Product Tape and Reel, Solderability & Package Outline Specification

Contents

1. General Information
2. Tape and Reel / T&R
3. Package Outline Drawing / POD
4. Electro Static Discharge / ESD
5. Moisture Sensitivity / MSL
6. PCB Design – Land Pattern and Stencil Design
7. Solder Paste
8. Reflow Profile
9. Product Shelf Life

1. General Information

This specification covers MicroLeadFrame (MLF | Quad flatpack no leads (QFN’s), DFN (Dual Flat No-Lead) and LFM (Lead Frame Module) SMT IC packages with soldered electrical connections made to the surface of the connecting PCB, shipped in Tape and Reel.

The QFN and LFM have leads on all four sides with the DFN having leads on two sides of the package. QFN and DFN packages have full leads exposed to the edge of the package. The exposed edge of the lead is not plated and a solder fillet is not necessary for proper mounting.

Lead finish for the QFN and LFM package is Matte Sn. Lead finish for the DFN packages is NiPdAu.
The packages noted are easily mounted using standard PCB SMT reflow assembly techniques and can be removed and replaced using standard removal techniques - see Section 8. This manufacturing note presents users with general information on how the devices are packaged on tape and reels and how to solder the component to PCB’s.

All packages listed in this specification are RoHS compliant lead-free packages. Please see www.guerrilla-rf.com/environmental for additional information.

2. Tape and Reel

Guerrilla RF’s Tape and Reel specification complies with Electronics Industries Association (EIA) standards for “Embossed Carrier Tape of Surface Mount Components for Automatic Handling”. Reference EIA-481. See Table 1 for Tape and Reel specifications along with units per reel.

Devices are loaded with pins down into the carrier pocket with protective cover tape, wound onto a plastic reel. Each reel will be packaged in a cardboard box. There will be product labels on the reel, the protective ESD bag and the outside surface of the box.

3. Package Outline Drawings - Continued

Note: The LFM package bottom metallization is complex. Shaded metallization required for device functionality. Non-shaded area should be covered with solder mask as a keep out area. Please reference product Gerber files to assist in PCB layout. Files are available at www.guerrilla-rf.com/products for each part number.

4. ESD

Guerrilla RF qualifies devices to ANSI/ESDA/JEDEC JS-001-2014 and ANSI/ESDA/JEDEC JS-002-2014. Devices are ESD sensitive and should be handled accordingly. Individual device ratings can be found on Product Data Sheets. JEDEC JESD625B is a common reference for review.

5. Moisture Sensitivity Level

6. PCB Design Guidelines - Land Pattern and Stencil Design

For Volume Production, devices can be treated as a standard surface mount component (ref IPC/JEDEC J-STD-020) with a standard assembly process. (Stencil solder printing, standard pick & place & solder reflow oven).

PCB design considerations are needed to properly design the PCB and solder stencil to mount the package. Recommended land pattern/gerber files are available to assist in PCB design. Guerrilla RF gerber files can be downloaded at www.guerrilla-rf.com at the bottom of each product landing page.
7. Solder Paste

There are no special requirements necessary when reflowing components. A low residue, no-clean solder (SN63/Pb37 or SAC alloy) paste is commonly used. The solder-paste manufacturer’s printing and temperature profile should be used to optimize the assembly process.

To verify any open or short circuits (bridging) after reflow, optical inspection and x-ray inspection are typical techniques that may be used.

8. Reflow Profile

A typical reflow profile is shown in Figure 10 as a reference only. The actual profile parameters depend upon the solder paste used, therefore, recommendations from paste manufacturers should be followed for reflow profile and any post solder cleaning.

Guerrilla RF has tested and qualified the packages listed in Table 1 for three (3x) reflow operations per JEDEC J-STD-020 at a classification temperature of 260C. Note the MSL value is noted on the packaging label of each reel.

Manual or hand soldering is not recommended but if necessary the same temperature profile as the normal reflow soldering should be used. The peak temperature must not exceed the standard assembly reflow process.
9.0 Product Shelf Life / Floor Life

Shelf life for semiconductor products is based on a number of factors, including moisture sensitivity level (MSL), use of moisture barrier bags (MBBs) and desiccant in product packaging. Under normal use and assuming reasonable turn of inventory there should be no shelf life concerns.

Guerrilla RF’s semiconductor’s parts are typically shipped in moisture-barrier bags (MBB) with desiccant, humidity indicator card and labeled with the MSL rating. Unless otherwise expressly noted, shelf life expectancy is unlimited from bag seal date, provided storage conditions adhere to IPC/JEDEC J-STD-033C. Within this period, and as long as the Humidity Indicator Card (HIC) does not indicate a need for re-baking, it is safe to reflow components per original MSL rating.

If the humidity indicator card (HIC) indicates that baking is not required, then it is safe to reflow the components per the original MSL rating. In all instances, Guerrilla RF recommends maintaining best known practices and to always properly reheat-seal the moisture barrier bag after opening.

Please note that although unanticipated, factors other than moisture sensitivity could affect the total shelf life of components. Guerrilla RF assumes no responsibility for mishandled or improperly stored products.

Guidelines established by IPC/JEDEC J-STD-033C should be followed when handling and storing semiconductor products.
