## CONTROL AND STATUS SIGNALS (CONTINUED)

### Output Signals

#### INPUT\_OK

Signal used to indicate the presence of DC input to the power supply. A logic level HIGH will indicate that the DC input to the power supply is within the operating range while a logic level LOW will indicate that input has been lost.

This is an open collector/drain output. This pin is pulled high by a 1 kohm resistor connected to 3.3 V inside the power supply. It is recommended that this pin be connected to a 200 pF decoupling capacitor and pulled down by a 100 kohm resistor.

		MIN	MAX
V <sub>OH</sub>	Output high voltage	2.4 V	3.6 V
V <sub>OL</sub>	Output low voltage		0.4 V
I <sub>SOURCE</sub>	Output signal source current		2 mA
I <sub>SINK</sub>	Output signal sink current		4 mA

#### PWR\_GOOD / PWOK

Signal used to indicate that main output voltage is within regulation range. The PWR\_GOOD signal will be driven HIGH when the output voltage is valid and will be driven LOW when the output falls below the under-voltage threshold.

This signal also gives an advance warning when there is an impending power loss due to loss of DC input or system shutdown request. More details in the Timing Section.

This is an open collector/drain output. This pin is pulled high by a 1 kohm resistor connected to 3.3 V inside the power supply. It is recommended that this pin be connected to a 100 pF decoupling capacitor and pulled down by a 100 kohm resistor.

		MIN	MAX
V <sub>OH</sub>	Output high voltage	2.4 V	3.6 V
V <sub>OL</sub>	Output low voltage		0.4 V
I <sub>SOURCE</sub>	Output signal source current		2 mA
I <sub>SINK</sub>	Output signal sink current		4 mA

#### PS\_PRESENT

Signal used to indicate to the system that a power supply is inserted in the power bay. This pin is connected via a 220 ohm resistor to the standby return in the power supply. Recommended pull-up resistor to VSB is 5.1 kohms. A 100 pF decoupling capacitor is also recommended.

#### PS\_INTERRUPT

Active low signal used by the power supply to indicate to the system that a change in power supply status has occurred. This event can be triggered by faults such as OVP, OCP, OTP, and fan fault. This signal can be cleared by a CLEAR\_FAULT command. Recommended pull-up resistor to VSB is 5.1 kohms. A 100 pF decoupling capacitor is also recommended.

		MIN	MAX
V <sub>OH</sub>	Output high voltage	2.4 V	3.6 V
V <sub>OL</sub>	Output low voltage		0.4 V
I <sub>SOURCE</sub>	Current that may be sourced by this pin		4 mA
I <sub>SINK</sub>	Current that may be sunk by this pin at low state		4 mA

### BUS Signals

#### ISHARE

Bus signal used by the power supply for active current sharing. All power supplies configured in the system for n+n sharing will refer to this bus voltage in order to load share.

Voltage Range The range of this signal for active sharing will be up to 8.0 V, which corresponds to the maximum output current.

		MIN	MAX
I <sub>SHARE</sub> Voltage	Input logic level LOW	7.75	8.25
	Voltage at 50% load, stand-alone unit	3.85	4.15
	Voltage at 0% load, stand-alone unit	0	1.0
I <sub>SOURCE</sub>	Current that may be sourced by this pin		4.0 mA

#### SCL, SDA

Clock and data signals defined as per I<sup>2</sup>C requirements. These pins are pulled high internally to 3.3V by a 100kohm resistor. It is recommended that these pins be pulled-up to a 2.2 kohm resistor to 3.3 V and a 200 pF decoupling capacitor at the system side.

VL	Input logic level LOW		0.8 V
VH	Input logic level HIGH	2.0 V	3.6 V

Note: All signal noise levels are below 400 mVpk-pk from 0 - 100 MHz.
