## FEATURES

- Compact DFN1006-2B package
- Low package height < 0.5 mm
- 1-line bidirectional ESD-protection
- AEC-Q101 qualified available
- OPEN Alliance 100Base-T1 and 1000Base-T1 compliant
- Working range  $\pm 24$  V
- Trigger voltage >100 V
- Capacitance < 2 pF
- ESD immunity acc. ISO 10605 and IEC 61000-4-2 (150 pF/330  $\Omega$ )  $\pm 15$  kV (1000 x contact discharge)
- Lead plating: Sn (e3)
  - Including wettable side walls (flanks)
  - Soldering can be checked by standard vision inspection
  - AOI = automated optical inspection
- Material categorization: for definitions of compliance please see [www.vishay.com/doc299912](http://www.vishay.com/doc299912)

## TECHNICAL NOTE

The ESD protection diode VETH100A1DD1 is a one line, bidirectional ESD-protection diode made for Automotive Ethernet which meets the OPEN Alliance specifications [IEEE 100BASE-T1 EMC Test Specification for Suppression Devices](#) and [IEEE 1000BASE-T1 EMC Test Specification for Suppression Devices](#).

The OPEN Alliance specifications specify various tests with the ESD protection diode mounted on test boards simulating the real environment in Automotive Ethernet application.

The test reports include the device classification according to related test specification such as:

- Mixed mode S-parameter measurement
- Damage from ESD
- ESD discharge current measurement and
- Unwanted clamping effect at RF immunity tests

The test reports are available on request (mail to: [ESDprotection@vishay.com](mailto:ESDprotection@vishay.com))

Connected between data line and ground the VETH100A1DD1 blocks voltages between -100 V and +100 V with low leakage current. Such high voltages can be induced in the unshielded twisted One Pair EtherNet (OPEN) cables by electromagnetic fields from anywhere in and around the vehicle where the in-vehicle-network is installed.

It needs a trigger voltage  $V_T$  above 100 V to trigger the voltage snap-back of the ESD-protection diode. In its snap-back state, the VETH100A1DD1 effectively clamps ESD pulses down to around 30 V (at  $I_{LP} = 1$  A). Additionally with this low dynamic resistance  $r_{dyn}$  the clamping voltage is only slightly depending on the current flowing through the diode to ground.

The very low capacitance  $C_D$  makes the VETH100A1DD1 invisible for the data signals, so that the data rate on the Automotive Ethernet network will not be affected.
