

General Description

The SLG59M1527V is designed for load switching application. The part comes with two 4.5 A rated MOSFETs switched on by two ON control pins. Each MOSFETs turn on time is independently adjusted by an external capacitor.

Features

- Two 4.5 A independent MOSFETs
- Two Integrated VGS Charge Pumps
- Two internal discharges per channel for gate and source
- Independent Ramp Control
- Protected by thermal shutdown with current limit
- Pb-Free / RoHS Compliant
- Halogen-Free
 - STDFN-14L, 1 x 3 x 0.55 mm

Pin Configuration

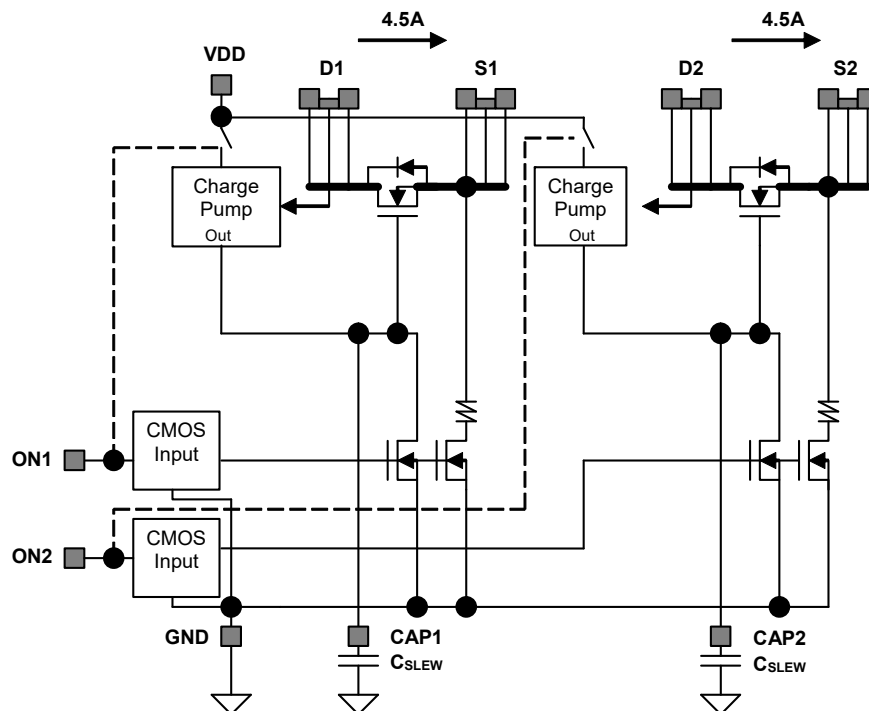

14-pin STDFN
(Top View)

Applications

- Ideal for switching ON and OFF S0 +5.0 and 3.3 V power rails with associated support circuitry discharges.
- Ideal for switching ON and OFF power rails 5 V or less.
- Can use either channel up to 4.5 A with combined maximum current of 8.5 A
- Maximum load capacitance of 1000 μ F for each Channel Source terminal.

Block Diagram

Do not probe CAP1 (PIN 12) or CAP2 (PIN 10) with low impedance probe.

Pin Description

Pin #	Pin Name	Type	Pin Description
1, 2	D1	MOSFET	Drain/Input terminal of Power MOSFET Channel 1. Connect a 10 μ F (or larger) low ESR capacitor from this pin to GND. Capacitors used at D1 should be rated at 10 V or higher.
3	ON1	Input	A low-to-high transition on this pin closes the Channel 1 of power switch. ON1 is an asserted-HIGH, level-sensitive CMOS input with $ON_V_{IL} < 0.3$ V and $ON_V_{IH} > 0.85$ V. Connect this pin to the output of a general-purpose output (GPO) from a microcontroller or other application processor. While there is an internal pull down circuit to ground (~ 4 M Ω), it is allowed this pin to be open-circuited.
4	VDD	VDD	VDD supplies the power for the operation of the power switch and internal control circuitry where its range is 2.5 V $\leq V_{DD} \leq 5.5$ V. Bypass the VDD pin to GND with a 0.1 μ F (or larger) capacitor.
5	ON2	Input	A low-to-high transition on this pin closes the Channel 2 of power switch. ON2 is an asserted-HIGH, level-sensitive CMOS input with $ON_V_{IL} < 0.3$ V and $ON_V_{IH} > 0.85$ V. Connect this pin to the output of a general-purpose output (GPO) from a microcontroller or other application processor. While there is an internal pull down circuit to ground (~ 4 M Ω), it is allowed this pin to be open-circuited.
6, 7	D2	MOSFET	Drain/Input terminal of Power MOSFET Channel 2. Connect a 10 μ F (or larger) low ESR capacitor from this pin to GND. Capacitors used at D2 should be rated at 10 V or higher.
8, 9	S2	MOSFET	Source/Output terminal of Power MOSFET Channel 2. Connect a 10 μ F (or larger) low ESR capacitor from this pin to GND. Capacitors used at S2 should be rated at 10 V or higher.
10	CAP2	Input	A low-ESR, stable dielectric, ceramic surface-mount capacitor connected from CAP2 pin to GND, sets the V_{S2} slew rate and overall turn on time of the SLG59M1527V. For best performance, the range for C_{SLEW} values are 1 nF $\leq C_{SLEW} \leq 22$ nF. Capacitors used at the CAP2 pin should be rated at 10V or higher.
11	GND	GND	Ground connection. Connect this pin to system analog or power ground plane.
12	CAP1	Input	A low-ESR, stable dielectric, ceramic surface-mount capacitor connected from CAP1 pin to GND, sets the V_{S1} slew rate and overall turn on time of the SLG59M1527V. For best performance, the range for C_{SLEW} values are 1 nF $\leq C_{SLEW} \leq 22$ nF. Capacitors used at the CAP1 pin should be rated at 10V or higher.
13, 14	S1	MOSFET	Source/Output terminal of Power MOSFET Channel 1. Connect a 10 μ F (or larger) low ESR capacitor from this pin to GND. Capacitors used at S1 should be rated at 10 V or higher.

Ordering Information

Part Number	Type	Production Flow
SLG59M1527V	STDFN-14L	Industrial, -40 °C to 85 °C
SLG59M1527VTR	STDFN-14L (Tape and Reel)	Industrial, -40 °C to 85 °C

Absolute Maximum Ratings

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
V_{DD}	Power Supply Voltage		--	--	6	V
T_S	Storage Temperature		-65	--	150	°C
ESD_{HBM}	ESD Protection	Human Body Model	2000	--	--	V
W_{DIS}	Package Power Dissipation		--	--	1.2	W
$I_{DS_{MAX}}$	Max Continuous Switch Current				4.5	A
MOSFET $I_{DS_{PK}}$	Peak Current from Drain to Source	For no more than 10 continuous seconds out of every 100 seconds	--	--	6	A

Note: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Electrical Characteristics

$T_A = -40\text{ °C}$ to 85 °C , unless otherwise noted. Typical values are at $T_A = 25\text{ °C}$

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
V_{DD}	Power Supply Voltage		2.5	--	5.5	V
I_{DD}	Power Supply Current	when OFF	--	0.1	1	μA
	Power Supply Current, both channels	when ON, no Load	--	50	75	μA
$R_{DS_{ON[1,2]}}$	ON Resistance	$T_A = 25\text{ °C}; I_{DS} = 100\text{ mA}$	--	14.5	18	mΩ
		$T_A = 70\text{ °C}; I_{DS} = 100\text{ mA}$	--	17	22	mΩ
		$T_A = 85\text{ °C}; I_{DS} = 100\text{ mA}$	--	18	23	mΩ
		$T_A = 85\text{ °C}; I_{DS} = 4.5\text{ A}$	--	19.3	25.1	mΩ
MOSFET I_{DS}	Current from D[1,2] to S[1,2]	Continuous	--	--	4.5	A
$V_{D[1,2]}$	Power Switch input Voltage		0.9	--	V_{DD}	V
T_{ON_Delay}	ON Delay Time	50% ON to $V_{S[1,2]}$ Ramp Start	--	300	500	μs
T_{Total_ON}	Total Turn On Time	50% ON to 90% $V_{S[1,2]}$	Set by External C_{SLEW}^1			ms
		Example: $C_{SLEW} = 4\text{ nF}$, $V_{DD} = V_{D[1,2]} = 5\text{ V}$; $C_{LOAD} = 10\text{ μF}$; $R_{LOAD} = 20\text{ Ω}$	--	2.0	--	ms
$V_{S(SR)}$	$V_{S[1,2]}$ Slew Rate	10% V_S to 90% V_S	Set by External C_{SLEW}^1			V/ms
		Example: $C_{SLEW} = 4\text{ nF}$, $V_{DD} = V_{D[1,2]} = 5\text{ V}$; $C_{LOAD} = 10\text{ μF}$; $R_{LOAD} = 20\text{ Ω}$	--	3.0	--	V/ms
C_{LOAD}	Output Load Capacitance	C_{LOAD} connected from S[1,2] to GND	--	--	1000	μF
$R_{DISCHRG}$	Output Discharge Resistance	$V_{DD} = 2.5\text{ V}$ to 5.5 V ; $V_{S[1,2]} = 0.4\text{ V}$ Input bias	100	150	300	Ω
ON_ V_{IH}	High Input Voltage on ON pin		0.85	--	V_{DD}	V
ON_ V_{IL}	Low Input Voltage on ON pin		-0.3	0	0.3	V

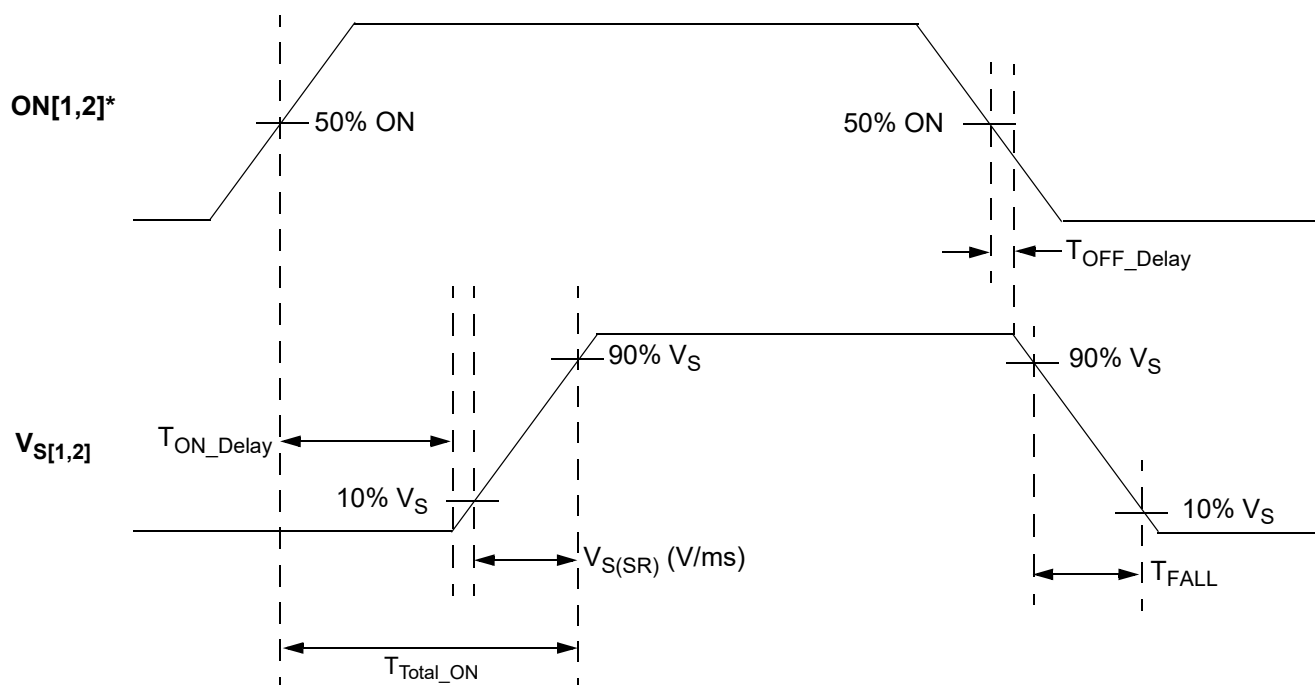

Electrical Characteristics (continued)

$T_A = -40\text{ }^{\circ}\text{C}$ to $85\text{ }^{\circ}\text{C}$, unless otherwise noted. Typical values are at $T_A = 25\text{ }^{\circ}\text{C}$

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
I_{LIMIT}	Active Current Limit, I_{ACL}	MOSFET will automatically limit current when $V_{S[1,2]} > 250\text{ mV}$	--	6.0	--	A
	Short Circuit Current Limit, I_{SCL}	MOSFET will automatically limit current when $V_{S[1,2]} < 250\text{ mV}$	--	0.5	--	A
THERM_{ON}	Thermal shutoff turn-on temperature		--	125	--	$^{\circ}\text{C}$
$\text{THERM}_{\text{OFF}}$	Thermal shutoff turn-off temperature		--	100	--	$^{\circ}\text{C}$
$\text{THERM}_{\text{TIME}}$	Thermal shutoff time		--	--	1	ms
$T_{\text{OFF_Delay}}$	OFF Delay Time	50% ON to $V_{S[1,2]}$ Fall Start; $V_{\text{DD}} = V_{D[1,2]} = 5\text{ V}$	--	--	15	μs

Notes:

1. Refer to typical Timing Parameter vs. C_{SLEW} performance charts for additional information when available.

Slew Rate vs. C_{SLEW}  T_{Total_ON} vs. C_{SLEW} 

$R_{DS(on)[1,2]}$ vs. I_{DS} @ $T_A = 85^\circ\text{C}$ **SLG59M1527V Power-Up/Power-Down Sequence Considerations**

To ensure glitch-free power-up under all conditions, apply V_{DD} first, followed by $V_{D[1,2]}$ after V_{DD} exceeds 1 V. Then allow $V_{D[1,2]}$ to reach 90% of its max value before toggling the ON pin from Low-to-High. Likewise, power-down in reverse order.

If V_{DD} and $V_{D[1,2]}$ need to be powered up simultaneously, glitching can be minimized by having a suitable load capacitor. A 10 μF C_{LOAD} will prevent glitches for rise times of V_{DD} and $V_{D[1,2]}$ less than 2 ms.

If the ON pin is toggled HIGH before V_{DD} and $V_{D[1,2]}$ have reached their steady-state values, the IPS timing parameters may differ from datasheet specifications.

The slew rate of output $V_{S[1,2]}$ follows a linear ramp set by a capacitor connected to the CAP pin. A larger capacitor value at the CAP pin produces a slower ramp, reducing inrush current from capacitive loads.

SLG59M1527V Current Limiting

The SLG59M1527V has two modes of current limiting, differentiated by the output (Source pin) voltage.

1. Standard Current Limiting Mode (with Thermal Protection)

When $V_{S[1,2]} > 250$ mV, the output current is initially limited to the Active Current Limit specification given in the Electrical Characteristics table. The current limiting circuit is very fast and responds within a few micro-seconds to sudden loads. When overload is sensed, the current limiting circuit increases the FET resistance to keep the current from exceeding the Active Current Limit.

However, if an overload condition persists, the die temperature rise due to the increased FET resistance while at maximum current can activate Thermal Protection. If the die temperature exceeds the $THERM_{ON}$ specification, the FET is shut completely OFF, allowing the die to cool. When the die cools to the $THERM_{OFF}$ temperature, the FET is allowed to turn back on. This process may repeat as long as the overload condition is present.

2. Short Circuit Current Limiting Mode (with Thermal Protection)

When $V_{S[1,2]} < 250$ mV (which is the case with a hard short, such as a solder bridge on the power rail), the current is limited to approximately 500 mA. Thermal Protection is also present, but since the Short Circuit Current Limit is much lower than Standard Current Limit, activation may only occur at higher ambient temperatures.

Power Dissipation

The junction temperature of the SLG59M1527V depends on factors such as board layout, ambient temperature, external air flow over the package, load current, and the RDS_{ON} -generated voltage drop across each power MOSFET. While the primary contributor to the increase in the junction temperature of the SLG59M1527V is the power dissipation of its power MOSFETs, its power dissipation and the junction temperature in nominal operating mode can be calculated using the following equations:

$$PD_{TOTAL} = (RDS_{ON1} \times I_{DS1}^2) + (RDS_{ON2} \times I_{DS2}^2)$$

where:

PD_{TOTAL} = Total package power dissipation, in Watts (W)

$RDS_{ON[1,2]}$ = Channel 1 and Channel 2 Power MOSFET ON resistance, in Ohms (Ω), respectively

$I_{DS[1,2]}$ = Channel 1 and Channel 2 Output current, in Amps (A), respectively

and

$$T_J = PD_{TOTAL} \times \theta_{JA} + T_A$$

Power Dissipation (continued)

where:

T_J = Die junction temperature, in Celsius degrees ($^{\circ}C$)

θ_{JA} = Package thermal resistance, in Celsius degrees per Watt ($^{\circ}C/W$) – highly dependent on pcb layout

T_A = Ambient temperature, in Celsius degrees ($^{\circ}C$)

In nominal operating mode, the SLG59M1527V's power dissipation can also be calculated by taking into account the voltage drop across each switch ($V_{DX}-V_{SX}$) and the magnitude of that channel's output current (I_{DSX}):

$$PD_{TOTAL} = [(V_{D1}-V_{S1}) \times I_{DS1}] + [(V_{D2}-V_{S2}) \times I_{DS2}] \text{ or}$$

$$PD_{TOTAL} = [(V_{D1} - (R_{LOAD1} \times I_{DS1})) \times I_{DS1}] + [(V_{D2} - (R_{LOAD2} \times I_{DS2})) \times I_{DS2}]$$

where:

PD_{TOTAL} = Total package power dissipation, in Watts (W)

$V_{D[1,2]}$ = Channel 1 and Channel 2 Input Voltage, in Volts (V), respectively

$R_{LOAD[1,2]}$ = Channel 1 and Channel 2 Output Load Resistance, in Ohms (Ω), respectively

$I_{DS[1,2]}$ = Channel 1 and Channel 2 output current, in Amps (A), respectively

$V_{S[1,2]}$ = Channel 1 and Channel 2 output voltage, or $R_{LOAD[1,2]} \times I_{DS[1,2]}$, respectively

Layout Guidelines:

1. The VDD pin needs a 0.1 μ F (or larger) external capacitor to smooth pulses from the power supply. Locate this capacitor as close as possible to the SLG59M1527V's pin 4.
2. Since the D1, D2, S1 and S2 pins dissipate most of the heat generated during high-load current operation, it is highly recommended to make power traces as short, direct, and wide as possible. A good practice is to make power traces with an absolute minimum widths of 15 mils (0.381 mm) per Ampere. A representative layout, shown in Figure 1, illustrates proper techniques for heat to transfer as efficiently as possible out of the device;
3. To minimize the effects of parasitic trace inductance on normal operation, it is recommended to connect input C_{IN} and output C_{LOAD} low-ESR capacitors as close as possible to the SLG59M1527V's D1, D2, S1 and S2 pins;
4. The GND pin should be connected to system analog or power ground plane.
5. 2 oz. copper is recommended for high current operation.

SLG59M1527V Evaluation Board:

A GFET3 Evaluation Board for SLG59M1527V is designed according to the statements above and is illustrated on Figure 1. Please note that evaluation board has D_Sense and S_Sense pads. They cannot carry high currents and dedicated only for $R_{DS(on)}$ evaluation.

Please solder your SLG59M1527V here

Basic Test Setup and Connections

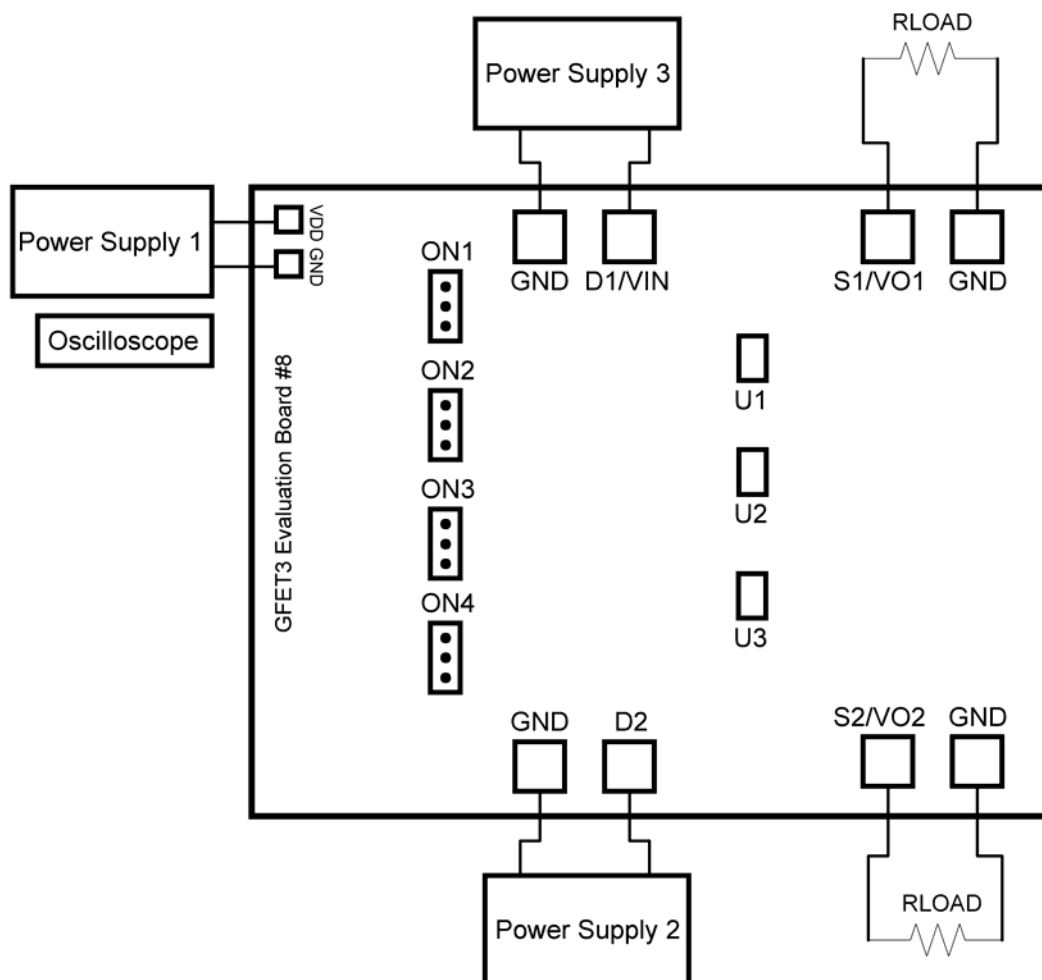

Figure 3. SLG59M1527V Evaluation Board Connection Circuit

EVB Configuration

1. Connect oscilloscope probes to D1/VIN, D2, S1/VO1, S2/VO2, ON1, ON2 etc.;
2. Turn on Power Supply 1 and set desired V_{DD} from 2.5 V...5.5 V range;
3. Turn on Power Supply 2, 3 and set desired $V_{D[1,2]}$ from 0.9 V... V_{DD} range;
4. Toggle the ON[1,2] signal High or Low to observe SLG59M1527V operation.
