FAN48610
2.5 MHz, Fixed-Output Synchronous TinyBoost® Regulator

Features
- Input Voltage Range: 2.35 V to 5.50 V
- Output Voltages Range: 3.0 V to 5.0 V
- $\text{I}_{\text{OUT}} \geq 1 \text{ A at } \text{V}_{\text{OUT}} = 5.0 \text{ V, V}_{\text{IN}} \geq 2.5 \text{ V}$
- $\text{I}_{\text{OUT}} \geq 1.5 \text{ A at } \text{V}_{\text{OUT}} = 5.0 \text{ V, V}_{\text{IN}} \geq 3.0 \text{ V}$
- Up to 94% Efficient
- Automatic Pass-Through Operation when $\text{V}_{\text{IN}} > \text{V}_{\text{OUT}}$
- Internal Synchronous Rectification
- Soft-Start with True Load Disconnect
- Short-Circuit Protection
- 9-Bump, 1.215 mm x 1.215 mm, 0.4 mm Pitch WLCSP
- Three External Components: 2016 0.47 $\mu$H Inductor, 0603 Case Size Input / Output Capacitors
- Total Application Board Solution Size: < 11 mm$^2$

Applications
- Class-D Audio Amplifier and USB OTG Supply
- Boost for Low-Voltage Li-Ion Batteries
- Smart Phones, Tablets, Portable Devices

Description
The FAN48610 is a low-power boost regulator designed to provide a minimum voltage-regulated rail from a standard single-cell Li-Ion battery and advanced battery chemistries. Even below the minimum system battery voltage, the device maintains the output voltage regulation for a minimum output load current of 1.0 A. The combination of built-in power transistors, synchronous rectification, and low supply current suit the FAN48610 for battery-powered applications.

The FAN48610 is available in a 9-bump, 0.4 mm pitch, Wafer-Level Chip-Scale Package (WLCSP).

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Thermal Properties

Junction-to-ambient thermal resistance is a function of application and board layout. This data is measured with four-layer 2s2p boards with vias in accordance to JEDEC standard JESD51. Special attention must be paid not to exceed junction temperature, $T_{J(max)}$, at a given ambient temperature, $T_A$.

Circuit Description

FAN48610 is a synchronous boost regulator, typically operating at 2.5 MHz in Continuous Conduction Mode (CCM), which occurs at moderate to heavy load current and low VIN voltages. The regulator’s Pass-Through Mode automatically activates when VIN is above the boost regulator’s set point.

</tbody>
</table>

Boost Mode Regulation

The FAN48610 uses a current-mode modulator to achieve excellent transient response and smooth transitions between CCM and DCM operation. During CCM operation, the device maintains a switching frequency of about 2.5 MHz. In light-load operation (DCM), frequency is naturally reduced to maintain high efficiency.

Shutdown and Startup

When EN is LOW, all bias circuits are off and the regulator is in Shutdown Mode. During shutdown, current flow is prevented from VIN to VOUT, as well as reverse flow from VOUT to VIN. It is recommended to keep load current draw below 500 mA until the devices successfully executes startup. The following table describes the startup sequence.

Table 3. Boost Startup Sequence

</tbody>
</table>

LIN Mode

When EN is HIGH and VIN > VUVLO, the regulator first attempts to bring VOUT within 300 mV of VIN by using the internal fixed-current source from VIN (Q2). The current is limited to the LIN1 set point.

If VOUT reaches VIN-300 mV during LIN1 Mode, the SS Mode is initiated. Otherwise, LIN1 times out after 512 µs and LIN2 Mode is entered.

In LIN2 Mode, the current source is incremented to 1.6 A. If VOUT fails to reach VIN-300 mV after 1024 µs, a fault condition is declared and the device waits 20 ms to attempt an automatic restart.

Soft-Start (SS) Mode

Upon the successful completion of LIN Mode (VOUT>VIN>300 mV), the regulator begins switching with boost pulses current limited to 50% of nominal level.

During SS Mode, if VOUT fails to reach regulation during the SS ramp sequence for more than 64 µs, a fault is declared. If large COUT is used, the reference is automatically stepped slower to avoid excessive input current draw.

Boost (BST) Mode

This is a normal operating mode of the regulator.

Pass-Through (PT) Mode

In normal operation, the device automatically transitions from Boost Mode to Pass-Through Mode if VIN goes above the target VOUT. In Pass-Through Mode, the device fully enhances Q2 to provide a very low impedance path from VIN to VOUT. Entry to the Pass-Through Mode is triggered by condition where VIN > VOUT and no switching has occurred during the past 5 µs. To soften the entry into Pass-Through Mode, Q2 is driven as a linear current source for the first 5 µs. Pass-Through Mode exit is triggered when VOUT reaches the target VOUT voltage. During Automatic Pass-Through Mode, the device is short-circuit protected by a voltage comparator tracking the voltage drop from VIN to VOUT; if the drop exceeds 300 mV, a fault is declared.

Fault State

The regulator enters Fault State under any of the following conditions:

- VOUT fails to achieve the voltage required to advance from LIN Mode to SS Mode.
- VOUT fails to achieve the voltage required to advance from SS Mode to BST Mode.
- Boost current limit triggers for 2 ms during BST Mode.
- VIN – VOUT > 300 mV; this fault can occur only after successful completion of the soft-start sequence.
- VIN < VUVLO.

Once a fault is triggered, the regulator stops switching and presents a high-impedance path between VIN and VOUT. After waiting 20 ms, an automatic restart is attempted.

Over-Temperature

The regulator shuts down if the die temperature exceeds 150°C. Restart occurs when the IC has cooled by approximately 20°C.
Application Information

Output Capacitance (C_{OUT})

The effective capacitance (C_{EFF}) of small, high-value ceramic capacitors decreases as their bias voltage increases, as illustrated in the graph below:

![Graph showing effective capacitance (C_{EFF}) vs. DC bias voltage (V)].

FAN48610 is guaranteed for stable operation with the minimum value of C_{EFF} (C_{EFF(MIN)}) outlined in Table 4.

Table 4. Minimum C_{EFF} Required for Stability

<table>
<thead>
<tr>
<th>Operating Conditions</th>
<th>C_{EFF(MIN)} (μF)</th>
</tr>
</thead>
<tbody>
<tr>
<td>V_{OUT} (V)</td>
<td>V_{IN} (V)</td>
</tr>
<tr>
<td>5.0</td>
<td>2.5 to 4.5</td>
</tr>
</tbody>
</table>

Note:
6. C_{EFF} varies by manufacturer, capacitor material, and case size.

Inductor Selection

Recommended nominal inductance value is 0.47 μH.

The FAN48610 employs valley-current limiting, so peak inductor current can reach 3.8 A for a short duration during overload conditions. Saturation effects cause the inductor current ripple to become higher under high loading, as only the valley of the inductor current ripple is controlled.

Startup

Input current limiting is in effect during soft-start, which limits the current available to charge C_{OUT} and any additional capacitance on the V_{OUT} line. If the output fails to achieve regulation within the limits described in the Soft-Start section above, a fault occurs, causing the circuit to shut down. It waits about 20 ms before attempting a restart. If the total combined output capacitance is very high, the circuit may not start on the first attempt, but eventually achieves regulation if no load is present. If a high current load and high capacitance are both present during soft-start, the circuit may fail to achieve regulation and continually attempt soft-start, only to have the output capacitance discharged by the load when in Fault State.

Output Voltage Ripple

Output voltage ripple is inversely proportional to C_{OUT}. During t_{ON}, when the boost switch is on, all load current is supplied by C_{OUT}.

\[ V_{ripples} = t_{ON} \cdot \frac{l_{LOAD}}{C_{OUT}} \]

and

\[ t_{ON} = t_{SW} \cdot D = t_{SW} \cdot \left(1 - \frac{V_{IN}}{V_{OUT}}\right) \]

therefore:

\[ V_{ripples} = t_{SW} \cdot \left(1 - \frac{V_{IN}}{V_{OUT}}\right) \cdot \frac{l_{LOAD}}{C_{OUT}} \]

\[ t_{SW} = \frac{1}{f_{SW}} \]

The maximum V_{ripples} occurs when V_{IN} is minimum and l_{LOAD} is maximum. For better ripple performance, more output capacitance can be added.

Layout Recommendations

The layout recommendations below highlight various top-copper pours by using different colors.

To minimize spikes at VOUT, C_{OUT} must be placed as close as possible to PGND and VOUT, as shown below.

For thermal reasons, it is suggested to maximize the pour area for all planes other than SW. Especially the ground pour should be set to fill all available PCB surface area and tied to internal layers with a cluster of thermal vias.

DISCLAIMER
FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HERETO IN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXCEED THE TERMS OF FAIRCHILD’S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVER THESE PRODUCTS.

LIFE SUPPORT POLICY
FAIRCHILD’S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:
1. Life support devices or systems are devices or systems which, if (a) intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

ANTI-COUNTERFEITING POLICY
Fairchild Semiconductor Corporation’s Anti-Counterfeiting Policy. Fairchild’s Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild’s quality standards for handling and storage and provide access to Fairchild’s full range of up-to-date technical and product information. Fairchild and its Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

PRODUCT STATUS DEFINITIONS
