General description

Introduction

This evaluation kit provides a test platform for Infineon's dual-channel non-isolated gate driver IC EiceDRIVER™ 2EDN7524F in DSO 8pin package.

The complete driving circuitry is integrated into the board to allow a simple and practical step-by-step discovery of the 2EDN7524F characteristic and to evaluate the influence of the surrounding driving circuitry on the signal delivered to the load. The dual-channel driver is intended to feed two low-side MOSFETs in TO-220 package, which can be allocated on the board. For this purpose a CoolMOS™ or OptiMOS™ power MOSFET solution from Infineon can be selected.

The evaluation kit requires an external function generator and a DC power supply to provide the input signals to the 2EDN7524F. As shown in the quick start guide, the easiest and immediate way-to-use the board is with zero-power applied to the MOSFETs. In that operating condition, the 2EDN7524F load is equivalent to a pure RC filter. Testing with different MOSFETs is a suggested option to evaluate and understand the impact of the MOSFETs input capacitance on the driving timing behavior.

Additionally, the possibility to power-up the MOSFETs and then, trigger the switch of the devices, is purposely provided through banana connectors. An external circuitry must be properly built in that case to provide the bulk voltage and limit the current. Furthermore, pads for a possible connection to a daughter card are included.

Summary of features:

- › Complete and easy-to-use solution platform integrating Infineon's 2EDN7524F EiceDRIVER™ gate driver IC and CoolMOS™ or OptiMOS™ power MOSFETs
- › Possible to evaluate the influence of the gate load (R_g or C_{gs}) on the driving behavior of the 2EDN7524F
- › Easy to replace and test different power MOSFETs in TO-220 package

The diagram illustrates the internal circuitry of a 2EDN7524F driver. It features a 2EDN7524F driver IC (IC1) with pins 1 (ENA), 2 (INA), 3 (GND), 4 (INB), 5 (OUTB), 6 (VDD), 7 (OUTA), and 8 (ENB). The driver is powered by a +12V input and ground. It drives two MOSFETs (T8 and T9) through resistors (R2, R3, R23, R24) and diodes (D7, D8). The MOSFETs are connected to a 12V2 card (U1) via connectors P1 and P2. Red annotations highlight 'MOSFETS CONNECTORS' and 'R_G,SINK'.

Steps for kit assembly

The following components need to be added to the kit:

- > Distance bolts
- > Source resistors
- > Sink resistors
- > Sink diodes
- > TO-220 sockets
- > TO-220 MOSFETS

Step 1
Distance bolts mounting

Step 2
Source resistor soldering

Step 3
Sink resistors and sink diodes soldering

Step 4
TO-220 sockets soldering

Step 5
MOSFETs placement into the sockets

Step 6
Heatsink mounting
