

XC6402 Series

High Current, High Speed LDO Regulators, Voltage Detector Function

■ GENERAL DESCRIPTION

The XC6402 series are precise, low noise, high current, positive voltage low dropout regulators with built-in voltage detector. They are fabricated using Torex's CMOS process. The series features a voltage reference, an error amplifier, a current limiter, a voltage detector, and a phase compensation circuit plus a driver transistor.

The output voltage of the LDO and detect voltage of the detector is selectable in 50mV increments within the range of 0.8V to 5.0V. With a low ON resistance driver transistor built-in, batteries can be used until input-output voltage differential is minimal and can accordingly be used for a longer time.

The series is also compatible with low ESR ceramic capacitors which give added output stability. The series provides options to the user to select from a variety of circuit features, such as detector monitoring, detector output logic, EN pin input logic, and internal pull-up / down resistance (semi-custom). The IC's internal regulator circuit can be placed in stand-by mode via the EN function (XC6402C series). In the stand-by mode, power consumption is greatly reduced. The XC6402F series offers the option of a delay on the detector output: the delay time can be controlled by the use of an external capacitor.

■ APPLICATIONS

- Optical disk drive
- Magnetic disk drive
- Digital still cameras / Camcorders
- Digital audio equipments
- Multi-function power supplies

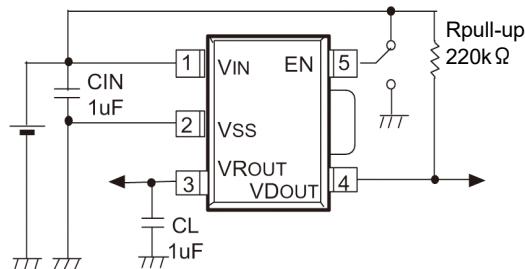

■ FEATURES

Maximum Output Current	: More than 700mA (800mA limit) ($1.6V \leq V_{OUT(T)} \leq 5.0V$)
Dropout Voltage	: 50mV @ 100mA 100mV @ 200mA
Maximum Operating Voltage	: 1.5V ~ 6.0V
VR Output Voltage Range	: 0.8V ~ 5.0V (50mV increments)
VD Detect Voltage Range	: 0.8V ~ 5.0V (50mV increments) More than 1.5V (V_{IN} sensing)
Highly Accurate	: $\pm 2\%$
Low Power Consumption	: $35\mu A$ (TYP.)
High Ripple Rejection	: 60dB @1kHz
Ambient Temperature	: $-40^{\circ}C$ ~ $85^{\circ}C$
Output Capacitor	: Ceramic capacitor compatible
Ultra-Small Packages	: SOT-25, SOT-89-5
Environmentally Friendly	: EU RoHS Compliant, Pb Free

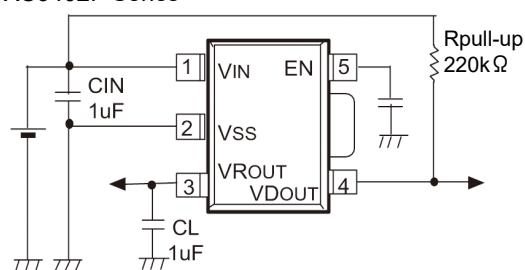

* VD: Voltage Detector

■ OPERATIONAL EXPLANATION

< VOLTAGE REGULATOR >

The voltage divided by resistors R1 & R2 which are connected to the V_{ROUT} pin is compared with the internal reference voltage by the error amplifier. The P-channel MOSFET, which is connected to the V_{ROUT} pin, is then driven by the subsequent output signal. The output voltage at the V_{ROUT} pin is controlled & stabilized by negative feedback. The current limit circuit and short circuit protection operate in relation to the level of output current. Further, the voltage regulator's internal circuitry can be shutdown via the EN pin's signal.

XC6402 Series CA/CB Type

XC6402 Series FV/FX Type

< VOLTAGE DETECTOR >

The series' detector function monitors the voltage divided by resistors R3 & R4 which are connected to the V_{ROUT} pin or the V_{IN} pin, as well as monitoring the voltage of the internal reference voltage source via the comparator.

The VDSEN pin has options (please refer to the Selection Guide, item 2).

A 'High' or 'Low' signal level can be output from the V_{DOUT} pin when the VD pin voltage level goes below the detect voltage. The VD output logic has options (please refer to the Selection Guide, item 3). As V_{DOUT} is an open-drain N-channel output, a pull-up resistor of about 100kΩ is needed to achieve a voltage output. Because of hysteresis at the detector function, output at the V_{DOUT} pin will invert when the detect voltage level increases above the release voltage (105% of the detect voltage).

For the XC6402C type, the detector function is active even in a stand-by, and the output of the V_{DOUT} pin is determined by the VD sense pin voltage.

Even at a stand-by, if the VD sense pin voltage is higher than the release voltage, the V_{DOUT} pin will be high impedance mode, and the pull up voltage will be output at V_{DOUT}. By connecting the Cdelay pin to a capacitor (Cd), the XC6402F series can apply a delay time to V_{DOUT} voltage when releasing voltage. The delay time can be calculated from the internal resistance, Rdelay (2MΩ TYP. fixed) and the value of Cd as per the following equation.

$$\text{Delay Time} = \text{Cdelay} \times \text{Rdelay} \times 0.7$$

Delay Time	Rdelay standard : 1.0 ~ 3.5MΩ	TYP : 2.0MΩ
Cdelay	DELAY TIME (TYP.)	DELAY TIME
0.01 μF	14 ms	7.0 ~ 24.5 ms
0.022 μF	30.8 ms	15.4 ~ 53.9 ms
0.047 μF	65.8 ms	32.9 ~ 115.15 ms
0.1 μF	140 ms	70.0 ~ 245.0 ms
0.22 μF	308 ms	154.0 ~ 539.0 ms
0.47 μF	658 ms	329.0 ~ 1151.5 ms
1 μF	1400 ms	700.0 ~ 2450.0 ms

■OPERATIONAL EXPLANATION (Continued)

<Low ESR Capacitors>

With the XC6402 series regulator, a stable output voltage is achievable even if low ESR capacitors are used, as a phase compensation circuit is built-in to the regulator. In order to ensure the effectiveness of the phase compensation, we suggest that an output capacitor (C_L) be connected as close as possible, between the output pin (V_{ROUT}) and the V_{ss} pin. Please use an output capacitor (C_L) with a capacitance, based on the chart below. We also suggest an input capacitor (C_{IN}) of $1\ \mu F$: this should be connected between V_{IN} and V_{ss} in order to stabilize input power source.

Output Capacitor Corresponding Chart

VR OUTPUT VOLTAGE	C_L
0.8 ~1.45V	1.5 ~ 1.75V
6.8 μF	2.2 μF
1.8V ~ 5.0V	1.0 μF

<Current Limiter, Short-Circuit Protection>

The XC6402 series regulator offers a combination of current limit and circuit protection by means of a built-in fixed current limiter circuit and a foldback circuit. When the load current reaches the current limit level, the fixed current limiter circuit operates and output voltage drops. As a result of this drop in output voltage, the foldback circuit operates, the output voltage drops further and output current decreases. When the output pin is shorted, a current of about 30mA flows.

<EN Pin>

The IC's internal regulator circuitry can be shut down via the signal from the EN pin with the XC6402C series. In shutdown mode, output at the V_{ROUT} pin will be pulled down to the V_{ss} level via R1 & R2. Note that as the XC6402*E to K types of the XC6402C series are 'High Active / No Pull-Down' and XC6402*R to U types of the XC6402C series are 'Active LOW / No Pull-Up', operations will become unstable with the EN pin open (See the chart below).

SERIES	EN INPUT LOGIC
XC6402C A ~ D	High Active with pull-Down resistor
XC6402C E ~ K	High Active with no pull-Down resistor
XC6402C L ~ P	Low Active with pull-Up resistor
XC6402C R ~ U	Low Active with no pull-Up resistor

We suggest that you use this IC with either a V_{IN} voltage or a V_{ss} voltage input at the EN pin. If this IC is used with the correct specifications for the EN pin, the IC will operate normally. However, supply current may increase as a result of through current in the IC's internal circuitry if a voltage other than V_{IN} or V_{ss} is applied.

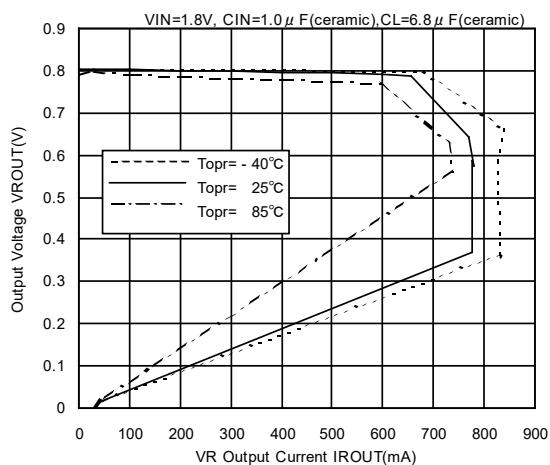

■ NOTES ON USE

1. Please use this IC within the stated absolute maximum ratings. The IC is liable to malfunction should the ratings be exceeded.
2. Where wiring impedance is high, operations may become unstable due to noise and/or phase lag depending on output current. Please strengthen V_{IN} and V_{SS} wiring in particular.
3. Please wire the input capacitor (C_{IN}) and the output capacitor (C_L) as close to the IC as possible.
Should rapidly input fluctuation or load fluctuation occur, please increase the capacitor value such as C_{IN} or C_L to stabilize the operation.
4. We place importance on improving our products and increasing reliability. However, please design safety into the device and system, including fail-safe design and post-aging treatment.

1. The product and product specifications contained herein are subject to change without notice to improve performance characteristics. Consult us, or our representatives before use, to confirm that the information in this datasheet is up to date.
2. The information in this datasheet is intended to illustrate the operation and characteristics of our products. We neither make warranties or representations with respect to the accuracy or completeness of the information contained in this datasheet nor grant any license to any intellectual property rights of ours or any third party concerning with the information in this datasheet.
3. Applicable export control laws and regulations should be complied and the procedures required by such laws and regulations should also be followed, when the product or any information contained in this datasheet is exported.
4. The product is neither intended nor warranted for use in equipment of systems which require extremely high levels of quality and/or reliability and/or a malfunction or failure which may cause loss of human life, bodily injury, serious property damage including but not limited to devices or equipment used in 1) nuclear facilities, 2) aerospace industry, 3) medical facilities, 4) automobile industry and other transportation industry and 5) safety devices and safety equipment to control combustions and explosions. Do not use the product for the above use unless agreed by us in writing in advance.
5. Although we make continuous efforts to improve the quality and reliability of our products; nevertheless Semiconductors are likely to fail with a certain probability. So in order to prevent personal injury and/or property damage resulting from such failure, customers are required to incorporate adequate safety measures in their designs, such as system fail safes, redundancy and fire prevention features.
6. Our products are not designed to be Radiation-resistant.
7. Please use the product listed in this datasheet within the specified ranges.
8. We assume no responsibility for damage or loss due to abnormal use.
9. All rights reserved. No part of this datasheet may be copied or reproduced unless agreed by Torex Semiconductor Ltd in writing in advance.
