Mobile Battery Connectors

TE Connectivity’s (TE) series of mobile battery connectors consists of several types, including low profile battery connectors, leaf battery connectors and floating battery interconnection system (FBIS II). These products have been widely adopted across applications, such as mobile phones, tablet PCs, digital cameras and other mobile devices.

Mobile battery connectors’ key benefits - low cost, high reliability and durability, low profile design and high design flexibility - allow them to be used in various fields. For example, they are used in mobile phones with removable batteries, since their high design flexibility allows them to be scaled up or down regardless of positions, working height and contact pitch. The low profile battery connector series improves cost effectiveness by reducing the number of components needed and the size of the tooling platform. They are designed for position extensions and height changes and can be used for SMT soldering and DIP type soldering, as well as fitted for a standard mount or mid-mount. TE’s technological capabilities make our mobile battery connector series a cost saving solution for our customers.

**Key Features**

- Can be used in mobile phone with removable battery
- 2.5 mm - 6.5 mm centerline
- Various positions include: 2, 3, 4 and 6
- Working height ranges from 0.4 mm to 6.7 mm
- Wide range of current ratings from 1.5 Amperes to 5 Amperes

**Benefits**

- Improve cost effectiveness by reducing the number of components needed and the size of the tooling platform
- Low profile design occupies a small area of PCB
- Design flexibility allows position extensions, height changes and customization
- Connection reliability and durability meets the general market requirements

**Applications**

- Mobile Phones
- Tablet PCs
- Mobile Media Players
- Digital Cameras
- Video Cameras
- Navigation Systems
- Gaming Consoles

Key Features

Low Profile Battery Connector

• Improved cost effectiveness by reducing components
  - For removable battery connectors, spring probe connectors are typically used in mobile phones due to their low profile design. Their disadvantage is due to a higher cost necessary as they require the customer to increase the component quantity and wide gold plating area. Moreover, they require additional pins to ensure a reliable connection. Low profile battery connectors require lesser components to achieve similar results.

• High connection reliability and durability
  - Connection reliability is high because the contact is produced from one single material
  - Durability cycle stands at 5,000 cycles and meets the general market requirement

• NEW 5A low profile battery connector
  - Provides a more reliable one-piece contact design
  - Supports faster charging speeds required for today’s consumer devices
Key Features

Low Profile Battery Connector

- Low profile design and design flexibility allow position extensions and height changes
- A new contact design allows for a low profile design. Traditional solutions like the leaf battery connector that is made from one material contact do not meet the low profile design.
- Developing 4 positions and mid mount types with the same contact concept allows the development of a variety products that fits customers’ requirements.

![Low Profile Battery Connector](image1)

**Connector height is 1.9mm, contact point is 0.8mm**

![Low Profile Battery Connector from PCB](image2)

**Connector height from PCB is 1.4mm, contact points is 0.4mm from PCB surface**

Leaf Battery

- Improved cost effectiveness
- Long stroke contact
- Features a pre-load contact for reliability

![Leaf Battery Pre-load Concept](image3)

**Pre-load Concept**

- Flexible mating direction for various applications
- Right angled and vertical mating directions are available.
Key Features

Floating Battery Interconnection System - FBIS II

- High connection reliability and durability
- Features dual beam floating contact function to absorb misalignment
- Prevents electrical disconnection due to physical shock and vibration

![Prevent electrical disconnection](image)

- Flexible mating direction for various applications
  - Right angled and vertical mating directions are available.

**Frequently Asked Questions**

**Question 1**
What is the working height of the TE mobile battery connector?

**Answer 1**
There are two working heights for low profile battery connectors: 0.4 mm and 0.8 mm, and they are smaller in size. Leaf battery connectors: it ranges from 2.28 mm to 6.7 mm. FBIS II can mate directly.

**Question 2**
What is the centerline (pitch) requirement?

**Answer 2**
TE offers the centerline space of 2.5 mm for low profile battery connectors, 3.2 mm to 6.5 mm for leaf battery connectors and 3.0 mm for FBIS II.

**Question 3**
What are the positions of the TE mobile battery connector?

**Answer 3**
TE offers mobile battery connectors ranging from 2 to 6 positions.

**Question 4**
What are the major applications of the TE mobile battery connector?

**Answer 4**
This product series can be used in mobile phones, tablet PCs, mobile media players, digital cameras, video cameras, navigation systems and gaming consoles.

**Question 5**
What is the maximum current rating of the TE mobile battery connector?

**Answer 5**
In general, the maximum current rating for FBIS II is 1.5 amperes, leaf battery connectors is 2 amperes, and for low profile battery connectors can be up to 5 amperes. Please refer to the TE product specification for more information.
