# RICOH

### **R3134x SERIES**

### LOW VOLTAGE DETECTOR WITH BUILT-IN DELAY CIRCUIT

NO.EA-209-160316

### OUTLINE

R3134x Series are CMOS-based voltage detector ICs with built-in delay circuit, high detector threshold accuracy, and ultra low supply current, which can operate at low voltage.

These ICs can be used as system reset generators, and each of these ICs consists of a voltage reference, a comparator, resistors for setting voltage detector threshold, an output driver transistor, manual reset circuit, and an output delay generator.

Detector threshold is fixed internally with high accuracy and requires no adjustment. When a supply voltage crosses a setting detector threshold voltage from a high value to a lower value, this IC generates reset signal.

R3134x Series output "L" at its detect.

Since each of R3134x Series embeds an output delay generator, during a setting 240ms delay time, which is fixed in the IC, this IC keeps the reset condition after they are released. Released conditions will be kept for the delay time from when a supply voltage crosses a setting detector threshold voltage from a low value to a higher value, or from when the manual reset signal is released.

Two output types, Nch open drain type and CMOS type, are available.

Since the packages for these ICs are DFN(PLP)1212-6, SOT-23-5, and SC-88A, high density mounting of the ICs on board is possible.

### FEATURES

| <ul><li>Supply Current</li><li>Operating Voltage Range</li></ul> | · · · · · · ·                                   |
|--|---|
| Detector Threshold Range   | 1.0V to 5.0V (0.1V steps)                       |
|  | Further, 2.32V, 2.63V, 2.93V, 3.08V, 4.38V, and |
|  | 4.63V can be provided as standard.              |
| Detector Threshold Accuracy                                      | ±1.8%   |
| Temperature-Drift Coefficient of Detector Threshold              | Typ. ±100ppm/°C                                 |
| Built-in Delay Time Circuit                                      | Typ. 240ms                                      |
| Output Delay Time Accuracy                                       | ±15%  |
| Output Types   | Nch Open Drain and CMOS                         |
| Packages   | DFN(PLP)1212-6, SC-88A, SOT-23-5                |
|  |   |

### APPLICATIONS

- CPU and Logic Circuit Reset
- Battery Checker
- Window Comparator
- Wave Shaping Circuit
- Battery Back-up Circuit
- Power Failure Detector

### **BLOCK DIAGRAMS**

### **SELECTION GUIDE**

The package type, the detector threshold, the output type and the taping type for the ICs can be selected at the users' request.

| Vmr    | Input Voltage                          | Vss-0.3 to Vdd+0.3 | V    |
| Іоит   | Output Current                         | 20                 | mA   |
|        | Power Dissipation (DFN(PLP)1212-6)*    | 400                |      |
| PD     | Power Dissipation (SC-88A)*            | 380                | mW   |
|        | Power Dissipation (SOT-23-5)*          | 420                |      |
| Topt   | Operating Temperature Range            | -40 to 85          | °C   |
| Tstg   | Storage Temperature Range              | –55 to 125         | °C   |

\*) For Power Dissipation, please refer to PACKAGE INFORMATION.

#### ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

### **ELECTRICAL CHARACTERISTICS**

#### • R3134x

The specification in \_\_\_\_\_ is checked and guaranteed by design engineering at  $-40^{\circ}C \le T_{opt} \le 85^{\circ}C$ .

RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

### **DEFINITION OF OUTPUT DELAY TIME**

Output Delay Time (tdelay) is specified as follows:

1. In the case of Nch Open Drain Output:

The time interval from rising edge of  $V_{DD}$  pulse 0.8V to  $V_{DET}$ +1.0V to the time at which the output reaches 2.5V under the condition that the output pin (D<sub>OUT</sub>) is pulled up to 5V through a 470k $\Omega$  resistor.

2. In the case of CMOS Output:

The time interval from rising edge of  $V_{DD}$  pulse 0.8V to  $V_{DET}$ +1.0V to the time at the output reaches ( $V_{DET}$ +1.0V)/2.

### **OPERATION**

Operation of R3134xxxEA

#### • Explanation of operation

Step 1. The output voltage is equal to the pull-up voltage.

- Step 2. At Point "A", Vref ≥ V<sub>DD</sub>×Rb/(Ra+Rb) is true, as a result, the output of comparator is reversed from "L" to "H", therefore the output voltage becomes the GND level. The voltage level of Point A means a detector threshold voltage (V<sub>DET</sub>).
- Step 3. When the supply voltage is lower than the minimum operating voltage, the operation of the output transistor becomes indefinite. The output voltage is equal to the pull-up voltage.
- Step 4. The output voltage is equal to the GND level.
- Step 5. At Point "B", Vref ≤ V<sub>DD</sub>×Rb/(Ra+Rb) is true, as a result, the output of comparator is reversed from "H" to "L", then the output voltage is equal to the pull-up voltage. The voltage level of Point B means a released voltage (V<sub>DET</sub>).
- \*) There is no hysteresis range between the detector threshold and the released voltage.

#### Operation of R3134xxxEC

#### • Explanation of operation

Step 1. The output voltage is equal to the supply voltage ( $V_{DD}$ ).

- Step 2. At Point "A", Vref ≥ V<sub>DD</sub>×Rb/(Ra+Rb) is true, as a result, the output of comparator is reversed from "L" to "H", therefore the output voltage becomes the GND level. The voltage level of Point A means a detector threshold voltage (V<sub>DET</sub>).
- Step 3. When the supply voltage is lower than the minimum operating voltage, the operation of the output transistor becomes indefinite.
- Step 4. The output voltage is equal to the GND level.
- Step 5. At Point "B", Vref ≤ V<sub>DD</sub>×Rb/(Ra+Rb) is true, as a result, the output of comparator is reversed from "H" to "L", then the output voltage is equal to the supply voltage (V<sub>DD</sub>). The voltage level of Point B means a released voltage (V<sub>DET</sub>).
- \*) There is no hysteresis range between the detector threshold and the released voltage.

### Detector Operation vs. glitch input voltage to the VDD pin

When the IC is released and a large pulse (glitch) crosses the detector threshold is forced, the IC may not maintain the released condition. The amplitude of the pulse (V<sub>DET</sub>-V<sub>DD</sub>min) and the pulse width the IC can maintain the released level is described in the graph as follows:

The graph above shows the condition for the maximum transient duration without generating a reset. If the larger amplitude or larger pulse width noise than the graph may be on the  $V_{DD}$ , the reset signal may be generated.

### **TEST CIRCUITS**

**Supply Current Test Circuit** 

Detector Threshold Test Circuit (Pull-up circuit is not necessary for CMOS Output type.)

"H" Output Voltage Test Circuit (CMOS Output Type only)

"L" Output Voltage Test Circuit

MR pin Input Voltage Test Circuit (Pull-up circuit is not necessary for CMOS Output type.)

\* R3134K (DFN(PLP)1212-6) and R3134Q (SC-88A) are the discontinued products as of March, 2016.

### R3134x

Off Leakage Current Test Circuit

Output Delay Time Test Circuit (Pull-up circuit is not necessary for CMOS Output type.)

### **TECHNICAL NOTES**

#### When connecting resistors to the device's input pin

When connecting a resistor (R1) to an input of this device, the input voltage decreases by [Device's Consumption Current] x [Resistance Value] only. And, the cross conduction current\*<sup>1</sup>, which occurs when changing from the detecting state to the release state, is decreased the input voltage by [Cross Conduction Current] x [Resistance Value] only. And then, this device will enter the re-detecting state if the input voltage reduction is larger than the difference between the detector voltage and the released voltage.

When the input resistance value is large and the VDD is gone up at mildly in the vicinity of the released voltage, repeating the above operation may result in the occurrence of output.

As shown in Figure A/B, set R1 to become 100 k $\Omega$  or less as a guide, and connect C<sub>IN</sub> of 0.1  $\mu$ F and more to between the input pin and GND. Besides, make evaluations including temperature properties under the actual usage condition, with using the evaluation board like this way. As a result, make sure that the cross conduction current has no problem.

\*<sup>1</sup> In the CMOS output type, a charging current for OUT pin is included.

\*<sup>2</sup> Note the bias dependence of capacitors.

- 1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
- 2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
- 3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
- 4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
- 5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
- 6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
- 7. Anti-radiation design is not implemented in the products described in this document.
- 8. The X-ray exposure can influence functions and characteristics of the products. Confirm the product functions and characteristics in the evaluation stage.
- 9. WLCSP products should be used in light shielded environments. The light exposure can influence functions and characteristics of the products under operation or storage.
- 10. There can be variation in the marking when different AOI (Automated Optical Inspection) equipment is used. In the case of recognizing the marking characteristic with AOI, please contact Ricoh sales or our distributor before attempting to use AOI.
- 11. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment. Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.
