- NOTES:
1. Temperature rise is 55°C in typical buck or boost circuits operating at 300kHz with rated Idc current and reference ET applied to inductor.
 2. Total inductor loss is 1.8W for 55°C temperature rise above ambient.
 3. In high volt-time applications, additional heating in the component can occur due to core losses in the inductor which may necessitate derating the current in order to limit the temperature rise of the component. In order to determine the approximate total losses (or temperature rise) for a given application, both copper and core losses should be taken into account.

Estimated Temperature Rise:

$$\text{Trise} = K3 * (\text{Coreloss(W)} + \text{Copperloss(W)})^{.833} \text{ (C)}$$

$$\text{CopperLoss} = \text{Irms}^2 * \text{DCR}_{\text{Typical}}(\text{m}\Omega) / 1000$$

$$\text{CoreLoss} = K2 * (\text{Freq_kHz})^{1.26} * (\Delta B)^{2.11}$$

$$\Delta B = K1 * \text{Volt-}\mu\text{sec} * 100$$

4. Optional Tape & Reel packaging can be ordered by adding a "T" suffix to the part number (i.e. PL8304 becomes **PL8304T**).
