Description

The highly integrated Dual Channel Switch and LNA Module includes two Antenna Switches and two 2-stage low noise amplifiers in a compact low cost 6 mm QFN package. The second stage LNAs can be bypassed. Mixed technologies are used to achieve high power handling, low noise figure, and low power consumption. The module only needs a single +5 V supply. T/R switch, LNA enable, and bypass function can be controlled with 1.8 V or 3.3 V logic.

8. Exceeding any one or combination of these limits may cause permanent damage to this device.

9. MACOM does not recommend sustained operation near these survivability limits.

10. Single event, up to 10 seconds duration.

11. Operating at nominal conditions with $T_J \leq +150^\circ\text{C}$ (RX Mode) and $T_J \leq +125^\circ\text{C}$ (TX Mode) will ensure MTTF $\gg 1 \times 10^6$ hours.

12. Operating/Case temperature (T_C) is the temperature of the exposed paddle.

13. Junction Temperature (T_J) = $T_C + \Theta_{JC} * P_{DISS}$ where P_{DISS} is the total DC & RF dissipated power.

- RX Mode: Typical thermal resistance (Θ_{JC}) = 33.4 °C/W.
- TX Mode: Typical thermal resistance (Θ_{JC}) = 9.8 °C/W.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

Power Supplies

De-coupling capacitors should be placed at the V_{DD} supply pin to minimize noise and fast transients. Supply voltage change or transients should have a slew rate smaller than 1 V / 10 μs . In addition, all control pins should remain at 0 V (+/- 0.3 V) and no RF power should be applied while the supply voltage ramps or while it returns to zero.
