

R-IN32M4-CL3

Compared to conventional technologies, Ethernet communications in the industrial field are strongly required to have high-performance functions such as higher speed real-time response. These requirements are not necessarily realized by traditional methods such as making the Ethernet processing itself hardware or using a dedicated CPU for high-speed network processing.

The R-IN32M4-CL3 Ethernet communications LSI from Renesas Electronics has the following functions to realize “higher speed real-time response” and “high-accuracy communications control (low jitter communications)” which are important for Ethernet communications in the factory automation field.

- CPU
 - Integrated Arm® Cortex®-M4 core
 - Integrated hardware real-time OS accelerator (HW-RTOS)
- Peripheral
 - Timers, WDT, I²C, UART, CSI, CAN, and general-purpose I/O ports (GPIO)
 - Serial flash memory controller
- External memory/external MCU (microcontroller) interface
 - External memory connection mode: 16- or 32-bit bus connection to external devices such as SRAM
 - External MCU connection mode: 16- or 32-bit bus connection to host MCU
- Ethernet
 - Integrated Gigabit Ethernet MAC
 - Integrated switching hub with cut-through transfer, IEEE 1588 timer, and Device Level Ring (DLR) functions
 - Integrated 2-port 10/100/1000BASE-PHY
 - Dedicated DMA controller and buffer for the network processor
- Supported industrial Ethernet protocol
 - CC-Link IE Field intelligent device station and remote device station
 - CC-Link IE TSN remote station (authentication Classes: A and B)
 - PROFINET RT
 - EtherNet/IP
 - Modbus TCP
- Target application
 - Remote I/O
 - Inverter and servo drive
 - Industrial Ethernet communication unit
- Others
 - Pin assignment considering a replacement from R-IN32M4-CL2
 - Integrated 2.5 V regulator for PHY

1. Overview

1.1 Functional Overview

Table 1.1 Functional Overview of R-IN32M4-CL3 (1/3)

Item	Product	R9A06G064MGBG (23 mm Square Package)	R9A06G064SGBG (17 mm Square Package)
CPU core		Arm Cortex-M4 32-bit RISC CPU + Real-Time OS Accelerator (Hardware Real-Time OS)	
Operating frequency		100 MHz	
Instruction set		Thumb®-2 instruction Armv7-M architecture	
Floating-point UNIT		Armv7M FPv4-SP (32-bit single precision)	
Instruction RAM		768 Kbytes (RAM with ECC)	
Data RAM		512 Kbytes (RAM with ECC)	
Buffer RAM		64 Kbytes (RAM with ECC)	
Network RAM		128 Kbytes (RAM with ECC)	
Internal system bus		32-bit system bus at 100 MHz (AHB-Lite) 64-bit system bus at 125 MHz (AXI) 128-bit communication bus at 100 MHz	
DMA function (system bus side)		4 channels + 1 channel (for real-time port), Supports software and various interrupt-triggered DMA.	
Boot modes		Serial flash ROM boot, External memory boot, External MCU boot	
Support for external memory access		• Bus-size selection (16 or 32 bits) • Paged ROM/ROM/SRAM interface • Synchronous burst memory interface • Programmable wait function	
Chip select signals for static memory		4-line	4- or 3-line*1
External memory space		256 Mbytes	256 or 192 Mbytes
External MCU interface		• Bus-size selection (16 or 32 bits) • General-purpose interface for static memory • Address space: 2 Mbytes (Instruction RAM, Data RAM, Register area) • Internal address space mapping switching function	
Serial flash ROM memory controller		• Supports serial interface compatible with SPI of companies. • Supports direct boot from serial memory device. • Supports Fast Read, Fast Read Dual Output, Fast Read Dual I/O, Fast Read Quad Output, and Fast Read Quad I/O modes. • Direct layout in memory space	
Interrupt		• 30 external interrupt ports	

Note 1. When using an asynchronous SRAM controller in the 17 mm square package, the external memory areas of CSZ0–CSZ2 can be accessed.

Product		R9A06G064MGBG (23 mm Square Package)	R9A06G064SGBG (17 mm Square Package)
Item			
Internal peripheral modules			
I/O port		CMOS I/O: 106 maximum	CMOS I/O: 101 maximum
Timers (4 sub-systems)		• Internal timer of hardware RTOS • Internal timer of the CPU • 32-bit timer (4 channels) • 16-bit timer (16 channels)	
Watchdog timer		• 1 channel • Software-triggered start mode • Watchdog error response options: – Generation of a non-maskable interrupt (NMI) – Generation of a reset • Interrupt when the counter reaches 75% of its overflow value	
Asynchronous serial interface		• 2 channels • Full duplex transfer • FIFOs: 10 bits × 16 receive and 8 bits × 16 transmit • Support output of receive errors and status • Character length: 7 or 8 bits • Parity bit options: Odd, even, 0, none • Transmit stop bits: 1 bit or 2 bits	
I ² C serial interface		• 2 channels • Operating modes: Normal or high-speed • Transfer modes: Single-transfer mode or continuous-transfer mode • Transfer data length: 8 bits	
CAN controller		• 2 channels • Conforming to ISO11898 • Support for transmission and reception of standard and expanded frames • Transfer rate: Up to 1 Mbps	Not available
Clocked serial interface		• 2 channels • Synchronized serial data transmission by three-wire system • Master mode or slave mode selectable • Built-in baud-rate generator • Transfer data length: 7 to 16 bits	
10/100/1000Mbps Ethernet MAC		• 1 channel • Built-in 2-port switch	
Ethernet PHY		• 2 ports IEEE 802.3 • 10BASE-T, 100BASE-TX, 1000BASE-T	
CC-Link IE		Two types of CC-Link IE (CC-Link IE Field and CC-Link IE TSN) are supported. They can be used exclusively	
	CC-Link IE Field	CC-Link IE Field (intelligent device station / remote device station)	
	CC-Link IE TSN	CC-Link IE TSN	

Table 1.1 Functional Overview of R-IN32M4-CL3 (3/3)

Item \ Product	R9A06G064MGBG (23 mm Square Package)	R9A06G064SGBG (17 mm Square Package)
On-chip debugging	• Selecting serial wire or JTAG • Full trace (built-in ETM)	
Internal PLL	Generates various clocks from 25 MHz input clock	
Built-in regulator	2.5V power supply dedicated to PHY can be generated from 3.3V power supply	
Power supply voltage	VDD33 = $3.3 \pm 0.165 \text{ V}^{*2}$ VDD11 = $1.15 \pm 0.06 \text{ V}^{*2}$ VDD25 = $2.5 \pm 0.125 \text{ V}^{*1, *2}$	
Operating temperature	$-40^{\circ}\text{C} \leq T_j \leq +125^{\circ}\text{C}$, $-40^{\circ}\text{C} \leq T_a \leq +85^{\circ}\text{C}$	
Packages	484-ball PBGA 23 mm × 23 mm, 1.0-mm Pitch	356-ball FBGA 17 mm × 17 mm, 0.8-mm Pitch

Note 1. 2.5 V power supply (VDD25) can be generated with the built-in regulator.

2. Ripple incorporated value. As a target value, set the DC component to within $\pm 3\%$ and the ripple component to within $\pm 2\%$.

2. Pin List by Function

The following tables list the meanings of the items, symbols, and abbreviations used in each pin table in this chapter. Some pins and functions are not available depending on the type of package. Refer to the PKG column.

Table 2.1 Meanings of the Items in the Pin Lists

Item	Meaning
Function Name	Name of a function of the pin under "Pin Name" below.
Pin Name	Name of the pin shown in Section 1.3 "Pin Assignments (Top View)".
PKG	Type of package 23□: 23 mm Square Package 17□: 17 mm Square Package
I/O	I/O direction of the given pin
Description	Summary of the given pin function
Active	Active level of the given pin
Level during Reset	The pin state while RSTOUTZ is Low. For details on the reset specifications, refer to the "R-IN32M4-CL3 User's Manual: Hardware edition".

Table 2.2 Meanings of the Symbols and Abbreviations in the Pin Lists

Target	Symbol and Abbreviation	Meaning
Pin Name	— (hyphen)	The pin is a dedicated pin that is not multiplexed with a port-pin function.
PKG	○	The pin exists.
	×	The pin does not exist.
I/O	— (hyphen)	The pin does not have an I/O direction, such as a power supply or ground pin.
Active	— (hyphen)	There is no active level (clock pins, data pins, and address pins).
	High	The active level is high.
	Low	The active level is low.
Level during Reset	— (hyphen)	This is an input-dedicated pin that has no initial level or state following a reset.
	High	The pin state during a reset is high.
	Low	The pin state during a reset is low.
	Hi-Z (High)	The pin state during a reset is Hi-Z (high) with the internal pull-up resistor pulling it to the high level.
	Hi-Z (Low)	The pin state during a reset is Hi-Z (Low) with the internal pull-down resistor pulling it to the Low level.

The pins described in Section 2.2 "Ethernet Pins" to Section 2.15 "Operating Mode Setting Pins" are multiplexed with port pins described in Section 2.1 "Port Pins and Real-Time Port Pins". For details, refer to Multiplexed function 1 to Multiplexed function 4 in Section 2.1 "Port Pins and Real-Time Port Pins".

2.1 Port Pins and Real-Time Port Pins

The LSI has 13 ports for the 3.3 V interface, all of which are 8-bit ports except for EXTP, which has 15 bits.

Grouping them into sets of four ports allows 32-bit access: for example, through ports 0 to 3 (P00–P37), ports 4 to 7 (P40–P77), and real-time ports 0 to 3 (RP00–RP37).

The pin is not available for the power supply of 2.5 V to other devices.

2.3 External SRAM and External MCU Interface Pins

Usage of the external SRAM interface pins and external MCU interface pins is exclusive.

This setting is selected by the level of the MEMIFSEL pin. (Setting value: Low level for the external SRAM interface pins and High level for the external MCU interface pins)

2.3.1 External SRAM Interface Pins

(a) External SRAM Interface Pins (when Asynchronous SRAM Controller is Selected (MEMCSEL = 0))

BCYSTZ	RP20	○	○	O	Bus cycle start status output					

Remark. The external memory interface pins other than BUSCLK are inputs as long as the internal reset signal (HRESETZ) is active.

Note 1. The WREN register is used to switch the pin functions between WRZ3–WRZ0 and BENZ3–BENZ0. For details on this register, refer to the “R-IN32M4-CL3 User’s Manual: Hardware edition”.

(b) External SRAM Interface Pins (When Synchronous Burst Access Memory Controller is Selected (MEMCSEL = 1))

ADVZ	RP20	○	○	O	Address valid output		

Remark. The external memory interface pins other than BUSCLK are inputs as long as the internal reset signal (HRESETZ) is active.

Note 1. When the ADMUXMODE pin is at the High level, these pin functions are multiplexed with address pin functions.

ADMUXMODE = 0: MD0–MD31 (separated address and data lines)

ADMUXMODE = 1: MD0–MD31 / MA0 to MA31 (multiplexed address and data lines)

2. The SET_OPMODE register is used to the switch pin functions between WRZ3–WRZ0 and BENZ3–BENZ0.

For details on this register, refer to the “R-IN32M4-CL3 User’s Manual: Hardware edition”.

2.3.2 External MCU Interface Pins

(a) External MCU Interface Pins (When Asynchronous SRAM Memory Controller is Selected (MEMCSEL = 0))

Function Name	Pin Name	PKG		I/O	Description	Active	Level during Reset

HERROUTZ	P42	○	○	O	Error interrupt output	Hi-Z (High)	
HBCYSTZ	RP20	○	○	I	Bus cycle input		Hi-Z (High)

Note 1. The HBUSCLK pin is used only in case of synchronous SRAM supported MCU connection mode (HIFSYNC pin is High). The HBUSCLK pin is not used in case of asynchronous SRAM supported MCU connection mode (HIFSYNC pin is Low). Furthermore, the other signal connection is common in each mode.

For details on the connection example, refer to the "R-IN32M4-CL3 User's Manual: Board Design edition".

- 2.** The level being input on the HWRZSEL pin controls switching between HWRZ3–HWRZ0 and HBENZ3–HBENZ0 signals.

Remark. The external MCU interface pins continue to operate as those pins even during a reset.

(b) External MCU Interface Pins (When Synchronous Burst Access Memory Controller is Selected (MEMCSEL = 1))

Function Name	Pin Name	PKG		I/O	Description	Active	Level during Reset
		23□	17□				
HBUSCLK	P43	○	○	I	Bus clock input	—	Hi-Z (High)

HERROUTZ	P42	○	○	O	Error interrupt output		High
HBCYSTZ	RP20	○	○	I	Bus cycle input		Hi-Z (High)

Note 1. The address/data pin connection depends on address/data multiplex mode (ADMUXMODE pin is High) or address/data separate mode (ADMUXMODE pin is Low).

For details on the connection example, refer to the “R-IN32M4-CL3 User's Manual: Board Design edition”.

2. When the MEMCSEL pin is High, setting the HWRZSEL pin to High is prohibited.

Remark. The external MCU interface pins continue to operate as those pins even during a reset.

2.4 Serial Flash ROM Interface Pins

The serial flash ROM interface pins are the pins of the serial flash ROM controller.

These pins support the following instruction formats: Fast Read, Fast Read Dual Output, Fast Read Dual I/O, Fast Read Quad Output, and Fast Read Quad I/O.

Function Name	Pin Name	PKG		I/O	Description	Active	Level during Reset
		23□	17□				
SMSCK	P14	○	○	O	Serial clock output signal for serial flash ROM	—	Hi-Z (High)
SMIO0	P15	○	○	I/O	Serial data I/O signals for serial flash ROM (Connected to the IO0 pin of serial flash ROM)		
SMIO1	P16	○	○		Serial data I/O signals for serial flash ROM (Connected to the IO1 pin of serial flash ROM)		
SMIO2	P10	○	×		Serial data I/O signals for serial flash ROM (Connected to the /WP(IO2) pin of serial flash ROM)		
	EXTP10	×	○				
SMIO3	P11	○	×		Serial data I/O signals for serial flash ROM (Connected to the /HOLD(IO3) pin of serial flash ROM)		
	EXTP11	×	○				
SMCSZ	P17	○	○	O	Chip select output signal for serial flash ROM	Low	

2.5 DMA Interface Pins

The DMA interface pins are the external interface pins of the DMA controllers.

Two types of DMA controllers built into the R-IN32M4-CL3, general-purpose DMA controllers (channels 0 and 1) and real-time port DMA controller, can be used as external DMA interfaces.

Function Name	Pin Name	PKG		I/O	Description	Active	Level during Reset
		23□	17□				
RTDMAREQZ	P62	○	○	I	RTDMAC DMA transfer request input	Low	Hi-Z (High)
RTDMAACKZ	P63	○	○	O	RTDMAC DMA acknowledge output		
RTDMATCZ	P64	○	○		RTDMAC terminal count output		
DMAREQZ0	P65	○	○	I	DMA transfer request input 0		
DMAACKZ0	P66	○	○	O	DMA acknowledge output 0		
DMATCZ0	P67	○	○		Terminal count output 0		
DMAREQZ1	P32	○	○	I	DMA transfer request input 1		
DMAACKZ1	P33	○	○	O	DMA acknowledge output 1		
DMATCZ1	P34	○	○		Terminal count output 1		

Note. These pins are fixed to channels of the DMA controllers. The pins cannot be assigned to the desired channel. For details, refer to the “R-IN32M4-CL3 User’s Manual: Hardware edition”.

2.6 External Interrupt Input Pins

The LSI has one non-maskable interrupt and 30 maskable interrupt input pins.

Function Name	Pin Name	PKG		I/O	Description	Active	Level during Reset
		23□	17□				
NMIZ	—	○	○	I	Non-maskable external interrupt input	Low	Hi-Z (High)
INTPZ0–INTPZ5	P00–P05	○	○	I	External interrupt input		Hi-Z (Low)
INTPZ6	P50	○	○				
INTPZ7	P51	○	○				
INTPZ8–INTPZ10	P22–P24	○	○				Hi-Z (High)
INTPZ11–INTPZ15	P73–P77	○	○				Hi-Z (Low)
INTPZ16–INTPZ21	RP00–RP05	○	○				
INTPZ22	P35	○	○				
INTPZ23	P36	○	○				Hi-Z (High)
INTPZ24	P37	○	○				Hi-Z (Low)
INTPZ25–INTPZ28	RP24–RP27	○	○				Hi-Z (High)
INTPZ29	P41	○	○				

2.7 Timer I/O Pins

Function Name	Pin Name	PKG		I/O	Description	Active	Level during Reset		
		23□	17□						
TINJ0 / TOUTJ0*1	P27	○	○	I/O	Timer TAUJ2 I/O pin	—	Hi-Z (High)

TIND7 / TOUTD7*1	P52	○	○						
TIND8 / TOUTD8	RP30	○	○						
TIND9 / TOUTD9	RP31	○	○						
TIND10 / TOUTD10	RP32	○	○						
TIND11 / TOUTD11	RP33	○	○						
TIND12 / TOUTD12	RP34	○	○						
TIND13 / TOUTD13	RP35	○	○						
TIND14 / TOUTD14	RP36	○	○						
TIND15 / TOUTD15	RP37	○	○						

Note 1. TINJ0–TINJ3 and TIND4–TIND7, and TOUTJ0–TOUTJ3 and TOUTD4–TOUTD7 are assigned as multiplexed functions of the same port pins. Use the TMISSEL register to select the pin functions to be used.

For details on this register, refer to the “R-IN32M4-CL3 User’s Manual: Hardware edition”.

When the external pin functions such as the interval timer function of the internal clock are not used, both TAUJ2 and TAUD channels can be used at the same time.

2.8 Watchdog Timer Output Pin

Function Name	Pin Name	PKG		I/O	Description	Active	Level during Reset

Note. Any combination of operating mode setting pins other than above is prohibited.

Note 1. The mode of the external MCU interface is selectable by the level on the HIFSYNC pin.

HIFSYNC = 0: Asynchronous SRAM supported MCU connection mode

HIFSYNC = 1: Synchronous SRAM supported MCU connection mode

For details, refer to the “R-IN32M4-CL3 User’s Manual: Hardware edition”.

2. The external MCU interface HWRZ or HBENZ is selectable by the level on the HWRZSEL pin.

For details, refer to the “R-IN32M4-CL3 User’s Manual: Hardware edition”.

3. Multiplexing of address and data lines is selectable by the level on the ADMUXMODE pin.

For details, refer to the “R-IN32M4-CL3 User’s Manual: Hardware edition”.

Remarks 1. The combination of operating mode setting pins used to select booting for instruction RAM (BOOT1–0 = 11) is the same as that for booting from external memory (BOOT1–0 = 00).

2. Asynchronous: Asynchronous SRAM controller (MEMCSEL = 0)

Synchronous: Synchronous burst access memory controller (MEMCSEL = 1)

3.1 Terminology

Table 3.1 Terms Used in Absolute Maximum Ratings

Parameter	Symbol	Meaning
Power supply voltage	V_{DD}	Indicates the voltage range within which damage or reduced reliability will not result when power is applied to a VDD pin.
Input voltage	V_I	Indicates the voltage range within which damage or reduced reliability will not result when power is applied to an input pin.
Output voltage	V_O	Indicates the voltage range within which damage or reduced reliability will not result when power is applied to an output pin.
Output current	I_O	Indicates the absolute tolerance value for DC current to prevent damage or reduced reliability when a current flows out of or into an output pin.
Operating ambient temperature	T_A	Indicates the ambient temperature range for normal logic operations.
Storage temperature	$T_{Sgt.}$	Indicates the element temperature range within which damage or reduced reliability will not result while no voltage or current is being applied to the device.

Table 3.2 Terms Used in Recommended Operating Range

Parameter	Symbol	Meaning
Power supply voltage	V_{DD}	Indicates the voltage range for normal logic operations that occur when $V_{SS} = 0$ V.
High-level input voltage	V_{IH}	A voltage, which is applied to the input pins of the R-IN32M4-CL3, indicating that the high level state for normal operation of the input buffer. – If a voltage that is equal to or greater than the minimum value is applied, the input voltage is guaranteed as a high level voltage.
Low-level input voltage	V_{IL}	A voltage, which is applied to the input pins of the R-IN32M4-CL3, indicating that the low level state for normal operation of the input buffer. – If a voltage that is equal to or less than the maximum value is applied, the input voltage is guaranteed as a low level voltage.
Positive trigger voltage	V_P	Indicates the input level at which the output level is inverted when the input to the R-IN32M4-CL3 is changed from the low-level side to the high-level side.
Negative trigger voltage	V_N	Indicates the input level at which the output level is inverted when the input to the R-IN32M4-CL3 is changed from the high-level side to the low-level side.
Hysteresis voltage	V_H	Indicates the differential between the positive trigger voltage and the negative trigger voltage.
Input rising time	$t_{ried},$ $t_{ric},$ t_{ris}	Indicates the limit value for the time period when an input voltage applied to R-IN32M4-CL3 rises from 10% to 90%. t_{ried} , t_{ric} , and t_{ris} each indicate the input rising time for the data, clock, and Schmitt buffer.
Input falling time	$t_{fid},$ $t_{fic},$ t_{fis}	Indicates the limit value for the time period when an input voltage applied to R-IN32M4-CL3 falls from 90% to 10%. t_{fid} , t_{fic} , and t_{fis} each indicate the input falling time for the data, clock, and Schmitt buffer.

Table 3.3 Terms Used for DC Characteristics

Parameter	Symbol	Meaning
Off-state output current	I_{OZ}	Indicates the current that flows via an output pin when the rated voltage is applied when a tri-state output has high impedance.
Output short circuit current	I_{OS}	Indicates the current that flows when the output pins are shorted to the ground when output is at high level.
Input leakage current	I_{LI}	Indicates the current that flows via an input pin when a voltage is applied to that pin.
Low-level output current	I_{OL}	Indicates the current that flows through the output pin when the rated low-level voltage is outputting.
High-level output current	I_{OH}	Indicates the current that flows from the output pin when the rated high-level voltage is outputting.
Low-level output voltage	V_{OL}	Indicates the output voltage at low level.
High-level output voltage	V_{OH}	Indicates the output voltage at high level.

3.2 Absolute Maximum Ratings

Table 3.4 Absolute Maximum Ratings

Item	Symbol	Conditions	Ratings	Unit
Power supply voltage	V_{DD}	1.15 V power supply	-0.3 to +1.265	V
		2.5 V power supply	-0.3 to +2.75	V
		3.3 V power supply	-0.3 to +4.20	V
I/O voltage	V_I/V_O	3.3 V buffer $V_I/V_O < V_{DD} + 0.3$ V	-0.3 to +4.20	V
		Gigabit Ethernet PHY MDI (Px_DyP/Px_DyN) x = 0, 1, y = 0 to 3	-0.3 to +2.75	V
	V_I	5 V-tolerant buffer	-0.3 to +5.80	V
	V_O		-0.3 to +4.20	V
Output current (3.3 V buffer)	I_O	8mA type	16.0	mA
		10mA type	22.3	mA
		12mA type	27.6	mA
Output current (5 V-tolerant buffer)	I_O	4mA type (5 V-tolerant buffer)	10.2	mA
Operating ambient temperature	T_A	—	-40 to +85	°C
Storage temperature	$T_{Sgt.}$	—	-55 to +125	°C
Junction temperature	T_j	—	-40 to +125	°C

Note. Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

Remark. Be sure to apply voltage to the I/O pins only after the supply voltage has been fixed.

3.7 Power-On/Off Sequence

Table 3.11 lists external power supplies to R-IN32M4-CL3. Figure 3.1 and Figure 3.3 show the power-on/off sequence. There is no particular rule for the power-on sequence. We recommend supplying external power voltage VDD11 first and then supplying external power voltage VDD33. On the other hand, when turning off the power, disconnect VDD33, then VDD11.

If VDD33 is supplied first, note that the I/O modes of the I/O buffers are not fixed and outputs become undefined over the period between VDD33 and VDD11 rising to their thresholds.

3.3 V must be applied to the input pins only after the power supply voltages have been applied.

Table 3.11 External Power Supplies

External power supply	Voltage [V]	External pin name
VDD33	$3.3 \pm 0.165^*$	VDD33 VDDREG_33 AVDDREG_33
VDD25	$2.5 \pm 0.125^*$	VDD25A
VDD11	$1.15 \pm 0.06^*$	VDD11 VDD11A PLL_VDD

Note. Ripple incorporated value. As a target value, set the DC component to within $\pm 3\%$ and the ripple component to within $\pm 2\%$.

3.7.1 Power-On/Off Sequence without 2.5-V built-in Regulator

(1) Supplying Power Voltages

Supply power voltages so that the following two conditions are both satisfied.

- 1) The period from when VDD33, VDD25, or VDD11 reaches 10% VDD to when all of them reach 90% VDD or higher is within 100 ms.
- 2) The period from when VDD33, VDD25, or VDD11 reaches 95% VDD to when all of them reach 95% VDD or higher is within 50 ms.

(2) Turning Off Power Voltages

Turn off power voltages so that the following two conditions are both satisfied.

- 1) The period from when VDD33, VDD25, or VDD11 reaches 90% VDD to when all of them reach 10% VDD or lower is within 100 ms.
- 2) The period from when VDD33, VDD25, or VDD11 reaches 95% VDD to when all of them reach 95% VDD or lower is within 50 ms.

3.8.3 External Memory Interface Pins

(1) How to calculate a delay value due to the external load

For the external memory interface pins of R-IN32M4-CL3, the listed values are for a load of 0 pF, but the actual loads will differ with users. Calculate the timing in accordance with the load conditions of the user. The user must also consider the wiring delay on the board.

Driving Ability	Delay Value per pF (ns)	
	MIN.	MAX.
8 mA	0.024	0.064
12 mA	0.013	0.039

Calculation Example:

When an address pin (8 mA output buffer) has a 30 pF load, the actual delay is as follows.

MIN. 1.0 ns (Minimum delay value for the load of 0 pF) + (0.024 × 30) ns = 1.72 ns

MAX. 7.0 ns (Maximum delay value for the load of 0 pF) + (0.064 × 30) ns = 8.92 ns

(2) Asynchronous SRAM controller access timing

Item	Symbol	MIN	MAX	Unit
Address and CSZ0–CSZ3 output delay time (for BUSCLK ↑)	t _{DKA}	1.0 (1.72)*	7.0 (8.92)*	ns
RDZ output delay time (for BUSCLK ↑)	t _{DKRD}	1.0 (1.72)*	7.0 (8.92)*	ns
WRZ0–WRZ3 (BENZ0–BENZ3) and WRSTBZ output delay time (for BUSCLK ↑)	t _{DKWR}	1.0 (1.72)*	7.0 (8.92)*	ns
BCYSTZ output delay time (for BUSCLK↑)	t _{DKBSL}	1.0 (1.72)*	7.0 (8.92)*	ns
WAITZ input setup time (for BUSCLK↓)	t _{SKW}	4.0	—	ns
WAITZ input hold time (for BUSCLK↓)	t _{HKW}	0	—	ns
Data input setup time (for BUSCLK↑)	t _{SKID}	4.0	—	ns
Data input hold time (for BUSCLK↑)	t _{HKID}	0	—	ns
Data output delay time (for BUSCLK↑)	t _{DKOD}	1.0 (1.72)*	7.0 (8.92)*	ns
Data float delay time (for BUSCLK↑)	t _{HKOD}	1.0 (1.72)*	7.0 (8.92)*	ns

Note. Values in parenthesis are the calculation results for the driving ability of 8 mA and the external load of 30 pF.

(a) Read timing

Figure 3.7 Memory Controller Read Timing (Asynchronous Memory)

Note. The WRZ0–WRZ3 pins are multiplexed with the BENZ0–BENZ3 pin functions. The pin names are WRZ0–WRZ3.

The WRZ0–WRZ3 pins are selected by default during a reset. Use the write enable switching register (WREN) to switch the pin functions of these pins.

For register details, refer to the “R-IN32M4-CL3 User’s Manual: Hardware edition”.

Remark. The above timing is for the case where the settings in the SMCn register for numbers of idle wait cycles, write recovery wait cycles, and address setting wait cycles are 0, and that for data wait cycles is 3.

(b) Write timing

Figure 3.8 Memory Controller Write Timing (Asynchronous Memory)

Note. The WRZ0–WRZ3 pins are multiplexed with the BENZ0–BENZ3 pin functions. The pin names are WRZ0–WRZ3.

The WRZ0–WRZ3 pins are selected by default during a reset. Use the write enable switching register (WREN) to switch the pin functions of these pins.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
