1 OVERVIEW AND KEY FEATURES

Every BL654PA module is designed to simplify OEMs enablement of Bluetooth Low Energy (BLE) v5.0 and Thread (802.15.4) to small, portable, highly power-conscious devices. The BL654PA provides engineers with considerable design flexibility in both hardware and software programming capabilities.

Based on the world-leading Nordic Semiconductor nRF52840 chipset, the BL654PA modules provide ultra-low power consumption with outstanding wireless range via +18 dBm of transmit power and the Long Range (CODED PHY) Bluetooth 5 feature. New circuitry both increases TX power and decreases sleep current for impeccable power management. The BL654PA is programmable via AT commands and Laird's *smartBASIC* language

smartBASIC is an event-driven programming language that is highly optimized for memory-constrained systems such as embedded modules. It was designed to make BLE development quicker and simpler, vastly cutting down time to market.

Note: BL654PA hardware provides all functionality of the nRF52840 chipset used in the module design. This is a hardware datasheet only – it does not cover the software aspects of the BL654PA.

For customers using *smartBASIC*, refer to the *smartBASIC* extensions guide (available from the [BL654PA product page](#) of the Laird website).

1.1 Features and Benefits

- Bluetooth v5.0 – Single mode
- NFC
- 802.15.4 (Thread) radio support
- External or internal antennas
- Multiple programming options
 - *smartBASIC*
 - AT command set
- Compact footprint
- Programmable Tx power +18 dBm to -6 dBm, -26 dBm
 - LE Coded max Tx is +14dBm
- Rx sensitivity – -98.5 dBm (1 Mbps), - 107dBm (125 kbps)
- Ultra-low power consumption
- Tx @ +18dBm– 102.2 mA peak (at 18 dBm, DCDC on)
(See [Note 1](#) in the *Power Consumption* section)
- Rx: 10.9 mA peak (DCDC on)
(See [Note 1](#) in the *Power Consumption* section)
- Standby Doze – 5.9 uA typical
- Deep Sleep – 2.0 uA – (See [Note 4](#) in the *Power Consumption* section)
- UART, GPIO, ADC, PWM, FREQ output, timers, I2C, SPI, I2S, PDM, and USB interfaces
- Fast time-to-market
- FCC, IC, RCM and Korea-certified
- Full Bluetooth Declaration ID
- Other regulatory certifications on request
- No external components required
- Industrial temperature range (-40° C to +85° C)

1.2 Application Areas

- Medical devices
- IoT Sensors
- Factory Automation
- HVAC Controllers
- Location awareness
- Home automation

2 SPECIFICATION

2.1 Specification Summary

Categories/Feature	Implementation	
Wireless Specification		
Bluetooth®	<ul style="list-style-type: none">BT 5.0 – Single mode4x Range (CODED PHY support) – BT 5.02x Speed (2M PHY support) – BT 5.0Concurrent master, slaveDiffie-Hellman based pairing (LE Secure Connections) – BT 4.2Data Packet Length Extension – BT 4.2Link Layer Privacy (LE Privacy 1.2) – BT 4.2LE Dual Mode Topology – BT 4.1LE Ping – BT 4.1	
Frequency	2.402 - 2.480 GHz	
Raw Data Rates	1 Mbps BLE (over-the-air) 2 Mbps BLE (over-the-air) 125 kbps BLE (over-the-air)	
Maximum Transmit Power Setting See Note 4 in <i>Module Specification Notes</i> .	+18 dBm conducted	453-00020 (integrated antenna)
	+18 dBm conducted	453-00021 (external antenna)
Minimum Transmit Power Setting	-26 dBm, -6 dBm, 0 dBm, 6 dBm, 14 dBm	
Receive Sensitivity (≤37 byte packet)	BLE 1 Mbps (BER=1E-3)	-98.5 dBm typical
	BLE 2 Mbps	-95 dBm typical
	BLE 125 kbps	-107 dBm typical
Link Budget (conducted)	116.5 dB	@ BLE 1 Mbps
	121 dB	@ BLE 125 kbps
Maximum Received Signal Strength at <0.1% PER	-11dBm (limited by 11dB RX LNA gain)	
RF Cellular Coexistence		
RF Band Pass Filter	Assists with cellular RF co-existence	

Categories/Feature	Implementation
NFC	
NFC-A Listen mode compliant	Based on NFC forum specification
	<ul style="list-style-type: none"> 13.56 MHz Data rate 106 kbps NFC Type 2 and Type 4 emulation
	Modes of Operation:
	<ul style="list-style-type: none"> Disable Sense Activated
System Wake-On-Field function	Use Cases:
	<ul style="list-style-type: none"> Touch-to-Pair with NFC NFC enabled out of band (OOB) pairing
Proximity Detection	
Host Interfaces and Peripherals	
Total	46 x multifunction I/O lines
UART	<ul style="list-style-type: none"> 2 UARTs Tx, Rx, CTS, RTS DCD, RI, DTR, DSR (See Note 1 in the Module Specification Notes) Default 115200, n, 8, 1 From 1,200 bps to 1 Mbps
USB	<ul style="list-style-type: none"> USB 2.0 FS (Full Speed, 12 Mbps) CDC driver/virtual UART (baud rate TBD)
GPIO	Up to 46, with configurable:
	<ul style="list-style-type: none"> I/O direction O/P drive strength (standard 0.5 mA or high 3mA/5 mA), Pull-up/pull-down Input buffer disconnect
ADC	<ul style="list-style-type: none"> Eight 8/10/12-bit channels 0.6 V internal reference
	<ul style="list-style-type: none"> Configurable 4, 2, 1, 1/2, 1/3, 1/4, 1/5 1/6 (default) pre-scaling Configurable acquisition time 3uS, 5uS, 10uS (default), 15uS, 20uS, 40uS. One-shot mode
PWM Output	PWM outputs on 16 GPIO output pins.
	<ul style="list-style-type: none"> PWM output duty cycle: 0%-100% PWM output frequency: Up to 500 kHz
FREQ Output	FREQ outputs on 16 GPIO output pins.
	<ul style="list-style-type: none"> FREQ output frequency: 0 MHz to 4 MHz (50% duty cycle)
I2C	Two I2C interface (up to 400 kbps) – See Note 2 in the Module Specification Notes
SPI	Four SPI Master Slave interface (up to 4 Mbps)
QSPI	<ul style="list-style-type: none"> One 32-MHz QSPI interface. Gives XIP (execute in place) capability External serial flash IC must be fitted as per Nordic specifications
Temperature Sensor	<ul style="list-style-type: none"> One temperature sensor Temperature range equal to the operating temperature range
	<ul style="list-style-type: none"> Resolution 0.25 degrees

Categories/Feature	Implementation				
RSSI Detector	<ul style="list-style-type: none"> One RF received signal strength indicator ± 2 dB accuracy (valid over -101 dBm to -31 dBm) – added 11 dB LNA gain One dB resolution 				
I2S	One inter-IC sound interface				
PDM	One pulse density modulation interface				
Optional (External to the BL654PA module)					
External 32.768 kHz crystal	For customer use, connect +/-20 ppm accuracy crystal for more accurate protocol timing.				
Profiles					
Services supported	<ul style="list-style-type: none"> Central mode Peripheral mode Custom and adopted profiles 				
Programmability					
<i>smartBASIC</i>	<ul style="list-style-type: none"> FW upgrade via JTAG or UART Application download via UART or via over-the-air (if SIO_02 pin is pulled high externally) 				
Operating Modes					
<i>smartBASIC</i>	<p>Self-contained Run mode</p> <ul style="list-style-type: none"> Selected by nAutoRun pin status: LOW (0V). Then runs \$autorun\$ (<i>smartBASIC</i> application script) if it exists. <p>Interactive/Development mode</p> <ul style="list-style-type: none"> HIGH (VDD). Then runs via at+run (and <i>file name of smartBASIC</i> application script). 				
Supply Voltage					
Supply (VDD or VDD_HV) options	<ul style="list-style-type: none"> Normal voltage mode VDD 3.0- 3.6 V – Internal DCDC converter or LDO (See Note 3 in the <i>Module Specification Notes</i>) OR High voltage mode VDD_HV 3.0V-5.5V Internal DCDC converter or LDO (See Note 3 in the <i>Module Specification Notes</i>) 				
Power Consumption					
Active Modes Peak Current (for maximum Tx power +18 dBm) – Radio only	102.2 mA peak Tx (with DCDC)				
Active Modes Peak Current (for Tx power -26 dBm) – Radio only	18.5 mA peak Tx (with DCDC)				
Active Modes Average Current	Depends on many factors, see Power Consumption				
Ultra-low Power Modes	<table> <tr> <td>Standby Doze</td><td>5.9 uA typical</td></tr> <tr> <td>Deep Sleep</td><td>2.0 uA</td></tr> </table>	Standby Doze	5.9 uA typical	Deep Sleep	2.0 uA
Standby Doze	5.9 uA typical				
Deep Sleep	2.0 uA				
Antenna Options					
Internal	Printed PCB monopole antenna – on-board 453-00020 variant				

Categories/Feature	Implementation
External	<ul style="list-style-type: none"> ▪ Dipole antenna (with IPEX connector) ▪ Dipole PCB antenna (with IPEX connector) ▪ Connection via IPEX MH4 – 453-00021 variant See the Antenna Information sections for FCC and IC, RCM, and Korea
Physical	
Dimensions	22.0 mm x 10 mm x 2.2 mm Pad Pitch – 0.8 mm Pad Type – Two rows of pads
Weight	<1 gram
Environmental	
Operating	-40 °C to +85 °C
Storage	-40 °C to +85 °C
Miscellaneous	
Lead Free	Lead-free and RoHS compliant
Warranty	One-year warranty
Development Tools	
Development Kit	Development kit per module SKU (455-00022 and 455-00023) and free software tools
Approvals	
Bluetooth®	Full Bluetooth SIG Declaration ID
FCC/IC/KC/RCM	All BL654PA types

Module Specification Notes:

Note 1	DSR, DTR, RI, and DCD can be implemented in the <i>smart</i> BASIC application
Note 2	With I2C interface selected, pull-up resistors on I2C SDA and I2C SCL must be connected externally as per I2C standard.
Note 3	Use of the internal DCDC convertor or LDO is decided by the underlying BLE stack.
Note 4	For BL654PA BLE coded PHY 125kbps (s=8), the RF TX power is limited to 14 dBm (conducted) to be within the FCC/IC TX power spectral density limit.

79	GND	-	-	-	-	-	-	Added GND in the BL654PA

Pin Definition Notes:

Note 1	SIO = Signal Input or Output. Secondary function is selectable in <i>smartBASIC</i> application or via Nordic SDK. I/O voltage level tracks VDD. AIN = Analog Input.
Note 2	<p>At reset, all SIO lines are configured as the defaults shown above.</p> <p>SIO lines can be configured through the <i>smartBASIC</i> application script to be either inputs or outputs with pull-ups or pull-downs. When an alternative SIO function is selected (such as I2C or SPI), the firmware does not allow the setup of internal pull-up/pull-down. Therefore, when I2C interface is selected, pull-up resistors on I2C SDA and I2C SCL must be connected externally as per I2C standard.</p>
Note 3	<p>JTAG (two-wire SWD interface), pin 1 (SWDIO) and pin 3 (SWDCLK).</p> <p>JTAG is required because Nordic SDK applications can only be loaded using JTAG (<i>smartBASIC</i> firmware can be loaded using the JTAG as well as UART). We recommend that you use JTAG (2-wire interface) to handle future BL654PAmodule <i>smartBASIC</i> firmware upgrades. You MUST wire out the JTAG (2-wire interface) on your host design (see Figure 7, where four lines (SWDIO, SWDCLK, GND and VDD) should be wired out. <i>smartBASIC</i> firmware upgrades can still be performed over the BL654PAUART interface, but this is slower (60 seconds using UART vs. 10 seconds when using JTAG) than using the BL654PAJTAG (2-wire interface).</p> <p>Upgrading <i>smartBASIC</i> firmware or loading the <i>smartBASIC</i> applications is done using the UART interface.</p>
Note 4	Pull the nRESET pin (pin 19) low for minimum 100 milliseconds to reset the BL654PA.
Note 5	The SIO_02 pin (pin 50) must be pulled high externally to enable VSP (Virtual Serial Port) which would allow OTA (over-the-air) <i>smartBASIC</i> application download. Refer to the latest firmware release documentation for details.
Note 6	Ensure that SIO_02 (pin 50) and AutoRUN (pin 5) are not both high (externally), in that state, the UART is bridged to Virtual Serial Port service; the BL654PAmodule does not respond to AT commands and cannot load <i>smartBASIC</i> application scripts.
Note 7	<p>Pin 5 (nAutoRUN) is an input, with active low logic. In the development kit it is connected so that the state is driven by the host's DTR output line. The nAutoRUN pin must be externally held high or low to select between the following two BL654PAoperating modes:</p> <ul style="list-style-type: none"> Self-contained Run mode (nAutoRUN pin held at 0V –this is the default (internal pull-down enabled)) Interactive/Development mode (nAutoRUN pin held at VDD) <p>The <i>smartBASIC</i> firmware checks for the status of nAutoRUN during power-up or reset. If it is low and if there is a <i>smartBASIC</i> application script named \$autorun\$, then the <i>smartBASIC</i> firmware executes the application script automatically; hence the name <i>Self-contained Run Mode</i>.</p>
Note 8	<p>The <i>smartBASIC</i> firmware has SIO pins as Digital (Default Function) INPUT pins, which are set PULL-UP by default. This avoids floating inputs (which can cause current consumption to drive with time in low power modes (such as Standby Doze). You can disable the PULL-UP through your <i>smartBASIC</i> application.</p> <p>All of the SIO pins (with a default function of DIO) are inputs (apart from SIO_05 and SIO_06, which are outputs):</p> <ul style="list-style-type: none"> SIO_06 (alternative function UART_TX) is an output, set High (in the firmware). SIO_05 (alternative function UART_RTS) is an output, set Low (in the firmware). SIO_08 (alternative function UART_RX) is an input, set with internal pull-up (in the firmware). SIO_07 (alternative function UART_CTS) is an input, set with internal pull-down (in the firmware). SIO_02 is an input set with internal pull-down (in the firmware). It is used for OTA downloading of <i>smartBASIC</i> applications. Refer to the latest firmware extension documentation for details. UART_RX, UART_TX, and UART_CTS are 3.3 V level logic (if VDD is 3.3 V; such as SIO pin I/O levels track VDD). For example, when Rx and Tx are idle, they sit at 3.3 V (if VDD is 3.3 V). Conversely, handshaking pins CTS and RTS at 0V are treated as assertions.

Pin Definition Notes:

Note 9	BL654PA also allows an option to connect an external higher accuracy (± 20 ppm) 32.768 kHz crystal to the BL654PA pins SIO_01/XL2 (pin 41) and SIO_00/XL1 (pin 42). This provides higher accuracy protocol timing and helps with radio power consumption in the system standby doze/deep sleep modes by reducing the time that the Rx window must be open.
Note 10	<p>Not required for BL654PA module normal operation. The on-chip 32.768 kHz LFRC oscillator provides the standard accuracy of ± 500 ppm, with calibration required every eight seconds (default) to stay within ± 500 ppm.</p> <p>BL654PA power supply options:</p> <ul style="list-style-type: none"> Option 1 – Normal voltage power supply mode entered when the external supply voltage is connected to both the VDD and VDD_HV pins (so that VDD equals VDD_HV). Connect external supply within range 3.0V to 3.6V range to BL654PA VDD and VDD_HV pins. <p>OR</p> <ul style="list-style-type: none"> Option 2 – High voltage mode power supply mode (using BL654PA VDD_HV pin) entered when the external supply voltage is ONLY connected to the VDDH pin and the VDD pin is not connected to any external voltage supply. Connect external supply within range 3.0V to 5.5V range to BL654PA VDD_HV pin. BL654PA VDD pin left unconnected. <p>For either option, if you use USB interface then the BL654PA VBUS pin must be connected to external supply within the range 4.35V to 5.5V. When using the BL654PA VBUS pin, you MUST externally fit a 4.7uF to ground.</p>

3.3 Electrical Specifications

3.3.1 Absolute Maximum Ratings

Absolute maximum ratings for supply voltage and voltages on digital and analogue pins of the module are listed below; exceeding these values causes permanent damage.

Table 2: Maximum current ratings

Parameter	Min	Max	Unit
Voltage at VDD pin	-0.3	+3.9 (Note 1)	V
Voltage at VDD_HV pin	-0.3	+5.5	V
VBUS	-0.3	+5.8	V
Voltage at GND pin		0	V
Voltage at SIO pin (at $VDD \leq 3.6V$)	-0.3	VDD +0.3	V
Voltage at SIO pin (at $VDD \geq 3.6V$)	-0.3	3.9	V
NFC antenna pin current (NFC1/2)	-	80	mA
Radio RF input level	-	-1	dBm
Environmental			
Storage temperature	-40	+85	°C
MSL (Moisture Sensitivity Level)	-	4	-
ESD (as per EN301-489)			
Conductive		4	KV
Air Coupling		8	KV
Flash Memory (Endurance) (Note 2)	-	10000	Write/erase cycles
Flash Memory (Retention)	-	10 years at 40 °C	-

Maximum Ratings Notes:

Note 1 The absolute maximum rating for VDD pin (max) is 3.9V for the BL654PA.

Note 2 Wear levelling is used in file system.

3.3.2 Recommended Operating Parameters**Table 3: Power supply operating parameters**

Parameter	Min	Typ	Max	Unit
VDD (independent of DCDC) ¹ supply range	3.0	3.3	3.6	V
VDD_HV (independent of DCDC) supply range	3.0	3.7	5.5	V
VBUS USB supply range	4.35	5	5.5	V
VDD Maximum ripple or noise ²	-	-	10	mV
VDD supply rise time (0V to 1.7V) ³	-	-	60	mS
Time in Power				mS
				mS
				mS
VDD_HV supply rise time (0V to 3.7V) ³			100	mS
Operating Temperature Range	-40	-	+85	°C
Maximum Received Signal Strength at <0.1% PER		-11		dBm

Recommended Operating Parameters Notes:

Note 1 4.7 uF internal to module on VDD. The internal DCDC convertor or LDO is decided by the underlying BLE stack.

Note 2 This is the maximum VDD or VDD_HV ripple or noise (at any frequency) that does not disturb the radio.

Note 3 The on-board power-on reset circuitry may not function properly for rise times longer than the specified maximum.

Note 4 BL654PA power supply options:

- **Option 1** – Normal voltage power supply mode entered when the external supply voltage is connected to both the VDD and VDD_HV pins (so that VDD equals VDD_HV). Connect external supply within range 3.0V to 3.6V range to BL654PA VDD and VDD_HV pins.

OR

- **Option 2** – High voltage mode power supply mode (using BL654PA VDD_HV pin) entered when the external supply voltage is ONLY connected to the VDD_HV pin and the VDD pin is not connected to any external voltage supply. Connect external supply within range 3.0V to 5.5V range to BL654PA VDD_HV pin. BL654PA VDD pin left unconnected.

For either option, if you use USB interface then the BL654PA VBUS pin must be connected to external supply within the range 4.35V to 5.5V. When using the BL654PA VBUS pin, you MUST externally fit a 4.7uF to ground.

Table 4: Signal levels for interface, SIO

Parameter	Min	Typ	Max	Unit
V _{IH} Input high voltage	0.7 VDD		VDD	V
V _{IL} Input low voltage	VSS		0.3 x VDD	V
V _{OH} Output high voltage				

Parameter	Min	Typ	Max	Unit
(std. drive, 0.5 mA) (Note 1)	VDD -0.4		VDD	V
(high-drive, 3 mA) (Note 1)	VDD -0.4		VDD	V
(high-drive, 5mA) (Note 2)	VDD -0.4		VDD	
V _{OL} Output low voltage				
(std. drive, 0.5 mA) (Note 1)	VSS		VSS+0.4	V
(high-drive, 3mA) (Note 1)	VSS		VSS+0.4	V
(high-drive, 5mA) (Note 2)	VSS		VSS+0.4	
V _{OL} Current at VSS+0.4V, Output set low				
(std. drive, 0.5 mA) (Note 1)	1	2	4	mA
(high-drive, 3 mA) (Note 1)	3	-	-	mA
(high-drive, 5 mA) (Note 2)	6	10	15	mA
V _{OL} Current at VDD -0.4, Output set low				
(std. drive, 0.5 mA) (Note 1)	1	2	4	mA
(high-drive, 3 mA) (Note 1)	3	-	-	mA
(high-drive, 5 mA) (Note 2)	6	9	14	mA
Pull up resistance	11	13	16	kΩ
Pull down resistance	11	13	16	kΩ
Pad capacitance		3		pF
Pad capacitance at NFC pads		4		pF

Signal Levels Notes:

- Note 1** For VDD ≥ 1.7V. The firmware supports high drive (3 mA, as well as standard drive).
- Note 2** For VDD ≥ 2.7V. The firmware supports high drive (5 mA (since VDD ≥ 2.7V), as well as standard drive).
- The GPIO (SIO) high reference voltage always equals the level on the **VDD** pin.
- Normal voltage mode – The GPIO high level equals the voltage supplied to the VDD pin
 - High voltage mode – The GPIO high level equals the level specified (is configurable to 1.8V, 2.1V, 2.4V, 2.7V, 3.0V, and 3.3V. The default voltage is 1.8V). In High voltage mode, the VDD pin becomes an output voltage pin. The VDD output voltage and hence the GPIO is configurable from 1.8V to 3.3V with possible settings of 1.8V, 2.1V, 2.4V, 2.7V, 3.0V, and 3.3V. Refer to [Table 15](#) for additional details.

Table 5: SIO pin alternative function AIN (ADC) specification

Parameter	Min	Typ	Max	Unit
Maximum sample rate			200	kHz
ADC Internal reference voltage	-1.5%	0.6 V	+1.5%	%
ADC pin input internal selectable scaling		4, 2, 1, 1/2, 1/3, 1/4, 1/5 1/6		scaling
ADC input pin (AIN) voltage maximum without damaging ADC w.r.t (see Note 1)				
VCC Prescaling				
0V-VDD	4, 2, 1, 1/2, 1/3, 1/4, 1/5, 1/6	VDD+0.3		V

Parameter	Min	Typ	Max	Unit
Maximum sample rate			200	kHz
Configurable Resolution	8-bit mode	10-bit mode	12-bit mode	bits
Configurable (see Note 2)				
Acquisition Time, source resistance $\leq 10\text{k}\Omega$		3		μS
Acquisition Time, source resistance $\leq 40\text{k}\Omega$		5		μS
Acquisition Time, source resistance $\leq 100\text{k}\Omega$		10		μS
Acquisition Time, source resistance $\leq 200\text{k}\Omega$		15		μS
Acquisition Time, source resistance $\leq 400\text{k}\Omega$		20		μS
Acquisition Time, source resistance $\leq 800\text{k}\Omega$		40		μS
Conversion Time (see Note 3)		<2		μS
ADC input impedance (during operation) (see Note 3)				
Input Resistance		>1		M Ω
Sample and hold capacitance at maximum gain		2.5		pF

Recommended Operating Parameters Notes:

Note 1	Stay within internal 0.6 V reference voltage with given pre-scaling on AIN pin and do not violate ADC maximum input voltage (for damage) for a given VCC, e.g. If VDD is 3.6V, you can only expose AIN pin to VDD+0.3 V. Default pre-scaling is 1/6 which configurable via <i>smartBASIC</i> .
Note 2	<p>Firmware allows configurable resolution (8-bit, 10-bit or 12-bit mode) and acquisition time. BL654PA ADC is a Successive Approximation type ADC (SSADC), as a result no external capacitor is needed for ADC operation. Configure the acquisition time according to the source resistance that customer has.</p> <p>The sampling frequency is limited by the sum of sampling time and acquisition time. The maximum sampling time is 2μs. For acquisition time of 3μs the total conversion time is therefore 5μs, which makes maximum sampling frequency of $1/5\mu\text{s} = 200\text{kHz}$. Similarly, if acquisition time of 40μs chosen, then the conversion time is 42μs and the maximum sampling frequency is $1/42\mu\text{s} = 23.8\text{ kHz}$.</p>
Note 3	ADC input impedance is estimated mean impedance of the ADC (AIN) pins.

3.4 Programmability

3.4.1 BL654PA Default Firmware

The BL654PA module comes loaded with *smartBASIC* firmware but does not come loaded with any *smartBASIC* application script (as that is dependent on customer-end application or use). Laird provides many sample *smartBASIC* application scripts via a sample application folder on GitHub – <https://github.com/LairdCP/BL654-Applications>

Therefore, it boots into AT command mode by default.

3.4.2 BL654PA Special Function Pins in *smartBASIC*

Refer to the *smartBASIC* extension manual for details of functionality connected to this:

- nAutoRUN pin (SIO_35), see [Table 6](#) for default
- VSP pin (SIO_02), see [Table 7](#) for default
- SIO_38 – Reserved for future use. Do not connect. See [Table 8](#)

Table 6: nAutoRUN pin

Signal Name	Pin #	I/O	Comments
nAutoRUN /(SIO_35)	5	I	Input with active low logic. Internal pull down (default). Operating mode selected by nAutoRun pin status: <ul style="list-style-type: none"> Self-contained Run mode (nAutoRUN pin held at 0V). If Low (0V), runs \$autorun\$ if it exists Interactive/Development mode (nAutoRUN pin held at VCC). If High (VCC), runs via at+run (and file name of application)

In the development board nAutoRUN pin is connected so that the state is driven by the host's DTR output line.

Table 7: VSP mode

Signal Name	Pin #	I/O	Comments
SIO_02	50	I	Internal pull down (default). VSP mode selected by externally pulling-up SIO_02 pin: High (VCC) , then OTA <i>smartBASIC</i> application download is possible.

Table 8: SIO_38

Signal Name	Pin #	I/O	Comments
SIO_38	63	I	Internal pull up (default). Reserved for future use. Do not connect if using smartBASIC FW.

4 POWER CONSUMPTION

Data at VDD of 3.3 V with internal (to chipset) LDO ON or with internal (to chipset) DCDC ON (see Power Consumption [Note 1](#)) and 25°C.

4.1 Power Consumption

Table 9: Power consumption

Parameter	Min	Typ	Max	Unit
With DCDC [with LDO]				
Active mode 'peak' current (Note 1)				
(Advertising or Connection)				
Tx only run peak current @ Txpwr = +18 dBm		102.2 [112.7]		mA
Tx only run peak current @ Txpwr = +14 dBm		65.9 [77.0]		mA
Tx only run peak current @ Txpwr = 6 dBm		37.2 [44.4]		mA
Tx only run peak current @ Txpwr = 0 dBm		25.5 [30.5]		mA
Tx only run peak current @ Txpwr = -6 dBm		21.2 [25.3]		mA
Tx only run peak current @ Txpwr = -26 dBm		18.5 [21.8]		mA
Active Mode				
Rx only 'peak' current, BLE 1 Mbps (Note 1)		10.9 [17.3]		mA
Ultra-Low Power Mode 1 (Note 2)				
Standby Doze, 256 k RAM retention		5.9		uA
Ultra-Low Power Mode 2 (Note 3)				
Deep Sleep (no RAM retention)		2.0		uA
Active Mode Average current (Note 4)				

Parameter	Min	Typ	Max	Unit
Advertising Average Current draw				
Max , with advertising interval (min) 20 mS		Note4		uA
Min , with advertising interval (max) 10240 mS		Note4		uA
Connection Average Current draw				
Max , with connection interval (min) 7.5 mS		Note4		uA
Min , with connection interval (max) 4000 mS		Note4		uA

Power Consumption Notes:

Note 1	This is for Peak Radio Current only, but there is additional current due to the MCU. The Normal Voltage mode internal REG1 DCDC convertor or LDO is decided by the underlying BLE stack.
Note 2	<p>BL654PA modules Standby Doze is 5.9uA typical. When using <i>smartBASIC</i> firmware, Standby Doze is entered automatically (when a waitevent statement is encountered within a smartBASIC application script). In Standby Doze, all peripherals that are enabled stay on and may re-awaken the chip. Depending on active peripherals, current consumption ranges from 5.9 uA to 370 uA (when UART is ON). See individual peripherals current consumption data in the Peripheral Block Current Consumption section. smartBASIC firmware has functionality to detect GPIO change with no current consumption cost, it is possible to close the UART and get to the 5.9 uA current consumption regime and still be able to detect for incoming data and be woken up so that the UART can be re-opened at expense of losing that first character.</p> <p>The BL654PA Standby Doze current consists of the below nRF52840 blocks:</p> <ul style="list-style-type: none"> ▪ nRF52 System ON IDLE current (no RAM retention) (0.97 uA) – This is the base current of the CPU ▪ LFRC (0.7 uA) and RTC (0.1uA) running as well as 256k RAM retention (1.4 uA) – This adds to the total of 3.1 uA typical. The RAM retention is 20nA per 4k block (1.28uA), but this can vary to 30nA per 4k block (1.92uA) which would make the total 3.7uA. ▪ BL654PA PA and LNA and associated circuitry takes the rest.
Note 3	<p>In Deep Sleep, everything is disabled and the only wake-up sources (including NFC to wakeup) are reset and changes on SIO or NFC pins on which sense is enabled. The current consumption seen is ~2.0 uA typical in BL654PA modules.</p> <ul style="list-style-type: none"> ▪ Coming out from Deep Sleep to Standby Doze through the reset vector.
Note 4	<p>Average current consumption depends on several factors (including Tx power, VCC, accuracy of 32MHz and 32.768 kHz). With these factors fixed, the largest variable is the advertising or connection interval set.</p> <p>Advertising Interval range:</p> <ul style="list-style-type: none"> ▪ 20 milliseconds to 10240 mS (10485759.375 mS in BT5.0) in multiples of 0.625 milliseconds. <p>For an advertising event:</p> <ul style="list-style-type: none"> ▪ The minimum average current consumption is when the advertising interval is large 10240 mS (10485759.375 mS (in BT5.0) although this may cause long discover times (for the advertising event) by scanners ▪ The maximum average current consumption is when the advertising interval is small 20 mS <p>Other factors that are also related to average current consumption include the advertising payload bytes in each advertising packet and whether it's continuously advertising or periodically advertising.</p> <p>Connection Interval range (for a peripheral):</p> <ul style="list-style-type: none"> ▪ 7.5 milliseconds to 4000 milliseconds in multiples of 1.25 milliseconds. <p>For a connection event (for a peripheral device):</p> <ul style="list-style-type: none"> ▪ The minimum average current consumption is when the connection interval is large 4000 milliseconds ▪ The maximum average current consumption is with the shortest connection interval of 7.5 ms; no slave latency.

Power Consumption Notes:

Other factors that are also related to average current consumption include:

- Number packets per connection interval with each packet payload size
- An inaccurate 32.768 kHz master clock accuracy would increase the average current consumption.

Connection Interval range (for a central device):

- 2.5 milliseconds to 40959375 milliseconds in multiples of 1.25 milliseconds.

4.2 Peripheral Block Current Consumption

The values below are calculated for a typical operating voltage of 3V.

Table 10: UART power consumption

Parameter	Min	Typ	Max	Unit
UART Run current @ 115200 bps	-	55	-	uA
UART Run current @ 1200 bps	-	55	-	uA
Idle current for UART (no activity)	-	1	-	uA
UART Baud rate	1.2	-	1000	kbps

Table 11: power consumption

Parameter	Min	Typ	Max	Unit
SPI Master Run current @ 2 Mbps	-		50	uA
SPI Master Run current @ 8 Mbps	-		50	uA
Idle current for SPI (no activity)		<1		uA
SPI bit rate		-	8	Mbps

Table 12: I2C power consumption

Parameter	Min	Typ	Max	Unit
I2C Run current @ 100 kbps	-	50	-	uA
I2C Run current @ 400 kbps	-	50	-	uA
I2C Bit rate	100	-	400	kbps

Table 13: ADC power consumption

Parameter	Min	Typ	Max	Unit
ADC current during conversion	-	700	-	uA

The above current consumption is for the given peripheral only and to operate that peripheral requires some other internal blocks which consume current (base current). This base current is consumed when the UART, SPI, I2C, or ADC is opened (operated).

For asynchronous interface, like the UART (asynchronous as the other end can communicate at any time), the UART on the BL654PA must be kept open (by a command in *smartBASIC* application script), resulting in the base current consumption penalty.

For a synchronous interface like the I2C or SPI (since BL654PA side is the master), the interface can be closed and opened (by a command in *smartBASIC* application script) only when needed, resulting in current saving (no base current consumption penalty). There's a similar argument for ADC (open ADC when needed).

5 FUNCTIONAL DESCRIPTION

To provide the widest scope for integration, a variety of physical host interfaces/sensors are provided. The major BL654PA module functional blocks described below.

5.1 Power Management

Power management features:

- System Standby Doze and Deep Sleep modes
- Open/Close peripherals (UART, SPI, QSPI, I2C, SIO's, ADC, NFC). Peripherals consume current when open; each peripheral can be individually closed to save power consumption
- Use of the internal DCDC convertor or LDO is decided by the underlying BLE stack
- *smartBASIC* command allows the supply voltage to be read (through the internal ADC)
- Pin wake-up system from deep sleep (including from NFC pins)

Power supply features:

- Supervisor hardware to manage power during reset, brownout, or power fail.
- 3.0V to 3.6V supply range for normal power supply (VDD pin) using internal DCDC convertor or LDO decided by the underlying BLE stack.
- 3.0V to 5.5 supply range for High voltage power supply (VDD_HV pin) using internal DCDC convertor or LDO decided by the underlying BLE stack.
- 4.35V to 5.5V supply range for powering USB (VBUS pin) portion of BL654PA only. The remainder of the BL654PA module circuitry must still be powered through the VDD (or VDD_HV) pin.

5.2 BL654PA Power Supply Options

The BL654PA module power supply internally contains the following two main supply regulator stages (Figure 4):

- REG0 – Connected to the VDD_HV pin
- REG1 – Connected to the VDD pin

The USB power supply is separate (connected to the VBUS pin).

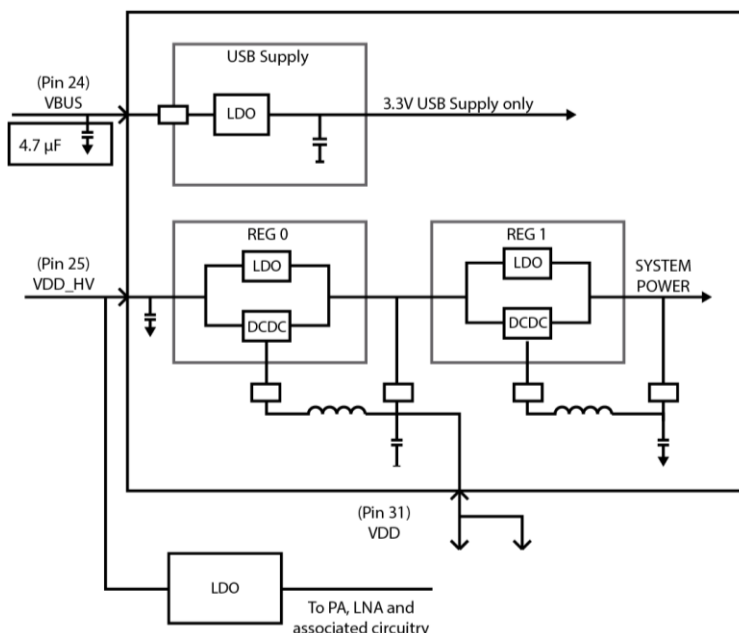

Figure 4: BL654PA power supply block diagram (adapted from the following resource:
http://infocenter.nordicsemi.com/pdf/nRF52840_PS_v1.0.pdf

The BL654PA power supply system enters one of two supply voltage modes, normal or high voltage mode, depending on how the external supply voltage is connected to these pins.

BL654PA power supply options:

- **Option 1** – Normal voltage power supply mode entered when the external supply voltage is connected to both the VDD and VDD_HV pins (so that VDD equals VDD_HV). Connect external supply within range 3.0V to 3.6V range to BL654PA VDD and VDD_HV pins.

OR

- **Option 2** – High voltage mode power supply mode (using BL654PA VDD_HV pin) entered when the external supply voltage is ONLY connected to the VDD_HV pin and the VDD pin is not connected to any external voltage supply. Connect external supply within range 3.0V to 5.5V range to BL654PA VDD_HV pin. BL654PA VDD pin left unconnected.

For either option, if you use USB interface then the BL654PA VBUS pin must be connected to external supply within the range 4.35V to 5.5V. When using the BL654PA VBUS pin, you **MUST** externally fit a 4.7uF to ground.

Table 14 summarizes these power supply options.

Table 14: BL654PA powering options

Power Supply Pins and Operating Voltage Range	OPTION 1 Normal voltage mode operation connect?	OPTION 2 High voltage mode operation connect?	OPTION 1 with USB peripheral, operation, and normal voltage connect?	OPTION 2 with USB peripheral, operation, and high voltage connect?
VDD (pin31) 3.0V to 3.6V	Yes (Note 1)	No (Note 2)	Yes	No (Note 2)
VDD_HV (pin25) 3.0V to 5.5V	No	Yes	No	Yes (Note 5)
VBUS (pin24) 4.35V to 5.5V	No	(Note 3)	Yes (Note 4)	Yes (Note 4)

Power Supply Option Notes:

Note 1 **Option 1** – External supply voltage is connected to BOTH the VDD and VDD_HV pins (so that VDD equals VDD_HV). Connect external supply within range 3.0V to 3.6V range to BOTH BL654PA VDD and VDD_HV pins.

Note 2 **Option 2** – External supply within range 3.0V to 5.5V range to the BL654PA VDD_HV pin ONLY. BL654PA VDD pin left unconnected.

In High voltage mode, the VDD pin becomes an output voltage pin. It can be used to supply external circuitry from the VDD pin. Before any current can be taken from the BL654PA VDD pin, this feature must be enabled in the BL654PA. Additionally, the VDD output voltage is configurable from 1.8V to 3.3V with possible settings of 1.8V, 2.1V, 2.4V, 2.7V, 3.0V, and 3.3V. The default voltage is 1.8V.

The supported BL654PA VDD pin output voltage range depends on the supply voltage provided on the BL654PA VDD_HV pin. The minimum difference between voltage supplied on the VDD_HV pin and the voltage output on the VDD pin is 0.3 V. The maximum output voltage of the VDD pin is VDDH – 0.3V. Table4 shows the current that can be drawn by external circuitry from VDD pin in high voltage mode (supply on VDD_HV).

Table 15: Current that can be drawn by external circuitry from VDD pin in High voltage mode (supply on VDD_HV)

Parameter	Min	Typ	Max	Unit
External current draw (from VDD pin) allowed in High Voltage mode (supply on VDD_HV) during System OFF (BL654PA Deep Sleep)			1	mA
External current draw (from VDD pin) allowed in High Voltage mode (supply on VDD_HV) when radio Tx RF power higher than 4dBm.			5	mA

Power Supply Option Notes:

	External current draw (from VDD pin) allowed in High Voltage mode (supply on VDD_HV) when radio Tx RF power lower than 4dBm.	25	mA
	Minimum difference between voltage supplied on VDD_HV pin and voltage on VDD pin	0.3	V
Note 3	External current draw is the sum of all GPIO currents and current being drawn from VDD. Depends on whether USB operation is required		
Note 4	When using the BL654PA VBUS pin, you must externally fit a 4.7uF capacitor to ground.		
Note 5	To use the BL654PA USB peripheral: <ol style="list-style-type: none"> 1. Connect the BL654PA VBUS pin to the external supply within the range 4.35V to 5.5V. When using the BL654PA VBUS pin, you MUST externally fit a 4.7 uF to ground. 2. Connect the external supply to either the VDD (Option 1) or VDD_HV (Option 2) pin to operate the rest of BL654PA module. When using the BL654PA USB peripheral, the VBUS pin can be supplied from same source as VDD_HV (within the operating voltage range of the VBUS pin and VDD_HV pin).		

5.3 Clocks and Timers

5.3.1 Clocks

The integrated high accuracy 32 MHz (± 10 ppm) crystal oscillator helps with radio operation and reducing power consumption in the active modes.

The integrated on-chip 32.768 kHz LFRC oscillator (± 500 ppm) provides protocol timing and helps with radio power consumption in the system StandByDoze and Deep Sleep modes by reducing the time that the RX window needs to be open.

To keep the on-chip 32.768 kHz LFRC oscillator within ± 500 ppm (which is needed to run the BLE stack) accuracy, RC oscillator needs to be calibrated (which takes 33 mS) regularly. The default calibration interval is eight seconds which is enough to keep within ± 500 ppm. The calibration interval ranges from 0.25 seconds to 31.75 seconds (in multiples of 0.25 seconds) and configurable via firmware

5.3.2 Timers

When using *smartBASIC*, the timer subsystem enables applications to be written which allows future events to be generated based on timeouts.

- **Regular Timer** – There are eight built-in timers (regular timers) derived from a single RTC clock which are controlled solely by *smartBASIC* functions. The resolution of the regular timer is 976 microseconds.
- **Tick Timer** – A 31-bit free running counter that increments every (1) millisecond. The resolution of this counter is 488 microseconds.

Refer to the **smartBASIC User Guide** available from the Laird BL654PA product page.

5.4 Radio Frequency (RF)

- 2402–2480 MHz Bluetooth Low Energy radio BT5.0 – 1 Mbps, 2 Mbps, and Long-range (125 kbps) over-the-air data rate.
- Tx output power of +18 dBm programmable down to 14 dBm, 6 dBm, 0 dBm, -6 dBm and final TX power level of -26 dBm.
- TX power for coded PHY 125 kbps ($s=8$) is limited to 14 dBm to stay within regulatory TX power spectral density requirements.
- Receiver (with integrated channel filters) to achieve maximum sensitivity -98.5 dBm @ 1 Mbps BLE, -95 dBm @ 2 Mbps, -107 dBm @ 125 kbps long-range).

- RF band pass filter to help with cellular RF co-existence.
- RF conducted interface available in the following two ways:
 - 453-00020: RF connected to on-board PCB trace antenna
 - 453-00021: RF connected to on-board IPEX MH4 RF connector
- Antenna options:
 - Integrated PCB trace antenna on the 453-00020
 - External dipole antenna connected with to IPEX MH4 RF connector on the 453-00021
- Received Signal Strength Indicator (RSSI)
- RSSI accuracy (valid range -90 to -20dBm) is ± 2 dB typical
 - BL654PA RX LNA gain is 11dB, so RSSI valid range becomes -101dB to -31dBm
- RSSI resolution 1dB typical
- Maximum Received Signal Strength (at <0.1% PER) of -11dBm. Limited by RX LNA gain of 11dB in Front End Module.

5.5 NFC

NFC support:

- Based on the NFC forum specification
 - 13.56 MHz
 - Data rate 106 kbps
 - NFC Type 2 and Type 4 tag emulation
- Modes of operation:
 - Disable
 - Sense
 - Activated

5.5.1 Use Cases

- Touch to pair with NFC
- Launch a smartphone app (on Android)
- NFC enabled Out-of-Band Pairing
- System Wake-On-Field function
 - Proximity Detection

Table 16: NFC interface

Signal Name	Pin No	I/O	Comments
NFC1/SIO_09	59	I/O	The NFC pins are by default NFC pins and an alternate function on each pin is GPIO. Refer to the <i>smartBASIC</i> . User manual.
NFC2/SIO_10	57	I/O	

5.5.2 NFC Antenna Coil Tuning Capacitors

From Nordic's *nRF52840 Objective Product Specification v1.0*: http://infocenter.nordicsemi.com/pdf/nRF52840_PS_v1.0.pdf

The NFC antenna coil must be connected differential between the NFC1 and NFC2 pins of the BL654PA. Two external capacitors should be used to tune the resonance of the antenna circuit to 13.56 MHz (Figure 5).

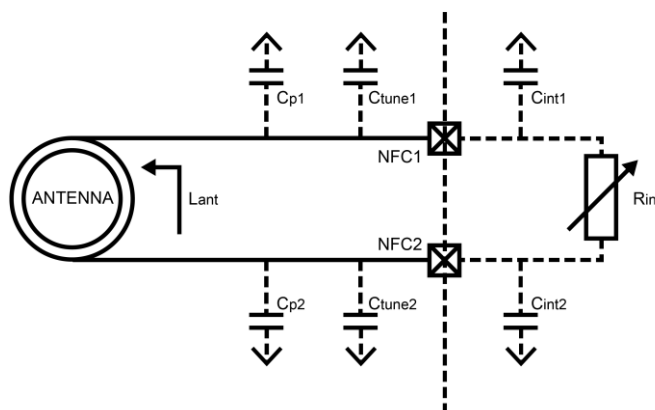

Figure 5: NFC antenna coil tuning capacitors

The required external tuning capacitor value is given by the following equations:

$$C_{tune} = \frac{2}{(2\pi \cdot 13.56 \text{ MHz})^2 \cdot L_{ant}} - C_{tune} - C_{int}$$

An antenna inductance of $L_{ant} = 0.72 \text{ uH}$ provides tuning capacitors in the range of 300 pF on each pin. The total capacitance on NFC1 and NFC2 must be matched. C_{int} and C_p are small usually (C_{int} is 4pF), so can omit from calculation.

Battery Protection Note: If the NFC coil antenna is exposed to a strong NFC field, the supply current may flow in the opposite direction due to parasitic diodes and ESD structures.

If the battery does not tolerate a return current, a series diode must be placed between the battery and the BL654PA to protect the battery.

5.6 UART Interface

Note: The BL654PA has two UARTs.

The Universal Asynchronous Receiver/Transmitter (UART) offers fast, full-duplex, asynchronous serial communication with built-in flow control support (UART_CTS, UART_RTS) in HW up to one Mbps baud. Parity checking and generation for the ninth data bit are supported.

UART_TX, UART_RX, UART_RTS, and UART_CTS form a conventional asynchronous serial data port with handshaking. The interface is designed to operate correctly when connected to other UART devices such as the 16550A. The signaling levels are nominal 0 V and 3.3 V (tracks VDD) and are inverted with respect to the signaling on an RS232 cable.

Two-way hardware flow control is implemented by UART_RTS and UART_CTS. UART_RTS is an output and UART_CTS is an input. Both are active low.

These signals operate according to normal industry convention. UART_RX, UART_TX, UART_CTS, UART_RTS are all 3.3 V level logic (tracks VDD). For example, when RX and TX are idle, they sit at 3.3 V. Conversely for handshaking pins CTS, RTS at 0 V is treated as an assertion.

The module communicates with the customer application using the following signals:

- Port/TxD of the application sends data to the module's UART_RX signal line
- Port/RxD of the application receives data from the module's UART_TX signal line

Figure 6: UART signals

Note: The BL654PA serial module output is at 3.3V CMOS logic levels (tracks VDD). Level conversion must be added to interface with an RS-232 level compliant interface.

Some serial implementations link CTS and RTS to remove the need for handshaking. We do not recommend linking CTS and RTS other than for testing and prototyping. If these pins are linked and the host sends data at the point that the BL654PA de-asserts its RTS signal, there is significant risk that internal receive buffers will overflow which could lead to an internal processor crash. This drops the connection and may require a power cycle to reset the module. We recommend that you adhere to the correct CTS/RTS handshaking protocol for proper operation.

Table 17: UART interface

Signal Name	Pin No	I/O	Comments
SIO_06 / UART_Tx	35	O	SIO_06 (alternative function UART_Tx) is an output, set high (in firmware).
SIO_08 / UART_Rx	29	I	SIO_08 (alternative function UART_Rx) is an input, set with internal pull-up (in firmware).
SIO_05 / UART_RTS	39	O	SIO_05 (alternative function UART_RTS) is an output, set low (in firmware).
SIO_07 / UART_CTS	37	I	SIO_07 (alternative function UART_CTS) is an input, set with internal pull-down (in firmware).

The UART interface is also used to load customer developed *smartBASIC* application script.

5.7 USB interface

BL654PA has USB2.0 FS (Full Speed, 12 Mbps) hardware capability.

Table 18: USB interface

Signal Name	Pin No	I/O	Comments
D-	17	I/O	
D+	15	I/O	
VBUS	24		When using the BL654PA VBUS pin (which is mandatory when a USB interface is used), you MUST connect a 4.7uF capacitor to ground. Note: You MUST power the rest of BL654PA module circuitry through the VDD pin (OPTION1) or VDD_HV pin (OPTION2).

5.8 SPI Bus

The SPI interface is an alternate function on SIO pins.

The module is a master device that uses terminals SPI_MOSI, SPI_MISO, and SPI_CLK. SPI_CS is implemented using any spare SIO digital output pins to allow for multi-dropping.

The SPI interface enables full duplex synchronous communication between devices. It supports a 3-wire (SPI_MOSI, SPI_MISO, SPI_SCK,) bidirectional bus with fast data transfers to and from multiple slaves. Individual chip select signals are necessary for each of the slave devices attached to a bus, but control of these is left to the application through use of SIO signals. I/O data is double-buffered.

The SPI peripheral supports SPI mode 0, 1, 2, and 3.

Table 19: SPI interfaces

Signal Name	Pin No	I/O	Comments
SIO_40/SPI_MOSI	32	O	This interface is an alternate function configurable by <i>smartBASIC</i> . Default in the FW pin 56 and 53 are SIO inputs. SPIOPEN() in <i>smartBASIC</i> selects SPI function and changes pin 56 and 53 to outputs (when in SPI master mode).
SIO_04/AIN2/SPI_MISO	34	I	
SIO_41/SPI_CLK	30	O	
Any_SIO/SPI_CS	54	I	SPI_CS is implemented using any spare SIO digital output pins to allow for multi-dropping. On Laird devboard SIO_44 (pin54) used as SPI_CS.

5.9 I2C Interface

The I2C interface is an alternate function on SIO pins.

The two-wire interface can interface a bi-directional wired-OR bus with two lines (SCL, SDA) and has master/slave topology. The interface is capable of clock stretching. Data rates of 100 kbps and 400 kbps are supported.

An I2C interface allows multiple masters and slaves to communicate over a shared wired-OR type bus consisting of two lines which normally sit at VDD. The SCL is the clock line which is always sourced by the master and SDA is a bi-directional data line which can be driven by any device on the bus.

IMPORTANT: You must remember that pull-up resistors on both SCL and SDA lines are not provided in the module and MUST be provided external to the module.

Table 20: I2C interface

Signal Name	Pin No	I/O	Comments
SIO_26/I2C_SDA	36	I/O	This interface is an alternate function on each pin, configurable by <i>smartBASIC</i> . I2COPEN() in <i>smartBASIC</i> selects I2C function.
SIO_27/I2C_SCL	38	I/O	

5.10 General Purpose I/O, ADC, PWM, and FREQ

5.10.1 GPIO

The 19 SIO pins are configurable by *smartBASIC* application script. They can be accessed individually. Each has the following user configured features:

- Input/output direction
- Output drive strength (standard drive 0.5 mA or high drive 5mA)
- Internal pull-up and pull-down resistors (13 K typical) or no pull-up/down or input buffer disconnect
- Wake-up from high or low-level triggers on all pins including NFC pins

5.10.2 ADC

The ADC is an alternate function on SIO pins, configurable by *smartBASIC*.

The BL654PA provides access to 8-channel 8/10/12-bit successive approximation ADC in one-shot mode. This enables sampling up to eight external signals through a front-end MUX. The ADC has configurable input and reference pre-scaling and sample resolution (8, 10, and 12 bit).

5.10.2.1 Analog Interface (ADC)

Table 21: Analog interface

Signal Name	Pin No	I/O	Comments
SIO_05/UART_RTS/AIN3 – Analog Input	39	I	This interface is an alternate function on each pin, configurable by <i>smartBASIC</i> . AIN configuration selected using GpioSetFunc() function. Configurable 8, 10, 12-bit resolution. Configurable voltage scaling 4, 2, 1/1, 1/3, 1/3, 1/4, 1/5, 1/6(default). Configurable acquisition time 3uS, 5uS, 10uS(default), 15uS, 20uS, 40uS. Full scale input range (VDD)
SIO_04/AIN2/SPI_MISO – Analog Input	34	I	
SIO_03/AIN1 – Analog Input	49	I	
SIO_02/AIN0 – Analog Input	50	I	
SIO_31/AIN7 – Analog Input	44	I	
SIO_30/AIN6 – Analog Input	45	I	
SIO_29/AIN5 – Analog Input	48	I	
SIO_28/AIN4 – Analog Input	46	I	

5.10.3 PWM Signal Output on up to 16 SIO Pins

The PWM output is an alternate function on ALL (GPIO) SIO pins, configurable by *smartBASIC*.

The **PWM output** signal has a frequency and duty cycle property. Frequency is adjustable (up to 1 MHz) and the duty cycle can be set over a range from 0% to 100%.

PWM output signal has a frequency and duty cycle property. PWM output is generated using dedicated hardware in the chipset. There is a trade-off between PWM output frequency and resolution.

For example:

- PWM output frequency of 500 kHz (2 uS) results in resolution of 1:2.
- PWM output frequency of 100 kHz (10 uS) results in resolution of 1:10.
- PWM output frequency of 10 kHz (100 uS) results in resolution of 1:100.
- PWM output frequency of 1 kHz (1000 uS) results in resolution of 1:1000.

5.10.4 FREQ Signal Output on up to 16 SIO Pins

The FREQ output is an alternate function on 16 (GPIO) SIO pins, configurable by *smartBASIC*.

Note: The frequency driving each of the 16 SIO pins is the same but the duty cycle can be independently set for each pin.

FREQ output signal frequency can be set over a range of 0 Hz to 4 MHz (with 50% mark-space ratio).

5.11 nRESET pin

Table 22: nRESET pin

Signal Name	Pin No	I/O	Comments
nRESET	19	I	BL654PA HW reset (active low). Pull the nRESET pin low for minimum 100mS for the BL654PA to reset.

5.12 Two-wire Interface JTAG

The BL654PA firmware hex file consists of four elements:

- *smart*BASIC runtime engine
- Nordic Softdevice
- Master Bootloader

Laird BL654PA *smart*BASIC firmware (FW) image part numbers are referenced as w.x.y.z (ex. v29.x.y.z). The BL654PA *smart*BASIC runtime engine and Softdevice combined image can be upgraded by the customer over the UART interface.

You also have the option to use the two-wire (JTAG) interface, during production, to clone the file system of a Golden preconfigured BL654PA to others using the Flash Cloning process. This is described in the following application note *Flash Cloning for the BL654PA*. In this case, the file system is also part of the .hex file.

Signal Name	Pin No	I/O	Comments
SWDIO	1	I/O	Internal pull-up resistor
SWDCLK	3	I	Internal pull-down resistor

The Laird development board incorporates an on-board JTAG J-link programmer for this purpose. There is also the following JTAG connector which allows on-board JTAG J-link programmer signals to be routed off the development board. The only requirement is that you should use the following JTAG connector on the host PCB.

The JTAG connector MPN is as follows:

Reference	Part	Description and MPN (Manufacturers Part Number)
JP1	FTSH-105	Header, 1.27mm, SMD, 10-way, FTSH-105-01-L-DV Samtech

Note: Reference on the BL654PA development board schematic (Figure 7) shows the DVK development schematic wiring only for the JTAG connector and the BL654PA module JTAG pins.

Figure 7: BL654PA development board schematic

Note: The BL654PA development board allows Laird on-board JTAG J-link programmer signals to be routed off the development board by from connector JP1

JTAG is require because Nordic SDK applications can only be loaded using the JTAG (*smart*BASIC firmware can be loaded using JTAG as well as over the UART). We recommend that you use JTAG (2-wire SWD interface) to handle future BL654PA module firmware upgrades. You **must** wire out the JTAG (2-wire SWD interface) on your host design (see Figure 7, where the following four lines should be wired out – SWDIO, SWDCLK, GND and VCC). *smart*BASIC firmware upgrades can still be performed over the BL654PA UART interface, but this is slower than using the BL654PA JTAG (2-wire SWD interface) – (60 seconds using UART vs. 10 seconds when using JTAG).

SWO (SIO_32) is a Trace output (called SWO, Serial Wire Output) and is not necessary for programming BL654PA over the SWD interface.

nRESET_BLE is not necessary for programming BL654PA over the SWD interface.

5.13 BL654PA Wakeup

5.13.1 Waking Up BL654PA from Host

Wake the BL654PA from the host using wake-up pins (any SIO pin). You may configure the BL654PA's wakeup pins via *smartBASIC* to do any of the following:

- Wake up when signal is low
- Wake up when signal is high
- Wake up when signal changes

Refer to the *smartBASIC* user guide for details. You can access this guide from the Laird BL654PA product page.

5.14 Low Power Modes

The BL654PA has three power modes: Run, Standby Doze, and Deep Sleep.

The module is placed automatically in Standby Doze if there are no pending events (when `WAITEVENT` statement is encountered within a customer's *smartBASIC* script). The module wakes from Standby Doze via any interrupt (such as a received character on the UART Rx line). If the module receives a UART character from either the external UART or the radio, it wakes up.

Deep sleep is the lowest power mode. Once awakened, the system goes through a system reset.

5.15 Temperature Sensor

The on-silicon temperature sensor has a temperature range greater than or equal to the operating temperature of the device. Resolution is 0.25°C degrees. The on-silicon temperature sensor accuracy is $\pm 5^\circ\text{C}$.

To read temperature from on-silicon temperature sensor (in tenth of centigrade, so 23.4°C is output as 234) using *smartBASIC*:

- In command mode, use **ATI2024**
or
- From running a *smartBASIC* application script, use **SYSINFO(2024)**

5.16 Security/Privacy

5.16.1 Random Number Generator

Exposed via an API in *smartBASIC* (see *smartBASIC* documentation available from the BL654PA product page). The **rand()** function from a running *smartBASIC* application returns a value.

5.16.2 AES Encryption/Decryption

Exposed via an API in *smartBASIC* (see *smartBASIC* documentation available from the BL654PA product page). Function called **aesencrypt** and **aesdecrypt**.

5.16.3 ARM Cryptocell

ARM Cryptocell incorporates a true random generator (TRNG) and support for a wide range of asymmetric, symmetric and hashing cryptographic services for secure applications. For more information, please check the Nordic SDK.

5.16.4 Readback Protection

The BL654PA supports readback protection capability that disallows the reading of the memory on the nrf52840 using a JTAG interface. Available via *smartBASIC*

5.16.5 Elliptic Curve Cryptography

The BL654PA offers a range of functions for generating public/private keypair, calculating a shared secret, as well as generating an authenticated hash. Available via *smartBASIC*

5.17 Optional External 32.768 kHz Crystal

This is not required for normal BL654PA module operation.

The BL654PA uses the on-chip 32.76 kHz RC oscillator (LFCLK) by default (which has an accuracy of ± 500 ppm) which requires regulator calibration (every eight seconds) to within ± 500 ppm.

You can connect an optional external high accuracy (± 20 ppm) 32.768 kHz crystal (and associated load capacitors) to the BL654PA SIO_01/XL2 (pin 41) and SIO_00/XL1 (pin 42) to provide improved protocol timing and to help with radio power consumption in the system standby doze/deep sleep modes by reducing the time that the RX window needs to be open. [Table 23](#) compares the current consumption difference between RC and crystal oscillator.

Table 23: Comparing current consumption difference between BL654PA on-chip RC 32.76 kHz oscillator and optional external crystal (32.768kHz) based oscillator

	BL654PA On-chip 32.768 kHz RC Oscillator (± 500 ppm) LFRC	Optional External Higher Accuracy (± 20 ppm) 32.768 kHz Crystal-based Oscillator LFXO
Current Consumption of 32.768 kHz Block	0.7 μ A	0.23 μ A
Standby Doze Current (SYSTEM ON IDLE +full RAM retention +RTC run current + LFRC or LFXO)	3.1 μ A	2.6 μ A
Calibration	<p>Calibration required regularly (default eight seconds interval).</p> <p>Calibration takes 33 ms; with DCDC used, the total charge of a calibration event is 16 μC.</p> <p>The average current consumed by the calibration depends on the calibration interval and can be calculated using the following formula:</p> <p>CAL_charge/CAL_interval – The lowest calibration interval (0.25 seconds) provides an average current of (DCDC enabled):</p> <p>$16\mu\text{C}/0.25\text{s} = 64\mu\text{A}$</p> <p>To get the 500-ppm accuracy, the BLE stack specification states that a calibration interval of eight seconds is enough. This gives an average current of:</p> <p>$16\mu\text{C}/8\text{s} = 2\mu\text{A}$</p> <p>Added to the LFRC run current and Standby Doze (IDLE) base current shown above results in a total average current of:</p> <p>$\text{LFRC} + \text{CAL} = 3.1 + 2 = 5.1\mu\text{A}$</p>	Not applicable
Total	5.1 μ A	2.6 μ A
Summary	<ul style="list-style-type: none"> Low current consumption Accuracy 500 ppm 	<ul style="list-style-type: none"> Lowest current consumption Needs external crystal High accuracy (depends on the crystal, usually 20 ppm)

Table 24: Optional external 32.768 kHz crystal specification

Optional external 32.768kHz crystal	Min	Typ	Max
Crystal Frequency	-	32.768 kHz	-
Frequency tolerance requirement of BLE stack	-	-	±500 ppm
Load Capacitance	-	-	12.5 pF
Shunt Capacitance	-	-	2 pF
Equivalent series resistance	-	-	100 kOhm
Drive level	-	-	1 uW
Input capacitance on XL1 and XL2 pads	-	4 pF	-
Run current for 32.768 kHz crystal based oscillator	-	0.23 uA	-
Start-up time for 32.768 kHz crystal based oscillator	-	0.25 seconds	-
Peak to peak amplitude for external low swing clock input signal must not be outside supply rails	200 mV	-	1000 mV

Be sure to tune the load capacitors on the board design to optimize frequency accuracy (at room temperature) so it matches that of the same crystal standalone, Drive Level (so crystal operated within safe limits) and oscillation margin (R_{neg} is at least 3 to 5 times ESR) over the operating temperature range.

5.18 453-00020 On-board PCB Antenna Characteristics

The 453-00020 on-board PCB trace monopole antenna radiated performance depends on the host PCB layout.

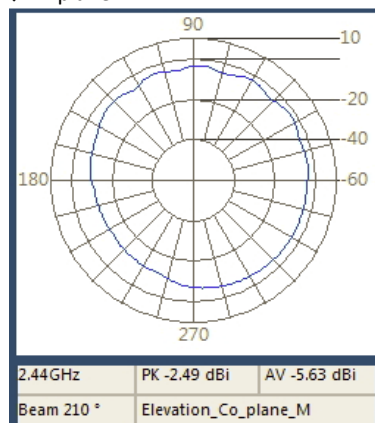

The BL654PA development board was used for BL654PA development and the 453-00020 PCB antenna performance evaluation. To obtain similar performance, follow guidelines in section *PCB Layout on Host PCB for the 453-00020* to allow the on-board PCB antenna to radiate and reduce proximity effects due to nearby host PCB GND copper or metal covers.

Unit in dBi @2440MHz	XY-plane		XZ-plane		YZ-plane	
	Peak	Avg	Peak	Avg	Peak	Avg
453-00020 PCB trace antenna	-1.05	-5.13	-1.51	-7.43	-2.49	-5.63

◆XY-plane

◆XZ-plane

◆YZ-plane

6 HARDWARE INTEGRATION SUGGESTIONS

6.1 Circuit

The BL654PA is easy to integrate, requiring no external components on your board apart from those which you require for development and in your end application.

The following are suggestions for your design for the best performance and functionality.

Checklist (for Schematic):

- **BL654PA power supply options:**

Option 1 – Normal voltage power supply mode entered when the external supply voltage is connected to both the VDD and VDDH pins (so that VDD equals VDD_HV). Connect external supply within range 3.0V to 3.6V range to BL654PA VDD and VDD_HV pins.

OR

Option 2 – High voltage mode power supply mode (using BL654PA VDD_HV pin) entered when the external supply voltage is ONLY connected to the VDDH pin and the VDD pin is not connected to any external voltage supply. Connect external supply within range 3.0V to 5.5V range to BL654PA VDD_HV pin. BL654PA VDD pin left unconnected.

For either option, if you use USB interface then the BL654PA VBUS pin must be connected to external supply within the range 4.35V to 5.5V. When using the BL654PA VBUS pin, you MUST externally fit a 4.7uF to ground.

External power source should be within the operating range, rise time and noise/ripple specification of the BL654PA. Add decoupling capacitors for filtering the external source. Power-on reset circuitry within BL654PA module incorporates brown-out detector, thus simplifying your power supply design. Upon application of power, the internal power-on reset ensures that the module starts correctly.

- **VDD and coin-cell operation**

With a built-in DCDC (operating range 3.0V to 3.6V) that reduces the peak current required from a coin cell battery, making it easier to use with a coin cell. The coin cell battery MUST be able to service the peak and average current requirements of the customer application.

- **AIN (ADC) and SIO pin IO voltage levels**

BL654PA SIO voltage levels are at VDD. Ensure input voltage levels into SIO pins are at VDD also (if VDD source is a battery whose voltage will drop). Ensure ADC pin maximum input voltage for damage is not violated.

- **AIN (ADC) impedance and external voltage divider setup**

If you need to measure with ADC a voltage higher than 3.6V, you can connect a high impedance voltage divider to lower the voltage to the ADC input pin.

- **JTAG**

This is REQUIRED as Nordic SDK applications can only be loaded using the JTAG (*smartBASIC* firmware can be loaded using the JTAG as well as the UART).

Laird recommends you use JTAG (2-wire interface) to handle future BL654PA module firmware upgrades. You MUST wire out the JTAG (2-wire interface) on your host design (see [Figure 7](#), where four lines should be wired out, namely SWDIO, SWDCLK, GND and VCC). Firmware upgrades can still be performed over the BL654PA UART interface, but this is slower (60 seconds using UART vs. 10 seconds when using JTAG) than using the BL654PA JTAG (2-wire interface). JTAG may be used if you intend to use Flash Cloning during production to load *smartBASIC* scripts.

- **UART**

Required for loading your *smartBASIC* application script during development (or for subsequent firmware upgrades (except JTAG for FW upgrades and/or Flash Cloning of the *smartBASIC* application script). Add connector to allow interfacing with UART via PC (UART-RS232 or UART-USB).

- **UART_RX and UART_CTS**

SIO_08 (alternative function UART_RX) is an input, set with internal weak pull-up (in firmware). The pull-up prevents the module from going into deep sleep when UART_RX line is idling.

SIO_07 (alternative function UART_CTS) is an input, set with internal weak pull-down (in firmware). This pull-down ensures the default state of the UART_CTS will be asserted which means can send data out of the UART_TX line. Laird recommends that UART_CTS be connected.

- **nAutoRUN pin and operating mode selection**

nAutoRUN pin needs to be externally held high or low to select between the two BL654PA operating modes at power-up:

- Self-contained Run mode (nAutoRUN pin held at 0V).

- Interactive / development mode (nAutoRUN pin held at VDD).
Make provision to allow operation in the required mode. Add jumper to allow nAutoRUN pin to be held high or low (BL654PA has internal 13K pull-down by default) OR driven by host GPIO.

- **I2C**

It is essential to remember that pull-up resistors on both I2C_SCL and I2C_SDA lines are not provided in the BL654PA module and MUST be provided external to the module as per I2C standard.

- **SPI**

Implement SPI chip select using any unused SIO pin within your *smartBASIC* application script or Nordic application then SPI_CS is controlled from the software application allowing multi-dropping.

- **SIO pin direction**

BL654PA modules shipped from production with *smartBASIC* FW, all SIO pins (with default function of DIO) are mostly digital inputs (see Pin Definitions Table2). Remember to change the direction SIO pin (in your *smartBASIC* application script) if that particular pin is wired to a device that expects to be driven by the BL654PA SIO pin configured as an output. Also, these SIO pins have the internal pull-up or pull-down resistor-enabled by default in firmware (see Pin Definitions Table 2). This was done to avoid floating inputs, which can cause current consumption in low power modes (e.g. StandbyDoze) to drift with time. You can disable the PULL-UP or Pull-down through their *smartBASIC* application.

Note: Internal pull-up, pull down will take current from VDD.

- **SIO_02 pin** and OTA *smartBASIC* application download feature

SIO_02 is an input, set with internal pull-down (in FW). Refer to latest firmware release documentation on how SIO_02 is used for Over the Air *smartBASIC* application download feature. The SIO_02 pin must be pulled high externally to enable the feature. Decide if this feature is required in production. When SIO_02 is high, ensure nAutoRun is NOT high at same time; otherwise you cannot load the *smartBASIC* application script.

- **NFC antenna connector**

To make use of the Laird flexi-PCB NFC antenna, fit connector:

- Description – FFC/FPC Connector, Right Angle, SMD/90d, Dual Contact, 1.2 mm Mated Height
- Manufacturer – Molex
- Manufacturers Part number – 512810594

Add tuning capacitors of 300 pF on NFC1 pin to GND and 300 pF on NFC2 pins to GND if the PCB track length is similar as development board.

- **nRESET pin (active low)**

Hardware reset. Wire out to push button or drive by host.
By default module is out of reset when power applied to VCC pins.

- **Optional External 32.768kHz crystal**

If the optional external 32.768kHz crystal is needed, then use a crystal that meets specification and add load capacitors whose values should be tuned to meet all specification for frequency and oscillation margin.

- **SIO_38 special function pin**

This is for future use by Laird. It is currently a Do Not Connect pin if using the *smartBASIC* FW.

- **BL654PA pin2 and pin4 are Do No Connect pins (on BL654 SIO_34 and SIO_36)**

Customer MUST NOT connect anything to BL654PA pin2 and pin4 which are Do No connect pins.

6.2 PCB Layout on Host PCB - General

Checklist (for PCB):

- MUST locate BL654PA module close to the edge of PCB (mandatory for the 453-00020 for on-board PCB trace antenna to radiate properly).
- Use solid GND plane on inner layer (for best EMC and RF performance).
- All module GND pins MUST be connected to host PCB GND.
- Place GND vias close to module GND pads as possible.
- Unused PCB area on surface layer can be flooded with copper but place GND vias regularly to connect the copper flood to the inner GND plane. If GND flood copper is on the bottom of the module, then connect it with GND vias to the inner GND plane.

- Route traces to avoid noise being picked up on VDD, VDDH, VBUS supply and AIN (analogue) and SIO (digital) traces. BL654PA pin 2 and 4 (SIO_34 and SIO_36) which are Do No Connect pins are especially important.
- Ensure no exposed copper is on the underside of the module (refer to land pattern of BL654PA development board).

6.3 PCB Layout on Host PCB for the 453-00020

6.3.1 Antenna Keep-out on Host PCB

The 453-00020 has an integrated PCB trace antenna and its performance is sensitive to host PCB. It is critical to locate the 453-00020 on the edge of the host PCB (or corner) to allow the antenna to radiate properly. Refer to guidelines in section **PCB land pattern and antenna keep-out area for the 453-00020**. Some of those guidelines repeated below.

- Ensure there is no copper in the antenna keep-out area on any layers of the host PCB. Keep all mounting hardware and metal clear of the area to allow proper antenna radiation.
- For best antenna performance, place the 453-00020 module on the edge of the host PCB, preferably in the edge center.
- The BL654PA development board has the 453-00020 module on the edge of the board (not in the corner). The antenna keep-out area is defined by the BL654PA development board which was used for module development and antenna performance evaluation is shown in [Figure 9](#), where the antenna keep-out area is ~5 mm wide, ~39.95 mm long; with PCB dielectric (no copper) height ~1 mm sitting under the 453-00020 PCB trace antenna.
- The 453-00020 PCB trace antenna is tuned when the 453-00020 is sitting on development board (host PCB) with size of 132 mm x 85 mm x 1mm.
- A different host PCB thickness dielectric will have small effect on antenna.
- The antenna-keep-out defined in the [Host PCB Land Pattern and Antenna Keep-out for the 453-00020](#) section.
- Host PCB land pattern and antenna keep-out for the BL654PA applies when the 453-00020 is placed in the edge of the host PCB preferably in the edge center. [Figure 9](#) shows an example.

Figure 9: PCB trace Antenna keep-out area (shown in red), corner of the BL654PA development board for the 453-00020 module.

Antenna Keep-out Notes:

- | | |
|---------------|--|
| Note 1 | The BL654PA module is placed on the edge, preferably edge centre of the host PCB. |
| Note 2 | Copper cut-away on all layers in the <i>Antenna Keep-out</i> area under the 453-00020 on host PCB. |

6.3.2 Antenna Keep-out and Proximity to Metal or Plastic

Checklist (for metal /plastic enclosure):

- Minimum safe distance for metals without seriously compromising the antenna (tuning) is 40 mm top/bottom and 30 mm left or right.
- Metal close to the 453-00020 PCB trace monopole antenna (bottom, top, left, right, any direction) will have degradation on the antenna performance. The amount of that degradation is entirely system dependent, meaning you will need to perform some testing with your host application.
- Any metal closer than 20 mm will begin to significantly degrade performance (S11, gain, radiation efficiency).
- It is best that you test the range with a mock-up (or actual prototype) of the product to assess effects of enclosure height (and materials, whether metal or plastic).

6.4 External Antenna Integration with the 453-00021

Please refer to the regulatory sections for FCC, IC, RCM, and Korea for details of use of BL654PA-with external antennas in each regulatory region.

The BL654PA family has been designed to operate with the below external antennas (with a maximum gain of 2.0 dBi). The required antenna impedance is 50 ohms. See [Table 25](#). External antennas improve radiation efficiency.

Table 25: External antennas for the BL654PA

Manufacturer	Model	Laird Part Number	Type	Connector	Peak Gain	
					2400-2500 MHz	2400-2480 MHz

7 MECHANICAL DETAILS

7.1 BL654PA Mechanical Details

Tolerances

Board Outline: $\pm 0.13\text{mm}$

Board Height: $\pm 0.15\text{mm}$

Figure 10: BL654PA mechanical drawings

Development Kit Schematics can be found in the software downloads tab of the BL654PA product page:

<https://www.lairdconnect.com/bl654-pa>

All dimensions are in mm.

Note 1	Ensure there is no copper in the antenna 'keep out area' on any layers of the host PCB. Also keep all mounting hardware or any metal clear of the area (Refer to 6.3.2) to reduce effects of proximity detuning the antenna and to help antenna radiate properly.
Note 2	For the best on-board antenna performance, the module 453-00020 MUST be placed on the edge of the host PCB and preferably in the edge centre and host PCB, the antenna "Keep Out Area" is extended (see Note 4).
Note 3	BL654PA development board has the 453-00020 placed on the edge of the PCB board (and not in corner) for that the Antenna keep out area is extended down to the corner of the development board, see section PCB Layout on Host PCB for the 453-00020 , Figure 11 . This was used for module development and antenna performance evaluation.
Note 4	Ensure that there is no exposed copper under the module on the host PCB.
Note 5	You may modify the PCB land pattern dimensions based on their experience and/or process capability.

8 APPLICATION NOTE FOR SURFACE MOUNT MODULES

8.1 Introduction

Laird Technologies surface mount modules are designed to conform to all major manufacturing guidelines. This application note is intended to provide additional guidance beyond the information that is presented in the User Manual. This Application Note is considered a living document and will be updated as new information is presented.

The modules are designed to meet the needs of several commercial and industrial applications. They are easy to manufacture and conform to current automated manufacturing processes.

8.2 Shipping

8.2.1 Tape and Reel Package Information

Figure 12: Reel specifications

1. 10 sprocket hole pitch cumulative tolerance ± 0.20 .
2. Carrier camber is within 1 mm in 250 mm.
3. Material : Black Conductive Polystyrene Alloy.
4. All dimensions meet ELA-481-D requirements.
5. Thickness : 0.30 ± 0.05 mm.
6. Packing length per 13" reel : 20.0Meters.(RUR-26-3-TL)
7. Component load per 13" reel : 1000 pcs.(前后留空各35pcs共70pcs)

Figure 13: Tape specifications

There are 1,000 x BL654PA modules taped in a reel (and packaged in a pizza box) and five boxes per carton (5000 modules per carton). Reel, boxes, and carton are labeled with the appropriate labels. See [Carton Contents](#) for more information.

Taiwan Patent No: 157713 China Patent No: 01224591.7	
W	44.00±0.30
A0	10.5±0.10
B0	22.35±0.10

8.2.2 Carton Contents

The following are the contents of the carton shipped for the BL654PA modules.

#	Item	Qty	#	Item	Qty
1	Module	1	7	Drier (60 g)	1/1000
2	Cover Tape	(1/1000)*20m	8	Humidity Card	1/1000
3	Carrier Tape	(1/1000)*20m	9	Bag	1/1000
4	Reel	1/box 5/carton	10	Bubble Cloth	1/1000
5	Foam Belt	1/1000	11	Box	1/1000 5/carton
6	Protective Band	1/1000	12	Carton	1/1000

8.2.3 Labeling

The following labels are included in each shipment.

Figure 14: Reel/bag/box label

Figure 15: Carton label

Figure 16: MSL label

8.3 Reflow Parameters

Prior to any reflow, it is important to ensure the modules were packaged to prevent moisture absorption. New packages contain desiccant (to absorb moisture) and a humidity indicator card to display the level maintained during storage and shipment. If directed to *bake units* on the card, see [Table 26](#) and follow instructions specified by IPC/JEDEC J-STD-033. A copy of this standard is available from the JEDEC website: <http://www.jedec.org/sites/default/files/docs/jstd033b01.pdf>

Any modules not manufactured before exceeding their floor life should be re-packaged with fresh desiccant and a new humidity indicator card. Floor life for MSL (Moisture Sensitivity Level) 4 devices is 168 hours in ambient environment $\leq 30^{\circ}\text{C}/60\%\text{RH}$.

Table 26: Recommended baking times and temperatures

MSL	125°C Baking Temp.		90°C/ $\leq 5\%\text{RH}$ Baking Temp.		40°C/ $\leq 5\%\text{RH}$ Baking Temp.	
	Saturated @ 30°C/85%	Floor Life Limit + 72 hours @ 30°C/60%	Saturated @ 30°C/85%	Floor Life Limit + 72 hours @ 30°C/60%	Saturated @ 30°C/85%	Floor Life Limit + 72 hours @ 30°C/60%
3	9 hours	7 hours	33 hours	23 hours	13 days	9 days

Laird surface mount modules are designed to be easily manufactured, including reflow soldering to a PCB. Ultimately it is the responsibility of the customer to choose the appropriate solder paste and to ensure oven temperatures during reflow meet the requirements of the solder paste. Laird surface mount modules conform to J-STD-020D1 standards for reflow temperatures.

Important: During reflow, modules should not be above 260° and not for more than 30 seconds. In addition, we recommend that the BL654PA module **does not** go through the reflow process more than one time; otherwise the BL654PA internal component soldering may be impacted.

Figure 17: Recommended reflow temperature

Temperatures should not exceed the minimums or maximums presented in [Table 27](#).

Table 27: Recommended maximum and minimum temperatures

Specification	Value	Unit
Temperature Inc./Dec. Rate (max)	1~3	°C / Sec
Temperature Decrease rate (goal)	2-4	°C / Sec
Soak Temp Increase rate (goal)	.5 - 1	°C / Sec

Specification	Value	Unit
Flux Soak Period (Min)	70	Sec
Flux Soak Period (Max)	120	Sec
Flux Soak Temp (Min)	150	°C
Flux Soak Temp (max)	190	°C
Time Above Liquidous (max)	70	Sec
Time Above Liquidous (min)	50	Sec
Time In Target Reflow Range (goal)	30	Sec
Time At Absolute Peak (max)	5	Sec
Liquidous Temperature (SAC305)	218	°C
Lower Target Reflow Temperature	240	°C
Upper Target Reflow Temperature	250	°C
Absolute Peak Temperature	260	°C

9 FCC AND IC REGULATORY STATEMENTS

Model	US/FCC	Canada/IC
453-00020	SQGBL654PA	3147A-BL654PA
453-00021	SQGBL654PA	3147A-BL654PA

The 453-00020 and the 453-00021 hold full modular approvals. The OEM must follow the regulatory guidelines and warnings listed below to inherit the modular approval.

Part #	Form Factor	Tx Outputs	Antenna
453-00020	Surface Mount	18 dBm	PCB Trace
453-00021	Surface Mount	18 dBm	IPEX MHF4

9.1 Antenna Information

The BL654PA family has been designed to operate with the antennas listed below with a maximum gain of 2 dBi. The required antenna impedance is 50 ohms.

Manufacturer	Model	Laird Part Number	Type	Connector	Peak Gain	
					2400-2500 MHz	2400-2480 MHz
Laird	NanoBlue	EBL2400A1-10MH4L	PCB Dipole	IPEX MHF4	2 dBi	-
Laird	FlexPIFA	001-0022	PIFA	IPEX MHF4	-	2 dBi
Laird	2.4 GHz dipole	001-0001	Dipole	RP-SMA male	2 dBi	-
Mag.Layers	EDA-8709-2G4C1-B27-CY	0600-00057	Dipole	IPEX MHF4	2 dBi	-
Laird	mFlexPIFA	EFA2400A3S-10MH4L	PIFA	IPEX MHF4	-	2 dBi
Laird	Laird NFC	0600-00061	NFC	N/A	-	-

Manufacturer	Model	Laird Part Number	Type	Connector	Peak Gain	
					2400-2500 MHz	2400-2480 MHz
Laird	BL654PA PCB printed antenna	NA	Printed PCB	N/A	0 dBi	-

Note: The OEM is free to choose another vendor's antenna of like type and equal or lesser gain as an antenna appearing in the table and still maintain compliance. Reference FCC Part 15.204(c)(4) for further information on this topic.

To reduce potential radio interference to other users, the antenna type and gain should be chosen so that the equivalent isotropic radiated power (EIRP) is not more than that permitted for successful communication.

9.2 Power Exposure Information

Federal Communication Commission (FCC) Radiation Exposure Statement:

This EUT complies with SAR for general population/uncontrolled exposure limits in FCC Part 1.1307, Part. 1310 and FCC KDB 447498 – RF Exposure Procedures and Equipment Authorization Policies for Mobile and Portable Devices.

This transceiver must not be co-located or operating in conjunction with any other antenna, transmitter, or external amplifiers. Further testing/evaluation of the end product will be required if the OEM's device violates any of these requirements.

The BL654PA is fully approved for mobile and portable applications.

9.3 OEM Responsibilities

WARNING: The OEM must ensure that FCC labelling requirements are met. This includes a clearly visible label on the outside of the OEM enclosure specifying the appropriate Laird Technology FCC identifier for this product.

Contains FCC ID: SQGBL654PA

If the size of the end product is larger than 8x10cm, then the following FCC part 15.19 statement must also be available on visible on outside of device:

The enclosed device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation

Label and text information should be in a size of type large enough to be readily legible, consistent with the dimensions of the equipment and the label. However, the type size for the text is not required to be larger than eight points.

CAUTION: The OEM should have their device which incorporates the BL654PA tested by a qualified test house to verify compliance with FCC Part 15 Subpart B limits for unintentional radiators.

CAUTION: Any changes or modifications not expressly approved by Laird Technology could void the user's authority to operate the equipment.

9.4 Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be

determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

FCC Caution: Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

IMPORTANT NOTE:

FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. Both the module and dongle meet the SAR exclusion requirements at the minimum separation distance of 5mm. As a result, there is no minimum separation distance restriction for the FCC requirements.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter without further evaluation to the requirements in FCC KDB 447498- RF Exposure Procedures and Equipment Authorization Policies for Mobile and Portable Devices.

Country Code selection feature to be disabled for products marketed to the US/CANADA.

This device is intended only for OEM integrators under the following conditions:

1. The transmitter module may not be co-located with any other transmitter or antenna without further evaluation to the RF exposure requirements as outlined in FCC KDB 447498.
2. For all products market in US, OEM has to limit the operation channels in CH1 to CH11 for 2.4G band by supplied firmware programming tool. OEM shall not supply any tool or info to the end-user regarding to Regulatory Domain change.

As long as these three conditions above are met, further transmitter test will not be required. However, the OEM integrator is still responsible for testing their end-product for any additional compliance requirements required with this module installed

IMPORTANT NOTE

If these conditions **cannot be met** (for example certain laptop configurations or co-location with another transmitter), then the FCC authorization is no longer considered valid and the FCC ID **cannot** be used on the final product without further review. In these circumstances, the OEM integrator is responsible for re-evaluating the end product (including the transmitter) and obtaining a separate FCC authorization if the FCC ID **cannot** be used.

End Product Labeling

The final end product must be labeled in a visible area with the following: **Contains FCC ID: SQGBL654PA.**

Manual Information to the End User

The OEM integrator must be aware not to provide information to the end user regarding how to install or remove this RF module in the user's manual of the end product which integrates this module.

The end user manual shall include all required regulatory information/warning as show in this manual.

Information on Test Modes and Additional Testing Requirements

*smart*BASIC DTM shall be used to set the module to transmit continuously.

9.5 Industry Canada Statement

This device contains licence-exempt transmitter(s)/receiver(s) that comply with Innovation, Science and Economic Development Canada's licence-exempt RSS(s). Operation is subject to the following two conditions:

- (1) This device may not cause interference; and
- (2) This device must accept any interference, including interference that may cause undesired operation of the device.

Cet appareil contient des émetteurs / récepteurs exempts de licence qui sont conformes au (x) RSS (s) exemptés de licence d'Innovation, Sciences et Développement économique Canada. L'opération est soumise aux deux conditions suivantes:

- (1) Cet appareil ne doit pas causer d'interférences
- (2) Cet appareil doit accepter toute interférence, y compris les interférences pouvant provoquer un fonctionnement indésirable de l'appareil.

This radio transmitter (IC: 3147A-BL654PA) has been approved by Industry Canada to operate with the antenna types listed below with the maximum permissible gain indicated. Antenna types not included in this list, having a gain greater than the maximum gain indicated for that type, are strictly prohibited for use with this device.

Le présent émetteur radio (IC: 3147A-BL654PA) a été approuvé par Industrie Canada pour fonctionner avec les types d'antenne énumérés ci-dessous et ayant un gain admissible maximal. Les types d'antenne non inclus dans cette liste, et dont le gain est supérieur au gain maximal indiqué, sont strictement interdits pour l'exploitation de l'émetteur.

Manufacturer	Model	Laird Part Number	Type	Connector	Peak Gain	
					2400-2500 MHz	2400-2480 MHz
Laird	NanoBlue	EBL2400A1-10MH4L	PCB Dipole	IPEX MHF4	2 dBi	-
Laird	FlexPIFA	001-0022	PIFA	IPEX MHF4	-	2 dBi

Mag.Layers	EDA-8709-2G4C1-B27-CY	0600-00057	Dipole	IPEX MHF4	2 dBi	-
Laird	mFlexPIFA	EFA2400A3S-10MH4L	PIFA	IPEX MHF4	-	2 dBi
Laird	Laird NFC	0600-00061	NFC	N/A	-	-
Laird	BL654PA PCB printed antenna	NA	Printed PCB	N/A	0 dBi	-

Radiation Exposure Statement:

This equipment complies with Canada radiation exposure limits set forth for an uncontrolled environment. The module meets the SAR exclusion limit when installed and operated with a minimum distance of 12mm between the radiator & your body. The USB Dongle was evaluated for SAR with a measured value of 0.05W/kg and as a result was found to be compliant at the 5 mm separation distance for 1 g SAR (W/kg).

Déclaration d'exposition aux radiations:

Cet équipement est conforme aux limites d'exposition aux rayonnements définies par le Canada pour un environnement non contrôlé. Le module respecte la limite d'exclusion SAR lorsqu'il est installé et utilisé avec une distance minimale de 12 mm entre le radiateur et votre corps. La clé USB a été évaluée pour le DAS avec une valeur mesurée de 0,05 W / kg et a donc été jugée conforme à la Distance de séparation de 5 mm pour 1 g de SAR (W / kg).

This device is intended only for OEM integrators under the following conditions:

1. The transmitter module may not be co-located with any other transmitter or antenna without further evaluation to the RF exposure requirements in IEEE 1528 or FCC KDB 447498.

As long as the condition above is met, further transmitter test will not be required. However, the OEM integrator is still responsible for testing their end-product for any additional compliance requirements required with this module installed.

Cet appareil est conçu uniquement pour les intégrateurs OEM dans les conditions suivantes:

1. Le module émetteur peut ne pas être coïmplanté avec un autre émetteur ou antenne sans autre évaluation des exigences en matière d'exposition RF dans IEEE 1528 ou FCC KDB 447498.

Tant que les 1 condition ci-dessus sont remplies, des essais supplémentaires sur l'émetteur ne seront pas nécessaires. Toutefois, l'intégrateur OEM est toujours responsable des essais sur son produit final pour toutes exigences de conformité supplémentaires requis pour ce module installé.

IMPORTANT NOTE:

In the event that these conditions can not be met (for example certain laptop configurations or co-location with another transmitter), then the Canada authorization is no longer considered valid and the IC ID can not be used on the final product. In these circumstances, the OEM integrator will be responsible for re-evaluating the end product (including the transmitter) and obtaining a separate Canada authorization.

NOTE IMPORTANTE:

Dans le cas où ces conditions ne peuvent être satisfaites (par exemple pour certaines configurations d'ordinateur portable ou de certaines co-localisation avec un autre émetteur), l'autorisation du Canada n'est plus considéré comme valide et l'ID IC ne peut pas être utilisé sur le produit final. Dans ces circonstances, l'intégrateur OEM sera chargé de réévaluer le produit final (y compris l'émetteur) et l'obtention d'une autorisation distincte au Canada.

End Product Labeling

The final end product must be labeled in a visible area with the following: **Contains IC: 3147A-BL654PA.**

Plaque signalétique du produit final

Le produit final doit être étiqueté dans un endroit visible avec l'inscription suivante: **Contains IC: 3147A-BL654PA.**

Manual Information to the End User

The OEM integrator has to be aware not to provide information to the end user regarding how to install or remove this RF module in the user's manual of the end product which integrates this module.

The end user manual shall include all required regulatory information/warning as show in this manual.

Manuel d'information à l'utilisateur final

L'intégrateur OEM doit être conscient de ne pas fournir des informations à l'utilisateur final quant à la façon d'installer ou de supprimer ce module RF dans le manuel de l'utilisateur du produit final qui intègre ce module.

Le manuel de l'utilisateur final doit inclure toutes les informations réglementaires requises et avertissements comme indiqué dans ce manuel.

10 KOREA (KC) REGULATORY

The BL654PA is approved for use in the Korean market.

Model	Certificate Number

13 BLUETOOTH SIG QUALIFICATION

13.1 Overview

The BL654PA module is listed on the Bluetooth SIG website as a qualified End Product.

Note: The BL654PA is included under the BL654 listing.

Design Name	Owner	Declaration ID	QD ID	Link to listing on the SIG website
BL654PA	Laird Technologies	D040166	114304	https://launchstudio.bluetooth.com/ListingDetails/63185
BL654PA	Laird Technologies	D041400	117615	https://launchstudio.bluetooth.com/ListingDetails/67595

It is a mandatory requirement of the Bluetooth Special Interest Group (SIG) that every product implementing Bluetooth technology has a Declaration ID. Every Bluetooth design is required to go through the qualification process, even when referencing a Bluetooth Design that already has its own Declaration ID. The Qualification Process requires each company to register as a member of the Bluetooth SIG – www.bluetooth.org

The following link provides a link to the Bluetooth Registration page: <https://www.bluetooth.org/login/register/>

For each Bluetooth Design, it is necessary to purchase a Declaration ID. This can be done before starting the new qualification, either through invoicing or credit card payment. The fees for the Declaration ID will depend on your membership status, please refer to the following webpage:

<https://www.bluetooth.org/en-us/test-qualification/qualification-overview/fees>

For a detailed procedure of how to obtain a new Declaration ID for your design, please refer to the following SIG document:

https://www.bluetooth.org/DocMan/handlers/DownloadDoc.ashx?doc_id=283698&vId=317486

13.2 Qualification Steps When Referencing a Laird End Product Design

To start a listing, go to: https://www.bluetooth.org/tpg/QLI_SDoc.cfm

In step 1, select the option, **Reference a Qualified Design** and enter D040166 or D041400 in the End Product table entry. You can then select your pre-paid Declaration ID from the drop-down menu or go to the Purchase Declaration ID page, (please note that unless the Declaration ID is pre-paid or purchased with a credit card, it will not be possible to proceed until the SIG invoice is paid).

Once all the relevant sections of step 1 are finished, complete steps 2, 3, and 4 as described in the help document. Your new Design will be listed on the SIG website and you can print your Certificate and Declaration of Conformity.

For further information, please refer to the following training material:

<https://www.bluetooth.org/en-us/test-qualification/qualification-overview/listing-process-updates>

Note: If using the BL654PA with Laird Firmware and *smartBASIC* script, you can skip “Controller Subsystem”, “Host Subsystem”, and “Profile Subsystem”.

13.3 Qualification Steps When Deviating from a Laird End Product Design

If you wish to deviate from the standard End Product design listed under D040166 or D041400, the qualification process follows the Traditional Project route, creating a new design. When creating a new design, it is necessary to complete the full qualification listing process and also maintain a compliance folder for the new design.

The BL654PA design under D040166 incorporates the following components:

Listing reference	Design Name	Core Spec Version
D038622	S140 Host v6.0.0	5.0
D038623	S140 Link layer v6.0.0	5.0

The BL654PA design under D041400 incorporates the following components:

Listing reference	Design Name	Core Spec Version
D039780	S140 Host v6.1.0	5.0
D040756	S140 Link layer v6.1.0x	5.0

In the future, Nordic may list updated versions of these components and it is possible to use them in your new design. Please check with Nordic to make sure these software components are compatible with the nRF52 hardware.

If your design is based on un-modified BL654PA hardware it is possible use the following process;

1. Reference the existing RF-PHY test report from the BL654PA listing.
2. Combine the relevant Nordic Link Layer (LL) – check QDID with Nordic.
3. Combine in a Host Component (covering L2CAP, GAP, ATT, GATT, SM) - check QDID with Nordic.
4. Test any standard SIG profiles that are supported in the design (customs profiles are exempt).

Figure 18: Scope of the qualification for an End Product Design

The first step is to generate a project on the TPG (Test Plan Generator) system. This determines which test cases apply to demonstrate compliance with the Bluetooth Test Specifications. If you are combining pre-tested and qualified components in your design and they are within their three-year listing period, you are not required to re-test those layers covered by these components.

If the design incorporates any standard SIG LE profiles (such as Heart Rate Profile), it is necessary to test these profiles using PTS or other tools where permitted; the results are added to the compliance folder.

You are required to upload your test declaration and test reports (where applicable) and then complete the final listing steps on the SIG website. Remember to purchase your Declaration ID before you start the qualification process, as it's impossible to complete the listing without it.
