The design of this product (including software) and its accessories is under tutelage of laws. Any action to violate relevant right of our product will be penalized through law. Please consciously observe relevant local laws in the use of this product.

1. Introduction

This module is an incremental rotary encoder. It encodes the rotation signal from the axis and output the signal by electronic pulse. The Grove – Encoder is one of the Grove series and has a standard Grove interface. When you need to add a rotary knob to your project, for example a volume knob for a speaker, a selection panel or a digital input, this will be your first choice.

2. Features

- Incremental encoder
- Grove Interface.
- 360 degree rotary

3. Specifications

Item	Min	Typical	Max	Unit
Voltage	4.5	5	5.5	VDC
Current	10	20	30	mA
Dimension	20x 20		mm	
Net Weight	12		Gram	

4. Usage

This Grove-Encoder is very easy to use with the [Encoder Lib](#) designed by seeedstudio. Simply connect this module to the D2 connector of Base Shield and you can start using. The following is a introduction of how to make a [Circular LED bar](#) (the idea came from [seeedstudio wish](#)) .

- This Circular LED bar consists of an Encoder and a [Grove-CircularLED](#) module. Connect the two modules to Base shield as the following picture:

- In the project, the [TimeOne Lib](#) and [Encoder Lib](#) and [CircularLED Library](#) are needed. Download all the libraries and install them to your Arduino IDE.
- Restart the Arduino IDE and open the example by the path :File->Examples->Encoder->EncodeCircuiBar.

```
#include <CircularLED.h>
#include <Encoder.h>
#include <TimerOne.h>
CircularLED circularLED;
unsigned int LED[24];
int index_LED;
void setup()
{
    encoder.Timer_init();
}
```

```
void loop()
{
    if (encoder.rotate_flag ==1)
    {
        if (encoder.direct==1)
        {
            index_LED++;
            if (index_LED>23)
            index_LED=24;
            SenttocircularBar(index_LED);
        }
        else
        {
            index_LED--;
            if(index_LED<0)
            index_LED=0;
            SenttocircularBar(index_LED);
        }
        encoder.rotate_flag =0;
    }
}

void SenttocircularBar(int index)
{
    for (int i=0;i<24;i++)
    {
        if (i<index)
        {
            LED[i]=0xff;
        }
        else
        LED[i]=0;
    }
    circularLED.CircularLEDWrite(LED);
}
```

Upload it to your Arduino/Seeeduino, please refer to [here](#) to learn how to upload sketches. You can see:

Note: It is able to generate another signal when it's being pressed down. However due to the limitation of the number of Grove signal cable, the module is made without output of this signal.

5. Resources

[Encoder Spec](#)

[Demo in Arduino forum](#)

[TimeOne Lib](#)
