auto-refresh resumes. When the bit is set to 1, the write value takes effect when the self-refresh operation starts. When it is set to 0, the write value has already taken effect when auto-refresh starts after the end of the self-refresh.

15.3.11 SDRAM Refresh Control Register (SDRFCR)

Address(es): BUS.SDRFCR 4000 3C14h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b11 to b0	RFC[11:0]	Auto-Refresh Request Interval Setting	b11 b0 0 0 0 0 0 0 0 0 0 0 0 0: Setting prohibited 0 0 0 0 0 0 0 0 0 0 0 1: 2 cycles 0 0 0 0 0 0 0 0 0 0 1 0: 3 cycles : 1 1 1 1 1 1 1 1 1 1 1 1: 4096 cycles.	R/W
b15 to b12	REFW[3:0]	Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting	b15 b12 0 0 0 0: 1 cycle 0 0 0 1: 2 cycles 0 0 1 0: 3 cycles 0 0 1 1: 4 cycles 0 1 0 0: 5 cycles 0 1 0 1: 6 cycles 0 1 1 0: 7 cycles 0 1 1 1: 8 cycles 1 0 0 0: 9 cycles 1 0 0 1: 10 cycles 1 0 1 0: 11 cycles 1 0 1 1: 12 cycles 1 1 0 0: 13 cycles 1 1 0 1: 14 cycles 1 1 1 0: 15 cycles 1 1 1 1: 16 cycles.	R/W

RFC[11:0] bits (Auto-Refresh Request Interval Setting)

The RFC[11:0] bits specify the auto-refresh request interval. They can be written to at any time, regardless of the state of the Auto-Refresh Operation Enable bit (RFEN) in SDRFEN. If auto-refresh is enabled, the write value takes effect after the end of the auto-refresh cycles. The refresh counter uses SDCLK.

REFW[3:0] bits (Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting)

The REFW[3:0] bits specify the number of auto-refresh cycles and the number of self-refresh clearing cycles. They can be written to at any time, regardless of the state of the Auto-Refresh Operation Enable bit (RFEN) in SDRFEN. If an auto-refresh cycle is in progress, the value written to the bits while auto-refresh is enabled takes effect after the cycle completes.

Note: Auto-refresh requests are not accepted while the SDRAM is being accessed. This means they must sometimes wait until the access completes for the auto-refresh interval to be extended. Set the RFC[11:0] bits to an auto-refresh request interval value that meets the specifications of the SDRAM being used. Additionally, make sure to set the auto-refresh request interval to a duration longer than the auto-refresh cycle. The auto-refresh interval cannot be automatically adjusted when the frequency is changed during operation. In this case, perform a self-refresh operation and set the auto-refresh interval to an appropriate value for the frequency again.

15.3.11.1 Auto-Refresh Request Interval and RFC Set Value

The SDRAMC (SDRAM area controller) includes a 12-bit refresh counter that generates auto-refresh requests at fixed intervals. Use the following equation to calculate the set value for the RFC[11:0] bits from the auto-refresh request interval:

RFC = (Auto-refresh request interval / SDCLK cycle) - 1

Note: Auto-refresh requests are not accepted while the SDRAM is being accessed. They must wait until the access completes. However, the counter value is updated regardless of whether or not the request was accepted. If two or more auto-refresh requests are generated while the SDRAM is being accessed, the second and subsequent requests are ignored.

15.3.12 SDRAM Auto-Refresh Control Register (SDRFEN)

Address(es): BUS.SDRFEN 4000 3C16h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RFEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	RFEN	Auto-Refresh Operation Enable	0: Disable 1: Enable.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RFEN bit (Auto-Refresh Operation Enable)

The RFEN bit enables auto-refresh operation. When auto-refresh is required, set the RFEN bit to 1 before SDRAM access.

Clearing this bit to 0 when auto-refresh is enabled causes auto-refresh operation to halt after the end of the auto-refresh cycle. The interval at which refresh requests are generated is determined by the value of the Auto-Refresh Request Interval Setting (RFC[11:0]) bits in the SDRAM Refresh Control Register (SDRFCR).

When reading SDRFEN after writing SDRFEN, read the register more than three times and confirm the new value after the third read.

15.3.13 SDRAM Initialization Sequence Control Register (SDICR)

Address(es): BUS.SDICR 4000 3C20h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	INIRQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	INIRQ	Initialization Sequence Start	0: Invalid 1: Start initialization sequence.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

INIRQ bit (Initialization Sequence Start)

Setting the INIRQ bit to 1 starts the SDRAM initialization sequence and automatically sets the Initialization Status bit (INIST) in the SDRAM Status Register (SDSR) to 1. The INIST bit clears automatically after the initialization sequence ends. The value written to the INIRQ bit is not retained.

Note: The INIRQ bit that starts the SDRAM initialization sequence can only be set when the conditions in Table 15.13 are satisfied. Otherwise, operation is not guaranteed.

15.3.14 SDRAM Initialization Register (SDIR)

Address(es): BUS.SDIR 4000 3C24h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

ARFI[3:0] bits (Initialization Auto-Refresh Interval)

The ARFI[3:0] bits specify the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence.

ARFC[3:0] bits (Initialization Auto-Refresh Count)

The ARFC[3:0] bits specify the number of times auto-refresh is to be performed in the SDRAM initialization sequence.

PRC[2:0] bits (Initialization Precharge Cycle Count)

The PRC[2:0] bits specify the number of precharged cycles in the SDRAM initialization sequence.

Note: Implement settings that satisfy the specifications of the connected SDRAM before starting the initialization sequence.

15.3.15 SDRAM Address Register (SDADR)

Address(es): BUS.SDADR 4000 3C40h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MXC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	MXC[1:0]	Address Multiplex Select	b1 b0 0 0: 8-bit shift 0 1: 9-bit shift 1 0: 10-bit shift 1 1: 11-bit shift.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SDADR can only be set when the conditions in Table 15.13 are satisfied. Otherwise, operation is not guaranteed.

MXC[1:0] bits (Address Multiplex Select)

The MXC[1:0] bits select the size of the shift towards the lower half of the row address in row address/column address multiplexing. These bits also select the row address bits to be used for comparison in SDRAMC continuous access operation. For details, see Table 15.18.

15.3.16 SDRAM Timing Register (SDTR)

Address(es): BUS.SDTR 4000 3C44h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	RAS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	RCD[1:0]		RP[2:0]			WR	—	—	—	—	—	CL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	CL[2:0]	SDRAMC Column Latency	b2 b0 0 0 0: Setting prohibited 0 0 1: 1 cycle 0 1 0: 2 cycles 0 1 1: 3 cycles 1 0 0: Setting prohibited 1 0 1: Setting prohibited 1 1 0: Setting prohibited 1 1 1: Setting prohibited.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	WR	Write Recovery Interval	0: 1 cycle 1: 2 cycles.	R/W

Bit	Symbol	Bit name	Description	R/W
b11 to b9	RP[2:0]	Row Precharge Interval	b11 b9 0 0 0: 1 cycle 0 0 1: 2 cycles 0 1 0: 3 cycles 0 1 1: 4 cycles 1 0 0: 5 cycles 1 0 1: 6 cycles 1 1 0: 7 cycles 1 1 1: 8 cycles.	R/W
b13, b12	RCD[1:0]	Row Column Latency	b13 b12 0 0: 1 cycle 0 1: 2 cycles 1 0: 3 cycles 1 1: 4 cycles.	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b18 to b16	RAS[2:0]	Row Active Interval	b18 b16 0 0 0: 1 cycle 0 0 1: 2 cycles 0 1 0: 3 cycles 0 1 1: 4 cycles 1 0 0: 5 cycles 1 0 1: 6 cycles 1 1 0: 7 cycles 1 1 1: Setting prohibited.	R/W
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SDTR specifies the timing for read and write accesses to the SDRAM. For more information, see section 15.6.11.3, Timing Register Settings and Access Timing.

SDTR can only be set when the conditions in Table 15.13 are satisfied. Otherwise, operation is not guaranteed.

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

CL[2:0] bits (SDRAMC Column Latency)

The CL[2:0] bits specify the column latency of the SDRAM controller. This setting only affects the latency setting on the SDRAM controller side. To specify the column latency for externally connected SDRAM, use the SDRAM mode register (SDMOD).

WR bit (Write Recovery Interval)

The WR bit specifies the interval that must elapse between the SDRAM write command (WRIT) and deactivation (PALL).

RP[2:0] bits (Row Precharge Interval)

The RP[2:0] bits specify the minimum number of cycles that must elapse between the SDRAM deactivation command (PALL) and the next valid command.

RAS[2:0] bits (Row Active Interval)

The RAS[2:0] bits specify the minimum interval that must elapse between the SDRAM row activation command (ACTV) and deactivation (PALL). The value specified in these bits must be less than or equal to the sum of the row column latency (RCD[1:0]) and column latency (CL[2:0]) settings.

15.3.17 SDRAM Mode Register (SDMOD)

Address(es): BUS.SDMOD 4000 3C48h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	MR[14:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b14 to b0	MR[14:0]	Mode Register Setting	Writing to these bits triggers a mode register set command.	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

SDMOD specifies the value to be written to the SDRAM mode register. Writing to SDMOD causes a mode register set command to be issued automatically to the SDRAM. SDMOD can only be set when the conditions in Table 15.13 are satisfied. Otherwise, operation is not guaranteed.

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

MR[14:0] bits (Mode Register Setting)

Writing to the MR[14:0] bits causes a mode register set command to be issued to the SDRAM, and the setting in the MR[14:0] bits is output to the lower bits of the address. For more information, see section 15.6.10, Setting the Mode Register.

Note: You must set a burst length of 1 for the SDRAM. Operation is not guaranteed with any other burst length setting.
Note: The SDRAM column latency must match the setting in the SDRAMC Column Latency setting (CL[2:0]) in the SDRAM Timing Register (SDTR). Operation is not guaranteed if the latency settings do not agree.
Note: Make sure the SRFST, INIST, and MRSST status bits in the SDRAM Status Register (SDSR) are all 0.

15.3.18 SDRAM Status Register (SDSR)

Address(es): BUS.SDSR 4000 3C50h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SRFST	INIST	—	—	MRSST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	MRSST	Mode Register Setting Status	0: Mode register setting not in progress 1: Mode register setting in progress.	R
b2, b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b3	INIST	Initialization Status	0: Initialization sequence not in progress 1: Initialization sequence in progress.	R
b4	SRFST	Self-Refresh Transition/Recovery Status	0: Transition/recovery not in progress 1: Transition/recovery in progress.	R
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

MRSST bit (Mode Register Setting Status)

When set to 1, the MRSST bit indicates that SDRAM mode register setting is in progress. When reading SDSR after writing to SDMOD, read the register more than three times and confirm that MRSST is 0 after the third.

INIST bit (Initialization Status)

When set to 1, the INIST bit indicates that the SDRAM initialization sequence is in progress. When reading SDSR after writing to SDICR, read the register more than three times and confirm that INIST is 0 after the third.

SRFST bit (Self-Refresh Transition/Recovery Status)

When set to 1, the SRFST bit indicates that a transition to or recovery from a self-refresh operation is in progress for the SDRAM. The "in progress" interval begins when the bits in Table 15.7 are written to and lasts until the associated commands are issued.

Note: Execution of a self-refresh, initialization sequence, or mode register setting can only be performed when all the status bits are 0. Do not rewrite the registers and bits in Table 15.7 when any of the SRFST, INIST, or MRSST status bits is set to 1.

Table 15.7 Registers and bits requiring status bit checking

Function	Register	Bits
Self-refresh	SDSELF	SFEN
Initialization sequence	SDICR	INIRQ
Mode register setting	SDMOD	MR[14:0]

15.3.19 Master Bus Control Register (BUSMCNT<master>)

Address(es): BUS.BUSMCNTM4I 4000 4000h, BUS.BUSMCNTM4D 4000 4004h, BUS.BUSMCNTSYS 4000 4008h, BUS.BUSMCNTDMA 4000 400Ch, BUS.BUSMCNTEDM 4000 4010h, BUS.BUSMCNTGPX 4000 4014h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	IERES	—	—	—	—	—	—	EWRES	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	EWRES	Early Write Response	0: Disable early write response 1: Enable early write response.	R/W
b14 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	IERES	Ignore Error Responses	0: Report bus errors 1: Do not report bus errors.	R/W

Note: Changing reserved bits from the initial value of 0 is prohibited. Operation during the change is not guaranteed.

Table 15.8 shows the registers associated with each bus type.

Table 15.8 Associations between bus types and registers (1 of 2)

Bus type	Master Bus Control Register	Slave Bus Control Register	Bus Error Address Register	Bus Error Status Register
ICode bus (CPU)	BUSMCNTM4I	—	BUS1ERRADD	BUS1ERRSTAT
DCode bus (CPU)	BUSMCNTM4D	—	BUS2ERRADD	BUS2ERRSTAT

Memory bus 1	—	BUSSCNTFLI	—	—
Memory bus 2	—	BUSSCNTRAMH	—	—
Memory bus 3	—	BUSSCNTMBIU	—	—
Memory bus 4	—	BUSSCNTRAM0	—	—
Memory bus 5	—	BUSSCNTRAM1	—	—
Internal peripheral bus 1, 3, 4, 5, 7, 8	—	BUSSCNTPnB (n = 0, 2, 3, 4, 6, 7)	—	—
Internal peripheral bus 9	—	BUSSCNTFBU	—	—
External bus (CS and SDRAM areas)	—	BUSSCNTEXT	—	—
External bus (QSPI area)	—	BUSSCNTEXT2	—	—

EWRES bit (Early Write Response)

The EWRES bit indicates whether the next write request is accepted before the response for the current write transaction occurs. When the value is 1, the next write request is accepted and high-speed transfer is possible, but AHB-Lite protocol error responses are not detected. Bus errors are returned to the requesting master IP using the error response protocol for AHB-Lite. For details on errors that occur on each bus, see section 15.7, Bus Error Monitoring Section. Only use the BUSMCNTSYS register.

IERES bit (Ignore Error Responses)

The IERES bit, when set, disables the AHB-Lite protocol error response.

15.3.20 Slave Bus Control Register (BUSSCNT<slave>)

Address(es): BUS.BUSSCNTFLI 4000 4100h, BUS.BUSSCNTRAMH 4000 4104h, BUS.BUSSCNTMBIU 4000 4108h, BUS.BUSSCNTRAM0 4000 410Ch, BUS.BUSSCNTRAM1 4000 4110h, BUS.BUSSCNTP0B 4000 4114h, BUS.BUSSCNTP2B 4000 4118h, BUS.BUSSCNTP3B 4000 411Ch, BUS.BUSSCNTP4B 4000 4120h, BUS.BUSSCNTP6B 4000 4128h, BUS.BUSSCNTP7B 4000 412Ch, BUS.BUSSCNTFBU 4000 4130h, BUS.BUSSCNTEXT 4000 4134h, BUS.BUSSCNTEXT2 4000 4138h, BUS.BUSSCNTGPX 4000 413Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	EWRES	—	—	ARBMET[1:0]		—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5, b4	ARBMET[1:0]	Arbitration Method	Specifies the group priorities. b5 b4 0 0: Fixed priority 0 1: Round-robin 1 0: Setting prohibited 1 1: Setting prohibited.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	EWRES	Early Write Response	0: Disable early write response 1: Enable early write response.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Changing reserved bits from the initial value of 0 is prohibited. Operation during the change is not guaranteed.

Table 15.8 lists the registers associated with each bus type.

ARBMET[1:0] bits (Arbitration Method)

The ARBMET[1:0] bits specify the arbitration protocol, with priority defined for all bus masters. For fixed priority, see Table 15.9. For round-robin, see Table 15.10.

EWRES bit (Early Write Response)

The EWRES bit indicates whether the next write request is accepted before the response for the current write transaction occurs. When the value is 1, the next write request is accepted and high-speed transfer is possible, but AHB-Lite error responses are not detected. Bus errors are returned to the requesting master IP using the error response protocol for AHB-Lite. For details on errors that occur on each bus, see section 15.7, Bus Error Monitoring Section. Only use the BUSSCNTMBIU, BUSSCNTP0B, and BUSSCNTEXT registers.

Table 15.9 Bus priorities with fixed-priority arbitration (ARBMET[1:0] = 00b)

Slave Bus Control Register	Slave interface	Priority order
BUSSCNTFLI	Memory bus 1	Memory bus 3 > DCode bus (CPU) > ICode bus (CPU)
BUSSCNTRAMH	Memory bus 2	Memory bus 3 > DCode bus (CPU) > ICode bus (CPU)
BUSSCNTMBIU	Memory bus 3	GPX bus > ETHER bus > DMA bus
BUSSCNTRAM0	Memory bus 4	GPX bus > ETHER bus > DMA bus > system bus (CPU)
BUSSCNTRAM1	Memory bus 5	GPX bus > ETHER bus > DMA bus > system bus (CPU)
BUSSCNTPnB (n = 0, 2, 3, 4, 6, 7)	Internal peripheral bus 1, 3, 4, 5, 7, 8	DMA bus > system bus (CPU)
BUSSCNTFBU	Internal peripheral bus 9	ETHER bus > DMA bus > system bus (CPU)
BUSSCNTEXT	External bus (CS and SDRAM areas)	GPX bus > ETHER bus > DMA bus > system bus (CPU)
BUSSCNTEXT2	External bus (QSPI area)	GPX bus > ETHER bus > DMA bus > system bus (CPU)
BUSSCNTGPX	GPX bus	GLCDC (Graphic 1) > 2D Drawing Engine (texture) > 2D Drawing Engine (data) > JPEG Codec (input) > GLCDC (Graphic 2) > JPEG Codec (output)

Table 15.10 Bus priorities with round-robin priority arbitration (ARBMET[1:0] = 01b)

Slave Bus Control Register	Slave interface	Priority order*1
BUSSCNTFLI	Memory bus 1	Memory bus 3 <=> DCode bus (CPU) <=> ICode bus (CPU)
BUSSCNTRAMH	Memory bus 2	Memory bus 3 <=> DCode bus (CPU) <=> ICode bus (CPU)
BUSSCNTMBIU	Memory bus 3	GPX bus <=> ETHER bus <=> DMA bus
BUSSCNTRAM0	Memory bus 4	GPX bus <=> ETHER bus <=> DMA bus <=> system bus (CPU)
BUSSCNTRAM1	Memory bus 5	GPX bus <=> ETHER bus <=> DMA bus <=> system bus (CPU)
BUSSCNTPnB (n = 0, 2, 3, 4, 6, 7)	Internal peripheral bus 1, 3, 4, 5, 7, 8	DMA bus <=> system bus (CPU)
BUSSCNTFBU	Internal peripheral bus 9	ETHER bus <=> DMA bus <=> system bus (CPU)
BUSSCNTEXT	External bus (CS and SDRAM areas)	GPX bus <=> ETHER bus <=> DMA bus <=> system bus (CPU)
BUSSCNTEXT2	External bus (QSPI area)	GPX bus <=> ETHER bus <=> DMA bus <=> system bus (CPU)
BUSSCNTGPX	GPX bus	GLCDC (Graphic 1) > 2D Drawing Engine (texture) > 2D Drawing Engine (data) > JPEG Codec (input) <=> GLCDC (Graphic 2) > JPEG Codec (output)

Note 1. Round-robin priority is denoted by <=>.

15.3.21 Bus Error Address Register (BUSnERRADD) (n = 1 to 11)

Address(es): BUS.BUS1ERRADD 4000 4800h, BUS.BUS2ERRADD 4000 4810h, BUS.BUS3ERRADD 4000 4820h, BUS.BUS4ERRADD 4000 4830h, BUS.BUS5ERRADD 4000 4840h, BUS.BUS6ERRADD 4000 4850h, BUS.BUS7ERRADD 4000 4860h, BUS.BUS8ERRADD 4000 4870h, BUS.BUS9ERRADD 4000 4880h, BUS.BUS10ERRADD 4000 4890h, BUS.BUS11ERRADD 4000 48A0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	BERAD[31:16]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	BERAD[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Bit name	Description	R/W
b31 to b0	BERAD[31:0]	Bus Error Address	When a bus error occurs, these bits store the error address.	R

Note: This register is cleared only by a reset that is not an MPU related reset. For more information, see section 6, Resets, and section 16, Memory Protection Unit (MPU).

Table 15.8 lists the registers associated with each bus type.

BERAD[31:0] bits (Bus Error Address)

When a bus error occurs, the BERAD[31:0] bits store the access address. For more information, see the BUSnERRSTAT.ERRSTAT bit description and section 15.7, Bus Error Monitoring Section.

A value of BUSnERRADD.BERAD[31:0] (n = 1 to 11) is only valid when BUSnERRSTAT.ERRSTAT (n = 1 to 11) is set to 1.

15.3.22 Bus Error Status Register (BUSnERRSTAT) (n = 1 to 11)

Address(es): BUS.BUS1ERRSTAT 4000 4804h, BUS.BUS2ERRSTAT 4000 4814h, BUS.BUS3ERRSTAT 4000 4824h, BUS.BUS4ERRSTAT 4000 4834h, BUS.BUS5ERRSTAT 4000 4844h, BUS.BUS6ERRSTAT 4000 4854h, BUS.BUS7ERRSTAT 4000 4864h, BUS.BUS8ERRSTAT 4000 4874h, BUS.BUS9ERRSTAT 4000 4884h, BUS.BUS10ERRSTAT 4000 4894h, BUS.BUS11ERRSTAT 4000 48A4h

	b7	b6	b5	b4	b3	b2	b1	b0
	ERRSTAT	—	—	—	—	—	—	ACCSTAT
Value after reset:	0	0	0	0	0	0	0	x

Bit	Symbol	Bit name	Description	R/W
b0	ACCSTAT	Error Access Status	Access status when the error occurred. 1: Write access 0: Read access.	R
b6 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	ERRSTAT	Bus Error Status	0: No bus error occurred 1: Bus error occurred.	R

Note: This register is cleared only by a reset that is not an MPU related reset. For more information, see section 6, Resets, and section 16, Memory Protection Unit (MPU).

Table 15.8 lists the registers associated with each bus type.

ACCSTAT bit (Error Access Status)

The ACCSTAT bit indicates the access status, write access or read access, when an error occurs on the associated bus.

For more information, see the BUSnERRSTAT.ERRSTAT bit description and section 15.7, Bus Error Monitoring Section.

The value is only valid when BUSnERRSTAT.ERRSTAT (n = 1 to 11) is set to 1.

ERRSTAT bit (Bus Error Status)

The ERRSTAT bit indicates whether a bus error occurred. When an error occurs on the associated bus, the access address and status of write or read access are stored. BUSnERRSTATn.ERRSTAT (n = 1 to 11) is set to 1.

The following types of errors can occur on each bus:

- Illegal address access
- Bus master MPU error
- Bus slave MPU error
- Time out.

When detecting bus master MPU errors or bus slave MPU errors, and reset is selected in the respective OAD bit, BUSnERRSTAT.ERRSTAT (n = 1 to 11) is not set to 1 if the bus access that caused the MPU error completes later than the internal reset signal being generated, which may occur depending on the wait setting.

When detecting bus master MPU errors or bus slave MPU errors, and NMI is selected in the respective OAD bit, BUSnERRSTAT.ERRSTAT (n = 1 to 11) is set to 1 when the bus access that caused the MPU error completes.

For more information on errors that occur on each bus, see section 15.7, Bus Error Monitoring Section, and section 16, Memory Protection Unit (MPU). For the GPX bus, BUSnERRSTAT.ERRSTAT (n = 6 to 11) is normally set to 1 unless a transfer request by different master bus is made after access with a bus master MPU error.

15.4 Endianness and Data Alignment

The external bus has a data alignment function to control which byte of the data bus (D15 to D08, D07 to D00) is used when accessing the external address space (the CS and SDRAM areas). Alignment is based on the bus specifications of the area to be accessed (8-bit or 16-bit bus space), the data size, and the endian order.

15.4.1 Data Alignment Control for the CS Areas

(1) 16-bit bus space

When a 16-bit bus space is selected in the BSIZE[1:0] bits in CSnCR, address buses A23 to A01 are enabled to output address signals in 16-bit units, and the address bus A00 is disabled (always outputs low).

When byte strobe mode is selected (WRMOD = 0 in CSnMOD), the WR0 and WR1 pins are enabled. The BC0 and BC1 pins are not used.

When single-write strobe mode is selected (WRMOD = 1 in CSnMOD), only the WR0 pin is enabled, and it always outputs low during write access, regardless of the data size. The WR1 pin is invalid (always outputs high). The valid byte position is indicated by the BC0 and BC1 pins.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See Figure 15.3 and Figure 15.4.

Page access can occur for accesses to data in 32-bit units. Page access can only occur when an access does not extend over a 32-bit boundary and causes no change in the BC0 and BC1 signals. The situations in which page access occurs are indicated by "(p)" in Figure 15.3 and Figure 15.4.

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address	WR1/BC1 | WR0/BC0 (RD) — Data bus D15 D08 D07 D00
8 bits	4n	One	First	8 bits	4n	7 0
	4n+1	One	First	8 bits	4n	7 0
	4n+2	One	First	8 bits	4n+2	7 0
	4n+3	One	First	8 bits	4n+2	7 0
16 bits	4n	One	First	16 bits	4n	15 8 7 0
	4n+2	One	First	16 bits	4n+2	15 8 7 0
32 bits	4n	Two	First	16 bits	4n	15 8 7 0
			Second	16 bits	4n+2 (p)	31 24 23 16

(p): Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

Figure 15.3 Data alignment in 16-bit bus space with little-endian order for CS areas

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address	WR1/BC1 | WR0/BC0 (RD) — Data bus D15 D08 D07 D00
8 bits	4n	One	First	8 bits	4n	7 0
	4n+1	One	First	8 bits	4n	7 0
	4n+2	One	First	8 bits	4n+2	7 0
	4n+3	One	First	8 bits	4n+2	7 0
16 bits	4n	One	First	16 bits	4n	15 8 7 0

(p): Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

Figure 15.4 Data alignment in 16-bit bus space with big-endian order for CS areas

(2) 8-bit bus space

When an 8-bit bus space is selected in the BSIZE[1:0] bits in CSnCR, the address buses A23 to A00 are enabled to output address signals in byte units.

In 8-bit bus space, only the WR0 pin is valid, regardless of the write access mode, and it always outputs low during write access. The WR1 and BC0 pins are not used.

The valid positions of data external to the MCU are D07 to D00, and WR0 is used as the control signal, regardless of the endian mode. See Figure 15.5 and Figure 15.6.

Page access can occur for accesses to data in 16-bit or 32-bit units. Page access can only occur when an access does not extend over a 32-bit boundary. The situations in which page access occurs are indicated by "(p)" in Figure 15.5 and Figure 15.6.

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address		WR1/BC1 RD D15 D08	WR0/BC0 RD D07 D00
8 bits	4n	One	First	8 bits	4n			7 0
	4n+1	One	First	8 bits	4n+1			7 0
	4n+2	One	First	8 bits	4n+2			7 0
	4n+3	One	First	8 bits	4n+3			7 0
16 bits	4n	Two	First	8 bits	4n			7 0
			Second	8 bits	4n+1	(p)		15 8
	4n+2	Two	First	8 bits	4n+2			7 0
			Second	8 bits	4n+3	(p)		15 8
32 bits	4n	Four	First	8 bits	4n			7 0
			Second	8 bits	4n+1	(p)		15 8
			Third	8 bits	4n+2	(p)		23 16
			Fourth	8 bits	4n+3	(p)		31 24

(p): Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

Figure 15.6 Data alignment in 8-bit bus space with big-endian order for CS areas

15.4.2 Data Alignment Control for the SDRAM Area

(1) 16-bit bus space

When a 16-bit bus space is selected in the BSIZE[1:0] bits in SDCCR, address buses A26 to A01 are enabled to output address signals in 16-bit units, and the address bus A00 is disabled (always outputs low). The valid byte position is indicated by the DQM0 and DQM1 signals.

External data is accessed using the DQ15 to DQ08 and DQ07 to DQ00 pins and DQM0 and DQM1 control signals. Data can be accessed in either 8-bit or 16-bit units at a time.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See Figure 15.7 and Figure 15.8.

Consecutive access can occur for accesses to data in 8- or 16-bit units. Consecutive access can only occur when a single bus access is generated in response to a single transfer request. The situations in which consecutive access occurs are indicated by "(r1)" in Figure 15.7 and Figure 15.8.

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address		DQM1 / DQM0 / WE / Data bus (DQ15 DQ08 DQ07 DQ00)
8 bits	4n	One	First	8 bits	4n	(r1)	7 0
	4n+1	One	First	8 bits	4n	(r1)	7 0
	4n+2	One	First	8 bits	4n+2	(r1)	7 0
	4n+3	One	First	8 bits	4n+2	(r1)	7 0
16 bit	4n	One	First	16 bits	4n	(r1)	15 8 7 0
	4n+2	One	First	16 bits	4n+2	(r1)	15 8 7 0
32 bits	4n	Two	First	16 bits	4n		15 8 7 0
			Second	16 bits	4n+2		31 24 23 16

Figure 15.7 Data alignment in 16-bit bus space with little-endian order for SDRAM area

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address		DQM1 / DQM0 / WE / Data bus (DQ15 DQ08 DQ07 DQ00)
8 bits	4n	One	First	8 bits	4n	(r1)	7 0
	4n+1	One	First	8 bits	4n	(r1)	7 0
	4n+2	One	First	8 bits	4n+2	(r1)	7 0
	4n+3	One	First	8 bits	4n+2	(r1)	7 0
16 bits	4n	One	First	16 bits	4n	(r1)	15 8 7 0
	4n+2	One	First	16 bits	4n+2	(r1)	15 8 7 0
32 bits	4n	Two	First	16 bits	4n		31 24 23 16
			Second	16 bits	4n+2		15 8 7 0

Figure 15.8 Data alignment in 16-bit bus space with big-endian order for SDRAM area

(2) 8-bit bus space

When an 8-bit width is selected in the BSIZE[1:0] bits in SDCCR, address buses A26 to A00 are enabled to output address signals in 8-bit units.

External data is accessed using the DQ07 to DQ00 pins and DQM0 control signal. 8-bit data is accessed in single 8-bit accesses, 16-bit data with two 8-bit accesses, and 32-bit data with four 8-bit accesses.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See Figure 15.9 and Figure 15.10.

Consecutive access can occur in access to data in 8-bit units. Consecutive access can only occur when a single bus access is generated in response to a single transfer request. The situations in which consecutive access occurs are indicated by "(r1)" in Figure 15.9 and Figure 15.10.

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address		DQM1 / DQM0 / WE / Data bus DQ15 DQ08 DQ07 DQ00
8 bits	4n	One	First	8 bits	4n	(r1)	7 0
	4n+1	One	First	8 bits	4n+1	(r1)	7 0
	4n+2	One	First	8 bits	4n+2	(r1)	7 0
	4n+3	One	First	8 bits	4n+3	(r1)	7 0
16 bits	4n	Two	First	8 bits	4n		7 0
			Second	8 bits	4n+1		15 8
	4n+2	Two	First	8 bits	4n+2		7 0
			Second	8 bits	4n+3		15 8

Figure 15.10 Data alignment in 8-bit bus space with big-endian order for SDRAM area

15.5 Operation of CS Area Controller

15.5.1 Separate Bus

This section describes the periods shown in the timing diagrams. The CS area controller (CSC) operates in synchronization with the external bus clock, BCLK. Operation cycles, such as wait cycles, specified in the CSC register, are counted on BCLK. In the following description, the frequencies of BCLK and EBCLK pin output are the same, unless otherwise noted. Access through the external bus starts at the same point as the output of a rising edge on the EBCLK pin. However, if the external bus clock, BCLK, and the output on the EBCLK pin are at different frequencies, the wait settings can cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the EBCLK pin. See Figure 15.16 to Figure 15.20. If recovery cycles are inserted for bus access, the setting for the number of recovery cycles can also cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the EBCLK pin. See Figure 15.32.

(a) Tw1 to Twn (clock cycles for waiting for a normal read cycle or normal write cycle)

The period from Tw1 to Twn is the number of clock cycles from the start of access through the external bus clock to one cycle before the strobe signal is valid. The number of cycles is selectable from 0 to 31. Within this period, the timing of CSn, RD, and WRn assertion (driving the signals low) is determined by the respective wait settings. The wait periods are controlled by the CS Assert Wait Select bits (CSON), the RD Assert Wait Select bits (RDON), the WR assert wait select bits (WRON), and the Write-Data Output Wait Select bits (WDON) in CSn Wait Control Register 2 (CSnWCR2). The number of clock cycles for each of these wait periods is selectable as a value from 0 to 7, counted from the start of external bus access. The selectable number of cycles is also within the overall number of clock cycles required for waiting to read or write.

(b) Tend (clock cycle where the strobe signal is valid)

Tend is the next clock cycle after completion of the wait period for a normal cycle of read or write, or for a cycle of page reading or page writing. If the wait select bit for these cycles is 0, bus access starts on the clock cycle where the strobe signal is valid. The RD and WRn signals are negated in the next clock cycle. For a read access, the clock cycle where the strobe signal is valid is where the data to be read is sampled. If an external wait is enabled, the wait signal is sampled on the cycle where the strobe signal is valid. The bus cycle is extended if the wait signal is low. The bus cycle completes in the next clock cycle if the wait signal is high. Tend indicates the cycle where sampling of the wait signal starts.

After the first cycle where the strobe signal is valid during page access, second and subsequent page access operations (see section (e), Tpw1 to Tpwn (page read cycle wait or page write cycle wait)) start in the next cycle, except during write access with a setting other than 0 for write-data output extension clock cycles (see section (d), Tdw1 to Tdwn (clock cycles for write-data output extension)). If the setting for the RD or WR assertion wait is any value other than 0, the RD and WRn signals are negated in the next clock cycle. If the setting is 0, assertion continues. Additionally, the CSn signal continues to be asserted rather than negated.

(c) Tn1 to Tnm (clock cycles for CS extension)

For normal access, Tn1 to Tnm represent the clock cycles of the period following the cycle where the strobe signal is valid (Tend) up to negation of the CSn signal. For read or write access, the negation timing can be controlled by the read-access CS Extension Cycle Select Bits (CSROFF) and the write-access CS Extension Cycle Select Bits (CSWOFF) in the CSn Wait Control Register 2 (CSnWCR2). The number of cycles is counted from the cycle following the cycle where the strobe signal is valid.

For page access, Tn1 to Tnm represent the clock cycles of the period following the last cycle where the strobe signal is valid up to negation of the CSn signal.

For write access, setting the Write Data Output Extension Cycle Select bits (WDOFF) controls extension of the period where the address and output data is valid.

(d) Tdw1 to Tdwn (clock cycles for write-data output extension)

For write access, if the wait setting for the write-data output extension is any value other than 0, the specified clock cycles are inserted from the cycle following the cycle where the strobe signal is valid (Tend).

For normal access, this period is inserted within the clock cycle period for CS extension (Tn1 to Tnm).

For page access, this period is inserted within the clock cycle period where the strobe signal is valid and subsequent page accesses, or within the clock cycle period for the CS extension (Tn1 to Tnm). Valid address and data output are extended over this period, and the WRn signal is negated.

(e) Tpw1 to Tpwn (page read cycle wait or page write cycle wait)

For the second and subsequent bus cycles during page access, the values for a page read cycle wait or page write cycle wait are used instead of the settings for a normal read or write cycle wait. The settings in the WR Assert Wait Select bits become enabled in the same way as for the first access. The RD assertion control operation depends on the page read access mode setting (the PRMOD bit in CSnMOD) as follows:

- CSnMOD.PRMOD = 0: A wait for RD assertion is inserted in the same way as for the first access, and the RD signal is negated
- CSnMOD.PRMOD = 1: Although a wait for RD assertion is inserted in the same way as for normal-access compatibility mode, the RD signal continues to be asserted over this period.

(f) Tr1 to Trn (recovery cycles)

Recovery cycles can be inserted from the point where a bus cycle is complete (CSn signal negation). The number of recovery cycles can be controlled by setting the Read Recovery (RRCV) or Write Recovery (WRCV) bits in the CSn Recovery Cycle Register (CSnREC). Both numbers of recovery cycles are counted from the end of a bus cycle (CSn negation) and can be selected from 0 to 15 cycles. For more information, see section 15.5.3, Insertion of Recovery Cycles.

(1) Normal access

When the PRENB and PWENB bits in CSnMOD are set to 0 to disable page read and page write access, all bus accesses take the form of normal read and write operations. Even when these bits are set to 1 to enable page read and page write access, bus access other than page access takes the form of normal read and write operations. Figure 15.11 to Figure 15.13 show the normal access operations.

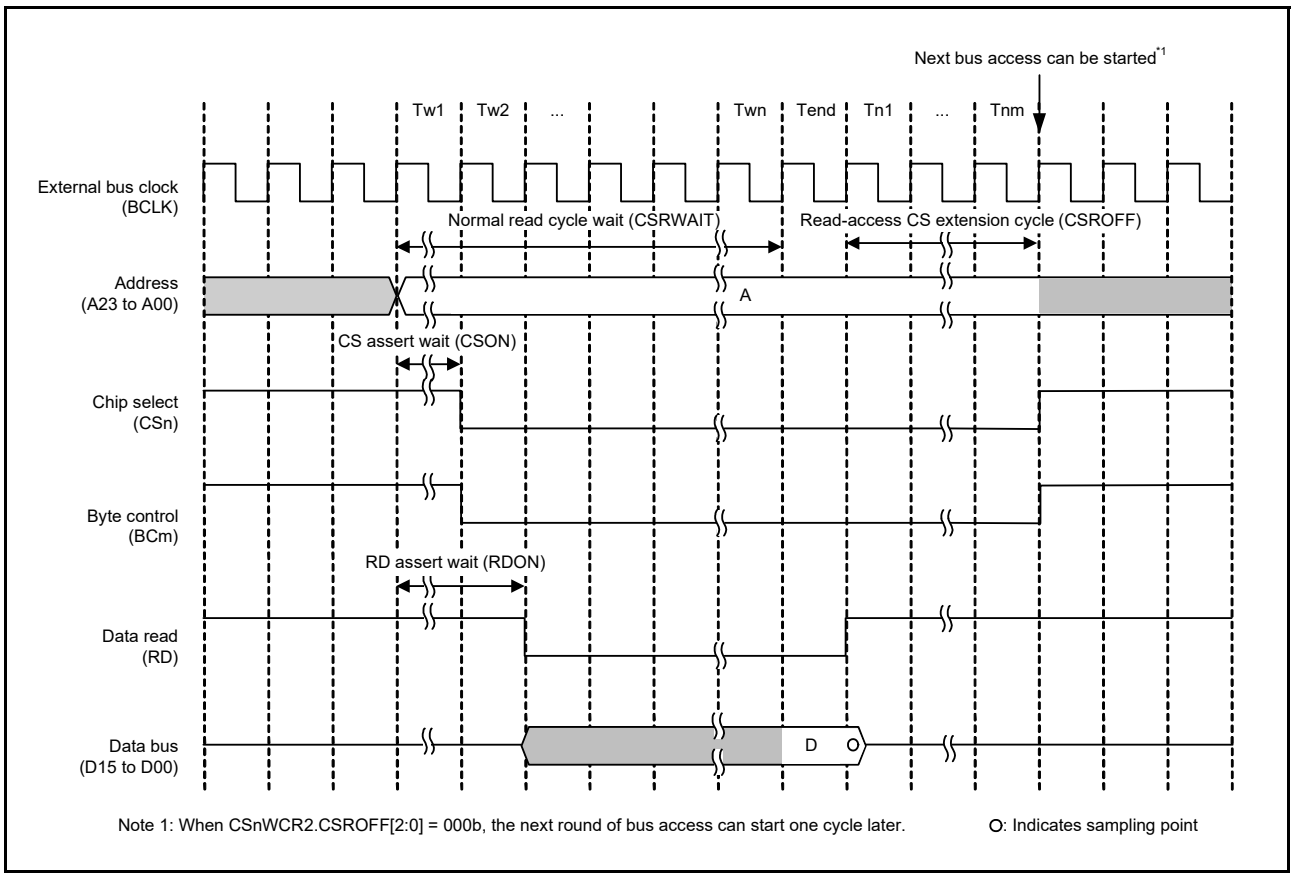

Figure 15.11 Bus timing for normal read operation (n = 0 to 7; m = 0, 1)

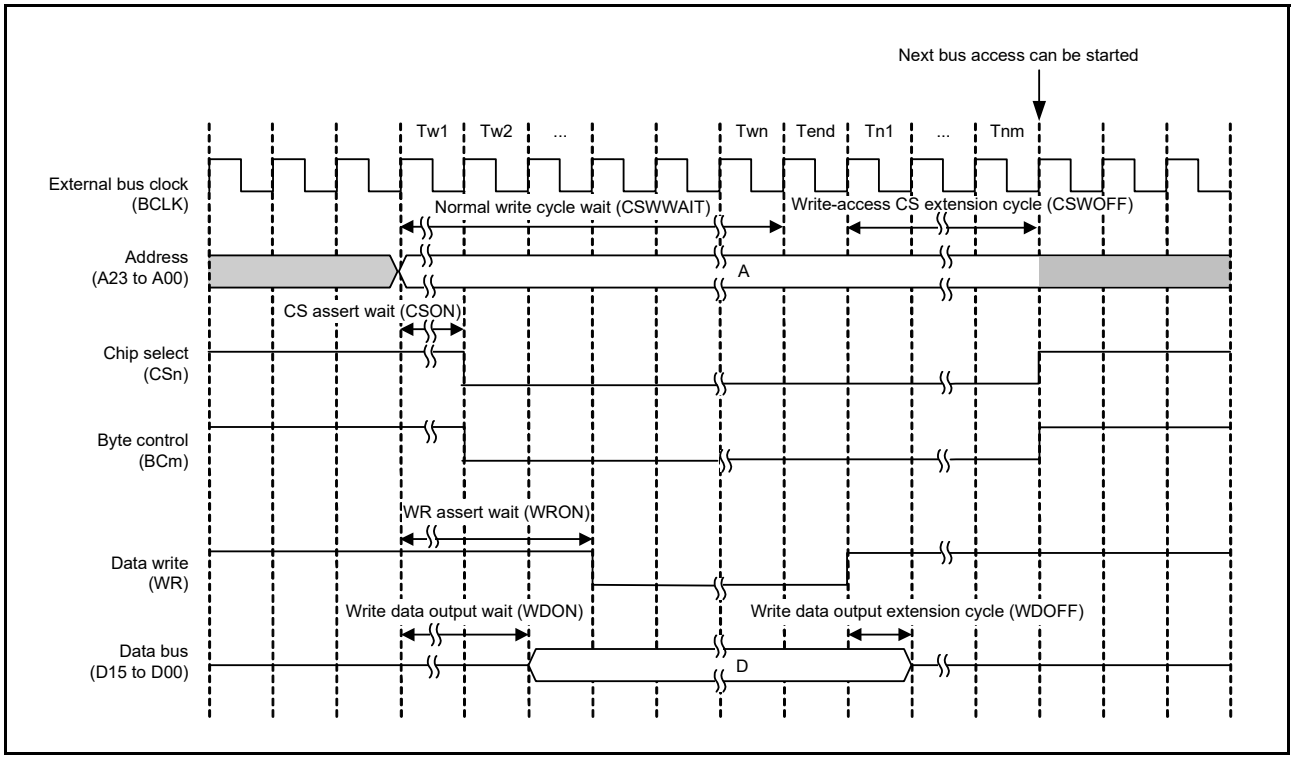

Figure 15.12 Bus timing for normal write operation in single-write strobe mode (n = 0 to 7; m = 0, 1)

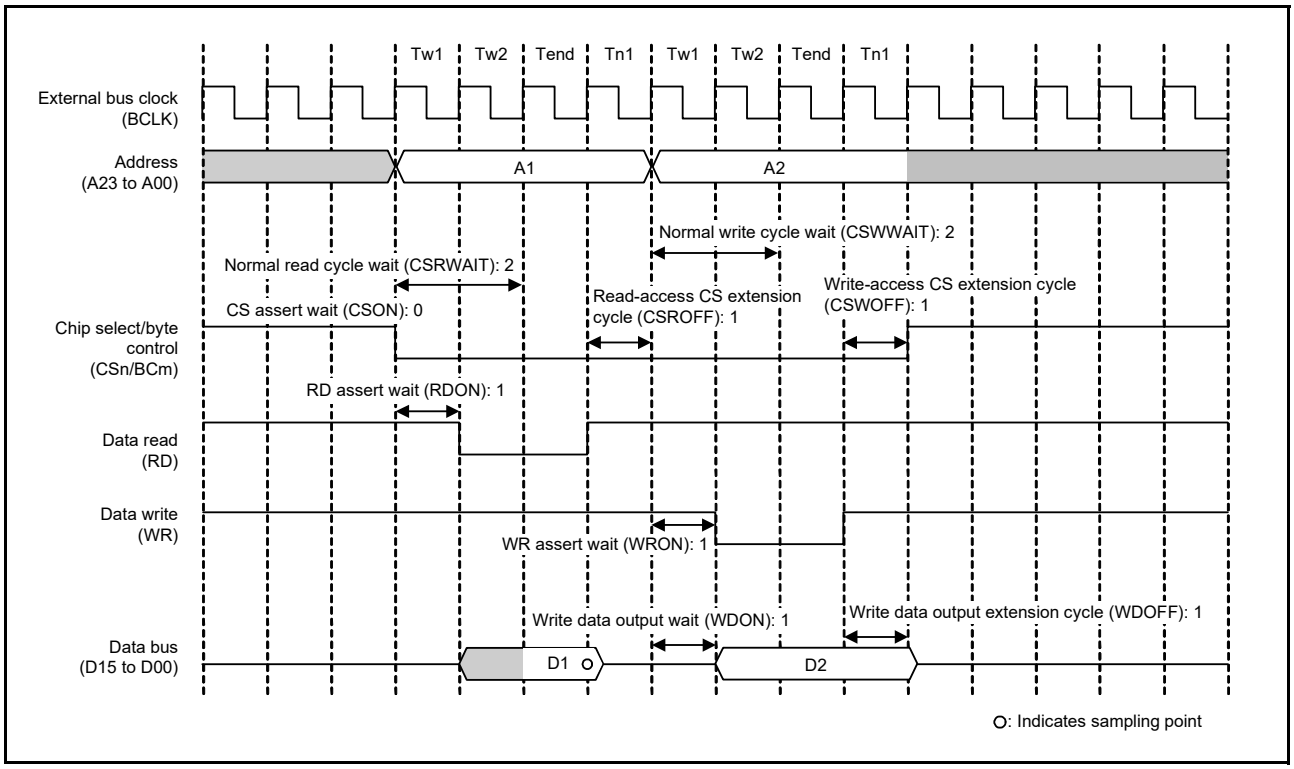

Figure 15.13 Example of normal access operation for read and write (n = 0 to 7; m = 0, 1)

When two or more rounds of external bus access are required in response to a single request for transfer from a bus master, normal access operations are repeated. See section (a), Tw1 to Twn (clock cycles for waiting for a normal read cycle or normal write cycle) to section (d), Tdw1 to Tdwn (clock cycles for write-data output extension). Figure 15.14 and Figure 15.15 show examples of operations when two rounds of bus access are generated in response to a single transfer request. If the recovery cycle insertion condition is satisfied, recovery cycles (section (f), Tr1 to Trn (recovery cycles)) are also inserted in the second and subsequent external bus accesses. See Figure 15.30.

The values in the wait control registers shown in the figures are example settings. In your application, set the registers appropriately for the specifications of connected devices.

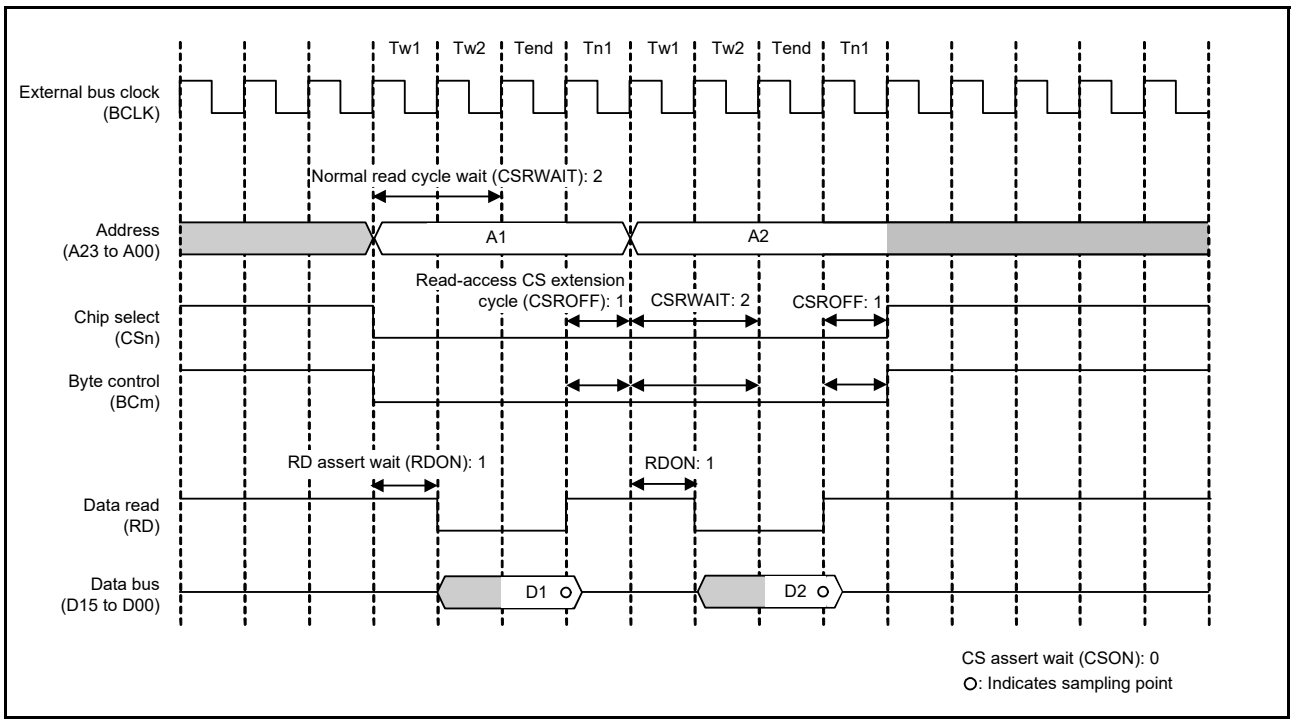

Figure 15.14 Example of normal read operation when two rounds of bus access are generated in response to a single transfer request (n = 0 to 7; m = 0, 1)

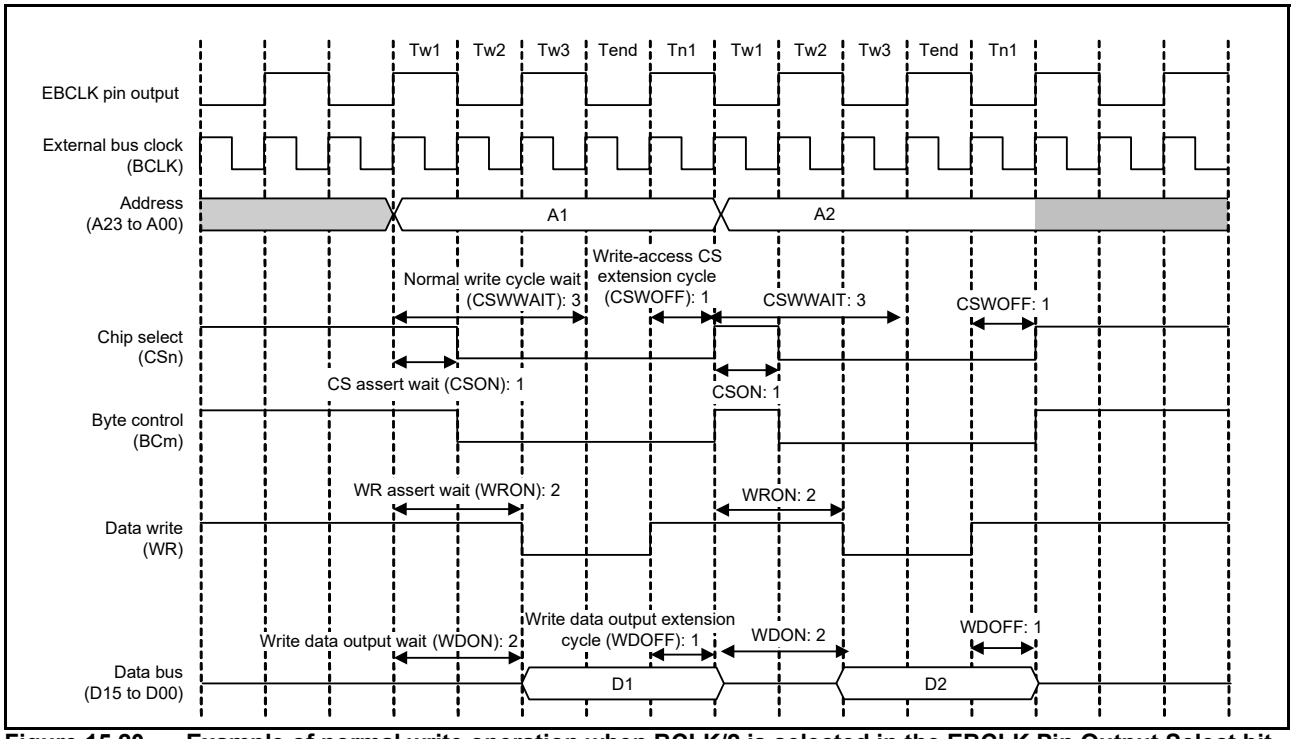

Figure 15.20 Example of normal write operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request (n = 0 to 7; m = 0, 1)

(2) Page access

When the PRENB and PWENB bits in CSnMOD are set to 1 to enable page read and page write access, the bus access for page access operations becomes page reading and writing. Page access can only occur when two or more rounds of external bus access are required for a single transfer request from the bus master. See Figure 15.3 to Figure 15.6 for the conditions under which page access occurs.

Figure 15.21 and Figure 15.22 show examples of page access operations.

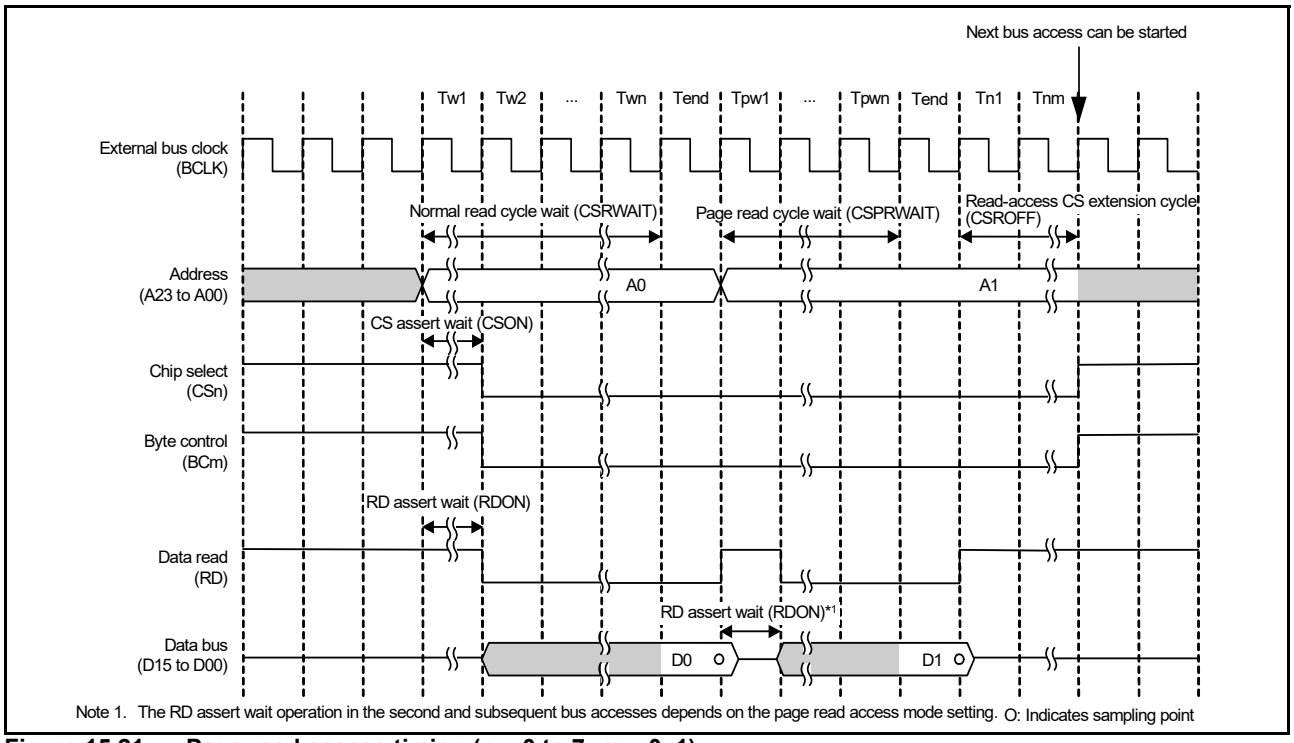

Figure 15.21 Page read access timing (n = 0 to 7; m = 0, 1)

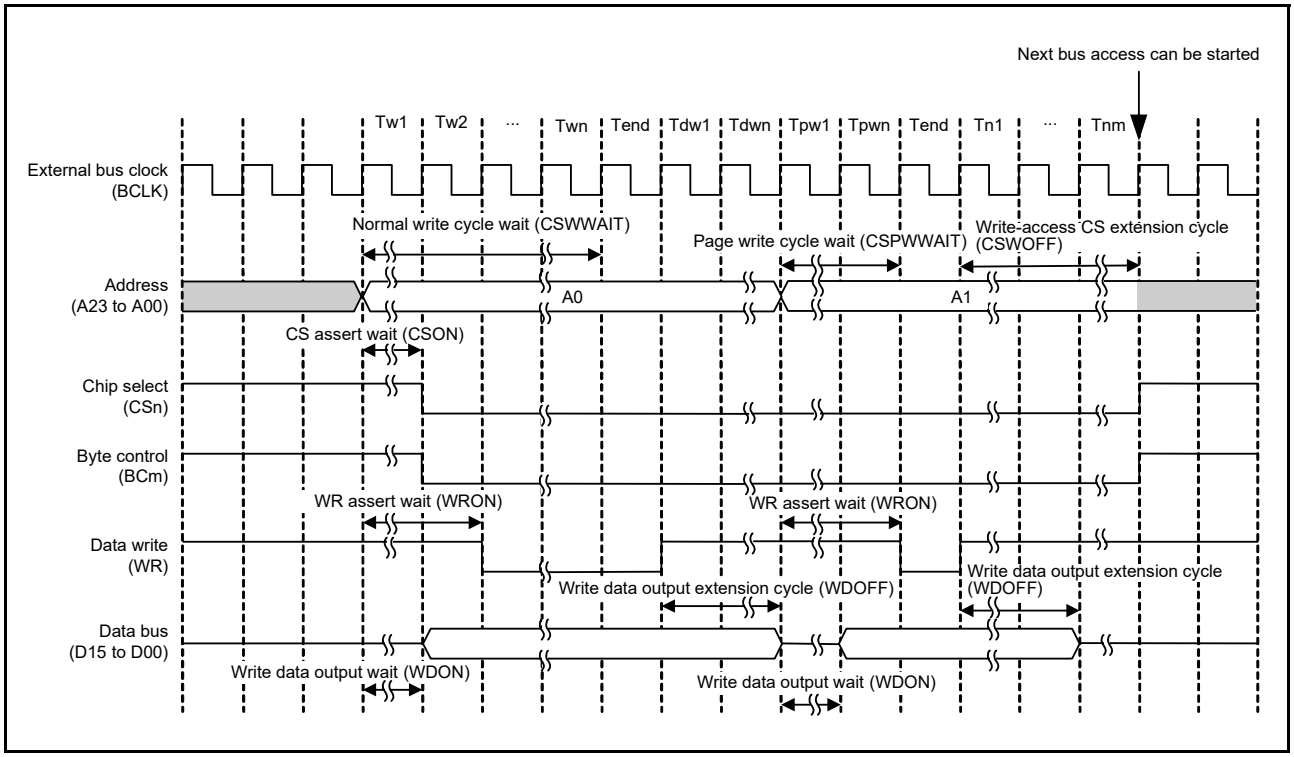

Figure 15.22 Page write access timing (n = 0 to 7; m = 0, 1)

Figure 15.23 and Figure 15.24 show examples of operations for access to a 16-bit bus space in 32 bits. The values of the wait control registers shown in the figures are example settings. In your application, set the registers appropriately for the specifications of connected devices.

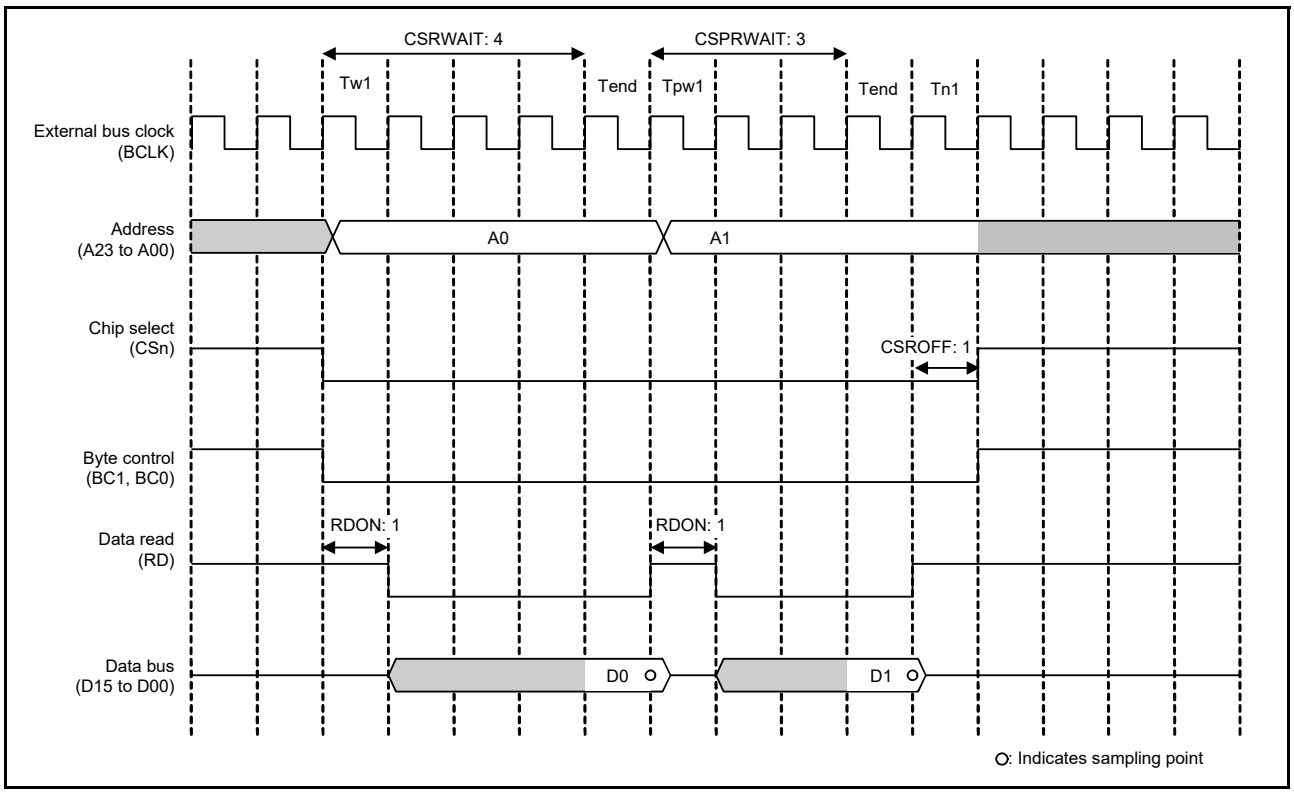

Figure 15.23 Example page read access operation when 16-bit bus space is accessed in 32 bits (n = 0 to 7)

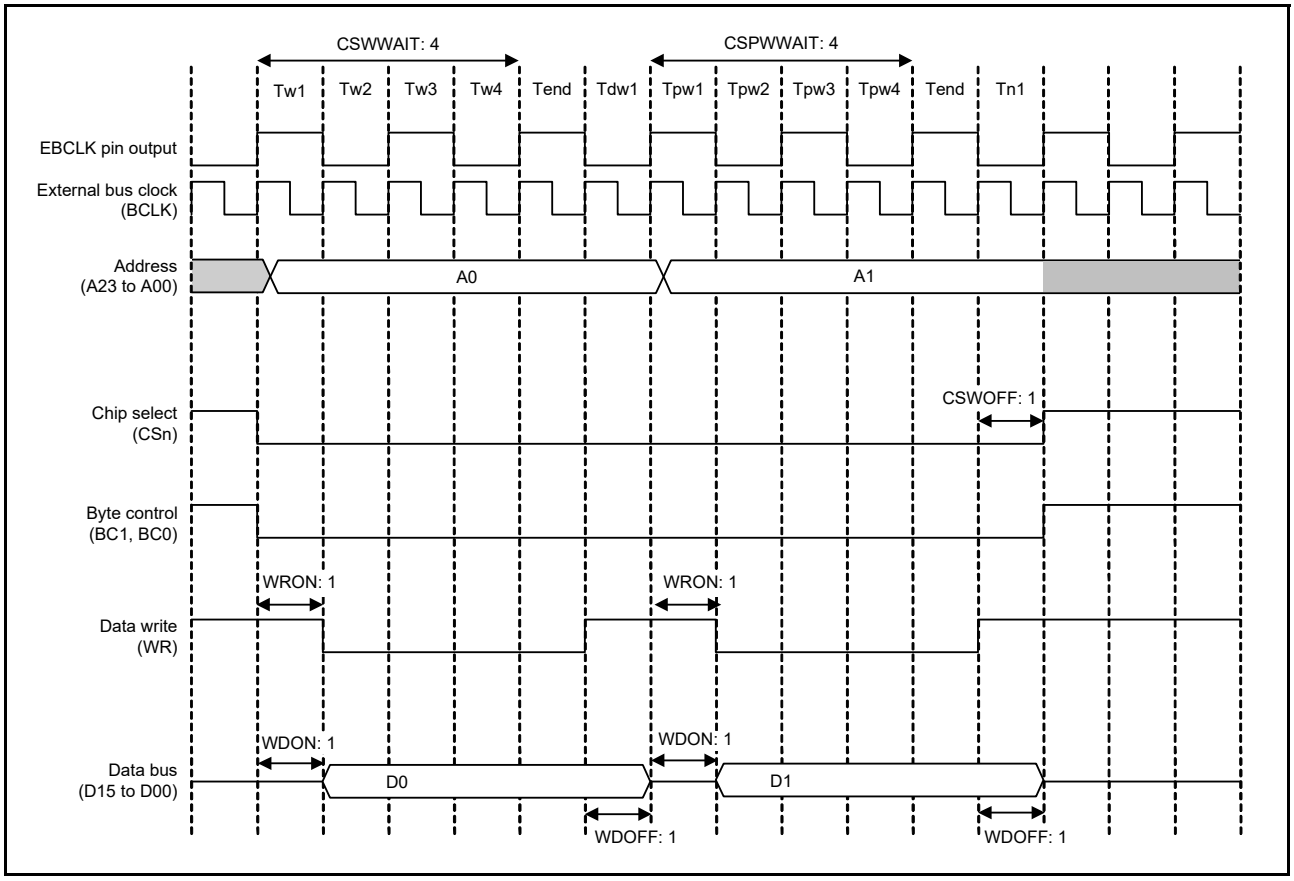

Figure 15.26 Example page write access operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request, in single-write strobe mode (n = 0 to 7)

15.5.2 External Wait Function

Wait cycles can be extended by the WAIT signal beyond the length of the normal access cycle wait specified in the CSRWAIT[4:0] and CSWWAIT[4:0] bits in CSnWCR1, and the page access cycle wait specified in the CSPRWAIT[2:0] and CSPWWAIT[2:0] bits in CSnWCR1.

When external wait is enabled (EWENB = 1 in CSnMOD), wait cycles are inserted while the WAIT signal is held low. When external wait is disabled (EWENB = 0 in CSnMOD), the WAIT signal has no effect. All wait cycles specified in CSnWCR1 are inserted independently of the WAIT signal. When external wait is enabled (EWENB = 1 in CSnMOD), BCLK and EBCLK must be operated at the same frequency.

(1) Normal access

Sampling of the WAIT signal begins on completion of the wait cycle (Tend) specified in CSnWCR1. The bus cycle is extended while the WAIT signal is held low. The wait cycle ends (Tend) at the next cycle after the WAIT signal goes high.

(2) Page access

The first access operation is the same as the normal access operation. Sampling of the WAIT signal begins on completion of the wait cycle (Tend) specified in the CSnWCR1 register. The bus cycle is extended while the WAIT signal is held low. The wait cycle (Tend) ends at the next cycle after the WAIT signal goes high.

For the second and subsequent accesses, sampling of the WAIT signal begins on completion of the page access wait cycle (Tend). The page access wait cycle is extended while the WAIT signal is held low, and ends (Tend) at the next cycle after the WAIT signal goes high.

Figure 15.27 and Figure 15.28 show examples of external wait insertion timing with the separate bus interface.

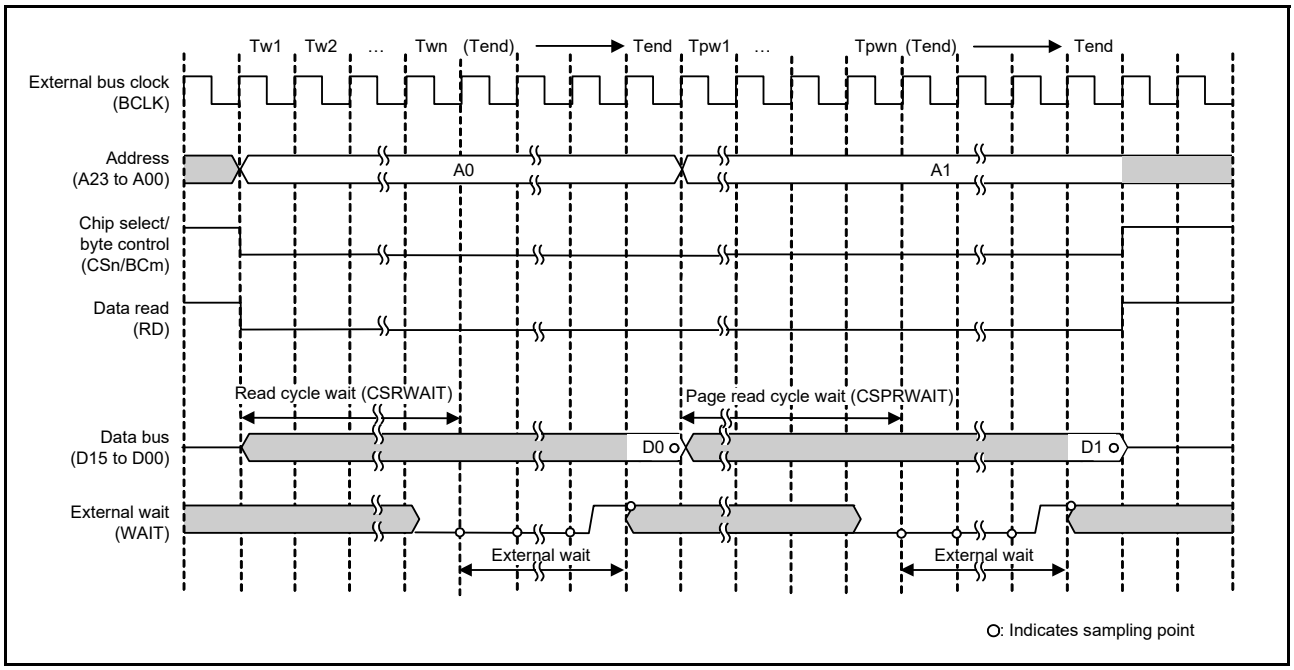

Figure 15.27 Example external wait timing for page read access to 16-bit bus space (n = 0 to 7; m = 0, 1)

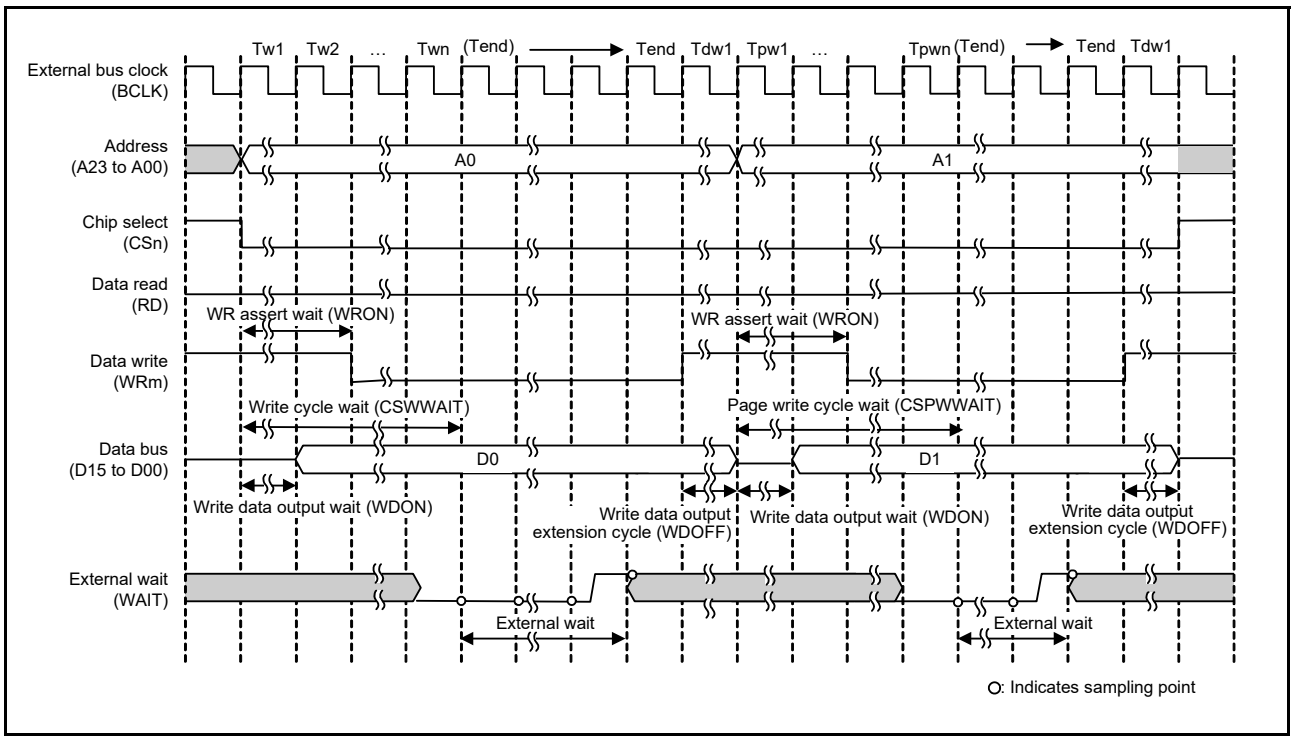

Figure 15.28 Example external wait timing for page write access to 16-bit bus space in byte strobe mode (n = 0 to 7; m = 0, 1)

15.5.3 Insertion of Recovery Cycles

Recovery cycles can be inserted between consecutive rounds of external bus access by setting the Recovery Cycle Insertion Enable bit in CSRECEN to 1. The number of recovery cycles to be inserted after read cycles and write cycles can be independently set for each area using CSnREC. When the preceding bus cycle is a write access, the number of write recovery cycles must be set with the WRCV[3:0] bits for the associated area. When the preceding bus cycle is a

read access, the number of read recovery cycles must be set with the RRCV[3:0] bits for the associated area. For example, when a CS1 read access occurs after a CS0 read access, the number of recovery cycles to be inserted between them is set in the RRCV[3:0] bits in CS0REC. Recovery cycle insertion can be enabled or disabled with RCVENi (i = 0 to 7) in CSRECEN when the preceding bus access is a separate bus access.

Recovery cycles can be inserted on any of the following conditions:

- After a read access to the external bus, a read access is made to the external bus in the same area.
- After a read access to the external bus, a read access is made to the external bus in a different area.
- After a read access to the external bus, a write access is made to the external bus in the same area.
- After a read access to the external bus, a write access is made to the external bus in a different area.
- After a write access to the external bus, a read access is made to the external bus in the same area.
- After a write access to the external bus, a read access is made to the external bus in a different area.
- After a write access to the external bus, a write access is made to the external bus in the same area.
- After a write access to the external bus, a write access is made to the external bus in a different area.

The recovery cycle starts at the end of the preceding bus cycle, for example when the CSn signal (n = 0 to 7) is negated. A high-level period of the CSn signal is inserted for the specified recovery cycle period starting from this point.

In the fastest case, the CSn signal for the next round of bus access is asserted immediately after the end of the recovery cycles. Even if the next request for access to an external address space is generated during the recovery period, the next access over the external bus starts immediately after the end of the recovery cycles.

When two or more external bus access cycles are required for a single transfer request from a bus master, and the recovery cycle insertion condition is satisfied, recovery cycles are also inserted between these bus access cycles. However, when page read access is enabled (CSnMOD.PRENB = 1) or page write access is enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted except after the last bus access cycle of the transfer, even if the recovery cycle insertion condition is satisfied. See Figure 15.31.

Similarly, during normal access with page access enabled, recovery cycles are not inserted between bus access cycles but only after the last bus access cycle of the transfer. When the recovery cycle insertion condition is satisfied, recovery cycles are inserted between bus access cycles regardless of the page access enable setting.

Figure 15.29 to Figure 15.31 show examples of recovery cycle insertion with the separate bus interface.

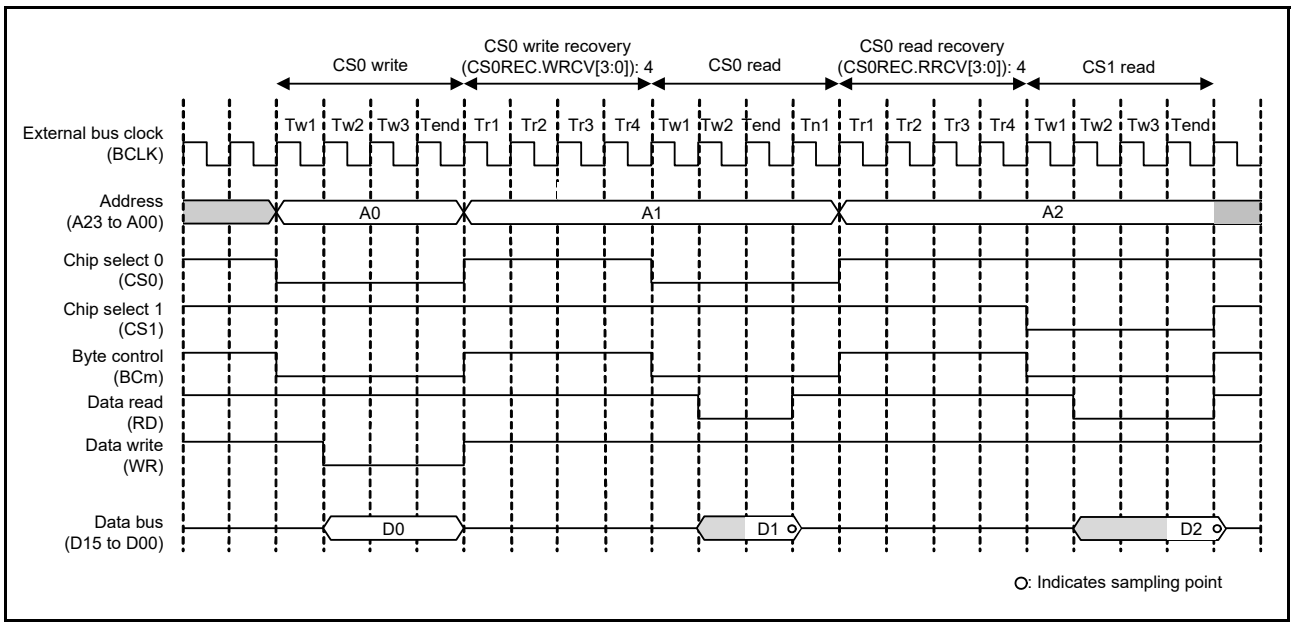

Figure 15.29 Example recovery cycle insertion with separate bus interface (m = 0, 1)

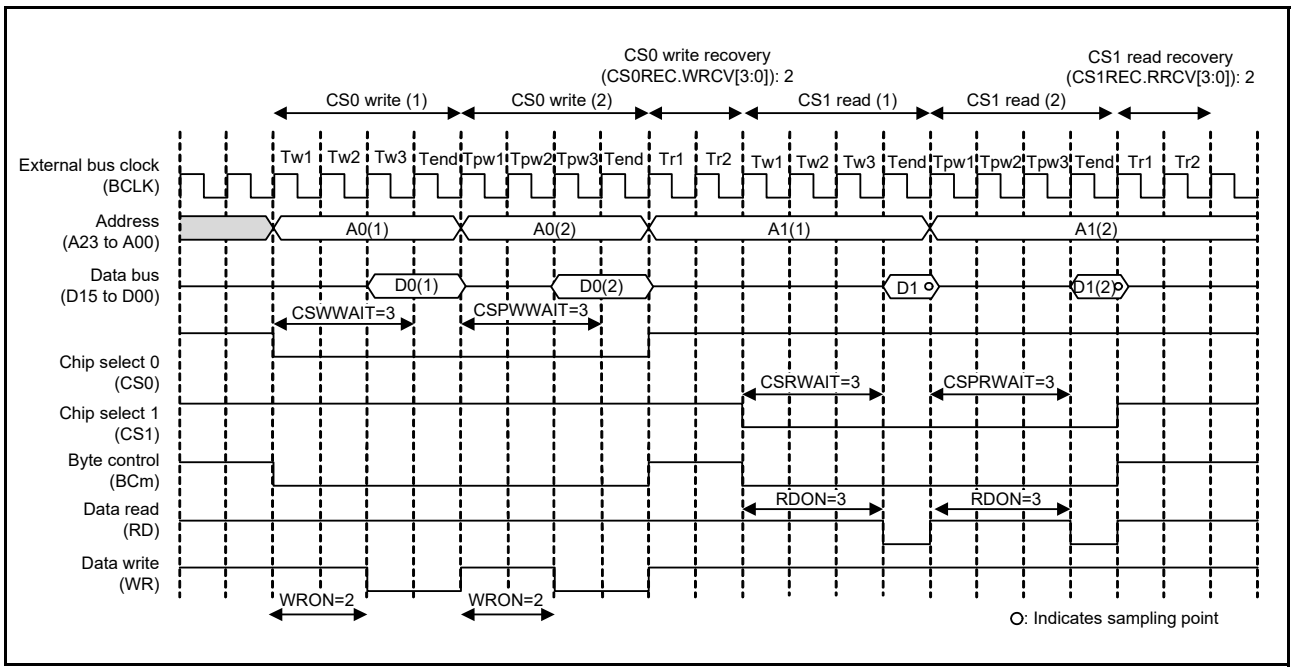

Figure 15.31 Example recovery cycle insertion when bus access is split, with separate bus interface and page access (m = 0, 1)

Figure 15.32 shows an example operation when BCLK/2 is selected as the frequency division in the EBCLK Pin Output Select bit.

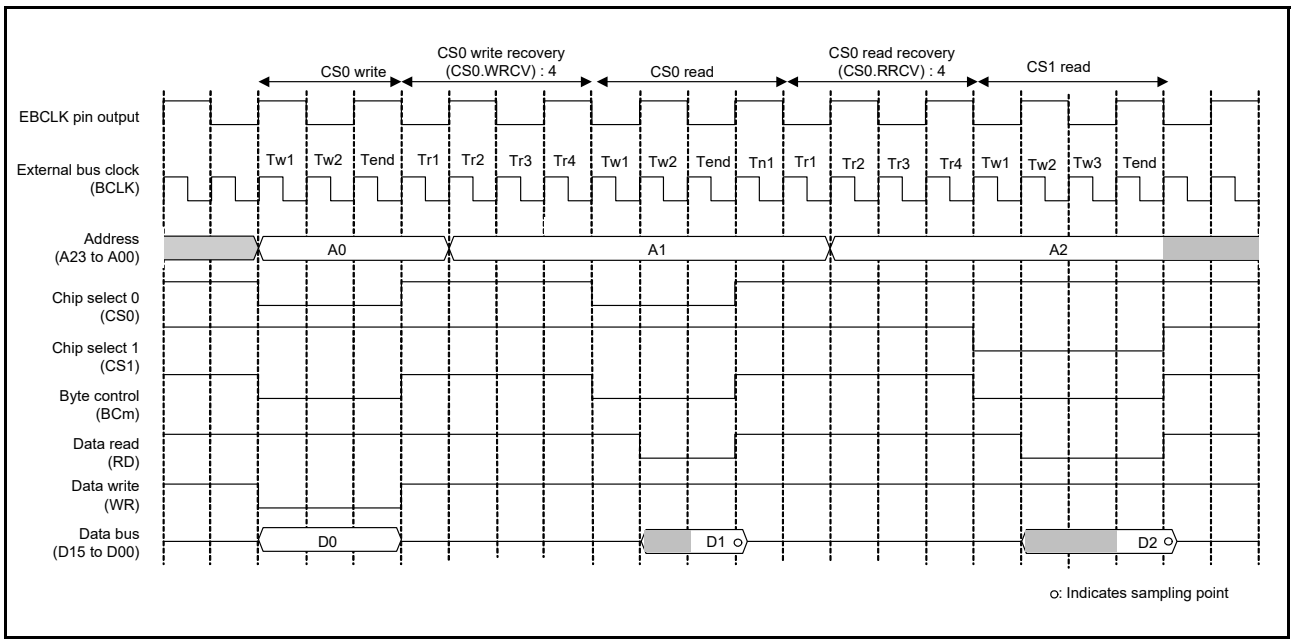

Figure 15.32 Example operation for recovery cycles when BCLK/2 is selected in the EBCLK Pin Output Select bit, with normal access through a separate bus interface (m = 0, 1)

15.5.4 No Access State

When no external address space is accessed, the CSn, BCn, WRn, RD signals are high, and D15 to D00 are in the high-impedance state.

15.5.5 Write Buffer Function (External Bus)

In write access, the main bus is released by writing data to the write buffer before the access is complete. This allows the next round of bus access to start. However, if the next access is to an external address space or to a register of the external bus controller, it is suspended until the external bus operations already in progress are complete.

Figure 15.33 shows an example of operation when the write buffer function is in use. When this function is in use, if the next operation after an external write is an internal access, the internal access is executed in parallel with the external write, for example without waiting for completion of the latter operation.

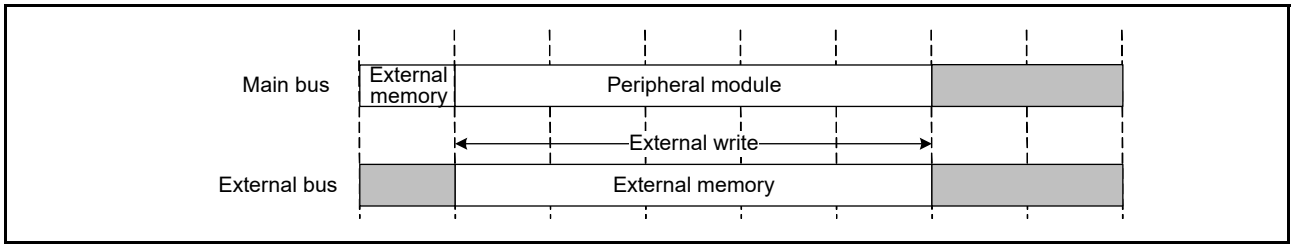

Figure 15.33 Example operation when the write buffer function is in use

15.5.6 Restrictions

(1) Restrictions on using a separate bus interface

Table 15.11 lists the restrictions that apply to bits in the CSn Wait Control Register 1 (CSnWCR1) and CSn Wait Control Register 2 (CSnWCR2) when normal and page accesses occur.

Even if the Page Read Access Enable bit or Page Write Access Enable bit in the CSn Mode Register is set to enable (CSnMOD.PRENB = 1 or CSnMOD.PWENB = 1), the first page access or access that does not fall within the scope of a page access is a normal access operation. Because of this, restrictions on normal access must be satisfied.

Table 15.11 Restrictions on normal access and page access

Restrictions on normal access		Restrictions on page access	
Reading	**Writing**	**Reading**	**Writing**
CSON[2:0] ≤ CSRWAIT RDON[2:0] ≤ CSRWAIT CSON[2:0] ≤ RDON	1 ≤ WDON[2:0] CSON[2:0] ≤ CSWWAIT WRON[2:0] ≤ CSWWAIT WDON[2:0] ≤ CSWWAIT WDOFF[2:0] ≤ CSWOFF WDON[2:0] ≤ WRON CSON[2:0] ≤ WRON	CSON[2:0] ≤ CSPRWAIT RDON[2:0] ≤ CSPRWAIT CSON[2:0] ≤ RDON	1 ≤ WDON[2:0] CSON[2:0] ≤ CSPWWAIT WRON[2:0] ≤ CSPWWAIT WDON[2:0] ≤ CSPWWAIT WDOFF[2:0] ≤ CSWOFF WDON[2:0] ≤ WRON CSON[2:0] ≤ WRON

Note: When two or more external bus access cycles are required for a single transfer request from a bus master, and the recovery cycle insertion condition is satisfied, with page read access enabled (CSnMOD.PRENB = 1) or page write access enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted between bus access cycles and are inserted only after the last bus access cycle of the transfer.

(2) Constraint on pin multiplexing between the A00 and BC0 functions

Setting the single-write strobe mode is prohibited in the 8-bit bus space.

(3) Restrictions when BCLK/2 is selected in the EBCLK Pin Output Select bit

When 1/2 cycle of BCLK is selected in the EBCLK Pin Output Select bit, the external bus access cycle starts on the rising edge of the EBCLK pin output. However, when two or more external bus access cycles are generated for a single transfer request from a bus master, the second or subsequent external bus access cycle can start on the falling edge of the EBCLK pin output, depending on the wait cycle settings. Set the registers appropriately for the specifications of connected devices. When 1/2 cycle of BCLK is selected in the EBCLK Pin Output Select bit, enabling an external wait (CSnMOD.EWENB = 1) is prohibited.

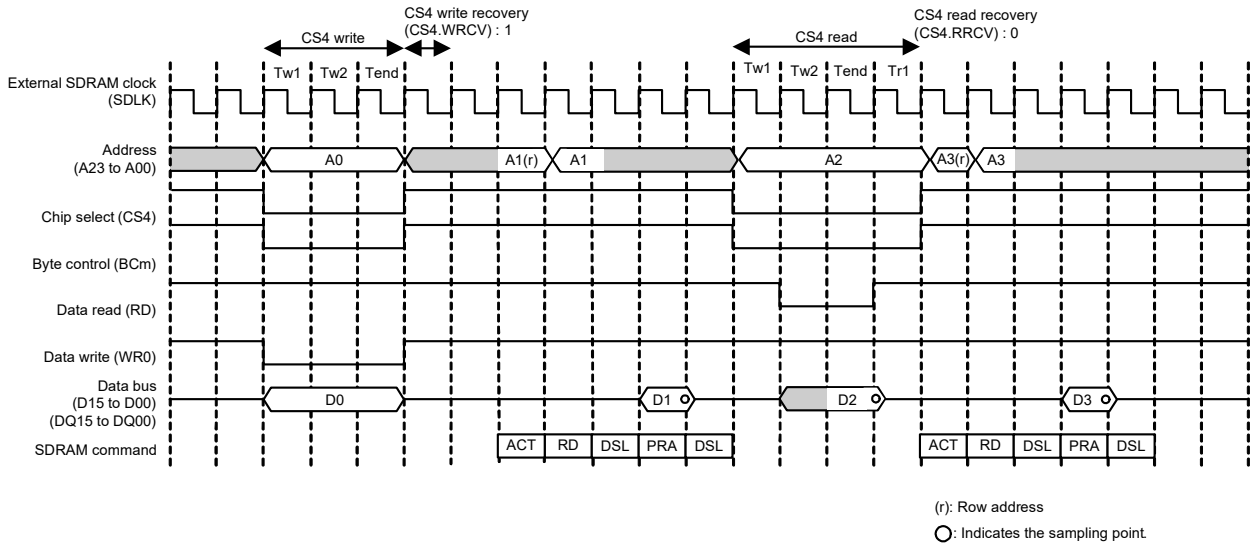
(4) Instruction code constraint

You must fix the instruction code to little endian order.

15.6 SDRAM Area Controller Operation

This section describes how the SDRAM area controller (SDRAMC) is enabled and the SDRAM bus width is set, followed by a description of the SDRAMC operations, including read, write, auto-refresh, self-refresh, initialization sequence, and mode register settings.

15.6.1 Enabling/Disabling SDRAM Access and Setting the SDRAM Bus Width



SDRAM access can be enabled or disabled using the SDC Control Register (SDCCR). The SDRAM bus width can also be set using SDCCR. The refresh operation is available even when the operation of the SDRAM address space is disabled, as long as self-refresh or auto-refresh is enabled.

15.6.2 No Access State

When no external address space is accessed, the SDCS, WE, RAS and CAS signals are high.

15.6.3 Insertion of Recovery Cycles

When access to the SDRAM area follows access to the CS area, data recovery cycles are inserted for the CS area controller (CSC). If the number of recovery cycles for the CSC is 0, the ACT command for the next SDRAM access is issued immediately after negation of CSn signal at the earliest. If the number of recovery cycles is not 0, the ACT command is issued two cycles after the specified recovery cycle period elapses after negation of CSn signal at the earliest. Because no data conflicts can occur during access to the SDRAM area, there is no need to set data recovery cycles for the SDRAM (fixed to 0 cycles).

Note: When using SDRAM and CS Area access simultaneously:
- EBCLK cannot be used
- CS0 to CS3 cannot be used.

Figure 15.34 Example of recovery timing (for SDRAM access)

15.6.4 Write Buffer Function

In write access, the main bus is released by writing data to the write buffer before the access is complete. This allows the next round of bus access to start. However, if the next access is to an external address space or to a register of the external bus controller, it is suspended until the external bus operations already in progress are complete.

15.6.5 SDRAM Commands

To control the SDRAM, the SDRAMC issues a command for each bus cycle. Commands are defined by a combination of the SDCS, RAS, CAS, WE, CKE, and other signals. Table 15.12 lists the commands issued by the SDRAMC.

Table 15.12 SDRAMC commands

							CKE			
Name	**Abbreviation**	**Command**	**SDCS**	**RAS**	**CAS**	**WE**	**n-1**	**n**	**BA1**	**BA0**
DESL	DSL	Device deselect	H	x	x	x	H	x	x	x
ACTV	ACT	Bank active	L	L	H	H	H	x	V	V
READ	RD	Read	L	H	L	H	H	x	V	V
WRIT	WRI	Write	L	H	L	L	H	x	V	V
PALL	PRA	All bank precharge	L	L	H	L	H	x	x	x
REF	RFA	Auto-refresh	L	L	L	H	H	x	x	x
MRS	MRS	Mode register set	L	L	L	L	H	x	L	L
SELF	RFS	Self-refresh entry	L	L	L	H	H	L	x	x
SELFX	RFX	Self-refresh end	H	x	x	x	L	H	x	x

Note: H = high level, L = low level, V = valid, x = don't care.
n = command issue cycle, n - 1 = one cycle before the command is issued.

15.6.6 Conditions for Setting the SDRAMC Registers

The SDRAMC registers must only be modified when all the conditions shown in Table 15.13 are satisfied.

Table 15.13 Conditions for register modification

Function or operation	Registers	Conditions
Self-refresh	SDSELF*1	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is enabled (SDRFEN.RFEN = 1)
Auto-refresh	SDRFCR	Self-refresh operation is disabled (SDSELF.SFEN = 0)
	SDRFEN	SDRAM access is disabled (SDCCR.EXENB=0*2) Self-refresh operation is disabled (SDSELF.SFEN = 0)
Initialization sequence	SDIR*1	SDICR is not set yet, and the same conditions as for SDICR modification are satisfied
	SDICR*1	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0)
Address register	SDADR	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0)
Timing register	SDTR	• Self-refresh operation is in progress (SDSELF.SFEN = 1) • SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0)
Mode register	SDMOD*1	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Self-refresh operation is disabled (SDSELF.SFEN = 0)
Access mode register	SDAMOD	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0)

Note 1. Before modifying this register, confirm that all the status bits in SDSR are 0.
Note 2. After writing 0 to the EXENB bit, confirm that it is set to 0.

15.6.7 Self-Refresh

Transition to or recovery from self-refresh mode is controlled with the SDRAM Self-Refresh Control Register (SDSELF). Immediately before the transition to self-refresh mode, an auto-refresh operation is performed. In self-refresh mode, the CKE signal is low. Immediately after recovery from self-refresh mode, the auto-refresh cycle starts.

Figure 15.35 and Figure 15.36 show timing examples of the transition to and recovery from self-refresh mode.

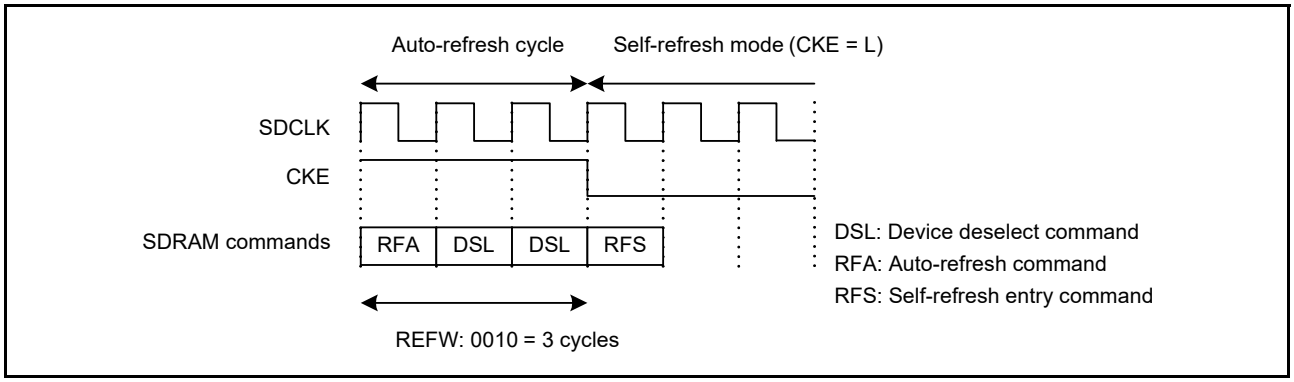


Figure 15.35 Example timing for transition to self-refresh mode when SDRFCR.REFW[3:0] = 0010b (3 cycles)

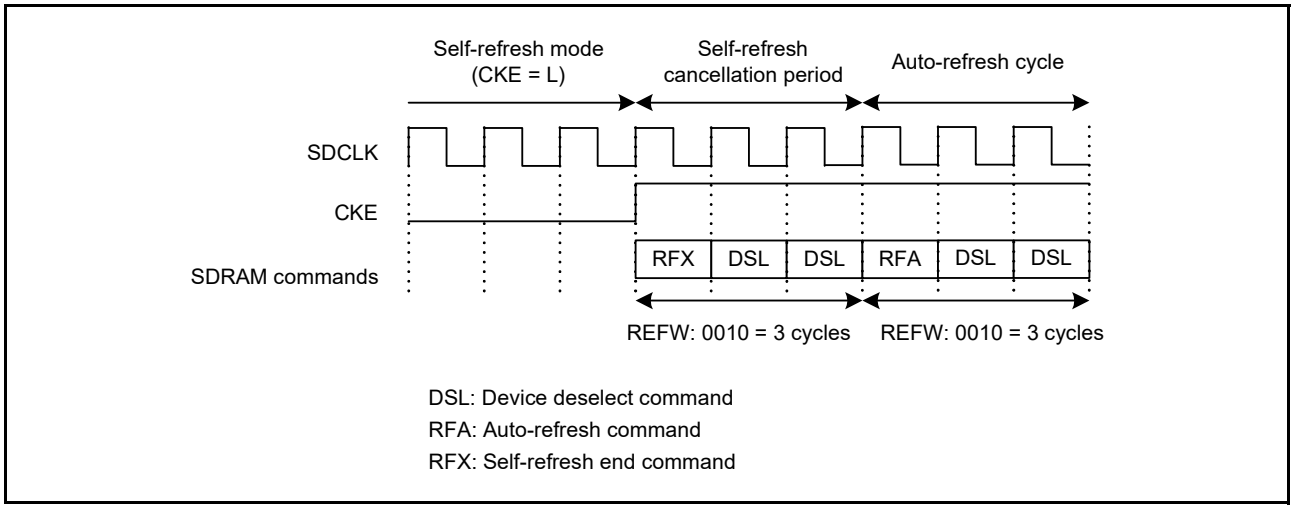

Figure 15.36 Example timing for recovery from self-refresh mode

(1) Self-refresh in Software Standby mode

When invoking self-refresh in Software Standby mode, first follow the procedure shown in section 15.6.11.2, Procedure for Transitioning to and Recovering from Self-Refresh Mode. Next set up the transition to Software Standby mode. In this mode, set the Output Port Enable bit (OPE) in the Standby Control Register (SBYCR) to 1 to hold the output state of the address bus and bus control signals.

After canceling Software Standby mode, follow the procedure shown in section 15.6.11.2, Procedure for Transitioning to and Recovering from Self-Refresh Mode. For details on invoking and canceling Software Standby mode, see section 11, Low Power Modes.

(2) Self-refresh in Deep Software Standby mode

Deep Software Standby mode is invoked from within Software Standby mode. On this transition, the pin states remain unchanged. Therefore, invoking of self-refresh in Deep Software Standby mode can be handled the same as for Software Standby mode with one additional setting. You must also set the I/O Port Keep bit (IOKEEP) in the Deep Software Standby mode Control Register (DPSBYCR) to 1.

Because the SDRAMC is reset internally when Deep Software Standby mode is canceled, the SDRAM control registers must be set again. After canceling Software Standby mode, follow the procedure in this section to cancel self-refresh.

Figure 15.37 shows self-refresh timing in Deep Software Standby mode. For details on invoking and canceling Deep Software Standby mode, see section 11, Low Power Modes.

To cancel self-refresh mode:

1. Set DPSBYCR.IOKEEP to 1 to keep the CKE signal output low in Deep Software Standby mode.
2. Start the clock supply to the SDRAMC.
3. Set the SDRAM control registers (SDCMOD, SDAMOD, SDADR, and SDTR) again. These registers were initialized by an internal reset on entering Deep Software Standby mode.
4. Enable an auto-refresh operation by setting SDRFEN.RFEN to 1.
5. Check that all the status bits in SDSR are cleared to 0 and set SDSELF.SFEN to 1 to select self-refresh mode again.
6. Modify the port settings for the SDRAM interface.
7. Set SDCKOCR.SDCKOEN to 1 to start the clock supply to the SDRAM with the SDCLK pin.
8. Check that all the status bits in SDSR are cleared to 0 and set SDSELF.SFEN to 0 to cancel self-refresh mode.

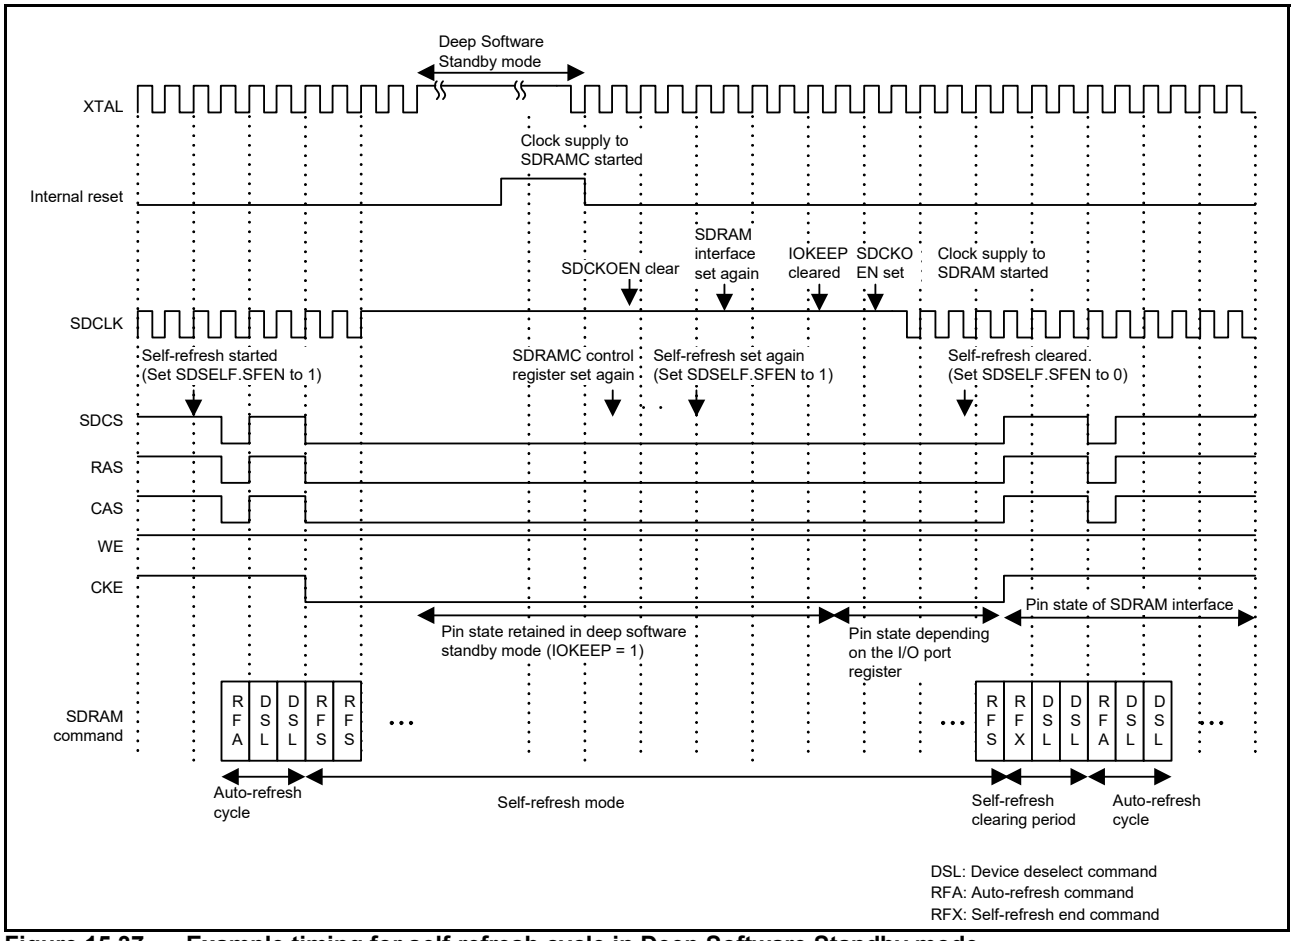

Figure 15.37 Example timing for self-refresh cycle in Deep Software Standby mode

15.6.8 Auto-Refresh

The auto-refresh cycle can be started by setting the Auto-Refresh Operation Enable bit (RFEN) in the SDRAM Auto-Refresh Control Register (SDRFEN) to 1. After the cycle starts, refresh requests are generated at fixed intervals determined by the refresh counter. However, because refresh requests are not accepted during read or write access, the auto-refresh cycle might be suspended. If an auto-refresh request is issued during consecutive accesses to the SDRAM, the auto-refresh cycle starts after completion of the bus access in response to a single transfer request from the bus master.

If an SDRAM access and a refresh request are generated at the same time, the refresh request takes precedence. A CS area access and a refresh request can be made at the same if the SDCS, RAS, CAS, WE, and CKE signals, which are required for issuing the refresh command, are exclusively provided for SDRAM access.

The refresh counter is halted during a self-refresh operation. After recovery from the self-refresh mode, the auto-refresh cycle starts and the counter value is reset, resuming the counter operation.

Figure 15.38 shows a timing example of an auto-refresh cycle.

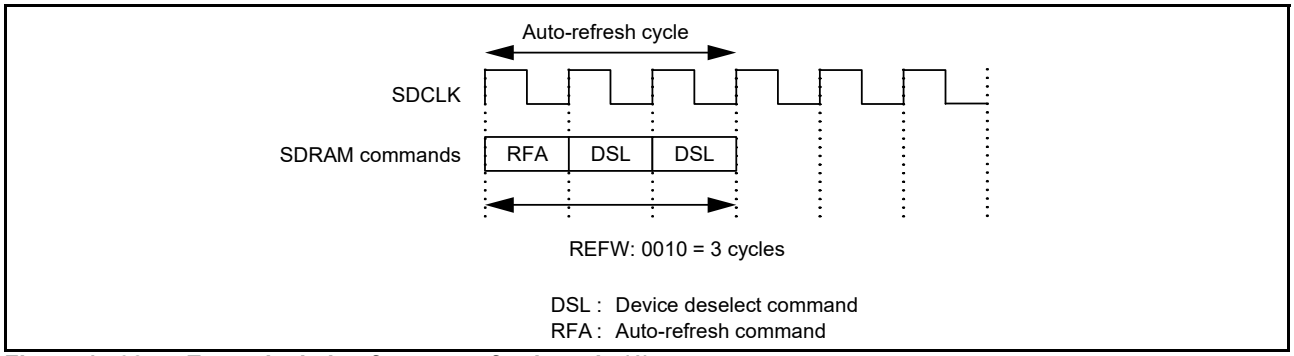

Figure 15.38 Example timing for auto-refresh cycle (1)

Figure 15.39 and Figure 15.40 show examples of operation when an auto-refresh request is generated during single access and continuous access.

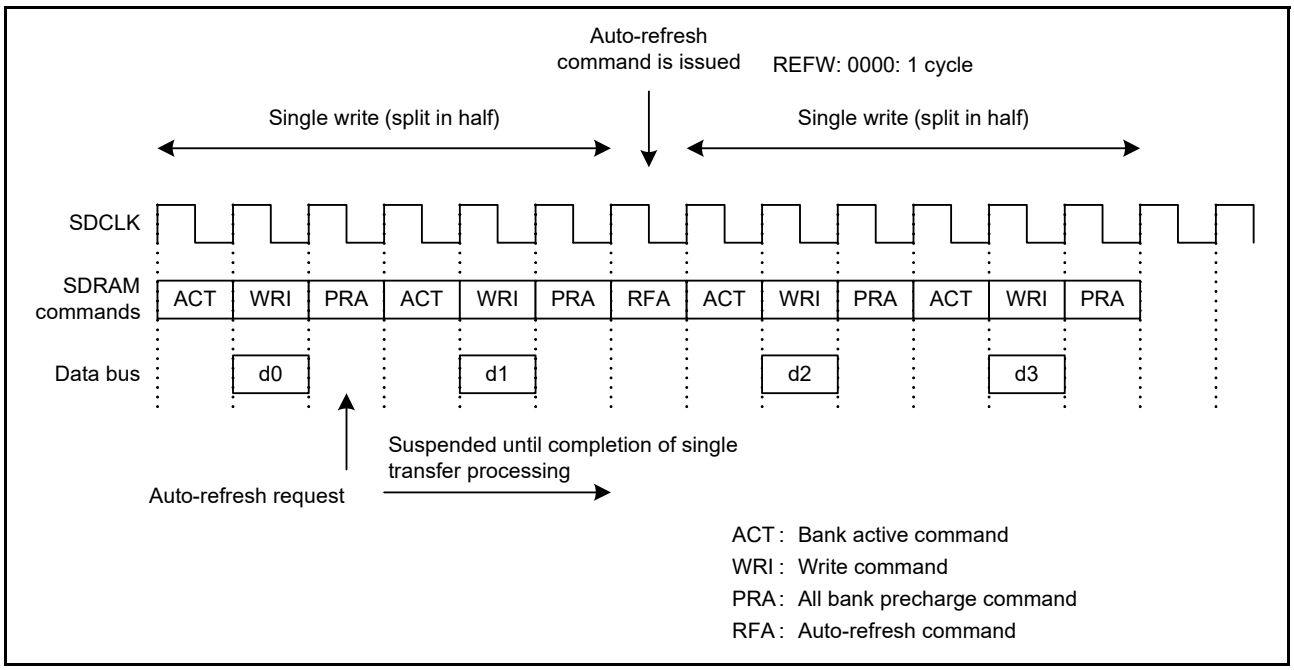

Figure 15.39 Example timing for auto-refresh cycle (2), when the auto-refresh request is made during single access

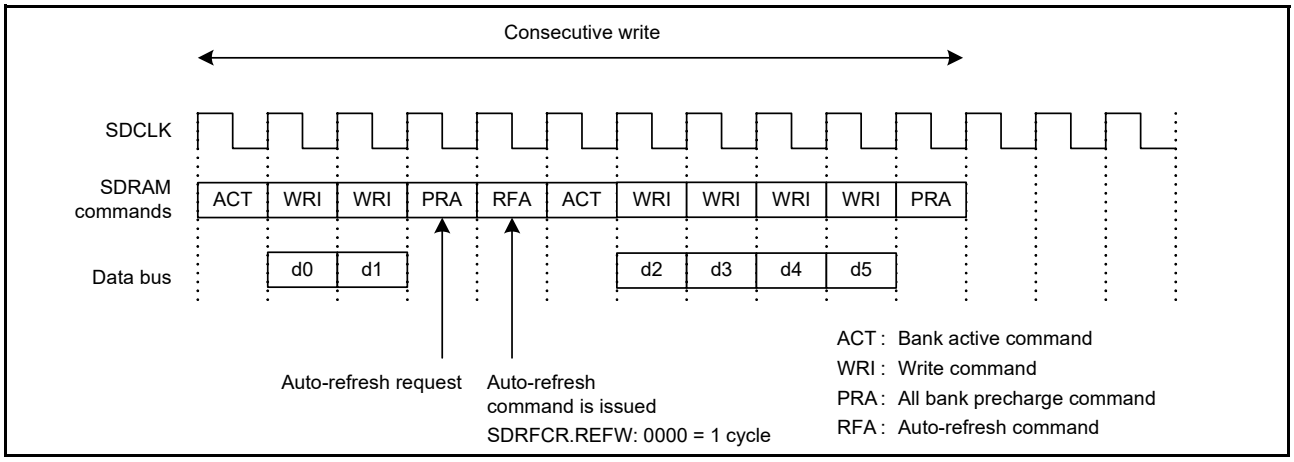

Figure 15.40 Example timing for auto-refresh cycle (3) when auto-refresh request is made during continuous access

15.6.9 Initialization Sequencer

The SDRAMC has a sequencer to issue SDRAM initialization commands. After a reset, the initialization sequencer must be activated without fail. Operation is not guaranteed if the SDRAM is not initialized.

The SDRAM initialization sequencer issues an all-bank precharge command followed by auto-refresh commands n times, where n = 1 to 15. The SDRAM initialization sequence timing can be set using the SDRAM Initialization Register (SDIR). The SDRAM initialization sequence can be activated using the SDRAM Initialization Sequence Control Register (SDICR). These registers must be set only when the conditions listed in Table 15.13 are satisfied.

Figure 15.41 shows a timing example of the SDRAM initialization sequence. When the ARFC[3:0] bits in SDIR are set so that auto-refresh operation is performed two or more times, auto-refresh cycles are repeated in the initialization sequence accordingly.

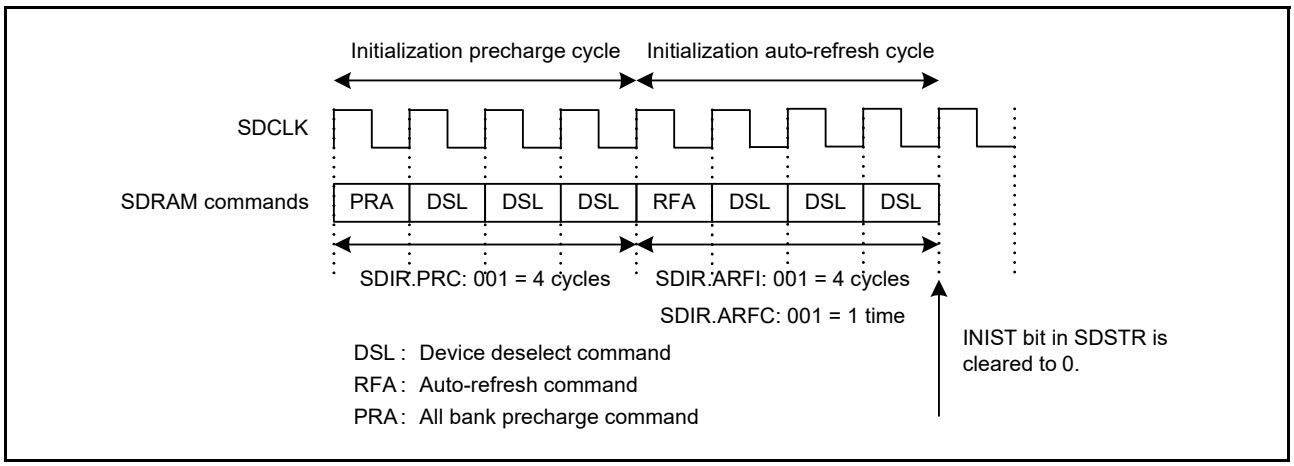

Figure 15.41 Example timing for SDRAM initialization sequence

15.6.10 Setting the Mode Register

Setting the SDRAM Mode Register (SDMOD) allows the mode register set command to be issued to the SDRAM and the value set in the MR[14:0] bits in SDMOD to be output to the lower bits of the address, specifically to A14 to A00 for 8-bit bus width or A15 to A01 for 16-bit bus width. Before setting the mode register, set the SDRAM Bus Width Select bits in the SDC Control Register (SDCCR.BSIZE[1:0]) to determine the data bus width of the SDRAM.

Figure 15.42 shows the mode register setting timing.

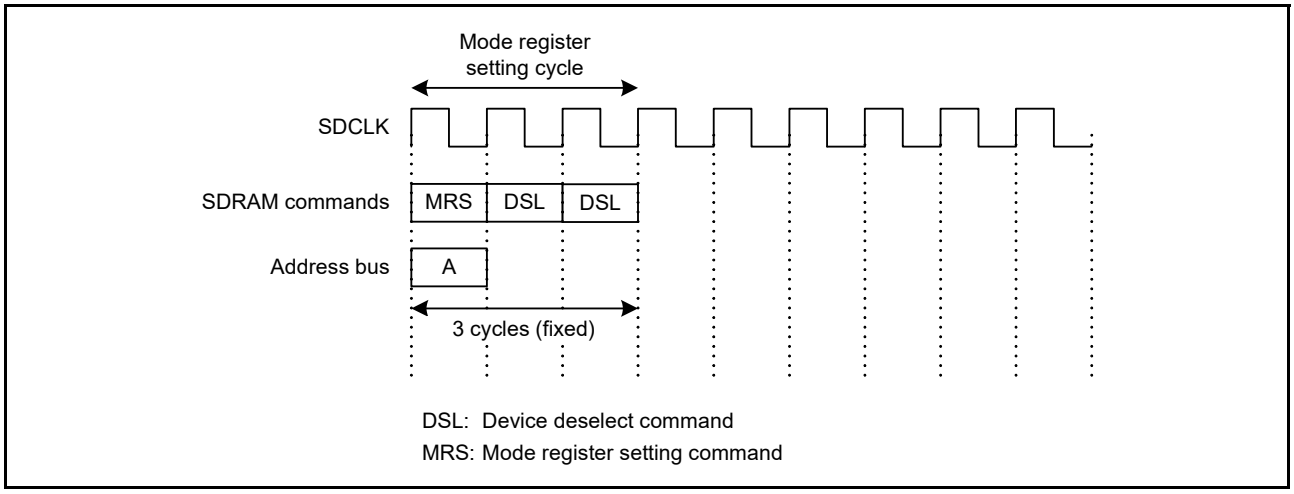

Figure 15.42 Mode register setting timing

15.6.11 SDRAMC Setting Examples

This section describes the following:

- SDRAMC setting procedure
- Timing register setting examples
- Procedure for transitioning to and recovering from self-refresh mode.

15.6.11.1 SDRAMC Access Procedure

Figure 15.43 shows the SDRAMC setting procedure.

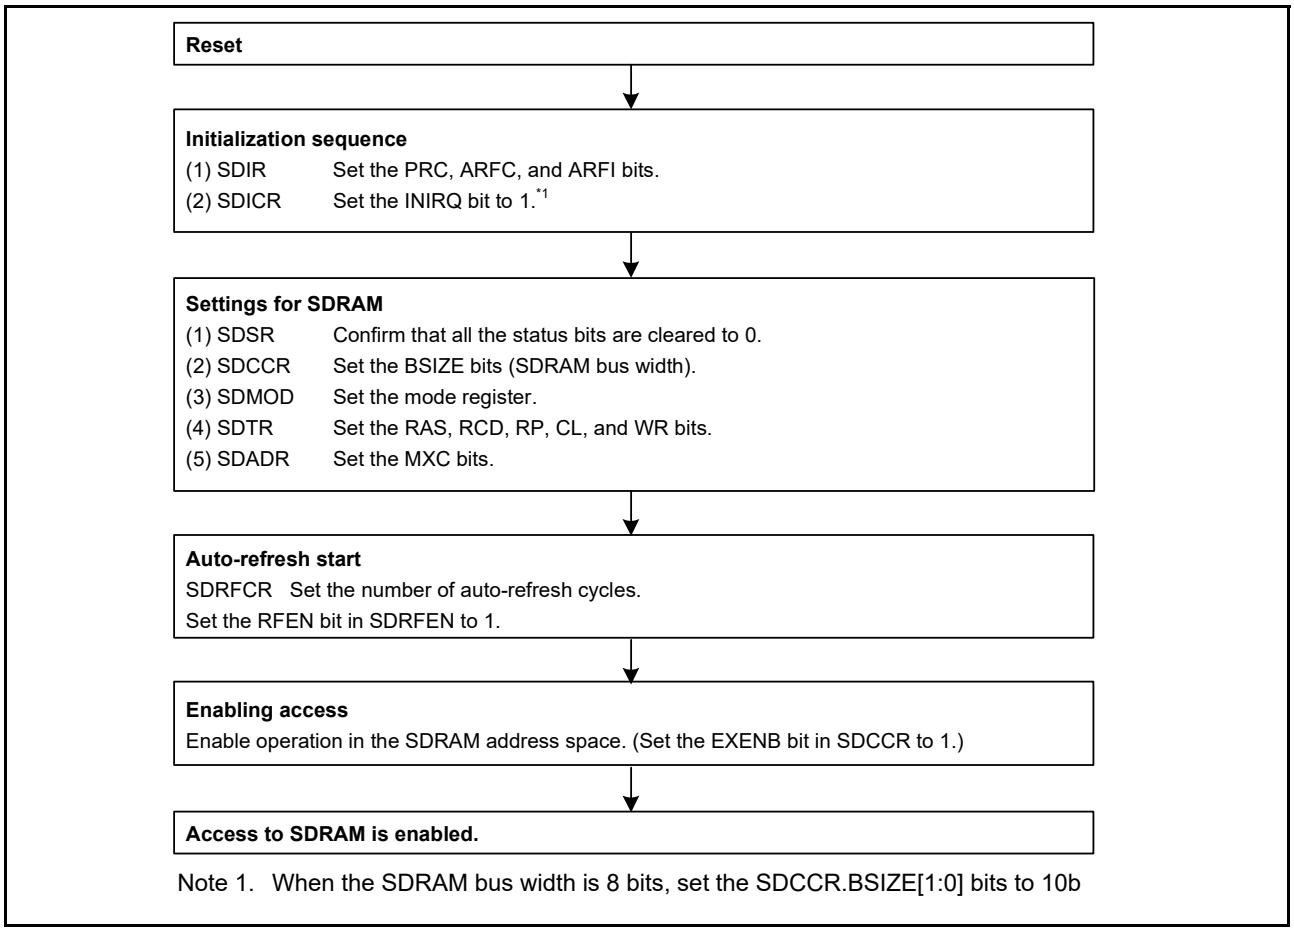

Figure 15.43 SDRAMC setting procedure

15.6.11.2 Procedure for Transitioning to and Recovering from Self-Refresh Mode

Figure 15.44 shows the procedure for transitioning to and recovering from self-refresh mode.

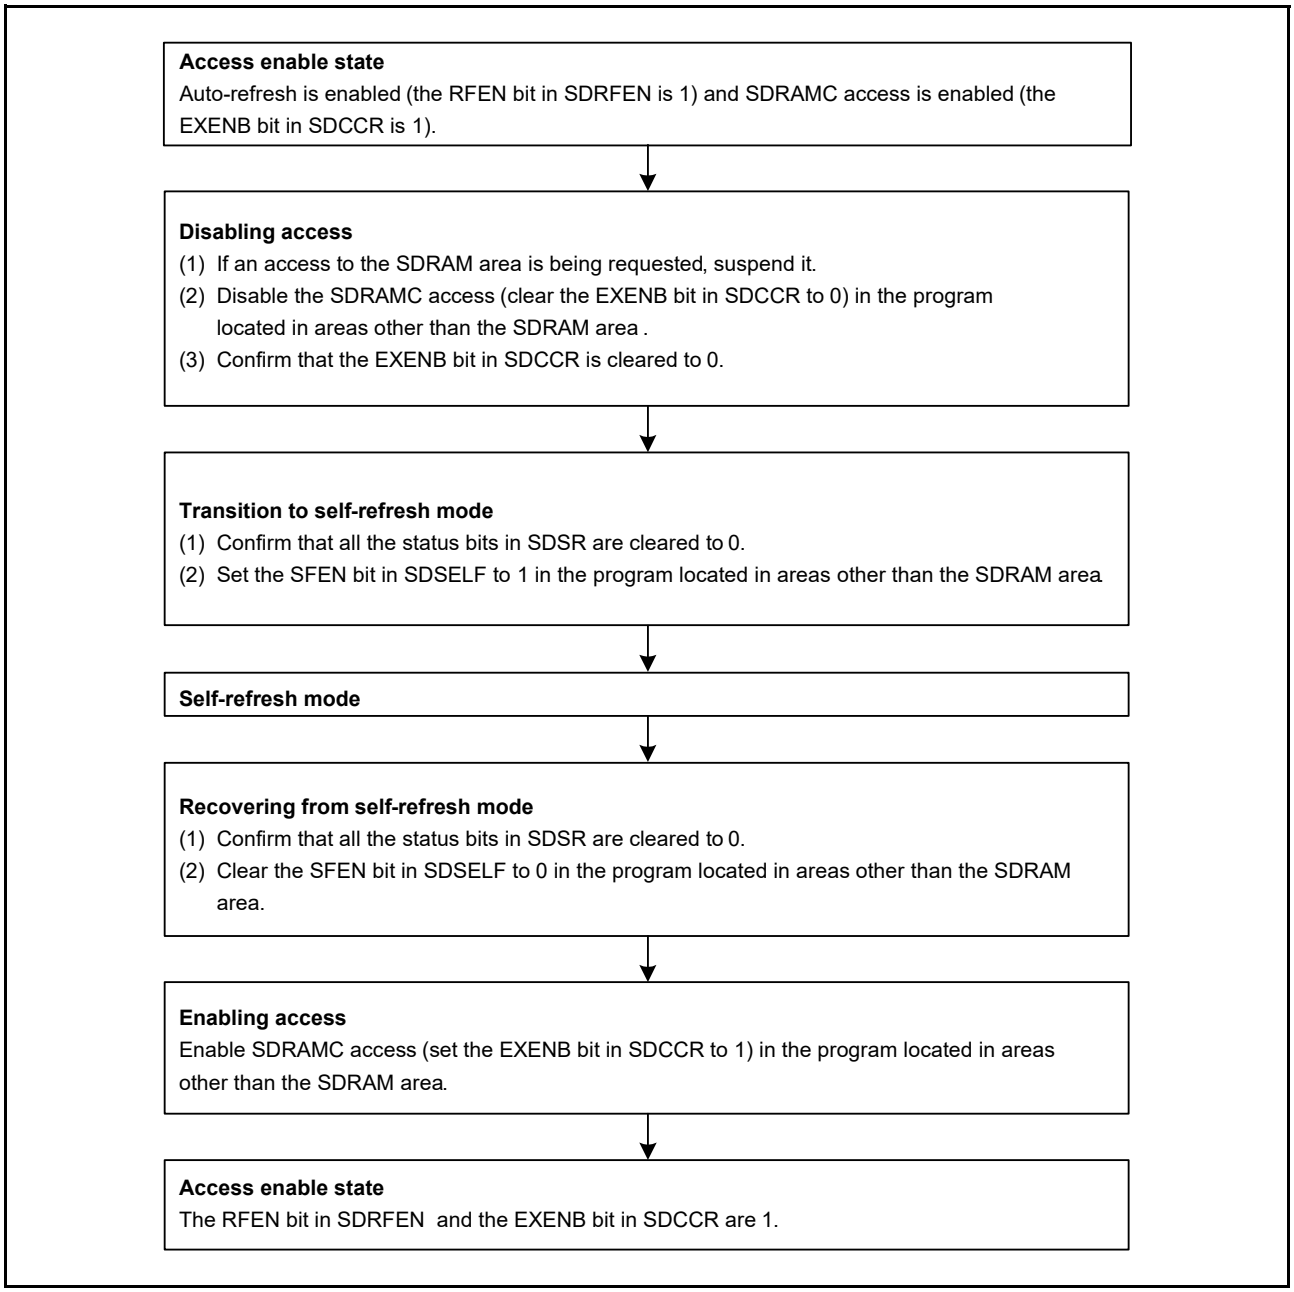

Figure 15.44 Procedure for transitioning to and recovering from self-refresh mode

Note: Self-refresh mode cannot be invoked during SDRAM access. SDRAM access must be disabled during both transition to and recovery from self-refresh mode. Follow the programming instructions shown in Figure 15.45.

Note: Before transitioning to self-refresh mode, disable access to the SDRAM area.

Note: During transition to self-refresh mode, self-refresh operation, and recovery from self-refresh mode, do not allow any operand access or instruction fetch, including prefetch to the SDRAM area, to be generated.

Figure 15.45 shows the procedure for transitioning to and recovering from self-refresh mode in Deep Software Standby mode.

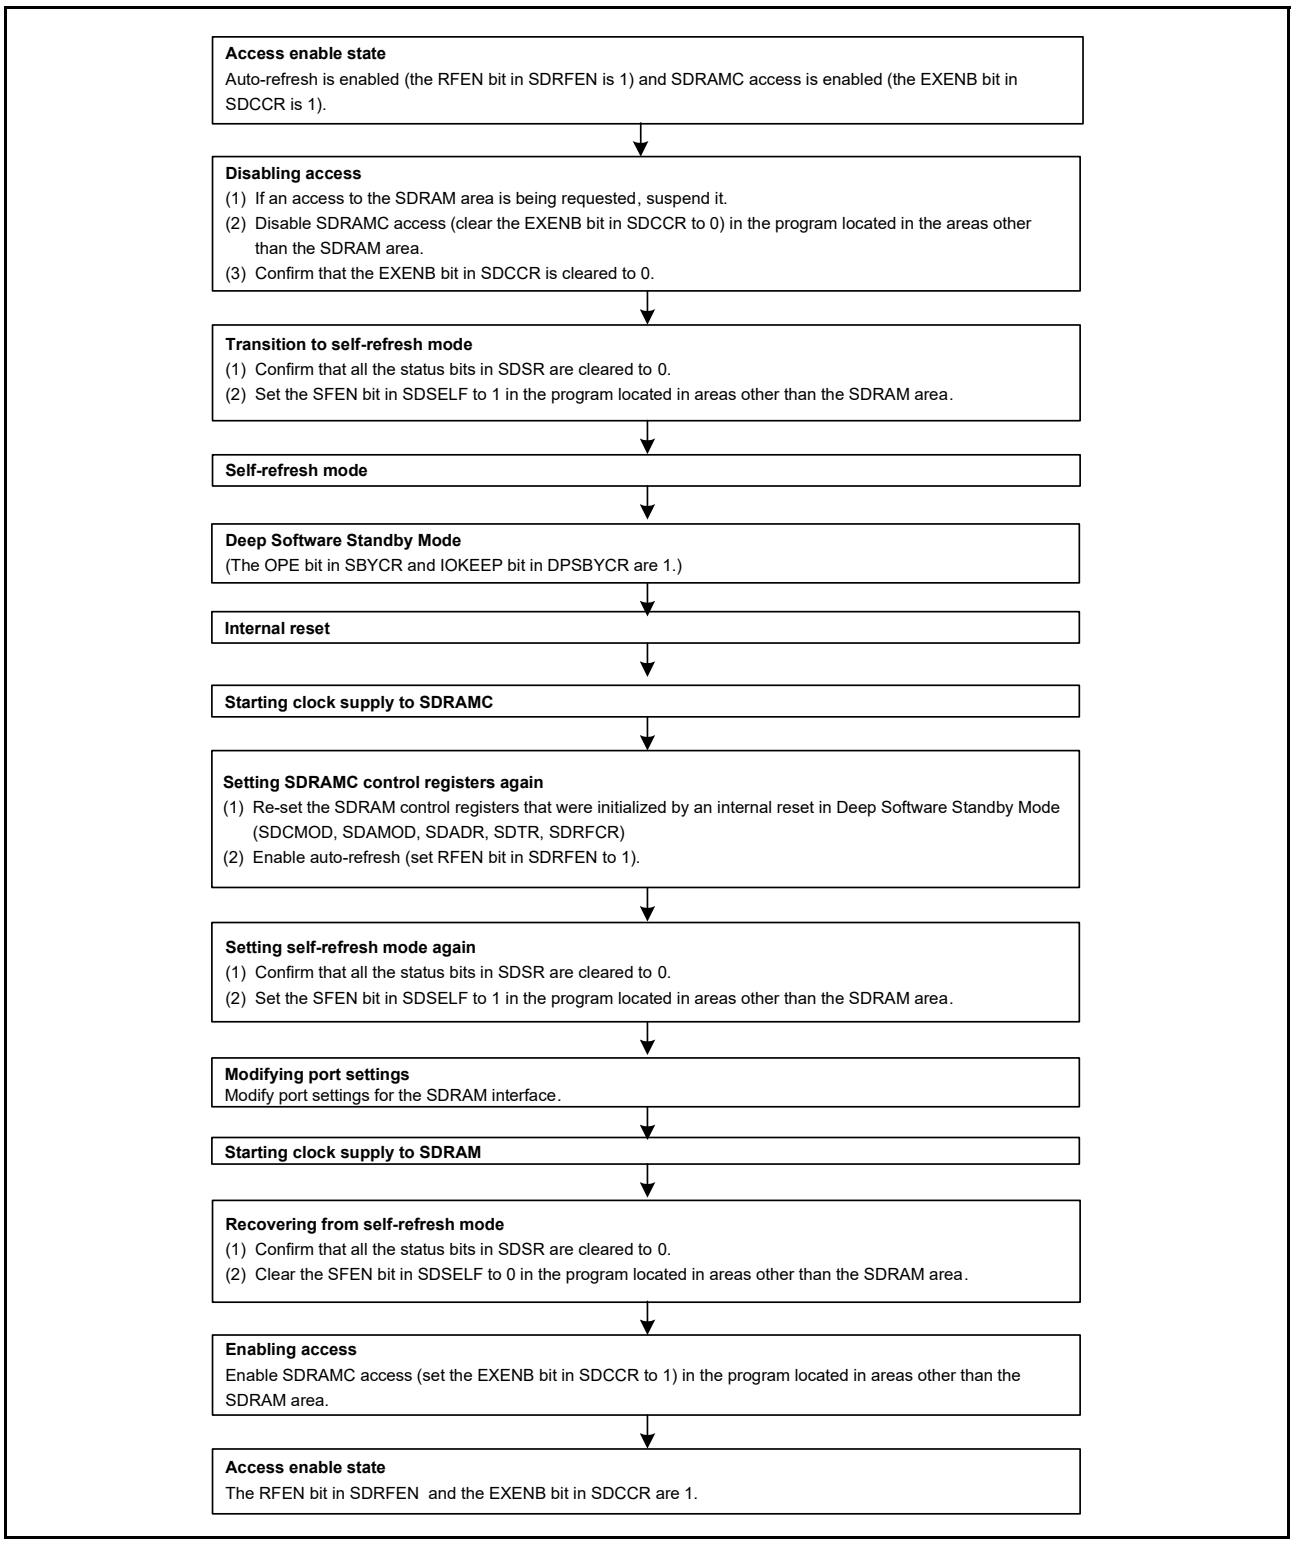

Figure 15.45 Procedure for transitioning to and recovering from self-refresh mode in Deep Software Standby mode

15.6.11.3 Timing Register Settings and Access Timing

This section describes the relationship between read and write timing and the settings in the SDRAM Timing Register (SDTR).

(1) Single read timing examples

Figure 15.46 to Figure 15.50 show the relationship between single read timing and the SDTR register settings. Table 15.14 shows the correspondence between the figures and the SDTR register settings.

During read access, the next bus access is enabled at the earliest two cycles after the read data becomes valid. However, if two or more accesses occur for one transfer request, the next bus access is enabled at the earliest one cycle after the read data becomes valid, as shown in Figure 15.50.

Table 15.14 Correspondence between timing figures and STDR register settings for single read timing

Figure no.	RAS[2:0] settings	Number of cycles	RCD[1:0] settings	Number of cycles	RP[2:0] settings	Number of cycles	CL[2:0] settings	Number of cycles

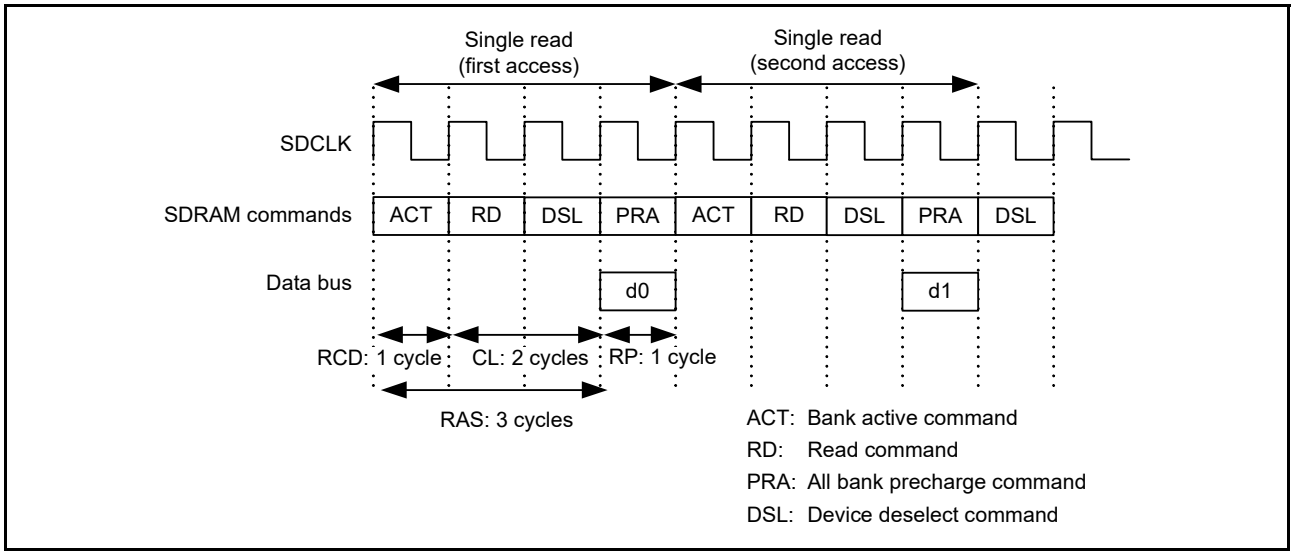

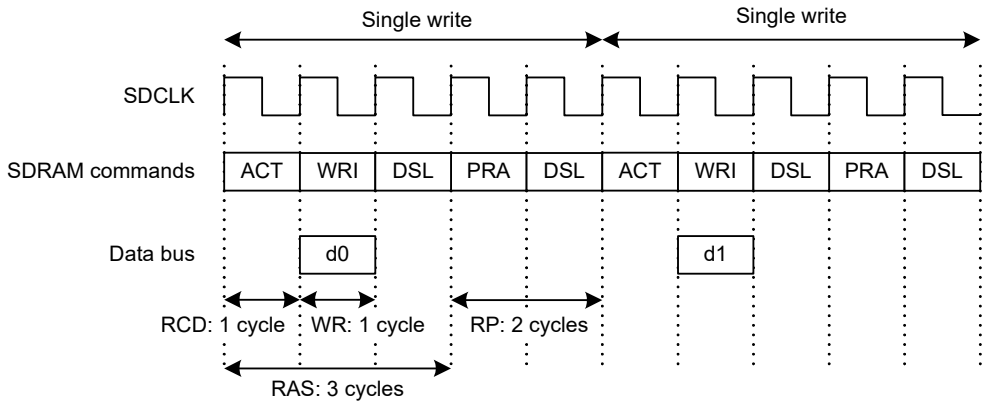

Figure 15.50 Example timing for single read (5), when two bus accesses occur for one transfer request

(2) Single write timing examples

Figure 15.51 to Figure 15.52 show the relationship between the single write timing and the SDTR register settings. Table 15.15 shows the correspondence between the figures and the SDTR register settings. During write access, the next bus access is enabled at the earliest two cycles after an all bank precharge command (PRA) is issued. However, if two or more accesses occur for one transfer request, the next bus access is enabled at the earliest one cycle after the PRA is issued, as shown in Figure 15.55.

Table 15.15 Correspondence between timing figures and STDR register settings for single write timing

15.6.12 Address Multiplexing

In the SDRAM space, row and column addresses are multiplexed. The size of the shift in a row address must be specified in the Address Multiplex Select bits (SDADR.MXC[1:0]) in the SDRAM Address Register (SDADR). Additionally, in the SDRAM space, the address precharge-select command (Precharge-sel) is output to the upper bits of column addresses. Table 15.18 shows the relationship between the SDADR.MXC[1:0] settings and the shift amount.

Table 15.18 Address multiplexing

MXC [1:0]	Shift amount	Data bus width	Address	Address pins external to the MCU															
				A15	A14	A13	A12	A11	A10	A09	A08	A07	A06	A05	A04	A03	A02	A01	A00

Figure 15.64 SDRAM connection example with 256-Mb × 1 and 16-bit bus

15.6.14 Restrictions

(1) Low-power states

In Software Standby and Deep Software Standby modes, auto-refresh operation is not available because the clock supply to the SDRAMC is stopped. To retain the data in the SDRAM when the SDRAM is externally connected, use the self-refresh function. For the procedure for transitioning to and recovering from self-refresh mode, see section 15.6.7, Self-Refresh.

(2) Setting the SDRAM Timing Register

Set the RAS[2:0] bits in the SDRAM Timing Register (SDTR) to a value less than or equal to the sum of the row column latency (SDTR.RCD[1:0]) and column latency (SDTR.CL[2:0]) settings. Operation is not guaranteed if this condition is not satisfied.

(3) Instruction code constraint

You must fix the instruction code to little endian order.

15.7 Bus Error Monitoring Section

This monitoring system monitors each individual area, and whenever it detects an error, it returns the error to the requesting master IP using the AHB-Lite error response protocol.

15.7.1 Bus Error Types

The following types of errors can occur on each bus:

- Illegal address access
- Bus master MPU error
- Bus slave MPU error
- Timeout.

Table 15.19 lists the address ranges where access leads to illegal address access errors. The reserved area in the slave does not trigger an illegal address access error. For more information on the bus master MPU and bus slave MPU, see section 16, Memory Protection Unit (MPU).

15.7.2 Operation When a Bus Error Occurs

When a bus error occurs, operation is not guaranteed and the error is returned to the requesting master IP. The bus errors that occur for each master are stored in the BUSnERRADD and BUSnERRSTAT registers. These registers must only be cleared by a reset. For more information, see section 15.3.21, Bus Error Address Register (BUSnERRADD) (n = 1 to 11) and section 15.3.22, Bus Error Status Register (BUSnERRSTAT) (n = 1 to 11).

Note: The DMAC and DTC do not receive bus errors. If the DMAC or DTC accesses the bus, the transfer continues. For other masters that receive bus errors, see the following sections:

- section 31, Ethernet DMA Controller (EDMAC)
- section 56, 2D Drawing Engine (DRW)
- section 57, JPEG Codec
- section 58, Graphics LCD Controller (GLCDC).

15.7.3 Conditions Leading to Illegal Address Access Errors

Table 15.19 lists the address spaces for each bus that trigger illegal address access errors.

Table 15.19 Conditions leading to illegal address access errors (1 of 2)

Address	Slave bus name	Master bus			
		CPU (ICode, DCode, System)	DMA	ETHER	GPX
0000 0000h to 01FF FFFFh	Memory bus 1 Memory bus 3	—	—	—	—
0200 0000h to 027F FFFFh	Memory mapping area	*1	E	E	E
0280 0000h to 1FFD FFFFh	Reserved	E	E	E	E
1FFE 0000h to 1FFF FFFFh	Memory bus 2 Memory bus 3	—	—	—	—
2000 0000h to 2003 FFFFh	Memory bus 4	—	—	—	—
2004 0000h to 200F FFFFh	Memory bus 5	—	—	—	—
2010 0000h to 3FFF FFFFh	Reserved	E	E	E	E
4000 0000h to 4001 FFFFh	Peripheral bus 1	—	—	E	E
4002 0000h to 4003 FFFFh	Reserved	E	E	E	E
4004 0000h to 4005 FFFFh	Peripheral bus 3	—	—	E	E
4006 0000h to 4007 FFFFh	Peripheral bus 4	—	—	E	E
4008 0000h to 4009 FFFFh	Peripheral bus 5	—	—	E	E

Table 15.19 Conditions leading to illegal address access errors (2 of 2)

Address	Slave bus name	Master bus			
		CPU (ICode, DCode, System)	DMA	ETHER	GPX
400A 0000h to 400B FFFFh	Reserved	—	—	E	E
400C 0000h to 400D FFFFh	Peripheral bus 7	—	—	E	E
400E 0000h to 400F FFFFh	Peripheral bus 8	—	—	E	E
4010 0000h to 407F FFFFh	Peripheral bus 9	—	—	—	E
4080 0000h to 5FFF FFFFh	Reserved	E	E	E	E
6000 0000h to 67FF FFFFh	QSPI area	—	—	—	—
6800 0000h to 7FFF FFFFh	Reserved	E	E	E	E
8000 0000h to 97FF FFFFh	CS/SDRAM area	—	—	—	—
9800 0000h to DFFF FFFFh	Reserved	E	E	E	E
E000 0000h to FFFF FFFFh	System for Cortex®-M4	—	E	E	E

E: Path where an illegal address access error occurs

Note 1. The bus module does not detect whether the MMF switched the address. Therefore if the MMF is enabled and the CPU accesses 0200 0000h, no error occurs. (This depends on the switched address.)
If the MMF is disabled and the CPU accesses 0200 0000h, the bus module can detect the error.

The bus module detects an access error resulting from access to a reserved area, for example if no area is assigned for the slave.

- 0200 0000h to 1FFD FFFFh: Access error detection
- 0000 0000h to 01FF FFFFh: Memory bus 1 no access error detection.

15.7.4 Timeout

For some peripheral modules, a timeout error occurs with the module-stop function. When there is no response from the slave for a certain period of time, a timeout error is detected. A timeout error is returned to the requesting master IP using the AHB-Lite error response protocol.

15.8 Constraint on Using the Flash Cache

When using the flash cache through access from the CPU, you must also set the Arm® MPU to cacheable. See references 1. and 2. for more information.

16. Memory Protection Unit (MPU)

16.1 Overview

The MCU provides three Memory Protection Units (MPUs) and a CPU stack pointer monitor function. Table 16.1 lists the MPU specifications and Table 16.2 shows the behavior on detection of each MPU error.

Table 16.1 MPU specifications

Parameter	Module/function	Specifications
Illegal memory access	Arm® Cortex®-M4 CPU	• Arm® CPU has a default memory map. If the CPU makes an illegal access, an exception interrupt occurs. • MPU can change a default memory map.
	CPU stack pointer monitor	2 regions: • Main stack pointer (MSP) • Process stack pointer (PSP).
Memory protection	Arm® MPU	Memory protection function for the CPU: • 8 MPU regions with subregions and background region.
	Bus master MPU	Memory protection function for each bus master except for the CPU: • Bus master MPU group A: 32 regions • Bus master MPU group B: 8 regions • Bus master MPU group C: 8 regions.
	Bus slave MPU	Memory protection function for each bus slave.

Table 16.2 Behavior on MPU error detection

MPU type	Reporting behavior	Bus access on error detection	Storing of error access information
CPU stack pointer monitor	Reset or non-maskable interrupt	Don't care	Not stored
Arm® MPU	Hard fault	• Does not correctly have write access • Does not correctly have read access.	Stored in the Cortex®-M4 processor
Bus master MPU	Reset or non-maskable interrupt	• Write access to the protected region • Read access to the protected region.	Stored
Bus slave MPU	• Reset or non-maskable interrupt • Hard fault.	• Write access ignored • Read access is read as 0.	Stored

For information on error access for the Arm® MPU, see section 16.6. For information on error access for other MPUs, see 15.3.21 and 15.3.22 in section 15, Buses.

16.2 CPU Stack Pointer Monitor

The CPU stack pointer monitor detects underflows and overflows of the stack pointer. Because the Arm® CPU has two stack pointers, a main stack pointer (MSP) and process stack pointer (PSP), it supports two CPU stack pointer monitors. If a stack pointer underflow or overflow is detected, the CPU stack pointer monitor generates a reset or a non-maskable interrupt.

To enable the CPU stack pointer monitor, set the Stack Pointer Monitor Enable bit in the Stack Pointer Monitor Access Control Register (MSPMPUCTL, PSPMPUCTL) to 1.

Table 16.3 lists the specifications of the CPU stack pointer monitor, Figure 16.1 shows the block diagram, and Figure 16.2 shows the register setting flow.

Table 16.3 Specifications of the CPU stack pointer monitor

Parameter	Specifications
Protected region	SRAM region
Number of regions	2 regions: main stack pointer and process stack pointer
Address specification for individual regions	Region start and end addresses configurable
Enable/disable setting for stack pointer monitor in individual regions	Settings enabled or disabled for the associated region
Operation on error detection	Reset or non-maskable interrupt
Register protection	Registers can be protected from illegal writes

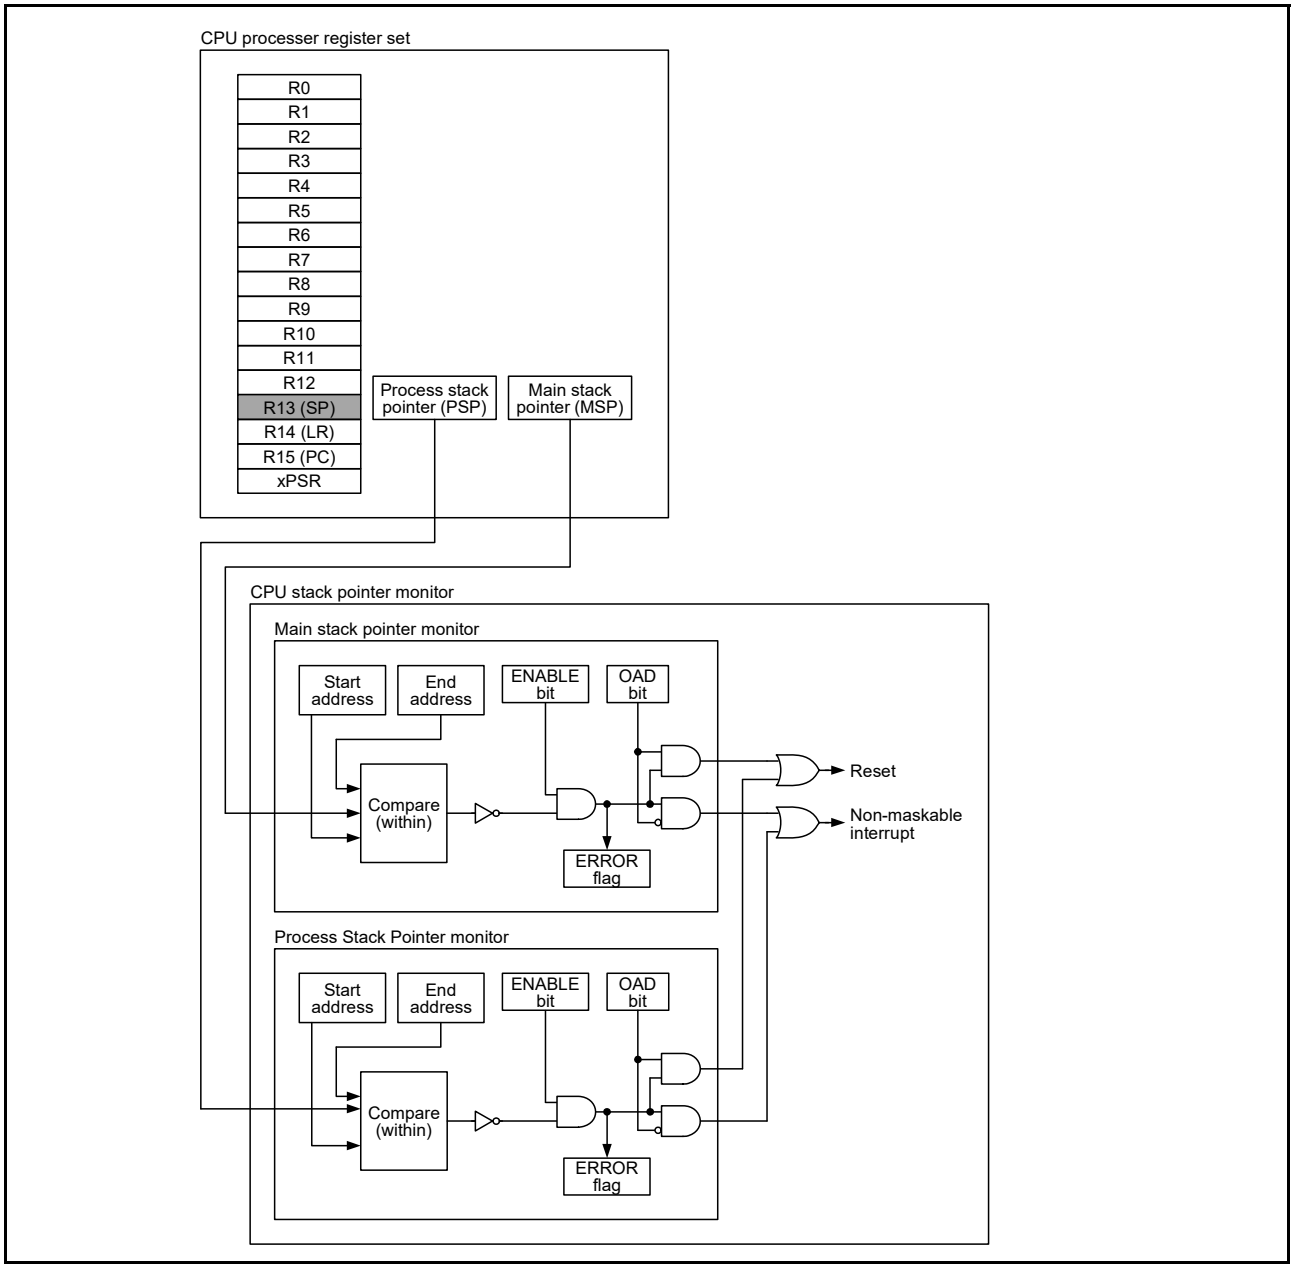

Figure 16.1 Block diagram of the CPU stack pointer monitor

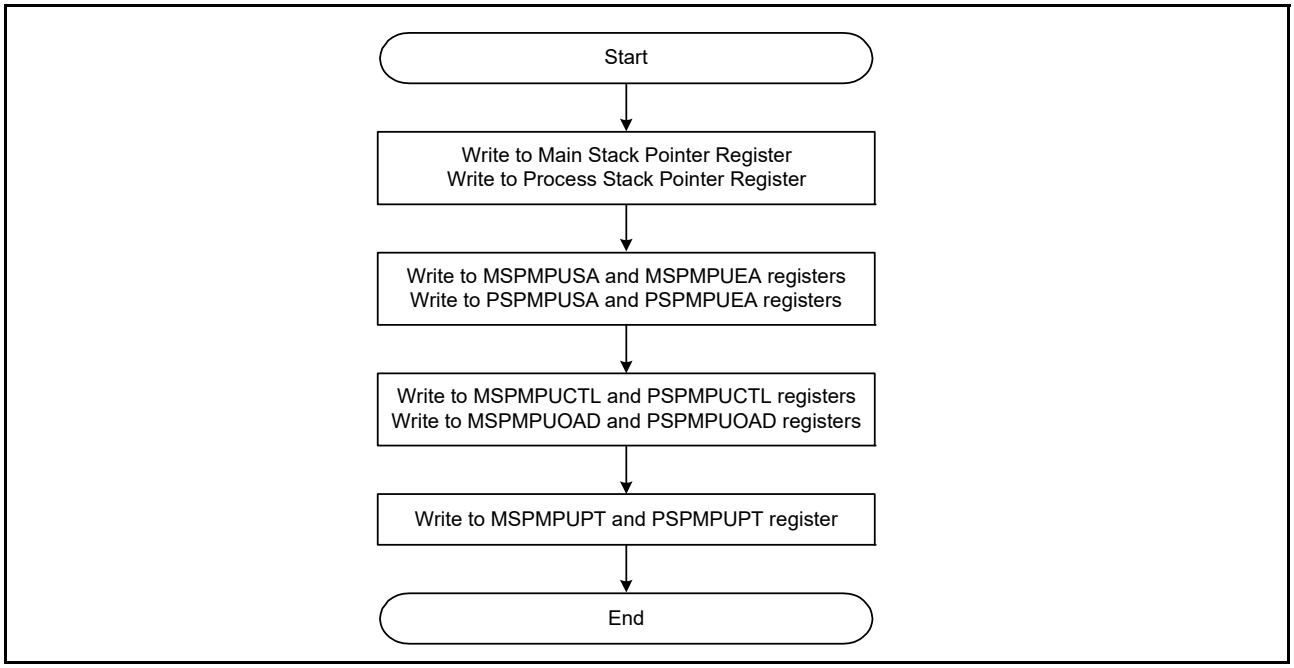

Figure 16.2 Register setting flow

16.2.1 Register Descriptions

Note: Bus access must be stopped before writing to the MPU registers.

16.2.1.1 Main Stack Pointer Monitor Start Address Register (MSPMPUSA)

Address(es): SPMON.MSPMPUSA 4000 0D08h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	PSPMPUSA[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b31 to b0	PSPMPUSA[31:0]	Region Start Address	Address where the region starts, for use in defining the region. Set the lower 2 bits to 0. The value range must be 1FF0 0000h to 200F FFFCh except reserved areas.	R/W

The PSPMPUSA and PSPMPUEA registers specify the CPU stack region in the SRAM (1FF0 0000h to 200F FFFFh, excluding reserved areas. For SRAM area to be covered, see Figure 4.1, Memory map.

16.2.1.4 Process Stack Pointer Monitor End Address Register (PSPMPUEA)

Address(es): SPMON.PSPMPUEA 4000 0D1Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	PSPMPUEA[31:16]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PSPMPUEA[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	1	1

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b31 to b0	PSPMPUEA[31:0]	Region End Address	Address where the region ends, for use in defining the region. Set the lower 2 bits to 1. The value range must be 1FF0 0003h to 200F FFFFh except reserved areas.	R/W

16.2.1.5 Stack Pointer Monitor Operation After Detection Register (MSPMPUOAD, PSPMPUOAD)

Address(es): SPMON.MSPMPUOAD 4000 0D00h, SPMON.PSPMPUOAD 4000 0D10h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	KEY[7:0]								—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OAD	Operation after Detection	0: Non-maskable interrupt 1: Reset.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b8	KEY[7:0]	Key Code	These bits enable or disable writes to the OAD bit.	R/(W)*1

Note 1. Write data is not saved.

OAD bit (Operation after Detection)

The OAD bit selects either a reset or a non-maskable interrupt to occur when a stack pointer underflow or overflow is detected by the CPU stack pointer monitor. The main and process stack pointer monitors each use the OAD bit to determine what signal is generated when a stack pointer underflow or overflow occurs. When writing to the OAD bit, write A5h simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the OAD bit. When writing to the OAD bit, write A5h simultaneously to the KEY[7:0] bits. When other values are written, the OAD bit is not updated. The KEY[7:0] bits always read as 00h.

16.2.1.6 Stack Pointer Monitor Access Control Register (MSPMPUCTL, PSPMPUCTL)

Address(es): SPMON.MSPMPUCTL 4000 0D04h, SPMON.PSPMPUCTL 4000 0D14h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	ERROR	—	—	—	—	—	—	—	ENABLE
Value after reset:	0	0	0	0	0	0	0	0/1*1	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ENABLE	Stack Pointer Monitor Enable	0: Stack pointer monitor disabled 1: Stack pointer monitor enabled.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	ERROR	Stack Pointer Monitor Error Flag	0: No stack pointer overflow and underflow occurred 1: Stack pointer overflow or underflow occurred.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The initial value depends on the reset generation sources.

ENABLE bit (Stack Pointer Monitor Enable)

The ENABLE bit enables or disables the associated stack pointer monitor function, independently set for the main stack pointer (MSP) monitor and the process stack pointer (PSP) monitor.

- When the MSPMPUCTL.ENABLE bit is set to 1, MSPMPUSA, MSPMPUEA, and MSPMPUOAD are available.
- When the MSPMPUCTL.ENABLE bit is set to 0, MSPMPUSA, MSPMPUEA, and MSPMPUOAD are unavailable.
- When the PSPMPUCTL.ENABLE bit is set to 1, PSPMPUSA, PSPMPUEA, and PSPMPUOAD are available.
- When the PSPMPUCTL.ENABLE bit is set to 0, PSPMPUSA, PSPMPUEA, and PSPMPUOAD are unavailable.

ERROR bit (Stack Pointer Monitor Error Flag)

The ERROR bit indicates the status of the stack pointer monitor error. Each stack pointer monitor has an independent ERROR bit. Only 0 can be written to this bit.

[Setting condition]

- Set by overflow or underflow of the stack pointer.

[Clearing conditions]

- 0 is written to this bit
- A reset other than the bus master MPU error reset, bus slave MPU error reset, and stack pointer error reset.

Note: Only 0 can be written to the ERROR bit.

16.2.1.7 Stack Pointer Monitor Protection Register (MSPMPUPT, PSPMPUPT)

Address(es): SPMON.MSPMPUPT 4000 0D06h, SPMON.PSPMPUPT 4000 0D16h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PROTECT	Protection of Register	0: Stack pointer monitor register writes are permitted 1: Stack pointer monitor register writes are protected. Reads are permitted.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b8	KEY[7:0]	Key Code	These bits enable or disable writes to the PROTECT bit.	R/(W)*1

Note 1. Write data is not saved.

PROTECT bit (Protection of Register)

The PROTECT bit enables or disables writes to the associated registers to be protected, independently set for the main stack pointer (MSP) monitor and the process stack pointer (PSP) monitor.

MSPMPUPT.PROTECT controls the following main stack pointer protection registers:

- MSPMPUCTL
- MSPMPUSA
- MSPMPUEA.

PSPMPUT.PROTECT controls the following process stack pointer protection registers:

- PSPMPUCTL
- PSPMPUSA
- PSPMPUEA.

When writing to the PROTECT bit, write A5h simultaneously to the KEY[7:0] bits, using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write A5h simultaneously to the KEY[7:0] bits. When other values are written, the PROTECT bit is not updated. The KEY[7:0] bits always read as 00h.

16.2.2 Operation

16.2.2.1 Protecting the Registers

To protect registers related to the CPU stack pointer monitor, set the associated PROTECT bit.

16.2.2.2 Overflow and Underflow Errors

The CPU stack pointer monitor generates an error if an overflow or underflow error is detected. Set the OAD bit to select whether the error is reported as a non-maskable interrupt or reset. The non-maskable interrupt status is indicated in ICU.NMISR.SPEST. (See section 14, Interrupt Controller Unit (ICU).) Reset status is indicated in SYSTEM.RSTSR1.SPERF. (See section 6, Resets.)

When ICU.NMISR.SPEST indicates that a CPU stack pointer monitor interrupt occurred, confirm it by checking the ERROR bit in MSPMPUCTL and PSPMPUCTL, and determine whether the error occurred on the main or process stack pointer monitor.

A non-maskable interrupt continues to output when a stack pointer overflows or underflows. To clear the error, clear the non-maskable interrupt flag. Set ICU.NMICLR. SPECLR bit = 1, after which the stack pointer resets. Write 0 to clear the ERROR bit in MSPMPUCTL or PSPMPUCTL.

16.3 Arm® MPU

The Arm® MPU has eight region MPUs and provides full support for:

- Protected regions
- Overlapping protected regions, with ascending priority:
  7 = highest priority
  0 = lowest priority.
- Access permissions
- Export of memory attributes to the system.

Arm® MPU mismatches and permission violations invoke the programmable-priority MemManage fault (HardFault) handler. For details, see section 16.6.

16.4 Bus Master MPU

The bus master MPU monitors the addresses accessed by the bus masters in the entire address space (0000 0000h to FFFF FFFFh). Access control, consisting of read and write permission, can be independently set for up to 32 regions. The bus master MPU monitors access to each region based on these settings. If access to a protected region is detected, the bus master MPU generates a reset or a non-maskable interrupt. For details on error access, see 15.3.21 and 15.3.22 in section 15, Buses.

Table 16.4 lists the specifications of the bus master MPU and Figure 16.3 shows the block diagram. Figure 16.4 illustrates MPU bus master groups A, B, and C.

Table 16.4 Specifications of the bus master MPU

Parameter	Specifications
Protected master groups	• Bus master MPU group A: DMA bus • Bus master MPU group B: ETHER bus • Bus master MPU group C: GPX bus
Protected region	0000 0000h to FFFF FFFFh
Number of regions	• Bus master MPU group A: 32 regions • Bus master MPU group B: 8 regions • Bus master MPU group C: 8 regions
Address specification for individual regions	Region start and end addresses configurable
Enable/disable setting for memory protection in individual regions	Settings enabled or disabled for the associated region
Access-control settings for individual regions	Permission to read and write
Operation on error detection	Reset or non-maskable interrupts
Register protection	Register can be protected from illegal writes

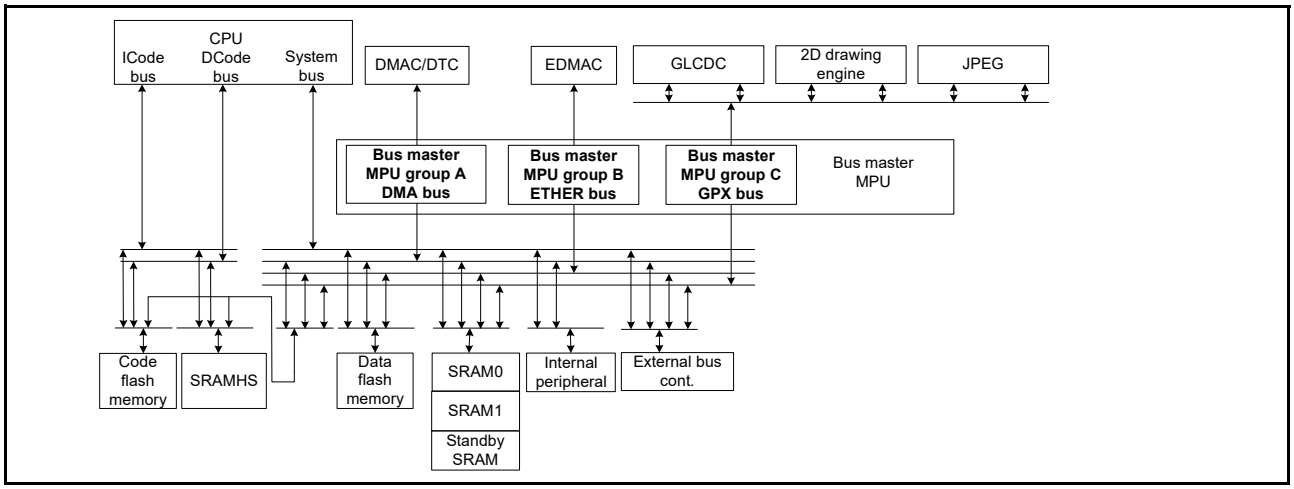

Figure 16.3 Block diagram of the MPU bus master

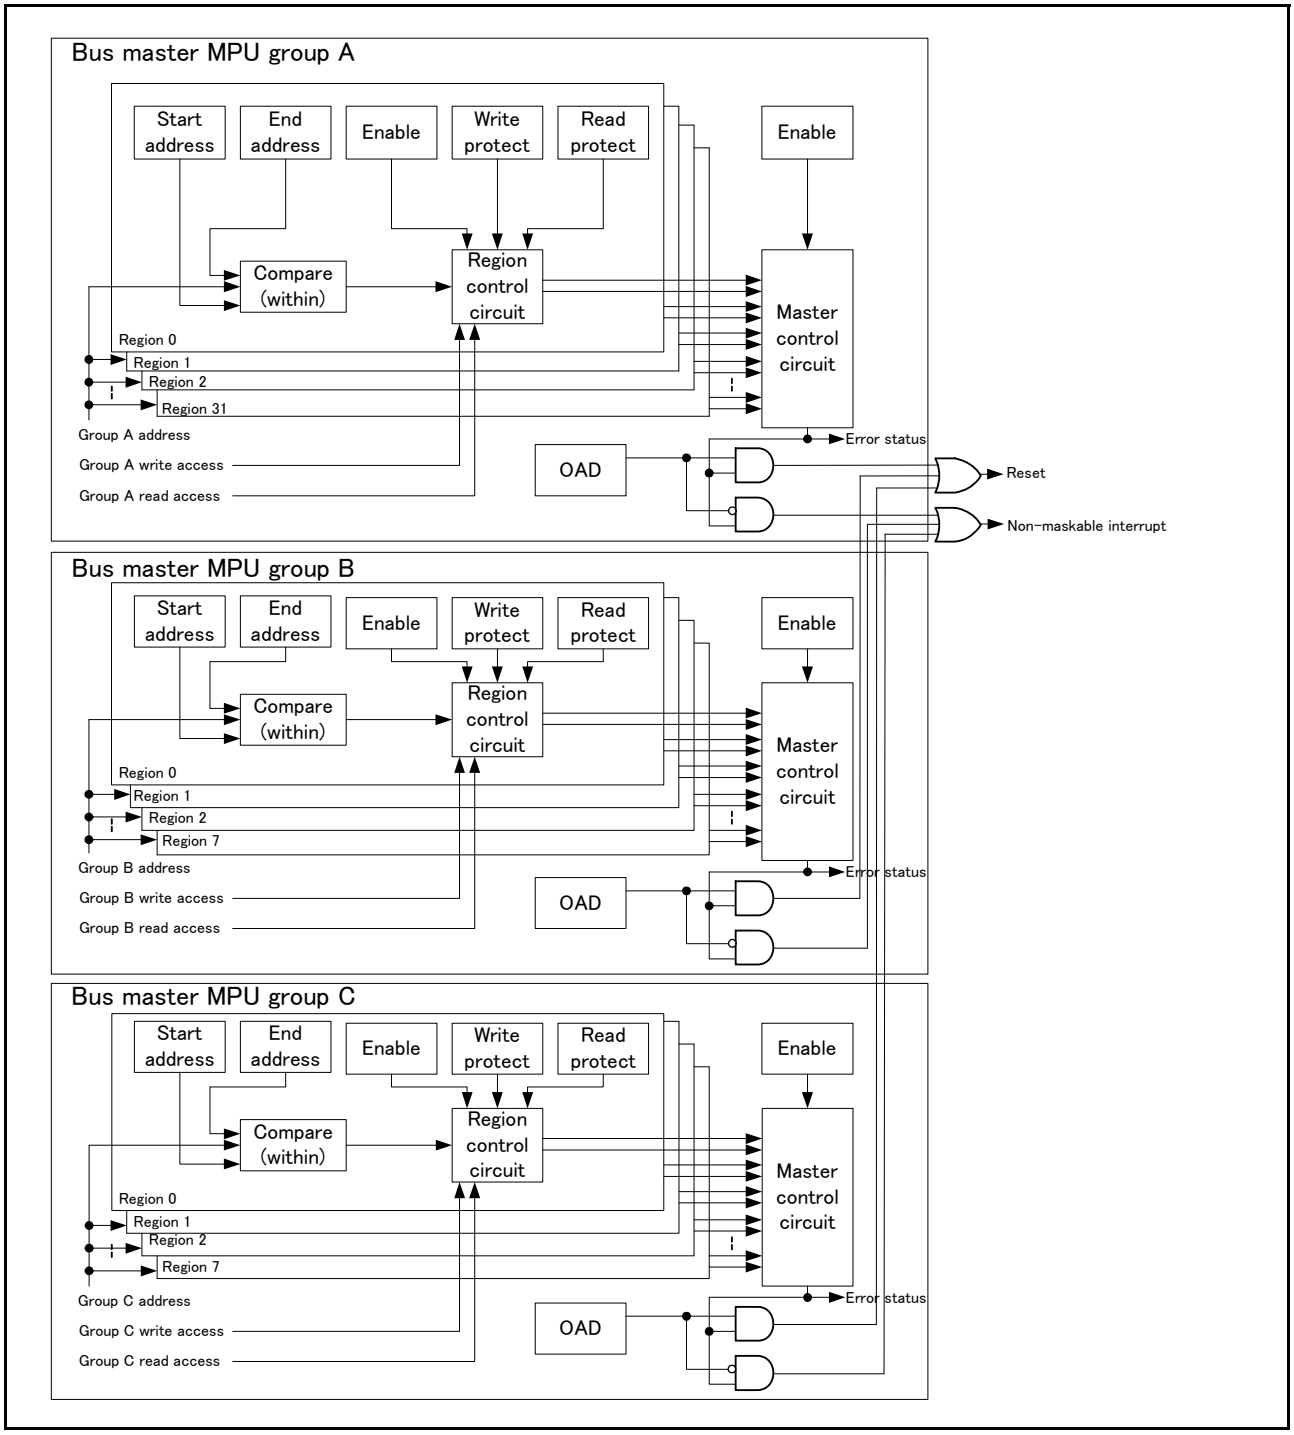

Figure 16.4 MPU bus master groups A, B, and C

16.4.1 Register Descriptions

Note: You must stop bus access before writing to these registers.

16.4.1.1 Group m Region n Start Address Register (MMPUSmn) (m = A to C; n = 0 to 31)

Address(es): MMPU.MMPUSA0 4000 0204h, MMPU.MMPUSA1 4000 0214h, MMPU.MMPUSA2 4000 0224h, MMPU.MMPUSA3 4000 0234h, MMPU.MMPUSA4 4000 0244h, MMPU.MMPUSA5 4000 0254h, MMPU.MMPUSA6 4000 0264h, MMPU.MMPUSA7 4000 0274h, MMPU.MMPUSA8 4000 0284h, MMPU.MMPUSA9 4000 0294h, MMPU.MMPUSA10 4000 02A4h, MMPU.MMPUSA11 4000 02B4h, MMPU.MMPUSA12 4000 02C4h, MMPU.MMPUSA13 4000 02D4h, MMPU.MMPUSA14 4000 02E4h, MMPU.MMPUSA15 4000 02F4h, MMPU.MMPUSA16 4000 0304h, MMPU.MMPUSA17 4000 0314h, MMPU.MMPUSA18 4000 0324h, MMPU.MMPUSA19 4000 0334h, MMPU.MMPUSA20 4000 0344h, MMPU.MMPUSA21 4000 0354h, MMPU.MMPUSA22 4000 0364h, MMPU.MMPUSA23 4000 0374h, MMPU.MMPUSA24 4000 0384h, MMPU.MMPUSA25 4000 0394h, MMPU.MMPUSA26 4000 03A4h, MMPU.MMPUSA27 4000 03B4h, MMPU.MMPUSA28 4000 03C4h, MMPU.MMPUSA29 4000 03D4h, MMPU.MMPUSA30 4000 03E4h, MMPU.MMPUSA31 4000 03F4h, MMPU.MMPUSB0 4000 0604h, MMPU.MMPUSB1 4000 0614h, MMPU.MMPUSB2 4000 0624h, MMPU.MMPUSB3 4000 0634h, MMPU.MMPUSB4 4000 0644h, MMPU.MMPUSB5 4000 0654h, MMPU.MMPUSB6 4000 0664h, MMPU.MMPUSB7 4000 0674h, MMPU.MMPUSC0 4000 0A04h, MMPU.MMPUSC1 4000 0A14h, MMPU.MMPUSC2 4000 0A24h, MMPU.MMPUSC3 4000 0A34h, MMPU.MMPUSC4 4000 0A44h, MMPU.MMPUSC5 4000 0A54h, MMPU.MMPUSC6 4000 0A64h, MMPU.MMPUSC7 4000 0A74h

16.4.1.3 Group m Region n Access Control Register (MMPUACmn) (m = A to C; n = 0 to 31)

Address(es): MMPU.MMPUACA0 4000 0200h, MMPU.MMPUACA1 4000 0210h, MMPU.MMPUACA2 4000 0220h, MMPU.MMPUACA3 4000 0230h, MMPU.MMPUACA4 4000 0240h, MMPU.MMPUACA5 4000 0250h, MMPU.MMPUACA6 4000 0260h, MMPU.MMPUACA7 4000 0270h, MMPU.MMPUACA8 4000 0280h, MMPU.MMPUACA9 4000 0290h, MMPU.MMPUACA10 4000 02A0h, MMPU.MMPUACA11 4000 02B0h, MMPU.MMPUACA12 4000 02C0h, MMPU.MMPUACA13 4000 02D0h, MMPU.MMPUACA14 4000 02E0h, MMPU.MMPUACA15 4000 02F0h, MMPU.MMPUACA16 4000 0300h, MMPU.MMPUACA17 4000 0310h, MMPU.MMPUACA18 4000 0320h, MMPU.MMPUACA19 4000 0330h, MMPU.MMPUACA20 4000 0340h, MMPU.MMPUACA21 4000 0350h, MMPU.MMPUACA22 4000 0360h, MMPU.MMPUACA23 4000 0370h, MMPU.MMPUACA24 4000 0380h, MMPU.MMPUACA25 4000 0390h, MMPU.MMPUACA26 4000 03A0h, MMPU.MMPUACA27 4000 03B0h, MMPU.MMPUACA28 4000 03C0h, MMPU.MMPUACA29 4000 03D0h, MMPU.MMPUACA30 4000 03E0h, MMPU.MMPUACA31 4000 03F0h, MMPU.MMPUACB0 4000 0600h, MMPU.MMPUACB1 4000 0610h, MMPU.MMPUACB2 4000 0620h, MMPU.MMPUACB3 4000 0630h, MMPU.MMPUACB4 4000 0640h, MMPU.MMPUACB5 4000 0650h, MMPU.MMPUACB6 4000 0660h, MMPU.MMPUACB7 4000 0670h, MMPU.MMPUACC0 4000 0A00h, MMPU.MMPUACC1 4000 0A10h, MMPU.MMPUACC2 4000 0A20h, MMPU.MMPUACC3 4000 0A30h, MMPU.MMPUACC4 4000 0A40h, MMPU.MMPUACC5 4000 0A50h, MMPU.MMPUACC6 4000 0A60h, MMPU.MMPUACC7 4000 0A70h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WP	RP	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ENABLE	Region Enable	0: Group m region n unit disabled 1: Group m region n unit enabled.	R/W
b1	RP	Read Protection	0: Read access permitted 1: Read access protected.	R/W
b2	WP	Write Protection	0: Write access permitted 1: Write access protected.	R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Individually configurable ENABLE, RP, and WP bits are provided for each group m region n unit.

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the group m region n unit. When the ENABLE bit is set to 1, the RP and WP bits can be set to permit or protect access to the region that is set in MMPUSmn and MMPUEmn. When the ENABLE bit is set to 0, no region is specified for group m region n access.

RP bit (Read Protection)

The RP bit enables or disables read protection for group m region n. The RP bit is available when the ENABLE bit is set to 1.

WP bit (Write Protection)

The WP bit enables or disables write protection for group m region n. The WP bit is available when the ENABLE bit is set to 1.

Table 16.5 Function of region control circuit

MMPUACmn.ENABLE	MMPUACmn.RP	MMPUACmn.WP	Access	Region	Output of group m region n unit
0	—	—	Read	—	Outside of region
			Write	—	Outside of region
1	0	0	Read	Inside	Permitted region
				Outside	Outside of region
			Write	Inside	Permitted region
				Outside	Outside of region
	0	1	Read	Inside	Permitted region
				Outside	Outside of region
			Write	Inside	Protected region
				Outside	Outside of region
	1	0	Read	Inside	Protected region
				Outside	Outside of region
			Write	Inside	Permitted region
				Outside	Outside of region
	1	1	Read	Inside	Protected region
				Outside	Outside of region
			Write	Inside	Protected region
				Outside	Outside of region

Note: m = A to C
When m = A, n = 0 to 31
When m = B or C, n = 0 to 7.

Table 16.6 Function of master control circuit

MMPUCTLm.ENABLE	Output of group m region 0 unit	Output of group m region 1 unit	Output of Group A Region 2 to 31 unit Output of Group B or C Region 2 to 7 unit	Function of group m
1	Protected region	Don't care	Don't care	Generate error
1	Don't care	Protected region	Don't care	Generate error
1	Don't care	Don't care	Protected region	Generate error
1	Outside of region	Outside of region	Outside of region	Generate error
Other case				No error

Note: m = A to C

A master MPU error occurs on the following conditions:

- MMPUCTLm.ENABLE = 1, and output of one or more region n units is to a protected region
- MMPUCTLm.ENABLE = 1, and output of all region n units is outside of region.

Other cases are handled as permitted regions.

16.4.1.4 Bus Master MPU Control Register (MMPUCTLm) (m = A to C)

Address(es): MMPU.MMPUCTLA 4000 0000h, MMPU.MMPUCTLB 4000 0400h, MMPU.MMPUCTLC 4000 0800h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	KEY[7:0]								—	—	—	—	—	—	OAD	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ENABLE	Master Group Enable	0: Master group m disabled 1: Master group m enabled.	R/W
b1	OAD	Operation After Detection	0: Non-maskable interrupt 1: Reset.	R/W
b7 to b2	—	Reserved	These bits are read as 0.The write value should be 0.	R/W
b15 to b8	KEY[7:0]	Key Code	These bits enable or disable writes to the OAD and ENABLE bits.	R/(W)*1

Note 1. Write data is not saved.

ENABLE bit (Master Group Enable)

The ENABLE bit enables or disables the bus master MPU function for each master group. When this bit is set to 1, MMPUACmn is available. When this bit is set to 0, MMPUACmn is unavailable, including permission for all regions. The bus master MPU function of each master group uses the ENABLE bit. When the ENABLE bit is set, write A5h to KEY[7:0] simultaneously.

OAD bit (Operation After Detection)

The OAD bit selects either a reset or a non-maskable interrupt to occur when access to the protected region is detected by the bus master MPU. The bus master MPU function for each master group uses its OAD bit independently. When writing to the OAD bit, write A5h simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the ENABLE and OAD bits. When writing to the ENABLE and OAD bits, write A5h simultaneously to the KEY[7:0] bits. When other values are written, the ENABLE and OAD bits are not updated. The KEY[7:0] bits always read as 00h.

16.4.1.5 Group m Protection of Register (MMPUPTm) (m = A to C)

Address(es): MMPU.MMPUPTA 4000 0102h, MMPU.MMPUPTB 4000 0502h, MMPU.MMPUPTC 4000 0902h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PROTECT	Protection of register	0: All bus master MPU group m register writes are permitted. 1: All bus master MPU group m register writes are protected. Read is possible.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b8	KEY[7:0]	Key Code	These bits enable or disable writes to the PROTECT bit.	R/(W)*1

Note 1. Write data is not saved.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected. MMPUTm.PROTECT controls the following bus master MPU group m protection registers:

- MMPUSmn
- MMPUEmn
- MMPUACmn
- MMPUCTLm.

When writing to the PROTECT bit, write A5h simultaneously to the KEY[7:0] bits, using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write A5h simultaneously to the KEY[7:0] bits. When other values are written, the PROTECT bit is not updated. The KEY[7:0] bits always read as 00h.

16.4.2 Operation

16.4.2.1 Memory Protection

The bus master MPU monitors memory access using control settings made individually for the access control regions. If access to a protected region is detected, the bus master MPU generates a memory protection error.

The bus master MPU can be configured for up to 32 protection regions. Protected regions include those with overlapping permitted and protected regions, and those with two overlapping permitted regions.

The bus master MPU provides three groups: A, B, and C. The memory protection function checks the address of the bus for a unified master group, and all accesses by a master group are protected. The bus master MPU sets the permission for all of the regions after reset. Setting MMPUCTLm.ENABLE to 1 protects all of the regions. A permitted region is set up within the protected region for each region. If access to the protected region is detected, the bus master MPU generates an error.

Figure 16.5 shows the use case of a bus master MPU.

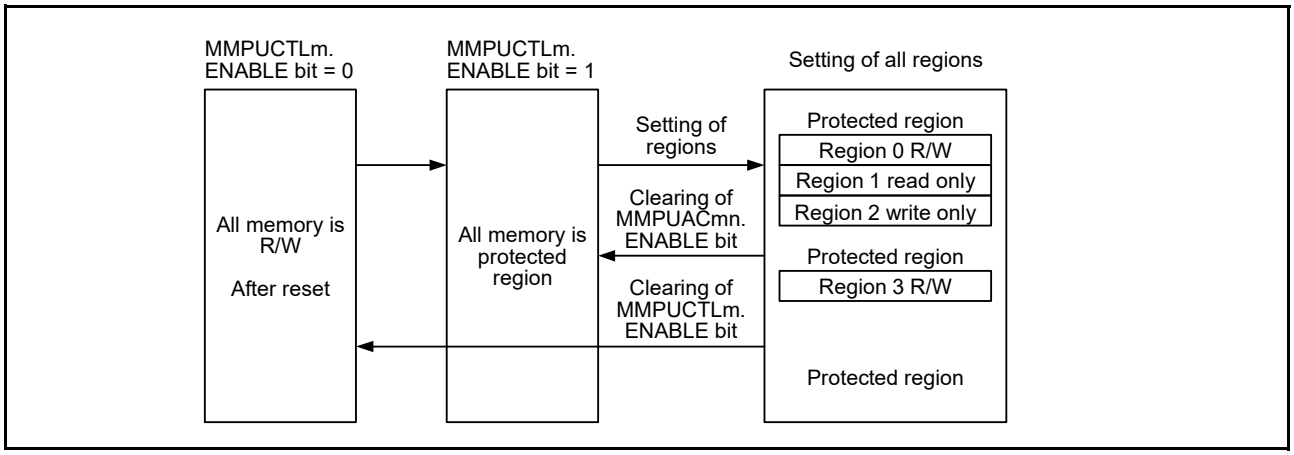

Figure 16.5 Use case of bus master MPU

Figure 16.6 shows the access permission or protection for overlapping bus master MPU regions. Access control for overlapping regions is as follows:

- The region is handled as protected when output of one or more region units is a protected region.
- The region is handled as protected when output of all region units is outside of the regions.
- Other cases are handled as permitted regions.

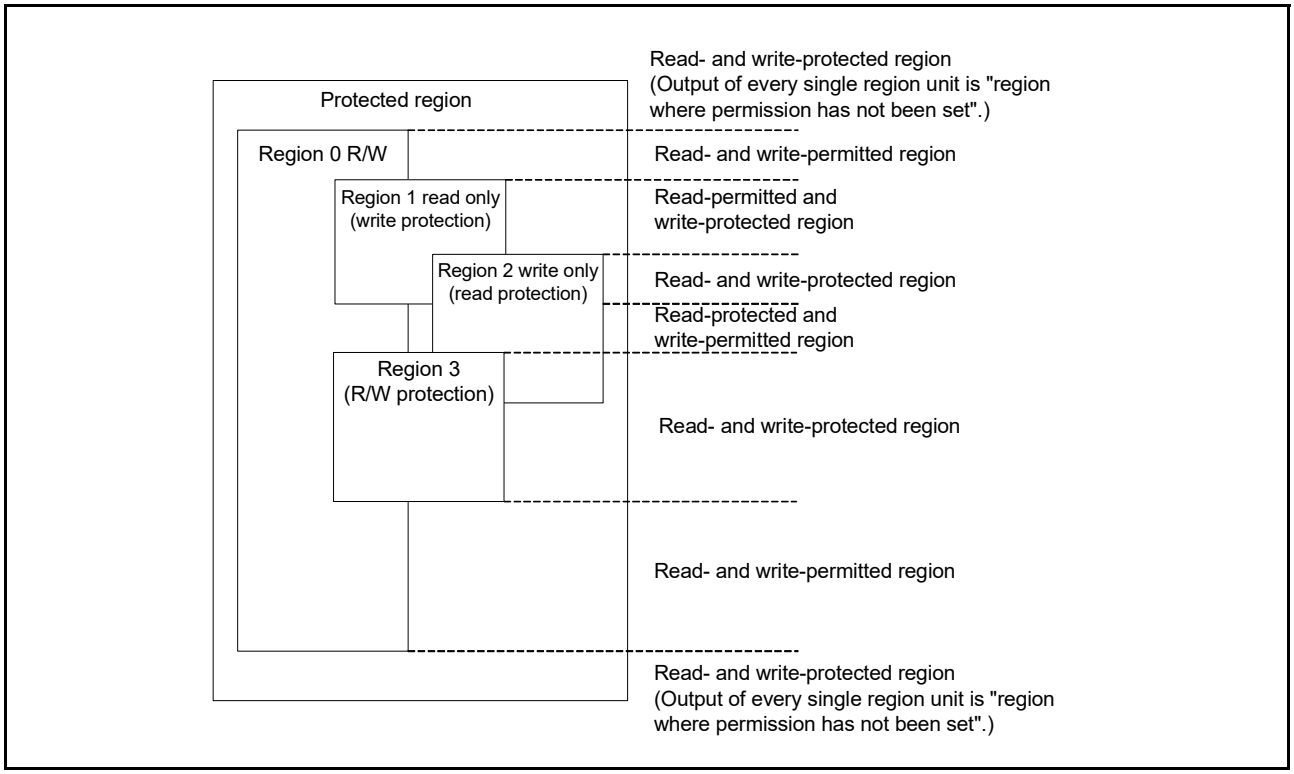

Figure 16.6 Access permission or protection by overlap of the bus master MPU region

Figure 16.7 shows the register setting flow after reset. During this register setting, stop all masters except the CPU.

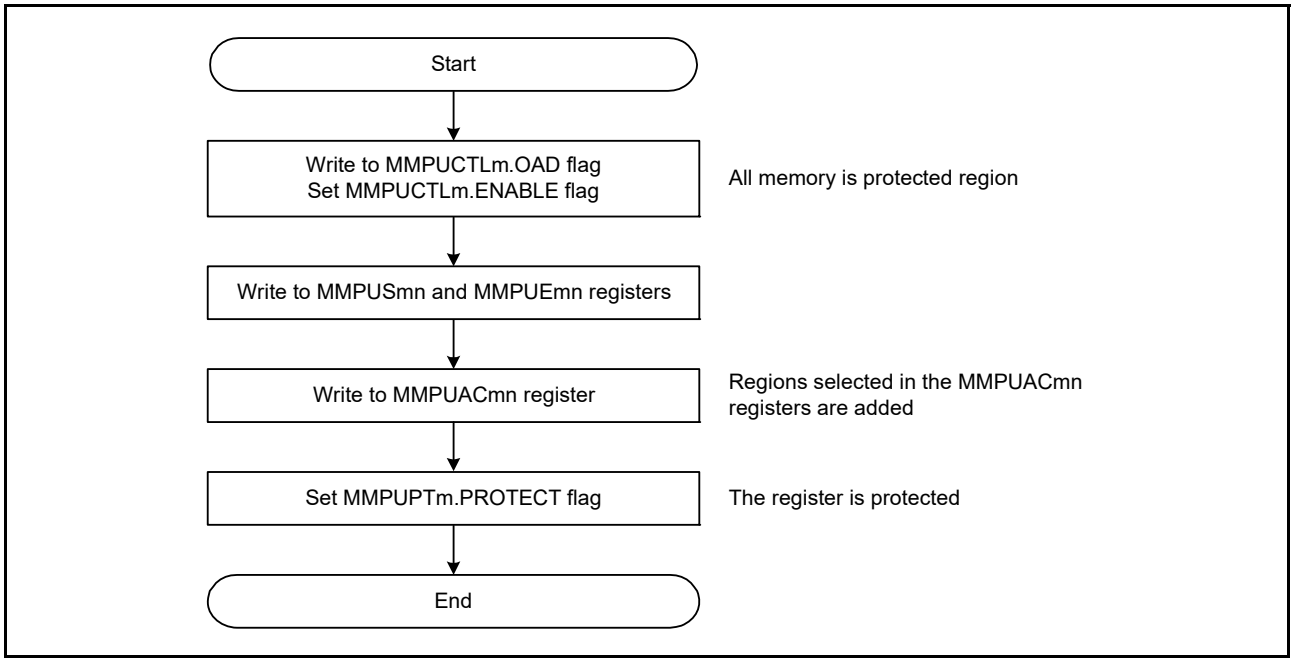

Figure 16.7 Register setting flow after reset

Figure 16.8 shows the register setting flow for adding regions. During this register setting, stop all masters except the CPU.

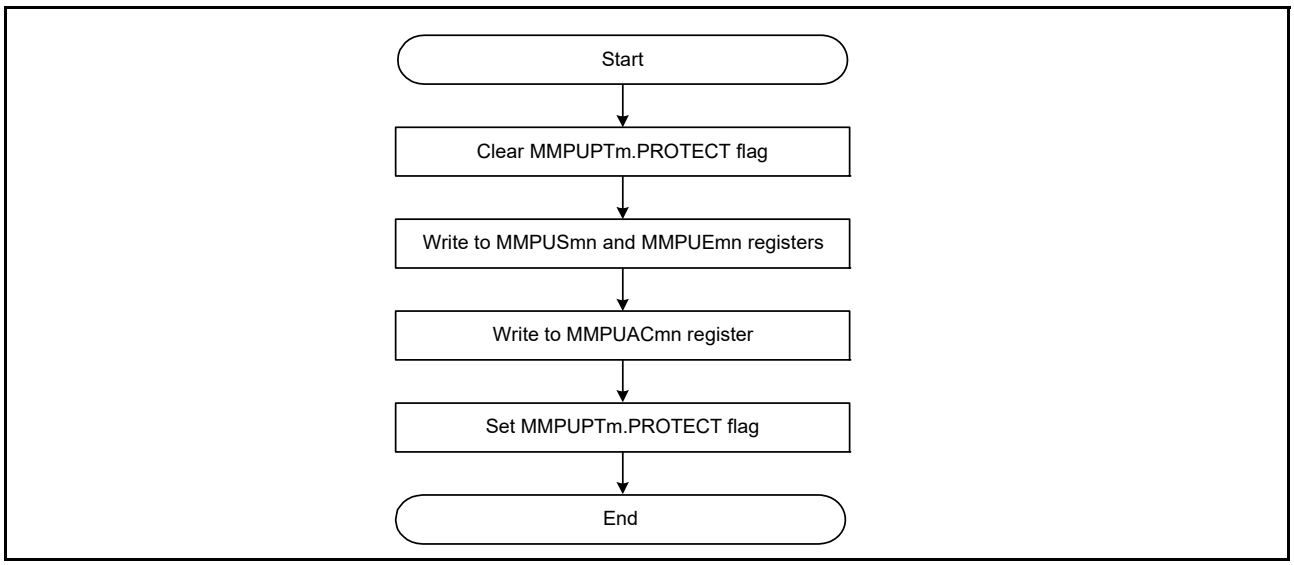

Figure 16.8 Register setting flow for region addition

16.4.2.2 Protecting the Registers

To protect registers related to the bus master MPU, set the PROTECT bit in the associated MMPUPTm register.

16.4.2.3 Memory Protection Error

The bus master MPU generates an error if access to a protected region is detected. Set the OAD bit to select whether the error is reported as a non-maskable interrupt or reset. The non-maskable interrupt or reset is shared between bus master MPU groups A, B, and C. The non-maskable interrupt status is indicated in ICU.NMISR.BUSMST. (See section 14, Interrupt Controller Unit (ICU).) Reset status is indicated in SYSTEM.RSTSR1.BUSMRF. (See section 6, Resets.)

16.5 Bus Slave MPU

The bus slave MPU monitors access to the bus slave functions, such as flash or SRAM. The function can be accessed from four bus masters: the CPU, and bus master MPU groups A, B, and C. The bus slave MPU has a separate protection register for each of the four bus masters, with independent access protection control, consisting of read and write permission. If access to a protected region is detected, the bus slave MPU generates a reset or a non-maskable interrupt, and can store the bus error address, bus error status, and error access status. For details, see 15.3.21 and 15.3.22 in section 15, Buses.

Table 16.7 lists the specifications of the bus slave MPU and Figure 16.9 shows the block diagram.

Table 16.7 Specifications of the bus slave MPU (1 of 2)

Parameter	Specifications
Protected bus masters	• Bus master MPU group A: DMA bus • Bus master MPU group B: ETHER bus • Bus master MPU group C: GPX bus.

Table 16.7 Specifications of the bus slave MPU (2 of 2)

Parameter	Specifications
Protected slave functions	• Memory bus 3: Code flash memory, SRAMHS • Internal peripheral bus 9: Flash memory (in P/E), data flash memory, and TSN • Memory bus 4: SRAM0 • Memory bus 5: SRAM1, Standby SRAM • Internal peripheral bus 1: DTC, DMAC, interrupt controller, flash registers, MPU, CSC, SDRAMC, SRAM registers, system controller and bus controller • Internal peripheral buses 3, 4, and 5: Other peripherals • Internal peripheral bus 7: Secure IPs (SCE7) • Internal peripheral bus 8: Graphic IPs (JPEG/GLCDC/2D Drawing Engine) • EXBIU: External memory interface (SDRAM, CSC) • EXBIU2: External device interface (QSPI).
Access-control settings for individual regions	Permission to read and write
Operation on error detection	Reset, non-maskable interrupt, or exception
Register protection	Register can be protected from illegal writes

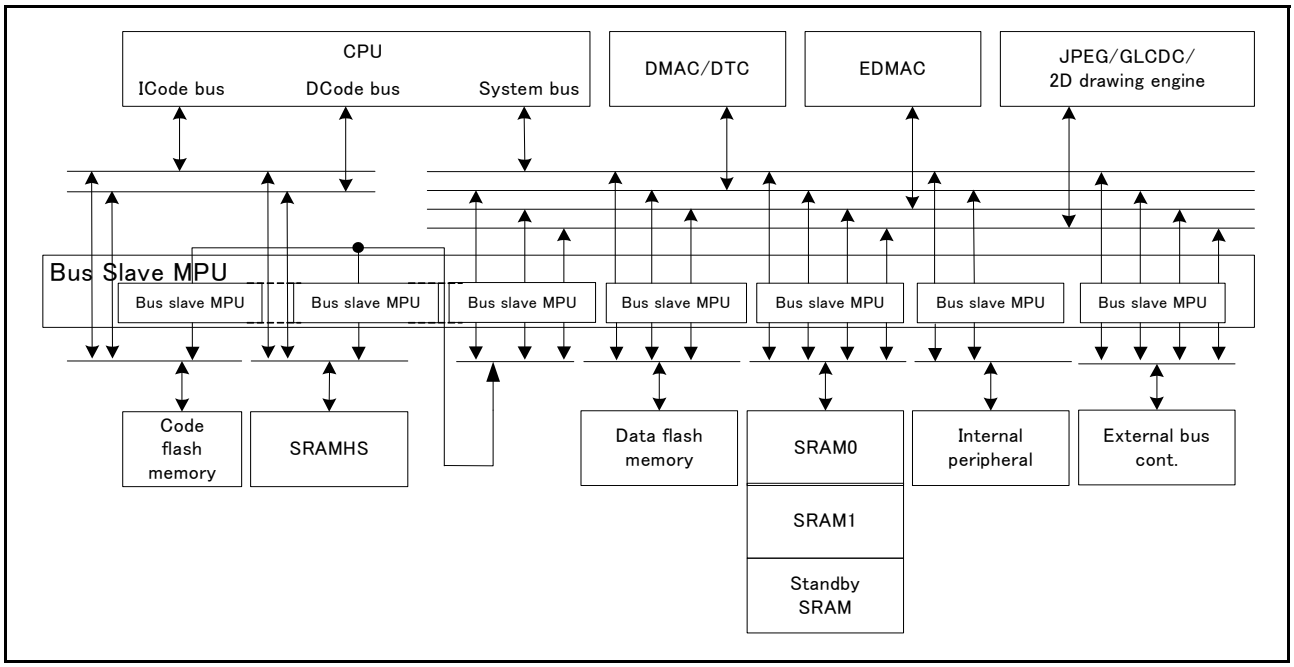

Figure 16.9 Block diagram of bus slave MPU

16.5.1 Register Descriptions

Note: Bus access must be stopped before writing to MPU registers.

16.5.1.1 Access Control Register for Memory Bus 3 (SMPUMBIU)

Address(es): SMPU.SMPUMBIU 4000 0C10h

b15	WPSRAMHS	SRAMHS Write Protection	0: Memory protection for SRAMHS writes from master group A, B, and C disabled 1: Memory protection for SRAMHS writes from master group A, B, and C enabled.	R/W

The SMPUMBIU register enables memory protection for the specified master and slave for access from master group A, B, or C to code flash memory and SRAMHS.

RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on memory bus 3.

WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on memory bus 3.

RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables or disables memory protection for reads by master group B on memory bus 3.

WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables or disables memory protection for writes by master group B on memory bus 3.

RPGRPC bit (Master Group C Read Protection)

The RPGRPC bit enables or disables memory protection for reads by master group C on memory bus 3.

WPGRPC bit (Master Group C Write Protection)

The WPGRPC bit enables or disables memory protection for writes by master group C on memory bus 3.

RPFLI bit (Code Flash Memory Read Protection)

The RPFLI bit enables or disables memory protection for reads by master group A, B, or C on the code flash memory.

WPFLI bit (Code Flash Memory Write Protection)

The WPFLI bit enables memory protection for writes by master group A, B, or C on the code flash memory.

RPSRAMHS bit (SRAMHS Read Protection)

The RPSRAMHS bit enables or disables memory protection for reads by master group A, B, or C on the SRAMHS.

WPSRAMHS bit (SRAMHS Write Protection)

The WPSRAMHS bit enables or disables memory protection for writes by master group A, B, or C on the SRAMHS.

16.5.1.2 Access Control Register for Internal Peripheral Bus 9 (SMPUFBIU)

Address(es): SMPU.SMPUFBIU 4000 0C14h

b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RPCPU bit (CPU Read protection)

The RPCPU bit enables or disables memory protection for reads by the CPU on internal peripheral bus 9.

WPCPU bit (CPU Write protection)

The WPCPU bit enables or disables memory protection for writes by the CPU on internal peripheral bus 9.

RPGRPA bit (Master Group A Read protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on internal peripheral bus 9.

WPGRPA bit (Master Group A Write protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on internal peripheral bus 9.

RPGRPB bit (Master Group B Read protection)

The RPGRPB bit enables or disables memory protection for reads by master group B on internal peripheral bus 9.

WPGRPB bit (Master Group B Write protection)

The WPGRPB bit enables or disables memory protection for writes by master group B on internal peripheral bus 9.

RPGRPC bit (Master Group C Read protection)

The RPGRPC bit enables memory protection for reads by master group C on internal peripheral bus 9. There is no connection between master group C and internal peripheral bus 9. This bit is read as 1, and the write value should be 1.

WPGRPC bit (Master Group C Write protection)

The WPGRPC bit enables memory protection for writes by master group C on internal peripheral bus 9. There is no connection between master group C and internal peripheral bus 9. This bit is read as 1, and the write value should be 1.

16.5.1.3 Access Control Register for Memory Bus 4 (SMPUSRAM0)

Address(es): SMPU.SMPUSRAM0 4000 0C18h

b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RPCPU bit (CPU Read protection)

The RPCPU bit enables or disables memory protection for reads by the CPU on memory bus 4.

WPCPU bit (CPU Write protection)

The WPCPU bit enables or disables memory protection for writes by the CPU on memory bus 4.

RPGRPA bit (Master Group A Read protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on memory bus 4.

WPGRPA bit (Master Group A Write protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on memory bus 4.

RPGRPB bit (Master Group B Read protection)

The RPGRPB bit enables or disables memory protection for reads by master group B on memory bus 4.

WPGRPB bit (Master Group B Write protection)

The WPGRPB bit enables or disables memory protection for writes by master group B on memory bus 4.

RPGRPC bit (Master Group C Read protection)

The RPGRPC bit enables or disables memory protection for reads by master group C on memory bus 4.

WPGRPC bit (Master Group C Write protection)

The WPGRPC bit enables or disables memory protection for writes by master group C on memory bus 4.

b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU on memory bus 5.

WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU on memory bus 5.

RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on memory bus 5.

WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on memory bus 5.

RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables or disables memory protection for reads by master group B on memory bus 5.

WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables or disables memory protection for writes by master group B on memory bus 5.

RPGRPC bit (Master Group C Read Protection)

The RPGRPC bit enables or disables memory protection for reads by master group C on memory bus 5.

WPGRPC bit (Master Group C Write Protection)

The WPGRPC bit enables or disables memory protection for writes by master group C on memory bus 5.

16.5.1.5 Access Control Register for Internal Peripheral Bus 1 (SMPUP0BIU)

Address(es): SMPU.SMPUP0BIU 4000 0C20h

b7	WPGRPC	Master Group C Write Protection	1: Memory protection for master group C writes enabled. Master group C is protected, and is not detected. This bit is read as 1. The write value should be 1.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU on internal peripheral bus 1.

WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU on internal peripheral bus 1.

RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on internal peripheral bus 1.

WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on internal peripheral bus 1.

RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables memory protection for reads by master group B on internal peripheral bus 1. There is no connection between master group B and internal peripheral bus 1. This bit is read as 1, and the write value should be 1.

WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables memory protection for writes by master group B on internal peripheral bus 1. There is no connection between master group B and internal peripheral bus 1. This bit is read as 1, and the write value should be 1.

RPGRPC bit (Master Group C Read Protection)

The RPGRPC bit enables memory protection for reads by master group C on internal peripheral bus 1. There is no connection between master group C and internal peripheral bus 1. This bit is read as 1, and the write value should be 1.

WPGRPC bit (Master Group C Write Protection)

The WPGRPC bit enables memory protection for writes by master group C on internal peripheral bus 1. There is no connection between master group C and internal peripheral bus 1. This bit is read as 1, and the write value should be 1.

16.5.1.6 Access Control Register for Internal Peripheral Bus 3 (SMPUP2BIU)

Address(es): SMPU.SMPUP2BIU 4000 0C24h

b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU on internal peripheral buses 3, 4, and 5.

WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU on internal peripheral buses 3, 4, and 5.

RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on internal peripheral buses 3, 4, and 5.

WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on internal peripheral buses 3, 4, and 5.

RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables memory protection for reads by master group B on internal peripheral buses 3, 4, and 5. There is no connection between master group B and internal peripheral buses 3, 4, and 5. This bit is read as 1, and the write value should be 1.

WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables memory protection for writes by master group B on internal peripheral buses 3, 4, and 5. There is no connection between master group B and internal peripheral buses 3, 4, and 5. This bit is read as 1, and the write value should be 1.

RPGRPC bit (Master Group C Read Protection)

The RPGRPC bit enables memory protection for reads by master group C on internal peripheral buses 3, 4, and 5. There is no connection between master group C and internal peripheral buses 3, 4, and 5. This bit is read as 1, and the write value should be 1.

WPGRPC bit (Master Group C Write Protection)

The WPGRPC bit enables memory protection for writes by master group C on internal peripheral buses 3, 4, and 5. There is no connection between master group C and internal peripheral buses 3, 4, and 5. This bit is read as 1, and the write value should be 1.

RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU on internal peripheral bus 7.

WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU on internal peripheral bus 7.

RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on internal peripheral bus 7.

WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on internal peripheral bus 7.

RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables memory protection for reads by master group B on internal peripheral bus 7. There is no connection between master group B and internal peripheral bus 7. This bit is read as 1, and the write value should be 1.

WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables memory protection for writes by master group B on internal peripheral bus 7. There is no connection between master group B and internal peripheral bus 7. This bit is read as 1, and the write value should be 1.

RPGRPC bit (Master Group C Read Protection)

The RPGRPC bit enables memory protection for reads by master group C on internal peripheral bus 7. There is no connection between master group C and internal peripheral bus 7. This bit is read as 1, and the write value should be 1.

WPGRPC bit (Master Group C Write Protection)

The WPGRPC bit enables memory protection for writes by master group C on internal peripheral bus 7. There is no connection between master group C and internal peripheral bus 7. This bit is read as 1, and the write value should be 1.

16.5.1.8 Access Control Register for Internal Peripheral Bus 8 (SMPUP7BIU)

Address(es): SMPU.SMPUP7BIU 4000 0C2Ch

RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU on internal peripheral bus 8.

WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU on internal peripheral bus 8.

RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A on internal peripheral bus 8.

WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A on internal peripheral bus 8.

RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables memory protection for reads by master group B on internal peripheral bus 8. There is no connection between master group B and internal peripheral bus 8. This bit is read as 1, and the write value should be 1.

WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables memory protection for writes by master group B on internal peripheral bus 8. There is no connection between master group B and internal peripheral bus 8. This bit is read as 1, and the write value should be 1.

RPGRPC bit (Master Group C Read Protection)

The RPGRPC bit enables memory protection for reads by master group C on internal peripheral bus 8. There is no connection between master group C and internal peripheral bus 8. This bit is read as 1, and the write value should be 1.

WPGRPC bit (Master Group C Write Protection)

The WPGRPC bit enables memory protection for writes by master group C on internal peripheral bus 8. There is no connection between master group C and internal peripheral bus 8. This bit is read as 1, and the write value should be 1.

16.5.1.9 Access Control Register for CS Area and SDRAM Area (SMPUEXBIU)

Address(es): SMPU.SMPUEXBIU 4000 0C30h

RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU in the CS and SDRAM areas.

WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU in the CS and SDRAM areas.

RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A in the CS and SDRAM areas.

WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A in the CS and SDRAM areas.

RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables or disables memory protection for reads by master group B in the CS and SDRAM areas.

WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables or disables memory protection for writes by master group B in the CS and SDRAM areas.

RPGRPC bit (Master Group C Read Protection)

The RPGRPC bit enables or disables memory protection for reads by master group C in the CS and SDRAM areas.

WPGRPC bit (Master Group C Write Protection)

The WPGRPC bit enables or disables memory protection for writes by master group C in the CS and SDRAM areas.

b6	RPGRPC	Master Group C Read Protection	0: Memory protection for master group C reads disabled 1: Memory protection for master group C reads enabled.	R/W
b7	WPGRPC	Master Group C Write Protection	0: Memory protection for master group C writes disabled 1: Memory protection for master group C writes enabled.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RPCPU bit (CPU Read Protection)

The RPCPU bit enables or disables memory protection for reads by the CPU in the QSPI area.

WPCPU bit (CPU Write Protection)

The WPCPU bit enables or disables memory protection for writes by the CPU in the QSPI area.

RPGRPA bit (Master Group A Read Protection)

The RPGRPA bit enables or disables memory protection for reads by master group A in the QSPI area.

WPGRPA bit (Master Group A Write Protection)

The WPGRPA bit enables or disables memory protection for writes by master group A in the QSPI area.

RPGRPB bit (Master Group B Read Protection)

The RPGRPB bit enables or disables memory protection for reads by master group B in the QSPI area.

WPGRPB bit (Master Group B Write Protection)

The WPGRPB bit enables or disables memory protection for writes by master group B in the QSPI area.

RPGRPC bit (Master Group C Read Protection)

The RPGRPC bit enables or disables memory protection for reads by master group C in the QSPI area.

WPGRPC bit (Master Group C Write Protection)

The WPGRPC bit enables or disables memory protection for writes by master group C in the QSPI Area.

16.5.1.11 Slave MPU Control Register (SMPUCTL)

Address(es): SMPU.SMPUCTL 4000 0C00h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	KEY[7:0]								—	—	—	—	—	—	PROTECT	OAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OAD	Operation After Detection	0: Non-maskable interrupt 1: Reset.	R/W
b1	PROTECT	Protection of Register	0: All Bus Slave register writes are permitted 1: All Bus Slave register writes are protected. Reads are permitted.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b8	KEY[7:0]	Key Code	These bits enable or disable writes to the OAD and PROTECT bits.	R/(W)*1

Note 1. Write data is not saved.

OAD bit (Operation After Detection)

The OAD bit selects either a reset or non-maskable interrupt to occur when access to the protected region is detected by the bus slave MPU. When writing to the OAD bit, write A5h simultaneously to the KEY[7:0] bits using halfword access.

PROTECT bit (Protection of Register)

The PROTECT bit enables or disables writes to the associated registers to be protected. SMPUCTL.PROTECT controls the following registers:

- SMPUMBIU
- SMPUFBIU
- SMPUSRAM0
- SMPUSRAM1
- SMPUP0BIU
- SMPUP2BIU
- SMPUP6BIU
- SMPUP7BIU
- SMPUEXBIU
- SMPUEXBIU2.

When writing to the PROTECT bit, write A5h simultaneously to the KEY[7:0] bits, using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the OAD and PROTECT bits. When writing to the OAD and PROTECT bits, write A5h simultaneously to the KEY[7:0] bits. When other values are written, the OAD and PROTECT bits are not updated. The KEY[7:0] bits always read as 00h.

16.5.2 Operation

16.5.2.1 Memory Protection

The bus slave MPU monitoring functions with access control information that is set for the individual access control register whether or not access by the bus slaves violates the access control settings. If access to the protected region is detected, the bus slave MPU generates a memory protection error.

The bus slave MPU is enabled by writing 1 to the Write Protect (WPCPU or WPGRPA) bit or the Read Protect (RPCPU or RPGRPA) bit in the access control register (SMPUMBIU, SMPUFBIU, SMPUSRAM0, SMPUSRAM1, SMPUP0BIU, SMPUP2BIU, SMPUP6BIU, SMPUP7BIU, SMPUEXBIU and SMPUEXBIU2).

16.5.2.2 Protecting the Registers

To protect registers related to the bus slave MPU, set the PROTECT bit in the SMPUCTL register.

16.5.2.3 Memory Protection Error

The slave master MPU generates an error if access to a protected region is detected. Set the OAD bit to select whether the error is reported as a non-maskable interrupt or reset. The non-maskable interrupt status is indicated in ICU.NMISR.BUSSST. (See section 14, Interrupt Controller Unit (ICU).) Reset status is indicated in SYSTEM.RSTSR1.BUSSRF. (See section 6, Resets.)

17. DMA Controller (DMAC)

The 8-channel DMA Controller (DMAC) can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.

17.1 Overview

Table 17.1 lists the DMAC specifications and Figure 17.1 shows the block diagram.

Table 17.1 DMAC specifications

Parameter		Specifications
Number of channels		8 channels (DMACm, m = 0 to 7)
Transfer space		4 GB (0000 0000h to FFFF FFFFh excluding reserved areas)
Maximum transfer volume		64M data units (maximum number of transfers in block transfer mode: 1,024 data units × 65,536 blocks)
DMA activation source		Selectable for each channel: • Software trigger • Interrupt requests from peripheral modules or trigger from external interrupt input pins.*1
Channel priority		Channel 0 > Channel 1 > Channel 2 > Channel 3... > Channel 7 (Channel 0: highest)
Transfer data	Single data	Bit length: 8, 16, 32 bits
	Block size	Number of data: 1 to 1,024
Transfer mode	Normal transfer mode	• One data transfer by one DMA transfer request • Selectable free running mode (total number of data transfers is not specified).
	Repeat transfer mode	• One data transfer by one DMA transfer request • Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination • Maximum settable repeat size: 1,024.
	Block transfer mode	• One data block transfer by one DMA transfer request • Maximum settable block size: 1,024 data.
Selective functions	Extended repeat area function	• Allows data to be transferred by repeating the address values in the specified range, with the upper bit values in the transfer address register remaining fixed • Area of 2 bytes to 128 MB individually selectable as the extended repeat area for transfer source and destination.
Interrupt request (DMACm_INT)	Transfer end interrupt	Generated on completion of transferring data volume specified in the transfer counter
	Transfer escape end interrupt	Generated when: • The repeat size of data transfer is complete • The source address of the extended repeat area overflows • The destination address of the extended repeat area overflows.
Event link activation (DMACm_INT)		An event link request is generated after each data transfer (for block transfer, after each block is transferred)
Module-stop function		Module-stop state can be set to reduce power consumption

Note 1. For details on DMAC activation sources, see Table 14.3, Interrupt vector table, in section 14, Interrupt Controller Unit (ICU).

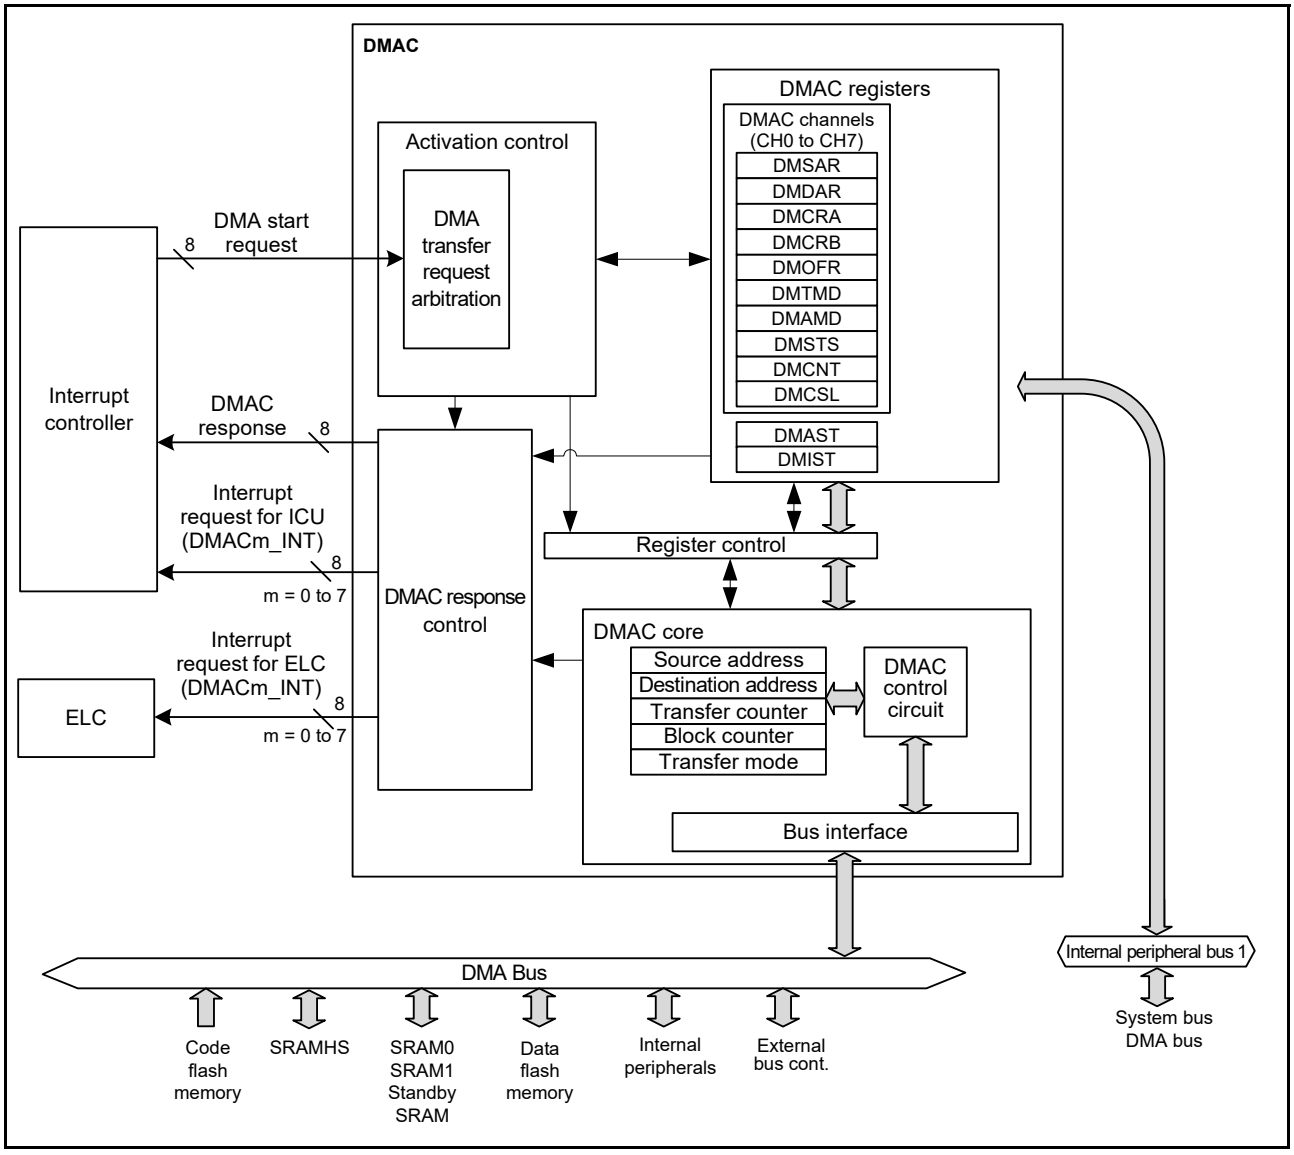

Figure 17.1 DMAC block diagram

17.2 Register Descriptions

17.2.1 DMA Source Address Register (DMSAR)

Address(es): DMAC0.DMSAR 4000 5000h, DMAC1.DMSAR 4000 5040h, DMAC2.DMSAR 4000 5080h, DMAC3.DMSAR 4000 50C0h, DMAC4.DMSAR 4000 5100h, DMAC5.DMSAR 4000 5140h, DMAC6.DMSAR 4000 5180h, DMAC7.DMSAR 4000 51C0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting range	R/W
b31 to b0	Specifies the transfer source start address.	0000 0000h to FFFF FFFFh (4 GB)	R/W

Set DMSAR while DMAC activation is disabled (the DMST bit in DMAST = 0) or DMA transfer is disabled (the DTE bit in DMCNT = 0).

Note: Address alignment in this register must match the transfer data size value selected in the SZ bit in DMTMD.

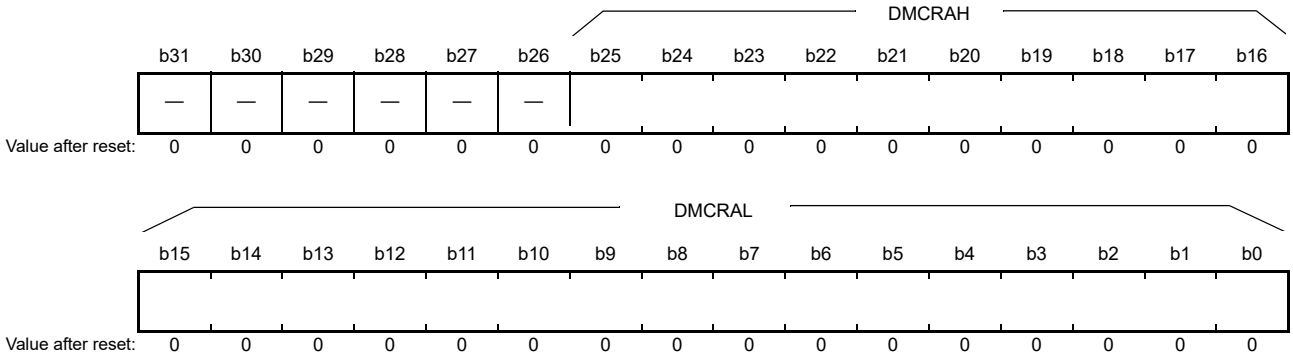
17.2.2 DMA Destination Address Register (DMDAR)

Address(es): DMAC0.DMDAR 4000 5004h, DMAC1.DMDAR 4000 5044h, DMAC2.DMDAR 4000 5084h, DMAC3.DMDAR 4000 50C4h, DMAC4.DMDAR 4000 5104h, DMAC5.DMDAR 4000 5144h, DMAC6.DMDAR 4000 5184h, DMAC7.DMDAR 4000 51C4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

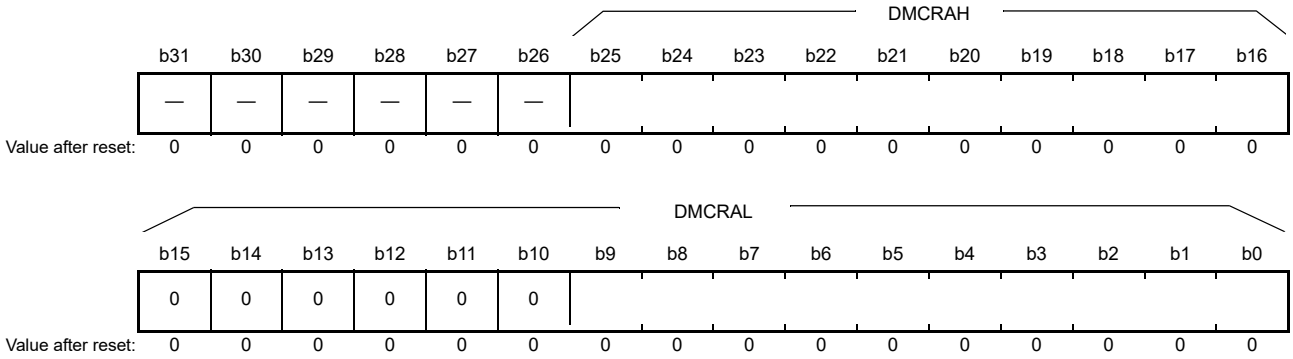
	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting range	R/W
b31 to b0	Specifies the transfer destination start address	0000 0000h to FFFF FFFFh (4 GB)	R/W



Set DMDAR while DMAC activation is disabled (the DMST bit in DMAST = 0) or DMA transfer is disabled (the DTE bit in DMCNT = 0).

Note: Address alignment in this register must match the transfer data size value selected in the SZ bit in DMTMD.



17.2.3 DMA Transfer Count Register (DMCRA)

Address(es): DMAC0.DMCRA 4000 5008h, DMAC1.DMCRA 4000 5048h, DMAC2.DMCRA 4000 5088h, DMAC3.DMCRA 4000 50C8h
DMAC4.DMCRA 4000 5108h, DMAC5.DMCRA 4000 5148h, DMAC6.DMCRA 4000 5188h, DMAC7.DMCRA 4000 51C8h

- Normal transfer mode

- Repeat transfer mode, block transfer mode

Symbol	Bit name	Description	R/W
DMCRAL	Lower bits of transfer count	Specifies the number of transfer operations.	R/W
DMCRAH	Upper bits of transfer count		R/W

Note: In repeat and block transfer modes, set the same value for DMCRAH and DMCRAL.

(1) Normal transfer mode (MD[1:0] bits in DMACm.DMTMD = 00b)

In normal transfer mode, DMCRAL functions as a 16-bit transfer counter. The number of transfer operations is one when the setting is 0001h, and 65,535 when it is FFFFh. The value is decremented by one each time data is transferred.
A setting of 0000h indicates an unspecified number of transfer operations. Data transfer is performed with the transfer counter stopped, that is, in free running mode.Do not use DMCRAH in normal transfer mode. Write 0000h to DMCRAH.

(2) Repeat transfer mode (MD[1:0] bits in DMACm.DMTMD = 01b)

In repeat transfer mode, DMCRAH specifies the repeat size and DMCRAL functions as a 10-bit transfer counter. The number of transfer operations is one when the setting is 001h, 1,023 when it is 3FFh, and 1,024 when it is 000h. In this mode, a value in the range of 000h to 3FFh (1 to 1,024) can be set for DMCRAH and DMCRAL.
Setting bits [15:10] in DMCRAL is invalid. Write 0 to these bits. The value in DMCRAL is decremented by one each time data is transferred until it reaches 000h, at which time the value in DMCRAH is loaded into DMCRAL.

(3) Block transfer mode (MD[1:0] bits in DMACm.DMTMD = 10b)

In block transfer mode, DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter. The block size is one when the setting is 001h, 1,023 when it is 3FFh, and 1,024 when it is 000h. In this mode, a value in the range of 000h to 3FFh can be set for DMCRAH and DMCRAL.
Setting bits [15:10] in DMCRAL is invalid. Write 0 to these bits. The value in DMCRAL is decremented by one each time data is transferred until it reaches 000h, at which time the value in DMCRAH is loaded into DMCRAL.

17.2.4 DMA Block Transfer Count Register (DMCRB)

Address(es): DMAC0.DMCRB 4000 500Ch, DMAC1.DMCRB 4000 504Ch, DMAC2.DMCRB 4000 508Ch, DMAC3.DMCRB 4000 50CCh, DMAC4.DMCRB 4000 510Ch, DMAC5.DMCRB 4000 514Ch, DMAC6.DMCRB 4000 518Ch, DMAC7.DMCRB 4000 51CCh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting range	R/W
b15 to b0	Specifies the number of block or repeat transfer operations	0001h to FFFFh (1 to 65,535) 0000h (65,536).	R/W

DMCRB specifies the number of operations in block and repeat transfer modes. The number of transfer operations is one when the setting is 0001h, 65,535 when it is FFFFh, and 65,536 when it is 0000h.

In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred. In block transfer mode, the value is decremented by one when the final data of one block size is transferred. Do not use DMCRB in normal transfer mode as the setting is invalid.

17.2.5 DMA Transfer Mode Register (DMTMD)

Address(es): DMAC0.DMTMD 4000 5010h, DMAC1.DMTMD 4000 5050h, DMAC2.DMTMD 4000 5090h, DMAC3.DMTMD 4000 50D0h, DMAC4.DMTMD 4000 5110h, DMAC5.DMTMD 4000 5150h, DMAC6.DMTMD 4000 5190h, DMAC7.DMTMD 4000 51D0h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MD[1:0]		DTS[1:0]		—	—	SZ[1:0]		—	—	—	—	—	—	DCTG[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	DCTG[1:0]	Transfer Request Source Select	b1 b0 0 0: Software 0 1: Interrupts*1 from peripheral modules or external interrupt input pins 1 0: Setting prohibited 1 1: Setting prohibited.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9, b8	SZ[1:0]	Transfer Data Size Select	b9 b8 0 0: 8 bits 0 1: 16 bits 1 0: 32 bits 1 1: Setting prohibited.	R/W
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13, b12	DTS[1:0]	Repeat Area Select	b13 b12 0 0: Specify destination as the repeat area or block area 0 1: Specify source as the repeat area or block area 1 0: Do not specify repeat area or block area 1 1: Setting prohibited.	R/W
b15, b14	MD[1:0]	Transfer Mode Select	b15 b14 0 0: Normal transfer 0 1: Repeat transfer 1 0: Block transfer 1 1: Setting prohibited.	R/W

Note 1. To select the DMAC activation source, use the DELSRn registers of the ICU. For details on DMAC activation sources, see Table 14.4, Event table in section 14, Interrupt Controller Unit (ICU).

DTS[1:0] bits (Repeat Area Select)

The DTS[1:0] bits select either the source or destination as the repeat area in repeat transfer mode and the block area in block transfer mode. In normal transfer mode, these bit settings are invalid.

17.2.6 DMA Interrupt Setting Register (DMINT)

Address(es): DMAC0.DMINT 4000 5013h, DMAC1.DMINT 4000 5053h, DMAC2.DMINT 4000 5093h, DMAC3.DMINT 4000 50D3h, DMAC4.DMINT 4000 5113h, DMAC5.DMINT 4000 5153h, DMAC6.DMINT 4000 5193h, DMAC7.DMINT 4000 51D3h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	DTIE	ESIE	RPTIE	SARIE	DARIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DARIE	Destination Address Extended Repeat Area Overflow Interrupt Enable	0: Disable 1: Enable.	R/W
b1	SARIE	Source Address Extended Repeat Area Overflow Interrupt Enable	0: Disable 1: Enable.	R/W
b2	RPTIE	Repeat Size End Interrupt Enable	0: Disable 1: Enable.	R/W
b3	ESIE	Transfer Escape End Interrupt Enable	0: Disable 1: Enable.	R/W
b4	DTIE	Transfer End Interrupt Enable	0: Disable 1: Enable.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

DARIE bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow occurs on the destination address while the DARIE bit is set to 1, the DTE bit in DMCNT clears to 0. At the same time, the ESIF flag in DMSTS is set to 1 to indicate an interrupt request triggered by an extended repeat area overflow on the destination address.

When block transfer mode is used with the extended repeat area function, an interrupt occurs after completion of a 1-block size transfer. When the DTE bit is set to 1 in DMACm.DMCNT of the channel associated with the stopped transfer, the transfer resumes from the state it was in when the transfer stopped.

If the extended repeat area is not specified for the destination address, this bit is ignored.

SARIE bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow occurs on the source address while the SARIE bit is set to 1, the DTE bit in DMCNT clears to 0. At the same time, the ESIF flag in DMSTS is set to 1 to indicate an interrupt request triggered by an extended repeat area overflow on the source address.

When block transfer mode is used with the extended repeat area function, an interrupt occurs after completion of a 1-block size transfer. When the DTE bit is set to 1 in DMACm.DMCNT of the channel associated with the stopped transfer, the transfer resumes from the state it was in when the transfer stopped.

If the extended repeat area is not specified for the source address, this bit is ignored.

RPTIE bit (Repeat Size End Interrupt Enable)

When the RPTIE bit is set to 1 in repeat transfer mode, the DTE bit in DMCNT clears to 0 after completion of a 1-repeat size data transfer. At the same time, the ESIF flag in DMSTS is set to 1 to indicate that the repeat size end interrupt request occurred. The repeat size end interrupt request can be generated even when the DTS[1:0] bits in DMTMD are 10b (repeat area or block area is not specified).

When the RPTIE bit is set to 1 in block transfer mode, the DTE bit in DMCNT clears to 0 after completion of a 1-block data transfer in the same way as repeat transfer mode. At the same time, the ESIF flag in DMSTS is set to 1 to indicate that the repeat size end interrupt request occurred. The repeat size end interrupt request can be generated even when the DTS[1:0] bits in DMTMD are 10b (repeat area or block area is not specified).

ESIE bit (Transfer Escape End Interrupt Enable)

The ESIE bit enables the transfer escape end interrupt requests (repeat size end interrupt request and extended repeat area overflow interrupt request) that occur during DMA transfer. The interrupt occurs when this bit is 1 and the ESIF flag in DMSTS is set to 1. To clear the transfer escape end interrupt, clear this bit or the ESIF flag in DMSTS to 0.

DTIE bit (Transfer End Interrupt Enable)

The DTIE bit enables the transfer end interrupt request that occurs on completion of a specified number of data transfers. The interrupt occurs when this bit is 1 and the DTIF flag in DMSTS is set to 1. To clear the transfer end interrupt, clear this bit or the DTIF flag in DMSTS to 0.

17.2.7 DMA Address Mode Register (DMAMD)

Address(es): DMAC0.DMAMD 4000 5014h, DMAC1.DMAMD 4000 5054h, DMAC2.DMAMD 4000 5094h, DMAC3.DMAMD 4000 50D4h, DMAC4.DMAMD 4000 5114h, DMAC5.DMAMD 4000 5154h, DMAC6.DMAMD 4000 5194h, DMAC7.DMAMD 4000 51D4h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SM[1:0]		—	SARA[4:0]					DM[1:0]		—	DARA[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b4 to b0	DARA[4:0]	Destination Address Extended Repeat Area	Specifies the extended repeat area on the destination address. For details on the settings, see Table 17.2.	R/W
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7, b6	DM[1:0]	Destination Address Update Mode	b7 b6 0 0: Fixed address 0 1: Offset addition 1 0: Incremented address 1 1: Decremented address.	R/W
b12 to b8	SARA[4:0]	Source Address Extended Repeat Area	Specifies the extended repeat area on the source address. For details on the settings, see Table 17.2.	R/W
b13	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b15, b14	SM[1:0]	Source Address Update Mode	b15 b14 0 0: Fixed address 0 1: Offset addition 1 0: Incremented address 1 1: Decremented address.	R/W

DARA[4:0] bits (Destination Address Extended Repeat Area)

The DARA[4:0] bits specify the extended repeat area on the destination address. The extended repeat area function is realized through an update of the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 MB.

The start address of the extended repeat area is set when the lower address overflows the extended repeat area on an address increment. Similarly, the end address of the extended repeat area is set when the lower address underflows the extended repeat area on an address decrement.

Do not specify the extended repeat area on the destination address when a repeat or block area is specified as the transfer destination. When repeat or block transfer is selected, and when DMACm.DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat or block area), write 00000b in the DARA[4:0] bits.

To request an interrupt when an overflow or underflow occurs in the extended repeat area, set the DARIE bit in DMINT to 1. Table 17.2 lists the extended repeat areas associated with each setting.

DM[1:0] bits (Destination Address Update Mode)

The DM[1:0] bits select the update mode for the destination address.

- When increment is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the destination address is incremented by 1, 2, and 4, respectively
- When decrement is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the destination address is decremented by 1, 2, and 4, respectively
- When offset addition is selected, the offset specified in the DMACm.DMOFR register is added to the address.

SARA[4:0] bits (Source Address Extended Repeat Area)

The SARA[4:0] bits specify the extended repeat area on the source address. The extended repeat area function is realized through an update of the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 MB.

The start address of the extended repeat area is set when the lower address overflows the extended repeat area on an address increment. Similarly, the end address of the extended repeat area is set when the lower address underflows the extended repeat area on an address decrement.

Do not specify the extended repeat area on the source address when a repeat or block area is specified as the transfer source. When repeat or block transfer is selected, and when DMACm.DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat or block area), write 00000b in the SARA[4:0] bits.

To request an interrupt when an overflow or underflow occurs in the extended repeat area, set the SARIE bit in DMINT to 1. Table 17.2 lists the extended repeat areas associated with each setting.

SM[1:0] bits (Source Address Update Mode)

The SM[1:0] bits select the update mode for the source address.

- When increment is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the source address is incremented by 1, 2, and 4, respectively
- When decrement is selected and the SZ[1:0] bits in DMTMD are set to 00b, 01b, and 10b, the source address is decremented by 1, 2, and 4, respectively
- When offset addition is selected, the offset specified in the DMACm.DMOFR register is added to the address.

.

Table 17.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (1 of 2)

SARA4 to SARA0 or DARA4 to DARA0	Extended repeat area
00000b	Not specified
00001b	2 bytes specified as extended repeat area by the lower 1 bit of the address
00010b	4 bytes specified as extended repeat area by the lower 2 bits of the address
00011b	8 bytes specified as extended repeat area by the lower 3 bits of the address
00100b	16 bytes specified as extended repeat area by the lower 4 bits of the address
00101b	32 bytes specified as extended repeat area by the lower 5 bits of the address
00110b	64 bytes specified as extended repeat area by the lower 6 bits of the address
00111b	128 bytes specified as extended repeat area by the lower 7 bits of the address
01000b	256 bytes specified as extended repeat area by the lower 8 bits of the address
01001b	512 bytes specified as extended repeat area by the lower 9 bits of the address
01010b	1 KB specified as extended repeat area by the lower 10 bits of the address

17.2.8 DMA Offset Register (DMOFR)

Address(es): DMAC0.DMOFR 4000 5018h, DMAC1.DMOFR 4000 5058h, DMAC2.DMOFR 4000 5098h, DMAC3.DMOFR 4000 50D8h, DMAC4.DMOFR 4000 5118h, DMAC5.DMOFR 4000 5158h, DMAC6.DMOFR 4000 5198h, DMAC7.DMOFR 4000 51D8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting range	R/W
b31 to b0	Specifies the offset when offset addition is selected as the address update mode for transfer source or destination	0000 0000h to 00FF FFFFh (0 bytes to (16 MB - 1 byte)) FF00 0000h to FFFF FFFFh (-16 MB to -1 byte).	R/W

Only write to this register while DMAC operation is stopped or DMA transfer is disabled, not during data transfer. Setting bits [31:25] is invalid. The value in bit [24] is extended to bits [31:25]. Reading DMOFR returns the extended value.

17.2.9 DMA Transfer Enable Register (DMCNT)

Address(es): DMAC0.DMCNT 4000 501Ch, DMAC1.DMCNT 4000 505Ch, DMAC2.DMCNT 4000 509Ch, DMAC3.DMCNT 4000 50DCh, DMAC4.DMCNT 4000 511Ch, DMAC5.DMCNT 4000 515Ch, DMAC6.DMCNT 4000 519Ch, DMAC7.DMCNT 4000 51DCh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DTE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DTE	DMA Transfer Enable	0: Disable 1: Enable.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

DTE bit (DMA Transfer Enable)

The DTE bit enables DMA transfer. To enable DMA transfer, set the DMST bit in DMAST to 1 to enable DMAC activation, then set the DTE bit to 1 to enable DMA transfer for the associated channel.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit
- When the specified volume of data transfer is complete
- When DMA transfer is stopped by a repeat size end interrupt
- When DMA transfer is stopped by an extended repeat area overflow interrupt.

17.2.10 DMA Software Start Register (DMREQ)

Address(es): DMAC0.DMREQ 4000 501Dh, DMAC1.DMREQ 4000 505Dh, DMAC2.DMREQ 4000 509Dh, DMAC3.DMREQ 4000 50DDh, DMAC4.DMREQ 4000 511Dh, DMAC5.DMREQ 4000 515Dh, DMAC6.DMREQ 4000 519Dh, DMAC7.DMREQ 4000 51DDh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CLRS	—	—	—	SWREQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SWREQ	DMA Software Start	0: Do not request DMA transfer 1: Request DMA transfer.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	CLRS	DMA Software Start Bit Auto Clear Select	0: Clear SWREQ bit after DMA transfer is started by software 1: Do not clear SWREQ bit after DMA transfer is started by software.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SWREQ bit (DMA Software Start)

Writing 1 to the SWREQ bit generates a DMA transfer request. After DMA transfer starts in response, SWREQ clears to 0 if the CLRS bit is 0.

SWREQ does not clear to 0 if CLRS is 1. A DMA transfer request is issued again after completion of the transfer.

Note: Setting this bit is valid and DMA transfer by software is enabled only when the DCTG[1:0] bits in DMTMD are set to 00b, specifying software as the DMA activation source. Setting this bit is invalid when the DCTG[1:0] bits in DMTMD are set to any value other than 00b.

To start DMA transfer by software with the CLRS bit set to 0, ensure that the SWREQ bit is 0, then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started with the CLRS bit set to 0 (the SWREQ bit is cleared after DMA transfer is started by software)
- When 0 is written to this bit.

CLRS bit (DMA Software Start Bit Auto Clear Select)

When an SWREQ setting of 1 triggers a transfer request, the CLRS bit specifies whether to clear the SWREQ bit to 0 after DMA transfer starts in response:

- When CLRS is set to 0, SWREQ clears to 0 after DMA transfer starts.
- When CLRS is set to 1, SWREQ does not clear to 0. A DMA transfer request is issued again after completion of the transfer.

17.2.11 DMA Status Register (DMSTS)

Address(es): DMAC0.DMSTS 4000 501Eh, DMAC1.DMSTS 4000 505Eh, DMAC2.DMSTS 4000 509Eh, DMAC3.DMSTS 4000 50DEh, DMAC4.DMSTS 4000 511Eh, DMAC5.DMSTS 4000 515Eh, DMAC6.DMSTS 4000 519Eh, DMAC7.DMSTS 4000 51DEh

	b7	b6	b5	b4	b3	b2	b1	b0
	ACT	—	—	DTIF	—	—	—	ESIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ESIF	Transfer Escape End Interrupt Flag	0: No interrupt occurred 1: Interrupt occurred.	R/W*1
b3 to b1	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b4	DTIF	Transfer End Interrupt Flag	0: No interrupt occurred 1: Interrupt occurred.	R/W*1
b6, b5	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	ACT	DMA Active Flag	0: DMAC operation suspended 1: DMAC operating.	R

Note 1. Only 0 can be written, to clear the flag.

ESIF flag (Transfer Escape End Interrupt Flag)

The ESIF flag indicates that a transfer escape end interrupt occurred.

[Setting conditions]

- In repeat transfer mode, when one repeat size data transfer completes with the RPTIE bit in DMINT set to 1
- In block transfer mode, when one block data transfer completes with the RPTIE bit in DMINT set to 1
- When an extended repeat area overflow on the source address occurs with the SARIE bit in DMINT set to 1, and the SARA[4:0] bits in DMAMD set to any value other than 00000b (extended repeat area is specified on the transfer source address)
- When an extended repeat area overflow on the destination address occurs with the DARIE bit in DMINT set to 1, and the DARA[4:0] bits in DMAMD set to any value other than 00000b (extended repeat area is specified on the transfer destination address).

[Clearing conditions]

- When 0 is written to this flag
- When 1 is written to the DTE bit in DMCNT.

DTIF flag (Transfer End Interrupt Flag)

The DTIF flag indicates that a transfer end interrupt occurred.

[Setting conditions]

- In normal transfer mode, when the specified number of unit transfers completes (the value of DMCRAL becomes 0 on completion of transfer)
- In repeat transfer mode, when the specified number of repeat transfer operations completes (the value of DMCRB becomes 0 on completion of transfer)
- In block transfer mode, when the specified number of blocks is transferred (the value of DMCRB becomes 0 on completion of transfer).

[Clearing conditions]

- When 0 is written to this flag
- When 1 is written to the DTE bit in DMCNT.

ACT flag (DMA Active Flag)

The ACT flag indicates whether the DMAC is in the idle or active state.

[Setting condition]

- When the DMAC starts a data transfer.

[Clearing condition]

- When the data transfer in response to one transfer request completes.

17.2.12 DMACA Module Activation Register (DMAST)

Address(es): DMA.DMAST 4000 5200h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DMST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DMST	DMAC Operation Enable	0: Disable 1: Enable.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

DMST bit (DMAC Operation Enable)

Setting the DMST bit to 1 enables DMAC activation for all channels. When the DMST bit is set to 1 (DMAC activation is enabled), and 1 is written to the DMACm.DMCNT.DTE bit (DMA transfer is enabled) for multiple channels, all of the associated channels can be placed in the transfer request ready state at the same time.

When the DMST bit is cleared to 0 during DMA transfer, DMA transfer is suspended after the current data transfer corresponding to a single transfer request completes. To resume DMA transfer, set the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit.

[Clearing condition]

- When 0 is written to this bit.

17.3 Operation

17.3.1 Transfer Mode

(1) Normal transfer mode

n normal transfer mode, one data unit is transferred for one transfer request. You can specify the number of transfer operations, up a maximum of 65,535, in DMACm.DMCRAL. When these bits are set to 0000h, no number of operations is specified and data transfer is performed with the transfer counter stopped (free running mode).

A transfer end interrupt request can be generated after completion of the specified number of transfer operations, except when data transfers are occurring in free running mode.

Setting DMACm.DMCRB is invalid in normal transfer mode.

Table 17.3 summarizes the register update operation in normal transfer mode.

Table 17.3 Register update operation in normal transfer mode

Register	Function	Update operation after completion of a transfer for one transfer request
DMACm.DMSAR	Transfer source address	Increment, decrement, fixed, or offset addition
DMACm.DMDAR	Transfer destination address	Increment, decrement, fixed, or offset addition
DMACm.DMCRAL	Transfer count	Decremented by one or not updated (in free running mode)
DMACm.DMCRAH	-	Not updated (not used in normal transfer mode)
DMACm.DMCRB	-	Not updated (not used in normal transfer mode)

Figure 17.2 shows the operation in normal transfer mode.

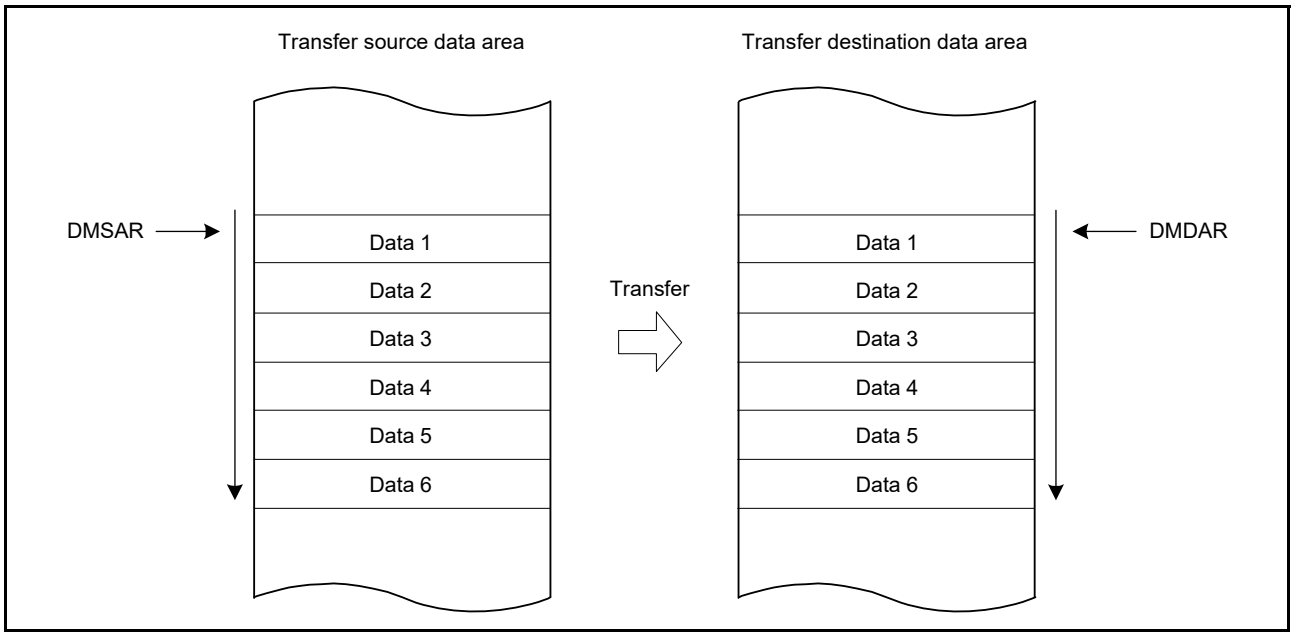

Figure 17.2 Operation in normal transfer mode

(2) Repeat transfer mode

In repeat transfer mode, one data unit is transferred for one transfer request. You can set the total data transfer size up to a maximum of 64M data units (1K data units × 64K repeat transfers). To do this, set a maximum of 1K data units as the total repeat transfer size in DMACm.DMCRA, and set a maximum of 64K as the number of repeat transfers in DMACm.DMCRB.

You can specify either the transfer source or destination as a repeat area. When transfer of the repeat size data is complete, the address of the specified repeat area (DMSAR or DMDAR in DMACm) returns to the transfer start address. In this mode, when all data of the specified repeat size is transferred, you can stop DMA transfer and request a repeat size end interrupt. To resume DMA transfer, write 1 to the DTE bit in DMACm.DMCNT during repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of repeat transfers.

Table 17.4 summarizes the register update operation in repeat transfer mode, and Figure 17.3 shows the operation in repeat transfer mode.

Table 17.4 Register update operation in repeat transfer mode

		Update operation after completion of a transfer for one transfer request	
Register	**Function**	**When DMACm.DMCRAL is not 1**	**When DMACm.DMCRAL is 1 (transfer of the last repeat size data unit)**
DMACm.DMSAR	Transfer source address	Increment, decrement, fixed, or offset addition	• DMACm.DMTMD.DTS[1:0] = 00b Increment, decrement, fixed, or offset addition • DMACm.DMTMD.DTS[1:0] = 01b Initial value of DMACm.DMSAR • DMACm.DMTMD.DTS[1:0] = 10b Increment, decrement, fixed, or offset addition
DMACm.DMDAR	Transfer destination address	Increment, decrement, fixed, or offset addition	• DMACm.DMTMD.DTS[1:0] = 00b Initial value of DMACm.DMDAR • DMACm.DMTMD.DTS[1:0] = 01b Increment, decrement, fixed, or offset addition • DMACm.DMTMD.DTS[1:0] = 10b Increment, decrement, fixed, or offset addition
DMACm.DMCRAH	Repeat size	Not updated	Not updated
DMACm.DMCRAL	Transfer count	Decremented by one	DMACm.DMCRAH
DMACm.DMCRB	Count of repeat transfer operations	Not updated	Decremented by one

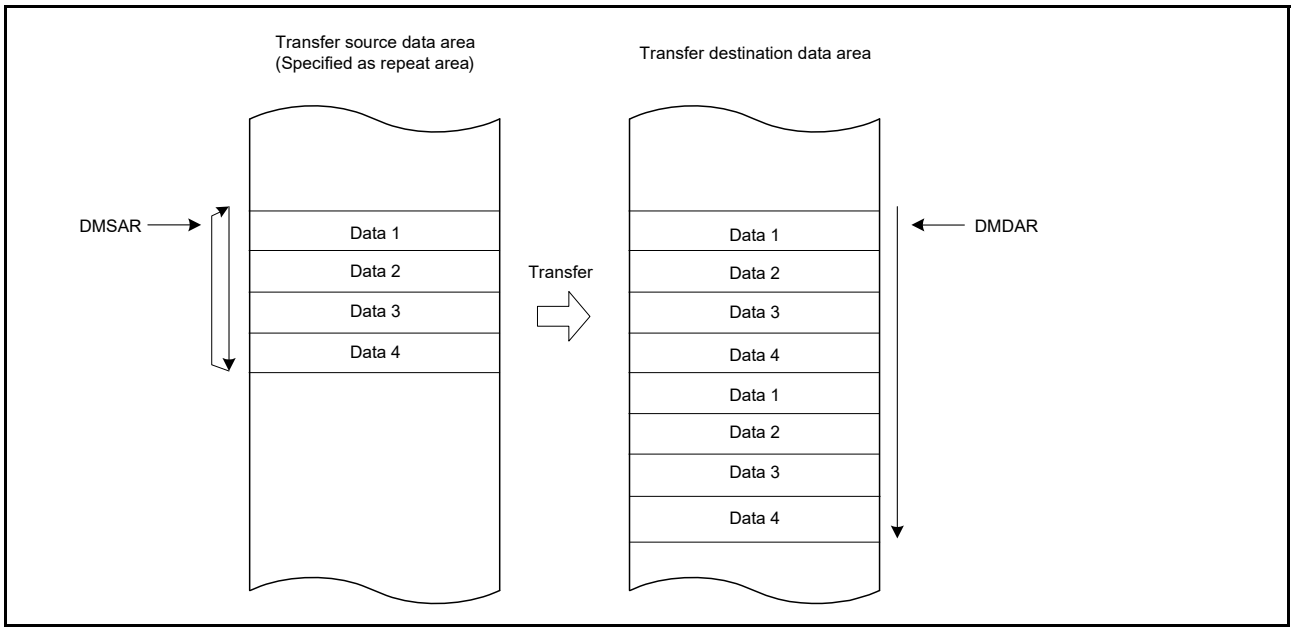

Figure 17.3 Operation in repeat transfer mode

(3) Block transfer mode

In block transfer mode, a single data block is transferred for one transfer request. You can set the total data transfer size up to a maximum of 64M data units (1K data units × 64K block transfers). To do this, set a maximum of 1K data units as the total block transfer size in DMACm.DMCRA, and set a maximum of 64K as the number of block transfers in DMACm.DMCRB.

You can specify either the transfer source or destination as a block area. When transfer of a single data block is complete, the address of the specified block area (DMSAR or DMDAR in DMACm) returns to the transfer start address. In this mode, when all data in a single block is transferred, you can stop DMA transfer and request a repeat size end interrupt. To resume DMA transfer, write 1 to the DTE bit in DMACm.DMCNT during repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of block transfers.

Table 17.5 summarizes the register update operation in block transfer mode, and Figure 17.4 shows the operation in block transfer mode.

Table 17.5 Register update operation in block transfer mode

Register	Function	Update operation after completion of single-block transfer for one transfer request
DMACm.DMSAR	Transfer source address	• DMACm.DMTMD.DTS[1:0] = 00b Increment, decrement, fixed, or offset addition • DMACm.DMTMD.DTS[1:0] = 01b Initial value of DMACm.DMSAR • DMACm.DMTMD.DTS[1:0] = 10b Increment, decrement, fixed, or offset addition.
DMACm.DMDAR	Transfer destination address	• DMACm.DMTMD.DTS[1:0] = 00b Initial value of DMACm.DMDAR • DMACm.DMTMD.DTS[1:0] = 01b Increment, decrement, fixed, or offset addition • DMACm.DMTMD.DTS[1:0] = 10b Increment, decrement, fixed, or offset addition.
DMACm.DMCRAH	Block size	Not updated
DMACm.DMCRAL	Transfer count	DMACm.DMCRAH
DMACm.DMCRB	Count of block transfer operations	Decremented by one

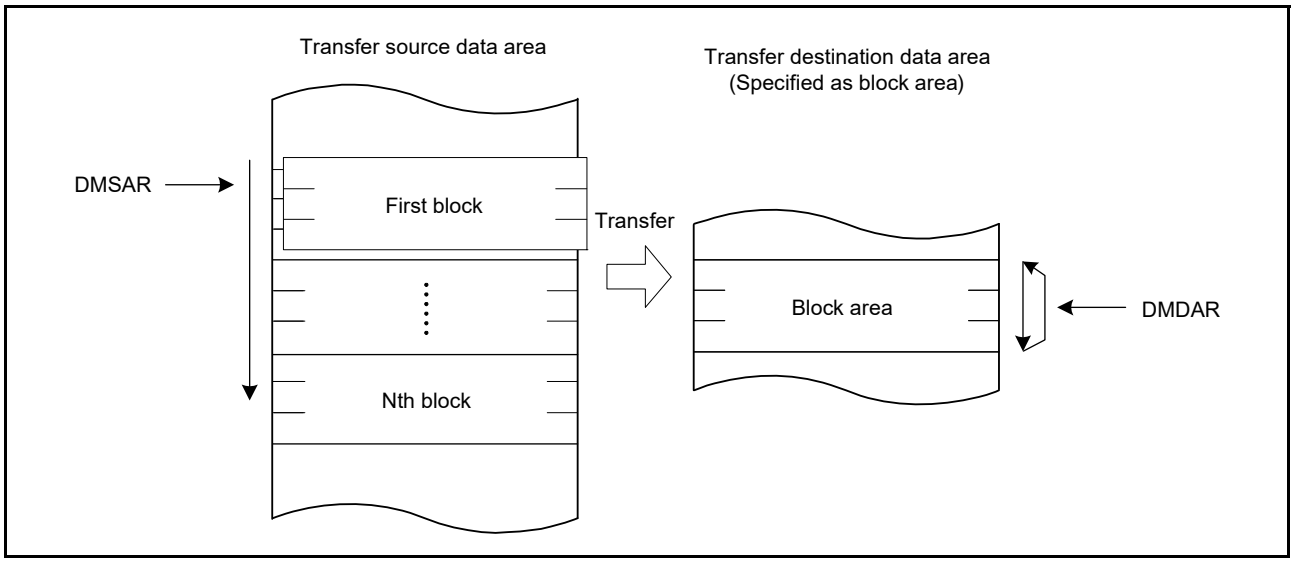

Figure 17.4 Operation in block transfer mode

17.3.2 Extended Repeat Area Function

The DMAC supports extended repeat areas on the transfer source and destination addresses, specified separately in the transfer source address register (DMSAR) and transfer destination address register (DMDAR) of DMACm. When this function is set, the address registers repeatedly indicate the addresses of the specified extended repeat areas. The extended repeat area on the source address is specified in the SARA[4:0] bits in DMACm.DMAMD.

The extended repeat area on the destination address is specified in the DARA[4:0] bits in DMACm.DMAMD. You can specify different sizes for the source and destination. However, you must not specify a transfer source or destination that is set as the repeat or block area as the extended repeat area.

When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an extended repeat area overflow interrupt can be requested. When an overflow occurs in the extended repeat area on the transfer source while the SARIE bit in DMACm.DMINT is set to 1, the ESIF flag in DMACm.DMSTS is set to 1 and the DTE bit in DMACm.DMCNT is set to 0 to stop DMA transfer. At this point, if the ESIE bit in DMACm.DMINT is set to 1, an extended repeat area overflow interrupt is requested. When the DARIE bit in DMACm.DMINT is set to 1, the destination address register becomes a target for the function. To resume DMA transfer, write 1 to the DTE bit in DMACm.DMCNT during interrupt handling.

Figure 17.5 shows an example of the extended repeat area operation.

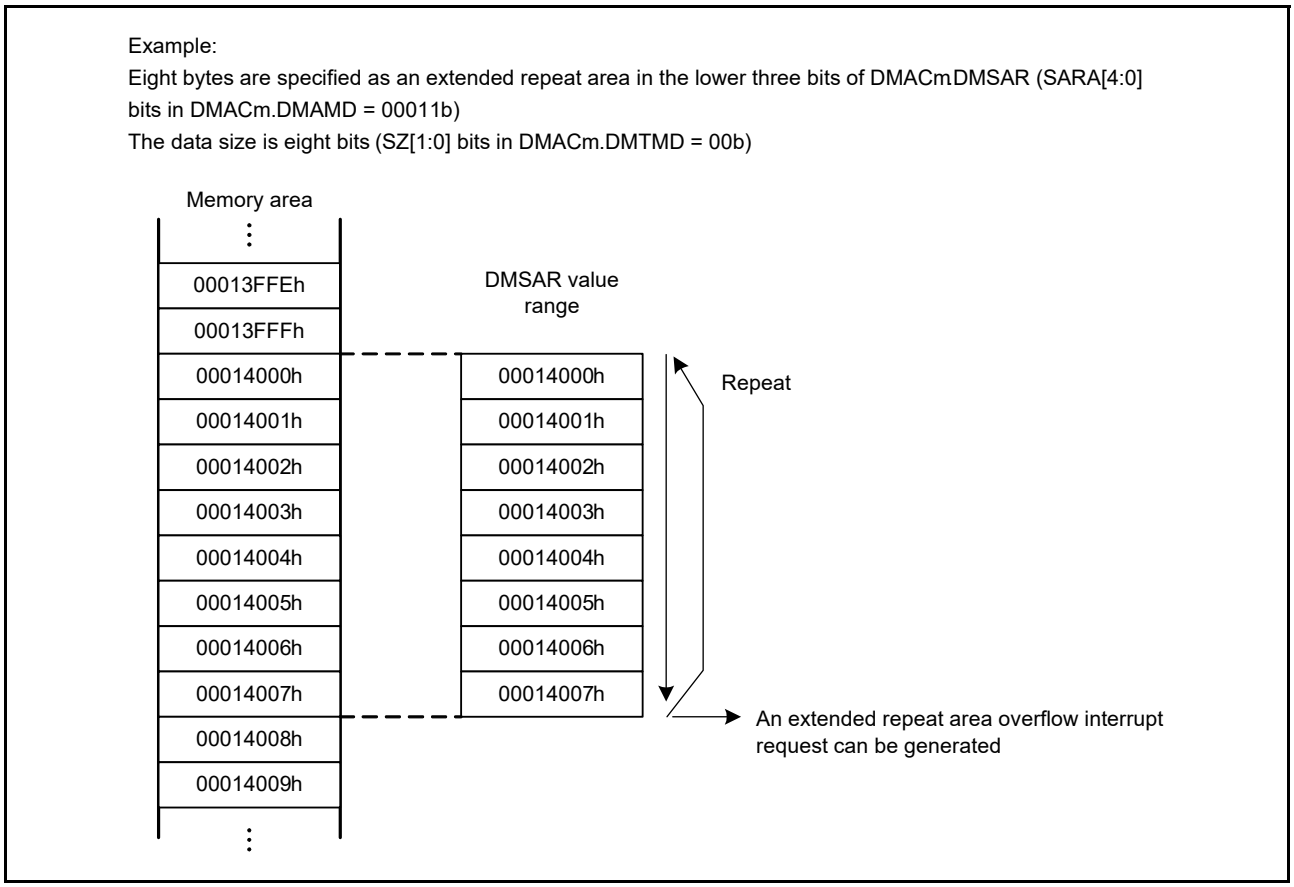

Figure 17.5 Example of extended repeat area operation

When using extended repeat area overflow interrupts in block transfer mode, take the following points into consideration:

- When a transfer is stopped by an extended repeat area overflow interrupt, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the overflow interrupt is suspended until transfer of the block is complete, and the transfer overruns.

Figure 17.6 shows an example of using the extended repeat area function in block transfer mode.

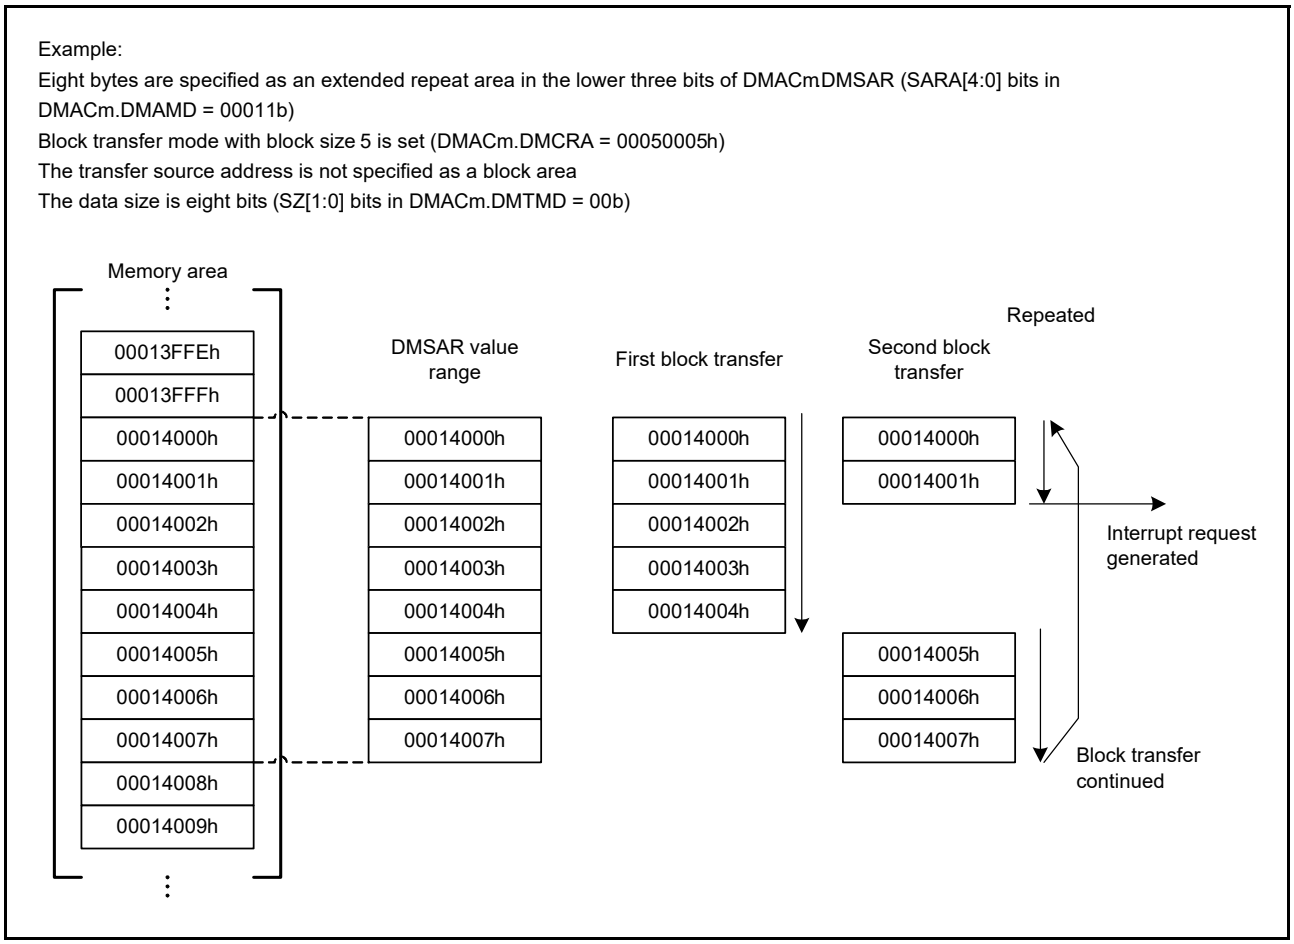

Figure 17.6 Example of extended repeat area function in block transfer mode

17.3.3 Address Update Function Using Offset

The source and destination addresses can be updated by fixing, incrementing, decrementing, or adding an offset. When offset addition is selected, the offset specified in the DMA Offset Register (DMACm.DMOFR) is added to the address every time the DMAC performs one data transfer. You can also subtract an offset by setting a negative value in DMACm.DMOFR. The negative value must be in two's complement.

Table 17.6 shows the address update method in each address update mode.

Table 17.6 Address update method in each address update mode

Address update mode	Settings of DMACm.DMAMD.SM[1:0] and DMACm.DMAMD.DM[1:0] for address update modes	Address update method for different SZ[1:0] settings in DMACm.DMTMD		
		SZ[1:0] = 00b	SZ[1:0] = 01b	SZ[1:0] = 10b
Address fixed	00b	Fixed		
Offset addition	01b	+DMACm.DMOFR*1		
Increment	10b	+1	+2	+4
Decrement	11b	-1	-2	-4

Note 1. When setting a negative value in the DMA Offset Register, the value must be in two's complement, obtained by the following formula:
two's complement of a negative offset value = ~ (offset) + 1 (~: bit inversion)

(1) Basic transfer using offset addition

Figure 17.7 shows an example of address updating using offset addition.

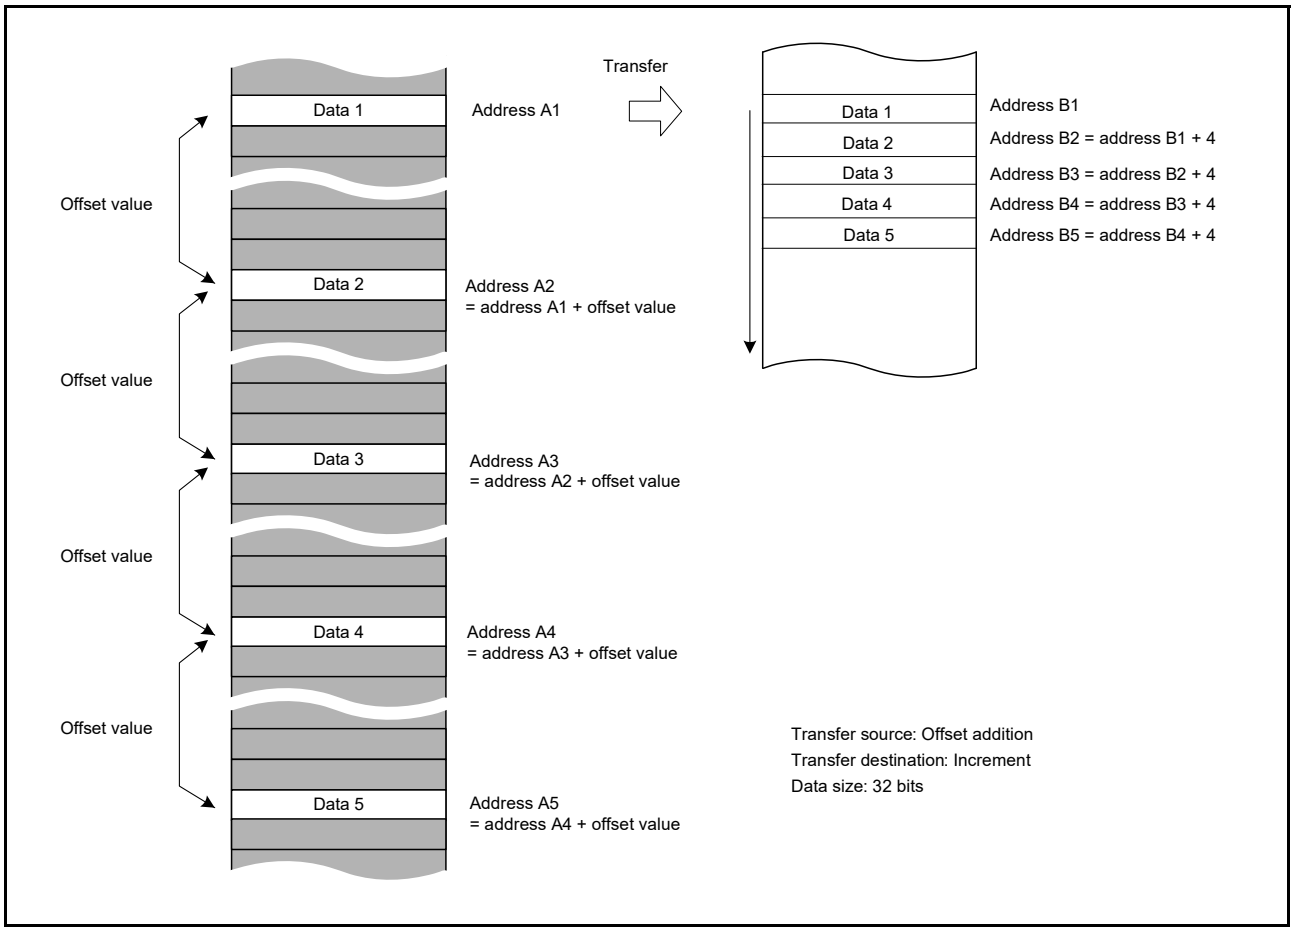

Figure 17.7 Example of address updating through offset addition

In Figure 17.7:

- The transfer data is 32 bits long
- Offset addition is set as the transfer source address update mode
- Increment is set as the transfer destination address update mode.

The second and subsequent data units are each read from the source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to continuous locations on the destination.

(2) Example of XY conversion using offset addition

Figure 17.8 shows XY conversion using offset addition in repeat transfer mode. The settings are as follows:

- DMAC0.DMAMD — Transfer source address update mode: offset addition
- DMAC0.DMAMD — Transfer destination address update mode: destination address is incremented
- DMAC0.DMTMD — Transfer data size select: 32 bits
- DMAC0.DMTMD — Transfer mode select: repeat transfer
- DMAC0.DMTMD — Repeat area select: the source is specified as the repeat area
- DMAC0.DMOFR — Offset address: 10h
- DMAC0.DMCRA — Repeat size: 4h
- DMAC0.DMINT — The repeat size end interrupt is enabled.

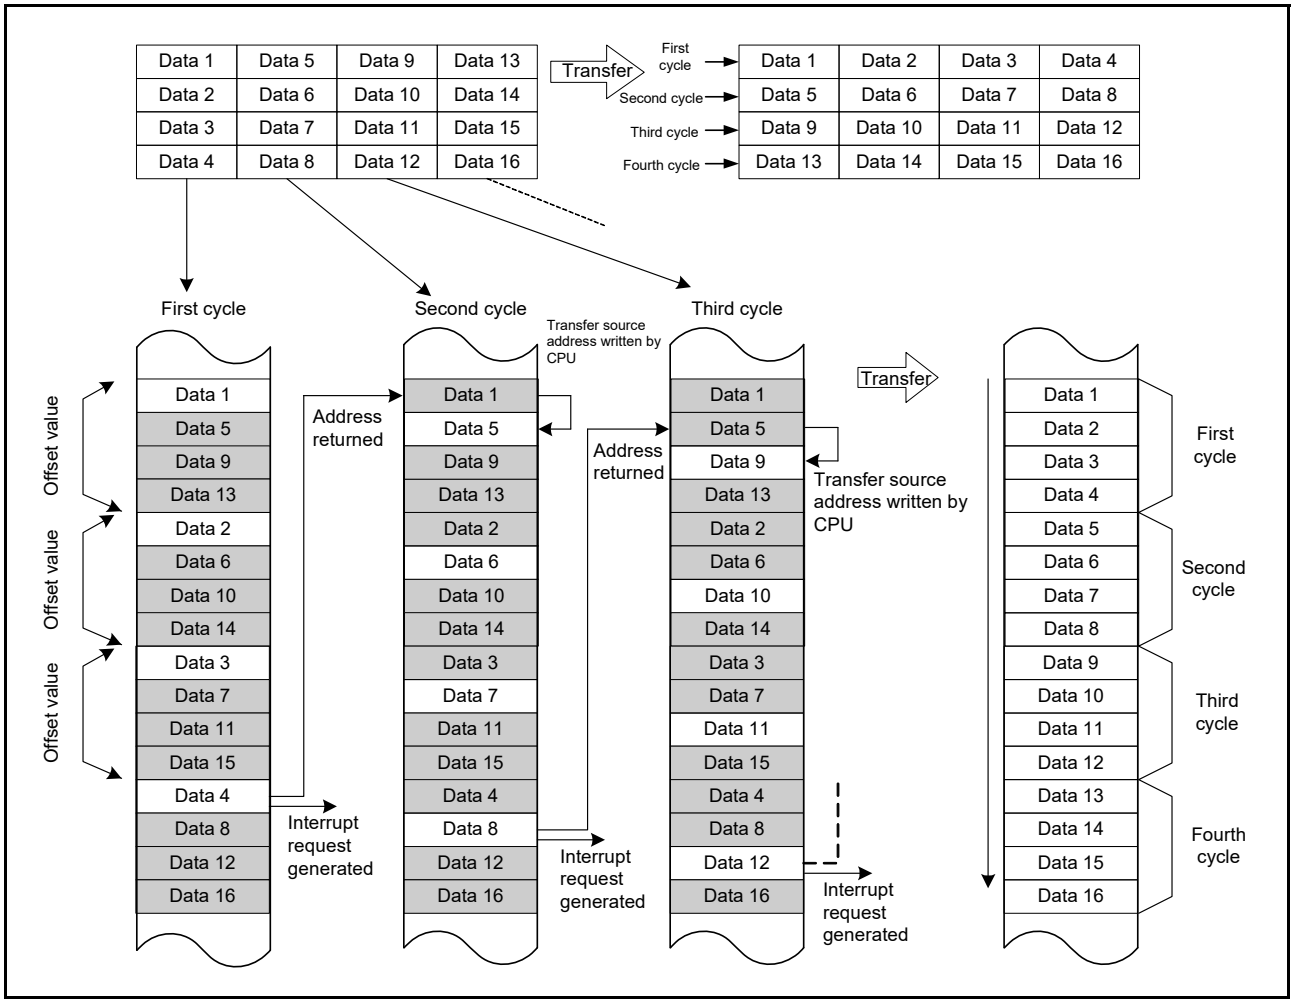

Figure 17.8 XY conversion operation using offset addition in repeat transfer mode

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to continuous destination addresses. When data 4 is transferred:

- The repeat size of the transfers is complete
- The transfer source address returns to the transfer start address (the address of data 1 on the transfer source)
- A repeat size end interrupt is requested.

During the time this interrupt pauses the transfer, perform the following:

- DMAC0.DMSAR — Rewrite the DMA transfer source address to the address of data 5 (in this example, the data 1 address + 4).
- DMAC0.DMCNT — Set the DTE bit to 1.

The DMA transfer resumes from the state when the DMA transfer was stopped. The same operations are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 17.9 shows the flow of the XY conversion.

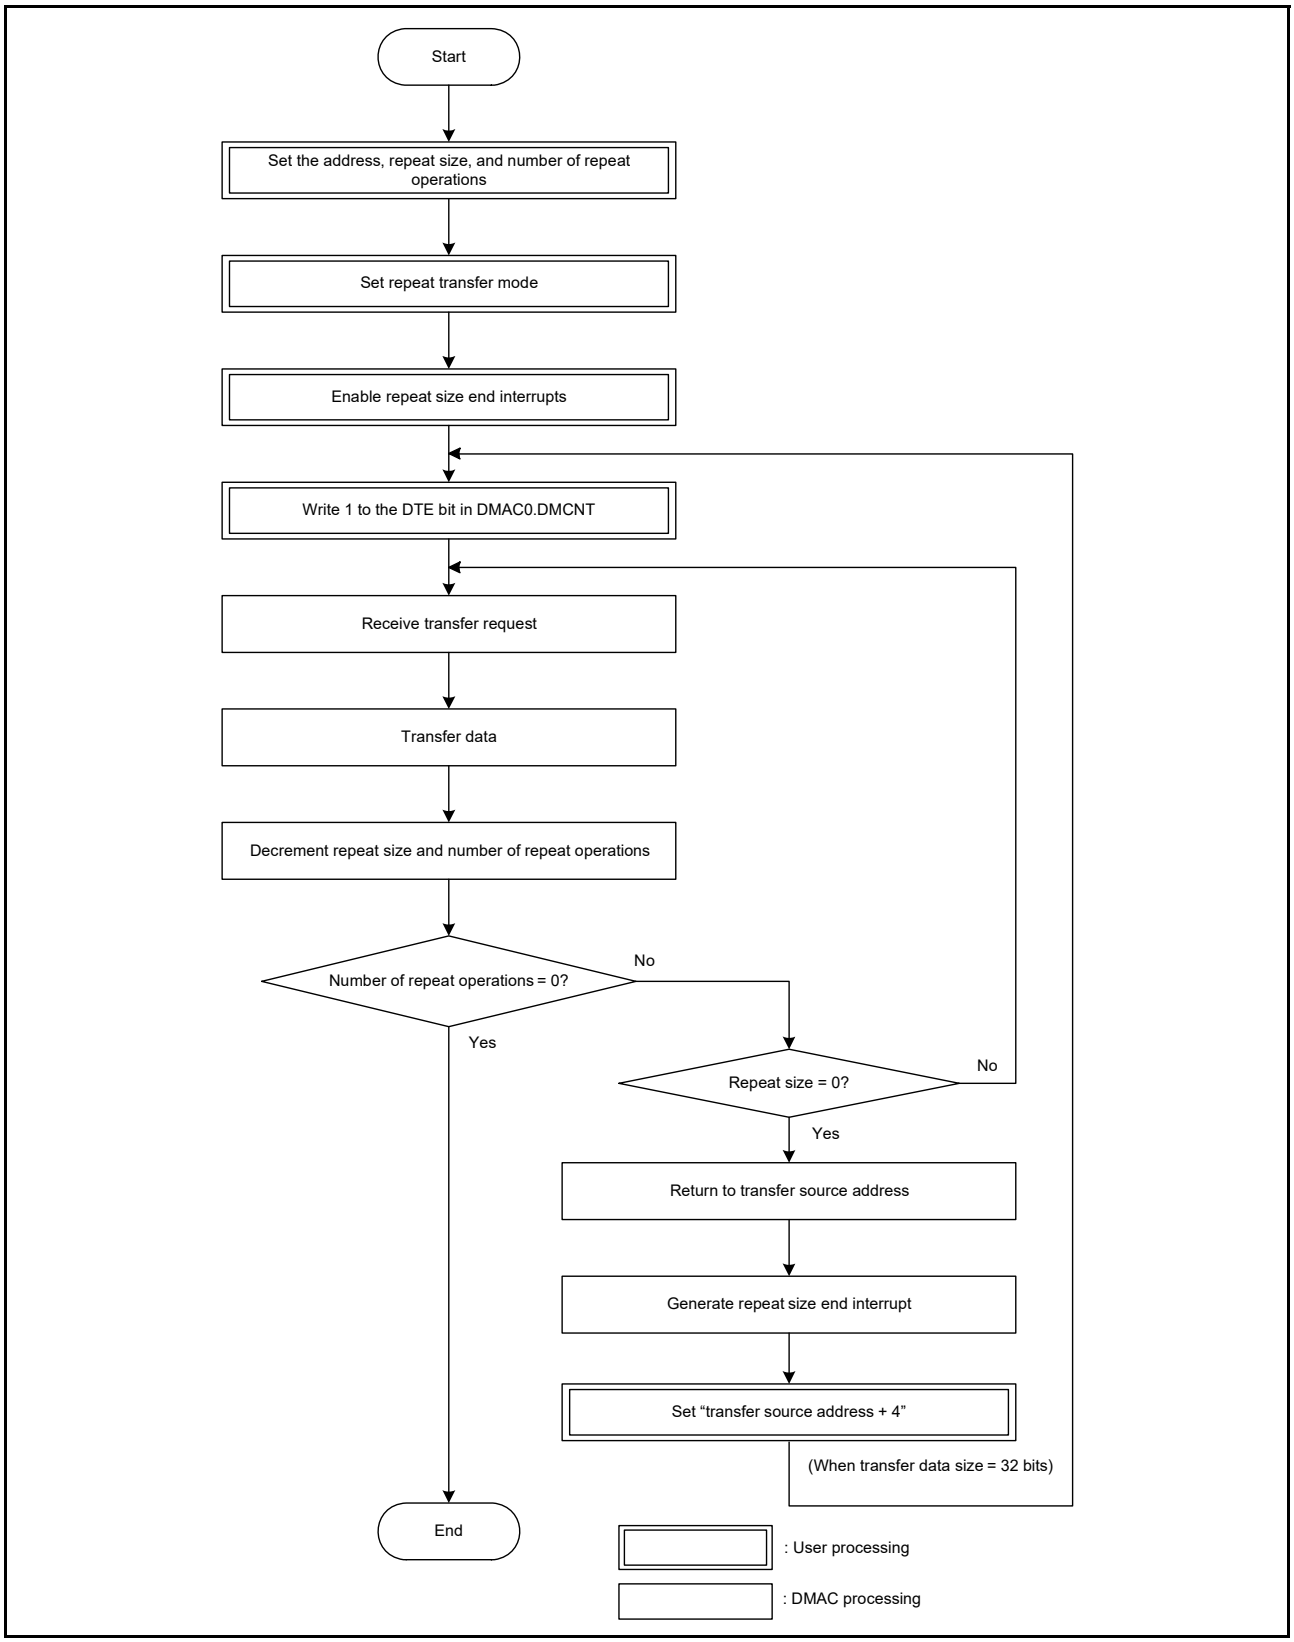

Figure 17.9 XY conversion flow using offset addition in repeat transfer mode

17.3.4 Activation Sources

Software, interrupt requests from the peripheral modules, and external interrupt requests can all be specified as DMAC activation sources. Set the DCTG[1:0] bits in DMACm.DMTMD to select the activation source.

(1) DMAC activation through software

To start DMA transfer through software:

1. Set the DCTG[1:0] bits in DMACm.DMTMD to 00b.
2. Set the DTE bit in DMACm.DMCNT to 1 (enable DMA transfer).
3. Set the DMST bit in DMAST to 1 (enable DMAC activation).
4. Set the SWREQ bit in DMACm.DMREQ to 1 (request DMA).

When the DMAC is activated by software while the CLRS bit in DMACm.DMREQ is 0, the SWREQ bit in DMACm.DMREQ is set to 0 after data transfer starts in response to a DMA transfer request. When the DMAC is activated by software while the CLRS bit is 1, SWREQ does not clear to 0 after data transfer starts. A DMA transfer request is issued again after completion of a transfer.

(2) DMAC activation through interrupt requests from on-chip peripheral modules or external interrupt requests

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as DMAC activation sources. The activation source can be selected individually for each channel in ICU.DELSRn.DELS[8:0] (n = 0 to 7).

To start DMAC transfer through an interrupt request from an on-chip peripheral module or an external interrupt request:

1. Set the DCTG[1:0] bits in DMACm.DMTMD to 01b (select interrupts from the peripheral modules and the external interrupt pins).
2. Set the DTE bit in DMACm.DMCNT to 1 (enable DMA transfer).
3. Set ICU.DELSRn.DSEL to the event number (select the DMAC Event Link).
4. Set the DMST bit in DMAST to 1 (enable DMAC activation).

For interrupt requests specified as DMAC activation sources, see Table 14.3, Interrupt vector table, in section 14, Interrupt Controller Unit (ICU).

17.3.5 Operation Timing

The following charts show the timing with the minimum number of execution cycles.

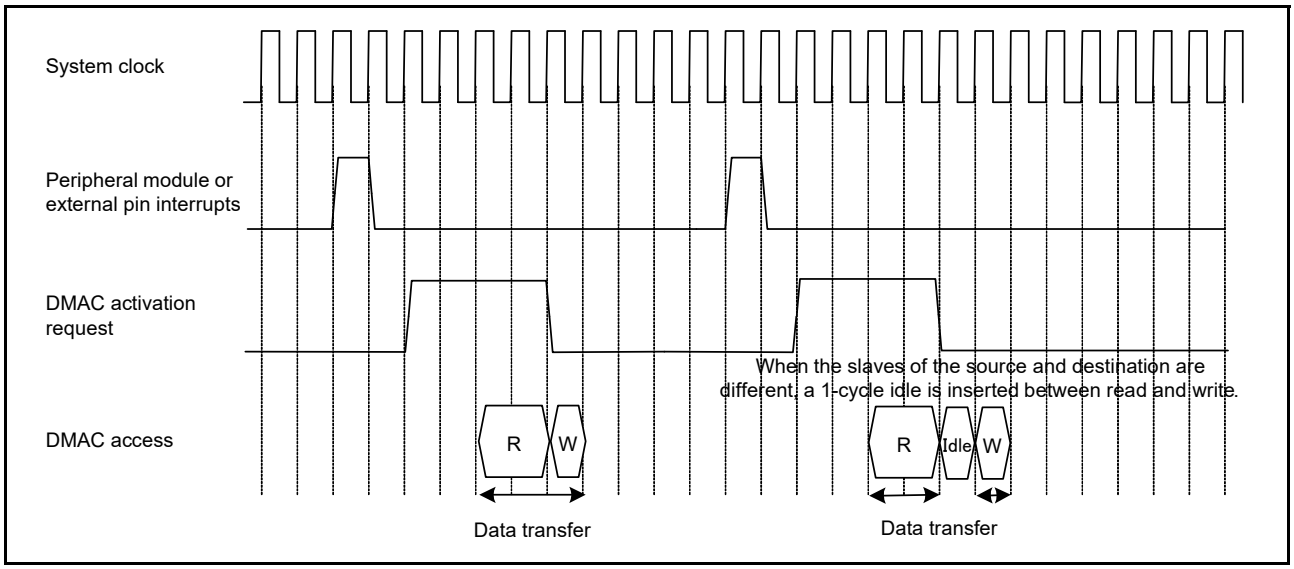

Figure 17.10 DMAC operation timing example 1: DMA activation by interrupt from peripheral module or external interrupt input pin, in normal transfer mode or repeat transfer mode

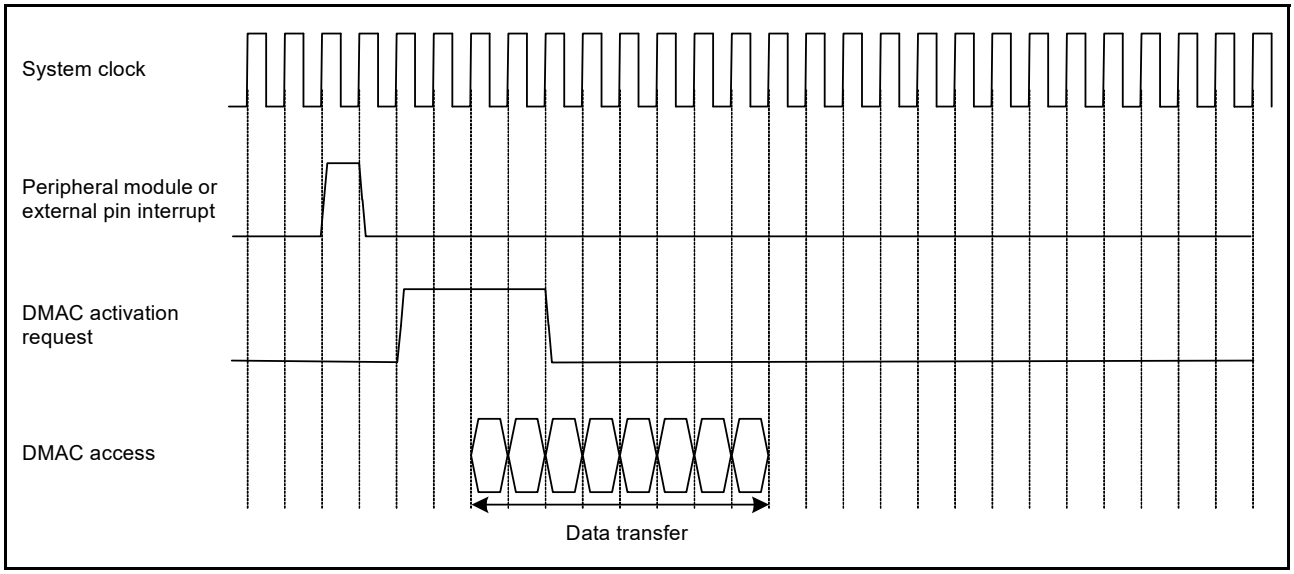

Figure 17.11 DMAC operation timing example 2: DMA activation by interrupt from peripheral module or external interrupt input pin, in block transfer mode with block size = 4

17.3.6 Execution Cycles of DMAC

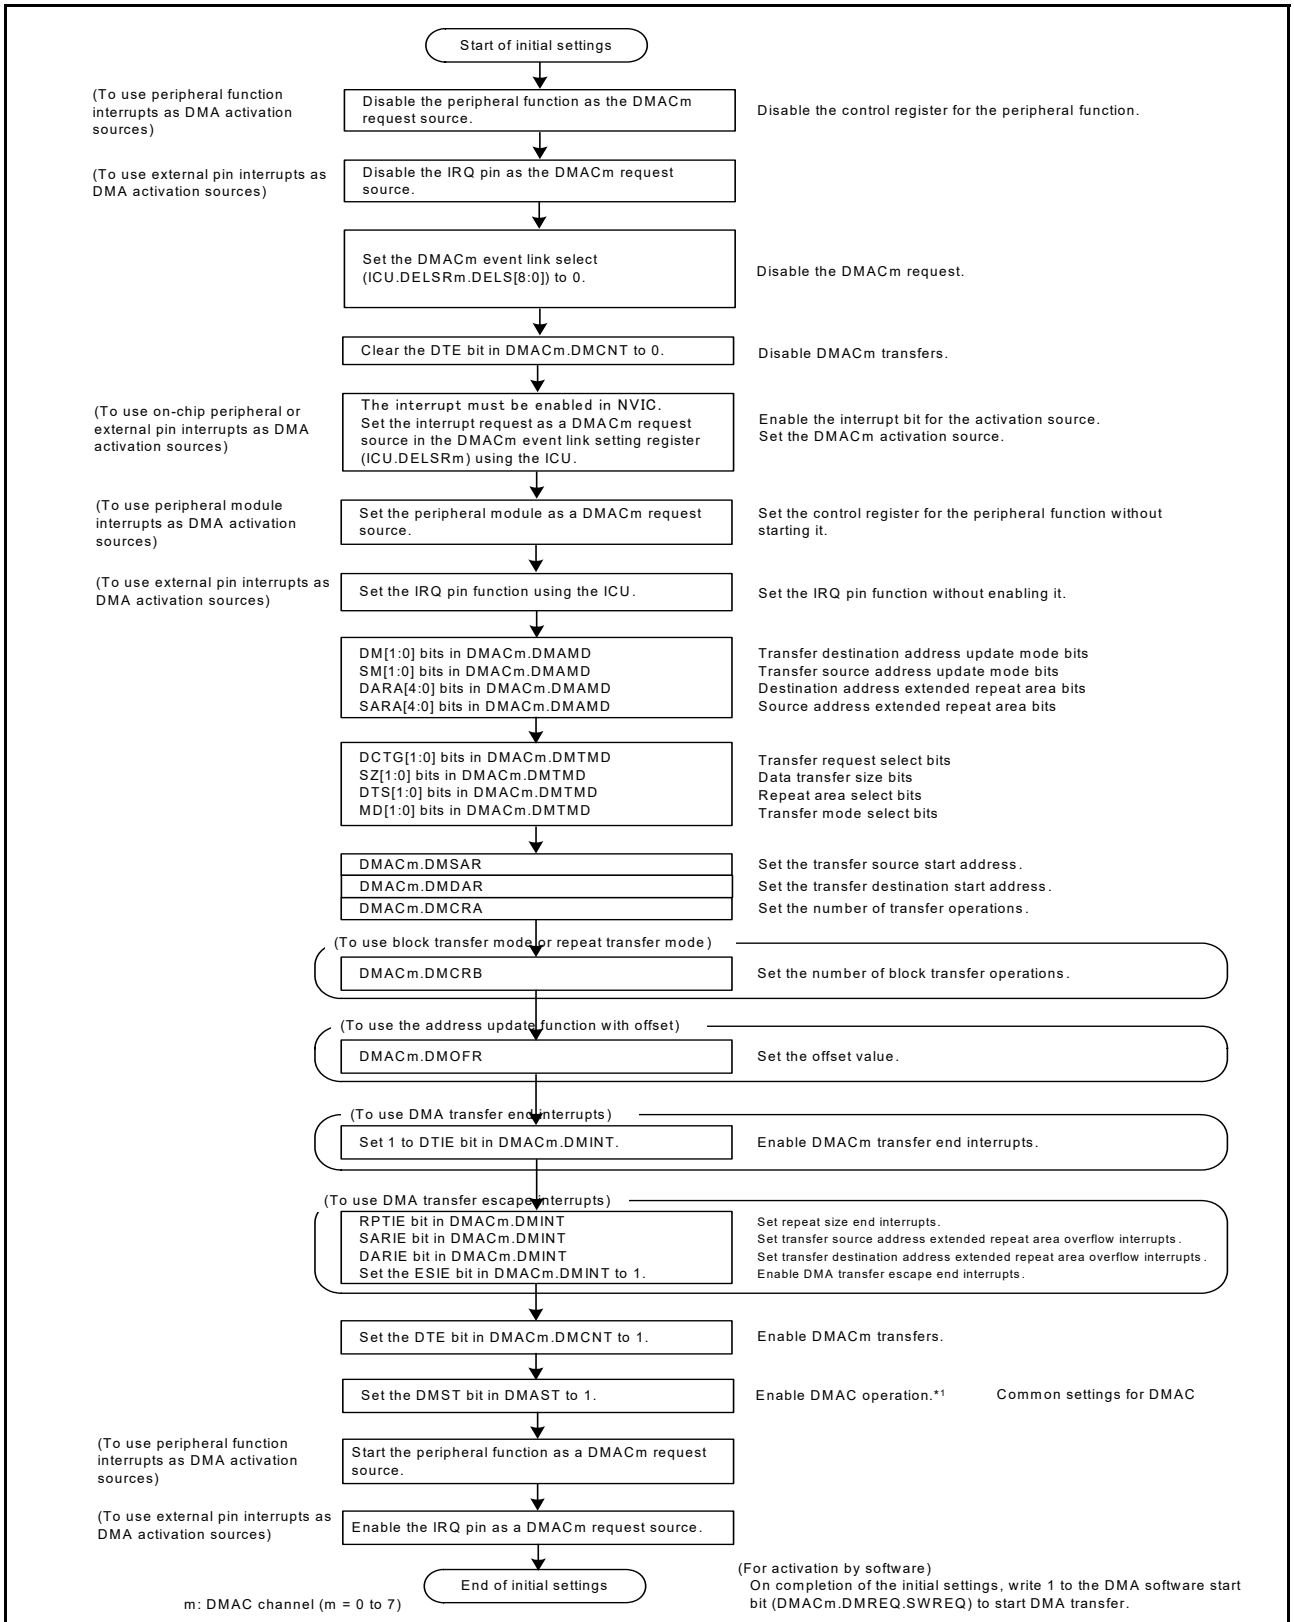
Table 17.7 lists the execution cycles in one DMAC data transfer operation.

Table 17.7 DMAC execution cycles

Transfer Mode	Data Transfer (Read)	Data Transfer (Write)
Normal	Cr+Cs+1	Cw+Cs
Repeat	Cr+Cs+1	Cw+Cs
Block*1	P × (Cr+Cs)	P × (Cw+Cs)

Note: P = Block size (DMCRAH register setting).
Cr = Read destination access cycle.
Cw = Data write destination access cycle.
Cs = When access SRAMHS, External Bus and peripheral modules related system control; 2 cycles.
When access elsewhere; 0cycle.
When a slave bus change by a read/write data transfer, furthermore add 1cycle.

Note 1. This is the case when the block size is 2 or more. When the block size is 1, normal transfer cycle applies.



Cr and Cw depend on the access destination. For the number of cycles for each access destination, see section 53, SRAM, section 55, Flash Memory, and section 15.2.3, External Bus. The frequency ratio of the system clock and the peripheral clock is also taken into consideration.

The unit for +1 in the Data Transfer (Read) column is one system clock cycle, ICLK. For the operation example, see section 17.3.5, Operation Timing.

The DMAC response time is the time from when the DMAC activation source is detected until the DMAC transfer starts. Table 17.7 does not include the time until the DMAC data transfer starts after the DMAC activation source becomes active.

17.3.7 Activating the DMAC

Figure 17.12 shows the register setting procedure.

Note 1. Setting of the DMAST.DMST bit does not necessarily have to follow the settings for the individual activation sources.

Figure 17.12 Register setting procedure

17.3.8 Starting DMA Transfer

To enable a DMA transfer of channel m, set the DTE bit in DMACm.DMCNT to 1 (DMA transfer enabled) and set the DMST bit in DMAST to 1 (DMAC start enabled). New activation requests are not accepted during the transfer of another DMAC channel or DTC. When the proceeding transfer is complete, channel arbitration selects the DMA transfer request of the highest priority channel, and DMA transfer of that channel starts. When DMA transfer starts, the ACT flag in DMACm.DMSTS is set to 1 (the DMAC is in the active state).

17.3.9 Registers during DMA Transfer

The DMAC registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMCNT, and DMACm.DMSTS, described in the following sections. For details on register update operations in each transfer mode, see Table 17.3 to Table 17.5.

(1) DMA Source Address Register (DMACm.DMSAR)

After the data for one transfer request is transferred, the contents of DMSAR are updated to the address to be accessed by the next transfer request.

(2) DMA Destination Address Register (DMACm.DMDAR)

After the data for one transfer request is transferred, the contents of DMDAR are updated to the address to be accessed by the next transfer request.

(3) DMA Transfer Count Register (DMACm.DMCRA)

After the data for one transfer request is transferred, the count value is updated. The update operation depends on the transfer mode selected.

(4) DMA Block Transfer Count Register (DMACm.DMCRB)

After the data for one transfer request is transferred, the count value is updated. The update operation depends on the transfer mode selected.

(5) DMA Transfer Enable bit (DMACm.DMCNT.DTE)

The DMACm.DMCNT.DTE bit enables or disables data transfer through register write access. It is automatically cleared to 0 by the DMAC based on the DMA transfer state.

The conditions for clearing this bit by the DMAC are as follows:

- When the specified total volume of data transfer is complete
- When DMA transfer is stopped by a repeat size end interrupt
- When DMA transfer is stopped by an extended repeat area overflow interrupt.

Writing to the registers for channels whose associated DMACm.DMCNT.DTE bit is set to 1 is prohibited except for DMACm.DMCNT. Writes are only possible after the bit is set to 0.

(6) DMA Active flag (DMACm.DMSTS.ACT)

The ACT flag in DMSTS of DMACm indicates whether the DMACm is in the idle or active state. This flag is set to 1 when the DMAC starts data transfer, and is set to 0 when data transfer for one transfer request is complete. Even when DMA transfer is stopped by write of 0 to the DTE bit in DMACm.DMCNT, this flag remains 1 until DMA transfer is complete.

(7) Transfer End Interrupt Flag (DMACm.DMSTS.DTIF)

The DTIF flag in DMACm.DMSTS is set to 1 after DMA transfer of the total transfer size is complete. When both this flag and the DTIE bit in DMACm.DMINT are 1, a transfer end interrupt is requested. This flag is set to 1 when the DMA transfer bus cycle is complete and the ACT flag in DMACm.DMSTS is set to 0, indicating the DMA transfer end. The flag automatically is set to 0 when the DTE bit in DMACm.DMCNT is set to 1 during interrupt handling.

(8) Transfer Escape End Interrupt Flag (DMACm.DMSTS.ESIF)

The ESIF flag in DMACm.DMSTS is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When this bit and the ESIE bit in DMACm.DMINT are 1, a transfer escape end interrupt is requested. This flag is set to 1 when the bus cycle of the DMA transfer that caused the interrupt request is complete and the ACT flag in DMACm.DMSTS is set to 0, indicating the DMA transfer end. The flag automatically is set to 0 when the DTE bit in DMACm.DMCNT is set to 1 during interrupt handling.

You must set the interrupt control register before sending an interrupt request from the DMAC to the CPU or the DTC. For more information, see section 14, Interrupt Controller Unit (ICU).

17.3.10 Channel Priority

When multiple DMA transfer requests occur, the DMAC determines the priority of channels that have DMA transfer requests.

The priority is fixed as channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7. (Channel 0 is the highest.)

When a DMA transfer request occurs during data transfer, channel arbitration starts after the final data unit is transferred, and DMA transfer of the highest-priority channel starts.

17.4 Ending DMA Transfer

The operation for ending a DMA transfer depends on the transfer end conditions. When a DMA transfer ends, the DTE bit in DMCNT and the ACT flag in DMACm.DMSTS change from 1 to 0.

17.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

(1) In normal transfer mode (DMACm.DMTMD.MD[1:0] = 00b)

When the value of DMACm.DMCRAL changes from 1 to 0, DMA transfer ends on the associated channel, the DTE bit in DMACm.DMCNT is set to 0, and the DTIF flag in DMACm.DMSTS is set to 1. If the DTIE bit in DMACm.DMINT is 1 at this time, a transfer end interrupt request is sent to the CPU or the DTC.

(2) In repeat transfer mode (DMACm.DMTMD.MD[1:0] = 01b)

When the value of DMACm.DMCRB changes from 1 to 0, DMA transfer ends on the associated channel, the DTE bit in DMACm.DMCNT is set to 0, and the DTIF flag in DMACm.DMSTS is set to 1. If the DTIE bit in DMACm.DMINT is 1 at this time, an interrupt request is sent to the CPU or the DTC.

(3) In block transfer mode (DMACm.DMTMD.MD[1:0] = 10b)

When the value of DMACm.DMCRB changes from 1 to 0, DMA transfer ends on the associated channel, the DTE bit in DMACm.DMCNT is set to 0, and the DTIF flag in DMACm.DMSTS is set to 1. If the DTIE bit in DMACm.DMINT is 1 at this time, an interrupt request is sent to the CPU or the DTC.

You must set the interrupt control register before sending an interrupt request from the DMAC to the CPU or the DTC. For more information, see section 14, Interrupt Controller Unit (ICU).

17.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, if the RPTIE bit in DMACm.DMINT is 1, a repeat size end interrupt is requested when transfer of a single repeat size of data is complete. The DTE bit in DMACm.DMCNT is set to 0 and the ESIF flag in DMACm.DMSTS is set to 1. If the ESIE bit in DMACm.DMINT is 1 at this time, an interrupt request is sent to the CPU or the DTC. To resume the transfer, write 1 to the DTE bit in DMACm.DMCNT.

A repeat size end interrupt can also be requested in block transfer mode. When transfer of a single block size of data is complete, the interrupt is requested in the same way as in repeat transfer mode.

You must set the interrupt control register before sending an interrupt request from the DMAC to the CPU or the DTC. For more information, see section 14, Interrupt Controller Unit (ICU).

17.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area occurs while the extended repeat area is specified and the SARIE or DARIE bit in DMACm.DMINT is 1, an extended repeat area overflow interrupt is requested. The DMA transfer is terminated, the DTE bit in DMACm.DMCNT is set to 0, and the ESIF flag in DMACm.DMSTS is set to 1. If the ESIE bit in DMACm.DMINT is 1 at this time, an interrupt request is sent to the CPU or the DTC.

If this interrupt is requested during a read cycle, the subsequent write cycle is performed. In block transfer mode, if the interrupt is requested during a one-block transfer, the remaining data in the block is transferred before transfer stops.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For more information, see section 14, Interrupt Controller Unit (ICU).

17.4.4 Precautions for the End of DMA Transfer

A DMA activation request source might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMA activation request is held in DMAC. To prevent this, stop the DMA activation requests by clearing the DELSRn.DSELS[8:0] bits in the ICU to 0.

When a DMA activation request occurs after the last round of the DMA transfer is generated, clear the DMA activation request with a DMA dummy transfer. See Figure 17.13.

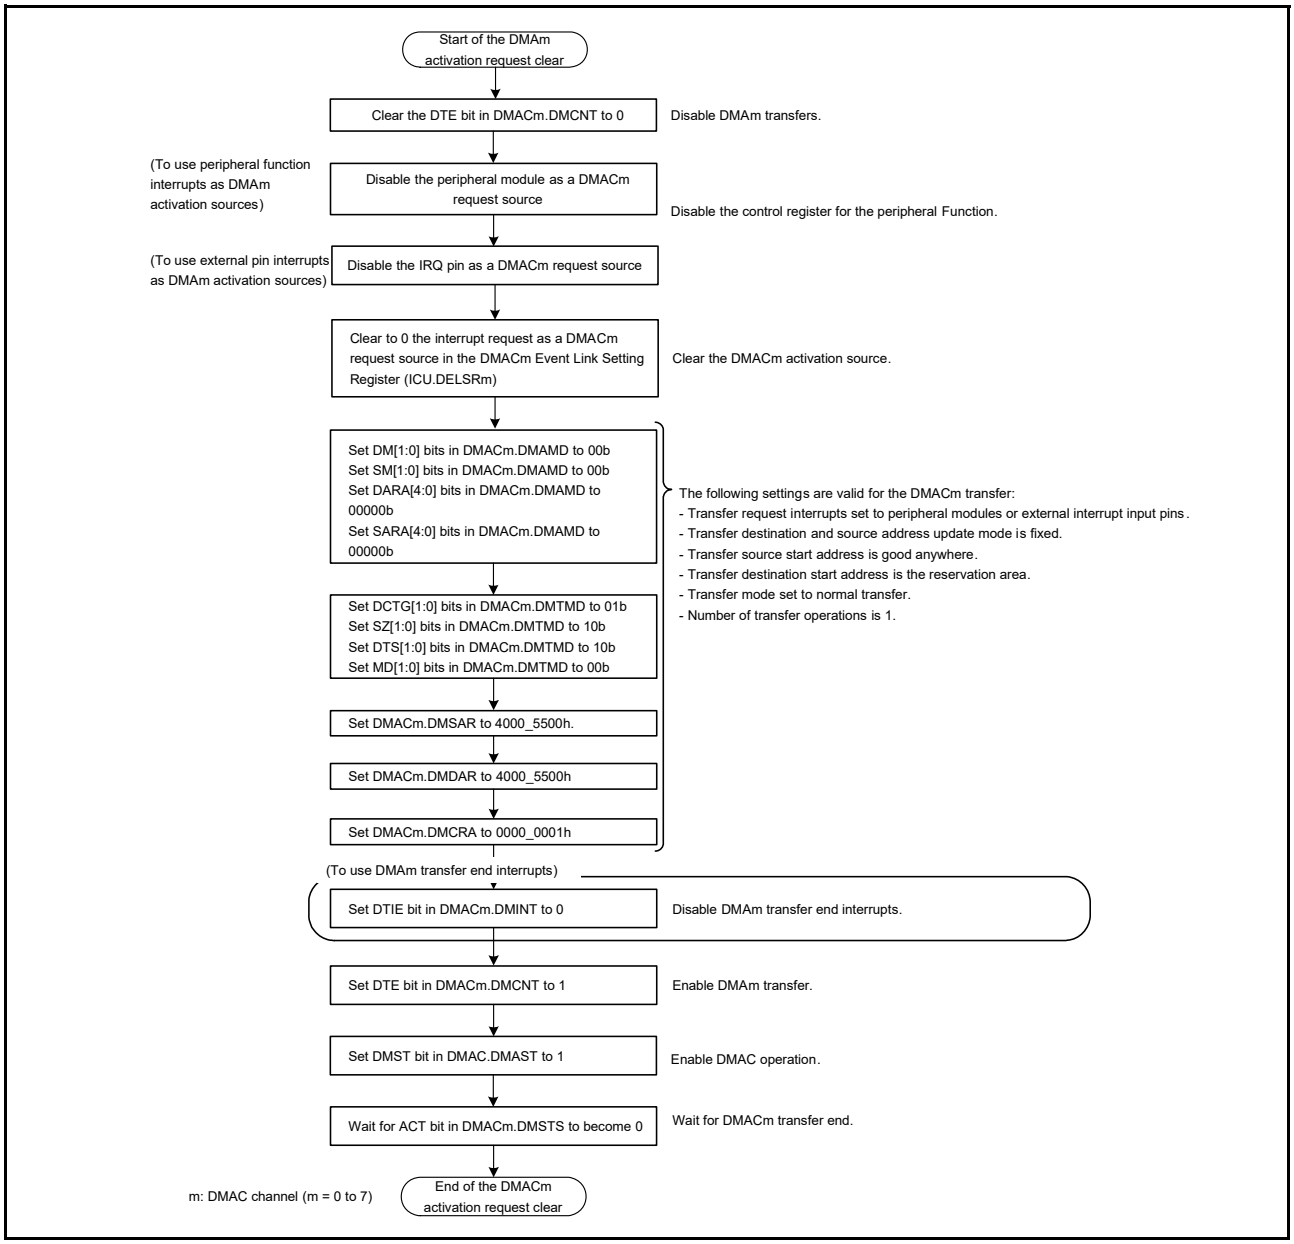


Figure 17.13 Example register setting procedure for clearing a DMA activation request

17.5 Interrupts

Each DMAC channel can output an interrupt request (DMACm_INT) to the CPU or DTC after transfer for one request is complete. When the transfer destination is the external bus, an interrupt request is generated after completion of a data write to the write buffer, and not to the actual transfer destination.

Table 17.8 lists the interrupt sources and their associated status flags and enable bits. Figure 17.14 shows the schematic logic diagram of the interrupt outputs (DMAC0 to DMAC7). Figure 17.15 shows the DMAC interrupt handling routine for resuming and terminating DMA transfers.

Table 17.8 Associations among interrupt sources, interrupt status flags, and interrupt enable bits

Interrupt sources		Interrupt enable bits	Interrupt status flags	Request output enable bits
Transfer end		—	DMACm.DMSTS.DTIF	DMACm.DMINT.DTIE
Escape transfer end	Repeat size end	DMACm.DMINT.RPTIE	DMACm.DMSTS.ESIF	DMACm.DMINT.ESIE
	Source address extended repeat area overflow	DMACm.DMINT.SARIE		
	Destination address extended repeat area overflow	DMACm.DMINT.DARIE		

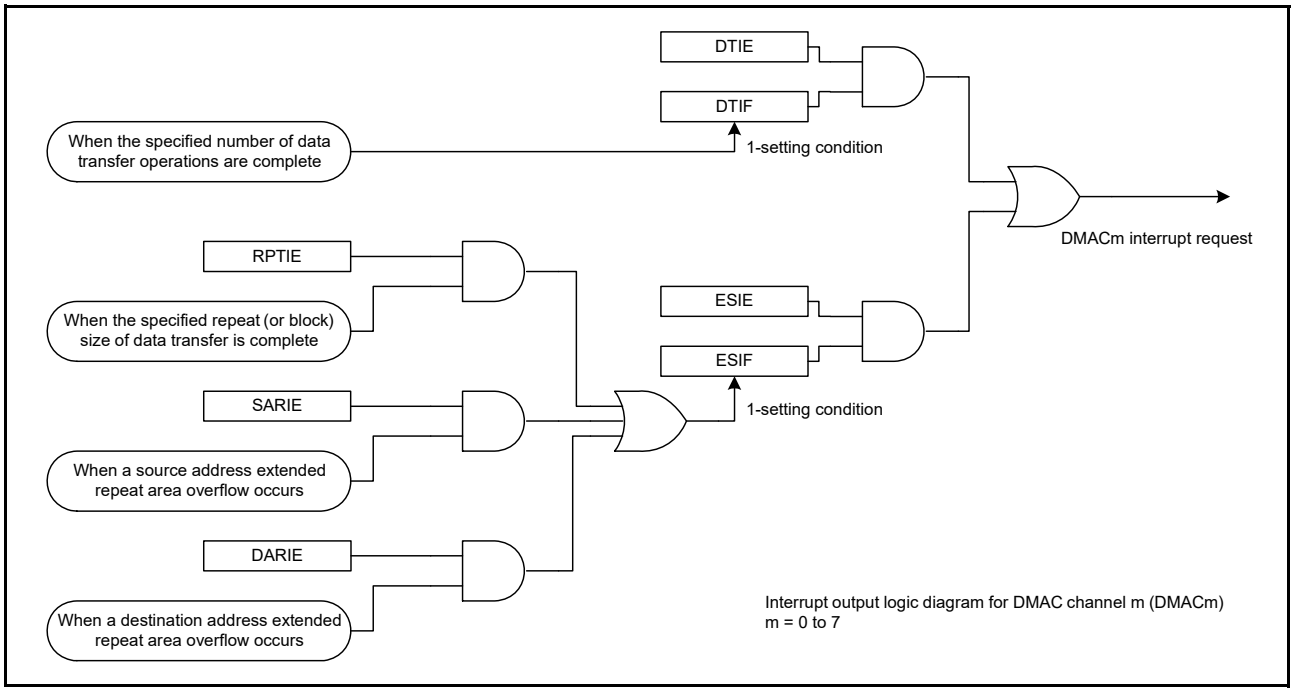

Figure 17.14 Schematic logic diagram of interrupt outputs for DMAC0 to DMAC7

Different procedures are used for canceling an interrupt to restart a DMA transfer in the following cases:

- When terminating a DMA transfer
- When continuing a DMA transfer.

(1) When terminating a DMA transfer

Write 0 to the DTIF flag in DMACm.DMSTS to clear a transfer end interrupt, and to the ESIF flag in DMACm.DMSTS to clear a repeat size interrupt or an extended repeat area overflow interrupt. DMACm remains in the stopped state. When starting another DMA transfer, set the appropriate registers and set the DTE bit in DMACm.DMCNT to 1 (DMA transfer enabled).

(2) When continuing a DMA transfer

Write 1 to the DTE bit in DMACm.DMCNT. The ESIF flag in DMSTS of DMACm automatically is set to 0 (interrupt source cleared), and the DMA transfer resumes.

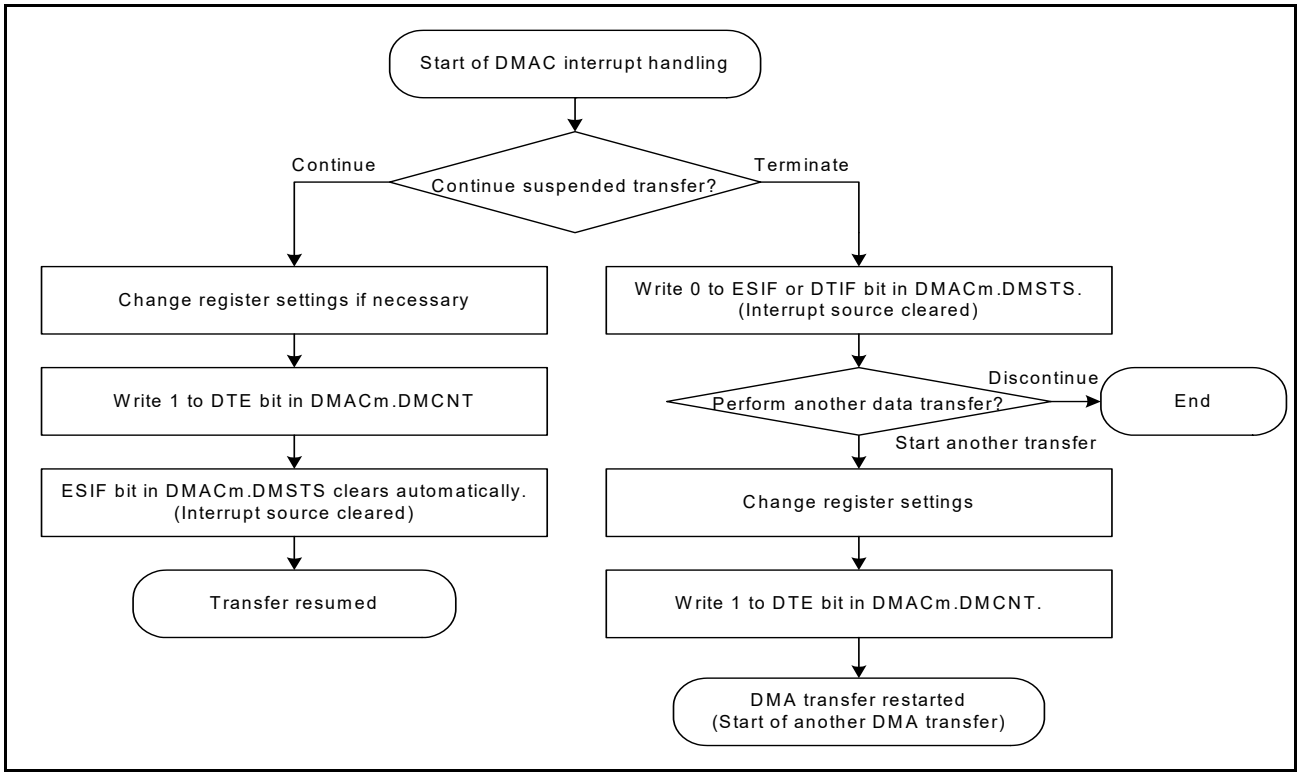

Figure 17.15 DMAC interrupt handling routine to resume or terminate a DMA transfer

17.6 Event Link

Each DMAC channel outputs an event link request signal (DMACm_INT) every time it completes a data transfer, or a block transfer in block transfer mode. When the transfer destination is the external bus, the signal is generated when writing to the write buffer is accepted. For more information, see section 19, Event Link Controller (ELC).

17.7 Low-Power Functions

Before entering the module-stop state, Software Standby mode, or Deep Software Standby mode, you must first clear the DMST bit in DMAST to 0 (DMAC suspended) and use the following settings.

(1) Module-stop function

Writing 1 to the MSTPA22 bit in MSTPCRA enables the module-stop function of the DMAC. If a DMA transfer is in progress at the time 1 is written to MSTPA22, the transition to the module-stop state continues after DMA transfer ends. Access to the DMAC registers is prohibited while MSTPA22 is 1. Writing 0 to the MSTPA22 bit releases the DMAC from the module-stop state.

(2) Software Standby and Deep Software Standby modes

Use the settings described in section 11.7.1, Transition to Software Standby Mode and section 11.9.1, Transition to Deep Software Standby Mode.

If DMA transfer operations are in progress when the WFI instruction is executed, the DMA transfer completes before the transition to Software Standby mode or Deep Software Standby mode.

(3) Notes on the low-power function

For information on the WFI instruction and register settings, see section 11.10.7, Timing of WFI Instruction.

To perform a DMA transfer after returning from a low power mode, set the DMST bit in DMAST to 1 again. To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination, as described in section 14.4.2, Selecting Interrupt Request Destinations, and then execute the WFI instruction.

17.8 Usage Notes

17.8.1 DMA Transfer to External Devices

In a DMA transfer to an external device, the ACT flag in DMACm.DMSTS must be cleared to 0 (DMAC transfer suspended) from the beginning of the final data write to the end of the external bus access.

17.8.2 Access to Registers during DMA Transfer

Do not write to the following registers of DMACm while the ACT flag in DMSTS of the associated channel is set to 1 (DMAC active state) or the DTE bit in DMCNT of the associated channel is set to 1 (DMA transfer enabled):

- DMSAR
- DMDAR
- DMCRA
- DMCRB
- DMTMD
- DMINT
- DMAMD
- DMOFR.

17.8.3 DMA Transfer to Reserved Areas

DMA transfer to reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on reserved areas, see section 4, Address Space.

17.8.4 Setting the DMAC Event Link Setting Register (DELSRn) of the Interrupt Controller Unit

Before setting the DMAC event link setting register (ICU.DELSRn), make sure the DMA transfer enable bit (DMACm.DMCNT.DTE) is set to 0, disabling DMA transfer. Additionally, ensure that the DTC activation enable register (ICU.IELSRn.DTCE) associated with the event number set in the ICU.DELSRn register is not set to 1. For details on ICU.IELSRn.DTCE and ICU.DELSRn, see section 14, Interrupt Controller Unit (ICU).

17.8.5 Suspending or Restarting DMA Activation

To suspend a DMA activation request, write 0 to the DMAC Event Link select bits (ICU.DELSRn.DELS[8:0]). To restart the DMA transfer, write the event number to the ICU.DELSRn.DELS[8:0] bit with the settings shown in section 17.3.7, Activating the DMAC.

18. Data Transfer Controller (DTC)

18.1 Overview

The Data Transfer Controller (DTC) performs data transfers when activated by an interrupt request. Table 18.1 lists the DTC specifications and Figure 18.1 shows the block diagram.

Table 18.1 DTC specifications

Parameter	Specifications
Transfer modes	• Normal transfer mode A single activation leads to a single data transfer. • Repeat transfer mode A single activation leads to a single data transfer. The transfer address returns to the start address after the number of data transfers reaches the specified repeat size. The maximum number of repeat transfers is 256 and the maximum data transfer size is 256 × 32 bits (1024 bytes). • Block transfer mode A single activation leads to a transfer of a single block. The maximum block size is 256 × 32 bits = 1024 bytes.
Transfer channel	• Channel transfer can be associated with the interrupt source (transferred by a DTC activation request from the ICU) • Multiple data units can be transferred on a single activation source (chain transfer) • Chain transfers selectable to either "executed," when the counter is 0, or "always executed."
Transfer space	• 4 GB (0000 0000h to FFFF FFFFh excluding reserved areas)
Data transfer units	• Single data unit: 1 byte (8 bits), 1 halfword (16 bits), 1 word (32 bits) • Single block size: 1 to 256 data units
CPU interrupt source	• An interrupt request can be generated to the CPU on a DTC activation interrupt • An interrupt request can be generated to the CPU after a single data transfer • An interrupt request can be generated to the CPU after a data transfer of a specified volume.
Event link function	An event link request is generated after one data transfer (for block, after one block transfer)
Read skip	Transfer information read skip can be executed
Write-back skip	When the transfer source or destination address is specified as fixed, a write-back skip is executed
Module-stop function	Module-stop state can be set to reduce power consumption

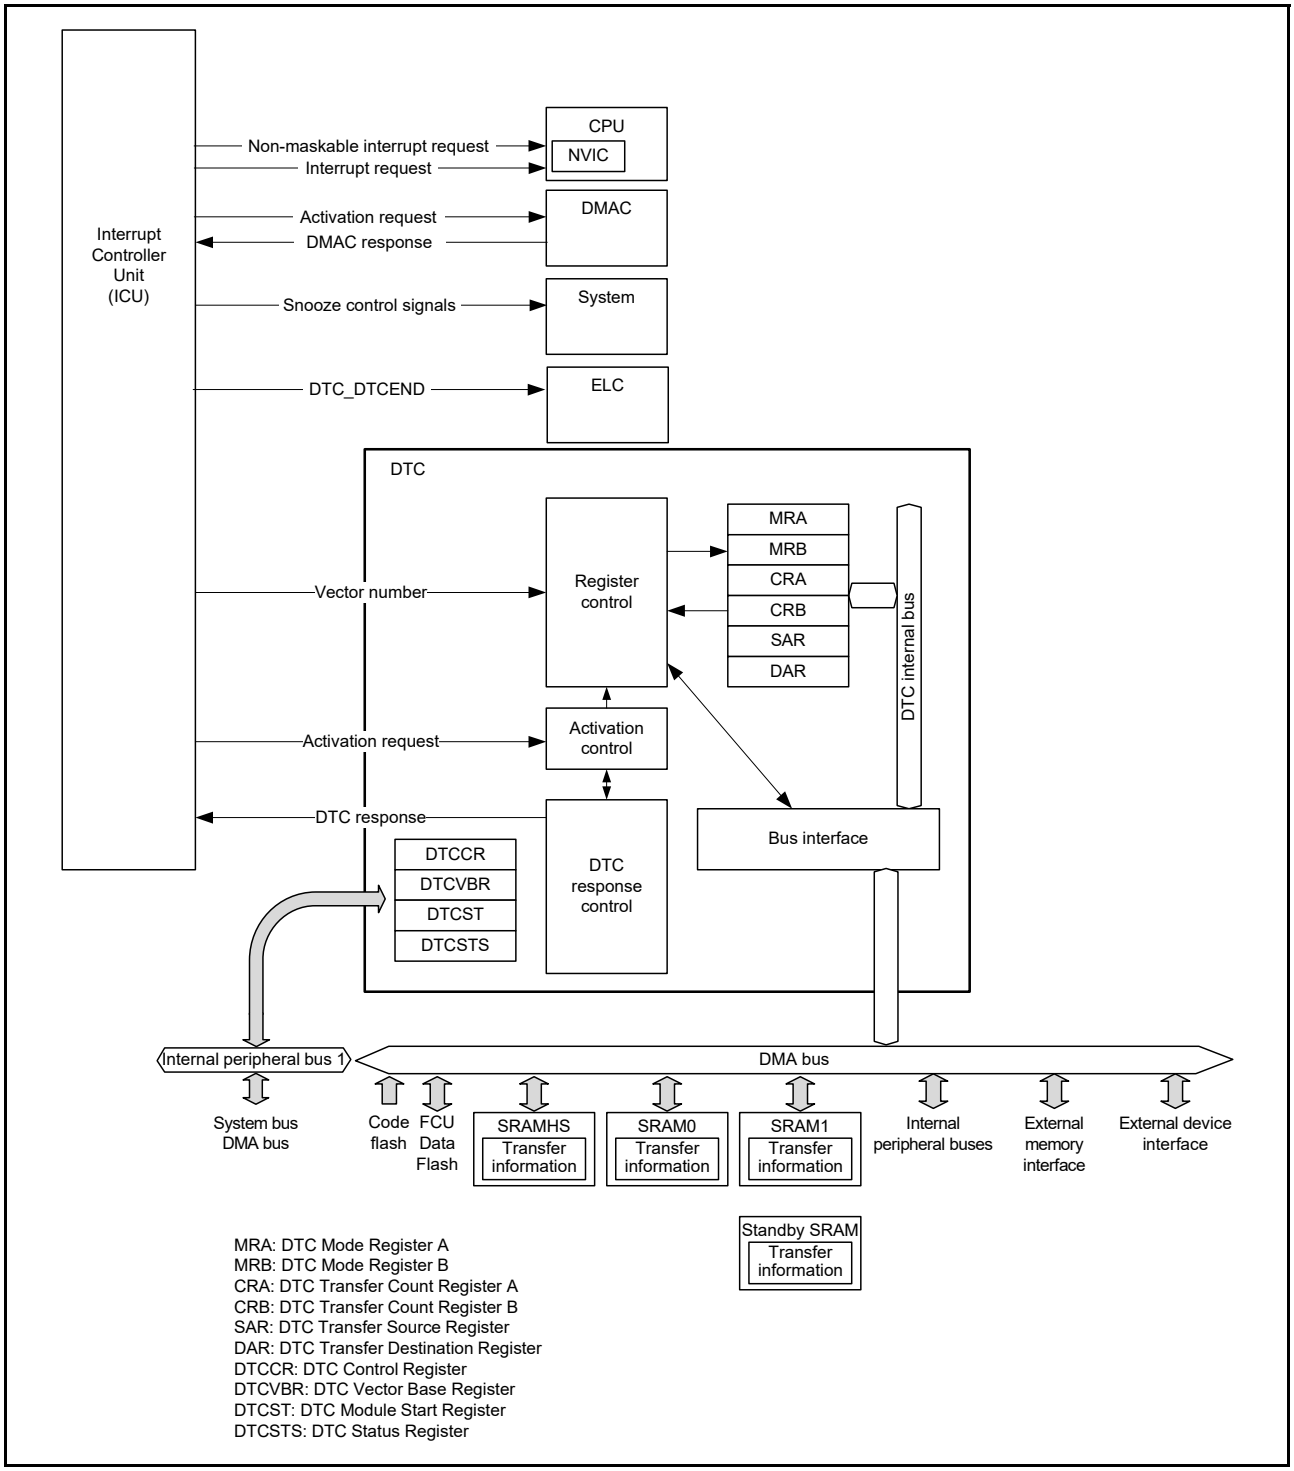

Figure 18.1 DTC block diagram

See 14.1 Overview, in section 14, Interrupt Controller Unit (ICU), for the connections between the DTC and NVIC (in the CPU).

18.2 Register Descriptions

The MRA, MRB, SAR, DAR, CRA, and CRB are all DTC internal registers that cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the SRAM area as transfer information. When an activation request is generated, the DTC reads the transfer information from the SRAM area and sets it in its internal registers. After the data transfer ends, the internal register contents are written back to the SRAM area as transfer information.

18.2.1 DTC Mode Register A (MRA)

Address(es): (Inaccessible directly from the CPU. See section 18.3.1.)

	b7	b6	b5	b4	b3	b2	b1	b0
	MD[1:0]		SZ[1:0]		SM[1:0]		—	—
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b1, b0	—	Reserved	These bits are read as undefined. The write value should be 0.	—
b3, b2	SM[1:0]	Transfer Source Address Addressing Mode	b3 b2 0 0: Fixed address in SAR register (skip write-back to SAR) 0 1: Fixed address in SAR register (skip write-back to SAR) 1 0: Increment SAR value after data transfer: +1 when SZ[1:0] = 00b +2 when SZ[1:0] = 01b +4 when SZ[1:0] = 10b. 1 1: Decrement SAR value after data transfer: -1 when SZ[1:0] = 00b -2 when SZ[1:0] = 01b -4 when SZ[1:0] = 10b.	—
b5, b4	SZ[1:0]	DTC Data Transfer Size	b5 b4 0 0: Byte (8-bit) transfer 0 1: Halfword (16-bit) transfer 1 0: Word (32-bit) transfer 1 1: Setting prohibited.	—
b7, b6	MD[1:0]	DTC Transfer Mode Select	b7 b6 0 0: Normal transfer mode 0 1: Repeat transfer mode 1 0: Block transfer mode 1 1: Setting prohibited.	—

MRA cannot be accessed directly from the CPU. The CPU can access the SRAM area (transfer information (n) start address + 03h) and DTC transfer it automatically from and to the MRA register. See section 18.3.1, Allocating Transfer information and the DTC Vector Table.

18.2.2 DTC Mode Register B (MRB)

Address(es): (Inaccessible directly from the CPU. See section 18.3.1.)

	b7	b6	b5	b4	b3	b2	b1	b0
	CHNE	CHNS	DISEL	DTS	DM[1:0]		—	—
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b1, b0	—	Reserved	These bits are read as undefined. The write value should be 0.	—
b3, b2	DM[1:0]	Transfer Destination Address Addressing Mode	b3 b2 0 0: Fixed address in DAR register (skip write-back to DAR) 0 1: Fixed address in DAR register (skip write-back to DAR) 1 0: Increment DAR value after data transfer: +1 when MRA.SZ[1:0] = 00b +2 when MRA.SZ[1:0] = 01b +4 when MRA.SZ[1:0] = 10b. 1 1: Decrement DAR value after data transfer: -1 when MRA.SZ[1:0] = 00b -2 when MRA.SZ[1:0] = 01b -4 when MRA.SZ[1:0] = 10b.	—
b4	DTS	DTC Transfer Mode Select	0: Select transfer destination as repeat or block area 1: Select transfer source as repeat or block area.	—
b5	DISEL	DTC Interrupt Select	0: Generate interrupt request to CPU when specified data transfer is complete 1: Generate interrupt request to CPU each time DTC data transfer is performed.	—
b6	CHNS	DTC Chain Transfer Select	0: Select continuous chain transfer 1: Select chain transfer occurring only when the transfer counter is changed from 1 to 0 or 1 to CRAH.	—
b7	CHNE	DTC Chain Transfer Enable	0: Disable chain transfer 1: Enable chain transfer.	—

MRB cannot be accessed directly from the CPU. The CPU can access the SRAM area (transfer information (n) start address + 02h) and DTC transfer it automatically from and to the MRB register. See section 18.3.1, Allocating Transfer information and the DTC Vector Table.

DTS bit (DTC Transfer Mode Select)

The DTS bit selects either the transfer source or transfer destination as the repeat area or block area in repeat or block transfer mode

CHNS bit (DTC Chain Transfer Select)

The CHNS bit selects the chain transfer condition. When CHNE is 0, the CHNS setting is ignored. For details on the conditions for chain transfer, see Table 18.3, Chain transfer conditions.

When the next transfer is chain transfer, completion of the specified number of transfers is not determined, the activation source flag is not cleared, and an interrupt request to the CPU is not generated.

CHNE bit (DTC Chain Transfer Enable)

The CHNE bit enables chain transfer. The chain transfer condition is selected by the CHNS bit. For details on chain transfer, see section 18.4.6, Chain Transfer.

18.2.3 DTC Transfer Source Register (SAR)

Address(es): (Inaccessible directly from the CPU. See section 18.3.1.)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

SAR sets the transfer source start address. It cannot be accessed directly from the CPU. The CPU can access the SRAM area (transfer information (n) start address + 04h) and DTC transfer it automatically from and to the SAR register. See section 18.3.1, Allocating Transfer information and the DTC Vector Table.

Note: Misalignment is prohibited for DTC transfers. Bit [0] must be 0 when MRA.SZ[1:0] = 01b.
Bits [1] and [0] must be 0 when MRA.SZ[1:0] = 10b.

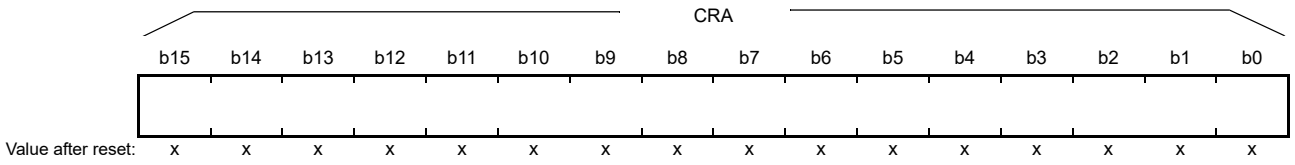
18.2.4 DTC Transfer Destination Register (DAR)

Address(es): (Inaccessible directly from the CPU. See section 18.3.1.)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

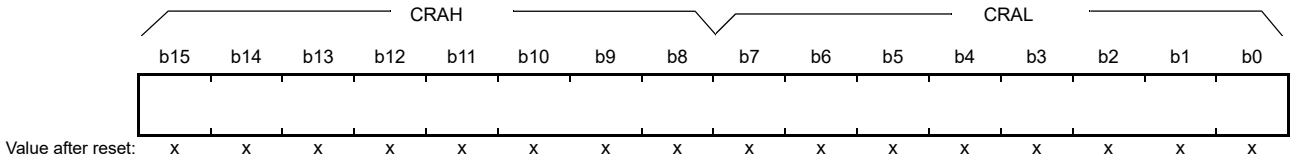
	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined



DAR sets the transfer destination start address. It cannot be accessed directly from the CPU. The CPU can access the SRAM area (transfer information (n) start address + 08h) and DTC transfer it automatically from and to the DAR register. See section 18.3.1, Allocating Transfer information and the DTC Vector Table.

Note: Misalignment is prohibited for DTC transfers. Bit [0] must be 0 when MRA.SZ[1:0] = 01b.
Bits [1] and [0] must be 0 when MRA.SZ[1:0] = 10b.



18.2.5 DTC Transfer Count Register A (CRA)

Address(es): (Inaccessible directly from the CPU. See section 18.3.1.)

- Normal transfer mode

- Repeat transfer mode/block transfer mode

x: Undefined

Symbol	Register name	Description	R/W
CRAL	Transfer Counter A Lower Register	Specifies the transfer count.	—
CRAH	Transfer Counter A Upper Register		—

Note: The function depends on the transfer mode.

Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

CRA cannot be accessed directly from the CPU. The CPU can access the SRAM area (transfer information (n) start address + 0Eh) and DTC transfer it automatically from and to the CRA register. See section 18.3.1, Allocating Transfer information and the DTC Vector Table.

(1) Normal transfer mode (MRA.MD[1:0] = 00b)

In normal transfer mode, CRA functions as a 16-bit transfer counter. The transfer count is 1, 65,535, and 65,536 when the set value is 0001h, FFFFh, and 0000h, respectively. The CRA value is decremented (-1) on each data transfer.

(2) Repeat transfer mode (MRA.MD[1:0] = 01b)

In repeat transfer mode, the CRAH register hold the transfer count and the CRAL register function as an 8-bit transfer counter. The transfer count is 1, 255, and 256 when the set value is 01h, FFh, and 00h, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 00h, the CRAH value is transferred to CRAL.

(3) Block transfer mode (MRA.MD[1:0] = 10b)

In block transfer mode, the CRAH register hold the block size and the CRAL register function as an 8-bit block size counter. The transfer count is 1, 255, and 256 when the set value is 01h, FFh, and 00h, respectively. The CRAL value is decremented (-1) at each data transfer. When it reaches 00h, the CRAH value is transferred to CRAL.

18.2.6 DTC Transfer Count Register B (CRB)

Address(es): (Inaccessible directly from the CPU. See section 18.3.1.)

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

CRB sets the block transfer count for block transfer mode. The transfer count is 1, 65,535, and 65,536 when the set value is 0001h, FFFFh, and 0000h, respectively. The CRB value is decremented (-1) when the final data of a single block size is transferred. When normal transfer mode or repeat transfer mode is selected, this register is not used and the set value is ignored.

CRB cannot be accessed directly from the CPU. The CPU can access the SRAM area (transfer information (n) start address + 0Ch) and DTC transfer it automatically from and to the CRB register. See section 18.3.1, Allocating Transfer information and the DTC Vector Table.

18.2.7 DTC Control Register (DTCCR)

Address(es): DTC.DTCCR 4000 5400h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	RRS	—	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b3	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b4	RRS	DTC Transfer Information Read Skip Enable	0: Do not skip transfer information read 1: Skip transfer information read when vector numbers match.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RRS bit (DTC Transfer Information Read Skip Enable)

The RRS enables skipping of transfer information reads when vector numbers match.

The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the value in the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

18.2.8 DTC Vector Base Register (DTCVBR)

Address(es): DTC.DTCVBR 4000 5404h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit name	Description	R/W
b31 to b0	DTC Vector Base Address	Specifies the DTC vector base address. (The lower 10 bits should be 0.)	R/W

DTCVBR sets the base address for calculating the DTC vector table address, which can be set in the range of 0000 0000h to FFFF FFFFh(4-GB) in 1-KB units.

18.2.9 DTC Module Start Register (DTCST)

Address(es): DTC.DTCST 4000 540Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DTCST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DTCST	DTC Module Start	0: Stop DTC module 1: Start DTC module.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

DTCST bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted. If this bit is set to 0 during a data transfer, the accepted transfer request is active until processing is complete.

DTCST must be set to 0 before making a transition to one of the following:

- Module-stop state
- Software Standby mode without Snooze mode transition
- Deep Software Standby mode.

For details on these transitions, see section 18.10, Module-Stop Function, and section 11, Low Power Modes.

18.2.10 DTC Status Register (DTCSTS)

Address(es): DTC.DTCSTS 4000 540Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ACT	—	—	—	—	—	—	—	VECN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	VECN[7:0]	DTC-Activating Vector Number Monitoring	These bits indicate the vector number for the activation source when a DTC transfer is in progress. The value is only valid if a DTC transfer is in progress (the value of the ACT flag is 1).	R
b14 to b8	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b15	ACT	DTC Active Flag	0: DTC transfer operation not in progress 1: DTC transfer operation in progress.	R

VECN[7:0] bits (DTC-Activating Vector Number Monitoring)

While transfer by the DTC is in progress, the VECN[7:0] bits indicate the vector number associated with the activation source for the transfer. The value read from the VECN[7:0] bits is valid if the value of the ACT flag is 1, indicating a DTC transfer is in progress, and invalid if the value of the ACT flag is 0, indicating no DTC transfer is in progress.

ACT flag (DTC Active Flag)

The ACT flag indicates the state of the DTC transfer operation.

[Setting condition]

- When the DTC is activated by a transfer request.

[Clearing condition]

- When transfer by the DTC, in response to a transfer request, is complete.

18.3 Activation Sources

The DTC is activated by an interrupt request. Setting the ICU.IELSRn.DTCE bit of the ICU to 1 enables activation of the DTC by the associated interrupt. The number of selected output n set in ICU.IELSR is defined as the interrupt vector number, where n = 0 to 95. For an enabled interrupt, the specific DTC interrupt source associated with each interrupt vector number n is selected by ICU.IELSRn.IELS[8:0], where n = 0 to 95.

For the setup of ICU.IELSRn.IELS[8:0] (n = 0 to 95), see Table 14.4, Event table, in section 14, Interrupt Controller Unit (ICU). For activation by software, see section 19.2.2, Event Link Software Event Generation Register n (ELSEGRn) (n = 0, 1).

The interrupt vector number is equivalent to the DTC vector table number. After the DTC accepts an activation request, it does not accept another activation request until transfer for that single request is complete, regardless of the priority of the requests. When multiple activation requests are generated during a DMAC or DTC transfer, a request with the highest priority on completion of the transfer is accepted. When multiple activation requests are generated while the DTC module start bit (DTCST.DTCST) is 0, the DTC accepts the request with the highest priority when the bit is subsequently set to 1. The small interrupt vector number is high priority.

The DTC performs the following operations at the start of a single data transfer, or for a chain transfer, after the last of the consecutive transfers:

- On completion of a specified round of data transfer, the ICU.IELSRn.DTCE bit is set to 0, and an interrupt request is sent to the CPU
- If the MRB.DISEL bit is 1, an interrupt request is sent to the CPU on completion of a data transfer
- For other transfers, the ICU.IELSRn.IR bit of the activation source is set to 0 at the start of the data transfer.

18.3.1 Allocating Transfer information and the DTC Vector Table

The DTC reads the start address of the transfer information associated with each activation source from the vector table and reads the transfer information starting at that address.

The vector table must be located so that the lower 10 bits of the base address (start address) are 0. Use the DTC Vector Base Register (DTCVBR) to set the base address of the DTC vector table. Transfer information is allocated in the SRAM area. In the SRAM area, the start address of the transfer information (n) with vector number n must be 4n added to the base address in the vector table.

Figure 18.2 shows the relationship between the DTC vector table and transfer information. Figure 18.3 shows the allocation of transfer information in the SRAM area.

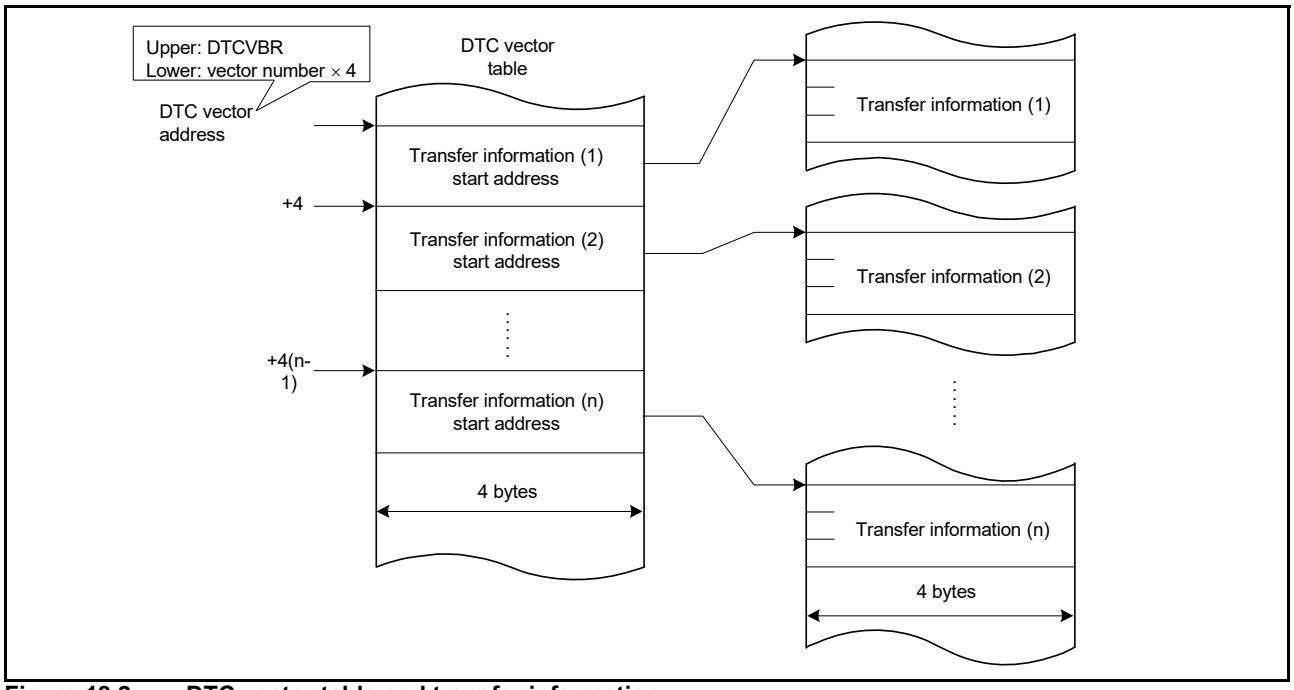


Figure 18.2 DTC vector table and transfer information

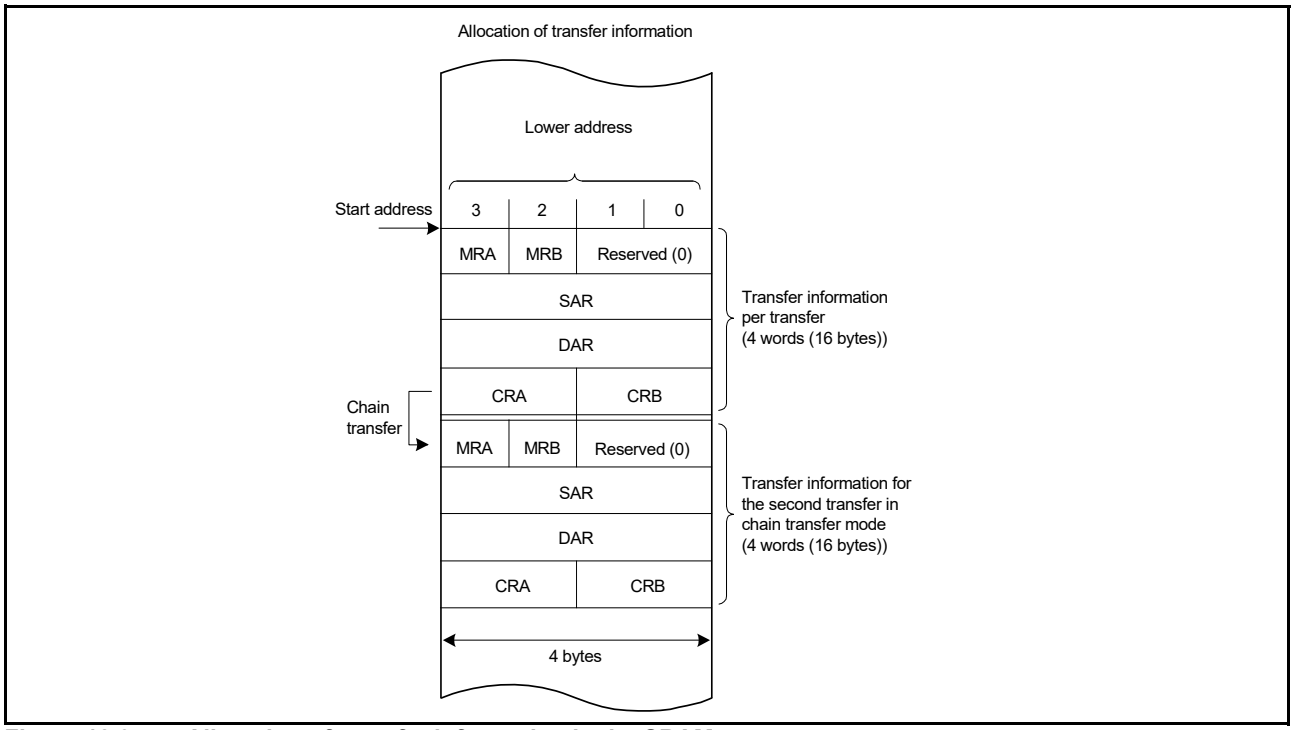

Figure 18.3 Allocation of transfer information in the SRAM area

18.4 Operation

The DTC transfers data according to the transfer information. Storage of the transfer information in the SRAM area is required before a DTC operation. When the DTC is activated, it reads the DTC vector associated with the vector number. The DTC then reads the transfer information from the transfer information store address referenced by the DTC vector and transfers the data. After the data transfer, the DTC writes back the transfer information. Storing the transfer information in the SRAM area allows data transfer of any number of channels.

The transfer modes include:

- Normal transfer mode
- Repeat transfer mode
- Block transfer mode.

The DTC specifies a transfer source address in the SAR register and a transfer destination address in the DAR register. The values in these registers are incremented, decremented, or address-fixed independently after the data transfer.

Table 18.2 describes the DTC transfer modes.

Table 18.2 DTC transfer modes

Transfer mode	Data size transferred on single transfer request	Increment or decrement of memory address	Settable transfer count
Normal transfer mode	1 byte (8 bits), 1 halfword (16 bits), or 1 word (32 bits)	Incremented or decremented by 1, 2, or 4 or address fixed	1 to 65,536
Repeat transfer mode*1	1 byte (8 bits), 1 halfword (16 bits), or 1 word (32 bits)	Incremented or decremented by 1, 2, or 4 or address fixed	1 to 256*3
Block transfer mode*2	Block size specified in CRAH (1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes))	Incremented or decremented by 1, 2, or 4 or address fixed	1 to 65,536

Note 1. Set the transfer source or destination as the repeat area.
Note 2. Set the transfer source or destination as the block area.
Note 3. After a data transfer of the specified count, the initial state is restored and operation restarts.

Setting the MRB.CHNE bit to 1 allows multiple transfers or a chain transfer on a single activation source. It also enables a chain transfer when the specified data transfer is complete.

Figure 18.4 shows the operation flow of the DTC. Table 18.3 lists the chain transfer conditions. The combination of control information for the second and subsequent transfers are omitted in this table.

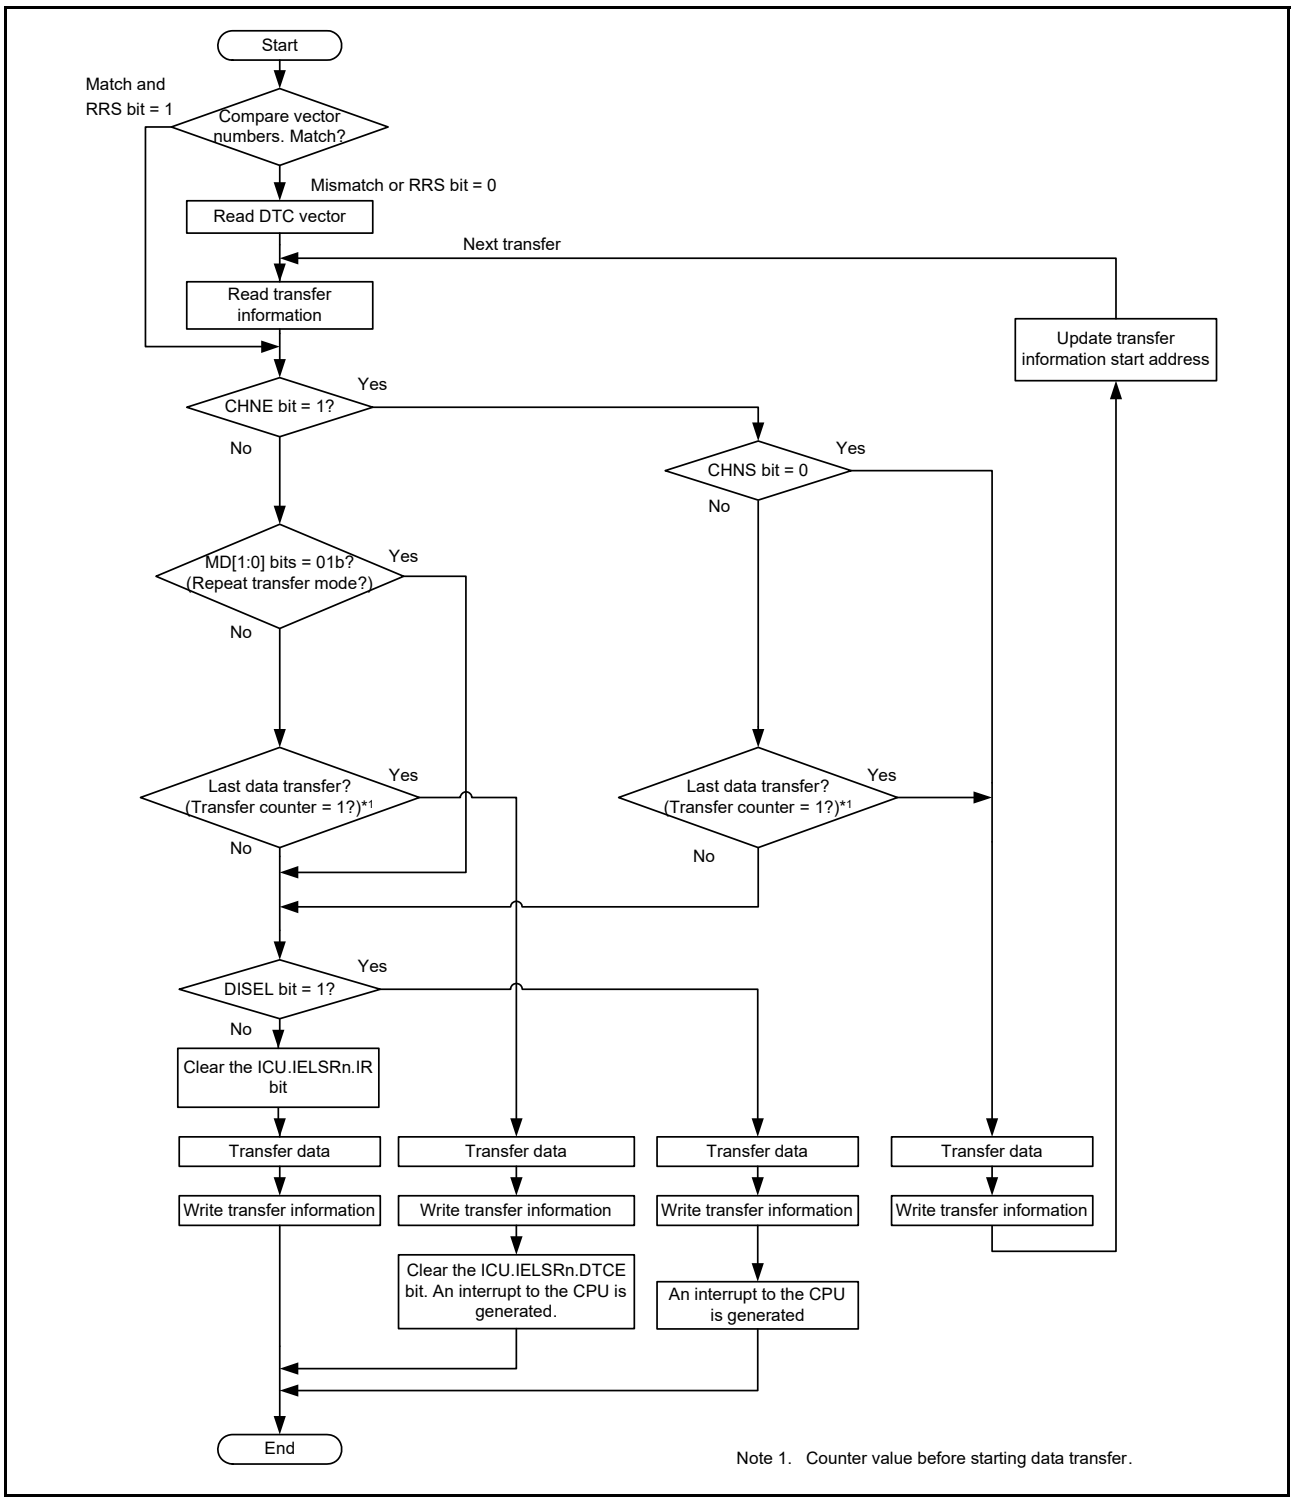

Figure 18.4 DTC operation flow

Table 18.3 Chain transfer conditions

First transfer				Second transfer*3				
CHNE bit	CHNS bit	DISEL bit	Transfer counter*1,*2	CHNE bit	CHNS bit	DISEL bit	Transfer counter*1,*2	DTC transfer
0	—	0	Other than (1 → 0)	—	—	—	—	Ends after the first transfer
0	—	0	(1 → 0)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU
0	—	1	—	—	—	—	—	
1	0	—	—	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	0	Other than (1 → *)	—	—	—	—	Ends after the first transfer
1	1	—	(1 → *)	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	1	Other than (1 → *)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU

Note 1. The transfer counters used depends on the transfer modes as follows:
Normal transfer mode — CRA register
Repeat transfer mode — CRAL register
Block transfer mode — CRB register

Note 2. On completion of a data transfer, the counters operate as follows:
1 → 0 in normal and block transfer modes
1 → CRAH in repeat transfer mode
(1 → *) in the table indicates both of these two operations, depending on the mode.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The conditions for the combination of the second transfer and CHNE bit = 1 is omitted.

18.4.1 Transfer information Read Skip Function

Reading of vector addresses and transfer information can be skipped through the setting in the DTCCR.RRS bit. When a DTC activation request is generated, the current DTC vector number is compared to the DTC vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, the DTC data transfer is performed without reading the vector address and transfer information. However, when the previous transfer is a chain transfer, the vector address and transfer information are read. Additionally, when the transfer counter (CRA register) becomes 0 during the previous normal transfer, or when the transfer counter (CRB register) becomes 0 during the previous block transfer, transfer information is read regardless of the value of the RRS bit. Figure 18.12 shows an example of a transfer information read skip.

To update the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, and then set the RRS bit to 1. The stored vector number is discarded by setting the RRS bit to 0. The updated DTC vector table and transfer information are read in the next activation process.

18.4.2 Transfer information Write-Back Skip Function

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to "address fixed," a part of the transfer information is not written back. Table 18.4 lists the transfer information write-back skip conditions and associated registers. The CRA and CRB registers are written back, and the write-back of the MRA and MRB registers is skipped.

Table 18.4 Transfer information write-back skip conditions and applicable registers

MRA.SM[1:0] bits		MRB.DM[1:0] bits			
b3	b2	b3	b2	**SAR register**	**DAR register**
0	0	0	0	Skip	Skip
0	0	0	1		
0	1	0	0		
0	1	0	1		
0	0	1	0	Skip	Write-back
0	0	1	1		
0	1	1	0		
0	1	1	1		
1	0	0	0	Write-back	Skip
1	0	0	1		
1	1	0	0		
1	1	0	1		
1	0	1	0	Write-back	Write-back
1	0	1	1		
1	1	1	0		
1	1	1	1		

18.4.3 Normal Transfer Mode

This mode allows a 1-byte (8-bit), 1-halfword (16-bit), or 1-word (32-bit) data transfer on a single activation source. The transfer count can be set from 1 to 65,536. Transfer source and destination addresses can be independently set to increment, decrement, or remain fixed. This mode enables an interrupt request to the CPU to be generated at the end of a specified-count transfer.

Table 18.5 lists register functions in normal transfer mode, and Figure 18.5 shows the memory map of normal transfer mode.

Table 18.5 Register functions in normal transfer mode

Register	Description	Value written back by writing transfer information
SAR	Transfer source address	Increment, decrement, or fixed*1
DAR	Transfer destination address	Increment, decrement, or fixed*1
CRA	Transfer counter A	CRA - 1
CRB	Transfer counter B	Not updated

Note 1. Write-back operation is skipped in address-fixed mode.

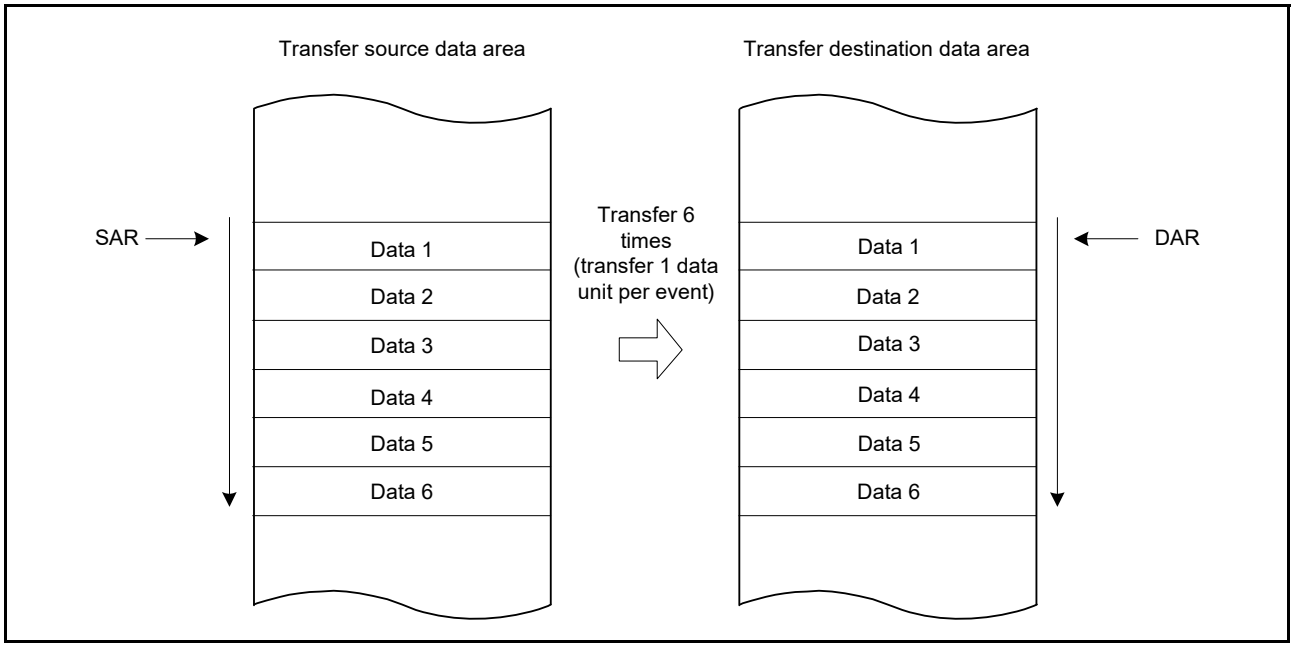

Figure 18.5 Memory map of normal transfer mode (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRA=0006h)

18.4.4 Repeat Transfer Mode

This mode allows a 1-byte (8-bit), 1-halfword (16-bit), or 1-word (32-bit) data transfer on a single activation source. Transfer source or transfer destination for the repeat area must be specified in the MRB.DTS bit. The transfer count can be set from 1 to 256. When the specified count transfer is complete, the initial value of the address register specified in the repeat area is restored, the initial value of the transfer counter is restored, and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.

When the transfer counter CRAL decrements to 00h in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. As a result, the transfer counter does not clear to 00h, which disables interrupt requests to the CPU when the MRB.DISEL bit is set to 0. An interrupt request to the CPU is generated when the specified data transfer is complete.

Table 18.6 lists the register functions in repeat transfer mode, and Figure 18.6 shows the memory map of repeat transfer mode.

Table 18.6 Register functions in repeat transfer mode

Register	Description	Value written back by writing transfer information	
		When CRAL is not 1	When CRAL is 1
SAR	Transfer source address	Increment, decrement, or fixed*1	(When the MRB.DTS bit is 0) Increment, decrement, or fixed*1 (When the MRB.DTS bit is 1) SAR register initial value
DAR	Transfer destination address	Increment, decrement, or fixed*1	(When the MRB.DTS bit is 0) DAR register initial value (When the MRB.DTS bit is 1) Increment, decrement, or fixed*1
CRAH	Holds transfer counter	CRAH	CRAH
CRAL	Transfer counter A	CRAL - 1	CRAH
CRB	Transfer counter B	Not updated	Not updated

Note 1. Write-back is skipped in address-fixed mode.

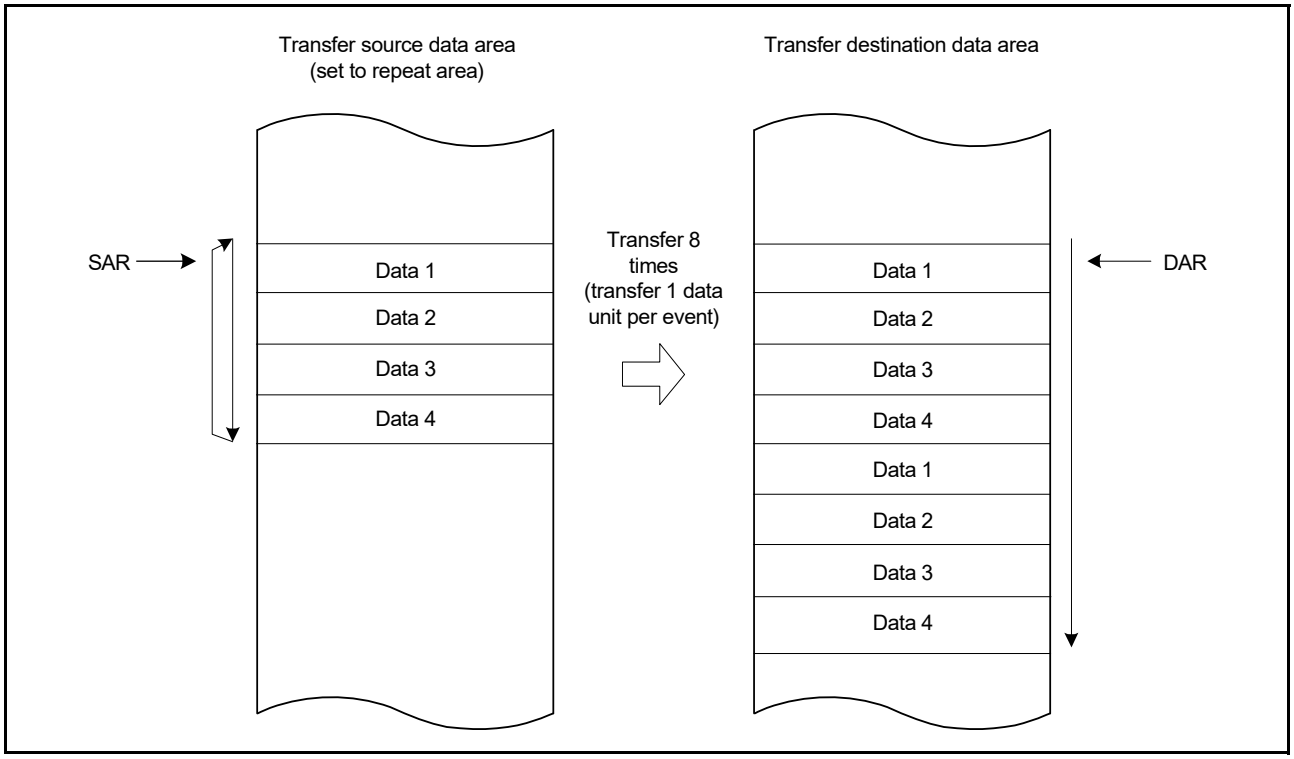

Figure 18.6 Memory map of repeat transfer mode when the transfer source is a repeat area (MRA.SM[1:0] = 10b, MRB.DM[1:0] =10b, CRAH=04h)

18.4.5 Block Transfer Mode

This mode allows single-block data transfer on a single activation source. Transfer source or transfer destination for the block area must be specified in the MRB.DTS bit. The block size can be set from 1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes). When transfer of the specified block completes, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS bit = 1 or the DAR register when the DTS bit = 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.

The transfer count (block count) can be set from 1 to 65,536. This mode enables an interrupt request to the CPU to be generated at the end of the specified-count block transfer.

Table 18.7 lists register functions in block transfer mode, and Figure 18.7 shows the memory map of block transfer mode.

Table 18.7 Register functions in block transfer mode

Register	Description	Value written back by writing transfer information
SAR	Transfer source address	(When MRB.DTS bit is 0) Increment, decrement, or fixed*1 (When MRB.DTS bit is 1) SAR register initial value
DAR	Transfer destination address	(When MRB.DTS bit is 0) DAR register initial value (When MRB.DTS bit is 1) Increment, decrement, or fixed*1
CRAH	Holds the block size	CRAH
CRAL	Block size counter	CRAH
CRB	Block transfer counter	CRB - 1

Note 1. Write-back is skipped in address-fixed mode.

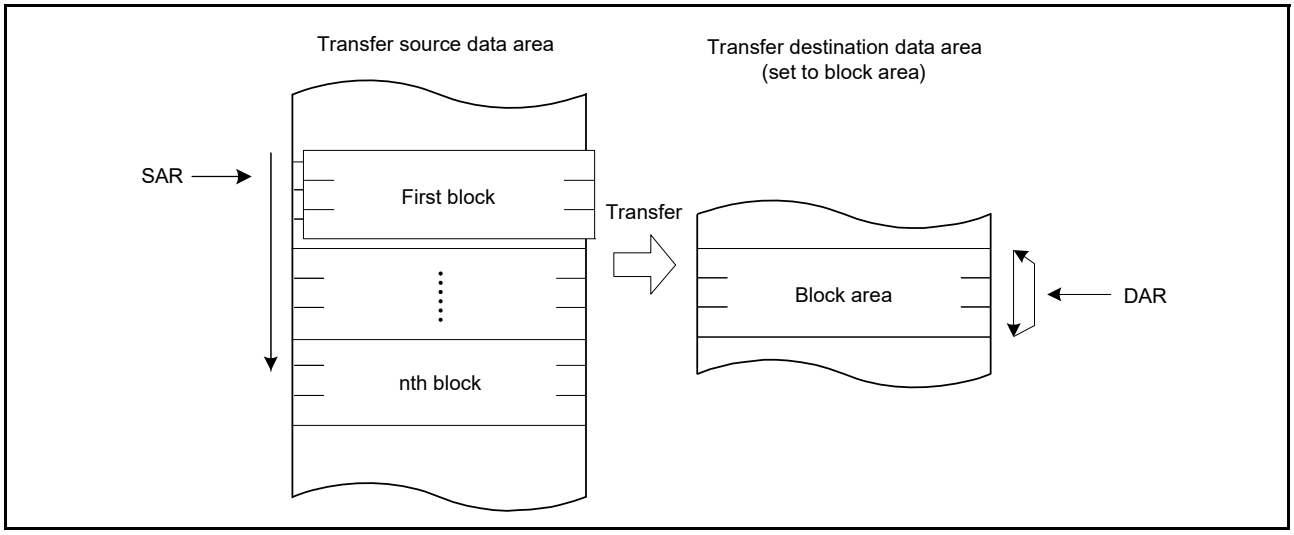

Figure 18.7 Memory map of block transfer mode

18.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single activation source. If MRB.CHNE is set to 1 and CHNS to 0, an interrupt request to the CPU is not generated on completion of the specified number of transfer rounds or by setting the MRB.DISEL bit to 1. An interrupt request is sent to the CPU each time DTC data transfer is performed. Data transfer has no effect on the ICU.IELSRn.IR bit of the activation source.

The SAR, DAR, CRA, CRB, MRA, and MRB registers can be set independently of each other to define the data transfer. Figure 18.8 shows a chain transfer operation.

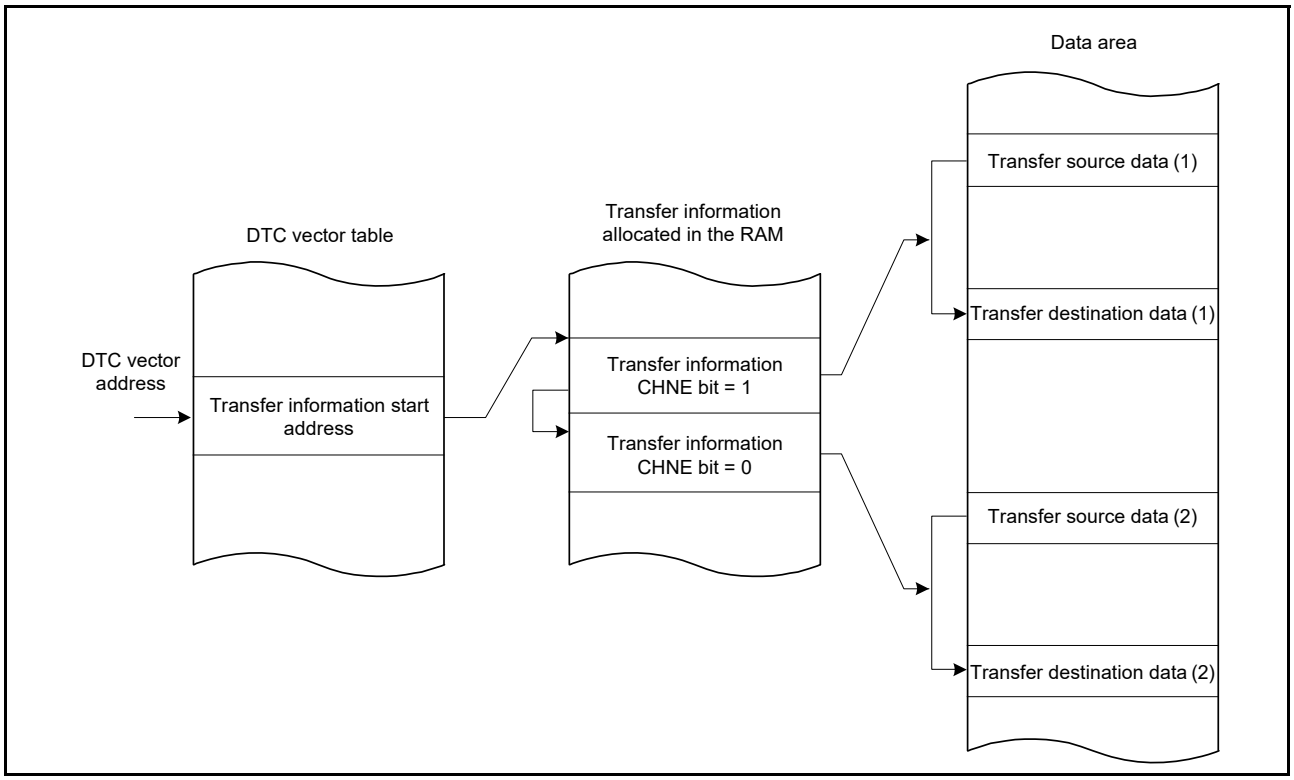

Figure 18.8 Chain transfer operation

Writing 1 to the MRB.CHNE and CHNS bits enables chain transfer to be performed only after completion of the specified data transfer. In repeat transfer mode, chain transfer is performed after completion of the specified data transfer. For details on chain transfer conditions, see Table 18.3, Chain transfer conditions.

18.4.7 Operation Timing

Figure 18.9 to Figure 18.12 are timing diagrams that show the minimum number of execution cycles.

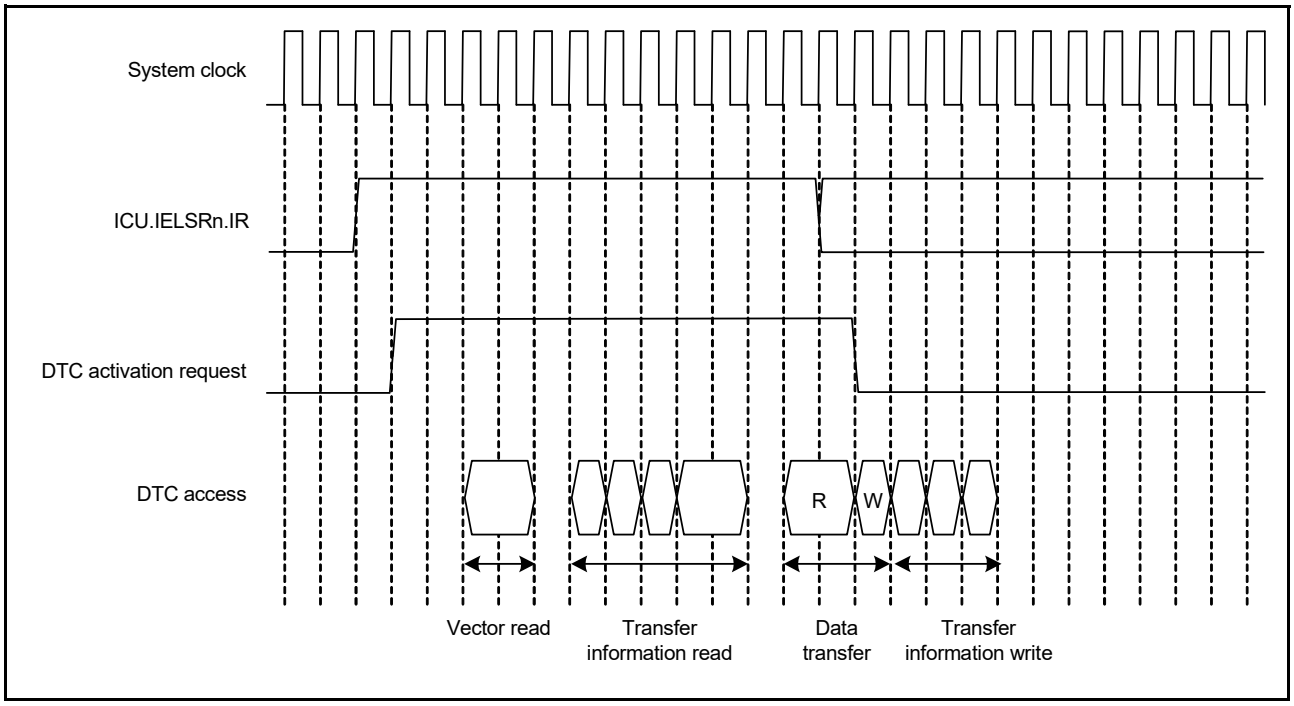

Figure 18.9 Example (1) of DTC operation timing in normal transfer and repeat transfer modes

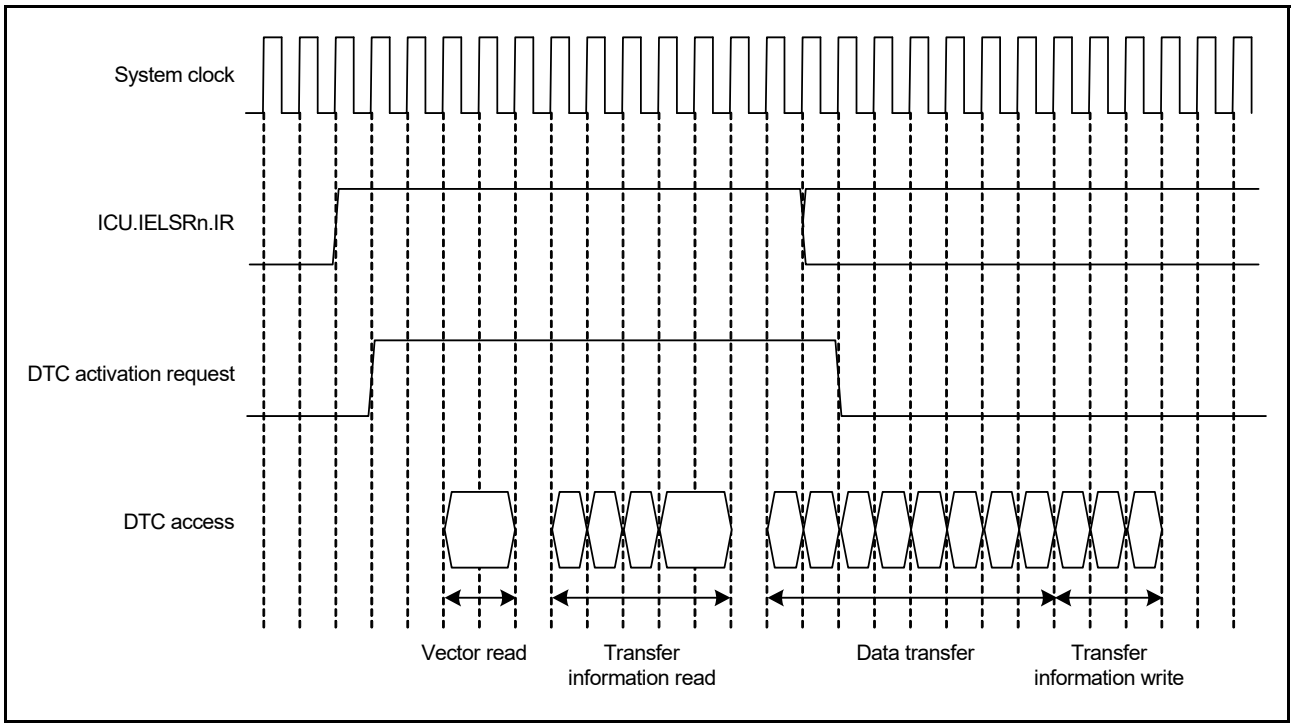

Figure 18.10 Example (2) of DTC operation timing in block transfer mode when the block size = 4

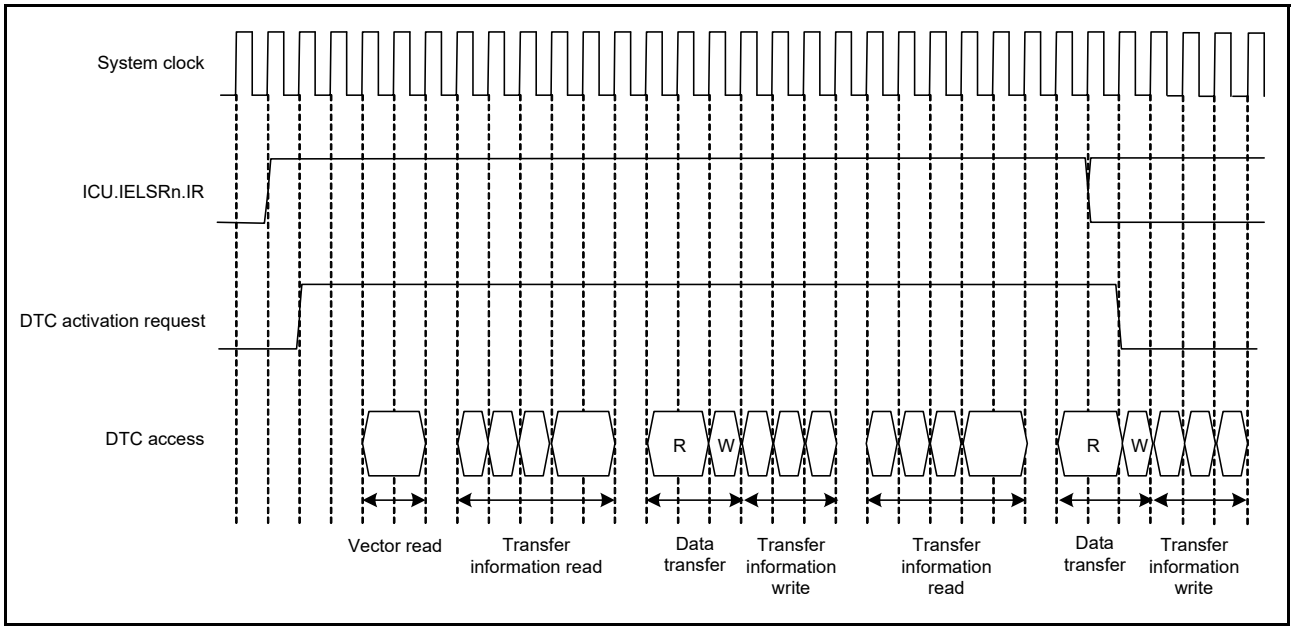

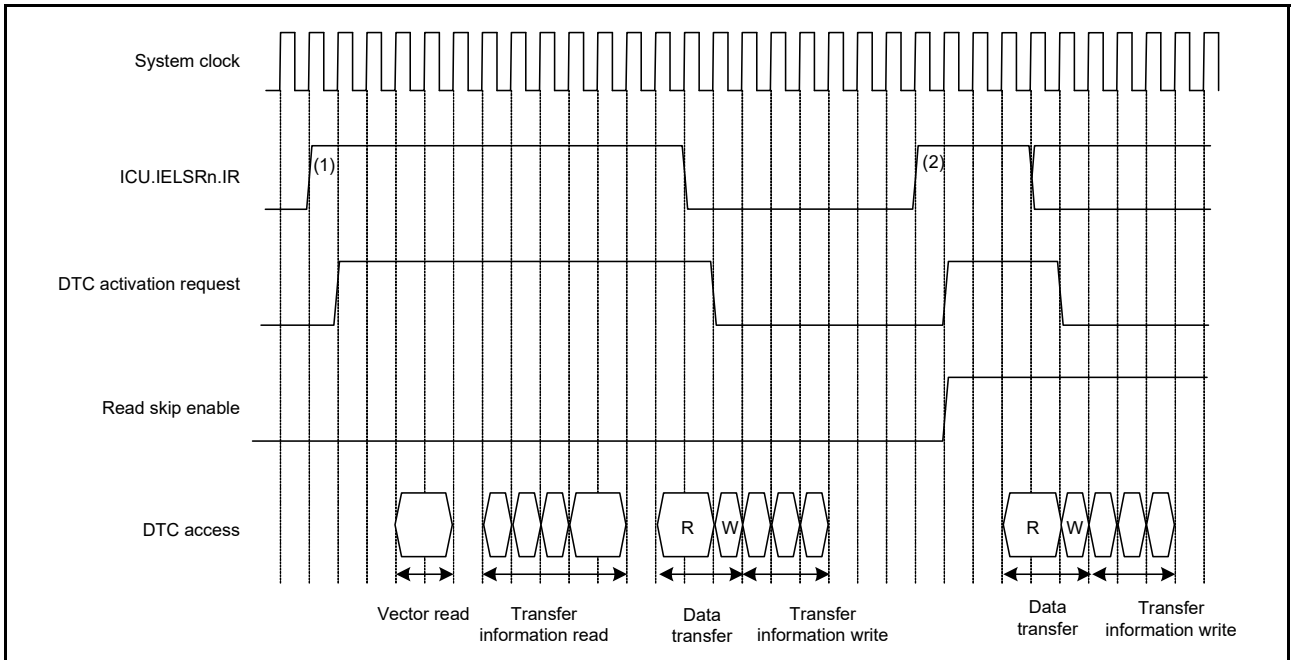

Figure 18.11 Example (3) of DTC operation timing, for chain transfer

Note: When activation sources (vector numbers) of (1) and (2) are the same and the RRS bit = 1, the transfer information read for request (2) is skipped.

Figure 18.12 Example of operation when a transfer information read is skipped, with the vector, transfer information, and transfer destination data on the SRAM, and the transfer source data on the peripheral module

18.4.8 Execution Cycles of DTC

Table 18.8 lists the execution cycles of single data transfer of the DTC.

For the order of the execution states, see section 18.4.7, Operation Timing.

Table 18.8 Execution cycles of DTC

Transfer mode	Vector read		Transfer information read		Transfer information write			Data transfer		Internal operation	
								Read	Write		
Normal	Cv+Cs1+1	0*1	4 × (Ci+Cs1) + 1	0*1	3 × (Ci+Cs1) +1*2	2 × (Ci+Cs1) +1*3	(Ci+Cs1)*4	Cr+Cs2 + 1	Cw+Cs2 + 1	2	0*1
Repeat								Cr+Cs2 + 1	Cw+Cs2 + 1		
Block*5								P × (Cr+Cs2)	P × (Cw+Cs2)		

Note 1. When transfer information read is skipped.
Note 2. When neither SAR nor DAR is set to address-fixed mode.
Note 3. When SAR or DAR is set to address-fixed mode.
Note 4. When SAR and DAR are set to address-fixed mode.
Note 5. When the block size is 2 or more. If the block size is 1, the cycle number for normal transfer is applied.

P: Block size (initial settings of CRAH and CRAL)
Cv: Cycles for access to vector transfer information storage destination
Ci: Cycles for access to transfer information storage destination address
Cr: Cycles for access to data read destination
Cw: Cycles for access to data write destination
Cs1: When access SRAMHS and External Bus; 2 cycles.
When access elsewhere; 0 cycle.
When a slave bus change by a read/write data transfer, furthermore add 1 cycle.
Cs2: When access SRAMHS , External Bus and peripheral modules related system control; 2 cycles.
When access elsewhere; 0 cycle.
When a slave bus change by a read/write data transfer, furthermore add 1 cycle.
The unit is system clocks (ICLK) for "+ 1" in the Vector read, Transfer information read, and Data transfer read columns and "2" in the Internal operation column.
Cv, Ci, Cr, and Cw vary depending on the corresponding access destination. For the number of cycles for respective access destinations, see section 53, SRAM, section 55, Flash Memory, and section 15.2.3, External Bus.
The frequency ratio of the system clock and peripheral clock is also taken into consideration.
The DTC response time is the time from when the DTC activation source is detected until DTC transfer starts.
This table does not include the time until DTC data transfer starts after the DTC activation source becomes active.

18.4.9 DTC Bus Mastership Release Timing

The DTC does not release bus mastership during transfer information reads. Before the transfer information is read or written, the bus is arbitrated according to the priority determined by the bus master arbitrator. For bus arbitration, see section 15, Buses.

18.5 DTC Setting Procedure

Before using the DTC, set the DTC vector base register (DTCVBR). Figure 18.13 shows the procedure for setting the DTC.

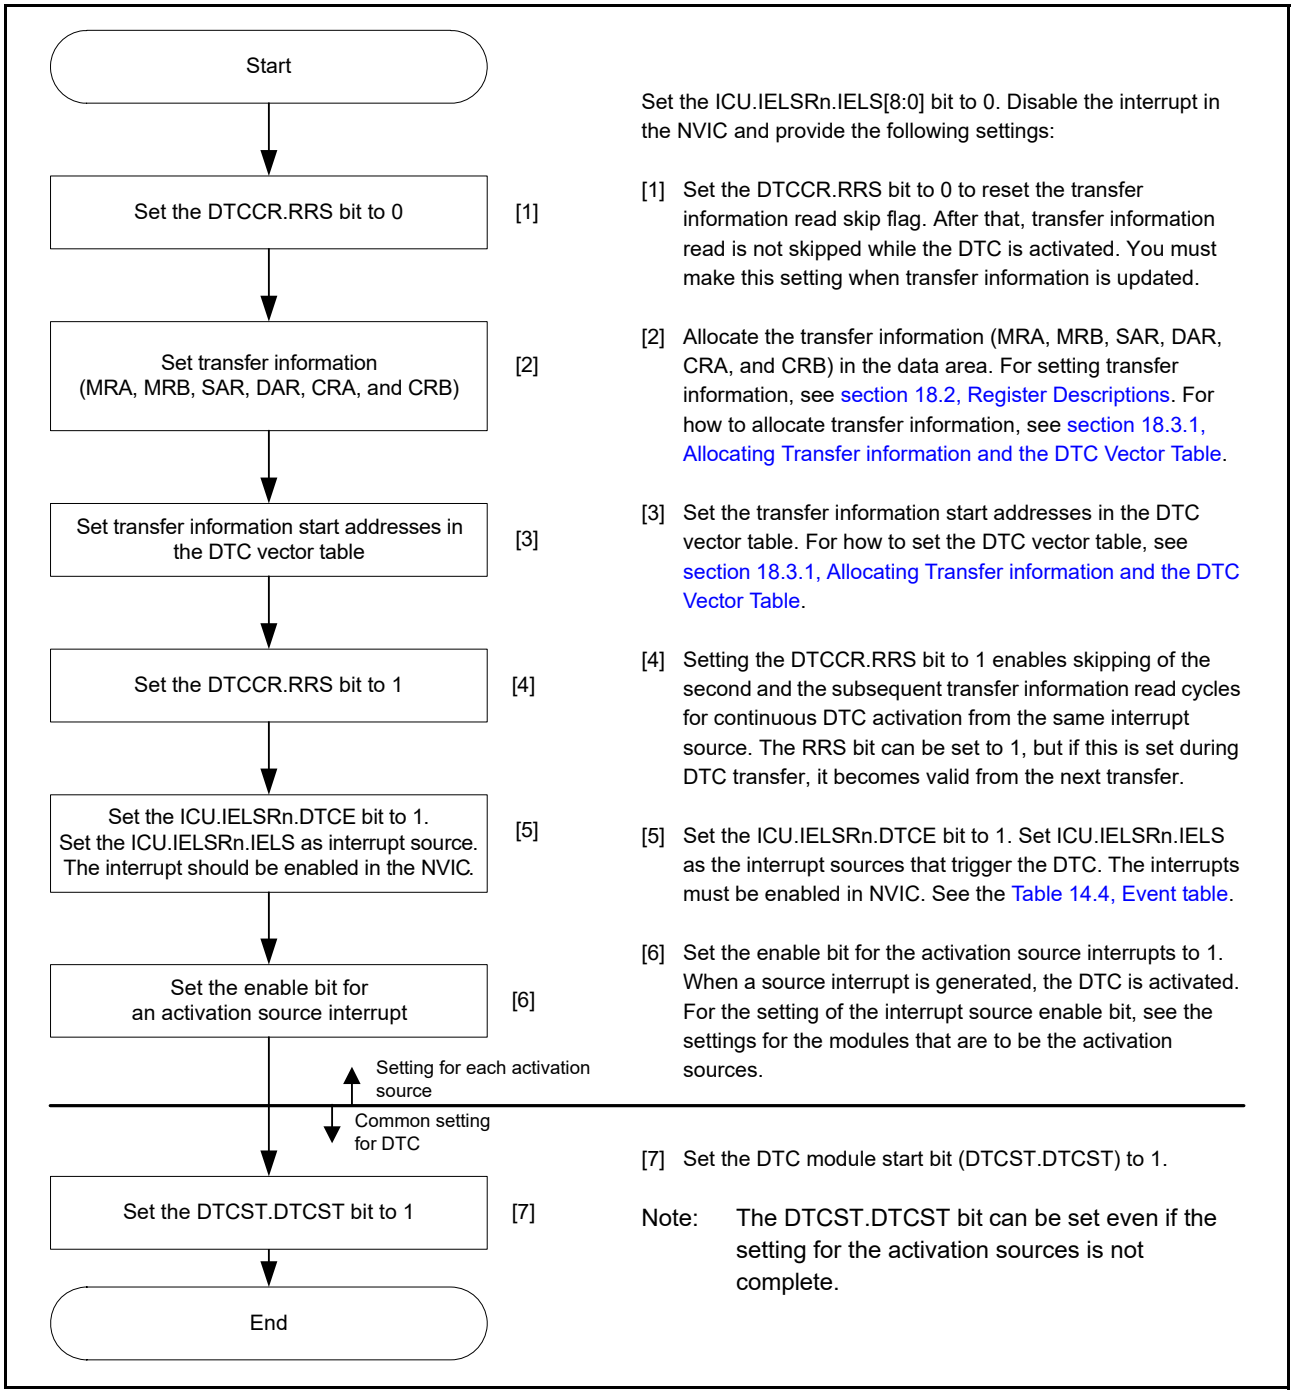

Figure 18.13 DTC setting procedure

18.6 Examples of DTC Usage

18.6.1 Normal Transfer

This section provides an example of DTC usage and its application in the reception of 128 bytes of data from an SCI.

(1) Transfer information settings

In the MRA register, select a fixed source address (MRA.SM[1:0] = 00b), normal transfer mode (MRA.MD[1:0] = 00b), and byte-sized transfer (MRA.SZ[1:0] = 00b). In the MRB register, specify incrementation of the destination address (MRB.DM[1:0] = 10b) and single data transfer by a single interrupt (MRB.CHNE = 0 and MRB.DISEL = 0). The MRB.DTS bit can be set to any value. Set the RDR register address of the SCI in the SAR register, the start address of the SRAM area for data storage in the DAR register, and 128 (0080h) in the CRA register. The CRB register can be set to any value.

(2) DTC vector table setting

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

(3) ICU settings and DTC module activation

Set the ICU.IELSRn.DTCE bit to 1 and set ICU.IELSRn.IELS as the SCI interrupt. The interrupt must be enabled in the NVIC. Set the DTCST.DTCST bit to 1.

(4) SCI settings

Enable the RXI interrupt by setting the SCR.RIE bit in the SCI to 1. If a reception error occurs during the SCI receive operation, reception stops. To manage this, use settings that allow the CPU to accept receive error interrupts.

(5) DTC transfer

Every time a reception of 1 byte by the SCI is complete, an RXI interrupt is generated to activate the DTC. The DTC transfers the received byte from the RDR of the SCI to the SRAM, after which the DAR register is incremented and the CRA register is decremented.

(6) Interrupt handling

After 128 rounds of data transfer are complete and the value in the CRA register becomes 0, an RXI interrupt request is generated for the CPU. Complete the process in the handling routine for this interrupt.

18.6.2 Chain Transfer

This section provides an example of chain transfer by the DTC and describes its use in the output of pulses by the General PWM Timer (GPT). You can use chain transfer to transfer PWM timer compare data and change the period of the PWM timer for GPT.

For the first of the chain transfers, normal transfer mode is specified for transfer to the GPT32m.GTCCRC register. For the second transfer, normal transfer mode is specified for transfer to the GPT32m.GTCCRE register. For the third transfer, normal transfer mode is specified for transfer to the GPT32m.GTPBR register. This is because clearing of the activation source and generation of an interrupt on completion of the specified number of transfers are restricted to the third of the chain transfers, that is, transfers while MRB.CHNE = 0.

The following example shows how to use the counter overflow interrupt with a GPT32EH0.GTPR register as an activating source for the DTC.

(1) First transfer information settings

Set up transfer to the GPT32EH0.GTCCRC register:

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).
4. Set the SAR to the first address of the data table.

5. Set the DAR register to the address of the GPT32EH0.GTCCRC register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

(2) Second transfer information settings

Set up transfer to the GPT32EH0.GTCCRE register:

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT32EH0.GTCCRE register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

(3) Third transfer information settings

Set up transfer to the GPT32EH0.GTPBR register:

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up single data transfer per interrupt (MRB.CHNE = 0, MRB.DISEL = 0). The MRB.DTS bit can be set to any value.
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT32EH0.GTPBR register.
6. Set the CRA register to the size of the data table. The CRB register can be set to any value.

(4) Transfer information assignment

Place the transfer information for use in the transfer to GPT32EH0.GTPBR immediately after the transfer control information for use in the GPT32EH0.GTCCRC and GPT32EH0.GTCCRE registers.

(5) DTC vector table

In the DTC vector table, set the address where the transfer control information for use in transfer to the GPT32EH0.GTCCRC and GPT32EH0.GTCCRE registers starts.

(6) ICU settings and DTC module activation

1. Set the ICU.IELSRn.DTCE bit associated with the GPT32EH0 counter overflow interrupt.
2. Set the ICU.IELSRn.IELS[8:0] to 182 (B6h) for the GPT32EH0 counter overflow.
3. Set the DTCST.DTCST bit to 1.

(7) GPT settings

1. Set the GPT32EH0.GTIOR register so that the GTCCRA and GTCCRB registers operate as output compare registers.
2. Set the default PWM timer compare values in the GPT32EH0.GTCCRA and GPT32EH0.GTCCRB registers and the next PWM timer compare values in the GPT32EH0.GTCCRC and GPT32EH0.GTCCRE registers.
3. Set the default PWM timer period values in the GPT32EH0.GTPR register and the next PWM timer period values in the GPT32EH0.GTPBR register.
4. Set 1 to the output bit in PmnPFS.PDR, and set 00011b to the peripheral select bits in PmnPFS.PSEL[4:0].

(8) GPT activation

Set the GPT32EH0.GTSTR.CSTRT bits to 1 to start the GPT32EH0.GTCNT counter.

(9) DTC transfer

Every time a GPT32EH0 counter overflow is generated with the GPT32EH0.GTPR register, the next PWM timer compare values are transferred to the GPT32EH0.GTCCRC and GPT32EH0.GTCCRE registers. The setting for the next PWM timer period is transferred to the GPT32EH0.GTPBR register.

(10) Interrupt handling

After the specified rounds of data transfer are complete, for example when the value in the CRA register for GPT transfer becomes 0, a GPT counter overflow interrupt request is issued for the CPU. Complete the process for this interrupt in the handling routine.

18.6.3 Chain Transfer When Counter = 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second transfer. Chain transfer enables transfers to be repeated 256 times or more.

The following procedure shows an example of configuring a 128-KB input buffer, where the input buffer is set so that its lower address starts with 0000h. Figure 18.14 shows a chain transfer when the counter = 0.

1. Set the normal transfer mode to input data for the first data transfer. Set the following:
   a. Transfer source address = fixed.
   b. CRA register = 0000h (65,536) times.
   c. MRB.CHNE bit = 1 (chain transfer is enabled).
   d. MRB.CHNS bit = 1 (chain transfer is performed only when the transfer counter is 0).
   e. MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
2. Prepare the upper 8-bit address of the start address at every 65,536 times of the transfer destination address for the first data transfer in different area such as the flash. For example, when setting the input buffer to 20 0000h to 21 FFFFh, prepare 21h and 20h.
3. For the second data transfer:
   a. Set the repeat transfer mode (with the source as the repeat area) to reset the transfer destination address of the first data transfer.
   b. Specify the upper 8 bits of the DAR register in the first transfer information area for the transfer destination.
   c. Set the MRB.CHNE bit = 0 (chain transfer is disabled).
   d. Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
   e. When setting the input buffer to 20 0000h to 21 FFFFh, also set the transfer counter to 2.
4. The first data transfer is performed by an interrupt 65,536 times. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the upper 8 bits of the transfer source address of the first data transfer to 21h. The lower 16 bits of the transfer destination address and the transfer counter of the first data transfer are 0000h.
5. In succession, the first data transfer is performed by an interrupt 65,536 times as specified for the first data transfer. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the upper 8 bits of the transfer source address of the first data transfer to 20h. The lower 16 bits of the transfer destination address and the transfer counter of the first data transfer are 0000h.
6. Steps 4 and 5 are repeated indefinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

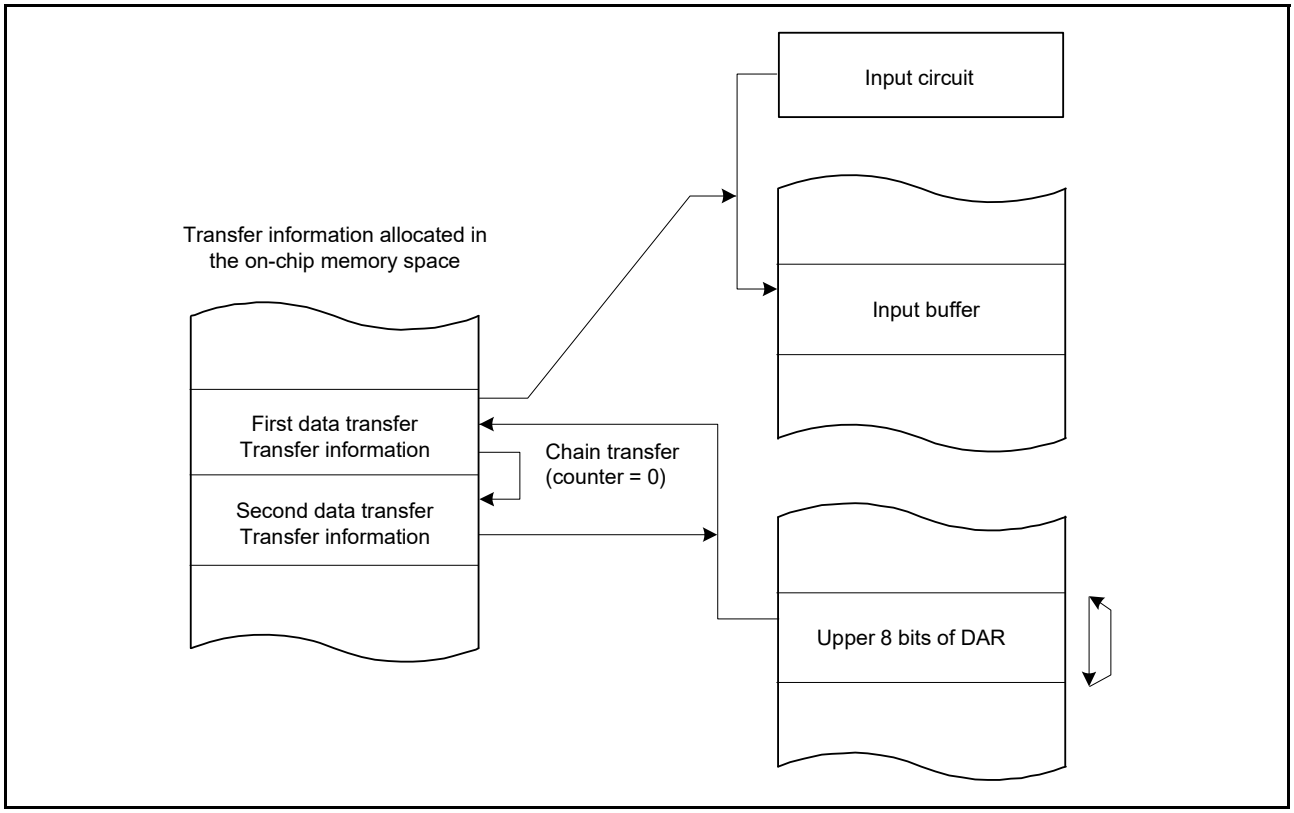

Figure 18.14 Chain transfer when counter = 0

18.7 Interrupt Sources

When the DTC finishes data transfer of the specified count or when data transfer with the MRB.DISEL set to 1 is complete, a DTC activation source generates an interrupt to the CPU. Interrupts to the CPU are controlled according to the settings in the NVIC and ICU.IELSRn.IELS[8:0]. See section 14, Interrupt Controller Unit (ICU).

The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

18.8 Event Link

The DTC is capable of producing an event link request on completion of one transfer request. When the destination for the transfer is an external bus, the event link request is issued after completion of writing to the write buffer rather than after completion of writing to the actual transfer destination.

18.9 Snooze Control Interface

To return to Software Standby mode from Snooze mode through the DTC, set the SYSTEM.SNZEDCR.DTCZRED or SYSTEM.SNZEDCR.DTCNZRED to 1. See section 11.8.3, Return to Software Standby Mode.

SYSTEM.SNZEDCR.DTCZRED enables or disables a Snooze end request on completion of the last DTC transmission, detected on DTC transmission completion of CRA and CRB are 0.

SYSTEM.SNZEDCR.DTCNZRED enables or disables a Snooze end request on a not last DTC transmission completion, detected on DTC transmission completion of CRA and CRB are not 0.

18.10 Module-Stop Function

Before transitioning to the module-stop function, Software Standby mode without a Snooze mode transition, or Deep Software Standby mode, set the DTCST.DTCST bit to 0, and then perform the operations described in the following sections. The DTC is available in Snooze mode by a setting of LPW.SNZCR.SNZDTCEN to 1. See section 11, Low Power Modes.

(1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DTC. If the DTC transfer is in progress at the time, 1 is written to the MSTPCRA.MSTPA22 bit. The transition to the module-stop state proceeds after DTC transfer ends. While the MSTPCRA.MSTPA22 bit is 1, accessing the DTC registers is prohibited.

Writing 0 to the MSTPCRA.MSTPA22 bit releases the DTC from the module-stop state.

(2) Software Standby and Deep Software Standby modes

Use the settings described in section 11.7.1, Transition to Software Standby Mode, or section 11.9.1, Transition to Deep Software Standby Mode.

If DTC transfer operations are in progress at the time the WFI instruction is executed, the transition to Software Standby mode or Deep Software Standby mode follows the completion of the DTC transfer.

When the Snooze control circuit receives a Snooze request in Software Standby mode, the MCU transfers to Snooze mode. See section 11.8.1, Transition to Snooze Mode. DTC operation in Snooze mode can be selected in the SYSTEM.SNZCR.SNZDTCEN bit. If DTC operation is enabled in Snooze mode, before making a transition to Software Standby mode, set the DTCST.DTCST bit to 1. To return to Software Standby mode through the DTC, set SYSTEM.SNZEDCR.DTCZRED or SYSTEM.SNZEDCR.DTCNZRED to 1. See section 11.8.3, Return to Software Standby Mode. The DTC activation request from the ICU is stopped during Software Standby mode but not during Snooze mode.

(3) Notes on the module-stop function

For the WFI instruction and the register setting procedure, see section 11, Low Power Modes.

To perform a DTC transfer after returning from a low power mode without Snooze mode transition, set the DTCST.DTCST bit to 1 again.

To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DTC activation request, specify the CPU as the interrupt request destination as described in section 14.4.2, Selecting Interrupt Request Destinations, and then execute a WFI instruction. If DTC operation is enabled in Snooze mode, do not use the module-stop function of the DTC.

18.11 Usage Notes

18.11.1 Transfer information Start Address

You must set multiples of 4 for the transfer information start addresses in the vector table. Otherwise, such addresses are accessed with their lowest 2 bits regarded as 00b.

19. Event Link Controller (ELC)

19.1 Overview

The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link without CPU intervention. Table 19.1 lists the ELC specifications and Figure 19.1 shows the block diagram.

Table 19.1 ELC specifications

Parameter	Specifications
Event link function	270 types of event signals can be directly connected to modules. The ELC can generate an ELC event signal, and events that activate the DTC.
Module-stop function	Module-stop state can be set to reduce power consumption

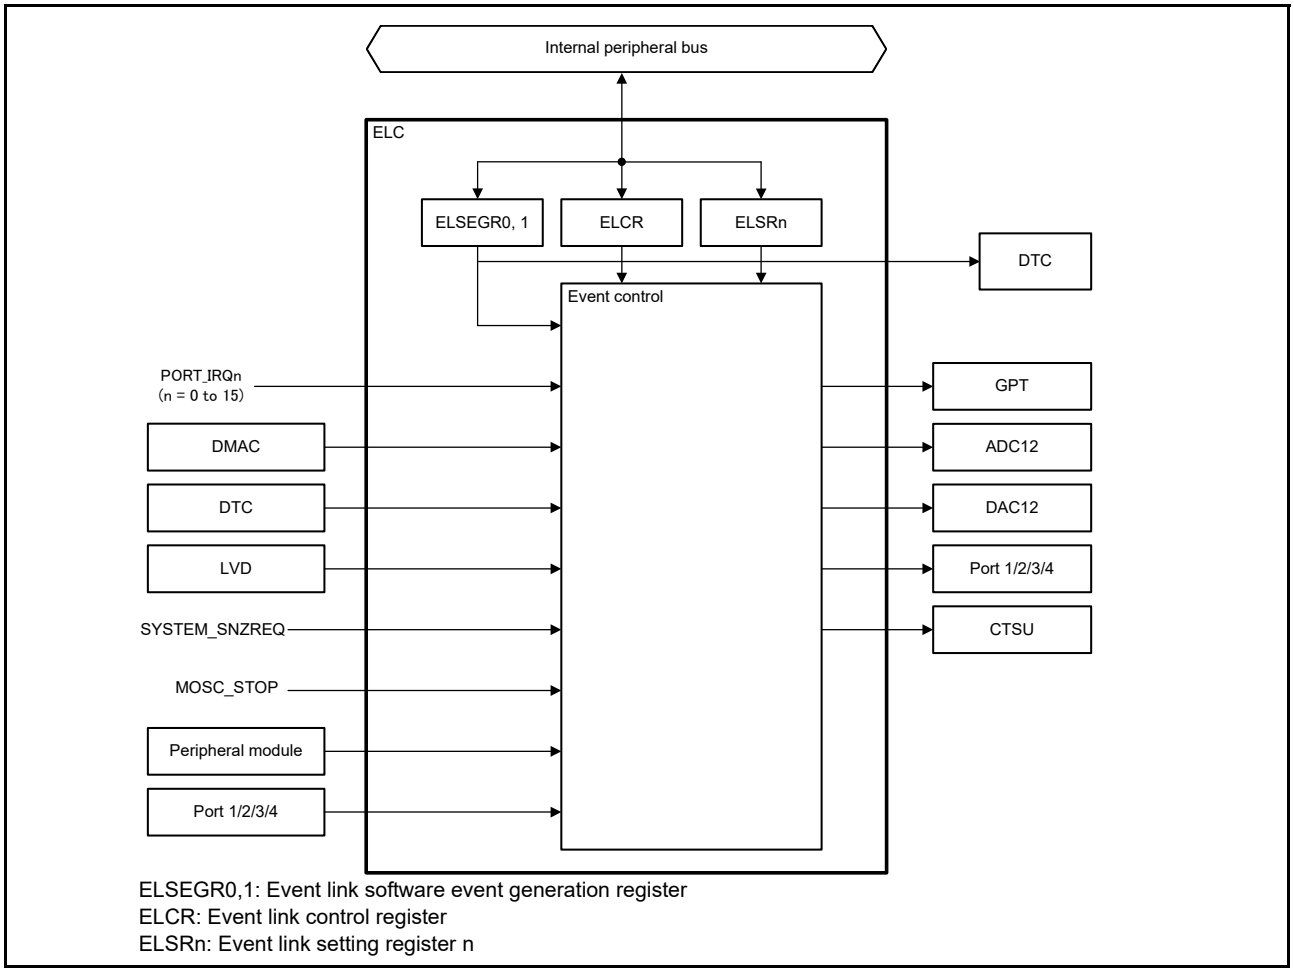

Figure 19.1 ELC block diagram (n = 0 to 18)

19.2 Register Descriptions

19.2.1 Event Link Controller Register (ELCR)

Address(es): ELC.ELCR 4004 1000h

	b7	b6	b5	b4	b3	b2	b1	b0
	ELCON	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	ELCON	All Event Link Enable	0: Disable ELC function 1: Enable ELC function.	R/W

The ELCR register controls the ELC operation.

19.2.2 Event Link Software Event Generation Register n (ELSEGRn) (n = 0, 1)

Address(es): ELC.ELSEGR0 4004 1002h, ELC.ELSEGR1 4004 1004h

	b7	b6	b5	b4	b3	b2	b1	b0
	WI	WE	—	—	—	—	—	SEG
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SEG	Software Event Generation	0: Normal operation 1: Generate a software event.	W
b5 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	WE	SEG Bit Write Enable	0: Disable writes to SEG bit 1: Enable writes to SEG bit.	R/W
b7	WI	ELSEGR Register Write Disable	0: Enable writes to ELSEGR register 1: Disable writes to ELSEGR register.	W

SEG bit (Software Event Generation)

When 1 is written to the SEG bit while the WE bit is 1, a software event is generated. This bit is read as 0. Even when 1 is written to this bit, data is not stored. The WE bit must be set to 1 before writing to this bit.

A software event can trigger a linked DTC event.

WE bit (SEG Bit Write Enable)

The SEG bit can only be written to when the WE bit is 1. Clear the WI bit to 0 before writing to this bit.

[Setting condition]

- If 1 is written to this bit while the WI bit is 0, this bit becomes 1.

[Clearing condition]

- If 0 is written to this bit while the WI bit is 0, this bit becomes 0.

WI bit (ELSEGR Register Write Disable)

The ELSEGR register can only be written to when the write value to the WI bit is 0. This bit is read as 1. Before setting the WE or SEG bit, the WI bit must be set to 0.

19.2.3 Event Link Setting Register n (ELSRn) (n = 0 to 18)

Address(es): ELC.ELSR0 4004 1010h, ELC.ELSR1 4004 1014h, ELC.ELSR2 4004 1018h, ELC.ELSR3 4004 101Ch, ELC.ELSR4 4004 1020h, ELC.ELSR5 4004 1024h, ELC.ELSR6 4004 1028h, ELC.ELSR7 4004 102Ch, ELC.ELSR8 4004 1030h, ELC.ELSR9 4004 1034h, ELC.ELSR10 4004 1038h, ELC.ELSR11 4004 103Ch, ELC.ELSR12 4004 1040h, ELC.ELSR13 4004 1044h, ELC.ELSR14 4004 1048h, ELC.ELSR15 4004 104Ch, ELC.ELSR16 4004 1050h, ELC.ELSR17 4004 1054h, ELC.ELSR18 4004 1058h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	ELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b8 to b0	ELS[8:0]	Event Link Select	b8 b0 000000000: Disable event output for the associated peripheral module 000000001 to 111000101b: Number setting for the event signal to be linked. Other settings are prohibited.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ELSRn register specifies an event signal to be linked to for each peripheral module. Table 19.2 shows the associations between the ELSRn registers and the peripheral modules. Table 19.3 shows the associations between the event signal names set in the ELSRn register and the signal numbers.

Table 19.2 Associations between the ELSRn registers and peripheral functions

Register name	Peripheral function (module)	Event name
ELSR0	GPT (A)	ELC_GPTA
ELSR1	GPT (B)	ELC_GPTB

1A4h	SCI8	SCI8_RXI *4	Receive data full
1A5h		SCI8_TXI *4	Transmit data empty
1A6h		SCI8_TEI	Transmit end
1A7h		SCI8_ERI *4	Receive error
1A8h		SCI8_AM	Address match event
1AAh	SCI9	SCI9_RXI *4	Receive data full
1ABh		SCI9_TXI *4	Transmit data empty
1ACh		SCI9_TEI	Transmit end
1ADh		SCI9_ERI *4	Receive error
1AEh		SCI9_AM	Address match event

Table 19.3 Associations between event signal names set in ELSRn.ELS bits and signal numbers (7 of 7)

Event number	Interrupt request source	Name	Description
1BCh	SPI0	SPI0_SPRI	Receive data full
1BDh		SPI0_SPTI	Transmit data empty
1BEh		SPI0_SPII	Idle
1BFh		SPI0_SPEI	Receive error
1C0h		SPI0_SPTEND	Transmit end
1C1h	SPI1	SPI1_SPRI	Receive data full
1C2h		SPI1_SPTI	Transmit data empty
1C3h		SPI1_SPII	Idle
1C4h		SPI1_SPEI	Receive error
1C5h		SPI1_SPTEND	Transmit end

Note 1. Only pulse (edge detection) is supported.
Note 2. ELSR8 to ELSR11, ELSR14 to ELSR17, and ELSR18 can select this event.
Note 3. This event can occur in Snooze mode.
Note 4. This event is not supported in FIFO mode.

19.3 Operation

19.3.1 Relation between Interrupt Handling and Event Linking

The Event number for an event link is the same as that for the associated interrupt source. For information on generating event signals, see the description in the chapter for each event source module.

19.3.2 Linking Events

When an event occurs and that event is already set as a trigger in the Event Link Setting Register (ELSRn), the associated module is activated. The operation of the module must be set up in advance. Table 19.4 lists the operations of modules when an event occurs.

Table 19.4 Module operations when event occurs

Module	Operations when event occurs
GPT	• Start counting • Stop counting • Clear counting • Up counting • Down counting • Input capture.
ADC12	Start A/D conversion
DAC12	Start D/A conversion
I/O ports	• Change pin output based on the EORR (reset) or EOSR (set) • Latch pin state to EIDR • The following ports can be used for the ELC: PORT 1 PORT 2 PORT 3 PORT 4.
CTSU	Start measurement operation
DTC	Start DTC data transfer

19.3.3 Example Procedure for Linking Events

To link events:

1. Set the operation of the module for which an event is to be linked.
2. Set the appropriate ELSRn register for the module to be linked.
3. Set the ELCR.ELCON bit to 1 to enable linkage of all events.

4. Configure the module from which an event is output and activate the module. The link between the two modules is now active.
5. To stop event linkage of modules individually, set 000000000b in the ELSRn.ELS[8:0] bits associated with the modules. To stop linkage of all events, set the ELCR.ELCON bit to 0.

If the event link output from the RTC is to be used, set the ELC after the RTC, for example initialization and time setting. Unintended events can be generated if the RTC settings are made after the ELC settings.

19.4 Usage Notes

19.4.1 Linking DMAC or DTC Transfer End Signals as Events

When linking the DMAC or DTC transfer end signals as events, do not set the same peripheral module as the DMAC or DTC transfer destination and event link destination. If set, the peripheral module might be started before DMAC or DTC transfer to the peripheral module is complete.

19.4.2 Setting Clocks

To link events, you must enable the ELC and the related modules. The modules cannot operate if the related modules are in the module-stop state or in low power modes in which the module is stopped (Software Standby mode or Deep Software Standby mode). Some modules can perform in Snooze mode. For more information, see Table 19.3 and section 11, Low Power Modes.

19.4.3 Settings for the Module-Stop Function

ELC operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The ELC is initially stopped after reset. Releasing the module-stop state enables access to the registers. For more information, see Table 19.3 and section 11, Low Power Modes. The ELCON bit must be set to 0 before ELC operation is disabled using the MSTPCRC register.

19.4.4 ELC Delay Time

In Figure 19.2, module A uses ELC and accesses module B through the ELC. There is a delay time in the ELC module between module A and module B. See Table 19.5, ELC delay time.

If the clock domains on both module A and module B are the same, the delay time is 0. But, if the clock domains on module A and B are different, ELC module has some delay. The time delay is defined by the slower clock frequency between module A and module B clocks.

Table 19.5 ELC delay time

Clock domain	Clock frequency	ELC delay time
clock_A = clock_B	clock_A = clock_B	0 cycle
clock_A ≠ clock_B	clock_A = clock_B	1 cycle to 2 cycles
	clock_A > clock_B	1 cycle to 2 cycles of B
	clock_A < clock_B	1 cycle to 2 cycles of A

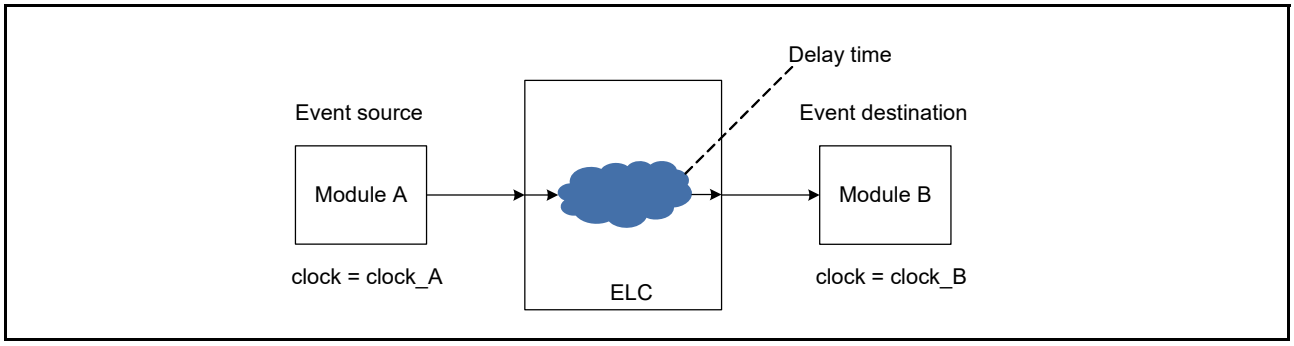

Figure 19.2 ELC delay time

20. I/O Ports

20.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC, or bus control pins. All pins operate as input pins immediately after a reset, and pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers. Figure 20.1 shows a connection diagram for the I/O port registers. The configuration of the I/O ports differs depending on the package. Table 20.1 lists the I/O port specifications by package, and Table 20.2 lists the port functions.

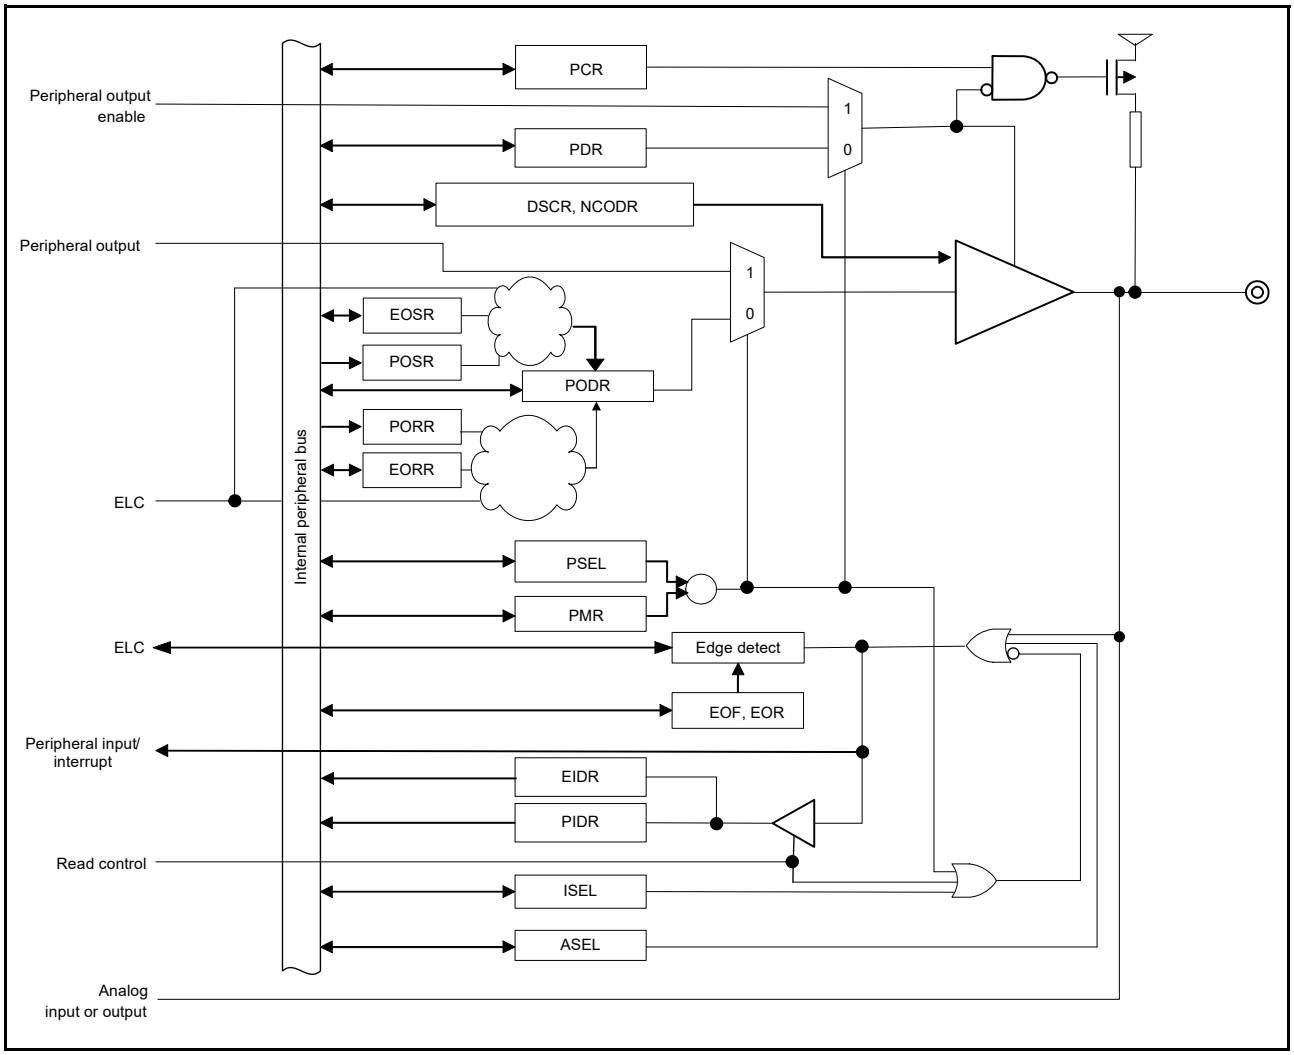

Figure 20.1 Connection diagram for I/O port registers

Note: This figure shows a basic port configuration. The configuration differs depending on the port.

Table 20.1 I/O port specifications (1 of 2)

Port	Package 224 pins	No. of pins	Package 176 pins	No. of pins	Package 144 pins, 145 pins	No. of pins	Package 100 pins	No. of pins
Port 0	P000 to P011, P014, P015	14	P000 to P010, P014, P015	13	P000 to P009, P014, P015	12	P000 to P008, P014, P015	11

Bit	Symbol	Bit name	Description	R/W
b15 to b0	PDRn	Pmn Direction	0: Input (functions as an input pin) 1: Output (functions as an output pin).	R/W
b31 to b16	PODRn	Pmn Output Data	0: Output low 1: Output high.	R/W

m = 0 to 9, A, B
n = 00 to 15

Port Control Register 1 is a 32- and 16-bit readable/writable register that controls port direction and port output data.

PCNTR1 specifies both the port direction and the output data, in 32-bit units. PDR (PCNTR1 bits [15:0]) and PODR (PCNTR1 bits [31:16]) specify port direction and port output data, respectively, and are accessed in 16-bit units.

The PDRn bits select the input or output direction for individual pins on the associated port when the pins are configured as general I/O pins. Each pin on port m is associated with a PORTm.PCNTR1.PDRn bit. The I/O direction can be specified in 1-bit units. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0. P000 to P007 and P200 are input only, so PORT0.PCNTR1 bits [7:0] and PORT2.PCNTR1 bit [0] are reserved. The PDRn bit in the PORTm.PCNTR1 register serves the same function as the PDR bit in the PFS.PmnPFS register.

The PODRn bits hold data to be output from the general I/O pins. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0. P000 to P007 and P200 are input only, so PORT0.PCNTR1 bits [23:16] and PORT2.PCNTR1 bit [16] are reserved. Writes to P000 to P007 and P200 have no effect. The PODRn bit in the PORTm.PCNTR1 register serves the same function as the PODR bit in the PFS.PmnPFS register.

20.2.2 Port Control Register 2 (PCNTR2/EIDR/PIDR)

Address(es): PORT0.PCNTR2 4004 0004h, PORT1.PCNTR2 4004 0024h, PORT2.PCNTR2 4004 0044h, PORT3.PCNTR2 4004 0064h, PORT4.PCNTR2 4004 0084h, PORT5.PCNTR2 4004 00A4h, PORT6.PCNTR2 4004 00C4h, PORT7.PCNTR2 4004 00E4h, PORT8.PCNTR2 4004 0104h, PORT9.PCNTR2 4004 0124h, PORTA.PCNTR2 4004 0144h, PORTB.PCNTR2 4004 0164h

PORT1.EIDR 4004 0024h, PORT2.EIDR 4004 0044h, PORT3.EIDR 4004 0064h, PORT4.EIDR 4004 0084h

PORT0.PIDR 4004 0006h, PORT1.PIDR 4004 0026h, PORT2.PIDR 4004 0046h, PORT3.PIDR 4004 0066h, PORT4.PIDR 4004 0086h, PORT5.PIDR 4004 00A6h, PORT6.PIDR 4004 00C6h, PORT7.PIDR 4004 00E6h, PORT8.PIDR 4004 0106h, PORT9.PIDR 4004 0126h, PORTA.PIDR 4004 0146h, PORTB.PIDR 4004 0166h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	EIDR15	EIDR14	EIDR13	EIDR12	EIDR11	EIDR10	EIDR09	EIDR08	EIDR07	EIDR06	EIDR05	EIDR04	EIDR03	EIDR02	EIDR01	EIDR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PIDR15	PIDR14	PIDR13	PIDR12	PIDR11	PIDR10	PIDR09	PIDR08	PIDR07	PIDR06	PIDR05	PIDR04	PIDR03	PIDR02	PIDR01	PIDR00
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b15 to b0	PIDRn	Pmn State	0: Low level 1: High level.	R
b31 to b16	EIDRn	Port Event Input Data*1,*2	When ELC_PORTx signal occurs: 0: Input low 1: Input high.	R

m = 0 to 9, A, B
n = 00 to 15
x = 1 to 4

Note 1. Supported for ports 1 to 4.

Note 2. When using GPT, ETHERC, SCI, or SPI as an event trigger, set peripheral operating frequency under the following conditions:
When using GPT, PCLKD ≤ 60MHz.
When using ETHERC, SCI, or SPI, PCLKA ≤ 60MHz.

The Port Control Register 2 allows read access to the Pmn state and the port event input data using 32-bit or 16-bit access.

The PCNTR2 specifies the Pmn state and the port event input data, and is accessed in 32-bit units. The PIDRn (bits [15:0] in PCNTR2) and EIDRn (bits [31:16] in PCNTR2) respectively, are accessed in 16-bit units. Bits associated with non-existent pins are reserved. Reserved bits are read as undefined.

The PIDRn bits reflect individual pin states of the port, regardless of the values set in PmnPFS.PMR and PORTm.PCNTR1.PDRn. The PIDRn bit in the PORTm.PCNTR2 register serves the same function as the PIDR bit in the PFS.PmnPFS register.

A pin state cannot be reflected in PIDRn when one of the following functions is enabled:

- Main clock oscillator (MOSC)
- CS area controller (CSC)
- Analog function (ASEL = 1)
- Capacitive Touch Sensing Unit (CTSU)
- USB 2.0 Full-Speed Module (USBFS) module.

The EIDRn bits latch a pin state when an ELC_PORTx signal occurs. Pin states can only be input to EIDRn when PmnPFS.PMR and PORTm.PCNTR1.PDRn are 0. When PmnPFS.ASEL is set 1, the associated pin state is not reflected in EIDRn.

20.2.3 Port Control Register 3 (PCNTR3/PORR/POSR)

Address(es): PORT0.PCNTR3 4004 0008h, PORT1.PCNTR3 4004 0028h, PORT2.PCNTR3 4004 0048h, PORT3.PCNTR3 4004 0068h, PORT4.PCNTR3 4004 0088h, PORT5.PCNTR3 4004 00A8h, PORT6.PCNTR3 4004 00C8h, PORT7.PCNTR3 4004 00E8h, PORT8.PCNTR3 4004 0108h, PORT9.PCNTR3 4004 0128h, PORTA.PCNTR3 4004 0148h, PORTB.PCNTR3 4004 0168h

PORT0.PORR 4004 0008h, PORT1.PORR 4004 0028h, PORT2.PORR 4004 0048h, PORT3.PORR 4004 0068h, PORT4.PORR 4004 0088h, PORT5.PORR 4004 00A8h, PORT6.PORR 4004 00C8h, PORT7.PORR 4004 00E8h, PORT8.PORR 4004 0108h, PORT9.PORR 4004 0128h, PORTA.PORR 4004 0148h, PORTB.PORR 4004 0168h

PORT0.POSR 4004 000Ah, PORT1.POSR 4004 002Ah, PORT2.POSR 4004 004Ah, PORT3.POSR 4004 006Ah, PORT4.POSR 4004 008Ah, PORT5.POSR 4004 00AAh, PORT6.POSR 4004 00CAh, PORT7.POSR 4004 00EAh, PORT8.POSR 4004 010Ah, PORT9.POSR 4004 012Ah, PORTA.POSR 4004 014Ah, PORTB.POSR 4004 016Ah

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	PORR 15	PORR 14	PORR 13	PORR 12	PORR 11	PORR 10	PORR 09	PORR 08	PORR 07	PORR 06	PORR 05	PORR 04	PORR 03	PORR 02	PORR 01	PORR 00

	POSR 15	POSR 14	POSR 13	POSR 12	POSR 11	POSR 10	POSR 09	POSR 08	POSR 07	POSR 06	POSR 05	POSR 04	POSR 03	POSR 02	POSR 01	POSR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	POSRn	Pmn Output Set	0: No effect on output 1: Output high.	W
b31 to b16	PORRn	Pmn Output Reset	0: No effect on output 1: Output low.	W

m = 0 to 9, A, B
n = 00 to 15

Note: When EORRn or EOSRn is set, writing to PODRn, PORRn, and POSRn is prohibited.
Note: PORRn and POSRn should not be set at the same time.

Port Control Register 3 is a 32- and 16-bit writable register that controls setting or resetting of the port output data.

PCNTR3 controls both setting or resetting of the port output data, and is set in 32-bit units. POSR (PCNTR3 bits 15:0]) and PORR (PCNTR3 bits [31:16]) control setting and resetting of port output data, respectively, and are accessed in 16-bit units.

POSR changes PODR when set by a software write. For example, for P100, when PORT1.POSR00 = 1, PORT1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value must always be 0. P000 to P007 and P200 are input only, so PORT0.PCNTR3 bits [7:0] and PORT2.PCNTR3 bit [0] are reserved.

PORR changes PODR when reset by a software write. For example, for P100, when PORT1.PORR00 = 1, PORT1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value must always be 0. P000 to P007 and P200 are input only, so PORT0.PCNTR3 bits [23:16] and PORT2.PCNTR3 bit [16] are reserved.

20.2.4 Port Control Register 4 (PCNTR4/EORR/EOSR)

Address(es): PORT1.PCNTR4 4004 002Ch, PORT2.PCNTR4 4004 004Ch, PORT3.PCNTR4 4004 006Ch, PORT4.PCNTR4 4004 008Ch
PORT1.EORR 4004 002Ch, PORT2.EORR 4004 004Ch, PORT3.EORR 4004 006Ch, PORT4.EORR 4004 008Ch

Bit	Symbol	Bit name	Description	R/W
b15 to b0	EOSRn	Pmn Event Output Set	When ELC_PORTx signal occurs: 0: No effect on output 1: Output high.	R/W
b31 to b16	EORRn	Pmn Event Output Reset	When ELC_PORTx signal occurs: 0: No effect on output 1: Output low.	R/W

m = 1 to 4
n = 00 to 15
x = 1 to 4

Note: When EORRn or EOSRn is set, writing to PODRn, PORRn, and POSRn is prohibited.
Note: EORRn and EOSRn should not be set at the same time.

Port Control Register 4 is a 32- and 16-bit readable/writable register that controls setting or resetting of the port output data by event input from the ELC. PCNTR4 controls both setting and resetting of the port output data by event input from the ELC, and is set in 32-bit units. EOSR (PCNTR4 bits [15:0]) and EORR (PCNTR4 bits [31:16]) control setting and resetting of output data by event input from the ELC, respectively, and are accessed in 16-bit units.

EOSR changes PODR when set because an ELC_PORTx signal occurs. For example, for P100, if PORT1.EOSR00 is set to 1 when ELC_PORTx occurs, PORT1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value must always be 0. P000 to P007 and P200 are input only, so PORT0.PCNTR4 bits [7:0] and PORT2.PCNTR4 bit [0] are reserved.

EORR changes PODR when reset because an ELC_PORTx signal occurs. For example, for P100, if PORT1.EORR00 = 1 when ELC_PORTx occurs, PORT1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value must always be 0. P000 to P007 and P200 are input only, so PORT0.PCNTR4 bits [23:16] and PORT2.PCNTR4 bit [16] are reserved.

20.2.5 Port mn Pin Function Select Register (PmnPFS/PmnPFS_HA/PmnPFS_BY) (m = 0 to 9, A, B; n = 00 to 15)

Address(es): PFS.P000PFS 4004 0800h to PFS.P015PFS 4004 083Ch, PFS.P100PFS 4004 0840h to PFS.P115PFS 4004 087Ch, PFS.P200PFS 4004 0880h to PFS.P215PFS 4004 08BCh, PFS.P300PFS 4004 08C0h to PFS.P315PFS 4004 08FCh, PFS.P400PFS 4004 0900h to PFS.P415PFS 4004 093Ch, PFS.P500PFS 4004 0940h to PFS.P515PFS 4004 097Ch, PFS.P600PFS 4004 0980h to PFS.P615PFS 4004 09BCh, PFS.P700PFS 4004 09C0h to PFS.P715PFS 4004 09FCh, PFS.P800PFS 4004 0A00h to PFS.P815PFS 4004 0A3Ch, PFS.P900PFS 4004 0A40h to PFS.P915PFS 4004 0A7Ch, PFS.PA00PFS 4004 0A80h to PFS.PA15PFS 4004 0ABCh, PFS.PB00PFS 4004 0AC0h to PFS.PB07PFS 4004 0ADCh

Bit	Symbol	Bit name	Description	R/W
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b28 to b24	PSEL[4:0]	Peripheral Select	These bits select the peripheral function. For individual pin functions, see the associated tables in this chapter.	R/W
b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: P012PFS to P013PFS, P208PFS to P211FPS, P214PFS to P215FPS, P714FPS to P715FPS, and P814PFS to P815PFS for 32-bit, 16-bit, and 8-bit access are not available.

Note 1. Supported for Ports 1 to 4.

Note 2. The initial value of P108, P109, P110, P201 and P300 is not 0000 0000h.
P108 is 0001 0410h, P109 is 0001 0400h, P110 is 0001 0010h, P201 is 0000 0010h, and P300 is 0001 0010h.

Port mn Pin Function Select Register is a 32-, 16-, and 8-bit readable/writable control register that selects the port mn pin functions. PmnPFS is accessed in 32-bit units.

PmnPFS is set by 32-bit units. PmnPFS_HA (PmnPFS bits [15:0]) is accessed in 16-bit units. PmnPFS_BY (PmnPFS bits [7:0]) is accessed in 8-bit units.

The PDR, PIDR, and PODR bits serve the same function as PCNTR. When these bits are read, the PCNTR value is read.

The PCR bit enables or disables an input pull-up resistor on the individual port pins. When a pin is in the input state with the associated bit in PORTm.PCR set to 1, the pull-up resistor connected to the pin is enabled. When a pin is set as an external bus pin, a general port output pin, or a peripheral function output pin, the pull-up resistor for the pin is disabled regardless of the PCR setting. The pull-up resistor is also disabled in the reset state. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

The NCODR bit specifies the output type for the port pins. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

The DSCR bit switches the drive capacity of the port. If the drive capacity of a pin is fixed, the associated bit is readable and writable, but the drive capacity cannot be changed. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

The EOR and EOF bits select the edge detection method for the port group input signal. These bits support rising, falling, or both edge detections. When the EOR and EOF bits are set to 01b, 10b, or 11b, the input enable of the I/O cell is asserted. Following that, the event pulse is input from the external pin, and the GPIO outputs the event pulse to the ELC. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

The ISEL bit specifies IRQ input pins. This setting can be used in combination with the peripheral functions, although an IRQn (external pin interrupt) of the same number must only be enabled for one pin.

The ASEL bit specifies analog pins. When a pin is set to analog pin by this bit:

1. Specify it as a general I/O port in the Port Mode Control bit (PmnPFS.PMR).
2. Disable the pull-up resistor with the Pull-up Control bit (PmnPFS.PCR).
3. Specify input in the Port Direction bit (PmnPFS.PDR). The pin state cannot be read at this point. The PmnPFS register is protected by the Write-Protect Register (PWPR). Release write-protect before modifying the register.

The ISEL bit for an unspecified IRQn is reserved. The ASEL bit for an unspecified analog I/O pin is reserved.

The PMR bit specifies the port pin function. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

The PSEL[4:0] bits assign the peripheral function.

For details on the peripheral settings for each product, see section 20.6, Peripheral Select Settings for Each Product.

20.2.6 Write-Protect Register (PWPR)

Address(es): PMISC.PWPR 4004 0D03h

	b7	b6	b5	b4	b3	b2	b1	b0
	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	PFSWE	PmnPFS Register Write Enable	0: Disable writes to the PmnPFS register 1: Enable writes to the PmnPFS register.	R/W
b7	B0WI	PFSWE Bit Write Disable	0: Enable writes the PFSWE bit 1: Disable writes to the PFSWE bit.	R/W

PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

20.2.7 Ethernet Control Register (PFENET)

Address(es): PMISC.PFENET 4004 0D00h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	PHYMODE1	PHYMODE0	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b4	PHYMODE0	Ethernet Mode Setting ch0	0: RMII mode (ETHERC channel 0) 1: MII mode (ETHERC channel 0).	R/W
b5	PHYMODE1	Ethernet Mode Setting ch1	0: RMII mode (ETHERC channel 1) 1: MII mode (ETHERC channel 1).	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

PHYMODE0 bit (Ethernet Mode Setting ch0)

The PHYMODE0 bit specifies the PHY mode of ETHERC channel 0. Select the same mode as that specified in the pin function select bits (PmnPFS.PSEL[4:0]). When the signals for the RMII mode are specified in the PmnPFS.PSEL[4:0] bits, set the PHYMODE bit to 0 (RMII mode). When the signals for the MII mode are specified in the PmnPFS.PSEL[4:0] bits, set the PHYMODE bit to 1 (MII mode).

PHYMODE1 bit (Ethernet Mode Setting ch1)

The PHYMODE1 bit specifies the PHY mode of ETHERC channel 1. Select the same mode as that specified in the pin function select bits (PmnPFS.PSEL[4:0]). When the signals for the RMII mode are specified in the PmnPFS.PSEL[4:0] bits, set the PHYMODE bit to 0 (RMII mode). When the signals for the MII mode are specified in the PmnPFS.PSEL[4:0] bits, set the PHYMODE bit to 1 (MII mode).

20.3 Operation

20.3.1 General I/O Ports

All pins except P108, P109, P110, and P300 operate as general I/O input ports after reset. General I/O ports are organized as 16 bits per port and can be accessed by port with the Port Control Registers (PCNTRn, where n = 1 to 4), or by individual pin with the Pin Function Select Registers. For details on these registers, see section 20, Register Descriptions.

Each port has the following bits:

- Port Direction bit (PDR), which selects input or output direction
- Port Output Data bit (PODR), which holds data for output
- Port Input Data bit (PIDR), which indicates the pin states
- Event Input Data bit (EIDR), which indicates the pin state when an ELC_PORT1, 2, 3, or 4 signal occurs
- Port Output Set bit (POSR), which indicates the output value when a software write occurs
- Port Output Reset bit (PORR), which indicates the output value when a software write occurs
- Event Output Set bit (EOSR), which indicates the output value when an ELC_PORT1, 2, 3 or 4 signal occurs
- Event Output Reset bit (EORR), which indicates the output value when an ELC_PORT1, 2, 3 or 4 signal occurs.

20.3.2 Port Function Select

The following port functions are available for configuring each pin:

- I/O configuration: Complementary or open-drain output, pull-up control, and drive strength
- General I/O port: Port direction, output data setting, and read input data
- Alternate function: Configured function mapping to the pin.

Each pin is associated with a Pin Function Select register (PmnPFS), which includes the associated PODR, PIDR, and PDR bits. In addition, the PmnPFS register includes the following:

- PCR: Pull-up resistor control bit that turns the input pull-up MOS on or off
- NCODR: N-channel open-drain control bit that selects the output type for each pin
- DSCR: Drive capacity control bits that select the drive capacity
- EOR: Event on rising bit used to detect rising edges on the port input
- EOF: Event on falling bit used to detect falling edges on the port input
- ISEL: IRQ input enable bit to specify an IRQ input pin
- ASEL: Analog input enable bit to specify an analog pin
- PMR: Port mode bit to specify the pin function of each port
- PSEL: Port function select bits to select the associated peripheral function.

These configurations can be made by a single-register access to the Pin Function Select Register. For details, see section 20, Port mn Pin Function Select Register (PmnPFS/PmnPFS_HA/PmnPFS_BY) (m = 0 to 9, A, B; n = 00 to 15).

20.3.3 Port Group Function for the ELC

In this MCU, Ports 1 to 4 are assigned for the ELC port group function.

20.3.3.1 Behavior When ELC_PORT1, 2, 3, or 4 is Input from the ELC

The MCU supports the two functions described in this section when an ELC_PORT1, 2, 3, or 4 signal comes from the ELC.

(1) Input to EIDR

For the GPI function (PDR = 0 and PMR = 0 in the PmnPFS register), when an ELC_PORT1, 2, 3, or 4 signal comes from the ELC, the input enable of the I/O cell is asserted, and then data from the external pins are read into the EIDR bit. For the GPO function (PDR = 1) or the peripheral mode (PMR = 1), 0 is input to the EIDR bit from the external pins.

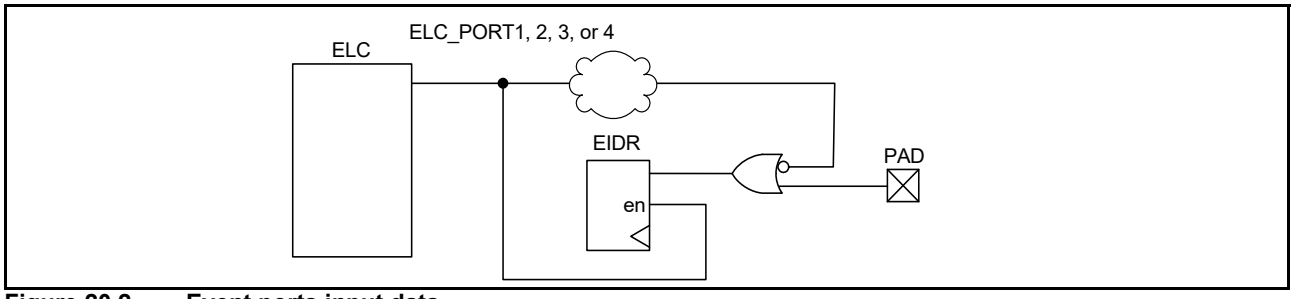

Figure 20.2 Event ports input data

(2) Output from PODR by EOSR and EORR

When an ELC_PORT1, 2, 3, or 4 signal occurs, the data is output from the PODR to the external pin based on the settings in the EOSR and EORR registers.

- If EOSR is set to 1, when ELC_PORT1, 2, 3, or 4 occurs, the PODR register outputs 1 to the external pin. Otherwise, when EOSR = 0, the PODR value is retained.
- If EORR is set to 1, when ELC_PORT1, 2, 3, or 4 occurs, the PODR register outputs 0 to the external pin. Otherwise, when EORR = 0, the PODR value is retained.

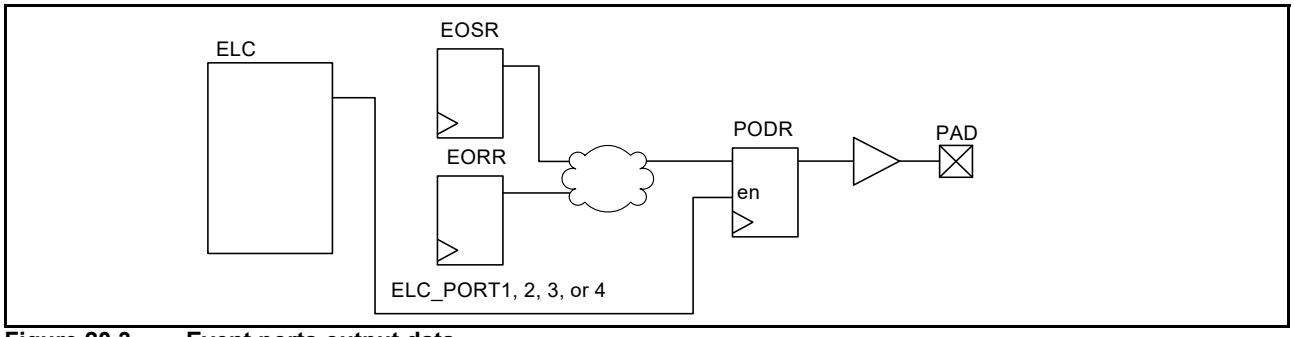

Figure 20.3 Event ports output data

20.3.3.2 Behavior when an Event Pulse is Output to the ELC

To output the event pulse from the external pins to the ELC, set the EOR and EOF bits in the PmnPFS register. For details, see section 20.2.5, Port mn Pin Function Select Register (PmnPFS/PmnPFS_HA/PmnPFS_BY) (m = 0 to 9, A, B; n = 00 to 15). When the EOR and EOF bits are set, the input enable of the I/O cell is asserted.

Data from the external pin is the input. For example, for Port 1, when the data is input from P100 to P115, the data of those 16 pins is organized by OR logic. This data is formed into a one-shot pulse that goes to the ELC. The operation of Ports 2 to 4 is the same.

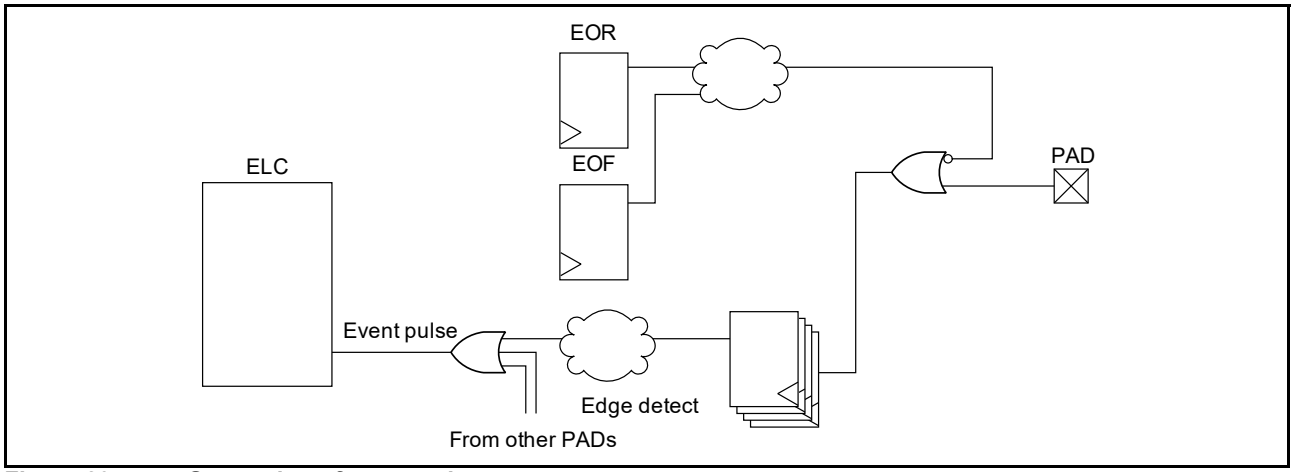

Figure 20.4 Generation of event pulse

20.4 Handling of Unused Pins

Table 20.3 shows how to handle unused pins.

Table 20.3 Handling of unused pins

Pin name	Handling when unused
MD	Use as a mode pin
RES	Connect to VCC through a resistor (pulling up)
USB_DP	Keep pin open
USB_DM	Keep pin open
P200/NMI	Connect to VCC through a resistor (pulling up)
EXTAL	When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P212). When this pin is not used as port P212, configure it in the same way as ports 1 to 9.
XTAL	When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P213). When the external clock is input to the EXTAL pin, the XTAL pin functions as P213. When this pin is not used as port P213, configure it in the same way as ports 1 to 9.
XCIN	Connect to VSS through a resistor (pulling down)
XCOUT	Keep pin open
P000 to P007	Connect to AVCC0 (pulled up) through a resistor or to AVSS0 (pulled down) through a resistor*1
P008 to P010 P014 to P015	• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to AVCC0 (pulled up) through a resistor or to AVSS0 (pulled down) through a resistor*1 • If the direction is set to output (PCNTR1.PDRn = 1), release the pin*1
P1x to P9x PAx to PBx	• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC (pulled up) through a resistor or to VSS (pulled down) through a resistor*1*2 • If the direction is set to output (PCNTR1.PDRn = 1), release the pin*1*3
VREFH0, VREFH	Connect to AVCC0
VREFL0, VREFL	Connect to AVSS0
USBHS_DP USBHS_DM USBHS_RREF	• Preconditions: AVCC_USBHS = VCC_USBHS: Connect to VCC AVSS_USBHS = PVSS_USBHS = VSS1_USBHS = VSS2_USBHS: Connect to VSS Set the module-stop state for USBHS (MSTPCRB.MSTPB12 = 1) • Processing details: USBHS_DP, USBHS_DM, and USBHS_RREF: Open
VCC_DCDC, VLO	• When not using a switching regulator (DCDC)*4 • Connect VCC_DCDC to VSS.
VBATT	• Connect to VCC or VSS. From a power consumption point of view, it is recommended to connect to VSS.*5

Note 1. Clear the PmnPFS.PMR, PmnPFS.ISEL, PmnPFS.PCR, and PmnPFS.ASEL bits to 0.
Note 2. P108, P110, P300 are recommended as pull up VCC (pulled up) through a resistor because these pins are input pull-up enabled from the initial value (PmnPFS.PCR = 1).
Note 3. P109 is recommended to be set as output (PCNTR1.PDRn = 1) because this pin is output from the initial value.
Note 4. For more information, see section 59, Internal Voltage Regulator.
Note 5. For details on electrical characteristics, see section 60, Electrical Characteristics.

20.5 Usage Notes

20.5.1 Procedure for Specifying the Pin Functions

To specify the I/O pin functions:

1. Clear the B0WI bit in the PWPR register. This enables writing to the PFSWE bit in the PWPR register.
2. Set 1 to the PFSWE bit in the PWPR register. This enables writing to the PmnPFS register.
3. Clear the port mode control in the PMR to 0 for the target pin to select the general I/O port.
4. Specify the I/O function for the pin through the PSEL[4:0] bit settings in the PmnPFS register.
5. Set the PMR bit to 1 as required to switch to the selected I/O function for the pin.

6. Clear the PFSWE bit in the PWPR register. This disables writing to the PmnPFS register.
7. Set 1 to the B0WI bit in the PWPR register. This disables writing to the PFSWE bit in the PWPR register.

20.5.2 Procedure for Using Port Group Input

To use the port group input (Ports 1 to 4):

1. Set the ELSRx.ELS[8:0] bits to 000000000b to ignore unexpected pulses. For more information, see section 19, Event Link Controller (ELC).
2. Set the EOF and EOR bits of the PmnPFS register to specify rising, falling, or both edge detections.
3. Execute a dummy read or wait for a short time, for example 100 ns. Ignoring of unexpected pulses depends on the initial value of the external pin.
4. Set the ELSRx.ELS[8:0] bits to enable the event signals.

20.5.3 Port Output Data Register (PODR) Summary

This register outputs data as follows:

1. Outputs 0 if PCNTR4.EORR is set to 1 when ELC_PORT1, 2, 3, or 4 occurs.
2. Outputs 1 if PCNTR4.EOSR is set to 1 when ELC_PORT1, 2, 3, or 4 occurs.
3. Outputs 0 if PCNTR3.PORR is set to 1.
4. Outputs 1 if PCNTR3.POSR is set to 1.
5. Outputs 0 or 1 because PCNTR1.PODR is set.
6. Outputs 0 or 1 because PmnPFS.PODR is set.

Numbers in this list correspond to the priority for writing to the PODR. For example, if 1. and 3. from the list occur at the same time, the higher priority event 1. is executed.

20.5.4 Notes on Using Analog Functions

To use an analog function, set the associated bits in both the Port Mode Control bit (PMR) and Port Direction bit (PDR) to 0 so that the pin acts as a general input port. Next, set the analog input enable bit (ASEL) in the Port mn Pin Function Select Register to 1.

20.5.5 I/O Buffer Specification

The P402, P403, and P404 can be used as the RTC input, AGT input, and other peripheral functions.

Table 20.4 lists the P402, P403, P404 specifications.

Table 20.4 P402, P403, P404 specifications

	Functions				
I/O port	RTC and AGT			other peripheral	
	RTC and AGT input enable register	RTC	AGT	other peripheral enable register	GPT, CAN SCI, MII, RMII, Interrupt, and PDC
P402	VBTICTLR .VCH0INEN	RTCIC0	AGTIO0_B AGTIO1_B	P402PFS.PSEL and PMR	For details, see Table 20.13 Register settings for I/O pin functions on Port 4
P403	VBTICTLR .VCH1INEN	RTCIC1	AGTIO0_C AGTIO1_C	P403PFS.PSEL and PMR	
P404	VBTICTLR .VCH2INEN	RTCIC2	—	P404PFS.PSEL and PMR	

The RTC and AGT inputs are controlled by the VBTICTLR register, which has the highest priority for selecting the RTC and AGT input functions. See Figure 20.5.

The VBTICTLR register is not initialized on reset. Therefore, when not using the RTC or AGT inputs, the corresponding bits of the VBTICTLR register must be set to 0 after reset.

For more information on the VBTICTLR register, see section 12.2.2, VBATT Input Control Register (VBTICTLR).

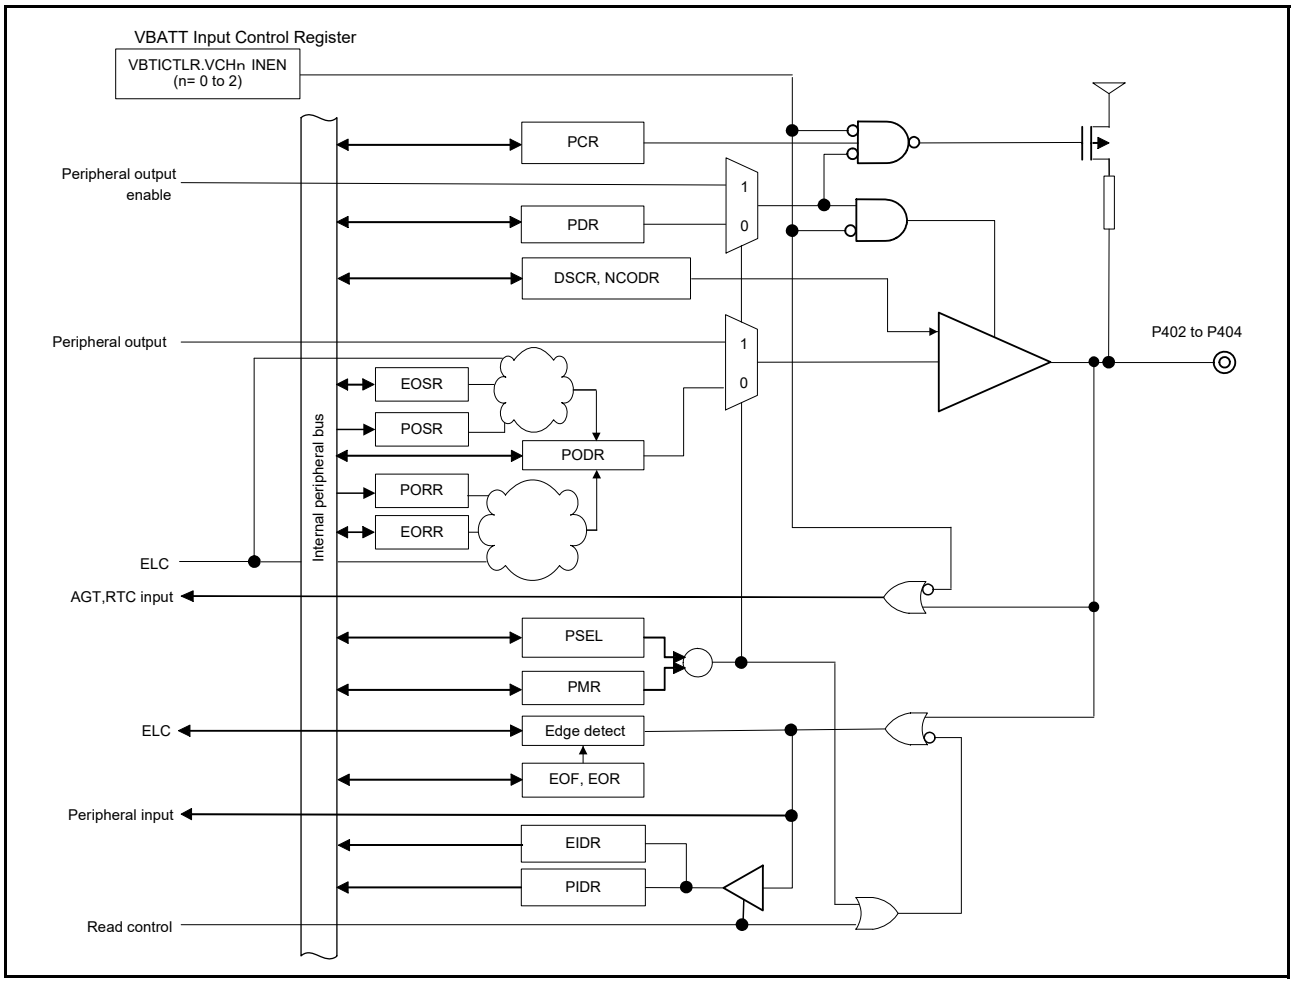

Figure 20.5 P402, P403, P404 diagram

20.6 Peripheral Select Settings for Each Product

This section describes the pin function select configuration using the PmnPFS register. Some pin names have added _A, _B, and _C suffixes. When assigning IIC, SPI, and SSI functionality, select the functional pins having the same suffix. The other pins can be selected regardless of the suffix. Assigning the same function to two or more pins simultaneously is prohibited.

20.7 Notes on the PmnPFS Register Setting

(1) In Pmn Pin Function Select Register (PmnPFS), the PSEL bits must be set when the PMR bit of the target pin is 0. If the PSEL bits are set when the PMR bit is 1, unexpected edges might be input for the input function or unexpected pulses might be output to the external pin for the output function.

(2) Only the allowed values (functions) should be specified in the PSEL bits of PmnPFS register. If a value that is not allowed for the register is specified, correct operation is not guaranteed.

(3) The single function should not be assigned to the multiple pins by the PmnPFS register.

(4) PORT0 and PORT5 have the analog functions such as A/D converter and D/A converter. When these pins are used for an analog function, to avoid loss of resolution, the PMR bit should be set to 0 and PDR bit should be set to 0. Then, ASEL bit should be set to 1.

Note 1. To use this pin function, set the associated pin as a general input (set the PmnPFS.PDR and PmnPFS.PMR bits to 0).

Note 2. The drive strength of this port cannot be controlled by PmnPFS.DSCR[1:0] bits.

Note 3. Recommend using pins that have a letter appended to their names, for instance "_A" or "_B", to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 4. There are 2 types output buffer which are middle drive and high drive.
Recommend using same drive buffer for output skew spec (tGTISK).

21. Key Interrupt Function (KINT)

21.1 Overview

A key interrupt (KEY_INTKR) can be generated by setting the Key Return Mode Register (KRM) and inputting a rising or falling edge on the key interrupt input pins, KR0 to KR7. Table 21.1 shows the pin assignment for key interrupt detection, Table 21.2 shows the function configuration, and Figure 21.1 shows the block diagram.

Table 21.1 Assignment of key interrupt detection pins

Key Interrupt Mode Control n (n = 0 - 7)	Description
KRM0	Controls KR00 signal in 1-bit units
KRM1	Controls KR01 signal in 1-bit units
KRM2	Controls KR02 signal in 1-bit units
KRM3	Controls KR03 signal in 1-bit units
KRM4	Controls KR04 signal in 1-bit units
KRM5	Controls KR05 signal in 1-bit units
KRM6	Controls KR06 signal in 1-bit units
KRM7	Controls KR07 signal in 1-bit units

Table 21.2 Configuration of key interrupt function

Parameter	Configuration
Input	KR00 to KR07
Control registers	Key Return Control Register (KRCTL) Key Return Mode Register (KRM) Key Return Flag Register (KRF)

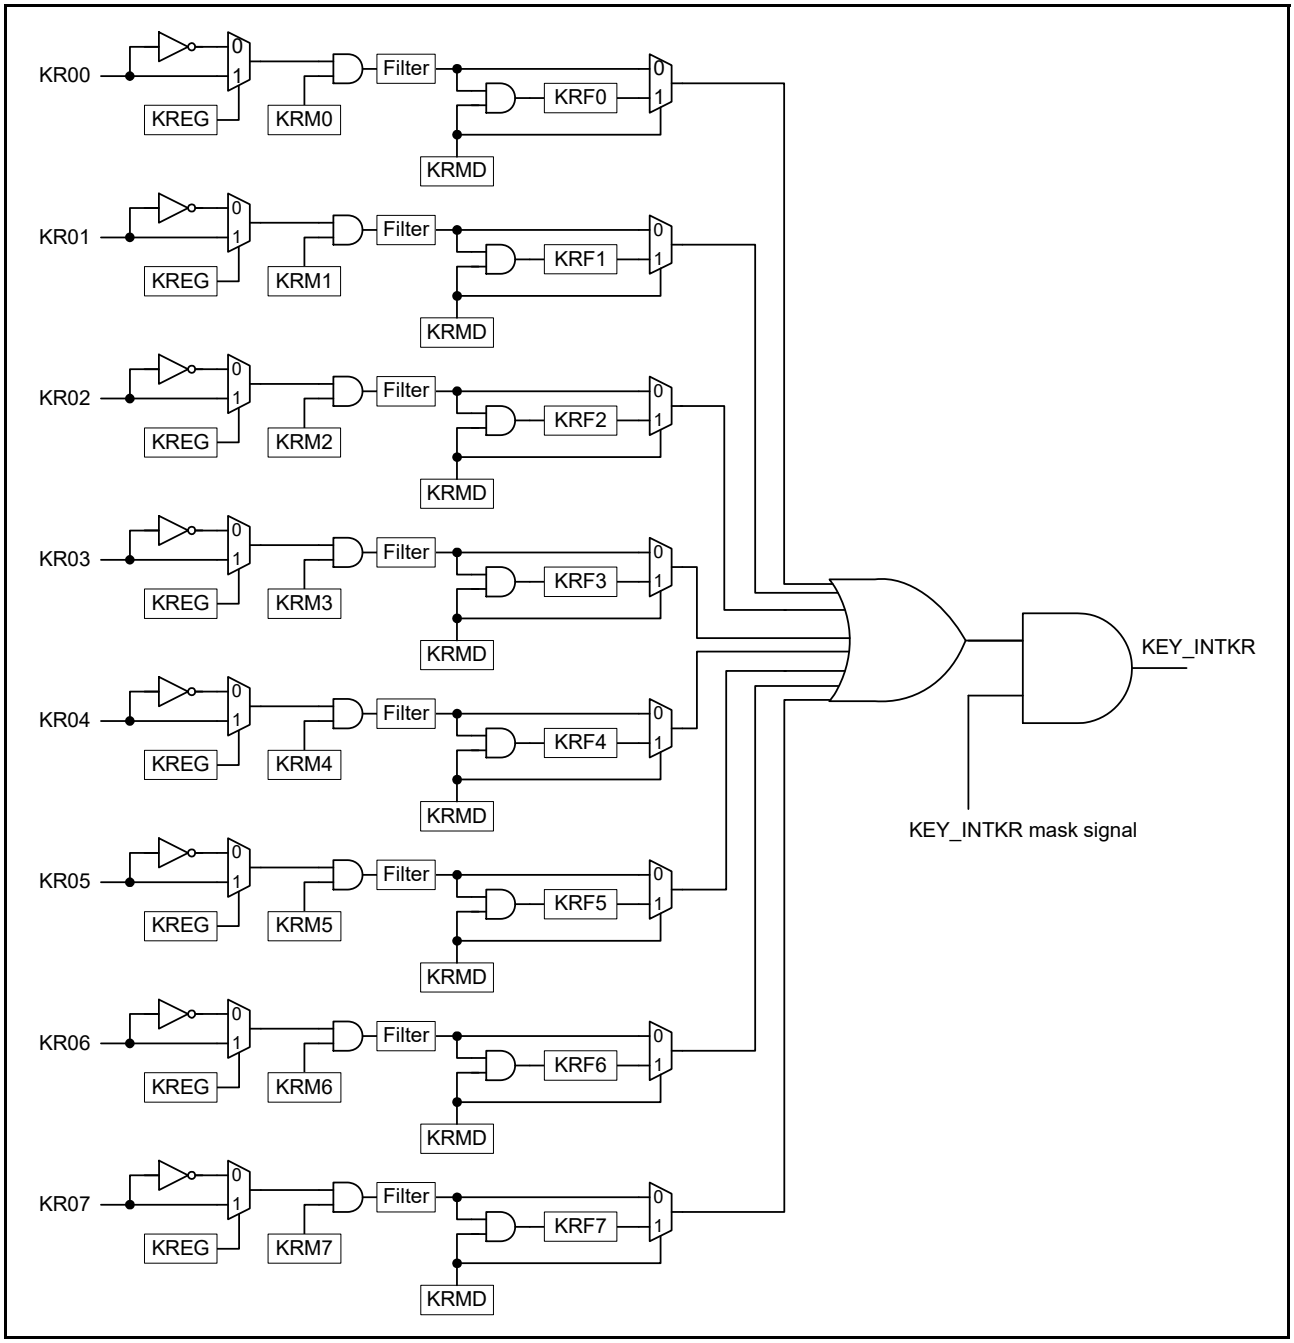

Figure 21.1 Key interrupt block diagram

All key return factors are merged by OR gate. The key interrupt KEY_INTKR is the output of the AND gate to mask merged key return factor by KEY_INTKR mask signal. When using KRFn (KRMD = 1), KEY_INTKR mask signal is used as the output mask that is asserted by clearing KRFn.

21.2 Register Descriptions

21.2.1 Key Return Control Register (KRCTL)

Address(es): KINT.KRCTL 4008 0000h

	b7	b6	b5	b4	b3	b2	b1	b0
	KRMD	—	—	—	—	—	—	KREG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	KREG	Detection Edge Selection (KR00 to KR07)	0: Falling edge 1: Rising edge.	R/W
b6 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	KRMD	Usage of Key Interrupt Flags (KRF0 to KRF7)	0: Do not use key interrupt flags 1: Use key interrupt flags.	R/W

The KRCTL register controls the usage of the key interrupt flags, KRF0 to KRF7, and sets the detection edge.

21.2.2 Key Return Flag Register (KRF)

Address(es): KINT.KRF 4008 0004h

	b7	b6	b5	b4	b3	b2	b1	b0
	KRF7	KRF6	KRF5	KRF4	KRF3	KRF2	KRF1	KRF0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	KRFn	Key Interrupt Flag n	0: No interrupt detected 1: Interrupt detected.	R/W

n = 0 to 7

Note: When KRMD = 0, setting the KRFn bit to 1 is prohibited.
When setting the KRFn bit to 1, the KRFn value does not change. To clear the KRFn bit, confirm that the target bit is 1 before writing 0 to the bit, then write 1 to the other bits.

The KRF register controls the key interrupt flags, KRF0 to KRF7.

21.2.3 Key Return Mode Register (KRM)

Address(es): KINT.KRM 4008 0008h

	b7	b6	b5	b4	b3	b2	b1	b0
	KRM7	KRM6	KRM5	KRM4	KRM3	KRM2	KRM1	KRM0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	KRMn	Key Interrupt Mode Control n	0: Do not detect key interrupt signals 1: Detect key interrupt signals.	R/W

n = 0 to 7

Note: The on-chip pull-up resistors can be applied by setting the associated key interrupt input pin in the pull-up resistor. For more information, see section 20, I/O Ports.
Key interrupts can be assigned in the PmnPFS.PSEL bits. For more information, see section 20, I/O Ports.
An interrupt is generated when the target bit in the KRM register is set while a low level (KREG = 0) or a high level (KREG = 1) is being input to the key interrupt input pin. To ignore this interrupt, set the KRM register after disabling the interrupt handling.

The KRM register sets the key interrupt mode.

21.3 Operation

21.3.1 Operation When Not Using the Key Interrupt Flags (KRMD = 0)

A key interrupt (KEY_INTKR) is generated when the valid edge specified in the KREG bit is input to a key interrupt pin, KR00 to KR07. To identify the channel to which the valid edge is input, read the port register and check the port level after the key interrupt (KEY_INTKR) is generated.

The KEY_INTKR signal changes based on the input level of the key interrupt input pin, KR00 to KR07.

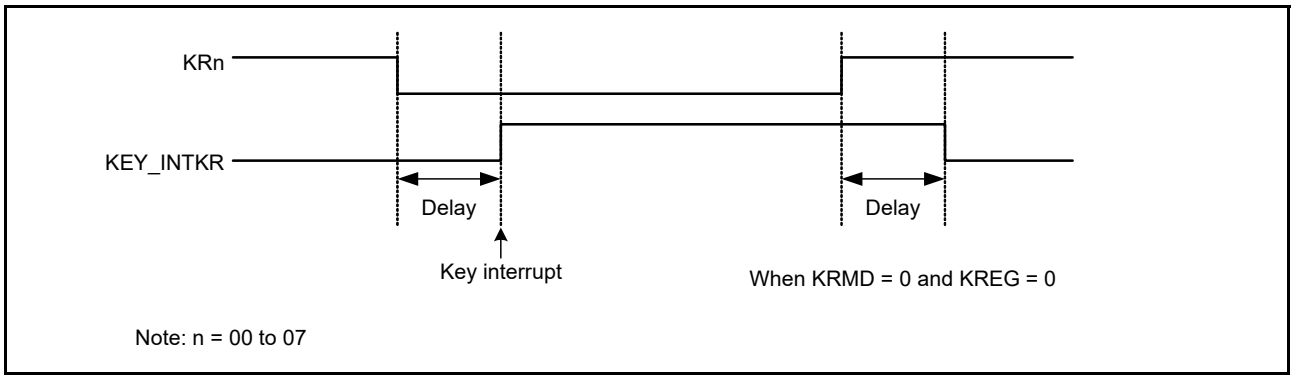

Figure 21.2 Operation of KEY_INTKR signal when a key interrupt is input to a single channel

Figure 21.3 shows the operation when a valid edge is input to multiple key interrupt input pins. The KEY_INTKR signal is set while a low level is being input to one pin (when KREG = 0). Therefore, even if a falling edge is input to another pin in this period, a key interrupt (KEY_INTKR) is not generated again. See [1] in Figure 21.3.

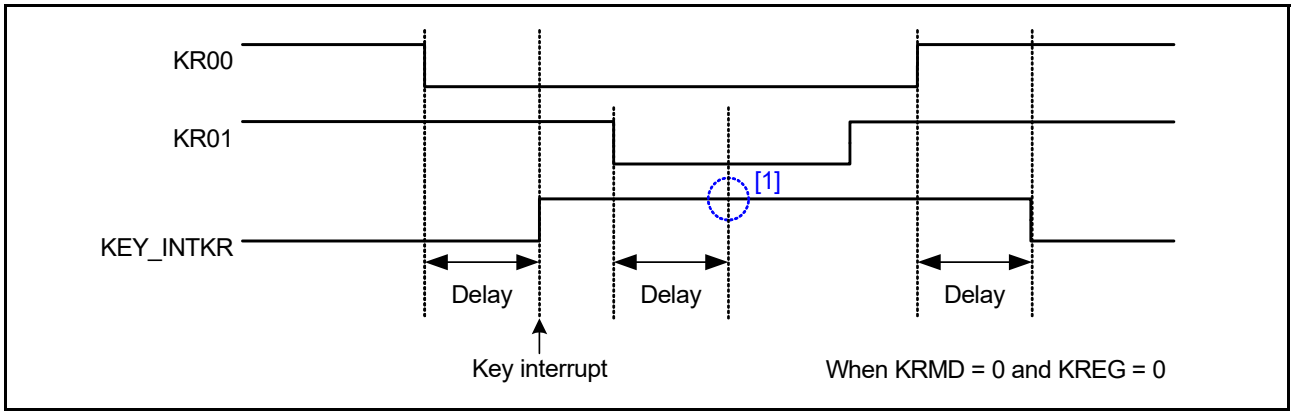

Figure 21.3 Operation of KEY_INTKR signal when key interrupts are input to multiple channels

21.3.2 Operation When Using the Key Interrupt Flags (KRMD = 1)

A key interrupt (KEY_INTKR) is generated when the valid edge specified in the KREG bit is input to a key interrupt pin, KR00 to KR07. To identify the channels to which the valid edge is input, read the Key Return Flag Register (KRF) after the key interrupt (KEY_INTKR) is generated. If the KRMD bit is set to 1, clear the KEY_INTKR signal by clearing the associated bit in the KRF register.

As Figure 21.4 shows, only one interrupt is generated each time a falling edge is input to one channel, (when KREG = 0), regardless of whether the KRFn bit is cleared before or after a rising edge is input.

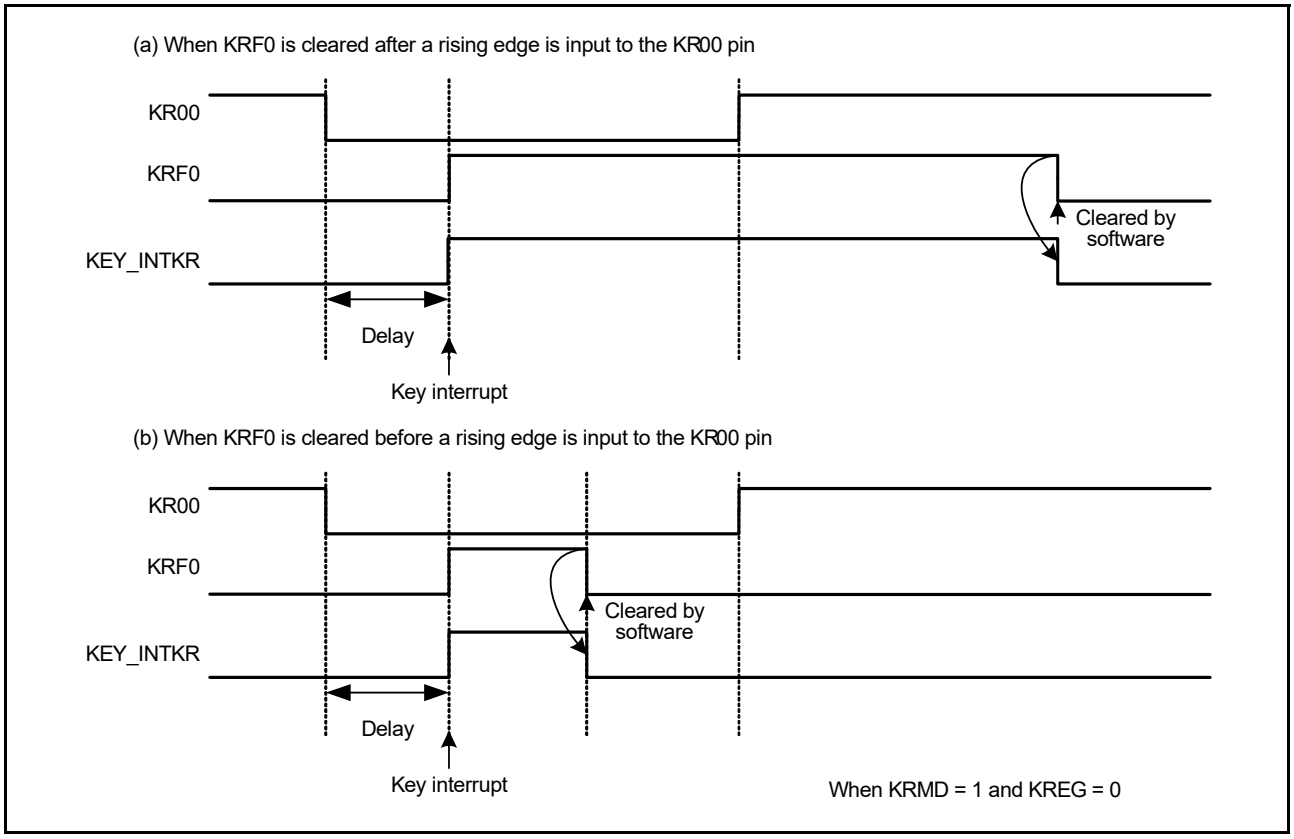

Figure 21.4 Basic operation of KEY_INTKR signal when key interrupt flag is used

The operation when a valid edge is input to multiple key interrupt input pins is shown in Figure 21.5. A falling edge is also input to the KR01 and KR05 pins after a falling edge is input to the KR00 pin (when KREG = 0). The KRF1 bit is set when the KRF0 bit is cleared. A key interrupt generates one clock, PCLKB, after the KRF0 bit is cleared. See [1] in Figure 21.5. Also, after a falling edge is input to the KR05 pin, the KRF5 bit is set. See [2] in the figure when the KRF1 bit is cleared. A key interrupt generates one clock, PCLKB, after the KRF1 bit is cleared. See [3] in the figure. It is therefore possible to generate a key interrupt when a valid edge is input to multiple channels.

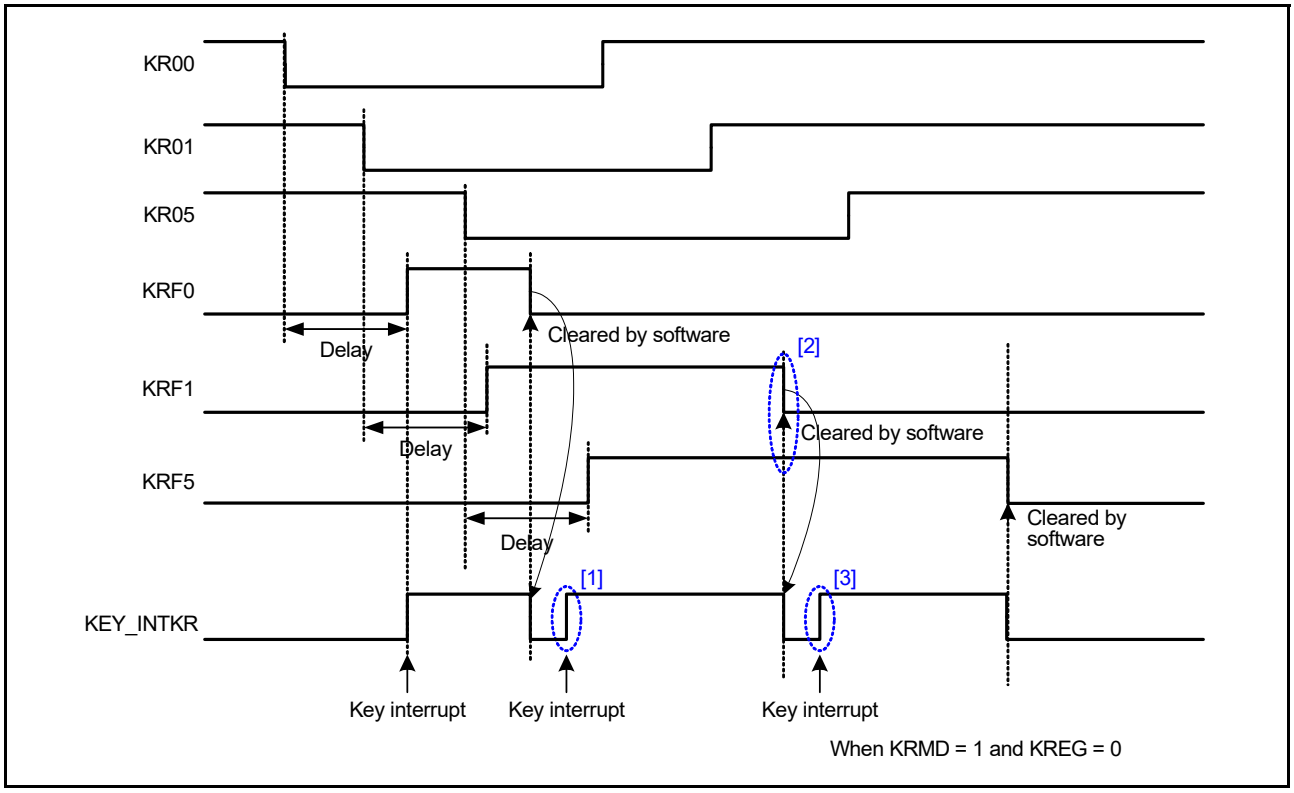

Figure 21.5 Operation of KEY_INTKR signal when key interrupts are input to multiple channels

21.4 Usage Notes

- If KEY_INTKR is used as the Snooze request, the KRMD bit must be set to 0.
- If KEY_INTKR is used as the interrupt source for returning to Normal mode from Snooze mode and Software Standby mode, the KRMD bit must be set to 1.
- When the key interrupt function (KINT) is assigned to a pin by the MPC, this pin input is always enabled in the Software Standby mode, and if the pin level changes, the associated KRFn can be set. Therefore, a key interrupt might occur on canceling the Software Standby mode.

To ignore changes to the key interrupt pin during Software Standby, clear the associated KRM bit before entering Software Standby. After canceling Software Standby, you must clear KRFn before the associated KRM bit can be set.

22. Port Output Enable for GPT (POEG)

22.1 Overview

Use the Port Output Enable for GPT (POEG) function to place the General PWM Timer (GPT) output pins in the output-disable state in one of the following ways:

- Input level detection of the GTETRGn (n = A, B, C, D) pins
- Output-disable request from the GPT
- Comparator interrupt request detection
- Oscillation stop detection of the Clock Generation Circuit
- Register settings.

The GTETRGn (n = A, B, C, D) pins can also be used as GPT external trigger input pins.

Table 22.1 lists the POEG specifications, Figure 22.1 shows the block diagram, and Table 22.2 lists the input pins.

Table 22.1 POEG specifications

Parameter	Specifications
Output-disable control through input level detection	GPT output pins can be disabled when a GTETRGA to GTETRGD rising edge or high level is sampled after polarity and filter selection
Output-disable request from the GPT	• When the GTIOCA pin and the GTIOCB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG.Through reception of these requests, the POEG can control whether the GTIOCA and GTIOCB pins are output-disabled • GPT output pins can be set to be disabled when the GPT output pins detect a dead time error
Output-disable control through comparator (ACMPHS) interrupt detection	GPT output pins can be disabled when an interrupt request is generated by a change in the output results of any of the comparators
Output-disable control through oscillation stop detection	GPT output pins can be disabled when oscillation of the Clock Generation Circuit stops
Output-disable control by software (registers)	GPT output pins can be disabled by modifying the register settings
Interrupt	• Allows output-disable control by input level detection • Allows output-disable requests from the GPT or ACMPHS
External trigger output to the GPT (count start, count stop, count clear, up-count, down-count, or input capture function)	GTETRGA to GTETRGD signals can be output to the GPT after polarity and filter selection
Noise filtering	• Three times sampling for every PCLKB/1, PCLKB/8, PCLKB/32, or PCLKB/128 can be set for any of the input pins GTETRGA to GTETRGD • Positive or negative polarity can be selected for any of the input pins, GTETRGA to GTETRGD • Signal state after polarity and filter selection can be monitored

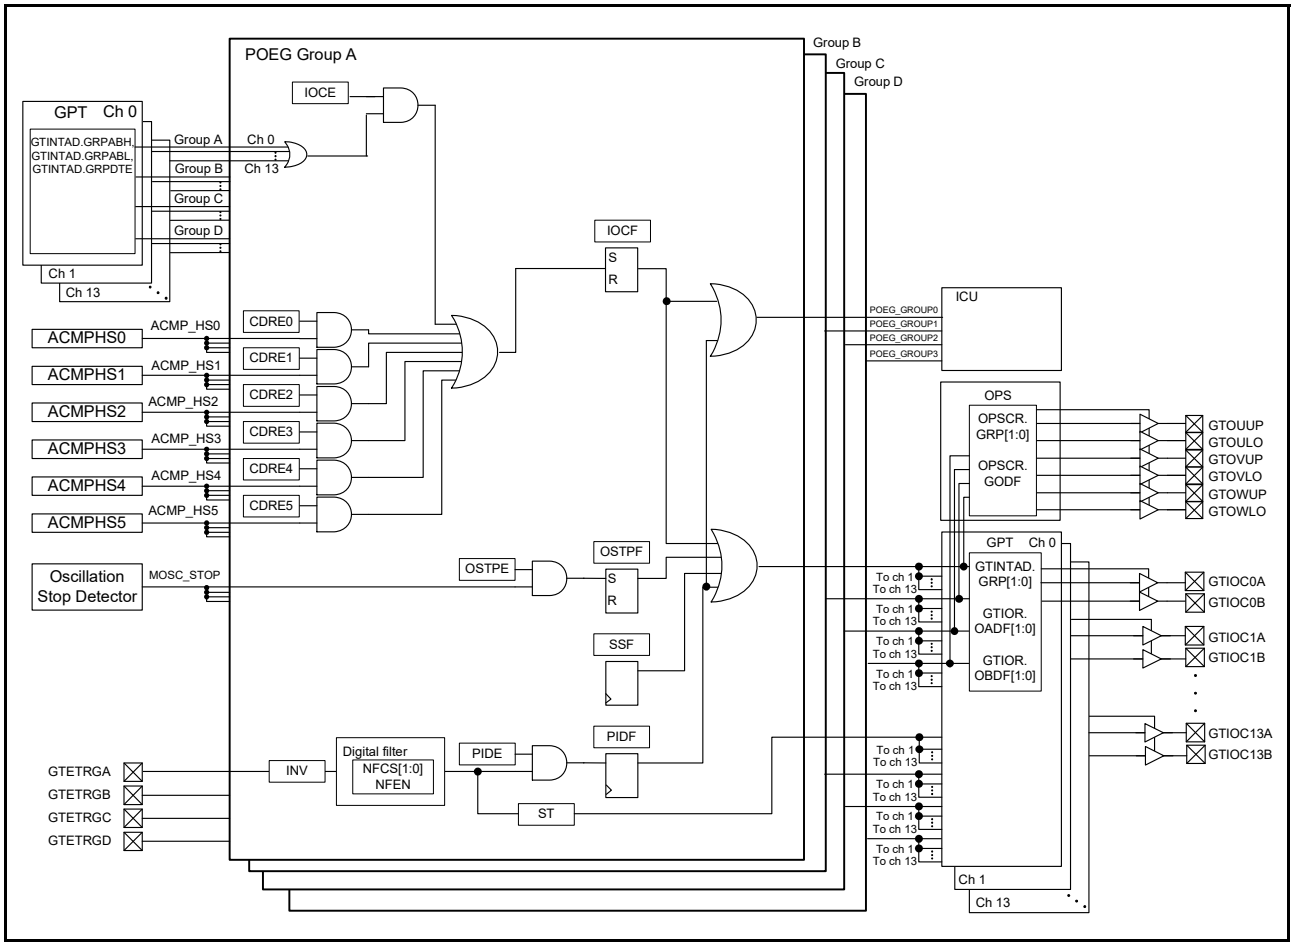

Figure 22.1 POEG block diagram

Table 22.2 POEG input pins

Pin name	I/O	Description
GTETRGA	Input	GPT output pin output-disable request signal and GPT external trigger input pin A
GTETRGB	Input	GPT output pin output-disable request signal and GPT external trigger input pin B
GTETRGC	Input	GPT output pin output-disable request signal and GPT external trigger input pin C
GTETRGD	Input	GPT output pin output-disable request signal and GPT external trigger input pin D

22.2 Register Descriptions

22.2.1 POEG Group n Setting Register (POEGGn) (n = A to D)

Address(es): POEG.POEGGA 4004 2000h, POEG.POEGGB 4004 2100h, POEG.POEGGC 4004 2200h, POEG.POEGGD 4004 2300h

b28	INV	GTETRGn Input Reverse	0: Input GTETRGn as-is 1: Input GTETRGn in reverse.	R/W
b29	NFEN	Noise Filter Enable	0: Disable noise filtering 1: Enable noise filtering.	R/W

Bit	Symbol	Bit name	Description	R/W
b31, b30	NFCS[1:0]	Noise Filter Clock Select	b1 b0 0 0: Sample GTETRGn pin input level three times every PCLKB 0 1: Sample GTETRGn pin input level three times every PCLKB/8 1 0: Sample GTETRGn pin input level three times every PCLKB/32 1 1: Sample GTETRGn pin input level three times every PCLKB/128.	R/W

Note 1. Only 0 can be written, to clear the flag.
Note 2. Can be modified only once after a reset.

The POEGGA to POEGGD registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT. In the descriptions, POEGGn represents all of the POEGGA to POEGGD registers.

22.3 Output-Disable Control Operation

If any of the following conditions is satisfied, the GTIOCxA, GTIOCxB, and the three-phase PWM output for BLDC motor control pins can be set to output-disable:

- Input level or edge detection of the GTETRGA to GTETRGD pins
  When POEGGn.PIDE is 1, the POEGGn.PIDF flag is set to 1.
- Output-disable request from the GPT
  When POEGGn.IOCE is 1, the POEGGn.IOCF flag is set to 1 if the disable request is enabled in GTINTAD. The GRPDTE, GTINTAD.GRPABH, and GTINTAD.GRPABL settings apply to the group selected in GPT register GTINTAD.GRP[1:0] and OPSCR.GRP[1:0].
- Comparator (ACMPHS) interrupt request detection
  Comparator interrupt detection is activated when any of the POEGGn.CDRE[5:0] registers is 1. When the associated comparator interrupt is generated, the GPT output pins are disabled. POEGGn.IOCF indicates the detection status.
- Oscillation stop detection for the Clock Generation Circuit
  When POEGGn.OSTPE is 1, the POEGGn.OSTPF flag is set to 1.
- SSF bit setting
  When POEGGn.SSF is set to 1.

The state of output-disable is controlled in the GPT module. The output-disable of the GTIOCxA and GTIOCxB pins are set in the GTINTAD.GRP[1:0] bits, GTIOR.OADF[1:0] bits, and GTIOR.OBDF[1:0] bits in GPTx. The output-disable of the three-phase PWM output for BLDC motor control pins are set in the OPSCR.GRP[1:0] bits and OPSCR.GODF bit in GPT_OPS.

22.3.1 Pin Input Level Detection Operation

If the input conditions set in POEGGn.PIDE, POEGGn.NFCS[1:0], POEGGn.NFEN, and POEGGn.INV occur on the GTETRGA to GTETRGD pins, the GPT output pins are output-disabled.

22.3.1.1 Digital Filter

Figure 22.2 shows high-level detection by the digital filter. When a high level associated with the POEGGn.INV polarity setting is detected three times consecutively with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not being output, changes of the levels on the GTETRGA to GTETRGD pins are ignored.

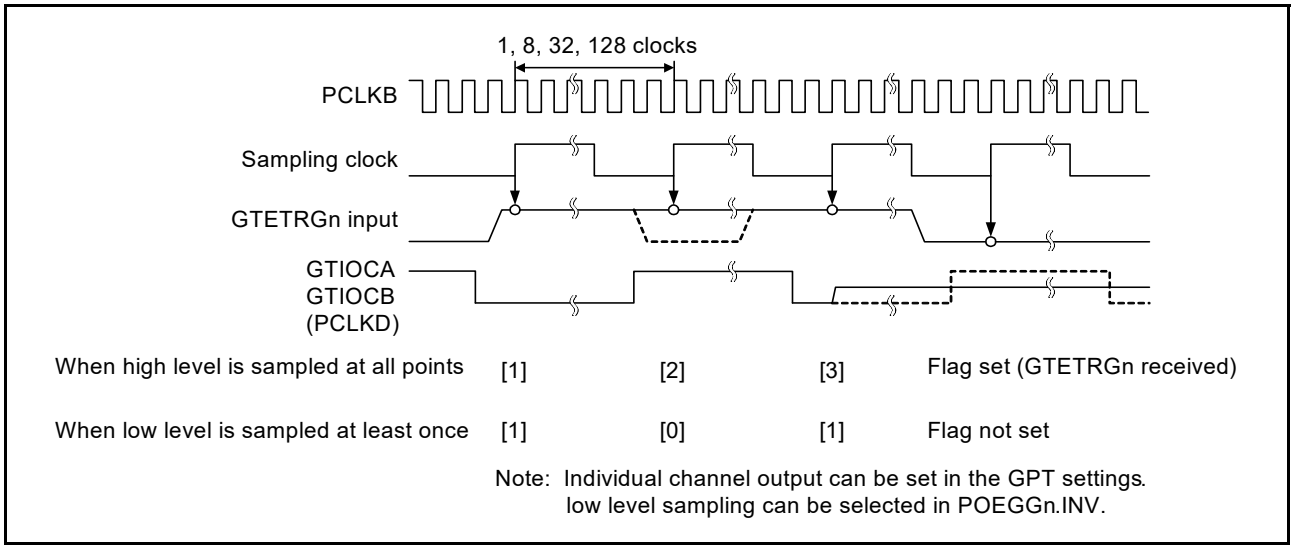

Figure 22.2 Example of digital filter operation

22.3.2 Output-Disable Requests from the GPT

For details on this operation, see the description of GTIOC Pin Output Negate Control in section 23, General PWM Timer (GPT).

22.3.3 Comparator Interrupt Detection

If POEGGn.CDRE[5:0] is 1 when the associated comparator interrupt request is generated, the GPT output pins are output-disabled for each group. The status flag is POEGGn.IOCF, which is shared with GPT output-disable detection.

22.3.4 Output-Disable Control Using Detection of Stopped Oscillation

When the oscillation stop detection function in the Clock Generation Circuit detects stopped oscillation while POEGGn.OSTPE is 1, the GPT output pins are output-disabled for each group.

22.3.5 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing to the software stop flag, POEGGn.SSF.

22.3.6 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all of the following:

- POEGGn.PIDF flag
- POEGGn.IOCF flag
- POEGGn.OSTPF flag
- POEGGn.SSF flag.

Writing 0 to the POEGGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRGA to GTETRGD, are not disabled and the POEGGn.ST bit is not set to 0.

Writing 0 to the POEGGn.IOCF flag is valid (the flag is cleared) only if all of the GTST.DTEF, GTST.OABHF, and GTST.OABLF flags in the GPT are set to 0.

Writing 0 to the POEGGn.OSTPF flag is ignored (the flag is not cleared) if the OSTDSR.OSTDF flag in the Clock Generation Circuit is not set to 0. In addition, when the flag set and release occur at the same time, the flag set takes precedence.

Figure 22.3 shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.

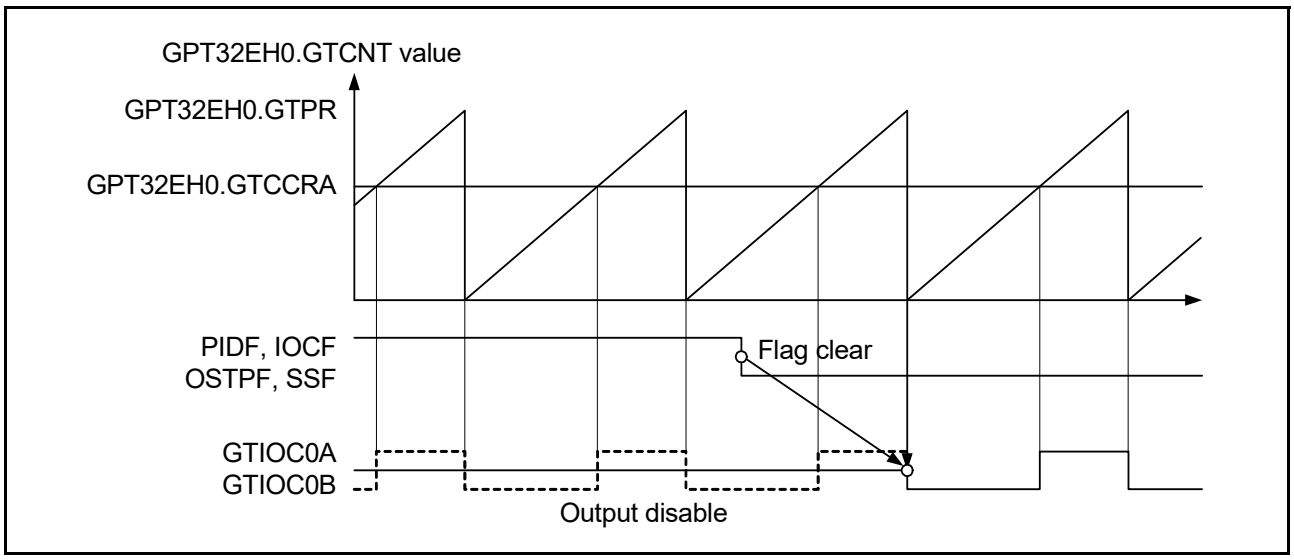

Figure 22.3 Output-disable release timing for GPT pin outputs

22.4 Interrupt Sources

The POEG generates an interrupt request when triggered by these sources:

- Output-disable control by input level detection
- Output-disable request from the GPT
- Comparator interrupt request detection.

Table 22.3 lists the conditions for interrupt requests.

Table 22.3 Interrupt sources and conditions

Interrupt source	Symbol	Associated flag	Trigger conditions
POEG group A interrupt	POEG_GROUP0	POEGGA.IOCF	Output-disable request from a GPT disable request occurred
			Output-disable request from a comparator interrupt occurred
		POEGGA.PIDF	Output-disable request from the GTETRGA pin occurred
POEG group B interrupt	POEG_GROUP1	POEGGB.IOCF	Output-disable request from a GPT disable request occurred
			Output-disable request from a comparator interrupt occurred
		POEGGB.PIDF	Output-disable request from the GTETRGB pin occurred
POEG group C interrupt	POEG_GROUP2	POEGGC.IOCF	Output-disable request from a GPT disable request occurred
			Output-disable request from a comparator interrupt occurred
		POEGGC.PIDF	Output-disable request from the GTETRGC pin occurred
POEG group D interrupt	POEG_GROUP3	POEGGD.IOCF	Output-disable request from a GPT disable request occurred
			Output-disable request from a comparator interrupt occurred
		POEGGD.PIDF	Output-disable request from the GTETRGD pin occurred

22.5 External Trigger Output to the GPT

The POEG outputs the GTETRGn signals as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear
- Up-count
- Down-count
- Input capture.

For the POEGG.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, that value is output. Set the control registers the same as for the input level detection operation described in section 22.3.1, Pin Input Level Detection Operation. The state after filtering can be monitored in POEGGn.ST.

Figure 22.4 shows the output timing of an external trigger to the GPT.

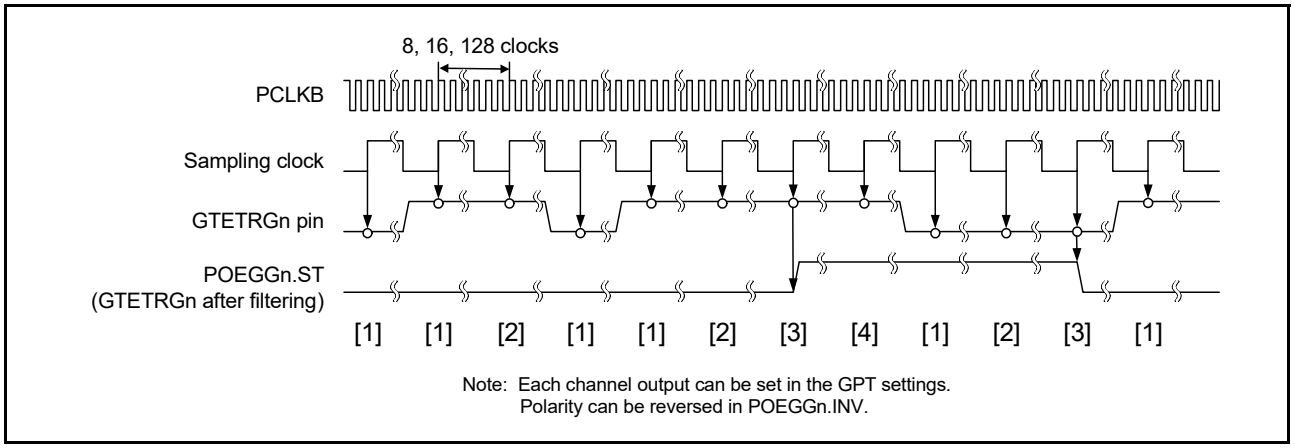

Figure 22.4 Output timing of external trigger to GPT

22.6 Usage Notes

22.6.1 Transition to Software Standby Mode

Do not invoke the Software Standby mode when using the POEG. In this mode, the POEG stops and therefore output-disable of the pins cannot be controlled.

22.6.2 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PmnPFS.PMR and PmnPFS.PSEL settings. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

23. General PWM Timer (GPT)

23.1 Overview

The General PWM Timer (GPT) features a set of highly configurable, 32-bit general purpose timers. The GPT also has the enhanced capability to generate PWM waveforms and PWM delay, perform pulse width measurement, and capture inputs using up and down counters. Counter start, stop, and clear operations can be triggered by multiple internal events or by several external inputs. The GPT has the flexibility to select clock sources independently for each channel.

The MCU has 4 GPT32EH channels, 4 GPT32E channels, and 6 GPT32 channels. Table 23.1 lists the GPT specifications and Table 23.2 shows the GPT functions. In addition to the differences shown in Table 23.2, GPT32EH is connected to dedicated PWM delay generation circuit. For details, see section 24, PWM Delay Generation Circuit.

Figure 23.1 shows the GPT block diagram, Figure 23.2 shows an example using multiple GPTs, and Table 23.3 lists the GPT I/O pins.

Table 23.1 GPT specifications

Parameter	Specifications
Functions	• 32 bits × 14 channels • Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter. • Clock sources independently selectable for each channel • Two I/O pins per channel • Two output compare/input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms. • Registers for setting up frame cycles in each channel (with capability for generating interrupts at overflow or underflow) • Generation of dead times in PWM operation • Synchronous starting, stopping and clearing counters for arbitrary channels • Starting, stopping, and clearing up/down counters in response to a maximum of eight ELC events • Starting, stopping, and clearing up/down counters in response to input level comparison • Starting, stopping, and clearing up/down counters in response to a maximum of four external triggers • Output pin disable function by dead time error and detected short-circuits between output pins • A/D converter start triggers can be generated • PWM waveform for controlling brushless DC motors can be generated • Compare match A to F event, overflow/underflow event and input UVW edge event can be output to the ELC • Enables the noise filter for input capture and input UVW • Bus clock: PCLKA • Core clock: PCLKD • Frequency ratio: PCLKA:PCLKD = 1:N (N = 1/2/4/8/16/32/64).

A/D converter start trigger		Compare match of GTADTRA or GTADTRB	-
Brushless DC motor control function		Available	Available
Interrupt sources		10 sources • GTCCRA compare match/input capture (GPTn_CCMPA) • GTCCRB compare match/input capture (GPTn_CCMPB) • GTCCRC compare match (GPTn_CMPC) • GTCCRD compare match (GPTn_CMPD) • GTCCRE compare match (GPTn_CMPCE) • GTCCRF compare match (GPTn_CMPF) • GTADTRA compare match (GPTn_ADTRGA) • GTADTRB compare match (GPTn_ADTRGB) • GTCNT overflow (GTPR compare match) (GPTn_OVF) • GTCNT underflow (GPTn_UDF)	8 sources • GTCCRA compare match/input capture (GPTn_CCMPA) • GTCCRB compare match/input capture (GPTn_CCMPB) • GTCCRC compare match (GPTn_CMPC) • GTCCRD compare match (GPTn_CMPD) • GTCCRE compare match (GPTn_CMPE) • GTCCRF compare match (GPTn_CMPF) • GTCNT overflow (GTPR compare match) (GPTn_OVF) • GTCNT underflow (GPTn_UDF)
Interrupt skipping function		Skips GTCNT overflows (GTPR compare match) (GPTn_OVF)/ GTCNT underflow (GPTn_UDF) interrupts (with interlocking function for other interrupts or A/D conversion requests).	-
Event linking (ELC) function		Available	Available
Noise filtering function		Available	Available

Note 1. The GTRETRGn triggers go through the POEG module before connecting to the GPT. Therefore, the clock must be supplied to the POEG (by clearing MSTPD bit 14) to use this GPT function.

GTWP : General PWM Timer Write-Protection Register
GTSTR : General PWM Timer Software Start Register
GTSTP : General PWM Timer Software Stop Register
GTCLR : General PWM Timer Software Clear Register
GTSSR : General PWM Timer Start Source Select Register
GTPSR : General PWM Timer Stop Source Select Register

GTCSR : General PWM Timer Clear Source Select Register
GTUPSR : General PWM Timer Up Count Source Select Register
GTDNSR : General PWM Timer Down Count Source Select Register

GTICASR : General PWM Timer Input Capture Source Select Register A
GTICBSR : General PWM Timer Input Capture Source Select Register B
GTCR : General PWM Timer Control Register
GTUDDTYC : General PWM Timer Count Direction and Duty Setting Register
GTIOR : General PWM Timer I/O Control Register
GTINTAD : General PWM Timer Interrupt Output Setting Register
GTST : General PWM Timer Status Register
GTBER : General PWM Timer Buffer Enable Register
GTITC : General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register
GTCNT : General PWM Timer Counter
GTCCRA : General PWM Timer Compare Capture Register A
GTCCRB : General PWM Timer Compare Capture Register B
GTCCRC : General PWM Timer Compare Capture Register C
GTCCRD : General PWM Timer Compare Capture Register D
GTCCRE : General PWM Timer Compare Capture Register E
GTCCRF : General PWM Timer Compare Capture Register F

GTPR : General PWM Timer Cycle Setting Register
GTPBR : General PWM Timer Cycle Setting Buffer Register
GTPDBR : General PWM Timer Cycle Setting Double-Buffer Register
GTADTRA : General PWM Timer A/D Converter Start Request Timing Register A
GTADTBRA : General PWM Timer A/D Converter Start Request Timing Buffer Register A
GTADTDBRA : General PWM Timer A/D Converter Start Request Timing Double-Buffer Register A
GTADTRB : General PWM Timer A/D Converter Start Request Timing Register B
GTADTBRB : General PWM Timer A/D Converter Start Request Timing Buffer Register B
GTADTDBRB : General PWM Timer A/D Converter Start Request Timing Double-Buffer Register B

GTDTCR : General PWM Timer Dead Time Control Register
GTDVU : General PWM Timer Dead Time Value Register U
GTDVD : General PWM Timer Dead Time Value Register D
GTDBU : General PWM Timer Dead Time Buffer Register U
GTDBD : General PWM Timer Dead Time Buffer Register D
GTSOS : General PWM Timer Output Protection Function Status Register
GTSOTR : General PWM Timer Output Protection Function Temporary Release Register

OPSCR : Output Phase Switching Control Register

Note 1. Some functions are reduced from GPT32EH/GPT32E.

23.2.1 General PWM Timer Write-Protection Register (GTWP)

Address(es): GPT32EHm.GTWP 4007 8000h + 0100h × m (m = 0 to 3)
GPT32Em.GTWP 4007 8000h + 0100h × m (m = 4 to 7)
GPT32m.GTWP 4007 8000h + 0100h × m (m = 8 to 13)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PRKEY[7:0]								—	—	—	—	—	—	—	WP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	WP	Register Write Disable	0: Enable writes to the register 1: Disable writes to the register.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b8	PRKEY[7:0]	GTWP Key Code	When A5h is written to these bits, the writes to the WP bits are permitted. These bits are read as 0.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

To prevent accidental changes, the GTWP enables or disables writing to following registers:

- GTSSR
- GTPSR
- GTCSR
- GTUPSR
- GTDNSR
- GTICASR
- GTIBCSR
- GTCR
- GTUDDTYC
- GTIOR
- GTINTAD
- GTST
- GTBER
- GTITC
- GTCNT
- GTCCRA
- GTCCRB
- GTCCRC
- GTCCRD
- GTCCRE
- GTCCRF

- GTPR
- GTPBR
- GTPDBR
- GTADTRA
- GTADTBRA
- GTADTDBRA
- GTADTRB
- GTADTBRB
- GTADTDBRB
- GTDTCR
- GTDVU
- GTDVD
- GTDBU
- GTDBD
- GTSOS
- GTSOTR.

23.2.2 General PWM Timer Software Start Register (GTSTR)

Address(es): GPT32EHm.GTSTR 4007 8004h + 0100h × m (m = 0 to 3)
GPT32Em.GTSTR 4007 8004h + 0100h × m (m = 4 to 7)
GPT32m.GTSTR 4007 8004h + 0100h × m (m = 8 to 13)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	CSTRT 13	CSTRT 12	CSTRT 11	CSTRT 10	CSTRT 9	CSTRT 8	CSTRT 7	CSTRT 6	CSTRT 5	CSTRT 4	CSTRT 3	CSTRT 2	CSTRT 1	CSTRT 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The GTSTR starts the GTCNT counter operation for each channel x, where x = 0 to 13.

The GTSTR bit number represents the channel number. The GTSTR register is shared by all of the channels. The GTCNT counter starts for the channel associated with the GTSTR bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTR register. For the association between the GTSTR bit number and channel number, see Figure 23.2.

CSTRTx bit (channel x GTCNT Count Start) (x = 0 to 13)

The CSTRTx bit starts channel x of the GTCNT counter operation. Writing to GTSTR.CSTRTx bit has no effect unless GPTx.GTSSR.CSTRT bit is set to 1.

Read data shows the counter status of each channel (GTCR.CST bit). Zero means the counter stops and 1 means the counter is running.

23.2.3 General PWM Timer Software Stop Register (GTSTP)

Address(es): GPT32EHm.GTSTP 4007 8008h + 0100h × m (m = 0 to 3)
GPT32Em.GTSTP 4007 8008h + 0100h × m (m = 4 to 7)
GPT32m.GTSTP 4007 8008h + 0100h × m (m = 8 to 13)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	CSTOP 13	CSTOP 12	CSTOP 11	CSTOP 10	CSTOP 9	CSTOP 8	CSTOP 7	CSTOP 6	CSTOP 5	CSTOP 4	CSTOP 3	CSTOP 2	CSTOP 1	CSTOP 0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The GTSTP stops the GTCNT counter operation for each channel x, where x = 0 to 13.

The GTSTP bit number represents the channel number. The GTSTP register is shared by all of the channels. The GTCNT counter stops for the channel associated with the GTSTP bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTP register. For the association between GTSTP bit number and a channel number, see Figure 23.2.

CSTOPx bit (channel x GTCNT Count Stop) where x = 0 to 13

The CSTOPx bit stops channel x of the GTCNT counter operation. Writing to GTSTP.CSTOPx bit has no effect unless GPTx.GTPSR.CSTOP bit is set to 1. Read data shows the counter status of each channel (invert of GTCR.CST bit). Zero means the counter is running and 1 means the counter stops.

23.2.4 General PWM Timer Software Clear Register (GTCLR)

Address(es): GPT32EHm.GTCLR 4007 800Ch + 0100h × m (m = 0 to 3)
GPT32Em.GTCLR 4007 800Ch + 0100h × m (m = 4 to 7)
GPT32m.GTCLR 4007 800Ch + 0100h × m (m = 8 to 13)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	CCLR 13	CCLR 12	CCLR 11	CCLR 10	CCLR 9	CCLR 8	CCLR 7	CCLR 6	CCLR 5	CCLR 4	CCLR 3	CCLR 2	CCLR 1	CCLR 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GTCLR is a write-only register that clears the GTCNT counter operation for each channel x, where x = 0 to 13.

The GTCLR bit number represents the channel number. The GTCLR register is shared by all of the channels. The GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter. For the association between the GTCLR bit number and a channel number, see Figure 23.2.

CCLRx bit (channel x GTCNT Count Clear), where x = 0 to 13.

Channel x of the GTCNT counter value is cleared on writing 1 to the CCLRx bit. This bit is read as 0.

23.2.5 General PWM Timer Start Source Select Register (GTSSR)

Address(es): GPT32EHm.GTSSR 4007 8010h + 0100h × m (m = 0 to 3)
GPT32Em.GTSSR 4007 8010h + 0100h × m (m = 4 to 7)
GPT32m.GTSSR 4007 8010h + 0100h × m (m = 8 to 13)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CSTRT	—	—	—	—	—	—	—	SSELCH	SSELCG	SSELCF	SSELCE	SSELCD	SSELCC	SSELCB	SSELCA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

GTSSR sets the source to start the GTCNT counter.

SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables GTCNT counter start on the rising edge of GTETRGA pin input.

SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables GTCNT counter start on the falling edge of GTETRGA pin input.

SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables GTCNT counter start on the rising edge of GTETRGB pin input.

SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables GTCNT counter start on the falling edge of GTETRGB pin input.

SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)

The SSGTRGCR bit enables or disables GTCNT counter start on the rising edge of GTETRGC pin input.

SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)

The SSGTRGCF bit enables or disables GTCNT counter start on the falling edge of GTETRGC pin input.

SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)

The SSGTRGDR bit enables or disables GTCNT counter start on the rising edge of GTETRGD pin input.

SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)

The SSGTRGDF bit enables or disables GTCNT counter start on the falling edge of GTETRGD pin input.

SSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Start Enable)

The SSCARBL bit enables or disables GTCNT counter start on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

SSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Start Enable)

The SSCARBH bit enables or disables GTCNT counter start on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

SSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Start Enable)

The SSCAFBL bit enables or disables GTCNT counter start on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

SSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Start Enable)

The SSCAFBH bit enables or disables GTCNT counter start on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

SSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Start Enable)

The SSCBRAL bit enables or disables GTCNT counter start on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

SSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Start Enable)

The SSCBRAH bit enables or disables GTCNT counter start on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

SSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Start Enable)

The SSCBFAL bit enables or disables GTCNT counter start on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

SSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Start Enable)

The SSCBFAH bit enables or disables GTCNT counter start on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

SSELCm bit (ELC_GPTm Source Counter Start Enable) (m = A to H)

The SSELCm bit enables or disables GTCNT counter start on the ELC_GPTm input.

CSTRT bit (Software Source Counter Start Enable)

The CSTRT bit enables or disables GTCNT counter start by GTSTR register.

b31	CSTOP	Software Source Counter Stop Enable	0: Disable counter stop by the GTSTP register 1: Enable counter stop by the GTSTP register	R/W

GTPSR sets the source to stop the GTCNT counter.

PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)

The PSGTRGAR bit enables or disables GTCNT counter stop on the rising edge of GTETRGA pin input.

PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)

The PSGTRGAF bit enables or disables GTCNT counter stop on the falling edge of GTETRGA pin input.

PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)

The PSGTRGBR bit enables or disables GTCNT counter stop on the rising edge of GTETRGB pin input.

PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)

The PSGTRGBF bit enables or disables GTCNT counter stop on the falling edge of GTETRGB pin input.

PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)

The PSGTRGCR bit enables or disables GTCNT counter stop on the rising edge of GTETRGC pin input.

PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)

The PSGTRGCF bit enables or disables GTCNT counter stop on the falling edge of GTETRGC pin input.

PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)

The PSGTRGDR bit enables or disables GTCNT counter stop on the rising edge of GTETRGD pin input.

PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)

The PSGTRGDF bit enables or disables GTCNT counter stop on the falling edge of GTETRGD pin input.

PSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Stop Enable)

The PSCARBL bit enables or disables GTCNT counter stop on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

PSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Stop Enable)

The PSCARBH bit enables or disables GTCNT counter stop on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

PSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Stop Enable)

The PSCAFBL bit enables or disables GTCNT counter stop on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

PSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Stop Enable)

The PSCAFBH bit enables or disables GTCNT counter stop on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

PSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Stop Enable)

The PSCBRAL bit enables or disables GTCNT counter stop on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

PSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Stop Enable)

The PSCBRAH bit enables or disables GTCNT counter stop on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

PSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Stop Enable)

The PSCBFAL bit enables or disables GTCNT counter stop on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

PSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Stop Enable)

The PSCBFAH bit enables or disables GTCNT counter stop on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

PSELCm bit (ELC_GPTm Source Counter Stop Enable) (m = A to H)

The PSELCm bit enables or disables GTCNT counter stop on the ELC_GPTm input.

CSTOP bit (Software Source Counter Stop Enable)

The CSTOP bit enables or disables GTCNT counter stop by GTSTP register.

b31	CCLR	Software Source Counter Clear Enable	0: Disable counter clear by the GTCLR register 1: Enable counter clear by the GTCLR register	R/W

GTCSR sets the source to clear the GTCNT counter.

CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables GTCNT counter clear on the rising edge of GTETRGA pin input.

CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables GTCNT counter clear on the falling edge of GTETRGA pin input.

CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables GTCNT counter clear on the rising edge of GTETRGB pin input.

CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables GTCNT counter clear on the falling edge of GTETRGB pin input.

CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables GTCNT counter clear on the rising edge of GTETRGC pin input.

CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables GTCNT counter clear on the falling edge of GTETRGC pin input.

CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables GTCNT counter clear on the rising edge of GTETRGD pin input.

CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)

The CSGTRGDF bit enables or disables GTCNT counter clear on the falling edge of GTETRGD pin input.

CSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Clear Enable)

The CSCARBL bit enables or disables GTCNT counter clear on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

CSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Clear Enable)

The CSCARBH bit enables or disables GTCNT counter clear on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

CSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Clear Enable)

The CSCAFBL bit enables or disables GTCNT counter clear on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

CSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Clear Enable)

The CSCAFBH bit enables or disables GTCNT counter clear on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

CSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Clear Enable)

The CSCBRAL bit enables or disables GTCNT counter clear on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

CSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Clear Enable)

The CSCBRAH bit enables or disables GTCNT counter clear on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

CSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Clear Enable)

The CSCBFAL bit enables or disables GTCNT counter clear on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

CSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Clear Enable)

The CSCBFAH bit enables or disables GTCNT counter clear on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

CSELCm bit (ELC_GPTm Source Counter Clear Enable) (m = A to H)

The CSELCm bit enables or disables GTCNT counter clear on the ELC_GPTm input.

CCLR bit (Software Source Counter Clear Enable)

The CCLR bit enables or disables GTCNT counter clear by GTCLR register.

GTUPSR sets the source to count up the GTCNT counter.

When at least 1 bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register, but the GTCNT counter set in GTCR.TPCS does not perform the count.

USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables GTCNT counter count up on the rising edge of GTETRGA pin input.

USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables GTCNT counter count up on the falling edge of GTETRGA pin input.

USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables GTCNT counter count up on the rising edge of GTETRGB pin input.

USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables GTCNT counter count up on the falling edge of GTETRGB pin input.

USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables GTCNT counter count up on the rising edge of GTETRGC pin input.

USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)

The USGTRGCF bit enables or disables GTCNT counter count up on the falling edge of GTETRGC pin input.

USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)

The USGTRGDR bit enables or disables GTCNT counter count up on the rising edge of GTETRGD pin input.

USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)

The USGTRGDF bit enables or disables GTCNT counter count up on the falling edge of GTETRGD pin input.

USCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Count Up Enable)

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

USCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Count Up Enable)

The USCARBH bit enables or disables GTCNT counter count up on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

USCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Count Up Enable)

The USCAFBL bit enables or disables GTCNT counter count up on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

USCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Count Up Enable)

The USCAFBH bit enables or disables GTCNT counter count up on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

USCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Count Up Enable)

The USCBRAL bit enables or disables GTCNT counter count up on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

USCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Count Up Enable)

The USCBRAH bit enables or disables GTCNT counter count up on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

USCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Count Up Enable)

The USCBFAL bit enables or disables GTCNT counter count up on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

USCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Count Up Enable)

The USCBFAH bit enables or disables GTCNT counter count up on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

USELCm bit (ELC_GPTm Source Counter Count Up Enable) (m = A to H)

The USELCm bit enables or disables GTCNT counter count up on the ELC_GPTm input.

GTDNSR sets the source to count down the GTCNT counter.

When at least 1 bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register, but the GTCNT counter set in GTCR.TPCS does not perform the count.

DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables GTCNT counter count down on the rising edge of GTETRGA pin input.

DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables GTCNT counter count down on the falling edge of GTETRGA pin input.

DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables GTCNT counter count down on the rising edge of GTETRGB pin input.

DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)

The DSGTRGBF bit enables or disables GTCNT counter count down on the falling edge of GTETRGB pin input.

DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)

The DSGTRGCR bit enables or disables GTCNT counter count down on the rising edge of GTETRGC pin input.

DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)

The DSGTRGCF bit enables or disables GTCNT counter count down on the falling edge of GTETRGC pin input.

DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)

The DSGTRGDR bit enables or disables GTCNT counter count down on the rising edge of GTETRGD pin input.

DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)

The DSGTRGDF bit enables or disables GTCNT counter count down on the falling edge of GTETRGD pin input.

DSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source Counter Count Down Enable)

The DSCARBL bit enables or disables GTCNT counter count down on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

DSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source Counter Count Down Enable)

The DSCARBH bit enables or disables GTCNT counter count down on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

DSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source Counter Count Down Enable)

The DSCAFBL bit enables or disables GTCNT counter count down on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

DSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source Counter Count Down Enable)

The DSCAFBH bit enables or disables GTCNT counter count down on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

DSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source Counter Count Down Enable)

The DSCBRAL bit enables or disables GTCNT counter count down on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

DSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source Counter Count Down Enable)

The DSCBRAH bit enables or disables GTCNT counter count down on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

DSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source Counter Count Down Enable)

The DSCBFAL bit enables or disables GTCNT counter count down on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

DSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source Counter Count Down Enable)

The DSCBFAH bit enables or disables GTCNT counter count down on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

DSELCm bit (ELC_GPTm Source Counter Count Down Enable) (m = A to H)

The DSELCm bit enables or disables GTCNT counter count down on the ELC_GPTm input.

GTICASR sets the source of input capture for GTCCRA.

ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGA pin input.

ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGAF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGA pin input.

ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGBR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGB pin input.

ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGBF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGB pin input.

ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGCR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGC pin input.

ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGCF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGC pin input.

ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGDR bit enables or disables input capture for GTCCRA on the rising edge of GTETRGD pin input.

ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGDF bit enables or disables input capture for GTCCRA on the falling edge of GTETRGD pin input.

ASCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source GTCCRA Input Capture Enable)

The ASCARBL bit enables or disables input capture for GTCCRA on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

ASCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source GTCCRA Input Capture Enable)

The ASCARBH bit enables or disables input capture for GTCCRA on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

ASCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source GTCCRA Input Capture Enable)

The ASCAFBL bit enables or disables input capture for GTCCRA on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

ASCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source GTCCRA Input Capture Enable)

The ASCAFBH bit enables or disables input capture for GTCCRA on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

ASCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source GTCCRA Input Capture Enable)

The ASCBRAL bit enables or disables input capture for GTCCRA on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

ASCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source GTCCRA Input Capture Enable)

The ASCBRAH bit enables or disables input capture for GTCCRA on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

ASCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source GTCCRA Input Capture Enable)

The ASCBFAL bit enables or disables input capture for GTCCRA on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

ASCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source GTCCRA Input Capture Enable)

The ASCBFAH bit enables or disables input capture for GTCCRA on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

ASELCm bit (ELC_GPTm Source Counter GTCCRA Input Capture Enable) (m = A to H)

The ASELCm bit enables or disables input capture for GTCCRA on the ELC_GPTm input.

GTICBSR sets the source of input capture for GTCCRB.

BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGAR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGA pin input.

BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGAF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGA pin input.

BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGBR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGB pin input.

BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGBF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGB pin input.

BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGCR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGC pin input.

BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGCF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGC pin input.

BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGDR bit enables or disables input capture for GTCCRB on the rising edge of GTETRGD pin input.

BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGDF bit enables or disables input capture for GTCCRB on the falling edge of GTETRGD pin input.

BSCARBL bit (GTIOCA Pin Rising Input during GTIOCB Value Low Source GTCCRB Input Capture Enable)

The BSCARBL bit enables or disables input capture for GTCCRB on the rising edge of GTIOCA pin input, when GTIOCB input is 0.

BSCARBH bit (GTIOCA Pin Rising Input during GTIOCB Value High Source GTCCRB Input Capture Enable)

The BSCARBH bit enables or disables input capture for GTCCRB on the rising edge of GTIOCA pin input, when GTIOCB input is 1.

BSCAFBL bit (GTIOCA Pin Falling Input during GTIOCB Value Low Source GTCCRB Input Capture Enable)

The BSCAFBL bit enables or disables input capture for GTCCRB on the falling edge of GTIOCA pin input, when GTIOCB input is 0.

BSCAFBH bit (GTIOCA Pin Falling Input during GTIOCB Value High Source GTCCRB Input Capture Enable)

The BSCAFBH bit enables or disables input capture for GTCCRB on the falling edge of GTIOCA pin input, when GTIOCB input is 1.

BSCBRAL bit (GTIOCB Pin Rising Input during GTIOCA Value Low Source GTCCRB Input Capture Enable)

The BSCBRAL bit enables or disables input capture for GTCCRB on the rising edge of GTIOCB pin input, when GTIOCA input is 0.

BSCBRAH bit (GTIOCB Pin Rising Input during GTIOCA Value High Source GTCCRB Input Capture Enable)

The BSCBRAH bit enables or disables input capture for GTCCRB on the rising edge of GTIOCB pin input, when GTIOCA input is 1.

BSCBFAL bit (GTIOCB Pin Falling Input during GTIOCA Value Low Source GTCCRB Input Capture Enable)

The BSCBFAL bit enables or disables input capture for GTCCRB on the falling edge of GTIOCB pin input, when GTIOCA input is 0.

BSCBFAH bit (GTIOCB Pin Falling Input during GTIOCA Value High Source GTCCRB Input Capture Enable)

The BSCBFAH bit enables or disables input capture for GTCCRB on the falling edge of GTIOCB pin input, when GTIOCA input is 1.

BSELCm bit (ELC_GPTm Source Counter GTCCRB Input Capture Enable) (m = A to H)

The BSELCm bit enables or disables input capture for GTCCRB on the ELC_GPTm input.

GTCR controls GTCNT.

CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit being 1.
- The ELC event input or the GTIOCA/GTIOCB/GTETRGn port input that are enabled by GTSSR for the starting counter source, occurs.
- 1 is written by software directly.

[Clearing conditions]

- GTSTP value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTOP bit being 1.

- The ELC event input or the GTIOCA/GTIOCB/GTETRGn port input that are enabled by GTSSR for the stopping counter source, occurs.
- 0 is written by software directly.

MD[2:0] bits (Mode Select)

The MD[2:0] bits select the GPT operating mode. The MD[2:0] bits must be set while the GTCNT operation is stopped.

TPCS[2:0] bits (Timer Prescaler Select)

The TPCS[2:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[2:0] bits must be set while the GTCNT operation is stopped.

b31 to b28	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

x: Don't care

GTUDDTYC sets the direction in which GTCNT counts (up-counting or down-counting) and sets the duty of GTIOCA/GTIOCB pin output.

Count direction:

- In saw-wave mode

When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down-counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting is stopped, the counter starts up-counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.

- In triangle-wave mode

When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.

When the UDF bit is set to 1 while counting stops, the UD value is reflected in the count direction when counting starts.

UD bit (Count Direction Setting)

The UD bit sets the count direction for up-counting or down-counting, for GTCNT.

UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only write 0 to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

Output duty

- In saw-wave mode

When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR). When the OADTY/OBDTY value changes during down-counting, the duty is reflected at an underflow (GTCNT = 0).

When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting is stopped, the output duty is not reflected at starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0). When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at the starting counter operation.

- In triangle-wave mode

When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow. When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation, however the output duty is reflected at an underflow.

When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

OmDTY[1:0] bits (GTIOCm Output Duty Setting) (m = A, B)

The OmDTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOCm pin.

OmDTYF bit (ForcibleGTIOCm Output Duty Setting) (m = A, B)

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0 during counter operation. When this bit is set to 1 while counting is stopped, return this bit to 0 until the first period ends after the counter starts.

OmDTYR bit (GTIOCm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)

The OmDTYR bits select the value that is the object of output retained or toggled at cycle end, when the control changes from 0%/100% duty setting to compare match for GTIOCm pin and GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end).

GPT internally continues to perform compare match operation in performing 0%/100% duty operation. When OmDTYR bit is set to 1, the value of compare match at cycle end is applied to GTIOR.GTIOm[3:2].

23.2.14 General PWM Timer I/O Control Register (GTIOR)

Address(es): GPT32EHm.GTIOR 4007 8034h + 0100h × m (m = 0 to 3)
GPT32Em.GTIOR 4007 8034h + 0100h × m (m = 4 to 7)
GPT32m.GTIOR 4007 8034h + 0100h × m (m = 8 to 13)

b28, b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b29	NFBEN	Noise Filter B Enable	0: Disable noise filter for GTIOCB pin 1: Enable noise filter for GTIOCB pin.	R/W
b31, b30	NFCSB[1:0]	Noise Filter B Sampling Clock Select	b31 b30 0 0: PCLKD/1 0 1: PCLKD/4 1 0: PCLKD/16 1 1: PCLKD/64.	R/W

GTIOR sets the functions of the GTIOCA and GTIOCB pins.

GTIOA[4:0] bits (GTIOCA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCA pin function. For details, see Table 23.5.

OADFLT bit (GTIOCA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCA pin outputs high or low when counting stops.

OAHLD bit (GTIOCA Pin Output Setting at the Start/Stop Count)

The OAHLD bit specifies whether the GTIOCA pin output level is retained or the level at the start/stop of counting depends on the register setting.

[When the OAHLD bit is set to 0]

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, it is immediately reflected in the output.

[When the OAHLD bit is set to 1]

- The output is retained when counting starts or stops.

OAE bit (GTIOCA Pin Output Enable)

The OAE bit disables or enables the GTIOCA pin output.

When GTCCRA register is used as the input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCA pin does not output independently of the OAE bit value.

OADF[1:0] bits (GTIOCA Pin Disable Value Setting)

The OADF[1:0] bits select the output value of GTIOCA pin when an output disable request occurs.

NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCA pin. Because changing the value of the bit might lead to internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCA pin. When setting these bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

GTIOB[4:0] bits (GTIOCB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCB pin function. For details, see Table 23.5.

OBDFLT bit (GTIOCB Pin Output Value Setting at the Count Stop)

The OBDFLT bit sets whether the GTIOCB pin outputs high or low when counting stops.

OBHLD bit (GTIOCB Pin Output Setting at the Start/Stop Count)

The OBHLD bit specifies whether the GTIOCB pin output level is retained or the level at the start/stop of counting depends on the register setting.

[When the OBHLD bit is set to 0]

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, it is immediately reflected in the output.

[When the OBHLD bit is set to 1]

- The output is retained when counting starts or stops.

OBE bit (GTIOCB Pin Output Enable)

The OBE bit disables or enables the GTIOCB pin output.

When GTCCRB register is used as the input capture register (at least one bit in GTICBSR register is set to 1), the GTIOCB pin does not output independently of the OBE bit value.

OBDF[1:0] bits (GTIOCB Pin Disable Value Setting)

The OBDF[1:0] bits select the output value of GTIOCB pin, when output disable request occurs.

NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCB pin. When setting these bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

Table 23.5 Settings of GTIOA[4:0] and GTIOB[4:0] bits

GTIOA/GTIOB[4:0] bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
0	0	0	0	0	Set initial output low	Retain output at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	0	0	0	1			Output low at GTCCRA/GTCCRB compare match
0	0	0	1	0			Output high at GTCCRA/GTCCRB compare match
0	0	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	0	1	0	0		Output low at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	0	1	0	1			Output low at GTCCRA/GTCCRB compare match
0	0	1	1	0			Output high at GTCCRA/GTCCRB compare match
0	0	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	1	0	0	0		Output high at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	1	0	0	1			Output low at GTCCRA/GTCCRB compare match
0	1	0	1	0			Output high at GTCCRA/GTCCRB compare match
0	1	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
0	1	1	0	0		Toggle output at cycle end	Retain output at GTCCRA/GTCCRB compare match
0	1	1	0	1			Output low at GTCCRA/GTCCRB compare match
0	1	1	1	0			Output high at GTCCRA/GTCCRB compare match
0	1	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	0	0	0	0	Set initial output high	Retain output at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	0	0	0	1			Output low at GTCCRA/GTCCRB compare match
1	0	0	1	0			Output high at GTCCRA/GTCCRB compare match
1	0	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	0	1	0	0		Output low at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	0	1	0	1			Output low at GTCCRA/GTCCRB compare match
1	0	1	1	0			Output high at GTCCRA/GTCCRB compare match
1	0	1	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	1	0	0	0		Output high at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	1	0	0	1			Output low at GTCCRA/GTCCRB compare match
1	1	0	1	0			Output high at GTCCRA/GTCCRB compare match
1	1	0	1	1			Toggle output at GTCCRA/GTCCRB compare match
1	1	1	0	0		Toggle output at cycle end	Retain output at GTCCRA/GTCCRB compare match
1	1	1	0	1			Output low at GTCCRA/GTCCRB compare match
1	1	1	1	0			Output high at GTCCRA/GTCCRB compare match
1	1	1	1	1			Toggle output at GTCCRA/GTCCRB compare match

Note 1. The cycle end means an overflow (GTCNT is changed from GTPR to 0 in up-counting) or underflow (GTCNT is changed from 0 to GTPR in down-counting). In this case, the GTCNT counter is cleared for saw waves and for the trough (GTCNT is changed from 0 to 1) for triangle waves.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note 3. In event count operation where at least 1 bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

23.2.15 General PWM Timer Interrupt Output Setting Register (GTINTAD)

Address(es): GPT32EHm.GTINTAD 4007 8038h + 0100h × m (m = 0 to 3)
GPT32Em.GTINTAD 4007 8038h + 0100h × m (m = 4 to 7)
GPT32m.GTINTAD 4007 8038h + 0100h × m (m = 8 to 13)

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

GTINTAD enables or disables interrupt requests, A/D converter start requests and output disable requests.

ADTRAUEN bit (GTADTRA Compare Match (Up-Counting) A/D Converter Start Request Enable)

The ADTRAUEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT up-counting. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

ADTRADEN bit (GTADTRA Compare Match (Down-Counting) A/D Converter Start Request Enable)

The ADTRADEN bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT down-counting. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

ADTRBUEN bit (GTADTRB Compare Match (Up-Counting) A/D Converter Start Request Enable)

The ADTRBUEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT up-counting. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

ADTRBDEN bit (GTADTRB Compare Match (Down-Counting) A/D Converter Start Request Enable)

The ADTRBDEN bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT down-counting. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

GRP[1:0] bits (Output Disable Source Select)

The GRP[1:0] bits select the GTIOCA pin and GTIOCB pin output disable source. The output disable request to POEG outputs to the group which is selected by GRP[1:0] bits when dead time error, same time output level high or low occurs according to each output disable request enable bits.

GTST.ODF shows the request of output disable source group that is selected with the GRP[1:0] bits.

The GRP[1:0] bits should be set when both GTIOR.OAE and GTIOR.OBE are 0.

GRPDTE bit (Dead Time Error Output Disable Request Enable)

The GRPDTE bit enables or disables dead time error output disable request. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

GRPABH bit (Same Time Output Level High Disable Request Enable)

The GRPABH bit enables or disables output disable request when GTIOCA pin and GTIOCB pin output 1 at the same time.

GRPABL bit (Same Time Output Level Low Disable Request Enable)

The GRPABL bit enables or disables output disable request when GTIOCA pin and GTIOCB pin output 0 at the same time.

23.2.16 General PWM Timer Status Register (GTST)

Address(es): GPT32EHm.GTST 4007 803Ch + 0100h × m (m = 0 to 3)
GPT32Em.GTST 4007 803Ch + 0100h × m (m = 4 to 7)
GPT32m.GTST 4007 803Ch + 0100h × m (m = 8 to 13)

b24	ODF	Output Disable Flag	0: No output disable request occurred 1: Output disable request occurred.	R
b27 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b28	DTEF	Dead Time Error Flag	0: No dead time error occurred 1: Dead time error occurred.	R
b29	OABHF	Same Time Output Level High Flag	0: GTIOCA pin and GTIOCB pin did not output 1 at the same time 1: GTIOCA pin and GTIOCB pin output 1 at the same time.	R
b30	OABLF	Same Time Output Level Low Flag	0: GTIOCA pin and GTIOCB pin did not output 0 at the same time 1: GTIOCA pin and GTIOCB pin output 0 at the same time.	R
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to this bit. Do not write 1.

GTST indicates the status of the GPT.

TCFA flag (Input Capture/Compare Match Flag A)

The TCFS flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register function as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFC flag (Input Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

[Setting condition]

- GTCNT = GTCCRC

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

TCFD flag (Input Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

[Setting condition]

- GTCNT = GTCCRD.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (GTCCRD performs buffer operation).

TCFE flag (Input Compare Match Flag E)

The TCFE flag indicates the status for the compare match of GTCCRE.

[Setting condition]

- GTCNT = GTCCRE.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

TCFF flag (Input Compare Match Flag F)

The TCFF flag indicates the status for the compare match of GTCCRF.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or a crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR-1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or a trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

ITCNT[2:0] bits (GPTn_OVF/GPTn_UDF Interrupt Skipping Count Counter)

When the GPTn_OVF/GPTn_UDF(n=0 to 7) interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter in the ITCNT[2:0] bits increments by 1 every time the GPTn_OVF/GPTn_UDF interrupt source that is selected in GTITC.IVTC[1:0] is generated.

Only GPT32EH and GPT32E have these bits. GPT32 does not have these bits.

[Clearing conditions]

- The GPTn_OVF/GPTn_UDF interrupt skipping function is not used (GTITC.IVTT[2:0] is 000b when GTITC.IVTC[1:0] is 00b)
- The GPTn_OVF/GPTn_UDF interrupt skipping count matches the specified count (ITCNT[2:0] matches the skipping count specified in GTITC.IVTT[2:0]).

TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and is set to 0 in down-counting.

ADTRAUF flag (GTADTRA Compare Match (Up-Counting) A/D Converter Start Request Flag)

The ADTRAUF flag is status flag for compare match of GTADTRA at up-counting.

[Setting condition]

- GTCNT = GTADTRA at up-counting.

[Clearing condition]

- 0 is written to this flag.

ADTRADF flag (GTADTRA Compare Match (Down-Counting) A/D Converter Start Request Flag)

The ADTRADF flag is status flag for compare match of GTADTRA at down-counting.

[Setting condition]

- GTCNT = GTADTRA at down-counting.

[Clearing condition]

- 0 is written to this flag.

ADTRBUF flag (GTADTRB Compare Match (Up-Counting) A/D Converter Start Request Flag)

The ADTRBUF flag is status flag for compare match of GTADTRB at up-counting.

[Setting condition]

- GTCNT = GTADTRB at up-counting.

[Clearing condition]

- 0 is written to this flag.

ADTRBDF flag (GTADTRB Compare Match (Down-Counting) A/D Converter Start Request Flag)

The ADTRBDF flag is a status flag for compare match of GTADTRB at down-counting.

[Setting condition]

- GTCNT = GTADTRB at down-counting.

[Clearing condition]

- 0 is written to this flag.

ODF flag (Output Disable Flag)

The ODF flag shows the request of the output disable source group that is selected by GRP[1:0] bits. When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

DTEF flag (Dead Time Error Flag)

The DTEF flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.

This flag returns to 0 when the timer output toggle point after the automatic addition of dead time is returned to the cycle. This flag is read only. Writing 0 to clear the flag is not allowed.

[Setting condition]

- The timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.
  For triangle wave in up-counting: GTCCRA - GTDVU ≤ 0
  For triangle wave in down-counting: GTCCRA - GTDVD < 0
  For saw wave 1 shot pulse mode in up-counting:
  GTCCRA - GTDVU < 0 or GTCCRA + GTDVD > GTPR
  For saw wave 1 shot pulse mode in down-counting:
  GTCCRA + GTDVU > GTPR or GTCCRA - GTDVD < 0

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the timer cycle.
  Only GPT32EH and GPT32E have this flag. GPT32 does not have this flag.
  GPT32 has the automatic dead time setting function but it does not generate dead time error.

OABHF flag (Same Time Output Level High Flag)

The OABHF flag indicates that GTIOCA pin and GTIOCB pin output 1 at the same time.

When GTIOCA pin or GTIOCB pin output 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is not allowed. When an interrupt by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request.

[Setting condition]

- GTIOCA pin and GTIOCB pin output 1 at the same time when both the OAE and OBE bits are set to 1.

[Clearing conditions]

- GTIOCA pin output value is different from GTIOCB pin output value when both the OAE and OBE bits are set to 1
- GTIOCA pin and GTIOCB pin output 0 at the same time when both the OAE and OBE bits are set to 1
- Either OAE bit or OBE bit is set to 0.

OABLF flag (Same Time Output Level Low Flag)

The OABLF flag indicates that GTIOCA pin and GTIOCB pin output 0 at the same time.

When GTIOCA pin or GTIOCB pin output 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is not allowed. When an interrupt by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request.

[Setting condition]

- GTIOCA pin and GTIOCB pin output 0 at the same time when both the OAE and OBE bits are set to 1.

[Clearing conditions]

- GTIOCA pin output value is different from GTIOCB pin output value when both the OAE and OBE bits are set to 1
- GTIOCA pin and GTIOCB pin output 1 at the same time when both the OAE and OBE bits are set to 1
- At least either OAE bit or OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before masked by the output disable function. When the output disable state is performed, a compare match also performs continuously in the GPT and the OABHF/OABLF flag is updated in association with the result of the compared values.

23.2.17 General PWM Timer Buffer Enable Register (GTBER)

Address(es): GPT32EHm.GTBER 4007 8040h + 0100h × m (m = 0 to 3)

GTBER provides settings for the buffer operation and must be set while the GTCNT operation stops.

BD[0] bit (GTCCR Buffer Operation Disable)

The BD[0] bit disables buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF of the combined GPT.

When GTDTCR.TDE is 1 and when BD[0] is set to 0, GTCCRB does not perform buffer operation and the GTCCRB register is automatically set to a compare match value for a negative-phase waveform with dead time.

BD[1] bit (GTPR Buffer Operation Disable)

The BD[1] bit disables buffer operation using GTPR, GTPBR, and GTPDBR of the combined GPT.

BD[2] bit (GTADTR Buffer Operation Disable)

The BD[2] bit disables buffer operation using GTADTRA, GTADTRB, GTADTBRA, GTADTBRB, GTADTDBRA, and GTADTDBRB of the combined GPT. In event count operation, this bit is not available and the GTADTR buffer operation is not performed. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

BD[3] bit (GTDV Buffer Operation Disable)

The BD[3] bit disables buffer operation using GTDVU, GTDVD, GTDBD, and GTDBU of the combined GPT.

When the GTDTCR.TDFER bit is set to 1 and when BD[3] is set to 0, buffer operation is not performed and the GTDVD value is set as a value of GTDVU automatically. In event count operation, this bit is not available and the GTDV buffer operation is not performed. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

CCRA[1:0] bits (GTCCRA Buffer Operation)

The CCRA[1:0] bits set buffer operation using GTCCRA, GTCCRC, and GTCCRD of the combined GPT. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.*1

CCRB[1:0] bits (GTCCRB Buffer Operation)

The CCRB[1:0] bits set buffer operation using GTCCRB, GTCCRE, and GTCCRF of the combined GPT. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.*1

PR[1:0] bits (GTPR Buffer Operation)

The PR[1:0] bits set buffer operation using GTPR, GTPBR, and GTPDBR of the combined GPT. GPT32 does not have PR[1] bit. Only single buffer operation setting by PR[0] bit is available for GPT32.

CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forcibly performs a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after 1 is written. This bit is read as 0 and is only valid when counting is stopped with a specified compare match operation.

ADTTA[1:0] bits (GTADTRA Buffer Transfer Timing Select)

The ADTTA[1:0] bits set the transfer timing for buffer operation of GTADTRA, GTADTBRA, and GTADTDBRA. These bits are not available in event count operation. Only GPT32EH and GPT32E have these bits. GPT32 does not have these bits.

ADTDA bit (GTADTRA Double Buffer Operation)

The ADTDA bit sets buffer operation with GTADTRA, GTADTBRA, and GTADTDBRA combined. This bit is not available in event count operation. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

ADTTB[1:0] bits (GTADTRB Buffer Transfer Timing Select

The ADTTB[1:0] bits set the transfer timing for buffer operation of GTADTRB, GTADTBRB, and GTADTDBRB. This bit is not available in event count operation. Only GPT32EH and GPT32E have these bits. GPT32 does not have these bits.

ADTDB bit (GTADTRB Double Buffer Operation)

The ADTDB bit sets buffer operation using GTADTRB, GTADTBRB, and GTADTDBRB of the combined GPT. This bit is not available in event count operation. Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

Note 1. The buffer operation mode is fixed in saw-wave one-shot pulse mode, or triangle-wave PWM mode 3 (64-bit transfer at trough).

23.2.18 General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register (GTITC)

Address(es): GPT32EHm.GTITC 4007 8044h + 0100h × m (m = 0 to 3)
GPT32Em.GTITC 4007 8044h + 0100h × m (m = 4 to 7)

b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

GTITC sets the skipping function for the GTCNT counter overflow (GTPR compare match) interrupt (GPTn_OVF) and underflow interrupt (GPTn_UDF). It also specifies whether to link other interrupts and A/D converter start requests with the GPTn_OVF/GPTn_UDF interrupt skipping function. A dead time error interrupts cannot be linked with the GPTn_OVF/GPTn_UDF interrupt skipping function. This bit is not available in event count operation. Only GPT32EH and GPT32E have this register. GPT32 does not have this register and it is read as 0.

ITLA bit (GTCCRA Compare Match/Input Capture Interrupt Link)

The ITLA bit specifies whether to link the GTCCRA compare match/input capture interrupt (GTCIA) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLB bit (GTCCRB Compare Match/Input Capture Interrupt Link)

The ITLB bit specifies whether to link the GTCCRB compare match/input capture interrupt (GTCIB) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLC bit (GTCCRC Compare Match Interrupt Link)

The ITLC bit specifies whether to link the GTCCRC compare match interrupt (GTCIC) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLD bit (GTCCRD Compare Match Interrupt Link)

The ITLD bit specifies whether to link the GTCCRD compare match interrupt (GTCID) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLE bit (GTCCRE Compare Match Interrupt Link)

The ITLE bit specifies whether to link the GTCCRE compare match interrupt (GTCIE) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLF bit (GTCCRF Compare Match Interrupt Link)

The ITLF bit specifies whether to link the GTCCRF compare match interrupt (GTCIF) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

IVTC[1:0] bits (GPTn_OVF/GPTn_UDF Interrupt Skipping Function Select)

The IVTC[1:0] bits set the skipping function for the GTPR compare match (GTCNT overflow) interrupt (GPTn_OVF) and GTCNT counter underflow interrupt (GPTn_UDF).

IVTT[2:0] bits (GPTn_OVF/GPTn_UDF Interrupt Skipping Count Select)

The IVTT[2:0] bits set the skipping count for the GTPR compare match (GTCNT overflow) interrupt (GPTn_OVF) and GTCNT counter underflow interrupt (GPTn_UDF). When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

ADTAL bit (GTADTRA A/D Converter Start Request Link)

The ADTAL bit specifies whether to link the GTADTRA A/D converter start request with GPTn_OVF/GPTn_UDF interrupt skipping function.

ADTBL bit (GTADTRB A/D Converter Start Request Link)

The ADTBL bit specifies whether to link the GTADTRB A/D converter start request with GPTn_OVF/GPTn_UDF interrupt skipping function.

23.2.19 General PWM Timer Counter (GTCNT)

Address(es): GPT32EHm.GTCNT 4007 8048h + 0100h × m (m = 0 to 3)
GPT32Em.GTCNT 4007 8048h + 0100h × m (m = 4 to 7)

GTCNT is a 32-bit read/write counter and can only be written to after counting stops. GTCNT must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited. GTCNT must be set within the range of 0 ≤ GTCNT ≤ GTPR.

23.2.20 General PWM Timer Compare Capture Register n (GTCCRn) (n = A to F)

Address(es): GPT32EHm.GTCCRA 4007 804Ch + 0100h × m (m = 0 to 3)
GPT32Em.GTCCRA 4007 804Ch + 0100h × m (m = 4 to 7)

GTCCRn registers are read/write registers.

GTCCRA and GTCCRB are registers used for both output compare and input capture.

GTCCRC and GTCCRE are compare match registers that can also function as buffer registers for GTCCRA and GTCCRB.

GTCCRD and GTCCRF are compare match registers that can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB).

23.2.21 General PWM Timer Cycle Setting Register (GTPR)

Address(es): GPT32EHm.GTPR 4007 8064h + 0100h × m (m = 0 to 3)
GPT32Em.GTPR 4007 8064h + 0100h × m (m = 4 to 7)
GPT32m.GTPR 4007 8064h + 0100h × m (m = 8 to 13)

GTPR is a read/write register that sets the maximum count value of GTCNT. For saw waves, the value of (GTPR + 1) is the cycle. For triangle waves, the value of (GTPR value × 2) is the cycle.

23.2.22 General PWM Timer Cycle Setting Buffer Register (GTPBR)

Address(es): GPT32EHm.GTPBR 4007 8068h + 0100h × m (m = 0 to 3)
GPT32Em.GTPBR 4007 8068h + 0100h × m (m = 4 to 7)
GPT32m.GTPBR 4007 8068h + 0100h × m (m = 8 to 13)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTADTRm registers are 32-bit read/write registers that set the timing of A/D converter start request generation. When the GTADTRm value matches the GTCNT counter value, an A/D converter start request is generated. GTADTRm must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited. Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read with the value after reset.

23.2.25 A/D Converter Start Request Timing Buffer Register m (GTADTBRm) (m = A, B)

Address(es): GPT32EHm.GTADTBRA 4007 8074h + 0100h × m (m = 0 to 3)
GPT32Em.GTADTBRA 4007 8074h + 0100h × m (m = 4 to 7)

GPT32EHm.GTADTBRB 4007 8080h + 0100h × m (m = 0 to 3)
GPT32Em.GTADTBRB 4007 8080h + 0100h × m (m = 4 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	TDE	Negative-Phase Waveform Setting	0: Set GTCCRB without using GTDVU and GTDVD. 1: Use GTDVU and GTDVD to set the compare match value for negative-phase waveform with automatic dead time in GTCCRB.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit name	Description	R/W
b4	TDBUE	GTDVU Buffer Operation Enable	0: Disable GTDVU buffer operation 1: Enable GTDVU buffer operation.	R/W
b5	TDBDE	GTDVD Buffer Operation Enable	0: Disable GTDVD buffer operation 1: Enable GTDVD buffer operation.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	TDFER	GTDVD Setting	0: Set GTDVU and GTDVD separately 1: Automatically set the value written to GTDVU to GTDVD.	R/W
b31 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

GTDTCR enables automatic setting of a compare match value for negative-phase waveform with dead time.

GPT32EH, GPT32E and GPT32 have dead time control function. GPT32 does not have the dead time buffer function and only GTDVU register is used for setting dead time value.

TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU and GTDVD. When GTDVU and GTDVD are used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU and GTDVD), is automatically set in GTCCRB.

The TDE bit setting is ignored in saw-wave PWM mode, and automatic setting does not take place.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB and the GTST.DTEF flag is set to 1. However, in triangle waves, when the obtained GTCCRB value exceeds the upper limit value, the GTST.DTEF flag is set to 0.

- Triangle waves
  Upper limit value: GTPR – 1
  Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode

  Upper limit value: GTPR
  Lower limit value: 0

TDBUE bit (GTDVU Buffer Operation Enable)

The TDBUE bit enables buffer operation with GTDVU and GTDBU combined. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves.

Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

TDBDE bit (GTDVD Buffer Operation Enable)

The TDBDE bit enables buffer operation with GTDVD and GTDBD combined. The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves. When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

TDFER bit (GTDVD Setting)

The TDFER bits sets whether or not the value written to GTDVU is also set to GTDVD automatically.

Only GPT32EH and GPT32E have this bit. GPT32 does not have this bit.

23.2.28 General PWM Timer Dead Time Value Register m (GTDVm) (m = U, D)

Address(es): GPT32EHm.GTDVU 4007 808Ch + 0100h x m (m = 0 to 3)
GPT32Em.GTDVU 4007 808Ch + 0100h x m (m = 4 to 7)
GPT32m.GTDVU 4007 808Ch + 0100h x m (m = 8 to 13)
GPT32EHm.GTDVD 4007 8090h + 0100h x m (m = 0 to 3)
GPT32Em.GTDVD 4007 8090h + 0100h x m (m = 4 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTDVm is a 32-bit read/write register that sets the dead time for generating PWM waveforms with dead time. GTDVU is used for up-counting and GTDVD is used for down-counting.

Setting a GTDVm value greater than or equal to GTPR is prohibited. Dead time setting beyond the cycle is prohibited. The compare match value set by the automatic dead time setting function for a negative waveform can be confirmed by reading from GTCCRB.

When GTDVm is used, writing to GTCCRB is not allowed. When this register is set to 0, waveforms without dead time are output. GTDVm must be accessed in 32-bit units. Access in 8-bit/16-bit units is prohibited. The way to rewrite GTDVm differs by GPT channel number.

GPT32EH0 to GPT32EH3 and GPT32E4 to GPT32E7

When GTDVm buffer operation is enabled, GTDVm can be written anytime. When GTDVm buffer operation is disabled, to change GTDVm to a new value, stop the GPT with the CST bit in the GTCR register.

GPT328 to GPT3213

While GPT is running, changing the GTDVU value is prohibited. To change GTDVU to a new value, stop the GPT with the CST bit in the GTCR register.

Only GPT32EH and GPT32E have GTDVD register. GPT32 does not have the GTDVD register. This register is read with the value after reset.

23.2.29 General PWM Timer Dead Time Buffer Register m (GTDBm) (m = U, D)

Address(es): GPT32EHm.GTDBU 4007 8094h + 0100h × m (m = 0 to 3)
GPT32Em.GTDBU 4007 8094h + 0100h × m (m = 4 to 7)

GPT32EHm.GTDBD 4007 8098h + 0100h × m (m = 0 to 3)
GPT32Em.GTDBD 4007 8098h + 0100h × m (m = 4 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

GTDBm is a 32-bit read/write register that functions as a buffer register for GTDVm.

Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read with the value after reset.

23.2.30 General PWM Timer Output Protection Function Status Register (GTSOS)

Address(es): GPT32EHm.GTSOS 4007 809Ch + 0100h x m (m = 0 to 3)
GPT32Em.GTSOS 4007 809Ch + 0100h × m (m = 4 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	SOS[1:0]	Output Protection Function Status	b1 b0 0 0: Normal operation 0 1: Protected state (set GTCCRA = 0 during transfer at trough or crest) 1 0: Protected state (set GTCCRA ≥ GTPR during transfer at trough) 1 1: Protected state (set GTCCRA ≥ GTPR during transfer at crest).	R
b31 to b2	—	Reserved	These bits are read as 0. Writing to these bits is ignored.	R

GTSOS is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (GTDTCR.TDE bit = 1) in triangle-wave mode.

Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read as 00000000h.

SOS[1:0] bits (Output Protection Function Status)

The SOS[1:0] bits indicate the status of the output protection function in triangle-wave PWM mode.

23.2.31 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR)

Address(es): GPT32EHm.GTSOTR 4007 80A0h + 0100h x m (m = 0 to 3)
GPT32Em.GTSOTR 4007 80A0h + 0100h × m (m = 4 to 7)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOTR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SOTR	Output Protection Function Temporary Release	0: Do not release protected state 1: Release protected state.	R/W
b31 to b1	—	Reserved	These bits are read as 0. Writing to these bits is ignored.	R/W

GTSOTR temporarily releases the protected state of GTIOCB pin output when output protection is set. The protected state can be released only when GTSOS.SOS[1:0] bits = 10b (protected state in which GTCCRA ≥ GTPR has occurred during transfer at trough). The protected state cannot be released in any other case.

Only GPT32EH and GPT32E have this register. GPT32 does not have this register. This register is read as 00000000h.

SOTR bit (Output Protection Function Temporary Release)

The SOTR bit specifies whether to temporarily release the protected state of the GTIOCB pin output in an output protected state. When the SOTR bit is set to 1, the output protection function is canceled from the first trough. When the SOTR bit is set to 0, output protection resumes from the first trough.

23.2.32 Output Phase Switching Control Register (OPSCR)

Address(es): GPT_OPS.OPSCR 4007 8FF0h

b28, b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit name	Description	R/W
b29	NFEN	External Input Noise Filter Enable	0: Do not use a noise filter on the external input 1: Use a noise filter on the external input.	R/W
b31, b30	NFCS[1:0]	External Input Noise Filter Clock Selection	Noise filter sampling clock setting of the external input. b31 b30 0 0: PCLKD/1 0 1: PCLKD/4 1 0: PCLKD/16 1 1: PCLKD/64.	R/W

Note 1. When OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP bit is high, the OPSCR.EN bit is set to 0.

The OPSCR register sets the output of the signal waveform required for brushless DC motor control.

UF, VF, WF bits (Input Phase Soft Setting)

The UF, VF, and WF bits set the input phase from the software settings. When OPSCR.FB bit = 1, these bits are valid. The set value of the UF/VF/WF take the place of the U/V/W external input.

U, V, W bits (Input Phase Monitor)

When OPSCR.FB bit = 0, external inputs that are synchronized by PCLKD are monitored by the U, V, and W bits. When OPSCR.FB bit = 1, the OPSCR.U, OPSCR.V, and OPSCR.W bits can read the OPSCR.UF, OPSCR.VF, and OPSCR.WF bits.

EN bit (Enable-Phase Output Control)

The EN bit controls the output enable signal output phase (positive phase/reverse phase).

When OPSCR.EN bit = 1, the signal waveform is output.

When OPSCR.EN bit = 0, first set OPSCR.FB, OPSCR.UF/VF/WF (software setting is selected), OPSCR.P/N, OPSCR.INV, OPSCR.RV, OPSCR.ALIGN, OPSCR.GRP, OPSCR.GODF, OPSCR.NFEN, OPSCR.NFCS. Then, set this bit to 1. Also when OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP bit is high, the OPSCR.EN bit is set to 0.

FB bit (External Feedback Signal Enable)

The FB bit selects the input phase from the software settings (OPSCR.UF, VF, WF) and external input such as a Hall element.

P bit (Positive-Phase Output (P) Control)

The P bit selects one of the Level signal output (PWM of GPT32EH0) or PWM signal output for the positive-phase output (GTOUUP pin, GTOVUP pin, GTOWUP pin).

N bit (Negative-Phase Output (N) Control)

The N bit selects one of the Level signal output (PWM of GPT32EH0) or PWM signal output for the negative-phase output (GTOULO pin, GTOVLO pin, GTOWLO pin).

INV bit (Invert-Phase Output Control)

The INV bit selects either positive logic (active-high) output or negative logic (active-low) output for the output phase.

ALIGN bit (Input Phase Alignment)

The ALIGN bit selects the PCLKD or PWM for the sampling of the input phase (input phase is specified in the OPSCR.FB bit).

When OPSCR.ALIGN bit = 0, input phase is aligned to PCLKD.

Note: When PWM output is selected (OPSCR.P/N = 1) and the PCLKD input phase is aligned, the PWM pulse might be short-pulsed.

Note: When OPSCR.ALIGN bit = 1, input phase is aligned with PWM output.

GRP[1:0] bits (Output Disabled Source Selection)

The GRP[1:0] bits select the output disable source (A to D).

GODF bit (Group Output Disable Function)

When the GODF bit = 1 and signal value selected by the OPSCR.GRP bit is high, the OPSCR.EN bit is set to 0. When GODF bit = 0, the bit is ignored.

NFEN bit (External Input Noise Filter Enable)

The NFEN bit selects the noise filter for external input.

When OPSCR.NFEN bit = 0, a noise filter to the external input is not used.

Note: When this bit is switched because of an unintentional internal edge, first set OPSCR.EN bit to 0.

NFCS[1:0] bits (External Input Noise Filter Clock Selection)

The NFCS[1:0] bits select the clock for the external input noise filter. When the OPSCR.NFEN bit = 1, noise filter sampling clock setting for an external input is enabled.

To select and enable the clock:

1. Set the NFCS[1:0] bits.
2. Wait for 2 cycles.
3. Set the OPSCR.EN bit to 1.

23.3 Operation

23.3.1 Basic Operation

Each channel has a 32-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR controls the count cycle. When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated pin GTIOCA or GTIOCB can be changed. GTCCRA or GTCCRB can be used as an input capture register with hardware resources.

GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

23.3.1.1 Counter Operation

(1) Counter start and stop

The counter of each channel starts the count operation by setting GTCR.CST to 1. The GTCR.CST bit value is changed by following sources.

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register.

(2) Periodic count operation in up-counting by count clock

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to 00000000h. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1. When GTCNT overflows, up-counting resumes from 00000000h.

Figure 23.3 shows an example of a periodic count operation in up-counting.

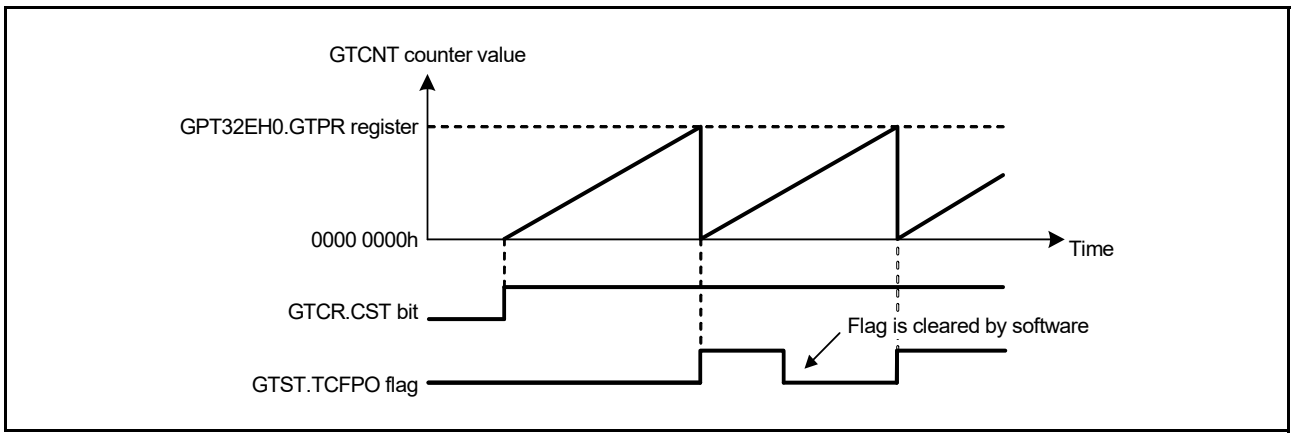

Figure 23.3 Example of periodic count operation in up-counting by the count clock

Figure 23.4 shows an example setting for periodic count operation in up-counting.

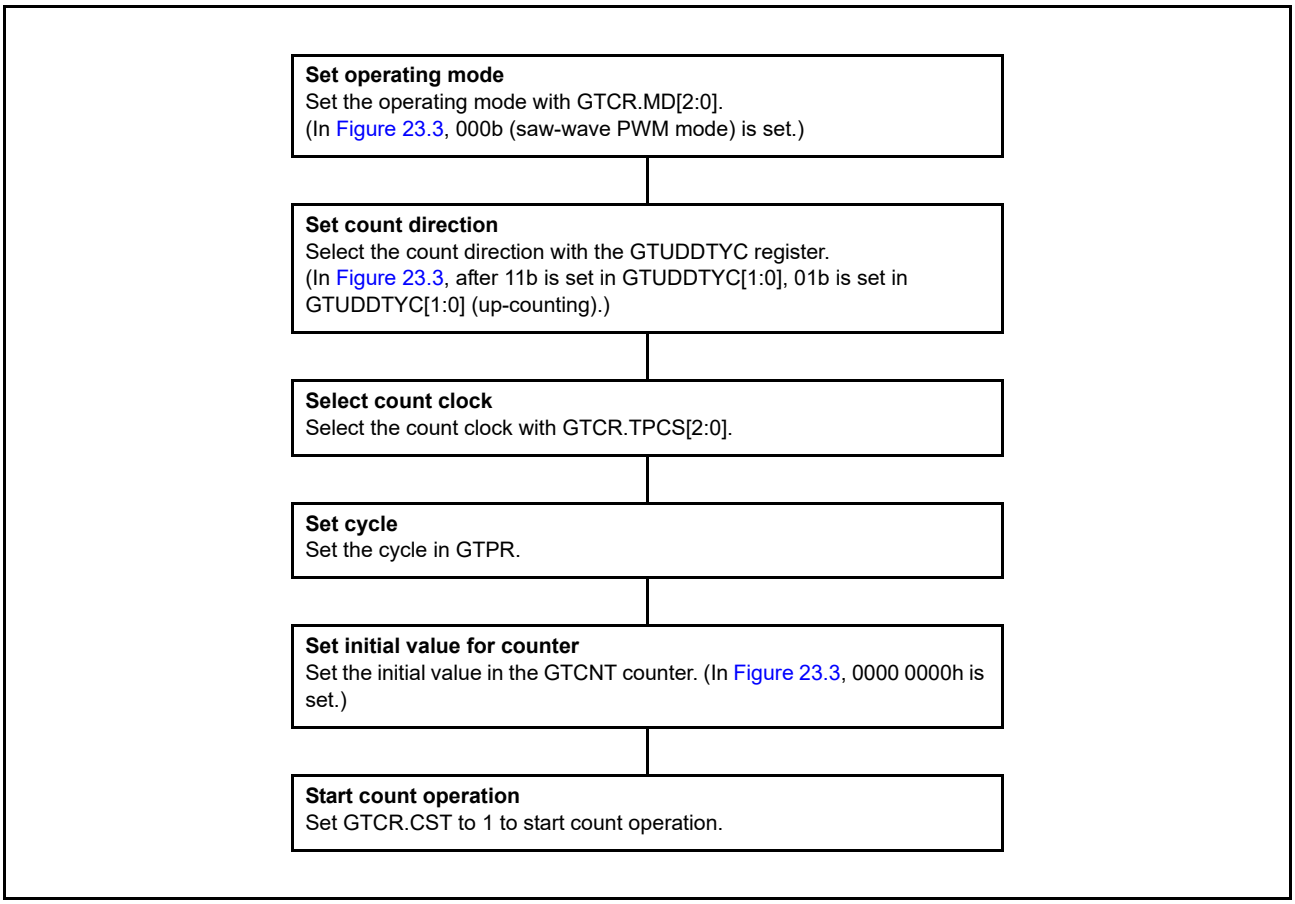

Figure 23.4 Example setting for a periodic count operation in up-counting by the count clock

(3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to 00000000h. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1. When the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 23.5 shows an example of periodic count operation in down-counting by the count clock.

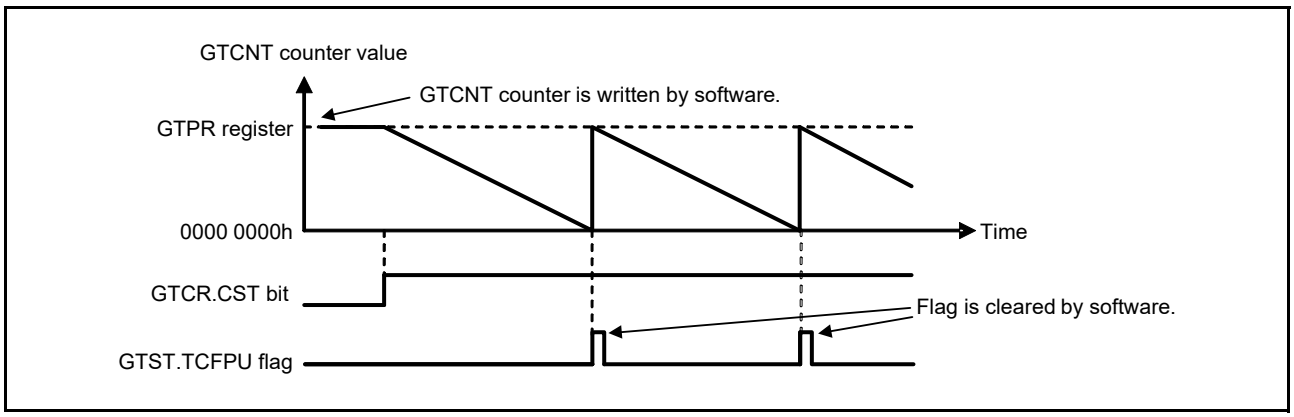

Figure 23.5 Example of periodic count operation in down-counting by the count clock

Figure 23.6 shows an example setting for periodic count operation in down-counting by the count clock.

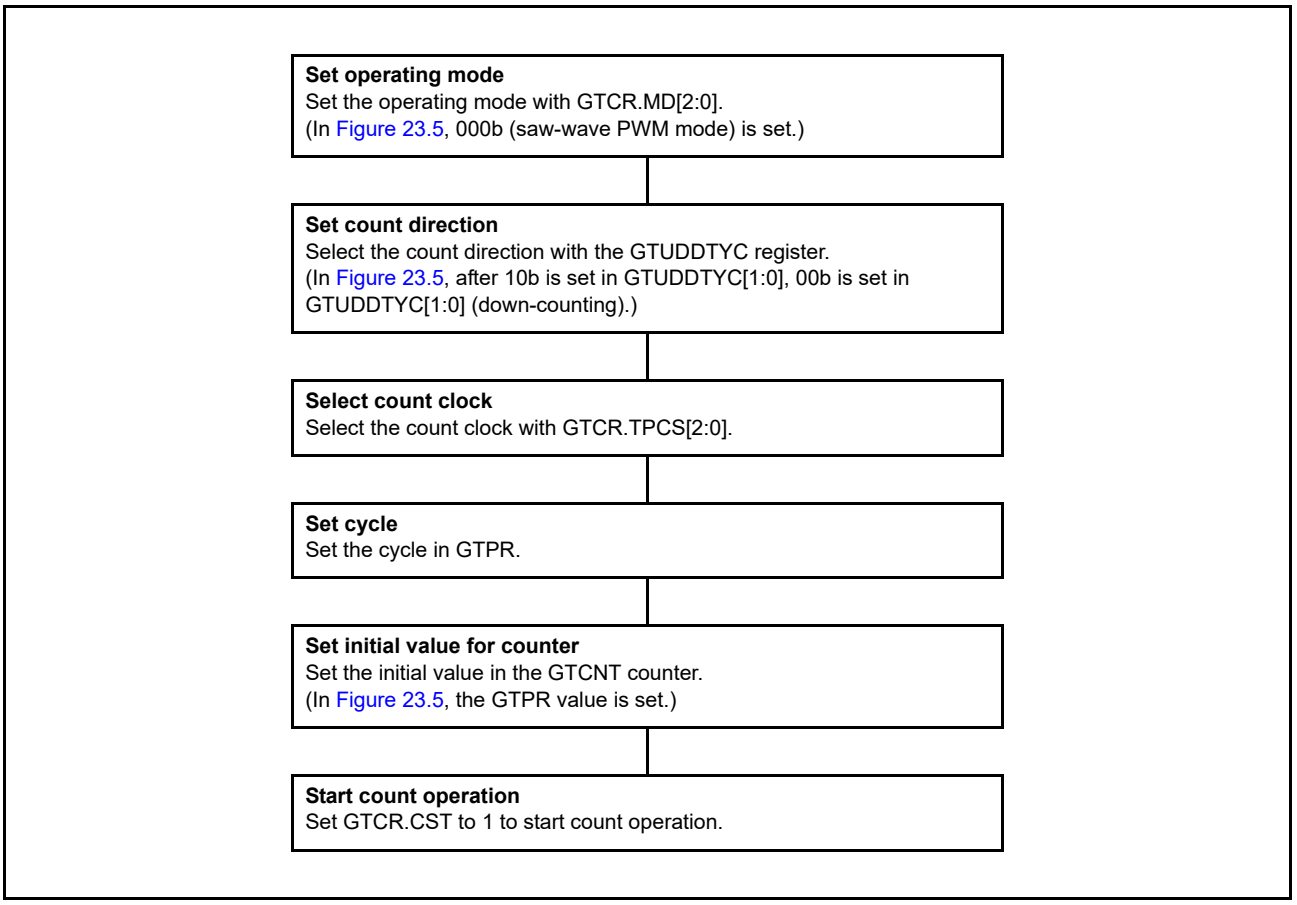

Figure 23.6 Example setting for periodic count operation in down-counting by count clock

(4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[2:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior for up-counting using hardware sources is the same as for up-counting by the count clock.

When GTCR.CST bit is set to 1 to count up using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[2:0] because the count operation is synchronized by the count clock selected by GTCR.TPCS[2:0]. Set GTCR.TPCS[2:0] to 000b to count up with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 23.7 shows an example of a periodic count operation in up-counting by a hardware resource (rising edge of GTETRGA pin).

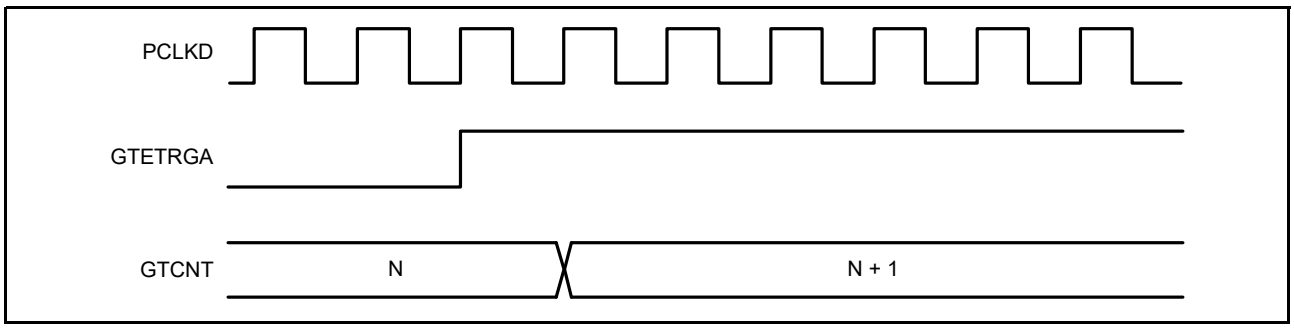

Figure 23.7 Example of periodic count operation in up-counting using hardware sources

Figure 23.8 shows an example setting for periodic count operation in down-counting by the count clock.

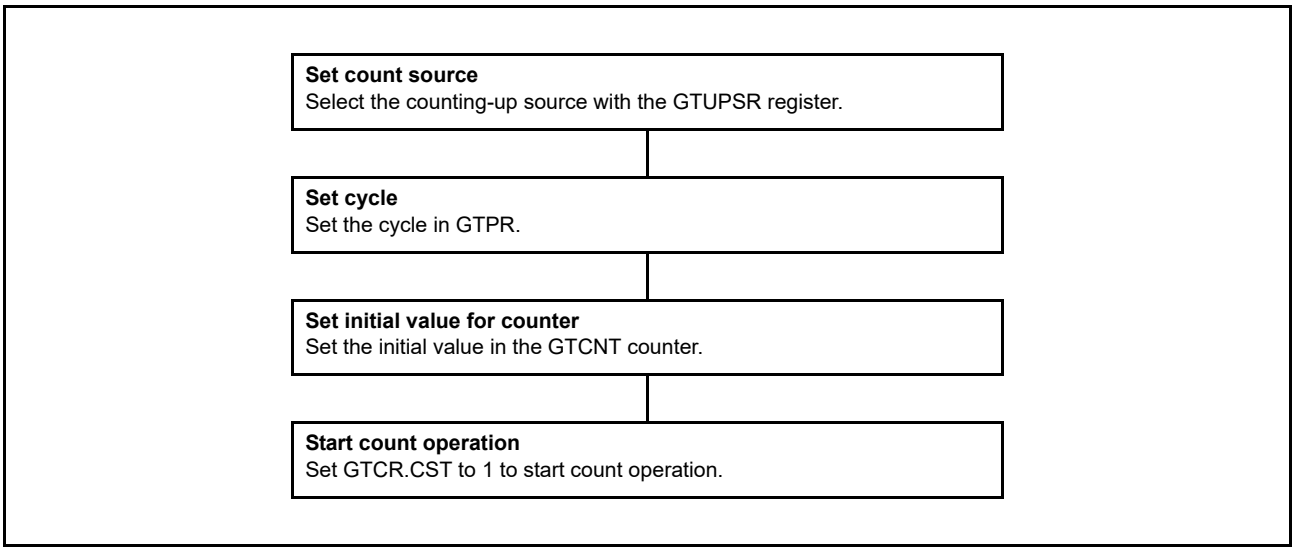

Figure 23.8 Example setting for an event count operation in up-counting using hardware sources

(5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR.

When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[2:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, GTCNT counter value does not change. The underflow behavior for down-counting using hardware sources is the same as for down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST

is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[2:0] because the count operation is synchronized with the count clock selected by GTCR.TPCS[2:0]. Set GTCR.TPCS[2:0] to 000b to count down with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 23.9 shows an example of a periodic count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).

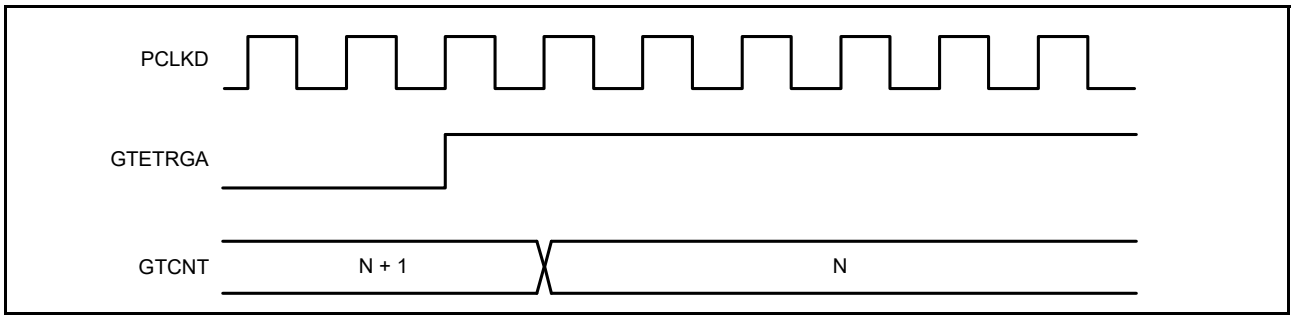

Figure 23.9 Example of event count operation in down-counting using hardware sources

Figure 23.10 shows an example setting for a periodic count operation in down-counting using a hardware resource.

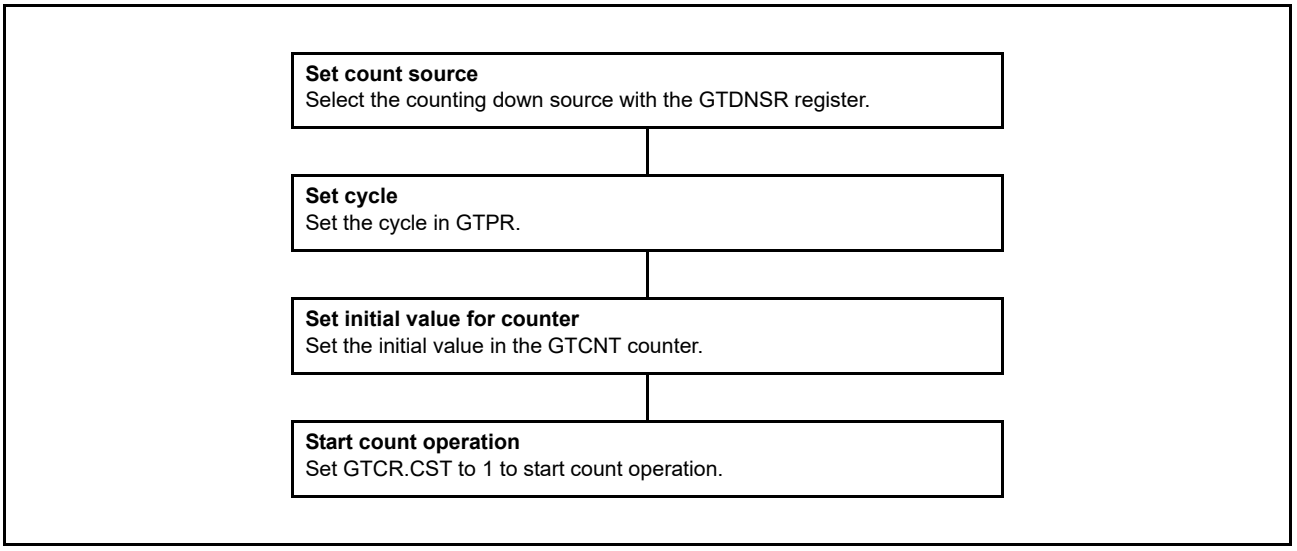

Figure 23.10 Example setting for an event count operation in down-counting using hardware sources

(6) Counter clear operation

The counter of each channel is cleared by following sources.

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST = 1) or not (GTCR.CST = 0).

For saw waves selected by setting GTCR.MD[2:0] and the count direction flag showing down-counting (GTST.TUCF = 0), the GTCNT register is set to the value of the GTPR register when writing 1 to the GTCLR register and when clearing by hardware sources are performed. When not in saw waves mode and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with PCLKD. If other settings are used, clear is synchronized with the counter clock selected by GTCR.TPCS[2:0].

23.3.1.2 Waveform Output by Compare Match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock including the event count. At the same time the GPT can output low, high, or toggle output from the associated GTIOCA or GTIOCB output pin. In addition, the GTIOCA or GTIOCB pin output can be low, high, or toggle at the cycle end which is determined by GTPR.

The cycle end is:

- For saw waves in up-counting — when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves in down-counting — when GTCNT changes from 0 to GTPR value (underflow)
- For saw waves — when the GTCNT counter is cleared
- For triangle waves — when the GTCNT changes from 0 to 1 (trough).

(1) Low and high output

Figure 23.11 shows an example of low and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GPT32EH0.GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOC0A pin by a GPT32EH0.GTCCRA compare match, and low is output from the GTOC0B pin by a GPT32EH0.GTCCRB compare match. The pin level does not change when the specified level and pin level match.

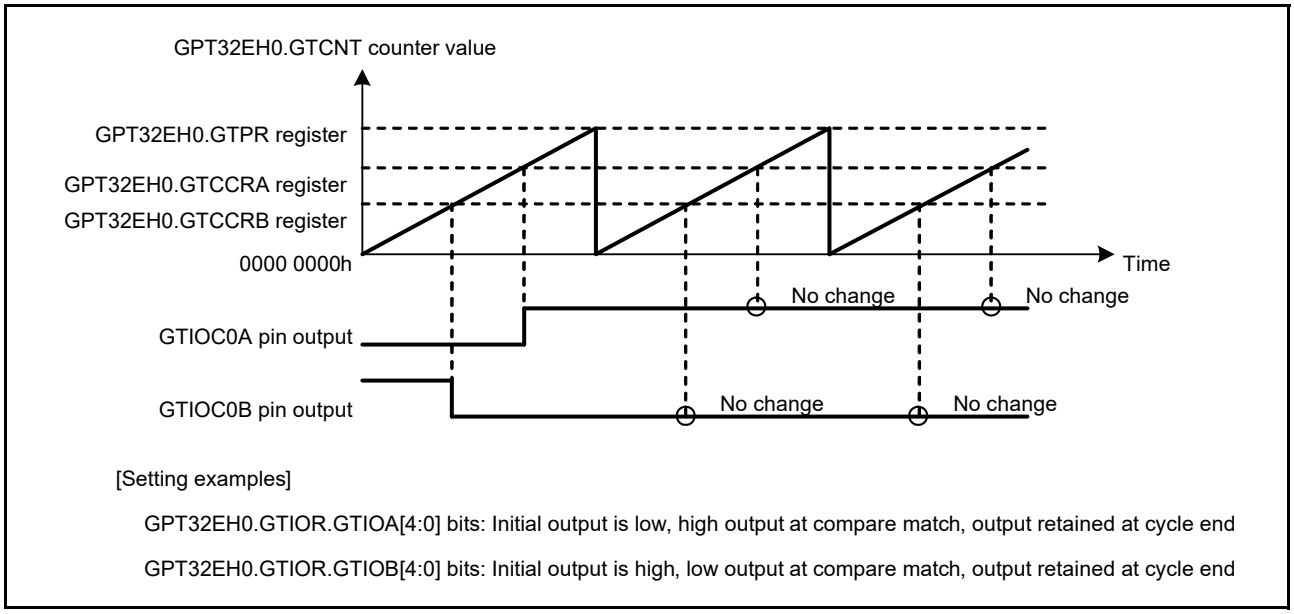

Figure 23.11 Example of low and high output operation

Figure 23.12 shows an example setting for low output and high output operation.

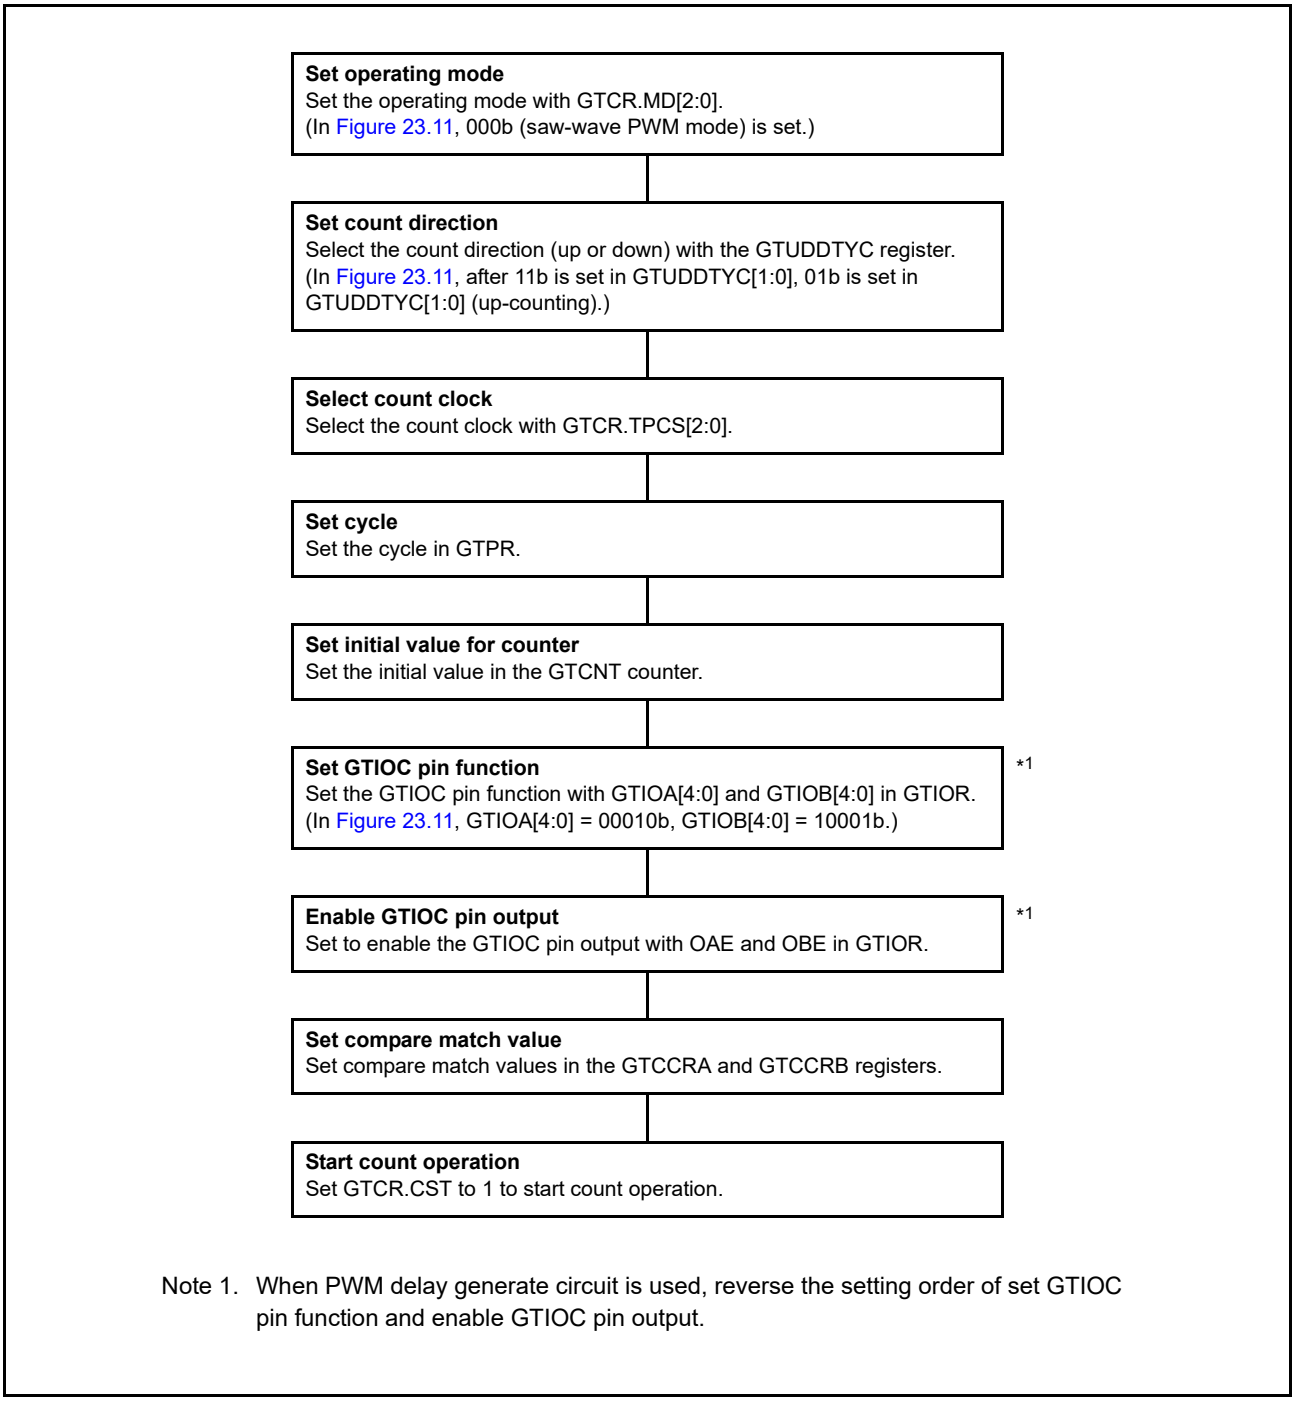

Figure 23.12 Example setting for low output and high output operation

(2) Toggled output

Figure 23.13 and Figure 23.14 show examples of toggled output operation by compare matches of GTCCRA and GTCCRB. In Figure 23.13, the GPT32EH0.GTCNT counter performs up-counting, and settings are made so that the GTIOC0A pin output by a GPT32EH0.GTCCRA compare match and GTIOC0B pin output by a GPT32EH0.GTCCRB compare match are toggled.

In Figure 23.14, the GPT32EH0.GTCNT counter performs up-counting, and settings are made so that the GTIOC0A output is toggled by a compare match of GPT32EH0.GTCCRA and the GTIOC0B output is toggled at the cycle end.

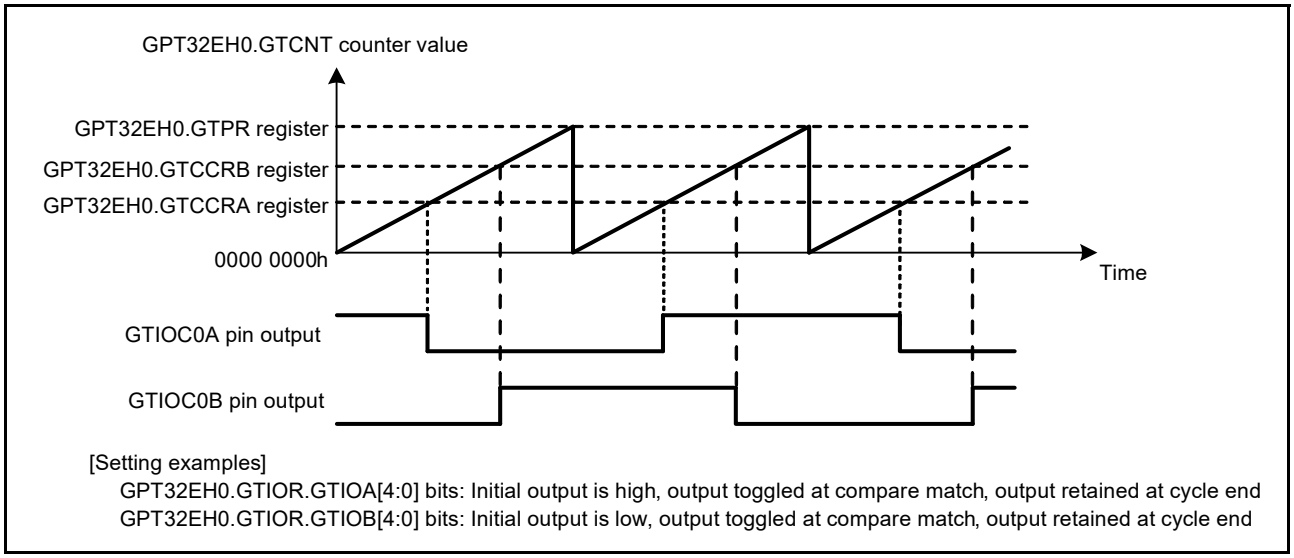

Figure 23.13 Example of toggled output operation (1)

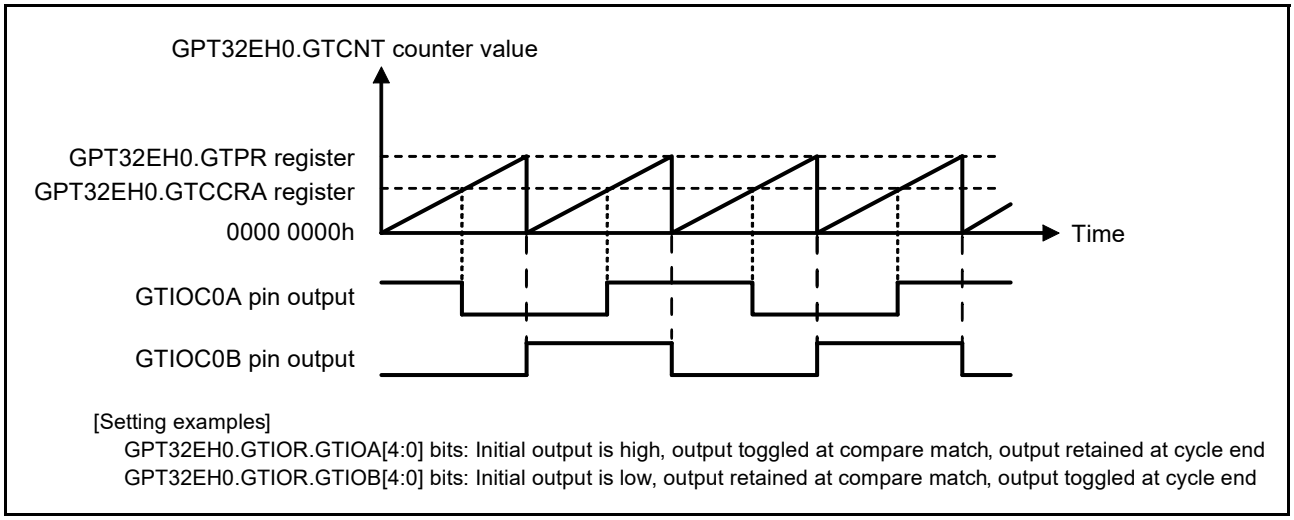

Figure 23.14 Example of toggled output operation (2)

Figure 23.15 shows an example setting for toggled output operation.

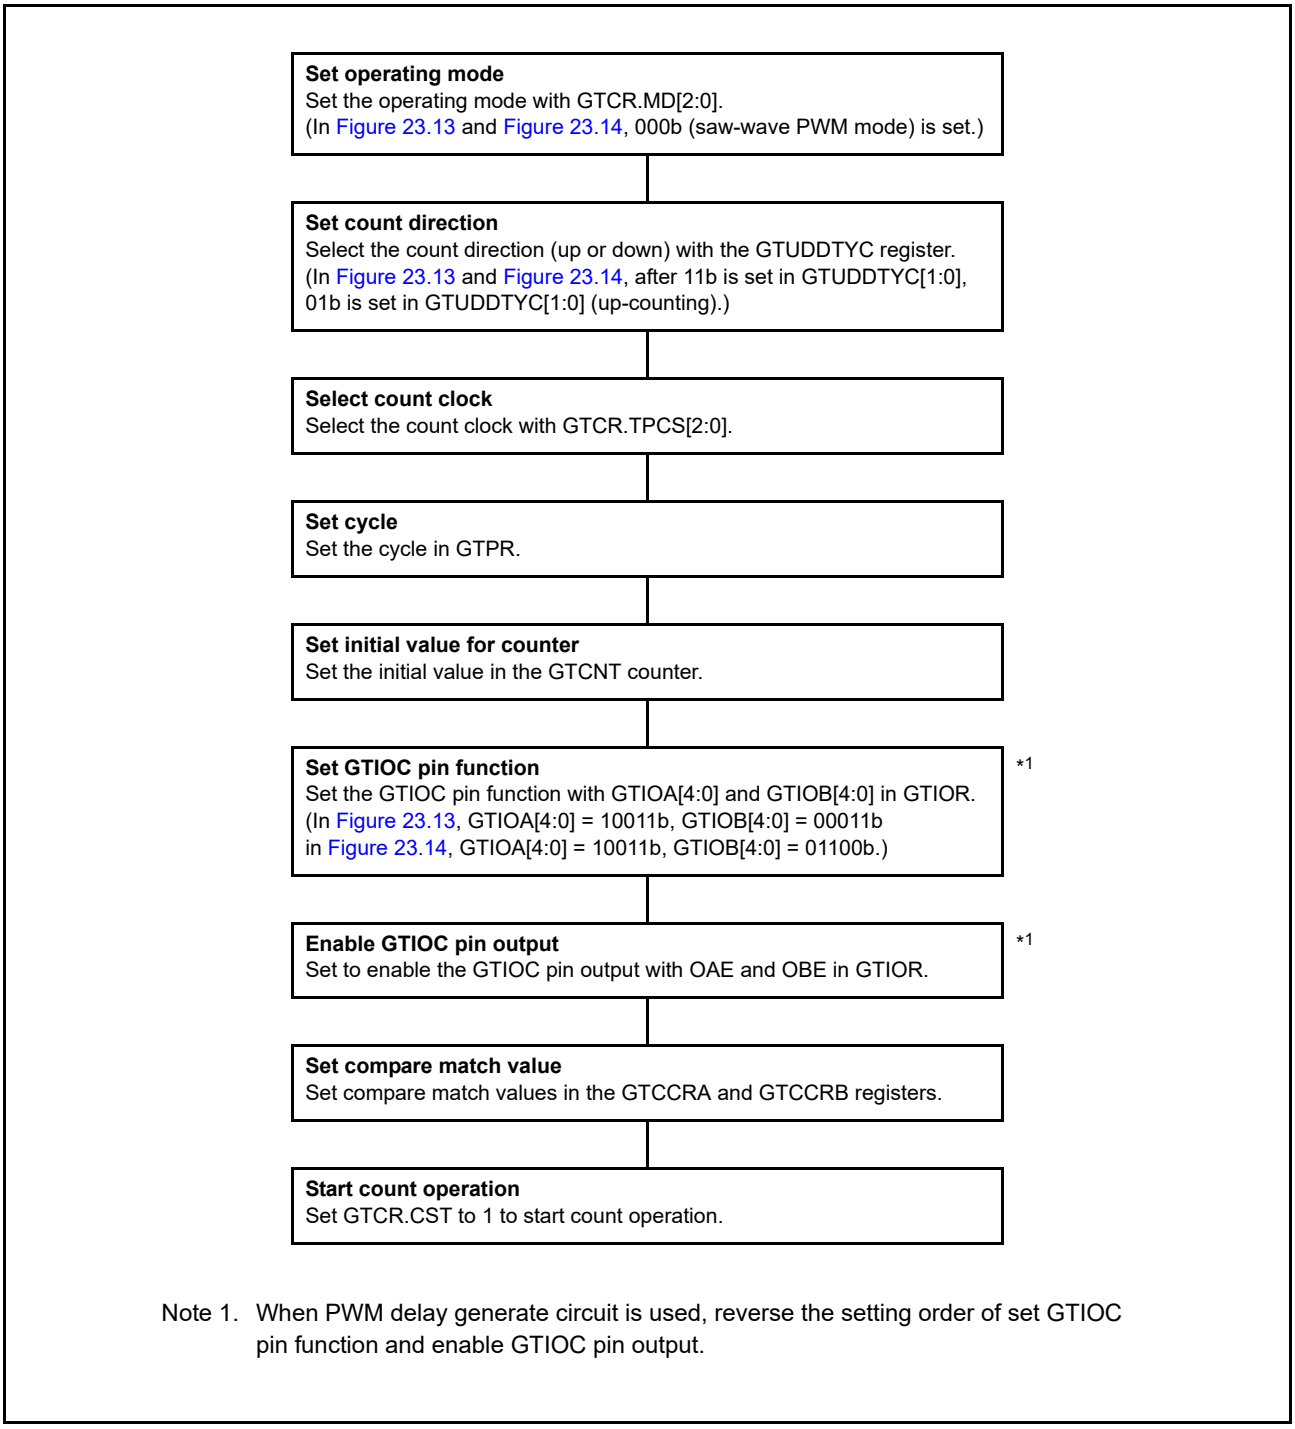

Figure 23.15 Example setting for toggled output operation

23.3.1.3 Input Capture Function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 23.16 shows an example of the input capture function.

In this example, the GPT32EH0.GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTICCRA at both edges of the GTIOC0A input pin and to GTICCRB on the rising edge of the GTIOC0B input pin.

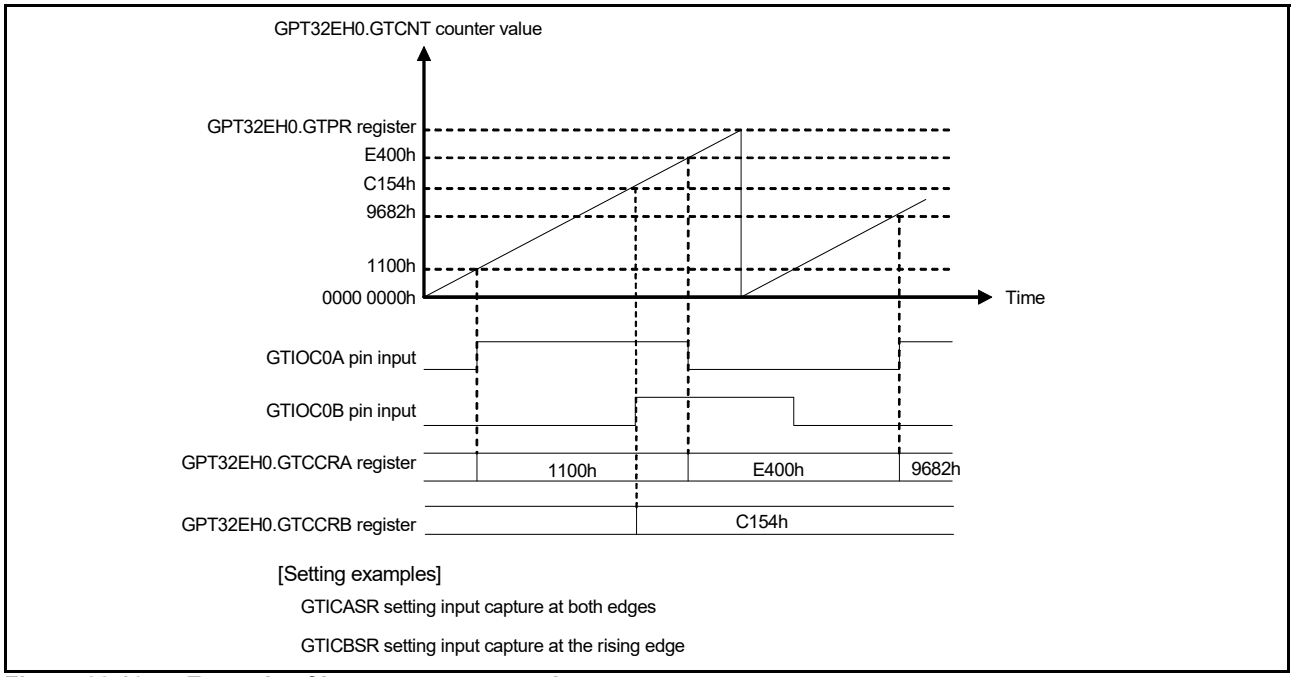

Figure 23.16 Example of input capture operation

Figure 23.17 shows an example setting for an input capture operation with count operation by the count clock.

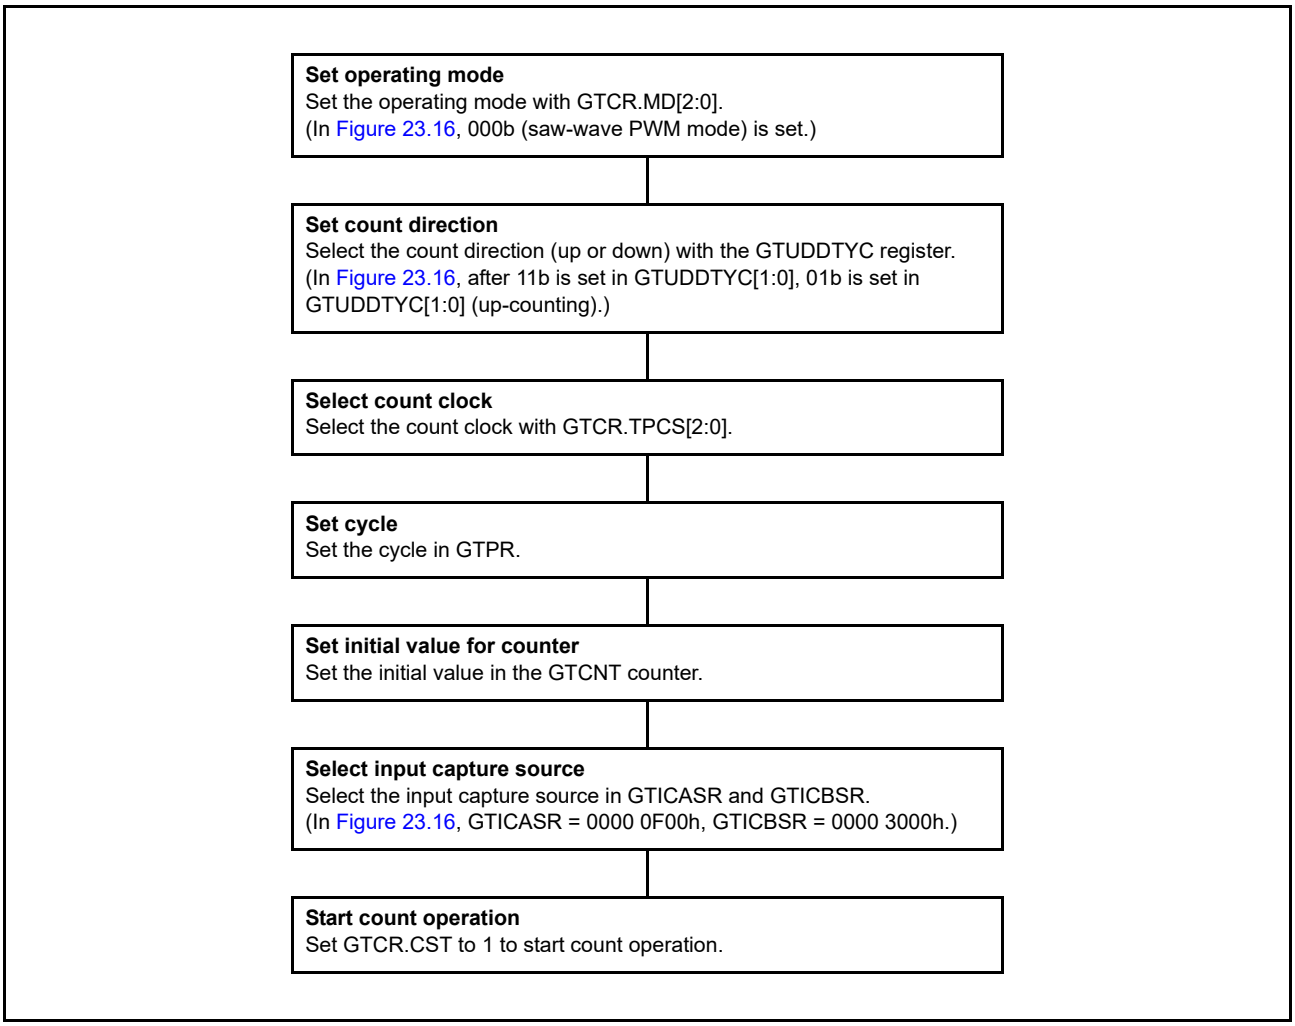

Figure 23.17 Example setting for input capture operation

23.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR, GTPBR, and GTPDBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF
- GTADTRA, GTADTBRA, and GTADTDBRA
- GTADTRB, GTADTBRB, and GTADTDBRB.

The following buffer operations can be set with GTDTCR:

- GTDVU and GTDBU
- GTDVU and GTDBD.

23.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR, and GTPDBR can function as a buffer register for GTPBR (double-buffer register for GTPR). The buffer transfer is performed at an overflow during up-counting or an underflow during down-counting in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR[23:0])
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR[n] bit is set to 1, n = channel number).

To set GTPR to function as double buffer, set GTBER.PR[1:0] to 10b or 11b. To set GTPR to not function as a buffer, set GTBER.PR[1:0] to 00b.

Figure 23.18 to Figure 23.20 show examples of GTPR buffer operation and Figure 23.21 shows an example setting for GTPR buffer operation.

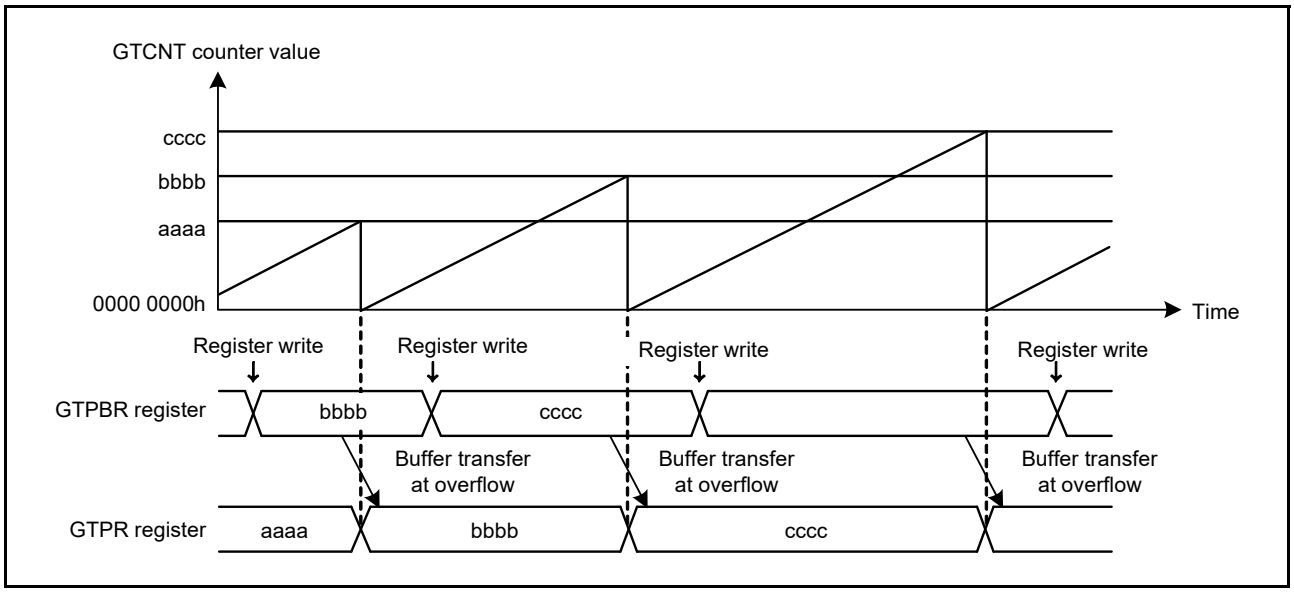

Figure 23.18 Example of GTPR buffer operation with saw waves in up-counting

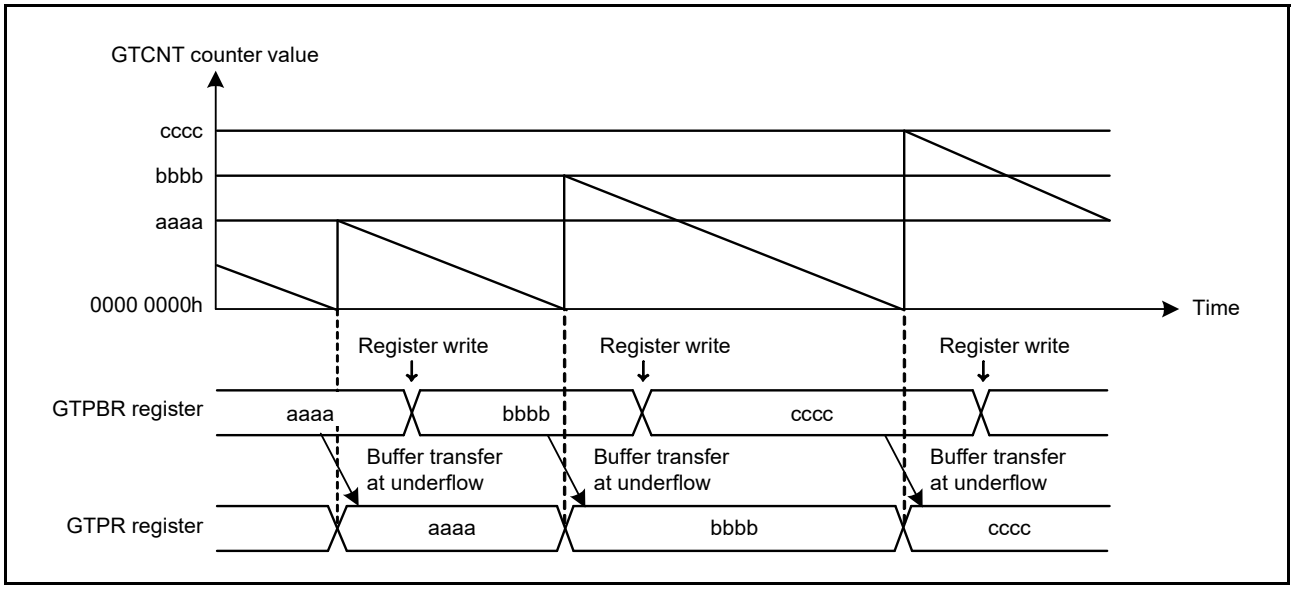

Figure 23.19 Example of GTPR buffer operation with saw waves in down-counting

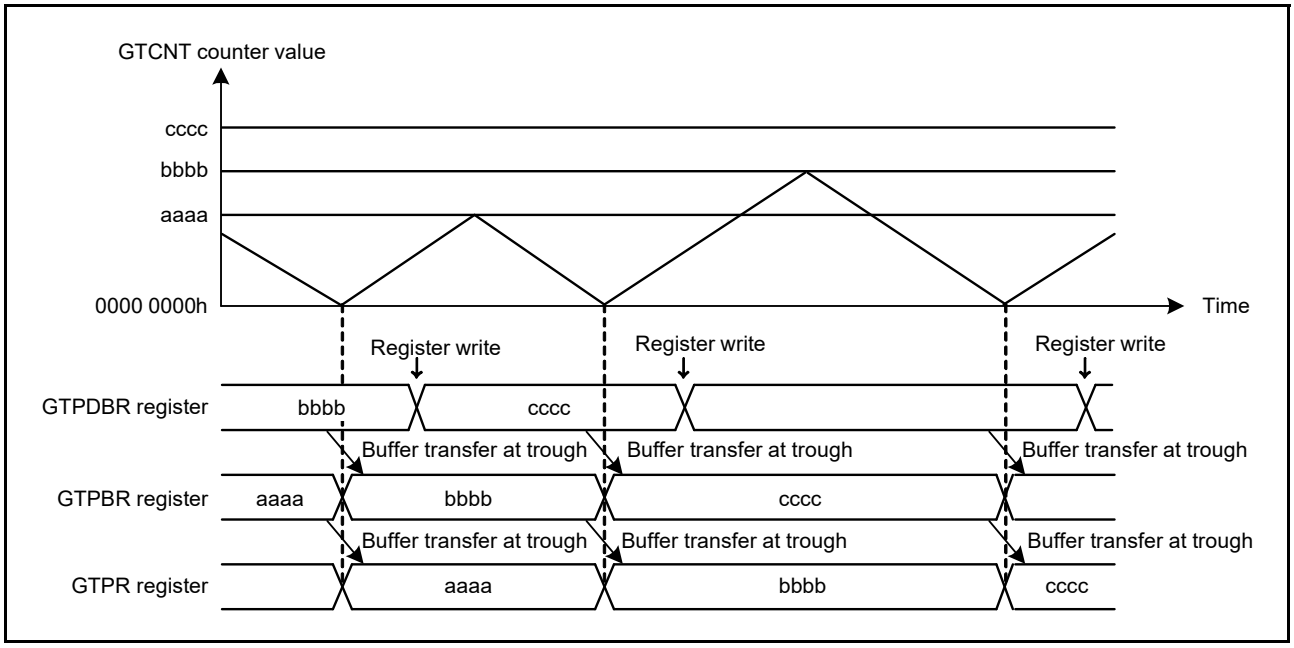

Figure 23.20 Example of GTPR double buffer operation with triangle waves

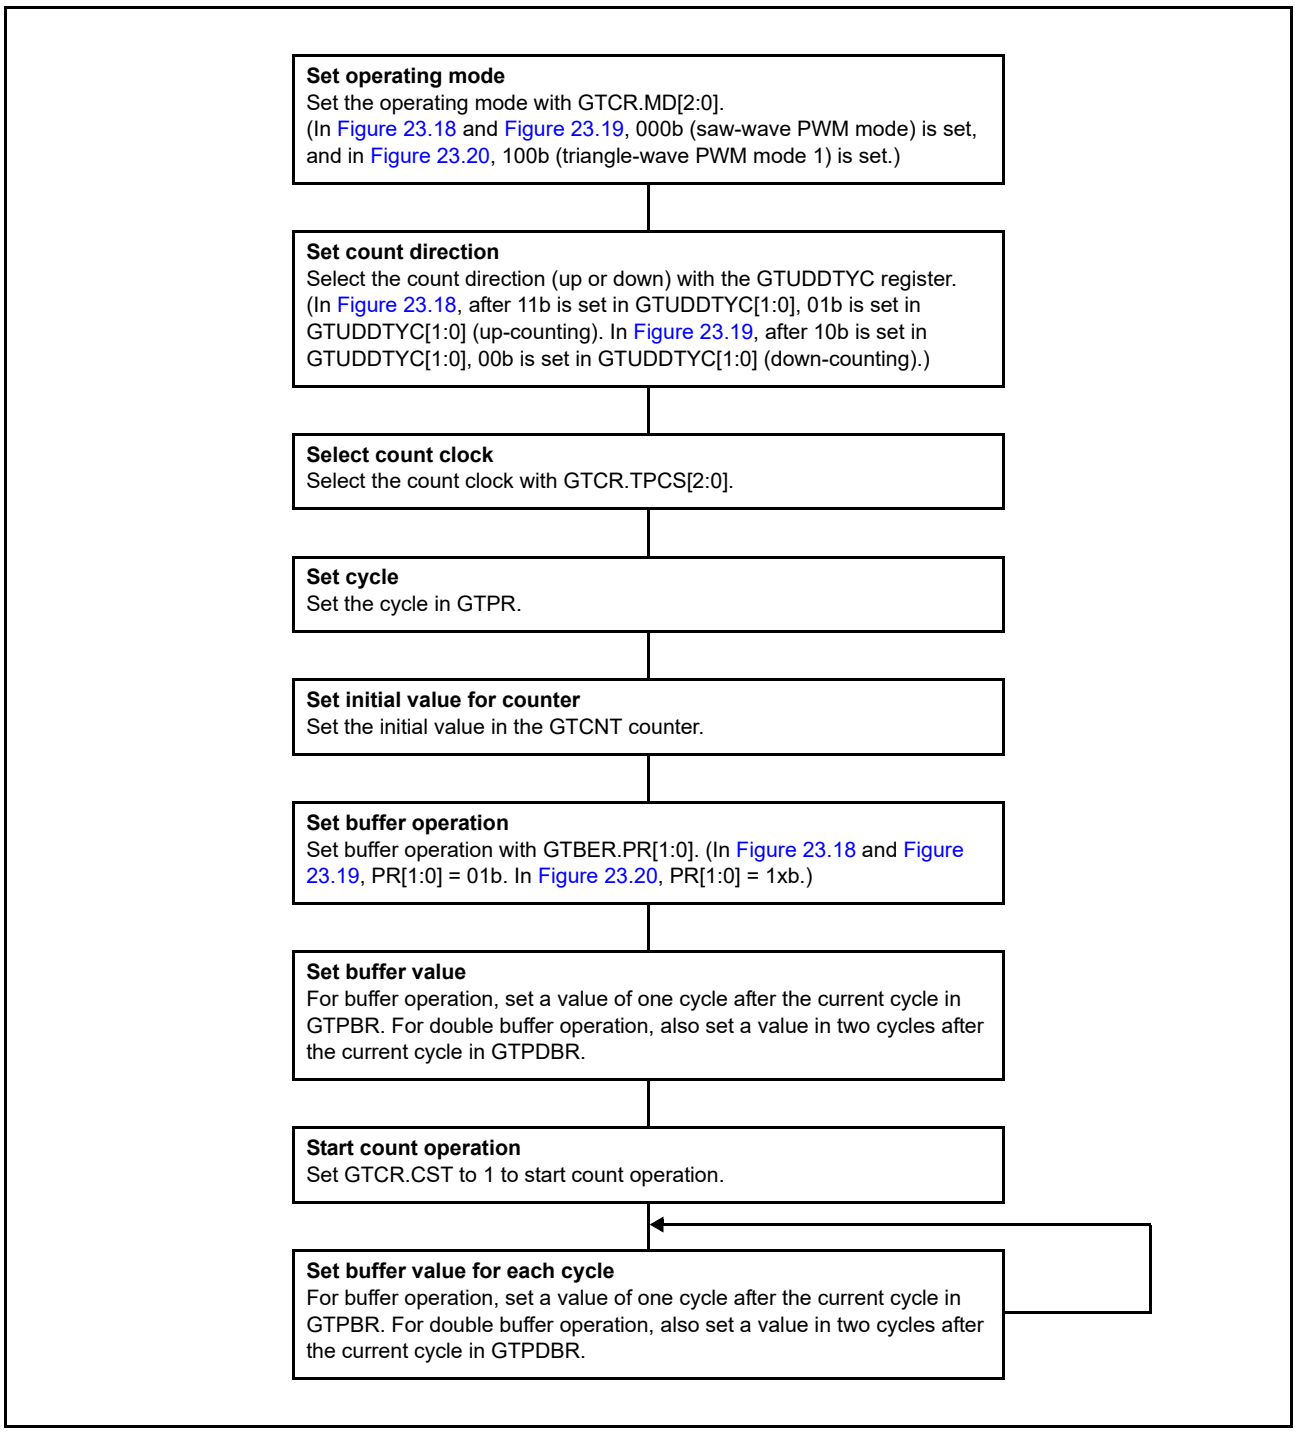

Figure 23.21 Example setting for GTPR buffer operation

23.3.2.2 Buffer Operation for GTCCRA and GTCCRB

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 01b. To set GTCCRA or GTCCRB to not function as a buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 00b.

(1) When GTCCRA or GTCCRB functions as an output compare register

Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow
  Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear
  In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources the same as shown in section 23.3.2.1, GTPR Register Buffer Operation. In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Forcible buffer transfer
  When the GTBER.CCRSWT bit is set to 1 while the count operation stops, the GTCCRA and the GTCCRB register buffer transfer is performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode. Additionally, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave 1 shot pulse mode or triangle-wave PWM mode 3.

Figure 23.22 to Figure 23.24 show examples of GTCCRA and GTCCRB buffer operation and Figure 23.25 shows an example setting for GTCCRA and GTCCRB buffer operation.

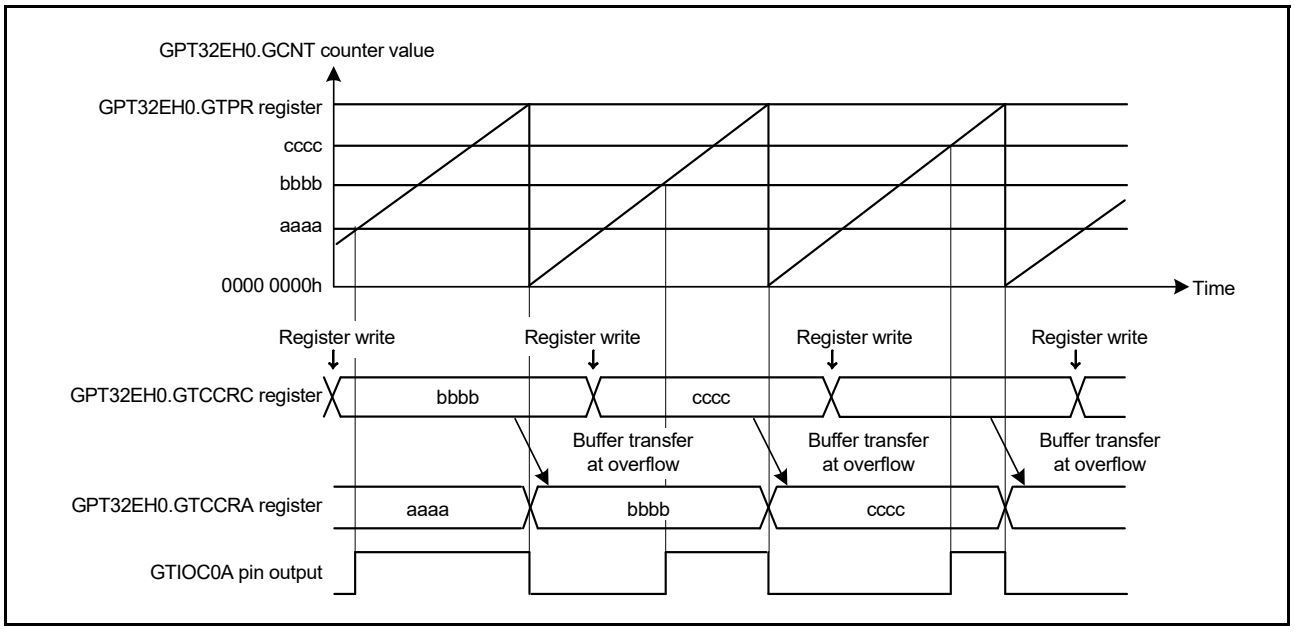

Figure 23.22 Example of GTCCRA and GTCCRB buffer operation with output compare, saw waves in up-counting, high output at GTCCRA compare match, and low output at cycle end

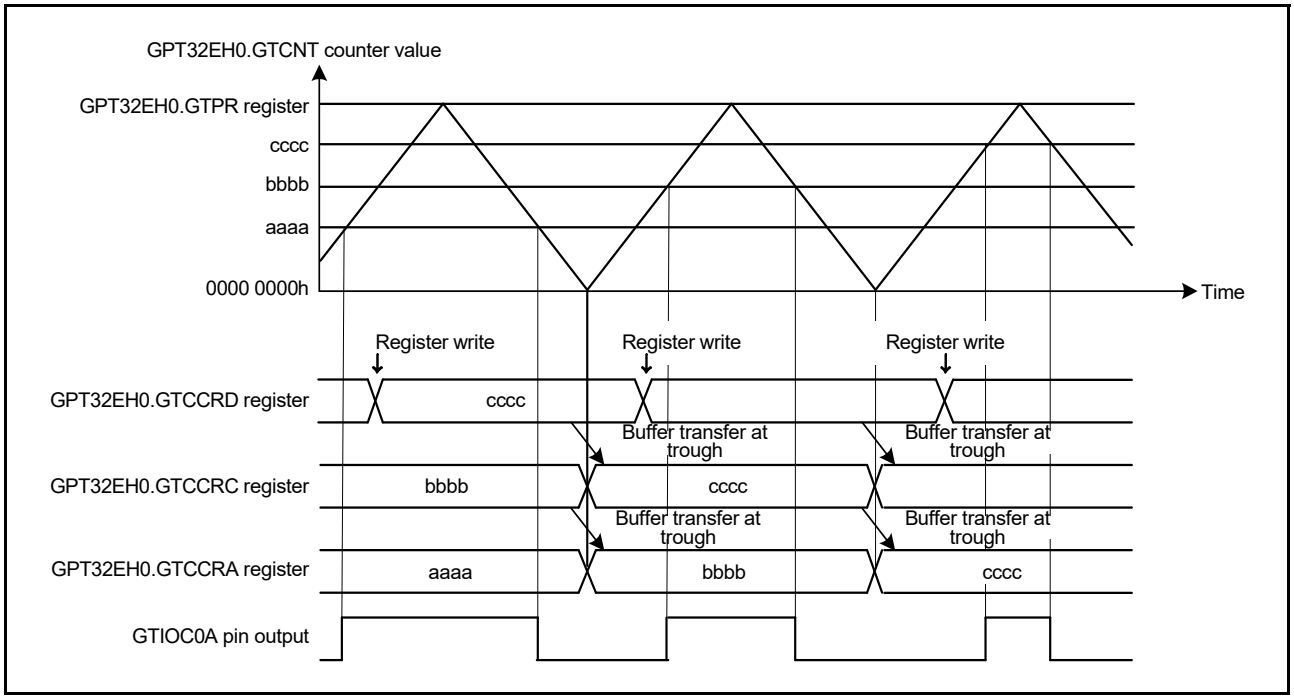

Figure 23.23 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA compare match, and output retained at cycle end

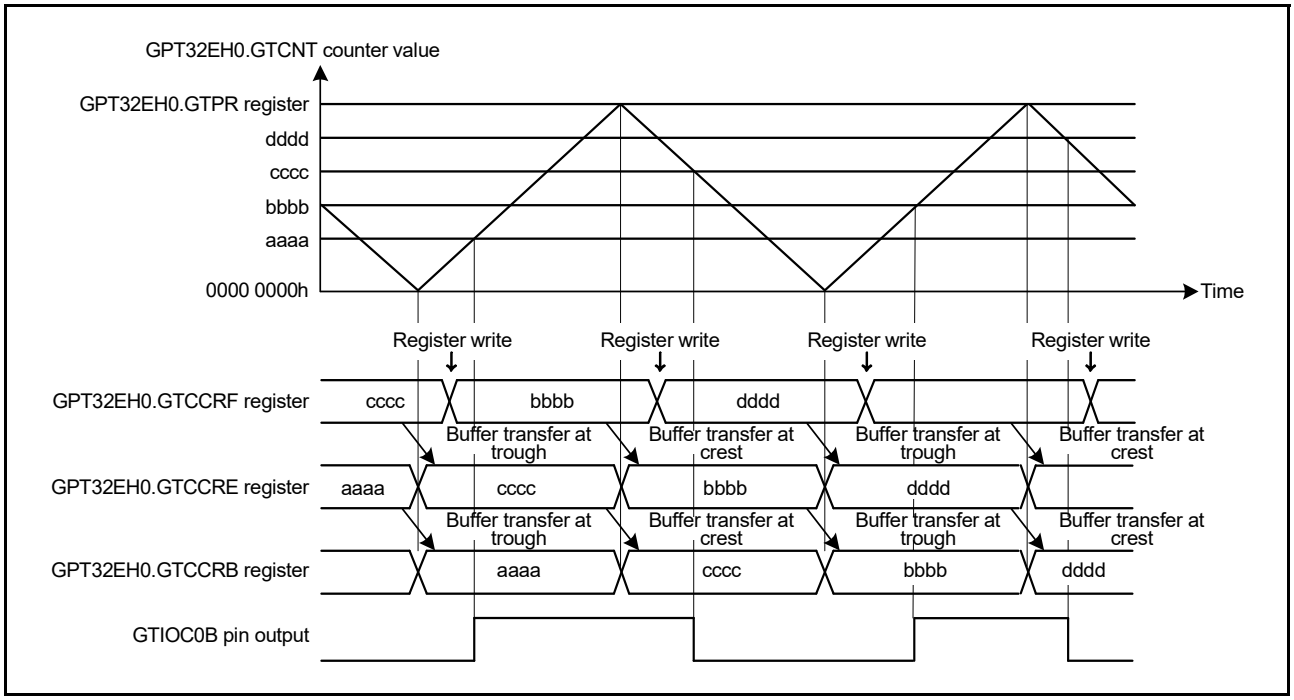

Figure 23.24 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB compare match, and output retained at cycle end

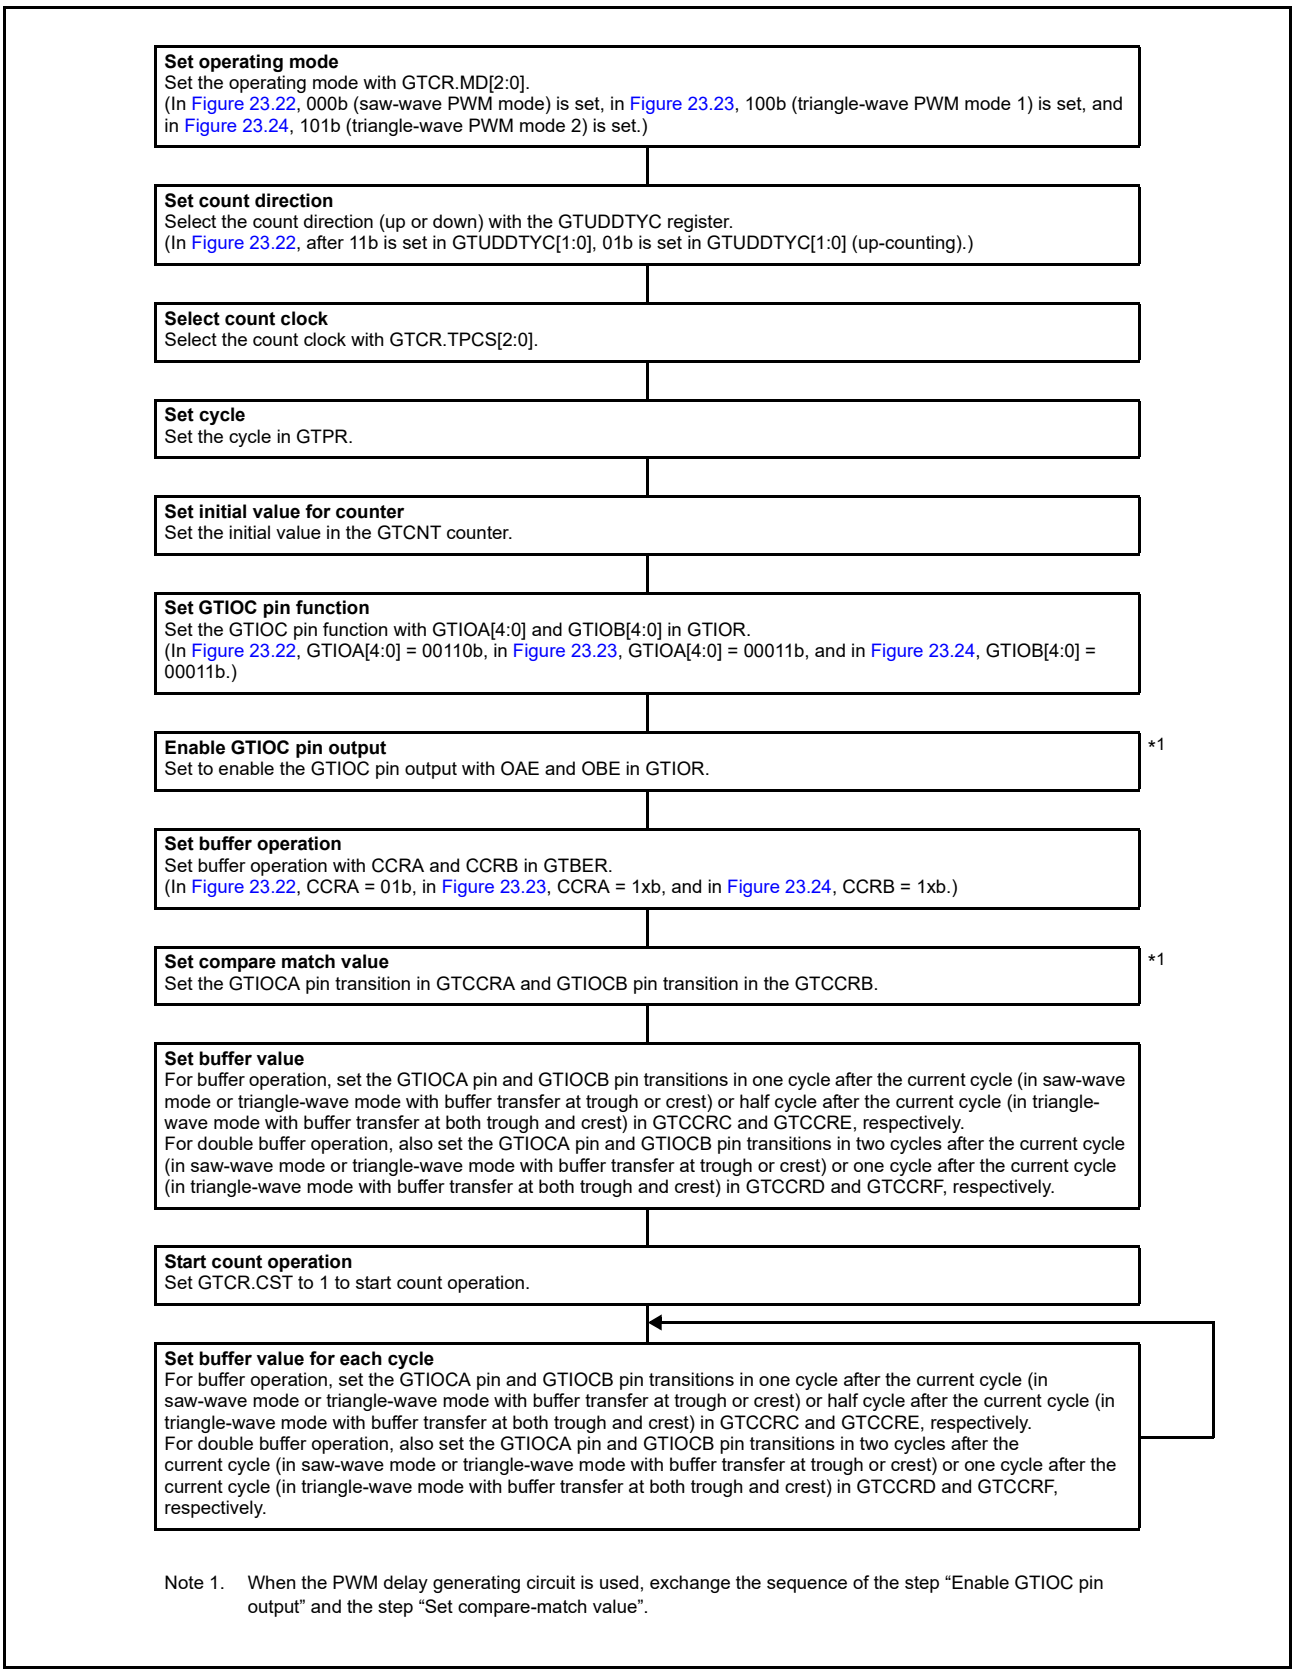

Figure 23.25 Example setting for GTCCRA and GTCCRB buffer operation with output compare

(2) When GTCCRA or GTCCRB functions as an input capture register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

Figure 23.26 and Figure 23.27 show examples of GTCCRA and GTCCRB buffer operation and Figure 23.28 shows an example setting for GTCCRB buffer operation.

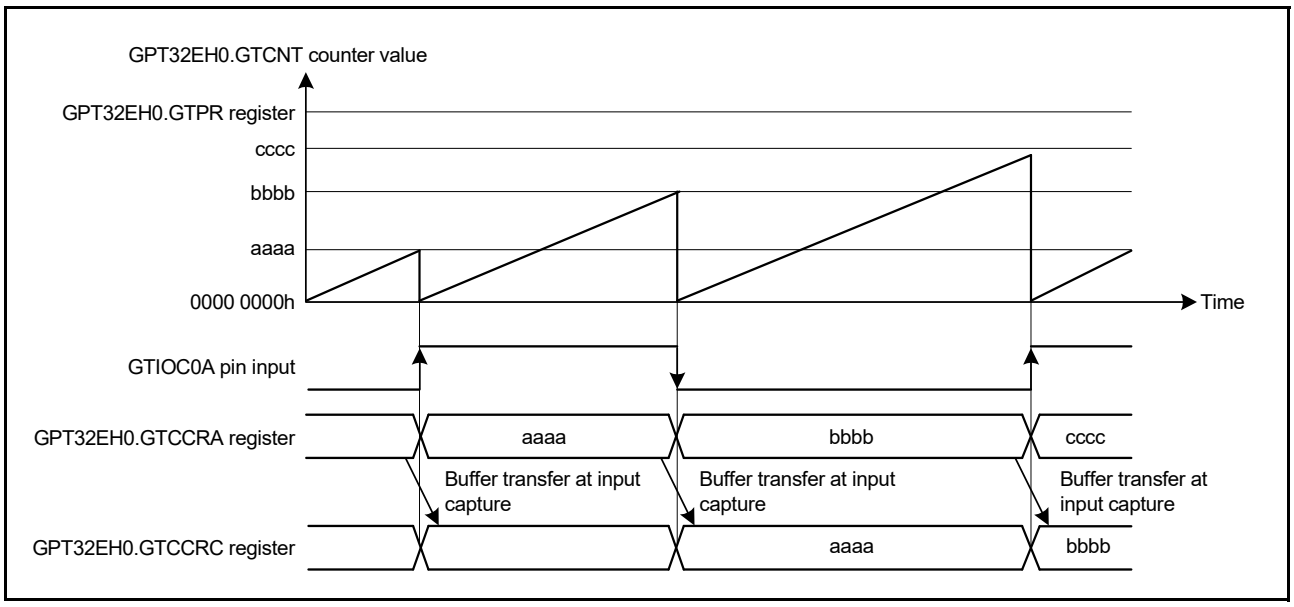

Figure 23.26 Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOC0A input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOC0A input

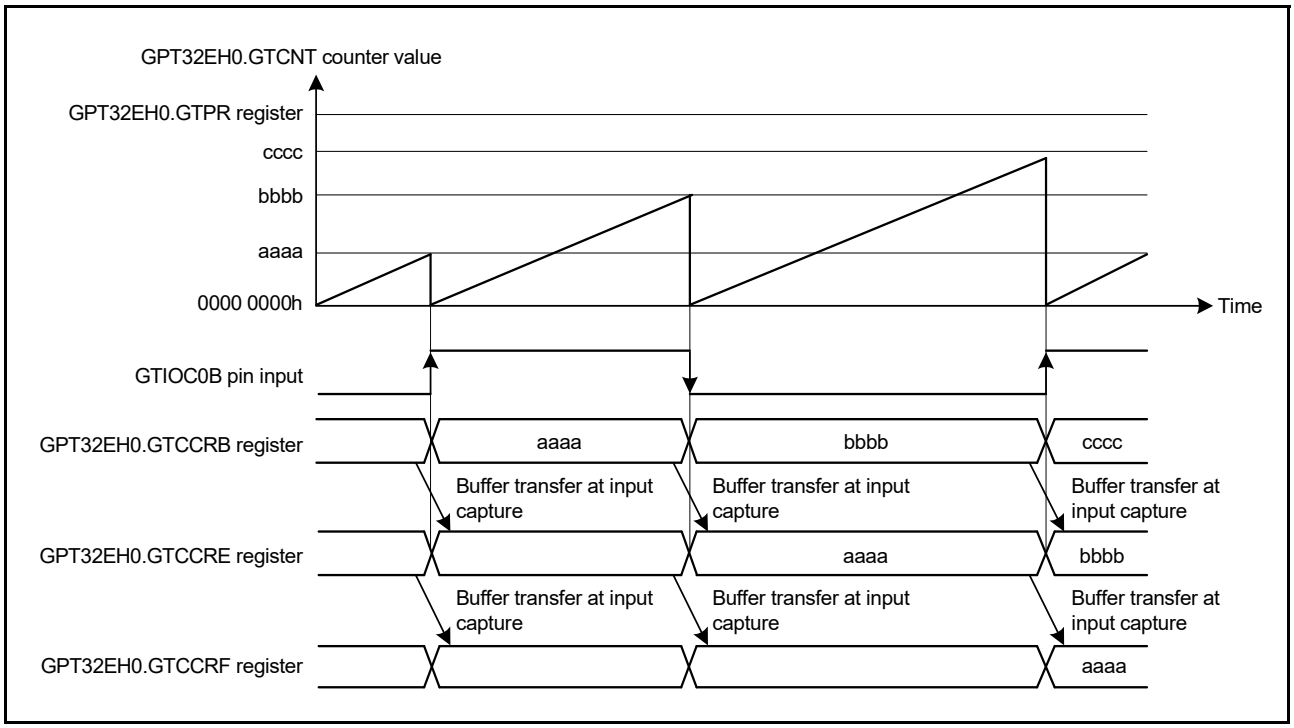

Figure 23.27 Example of GTCCRA and GTCCRB double buffer operation with input capture at both edges of GTIOC0B input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOC0B input

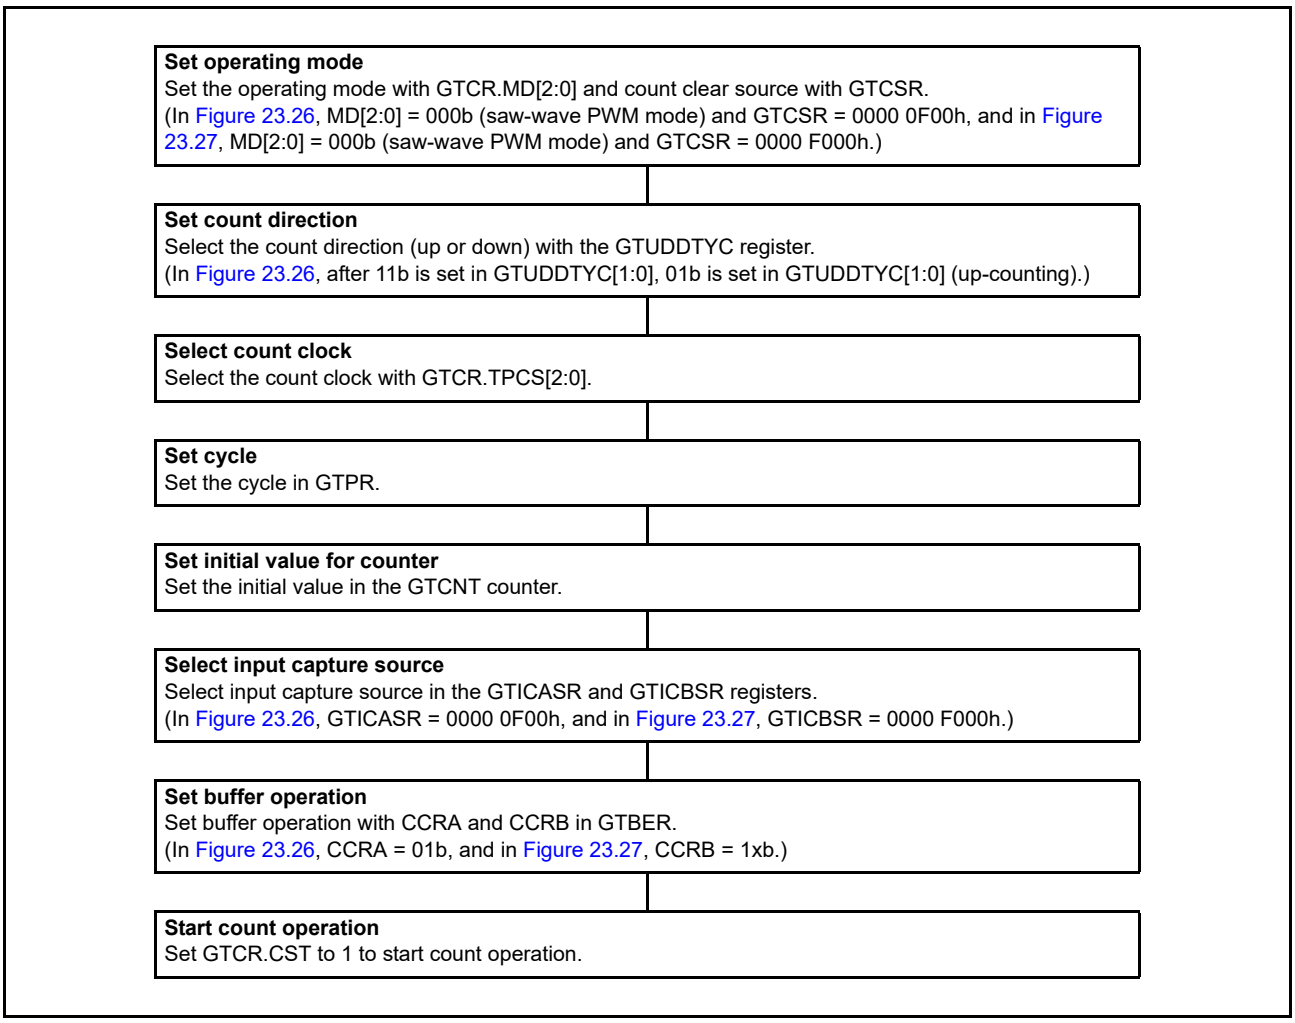

Figure 23.28 Example setting for GTCCRA and GTCCRB buffer operation with input capture

23.3.2.3 Buffer Operation for GTADTRA and GTADTRB

GTADTBRA can function as the GTADTRA buffer register and GTADTDBRA can function as the GTADTBRA buffer register (double-buffer register for GTADTRA). Similarly, GTADTBRB can function as the GTADTRB buffer register and GTADTDBRB can function as the GTADTBRB buffer register (double-buffer register for GTADTRB).

To set GTADTRA or GTADTRB to function as a double buffer, set GTBER.ADTDA or GTBER.ADTDB to 1. For single buffer operation, set GTBER.ADTDA or GTBER.ADTDB to 0. To set GTADTRA or GTADTRB to not function as a buffer, set GTBER.ADTTA[1:0] or GTBER.ADTTB[1:0] to 00b.

The buffer transfer timing can be set with the GTBER.ADTTA[1:0] bits. For saw waves, overflows (during up-counting) or underflows (during down-counting) can be selected. For triangle waves, crests are selected when GTBER.ADTTA[1:0] = 01b, troughs are selected when GTBER.ADTTA[1:0] = 10b, and both crests and troughs are selected when GTBER.ADTTA[1:0] = 11b.

Figure 23.29 to Figure 23.31 show examples of GTADTRA and GTADTRB buffer operation and Figure 23.32 shows an example setting for GTDTRA and GTADTRB buffer operation.

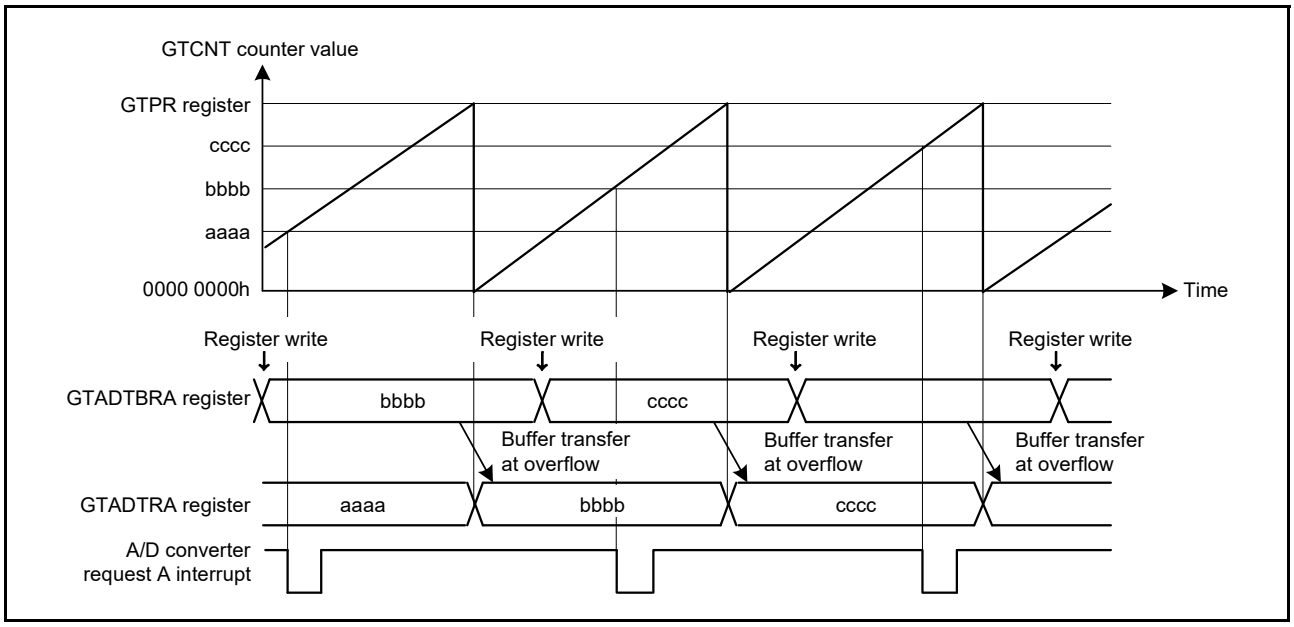

Figure 23.29 Example of GTADTRA and GTADTRB buffer operation with saw waves in up-counting and A/D converter start request interrupt generated by up-counting

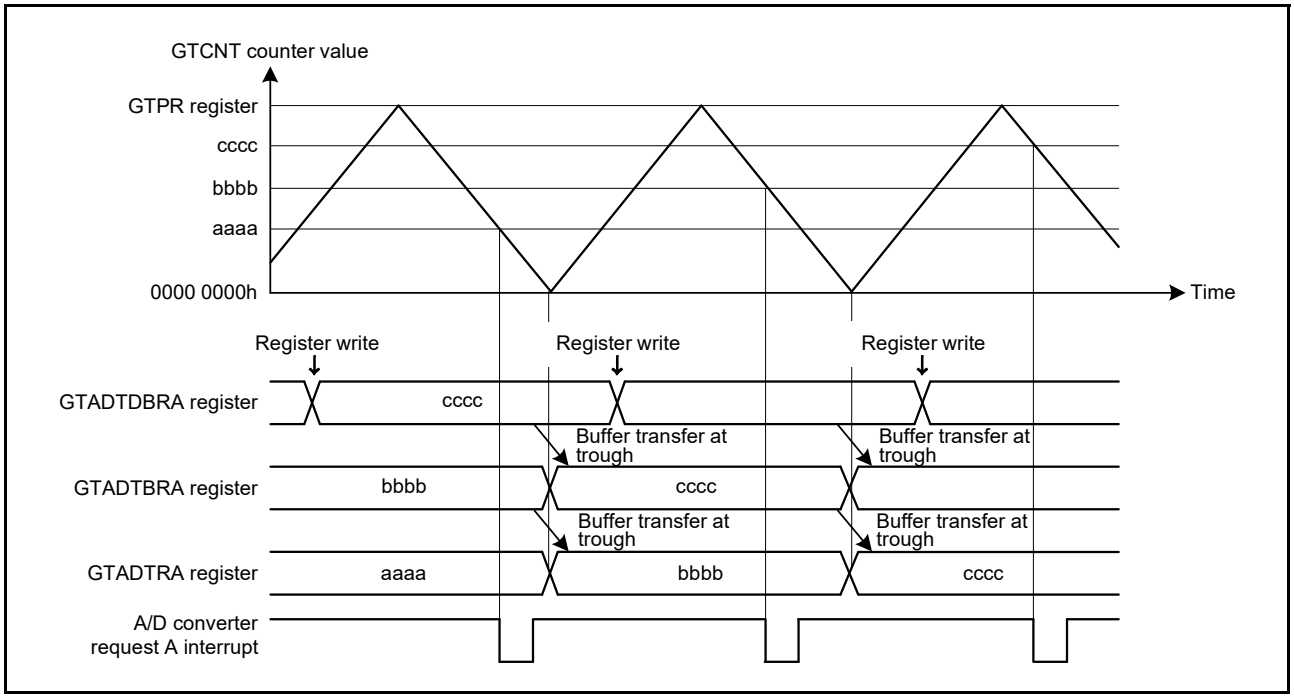

Figure 23.30 Example of GTADTRA and GTADTRB double buffer operation with triangle waves, buffer transfer at troughs, and A/D converter start request interrupt generated by down-counting

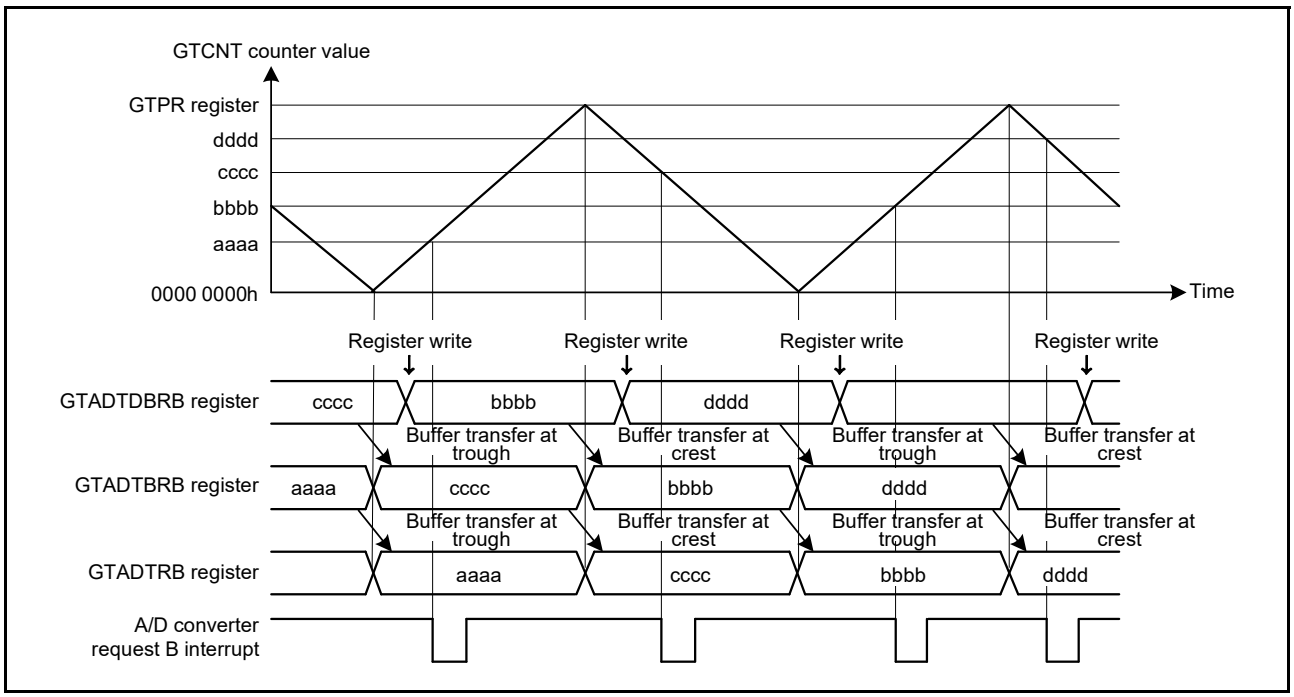

Figure 23.31 Example of GTADTRA and GTADTRB double buffer operation with triangle waves, buffer transfer at both troughs and crests, and A/D converter start request interrupt generated by both up- and down-counting

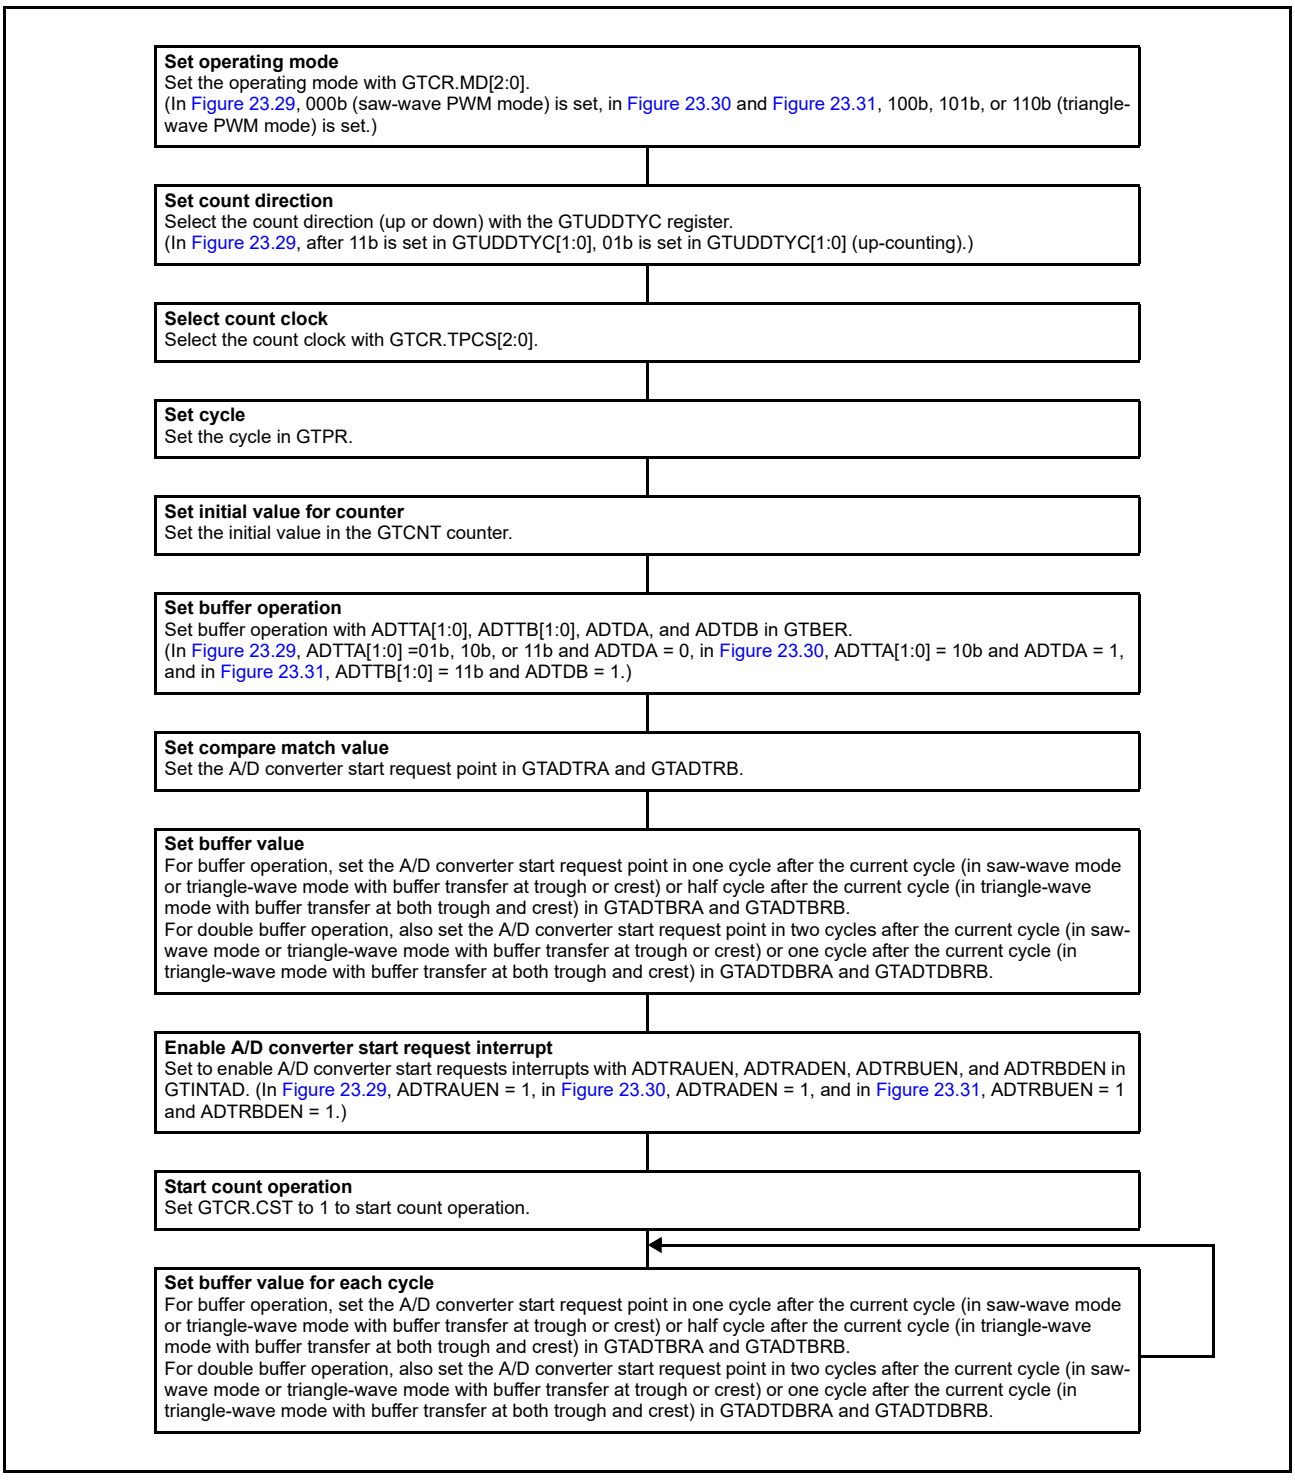

Figure 23.32 Example setting for GTADTRA and GTADTRB buffer operation

23.3.3 PWM Output Operating Mode

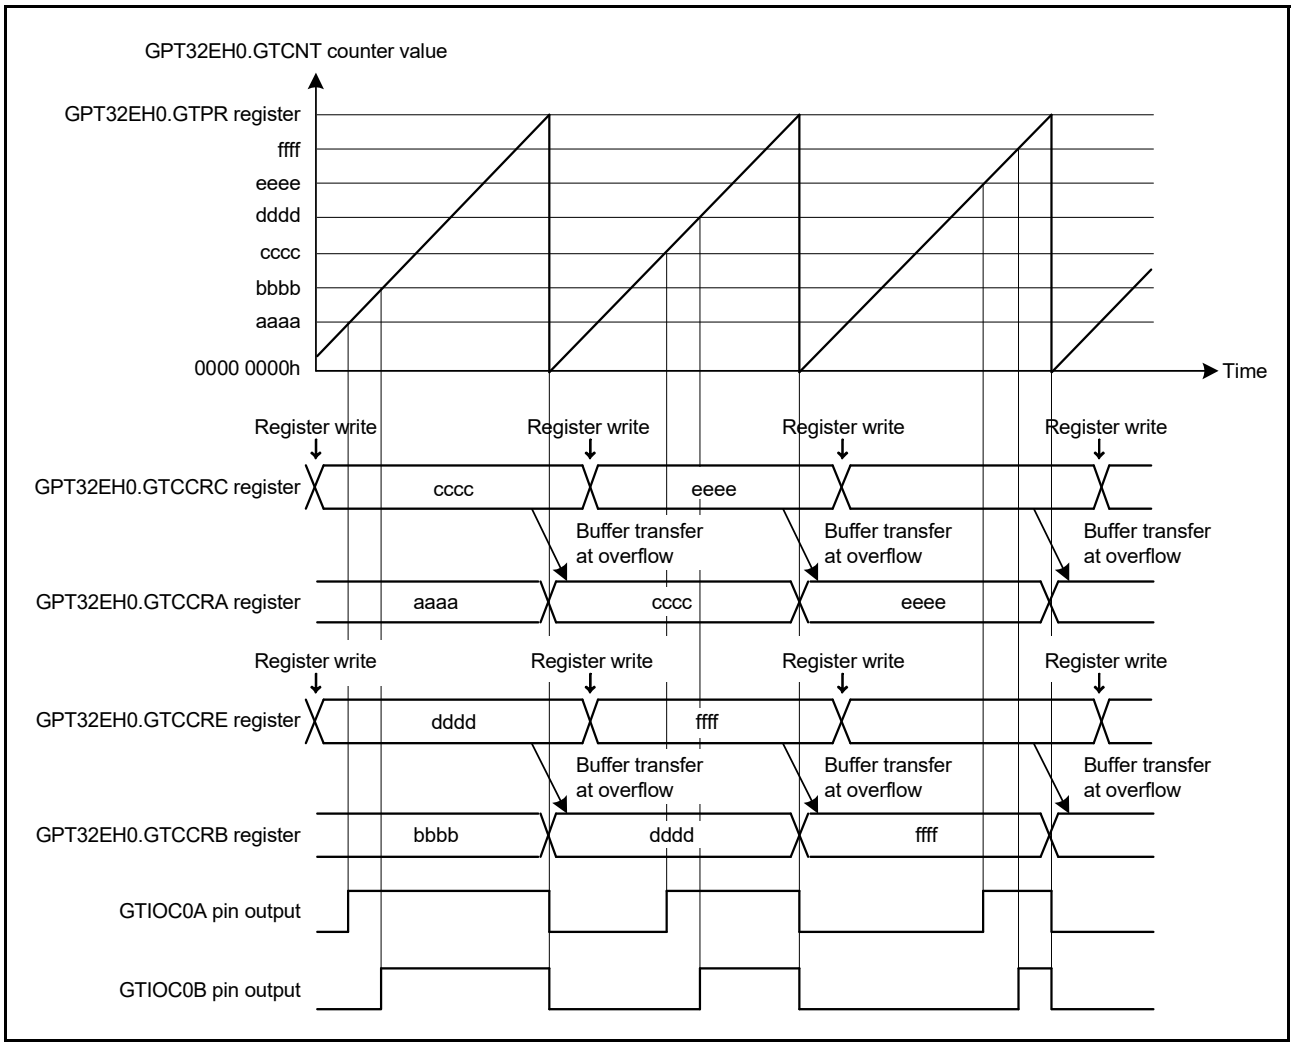
The GPT can output PWM waveforms to the GTIOCA or GTIOCB pin by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

By setting GTDTCR, GTDVU, and GTDVD, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

23.3.3.1 Saw-Wave PWM Mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR.A PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

Figure 23.33 shows an example of saw-wave PWM mode operation, and Figure 23.34 shows an example setting for saw-wave PWM mode.



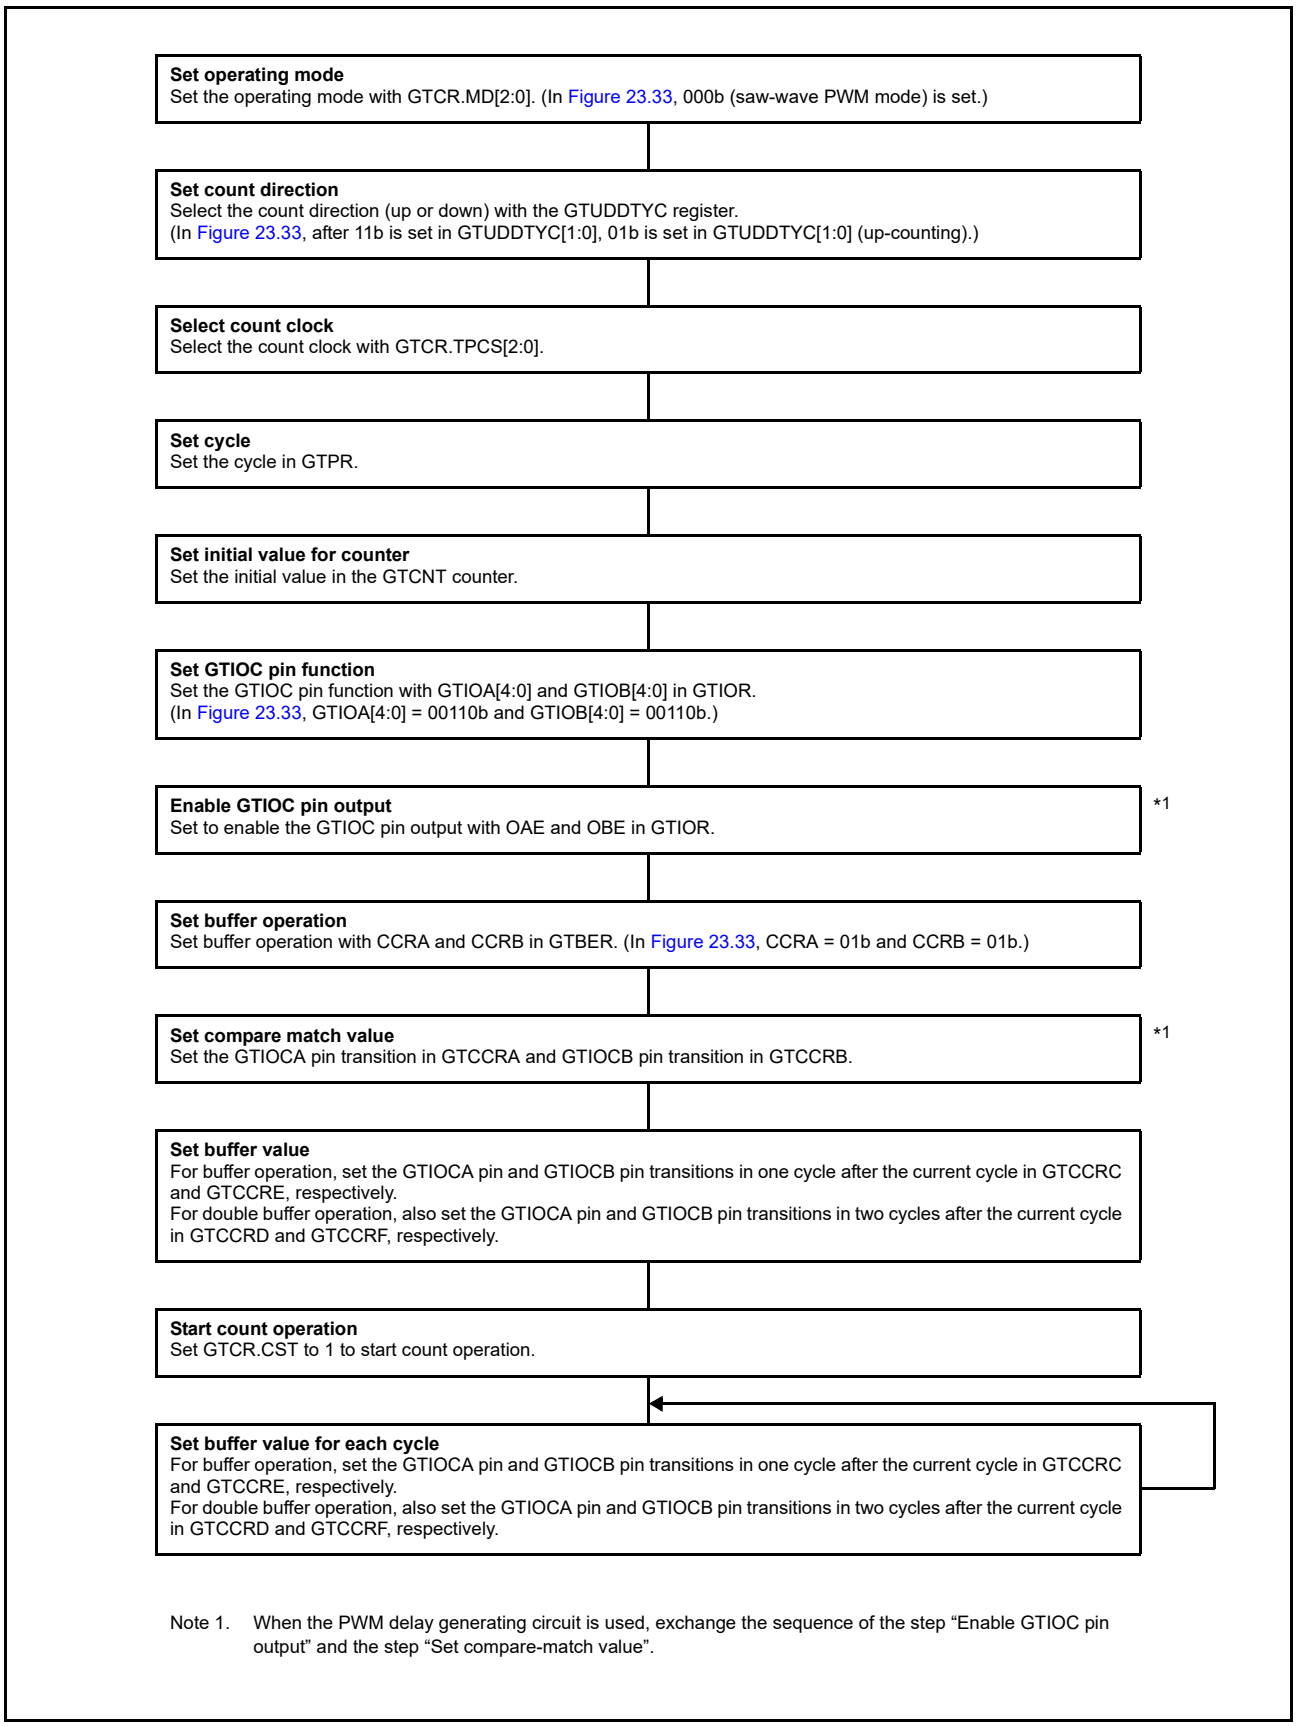


Figure 23.33 Example of saw-wave PWM mode operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, and low output at cycle end

Note 1. When the PWM delay generating circuit is used, exchange the sequence of the step "Enable GTIOC pin output" and the step "Set compare-match value".

Figure 23.34 Example setting for saw-wave PWM mode

23.3.3.2 Saw-Wave One-Shot Pulse Mode

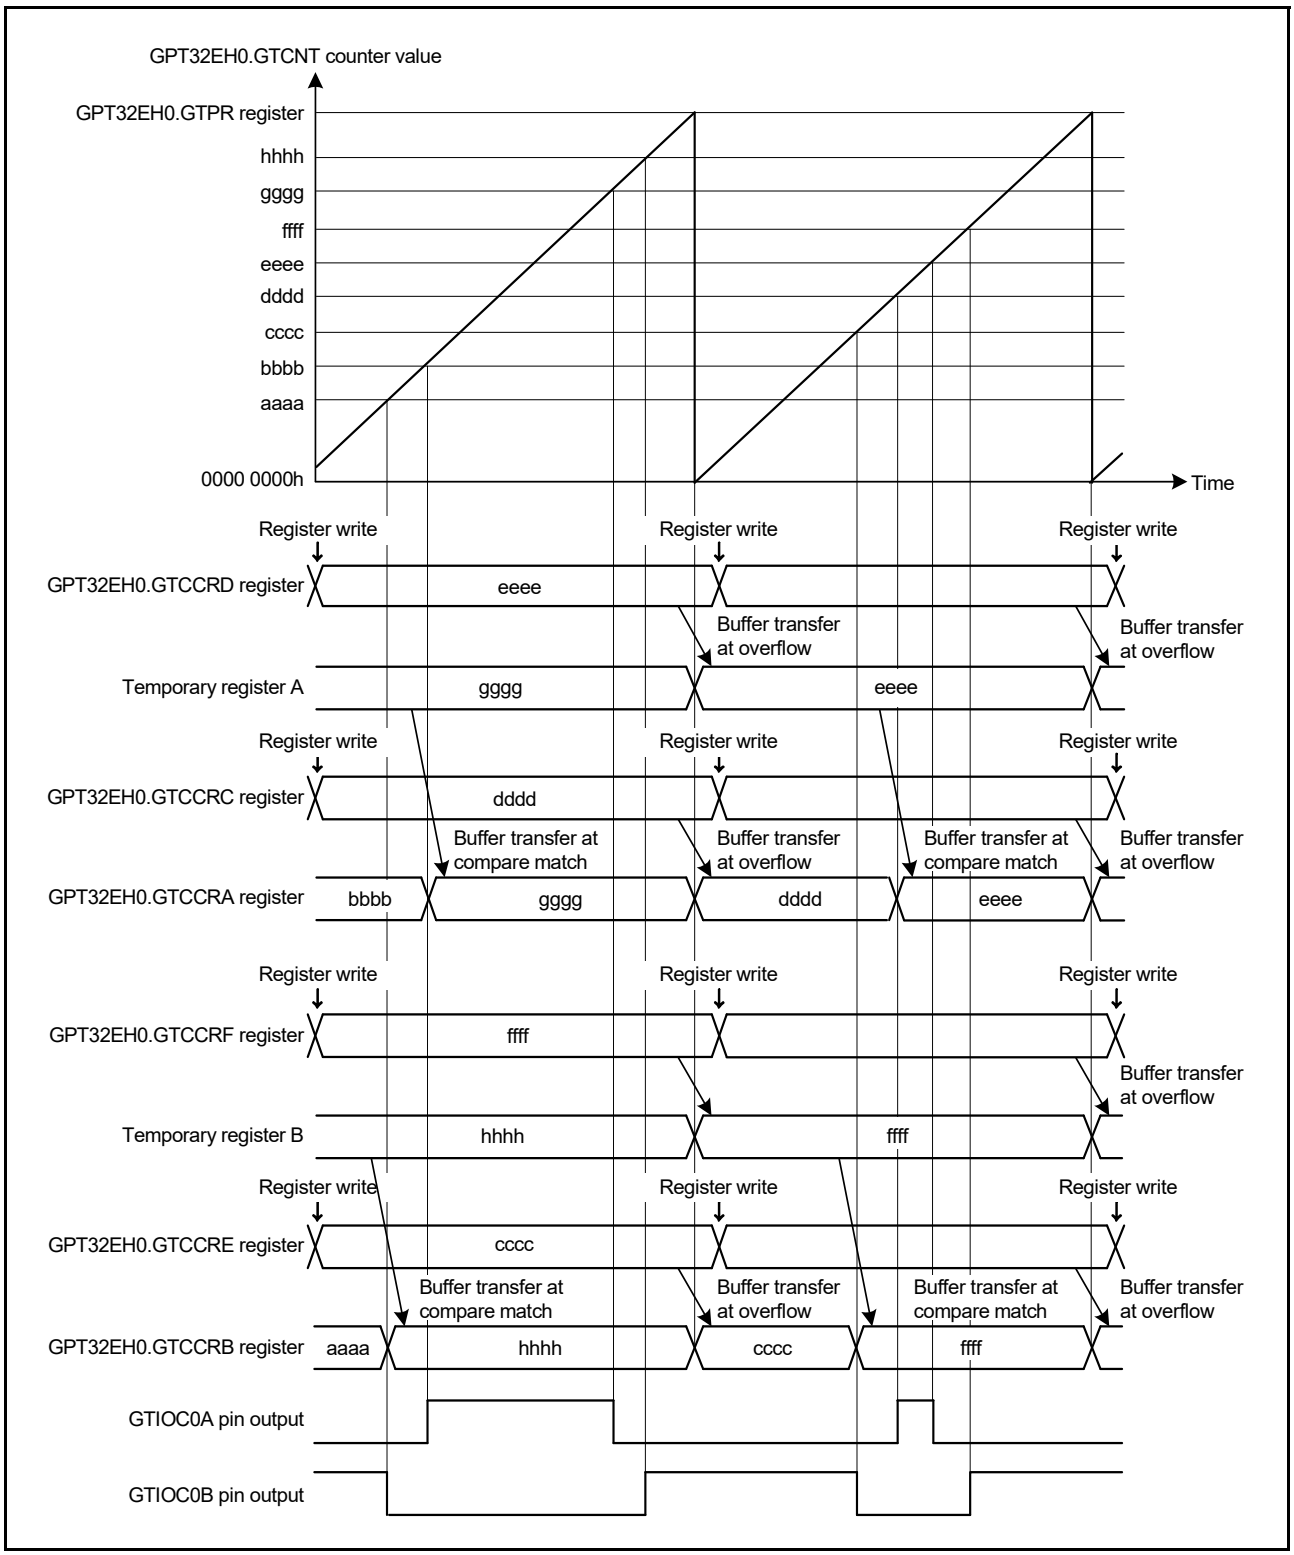
The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR. The GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCA or GTIOCB pin at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and the cycle end based on the GTIOR setting. When the GTBER.CCRSWT bit is set to 1 while the count operation stops, the buffer is transferred forcibly from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 23.35 shows an example of saw-wave one-shot pulse mode operation, and Figure 23.36 shows an example setting for saw-wave one-shot pulse mode.



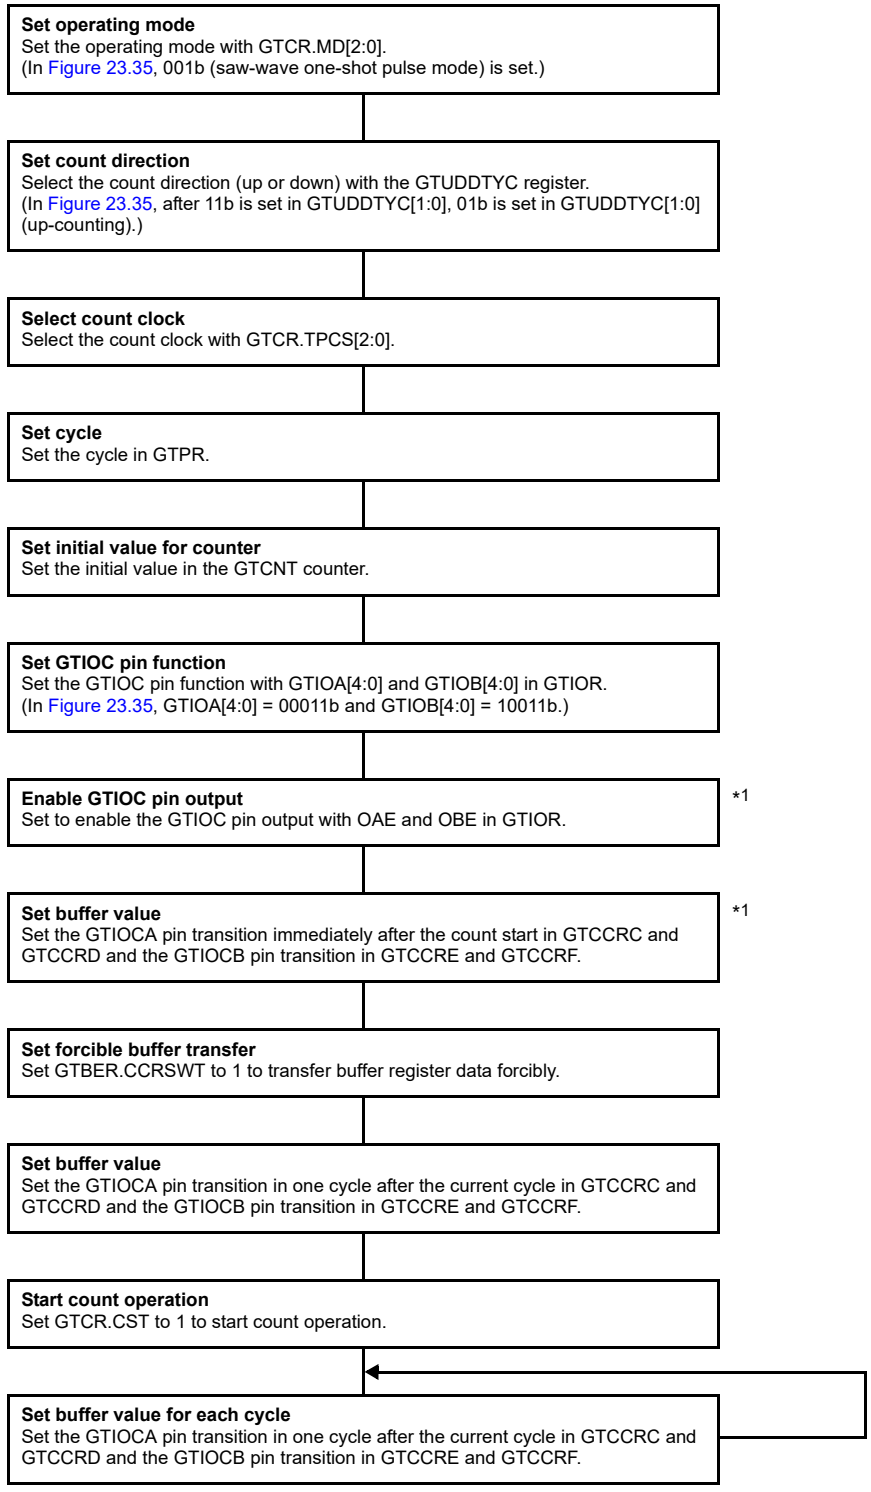


Figure 23.35 Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

Note 1. When the PWM delay generating circuit is used, exchange the sequence of the step "Enable GTIOC pin output" and the step "Set buffer value".

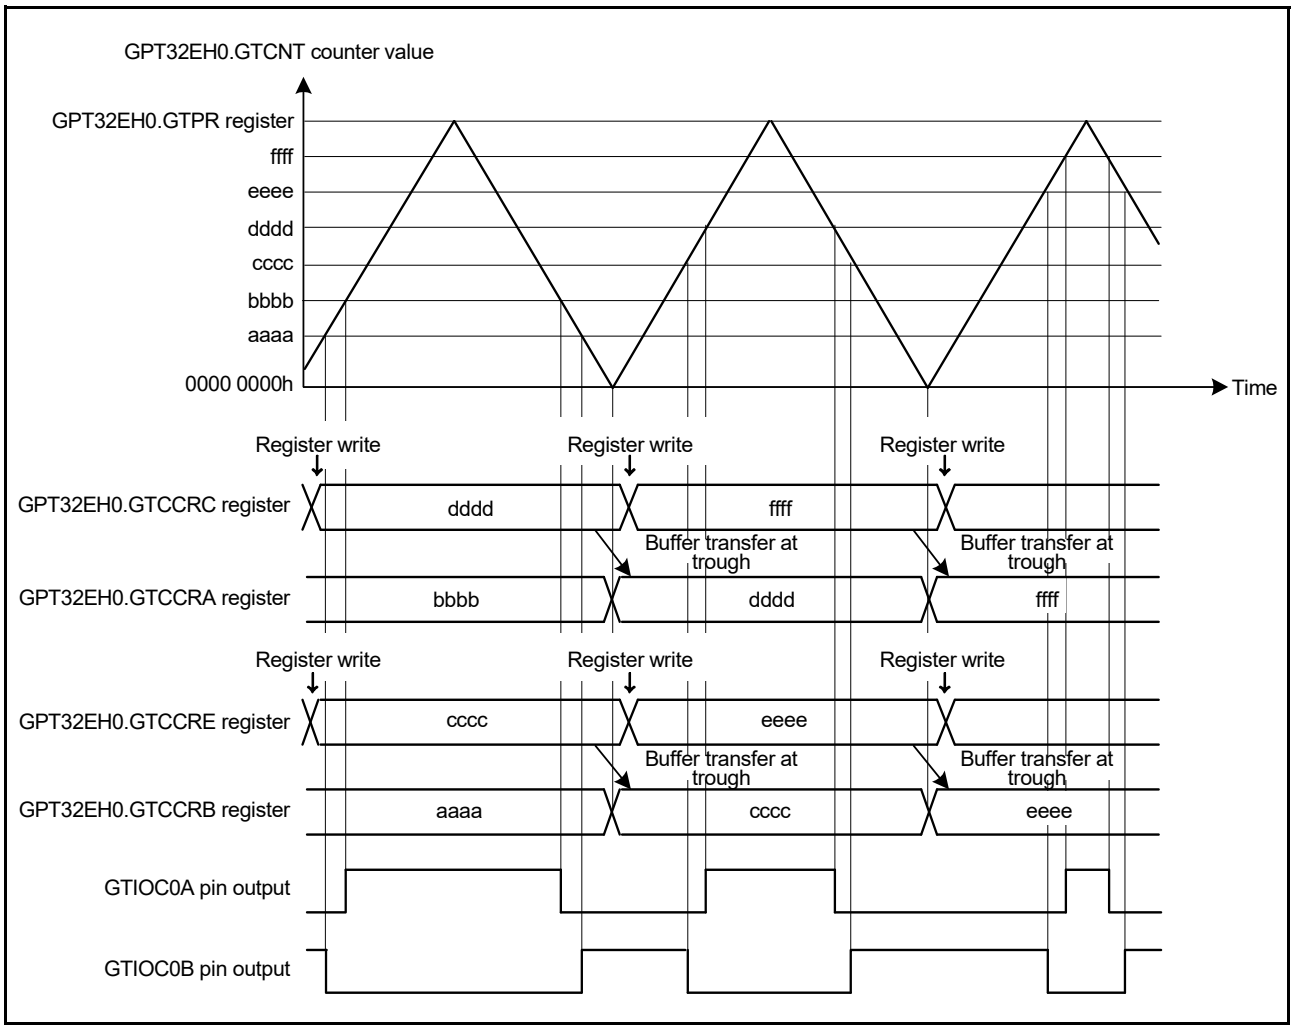
Figure 23.36 Example setting for saw-wave one-shot pulse mode

23.3.3.3 Triangle-Wave PWM Mode 1 (32-bit transfer at trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 23.37 shows an example of a triangle-wave PWM mode 1 operation, and Figure 23.38 shows an example setting for a triangle-wave PWM mode 1.



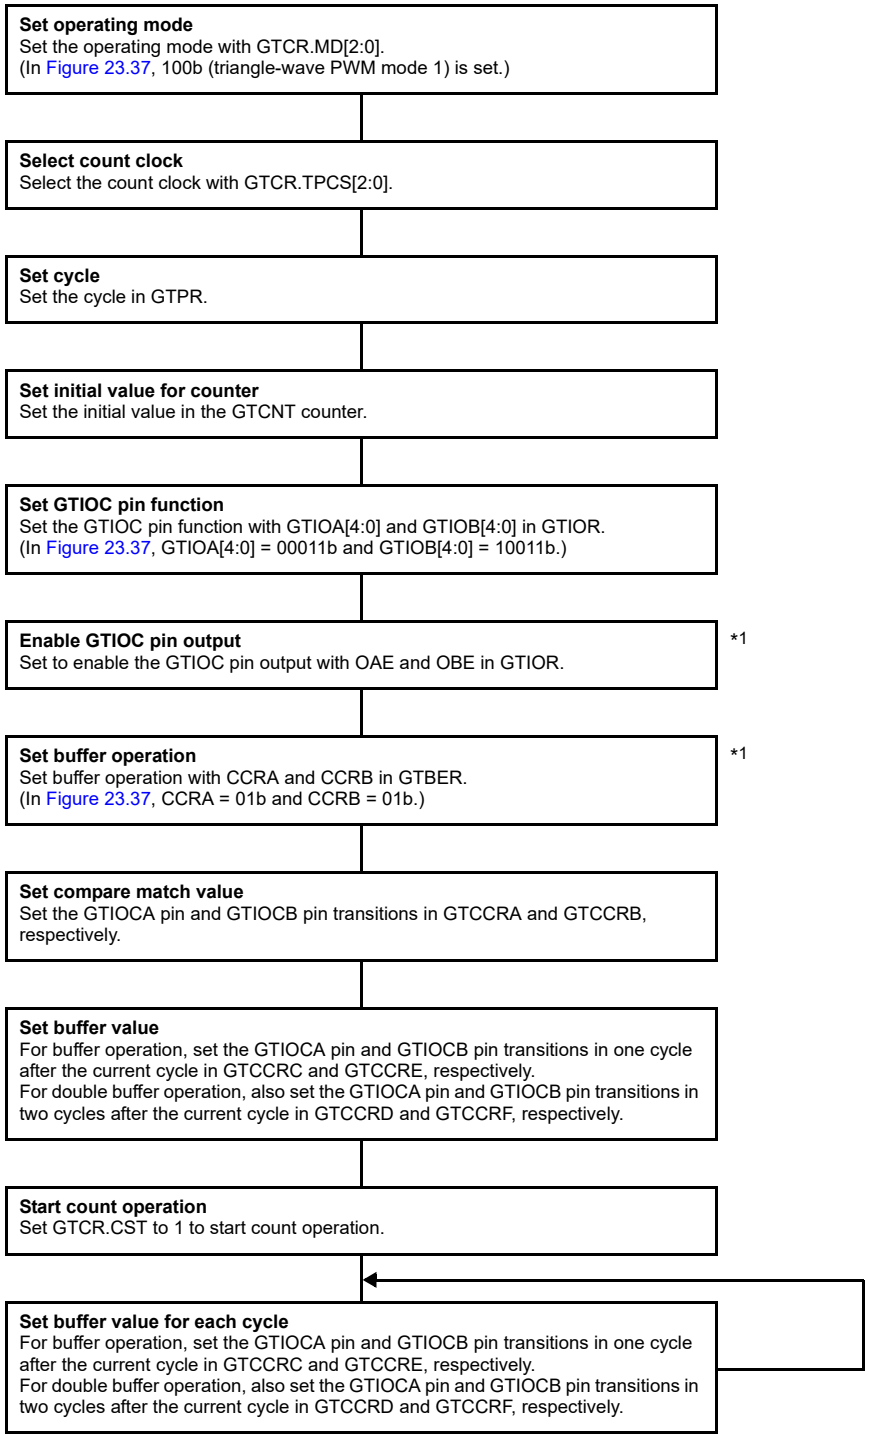


Figure 23.37 Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB register compare match, and output retained at cycle end

Note 1. When the PWM delay generating circuit is used, exchange the sequence of the step "Enable GTIOC pin output" and the step "Set buffer value".

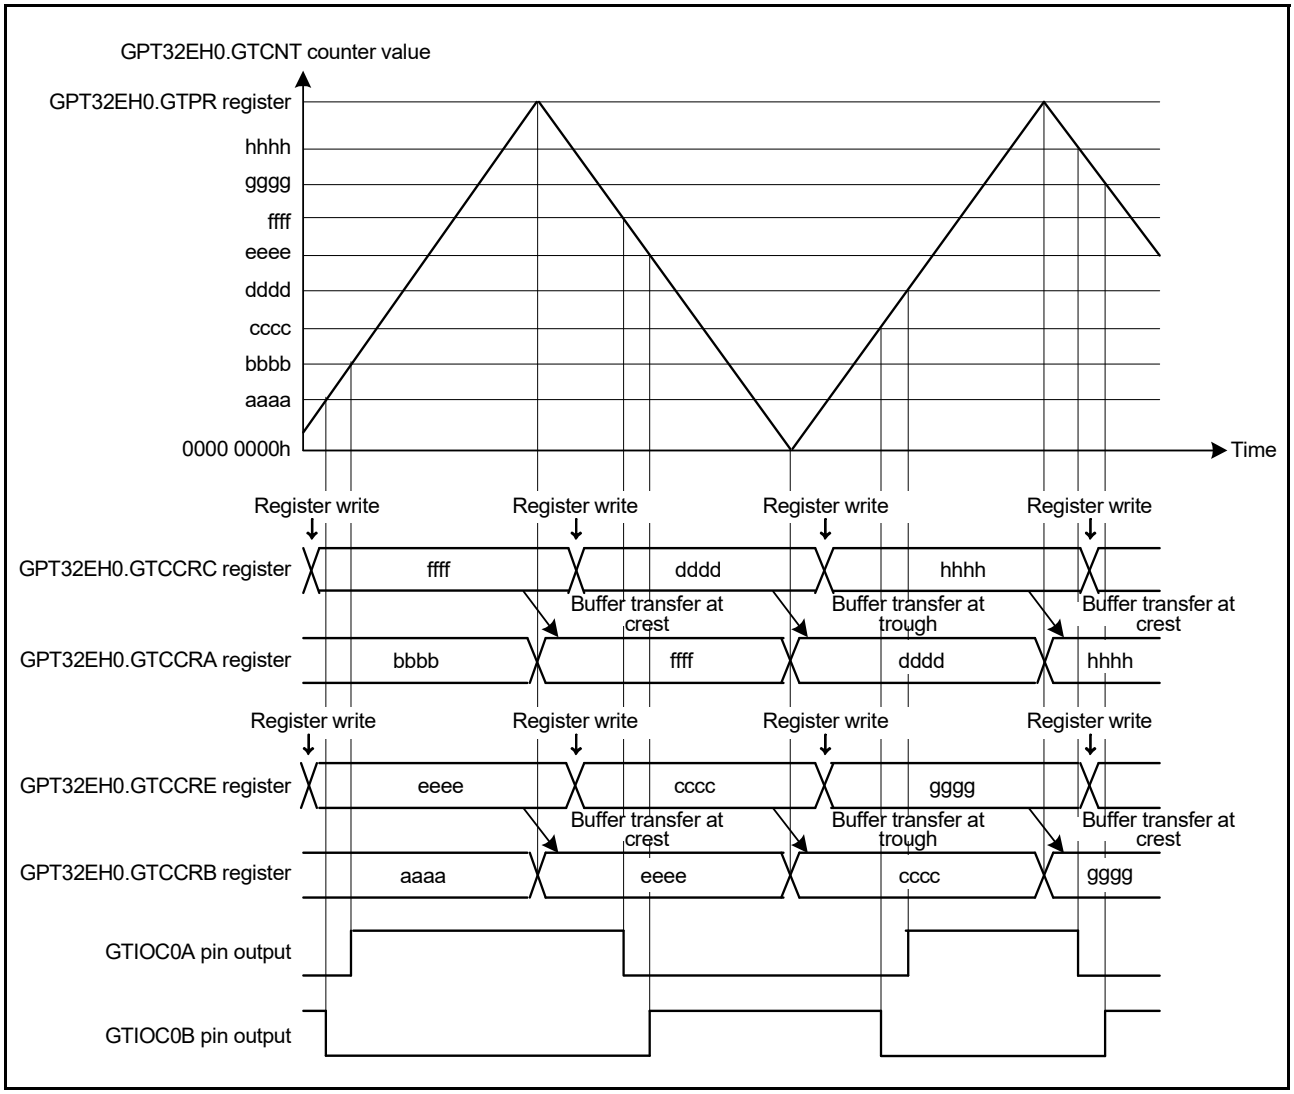
Figure 23.38 Example setting for triangle-wave PWM mode 1

23.3.3.4 Triangle-Wave PWM Mode 2 (32-bit transfer at crest and trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCA or GTIOCB pin when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 23.39 shows an example of triangle-wave PWM mode 2 operation, and Figure 23.40 shows an example setting for triangle-wave PWM mode 2.



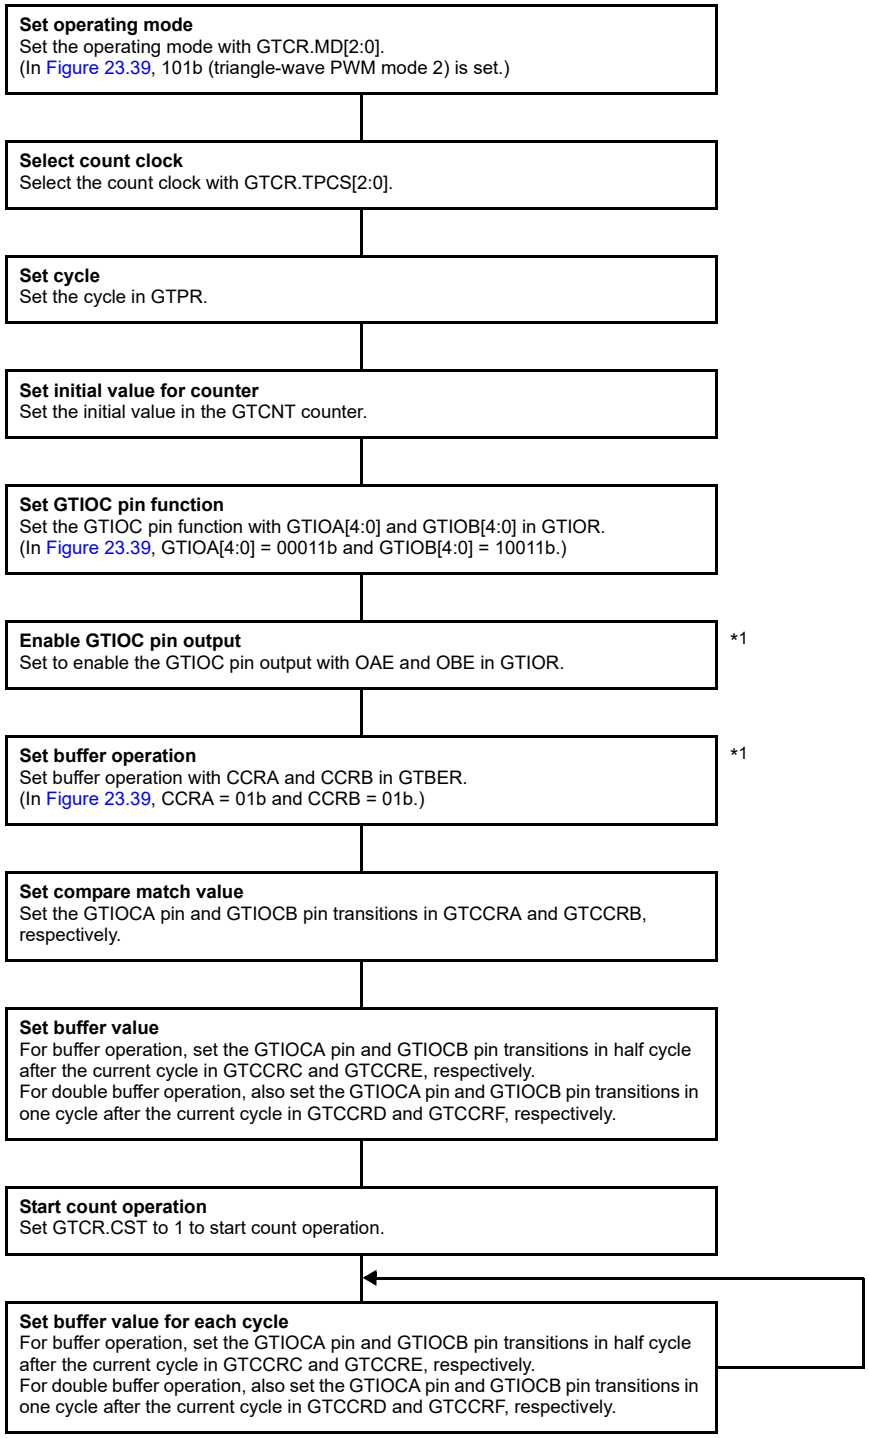


Figure 23.39 Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

Note 1. When the PWM delay generating circuit is used, exchange the sequence of the step "Enable GTIOC pin output" and the step "Set buffer value".

Figure 23.40 Example setting for triangle-wave PWM mode 2

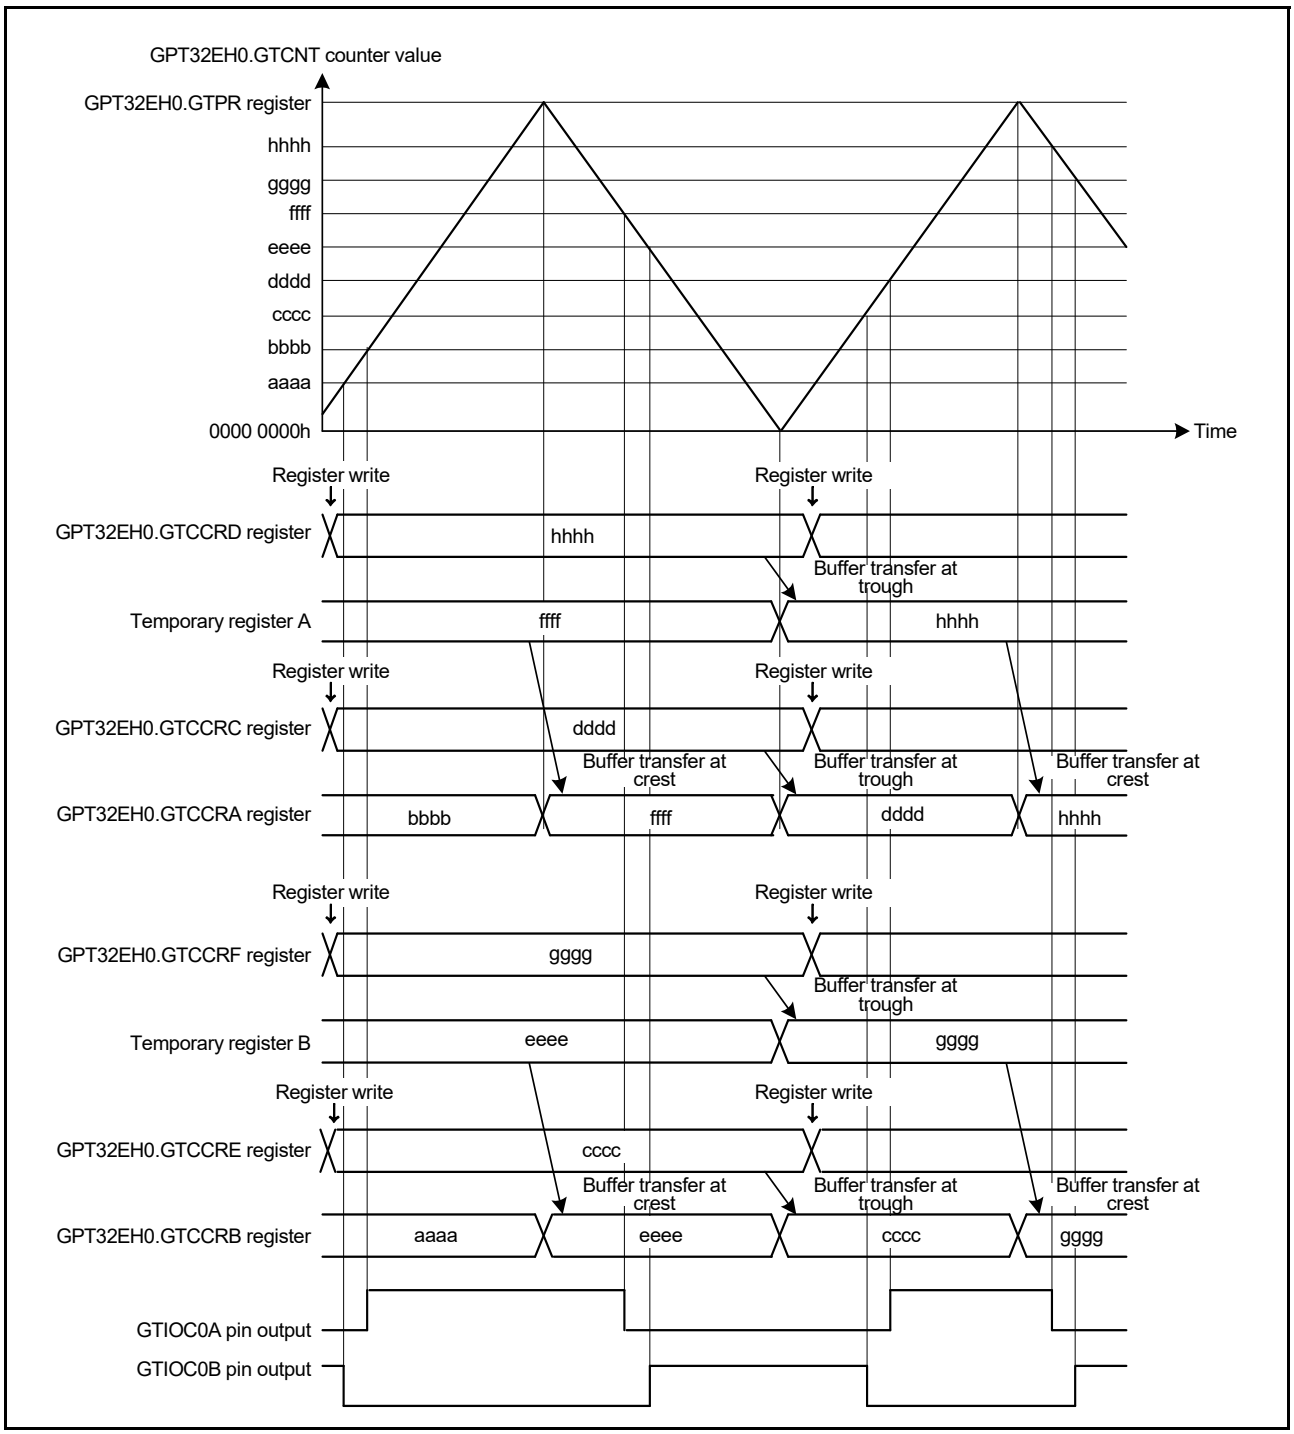
23.3.3.5 Triangle-Wave PWM Mode 3 (64-bit transfer at trough)

The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCA or GTIOCB pin at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest.

The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end based on the GTIOR setting. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 23.41 shows an example of triangle-wave PWM mode 3 operation, and Figure 23.42 shows an example setting for triangle-wave PWM mode 3.



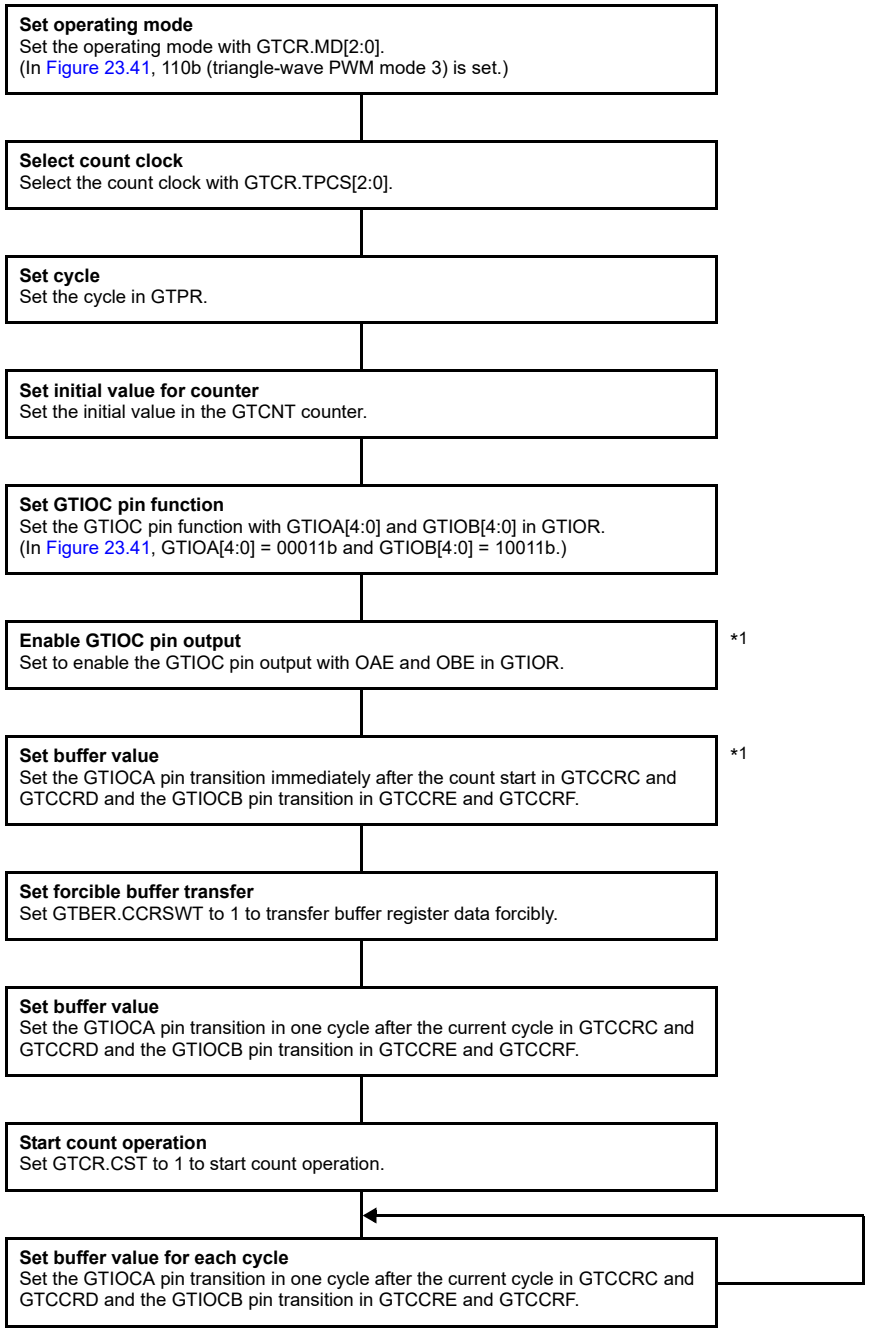


Figure 23.41 Example of triangle-wave PWM mode 3 operation with low output from the GTIOC0A pin and high output from the GTIOC0B pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

Note 1. When the PWM delay generating circuit is used, exchange the sequence of the step "Enable GTIOC pin output" and the step "Set buffer value".

Figure 23.42 Example setting for triangle-wave PWM mode 3

23.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time values (GTDVU and GTDVD values) can automatically be set to GTCCRB. The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Dead time can be separately set for the first half and second half of a waveform. Dead time for the transition in the first half of a negative waveform is set in GTDVU and that in the second half is set in GTDVD. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1.

GTDBU can be used as a buffer register of GTDVU, and GTDBD can be used as a buffer register of GTDVD. Buffer transfer is performed at the cycle end at an GTCNT overflow (during up-counting) or an underflow (during down-counting) or GTCNT counter clear for saw waves and at the trough for triangle waves.

The compare match value set by the automatic dead time setting function can be confirmed by reading from GTCCRB. Writing to GTCCRB is prohibited when the automatic dead time setting function is used.

Dead time setting beyond the cycle is prohibited. When a dead time error occurs, the compare match values for positive and negative waveforms are adjusted to generate the waveforms with the dead time as shown in Table 23.7. The adjusted value for the negative waveform is set for GTCCRB automatically. The adjusted value for the positive waveform is used as internal signal and not set for GTCCRA.

In saw-wave one-shot pulse mode, when the adjusted value is beyond the cycle or the adjusted waveform toggle points are in disorder, the complementarity of the waveforms is not guaranteed.

In triangle-wave mode, when the dead time is beyond the cycle by setting the value GTCCR = 0 or GTCCRA >= GTPR for GTCCRA, the output protection function keeps the level of output. For details, see section section 23.8.4, Output Protection Function for GTIOC Pin Output. When GTCCRA >= GTPR + GTDVm, GTPR-1 is set for GTCCRB as the upper limit value. The automatic dead time value setting to GTCCRB is performed at the next count clock cycle when registers that are used for calculating the automatic dead time value are updated.

The way to rewrite GTDVm differs by GPT channel number.

Table 23.6 Compare match value after adjusting for dead time error

PWM output operating mode	Count direction	First half / second half	Condition of dead time error	Compare match value after adjusting	
				Positive waveform	Negative waveform
Saw-wave one-shot pulse mode	Up	First half	GTCCRA - GTDVU < 0	GTDVU	0
		Second half	GTCCRA + GTDVD > GTPR	GTPR - GTDVD	GTPR
	Down	First half	GTCCRA + GTDVU > GTPR	GTPR - GTDVU	GTPR
		Second half	GTCCRA - GTDVD < 0	GTDVD	0
Triangle-wave PWM mode 1/2/3	Up	(First half)	GTCCRA - GTDVU <= 0	GTDVU + 1	1
	Down	(Second half)	GTCCRA - GTDVD < 0	GTDVD	0

GPT32EH0 to GPT32EH3 and GPT32E4 to GPT32E7

When GTDVm buffer operation is enabled, GTDBm can be written at anytime. GTDBm is transferred to GTDVm at the cycle end.

When GTDVm buffer operation is disabled, to change GTDVm to a new value, first stop the GPT using the CST bit in the GTCR register.

GPT328 to GPT3213

While GPT is running, changing the GTDVU values is prohibited. To change GTDVU to a new value, first stop the GPT using the CST bit in the GTCR register.

Figure 23.43 to Figure 23.46 show examples of automatic dead time setting function operation for GPT32EH and GPT32E. Figure 23.47 and Figure 23.48 show the setting examples.

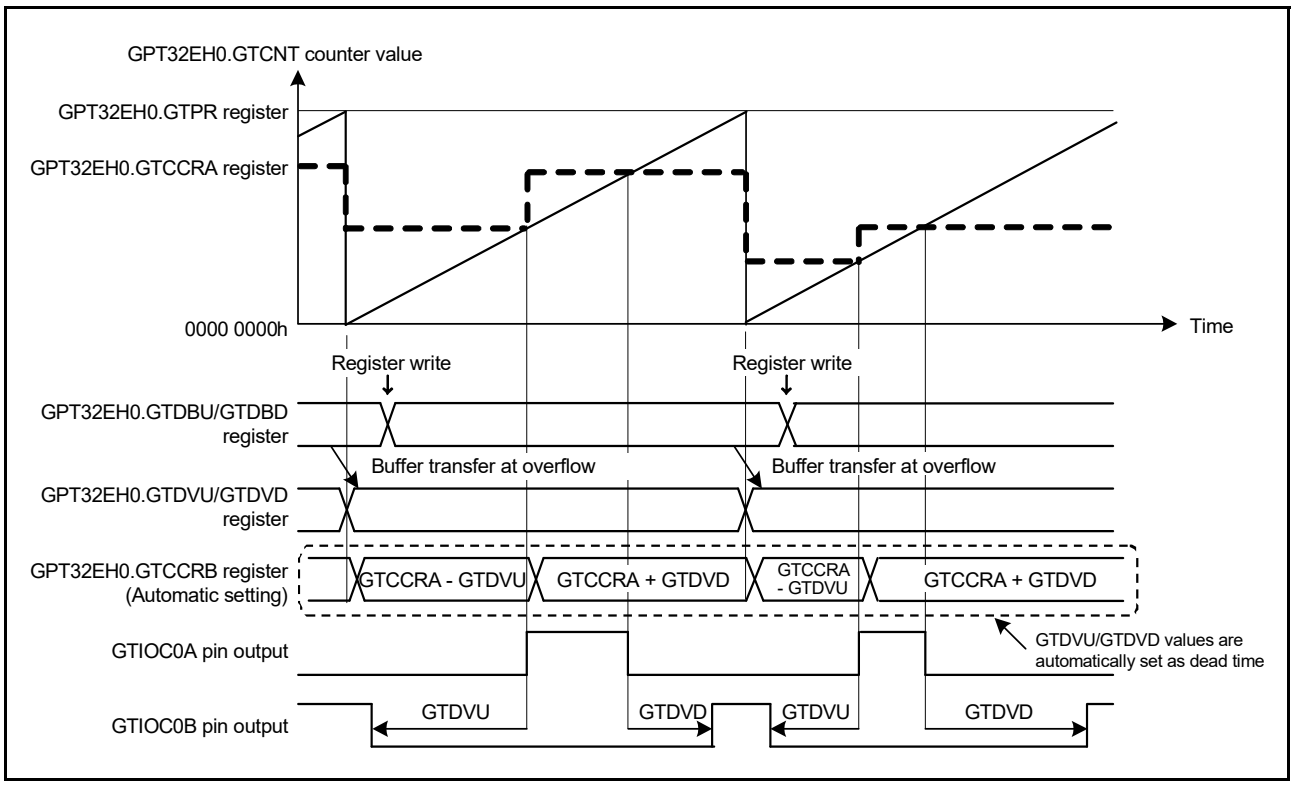

Figure 23.43 Example of automatic dead time setting function operation with saw-wave one-shot pulse mode, up-counting, GTDVU and GTDVD set to buffer operation, and active-high

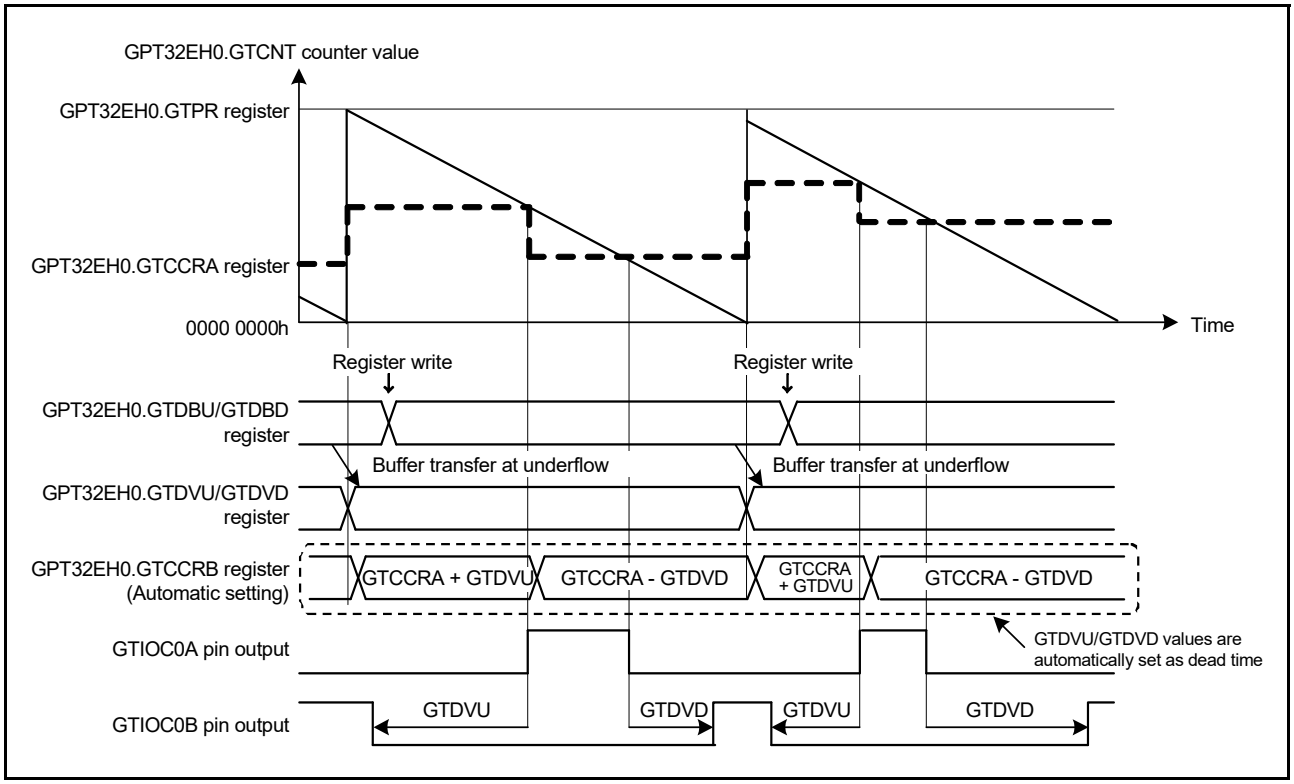

Figure 23.44 Example of automatic dead time setting function operation with saw-wave one-shot pulse mode, down-counting, GTDVU and GTDVD set to buffer operation, and active-high

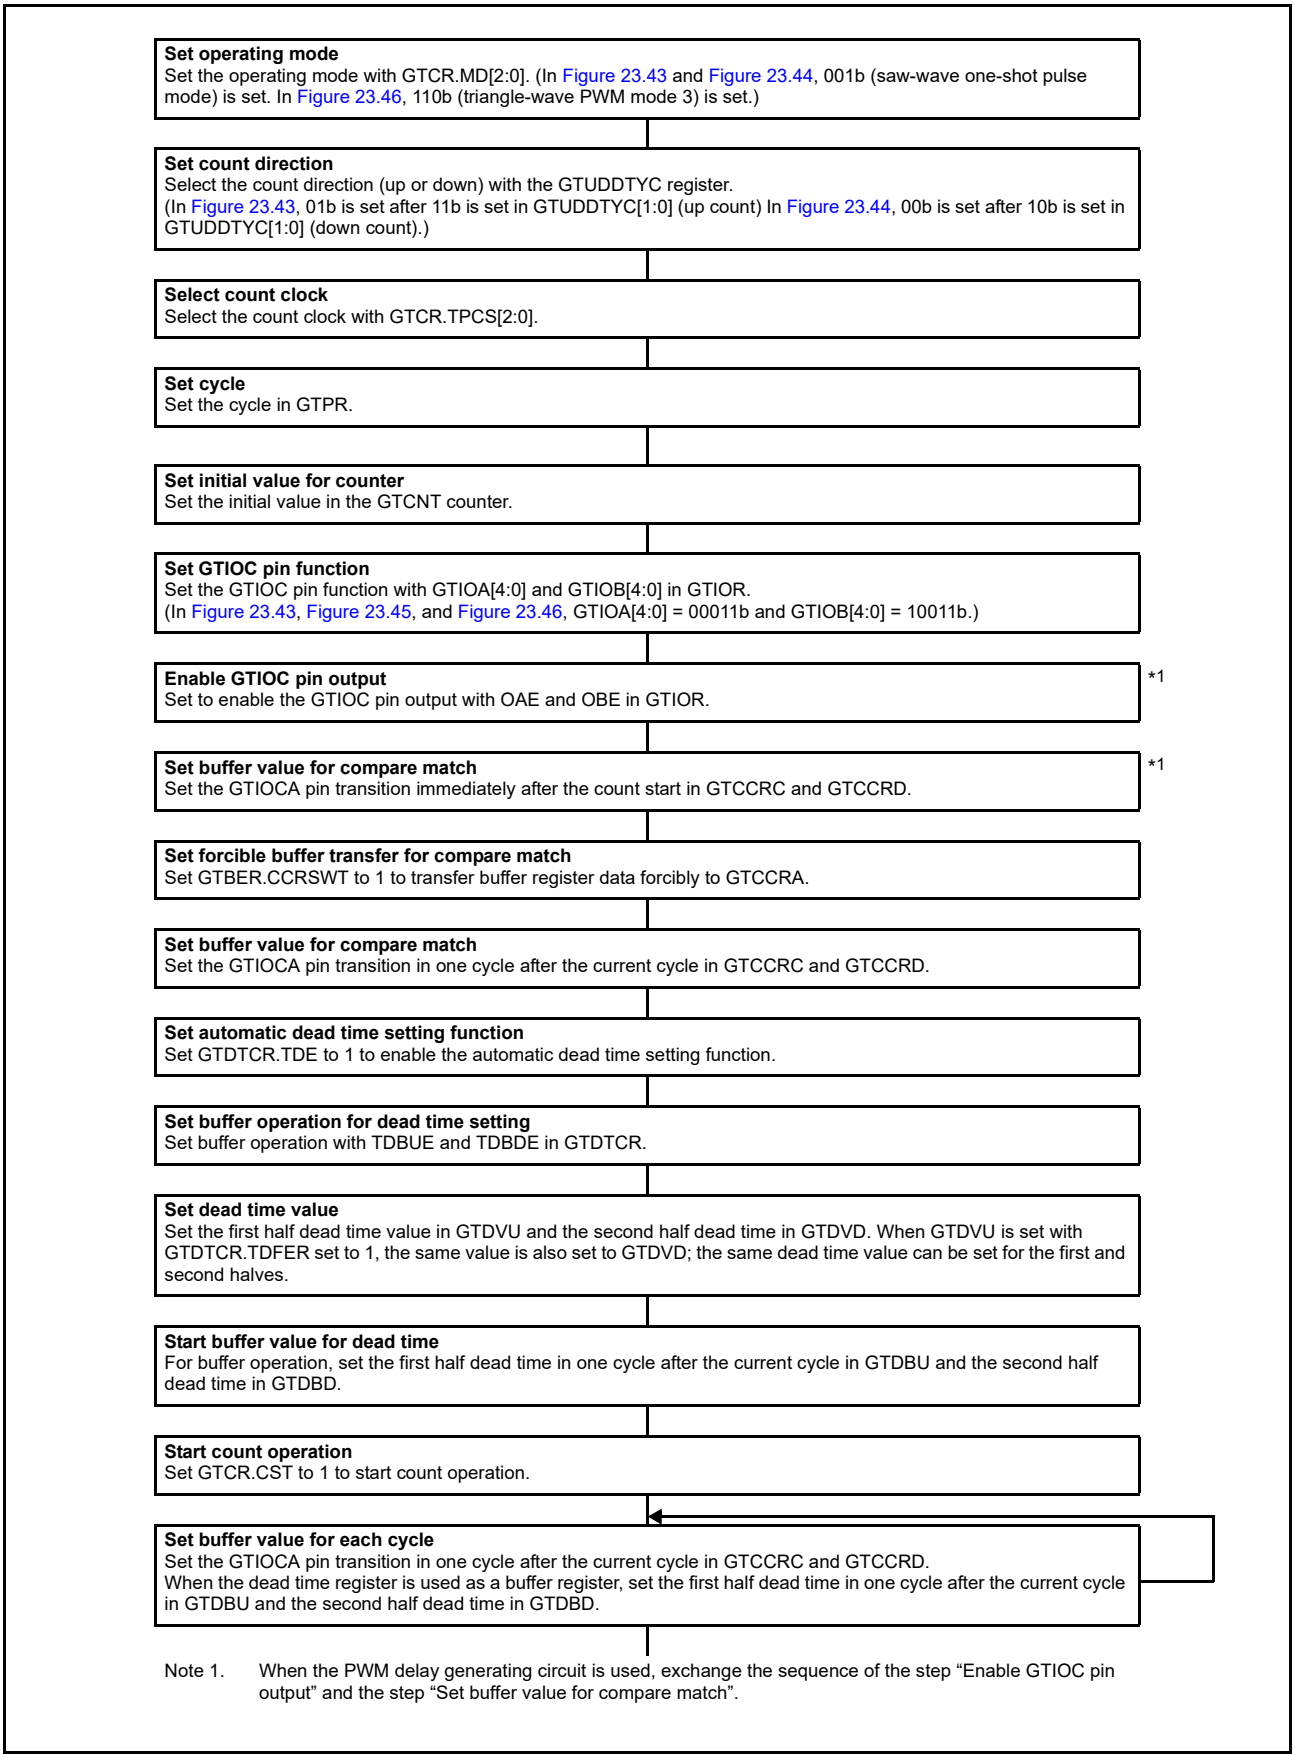

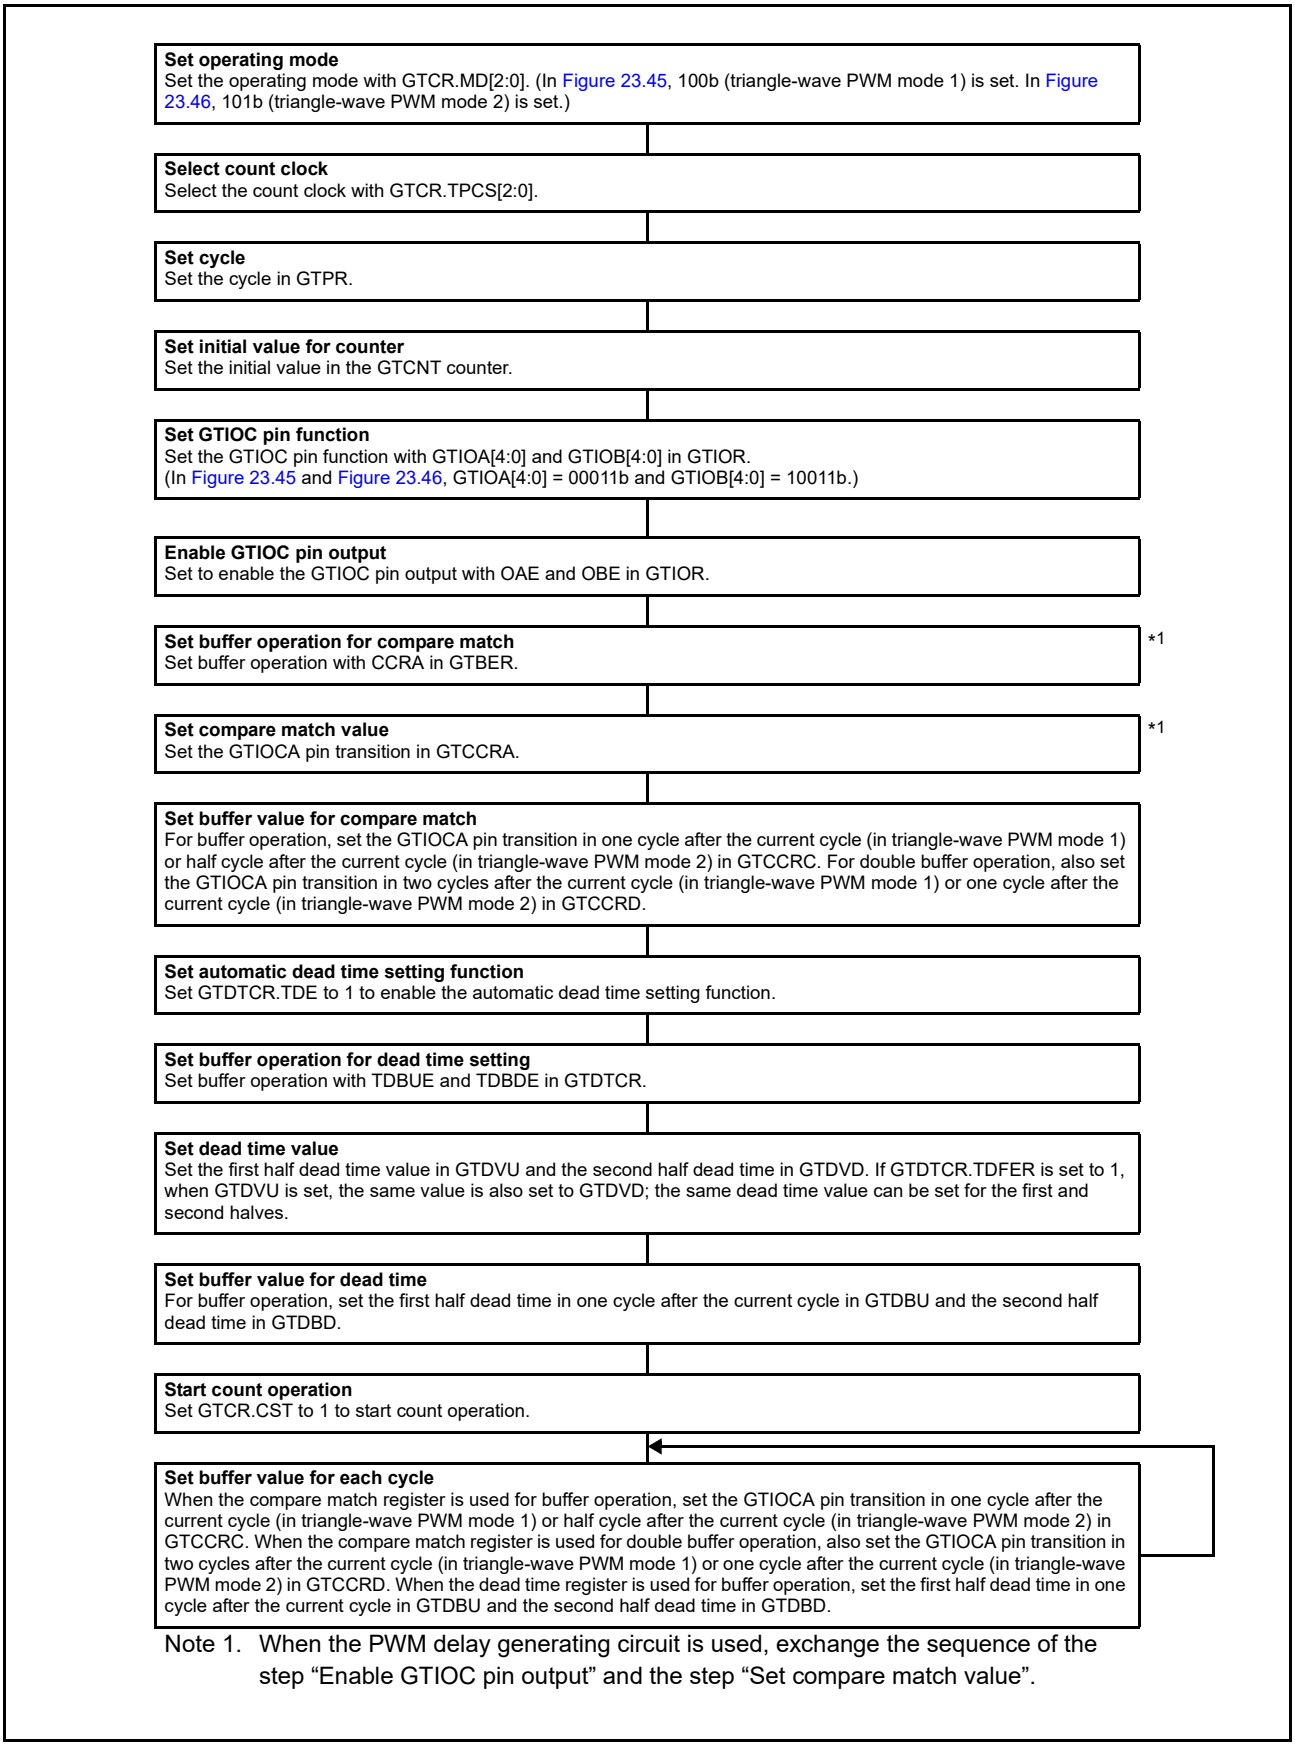

Figure 23.47 Example setting for automatic dead time setting function with saw-wave one-shot pulse mode, and triangle-wave PWM mode 3

Note 1. When the PWM delay generating circuit is used, exchange the sequence of the step "Enable GTIOC pin output" and the step "Set compare match value".

Figure 23.48 Example setting for automatic dead time setting function with triangle-wave PWM mode 1 or 2

23.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation stops and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction does not change even though the UD bit in GTUDDTYC is modified during the count operation. Similarly, even though the GTUDDTYC.UD bit is modified while the count operation stops and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected to the count cycle during up-counting and the GTPR value before the start of down-counting is reflected during down-counting.

Figure 23.49 shows an example of count direction changing function operation.

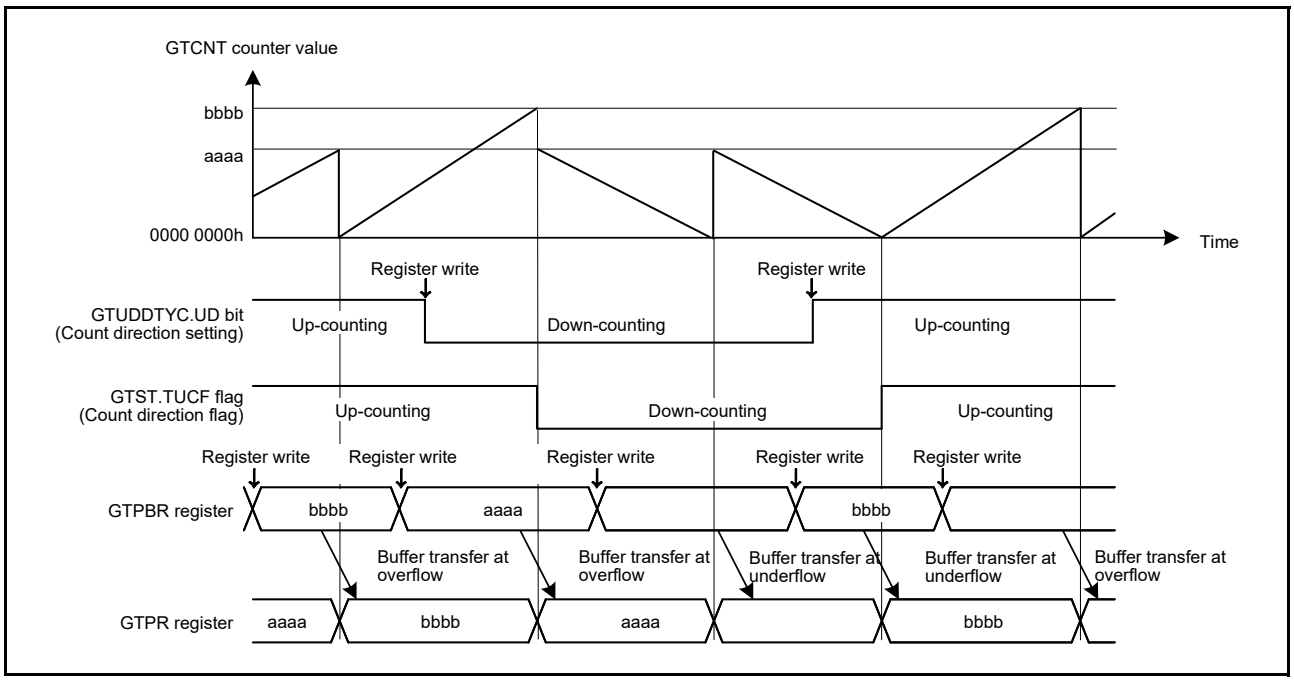

Figure 23.49 Example of count direction changing function operation during buffer operation

23.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCA pin and the GTIOCB pin are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is set to 1 while the count operation stops, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0%/100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.

When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). Table 23.7 shows the values of GTIOCA/GTIOCB pin output at cycle end.

Table 23.7 Output values after releasing 0% or 100% duty setting (m = A, B)

GTIOR.GTIOm[3:2]	Compare match value at cycle end masked by 0% or 100% duty setting	GTUDDTYC.OmDTYR in duty 0% setting		GTUDDTYC.OmDTYR in duty 100% setting	
		0	1	0	1
00 (Output retained at cycle end)	0	0	0	1	0
	1	0	1	1	1
01 (low output at cycle end)	—	0	0	0	0
10 (high output at cycle end)	—	1	1	1	1
11 (Output toggled at cycle end)	0	1	1	0	1
	1	1	0	0	0

Figure 23.50 shows an example of output duty 0% and 100% function operation.

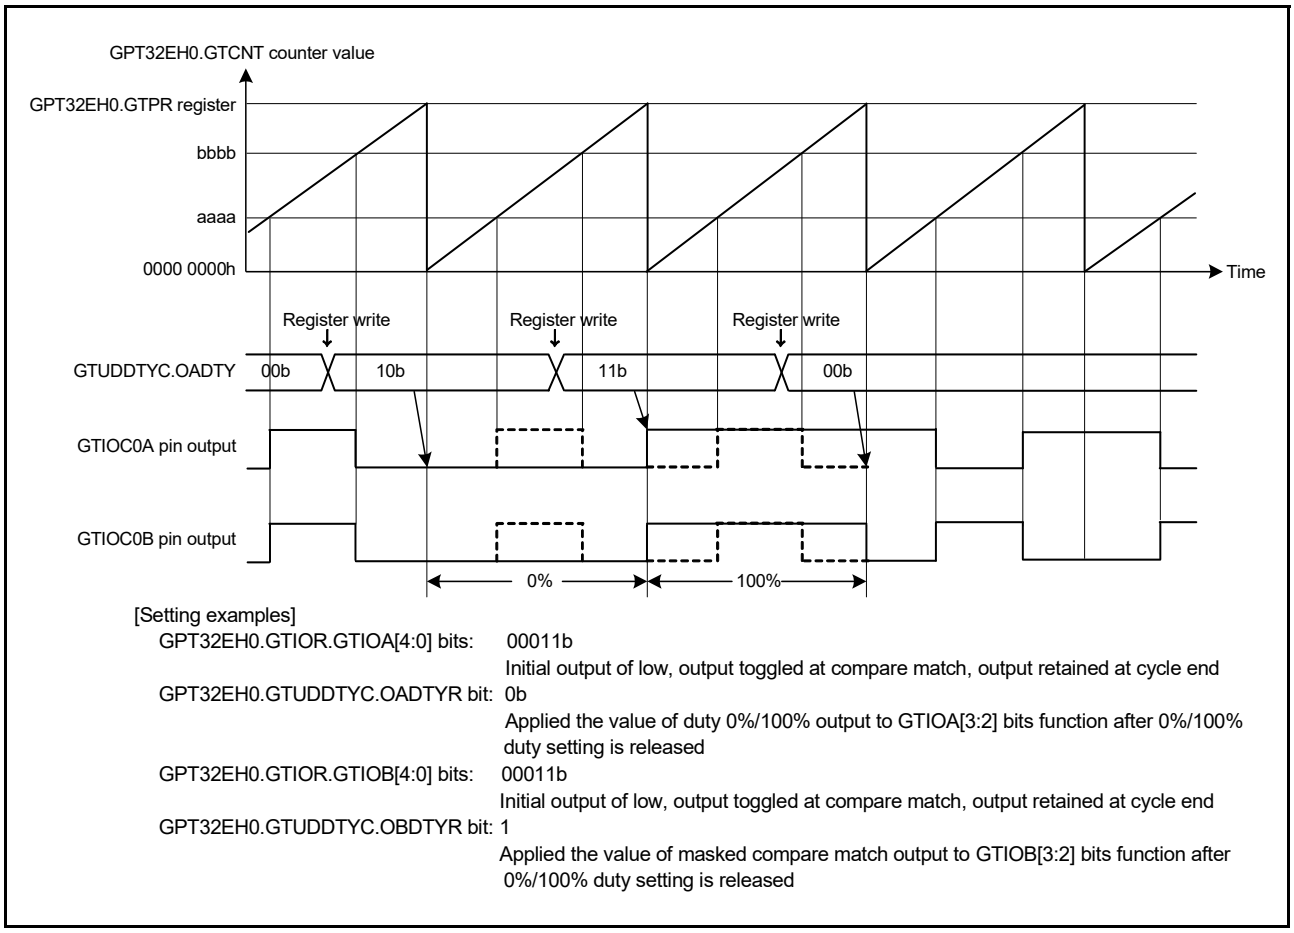

Figure 23.50 Example of output duty 0% and 100% functions

23.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- Output trigger input
- ELC event input
- GTIOCA/GTIOCB pin input.

23.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 23.51 shows an example of a count start operation by a hardware source. Figure 23.52 shows the setting example.

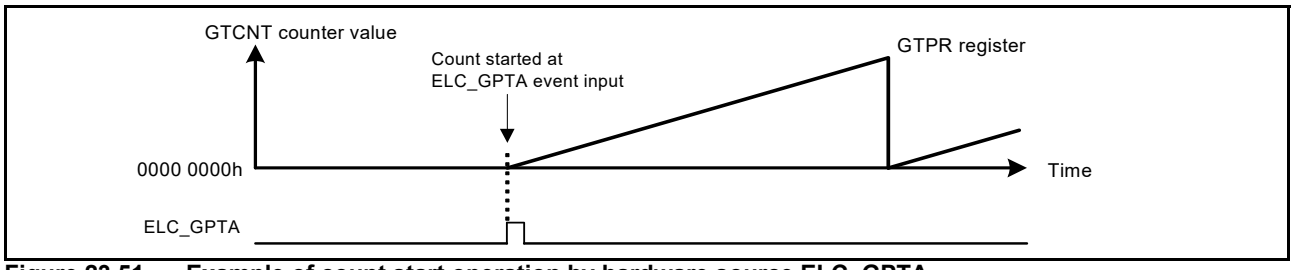

Figure 23.51 Example of count start operation by hardware source ELC_GPTA

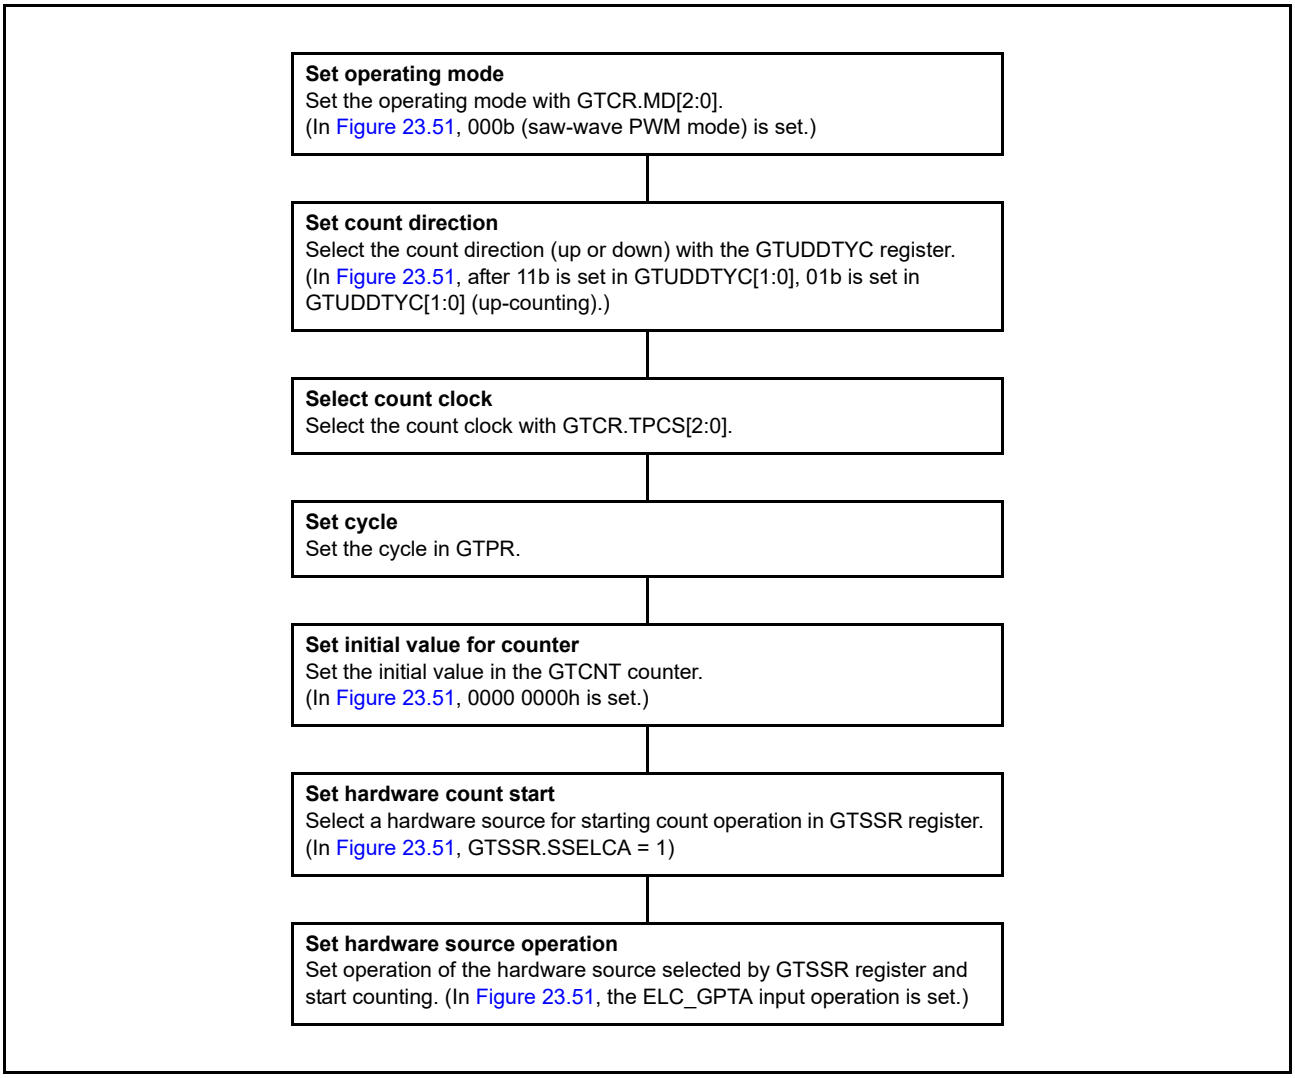

Figure 23.52 Example setting for count start operation by hardware source

23.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR. Figure 23.53 shows an example of a count stop operation by a hardware source. Figure 23.54 shows the setting example. In this example, the count operation stops at the edge of the ELC_GPTA input and restarts at the edges of the ELC_GPTB input.

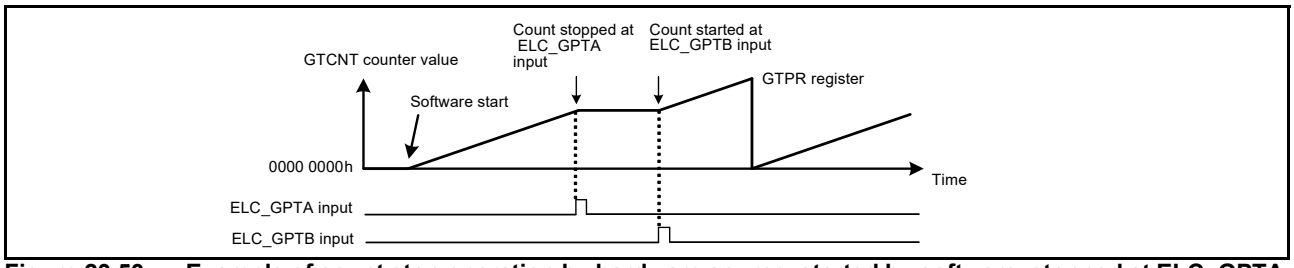

Figure 23.53 Example of count stop operation by hardware source, started by software, stopped at ELC_GPTA input, and restarted at ELC_GPTB input

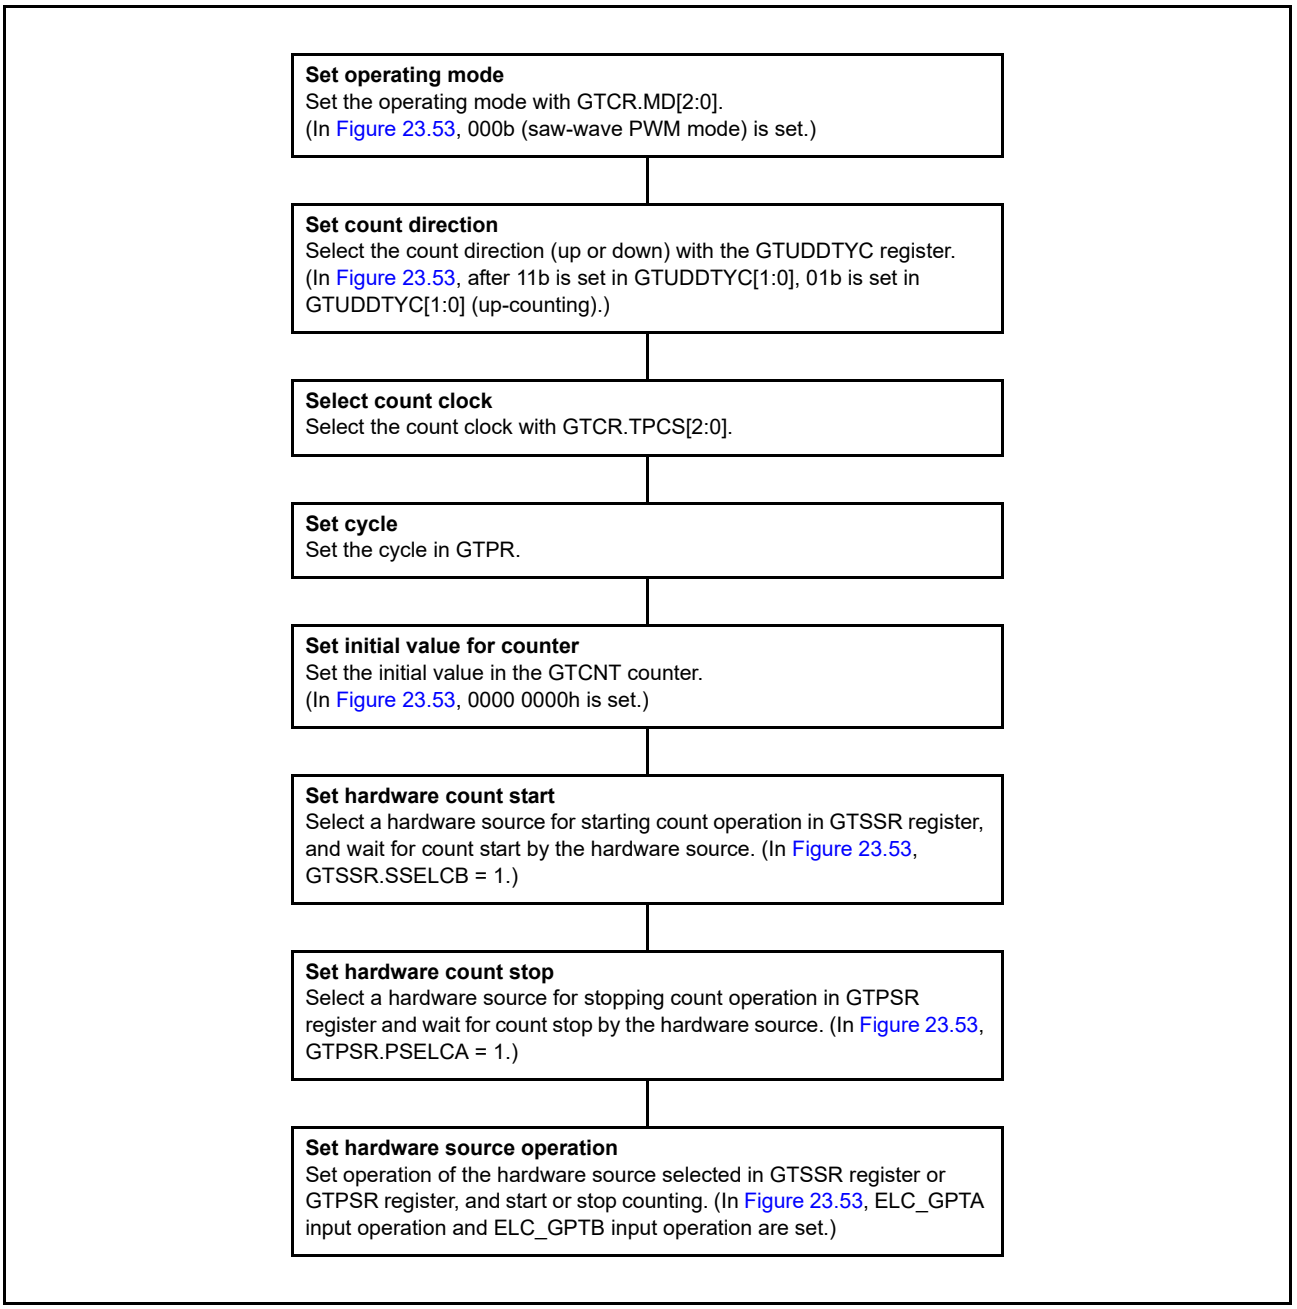

Figure 23.54 Example setting for count stop operation by hardware source

Figure 23.55 shows an example of a count start/stop operation by a hardware source. Figure 23.56 shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

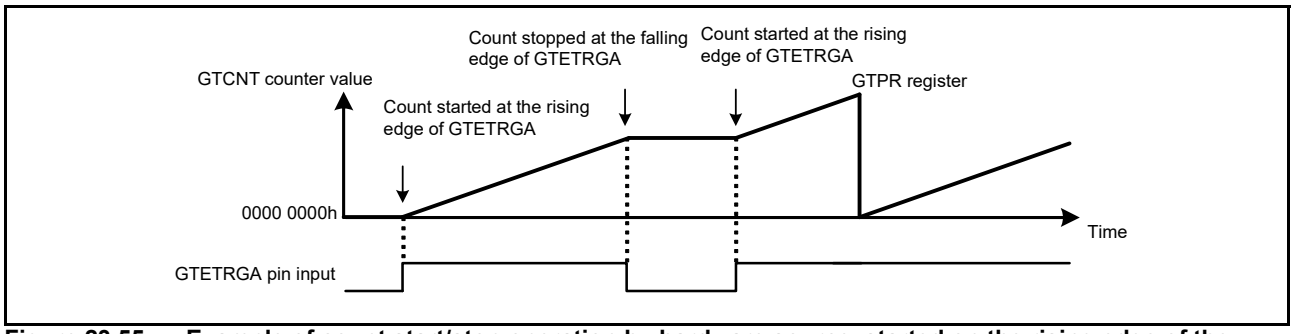

Figure 23.55 Example of count start/stop operation by hardware source, started on the rising edge of the GTETRGA pin input and stopped on the falling edge of the GTETRGA pin input

Set operating mode
Set the operating mode with GTCR.MD[2:0].
(In Figure 23.55, 000b (saw-wave PWM mode) is set.)

Set count direction
Select the count direction (up or down) with the GTUDDTYC register.
(In Figure 23.55, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)

Select count clock
Select the count clock with GTCR.TPCS[2:0].

Set cycle
Set the cycle in GTPR.

Set initial value for counter
Set the initial value in the GTCNT counter.
(In Figure 23.55, 0000 0000h is set.)

Set hardware count start
Select a hardware source for starting count operation with GTSSR register and wait for count start by the hardware source.
(In Figure 23.55, GTSSR.SSGTRGAR = 1)

Set hardware count stop
Select a hardware source for stopping count operation with GTPSR register and wait for count stop by the hardware source.
(In Figure 23.55, GTPSR.PSGTRGAF = 1.)

Set hardware source operation
Set operation of the hardware source selected in GTSSR or GTPSR and start or stop counting.
(In Figure 23.55, the GTETRGA pin operation is set.)

Figure 23.56 Example setting for count start/stop operation by hardware source

23.3.7.3 Hardware Clear Operation

The GTCNT counter can be cleared by selecting a hardware source using GTCSR. The GPTn_OVF/GPTn_UDF(n=0 to 13) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 23.57 and Figure 23.58 show examples of the GTCNT counter clearing operation by a hardware source. Figure 23.59 shows the setting example. In this example, the GTCNT counter starts at the edge of the ELC_GPTA input, and the counter stops/clears at the edge of the ELC_GPTB input.

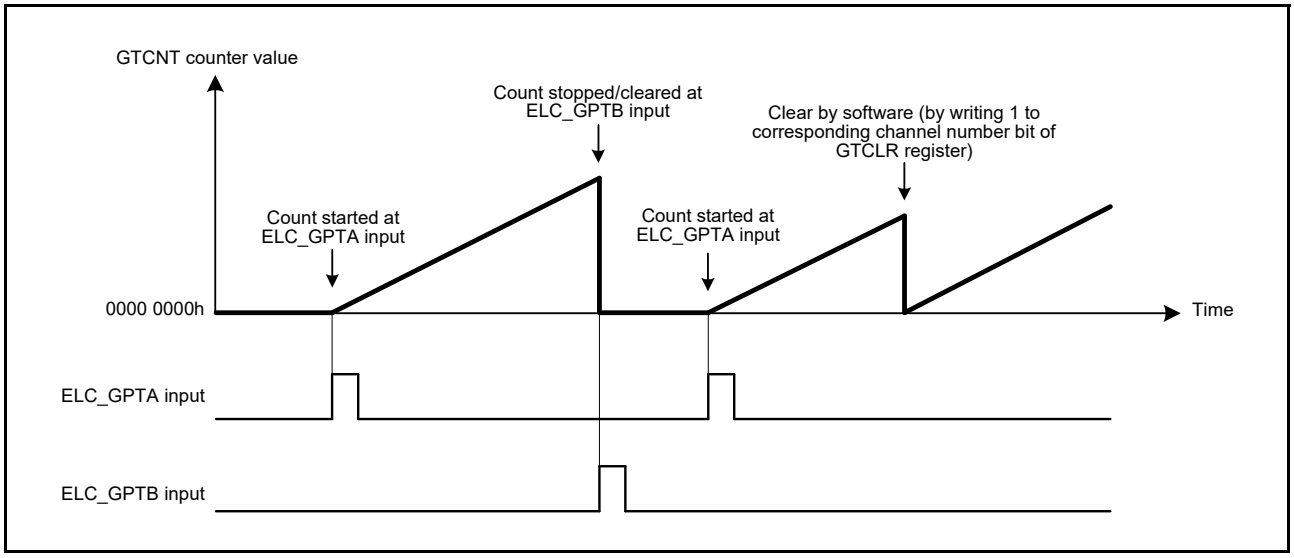

Figure 23.57 Examples of count clearing operation by hardware source with saw wave up-counting, started at ELC_GPTA input, and stopped/cleared at ELC_GPTB input

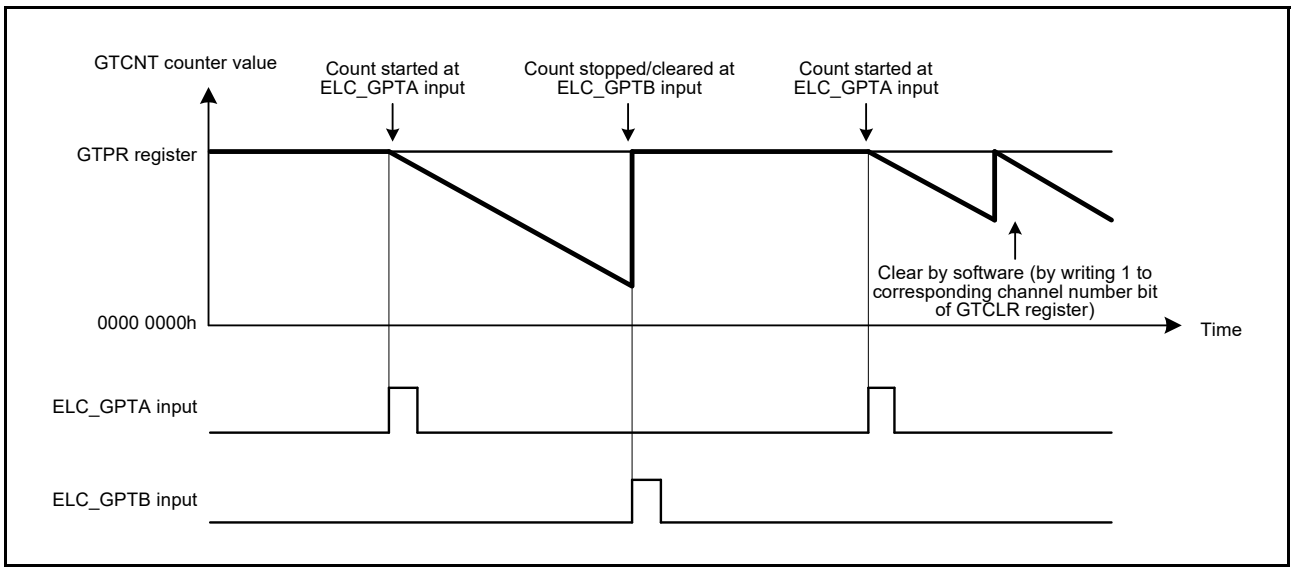

Figure 23.58 Examples of count clearing operation by hardware source with saw wave down-counting, started at ELC_GPTA input, and stopped/cleared at ELC_GPTB input

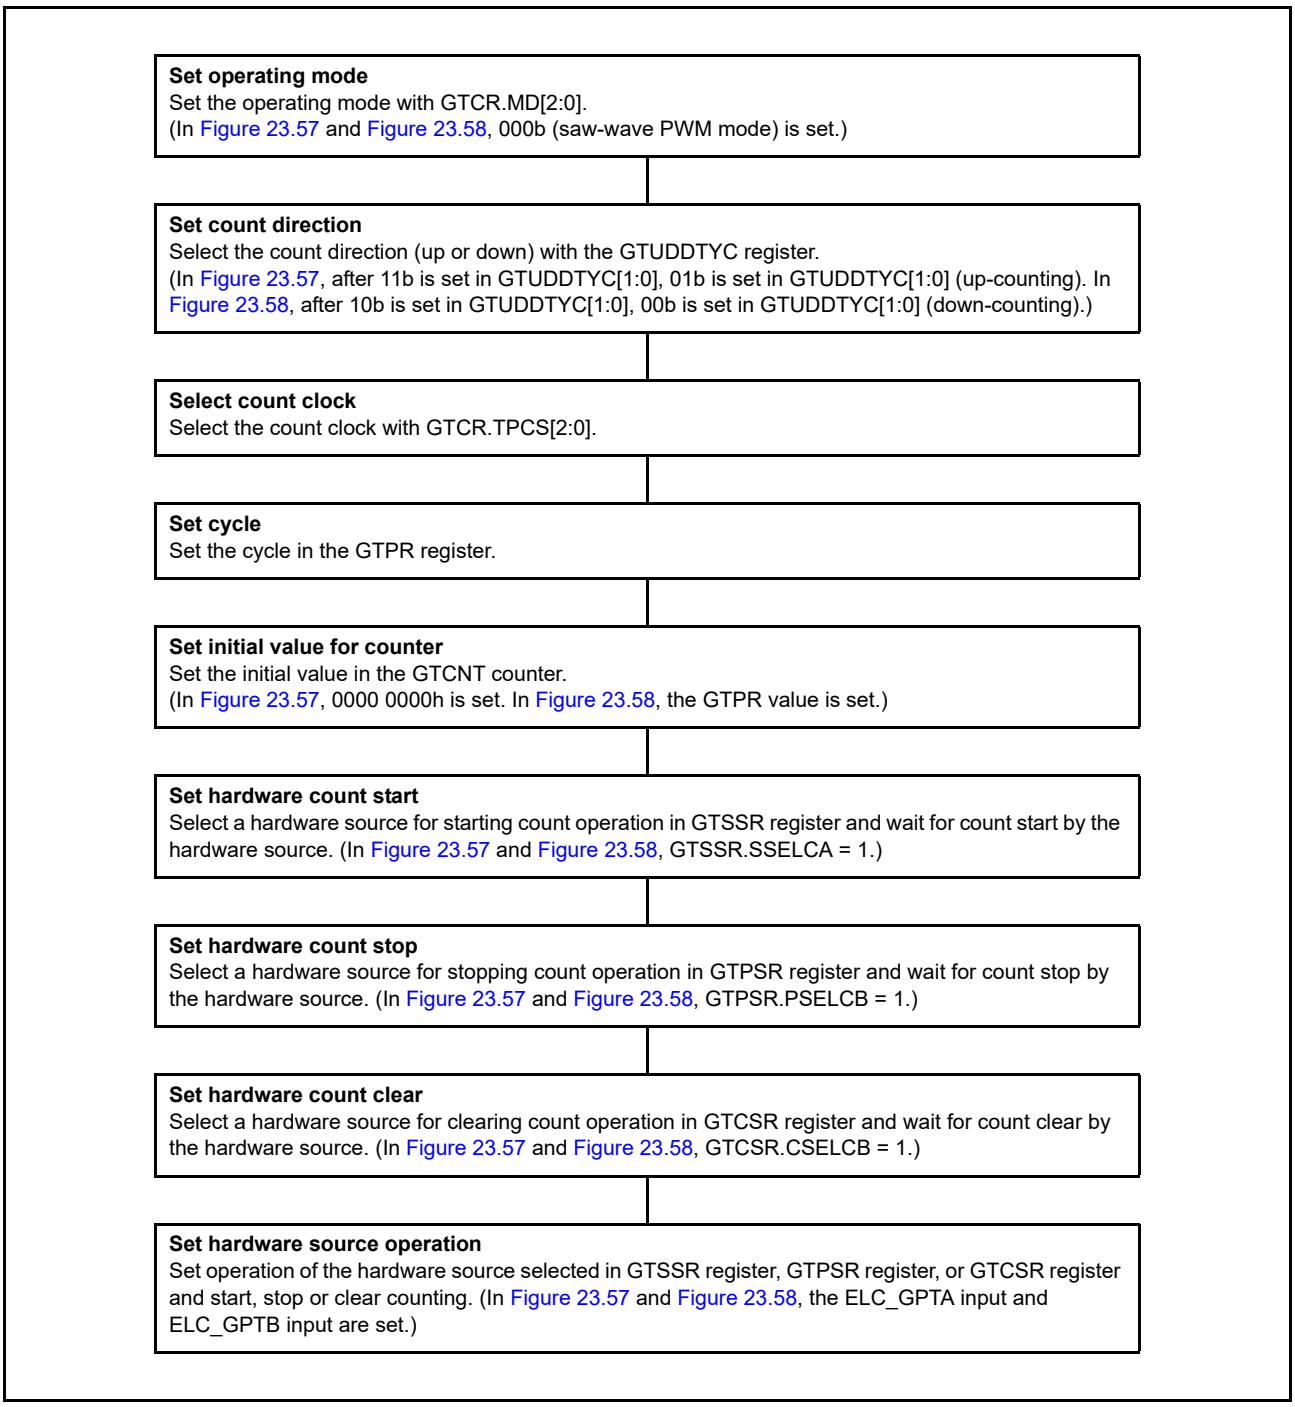

Figure 23.59 Example setting for count clearing operation by hardware source

The GPTn_OVF/GPTn_UDF(n=0 to 13) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 23.60 shows the relationship between the counter clearing by a hardware source and the GPTn_OVF(n=0 to 13) interrupt.

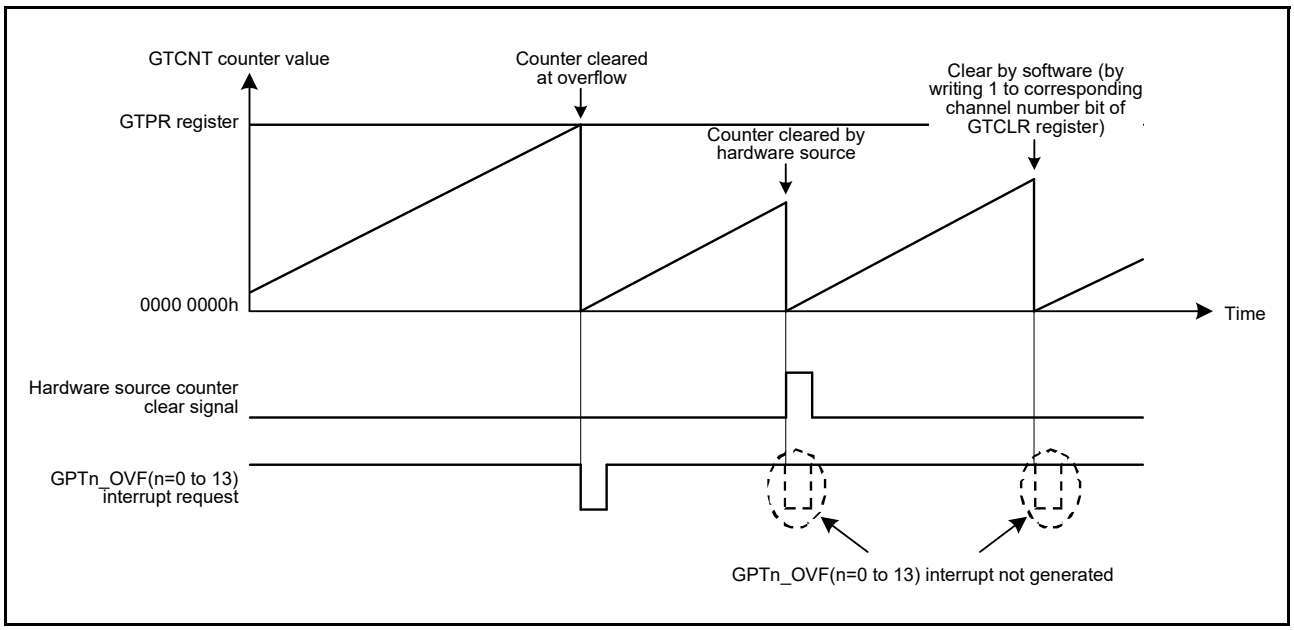

Figure 23.60 Relationship between counter clearing by hardware source and GPTn_OVF (n = 0 to 13) interrupt

23.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop and clear operation can be performed.

23.3.8.1 Synchronized Operation by Software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP or GTCLR bits simultaneously to 1.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.

Figure 23.61 shows an example of a simultaneous start, stop and clear by software. Figure 23.62 shows an example of phase start operation by software.

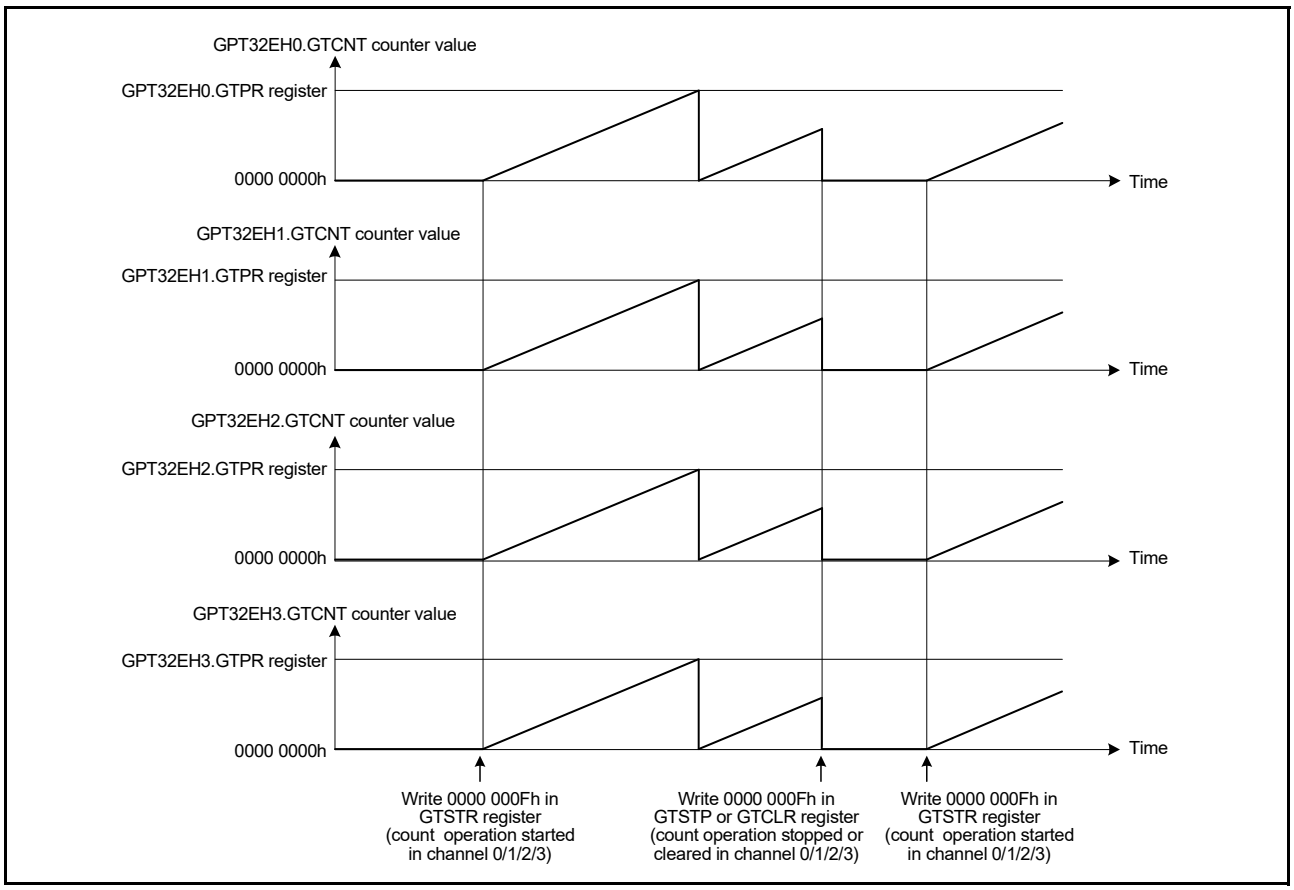

Figure 23.61 Example of a simultaneous start, stop, and clear by software, with the same count cycle (GTPR register value)

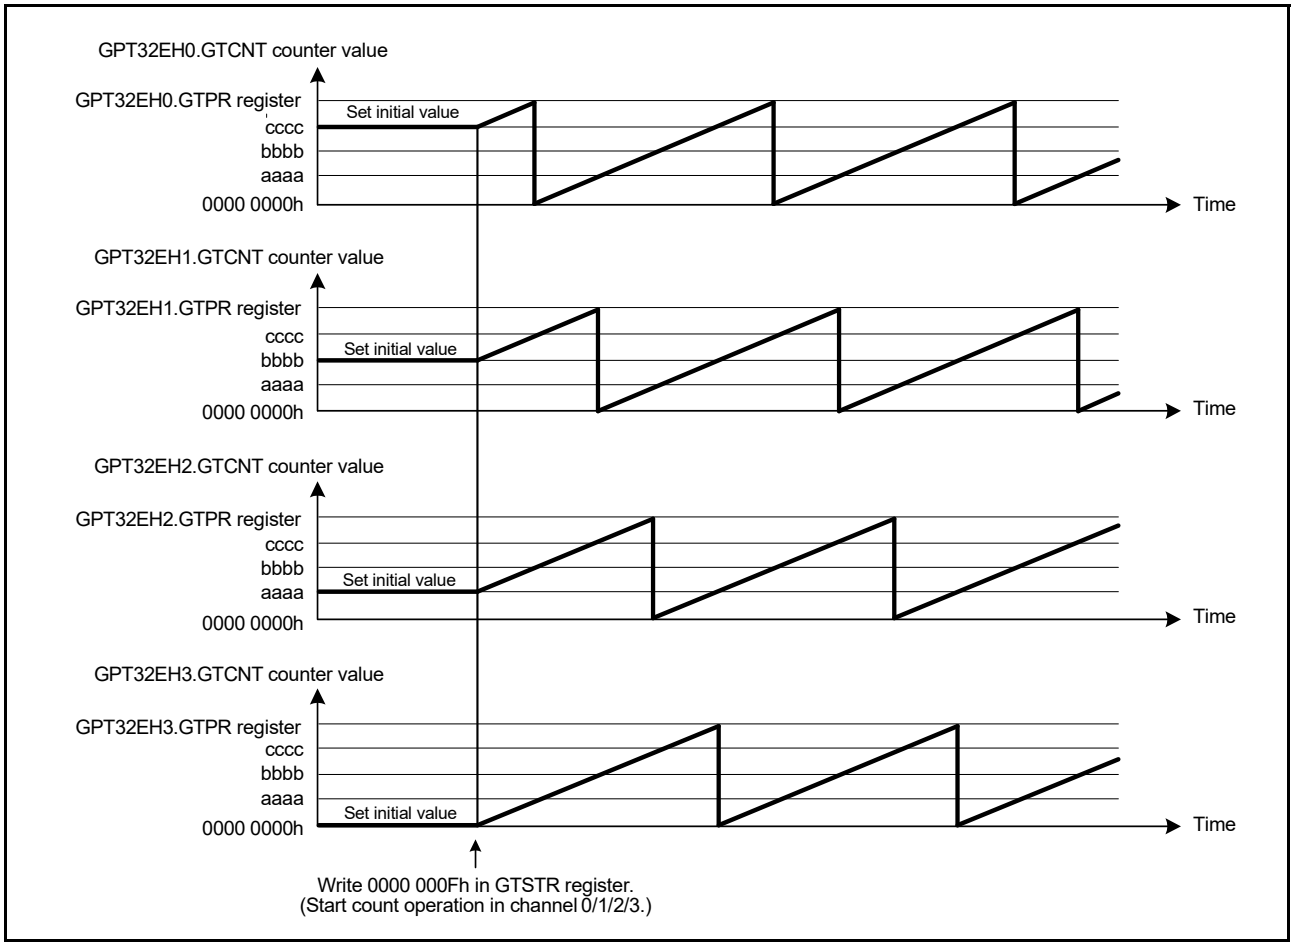

Figure 23.62 Example of software phase start with the same count cycle (GTPR register value)

23.3.8.2 Synchronized Operation by Hardware

The GTCNT counters can be started simultaneously by the following hardware sources:

- Output trigger input
- ELC event input.

Figure 23.63 shows an example of a simultaneous start, stop and clear operation by a hardware source. Figure 23.64 shows the setting example.

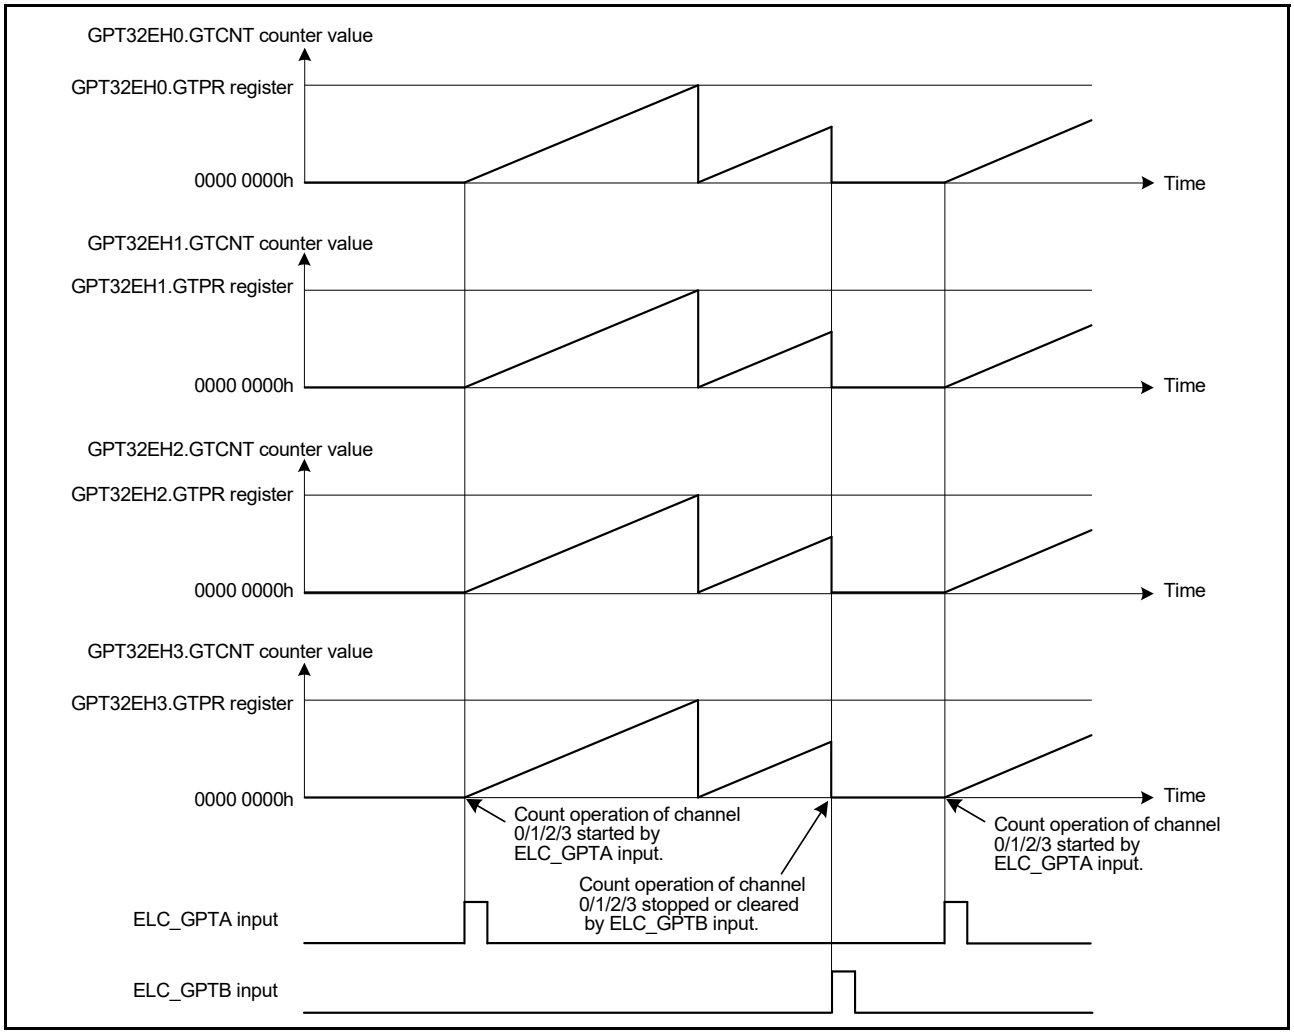

Figure 23.63 Example of a simultaneous start, stop, and clear by hardware source, with the same count cycle (GTPR register value)

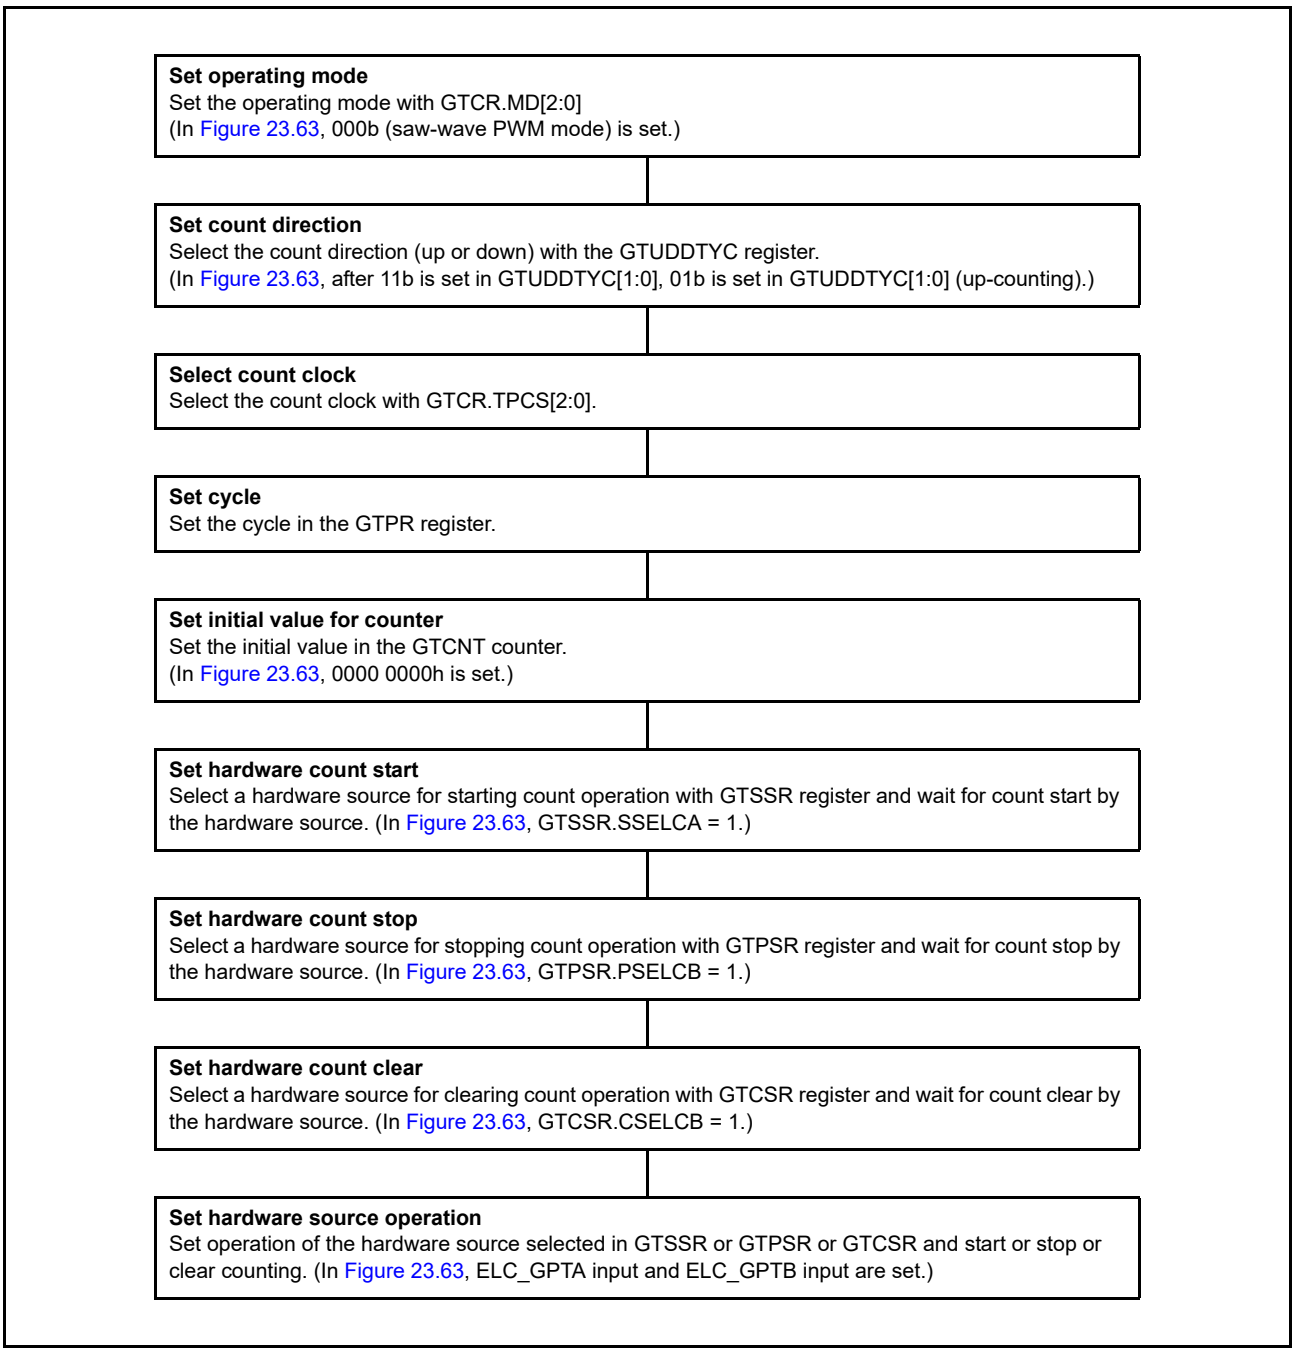

Figure 23.64 Example setting for simultaneous start by hardware source

23.3.9 PWM Output Operation Examples

23.3.9.1 Synchronized PWM Output

The GPT output 28 phases of linked PWM waveforms for a maximum of 14 channels by multiple GPTs.

Figure 23.65 shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

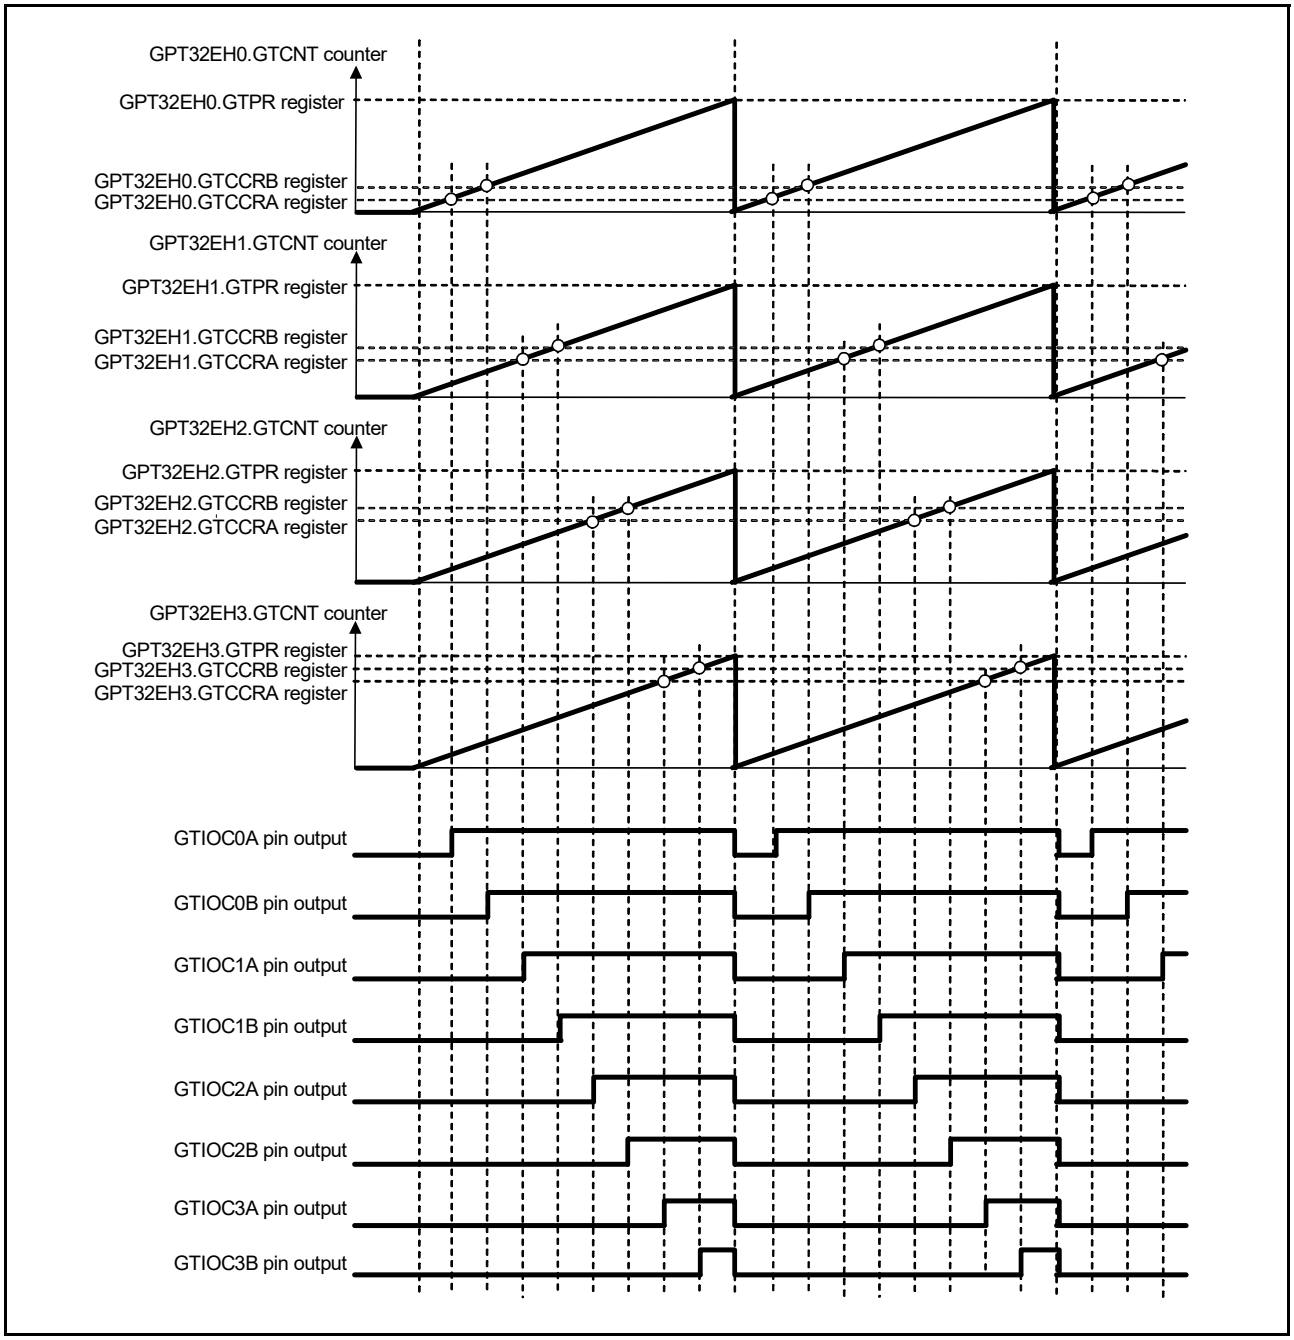

Figure 23.65 Example of synchronized PWM output

23.3.9.2 Three-Phase Saw-Wave Complementary PWM Output

Figure 23.66 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

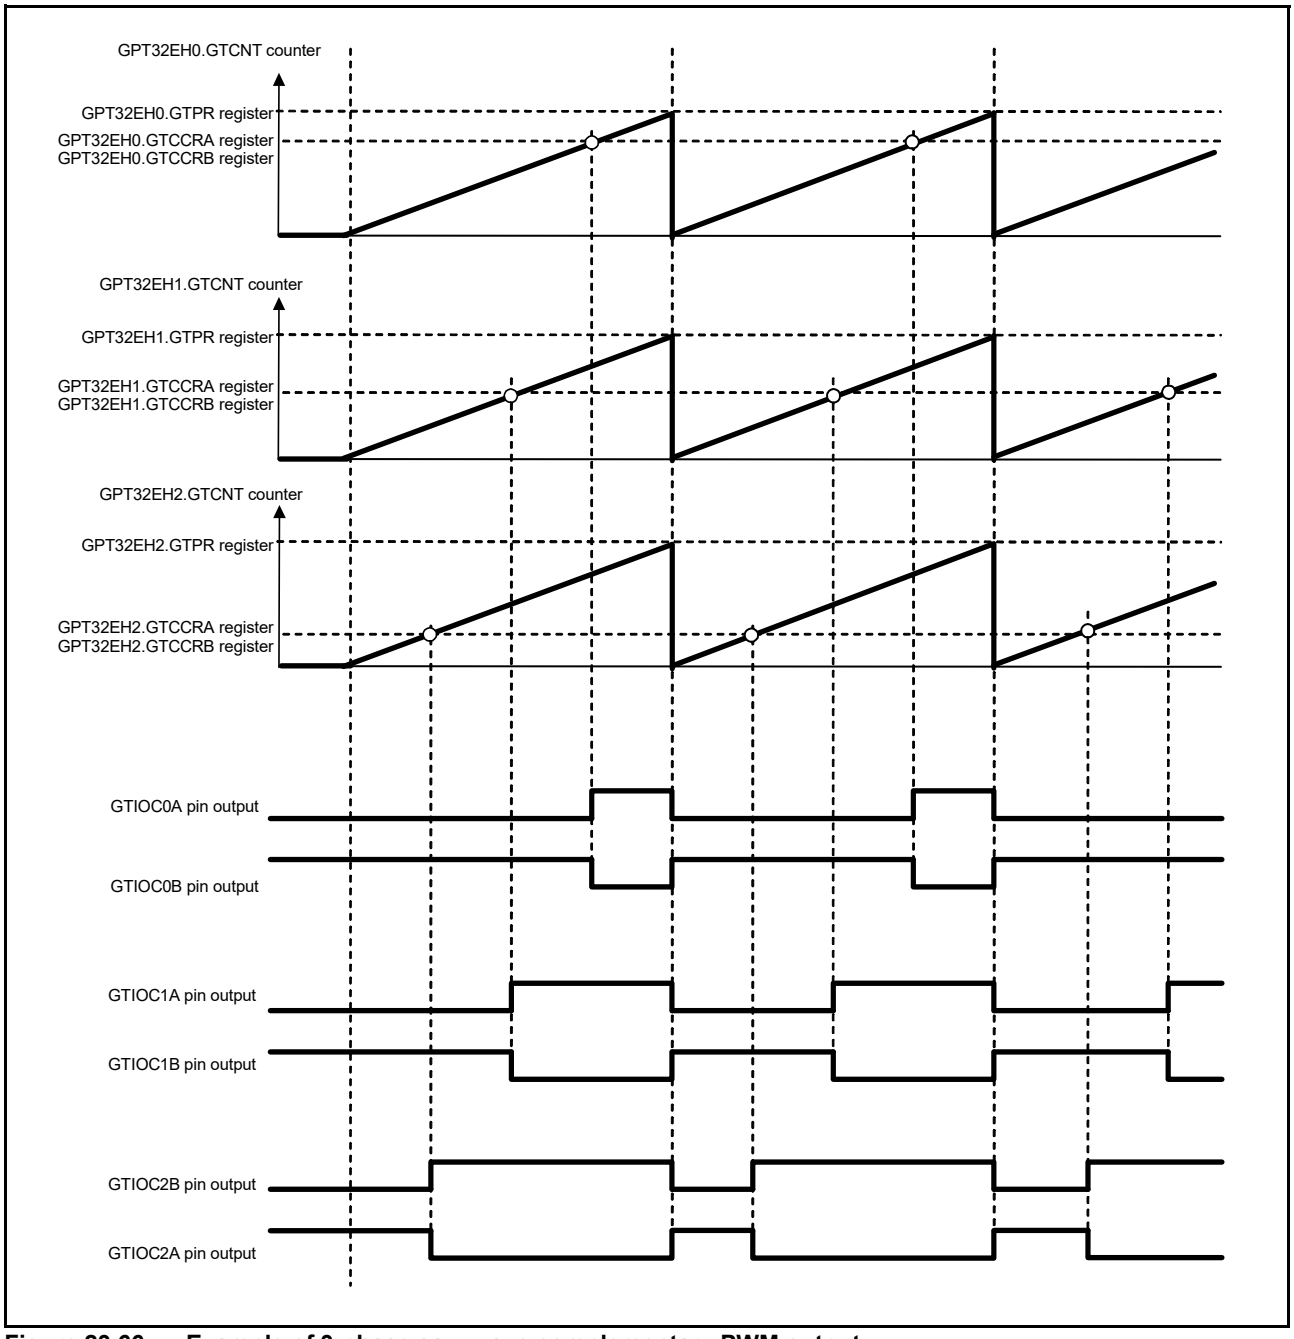

Figure 23.66 Example of 3-phase saw-wave complementary PWM output

23.3.9.3 3-Phase Saw-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 23.67 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggle the output at a GTCCRA compare match, and retain the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggle the output at a GTCCRB compare match, and retain the output at the cycle end.

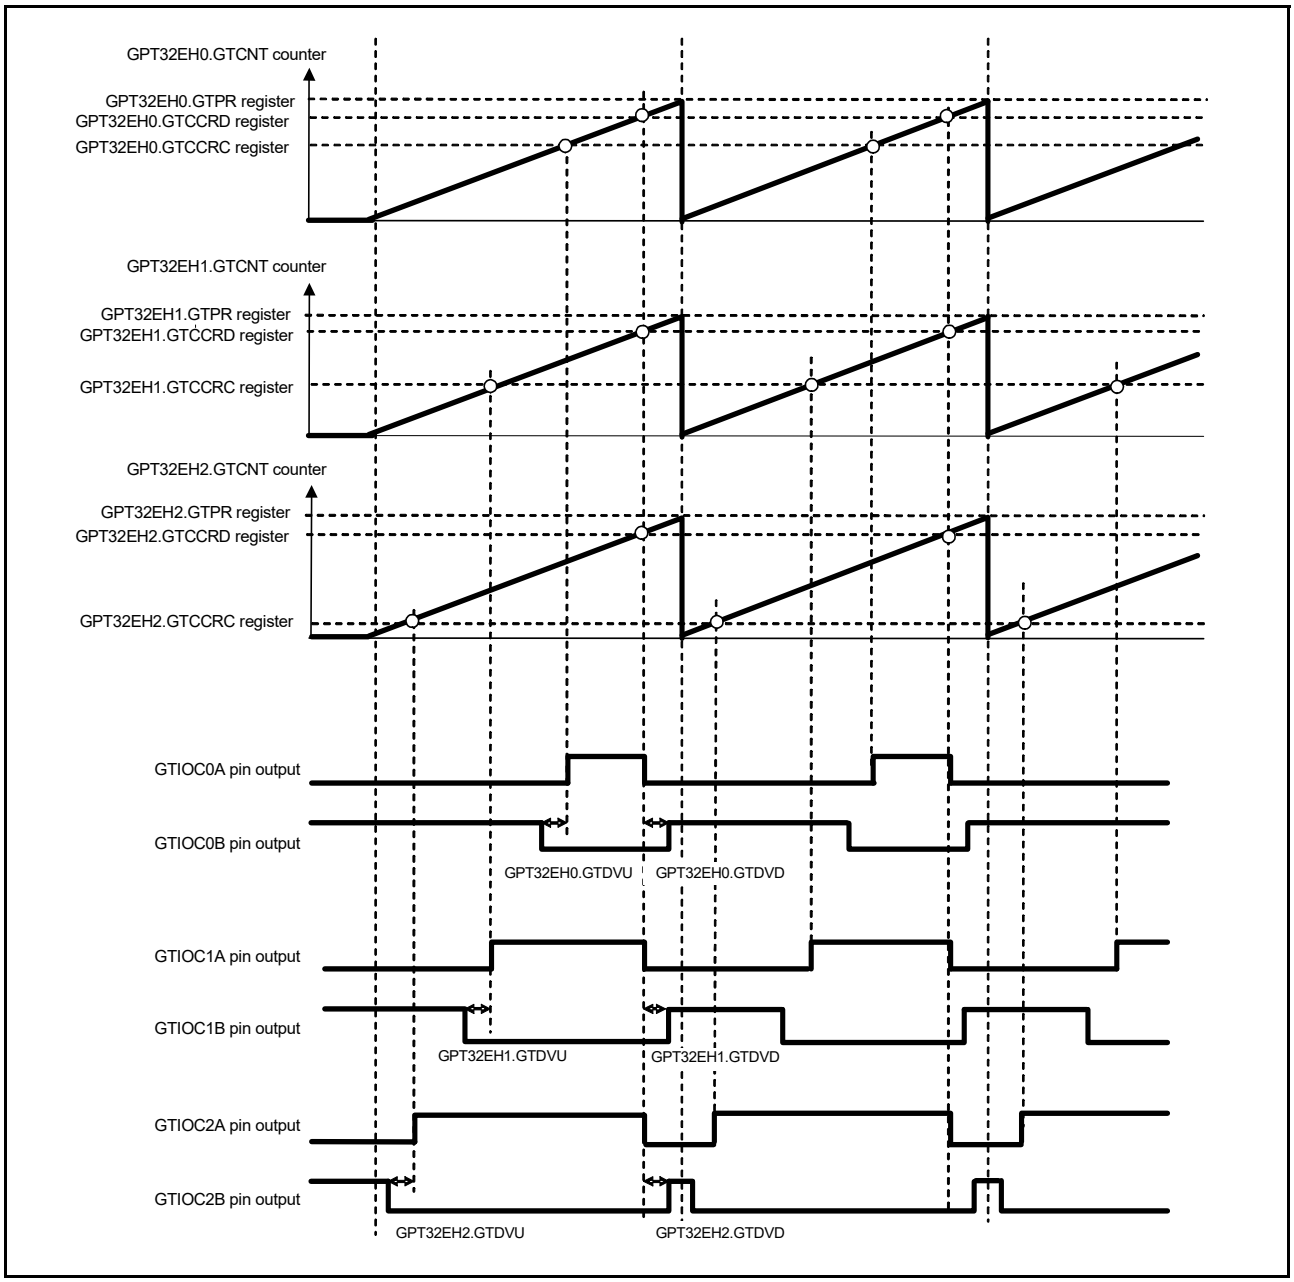

Figure 23.67 Example of 3-phase saw-wave complementary PWM output with automatic dead time setting

23.3.9.4 3-Phase Triangle-Wave Complementary PWM Output

Figure 23.68 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

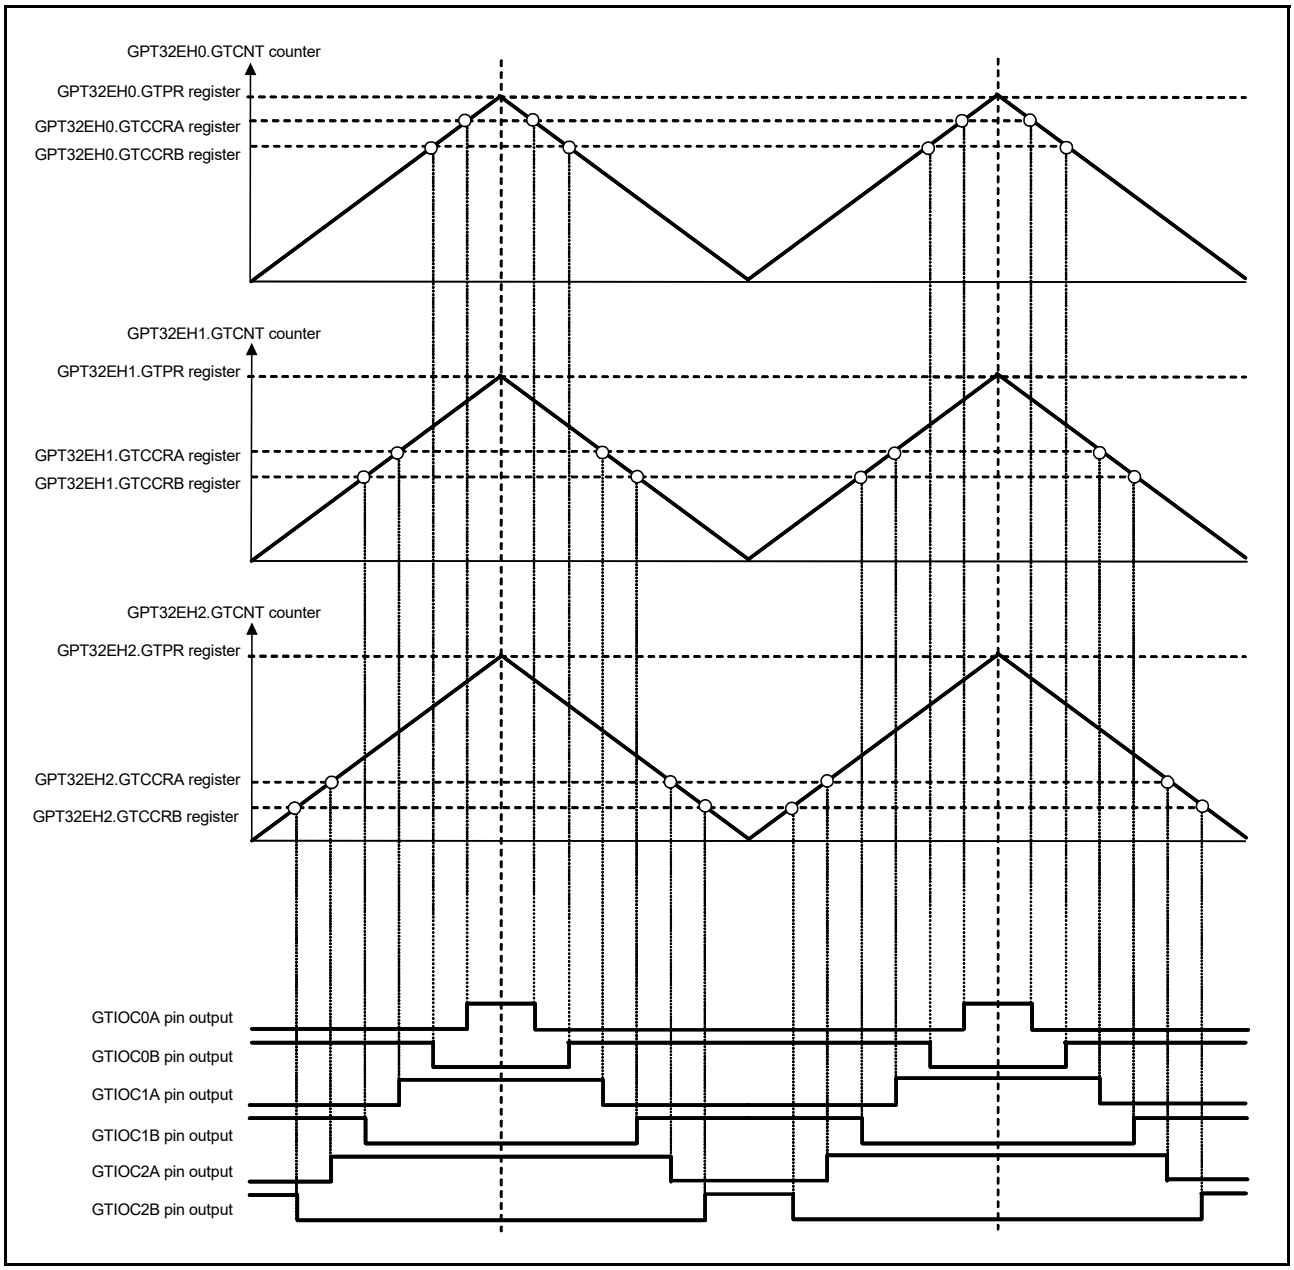

Figure 23.68 Example of 3-phase triangle-wave complementary PWM output

23.3.9.5 3-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 23.69 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

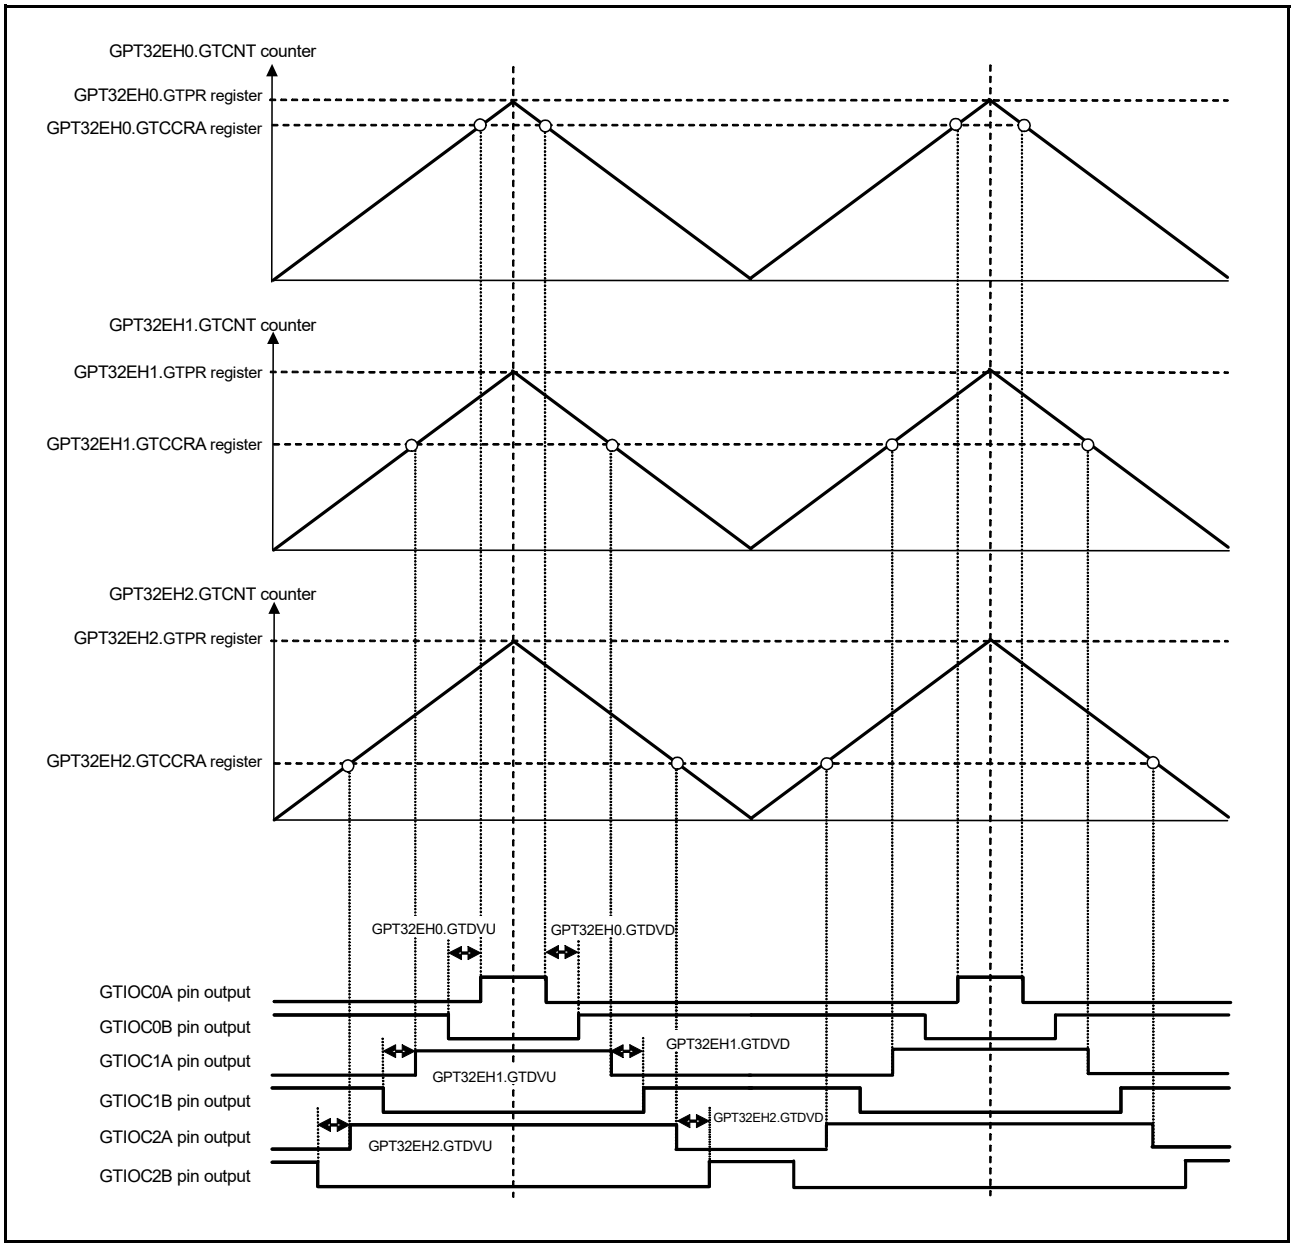

Figure 23.69 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting

23.3.9.6 3-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 23.70 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCA is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCB is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

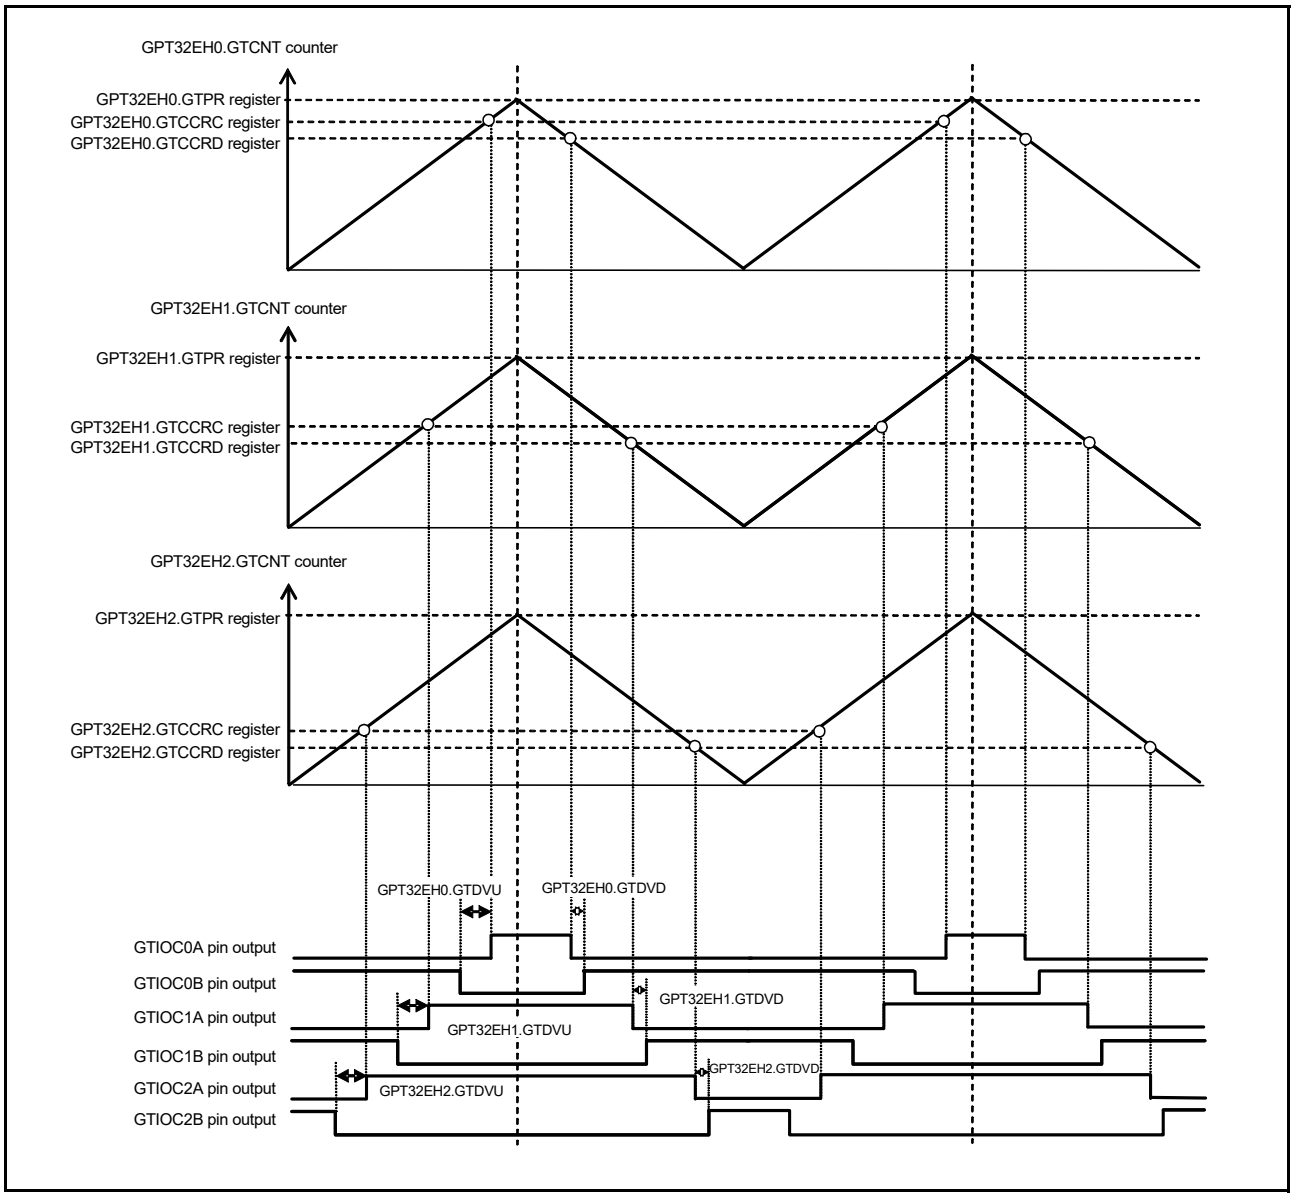

Figure 23.70 Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

23.3.10 Phase Counting Function

The phase difference between the GTIOCA pin input and GTIOCB pin input is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOCA pin and GTIOCB pin input being set in the GTUPSR and GTDNSR registers. For details on count operation, see section 23.3.1.1, Counter Operation.

Figure 23.71 to Figure 23.80 show phase counting modes 1 to 5. Table 23.8 to Table 23.17 show conditions of up-counting or down-counting and lists settings for the GTUPSR and GTDNSR registers.

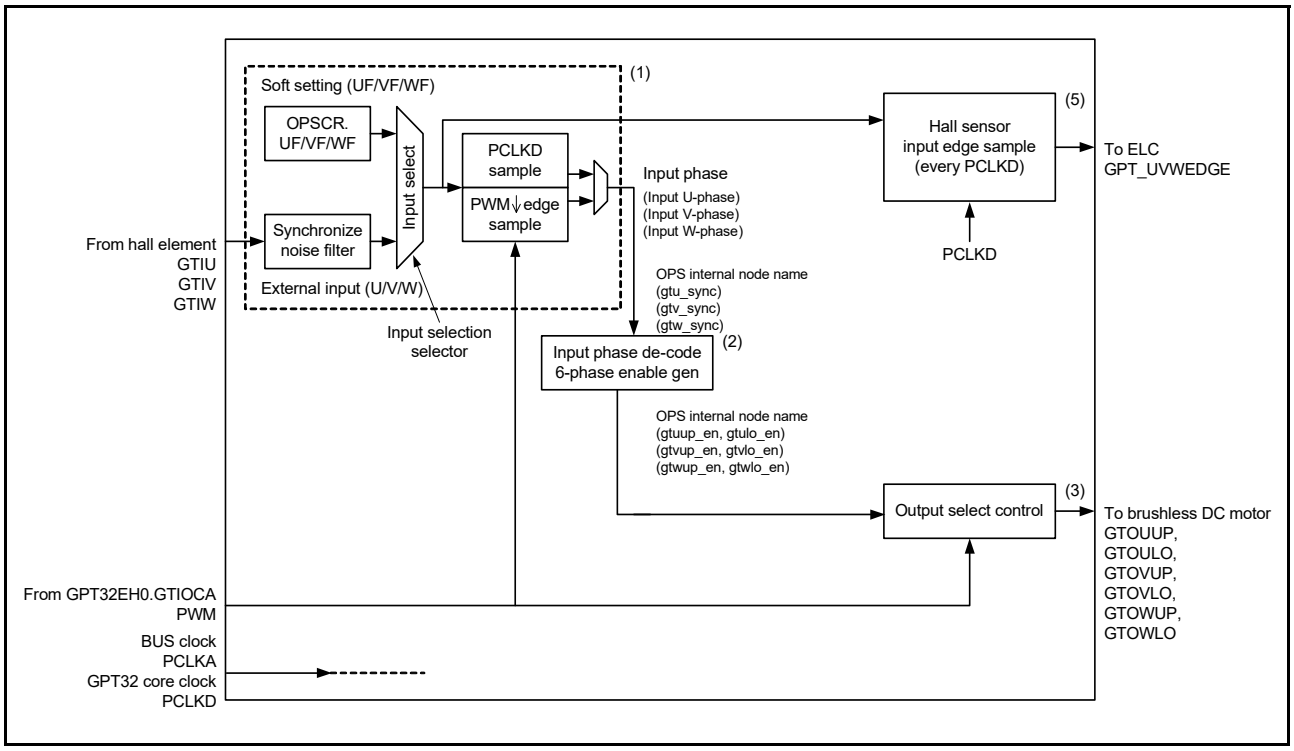
23.3.11 Output Phase Switching (GPT_OPS)

GPT_OPS provides a function for easy control of brushless DC motor operation using the Output Phase Switching Control Register (OPSCR).

GPT_OPS outputs a PWM signal to be used for chopper control or level signal for each phase (U-positive phase/negative phase, V-positive phase/negative phase, W-positive phase/negative phase) of the 6-phase motor control. This function uses a soft setting value (OPSCR.UF, VF, WF) set by software or external signals detected by the Hall element, a PWM waveform of GPT32EH0.GTIOCA.

Figure 23.81 shows the GPT_OPS control flow conceptual diagram.



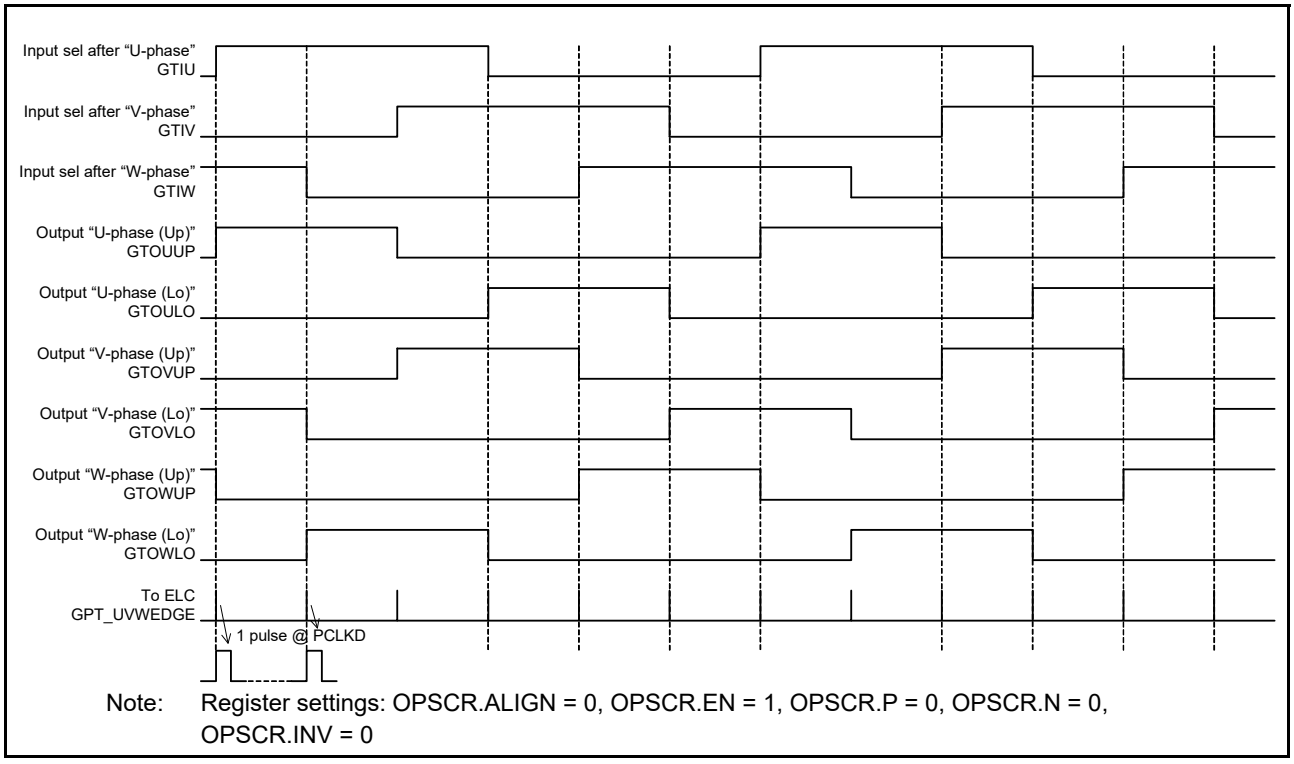


Figure 23.81 Conceptual diagram of GPT_OPS control flow

Figure 23.82 shows a 6-phase level signals output example of an GPT_OPS operation.

The GPT_UVWEDGE signal in Figure 23.82 is the Hall sensor input edge to ELC output.

Note: Register settings: OPSCR.ALIGN = 0, OPSCR.EN = 1, OPSCR.P = 0, OPSCR.N = 0, OPSCR.INV = 0

Figure 23.82 Example of 6-phase level output operation

Figure 23.83 shows a 6-phase PWM output example of the OPS operation (chopper control).

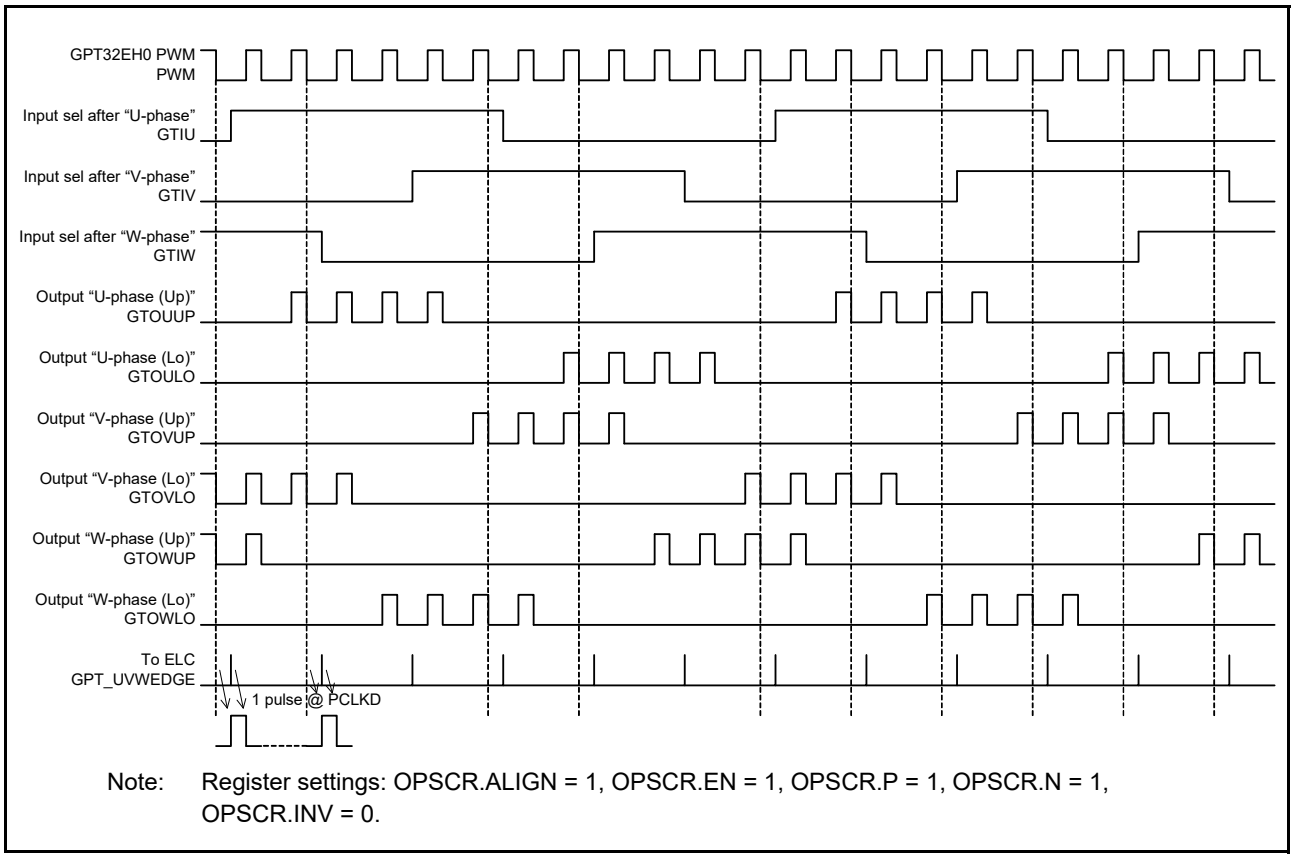

Figure 23.83 Example of 6-phase PWM output operation with chopper control

Figure 23.84 shows an example of output disable control (6-phase PWM output operation).

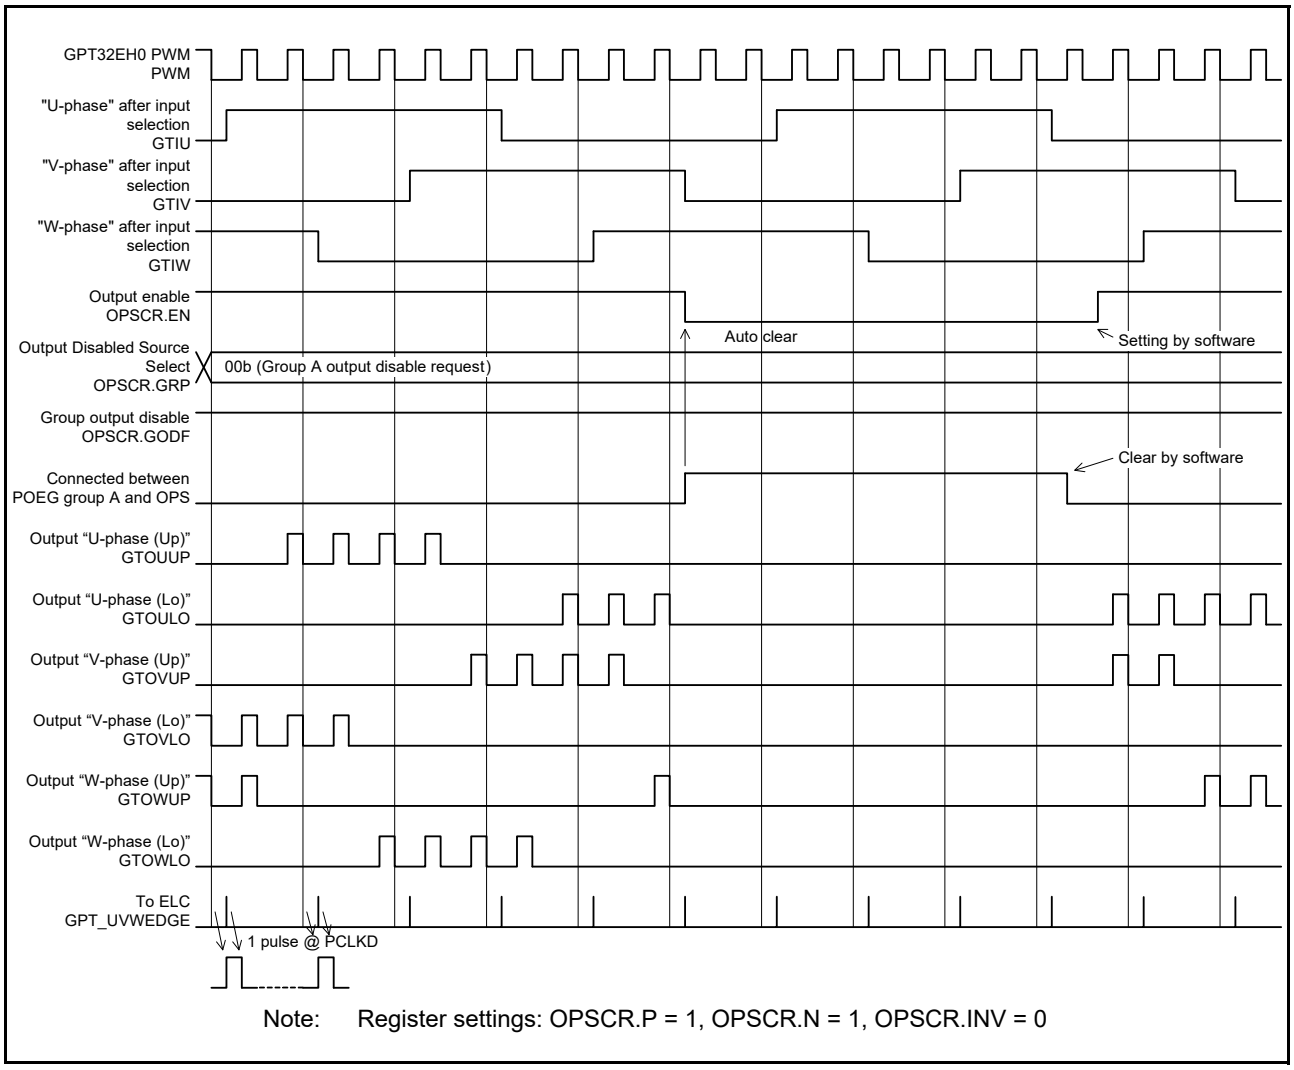

Figure 23.84 Example of group output disable control operation

23.3.11.1 Input Selection and Synchronization of External Input Signal

In the GPT_OPS control flow conceptual diagram shown in Figure 23.81, (1) is a selection of input phase from the software settings and external input by the OPSCR.FB bit.

When the OPSCR.FB bit = 0, select the external input. Enable the input signal after synchronization with the GPT core clock (PCLKD). After carrying out noise filtering (optional), set the external input to the input phase of PWM (PWM of GPT32EH0.GTIOCA) using falling edge sampling with OPSCR.ALIGN bit = 1.

When OPSCR.FB bit = 1, select the soft setting (OPSCR.UF, VF, WF) with the value of the input phase of PWM (PWM of GPT32EH0.GTIOCA) using falling edge sampling with OPSCR.ALIGN bit = 1.

When OPSCR.ALIGN bit = 0, OPS operates with the input phase of PCLKD synchronization with either OPSCR.FB bit = 0 or OPSCR.FB bit = 1. However, in some situations, the PWM pulse width of the output U/V/W phases (PWM output mode) of switch timing (just before or just after) is shortened.

Table 23.18 shows the input selection process and setting of associated OPSCR bits.

Table 23.18 Input selection processing method

Register OPSCR		Selection of input phase sampling method (U/V/W-phase)	Synchronization I/O selection process (OPS internal node name)
FB bit	ALIGN bit		
0	1	External Input at PWM Falling Edge Sampling (PCLKD synchronization + falling edge sample)	"Input Phase" Input U-Phase (gtu_sync) Input V-Phase (gtv_sync) Input W-Phase (gtw_sync)
	0	External Input at PCLKD Synchronization Output (PCLKD synchronization + through mode)	
1	1	Software Settings at PWM Falling Edge Sampling (OPSCR.UF, VF, WF of falling edge sample)	
	0	Software Setting Value Selection (= OPSCR.UF/VF/WF value) (= PCLKD synchronization)	

23.3.11.2 Input Sampling

The OPSCR.U, V, W register indicates the PCLKD sampling results of the input selected by the OPSCR.FB bit.

When OPSCR.FB bit = 0 and after synchronization with the GPT core clock (PCLKD) and noise filtering (optional), OPSCR.U, V, W register indicates the sampling results of the external input. When OPSCR.FB bit = 1, OPSCR.U, V, W register is the value (OPSCR.UF, VF, WF) of the soft setting.

23.3.11.3 Input Phase Decode

In the GPT_OPS control flow conceptual diagram shown in Figure 23.81, (2) enables the 6-phase signals by decoding the input phase selected by the OPSCR.FB bit. The 6-phase enable signal is used for internal processing of GPT_OPS.

Table 23.19 shows the decode table of input phase.

Table 23.19 Decode table for input phases

Input phase (U/V/W) (OPS internal node name)			6-phase enable [U/V/W (up/low)] by decoding input phase (OPS internal node name)					
Input U-phase	Input V-phase	Input W-phase	U-phase (up)	U-phase (low)	V-phase (up)	V-phase (low)	W-phase (up)	W-phase (low)
(gtu_sync)	(gtv_sync)	(gtw_sync)	(gtuup_en)	(gtulo_en)	(gtvup_en)	(gtvlo_en)	(gtwup_en)	(gtwlo_en)
1	0	1	1	0	0	1	0	0
1	0	0	1	0	0	0	0	1
1	1	0	0	0	1	0	0	1
0	1	0	0	1	1	0	0	0
0	1	1	0	1	0	0	1	0
0	0	1	0	0	0	1	1	0
0	0	0	0	0	0	0	0	0
1	1	1	0	0	0	0	0	0

23.3.11.4 Output Selection Control

In the GPT_OPS control flow conceptual diagram in Figure 23.81, (3) presents the selection of the output waveform by setting the OPSCR register bit.

For output selection, the following bits are relevant:

- The OPSCR.EN bit controls whether to output the 6-phase output, or to stop
- The OPSCR.P and OPSCR.N bits can select from the level signal or PWM signal (chopper output) for the output

phase

- The polarity of the output phase can be set to positive logic or negative logic by the OPSCR. INV bit.

Table 23.20 and Table 23.21 show the output selection control method using the OPSCR register bit.

Table 23.20 Output selection control method (positive phase)

Enable-phase output control	Positive-phase output (P) control	Invert-phase output control	Output port name (positive phase = up) (output selection internal node allocation)	
OPSCR.EN bit	OPSCR.P bit	OPSCR.INV bit	GTOUUP GTOVUP GTOWUP	Mode
0	x	x	0	Output Stop (External pin: Hi-Z) GPT_OPS=> 0 output
1	0	0	Level signal (gtuup_en) (gtvup_en) (gtwup_en)	Level Output mode (Positive phase) (Positive logic)
1	0	1	Level signal (~gtuup_en) (~gtvup_en) (~gtwup_en)	Level Output mode (Positive phase) (Negative logic)
1	1	0	PWM signal (PWM & gtuup_en) (PWM & gtvup_en) (PWM & gtwup_en)	PWM Output mode (Positive phase) (Positive logic)
1	1	1	PWM signal (~(PWM & gtuup_en)) (~(PWM & gtvup_en)) (~(PWM & gtwup_en))	PWM Output mode (Positive phase) (Negative logic)

Table 23.21 Output selection control method (negative phase)

Enable-phase output control	Negative-phase output (N) control	Invert-phase output control	Output port name (negative phase = low) (output selection internal node allocation)	
OPSCR.EN bit	OPSCR.N bit	OPSCR.INV bit	GTOULO GTOVLO GTOWLO	Mode
0	x	x	0	Output Stop (External pin: Hi-Z) GPT_OPS=> 0 output
1	0	0	Level signal (gtulo_en) (gtvlo_en) (gtwlo_en)	Level Output mode (Negative phase) (Positive logic)
1	0	1	Level signal (~gtulo_en) (~gtvlo_en) (~gtwlo_en)	Level Output mode (Negative phase) (Negative logic)
1	1	0	PWM signal (PWM & gtulo_en) (PWM & gtvlo_en) (PWM & gtwlo_en)	PWM Output mode (Negative phase) (Positive logic)
1	1	1	PWM signal (~(PWM & gtulo_en)) (~(PWM & gtvlo_en)) (~(PWM & gtwlo_en))	PWM Output mode (Negative phase) (Negative logic)

23.3.11.5 Output Selection Control (Group Output Disable Function)

When OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP bit is high (output disable request), the GPT_OPS output pins change to Hi-Z asynchronously and the OPSCR.EN bit is set to 0 by the output disable request signal synchronized with PCLKD. For the return, set the OPSCR.EN to 1 after clearing the output disable request with software.

The timing of OPSCR.EN bit cleared to 0 is 3 PCLKD cycles after generating the output disable request. To perform output disable control reliably, allow at least 4 PCLKD cycles after generating the output disable request (by clearing the output disable request flag in POEG) until the output disable request is terminated. For an example of the operation of group output disable control, see Figure 23.84.

23.3.11.6 Event Link Controller (ELC) Output

In the GPT_OPS control flow conceptual diagram shown in Figure 23.81, (5) outputs the hall sensor input signal edge to the ELC.

The hall sensor input edge signal is the logical OR of the rising and falling edge signals of each U-phase/V-phase/W-phase of input sampled at PCLKD. That is, if the high period of each of the U-phase/V-phase/W-phase input is short in duration, the hall sensor edge input signal is not output at that time.

When OPSCR.FB bit = 0, the hall sensor input edge signal is the logical OR of the edge signals of the external input phase sampled at PCLKD. When OPSCR.FB bit = 1, the hall sensor input edge signal is the logical OR of the edge of the soft setting (OPSCR.UF, VF, WF) sampled at PCLKD.

See Figure 23.82 to Figure 23.84 for examples of the output signal to the ELC.

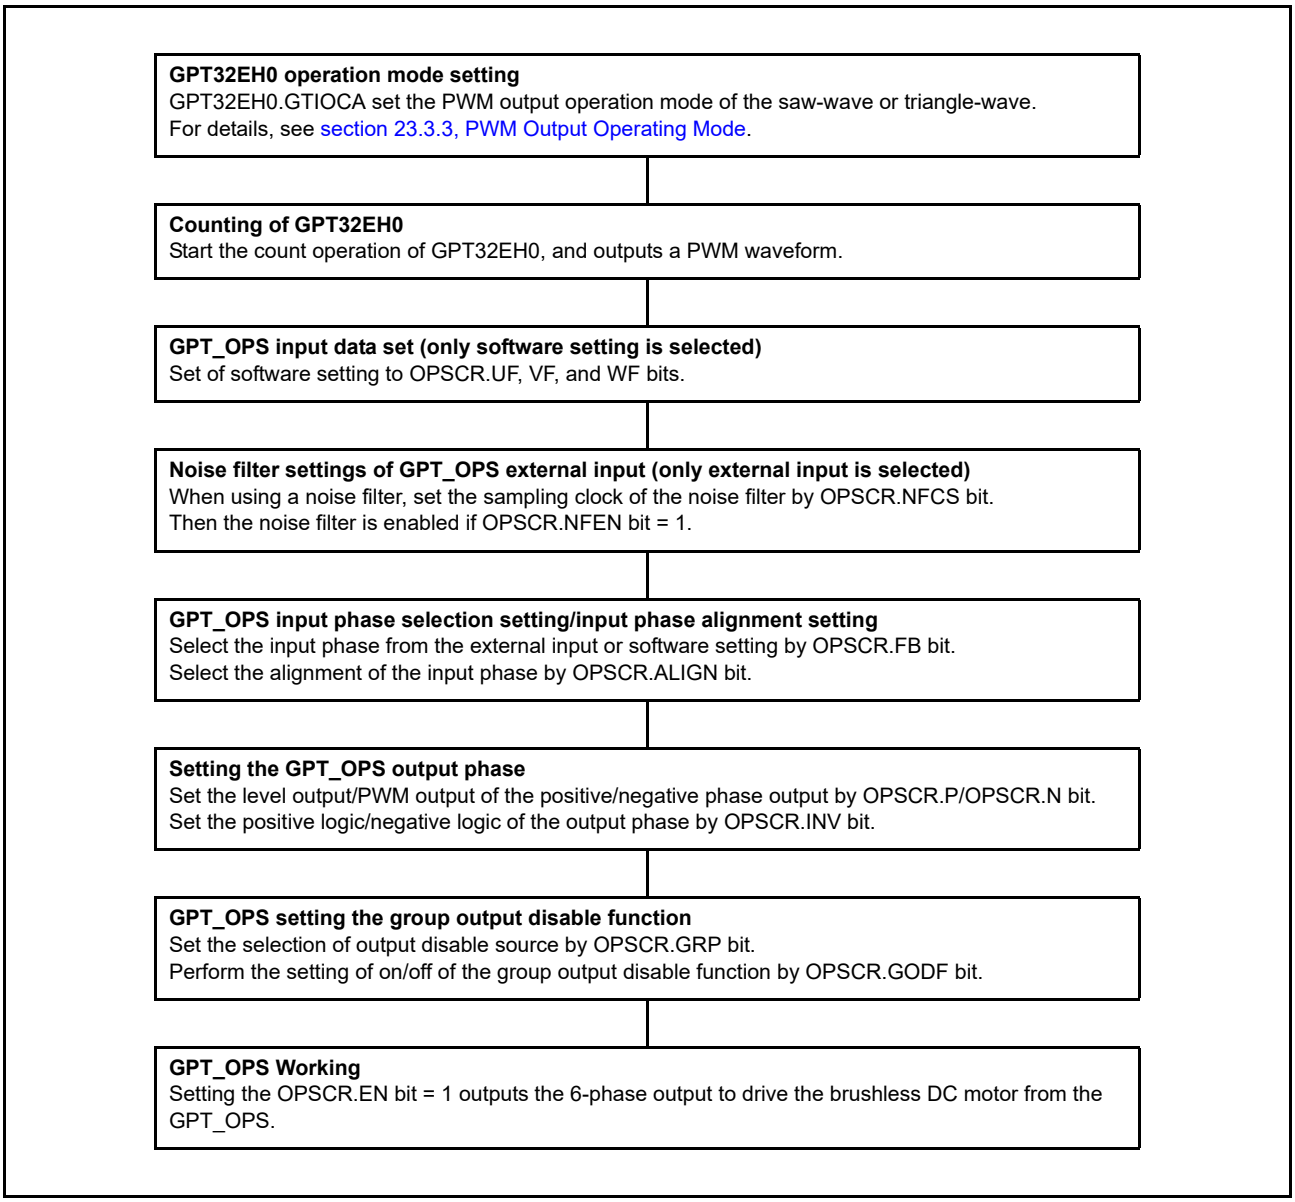

Figure 23.85 Example setting for of GPT_OPS start operation

23.4 Interrupt Sources

23.4.1 Interrupt Sources

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTADTR compare match
- GTCNT counter overflow (GTPR compare match)/underflow.

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear happen at the same time, flag clear takes priority over flag set. These flags are automatically updated by internal state. Table 23.22 lists the GPT interrupt sources.

Table 23.22 Interrupt sources (1 of 4)

Channel	Name	Interrupt source	Interrupt flag	DMAC/DTC activation
0	GPT0_CCMPA	GPT32EH0.GTCCRA input capture/compare match	TCFA	Possible
	GPT0_CCMPB	GPT32EH0.GTCCRB input capture/compare match	TCFB	Possible

(1) GPTn_ADTRGA interrupt (n = 0 to 7)

When the GTCNT counter value matches with the GTADTRA register, an interrupt request is generated under the following condition:

- In up-counting, the interrupt enable bit (ADTRAUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRADEN) in the GTINTAD register is 1.

In event count operation performing, this interrupt request is not generated.

(2) GPTn_ADTRGB interrupt (n = 0 to 7)

When the GTCNT counter value matches with the GTADTRB register, an interrupt request is generated under the following condition:

- In up-counting, the interrupt enable bit (ADTRBUEN) in the GTINTAD register is 1
- In down-counting, the interrupt enable bit (ADTRBDEN) in the GTINTAD register is 1.

In event count operation performing, this interrupt request is not generated.

(3) GPTn_CCMPA interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register.
- When the GTCCRA register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRA register.

(4) GPTn_CCMPB interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register.
- When the GTCCRB register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRB register.

(5) GPTn_CMPC interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and an interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

(6) GPTn_CMPD interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and therefore interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

(7) GPTn_CMPE interrupt (n = 0 to 13)

An interrupt request is generated under the following condition.

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and an interrupt is not requested under the following conditions.

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register)

(8) GPTn_CMPF interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and therefore interrupt is not requested under the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

(9) GPTn_OVF interrupt (n = 0 to 13)

An interrupt request is generated under the following conditions:

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (GTCNT changes from GTPR to GTPR-1)
- In counting by hardware sources, overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

(10) GPTn_UDF interrupt (n = 0 to 13)

An interrupt request is generated under the following conditions:

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting).
- In triangle-wave mode, interrupt requests are enabled at troughs (GTCNT changes from 0 to 1).
- In counting by hardware sources, underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

Table 23.23 Interrupt signals, interrupt permission bits, and interrupt status flags

Interrupt signal	Interrupt permission bit	Interrupt status flag
GPTn_UDF	— *1	GTST[7] (TCFPU)
GPTn_OVF		GTST[6] (TCFPO)
GPTn_ADTRGB	GTINTAD[19] (ADTRBDEN) GTINTAD[18] (ADTRBUEN)	GTST[19] (ADTRBDF) GTST[18] (ADTRBUF)
GPTn_ADTRGA	GTINTAD[17] (ADTRADEN) GTINTAD[16] (ADTRAUEN)	GTST[17] (ADTRADF) GTST[16] (ADTRAUF)
GPTn_CMPF	— *1	GTST[5] (TCFF)
GPTn_CMPE		GTST[4] (TCFE)
GPTn_CMPD		GTST[3] (TCFD)
GPTn_CMPC		GTST[2] (TCFC)
GPTn_CCMPB		GTST[1] (TCFB)
GPTn_CCMPA		GTST[0] (TCFA)

Note 1. Interrupt is always permitted.

23.4.2 DMAC/DTC Activation

The DMAC and DTC can be activated by the interrupt in each channel. For details, see section 14, Interrupt Controller Unit (ICU), and section 18, Data Transfer Controller (DTC).

23.4.3 Interrupt and A/D Conversion Request Skipping Function

By setting the GTITC register, the GTCNT counter overflow (GTPR compare match) interrupt (GPTn_OVF) and underflow interrupt (GPTn_UDF) can be skipped. Other interrupts and A/D converter start request signals can be skipped in coordination with the GPTn_OVF/GPTn_UDF skipping function.

The interrupt request skipping function only depends on the setting of GTITC register and is independent of the setting of interrupt permission bits in the GTINTAD register.

When both troughs and crests are counted and skipped in triangle-wave mode, if the number of times of skipping is odd, GPTn_OVF/GPTn_UDF interrupt requests cannot be generated at troughs only or at crests only depending on the

skipping counter start timing. To count both troughs and crests and generate the GPTn_OVF/GPTn_UDF interrupts at troughs only or crests only in triangle-wave mode, you must set an even number of skips.

Similarly, in saw-wave mode, when both overflows and underflows are counted and skipped with the count direction changed, GPTn_OVF interrupt requests cannot be generated on either overflows or underflows only. To count both overflows and underflows with the count direction changed and generate the GPTn_OVF/GPTn_UDF interrupts on either overflows or underflows only in saw wave mode, first check the skipping state carefully.

Before changing the skipping count, you must release the skipping count setting (GTITC.IVTC[1:0] bits = 00b).

Figure 23.86 to Figure 23.91 show examples of skipping function operation.

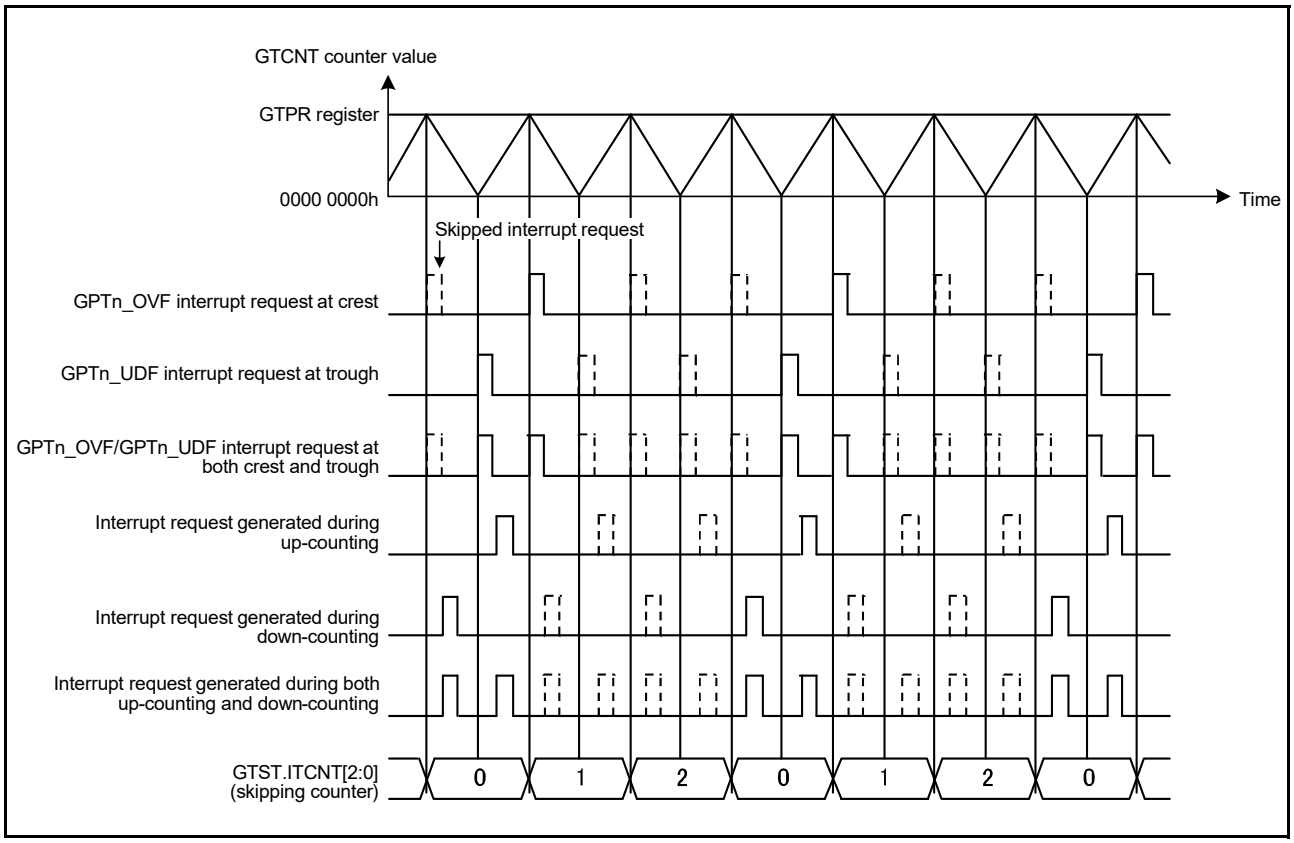

Figure 23.86 Example of interrupt skipping function operation with triangle waves, counting and skipping crests, and skipping count = 2

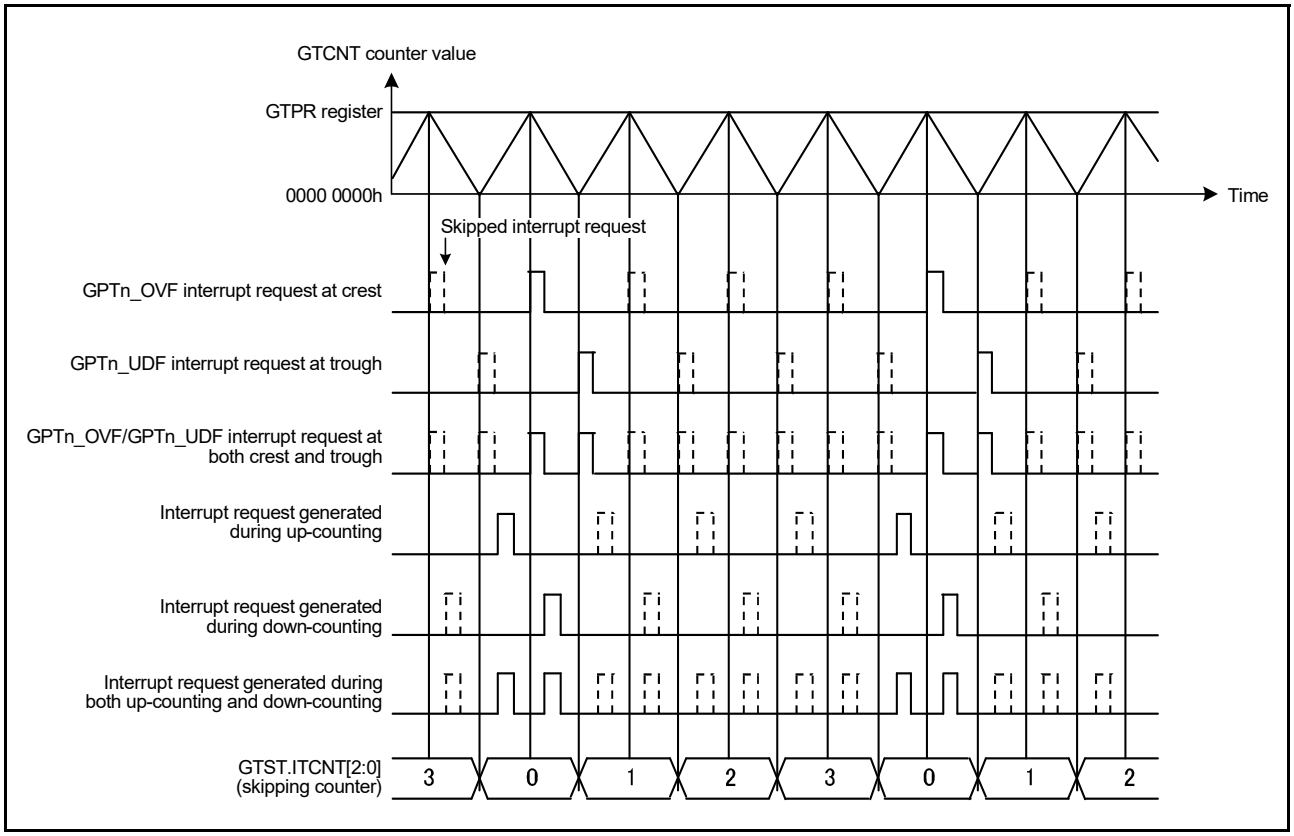

Figure 23.87 Example of interrupt skipping function operation with triangle waves, counting and skipping troughs, and skipping count = 3

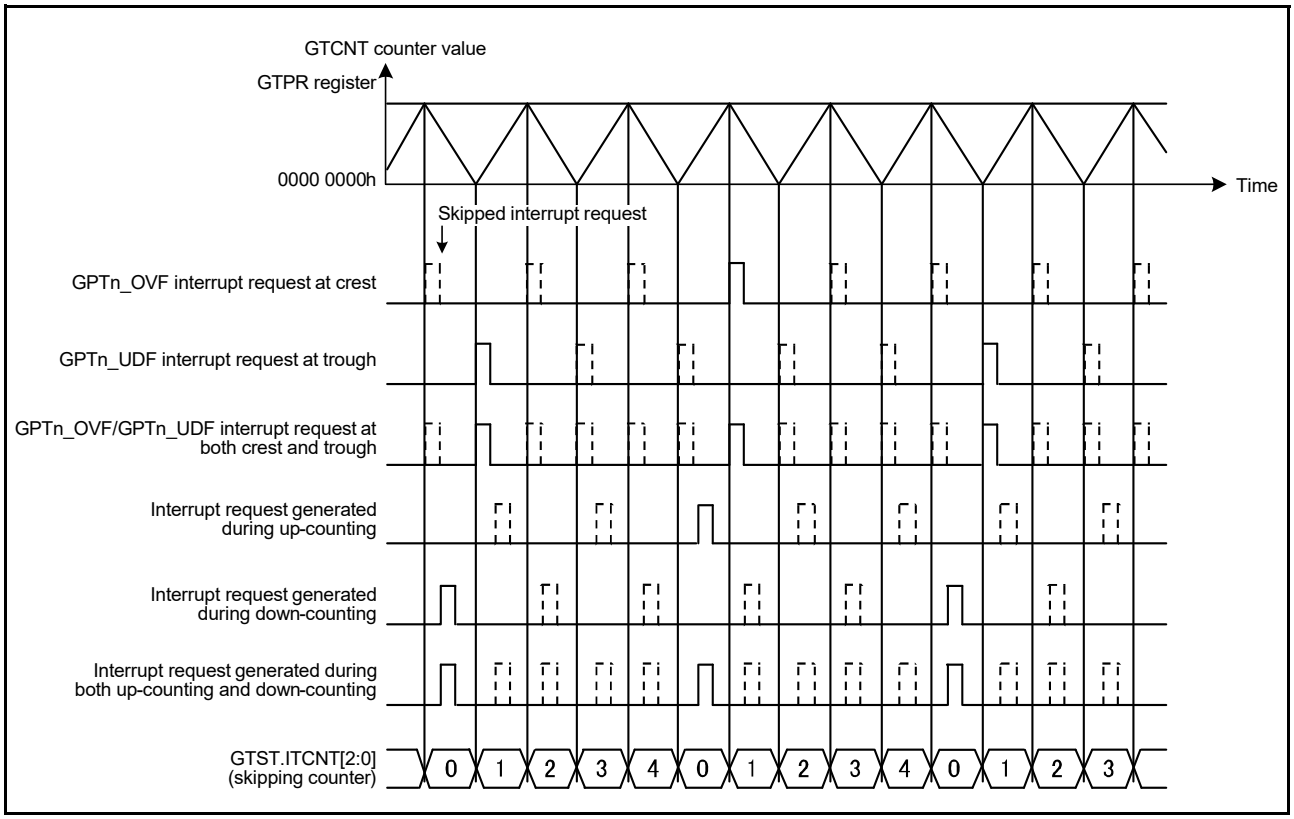

Figure 23.88 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, and skipping count = 4

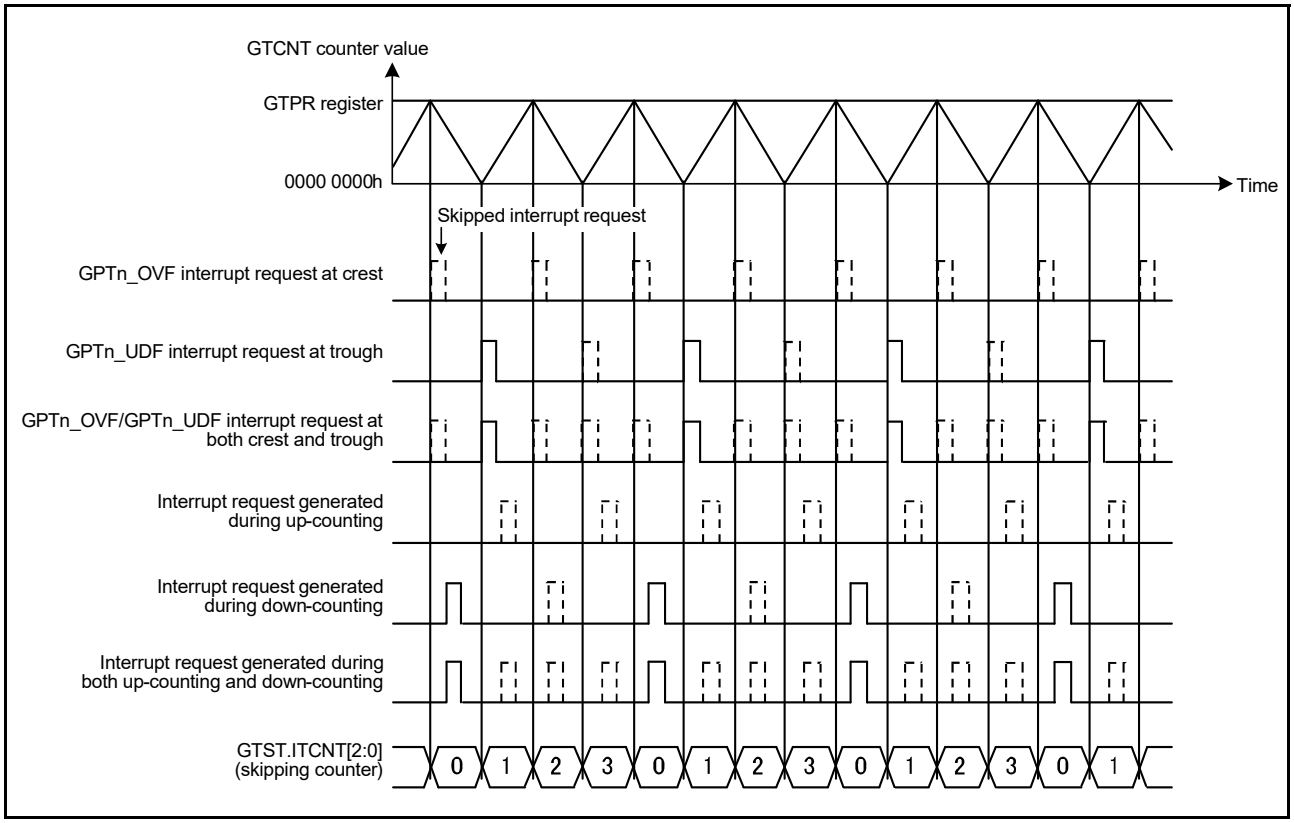

Figure 23.89 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, skipping count = 3, and skipping started at up-counting

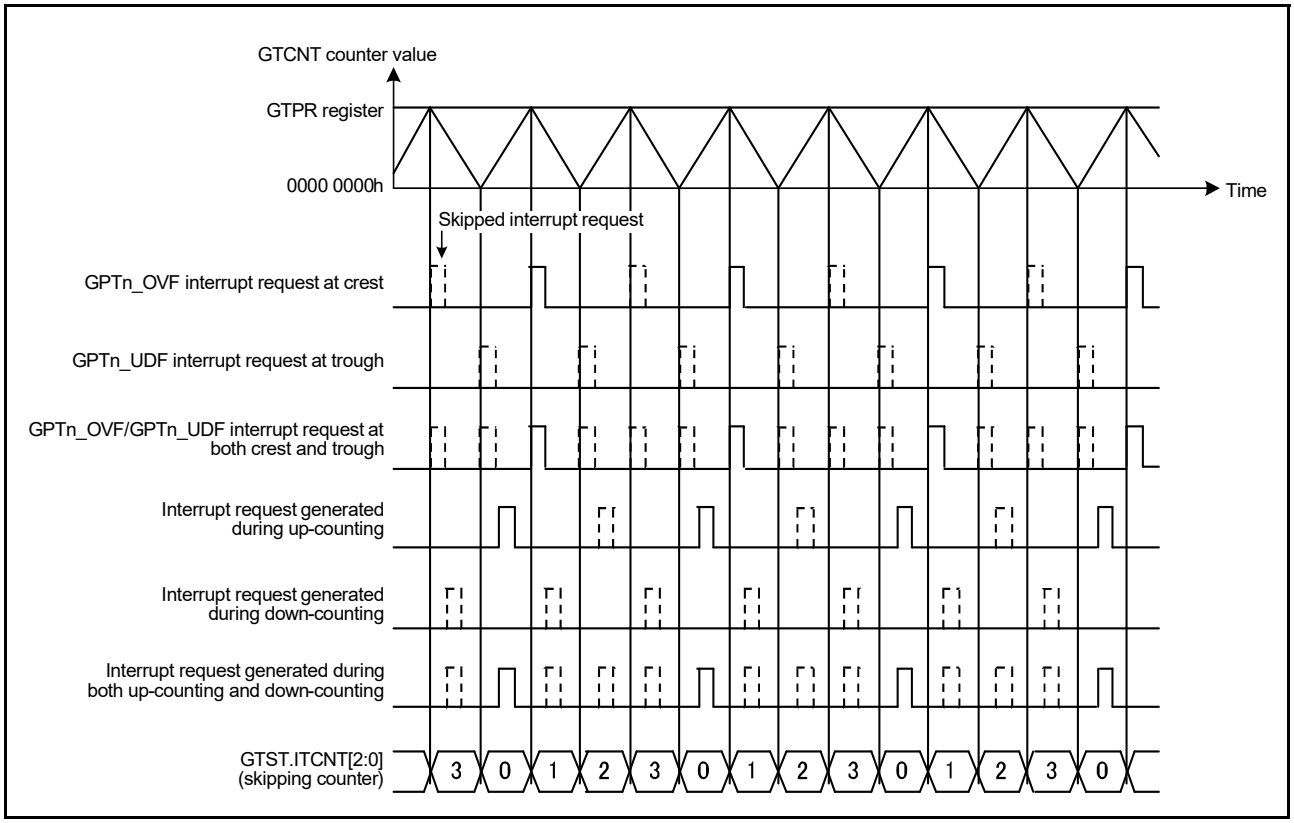

Figure 23.90 Example of interrupt skipping function operation with triangle waves, counting and skipping both troughs and crests, skipping count = 3, and skipping started at down-counting

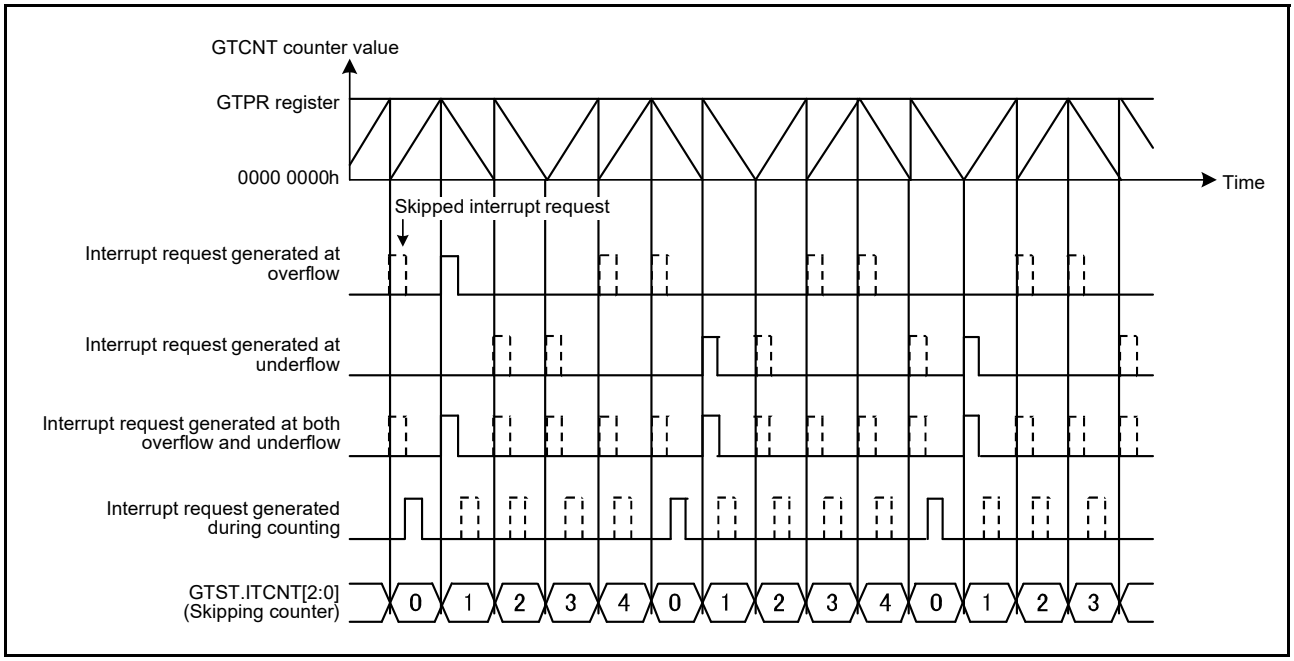

Figure 23.91 Example of interrupt skipping function operation with saw waves, operation with count direction changed, counting and skipping both overflows and underflows, and skipping count = 4

23.5 A/D Converter Start Request

An A/D converter start request can be issued at a compare match between the GTCNT counter and GTADTRA or GTADTRB, and up-counting only, down-counting only, or both up-counting and down-counting can be specified.

In event count operation performing, A/D converter start requests interrupt cannot be generated. An A/D converter start request does not direct output to the A/D converter module but results in output to ELC as event signals.

GTADTRA and GTADTRB each has two buffer registers. Buffer operation with GTADTRA combined with GTADTBRA and GTADTDBRA, and buffer operation with GTADTRB combined with GTADTBRB and GTADTDBRB can be performed.

Figure 23.92 shows an example of A/D converter start request operation, and Figure 23.93 shows an example setting for A/D converter start request operation.

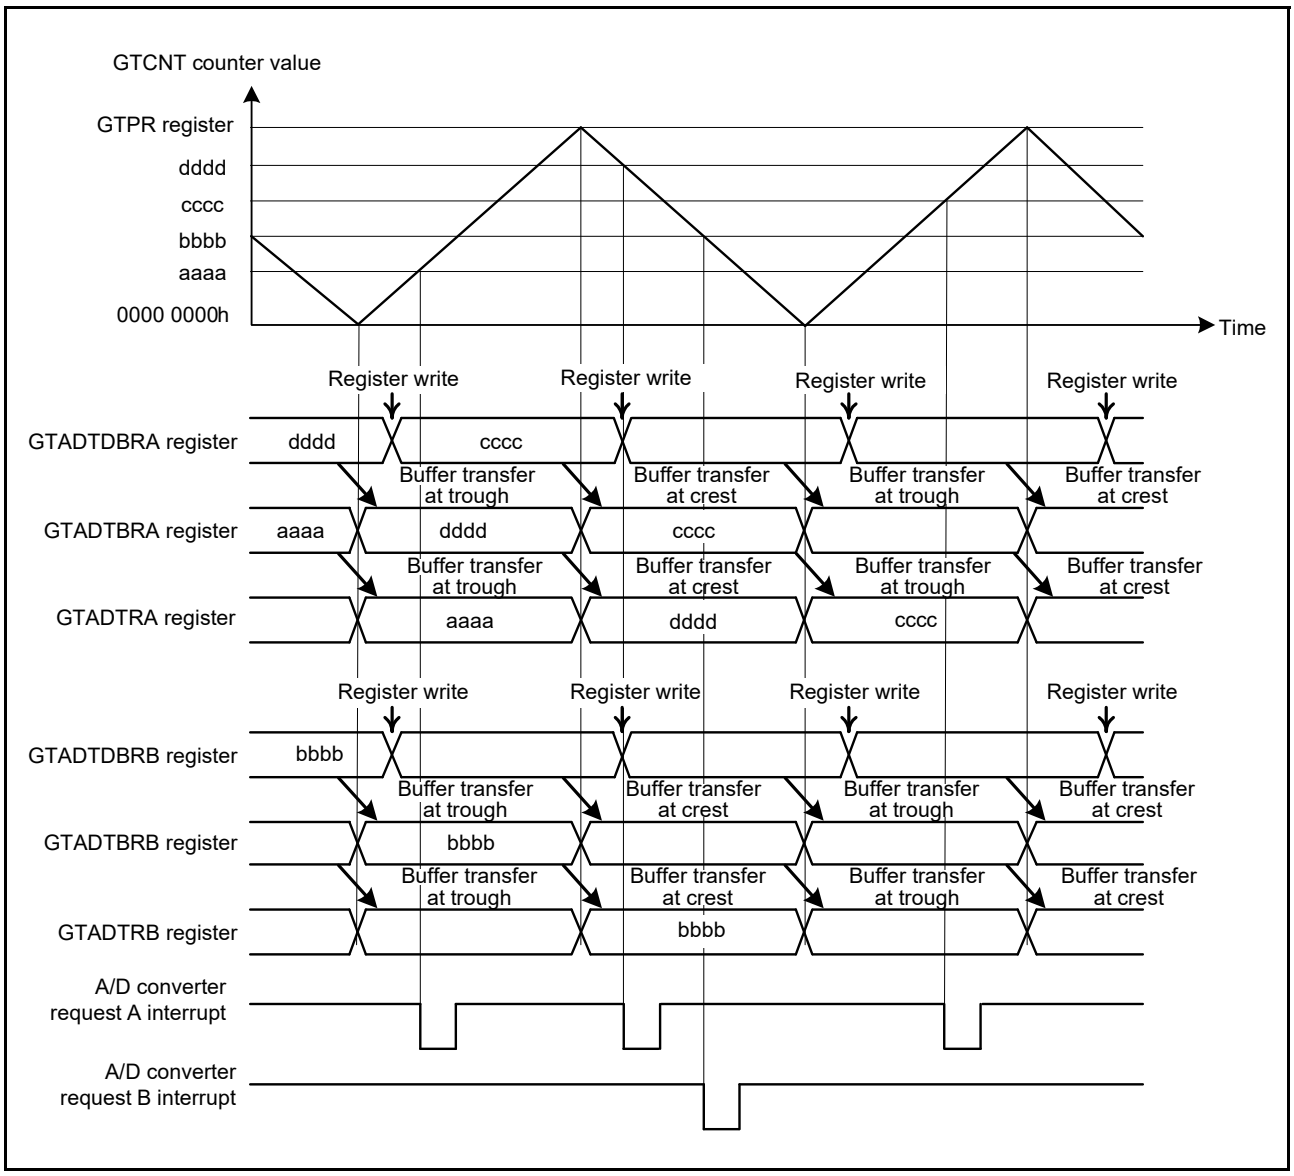

Figure 23.92 Example of A/D converter start request timing operation with triangle waves, double buffer operation, buffer transfer at both troughs and crests, A/D converter start request interrupt by GTADTRA at both up-counting and down-counting, and A/D converter start request interrupt by GTADTRB at down-counting

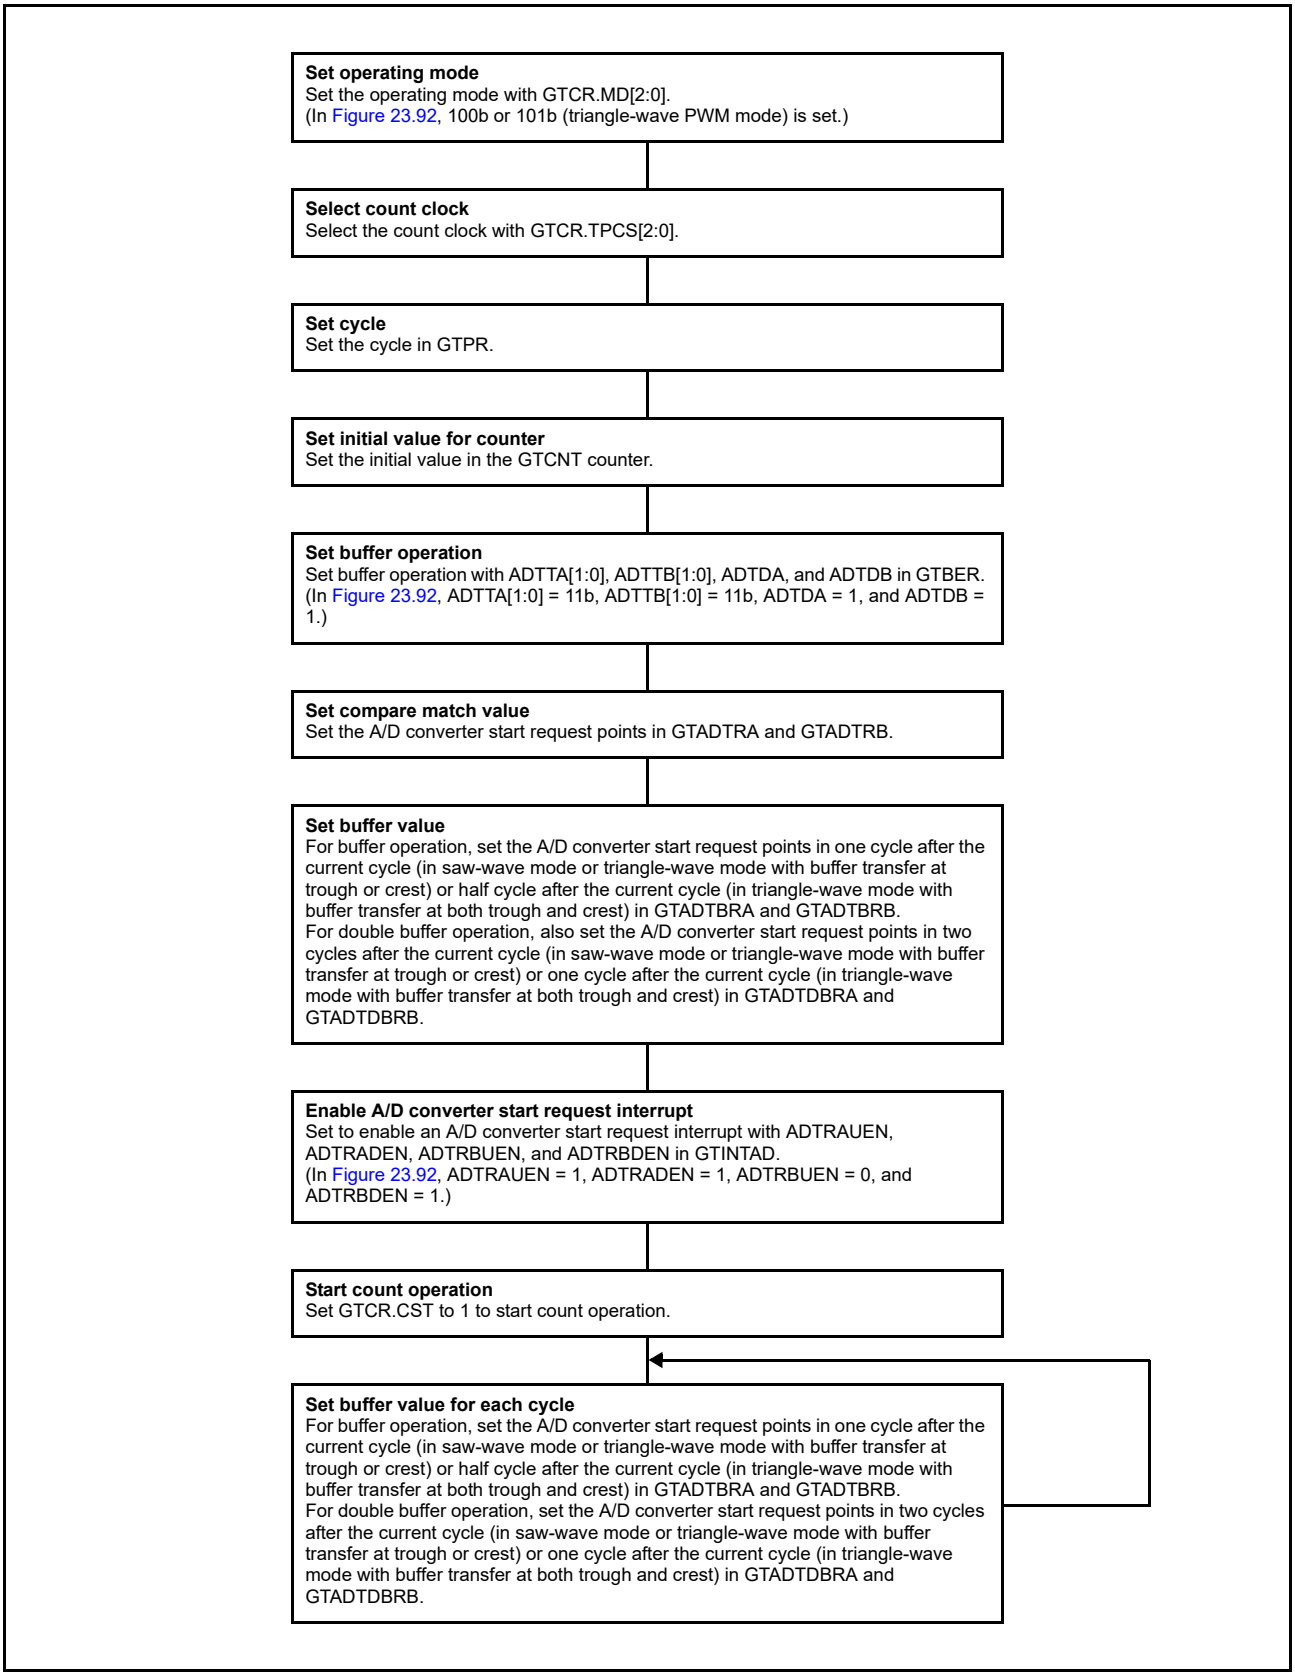

Figure 23.93 Example setting for A/D converter start request timing operation

23.6 Operations Linked by the ELC

23.6.1 Event Signal Output to the ELC

GPT is capable of operation linked with another module set in advance when its interrupt request signal is used as an event signal by the ELC.

A/D converter start requests can be enabled and disabled individually with each up-counting and down-counting for both interrupts and events output to ELC by enable bits of the interrupt request.

The GPT has the following ELC event signals:

- Generating of compare match A interrupt (GPTn_CCMPA (n= 0 to 13))
- Generating of compare match B interrupt (GPTn_CCMPB (n= 0 to 13))
- Generating of compare match C interrupt (GPTn_CMPC (n= 0 to 13))
- Generating of compare match D interrupt (GPTn_CMPD (n= 0 to 13))
- Generating of compare match E interrupt (GPTn_CMPE (n= 0 to 13))
- Generating of compare match F interrupt (GPTn_CMPF (n= 0 to 13))
- Generating of overflow interrupt (GPTn_OVF (n= 0 to 13))
- Generating of underflow interrupt (GPTn_UDF (n= 0 to 13))
- A/D converter start request A interrupt (GPTn_ADTRGA (n= 0 to 7))
- A/D converter start request B interrupt (GPTn_ADTRGB (n= 0 to 7)).

23.6.2 Event Signal Inputs from the ELC

The GPT can perform the following operations in response to a maximum of eight events from the ELC:

- Start counting, stop counting, clear counting
- Up-counting, down counting
- Input capture.

See section 23.3, Operation for detail on hardware resources.

23.7 Noise Filter Function

Each pin for use in input capture and hall sensor input to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than three sampling cycles.

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

Figure 23.94 shows the timing of noise filtering.

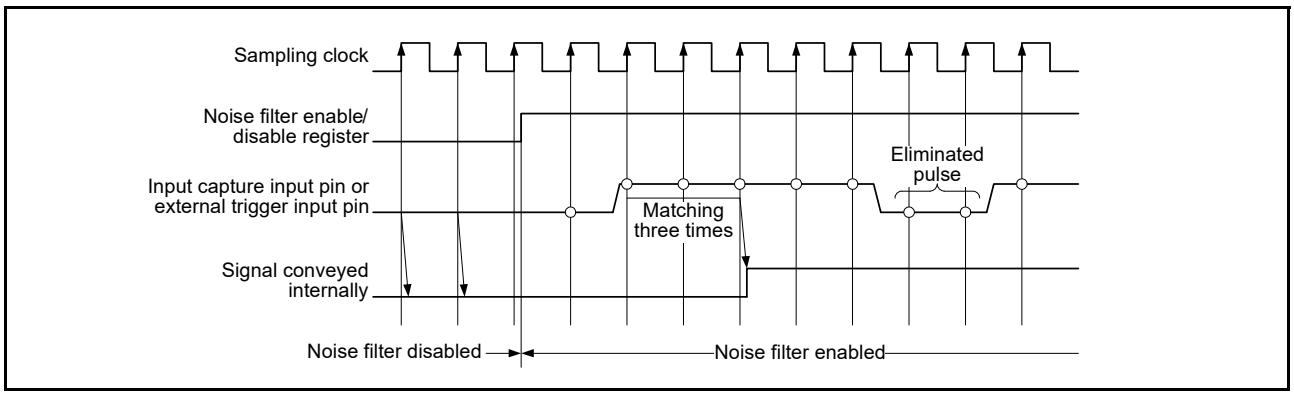

Figure 23.94 Timing of noise filtering

If noise filtering is enabled, the input capture operation or external trigger operation performs on the edges of the noise filtered signal after a delay of a minimum sampling interval × 2 + PCLKD. This is caused by the noise filtering for the input capture input or external trigger operation.

23.8 Protection Function

23.8.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTIBCSR, GTCR, GTUDDTYC, GTIOR, GTINTAD,GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR,

GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR.

23.8.2 Disabling of Buffer Operation

If the timing of buffer register write is delayed in relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD setting. Buffer transfer can be temporarily disabled even when a buffer transfer condition is generated during a buffer register write. This can be done by setting the associated GTBER.BD bit to 1 (buffer operation disabled) before a buffer register write and clearing the bit to 0 (buffer operation enabled) after completion of writing to all buffer registers. Figure 23.95 shows an example of operation for disabling buffer operation.

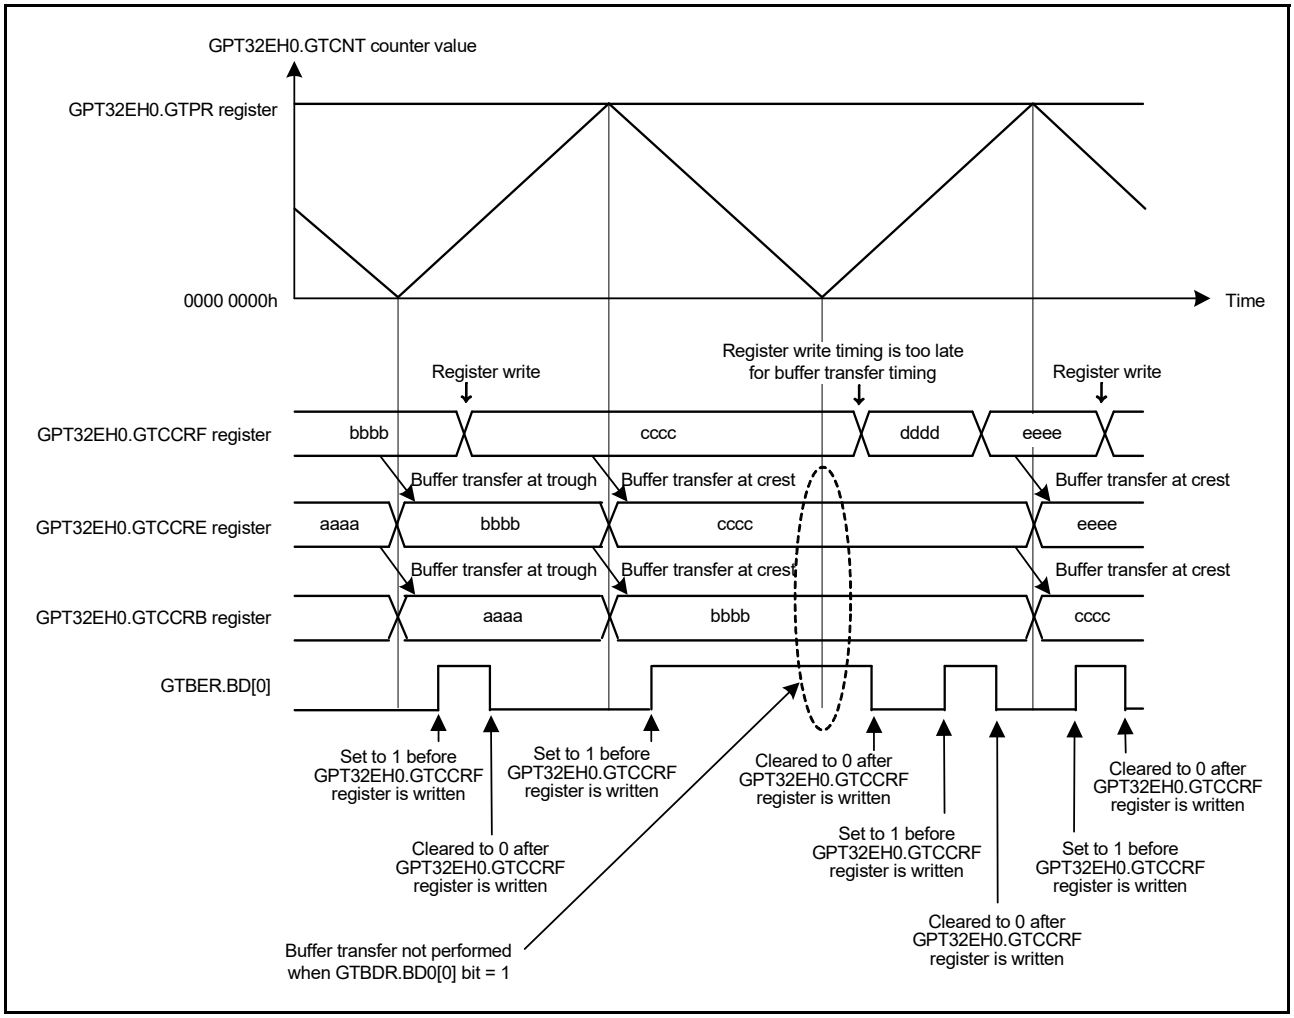

Figure 23.95 Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests

23.8.3 GTIOC Pin Output Negate Control

For protection from system failure, the output disable control that changes the GTIOC pin output value forcibly is provided for GTIOC pin output by the request of output disable from POEG.

When dead time error occurs or the GTIOCA pin output value is the same as the GTIOCB pin output value, output protection is required. GPT detects this condition and generates output disable requests to POEG based on the settings in the output disable request permission bits, such as GTINTAD.GRPDTE, GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG receives output disable requests from each channel and calculates external input using an OR operation, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCA pin and the GTIOCB pin) out of four output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected disable output request is monitored by reading the GTST.ODF bit. The output level during output disable is based on the GTIOR.OADF[1:0] setting for the GTIOCA pin and the GTIOR.OBDF[1:0] setting for the GTIOCB pin.

The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. The timing of release of the output disable state is a minimum of 3 PCLKD cycles after terminating the output disable request. To perform output disable control reliably, allow at least 4 PCLKD cycles after generating the output disable request (by clearing the output disable request flag in POEG) until the output disable request is terminated.

When event count is performed or when the output disable state is to be released immediately without waiting for an end of cycle, GTIOR.OADF[1:0] must be set to 00b (for GTIOCA pin) or GTIOR.OBDF[1:0] must be set to 00b (for GTIOCB pin).

Figure 23.96 shows an example of the GTIOC pin output disable control operation.

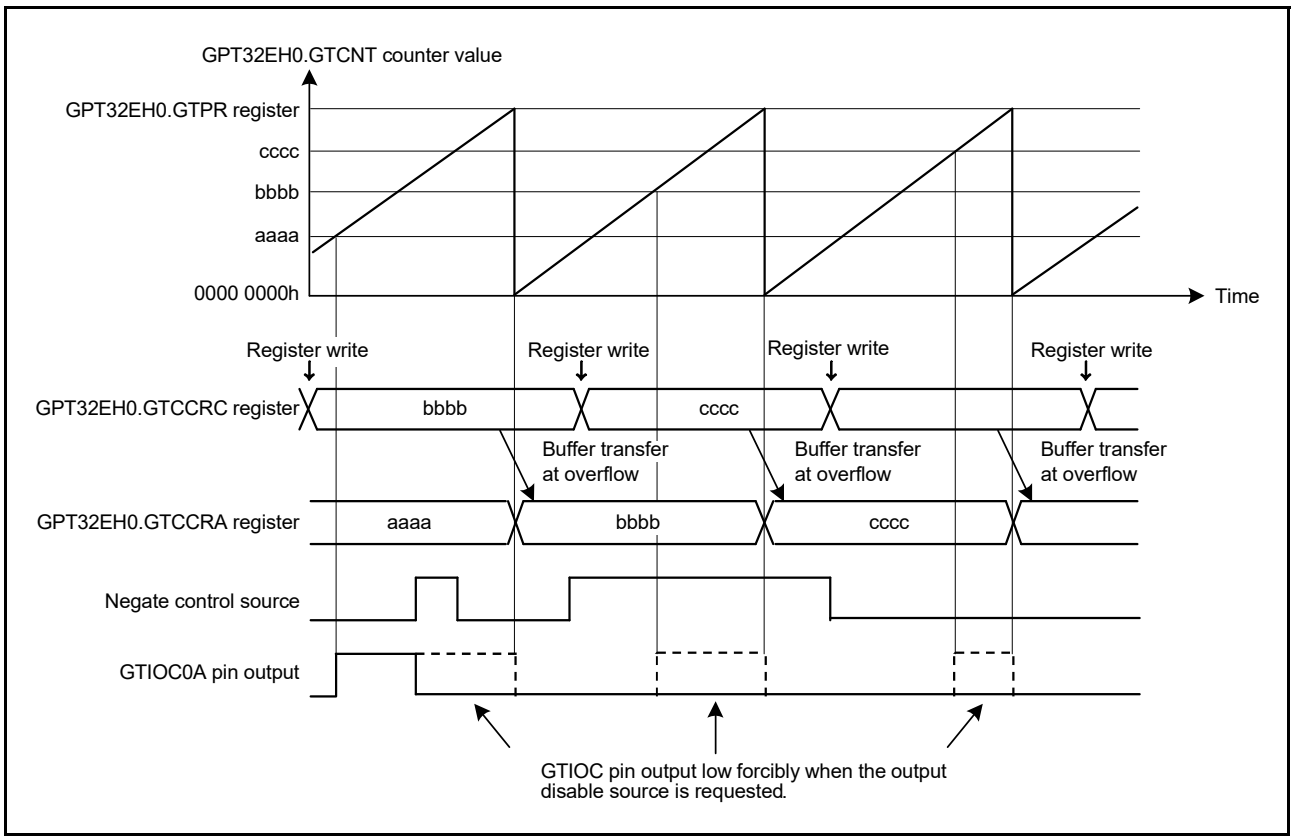

Figure 23.96 Example of GTIOC pin output disable control operation with saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable

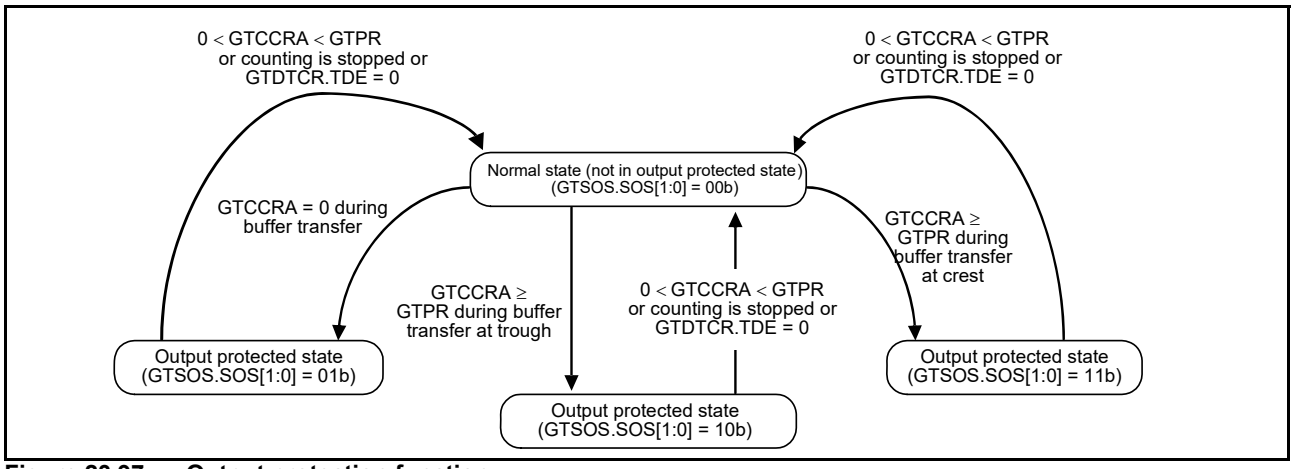
23.8.4 Output Protection Function for GTIOC Pin Output

In preparation for incorrect settings of the GTCCRA register (settings outside the range of 0 < GTCCRA < GTPR), the output protection function for the GTIOC pin output (disabling function) is activated when the automatic dead time setting (GTDTCR.TDE = 1) is made in triangle-wave mode. The status of the output protection function can be read from GTSOS.SOS[1:0].

Figure 23.97 shows the output protection function state transition.



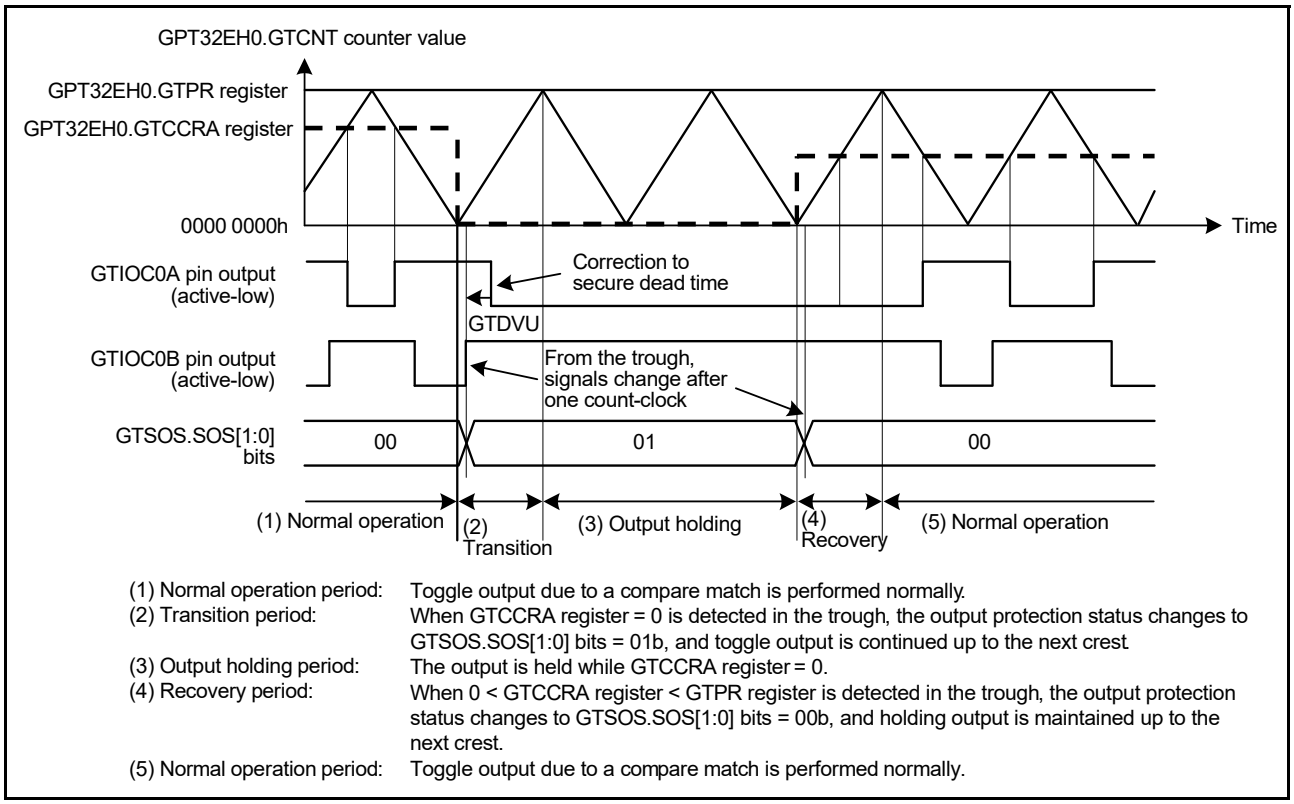


Figure 23.97 Output protection function

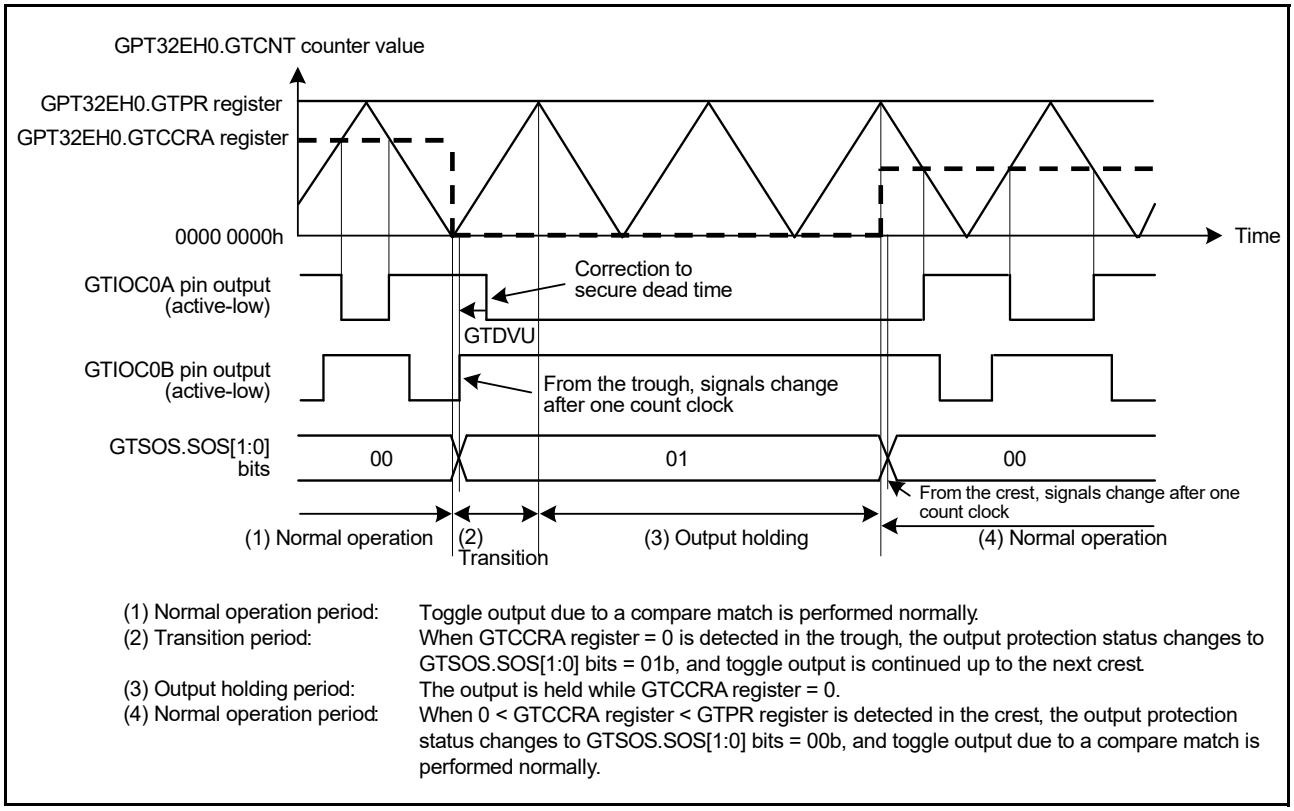
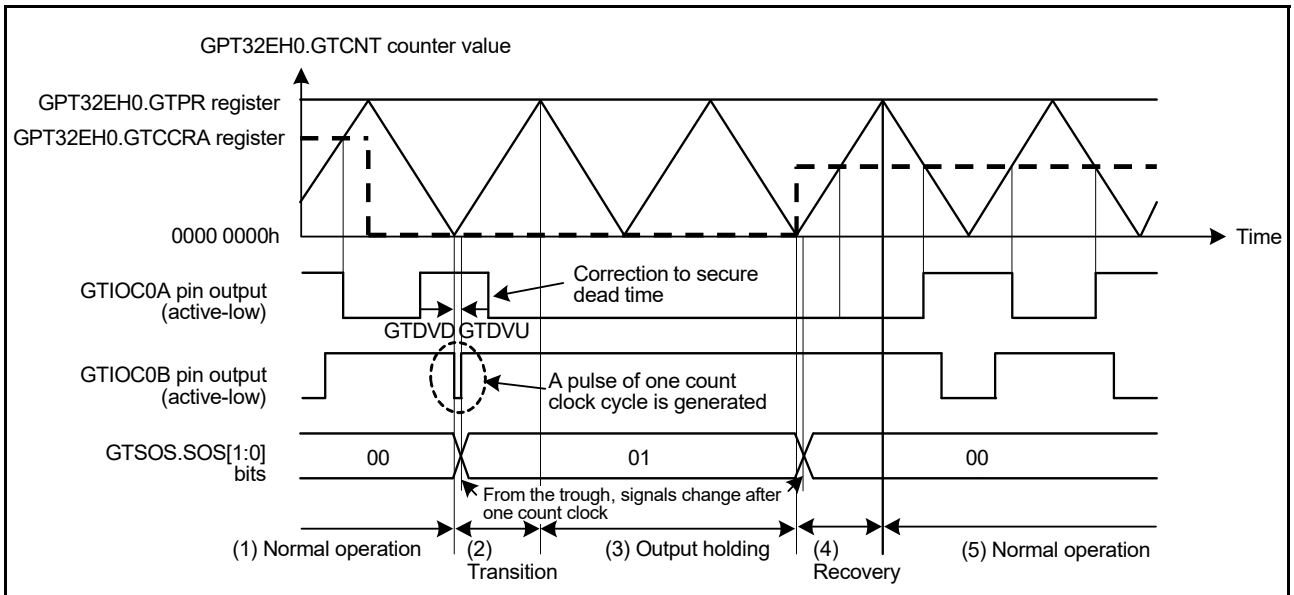


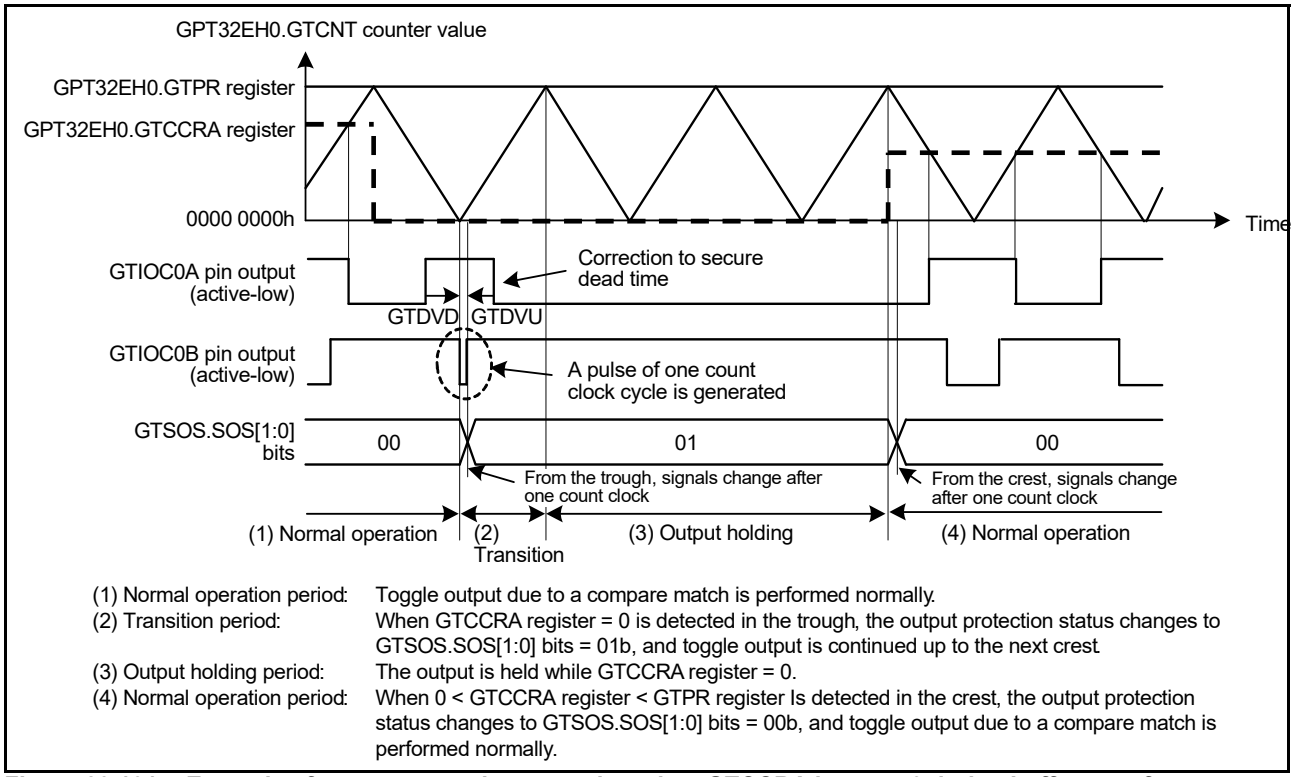
23.8.4.1 Output Protection Function When the GTCCRA Register is Set to 0 during Buffer Transfer

Figure 23.98 and Figure 23.99 show examples of output protection function operation when the GTCCRA register is set to 0 during buffer transfer at troughs, and Figure 23.100 and Figure 23.101 show examples when the GTCCRA register is set to 0 during buffer transfer at crests.



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA register = 0.
(4) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 23.98 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

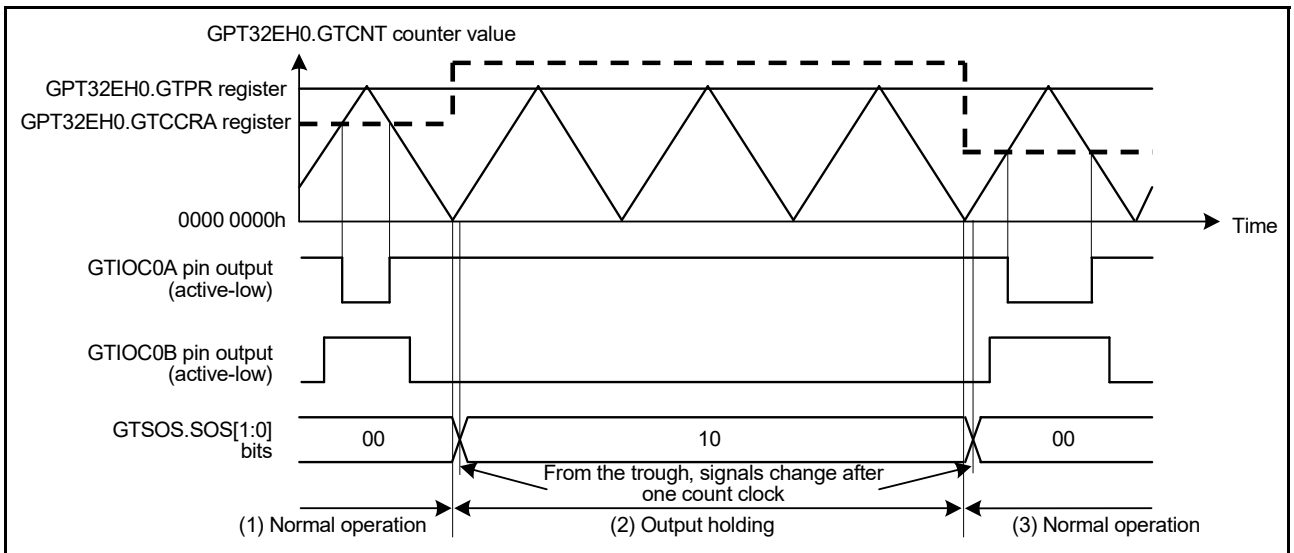


(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA register = 0.
(4) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 23.99 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low

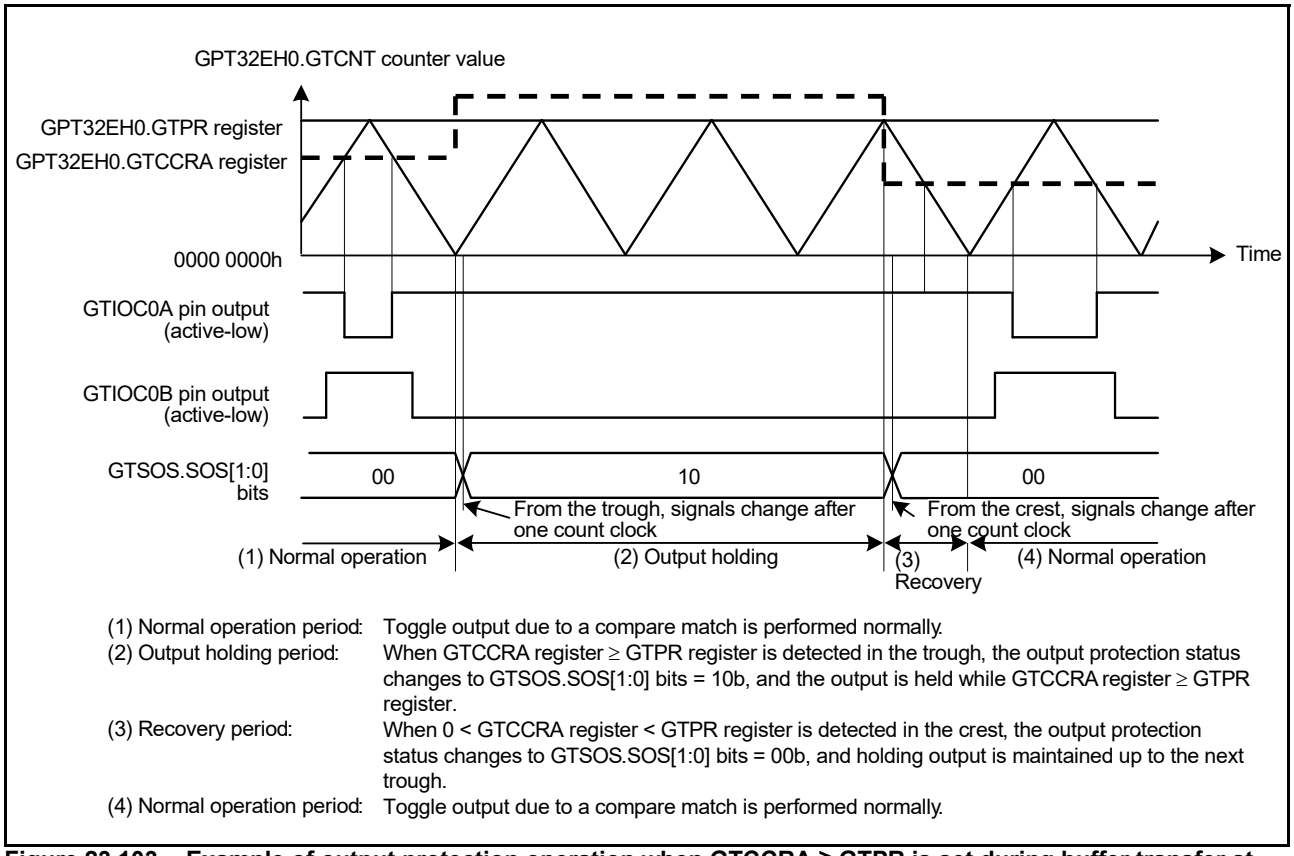
(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA register = 0.
(4) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 23.100 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA register = 0.
(4) Normal operation period: When 0 < GTCCRA register < GTPR register Is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 23.101 Example of output protection operation when GTCCRA is set to 0 during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low

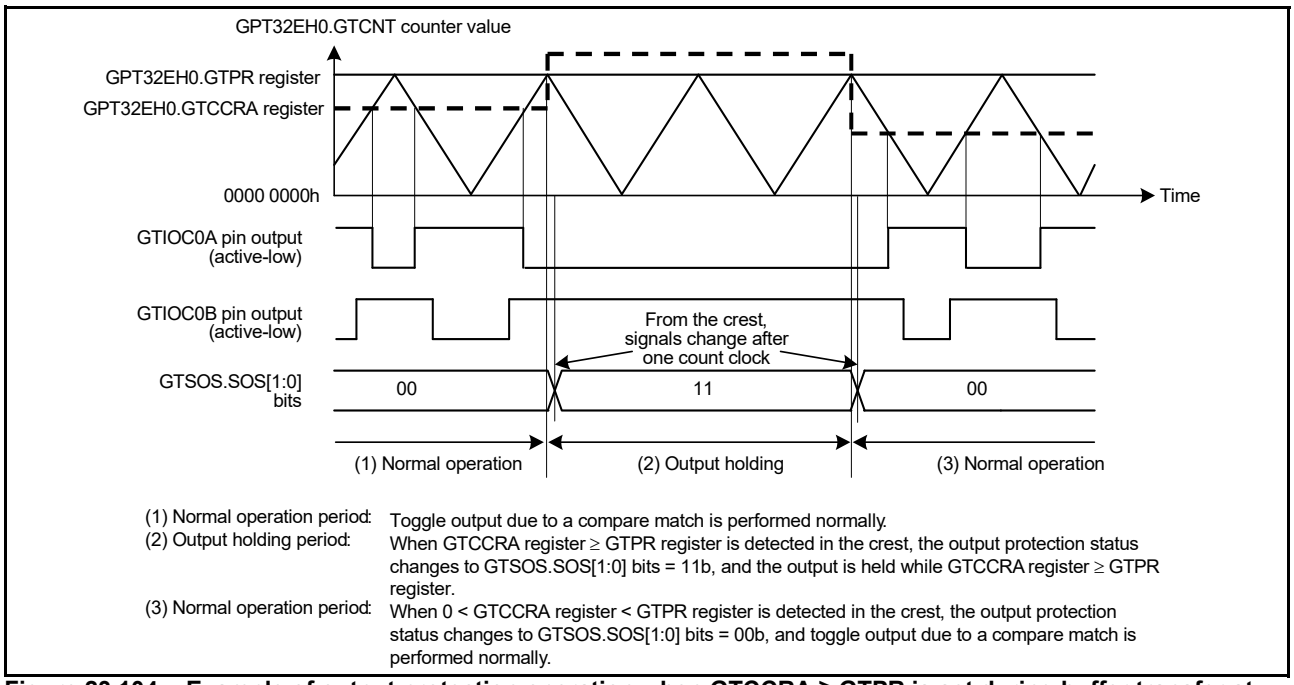


23.8.4.2 Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Troughs

Figure 23.102 and Figure 23.103 show examples of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs.

(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 23.102 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to GTSOS.SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and holding output is maintained up to the next trough.
(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 23.103 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low

23.8.4.3 Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Crests

Figure 23.104 and Figure 23.105 show examples of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at crests.

(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 11b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to GTSOS.SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 23.104 Example of output protection operation when GTCCRA ≥ GTPR is set during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at crests, and active-low

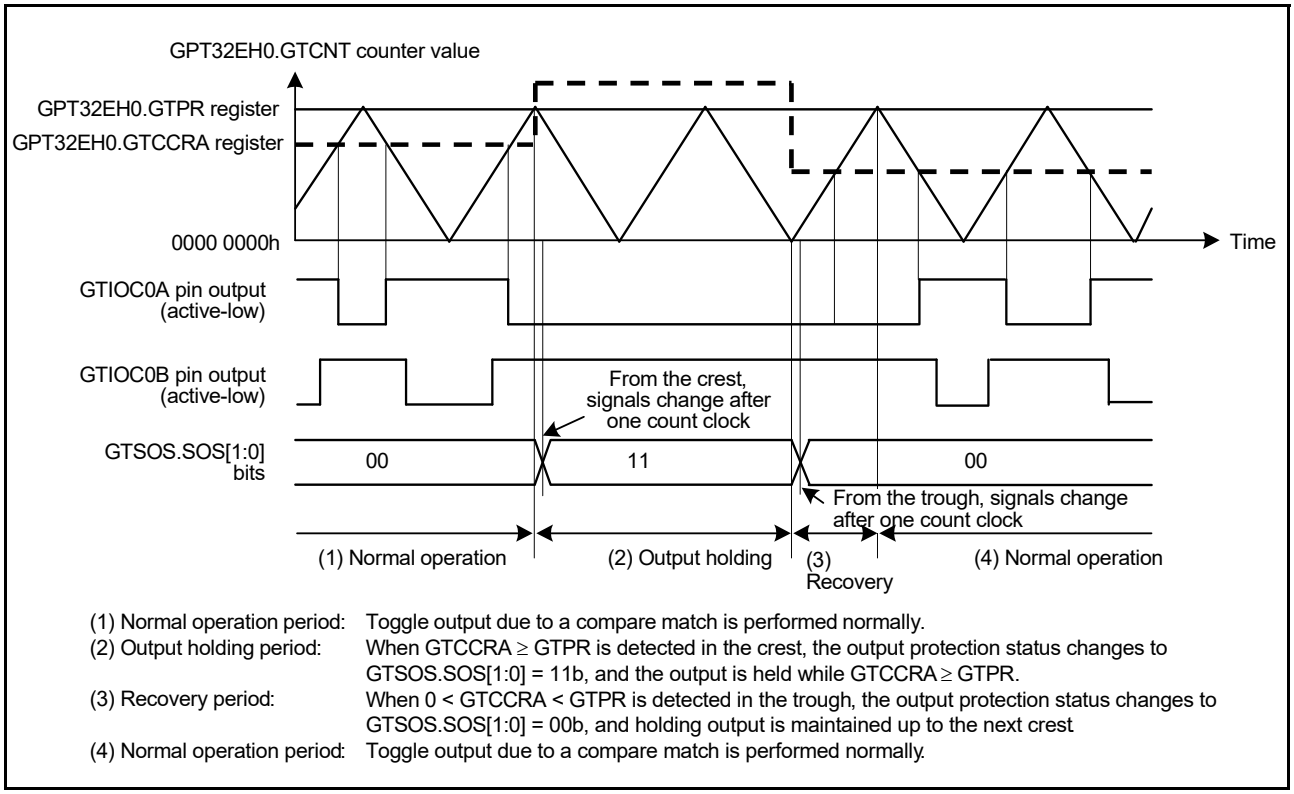


Figure 23.105 Example of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at crests, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

23.8.4.4 Restricted Specification of Output Protection Function

The value of the GTCCRA register must be set within the range of (0 < GTCCRA < GTPR) at count start. If an incorrect value is set in the GTCCRA register during counting (a setting outside the range of 0 < GTCCRA < GTPR), the output protection function deactivates the level of one of the positive and negative outputs. The function does not operate correctly if the following conditions are not satisfied:

- 0 < GTCCRA < GTPR when counting starts
- GTCCRA < GTPR + GTDVD - 1 during buffer transfer at crests
- When GTCCRA is greater than or equal to GTPR during buffer transfer at troughs, GTCCRA > GTDVU + 1.

23.8.4.5 Temporary Cancellation of Output Protection Function

When the GTSOTR.SOTR bit is set to 1 with GTSOS.SOS[1:0] bits equal to 10b (showing output protection state by GTCCRA ≥ GTPR during buffer transfer at troughs), the output protection function for GTIOCB pin is temporarily canceled. GTSOS.SOS[1:0] bits retain the value of 10b even when the output protection function is canceled. When the SOTR bit is set to 0, the output protection function for GTIOCB pin resumes.

Figure 23.106 shows examples of temporary cancellation of output protection function operation when the GTCCRA ≥ GTPR is set during buffer transfer at troughs.

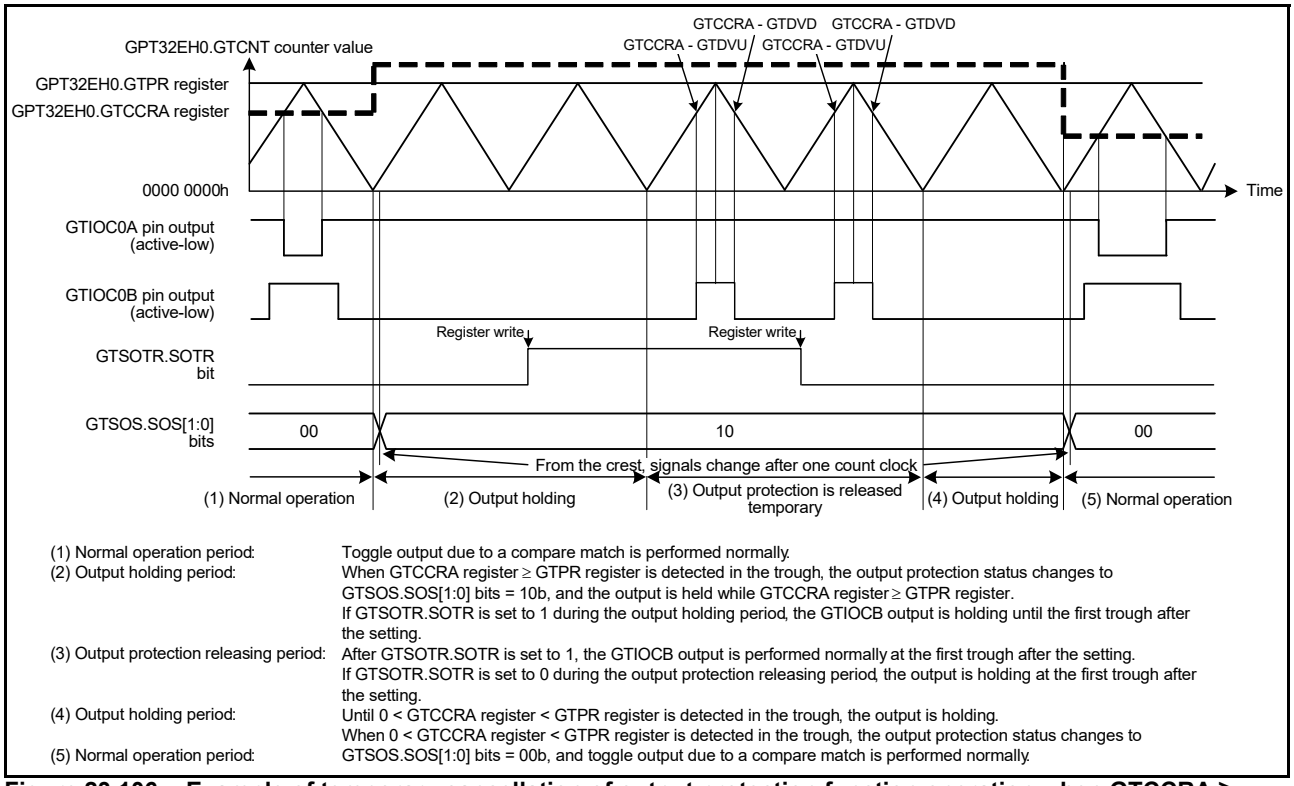

Figure 23.106 Example of temporary cancellation of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs, with 0 < GTCCRA < GTPR restored during buffer transfer at troughs, and active-low

23.9 Initialization Method of Output Pins

23.9.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port pin function by PmnPFS register, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.

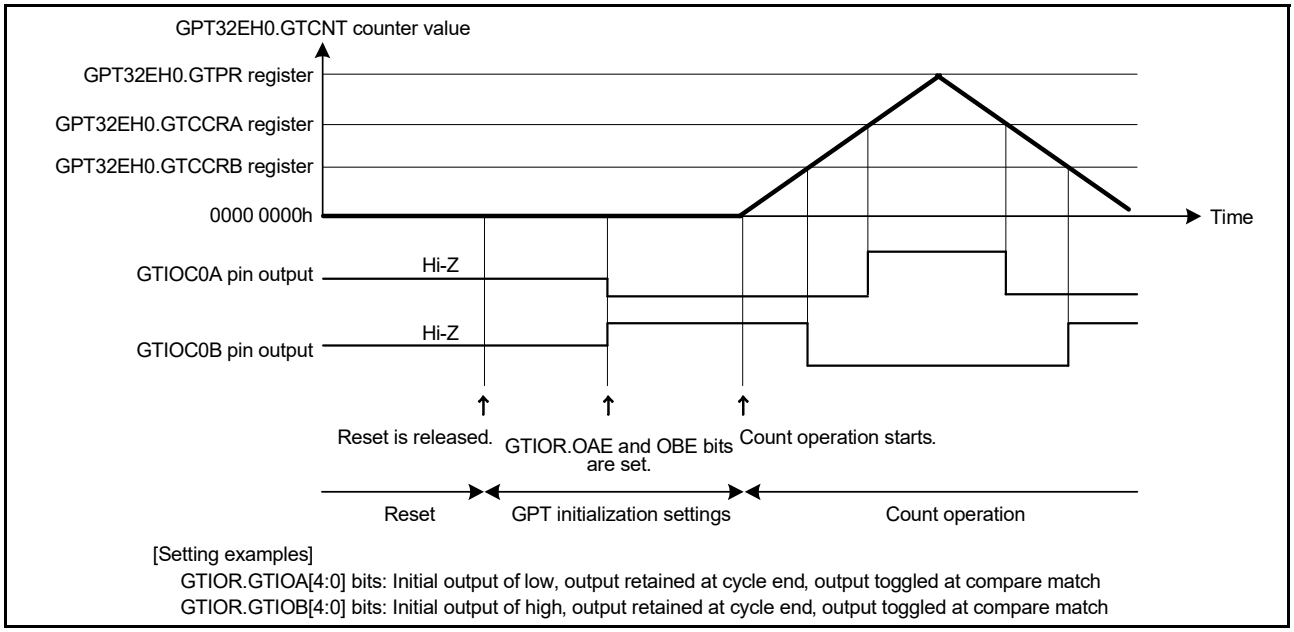

Figure 23.107 Example of pin settings after reset

23.9.2 Pin Initialization Caused by Error during Operation

If an error occurs during GPT operation, the following four types of pin processing can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop.
- Set the OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values in OADFLT and OBDFLT in GTIOR, and output the arbitrary values on count stop.
- Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR, and PmnPFS registers of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0 and the control bit associated with the pin in the PmnPFS.PMR to 0, to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

When the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting resumes, operation continues from where it stops. If counting stops, registers must be initialized before counting starts.

23.10 Usage Notes

23.10.1 Settings for the Module-Stop Function

GPT operation can be disabled or enabled using the Module Stop Control Register. The GPT module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

23.10.2 GTCCRn Settings during Compare Match Operation (n = A to F)

(1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRA register must satisfy the following conditions: GTDVU < GTCCRA, GTDVD < GTCCRA, and GTCCRA < GTPR.

When the setting of GTCCRA = 0 or GTCCRA ≥ GTPR is made during count operation, the output protection function is activated. However, the function does not operate correctly if the following conditions are not satisfied:

- 0 < GTCCRA < GTPR when counting starts
- GTCCRA < GTPR + GTDVD - 1 during buffer transfer at crests
- When GTCCRA is greater than or equal to GTPR during buffer transfer at troughs, GTCCRA > GTDVU + 1.

For details, see section 23.8.4, Output Protection Function for GTIOC Pin Output.

(2) When automatic dead time setting is not made in triangle-wave PWM mode

The GTCCRA register must be set within the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. When GTCCRA > GTPR, no compare match occurs.

Similarly, GTCCRB must be set within the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRB = GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. When GTCCRB > GTPR, no compare match occurs.

(3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, correct output waveforms with secured dead time might not be obtained.

- In up-counting: GTCCRC < GTCCRD, GTCCRC > GTDVU, GTCCRD < GTPR - GTDVD
- In down-counting: GTCCRC > GTCCRD, GTCCRC < GTPR - GTDVU, GTCCRD > GTDVD

(4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRC < GTCCRD < GTPR
- In down-counting: GTPR > GTCCRC > GTCCRD > 0

Similarly, GTCCRE and GTCCRF must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRE < GTCCRF < GTPR
- In down-counting: GTPR > GTCCRE > GTCCRF > 0

(5) In saw-wave PWM mode

The GTCCRA register must be set with the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. If GTCCRA > GTPR is set, no compare match occurs.

Similarly, GTCCRB must be set with the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRB = GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. If GTCCRB > GTPR is set, no compare match occurs.

23.10.3 Setting Range for the GTCNT Counter

The GTCNT counter register must be set with the range of 0 ≤ GTCNT ≤ GTPR.

23.10.4 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the GTCNT counter by the GTCR.CST bit synchronizes the count clock that is selected in GTCR.TPCS[2:0]. When GTCR.CST is updated, the GTCNT counter starts/stops after a count clock that is selected in GTCR.TPCS[2:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored, resulting in situations in which an event is accepted or an interrupt occurs after GTCR.CST is set to 0.

23.10.5 Priority Order of Each Event

(1) GTCNT register

Table 23.24 shows a priority order of events updating GTCNT register.

Table 23.24 Priority order of sources updating GTCNT

Source updating GTCNT	Priority order
Writing by CPU (Writing to GTCNT/GTCLR)	High ↑
Clear by hardware sources set in GTCSR	
Count up or down by hardware sources set in GTUPSR/GTDNSR	
Count operation	Low

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

(2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), writing by CPU has a priority over starting/stopping by hardware sources.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. Where there is a conflict between updating the GTCR.CST bit and reading by the CPU, pre-update data is read.

(3) GTCCRm registers (m = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to GTCCRm registers, writing to GTCCRm registers has a priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. Where there is a conflict between updating the GTCCRm registers and reading by the CPU, pre-update data is read.

(4) GTPR registers

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has a priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

(5) GTADTRm registers (m = A, B)

When there is a conflict between buffer transfer operation and writing to the GTADTRm registers, writing to the GTADTRm registers has priority over buffer transfer operation. Where there is a conflict between updating GTADTRm registers and reading by the CPU, pre-update data is read.

(6) GTDVm registers (m = U, D)

When there is a conflict between buffer transfer operation and writing to GTDVm registers, writing to GTDVm registers has priority over buffer transfer operation. When there is a conflict between updating GTDVm registers and reading by the CPU, pre-update data is read.

24. PWM Delay Generation Circuit

24.1 Overview

The MCU has 4 channel delay circuits that can connect to the General PWM Timer (GPT). Table 24.1 lists the specifications for the PWM Delay Generation Circuit, Figure 24.1 shows the block diagram, and Table 24.2 lists the I/O pins.

Table 24.1 Specifications of the PWM Delay Generation Circuit

Parameter	Specifications
Function	The circuit can control the timing with which signals on the two PWM output pins for channel 0/1/2/3 rise and fall to an accuracy of up to 1/32 times the period of the GPT clock (PCLKD).

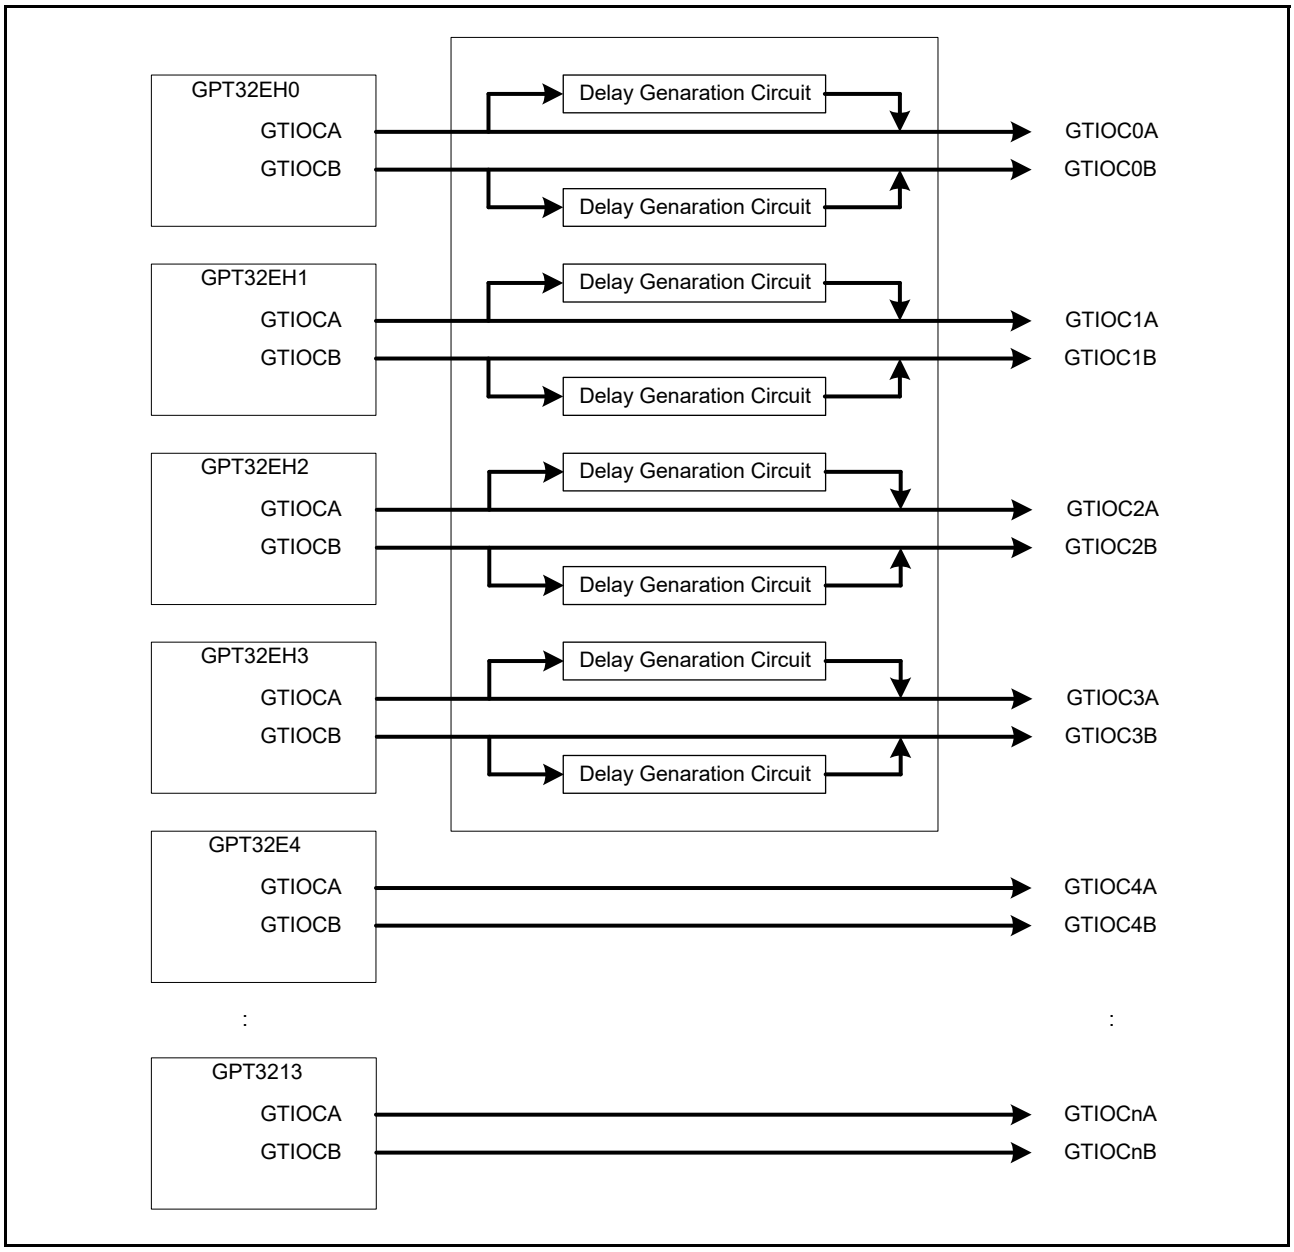

Figure 24.1 Block diagram of the PWM Delay Generation Circuit

Table 24.2 I/O pins of the PWM Delay Generation Circuit

I/O pin	I/O	Function
GTIOC0A	Output	Delayed output of GTIOCA pin of GPT channel 0
GTIOC0B	Output	Delayed output of GTIOCB pin of GPT channel 0
GTIOC1A	Output	Delayed output of GTIOCA pin of GPT channel 1
GTIOC1B	Output	Delayed output of GTIOCB pin of GPT channel 1
GTIOC2A	Output	Delayed output of GTIOCA pin of GPT channel 2
GTIOC2B	Output	Delayed output of GTIOCB pin of GPT channel 2
GTIOC3A	Output	Delayed output of GTIOCA pin of GPT channel 3
GTIOC3B	Output	Delayed output of GTIOCB pin of GPT channel 3

24.2 Register Descriptions

24.2.1 PWM Output Delay Control Register (GTDLYCR)

Address(es): GPT_ODC.GTDLYCR 4007 B000h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DLYRST	DLLEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DLLEN	DLL Operation Enable	0: Disable DLL operation 1: Enable DLL operation.	R/W
b1	DLYRST	PWM Delay Generation Circuit Reset	0: Normal operation 1: Reset.	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

GTDLYCR controls the PWM Delay Generation Circuit, which applies delays to the PWM outputs. GTDLYCR register can be written when register write protection is disabled (GPT32EH0.GTWP.WP = 0).

DLLEN bit (DLL Operation Enable)

The DLLEN bit selects whether the on-chip DLL in the PWM Delay Generation Circuit is activated or not.

DLYRST bit (PWM Delay Generation Circuit Reset)

The DLYRST bit resets the internal state of the PWM Delay Generation Circuit.

24.2.2 PWM Output Delay Control Register 2 (GTDLYCR2)

Address(es): GPT_ODC.GTDLYCR2 4007 B002h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	DLYEN3	DLYEN2	DLYEN1	DLYEN0	—	—	—	—	DLYBS3	DLYBS2	DLYBS1	DLYBS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DLYBS0	PWM Delay Generation Circuit bypass for channel 0	0: Bypass delay generation circuit of channel 0 1: Do not bypass delay generation circuit of channel 0.	R/W
b1	DLYBS1	PWM Delay Generation Circuit bypass for channel 1	0: Bypass delay generation circuit of channel 1 1: Do not bypass delay generation circuit of channel 1.	R/W
b2	DLYBS2	PWM Delay Generation Circuit bypass for channel 2	0: Bypass delay generation circuit of channel 2 1: Do not bypass delay generation circuit of channel 2.	R/W
b3	DLYBS3	PWM Delay Generation Circuit bypass for channel 3	0: Bypass delay generation circuit of channel 3 1: Do not bypass delay generation circuit of channel 3.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	DLYEN0	PWM Delay Generation Circuit enable for channel 0	0: Enable delay generation circuit of channel 0 1: Disable delay generation circuit of channel 0.	R/W
b9	DLYEN1	PWM Delay Generation Circuit enable for channel 1	0: Enable delay generation circuit of channel 1 1: Disable delay generation circuit of channel 1.	R/W
b10	DLYEN2	PWM Delay Generation Circuit enable for channel 2	0: Enable delay generation circuit of channel 2 1: Disable delay generation circuit of channel 2.	R/W
b11	DLYEN3	PWM Delay Generation Circuit enable for channel 3	0: Enable delay generation circuit of channel 3 1: Disable delay generation circuit of channel 3.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

GTDLYCR2 controls each channel of PWM Delay Generation Circuit. The GTDLYCR2 register can be written when register write protection is disabled (GPT32EH0.GTWP.WP = 0).

DLYBSn (n = 0 to 3) bits (PWM Delay Generation Circuit Bypass for channel n)

The DLYBSn bits select whether delays are applied to PWM output signals from the GTIOCnA and GTIOCnB pins (n = 0 to 3) by the PWM Delay Generation Circuit or whether the circuit is bypassed.

A signal delayed in the PWM Delay Generation Circuit is output three cycles of GPT operation clock (PCLKD) later than if it is bypassed the PWM Delay Generation Circuit.

DLYENn (n = 0 to 3) bits (PWM Delay Generation Circuit Enable for channel n)

The DLYENn bits select whether the channel n (n = 0 to 3) of PWM Delay Generation Circuit is power on or off. If the channel n of the PWM Delay Generation Circuit is not used, set to 1.

24.2.3 GTIOCnA Rising Output Delay Register (GTDLYRnA) (n = 0 to 3)

Address(es): GPT_ODC.GTDLYR0A 4007 B018h, GPT_ODC.GTDLYR1A 4007 B01Ch, GPT_ODC.GTDLYR2A 4007 B020h, GPT_ODC.GTDLYR3A 4007 B024h

R/W
b15 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

GTDLYFnB register sets a delay to be applied to falling edges of output signals on the GTIOCnB pin. On the timing for the transfer of settings, see section 24.3.2, Timing for Transfer of GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB Register Settings. GTDLYFnB register can be written when register write protection is disabled (GPT32EHn.GTWP.WP = 0).

24.3 Operation

24.3.1 Adjustments to the Timing of Rising and Falling Edges in PWM Waveforms

The timing of rising and falling edges in PWM waveforms which are output from the GTIOCnA and GTIOCnB pins, where n = channel number, can be delayed to an accuracy of 1/32 of the GPT operating clock (PCLKD) period.

If the timing of rising or falling edges in PWM waveforms output from the GTIOCnA and GTIOCnB pins must be adjusted, make the initial settings for the PWM generation circuit as shown in the procedure in Figure 24.2.

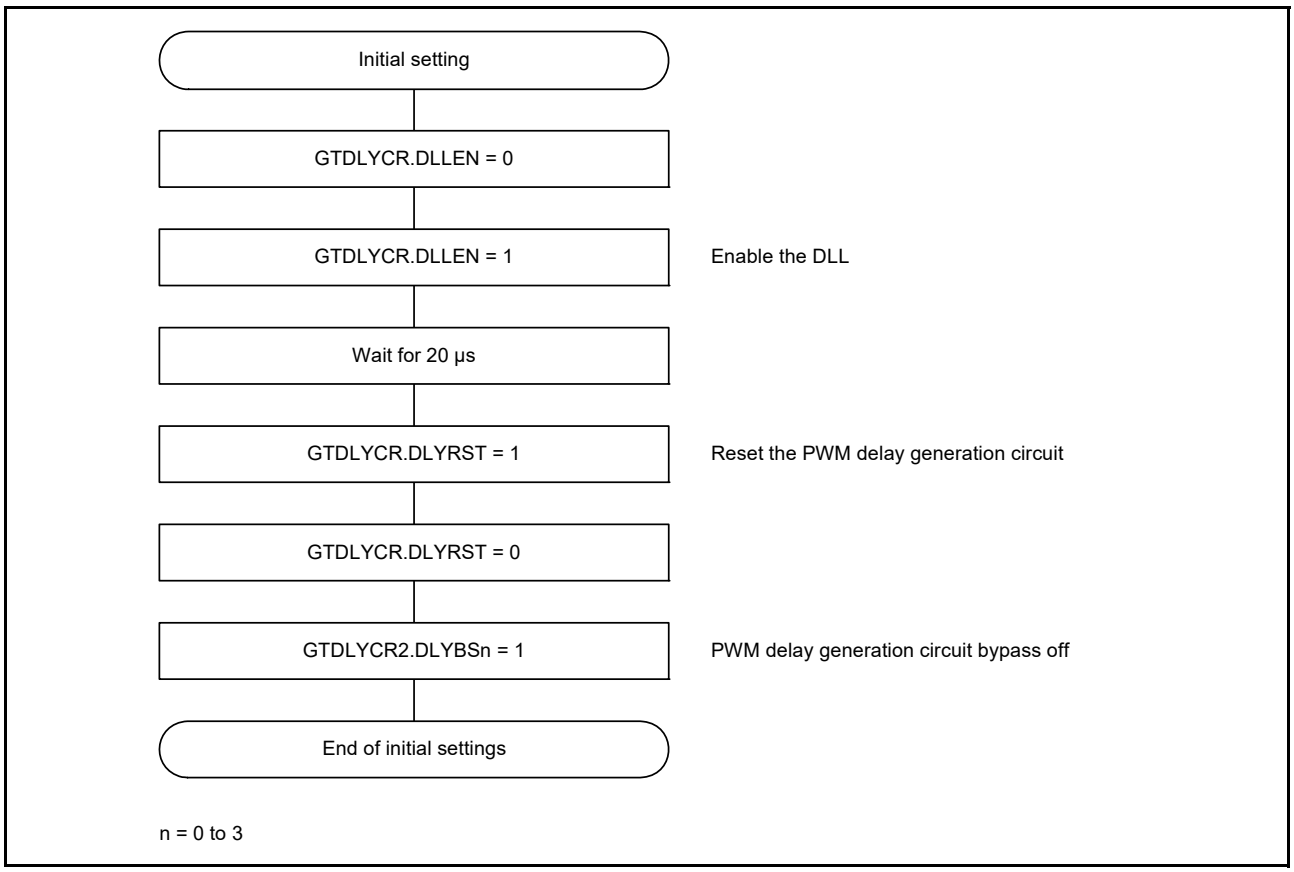

Figure 24.2 Example of initialization flow for the PWM Delay Generation Circuit

In the PWM Delay Generation Circuit, delay can be applied to rising and falling edges of the PWM output to an accuracy of 1/32 of the period of the GPT operation clock (PCLKD). This is described in section 23.3.3, PWM Output Operating Mode. Delays corresponding to the settings are reflected in the PWM output with the timing described in section 24.3.2, Timing for Transfer of GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB Register Settings. Table 24.3 shows the association between the GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB registers and the PWM outputs.

Table 24.3 Association between PWM output pins and delay setting registers

PWM output pin	Rising-edge delay setting register	Falling-edge delay setting register
GTIOC0A	GTDLYR0A	GTDLYF0A
GTIOC0B	GTDLYR0B	GTDLYF0B
GTIOC1A	GTDLYR1A	GTDLYF1A
GTIOC1B	GTDLYR1B	GTDLYF1B
GTIOC2A	GTDLYR2A	GTDLYF2A
GTIOC2B	GTDLYR2B	GTDLYF2B
GTIOC3A	GTDLYR3A	GTDLYF3A
GTIOC3B	GTDLYR3B	GTDLYF3B

When the PWM Delay Generation Circuit is in use, the timing with which a PWM output signal rises and falls can be controlled to an accuracy of 1/32 of the period of the GPT operation clock (PCLKD). When this facility is not in use, the period of the PWM output waveform is controlled to an accuracy of one period of the input clock for the timer counter which is PCLKD. With the PWM Delay Generation Circuit, the output can be controlled to an accuracy 32 times better. Additionally, the delay settings also control the periods at high and low level for the PWM waveform to the given accuracy. PWM Delay Generation Circuit channels can be individually enabled or disabled.

24.3.2 Timing for Transfer of GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB Register Settings

Settings for the GTDLYRnA, GTLDYRnB, GTDLYFnA, and GTDLYFnB registers are initially transferred to temporary registers, and then reflected in the amounts of delay on the GTIOCnA and GTIOCnB (n = 0 to 3) outputs. Transfer of the settings takes place on overflows (in up-counting) or underflows (in down-counting) for saw waves, and in the troughs of triangle waves.

Figure 24.3 and Figure 24.4 show examples of the operation of the GTDLYR0A and GTDLYF0A registers.

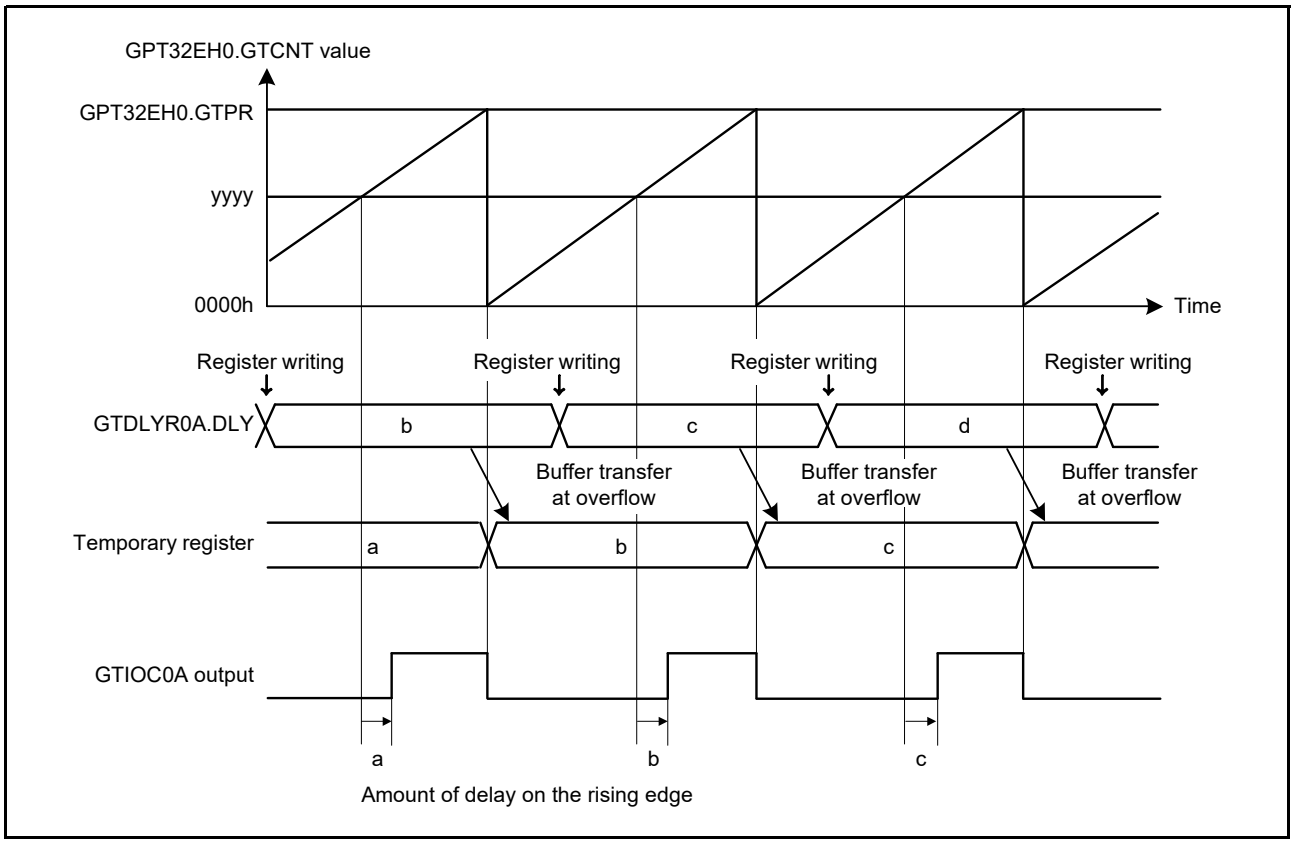

Figure 24.3 Example of GTLDYR0A register operation with PWM saw-wave generation

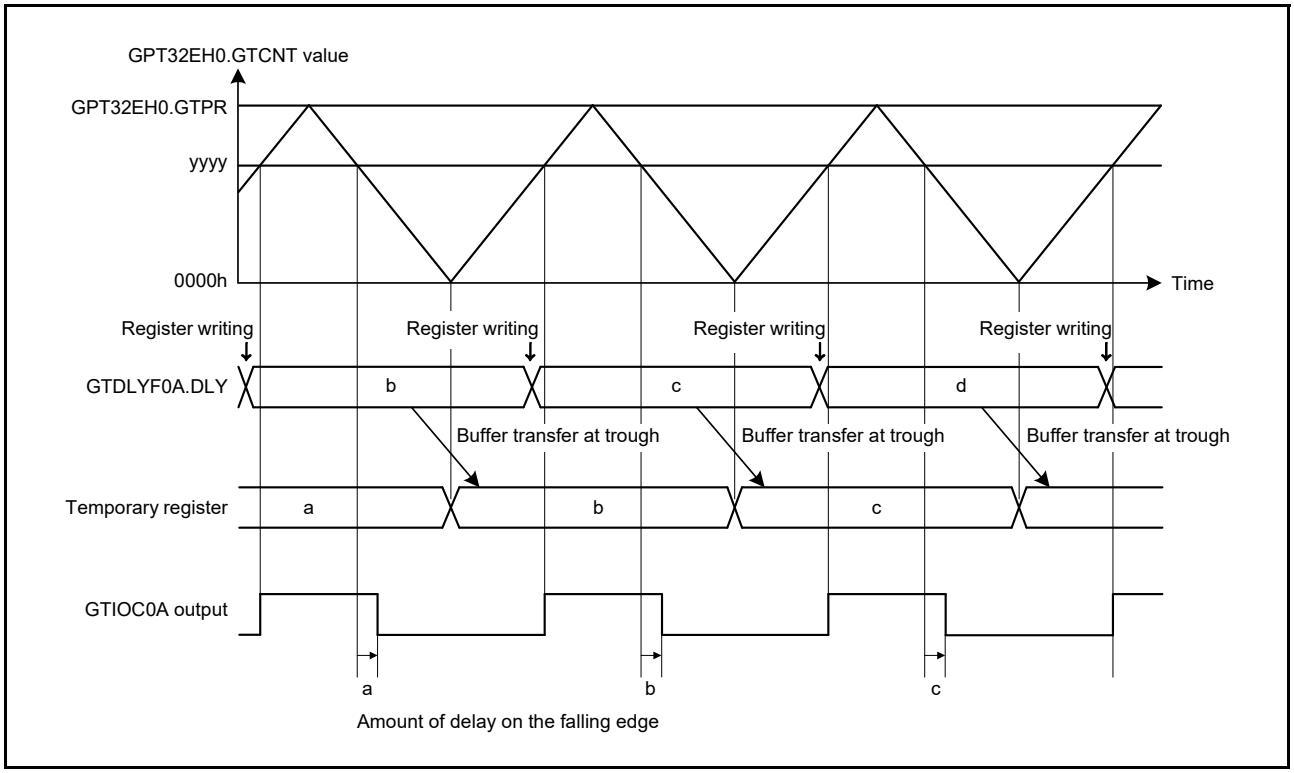

Figure 24.4 Example of GTLDYF0A register operation with PWM triangle-wave generation

24.4 Usage Notes

24.4.1 Settings for the Module-Stop Function

Operation of the PWM Delay Generation Circuit can be disabled or enabled using the Module Stop Control Register D (MSTPCRD). The PWM Delay Generation Circuit is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

24.4.2 Notes on Delay Settings for PWM Delay Generation Circuit

When the PWM Delay Generation Circuit generates delays for a PWM output waveform and the waveform is toggled in response to compare-matches, do not change the settings for delay while the compare-match value is within the ranges listed in the following table. This constraint applies to the GTDLYFnA, GTDLYRnA, GTDLFnB, and GTDLYRnB registers.

Table 24.4 Restrictions on delay settings

Mode	Direction of counting	Compare-match value
Saw-wave mode	Up	GTPR - 2 or above
	Down	2 or below
Triangle-wave mode	Down	2 or below

An example of how the restrictions apply to the timing of setting GTDLYFnA in Saw-wave waveform one-shot pulse mode (counting up) is shown as Figure 24.5. Do not change the value set in GTDLYFnA while GTCCRD ≥ GTPR - 2.

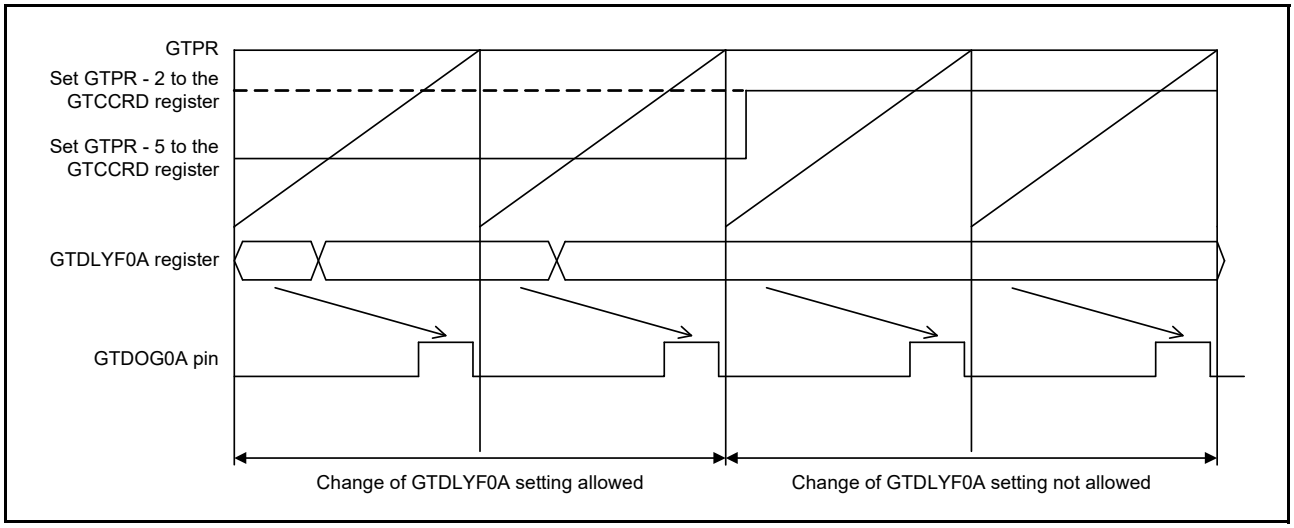

Figure 24.5 Restrictions on the timing of GTDLYF0A register settings

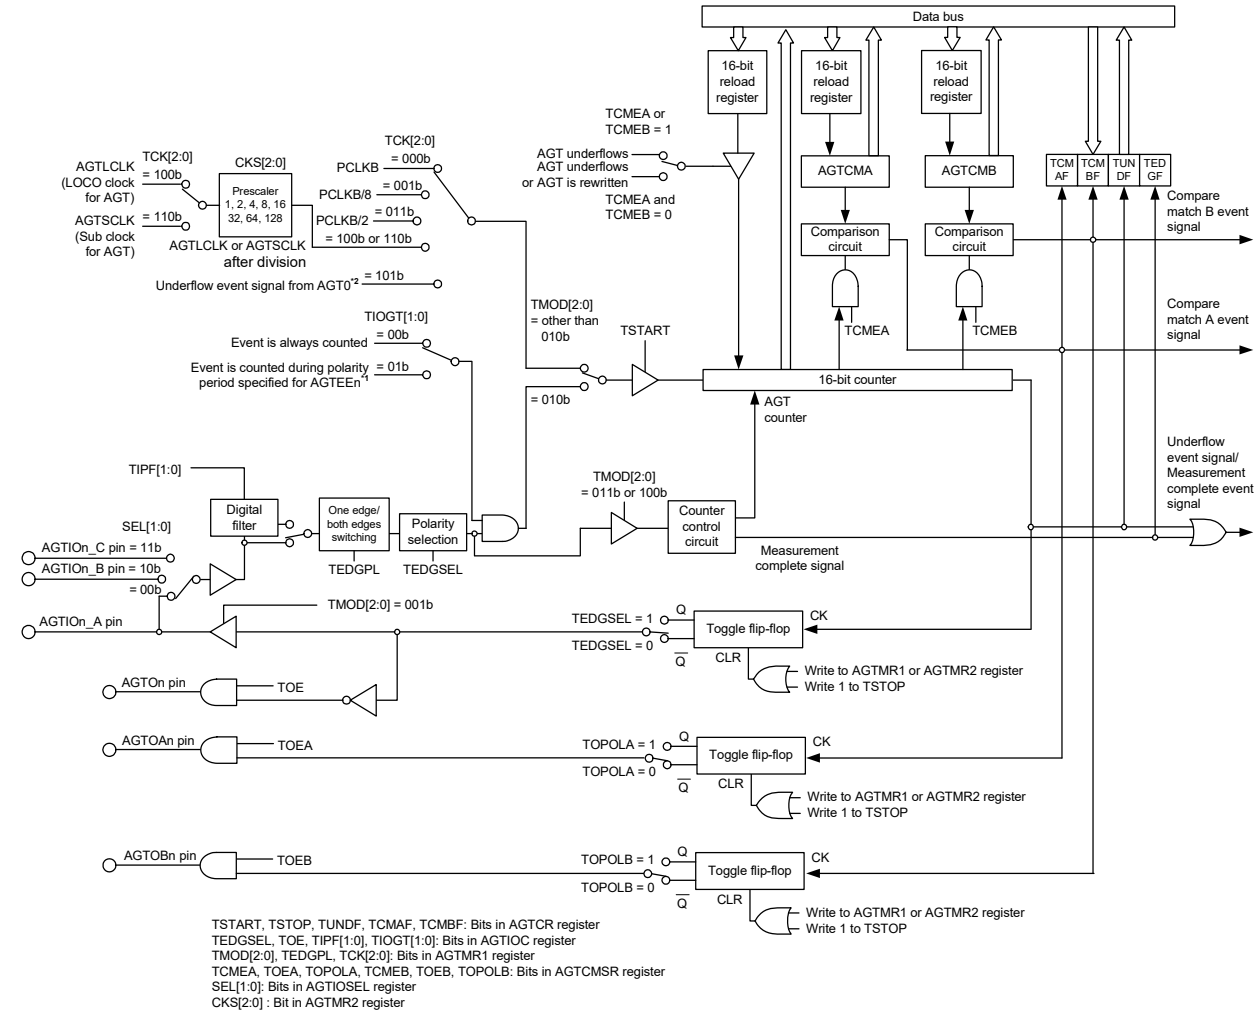
Changing the values in the GTDLYFnA, GTDLYRnA, GTDLYFnB, and GTDLYRnB registers during periods where changes to settings are not allowed might lead to faulty output waveforms such as shifts in the timing of output waveform transitions from the expected values.

25. Asynchronous General-Purpose Timer (AGT)



25.1 Overview

The Asynchronous General-Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This 16-bit timer consists of a reload register and a down counter. The reload register and the down counter are allocated in the same address, and they can be accessed with the AGT register. Table 25.1 lists the AGT specifications, Figure 25.1 shows the block diagram, and Table 25.2 lists the I/O pins.

Table 25.1 AGT specifications

Parameter		Specifications
Operating modes	Timer mode	The count source is counted
	Pulse output mode	The count source is counted and the output is inverted at each timer underflow
	Event counter mode	An external event is counted
	Pulse width measurement mode	An external pulse width is measured
	Pulse period measurement mode	An external pulse period is measured
Count source (Operating clock)*2		PCLKB, PCLKB/2, PCLKB/8, AGTLCLK, AGTLCLK/2, AGTLCLK/4, AGTLCLK/8, AGTLCLK/16, AGTLCLK/32, AGTLCLK/64, AGTLCLK/128, AGTSCLK, AGTSCLK/2, AGTSCLK/4, AGTSCLK/8, AGTSCLK/16, AGTSCLK/32, AGTSCLK/64, AGTSCLK/128 or underflow signal of AGT0*1 selectable.
Interrupt/Event link function (Output)		Underflow event signal or measurement complete event signal • When the counter underflows • When the measurement of the active width of the external input (AGTIO) is complete in pulse width measurement mode • When the set edge of the external input (AGTIO) is input in pulse period measurement mode Compare match A event signal • When the values of AGT and AGTCMA matched (Compare match A function enabled) Compare match B event signal • When the values of AGT and AGTCMB matched (Compare match B function enabled).
Selectable functions		• Compare match function One or two of the compare match A and B registers is selectable.

Note 1. AGT0 cannot use it. AGT1 connects directly with the underflow event signal from the AGT0 timer.
Note 2. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source clock.

Note 1. The polarity can be selected by the EEPS bit in the AGTISR register.
Note 2. AGT0 cannot use it. AGT1 uses the underflow of AGT0.

Figure 25.1 AGT block diagram

Table 25.2 AGT I/O pins

Pin name	I/O	Function
AGTEEn	Input	External event input for AGT
AGTIOn*1	Input*1/output	External event input and pulse output for AGT
AGTOn	Output	Pulse output for AGT
AGTOAn	Output	Output compare match A output for AGT
AGTOBn	Output	Output compare match B output for AGT

Note: Channel number (n = 0, 1).
Note 1. AGTIO can be used also in Deep Software Standby mode.
AGTIO can be controlled by the VBTICTLR register.

For more information, see section 12.2.2, VBATT Input Control Register (VBTICTLR) and section 20.5.5, I/O Buffer Specification.

25.2 Register Descriptions

25.2.1 AGT Counter Register (AGT)

Address(es): AGT0.AGT 4008 4000h, AGT1.AGT 4008 4100h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Description	Setting range	R/W
b15 to b0	16-bit counter and reload register *1, *2	0000h to FFFFh	R/W

Note 1. When 1 is written to the TSTOP bit in the AGTCR register, the 16-bit counter is forcibly stopped and set to FFFFh.

Note 2. When the setting of bits TCK[2:0] in the AGTMR1 register is other than 001b (PCLKB/8) or 011b (PCLKB/2), if the AGT register is set to 0000h, a request signal to the ICU, the DTC and the ELC is generated once immediately after the count starts. The AGTOn and AGTIOn output is toggled.
When the AGT register is set to 0000h in event counter mode, regardless of the value of bits TCK[2:0], a request signal to the ICU, the DTC and the ELC is generated once immediately after the count starts.
In addition, the AGTOn output toggles even during a period other than the specified count period. When the AGT register is set to 0001h or more, a request signal is generated each time AGT underflows.

AGT is a 16-bit register. The write value is written to the reload register and the read value is read from the counter.

The states of the reload register and the counter change according to the TSTART bit in the AGTCR register and TCMEA/TCMEB bit in the AGTCMSR register. For details, see section 25.3.1, Reload Register and Counter Rewrite Operation. The AGT register can be set by a 16-bit memory manipulation instruction.

25.2.2 AGT Compare Match A Register (AGTCMA)

Address(es): AGT0.AGTCMA 4008 4002h, AGT1.AGTCMA 4008 4102h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Description	Setting range	R/W
b15 to b0	16-bit compare match A data is stored.*1	0000h to FFFFh	R/W

Note 1. Set the AGTCMA register to FFFFh when the compare match A is not used.

The AGTCMA register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register A change according to the TSTART bit in the AGTCR register. For details, see section 25.3.2, Reload Register and Compare Register A/B Rewrite Operation. The AGTCMA register can be set by a 16-bit memory manipulation instruction.

25.2.3 AGT Compare Match B Register (AGTCMB)

Address(es): AGT0.AGTCMB 4008 4004h, AGT1.AGTCMB 4008 4104h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Description	Setting range	R/W
b15 to b0	16-bit compare match B data is stored.*1	0000h to FFFFh	R/W

Note 1. Set the AGTCMB register to FFFFh when Compare match B is not used.

The AGTCMB register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register B change according to the TSTART bit in the AGTCR register. For details, see section 25.3.2, Reload Register and Compare Register A/B Rewrite Operation. The AGTCMB register can be set by a 16-bit memory manipulation instruction.

25.2.4 AGT Control Register (AGTCR)

Address(es): AGT0.AGTCR 4008 4008h, AGT1.AGTCR 4008 4108h

	b7	b6	b5	b4	b3	b2	b1	b0
	TCMBF	TCMAF	TUNDF	TEDGF	—	TSTOP	TCSTF	TSTART
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	TSTART	AGT Count Start*2	0: Stop count 1: Start count.	R/W
b1	TCSTF	AGT Count Status Flag*2	0: Count stopped 1: Count in progress.	R
b2	TSTOP	AGT Count Forced Stop*1	0: Invalid (writing 0 has no effect) 1: Force count to stop.	W
b3	—	Reserved	The read value is 0. The write value should be 0.	R/W
b4	TEDGF	Active Edge Judgment Flag	0: No active edge received 1: Active edge received.	R/(W)*3
b5	TUNDF	Underflow Flag	0: No underflow 1: Underflow.	R/(W)*3
b6	TCMAF	Compare Match A Flag	0: No match 1: Match.	R/(W)*3
b7	TCMBF	Compare Match B Flag	0: No match 1: Match.	R/(W)*3

Note 1. When 1 (count is forcibly stopped) is written to the TSTOP bit, the TSTART and TCSTF bits are initialized at the same time. The pulse output level is also initialized. The read value is 0.

Note 2. For information on using the TSTART and TCSTF bits, see section 25.4.1, Count Operation Start and Stop Control.

Note 3. Only 0 can be written to clear the flag.

TSTART bit (AGT Count Start)

The count operation is started by writing 1 to the TSTART bit and stopped by writing 0. When this bit is set to 1, the TCSTF bit is set to 1 (count in progress) in synchronization with the count source. Also, after 0 is written to the TSTART bit, the TCSTF bit is set to 0 (count stops) in synchronization with the count source. For details, see section 25.4.1, Count Operation Start and Stop Control.

TCSTF flag (AGT Count Status Flag)

The TCSTF flag indicates the AGT count status.

[Setting condition]

- When 1 is written to the TSTART bit (the TCSTF bit is set to 1 in synchronization with the count source).

[Clearing conditions]

- When 0 is written to the TSTART bit (the TCSTF bit is set to 0 in synchronization with the count source)
- When 1 is written to the TSTOP bit.

TSTOP bit (AGT Count Forced Stop)

When 1 is written to the TSTOP bit, the count is forcibly stopped. The read value is 0.

TEDGF flag (Active Edge Judgment Flag)

The TEDGF flag indicates that an active edge was detected.

[Setting condition]

- When the measurement of the active width of the external input (AGTIO) is complete in pulse width measurement mode.
- When the set edge of the external input (AGTIO) is input in pulse period measurement mode

[Clearing condition]

- When 0 is written to this flag by software.

TUNDF flag (Underflow Flag)

The TUNDF flag indicates that the counter underflowed.

[Setting condition]

- When the counter underflows.

[Clearing condition]

- When 0 is written to this flag by software.

TCMAF flag (Compare Match A Flag)

The TCMAF flag indicates that compare match A was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMA register.

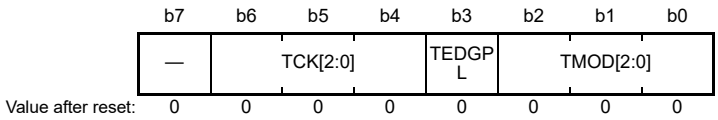
[Clearing condition]

- When 0 is written to this flag by software.

TCMBF flag (Compare Match B Flag)

The TCMBF flag indicates that compare match B was detected.

[Setting condition]



- When the value in the AGT register matches the value in the AGTCMB register.

[Clearing condition]

- When 0 is written to this flag by software.

25.2.5 AGT Mode Register 1 (AGTMR1)

Address(es): AGT0.AGTMR1 4008 4009h, AGT1.AGTMR1 4008 4109h

Bit	Symbol	Bit name	Description	R/W
b2 to b0	TMOD[2:0]	Operating Mode*3	b2 b0 0 0 0: Timer mode 0 0 1: Pulse output mode 0 1 0: Event counter mode 0 1 1: Pulse width measurement mode 1 0 0: Pulse period measurement mode. Other settings are prohibited.	R/W
b3	TEDGPL	Edge Polarity*4	0: Single-edge 1: Both-edge.	R/W
b6 to b4	TCK[2:0]	Count Source*1, *2, *5	b6 b4 0 0 0: PCLKB 0 0 1: PCLKB/8 0 1 1: PCLKB/2 1 0 0: Divided clock AGTLCLK specified in CKS[2:0] bits in AGTMR2 register 1 0 1: Underflow event signal from AGT0*6 1 1 0: Divided clock AGTSCLK specified in CKS[2:0] bits in AGTMR2 register. Other settings are prohibited.	R/W
b7	—	Reserved	The read value is 0. The write value should be 0.	R/W

Note: Write access to the AGTMR1 register initializes the output from pins AGTOn, AGTIOn, AGTOAn and AGTOBn of AGT (n = 0, 1). For details on the output level at initialization, see the description of section 25.2.7, AGT I/O Control Register (AGTIOC).

Note 1. When event counter mode is selected, the external input (AGTIOn) is selected as the count source regardless of the setting of bits TCK[2:0].

Note 2. Do not switch count sources during count operation. Only switch count sources when both the TSTART and TCSTF bits in the AGTCR register are set to 0 (count stops).

Note 3. The operating mode can be changed only when the count is stopped while both the bits TSTART and TCSTF in the AGTCR register are set to 0 (count stops). Do not change the operating mode during count operation.

Note 4. The TEDGPL bit is enabled only in event counter mode.

Note 5. When using in Software Standby and Deep Software Standby modes, set AGTSCLK or AGTLCLK (TCK[2:0] = 100b or 110b) to count source.

Note 6. AGT0 cannot use it (setting prohibited). AGT1 uses the underflow of AGT0.

25.2.6 AGT Mode Register 2 (AGTMR2)

Address(es): AGT0.AGTMR2 4008 400Ah, AGT1.AGTMR2 4008 410Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	LPM	—	—	—	—	CKS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	CKS[2:0]	AGTSCLK/AGTLCLK Count Source Clock Frequency Division Ratio *1, *2, *3	b2 b0 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128.	R/W
b6 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	LPM	Low Power Mode	0: Normal mode 1: Low power mode.	R/W

Note 1. Do not rewrite the CKS[2:0] bits during count operation. Only rewrite CKS[2:0] when both the TSTART and TCSTF bits in the AGTCR register are set to 0 (count stops).
Note 2. When count source is AGTSCLK/AGTLCLK, the switch of CKS[2:0] is valid.
Note 3. Do not switch the TCK[2:0] bits in the AGTMR1 register when CKS[2:0] are not 000b. Switch the TCK[2:0] bits in the AGTMR1 register after CKS[2:0] are set to 000b, and wait for one cycle of the count source.

LPM bit (Low Power Mode)

The LPM bit selects low power mode, which impacts access to certain AGT registers. Set 1 to operate in low power. When this bit is 1, access to the following registers is prohibited:

- AGT/AGTCMA/AGTCMB/AGTCR.

After this bit is switched from 1 to 0, the first access to the register is constrained as follows:

- AGT: Read AGT register twice. Only the second reading of data is valid.
- AGT, AGTCMA, AGTCMB, and AGTCR: Allow at least two cycles of the count source clock when writing to the register.

25.2.7 AGT I/O Control Register (AGTIOC)

Address(es): AGT0.AGTIOC 4008 400Ch, AGT1.AGTIOC 4008 410Ch

	b7	b6	b5	b4	b3	b2	b1	b0

b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. Do not rewrite the AGTCMSR register during a count operation. Only rewrite the AGTCMSR register when both the TSTART and TCSTF bits in the AGTCR register are set to 0 (count stops).

Note 2. Do not set 1 when in pulse width measurement mode or pulse period measurement mode.

25.2.10 AGT Pin Select Register (AGTIOSEL)

Address(es): AGT0.AGTIOSEL 4008 400Fh, AGT1.AGTIOSEL 4008 410Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	TIES	—	—	SEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	SEL[1:0]	AGTIO Pin Select	b1 b0 0 0: Select AGTIO_A as AGTIO AGTIO_A cannot be used as AGTIO input pin in Deep Software Standby mode. 0 1: Setting prohibited 1 0: Select AGTIO_B as AGTIO AGTIO_B can be used as AGTIO input pin in Deep Software Standby mode. AGTIO_B is input only. It cannot be used for output. 1 1: Select AGTIO_C as AGTIO. AGTIO_C can be used as AGTIO input pin in Deep Software Standby mode. AGTIO_C is input only. It cannot be used for output.	R/W*1
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	TIES	AGTIO Input Enable	0: Disable external event input during Software Standby mode 1: Enable external event input during Software Standby mode.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. AGTIO_B and AGTIO_C can be used as external event input pins for the AGT in Deep Software Standby mode. AGTIO_A cannot be used as external event input pins for the AGT in Deep Software Standby mode. AGTIO_B and AGTIO_C are input only.

Note 2. When AGTIOn_A is selected, you must set the Pin Function Select Register. See section 20, I/O Ports.

The AGTIOSEL register sets the AGTIO pin when using the AGTIO in Deep Software Standby mode and Software Standby mode. The AGTIOSEL register can be set with an 8-bit memory manipulation instruction.

SEL[1:0] bits (AGTIO Pin Select)

The SEL[1:0] bits select the AGTIO pin function.

TIES bit (AGTIO Input Enable)

The TIES bit enables or disables an external event input.

25.3 Operation

25.3.1 Reload Register and Counter Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and the counter differs depending on the value of the TSTART bit in the AGTCR register and of the TCMEA or TCMEB bit in the AGTCMSR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and the counter. When the TSTART bit is 1 (count starts) and the TCMEA bit and TCMEB bit are 0 (compare match A/B registers are invalid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the next count source. When the TSTART bit is 1 (count starts) and the TCMEA bit or TCMEB bit is 1 (compare match A register or compare match B register is valid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the underflow of the counter.

Figure 25.2 and Figure 25.3 show the timing of rewrite operation with TSTART bit value and TCMEA/TCMEB bit value.

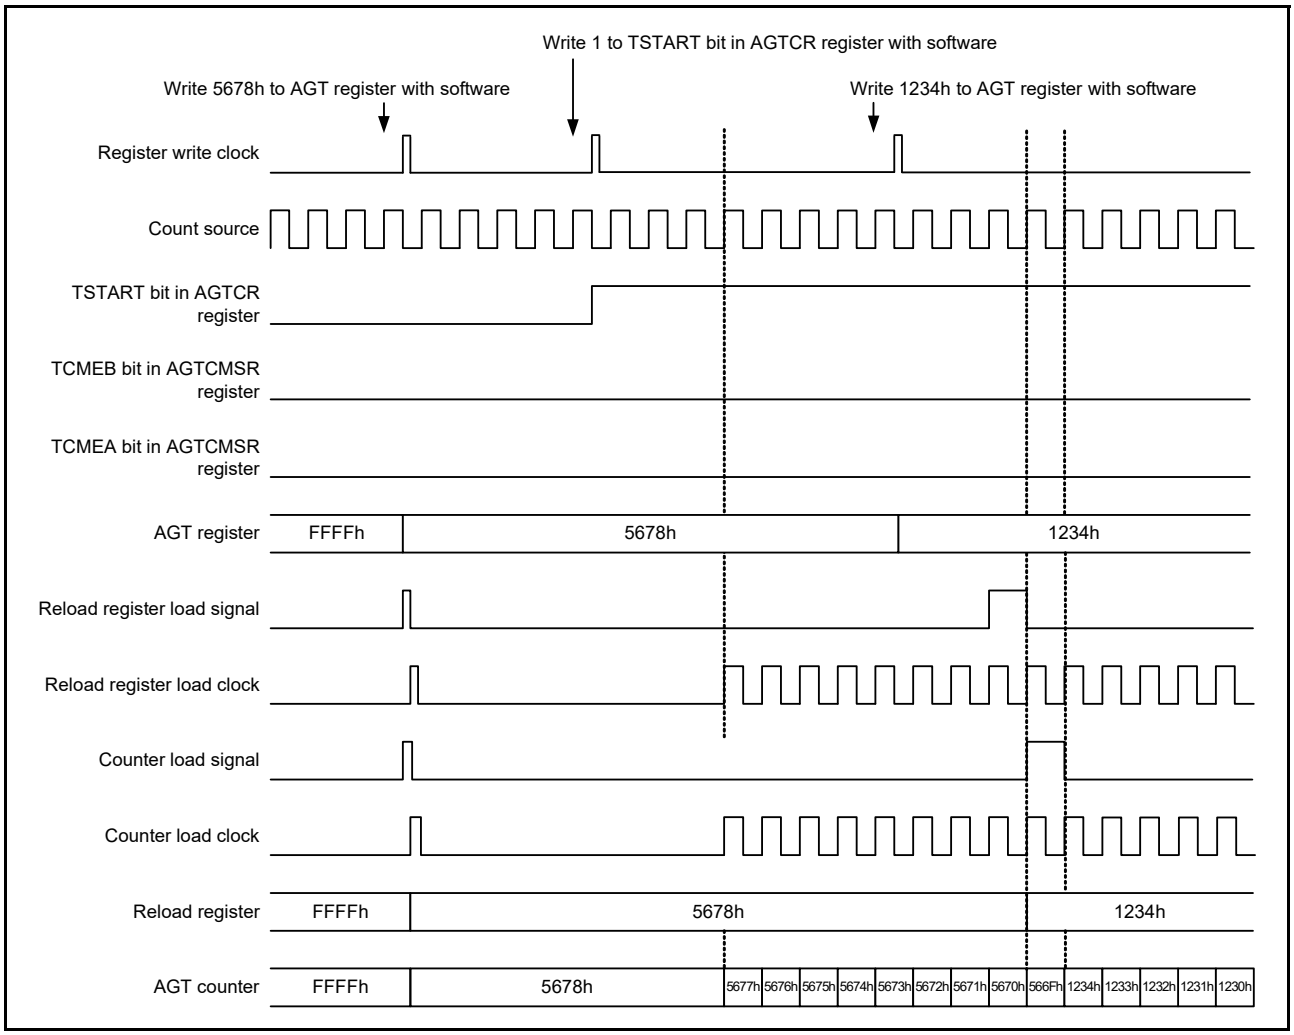

Figure 25.2 Timing of rewrite operation with TSTART and TCMEA or TCMEB bit values when compare match register A or B is invalid

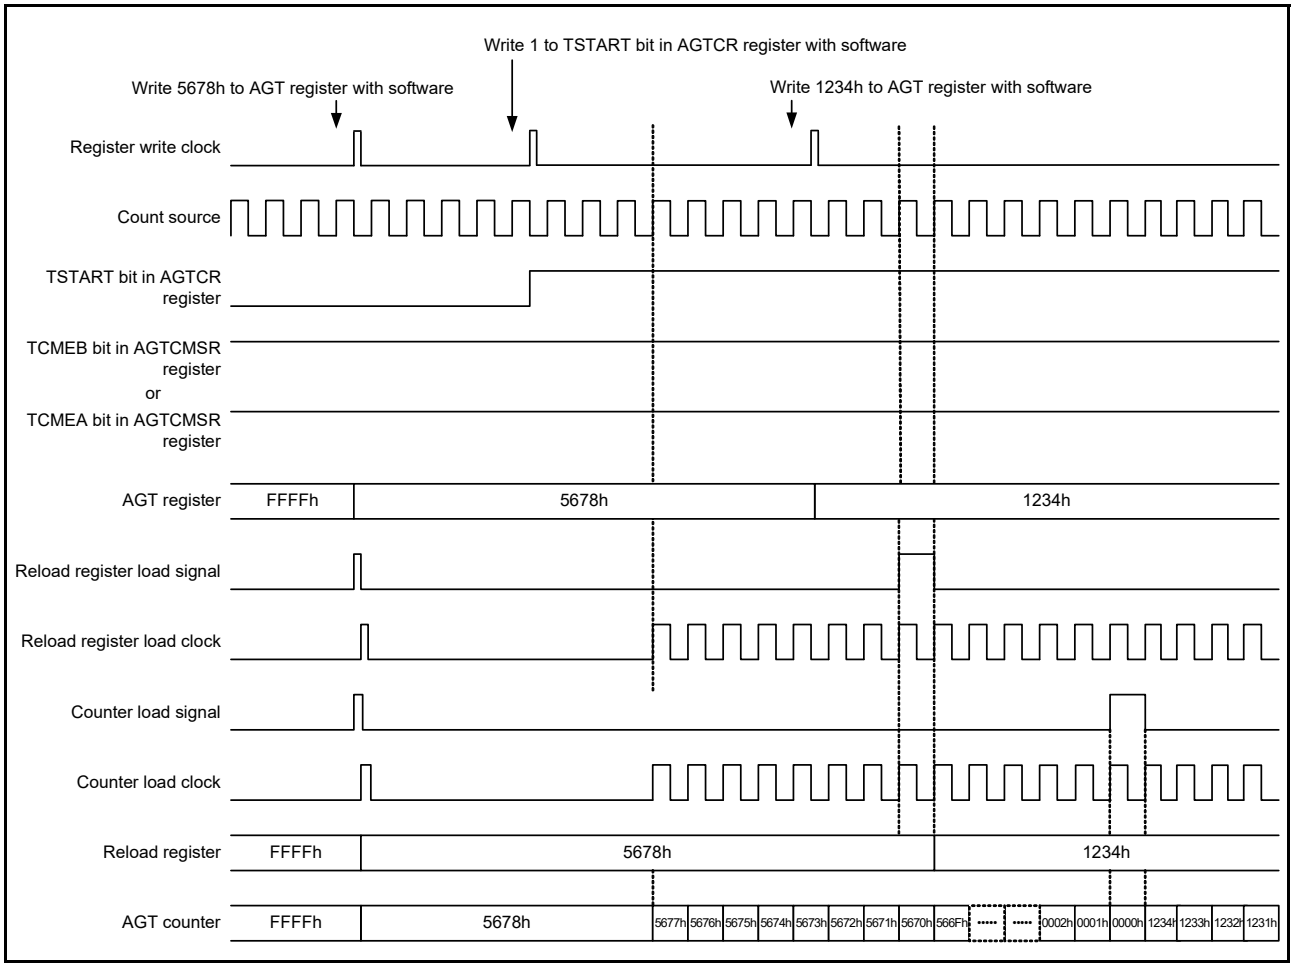

Figure 25.3 Timing of rewrite operation with TSTART and TCMEA or TCMEB bit values when compare match register A or B is valid

25.3.2 Reload Register and Compare Register A/B Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to compare register A/B depends on the value of the TSTART bit in the AGTCR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and compare register A/B. When the TSTART bit is 1 (count starts), the value is written to the reload register in synchronization with the count source, and then to the compare register in synchronization with the underflow of the counter.

Figure 25.4 shows the timing of rewrite operation with TSTART bit value for compare register A. Compare register B is of the same timing as compare register A.

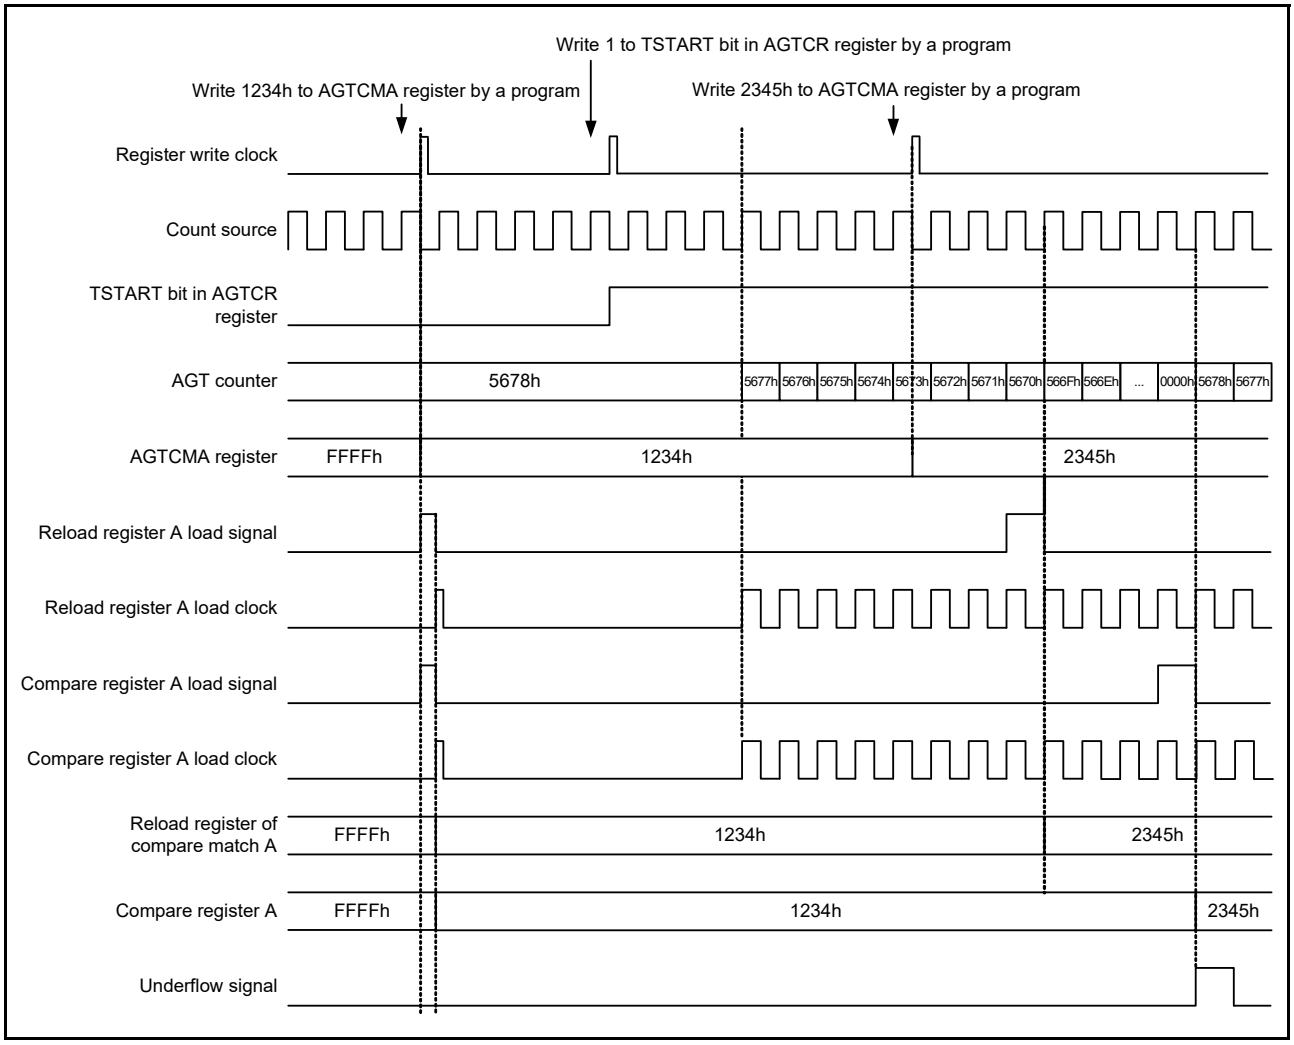

Figure 25.4 Timing of rewrite operation with TSTART bit value for compare register A

25.3.3 Timer Mode

In this mode, the AGT counter is decremented by the count source selected by bits TCK[2:0] in the AGTMR1 register. In timer mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0000h and the next count source is input, an underflow occurs and an interrupt request is generated.

Figure 25.5 shows the operation example in timer mode.

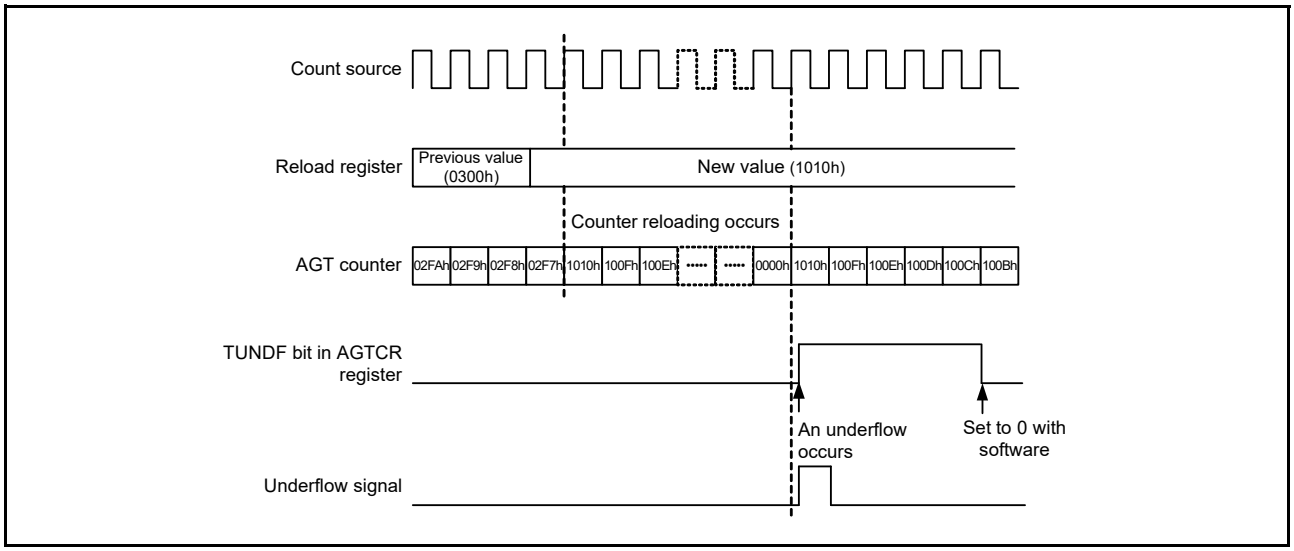

Figure 25.5 Operation example in timer mode

25.3.4 Pulse Output Mode

In this mode, the counter is decremented by the count source selected by bits TCK[2:0] in the AGTMR1 register, and the output level of pins AGTIOn and AGTOn pin is inverted each time an underflow occurs.

In pulse output mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0000h and the next count source is input, an underflow occurs and an interrupt request is generated. In addition, a pulse can be output from the AGTIOn and AGTOn pins. The output level is inverted each time an underflow occurs. The pulse output from the AGTOn pin can be stopped with the TOE bit in the AGTIOC register. The output level can be selected with the TEDGSEL bit in the AGTIOC register.

Figure 25.6 shows the operation example in pulse output mode.

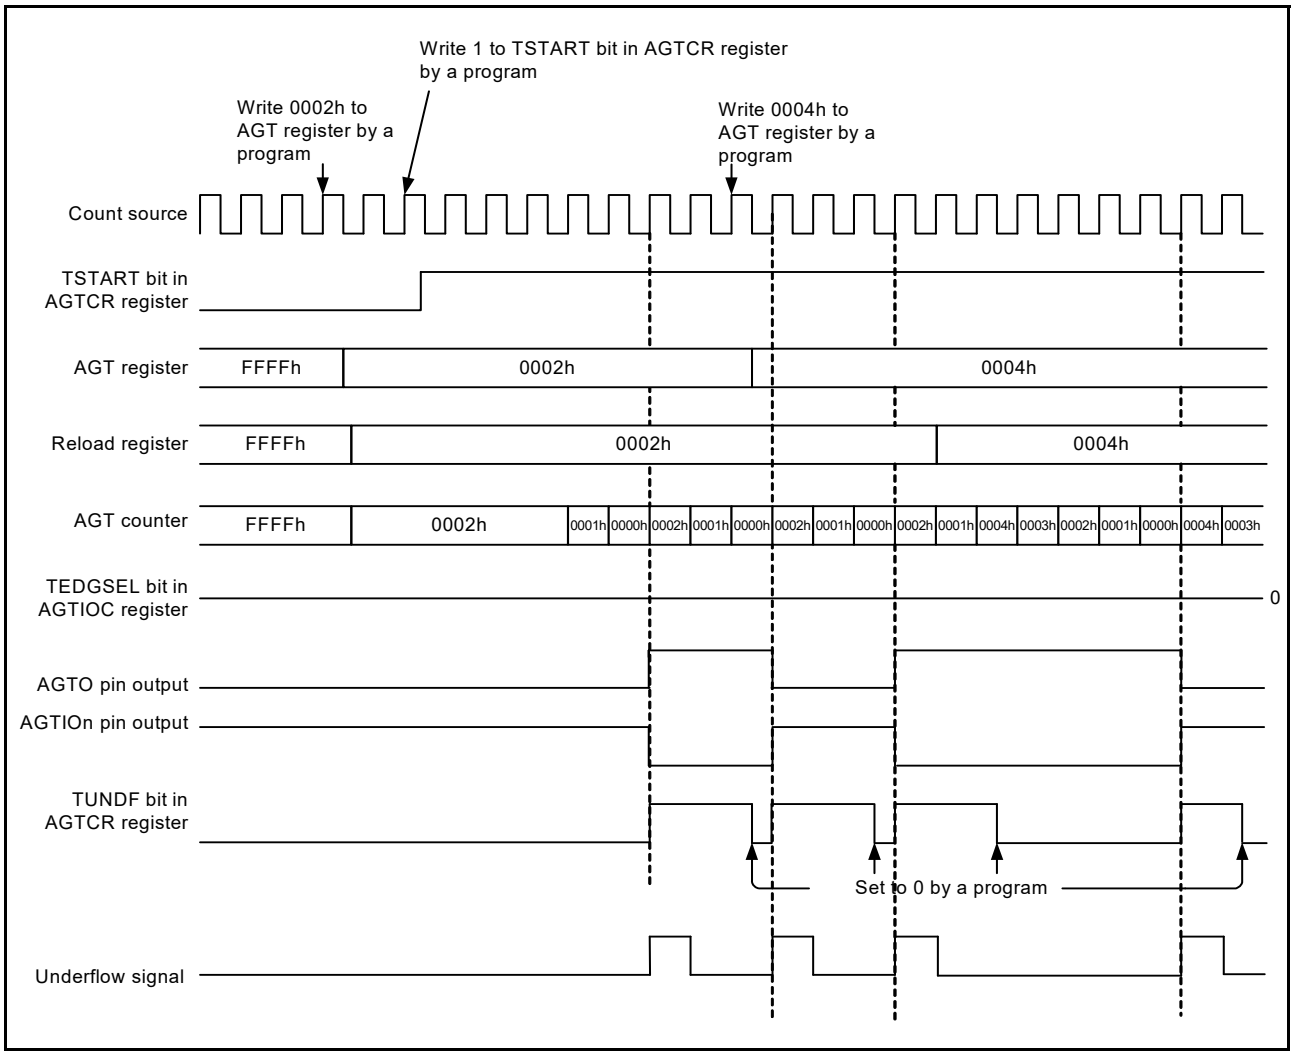

Figure 25.6 Operation example in pulse output mode

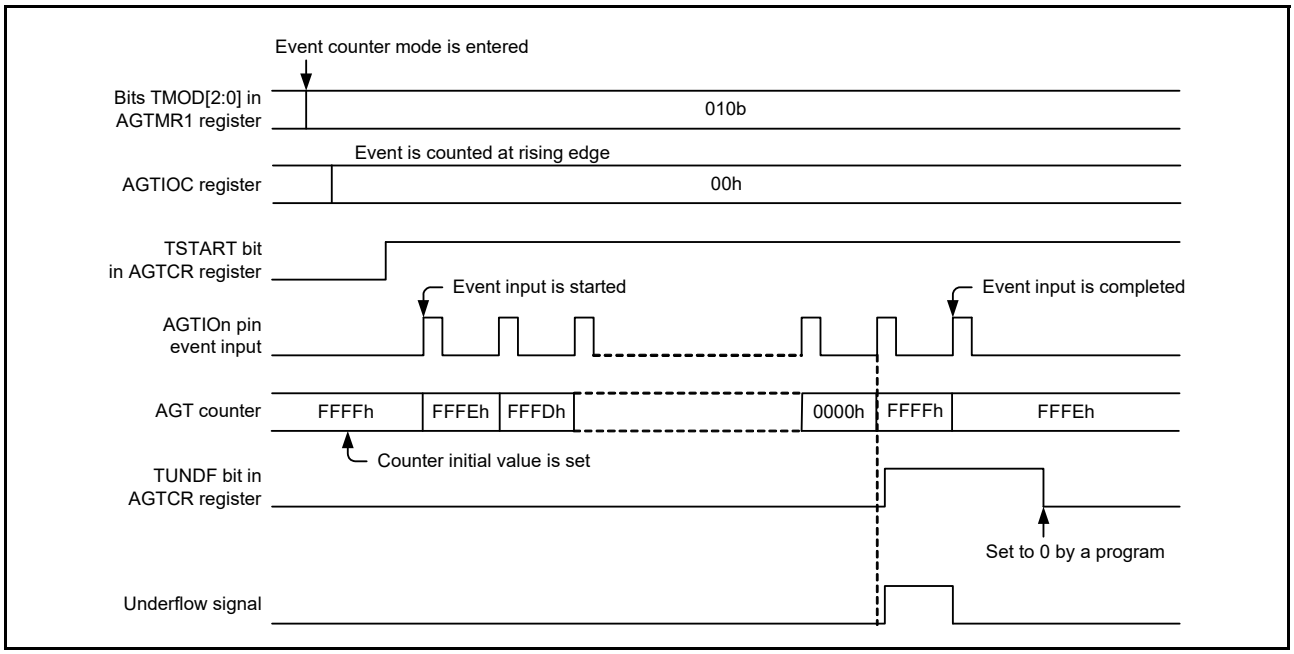
25.3.5 Event Counter Mode

In this mode, the counter is decremented by an external event signal input to the AGTIOn pin. Various periods for counting events can be set with the TIOGT[1:0] bits in the AGTIOC and AGTISR registers. In addition, the filter function for the AGTIOn input can be specified with bits TIPF[1:0] in the AGTIOC register. The output from the AGTOn pin can be toggled even in event counter mode.

Figure 25.7 shows the operation example in event counter mode.



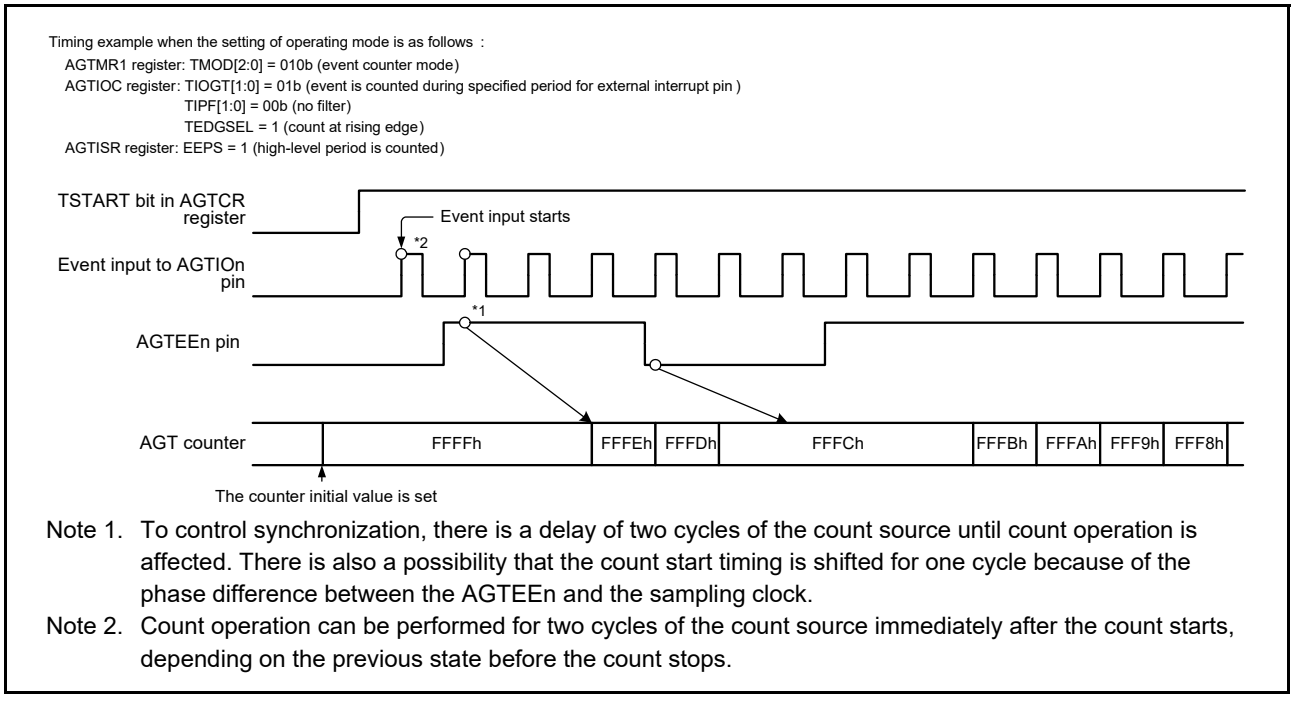


Figure 25.7 Operation example 1 in event counter mode

Figure 25.8 shows an operation example for counting during the specified period in event counter mode (bits TIOGT[1:0] in the AGTIOC register are set to 01b).

Note 1. To control synchronization, there is a delay of two cycles of the count source until count operation is affected. There is also a possibility that the count start timing is shifted for one cycle because of the phase difference between the AGTEEn and the sampling clock.

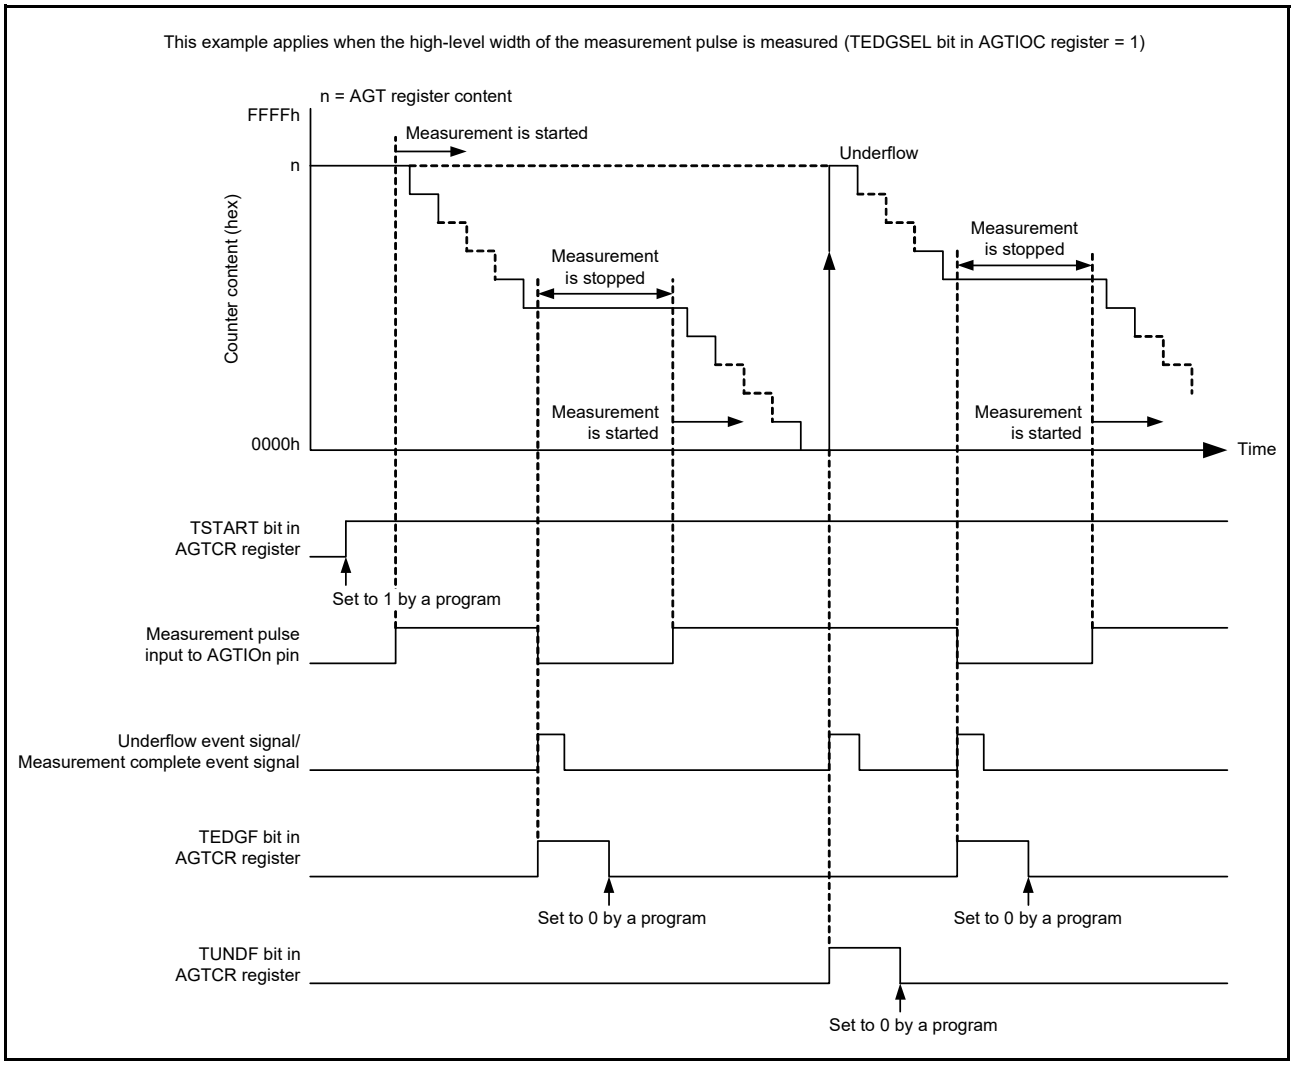
Note 2. Count operation can be performed for two cycles of the count source immediately after the count starts, depending on the previous state before the count stops.

Figure 25.8 Operation example 2 in event counter mode

25.3.6 Pulse Width Measurement Mode

In this mode, the pulse width of an external signal input to the AGTIOn pin is measured. When the level specified in the TEDGSEL bit in the AGTIOC register is input to the AGTIOn pin, the counter is decremented by the count source selected by bits TCK[2:0] in the AGTMR1 register. When the specified level on the AGTIOn pin ends, the counter is stopped, the TEDGF bit in the AGTCR register is set to 1 (active edge received), and an interrupt request is generated. The measurement of pulse width data is performed by reading the count value while the counter is stopped. Also, when the counter underflows during measurement, the TUNDF bit in the AGTCR register is set to 1 and an interrupt request is generated.

Figure 25.9 shows the operation example in pulse width measurement mode.



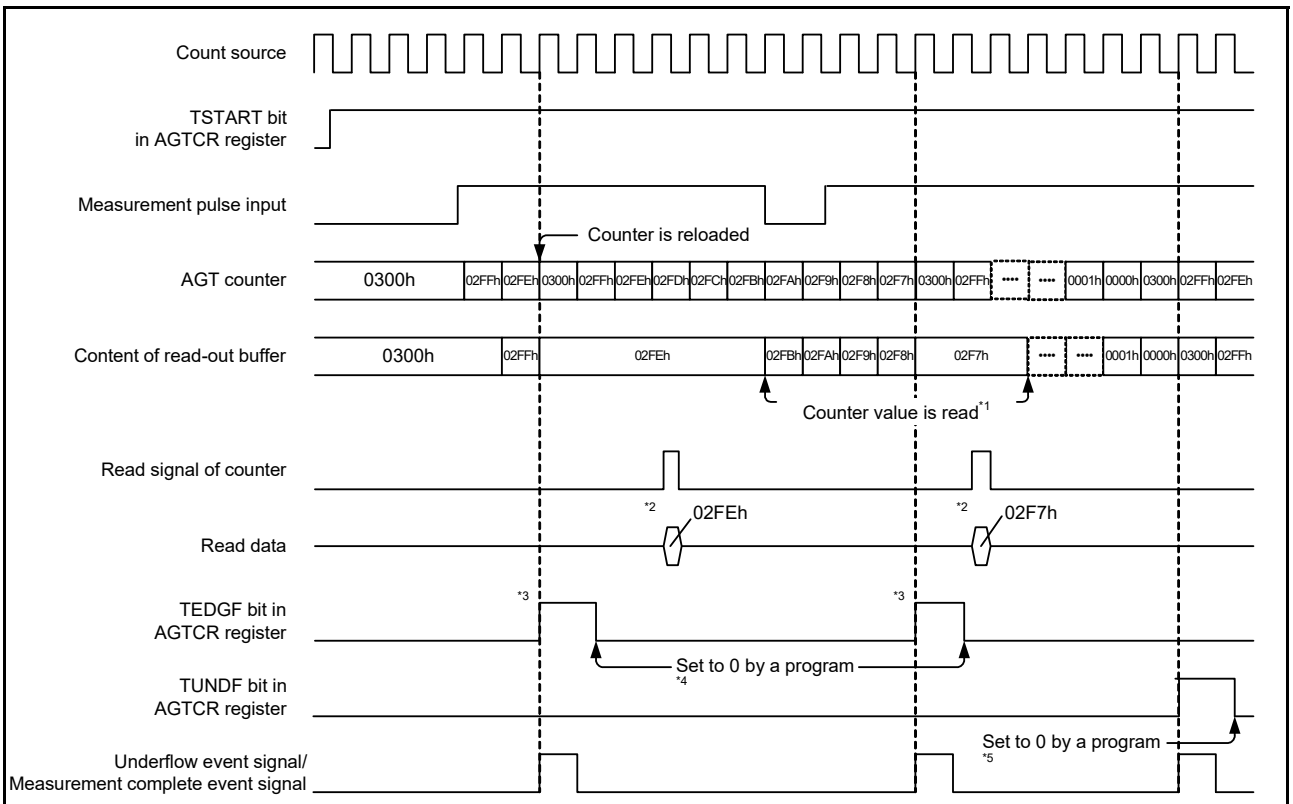


Figure 25.9 Operation example in pulse width measurement mode

25.3.7 Pulse Period Measurement Mode

In this mode, the pulse period of an external signal input to the AGTIOn pin is measured. The counter is decremented by the count source selected with bits TCK[2:0] in the AGTMR1 register. When a pulse with the period specified in the TEDGSEL bit in the AGTIOC register is input to the AGTIOn pin, the count value is transferred to the read-out buffer on the rising edge of the count source. The value in the reload register is loaded to the counter at the next rising edge. Simultaneously, the TEDGF bit in the AGTCR register is set to 1 (active edge received) and an interrupt request is generated. The read-out buffer (AGT register) is read at this time and the difference from the reload value (see section 25.4.5, How to Calculate Event Number, Pulse Width, and Pulse Period) is the period data of the input pulse. The period data is retained until the read-out buffer is read. When the counter underflows, the TUNDF bit in the AGTCR register is set to 1 (underflow) and an interrupt request is generated.

Figure 25.10 shows the operation example in pulse period measurement mode.

Only input pulses with a period longer than twice the period of the count source are measured. Also, the low-level and high-level widths must both be longer than the period of the count source. If a pulse period shorter than these conditions is input, the input might be ignored.

This example applies when the initial value of the AGT register is set to 0300h, the TEDGSEL bit in the AGTIOC register is set to 0, and the period from one rising edge to the next edge of the measurement pulse is measured.

Note 1. Reading from the AGT register must be performed during the period from when the TEDGF bit is set to 1 (active edge received) until the next active edge is input. The content of the read-out buffer is retained until the AGT register is read. If it is not read before the active edge is input, the measurement result of the previous period is retained.
Note 2. When the AGT register is read in pulse period measurement mode, the content of the read-out buffer is read.
Note 3. When the active edge of the measurement pulse is input and then the set edge of an external pulse is input, the TEDGF bit in the AGTCR register is set to 1 (active edge received).
Note 4. To set to 0 with software, write 0 to the TEDGF bit in the AGTCR register using an 8-bit memory manipulation instruction.
Note 5. To set to 0 with software, write 0 to the TUNDF bit in the AGTCR register using an 8-bit memory manipulation instruction.

Figure 25.10 Operation example in pulse period measurement mode

25.3.8 Compare Match Function

This function detects matches (compare match) between the content of the AGTCMA/AGTCMB register and the content of the AGT register. This function is enabled when the TCMEA bit or the TCMEB bit in the AGTCMSR register is 1 (Compare match A register or compare match B register is valid). The counter is decremented by the count source selected by bits TCK[2:0] in the AGTMR1 register, and when the values of AGT and AGTCMA/AGTCMB match, the TCMAF/TCMBF bit in the AGTCR register is set to 1 (match), and an interrupt request is generated.

When compare match function is enabled, the timing of the rewrite operation to the reload register and the counter differs. See section 25.3.1, Reload Register and Counter Rewrite Operation for details. In addition, the output level of the AGTOAn and AGTOBn pins is inverted by the match and by the underflow. The output level can be selected with the TOPOLA or TOPOLB bit in the AGTCMSR register.

Figure 25.11 shows the operation example in compare match mode.

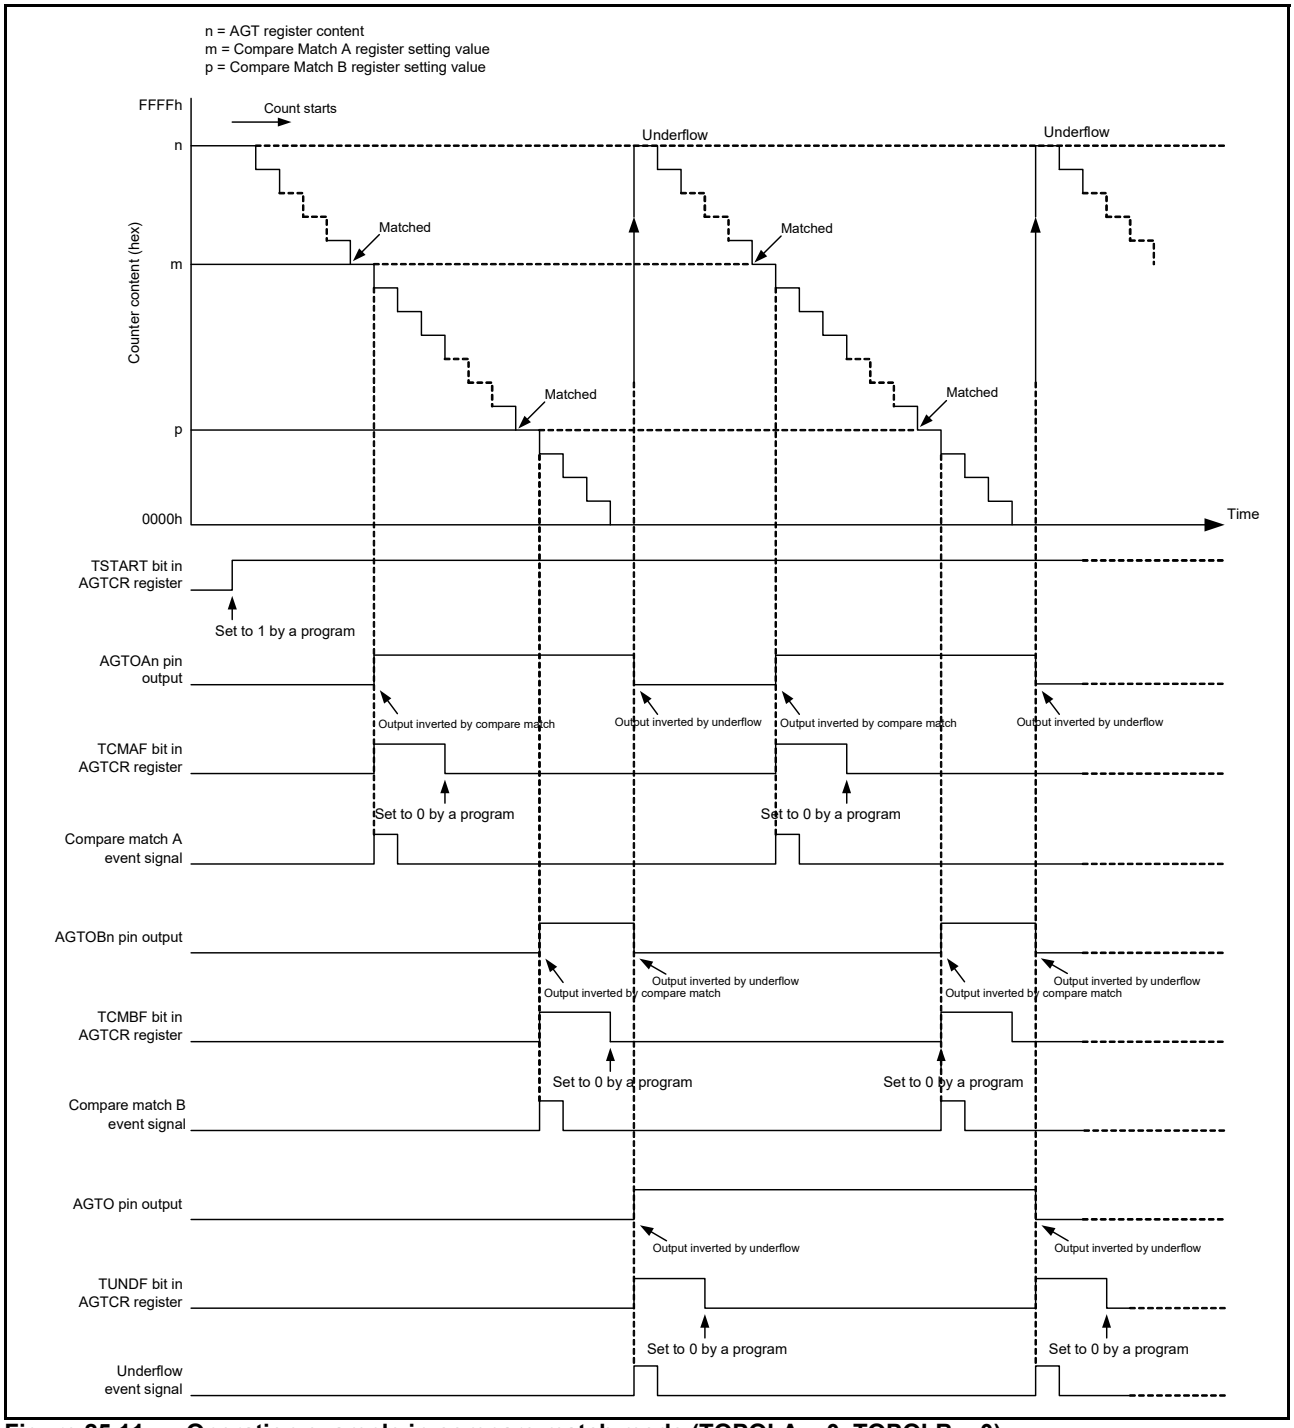

Figure 25.11 Operation example in compare match mode (TOPOLA = 0, TOPOLB = 0)

25.3.9 Output Settings for Each Mode

Table 25.5 to Table 25.8 list the states of pins AGTOn, AGTIOn, AGTOAn, and AGTOBn in each mode.

Table 25.5 AGTOn pin settings

25.3.10 Standby Mode

The AGT can operate in Software Standby and Deep Software Standby modes. Set it to Software Standby mode or Deep Software Standby mode with count operation start (TSTART = 1, TCSTF = 1).

Table 25.9 and Table 25.10 show the setting that can be used in Software Standby and Deep Software Standby modes.

Table 25.9 Usable settings for AGT0 in Software Standby and Deep Software Standby modes

Operating mode	TCK[2:0] bits of AGTMR1 register	Operating clock	Resurgence factor of CPU
Timer mode	100b or 110b	AGTLCLK or AGTSCLK	—
Pulse output mode	100b or 110b	AGTLCLK or AGTSCLK	—
Event counter mode	- (Invalid)	AGTIOn	—
Pulse width measurement mode	100b or 110b	AGTLCLK or AGTSCLK	—
Pulse period measurement mode	100b or 110b	AGTLCLK or AGTSCLK	—

Table 25.10 Usable settings AGT1 in Software Standby and Deep Software Standby modes

Operating mode	TCK[2:0] bits of AGTMR1 register	Operating clock	Resurgence factor of CPU
Timer mode	100b or 110b or 101b *1	AGTLCLK or AGTSCLK or AGT0 underflow	• Underflow • Compare match A/B
Pulse output mode	100b or 110b or 101b *1	AGTLCLK or AGTSCLK or AGT0 underflow	• Underflow • Compare match A/B
Event counter mode	- (Invalid)	AGTIOn	• Underflow • Compare match A/B

Pulse period measurement mode	100b or 110b or 101b *1	AGTLCLK or AGTSCLK or AGT0 underflow	• Underflow • Active edge

Note: Release of Software Standby mode or Deep Software Standby mode is only AGT1.
Note 1. Only when AGT0 operates in Table 25.9.

25.3.11 Interrupt Sources

The AGT has three interrupt sources described in Table 25.11.

Table 25.11 AGT interrupt sources

Name	Interrupt source	DMAC/DTC activation
AGTn_AGTI	• When the counter underflows • When measurement of the active width of the external input (AGTIO) is completed in pulse width measurement mode • When the set edge of the external input (AGTIO) is input in pulse period measurement mode.	Possible
AGTn_AGTCMAI	When the values of AGT and AGTCMA match	Possible
AGTn_AGTCMBI	When the values of AGT and AGTCMB match	Possible

Note: n = 0 or 1 channel number.

25.3.12 Output to the Event Link Controller (ELC)

The AGT uses the ELC to perform a link operation to a specified module using the interrupt request signal as the event signal. The AGT outputs compare match A, compare match B, and underflow/measurement complete signals as event signals. For details, see section 19, Event Link Controller (ELC).

25.4 Usage Notes

25.4.1 Count Operation Start and Stop Control

- When the operating mode (see Table 25.1) is set to other than the event counter mode, or the count source is set to other than AGT0 underflow (TCK[2:0] = 101b).
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF bit in the AGTCR register remains 0 (count stops) for three cycles of the count source. Do not access the registers associated with AGT*1 other than the TCSTF bit until this bit is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF bit remains 1 for three cycles of the count source. When the TCSTF bit is set to 0, the count stops. Do not access the registers associated with AGT*1 other than the TCSTF bit until this bit is set to 0.
  - Clear the interrupt register before changing the TSTART bit from 0 to 1. See section 14, Interrupt Controller Unit (ICU) for details.

Note 1. Registers associated with AGT: AGT, AGTCMA, AGTCMB, AGTCR, AGTMR1, AGTMR2, AGTIOC, AGTISR, and AGTCMSR.

- When the operating mode (see Table 25.1) is set to event counter mode, or the count source is set to AGT0 underflow (TCK[2:0] = 101b)
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF bit in the AGTCR register remains 0 (count stops) for two cycles of the PCLKB. Do not access the registers associated with AGT*1 other than the TCSTF bit until this bit is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF bit remains 1 for two cycles of the PCLKB. When the TCSTF bit is set to 0, the count is stopped. Do not access the registers associated with AGT*1 other than the TCSTF bit until this bit is set to 0.
  - Clear the interrupt register before changing the TSTART bit from 0 to 1. See section 14, Interrupt Controller Unit (ICU) for details.

Note 1. Registers associated with AGT: AGT, AGTCMA, AGTCMB, AGTCR, AGTMR1, AGTMR2, AGTIOC, AGTISR and AGTCMSR.

25.4.2 Access to Counter Register

When bits TSTART and TCSTF in the AGTCR register are both 1 (count starts), allow at least three cycles of the count source clock between writes when writing to the AGT register successively.

25.4.3 When Changing Mode

The registers associated with AGT operating mode (AGTMR1, AGTMR2, AGTIOC, AGTISR, AGTCMSR and AGTIOC) can be changed only when the count is stopped with both the TSTART and TCSTF bits set to 0 (count stops). Do not change these registers during count operation.

When the registers associated with AGT operating mode are changed, the values of bits TEDGF, TUNDF, TCMAF and TCMBF are undefined. Before starting the count, write 0 to the following bits:

- TEDGF (no active edge received)
- TUNDF (no underflow)
- TCMAF (no match)
- TCMBF (no match).

25.4.4 Digital Filter

When using the digital filter, do not start the timer operation for five cycles of the digital filter clock after setting bits TIPF[1:0] and when the TEDGSEL bit in the AGTIOC register changes.

25.4.5 How to Calculate Event Number, Pulse Width, and Pulse Period

- In event counter mode, event number is expressed mathematically as follows:
  Event number = initial value of counter [AGT register] - counter value of active event end
- In pulse width measurement mode, pulse width is expressed mathematically as follows:
  Pulse width = counter value of stopping measurement - counter value of next stopping measurement
- In pulse period measurement mode, input pulse period is expressed mathematically as follows:
  Period of input pulse = (initial value of counter [AGT register] - reading value of the read-out buffer) + 1

25.4.6 When Count Is Forcibly Stopped by TSTOP Bit

After the counter is forcibly stopped by the TSTOP bit in the AGTCR register, do not access the following I/O registers for one cycle of the count source:

- AGT
- AGTCMA
- AGTCMB
- AGTCR
- AGTMR1
- AGTMR2.

25.4.7 When Selecting AGT0 Underflow as the Count Source

Operate the AGT according to the procedures described in this section when selecting the underflow signal of AGT as the count source.

(1) Procedure for starting operation

1. Set AGT0 and AGT1.
2. Start the count operation of AGT1.
3. Start the count operation of AGT0.

(2) Procedure for stopping operation

1. Stop the count operation of AGT0.
2. Stop the count operation of AGT1.
3. Stop the count source clock of AGT1 (by writing "000b" in AGT1.AGTMR1.TCK[2:0] bits).

25.4.8 Reset of I/O Register

The I/O register of the AGT is not initialized by some types of resets. For details, see section 6, Resets.

25.4.9 When Selecting PCLKB, PCLKB/8, or PCLKB/2 as the Count Source

Operation of the AGT is not guaranteed after a reset is generated. Set the registers associated with AGT again.

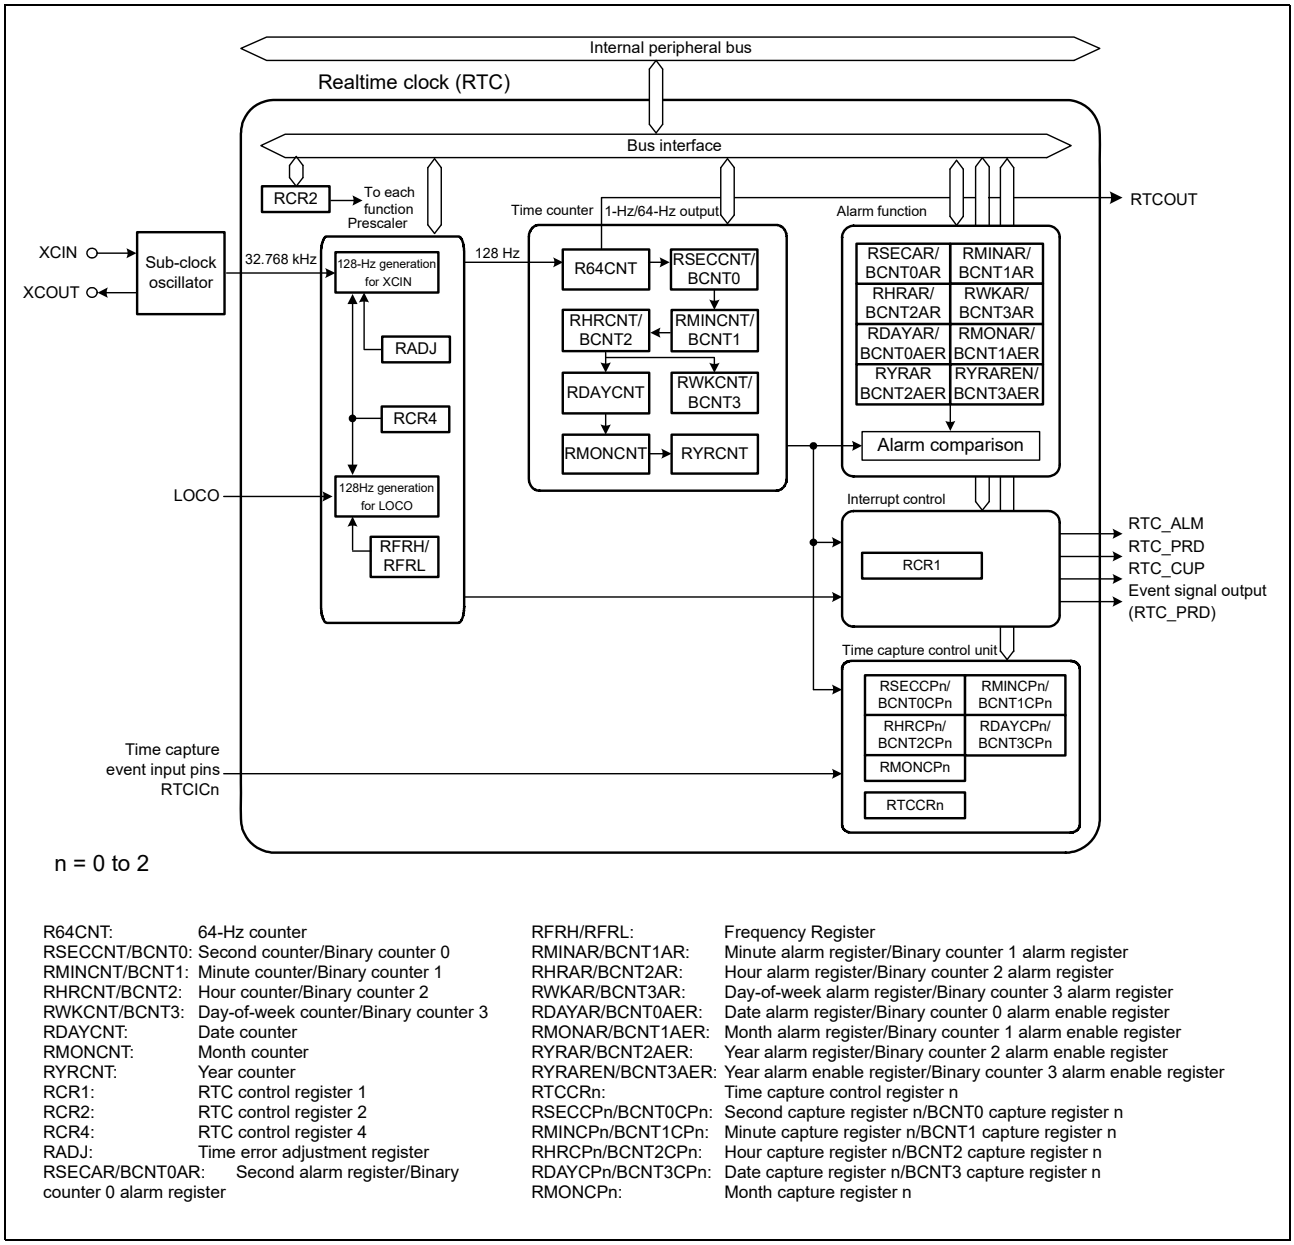
25.4.10 When Selecting AGTSCLK or AGTLCLK as the Count Source

The MSTPD2 in MSTPCRD register must be set to 1 except when accessing the AGT1 registers. The MSTPD3 in MSTPCRD register must be set to 1 except when accessing the AGT0 registers. Operation of AGT1 or AGT0 is not guaranteed when a reset occurs while MSTPD2 or MSTPD3 is 0. Set the registers associated with AGT again.

26. Realtime Clock (RTC)

26.1 Overview

The Realtime Clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100 year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar.



The sub-clock oscillator or LOCO can be selected as the count source of the time counters. The RTC uses a 128-Hz clock acquired by dividing the count source by a prescaler. Year, month, date, day-of-week, a.m./p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted by 1/128 second.

Table 26.1 lists the RTC specifications, Figure 26.1 shows the block diagram, and Table 26.2 lists the I/O pins.

Table 26.1 RTC specifications

Parameter	Specifications
Count mode	Calendar count mode/binary count mode
Count source*1	Sub-clock oscillator (XCIN) or LOCO
Clock and calendar functions	• Calendar count mode Year, month, date, day of week, hour, minute, second are counted, BCD display 12 hours/24 hours mode switching function 30 seconds adjustment function (a number less than 30 is rounded down to 00 seconds, and 30 seconds or more are rounded up to 1 minute) Automatic adjustment function for leap years. • Binary count mode Count seconds in 32 bits, binary display. • Shared by both modes Start/stop function The sub-second digit is displayed in binary units (1 Hz, 2 Hz, 4 Hz, 8 Hz, 16 Hz, 32 Hz, or 64 Hz) Clock error correction function Clock (1-Hz/64-Hz) output.
Interrupts	• Alarm interrupt (RTC_ALM) As an alarm interrupt condition, selectable for comparison with the following: Calendar count mode: Year, month, date, day-of-week, hour, minute, or second can be selected Binary count mode: Each bit of the 32-bit binary counter. • Periodic interrupt (RTC_PRD) 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second can be selected as an interrupt period. • Carry interrupt (RTC_CUP) An interrupt is generated at either of the following conditions: - When a carry from the 64-Hz counter to the second counter is generated - When the 64-Hz counter is changed and the R64CNT register is read at the same time. • Return from Software Standby mode or Deep Software Standby mode can be performed by an alarm interrupt or periodic interrupt.
Time capture function	• Times can be captured when the edge of the time capture event input pin is detected. For every event input, month, date, hour, minute, and second are captured or the 32-bit binary counter value is captured.
Event link function	Periodic event output (RTC_PRD)

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source clock.

R64CNT: 64-Hz counter

Table 26.2 RTC I/O pins

Pin name	I/O	Function
XCIN	Input	Connect a 32.768-kHz crystal to these pins
XCOUT	Output	
RTCOUT	Output	This pin is used to output a 1-Hz/64-Hz waveform, but not in Deep Software Standby mode
RTCIC0	Input	Time capture event input pins RTCIC0 to RTCIC2 can be controlled by the VBTICTLR register. For more information, see section 12, Battery Backup Function and section 20, I/O Ports.
RTCIC1	Input	
RTCIC2	Input	

26.2 Register Descriptions

Write or read from the RTC registers as described in section 26.6.5, Notes on Writing to and Reading from Registers.

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low-power state during counting operations, for example while the RCR2.START bit is 1, the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate.

Note: A reset generated while writing to a register might destroy the register value. In addition, do not allow the MCU to enter Software Standby mode or Deep Software Standby mode immediately after setting any of these registers. For details, see section 26.6.4, Transitions to Low Power Modes after Setting Registers.

26.2.1 64-Hz Counter (R64CNT)

Address(es): RTC.R64CNT 4004 4000h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	F1HZ	F2HZ	F4HZ	F8HZ	F16HZ	F32HZ	F64HZ
Value after reset:	0	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	F64HZ	64 Hz	These bits indicate the state between 1 Hz and 64 Hz of the sub-second digit.	R
b1	F32HZ	32 Hz		R
b2	F16HZ	16 Hz		R
b3	F8HZ	8 Hz		R
b4	F4HZ	4 Hz		R
b5	F2HZ	2 Hz		R
b6	F1HZ	1 Hz		R
b7	—	Reserved	This bit is read as 0.	R

The R64CNT counter is used in both calendar count mode and in binary count mode. The 64-Hz counter (R64CNT) generates the period for a second by counting up periods of the 128-Hz clock. The state in the sub-second range can be confirmed by reading this counter.

This counter is set to 00h by an RTC software reset or an execution of a 30-second adjustment. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

26.2.2 Second Counter (RSECCNT)/Binary Counter 0 (BCNT0)

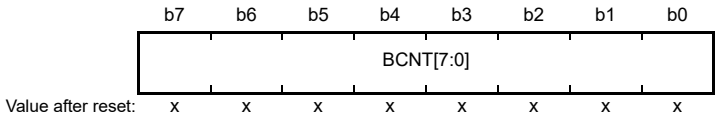
(1) In calendar count mode

Address(es): RTC.RSECCNT 4004 4002h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	SEC1[3:0]	1-Second Count	Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place.	R/W
b6 to b4	SEC10[2:0]	10-Second Count	Counts from 0 to 5 for 60-second counting.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W



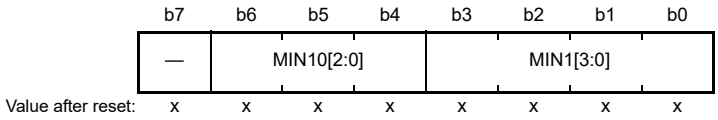
The RSECCNT counter is used for setting and counting the BCD-coded second value. It counts the carries generated

once per second in the 64-Hz counter.
The setting range is decimal 00 to 59. The RTC does not operate normally if any other value is set. Before writing to this register, you must stop the count operation using the START bit in RCR2.

To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

(2) In binary count mode

Address(es): RTC.BCNT0 4004 4002h



x: Undefined

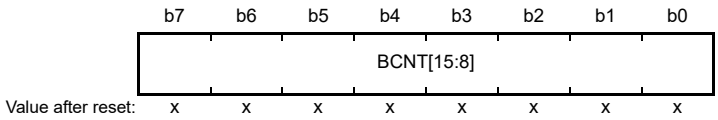
BCNT0 is a read/write 32-bit binary counter b7 to b0 that performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

26.2.3 Minute Counter (RMINCNT)/Binary Counter 1 (BCNT1)

(1) In calendar count mode

Address(es): RTC.RMINCNT 4004 4004h

x: Undefined



Bit	Symbol	Bit name	Description	R/W
b3 to b0	MIN1[3:0]	1-Minute Count	Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place.	R/W
b6 to b4	MIN10[2:0]	10-Minute Count	Counts from 0 to 5 for 60-minute counting.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

The RMINCNT counter is used for setting and counting the BCD-coded minute value. It counts the carries generated once every minute in the second counter.

A value from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

(2) In binary count mode

Address(es): RTC.BCNT1 4004 4004h

x: Undefined

BCNT1 is a read/write 32-bit binary counter b15 to b8 that performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

26.2.4 Hour Counter (RHRCNT)/Binary Counter 2 (BCNT2)

(1) In calendar count mode

Address(es): RTC.RHRCNT 4004 4006h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	HR1[3:0]	1-Hour Count	Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place.	R/W
b5, b4	HR10[1:0]	10-Hour Count	Counts from 0 to 2 once per carry from the ones place.	R/W
b6	PM	PM	A.m./p.m. select for time counter setting. 0: a.m. 1: p.m.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

The RHRCNT counter is used for setting and counting the BCD-coded hour value. It counts the carries generated once per hour in the minute counter. The specifiable time differs based on the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 — from 00 to 11 (in BCD)
- When the RCR2.HR24 bit is 1 — from 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. The PM bit is only enabled when the RCR2.HR24 bit is 0. Otherwise, the setting in the PM bit has no effect. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

(2) In binary count mode

Address(es): RTC.BCNT2 4004 4006h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[23:16]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT2 is a read/write 32-bit binary counter b23 to b16 that performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

26.2.5 Day-of-Week Counter (RWKCNT)/Binary Counter 3 (BCNT3)

(1) In calendar count mode

Address(es): RTC.RWKCNT 4004 4008h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	DAYW[2:0]		
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b2 to b0	DAYW[2:0]	Day-of-Week Counting	b2 b0 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting prohibited.	R/W
b7 to b3	—	Reserved	Set these bits to 0. They are read as the set value.	R/W

The RWKCNT counter is used for setting and counting in the coded day-of-week value. It counts the carries generated once per day in the hour counter. A value from 0 through 6 can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

(2) In binary count mode

Address(es): RTC.BCNT3 4004 4008h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT3 is a read/write 32-bit binary counter b31 to b24 that performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

26.2.6 Day Counter (RDAYCNT)

Address(es): RTC.RDAYCNT 4004 400Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	0	0	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	DATE1[3:0]	1-Day Count	Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place.	R/W
b5, b4	DATE10[1:0]	10-Day Count	Counts from 0 to 3 once per carry from the ones place.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RDAYCNT counter is used in calendar count mode. RDAYCNT is used for setting and counting the BCD-coded date value. It counts the carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year. Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.

A value from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. When specifying a value, the range of specifiable days depends on the month and whether the year is a leap year. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

26.2.7 Month Counter (RMONCNT)

Address(es): RTC.RMONCNT 4004 400Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	MON10	MON1[3:0]			
Value after reset:	0	0	0	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	MON1[3:0]	1-Month Count	Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place.	R/W
b4	MON10	10-Month Count	Counts from 0 to 1 once per carry from the ones place.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RMONCNT counter is used in calendar count mode. RMONCNT is used for setting and counting the BCD-coded month value. It counts the carries generated once per month in the date counter.

A value from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

26.2.8 Year Counter (RYRCNT)

Address(es): RTC.RYRCNT 4004 400Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	YR1[3:0]	1-Year Count	Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place.	R/W
b7 to b4	YR10[3:0]	10-Year Count	Counts from 0 to 9 once per carry from ones place. When a carry is generated in the tens place, 1 is added to the hundreds place.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RYRCNT counter is used in calendar count mode. RYRCNT is used for setting and counting the BCD-coded year value. It counts the carries generated once per year in the month counter.

A value from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time.

26.2.9 Second Alarm Register (RSECAR)/Binary Counter 0 Alarm Register (BCNT0AR)

(1) In calendar count mode

Address(es): RTC.RSECAR 4004 4010h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	SEC1[3:0]	1 Second	Value for the ones place of seconds.	R/W
b6 to b4	SEC10[2:0]	10 Seconds	Value for the tens place of seconds.	R/W
b7	ENB	ENB	0: Do not compare register value with RSECCNT counter value 1: Compare register value with RSECCNT counter value.	R/W

RSECAR is an alarm register associated with the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RSECAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 00h by an RTC software reset.

(2) In binary count mode

Address(es): RTC.BCNT0AR 4004 4010h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT0AR is a read/write alarm register associated with the 32-bit binary counter b7 to b0. This register is set to 00h by an RTC software reset.

26.2.10 Minute Alarm Register (RMINAR)/Binary Counter 1 Alarm Register (BCNT1AR)

(1) In calendar count mode

Address(es): RTC.RMINAR 4004 4012h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	MIN10[2:0]			MIN1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	MIN1[3:0]	1 Minute	Value for the ones place of minutes.	R/W
b6 to b4	MIN10[2:0]	10 Minutes	Value for the tens place of minutes.	R/W
b7	ENB	ENB	0: Do not compare register value with RMINCNT counter value 1: Compare register value with RMINCNT counter value.	R/W

RMINAR is an alarm register associated with the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RMINAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 00h by an RTC software reset.

(2) In binary count mode

Address(es): RTC.BCNT1AR 4004 4012h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT1AR is a read/write alarm register associated with the 32-bit binary counter from b15 to b8. This register is set to 00h by an RTC software reset.

26.2.11 Hour Alarm Register (RHRAR)/Binary Counter 2 Alarm Register (BCNT2AR)

(1) In calendar count mode

Address(es): RTC.RHRAR 4004 4014h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	HR1[3:0]	1 Hour	Value for the ones place of hours.	R/W
b5, b4	HR10[1:0]	10 Hours	Value for the tens place of hours.	R/W
b6	PM	PM	A.m./p.m. select for alarm setting. 0: a.m. 1: p.m.	R/W
b7	ENB	ENB	0: Do not compare register value with RHRCNT counter value 1: Compare register value with RHRCNT counter value.	R/W

RHRAR is an alarm register associated with the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 — From 00 to 11 (in BCD)
- When the RCR2.HR24 bit is 1 — From 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. When the RCR2.HR24 bit is 0, you must set the PM bit. When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect. This register is set to 00h by an RTC software reset.

(2) In binary count mode

Address(es): RTC.BCNT2AR 4004 4014h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[23:16]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT2AR is a read/write alarm register associated with to the 32-bit binary counter b23 to b16. This register is set to 00h by an RTC software reset.

26.2.12 Day-of-Week Alarm Register (RWKAR)/Binary Counter 3 Alarm Register (BCNT3AR)

(1) In calendar count mode

Address(es): RTC.RWKAR 4004 4016h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	—	—	DAYW[2:0]		
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b2 to b0	DAYW[2:0]	Day-of-Week Setting	b2 b0 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting prohibited.	R/W
b6 to b3	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: Do not compare register value with RWKCNT counter value 1: Compare register value with RWKCNT counter value.	R/W

RWKAR is an alarm register associated with the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values all match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RWKAR values from 0 through 6 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 00h by an RTC software reset.

(2) In binary count mode

Address(es): RTC.BCNT3AR 4004 4016h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT3AR is a read/write alarm register associated with the 32-bit binary counter b31 to b24. This register is set to 00h by an RTC software reset.

26.2.13 Date Alarm Register (RDAYAR)/Binary Counter 0 Alarm Enable Register (BCNT0AER)

(1) In calendar count mode

Address(es): RTC.RDAYAR 4004 4018h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	DATE1[3:0]	1 Day	Value for the ones place of days.	R/W
b5, b4	DATE10[1:0]	10 Days	Value for the tens place of days.	R/W
b6	—	Reserved	Set this bit to 0. It is read as the set value.	R/W
b7	ENB	ENB	0: Do not compare register value with RDAYCNT counter value 1: Compare register value with RDAYCNT counter value.	R/W

RDAYAR is an alarm register associated with the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RDAYAR values from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 00h by an RTC software reset.

(2) In binary count mode

Address(es): RTC.BCNT0AER 4004 4018h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT0AER is a read/write register for setting the alarm enable associated with the 32-bit binary counter b7 to b0. The binary counter (BCNT[31:0]) associated with the ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR[31:0]), and when all match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 00h by an RTC software reset.

26.2.14 Month Alarm Register (RMONAR)/Binary Counter 1 Alarm Enable Register (BCNT1AER)

(1) In calendar count mode

Address(es): RTC.RMONAR 4004 401Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	MON10	MON1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	MON1[3:0]	1 Month	Value for the ones place of months.	R/W
b4	MON10	10 Months	Value for the tens place of months.	R/W
b6, b5	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: Do not compare register value with RMONCNT counter value 1: Compare register value with RMONCNT counter value.	R/W

RMONAR is an alarm register associated with the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RMONAR values from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 00h by an RTC software reset.

(2) In binary count mode

Address(es): RTC.BCNT1AER 4004 401Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT1AER is a read/write register for setting the alarm enable associated with the 32-bit binary counter b15 to b8. The binary counter (BCNT[31:0]) associated with the ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR[31:0]), and when all match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 00h by an RTC software reset.

26.2.15 Year Alarm Register (RYRAR)/Binary Counter 2 Alarm Enable Register (BCNT2AER)

(1) In calendar count mode

Address(es): RTC.RYRAR 4004 401Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	YR1[3:0]	1 Year	Value for the ones place of years.	R/W
b7 to b4	YR10[3:0]	10 Years	Value for the tens place of years.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RYRAR is an alarm register associated with the BCD-coded year counter RYRCNT. The RYRAR values from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0000h by an RTC software reset.

(2) In binary count mode

Address(es): RTC.BCNT2AER 4004 401Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ENB[23:16]							
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

BCNT2AER is a read/write register for setting the alarm enable associated with the 32-bit binary counter b23 to b16. The binary counter (BCNT[31:0]) associated with the ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR[31:0]), and when all match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 0000h by an RTC software reset.

26.2.16 Year Alarm Enable Register (RYRAREN)/Binary Counter 3 Alarm Enable Register (BCNT3AER)

(1) In calendar count mode

Address(es): RTC.RYRAREN 4004 401Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: Do not compare register value with RYRCNT counter value 1: Compare register value with RYRCNT counter value.	R/W

When the ENB bit in RYRAREN is set to 1, the RYRAR value is compared with the RYRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN.

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 00h by an RTC software reset.

(2) In binary count mode

Address(es): RTC.BCNT3AER 4004 401Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

BCNT3AER is a read/write register for setting the alarm enable associated with the 32-bit binary counter b31 to b24. The binary counter (BCNT[31:0]) associated with the ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR[31:0]), and when all match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 00h by an RTC software reset.

26.2.17 RTC Control Register 1 (RCR1)

Address(es): RTC.RCR1 4004 4022h

	b7	b6	b5	b4	b3	b2	b1	b0
	PES[3:0]				RTCOS	PIE	CIE	AIE
Value after reset:	x	x	x	x	0	x	0	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	AIE	Alarm Interrupt Enable	0: Disable alarm interrupt requests 1: Enable alarm interrupt requests.	R/W
b1	CIE	Carry Interrupt Enable	0: Disable carry interrupt requests 1: Enable carry interrupt requests.	R/W
b2	PIE	Periodic Interrupt Enable	0: Disable periodic interrupt requests 1: Enable periodic interrupt requests.	R/W
b3	RTCOS	RTCOUT Output Select	0: Outputs 1 Hz on RTCOUT 1: Outputs 64 Hz RTCOUT.	R/W
b7 to b4	PES[3:0]	Periodic Interrupt Select	b7 b4 0 1 1 0: Generate periodic interrupt every 1/256 second*1 0 1 1 1: Generate periodic interrupt every 1/128 second 1 0 0 0: Generate periodic interrupt every 1/64 second 1 0 0 1: Generate periodic interrupt every 1/32 second 1 0 1 0: Generate periodic interrupt every 1/16 second 1 0 1 1: Generate periodic interrupt every 1/8 second 1 1 0 0: Generate periodic interrupt every 1/4 second 1 1 0 1: Generate periodic interrupt every 1/2 second 1 1 1 0: Generate periodic interrupt every 1 second 1 1 1 1: Generate periodic interrupt every 2 seconds. Other settings: Do not generate periodic interrupts.	R/W

Note 1. When LOCO is selected (RCR4.RCKSEL = 1) while PES[3:0] = 0110b, a periodic interrupt is generated every 1/128 second.

The RCR1 register is used in both calendar count mode and in binary count mode. Bits AIE, PIE, and PES[3:0] are updated synchronously with the count source. When the RCR1 register is modified, check that all the bits are updated before proceeding.

AIE bit (Alarm Interrupt Enable)

The AIE bit enables or disables alarm interrupt requests.

If the times indicated in the counters and alarm settings match in Deep Software Standby mode, the MCU returns from the mode regardless of the value of the AIE bit.

CIE bit (Carry Interrupt Enable)

The CIE bit enables or disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

PIE bit (Periodic Interrupt Enable)

The PIE bit enables or disabled a periodic interrupt.

If the periods indicated in the counters and PES[3:0] settings match in Deep Software Standby mode, the MCU returns from the mode regardless of the value of the PIE bit.

RTCOS bit (RTCOUT Output Select)

The RTCOS bit selects the RTCOUT output period. The RTCOS bit must be rewritten while the count operation is stopped (the RCR2.START bit is 0) and the RTCOUT output is disabled (the RCR2.RTCOE bit is 0). When the RTCOUT is output to an external pin, the RCR2.RTCOE bit must be enabled. For details on controlling the I/O ports, see section 20.5.1, Procedure for Specifying the Pin Functions.

PES[3:0] bits (Periodic Interrupt Select)

The PES[3:0] bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified in these bits.

26.2.18 RTC Control Register 2 (RCR2)

(1) In calendar count mode

Address(es): RTC.RCR2 4004 4024h

	b7	b6	b5	b4	b3	b2	b1	b0
	CNTMD	HR24	AADJP	AADJE	RTCOE	ADJ30	RESET	START
Value after reset:	x	x	x	x	0	0	0	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	START	Start	0: Stop prescaler and time counter 1: Operate prescaler and time counter normally.	R/W
b1	RESET	RTC Software Reset	• In writing 0: Invalid (writing 0 has no effect) 1: Initialize prescaler and target registers for RTC software reset. *1 • In reading 0: Normal time operation in progress, or RTC software reset has completed 1: RTC software reset in progress.	R/W
b2	ADJ30	30-Second Adjustment	• In writing 0: Invalid (writing 0 has no effect) 1: Execute 30-second adjustment. • In reading 0: Normal time operation in progress, or 30-second adjustment has completed 1: 30-second adjustment in progress.	R/W
b3	RTCOE	RTCOUT Output Enable	0: Disable RTCOUT output 1: Enable RTCOUT output.	R/W
b4	AADJE	Automatic Adjustment Enable*2	0: Disable automatic adjustment 1: Enable automatic adjustment.	R/W
b5	AADJP	Automatic Adjustment Period Select*2	0: Adjust RADJ.ADJ[5:0] setting from the count value of the prescaler every minute 1: Adjust RADJ.ADJ[5:0] setting from the count value of the prescaler every 10 seconds.	R/W
b6	HR24	Hours Mode	0: Operate RTC in 12-hour mode 1: Operate RTC in 24-hour mode.	R/W
b7	CNTMD	Count Mode Select	0: Calendar count mode 1: Binary count mode.	R/W

Note 1. R64CNT, RSECAR/BCNT0AR, RMINAR/BCNT1AR, RHRAR/BCNT2AR, RWKAR/BCNT3AR, RDAYAR/BCNT0AER, RMONAR/BCNT1AER, RYRAR/BCNT2AER, RYRAREN/BCNT3AER, RADJ, RTCCRy, RSECCPy/BCNT0CPy, RMINCPy/BCNT1CPy, RHRCPy/BCNT2CPy, RDAYCPy/BCNT3CPy, RMONCPy, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

Note 2. When LOCO is selected, the setting of this bit is disabled.

The RCR2 register is related to hours mode, automatic adjustment function, enabling RTCOUT output, 30-second adjustment, RTC software reset, and controlling count operation.

START bit (Start)

The START bit stops or restarts the prescaler or time counter operation. The bit is updated in synchronization with the next cycle of the count source. When the START bit is modified, check that the bit is updated before proceeding.

RESET bit (RTC Software Reset)

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is completed, the RESET bit is automatically set to 0. Check that this bit is 0 before proceeding.

ADJ30 bit (30-Second Adjustment)

The ADJ30 bit is for 30-second adjustment.

When 1 is written to the ADJ30 bit, the RSECCNT value of 30 seconds or less is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute.

The 30-second adjustment is performed in synchronization with the count source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment is completed. If 1 is written to the ADJ30 bit, check that the bit is 0 before proceeding. When the 30-second adjustment is performed, the prescaler and R64CNT are also reset. The ADJ30 bit is set to 0 by an RTC software reset.

RTCOE bit (RTCOUT Output Enable)

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time.

When RTCOUT is to be output from an external pin, enable the RTCOE bit and set up the port control for the pin.

AADJE bit (Automatic Adjustment Enable)

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.

The AADJE bit is set to 0 by an RTC software reset.

AADJP bit (Automatic Adjustment Period Select)

The AADJP bit selects the automatic-adjustment period.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.

The AADJP bit is set to 0 by an RTC software reset.

HR24 bit (Hours Mode)

The HR24 bit specifies whether the RTC operates in 12- or 24-hour mode.

Use the START bit to stop counting before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.

CNTMD bit (Count Mode Select)

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated synchronously with the count source, and its value is fixed before the RTC software reset is completed.

For details on initial settings, see section 26.3.1, Outline of Initial Settings of Registers after Power On.

(2) In binary count mode

Address(es): RTC.RCR2 4004 4024h

	b7	b6	b5	b4	b3	b2	b1	b0
	CNTMD	—	AADJP	AADJE	RTCOE	—	RESET	START
Value after reset:	x	x	x	x	0	0	0	x

b7	CNTMD	Count Mode Select	0: Calendar count mode 1: Binary count mode.	R/W

Note 1. R64CNT, RSECAR/BCNT0AR, RMINAR/BCNT1AR, RHRAR/BCNT2AR, RWKAR/BCNT3AR, RDAYAR/BCNT0AER, RMONAR/BCNT1AER, RYRAR/BCNT2AER, RYRAREN/BCNT3AER, RADJ, RTCCRy, RSECCPy/BCNT0CPy, RMINCPy/BCNT1CPy, RHRCPy/BCNT2CPy, RDAYCPy/BCNT3CPy, RMONCPy, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP

Note 2. When LOCO is selected, the setting of this bit is disabled.

START bit (Start)

The START bit stops or restarts the prescaler or counter (clock) operation. The bit is updated in synchronization with the count source. When the START bit is modified, check that the bit is updated before proceeding.

RESET bit (RTC Software Reset)

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is completed, the RESET bit is automatically set to 0. When 1 is written to the RESET bit, check that the bit is 0 before proceeding.

RTCOE bit (RTCOUT Output Enable)

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time. When an RTCOUT signal is to be output from an external pin, enable the port control in addition to setting this bit.

AADJE bit (Automatic Adjustment Enable)

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit. The AADJE bit is set to 0 by an RTC software reset.

AADJP bit (Automatic Adjustment Period Select)

The AADJP bit selects the automatic-adjustment period.

Correction period can be selected from 32 second units or 8 second units in binary count mode.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit. The AADJP bit is set to 0 by an RTC software reset.

CNTMD bit (Count Mode Select)

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated synchronously with the count source, and its value is fixed before the RTC software reset is completed.

For details on initial settings, see section 26.3.1, Outline of Initial Settings of Registers after Power On.

26.2.19 RTC Control Register 4 (RCR4)

Address(es): RTC.RCR4 4004 4028h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RCKSEL
Value after reset:	0	0	0	0	0	0	0	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	RCKSEL	Count Source Select	0: Select sub-clock oscillator 1: Select LOCO.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RCR4 register selects the count source and is used in both calendar count mode and binary count mode. When the RCKSEL bit is set to 0, the time is counted with the sub-clock oscillator. When the bit is set to 1, the time is counted with LOCO.

RCKSEL bit (Count Source Select)

The RCKSEL bit selects the count source from the sub-clock oscillator and LOCO.

The count source must be selected only once before making the initial settings of the RTC registers at power on.

26.2.20 Frequency Register (RFRH/RFRL)

Address(es): RTC.RFRH 4004 402Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	RFC16	Reserved	Write 0 before writing to the RFRL register after a cold start.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Address(es): RTC.RFRL.4004 402Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RFC[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

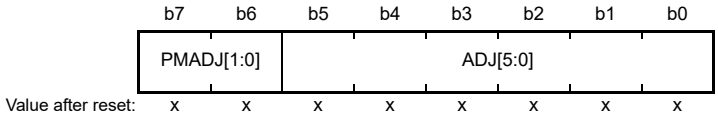
x: Undefined

Bit	Symbol	Bit name	Description	R/W
b15 to b0	RFC[15:0]	Frequency Comparison Value	Write 00FFh to this register when using the LOCO.	R/W

RFRL is a register for controlling the prescaler when LOCO is selected.

The RTC time counter operates on a 128-Hz clock signal as the base clock. Therefore, when LOCO is selected, LOCO is divided by the prescaler to generate a 128-Hz clock signal. Set the frequency comparison value in the RFC[15:0] bits to generate a 128-Hz clock from the LOCO frequency. Before writing to RFC[15:0] after a cold start, write 0000h to the RFRH register.

A value from 0007h through 01FFh can be specified as the frequency comparison value. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2. The operating frequency of the peripheral module clock and the LOCO should be such that the peripheral module clock >= LOCO.



Calculation method of frequency comparison value:

RFC[15:0] = (LOCO clock frequency) / 128 - 1

When the LOCO frequency is 32.768 kHz, the RFRL register should be set to 00FFh.

26.2.21 Time Error Adjustment Register (RADJ)

Address(es): RTC.RADJ 4004 402Eh

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b5 to b0	ADJ[5:0]	Adjustment Value	These bits specify the adjustment value from the prescaler.	R/W
b7, b6	PMADJ[1:0]	Plus-Minus	b7 b6 0 0: Do not perform adjustment 0 1: Perform adjustment by addition to the prescaler 1 0: Perform adjustment by subtraction from the prescaler 1 1: Setting prohibited.	R/W

Adjustment is performed by the addition to or subtraction from the prescaler. If the automatic adjustment enable (RCR2.AADJE) bit is 0, adjustment is performed when writing to the RADJ. If the RCR2.AADJE bit is 1, adjustment is performed in the interval specified in the automatic adjustment period select (RCR2.AADJP) bit.

Adjusting the current by software (disabling automatic adjustment) might not be valid if the following adjustment value is specified within 320 cycles of the count source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the count source after the register setting, and then specify the next adjustment value.

RADJ is updated in synchronization with the count source. When RADJ is modified, check that all the bits are updated before continuing with more processing. This register is set to 00h by an RTC software reset. The setting of this register is enabled only when the sub-clock oscillator is selected. When LOCO is selected, adjustment is not performed.

ADJ[5:0] bits (Adjustment Value)

The ADJ[5:0] bits specify the adjustment value (number of sub-clock cycles) from the prescaler.

PMADJ[1:0] bits (Plus-Minus)

The PMADJ[1:0] bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

26.2.22 Time Capture Control Register y (RTCCRy) (y = 0 to 2)

Address(es): RTC.RTCCR0 4004 4040h, RTC.RTCCR1 4004 4042h, RTC.RTCCR2 4004 4044h

	b7	b6	b5	b4	b3	b2	b1	b0
	TCEN	—	TCNF[1:0]		—	TCST	TCCT[1:0]	
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b1, b0	TCCT[1:0]	Time Capture Control	b1 b0 0 0: Do not detect events 0 1: Detect rising edge 1 0: Detect falling edge 1 1: Detect both edges.	R/W
b2	TCST	Time Capture Status	0: No event detected 1: Event detected.*1	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5, b4	TCNF[1:0]	Time Capture Noise Filter Control	b5 b4 0 0: Turn noise filter off 0 1: Setting prohibited 1 0: Turn noise filter on (count source) 1 1: Turn noise filter on (count source by divided by 32).	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	TCEN	Time Capture Event Input Pin Enable	0: The RTCICn pin is disabled as the time capture event input 1: The RTCICn pin is disabled as the time capture event input (n = 0 to 2).	R/W

Note 1. Indicates that an event is detected. Writing 1 to this bit has no effect. Writing 0 sets this bit to 0.

The RTCCRy register is used both in calendar count mode and in binary count mode. RTCCR0, RTCCR1, and RTCCR2 control the RTCIC0, RTCIC1, and RTCIC2 pins, respectively.

RTCCRy is updated in synchronization with the count source. When RTCCRy is modified, check that all the bits except for the TCST bit are updated before continuing with more processing. This register is set to 00h by an RTC software reset. When RTCICn is used as the time capture pin, VBTICTLR.VCHnIEN (n = 0 to 2) must be set to 1. For more information, see section 12, Battery Backup Function.

TCCT[1:0] bits (Time Capture Control)

The TCCT[1:0] bits control the edge detection of the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2. The detection edge is selectable. The TCCT[1:0] bits must be set while the VBTICTLR.VCHnIEN bit is 1.

TCST bit (Time Capture Status)

The TCST bit indicates that an event of the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2, was detected. When the TCST bit is 0, no event is detected. When the TCST bit is 1, this bit indicates that an event was detected on the associated pin and the capture register is valid. When multiple events are detected, the capture time for the first event is retained.

If an event is detected while the count operation stops, that is, the RCR2.START bit is 0, the captured value is not guaranteed. In this case, set the TCST bit to 0 to delete the captured value. Writing 0 sets the TCST bit to 0. Writing any other value except 0 has no effect.

Set the TCST bit while the TCCT[1:0] bits are 00b (no event is detected). The TCST bit is set to 0 in synchronization with the count source. When the TCST bit is set to 0, check that the bit is updated before continuing with more processing.

TCNF[1:0] bits (Time Capture Noise Filter Control)

The TCNF[1:0] bits control the noise filter of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2).

When the noise filter is on, the count source divided by 1 or divided by 32 is selectable. In this case, when the input level on the time capture event input pin matches three consecutive times at the set sampling period, the input level is determined.

Set the TCNF[1:0] bits while the TCCT[1:0] bits are 00b (no event is detected). When the noise filter is used, set the TCNF[1:0] bits, wait for three cycles of the specified sampling period, and then set the TCCT[1:0] bits. Set the TCNF[1:0] bits when the VBTICTLR.VCHnIEN bit is 1.

TCEN bit (Time Capture Event Input Pin Enable)

This bit controls the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2). When the functions of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2) are multiplexed, VBTICTLR should be set first. If the TCEN bit is set to 0, also set the TCCT[1:0] bits to 00b.

26.2.23 Second Capture Register y (RSECCPy) (y = 0 to 2)/BCNT0 Capture Register y (BCNT0CPy) (y = 0 to 2)

(1) In calendar count mode

Address(es): RTC.RSECCP0 4004 4052h, RTC.RSECCP1 4004 4062h, RTC.RSECCP2 4004 4072h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	SEC1[3:0]	1-Second Capture	Capture value for the ones place of seconds.	R
b6 to b4	SEC10[2:0]	10-Second Capture	Capture value for the tens place of seconds.	R
b7	—	Reserved	This bit is read as 0 after an RTC software reset.	R

RSECCPy is a read-only register that captures the RSECCNT value when a time capture event is detected.

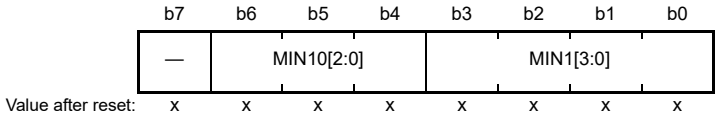
The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RSECCP0, RSECCP1, and RSECCP2 registers, respectively. This register is set to 00h by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

(2) In binary count mode

Address(es): RTC.BCNT0CP0 4004 4052h, RTC.BCNT0CP1 4004 4062h, RTC.BCNT0CP2 4004 4072h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTCPy[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined



BCNT0CPy is a read-only register that captures the BCNT0 value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT0CP0, BCNT0CP1, and BCNT0CP2 registers, respectively.

This register is set to 00h by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

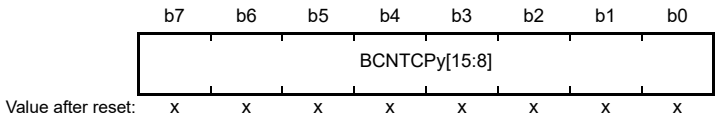
26.2.24 Minute Capture Register y (RMINCPy) (y = 0 to 2)/BCNT1 Capture Register y (BCNT1CPy) (y = 0 to 2)

(1) In calendar count mode

Address(es): RTC.RMINCP0 4004 4054h, RTC.RMINCP1 4004 4064h, RTC.RMINCP2 4004 4074h

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	MIN1[3:0]	1-Minute Capture	Capture value for the ones place of minutes.	R
b6 to b4	MIN10[2:0]	10-Minute Capture	Capture value for the tens place of minutes.	R
b7	—	Reserved	This bit is read as 0 after an RTC software reset.	R



RMINCPy is a read-only register that captures the RMINCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMINCP0, RMINCP1, and RMINCP2 registers, respectively.

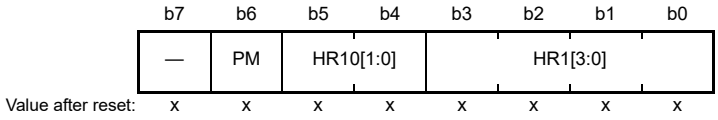
This register is set to 00h by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

(2) In binary count mode

Address(es): RTC.BCNT1CP0 4004 4054h, RTC.BCNT1CP1 4004 4064h, RTC.BCNT1CP2 4004 4074h

x: Undefined

BCNT1CPy is a read-only register that captures the BCNT1 value when a time capture event is detected.



The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT1CP0, BCNT1CP1, and BCNT1CP2 registers, respectively.

This register is set to 00h by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

26.2.25 Hour Capture Register y (RHRCPy) (y = 0 to 2)/BCNT2 Capture Register y (BCNT2CPy) (y = 0 to 2)

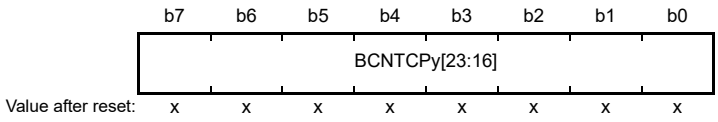
(1) In calendar count mode

Address(es): RTC.RHRCP0 4004 4056h, RTC.RHRCP1 4004 4066h, RTC.RHRCP2 4004 4076h

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	HR1[3:0]	1-Hour Capture	Capture value for the ones place of hours	R
b5, b4	HR10[1:0]	10-Hour Capture	Capture value for the tens place of hours	R
b6	PM	PM	0: a.m. 1: p.m.	R
b7	—	Reserved	This bit is read as 0 after an RTC software reset.	R

RHRCPy is a read-only register that captures the RHRCNT value when a time capture event is detected.



The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RHRCP0, RHRCP1, and RHRCP2 registers, respectively.

The PM bit is only enabled when the RCR2.HR24 bit is 0 (in 12-hour mode).

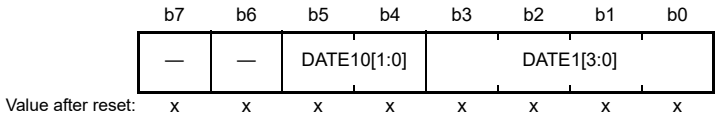
This register is set to 00h by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

(2) In binary count mode

Address(es): RTC.BCNT2CP0 4004 4056h, RTC.BCNT2CP1 4004 4066h, RTC.BCNT2CP2 4004 4076h

x: Undefined

BCNT2CPy is a read-only register that captures the BCNT2 value when a time capture event is detected.



The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT2CP0, BCNT2CP1, and BCNT2CP2 registers, respectively.

This register is set to 00h by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

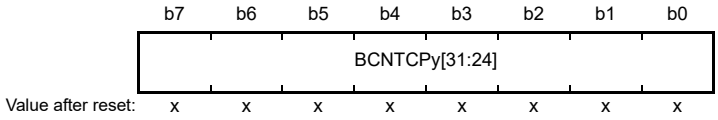
26.2.26 Date Capture Register y (RDAYCPy) (y = 0 to 2)/BCNT3 Capture Register y (BCNT3CPy) (y = 0 to 2)

(1) In calendar count mode:

Address(es): RTC.RDAYCP0 4004 405Ah, RTC.RDAYCP1 4004 406Ah, RTC.RDAYCP2 4004 407Ah

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	DATE1[3:0]	1-Day Capture	Capture value for the ones place of days.	R
b5, b4	DATE10[1:0]	10-Day Capture	Capture value for the tens place of days.	R
b7, b6	—	Reserved	These bits are read as 0 after an RTC software reset.	R



RDAYCPy is a read-only register that captures the RDAYCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RDAYCP0, RDAYCP1, and RDAYCP2 registers, respectively.

This register is set to 00h by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

(2) In binary count mode

Address(es): RTC.BCNT3CP0 4004 405Ah, RTC.BCNT3CP1 4004 406Ah, RTC.BCNT3CP2 4004 407Ah

x: Undefined

BCNT3CPy is a read-only register that captures the BCNT3 value when a time capture event is detected.

The event detection times detected by the RTCTC0, RTCTC1, and RTCTC2 pins are stored in the BCNT3CP0, BCNT3CP1, and BCNT3CP2 registers, respectively.

This register is set to 00h by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

26.2.27 Month Capture Register y (RMONCPy) (y = 0 to 2)

(1) In calendar count mode:

Address(es): RTC.RMONCP0 4004 405Ch, RTC.RMONCP1 4004 406Ch, RTC.RMONCP2 4004 407Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	MON10	MON1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b3 to b0	MON1[3:0]	1-Month Capture	Capture value for the ones place of months.	R
b4	MON10	10-Month Capture	Capture value for the tens place of months.	R
b7 to b5	—	Reserved	These bits are read as 0.	R

RMONCPy is a read-only register that captures the RMONCNT value when a time capture event is detected.

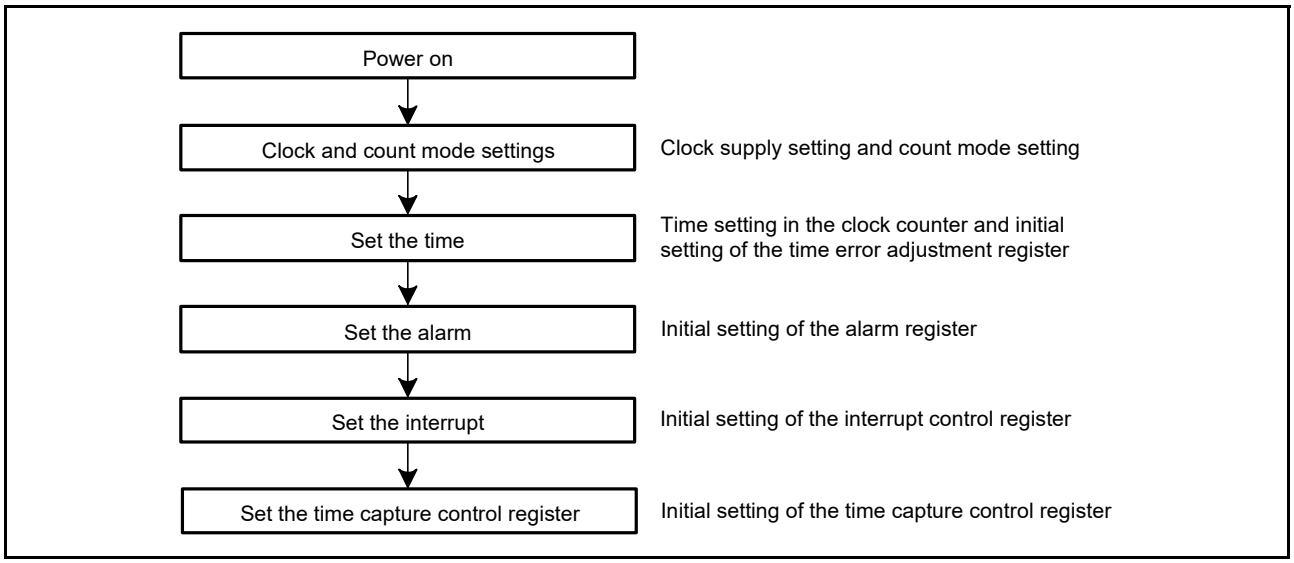
The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMONCP0, RMONCP1, and RMONCP2 registers, respectively.

This register is set to 00h by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRy.TCCT[1:0] bits.

26.3 Operation

26.3.1 Outline of Initial Settings of Registers after Power On

On power on, always perform the initial settings for the clock setting, count mode setting, time error adjustment, time setting, alarm, interrupt, and time capture control register.



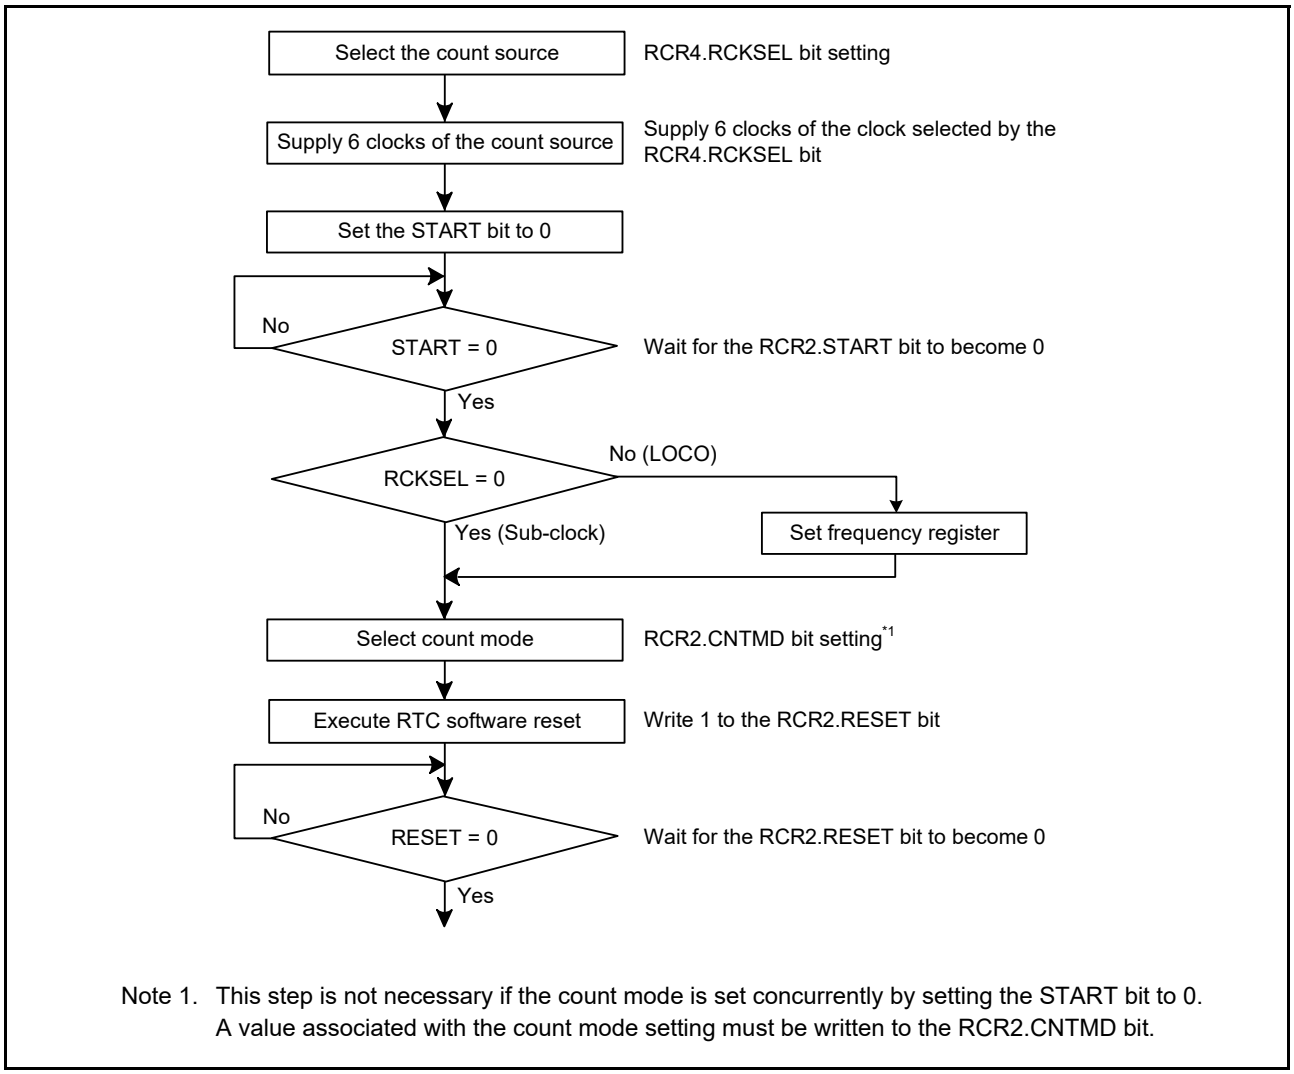


Figure 26.2 Outline of initial settings after a power on

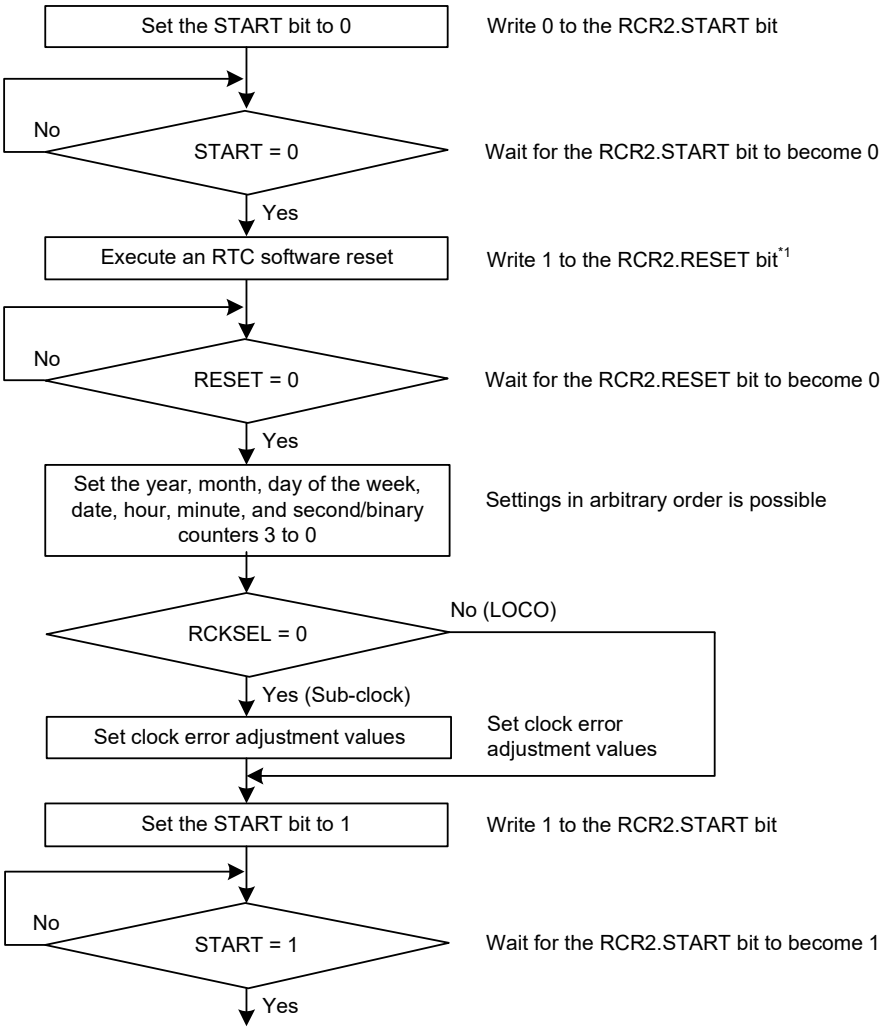
26.3.2 Clock and Count Mode Setting Procedure

Figure 26.3 shows how to set the clock and the count mode.



Note 1. This step is not necessary if the count mode is set concurrently by setting the START bit to 0. A value associated with the count mode setting must be written to the RCR2.CNTMD bit.

Figure 26.3 Clock and count mode setting procedure

26.3.3 Setting the Time

Figure 26.4 shows how to set the time.

Note 1. This step is not necessary for the time-setting procedure because an RTC software reset is executed in the clock setting procedure of the initial settings for the power supply.

Figure 26.4 Setting the time

26.3.4 30-Second Adjustment

Figure 26.5 shows how to execute a 30-second adjustment.

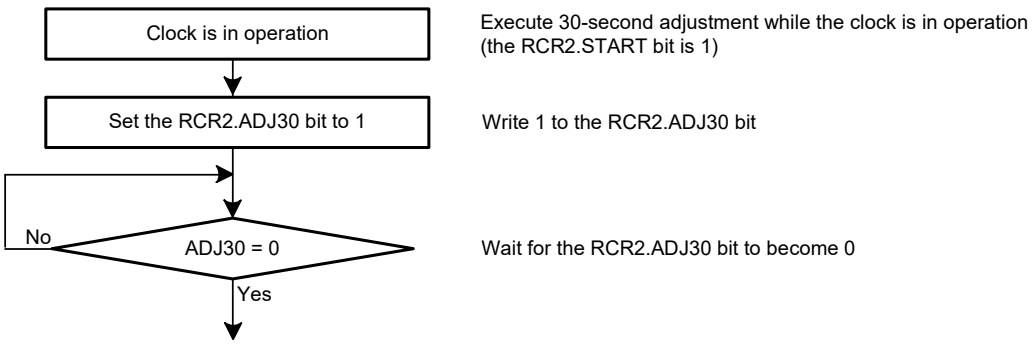


Figure 26.5 30-second adjustment

26.3.5 Reading 64-Hz Counter and Time

Figure 26.6 shows how to read a 64-Hz counter and time.

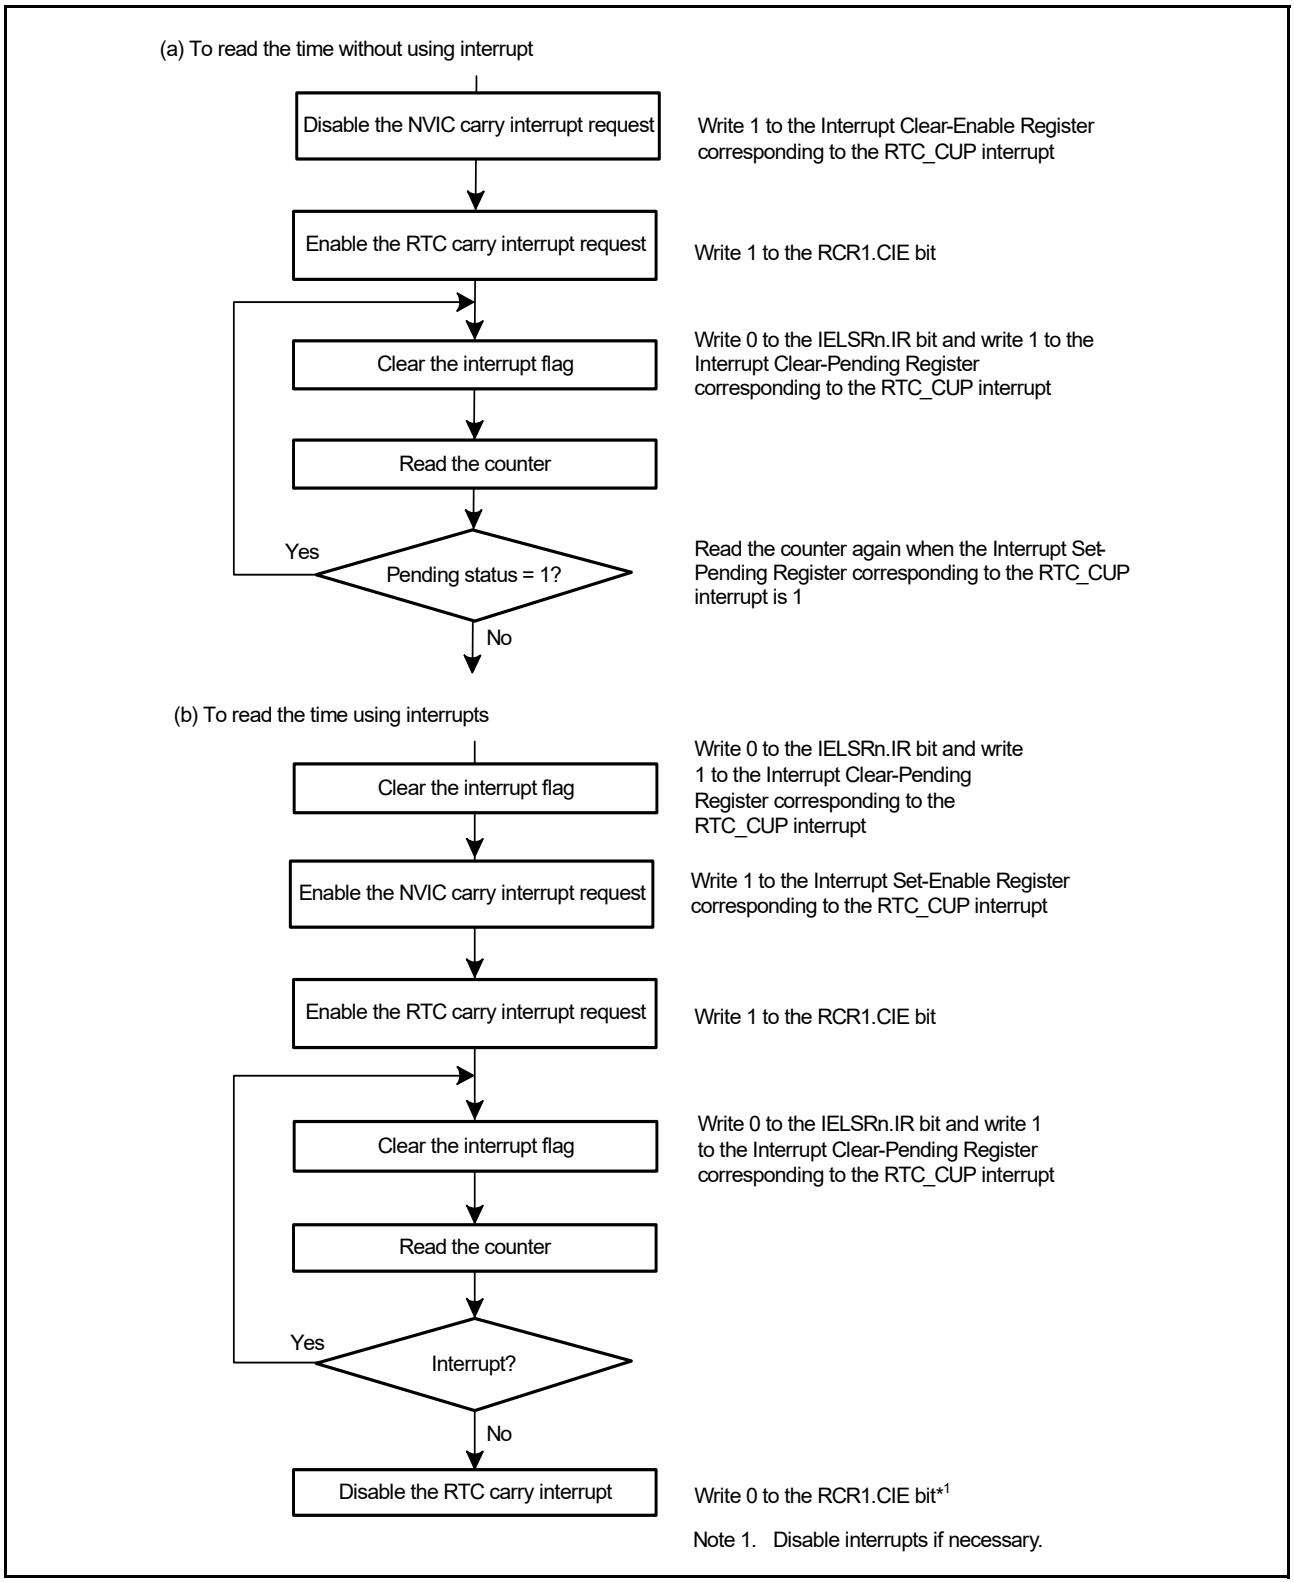

Figure 26.6 Reading time

If a carry occurs while the 64-Hz counter and time are read, the correct time is not obtained, therefore they must be read again. The procedure for reading the time without using interrupts is shown in (a) in Figure 26.6, and the procedure using carry interrupts is shown in (b). To keep the program simple, Renesas recommends using method (a) in most cases.

26.3.6 Alarm Function

Figure 26.7 shows how to use the alarm function.

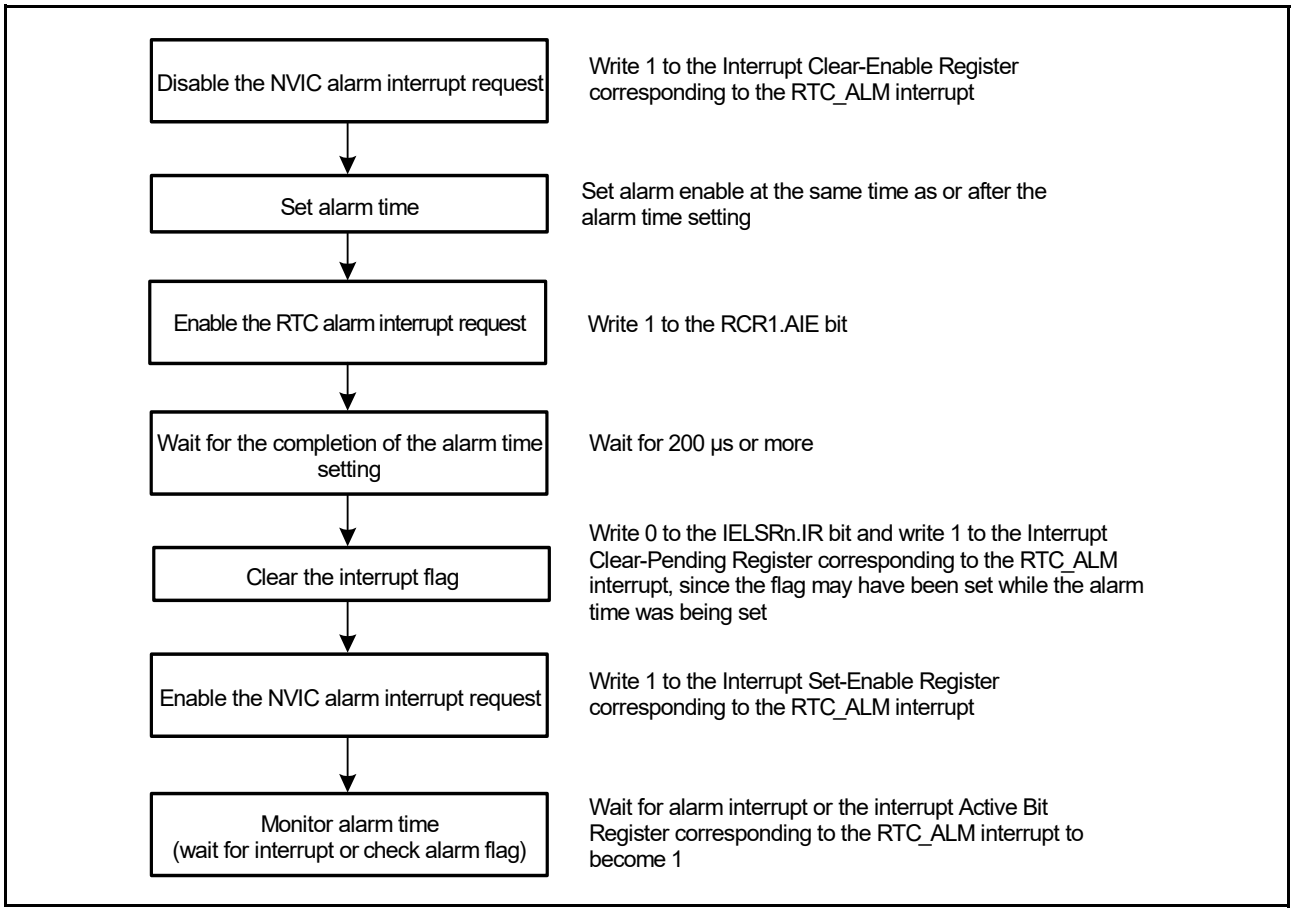

Figure 26.7 Using the alarm function

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the alarm enable register associated with the target bit of the alarm, and set the alarm time in the alarm register. For bits that are not the target of the alarm, write 0 to the ENB bit of the alarm enable register.

When the counter and the alarm time match, the IELSRn.IR bit and Interrupt Set-Pending/Clear-Pending Register associated with the RTC_ALM interrupt is set to 1. Alarm detection can be confirmed by reading the interrupt Set-Pending Register associated with the RTC_ALM interrupt, but Renesas recommends using an interrupt in most cases. If 1 is set in the Interrupt Set-Enable Register associated with the RTC_ALM interrupt, an alarm interrupt is generated in the event of the alarm, enabling the alarm to be detected.

Writing 0 sets the IELSRn.IR bit associated with the RTC_ALM interrupt to 0. If interrupt is enabled, the Interrupt Set-Pending/Clear-Pending Register associated with the RTC_ALM interrupt is cleared automatically after exiting the interrupt handler. Otherwise, write 1 to the Interrupt Clear-Pending Register associated with the RTC_ALM interrupt to clear it.

When the counter and the alarm time match in a low-power state, the MCU returns from the low-power state. In Deep Software Standby mode, the MCU returns from the Deep Software Standby mode even when the alarm interrupt request is disabled.

26.3.7 Procedure for Disabling Alarm Interrupt

Figure 26.8 shows the procedure for disabling the enabled alarm interrupt request.

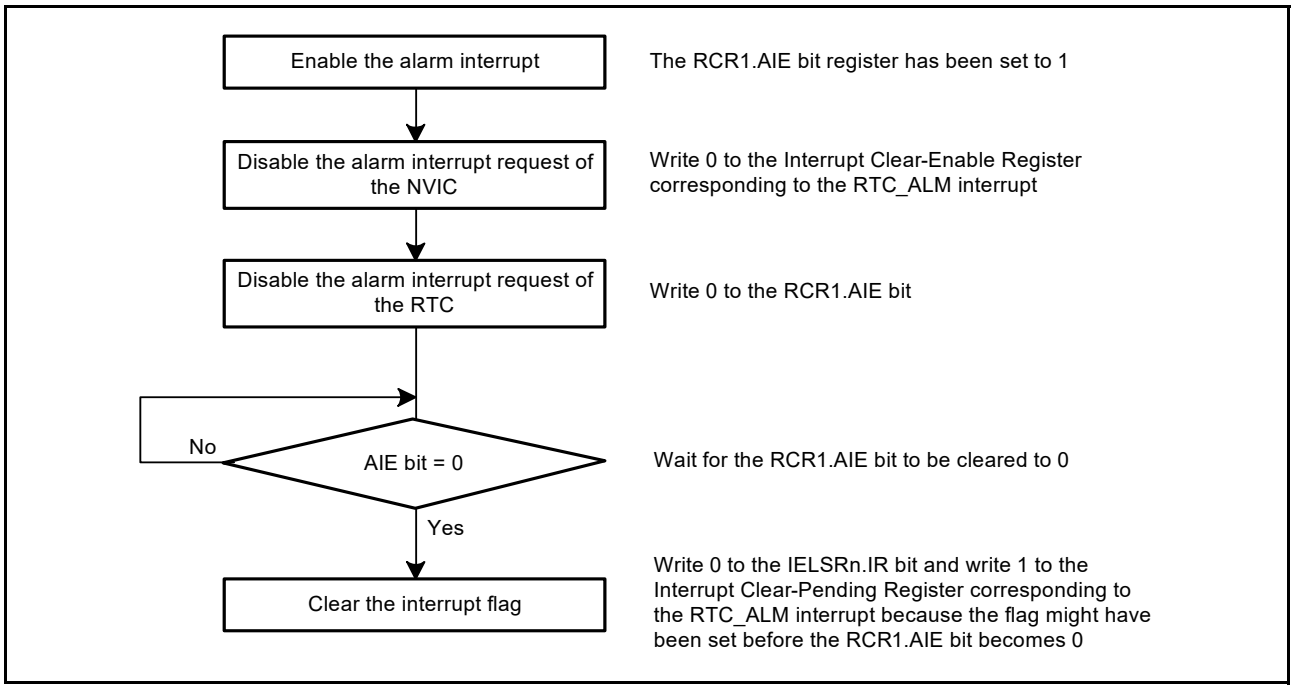

Figure 26.8 Procedure for disabling alarm interrupt request

26.3.8 Time Error Adjustment Function

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32,768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low.

The time error adjustment functions include:

- Automatic Adjustment
- Adjustment by Software.

Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

26.3.8.1 Automatic Adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1. Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJP bit elapses.

(1) Example 1: Sub-clock oscillator running at 32.769 kHz

(a) Adjustment procedure

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

Register settings: (when RCR2.CNTMD = 0)

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 60 (3Ch).

(2) Example 2: Sub-clock oscillator running at 32.766 kHz

(a) Adjustment procedure

When the sub-clock oscillator is running at 32.766 kHz, 1 second elapses every 32,766 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs slow by two clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

Register settings: (when RCR2.CNTMD = 0)

- RCR2.AADJP = 1 (adjustment every 10 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 20 (14h).

(3) Example 3: Sub-clock oscillator running at 32.764 kHz

(a) Adjustment procedure

At 32.764 kHz, 1 second elapses on 32,764 clock cycles. Because the RTC operates for 32,768 clock cycles as 1 second, the clock is delayed for four clock cycles per second. In 8 seconds, the delay is 32 clock cycles, therefore correction can be made by proceeding the clock for 32 clock cycles every 8 seconds.

Register settings when the RCR2.CNTMD bit is 1

- RCR2.AADJP = 1 (adjustment every 8 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 32 (20h).

26.3.8.2 Adjustment by Software

Enable adjustment by software by setting the RCR2.AADJE bit to 0. Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register on execution of a write instruction to the RADJ register.

(1) Example 1: Sub-clock oscillator running at 32.769 kHz

(a) Adjustment procedure

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by one clock cycle per second, so adjustment can take the form of setting the clock back by one cycle every second.

(b) Register settings

- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 1 (01h)
  This is written to the RADJ register once per 1-second interrupt.

26.3.8.3 Procedure for Changing the Mode of Adjustment

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

To change adjustment by software to automatic adjustment:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 1 (automatic adjustment is enabled).
3. Use the RCR2.AADJP bit to select the period of adjustment.
4. In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

To change automatic adjustment to adjustment by software:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).
3. Proceed with the adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the wanted time. After that, the time is adjusted every time a value is written to the RADJ register.

26.3.8.4 Procedure for Stopping Adjustment

Stop the adjustment by setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

26.3.8.5 Capturing the Time

The RTC is capable of storing the month, date, hour, minute and second/binary counters 3 to 0 by detecting an edge of a signal on a time capture event input pin.

A noise filter can also be used on a time capture event input pin. If the noise filter is enabled, the TCST bit is set to 1 when the input level on the pin matches three times.

The noise filter can be switched on or off for each of the time capture event input pins. Set VBTICTLR.VCHnIEN (n = 0 to 2) to 1 to enable the RTCICn input. Operation when the noise filter is off is shown in Figure 26.9 and operation when the noise filter is on is shown in Figure 26.10.

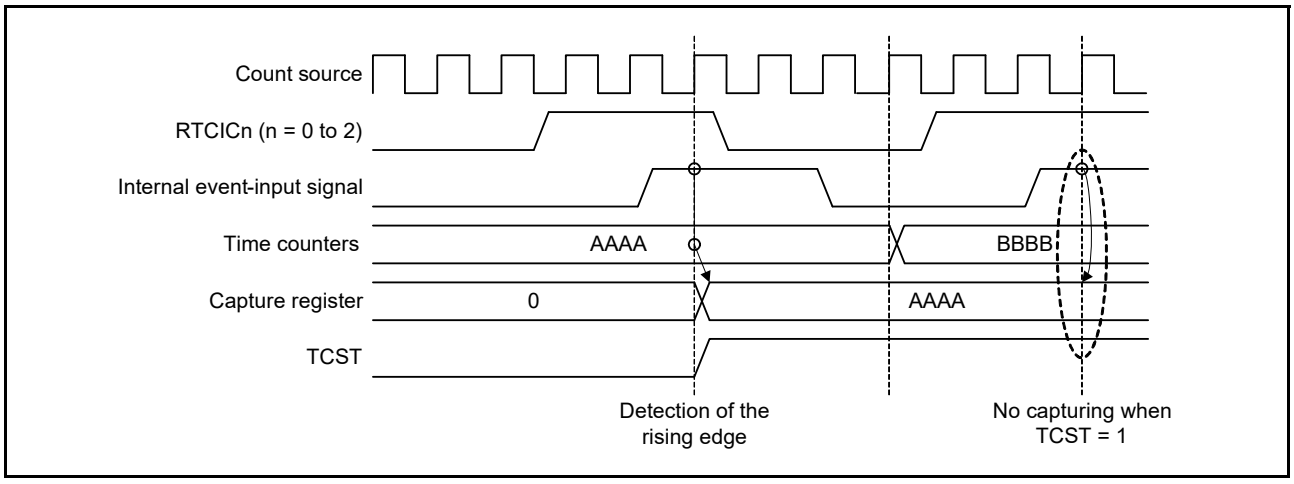

Figure 26.9 Timing of a time capture operation, with the filter off

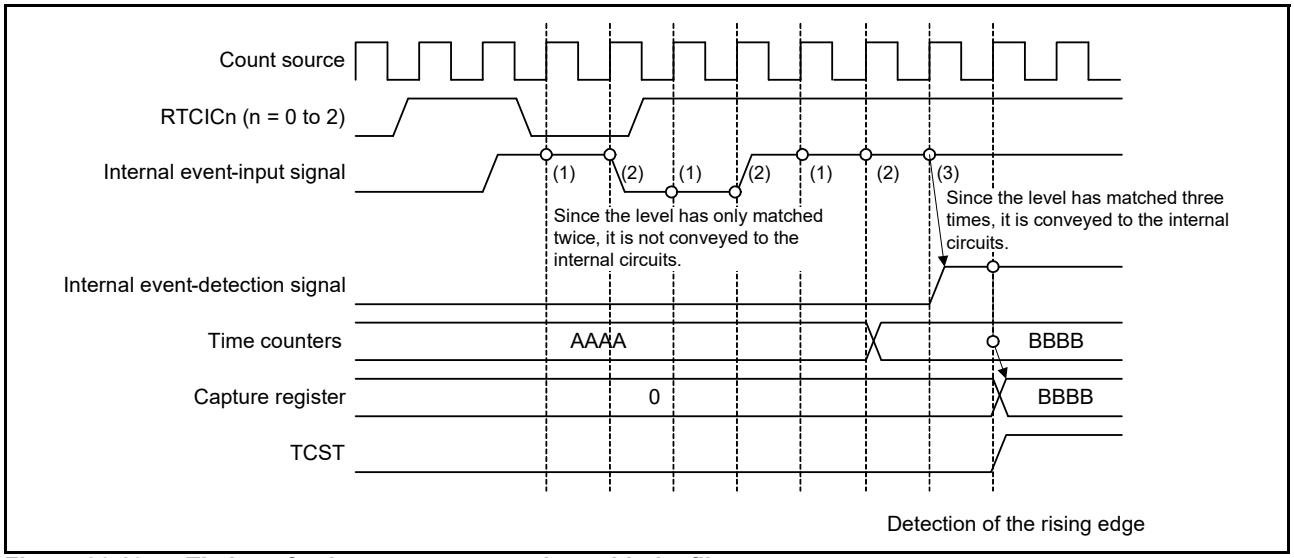

Figure 26.10 Timing of a time capture operation, with the filter on

26.4 Interrupt Sources

The RTC has three interrupt sources, as listed in Table 26.3.

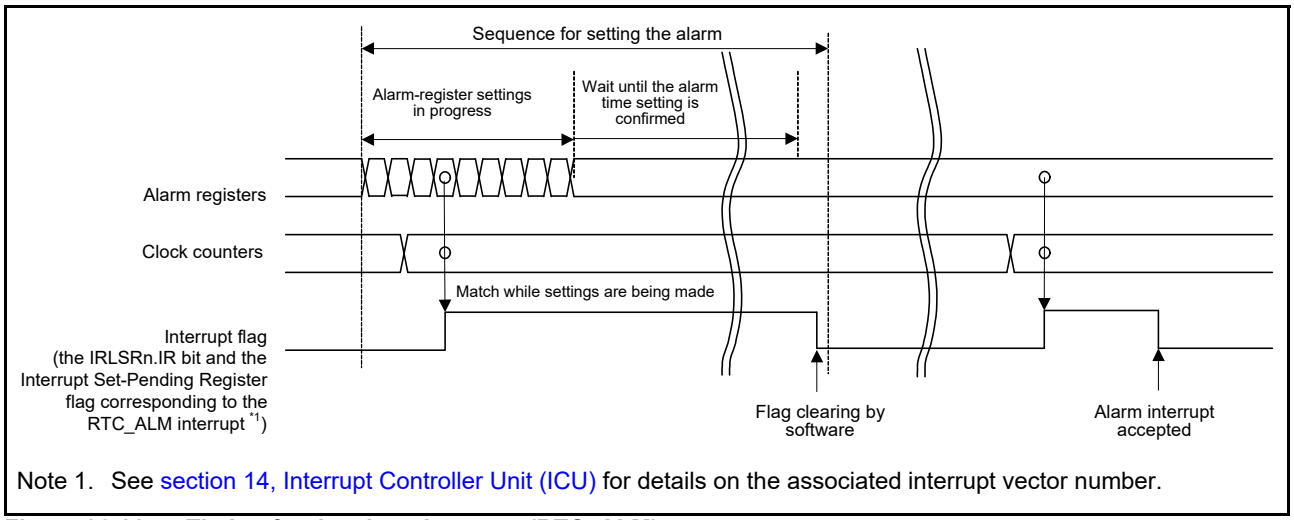

Table 26.3 RTC interrupt sources

Name	Interrupt source
RTC_ALM	Alarm interrupt
RTC_PRD	Periodic interrupt
RTC_CUP	Carry interrupt

(1) Alarm interrupt (RTC_ALM)

This interrupt is generated based on the result of comparison between the alarm registers and RTC counters. For details, see section 26.3.6, Alarm Function.

Because there is a possibility that the interrupt flag might be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and clear the IELSRn.IR bit and the interrupt Set-Pending Register associated with the RTC_ALM interrupt to 0 again after modifying values of the alarm registers. After the interrupt flag for the alarm interrupt is set to 1 and the state is returned to non-matching of the alarm registers and clock counters, the flag does not set again until there is another match or the values of the alarm registers are modified again.

Note 1. See section 14, Interrupt Controller Unit (ICU) for details on the associated interrupt vector number.

Figure 26.11 Timing for the alarm interrupt (RTC_ALM)

(2) Periodic interrupt (RTC_PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected through the RCR1.PES[3:0] bits.

(3) Carry interrupt (RTC_CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

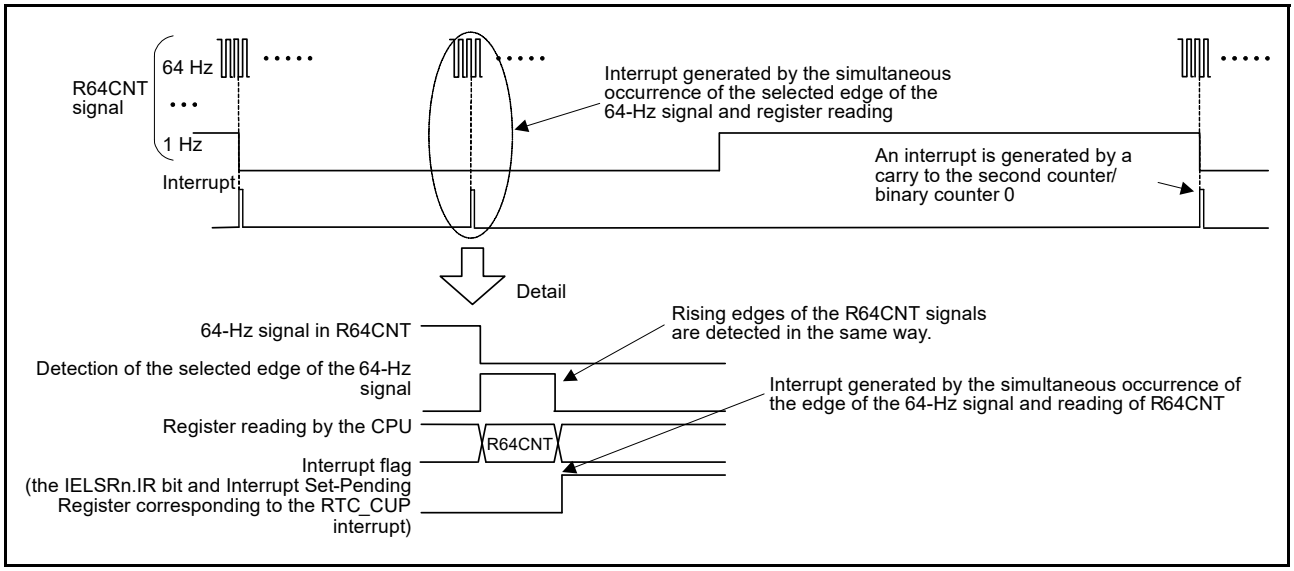

Figure 26.12 Timing for the carry interrupt (RTC_CUP)

26.5 Output to the Event Link Controller (ELC)

The RTC generates periodic event output (RTC_PRD) event signal for the ELC that can be used to initiate operations by other modules selected in advance.

The periodic event signal is output at the interval selected from 1/256, 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2, 1, and 2 seconds by setting the RCR1.PES[3:0] bits.

The event generation period immediately after the event generation is selected is not guaranteed.

Note: If event linking from the RTC is used, only set the ELC after setting the RTC, for example initialization and time settings. Setting the RTC after the ELC can lead to output of unexpected event signals.

26.5.1 Interrupt Handling and Event Linking

The RTC has a bit to enable or disable periodic interrupts. An interrupt request signal is output for the CPU when an interrupt source is generated while the associated enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal through the ELC when an interrupt source is generated, regardless of the setting of the associated interrupt enable bit.

Note: Although alarm and periodic interrupts can still be output during Software Standby mode or Deep Software Standby mode, the periodic event signals for the ELC are not output.

26.6 Usage Notes

26.6.1 Register Writing during Counting

The following registers must not be written to during counting, that is, while the RCR2.START bit is 1:

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3
- RMONCNT
- RYRCNT
- RCR1.RTCOS
- RCR2.RTCOE
- RCR2.HR24
- RFRL.

The counter must be stopped before writing to any of these registers.

26.6.2 Use of Periodic Interrupts

The procedure for using periodic interrupts is shown in Figure 26.13.

The generation and period of the periodic interrupt can be changed by setting the RCR1.PES[3:0] bits. However, because the prescaler R64CNT and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting the RCR1.PES[3:0] bits.

In addition, stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the interrupt period. When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted based on the adjustment value.

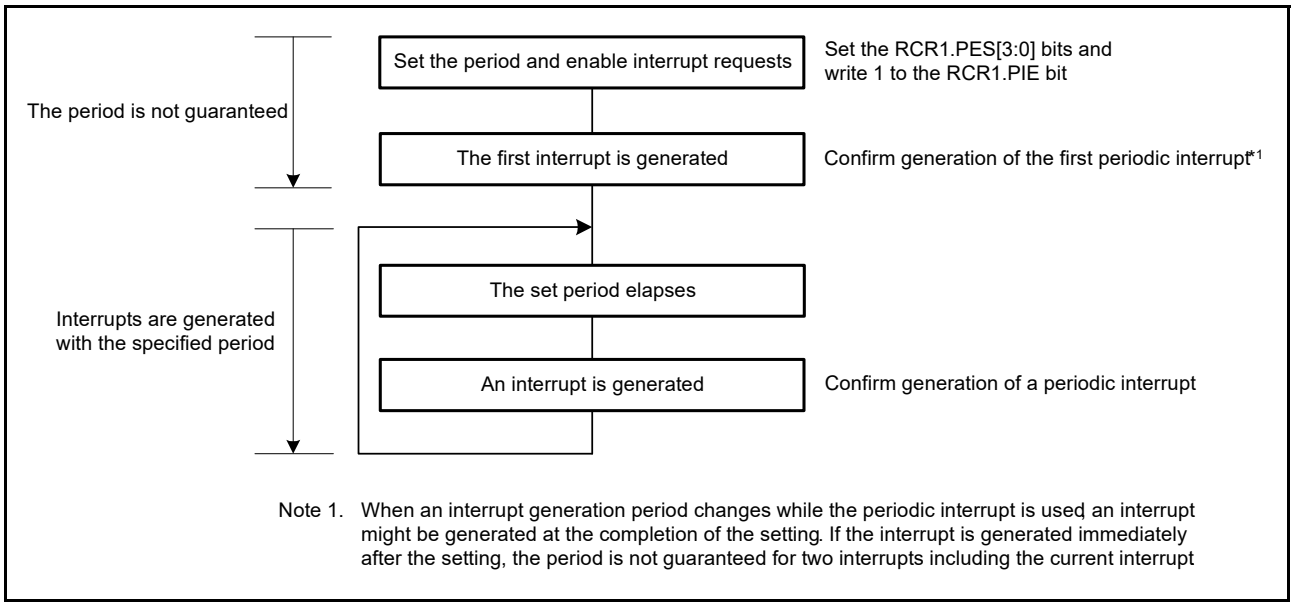

Figure 26.13 Using the periodic interrupt function

26.6.3 RTCOUT (1-Hz/64-Hz) Clock Output

Stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the period of RTCOUT (1-Hz/64-Hz) output. When the time error adjustment function is used, the period of RTCOUT (1-Hz/64-Hz) output after adjustment is added or subtracted based on the adjustment value.

26.6.4 Transitions to Low Power Modes after Setting Registers

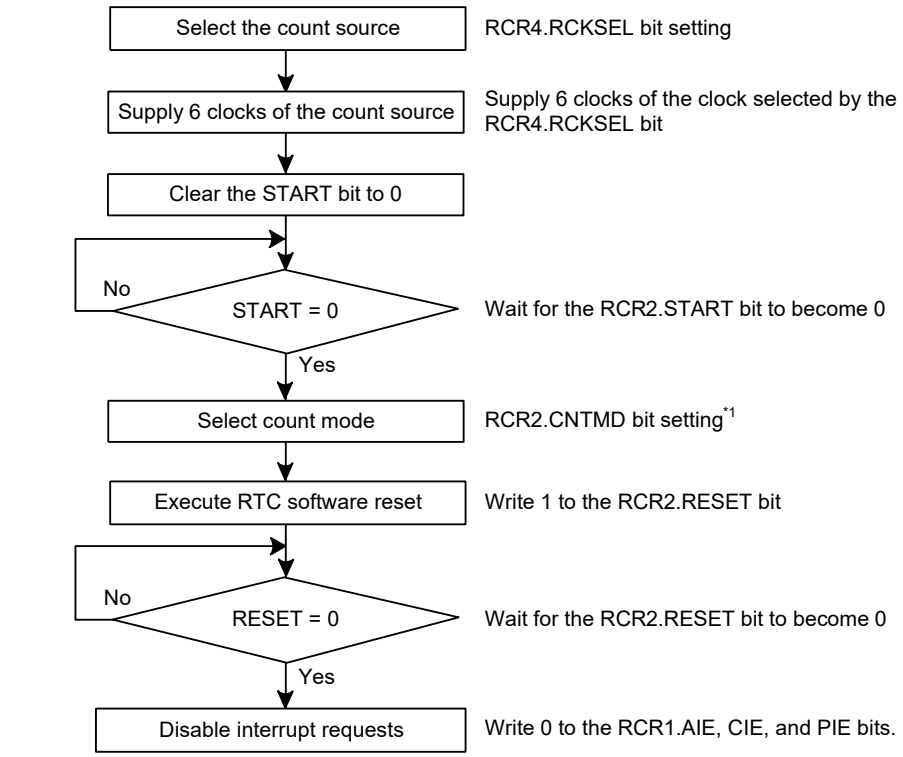
A transition to a low-power state (Software Standby mode, Deep Software Standby mode, or battery backup) during a write to an RTC register might corrupt the value in the register. After setting the register, confirm that the setting is in place before initiating a transition to a low power mode.

26.6.5 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter after writing to the counter register, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, RCR4 register, or frequency register is reflected when four read operations are performed after writing
- The values written to the RCR1.CIE, RCR1.RTCOS, and RCR2.RTCOE bits can be read immediately after writing
- To read the value from the timer counter after return from a reset, period in Software Standby mode, Deep Software Standby mode, or the battery backup state, wait for1/128 second while the clock operates (RCR2.START bit is 1).
- After a reset is generated, write to the RTC register after six cycles of the count source clock have elapsed.

26.6.6 Changing the Count Mode

When changing the count mode (calendar/binary), set the RCR2.START bit to 0, stop the counting operation, and then start it again from the initial setting. For details on the initial setting, see section 26.3.1, Outline of Initial Settings of Registers after Power On.



26.6.7 Initialization Procedure When the Realtime Clock Is Not to Be Used

Registers in the RTC are not initialized by a reset. Depending on the initial state, the generation of an unintentional interrupt request or operation of the counter might lead to increased power consumption.

For applications that do not require a realtime clock, initialize the registers by following the initialization procedure shown in Figure 26.14.

Alternatively, when the sub-clock oscillator is not used as the system clock or realtime clock, the counter can be stopped by writing 0 (sub-clock oscillator is selected) to the RCR4.RCKSEL bit and stopping the sub-clock oscillator. To stop the sub-clock oscillator, write 1 to the SOSCCR.SOSTP bit.

For details on the setting of the SOSCCR.SOSTP bit, see section 9, Clock Generation Circuit.

Note 1. This step is not necessary if the count mode is set concurrently by setting the START bit to 0.

Figure 26.14 Initialization procedure

27. Watchdog Timer (WDT)

27.1 Overview

The Watchdog Timer (WDT) is a 14-bit down-counter and can be used to reset the MCU when the counter underflows because the system has run out of control and become unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt. The refresh-permitted period can be set to refresh the counter and to detect when the system runs out of control. Table 27.1 lists the WDT specifications and Figure 27.1 shows the block diagram.

Table 27.1 WDT specifications

Parameter	Specifications
Count source	Peripheral clock (PCLKB)
Clock division ratio	Divide by 4, 64, 128, 512, 2,048, or 8,192
Counter operation	Counting down using a 14-bit down-counter
Conditions for starting the counter	• Auto start mode: Counting automatically starts after a reset, or after an underflow or refresh error occurs • Register start mode: Counting is started by a refresh on a write to the WDTRR register
Conditions for stopping the counter	• Reset (the down-counter and other registers return to their initial values) • A counter underflows or a refresh error is generated
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
WDT reset sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Non-maskable interrupt/interrupt sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Reading of the counter value	The down-counter value can be read by the WDTSR register
Event link function (output)	• Down-counter underflow event output • Refresh error event output
Output signal (internal signal)	• Reset output • Interrupt request output • Sleep mode count stop control output

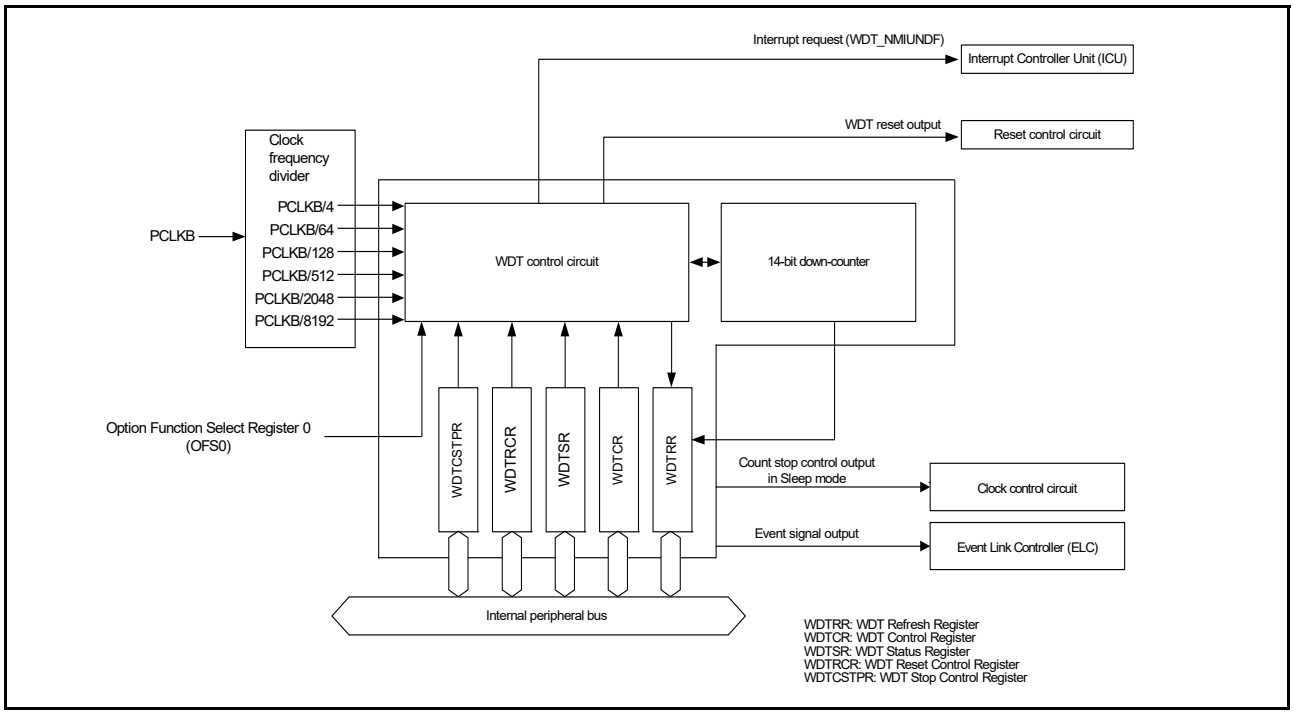


Figure 27.1 WDT block diagram

27.2 Register Descriptions

27.2.1 WDT Refresh Register (WDTRR)

Address(es): WDT.WDTRR 4004 4200h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

Bit	Description	R/W
b7 to b0	The down-counter is refreshed by writing 00h and then writing FFh to this register	R/W

The WDTRR register refreshes the down-counter of the WDT. The down-counter of the WDT is refreshed by writing 00h and then writing FFh to WDTRR (refresh operation) within the refresh-permitted period. In auto-start mode, after the down-counter is refreshed, it starts counting down from the value selected in the WDT timeout period select bits (OFS0.WDTTOPS[1:0]) in Option Function Select Register 0. In register-start mode, counting down starts from the value selected in the timeout period select bits (WDTCR.TOPS[1:0]) in the WDT Control Register.

When 00h is written, the read value is 00h. When a value other than 00h is written, the read value is FFh. For details on the refresh operation, see section 27.3.3, Refresh Operation.

27.2.2 WDT Control Register (WDTCR)

Address(es): WDT.WDTCR 4004 4202h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13, b12	RPSS[1:0]	Window Start Position Select	b13 b12 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (do not specify window start position).	R/W

Bit	Symbol	Bit name	Description	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Some restrictions apply to writes to the WDTCR register. For details, see section 27.3.2, Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto-start mode, the settings in the WDTCR register are disabled, and the settings in Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made for the OFS0 register. For details, see section 27.3.7, Associations between Option Function Select Register 0 (OFS0) and WDT Registers.

TOPS[1:0] bits (Timeout Period Select)

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 1,024, 4,096, 8,192, and 16,384 cycles, taking the divided clock specified in the CKS[3:0] bits as one cycle. After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the number of PCLKB cycles until the counter underflows.

Table 27.2 lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles.

Table 27.2 Timeout period settings

CKS[3:0] bits				TOPS[1:0] bits				
b7	b6	b5	b4	b1	b0	Clock division ratio	Timeout period (number of cycles)	PCLKB clock cycles
0	0	0	1	0	0	PCLKB/4	1,024	4,096
				0	1		4,096	16,384
				1	0		8,192	32,768
				1	1		16,384	65,536
0	1	0	0	0	0	PCLKB/64	1,024	65,536
				0	1		4,096	262,144
				1	0		8,192	524,288
				1	1		16,384	1,048,576
1	1	1	1	0	0	PCLKB/128	1,024	131,072
				0	1		4,096	524,288
				1	0		8,192	1,048,576
				1	1		16,384	2,097,152
0	1	1	0	0	0	PCLKB/512	1,024	524,288
				0	1		4,096	2,097,152
				1	0		8,192	4,194,304
				1	1		16,384	8,388,608
0	1	1	1	0	0	PCLKB/2048	1,024	2,097,152
				0	1		4,096	8,388,608
				1	0		8,192	16,777,216
				1	1		16,384	33,554,432
1	0	0	0	0	0	PCLKB/8192	1,024	8,388,608
				0	1		4,096	33,554,432
				1	0		8,192	67,108,864
				1	1		16,384	134,217,728

CKS[3:0] bits (Clock Division Ratio Select)

The CKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the peripheral clock (PCLKB) divided by 4, 64, 128, 512, 2048, and 8,192. Combined with the TOPS[1:0] bit setting, this allows the WDT to be configured to a count period between 4,096 and 134,217,728 cycles of the PCLKB clock.

RPES[1:0] bits (Window End Position Select)

The RPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the value for the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.

RPSS[1:0] bits (Window Start Position Select)

The RPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window end position. Set the window start position to a value greater than the value for the window end position. If the window start position is set to a value less than or equal to the window end position, the window end position is set to 0%.

Table 27.3 lists the counter values for the window start and end positions, and Figure 27.2 shows the refresh-permitted period set in the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

Table 27.3 Relationship between the timeout period and window start and end counter values

TOPS[1:0] bits		Timeout period		Window start and end counter value			
		Cycles	Counter value	100%	75%	50%	25%
0	0	1024	03FFh	03FFh	02FFh	01FFh	00FFh
0	1	4096	0FFFh	0FFFh	0BFFh	07FFh	03FFh
1	0	8192	1FFFh	1FFFh	17FFh	0FFFh	07FFh
1	1	16384	3FFFh	3FFFh	2FFFh	1FFFh	0FFFh

RPSS[1:0] bits		RPES[1:0] bits		Window	
b13	b12	b9	b8	Start (%)	End (%)
1	1	1	1	100	0
		1	0		25
		0	1		50
		0	0		75
1	0	1	1	75	0
		1	0		25
		0	1		50
		0	0		75
0	1	1	1	50	0
		1	0		25
		0	1		50
		0	0		75
0	0	1	1	25	0
		1	0		25
		0	1		50
		0	0		75

Note: If window end setting ≥ window start setting, the window end setting is set to 0%.

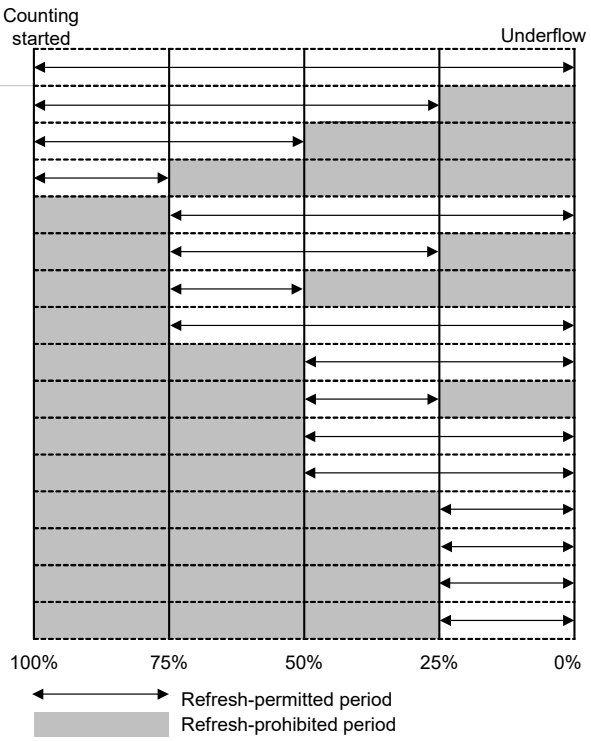

Figure 27.2 RPSS[1:0] and RPES[1:0] bit settings and refresh-permitted period

27.2.3 WDT Status Register (WDTSR)

Address(es): WDT.WDTSR 4004 4204h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	REFEF	UNDFF	CNTVAL[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b13 to b0	CNTVAL[13:0]	Down-Counter Value	Value counted by the down-counter	R
b14	UNDFF	Underflow Flag	0: No underflow occurred 1: Underflow occurred.	R(/W) *1
b15	REFEF	Refresh Error Flag	0: No refresh error occurred 1: Refresh error occurred.	R(/W) *1

Note 1. Only 0 can be written to clear the flag.

CNTVAL[13:0] bits (Down-Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

UNDFF flag (Underflow Flag)

Read the UNDFF flag to confirm whether an underflow occurred in the down-counter. A value of 1 indicates that the down-counter underflowed. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles following an underflow. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0001b, N = 4
- When WDTCR.CKS[3:0] = 0100b, N = 64
- When WDTCR.CKS[3:0] = 1111b, N = 128
- When WDTCR.CKS[3:0] = 0110b, N = 512
- When WDTCR.CKS[3:0] = 0111b, N = 2048
- When WDTCR.CKS[3:0] = 1000b, N = 8192.

REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred, indicating that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles following a refresh error. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0001b, N = 4
- When WDTCR.CKS[3:0] = 0100b, N = 64
- When WDTCR.CKS[3:0] = 1111b, N = 128
- When WDTCR.CKS[3:0] = 0110b, N = 512
- When WDTCR.CKS[3:0] = 0111b, N = 2048
- When WDTCR.CKS[3:0] = 1000b, N = 8192.

27.2.4 WDT Reset Control Register (WDTRCR)

Address(es): WDT.WDTRCR 4004 4206h

	b7	b6	b5	b4	b3	b2	b1	b0
	RSTIRQS	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	RSTIRQS	Reset Interrupt Request Select	0: Enable non-maskable interrupt requests or interrupt request output 1: Enable reset output.	R/W

Some restrictions apply to writes to the WDTRCR register. For details, see section 27.3.2, Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto-start mode, the WDTRCR register settings are disabled, and the settings in Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made for the OFS0 register. For details, see section 27.3.7, Associations between Option Function Select Register 0 (OFS0) and WDT Registers.

27.2.5 WDT Count Stop Control Register (WDTCSTPR)

Address(es): WDT.WDTCSTPR 4004 4208h

	b7	b6	b5	b4	b3	b2	b1	b0
	SLCSTP	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	SLCSTP	Sleep-Mode Count Stop Control	0: Disable count stop 1: Stop count on transition to Sleep mode.	R/W

The WDTCSTPR register controls whether to stop the WDT counter in a low power mode. Some restrictions apply to writes to the WDTCSTPR register. For details, see section 27.3.2, Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto-start mode, the WDTCSTPR register settings are disabled, and the settings in Option Function Select register 0 (OFS0) are enabled. The settings for the WDTCSTPR register can also be made for the OFS0 register. For details, see section 27.3.7, Associations between Option Function Select Register 0 (OFS0) and WDT Registers.

SLCSTP bit (Sleep-Mode Count Stop Control)

The SLCSTP bit selects whether to stop counting on transition to Sleep mode.

27.2.6 Option Function Select Register 0 (OFS0)

For information on the OFS0 register, see section 27.3.7, Associations between Option Function Select Register 0 (OFS0) and WDT Registers.

27.3 Operation

27.3.1 Count Operation in Each Start Mode

The WDT has two start modes:

- Auto start mode, in which counting automatically starts after a release from the reset state
- Register start mode, in which counting is started with a refresh by writing to the register.

In auto-start mode, counting automatically starts after release from the reset state according to the settings in Option Function Select Register 0 (OFS0) in the flash.

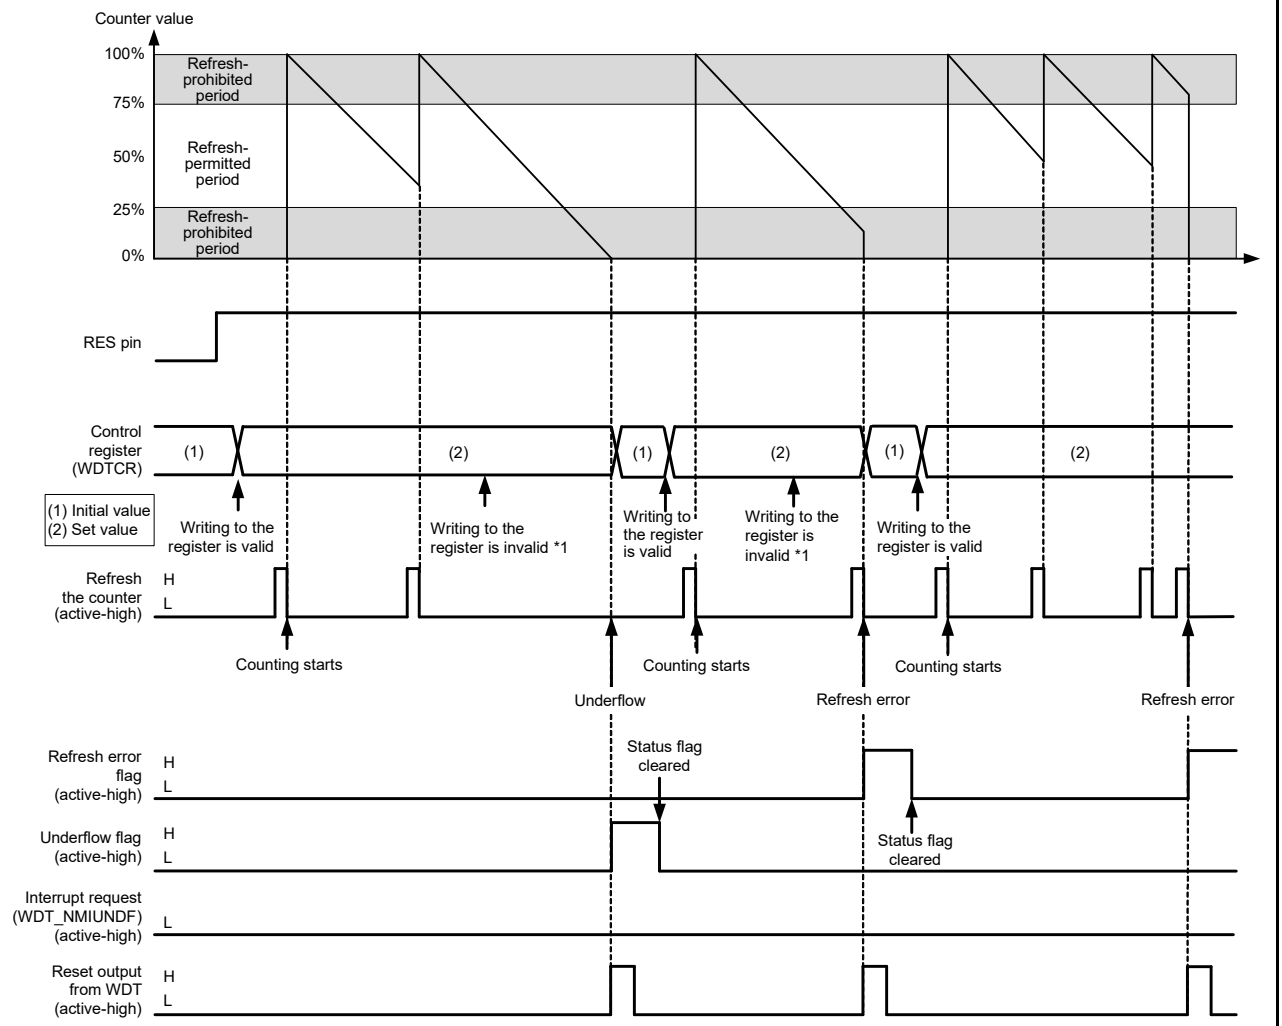
In register-start mode, counting starts with a refresh by writing to the register after the respective registers are set after a release from the reset state.

Select auto-start mode or register-start mode by setting the WDT start mode select bit (OFS0.WDTSTRT) in the OFS0 register. When auto-start mode is selected, the settings in the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are disabled, and the settings in the OFS0 register are enabled. When register-start mode is selected, the OFS0 register settings are disabled, and the settings in the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are enabled.

27.3.1.1 Register-Start Mode

When the WDT start mode select bit (OFS0.WDTSTRT) is 1, register-start mode is selected and the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are enabled.

After the reset state is released, set the following to Sleep mode in the WDTCSTPR register:



- Clock division ratio
- Window start and end positions
- Timeout period in the WDTCR register
- Reset output or interrupt request output in the WDTRCR register
- Counter stop control during transitions.

Refresh the down-counter to start counting down from the value set in the timeout period select bits (WDTCR.TOPS[1:0]).

After that, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and down-counting continues. The WDT does not output the reset signal as long as counting continues. However, if the down-counter underflows because a runaway program makes refreshing of the down-counter impossible, or because a refresh error occurs when an attempt is made to refresh outside the refresh-permitted period, the WDT asserts the reset signal or non-maskable interrupt request/interrupt request (WDT_NMIUNDF). Reset output or interrupt request output can be selected in the WDT reset interrupt request select bit (WDTRCR.RSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the WDT underflow/refresh error interrupt enable bit (NMIER.WDTEN).

Figure 27.3 shows an example of operation under the following conditions:

- Register start mode (OFS0.WDTSTRT = 1)
- Reset output is enabled (WDTRCR.RSTIRQS = 1)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b).

Note 1. See section 27.3.2. Controlling writes to the WDTCR, WDTRCR, and WDTCSTPR registers.

Figure 27.3 Operation example in register-start mode

27.3.1.2 Auto-Start Mode

When the WDT start mode select bit (OFS0.WDTSTRT) is 0, auto-start mode is selected. The WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are disabled, and the settings in the OFS0 register are enabled.

Within the reset state, the setting values for the following in Option Function Select Register 0 (OFS0) are set in the IWDT registers:

- Clock division ratio
- Window start and end positions
- Timeout period
- Reset output or interrupt request
- Counter stop control on transition to Sleep mode.

When the reset state is released, the down-counter automatically starts counting down from the value set in the WDT timeout period select bits (OFS0.WDTTOPS[1:0]).

After that, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and down-counting continues. The WDT does not output the reset signal as long as the counting continues. However, if the down-counter underflows because a runaway program makes refreshing of the down-counter

impossible, or because a refresh error occurs when an attempt is made to refresh outside the refresh-permitted period, the WDT asserts the reset signal or non-maskable interrupt request/interrupt request (WDT_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for one cycle. The value of the timeout period is set in the down-counter and counting restarts. Reset output or interrupt request output can be selected in the WDT reset interrupt request select bit (OFS0.WDTRSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the WDT underflow/refresh error interrupt enable bit (NMIER.WDTEN).

Figure 27.4 shows an example of operation (non-maskable interrupt) under the following conditions:

- Auto start mode (OFS0.WDTSTRT = 0)
- Non-maskable interrupt request output is enabled (OFS0.WDTRSTIRQS = 0)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b).

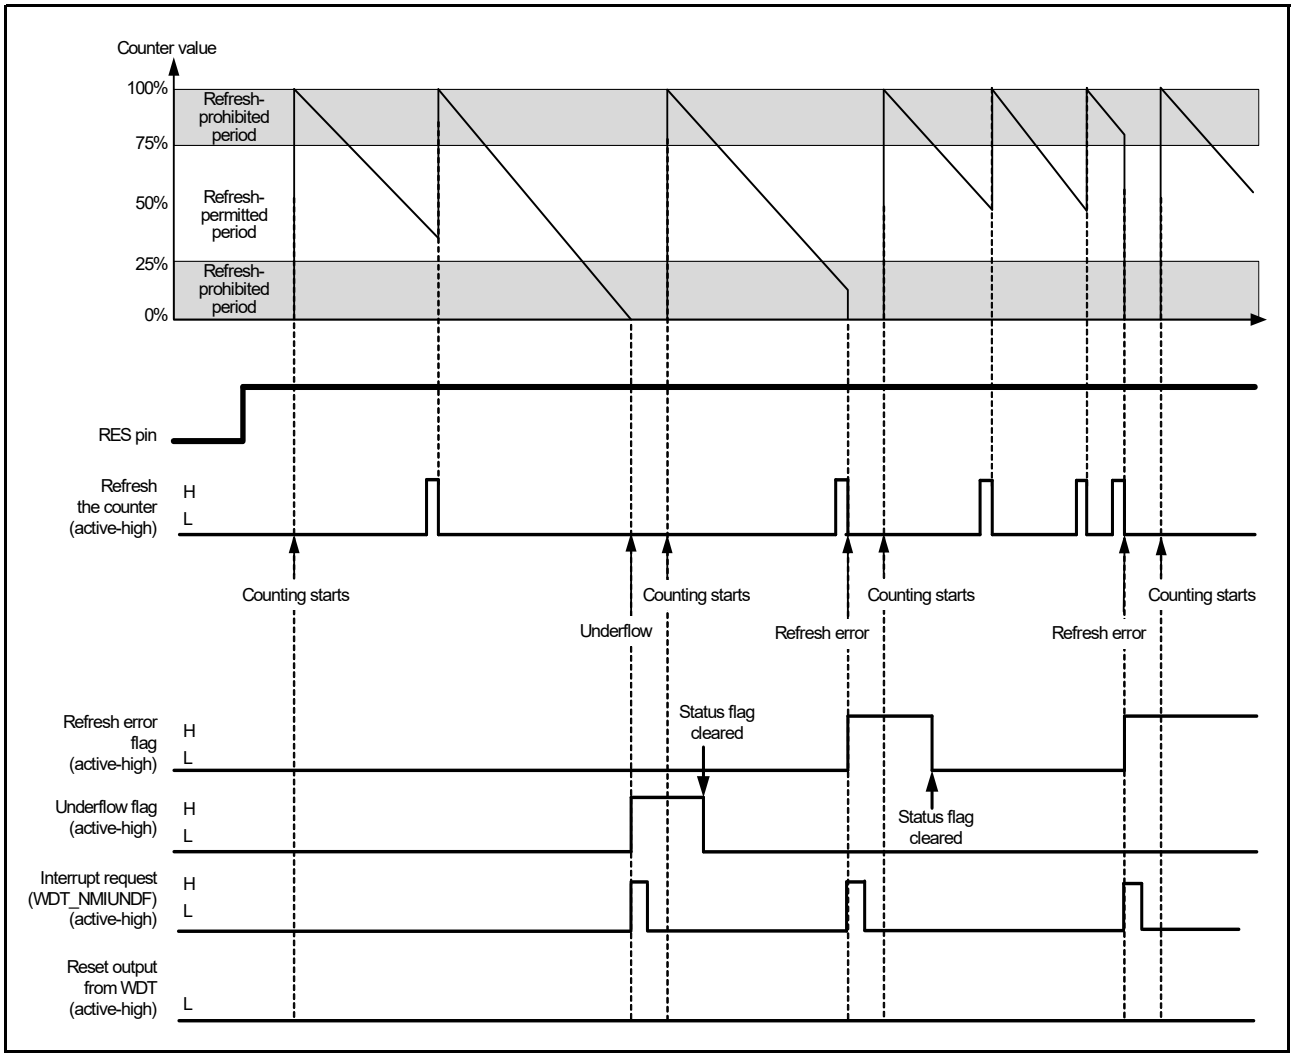


Figure 27.4 Operation example in auto-start mode

27.3.2 Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers

Writing to the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), or WDT Count Stop Control Register (WDTCSTPR) is possible once between the release from the reset state and the first refresh operation.

After a refresh (counting starts) or a write to WDTCR, WDTRCR or WDTCSTPR, the protection signal in the WDT becomes 1 to protect WDTCR, WDTRCR and WDTCSTPR against subsequent write attempts. This protection is released by a reset source of the WDT. With other reset sources, the protection is not released.

Figure 27.5 shows control waveforms produced in response to writing to the WDTCR.

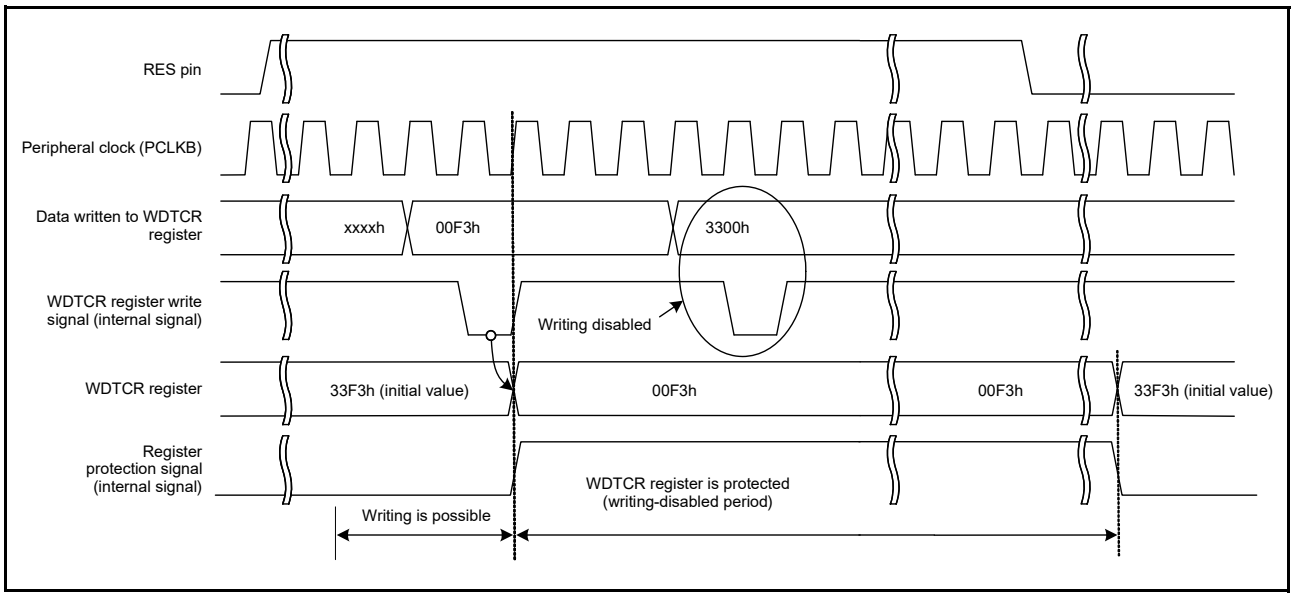

Figure 27.5 Control waveforms produced in response to writes to the WDTCR register

27.3.3 Refresh Operation

The down-counter is refreshed and starts counting operation on a write of the values 00h and FFh to the WDT Refresh Register (WDTRR). If a value other than FFh is written after 00h, the down-counter is not refreshed. If an invalid value is written, correct refreshing resumes on a write of 00h and FFh to the WDTRR register.

Correct refreshing is also performed when a register other than WDTRR is accessed or WDTRR is read between writing 00h and writing FFh to WDTRR.Writes to refresh the counter must be made within the refresh-permitted period, and this is determined by the FFh write. For this reason, correct refreshing is performed even when 00h is written outside the refresh-permitted period.

[Example write sequences that are valid for refreshing the counter]

- 00h → FFh
- 00h (n-1th time) → 00h (nth time) → FFh
- 00h → access to another register or read from WDTRR → FFh.

[Example write sequences that are invalid for refreshing the counter]

- 23h (a value other than 00h) → FFh
- 00h → 54h (a value other than FFh)
- 00h→ AAh (00h and a value other than FFh) → FFh.

After FFh is written to the WDT Refresh Register (WDTRR), refreshing the down-counter requires up to four cycles of the signal for counting. To meet this requirement, complete writing FFh to WDTRR four count cycles before the down-counter underflows.

Figure 27.6 shows the WDT refresh-operation waveforms when the clock division ratio = PCLKB/64.

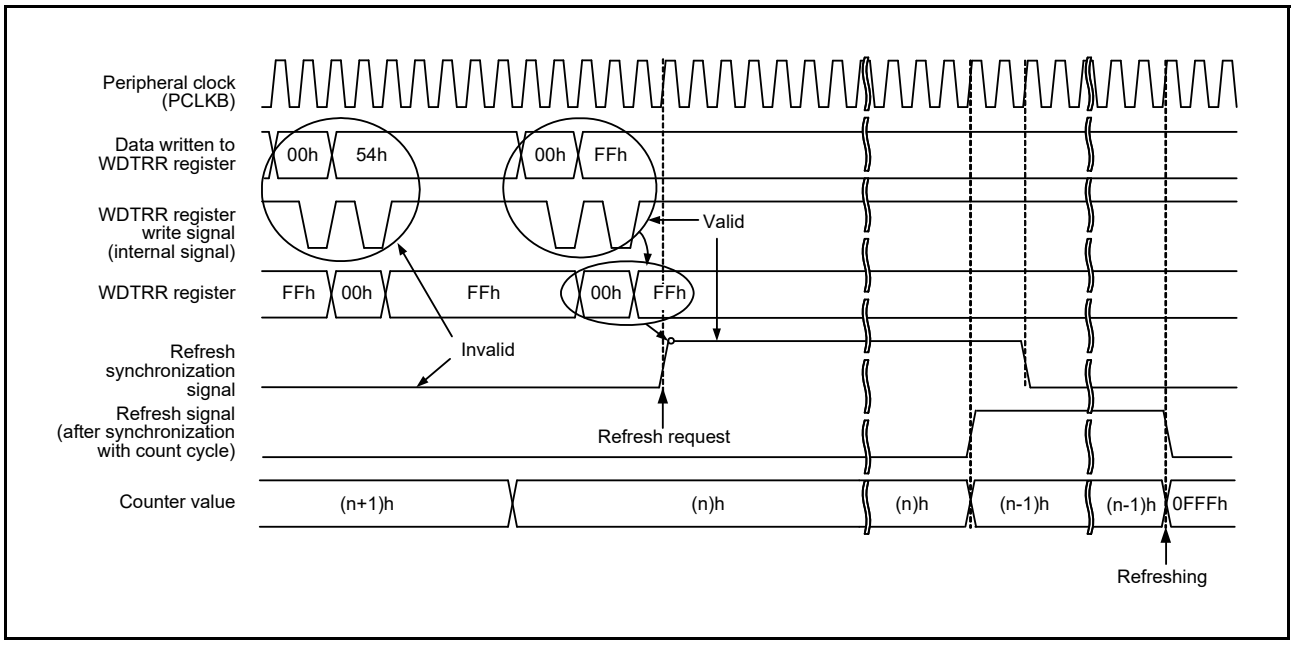

Figure 27.6 WDT refresh operation waveforms when WDTCR.CKS[3:0] = 0100b and WDTCR.TOPS[1:0] = 01b

27.3.4 Reset Output

When the reset interrupt select bit (WDTRCR.RSTIRQS) is set to 1 in register-start mode, or when the WDT reset interrupt request select bit (OFS0.WDTRSTIRQS) in Option Function Select Register 0 (OFS0) is set to 1 in auto-start mode, a reset signal is output for one cycle count when an underflow in the down-counter or a refresh error occurs.

In register-start mode, the down-counter is initialized (all bits set to 0) and stopped in that state after output of a reset signal. After the reset state is released and the program is restarted, the counter is set up and counting down starts again with a refresh. In auto-start mode, counting down starts automatically after the reset state is released.

27.3.5 Interrupt Sources

When the reset interrupt select bit (WDTRCR.RSTIRQS) is set to 0 in register-start mode or when the WDT reset interrupt request select bit (OFS0.WDTRSTIRQS) in Option Function Select Register 0 (OFS0) is set to 0 in auto-start mode, an interrupt signal (WDT_NMIUNDF) is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see section 14, Interrupt Controller Unit (ICU).

Table 27.4 WDT interrupt sources

Name	Interrupt source	DTC activation	DMAC activation
WDT_NMIUNDF	• Down-counter underflow • Refresh error	Not possible	Not possible

27.3.6 Reading the Down-Counter Value

The WDT stores the counter value in the down-counter value bits (WDTSR.CNTVAL[13:0]) of the WDT Status Register. Check these bits to obtain the counter value.

Figure 27.7 shows the processing for reading the WDT down-counter value when the clock division ratio = PCLKB/64.

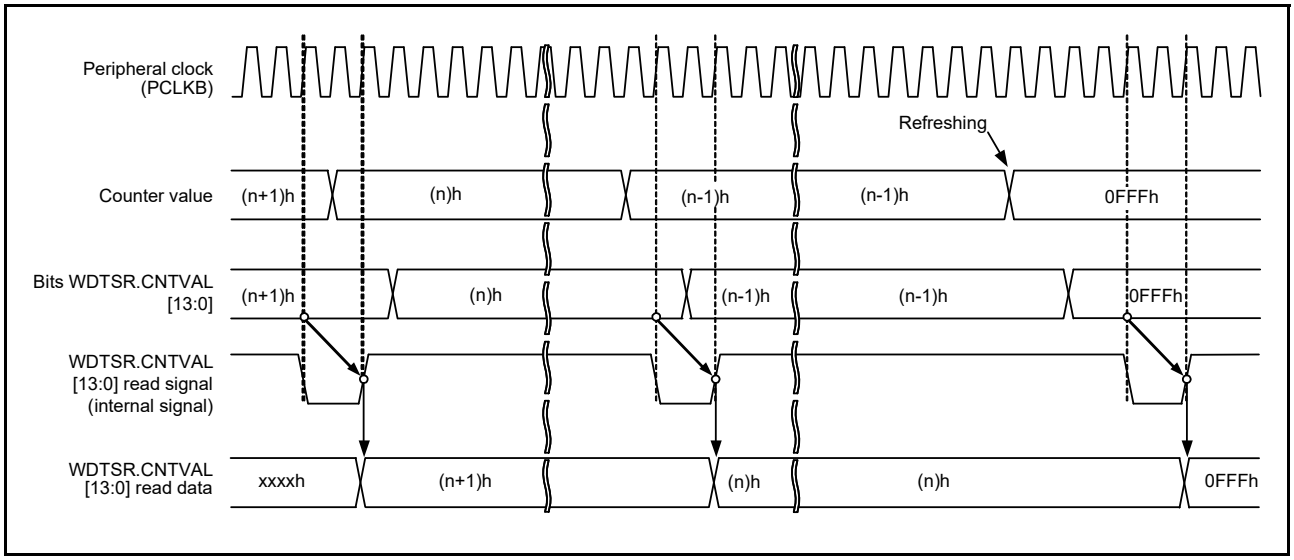

Figure 27.7 Processing for reading WDT down-counter value when WDTCR.CKS[3:0] = 0100b and WDTCR.TOPS[1:0] = 01b

27.3.7 Associations between Option Function Select Register 0 (OFS0) and WDT Registers

Table 27.5 lists the associations between Option Function Select Register 0 (OFS0), used in auto-start mode, and the registers used in register-start mode. Do not change the OFS0 register settings during WDT operation. For details on Option Function Select Register 0 (OFS0), see section 7, Option Function Select Register 0 (OFS0).

Table 27.5 Association between Option Function Select register 0 (OFS0) and the WDT registers

Control target	Function	OFS0 register (enabled in auto-start mode) OFS0.WDTSTRT = 0	WDT registers (enabled in register-start mode) OFS0.WDTSTRT = 1
Down-counter	Timeout period select	OFS0.WDTTOPS[1:0]	WDTCR.TOPS[1:0]
	Clock division ratio select	OFS0.WDTCKS[3:0]	WDTCR.CKS[3:0]
	Window start position select	OFS0.WDTRPSS[1:0]	WDTCR.RPSS[1:0]
	Window end position select	OFS0.WDTRPES[1:0]	WDTCR.RPES[1:0]
Reset output or interrupt request output	Reset output or interrupt request output select	OFS0.WDTRSTIRQS	WDTRCR.RSTIRQS
Count stop	Sleep-mode count stop control	OFS0.WDTSTPCTL	WDTCSTPR.SLCSTP

27.4 Output to the Event Link Controller (ELC)

The WDT is capable of link operation for a specified module when interrupt request signal is used as an event signal by the ELC. The event signal is output by the counter underflow or refresh error.

An event signal is output regardless of the setting in the WDTRCR.RSTIRQS bit in register-start mode or the OFS0.WDTRSTIRQS bit in auto-start mode. An event signal can also be output when the next interrupt source is generated while the refresh error flag (WDTSR.REFEF) or underflow flag (WDTSR.UNDFF) is 1. For details, see section 19, Event Link Controller (ELC).

27.5 Usage Notes

27.5.1 Restrictions on the ICU Event Link Setting Register n (IELSRn) Setting

Setting 47h to ICU Event Link Setting Register n (IELSRn.IELS[8:0] bits) is prohibited when enabling the WDT reset assertion (OFS0.WDTRSTIRQS = 1 or WDTRCR.RSTIRQS = 1) or when enabling event link operation (47h is set to ELSRm.ELS[8:0]).

28. Independent Watchdog Timer (IWDT)

28.1 Overview

The Independent Watchdog Timer (IWDT) is a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT can be used to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates using an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a failsafe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, or refresh error, or a refresh of the count value in the registers.

The IWDT functions differ from those of the WDT as follows:

- The divided IWDT-dedicated clock (IWDTCLK) is used as the count source (not affected by PCLKB)
- IWDT does not support the register start mode
- When transitioning to Low Power mode (exclude Deep Software Standby mode), the OFS0.IWDTSTPCTL bit can be used to select whether to stop the counter or not.

Table 28.1 lists the IWDT specifications and Figure 28.1 shows the block diagram.

Table 28.1 IWDT specifications

Parameter	Specifications
Count source*1	IWDT-dedicated clock (IWDTCLK)
Clock division ratio	Division by 1, 16, 32, 64, 128, or 256
Counter operation	Counting down using a 14-bit down-counter
Condition for starting the counter	• Counting automatically starts after a reset
Conditions for stopping the counter	• Reset (the down-counter and other registers return to their initial values) • A counter underflows or a refresh error is generated (and counting restarts automatically)
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
IWDT reset sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Non-maskable interrupt/interrupt sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Reading of the counter value	The down-counter value can be read by the IWDTSR register
Event link function (output)	• Down-counter underflow event output • Refresh error event output
Output signal (internal signal)	• Reset output • Interrupt request output • Sleep-mode count stop control output
Auto start mode	Configurable to the following triggers: • Clock frequency division ratio after a reset (OFS0.IWDTCKS[3:0] bits) • Timeout period of the IWDT (OFS0.IWDTTOPS[1:0] bits) • Window start position in the IWDT (OFS0.IWDTRPSS[1:0] bits) • Window end position in the IWDT (OFS0.IWDTRPES[1:0] bits) • Reset output or interrupt request output (OFS0.IWDTRSTIRQS bit) • Down-count stop function on transition to Sleep mode, Software Standby mode, or Snooze mode (OFS0.IWDTSTPCTL bit)

Note 1. This must satisfy the frequency of the peripheral module clock (PCLKB) ≥ 4 × (the frequency of the count clock source after division).

To use the IWDT, you must supply the IWDT-dedicated clock (IWDTCLK). The bus interface and registers operate with PCLKB, and the 14-bit counter and control circuits operate with IWDTCLK.

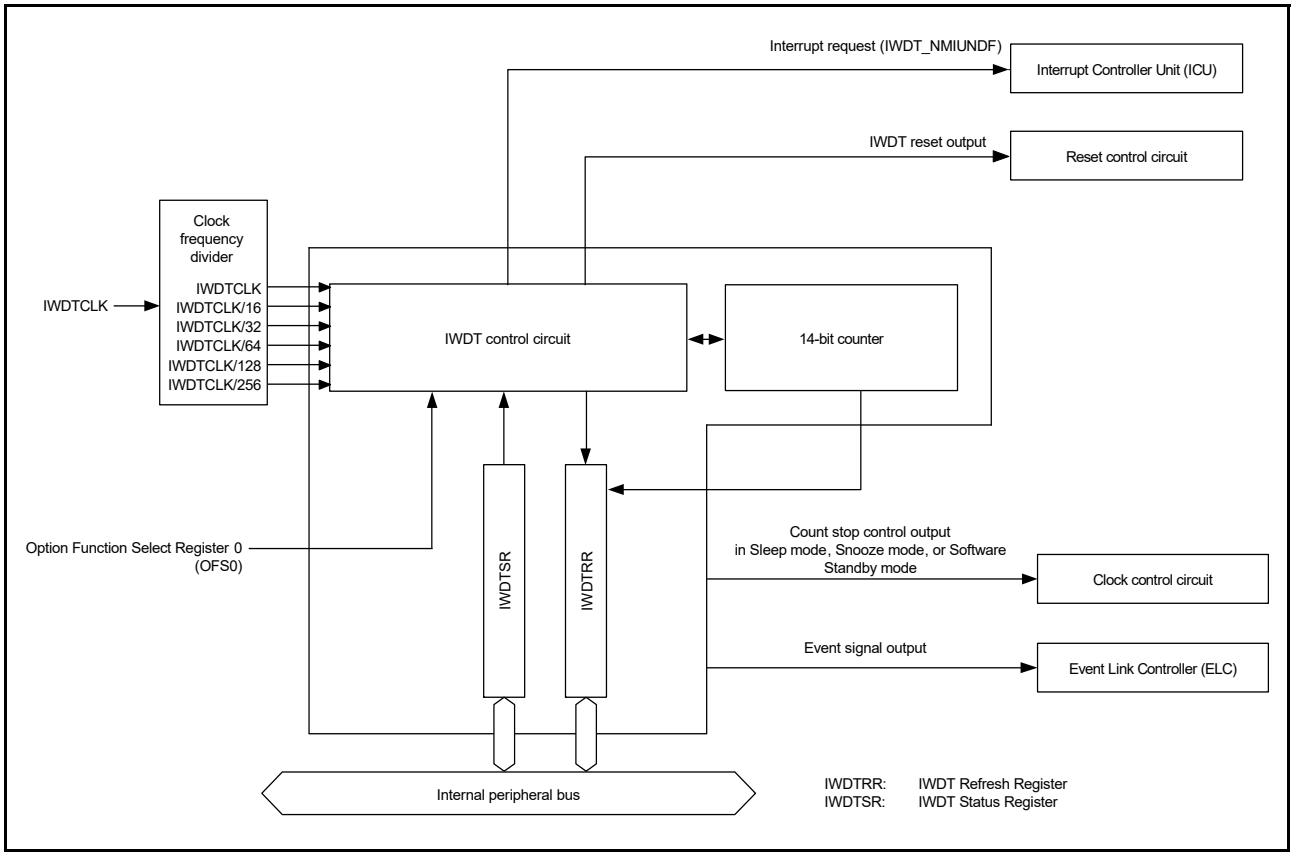

Figure 28.1 IWDT block diagram

28.2 Register Descriptions

28.2.1 IWDT Refresh Register (IWDTRR)

Address(es): IWDT.IWDTRR 4004 4400h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

Bit	Description	R/W
b7 to b0	The down-counter is refreshed by writing 00h and then writing FFh to this register.	R/W

The IWDTRR register refreshes the down-counter of the IWDT. The down-counter of the IWDT is refreshed by writing 00h and then writing FFh to IWDTRR (refresh operation) within the refresh-permitted period. After the counter is refreshed, it starts counting down from the value selected in the IWDT timeout period select bits (OFS0.IWDTTOPS[1:0]) in Option Function Select Register 0 (OFS0).

When 00h is written, the read value is 00h. When a value other than 00h is written, the read value is FFh. For details on the refresh operation, see section 28.3.2, Refresh Operation.

28.2.2 IWDT Status Register (IWDTSR)

Address(es): IWDT.IWDTSR 4004 4404h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	REFEF	UNDFF	CNTVAL[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b13 to b0	CNTVAL[13:0]	Counter Value	Value counted by the down-counter	R
b14	UNDFF	Underflow Flag	0: No underflow occurred 1: Underflow occurred.	R/(W)*1
b15	REFEF	Refresh Error Flag	0: No refresh error occurred 1: Refresh error occurred.	R/(W)*1

Note 1. Only 0 can be written to clear the flag.

CNTVAL[13:0] bits (Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

UNDFF flag (Underflow Flag)

Read the UNDFF flag to confirm whether an underflow occurred in the counter. A value of 1 indicates that the down-counter underflowed. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFF flag takes (N+2) IWDTCLK cycles and 2 PCLKB cycles. In addition, clearing of the flag is ignored for (N+2) IWDTCLK cycles following an underflow. N is specified in the IWDTCKS[3:0] bits as follows:

- When IWDTCKS[3:0] = 0000b, N = 1
- When IWDTCKS[3:0] = 0010b, N = 16
- When IWDTCKS[3:0] = 0011b, N = 32
- When IWDTCKS[3:0] = 0100b, N = 64
- When IWDTCKS[3:0] = 1111b, N = 128
- When IWDTCKS[3:0] = 0101b, N = 256.

REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred, indicating that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N+2) IWDTCLK cycles and 2 PCLKB cycles. In addition, clearing of the flag is ignored for a (N+2) IWDTCLK cycles following a refresh error. N is specified in the IWDTCKS[3:0] bits as follows:

- When IWDTCKS[3:0] = 0000b, N = 1
- When IWDTCKS[3:0] = 0010b, N = 16
- When IWDTCKS[3:0] = 0011b, N = 32
- When IWDTCKS[3:0] = 0100b, N = 64
- When IWDTCKS[3:0] = 1111b, N = 128
- When IWDTCKS[3:0] = 0101b, N = 256.

28.2.3 Option Function Select Register 0 (OFS0)

For information on Option Function Select Register 0 (OFS0), see section 7.2.1, Option Function Select Register 0 (OFS0).

IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 128, 512, 1024, or 2048 cycles, taking the divided clock specified in the IWDTCKS[3:0] bits as one cycle. After the down-counter is refreshed, the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits determines the number of IWDTCLK cycles until the counter underflows.

Table 28.2 lists the relationship between the IWDTCKS[3:0] and IWDTTOPS[1:0] bit settings, the timeout period, and the number of IWDTCLK cycles.

Table 28.2 Timeout period settings

IWDTCKS[3:0] bits				IWDTTOPS[1:0] bits				
b7	b6	b5	b4	b1	b0	Clock division ratio	Timeout period (number of cycles)	Cycles of IWDTCLK
0	0	0	0	0	0	IWDTCLK	128	128
				0	1		512	512
				1	0		1,024	1,024
				1	1		2,048	2,048
0	0	1	0	0	0	IWDTCLK/16	128	2,048
				0	1		512	8,192
				1	0		1,024	16,384
				1	1		2,048	32,768
0	0	1	1	0	0	IWDTCLK/32	128	4,096
				0	1		512	16,384
				1	0		1,024	32,768
				1	1		2,048	65,536
0	1	0	0	0	0	IWDTCLK/64	128	8,192
				0	1		512	32,768
				1	0		1,024	65,536
				1	1		2,048	131,072
1	1	1	1	0	0	IWDTCLK/128	128	16,384
				0	1		512	65,536
				1	0		1,024	131,072
				1	1		2,048	262,144
0	1	0	1	0	0	IWDTCLK/256	128	32,768
				0	1		512	131,072
				1	0		1,024	262,144
				1	1		2,048	524,288

IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the IWDT-dedicated clock (IWDTCLK) divided by 1, 16, 32, 64, 128, and 256. Combined with the IWDTTOPS[1:0] bit setting, this allows the IWDT to be configured to a count period between 128 and 524288 cycles of the IWDTCLK clock.

IWDTRPES[1:0] bits (IWDT Window End Position Select)

The IWDTRPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than

the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.

IWDTRPSS[1:0] bits (IWDT Window Start Position Select)

The IWDTRPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the window end position. If the window start position is less than or equal to the window end position, the window end position is set to 0%.

Table 28.3 lists the counter values for the window start and end positions, and Figure 28.2 shows the refresh-permitted period set in the IWDTRPSS[1:0], IWDTRPES[1:0], and IWDTTOPS[1:0] bits.

Table 28.3 Relationship between the timeout period and window start and end counter values

IWDTTOPS[1:0] bits		Timeout period		Window start and end counter value			
b1	b0	Cycles	Counter value	100%	75%	50%	25%
0	0	128	007Fh	007Fh	005Fh	003Fh	001Fh
0	1	512	01FFh	01FFh	017Fh	00FFh	007Fh
1	0	1,024	03FFh	03FFh	02FFh	01FFh	00FFh
1	1	2,048	07FFh	07FFh	05FFh	03FFh	01FFh

IWDTRPSS[1:0] bits		IWDTRPES[1:0] bits		Window	
b13	b12	b9	b8	Start (%)	End (%)
1	1	1	1	100	0
		1	0		25
		0	1		50
		0	0		75
1	0	1	1	75	0
		1	0		25
		0	1		50
		0	0		75
0	1	1	1	50	0
		1	0		25
		0	1		50
		0	0		75
0	0	1	1	25	0
		1	0		25
		0	1		50
		0	0		75

Note: If window end setting ≥ window start setting, the window end setting is set to 0%.

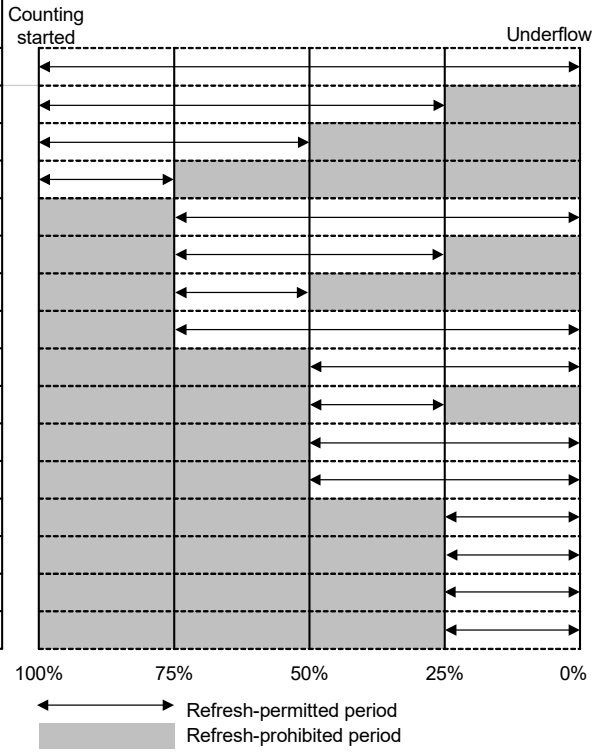

Figure 28.2 IWDTRPSS[1:0] and [IWDTRPES[1:0] bit settings and refresh-permitted period

IWDTRSTIRQS bit (IWDT Reset Interrupt Request Select)

The IWDTRSTIRQS bit specifies the behavior when an underflow or a refresh error occurs. Setting 1 selects reset output. Setting 0 selects non-maskable interrupt or interrupt.

IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit controls whether to stop counting on transition to Sleep mode, Snooze mode, or Software Standby mode.

28.3 Operation

28.3.1 Auto-Start Mode

When the IWDT start mode select bit (OFS0.IWDTSTRT) is 0, auto-start mode is selected. Otherwise, the IWDT is disabled.

Within the reset state, the setting values for the following in Option Function Select Register 0 (OFS0) are set in the IWDT registers:

- Clock division ratio
- Window start and end positions
- Timeout period
- Reset output or interrupt request
- Counter stop control on transition to the low power modes.

When the reset state is released, the down-counter automatically starts counting down from the value set in the IWDT timeout period select bits (OFS0.IWDTTOPS[1:0]).

After that, as long as the program continues normal operation and the counter is refreshed within the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and down-counting continues. The IWDT does not output the reset signal as long as this procedure continues. However, if the counter underflows because the program crashes, or because a refresh error occurs when an attempt is made to refresh outside the refresh-permitted period, the IWDT asserts the reset signal or non-maskable interrupt request/interrupt request (IWDT_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for one cycle, and restarts the count. Reset output or interrupt request output can be selected in the IWDT reset interrupt request select bit (OFS0.IWDTRSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the IWDT underflow/refresh error interrupt enable bit (NMIER.IWDTEN).

Figure 28.3 shows an example of operation under the following conditions:

- Auto start mode (OFS0.IWDTSTRT = 0)
- Non-maskable interrupt request output is enabled (OFS0.IWDTRSTIRQS = 0)
- The window start position is 75% (OFS0.IWDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.IWDTRPES[1:0] = 10b).

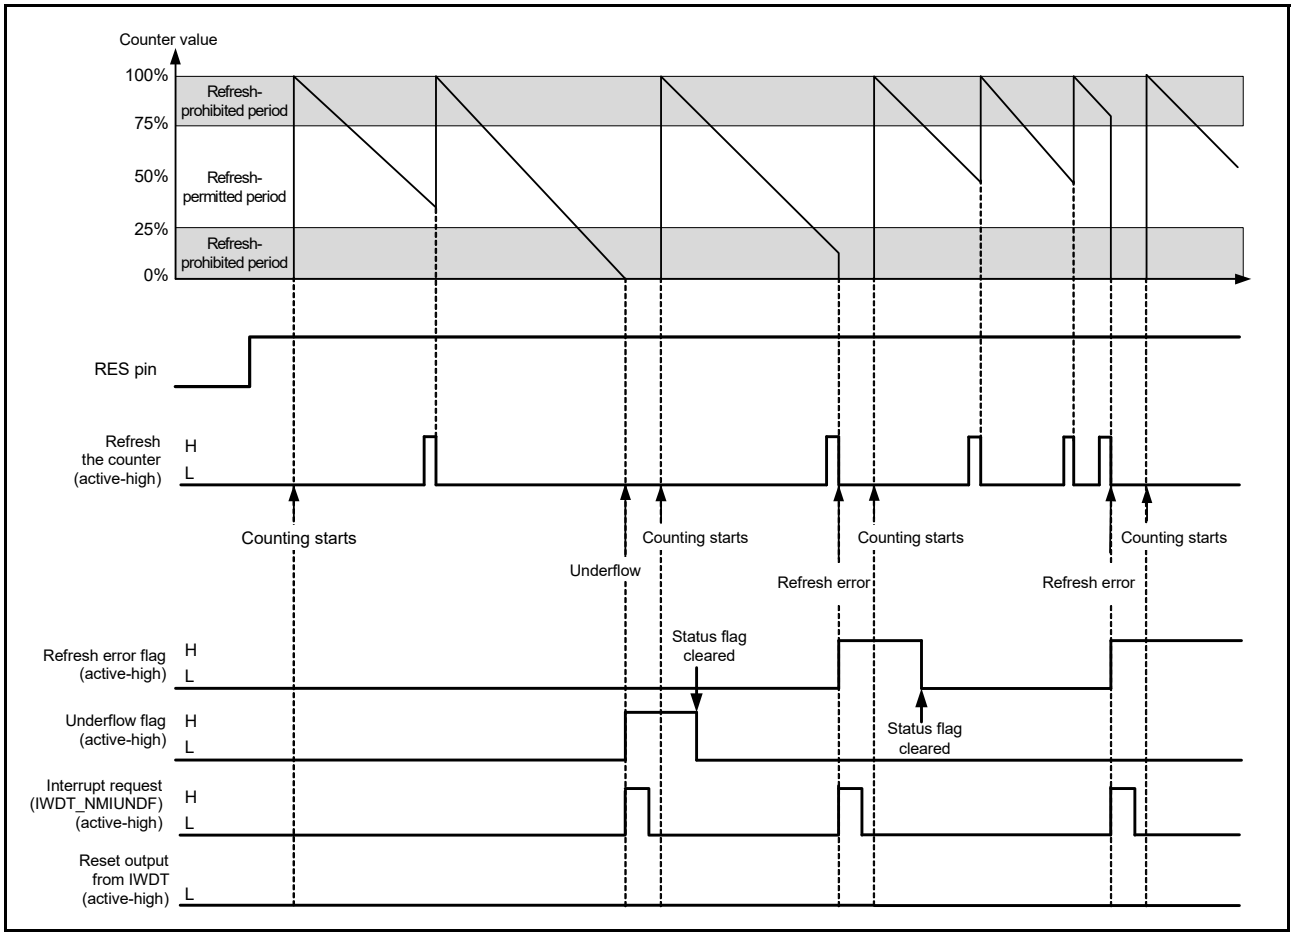

Figure 28.3 Operation example in auto-start mode

28.3.2 Refresh Operation

The down-counter is refreshed by writing the values 00h and FFh to the IWDT Refresh Register (IWDTRR). If a value other than FFh is written after 00h, the down-counter is not refreshed. If an invalid value is written, correct refreshing resumes on a write of 00h and FFh to the IWDTRR register.

When writes are made in the order of 00h (first time) → 00h (second time), and if FFh is written after that, the writing order 00h → FFh is satisfied. Writes of 00h (n-1th time) → 00h (nth time) → FFh are valid, and the refresh is performed correctly. Even when the first value written before 00h is not 00h, correct refreshing is performed as long as the operation contains the write sequence of 00h → FFh.

Correct refreshing is also performed when a register other than IWDTRR is accessed or IWDTRR is read between writing 00h and writing FFh to IWDTRR. Writes to refresh the counter must be made within the refresh-permitted period, and this is determined by the FFh write. For this reason, correct refreshing is performed even when 00h is written outside the refresh-permitted period.

[Example write sequences that are valid for refreshing the counter]

- 00h → FFh
- 00h (n-1th time) → 00h (nth time) → FFh
- 00h → access to another register or read from IWDTRR → FFh.

[Example write sequences that are invalid for refreshing the counter]

- 23h (a value other than 00h) → FFh
- 00h → 54h (a value other than FFh)
- 00h → AAh (00h and a value other than FFh) → FFh.

After FFh is written to the IWDT Refresh Register (IWDTRR), refreshing the down-counter requires up to four cycles of the signal for counting (the IWDT-dedicated clock frequency division ratio select bits (OFS0.IWDTCKS[3:0]) determine how many cycles of the IWDT-dedicated clock (IWDTCLK) make up one cycle for counting). To meet this requirement, complete writing FFh to IWDTRR four count cycles before the end of the refresh-permitted period or a counter underflow. The value of the counter can be checked in the counter bits (IWDTSR.CNTVAL[13:0]).

[Example refreshing timings]

- When the window start position is set to 1FFFh, even if 00h is written to IWDTRR before 1FFFh is reached (at 2002h, for example), refreshing occurs if FFh is written to IWDTRR after the value of the IWDTSR.CNTVAL[13:0] bits reaches 1FFFh.
- When the window end position is set to 1FFFh, refreshing occurs if 2003h (four count cycles before 1FFFh) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after a write of 00h → FFh to IWDTRR.
- When the refresh-permitted period continues until count 0000h, refreshing can be performed immediately before an underflow. In this case, if 0003h (four count cycles before an underflow) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after a write of 00h → FFh to IWDTRR, no underflow occurs and refreshing is performed.

Figure 28.4 shows the IWDT refresh-operation waveforms when PCLKB > IWDTCLK and the clock division ratio is IWDTCLK.

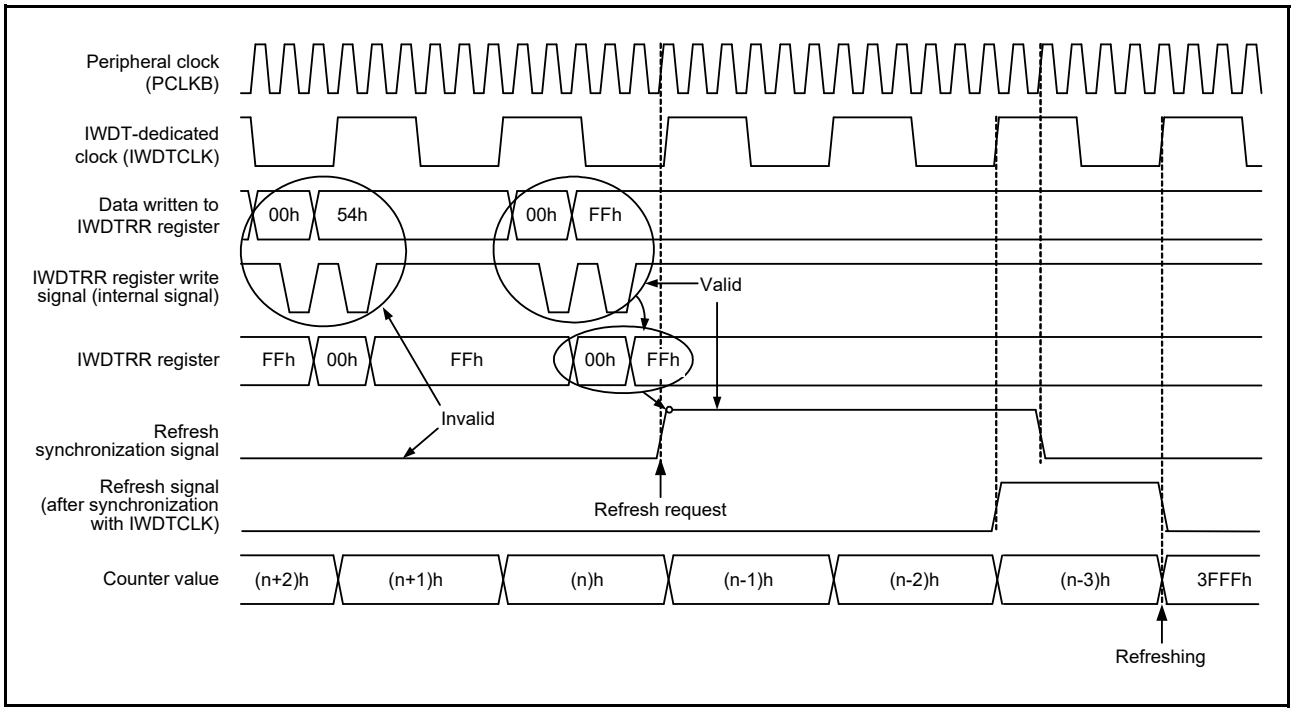

Figure 28.4 IWDT refresh operation waveforms when OFS0.IWDTCKS[3:0] = 0000b and OFS0.IWDTTOPS[1:0] = 11b)

28.3.3 Status Flags

The refresh error (IWDTSR.REFEF) and underflow (IWDTSR.UNDFF) flags retain the source of the reset signal output from the IWDT or the source of the interrupt request from the IWDT. After a release from the reset state or interrupt request generation, read the IWDTSR.REFEF and UNDFF flags to check for the reset or interrupt source. For each flag, writing 0 clears the bit and writing 1 has no effect.

Leaving the status flags unchanged does not affect operation. If the flags are not cleared on the next reset or interrupt request from the IWDT, the earlier reset or interrupt source is cleared and the new reset or interrupt source is written. After 0 is written to each flag, up to three IWDTCLK cycles and two PCLKB cycles are required before the value is reflected.

28.3.4 Reset Output

When the IWDT reset interrupt request select bit (OFS0.IWDTRSTIRQS) in Option Function Select Register 0 (OFS0) is set to 1, a reset signal is output when an underflow in the down-counter or a refresh error occurs. Counting down starts automatically after the reset output.

28.3.5 Interrupt Sources

When the IWDT reset interrupt request select bit (OFS0.IWDTRSTIRQS) in Option Function Select Register 0 (OFS0) is set to 0, an interrupt signal (IWDT_NMIUNDF) is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see section 14, Interrupt Controller Unit (ICU).

Table 28.4 IWDT interrupt source

Name	Interrupt source	DTC activation	DMAC activation
IWDT_NMIUNDF	• Down-counter underflow • Refresh error	Not possible	Not possible

28.3.6 Reading the Down-Counter Value

As the counter is the IWDT-dedicated clock (IWDTCLK), the counter value cannot be read directly. The IWDT synchronizes the counter value with the peripheral clock (PCLKB) and stores it in the down-counter value bits (IWDTSR.CNTVAL[13:0]) of the IWDT status register. Check these bits to obtain the counter value indirectly. Reading the counter value requires multiple PCLKB clock cycles (up to four clock cycles), and the read counter value might differ from the actual counter value by a value of one count.

Figure 28.5 shows the processing for reading the IWDT counter value when PCLKB > IWDTCLK and the clock division ratio is IWDTCLK.

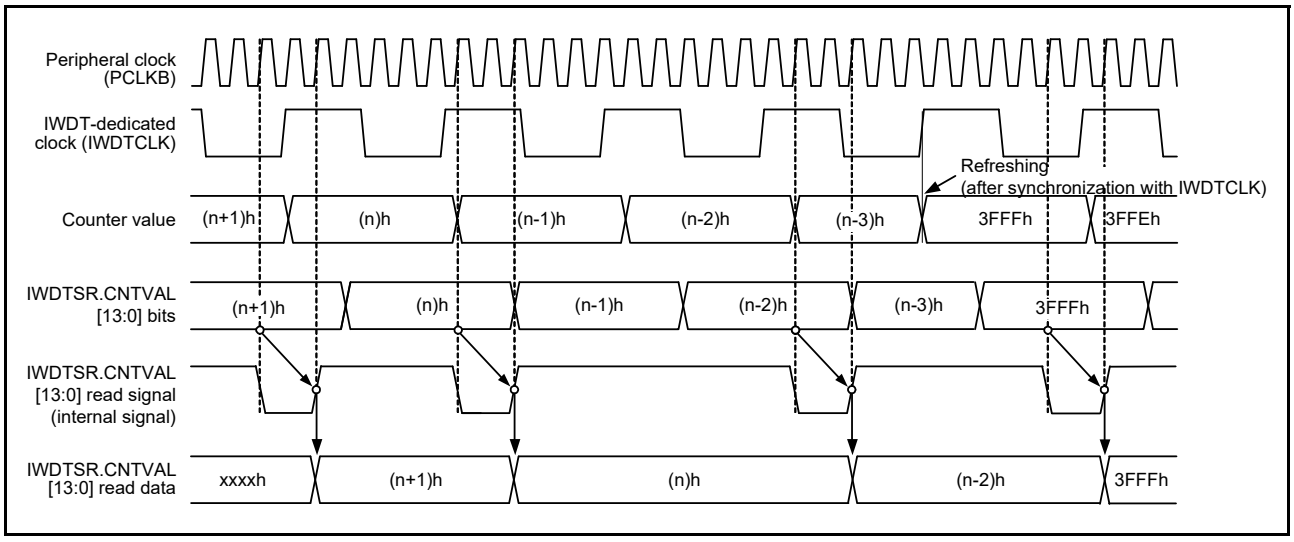

Figure 28.5 Processing for reading IWDT counter value when OFS0.IWDTCKS[3:0] = 0000b and OFS0.IWDTTOPS[1:0] = 11b

28.4 Output to the Event Link Controller (ELC)

The IWDT is capable of link operation for a specified module when the interrupt request signal is used as an event signal by the ELC. The event signal is output by the counter underflow or refresh error.

An event signal is output regardless of the setting in the OFS0.WDTRSTIRQS bit. An event signal can also be output when the next interrupt source while the refresh error flag (IWDTSR.REFEF) or underflow flag (IWDTSR.UNDFF) is 1. For details, see section 19, Event Link Controller (ELC).

28.5 Usage Notes

28.5.1 Refresh Operations

While configuring the refresh time, consider variations in the range of errors given the accuracy of PCLKB and IWDTCLK. Set values that ensure refreshing is possible.

28.5.2 Restrictions on the Clock Division Ratio Setting

Satisfy the following required frequency of the peripheral module clock (PCLKB):

PCLKB ≥ 4 × (the frequency of the count clock source after division).

29. Ethernet MAC Controller (ETHERC)

29.1 Overview

The MCU provides a two-channel Ethernet Controller (ETHERC) compliant with the Ethernet/IEEE802.3 Media Access Control (MAC) layer protocol. Each ETHERC channel has one channel of the MAC layer interface. Connecting the MCU to the physical layer LSI (PHY-LSI) allows transmission and reception of frames compliant with the Ethernet/IEEE802.3 standard. The ETHERC is connected through the Ethernet PTP Controller (EPTPC) to the Ethernet DMA Controller (EDMAC), so data can be transferred without using the CPU. When the EPTPC is not used, bypass the EPTPC by setting the bypass registers in the EPTPC. See section 30.2.86, Bypass 1588 Module Register (BYPASS).

Table 29.1 lists the ETHERC specifications, Figure 29.1 shows the configuration, and Table 29.2 lists the I/O pins. Figure 29.2 and Figure 29.3 show examples connections of the MCU to an external PHY-LSI.

Table 29.1 ETHERC specifications

Parameter	Specifications
Number of channels	Two channels
Protocol	Flow control compliant with IEEE802.3x
Data transmission/reception	Frames compliant with the Ethernet/IEEE802.3 standard can be transmitted and received
Bit rate	Supports 10 Mbps and 100 Mbps
Operation modes	Supports full-duplex and half-duplex modes
Interfaces	Media Independent Interface (MII), Reduced Media Independent Interface (RMII), compliant with the IEEE802.3u standard
Functions	Magic Packet™ *1 detection, Wake-on-LAN (WOL) signal output

Note 1. Magic Packet is a trademark of Advanced Micro Devices, Inc.

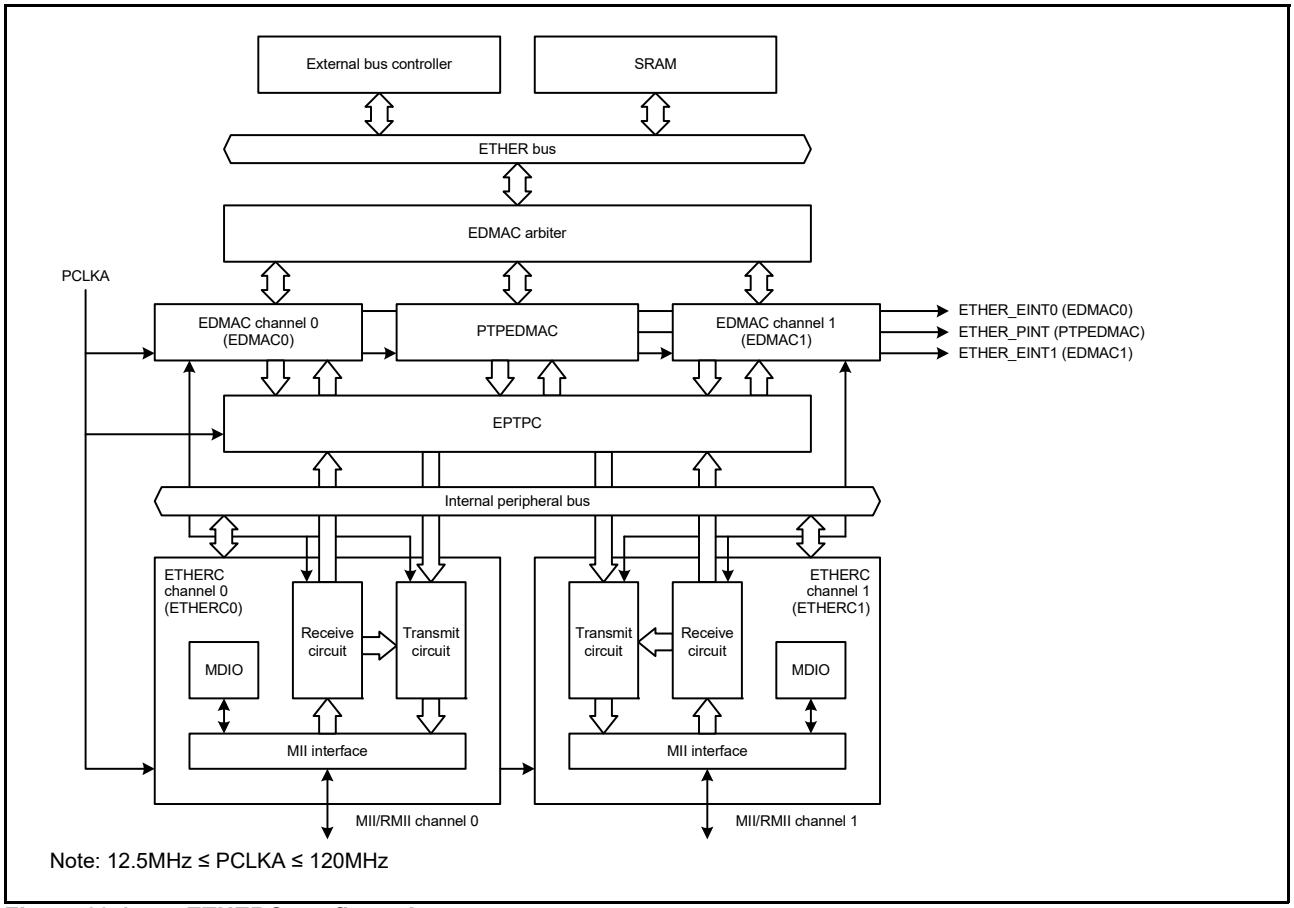

Figure 29.1 ETHERC configuration

Table 29.2 ETHERC I/O pins (n = 0, 1)

Operating mode	Pin name	I/O	Description
MII	ETn_TX_CLK *1	Input	Transmit clock Timing reference signal for outputting the ETn_TX_EN, ETn_ETXD3 to ETn_ETXD0, and ETn_TX_ER signals.
	ETn_RX_CLK *1	Input	Receive clock Timing reference signal for inputting the ETn_RX_DV, ETn_ERXD3 to ETn_ERXD0, and ETn_RX_ER signals.
	ETn_TX_EN *1	Output	Transmit data valid This signal indicates that valid transmit data was output on pins ETn_ETXD3 to ETn_ETXD0.
	ETn_ETXD3 to ETn_ETXD0 *1	Output	4-bit transmit data
	ETn_TX_ER *1	Output	Transmit error This signal notifies the PHY-LSI that an error occurred during transmission.
	ETn_RX_DV *1	Input	Receive data valid This signal indicates that valid receive data is on pins ETn_ERXD3 to ETn_ERXD0.
	ETn_ERXD3 to ETn_ERXD0 *1	Input	4-bit receive data
	ETn_RX_ER *1	Input	Receive error This signal indicates that there is an error in a frame that is being transferred from the PHY-LSI to the ETHERC.
	ETn_CRS *1	Input	Carrier sense
	ETn_COL *1	Input	Collision detection signal
	ETn_MDC *1	Output	Management data clock Reference clock signal for transfer of information on the ETn_MDIO pin.
	ETn_MDIO *1	I/O	Management data input/output Bidirectional data signal for exchanging management data with the PHY-LSI.
	ETn_LINKSTA	Input	Link status input from the PHY-LSI
	ETn_EXOUT	Output	General output pin
	ETn_WOL	Output	Wake-on-LAN. This signal indicates that a Magic Packet was received.
RMII	REF50CKn *2	Input	Reference clock Timing reference signal for the RMIIn_TXD_EN, RMIIn_TXD1 to RMIIn_TXD0, RMIIn_CRS_DV, RMIIn_RXD1 to RMIIn_RXD0, and RMIIn_RX_ER pins.
	RMIIn_TXD_EN *2	Output	Transmit data valid This signal indicates that valid transmit data was output on the RMIIn_TXD1 and RMIIn_TXD0 pins.
	RMIIn_TXD1 to RMIIn_TXD0 *2	Output	2-bit transmit data
	RMIIn_CRS_DV *2	Input	Carrier sense/receive data valid This signal indicates that valid receive data is on the RMIIn_RXD1 and RMIIn_RXD0 pins.
	RMIIn_RXD1 to RMIIn_RXD0 *2	Input	2-bit receive data
	RMIIn_RX_ER *2	Input	Receive error This signal indicates that there is an error in a frame that is being transferred from the PHY-LSI to the ETHERC. See the note in section 29, Input to RMIIn_RX_ER Pin While RMII Is Selected.
	ETn_MDC *2	Output	Management data clock Reference clock signal for transfer of information on the ETn_MDIO pin
	ETn_MDIO *2	I/O	Management data I/O Bidirectional data signal for exchanging management data with the PHY-LSI.
	ETn_LINKSTA	Input	Link status input from the PHY-LSI.
	ETn_EXOUT	Output	General output pin
	ETn_WOL	Output	Wake-on-LAN. This signal indicates that a Magic Packet was received.

Note 1. MII signal compliant with IEEE802.3u.
Note 2. RMII signal compliant with IEEE802.3u.

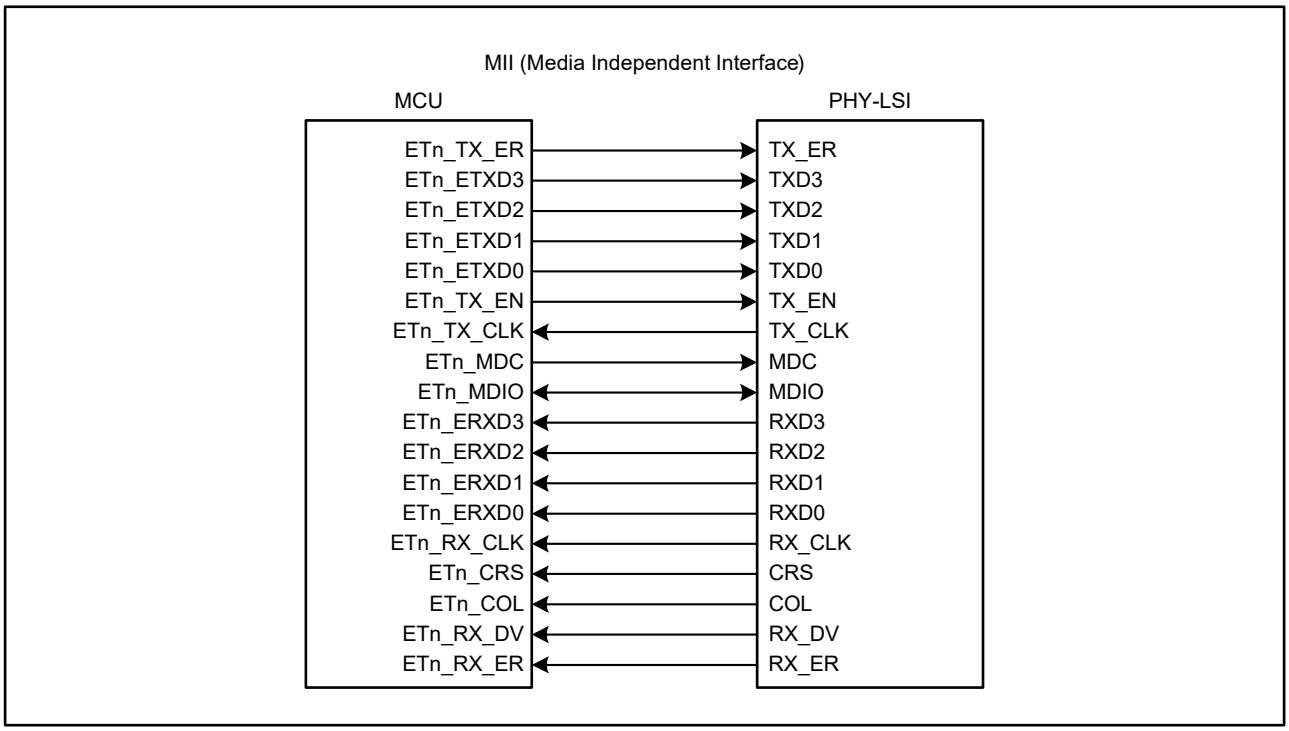

Figure 29.2 Example of connection with PHY-LSI for MII

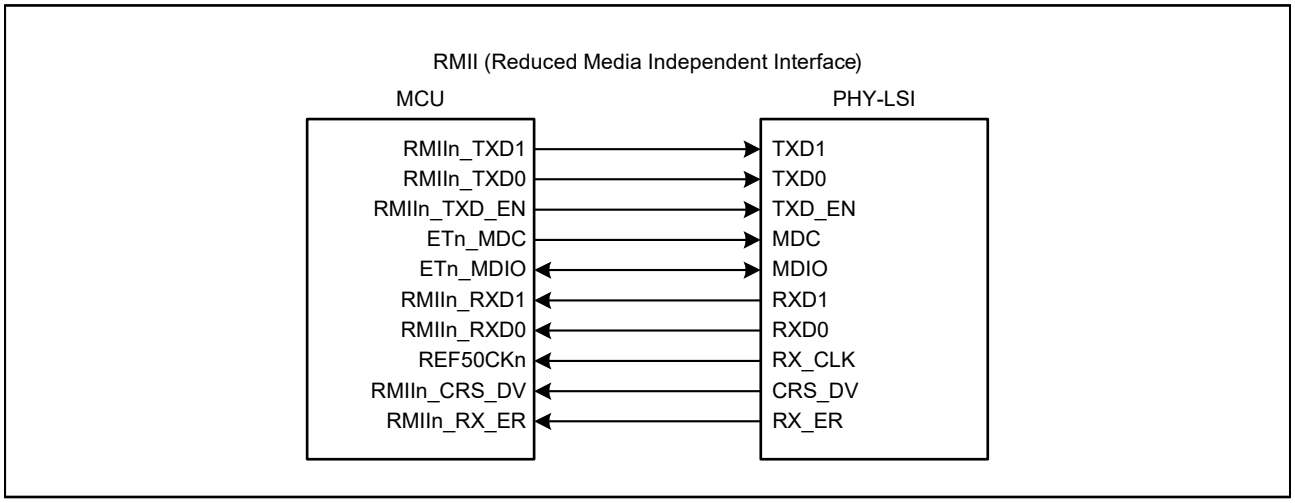

Figure 29.3 Example of connection with PHY-LSI for RMII

29.2 Register Descriptions

29.2.1 ETHERC Mode Register (ECMR)

Address(es): ETHERC0.ECMR 4006 4100h, ETHERC1.ECMR 4006 4300h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	TPC	ZPF	PFR	RXF	TXF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	PRCEF	—	—	MPDE	—	—	RE	TE	—	ILB	RTM	DM	PRM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PRM	Promiscuous Mode	0: Disable promiscuous mode 1: Enable promiscuous mode.	R/W
b1	DM	Duplex Mode	0: Half-duplex mode 1: Full-duplex mode.	R/W
b2	RTM	Bit Rate	0: 10 Mbps 1: 100 Mbps.	R/W
b3	ILB	Internal Loopback Mode	0: Perform normal data transmission or reception 1: Loop data back in the ETHERC when full-duplex mode is selected.	R/W
b4	—	Reserved	The read value is 0. The write value should be 0.	R/W
b5	TE	Transmission Enable	0: Disable transmit function 1: Enable transmit function.	R/W
b6	RE	Reception Enable	0: Disable receive function 1: Enable receive function.	R/W
b8, b7	—	Reserved	The read value is 0. The write value should be 0.	R/W
b9	MPDE	Magic Packet Detection Enable	0: Disable Magic Packet detection 1: Enable Magic Packet detection.	R/W
b11, b10	—	Reserved	The read value is 0. The write value should be 0.	R/W
b12	PRCEF	CRC Error Frame Receive Mode	0: Notify EDMAC of a CRC error 1: Do not notify EDMAC of a CRC error.	R/W
b15 to b13	—	Reserved	The read value is 0. The write value should be 0.	R/W
b16	TXF	Transmit Flow Control Operating Mode	0: Disable automatic PAUSE frame transmission (PAUSE frame is not automatically transmitted) 1: Enable automatic PAUSE frame transmission (PAUSE frame is automatically transmitted as required).	R/W
b17	RXF	Receive Flow Control Operating Mode	0: Disable PAUSE frame detection 1: Enable PAUSE frame detection.	R/W
b18	PFR	PAUSE Frame Receive Mode	0: Do not transfer PAUSE frame to the EDMAC 1: Transfer PAUSE frame to the EDMAC.	R/W
b19	ZPF	0 Time PAUSE Frame Enable	0: Do not use PAUSE frames that contain a pause_time parameter of 0 1: Use PAUSE frames that contains a pause_time parameter of 0.	R/W
b20	TPC	PAUSE Frame Transmit	0: Transmit PAUSE frame even during a PAUSE period 1: Do not transmit PAUSE frame during a PAUSE period.	R/W
b31 to b21	—	Reserved	The read value is 0. The write value should be 0.	R/W

The ECMR register controls ETHERC operation. Except for the TE and RE bits, set the bits in this register during initialization after a reset. When rewriting this register outside the initialization process, set the EDMACn.EDMR.SWR bit to 1 to reset the EDMAC and ETHERC, and then set this register again.

PRM bit (Promiscuous Mode)

When the PRM bit is set to 1, the ETHERC operates in promiscuous mode, where all Ethernet frames are received. In promiscuous mode, the ETHERC receives all valid frames regardless of whether the address matches the destination or broadcast address and regardless of the multicast bit setting.

RTM bit (Bit Rate)

The RTM bit sets the bit rate when the RMII is selected.

ILB bit (Internal Loopback Mode)

When the ILB bit is set to 1, transmit frames can be looped back in the MCU. Set the DM bit to 1 (full-duplex mode) to perform a loopback test.

TE bit (Transmission Enable)

When the TE bit is set to 1, the ETHERC transmit function is enabled. When the TE bit is set to 0, the transmit function is disabled after the frame being processed is completely transmitted.

RE bit (Reception Enable)

When the RE bit is set to 1, the ETHERC receive function is enabled. When the RE bit is set to 0, the receive function is disabled after the frame being processed is completely received.

PRCEF bit (CRC Error Frame Receive Mode)

When the PRCEF bit is set to 1, the EDMAC is not notified that a CRC error has occurred even when the error is detected in a receive frame. Accordingly, the EDMACn.EESR.CERF flag and RFS0 bit in receive descriptor 0 (RD0) do not set to 1.

ZPF bit (0 Time PAUSE Frame Enable)

When the ZPF bit is 1, a PAUSE frame with a pause_time parameter of 0 is transmitted when a PAUSE frame transmit request is canceled before the PAUSE time of the previously transmitted PAUSE frame has elapsed. After the PAUSE frame containing the pause_time parameter of 0 is received, the ETHERC is ready for transmission.

When the ZPF bit is 0, even if the PAUSE frame transmit request from the receive FIFO is canceled, the next PAUSE frame is not transmitted until the PAUSE time of the previously transmitted PAUSE frame has elapsed. When a PAUSE frame containing a pause_time parameter of 0 is received, it is discarded.

29.2.2 Receive Frame Maximum Length Register (RFLR)

Address(es): ETHERC0.RFLR 4006 4108h, ETHERC1.RFLR 4006 4308h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	RFL[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b11 to b0	RFL[11:0]	Receive Frame Maximum Length	The set value becomes the maximum frame length. The minimum value that can be set is 1,518 bytes, and the maximum value that can be set is 2,048 bytes. Values less than 1,518 bytes are regarded as 1,518 bytes, and values larger than 2,048 bytes are regarded as 2,048 bytes.	R/W
b31 to b12	—	Reserved	The read value is 0. The write value should be 0.	R/W

The RFLR register specifies the maximum frame length that can be received by the MCU. Set the length in bytes. Do not rewrite this register while the ECMR.RE bit is 1 (receive function enabled).

RFL[11:0] bits (Receive Frame Maximum Length)

The RFL[11:0] bits set the frame length to be checked. The frame length is the number of bytes in a field, extending from the destination address to the frame check sequence [FCS] of the received frame. When this length exceeds the RFL[11:0] bit value, the EDMAC is notified of a frame-too-long error, and the excess data is discarded.

29.2.3 ETHERC Status Register (ECSR)

Address(es): ETHERC0.ECSR 4006 4110h, ETHERC1.ECSR 4006 4310h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	BFR	PSRTO	—	LCHNG	MPD	ICD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ICD	False Carrier Detect Flag	0: PHY-LSI has not detected a false carrier on the line 1: PHY-LSI detected a false carrier on the line.	R/W *1
b1	MPD	Magic Packet Detect Flag	0: Magic Packet not detected 1: Magic Packet detected.	R/W *1
b2	LCHNG	Link Signal Change Flag	0: Change in the ETn_LINKSTA signal not detected 1: Change in the ETn_LINKSTA signal detected (high to low, or low to high).	R/W *1
b3	—	Reserved	The read value is 0. The write value should be 0.	R/W
b4	PSRTO	PAUSE Frame Retransmit Over Flag	0: PAUSE frame retransmit count has not reached the upper limit 1: PAUSE frame retransmit count reached the upper limit.	R/W *1
b5	BFR	Continuous Broadcast Frame Reception Flag	0: Continuous reception of broadcast frames not detected 1: Continuous reception of broadcast frames detected.	R/W *1
b31 to b6	—	Reserved	The read value is 0. The write value should be 0.	R/W

Note 1. Write 1 to clear the flag.

The ECSR register indicates the status of the ETHERC. When any flag in the ECSR register is set to 1 while the associated bit in the ECSIPR register is 1 (interrupt enabled), the EDMACn.EESR.ECI flag is set to 1.

ICD flag (False Carrier Detect Flag)

The ICD flag indicates that the PHY-LSI has detected a false carrier on the line. The flag is set to 1 when a receive error signal shown in Figure 29.11 is received from the PHY-LSI. The information might not be correct when signals input from the PHY-LSI change faster than software recognizes the change. Check the timing of the PHY-LSI.

LCHNG flag (Link Signal Change Flag)

The LCHNG flag indicates that the ETn_LINKSTA signal input from the PHY-LSI has changed from high to low, or from low to high. Check the PSR.LMON flag for the current link status. See section 29, Preventing the LCHNG Flag from Erroneously Setting to 1 for more information.

PSRTO flag (PAUSE Frame Retransmit Over Flag)

The PSRTO flag indicates that the number of retransmissions reached the value set in the TPAUSER register when retransmitting a PAUSE frame while automatic PAUSE frame transmission is enabled.

29.2.4 ETHERC Interrupt Enable Register (ECSIPR)

Address(es): ETHERC0.ECSIPR 4006 4118h, ETHERC1.ECSIPR 4006 4318h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	BFSIPR	PSRTOIP	—	LCHNGIP	MPDIP	ICDIP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ICDIP	False Carrier Detect Interrupt Enable	0: Disable interrupt notification 1: Enable interrupt notification.	R/W
b1	MPDIP	Magic Packet Detect Interrupt Enable	0: Disable interrupt notification 1: Enable interrupt notification.	R/W
b2	LCHNGIP	LINK Signal Change Interrupt Enable	0: Disable interrupt notification 1: Enable interrupt notification.	R/W
b3	—	Reserved	0: Disable interrupt notification 1: Enable interrupt notification.	R/W
b4	PSRTOIP	PAUSE Frame Retransmit Over Interrupt Enable	0: Disable interrupt notification 1: Enable interrupt notification.	R/W
b5	BFSIPR	Continuous Broadcast Frame Reception Interrupt Enable	0: Disable interrupt notification 1: Enable interrupt notification.	R/W
b31 to b6	—	Reserved	The read value is 0. The write value should be 0.	R/W

The ECSIPR register selects whether to notify the EDMAC of the status indicated in the ECSR register. Each bit is associated with the flag in the ECSR register with the same bit number.

29.2.5 PHY Interface Register (PIR)

Address(es): ETHERC0.PIR 4006 4120h, ETHERC1.PIR 4006 4320h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	x	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	MDC	MII/RMII Management Data Clock	This value is output from the ETn_MDC pin to supply the management data clock to the MII or RMII.	R/W
b1	MMD	MII/RMII Management Mode	0: Read 1: Write.	R/W
b2	MDO	MII/RMII Management Data-Out	This value is output from the ETn_MDIO pin when the MMD bit is 1 (write), and not when MMD is 0 (read).	R/W
b3	MDI	MII/RMII Management Data-In	This bit indicates the level of the ETn_MDIO pin. The write value should be 0.	R
b31 to b4	—	Reserved	The read value is 0. The write value should be 0.	R/W

The PIR register accesses registers in the PHY-LSI through the MII or RMII. The management clock and management data are controlled by software. See section 29.3.4, Accessing the MII and RMII Registers for details on accessing the MII and RMII registers.

29.2.6 PHY Status Register (PSR)

Address(es): ETHERC0.PSR 4006 4128h, ETHERC1.PSR 4006 4328h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LMON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x

Bit	Symbol	Bit name	Description	R/W
b0	LMON	ETn_LINKSTA Pin Status Flag	The link status can be read by connecting the link signal output from the PHY-LSI to the ETn_LINKSTA pin. For details on the polarity, see the specifications of the connected PHY-LSI.	R
b31 to b1	—	Reserved	The read value is 0. The write value should be 0.	R

The PSR register monitors interface signals from the PHY-LSI.

29.2.7 Random Number Generation Counter Upper Limit Setting Register (RDMLR)

Address(es): ETHERC0.RDMLR 4006 4140h, ETHERC1.RDMLR 4006 4340h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	RMD[19:16]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RMD[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b19 to b0	RMD[19:0]	Random Number Generation Counter	00000h: Normal operation 00001h to FFFFFh: Setting prohibited.	R/W
b31 to b20	—	Reserved	The read value is 0. The write value should be 0.	R/W

The RDMLR register specifies the maximum value for the counter used in the random number generator. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled) or while the ECMR.RE bit is 1 (receive function enabled).

29.2.8 Interpacket Gap Register (IPGR)

Address(es): ETHERC0.IPGR 4006 4150h, ETHERC1.IPGR 4006 4350h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	IPG[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0

Bit	Symbol	Bit name	Description	R/W
b4 to b0	IPG[4:0]	Interpacket Gap	00h: 16 bit times 01h: 20 bit times : : 14h: 96 bit times (initial value) : : 1Fh: 140 bit times.	R/W
b31 to b5	—	Reserved	The read value is 0. The write value should be 0.	R/W

The IPGR register specifies the interpacket gap (IPG) value. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled) or while the ECMR.RE bit is 1 (receive function enabled). See section 29.3.6, Adjusting Transmission Efficiency by Changing the IPG for details on the IPG.

29.2.9 Automatic PAUSE Frame Register (APR)

Address(es): ETHERC0.APR 4006 4154h, ETHERC1.APR 4006 4354h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AP[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Bit name	Description	R/W
b15 to b0	AP[15:0]	Automatic PAUSE Time Setting	These bits set the value of the pause_time parameter for PAUSE frames that are automatically transmitted. Transmission is not performed until the set value multiplied by 512 bit times has elapsed.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The APR register specifies the PAUSE time for PAUSE frames that are automatically transmitted. The value set in the APR register is used for the pause_time parameter of the PAUSE frame. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled) or while the ECMR.RE bit is 1 (receive function enabled).

29.2.10 Manual PAUSE Frame Register (MPR)

Address(es): ETHERC0.MPR 4006 4158h, ETHERC11.MPR 4006 4358h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MP[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Bit name	Description	R/W
b15 to b0	MP[15:0]	Manual PAUSE Time Setting	These bits set the value of the pause_time parameter for PAUSE frames that are manually transmitted. Transmission is not performed until the set value multiplied by 512 bit times has elapsed. The read value is undefined.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The MPR register specifies the PAUSE time for PAUSE frames that are manually transmitted. The value set in the MPR register is used for the pause_time parameter of the PAUSE frame. When a value is set to this register, a PAUSE frame is transmitted. Rewrite this register while the ECMR.TE bit is 1 (transmit function enabled).

29.2.11 Received PAUSE Frame Counter (RFCF)

Address(es): ETHERC0.RFCF 4006 4160h, ETHERC1.RFCF 4006 4360h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	RPAUSE[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	RPAUSE[7:0]	Received PAUSE Frame Count	Number of received PAUSE frames.	R
b31 to b8	—	Reserved	The read value is 0	R

The RFCF register is a counter that indicates the number of received PAUSE frames. The counter is reset after this register is read.

29.2.12 PAUSE Frame Retransmit Count Setting Register (TPAUSER)

Address(es): ETHERC0.TPAUSER 4006 4164h, ETHERC1.TPAUSER 4006 4364h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TPAUSE[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	TPAUSE[15:0]	Automatic PAUSE Frame Retransmit Setting	0000h: Number of retransmissions is unlimited 0001h: Maximum number of retransmissions is 1 : : FFFFh: Maximum number of retransmissions is 65,535.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The TPAUSER register selects the maximum number of times a PAUSE frame is automatically transmitted. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled).

29.2.13 PAUSE Frame Retransmit Counter (TPAUSECR)

Address(es): ETHERC0.TPAUSECR 4006 4168h, ETHERC1.TPAUSECR 4006 4368h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TXP[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	TXP[7:0]	PAUSE Frame Retransmit Count	Number of times a PAUSE frame was retransmitted.	R
b31 to b8	—	Reserved	The read value is 0	R

The TPAUSECR register is a counter that indicates the number of times a PAUSE frame was automatically retransmitted. The counter is reset after this register is read.

29.2.14 Broadcast Frame Receive Count Setting Register (BCFRR)

Address(es): ETHERC0.BCFRR 4006 416Ch, ETHERC1.BCFRR 4006 436Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	BCF[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	BCF[15:0]	Broadcast Frame Continuous Receive Count Setting	0000h: Number of receptions is unlimited 0001h: Receive 1 frame. : : FFFFh: Receive 65,535 frames.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The BCFRR register specifies the number of times broadcast frames can be received continuously. When the number of received frames exceeds the BCF[15:0] bit value, the excess broadcast frames are discarded. Do not rewrite this register while the EMCR.RE bit is 1 (receive function enabled).

29.2.15 MAC Address Upper Bit Register (MAHR)

Address(es): ETHERC0.MAHR 4006 41C0h, ETHERC1.MAHR 4006 43C0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MAHR[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MAHR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	MAHR[31:0]	MAC Address Upper Bit	See the description following this table	R/W

The MAHR register specifies the upper 32 bits ([47:16]) of the 48-bit MAC address. For example, if the MAC address is 01-23-45-67-89-AB, set the register to 0123 4567h.

Set the MAHR register during initialization after a reset. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled) or while the ECMR.RE bit is 1 (receive function enabled). When rewriting this register, set the EDMACn.EDMR.SWR bit to 1 to reset the EDMAC and ETHERC, and then set this register again.

29.2.16 MAC Address Lower Bit Register (MALR)

Address(es): ETHERC0.MALR 4006 41C8h, ETHERC1.MALR 4006 43C8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	—	—	These bits set the lower 16 bits of the MAC address.	R/W
b31 to b16	—	Reserved	The read value is 0. The write value should be 0.	R/W

The MALR register specifies the lower 16 bits of the 48-bit MAC address. For example, if the MAC address is 01-23-45-67-89-AB, set the register to 0000 89ABh.

Set the MALR register during initialization after a reset. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled) or while the ECMR.RE bit is 1 (receive function enabled). When rewriting this register, set the EDMACn.EDMR.SWR bit to 1 to reset the EDMAC and ETHERC and then set this register again.

29.2.17 Transmit Retry Over Counter Register (TROCR)

Address(es): ETHERC0.TROCR 4006 41D0h, ETHERC1.TROCR 4006 43D0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TROCR[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TROCR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	TROCR[31:0]	Transmit Retry Over Counter	See the description following this table	R/W

The TROCR register is a counter that indicates the number of frames that failed to be retransmitted. The register is incremented by 1 when a frame fails to be retransmitted 15 times. The counter stops when the register value becomes FFFF FFFFh. Writing any value to the TROCR register clears the counter value to 0.

29.2.18 Late Collision Detect Counter Register (CDCR)

Address(es): ETHERC0.CDCR 4006 41D4h, ETHERC1.CDCR 4006 43D4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CDCR[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CDCR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	CDCR[31:0]	Late Collision Detect Counter	See the description following this table	R/W

The CDCR register is a counter that indicates the number of late collisions that are detected after transmission starts. When the register value becomes FFFF FFFFh, the counter stops. Writing any value to the CDCR register clears the counter value to 0.

29.2.19 Lost Carrier Counter Register (LCCR)

Address(es): ETHERC0.LCCR 4006 41D8h, ETHERC1.LCCR 4006 43D8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LCCR[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

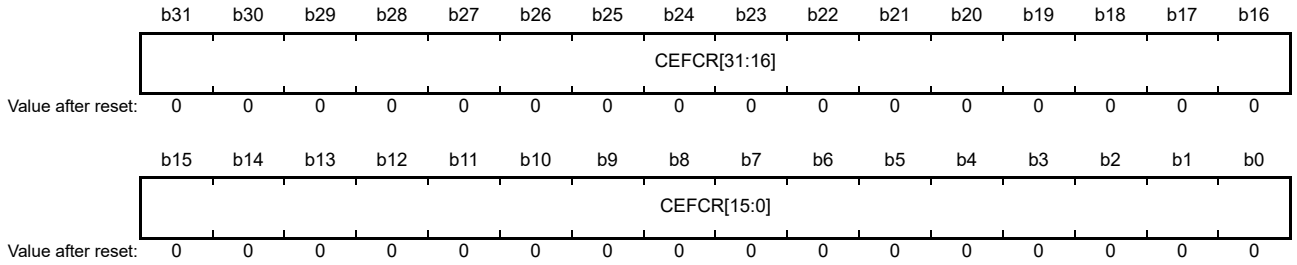
	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LCCR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LCCR[31:0]	Lost Carrier Counter	See the description following this table	R/W

The LCCR register is a counter that indicates the number of times a loss of carrier is detected during frame transmission. When the register value becomes FFFF FFFFh, the counter stops. Writing any value to the LCCR register clears the counter value to 0.

29.2.20 Carrier Not Detect Counter Register (CNDCR)

Address(es): ETHERC0.CNDCR 4006 41DCh, ETHERC1.CNDCR 4006 43DCh

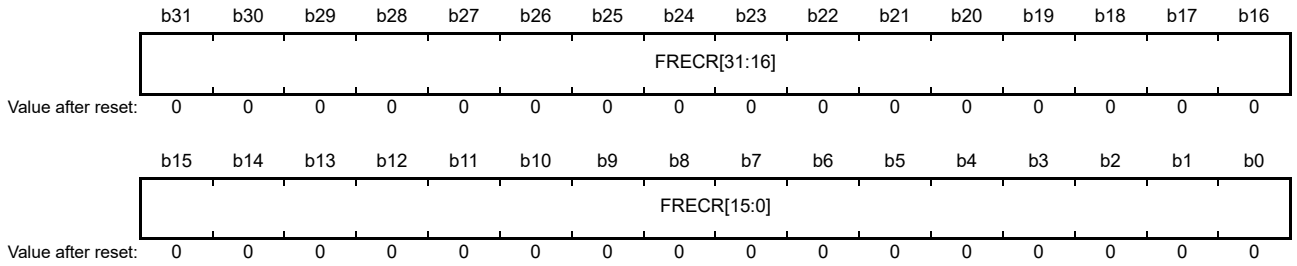


Bit	Symbol	Bit name	Description	R/W
b31 to b0	CNDCR[31:0]	Carrier Not Detect Counter	See the description following this table	R/W

The CNDCR register is a counter that indicates the number of times a carrier is not detected during preamble transmission. When the register value becomes FFFF FFFFh, the counter stops. Writing any value to the CNDCR register clears the counter value to 0.

29.2.21 CRC Error Frame Receive Counter Register (CEFCR)

Address(es): ETHERC0.CEFCR 4006 41E4h, ETHERC1.CEFCR 4006 43E4h

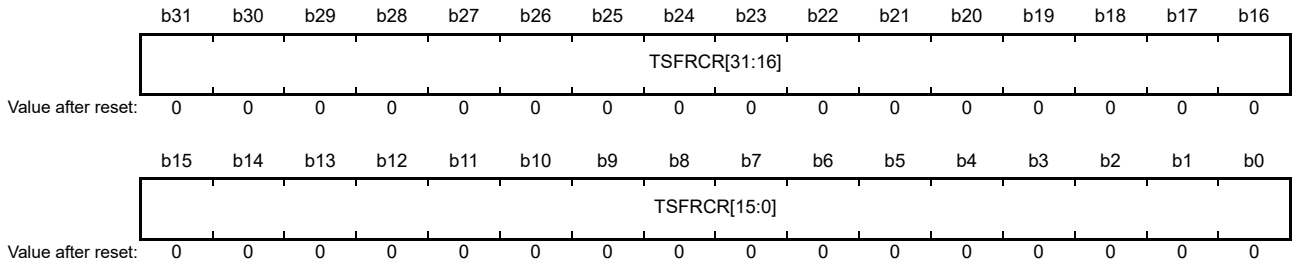


Bit	Symbol	Bit name	Description	R/W
b31 to b0	CEFCR[31:0]	CRC Error Frame Receive Counter	See the description following this table	R/W

The CEFCR register is a counter that indicates the number of received frames where a CRC error was detected. When the register value becomes FFFF FFFFh, the counter stops. Writing any value to the CEFCR register clears the counter value to 0.

29.2.22 Frame Receive Error Counter Register (FRECR)

Address(es): ETHERC0.FRECR 4006 41E8h, ETHERC1.FRECR 4006 43E8h



Bit	Symbol	Bit name	Description	R/W
b31 to b0	FRECR[31:0]	Frame Receive Error Counter	See the description following this table	R/W

The FRECR register is a counter that indicates the number of times a frame receive error has occurred. The PHY-LSI notifies the ETHERC of the frame receive error using the ETn_RX_ER pin. The FRECR register increments each time the ETn_RX_ER pin goes high. When the register value becomes FFFF FFFFh, the counter stops. Writing any value to the FRECR register clears the counter value to 0.

29.2.23 Too-Short Frame Receive Counter Register (TSFRCR)

Address(es): ETHERC0.TSFRCR 4006 41ECh, ETHERC1.TSFRCR 4006 43ECh

Bit	Symbol	Bit name	Description	R/W
b31 to b0	TSFRCR[31:0]	Frame Receive Error Counter	See the description following this table	R/W

The TSFRCR register is a counter that indicates the number of times a short frame that is shorter than 64 bytes was received. When the register value becomes FFFF FFFFh, the counter stops. Writing any value to the TSFRCR register clears the counter value to 0.

29.2.24 Too-Long Frame Receive Counter Register (TLFRCR)

Address(es): ETHERC0.TLFRCR 4006 41F0h, ETHERC1.TLFRCR 4006 43F0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TLFRCR[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TLFRCR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	TLFRCR[31:0]	Too-Long Frame Receive Counter	See the description following this table	R/W

The TLFRCR register is a counter that indicates the number of times a long frame that is longer than the RFLR register value was received. When the register value becomes FFFF FFFFh, the counter stops. Writing any value to the TLFRCR register clears the counter value to 0.

Note: The TLFRCR register does not increment when a frame is received with an alignment error. In this case, the RFCR register increments.

29.2.25 Received Alignment Error Frame Counter Register (RFCR)

Address(es): ETHERC0.RFCR 4006 41F4h, ETHERC1.RFCR 4006 43F4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RFCR[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RFCR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	RFCR[31:0]	Received Alignment Error Frame Counter	See the description following this table	R/W

The RFCR register is a counter that indicates the number of times a frame was received with an alignment error, meaning that it is not an integral number of octets. When the register value becomes FFFF FFFFh, the counter stops. Writing any value to the RFCR register clears the counter value to 0.

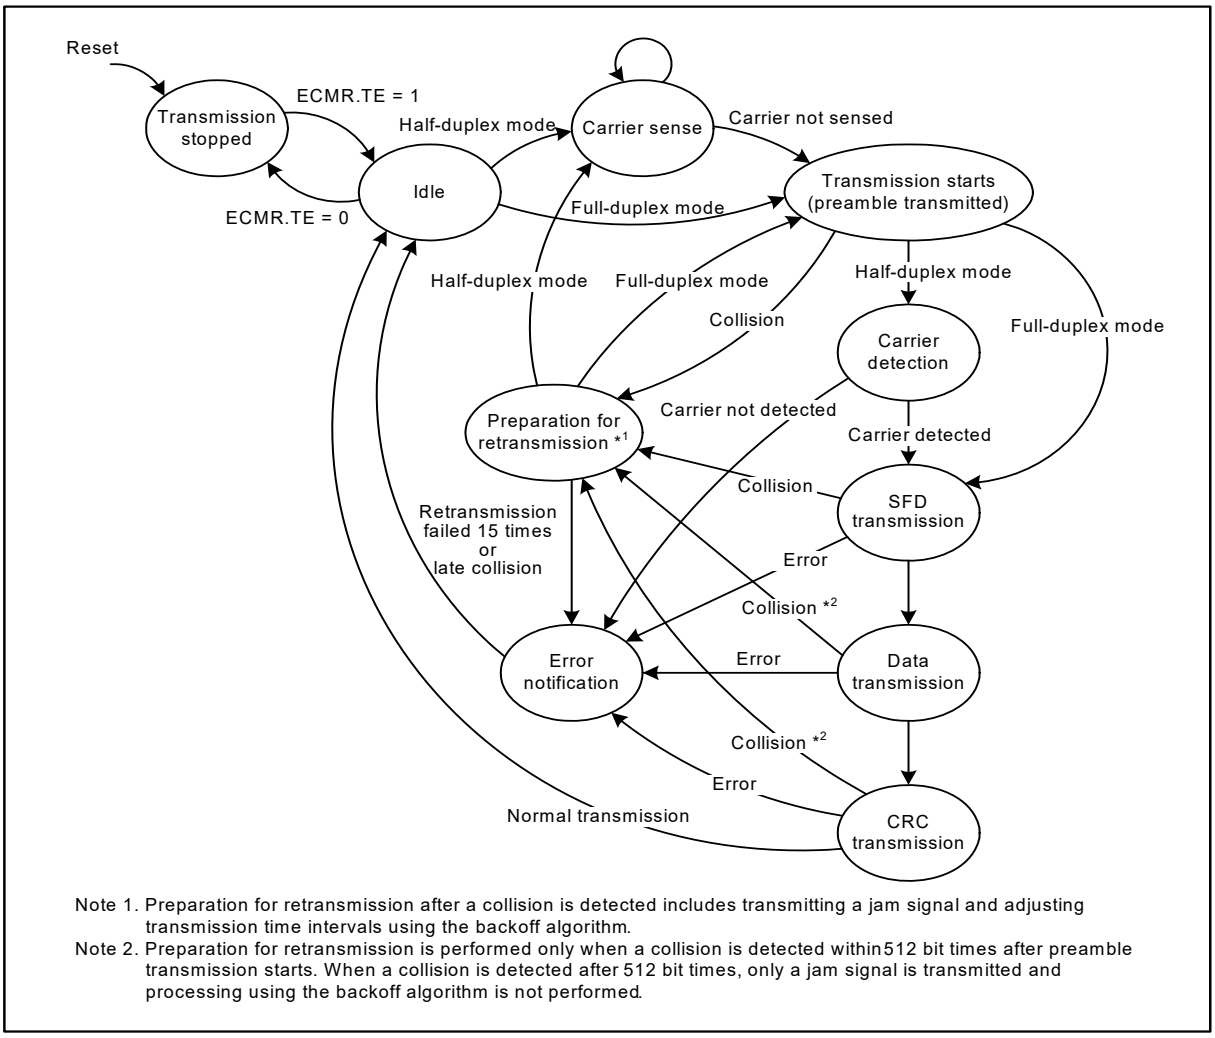
29.2.26 Multicast Address Frame Receive Counter Register (MAFCR)

Address(es): ETHERC0.MAFCR 4006 41F8h, ETHERC1.MAFCR 4006 43F8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MAFCR[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MAFCR[16:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	MAFCR[31:0]	Multicast Address Frame Receive Counter	See the description following this table	R/W



The MAFCR register is a counter that indicates the number of times a frame with the multicast address set was received. When the register value becomes FFFF FFFFh, the counter stops. Writing any value to the MAFCR register clears the counter value to 0.

29.3 Operation

This section provides an overview of the ETHERC operations. The ETHERC supports flow control compliant with IEEE802.3x, and can transmit and receive PAUSE frames.

29.3.1 Transmission

The ETHERC transmitter assembles transmit data into a frame and outputs it to the MII or RMII when a transmit request is received from the EDMAC. The frame transmitted through the MII or RMII is transmitted on the line by the PHY-LSI. Figure 29.4 shows the state transitions of the ETHERC transmitter.

Note 1. Preparation for retransmission after a collision is detected includes transmitting a jam signal and adjusting transmission time intervals using the backoff algorithm.
Note 2. Preparation for retransmission is performed only when a collision is detected within 512 bit times after preamble transmission starts. When a collision is detected after 512 bit times, only a jam signal is transmitted and processing using the backoff algorithm is not performed.

Figure 29.4 ETHERC transmitter state transitions

The ETHERC transmitter state transitions are as follows:

1. When the ECMR.TE bit is set to 1, the ETHERC enters the transmit idle state.
2. When a transmit request is received from the EDMAC, the ETHERC enters the carrier sense state. The ETHERC waits for the interpacket gap and then transmits a preamble to the MII or RMII. When full-duplex mode is selected, carrier sensing is not required, so the ETHERC transmits a preamble immediately after receiving a transmit request from the EDMAC.
3. The ETHERC transmits the Start Frame Delimiter (SFD), transmit data, and CRC sequentially. When the transmission completes successfully, the ETHERC notifies the EDMAC of successful completion, and the EDMAC sets the EDMACn.EESR.TC flag to 1. When a late collision or loss of carrier is detected during data transmission, the ETHERC stops the transmission and notifies the EDMAC of the error.
4. After the time specified as the interpacket gap elapses, the ETHERC enters the idle state and continues transmission when transmit data remains.

29.3.2 Reception

The ETHERC receiver separates the frame input from the MII or RMII into the preamble, SFD, receive data, and CRC, and transmits only the receive data (destination address, source address, type/length, data/LLC). Figure 29.5 shows the state transitions of the ETHERC receiver.

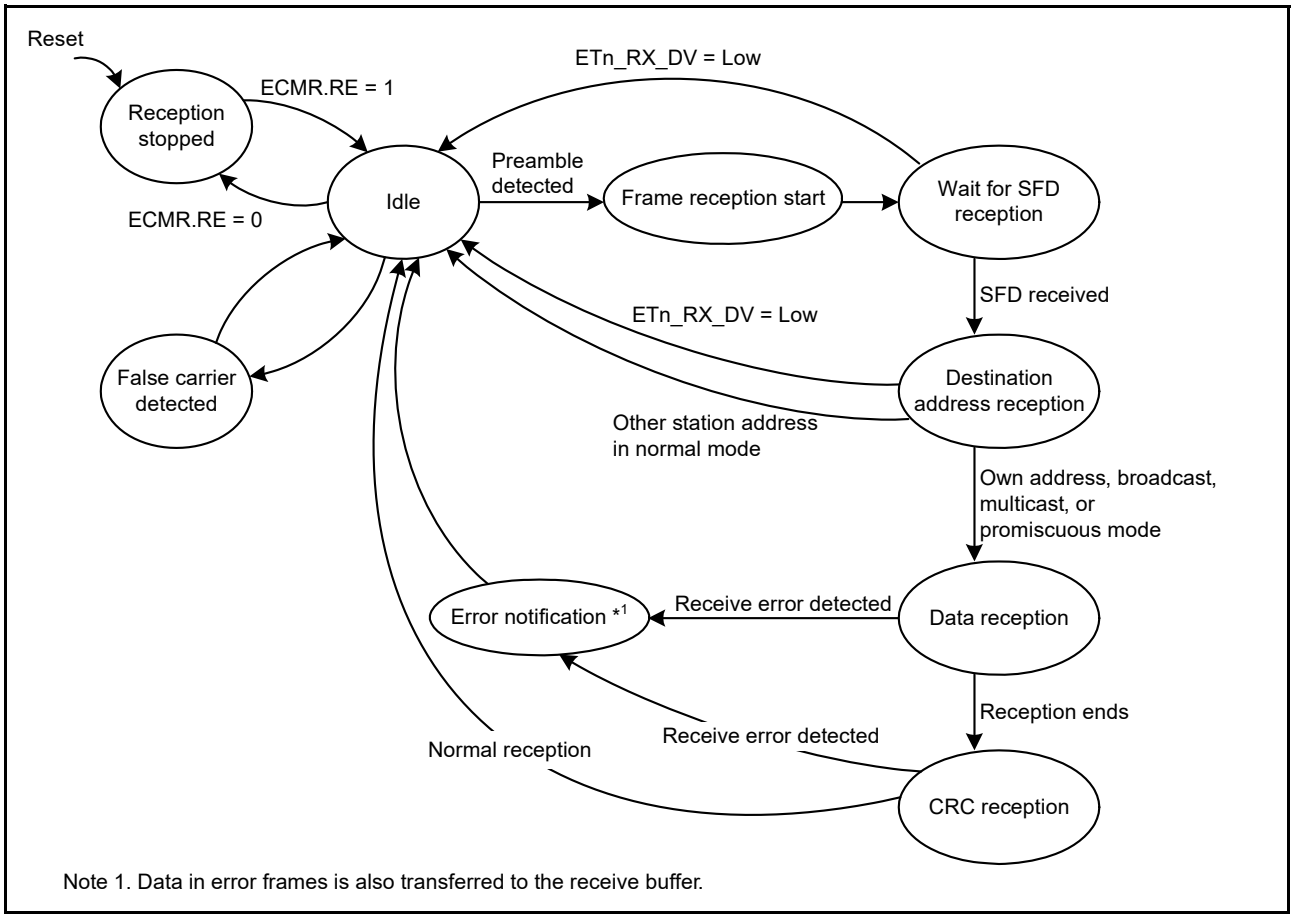


Figure 29.5 ETHERC receiver state transitions

The ETHERC receiver state transitions are as follows:

1. When the ECMR.RE bit is set to 1, the ETHERC enters the receive idle state.
2. When the SFD following the preamble of the receive packet is detected, the ETHERC starts reception. If the received SFD is invalid, the ETHERC discards the frame.
3. In normal mode, the ETHERC starts data reception when the destination address of the receive frame is the address of the MCU or the receive frame is a broadcast or multicast frame. In promiscuous mode, the ETHERC starts data reception regardless of the receive frame type.
4. After receiving data from the MII or RMII, the ETHERC performs a CRC check. The ETHERC notifies the EDMAC of the CRC check result. After the received data is transferred to the receive buffer, the CRC check result is written back to the receive descriptor as status. The result is also reflected in the EDMACn.EESR.CERF flag.
5. When the ECMR.RE bit is 1 after one frame is received, the ETHERC prepares to receive the next frame.

29.3.3 Frame Timing

29.3.3.1 MII Frame Timing

Figure 29.6 to Figure 29.11 show the MII frame timing.

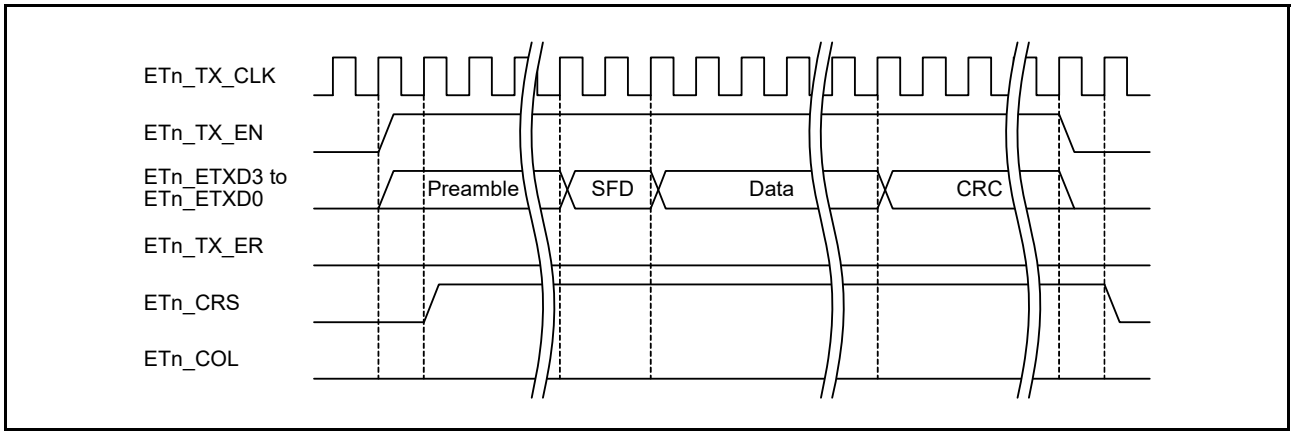

Figure 29.6 MII frame transmit timing during normal transmission

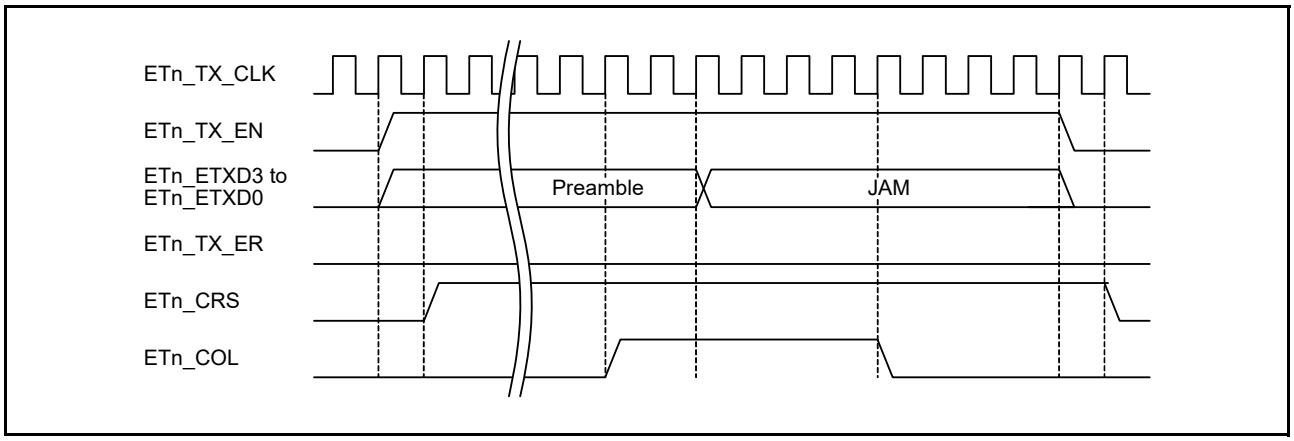

Figure 29.7 MII frame transmit timing when a collision occurs

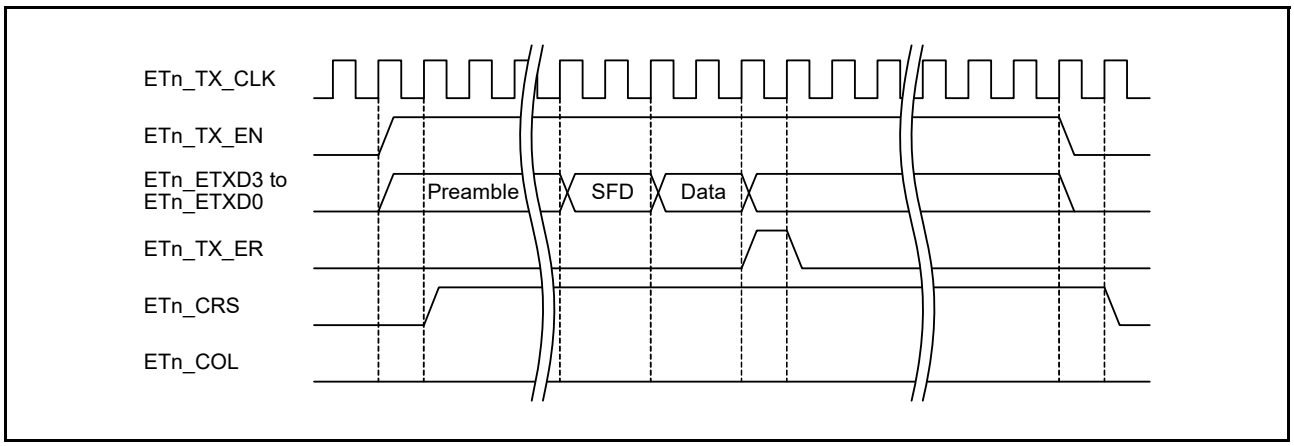

Figure 29.8 MII frame transmit timing when a transmit error occurs

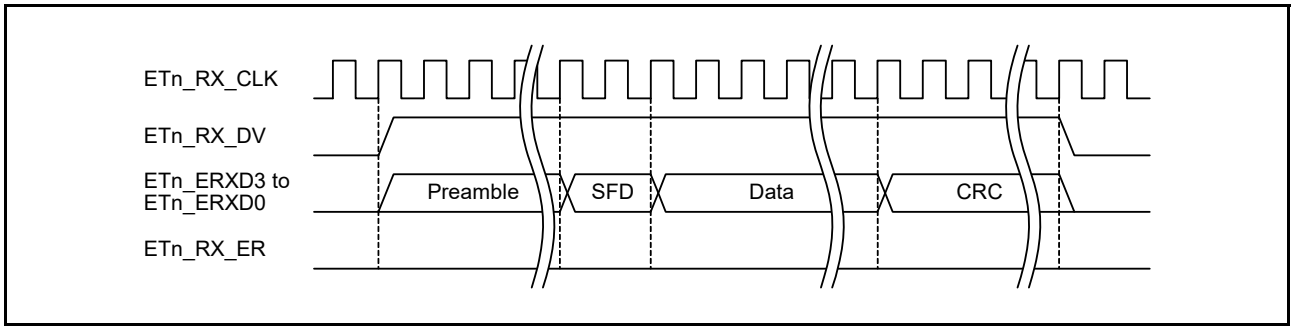

Figure 29.9 MII frame receive timing during normal reception

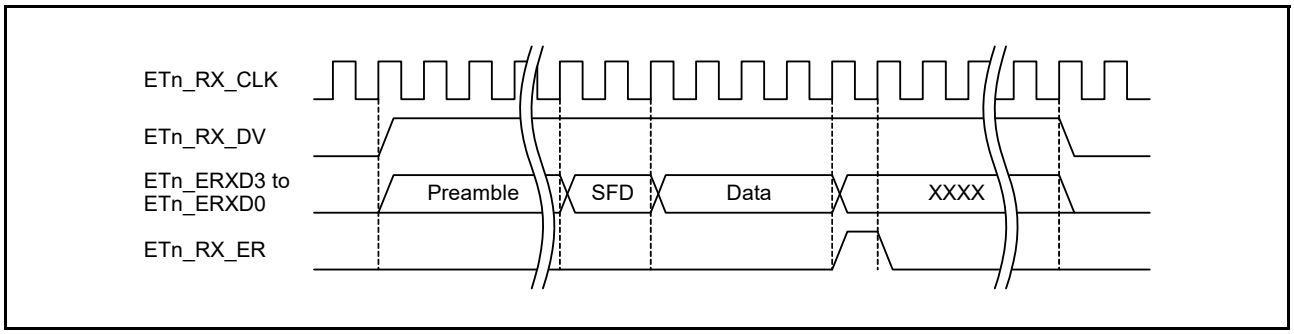

Figure 29.10 MII frame receive timing for receive error notification

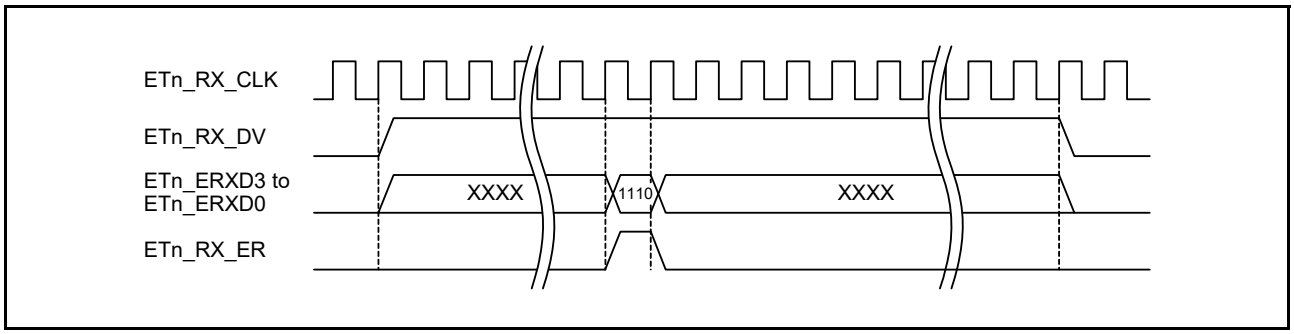

Figure 29.11 MII frame receive timing for false carrier notification

29.3.3.2 RMII Frame Timing

Figure 29.12 to Figure 29.14 show the RMII frame timing.

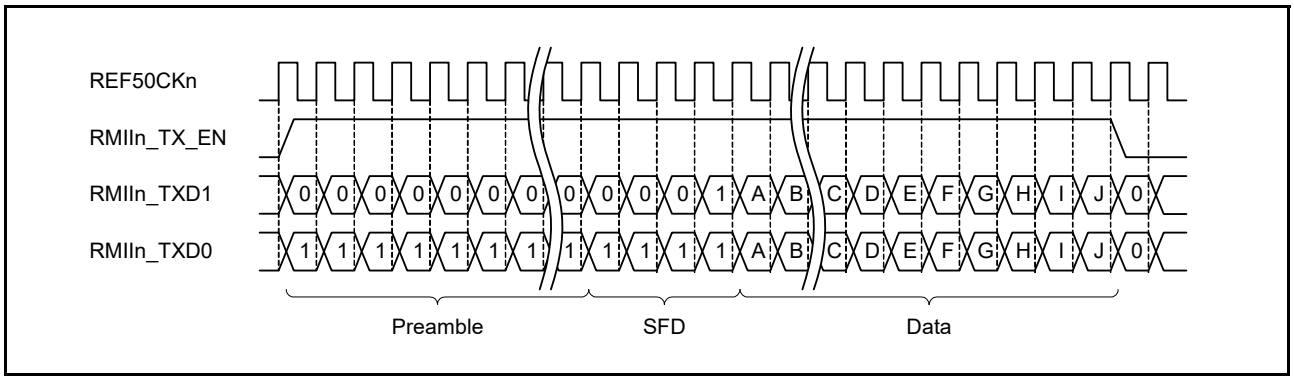

Figure 29.12 RMII frame transmit timing during normal transmission

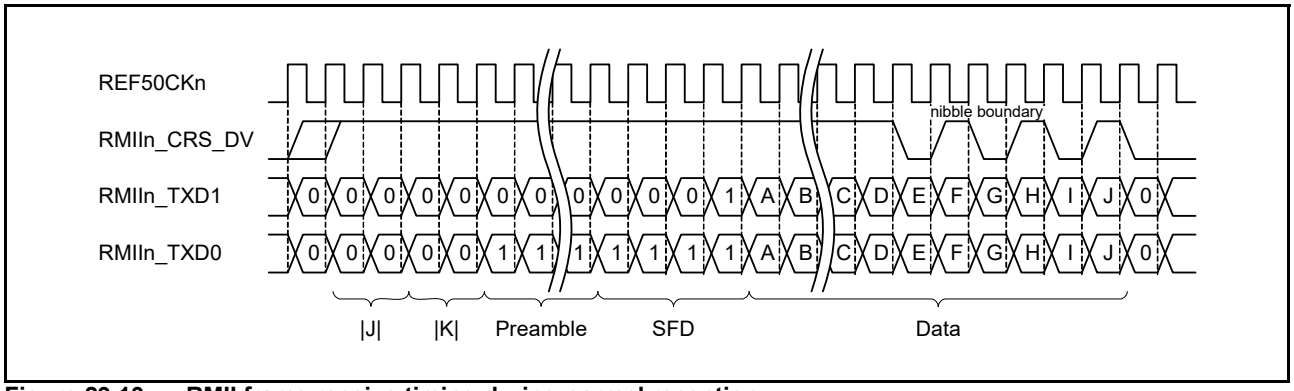

Figure 29.13 RMII frame receive timing during normal reception

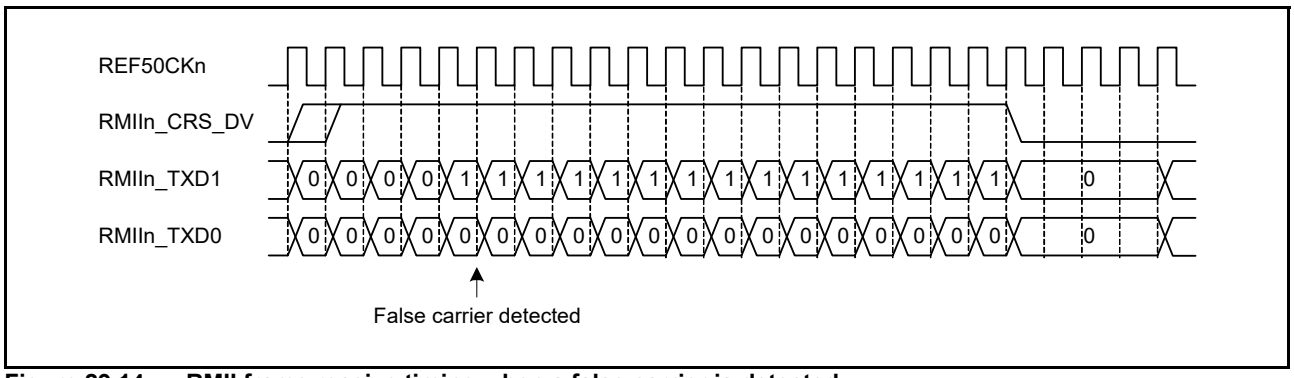

Figure 29.14 RMII frame receive timing when a false carrier is detected

29.3.4 Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ETn_MDC and ETn_MDIO pins controlled by software.

29.3.4.1 MII and RMII Management Frame Format

Table 29.3 lists the MII and RMII management frame formats.

Table 29.3 MII and RMII management frame formats

Access type		MII and RMII management frame							
	Parameter	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
	Number of bits	32	2	2	5	5	2	16	1
Read		1...1	01	10	00001	RRRRR	Z0	DDDDDDDDDDDDDDDD	Z
Write		1...1	01	01	00001	RRRRR	10	DDDDDDDDDDDDDDDD	Z

Note: PRE (preamble): Send 32 consecutive 1s.
ST (start of frame): Send 01b.
OP (operation code): Send 10b for read or 01b for write.
PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.
REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.
TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation. Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output). (This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)
DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.
IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write operation (Z is output). No control is required, because a bus was already released during a read operation.

29.3.4.2 MII and RMII Register Access Procedure

Access to the MII and RMII registers includes writing data in 1-bit units, reading data in 1-bit units, and releasing the bus. Figure 29.15 to Figure 29.18 show examples of the MII and RMII register access timing. The access timing differs with the PHY-LSI type.

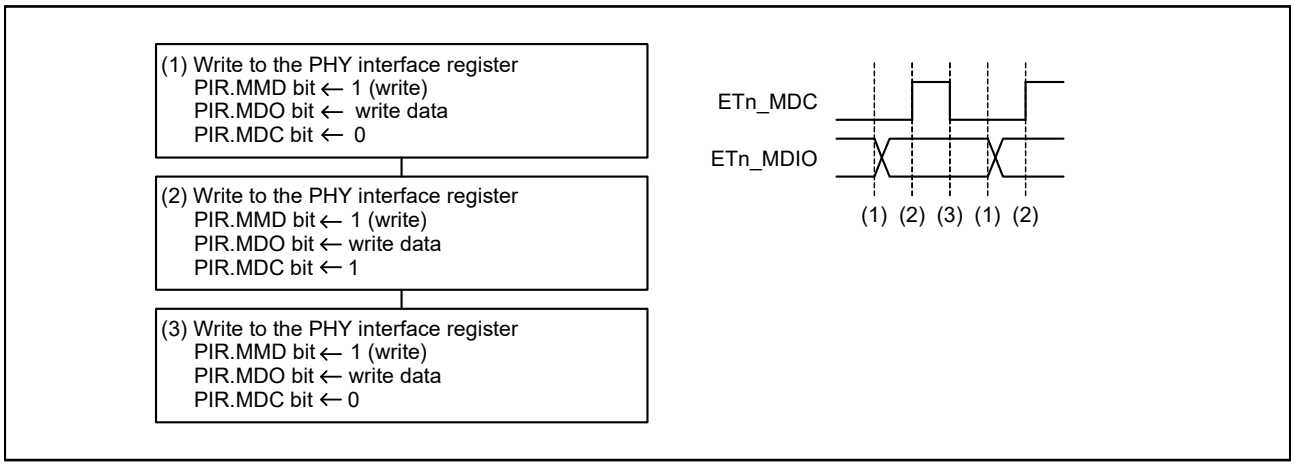

Figure 29.15 1-bit data write flow

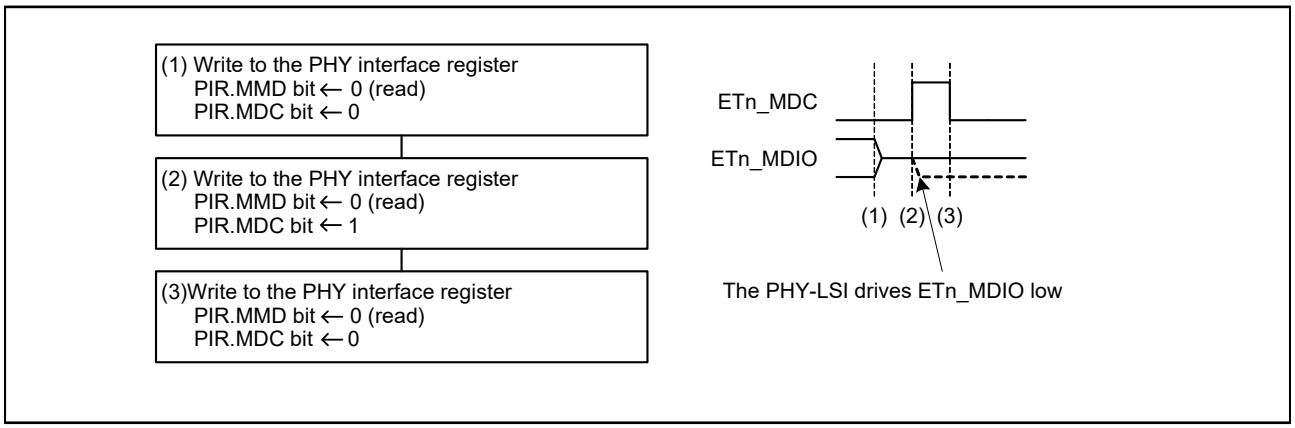

Figure 29.16 Bus release flow, with TA in read operation in Table 29.3

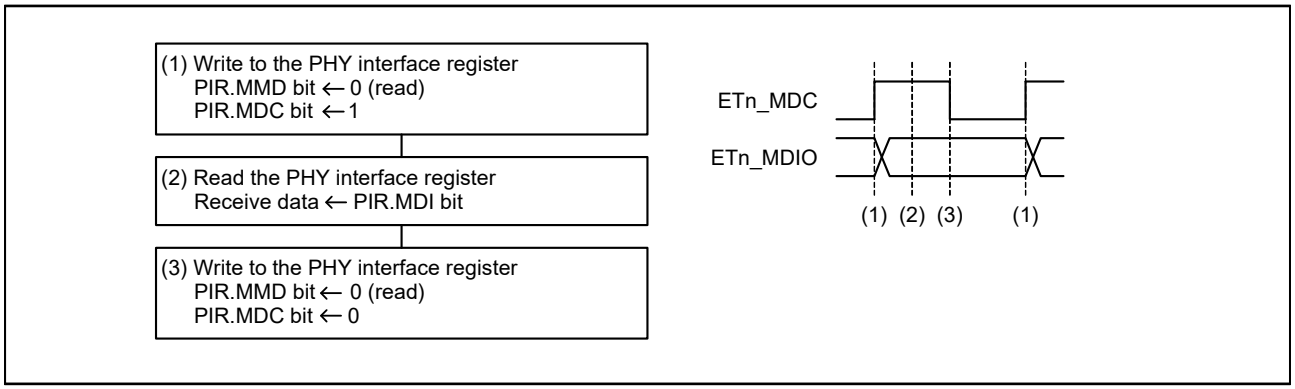

Figure 29.17 1-bit data read flow

Figure 29.18 Bus release flow, with IDLE in write operation in Table 29.3

29.3.5 Magic Packet Detection

The ETHERC supports Wake-on-LAN (WOL). WOL is a function to detect a Magic Packet transmitted from a host device or other device and wake the MCU from a low power mode such as Sleep. When the ETHERC detects a Magic Packet, it outputs high on the ETn_WOL pin. Write 1 to the EDMACn.EDMR.SWR bit to drive the ETn_WOL pin low.

Because a Magic Packet is transmitted in broadcast mode, it is received regardless of the destination MAC address selected in the format. The ETHERC outputs high on the ETn_WOL pin only when the destination MAC address matches its own MAC address. See the technical documentation provided by Advanced Micro Devices, Inc., for details on the Magic Packet.

To use WOL in the MCU, use the procedure in the following example:

1. Configure the ICU to disable ETHER_EINTn interrupt requests.
2. Set the ECMR.MPDE bit to 1 to enable Magic Packet detection, and set the ECMR.RE bit to 1 to enable reception.
3. Set the ECSIPR.MPDIP bit to 1 to enable notification of Magic Packet detection interrupts.
4. Set the EDMACn.EESIPR.ECIIP bit to 1 to enable ETHERC status register source interrupts.
5. Configure the ICU to enable ETHER_EINTn interrupt requests.
6. Change the CPU operating mode to Sleep mode or place unused peripherals in the module-stop state, as required.
7. When a Magic Packet is detected, an interrupt request is sent to the CPU. high is output on the ETn_WOL pin to notify peripheral devices that the Magic Packet was detected.

29.3.5.1 Restrictions on Magic Packet Detection

The ETHERC receives packets, including broadcast packets, even when waiting to receive a Magic Packet. This means that receive data might already be stored in the receive FIFO of the EDMAC when a Magic Packet is detected. Also, flags in the ECSR and EDMACn.EESR registers might have changed. When returning to normal operation after detecting a Magic Packet, set the EDMACn.EDMR.SWR bit to 1 to reset the ETHERC and EDMAC.

29.3.6 Adjusting Transmission Efficiency by Changing the IPG

The IPG is a non-transmit period between transmit frames. The ETHERC can change the value of the IPG to increase or decrease transmission efficiency based on the value set in the IPGR register. Typical values are specified in the IEEE802.3 standard. When changing the setting, confirm that all devices in the same network operate normally.

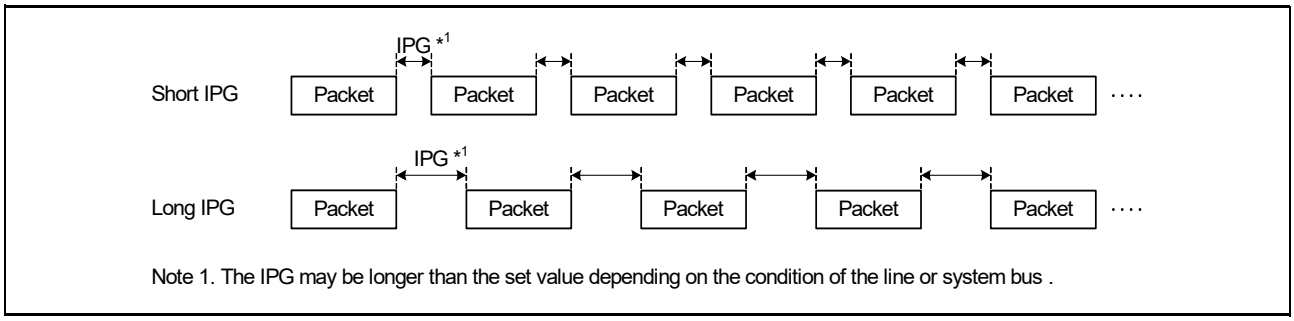

Figure 29.19 Differences in transmission efficiency based on changes in the IPG

29.3.7 Flow Control

The ETHERC can perform flow control compliant with IEEE802.3x in full-duplex mode, and the receiver and transmitter can be set independently. PAUSE frames can be transmitted automatically or manually.

29.3.7.1 Automatic PAUSE Frame Transmission

When the ECMR.TXF bit is set to 1, automatic PAUSE frame transmission is enabled. A PAUSE frame is automatically transmitted by a PAUSE frame transmit request from the EDMAC. The APR.AP[15:0] bit value is used for the pause_time parameter of the PAUSE frame.

When a PAUSE frame is transmitted, if the EDMAC is still requesting PAUSE frame transmission after the PAUSE time elapses, a PAUSE frame is transmitted again. The maximum number of PAUSE frame retransmissions can be set in the TPAUSER.TPAUSE[15:0] bits. If the maximum number of retransmissions is reached, subsequent PAUSE frames are not transmitted.

Figure 29.20 shows the procedure for setting up automatic PAUSE frame transmission.

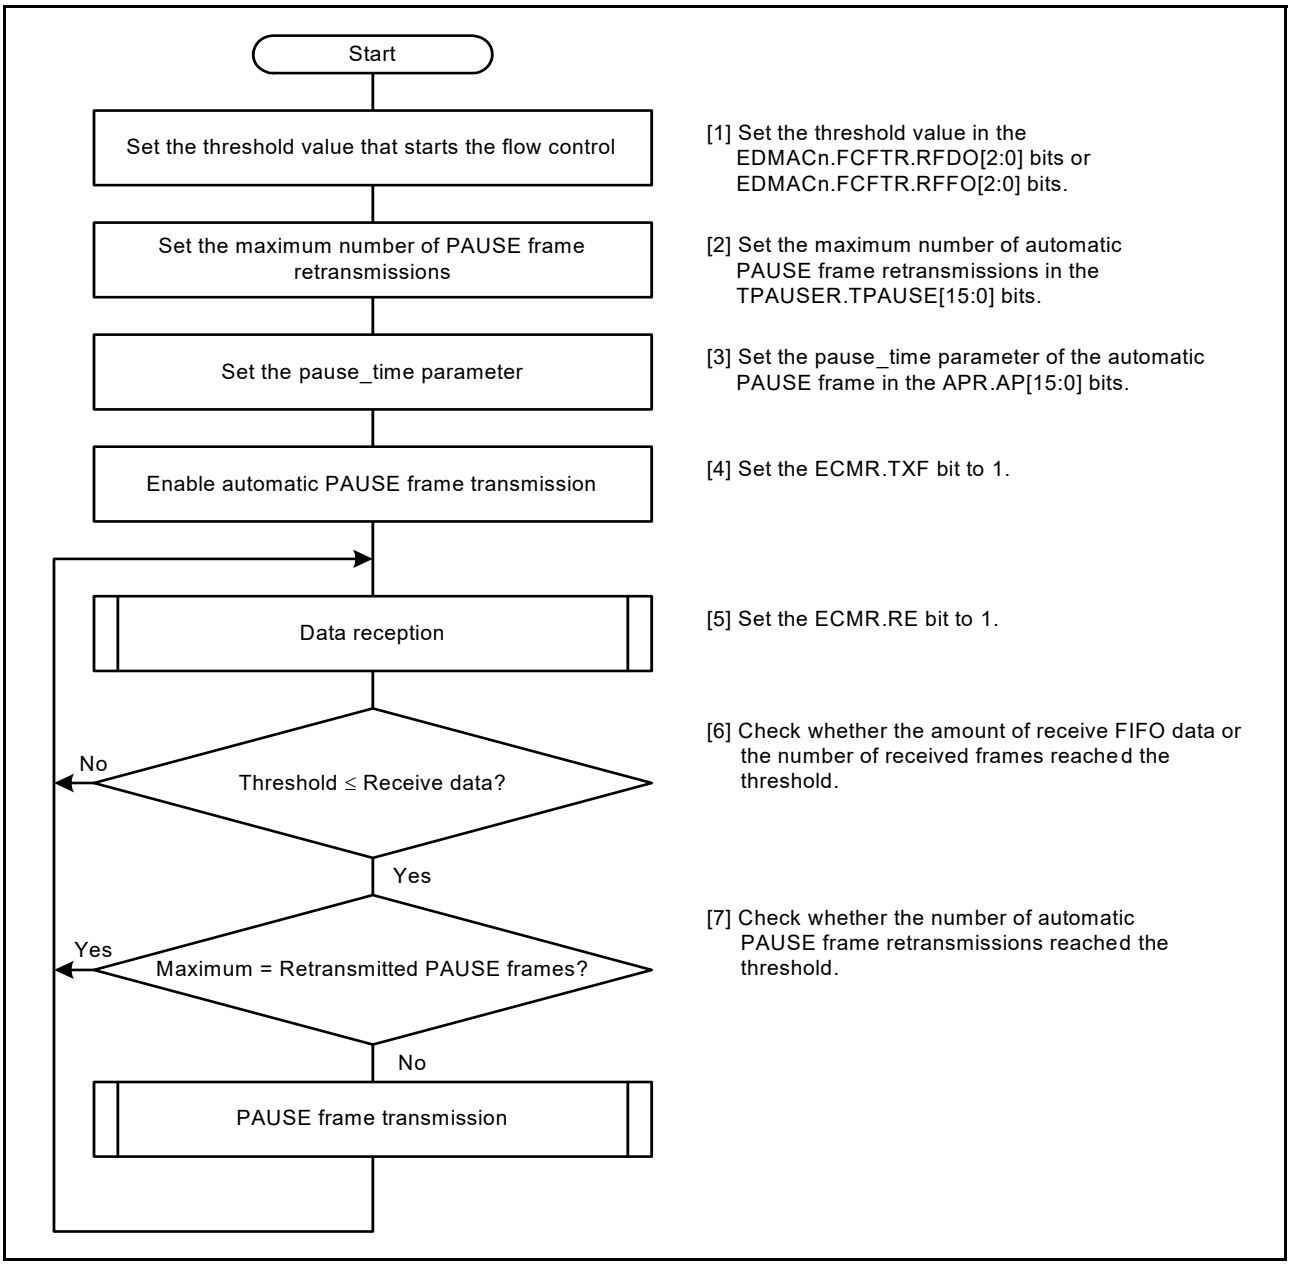

Figure 29.20 Example procedure for setting up automatic PAUSE frame transmission

29.3.7.2 Manual PAUSE Frame Transmission

A PAUSE frame can be manually transmitted at any time. When the software writes the pause_time parameter of the PAUSE frame to the MPR.MP[15:0] bits, the ETHERC transmits a PAUSE frame once. To transmit a PAUSE frame more than once, write to the MPR.MP[15:0] bits for each transmission.

29.3.7.3 PAUSE Frame Reception

When the ECMR.RXF bit is set to 1, PAUSE frame detection is enabled. After a PAUSE frame is received, the ETHERC completes transmission of the current frame and waits for the PAUSE time of the received PAUSE frame to elapse before it can transmit the next frame. The ETHERC also increments the RFCF.RPAUSE[7:0] bit value.

However, while waiting for the PAUSE time to elapse, if a PAUSE frame that contains a pause_time parameter of 0 is received and the ECMR.ZPF bit is 1, the ETHERC becomes ready to transmit immediately.

29.4 Interrupts

When a flag in the ECSR register is set to 1 and the associated bit in the ECSIPR register is 1, the ETHERC notifies the EDMAC of the interrupt source status. After receiving the notification, the EDMAC sets the EDMACn.EESR.ECI flag to 1. When the EDMACn.EESIPR.ECIIP bit is 1, the EDMAC sends an ETHER_EINTn interrupt request to the CPU. For details, see section 31, Ethernet DMA Controller (EDMAC).

29.5 Usage Notes

29.5.1 Preventing the LCHNG Flag from Erroneously Setting to 1

The ECSR.LCHNG flag might set to 1 even when the input level of the ETn_LINKSTA pin remains the same. If this occurs, high is input to the ETn_LINKSTA pin when setting the MPC.PmnPFS register to assign the ETn_LINKSTA signal to a port or when releasing the ETHERC and EDMAC software reset using the EDMACn.EDMR.SWR bit. The ECSR.LCHNG flag is set to 1 because the ETn_LINKSTA signal in the ETHERC is fixed low regardless of the input level to the external pin if the MPC does not assign the ETn_LINKSTA signal or during an ETHERC and EDMAC software reset.

To avoid erroneously generating a link signal change interrupt, clear the ECSR.LCHNG flag, and then set the ECSIPR.LCHNGIP bit to 1.

29.5.2 Input to RMIIn_RX_ER Pin While RMII Is Selected

When the width of a reception error signal received from the PHY-LSI is only one cycle of the REF50CKn clock (50 MHz) while the RMII is selected, the signal is not recognized as an error signal.

30. Ethernet PTP Controller (EPTPC)

30.1 Overview

The MCU provides an on-chip Precision Time Protocol (PTP) module for the Ethernet Controller (EPTPC). The EPTPC applies the PTP as defined in version 2 of the IEEE 1588-2008 standard to handle timing and synchronization between devices. The EPTPC is composed of Synchronization Frame Processing units (SYNFP0 and SYNFP1), a Packet Relation Controller unit (PRC-TC), and a Statistical Time Correction Algorithm unit (STCA).

The EPTPC is used in combination with the on-chip Ethernet Controller (ETHERC) and the DMA Controller for the PTP Ethernet Controller (PTPEDMAC). When the EPTPC is not used, you can bypass it by setting the bypass registers in the EPTPC. See section 30.2.86, Bypass 1588 Module Register (BYPASS).

Table 30.1 lists the EPTPC specifications. Figure 30.1 shows the EPTPC configuration.

Table 30.1 EPTPC specifications

Parameter	Specifications
Protocol	Compliant with the Precision Time Protocol (PTP) defined in IEEE 1588
Synchronization Frame Processing units (SYNFP0 and SYNFP1)	• Transmission and reception of PTP messages as a master or slave • Support for multiple clock devices: - Ordinary clock (OC) - Boundary clock (BC) - Transparent clock (TC) • Support for end-to-end (E2E) and peer-to-peer (P2P) master/slave operation • Calculation of meanPathDelay and offsetFromMaster as defined in IEEE 1588 • Capable of generating a master clock • Hardware filtering of received multicast packets with a MAC address • Capable of hardware filtering with the type of PTP message • Support for PTP message frames in layer 4 (IPv4 and UDP) and layer 2 (Ethernet frames) • Can be used as a normal Ethernet port when time synchronization is not in use.
Packet Relation Controller unit (PRC-TC)	• Relaying of received data between Ethernet ports 0 and 1 • Transmission of data from both or only one of Ethernet ports 0 and 1 configurable by setting the same MAC address in the ports • Store-and-forward method or cut-through method selectable for packet relaying.
Statistical Time Correction Algorithm unit (STCA)	• Frequency of the clock supplied to the statistical time correction algorithm unit is selectable as 20, 25, 50, or 100 MHz • In slave operation, the synchronized state can be indicated by the offsetFromMaster value staying below a threshold specified in advance or calculated statistically from collected positive and negative gradient values (worst-10 acquisition) • Local clock counter holds corrected time information obtained from a master clock • STCA clock can be used as the clock source for generating pulse signals from pulse output timer m (m = 0 to 5) • Peripheral modules such as GPT can be started or stopped on the edge of pulses synchronized with the master clock in response to interrupt requests by the pulse output timer or the output of event signals to the ELC
Interrupt sources	ETHER_MINT interrupt: • Requested when the state of the individual modules is changed • Requested on rising edges of the pulse signal generated by the pulse output timer. ETHER_IPLS interrupt: • Requested on rising or falling edges of the pulse signal generated by the previously selected pulse output timer group • Can be requested on every edge or only once.
Event linking	• Event signal is output to the ELC on a rising edge or falling edge of the pulse signal generated by the pulse output timer • Event signal can be output on every edge or only once.

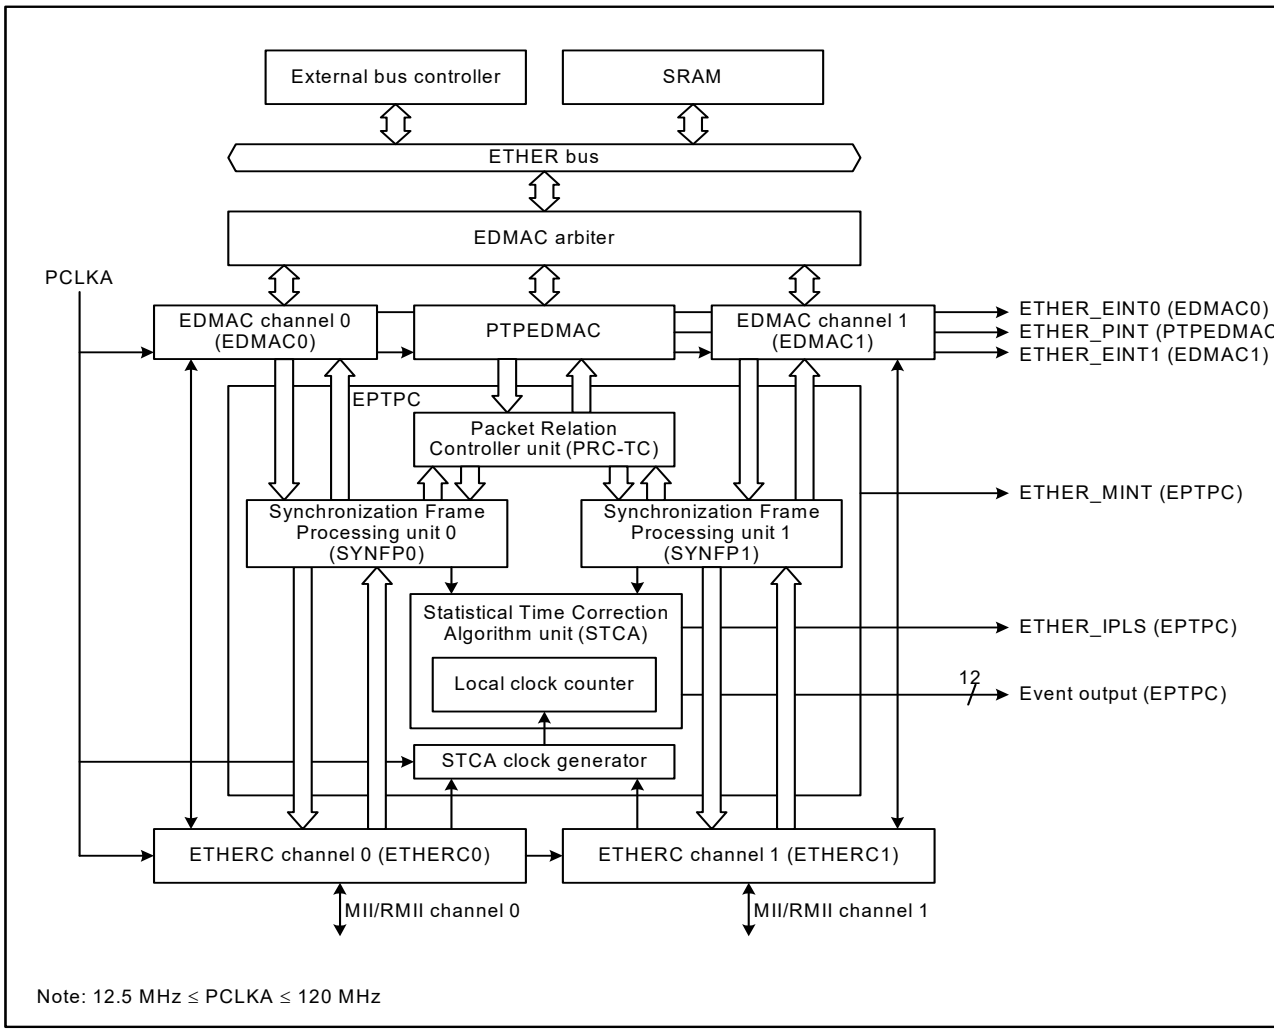

Figure 30.1 EPTPC configuration

In this section, individual channels might not be mentioned in the overall descriptions of modules that have multiple channels. Table 30.2 lists examples of the notation.

Table 30.2 Notation examples

Module name	Channel	Meaning
SYNFPn module	n = 0, 1	Synchronization Frame Processing units 0 and 1 (SYNFP0 and SYNFP1)
Pulse output timer m	m = 0 to 5	Pulse output timer channels 0 to 5

30.1.1 Combination of Clock Device and Ethernet Port

The EPTPC supports operation as three types of clock devices:

- Ordinary clock (OC)
- Boundary clock (BC)
- Transparent clock (TC).

In addition, it supports both end-to-end (E2E) and peer-to-peer (P2P) operation for all three clock devices. Table 30.3 lists the available combinations for usage of Ethernet ports 0 and 1.

Table 30.3 Combination of clock devices and Ethernet ports

Clock device	Ethernet port 0		Ethernet port 1	
No control by EPTPC	PTP packets are not handled.			
Ordinary clock (OC) Only Ethernet port 0 is used for handling PTP packets	Master	End-to-end (E2E)	PTP packets are not handled	
		Peer-to-peer (P2P)		
	Slave	E2E		
		P2P		
Ordinary clock (OC) Only Ethernet port 1 is used for handling PTP packets	PTP packets are not handled		Master	E2E
				P2P
			Slave	E2E
				P2P
Boundary clock (BC)	Master	E2E	Master	E2E
		E2E		P2P
		P2P		E2E
		P2P		P2P
	Master	E2E	Slave	E2E
		E2E		P2P
		P2P		E2E
		P2P		P2P
	Slave	E2E	Master	E2E
		E2E		P2P
		P2P		E2E
		P2P		P2P
Transparent clock (TC)	E2E TC			
	P2P TC			

30.1.2 Frame Format of PTP Messages

The frame format of PTP messages can be selected by setting the FORM0 and FORM1 bits in the SYNFP Frame Format Setting Register (SYFORMR). Figure 30.2 shows the PTP message formats for transmission and reception by the EPTPC.

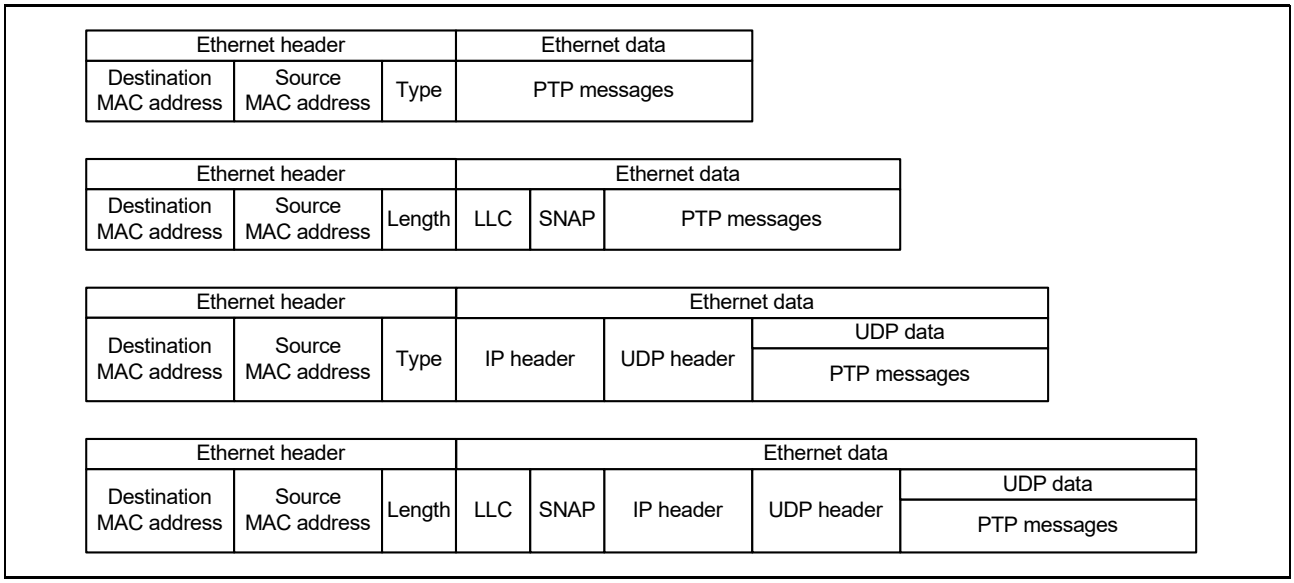

Figure 30.2 Frame format of PTP messages

The EPTPC module is capable of transmitting PTP messages. When the EPTPC sends a PTP message, multicast addresses as defined in IEEE 1588 are normally specified as the destination MAC address and IP address, depending on the type of PTP message to be sent. In addition, when a PTP message is encapsulated for use with UDP, the port number must also be specified in accordance with the message type, as stipulated in IEEE 1588.

Table 30.4 provides a summary of the information required to specify the Ethernet frame format for PTP messages.

Table 30.4 PTP message types for multicast and information for specifying the Ethernet frame format

PTP message type			IEEE802.3 frame format (SYFORMR.FORM0 bit = 1)		Ethernet II frame format (SYFORMR.FORM0 bit = 0)		UDP port no.*1
			MAC address	IP address	MAC address	Ethertype	
PTP-primary	Event messages	Sync	01-00-5E-00-01-81	224.0.1.129	01-1B-19-00-00-00	88F7h	319
		Delay_Req					
PTP-pdelay		Pdelay_Req	01-00-5E-00-00-6B	224.0.0.107	01-80-C2-00-00-0E		
		Pdelay_Resp					
	General messages	Pdelay_Resp_Follow_Up					320
PTP-primary		Announce	01-00-5E-00-01-81	224.0.1.129	01-1B-19-00-00-00		
		Follow_Up					
		Delay_Resp					
		Signaling					
		Management					

Note 1. The port number must be specified only when a PTP message is encapsulated for use with UDP, when the SYFORMR.FORM1 bit = 1.

30.1.3 PTP Message Type and Processing Details

Table 30.5 and Table 30.6 give details on EPTPC processing for receiving and transmitting PTP messages.

Table 30.5 Processing of PTP messages received by the EPTPC

Message type	Message	The EPTPC...
Event	Sync	Calculates the value of offsetFromMaster if twoStepFlag in flagField is FALSE
	Delay_Req	Responds to Delay_Resp
	Pdelay_Req	Responds to Pdelay_Resp
	Pdelay_Resp	Calculates the value of meanPathDelay if twoStepFlag in flagField is FALSE
General	Announce	—
	Follow_Up	Calculates the value of offsetFromMaster if twoStepFlag in flagField of the most recently received Sync message was TRUE and the value of meanPathDelay is fixed
	Delay_Resp	Calculates the value of meanPathDelay
	Pdelay_Resp_Follow_Up	Calculates the value of meanPathDelay if twoStepFlag in flagField of the most recently received Pdelay_Resp message was TRUE
	Management	—
	Signaling	—

Table 30.6 Processing of PTP messages to be transmitted by the EPTPC

Message type	Message	The EPTPC...
Event	Sync	Transmits sync messages at the fixed interval specified in the SYTLIR.SYNC[7:0] bits
	Delay_Req	Proceeds with transmission with an interval from 0 to twice the interval set in the SYTLIR.DREQ[7:0] bits and determined by a random number
	Pdelay_Req	Transmits Pdelay_Req messages at the fixed interval specified in the SYTLIR.DREQ[7:0] bits
	Pdelay_Resp	Transmits responses to Pdelay_Req
General	Announce	Transmits Announce messages at the fixed interval specified in the SYTLIR.ANCE[7:0] bits
	Follow_Up	—
	Delay_Resp	Transmits responses to Delay_Req
	Pdelay_Resp_Follow_Up	—
	Management	—
	Signaling	—

30.2 Register Descriptions

30.2.1 ETHER_MINT Interrupt Source Status Register (MIESR)

Address(es): EPTPC.MIESR 4006 5000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	CYC5	CYC4	CYC3	CYC2	CYC1	CYC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	PRC	SY1	SY0	ST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ST	STCA Status Flag	0: No change in the state of the STCA module 1: Change in the state of the STCA module.	R
b1	SY0	SYNFP0 Status Flag	0: No change in the state of the SYNFP0 module 1: Change in the state of the SYNFP0 module.	R
b2	SY1	SYNFP1 Status Flag	0: No change in the state of the SYNFP1 module 1: Change in the state of the SYNFP1 module.	R
b3	PRC	PRC-TC Status Flag	0: No change in the state of the PRC-TC module 1: Change in the state of the PRC-TC module.	R
b15 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	CYC0	Pulse Output Timer 0 Rising Edge Detection Flag	0: Rising edge not detected on the periodic pulse signal from pulse output timer 0 1: Rising edge detected on the periodic pulse signal from pulse output timer 0.	R/W*1
b17	CYC1	Pulse Output Timer 1 Rising Edge Detection Flag	0: Rising edge not detected on the periodic pulse signal from pulse output timer 1 1: Rising edge detected on the periodic pulse signal from pulse output timer 1.	R/W*1

Bit	Symbol	Bit name	Description	R/W
b18	CYC2	Pulse Output Timer 2 Rising Edge Detection Flag	0: Rising edge not detected on the periodic pulse signal from pulse output timer 2 1: Rising edge detected on the periodic pulse signal from pulse output timer 2.	R/W*1
b19	CYC3	Pulse Output Timer 3 Rising Edge Detection Flag	0: Rising edge not detected on the periodic pulse signal from pulse output timer 3 1: Rising edge detected on the periodic pulse signal from pulse output timer 3.	R/W*1
b20	CYC4	Pulse Output Timer 4 Rising Edge Detection Flag	0: Rising edge not detected on the periodic pulse signal from pulse output timer 4 1: Rising edge detected on the periodic pulse signal from pulse output timer 4.	R/W*1
b21	CYC5	Pulse Output Timer 5 Rising Edge Detection Flag	0: Rising edge not detected on the periodic pulse signal from pulse output timer 5 1: Rising edge detected on the periodic pulse signal from pulse output timer 5.	R/W*1
b31 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing 1 clears the flag. Writing 0 does not affect the flag value.

The MIESR register indicates changes in the states of the STCA, SYNFPn, and PRC-TC modules, which act as ETHER_MINT interrupt sources, and indicates the detection of rising edges on pulse output timers m (m = 0 to 5). For more information about the ETHER_MINT interrupt, see section 30.4, Interrupts.

ST flag (STCA Status Flag)

The ST flag indicates changes in the state of the STCA module.

[Setting condition]

- A change in the state of a flag in the STSR register for which notification is enabled in the STIPR register.

[Clearing conditions]

When any of the following conditions is met:

- All flags in the STSR register are 0
- All bits in the STIPR register are 0
- A bit is set to 1 in the STIPR register, but the associated flag in the STSR register is 0.

SYn flag (SYNFPn Status Flag)

The SYn flag indicates changes in the state of the SYNFPn module.

[Setting condition]

- A change in the state of a flag in the SYSR register for which notification is enabled in the SYIPR register.

[Clearing conditions]

When any of the following conditions is met:

- All flags in the SYSR register are 0
- All bits in the SYIPR register are 0
- A bit is set to 1 in the SYIPR register, but the associated flag in the SYSR register is 0.

PRC flag (PRC-TC Status Flag)

The PRC flag indicates changes in the state of the PRC-TC module.

[Setting condition]

- A change in the state of a flag in the PRSR register for which notification is enabled in the PRIPR register.

[Clearing conditions]

When any of the following conditions is met:

- All flags in the PRSR register are 0
- All bits in the PRIPR register are 0
- A bit is set to 1 in the PRIPR register, but the associated bit in the PRSR register is 0.

CYCm flag (Pulse Output Timer m Rising Edge Detection Flag)

The CYCm flag indicates detection of a rising edge on the periodic pulse signal produced by the associated pulse output timer m (m = 0 to 5).

[Setting condition]

- Detection of a rising edge on the periodic pulse signal produced by a pulse output timer for which notification is enabled in the MITSELR register.

[Clearing condition]

- Writing 1 to this flag.
  After the flag is cleared to 0, it is set to 1 again on detection of a rising edge on the periodic pulse signal from the associated pulse output timer.

30.2.2 ETHER_MINT Interrupt Request Enable Register (MIEIPR)

Address(es): EPTPC.MIEIPR 4006 5004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	CYC5	CYC4	CYC3	CYC2	CYC1	CYC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	PR	SY1	SY0	ST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ST	STCA Status Interrupt Request Enable	0: Disable generation of ETHER_MINT interrupt requests by the STCA status flag 1: Enable generation of ETHER_MINT interrupt requests by the STCA status flag.	R/W
b1	SY0	SYNFP0 Status Interrupt Request Enable	0: Disable generation of ETHER_MINT interrupt requests by the SYNFP0 status flag 1: Enable generation of ETHER_MINT interrupt requests by the SYNFP0 status flag.	R/W
b2	SY1	SYNFP1 Status Interrupt Request Enable	0: Disable generation of ETHER_MINT interrupt requests by the SYNFP1 status flag 1: Enable generation of ETHER_MINT interrupt requests by the SYNFP1 status flag.	R/W
b3	PR	PRC-TC Status Interrupt Request Enable	0: Disable generation of ETHER_MINT interrupt requests by the PRC-TC status flag 1: Enable generation of ETHER_MINT interrupt requests by the PRC-TC status flag.	R/W
b15 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	CYC0	Pulse Output Timer 0 Rising Edge Detection Interrupt Request Enable	0: Disable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 0 1: Enable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 0.	R/W
b17	CYC1	Pulse Output Timer 1 Rising Edge Detection Interrupt Request Enable	0: Disable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 1 1: Enable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 1.	R/W
b18	CYC2	Pulse Output Timer 2 Rising Edge Detection Interrupt Request Enable	0: Disable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 2 1: Enable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 2.	R/W
b19	CYC3	Pulse Output Timer 3 Rising Edge Detection Interrupt Request Enable	0: Disable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 3 1: Enable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 3.	R/W
b20	CYC4	Pulse Output Timer 4 Rising Edge Detection Interrupt Request Enable	0: Disable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 4 1: Enable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 4.	R/W
b21	CYC5	Pulse Output Timer 5 Rising Edge Detection Interrupt Request Enable	0: Disable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 5 1: Enable generation of ETHER_MINT interrupt requests on detection of a rising edge of pulse output timer 5.	R/W
b31 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The MIEIPR register enables or disables the generation of ETHER_MINT interrupt requests when ETHER_MINT interrupt source conditions are satisfied.

30.2.3 ELC Output/ETHER_IPLS Interrupt Request Permission Register (ELIPPR)

Address(es): EPTPC.ELIPPR 4006 5010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ELIPPR register determines whether rising and falling edges of the periodic pulse signals produced by pulse output timers m are output as event signals to the ELC. The register also enables or disables ETHER_IPLS interrupts triggered by rising or falling edges of signals from the pulse output timer selected in the IPTSELR register.

Peripheral modules such as the GPT can be controlled with the clock synchronized by the PTP by using the ELC linking function to set a periodic pulse generated by pulse output timer m as a trigger for operations of the peripheral module.

The ELIPACR register can be used to set up the one-time-only output of event signals to the ELC or of ETHER_IPLS interrupt requests. For more details about the ETHER_IPLS interrupt, see section 30.4, Interrupts.

30.2.4 ELC Output/ETHER_IPLS Interrupt Permission Automatic Clearing Register (ELIPACR)

b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ELIPACR register enables one-time output of each event to the ELC and each ETHER_IPLS interrupt request triggered by detecting edges of the periodic pulses of pulse output timer m. Normally, an event is output to the ELC or an ETHER_IPLS interrupt request is generated on each edge of the periodic pulses of pulse output timer m while the associated bit in the ELIPPR register is 1 (enabled). When a bit in the ELIPPR register is 1 while the associated bit in the ELIPACR register is also 1, the bit in the ELIPPR register automatically clears to 0 when the event signal for the ELC or ETHER_IPLS interrupt request is generated. For more information about the ETHER_IPLS interrupt, see section 30.4, Interrupts.

30.2.5 STCA Status Register (STSR)

Address(es): EPTPC.STSR 4006 5040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	W10D	SYNTOUT	—	SYNCOUT	SYNC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SYNC	Synchronized State Detection Flag	0: Synchronization not detected 1: Synchronization detected.	R/W*1
b1	SYNCOUT	Synchronization Loss Detection Flag	0: Loss of synchronization not detected 1: Loss of synchronization detected.	R/W*1
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b3	SYNTOUT	Sync Message Reception Timeout Detection Flag	0: Sync message reception timeout not detected 1: Sync message reception timeout detected.	R/W*1
b4	W10D	Worst 10 Acquisition Completion Flag	0: Ten worst values not acquired yet 1: Ten worst values acquired.	R/W*1
b31 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When the SYNSTARTR.STR bit is 0, the value of the associated flag stays the same.
Note 1. Writing 1 clears the flag. Writing 0 does not affect the flag value.

The STSR register indicates the state of the STCA module.

SYNC flag (Synchronized State Detection Flag)

The SYNC flag indicates that synchronization has occurred more than the number of times specified in the STMR.SYTH[3:0] bits in succession when the STMR.ALEN0 bit is 1. When the STMR.ALEN0 bit is 0, the SYNC flag is not set to 1 even if synchronization has occurred more than the specified number of times in succession.

SYNCOUT flag (Synchronization Loss Detection Flag)

The SYNCOUT flag indicates that loss of synchronization has occurred more than the number of times specified in the STMR.DVTH[3:0] bits in succession when the STMR.ALEN0 bit is 1.

Because the time is not synchronized immediately after time synchronization starts (when the SYNSTARTR.STR bit is set to 1), SYNCOUT is set to 1 regardless of the STMR.ALEN0 bit setting. When using the SYNTOUT flag, set the SYNTOUT flag to 0 immediately after starting time synchronization.

When the STMR.ALEN0 bit is 0, the SYNCOUT flag is not set to 1 even if loss of synchronization occurs more than the specified number of times in succession after time synchronization starts and the SYNTOUT flag is immediately set to 0.

SYNTOUT flag (Sync Message Reception Timeout Detection Flag)

The SYNTOUT flag indicates that a Sync message was not received during the period specified in the SYNTOR register when the STMR.ALEN1 bit is 1. The SYNTOUT flag is set to 1 immediately after time synchronization starts (when the SYNSTARTR.STR bit is set to 1) when no Sync message is received after the EPTPC starts. When using the SYNTOUT flag, set the SYNTOUT flag to 0 immediately after starting time synchronization.

W10D flag (Worst 10 Acquisition Completion Flag)

The W10D flag indicates that acquisition of the worst 10 values is complete.

30.2.6 STCA Status Notification Enable Register (STIPR)

Address(es): EPTPC.STIPR 4006 5044h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	W10D	SYNTOUT	—	SYNCOUT	SYNC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SYNC	SYNC Status Notification Enable	0: Disable notification of the STSR.SYNC state 1: Enable notification of the STSR.SYNC state.	R/W
b1	SYNCOUT	SYNCOUT Status Notification Enable	0: Disable notification of the STSR.SYNCOUT state 1: Enable notification of the STSR.SYNCOUT state.	R/W
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b3	SYNTOUT	SYNTOUT Status Notification Enable	0: Disable notification of the STSR.SYNTOUT state 1: Enable notification of the STSR.SYNTOUT state.	R/W
b4	W10D	W10D Status Notification Enable	0: Disable notification of the STSR.W10D state 1: Enable notification of the STSR.W10D state.	R/W
b31 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The STIPR register specifies whether the MIESR.ST flag does or does not reflect changes in the state of the STCA module.

30.2.7 STCA Clock Frequency Setting Register (STCFR)

Address(es): EPTPC.STCFR 4006 5050h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCF[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	STCF[1:0]	STCA Clock Frequency	b1 b0 0 0: 20 MHz 0 1: 25 MHz 1 0: 50 MHz 1 1: 100 MHz.	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings during operation.

The STCFR register specifies the frequency of the clock source for the STCA module (STCA clock). The frequency set in the STCFR register must the same frequency as selected in the STCSELR register.

STCF[1:0] bits (STCA Clock Frequency)

The STCF[1:0] bits select the frequency of the STCA clock. To enable synchronous control in compliance with IEEE 1588, the STCA clock frequency must be specified as 20, 25, 50, or 100 MHz. Operation is not guaranteed if the frequency selected in these bits differs from the clock frequency actually input to the STCA module.

30.2.8 STCA Operating Mode Register (STMR)

Address(es): EPTPC.STMR 4006 5054h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	ALEN1	ALEN0	—	—	—	—	DVTH[3:0]				SYTH[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	W10S	—	CMOD	—	—	—	—	—	WINT[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	WINT[7:0]	Worst 10 Acquisition Time	00h: Do not acquire the worst 10 values 01h: Sync message reception: 1 time : FFh: Sync message reception: 255 times.	R/W
b12 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	CMOD	Time Synchronization Correction Mode	0: Mode 1 1: Mode 2.	R/W
b14	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b15	W10S	Worst 10 Acquisition Control Select	0: Start measurement by hardware and use the value acquired in the PW10VR or MW10R register as the filtering limit 1: Start measurement using the GETW10R.GW10 bit and use the value set in the PLIMITR or MLIMITR register as the filtering limit.	R/W
b19 to b16	SYTH[3:0]	Synchronized State Detection Threshold Setting	0h: None *1 1h: 1 time : Fh: 15 times.	R/W
b23 to b20	DVTH[3:0]	Synchronization Loss Detection Threshold Setting	0h: None *2 1h: 1 time : Fh: 15 times.	R/W
b27 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b28	ALEN0	Alarm Detection Enable 0	0: Disable STSR.SYNC or SYNCOUT flag from being set to 1 on detection of synchronization or loss of synchronization 1: Enable STSR.SYNC or SYNCOUT flag to be set to 1 on detection of synchronization or loss of synchronization.	R/W
b29	ALEN1	Alarm Detection Enable 1	0: Disable STSR.SYNTOUT flag from being set to 1 on detection of the Sync message reception timeout interrupt 1: Enable STSR.SYNTOUT flag to be set to 1 on detection of the Sync message reception timeout interrupt.	R/W
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The STSR.SYNC flag is not set to 1 regardless of the ALEN0 bit setting.
Note 2. The STSR.SYNCOUT flag is not set to 1 regardless of the ALEN0 bit setting.

The STMR register specifies the operating mode of the STCA module.

WINT[7:0] bits (Worst 10 Acquisition Time)

The WINT[7:0] bits set the time for acquiring the worst 10 gradients (the number of times Sync messages are received). Renesas recommends setting the number of Sync message receptions to 32 or more in most cases.

CMOD bit (Time Synchronization Correction Mode)

Mode 1 or mode 2 can be selected in the CMOD bit to correct the local time information when the EPTPC operates as a slave clock. Select the appropriate mode for your system configuration. Table 30.7 provides a summary of the two correction modes.

Table 30.7 Correction mode features

Correction mode	Function	Features	Notes
Mode 1	Mode for correcting the counter every Sync message reception by using the current offsetFromMaster. Operation is in mode 1 after the start of correction, and then shifts to the specified mode.	The time information of the master clock is set as the local time information at a specific time.	Synchronization is not guaranteed if calculating offsetFromMaster is not possible, for example if packets are temporarily being discarded because of a failure of communications.
Mode 2	Mode where the gradient value calculated from offsetFromMaster (worst-10 control) is retained and used in correcting the local time information so that it approximates the time information of the master clock.	Even when calculating offsetFromMaster is not possible, a certain level of synchronization can be guaranteed in this mode, because the counter is still corrected from the gradient information.	Establishing synchronization takes longer.

W10S bit (Worst 10 Acquisition Control Select)

The W10S bit selects the value used for measuring and filtering the worst 10 gradients. When the W10S bit is set to 0, the values acquired in the PW10VRU, PW10VRM, and PW10VRL registers and the MW10RU, MW10RM, and MW10RL registers are used as the limit for the filter. When the W10S bit is set to 1, the values set in the PLIMITRU, PLIMITRM, and PLIMITRL registers and the MLIMITRU, MLIMITRM, and MLIMITRL registers are used as the limit for the filter.

SYTH[3:0] bits (Synchronized State Detection Threshold Setting)

The SYTH[3:0] bits specify the number of consecutive times that a value should fall within the thresholds set in registers SYNTDBRU and SYNTDBRL, to be considered as a synchronized state. When the ALEN0 bit is 1, the STSR.SYNCOUT flag becomes 1.

DVTH[3:0] bits (Synchronization Loss Detection Threshold Setting)

The DVTH[3:0] bits specify a value for the number of consecutive times the offsetFromMaster value must exceed the specified thresholds for the STCA module to detect loss of synchronization. The thresholds are specified in the SYNTDARU and SYNTDARL registers. When the ALEN0 bit is 1, the STSR.SYNCOUT flag is set to 1 on loss of synchronization detection.

ALEN0 bit (Alarm Detection Enable 0)

When the ALEN0 bit is 1, the STSR.SYNC or SYNCOUT flag is set to 1 on detection of synchronization or loss of synchronization. When the ALEN0 bit is 0, the SYNC or SYNCOUT flag is not set to 1 even if synchronization or loss of synchronization is detected.

ALEN1 bit (Alarm Detection Enable 1)

When the ALEN1 bit is 1, the STSR.SYNTOUT flag is set to 1 if a Sync message is not received within the time specified in the SYNTOR register. When the ALEN1 bit is 0, the SYNTOUT flag is not set to 1 even if a reception timeout occurs.

30.2.9 Sync Message Reception Timeout Register (SYNTOR)

Address(es): EPTPC.SYNTOR 4006 5058h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	If no Sync message is received within 1024 × n (ns), where n is the setting, a timeout for reception of Sync messages occurs, and the STSR.SYNTOUT flag is set to 1.	R/W

The SYNTOR register specifies the timeout period for reception of Sync messages. The timeout period is 1024 times the setting, in nanoseconds. If no Sync message is received within the period specified in these bits, a timeout is detected. When the SYNTOR register is 0, the STSR.SYNTOUT flag is not set to 1.

30.2.10 ETHER_IPLS Interrupt Request Timer Select Register (IPTSELR)

Address(es): EPTPC.IPTSELR 4006 5060h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	IPTSEL0	Pulse Output Timer 0 Select	0: Do not select pulse output timer 0 as a source for ETHER_IPLS interrupt requests 1: Select pulse output timer 0 as a source for ETHER_IPLS interrupt requests.	R/W
b1	IPTSEL1	Pulse Output Timer 1 Select	0: Do not select pulse output timer 1 as a source for ETHER_IPLS interrupt requests 1: Select pulse output timer 1 as a source for ETHER_IPLS interrupt requests.	R/W
b2	IPTSEL2	Pulse Output Timer 2 Select	0: Do not select pulse output timer 2 as a source for ETHER_IPLS interrupt requests 1: Select pulse output timer 2 as a source for ETHER_IPLS interrupt requests.	R/W
b3	IPTSEL3	Pulse Output Timer 3 Select	0: Do not select pulse output timer 3 as a source for ETHER_IPLS interrupt requests 1: Select pulse output timer 3 as a source for ETHER_IPLS interrupt requests.	R/W
b4	IPTSEL4	Pulse Output Timer 4 Select	0: Do not select pulse output timer 4 as a source for ETHER_IPLS interrupt requests 1: Select pulse output timer 4 as a source for ETHER_IPLS interrupt requests.	R/W

Bit	Symbol	Bit name	Description	R/W
b5	IPTSEL5	Pulse Output Timer 5 Select	0: Do not select pulse output timer 5 as a source for ETHER_IPLS interrupt requests 1: Select pulse output timer 5 as a source for ETHER_IPLS interrupt requests.	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The IPTSELR register selects the pulse output timers that generate ETHER_IPLS interrupt requests.

Each pulse output timer m (m = 0 to 5) takes the clock signal from the STCA as its clock source and produces pulses with a specified period and duty cycle. An ETHER_IPLS interrupt is requested on rising edges if the ELIPPR.PLSP bit is set to 1 and on falling edges if the ELIPPR.PLSN bit is set to 1. When multiple pulse output timers are selected in the IPTSELR register, the interrupt request signal becomes the logical OR of the interrupt requests from the given pulse output timers. For more details about the ETHER_IPLS interrupt, see section 30.4, Interrupts.

30.2.11 ETHER_MINT Interrupt Request Timer Select Register (MITSELR)

Address(es): EPTPC.MITSELR 4006 5064h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	MINTEN5	MINTEN4	MINTEN3	MINTEN2	MINTEN1	MINTEN0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	MINTEN0	Pulse Output Timer 0 ETHER_MINT Interrupt Output Enable	0: Do not set MIESR.CYC0 flag on detection of rising edge from pulse output timer 0 1: Set MIESR.CYC0 flag on detection of rising edge from pulse output timer 0.	R/W
b1	MINTEN1	Pulse Output Timer 1 ETHER_MINT Interrupt Output Enable	0: Do not set MIESR.CYC1 flag on detection of rising edge from pulse output timer 1 1: Set MIESR.CYC1 flag on detection of rising edge from pulse output timer 1.	R/W
b2	MINTEN2	Pulse Output Timer 2 ETHER_MINT Interrupt Output Enable	0: Do not set MIESR.CYC2 flag on detection of rising edge from pulse output timer 2 1: Set MIESR.CYC2 flag on detection of rising edge from pulse output timer 2.	R/W
b3	MINTEN3	Pulse Output Timer 3 ETHER_MINT Interrupt Output Enable	0: Do not set MIESR.CYC3 flag on detection of rising edge from pulse output timer 3 1: Set MIESR.CYC3 flag on detection of rising edge from pulse output timer 3.	R/W
b4	MINTEN4	Pulse Output Timer 4 ETHER_MINT Interrupt Output Enable	0: Do not set MIESR.CYC4 flag on detection of rising edge from pulse output timer 4 1: Set MIESR.CYC4 flag on detection of rising edge from pulse output timer 4.	R/W
b5	MINTEN5	Pulse Output Timer 5 ETHER_MINT Interrupt Output Enable	0: Do not set MIESR.CYC5 flag on detection of rising edge from pulse output timer 5 1: Set MIESR.CYC5 flag on detection of rising edge from pulse output timer 5.	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The MITSELR register selects pulse output timers that set interrupt flags in the MIESR register. Each pulse output timer m (m = 0 to 5) takes the clock signal from the STCA as its clock source and produces pulses with a specified period and duty cycle. An ETHER_MINT interrupt is requested on rising edges of the pulse signal from the associated pulse output timer m if the MITSELR.MINTENm bit and MIEIPR.CYCm are both set to 1. For more information about the ETHER_MINT interrupt, see section 30.4, Interrupts.

30.2.12 ELC Output Timer Select Register (ELTSELR)

Address(es): EPTPC.ELTSELR 4006 5068h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	ELTDIS5	ELTDIS4	ELTDIS3	ELTDIS2	ELTDIS1	ELTDIS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ELTDIS0	Pulse Output Timer 0 Event Generation Disable	0: Use pulse output timer 0 to generate event signals to the ELC 1: Do not use pulse output timer 0 to generate event signals to the ELC.	R/W
b1	ELTDIS1	Pulse Output Timer 1 Event Generation Disable	0: Use pulse output timer 1 to generate event signals to the ELC 1: Do not use pulse output timer 1 to generate event signals to the ELC.	R/W
b2	ELTDIS2	Pulse Output Timer 2 Event Generation Disable	0: Use pulse output timer 2 to generate event signals to the ELC 1: Do not use pulse output timer 2 to generate event signals to the ELC.	R/W
b3	ELTDIS3	Pulse Output Timer 3 Event Generation Disable	0: Use pulse output timer 3 to generate event signals to the ELC 1: Do not use pulse output timer 3 to generate event signals to the ELC.	R/W
b4	ELTDIS4	Pulse Output Timer 4 Event Generation Disable	0: Use pulse output timer 4 to generate event signals to the ELC 1: Do not use pulse output timer 4 to generate event signals to the ELC.	R/W
b5	ELTDIS5	Pulse Output Timer 5 Event Generation Disable	0: Use pulse output timer 5 to generate event signals to the ELC 1: Do not use pulse output timer 5 to generate event signals to the ELC.	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ELTSELR register selects the pulse output timers that output event signals to the ELC. Each pulse output timer m (m = 0 to 5) takes the clock signal from the STCA as its clock source and produces pulses with a specified period and duty cycle. An event signal is output to the ELC on rising edges if the ELIPPR.CYCPm bit is set to 1 and on falling edges if the ELIPPR.CYCNm bit is set to 1. For more information about output of event signals to the ELC, see section 30.5, Event Link (Output).

30.2.13 Time Synchronization Channel Select Register (STCHSELR)

Address(es): EPTPC.STCHSELR 4006 506Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SYSEL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SYSEL	Timer Information Input Select	0: Use time information from the SYNFP0 module 1: Use time information from the SYNFP1 module.	R/W*1
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Do not change the value of this bit when the SYNSTARTR.STR bit is 1.

The STCHSELR register selects the time information input to the STCA module.

30.2.14 Slave Time Synchronization Start Register (SYNSTARTR)

Address(es): EPTPC.SYNSTARTR 4006 5080h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	STR	Slave Time Synchronization Control	0: Stop slave time synchronization 1: Start slave time synchronization.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYNSTARTR register starts or stops time synchronization. This register is used when the EPTPC is operating as a slave node.

30.2.15 Local Clock Counter Initial Value Load Directive Register (LCIVLDR)

Address(es): EPTPC.LCIVLDR 4006 5084h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LOAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	LOAD	Local Clock Counter Initial Value Load Directive	0: Do not load initial value to the local clock counter 1: Load initial value to the local clock counter.	W*1
b31 to b1	—	Reserved	The write value should be 0.	W

Note 1. Do not change the value of this bit when the SYNSTARTR.STR bit is 1.

The LCIVLDR register specifies the value in the LCIVRU, LCIVRM, and LCIVRL registers as the initial value of the local clock counter.

30.2.16 Synchronization Loss Detection Threshold Register (SYNTDARU, SYNTDARL)

Address(es): EPTPC.SYNTDARU 4006 5090h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the upper-order 32 bits of the threshold for detection of loss of synchronization.	R/W

Address(es): EPTPC.SYNTDARL 4006 5094h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the lower-order 32 bits of the threshold for detection of loss of synchronization.	R/W

The SYNTDARU and SYNTDARL registers specify the threshold value for offsetFromMaster to be used in determining loss of synchronization. When setting a threshold value, write the upper-order 32 bits to SYNTDARU and the lower-order 32 bits to SYNTDARL, in that order and in consecutive operations. If the offsetFromMaster value exceeds the value specified in SYNTDARU and SYNTDARL, a loss of synchronization is detected. Set the value in SYNTDARU and SYNTDARL in nanoseconds. SYNTDARU and SYNTDARL are not used when the device is operating as a master clock.

30.2.17 Synchronization Detection Threshold Register (SYNTDBRU, SYNTDBRL)

Address(es): EPTPC.SYNTDBRU 4006 5098h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the upper-order 32 bits of the threshold for detection of synchronization.	R/W

Address(es): EPTPC.SYNTDBRL 4006 509Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the lower-order 32 bits of the threshold for detection of synchronization.	R/W

The SYNTDBRU and SYNTDBRL registers specify the threshold value for offsetFromMaster to be used in determining synchronization. When setting a threshold value, write the upper-order 32 bits to SYNTDBRU and the lower-order 32 bits to SYNTDBRL, in that order and in consecutive operations. If the offsetFromMaster value is less than the value specified in SYNTDBRU and SYNTDBRL, synchronization is detected. Set the value in SYNTDBRU and SYNTDBRL in nanoseconds. SYNTDBRU and SYNTDBRL are not used when the device is operating as a master clock.

30.2.18 Local Clock Counter Initial Value Register (LCIVRU, LCIVRM, LCIVRL)

Address(es): EPTPC.LCIVRU 4006 50B0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	—	—	These bits specify the upper-order 16 bits of the integer portion of the initial value for the local clock counter.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Address(es): EPTPC.LCIVRM 4006 50B4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the lower-order 32 bits of the integer portion of the initial value for the local clock counter.	R/W

Address(es): EPTPC.LCIVRL 4006 50B8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the fractional portion of the initial value of the local clock counter in nanoseconds.	R/W

The LCIVRU, LCIVRM, and LCIVRL registers specify the initial value in seconds of the local clock counter. When setting an initial value, write the upper-order 16 bits of the integer portion to LCIVRU, the lower-order 32 bits of the integer portion to LCIVRM, and the fractional portion in nanoseconds to LCIVRL, in that order and in consecutive operations.

The value in these registers can be used as the initial value of the local clock counter. To set these register values in the local clock counter, set the LCIVLDR.LOAD bit to 1.

(1) Example

When 2.000000025 s is set as the initial value, write the following values to the registers:

- LCIVRU: 0000 0000h
- LCIVRM: 0000 0002h
- LCIVRL: 0000 0019h.

30.2.19 Worst 10 Acquisition Directive Register (GETW10R)

Address(es): EPTPC.GETW10R 4006 5124h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GW10
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	GW10	Worst 10 Acquisition Directive	0: Do not acquire the worst 10 values 1: Start acquiring the worst 10 values.	R/W*1
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Do not set this bit to 1 when the STMR.W10S bit is 0.

The GETW10R register is used in software control to start calculation of gradient values for use in selecting the worst 10 values.

A gradient value is the amount by which the timer counter of a slave is incremented when a given interval elapses. Setting the GW10 bit to 1 when the value of the STMR.W10S bit is 1 selects calculation of a gradient value by the EPTPC each time it receives a Sync message. Gradient values are calculated the number of times specified in the STMR.WINT[7:0] bits. The GW10 bit is set to 0 on completion of this number of calculations. The GETW10R register is not used when the device is operating as a master clock.

30.2.20 Positive Gradient Limit Register (PLIMITRU, PLIMITRM, PLIMITRL)

Address(es): EPTPC.PLIMITRU 4006 5128h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b30 to b0	—	—	These bits specify the upper-order 31 bits of the limit for the positive gradient.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Address(es): EPTPC.PLIMITRM 4006 512Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the middle-order 32 bits of the limit for the positive gradient.	R/W

Address(es): EPTPC.PLIMITRL 4006 5130h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the lower-order 32 bits of the limit for the positive gradient.	R/W

The PLIMITRU, PLIMITRM, and PLIMITRL registers specify an upper limit on the gradient (= positive gradient) used in time synchronization. When setting the upper limit, write to the registers consecutively in the order of PLIMITRU, PLIMITRM, PLIMITRL. Gradients that exceed the value specified in these registers are not used in time synchronization. These registers are not used when the device is operating as a master clock. The registers are valid when the STMR.CMOD and W10S bits are 1.

Use the following expression to calculate the gradient value to be set in the registers:

PLIMITRU, PLIMITRM, and PLIMITRL register values = A (s)/T (s) × 2^{32}

A: Time (s) by which the slave local clock counter advances during the interval between received Sync messages

T: Actual time (s) between received Sync messages

For example, if the interval between Sync messages is 0.5 seconds and the local clock counter advances by 0.7 seconds during that time, and this is to be set as the limit, then the setting for PLIMITR = 0.7/0.5 × 2^{32} = 6 012 954 214 = 1 6666 6666h, and the settings for the individual registers are as follows:

- PLIMITRU = 0000 0000h
- PLIMITRM = 0000 0001h
- PLIMITRL = 6666 6666h.

The minimum setting depends on the STCA clock frequency as the clock source for counting by the local clock counter. For example, if the STCA clock frequency is 50 MHz, then the minimum allowable setting for PLIMITRU, PLIMITRM, and PLIMITRL = (1/50 (MHz)) (s)/0.5 (s) × 2^{32} = 172 = ACh, and the settings for the individual registers are as follows:

- PLIMITRU = 0000 0000h
- PLIMITRM = 0000 0000h
- PLIMITRL = 0000 00ACh.

The gradient limit values to be set are valid when time synchronization correction mode is mode 2 (STMR.CMOD is 1) and the gradient is controlled by software (STMR.W10S is 1).

30.2.21 Negative Gradient Limit Register (MLIMITRU, MLIMITRM, MLIMITRL)

Address(es): EPTPC.MLIMITRU 4006 5134h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the lower-order 32 bits of the limit for the negative gradient.	R/W

The MLIMITRU, MLIMITRM, and MLIMITRL registers specify a lower limit on the gradient (= negative gradient) used in time synchronization. Use a two's complement value to set the lower limit. When setting the lower limit, write to the registers consecutively in the order of MLIMITRU, MLIMITRM, MLIMITRL. Gradients that are less than the value specified in these registers are not used in time synchronization. These registers are not used when the device is operating as a master clock. The registers are valid when the STMR.CMOD and W10S bits are 1.

The procedure for setting the value, and the minimum value that can be set, are the same as for the PLIMITRU, PLIMITRM, and PLIMITRL registers.

30.2.22 Statistical Information Retention Control Register (GETINFOR)

Address(es): EPTPC.GETINFOR 4006 5140h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INFO
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	INFO	Information Retention Control	When written: 0: No effect 1: Information is retained. When read: 0: Information retention is complete 1: Processing for information retention is in progress. After information fetching is directed, values of some statistical information read before completion of information fetching are not guaranteed.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GETINFOR register controls retention of the following statistical information:

- LCCVRU, LCCVRM, and LCCVRL registers
- PW10VRU, PW10VRM, and PW10VRL registers
- MW10RU, MW10RM, and MW10RL registers.

The only value that is writable to the INFO bit is 1. When setting a value in the PW10VRU, PW10VRM, and PW10VRL registers, or the MW10RU, MW10RM, and MW10RL registers, only set the INFO bit to 1 while the STMR.W10S bit is 1. If the INFO bit is set to 1 before acquisition of the worst 10 values is complete, the information retained in the PW10VRU, PW10VRM, and PW10VRL registers and MW10RU, MW10RM, and MW10RL registers is not guaranteed to be correct. Use the GETW10R.GW10 bit to confirm that acquisition is completed before setting the INFO bit to 1. The INFO bit automatically returns to 0 on completion of information fetching.

30.2.23 Local Clock Counter (LCCVRU, LCCVRM, LCCVRL)

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits indicate the fractional portion of the value in the local clock counter (in nanoseconds).	R

The LCCVRU, LCCVRM, and LCCVRL registers indicate the value of the local clock counter. When the GETINFOR.INFO bit is set to 1, the value of the local clock counter at that time is stored in these registers as follows:

- LCCVRU: Upper-order 16 bits of the integer portion in seconds
- LCCVRM: Lower-order 32 bits of the integer portion in seconds
- LCCVRL: Fractional portion in nanoseconds.

For example, if the local time information is 14:25, 44 seconds, 10 milliseconds, 23 microseconds, and 39 nanoseconds, the registers have $14 \times 3600 + 25 \times 60 + 44 = 51944$ (s) = 0000 0000 CAE8h as the setting of the upper-order 48 bits and $10 \times 10^6 + 23 \times 10^3 + 39 = 10023039$ (ns) = 0098 F07Fh as the setting of the lower-order 32 bits.

30.2.24 Positive Gradient Worst 10 Value Register (PW10VRU, PW10VRM, PW10VRL)

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the lower-order 32 bits of the start time of the pulse output timer in nanoseconds.	R/W

The TMSTTRUm and TMSTTRLm registers specify the start time of pulse output timer m.

Set the start time of pulse output timer m (64 bits) in nanoseconds. Although the setting is in nanoseconds, the start time of pulse output timer m depends on the resolution of the STCA clock. For example, if the STCA clock is running at 50 MHz, one cycle takes 20 ns, so the time at which the timer starts might differ from the time set in these registers by up to 20 ns. When writing to the registers, write values consecutively in the order of TMSTTRUm, TMSTTRLm, when the TMSTARTR.ENm bit is 0. The format for setting times in these registers differs from that described in section 30.2.23, Local Clock Counter (LCCVRU, LCCVRM, LCCVRL).

30.2.27 Timer Cycle Setting Registers m (TMCYCRm) (m = 0 to 5)

Address(es): EPTPC.TMCYCR0 4006 5308h, EPTPC.TMCYCR1 4006 5318h, EPTPC.TMCYCR2 4006 5328h, EPTPC.TMCYCR3 4006 5338h, EPTPC.TMCYCR4 4006 5348h, EPTPC.TMCYCR5 4006 5358h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b29 to b0	—	—	These bits specify the cycle of the pulse output timer in nanoseconds. Set a value that is equivalent to at least four cycles of the STCA clock.	R/W
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The TMCYCRm registers specify the period of the output signal generated by the associated pulse output timer m.

Set a value in nanoseconds that is equivalent to at least four cycles of the STCA clock, when the value of the TMSTARTR.ENm bit is 0. Although the setting is in nanoseconds, the period of the output signal generated by pulse output timer m and the time at which the timer starts depend on the period of the STCA clock. For example, if the STCA clock is running at 50 MHz, one cycle takes 20 ns, so the clock source for counting by pulse output timer m might differ from the period set in these registers by up to 19 ns. The SYNFP module handles calculations to correct this difference.

For example, if the setting for the timer period is 81 ns and the STCA clock is running at 50 MHz, the only available settings close to the actual timer period are for 80 or 100 ns. By setting the timer period in the SYNFP module to 80 ns for 19 and to 100 ns for 1 of every 20 cycles, the average period can be adjusted to 81 ns.

$$(80\ (\text{ns}) \times 19 + 100\ (\text{ns}) \times 1)/20 = 81\ (\text{ns})$$

The minimum value that can be set in a TMCYCRm register is four cycles of the STCA clock. For example, if the STCA clock is running at 50 MHz, the minimum setting corresponds to 80 ns. Timer operation is not guaranteed if a value set in one of these registers is less than this value.

30.2.28 Timer Pulse Width Setting Register m (TMPLSRm) (m = 0 to 5)

Address(es): EPTPC.TMPLSR0 4006 530Ch, EPTPC.TMPLSR1 4006 531Ch, EPTPC.TMPLSR2 4006 532Ch, EPTPC.TMPLSR3 4006 533Ch, EPTPC.TMPLSR4 4006 534Ch, EPTPC.TMPLSR5 4006 535Ch

	—	—	—													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b28 to b0	—	—	These bits specify the width of the high level of the pulse signal from the timer, in nanoseconds. Set a value that is equivalent to at least two cycles of the STCA clock.	R/W
b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The TMPLSRm registers specify the width of the high level of the output signal generated by the associated pulse output timer m.

Set a value corresponding to a time no shorter than two cycles of the STCA clock in nanoseconds. Although the setting is in nanoseconds, the high-level width of the signal from the timer depends on the period of the STCA clock. The method for correcting the high-level width of the signal from the timer is the same as that for correcting the timer periods set in the TMCYCRm register.

The upper-order 3 bits of the TMPLSRm register are reserved. These bits are read as 000b. When writing, write 000b to these bits.

Set the TMPLSRm register when the TMSTARTR.ENm bit is 0.

30.2.29 Timer Start Register (TMSTARTR)

Address(es): EPTPC.TMSTARTR 4006 537Ch

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OVRE0	Relay Packet Overflow Detection Flag 0	0: No overflow in transfer of data from SYNFP1 to PTPEDMAC 1: Overflow detected in transfer of data from SYNFP1 to PTPEDMAC.	R/W*1
b1	OVRE1	Relay Packet Overflow Detection Flag 1	0: No overflow in transfer of data from SYNFP0 to PTPEDMAC 1: Overflow detected in transfer of data from SYNFP0 to PTPEDMAC.	R/W*1
b2	OVRE2	Relay Packet Overflow Detection Flag 2	0: No overflow in transfer of data from SYNFP1 to SYNFP0 1: Overflow detected in transfer of data from SYNFP1 to SYNFP0.	R/W*1
b3	OVRE3	Relay Packet Overflow Detection Flag 3	0: No overflow in transfer of data from SYNFP0 to SYNFP1 1: Overflow detected in transfer of data from SYNFP0 to SYNFP1.	R/W*1
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	MACE	Source MAC Address Mismatch Detection Flag	0: MAC address mismatch not detected 1: MAC address mismatch detected.	R/W*1
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b27 to b16	—	Reserved	These bits are read as undefined. The write value should be 0.	R/W
b28	URE0	Relay Packet Underflow Detection Flag 0	0: No underflow in transfer of data from SYNFP1 to SYNFP0 1: Underflow detected in transfer of data from SYNFP1 to SYNFP0.	R/W*1
b29	URE1	Relay Packet Underflow Detection Flag 1	0: No underflow in transfer of data from SYNFP0 to SYNFP1 1: Underflow detected in transfer of data from SYNFP0 to SYNFP1.	R/W*1
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing 1 clears the flag. Writing 0 does not affect the flag value.

The PRSR register indicates the state of the PRC-TC module.

The PRC-TC module transmits and receives Ethernet packets through Ethernet port 0, Ethernet port 1, and the PTPEDMAC. The PRSR register indicates the states as overflows, underflows, and non-matching MAC addresses in the transmission and reception of Ethernet packets.

OVRE0 flag (Relay Packet Overflow Detection Flag 0)

The OVRE0 flag indicates that the FIFO buffer overflowed while packets were being transferred from the SYNFP1 module to the PTPEDMAC. When the OVRE0 flag is set to 1, the data received in the PTPEDMAC might be incorrect.

OVRE1 flag (Relay Packet Overflow Detection Flag 1)

The OVRE1 flag indicates that the FIFO buffer overflowed while packets were being transferred from the SYNFP0 module to the PTPEDMAC. When the OVRE1 flag is set to 1, the data received in the PTPEDMAC might be incorrect.

OVRE2 flag (Relay Packet Overflow Detection Flag 2)

The OVRE2 flag indicates that the FIFO buffer overflowed while packets were being transferred from the SYNFP1 module to the SYNFP0 module.

OVRE3 flag (Relay Packet Overflow Detection Flag 3)

The OVRE3 flag indicates that the FIFO buffer overflowed while packets were being transferred from the SYNFP0 module to the SYNFP1 module.

MACE flag (Source MAC Address Mismatch Detection Flag)

The MACE flag is set to 1 if the source MAC address of a packet to be transmitted from the PTPEDMAC matches none of the PRMACRU0, PRMACRL0, PRMACRU1, and PRMACRL1 registers.

URE0 flag (Relay Packet Underflow Detection Flag 0)

The URE0 flag indicates that the FIFO buffer underflowed while packets were being transferred from the SYNFP1 module to the SYNFP0 module.

URE1 flag (Relay Packet Underflow Detection Flag 1)

The URE1 flag indicates that the FIFO buffer underflowed while packets were being transferred from the SYNFP0 module to the SYNFP1 module.

30.2.31 PRC-TC Status Notification Enable Register (PRIPR)

Address(es): EPTPC.PRIPR 4006 5404h

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the lower-order 24 bits of the local MAC address for Ethernet port 0.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PRMACRU0 and PRMACRL0 register specify the local MAC address for Ethernet port 0.

Set the upper-order 24 bits of the MAC address in PRMACRU0 and the lower-order 24 bits in PRMACRL0. These registers are used in transmission from the PTPEDMAC to send frames from transmission sources with MAC addresses matching the value in this register to Ethernet port 0. Set these registers to the same values as the SYMACRU and SYMACRL registers for Ethernet port 0 (EPTPC0.SYMACRU and EPTPC0.SYMACRL).

Set these registers before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.33 Channel 1 Local MAC Address Register (PRMACRU1, PRMACRL1)

Address(es): EPTPC.PRMACRU1 4006 5418h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the upper-order 24 bits of the local MAC address for Ethernet port 1.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Address(es): EPTPC.PRMACRL1 4006 541Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the lower-order 24 bits of the local MAC address for Ethernet port 1.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PRMACRU1 and PRMACRL1 register specify the local MAC address for Ethernet port 1. Set the upper-order 24 bits of the MAC address in PRMACRU1 and the lower-order 24 bits in PRMACRL1. These registers are used in transmission from the PTPEDMAC to send frames from transmission sources with MAC addresses matching the value in this register to Ethernet port 1. Set these registers to the same value as SYMACRU and SYMACRL registers for Ethernet port 1 (EPTPC1.SYMACRU and EPTPC1.SYMACRL).

Set these registers before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.34 Packet Transmission Control Register (TRNDISR)

Address(es): EPTPC.TRNDISR 4006 5420h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDIS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	TDIS[1:0]	Packet Transmission Control	b1 b0 0 0: Transmit PTP packets through both Ethernet ports 0 and 1 0 1: Only transmit PTP packets through Ethernet port 0 1 0: Only transmit PTP packets through Ethernet port 1 1 1: Setting prohibited.	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The TRNDISR register controls transmission of PTP packets when Ethernet ports 0 and 1 have the same local MAC address. When the PRMACRU0 and PRMACRL0 registers and the PRMACRU1 and PRMACRL1 registers have the same local MAC address setting, the EPTPC can select whether PTP packets with the matching address are transmitted through both ports or are only transmitted through port 0 or 1.

If Ethernet ports 0 and 1 have different local MAC address settings, set the TDIS[1:0] bits to 00b. If the setting is other than 00b, the transmission of frames with a source MAC address matching that of the Ethernet port might be blocked.

Set the TRNDISR register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.35 Relay Mode Register (TRNMR)

Address(es): EPTPC.TRNMR 4006 5430h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	FWD1	FWD0	—	—	—	—	—	—	—	MOD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	MOD	Cut-Through Mode	0: Store-and-forward 1: Cut-through.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	FWD0	Channel 0 Relay Enable	0: Do not relay unicast, multicast (other than PTP packets), and broadcast messages from the other node from port 0 to port 1 1: Relay unicast, multicast (other than PTP packets), and broadcast messages from the other node from port 0 to port 1.	R/W

Bit	Symbol	Bit name	Description	R/W
b9	FWD1	Channel 1 Relay Enable	0: Do not relay unicast, multicast (other than PTP packets), and broadcast messages from the other node from port 1 to port 0 1: Relay unicast, multicast (other than PTP packets), and broadcast messages from the other node from port 1 to port 0.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The TRNMR register controls relaying of packets between Ethernet ports 0 and 1 with the PRC-TC module. For example, as Figure 30.3 shows, if the network is in a daisy-chain configuration, packets can be transferred through all three devices by enabling relaying of packets between Ethernet ports 0 and 1 (device 2 in the center of the figure).

When recalculating the CRC value in a packet transfer, in cut-through mode, a packet that has an abnormal CRC value can be transferred with a normal CRC value. Use store-and-forward mode when abnormal packets must be discarded. There is no difference in the latency of transfer in cut-through mode and store-and-forward mode when the length of the packets is shorter than 96 bytes.

Set the TRNMR register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

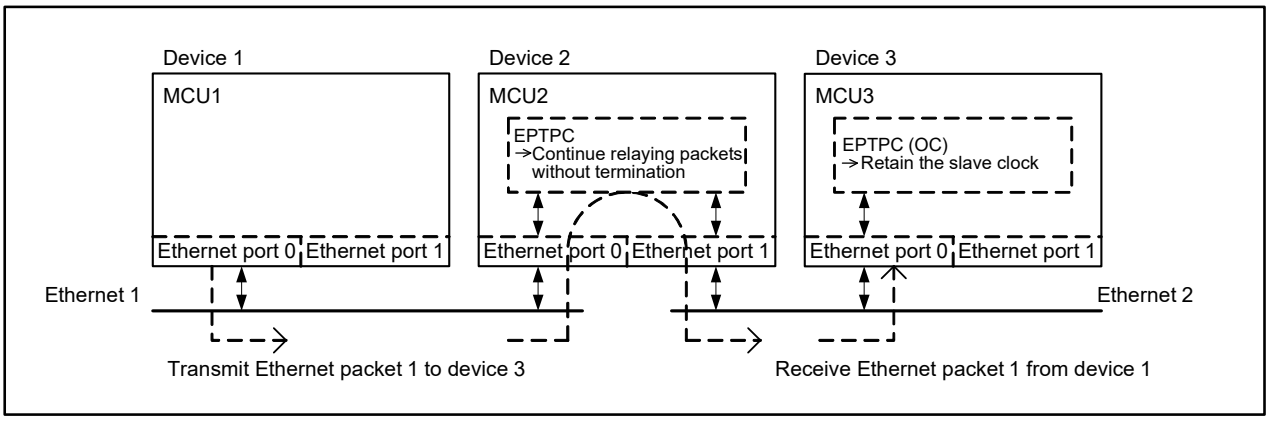

Figure 30.3 Network configuration example

30.2.36 Cut-Through Transfer Start Threshold Register (TRNCTTDR)

Address(es): EPTPC.TRNCTTDR 4006 5434h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	THVAL[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	THVAL[10:0]	FIFO Read Start Threshold	Threshold for starting to read data from the relay FIFO in cut-through mode, specified as the number of bytes.*1, *2	R
b10 to b2				R/W
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. A value cannot be set in the lower-order 2 bits. These bits are fixed to 0.
Note 2. A value of less than 96 bytes cannot be set.

The TRNCTTDR register specifies the threshold for the transmitting port to start reading data from the relay FIFO when

the cut-through mode is selected for relaying between the Ethernet ports (when the TRNMR.MOD bit is 1).

In cut-through mode, data transfer can start without waiting for all frame data to be stored in the relay FIFO. The setting of the THVAL[10:0] bits is the amount of data, in bytes, that must be stored in the relay FIFO before transmission starts. Set a multiple of four as the threshold value.

Reading from the relay FIFO starts when either of the following conditions is met:

- The relay FIFO holds at least as much data as the number of bytes specified in the THVAL[10:0] bits
- The relay FIFO holds at least one frame.

Set the TRNCTTDR register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.37 SYNFP Status Register (SYSR)

Address(es): EPTPC0.SYSR 4006 5800h, EPTPC1.SYSR 4006 5C00h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GENDN	RESDN

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	INFABT	—	RECLP	—	—	—	—	—	DRQOVR	INTDEV	DRPTO	—	MPDUD	INTCHG	OFMUD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OFMUD	offsetFromMaster Value Update Flag	0: offsetFromMaster value not updated 1: offsetFromMaster value updated.	R/W*1
b1	INTCHG	Receive logMessageInterval Value Change Detection Flag	0: Received logMessageInterval value did not change 1: Received logMessageInterval value changed.	R/W*1
b2	MPDUD	meanPathDelay Value Update Flag	0: meanPathDelay value not updated 1: meanPathDelay value updated.	R/W*1
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	DRPTO	Delay_Resp/Pdelay_Resp Reception Timeout Detection Flag	0: No Delay_Resp/Pdelay_Resp timeout occurred 1: Delay_Resp/Pdelay_Resp timeout occurred.	R/W*1
b5	INTDEV	Receive logMessageInterval Value Out-of-Range Flag	0: Received logMessageInterval value is within the range 1: Received logMessageInterval value is out of the range.	R/W*1
b6	DRQOVR	Delay_Req Reception FIFO Overflow Detection Flag	0: Received Delay_Req did not cause the reception FIFO to overflow 1: Received Delay_Req caused the reception FIFO to overflow.	R/W*1
b11 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	RECLP	Loop Reception Detection Flag	0: Received message did not return through a loop 1: Received message returned through a loop.	R/W*1
b13	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b14	INFABT	Control Information Abnormality Detection Flag	0: No abnormality in control information 1: Abnormality in control information.	R/W*1
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b16	RESDN	Response Stop Completion Detection Flag	0: Stopping responses not completed 1: Stopping responses completed.	R/W*1
b17	GENDN	Generation Stop Completion Detection Flag	0: Stopping generation not completed 1: Stopping generation completed.	R/W*1
b23 to b18	—	Reserved	These bits are read as undefined. The write value should be 0.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing 1 clears the flag. Writing 0 does not affect the flag value.

The SYSR register indicates the state of the SYNFP module.

OFMUD flag (offsetFromMaster Value Update Flag)

The OFMUD flag indicates that the value of offsetFromMaster was updated.

INTCHG flag (Receive logMessageInterval Value Change Detection Flag)

The INTCHG flag indicates that the logMessageInterval value of the Delay_Resp, Sync, or Announce message differs from the previously received value.

MPDUD flag (meanPathDelay Value Update Flag)

The MPDUD flag indicates that the value of meanPathDelay was updated.

DRPTO flag (Delay_Resp/Pdelay_Resp Reception Timeout Detection Flag)

The DRPTO flag indicates that a Delay_Resp or Pdelay_Resp message was not received within the period set in the RSTOUTR register.

INTDEV flag (Receive logMessageInterval Value Out-of-Range Flag)

The INTDEV flag indicates that a Delay_Resp message was received with a logMessageInterval value outside the range -7 to +6.

DRQOVR flag (Delay_Req Reception FIFO Overflow Detection Flag)

The DRQOVR flag indicates that the FIFO buffer for storing information from received Delay_Req messages holds 32 or more entries.

RECLP flag (Loop Reception Detection Flag)

The RECLP flag indicates that the value of the sourcePortIdentity field in a received PTP message matches the local PortIdentity as set in the SYCIDRU, SYCIDRL, and SYPNUMR registers.

INFABT flag (Control Information Abnormality Detection Flag)

The INFABT flag indicates that the control information includes a mismatch. If an erroneous frame is detected because of a corrupted frame or noise in the external circuit when the ETHERC and EPTPC are receiving data, subsequent normal frames might not be received properly.

Reset the EDMAC, ETHERC, and EPTPC after an erroneous frame is detected. Then wait for the required number of cycles before setting communications again.

(1) Detecting an erroneous frame

To detect an erroneous frame, read the INFABT flag in the EPTPCn.SYSR register. An INFABT flag is provided for each Ethernet channel, but the ETHER_MINT interrupt is shared by both channels. This requires both INFABT flags to be read in the ETHER_MINT interrupt handler to confirm in which channel the erroneous frame was detected.

When EPTPCn is not used and only EDMACn and ETHERCn (n = 0, 1) are used to receive and transmit standard Ethernet frames, read the INFABT flag to detect an erroneous frame.

(2) Resetting after detection of an erroneous flag

When the EPTPCn.SYSR.INFABT flag is set to 1, reset EPTPCn, and ETHERCn for the associated channel, then wait for the required number of cycles before setting the registers.

When EPTPCn is not used and only EDMACn and ETHERCn (n = 0, 1) are used to receive and transmit standard Ethernet frames, reset EPTPCn and the registers. In this case, resetting PTPEDMAC is not required.

To reset EPTPCn and the registers:

1. Set the EPTPCn.PTRSTR.RESET bit to 1.
2. Set the EDMACn.EDMR.SWR bit to 1.
3. Use a software loop or timer to wait for at least 64 cycles of the peripheral module clock, PCLKA. This step is

necessary to initialize EDMACn and ETHERCn.

4. Set the EPTPCn.PTRSTR.RESET bit to 0.
5. Reset communications by setting the EDMACn, ETHERCn, PTPEDMAC, and EPTPCn registers to enable communications.

RESDN flag (Response Stop Completion Detection Flag)

The RESDN flag indicates the end of processing for transmission of Delay_Resp or Pdelay_Resp as response messages when the handling of a received Delay_Req or Pdelay_Req by the SYNFP module is disabled in the SYRFL1R or SYRVLDR register.

GENDN flag (Generation Stop Completion Detection Flag)

The GENDN flag indicates the end of processing for transmission of messages of a type disabled in the SYTRENR or SYRVLDR register.

30.2.38 SYNFP Status Notification Enable Register (SYIPR)

Address(es): EPTPC0.SYIPR 4006 5804h, EPTPC1.SYIPR 4006 5C04h

b0	OFMUD	SYSR.OFMUD Status Notification Enable	0: Disable notification of the SYSR.OFMUD state 1: Enable notification of the SYSR.OFMUD state.	R/W
b1	INTCHG	SYSR.INTCHG Status Notification Enable	0: Disable notification of the SYSR.INTCHG state 1: Enable notification of the SYSR.INTCHG state.	R/W
b2	MPDUD	SYSR.MPDUD Status Notification Enable	0: Disable notification of the SYSR.MPDUD state 1: Enable notification of the SYSR.MPDUD state.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	DRPTO	SYSR.DRPTO Status Notification Enable	0: Disable notification of the SYSR.DRPTO state 1: Enable notification of the SYSR.DRPTO state.	R/W
b5	INTDEV	SYSR.INTDEV Status Notification Enable	0: Disable notification of the SYSR.INTDEV state 1: Enable notification of the SYSR.INTDEV state.	R/W
b6	DRQOVR	SYSR.DRQOVR Status Notification Enable	0: Disable notification of the SYSR.DRQOVR state 1: Enable notification of the SYSR.DRQOVR state.	R/W
b11 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	RECLP	SYSR.RECLP Status Notification Enable	0: Disable notification of the SYSR.RECLP state 1: Enable notification of the SYSR.RECLP state.	R/W
b13	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b14	INFABT	SYSR.INFABT Status Notification Enable	0: Disable notification of the SYSR.INFABT state 1: Enable notification of the SYSR.INFABT state.	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b16	RESDN	SYSR.RESDN Status Notification Enable	0: Disable notification of the SYSR.RESDN state 1: Enable notification of the SYSR.RESDN state.	R/W
b17	GENDN	SYSR.GENDN Status Notification Enable	0: Disable notification of the SYSR.GENDN state 1: Enable notification of the SYSR.GENDN state.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYIPR register specifies whether the MIESR.SYn flag reflects changes in the state of the SYNFPn module.

30.2.39 SYNFP MAC Address Register (SYMACRU, SYMACRL)

Address(es): EPTPC0.SYMACRU 4006 5810h, EPTPC1.SYMACRU 4006 5C10h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the upper-order 24 bits of the local MAC address.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Address(es): EPTPC0.SYMACRL 4006 5814h, EPTPC1.SYMACRL 4006 5C14h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the lower-order 24 bits of the local MAC address.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYMACRU and SYMACRL registers specify the local MAC address for Ethernet ports 0 and 1. Set these registers before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.40 SYNFP LLC-CTL Value Register (SYLLCCTLR)

Address(es): EPTPC0.SYLLCCTLR 4006 5818h, EPTPC1.SYLLCCTLR 4006 5C18h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CTL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Bit name	Description	R/W
b7 to b0	CTL[7:0]	LLC-CTL Field	These bits specify the value used for the control field in the LLC sublayer when generating IEEE802.3 frames.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYLLCCTLR register specifies the control field (LLC-CTL) value of LLC frames generated by the SYNFP module. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.41 SYNFP Local IP Address Register (SYIPADDRR)

Address(es): EPTPC0.SYIPADDRR 4006 581Ch, EPTPC1.SYIPADDRR 4006 5C1Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the local IP address.	R/W

The SYIPADDRR register specifies the local IP address for Ethernet ports 0 and 1. Set the SYIPADDRR register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.42 SYNFP Specification Version Setting Register (SYSPVRR)

Address(es): EPTPC0.SYSPVRR 4006 5840h, EPTPC1.SYSPVRR 4006 5C40h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TRSP[3:0]				VER[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	VER[3:0]	versionPTP Field Value	These bits specify the versionPTP field value of the PTP v2 header. When a message is received, this value is compared with the versionPTP field of the received frame. In generating messages, the value is used for the versionPTP field of the frame to be transmitted. Set these bits to 0010b (PTP v2).	R/W
b7 to b4	TRSP[3:0]	transportSpecific Field Value	These bits specify the transportSpecific field value of the PTP v2 header. When a message is received, this value is compared with the transportSpecific field of the received frame. In generating messages, the value is used for the transportSpecific field of the frame to be transmitted. Set these bits to 0000b (IEEE 1588).	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYSPVRR register specifies the transportSpecific and versionPTP field values of the PTP v2 message header. Do not change the settings while reception or transmission of PTP messages is enabled.

30.2.43 SYNFP Domain Number Setting Register (SYDOMR)

Address(es): EPTPC0.SYDOMR 4006 5844h, EPTPC1.SYDOMR 4006 5C44h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	DNUM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	DNUM[7:0]	domainNumber Field Value Setting	These bits specify the domainNumber field value of the PTP v2 header. When a message is received, this value is compared with the domainNumber field of the received frame as a condition for PTP reception processing. In generating messages, the value is used for the domainNumber field of the frame to be transmitted.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYDOMR register specifies the domainNumber field value of the PTP v2 message header. Do not change the settings while reception or transmission of PTP messages is enabled.

30.2.44 Announce Message Flag Field Setting Register (ANFR)

Address(es): EPTPC0.ANFR 4006 5850h, EPTPC1.ANFR 4006 5C50h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FLAG14	FLAG13	—	—	FLAG10	—	FLAG8	—	—	FLAG5	FLAG4	FLAG3	FLAG2	FLAG1	FLAG0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FLAG0	leap61	This bit specifies the logical value of the leap61 member of timePropertiesDS. 0: Set leap61 to FALSE 1: Set leap61 to TRUE.	R/W
b1	FLAG1	leap59	This bit specifies the logical value of the leap59 member of timePropertiesDS. 0: Set leap59 to FALSE 1: Set leap59 to TRUE.	R/W
b2	FLAG2	currentUtcOffsetValid	This bit specifies the logical value of the currentUtcOffsetValid member of timePropertiesDS. 0: Set currentUtcOffsetValid to FALSE 1: Set currentUtcOffsetValid to TRUE.	R/W
b3	FLAG3	ptpTimescale	This bit specifies the logical value of the ptpTimescale member of timePropertiesDS. 0: Set ptpTimescale to FALSE 1: Set ptpTimescale to TRUE.	R/W
b4	FLAG4	timeTraceable	This bit specifies the logical value of the timeTraceable member of timePropertiesDS. 0: Set timeTraceable to FALSE 1: Set timeTraceable to TRUE.	R/W
b5	FLAG5	frequencyTraceable	This bit specifies the logical value of the frequencyTraceable member of timePropertiesDS. 0: Set frequencyTraceable to FALSE 1: Set frequencyTraceable to TRUE.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	FLAG8	alternateMasterFlag	0: Set alternateMasterFlag to FALSE 1: Set alternateMasterFlag to TRUE.	R/W
b9	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b10	FLAG10	unicastFlag	0: Set unicastFlag to FALSE 1: Set unicastFlag to TRUE.	R/W
b12, b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	FLAG13	PTP profile Specific 1	0: Set PTP profile Specific 1 to FALSE 1: Set PTP profile Specific 1 to TRUE.	R/W
b14	FLAG14	PTP profile Specific 2	0: Set PTP profile Specific 2 to FALSE 1: Set PTP profile Specific 2 to TRUE.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ANFR register specifies the flagField section of the header when the SYNFP module is to generate an Announce message. The values specified in this register are only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

30.2.45 Sync Message Flag Field Setting Register (SYNFR)

Address(es): EPTPC0.SYNFR 4006 5854h, EPTPC1.SYNFR 4006 5C54h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FLAG14	FLAG13	—	—	FLAG10	FLAG9	FLAG8	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	FLAG8	alternateMasterFlag	0: Set alternateMasterFlag to FALSE 1: Set alternateMasterFlag to TRUE.	R/W
b9	FLAG9	twoStepFlag	Set this bit to 0 (FALSE).	R/W
b10	FLAG10	unicastFlag	0: Set unicastFlag to FALSE 1: Set unicastFlag to TRUE.	R/W
b12, b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	FLAG13	PTP profile Specific 1	0: Set PTP profile Specific 1 to FALSE 1: Set PTP profile Specific 1 to TRUE.	R/W
b14	FLAG14	PTP profile Specific 2	0: Set PTP profile Specific 2 to FALSE 1: Set PTP profile Specific 2 to TRUE.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYNFR register specifies the flagField section of the header when the SYNFP module is to generate a Sync message. The values specified in this register are only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

30.2.46 Delay_Req Message Flag Field Setting Register (DYRQFR)

Address(es): EPTPC0.DYRQFR 4006 5858h, EPTPC1.DYRQFR 4006 5C58h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FLAG14	FLAG13	—	—	FLAG10	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b9 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b10	FLAG10	unicastFlag	0: Set unicastFlag to FALSE 1: Set unicastFlag to TRUE.	R/W
b12, b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	FLAG13	PTP profile Specific 1	0: Set PTP profile Specific 1 to FALSE. 1: Set PTP profile Specific 1 to TRUE.	R/W

Bit	Symbol	Bit name	Description	R/W
b14	FLAG14	PTP profile Specific 2	0: Set PTP profile Specific 2 to FALSE. 1: Set PTP profile Specific 2 to TRUE.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The DYRQFR register specifies the flagField section of the header when the SYNFP module is to generate a Delay_Req or Pdelay_Req message. The values specified in this register are only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

30.2.47 Delay_Resp Message Flag Field Setting Register (DYRPFR)

Address(es): EPTPC0.DYRPFR 4006 585Ch, EPTPC1.DYRPFR 4006 5C5Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FLAG14	FLAG13	—	—	FLAG10	FLAG9	FLAG8	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	FLAG8	alternateMasterFlag*1	0: Set alternateMasterFlag to FALSE 1: Set alternateMasterFlag to TRUE.	R/W
b9	FLAG9	twoStepFlag*2	Set this bit to 0 (FALSE).	R/W
b10	FLAG10	unicastFlag	0: Set unicastFlag to FALSE 1: Set unicastFlag to TRUE.	R/W
b12, b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	FLAG13	PTP profile Specific 1	0: Set PTP profile Specific 1 to FALSE 1: Set PTP profile Specific 1 to TRUE.	R/W
b14	FLAG14	PTP profile Specific 2	0: Set PTP profile Specific 2 to FALSE 1: Set PTP profile Specific 2 to TRUE.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is reserved for Pdelay_Resp messages. Set the bit to 0.
Note 2. This bit is reserved for Delay_Resp messages.

The DYRPFR register specifies the flagField section of the header when the SYNFP module is to generate a Delay_Resp or PDelay_Resp message. The values specified in this register are only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1. Do not change the settings in this register while transmission of Delay_Resp or Pdelay_Resp messages is enabled. After disabling this transmission processing, do not change the settings in this register until the SYSR.RESDN flag is set to 1.

30.2.48 SYNFP Local Clock ID Register (SYCIDRU, SYCIDRL)

Address(es): EPTPC0.SYCIDRU 4006 5860h, EPTPC1.SYCIDRU 4006 5C60h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the upper-order 32 bits of the clock-ID of the local port.	R/W

Address(es): EPTPC0.SYCIDRL 4006 5864h, EPTPC1.SYCIDRL 4006 5C64h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the lower-order 32 bits of the clock-ID of the local port.	R/W

The SYCIDR registers specify the clock-ID of the local port. They are used for the clockIdentity section in the sourcePortIdentity field of the header when the SYNFP module is to generate a PTP message. When a PTP message is received, the value in these registers is compared with the clockIdentity section in the sourcePortIdentity field of the PTP message to determine whether the message is one that was transmitted by the local device. In most cases, this setting should be the same as the value of portDS.portIdentity.clockIdentity.

Do not change the settings in these registers while reception or transmission of PTP messages is enabled.

30.2.49 SYNFP Local Port Number Register (SYPNUMR)

Address(es): EPTPC0.SYPNUMR 4006 5868h, EPTPC1.SYPNUMR 4006 5C68h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PNUM[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	PNUM[15:0]	Local Port Number Setting	These bits specify the port number of the local port.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYPNUMR register specifies the port number of the local port. This register is used for the portNumber section in the sourcePortIdentity field of the header when the SYNFP module is to generate a PTP message. When a PTP message is received, the value in this register is compared with the portNumber section in the sourcePortIdentity field of the PTP message to determine whether the message is one that was transmitted by the local device. In most cases, this setting should be the same as the value of portDS.portIdentity.portNumber.

Do not change the settings in this register while reception or transmission of PTP messages is enabled.

30.2.50 SYNFP Register Value Load Directive Register (SYRVLDR)

Address(es): EPTPC0.SYRVLDR 4006 5880h, EPTPC1.SYRVLDR 4006 5C80h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	BMUP	BMC Update	When this bit is set to 1, the SYNFP module simultaneously reflects values of registers storing the information that identifies MasterClock.	W
b1	STUP	State Update	When this bit is set to 1, the SYNFP module simultaneously reflects register values for PTP message reception and transmission.	W
b2	ANUP	Announce Message Generation Information Update	When this bit is set to 1, the Announce message generation block simultaneously reflects register values required for generating Announce messages.	W
b31 to b3	—	Reserved	The write value should be 0.	W

The SYRVLDR register simultaneously updates multiple register values in the SYNFP module.

BMUP bit (BMC Update)

When the BMUP bit is set to 1, the SYNFP module simultaneously reflects the values of the following registers that store the information that identifies MasterClock:

- MTCIDU and MTCIDL registers
- MTPID register.

STUP bit (State Update)

When the STUP bit is set to 1, the SYNFP module simultaneously reflects the values of the following registers and bits for PTP message reception and transmission:

- SYNFR register
- DYRQFR register
- SYTLIR.DREQ[7:0] bits
- RSTOUTR register
- SYRFL1R register
- SYRFL2R register
- SYTRENR register.

ANUP bit (Announce Message Generation Information Update)

When the ANUP bit is set to 1, the Announce message generation block simultaneously reflects the values of the following registers and bits required for generating Announce messages:

- ANFR register
- SYTLIR.ANCE[7:0] bits
- GMPR register
- GMCQR register
- GMIDRU and GMIDRL registers
- CUOTSR register
- SRR register.

30.2.51 SYNFP Reception Filter Register 1 (SYRFL1R)

b29			0: The PRC-TC does not relay messages between ports 0 and 1 1: The PRC-TC relays messages between ports 0 and 1.	R/W
b30			0: Do not process messages in the SYNFP 1: Process messages in the SYNFP.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

The SYRFL1R register specifies filtering for the reception of PTP messages. Multiple bits can be set to 1 for each message type. Setting all bits for a message type to 0 leads to all messages of the given type being discarded. The values specified in this register are only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

30.2.52 SYNFP Reception Filter Register 2 (SYRFL2R)

Address(es): EPTPC0.SYRFL2R 4006 5894h, EPTPC1.SYRFL2R 4006 5C94h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	MAN[1:0]	Management Message Processing Setting	0: Do not transfer messages to the PTPEDMAC 1: Transfer messages to the PTPEDMAC.	R/W
b1			0: The PRC-TC does not relay messages between ports 0 and 1 1: The PRC-TC relays messages between ports 0 and 1.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	SIG[1:0]	Signaling Message Processing Setting	0: Do not transfer messages to the PTPEDMAC 1: Transfer messages to the PTPEDMAC.	R/W
b5			0: The PRC-TC does not relay messages between ports 0 and 1 1: The PRC-TC relays messages between ports 0 and 1.	R/W
b27 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b28	ILL[1:0]	Illegal Message Processing Setting*1	0: Do not transfer messages to the PTPEDMAC 1: Transfer messages to the PTPEDMAC.	R/W
b29			0: The PRC-TC does not relay messages between ports 0 and 1 1: The PRC-TC relays messages between ports 0 and 1.	R/W
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. PTP messages other than PTP v2 messages and messages of undefined type are handled as illegal messages.

The SYRFL2R register specifies filtering for the reception of PTP messages. Multiple bits can be set to 1 for each message type. Setting all bits for a message type to 0 leads to all messages of the given type being discarded. The values specified in this register are only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

30.2.53 SYNFP Transmission Enable Register (SYTRENR)

Address(es): EPTPC0.SYTRENR 4006 5898h, EPTPC1.SYTRENR 4006 5C98h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	PDRQ	—	—	—	DRQ	—	—	—	SYNC	—	—	—	ANCE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ANCE	Announce Message Transmission Enable	0: Do not transmit Announce messages 1: Transmit Announce messages.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit name	Description	R/W
b4	SYNC	Sync Message Transmission Enable	0: Do not transmit Sync messages 1: Transmit Sync messages.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	DRQ	Delay_Req Message Transmission Enable	0: Do not transmit Delay_Req messages 1: Transmit Delay_Req messages.	R/W
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	PDRQ	Pdelay_Req Message Transmission Enable	0: Do not transmit Pdelay_Req messages 1: Transmit Pdelay_Req messages.	R/W
b31 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYTRENR register enables or disables transmission of PTP messages. Do not set the PDRQ and DRQ bits to 1 at the same time. Operation is not guaranteed when both bits are set to 1. The values specified in this register are only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

30.2.54 Master Clock ID Register (MTCIDU, MTCIDL)

Address(es): EPTPC0.MTCIDU 4006 58A0h, EPTPC1.MTCIDU 4006 5CA0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the upper-order 32 bits of the clock-ID of the master clock.	R/W

Address(es): EPTPC0.MTCIDL 4006 58A4h, EPTPC1.MTCIDL 4006 5CA4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the lower-order 32 bits of the clock-ID of the master clock.	R/W

The MTCIDU and MTCIDL register specify the clock-ID of the master clock for synchronization. The value specified in these registers is only reflected in the SYNFP module after the SYRVLDR.BMUP bit is set to 1.

30.2.55 Master Clock Port Number Register (MTPID)

Address(es): EPTPC0.MTPID 4006 58A8h, EPTPC1.MTPID 4006 5CA8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PNUM[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	PNUM[15:0]	Master Clock Port Number Setting	These bits specify the port number of the master clock.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The MTPID register specifies the port number of the master clock for synchronization. The value specified in this register is only reflected in the SYNFP module after the SYRVLDR.BMUP bit is set to 1. In normal usage, set the value of parentDS.parentPortIdentity.portNumber in this register.

30.2.56 SYNFP Transmission Interval Setting Register (SYTLIR)

Address(es): EPTPC0.SYTLIR 4006 58C0h, EPTPC1.SYTLIR 4006 5CC0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	DREQ[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC[7:0]								ANCE[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit name	Description	R/W
b7 to b0	ANCE[7:0]	Announce Message Transmission Interval Setting	These bits set the interval for the transmission of Announce messages.	R/W
b15 to b8	SYNC[7:0]	Sync Message Transmission Interval Setting	These bits set the interval for the transmission of Sync messages. The setting is also placed in the logMessageInterval field of transmitted Sync messages.	R/W
b23 to b16	DREQ[7:0]	Delay_Req Transmission Interval Average Value/Pdelay_Req Transmission Interval Setting	The bits set the average interval for the transmission of Delay_Req messages and the interval for the transmission of Pdelay_Req messages.The setting is also placed in the logMessageInterval field of Delay_Resp messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYTLIR register specifies the interval for the transmission of messages generated by the SYNFP module. The setting is an integer logarithm in base 2 (log2(x)) and determines a value x in seconds. In other words, the interval for transmission is 2n (s), where n is the setting. The available settings are from -7 (F9h) to +6 (06h).

Examples:

- If the setting is 06h, then the interval for transmission is $2^6 = 64$ (s)
- If the setting is 00h, then the interval for transmission is $2^0 = 1$ (s)

- If the setting is FFh, then the interval for transmission is 2^{-1} = 0.5 (s) = 500 (ms)
- If the setting is F9h, then the interval for transmission is 2^{-7} = 0.0078125 (s) = 7.8125 (ms).

The value specified in the ANCE[7:0] bits is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1. The values specified in the DREQ[7:0] and SYNC[7:0] bits are only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

30.2.57 SYNFP Received logMessageInterval Value Indication Register (SYRLIR)

Address(es): EPTPC0.SYRLIR 4006 58C4h, EPTPC1.SYRLIR 4006 5CC4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	DRESP[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC[7:0]								ANCE[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	ANCE[7:0]	Announce Message logMessageInterval Field Indication Flag	These bits indicate the logMessageInterval field value of a received Announce message.	R
b15 to b8	SYNC[7:0]	Sync Message logMessageInterval Field Indication Flag	These bits indicate the logMessageInterval field value of a received Sync message.	R
b23 to b16	DRESP[7:0]	Delay_Resp Message logMessageInterval Field Indication Flag	These bits indicate the logMessageInterval field value of a received Delay_Resp message.	R
b31 to b24	—	Reserved	These bits are read as 0.	R

The SYRLIR register indicates the logMessageInterval field values of received PTP messages.

30.2.58 offsetFromMaster Value Register (OFMRU, OFMRL)

Address(es): EPTPC0.OFMRU 4006 58C8h, EPTPC1.OFMRU 4006 5CC8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits indicate the upper-order 32 bits of the calculated offsetFromMaster value.	R

Address(es): EPTPC0.OFMRL 4006 58CCh, EPTPC1.OFMRL 4006 5CCCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits indicate the lower-order 32 bits of the calculated offsetFromMaster value.	R

The OFMRU and OFMRL registers indicate the calculated offsetFromMaster value. The value is expressed as a two's complement in nanoseconds. The numeric representation differs from that of the offsetFromMaster member of the current data set (currentDS), as shown in the following note. For reads, access the registers in the order of OFMRU, OFMRL.

Note 1. The value of currentDS.offsetFromMaster is multiplied by 2^{16}. Example: 2.5 (ns) = 00000000_00028000h

30.2.59 meanPathDelay Value Register (MPDRU, MPDRL)

Address(es): EPTPC0.MPDRU 4006 58D0h, EPTPC1.MPDRU 4006 5CD0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	GMPR2[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	GMPR2[7:0]	grandmasterPriority2 Field Value Setting	These bits specify the value of the grandmasterPriority2 fields of Announce messages.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b23 to b16	GMPR1[7:0]	grandmasterPriority1 Field Value Setting	These bits specify the value of the grandmasterPriority1 fields of Announce messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GMPR register specifies the grandmasterPriority1 and grandmasterPriority2 field values of Announce messages generated by the SYNFP module. The values specified in this register are only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

30.2.61 grandmasterClockQuality Field Setting Register (GMCQR)

Address(es): EPTPC0.GMCQR 4006 58E4h, EPTPC1.GMCQR 4006 5CE4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the value of the grandmasterClockQuality fields of Announce messages. The associations between bits and the grandmasterClockQuality fields are as follows: b31 to b24: clockClass b23 to b16: clockAccuracy b15 to b0: offsetScaledLogVariance.	R/W

The GMCQR register specifies the grandmasterClockQuality field value of Announce messages generated by the SYNFP module. The value specified in the GMCQR register is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

30.2.62 grandmasterIdentity Field Setting Register (GMIDRU, GMIDRL)

Address(es): EPTPC0.GMIDRU 4006 58E8h, EPTPC1.GMIDRU 4006 5CE8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the upper-order 32 bits of the value of the grandmasterIdentity fields of Announce messages.	R/W

Address(es): EPTPC0.GMIDRL 4006 58ECh, EPTPC1.GMIDRL 4006 5CECh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the lower-order 32 bits of the value of the grandmasterIdentity fields of Announce messages.	R/W

The GMIDRU and GMIDRL registers specify the grandmasterIdentity field value of Announce messages generated by the SYNFP module. The value specified in these registers is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

30.2.63 currentUtcOffset/timeSource Field Setting Register (CUOTSR)

Address(es): EPTPC0.CUOTSR 4006 58F0h, EPTPC1.CUOTSR 4006 5CF0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CUTO[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TSRC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	TSRC[7:0]	timeSource Field Setting	These bits specify the value of the timeSource fields of Announce messages.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b31 to b16	CUTO[15:0]	currentUtcOffset Field Setting	These bits specify the value of the currentUtcOffset fields of Announce messages.	R/W

The CUOTSR register specifies the currentUtcOffset and timeSource field values of Announce messages generated by the SYNFP module. The values specified in this register are only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

30.2.64 stepsRemoved Field Setting Register (SRR)

Address(es): EPTPC0.SRR 4006 58F4h, EPTPC1.SRR 4006 5CF4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SRMV[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	SRMV[15:0]	stepsRemoved Field Value Setting	These bits specify the value of the stepsRemoved fields of Announce messages.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SRR register specifies the stepsRemoved field value of Announce messages generated by the SYNFP module. The value specified in this register is only reflected in the SYNFP module after the SYRVLDR.ANUP bit is set to 1.

30.2.65 PTP-primary Message Destination MAC Address Setting Register (PPMACRU, PPMACRL)

Address(es): EPTPC0.PPMACRU 4006 5900h, EPTPC1.PPMACRU 4006 5D00h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	1	1	0	1	1	0	0	0	1	1	0	0	1

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the upper-order 24 bits of the destination MAC address for PTP-primary messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Address(es): EPTPC0.PPMACRL 4006 5904h, EPTPC1.PPMACRL 4006 5D04h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the lower-order 24 bits of the destination MAC address for PTP-primary messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PPMACR registers specify the destination MAC address for PTP-primary messages. In normal usage, set 01:1B:19:00:00:00 in these registers. The value is used in the destination MAC address field when generating an Ethernet frame for a PTP-primary message. It is also used as a determining condition for received frames carrying PTP messages. Set these registers before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.66 PTP-pdelay Message MAC Address Setting Register (PDMACRU, PDMACRL)

Address(es): EPTPC0.PDMACRU 4006 5908h, EPTPC1.PDMACRU 4006 5D08h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	0	0	0	0	0	0	0	1	1	0	0	0	0	1	0

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the upper-order 24 bits of the destination MAC address for PTP-pdelay messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Address(es): EPTPC0.PDMACRL 4006 590Ch, EPTPC1.PDMACRL 4006 5D0Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the lower-order 24 bits of the destination MAC address for PTP-pdelay messages.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PDMACR registers specify the destination MAC address for PTP-pdelay messages. In normal usage, set 01:80:C2:00:00:0E in these registers. This value is used in the destination MAC address field when generating frames carrying PTP-pdelay messages in the Ethernet format. It is also used as a determining condition for received frames carrying PTP messages. Set these registers before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.67 PTP Message Ethertype Setting Register (PETYPER)

Address(es): EPTPC0.PETYPER 4006 5910h, EPTPC1.PETYPER 4006 5D10h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TYPE[15:0]															
Value after reset:	1	0	0	0	1	0	0	0	1	1	1	1	0	1	1	1

Bit	Symbol	Bit name	Description	R/W
b15 to b0	TYPE[15:0]	PTP Message Ethertype Value Setting	These bits specify the Ethertype field value for frames in the Ethernet II format.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PETYPER register specifies the Ethertype field for frames carrying the PTP messages. In normal usage, set 0000 88F7h in this register. This value is used in the Ethertype field when generating frames carrying PTP messages in the Ethernet II format. It is also used as a determining condition for received frames carrying PTP messages. Set these registers before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.68 PTP-primary Message Destination IP Address Setting Register (PPIPR)

Address(es): EPTPC0.PPIPR 4006 5920h, EPTPC1.PPIPR 4006 5D20h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	1

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the destination IP address for PTP-primary messages.	R/W

The PPIPR register specifies the destination IP address for PTP messages. In normal usage, set E000 0181h (224.0.1.129) in this register. This value is used in the destination IP address field when generating frames carrying PTP-primary messages in the IPv4 format. The lower-order 23 bits are also used in the destination MAC address field for Ethernet frames. The value is also used as a determining condition for received frames carrying PTP messages. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.69 PTP-pdelay Message Destination IP Address Setting Register (PDIPR)

Address(es): EPTPC0.PDIPR 4006 5924h, EPTPC1.PDIPR 4006 5D24h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	1	1	0	1	0	1	1

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the destination IP address for PTP-pdelay messages.	R/W

The PDIPR register specifies the destination IP address for PTP-pdelay messages. In normal usage, set E000 006Bh (224.0.0.107) in this register. The value is used in the destination IP address field when generating frames carrying PTP-pdelay messages in the IPv4 format. The lower-order 23 bits are also used in the destination MAC address field for Ethernet frames. The value is also used as a determining condition for received frames carrying PTP messages. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.70 PTP Event Message TOS Setting Register (PETOSR)

Address(es): EPTPC0.PETOSR 4006 5928h, EPTPC1.PETOSR 4006 5D28h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	EVTO[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	EVTO[7:0]	PTP Event Message TOS Field Value Setting	These bits specify the value of the TOS field within the IPv4 headers of PTP event messages.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PETOSR register specifies the TOS (type of service) field value within the IPv4 headers of PTP event messages. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.71 PTP general Message TOS Setting Register (PGTOSR)

Address(es): EPTPC0.PGTOSR 4006 592Ch, EPTPC1.PGTOSR 4006 5D2Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	GETO[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	GETO[7:0]	PTP general Message TOS Field Value Setting	These bits specify the value of the TOS field within the IPv4 headers of PTP general messages.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PGTOSR register specifies the TOS (type of service) field value within the IPv4 headers of PTP general messages. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.72 PTP-primary Message TTL Setting Register (PPTTLR)

Address(es): EPTPC0.PPTTLR 4006 5930h, EPTPC1.PPTTLR 4006 5D30h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	PRTL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	PRTL[7:0]	PTP-primary Message TTL Field Value Setting	These bits specify the value of the TTL field within the IPv4 headers of PTP-primary messages.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PPTTLR register specifies the TTL (time to live) field value within the IPv4 headers of PTP-primary messages. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.73 PTP-pdelay Message TTL Setting Register (PDTTLR)

Address(es): EPTPC0.PDTTLR 4006 5934h, EPTPC1.PDTTLR 4006 5D34h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	PDTL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit name	Description	R/W
b7 to b0	PDTL[7:0]	PTP-pdelay Message TTL Field Value	These bits specify the value of the TTL field within the IPv4 headers of PTP-pdelay messages.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PDTTLR register specifies the TTL field value within the IPv4 headers of PTP-pdelay messages. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.74 PTP Event Message UDP Destination Port Number Setting Register (PEUDPR)

Address(es): EPTPC0.PEUDPR 4006 5938h, EPTPC1.PEUDPR 4006 5D38h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EVUPT[15:0]															
Value after reset:	0	0	0	0	0	0	0	1	0	0	1	1	1	1	1	1

Bit	Symbol	Bit name	Description	R/W
b15 to b0	EVUPT[15:0]	PTP Event Message Destination Port Number Setting	These bits specify the value of the destination port number field within the UDP headers of PTP event messages.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PEUDPR register specifies the destination port number field value within the UDP headers of PTP event messages. In normal usage, set 013Fh (319) in this register. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.75 PTP general Message UDP Destination Port Number Setting Register (PGUDPR)

Address(es): EPTPC0.PGUDPR 4006 593Ch, EPTPC1.PGUDPR 4006 5D3Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	GEUPT[15:0]															
Value after reset:	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	GEUPT[15:0]	PTP general Message Destination Port Number	These bits specify the value of the destination port number field within the UDP headers of PTP general messages.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PGUDPR register specifies the destination port number field value within the UDP headers of PTP general messages. In normal usage, set 0140h (320) in this register. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.76 Frame Reception Filter Setting Register (FFLTR)

Address(es): EPTPC0.FFLTR 4006 5940h, EPTPC1.FFLTR 4006 5D40h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXTPRM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ENB	PRT	SEL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SEL	Receive MAC Address Select*1	These bits select how filtering is handled when multicast frames other than PTP messages are received. b2 b0 0 0: 0: Disable filtering (receive all multicast frames) 0 0: 1: Disable filtering (receive all multicast frames) 0 1: 0: Disable filtering (receive all multicast frames) 0 1: 1: Disable filtering (receive all multicast frames) 1 0: 0: Do not receive multicast frames 1 0: 1: Do not receive multicast frames 1 1: 0: Only receive multicast frames matching the MAC address setting in the FMAC0RU and FMAC0RL registers 1 1: 1: Only receive multicast frames matching the MAC address setting in the FMAC1RU and FMAC1RL registers.	R/W
b1	PRT	Frame Reception Enable*1		R/W
b2	ENB	Reception Filter Enable*1		R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	EXTPRM	Extended Promiscuous Mode Setting	0: Normal operation (receive unicast frames addressed to the EPTPC, filter PTP frames, filter multicast frames, and receive all broadcast frames) 1: Extended promiscuous mode (receive all frames).	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The setting in these bits is only valid when the EXTPRM bit is 0.

The FFLTR register switches extended promiscuous mode on or off and selects how filtering is handled when multicast frames other than PTP messages are received. To enable the filter for the reception of multicast frames other than PTP messages, set the ENB, PRT, and SEL bits to 110b or 111b. Frames passed by the filter are then transferred by EDMACn. Relaying of multicast frames other than PTP messages is based on the TRNMR register setting, and relaying and reception of PTP messages is based on the SYRFL1R and SYRFL2R register settings.

Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.77 Frame Reception Filter MAC Address 0 Setting Register (FMAC0RU, FMAC0RL)

Address(es): EPTPC0.FMAC0RU 4006 5960h, EPTPC1.FMAC0RU 4006 5D60h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the upper-order 24 bits of the destination MAC address for received multicast frames.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Address(es): EPTPC0.FMAC1RL 4006 596Ch, EPTPC1.FMAC1RL 4006 5D6Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b23 to b0	—	—	These bits specify the lower-order 24 bits of the destination MAC address for received multicast frames.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The FMAC1RU and FMAC1RL registers specify the MAC address for filtering during the reception of multicast frames other than PTP messages. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.79 Asymmetric Delay Setting Register (DASYMRU, DASYMRL)

Address(es): EPTPC0.DASYMRU 4006 59C0h, EPTPC1.DASYMRU 4006 5DC0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	—	—	These bits specify the upper-order 16 bits of the asymmetric delay value. Set these bits to 0000h.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Address(es): EPTPC0.DASYMRL 4006 59C4h, EPTPC1.DASYMRL 4006 5DC4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the lower-order 32 bits of the asymmetric delay value. Set these bits to 0000 0000h.	R/W

The DASYMRU and DASYMRL registers specify the asymmetric delay value (delayAsymmetry). Set registers DASYMRU and DASYMRL to 0000 0000h.

30.2.80 Timestamp Latency Setting Register (TSLATR)

Address(es): EPTPC0.TSLATR 4006 59C8h, EPTPC1.TSLATR 4006 5DC8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	INGP[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EGP[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	EGP[15:0]	Output Port Timestamp Latency Setting	These bits specify the timestamp latency (ns) for the output ports.	R/W
b31 to b16	INGP[15:0]	Input Port Timestamp Latency Setting	These bits specify the timestamp latency (ns) for the input ports.	R/W

The TSLATR register specifies the amount of latency in timestamp acquisition in nanoseconds. Do not change the settings while reception or transmission of PTP messages is enabled.

EGP[15:0] bits (Output Port Timestamp Latency Setting)

Set the EGP[15:0] bits to the fixed values listed in Table 30.8 for the target system. The timestamp latency differs with the link transfer rate (100 or 10 Mbps) and the frequency of the STCA clock (20, 25, 50, or 100 MHz).

Table 30.8 EGP[15:0] bit settings (ns)

		STCA clock frequency			
Link transfer rate		20 MHz	25 MHz	50 MHz	100 MHz
MII	100 Mbps	590	625	695	730
	10 Mbps	7,430	7,465	7,535	7,570
RMII	100 Mbps	770	805	875	910
	10 Mbps	9,230	9,265	9,335	9,370

INGP[15:0] bits (Input Port Timestamp Latency Setting)

Set the INGP[15:0] bits to the fixed values listed in Table 30.9 for the target system. The timestamp latency differs with the link transfer rate (100 or 10 Mbps) and the frequency of the STCA clock (20, 25, 50, or 100 MHz).

Table 30.9 INGP[15:0] bit settings (ns)

		STCA clock frequency			
Link transfer rate		20 MHz	25 MHz	50 MHz	100 MHz
MII	100 Mbps	980	945	875	840
	10 Mbps	8,180	8,145	8,075	8,015
RMII	100 Mbps	1,060	1,025	955	920
	10 Mbps	8,980	8,945	8,875	8,815

30.2.81 SYNFP Operation Setting Register (SYCONFR)

Address(es): EPTPC0.SYCONFR 4006 59CCh, EPTPC1.SYCONFR 4006 5DCCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	TCMOD	—	—	—	FILDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SBDIS	—	—	—	—	TCYC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	TCYC[7:0]	PTP Message Transmission Interval Setting	These bits specify the time from the completion of one transmission to the start of the next in transmission clock cycles. A value n in these bits means that a transmission interval of n cycles is secured. No interval is secured if the setting is 00h. Recommended setting: 28h (40 cycles).	R/W
b11 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	SBDIS	Sync Message Transmission Bandwidth Securing Disable	0: Enable securing of the bandwidth for the transmission of SYNC messages (give lower priority to transfers by the EDMAC) 1: Disable securing of the bandwidth for the transmission of SYNC messages (give higher priority to transfers by the EDMAC).	R/W
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	FILDIS	Receive Message domainNumber Filter Disable	0: Include comparison with the domainNumber field in the filtering conditions for the reception of PTP messages 1: Do not include comparison with the domainNumber field in the filtering conditions for the reception of PTP messages.	R/W
b19 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b20	TCMOD	TC Mode Setting	0: E2E TC 1: P2P TC.	R/W
b31 to b21	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYCONFR register controls operation of the SYNFP module. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

TCYC[7:0] bits (PTP Message Transmission Interval Setting)

The TCYC[7:0] bits specify a wait time between packets to secure a fixed transmission delay. The setting defines the interval from input of the transmission completed signal from the ETHERC to output of the next transmission request as a number of cycles of the transmission clock (which runs at 2.5 MHz if the link transfer rate is 10 Mbps and at 25 MHz if the link transfer rate is 100 Mbps).

SBDIS bit (Sync Message Transmission Bandwidth Securing Disable)

The SBDIS bit disables securing of bandwidth to increase accuracy of the interval for the transmission of SYNC messages.

TCMOD bit (TC Mode Setting)

The TCMOD bit specifies the delay mechanism for operation as a transparent clock (TC). The bit setting changes the method of calculating the values used in the correctionField field during operation as a TC.

30.2.82 SYNFP Frame Format Setting Register (SYFORMR)

Address(es): EPTPC0.SYFORMR 4006 59D0h, EPTPC1.SYFORMR 4006 5DD0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FORM1	FORM0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FORM0	Ethernet Frame Format Setting	0: Ethernet II frame format 1: IEEE802.3 frame format.	R/W
b1	FORM1	Ethernet/UDP Encapsulation	0: PTP directly over Ethernet 1: PTP over UDP/IPv4.	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SYFORMR register specifies the format for frame generation by the SYNFP module. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

30.2.83 Response Message Reception Timeout Register (RSTOUTR)

Address(es): EPTPC0.RSTOUTR 4006 59D4h, EPTPC1.RSTOUTR 4006 5DD4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	Response Message Reception Timeout Time Setting	If no response message is received within n × 1024 (ns), where n is the setting in these bits, a timeout is detected.	R/W

The RSTOUTR register specifies the time for detection of a timeout during the reception of PTP response messages (Delay_Resp and Pdelay_Resp). If no Delay_Resp or Pdelay_Resp message is received within the time specified in this register after transmission of a Delay_Req or Pdelay_Req message, the SYSR.DRPTO flag is set to 1. The value specified in this register is only reflected in the SYNFP module after the SYRVLDR.STUP bit is set to 1.

30.2.84 PTP Reset Register (PTRSTR)

Address(es): EPTPC_CFG.PTRSTR 4006 4500h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RESET
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	RESET	EPTPC Software Reset	0: Do not reset the EPTPC 1: Reset the EPTPC.*1	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Do not access the EPTPC-related registers other than this register while a software reset is being issued.

The PTRSTR register resets the EPTPC. It takes 64 cycles of the peripheral module clock (PCLKA) until initialization of the EPTPC is complete. After the RESET bit is set to 1, wait for 64 cycles of the PCLKA before clearing its value to 0.

30.2.85 STCA Clock Select Register (STCSELR)

Address(es): EPTPC_CFG.STCSELR 4006 4504h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SCLKSEL[2:0]			—	—	—	—	—	SCLKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	SCLKDIV[2:0]	PCLKA Clock Frequency Division	b2 b0 0 0 1: 1 0 1 0: 1/2 0 1 1: 1/3 1 0 0: 1/4 1 0 1: 1/5 1 1 0: 1/6. Other settings are prohibited.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b10 to b8	SCLKSEL[2:0]	STCA Clock Select	b10 b8 0 0 0: Use PCLKA clock divided by 1 to 6 0 1 0: Input clock from the REF50CK0 pin 0 1 1: Input clock from the REF50CK1 pin. Other settings are prohibited.	R/W
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The STCSELR register selects the STCA clock signal for the EPTPC. Set this register before starting the EDMAC, ETHERC, or PTPEDMAC. Do not change the settings while the EPTPC is operating.

SCLKDIV[2:0] bits (PCLKA Clock Frequency Division)

The SCLKDIV[2:0] bits select the division ratio of PCLKA. When the setting of the SCLKSEL[2:0] bits is 000b, the frequency-divided PCLKA is used as the STCA clock signal.

SCLKSEL[2:0] bits (STCA Clock Select)

The SCLKSEL[2:0] bits select the STCA clock signal for use in the EPTPC.

30.2.86 Bypass 1588 Module Register (BYPASS)

Address(es): EPTPC_CFG.BYPASS 4006 4508h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	BYPASS0	Bypass1588 module for Ether 0ch	0: Use 1588 module for Ether channel 0 1: Bypass 1588 module for Ether channel 0.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	BYPASS1	Bypass1588 module for Ether 1ch	0: Use 1588 module for Ether channel 1 1: Bypass 1588 module for Ether channel 1.	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Do not access the BYPASS register while the Ether module is in operation. When the EPTPC is not used, bypass it by setting the BYPASS register.

30.3 Operation

After reset release, the EPTPC is set to not receive (analyze) or transmit (generate) PTP messages, so it has no effect on the transmission or reception of frames by the ETHERC and EDMAC immediately after reset. The EPTPC registers must be configured for the ETHERC and EDMAC to be able to use packet filtering by MAC address in the SYNFP modules and for relaying between Ethernet ports by the PRC-TC module. Transmission and reception of PTP messages requires setting of EPTPC registers.

Figure 30.4 shows the block diagram of the modules involved in frame transfer and relay.

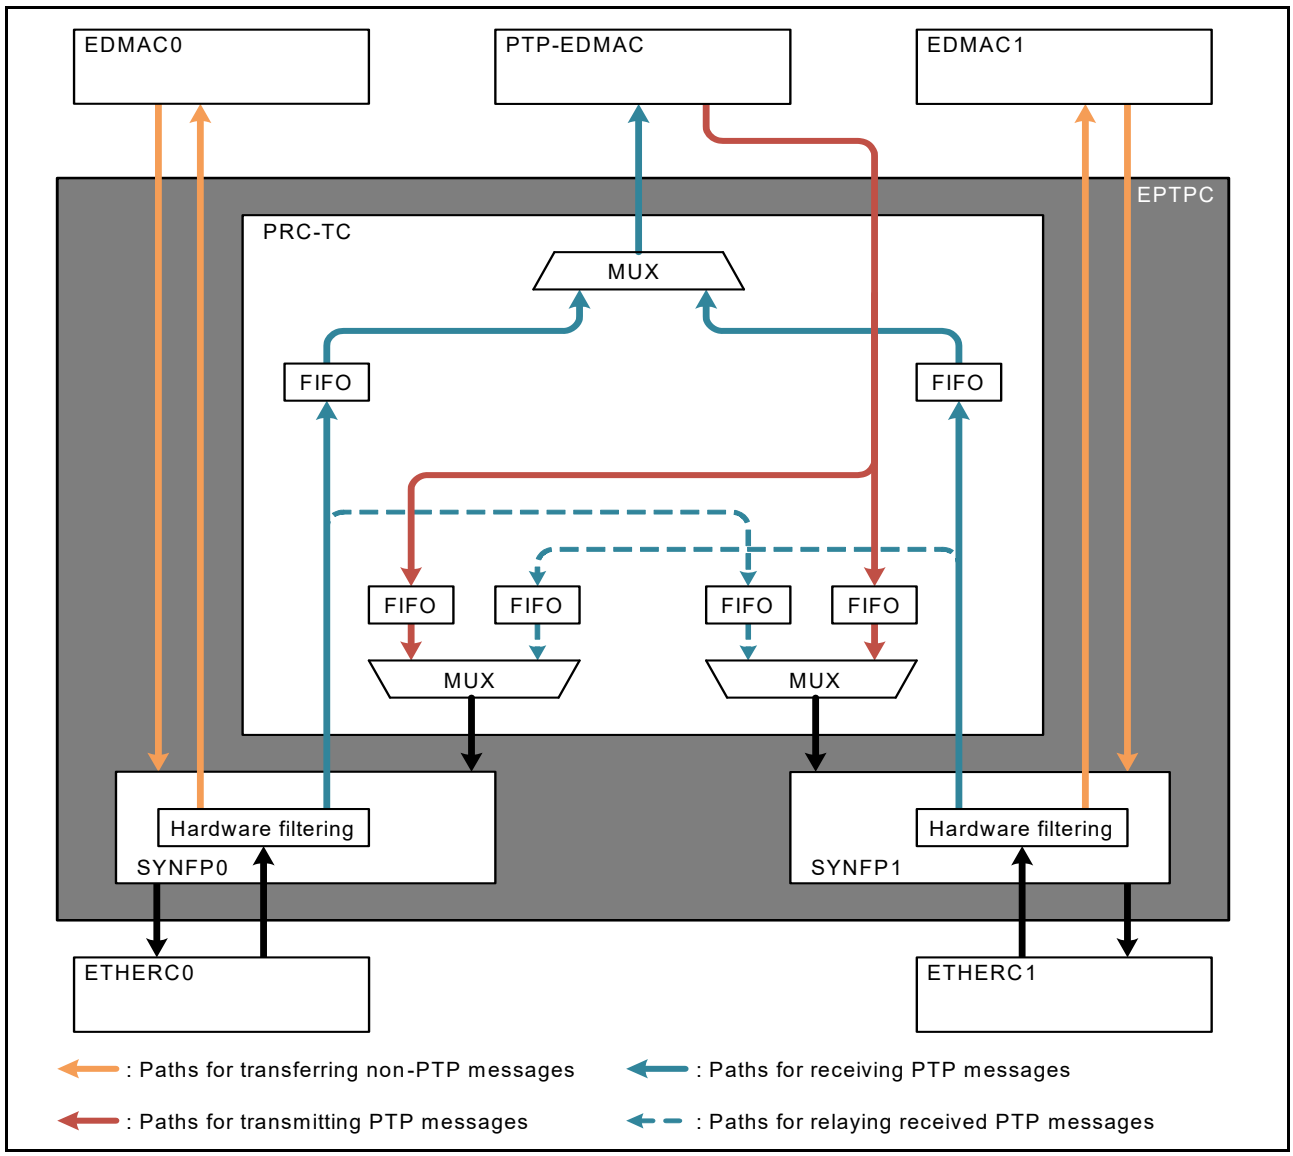

Figure 30.4 Block diagram of the modules involved in frame transfers and relays

30.3.1 Transmission, Reception, and Relaying of Non-PTP Messages

The EPTPC operates in extended promiscuous mode when the FFLTR.EXTPRM bit is 1. In extended promiscuous mode, all frames received by the Ethernet ports are transferred to the EDMAC without filtering. The EPTPC operates in normal mode when the FFLTR.EXTPRM bit is 0. In normal mode, the SYNFP module applies its hardware filtering function to filter frames received by the Ethernet ports.

Frames for one node can also be relayed to the Ethernet port on the other side based on the settings in the TRNMR.FWD0 and FWD1 bits.

The EPTPC and EDMAC transfer received unicast frames if they are for the given node. When a received frame is for

the other node, the EPTPC is able to relay received frames to the other port if relaying between Ethernet ports is enabled.

Operation when multicast frames are received can be configured such that:

- Frames are transferred to the EDMAC
- Frames are not transferred to the EDMAC
- Frames are transferred to the EDMAC only when the address matches the specified MAC address.

The EPTPC also relays multicast frames to the other Ethernet port if relaying between Ethernet ports is enabled.

The EPTPC transfers received broadcast frames to the EDMAC for the receiving Ethernet port. The EPTPC also relays broadcast frames to the other Ethernet port if relaying between Ethernet ports is enabled.

The PRC-TC module, which handles the relaying of frames received by one Ethernet port to the other Ethernet port, has a relaying FIFO buffer for use in this process. Either of two methods for reading from the relaying FIFO can be selected, store-and-forward or cut-through. With the cut-through method, reading from the relaying FIFO starts when it holds more than one frame or more data than a specified threshold value, or when both of these conditions are satisfied. The TRNCTTDR.THVAL[10:0] bits specify the threshold value for reading from the relaying FIFO.

With the cut-through method, when a frame is handled as an error frame because of a fault (such as malformed data being read) after a read operation starts, there is no procedure for notifying the ETHERC module of the error. As a result, the ETHERC might send such error frames as if they were normal frames. To avoid situations of this kind, use the store-and-forward method with the relaying FIFO. With the store-and-forward method, the PRC-TC module internally discards error frames.

30.3.2 Paths for the Transfer of Non-PTP Messages

Messages received through the Ethernet port are transferred to the EDMAC. The PRC-TC module is capable of relaying messages between the Ethernet ports. Figure 30.5 is a diagram of paths for the transmission, reception, and relaying of non-PTP messages.

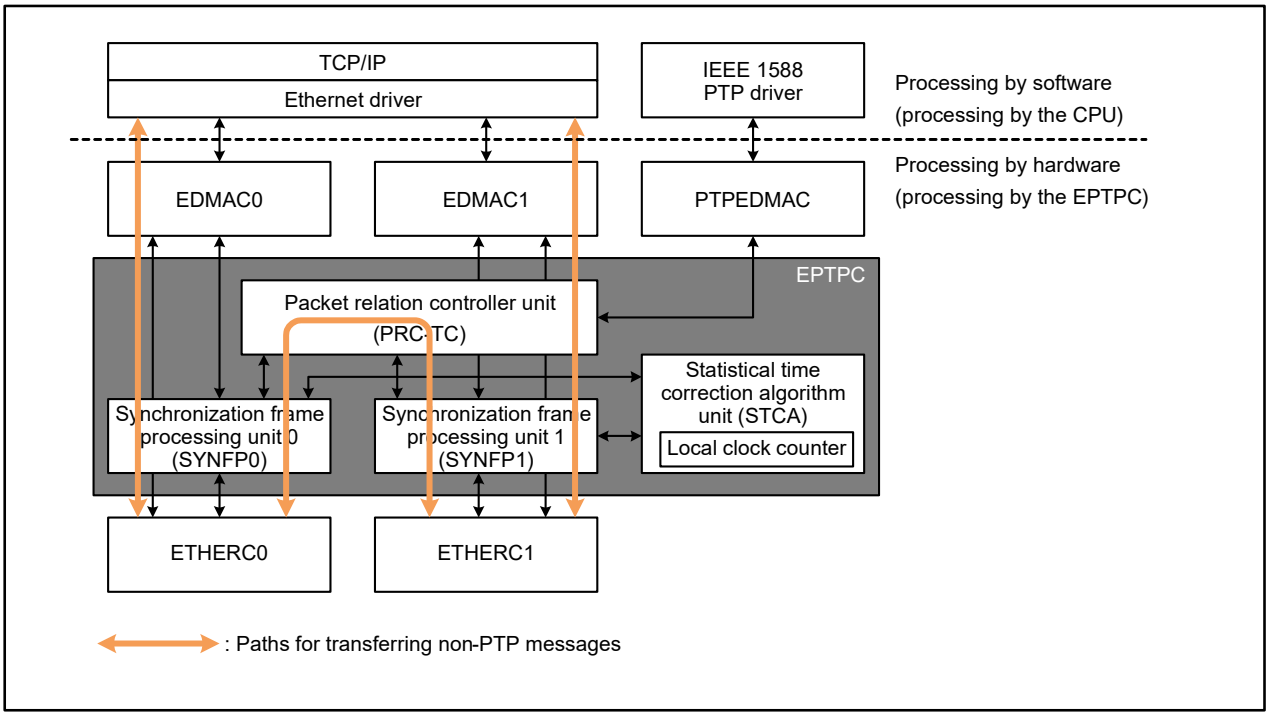

Figure 30.5 Paths for the transmission, reception, and relaying of non-PTP messages

30.3.3 Transmission, Reception, and Relaying of PTP Messages

The EPTPC hardware automatically handles analysis and extraction of fields from received PTP messages, and generation and transmission of PTP messages. However, software must still handle the transmission of certain PTP messages. Table 30.10 shows the specifications for control over the transmission and reception of the different PTP message types.

Table 30.10 Control over the transmission and reception of PTP messages

Message type	Message	Ordinary clock (OC) / Boundary clock (BC)		Transparent clock (TC)
		Master	Slave	
Event	Sync	Generation (automatic)	Reception (automatic)	Relaying (automatic)
	Delay_Req	Generation (automatic)	Reception (automatic)	Relaying (automatic)
	Pdelay_Req	Generation and reception (automatic)	Generation and reception (automatic)	Generation and reception (automatic)
	Pdelay_Resp	Generation and reception (automatic)	Generation and reception (automatic)	Generation and reception (automatic)
General	Announce	Generation (automatic)	Reception (software)	Reception (software)
	Follow_Up	—*1	Reception (automatic)	Relaying (automatic)
	Delay_Resp	Packet generation	Reception (automatic)	Relaying (automatic)
	Pdelay_Resp_Follow_Up	—*1	Reception (automatic)	Relaying (automatic)
	Management	Transmission and reception (software)		Transmission and reception (software) Relaying (automatic)
	Signaling	Transmission and reception (software)		Transmission and reception (software) Relaying (automatic)

Note 1. Control is not required as the clock for this is a one-step clock.

30.3.4 Paths for the Transfer of PTP Messages

Transfer paths for the PTP messages differ based on whether transfer requires processing by software or is automatically processed by hardware.

30.3.4.1 Paths for the Transfer of PTP Messages Requiring Processing by Software

Figure 30.6 shows the paths for the transfer of PTP messages where transfer requires software processing. The figure shows paths for all message, clock-type, and process combinations for which "(software)" is indicated in Table 30.10.

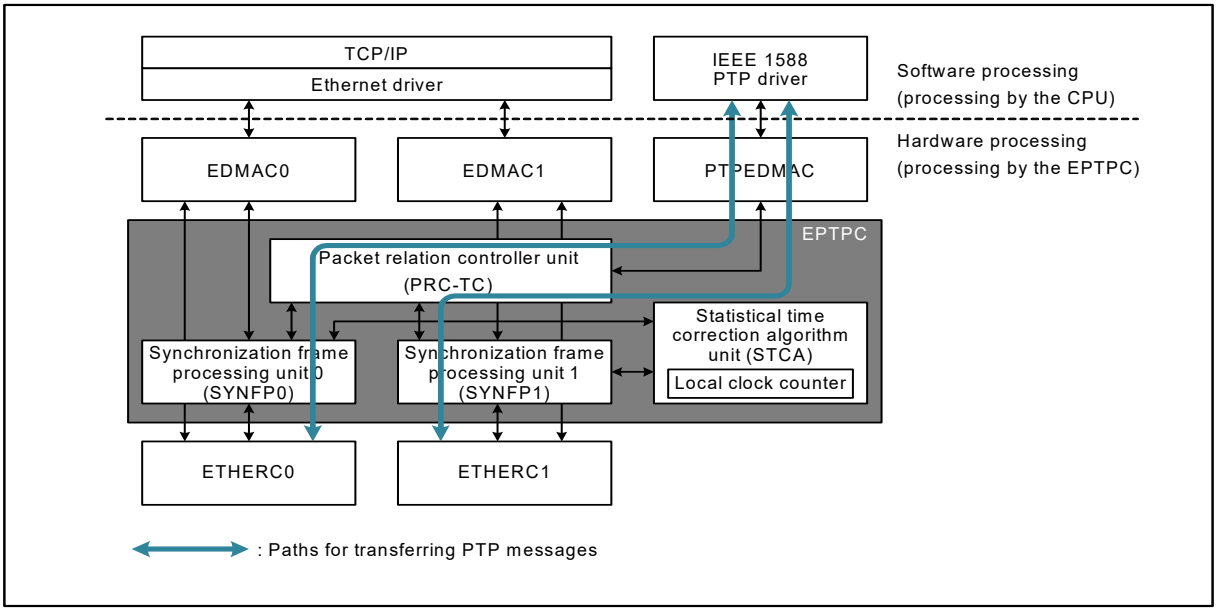

Figure 30.6 Paths for the transfer of PTP messages requiring software processing

30.3.4.2 Paths for the Transfer of PTP Messages Handled Automatically by Hardware

For PTP messages for which the hardware automatically handles the processing, the SYNFP modules handle transmission and reception, and the PRC-TC module handles relaying.

(1) Generation of and response to PTP messages by hardware

Figure 30.7 shows the transfer paths in the automatic generation of and response to PTP messages by the SYNFP modules. The paths in the figure are used for the "Generation (automatic)", "Reception (automatic)", and "Generation and reception (automatic)" operations indicated in Table 30.10.

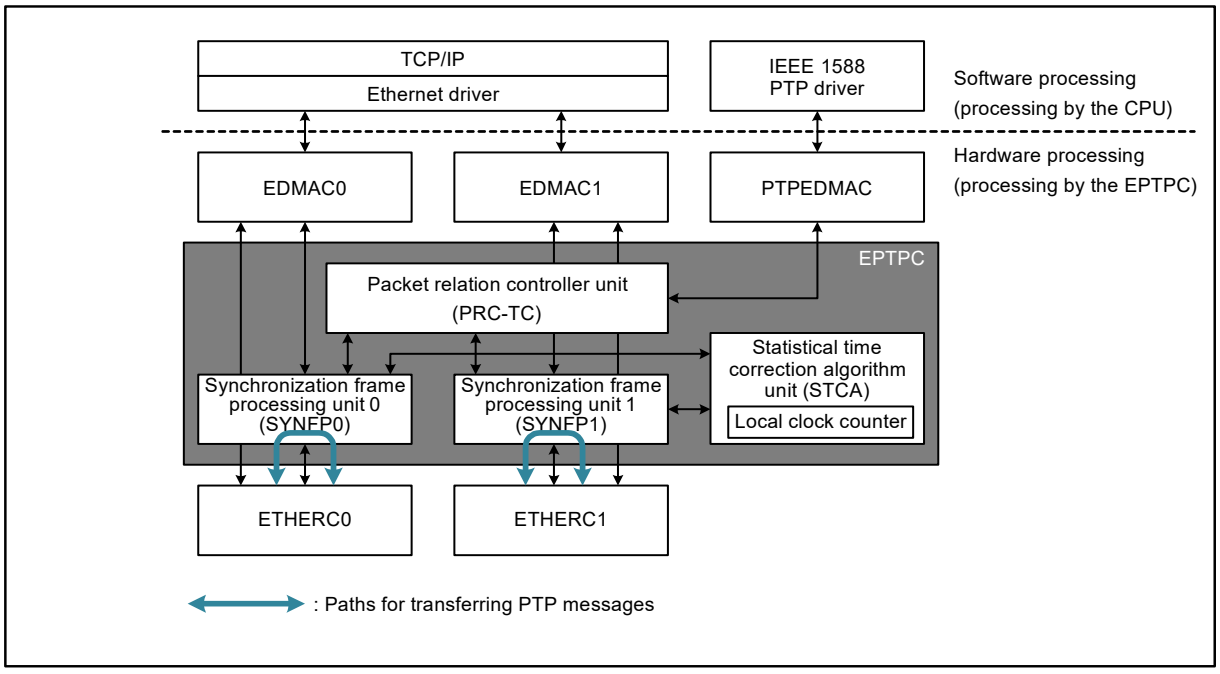

Figure 30.7 Paths for the generation of and response to PTP messages by hardware

(2) Relaying of PTP messages by hardware

Figure 30.8 shows paths for the relaying of PTP messages by the PRC-TC module. The paths in the figure are used for the "Relaying" operation indicated in Table 30.10.

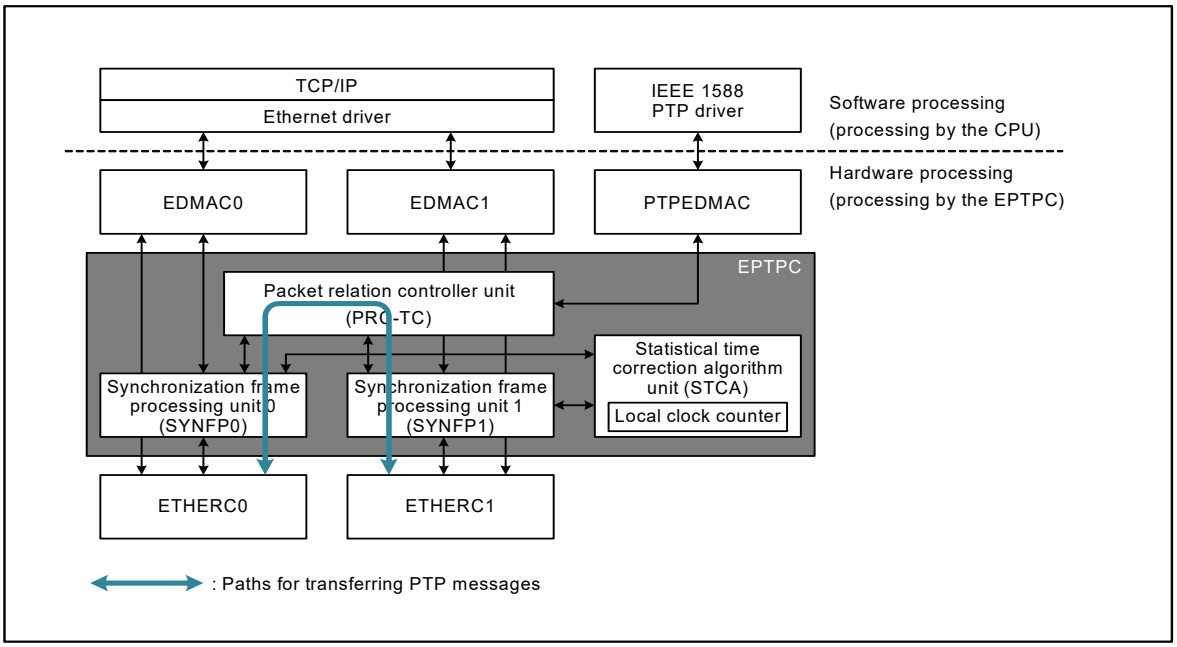

Figure 30.8 Paths for the relaying of PTP messages by hardware

30.3.5 Clock Devices

The EPTPC can operate as the clock devices defined in IEEE 1588.

30.3.5.1 End-to-End (E2E)

(1) Master

When the EPTPC operates as an end-to-end (E2E) master, PTP messages are transmitted and received as described in Table 30.11 in operation as an end-to-end (E2E) master.

Table 30.11 Processing of PTP messages by an E2E master

Message type	Message	The EPTPC...
Event	Sync	Transmits Sync messages at the fixed interval specified in the SYTLIR.SYNC[7:0] bits
	Delay_Req	When this message is received, transmits a Delay_Resp message in response
	Pdelay_Req	—
	Pdelay_Resp	—
General	Announce	Transmits Announce messages at the fixed interval specified in the SYTLIR.ANCE[7:0] bits
	Follow_Up	—
	Delay_Resp	Transmits this as the response to a received Delay_Req messages
	Pdelay_Resp_Follow_Up	—
	Management	Transmits and receives Management messages by software through the PTPEDMAC
	Signaling	Transmits and receives Signaling messages by software through the PTPEDMAC

(2) Slave

When the EPTPC operates as an end-to-end (E2E) slave, PTP messages are transmitted and received as described in

Table 30.12, and the calculated offsetFromMaster is used to correct the local time information.

Table 30.12 Processing of PTP messages by an E2E slave

Message type	Message	The EPTPC...
Event	Sync	Calculates the offsetFromMaster value when this message is received if twoStepFlag in flagField was FALSE (1-step clock)
	Delay_Req	Transmits Delay_Req messages at random intervals from 0 to the time specified in the SYTLIR.DREQ[7:0] bits × 2
	Pdelay_Req	—
	Pdelay_Resp	—
General	Announce	Transmits Announce messages by software through the PTPEDMAC
	Follow_Up	Calculates the offsetFromMaster value when this message is received if twoStepFlag in flagField of the most recently received Sync message was TRUE (two-step clock)
	Delay_Resp	Calculates the meanPathDelay value when this message is received
	Pdelay_Resp_Follow_Up	—
	Management	Transmits and receives Management messages by software through the PTPEDMAC
	Signaling	Transmits and receives Signaling messages by software through the PTPEDMAC

30.3.5.2 Peer-to-Peer (P2P)

(1) Master

When the EPTPC operates as a peer-to-peer (P2P) master, PTP messages are transmitted and received as described in Table 30.13.

Table 30.13 Processing of PTP messages by a P2P master

Packet type	Message	The EPTPC...
Event	Sync	Transmits timestamps for transmission at the fixed interval specified in the SYTLIR.SYNC[7:0] bits
	Delay_Req	—
	Pdelay_Req	• Transmits Pdelay_Req messages at the fixed interval specified in the SYTLIR.DREQ[7:0] bits • Transmits a Pdelay_Resp message in response when this message is received.
	Pdelay_Resp	• Transmits this as the response to a received Pdelay_Req message • Calculates the meanPathDelay value when this message is received if twoStepFlag in flagField was FALSE (one-step clock).
General	Announce	Transmits Announce messages at the fixed interval specified in the SYTLIR.ANCE[7:0] bits
	Follow_Up	—
	Delay_Resp	—
	Pdelay_Resp_Follow_Up	Calculates the meanPathDelay value when this message is received if twoStepFlag in flagField of the most recently received Pdelay_Resp message was TRUE (two-step clock)
	Management	Transmits Management messages by software through the PTPEDMAC
	Signaling	Transmits Signaling messages by software through the PTPEDMAC

(2) Slave

When the EPTPC operates as a peer-to-peer (P2P) master, PTP messages are transmitted and received as described in Table 30.14, and the calculated offsetFromMaster is used to correct the local time information.

Table 30.14 Processing of PTP messages by a P2P slave

Packet type	Message	The EPTPC...
Event	Sync	Calculates the offsetFromMaster value when this message is received if twoStepFlag in flagField is FALSE (1-step clock)
	Delay_Req	—
	Pdelay_Req	• Transmits Pdelay_Req messages at the fixed interval specified in the SYTLIR.DREQ[7:0] bits • Transmits a Pdelay_Resp message in response when this message is received.
	Pdelay_Resp	• Transmits this as the response to a received Pdelay_Req messages • Calculates the meanPathDelay value when this message is received if twoStepFlag in flagField was FALSE (one-step clock)
General	Announce	Transmits Announce messages by software through the PTPEDMAC
	Follow_Up	Calculates the offsetFromMaster value when this message is received if twoStepFlag in flagField of the most recently received Sync message was TRUE (two-step clock)
	Delay_Resp	—
	Pdelay_Resp_Follow_Up	Calculates the meanPathDelay value when this message is received if twoStepFlag in flagField of the most recently received Pdelay_Resp message was TRUE (2-step clock)
	Management	Transmits and receives Management messages by software through the PTPEDMAC
	Signaling	Transmits and receives Signaling messages by software through the PTPEDMAC

30.3.5.3 Ordinary Clock (OC)

PTP messages are transmitted and received through one Ethernet port in operation as an ordinary clock. An ordinary clock operates as the grand master clock or as a slave clock in the master-slave hierarchy. For operation as an E2E master, E2E slave, P2P master, or P2P slave, see the following sections:

- section 30.3.7, Operation as an E2E Master
- section 30.3.8, Operation as an E2E Slave
- section 30.3.10, Operation as a P2P Master
- section 30.3.11, Operation as a P2P Slave

30.3.5.4 Boundary Clock (BC)

PTP messages are transmitted and received through both ports in operation as a boundary clock. One port operates as a slave in synchronization with the root master clock and the other operates as the master that delivers time information synchronized with the master clock. Both ports can also operate as masters. For operation as an E2E master, E2E slave, P2P master, or P2P slave, see the following sections:

- section 30.3.7, Operation as an E2E Master
- section 30.3.8, Operation as an E2E Slave
- section 30.3.10, Operation as a P2P Master
- section 30.3.11, Operation as a P2P Slave

30.3.5.5 Transparent Clock (TC)

(1) E2E TC

In operation as an E2E TC, received PTP-primary and PTP-pdelay messages are relayed.

Table 30.15 Processing of packets by an E2E TC

Message type	Message	The EPTPC...
Event	Sync	Adds the packet residence time in the clock device when these messages are relayed
	Delay_Req	
	Pdelay_Req	
	Pdelay_Resp	
General	Announce	Relays these messages
	Follow_Up	
	Delay_Resp	
	Pdelay_Resp_Follow_Up	
	Management	• Relays these messages • Transmits and receives messages by software through the PTPEDMAC
	Signaling	

(2) P2P TC

In operation as a P2P TC, PTP-primary messages other than Delay_Req and Delay_Resp are relayed.

Table 30.16 Processing of packets by a P2P TC

Message type	Message	The EPTPC...
Event	Sync	Adds the packet residence time in the clock device when this message is relayed
	Delay_Req	—
	Pdelay_Req	• Transmits Pdelay_Req messages at the fixed interval specified in the SYTLIR.DREQ[7:0] bits • Transmits a Pdelay_Resp message in response when this message is received
	Pdelay_Resp	• Transmits this as the response to a received Pdelay_Req message • Calculates the meanPathDelay value when this message is received if twoStepFlag in flagField was FALSE (1-step clock)
General	Announce	Relays these messages
	Follow_Up	
	Delay_Resp	—
	Pdelay_Resp_Follow_Up	Calculates the meanPathDelay value when this message is received if twoStepFlag in flagField of the most recently received Pdelay_Resp message is TRUE (2-step clock)
	Management	• Relays these messages • Transmits and receives messages by software through the PTPEDMAC
	Signaling	

30.3.6 EPTPC Initialization

Transmitting and receiving PTP messages requires the settings in the EPTPC registers listed in Table 30.17. Set the registers associated with the Ethernet port used. Also set the registers listed in Table 30.18 if the UDP and IPv4 are used for the frame format of the PTP messages.

Table 30.17 Registers requiring settings for EPTPC initialization (1 of 2)

Register name	Settings	Description
STCFR	Example: 0x00000002	The value of 50 MHz is given as an example. Three other settings are also available

Table 30.17 Registers requiring settings for EPTPC initialization (2 of 2)

Register name	Settings	Description
PRMACRU0, PRMACRL0	As wanted	This setting is not required If Ethernet port 0 is not used
PRMACRU1, PRMACRL1	As wanted	This setting is not required If Ethernet port 1 is not used
SYCONFR	Example: 0x00000002	The setting differs with the type of PTP clock operation
SYMACRU, SYMACRL	As wanted	—
SYSPVRR	0x0000002	transportSpecific and version fields
SYDOMR	As wanted	—
SYCIDRU, SYCIDRL	As wanted	Set the same value for Ethernet ports 0 and 1
SYPNUMR	0x00000001 or 0x00000002	If the PTP clock operates as an OC, the setting is 0x00000001. If it operates as a BC or TC, set 0x00000001 for one port and 0x00000002 for the other
PPMACRU, PPMACRL	01:1B:19:00:00:00	MAC address for PTP-primary messages
PDMACRU, PDMACRL	01:80:C2:00:00:0E	MAC address for PTP-pdelay messages
DASYMRU, DASYMRL	0x00000000	—
TSLATR	As wanted	Depends on the link transfer rate and STCA clock frequency
SYFORMR	As wanted	Four settings are available
SYLLCCTLR	0x00000003	LLC-CTL field value for Ethernet frames
PETYPER	0x000088F7	Ethertype for PTP messages

Table 30.18 Registers requiring additional settings when UDP or IPv4 is used

Register name	Settings	Description
SYIPADDRR	As wanted	Local IP address
PRIPR	0xE0000181	IP address for PTP-primary messages
PETOSR	As wanted	Set the highest allowable traffic class selector codepoint as the value for the differentiated service (DS) field
PGTOSR	As wanted	—
PPTTLR	As wanted	TTL field value for PTP-primary messages
PEUDPR	0x0000013F	UDP port number for event messages
PGUDPR	0x00000140	UDP port number for general messages
PDIPR	0xE000006B	IP address for PTP-pdelay messages
PDTTLR	0x00000001	TTL field value for PTP-pdelay messages

In operation as an OC or BC, set registers as shown in Figure 30.9 to transfer received Announce, Management, and Signaling messages to the PTPEDMAC.

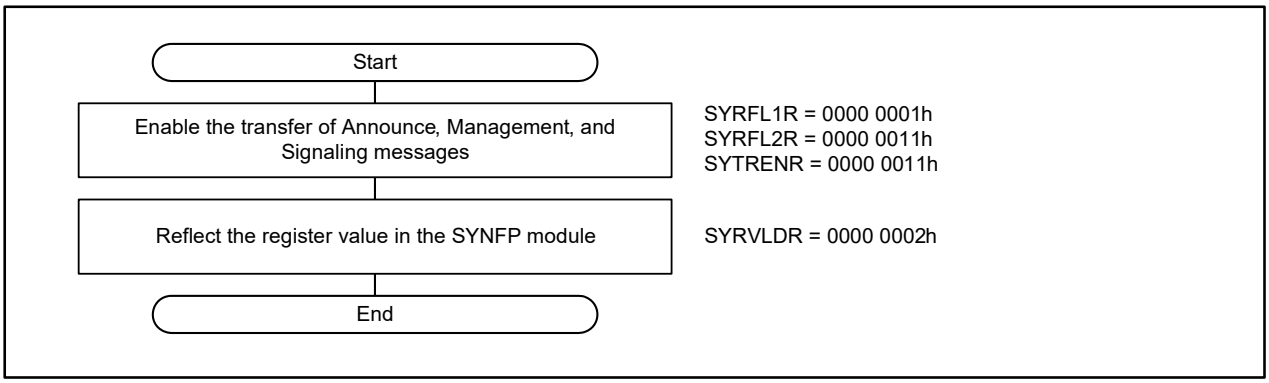

Figure 30.9 Shared settings for PTP devices

30.3.7 Operation as an E2E Master

30.3.7.1 Preparatory Setting

Table 30.19 lists the registers for use in operation as an E2E master. When the EPTPC operates as an OC or BC using both ports as masters, set the initial value of the time information in advance. See section 30.2.18, Local Clock Counter Initial Value Register (LCIVRU, LCIVRM, LCIVRL) for this value. To reflect the value set in these registers, set the SYRVLDR.STUP or ANUP bit to 1.

Table 30.19 Registers used in E2E master operation

Register name	SYRVLDR register bits used for loading direction	Settings	Description
SYNFR	STUP	0x00000000	flagField for Sync messages
SYTLIR	STUP ANUP	Example: 0x00000001	Delay_Resp: 1 s Sync: 1 s Announce: 2 s
ANFR	ANUP	0x00000000	flagField for Announce messages
GMPR	ANUP	As wanted	—
GMCQR	ANUP	As wanted	—
GMIDRU, GMIDRL	ANUP	As wanted	—
CUOTSR	ANUP	As wanted	timeSource: Internal Oscillator
SRR	ANUP	As wanted	• If the EPTPC operates as an OC or as a BC with both ports serving as masters, set this register to 0x00000000 • If the EPTPC operates as a BC in the combination of a slave and master, set this register to the StepsRemoved field value of Announce messages received by the slave plus one.
SYRFL1R	STUP	0x00004001	Enables the processing of Delay_Req messages by the SYNFP module
SYRFL2R	STUP	0x00000011	Enables the transfer of Signaling and Management messages to the PTPEDMAC
SYTRENR	STUP	0x00000011	Enables the transmission of Sync and Announce messages

30.3.7.2 Procedure for Starting Operations

Figure 30.10 shows the procedure for starting operation as an E2E master.

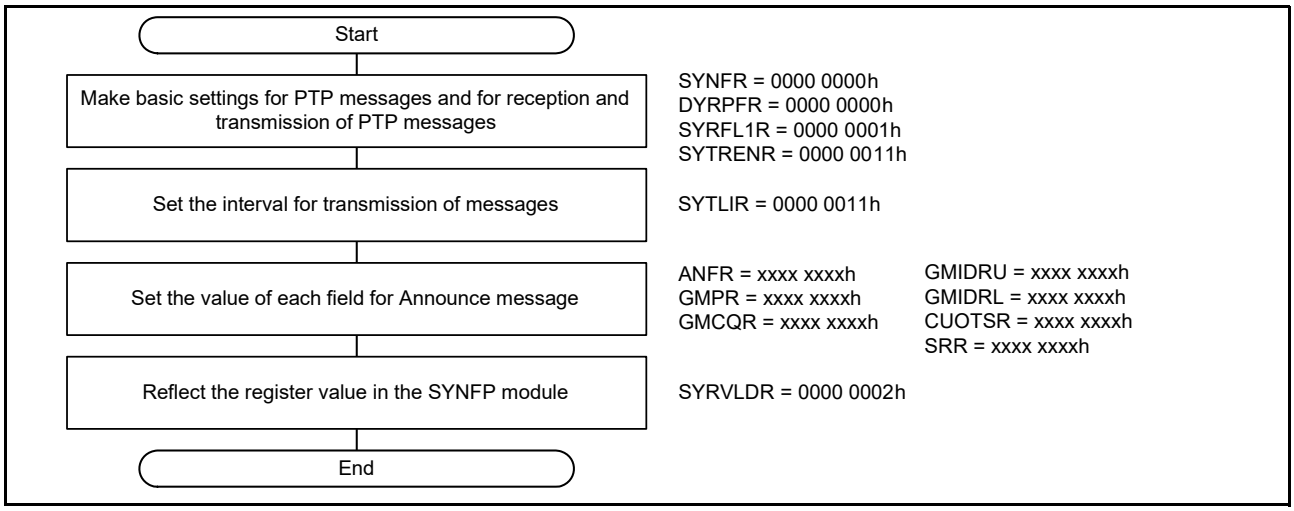

Figure 30.10 Procedure for starting operation as an E2E master

30.3.7.3 Procedure for Changing the Settings

Increases in the frequency of receiving Delay_Req messages caused by network conditions might lead to an overflow of the FIFO buffer that receives the Delay_Req messages. In such cases, change the value of the logMessageInterval field of Delay_Resp messages so that the slave sending the Delay_Req messages lengthens the interval between the messages. Figure 30.11 shows the procedure for changing the value of the logMessageInterval field.

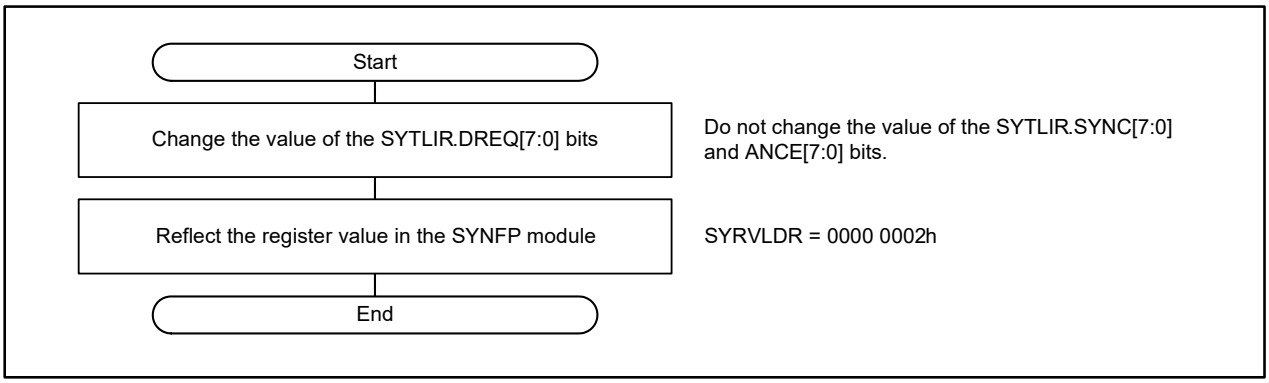

Figure 30.11 Procedure for changing the value of the logMessageInterval Field for Delay_Resp messages

30.3.7.4 Procedure for Stopping Operations

Figure 30.12 shows the procedure for stopping operation as an E2E master. To confirm that operation is completely stopped, read the SYSR.GENDN and RESDN flags to check that generation of messages and sending of responses are completely stopped.

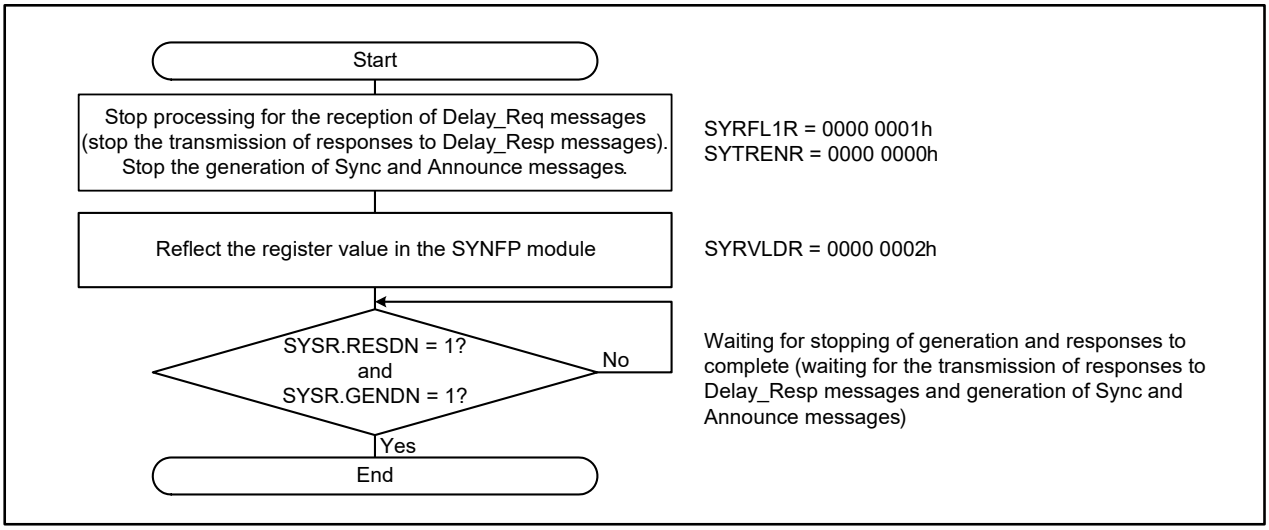

Figure 30.12 Procedure for stopping operation as an E2E master

30.3.8 Operation as an E2E Slave

30.3.8.1 Preparatory Settings

Table 30.20 lists the registers for use in operation as an E2E slave. To reflect the value set in the registers in SYNFP operations, set the SYRVLDR.STUP, ANUP, or BMUP bit to 1.

Table 30.20 Registers used in E2E slave operation

Register name	SYRVLDR register bits used for loading direction	Settings	Description
MTCID	BMUP	As wanted	clockIdentity value of the master clock that provides synchronization
MTPID	BMUP	As wanted	portNumber value of the master clock that provides synchronization
SYTLIR	ANUP BMUP	0x00000000	Delay_Resp: 1 s*1
RSTOUTR	STUP	As wanted	—
SYNTOR	—	As wanted	—
SYRFL1R	STUP	0x00040441	Enables reception of Delay_Resp, Follow_Up, and Sync messages and transfer of Announce messages to the PTPEDMAC
SYRFL2R	STUP	0x00000011	Enables transfer of Signaling and Management messages to the PTPEDMAC
SYTRENR	STUP	0x00000100	Enables the generation of Delay_Req messages

Note 1. During the reception of Delay_Resp messages by an E2E slave, the SYTLIR.DREQ[7:0] bits must be adjusted if the value of the SYRLIR.DRESP[7:0] flags is to be altered. The SYTLIR.DREQ[7:0] bits specify a value in the range from -7 to +6. Set the SYTLIR.DREQ[7:0] bits to -7 if the value indicated in the SYRLIR.DRESP[7:0] flags is less than or equal to -8 and to 6 if the value indicated in the SYRLIR.DRESP[7:0] flags is greater than or equal to 7.

30.3.8.2 Procedure for Starting Operations

Figure 30.13 shows the procedure for starting operation as an E2E slave.

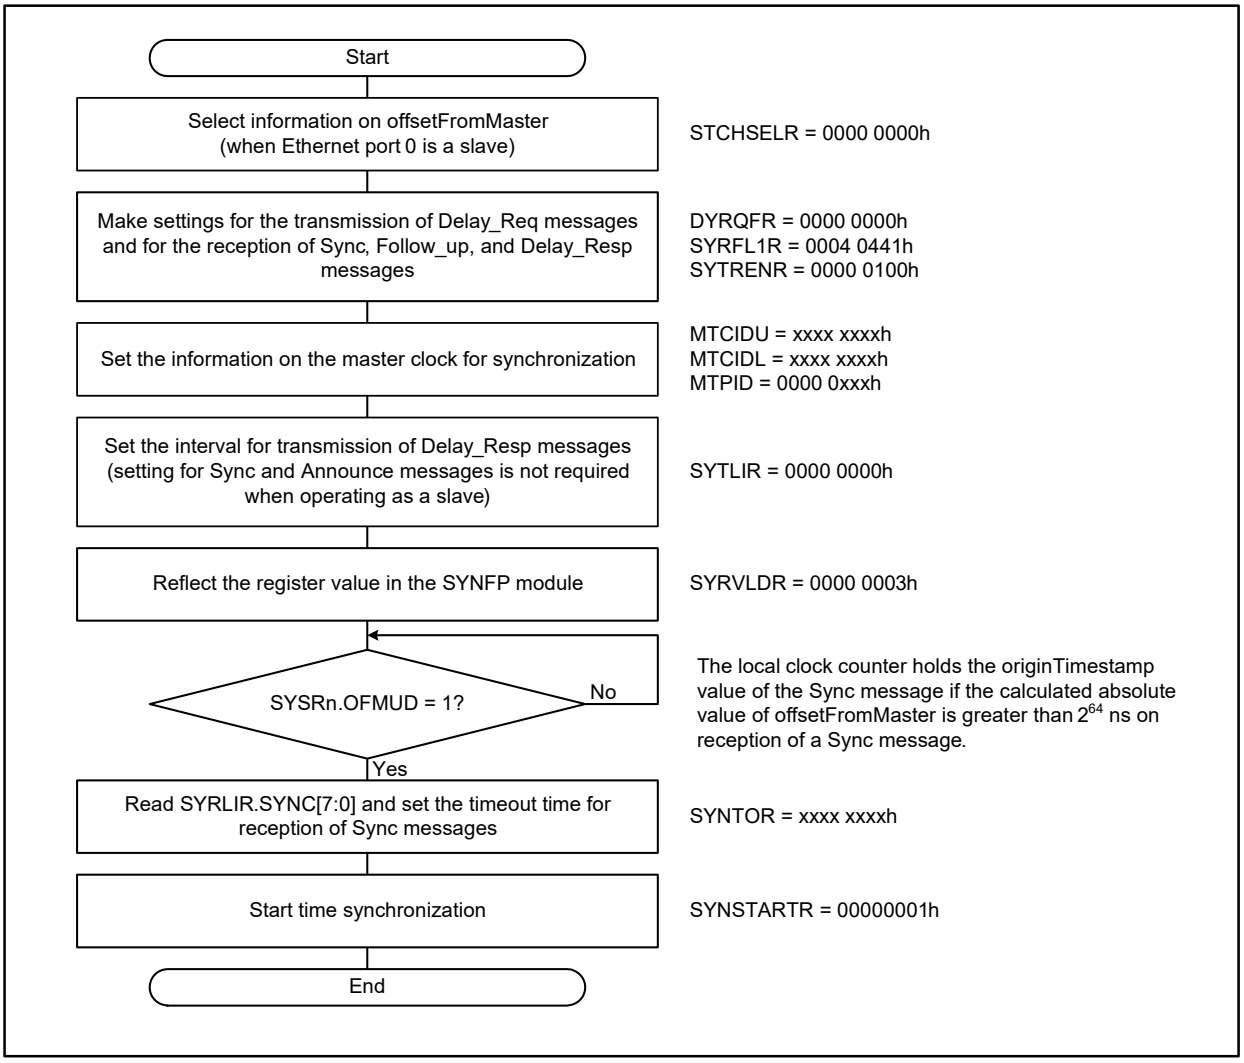

Figure 30.13 Procedure for starting operation as an E2E slave

30.3.8.3 Procedure for Changing the Settings

IEEE 1588 stipulates that the average interval for the transmission of Delay_Req messages must be adjusted in response to changes in the value of the logMessageInterval field of received Delay_Resp messages. The EPTPC sets the SYSR.INTCHG flag to 1 if the logMessageInterval value of a received message differs from that of the previous message.

When this happens, the application must set the SYTLIR.DREQ[7:0] bits to the value in the SYRLIR.DRESP[7:0] bits. The SYTLIR.DREQ[7:0] bits specify a value in the range from -7 to +6. Set the SYTLIR.DREQ[7:0] bits to -7 if the value indicated in the SYRLIR.DRESP[7:0] flags is less than or equal to -8 and to 6 if the value indicated in the SYRLIR.DRESP[7:0] bits is greater than or equal to 7.

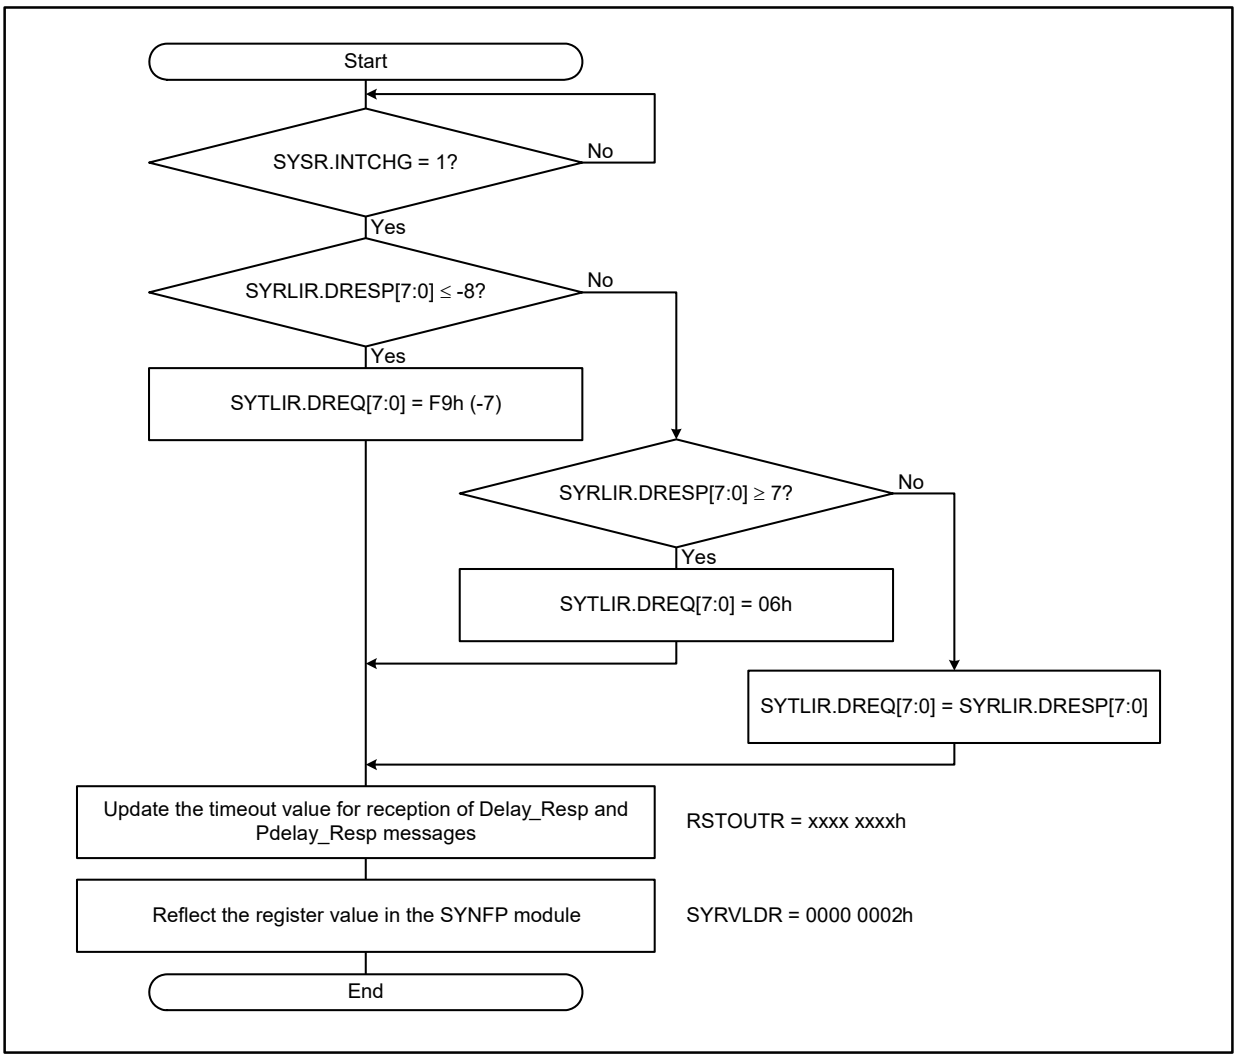

Figure 30.14 Procedure for changing the transmission interval for Delay_Req messages

30.3.8.4 Procedure for Stopping Operations

Figure 30.15 shows the procedure for stopping operation as an E2E slave. To confirm that operation as an E2E slave is completely stopped, read the SYSR.GENDN flag to check that generation is completely stopped.

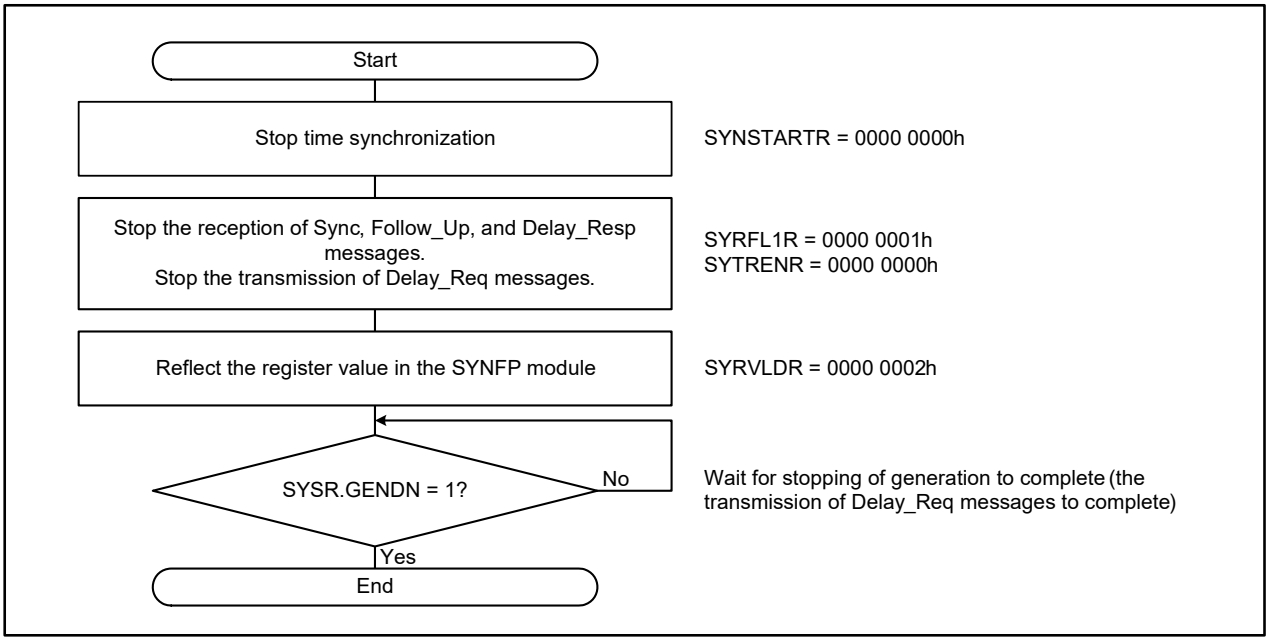

Figure 30.15 Procedure for stopping operation as an E2E slave

30.3.9 P2P Operation (Shared by Master and Slave)

Table 30.21 lists the registers for use in P2P operation. When the EPTPC is to be operated with P2P protocol, the SYNFP module handles the processing of PTP-pdelay messages regardless of whether operation is as a master or slave. The interval for Pdelay_Req transmission and the parameters for monitoring of Pdelay_Resp messages must be set at the same time.

Table 30.21 Registers for use in P2P operation

Register name	SYRVLDR register bits used for loading direction	Settings	Description
MTCID	BMUP	As wanted	clockIdentity value of the synchronized master clock
MTPID	BMUP	As wanted	portNumber value of the synchronized master clock
SYTLIR	ANUP STUP	0x00000000	Announce: — Sync: — Pdelay_Req: 1 s
RSTOUTR	STUP	As wanted	—
SYRFL1R	STUP	0x44400001	Enables the reception of Pdelay_Req, Pdelay_Resp, and Pdelay_Resp_Follow_Up messages and the transfer of Announce messages to the PTPEDMAC
SYRFL2R	STUP	0x00000011	Enables the transfer of Signaling and Management messages to the PTPEDMAC
SYTRENR	STUP	0x00001000	Enables the generation of Pdelay_Req messages

30.3.9.1 Procedure for Starting Operations

Figure 30.16 shows the procedure for starting P2P operation (sending and receiving PTP-pdelay messages).

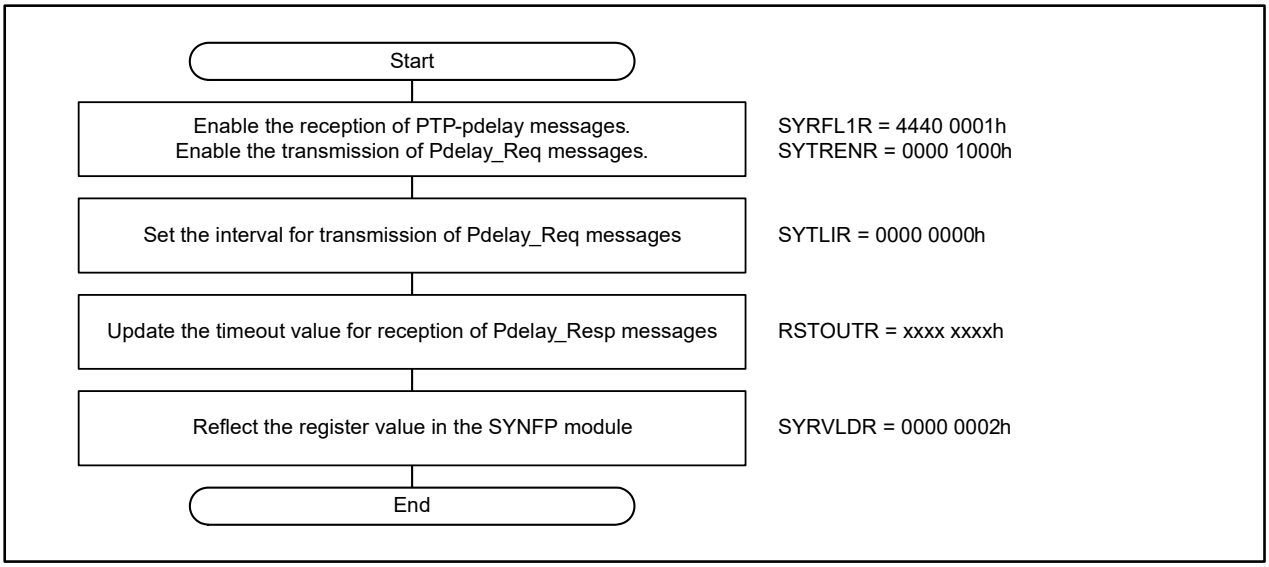

Figure 30.16 Procedure for starting P2P operation

30.3.9.2 Procedure for Stopping Operations

Figure 30.17 shows the procedure for stopping P2P operation (sending and receiving PTP-pdelay messages).

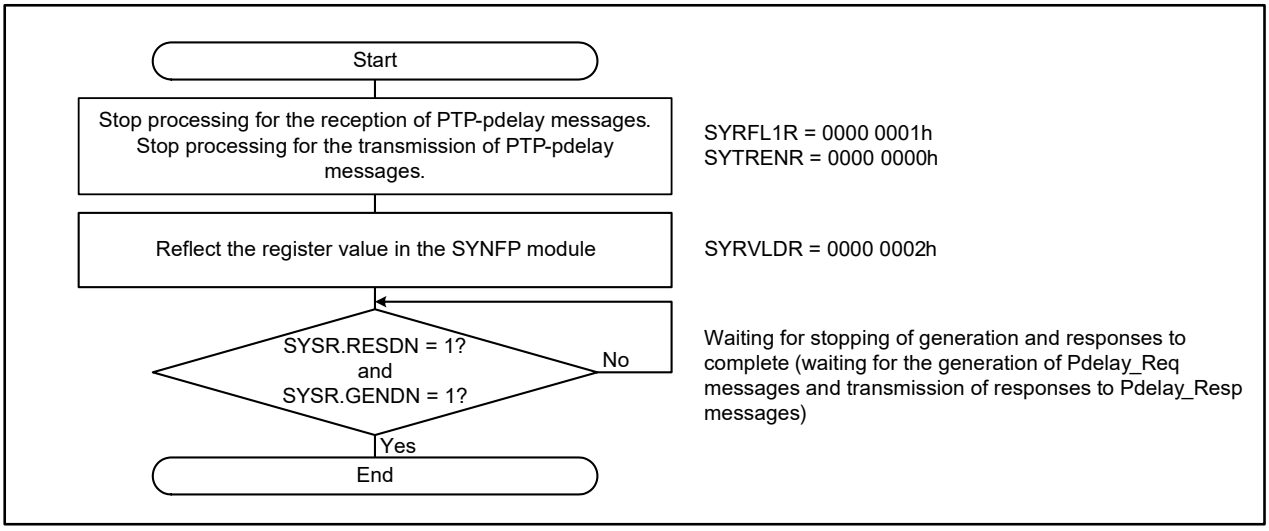

Figure 30.17 Procedure for stopping P2P operation

30.3.10 Operation as a P2P Master

Table 30.22 lists the registers for use in operation as a P2P master. When the EPTPC operates as an OC or BC using both ports as masters, set the initial value of the time information in advance as required. See section 30.2.18, Local Clock Counter Initial Value Register (LCIVRU, LCIVRM, LCIVRL) for this value.

Table 30.22 Registers used in P2P master operation

Register name	SYRVLDR register bits used for loading direction	Settings	Description
SYCONFR	—	0x00000028	—
ANFR	ANUP	0x00000000	flagField for Announce messages
SYNFR	STUP	0x00000000	flagField for Sync messages
SYTLIR	ANUP STUP	0x00000001	Announce: 2 s Sync: 1 s Pdelay_Req: 1 s
GMPR	ANUP	As wanted	Grandmaster Priority1 and Priority2
GMCQR	ANUP	As wanted	Grandmaster Quality
GMIDR	ANUP	As wanted	Grandmaster Identity
CUOTSR	ANUP	As wanted	currentUtcOffset, timeSource
SRR	ANUP	As wanted	StepsRemoved
RSTOUTR	STUP	As wanted	—
SYRFL1R	STUP	0x44400000	Enables the reception of Pdelay_Req, Pdelay_Resp, and Pdelay_Resp_Follow_Up messages
SYRFL2R	STUP	0x00000011	Enables the transfer of Signaling and Management messages to the PTPEDMAC
SYTRENR	STUP	0x00001011	Enables the transmission of Pdelay_Req, Sync, and Announce messages

30.3.10.1 Procedure for Starting Operations

When transmission of Sync and Announce messages is started during P2P operation (sending and receiving PTP-pdelay messages), the EPTPC operates as a P2P master. Figure 30.18 shows the procedure for starting operation as a P2P master.

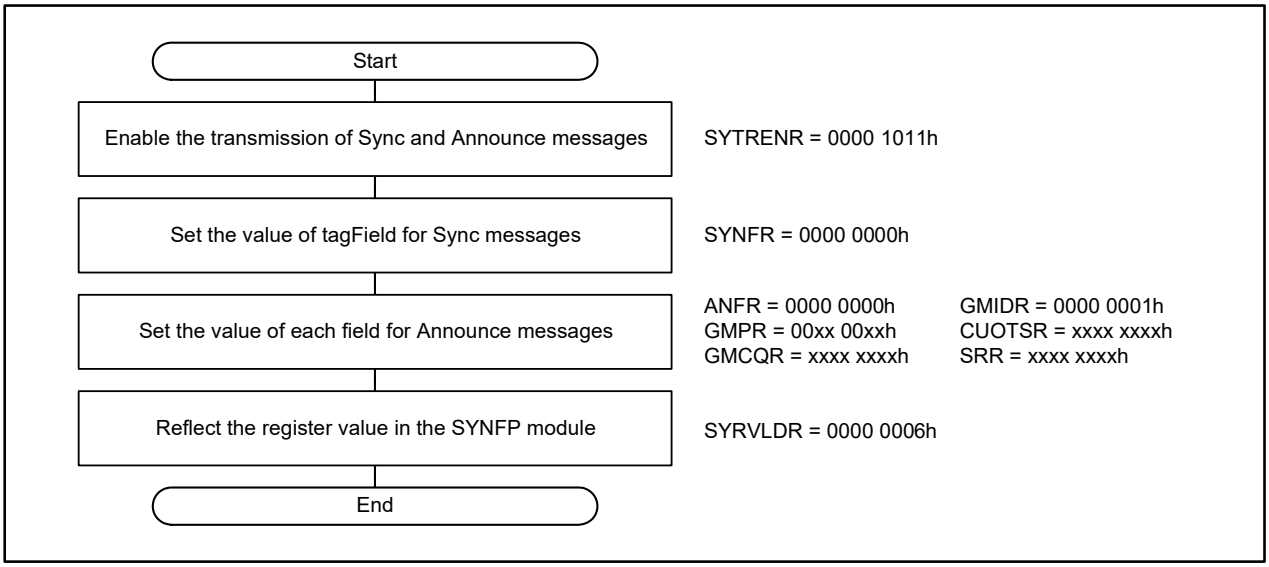

Figure 30.18 Procedure for starting operation as a P2P master

30.3.10.2 Procedure for Stopping Operations

Figure 30.19 shows the procedure for stopping the transmission of Sync and Announce messages to stop operation as a P2P master.

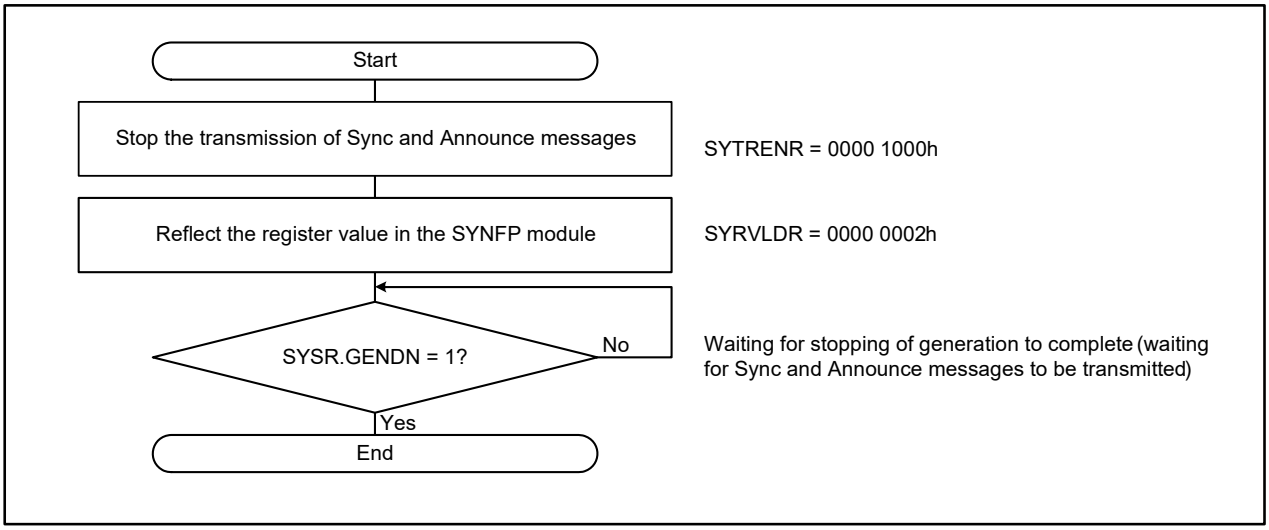

Figure 30.19 Procedure for stopping operation as a P2P master

30.3.11 Operation as a P2P Slave

Table 30.23 lists the registers for use in operation as a P2P slave. Setting a SYNFP module to receive Sync messages and Follow_Up messages during P2P operation results in operation as a P2P slave. Information on the master clock for synchronization must be specified.

Table 30.23 Registers used in P2P slave operation

Register name	SYRVLDR register bits used for loading direction	Settings	Description
MTCID	BMUP	As wanted	clockIdentity value of the synchronized master clock
MTPID	BMUP	As wanted	portNumber value of the synchronized master clock
RSTOUTR	STUP	As wanted	—
SYRFL1R	STUP	0x44400441	Enables the reception of Pdelay_Req, Pdelay_Resp, Pdelay_Resp_Follow_Up, Follow_Up, and Sync messages and the transfer of Announce messages to the PTPEDMAC

30.3.11.1 Procedure for Starting Operations

Figure 30.20 shows the procedure for making the additional settings for shifting to slave operation during P2P operation (sending and receiving PTP-pdelay messages).

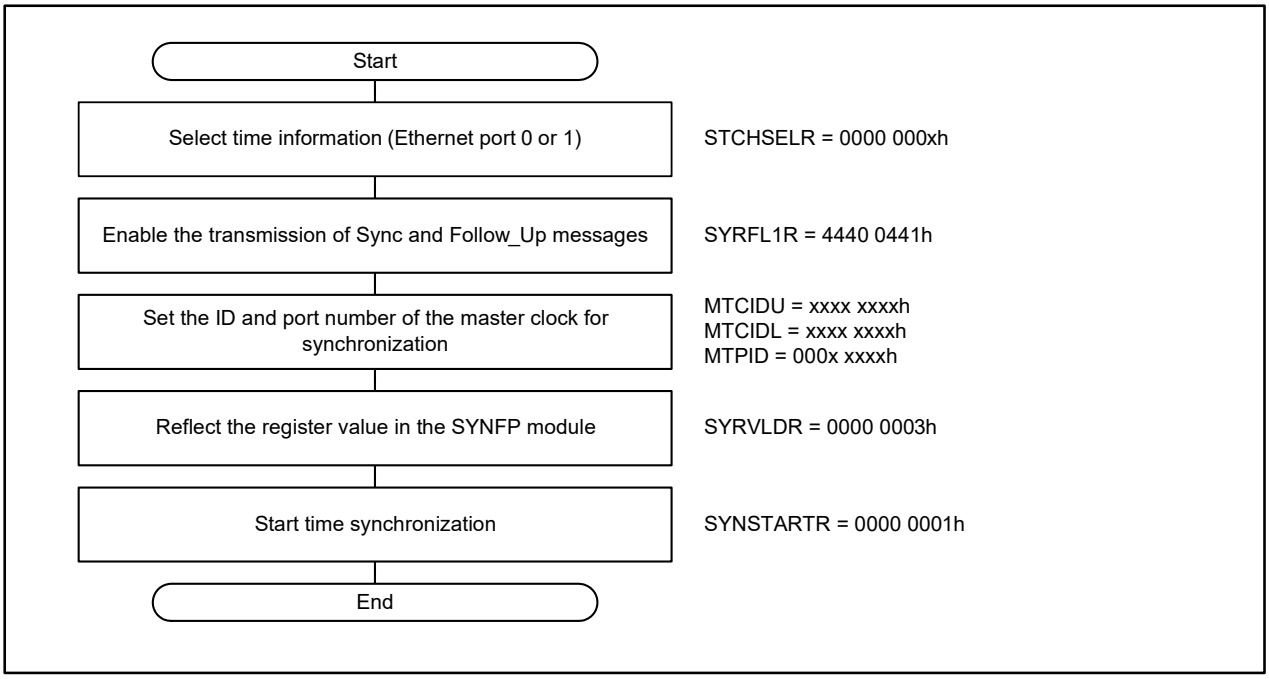

Figure 30.20 Procedure for starting operation as a P2P slave

30.3.11.2 Procedure for Stopping Operations

Figure 30.21 shows the procedure for stopping the reception of Sync and Follow_Up messages to stop operation as a P2P slave.

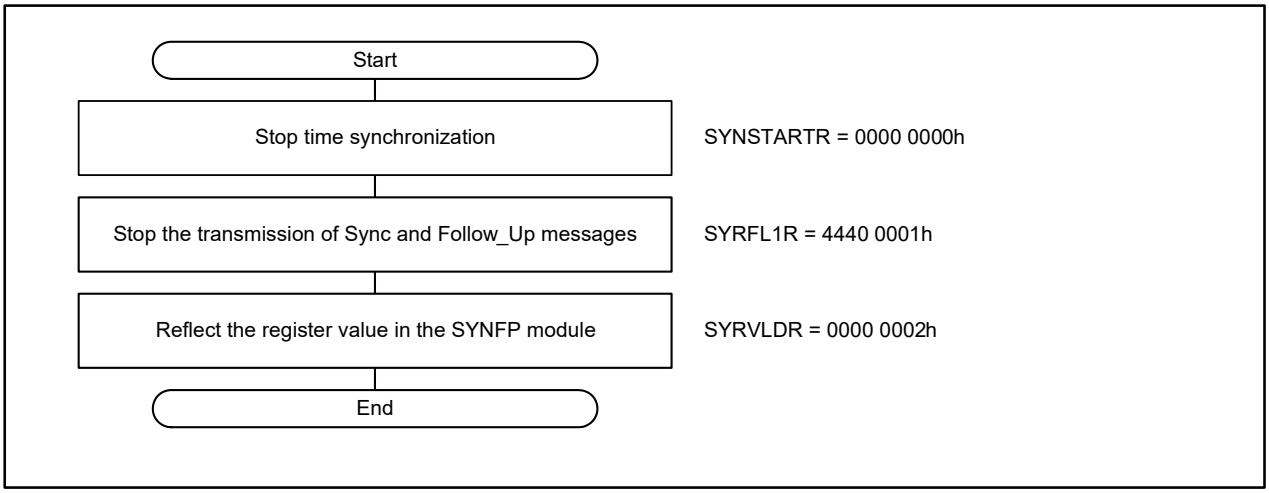

Figure 30.21 Procedure for stopping operation as a P2P slave

30.3.12 Operation as an E2E TC

30.3.12.1 Preparatory Setting

Table 30.24 lists the registers for use in operation as an E2E TC. Make the settings for both the SYNFP0 and SYNFP1 modules.

Table 30.24 Registers used in E2E TC operation

Register name	SYRVLDR register bits used for loading direction	Settings	Description
SYCONFR	—	Example: 0x00000028	Set the TCMOD bit to 0 as a preparatory setting for the PTP device
SYRFL1R	STUP	0x22222222	Enables the relaying of messages by the PRC-TC
SYRFL2R	STUP	0x20000033	Enables the transfer of Signaling and Management messages to the PTPEDMAC and the relaying of these messages by the PRC-TC
SYTRENR	STUP	0x00000000	No generation of messages

30.3.12.2 Procedure for Starting Operations

Figure 30.22 shows the procedure for starting operation as an E2E TC.

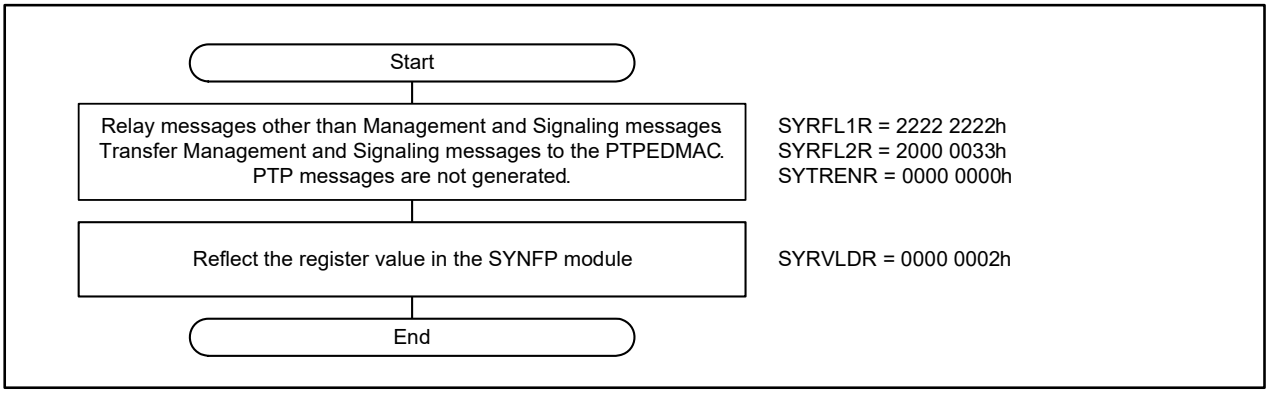

Figure 30.22 Procedure for starting operation as an E2E TC

30.3.13 Operation as a P2P TC

Table 30.25 lists the registers for use in operation as a P2P TC. Make the settings for both the SYNFP0 and SYNFP1 modules.

Table 30.25 Registers used in P2P TC operation

Register name	SYRVLDR register bits used for loading direction	Settings	Description
SYCONFR	—	Example: 0x00100028	Set the TCMOD bit to 1 as a preparatory setting for the PTP device
RSTOUTR	STUP	As wanted	—
SYTLIR	STUP	Example: 0x00000000	Pdelay_Req: 1 s
SYRFL1R	STUP	0x44400222	Enables the discarding of Delay_Req and Delay_Resp messages and the relaying of Sync, Follow_Up, and Announce messages by the PRC-TC
SYRFL2R	STUP	0x20000033	Enables the transfer of Signaling and Management messages to the PTPEDMAC and the relaying of these messages by the PRC-TC
SYTRENR	STUP	0x00001000	Enables the generation of Pdelay_Req messages

30.3.13.1 Procedure for Starting Operations

Figure 30.23 shows the procedure for starting operation as a P2P TC.

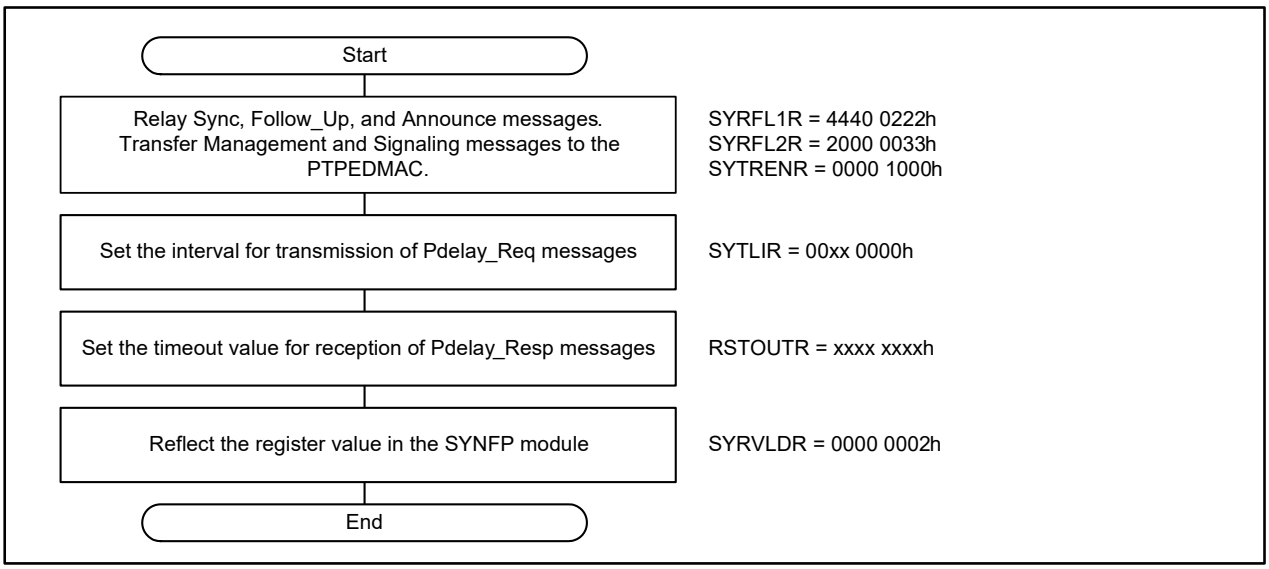

Figure 30.23 Procedure for starting operation as a P2P TC

30.3.14 Monitoring of Received Messages

30.3.14.1 Reception of Announce Messages

The EPTPC does not detect timeouts during the reception of Announce messages. To detect timeouts, monitor the reception of Announce messages in software.

30.3.14.2 Reception of Sync Messages

The STSR.SYNTOUT flag is set to 1 when a timeout occurs during the reception of a Sync message while correcting time synchronization.

The SYSR.OFMUD flag is set to 1 when a Sync message is received, regardless of whether time synchronization is being corrected. Accordingly, the reception of Sync messages is detectable by referencing this flag even when the correction of time synchronization stops because a timeout occurs during the reception of a Sync message.

30.3.14.3 Reception of Delay_Resp and Pdelay_Resp Messages

The SYSR.DRPTO flag is set to 1 when a timeout occurs during the reception of a Delay_Resp message after the transmission of a Delay_Req message while operating as an E2E slave, or when a timeout occurs during the reception of a Pdelay_Resp message after the transmission of a Pdelay_Req message while operating as a P2P.

The SYSR.MPDUD flag is set to 1 when a Delay_Resp or Pdelay_Resp message is received, so the reception of these messages is still detectable when a timeout occurs during reception.

30.3.15 Correcting Time Synchronization

A slave detects differences in the clock gradient relative to the master clock. The offsetFromMaster values calculated using the standard IEEE 1588 algorithm are used to calculate the clock gradient, so the result includes elements of network fluctuation that are not frequency differences. The EPTPC has a worst-10 function to eliminate fluctuations caused by network load and other dynamic conditions. With these functions, the time is corrected from the calculated gradient difference values and results of correction are obtained as shown in Figure 30.25.

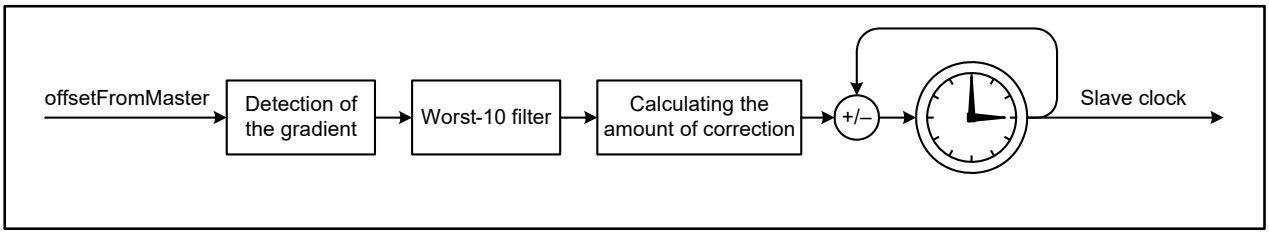

Figure 30.24 Configuration of the time correction circuit

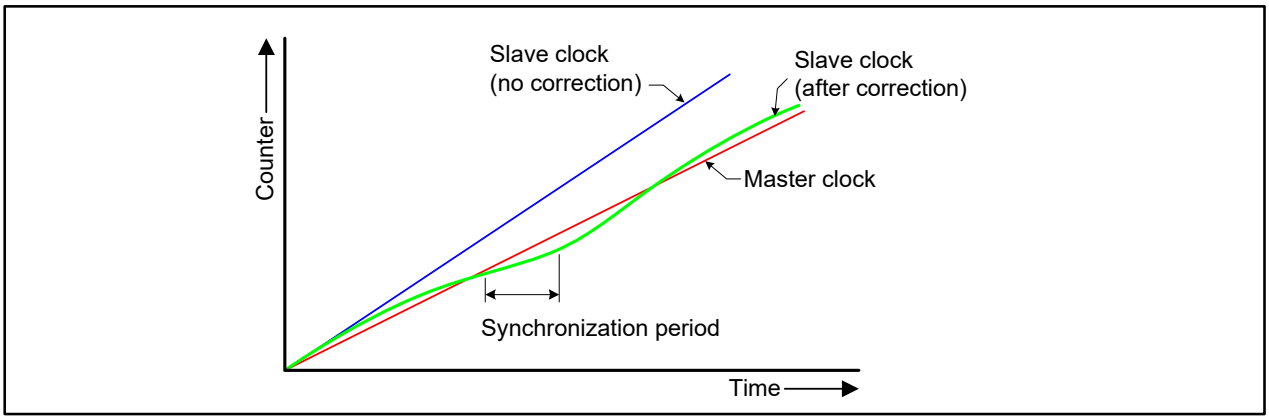

Figure 30.25 Overview of time correction

30.3.15.1 Determining Synchronization and Loss of Synchronization

Loss of synchronization is detected if the absolute value of offsetFromMaster reaches or exceeds the value specified in the SYNTDARU or SYNTDARL register. Synchronization is considered maintained if the absolute value of offsetFromMaster is less than the absolute values of the synchronization detection threshold registers, SYNTDBRU and SYNTDBRL.

The STSR.SYNCOUT flag is set to 1 when synchronization is lost, and the STSR.SYNC flag is set to 1 when synchronization is obtained. Hysteresis can be obtained by setting the threshold registers to appropriate different values. In addition, the STMR.DVTH[3:0] and SYTH[3:0] bits can be used to set the consecutive number of times detection must occur for the determination of synchronization and loss of synchronization.

For systems where control must be aborted if synchronization is lost because of fluctuations in network conditions, set the SYNTDARU and SYNTDARL registers to low values and set the number of times detection is required to trigger a loss of synchronization to one. In systems where these conditions do not apply, set the SYNTDARU and SYNTDARL registers and the number of times detection is required to large values.

Figure 30.26 shows an example of a situation where synchronization is lost and regained. In this example, the number of consecutive times detection is required is three for both synchronization and loss of synchronization.

Note: The setting of the STSR.SYNCOUT flag is 1 when time synchronization starts, even if the condition for determining loss of synchronization is not satisfied at this stage. For this reason, detection of loss of synchronization must be ignored immediately after time synchronization starts.

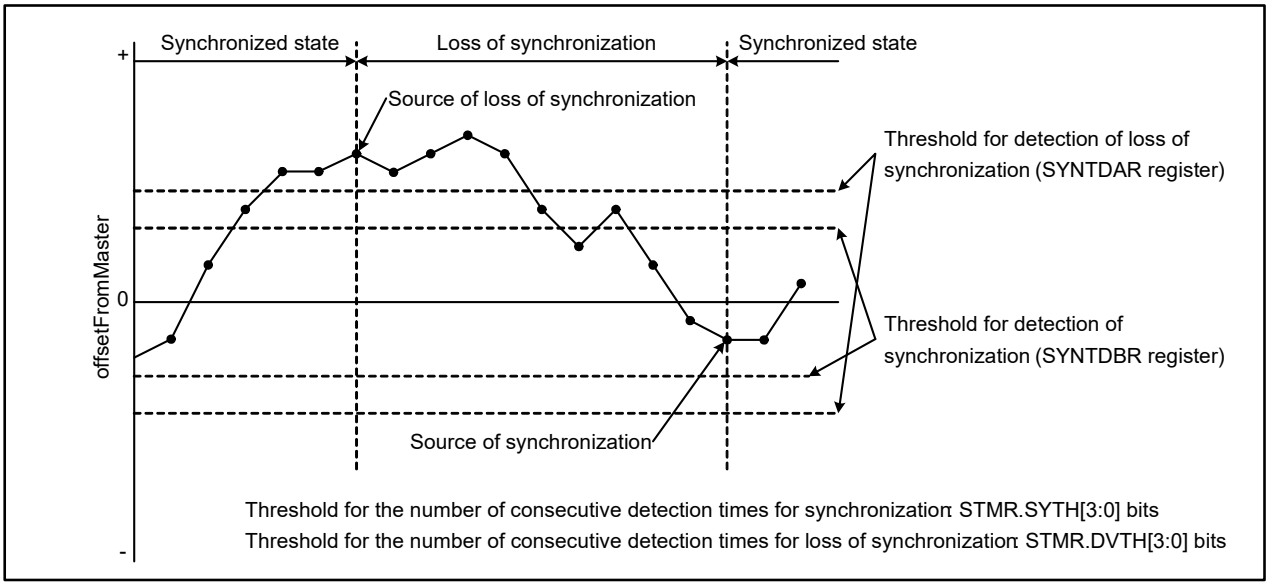

Figure 30.26 Example of a situation where synchronization is lost and regained, when the number of consecutive detections is set to three in the STMR.DVTH[3:0] and SYTH[3:0] bits

30.3.15.2 Worst-10 Function

The worst-10 function is used to impose limits on exceedingly large and small values among the calculated values for clock gradient differences. These values are collected by observing the transfer over a specified interval, and threshold values to impose limits are extracted from the observed values. Fluctuations in network conditions must be considered in addition to clock errors, and differences in both the positive and negative directions are collected, as shown in Figure 30.27.

The function selects the largest gradient values from the collected values for positive and negative gradient differences, orders them from first to tenth (worst to tenth worst), and uses the tenth worst as a threshold value. Fluctuations in the time kept by a slave clock can be suppressed by continually overwriting the tenth worst value with new values large enough to exceed the threshold. Periodic collections of gradient values can also be made for updating the threshold values during operations or for using the method of setting threshold values from previously measured results.

However, while fluctuations in the time kept by a slave clock can be suppressed by the valid filtering of values for gradient difference (collecting the worst 10 values and using the tenth worst), this slows down the following of time kept by a master clock.

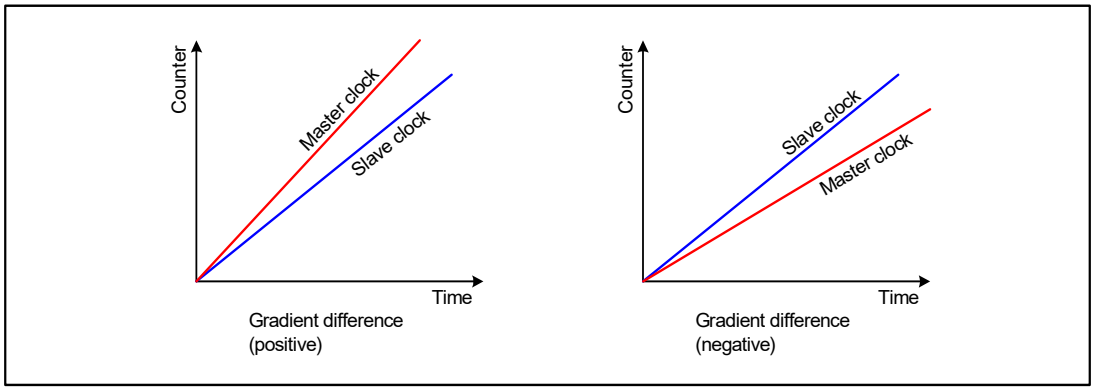

Figure 30.27 Overview of gradient differences

30.3.15.3 Collecting Differences in Clock Gradient and Extracting the Worst Ten Values

During slave operation, the EPTPC can calculate the offsetFromMaster values from received messages and calculate gradient differences between the local clock (acting as a slave clock) and master clock from those values. Specifically, the worst ten values are extracted from the sets of collected values for gradient difference. Either automatic filtering by the hardware or software-triggered filtering can be designated for acquisition of the sets of the worst 10 values. Figure 30.28 gives an overview of the collection of gradient difference values.

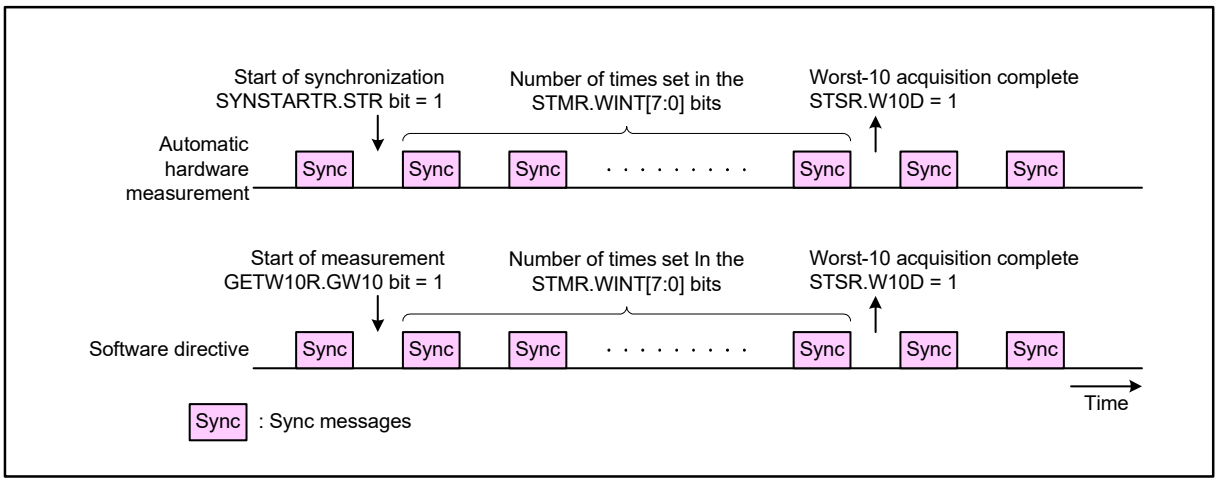

Figure 30.28 Overview of the collection of gradient difference values

(1) Collecting gradient differences and extracting the worst ten values by hardware

The EPTPC automatically collects the gradient difference values by hardware if the STMR.W10S bit is 0.

When the SYNSTARTR.STR bit is set to 1 (starting slave time synchronization), the EPTPC collects gradient difference values for the number of times set in the STMR.WINT[7:0] bits. When the collection of gradient difference values is finished, the tenth largest values on the positive and negative sides are stored as the tenth worst values in the PW10VRU, PW10VRM, and PW10VRL registers and the MW10RU, MW10RM, and MW10RL registers. When acquisition of the worst 10 values completes, the STSR.W10D flag is set to 1. Filtering of gradient difference values by using the stored tenth worst values then proceeds automatically.

If the number of times set in the STMR.WINT[7:0] bits is less than ten, the double of the best of the collected values on the positive side is stored in the PW10VRU, PW10VRM, and PW10VRL registers. The half of the best of the collected values on the negative side is stored in the MW10RU, MW10RM, and MW10RL registers.

(2) Collecting gradient differences and extracting the worst ten values by software

The EPTPC collects gradient difference values by software if the STMR.W10S bit is 1.

When the GETW10R.GW10 bit is set to 1 after time synchronization starts, the EPTPC collects gradient difference values for the number of times set in the STMR.WINT[7:0] bits. When the collection of gradient difference values is finished, the tenth largest values on the positive and negative sides are stored as the tenth worst values in the PW10VRU, PW10VRM, and PW10VRL registers and the MW10RU, MW10RM, and MW10RL registers. When acquisition of the worst 10 values completes, the STSR.W10D flag is set to 1.

Because filtering of gradient difference values proceeds with the values set in the PLIMITRU, PLIMITRM, and PLIMITRL registers as the upper filtering limit and the MLIMITRU, MLIMITRM, and MLIMITRL registers as the lower filtering limit, you must write the values stored in the PW10VRU, PW10VRM, and PW10VRL registers to PLIMITRU, PLIMITRM, and PLIMITRL, and write the values stored in the MW10RU, MW10RM, and MW10RL registers to MLIMITRU, MLIMITRM, and MLIMITRL.

If the number of times set in the STMR.WINT[7:0] bits is less than ten, the double of the best of the collected values on the positive is stored in the PW10VRU, PW10VRM, and PW10VRL registers. The half of the best of the collected values on the negative side is stored in the MW10RU, MW10RM, and MW10RL registers.

The flow in Figure 30.29 shows an example of the procedure for software-triggered acquisition of the worst 10 values.

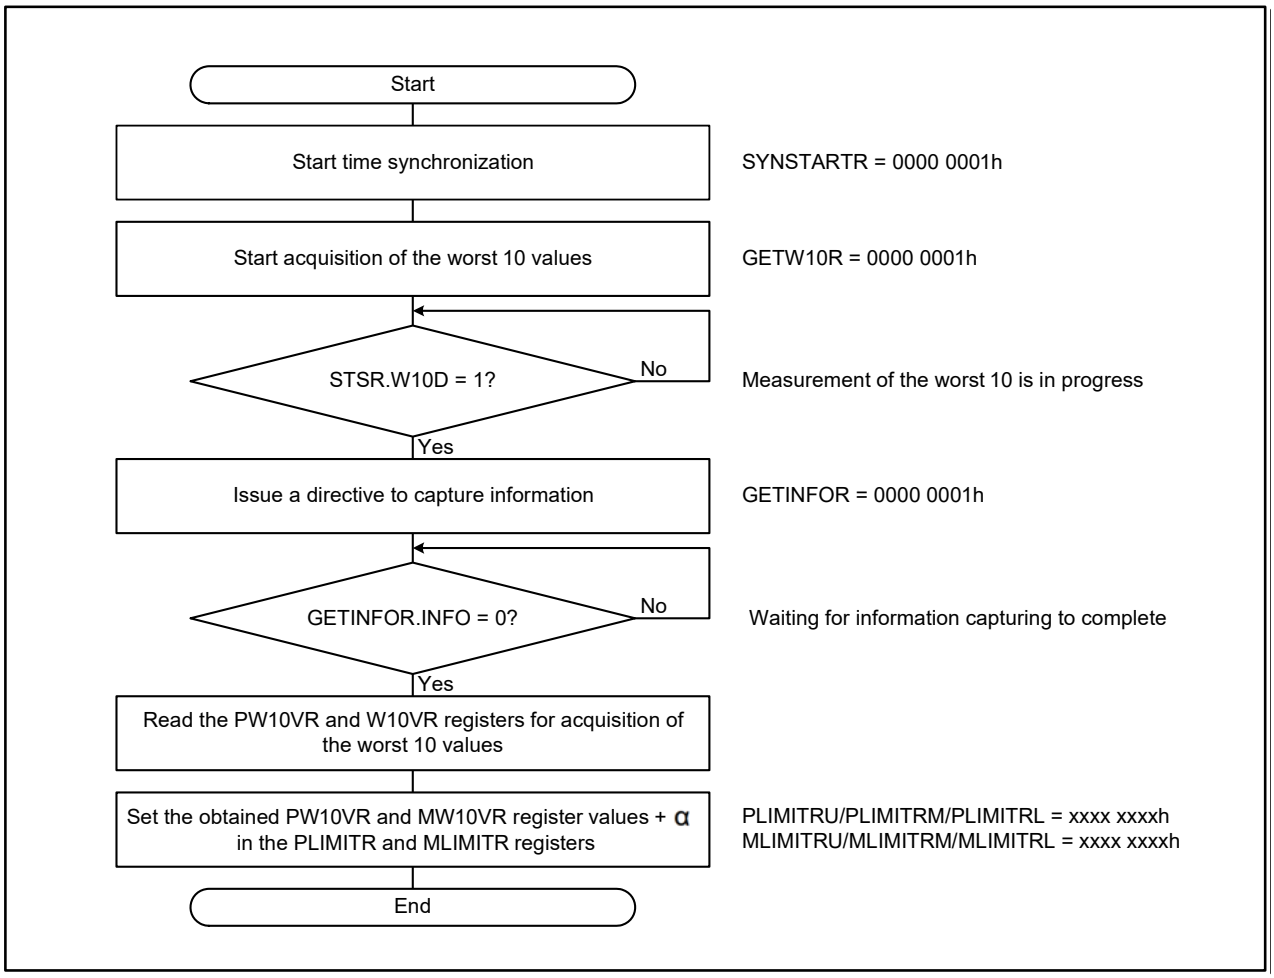

Figure 30.29 Example procedure for software-triggered acquisition of the worst 10 values

30.3.16 Local Clock Counter

The local clock counter retains the synchronized time information. The counter starts counting from 0 after the ETHERC is released from the module-stop state or the EPTPC is released from the software reset state. The local clock counter can then be set to any value. Figure 30.30 shows the procedure for setting the initial value in the local clock counter.

The time information kept by the local clock counter is also readable. Figure 30.31 shows the procedure for reading the time information kept by the local clock counter.

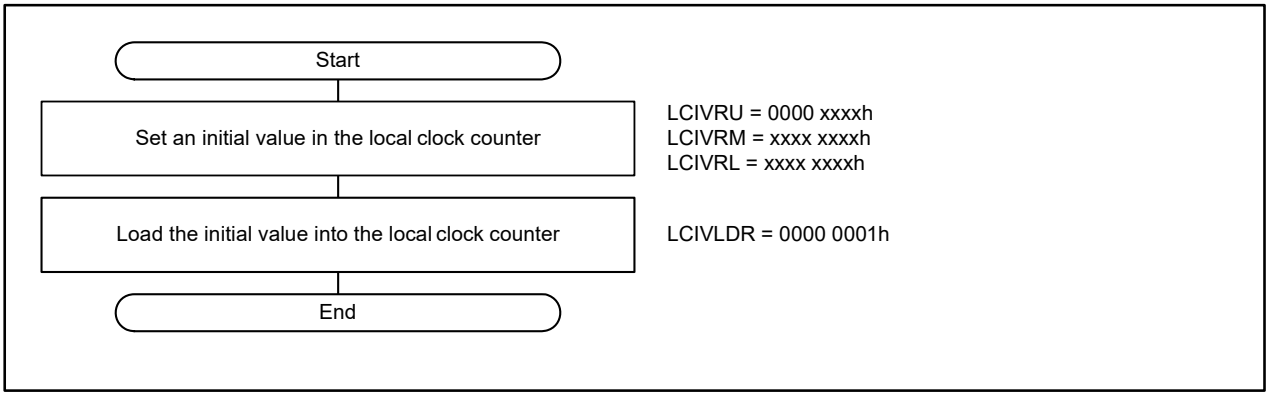

Figure 30.30 Procedure for setting a new initial value in the local clock counter

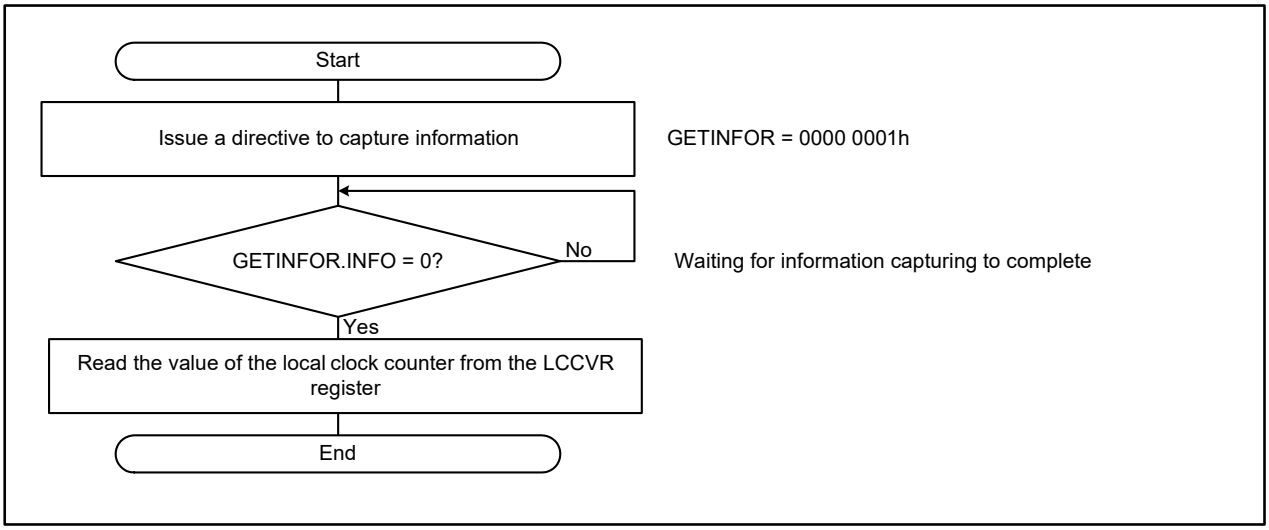

Figure 30.31 Procedure for reading the time kept by the local clock counter

30.3.17 Pulse Output Timer

The STCA module of the EPTPC incorporates six timers (pulse output timers 0 to 5) that operate independently of each other. The pulse output timers produce periodic pulses, and the rising or falling edges of these pulses can be used as interrupt requests or output to the ELC as event signals. The time at which a pulse output timer starts operating (t_{start}), and the period (t_c) and pulse width (t_w) of the output pulses, can be specified.

Figure 30.32 shows the timing of pulse output timer operation, and Table 30.26 lists the restrictions on the settings.

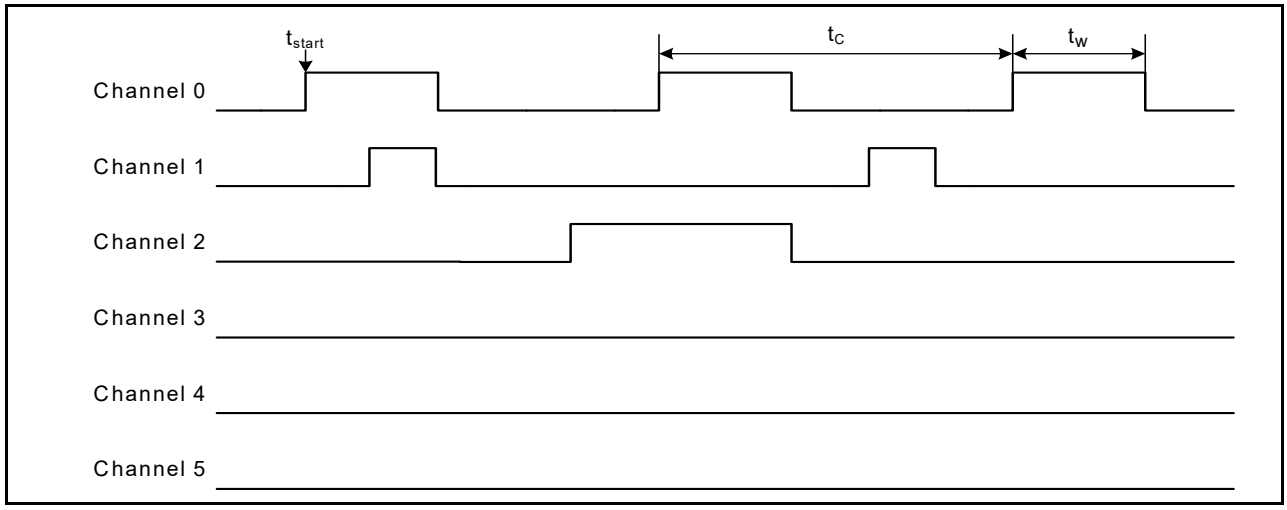

Figure 30.32 Time at which a pulse output timer starts operating

Table 30.26 Restrictions on the values that can be specified for a pulse output timer

Parameter	Restrictions
Cycle (t_C)	From four cycles of the STCA clock to 1 s
Resolution of the cycle	Set in nanoseconds However, the timing of rising edges is rounded by the period of the system clock (50 ns, 40 ns, 20 ns, or 10 ns).
Pulse width (t_W)	From two cycles of the STCA clock to 500 ms
Resolution of the pulse width	Set in nanoseconds However, the timing of falling edges is rounded by the period of the system clock (50 ns, 40 ns, 20 ns, or 10 ns).

30.3.17.1 Procedure for Setting a Pulse Output Timer

Figure 30.33 shows the procedure for setting a pulse output timer.

Note: A timer does not produce periodic pulses if the time set in the TMSTTRUm and TMSTTRLm registers (m = 0 to 5) has elapsed. Set the time for a pulse output timer to start at a later time than that when the timer is set.

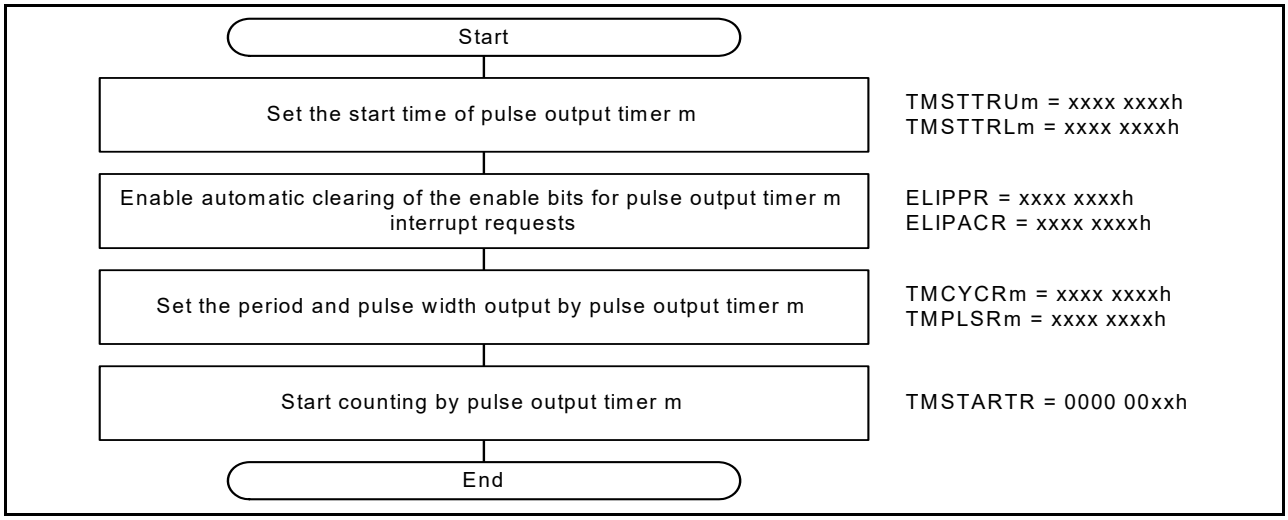

Figure 30.33 Procedure for setting a pulse output timer

30.3.17.2 Output of periodic pulses as interrupt requests or event signals

ETHER_MINT interrupt requests, ETHER_IPLS interrupt requests, or event output signals for the ELC can be generated on detection of rising or falling edges of the periodic pulses from the pulse output timer. The detection edge and the pulse output timer used are configurable, and automatic clearing of enable bits for the ETHER_IPLS interrupt or event output can be set. Make the required settings before setting the TMSTARTR.ENm bit to 1 (starting pulse output timer m).

(1) ETHER_MINT interrupt request

ETHER_MINT interrupt requests can be generated on rising edges of the periodic pulses from the pulse output timers. They cannot be generated on falling edges. Select the pulse output timers for generating these requests in the MITSELR.MINTENm bits. Automatic clearing of the enable bits for ETHER_MINT interrupt requests is not available.

(2) ETHER_IPLS interrupt request

ETHER_IPLS interrupt requests can be generated on either rising or falling edges of the periodic pulses from the pulse output timers. Select the pulse output timers for generating these requests in the IPTSELR.IPTSELm bits. Setting the ELIPACR.PLSP or PLSN bit enables automatic clearing of the enable bits for ETHER_IPLS interrupt requests.

(3) Output of event signals to the ELC

Event signals can be output to the ELC on either rising or falling edges of the periodic pulses from the pulse output timers. Select the pulse output timers for event signal output and the valid edge in the ELIPPR.CYCPm or CYCNm bits. Setting the ELIPACR.CYCPm or CYCNm bits enables automatic clearing of the event output enable bits.

30.3.18 Priority Control in Transmission

30.3.18.1 Arbitration

When contention between a message to be transmitted from the PTPEDMAC and a request for relaying from another channel exists, the PRC-TC module gives priority to the request for relaying from the other channel. Contention between multiple requests for the transmission of messages by the SYNFP module are arbitrated in the order of priority shown in Table 30.27.

Table 30.27 Priority for message transmission arbitration

Transmission message	Priority order	Remark
Sync	1 Highest priority	—
Delay_Req, Pdelay_Req	2	There is no device type that simultaneously transmits Delay_Req and Pdelay_Req messages
Delay_Resp, Pdelay_Resp	3	There is no device type that simultaneously transmits Delay_Resp and Pdelay_Resp messages
Announce	4	—
Relay messages from another channel	5	The PRC-TC module determines the order of priority for these two items
Messages to be transmitted from the PTPEDMAC	5	
Messages to be transmitted from the EDMAC	6	—

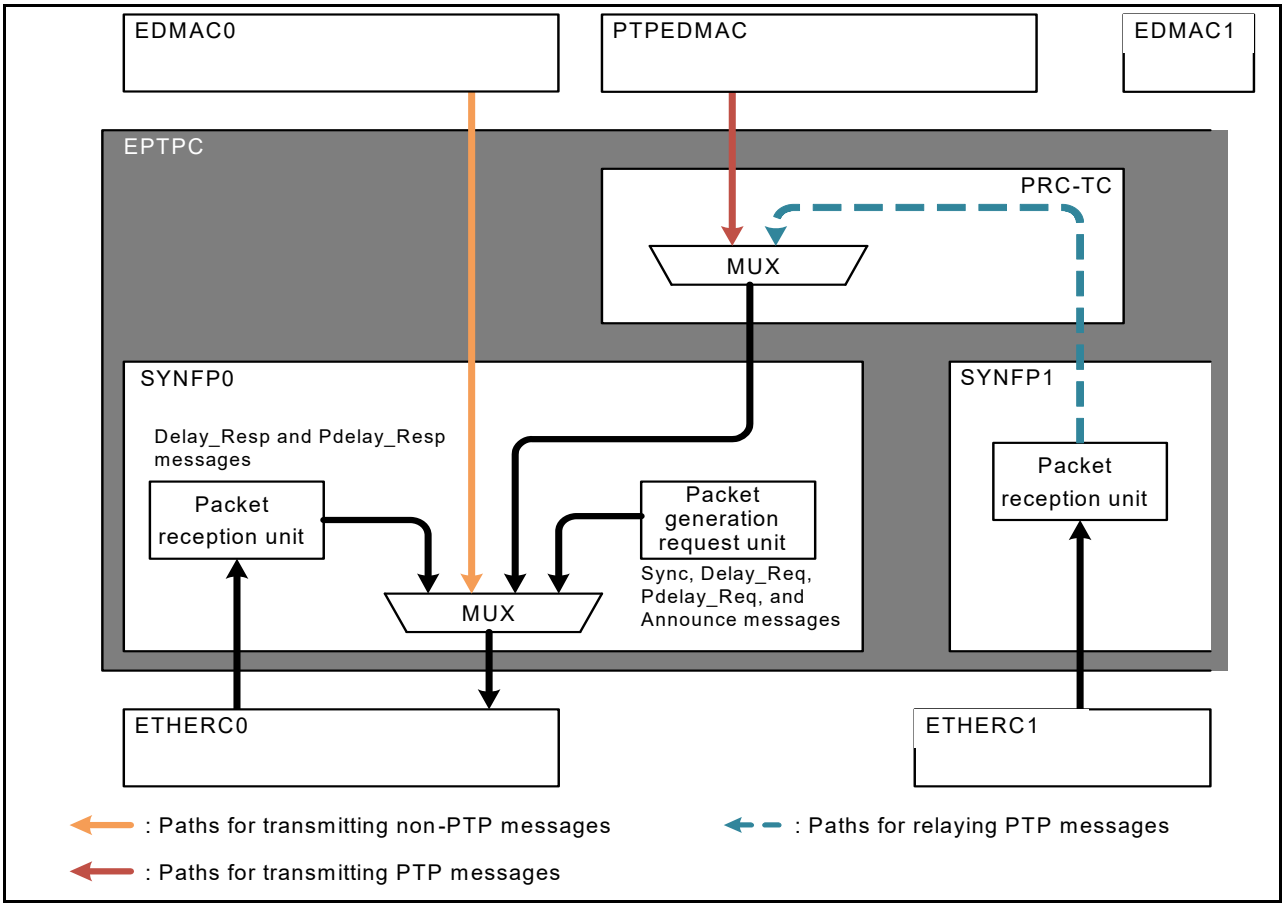

Figure 30.34 Arbitration in message transmission

30.3.18.2 Securing Bandwidth for the Transmission of Sync Messages

The EPTPC secures bandwidth for the transmission of Sync messages, and is capable of handling transmission at very precise intervals.

If the transmission of a Sync message at a fixed interval proceeds at the same time that transmission by the PTPEDMAC or the relaying of messages by another channel is in progress, because transmission of the Sync message proceeds when the other processing is complete, the interval for transmission is no longer fixed. Securing bandwidth for the transmission of Sync messages limits the transmission of messages from EDMAC0, EDMAC1, and the PTPEDMAC, allowing Sync message transmission to be handled without fluctuations. To disable securing of bandwidth for Sync message transmission, set the SYCONFR.SBDIS bit to 1.

Figure 30.35 gives a schematic view of securing bandwidth for the transmission of Sync messages.

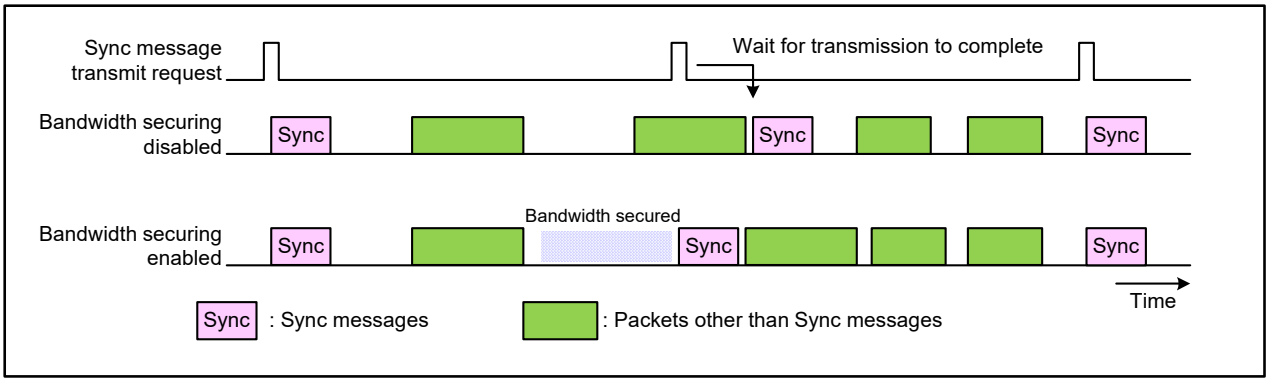

Figure 30.35 Securing of bandwidth for Sync message transmission

30.3.18.3 Securing of Transmission Interval

In the transmission of messages by the ETHERC, if there is a fixed delay from the time of a request for transmission to the time of transmission on the MII of Ethernet port 0 or 1, PTP message timestamps can be used for accurately obtaining the size of the delay during slave operation. However, for continuous transfer where processing of messages to wait for inter-packet gap times is required, delay times might fluctuate.

To enable the ETHERC to secure the reliability of timestamp values, specify an interval for frame transmission in the SYCONFR.TCYC[7:0] bits to control the interval between the completion of transmission and the next request for transmission. This avoids the effects of inter-packet gap times and provides a fixed delay for transmission.

30.4 Interrupts

The EPTPC provides the ETHER_MINT and ETHER_IPLS interrupt requests. Figure 30.36 shows the relationship between the two interrupt requests. Figure 30.37 shows the details on interrupt requests of the pulse output timer.

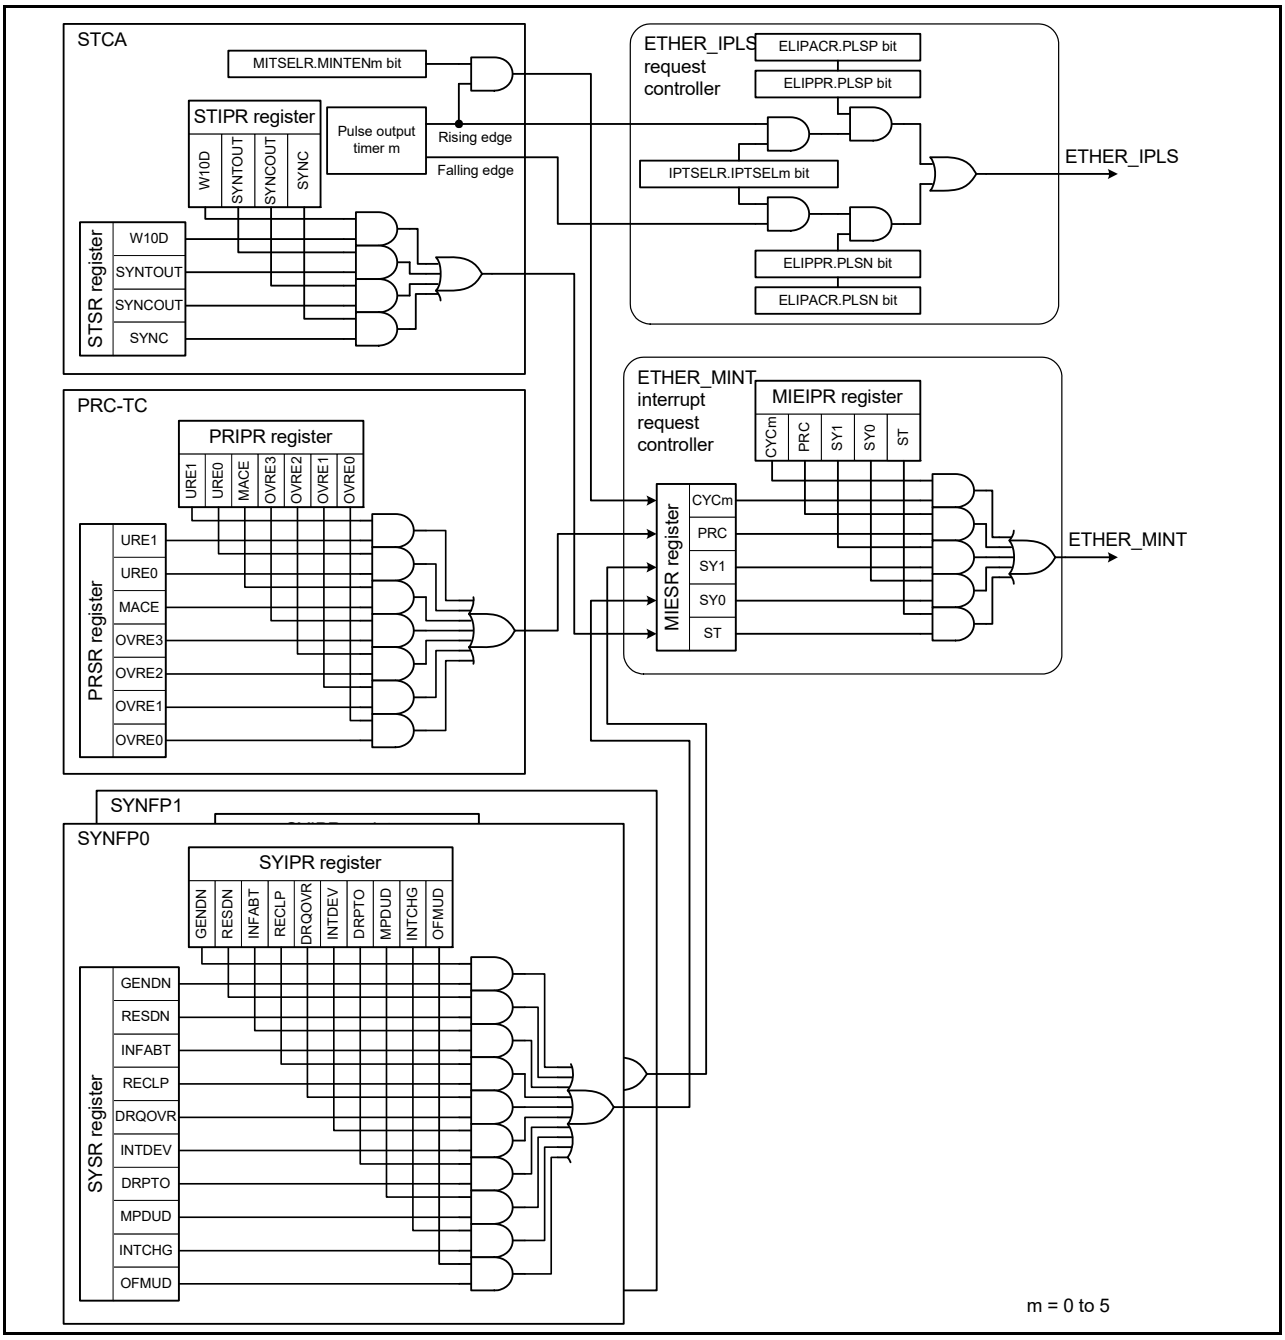

Figure 30.36 ETHER_MINT and ETHER_IPLS interrupt requests

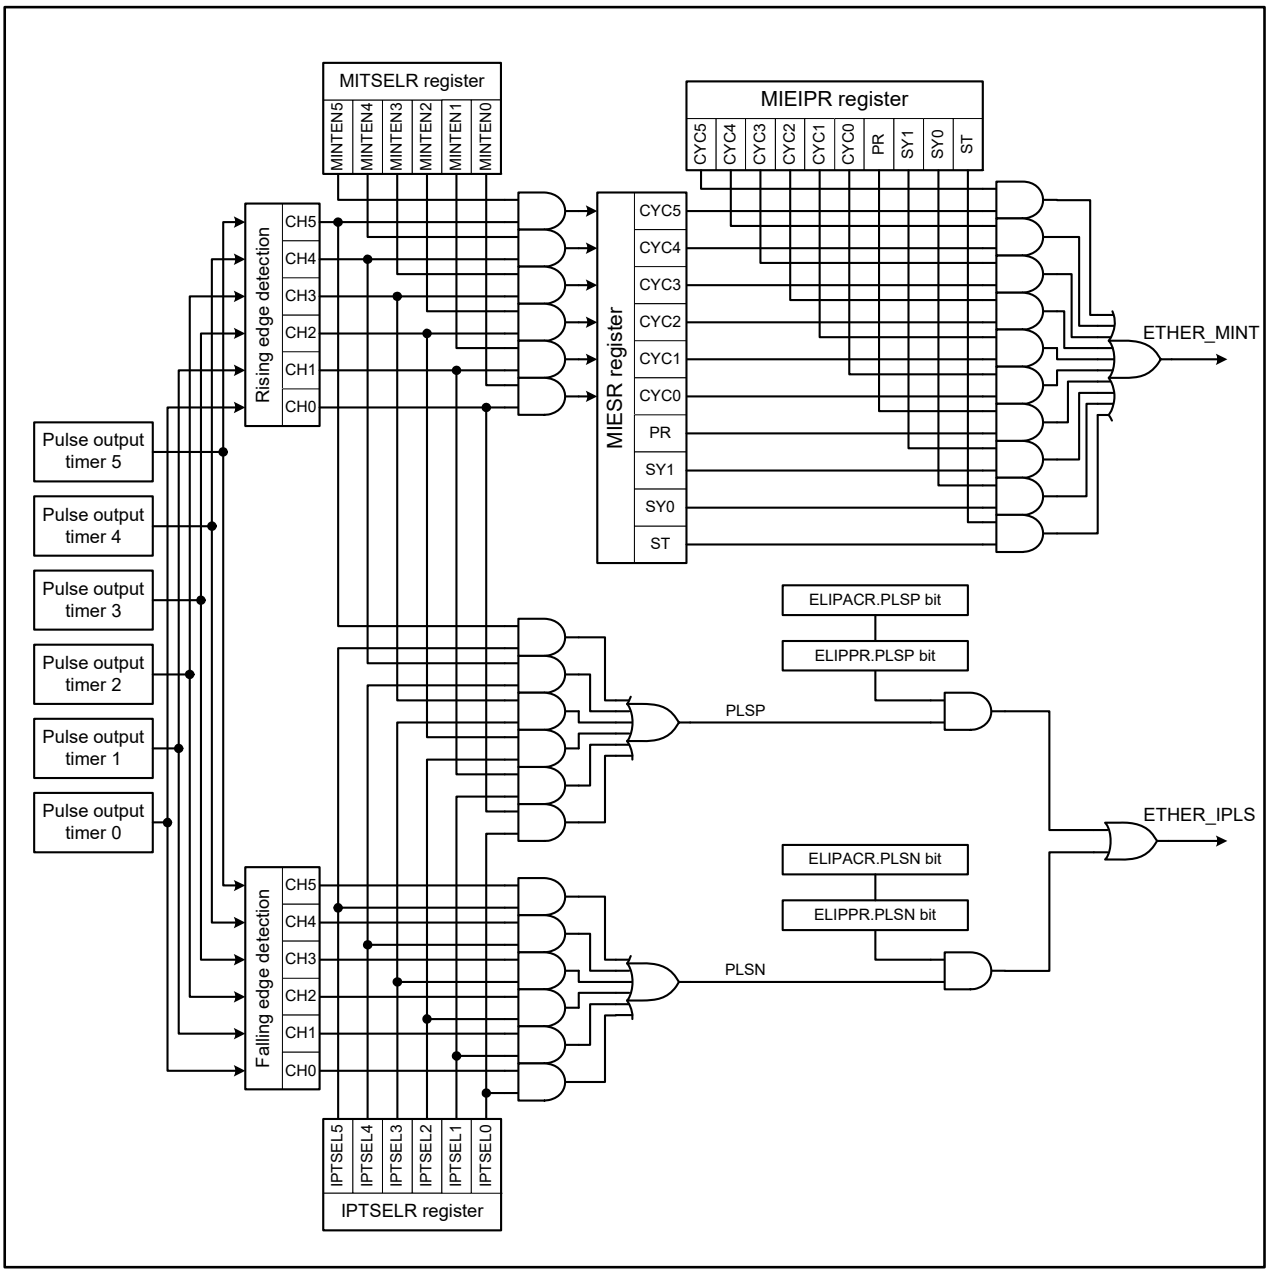

Figure 30.37 Details on interrupt requests of the pulse output timer

30.5 Event Link (Output)

The EPTPC can output an event to the ELC by detecting the rising or falling edge of the pulse from the pulse output timer. Figure 30.38 shows the relationship between the pulse output timer and the ELC.

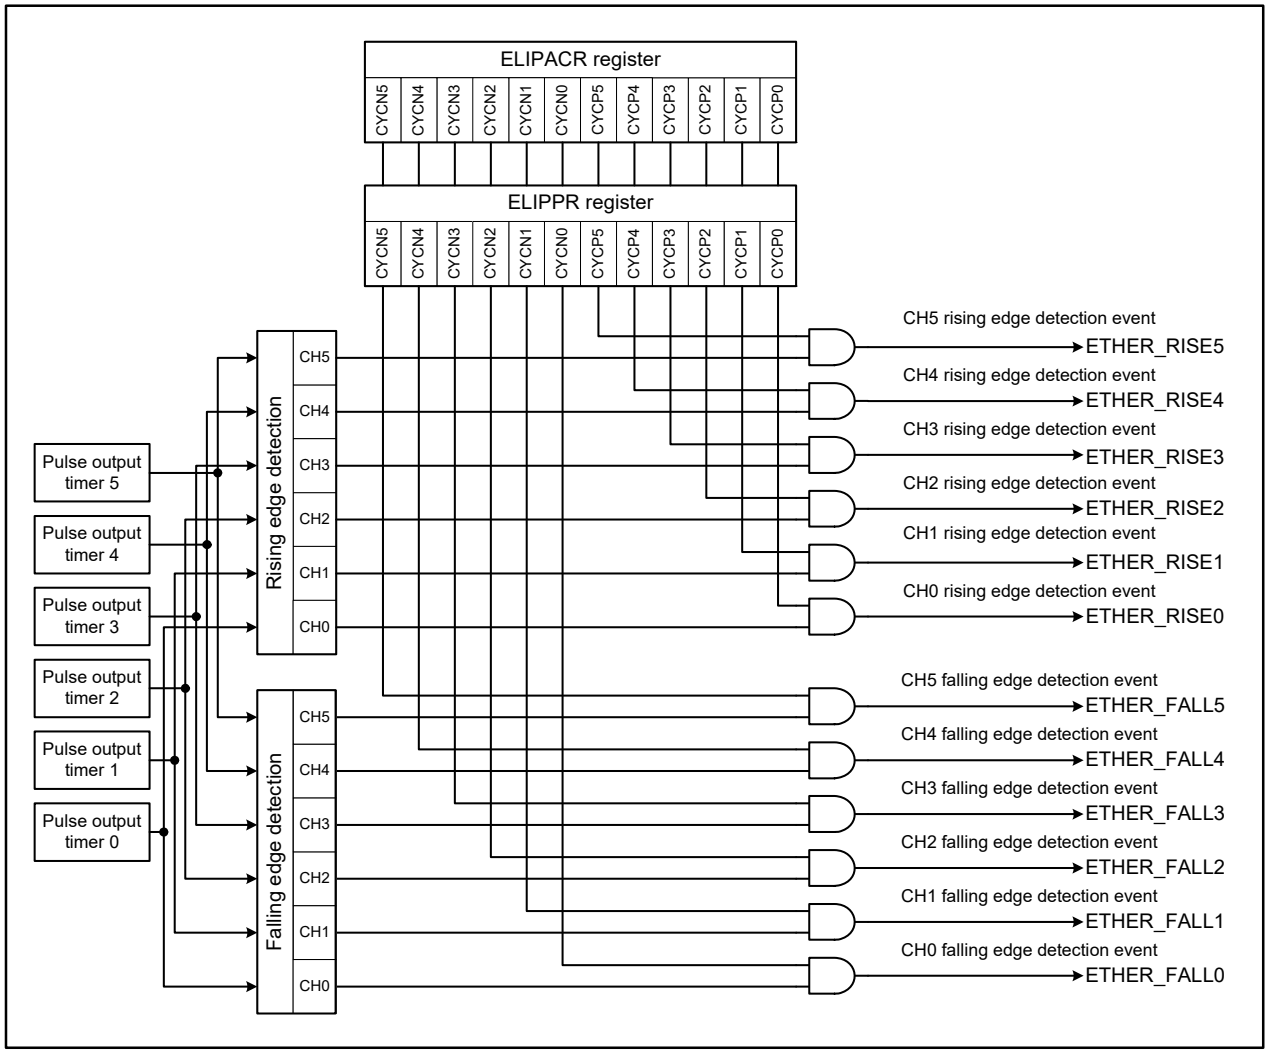

Figure 30.38 Relationship between the pulse output timer and the ELC

30.6 Usage Notes

30.6.1 Restrictions on Register Access

When the EPTPC and PTPEDMAC operations are enabled (MSTPCRB.MSTPB13 = 0), some registers in the EPTPC become inaccessible depending on the combined settings of the MSTPCRB.MSTPB14 bit, MSTPCRB.MSTPB15 bit, and EPTPC bypass bit (BYPASS.BYPASS[1:0] bits). Table 30.28 to Table 30.31 summarize the restrictions on access to the registers.

Table 30.28 Restrictions on register access when no channels are bypassed (BYPASS.BYPASS0 = 0 and BYPASS.BYPASS1 = 0)

Restrictions on register access							
Ethernet port usage		Allocation of register addresses for access					
MSTPB15 setting (EMACC0 and EDMAC0)	MSTPB14 setting (EMACC1 and EDMAC1)	4006 4500h to 4006 45FFh	4006 5000h to 4006 503Fh	4006 5040h to 4006 53FFh (STCA)	4006 5400h to 4006 57FFh (PRC-TC)	4006 5800h to 4006 5BFFh (SYNFP0)	4006 5C00h to 4006 5FFFh (SYNFP1)

1	0	Accessible	Access prohibited	Access prohibited	Access prohibited	Access prohibited	Access prohibited
1	1	Accessible	Access prohibited	Access prohibited	Access prohibited	Access prohibited	Access prohibited

Note: Access to an access-prohibited register can lead to a bus timeout error. If a bus timeout error occurs, set the PTRSTR.RESET bit to 1 to reset the EPTPC by software.

30.6.2 Wait Cycles for Register Access

Access to registers in the EPTPC involves the arbitration of different clock signals, specifically the peripheral module clock signal (PCLKA), the STCA clock signal, and the MII clock signals such as TX_CLK. Accordingly, the number of wait cycles for register access differs depending on the combination of the frequency settings for these clock signals.

Table 30.32 gives examples of numbers of wait cycles for different combinations. Add 1 to 2 cycles to these values to obtain the number of access cycles.

Table 30.32 Wait cycles for register access when the STCA clock is 20 MHz

	STCA clock = 20 MHz							
	Peripheral module clock PCLKA = 120 MHz				Peripheral module clock PCLKA = 20 MHz			
	MII clock 25 MHz (100 Mbps)		MII clock 2.5 MHz (10 Mbps)		MII clock 25 MHz (100 Mbps)		MII clock 2.5 MHz (10 Mbps)	
Address range	Read	Write	Read	Write	Read	Write	Read	Write
4006 4500h to 4006 45FFh	2	2	2	2	2	2	2	2
4006 5000h to 4006 503Fh	4	4	4	4	4	4	4	4
4006 5040h to 4006 53FFh (STCA)	7	27 to 41*1	7	27 to 41*1	7	15 to 17*1	7	15 to 17*1
4006 5400h to 4006 57FFh (PRC-TC)	8	8	8	8	8	8	8	8
4006 5800h to 4006 5BFFh (SYNFP0)	8	23 to 33*2	8	111 to 209*2	8	15 to 17*2	8	31 to 49*2
4006 5C00h to 4006 5FFFh (SYNFP1)	8	23 to 33*2	8	111 to 209*2	8	15 to 17*2	8	31 to 49*2

Note 1. The number of wait cycles in access to the STCA-related registers (W_{STCA}) can be calculated to the following range from the periods of the peripheral module clock ($t_{c(PCLKA)}$) and STCA clock ($t_{c(STCA)}$).

Minimum value of W_{STCA} = Int ($t_{c(STCA)}/t_{c(PCLKA)}$) × 2 + 15 ($t_{c(PCLKA)} \leq t_{c(STCA)}$)
= 15 ($t_{c(PCLKA)} > t_{c(STCA)}$)

Maximum value of W_{STCA} = Int ($t_{c(STCA)}/t_{c(PCLKA)}$) × 4 + 17 ($t_{c(PCLKA)} \leq t_{c(STCA)}$)
= 17 ($t_{c(PCLKA)} > t_{c(STCA)}$)

- Int(A) is the calculation of the largest integer not greater than A.
- This calculation assumes that the CPU clock and peripheral module clock have the same periods.

For example, if the frequency of the peripheral module clock is 120 MHz and that of the STCA clock is 1/6 that of the peripheral module clock (= 20 MHz),

Minimum value of W_{STCA} = Int (50 [ns]/8.3 [ns]) × 2 + 15 = 27, and
Maximum value of W_{STCA} = Int (50 [ns]/8.3 [ns]) × 4 + 17 = 41.

If REF50CK0 or REF50CK1 is used as the STCA clock, the frequency of the STCA clock is 25 MHz.

Note 2. The number of wait cycles in access to the SYNFP-related registers (W_{SYNF}) can be calculated to the following range from the periods of the peripheral module clock ($t_{c(PCLKA)}$) and MII clock ($t_{c(MII)}$).

Minimum value of W_{SYNF} = Int ($t_{c(MII)}/t_{c(PCLKA)}$) × 2 + 15 ($t_{c(PCLKA)} \leq t_{c(MII)}$)
= 15 ($t_{c(PCLKA)} > t_{c(MII)}$)

Maximum value of W_{SYNF} = Int ($t_{c(MII)}/t_{c(PCLKA)}$) × 4 + 17 ($t_{c(PCLKA)} \leq t_{c(MII)}$)
= 17 ($t_{c(PCLKA)} > t_{c(MII)}$)

- Int(A) is the calculation of the largest integer not greater than A.
- This calculation assumes that the CPU clock and peripheral module clock have the same periods.

For example, if the frequency of the peripheral module clock is 120 MHz and the transmission rate is 10 Mbps (so the MII clock is running at 2.5 MHz),

Minimum value of W_{SYNF} = Int (400 [ns]/8.3 [ns]) × 2 + 15 = 111, and
Maximum value of W_{SYNF} = Int (400 [ns]/8.3 [ns]) × 4 + 17 = 209.

31. Ethernet DMA Controller (EDMAC)

31.1 Overview

The MCU provides three channels for the Ethernet DMA Controller (EDMAC), two channels for the Ethernet Controller (ETHERC) and one channel for the Ethernet PTP Controller (EPTPC). EDMAC0 controls data transmission and reception for ETHERC0, and EDMAC1 for ETHERC1. The PTPEDMAC controls data transmission and reception for ETHERC0 and ETHERC1 based on the EPTPC settings. In this chapter, channel numbers are indicated as n, where n = 0 or 1.

The EDMAC controls most of the transmit and receive buffer management for communications. This reduces the load on the CPU and allows efficient data transmission and reception. The data transfers are controlled according to the information referred to as descriptors, in memory.

Table 31.1 lists the EDMAC specifications and Figure 31.1 shows the configuration. Figure 31.2 shows the configuration of descriptors and transmit and receive buffers in memory.

Table 31.1 EDMAC specifications

Parameter	Specifications
Data transmission and reception	• Controls data transmission and reception according to descriptors • Supports single buffer frame transmission and reception (1 buffer per frame) and multi-buffer frame transmission and reception (multiple buffers per frame)
Functions	• Minimizes system bus occupancy time using block transfer (32-byte units) • Writes back the transmit or receive frame state to descriptors • Inserts padding in receive data
Module-stop function	Module-stop state can be set to reduce power consumption

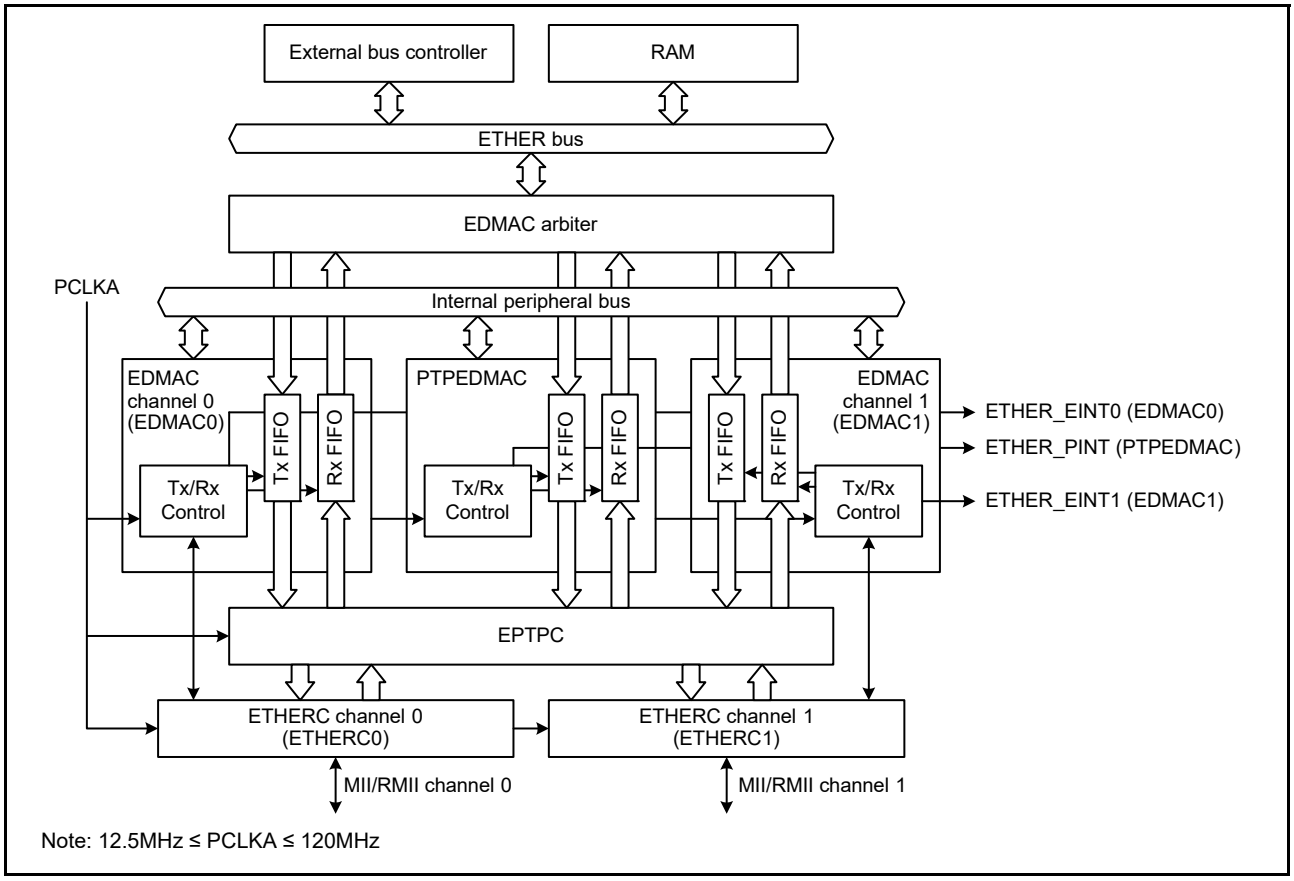

Figure 31.1 EDMAC configuration

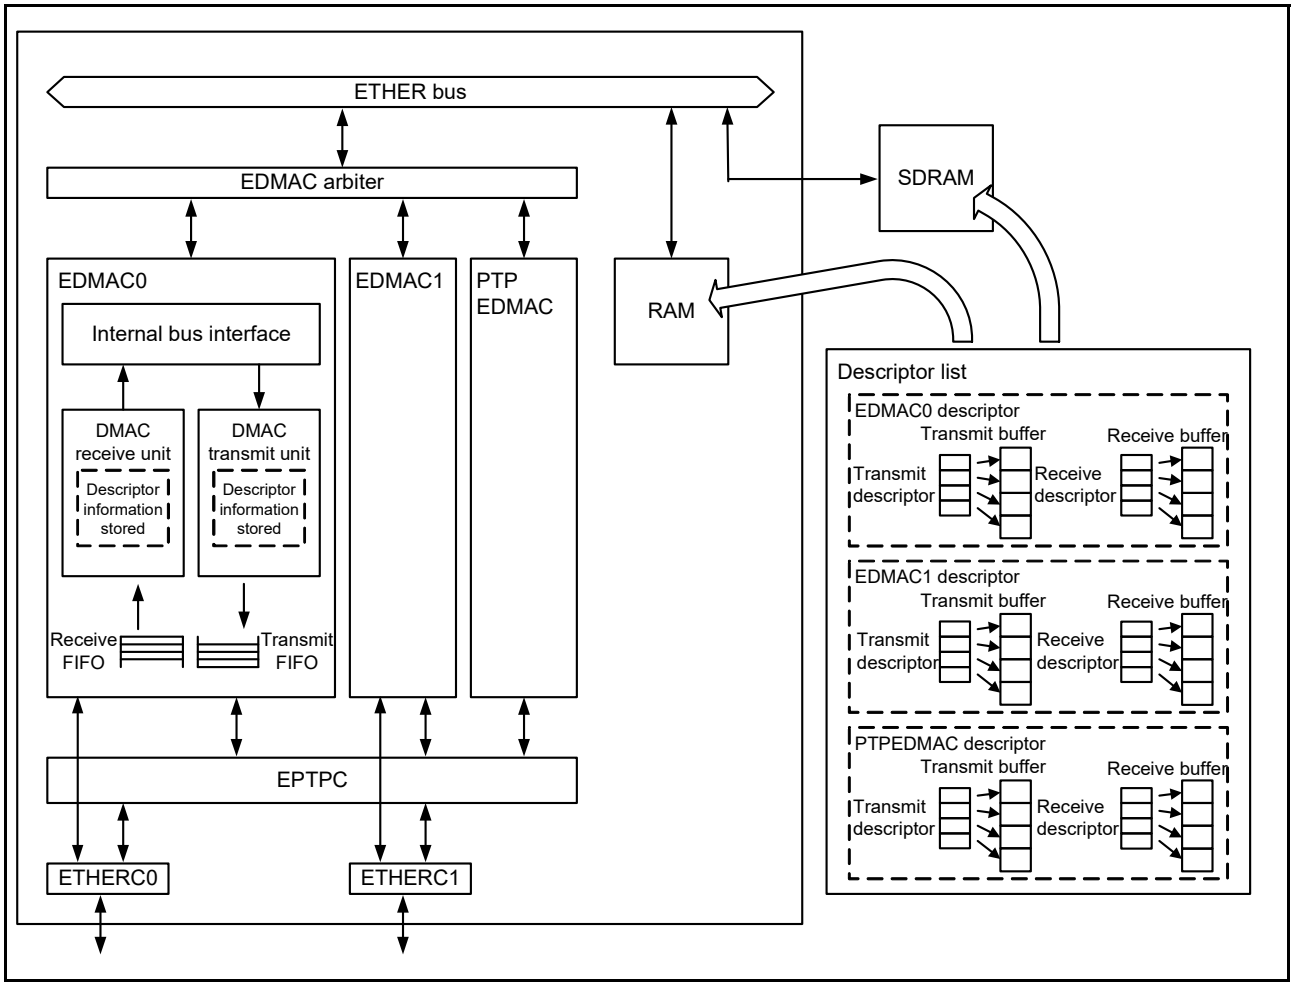

Figure 31.2 Configuration of descriptors and transmit and receive buffers in memory

31.2 Register Descriptions

31.2.1 EDMAC Mode Register (EDMR)

Address(es): EDMAC0.EDMR 4006 4000h, EDMAC1.EDMR 4006 4200h, PTPEDMAC.EDMR 4006 4400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	DE	DL[1:0]		—	—	—	SWR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SWR	Software Reset	When 1 is written, the associated channels of the EDMAC and ETHERC are reset. Note: The ETHERC is not reset for the PTPEDMAC. The TDLAR, RDLAR, RMFCR, TFUCR, and RFOCR registers are not reset with this bit.The read value is 0.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit name	Description	R/W
b5, b4	DL[1:0]	Transmit/Receive Descriptor Length	b5 b4 0 0: 16 bytes 0 1: 32 bytes 1 0: 64 bytes 1 1: 16 bytes.	R/W
b6	DE	Big Endian Mode/Little Endian Mode*1	0: Big endian mode 1: Little endian mode.	R/W
b31 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This setting applies to data for the transmit and receive buffers. It does not apply to transmit and receive descriptors and registers.

The EDMR register controls EDMAC operation. Set the EDMR register during initialization process after a reset. When rewriting this register outside of the initialization process, set the SWR bit to 1 to reset the EDMAC and ETHERC, and then set this register again. If the ETHERC and EDMAC are reset during data transmission or reception, abnormal data might be sent on the line. Do not rewrite this register while the ETHERC transmit or receive function is enabled. It takes 64 cycles of the peripheral module clock (PCLKA) to initialize the ETHERC and EDMAC. Complete the initialization before accessing registers in the ETHERC and EDMAC.

31.2.2 EDMAC Transmit Request Register (EDTRR)

Address(es): EDMAC0.EDTRR 4006 4008h, EDMAC1.EDTRR 4006 4208h, PTPEDMAC.EDTRR 4006 4408h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	TR	Transmit Request	When 1 is written, the EDMAC reads the associated descriptor and transmits frames where the TD0.TACT bit is 1. The TR bit is set to 0 after all the valid frames are transmitted. Writing 0 to this bit has no effect.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The EDTRR register controls EDMAC transmission. After the EDMAC transmits one frame, it reads the next descriptor. When the TD0.TACT bit in the descriptor is 1, the EDMAC continues transmission. When the TD0.TACT bit is 0, the EDMAC sets the TR bit to 0 and stops transmission.

31.2.3 EDMAC Receive Request Register (EDRRR)

Address(es): EDMAC0.EDRRR 4006 4010h, EDMAC1.EDRRR 4006 4210h, PTPEDMAC.EDRRR 4006 4410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	RR	Receive Request	0: Disable the receive function*1 1: Read receive descriptor and enable the receive function.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. If the receive function is disabled during frame reception, write-back to the receive descriptor is not performed successfully. Subsequent pointers for reading a receive descriptor become abnormal and the EDMAC cannot operate normally. In this case, to enable the EDMAC receive function again, execute a software reset by setting the EDMR.SWR bit to 1.
To disable the EDMAC receive function without resetting the EDMAC, set the ETHERCn.ECMR.RE bit to 0. After the EDMAC completes reception and write-back to the receive descriptor is confirmed, set the RR bit to 0.

The EDRRR register controls EDMAC reception. When the RR bit is set to 1, the EDMAC reads the receive descriptor. When the RD0.RACT bit is 1, the EDMAC waits for a receive request from the ETHERC. When the EDMAC has received data for the receive buffer size, it reads the next descriptor and waits to receive a frame. If the RD0.RACT bit is 0, the EDMAC sets the RR bit to 0 and stops reception.

31.2.4 Transmit Descriptor List Start Address Register (TDLAR)

Address(es): EDMAC0.TDLAR 4006 4018h, EDMAC1.TDLAR 4006 4218h, PTPEDMAC.TDLAR 4006 4418h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify the start address of the transmit descriptor list. Set the start address according to the descriptor length selected in the EDMR.DL[1:0] bits. • 16-byte boundary: Lower 4 bits = 0000b • 32-byte boundary: Lower 5 bits = 00000b • 64-byte boundary: Lower 6 bits = 000000b.	R/W

The TDLAR register specifies the start address of the transmit descriptor list. Align each descriptor on the associated boundary to the descriptor length selected in the EDMR.DL[1:0] bits. Do not rewrite the TDLAR register during transmission. Rewrite the TDLAR register while the EDTRR.TR bit is 0.

31.2.5 Receive Descriptor List Start Address Register (RDLAR)

Address(es): EDMAC0.RDLAR 4006 4020h, EDMAC1.RDLAR 4006 4220h, PTPEDMAC.RDLAR 4006 4420h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	The start address of the receive descriptor list is set. Set the start address according to the descriptor length selected by the EDMR.DL[1:0] bits. • 16-byte boundary: Lower 4 bits = 0000b • 32-byte boundary: Lower 5 bits = 00000b • 64-byte boundary: Lower 6 bits = 000000b.	R/W

The RDLAR register specifies the start address of the receive descriptor list. Allocate each descriptor on the associated boundary to the descriptor length selected by the EDMR.DL[1:0] bits. Do not rewrite the RDLAR register during reception. Rewrite the RDLAR register while the EDRRR.RR bit is 0.

31.2.6 ETHERC/EDMAC Status Register (EDMACn.EESR) (n = 0, 1)

Address(es): EDMAC0.EESR 4006 4028h, EDMAC1.EESR 4006 4228h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	TWB	—	—	—	TABT	RABT	RFCOF	ADE	ECI	TC	TDE	TFUF	FR	RDE	RFOF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CND	DLC	CD	TRO	RMAF	—	—	RRF	RTLF	RTSF	PRE	CERF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CERF	CRC Error Flag	0: CRC error not detected 1: CRC error detected.	R/W
b1	PRE	PHY-LSI Receive Error Flag	0: PHY-LSI receive error not detected 1: PHY-LSI receive error detected.	R/W
b2	RTSF	Frame-Too-Short Error Flag	0: Frame-too-short error not detected 1: Frame-too-short error detected.	R/W
b3	RTLF	Frame-Too-Long Error Flag	0: Frame-too-long error not detected 1: Frame-too-long error detected.	R/W
b4	RRF	Alignment Error Flag	0: Alignment error not detected 1: Alignment error detected.	R/W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	RMAF	Multicast Address Frame Receive Flag	0: Multicast address frame not received 1: Multicast address frame received.	R/W
b8	TRO	Transmit Retry Over Flag	0: Transmit retry-over condition not detected 1: Transmit retry-over condition detected.	R/W

Bit	Symbol	Bit name	Description	R/W
b9	CD	Late Collision Detect Flag	0: Late collision not detected 1: Late collision detected during frame transmission.	R/W
b10	DLC	Loss of Carrier Detect Flag	0: Loss of carrier not detected 1: Loss of carrier detected during frame transmission.	R/W
b11	CND	Carrier Not Detect Flag	0: Carrier detected when transmission started 1: Carrier not detected during preamble transmission.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	RFOF	Receive FIFO Overflow Flag	0: No overflow occurred 1: Overflow occurred.	R/W
b17	RDE	Receive Descriptor Empty Flag	0: EDMAC detected that the receive descriptor valid bit (RD0.RACT) is 1 1: EDMAC detected that the receive descriptor valid bit (RD0.RACT) is 0.	R/W
b18	FR	Frame Receive Flag	0: Frame not received 1: Frame received and update of the receive descriptor is complete.	R/W
b19	TFUF	Transmit FIFO Underflow Flag	0: No underflow occurred 1: Underflow occurred.	R/W
b20	TDE	Transmit Descriptor Empty Flag	0: EDMAC detected that the transmit descriptor valid bit (TD0.TACT) is 1 1: EDMAC detected that the transmit descriptor valid bit (TD0.TACT) is 0.	R/W
b21	TC	Frame Transfer Complete Flag	0: Transfer not complete or no transfer requested 1: All frames indicated in the transmit descriptor were completely transferred to the transmit FIFO.	R/W
b22	ECI	ETHERC Status Register Source Flag	0: ETHERC status interrupt source not detected 1: ETHERC status interrupt source detected.	R*1
b23	ADE	Address Error Flag	0: Invalid memory address not detected (normal operation) 1: Invalid memory address detected.*2	R/W
b24	RFCOF	Receive Frame Counter Overflow Flag	0: Receive frame counter did not overflow 1: Receive frame counter overflowed.	R/W
b25	RABT	Receive Abort Detect Flag	0: Frame reception not aborted or no reception requested 1: Frame reception aborted.	R/W
b26	TABT	Transmit Abort Detect Flag	0: Frame transmission not aborted or no transmission requested. 1: Frame transmission aborted.	R/W
b29 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b30	TWB	Write-Back Complete Flag	0: Write-back not complete or no transmission requested 1: Write-back to the transmit descriptor completed.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. The ECI flag is read-only. When the source in the ETHERCn.ECSR register is cleared, the ECI flag is also cleared.

Note 2. When an address error is detected, the EDMAC halts the process. To resume operation, set the EDMR.SWR bit to 1 (resetting the EDMAC and ETHERC), and then reconfigure the EDMAC and ETHERC.

The EDMACn.EESR register indicates the ETHERC and EDMAC communication status. Each flag in the EESR register can be output as an interrupt request signal (ETHER_EINTn) from the EDMAC. Writing 1 clears all of the flags except ECI to 0. Writing 0 does not affect any of the flag values. The interrupt sources are enabled by setting the associated bits in the EDMACn.EESIPR register.

CERF flag (CRC Error Flag)

The CERF flag is set to 1 when an error is detected while checking the frame check sequence (FCS) field of the receive frame.

PRE flag (PHY-LSI Receive Error Flag)

The PRE flag indicates that the RX_ER signal output from the PHY-LSI is high.

RTSF flag (Frame-Too-Short Error Flag)

The RTSF flag indicates that a received frame is less than 64 bytes.

RTLF flag (Frame-Too-Long Error Flag)

The RTLF flag indicates that a received frame is greater than the upper limit of the receive frame length set in the ETHERCn.RFLR register. The excess data is discarded.

RRF flag (Alignment Error Flag)

The RRF flag indicates that a frame is not an integral number of octets. The last word that is not an integral number of octets is not transferred.

RMAF flag (Multicast Address Frame Receive Flag)

The RMAF flag indicates that a multicast frame was received.

TRO flag (Transmit Retry Over Flag)

The TRO flag indicates that a collision occurred again during the 15th retry of frame transmission.

CD flag (Late Collision Detect Flag)

The CD flag indicates that a late collision was detected during frame transmission.

DLC flag (Loss of Carrier Detect Flag)

The DLC flag indicates that a loss of carrier was detected during frame transmission.

CND flag (Carrier Not Detect Flag)

The CND flag is set to 1 when a carrier is not detected during preamble transmission.

RFOF flag (Receive FIFO Overflow Flag)

The RFOF flag indicates that the receive FIFO overflowed during frame reception.

RDE flag (Receive Descriptor Empty Flag)

The RDE flag indicates that the read receive descriptor is invalid. When this flag is set to 1, set the RD0.RACT bit in the receive descriptor to 1 and set the EDRRR.RR bit to 1 to resume reception.

FR flag (Frame Receive Flag)

The FR flag indicates that a frame was received and the receive descriptor was updated. The FR flag is set to 1 every time a frame is received.

TFUF flag (Transmit FIFO Underflow Flag)

The TFUF flag indicates that no data remains in the transmit FIFO during frame transmission. Incomplete data is sent to the line.

TDE flag (Transmit Descriptor Empty Flag)

The TDE flag indicates that the TD0.TACT bit of the transmit descriptor is 0 while the previous transmit descriptor indicates that the frame is not complete (TD0.TFP[1:0] bits are 10b or 00b) in multi-buffer frame transmission. As a result, an incomplete frame might be sent.

When this flag is set to 1, perform a software reset and then set the EDTRR.TR bit to 1 to resume transmission. Transmission starts from the address stored in the TDLAR register.

TC flag (Frame Transfer Complete Flag)

The TC flag indicates that all the data specified in the transmit descriptor was transmitted from the ETHERC. This flag is set to 1 when one frame was transmitted in single-buffer frame transmission or when the last data of a frame is transmitted in multi-buffer frame transmission and the TD0.TACT bit in the next transmit descriptor is 0. After frame transmission is complete, the EDMAC writes the transfer status back to the descriptor.

ECI flag (ETHERC Status Register Source Flag)

The ECI flag is set to 1 when an interrupt request is generated by the ETHERC.ECSR register.

ADE flag (Address Error Flag)

The ADE flag indicates that the memory address that the EDMAC tried to use for transfer is invalid.

RFCOF flag (Receive Frame Counter Overflow Flag)

The RFCOF flag indicates that the next frame reception started while the number of frames stored in the receive FIFO reached the maximum number of frames (16 frames). The received frame is discarded while the RFCOF flag is 1.

RABT flag (Receive Abort Detect Flag)

The RABT flag indicates that the ETHERC aborted frame reception because of a CRC error, PHY-LSI receive error, frame-too-short error, frame-too-long error, or other error.

TABT flag (Transmit Abort Detect Flag)

The TABT flag indicates that the ETHERC aborted frame transmission because of transmit retry over, loss of carrier, no carrier detection, or other error.

TWB flag (Write-Back Complete Flag)

The TWB flag indicates the EDMAC completed writing back to the descriptor after frame transmission. This flag is set to 1 after each frame transmission when the TRIMD.TIM bit is 0. It only is set to 1 when the TRIMD.TIS bit is 1.

31.2.7 PTP/EDMAC Status Register (PTPEDMAC.EESR)

Address(es): PTPEDMAC.EESR 4006 4428h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b7	RPORT	Receive Port Flag	0: Port 0 1: Port 1.	R/W

Bit	Symbol	Bit name	Description	R/W
b8	MACE	MAC Address Mismatch Flag	0: Source MAC address of transmit frame data matches the set value 1: Source MAC address of transmit frame data does not match the set value.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	RFOF	Receive FIFO Overflow Flag	0: No overflow occurred 1: Overflow occurred.	R/W
b17	RDE	Receive Descriptor Empty Flag	0: EDMAC detected that the receive descriptor valid bit (RD0.RACT) is 1 1: EDMAC detected that the receive descriptor valid bit (RD0.RACT) is 0.	R/W
b18	FR	Frame Receive Flag	0: Frame not received 1: Frame received and receive descriptor updated.	R/W
b19	TFUF	Transmit FIFO Underflow Flag	0: No underflow occurred 1: Underflow occurred.	R/W
b20	TDE	Transmit Descriptor Empty Flag	0: EDMAC detected that the transmit descriptor valid bit (TD0.TACT) is 1 1: EDMAC detected that the transmit descriptor valid bit (TD0.TACT) is 0.	R/W
b21	TC	Frame Transfer Complete Flag	0: Transfer not complete or transfer not requested 1: All frames indicated in the transmit descriptor were completely transferred to the transmit FIFO.	R/W
b22	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b23	ADE	Address Error Flag	0: Invalid memory address not detected (normal operation) 1: Invalid memory address detected.*1	R/W
b24	RFCOF	Receive Frame Counter Overflow Flag	0: Receive frame counter did not overflow 1: Receive frame counter overflowed.	R/W
b25	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b26	TABT	Transmit Abort Detect Flag	0: Frame transmission not aborted or transmission not requested 1: Frame transmission aborted.	R/W
b29 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b30	TWB	Write-Back Complete Flag	0: Write-back not complete or transmission not requested 1: Write-back to the transmit descriptor completed.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. When an address error is detected, the EDMAC halts the process. To resume operation, set the EDMR.SWR bit to 1 (resetting the EDMAC and ETHERC), and then reconfigure the EDMAC and ETHERC.

The PTPEDMAC.EESR register indicates the PTPEDMAC communication status. Each flag in the EESR register can be output as an interrupt request signal (ETHER_PINT) from the PTPEDMAC. Writing 1 clears the flags to 0. Writing 0 does not affect the flag values. All of the interrupt sources, except for the TYPE[3:0] flag, are enabled by setting the associated bits in the PTPEDMAC.EESIPR register.

TYPE[3:0] flags (PTP v2 Message Type Flag)

The TYPE[3:0] flags indicate the type of received PTP message.

PVER flag (PTP v2 Packet Flag)

The PVER flag indicates whether the received packet is a PTP v2 packet.

RPORT flag (Receive Port Flag)

The RPORT flag indicates which Ethernet port was used for receiving a PTP message.

MACE flag (MAC Address Mismatch Flag)

The MACE flag indicates that the source MAC address is different from the set value.

RFOF flag (Receive FIFO Overflow Flag)

The RFOF flag indicates that the receive FIFO overflowed during frame reception.

RDE flag (Receive Descriptor Empty Flag)

The RDE flag indicates that the read receive descriptor is invalid. When this flag is set to 1, set the RD0.RACT bit in the receive descriptor to 1 and set the EDRRR.RR bit to 1 to resume reception.

FR flag (Frame Receive Flag)

The FR flag indicates that a frame was received and the receive descriptor was updated. The FR flag is set to 1 every time a frame is received.

TFUF flag (Transmit FIFO Underflow Flag)

The TFUF flag indicates that no data remains in the transmit FIFO during frame transmission. Incomplete data is sent to the line.

TDE flag (Transmit Descriptor Empty Flag)

The TDE flag indicates that the TD0.TACT bit of the transmit descriptor is 0 while the previous transmit descriptor indicates that the frame is not complete (TD0.TFP[1:0] bits are 10b or 00b) in multi-buffer frame transmission. As a result, an incomplete frame might be sent.

When this flag is set to 1, perform a software reset and then set the EDTRR.TR bit to 1 to resume transmission. Transmission starts from the address stored in the TDLAR register.

TC flag (Frame Transfer Complete Flag)

The TC flag indicates that all the data specified in the transmit descriptor was transmitted from the ETHERC. This flag is set to 1 when one frame is transmitted in single-buffer frame transmission or when the last data of a frame is transmitted in multi-buffer frame transmission and the TD0.TACT bit in the next transmit descriptor is 0. After frame transmission is complete, the PTPEDMAC writes the transfer status back to the descriptor.

ADE flag (Address Error Flag)

The ADE flag indicates that the memory address that the PTPEDMAC tried to use for transfer is invalid.

RFCOF flag (Receive Frame Counter Overflow Flag)

The RFCOF flag indicates that the next frame reception started while the number of frames stored in the receive FIFO reached the maximum number of frames (16 frames). Received frames are discarded while the RFCOF flag is 1.

TABT flag (Transmit Abort Detect Flag)

The TABT flag indicates that the ETHERC aborted frame transmission because of transmit retry over, loss of carrier, no carrier detection, or other error.

TWB flag (Write-Back Complete Flag)

The TWB flag indicates the PTPEDMAC completed writing back to the descriptor after frame transmission. This flag is set to 1 after each frame transmission when the TRIMD.TIM bit is 0. It only is set to 1 when the TRIMD.TIS bit is 1.

31.2.8 ETHERC/EDMAC Status Interrupt Enable Register (EDMACn.EESIPR) (n = 0, 1)

Address(es): EDMAC0.EESIPR 4006 4030h, EDMAC1.EESIPR 4006 4230h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit name	Description	R/W
b20	TDEIP	Transmit Descriptor Empty Interrupt Request Enable	0: Disable transmit descriptor empty interrupt requests 1: Enable transmit descriptor empty interrupt requests.	R/W
b21	TCIP	Frame Transfer Complete Interrupt Request Enable	0: Disable frame transmission complete interrupt requests 1: Enable frame transmission complete interrupt requests.	R/W
b22	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b23	ADEIP	Address Error Interrupt Request Enable	0: Disable address error interrupt requests 1: Enable address error interrupt requests.	R/W
b24	RFCOFIP	Receive Frame Counter Overflow Interrupt Request Enable	0: Disable receive frame counter overflow interrupt requests 1: Enable receive frame counter overflow interrupt requests.	R/W
b25	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b26	TABTIP	Transmit Abort Detect Interrupt Request Enable	0: Disable transmit abort detect interrupt requests 1: Enable transmit abort detect interrupt requests.	R/W
b29 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b30	TWBIP	Write-Back Complete Interrupt Request Enable	0: Disable write-back complete interrupt requests 1: Enable write-back complete interrupt requests.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

The PTPEDMAC.EESIPR register enables interrupt requests associated with bits in the PTPEDMAC.EESR register. When a bit in this register is 1, the associated interrupt request is enabled.

31.2.10 ETHERC/EDMAC Transmit/Receive Status Copy Enable Register (EDMACn.TRSCER) (n = 0, 1)

Address(es): EDMAC0.TRSCER 4006 4038h, EDMAC1.TRSCER 4006 4238h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	RMAFCE	—	—	RRFCE	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	RRFCE	RRF Flag Copy Enable	0: Reflect the EESR.RRF flag status in the RD0.RFE bit of the receive descriptor 1: Do not reflect the EESR.RRF flag status in the RD0.RFE bit of the receive descriptor.	R/W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	RMAFCE	RMAF Flag Copy Enable	0: Reflect the EESR.RMAF flag status in the RD0.RFE bit of the receive descriptor 1: Do not reflect the EESR.RMAF flag status in the RD0.RFE bit of the receive descriptor.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The EDMACn.TRSCER register selects whether the receive status indicated in the EDMACn.EESR.RMAF and RRF flags is reflected in the RFE bit of the receive descriptor as a summary. The bits in this register are associated with bits in the EESR register that have the same number. When the RMAFCE or RRFCE bit is set to 0, the associated receive status is reflected in the RFE bit. When the RMAFCE or RRFCE bit is set to 1, the associated receive status is not reflected.

31.2.11 Missed-Frame Counter Register (RMFCR)

Address(es): EDMAC0.RMFCR 4006 4040h, EDMAC1.RMFCR 4006 4240h, PTPEDMAC.RMFCR 4006 4440h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MFC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	MFC[15:0]	Missed-Frame Counter	These bits indicate the number of frames that are discarded and not transferred to the receive buffer during reception.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RMFCR register indicates that the number of frames that could not be stored in the receive FIFO and so were discarded during reception. When the receive FIFO overflows, it stops receiving data, and the rest of frames are discarded. At the same time, the RMFCR register value is incremented. When the RMFCR register value reaches FFFFh, count-up is halted. Writing any value to the RMFCR register clears the counter value to 0.

For frames that are not completely received, after data in the receive FIFO is transferred to the receive buffer, the RACT bit in the receive descriptor 0 (RD0) is set to 0 (descriptor disabled), the RFS9 bit is set to 1 (receive FIFO overflowed), and the EDMACn.EESR.RFOF or PTPEDMAC.EESR.RFOF flag is set to 1 (overflow detected).

31.2.12 Transmit FIFO Threshold Register (TFTR)

Address(es): EDMAC0.TFTR 4006 4048h, EDMAC1.TFTR 4006 4248h, PTPEDMAC.TFTR 4006 4448h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TFT[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b10 to b0	TFT[10:0]	Transmit FIFO Threshold	000h: Store-and-forward mode 001h to 00Ch: Setting prohibited 00Dh to 200h: The threshold is the set value multiplied by 4. Example: 00Dh: 52 bytes 040h: 256 bytes 100h: 1024 bytes 200h: 2048 bytes 201h to 7FFh: Setting prohibited.	R/W
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When starting transmission before one frame data is completely written, take care to prevent an underflow. To prevent a transmit underflow, Renesas recommends using the initial value (store-and-forward mode).

The TFTR register specifies the transmit FIFO threshold at which the first transmission starts. The actual threshold is the set value multiplied by 4.

The ETHERC starts transmission when the amount of data in the transmit FIFO exceeds the number of bytes set in this register, when the transmit FIFO is full, or when one frame of data is completely written. Set the TFTR register while the EDTRR.TR bit is 0.

31.2.13 FIFO Depth Register (FDR)

Address(es): EDMAC0.FDR 4006 4050h, EDMAC1.FDR 4006 4250h, PTPEDMAC.FDR 4006 4450h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	TFD[4:0]					—	—	—	RFD[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b4 to b0	RFD[4:0]	Receive FIFO Depth	b4 b0 01111: 4096 bytes. Other settings are prohibited.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12 to b8	TFD[4:0]	Transmit FIFO Depth	b12 b8 00111: 2048 bytes. Other settings are prohibited.	R/W
b31 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The FDR register specifies the transmit and receive FIFO depths. Set this register to 0000 070Fh before starting transmission and reception.

31.2.14 Receive Method Control Register (RMCR)

Address(es): EDMAC0.RMCR 4006 4058h, EDMAC1.RMCR 4006 4258h, PTPEDMAC.RMCR 4006 4458h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RNR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	RNR	Receive Request Reset	0: EDRRR.RR bit (receive request bit) is set to 0 when one frame is received 1: EDRRR.RR bit (receive request bit) is not cleared to 0 when one frame is received.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RMCR register specifies how to control the EDRRR.RR bit when receiving a frame. When the RNR bit is 0, the EDRRR.RR bit is set to 0 when one frame is received, so it must be set to 1 by software to receive the subsequent frame. When the RNR bit is 1, the EDRRR.RR bit does not clear to 0 when one frame is received, and the EDMAC reads the next receive descriptor and continues frame reception. Renesas recommends setting the RNR bit to 1 when receiving data continuously. Set the RMCR register while the EDRRR.RR bit is 0.

31.2.15 Transmit FIFO Underflow Counter (TFUCR)

Address(es): EDMAC0.TFUCR 4006 4064h, EDMAC1.TFUCR 4006 4264h, PTPEDMAC.TFUCR 4006 4464h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	UNDER[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	UNDER[15:0]	Transmit FIFO Underflow Count	These bits indicate how many times the transmit FIFO underflows. The counter stops when the counter value reaches FFFFh.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The TFUCR register indicates how many times the transmit FIFO underflows. Writing any value to the TFUCR register clears the counter value to 0.

31.2.16 Receive FIFO Overflow Counter (RFOCR)

Address(es): EDMAC0.RFOCR 4006 4068h, EDMAC1.RFOCR 4006 4268h, PTPEDMAC.RFOCR 4006 4468h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVER[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	OVER[15:0]	Receive FIFO Overflow Count	These bits indicate how many times the receive FIFO overflows. The counter stops when the counter value reaches FFFFh.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RFOCR register indicates how many times the receive FIFO overflows. Writing any value to the RFOCR register clears the counter value to 0.

31.2.17 Independent Output Signal Setting Register (IOSR)

Address(es): EDMAC0.IOSR 4006 406Ch, EDMAC1.IOSR 4006 426Ch, PTPEDMAC.IOSR 4006 446Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ELB
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ELB	External Loopback Mode	0: Output low on the ETn_EXOUT pin 1: Output high on the ETn_EXOUT pin.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The IOSR register selects the output level of the ETHERC external output pin (ETn_EXOUT) in external loopback mode. The ELB bit value is output on the ETn_EXOUT pin, which can be used to set loopback mode for the PHY-LSI. To use the loopback function of the PHY-LSI through this register, you must connect the PHY-LSI to the ETn_EXOUT pin.

31.2.18 Flow Control Start FIFO Threshold Setting Register (FCFTR)

Address(es): EDMAC0.FCFTR 4006 4070h, EDMAC1.FCFTR 4006 4270h, PTPEDMAC.FCFTR 4006 4470h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	RFFO[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RFDO[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit	Symbol	Bit name	Description	R/W
b2 to b0	RFDO[2:0]	Receive FIFO Data PAUSE Output Threshold	b2 b0 0 0 0: When 224 (256 to 32) bytes of data is stored in the receive FIFO 0 0 1: When 480 (512 to 32) bytes of data is stored in the receive FIFO : 1 1 0: When 1760 (1792 to 32) bytes of data is stored in the receive FIFO 1 1 1: When 2016 (2048 to 32) bytes of data is stored in the receive FIFO.	R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b18 to b16	RFFO[2:0]	Receive FIFO Frame PAUSE Output Threshold	b18 b16 0 0 0: When 2 receive frames are stored in the receive FIFO 0 0 1: When 4 receive frames are stored in the receive FIFO 0 1 0: When 6 receive frames are stored in the receive FIFO : 1 1 0: When 14 receive frames are stored in the receive FIFO 1 1 1: When 16 receive frames are stored in the receive FIFO.	R/W
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The FCFTR register specifies the ETHERC flow control. Set the threshold to automatically transmit a PAUSE frame. The threshold can be set using the data size (RFDO[2:0] bits) and the number of frames (RFFO[2:0] bits) stored in the receive FIFO. Flow control starts when the stored data size or the number of stored frames reaches its threshold.

31.2.19 Receive Data Padding Insert Register (RPADIR)

Address(es): EDMAC0.RPADIR 4006 4078h, EDMAC1.RPADIR 4006 4278h, PTPEDMAC.RPADIR 4006 4478h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PADS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	PADR[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	PADR[5:0]	Padding Slot	00h: Insert padding at the head of received data 01h: Insert padding between the 1st and 2nd bytes of received data : 3Eh: Insert padding between the 62nd and 63rd bytes of received data 3Fh: Insert padding between the 63rd and 64th bytes of received data.	R/W
b15 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b17, b16	PADS[1:0]	Padding Size	b17b16 0 0: Do not insert padding 0 1: Insert 1 byte 1 0: Insert 2 bytes 1 1: Insert 3 bytes.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RPADIR register specifies insertion of padding for received data. The padding value is 00h. Set the EDMR.SWR bit to 1 to reset before rewriting the PRADIR register.

31.2.20 Transmit Interrupt Setting Register (TRIMD)

Address(es): EDMAC0.TRIMD 4006 407Ch, EDMAC1.TRIMD 4006 427Ch, PTPEDMAC.TRIMD 4006 447Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	TIM	—	—	—	TIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	TIS	Transmit Interrupt Enable	0: Disable transmit interrupts 1: Enable transmit Interrupts. Set the EESR.TWB flag to 1 in the mode selected in the TIM bit to report an interrupt.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	TIM	Transmit Interrupt Mode	0: Select transmission complete interrupt mode, where an interrupt occurs when a frame is transmitted 1: Select write-back complete interrupt mode, where an interrupt occurs when write-back to the transmit descriptor is complete while the TWBI bit is 1.	R/W
b31 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The TRIMD register specifies the transmit interrupt mode and enables or disables transmit interrupts. When the

condition selected in this register is satisfied, the EESR.TWB flag is set to 1, and an interrupt request is output when the EESIPR.TWBIP bit is 1.

31.2.21 Receive Buffer Write Address Register (RBWAR)

Address(es): EDMAC0.RBWAR 4006 40C8h, EDMAC1.RBWAR 4006 42C8h, PTPEDMAC.RBWAR 4006 44C8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The RBWAR register indicates the last address that the EDMAC wrote data to when writing to the receive buffer. Check the contents of this register to identify which address in the receive buffer the EDMAC is writing data to. The address that the EDMAC is outputting to the receive buffer might not match the read value of the RBWAR register during data reception. The RBWAR register is read-only. Do not write to this register.

31.2.22 Receive Descriptor Fetch Address Register (RDFAR)

Address(es): EDMAC0.RDFAR 4006 40CCh, EDMAC1.RDFAR 4006 42CCh, PTPEDMAC.RDFAR 4006 44CCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The RDFAR register indicates the start address of the last fetched receive descriptor when the EDMAC is fetching descriptor information from the receive descriptor. Check the contents of this register to identify which receive descriptor information the EDMAC is using for active processing. The address of the receive descriptor that the EDMAC is fetching might not match the read value of the RDFAR register during data reception. The RDFAR register is read-only. Do not write to this register.

31.2.23 Transmit Buffer Read Address Register (TBRAR)

Address(es): EDMAC0.TBRAR 4006 40D4h, EDMAC1.TBRAR 4006 42D4h, PTPEDMAC.TBRAR 4006 44D4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The TBRAR register indicates the last address that the EDMAC read data from when reading data from the transmit buffer. Check the contents of this register to identify which address in the transmit buffer the EDMAC is reading from. The address that the EDMAC is outputting to the transmit buffer might not match the read value of the TBRAR register. The TBRAR register is read-only. Do not write to this register.

31.2.24 Transmit Descriptor Fetch Address Register (TDFAR)

Address(es): EDMAC0.TDFAR 4006 40D8h, EDMAC1.TDFAR 4006 42D8h, PTPEDMAC.TDFAR 4006 44D8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The TDFAR register indicates the start address of the last fetched transmit descriptor when the EDMAC is fetching descriptor information from the transmit descriptor. Check the contents of this register to identify which transmit descriptor information the EDMAC is using for active processing. The address of transmit descriptor that the EDMAC fetches might not match the read value of the TDFAR register. The TDFAR is read only. Do not write to this register.

31.3 Operation

The EDMAC transfers data according to the information written in the descriptor. Two descriptors are provided: transmit and receive. A descriptor includes the buffer size, address, and transmit or receive status. The EDMAC transmits or receives data continuously by using sequentially arranged descriptors.

31.3.1 Descriptor Lists and Data Buffers

To transfer data using the EDMAC, create the transmit and receive descriptor lists in memory, set the start address of the transmit descriptor list in the TDLAR register, and set the start address of the receive descriptor list in the RDLAR register. Also, transmit and receive buffers associated with each descriptor are required.

Align the descriptor list on the appropriate address boundary according to the descriptor length set in the EDMR.DL[1:0] bits. The transmit buffer can be aligned on a word boundary, halfword boundary, or byte boundary. When the valid transmit buffer size is 16 bytes or less, align it on a 32-byte boundary. Align the receive buffer on a 32-byte boundary. Set different addresses for the transmit and receive descriptors and buffers for EDMAC0, EDMAC1, and the PTPEDMAC.

31.3.1.1 Transmit Descriptor

Figure 31.3 shows the relationship between a transmit descriptor and transmit buffer. A transmit descriptor consists of TD0 to TD2. The transmit frame and transmit buffer configuration can be specified as one buffer per frame (single-buffer frame transmission) or multiple buffers per frame (multi-buffer frame transmission) by setting the transmit descriptor.

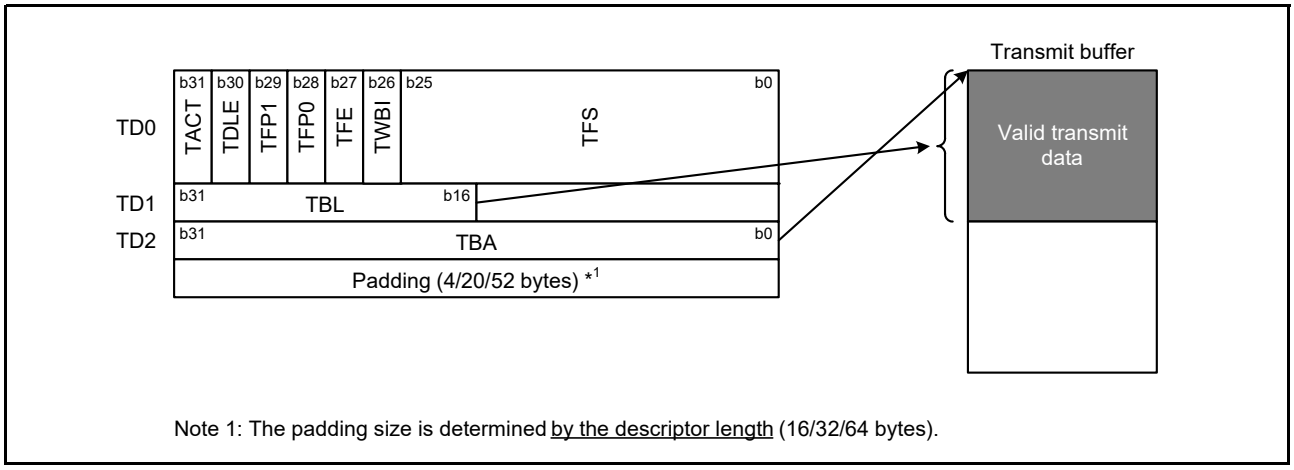

Figure 31.3 Relationship between transmit descriptor and transmit buffer

(1) Transmit descriptor 0 (TD0)

Bit	Symbol	Bit name	Description	R/W
b25 to b0	TFS	Transmit Frame Status	Set all bits to 0 when creating a descriptor. After write-back, the bits indicate the following: • For EDMACn: TFS25 to TFS9: Reserved TFS8: Transmit abort was detected (value is equivalent to the EESR.TABT flag) TFS7 to TFS4: Reserved TFS3: No carrier was detected (value is equivalent to the EESR.CND flag) TFS2: Loss of carrier was detected (value is equivalent to the EESR.DLC flag) TFS1: Late collision during transmission was detected (value is equivalent to the EESR.CD flag) TFS0: Transmit retry over (value is equivalent to the EESR.TRO flag). When a bit is set to 1, it indicates that the associated error occurred during frame transmission. When any of the TFS bits is set to 1, the TFE bit also is set to 1. When any of bits TFS3 to TFS0 is set to 1, TFS8 also is set to 1. • For the PTPEDMAC: TFS25 to TFS9: Reserved TFS8: Transmit abort was detected (value is equivalent to the EESR.TABT flag) TFS7 to TFS1: Reserved TFS0: The transmission source MAC address of the transmit frame data did not match the set value (value is equivalent to the EESR.MACE flag). When a bit is set to 1, it indicates that the associated error occurred during frame transmission. When any of the TFS bits is set to 1, the TFE bit also is set to 1. When TFS0 is set to 1, TFS8 also is set to 1.	R/W
b26	TWBI	Write-Back Complete Interrupt Enable	0: Do not generate interrupt when write-back to this descriptor is complete 1: Generate interrupt when write-back to this descriptor is complete.	R/W
b27	TFE	Transmit Frame Error	0: Frame transmission is successfully complete 1: Error occurred during frame transmission (transmission aborted).	R/W
b29, b28	TFP[1:0]	Transmit Frame Position	b29 b28 0 0: Transmit buffer indicated in this descriptor is the middle of a transmit frame (frame information is incomplete) 0 1: Transmit buffer indicated in this descriptor is the end of a transmit frame (frame information is complete) 1 0: Transmit buffer indicated in this descriptor is the head of a transmit frame (frame information is incomplete) 1 1: Transmit buffer indicated in this descriptor is all of a transmit frame (one buffer per frame).	R/W
b30	TDLE	Transmit Descriptor List End	When this bit is 1, it indicates that this descriptor is the last in the descriptor list.	R/W
b31	TACT	Transmit Descriptor Valid	This bit indicates that this descriptor is valid.	R/W

Note: Bits for write-back are underlined.

TD0 specifies the transmit frame settings and indicates the status after transmission.

TFE bit (Transmit Frame Error)

When the TFE bit is 1, it indicates that any of the TFS bits is 1.

TFP[1:0] bits (Transmit Frame Position)

The TFP[1:0] bits indicate which part of a transmit frame corresponds to the transmit buffer indicated in this descriptor. The TFP[1:0] and TD1.TBL bit settings must be logically consistent in the previous and next descriptors.

TACT bit (Transmit Descriptor Valid)

The TACT bit indicates that this descriptor is valid. The TACT bit is set to 1 by software. This bit is set to 0 when the transmit frame is transferred or when the transmission is aborted.

(2) Transmit descriptor 1 (TD1)

Bit	Symbol	Bit name	Description	R/W
b15 to b0	—	Reserved	The read value is 0. The write value should be 0.	R/W
b31 to b16	TBL	Transmit Buffer Length	Specifies the valid byte length of the associated transmit buffer. Set a value equal to or greater than 1.	R/W

TD1 specifies the valid byte length of the transmit buffer.

(3) Transmit descriptor 2 (TD2)

Bit	Symbol	Bit name	Description	R/W
b31 to b0	TBA	Transmit Buffer Address	Specifies the start address of the transmit buffer. When the TD1.TBL bit value is 1 to 16 bytes, align it on a 32-byte boundary.	R/W

TD2 specifies the start address of the transmit buffer.

31.3.1.2 Receive Descriptor

Figure 31.4 shows the relationship between a receive descriptor and receive buffer. The receive frame and receive buffer configuration can be specified as one buffer per frame (single-buffer frame transmission) or multiple buffers per frame (multi-buffer frame transmission) by setting the receive descriptor. If the receive buffer length (RBL) is set to 0, operation indicated in the descriptor is not guaranteed.

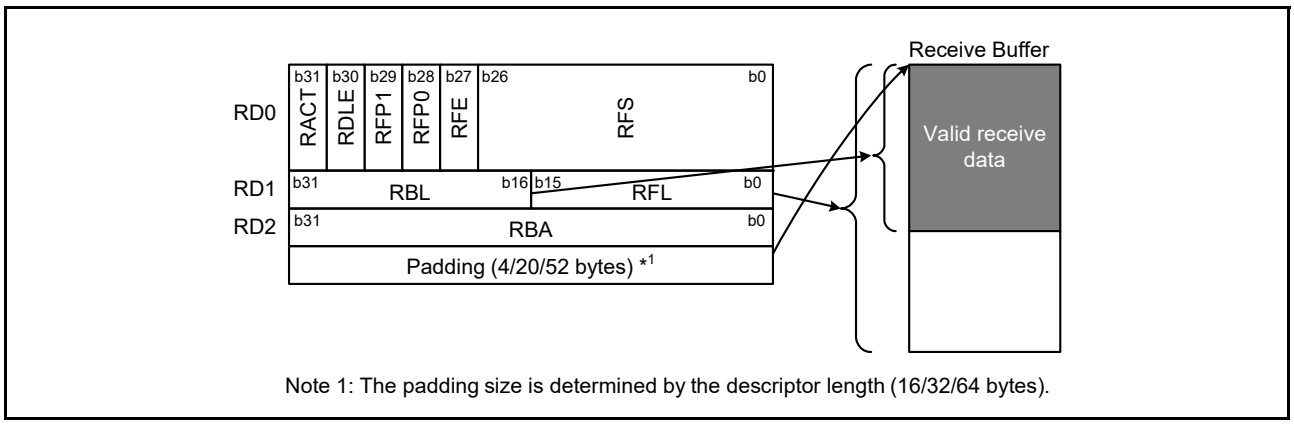

Figure 31.4 Relationship between receive descriptor and receive buffer

(1) Receive descriptor 0 (RD0)

Bit	Symbol	Bit name	Description	R/W
b26 to b0	RFS	Receive Frame Status	Set all bits to 0 when creating a descriptor. After write-back, the bits indicate the following: • For EDMACn: RFS26 to RFS10: Reserved RFS9: Receive FIFO overflow (value is equivalent to the EESR.RFOF flag) RFS8: Receive abort was detected (value is equivalent to the EESR.RABT flag) RFS7: Multicast address frame was received (value is equivalent to the EESR.RMAF flag) RFS6 and RFS5: Reserved RFS4: Alignment error was detected (value is equivalent to the EESR.RRF flag) RFS3: Frame-too-long error (value is equivalent to the EESR.RTLF flag) RFS2: Frame-too-short error (value is equivalent to the EESR.RTSF flag) RFS1: PHY-LSI receive error (value is equivalent to the EESR.PRE flag) RFS0: CRC error (value is equivalent to the EESR.CERF flag). When a bit is set to 1, it indicates that the associated error occurred during frame reception. When any of the RFS bits is set to 1, the RFE bit also is set to 1. (Set the TRSCER register to select whether bits RFS7 and RFS4 are reflected in the RFE bit.) When any of bits RFS3 to RFS0 is set to 1, RFS8 also is set to 1. • For the PTPEDMAC: RFS26 to RFS10: Reserved RFS9: Receive FIFO overflow (value is equivalent to the EESR.RFOF flag) RFS8: Reserved RFS7: Receive port (value is equivalent to the EESR.RPORT flag) RFS4: PTPV2 packet was received (value is equivalent to the EESR.PVER flag) (The PTPEDMAC can only receive PTP packets. If a non-PTP packet is received, the packet is not transferred to the PTPEDAC, and it is discarded.) RFS3 to RFS0: Type of the received PTP message (value is equivalent to the EESR.TYPE[3:0] flags). Each bit indicates the status of the received frame.	R/W
b27	RFE	Receive Frame Error	• For EDMACn: 0: No error occurred in the received frame 1: Error occurred in the received frame. • For the PTPEDMAC: Reserved.	R/W
b29, b28	RFP[1:0]	Receive Frame Position	b29 b28 0 0: Receive buffer indicated in this descriptor is the middle of a receive frame (frame information is incomplete) 0 1: Receive buffer indicated in this descriptor is the end of a receive frame (frame information is complete) 1 0: Receive buffer indicated in this descriptor is the head of a receive frame (frame information is incomplete) 1 1: Receive buffer indicated in this descriptor is all of a receive frame (one buffer per frame).	R/W
b30	RDLE	Receive Descriptor List End	When this bit is 1, it indicates that this descriptor is the last in the descriptor list.	R/W
b31	RACT	Receive Descriptor Valid	Indicates that this descriptor is valid.	R/W

Note: Bits for write-back are underlined.

RD0 indicates the receive frame status.

RFE bit (Receive Frame Error)

When the RFE bit is 1, it indicates that any of the RFS bits is 1. Set the TRSCER register to select whether the RFS7 and RFS4 bits of EDMACn are reflected in the RFE bit.

RFP[1:0] bits (Receive Frame Position)

The RFP[1:0] bits indicate which part of a receive frame corresponds to the receive buffer indicated in this descriptor.

RACT bit (Receive Descriptor Valid)

The RACT bit indicates that this descriptor is valid. The RACT bit is set to 1 by software. This bit is set to 0 when all data is transferred to the receive buffer indicated in RD2 or when the receive buffer becomes full.

(2) Receive descriptor 1 (RD1)

Bit	Symbol	Bit name	Description	R/W
b15 to b0	RFL	Receive Frame Length	Specifies the length (number of bytes) of the receive frame stored in the buffer. This does not include the number of bytes for padding set in the RPADIR register. These bits are written back to the descriptor associated with the end of a frame.	R/W
b31 to b16	RBL	Receive Buffer Length	Specifies the byte length of the associated receive buffer. Set an integral multiple of 32 as the buffer length.	R/W

Note: Bits for write-back are underlined.

RD1 specifies the receive buffer length. When reception is complete, the receive frame length is written back.

(3) Receive descriptor 2 (RD2)

Bit	Symbol	Bit name	Description	R/W
b31 to b0	RBA	Receive Buffer Address	Specifies the start address of the receive buffer. Align the buffer address on a 32-byte boundary.	R/W

RD2 specifies the start address of the receive buffer.

31.3.2 Transmission

When the EDTRR.TR bit is set to 1 while the ETHERCn.ECMR.TE bit is 1, the EDMAC reads the descriptor following the previously used descriptor in the transmit descriptor list (or the descriptor indicated in the TDLAR register after a reset). When the TACT bit is 1 in the transmit descriptor (TD0), the EDMAC sequentially reads transmit data from the start address of the transmit buffer indicated in transmit descriptor 2 (TD2) and transfers it to the ETHERC through the transmit FIFO. The ETHERC creates a transmit frame and starts transmission to the MII or RMII. When all data indicated in the TD1.TBL bit is transferred, write-back is performed based on the TD0.TFP[1:0] bit setting as follows:

- When the TD0.TFP[1:0] bits are 00b or 10b (frame is incomplete), the TD0.TACT bit is written back
- When the TD0.TFP[1:0] bits are 01b or 11b (frame is complete), the TD0.TACT, TD0.TFS, and TD0.TFE bits are written back.

When the TD0.TACT bit in the read descriptor is 1, the EDMAC continues reading descriptors and transmit frames. When the TD0.TACT bit in the read descriptor is 0, the EDMAC sets the EDTRR.TR bit to 0 and stops transmission.

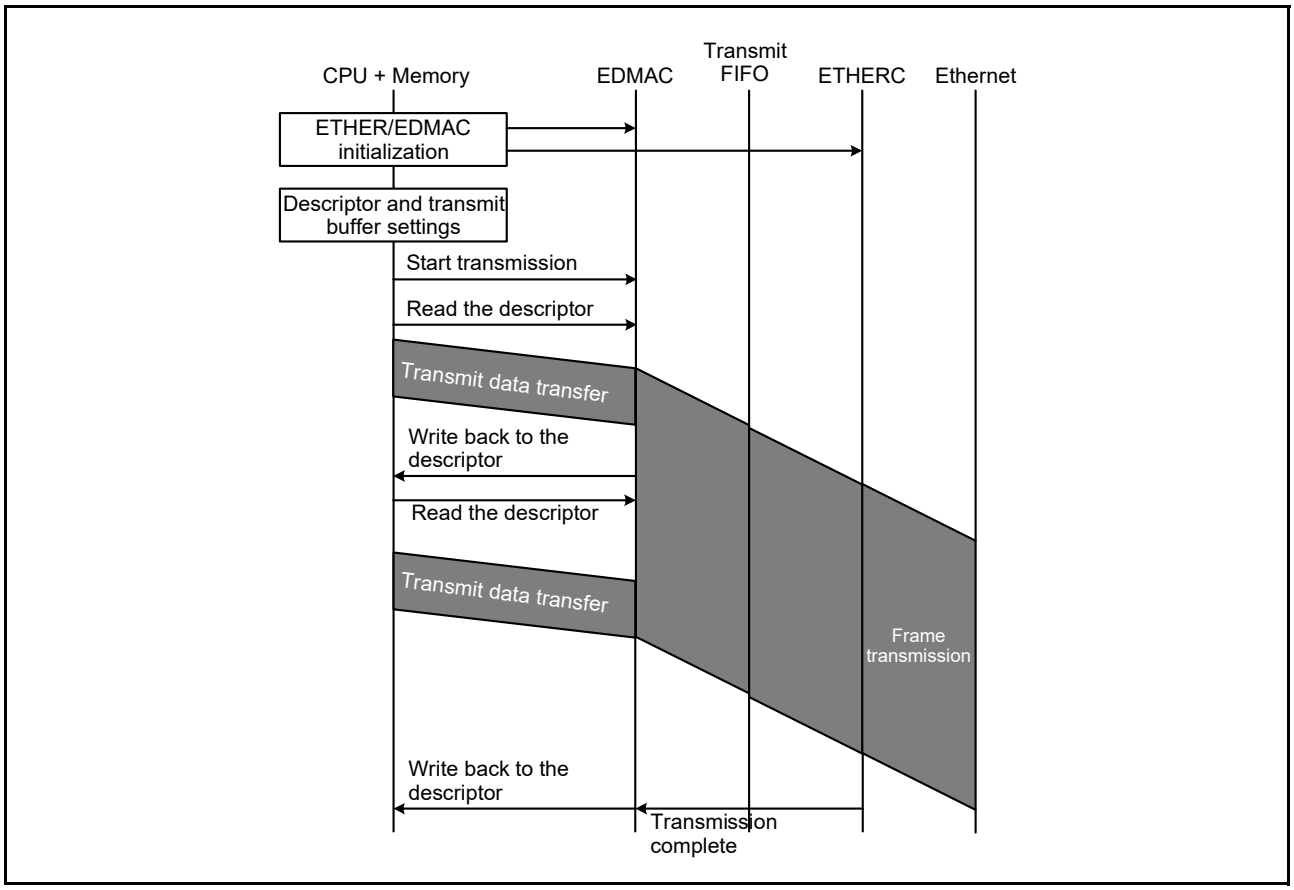

Figure 31.5 Example of transmission flow

31.3.3 Reception

When the EDRRR.RR bit is set to 1 while the ETHERCn.ECMR.RE bit is 1, the EDMAC reads the receive descriptor following the previously used descriptor (or the descriptor indicated in the RDLAR register after a reset) and then waits for reception. When the RD0.RACT bit is 1, if the data stored in the receive FIFO is 32 bytes or more, or if the end byte of the frame is stored in the receive buffer, the EDMAC transfers data from the receive FIFO to the receive buffer indicated in receive descriptor 2 (RD2).

If the data length of the received frame is longer than the buffer length set in the RBL bit in receive descriptor 1 (RD1), the EDMAC writes back 10b or 00b to the RD0.RFP[1:0] bits and 0 to the RD0.RACT bit when the receive buffer becomes full, and then the EDMAC reads the next data. After that, the EDMAC transfers data to another receive buffer.

When the frame reception is complete or when the frame reception is aborted by an error, the EDMAC writes back 11b or 01b to the RD0.RFP[1:0] bits, 0 to the RD0.RACT bit, and the receive frame length to the RD1.RFL bit. When the RMCR.RNR bit is 1, the EDMAC reads the next descriptor and waits for reception. When the RNR bit is 0, the EDMAC sets the EDRRR.RR bit to 0 and stops reception.

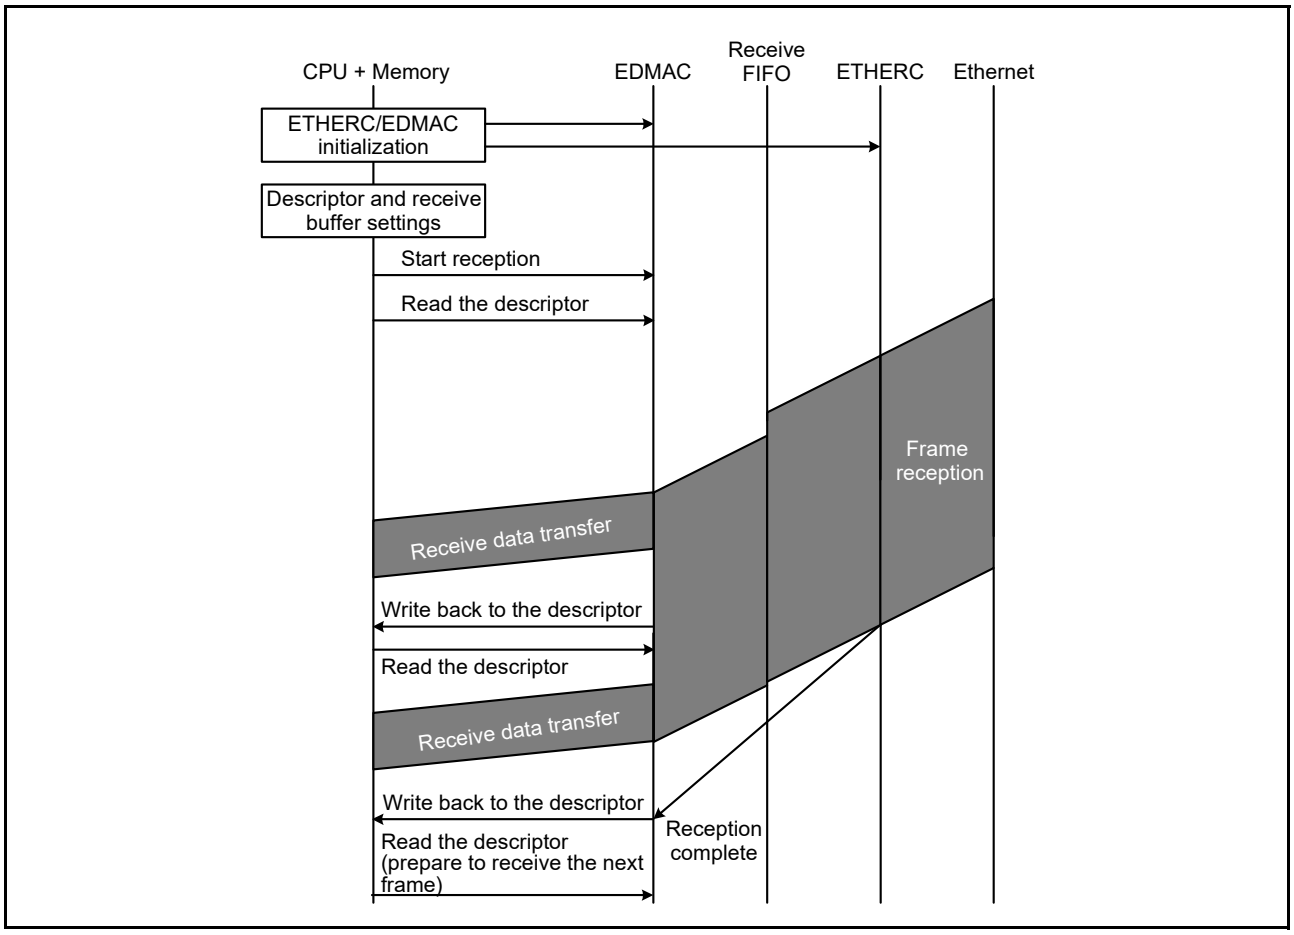

Figure 31.6 Example of reception flow

31.3.4 Multi-Buffer Frame Transmission

31.3.4.1 Error Processing While Transmitting Multi-Buffer Frame

If an error occurs during multi-buffer frame transmission, the EDMAC performs the processing shown in Figure 31.7. In the figure, when the TACT bit of transmit descriptor 0 (TD0) is 0, the descriptor indicates that all data in the buffer is successfully transmitted. When the TACT bit is 1, the descriptor indicates that data in the buffer is not yet transmitted. If a frame transmit error*1 occurs in the head or middle of the frame while the TD0.TACT bit is 1, the EDMAC stops data transmission from the transmit FIFO and EDMAC data transfer, and sets the TD0.TACT bit to 0.

After that, the EDMAC reads the next descriptor to see if the descriptor indicates the middle of the frame (TD0.TFP[1:0] bits are 00b) or the end of the frame (TD0.TFP[1:0] bits are 01b). When the descriptor indicates the middle of the frame, the EDMAC sets the TD0.TACT bit to 0 and reads the next descriptor. When the descriptor indicates the end of the frame, in addition to setting the TD0.TACT bit to 0, the EDMAC also writes back to the TD0.TFE and TD0.TFS bits.

After an error occurs, data in the buffer is not transmitted until write-back to the descriptor for the end of the frame. When the associated transmit error interrupt is enabled in the EESIPR register, an interrupt request is generated immediately after write-back to the descriptor for the end of the frame.

Note 1. For EDMACn, a transmit retry-over condition, late collision, or loss of carrier is detected, or a carrier is not detected. For the PTPEDMAC, the MAC address does not match the set value.

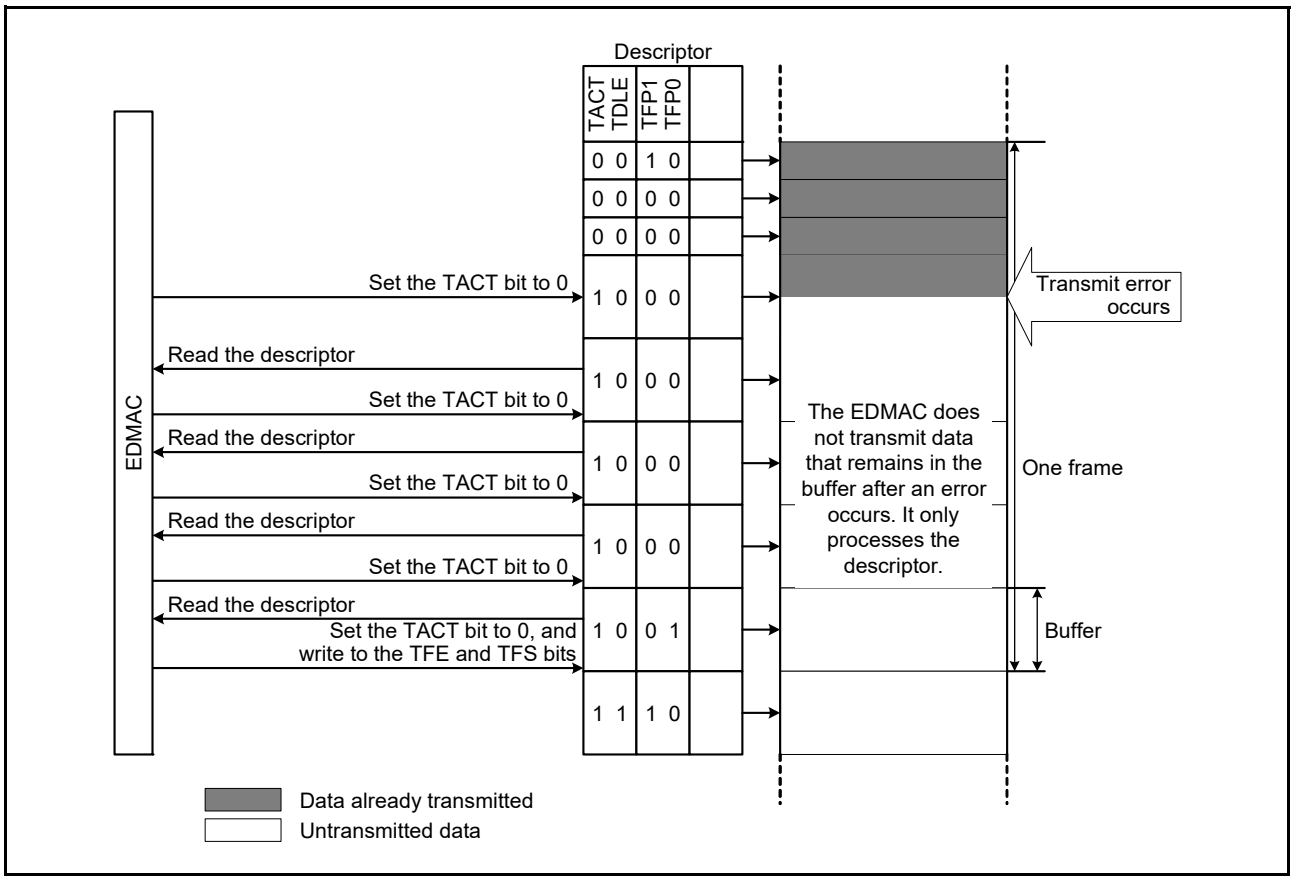

Figure 31.7 EDMAC operation after transmit error occurs

31.3.4.2 Error Processing While Receiving Multi-Buffer Frame

If an error occurs during multi-buffer frame reception, the EDMAC performs the processing shown in Figure 31.8. In the figure, when the RACT bit of receive descriptor 0 (RD0) is 0, the descriptor indicates that data was successfully received in the buffer. When the RACT bit is 1, the descriptor indicates that data is not yet received in the buffer. If a frame receive error*1 occurs, the EDMAC stops receiving new data, but it transfers data that is already stored in the receive FIFO to the receive buffer.

When the receive buffer becomes full during transfer, the EDMAC sets the RACT bit to 0 and the RFP[1:0] bits to 10b or 00b and reads the next descriptor. After all data in the receive FIFO is transferred, the EDMAC writes back the status to the descriptor.

When the associated receive error interrupt is enabled in the EESIPR register, an interrupt request is generated immediately after write-back to the descriptor. When there is a request to receive a new frame, the EDMAC continues reception using the descriptor following the descriptor where the error occurred.

Note 1. For EDMACn, a CRC error, PHY-LSI receive error, frame-too-short error, frame-too-long error, or alignment error is detected. For the PTPEDMAC, a parity error is detected.

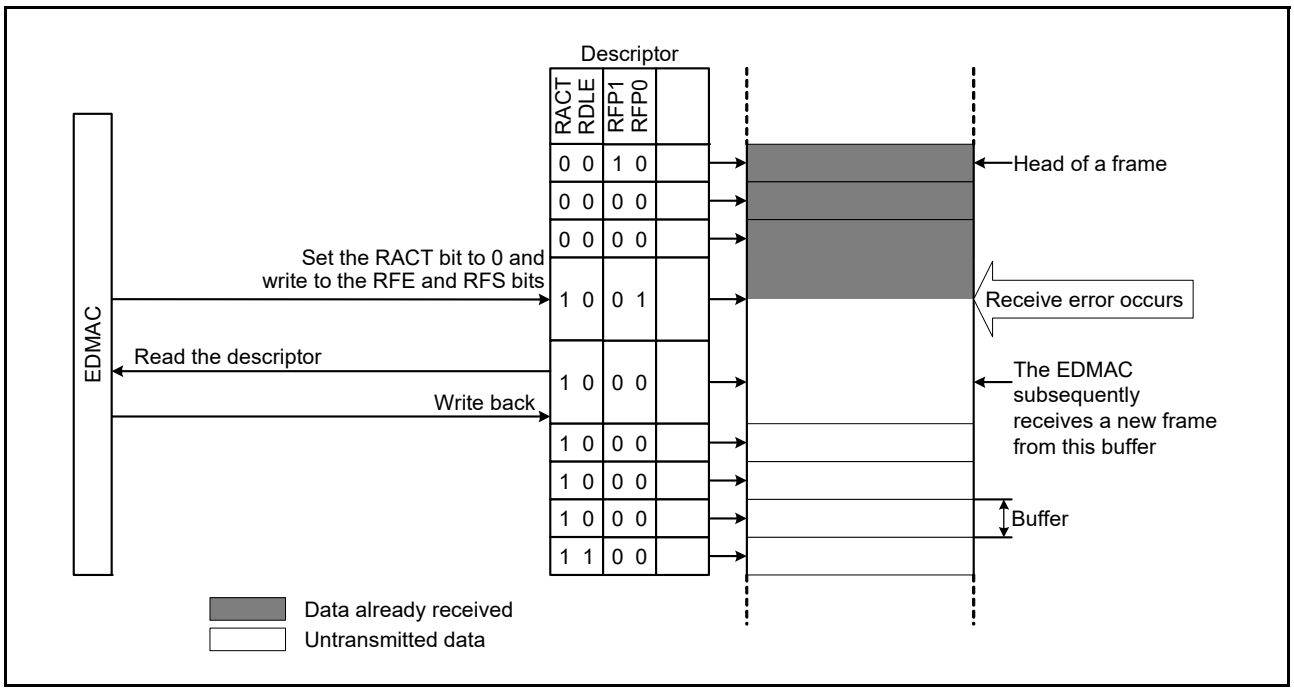

Figure 31.8 EDMAC operation after receive error occurs

31.3.5 EDMAC Channel Priority

The priority of the three EDMAC channels (EDMAC0, EDMAC1, PTPEDMAC) is determined in a round-robin fashion. Each time transfer of one channel is complete, the channel takes the lowest priority. This operation is shown in Figure 31.9. After a reset, the priority is EDMAC0 > EDMAC1 > PTPEDMAC.

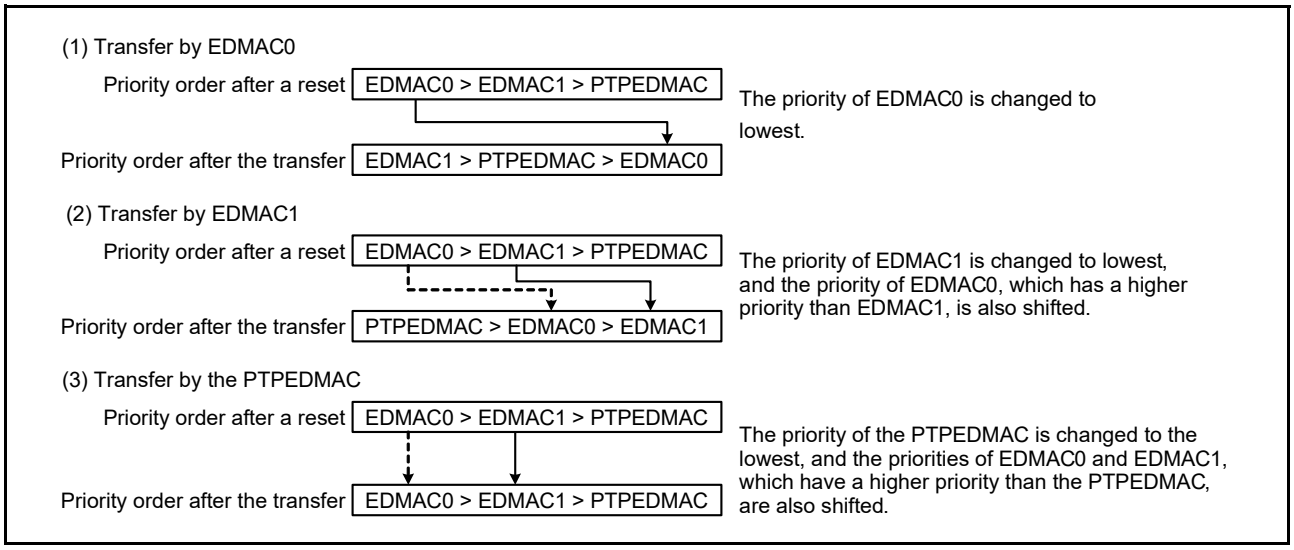

Figure 31.9 Operation in round-robin fashion

Figure 31.10 shows the change in the channel priority order when transfer requests are concurrently generated to EDMAC0 and the PTPEDMAC and a transfer request to the EDMAC1 while EDMAC0 is transferring data.

The operations in the figure are as follows:

1. Transfer requests are concurrently sent to EDMAC0 and the PTPEDMAC.
2. Because EDMAC0 has a higher priority than the PTPEDAC, EDMAC0 starts a transfer and the PTPEDMAC waits.
3. A transfer request is sent to EDMAC1 during the transfer by EDMAC0, and EDMAC1 and the PTPEDMAC wait.
4. After EDMAC0 ends the transfer, the priority of EDMAC0 is changed to the lowest.
5. Because EDMAC1 has higher priority than the PTPEDMAC at this time, EDMAC1 starts a transfer and the PTPEDMAC waits.
6. After EDMAC1 ends the transfer, the priority of EDMAC1 is changed to the lowest.
7. The PTPEDMAC starts a transfer.
8. After the PTPEDMAC ends the transfer, the priority of PTPEDMAC is changed to the lowest.

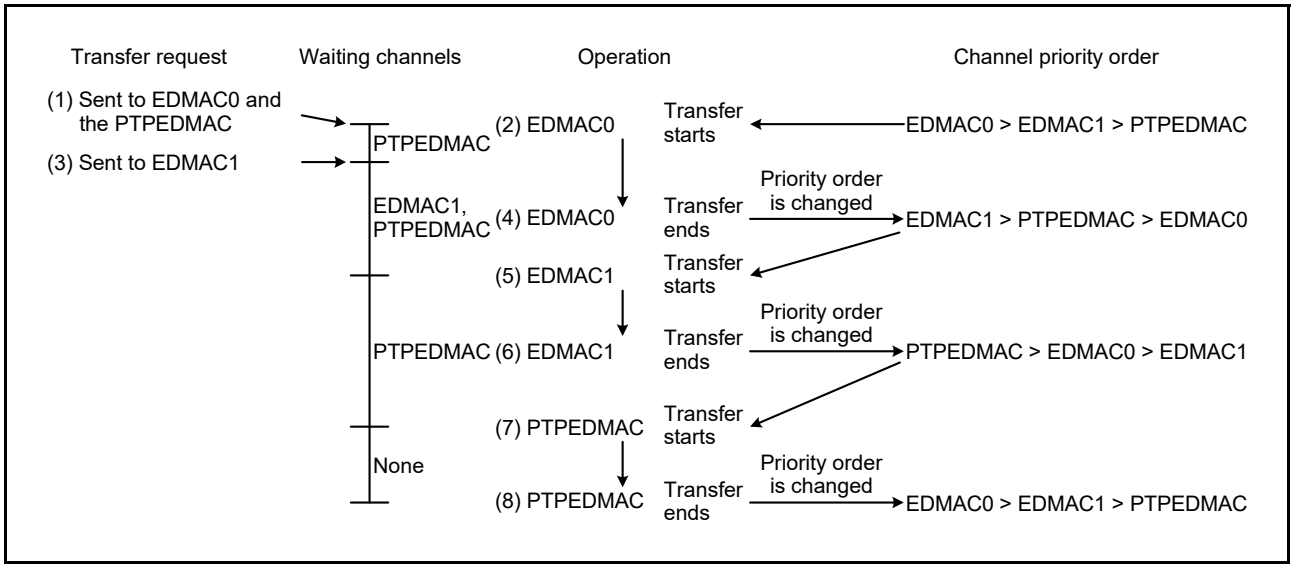

Figure 31.10 Channel priority in round-robin fashion

31.4 Interrupts

When any of the status flags in the EESR register is set to 1 while the associated interrupt request enable bit in the EESIPR register is 1, EDMACn issues an ETHER_EINTn interrupt request or the PTPEDMAC issues an ETHER_PINT interrupt request to the CPU.

31.5 Usage Notes

31.5.1 Settings for the Module-Stop Function

The following bits in Module Stop Control Register B (MSTPCRB) enable or disable EDMAC module operation:

- The MSTPB15 bit in enables or disables ETHERC0 and EDMAC0 operation
- The MSTPCRB.MSTPB14 bit enables or disables ETHERC1 and EDMAC1 operation
- The MSTPCRB.MSTPB13 bit enables or disables EPTPC and PTPEDMAC operation.

The modules are initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

Note: When EPTPC and PTPEDMAC operation is enabled (MSTPB13 = 0), some registers in the EPTPC module become inaccessible depending on the combination of the MSTPB14 bit, MSTPB15 bit, and EPTPC bypass bit (BYPASS.BYPASS0 and BYPASS.BYPASS1) settings. See section 30., Ethernet PTP Controller (EPTPC).

31.5.2 Stopping the EDMAC during Operation

When stopping EDMAC operation by using a Sleep instruction or the module-stop function while the EDMAC is running, confirm that the EDTRR.TR and EDRRR.RR bits are 0. If the EDMAC is stopped while the EDTRR.TR or EDRRR.RR bit is 1, the data for the frame that is being transmitted or received might not be complete, and EDMAC operation after exiting Sleep mode or the module-stop state is not guaranteed.

32. USB 2.0 Full-Speed Module (USBFS)

32.1 Overview

The MCU provides a USB 2.0 Full-Speed module (USBFS) that operates as a host or device controller compliant with the Universal Serial Bus (USB) specification revision 2.0. The host controller supports USB 2.0 full-speed and low-speed transfers, and the device controller supports USB 2.0 full-speed transfers. The USBFS has an internal USB transceiver and supports all of the transfer types defined in the USB 2.0 specification.

The USBFS has FIFO buffer for data transfers, providing a maximum of 10 pipes. Any endpoint number can be assigned to pipes 1 to 9, based on the peripheral devices or the communication requirements for your system.

Table 32.1 lists the USBFS specifications, Figure 32.1 shows the block diagram, and Table 32.2 lists the I/O pins.

Table 32.1 USBFS specifications

Parameter	Specifications
Features	• USB Device Controller (UDC) and USB 2.0 transceiver supporting host controller, device controller, and On-The-Go (OTG) functions (one channel) • Host and device controller can be switched by the software • Self-power or bus power mode selectable.
	Host controller features: • Full-speed transfer (12 Mbps) and low-speed transfer (1.5 Mbps) • Automatic scheduling for SOF and packet transmissions • Programmable intervals for isochronous and interrupt transfers • Communications with multiple peripheral devices connected through a single hub.
	Device controller features: • Full-speed transfer (12 Mbps)*1 • Control transfer stage control function • Device state control function • Auto response function for SET_ADDRESS request • SOF interpolation.
Supported transfer types	• Control transfer • Bulk transfer • Interrupt transfer • Isochronous transfer.
Pipe configuration	• FIFO buffer for USB communication • Up to 10 pipes selectable, including the default control pipe • Pipes 1 to 9 assignable to any endpoint number.
	Transfer conditions specifiable for each pipe: • Pipe 0: Control transfer with 64-byte single buffer • Pipes 1 and 2: Selectable to bulk transfer with 64-byte double buffer or isochronous transfer with 256-byte double buffer • Pipes 3 to 5: Bulk transfer with 64-byte double buffer • Pipes 6 to 9: Interrupt transfer with 64-byte single buffer.
Other features	• Reception end function using transaction count • Function that changes the BRDY interrupt event notification timing (BFRE) • Automatic clearing of the FIFO buffer after the data for the pipe specified in the DnFIFO port (n = 0, 1) is read (DCLRM) • NAK setting function for response PID generated on transfer end (SHTNAK) • On-chip pull-up and pull-down resistors for D+ and D-.
Module-stop function	Module-stop state can be set to reduce power consumption

Note 1. Low-speed transfer (1.5 Mbps) is not supported.

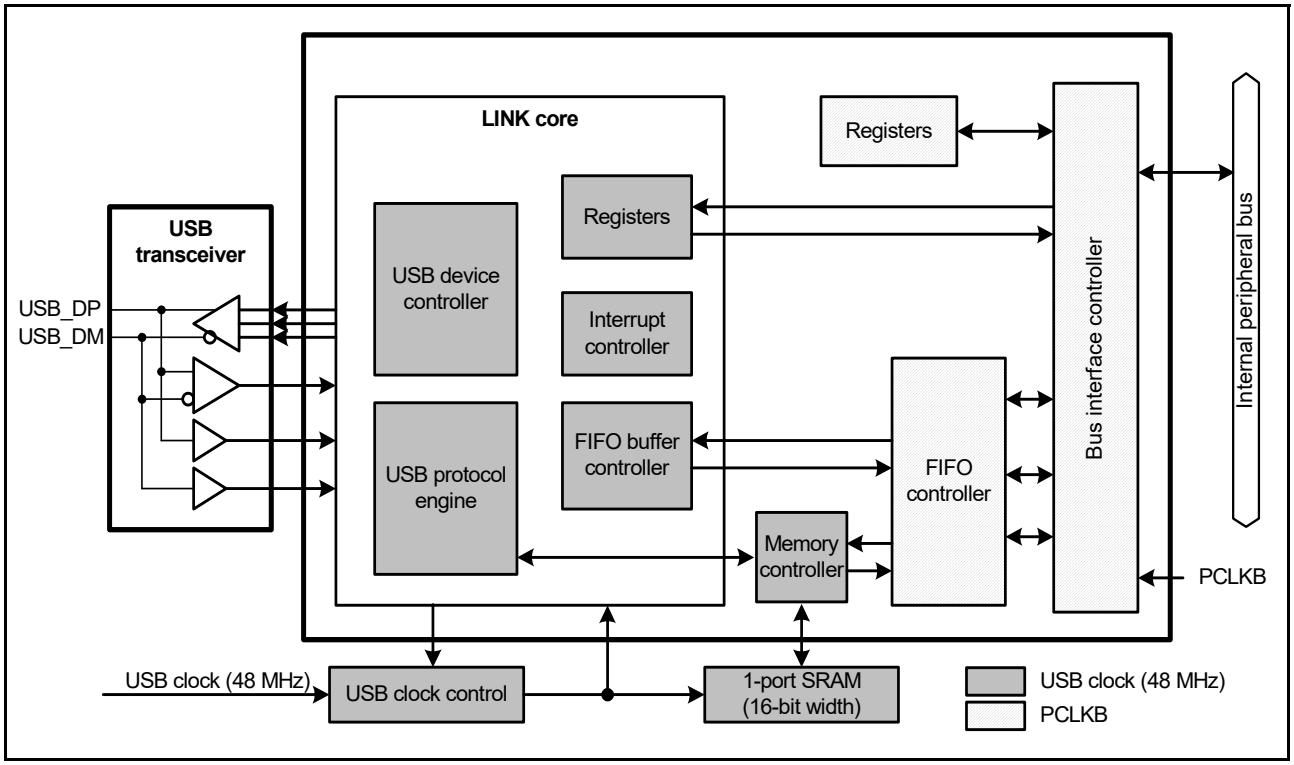

Figure 32.1 USBFS block diagram

Table 32.2 USBFS pin configuration

Port	Pin name	I/O	Function
USBFS	USB_DP	I/O	D+ I/O pin for the on-chip USB transceiver. Must be connected to the D+ data line of the USB bus.
	USB_DM	I/O	D- I/O pin for the on-chip USB transceiver. Must be connected to the D- data line of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. Must be connected to VBUS signal on the USB bus. VBUS pin status (connected or disconnected) can be detected when the USBFS is a device controller.*1
	USB_EXICEN	Output	Low-power control signal for the OTG power supply IC
	USB_VBUSEN	Output	VBUS (5 V) enable signal for the external power supply IC
	USB_OVRCURA USB_OVRCURB	Input	Overcurrent pins for USBFS. Must be connected to external overcurrent detection signals. When the OTG power supply chip is connected, must be connected to the VBUS comparator signals.
	USB_ID	Input	Must be connected to MicroAB connector ID input signal in OTG mode
Shared	VCC_USB	Input	USB transceiver input supply voltage
	VSS_USB	Input	USB ground pin

Note 1. P407 is 5-V tolerant.

32.2 Register Descriptions

32.2.1 System Configuration Control Register (SYSCFG)

Address(es): USBFS.SYSCFG 4009 0000h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SCKE	—	—	—	DCFM	DRPD	DPRPU	—	—	—	USBE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	USBE	USBFS Operation Enable	0: Disable 1: Enable.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	DPRPU	D+ Line Resistor Control	0: Disable line pull-up 1: Enable line pull-up.	R/W
b5	DRPD	D+/D- Line Resistor Control	0: Disable line pull-down 1: Enable line pull-down.	R/W
b6	DCFM	Controller Function Select	0: Select device controller 1: Select host controller.	R/W
b9 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b10	SCKE	USB Clock Enable*1	0: Stop clock supply to the USBFS 1: Enable clock supply to the USBFS.	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. After writing 1 to the SCKE bit, read it to confirm that it is set to 1.

USBE bit (USBFS Operation Enable)

The USBE bit enables or disables operation of the USBFS.

Changing the USBE bit from 1 to 0 initializes the bits listed in Table 32.3. Only change this bit while the SCKE bit is 1. In host controller mode, this bit must be set to 1 after setting the DRPD bit to 1, eliminating SYSSTS0.LNST[1:0] flag chattering, and confirming that the USB bus state is stable.

Table 32.3 Registers initialized by writing 0 to the SYSCFG.USBE bit

Selected function	Register	Bit	Remarks
Device controller	SYSSTS0	LNST[1:0]	Value is saved in host controller mode
	DVSTCTR0	RHST[2:0]	-
	INTSTS0	DVSQ[2:0]	Value is saved in host controller mode
	USBADDR	USBADDR[6:0]	Value is saved in host controller mode
	USBREQ	BREQUEST[7:0], BMREQUESTTYPE[7:0]	Value is saved in host controller mode
	USBVAL	WVALUE[15:0]	Value is saved in host controller mode
	USBINDX	WINDEX[15:0]	Value is saved in host controller mode
	USBLENG	WLENTUH[15:0]	Value is saved in host controller mode
Host controller	DVSTCTR0	RHST[2:0]	-
	FRMNUM	FRNM[10:0]	Value is saved in device controller mode

DPRPU bit (D+ Line Resistor Control)

The DPRPU bit enables or disables pulling up the D+ line in device controller mode.

When the DPRPU bit is set to 1 in device controller mode, the USBFS pulls up the D+ line to notify the USB host that it attached. Changing the DPRPU bit from 1 to 0 releases the pull-up, thereby notifying the USB host that it detached.

Set this bit to 1 in device controller mode and to 0 in host controller mode.

DRPD bit (D+/D- Line Resistor Control)

The DRPD bit enables or disables pulling down D+ and D- lines in host controller mode.

Set this bit to 1 in host controller mode and to 0 in device controller mode.

DCFM bit (Controller Function Select)

The DCFM bit selects the host or device function of the USBFS.

Only change this bit when the DPRPU and DRPD bits are both 0.

SCKE bit (USB Clock Enable)

The SCKE bit stops or enables the 48-MHz clock supply to the USBFS.

When this bit is 0, only SYSCFG is permitted to be read from and written to. Other registers related to the USB should not be read from or written to.

32.2.2 System Configuration Status Register 0 (SYSSTS0)

Address(es): USBFS.SYSSTS0 4009 0004h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVCMON[1:0]		—	—	—	—	—	—	—	HTACT	SOFEA	—	—	IDMON	LNST[1:0]	
Value after reset:	0*1	0*1	0	0	0	0	0	0	0	0	0	0	0	0*1	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	LNST[1:0]	USB Data Line Status Monitor	Indicates the status of the USB data lines, see Table 32.4	R
b2	IDMON	External ID0 Input Pin Monitor	0: USB_ID pin is low 1: USB_ID pin is high.	R
b4, b3	—	Reserved	These bits are read as 0 and cannot be modified	R
b5	SOFEA	Active Monitor When the Host Controller Is Selected	0: SOF output stopped 1: SOF output operating.	R
b6	HTACT	USB Host Sequencer Status Monitor	0: Host sequencer completely stopped 1: Host sequencer not completely stopped.	R
b13 to b7	—	Reserved	These bits are read as 0 and cannot be changed.	R
b15, b14	OVCMON[1:0]	External USB_OVRCURA/ USB_OVRCURB Input Pin Monitor	OVCMON[1] indicates the USB_OVRCURA pin status. OVCMON[0] indicates the USB_OVRCURB pin status.	R

Note 1. Depends on the status of the USB_OVRCURA, USB_OVRCURB, and USB_ID pins.

LNST[1:0] bits (USB Data Line Status Monitor)

The LNST[1:0] bits indicate the state of the USB data lines, D+ and D-. For details, see Table 32.4.

In device controller mode, read the LNST[1:0] bits after connection processing (SYSCFG.DPRPU bit = 1). In host controller mode, read them after enabling pull-down of the lines (SYSCFG.DRPD bit = 1).

Table 32.4 Status of the USB data bus lines (D+ and D-)

LNST[1:0] bits	During full-speed operation	During low-speed operation
00b	SE0	SE0
01b	J-State	K-State
10b	K-State	J-State
11b	SE1	SE1

SOFEA bit (Active Monitor When the Host Controller Is Selected)

The SOFEA bit is used in host controller mode to check whether the output of the last SOF is complete when the USBFS is suspended because of a 0 setting to the DVSTCTR0.UACT bit.

In host controller mode, check that both the HTACT and SOFEA bits are 0 before setting the SYSCFG.USBE bit to 0 to stop the USBFS or setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

HTACT bit (USB Host Sequencer Status Monitor)

The HTACT bit is set to 0 when the host sequencer of the USBFS is completely stopped.

In host controller mode, check that the HTACT bit is 0 before setting the DVSTCTR0.UACT bit to 0 to place the USBFS in the suspended state or setting the SCKE bit to 0 to stop the clock signal supply during communication.

OVCMON[1:0] bits (External USB_OVRCURA/ USB_OVRCURB Input Pin Monitor)

The OVCMON[1:0] bits indicate the status of the overcurrent signals from an external power supply IC.

32.2.3 Device State Control Register 0 (DVSTCTR0)

Address(es): USBFS.DVSTCTR0 4009 0008h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	HNPBTOA	EXICEN	VBUSEN	WKUP	RWUPE	USBRST	RESUME	UACT	—	RHST[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	RHST[2:0]	USB Bus Reset Status	• In host controller mode: b2 b0 0 0 0: Communication speed indeterminate (powered state or no connection) 1 x x: USB bus reset in progress 0 0 1: Low-speed connection 0 1 0: Full-speed connection. • In device controller mode b2 b0 0 0 0: Communication speed indeterminate 0 0 1: USB bus reset in progress 0 1 0: USB bus reset in progress or full-speed connection.	R
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	UACT	USB Bus Enable	0: Disable downstream port (disable SOF transmission) 1: Enable downstream port (enable SOF transmission).	R/W
b5	RESUME	Resume Output	0: Do not output resume signal 1: Output resume signal.	R/W
b6	USBRST	USB Bus Reset Output	0: Do not output USB bus reset signal 1: Output USB bus reset signal.	R/W
b7	RWUPE	Wakeup Detection Enable	0: Disable downstream-port remote wakeup 1: Enable downstream-port remote wakeup.	R/W
b8	WKUP	Wakeup Output	0: Do not output remote wakeup signal 1: Output remote wakeup signal.	R/W
b9	VBUSEN	USB_VBUSEN Output Pin Control	0: Output low on external USB_VBUSEN pin 1: Output high on external USB_VBUSEN pin.	R/W
b10	EXICEN	USB_EXICEN Output Pin Control	0: Output low on external USB_EXICEN pin 1: Output high on external USB_EXICEN pin.	R/W
b11	HNPBTOA	Host Negotiation Protocol (HNP) Control	Use this bit when switching from device B to device A in OTG mode. If the HNPBTOA bit is 1, the internal function control remains in the Suspend state until the HNP processing ends even if SYSCFG.DPRPU = 0 or SYSCFG.DCFM = 1.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

x: Don't care

The USBFS controller does not support low-speed connections in device controller mode. When this value is read, abnormal connection processing must be executed in higher level application software.

RHST[2:0] bits (USB Bus Reset Status)

The RHST[2:0] bits indicate the status of the USB bus reset.

In host controller mode, writing 1 to the USBRST bit causes the RHST[2:0] bits to set to 100b. When 0 is written to the USBRST bit and the USBFS ends the SE0 state, the RHST[2:0] bits update to a new value.

In device controller mode, when the USBFS detects a USB bus reset, the RHST[2:0] bits indicate 010b if the DPRPU bit is 1, and a DVST interrupt is generated.

UACT bit (USB Bus Enable)

When set to 1 in host controller mode, the UACT bit enables USB bus operation by controlling SOF packet transmission to the USB bus in addition to data and reception. The USBFS starts SOF packet output within one frame period after the UACT bit is set to 1. When UACT is set to 0, the USBFS enters the idle state after the SOF packet output.

The USBFS sets the UACT bit to 0 on any of the following conditions:

- A DTCH interrupt is detected during communication (when UACT = 1)
- An EOFERR interrupt is detected during communication (when UACT = 1).

Always write 1 to the UACT bit at the end of the USB bus reset processing (writing 0 to the USBRST bit) or at the end of resume processing from the suspended state (writing 0 to the RESUME bit).

In device controller mode, always set this bit to 0.

RESUME bit (Resume Output)

The RESUME bit controls the resume signal output in host controller mode.

When this bit is set to 1, the USBFS drives the USB port to the K-state and outputs the resume signal. The USBFS sets the bit to 1 on detection of a remote wakeup signal while the RWUPE bit is 1 and in the USB Suspend state.

The USBFS continues outputting the K-state while the RESUME bit is 1, until the bit is set to 0 by the software. The RESUME bit must be 1 (resume period) for the time defined in the USB 2.0 specification. Only set this bit to 1 while the interface is in the Suspend state. Write 1 to the UACT bit simultaneously with the end of the resume processing (writing 0 to the RESUME bit).

Always set this bit to 0 in device controller mode.

USBRST bit (USB Bus Reset Output)

The USBRST bit controls the output of the USB bus signal in host controller mode. When this bit set to 1, the USBFS drives the USB port to the SE0 state to reset the USB bus. The USBFS continues outputting SE0 while the USBRST bit is 1, until the bit is set to 0 by software. The USBRST bit must be 1 (USB bus reset period) for the time defined in the USB 2.0 specification. Writing 1 to the USBRST bit during communication (UACT bit = 1) or during resume processing (RESUME bit = 1) prevents the USBFS from starting USB bus reset processing until both the UACT and RESUME bits become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset processing (writing 0 to the USBRST bit).

Always set this bit to 0 in device controller mode.

RWUPE bit (Wakeup Detection Enable)

The RWUPE bit enables or disables remote wakeup signals (resume signals) from downstream peripheral devices in host controller mode. When this bit is set to 1, the USBFS detects a remote wakeup signal (K-state for 2.5 µs) from a downstream peripheral device, and performs resume processing, driving the K-state. When the RWUPE bit is set to 0, the USBFS ignores remote wakeup signals (K-states) from peripheral devices connected to the USB port.

Do not stop the internal clock when the RWUPE bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in device controller mode.

WKUP bit (Wakeup Output)

The WKUP bit enables or disables remote wakeup signals (resume signals) to the USB bus in device controller mode.

The USBFS controls the output timing of the remote wakeup signals. When this bit is set to 1, the USBFS clears it to 0 after outputting the K-state for 10 ms. The USB 2.0 specification specifies that the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is sent. If the USBFS writes 1 to the WKUP bit immediately after detecting the Suspend state, the K-state is output after 2 ms.

Only write 1 to the WKUP bit when the device is in the Suspend state (INTSTS0.DVSQ[2:0] bits = 1xxb) and the USB host enables the remote wakeup signal (RWUPE = 1). Do not stop the internal clock while this bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in host controller mode.

HNPBTOA bit (Host Negotiation Protocol (HNP) Control)

The HNPBTOA bit is used when switching from device B to device A while in OTG mode.

If the HNPBTOA bit is 1, the internal function control maintains the Suspend state until HNP processing ends, even if the SYSCFG.DPRPU bit is set to 0 or the SYSCFG.DCFM bit is set to 1. Resume interrupts (RESM) are not generated even if a falling edge of D+ is detected.

The HNP processing ends when a host attach event is detected, because of a pull-up by the initiating party, or the HNPBTOA bit is set to 0 by software because the HNP processing times out.

32.2.4 CFIFO Port Register (CFIFO/CFIFOL)
D0FIFO Port Register (D0FIFO/D0FIFOL)
D1FIFO Port Register (D1FIFO/D1FIFOL)

(1) When the MBW bit is 1

Address(es): USBFS.CFIFO 4009 0014h, USBFS.D0FIFO 4009 0018h, USBFS.D1FIFO 4009 001Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	FIFOPORT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

(2) When the MBW bit is 0

Address(es): USBFS.CFIFOL 4009 0014h, USBFS.D0FIFOL 4009 0018h, USBFS.D1FIFOL 4009 001Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	FIFOPORT[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	FIFOPORT[15:0]*1	FIFO Port	Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits	R/W

Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW, D0FIFOSEL.MBW, and D1FIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND, D0FIFOSEL.BIGEND, and D1FIFOSEL.BIGEND) in the associated port select register. See Table 32.5 and Table 32.6.

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO.

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port select register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR).

Each FIFO port has the following restrictions:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIFO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port select register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU.

FIFOPORT[15:0] bits (FIFO Port)

When the FIFOPORT bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port select register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See Table 32.5 and Table 32.6.

Table 32.5 Endian operation in 16-bit access

CFIFOSEL.BIGEND bit D0FIFOSEL.BIGEND bit D1FIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	N + 1 data	N + 0 data
1	N + 0 data	N + 1 data

Table 32.6 Endian operation in 8-bit access

CFIFOSEL.BIGEND bit D0FIFOSEL.BIGEND bit D1FIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	Access prohibited*1	N + 0 data
1	Access prohibited*1	N + 0 data

Note 1. Writing to or reading from these areas is not allowed.

32.2.5 CFIFO Port Select Register (CFIFOSEL) D0FIFO Port Select Register (D0FIFOSEL) D1FIFO Port Select Register (D1FIFOSEL)

CFIFOSEL

Address(es): USBFS.CFIFOSEL 4009 0020h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RCNT	REW	—	—	—	MBW	—	BIGEND	—	—	ISEL	—	CURPIPE[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	CURPIPE[3:0]	CFIFO Port Access Pipe Specification	b3 b0 0 0 0 0: DCP (default control pipe) 0 0 0 1: Pipe 1 0 0 1 0: Pipe 2 0 0 1 1: Pipe 3 0 1 0 0: Pipe 4 0 1 0 1: Pipe 5 0 1 1 0: Pipe 6 0 1 1 1: Pipe 7 1 0 0 0: Pipe 8 1 0 0 1: Pipe 9. Other settings are prohibited.	R/W
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5	ISEL	CFIFO Port Access Direction When DCP Is Selected	0: Select reading from the FIFO buffer 1: Select writing to the FIFO buffer.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	BIGEND	CFIFO Port Endian Control	0: Little endian 1: Big endian.	R/W
b9	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b10	MBW	CFIFO Port Access Bit Width	0: 8-bit width 1: 16-bit width.	R/W
b13 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	REW	Buffer Pointer Rewind	0: Do not rewind buffer pointer 1: Rewind buffer pointer.	R/W*1
b15	RCNT	Read Count Mode	0: The DTLN[8:0] bits (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) are cleared when all receive data is read from the CFIFO. In double buffer mode, the DTLN[8:0] bit value is cleared when all data is read from only a single plane. 1: The DTLN[8:0] bits are decremented each time the receive data is read from the CFIFO.	R/W

Note 1. Only 0 can be read.

Do not specify the same pipe number in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected.

Do not change the pipe number while DMA or DTC transfer is enabled.

CURPIPE[3:0] bits (CFIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the CFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

ISEL bit (CFIFO Port Access Direction When DCP Is Selected)

After writing a new value to the ISEL bit with the DCP as the selected pipe, read the ISEL bit to check that the written value agrees with the read value before proceeding to the next process. Set the ISEL and CURPIPE[3:0] bits simultaneously.

MBW bit (CFIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the CFIFO port.

When the selected pipe is receiving, set the CURPIPE[3:0] and MBW bits simultaneously. After a write to these bits starts a data read from the FIFO buffer, do not change the bits until all of the data is read. When you read the FIFO buffer, read with the access size which is set in MBW.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the REW bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

D0FIFOSEL, D1FIFOSEL

Address(es): USBFS.D0FIFOSEL 4009 0028h, USBFS.D1FIFOSEL 4009 002Ch

b9	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b10	MBW	FIFO Port Access Bit Width	0: 8-bit width 1: 16-bit width.	R/W
b11	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit name	Description	R/W
b12	DREQE	DMA/DTC Transfer Request Enable	0: Disable DMA/DTC transfer request 1: Enable DMA/DTC transfer request.	R/W
b13	DCLRM	Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read	0: Disable auto buffer clear mode 1: Enable auto buffer clear mode.	R/W
b14	REW	Buffer Pointer Rewind	0: Do not rewind buffer pointer 1: Rewind buffer pointer.	R/W*1
b15	RCNT	Read Count Mode	0: Clear DTLN[8:0] flags in (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) when all receive data is read from DnFIFO (after read of a single plane in double buffer mode) 1: Decrement DTLN[8:0] flags each time receive data is read from DnFIFO. n = 0, 1.	R/W

Note 1. Only 0 can be read.

The same pipe must not be specified in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected. The pipe number must not be changed while DMA or DTC transfer is enabled.

CURPIPE[3:0] bits (FIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the DnFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

MBW bit (FIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the DnFIFO port.

When the selected pipe is receiving, after a write to these bits starts a data read from the FIFO buffer, do not change the bits until all of the data is read. Set the CURPIPE[3:0] and MBW bits simultaneously. When you read the FIFO buffer, read with the access size which is set in MBW.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

DREQE bit (DMA/DTC Transfer Request Enable)

The DREQE bit enables or disables issuing of DMA or DTC transfer requests. To enable DMA or DTC transfer requests, set this bit to 1 after setting the CURPIPE[3:0] bits. To change the CURPIPE[3:0] setting, first set this bit to 0.

DCLRM bit (Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read)

The DCLRM bit enables or disables automatic FIFO buffer clearing after data in the selected pipe is read.

When this bit is set to 1, on receiving a zero-length packet while the FIFO buffer assigned to the selected pipe is empty, or when reading of a received short packet is complete while the PIPECFG.BFRE bit is 1, the USBFS sets the BCLR bit in the FIFO port control register to 1.

When using the USBFS with the SOFCFG.BRDYM bit set to 1, set this bit to 0.

REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the bit to 1, be sure to check that the FRDY flag is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

RCNT bit (Read Count Mode)

The RCNT bit specifies the read mode for the value in the CFIFOCTR.DTLN bit. When accessing DnFIFO with the PIPECFG.BFRE bit set to 1, set the RCNT bit to 0.

32.2.6 CFIFO Port Control Register (CFIFOCTR)
D0FIFO Port Control Register (D0FIFOCTR)
D1FIFO Port Control Register (D1FIFOCTR)

Address(es): USBFS.CFIFOCTR 4009 0022h, USBFS.D0FIFOCTR 4009 002Ah, USBFS.D1FIFOCTR 4009 002Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	BVAL	BCLR	FRDY	—	—	—	—	DTLN[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b8 to b0	DTLN[8:0]	Receive Data Length	Receive data length The meaning of the values differs depending on the RCNT bit setting in the port select register. For details, see the description of the DTLN[8:0] bits.	R
b12 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	FRDY	FIFO Port Ready	0: FIFO port access disabled 1: FIFO port access enabled.	R
b14	BCLR	CPU Buffer Clear	0: No operation 1: Clear FIFO buffer on the CPU side.	R/W*1
b15	BVAL	Buffer Memory Valid Flag	0: Invalid (writing 0 has no effect) 1: Writing ended.	R/W

Note 1. Only 0 can be read.

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit (n = 0, 1), as follows:

- RCNT = 0
  The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all of the received data from a single FIFO buffer plane.
  While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.
- RCNT = 1
  The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. (The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.)
  The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all of the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all of the data is read from the latter plane.

FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty

- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1.

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

BCLR bit (CPU Buffer Clear)

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY flag in the FIFO port control register is 1 (set by the USBFS).

BVAL flag (Buffer Memory Valid Flag)

Set the BVAL flag to 1 when data is completely written to the FIFO buffer on the CPU side for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag to 1 in the following cases:

- To transmit a short packet, set this flag to 1 after data is written
- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer.

The USBFS then switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

32.2.7 Interrupt Enable Register 0 (INTENB0)

Address(es): USBFS.INTENB0 4009 0030h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	VBSE	RSME	SOFE	DVSE	CTRE	BEMPE	NRDYE	BRDYE	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

b11	CTRE	Control Transfer Stage Transition Interrupt Enable*1	0: Disable interrupt request 1: Enable interrupt request.	R/W
b12	DVSE	Device State Transition Interrupt Enable*1	0: Disable interrupt request 1: Enable interrupt request.	R/W

Bit	Symbol	Bit name	Description	R/W
b13	SOFE	Frame Number Update Interrupt Enable	0: Disable interrupt request 1: Enable interrupt request.	R/W
b14	RSME	Resume Interrupt Enable*1	0: Disable interrupt request 1: Enable interrupt request.	R/W
b15	VBSE	VBUS Interrupt Enable	0: Disable interrupt request 1: Enable interrupt request.	R/W

Note 1. The RSME, DVSE, and CTRE bits can only be set to 1 in device controller mode. Do not set these bits to 1 in host controller mode.

When a status flag in the INTSTS0 register is set to 1 and the associated interrupt request enable bit setting in the INTENB0 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB0 register setting, the status flag in the INTSTS0 register is set to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB0 register is switched from 0 to 1 while the associated status flag in the INTSTS0 register is set to 1, a USBFS interrupt is requested.

32.2.8 Interrupt Enable Register 1 (INTENB1)

Address(es): USBFS.INTENB1 4009 0032h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVRCRE	BCHGE	—	DTCHE	ATTCHE	—	—	—	—	EOFERRE	SIGNE	SACKE	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

b12	DTCHE	Disconnection Detection Interrupt Enable	0: Disable interrupt request 1: Enable interrupt request.	R/W
b13	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b14	BCHGE	USB Bus Change Interrupt Enable	0: Disable interrupt request 1: Enable interrupt request.	R/W
b15	OVRCRE	Overcurrent Input Change Interrupt Enable	0: Disable interrupt request 1: Enable interrupt request.	R/W

Note: The bits in INTENB1 can only be set to 1 in host controller mode. Do not set these bits to 1 in device controller mode.

INTENB1 specifies the interrupt masks in host controller mode and for the setup transaction.

When a status flag in the INTSTS1 register is set to 1 and the associated interrupt request enable bit setting in the INTENB1 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB1 register setting, the status flag in the INTSTS1 register is set to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB1 register is switched from 0 to 1 while the associated status flag in the INTSTS1 register is set to 1, a USBFS interrupt is requested.

Do not enable interrupts in device controller mode.

32.2.9 BRDY Interrupt Enable Register (BRDYENB)

Address(es): USBFS.BRDYENB 4009 0036h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b7	PIPE7BRDYE	BRDY Interrupt Enable for Pipe 7	0: Disable interrupt request 1: Enable interrupt request.	R/W
b8	PIPE8BRDYE	BRDY Interrupt Enable for Pipe 8	0: Disable interrupt request 1: Enable interrupt request.	R/W
b9	PIPE9BRDYE	BRDY Interrupt Enable for Pipe 9	0: Disable interrupt request 1: Enable interrupt request.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The BRDYENB register enables or disables the INTSTS0.BRDY bit to be set to 1 when a BRDY interrupt is detected for each pipe.

When a status flag in the BRDYSTS register is set to 1 and the associated PIPEnBRDYE bit (n = 0 to 9) setting in the BRDYENB register is 1, the INTSTS0.BRDY flag is set to 1. In this case, if the BRDYE bit in INTENB0 is 1, the USBFS generates a BRDY interrupt request. While at least one PIPEnBRDY bit indicates 1, the USB generates the BRDY interrupt request when the associated interrupt request enable bit in the BRDYENB register is changed from 0 to 1 by the software.

32.2.10 NRDY Interrupt Enable Register (NRDYENB)

Address(es): USBFS.NRDYENB 4009 0038h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PIPE9NRDYE	PIPE8NRDYE	PIPE7NRDYE	PIPE6NRDYE	PIPE5NRDYE	PIPE4NRDYE	PIPE3NRDYE	PIPE2NRDYE	PIPE1NRDYE	PIPE0NRDYE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PIPE0NRDYE	NRDY Interrupt Enable for Pipe 0	0: Disable interrupt request 1: Enable interrupt request.	R/W
b1	PIPE1NRDYE	NRDY Interrupt Enable for Pipe 1	0: Disable interrupt request 1: Enable interrupt request.	R/W

Bit	Symbol	Bit name	Description	R/W
b2	PIPE2NRDYE	NRDY Interrupt Enable for Pipe 2	0: Disable interrupt request 1: Enable interrupt request.	R/W
b3	PIPE3NRDYE	NRDY Interrupt Enable for Pipe 3	0: Disable interrupt request 1: Enable interrupt request.	R/W
b4	PIPE4NRDYE	NRDY Interrupt Enable for Pipe 4	0: Disable interrupt request 1: Enable interrupt request.	R/W
b5	PIPE5NRDYE	NRDY Interrupt Enable for Pipe 5	0: Disable interrupt request 1: Enable interrupt request.	R/W
b6	PIPE6NRDYE	NRDY Interrupt Enable for Pipe 6	0: Disable interrupt request 1: Enable interrupt request.	R/W
b7	PIPE7NRDYE	NRDY Interrupt Enable for Pipe 7	0: Disable interrupt request 1: Enable interrupt request.	R/W
b8	PIPE8NRDYE	NRDY Interrupt Enable for Pipe 8	0: Disable interrupt request 1: Enable interrupt request.	R/W
b9	PIPE9NRDYE	NRDY Interrupt Enable for Pipe 9	0: Disable interrupt request 1: Enable interrupt request.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The NRDYENB register enables or disables the INTSTS0.NRDY bit to be set to 1 when a NRDY interrupt is detected for each pipe.

When a status flag in the NRDYSTS register is set to 1 and the associated PIPEnNRDYE (n = 0 to 9) bit setting in the NRDYENB register is 1, the INTSTS0.NRDY flag is set to 1. In this case, if the NRDYE bit in INTENB0 is 1, the USBFS generates a NRDY interrupt request. While at least one PIPEnNRDY bit indicates 1, the USBFS generates the NRDY interrupt request when the associated interrupt request enable bit in the NRDYENB register is changed from 0 to 1 by the software.

32.2.11 BEMP Interrupt Enable Register (BEMPENB)

Address(es): USBFS.BEMPENB 4009 003Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PIPE0BEMPE	BEMP Interrupt Enable for Pipe 0	0: Disable interrupt request 1: Enable interrupt request.	R/W
b1	PIPE1BEMPE	BEMP Interrupt Enable for Pipe 1	0: Disable interrupt request 1: Enable interrupt request.	R/W
b2	PIPE2BEMPE	BEMP Interrupt Enable for Pipe 2	0: Disable interrupt request 1: Enable interrupt request.	R/W
b3	PIPE3BEMPE	BEMP Interrupt Enable for Pipe 3	0: Disable interrupt request 1: Enable interrupt request.	R/W
b4	PIPE4BEMPE	BEMP Interrupt Enable for Pipe 4	0: Disable interrupt request 1: Enable interrupt request.	R/W
b5	PIPE5BEMPE	BEMP Interrupt Enable for Pipe 5	0: Disable interrupt request 1: Enable interrupt request.	R/W
b6	PIPE6BEMPE	BEMP Interrupt Enable for Pipe 6	0: Disable interrupt request 1: Enable interrupt request.	R/W
b7	PIPE7BEMPE	BEMP Interrupt Enable for Pipe 7	0: Disable interrupt request 1: Enable interrupt request.	R/W
b8	PIPE8BEMPE	BEMP Interrupt Enable for Pipe 8	0: Disable interrupt request 1: Enable interrupt request.	R/W

Bit	Symbol	Bit name	Description	R/W
b9	PIPE9BEMPE	BEMP Interrupt Enable for Pipe 9	0: Disable interrupt request 1: Enable interrupt request.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The BEMPENB register enables or disables the INTSTS0.BEMP bit to be set to 1 when a BEMP interrupt is detected for each pipe.

When a status flag in the BEMPSTS register is set to 1 and the associated PIPEnBEMPE (n = 0 to 9) bit setting in the BEMPENB register is 1, the INTSTS0.BEMP flag is set to 1. In this case, if the BEMPE bit in INTENB0 is 1, the USBFS generates a BEMP interrupt request. While at least one PIPEnBEMP bit indicates 1, the USBFS generates the BEMP interrupt request when the associated interrupt request enable bit in the BEMPENB register is changed from 0 to 1 by the software.

32.2.12 SOF Output Configuration Register (SOFCFG)

Address(es): USBFS.SOFCFG 4009 003Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TRNENSEL	—	BRDYM	—	EDGESTS	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	EDGESTS	Edge Interrupt Output Status Monitor*1	Indicates 1 during the edge processing of an edge interrupt output signal.	R
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6	BRDYM	BRDY Interrupt Status Clear Timing	0: Clear BRDY flag by the software 1: Clear BRDY flag by the USBFS through a data read from the FIFO buffer or data write to the FIFO buffer.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b8	TRNENSEL	Transaction-Enabled Time Select*1	0: Not low-speed communication 1: Low-speed communication.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Confirm that these bits are 0 before stopping the clock supply to the USBFS.

EDGESTS bit (Edge Interrupt Output Status Monitor)

The EDGESTS bit indicates 1 during the edge processing of an edge interrupt output signal. Confirm that this bit is 0 before stopping the clock supply to the USBFS.

BRDYM bit (BRDY Interrupt Status Clear Timing)

The BRDYM bit specifies how the BRDY interrupt status flags for the pipes are cleared.

TRNENSEL bit (Transaction-Enabled Time Select)

When the USB port is in use for full- or low-speed communications, the TRNENSEL bit specifies the timing with which the USBFS issues tokens in a frame (transaction-enabled time).

Set this bit to 1 when a low-speed device is connected. The bit is only valid in host controller mode. Set this bit to 0 in device controller mode.

32.2.13 Interrupt Status Register 0 (INTSTS0)

Address(es): USBFS.INTSTS0 4009 0040h

x: Don't care

Note 1. The value is 0 when the MCU is reset and 1 after a USB bus reset.
Note 2. The value is 1 when the USB_VBUS pin is high and 0 when the USB_VBUS pin is low.
Note 3. The value is 000b when the MCU is reset and 001b after a USB bus reset.
Note 4. To clear the VBINT, RESM, SOFR, DVST, CTRT, or VALID bits, write 0 only to the bits to be cleared. Write 1 to the other bits. Do not write 0 to the status bits indicating 0.
Note 5. The status of the RESM, DVST, and CTRT bits are changed only in device controller mode. Set the associated interrupt enable bits to 0 (disabled) in host controller mode.
Note 6. The USBFS detects a change in the status indicated in the VBINT and RESM bits even while the clock supply is stopped (SCKE bit = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply before clearing the status by the software.

CTSQ[2:0] bits (Control Transfer Stage)

In host controller mode, the read value of the CTSQ[2:0] bits is invalid.

VALID bit (USB Request Reception)

In host controller mode, the read value of the VALID bit is invalid.

DVSQ[2:0] bits (Device State)

The DVSQ[2:0] bits are initialized by a USB bus reset. In host controller mode, the read value is invalid.

BRDY flag (Buffer Ready Interrupt Status)

The BRDY flag indicates the BRDY interrupt status.

The USBFS sets the BRDY bit to 1 when it detects a BRDY interrupt status (PIPEnBRDY = 1, n = 0 to 9) on at least one pipe for which BRDY interrupts are enabled (BRDYENB.PIPEnBRDYE = 1).

For the conditions that cause the PIPEnBRDY status to be asserted, see section 32.3.3.1, BRDY Interrupt.

The USBFS sets the BRDY bit to 0 when the software writes 0 to all of the PIPEnBRDY bits associated with the PIPEnBRDYE bits that are set to 1. Writing 0 to the BRDY flag in the software does not clear the flag.

NRDY flag (Buffer Not Ready Interrupt Status)

The NRDY flag indicates the NRDY interrupt status.

The USBFS sets the NRDY bit to 1 when it detects a NRDY interrupt status (PIPEnNRDY = 1, n = 0 to 9) on at least one pipe for which NRDY interrupts are enabled (NRDYENB.PIPEnNRDYE = 1).

For the conditions that cause the PIPEnNRDY status to be asserted, see section 32.3.3.2, NRDY Interrupt.

The USBFS sets the NRDY bit to 0 when the software writes 0 to all of the PIPEnNRDY bits associated with the PIPEnNRDYE bits that are set to 1. Writing 0 to the NRDY flag in the software does not clear the flag.

BEMP flag (Buffer Empty Interrupt Status)

The BEMP flag indicates the BEMP interrupt status.

The USBFS sets the BEMP bit to 1 when it detects a BEMP interrupt status (PIPEnBEMP = 1, n = 0 to 9) on at least one pipe for which BEMP interrupts are enabled (BEMPENB.PIPEnBEMPE = 1).

For the conditions that cause the PIPEnBEMP status to be asserted, see section 32.3.3.3, BEMP Interrupt.

The USBFS sets the BEMP bit to 0 when the software writes 0 to all of the PIPEnBEMP bits associated with the PIPEnBEMPE bits that are set to 1. Writing 0 to the BEMP flag in the software does not clear the flag.

CTRT flag (Control Transfer Stage Transition Interrupt Status)

In device controller mode, the USBFS updates the value of the CTSQ[2:0] bits and sets the CTRT flag to 1 on detecting a transition in the control transfer stage. When a control transfer stage transition interrupt occurs, clear the CTRT flag before the USBFS detects the next control transfer stage transition.

Values read from the CTRT flag in host controller mode are invalid.

DVST flag (Device State Transition Interrupt Status)

In device controller mode, the USBFS updates the value of the DVSQ[2:0] bits and sets the DVST flag to 1 on detecting a change in the device state. When a device state transition interrupt occurs, clear the DVST flag before the USBFS detects the next device state transition.

Values read from the DVST flag in host controller mode are invalid.

SOFR flag (Frame Number Refresh Interrupt Status)

In host controller mode, the USBFS sets the SOFR flag to 1 on updating the frame number when the DVSTCTR0.UACT bit is set to 1 by the software. A SOFR interrupt is detected every 1 ms.

In device controller mode, the USBFS sets the SOFR flag to 1 on updating the frame number. A frame number refresh interrupt is detected every 1 ms.

The USBFS can detect an SOFR interrupt through the internal interpolation function even when a corrupted SOF packet is received from the USB host.

RESM flag (Resume Interrupt Status)

In device controller mode, the USBFS sets the RESM flag to 1 on detecting the falling edge of the signal on the USB_DP pin in the Suspend state (DVSQ[2:0] = 1xxb). Values read from the RESM flag in host controller mode are invalid.

VBINT flag (VBUS Interrupt Status)

The USBFS sets the VBINT flag to 1 on detecting a level change (high to low or low to high) in the USB_VBUS pin input value. The USBFS sets the VBSTS flag to indicate the USB_VBUS pin input value. When a VBUS interrupt occurs, eliminate transient elements by reading the VBSTS flag at least three times through software processing and check that the values read are the same.

32.2.14 Interrupt Status Register 1 (INTSTS1)

Address(es): USBFS.INTSTS1 4009 0042h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVRCR	BCHG	—	DTCH	ATTCH	—	—	—	—	EOFERR	SIGN	SACK	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	SACK	Setup Transaction Normal Response Interrupt Status	0: No SACK interrupt occurred 1: SACK interrupt occurred.	R/W *1
b5	SIGN	Setup Transaction Error Interrupt Status	0: No SIGN interrupt occurred 1: SIGN interrupt occurred.	R/W *1
b6	EOFERR	EOF Error Detection Interrupt Status	0: No EOFERR interrupt occurred 1: EOFERR interrupt occurred.	R/W *1
b10 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b11	ATTCH	ATTCH Interrupt Status	0: No ATTCH interrupt occurred 1: ATTCH interrupt occurred.	R/W *1
b12	DTCH	USB Disconnection Detection Interrupt Status	0: No DTCH interrupt occurred 1: DTCH interrupt occurred.	R/W *1
b13	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b14	BCHG	USB Bus Change Interrupt Status*2	0: No BCHG interrupt occurred 1: BCHG interrupt occurred.	R/W *1
b15	OVRCR	Overcurrent Input Change Interrupt Status*2	0: No OVRCR interrupt occurred 1: OVRCR interrupt occurred.	R/W *1

Note 1. To clear the bits in INTSTS1, write 0 only to the bits to be cleared. Write 1 to the other bits.

Note 2. The USBFS detects a change in the status in the OVRCR or BCHG bit even when the clock supply is stopped (SYSCFG.SCKE = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply (SYSCFG.SCKE = 1) before clearing the status by the software. No other interrupts can be detected while the clock supply is stopped (SYSCFG.SCKE bit = 0).

INTSTS1 is used to confirm the status of each interrupt in host controller mode. Only enable the status change interrupts indicated in the bits in INTSTS1 in host controller mode.

SACK flag (Setup Transaction Normal Response Interrupt Status)

The SACK flag indicates the status of the setup transaction normal response interrupt in host controller mode.

The USBFS detects the SACK interrupt and sets this flag to 1 when an ACK response is returned from a peripheral device during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by the software,

the USBFS generates the interrupt.

Values read from the SACK flag in device controller mode are invalid.

SIGN flag (Setup Transaction Error Interrupt Status)

The SIGN flag indicates the status of setup transaction error interrupts in host controller mode.

The USBFS detects the SIGN interrupt and sets this flag to 1 when an ACK response is not returned from a peripheral device three consecutive times during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by the software, the USBFS generates the interrupt.

The USBFS detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions:

- Timeout is detected by the USBFS when the peripheral device has returned no response
- A corrupted ACK packet is received
- A handshake other than ACK (NAK, NYET, or STALL) is received.

Values read from the SIGN flag in device controller mode are invalid.

EOFERR flag (EOF Error Detection Interrupt Status)

The EOFERR flag indicates the status of EOF error detection interrupts in host controller mode.

The USBFS detects the EOFERR interrupt and sets this flag to 1 on detecting that communication did not complete at the EOF2 timing defined in the USB 2.0 specification. If the associated interrupt enable bit is set to 1 by the software, the USBFS generates the interrupt.

After detecting the EOFERR interrupt, the USBFS controls the hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit for the port in which the EOFERR interrupt was detected to 0
- Puts the port in which the EOFERR interrupt occurred into the idle state.

The software must terminate all pipes in which communications are being carried out and re-enumerate the USB port.

Values read from the EOFERR flag in device controller mode are invalid.

ATTCH flag (ATTCH Interrupt Status)

The ATTCH flag indicates the status of USB attach detection interrupts in host controller mode.

The USBFS detects the ATTCH interrupt and sets this flag to 1 on detecting a J- or K-state on the full- or low-speed signal level for 2.5 µs. If the associated interrupt enable bit is set to 1 by the software, the USBFS generates the interrupt.

The USBFS detects the ATTCH interrupt on any of the following conditions:

- K-state, SE0, or SE1 changes to J-state, and J-state continues for 2.5 µs
- J-state, SE0, or SE1 changes to K-state, and K-state continues for 2.5 µs.

Values read from the ATTCH flag in device controller mode are invalid.

DTCH flag (USB Disconnection Detection Interrupt Status)

The DTCH flag indicates the status of USB disconnection detection interrupts in host controller mode.

The USBFS detects the DTCH interrupt and sets this flag to 1 on detecting a USB bus detach event. If the associated interrupt enable bit is set to 1 by the software, the USBFS generates the interrupt.

The USBFS detects bus detach events based on the USB 2.0 specification.

After detecting the DTCH interrupt, the USBFS controls hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit for the port in which the DTCH interrupt was detected to 0
- Puts the port in which the DTCH interrupt occurred into the idle state.

The software must terminate all pipes in which communications are being carried out and invoke the wait state for attaching to the USB port (waiting for ATTCH interrupt generation).

Values read from the DTCH flag in device controller mode are invalid.

BCHG flag (USB Bus Change Interrupt Status)

The BCHG flag indicates the status of USB bus change interrupts in host controller mode.

The USBFS detects the BCHG interrupt and sets this flag to 1 when a change in the full- or low-speed signal level occurs on the USB port. This includes any change from J-state, K-state, or SE0 to J-state, K-state, or SE0. If the associated interrupt enable bit is set to 1 by the software, the USBFS generates the interrupt.

The USBFS sets the LNST[1:0] flags to indicate the input state of the USB port. When a BCHG interrupt occurs, eliminate transient elements by repeat reading the LNST[1:0] flags by the software until the same value is read at least three times.

Change in the USB bus state can be detected while the internal clock is stopped.

Values read from the BCHG flag in device controller mode are invalid.

OVRCR flag (Overcurrent Input Change Interrupt Status)

The OVRCR flag indicates the status of USB_OVRCURA and USB_OVRCURB input pin change interrupts.

The USBFS detects the OVRCR interrupt and sets this flag to 1 when a change (high to low or low to high) occurs in at least one of the input values to the USB_OVRCURA and USB_OVRCURB pins. If the associated interrupt enable bit is set to 1 by the software, the USBFS generates the interrupt.

32.2.15 BRDY Interrupt Status Register (BRDYSTS)

Address(es): USBFS.BRDYSTS 4009 0046h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PIPE9BRDY	PIPE8BRDY	PIPE7BRDY	PIPE6BRDY	PIPE5BRDY	PIPE4BRDY	PIPE3BRDY	PIPE2BRDY	PIPE1BRDY	PIPE0BRDY
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PIPE0BRDY	BRDY Interrupt Status for Pipe 0*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W *1
b1	PIPE1BRDY	BRDY Interrupt Status for Pipe 1*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W *1
b2	PIPE2BRDY	BRDY Interrupt Status for Pipe 2*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W *1
b3	PIPE3BRDY	BRDY Interrupt Status for Pipe 3*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W *1
b4	PIPE4BRDY	BRDY Interrupt Status for Pipe 4*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W *1
b5	PIPE5BRDY	BRDY Interrupt Status for Pipe 5*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W *1
b6	PIPE6BRDY	BRDY Interrupt Status for Pipe 6*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W *1
b7	PIPE7BRDY	BRDY Interrupt Status for Pipe 7*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W *1
b8	PIPE8BRDY	BRDY Interrupt Status for Pipe 8*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W *1
b9	PIPE9BRDY	BRDY Interrupt Status for Pipe 9*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W *1
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. When the SOFCFG.BRDYM bit is set to 0, to clear the status indicated in the bits in BRDYSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.
Note 2. When the SOFCFG.BRDYM bit is set to 0, clear BRDY interrupts before accessing the FIFO.

32.2.16 NRDY Interrupt Status Register (NRDYSTS)

Address(es): USBFS.NRDYSTS 4009 0048h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PIPE9NRDY	PIPE8NRDY	PIPE7NRDY	PIPE6NRDY	PIPE5NRDY	PIPE4NRDY	PIPE3NRDY	PIPE2NRDY	PIPE1NRDY	PIPE0NRDY
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PIPE0NRDY	NRDY Interrupt Status for Pipe 0	0: No NRDY interrupt occurred 1: NRDY interrupt occurred.	R/W *1
b1	PIPE1NRDY	NRDY Interrupt Status for Pipe 1	0: No NRDY interrupt occurred 1: NRDY interrupt occurred.	R/W *1
b2	PIPE2NRDY	NRDY Interrupt Status for Pipe 2	0: No NRDY interrupt occurred 1: NRDY interrupt occurred.	R/W *1
b3	PIPE3NRDY	NRDY Interrupt Status for Pipe 3	0: No NRDY interrupt occurred 1: NRDY interrupt occurred.	R/W *1
b4	PIPE4NRDY	NRDY Interrupt Status for Pipe 4	0: No NRDY interrupt occurred 1: NRDY interrupt occurred.	R/W *1
b5	PIPE5NRDY	NRDY Interrupt Status for Pipe 5	0: No NRDY interrupt occurred 1: NRDY interrupt occurred.	R/W *1
b6	PIPE6NRDY	NRDY Interrupt Status for Pipe 6	0: No NRDY interrupt occurred 1: NRDY interrupt occurred.	R/W *1
b7	PIPE7NRDY	NRDY Interrupt Status for Pipe 7	0: No NRDY interrupt occurred 1: NRDY interrupt occurred.	R/W *1
b8	PIPE8NRDY	NRDY Interrupt Status for Pipe 8	0: No NRDY interrupt occurred 1: NRDY interrupt occurred.	R/W *1
b9	PIPE9NRDY	NRDY Interrupt Status for Pipe 9	0: No NRDY interrupt occurred 1: NRDY interrupt occurred.	R/W *1
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. To clear the status indicated in the bits in NRDYSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

32.2.17 BEMP Interrupt Status Register (BEMPSTS)

Address(es): USBFS.BEMPSTS 4009 004Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PIPE9BEMP	PIPE8BEMP	PIPE7BEMP	PIPE6BEMP	PIPE5BEMP	PIPE4BEMP	PIPE3BEMP	PIPE2BEMP	PIPE1BEMP	PIPE0BEMP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PIPE0BEMP	BEMP Interrupt Status for Pipe 0	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W *1
b1	PIPE1BEMP	BEMP Interrupt Status for Pipe 1	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W *1
b2	PIPE2BEMP	BEMP Interrupt Status for Pipe 2	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W *1
b3	PIPE3BEMP	BEMP Interrupt Status for Pipe 3	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W *1
b4	PIPE4BEMP	BEMP Interrupt Status for Pipe 4	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W *1
b5	PIPE5BEMP	BEMP Interrupt Status for Pipe 5	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W *1
b6	PIPE6BEMP	BEMP Interrupt Status for Pipe 6	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W *1
b7	PIPE7BEMP	BEMP Interrupt Status for Pipe 7	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W *1
b8	PIPE8BEMP	BEMP Interrupt Status for Pipe 8	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W *1
b9	PIPE9BEMP	BEMP Interrupt Status for Pipe 9	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W *1
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. To clear the status indicated in the bits in BEMPSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

32.2.18 Frame Number Register (FRMNUM)

Address(es): USBFS.FRMNUM 4009 004Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVRN	CRCE	—	—	—	FRNM[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b10 to b0	FRNM[10:0]	Frame Number	Latest frame number.	R
b13 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	CRCE	Receive Data Error	0: No error occurred 1: Error occurred.	R/W*1
b15	OVRN	Overrun/Underrun Detection Status	0: No error occurred 1: Error occurred.	R/W*1

Note 1. To clear the status, write 0 only to the bits to be cleared. Write 1 to the other bits.

FRNM[10:0] flags (Frame Number)

The USBFS sets the FRNM[10:0] flags to indicate the latest frame number, which is updated every 1 ms, when an SOF packet is issued or received.

CRCE flag (Receive Data Error)

The CRCE flag is set to 1 when a CRC error or bit stuffing error occurs during isochronous transfer. On detecting a CRC error in host controller mode, the USBFS generates an internal NRDY interrupt.

To clear the CRCE flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

OVRN flag (Overrun/Underrun Detection Status)

The OVRN flag is set to 1 when an overrun or underrun error occurs during isochronous transfer. To clear the flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

In host controller mode, the OVRN flag is set to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the time to issue an OUT token comes before all of the transmit data is written to the FIFO buffer.
- For a receiving isochronous pipe, the time to issue an IN token comes when no FIFO buffer planes are empty.

In device controller mode, the OVRN flag is set to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the IN token is received before all of the transmit data is written to the FIFO buffer.
- For a receiving isochronous pipe, the OUT token is received when no FIFO buffer planes are empty.

32.2.19 Device State Change Register (DVCHGR)

Address(es): USBFS.DVCHGR 4009 004Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DVCHG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b14 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	DVCHG	Device State Change	0: Disable writes to the USBADDR.STSRECOV[3:0] and USBADDR.USBADDR[6:0] bits 1: Enable writes to the USBADDR.STSRECOV[3:0] and USBADDR.USBADDR[6:0] bits.	R/W

For details, see section 32.3.1.5, Release from Deep Software Standby Mode Because of USB Suspend/Resume Interrupts.

32.2.20 USB Address Register (USBADDR)

Address(es): USBFS.USBADDR 4009 0050h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	STSRECOV[3:0]				—	USBADDR[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	USBADDR[6:0]	USB Address	In device controller mode, these bits indicate the USB address assigned by the host when the USBFS processed the SET_ADDRESS request successfully.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b11 to b8	STSRECOV[3:0]	Status Recovery	• Recovery in device controller mode b11 b8 1 0 0 1: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 001b (Default state) 1 0 1 0: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 010b (Address state) 1 0 1 1: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 011b (Configured state). Other settings are prohibited. • Recovery in host controller mode b11 b8 0 1 0 0: Return to the low-speed state (bits DVSTCTR0.RHST[2:0] = 001b) 1 0 0 0: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b). Other settings are prohibited.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

USBADDR[6:0] bits (USB Address)

In device controller mode, the USBADDR[6:0] flags indicate the USB address received when the USBFS processed a SetAddress request successfully. The USBFS sets the USBADDR[6:0] bits to 00h on detecting a USB bus reset.

Writing to these bits is enabled while the DVCHGR.DVCHG bit is set to 1. On recovering from a USB power shut-off, the operation can resume from the USB address set before the software shut-off.

In host controller mode, the USBADDR[6:0] bits are invalid.

STSRECOV[3:0] bits (Status Recovery)

Use the STSRECOV[3:0] bits to resume the state of the internal sequencer on recovering from USB power shut-off. For details, see section 32.3.1.5, Release from Deep Software Standby Mode Because of USB Suspend/Resume Interrupts.

Writing to these bits is enabled while the DVCHGR.DVCHG bit is set to 1.

32.2.21 USB Request Type Register (USBREQ)

Address(es): USBFS.USBREQ 4009 0054h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	BREQUEST[7:0]								BMREQUESTTYPE[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	BMREQUESTTYPE[7:0]	Request Type	USB request bmRequestType value.	R/W *1
b15 to b8	BREQUEST[7:0]	Request	USB request bRequest value.	R/W *1

Note 1. In device controller mode, these bits are readable, but writing to them has no effect. In host controller mode, these bits are both readable and writable.

USBREQ stores setup requests for control transfers.

In device controller mode, it stores the received bRequest and bmRequestType values. In host controller mode, it is set to the bRequest and bmRequestType values to be transmitted.

USBREQ is initialized by a USB bus reset.

BMREQUESTTYPE[7:0] bits (Request Type)

The BMREQUESTTYPE[7:0] bits hold the bmRequestType value of USB requests.

- In host controller mode:
  Set these bits to the value of the USB request data in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
  These bits indicate the value of the USB request data in reception setup transactions. Writing to the bits has no effect.

BREQUEST[7:0] bits (Request)

The BREQUEST[7:0] bits store bRequest value of the USB request.

- In host controller mode:
  Set these bits to the value of the USB request data in setup transmission transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
  These bits indicate the value of the USB request data in reception setup transactions. Writing to the bits has no effect.

32.2.22 USB Request Value Register (USBVAL)

Address(es): USBFS.USBVAL 4009 0056h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WVALUE[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	WVALUE[15:0]	Value	USB request wValue value.	R/W *1

Note 1. In device controller mode, these bits are readable, but writing to them has no effect. In host controller mode, these bits are both readable and writable.

In device controller mode, USBVAL stores the received wValue value. In host controller mode, it is set to the wValue value to be transmitted is set.

USBVAL is initialized by a USB bus reset.

WVALUE[15:0] bits (Value)

The WVALUE[15:0] bits store wValue value of the USB request.

- In host controller mode:
  Set these bits to the value of the wValue field in USB requests of transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
  These bits indicate the wValue value of USB requests in reception setup transactions. Writing to the bits has no effect.

32.2.23 USB Request Index Register (USBINDX)

Address(es): USBFS.USBINDX 4009 0058h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WINDEX[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	WINDEX[15:0]	Index	USB request wIndex value.	R/W *1

Note 1. In device controller mode, these bits are readable, but writing to them has no effect. In host controller mode, these bits are both readable and writable.

USBINDX stores setup requests for control transfers.

In device controller mode, it stores the received wIndex value. In host controller mode, it is set to the wIndex value to be transmitted.

USBINDX is initialized by a USB bus reset.

WINDEX[15:0] bits (Index)

The WINDEX[15:0] bits hold the wIndex value of a USB request.

- In host controller mode:
  Set these bits to the wIndex value in USB requests in transmission setup transactions. Do not change the value of the

bits while the DCPCTR.SUREQ bit is 1.

- In device controller mode:
  These bits indicate the wIndex value in USB requests received in reception setup transactions. Writing to the bits has no effect.

32.2.24 USB Request Length Register (USBLENG)

Address(es): USBFS.USBLENG 4009 005Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WLENTUH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	WLENTUH[15:0]	Length	USB request wLength value.	R/W *1

Note 1. In device controller mode, these bits are readable, but writing to them has no effect. In host controller mode, these bits are both readable and writable.

USBLENG stores setup requests for control transfers.

In device controller mode, the value of wLength that is received is stored. In host controller mode, the value of wLength to be transmitted is set.

USBLENG is initialized by a USB bus reset.

WLENTUH[15:0] bits (Length)

The WLENTUH[15:0] bits hold the wLength value of a USB request.

- In host controller mode:
  Set these bits to the wLength value in USB requests in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
  These bits indicate the wLength value in USB requests received in reception setup transactions. Writing to the bits has no effect.

32.2.25 DCP Configuration Register (DCPCFG)

Address(es): USBFS.DCPCFG 4009 005Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	SHTNAK	—	—	DIR	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	DIR	Transfer Direction*1	0: Data receiving direction 1: Data transmitting direction.	R/W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	SHTNAK	Pipe Disabled at End of Transfer*1	0: Keep pipe open after transfer ends 1: Disable pipe after transfer ends.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only set this bit while the PID is NAK. Before setting this bit, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

DIR bit (Transfer Direction)

In host controller mode, the DIR bit sets the transfer direction of the data stage and status stage for control transfers. In device controller mode, set the DIR bit to 0.

SHTNAK bit (Pipe Disabled at End of Transfer)

The SHTNAK bit specifies whether to change PID to NAK on transfer end when the selected pipe is receiving. It is only valid when the selected pipe is receiving.

When the SHTNAK bit is 1, the USBFS changes the DCPCTR.PID[1:0] bits for the DCP to NAK on determining that a transfer has ended. The USBFS determines transfer end on the following condition:

- A short packet, including a zero-length packet, is successfully received.

32.2.26 DCP Maximum Packet Size Register (DCPMAXP)

Address(es): USBFS.DCPMAXP 4009 005Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DEVSEL[3:0]				—	—	—	—	—	MXPS[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	MXPS[6:0]	Maximum Packet Size*1	Maximum data payload specification (maximum packet size) for the DCP.	R/W
b11 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b12	DEVSEL[3:0]	Device Select*2	b15 b12 0 0 0 0: Address 0000b 0 0 0 1: Address 0001b 0 0 1 0: Address 0010b 0 0 1 1: Address 0011b 0 1 0 0: Address 0100b 0 1 0 1: Address 0101b. Other settings are prohibited.	R/W

Note 1. Only set the MXPS[6:0] bits while PID is NAK. Before setting these bits, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary. After the MXPS[6:0] bits are set and the DCP is set to the CURPIPE[3:0] bits in a port select register, clear the buffer by setting the BCLR bit the port control register to 1.

Note 2. Only set the DEVSEL[3:0] bits while PID is NAK and the DCPCTR.SUREQ bit is 0. Before setting these bits, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

MXPS[6:0] bits (Maximum Packet Size)

The MXPS[6:0] bits specify the maximum data payload (maximum packet size) for the DCP. The initial value is 40h (64 bytes). Set the bits to a USB 2.0-compliant value. Do not write to the FIFO buffer or set PID = BUF while MXPS[6:0] is set to 0.

DEVSEL[3:0] bits (Device Select)

In host controller mode, the DEVSEL[3:0] bits specify the address of the target peripheral device for a control transfer. Set up the device address in the associated DEVADDn (n = 0 to 5) register first, and then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0010b, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0000b.

32.2.27 DCP Control Register (DCPCTR)

Address(es): USBFS.DCPCTR 4009 0060h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	BSTS	SUREQ	—	—	SUREQ CLR	—	—	SQCLR	SQSET	SQMON	PBUSY	—	—	CCPL	PID[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	PID[1:0]	Response PID	b1 b0 0 0: NAK response 0 1: BUF response (depends on the buffer state) 1 0: STALL response 1 1: STALL response.	R/W
b2	CCPL	Control Transfer End Enable	0: Disable control transfer completion 1: Enable control transfer completion.	R/W
b4, b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5	PBUSY	Pipe Busy	0: DCP not used for the USB bus 1: DCP in use for the USB bus.	R
b6	SQMON	Sequence Toggle Bit Monitor	0: DATA0 1: DATA1.	R
b7	SQSET	Sequence Toggle Bit Set*2	Sets the sequence toggle bit in DCP transfers. 0: Invalid (writing 0 has no effect) 1: Set the expected value for the next transaction to DATA1. This bit is read as 0.	R/W*1
b8	SQCLR	Sequence Toggle Bit Clear*2	Clears the sequence toggle bit in DCP transfers. 0: Invalid (writing 0 has no effect) 1: Clear the expected value for the next transaction to DATA0. This bit is read as 0.	R/W*1
b10, b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b11	SUREQCLR	SUREQ Bit Clear	Clears the SUREQ bit in host controller mode. 0: Invalid (writing 0 has no effect) 1: Clear SUREQ to 0. This bit is read as 0.	R/W
b13, b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	SUREQ	Setup Token Transmission	Sets up token transmission in host controller mode. 0: Invalid (writing 0 has no effect) 1: Transmit setup packet.	R/W
b15	BSTS	Buffer Status	0: Buffer access disabled 1: Buffer access enabled.	R

Note 1. This bit is read as 0.

Note 2. Only set the SQSET and SQCLR bits while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

PID[1:0] bits (Response PID)

The PID[1:0] bits control the USB response type during control transfers.

In host controller mode, to change the PID[1:0] setting from NAK to BUF:

- When the transmitting direction is set:

a. Write all of the transmit data to the FIFO buffer while the DVSTCTR0.UACT bit is 1 and PID is NAK.

b. Set PID[1:0] bits to 01b (BUF).
The USBFS then executes the OUT transaction.

- When the receiving direction is set:

a. Check that the FIFO buffer is empty (or empty the buffer) while the DVSTCTR0.UACT bit is 1 and PID is NAK.

b. Set PID[1:0] bits to 01b (BUF).
The USBFS then executes the IN transaction.

The USBFS changes the PID[1:0] setting as follows:

- When the PID[1:0] bits are set to BUF (01b) by the software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets the PID[1:0] to STALL (11b).
- When a reception error, such as a CRC error, is detected three times consecutively, the USBFS sets the PID[1:0] bits to NAK (00b).
- On receiving the STALL handshake, the USBFS sets PID[1:0] to STALL (11b).

In device controller mode, the USBFS changes the PID[1:0] setting as follows:

- On receiving a setup packet, the USBFS sets PID[1:0] to NAK (00b). The USBFS then sets the INTSTS0.VALID flag to 1, and the PID[1:0] setting cannot be changed until the software clears the VALID flag to 0.
- When the PID[1:0] bits are set to BUF (01b) by the software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets PID[1:0] to STALL (11b).
- On detecting a control transfer sequence error, the USBFS sets PID[1:0] to STALL (1xb).
- On detecting a USB bus reset, the USBFS sets PID[1:0] to NAK.

The USBFS does not check the PID[1:0] setting while processing a SET_ADDRESS request.

The PID[1:0] bits are initialized by a USB bus reset.

CCPL bit (Control Transfer End Enable)

In device controller mode, setting the CCPL bit to 1 enables the status stage of the control transfer to be completed. When the bit is set to 1 by the software while the associated PID[1:0] bits are set to BUF, the USBFS completes the control transfer status stage.

During control read transfers, the USBFS transmits the ACK handshake in response to the OUT transaction from the USB host. During control write or no-data control transfers, it transmits the zero-length packet in response to the IN transaction from the USB host. On detecting a SET_ADDRESS request, the USBFS operates in auto response mode from the setup stage up to status stage completion regardless of the CCPL bit setting.

The USBFS changes the CCPL bit from 1 to 0 on receiving a new setup packet. The software cannot write 1 to the bit while the INTSTS0.VALID bit is 1. The bit is initialized by a USB bus reset.

In host controller mode, always write 0 to the CCPL bit.

PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether DCP is used for the transaction when USBFS changes the PID[1:0] bits from BUF to NAK. The USBFS changes the PBUSY bit from 0 to 1 on start of a USB transaction for the selected pipe. It changes the PBUSY bit from 1 to 0 on completion of one transaction.

After PID is set to NAK by the software, the value in the PBUSY bit indicates whether changes to pipe settings can proceed. For details, see section 32.3.4.1, Pipe Control Register Switching Procedures.

SQMON bit (Sequence Toggle Bit Monitor)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

The USBFS toggles the bit on normal completion of the transaction. It does not toggle the bit, however, when a DATA-PID mismatch occurs during a transfer in the receiving direction.

In device controller mode, the USBFS sets the SQMON bit to 1 (specifies DATA1 as the expected value) on successful reception of the setup packet.

In device controller mode, the USBFS does not reference this bit during IN or OUT transactions at the status stage, and it does not toggle the bit on normal completion.

SQSET bit (Sequence Toggle Bit Set)

The SQSET bit specifies DATA1 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

SQCLR bit (Sequence Toggle Bit Clear)

The SQCLR bit specifies DATA0 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer. It is read as 0.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

SUREQCLR bit (SUREQ Bit Clear)

In host controller mode, setting the SUREQCLR bit to 1 clears the SUREQ bit to 0. The bit is read as 0.

If transfer stops while the SUREQ bit is set to 1 in a setup transaction, set the SUREQCLR bit to 1 by the software. This is not necessary at the end of a normal setup transaction, because the USBFS automatically clears the SUREQ bit to 0.

Only control the SUREQ bit through the SUREQCLR bit while the DVSTCTR0.UACT bit is 0. When UACT is 0, communication is halted or no transfer is occurring because a bus disconnection was detected.

In device controller mode, always write 0 to this bit.

SUREQ bit (Setup Token Transmission)

In host controller mode, setting the SUREQ bit to 1 triggers the USBFS to transmit the setup packet. After completing the setup transaction process, the USBFS generates either the SACK or SIGN interrupt and clears the SUREQ bit to 0. The USBFS also clears the SUREQ bit to 0 when the software sets the SUREQCLR bit to 1.

Before setting the SUREQ bit to 1, set the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, and USBLENG appropriately to transmit the wanted USB request in the setup transaction. Also check that the PID[1:0] bits for the DCP are set to NAK. After setting the SUREQ bit to 1, do not change the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, or USBLENG until the setup transaction is complete (SUREQ bit = 1). Write 1 to the SUREQ bit only when transmitting the setup token. Otherwise, write 0.

In device controller mode, always write 0 to this bit.

BSTS flag (Buffer Status)

The BSTS flag indicates the status of access to the DCP FIFO buffer. The meaning of this flag varies as follows depending on the CFIFOSEL.ISEL setting:

- When ISEL = 0, the bit indicates whether receive data can be read from the buffer.
- When ISEL = 1, the bit indicates whether transmit data can be written to the buffer.

32.2.28 Pipe Window Select Register (PIPESEL)

Address(es): USBFS.PIPESEL 4009 0064h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	PIPESEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	PIPESEL[3:0]	Pipe Window Select	b3 b0 0 0 0 0: No pipe selected 0 0 0 1: Pipe 1 0 0 1 0: Pipe 2 0 0 1 1: Pipe 3 0 1 0 0: Pipe 4 0 1 0 1: Pipe 5 0 1 1 0: Pipe 6 0 1 1 1: Pipe 7 1 0 0 0: Pipe 8 1 0 0 1: Pipe 9. Other settings are prohibited.	R/W
b15 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Set pipes 1 to 9 using the PIPESEL, PIPECFG, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN registers (n = 0 to 9).

After selecting the pipe in the PIPESEL register, pipe functions must be set in the associated PIPECFG, PIPEMAXP, and PIPEPERI registers. PIPEnCTR, PIPEnTRE, and PIPEnTRN can be set independently of the pipe selection in this register.

PIPESEL[3:0] bits (Pipe Window Select)

The PIPESEL[3:0] bits select the pipe number associated with the PIPECFG, PIPEMAXP, and PIPEPERI registers used for data writing and reading. Selecting a pipe number in the PIPESEL[3:0] bits allows writing to and reading from PIPECFG, PIPEMAXP, and PIPEPERI associated with the selected pipe number.

When PIPESEL[3:0] = 0000b, 0 is read from all of the bits in PIPECFG, PIPEMAXP, and PIPEPERI. Writing to these bits has no effect.

32.2.29 Pipe Configuration Register (PIPECFG)

Address(es): USBFS.PIPECFG 4009 0068h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TYPE[1:0]		—	—	—	BFRE	DBLB	—	SHTNAK	—	—	DIR	EPNUM[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	EPNUM[3:0]	Endpoint Number*1	Specifies the endpoint number for the selected pipe. Setting 0000b indicates the pipe is not used.	R/W
b4	DIR	Transfer Direction*2,*3	0: Receiving direction 1: Transmitting direction.	R/W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	SHTNAK	Pipe Disabled at End of Transfer*1	0: Continue pipe operation after transfer ends 1: Disable pipe after transfer ends.	R/W
b8	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit name	Description	R/W
b9	DBLB	Double Buffer Mode*2,*3	0: Single buffer 1: Double buffer.	R/W
b10	BFRE	BRDY Interrupt Operation Specification*2,*3	0: Generate BRDY interrupt on transmitting or receiving data 1: Generate BRDY interrupt on completion of reading data.	R/W
b13 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15, b14	TYPE[1:0]	Transfer Type*1	• Pipes 1 and 2 b15 b14 0 0: Pipe not used 0 1: Bulk transfer 1 0: Setting prohibited 1 1: Isochronous transfer. • Pipes 3 to 5 b15 b14 0 0: Pipe not used 0 1: Bulk transfer 1 0: Setting prohibited 1 1: Setting prohibited. • Pipes 6 to 9 b15 b14 0 0: Pipe not used 0 1: Setting prohibited 1 0: Interrupt transfer 1 1: Setting prohibited.	R/W

Note 1. Only set the TYPE[1:0], SHTNAK, and EPNUM[3:0] bits while PID is NAK. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 2. Only set the BFRE, DBLB, and DIR bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 3. To change the BFRE, DBLB, or DIR bits after completing USB communication on the selected pipe, in addition to the restrictions described in note 2, write 1 and 0 to the PIPEnCTR.ACLRM bit continuously by the software and clear the FIFO buffer assigned to the pipe.

PIPECFG specifies the transfer type, FIFO buffer access direction, and endpoint numbers for pipes 1 to 9. It also selects single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.

EPNUM[3:0] bits (Endpoint Number)

The EPNUM[3:0] bits specify the endpoint number for the selected pipe. Setting 0000b indicates the pipe not used.

Set these bits so that the combination of the DIR and EPNUM[3:0] settings is different from those for other pipes. (The EPNUM[3:0] bits can be set to 0000b for all pipes.)

DIR bit (Transfer Direction)

The DIR bit specifies the transfer direction for the selected pipe.

When the software sets this bit to 0, the USBFS uses the selected pipe for receiving. When the software sets this bit to 1, the USBFS uses the selected pipe for transmitting.

SHTNAK bit (Pipe Disabled at End of Transfer)

The SHTNAK bit specifies whether to change the PIPEnCTR.PID[1:0] bits to 00b (NAK) at the end of transfer when the selected pipe is set in the receiving direction. The bit is valid for pipes 1 to 5 in the receiving direction.

When the software sets this bit to 1 for a receiving pipe, the USBFS changes the associated PIPEnCTR.PID[1:0] bits to 00b (NAK) on determining the transfer end. The USBFS determines that the transfer has ended on the following conditions:

- Short packet data (including a zero-length packet) was successfully received.
- The transaction counter is used and the number of packets specified for the transaction counter were successfully received.

DBLB bit (Double Buffer Mode)

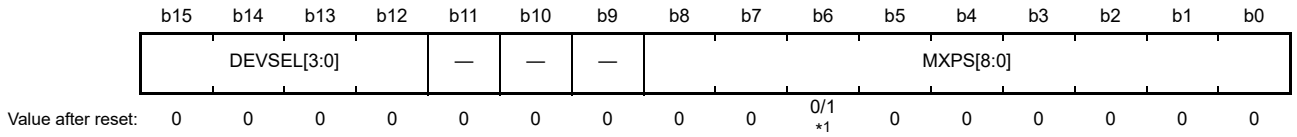
The DBLB bit selects either single or double buffer mode for the FIFO buffer used by the selected pipe. The bit is valid for pipes 1 to 5.

BFRE bit (BRDY Interrupt Operation Specification)

The BFRE bit specifies the BRDY interrupt generation timing from the USBFS to the CPU for the selected pipe.

When the software sets the BFRE bit to 1 and the selected pipe is in the receiving direction, the USBFS detects the transfer completion and generates the BRDY interrupt on reading the packet.

When a BRDY interrupt is generated with this setting, the software must write 1 to the BCLR bit in the port control register. The FIFO buffer assigned to the selected pipe is not enabled for reception until 1 is written to the BCLR bit.



When the BFRE bit is set to 1 by the software and the selected pipe is in the transmitting direction, the USBFS does not generate the BRDY interrupt. For details, see section 32.3.3.1, BRDY Interrupt.

TYPE[1:0] bits (Transfer Type)

The TYPE[1:0] bits specify the transfer type for the pipe selected in the PIPESEL.PIPESEL[3:0] bits. Before setting PID to BUF and starting USB communication on the selected pipe, set the TYPE[1:0] bits to a value other than 00b.

32.2.30 Pipe Maximum Packet Size Register (PIPEMAXP)

Address(es): USBFS.PIPEMAXP 4009 006Ch

Bit	Symbol	Bit name	Description	R/W
b8 to b0	MXPS[8:0]	Maximum Packet Size*2	• Pipes 1 and 2 1 byte (001h) to 256 bytes (100h) • Pipes 3 to 5 8 bytes (008h), 16 bytes (010h), 32 bytes (020h), 64 bytes (040h) (Bits [8:7] and [2:0] not supported.) • Pipes 6 to 9 1 byte (001h) to 64 bytes (040h) (Bits [8:7] not supported.)	R/W
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b12	DEVSEL[3:0]	Device Select*3	b3 b0 0 0 0 0: Address 0000b 0 0 0 1: Address 0001b 0 0 1 0: Address 0010b 0 0 1 1: Address 0011b 0 1 0 0: Address 0100b 0 1 0 1: Address 0101b. Other settings are prohibited.	R/W

Note 1. The value of the MXPS[8:0] bits is 000h when no pipe is selected in the PIPESEL.PIPESEL[3:0] bits and 040h when a pipe is selected.

Note 2. Only set the MXPS[8:0] bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 3. Only set the DEVSEL[3:0] bits while PID is NAK. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEMAXP specifies the maximum packet size for pipes 1 to 9.

MXPS[8:0] bits (Maximum Packet Size)

The MXPS[8:0] bits specify the maximum data payload (maximum packet size) for the selected pipe.

Set these bits to the appropriate value for each transfer type based on the USB 2.0 specification. When MXPS[8:0] = 0, do not write to the FIFO buffer or set PID to BUF. These writes have no effect.

DEVSEL[3:0] bits (Device Select)

In host controller mode, the DEVSEL[3:0] bits specify the address of the target device for USB communication. Set up the device address in the associated DEVADDn (n = 0 to 5) register first, and then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0010b, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0000b.

32.2.31 Pipe Cycle Control Register (PIPEPERI)

Address(es): USBFS.PIPEPERI 4009 006Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	IITV[2:0] *1	Interval Error Detection Interval	Specifies the interval error detection timing for the selected pipe as the n-th power of 2 of the frame timing.	R/W
b11 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	IFIS	Isochronous IN Buffer Flush	0: Do not flush buffer 1: Flush buffer.	R/W
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only set the IITV[2:0] bits while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEPERI selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfers, and sets the interval error detection interval for pipes 1 to 9.

IITV[2:0] bits (Interval Error Detection Interval)

To change the IITV[2:0] bits to another value after they are set and USB communication is performed, set the PIPEnCTR.PID[1:0] bits to 00b (NAK) and then set the PIPEnCTR.ACLRM bit to 1 to initialize the interval timer.

The IITV[2:0] bits are not provided for pipes 3 to 5. Write 000b to bit positions of the IITV[2:0] bits associated with pipes 3 to 5.

IFIS bit (Isochronous IN Buffer Flush)

The IFIS bit specifies whether to flush the buffer when the pipe selected in the PIPESEL.PIPESEL[3:0] bits is used for isochronous IN transfers.

In device controller mode when the selected pipe is for isochronous IN transfers, the USBFS automatically clears the FIFO buffer if the USBFS fails to receive the IN token from the USB host within the interval set in the IITV[2:0] bits in terms of frames.

When double buffering is specified (PIPECFG.DBLB = 1), the USBFS only clears the data in the previously used plane.

The USBFS clears the FIFO buffer on receiving the SOF packet immediately after the frame in which the USBFS expected to receive the IN token. Even if the SOF packet is corrupted, the FIFO buffer is cleared at the time the SOF packet is expected to be received by using the internal interpolation function.

In host controller mode, set the IITV[2:0] bits to 000b.

Set the IITV[2:0] bits to 000b when the selected pipe is not used for isochronous transfers.

When the host controller function is selected, set this bit to 0. Set this bit to 0 when the selected pipe is not for isochronous transfer.

32.2.32 PIPEn Control Registers (PIPEnCTR) (n = 1 to 9)

PIPEnCTR (n = 1 to 5)

Address(es): USBFS.PIPE1CTR 4009 0070h, USBFS.PIPE2CTR 4009 0072h, USBFS.PIPE3CTR 4009 0074h, USBFS.PIPE4CTR 4009 0076h, USBFS.PIPE5CTR 4009 0078h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	BSTS	INBUFM	—	—	—	ATREPM	ACLRM	SQCLR	SQSET	SQMON	PBUSY	—	—	—	PID[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	PID[1:0]	Response PID	b1 b0 0 0: NAK response 0 1: BUF response (depends buffer state) 1 0: STALL response 1 1: STALL response.	R/W
b4 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5	PBUSY	Pipe Busy	0: Pipe n not in use for the transaction 1: Pipe n in use for the transaction.	R
b6	SQMON	Sequence Toggle Bit Confirmation	0: DATA0 1: DATA1.	R
b7	SQSET	Sequence Toggle Bit Set*2	Sets the sequence toggle bit for pipe n. 0: Invalid (writing 0 has no effect) 1: Set the expected value for the next transaction to DATA1. This bit is read as 0.	R/W*1
b8	SQCLR	Sequence Toggle Bit Clear*2	Clears the sequence toggle bit for pipe n. 0: Invalid (writing 0 has no effect) 1: Clear the expected value for the next transaction to DATA0. This bit is read as 0.	R/W*1
b9	ACLRM	Auto Buffer Clear Mode*3	0: Disable 1: Enable (initialize all buffers).	R/W
b10	ATREPM	Auto Response Mode*2	0: Disable auto response mode 1: Enable auto response mode.	R/W
b13 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	INBUFM	Transmit Buffer Monitor	0: No data to be transmitted is in the FIFO buffer 1: Data to be transmitted is in the FIFO buffer.	R
b15	BSTS	Buffer Status	0: Buffer access by the CPU disabled 1: Buffer access by the CPU enabled.	R

Note 1. Only 0 can be read.

Note 2. Only set the ATREPM bit or write 1 to the SQCLR or SQSET bit while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 3. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting this bit, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEnCTR can be set for any pipe selection in the PIPESEL register.

PID[1:0] bits (Response PID)

The PID[1:0] bits specify the response type for the next transaction on the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USB transfer. Table 32.7 and Table 32.8 show the basic operations of the USBFS (when there are no errors in the communication packets) based on the PID[1:0] bit setting.

After changing the PID[1:0] setting from BUF to NAK through the software during USB communication on the selected

pipe, check that the PBUSY bit is 1 to see if USB transfer on the pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through the software is not necessary.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to NAK on recognizing completion of the transfer when the selected pipe is in the receiving direction and the PIPECFG.SHTNAK bit for the selected pipe is set to 1 by the software
- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode.

To specify the response type, set the PID[1:0] bits as follows.

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, transition to NAK and then BUF.

Table 32.7 Operation of the USBFS based on the PID[1:0] setting in host controller mode

PID[1:0] value	Transfer type	Transfer direction (DIR bit)	USBFS operation
00b (NAK)	Does not depend on the setting.	Does not depend on the setting.	Does not issue tokens.
01b (BUF)	Bulk or interrupt	Does not depend on the setting.	Issues tokens when the DVSTCTR0.UACT bit is 1 and the FIFO buffer associated with the selected pipe is ready for transmission and reception. Does not issue tokens when the DVSTCTR0.UACT bit is 0 or the FIFO buffer associated with the selected pipe is not ready for transmission or reception.
	Isochronous	Does not depend on the setting.	Issues tokens regardless of the status of the FIFO buffer associated with the selected pipe.
10b (STALL) or 11b (STALL)	Does not depend on the setting.	Does not depend on the setting.	Does not issue tokens.

Table 32.8 Operation of the USBFS based on the PID[1:0] setting in device controller mode (1 of 2)

PID[1:0] value	Transfer type	Transfer direction (DIR bit)	USBFS operation
00b (NAK)	Bulk or interrupt	Does not depend on the setting.	Returns NAK in response to the token from the USB host.
	Isochronous	Does not depend on the setting.	Returns nothing in response to the token from the USB host.

Table 32.8 Operation of the USBFS based on the PID[1:0] setting in device controller mode (2 of 2)

PID[1:0] value	Transfer type	Transfer direction (DIR bit)	USBFS operation
01b (BUF)	Bulk	Receiving direction (DIR = 0)	Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception.
	Interrupt	Receiving direction (DIR = 0)	Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception.
	Bulk or interrupt	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the FIFO buffer associated with the selected pipe is ready for transmission. Otherwise, returns NAK.
	Isochronous	Receiving direction (DIR = 0)	Receives data in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception. Otherwise, discards the data.
	Isochronous	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the associated FIFO buffer is ready for transmission. Otherwise, transmits a zero-length packet.
10b (STALL) or 11b (STALL)	Bulk or interrupt	Does not depend on the setting.	Returns STALL in response to the token from the USB host.
	Isochronous	Does not depend on the setting.	Returns nothing in response to the token from the USB host.

PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 on start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit by the software after PID is set to NAK allows you to check whether changing the pipe setting is possible. For details, see section 32.3.4.1, Pipe Control Register Switching Procedures.

SQMON bit (Sequence Toggle Bit Confirmation)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

When the selected pipe is not the isochronous transfer type, the USBFS toggles the SQMON flag on successful completion of the transaction. However, the USBFS does not toggle the SQMON flag when a DATA-PID mismatch occurs during transfer in the receiving direction.

SQSET bit (Sequence Toggle Bit Set)

Setting the SQSET bit to 1 through the software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS clears the SQSET bit to 0.

SQCLR bit (Sequence Toggle Bit Clear)

Setting the SQCLR bit to 1 through the software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS clears the SQCLR bit to 0.

ACLRM bit (Auto Buffer Clear Mode)

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

Table 32.9 shows the data cleared by writing 1 and 0 to the ACLRM bit continuously and the cases in which this processing is required.

Table 32.9 Data cleared by the USBFS when ACLRM = 1

No.	Data cleared by setting the ACLRM bit	Situations requiring data clear
1	All data in the FIFO buffer allocated to the selected pipe (two FIFO buffers in double buffer mode)	When initializing the selected pipe
2	Interval count value when the selected pipe is the isochronous transfer type	When resetting the interval count value
3	Internal flags related to the PIPECFG.BFRE bit	When changing the PIPECFG.BFRE setting
4	FIFO buffer toggle control	When changing the PIPECFG.DBLB setting
5	Internal flags related to the transaction count	When forcing the transaction count function to terminate

ATREPM bit (Auto Response Mode)

The ATREPM bit enables or disables auto response mode for the selected pipe.

This bit can be set to 1 in device controller mode when the selected pipe is the bulk transfer type. When the bit is set to 1, the USBFS responds to the token from the USB host as follows:

- When the selected pipe is set for Bulk IN transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 1):
  a. When the ATREPM bit = 1 and PID = BUF, the USBFS transmits a zero-length packet in response to the IN token.
  b. The USBFS updates (allows toggling of) the sequence toggle bit (DATA-PID) each time the USBFS receives ACK from the USB host. In a single transaction, the IN token is received, a zero-length packet is transmitted, and then ACK is received. The USBFS does not generate the BRDY or BEMP interrupt.
- When the selected pipe is set for Bulk OUT transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 0):

  When the ATREPM bit = 1 and PID = BUF, the USBFS returns NAK in response to the OUT token and generates an NRDY interrupt.

For USB communication in auto response mode, set the ATREPM bit to 1 while the FIFO buffer is empty. Do not write to the FIFO buffer during USB communication in auto response mode. When the selected pipe uses isochronous transfer, always set this bit to 0.

In host controller mode, always set the ATREPM bit to 0.

INBUFM bit (Transmit Buffer Monitor)

The INBUMFM bit indicates the FIFO buffer status for the selected pipe in the transmitting direction.

When the selected pipe is set in the transmitting direction (PIPECFG.DIR = 1), the USBFS sets this bit to 1 when the CPU or DMA/DTC completes writing data to at least one FIFO buffer plane.

The USBFS sets this bit to 0 when the USBFS completes transmission of the data from the FIFO buffer plane to which all the data is written. In double buffer mode (PIPECFG.DBLB = 1), the USBFS sets the INBUFM bit to 0 when the USBFS completes transmission of the data from the two FIFO buffer planes before the CPU or DMA/DTC completes writing data to one FIFO buffer plane.

The INBUFM bit indicates the same value as the BSTS bit when the selected pipe is in the receiving direction (PIPECFG.DIR = 0).

BSTS bit (Buffer Status)

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 32.10.

Table 32.10 BSTS bit operation

DIR value	BFRE value	DCLRM value	BSTS bit function
0	0	0	Sets to 1 when receive data can be read from the FIFO buffer, and is set to 0 on completion of data read.
		1	Setting prohibited
	1	0	Sets to 1 when receive data can be read from the FIFO buffer, and is set to 0 when the software sets the BCLR bit in the port control register to 1 after the data read is complete.
		1	Sets to 1 when receive data can be read from the FIFO buffer, and is set to 0 on completion of data read.
1	0	0	Sets to 1 when transmit data can be written to the FIFO buffer, and is set to 0 on completion of data write.
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

PIPEnCTR (n = 6 to 9)

Address(es): USBFS.PIPE6CTR 4009 007Ah, USBFS.PIPE7CTR 4009 007Ch, USBFS.PIPE8CTR 4009 007Eh, USBFS.PIPE9CTR 4009 0080h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	BSTS	—	—	—	—	—	ACLRM	SQCLR	SQSET	SQMON	PBUSY	—	—	—	PID[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	PID[1:0]	Response PID	b1 b0 0 0: NAK response 0 1: BUF response (depends on the buffer state) 1 0: STALL response 1 1: STALL response.	R/W
b4 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5	PBUSY	Pipe Busy	0: Pipe n not in use for the transaction 1: Pipe n in use for the transaction.	R
b6	SQMON	Sequence Toggle Bit Confirmation	0: DATA0 1: DATA1.	R
b7	SQSET	Sequence Toggle Bit Set*2	Sets the sequence toggle bit for pipe n: 0: Invalid (writing 0 has no effect) 1: Set the expected value for the next transaction to DATA1. This bit is read as 0.	R/W *1
b8	SQCLR	Sequence Toggle Bit Clear*2	Clears the sequence toggle bit for pipe n: 0: Invalid (writing 0 has no effect) 1: Clear the expected value for the next transaction to DATA0. This bit is read as 0.	R/W *1
b9	ACLRM	Auto Buffer Clear Mode*3	0: Disable 1: Enable (all buffers initialized).	R/W
b14 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	BSTS	Buffer Status	0: Buffer access disabled 1: Buffer access enabled.	R

Note 1. Only 0 can be read. Only 1 can be written.

Note 2. Only write 1 to the SQCLR or SQSET bit while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 3. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port

select register. Before setting this bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PID[1:0] bits (Response PID)

The PID[1:0] bits specify the response type for the next transaction of the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USB transfer. Table 32.7 and Table 32.8 show the basic operation (when there are no errors in the transmitted and received packets) of the USBFS depending on the PID[1:0] setting.

After changing the PID[1:0] setting from BUF to NAK through the software during USB communication on the selected pipe, check that the PBUSY bit is 1 to see if USB transfer on the selected pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through the software is not necessary.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode.

To specify each response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, transition to NAK and then BUF.

PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 on start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit by the software after PID is set to NAK allows you to check whether changing the pipe setting is possible.

SQMON bit (Sequence Toggle Bit Confirmation)

The SQMON flag indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

The USBFS toggles the SQMON flag on successful completion of the transaction. However, the USBFS does not toggle the SQMON flag when a DATA-PID mismatch occurs during transfer in the receiving direction.

SQSET bit (Sequence Toggle Bit Set)

Setting the SQSET bit to 1 through the software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS sets the SQSET bit to 0.

SQCLR bit (Sequence Toggle Bit Clear)

Setting the SQCLR bit to 1 through the software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS sets the SQCLR bit to 0.

ACLRM bit (Auto Buffer Clear Mode)

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

Table 32.11 shows the data cleared by writing 1 and 0 continuously to the ACLRM bit and the cases in which this processing is required.

Table 32.11 Data cleared by the USBFS when ACLRM = 1

No.	Data cleared by setting the ACLRM bit	Situations requiring data clear
1	All data in the FIFO buffer allocated to the selected pipe	When initializing the selected pipe
2	Interval count value when the selected pipe is the isochronous transfer type	When resetting the interval count value
3	Internal flags related to the PIPECFG.BFRE bit	When changing the PIPECFG.BFRE setting
4	Internal flags related to the transaction count	When forcing the transaction count function to terminate

BSTS bit (Buffer Status)

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 32.10.

32.2.33 PIPEn Transaction Counter Enable Register (PIPEnTRE) (n = 1 to 5)

Address(es): USBFS.PIPE1TRE 4009 0090h, USBFS.PIPE2TRE 4009 0094h, USBFS.PIPE3TRE 4009 0098h, USBFS.PIPE4TRE 4009 009Ch, USBFS.PIPE5TRE 4009 00A0h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	TRCLR	Transaction Counter Clear	0: Invalid (writing 0 has no effect) 1: Clear counter value.	R/W
b9	TRENB	Transaction Counter Enable	0: Disable transaction counter 1: Enable transaction counter.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Set each bit in PIPEnTRE while PID is NAK. Before setting these bits after changing the PIPEnCTR.PID[1:0] bits for the selected pipe from BUF to NAK, check that the PIPEnCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

TRCLR bit (Transaction Counter Clear)

When the TRCLR bit is set to 1, the USBFS clears the value of the transaction counter associated with the selected pipe and then sets the TRCLR bit to 0.

TRENB bit (Transaction Counter Enable)

The TRENB bit enables or disables the transaction counter.

For receiving pipes, setting the TRENB bit to 1 after setting the total number of the packets to be received in the PIPEnTRN.TRNCNT[15:0] bits through the software allows the USBFS to control hardware as follows on having received the number of packets equal to the TRNCNT[15:0] setting.

- When the PIPECFG.SHTNAK bit is 1, the USBFS changes the PID bits to NAK for the associated pipe on having received the number of packets equal to the TRNCNT[15:0] setting.
- When the PIPECFG.BFRE bit is 1, the USBFS asserts the BRDY interrupt on having received the number of packets equal to the TRNCNT[15:0] setting and then reading the last received data.

For transmitting pipes, set the TRENB bit to 0.

When the transaction counter is not used, set this bit to 0. When the transaction counter is used, set the TRNCNT[15:0] bits before setting this bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.

32.2.34 PIPEn Transaction Counter Register (PIPEnTRN) (n = 1 to 5)

Address(es): USBFS.PIPE1TRN 4009 0092h, USBFS.PIPE2TRN 4009 0096h, USBFS.PIPE3TRN 4009 009Ah, USBFS.PIPE4TRN 4009 009Eh, USBFS.PIPE5TRN 4009 00A2h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TRNCNT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	TRNCNT[15:0]	Transaction Counter	• When written to: Specifies the total packets (number of transactions) to be received by the selected pipe. • When read from: When PIPEnTRE.TRENB is 0, indicates the specified number of transactions. When PIPEnTRE.TRENB is 1, indicates the current transactions count.	R/W

The PIPEnTRN registers retain their settings during a USB bus reset.

TRNCNT[15:0] bits (Transaction Counter)

The USBFS increments the value of the TRNCNT[15:0] bits by one when all of the following conditions are satisfied on receiving the packet:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value ≠ current counter value + 1) on receiving the packet
- The payload of the received packet agrees with the PIPEMAXP.MXPS[8:0] setting.

The USBFS clears the value of the TRNCNT[15:0] bits to 0 when any of the following conditions are satisfied:

All of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value = current counter value + 1) on receiving the packet
- The payload of the received packet agrees with the PIPEMAXP.MXPS[8:0] setting.

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The USBFS received a short packet.

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The PIPEnTRE.TRCLR bit was set to 1 by the software.

For transmitting pipes, set the TRNCNT[15:0] bits to 0. When the transaction counter is not used, set the TRNCNT[15:0] bits to 0.

Setting the number of transactions to be transferred to the TRNCNT[15:0] bits is only enabled when the PIPEnTRE.TRENB bit is 0. To set the number of transactions to be transferred, set the TRCLR bit to 1 to clear the current counter value before setting the PIPEnTRE.TRENB bit to 1.

32.2.35 Device Address n Configuration Register (DEVADDn) (n = 0 to 5)

Address(es): USBFS.DEVADD0 4009 00D0h, USBFS.DEVADD1 4009 00D2h, USBFS.DEVADD2 4009 00D4h, USBFS.DEVADD3 4009 00D6h, USBFS.DEVADD4 4009 00D8h, USBFS.DEVADD5 4009 00DAh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	USBSPD[1:0]		—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7, b6	USBSPD[1:0]	Transfer Speed of Communication Target Device	b7 b6 0 0: Do not use DEVADDn 0 1: Low-speed 1 0: Full-speed 1 1: Setting prohibited.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The DEVADDn register specifies the transfer speed of the peripheral device that is the communication target for pipes 0 to 9.

In host controller mode, set all DEVADDn bits before starting communication to any pipes. Only change the bits in DEVADDn when no valid pipes are using the bit settings. A valid pipe is defined as one that satisfies both of the following conditions:

- DEVADDn is selected in the DEVSEL[3:0] bits
- The PID[1:0] bits are set to BUF for the selected pipe, or the selected pipe is the DCP with the DCPCTR.SUREQ bit set to 1.

In device controller mode, set all bits in this register to 0.

USBSPD[1:0] bits (Transfer Speed of Communication Target Device)

The USBSPD[1:0] bits specify the USB transfer speed of the target peripheral device. Set these bits to 10b when a full-speed device is connected through the hub. In host controller mode, the USBFS generates packets based on the USBSPD[1:0] setting. In device controller mode, set these bits to 00b.

32.2.36 PHY Cross Point Adjustment Register (PHYSLEW)

Address(es): USBFS.PHYSLEW 4009 00F0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	x	0	x	x	0	0	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	SLEWF01	SLEWF00	SLEWR01	SLEWR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	SLEWR00	Driver Cross Point Adjustment 00	0: Reserved 1: Host or device controller mode.	R/W
b1	SLEWR01	Driver Cross Point Adjustment 01	0: Host or device controller mode 1: Reserved.	R/W
b2	SLEWF00	Driver Cross Point Adjustment 00	0: Reserved 1: Host or device controller mode.	R/W

Bit	Symbol	Bit name	Description	R/W
b3	SLEWF01	Driver Cross Point Adjustment 01	0: Host or device controller mode 1: Reserved.	R/W
b15 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b17, b16	—	Reserved	The read value is undefined. The write value should be 0.	R/W
b19, b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b21, b20	—	Reserved	The read value is undefined. The write value should be 0.	R/W
b22	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b23	—	Reserved	The read value is undefined. The write value should be 0.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PHYSLEW register adjusts the cross point of the driver. In both host and device controller modes, set this register before operating the controller.

32.2.37 Deep Software Standby USB Transceiver Control/Pin Monitor Register (DPUSR0R)

Address(es): USBFS.DPUSR0R 4009 0400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	x	0	x	x	0	0	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	FIXPHY0	DRPD0	—	RPUE0	SRPC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	SRPC0	USB Single-Ended Receiver Control	0: Disable input through DP and DM inputs 1: Enable input through DP and DM inputs.	R/W
b1	RPUE0*1	DP Pull-Up Resistor Control	0: Disable DP pull-up resistor 1: Enable DP pull-up resistor.	R/W
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b3	DRPD0*1	D+/D- Pull-Down Resistor Control	0: Disable DP/DM pull-down resistor 1: Enable DP/DM pull-down resistor.	R/W
b4	FIXPHY0	USB Transceiver Output Fix	0: Fix outputs in Normal mode and on return from Deep Software Standby mode 1: Fix outputs on transition to Deep Software Standby mode.	R/W
b15 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	DP0	USB D+ Input	Indicates D+ input signal on the USBFS side.	R
b17	DM0	USB D- Input	Indicates D- input signal on the USBFS side.	R
b19, b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b20	DOVCA0	USB OVRCURA Input	Indicates OVRCURA input signal on the USBFS side.	R
b21	DOVCB0	USB OVRCURB Input	Indicates OVRCURB input signal on the USBFS side.	R
b22	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b23	DVBSTS0	USB VBUS Input	Indicates VBUS input signal on the USBFS side.	R
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Use this bit during operation in Deep Software Standby mode. For details, see section 32.3.1.5, Release from Deep Software Standby Mode Because of USB Suspend/Resume Interrupts.

SRPC0 bit (USB Single-Ended Receiver Control)

The SRPC0 bit controls the D+ and D- inputs of the USB transceiver. This bit is only valid when the FIXPHY0 bit is 1.

FIXPHY0 bit (USB Transceiver Output Fix)

The FIXPHY0 bit keeps the outputs of the USB transceiver disabled.

32.2.38 Deep Software Standby USB Suspend/Resume Interrupt Register (DPUSR1R)

Address(es): USBFS.DPUSR1R 4009 0404h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit name	Description	R/W
b0	DPINTE0	USB DP Interrupt Enable/Clear	0: Disable recovery from Deep Software Standby mode 1: Enable recovery from Deep Software Standby mode.	R/W
b1	DMINTE0	USB DM Interrupt Enable/Clear	0: Disable recovery from Deep Software Standby mode 1: Enable recovery from Deep Software Standby mode.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	DOVRCRAE0	USB OVRCURA Interrupt Enable/Clear	0: Disable recovery from Deep Software Standby mode 1: Enable recovery from Deep Software Standby mode.	R/W
b5	DOVRCRBE0	USB OVRCURB Interrupt Enable/Clear	0: Disable recovery from Deep Software Standby mode 1: Enable recovery from Deep Software Standby mode.	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	DVBSE0	USB VBUS Interrupt Enable/Clear	0: Disable recovery from Deep Software Standby mode 1: Enable recovery from Deep Software Standby mode.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	DPINT0	USB DP Interrupt Source Recovery	0: System has not recovered from Deep Software Standby mode 1: System recovered from Deep Software Standby mode.	R
b17	DMINT0	USB DM Interrupt Source Recovery	0: System has not recovered from Deep Software Standby mode 1: System recovered from Deep Software Standby mode.	R
b19, b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b20	DOVRCRA0	USB OVRCURA Interrupt Source Recovery	0: System has not recovered from Deep Software Standby mode 1: System recovered from Deep Software Standby mode.	R
b21	DOVRCRB0	USB OVRCURB Interrupt Source Recovery	0: System has not recovered from Deep Software Standby mode 1: System recovered from Deep Software Standby mode.	R
b22	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b23	DVBINT0	USB VBUS Interrupt Source Recovery	0: System has not recovered from Deep Software Standby mode 1: System recovered from Deep Software Standby mode.	R
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

DPINTE0 bit (USB DP Interrupt Enable/Clear)

The DPINET0 bit enables or disables triggering of recovery from Deep Software Standby mode by the DP input of the USBFS. Writing 0 to this bit while the DPINT0 bit is 1 sets the DPINT0 bit to 0.

DMINTE0 bit (USB DM Interrupt Enable/Clear)

The DMINTE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the DM input of the USBFS. Writing 0 to this bit while the DMINT0 bit is 1 clears the DMINTE0 bit to 0.

DOVRCRAE0 bit (USB OVRCURA Interrupt Enable/Clear)

The DOVRCRAE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the OVRCURA input of the USBFS. Writing 0 to this bit while the DOVRCRA0 bit is 1 clears the DOVRCRAE0 bit to 0.

DOVRCRBE0 bit (USB OVRCURB Interrupt Enable/Clear)

The DOVRCRBE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the OVRCURB input of the USBFS. Writing 0 to this bit while the DOVRCRB0 bit is 1 clears the DOVRCRB0 bit to 0.

DVBSE0 bit (USB VBUS Interrupt Enable/Clear)

The DVBSE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the VBUS input of the USBFS. Writing 0 to this bit while the DVBINT0 bit is 1 clears the DVBINT0 bit to 0.

DPINT0 bit (USB DP Interrupt Source Recovery)

The DPINT0 bit indicates that the system has returned from Deep Software Standby mode because of the DP input of the USBFS. This recovery is only enabled when the DPINTE0 bit is 1. Writing 0 to the DPINTE0 bit while this bit is 1 clears this bit to 0.

DMINT0 bit (USB DM Interrupt Source Recovery)

The DMINT0 bit indicates that the system has returned from Deep Software Standby mode because of the DM input of the USBFS. This recovery is only enabled when the DMINTE0 bit is 1. Writing 0 to the DPINTE0 bit while this bit is 1 clears this bit to 0.

DOVRCRA0 bit (USB OVRCURA Interrupt Source Recovery)

The DOVRCRA0 bit indicates that the system has returned from Deep Software Standby mode because of the OVRCURA input of the USBFS. This recovery is only enabled when the DOVRCRAE0 bit is 1. Writing 0 to the DOVRCRAE0 bit while this bit is 1 clears this bit to 0.

DOVRCRB0 bit (USB OVRCURB Interrupt Source Recovery)

The DOVRCRB0 bit indicates that the system has returned from Deep Software Standby mode because of the OVRCURB input of the USBFS. This recovery is only enabled when the DOVRCRBE0 bit is 1. Writing 0 to the DOVRCRBE0 bit while this bit is 1 clears this bit to 0.

DVBINT0 bit (USB VBUS Interrupt Source Recovery)

The DVBINT0 bit indicates that the system has returned from Deep Software Standby mode because of the VBUS input of the USBFS. This recovery is only enabled when the DVBSE0 bit is 1. Writing 0 to the DVBSE0 bit while this bit is 1 clears this bit to 0.

32.3 Operation

32.3.1 System Control

This section describes register settings required for initializing the USBFS and controlling power consumption.

32.3.1.1 Setting Data to the USBFS-Related Registers

Setting the SYSCFG.USBE bit to 1 after starting the clock supply (SYSCFG.SCKE bit = 1) enables and starts USBFS operation.

32.3.1.2 Selecting the Controller Function

The USBFS can operate as either a host or device controller.

Use the SYSCFG.DCFM bit to select one of these USBFS functions. The DCFM bit must be changed in the initial settings immediately after a reset or in the D+ pull-up-disabled state (SYSCFG.DPRPU bit = 0) and D+ and D- pull-down-disabled state (SYSCFG.DRPD bit = 0).

32.3.1.3 Controlling the USB Data Bus Using Resistors

The USBFS provides pull-up and pull-down resistors for the D+ and D- lines. Pull these lines up or down by setting the SYSCFG.DPRPU and DRPD bits.

In device controller mode, confirm that connection to the USB host is made, and then set the SYSCFG.DPRPU bit to 1 and pull up the D+ line (in full-speed communication).

When the SYSCFG.DPRPU bit is set to 0 during communication with a PC, the USBFS disables the pull-up resistor of the USB data line, thereby notifying the USB host of disconnection.

In host controller mode, set the SYSCFG.DRPD bit to 1 to pull down the D+ and D- lines.

Table 32.12 USB data bus resistor control

SYSCFG register settings		USB data bus control		
DRPD bit	**DPRPU bit**	**D-**	**D+**	**Function**
0	0	Open	Open	When resistors not used
0	1	Open	Pull-up	When operating as a device controller at full-speed
1	0	Pull-down	Pull-down	When operating as a host controller
1	1	—	—	Setting prohibited

32.3.1.4 Example External Connection Circuits

Figure 32.2 shows an example OTG connection in the self-powered system. The USBFS controls the pull-up resistor of the D+ line and the pull-down resistor of D+ and D- lines. Select pull-up and pull-down for the lines in the SYSCFG.DPRPU and SYSCFG.DRPD bits. In device controller mode, the pull-up resistor of USB data line is disabled if SYSCFG.DPRPU bit is set to 0 while communicating with the USB host. The USBFS can use this to notify the USB host of a device disconnect.

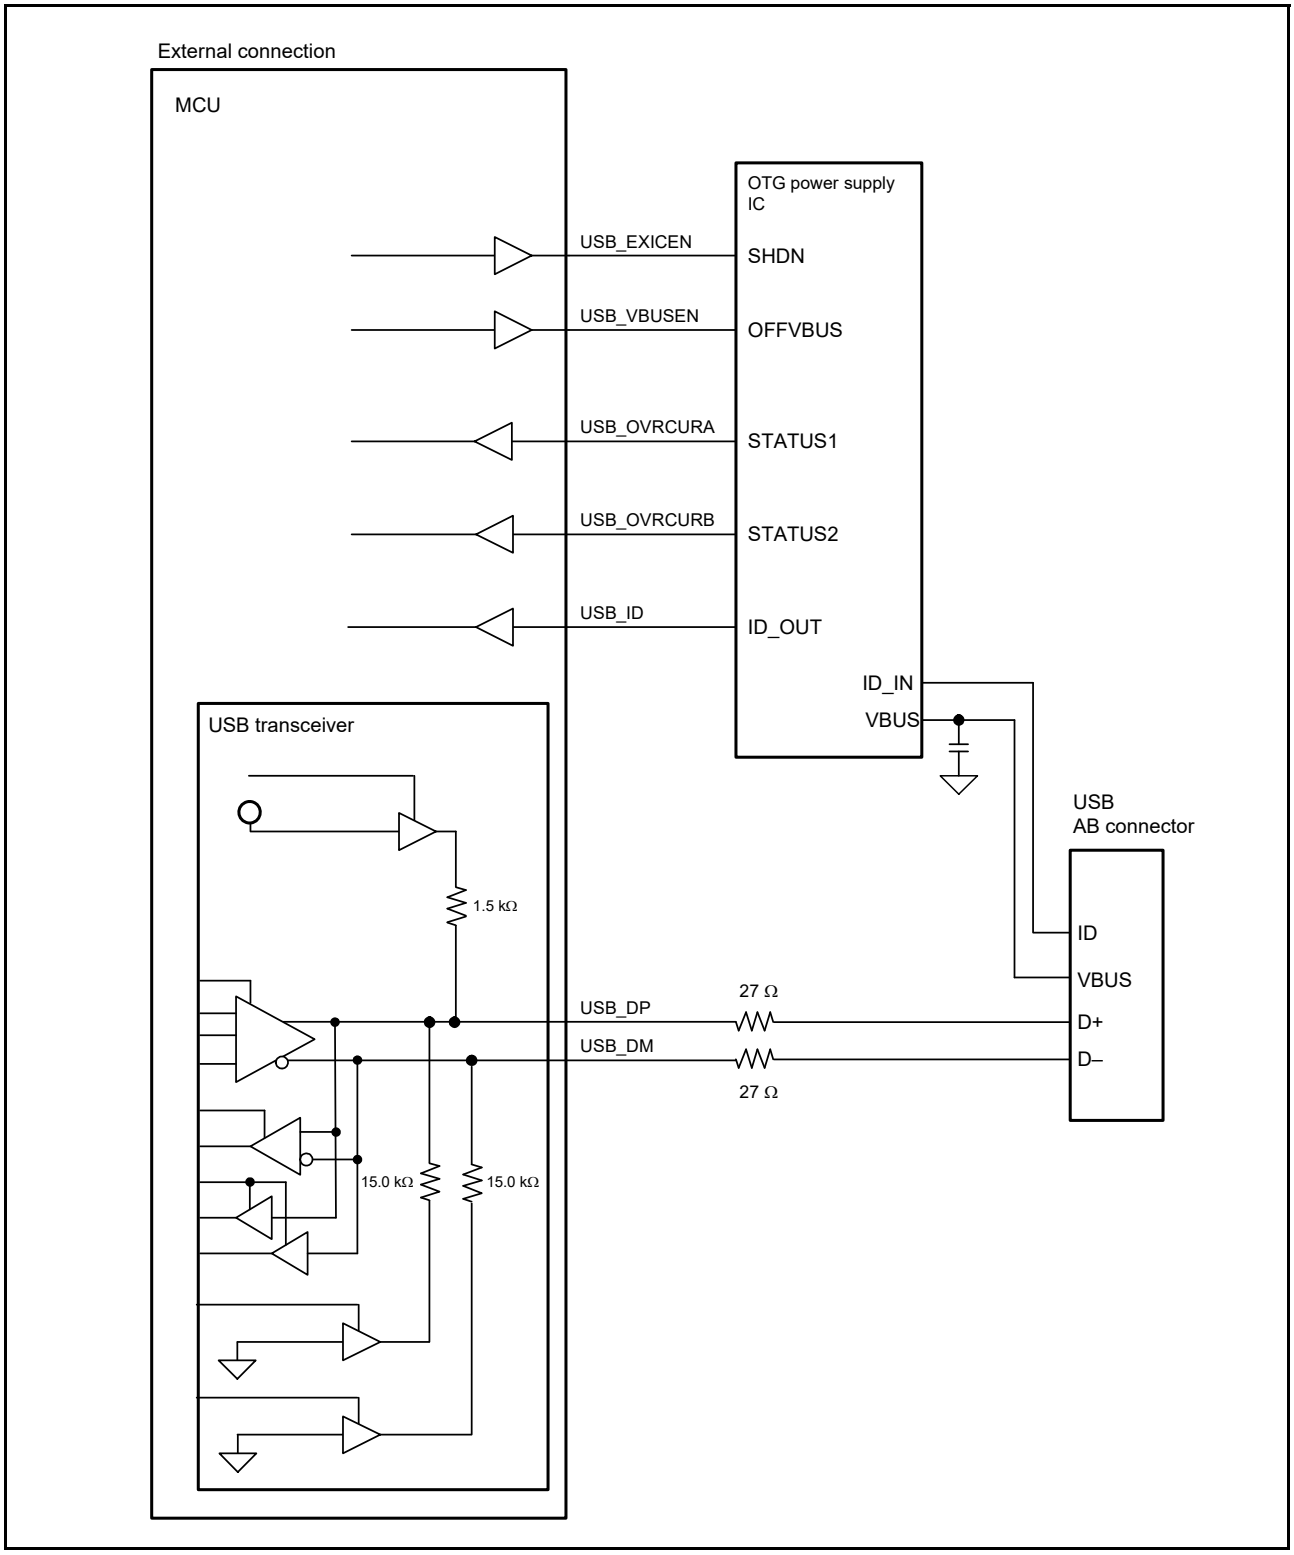

Figure 32.2 Example OTG connection in a self-powered system

Figure 32.3 shows an example device connection in a self-powered system.

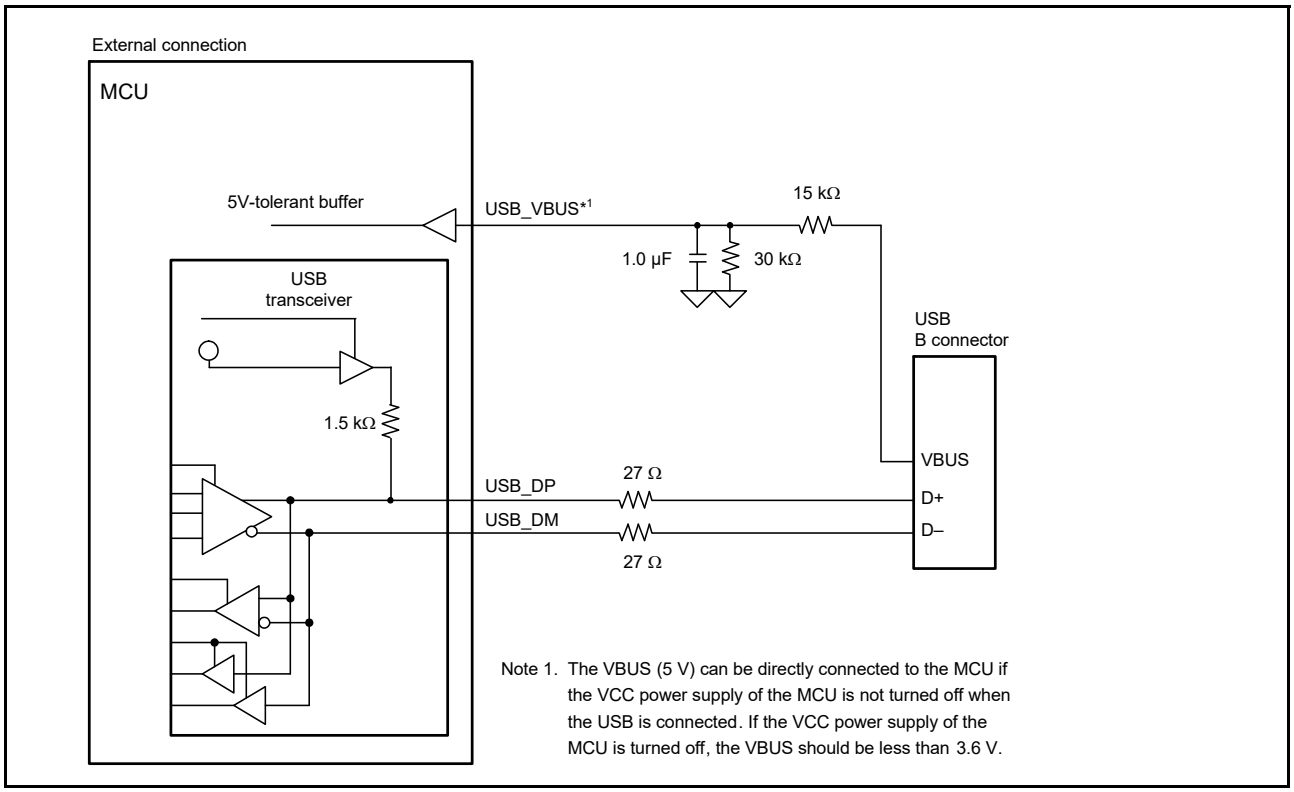

Figure 32.3 Example device connection in a self-powered system

Figure 32.4 shows an example host connection.

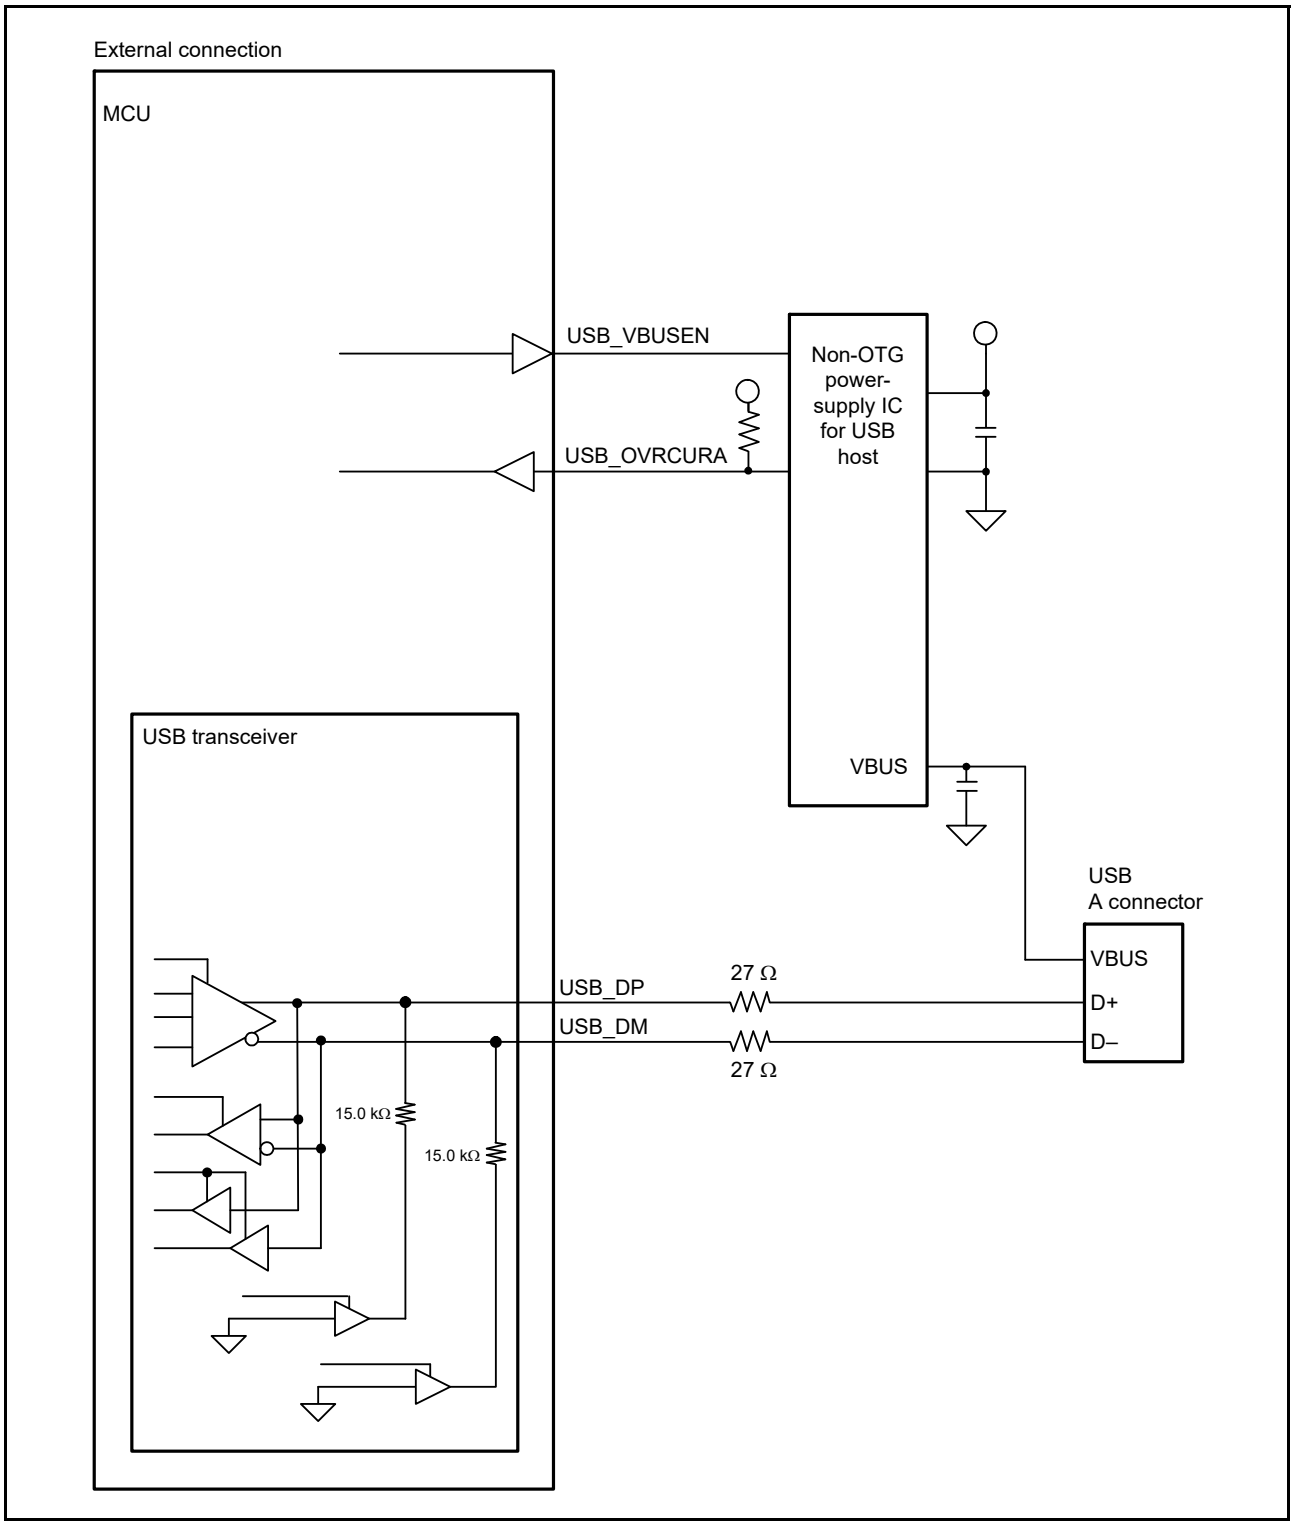

Figure 32.4 Example host connection

Figure 32.5 shows an example device connection in a bus-powered system.

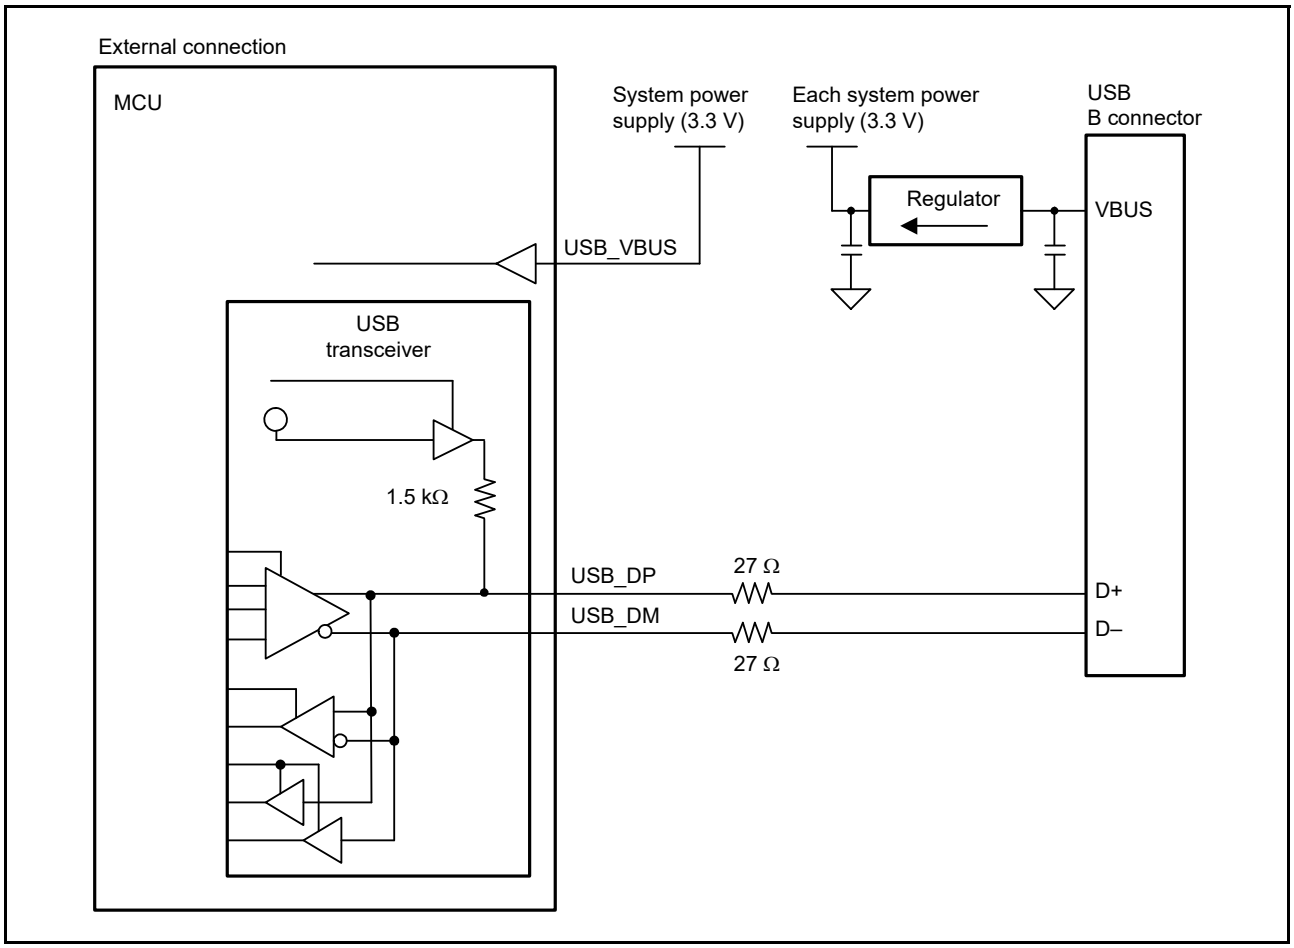

Figure 32.5 Example device connection in a bus-powered state

The examples of external circuits given in this section are simplified circuits, and their operation in every system is not guaranteed.

32.3.1.5 Release from Deep Software Standby Mode Because of USB Suspend/Resume Interrupts

Deep Software Standby mode can be canceled by a USB suspend/resume interrupt. USB suspend/resume interrupts are detected by the USB resume detecting unit, which controls and monitors the USB I/O pins to detect the interrupts.

Figure 32.6 shows a schematic diagram of the connection between the USB resume detecting unit and the USB I/O pins.

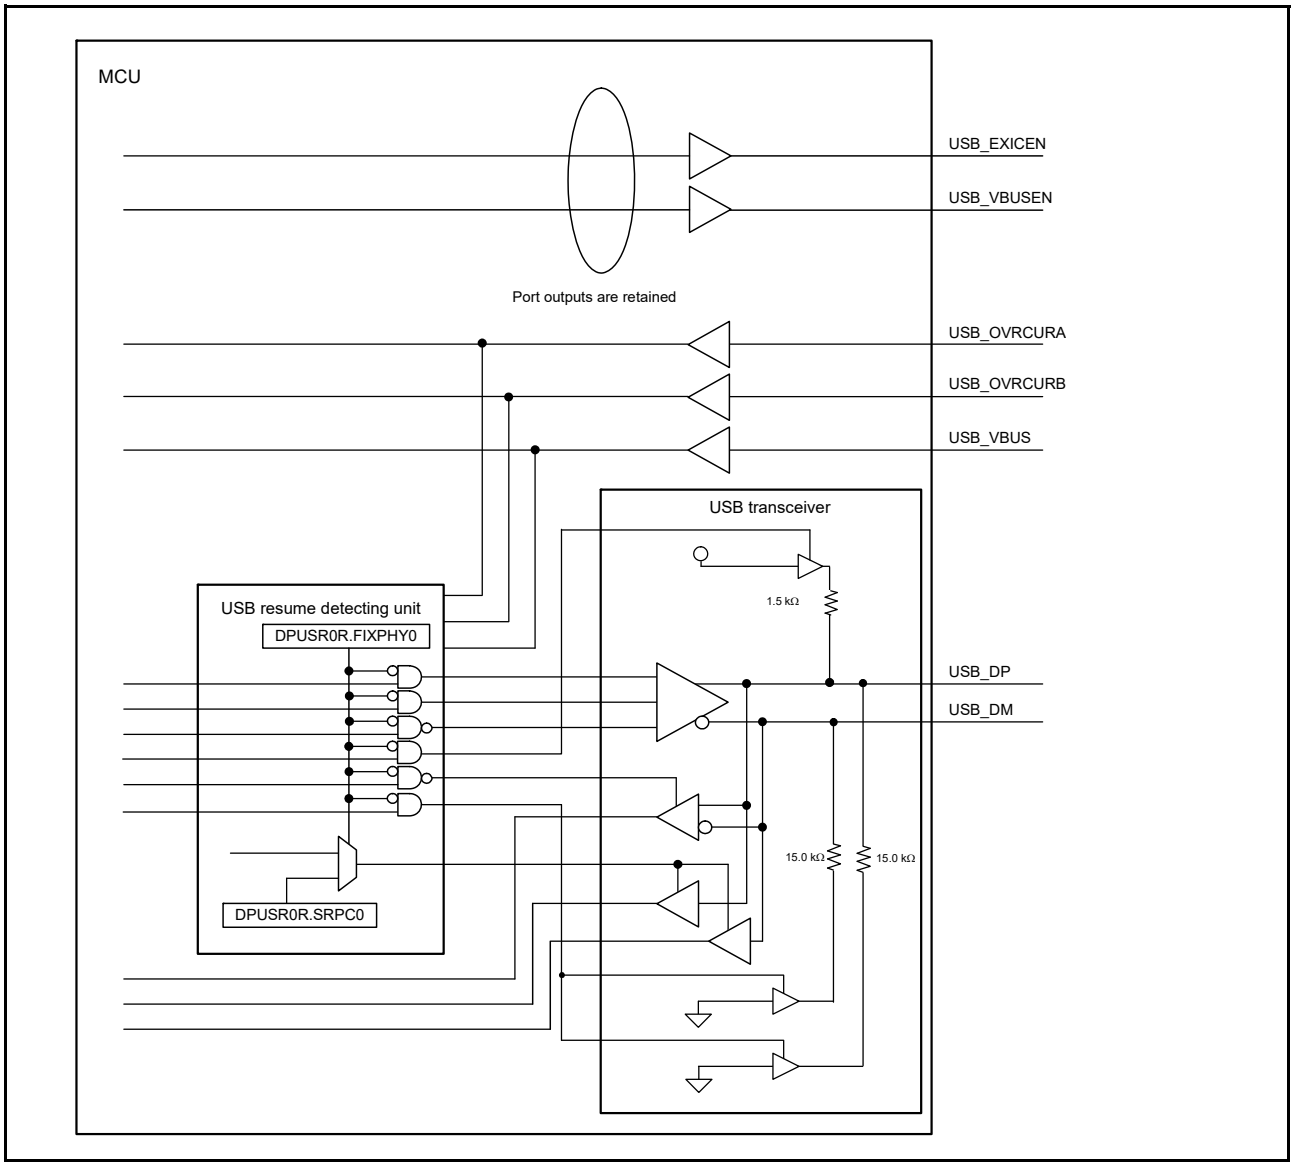

Figure 32.6 Connection between the USB resume detecting unit and the USB I/O pins

Table 32.13 shows the USB suspend and resume interrupt sources and their associated I/O pins.

Table 32.13 USB suspend and resume interrupt sources and their associated I/O pins

USB operating mode	Source	Pin name
Device, OTG	Resume	USB_DP
Host, OTG	Attach or detach	USB_DP, USB_DM
Device	Attach or detach	USB_VBUS
Host	Overcurrent detection	USB_OVRCURA
OTG	Overcurrent detection	USB_OVRCURA, USB_OVRCURB

Figure 32.7 shows the flow for setting the USBFS when entering Deep Software Standby mode from either host or device controller mode. Figure 32.8 shows the flow for setting the USBFS when canceling Deep Software Standby mode from host controller mode. Figure 32.9 shows the flow for setting the USBFS when canceling Deep Software Standby mode from device controller mode.

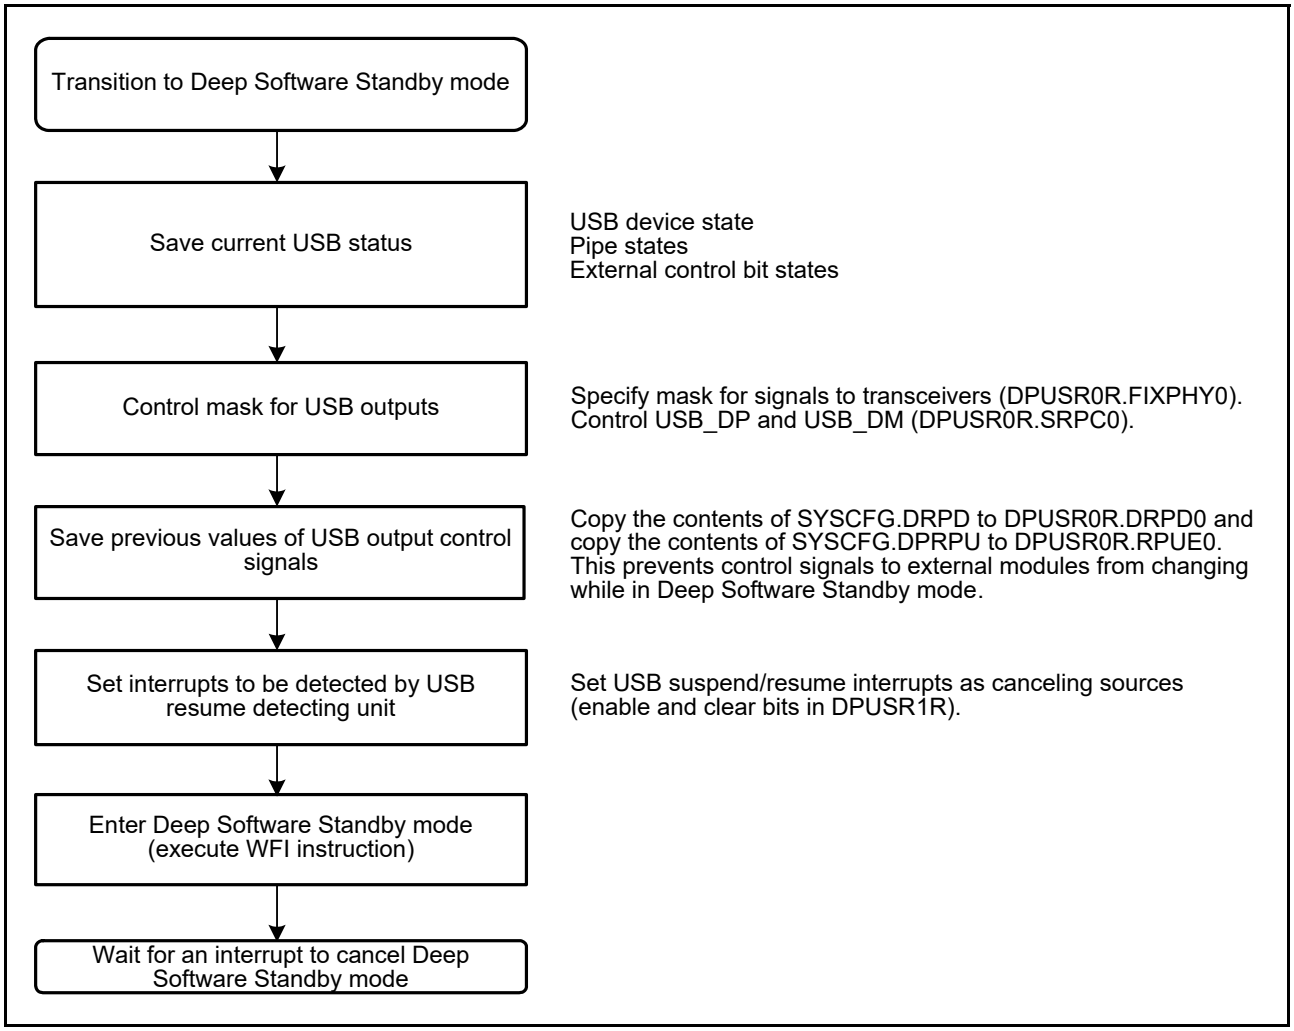

Figure 32.7 USBFS setup flow for transition to Deep Software Standby mode as host or device controller

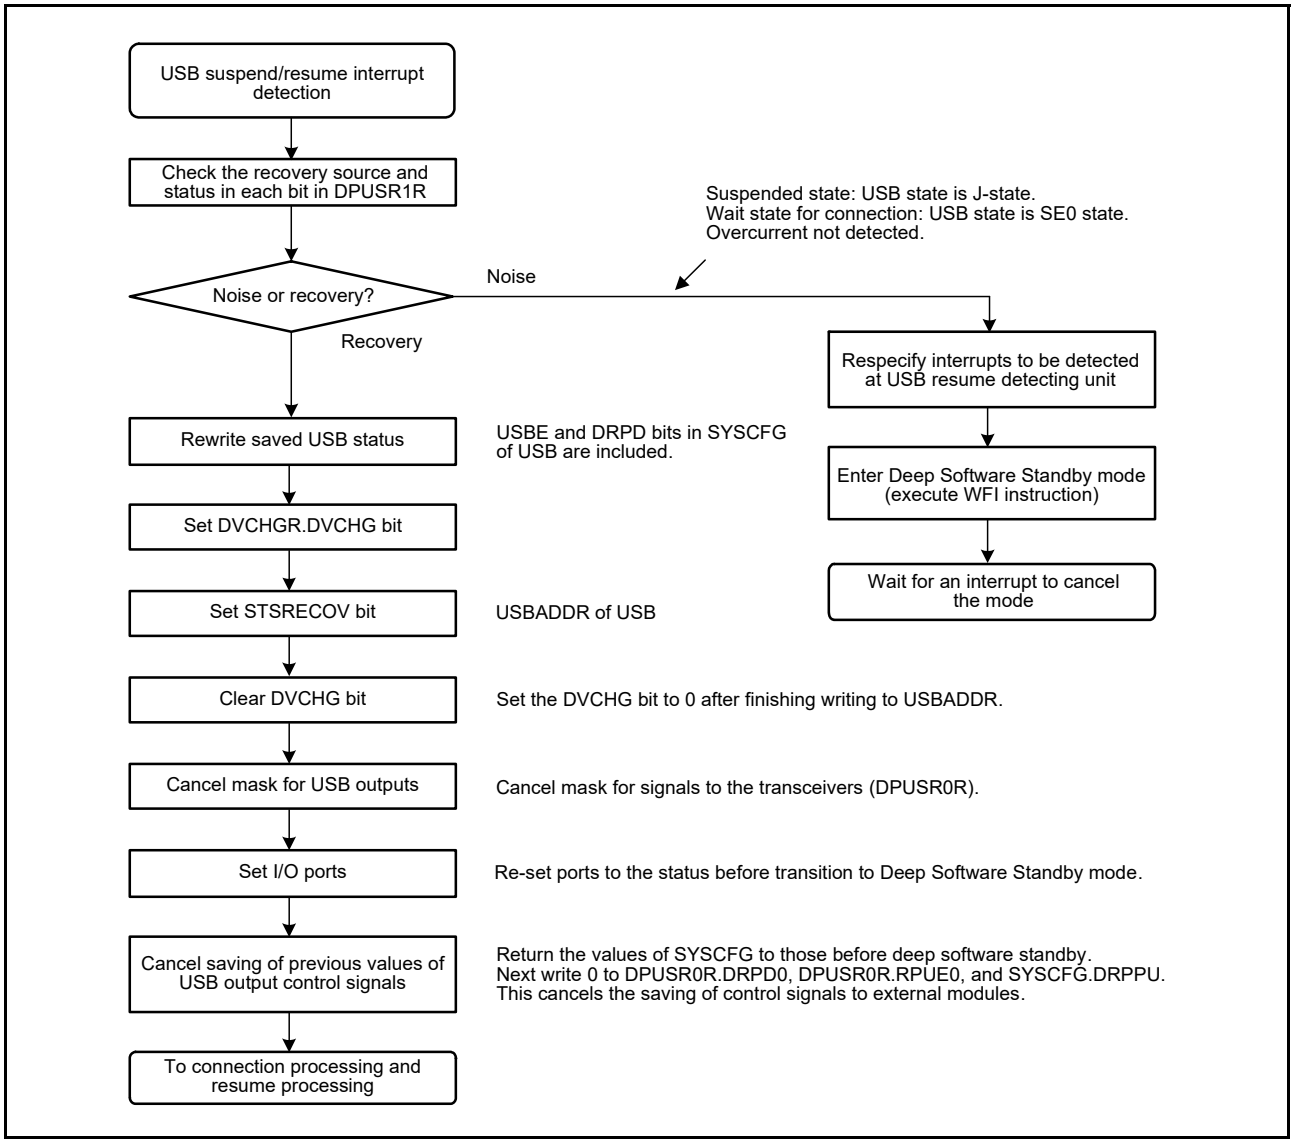

Figure 32.8 USBFS setup flow for canceling Deep Software Standby mode as host controller

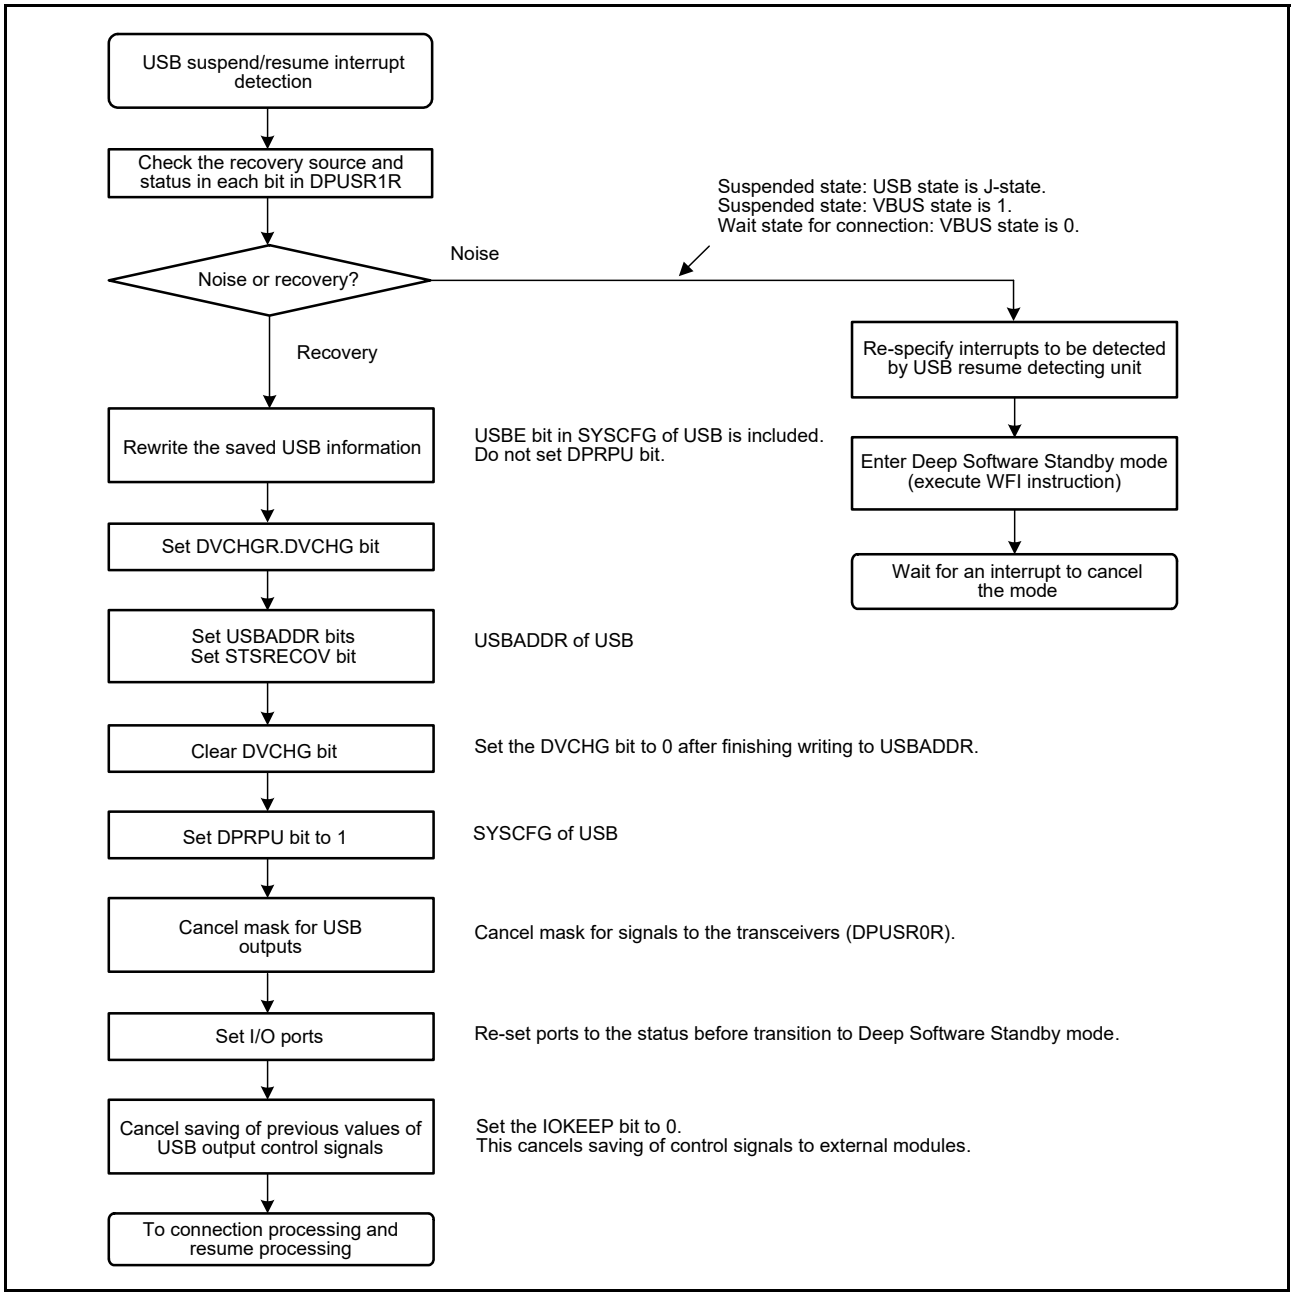

Figure 32.9 USBFS setup flow for canceling Deep Software Standby mode as device controller

32.3.2 Interrupts

Table 32.14 lists the interrupt sources in the USBFS. When an interrupt generation condition is satisfied and the interrupt output is enabled using the associated interrupt enable register, a USBFS interrupt request is issued to the Interrupt Controller Unit (ICU) and an USBFS interrupt is generated.

Table 32.14 Interrupt sources (1 of 2)

Bit to be set to 1	Name	Interrupt source	Applicable controller function	Status flag
VBINT	VBUS interrupt	• A change in the state of the USB_VBUS input pin was detected (low to high or high to low)	Host or device*1	INTSTS0. VBSTS
RESM	Resume interrupt	• A change in the state of the USB bus was detected in the Suspend state (J-state to K-state or J-state to SE0)	Device	—

Table 32.14 Interrupt sources (2 of 2)

Bit to be set to 1	Name	Interrupt source	Applicable controller function	Status flag
SOFR	Frame number update interrupt	In host controller mode: • An SOF packet with a different frame number was transmitted In device controller mode: • An SOF packet with a different frame number was received	Host or device	—
DVST	Device state transition interrupt	• One of the following device state transitions was detected: - USB bus reset was detected - Suspend state was detected - SET_ADDRESS request was received - SET_CONFIGURATION request was received	Device	INTSTS0. DVSQ[2:0]
CTRT	Control transfer stage transition interrupt	• A control transfer stage transition was detected because of one of the following: - Setup stage completed - Control write transfer status stage transition occurred - Control read transfer status stage transition occurred - Control transfer completed - Control transfer sequence error occurred	Device	INTSTS0. CTSQ[2:0]
BEMP	Buffer empty interrupt	• The buffer is empty after all FIFO buffer data was transmitted • A packet larger than the maximum packet size was received	Host or device	BEMPSTS. PIPEnBEMP
NRDY	Buffer not ready interrupt	In host controller mode: • A STALL response was received from the peripheral device in response to the issued token • The response from the peripheral device in response to the issued token was not received successfully (no response three times consecutively or packet reception error three times consecutively) • An overrun or underrun error occurred during isochronous transfer In device controller mode: • NAK was returned for an IN or OUT token while the PID[1:0] bits were set to 01b (BUF) • A CRC error or bit stuffing error occurred during data reception in isochronous transfer • An overrun or underrun occurred during data reception in isochronous transfer	Host or device	NRDYSTS. PIPEnNRDY
BRDY	Buffer ready interrupt	• The buffer is ready (readable or writable state)	Host or device	BRDYSTS. PIPEnBRDY
OVRCR	Overcurrent input change interrupt	• USB_OVRCURA or USB_OVRCURB input pin state change was detected (low to high or high to low)	Host	INTSTS1. OVRCR
BCHG	Bus change interrupt	• USB bus state change was detected	Host or device	SYSSTS0. LNST[1:0]
DTCH	Disconnect detection during full-speed operation	• Peripheral device disconnect was detected in full-speed operation	Host	DVSTCTR0. RHST[2:0]
ATTCH	Device connect detection interrupt	• J-state or K-state was detected on the USB bus for 2.5 µs continuously This interrupt can be used to check whether peripheral devices are connected.	Host	—
EOFERR	EOF error detection interrupt	• An EOF error was detected for a peripheral device	Host	—
SACK	Setup normal interrupt	• A setup transaction normal response (ACK) was received	Host	—
SIGN	Setup error interrupt	• A setup transaction error (no response or ACK packet corruption) was detected three consecutive times	Host	—

Note 1. Although this interrupt can be generated in host controller mode, it is not usually used in this mode.

Figure 32.10 shows the circuits related to the USBFS interrupts.

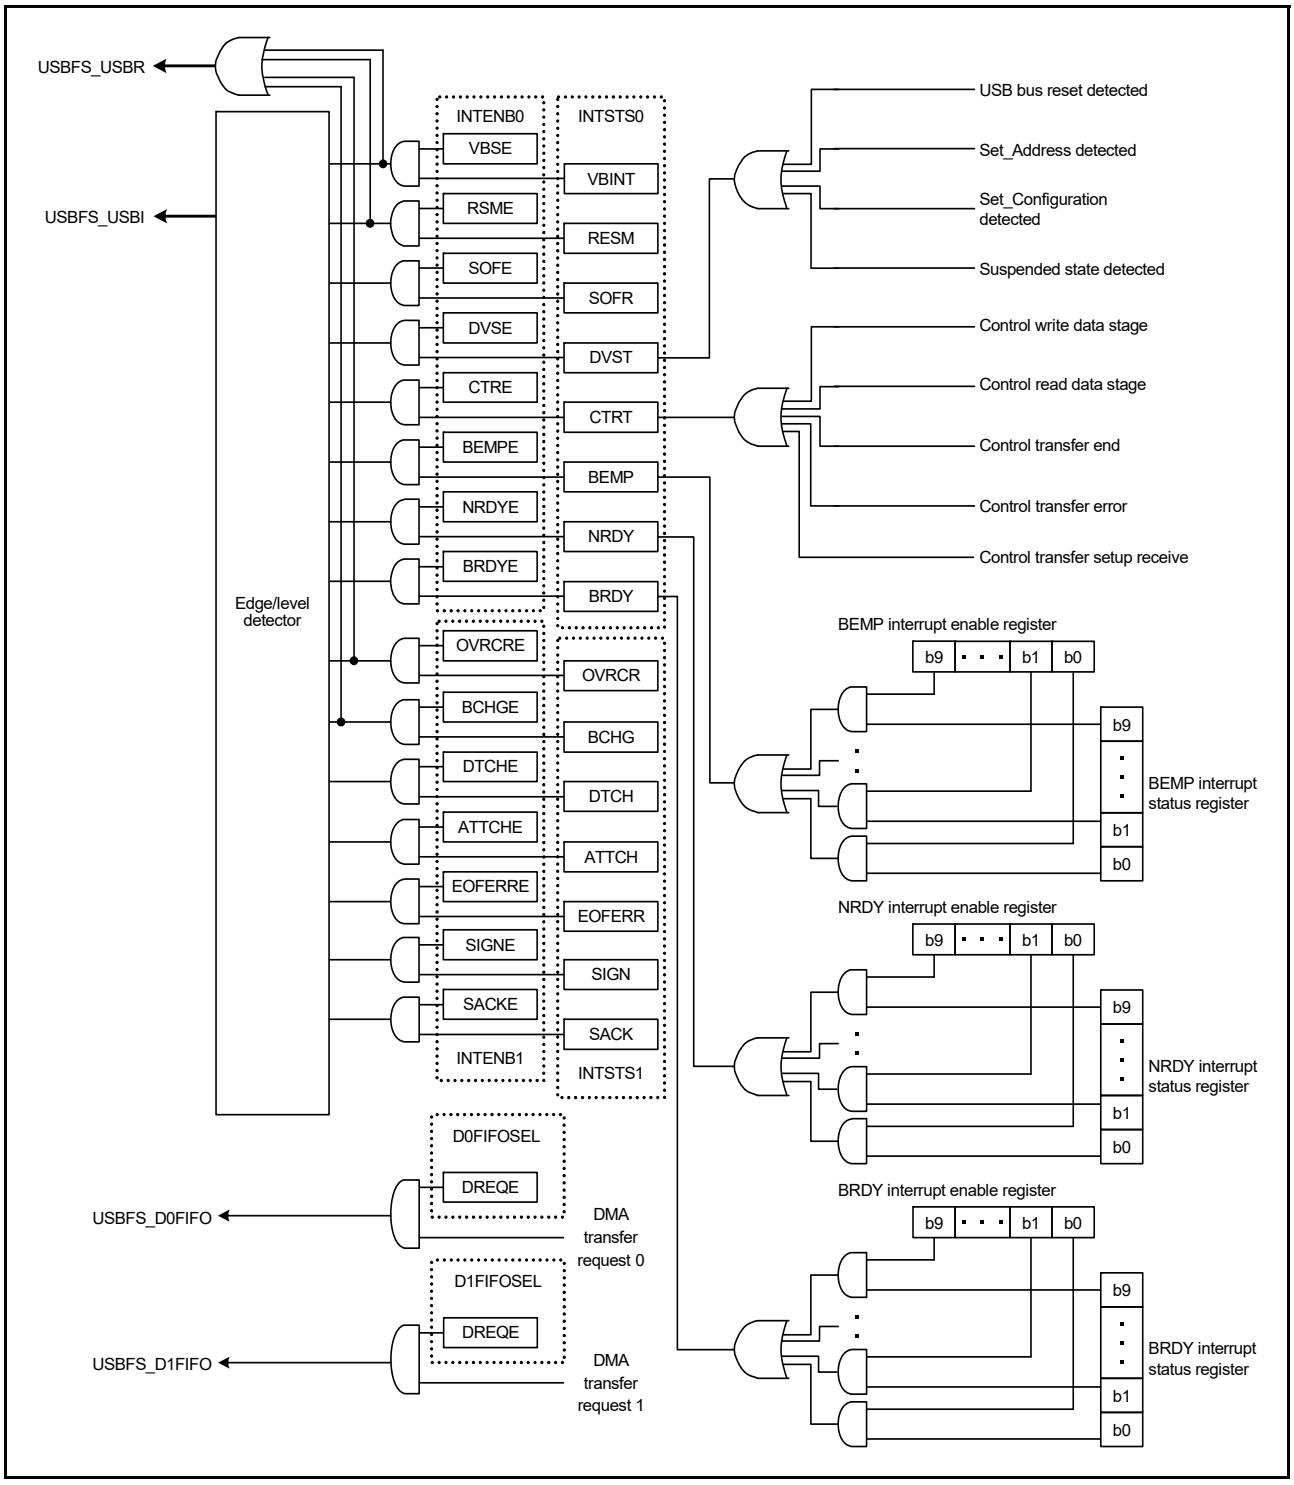

Figure 32.10 USBFS interrupt-related circuits

Table 32.15 shows the interrupts generated by the USBFS.

Table 32.15 USBFS interrupts

Interrupt name	Interrupt status flag	DTC activation	DMAC activation	Priority
USBFS_D0FIFO	DMA transfer request 0	Possible	Possible	High
USBFS_D1FIFO	DMA transfer request 1	Possible	Possible	
USBFS_USBI	VBUS interrupt, resume interrupt, frame number update interrupt, device state transition interrupt, control transfer stage transition interrupt, buffer empty interrupt, buffer not ready interrupt, buffer ready interrupt, overcurrent input change interrupt, bus change interrupt, disconnect detection interrupt during full-speed operation, device connect detection interrupt, EOF error detection interrupt, normal setup operation interrupt, and setup error interrupt	Not possible	Not possible	
USBFS_USBR	VBUS interrupt, resume interrupt, overcurrent input change interrupt, and bus change interrupt	Not possible	Not possible	—

Low

32.3.3 Interrupt Descriptions

32.3.3.1 BRDY Interrupt

The BRDY interrupt is generated in both host and device controller modes. This section describes the conditions in which the USBFS sets the associated bit in BRDYSTS to 1. Under these conditions, the USBFS generates a BRDY interrupt if the software has set 1 to the bit in BRDYENB associated with the given pipe and 1 to the INTENB0.BRDYE bit.

The conditions for generating and clearing the BRDY interrupt depend on the SOFCFG.BRDYM and PIPECFG.BFRE settings for each pipe as follows:

(1) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.

On any of the following conditions, the USBFS generates an internal BRDY interrupt request trigger and sets 1 to the BRDYSTS.PIPEnBRDY bit associated with the selected pipe.

(a) For transmitting pipes

- When the DIR bit is changed from 0 to 1 by the software.
- When packet transmission is complete for a pipe while write-access from the CPU to the FIFO buffer for the pipe is disabled (when the BSTS bit is read as 0).
- When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode.
- No request trigger is generated until completion of writing data to the currently-written FIFO buffer even if transmission to the other FIFO buffer is complete.
- When the hardware flushes the buffer of the pipe for isochronous transfers.
- When 1 is written to the PIPEnCTR.ACLRM bit, which causes the FIFO buffer to transition from the write-disabled to write-enabled state.

No request trigger is generated for the DCP, that is, during data transmission for control transfers.

(b) For receiving pipes

- When packet reception is successfully complete, enabling the FIFO buffer to be read while read-access from the CPU to the FIFO buffer for the given pipe is disabled (when the BSTS bit is read as 0). No request trigger is generated for transactions in which a DATA-PID mismatch has occurred.
- When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode. No request trigger is generated until completion of reading data from the currently-read FIFO buffer, even if reception by the other FIFO buffer is complete.

In device controller mode, the BRDY interrupt is not generated in the status stage of control transfers. The PIPEnBRDY interrupt status of the selected pipe can be set to 0 by writing 0 to the associated PIPEnBRDY bit through the software. In this case, the other PIPEnBRDY bit should be set to 1.

Clear the BRDY status before accessing the FIFO buffer.

(2) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 1

With these settings, the USBFS generates a BRDY interrupt on completion of reading all data for a single transfer using the receiving pipe, and sets 1 to the bit in BRDYSTS associated with the pipe.

On any of the following conditions, the USBFS determines that the last data for a single transfer was received.

- When a short packet including a zero-length packet is received
- When the PIPEn transaction counter register (PIPEnTRN) is used and the number of packets specified in the PIPEnTRN.TRNCNT[15:0] bits are completely received.

When the data is completely read after any of these conditions is satisfied, the USBFS determines that all data for a single transfer is completely read.

When a zero-length packet is received while the FIFO buffer is empty, the USBFS determines that all data for a single transfer is completely read when the FRDY bit in the FIFO port control register is 1 and the DTLN[8:0] bits are 0. In this case, to start the next transfer, write 1 to the BCLR bit in the associated port control register through the software. With these settings, the USBFS does not detect a BRDY interrupt for the transmitting pipe.

The PIPEnBRDY interrupt status of a pipe can be set to 0 by writing 0 to the associated BRDYSTS.PIPEnBRDY bit through the software. In this case, the other PIPEnBRDY bit should be set to 1.

In this mode, do not change the PIPECFG.BFRE bit setting until all data for a single transfer is processed. When it is necessary to change the PIPECFG.BFRE bit before completion of processing, all FIFO buffers for the pipe must be cleared using the PIPEnCTR.ACLRM bit.

(3) When SOFCFG.BRDYM = 1 and PIPECFG.BFRE = 0

With these settings, the BRDYSTS.PIPEnBRDY values are linked to the BSTS bit setting for each pipe. In other words, the BRDY interrupt status bits (PIPEnBRDY) are set to 1 or 0 by the USB depending on the FIFO buffer status.

(a) For transmitting pipes

The BRDY interrupt status bits are set to 1 when the FIFO buffer is ready for write access, and are set to 0 when it is not ready. The BRDY interrupt is not generated for the DCP in the transmitting direction even when it is ready for write access.

(b) For receiving pipes

The BRDY interrupt status bits set to 1 when the FIFO buffer is ready for read access, and set to 0 when all data is read (not ready for read access).

When a zero-length packet is received while the FIFO buffer is empty, the associated bit is set to 1 and the BRDY interrupt is continuously generated until the software writes 1 to BCLR. With this setting, the PIPEnBRDY bit cannot be set to 0 by the software.

When the SOFCFG.BRDYM bit is set to 1, set the PIPECFG.BFRE bit for all pipes to 0.

Figure 32.11 shows the timing of BRDY interrupt generation.

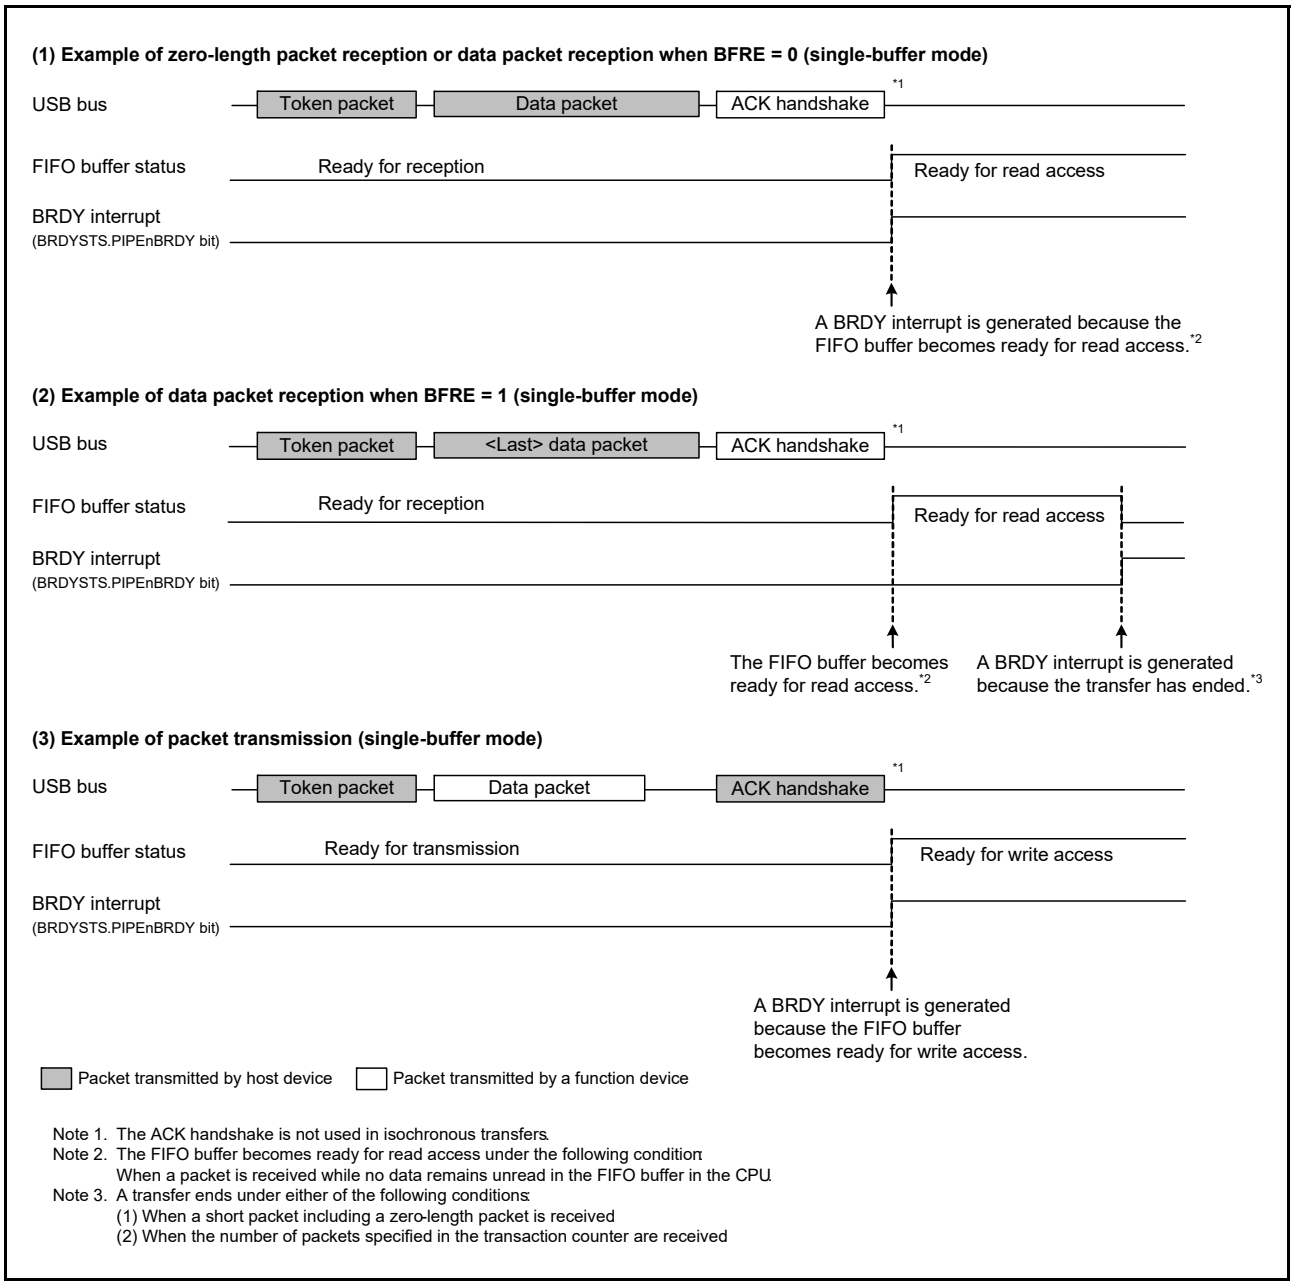

Figure 32.11 Timing of BRDY interrupt generation

The condition for clearing the INTSTS0.BRDY bit depends on the SOFCFG.BRDYM bit setting, as shown in Table 32.16.

Table 32.16 Conditions for clearing the BRDY bit

BRDYM bit	Condition for clearing BRDY bit
0	When all bits in BRDYSTS are set to 0 by the software
1	When the BSTS bits for all pipes have cleared to 0

32.3.3.2 NRDY Interrupt

On generating an internal NRDY interrupt request for the pipe whose PID bits are set to BUF by the software, the USBFS sets the associated PIPEnNRDY bit in NRDYSTS to 1. If the associated bit in NRDYENB is set to 1 by the software, the USBFS sets the INTSTS0.NRDY bit to 1 and generates a USBFS interrupt.

This section describes the conditions in which the USBFS generates the internal NRDY interrupt request for a given pipe.

The internal NRDY interrupt request is not generated during setup transaction execution in host controller mode. During setup transactions in host controller mode, the SACK or SIGN interrupt is detected.

The internal NRDY interrupt request is not generated during status stage execution of the control transfer in device controller mode.

(1) In host controller mode

(a) For transmitting pipes

On any of the following conditions, the USBFS detects an NRDY interrupt:

- For isochronous transfer pipes, when the time to issue an OUT token comes while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS transmits a zero-length packet following the OUT token and sets the associated NRDYSTS.PIPEnNRDY bit and the FRMNUM.OVRN bit to 1.
- During communications other than setup transactions on pipes not used for isochronous transfers, when any combination of the following two cases occur three consecutive times:
  - No response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device.
  - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK.
- During communications other than setup transactions, when the STALL handshake is received from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the PID[1:0] setting for the associated pipe to STALL (11b).

(b) For receiving pipes

- For isochronous transfer pipes, when the time to issue an IN token comes but there is no space available in the FIFO buffer. In this case, the USBFS discards the received data for the IN token and sets the PIPEnNRDY bit associated with the pipe and the OVRN bit to 1. When a packet error is detected in the received data for the IN token, the USBFS also sets the FRMNUM.CRCE bit to 1.
- For non-isochronous transfer pipes, when any combination of the following two cases occur three consecutive times:
  - No response is returned from the peripheral device for the IN token issued by the USBFS (when timeout is detected before detection of the DATA packet from the peripheral device).
  - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK.
- For isochronous transfer pipes, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe to 1. The PID[1:0] setting for the pipe is not changed.
- For isochronous transfer pipes, when a CRC error or a bit stuffing error is detected in the received data packet. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe and the CRCE bit to 1.
- When the STALL handshake is received. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe to 1 and changes the PID[1:0] setting for the associated pipe to STALL.

(2) In device controller mode

(a) For transmitting pipes

- When an IN token is received while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS generates a NRDY interrupt request on reception of the IN token and sets the NRDYSTS.PIPEnNRDY bit to 1. For an isochronous transfer pipe in which an interrupt is generated, the USBFS transmits a zero-length packet and sets the FRMNUM.OVRN bit to 1.

(b) For receiving pipes

- When an OUT token is received but there is no space available in the FIFO buffer. For an isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request on reception of the OUT token and sets the PIPEnNRDY bit to 1 and OVRN bit to 1. For a non-isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request when a NAK handshake is transferred after the data following the OUT token is received, and sets the PIPEnNRDY bit to 1. The NRDY interrupt request is not generated during retransmission because of a DATA-PID mismatch. In addition, the NRDY interrupt request is not generated if an error occurs in the DATA packet.
- For isochronous transfer pipes, when a token is not received successfully within an interval frame. In this case, the USBFS generates a NRDY interrupt request when the SOF is received, and sets the PIPEnNRDY bit to 1.

Figure 32.12 shows the timing of NRDY interrupt generation in device controller mode.

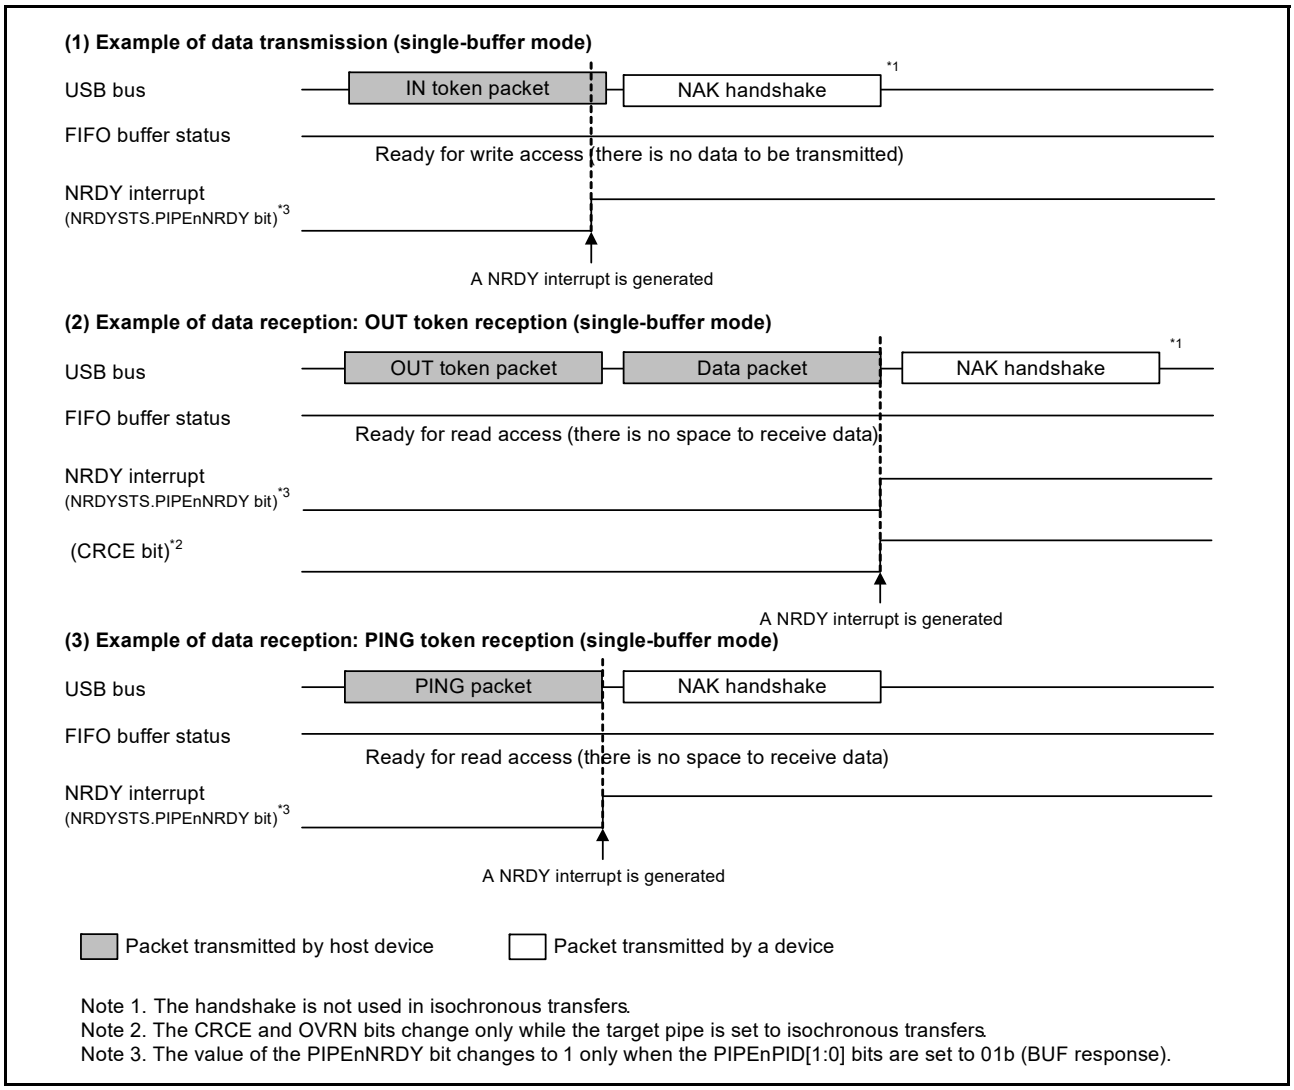

Figure 32.12 Timing of NRDY interrupt generation in device controller mode

32.3.3.3 BEMP Interrupt

On detecting a BEMP interrupt for the pipe whose PID bits are set to BUF by the software, the USBFS sets the associated BEMPSTS.PIPEnBEMP bit to 1. If the associated bit in BEMPENB is set to 1 by the software, the USBFS sets the INTSTS0.BEMP bit to 1 and generates a USBFS interrupt. This section describes the conditions in which the USBFS generates an internal BEMP interrupt request.

(1) For transmitting pipes

When the FIFO buffer of the associated pipe is empty on completion of transmission, including zero-length packet transmission, and in single buffer mode, an internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for a non-DCP pipe. The internal BEMP interrupt request is not generated on any of the following conditions:

- When the CPU or DMA/DTC has already started writing data to the FIFO buffer of the CPU on completion of transmitting data from one FIFO buffer in double buffer mode.
- When the buffer is cleared (emptied) by a 1 setting to the PIPEnCTR.ACLRM or the BCLR bit in the port control register.
- When an IN transfer (zero-length packet transmission) is performed during the control transfer status stage in device controller mode.

(2) For receiving pipes

When a successfully-received data packet size exceeds the specified maximum packet size. In this case, the USBFS generates a BEMP interrupt request, sets the associated BEMPSTS.PIPEnBEMP bit to 1, discards the received data, and changes the associated PID[1:0] setting for the pipe to STALL (11b). The USBFS returns no response in host controller mode, and returns STALL response in device controller mode.

The internal BEMP interrupt request is not generated on any of the following conditions:

- When a CRC error or a bit stuffing error is detected in the received data
- When a setup transaction is being performed,
  - Writing 0 to the BEMPSTS.PIPEnBEMP bit clears the status
  - Writing 1 to the BEMPSTS.PIPEnBEMP bit has no effect.

Figure 32.13 shows the timing of BEMP interrupt generation in device controller mode.

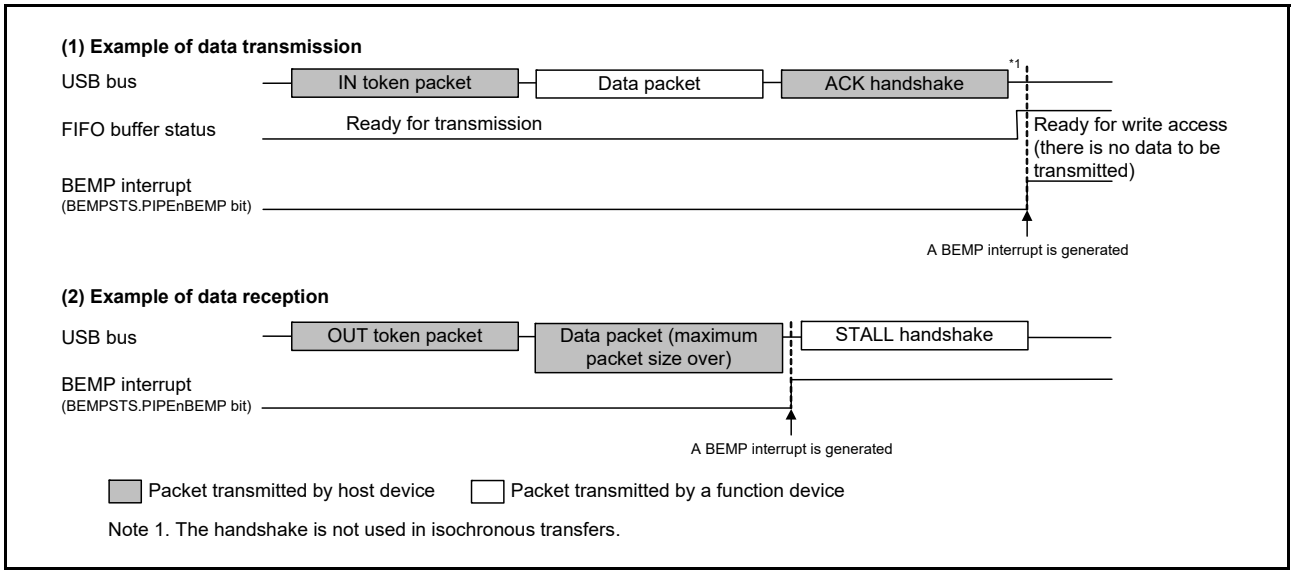

Figure 32.13 Timing of BEMP interrupt generation in device controller mode

32.3.3.4 Device State Transition Interrupt (Device Controller Mode)

Figure 32.14 diagrams the USBFS device state transitions. The USBFS controls device states and generates device state transition interrupts. However, recovery from the Suspend state (resume signal detection) is detected by means of the resume interrupt. Device state transition interrupts can be enabled or disabled independently in INTENB0. Devices whose states have changed can be checked in the INTSTS0.DVSQ[2:0] bits.

When a transition is made to the default state, a device state transition interrupt is generated after a USB bus reset is detected.

The USBFS controls device states, and device state transition interrupts can be generated, only in device controller mode.

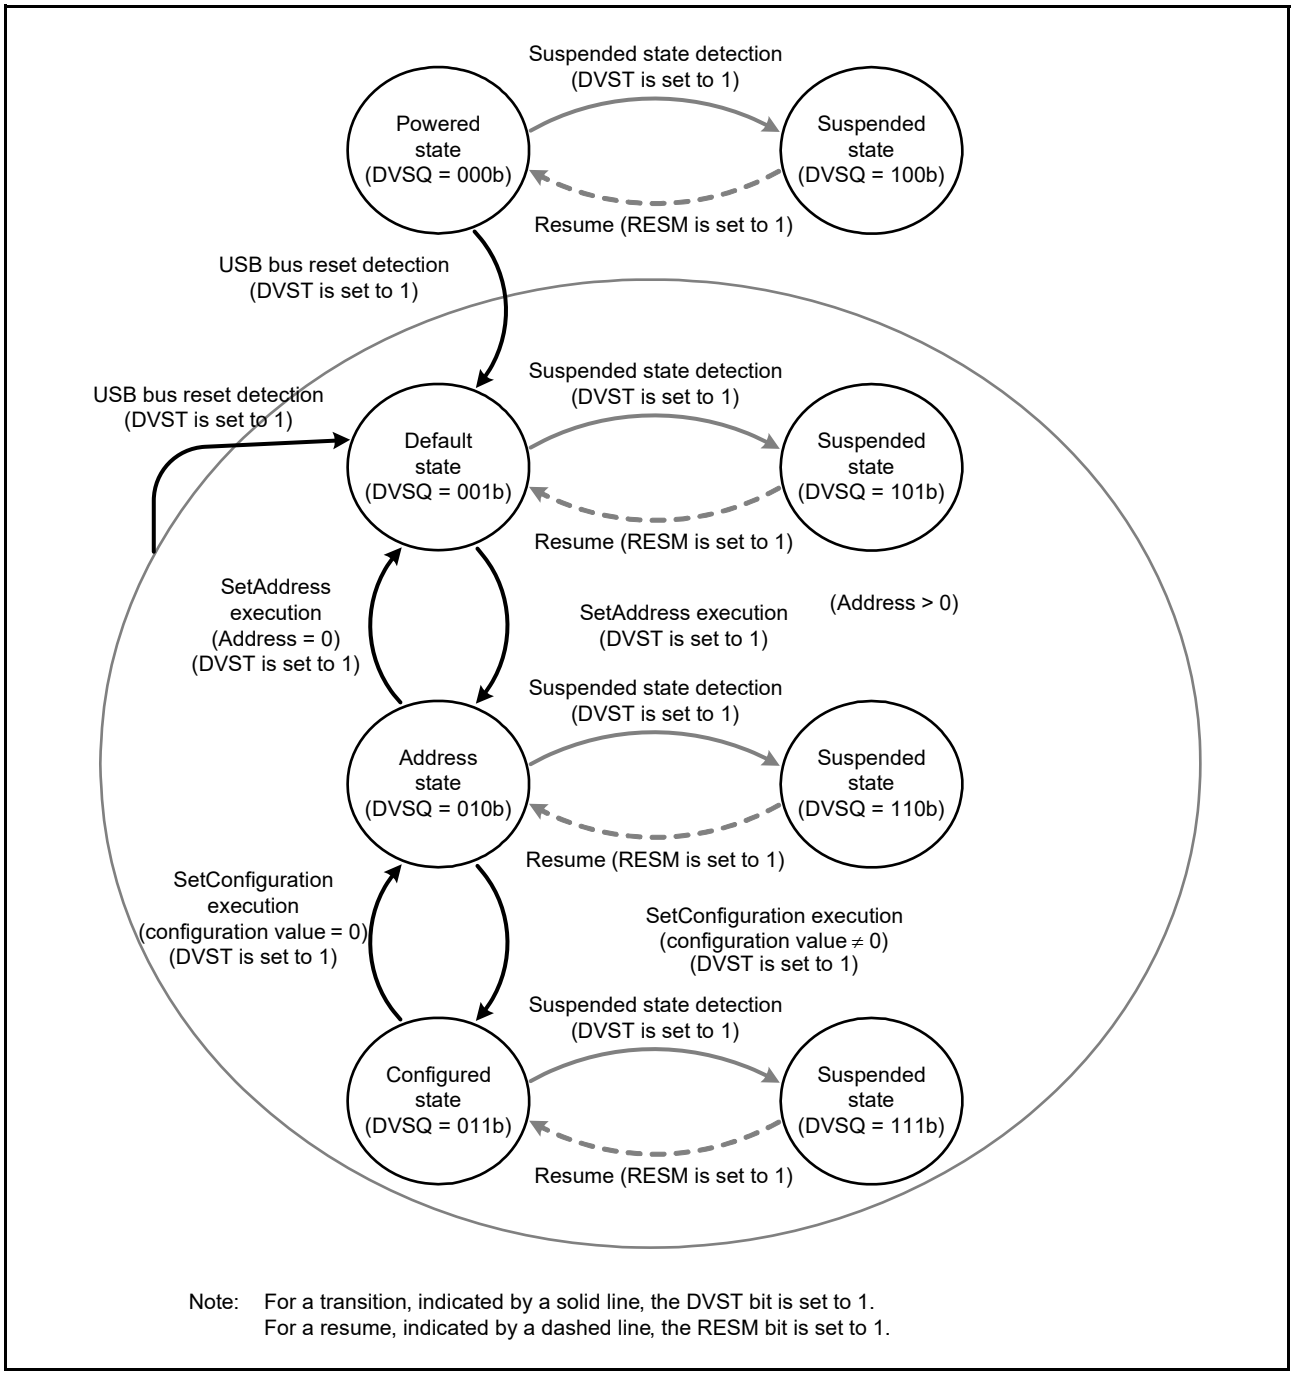

Figure 32.14 Device state transitions

32.3.3.5 Control Transfer Stage Transition Interrupt (Device Controller Mode)

Figure 32.15 diagrams the control transfer stage transitions of the USBFS. The USBFS controls the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled independently in INTENB0. Transfer stages that have transitioned can be checked in the INTSTS0.CTSQ[2:0] bits.

Control transfer stage transition interrupts are generated only in device controller mode. This section describes control transfer sequence errors. If an error occurs, the DCPCTR.PID[1:0] bits are set to 1xb (STALL response).

(1) Control read transfer errors

- An OUT token is received but no data is transferred in response to the IN token at the data stage
- An IN token is received at the status stage
- A data packet with DATAPID = DATA0 is received at the status stage.

(2) Control write transfer errors

- An IN token is received but no ACK is returned in response to the OUT token at the data stage
- A data packet with DATAPID = DATA0 is received as the first data packet at the data stage
- An OUT token is received at the status stage.

(3) Control write no data transfer errors

- An OUT token is received at the status stage.

At the control write transfer data stage, if the receive data length exceeds the wLength value of the USB request, it is not recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (INTSTS0.CTRT = 1), the CTSQ[2:0] = 110b value is saved until the CTRT bit is set to 0, clearing the interrupt status. While CTSQ[2:0] = 110b is being saved, no CTRT interrupt for ending the setup stage is generated, even if a new USB request is received. The USBFS saves the setup stage completion status, and it generates a CTRT interrupt after the interrupt status is cleared by the software.

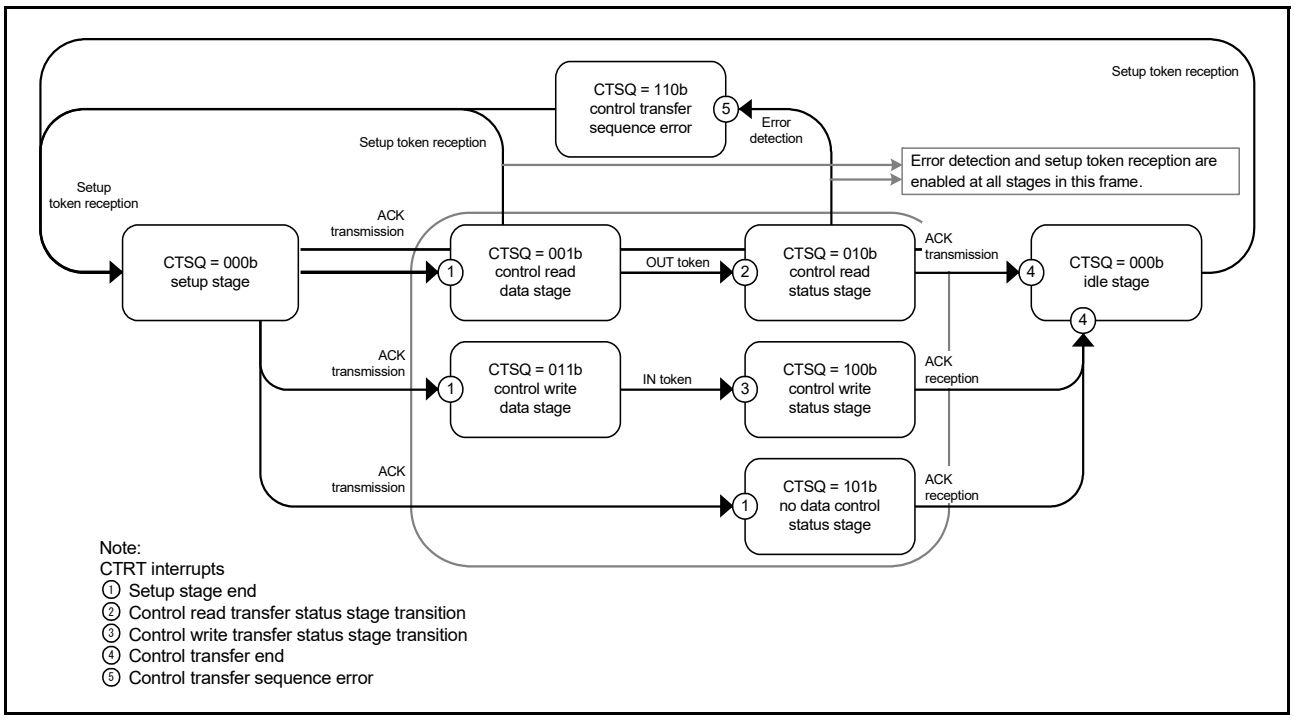

Figure 32.15 Control transfer stage transitions

32.3.3.6 Frame Update Interrupt

In host controller mode, an interrupt is generated when the frame number is updated.

In device controller mode, an SOFR interrupt is generated when the frame number is updated. The USBFS updates the frame number and generates an SOFR interrupt if it detects a new SOF packet during full-speed operation.

32.3.3.7 VBUS Interrupt

When the USB_VBUS pin level changes, a VBUS interrupt is generated. The level of the USB_VBUS pin can be checked with the INTSTS0.VBSTS bit. Whether the host controller is connected or disconnected can be confirmed using the VBUS interrupt. If the system is activated with the host controller connected, the first VBUS interrupt is not generated, because there is no change in the USB_VBUS pin level.

32.3.3.8 Resume Interrupt

In device controller mode, a resume interrupt is generated when the device state is the Suspend state and the USB bus state has changed (from J-state to K-state, or from J-state to SE0). Recovery from the Suspend state is detected by means of the resume interrupt.

In host controller mode, no resume interrupt is generated. Use the BCHG interrupt to detect a change in the USB bus state.

32.3.3.9 OVRCR Interrupt

An OVRCR interrupt is generated when the USB_OVRCURA or USB_OVRCURB pin level has changed. The levels of the USB_OVRCURA and USB_OVRCURB pins can be checked in the SYSSTS0.OVCMON[1:0] flags. The external power supply IC can check whether overcurrent is detected using the OVRCR interrupt.

For OTG connections, the OVRCR interrupt allows you to check whether a change is detected in the VBUS comparator.

32.3.3.10 BCHG Interrupt

A BCHG interrupt is generated when the USB bus state has changed. The BCHG interrupt can be used to detect whether a peripheral device is connected and can also be used to detect a remote wakeup in host controller mode. The BCHG interrupt is generated both host and device controller modes.

32.3.3.11 DTCH Interrupt

A DTCH interrupt occurs when a USB bus disconnect is detected in host controller mode. The USBFS detects bus disconnects in compliance with the USB 2.0 specification.

On interrupt detection, all pipes in which communications are being carried out for the relevant port must be terminated by the software. The pipes enter the wait state for a bus connection to the port, waiting for an ATTCH interrupt to occur. Regardless of the value set in the associated interrupt enable bit, the USBFS hardware:

- Sets the DVSTCTR0.UACT bit for the port in which the DTCH interrupt is detected to 0
- Puts the port in which the DTCH interrupt occurred into the idle state.

32.3.3.12 SACK Interrupt

A SACK interrupt is generated when an ACK response for the transmitted setup packet is received from the peripheral device in host controller mode. The SACK interrupt can be used to confirm that the setup transaction is successfully complete.

32.3.3.13 SIGN Interrupt

A SIGN interrupt is generated when an ACK response for the transmitted setup packet is not correctly received from the peripheral device three consecutive times in host controller mode. The SIGN interrupt can be used to detect no ACK response transmitted from the peripheral device or corruption of an ACK packet.

32.3.3.14 ATTCH Interrupt

An ATTCH interrupt is generated when J-state or K-state of the full-speed signal level is detected on the USB port for

2.5 µs with in host controller mode. To be more specific, an ATTCH interrupt is detected on any of the following conditions:

- When K-state, SE0, or SE1 changes to J-state, and J-state continues 2.5 µs
- When J-state, SE0, or SE1 changes to K-state, and K-state continues 2.5 µs.

32.3.3.15 EOFERR Interrupt

An EOFERR interrupt occurs when the USBFS detects that communication is not complete at the EOF2 timing defined in the USB 2.0 specification.

On interrupt detection, all pipes in which communications are being carried out for the relevant port must be terminated by the software, and the port must be re-enumerated. Regardless of the value set in the associated interrupt enable bit, the USBFS hardware:

- Sets the DVSTCTR0.UACT bit for the port in which the EOFERR interrupt is detected to 0
- Puts the port in which the EOFERR interrupt is generated into the idle state.

32.3.4 Pipe Control

Table 32.17 lists the pipe settings for the USBFS. USB data transfer is performed through logical pipes that the software associates with endpoints. The USBFS provides 10 pipes that are used for data transfer. Set up the pipes based on your system specifications.

Table 32.17 Pipe settings (1 of 2)

Register name	Bit name	Setting	Notes
DCPCFG PIPECFG	TYPE	Transfer type	Pipes 1 to 9: Settable
	BFRE	BRDY interrupt mode	Pipes 1 to 5: Settable
	DBLB	Double buffer select	Pipes 1 to 5: Settable
	DIR	Transfer direction select	IN or OUT settable
	EPNUM	Endpoint number	Pipes 1 to 9: Settable A value other than 0000b must be set when the pipe is used.
	SHTNAK	Disabled state select for pipe on transfer end	Pipes 1 and 2: Settable only for bulk transfers Pipes 3 to 5: Settable
DCPMAXP PIPEMAXP	DEVSEL	Device select	Referenced only in host controller mode.
	MXPS	Maximum packet size	Compliant with the USB 2.0 specification.
PIPEPERI	IFIS	Buffer flush	Pipes 1 and 2: Settable only for isochronous transfers Pipes 3 to 9: Setting disabled
	IITV	Interval counter	Pipes 1 and 2: Settable only for isochronous transfers Pipes 3 to 5: Setting disabled Pipes 6 to 9: Settable only in host controller mode
DCPCTR PIPEnCTR	BSTS	Buffer status	For the DCP, receive buffer status and transmit buffer status are switched with the ISEL bit.
	INBUFM	IN buffer monitor	Available only for pipes 1 to 5.
	SUREQ	Setup request	Settable only for the DCP and controlled in host controller mode
