FLEXIBLE PRINTED CIRCUIT (FPC) CONNECTORS

TE Connectivity’s (TE) FPC interconnects are ideal where small centerline spacing makes larger wire-to-board interconnects impractical. As the market trends towards minaturization, FPC connectors have been developed to meet the challenges of an expanding market that demands smaller centerlines, lower profiles, and lighter interconnect solutions. TE’s FPC interconnects utilize an actuator to secure the cable termination and are field terminatable (require no tooling). Available in 0.25mm, 0.3mm, 0.4mm, 0.5mm, 1.0mm and 1.25mm centerline spacing, TE’s FPC interconnects are suited for a wide variety of applications.

Key Features
- Uses FPC / FFC cable
- Available in ZIF and non-ZIF versions
- Top, bottom and dual contact versions available
- Requires no application tooling
- Low profile height
- Light weight
- 0.25mm pitch series accepts angled insertion of flexible printed circuit

Key Benefits
- Space savings over other wire-to-board connectors
- Improved assembly efficiency
- Greater durability and tactile feel
- Design flexibility

Applications
- Flat flexible printed cable applications
- LC displays
- Game consoles
- Tablets
- Wearables
- Cameras
- Inkjet, laser and 3D printers
- Personal computers
- Mobile and smart phones
- GPS devices
- Streaming devices/set top boxes
- Disk drives
- Medical equipment
Flexible Printed Circuit (FPC) Connectors

ZIF and non-ZIF Connector Styles

**ZIF Connectors**
- Use an actuator to secure the flex cable
- Less wear on contacts
- Increase mating cycle count
- Provide added retention
- Better for high vibration environments

**Non-ZIF Connectors**
- Use friction to secure the flex cable
- Lower mating cycle count
- Better for static applications
- Smaller and lighter weight than ZIF counterpart
- Uses less space
- Typically less expensive than ZIF counterpart

Actuator Styles

TE’s fine pitch FPC connectors incorporate a flip lock actuator for greater printed circuit retention. This termination method also allows for zero insertion force (ZIF). The operation of a flip-lock actuator can be seen below.

**Front Flip-Lock Actuator**
- Step One: Open flip-lock actuator.
- Step Two: Insert the FPC into the connector.
- Step Three: With the FPC inserted, close the flip-lock actuator.
- Step Four: Your FPC is now securely mated with the connector.

**Back Flip-Lock Actuator**
- Step One: Open flip-lock actuator.
- Step Two: Insert the FPC into the connector.
- Step Three: With the FPC inserted, close the flip-lock actuator.
- Step Four: Your FPC is now securely mated with the connector.

**Stuffer Actuator (Plunger Style)**

Larger pitch ZIF-style FPC connectors use a stuffer type actuator. Stuffer actuators are typically used in vertical applications for ease of use, however right angle versions are also available.

**Contact Styles**

TE’s FPC connectors are available with a top contact, bottom contact or dual contact design. Choosing the correct contact design is generally based on the orientation of the flexible printed circuit. If the contacts of the flexible printed circuit are facing up, a top contact design is required. If they face down, a bottom contact design is required. A dual contact design can accommodate a flexible printed circuit facing in either orientation.
## Flexible Printed Circuit (FPC) Connectors

### Part Number Detail

#### 0.25mm Pitch FPC Connector

<table>

* NOTES: (Type A and B Layouts refer to circuit #1 position (see customer drawing for detail)
Frequently Asked Questions

Question 1:
What position sizes can TE provide?
Answer 1:
We offer odd number position sizes only, unless otherwise stated on the product drawing. We can also offer up to 71P in our 0.3mm series and up to 61P in our 0.25mm pitch series.

Question 2:
What is the advantage of angled flexible printed circuit insertion?
Answer 2:
Being able to insert and mate the FPC into the connector at an angle makes it possible to mount the FPC connector almost anywhere on your PCB as there is much less clearance needed in front of the connector during mating and unmating.

Question 3:
What is the minimum height of this product series?
Answer 3:
For the part numbers in this guide, 0.9mm is the lowest height.

Question 4:
What is the biggest differentiator of TE’s FPC connector series?
Answer 4:
Our FPC connectors offer the same product function in one of the smallest form factors in the market. Our product also offers a distinct click lock and a larger vacuum pick up area.

Question 5:
What centerlines are your FPC connectors available in?
Answer 5:
TE’s FPC connectors are available in centerlines ranging from 0.25 to 1.25mm.

Question 6:
Do you have products suited for a high vibration environment?
Answer 6:
Our ZIF version FPC connectors have a greater retention force and are suitable for high vibration environments.

Question 7:
Do you have products that are capable of a high amount of mating cycles?
Answer 7:
Our ZIF version FPC connectors allow for a greater number of mating cycles by using an actuator.

Question 8:
When should I use a top contact or a bottom contact version?
Answer 8:
If your flex cable contact pads face down, use a bottom contact version. If they face up, use a top contact version. Our dual contact version products can accommodate a cable in either orientation.
