

1. Features and Benefits

- High accuracy relative pressure sensor
- Ratiometric analog output or digital SENT output with available compensated $\pm 1^{\circ}\text{C}$ accurate NTC temperature information
- System in a package: MEMS, analog front end circuitry, 16 bit microcontroller, analog back end circuitry, voltage regulators
- Large automotive temperature range (-40°C to 150°C)
- Automotive qualified and automotive diagnostic features (clamping levels, broken track diagnostics, multiple internal fault diagnostics)
- Factory calibrated or fully programmable or reconfigurable through the connector for customized calibration curves
- Back side exposed relative pressure sensor for higher resistance to common automotive media
- Assembled in a robust easy to seal package

2. Application Examples

- Fuel vapor pressure sensor
- Crankcase ventilation pressure sensor
- Pressure sensor for filter monitoring

MLX90821	L	XG	DBA-005	RE
MLX90821	L	XG	DBA-006	RE
MLX90821	V	XG	DBA-008	RE
MLX90821	L	XG	DBA-100	RE

Legend:

Temperature Code: L = -40°C to 150°C

V = -40°C to 115°C

Package Code: XG = SOIC16 WB cavity package

Option Code: DBA-003 = -0.06 to 0.26bar relative pressure / 0.5V to 4.5V analog output

DBA-005 = -0.05 to 0.05bar relative pressure / 0.5V to 4.5V analog output

DBA-006 = -0.2 to 0.5bar relative pressure / 4.5V to 0.5V analog output

DBA-008 = -0.0375 to 0.0125bar relative pressure / 4.5V to 0.5V analog output

DBA-100 = -0.06 to 0.26bar relative pressure / 193 to 3896LSB SENT output / NTC

Packing Form: RE = Reel

Ordering example: MLX90821LXG-DBA-003-RE

4. Functional Diagram

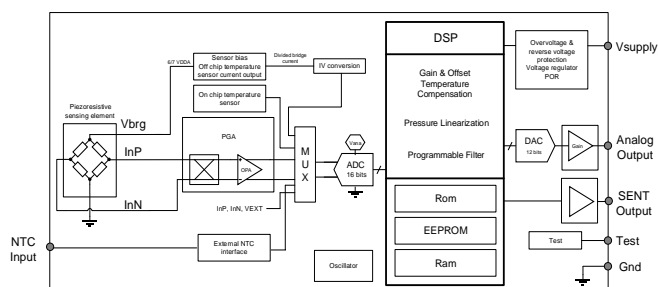

Figure 1: Functional block diagram

5. General Description

The MLX90821 is a packaged, factory calibrated, relative pressure sensor delivering a ratiometric analog output or a digital signal using the SENT protocol.

Using a best in class MEMS sensor enables reliably and accurately measuring very low pressures of a few tenths of millibars. An optimized architecture and a high density CMOS technology imparts the MLX90821 with best in class automotive EMC performance. A DSP based architecture using a 16bit microcontroller provides outstanding performance in terms of initial accuracy of both pressure and optionally external NTC temperature.

A smart package and die assembly concept suits applications with stringent automotive temperature and stress conditions needing small drift over life.

Pressure output noise analog		BW limited to 50kHz.			2	mVrms
Input voltage range on NTC pin			0		3.5	V

Table 4: Electrical specifications

10. Detailed General Description

The MLX90821 contains a pressure sensing element which consists of a square diaphragm realized in the silicon chip by backside etching. The diaphragm reacts to a pressure difference between the top and bottom side of the diaphragm. The internal strain increases, in particular at the border of the diaphragm. Here, the piezoresistive elements have been implanted into the silicon diaphragm, which act as a transducer.

The sensor interface containing the readout circuit is integrated in the same package as the sensing element. The electronics front end amplifies the signal from the bridge, performs a coarse offset compensation and an ADC conversion. The DSP performs the compensations over temperature. Furthermore, the digital circuit provides some filtering, the possibility to linearize the pressure signal and also implements the clamping function. The analog back end consists of a 12 bit DAC and an output driver. This chip delivers an analog output proportional to the pressure or a SENT output compliant with the rev 4 from April 2016 of the SAE J2716 specification. An accurate factory calibrated external NTC temperature is also available on the SENT output.

⁴ Number of SENT frames between pressure step and settled output (last frame containing stable pressure data)

Relative Pressure Sensor IC

can be enabled by programming EEPROM settings. Figure 3 describes MLX90821 block diagram.

Figure 3: MLX90821 block diagram

11. Default programmed settings

The MLX90821 is calibrated at the final manufacturing test step. During the calibration, settings are stored in the on chip EEPROM to define the pressure transfer curve as well as the output clamping levels. On MLX90821 devices using the SENT output, besides pressure, the internal temperature and optionally the NTC temperature calibrations are performed. Together with the transfer functions, the IC filter values are set.

The analog output transfer curves as described below are valid assuming a supply voltage of 5V for the IC, the analog output scales in a ratiometric way to the supply voltage.

Extended NTC temperature accuracy	ϵ_{Te}		-2		2	°C

Table 9: DBA-100 Default configuration

12. Filters

There are two filters available to filter the pressure signal. The first filter is a Small Signal Filter which can be disabled or enabled. The second filter is a first order low pass filter for the pressure signal which has a programmable depth.

12.1. PFLT

PFLT is a programmable first order low pass filter. The depth of this filter can be selected. This filter can be configured to select the optimal trade-off between response time and output noise.

The low pass filter is implemented according to the following formula:

$$Filter_{output}(k) = \frac{Filter_{input}(k) - Filter_{output}(k-1)}{2^{PFLT}} + Filter_{output}(k-1)$$

The PFLT parameter in the formula is set in EEPROM and can have a value between 0 and 9. An overview of typical response times when applying a step on the input using different PFLT filter settings can be found in Table 10. Filter setting 0 disables the PFLT.

PFLT setting	Analog output Response time in ms ⁽⁵⁾	SENT output Response time in SENT frames ⁽⁶⁾
0	0.93	3
1	1.25	3
2	2	5
3	3.7	8
4	7.1	13
5	13.7	24
6	27.0	45
7	53.8	88
8	106.8	176
9	203.8	350

Table 10: Filter settings and typical response times

12.2. SSF

The SSF (Small Signal Filter) is a digital filter which is designed not to have an impact on the response time of a fast changing pressure signal like a pressure step. When a large signal change at the input is present, the filter is bypassed and not filtering the signal. For small signal changes, which are in most cases noise, the filter is used and filtering the pressure signal.

The Small Signal Filter can be enabled or disabled in EEPROM. It is advised not to use the SSF in combination with the PFLT enabled.

⁵ Time needed for the output to change from an input pressure step to 90% of its final value.

⁶ Tick time is set to 3us and Pause Pulse is enabled.

13. Analog Front End

The analog front end of the MLX90821 consists of a chopping stage and 3 amplification stages as can be seen in Figure 9. There are also several input diagnostics integrated into this front end to be able to detect a broken InP or InN connection or an input which is out of range. This diagnostic information is transferred to the microcontroller to handle further action for example flagging a diagnostic message.

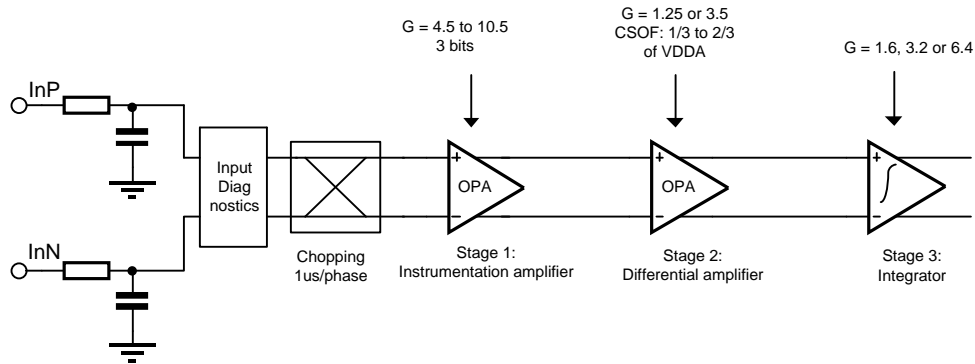

Figure 9: Analog front end block diagram

The first stage is an instrumentation amplifier of which the gain can be programmed using 3 bits to cover a gain range between 4.5 and 10.6.

Transfer equation:

$$\text{OUTP1} - \text{OUTN1} = \text{Gst1} * (\text{InP} - \text{InN}) \text{ in phase 1}$$

$$\text{OUTP1} - \text{OUTN1} = \text{Gst1} * (\text{InN} - \text{InP}) \text{ in phase 2}$$

The second stage is a fully differential amplifier. The gain of the amplifier can be calibrated using 1 bit.

Transfer equation:

$$\text{OUTP2} - \text{OUTN2} = -\text{Gst2} * (\text{OUTP1} - \text{OUTN1}) - \text{Gst2} * (\text{CSOF1} - \text{CSOF2}) \text{ in phase 1}$$

$$\text{OUTP2} - \text{OUTN2} = -\text{Gst2} * (\text{OUTN1} - \text{OUTP1}) - \text{Gst2} * (\text{CSOF2} - \text{CSOF1}) \text{ in phase 2}$$

The CSOF1 and CSOF2 signals are generated by the coarse offset DAC with the following transfer functions:

$$\text{CSOF1} = \frac{\text{VDDA}}{2} + (-1)^{\text{CO7}} * \left(\frac{2}{3} - \frac{1}{3} \right) * \frac{\text{VDDA}}{2} * \frac{\text{CO}[6:0]}{127}$$

$$\text{CSOF2} = \frac{\text{VDDA}}{2} - (-1)^{\text{CO7}} * \left(\frac{2}{3} - \frac{1}{3} \right) * \frac{\text{VDDA}}{2} * \frac{\text{CO}[6:0]}{127}$$

CO[6:0] fixes the DAC output. CO7 is used for the polarity.

The third stage is an integrator which is controlled using 2 bits to set a gain between 1.6 and 6.4

Transfer equation at the outputs of the amplifier:

$$\text{OUTP3} - \text{OUTN3} = -N * (\text{C1}/\text{C2}) * (\text{OUTP2} - \text{OUTN2})$$

$$\text{OUTP3_common_mode} \text{ and } \text{OUTN3_common_mode} = \text{VCM} = \text{VDDA}/2$$

In this equation N represents the number of integration cycles which is a fixed value of N = 40.

C2 is a fixed feedback capacitor of approximately 5pF. C1 can have 3 different values: 0.2pF, 0.4pF or 0.8pF.

Transfer equation after the ADC:

$$\text{Pressure_ADC} = ((\text{OUTN3} - \text{OUTP3}) * 2^{16} / \text{VDDA}) + 32768$$

An overview of all possible values for Gst1, Gst2 and Gst3 can be found in Table 11 below.

The input stage is designed to work with an input common-mode voltage range between 42%Vbrg and 58%Vbrg.

Gain setting [-]	Gst1 [V/V]	Gst2 [V/V]	Gst3 [V/V]	Total gain [V/V]	FS Differential input signal [mV]
0	4.49	-1.25	1.6	-9.0	± 195

Table 11: Gain and input signal range of the analog front end

14. ADC

The 16 bit differential ADC has a range from $-VDDA/2$ to $+VDDA/2$.

There are 7 different ADC channels. Channel 0 is not used. Table 12 below describes all the channels.

ADC	Signal	Remarks
SIN[2:0]		
0	-	Nothing connected
1	P	Pressure
2	Tint	Internal Temperature
3	Vsup	External Supply
4	InP/InN	Multiplexing between Positive/Negative Sensor Output
5	Vdig	Digital Regulator
6	Tntc	NTC Output
7	Text	External Temperature

Table 12: ADC channels

The different channels are converted in a constantly repeating sequence. A new ADC conversion is done every 50us following the sequence shown below in Figure 10. This is resulting in an updated pressure output value every 200us.

Figure 10: ADC sequence

15. Digital

The digital is built around a 16-bit microcontroller. It contains besides the processor also ROM, RAM and EEPROM and a set of user and system IO registers.

Temperature compensation of the pressure signal and pressure linearization is handled by the microcontroller. For the pressure compensation there are EEPROM parameters allocated to be able to cover a large variety of calibration approaches.

Both for gain and offset of the pressure signal, there is a separate temperature dependency programmable ranging from a temperature independence to a first order, second order and finally a third order compensation. This is reflected in EEPROM parameters for the offset (O0, O1, O2 and O3) and for the gain (G0, G1, G2 and G3). If required, the linearity of the pressure signal can also be compensated without a temperature dependency or with a first order temperature dependency through EEPROM parameters L0 and L1.

Linearization of the NTC temperature is also covered partially by the microcontroller. More information in this topic can be found in chapter 16.

16. NTC Temperature Linearization

The linearization of the NTC temperature signal is split up in several stages. A schematic overview of these steps can be seen in Figure 11.

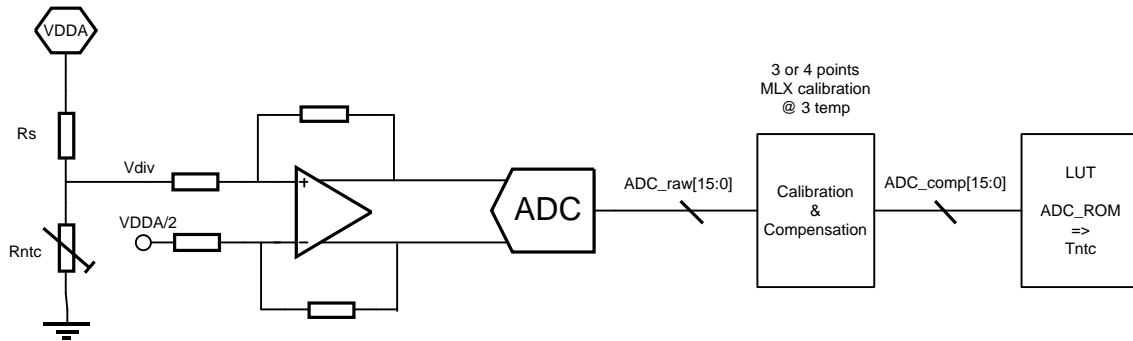

Figure 11: Block diagram NTC linearization

The complete system can be divided into 5 separate stages.

1. A resistor divider with internal resistor R_s is used to linearize R_{ntc} into a voltage.
2. A fully differential amplifier with unity gain is used to drive the ADC.
3. The 16-bit ADC is being used to convert the analog resistor divider output voltage into a digital signal called ADC_raw .
4. With the help of calibration data saved in EEPROM the microcontroller will perform a first compensation on ADC_raw converting in to ADC_comp . This new value is targeted to be as close as possible to the value ADC_ROM .
5. Finally a look up table (LUT) will be used to convert the ADC_ROM values into the T_{ntc} value which is the desired linearized NTC temperature.

The default NTC characteristic which is calibrated on option code DBA-100 can be found in Table 13. When using an NTC which does not match the coefficients described above, it is advised to contact Melexis.

The EEPROM coefficients which are used for the conversion from ADC_raw to ADC_comp are $N0$ to $N3$, $N0_Diff_Low$ to $N3_Diff_Low$, $N0_Diff_High$ to $N3_Diff_High$ and $TEMP1$ to $TEMP3$.

T (°C)	R _T /R ₂₅	R (Ω)	T (°C)	R _T /R ₂₅	R (Ω)

Table 13: Default NTC characteristic

17. SENT Configuration

The SENT output is designed to be compliant with the SAE J2716 rev. Apr 2016 SENT standard. The tick time is configurable in EEPROM using parameter `TICK_DIV`. The available tick time settings are 3us, 4us, 6us, 10us, 12us and 16us. A pause pulse can also be enabled to have a fixed frame length of 282 ticks. This can be done using parameter `PAUSE`. The default configuration for option code DBA-100 is 3us tick time and pause pulse enabled.

17.1. Fast Channel Configuration

On the fast channel, 8 different options are available to configure channel 1 and channel 2. An overview of these different options and how to configure them can be found in Table 14.

#	FC_CFG setting	Fast Channel 1	Fast Channel 2	Remark
1	0	Pressure (3x 4 bit)	Inverse of Pressure (3x 4 bit)	
2	1	Pressure (3x 4 bit)	Rolling counter (2x 4 bit) and inverse of MSN of Pressure (1x 4 bit)	
3	2	Pressure (3x 4 bit)	Medium temperature (3x 4 bit)	Media temperature can either be NTC or sensing element temperature. (Tmedium_Select). Default for option code DBA-100.
4	3	Pressure (3x 4 bit)	Internal temperature (3x 4 bit)	Internal temperature can either be PTAT or sensing element temperature (Tinternal_Select).
5	4	Pressure only (3x 4 bit)	/	
6	5	Pressure only (4x 3 bit)	/	
7	6	Data indicated by pointer 1 (3x 4 bit)	Data indicated by pointer 2 (3x 4 bit)	In this mode no diagnostics are available. FC configuration only used by Melexis.
8	7	Pressure (3x 4 bit)	0 (3x 4 bit)	

Table 14: Fast channel configuration options

The selection of the fast channel output mode can be done by changing the parameter 'FC_CFG' in the EEPROM.

In case Medium temperature is selected to be available on fast channel 2, the type of media can be defined in EEPROM using parameter 'Tmedium_Select'. When selecting 0, linearized NTC temperature will be available. Selecting 1 enables sensing element temperature. Sensing element temperature is not calibrated by default.

For Internal temperature, also two options are available defined in EEPROM parameter 'Tinternal_Select' where 0 corresponds to on chip factory calibrated PTAT temperature and 1 corresponds to sensing element temperature. The same comment regarding the calibration of the sensing element temperature calibration as made above applies here.

17.2. Slow Channel Configuration

The Slow Serial Channel is implemented according to the Enhanced Serial Message Format using 12 bit data and 8 bit message ID as described in the reference SENT protocol standard SAE J2716 rev. Apr 2016.

An overview of the different slow channel messages which are available in the MLX90821 can be found in Table 15. From this table 16 messages can be configured completely in EEPROM. The 12 bit data content of these messages can be configured freely. The ID of programmable message PR0, PR1, PR2 and PR3 is copied from EEPROM (2x 4 bit). The ID of PR5 is 1 bit higher than of PR4. The same is valid for the other pairs: PR6-7, PR8-9, ..., PR14-15. This programmable ID is indicated in Table 15 as 0xYZ.

All programmable messages can also be enabled and disabled, but not all independently of each other:

- PR0, PR1, PR2 and PR3 can be each independently enabled or disabled
- PR4 and PR5 are together enabled or disabled
- PR6 and PR7 are together enabled or disabled
- PR8, PR9, PR10 and PR11 are together enabled or disabled
- PR12, PR13, PR14 and PR15 are together enabled or disabled

#	Type	ID	Description	Data	Rep

Table 15: Slow channel messages

Messages which have a “Y” in the column Rep of Table 15 can be selected to have a higher occurrence in the slow channel message sequence. Their repetition rate can be configured as indicated in Table 16.

The repeatable messages MID01h, MID10h and MID23h can be configured individually to have their own repetition rate. The repetition factor setting can be done in respectively “SENT_REP_FACT_ID_01”, “SENT_REP_FACT_ID_10” and “SENT_REP_FACT_ID_23”.

Repetition Factor Setting	Real Repetition Factor
0	Message repetition disabled
1	Message repeat every 2 messages
2	Message repeat every 3 messages
3	Message repeat every 4 messages
4	Message repeat every 5 messages
5	Message repeat every 6 messages
6	Message repeat every 7 messages
7	Message repeat every 8 messages
8	Message repeat every 9 messages
9	Message repeat every 10 messages
10	Message repeat every 12 messages
11	Message repeat every 16 messages
12	Message repeat every 20 messages
13	Message repeat every 24 messages
14	Message repeat every 28 messages
15	Message repeat every 30 messages

Table 16: Repetition rate settings

Once a message is configured to be repeatable, it will automatically have the highest priority. Therefore it will appear first in the slow message sequences.

The priority order between MID01, MID10 and MID23 can also be configured using EEPROM parameter “SC_R_O”:

- SC_R_O = 0: Priority order: ID01h > ID10h > ID23h
- SC_R_O = 1: Priority order: ID10h > ID23h > ID01h

18. Wrong Connections Overview Analog Output

Table 17 provides an overview of the behavior of the MLX90821 when different combinations of connections to GND, VDD and OUT are made.

GND	VDD	Analog out	Effect on output	Action after wrong connection
0V	5V	Pull-down or Pull-up	Normal operation	Normal operation
Disconnected	5V	Pull-down or Pull-up	High Fault Band	Normal operation
0V	Disconnected	Pull-down or Pull-up	Low Fault Band	Normal operation
0V	5V	Disconnected	Low Fault Band for Pull-down High Fault Band for Pull-up	Normal operation
0V	5V	0V	Low Fault Band	Normal operation
0V	5V	5V	High Fault Band	Normal operation
0V	5V	18V	18V	Normal operation
0V	0V	Pull-down or Pull-up	Low Fault Band	Normal operation
0V	18V	Pull-down or Pull-up	Low Fault Band for Pull-down High Fault Band for Pull-up	Normal operation
5V	5V	Pull-down or Pull-up	High Fault Band	Normal operation
5V	0V	Pull-down or Pull-up		Normal operation

Table 17: Wrong connections overview

19. Wrong Connections Overview SENT Output

Table 18 provides an overview of the behavior of the MLX90821 when different combinations of connections to GND, VDD and OUT are made.

GND	VDD	SENT out	Effect on output	Action after wrong connection
0V	5V	SAE Standard Load Circuit	Normal operation	Normal operation
Disconnected	5V	SAE Standard Load Circuit	No communication	Normal operation
0V	Disconnected	SAE Standard Load Circuit	No communication	Normal operation
0V	5V	Disconnected	No communication	Normal operation
0V	5V	0V	0V – No communication	Normal operation
0V	5V	5V	5V – No communication	Normal operation
0V	5V	18V	18V – No communication	Normal operation
0V	0V	SAE Standard Load Circuit	No communication	Normal operation
0V	18V	SAE Standard Load Circuit	No communication	Normal operation
5V	5V	SAE Standard Load Circuit	No communication	Normal operation
5V	0V	SAE Standard Load Circuit	No communication	Normal operation

Table 18: Wrong connections overview

20. Diagnostics

20.1. Input Diagnostics

An overview of the different input diagnostics conditions and their corresponding fault band and diagnostic source can be found in Table 19.

Condition	Analog Output Fault Band	SENT Output Fast Channel Code	Diagnostic Source ⁽⁷⁾
Vbrg disconnected	Low	4090	ERR_EN_SPSN
GND (sensor) disconnected	Low	4090	ERR_EN_SPSN
InP disconnected	Low	4090	ERR_EN_BW
InN disconnected	Low	4090	ERR_EN_BW
Vbrg shorted to GND	Low	4090	ERR_EN_SPSN
InP shorted to GND	Low	4090	ERR_EN_SPSN
InN shorted to GND	Low	4090	ERR_EN_SPSN
InP shorted to Vbrg	Low	4090	ERR_EN_SPSN
InN shorted to Vbrg	Low	4090	ERR_EN_SPSN

Table 19: Input diagnostics

20.2. Diagnostic Sources

The MLX90821 product has several internal checks which monitor the status of device. These checks or diagnostic sources can be enabled or disabled based on the sensor module requirements. An overview of the different diagnostic sources, their enable/disable parameter and the explanation of their functionality can be found below in Table 20. The default diagnostic configuration for the different option codes can be found in Table 21.

Bit	Parameter	Error condition
10	ERR_EN_TINT	The Internal temperature could not be measured/calculated
9	ERR_EN_IO	RAM configuration error
8	ERR_EN_SPSN	SP or SN pin voltage out of range
7	ERR_EN_PV	The pressure value could not be measured/calculated
6	ERR_EN_PP	Pressure parameter error
5	ERR_EN_BW	A broken wire is detected in the pressure sensor path
4	ERR_EN_TMED	The Medium temperature could not be measured/calculated
2	ERR_EN_VSUPH	The supply voltage is too high
1	ERR_EN_VSUPL	The supply voltage is too low
0	ERR_EN_TCHIP	The chip temperature out of range

Table 20: Diagnostic sources

⁷ See tables 22 to 24 for more information on the errors

Parameter	DBA-003	DBA-005	DBA-006	DBA-008	DBA-100

Table 21: Default diagnostic configuration

The level of the over and under voltage diagnostics can be configured according to the ranges described in Table 22.

Parameter	Min	Max	Units	Comment
Under voltage detection threshold range	3.25	5.74	V	Optional and Programmable with 8 bits in parameter VSUP_LOW
Overvoltage detection threshold range	4.25	6.74	V	Optional and Programmable with 8 bits in parameter VSUP_HIGH
Over-/Under-voltage detection accuracy		200	mV	

Table 22: MLX90821 under and overvoltage detection

20.3. Sent Output Fast and Slow Channel Diagnostics

There are two values reserved to show an error diagnostic mode in the fast channel. These values are 4090 and 4091. According to the type of diagnostic flag, one of the values will be transmitted if enabled. Internal errors like for example PRESS_BROKEN_W or PRESS_PAR use 4090 to indicate an error condition on the fast channel. Errors conditions which can be linked to external influences can be configured to either transmit 4090 or 4091. These errors are VSUP_HIGH, VSUP_LOW and T_CHIP.

For both VSUP_HIGH and VSUP_LOW fast channel overwriting using an error message can even be disabled. This allows you to still decode properly the pressure or optionally temperature information in case of an over voltage or under voltage condition. The OV or UV condition can still be monitored using the status bits for FC1 and FC2 and the slow channel diagnostic message MID01.

An overview of the fast channel error configuration can be found in Table 23. The EEPROM parameters V_ERR, FCE_VSUP and FCE_TCHIP handle this configuration.

Fast Channel	Parameter		Fast Channel	Parameter
ERR_VSUP	V_ERR	FCE_VSUP	ERR_TCH	FCE_TCHIP
No change	0	Not applicable	4091	0
4091	1	0	4090	1
4090	1	1		

Table 23: Fast channel error configuration

The diagnostic slow channel message (MID 1) can be enabled or disabled independent of the other slow channel messages and it has an adjustable repetition factor (2, 4, .., 30).

More information on the different diagnostics shown in SENT, their fast channel, slow channel and status bit mapping can be found in the tables below.

Multiple diagnostic errors can be flagged in the range 8xxh – FFFh in case parameter DIAG_INT is set to 0.

ERROR_ENABLE parameter	ERROR	FC_CFG = 0				FC_CFG = 1				FC_CFG = 2				FC_CFG = 3

Table 25: Diagnostics in fast channel configuration 4 - 7

ERROR_ENABLE parameter	ERROR	Slow channel diagnostic
N.A.	no error	000h
-	not calibrated	nc = no change
DIAG_INT	initialization error	003h (only once when reinit passes after reset) (Remark: in contrary to the other errors, DIAG_INT is used here to enable/disable the complete check and not only the customized slow channel error reporting)
ERR_EN_TINT	T_INT	A05h if DIAG_INT=1, else set bit 11 & 10
ERR_EN_IO	RAM_IO_CFG	A05h if DIAG_INT=1, else set bit 11 & 9
ERR_EN_SPSN	SPSN	A05h if DIAG_INT=1, else set bit 11 & 8
ERR_EN_PV	PRESS	A05h if DIAG_INT=1, else set bit 11 & 7
ERR_EN_PP	PRESS_PAR	A05h if DIAG_INT=1, else set bit 11 & 6
ERR_EN_BW	PRESS_BROKEN_W	A05h if DIAG_INT=1, else set bit 11 & 5
ERR_EN_TMED	T_MED	A05h if DIAG_INT=1, else set bit 11 & 4
ERR_EN_TCHIP	T_CHIP	A05h if DIAG_INT=1, else set bit 11 & 0
ERR_EN_VSUPH	VSUP_HIGH	021h / 901h if DIAG_VSUP = 0 / 1, but set bit 11 & 2 if also other errors are reported in the fast channel and if DIAG_INT=0 (if DIAG_INT=1 and other errors, then A05h)
ERR_EN_VSUPL	VSUP_LOW	020h / 900h if DIAG_VSUP = 0 / 1, but set bit 11 & 1 if also other errors are reported in the fast channel and if DIAG_INT=0 (if DIAG_INT=1 and other errors, then A05h)
DIAG_P1	P @ FC1 =	002h if DIAG_PCL = 0 / 812h if DIAG_PCL = 1
DIAG_P1	P @ FC1 =	001h if DIAG_PCL = 0 / 811h if DIAG_PCL = 1
DIAG_P2	P @ FC1 =	002h
DIAG_P2	P @ FC1 =	001h
DIAG_T1	T @ FC2 =	005h
DIAG_T1	T @ FC2 =	004h
DIAG_T2	T @ FC2 =	805h (Remark: value 186 matches with -50 degC)
DIAG_T2	T @ FC2 =	804h (Remark: value 2266 matches with +210 degC)

Table 26: Diagnostics in slow channel

21. SENT Timings

Parameter	Symbol	Comment	Min	Typ	Max	Unit
SENT frame period	tframe	Shortest message (without pause pulse) and longest message (pause pulse enabled). Example in μs calculated using a $3\mu\text{s}$ tick time.	154 462		282 846 ⁽⁸⁾	ticks μs
Start-up time (to first falling edge)	tsu1	Based on default settings.	0.7	1	1.1	ms
Start-up time (up to first data received)	tsu2	First SENT frame contains valid pressure data. Calculation based on $3\mu\text{s}$ tick time.			1.946 ⁽⁸⁾	ms

Table 27: Start-up timings

Figure 12: Start-up timings

⁸ Using nominal tick time, excluding tick time variations.

These recommendations for external components are only providing a basic protection. Depending on the module design and the EMC speciation requirements different configurations can be needed.

23. Standard information regarding manufacturability of Melexis products with different soldering processes

Our products are classified and qualified regarding soldering technology, solderability and moisture sensitivity level according to following test methods:

Reflow Soldering SMD's (Surface Mount Device)s

- IPC/JEDEC J-STD-020
Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices (classification reflow profiles according to table 5-2)
- EIA/JEDEC JESD22-A113
Preconditioning of Nonhermetic Surface Mount Devices Prior to Reliability Testing (reflow profiles according to table 2)

Wave Soldering SMD's (Surface Mount Device)s and THD's (Through Hole Device)s

- EN60749-20
Resistance of plastic- encapsulated SMD's to combined effect of moisture and soldering heat
- EIA/JEDEC JESD22-B106 and EN60749-15
Resistance to soldering temperature for through-hole mounted devices

Iron Soldering THD's (Through Hole Device)s

- EN60749-15
Resistance to soldering temperature for through-hole mounted devices

Solderability SMD's (Surface Mount Device)s and THD's (Through Hole Device)s

- EIA/JEDEC JESD22-B102 and EN60749-21
Solderability

For all soldering technologies deviating from above mentioned standard conditions (regarding peak temperature, temperature gradient, temperature profile etc) additional classification and qualification tests have to be agreed upon with Melexis.

The application of Wave Soldering for SMD's is allowed only after consulting Melexis regarding assurance of adhesive strength between device and board.

Melexis is contributing to global environmental conservation by promoting **lead free** solutions. For more information on qualifications of **RoHS** compliant products (RoHS = European directive on the Restriction Of the use of certain Hazardous Substances) please visit the quality page on our website: <http://www.melexis.com/quality.aspx>

24. ESD Precautions

Electronic semiconductor products are sensitive to Electro Static Discharge (ESD). Always observe Electro Static Discharge control procedures whenever handling semiconductor products.

25. Package Information

TOP VIEW

FRONT VIEW

SIDE VIEW

BOTTOM VIEW

NOTES:

1. DIMENSIONS ARE IN MILLIMETER.
2. DIMENSION 'D' DOES NOT INCLUDE MOLD FLASH, PROTRUSIONS OR GATE BURRS. MOLD FLASH, PROTRUSIONS OR GATE BURRS SHALL NOT EXCEED 0.15MM PER SIDE. DIMENSION 'E' DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION. INTERLEAD FLASH OR PROTRUSION SHALL NOT EXCEED 0.25MM PER SIDE. 'D' AND 'E' DIMENSIONS ARE DETERMINED AT DATUM 'H'.
3. THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM. DIMENSIONS 'D' AND 'E' ARE DETERMINED AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY, INCLUDING ANY MISMATCH BETWEEN THE TOP AND BOTTOM OF THE PLASTIC BODY. 'D' AND 'E' DIMENSIONS ARE DETERMINED AT DATUM 'H'.
4. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10 MM AND 0.25 MM FROM THE LEAD TIP.
5. DIMENSION 'b' DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.10MM TOTAL IN EXCESS OF THE 'b' DIMENSION AT MAXIMUM MATERIAL CONDITION. THE DAMBAR CANNOT BE LOCATED ON THE LOWER RADII OF THE FOOT.
6. LEAD COPLANARITY SHOULD BE 0 TO 0.1MM (.004") MAX.
7. PREMOLD PACKAGE USING FAM (FILM ASSISTANT MOLDING).
8. ROUGHNESS OF PACKAGE:
Ra 0.4-0.8µm (SHINY-SURFACE OUTLOOK DUE TO USE OF FILM)

Figure 15: MLX90821 package drawing

27. Disclaimer

The information furnished by Melexis herein ("Information") is believed to be correct and accurate. Melexis disclaims (i) any and all liability in connection with or arising out of the furnishing, performance or use of the technical data or use of the product(s) as described herein ("Product") (ii) any and all liability, including without limitation, special, consequential or incidental damages, and (iii) any and all warranties, express, statutory, implied, or by description, including warranties of fitness for particular purpose, non-infringement and merchantability. No obligation or liability shall arise or flow out of Melexis' rendering of technical or other services.

The Information is provided "as is" and Melexis reserves the right to change the Information at any time and without notice. Therefore, before placing orders and/or prior to designing the Product into a system, users or any third party should obtain the latest version of the relevant information to verify that the information being relied upon is current. Users or any third party must further determine the suitability of the Product for its application, including the level of reliability required and determine whether it is fit for a particular purpose.

The Information is proprietary and/or confidential information of Melexis and the use thereof or anything described by the Information does not grant, explicitly or implicitly, to any party any patent rights, licenses, or any other intellectual property rights.

This document as well as the Product(s) may be subject to export control regulations. Please be aware that export might require a prior authorization from competent authorities.

The Product(s) are intended for use in normal commercial applications. Unless otherwise agreed upon in writing, the Product(s) are not designed, authorized or warranted to be suitable in applications requiring extended temperature range and/or unusual environmental requirements. High reliability applications, such as medical life-support or life-sustaining equipment are specifically not recommended by Melexis.

The Product(s) may not be used for the following applications subject to export control regulations: the development, production, processing, operation, maintenance, storage, recognition or proliferation of 1) chemical, biological or nuclear weapons, or for the development, production, maintenance or storage of missiles for such weapons; 2) civil firearms, including spare parts or ammunition for such arms; 3) defense related products, or other material for military use or for law enforcement; 4) any applications that, alone or in combination with other goods, substances or organisms could cause serious harm to persons or goods and that can be used as a means of violence in an armed conflict or any similar violent situation.

The Products sold by Melexis are subject to the terms and conditions as specified in the Terms of Sale, which can be found at <https://www.melexis.com/en/legal/terms-and-conditions>.

This document supersedes and replaces all prior information regarding the Product(s) and/or previous versions of this document.
