APPLICATION NOTES

All DC-DC converters of this series are tested before delivery using the recommended circuit shown in Fig. 1. Input and/or output ripple can be further reduced by appropriately increasing the input & output capacitor values C_{in} and C_{out} and/or by selecting capacitors with a low ESR (equivalent series resistance). Also make sure that the capacitance is not exceeding the specified max. capacitive load value of the product.

REMOTE SENSE APPLICATION

Figure 4
REMOTE SENSE CONNECTION
IF NOT USED

- Note:
1. Lines must be kept as short as possible.
 2. If the sense function is not used for remote regulation the user must connect the +Sense to + Vo and -Sense to 0V at the DC-DC converter pins and will compensate for voltage drop across pins only.
 3. The connections between Sense lines and their respective power lines must be kept as short as possible, otherwise they may be picking up noise, interference and/or causing unstable operation of the power module.

Figure 5
REMOTE SENSE CONNECTION
USED FOR COMPENSATION

- Note:
1. In cables and discrete wiring applications, twisted pair or other techniques should be implemented.
 2. Using remote sense with long wires may cause unstable output, please contact technical support if long wires must be used.
 3. PCB-tracks or cables/wires for Remote Sense must be kept as short as possible. Twisted pair or shielded wires are suggested for remote compensation and must be kept as short as possible.
 4. We recommend using adequate cross section for PCB-track layout and/or cables to connect the power supply module to the load in order to keep the voltage drop below 0.3V and to make sure the power supply's output voltage remains within the specified range.
 5. Note that large wire impedance may cause oscillation of the output voltage and/or increased ripple. Consult technical support or factory for further advice of sense operation.

Trim up

Trim down

$$R_{TRIM} = \left(\frac{5.11 \cdot V_{NOM} (100 + \Delta\%)}{1.225 \Delta\%} - \frac{511}{\Delta\%} - 10.22 \right) (K\Omega)$$

Formula for Trim up

$$R_{TRIM} = \left(\frac{511}{\Delta\%} \right) - 10.22 (K\Omega)$$

Formula for Trim down

Note: R_{TRIM} : Trim resistance

$$\Delta\%: \Delta\% = \left| \frac{V_{NOM} - V_{OUT}}{V_{NOM}} \right| \times 100$$

V_{NOM} : Nominal output voltage

V_{OUT} : Target output voltage

THERMAL TEST POINT

The thermal element is installed on the top surface of the product and dissipates heat to the surrounding environment through conduction, convection and radiation. Sufficient heat dissipation conditions should be provided to ensure the reliable operation of the product. By measuring the temperature of the thermal test point in Fig. 7, it can be verified whether the heat dissipation conditions are met.

Figure 7

Note:

1. Maximum capacitive load is tested at input voltage range and full load.
2. All specifications are measured at $T_a = 25^\circ\text{C}$, humidity < 75%, nominal input voltage and rated output load unless otherwise specified.
