Silicon NPN Power Transistors

Silicon NPN power transistors are for use in power amplifier and switching circuits – excellent safe area limits. Complement to PNP 2N5194, 2N5195.

Features

- Epoxy Meets UL 94 V−0 @ 0.125 in.
- These Devices are Pb−Free and are RoHS Compliant*

Active–Region Safe Operating Area**

There are two limitations on the power handling ability of a transistor; average junction temperature and second breakdown. Safe operating area curves indicate $I_C - V_{CE}$ limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figure 11 is based on $T_{J(pk)} = 150°C$; T_C is variable depending on conditions. Second breakdown pulse limits are valid for duty cycles to 10% provided $T_{J(pk)} \leq 150°C$. At high case temperatures, thermal limitations will reduce the power that can be handled to values less than the limitations imposed by second breakdown.

DESIGN NOTE: USE OF TRANSIENT THERMAL RESISTANCE DATA

DUTY CYCLE, $D = t_1 f - \dfrac{t_1}{t_P}$

PEAK PULSE POWER = P_P

Figure A

A train of periodical power pulses can be represented by the model shown in Figure A. Using the model and the device thermal response, the normalized effective transient thermal resistance of Figure 12 was calculated for various duty cycles.

To find $\theta_{JC}(t)$, multiply the value obtained from Figure 12 by the steady state value θ_{JC}.

Example:
The 2N5190 is dissipating 50 watts under the following conditions: $t_1 = 0.1$ ms, $t_p = 0.5$ ms. (D = 0.2).

Using Figure 12, at a pulse width of 0.1 ms and D = 0.2, the reading of $r(t_1, D)$ is 0.27.

The peak rise in function temperature is therefore:

$$\Delta T = r(t) \times P_P \times \theta_{JC} = 0.27 \times 50 \times 3.12 = 42.2°C$$
