Efficiency vs Output Power

Recommended gate drive: (0V, 8-10V) with $R_{G(tot)} = 15\Omega$, where $R_{G(tot)} = R_G + R_{DRIVER}$

Required DC Link RC Snubber (RC_{DCL}) ^a	Recommended Switching Node RC Snubber (RC_{SN}) ^{b, c}
$[10nF + 8\Omega] \times 2$	$100pF + 10\Omega$

Notes:

- RC_{DCL} should be placed as close as possible to the drain pin
- A switching node RC snubber (C, R) is recommended for high switching currents (>70% of I_{RDMC1} or I_{RDMC2} ; see page 5 for I_{RDMC1} and I_{RDMC2})
- I_{RDM} values can be increased by increasing R_G and C_{SN}

Design Considerations

The fast switching of GaN devices reduces current-voltage crossover losses and enables high frequency operation while simultaneously achieving high efficiency. However, taking full advantage of the fast switching characteristics of GaN switches requires adherence to specific PCB layout guidelines and probing techniques.

Before evaluating Transphorm GaN devices, see application note [Printed Circuit Board Layout and Probing for GaN Power Switches](#). The table below provides some practical rules that should be followed during the evaluation.

When Evaluating Transphorm GaN Devices:

DO	DO NOT
Minimize circuit inductance by keeping traces short, both in the drive and power loop	Twist the pins of TO-220 or TO-247 to accommodate GDS board layout
Minimize lead length of TO-220 and TO-247 package when mounting to the PCB	Use long traces in drive circuit, long lead length of the devices
Use shortest sense loop for probing; attach the probe and its ground connection directly to the test points	Use differential mode probe or probe ground clip with long wire
See AN0003 : Printed Circuit Board Layout and Probing
